Service Manual: 01 - SALES CHECK -- (95B) - MACAN

WM 010100 SALES CHECK (ALL MODELS) > SALES CHECK

Information

- The term "checking" includes all necessary subsequent work such as adjusting, readjusting, correcting and topping up, but does not include repairing, replacing and reconditioning parts or assemblies.

Work instruction for order no.								
Dealer No.								

Vehicle Ident. No.

	OK (1)	Not OK (2)
Check PIWIS information system for open workshop campaigns and recall campaigns for the vehicle		
Check conformity of vehicle identification number on the vehicle, on the data carrier, in the vehicle registration documents and on-board literature → 0X01IN CHECKING VEHICLE IDENTIFICATION NUMBER		
Activate PCC/PVTS - vehicles with Vehicle Tracking System (VTS) → 906425 ACTIVATING PCC/PVTS		
Remove transport locks and transport protection → 0X01IN REMOVING TRANSPORT PROTECTION		
Diagnostic system: Perform vehicle handover; read out and erase fault memory. → 0X01IN DIAGNOSTIC SYSTEM: PERFORMING VEHICLE HANDOVER		

Windscreen wiper/washer system, headlight cleaning system: Check function, fluid level and nozzle settings; check window cleaner and antifreeze, depending on the season; check wiper blades → 0X03IN ELECTRICS MAINTENANCE: CHECKING WINDSCREEN WIPER AND WASHER SYSTEM		
Vehicle lights: check function. All headlights: check adjustment. Horn and clock: check function		
Electrical equipment, warning and indicator lights: check function → 0X01IN CHECKING OPERATION OF ELECTRICAL EQUIPMENT AS WELL AS WARNING AND INDICATOR LIGHTS		
Mobile roofs: check function → 0X01IN MOBILE ROOFS: CHECKING OPERATION		
Check engine-oil level → 170101 CHECKING ENGINE-OIL LEVEL		
Check comfort tire pressure → 0X03IN RUNNING GEAR MAINTENANCE: TIRES AND SPARE WHEEL: CHECKING CONDITION AND TYRE PRESSURE		
Wheels, tires: visual inspection for damage → 0X03IN RUNNING GEAR MAINTENANCE: TIRES AND SPARE WHEEL: CHECKING CONDITION AND TYRE PRESSURE		
Check wheel mounting → 0X03IN CHECKING WHEEL MOUNTING		
Brake hoses and lines: visual inspection for damage in wheel area → 0X03IN RUNNING GEAR MAINTENANCE: VISUAL		

INSPECTION - BRAKE LINES/BRAKE PADS/BRAKE DISCS		
Check brake fluid level → 0X03IN RUNNING GEAR MAINTENANCE: CHECKING BRAKE FLUID LEVEL AND CHANGING BRAKE FLUID		
Visual inspection for leaks: oils, fluids		
Exterior equipment and paint finish: visual inspection for damage → 0X01IN CHECKING EXTERIOR EQUIPMENT AND PAINTWORK		
Glazing: visual inspection for damage → 0X01IN CHECKING GLAZING		
Interior equipment: visual inspection for damage and soiling → 0X01IN INTERIOR EQUIPMENT: VISUAL INSPECTION FOR DAMAGE AND SOILING		
Door and lid locks: check function → 0X01IN CHECKING LIDS AND DOORS		
Alarm system: check function and monitoring devices → 0X01IN ALARM SYSTEM: CHECKING FUNCTION OF MONITORING DEVICES		
Complete the vehicle and check that all vehicle equipment is present → 0X01IN CHECKING VEHICLE EQUIPMENT FOR COMPLETENESS		
Insert control panel into the ignition lock (vehicles with Entry & Drive)		

(1)	OK = okay
(2)	Not OK = not okay

Test drive	OK (1)	Not OK (2)
Foot and parking brakes, steering, cruise control, ParkAssist, heating, sports exhaust system, air conditioning and instruments: check function → 0X01IN TEST DRIVE - SALES CHECK		
Transmission: check function		
Check vehicle for unusual handling behavior, vibration and noise		
Diagnostic system: read out and erase fault memory → 033500 FAULT MEMORY FOR ON-BOARD DIAGNOSIS		

(1)	OK = okay
(2)	Not OK = not okay

Stamp of Official Porsche Centre

WM 0X00IN OVERVIEW OF A, B AND C MARKETS (MACAN, MACAN S, MACAN TURBO) > INFORMATION > OVERVIEW OF A, B AND C MARKETS

Information

For vehicles as of model year 2011

Because of different fuel octane ratings, the change intervals for oil, spark plugs and air cleaner have been adapted to suit the various markets.

Markets	Countries
A markets	Andorra Belgium Germany Denmark Estonia Finland, France Greece, Great Britain Ireland, Iceland, Italy Japan Latvia Liechtenstein, Lithuania, Luxembourg Malta Netherlands, Norway Austria Poland, Portugal Sweden, Switzerland, Slovakia, Spain Czech Republic Hungary Cyprus
B markets	Egypt, Algeria, Angola, Argentina, Armenia, Aruba (itc Caribbean), Azerbaijan, Australia Bahamas, Bahrain, Bangladesh, Barbados, Bosnia and Herzegovina, Brazil, Brunei, Bulgaria Chile, Costa Rica Dominican Republic Ecuador, El Salvador French Guiana, French Polynesia Ghana, Guadeloupe, Guatemala Haiti, Dutch Antilles, Honduras, Hong Kong India, Iraq, Iran, Israel Jamaica (itc Caribbean), Yemen, Jordan Cameroon, Canada, Kazakhstan, Qatar, Cayman Islands, Kenya, Columbia, Croatia, Kuwait Lesotho, Lebanon, Libya Malaysia, Morocco, Martinique (F), Mauritius, Mexico, Moldova, Monaco

	Namibia, New Caledonia, New Zealand, Nigeria, Nicaragua Oman Pakistan, Panama, Paraguay, Peru, Philippines, Puerto Rico Reunion, Romania, Russia Saudi Arabia, Serbia and Montenegro, Zimbabwe, Singapore, Slovenia, Sri Lanka, South Africa, South Korea, Swaziland, Syria Taiwan, Thailand, Trinidad and Tobago, Turkey, Tunisia Ukraine, Uruguay, USA UAE (Abu Dhabi, Dubai), Venezuela, Vietnam Belarus, Western Sahara
C markets	China, Indonesia

WM 0X01IN ALARM SYSTEM: CHECKING OPERATION OF MONITORING DEVICES (MACAN, MACAN S, MACAN TURBO) > ALARM SYSTEM: CHECKING OPERATION OF MONITORING DEVICES

1. Read out the fault memory and activate systems on the unlocked vehicle (see previous point in sales check).
2. Lock the vehicle using the remote control (key fob). A warning tone must not be emitted by the alarm system horn shortly after locking the vehicle (not relevant for USA).
3. If a warning tone is emitted, open and close all doors and outer lids one after the other (not relevant for USA).
4. As soon as the vehicle is locked, the LED in the driver's door panel must flash quickly for 2 seconds and then start to flash slowly.

   Fault indicator:

5. LED flashes quickly for 2 seconds, lights up for 28 seconds and then flashes slowly: Connect the System Tester and read out the fault memory.

WM 0X01IN CHECKING EXTERIOR EQUIPMENT AND PAINTWORK (MACAN, MACAN S, MACAN TURBO) > CHECKING EXTERIOR EQUIPMENT AND PAINTWORK

Information

- The following items can be checked by simple visual inspection, no assembly work required.

  1. Check whether transport protection has been completely removed and ensure that no film remains in the body joints or under seals.

WM 0X01IN CHECKING EXTERIOR EQUIPMENT AND PAINTWORK (MACAN, MACAN S, MACAN TURBO) > CHECKING EXTERIOR EQUIPMENT AND PAINTWORK > CHECKING EXTERIOR EQUIPMENT

1. Check vehicle for secure fit of accessories such as trim strips, doors mirrors, front and rear spoilers.
2. Check underbody for noticeable areas where undersealing material is missing (e.g. scrapes).
3. Check side member of body flange for deformation of jacking points.
4. Check outer shell of vehicle for noticeable soiling with cavity sealing wax.

WM 0X01IN CHECKING EXTERIOR EQUIPMENT AND PAINTWORK (MACAN, MACAN S, MACAN TURBO) > CHECKING EXTERIOR EQUIPMENT AND PAINTWORK > CHECKING PAINTWORK

1. Check outer shell of vehicle for noticeable sheetmetal damage such as dents and bulges.
2. Check painted surfaces of vehicle for noticeable defects such as scores, scratches, notches, scrapes, pores, bubbles or signs that the bodywork is coming through the paint.

WM 0X01IN CHECKING GLAZING (MACAN S, MACAN TURBO) > CHECKING GLAZING

Information

- The following items can be checked by simple visual inspection, no assembly work required.
    1. Check whether transport protection has been completely removed and ensure that no film remains in the body joints or under seals.
    2. Check vehicle glazing for stone damage and scratches.
    3. Check surrounds and rubber sections of vehicle glazing for damage and cracks.

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > FUNCTION TEST ON FRONT LID LOCK

Information

The lid lock does not have an emergency release.

When working close to the front apron and on the various parts of the lock, carry out the following function test before closing the lid:

1. Check that the release cable is clipped fully into the bracket provided.

2. Lock lower part of lid lock using a screwdriver.
3. Release the lid lock using the lever in the passenger compartment.
4. Perform a visual inspection to check that the lock releases correctly.

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > CHECKING LID LOCK AT FRONT AND REAR

- Check that the lid locks engage when the lids (front and rear) are closed by engaging the upper parts of the lock and that they disengage again when the lid releases are activated.

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > CHECKING SAFETY HOOK ON FRONT LID

- Check that the front lid is held down by the safety hook (locking hook) after the lid lock is opened.
- Check that the return spring on the upper part of the lock pulls the safety hook back as far as the stop.

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > FUNCTION TEST ON DOOR LOCKS

- Check that the door locks engage in two stages when the doors are closed and that they disengage again when the door openers are actuated (inside and outside).

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > FUNCTION TEST ON FUEL TANK CAP LOCK

- Lock the vehicle.
- Check that the fuel tank cap is locked by the fuel tank cap lock in the closed position.

WM 0X01IN CHECKING OPERATION OF ELECTRICAL EQUIPMENT AS WELL AS WARNING AND INDICATOR LIGHTS (MACAN, MACAN S, MACAN TURBO) > CHECKING OPERATION OF ELECTRICAL EQUIPMENT AS WELL AS WARNING AND INDICATOR LIGHTS

- Turn ignition key and check function of warning and indicator lights (visual inspection).
- Actuate power windows and check that they are working correctly.

- Check that rear window heating is working.
- Adjust heater blower and fans to high and low and check the air vents for air throughput.
- Front seats and back seats: check function.
- Check audio function.
- Check function of exterior mirrors, check adjustment options.
- Check function of orientation lights.
- Check function of luggage compartment lamps.
- Check function of interior lights.
- Actuate central locking and check function.
- Operate cigarette lighter and check that it is working.

WM 0X01IN CHECKING VEHICLE EQUIPMENT FOR COMPLETENESS (MACAN, MACAN S, MACAN TURBO) > VEHICLE EQUIPMENT

Check that the items listed below are in the vehicle.

Designation	Qty.	Restrictions	Position in the vehicle
Warning triangle	1 x	Country-specific (1)	Trim panel for rear lock support
Addition warning triangle	1 x	Country-specific (2)	Stored in luggage compartment
First-aid kit and warning triangle	1 x	Country-specific (3)	Trim panel for rear lock support
On-board folder containing technical information (4) Driver's Manual, PCM/CDR operating instructions, Warranty and Maintenance booklet (5)	1 x	Standard	Glove compartment
18-inch spare wheel	1 x	Only with vehicle spare wheel (I-no.: 1G1)	Luggage compartment (under the loadspace floor)
Bottle of sealing compound for tyres, Tire Fit	1 x	Only with vehicle flat-tyre set (I-no.: 1G8)	
Compressor	1 x		
Tyre inflation hose	1 x	Only with vehicle flat-tyre set (I-no.: 1G8)	Contained in Tire Fit bag

Torch and torch holder	1 x	Japan only	A-pillar trim
Front number plate carrier, including fastening material	1 x	USA only (6)	Stored in luggage compartment
Wiper blades, front (7)	2 x		

(1)	All countries except USA, Canada, Japan, Greece and Germany
(2)	The dealer or importer must supply the additional warning triangle.
(3)	Only in Germany and Greece.
(4)	Except for German-speaking countries, the on-board folder containing technical information (Driver's Manual and Guarantee and Maintenance booklet) must be supplied by the dealer or importer.
(5)	The PCM/CDR operating instructions must be supplied by the dealer or importer in all non-German-speaking countries.
(6)	Only in states in the USA that require a number plate at the front of the vehicle. → 668319 REMOVING AND INSTALLING NUMBER PLATE COVER .
(7)	Replace the one-way wiper blades with the enclosed wiper blades → 922719 REMOVING AND INSTALLING WIPER BLADE.

WM 0X01IN CHECKING VEHICLE EQUIPMENT FOR COMPLETENESS (MACAN, MACAN S, MACAN TURBO) > VEHICLE EQUIPMENT > TOOL KIT

Designation	Qty.	Restrictions	Position in the vehicle
Open-ended wrench	1 x	Standard	Luggage compartment (under the loadspace floor)
Towing lug	1 x		
Screwdriver	1 x		
Socket wrench	1 x		
Socket for security wheel bolts	1 x		
Wheel wrench	1 x	Only for vehicles with spare wheel (I-no.: 1G1)	
Jack with ratchet	1 x		
Assembly pin	1 x		
Puller hook	1 x		
Additional assembly pin and holder	1 x	Only for vehicles with spare wheel (I-no.: 1G1)	
Allen key for emergency operation of sliding roof panel	1 x	Vehicles with sliding roof	

Additional jack with ratchet in bag	1 x	Only for Australia (I-no.: +479)	

WM 0X01IN CHECKING VEHICLE EQUIPMENT FOR COMPLETENESS (MACAN, MACAN S, MACAN TURBO) > VEHICLE EQUIPMENT > VEHICLE KEY

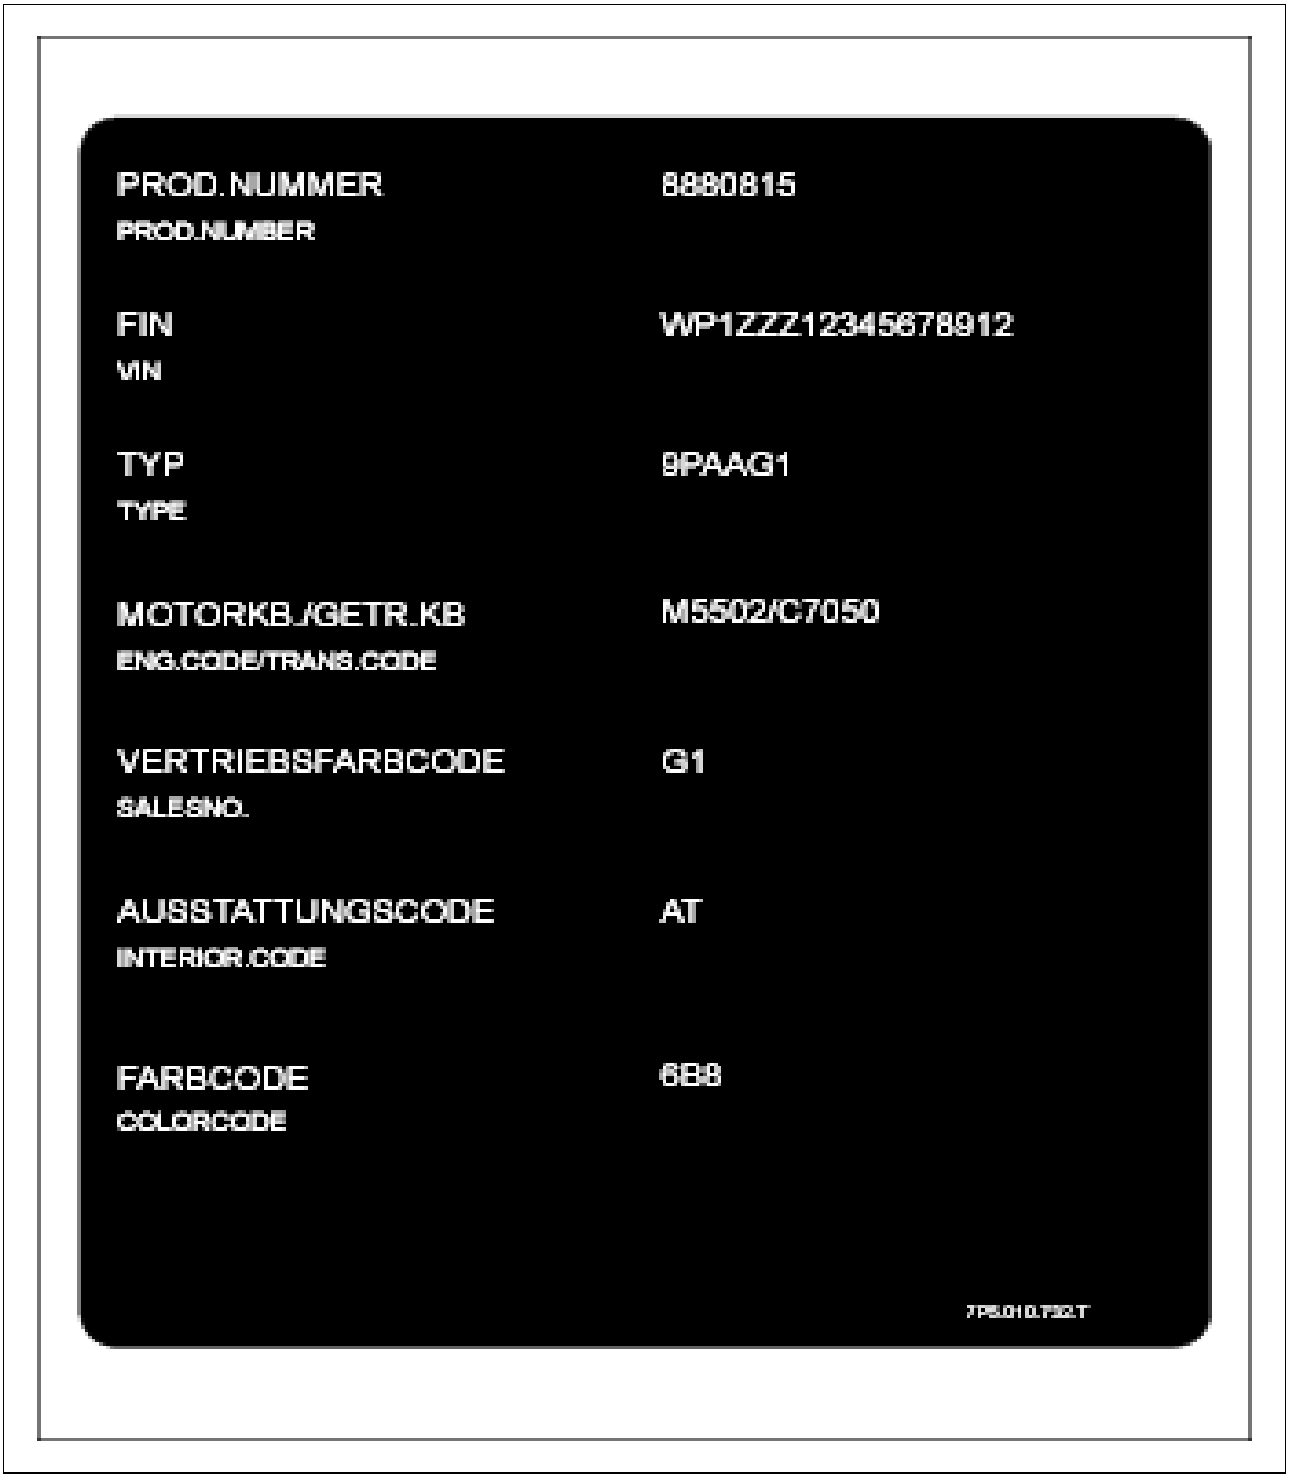
Designation	Qty.	Restrictions
Key ring	1 x	Standard
Key tag	1 x	Standard
Remote control	2 x	Standard
Emergency key (contained in remote control)	2 x	Standard
Control element	1 x	Only for vehicles with Porsche Entry & Drive

WM 0X01IN CHECKING VEHICLE IDENTIFICATION NUMBER FOR CONFORMITY (MACAN S, MACAN TURBO) > CHECKING VEHICLE IDENTIFICATION NUMBER FOR CONFORMITY

Information

- The sticker for the on-board literature is included with the vehicle registration documents and can be found in the glove compartment.

Fig 1: Identifying Vehicle Identification Sticker



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Check that the following vehicle identification numbers are identical. Then stick the vehicle data carrier sticker supplied with the vehicle in the on-board literature (Warranty and Maintenance booklet).

- Vehicle identification number on lower left of the windscreen.
- Vehicle identification number stamped on the bodyshell in the front right footwell.
- Vehicle identification number on the vehicle data carrier sticker.

- Vehicle identification number in the vehicle registration documents.

WM 0X01IN DIAGNOSTIC SYSTEM: PERFORMING VEHICLE HANDOVER (MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		

WM 0X01IN DIAGNOSTIC SYSTEM: PERFORMING VEHICLE HANDOVER (MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 0X01IN DIAGNOSTIC SYSTEM: PERFORMING VEHICLE HANDOVER (MACAN S, MACAN TURBO) > DIAGNOSTIC SYSTEM: PERFORMING VEHICLE HANDOVER

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

1. **PIWIS Tester II 9818** must be connected to the vehicle. Then start the Tester.
    1. 1.1. **Switch on ignition.**
2. Select the required vehicle.
3. When the **overview of control units** is displayed, press [F7] to continue.
4. Select **Vehicle handover log** menu and press [F12].
5. When **Remove transport protection** is displayed, press [F12] to continue.
6. The control units are activated and the status is displayed. Compare the chassis number displayed on the Tester with the chassis number of the vehicle. Press [F12] to continue.
7. **If the vehicle is a new vehicle** , press [F8] (Yes) to continue.
8. **Select the relevant country** and press [F12] to continue.
9. The Tester displays the message **Write service interval** . Press [F8] to confirm.
10. Service intervals will be written. Press [F12] to continue.
11. **Chassis number is correct?** . Press [F12] to confirm and then press [F11] to return to the data entry screen.
12. Archive the vehicle handover log file. Press [F12] to continue.
13. Carry out a test drive and read out the fault memory.
    1. 13.1. Check faults following diagnosis if necessary and erase the fault memory before delivering the vehicle.

WM 0X01IN INTERIOR EQUIPMENT: VISUAL INSPECTION FOR DAMAGE AND SOILING (MACAN S, MACAN TURBO) > CHECKING INTERIOR EQUIPMENT

Information

- The following items can be checked by simple visual inspection, no assembly work required.

1. Check that transport protection has been completely removed and ensure that no film remains in the component joints or under seals.
2. Check interior equipment of vehicle for noticeable damage such as scores, scratches, notches and scrapes.
3. Check interior equipment of vehicle for soiling.

WM 0X01IN INTERIOR EQUIPMENT: VISUAL INSPECTION FOR DAMAGE AND

SOILING (MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > FUNCTION TEST

- The following requirements must be met when fitting the seat belt.
- If one of the requirements listed below is not met, the seat belt or seat-belt buckle must be replaced.

It must be possible to unroll the belt strap smoothly from the belt retractor via the deflector fitting by pulling evenly.

The tongue of the seat belt must engage audibly in the buckle.

An abrupt pull on the belt strap must lock the belt retractor.

WM 0X01IN INTERIOR EQUIPMENT: VISUAL INSPECTION FOR DAMAGE AND SOILING (MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > CONDITION INSPECTION

Visually inspect the belt strap for damage by unrolling it completely.

If there are signs of damage on the belt strap in the form of cuts, fraying, seam tears, etc., the seat belt must be replaced.

WM 0X01IN MOBILE ROOFS: CHECKING FUNCTION (MACAN S, MACAN TURBO) > CHECKING SLIDING ROOF AND PANORAMA ROOF SYSTEM

1. By operating the control switch, return to original tilting, opening and closing positions. During operation, check for malfunctions and noises.
2. Completely open and close trim panel/sun blinds for roof systems. During operation, check for noise and stiffness.

WM 0X01IN REMOVING TRANSPORT PROTECTION (MACAN, MACAN S, MACAN TURBO) > REMOVING OUTER TRANSPORT PROTECTION

- **Installation position:** Body
- **Material:** Plastic film
- **Installation position:** Doors
- **Material:** Foam strips with adhesive film
- **Installation position:** Front bumper
- **Material:** Foam strips with adhesive film
- **Installation position:** Rims

- **Material:** Self-adhesive rim protection
- **Installation position:** Mirrors
- **Material:** Plastic bag

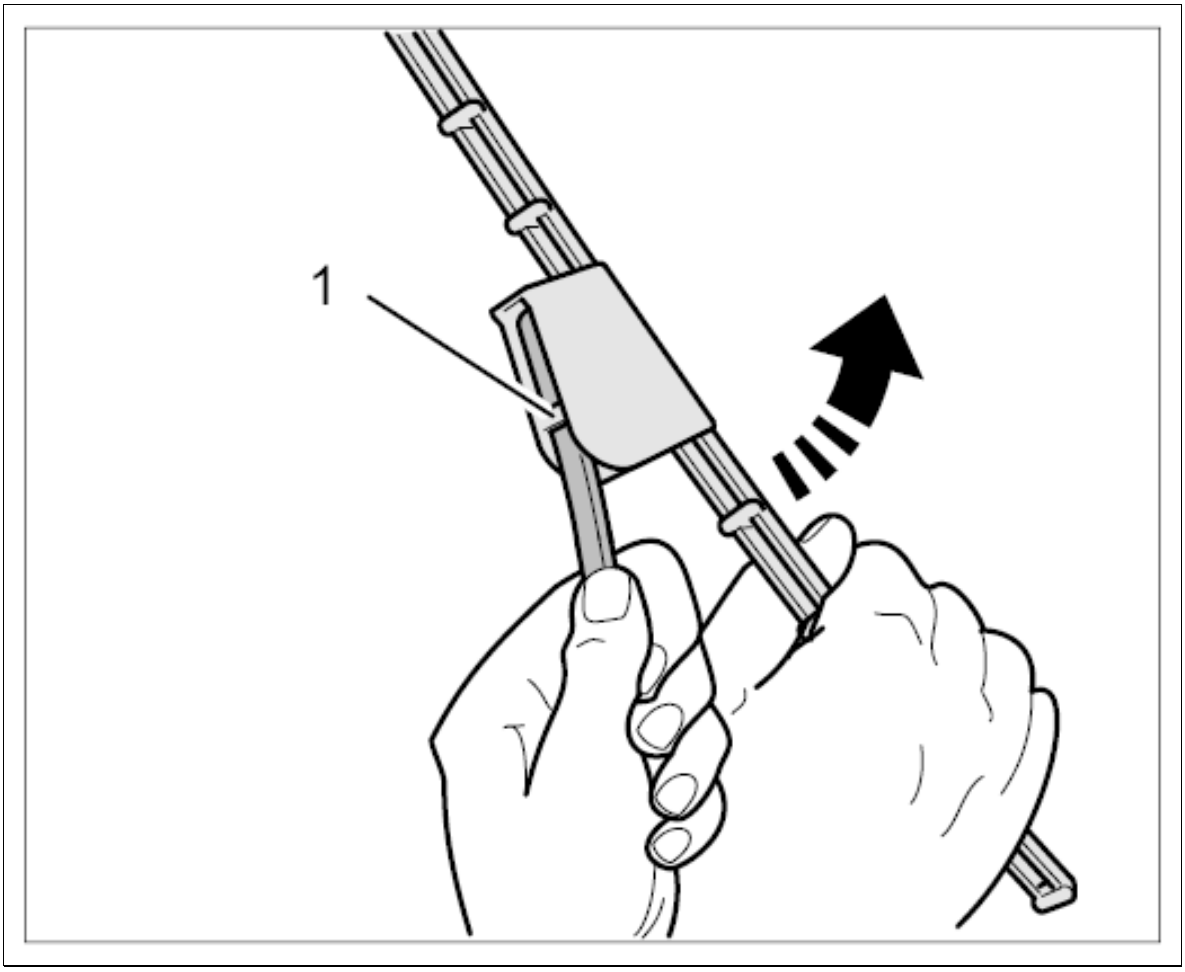
WM 0X01IN REMOVING TRANSPORT PROTECTION (MACAN, MACAN S, MACAN TURBO) > REMOVING INNER TRANSPORT PROTECTION

- **Installation position:** Seats (front)
- **Material:** Fleece
- **Installation position:** Centre console cover
- **Material:** Fleece
- **Installation position:** Door sill
- **Material:** Plastic film
- **Installation position:** Lower door trim panel
- **Material:** Cardboard protection
- **Installation position:** Inner door handle
- **Material:** Plastic film
- **Installation position:** Footwell
- **Material:** Cardboard protection

WM 0X01IN REPLACING TRANSPORT WIPER (MACAN S, MACAN TURBO) > REPLACING TRANSPORT WIPER

1. Fold out wiper arm.
2. Break off bar on transport wiper **-1-** by moving the transport wiper with force. Make sure that the wiper arm is not deformed in the process.

Fig 1: Removing Transport Wiper



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Fit wiper blade. → INSTALLING WIPER BLADE .

WM 0X01IN TEST DRIVE - SALES CHECK (MACAN, MACAN S, MACAN TURBO) > TEST DRIVE - SALES CHECK

Information

- The following test items are included in the test drive.
  - Check electric parking brake and footbrake operation and actuation travel.
  - Actuate steering and check operation.
  - Change gears and check gearshift operation.
  - ParkAssist: select reverse gear and check operation.
  - Activate automatic cruise control during the test drive and check operation.
  - Check operation of heating adjustment when engine is warm.

- Check operation of sports exhaust system.
- Check operation of air-conditioning system when engine is running.
- Check operation of instruments.

WM 0X01IN WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS

NOTE: Headlight surface not cleaned properly

- *Scratches*

→ Use only soapy water to clean the exterior lights and the plastic headlight lenses.

→ Never use chemical cleaning agents.

→ To avoid scratches, do not rub with dry or slightly damp cloths, paper towels or insect-removal sponges.

Information

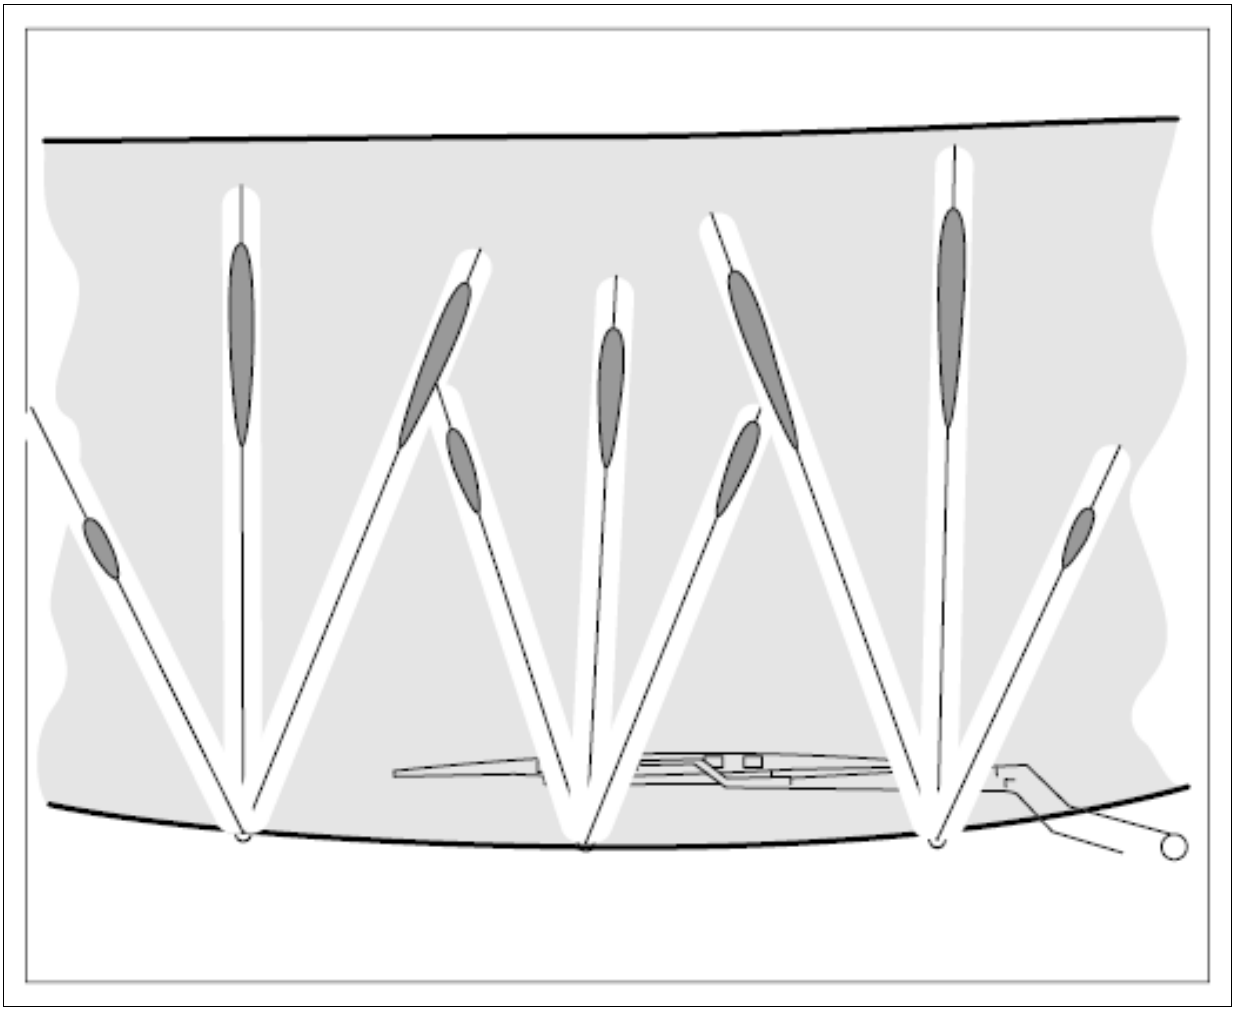
- The headlight washer nozzles are pre-set!
- Generally, it is not necessary to adjust them!

Information

Check operation, fluid level indicator and nozzle settings. If the spray nozzle settings for the windscreen washer system are not OK, the nozzles need to be adjusted:

- Insert a sharp object (needle) into the nozzle hole.
- Align the spray nozzles using the sharp object.

Fig 1: Aligning Spray Nozzle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0X01IN WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > MIXTURE RATIO OF FLUIDS FOR THE WINDSCREEN WASHER SYSTEM

Fluid:	Mixture ratio:
Water	Undiluted
Water/isopropanol	1: 1
	2: 1
	3: 1
Water/ethanol	1: 1

	2: 1
	3: 1

WM 0X01IN WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > CHECKING WIPER BLADES

Check the wiper blades for any deformities and tears.

1. Switch on ignition, operate the spray nozzles and check the quality of the wiper action.

WM 0X03IN CHECKING WHEEL MOUNTING (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Wheel to wheel hub		Tightening torque	160 Nm (118 ftlb.)		

WM 0X03IN CHECKING WHEEL MOUNTING (MACAN, MACAN S, MACAN TURBO) > CHECKING > CHECKING WHEEL MOUNTING

Information

Use a suitable commercially available tool together with a tested torque wrench, covering the range from 40 to 200 Nm (30-148 ftlb.). Never use an impact bolter.

- Do not loosen the wheel bolts to check whether they are secure.
- Re-tighten wheel bolts and check that they are seated securely. **Tightening torque 160 Nm (118 ftlb.)**

WM 0X03IN CREATING VEHICLE ANALYSIS LOG (VAL) (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	

PIWIS Tester II	Special tool	9818		

WM 0X03IN CREATING VEHICLE ANALYSIS LOG (VAL) (MACAN, MACAN S, MACAN TURBO) > CREATING VEHICLE ANALYSIS LOG (VAL)

Information

When creating the FAP, it is essential to guarantee the power supply for the Porsche System Tester. A battery charger with a current rating of at least 40 A must be connected to the vehicle battery.

The Porsche System Tester instructions take precedence and in the event of a discrepancy, these are the instructions that must be followed. Deviations may occur with later software versions.

The procedure described here has been structured in general terms; different text or additions may appear in the Porsche System Tester.

1. **PIWIS Tester II 9818** must be connected to the vehicle. Then start the Tester.
2. Switch on ignition.
3. **Select "Diagnosis".**
4. Select vehicle type.
5. **Select "Additional menu"** by pressing [F7].
6. **Select VAL** by pressing [F12].
7. **Select AS VAL** or **OBD VAL** . Then press [F8] to start.
8. Check the chassis number and correct it if necessary.
9. If you want to print the data, connect the printer to **PIWIS Tester II 9818.**
10. Switch on the printer.
11. Press [F10] to display the VAL.
12. If there is a printer connected, the print job can be started using the menu bar.
13. Then **save** or **delete** the VAL using the touchpad.
14. Shut down the Tester, switch it off and disconnect it from the vehicle.

WM 0X03IN ELECTRICS MAINTENANCE: CHECKING WINDSCREEN WIPER AND WASHER SYSTEM (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
adjusting tool	VW tool	T40187		
WM 0X03IN ELECTRICS MAINTENANCE: CHECKING WINDSCREEN WIPER AND WASHER SYSTEM (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > CHECKING AND ADJUSTING SPRAY NOZZLES FOR WINDSCREEN WASHER SYSTEM

Information

Only use windscreen cleaning agents and antifreeze approved by Porsche.

Observe the required mixture ratio in accordance with manufacturer's specifications and season.

1. Fill the windscreen-washer reservoir with a mixture of water and window cleaner or antifreeze, depending on the season.
2. Actuate the windscreen washer system and align spray nozzles for the windscreen washer system as required using **adjusting tool T40187.** → 926619 REMOVING AND INSTALLING SPRAY NOZZLE FOR WINDSCREEN WASHER SYSTEM .

WM 0X03IN ELECTRICS MAINTENANCE: CHECKING WINDSCREEN WIPER AND WASHER SYSTEM (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > CHECKING WIPER BLADES

Check condition of wiper blades on windscreen and rear window for wear, deformities and tears.

1. Switch on ignition, operate the windscreen-washer system spray nozzles and check wiping

quality.

1. 1.1. Replace windscreen wiper blades if necessary. → 922719 REMOVING AND INSTALLING WIPER BLADE .
2. 1.2. Replace wiper blade for rear window washer as required. → 924319 REMOVING AND INSTALLING WIPER BLADE FOR REAR WINDOW WASHER .

WM 0X03IN ELECTRICS MAINTENANCE: CHECKING WINDSCREEN WIPER AND WASHER SYSTEM (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS

NOTE: Headlight surface not cleaned properly

- *Scratches*

→ Use only soapy water to clean the exterior lights and the plastic headlight lenses.

→ Never use chemical cleaning agents.

→ To avoid scratches, do not rub with dry or slightly damp cloths, paper towels or insect-removal sponges.

Information

- The headlight washer nozzles are pre-set!
- Generally, it is not necessary to adjust them!

1. Check function and adjustment of spray nozzles for headlight washer system.

WM 0X03IN RUNNING GEAR MAINTENANCE: BALL JOINTS/DRIVE SHAFTS (MACAN S, MACAN TURBO) > PRELIMINARY WORK

WARNING: Vehicle can fall down

- *Risk of squashing or crushing*
- *Risk of damage to the vehicle*

→ Do not place any solid objects under the raised vehicle.

→ Ensure that the lifting platform is prevented from lowering.

→ Remove solid objects before lowering the vehicle.

→ Raise the vehicle only at the jacking points provided.

→ The outer jacking points should be used primarily.

1. Jack and raise the vehicle at the prescribed jacking points.

   → 4X00IN LIFTING THE VEHICLE .

WM 0X03IN RUNNING GEAR MAINTENANCE: BALL JOINTS/DRIVE SHAFTS (MACAN S, MACAN TURBO) > INFORMATION > AXLE JOINTS: CHECKING PLAY AND DUST BELLOWS

1. Check joint clearance.

   Information

   1. When doing so, press the rubber dust boots down with your fingers to reveal any hidden cracks.
   2. If a rubber dust boot is leaking, the corresponding joint or control arm must be replaced because any dirt or moisture that seeps in will cause irreparable damage to the joint.

2. Visually inspect the dust boots for damage.
3. Inspect the dust boots of the axle joints (ball joints) on the wheel suspension as follows:

   1. Place the vehicle on a lifting platform with the steering lock disengaged.
   2. Perform a visual inspection after cleaning.

The procedure for the front axle is as follows:

> ⚠ *CAUTION: Turning steering too sharply using the steering wheel.*
>
> - *Risk of squashing arms.*

→ Only turn the steering wheel as far to the left and right as required in order to check the amount of play on the tie rod.

- Turn the front wheels as far as they will go
- Perform a visual inspection of the visible surfaces on the left and right
- After turning the front wheels to the other steering stop, check the other half of each rubber dust boot.

WM 0X03IN RUNNING GEAR MAINTENANCE: BALL JOINTS/DRIVE SHAFTS (MACAN

S, MACAN TURBO) > INFORMATION > DRIVE SHAFTS: VISUAL INSPECTION OF BOOTS

- Perform a visual inspection of the boots for leaks and damage.

WM 0X03IN RUNNING GEAR MAINTENANCE: CHASSIS ADJUSTMENT/STORAGE OF ASSEMBLIES (MACAN S, MACAN TURBO) > INFORMATION > CHASSIS ADJUSTMENT (WHEEL ALIGNMENT VALUES)

- Check that threaded connections for chassis adjustment (wheel alignment values) at front and rear are secure.

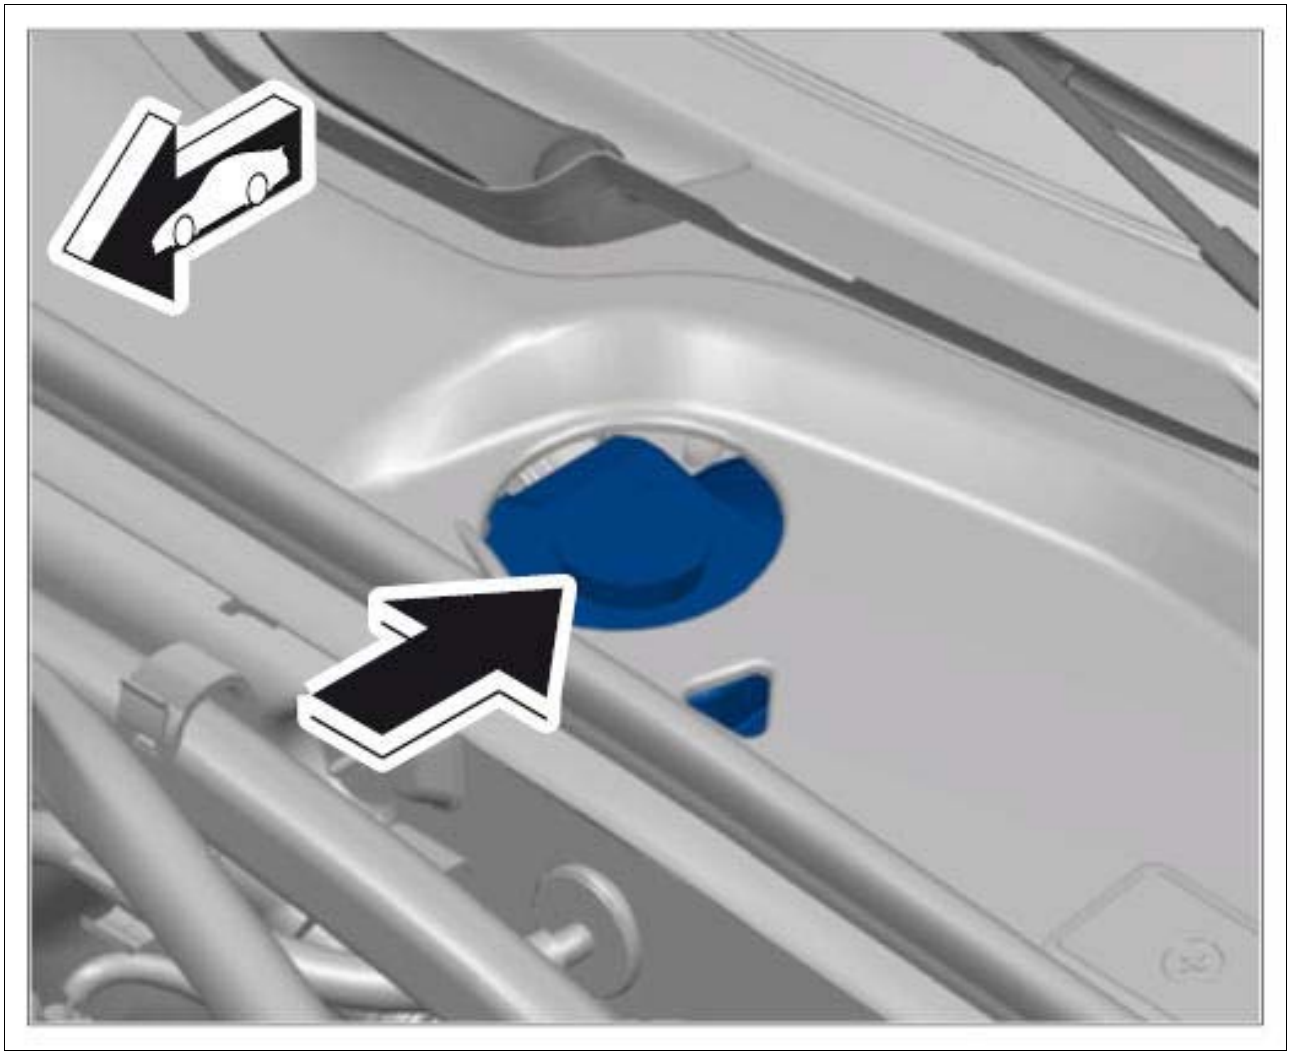
WM 0X03IN RUNNING GEAR MAINTENANCE: CHASSIS ADJUSTMENT/STORAGE OF ASSEMBLIES (MACAN S, MACAN TURBO) > INFORMATION > STORAGE OF ASSEMBLIES AND CHASSIS

- Visual inspection of all rubber mountings for damage.

WM 0X03IN RUNNING GEAR MAINTENANCE: CHECKING BRAKE FLUID LEVEL AND CHANGING BRAKE FLUID (MACAN S, MACAN TURBO) > CHECKING

Visually check the brake fluid level. The brake fluid reservoir is located under the left plenum panel cover **-arrow-** .

Fig 1: Locating Brake Fluid Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

- The brake fluid level must not exceed the MAX mark.
- Observe brake fluid quality. Use only new DOT 4 brake fluid.
- This brake fluid is available under the following part numbers: Quantity supplied: 1 litre = 000.043.203.66; 30 litres = 000.043.203.67.

MAX marking on brake fluid reservoir. The brake fluid level must be between the MIN and MAX markings.

WM 0X03IN RUNNING GEAR MAINTENANCE: CHECKING BRAKE FLUID LEVEL AND CHANGING BRAKE FLUID (MACAN S, MACAN TURBO) > CHANGING BRAKE FLUID

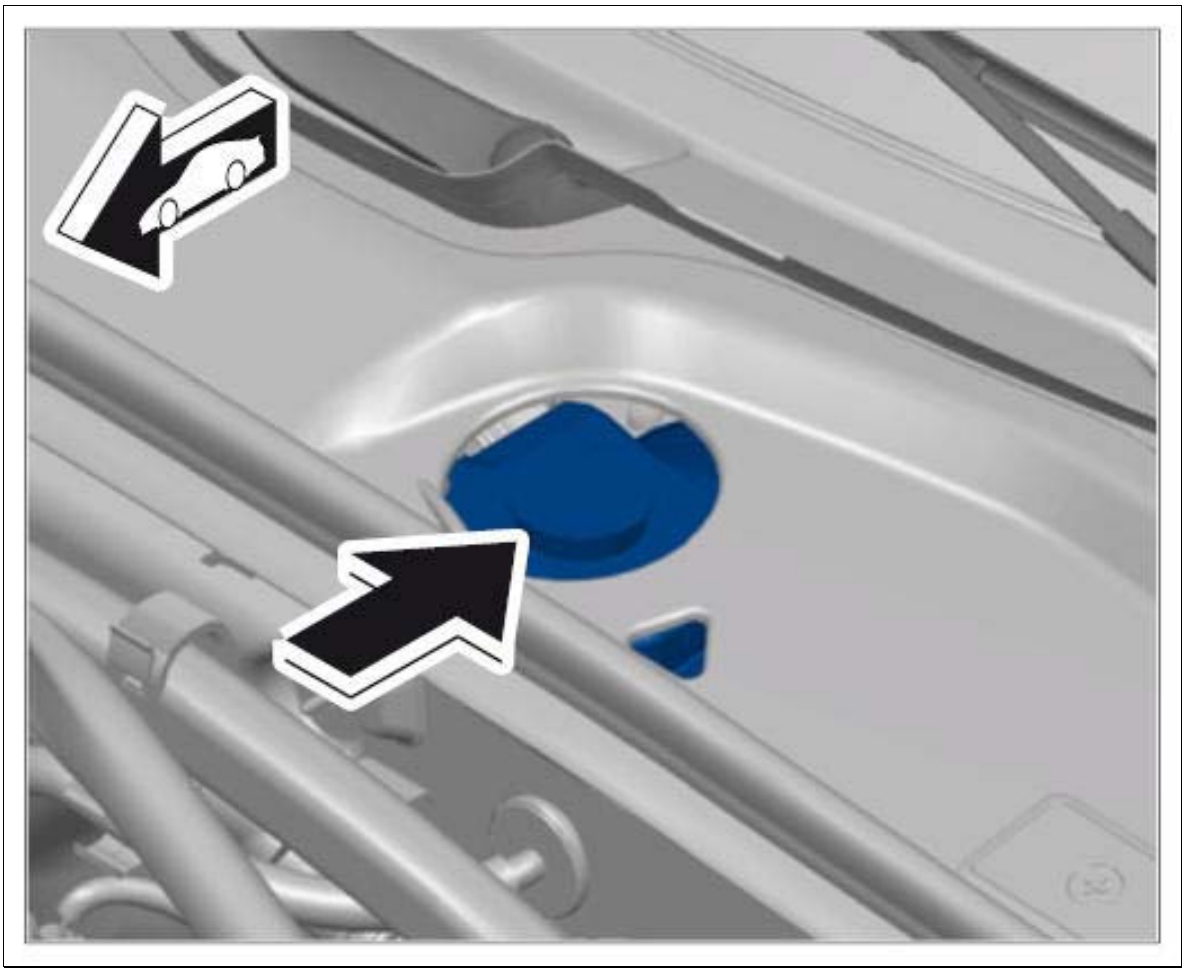
Information

- Observe brake fluid quality. Use only new DOT 4 brake fluid.

- The brake fluid change interval is two years using Super DOT 4 brake fluid.
- This brake fluid is available under the following part numbers: Quantity supplied: 1 litre = 000.043.203.66; 30 litres = 000.043.203.67.
- Drain brake fluid from every brake calliper at both bleeder valves.
- There are two bleeder valves on the brake calliper. Brake fluid must be drained at both bleeder valves. Observe specified sequence: Bleed the outer bleeder valve first.

1. Open threaded cover on brake fluid reservoir **-arrow-** .

   Fig 1: Locating Brake Fluid Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Connect bleeding device to the brake fluid reservoir.
3. Switch on the bleeding device. Bleeding pressure is approx. 2.0 bar.
4. Continue changing the brake fluid at the brake callipers. Do so in the following sequence: rear right/rear left/front right/front left.
5. Open every bleeder valve until clear, bubble-free brake fluid emerges and until the corresponding change quantity per brake calliper is reached (approx. 250 cm^3).
6. Use a transparent hose and a collecting bottle to check the escaping brake fluid for cleanliness, absence of air bubbles and to determine the amount of brake fluid used.

7. Tighten the bleeder valves to the specified tightening torque → Tightening torques for brake hydraulic system → 47 - BRAKES - HYDRAULIC BRAKE SYSTEM, REGULATOR -- (95B) - MACAN - "Technical values" and remove the bleeder hoses.

8. Switch off the bleeding device and remove the adapter at the reservoir. The brake fluid level in the reservoir must be between the MIN and MAX markings once the vehicle has been filled and bled. Correct the brake fluid level if necessary.

WM 0X03IN RUNNING GEAR MAINTENANCE: STEERING GEAR - VISUAL INSPECTION OF BELLOWS AND TIE ROD JOINTS (MACAN S, MACAN TURBO) > CHECKING > CHECKING BELLOWS

Information

- The bellows on the steering gear can be damaged by external influences for example, by stone damage or during assembly work!
- The steering gear can become damaged if dirt or moisture leaks into it as a result of a leaky bellows!

- Visually inspect the bellows for damage.

WM 0X03IN RUNNING GEAR MAINTENANCE: STEERING GEAR - VISUAL INSPECTION OF BELLOWS AND TIE ROD JOINTS (MACAN S, MACAN TURBO) > CHECKING > TIE ROD ENDS: CHECKING PLAY AND DUST BELLOWS

1. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .

   Information

   1. The rubber dust bellows and tie rods can be damaged by external influences, e.g. stone impact, or during assembly work.

   2. If a rubber dust boot leaks, the joint or tie rod must be replaced, because any dirt or moisture that seeps in will destroy the joint.

2. Check joint clearance and dust boots.

3. Check that the dust boots and joints are working perfectly and have no leaks.

WM 0X03IN RUNNING GEAR MAINTENANCE: TIRES AND SPARE WHEEL: CHECKING CONDITION AND TIRE PRESSURE (MACAN S, MACAN TURBO) > CHECKING > CHECK CONDITION

For vehicles with Tyre Pressure Monitoring (TPM), which can be identified by aluminium valves, the tire pressure must be adjusted according to the >> Filling information << on the multi-function display. To do this, select >> Main menu >> Tyre pressure >> Filling information <<. Adjust the deviation values so that

they range from 0.0 bar to +0.1 bar. Fill the tires according to the display using the tire-inflating device. Example: If the tire pressure display >> Filling information << shows - 0.2 bar, 0.2 bar pressure must be added.

Fig 1: Display - Tyre Pressure Information Screen

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

The >> Tyre pressure << display is for information purposes only.

- Tyre pressure settings can only be entered according to the values in >> Filling information <<.

Due to the pressure and temperature relationship (approx. 0.1 bar/10° C), the actual pressure values displayed under >> Tyre pressure << on the multi-function display, or on the pressure gauge of the tire-inflating device, can deviate from the required pressure specified at 20° C on the tire pressure plate if the air temperature in the tire is significantly above (higher values) or significantly below 20° C (lower values). Changes in tire pressure are displayed after max. 1 minute under >> Filling information << after switching on the ignition. A series of dashes (-.-) will appear instead of the tire pressure during this time.

Fig 2: Display - Tyre Pressure Information Screen

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

For vehicles with Tyre Pressure Monitoring (TPM), always use plastic valve caps. Plastic valve caps protect against dust, dirt and humidity, and therefore against damage (corrosion).

Tyres are a safety element that meet the demands placed on them only if they have the correct air pressure and sufficient tread depth.

> *WARNING: Risk of accidents if the air pressure in the tires falls below the minimum pressure, if the tread depth is insufficient or if there are foreign bodies, pricks, cracks and bulges in the sidewall (ply breakage).*
>
> - *Modified handling behaviour can cause accidents and significant material damage.*

→ The tire pressure must never fall below the values specified (these are minimum pressures).

→ The tread depth must never fall below the minimum value.

→ A visual inspection of the tires (for cracks, pricks, bulges in the sidewall and/or foreign bodies) must

be carried out.

1. Check condition and tire pressure.
2. Always screw on valve caps tightly and replace missing valve caps.

> *NOTE: Tyre pressure for cold tires (approx. 20 °C)*

Information

The currently applicable air pressure values and comfort tire pressure values in the individual countries can be found in the Manufacturer Approval >>Approved wheels and tires<< in the >>Manufacturer Approvals<< .

Tyre pressures apply to all-season, winter and summer tires. They also apply only to tires approved by Porsche.

Part load = payload < 260 kg

Full load = payload > 260 kg

The collapsible spare wheel is an optional extra (tire sealing compound comes as standard).

WM 0X03IN RUNNING GEAR MAINTENANCE: VISUAL INSPECTION - BRAKE LINES/BRAKE PADS/BRAKE DISCS (MACAN S, MACAN TURBO) > CHECKING > BRAKE HOSES AND LINES

- Carry out visual inspection for leaks, damage, routing and corrosion.

WM 0X03IN RUNNING GEAR MAINTENANCE: VISUAL INSPECTION - BRAKE LINES/BRAKE PADS/BRAKE DISCS (MACAN S, MACAN TURBO) > CHECKING > BRAKE SYSTEM: VISUAL INSPECTION OF BRAKE PADS AND BRAKE DISCS FOR WEAR

> *WARNING: Risk of accidents if brake pads and brake discs are not replaced in time.*
>
> - *Risk of injury and material damage due to impaired braking effect.*

→ The brake pads must be replaced when the brake pad warning indicator lights up, but no later than when there is a residual pad thickness of 2 mm.

→ Brake discs must be replaced on reaching the wear limits.

Information

- If brake pad wear is indicated by the warning light, the warning contact (sender including line and

plug connection) must also be replaced.

- Replacing the warning contact can be avoided by replacing the brake pads no later than when the pad thickness is approx. 2.5 mm.
- Warning contacts must be replaced if the core of the wire is worn. Worn insulation is not important.
- However, if only the plastic part of the warning contact is worn, there is no need to replace it.

1. Visually inspect the brake pads for wear (wear limit: 2 mm).

   See:

   → 463602 CHECKING THICKNESS OF FRONT BRAKE PADS

   → 463802 CHECKING THICKNESS OF REAR BRAKE PADS

2. Visually inspect the brake discs for wear → 4650TW TECHNICAL DATA/BRAKE WEAR LIMIT .

WM 0X03IN TEST DRIVE - MAINTENANCE (MACAN, MACAN S, MACAN TURBO) > TEST DRIVE - MAINTENANCE

Information

- The following test items are included in the test drive.
  - Actuate remote control for central locking and check operation.
  - Seats: check operation of adjustment options.
  - Check electric parking brake and footbrake operation and actuation travel.
  - Start engine, check operation.
  - Actuate steering and check operation.
  - Change gears and check gearshift operation.
  - ParkAssist: select reverse gear and check operation.
  - Activate automatic cruise control during the test drive and check operation.
  - Actuate PSM switch during the test drive and check operation.
  - Check operation of heating adjustment when engine is warm.
  - Check operation of sports exhaust system.
  - Check operation of air-conditioning system when engine is running.
  - Check operation of instruments.

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
socket tester V.A.G. 1537 A	Workshop equipment	WE 1180		

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > INFORMATION > TRAILER HITCH MAINTENANCE: CHECKING FUNCTION

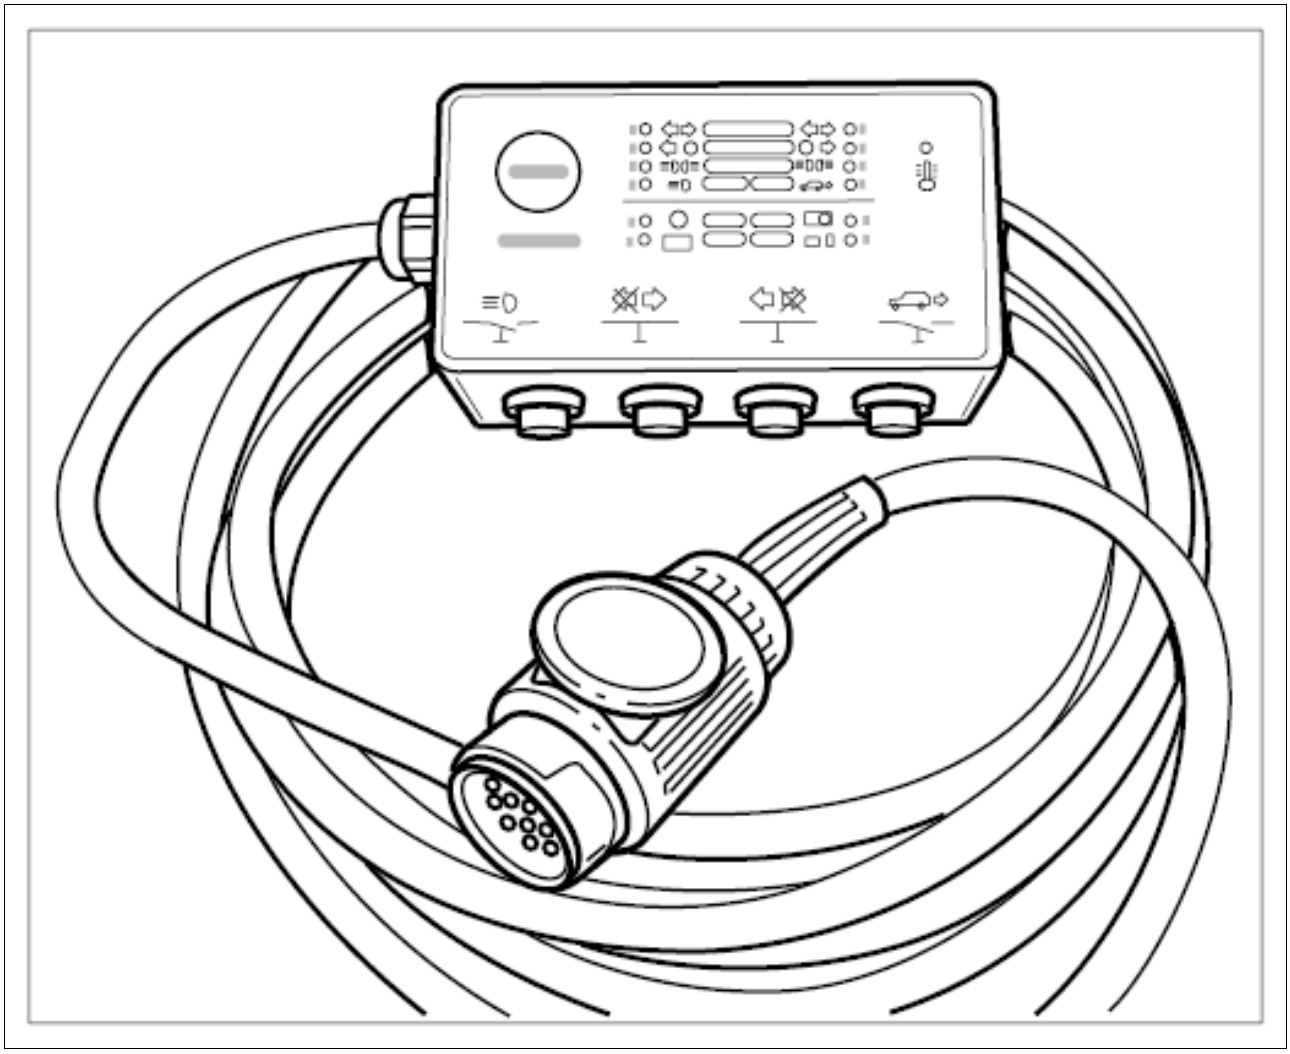
Information

The function test on the electrical components of the trailer hitch can be performed using a trailer with no faults in the wiring and lights or using the **socket tester V.A.G. 1537 A WE 1180** . The procedure for testing using the **socket tester V.A.G. 1537 A WE 1180** is described below.

The **socket tester V.A.G. 1537 A WE 1180** can only be used to test 13-pin plug sockets. An adapter is required for testing 7-pin sockets.

Thermal cut-off can occur on the **socket tester V.A.G. 1537 A WE 1180** as a result of the build-up of heat.

Fig 1: Identifying Socket Tester - V.A.G. 1537 A



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > INFORMATION > CHECKING FUNCTION OF THE TRAILER HITCH PLUG SOCKET

WARNING: Risk of injury and damage when retracting and extending the ball hitch.

- *Make sure that no persons, animals or obstacles are in the movement range of the ball hitch.*
- *To interrupt the swivel action of the ball hitch in the event of danger, touch the rocker switch again.*

→ Never swivel the ball hitch when a trailer is coupled or when, for example, bicycle racks are mounted or supported on the ball hitch.

→ Only use the trailer coupling when the ball hitch is extended fully.

→ Never insert tools of any kind into the ball hitch swivel mechanism. This could damage the locking mechanism; safe operation of the trailer hitch can then no longer be assured.

→ Check that the ball hitch locks into position correctly before every journey.

Vehicles with electrically extendable trailer hitch

1. Unfold coupling.

   All vehicles

2. Plug test cable of **socket tester V.A.G. 1537 A WE 1180** into the plug socket for the trailer hitch and route it towards the driver's seat.

   Fig 1: Connecting Test Cable (Cayenne)

2. **2** - Rear fog light
3. **4** - Right direction indicator
4. **5** - Right parking light
5. **6** - Left and right brake lights
6. **7** - Left parking light
7. **8** - Reversing light
8. **9** - Permanent positive
9. **10** - Charge positive
10. **11** - Ground for charge positive
11. **12** - Trailer detection
12. **13** - Socket Tester overheats

3. Switch on ignition.
4. Check permanent positive function.
    1. 4.1. LED **-9-** must light up continuously.
5. Check function of left direction indicator.
    1. 5.1. Switch on left direction indicator. The LED **-1-** and the left direction of travel

arrow in the instrument cluster must flash.

2. 5.2. Press button **-B-** . The LED **-1-** and the left direction of travel arrow in the instrument cluster must not flash.

6. Check function of right direction indicator.

    1. 6.1. Switch on right direction indicator. The LED **-4-** and the right direction of travel arrow in the instrument cluster must flash.

    2. 6.2. Press button **-C-** . The LED **-4-** and the right direction of travel arrow in the instrument cluster must not flash.

7. Check function of brake lights.

    1. 7.1. Press the brake pedal. The LED **-6-** must light up.

8. Check function of reversing light.

    1. 8.1. Engage reverse gear. The LED **-8-** must light up.

9. Check function of parking light.

    1. 9.1. Switch on the parking light. The LEDs -5, 7- must light up.

10. Check function of rear fog lights.

    1. 10.1. Switch on dipped beam headlights and rear fog light. The LEDs -5, 7- and the LED **-2-** must light up. The rear fog lights on the vehicle must not light up.

    2. 10.2. Unplug test cable of **socket tester V.A.G. 1537 A WE 1180** from the trailer hitch plug socket, the rear fog lights on the vehicle must light up.

11. Switch off parking light.

12. Shift the transmission to position P.

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > INFORMATION > CHECKING ELECTRICALLY EXTENDABLE TRAILER HITCH

Information

- The swivel action of the ball hitch is interrupted in the one-touch function of the rocker switch if resistance interferes with the movement sequence. The interruption is indicated by the rapid flashing of the red LED in the rocker switch.
- Overload protection is switched off by pressing the rocker switch for at least two seconds.

WARNING: Risk of injury and damage when retracting and extending the ball hitch.

- *Make sure that no persons, animals or obstacles are in the movement range of the ball hitch.*

- *To interrupt the swivel action of the ball hitch in the event of danger, touch the rocker switch again.*

→ Never swivel the ball hitch when a trailer is coupled or when, for example, bicycle racks are mounted or supported on the ball hitch.

→ Only use the trailer coupling when the ball hitch is extended fully.

→ Never insert tools of any kind into the ball hitch swivel mechanism. This could damage the locking mechanism; safe operation of the trailer hitch can then no longer be assured.

→ Check that the ball hitch locks into position correctly before every journey.

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > INFORMATION > OVERLOAD PROTECTION

Information

- The vehicle must be stationary.
- Rear lid or rear window must be open.
- The trailer must be unhitched.
- Connectors (and any adapters) must be removed from the socket.
- There must not be any accessories on the ball hitch (e.g. ball protection cap, bicycle rack, etc.).

1. **Swivelling out the trailer coupling**

   Information

   1. The vehicle must be stationary.
   2. Rear lid or rear window must be open.

      1. 1.1.
      2. 1.2. **To swivel out:**
      3. 1.3. Touch rocker switch **-A-** .
      4. 1.4. >> The ball hitch moves automatically into operating position.
      5. 1.5. The red LED in the rocker switch flashes until the operating position is reached.

WM 6X00IN DISPOSAL OF AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > DISPOSAL OF AIRBAG AND SEAT-BELT PRETENSIONER UNITS

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

Information

- Country-specific statutory regulations and legislation based on them which go beyond these instructions must always be observed and take precedence over these instructions!

Information

- Airbag units are pyrotechnical items and can pose an environmental hazard!
- For this reason, non-ignited airbag units or entire vehicles must not be disposed of as normal scrap, refuse or in other final storage facilities!
- If the vehicle suffered fire damage which caused one or several airbags or belt tensioners to be triggered, additional ignition with the adapter cable must be carried out in order to ensure that only parts without pyrotechnical contents are scrapped!
- In the case of airbag units which cannot be ignited or if the conditions for safe ignition are insufficient, always return the airbag units to Porsche or the respective importer in their original packaging!

WM 6X00IN DISPOSAL OF AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > SAFETY PROCEDURES WHEN IGNITING AIRBAG UNITS

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's

airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

Information

Only ignite airbag units that are securely installed in the vehicle and in the original condition. Use only the ignition tool intended for this purpose.

Carry out ignition only in suitable, open areas.

First remove all loose objects from the expansion area of the airbag.

Each ignition circuit for all airbag units and seat-belt tensioners must be ignited individually.

Persons possibly affected must be informed of the resulting noise beforehand.

Wear ear protectors. Keep a safe distance by utilizing the entire cable length of the ignition tool.

Connect power source only just prior to igniting.

If ignition fails, wait for approx. 3 minutes before approaching the vehicle.

Allow airbag units to cool down under observation following ignition.

Avoid skin contact with ignited airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

Information

Only ignite airbag units that are securely installed and in original condition in the vehicle. Allow airbag units to cool down under observation following ignition.

- Use only the ignition tool intended for this purpose. First remove all loose objects from the expansion area of the airbag.
- Every ignition circuit for all airbag units and seat-belt pretensioners must be ignited individually.
- Persons who may be affected must be informed of the resulting noise beforehand.
- Wear ear protectors.
- Keep a safe distance by utilizing the entire cable length of the ignition tool. Do not connect the voltage source until all other preparations are complete.
- If ignition fails, wait for approx. 3 minutes before approaching the vehicle.
- Carry out ignition only in suitable, open areas.
- Do not allow ignited airbag units to come into contact with the skin.

4. Connect the **ignition device 9257** to the 2-pin connector of the **adapter cable 9257/6** .
5. Place the ignition device in front of the vehicle through the door gap.

WM 6X00IN DISPOSAL OF AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > CONNECTING IGNITION TOOL > HEAD AIRBAG

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

Information

Only ignite airbag units that are securely installed and in original condition in the vehicle. Allow airbag units to cool down under observation following ignition.

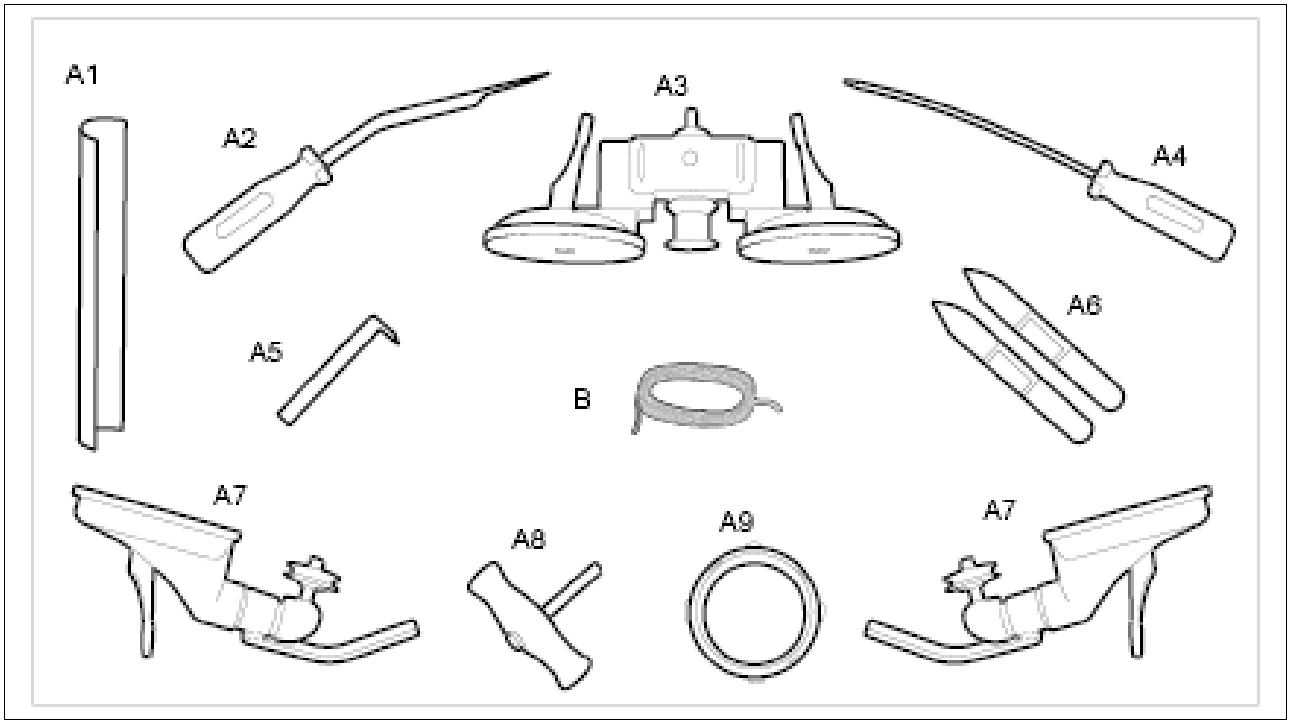
WM 6X00IN GENERAL INFORMATION ON REMOVING CAR WINDOWS (ALL MODELS) > REMOVING GLASS WITH CUTTING-WIRE SEPARATING DEVICE

Information

- The following instructions describe the general procedure for removing car windows with the glass separating tool VAG 1474 B.
- Information on procedures relating to specific vehicles can be obtained from the instructions in the corresponding chapters in the Technical Information.

Fig 1: Identifying Flush Bonded Windows Removal Kit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

A - Removal kit for flush bonded windows VAG 1474 B [1)]

B - Cutting thread

A1 - Guide rail

A2 - Cutting tool (wire holder)

A3 - Spooling device

A4 - Awl

A5 - Guide rail

A6 - Spatula

A7 - Steering roller with arm bracket

A8 - Handle

A9 - Square cutting wire

[1)] Contains set components A1-A9 and protective film for dashboard

Information

- It is generally possible to remove the windscreen with the cutting wire and the optional cutting thread contained in the tool set.
- In contrast to cutting threads, however, the cutting wire has the following disadvantages:
- Danger of injury when tearing off the cutting wire.
- Danger of damage to materials on paint surfaces and interior equipment parts.
- For the reasons outlined above we recommend using the cutting thread.

WARNING: Vehicle windows removed and installed incorrectly

- *Danger of cuts*
- *Risk of eye injuries*

→ Wear personal protective gear.

→ Always shut off power supply when replacing cutting knife.

NOTE: Windscreen removed incorrectly

- *Risk of damage to vehicle identification number (VIN) label*
- *Risk of damage to paintwork*

→ When cutting out the windscreen, make sure that the label with the vehicle identification number (VIN) is not damaged.

Information

- In order to guarantee an optimum fastening intake grip, it is advisable to clean the inside of the glass before removal.

1. Clean inside of glass.

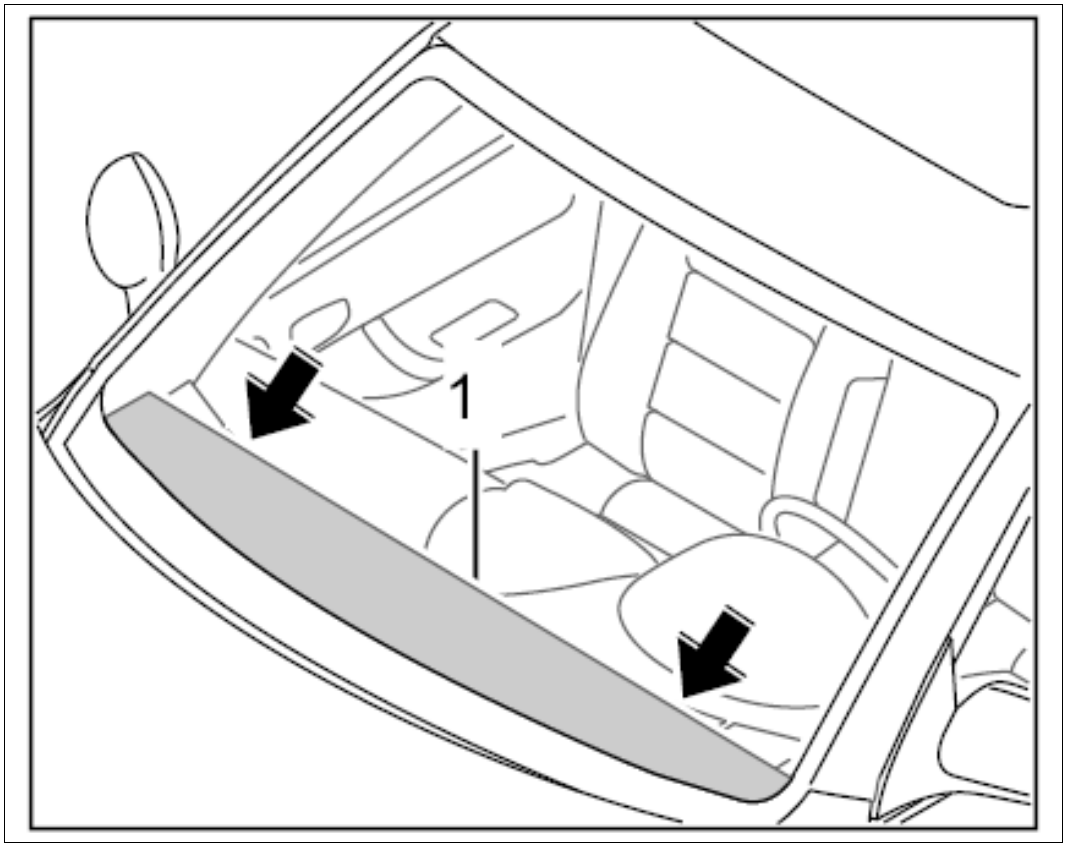
   Information

   1. The film protects the damping mat against damage when removing the glass.

2. Affix protective film on the dashboard.

   1. 2.1. Select the appropriate film **-1-** and insert between windscreen and damping mat.

Fig 2: Inserting Windscreen And Damping Mat



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

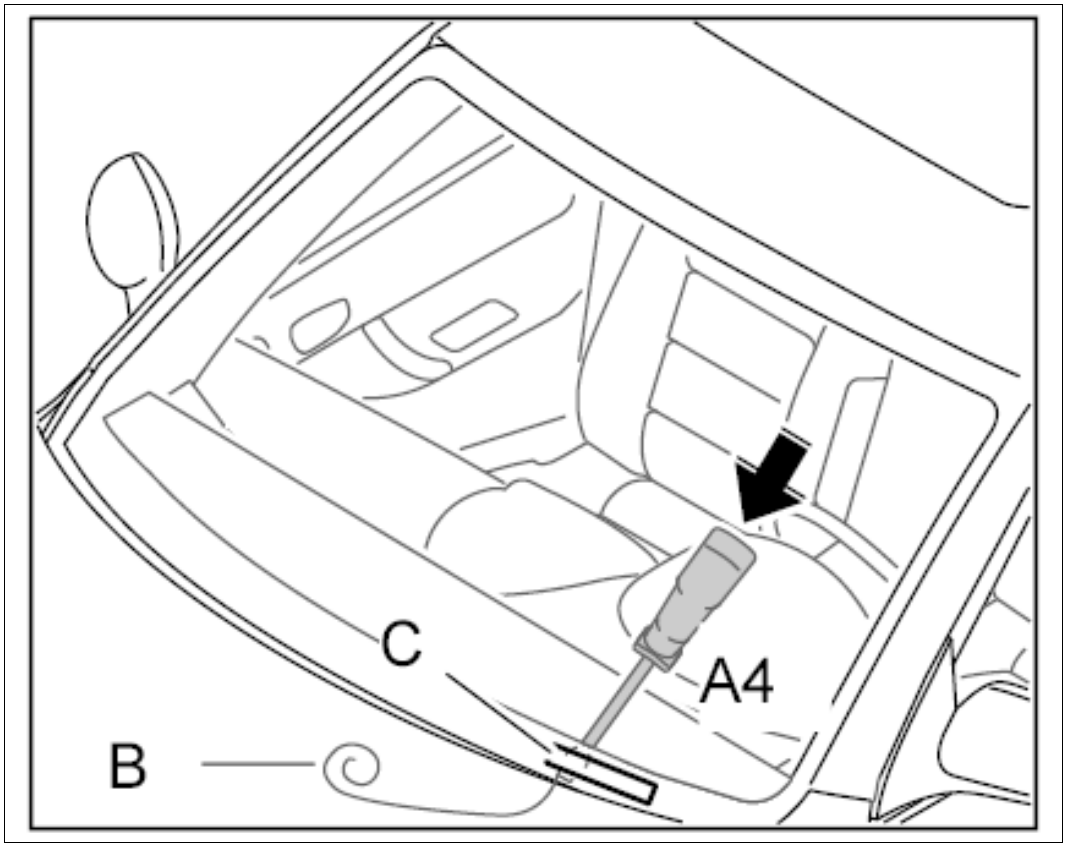
Information

1. In order to prevent damage, make sure that the vehicle identification number is completely covered by the protective film when pushing through the adhesive bead.

3. Insert cutting thread into the passenger compartment.

    1. 3.1. Push through adhesive bead on the glass on the edge of the vehicle identification number **-C-** with the awl **-A4-** from the inside to the outside.
    2. 3.2. Pass cutting thread **-B-** through the eyelet on the awl **-A4-** .
    3. 3.3. Pull cutting thread **-B-** into the passenger compartment.
    4. 3.4. Pull cutting thread **-B-** out of the awl **-A4-** .
    5. 3.5. Pull cutting thread **-B-** approx. 1 m into the passenger compartment.

Fig 3: Pulling Cutting Thread



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

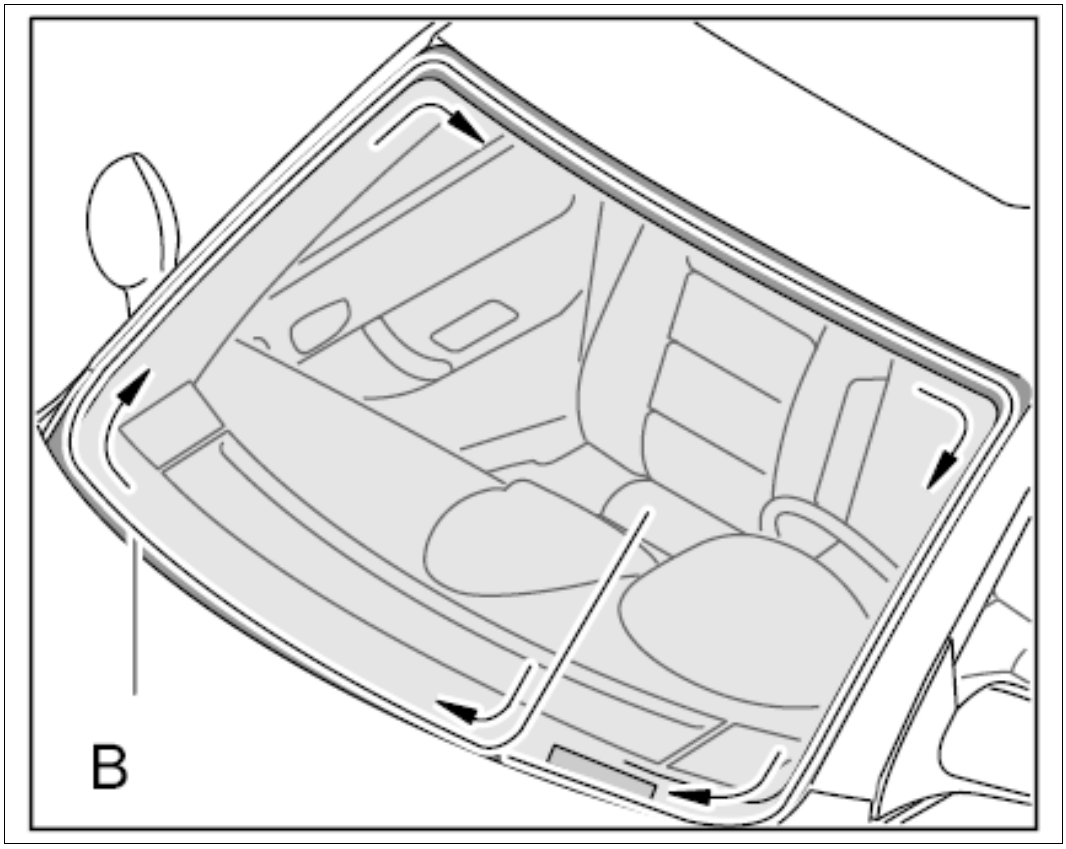
Information

1. The cutting thread should be positioned under the rim as far as possible. The sealing lip must be raised slightly in the upper part of the glass in order to pull the cutting thread through.

4. Insert cutting thread into the gap in the glass.

    1. 4.1. Pull the cutting thread **-B-** all the way around in direction of arrow and into the gap between the window and body; use a spatula **-A6-** if necessary.

Fig 4: Inserting Cutting Thread

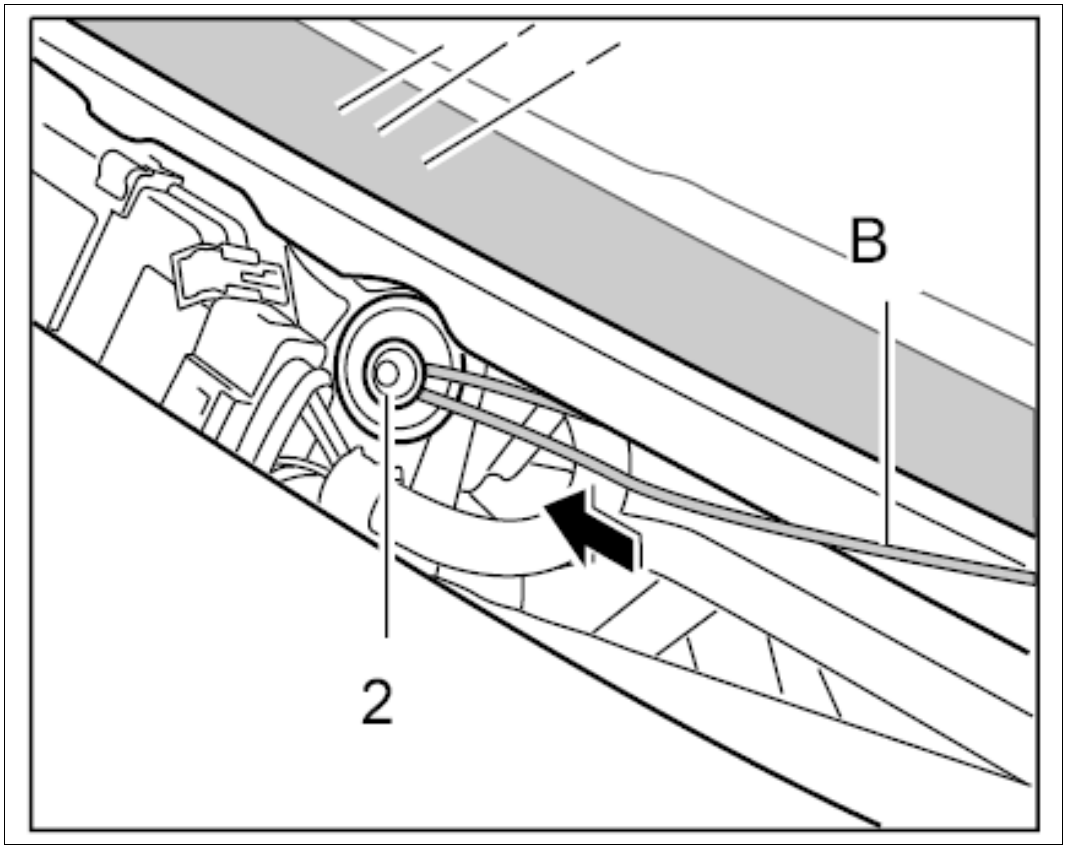


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Secure cutting thread to the body.

    1. 5.1. Secure the loose end of the cutting thread **-B-** at a suitable point on the body using the fastening screw **-2-** on a component (e.g. wiper motor fastening screw). Loosen the fastening screw, wind the cutting thread **-B-** once around the screw and then tighten the fastening screw again.

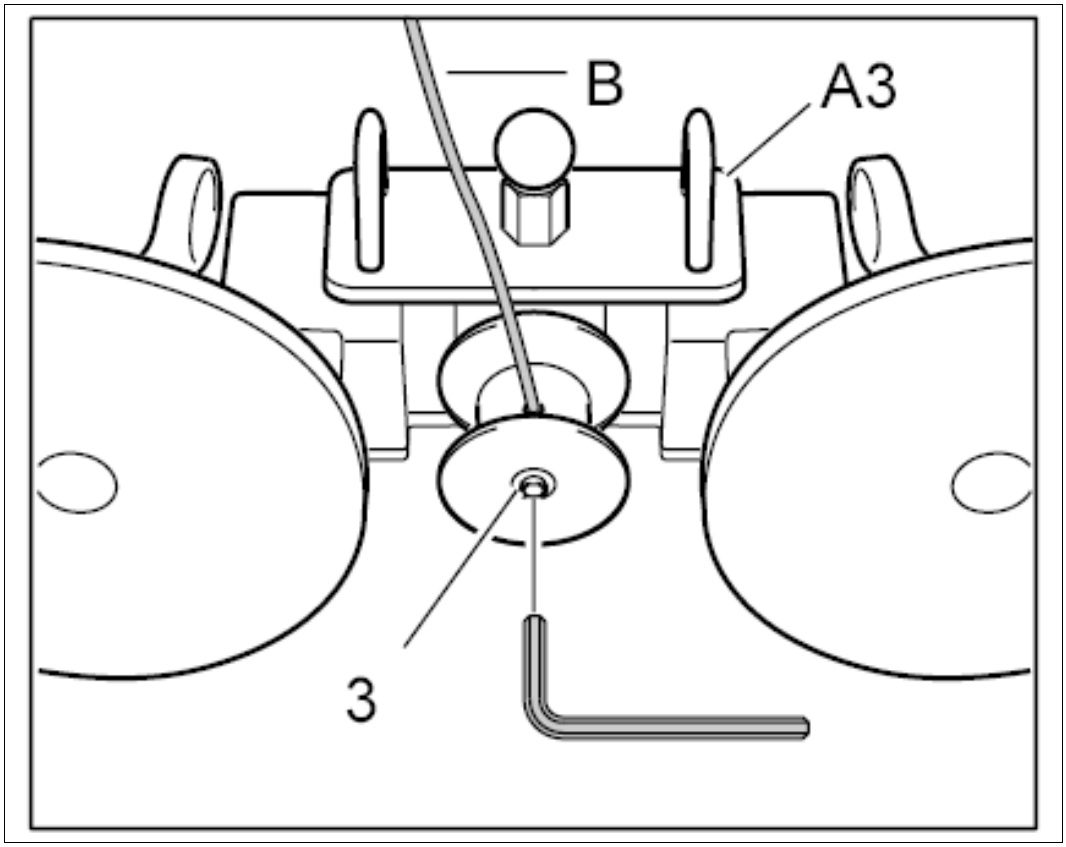
Fig 5: Loosening Car Windows Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Fit cutting thread to the spooling device.
    1. 6.1. Loosen clamping screw **-3-** .
    2. 6.2. Insert the cutting thread **-B-** into the bore on the spooling device **-A3-** .
    3. 6.3. Attach cutting thread **-B-** firmly with the clamping screw **-3-** .

Fig 6: Inserting Cutting Thread Into Bore On Spooling Device



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. The fastening force can be increased by moistening the fastening intake.

7. Fit spooling device and deflection rollers on the glass.
    1. 7.1. Position spooling device **-A3-** diagonally in the center of the glass.
    2. 7.2. Press spooling device **-A3-** firmly against the glass using the suction cups.
    3. 7.3. Secure suction cup onto the glass by moving the actuating lever.

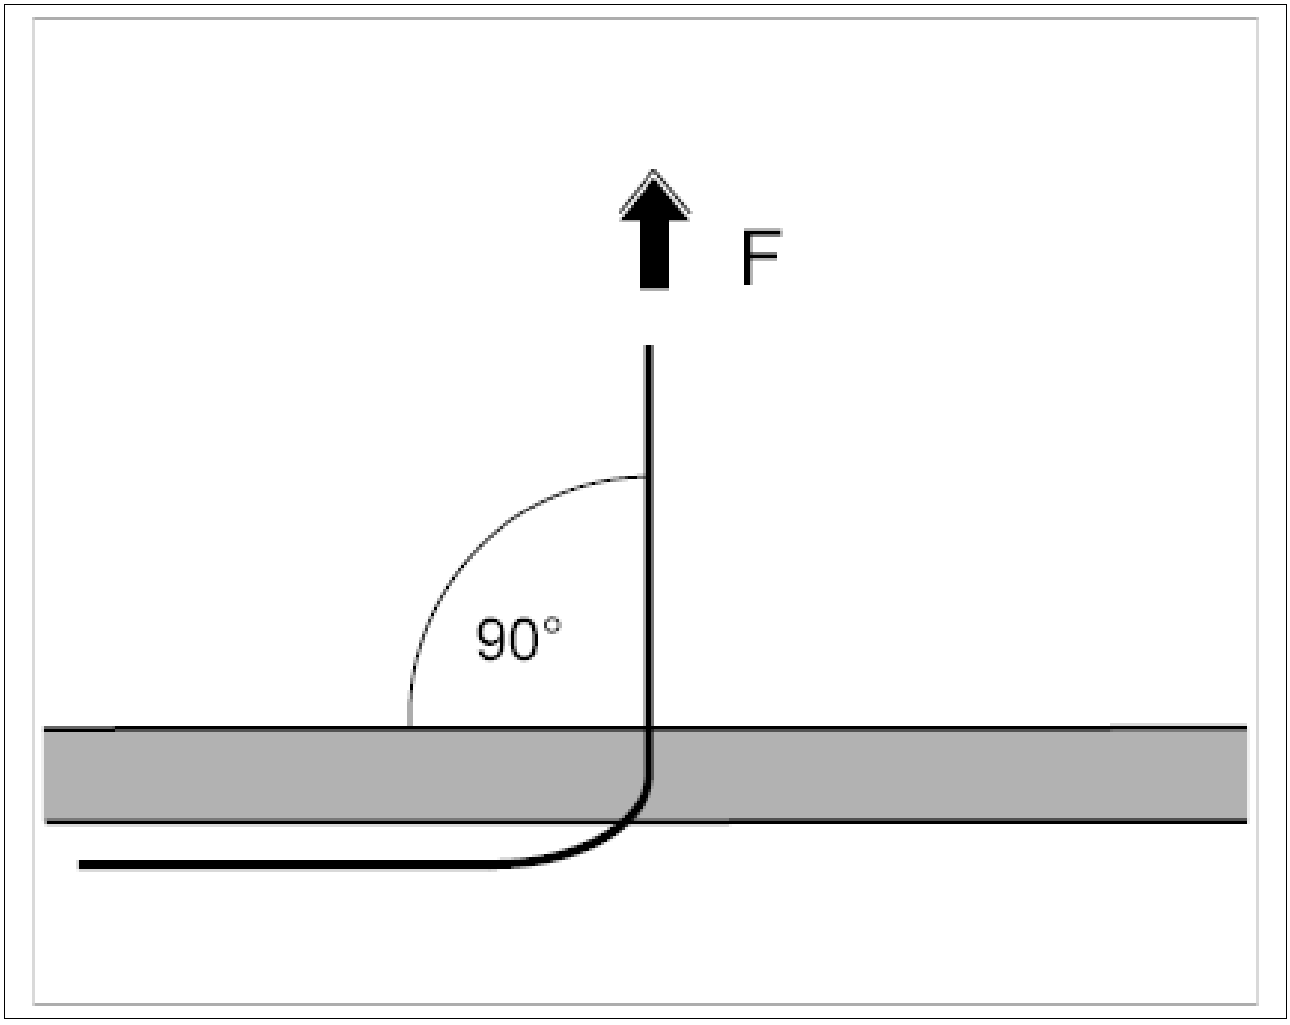
WM 6X00IN GENERAL INFORMATION ON REMOVING CAR WINDOWS (ALL MODELS) > CUTTING FORCE FOR REMOVING GLASS WITH CUTTING WIRE

Information

- The force required for separating the glass is lower when the cutting thread is deflected to its maximum point. An angle greater than 90° should be avoided.

Unfavourable angle (strong pulling force required)

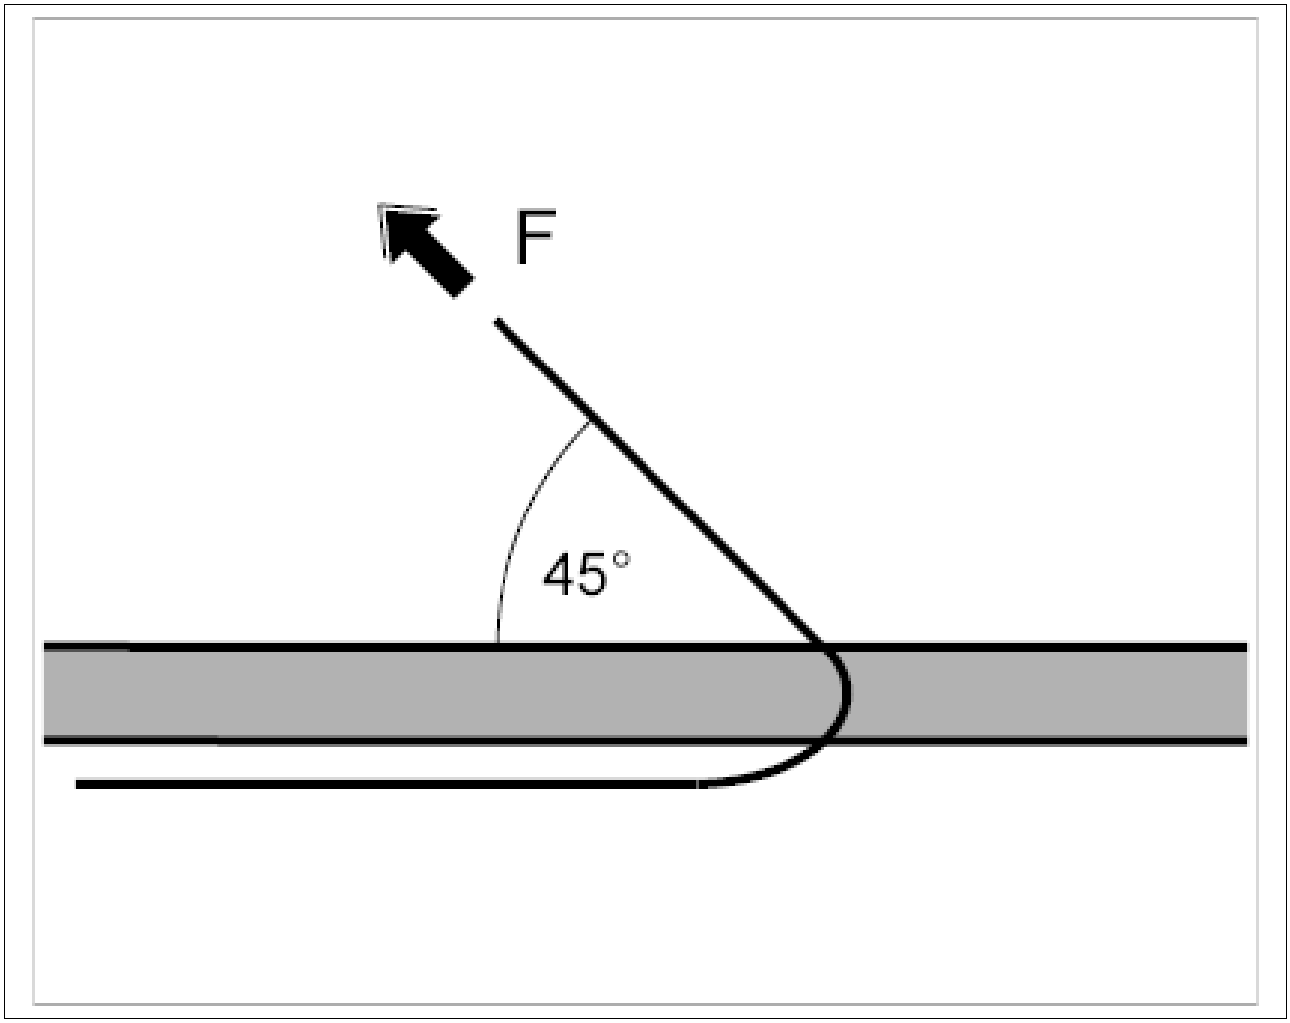
Fig 1: Identifying Glass High Cutting Force



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Favourable angle (average pulling force required)

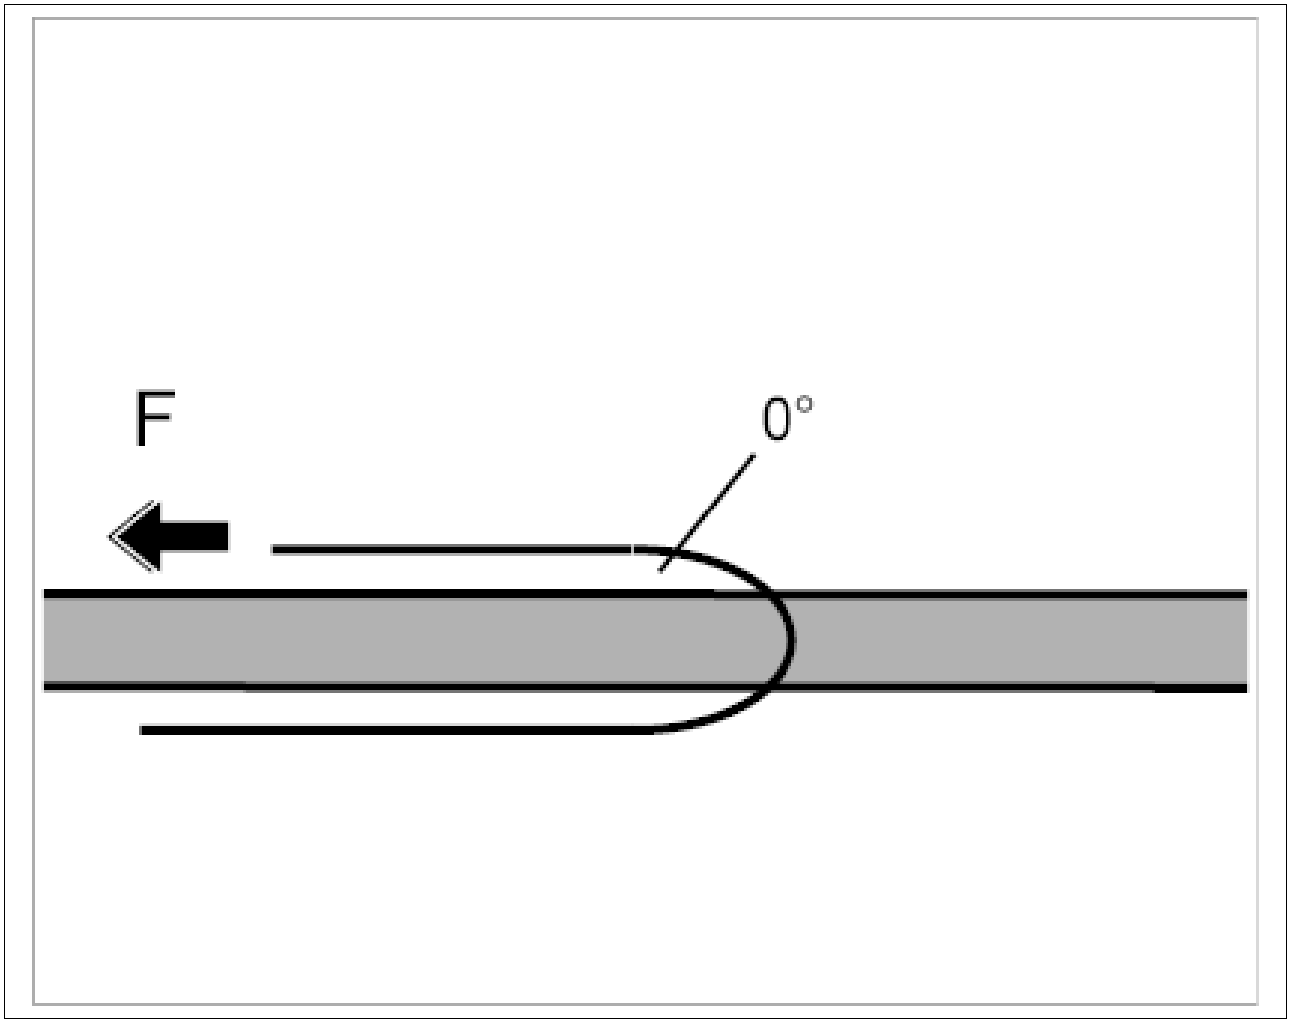
Fig 2: Identifying Glass Average Cutting Force



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Optimum angle (minimum pulling force required)

Fig 3: Identifying Glass Low Cutting Force



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 6X00IN HANDLING AND REPLACING AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
2nd generation PIWIS Tester	Special tool	9818		
WM 6X00IN HANDLING AND REPLACING AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > TOOLS AND MATERIALS > MATERIALS

- Use Porsche work clothing.

WM 6X00IN HANDLING AND REPLACING AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > GENERAL WARNING NOTES > GENERAL WARNINGS FOR HANDLING AIRBAG AND SEAT-BELT PRETENSIONER UNITS

> ⚠ *CAUTION: Danger of injury and material damage if the airbag unit is not handled correctly!*
>
> - *Triggering of the airbag unit!*

→ The airbag units are pyrotechnical items in hazard class T 1!

→ Handling, transport and storage of these units must conform to hazardous goods regulation and explosives legislation!

→ The listed statutory requirements . The relevant valid regulations must be observed in all other countries. Consult the importer for the country concerned!

→ The commencement of work with pyrotechnical items must be reported to the Trade Supervisory Office (responsible authority) 14 days in advance!

→ The airbag units may only be shipped in transport packaging officially approved for this purpose!

→ Internally and otherwise, they must always be transported in the luggage compartment or loadspace of a vehicle using the above-mentioned transport packaging!

→ They must never be transported in the passenger compartment!

→ Airbag units must be stored in accordance with the explosives legislation SprengLR 240 - Storage of airbag and seat-belt pretensioner units!

→ This ordinance stipulates that small quantities of materials and items may be stored at certain locations without special storage approval!

→ The airbag units must be kept in a locked place!

→ When storing airbag units, ensure that the blow-out opening is facing upwards (risk of injury as a result of inflation of the airbag units in the event of accidental ignition)!

→ The airbag units must be stored in a dry place and must not be stored together with other hazardous goods (lacquers, etc.)!

→ Loose airbag units or airbag units in a removed steering wheel must never become the actual (physical) property of the customer!

→ The possession of loose airbag units not installed in the vehicle is not permitted in the private sector!

→ Airbag units may become the property of the customer only when installed in the vehicle!

WM 6X00IN HANDLING AND REPLACING AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > GENERAL WARNING NOTES > WARNINGS ABOUT ASSEMBLY AND STRAIGHTENING WORK

WARNING: Incorrect handling of airbag triggering unit

- *Malfunction in airbag system*

→ Never drive with an untaught or unlocked airbag triggering unit.

→ Teach and lock the airbag triggering unit using the **2nd generation PIWIS Tester 9818** . The warning light will flash continuously until such a time as you teach and lock the airbag triggering unit.

→ Inspection and assembly work may only be carried out by specialist staff.

WM 6X00IN HANDLING AND REPLACING AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > INFORMATION FOR HANDLING AIRBAG AND SEAT-BELT PRETENSIONER UNITS > DANGERS FOR PERSONS AND THE ENVIRONMENT

Information

Dangers for persons and the environment

Injury caused by incorrect triggering of the installed unit.

Injury caused by spinning away, e.g. of the entire unit.

Burns caused by touching the hot surfaces of a triggered unit.

Damage to hearing due to the explosion when gas is released.

Irritation caused by breathing in fuel particles.

Irritation caused by skin and eye contact with fuel particles.

Airbag/seat-belt pretensioner components must not be opened or repaired; always use new parts.

Injury caused by incorrect triggering due to tampering with the short circuit bridges.

WM 6X00IN HANDLING AND REPLACING AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > INFORMATION FOR HANDLING AIRBAG AND SEAT-BELT

PRETENSIONER UNITS > PROTECTIVE MEASURES AND RULES OF BEHAVIOR

Information

Protective measures and rules of behavior

Assembly work must only be carried out by trained staff.

Carry out tests only using the diagnostic tester **PIWIS Tester II 9818** ; do not use test lamps, voltmeters or ohmmeters.

Avoid contact with grease, solvents, cleaning agents or liquids.

Do not expose to temperatures above 90 °C.

Keep the deployment area of the blow-out opening clear; e.g. do not hang test devices over the steering wheel. When carrying the airbag, hold it with the blow-out opening facing away from the body. Set the airbag unit down with the blow-out opening facing upwards.

Electrostatic charge: Always wear appropriate work clothing and footwear.

Do not remove the short-circuit spring of the plug contacts.

An airbag unit must never be connected incorrectly to electric power sources (danger of ignition). Only use testers prescribed by the manufacturer.

During installation/removal or work on the vehicle involving vibrations: switch off ignition, disconnect and cover the negative terminal of the battery, wait 1 minute and only then should you disconnect the plug connection.

Transport: In transport packaging. Never in the passenger compartment!

Storage in the workshop: Max. 10 kg (=> 100 driver or 50 passenger airbags); protect against theft!

The airbag/seat-belt pretensioner unit must be installed immediately after removal from the transport container.

If work is interrupted, the airbag/seat-belt pretensioner unit must be stored in the transport container again.

Never leave the airbag/seat-belt pretensioner unit unattended.

WM 6X00IN HANDLING AND REPLACING AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > INFORMATION FOR HANDLING AIRBAG AND SEAT-BELT PRETENSIONER UNITS > BEHAVIOR IN CASES OF MALFUNCTION OR DANGER

Information

Behavior in cases of malfunction or danger

Protect from flames and heat.

In case of fire, inform the fire brigade on arrival about the units present.

Do not install mechanically damaged units or units that have fallen, even from a low height.

Always replace units that are mechanically damaged (bulges, cracks).

Because of the irritating combustion residues, always use protective gloves and goggles when handling triggered airbags.

In the event of contact with combustion residues, wash the affected skin with soap and water.

In the event of eye contact, wash the eyes out with water.

WM 6X00IN HANDLING AND REPLACING AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > GENERAL INFORMATION

Information

Airbags - general information

A period of 10 seconds is required to enable the triggering unit to identify all faults in the system!

In order to guarantee that every possible fault source is checked during the vehicle test, the ignition must be switched on for at least 10 seconds!

The fault memory must be cleared following a fault in the airbag system and after it has been corrected!

The replacement of a component must be noted in the Guarantee and Maintenance booklet!

To do this, stick or enter the documentation number in a free panel intended for this purpose!

The documentation number is attached to the replacement part as a tear-off sticker or is stored in **PIWIS Tester II 9818!**

Replaced airbag units or airbag modules must be retained by the Porsche Centre or authorised Porsche dealer and must not be handed over to the customer (customer has no right to keep them). They must be destroyed or disposed of in accordance with the explosives ordinance and the hazardous materials ordinance, or returned to the manufacturer!

When the steering wheel is replaced, e.g. in order to install a steering wheel from the Tequipment range, the airbag unit of the replaced steering wheel must be removed and destroyed, disposed of or returned to the manufacturer before the steering wheel that was replaced is handed over to the customer!

The airbag system is constantly monitored by a diagnosis unit in the triggering unit. Any fault is signalled by a warning light. The warning light for the airbag system comes on in the event of a fault. The airbag warning light comes on for approx. 3 seconds after the ignition is switched on and goes out if no fault has been entered in the fault memory. If it comes on again, this indicates a fault in the system. The fault can be read out using **PIWIS Tester II 9818** .

WM 6X00IN HANDLING AND REPLACING AIRBAG AND SEAT-BELT PRETENSIONER UNITS (ALL MODELS) > GENERAL INFORMATION > REPLACING COMPONENTS AFTER AIRBAG/SEAT-BELT PRETENSIONER TRIGGERING

The following components must be removed and replaced after the airbag system is triggered:

Airbag unit on driver's side:

1. Contact unit.
2. Airbag unit on driver's side.
3. Triggering unit after the system is triggered for the third time.
4. Airbag sensors: see below → 1. → 14.

Airbag unit on passenger's side:

1. Airbag unit on passenger's side.
2. Triggering unit after the system is triggered for the third time.
3. Dashboard.
4. Check dashboard bracket for deformation and replace it if necessary.
5. Airbag sensors: see below → 1. → 14.

Side airbag unit, seat:

1. Side airbag unit, seat.
2. Seat covering, deformed seat components.
3. Triggering unit after the system is triggered for the third time.
4. Airbag sensors: see below → 1. → 14.

Head airbag unit:

1. Replace roof lining.
2. Airbag sensors: see below → 1. → 14.
3. Triggering unit after the system is triggered for the third time.

Airbag sensor:

1. All airbag sensors in damaged/deformed areas of the vehicle must always be replaced.
2. Otherwise (i.e. even if the vehicle was not crashed), the airbag sensors must be replaced if they show signs of mechanical damage and/or if the airbag control unit detects that the airbag sensor is defective (use **PIWIS Tester II 9818** to read out the fault memory).
3. Triggering unit after the system is triggered for the third time.

Seat-belt pretensioner:

1. All seat-belt pretensioner units.
2. Triggering unit after the system is triggered for the third time.

Because it is difficult to visually determine if one or more seat-belt pretensioners has been

triggered, check the following points:

- Use **PIWIS Tester II 9818** to read out the fault memory.
- Check plug connection on the seat-belt pretensioner for damage.
- Pull out the belt strap as far as possible and check for wear.
- Perform a function test on the automatic belt device.

WM 6X00IN WORKING WITH PORSCHE 2-COMPONENT WINDOW ADHESIVE (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Porsche 2-component window adhesive		working time	15 min		

WM 6X00IN WORKING WITH PORSCHE 2-COMPONENT WINDOW ADHESIVE (ALL MODELS) > OVERVIEW OF TOOLS AND MATERIALS

Activate adhesive bead (only necessary after idle times > 24 h) ↓	Prime flange surface ↓
Apply adhesive	
Install glass	

WM 6X00IN WORKING WITH PORSCHE 2-COMPONENT WINDOW ADHESIVE (ALL MODELS) > MIXING PROCEDURE (HANDLING DOUBLE CARTRIDGE PRESS)

⚠ *CAUTION: → Observe the safety instructions of the individual adhesive set components.*

Information

- In addition to this information, observe the relevant job descriptions for body repairs!

1. Prepare cartridge components A and B **-H5, H6-** .

    1. 1.1. Pierce the membrane in the nozzle connection of components A and B (aluminum cartridge) **-H5-** with a screwdriver and widen the opening. Remove flanged cover on end of cartridge.

        Fig 1: Removing Flanged Cover On End Cartridge

        
        Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Screw on mixing nozzle **-H7-** .

    1. 2.1. Screw both cartridges onto the mixing nozzle.

3. Insert mixing cartridge into the double cartridge gun.

    1. 3.1. Move pressure pistons back fully.

    2. 3.2. Insert double cartridge **-H5, H6-** into the bonding gun **-A-** .

4. Press out adhesive.

    1. 4.1. Actuate the valve **-arrow-** to move the pressure pistons out slowly until both components of the bonding material emerge at the mixing tube.

    2. 4.2. Wipe off emerging adhesive.

5. Screw on processing nozzle **-H8-** .

1. 5.1. Screw processing nozzle **-H8-** onto the mixing nozzle **-H7-** .

6. Align processing nozzle.

    1. 6.1. Turn the processing nozzle on the mixing nozzle until the illustrated position is reached.

        Information

        1. In this position, the closed surfaces must be visible at the horizontal mixing nozzle from above and below and the mixing blade of the mixer insert from the sides.

    2. 6.2.

7. Mix adhesive components.

    1. 7.1. Actuate the valve **-arrow-** to move the pressure pistons out slowly until the adhesive is visible in the processing pipe.

        Fig 2: Locating Adhesive Bead

        
        Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Affix car window.

    Information

    1. In order to ensure that the substance is completely mixed, apply a 30 mm long adhesive bead of fresh adhesive to a piece of cardboard before processing.

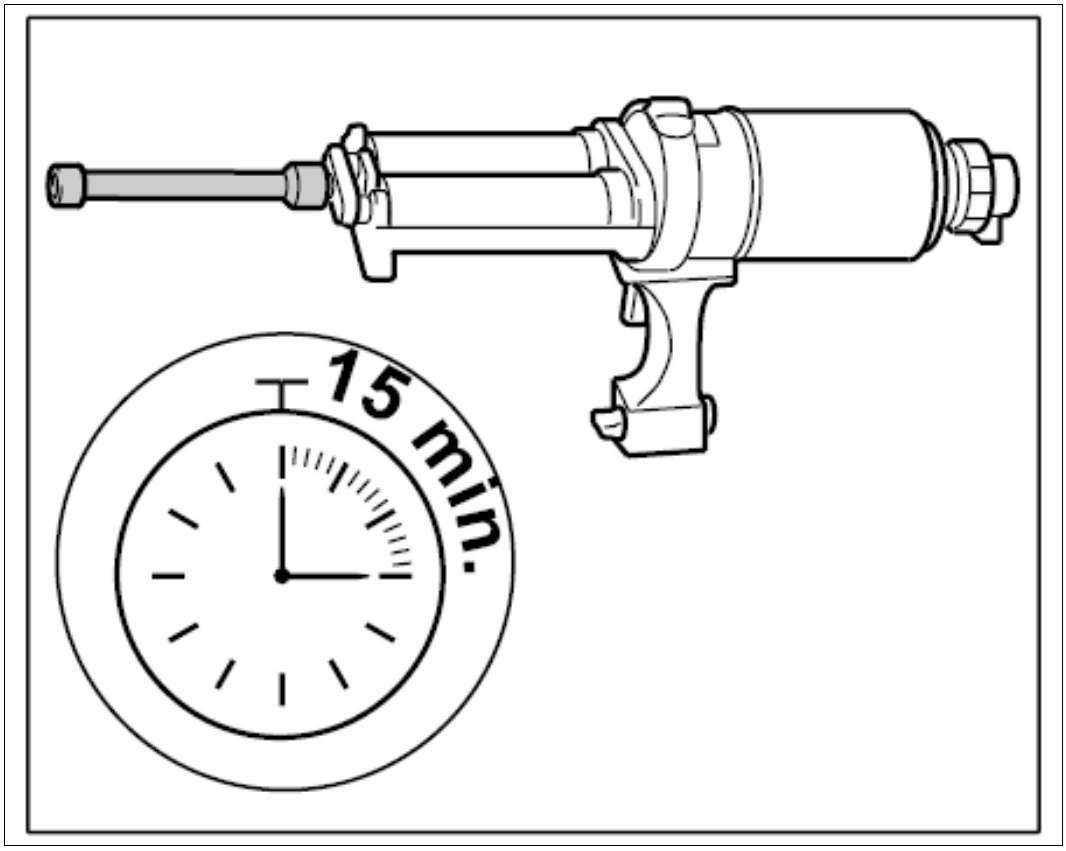
    2. The bonding material has an open time of → working time: 15 min , the bonding material

must be applied and the window must be assembled within this time.

3. Do not load bonded parts until hardening is complete!
4. If the contents of the cartridge is not completely used up, the processing nozzle should not be removed until the adhesive has hardened on the cartridge. A new processing nozzle must be used for subsequent bonding work.

1. 8.1.

Fig 3: Identifying Adhesive Bead



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0X00IN OVERVIEW OF A, B AND C MARKETS (MACAN, MACAN S, MACAN TURBO) > INFORMATION > OVERVIEW OF A, B AND C MARKETS

Information

For vehicles as of model year 2011

Because of different fuel octane ratings, the change intervals for oil, spark plugs and air cleaner have been adapted to suit the various markets.

Markets	Countries
A markets	Andorra Belgium Germany Denmark Estonia Finland, France Greece, Great Britain Ireland, Iceland, Italy Japan Latvia Liechtenstein, Lithuania, Luxembourg Malta Netherlands, Norway Austria Poland, Portugal Sweden, Switzerland, Slovakia, Spain Czech Republic Hungary Cyprus
B markets	Egypt, Algeria, Angola, Argentina, Armenia, Aruba (itc Caribbean), Azerbaijan, Australia Bahamas, Bahrain, Bangladesh, Barbados, Bosnia and Herzegovina, Brazil, Brunei, Bulgaria Chile, Costa Rica Dominican Republic Ecuador, El Salvador French Guiana, French Polynesia Ghana, Guadeloupe, Guatemala Haiti, Dutch Antilles, Honduras, Hong Kong India, Iraq, Iran, Israel Jamaica (itc Caribbean), Yemen, Jordan Cameroon, Canada, Kazakhstan, Qatar, Cayman Islands, Kenya, Columbia, Croatia, Kuwait Lesotho, Lebanon, Libya Malaysia, Morocco, Martinique (F), Mauritius, Mexico, Moldova, Monaco

	Namibia, New Caledonia, New Zealand, Nigeria, Nicaragua Oman Pakistan, Panama, Paraguay, Peru, Philippines, Puerto Rico Reunion, Romania, Russia Saudi Arabia, Serbia and Montenegro, Zimbabwe, Singapore, Slovenia, Sri Lanka, South Africa, South Korea, Swaziland, Syria Taiwan, Thailand, Trinidad and Tobago, Turkey, Tunisia Ukraine, Uruguay, USA UAE (Abu Dhabi, Dubai), Venezuela, Vietnam Belarus, Western Sahara
C markets	China, Indonesia

WM 0X01IN ALARM SYSTEM: CHECKING OPERATION OF MONITORING DEVICES (MACAN, MACAN S, MACAN TURBO) > ALARM SYSTEM: CHECKING OPERATION OF MONITORING DEVICES

1. Read out the fault memory and activate systems on the unlocked vehicle (see previous point in sales check).
2. Lock the vehicle using the remote control (key fob). A warning tone must not be emitted by the alarm system horn shortly after locking the vehicle (not relevant for USA).
3. If a warning tone is emitted, open and close all doors and outer lids one after the other (not relevant for USA).
4. As soon as the vehicle is locked, the LED in the driver's door panel must flash quickly for 2 seconds and then start to flash slowly.

   Fault indicator:

5. LED flashes quickly for 2 seconds, lights up for 28 seconds and then flashes slowly: Connect the System Tester and read out the fault memory.

WM 0X01IN CHECKING EXTERIOR EQUIPMENT AND PAINTWORK (MACAN, MACAN S, MACAN TURBO) > CHECKING EXTERIOR EQUIPMENT AND PAINTWORK

Information

- The following items can be checked by simple visual inspection, no assembly work required.

  1. Check whether transport protection has been completely removed and ensure that no film remains in the body joints or under seals.

WM 0X01IN CHECKING EXTERIOR EQUIPMENT AND PAINTWORK (MACAN, MACAN S, MACAN TURBO) > CHECKING EXTERIOR EQUIPMENT AND PAINTWORK > CHECKING EXTERIOR EQUIPMENT

1. Check vehicle for secure fit of accessories such as trim strips, doors mirrors, front and rear spoilers.
2. Check underbody for noticeable areas where undersealing material is missing (e.g. scrapes).
3. Check side member of body flange for deformation of jacking points.
4. Check outer shell of vehicle for noticeable soiling with cavity sealing wax.

WM 0X01IN CHECKING EXTERIOR EQUIPMENT AND PAINTWORK (MACAN, MACAN S, MACAN TURBO) > CHECKING EXTERIOR EQUIPMENT AND PAINTWORK > CHECKING PAINTWORK

1. Check outer shell of vehicle for noticeable sheetmetal damage such as dents and bulges.
2. Check painted surfaces of vehicle for noticeable defects such as scores, scratches, notches, scrapes, pores, bubbles or signs that the bodywork is coming through the paint.

WM 0X01IN CHECKING GLAZING (MACAN S, MACAN TURBO) > CHECKING GLAZING

Information

- The following items can be checked by simple visual inspection, no assembly work required.
    1. Check whether transport protection has been completely removed and ensure that no film remains in the body joints or under seals.
    2. Check vehicle glazing for stone damage and scratches.
    3. Check surrounds and rubber sections of vehicle glazing for damage and cracks.

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > FUNCTION TEST ON FRONT LID LOCK

Information

The lid lock does not have an emergency release.

When working close to the front apron and on the various parts of the lock, carry out the following function test before closing the lid:

1. Check that the release cable is clipped fully into the bracket provided.

2. Lock lower part of lid lock using a screwdriver.
3. Release the lid lock using the lever in the passenger compartment.
4. Perform a visual inspection to check that the lock releases correctly.

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > CHECKING LID LOCK AT FRONT AND REAR

- Check that the lid locks engage when the lids (front and rear) are closed by engaging the upper parts of the lock and that they disengage again when the lid releases are activated.

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > CHECKING SAFETY HOOK ON FRONT LID

- Check that the front lid is held down by the safety hook (locking hook) after the lid lock is opened.
- Check that the return spring on the upper part of the lock pulls the safety hook back as far as the stop.

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > FUNCTION TEST ON DOOR LOCKS

- Check that the door locks engage in two stages when the doors are closed and that they disengage again when the door openers are actuated (inside and outside).

WM 0X01IN CHECKING LIDS AND DOORS (MACAN, MACAN S, MACAN TURBO) > CHECKING LIDS AND DOORS > FUNCTION TEST ON FUEL TANK CAP LOCK

- Lock the vehicle.
- Check that the fuel tank cap is locked by the fuel tank cap lock in the closed position.

WM 0X01IN CHECKING OPERATION OF ELECTRICAL EQUIPMENT AS WELL AS WARNING AND INDICATOR LIGHTS (MACAN, MACAN S, MACAN TURBO) > CHECKING OPERATION OF ELECTRICAL EQUIPMENT AS WELL AS WARNING AND INDICATOR LIGHTS

- Turn ignition key and check function of warning and indicator lights (visual inspection).
- Actuate power windows and check that they are working correctly.

- Check that rear window heating is working.
- Adjust heater blower and fans to high and low and check the air vents for air throughput.
- Front seats and back seats: check function.
- Check audio function.
- Check function of exterior mirrors, check adjustment options.
- Check function of orientation lights.
- Check function of luggage compartment lamps.
- Check function of interior lights.
- Actuate central locking and check function.
- Operate cigarette lighter and check that it is working.

WM 0X01IN CHECKING VEHICLE EQUIPMENT FOR COMPLETENESS (MACAN, MACAN S, MACAN TURBO) > VEHICLE EQUIPMENT

Check that the items listed below are in the vehicle.

Designation	Qty.	Restrictions	Position in the vehicle
Warning triangle	1 x	Country-specific (1)	Trim panel for rear lock support
Addition warning triangle	1 x	Country-specific (2)	Stored in luggage compartment
First-aid kit and warning triangle	1 x	Country-specific (3)	Trim panel for rear lock support
On-board folder containing technical information (4) Driver's Manual, PCM/CDR operating instructions, Warranty and Maintenance booklet (5)	1 x	Standard	Glove compartment
18-inch spare wheel	1 x	Only with vehicle spare wheel (I-no.: 1G1)	Luggage compartment (under the loadspace floor)
Bottle of sealing compound for tyres, Tire Fit	1 x	Only with vehicle flat-tyre set (I-no.: 1G8)	
Compressor	1 x		
Tyre inflation hose	1 x	Only with vehicle flat-tyre set (I-no.: 1G8)	Contained in Tire Fit bag

Torch and torch holder	1 x	Japan only	A-pillar trim
Front number plate carrier, including fastening material	1 x	USA only (6)	Stored in luggage compartment
Wiper blades, front (7)	2 x		

(1)	All countries except USA, Canada, Japan, Greece and Germany
(2)	The dealer or importer must supply the additional warning triangle.
(3)	Only in Germany and Greece.
(4)	Except for German-speaking countries, the on-board folder containing technical information (Driver's Manual and Guarantee and Maintenance booklet) must be supplied by the dealer or importer.
(5)	The PCM/CDR operating instructions must be supplied by the dealer or importer in all non-German-speaking countries.
(6)	Only in states in the USA that require a number plate at the front of the vehicle. → 668319 REMOVING AND INSTALLING NUMBER PLATE COVER .
(7)	Replace the one-way wiper blades with the enclosed wiper blades → 922719 REMOVING AND INSTALLING WIPER BLADE.

WM 0X01IN CHECKING VEHICLE EQUIPMENT FOR COMPLETENESS (MACAN, MACAN S, MACAN TURBO) > VEHICLE EQUIPMENT > TOOL KIT

Designation	Qty.	Restrictions	Position in the vehicle
Open-ended wrench	1 x	Standard	Luggage compartment (under the loadspace floor)
Towing lug	1 x		
Screwdriver	1 x		
Socket wrench	1 x		
Socket for security wheel bolts	1 x		
Wheel wrench	1 x	Only for vehicles with spare wheel (I-no.: 1G1)	
Jack with ratchet	1 x		
Assembly pin	1 x		
Puller hook	1 x		
Additional assembly pin and holder	1 x	Only for vehicles with spare wheel (I-no.: 1G1)	
Allen key for emergency operation of sliding roof panel	1 x	Vehicles with sliding roof	

Additional jack with ratchet in bag	1 x	Only for Australia (I-no.: +479)	

WM 0X01IN CHECKING VEHICLE EQUIPMENT FOR COMPLETENESS (MACAN, MACAN S, MACAN TURBO) > VEHICLE EQUIPMENT > VEHICLE KEY

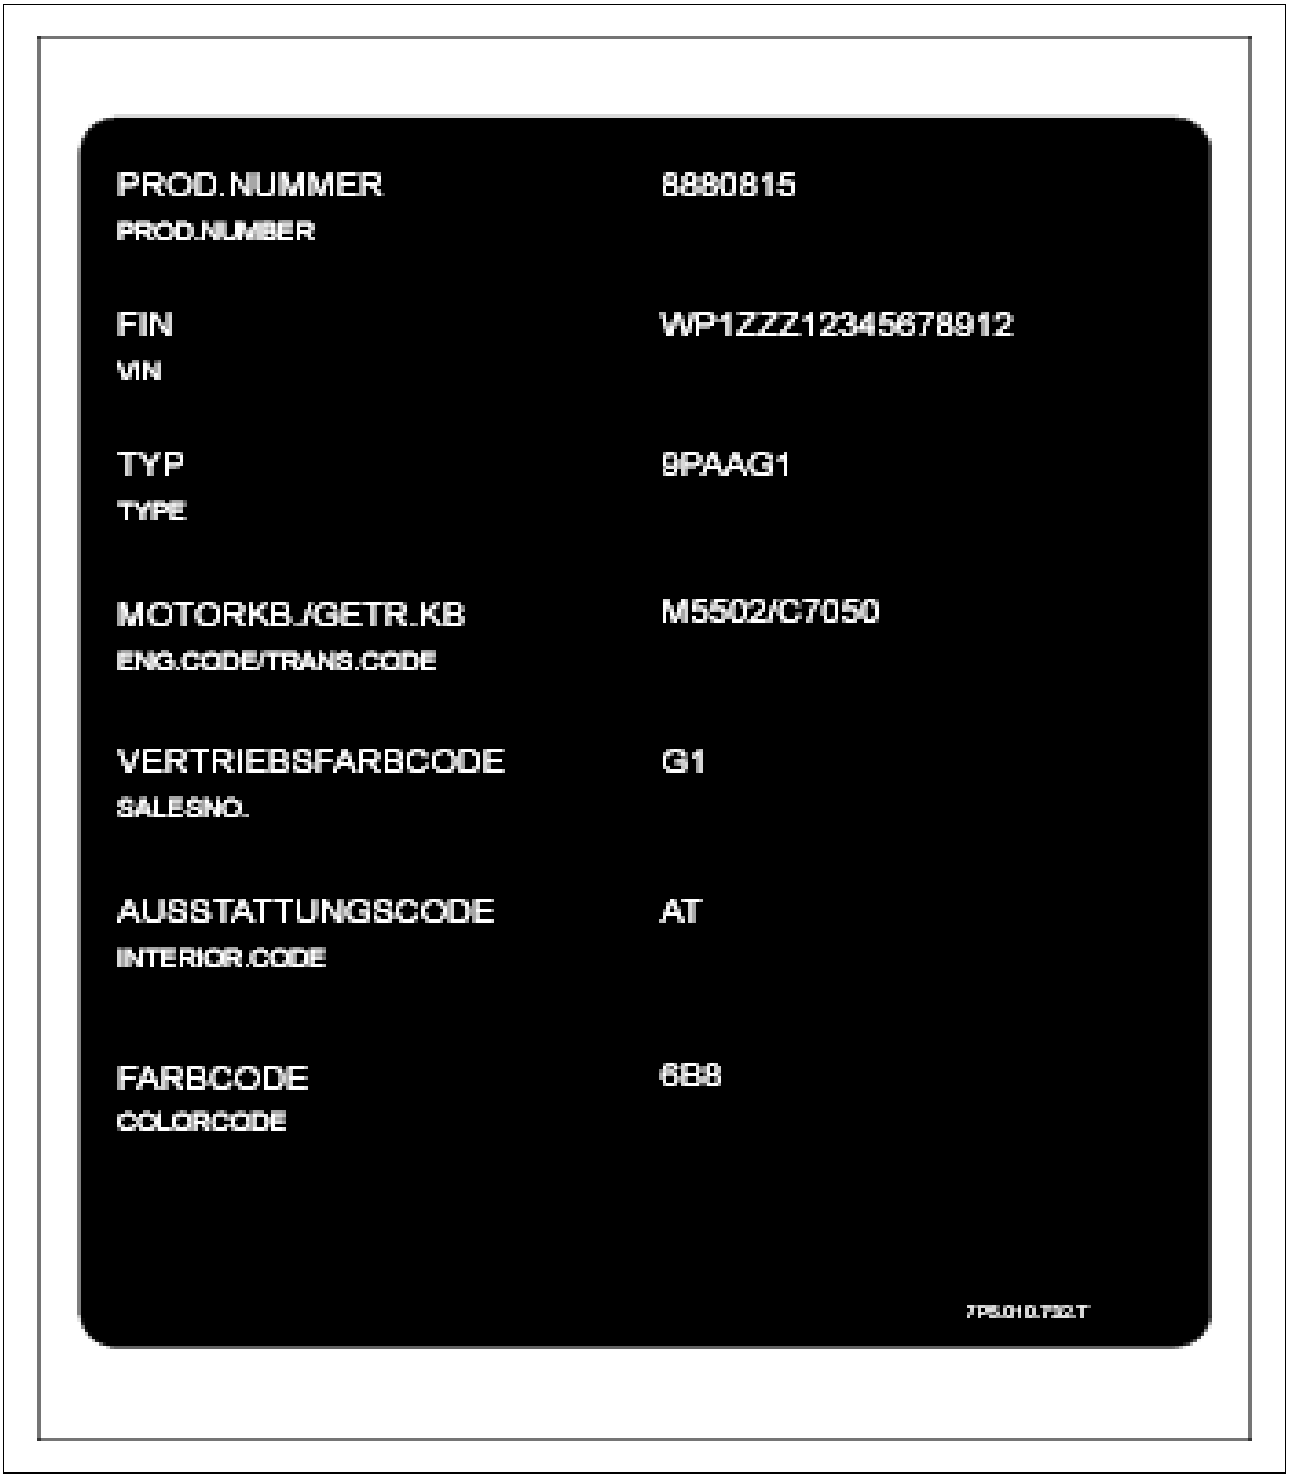
Designation	Qty.	Restrictions
Key ring	1 x	Standard
Key tag	1 x	Standard
Remote control	2 x	Standard
Emergency key (contained in remote control)	2 x	Standard
Control element	1 x	Only for vehicles with Porsche Entry & Drive

WM 0X01IN CHECKING VEHICLE IDENTIFICATION NUMBER FOR CONFORMITY (MACAN S, MACAN TURBO) > CHECKING VEHICLE IDENTIFICATION NUMBER FOR CONFORMITY

Information

- The sticker for the on-board literature is included with the vehicle registration documents and can be found in the glove compartment.

Fig 1: Identifying Vehicle Identification Sticker



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Check that the following vehicle identification numbers are identical. Then stick the vehicle data carrier sticker supplied with the vehicle in the on-board literature (Warranty and Maintenance booklet).

- Vehicle identification number on lower left of the windscreen.
- Vehicle identification number stamped on the bodyshell in the front right footwell.
- Vehicle identification number on the vehicle data carrier sticker.

- Vehicle identification number in the vehicle registration documents.

WM 0X01IN DIAGNOSTIC SYSTEM: PERFORMING VEHICLE HANDOVER (MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		

WM 0X01IN DIAGNOSTIC SYSTEM: PERFORMING VEHICLE HANDOVER (MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 0X01IN DIAGNOSTIC SYSTEM: PERFORMING VEHICLE HANDOVER (MACAN S, MACAN TURBO) > DIAGNOSTIC SYSTEM: PERFORMING VEHICLE HANDOVER

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

1. **PIWIS Tester II 9818** must be connected to the vehicle. Then start the Tester.
    1. 1.1. **Switch on ignition.**
2. Select the required vehicle.
3. When the **overview of control units** is displayed, press [F7] to continue.
4. Select **Vehicle handover log** menu and press [F12].
5. When **Remove transport protection** is displayed, press [F12] to continue.
6. The control units are activated and the status is displayed. Compare the chassis number displayed on the Tester with the chassis number of the vehicle. Press [F12] to continue.
7. **If the vehicle is a new vehicle** , press [F8] (Yes) to continue.
8. **Select the relevant country** and press [F12] to continue.
9. The Tester displays the message **Write service interval** . Press [F8] to confirm.
10. Service intervals will be written. Press [F12] to continue.
11. **Chassis number is correct?** . Press [F12] to confirm and then press [F11] to return to the data entry screen.
12. Archive the vehicle handover log file. Press [F12] to continue.
13. Carry out a test drive and read out the fault memory.
    1. 13.1. Check faults following diagnosis if necessary and erase the fault memory before delivering the vehicle.

WM 0X01IN INTERIOR EQUIPMENT: VISUAL INSPECTION FOR DAMAGE AND SOILING (MACAN S, MACAN TURBO) > CHECKING INTERIOR EQUIPMENT

Information

- The following items can be checked by simple visual inspection, no assembly work required.

1. Check that transport protection has been completely removed and ensure that no film remains in the component joints or under seals.
2. Check interior equipment of vehicle for noticeable damage such as scores, scratches, notches and scrapes.
3. Check interior equipment of vehicle for soiling.

WM 0X01IN INTERIOR EQUIPMENT: VISUAL INSPECTION FOR DAMAGE AND

SOILING (MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > FUNCTION TEST

- The following requirements must be met when fitting the seat belt.
- If one of the requirements listed below is not met, the seat belt or seat-belt buckle must be replaced.

It must be possible to unroll the belt strap smoothly from the belt retractor via the deflector fitting by pulling evenly.

The tongue of the seat belt must engage audibly in the buckle.

An abrupt pull on the belt strap must lock the belt retractor.

WM 0X01IN INTERIOR EQUIPMENT: VISUAL INSPECTION FOR DAMAGE AND SOILING (MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > CONDITION INSPECTION

Visually inspect the belt strap for damage by unrolling it completely.

If there are signs of damage on the belt strap in the form of cuts, fraying, seam tears, etc., the seat belt must be replaced.

WM 0X01IN MOBILE ROOFS: CHECKING FUNCTION (MACAN S, MACAN TURBO) > CHECKING SLIDING ROOF AND PANORAMA ROOF SYSTEM

1. By operating the control switch, return to original tilting, opening and closing positions. During operation, check for malfunctions and noises.
2. Completely open and close trim panel/sun blinds for roof systems. During operation, check for noise and stiffness.

WM 0X01IN REMOVING TRANSPORT PROTECTION (MACAN, MACAN S, MACAN TURBO) > REMOVING OUTER TRANSPORT PROTECTION

- **Installation position:** Body
- **Material:** Plastic film
- **Installation position:** Doors
- **Material:** Foam strips with adhesive film
- **Installation position:** Front bumper
- **Material:** Foam strips with adhesive film
- **Installation position:** Rims

- **Material:** Self-adhesive rim protection
- **Installation position:** Mirrors
- **Material:** Plastic bag

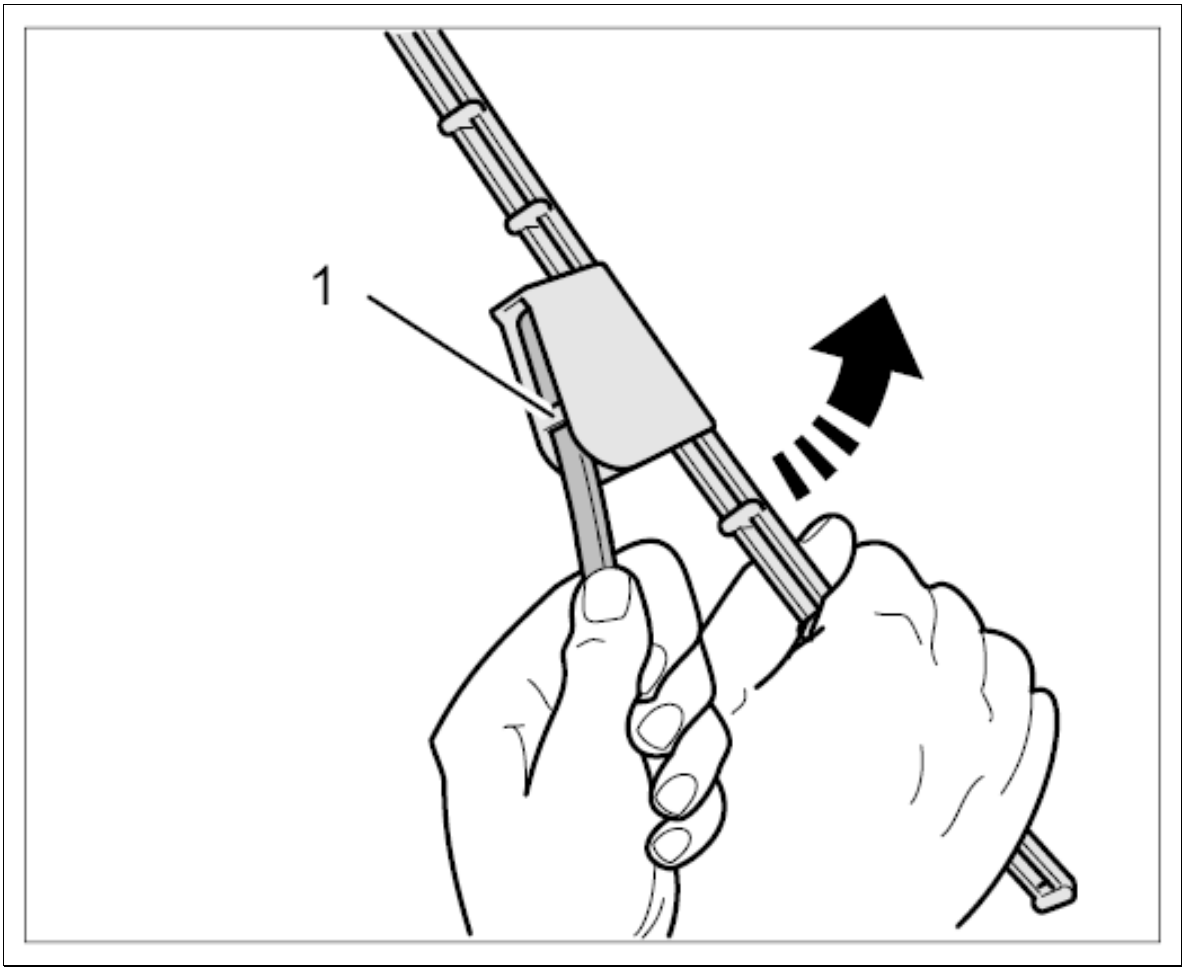
WM 0X01IN REMOVING TRANSPORT PROTECTION (MACAN, MACAN S, MACAN TURBO) > REMOVING INNER TRANSPORT PROTECTION

- **Installation position:** Seats (front)
- **Material:** Fleece
- **Installation position:** Centre console cover
- **Material:** Fleece
- **Installation position:** Door sill
- **Material:** Plastic film
- **Installation position:** Lower door trim panel
- **Material:** Cardboard protection
- **Installation position:** Inner door handle
- **Material:** Plastic film
- **Installation position:** Footwell
- **Material:** Cardboard protection

WM 0X01IN REPLACING TRANSPORT WIPER (MACAN S, MACAN TURBO) > REPLACING TRANSPORT WIPER

1. Fold out wiper arm.
2. Break off bar on transport wiper **-1-** by moving the transport wiper with force. Make sure that the wiper arm is not deformed in the process.

Fig 1: Removing Transport Wiper



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Fit wiper blade. → INSTALLING WIPER BLADE .

WM 0X01IN TEST DRIVE - SALES CHECK (MACAN, MACAN S, MACAN TURBO) > TEST DRIVE - SALES CHECK

Information

- The following test items are included in the test drive.
  - Check electric parking brake and footbrake operation and actuation travel.
  - Actuate steering and check operation.
  - Change gears and check gearshift operation.
  - ParkAssist: select reverse gear and check operation.
  - Activate automatic cruise control during the test drive and check operation.
  - Check operation of heating adjustment when engine is warm.

- Check operation of sports exhaust system.
- Check operation of air-conditioning system when engine is running.
- Check operation of instruments.

WM 0X01IN WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS

NOTE: Headlight surface not cleaned properly

- *Scratches*

→ Use only soapy water to clean the exterior lights and the plastic headlight lenses.

→ Never use chemical cleaning agents.

→ To avoid scratches, do not rub with dry or slightly damp cloths, paper towels or insect-removal sponges.

Information

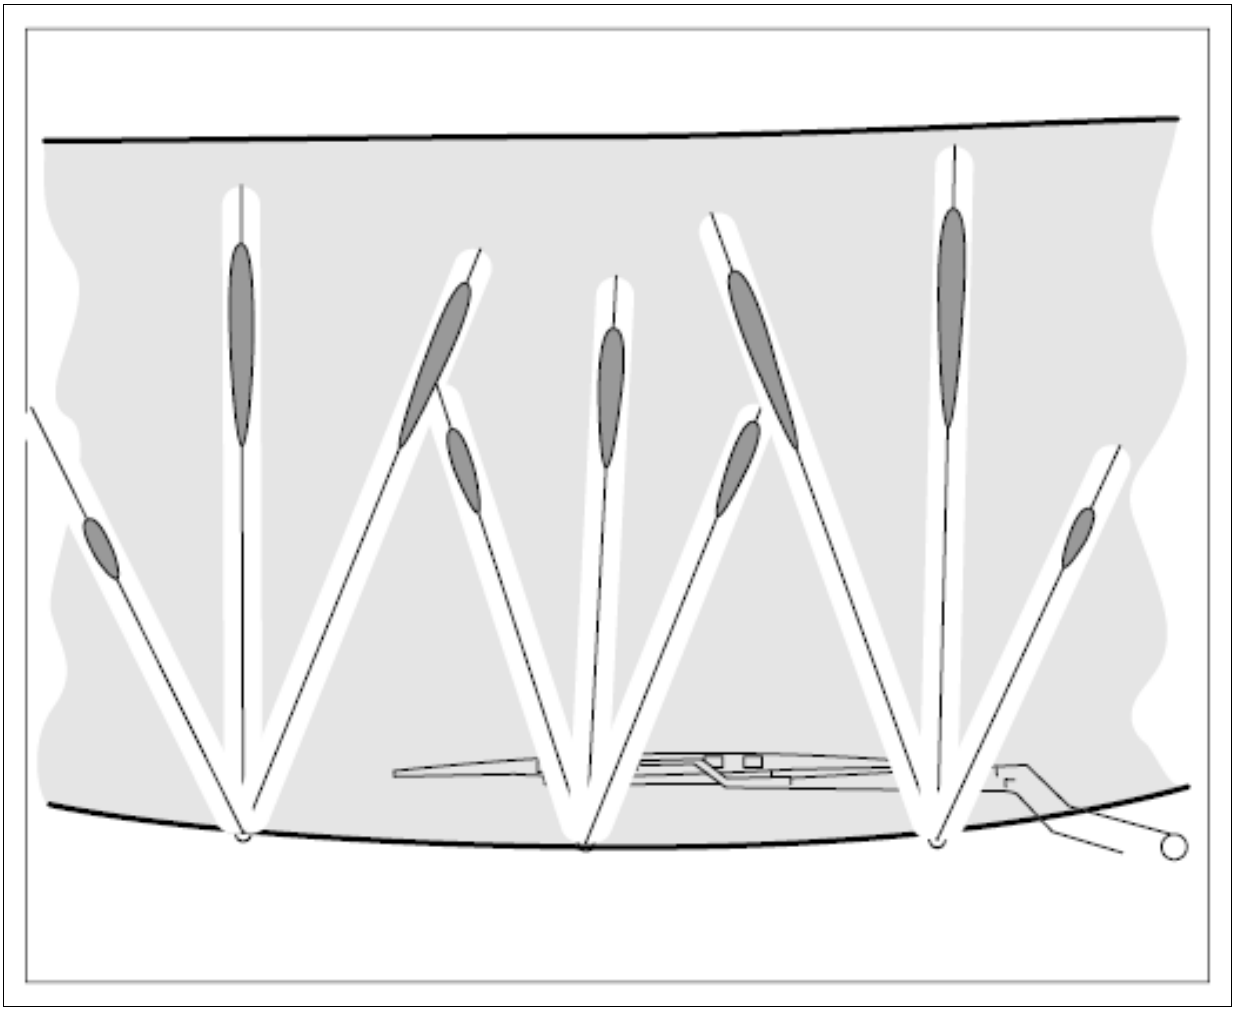
- The headlight washer nozzles are pre-set!
- Generally, it is not necessary to adjust them!

Information

Check operation, fluid level indicator and nozzle settings. If the spray nozzle settings for the windscreen washer system are not OK, the nozzles need to be adjusted:

- Insert a sharp object (needle) into the nozzle hole.
- Align the spray nozzles using the sharp object.

Fig 1: Aligning Spray Nozzle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0X01IN WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > MIXTURE RATIO OF FLUIDS FOR THE WINDSCREEN WASHER SYSTEM

Fluid:	Mixture ratio:
Water	Undiluted
Water/isopropanol	1: 1
	2: 1
	3: 1
Water/ethanol	1: 1

	2: 1
	3: 1

WM 0X01IN WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > CHECKING WIPER BLADES

Check the wiper blades for any deformities and tears.

1. Switch on ignition, operate the spray nozzles and check the quality of the wiper action.

WM 0X03IN CHECKING WHEEL MOUNTING (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Wheel to wheel hub		Tightening torque	160 Nm (118 ftlb.)		

WM 0X03IN CHECKING WHEEL MOUNTING (MACAN, MACAN S, MACAN TURBO) > CHECKING > CHECKING WHEEL MOUNTING

Information

Use a suitable commercially available tool together with a tested torque wrench, covering the range from 40 to 200 Nm (30-148 ftlb.). Never use an impact bolter.

- Do not loosen the wheel bolts to check whether they are secure.
- Re-tighten wheel bolts and check that they are seated securely. **Tightening torque 160 Nm (118 ftlb.)**

WM 0X03IN CREATING VEHICLE ANALYSIS LOG (VAL) (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	

PIWIS Tester II	Special tool	9818		

WM 0X03IN CREATING VEHICLE ANALYSIS LOG (VAL) (MACAN, MACAN S, MACAN TURBO) > CREATING VEHICLE ANALYSIS LOG (VAL)

Information

When creating the FAP, it is essential to guarantee the power supply for the Porsche System Tester. A battery charger with a current rating of at least 40 A must be connected to the vehicle battery.

The Porsche System Tester instructions take precedence and in the event of a discrepancy, these are the instructions that must be followed. Deviations may occur with later software versions.

The procedure described here has been structured in general terms; different text or additions may appear in the Porsche System Tester.

1. **PIWIS Tester II 9818** must be connected to the vehicle. Then start the Tester.
2. Switch on ignition.
3. **Select "Diagnosis".**
4. Select vehicle type.
5. **Select "Additional menu"** by pressing [F7].
6. **Select VAL** by pressing [F12].
7. **Select AS VAL** or **OBD VAL** . Then press [F8] to start.
8. Check the chassis number and correct it if necessary.
9. If you want to print the data, connect the printer to **PIWIS Tester II 9818.**
10. Switch on the printer.
11. Press [F10] to display the VAL.
12. If there is a printer connected, the print job can be started using the menu bar.
13. Then **save** or **delete** the VAL using the touchpad.
14. Shut down the Tester, switch it off and disconnect it from the vehicle.

WM 0X03IN ELECTRICS MAINTENANCE: CHECKING WINDSCREEN WIPER AND WASHER SYSTEM (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
adjusting tool	VW tool	T40187		
WM 0X03IN ELECTRICS MAINTENANCE: CHECKING WINDSCREEN WIPER AND WASHER SYSTEM (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > CHECKING AND ADJUSTING SPRAY NOZZLES FOR WINDSCREEN WASHER SYSTEM

Information

Only use windscreen cleaning agents and antifreeze approved by Porsche.

Observe the required mixture ratio in accordance with manufacturer's specifications and season.

1. Fill the windscreen-washer reservoir with a mixture of water and window cleaner or antifreeze, depending on the season.
2. Actuate the windscreen washer system and align spray nozzles for the windscreen washer system as required using **adjusting tool T40187.** → 926619 REMOVING AND INSTALLING SPRAY NOZZLE FOR WINDSCREEN WASHER SYSTEM .

WM 0X03IN ELECTRICS MAINTENANCE: CHECKING WINDSCREEN WIPER AND WASHER SYSTEM (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > CHECKING WIPER BLADES

Check condition of wiper blades on windscreen and rear window for wear, deformities and tears.

1. Switch on ignition, operate the windscreen-washer system spray nozzles and check wiping

quality.

1. 1.1. Replace windscreen wiper blades if necessary. → 922719 REMOVING AND INSTALLING WIPER BLADE .
2. 1.2. Replace wiper blade for rear window washer as required. → 924319 REMOVING AND INSTALLING WIPER BLADE FOR REAR WINDOW WASHER .

WM 0X03IN ELECTRICS MAINTENANCE: CHECKING WINDSCREEN WIPER AND WASHER SYSTEM (MACAN, MACAN S, MACAN TURBO) > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS > WINDSCREEN WASHER/HEADLIGHT CLEANING SYSTEM: CHECKING OPERATION, NOZZLE SETTINGS

NOTE: Headlight surface not cleaned properly

- *Scratches*

→ Use only soapy water to clean the exterior lights and the plastic headlight lenses.

→ Never use chemical cleaning agents.

→ To avoid scratches, do not rub with dry or slightly damp cloths, paper towels or insect-removal sponges.

Information

- The headlight washer nozzles are pre-set!
- Generally, it is not necessary to adjust them!

1. Check function and adjustment of spray nozzles for headlight washer system.

WM 0X03IN RUNNING GEAR MAINTENANCE: BALL JOINTS/DRIVE SHAFTS (MACAN S, MACAN TURBO) > PRELIMINARY WORK

WARNING: Vehicle can fall down

- *Risk of squashing or crushing*
- *Risk of damage to the vehicle*

→ Do not place any solid objects under the raised vehicle.

→ Ensure that the lifting platform is prevented from lowering.

→ Remove solid objects before lowering the vehicle.

→ Raise the vehicle only at the jacking points provided.

→ The outer jacking points should be used primarily.

1. Jack and raise the vehicle at the prescribed jacking points.

   → 4X00IN LIFTING THE VEHICLE .

WM 0X03IN RUNNING GEAR MAINTENANCE: BALL JOINTS/DRIVE SHAFTS (MACAN S, MACAN TURBO) > INFORMATION > AXLE JOINTS: CHECKING PLAY AND DUST BELLOWS

1. Check joint clearance.

   Information

   1. When doing so, press the rubber dust boots down with your fingers to reveal any hidden cracks.
   2. If a rubber dust boot is leaking, the corresponding joint or control arm must be replaced because any dirt or moisture that seeps in will cause irreparable damage to the joint.

2. Visually inspect the dust boots for damage.
3. Inspect the dust boots of the axle joints (ball joints) on the wheel suspension as follows:

   1. Place the vehicle on a lifting platform with the steering lock disengaged.
   2. Perform a visual inspection after cleaning.

The procedure for the front axle is as follows:

> ⚠ *CAUTION: Turning steering too sharply using the steering wheel.*
>
> - *Risk of squashing arms.*

→ Only turn the steering wheel as far to the left and right as required in order to check the amount of play on the tie rod.

- Turn the front wheels as far as they will go
- Perform a visual inspection of the visible surfaces on the left and right
- After turning the front wheels to the other steering stop, check the other half of each rubber dust boot.

WM 0X03IN RUNNING GEAR MAINTENANCE: BALL JOINTS/DRIVE SHAFTS (MACAN

S, MACAN TURBO) > INFORMATION > DRIVE SHAFTS: VISUAL INSPECTION OF BOOTS

- Perform a visual inspection of the boots for leaks and damage.

WM 0X03IN RUNNING GEAR MAINTENANCE: CHASSIS ADJUSTMENT/STORAGE OF ASSEMBLIES (MACAN S, MACAN TURBO) > INFORMATION > CHASSIS ADJUSTMENT (WHEEL ALIGNMENT VALUES)

- Check that threaded connections for chassis adjustment (wheel alignment values) at front and rear are secure.

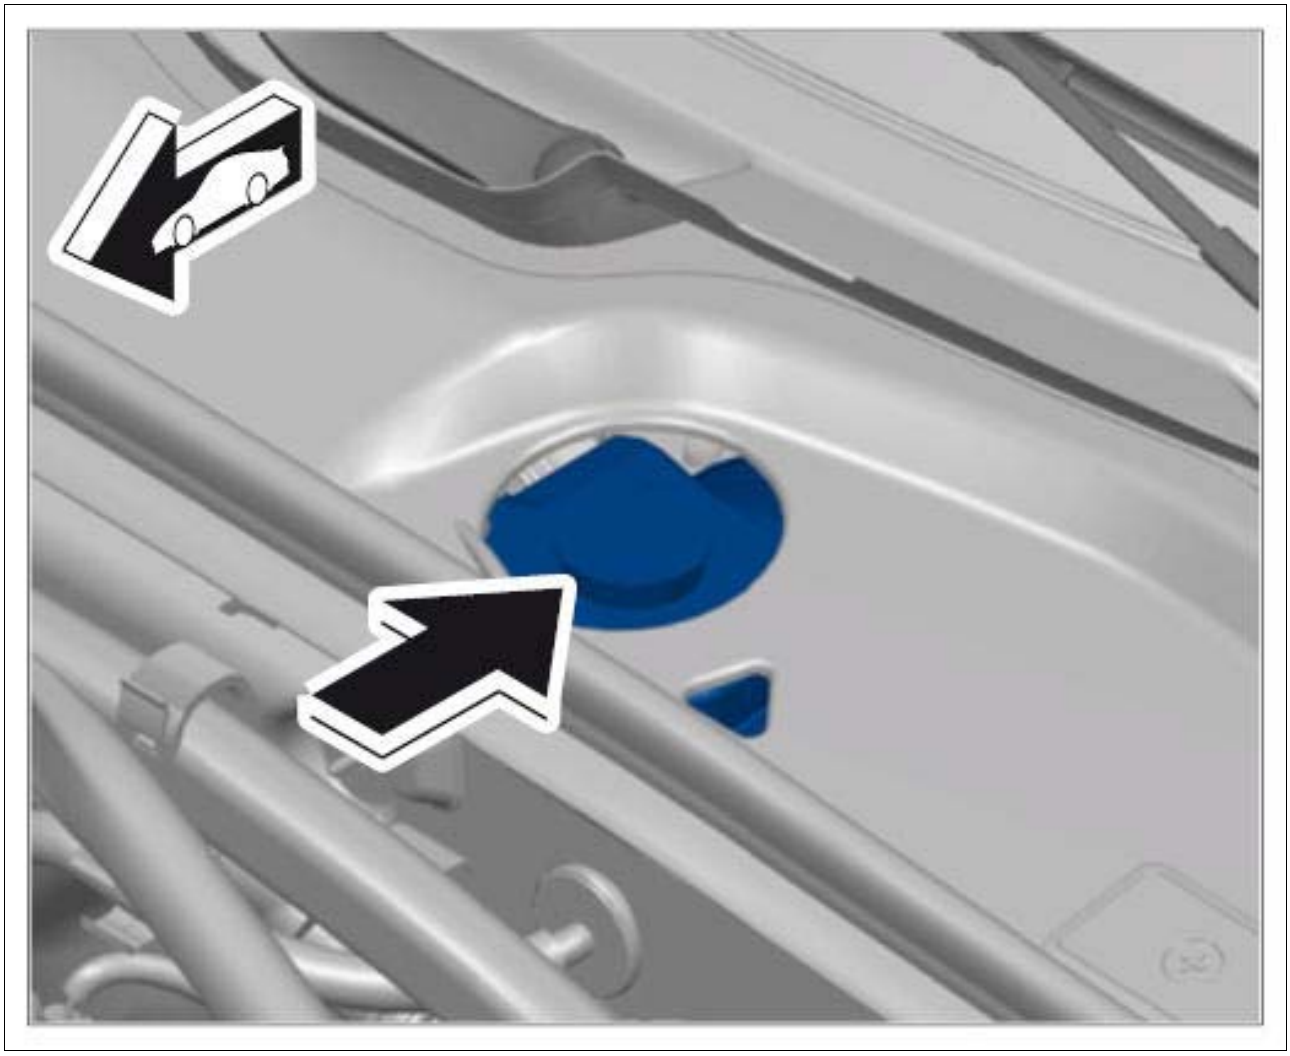
WM 0X03IN RUNNING GEAR MAINTENANCE: CHASSIS ADJUSTMENT/STORAGE OF ASSEMBLIES (MACAN S, MACAN TURBO) > INFORMATION > STORAGE OF ASSEMBLIES AND CHASSIS

- Visual inspection of all rubber mountings for damage.

WM 0X03IN RUNNING GEAR MAINTENANCE: CHECKING BRAKE FLUID LEVEL AND CHANGING BRAKE FLUID (MACAN S, MACAN TURBO) > CHECKING

Visually check the brake fluid level. The brake fluid reservoir is located under the left plenum panel cover **-arrow-** .

Fig 1: Locating Brake Fluid Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

- The brake fluid level must not exceed the MAX mark.
- Observe brake fluid quality. Use only new DOT 4 brake fluid.
- This brake fluid is available under the following part numbers: Quantity supplied: 1 litre = 000.043.203.66; 30 litres = 000.043.203.67.

MAX marking on brake fluid reservoir. The brake fluid level must be between the MIN and MAX markings.

WM 0X03IN RUNNING GEAR MAINTENANCE: CHECKING BRAKE FLUID LEVEL AND CHANGING BRAKE FLUID (MACAN S, MACAN TURBO) > CHANGING BRAKE FLUID

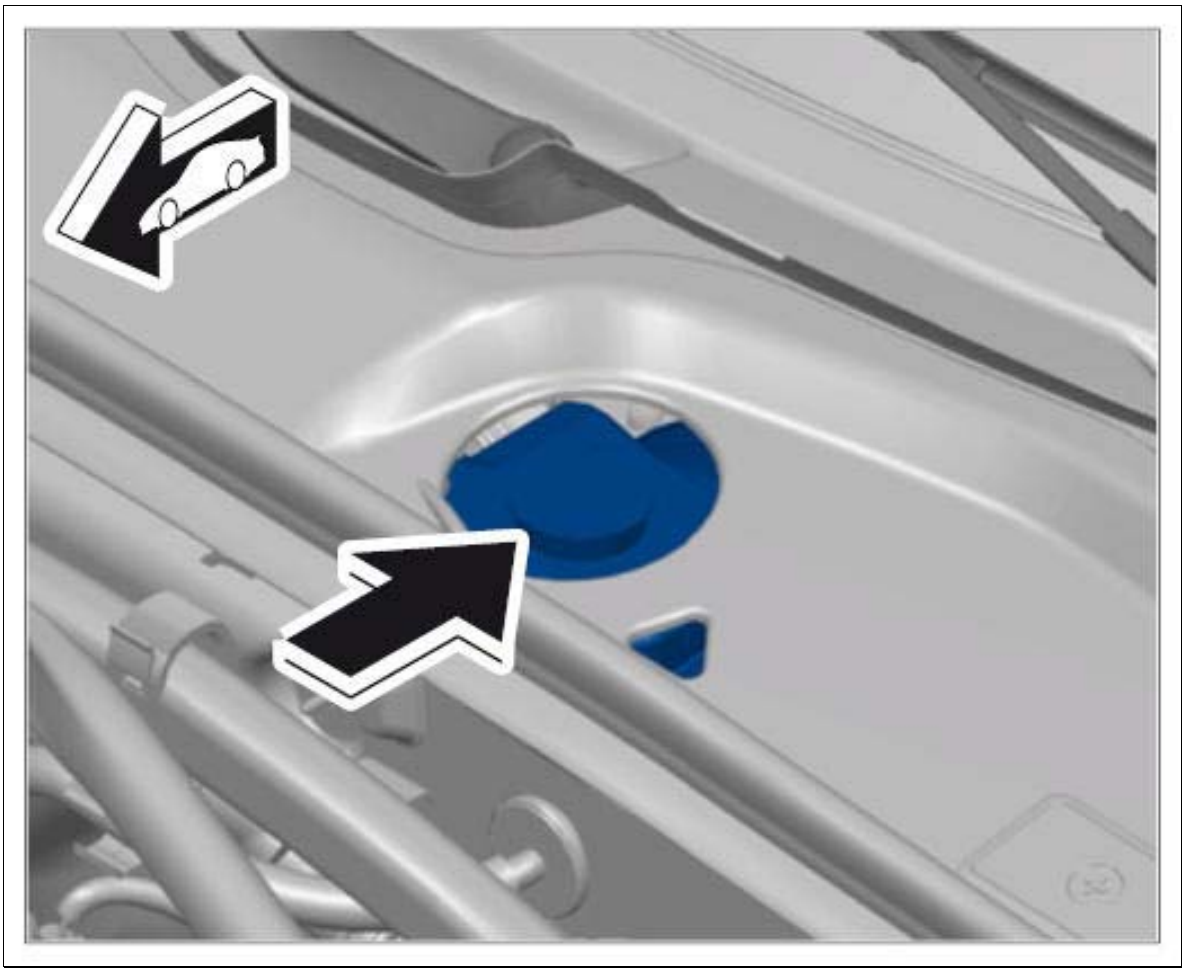
Information

- Observe brake fluid quality. Use only new DOT 4 brake fluid.

- The brake fluid change interval is two years using Super DOT 4 brake fluid.
- This brake fluid is available under the following part numbers: Quantity supplied: 1 litre = 000.043.203.66; 30 litres = 000.043.203.67.
- Drain brake fluid from every brake calliper at both bleeder valves.
- There are two bleeder valves on the brake calliper. Brake fluid must be drained at both bleeder valves. Observe specified sequence: Bleed the outer bleeder valve first.

1. Open threaded cover on brake fluid reservoir **-arrow-** .

   Fig 1: Locating Brake Fluid Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Connect bleeding device to the brake fluid reservoir.
3. Switch on the bleeding device. Bleeding pressure is approx. 2.0 bar.
4. Continue changing the brake fluid at the brake callipers. Do so in the following sequence: rear right/rear left/front right/front left.
5. Open every bleeder valve until clear, bubble-free brake fluid emerges and until the corresponding change quantity per brake calliper is reached (approx. 250 cm^3).
6. Use a transparent hose and a collecting bottle to check the escaping brake fluid for cleanliness, absence of air bubbles and to determine the amount of brake fluid used.

7. Tighten the bleeder valves to the specified tightening torque → Tightening torques for brake hydraulic system → 47 - BRAKES - HYDRAULIC BRAKE SYSTEM, REGULATOR -- (95B) - MACAN - "Technical values" and remove the bleeder hoses.

8. Switch off the bleeding device and remove the adapter at the reservoir. The brake fluid level in the reservoir must be between the MIN and MAX markings once the vehicle has been filled and bled. Correct the brake fluid level if necessary.

WM 0X03IN RUNNING GEAR MAINTENANCE: STEERING GEAR - VISUAL INSPECTION OF BELLOWS AND TIE ROD JOINTS (MACAN S, MACAN TURBO) > CHECKING > CHECKING BELLOWS

Information

- The bellows on the steering gear can be damaged by external influences for example, by stone damage or during assembly work!
- The steering gear can become damaged if dirt or moisture leaks into it as a result of a leaky bellows!

- Visually inspect the bellows for damage.

WM 0X03IN RUNNING GEAR MAINTENANCE: STEERING GEAR - VISUAL INSPECTION OF BELLOWS AND TIE ROD JOINTS (MACAN S, MACAN TURBO) > CHECKING > TIE ROD ENDS: CHECKING PLAY AND DUST BELLOWS

1. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .

   Information

   1. The rubber dust bellows and tie rods can be damaged by external influences, e.g. stone impact, or during assembly work.

   2. If a rubber dust boot leaks, the joint or tie rod must be replaced, because any dirt or moisture that seeps in will destroy the joint.

2. Check joint clearance and dust boots.

3. Check that the dust boots and joints are working perfectly and have no leaks.

WM 0X03IN RUNNING GEAR MAINTENANCE: TIRES AND SPARE WHEEL: CHECKING CONDITION AND TIRE PRESSURE (MACAN S, MACAN TURBO) > CHECKING > CHECK CONDITION

For vehicles with Tyre Pressure Monitoring (TPM), which can be identified by aluminium valves, the tire pressure must be adjusted according to the >> Filling information << on the multi-function display. To do this, select >> Main menu >> Tyre pressure >> Filling information <<. Adjust the deviation values so that

they range from 0.0 bar to +0.1 bar. Fill the tires according to the display using the tire-inflating device. Example: If the tire pressure display >> Filling information << shows - 0.2 bar, 0.2 bar pressure must be added.

Fig 1: Display - Tyre Pressure Information Screen

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

The >> Tyre pressure << display is for information purposes only.

- Tyre pressure settings can only be entered according to the values in >> Filling information <<.

Due to the pressure and temperature relationship (approx. 0.1 bar/10° C), the actual pressure values displayed under >> Tyre pressure << on the multi-function display, or on the pressure gauge of the tire-inflating device, can deviate from the required pressure specified at 20° C on the tire pressure plate if the air temperature in the tire is significantly above (higher values) or significantly below 20° C (lower values). Changes in tire pressure are displayed after max. 1 minute under >> Filling information << after switching on the ignition. A series of dashes (-.-) will appear instead of the tire pressure during this time.

Fig 2: Display - Tyre Pressure Information Screen

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

For vehicles with Tyre Pressure Monitoring (TPM), always use plastic valve caps. Plastic valve caps protect against dust, dirt and humidity, and therefore against damage (corrosion).

Tyres are a safety element that meet the demands placed on them only if they have the correct air pressure and sufficient tread depth.

> *WARNING: Risk of accidents if the air pressure in the tires falls below the minimum pressure, if the tread depth is insufficient or if there are foreign bodies, pricks, cracks and bulges in the sidewall (ply breakage).*
>
> - *Modified handling behaviour can cause accidents and significant material damage.*

→ The tire pressure must never fall below the values specified (these are minimum pressures).

→ The tread depth must never fall below the minimum value.

→ A visual inspection of the tires (for cracks, pricks, bulges in the sidewall and/or foreign bodies) must

be carried out.

1. Check condition and tire pressure.
2. Always screw on valve caps tightly and replace missing valve caps.

> *NOTE: Tyre pressure for cold tires (approx. 20 °C)*

Information

The currently applicable air pressure values and comfort tire pressure values in the individual countries can be found in the Manufacturer Approval >>Approved wheels and tires<< in the >>Manufacturer Approvals<< .

Tyre pressures apply to all-season, winter and summer tires. They also apply only to tires approved by Porsche.

Part load = payload < 260 kg

Full load = payload > 260 kg

The collapsible spare wheel is an optional extra (tire sealing compound comes as standard).

WM 0X03IN RUNNING GEAR MAINTENANCE: VISUAL INSPECTION - BRAKE LINES/BRAKE PADS/BRAKE DISCS (MACAN S, MACAN TURBO) > CHECKING > BRAKE HOSES AND LINES

- Carry out visual inspection for leaks, damage, routing and corrosion.

WM 0X03IN RUNNING GEAR MAINTENANCE: VISUAL INSPECTION - BRAKE LINES/BRAKE PADS/BRAKE DISCS (MACAN S, MACAN TURBO) > CHECKING > BRAKE SYSTEM: VISUAL INSPECTION OF BRAKE PADS AND BRAKE DISCS FOR WEAR

> *WARNING: Risk of accidents if brake pads and brake discs are not replaced in time.*
>
> - *Risk of injury and material damage due to impaired braking effect.*

→ The brake pads must be replaced when the brake pad warning indicator lights up, but no later than when there is a residual pad thickness of 2 mm.

→ Brake discs must be replaced on reaching the wear limits.

Information

- If brake pad wear is indicated by the warning light, the warning contact (sender including line and

plug connection) must also be replaced.

- Replacing the warning contact can be avoided by replacing the brake pads no later than when the pad thickness is approx. 2.5 mm.
- Warning contacts must be replaced if the core of the wire is worn. Worn insulation is not important.
- However, if only the plastic part of the warning contact is worn, there is no need to replace it.

1. Visually inspect the brake pads for wear (wear limit: 2 mm).

   See:

   → 463602 CHECKING THICKNESS OF FRONT BRAKE PADS

   → 463802 CHECKING THICKNESS OF REAR BRAKE PADS

2. Visually inspect the brake discs for wear → 4650TW TECHNICAL DATA/BRAKE WEAR LIMIT .

WM 0X03IN TEST DRIVE - MAINTENANCE (MACAN, MACAN S, MACAN TURBO) > TEST DRIVE - MAINTENANCE

Information

- The following test items are included in the test drive.
  - Actuate remote control for central locking and check operation.
  - Seats: check operation of adjustment options.
  - Check electric parking brake and footbrake operation and actuation travel.
  - Start engine, check operation.
  - Actuate steering and check operation.
  - Change gears and check gearshift operation.
  - ParkAssist: select reverse gear and check operation.
  - Activate automatic cruise control during the test drive and check operation.
  - Actuate PSM switch during the test drive and check operation.
  - Check operation of heating adjustment when engine is warm.
  - Check operation of sports exhaust system.
  - Check operation of air-conditioning system when engine is running.
  - Check operation of instruments.

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
socket tester V.A.G. 1537 A	Workshop equipment	WE 1180		

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > INFORMATION > TRAILER HITCH MAINTENANCE: CHECKING FUNCTION

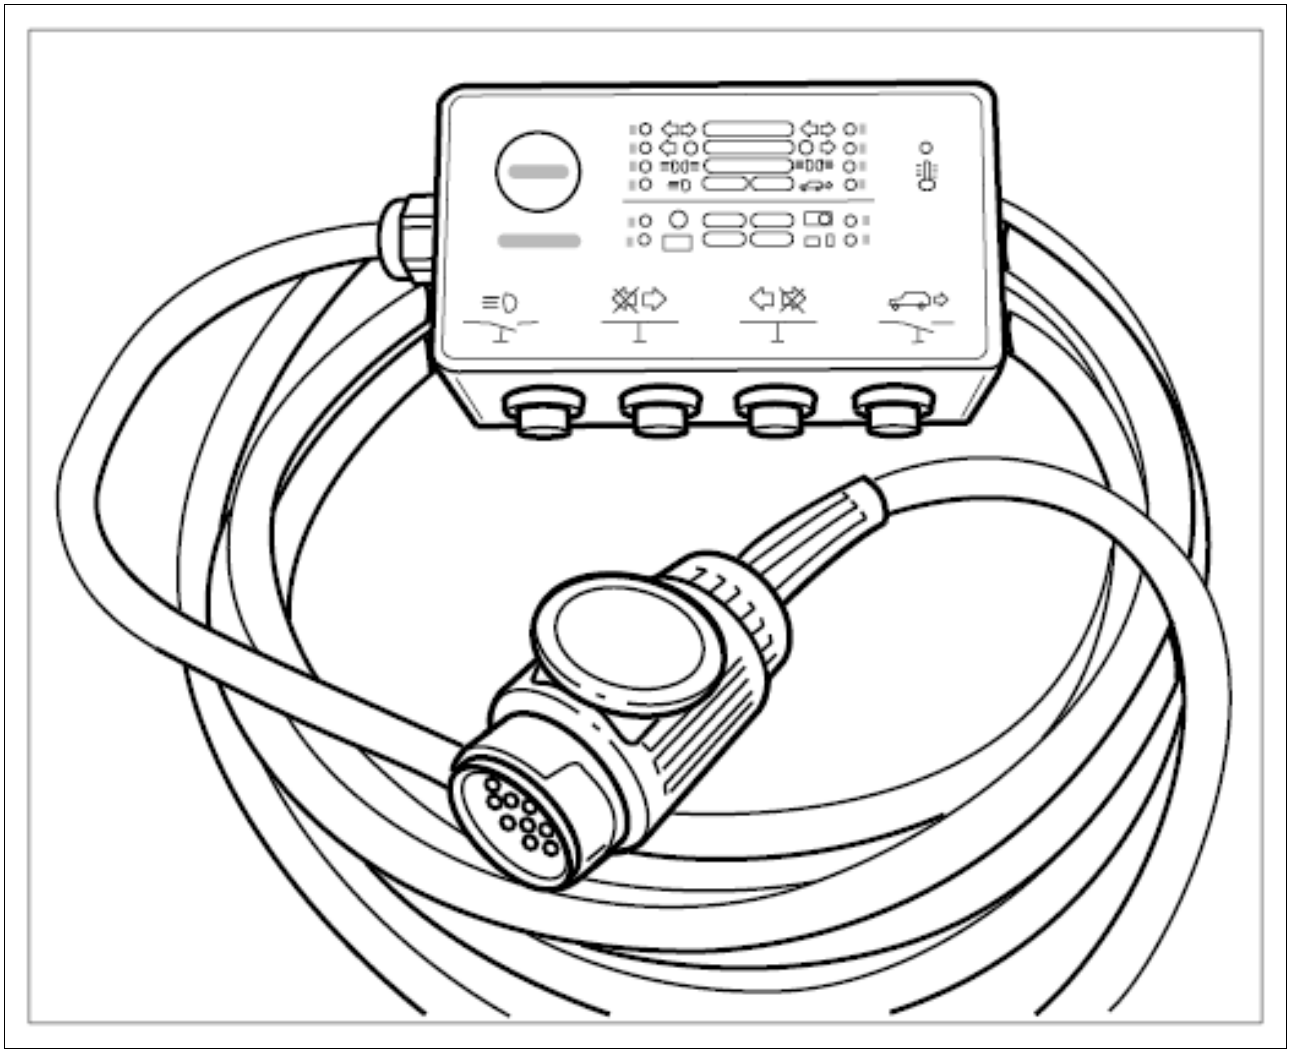
Information

The function test on the electrical components of the trailer hitch can be performed using a trailer with no faults in the wiring and lights or using the **socket tester V.A.G. 1537 A WE 1180** . The procedure for testing using the **socket tester V.A.G. 1537 A WE 1180** is described below.

The **socket tester V.A.G. 1537 A WE 1180** can only be used to test 13-pin plug sockets. An adapter is required for testing 7-pin sockets.

Thermal cut-off can occur on the **socket tester V.A.G. 1537 A WE 1180** as a result of the build-up of heat.

Fig 1: Identifying Socket Tester - V.A.G. 1537 A



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > INFORMATION > CHECKING FUNCTION OF THE TRAILER HITCH PLUG SOCKET

WARNING: Risk of injury and damage when retracting and extending the ball hitch.

- *Make sure that no persons, animals or obstacles are in the movement range of the ball hitch.*
- *To interrupt the swivel action of the ball hitch in the event of danger, touch the rocker switch again.*

→ Never swivel the ball hitch when a trailer is coupled or when, for example, bicycle racks are mounted or supported on the ball hitch.

→ Only use the trailer coupling when the ball hitch is extended fully.

→ Never insert tools of any kind into the ball hitch swivel mechanism. This could damage the locking mechanism; safe operation of the trailer hitch can then no longer be assured.

→ Check that the ball hitch locks into position correctly before every journey.

Vehicles with electrically extendable trailer hitch

1. Unfold coupling.

   All vehicles

2. Plug test cable of **socket tester V.A.G. 1537 A WE 1180** into the plug socket for the trailer hitch and route it towards the driver's seat.

   Fig 1: Connecting Test Cable (Cayenne)

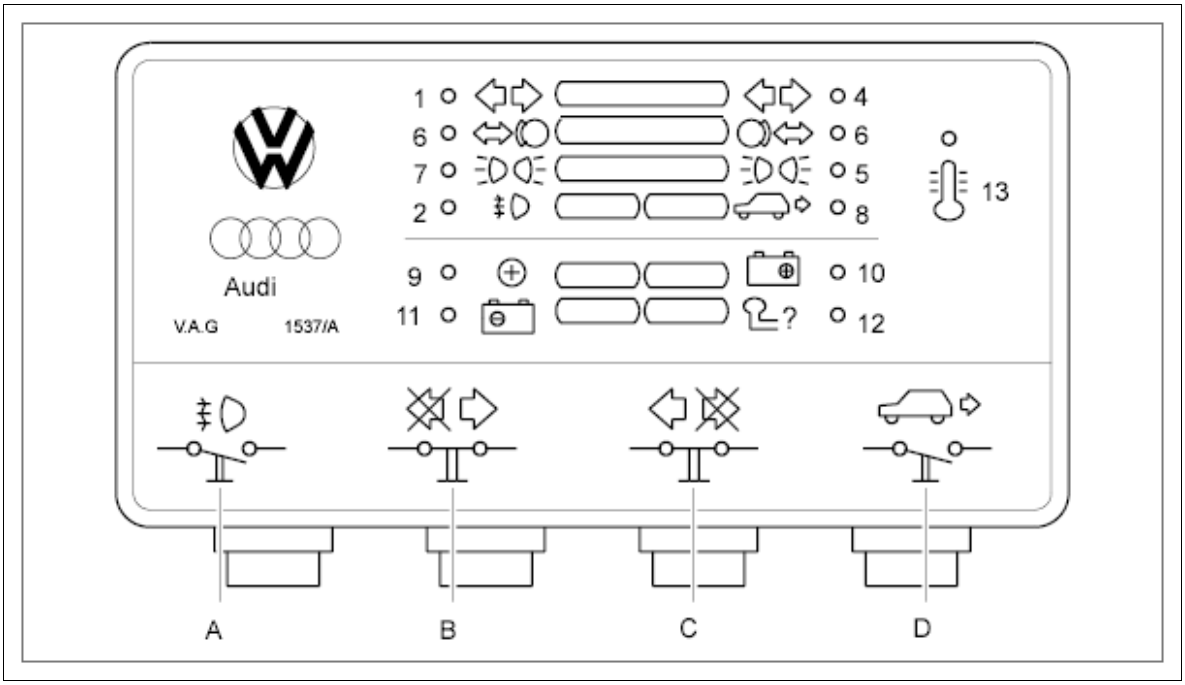
Fig 2: Identifying Tester Marking



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. **1** - Left direction indicator
2. **2** - Rear fog light
3. **4** - Right direction indicator
4. **5** - Right parking light
5. **6** - Left and right brake lights
6. **7** - Left parking light
7. **8** - Reversing light
8. **9** - Permanent positive
9. **10** - Charge positive
10. **11** - Ground for charge positive
11. **12** - Trailer detection
12. **13** - Socket Tester overheats

3. Switch on ignition.
4. Check permanent positive function.
    1. 4.1. LED **-9-** must light up continuously.
5. Check function of left direction indicator.
    1. 5.1. Switch on left direction indicator. The LED **-1-** and the left direction of travel

arrow in the instrument cluster must flash.

2. 5.2. Press button **-B-** . The LED **-1-** and the left direction of travel arrow in the instrument cluster must not flash.

6. Check function of right direction indicator.

    1. 6.1. Switch on right direction indicator. The LED **-4-** and the right direction of travel arrow in the instrument cluster must flash.

    2. 6.2. Press button **-C-** . The LED **-4-** and the right direction of travel arrow in the instrument cluster must not flash.

7. Check function of brake lights.

    1. 7.1. Press the brake pedal. The LED **-6-** must light up.

8. Check function of reversing light.

    1. 8.1. Engage reverse gear. The LED **-8-** must light up.

9. Check function of parking light.

    1. 9.1. Switch on the parking light. The LEDs -5, 7- must light up.

10. Check function of rear fog lights.

    1. 10.1. Switch on dipped beam headlights and rear fog light. The LEDs -5, 7- and the LED **-2-** must light up. The rear fog lights on the vehicle must not light up.

    2. 10.2. Unplug test cable of **socket tester V.A.G. 1537 A WE 1180** from the trailer hitch plug socket, the rear fog lights on the vehicle must light up.

11. Switch off parking light.

12. Shift the transmission to position P.

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > INFORMATION > CHECKING ELECTRICALLY EXTENDABLE TRAILER HITCH

Information

- The swivel action of the ball hitch is interrupted in the one-touch function of the rocker switch if resistance interferes with the movement sequence. The interruption is indicated by the rapid flashing of the red LED in the rocker switch.
- Overload protection is switched off by pressing the rocker switch for at least two seconds.

WARNING: Risk of injury and damage when retracting and extending the ball hitch.

- *Make sure that no persons, animals or obstacles are in the movement range of the ball hitch.*

- *To interrupt the swivel action of the ball hitch in the event of danger, touch the rocker switch again.*

→ Never swivel the ball hitch when a trailer is coupled or when, for example, bicycle racks are mounted or supported on the ball hitch.

→ Only use the trailer coupling when the ball hitch is extended fully.

→ Never insert tools of any kind into the ball hitch swivel mechanism. This could damage the locking mechanism; safe operation of the trailer hitch can then no longer be assured.

→ Check that the ball hitch locks into position correctly before every journey.

WM 0X03IN TRAILER HITCH MAINTENANCE: CHECKING FUNCTION (MACAN, MACAN S, MACAN TURBO) > INFORMATION > OVERLOAD PROTECTION

Information

- The vehicle must be stationary.
- Rear lid or rear window must be open.
- The trailer must be unhitched.
- Connectors (and any adapters) must be removed from the socket.
- There must not be any accessories on the ball hitch (e.g. ball protection cap, bicycle rack, etc.).

1. **Swivelling out the trailer coupling**

   Information

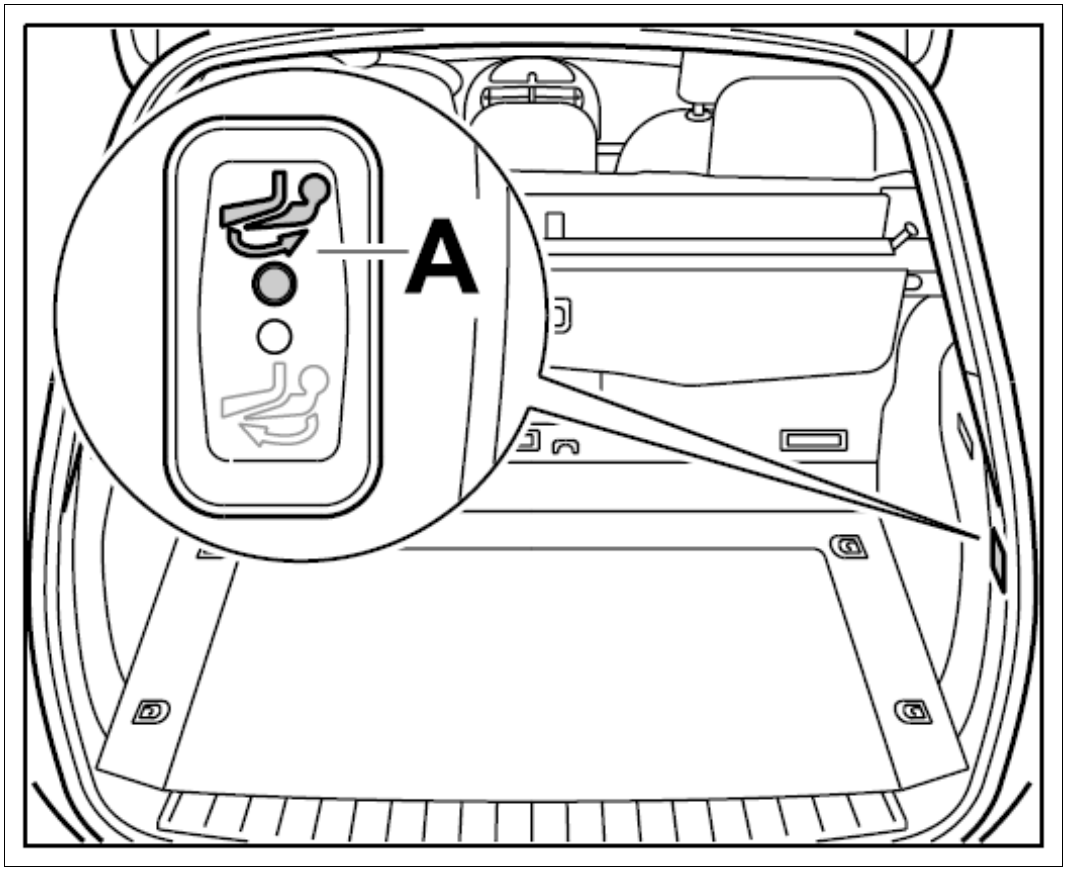
   1. The vehicle must be stationary.
   2. Rear lid or rear window must be open.

      1. 1.1.
      2. 1.2. **To swivel out:**
      3. 1.3. Touch rocker switch **-A-** .
      4. 1.4. >> The ball hitch moves automatically into operating position.
      5. 1.5. The red LED in the rocker switch flashes until the operating position is reached.

Fig 1: Identifying Rocker Switch



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. **Retracting the trailer hitch**

Information

1. The vehicle must be stationary.
2. Rear lid or rear window must be open.
3. The trailer must be unhitched.
4. Connectors (and any adapters) must be removed from the socket.
5. There must not be any accessories on the ball hitch (e.g. ball protection cap, bicycle rack, etc.).

1. 2.1.
2. 2.2. **To retract:**
3. 2.3. Touch rocker switch **-A-** .
4. 2.4. >> The ball hitch moves automatically into operating position.
5. 2.5. The red LED in the rocker switch flashes until the operating position is reached.

WM 911055 REPLACING PCM DISPLAY AND OPERATOR CONTROL UNIT (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 911055 REPLACING PCM DISPLAY AND OPERATOR CONTROL UNIT (ALL MODELS) > REPLACING PCM DISPLAY AND OPERATOR CONTROL UNIT > WRITING VALUES

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

- If a new PCM/CDR is to be installed in a vehicle, the enabling code specified in the PIWIS information system must be used.
- You can get the codes from the PIWIS Infosystem or from your importer by specifying the vehicle identification number.
- During coding, it is essential to guarantee the power supply for the PIWIS Tester II 9818 . A battery charger with a current rating of at least 40 A must be connected to the vehicle battery.
- The PIWIS Tester II 9818 instructions take precedence and in the event of a discrepancy, these are the instructions that must be followed. Deviations may occur with later software versions.
- The procedure described here has been structured in general terms; different text may appear in the PIWIS Tester II 9818 or additional information/steps may be displayed or required.

Information

If the PCM unit is to be replaced with a new unit, the navigation data must be installed using a **Software Update navigation CD/DVD** .

- To enable you to actually install the Software Update navigation data , you must read out the enabling code from the PIWIS information system. Additional enabling codes, e.g. customer has navigation system for Europe and Russia, or customer has already obtained navigation updates, must be queried by customer service personnel at the customer site.
- The PCM maps software version can be read from the PIWIS information system (electrics/electronics information)
- The required Software Update navigation CD/DVD must be ordered via PET.
- The Software Update navigation CD/DVD must not be handed over to the customer. This CD/DVD can only be used with PIWIS Tester II 9818 .
- The Software Update navigation CD/DVD that corresponds to the relevant vehicle model year must always be used for the required PCM system, e.g. if the vehicle model year is 2010, the CD/DVD for 2010 must be used. This applies even if CDs/DVDs for 2011 are available.
- The model year-based Software Update navigation CD/DVD must always be archived in the Porsche Centre.
- Further changes/supplements to the Software Update navigation CD/DVD can also be obtained. These will have to be used later for older vehicles. For example, CDs/DVDs for 2011 are already available, but an error was found on the 2010 version, so the old CD/DVD for 2010 will have to be replaced with an updated CD/DVD for 2010. This process will be announced in a TI.
- Current compatibility with Bluetooth telephones can be checked at http://www.porsche.com /germany/accessoriesandservices/porscheservice/vehicleinformation/documents/

1. Switch off ignition and replace control unit. → 911019 REMOVING AND INSTALLING PCM DISPLAY AND OPERATOR CONTROL UNIT .
2. Connect the PIWIS Tester to the vehicle and start the PIWIS Tester. Switch on ignition.
3. Select the vehicle type and start the diagnostic application.
4. Select the required control unit **PCM 3.1** in the **overview** .
5. **Extended identification** must now be selected.
6. Select the **Vehicle identification number** field.
7. **Enter the vehicle identification number** and press [F8] to write data.
8. **Maintenance/repairs** must then be selected.
9. **Control unit replacement** must now be selected. Then press [F12].
10. **Select Write data** , press [F12] and then press [F8] to start.
11. The Tester displays the message **Data has been written** . Press [F12] to continue.
12. **Read out the fault memory** and erase it if necessary.
13. Select **Function activation** in the **Maintenance/repairs** menu and press [F12].
    1. 13.1. The PIWIS Tester displays all the possible enabling codes.
    2. 13.2. Using the vehicle-specific codes from the PIWIS information system, click on the menus, enter the relevant **enabling code** and press [F8] to start coding.
14. Exit the **PCM 3.1** control unit. PCM 3.1 goes out of **Service** mode.
15. Insert the **Software Update navigation CD/DVD** into the PCM3.1 unit .
16. Confirm the messages on the PCM unit, start the **update** according to instructions and leave it running.
17. PCM then displays the message **Update to version completed successfully** . Confirm this info on the touchscreen.
18. Check the audio, telephone, TV and navigation functions, depending on vehicle equipment.

    Only for equipment variant XM radio

19. Drive the vehicle to a free area outside. Leave the engine switched on.
20. Adjust the radio to Station preview.
21. Contact SiriusXM OEM Call Centre at 1-800-852-9696. Press button 2 for "Other enquiries" in the selection menu.
22. Give the customer advisor the radio ID/ESN of both the original and new PCM systems.
23. Once you have successfully registered the system, check that all PCM functions are working.

    All vehicles

24. Read out the fault memory on the **PCM 3.1** system.

WM 9143K2 CALIBRATING REVERSING CAMERA (ALL MODELS) > INFORMATION

When does reversing camera need to be calibrated?

The reversing camera must be re-calibrated in the following situations:

- When removing and installing the reversing camera.
- When changing the height of the chassis.

- When removing and installing the rear apron.

WM 9143K2 CALIBRATING REVERSING CAMERA (ALL MODELS) > PRELIMINARY WORK

Information

Calibrating the reversing camera balances the tires, chassis tolerances and installation tolerances of the camera.

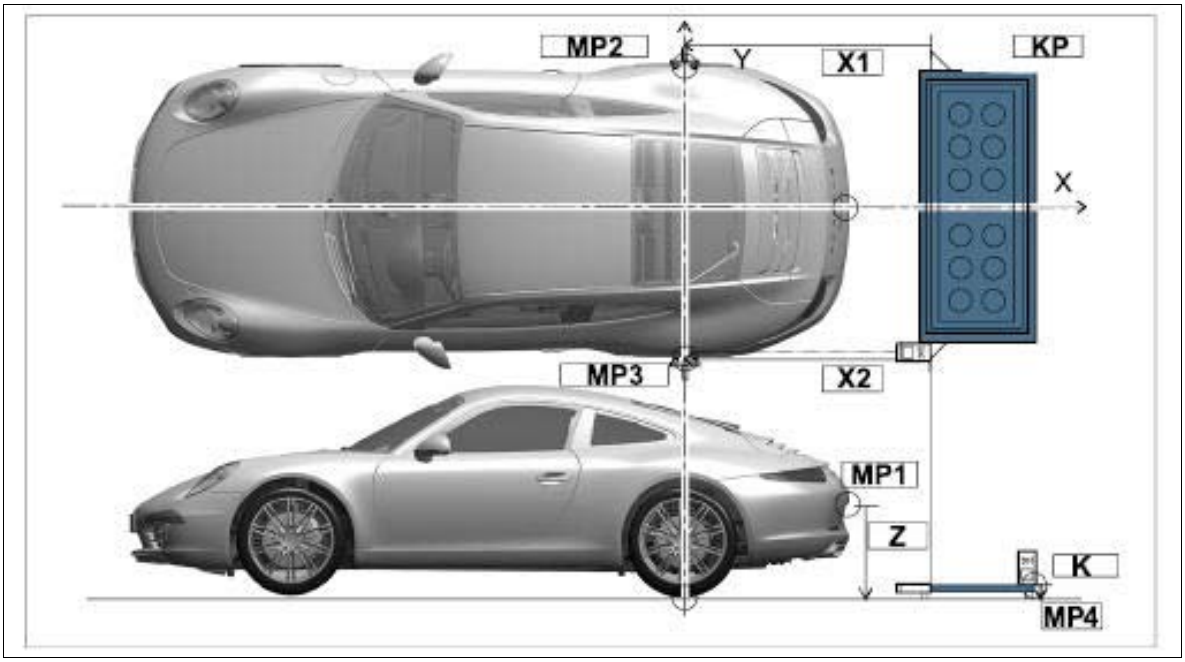
- The calibration unit VAS 6350 WE 1368 and the spacing laser VAS 6350/2 WE 1369 are needed for calibration.
- During calibration, the control unit for the reversing camera calculates the vehicle-specific adjustment values (e.g. image rectification) for the camera image.
- After the actual calibration process, which takes approx. 2 minutes, the rectified image is shown on the vehicle display.

Information

Calibration must only be performed on level ground.

1. Park the vehicle on a level surface and set up the **calibration unit VAS 6350 WE 1368** behind the vehicle in accordance with the operating instructions.

   Fig 1: Overview Of Vehicle (Shown On 911 Carerra)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. **MP1 - MP4** - Measuring points
2. **X1** - Distance from calibration board to right reflector

3. **X2** - Distance from calibration board to left reflector
4. **Z** - Distance from reversing camera to floor
5. **K** - Calibration board height

2. Fit the wheel nut support with the right reflector and the wheel nut support with the left reflector on the vehicle in accordance with the operating instructions for **calibration unit VAS 6350 WE 1368** . The reflectors must be hanging freely.

3. Align the calibration board with the center of the vehicle and adjust the linear laser on the calibration board in accordance with the operating instructions for **calibration unit VAS 6350 WE 1368** .

WM 9143K2 CALIBRATING REVERSING CAMERA (ALL MODELS) > CALIBRATING REVERSING CAMERA

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

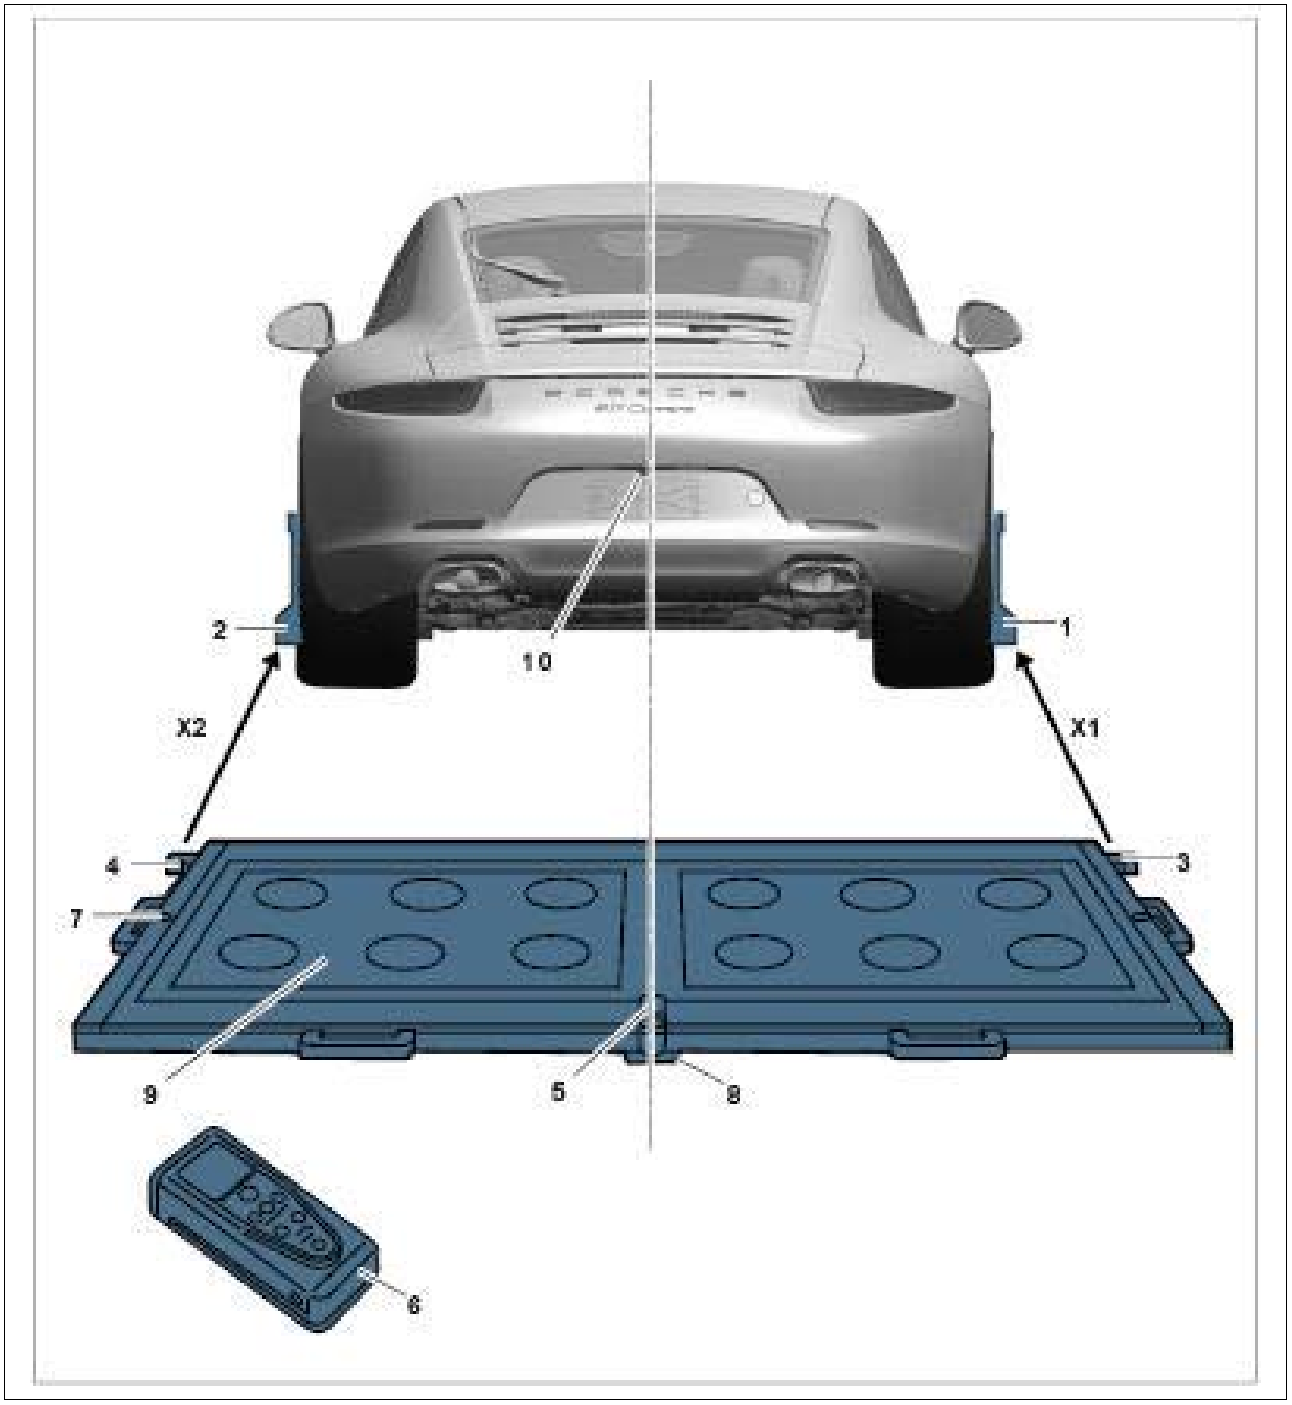
The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

Information

When you calibrate the reversing camera by selecting **Calibrate reversing camera** in the PIWIS Tester, the reversing camera control unit is then coded automatically. To do this, follow the relevant instructions on the PIWIS Tester.

Fig 1: Identifying Explanation Of Terms (Shown On 911 Carerra)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1 - Wheel center support with right reflector

2 - Wheel center support with left reflector

3 - Right stop bracket for distance measuring unit

4 - Left stop bracket for distance measuring unit

5 - Linear laser

6 - Distance measuring unit

8 - Spirit level for adjusting calibration board in X and Y direction and cut-out for measuring calibration board height

8 - Height-adjustable calibration board base

9 - Calibration pattern

10 - Reversing camera

X1 - Distance from calibration board to right reflector

X2 - Distance from calibration board to left reflector

Information

The surface of the calibration board must be clean and free of objects.

1. Align the linear laser **-5-** .
    1. 1.1. Position the distance measuring unit **-6-** at the right stop bracket **-3-** of the calibration board and measure the distance **-X1-** to the right reflector **-1-** . The distance must be approx. 1, 400 mm.
    2. 1.2. Position the distance measuring unit **-6-** at the left stop bracket **-4-** of the calibration board and measure the distance **-X2-** to the left reflector **-2-** . The distance must be approx. 1, 400 mm.
    3. 1.3. The difference between distance **-X1-** and distance **-X2-** can be max. 1 mm.
2. **PIWIS Tester II 9818** must be connected to the vehicle before starting **PIWIS Tester II 9818** . Switch on ignition.
3. Start the diagnostic application and select the required vehicle type.
4. Select **Reversing camera** control unit in the **overview** .
5. **Maintenance/repairs** must then be selected.
6. **Select Calibrate reversing camera** and press [F12] to continue.
7. In the **Code control unit** phase display, press [F12] to continue.
8. Wait until the **Code control unit** phase has finished and then press [F12] to continue.
9. Follow the **calibration** instructions on the Tester, then press [F12].
10. **PIWIS Tester II 9818** confirms that the **calibration was completed successfully.**
11. Check the function and image quality of the reversing camera.
12. Read out the fault memory.

WM 917025 PROGRAMMING CONTROL UNIT FOR LANE CHANGE ASSIST (ALL MODELS) > INFORMATION

The Lane Change Assist control units must be re-calibrated in the following situations:

- When one or both Lane Change Assist control units are replaced.
- When the installation position of one or both Lane Change Assist control units is changed.
- When body repairs are carried out on the rear of the vehicle.
- When the rear bumper/rear apron is removed or moved out of position.

WM 917025 PROGRAMMING CONTROL UNIT FOR LANE CHANGE ASSIST (ALL MODELS) > PRELIMINARY WORK

Information

The calibration process sends out radar beams, which the Doppler generator reflects. This simulates a vehicle.

A certain number of radar beams are expected in a defined time due to the defined position of the Doppler generator.

Deviations indicate that the control units are not at the correct installation position.

These deviations are displayed on the Porsche System Tester.

Information

The following tools are required for calibration:

- Calibration plates and wheel center mountings: Calibration unit VAS 6350 WE 1368 .
- Doppler generator: Calibration unit for Lane Change Assist VAS 6350/4 WE 1375
- Spacing laser: Spacing laser VAS 6350/2 WE 1369

Information

The following conditions must be observed in order to perform calibration:

- Calibration must only be performed on level ground.
- The vehicle must be empty.
- Wheels must be positioned straight ahead.
- Vehicle doors must be closed.
- Tires must have the specified air pressure.
- On vehicles with air suspension, the chassis must be set to ↓Normal Level and suspension levelling (air suspension) must be completed.
- The retractable trailer hitch must be retracted.
- The engine must not be running during calibration.

- Check that there is adequate space behind the vehicle and that there are no metal objects/obstacles within 5 meters of the rear of the vehicle.
- Make sure that no objects are moved or no-one moves behind the vehicle during calibration.
- There must be no heavy soiling in the sensor area on the rear apron.
- There must be no stickers in the sensor area on the rear apron.
- The calibration plates, wheel center mountings and the Doppler generators must be fitted, centered/aligned in accordance with the operating instructions.

Workshop conditions

- The system must only be calibrated in a suitable area of the workshop.
- This area of the workshop must be sheltered from all environmental influences, such as rain, snow and swirling dust.
- The workshop must be at room temperature.

1. Park the vehicle on a level surface and set up the **calibration unit VAS 6350 WE 1368** behind the vehicle in accordance with the operating instructions for VAS 6350.

   Fig 1: Overview Of Vehicle (Shown On Panamera)

Inner ParkAssist sensors

1. Install front apron. → Installing Front Apron

Outer ParkAssist sensors

2. Engage trim in the front apron.

WM 917719 REMOVING AND INSTALLING MULTI-FUNCTION CONTROL UNIT (ALL MODELS) > PRELIMINARY WORK

1. Remove driver's airbag unit. → Removing driver's airbag unit

WM 917719 REMOVING AND INSTALLING MULTI-FUNCTION CONTROL UNIT (ALL MODELS) > REMOVING MULTI-FUNCTION CONTROL UNIT

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

Designation	Type	Number	Description	

PIWIS Tester II	Special tool	9818		
WM 919125 TEACHING ADDITIONAL HANDSET (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 919125 TEACHING ADDITIONAL HANDSET (ALL MODELS) > TEACHING ADDITIONAL HANDSET > TEACHING ADDITIONAL HANDSET/TELEPHONE HANDSET

⚠ *CAUTION: Voltage drop*

- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

Later versions of the software may display slightly different text or require a slightly different procedure. The instructions you receive from the Tester itself take precedence over this description.

1. **PIWIS Tester II 9818** must be connected to the vehicle before starting the Tester. Switch on ignition.

2. Select the vehicle type and start the diagnostic application.

3. Select **PCM** control unit.

4. **Select Drive links/checks** and press [F12] to continue.

5. Engage telephone handset in the charging cradle.

6. Select **Teach handset** and press [F12] to continue.

7. Set **Activation: Value = on** and press [F8] to start the teaching process.

8. Check the function of the handset.

9. Read out the fault memory and erase it if necessary.

1. Remove interior rear-view mirror. → Removing Interior Rear-View Mirror

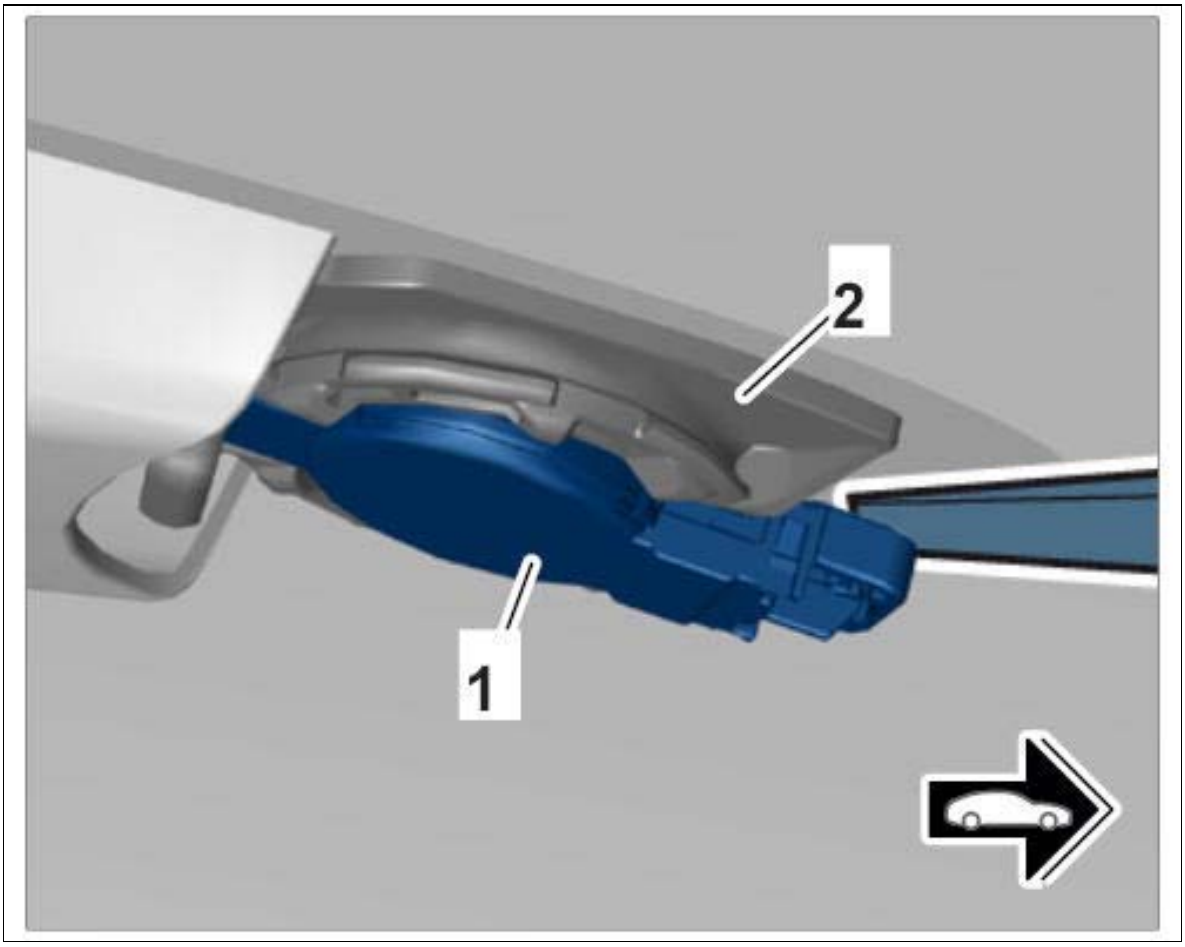
WM 921219 REMOVING AND INSTALLING RAIN SENSOR (ALL MODELS) > REMOVING RAIN SENSOR

Information

Do not touch or soil the sensor surface of the rain sensor.

1. Carefully lever the rain sensor **-1-** out of the adhesive plate **-2-** using a plastic wedge.

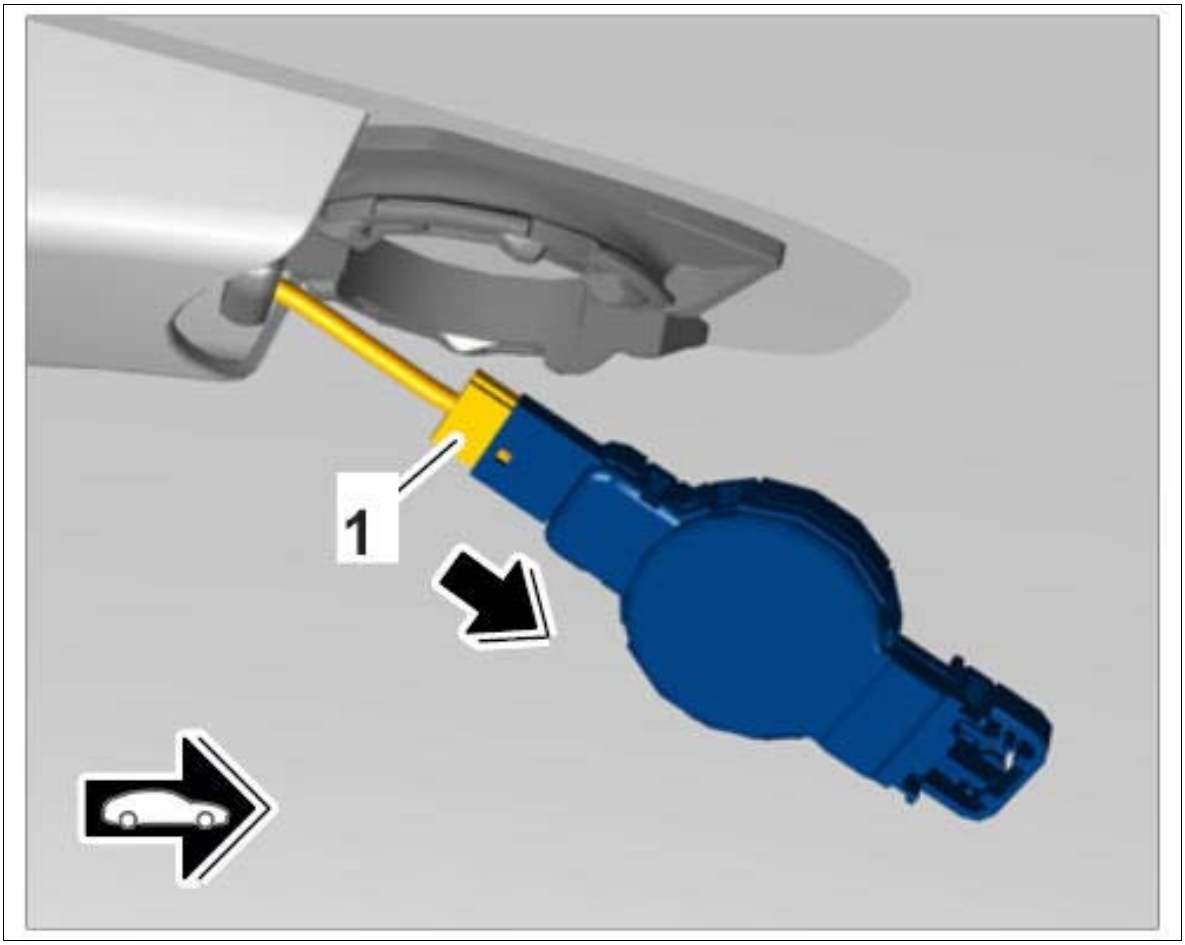
   Fig 1: Removing Rain Sensor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Unplug electric plug connection **-1-** .

Fig 2: Disconnecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 921219 REMOVING AND INSTALLING RAIN SENSOR (ALL MODELS) > INSTALLING RAIN SENSOR

Information

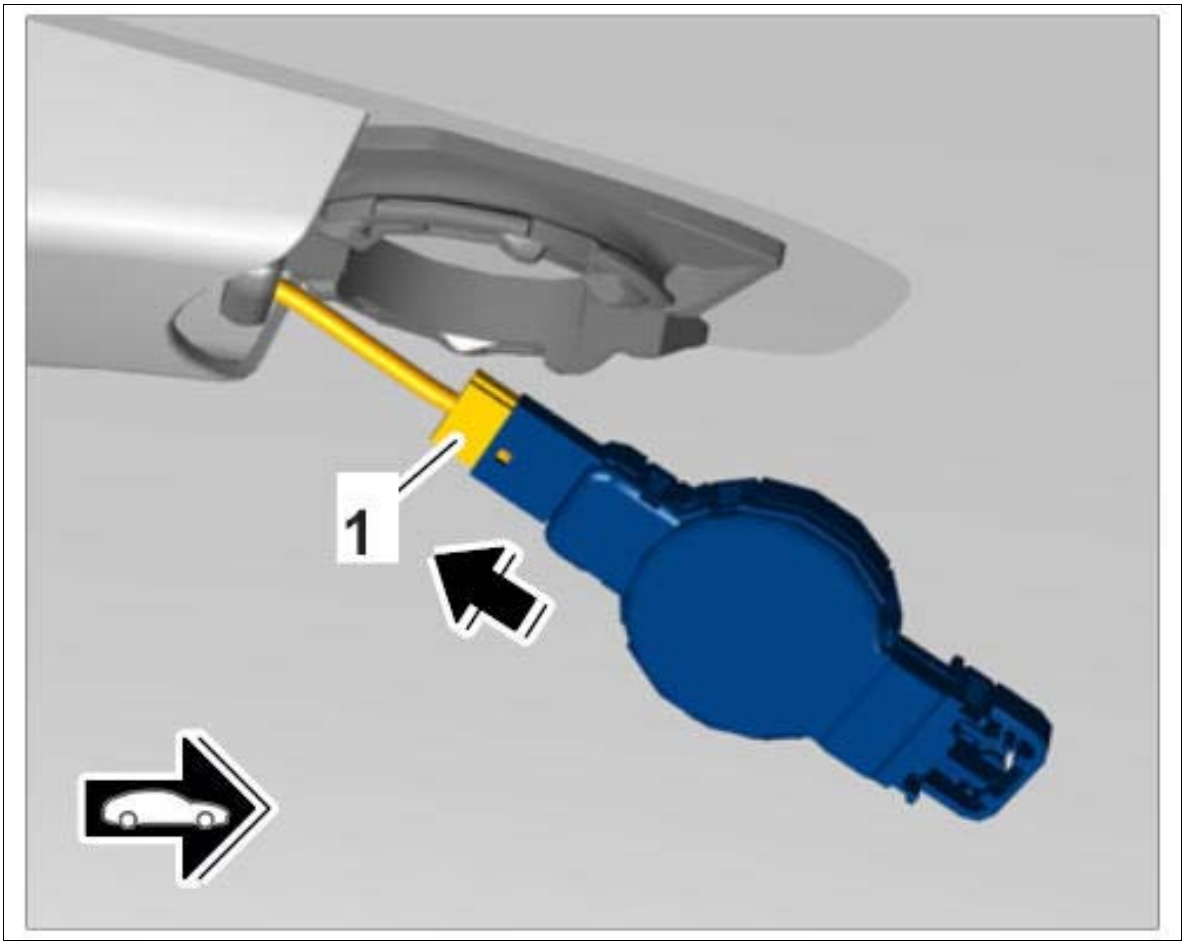
Limited rain sensor function if the following points are not observed:

- There must be no air trapped between the windscreen and silicone layer on the rain sensor.
- The temperature of the windscreen and rain sensor must be approx. 20 °C during assembly. Carefully heat the windscreen and rain sensor using a hot-air gun if necessary.
- The contact surfaces must be free of grease and dirt.
- Do not touch silicone layer on the rain sensor.
- Do not remove the protection cap from a new rain sensor until immediately before pressing the rain sensor onto the windscreen.

1. Clean the contact area for the rain sensor on the inside of the windscreen.

2. Plug electric plug connection **-1-** into the rain sensor until it engages securely.

Fig 1: Connecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove protection cap from the rain sensor.
4. Position rain sensor **-1-** and insert it into the adhesive plate **-2-** .

Wiper arm to wiper linkage	Hexagon nut, M10	Tightening torque	32 Nm (24 ftlb.)		
Distance from left wiper arm to cowl panel cover	Dimension a	Nominal value	30 mm		
Distance from right wiper arm to cowl panel cover	Dimension b	Nominal value	34 mm		

WM 922519 REMOVING AND INSTALLING WIPER ARM (ALL MODELS) > REMOVING WIPER ARM

WARNING: Electrically moved components

- *Danger of limbs being trapped or severed*

→ Switch off electric power to drive motor.

→ Make sure it does not switch on again.

→ Check that there is no electric charge.

Information

To counteract the deformation of the wiper rubber that occurs when it is at rest, the wiper arm is alternately moved to two different parked positions. However, the wiper arm may only be removed and

installed in the lower parked position. Before removing or installing the wiper arm, operate the wiper once and watch whether the wiper is moved up again slightly into the upper parked position after it has reached the lower parked position. In this case, operate the wiper again so that the wiper arm is moved into the lower parked position.

1. Move the windscreen wiper to its lower parked position using the one-touch wipe function.
2. Switch off ignition and pull remote control out of ignition lock.
3. Lever off cap **-1-** .
4. Screw off fastening nut **-2-** .

Fig 1: Removing Windscreen Wiper Arm

WM 941415 ADJUSTING HEADLIGHT MOUNTING (ALL MODELS) > ADJUSTING HEADLIGHT MOUNTING > CHECKING ADJUSTING ELEMENTS

Information

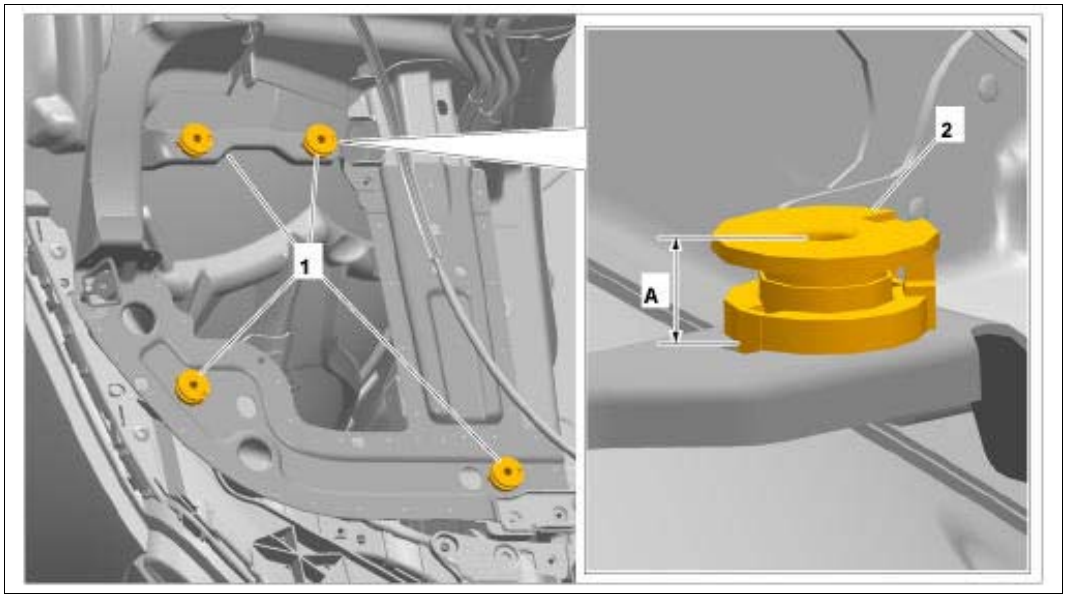
To restore the original installation position, thereby minimizing the amount of adjustment work required, the following steps must be carried out prior to removal:

- Mark the position of the headlight mounting with respect to fastening screws.
- Measure and take note of the height of the headlight mounting with respect to the body.

1. Check adjusting elements.

    1. 1.1. Check adjusting elements **-1-** for damage and make sure they are seated securely. If an adjusting element **-1-** is damaged, it must be replaced. Check that the adjusting elements **-1-** are fitted correctly in the body.
    2. 1.2. Measure the height **-A-** of the adjusting elements **-1-** using a calliper gauge and write it down so that you can set the original adjustment height again after the next test step.
    3. 1.3. Check that the adjusting rings **-2-** are not stiff. **Important: Left thread!** It must be possible to turn adjusting ring **-2-** without resistance over the entire thread length, otherwise replace adjusting element **-1-** .
    4. 1.4. Set original height **-A-** of the adjusting elements **-1-** again.

    Fig 1: Checking Adjusting Elements



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 941415 ADJUSTING HEADLIGHT MOUNTING (ALL MODELS) > ADJUSTING HEADLIGHT MOUNTING > INSTALLING HEADLIGHT MOUNTING

Information

If work is carried out on the headlight or retainer plate, the installed fastening screws must be replaced by microencapsulated fastening screws .

Micro-encapsulated fastening screws must be tightened only once to the specified torque.

Micro-encapsulated fastening screws must be replaced after loosening them.

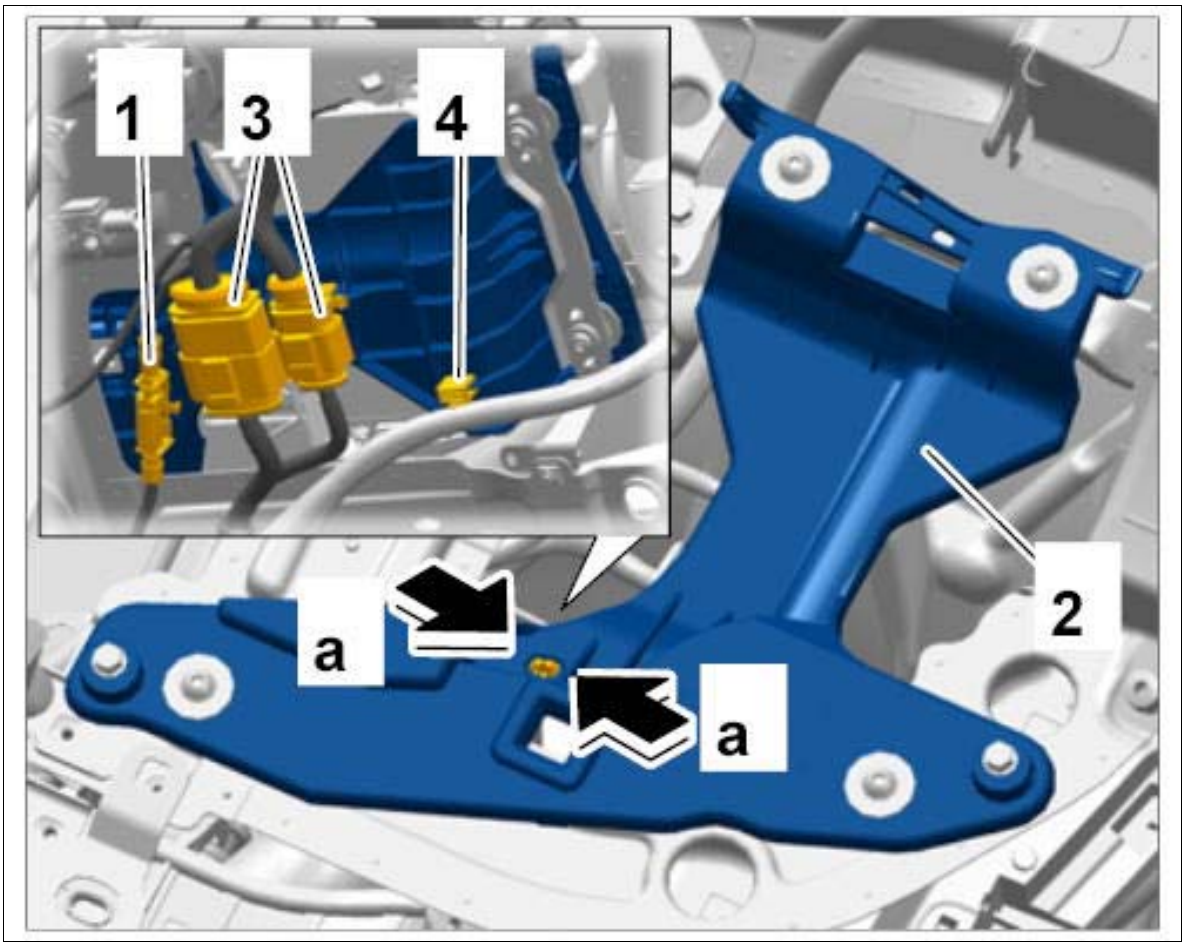
Left headlight mounting:

1. Clip antenna line holder **-1-** into the headlight mounting **-2-** .
2. Clip holders for electric plug connections **-3-** and headlight cleaning system hose **-4-** into the headlight mounting **-2-** .

   Headlight mounting at the left and right:

3. Position headlight mounting **-2-** on the adjusting elements.

   Fig 1: Clipping Holders And Electric Plug Connections



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Fit fastening screws **-1-** .
   1. 4.1. Press fastening screw **-1-** into adjusting element.
   2. 4.2. Press headlight mounting **-2-** in the adjusting element area down **-arrow F-** and screw fastening screw **-1-** into adjusting element.
   3. 4.3. Align markings on the headlight mounting **-2-** - if markings were made - with the washers, press headlight mounting **-2-** down in the adjusting element area **-arrow F-** and tighten fastening screws **-1-** .

Fig 2: Screwing Fastening Screws

WM 941415 ADJUSTING HEADLIGHT MOUNTING (ALL MODELS) > ADJUSTING HEADLIGHT MOUNTING > ADJUSTING HEADLIGHT MOUNTING TOWARDS Z-AXIS AND X-AXIS

Information

- Do not adjust gap dimensions between the headlight mounting and front lid until you have adjusted the gap dimensions of the front lid with respect to all other add-on parts.
- Adjust gap dimensions between the headlights and front lid in accordance with the specified

dimensions.

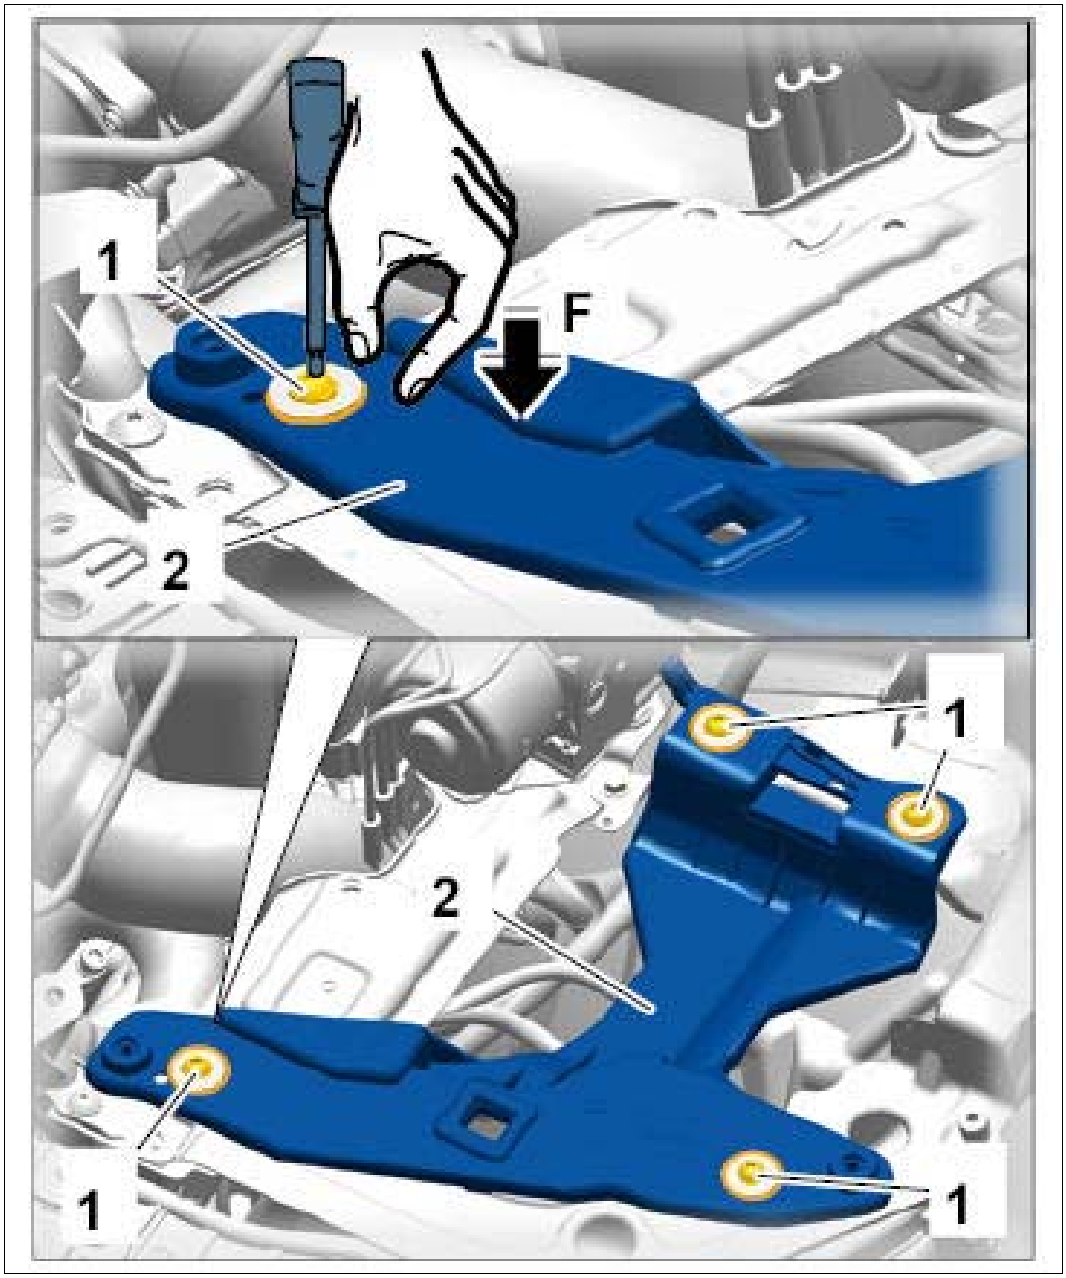
- The specified gap dimensions are guidelines and are relevant for repair work and assembly work.
- The gaps must not taper off or become narrow in places.
- Use star gauge Nr.127-1 Pos.1 and star gauge Nr.127-1 Pos.2 to check the gap dimensions.
- The gap dimensions and offset positions of the headlights are adjusted by moving the headlight mountings and by screwing the adjusting elements in and out.

1. Insert headlight into the mounting.
2. Close the front lid and check the gap dimensions between the headlight and front lid. → 5X00IN41 GAP DIMENSIONS

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Gap dimension between headlight and front lid	Gap dimension on headlight is the same all the way around	Gap dimension	4.7 mm	+/-0.8 mm	

3. Remove headlight.
4. Loosen fastening screws **-1-** .
    1. 4.1. Press headlight mounting **-2-** in the adjusting element area down **-arrow F-** to ensure that the position of the adjusting element cannot be changed.

Fig 1: Loosening Fastening Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

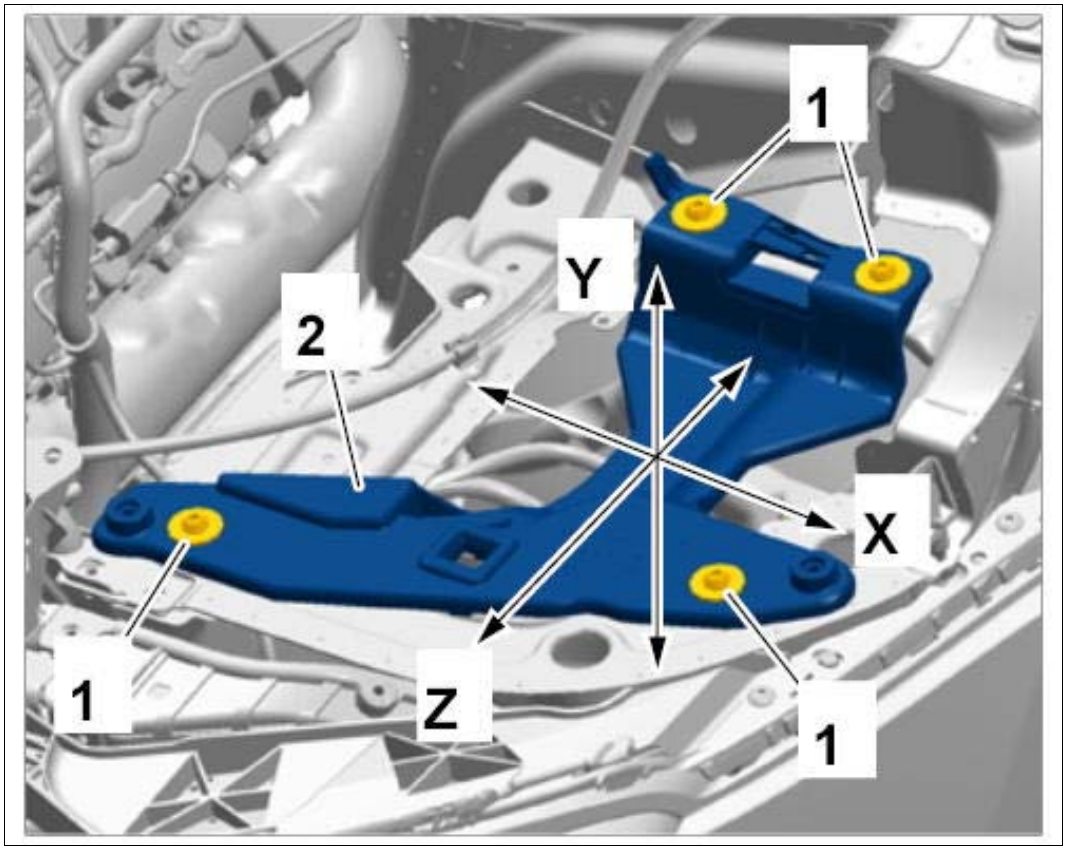
5. Move headlight mounting **-2-** in the required direction **-X, Z-** .

   A scale is visible close to the fastening screws on the headlight mounting. The scale serves as a guide when the headlight is removed and makes adjustments easier.

6. Tighten fastening screws **-1-** .

   1. 6.1. Press headlight mounting **-2-** in the adjusting element area down to ensure that the position of the adjusting element cannot be changed.

Fig 2: Positioning Headlight Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Insert headlight into the mounting.
8. Close the front lid and check the gap dimensions between the headlight and front lid.
9. Repeat the adjustment procedure if necessary.

WM 941415 ADJUSTING HEADLIGHT MOUNTING (ALL MODELS) > ADJUSTING HEADLIGHT MOUNTING > ADJUSTING HEADLIGHT MOUNTING TOWARDS Y-AXIS

Information

If work is carried out on the headlight or retainer plate, the installed fastening screws must be replaced by microencapsulated fastening screws .

Micro-encapsulated fastening screws must be tightened only once to the specified torque.

Micro-encapsulated fastening screws must be replaced after loosening them.

1. Insert headlight into the mounting.
2. Close the front lid and check the gap dimensions between the headlight and front lid. → 5X00IN41 GAP DIMENSIONS
3. Remove headlight.

Fig 1: Positioning Headlight Mounting

Headlight mounting at the left and right

5. Remove headlight mounting.

WM 941419 REMOVING AND INSTALLING HEADLIGHT MOUNTING (ALL MODELS) > INSTALLING HEADLIGHT MOUNTING

1. Copy markings for the washers from the faulty headlight mounting to the new headlight mounting.
2. Installation is performed in reverse order to removal.
3. Tighten fastening screws securing headlight mounting to body.

WM 941419 REMOVING AND INSTALLING HEADLIGHT MOUNTING (ALL MODELS) > SUBSEQUENT WORK

1. Install headlights. → Installing Headlights

2. Close the front lid carefully and check gap dimensions between the headlights and front lid. Adjust gap dimensions if necessary. → 941415 ADJUSTING HEADLIGHT MOUNTING

3. Check headlight adjustment and correct it if necessary. → 941516 ADJUSTING HEADLIGHTS AND FOG LIGHTS

WM 941516 ADJUSTING HEADLIGHTS AND FOG LIGHTS (ALL MODELS) > ADJUSTING HEADLIGHTS

Information

- Some of the repair illustrations show only one side of the vehicle.
- Naturally, some steps also have to be performed on the opposite side of the vehicle as well.

Information

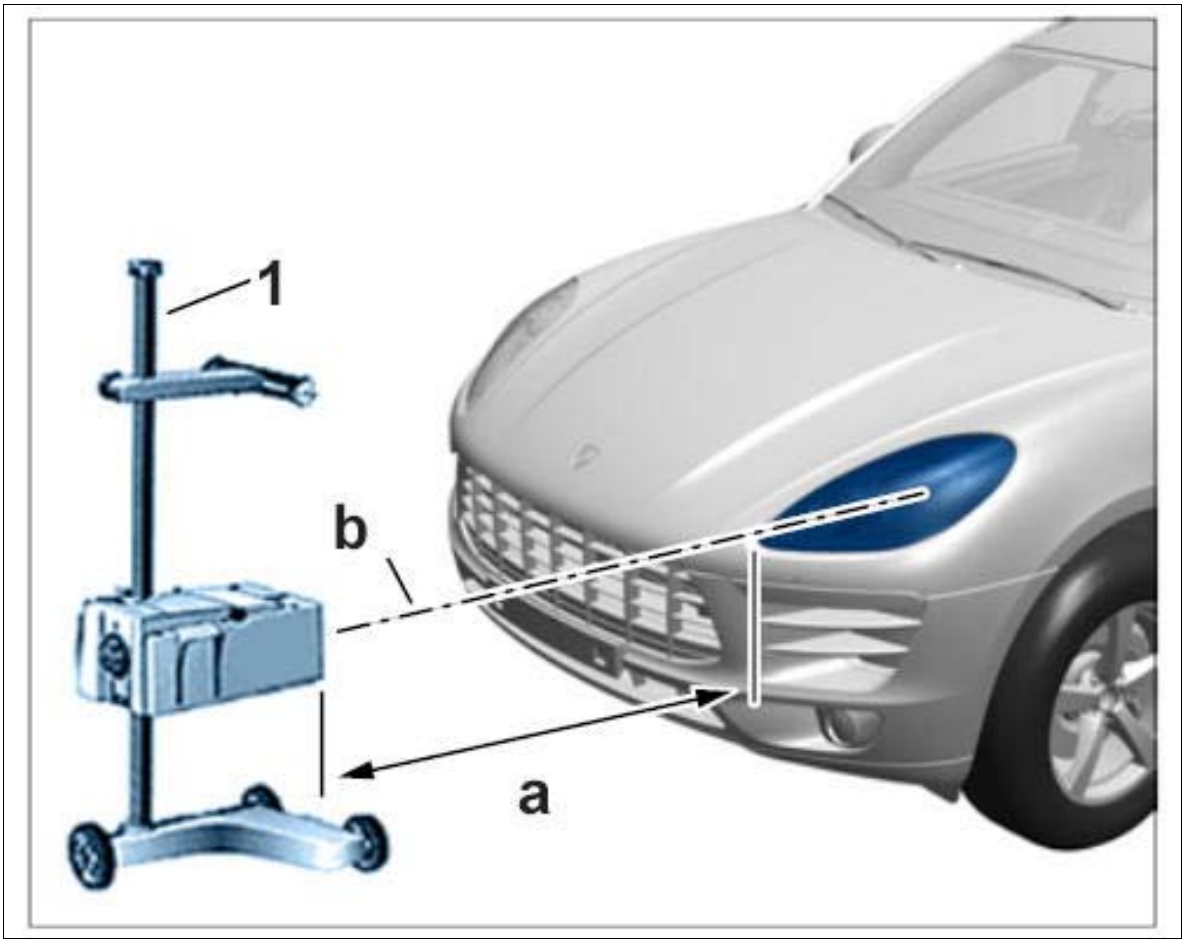
Read the operating instructions for the headlight aiming device and observe the following test and adjustment conditions:

- Vehicle and headlight aiming device positioned on a horizontal, clean surface.
- Vehicle parked safely and ready to drive, empty, including all fluids and fuel.
- All doors and rear lid closed.
- Tyre pressure corresponds to the specified values.
- Driver's seat occupied by one person or a weight of 75 kg.
- Steering in straight-ahead position.
- For vehicles with air suspension: Vehicle level in center position.
- Vehicle and chassis have been bounced.

1. Align the headlight aiming device **-1-** at a 90° angle to the longitudinal axis of the vehicle and position it at a distance of **-a-** in front of the left headlight.

2. Set the tilt angle of the light/dark limit of the dipped beam headlight on the headlight aiming device and align the collecting box with the center axis **-b-** of the dipped beam headlight.

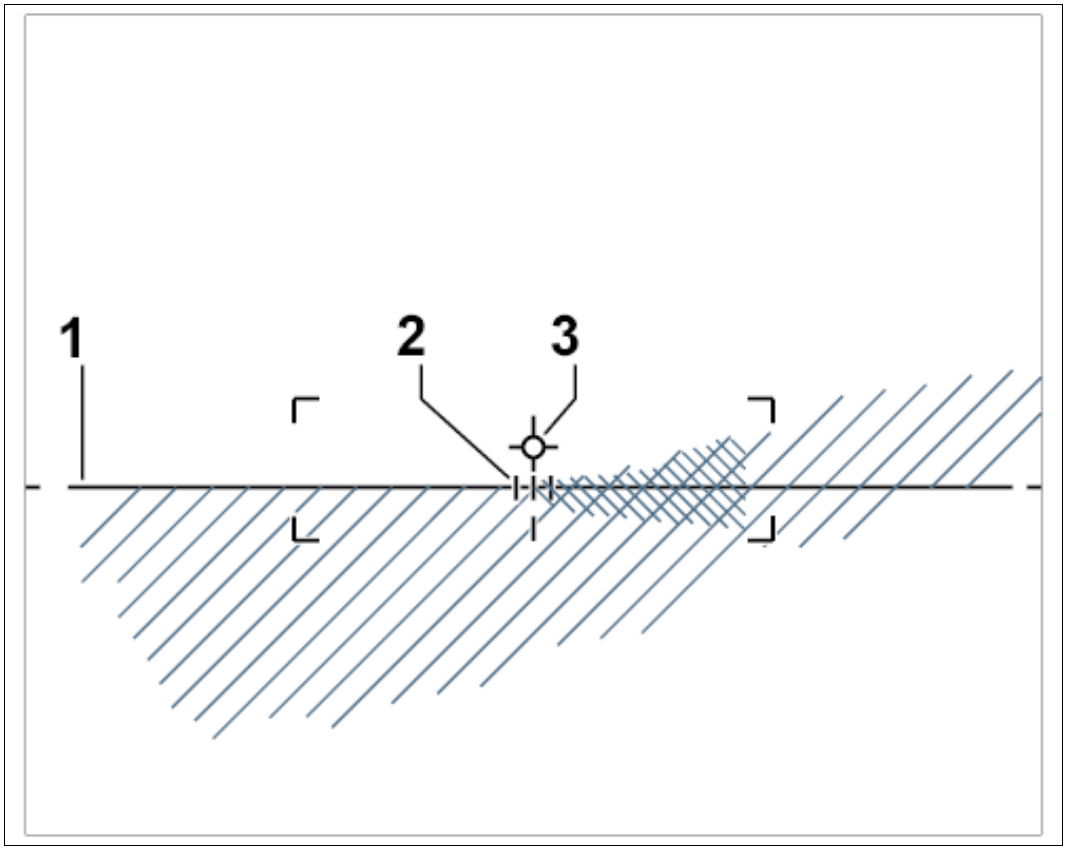
Fig 1: Positioning Headlight Aiming Device



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Switch on ignition and dipped beam headlights.
4. Check the headlight setting.
    1. 4.1. The horizontal part of the light/dark limit must run along the dividing line **-1-** .
    2. 4.2. The salient point **-2-** of the horizontal part and right-elevated part of the light/dark limit must be positioned along the vertical line running through the central mark **-3-** . The bright core of the light beam is at the right of this vertical line.

Fig 2: Identifying Light Distribution Of Dipped Beam Headlight



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Correct the headlight setting if necessary.

    1. 5.1. Adjust the height of the light/dark limit at the inner adjusting screw **-1-** using a 6-mm Allen key.

    2. 5.2. Adjust the lateral setting of the light/dark limit at the outer adjusting screw **-2-** using a long 6-mm Allen key.

Fig 3: Turning Headlight Adjusting Screws

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

For vehicles with Xenon headlights:

6. Switch the ignition off and on again with the dipped beam headlights on.
7. Check the headlight setting again.

All vehicles:

8. Repeat the test and adjustment procedure on the right headlight.
9. Switch off dipped beam headlights and ignition.

WM 941516 ADJUSTING HEADLIGHTS AND FOG LIGHTS (ALL MODELS) > ADJUSTING FOG LIGHTS

Information

- Some of the repair illustrations show only one side of the vehicle.
- Naturally, some steps also have to be performed on the opposite side of the vehicle as well.

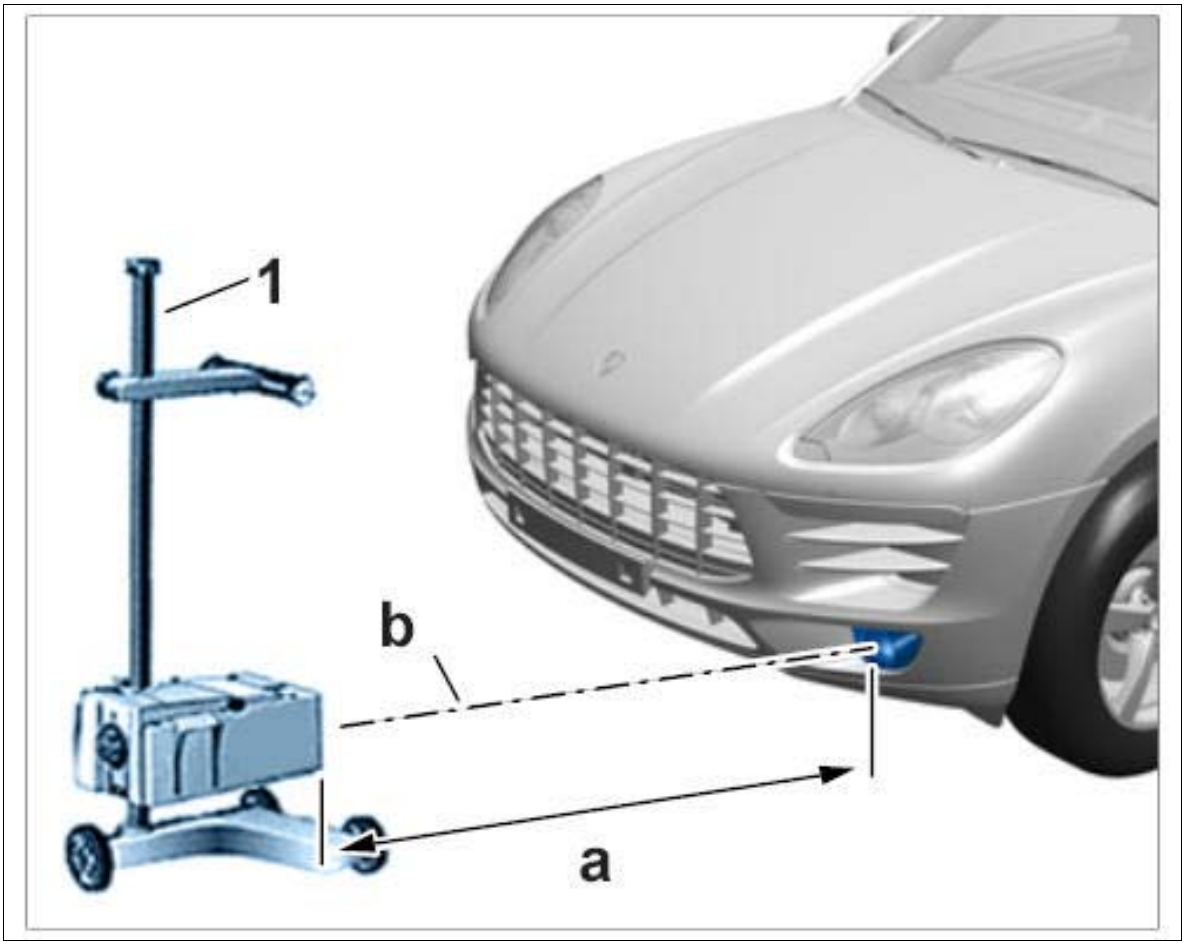
Information

Read the operating instructions for the headlight aiming device and observe the following test and adjustment conditions:

- Vehicle and headlight aiming device positioned on a horizontal, clean surface.
- Vehicle parked safely and ready to drive, empty, including all fluids and fuel.
- All doors and rear lid closed.
- Tyre pressure corresponds to the specified values.
- Driver's seat occupied by one person or a weight of 75 kg.
- Steering in straight-ahead position.
- For vehicles with air suspension: Vehicle level in center position.
- Vehicle and chassis have been bounced.
- For vehicles with halogen headlights: Switch for headlight levelling system at position "0".

1. Align the headlight aiming device **-1-** at a 90° angle to the longitudinal axis of the vehicle and position it at a distance of **-a-** in front of the left fog light.
2. Set the tilt angle of the light/dark limit of the fog light on the headlight aiming device and align the collecting box with the center axis **-b-** of the fog light.

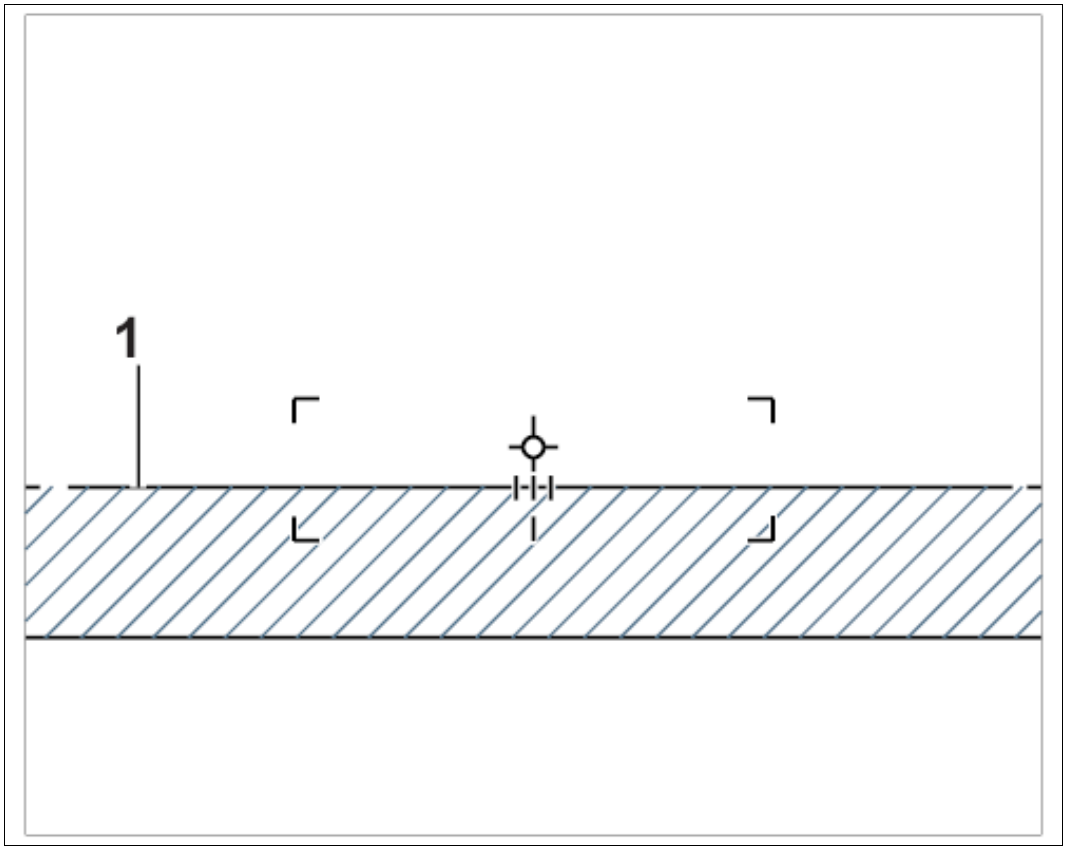
Fig 1: Positioning Headlight Aiming Device



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Switch on ignition and fog light.
4. Check the fog light setting.
    1. 4.1. The light/dark limit must run along the dividing line **-1-** .

Fig 2: Identifying Light Distribution Of Fog Light



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Correct the fog light setting if necessary.

    1. 5.1. Adjust the height of the light/dark limit at the adjusting screw **-1-** by inserting a long 6-mm Allen key through the front apron from below.

Fig 3: Turning Fog Light Adjusting Screw (Halogen Light Shown)

6. Repeat the test and adjustment procedure on the right fog light.
7. Switch off fog light and ignition.

WM 941516 HEADLIGHTS - BASIC SETTING IN THE BODY (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
Star gauges for body gap dimensions	Special tool	NR.127-1		
WM 941516 HEADLIGHTS - BASIC SETTING IN THE BODY (ALL MODELS) > ADJUSTING HEADLIGHTS (BASIC SETTING IN THE BODY)

Information

- The headlights are fitted into the body at the factory!
- The headlights must only be re-adjusted during accident repairs or if the headlights are being replaced!

Information

If work is carried out on the headlight or retainer plate, the installed fastening screws must be replaced by microencapsulated fastening screws .

Micro-encapsulated fastening screws must be tightened only once to the specified torque.

Micro-encapsulated fastening screws must be replaced after loosening them.

Information

- Set gap dimensions on lid and accessories in accordance with the gap specifications.
- Given a clearance in the opening that is too great or too small, the accessories must be centered with respect to the body.
- Ensure that the gaps do not run in a wedge-shaped fashion or do not narrow at local points.
- The given values are guidelines, which should be observed as far as possible.
- The guidelines apply to repair and assembly work.
- Use star gauges to check the gap dimensions. Star gauges for body gap dimensions NR.127-1

The headlight is aligned in the body by adjusting the headlight mounting points. → 941415 ADJUSTING HEADLIGHT MOUNTING

WM 941519 REMOVING AND INSTALLING HEADLIGHTS (ALL MODELS) > PRELIMINARY WORK

1. Remove cover on front lock support. → Removing cover for front lock support

WM 9415IN CONVERTING HEADLIGHTS FOR LEFT/RIGHT-HAND DRIVING (ALL MODELS) > CONVERTING HEADLIGHTS FOR LEFT/RIGHT-HAND DRIVING > INFORMATION

Information

For driving in countries in which vehicles drive on the other side of the road, it is important to adapt the headlights as soon as you cross the border. The dipped beam headlight then lights symmetrically so that oncoming traffic is not dazzled.

Headlights with dynamic cornering light must be adapted in the multi-function display. The message "Headlights adapted for LHD/RHD" appears in the multi-function display every time the ignition is switched on. Don't forget to reset the headlights for the return journey.

WM 9415IN CONVERTING HEADLIGHTS FOR LEFT/RIGHT-HAND DRIVING (ALL MODELS) > CONVERTING HEADLIGHTS FOR LEFT/RIGHT-HAND DRIVING > CONVERTING HEADLIGHTS WITHOUT DYNAMIC CORNERING LIGHT

1. Remove headlight.

   → Removing Headlights

   1. 1.1. Remove cover.

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Close the cover on the headlight. Both brackets must be fully engaged.
4. Install headlight.

   → Installing Headlights
5. Repeat conversion for the other headlight.

WM 941619 REMOVING AND INSTALLING (CENTRAL) HEADLIGHT CONTROL UNIT (ALL MODELS) > PRELIMINARY WORK

1. Remove rear seat. → Removing rear seat

WM 941619 REMOVING AND INSTALLING (CENTRAL) HEADLIGHT CONTROL UNIT (ALL MODELS) > REMOVING (CENTRAL) HEADLIGHT CONTROL UNIT

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

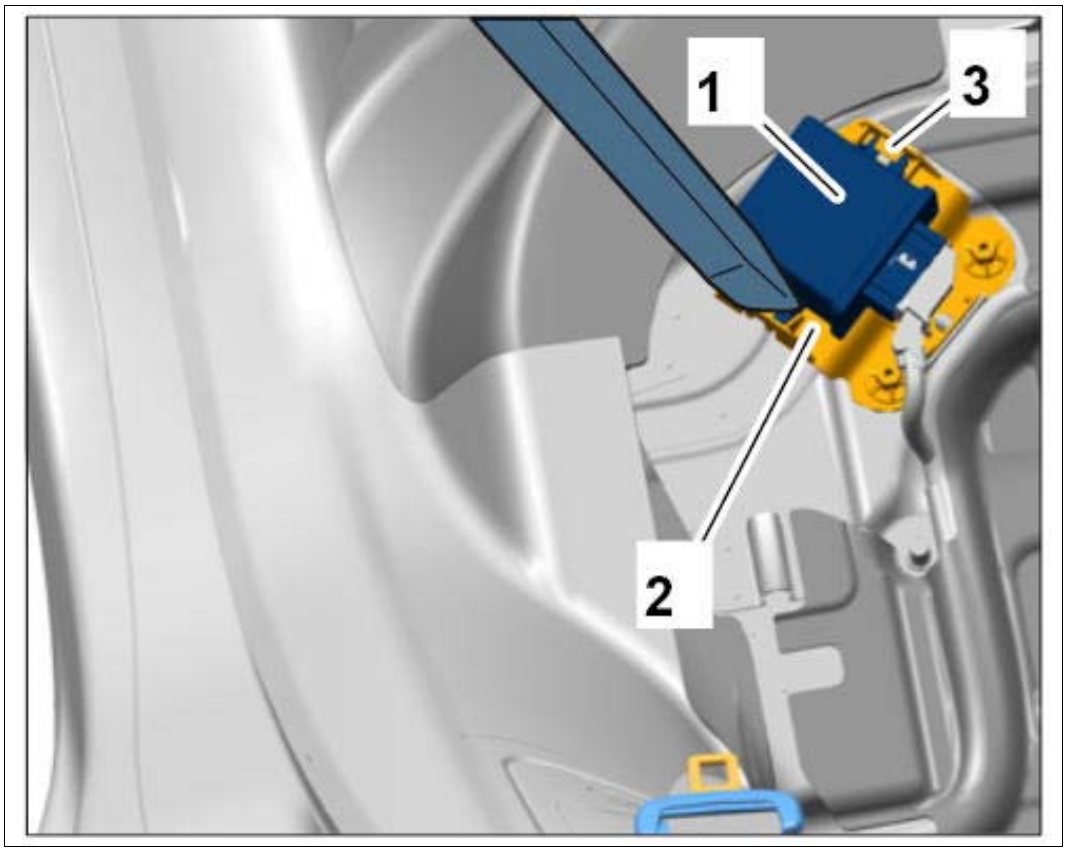
Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

1. Switch off position lights.
2. Switch off ignition and pull remote control out of ignition lock.
3. Remove (central) headlight control unit **-1-** .
    1. 3.1. Press back locking lug on the holder **-2-** using a plastic wedge.
    2. 3.2. Carefully lift up (central) headlight control unit at the left and pull it out of the right tab **-3-** on the holder.

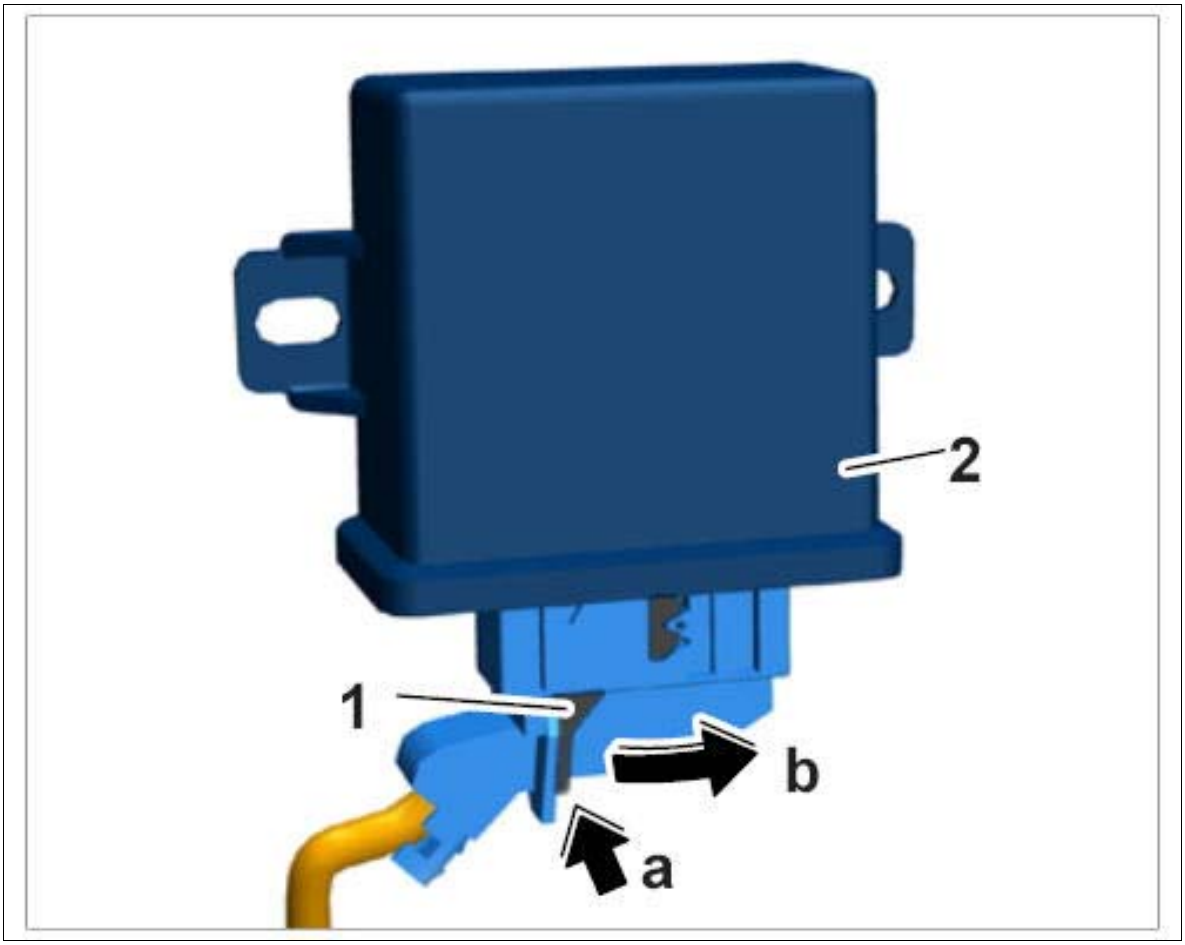
Fig 1: Removing Central Headlight Control Unit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Release clip **-1-** (**-a-**), swivel it aside **-b-** and remove electric plug connection from the (central) headlight control unit **-2-** .

Fig 2: Disconnecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 941625 PROGRAMMING (CENTRAL) HEADLIGHT CONTROL UNIT (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 941625 PROGRAMMING (CENTRAL) HEADLIGHT CONTROL UNIT (ALL MODELS) > PROGRAMMING (CENTRAL) HEADLIGHT CONTROL UNIT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. **PIWIS Tester II 9818** must be connected to the vehicle and ignition switched on.
2. Start the diagnostic application and select the required vehicle type.
3. Select the **central headlight** control unit in the **overview** .
4. **Extended identification** must now be selected.
5. **Enter the vehicle identification number** and press [Enter].
6. **Maintenance/repairs** must then be selected.
7. **Control unit replacement** must now be selected. Then press [F12].
8. **Select Write data,** press [F12] and then press [F8] to start. The data is now loaded.
9. The Tester displays the message **Data has been written.** Press [F12] to continue.
10. **Maintenance/repairs** must now be selected.
11. **Select Headlight start-up** and press [F12] to continue.
12. **Read the preconditions** for start-up and press [F12] to continue.
13. **Headlight start-up** can now be started by pressing [F8].
14. Wait for confirmation that **coding was completed successfully.** Then press [F12] to continue.
15. Wait for confirmation that **start-up was completed successfully.** Press [F12] to continue.
16. Read out the fault memory and erase it if necessary.
17. Perform a function test on the control unit.

WM 942355 REPLACING HALOGEN BULB (ALL MODELS) > PRELIMINARY WORK

1. Remove trim panel behind headlight. → Removing front trim panel

WM 942355 REPLACING HALOGEN BULB (ALL MODELS) > REMOVING HALOGEN BULB

NOTE: Incorrect handling of bulbs

- *Risk of damage to bulbs and the bulb housing*

→ Switch off ignition and remove ignition key.

→ Switch off the relevant loads when changing bulbs.

→ Only use bulbs listed in the bulb table.

→ Only install clean bulbs that are free of grease.

→ Always use a cloth or soft paper when working with bulbs.

→ Observe the safety instructions when changing a bulb in a Bi-Xenon headlight.

→ In certain states, it is compulsory to carry spare light bulbs.

1. Switch off position lights.
2. Switch off ignition and pull remote control out of ignition lock.
3. Release hose connection for the breather hose **-1-** (**-a-**) and pull it off the headlight.
4. Turn the rear cover **-2-** in direction of arrow and remove it.

Fig 1: Removing Rear Cover

WM 944919 REMOVING AND INSTALLING CONTROL UNIT FOR FRONT-END ELECTRONICS (ALL MODELS) > PRELIMINARY WORK

1. Remove trim panel under dashboard at the left. → Removing trim panel under dashboard at the left

WM 944919 REMOVING AND INSTALLING CONTROL UNIT FOR FRONT-END ELECTRONICS (ALL MODELS) > REMOVING CONTROL UNIT FOR FRONT-END ELECTRONICS

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

Information

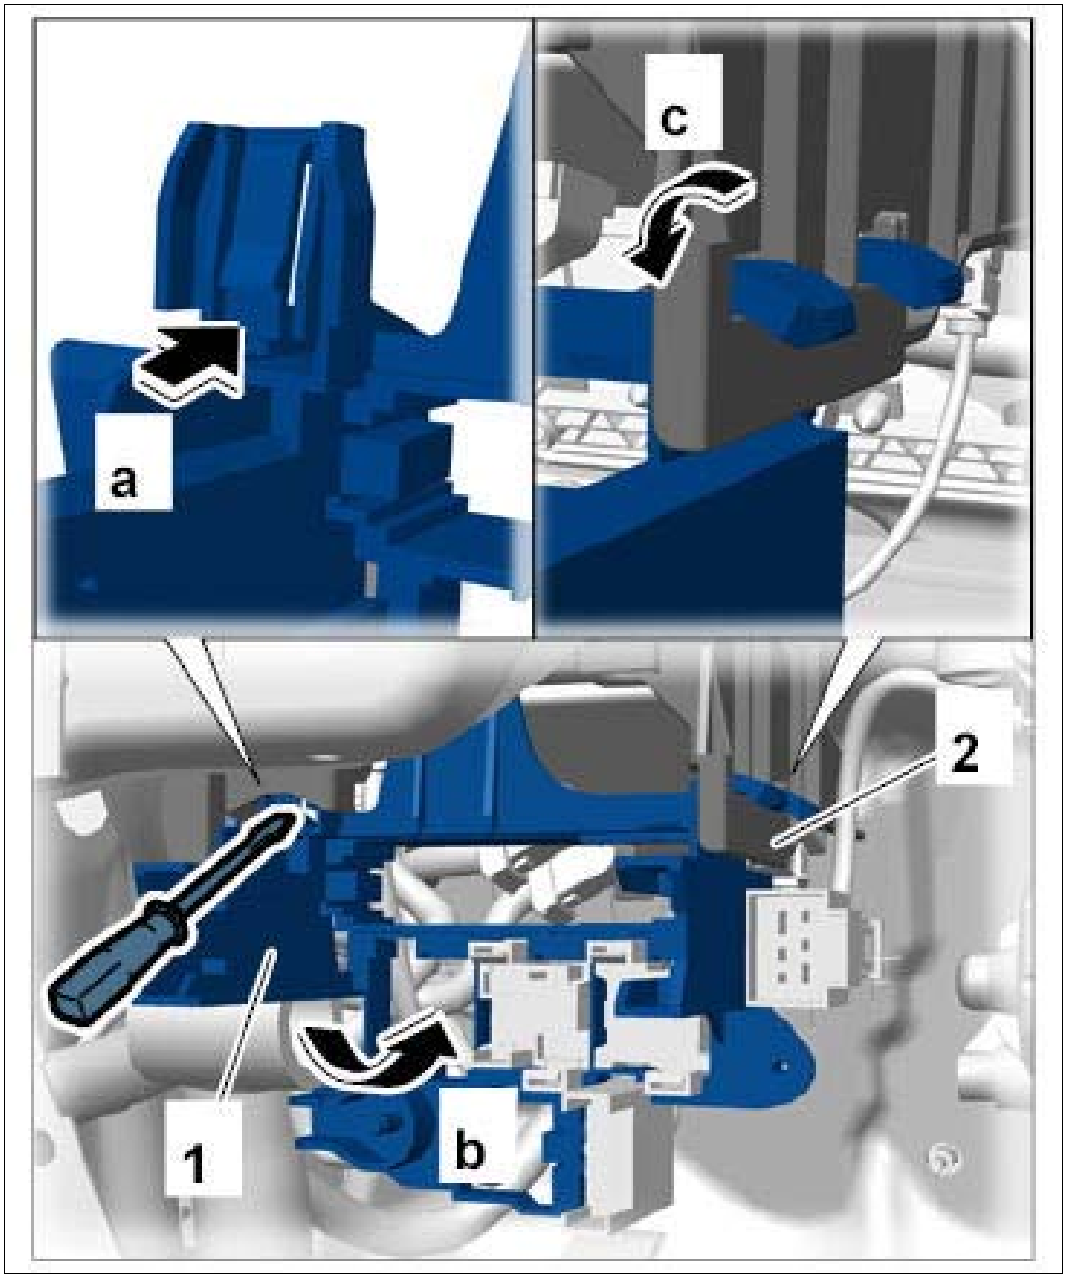
Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

1. Switch off ignition and pull remote control out of ignition lock.
2. Loosen relay carrier **-1-** .
    1. 2.1. Release the relay carrier **-a-** and swivel it down **-b-** .
    2. 2.2. Pull the relay carrier out of the holder **-2-** (**-c-**) and set it aside with lines

connected.

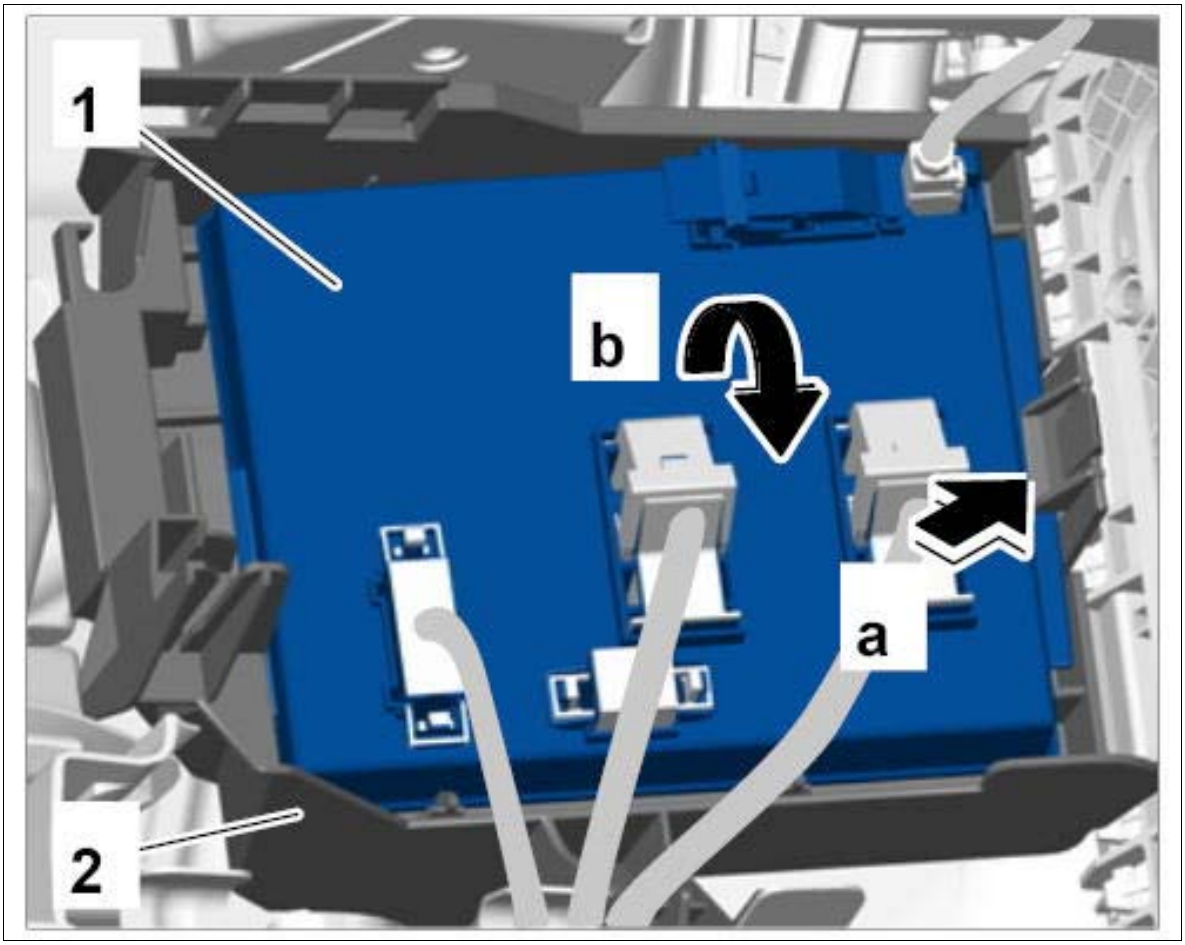
Fig 1: Loosening Relay Carrier



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Press release **-a-** , swivel the front-end electronics control unit **-1-** down at the front **-b-** and remove it from the holder **-2-** at the rear.

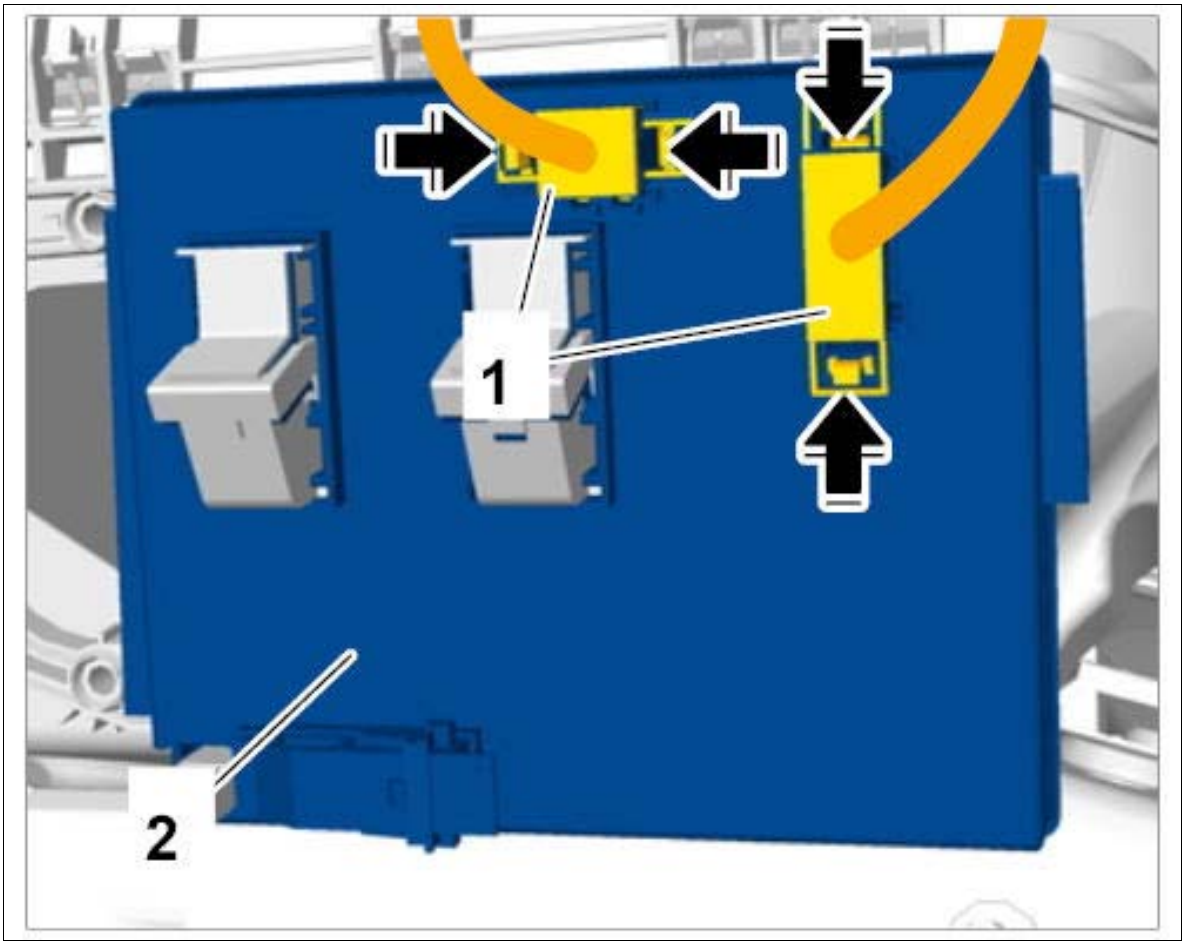
Fig 2: Loosening Front-End Electronics Control Unit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Release electric plug connections **-1-** (**-arrows-**) and disconnect them from the rear-end electronics control unit **-2-** .

Fig 3: Disconnecting Electric Plug Connections



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Release the swivel bar **-1-** (**-a-**), swivel it down and disconnect electric plug connections from the rear-end electronics control unit **-2-** .
6. Release electric plug connection **-3-** (**-b-**) and disconnect it from the rear-end electronics control unit.

Fig 4: Disconnecting Electric Plug Connections

WM 944919 REMOVING AND INSTALLING CONTROL UNIT FOR FRONT-END ELECTRONICS (ALL MODELS) > INSTALLING CONTROL UNIT FOR FRONT-END ELECTRONICS

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

1. Installation is performed in reverse order to removal.

WM 944919 REMOVING AND INSTALLING CONTROL UNIT FOR FRONT-END ELECTRONICS (ALL MODELS) > SUBSEQUENT WORK

1. Install trim panel under dashboard at the left. → Installing trim panel under dashboard at the left
2. If the front-end electronics control unit was replaced, teach the new front-end electronics control unit to suit the vehicle using **PIWIS Tester II 9818.** → 944955 REPLACING CONTROL UNIT FOR FRONT-END ELECTRONICS

WM 944955 REPLACING CONTROL UNIT FOR FRONT-END ELECTRONICS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 944955 REPLACING CONTROL UNIT FOR FRONT-END ELECTRONICS (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 944955 REPLACING CONTROL UNIT FOR FRONT-END ELECTRONICS (ALL MODELS) > PRELIMINARY WORK

1. Switch off ignition and replace control unit. → 944919 REMOVING AND INSTALLING CONTROL UNIT FOR FRONT-END ELECTRONICS .

WM 944955 REPLACING CONTROL UNIT FOR FRONT-END ELECTRONICS (ALL MODELS) > REPLACING CONTROL UNIT FOR FRONT-END ELECTRONICS

Information

All remote controls (keys) are required for teaching a DME, front-end electronics (front BCM), rear-end electronics (rear BCM), electronic steering lock (ELV) control unit or remote controls (keys) for example.

Remote controls (keys) that are not taught during this teaching procedure will no longer be recognized by the vehicle.

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms; different text or additions may appear in **PIWIS Tester II 9818.**

1. **PIWIS Tester II 9818** must be connected to the vehicle before starting the Tester. Switch on ignition.
2. Select the vehicle type and start the diagnostic application.
3. **Select Front-end electronics.**
4. **Extended identification** must now be selected.
5. **Enter the vehicle identification number** and press [Enter] to confirm your entry.
6. **Maintenance/repairs** must then be selected.
7. **Control unit replacement** must now be selected. Then press [F12] to continue.
8. **Select Write values** and press [F12] to continue.
9. Press [F8] to start writing values.
10. When a message appears confirming that the **values were written and coded successfully,** press [F12] to continue.

11. Go back to the Start page on the Tester.
12. To activate the control units, switch on the hazard warning lights.
13. Select the menu **Diagnostics --> Online teaching function --> Engine immobilizer** on the Start page.
14. **Vehicle** must now be selected. Then press [F12] to continue. Vehicle data will be read out.
15. Follow the instructions on the Tester.
16. The vehicle identification number (VIN) is displayed. Change the vehicle identification number if necessary.
17. Enter the repair order number and press [F12] to continue.
18. Enter the PPN user name and password and press [F12] to continue.
19. Login is performed.
20. The Tester displays the message **Login successful** . Press [F12] to continue.
21. Follow the instructions on the Tester to select the required menu.
22. Once the teaching process is completed successfully, the Tester shows the following status, for example:

    2 keys taught

    Front BCM: taught

    ELV: taught

    Rear BCM: taught

    DME: taught

    Overall vehicle status: taught. Press [F12] to continue.
23. Press [ESC] to exit the **Online teaching function** and select the **vehicle type** on the Start page.
24. Read out the fault memory and erase it if necessary.
25. Function test: Lock, open and start the vehicle using all remote controls (hand-held transmitters).

WM 945019 REMOVING AND INSTALLING STEERING-COLUMN SWITCH (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Clamp securing steering-column switch	Hexagon socket head bolt, M6 x 15	Tightening torque	4 Nm (3 ftlb.)		

to steering column					

WM 945019 REMOVING AND INSTALLING STEERING-COLUMN SWITCH (ALL MODELS) > PRELIMINARY WORK

1. Remove steering wheel. → Removing And Installing Steering Wheel

WM 945955 REPLACING GAS-DISCHARGE HEADLIGHT (ALL MODELS) > PRELIMINARY WORK

1. Remove trim panel behind headlight. → Removing front trim panel

WM 945955 REPLACING GAS-DISCHARGE HEADLIGHT (ALL MODELS) > REMOVING GAS-DISCHARGE HEADLIGHT

NOTE: Incorrect handling of bulbs

- *Risk of damage to bulbs and the bulb housing*

→ Switch off ignition and remove ignition key.

→ Switch off the relevant loads when changing bulbs.

→ Only use bulbs listed in the bulb table.

→ Only install clean bulbs that are free of grease.

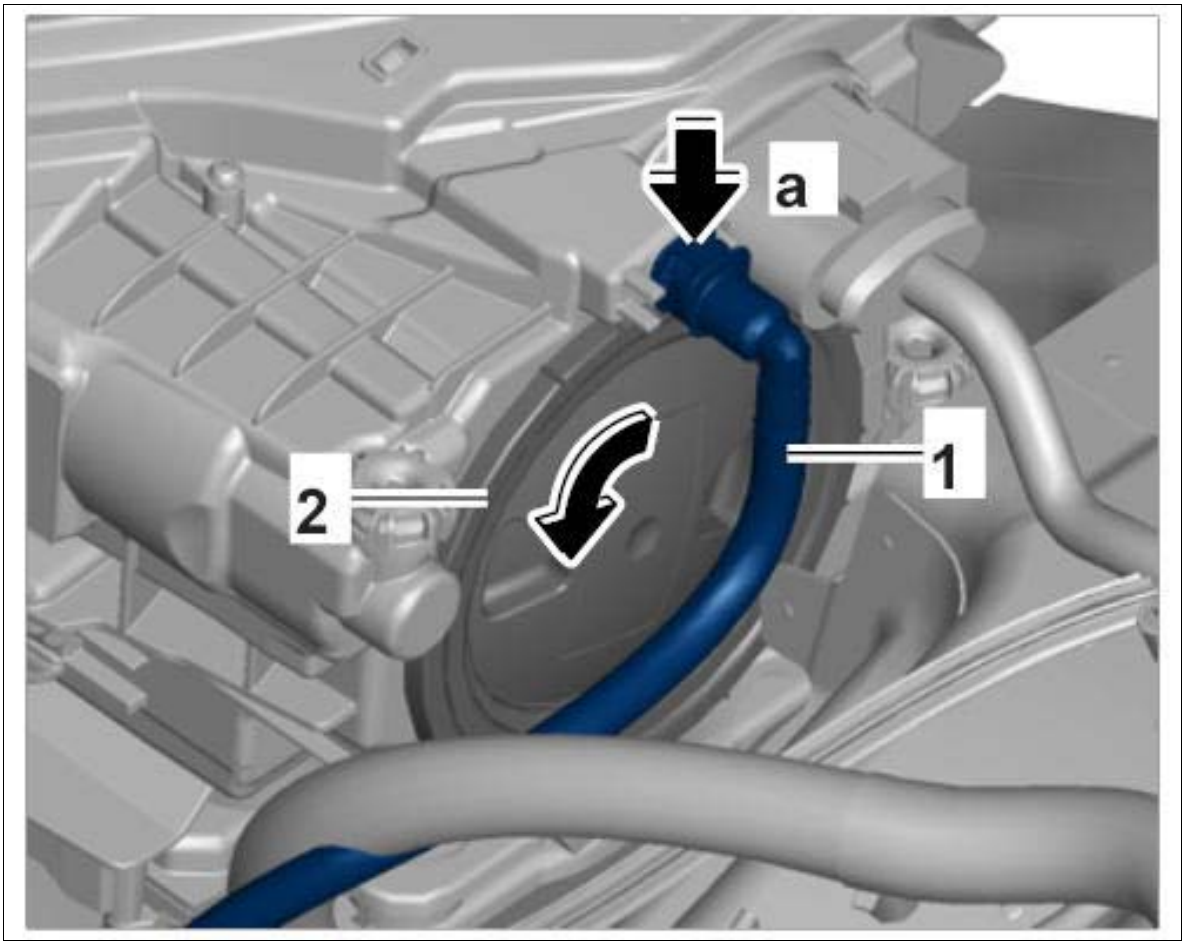
→ Always use a cloth or soft paper when working with bulbs.

→ Observe the safety instructions when changing a bulb in a Bi-Xenon headlight.

→ In certain states, it is compulsory to carry spare light bulbs.

1. Switch off position lights.
2. Switch off ignition and pull remote control out of ignition lock.
3. Release hose connection for the breather hose **-1-** (**-a-**) and pull it off the headlight.
4. Turn the rear cover **-2-** in direction of arrow and remove it.

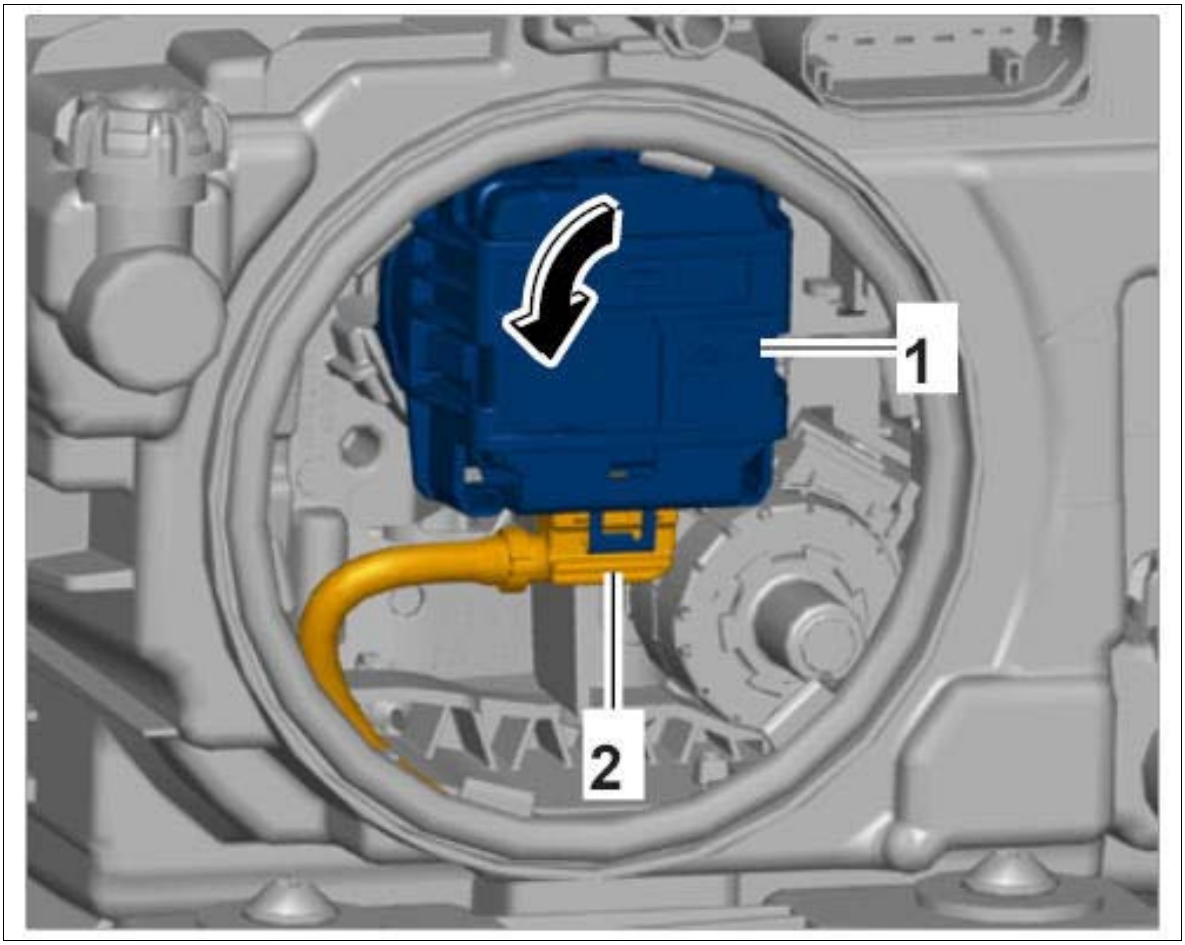
Fig 1: Removing Rear Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Turn gas-discharge headlight **-1-** in direction of arrow and carefully remove it from the headlight.
6. Disconnect electric plug connection **-2-** from the gas-discharge headlight.

Fig 2: Removing Gas-Discharge Headlight



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 945955 REPLACING GAS-DISCHARGE HEADLIGHT (ALL MODELS) > INSTALLING GAS-DISCHARGE HEADLIGHT

NOTE: Incorrect handling of bulbs

- *Risk of damage to bulbs and the bulb housing*

→ Switch off ignition and remove ignition key.

→ Switch off the relevant loads when changing bulbs.

→ Only use bulbs listed in the bulb table.

→ Only install clean bulbs that are free of grease.

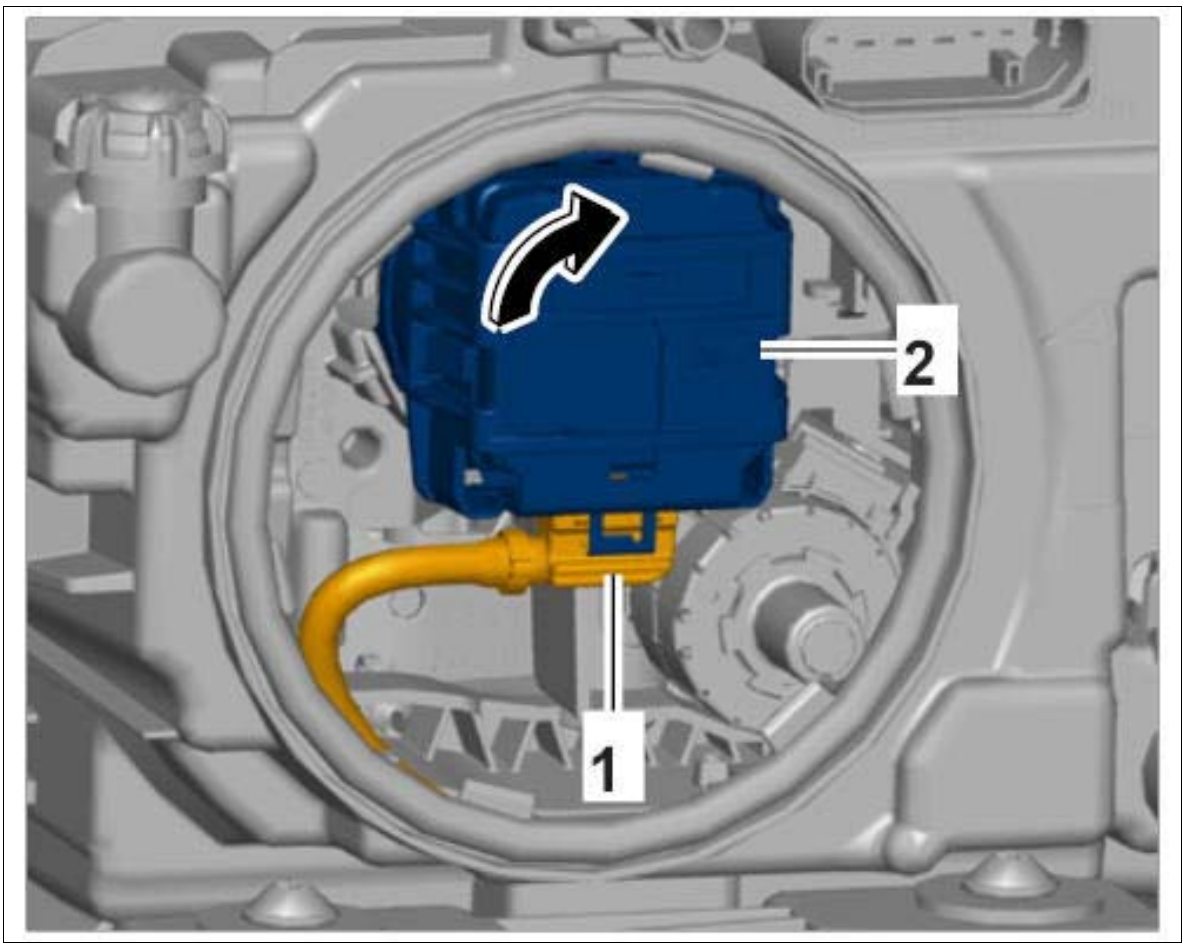
→ Always use a cloth or soft paper when working with bulbs.

→ Observe the safety instructions when changing a bulb in a Bi-Xenon headlight.

→ In certain states, it is compulsory to carry spare light bulbs.

1. Connect electric plug connection **-1-** on the gas-discharge headlight **-2-** until it engages securely.
2. Position gas-discharge headlight in the headlight and lock it by turning it in direction of arrow.

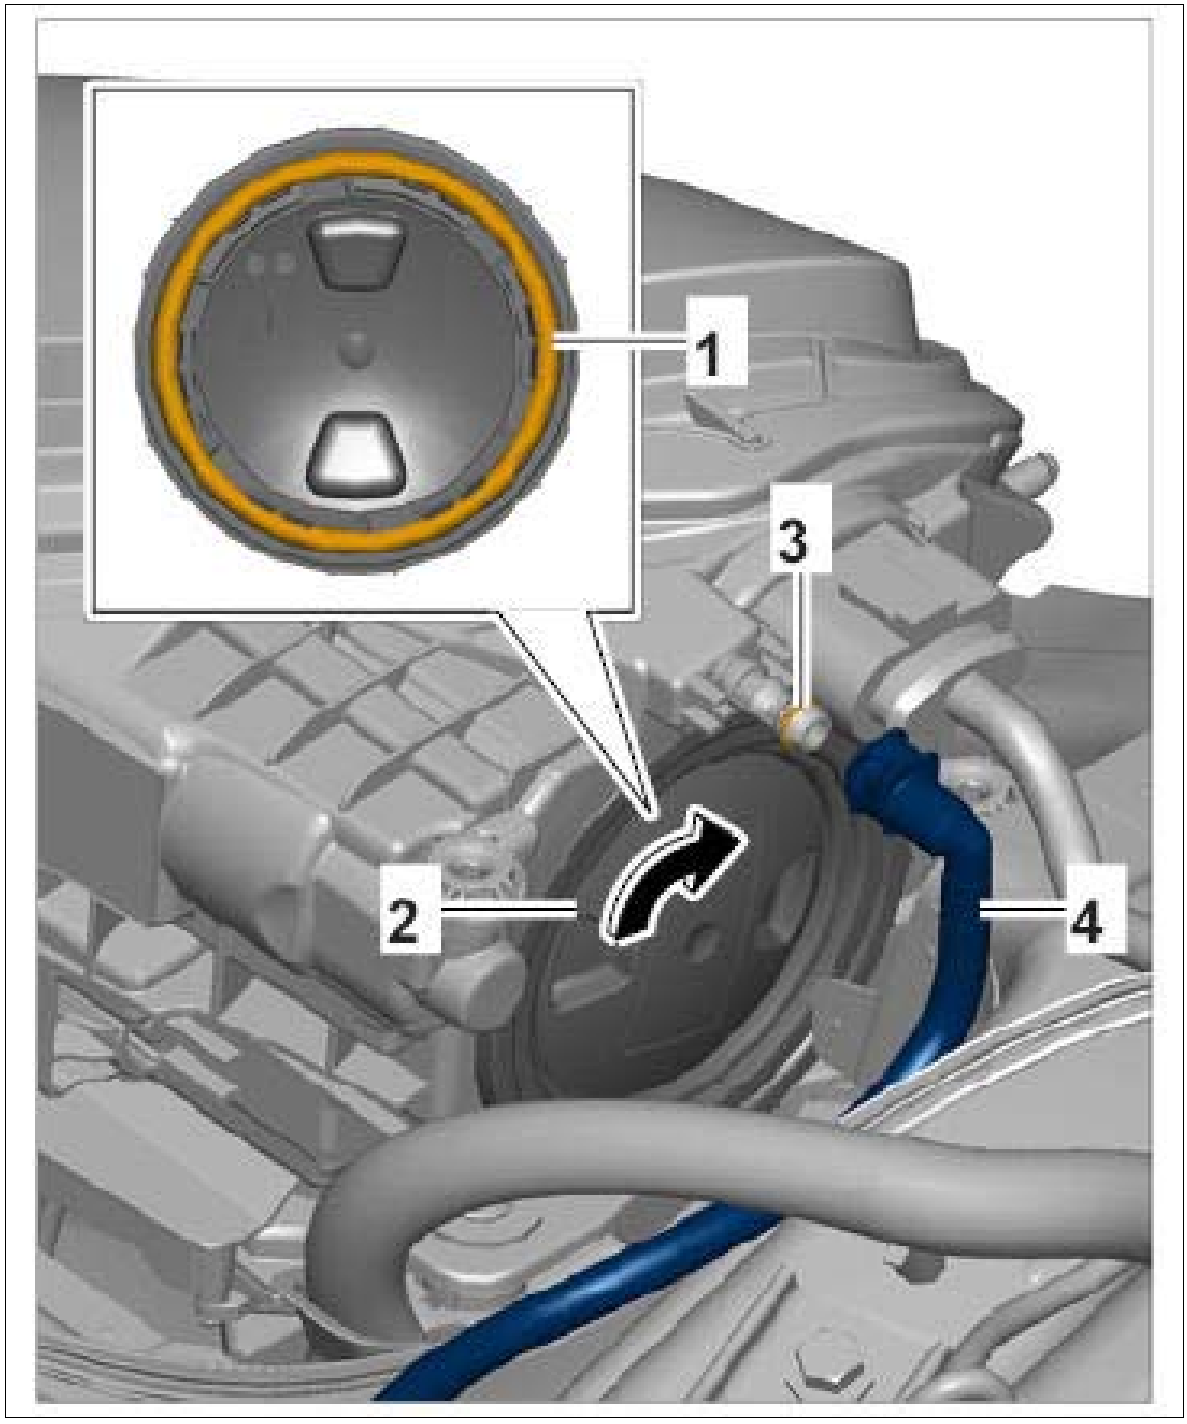
   Fig 1: Installing Gas-Discharge Headlight



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Check condition of the seal **-1-** and check that it is fitted correctly on the rear cover **-2-** .
4. Position rear cover on the headlight and lock it by turning it in direction of arrow.
5. Check condition of O-ring **-3-** and check that it is seated correctly.
6. Connect hose connection **-4-** for the breather hose at the headlight until it engages securely.

Fig 2: Installing Rear Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 945955 REPLACING GAS-DISCHARGE HEADLIGHT (ALL MODELS) > SUBSEQUENT WORK

1. Install trim panel behind headlight. → Installing front trim panel

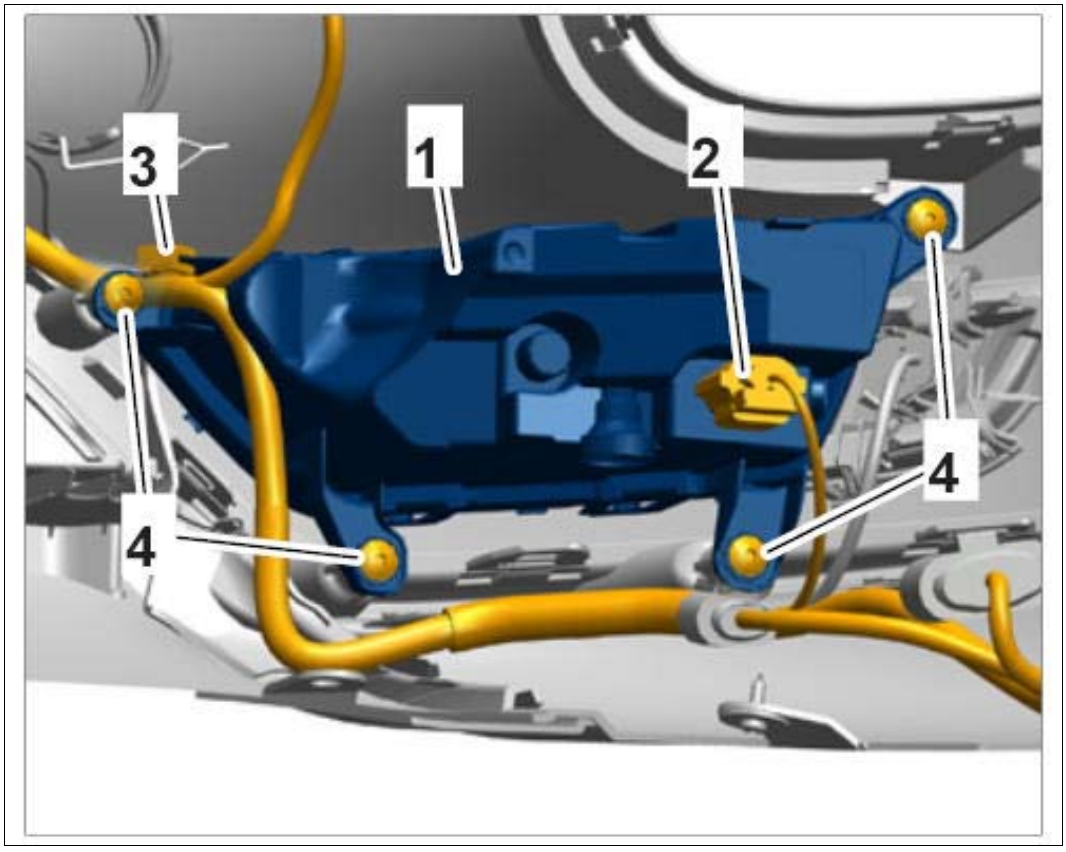
WM 946419 REMOVING AND INSTALLING FOG LIGHTS (EXCEPT MACAN) > PRELIMINARY WORK

1. Remove front apron. → Removing Front Apron

WM 946419 REMOVING AND INSTALLING FOG LIGHTS (EXCEPT MACAN) > REMOVING FOG LIGHTS

1. Remove fog light **-1-** .
    1. 1.1. Release and disconnect electric plug connection **-2-** .
    2. 1.2. Pull off holder **-3-** for the electric line at the fog light.
    3. 1.3. Unscrew fastening screws **-4-** and remove fog light.

Fig 1: Removing Fog Lights



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 946419 REMOVING AND INSTALLING FOG LIGHTS (EXCEPT MACAN) > INSTALLING FOG LIGHTS

1. Installation is performed in reverse order to removal.

2. Tighten fastening screws for the fog light.

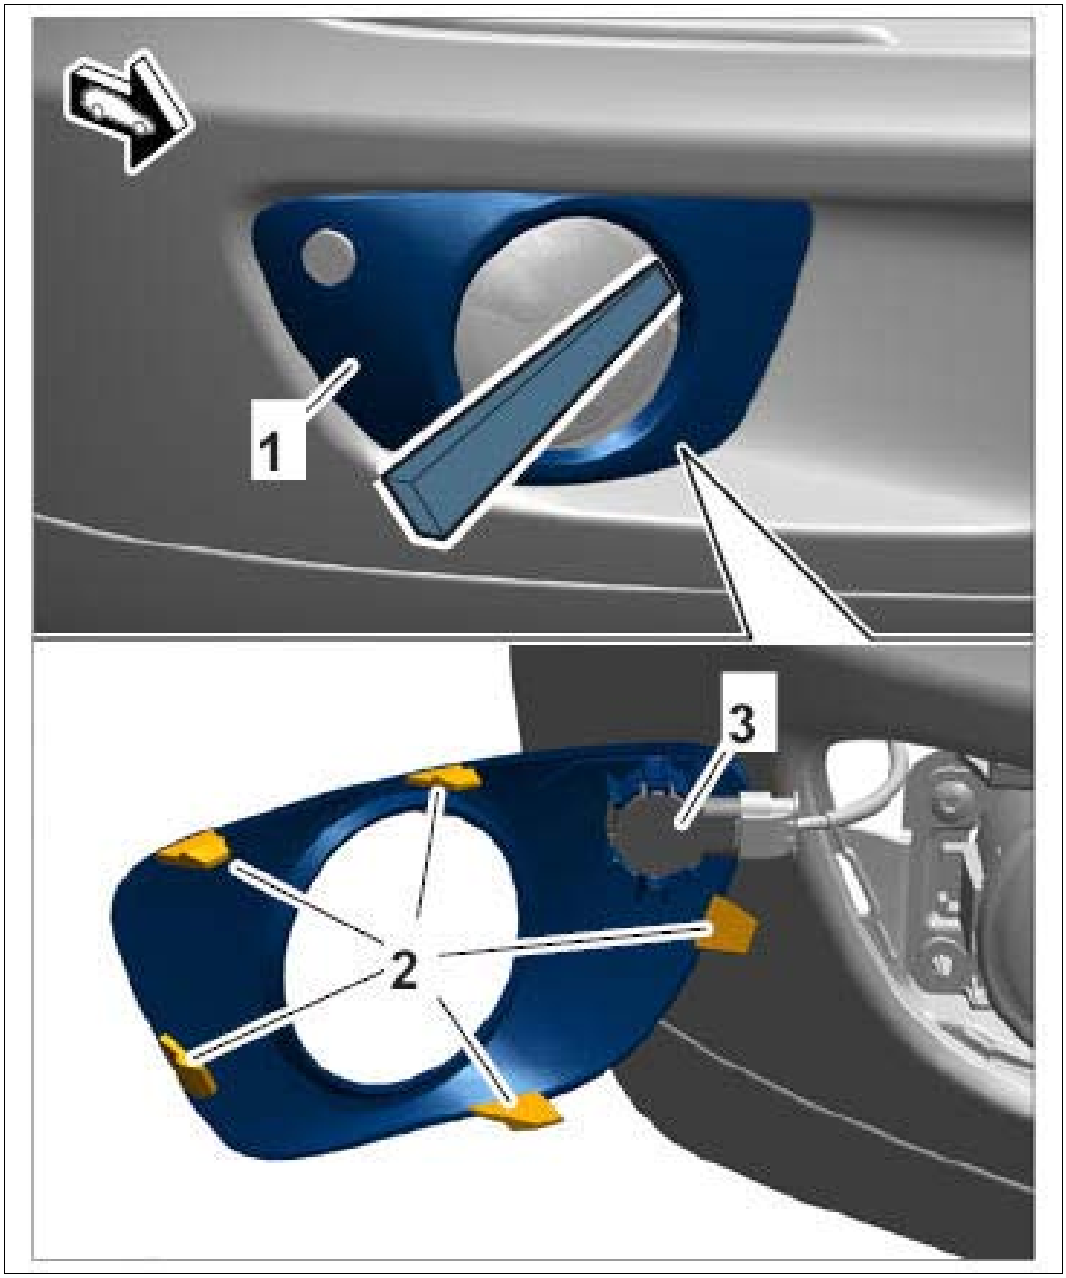
1. Install front apron. → Installing Front Apron
2. Check fog light setting. → WM 941516 ADJUSTING HEADLIGHTS AND FOG LIGHTS

WM 946419 REMOVING AND INSTALLING FOG LIGHTS (EXCEPT MACAN TURBO) > REMOVING FOG LIGHTS

1. Loosen trim **-1-** .
    1. 1.1. Carefully prise locking lugs **-2-** on the trim out of the front apron using a plastic wedge.
    2. 1.2. Leave electric plug connection on the ParkAssist sensor **-3-** .

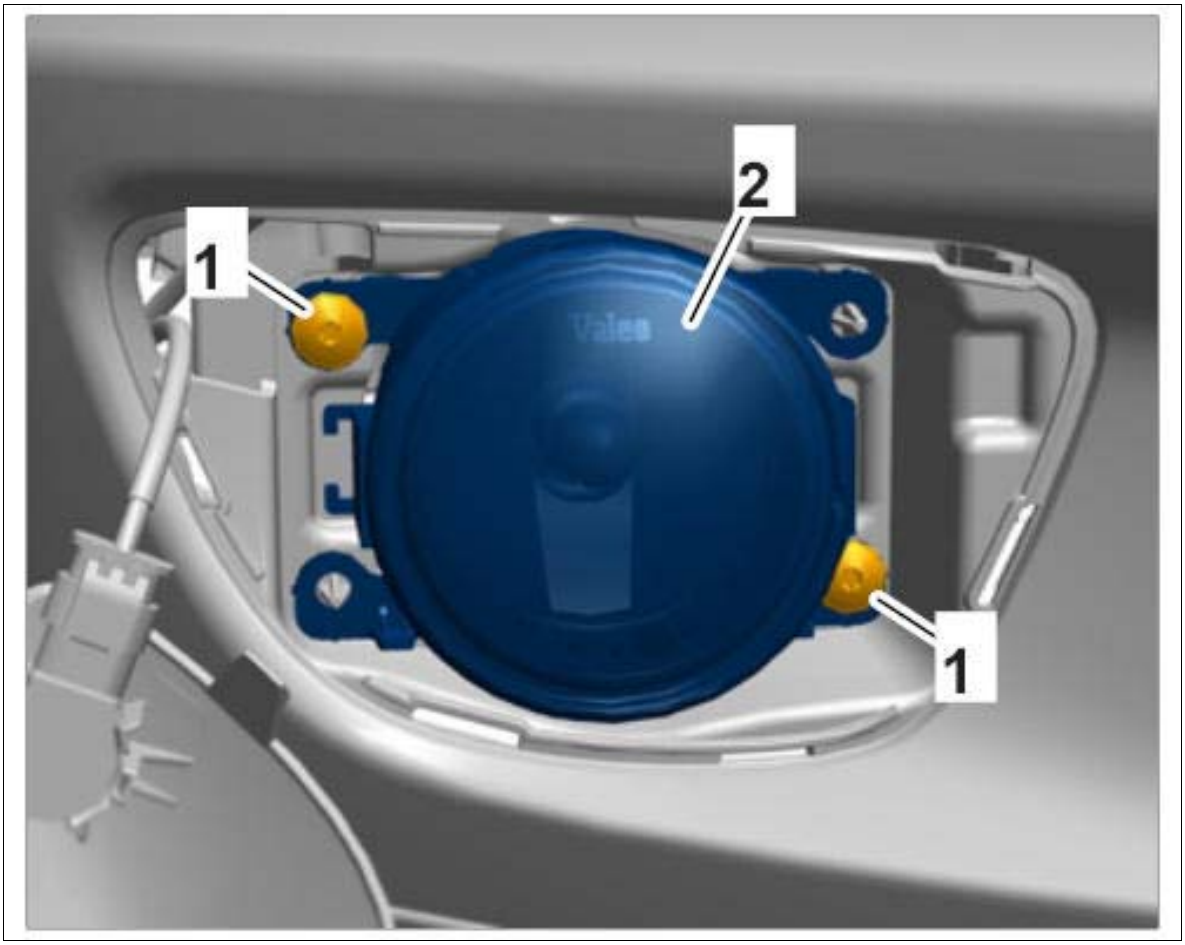
Fig 1: Loosening Trim



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Unscrew fastening screws **-1-** and remove fog light **-2-** .

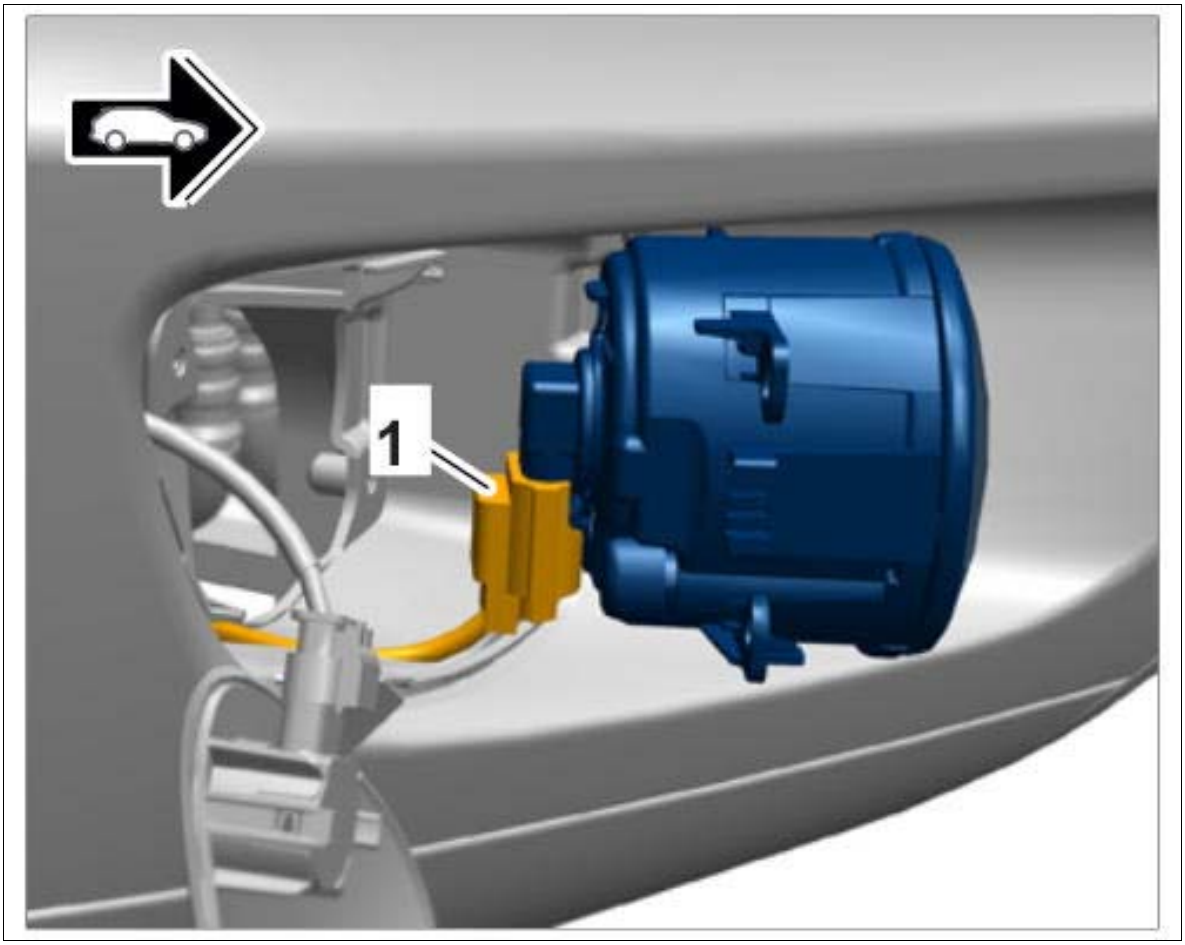
Fig 2: Loosening Fog Light



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Release and disconnect electric plug connection **-1-** .

Fig 3: Disconnecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 946419 REMOVING AND INSTALLING FOG LIGHTS (EXCEPT MACAN TURBO) > INSTALLING FOG LIGHTS

1. Installation is performed in reverse order to removal.
2. Tighten fastening screws for the fog light.

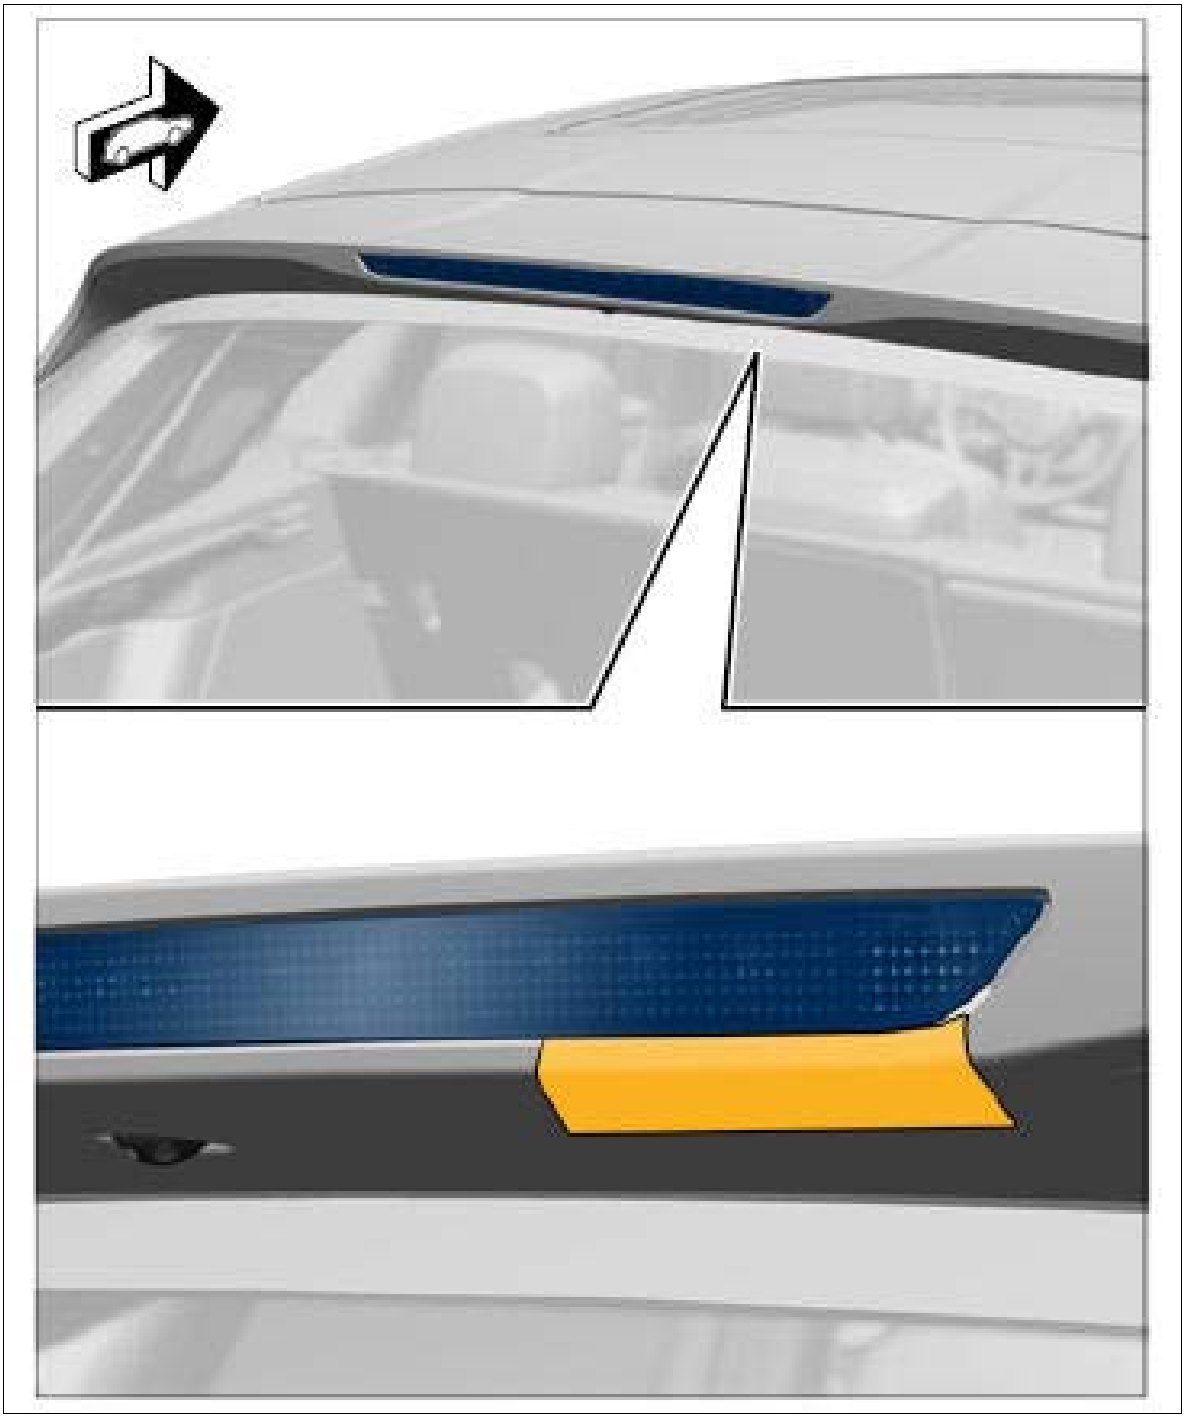
WM 946419 REMOVING AND INSTALLING FOG LIGHTS (EXCEPT MACAN TURBO) > SUBSEQUENT WORK

1. Check fog light setting. → WM 941516 ADJUSTING HEADLIGHTS AND FOG LIGHTS

WM 947019 REMOVING AND INSTALLING ADDITIONAL BRAKE LIGHT (ALL MODELS) > REMOVING ADDITIONAL BRAKE LIGHT

1. Remove additional brake light.

Fig 1: Masking Rear Spoiler



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Mask the right-hand side of the rear spoiler underneath the additional brake light as shown → Masking rear spoiler using fabric adhesive tape.

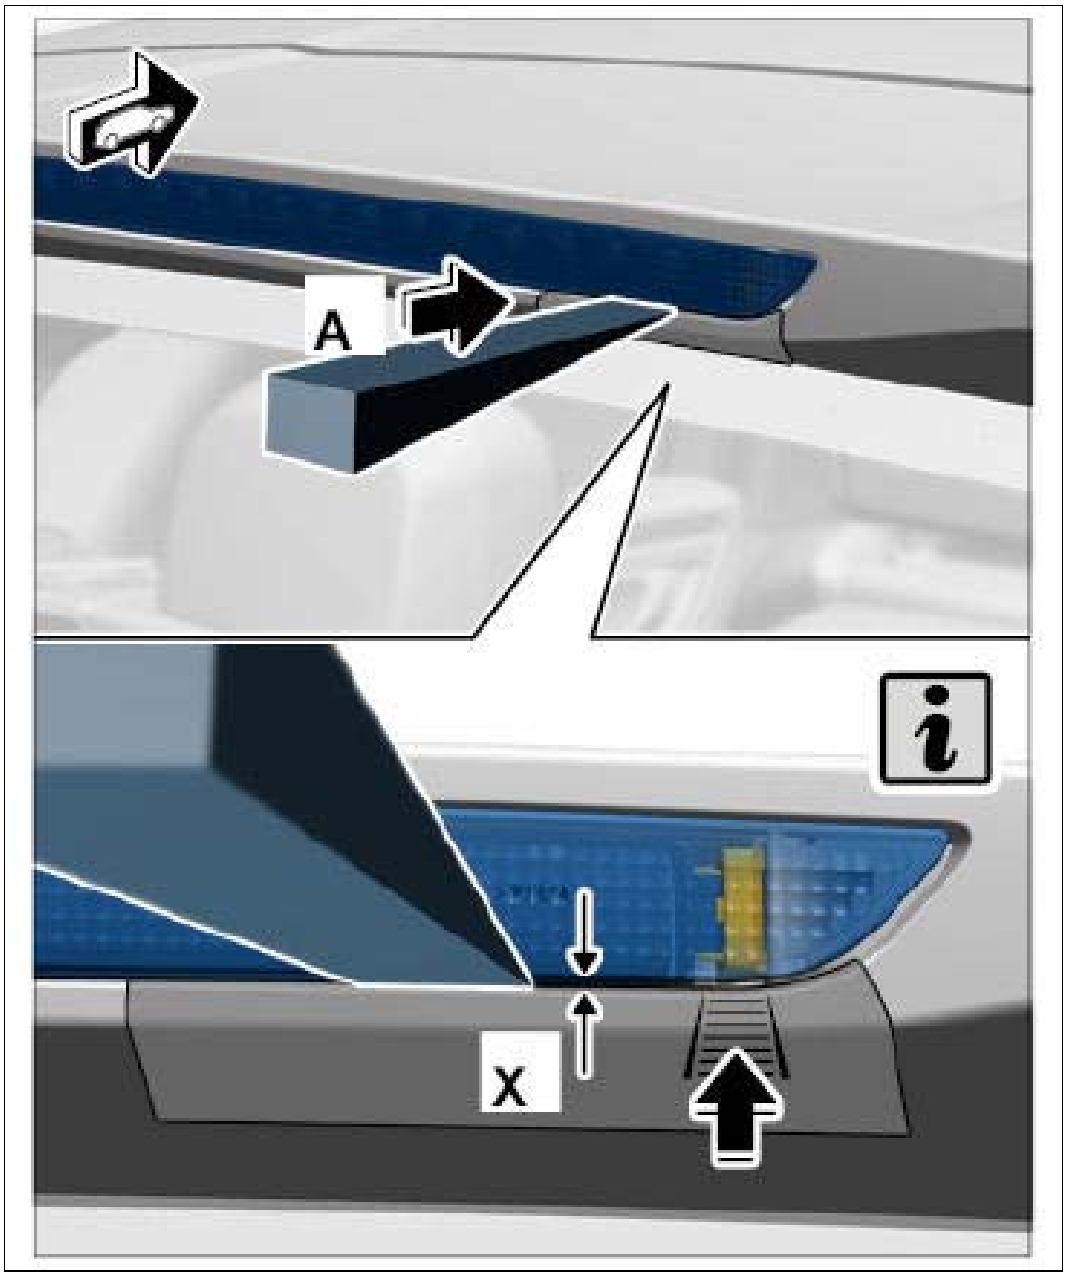
   Information

   To **prevent damage** to the **additional brake light,** always observe the following installation sequence and **never** use a plastic wedge or slotted screwdriver to **lever the additional brake light out of the rear spoiler.**

You will find a **video clip** showing how to remove the additional brake light as a PDF file in the PIWIS information system in the "Workshop Manual" information medium under **==> "947019 Removing additional brake light - video clip".**

2. 1.2. Carefully insert a plastic wedge at a horizontal position between the rear spoiler and additional brake light **-arrow A-** until there is a gap of approx. **X = 3 mm** between the lower edge of the additional brake light and rear spoiler.

Fig 2: Removing Additional Brake Light



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

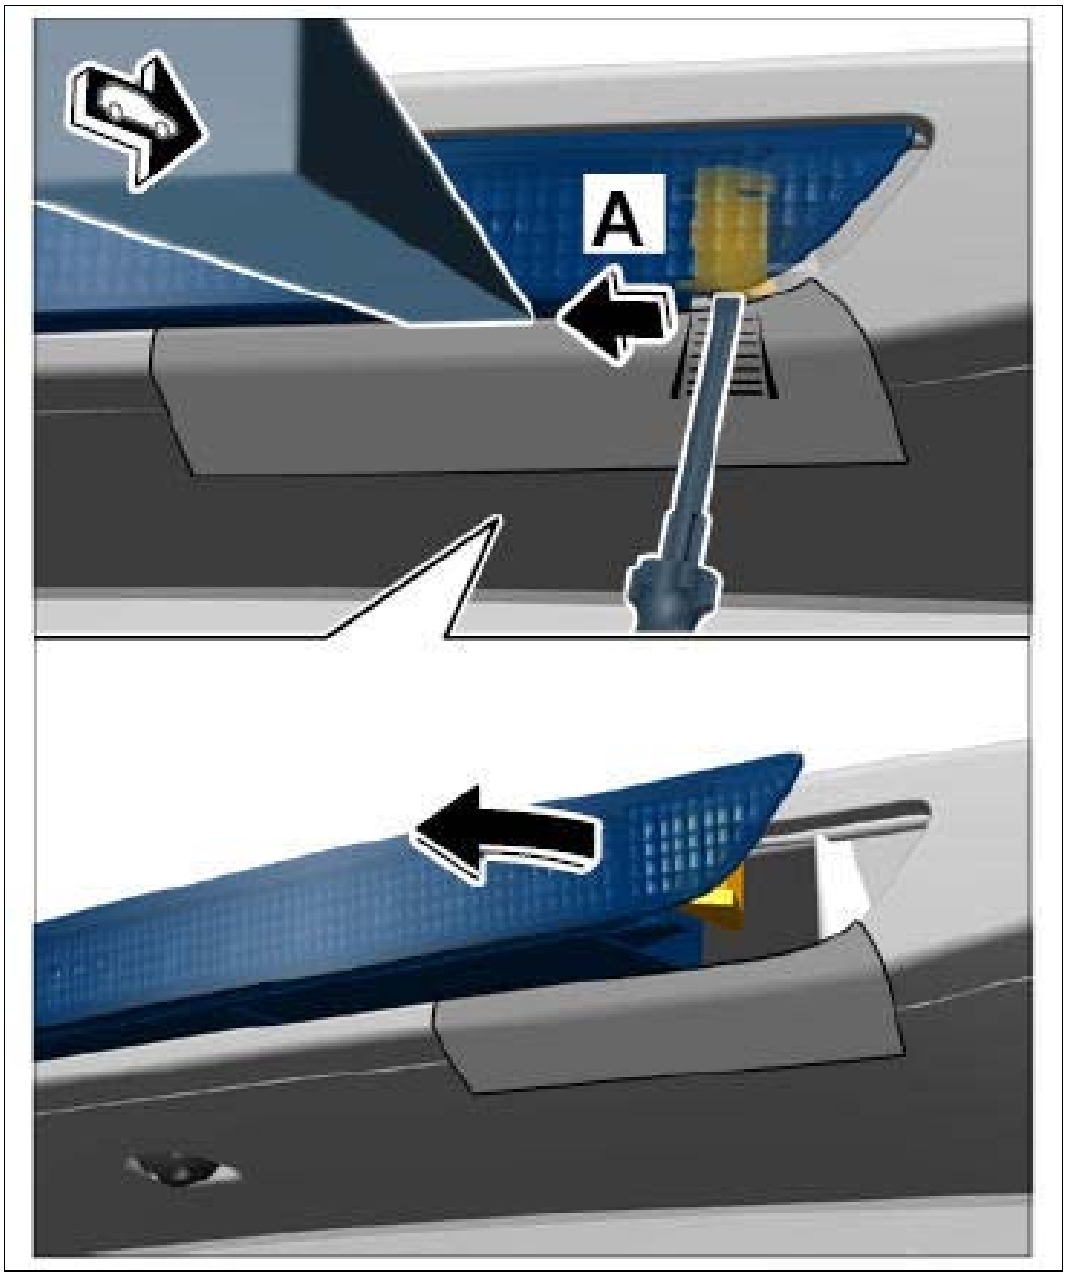
When removing the additional brake light, always use a small slotted screwdriver to move the locking lug to the left and unlock it through the widened gap.

Only release the additional brake light when part of the locking lug is visible through

the gap. Use a hand lamp to check this if necessary.

3. 1.3. Insert a narrow screwdriver in the marked area of the gap and push the additional brake light locking lug lying behind it to the left to unlock it **-arrow A-** until the additional brake light pops out slightly.

   Fig 3: Removing Additional Brake Light

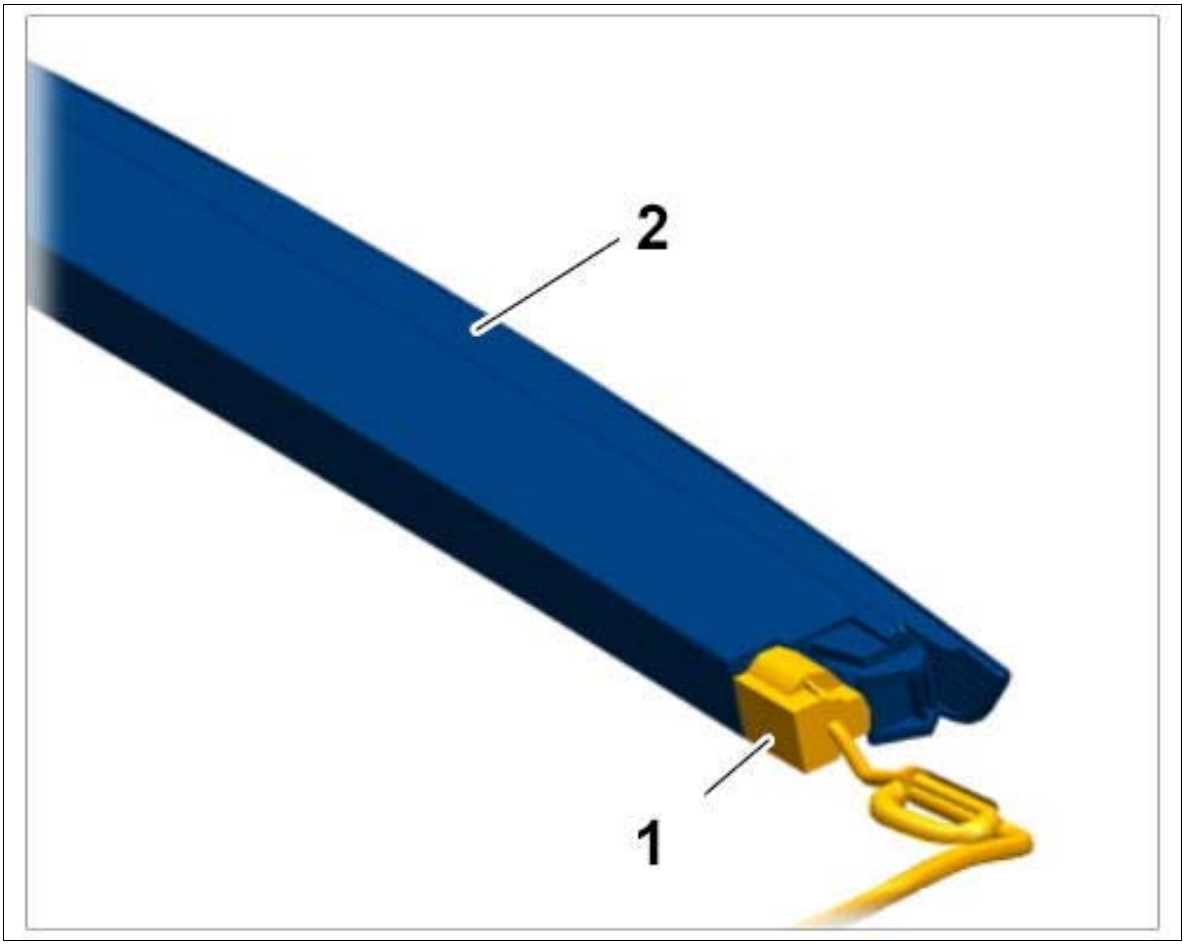


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. 1.4. Carefully pull the plastic wedge and additional brake light out of the rear spoiler **-arrow-** and leave the additional brake light hanging on the wire harness at the left.
5. 1.5. Remove the fabric tape you affixed to the rear spoiler earlier.

2. Remove additional brake light.
3. Release electric plug connection **-1-** and pull it off the additional brake light **-2-** .

Fig 4: Identifying Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

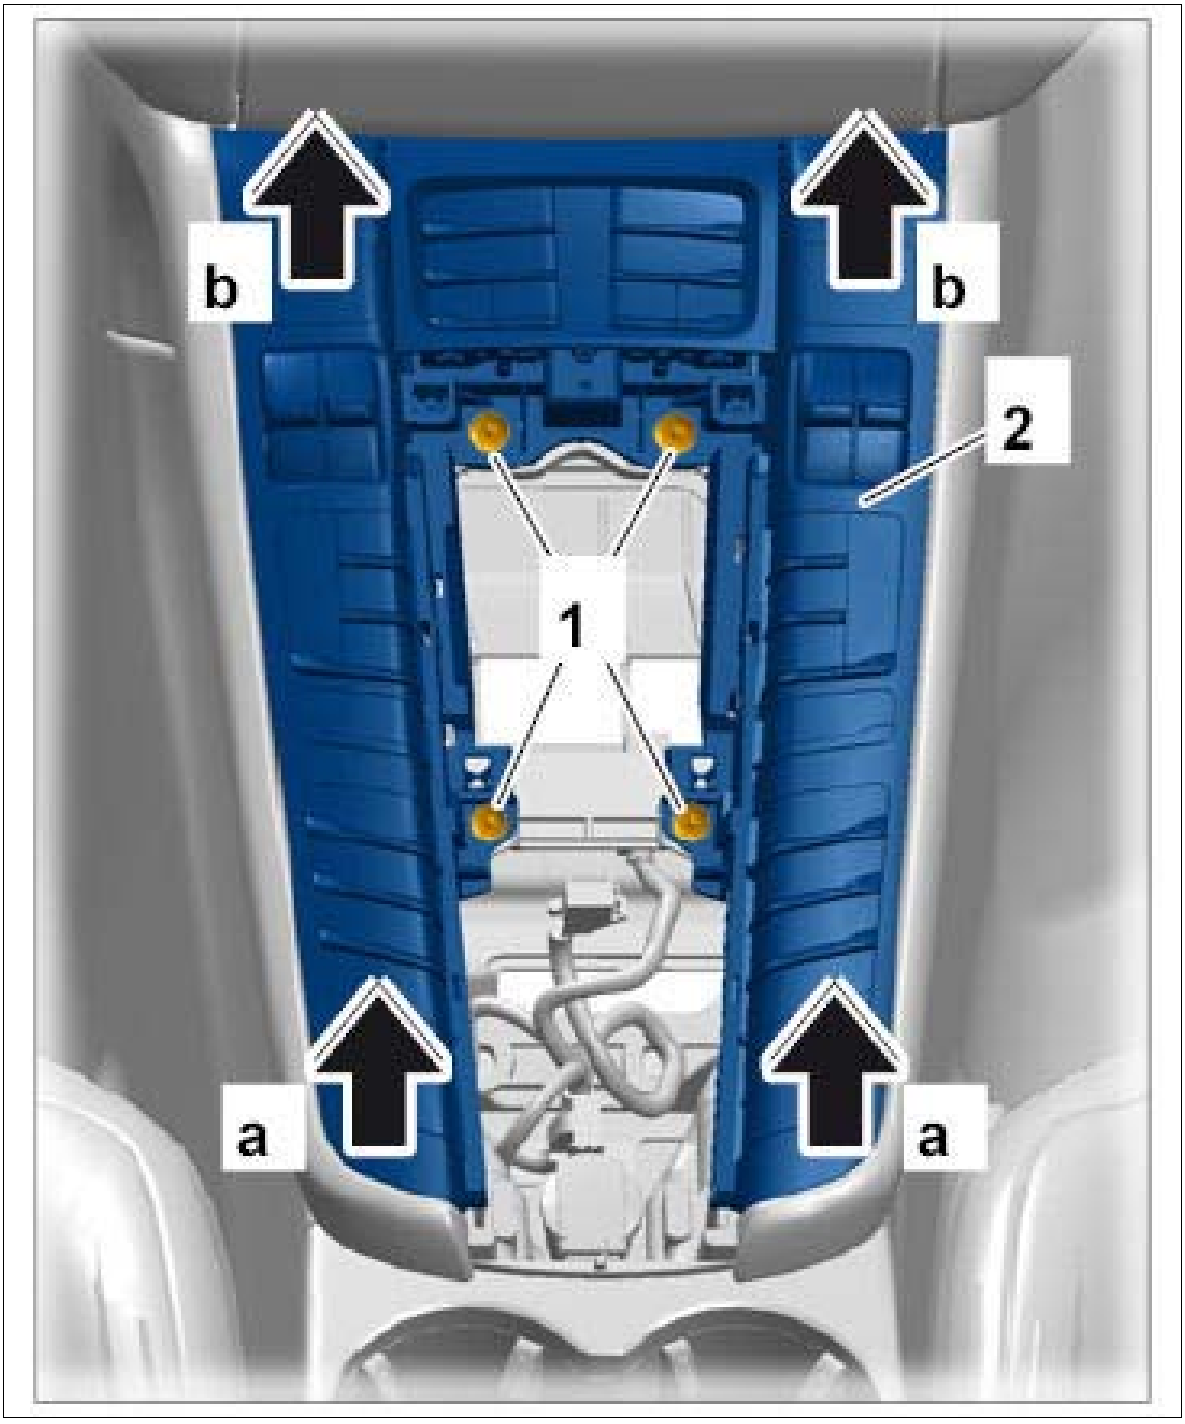
NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

1. Unscrew fastening screws **-1-** .
2. Carefully disengage switch console **-2-** from the center console in an upward direction **-a, b-** and pull it out under the flap on the DVD autochanger.

Fig 1: Loosening Switch Console



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Always comply with the regulations for handling ESD-sensitive components!

1. Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
2. The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.

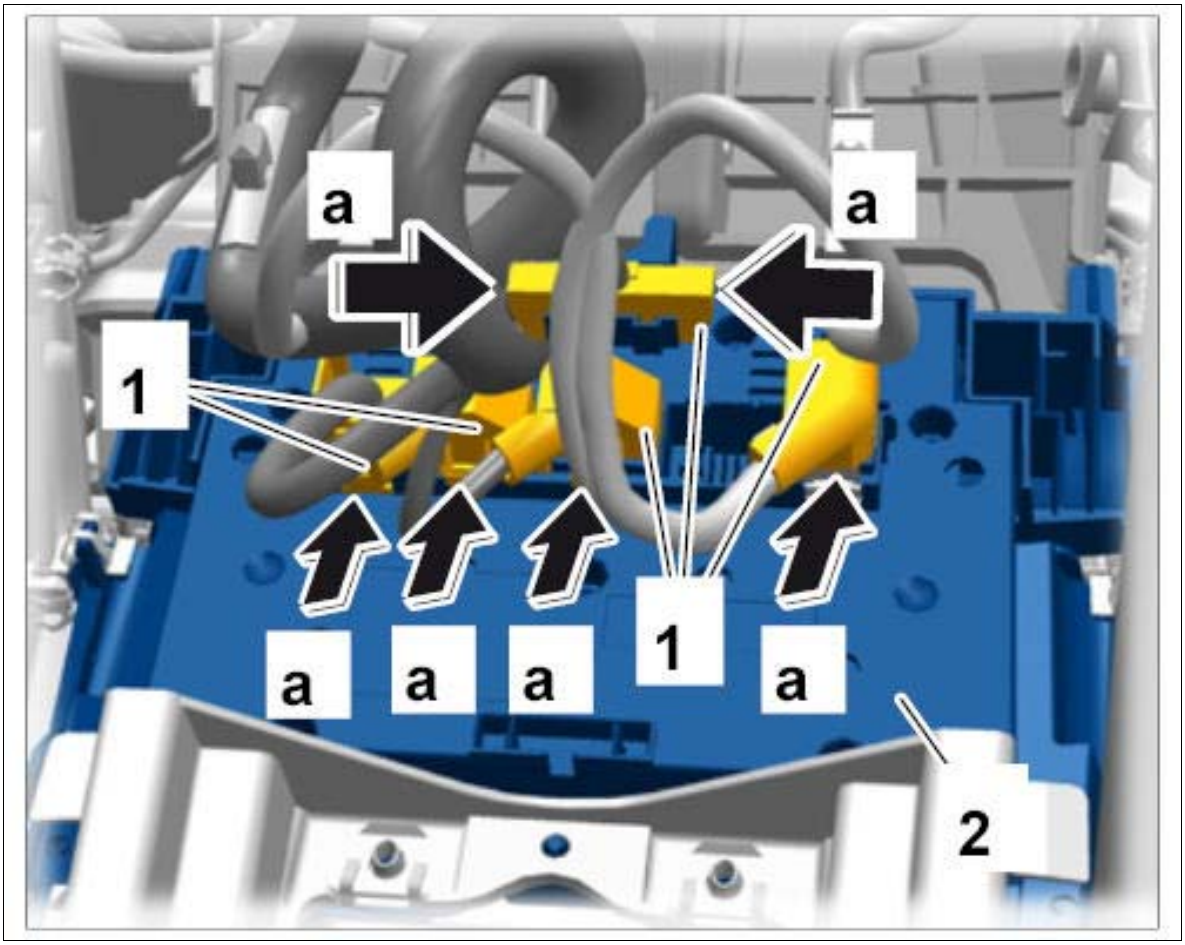
3. Never touch the electric pins and plug contacts.

Information

The number of plug connections can vary, depending on equipment.

3. Release electric plug connections **-1-** (**-a-**) and disconnect them from the switch console **-2-** .

Fig 2: Disconnecting Electric Plug Connections



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 962719 REMOVING AND INSTALLING SWITCH CONSOLE (ALL MODELS) > INSTALLING SWITCH CONSOLE

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.

- Never touch the electric pins and plug contacts.

1. Installation is performed in reverse order to removal.
2. Tighten fastening screws securing switch console to center console. **Tightening torque 4 Nm (3 ftlb.)**

WM 962719 REMOVING AND INSTALLING SWITCH CONSOLE (ALL MODELS) > SUBSEQUENT WORK

1. Install upper part of center console cover. → Installing Upper Part Of Center Console Cover
2. If the switch console was replaced, teach the new switch console to suit the vehicle using **PIWIS Tester II 9818.** → 962755 REPLACING SWITCH CONSOLE

WM 962755 REPLACING SWITCH CONSOLE (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 962755 REPLACING SWITCH CONSOLE (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 962755 REPLACING SWITCH CONSOLE (ALL MODELS) > PRELIMINARY WORK

1. Replace control unit for switch console. → 962719 REMOVING AND INSTALLING SWITCH CONSOLE

WM 962755 REPLACING SWITCH CONSOLE (ALL MODELS) > REPLACING SWITCH

CONSOLE

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the PIWIS Tester to the vehicle and start the diagnostic application. Switch on ignition.
2. Select vehicle type.
3. Select the **Air conditioning** control unit in the **overview** .
4. **Codings/adaptations** must now be selected.
5. **Automatic coding** must then be selected and press [F12] to start coding.
6. The Tester displays the message **Coding completed successfully.**
7. Select the **Drive links/checks** menu.
8. Select **General** group and press [F12].

   Information

   1. The Compressor run-in function can only be carried out when the engine is running.
   2. Prerequisites for compressor run-in can be displayed in the Porsche System Tester by pressing the [F1] Help button for the air-conditioning system control unit.
   3. Specifications in the Porsche System Tester have priority and take precedence over the specifications in the description.

4. If the Compressor run-in function cannot be activated, then the Reset compressor run-in function must be carried out first.

5. Then start the Compressor run-in function again.

9. Start the engine.

10. Select the **Reset compressor run-in** function by pressing [F12] and then press [F8] to start the reset process.

    1. 10.1. A **compressor run-in remaining time of 150 s** must be set.

11. Select the **Compressor run-in** function, press [F12] and then [F8] to start.

12. Read out the fault memory and erase it if necessary.

13. Check the function of the switch console during a test drive and read out the fault memory.

WM 963819 REMOVING AND INSTALLING FRONT CAMERA (ALL MODELS) > PRELIMINARY WORK

1. Remove trim panels over interior rear-view mirror. → Removing Interior Rear-View Mirror

WM 963819 REMOVING AND INSTALLING FRONT CAMERA (ALL MODELS) > REMOVING FRONT CAMERA

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

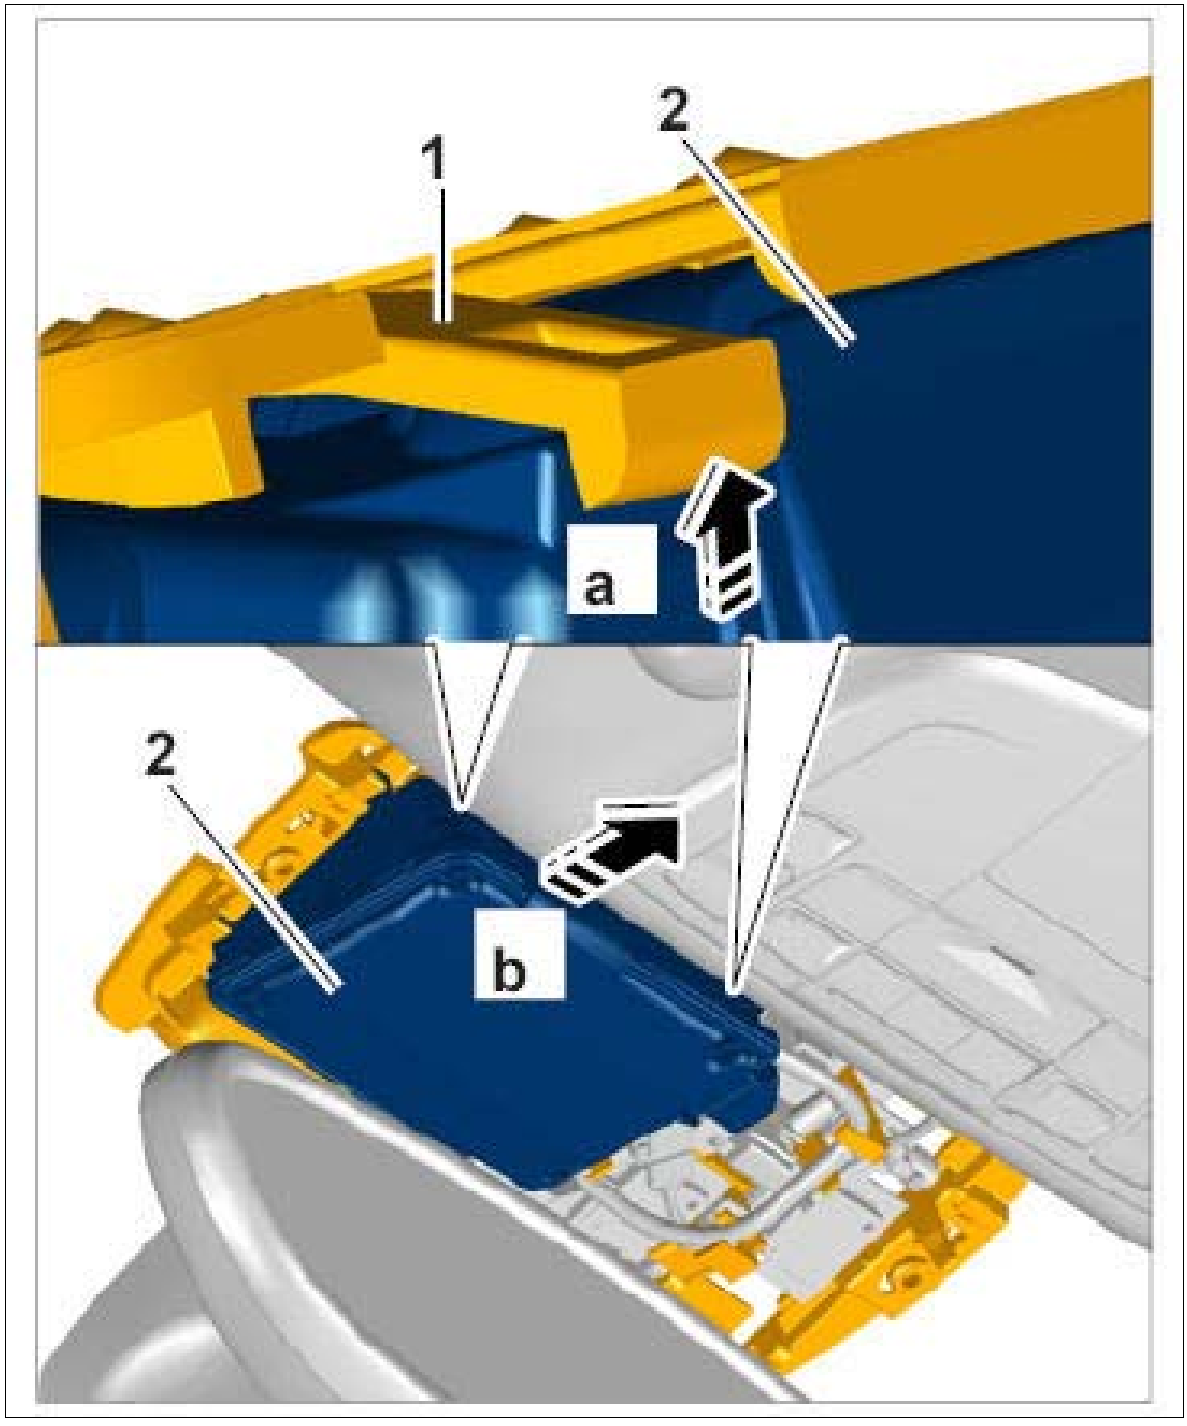
Information

Do not touch the front camera lens!

1. Switch off ignition and pull remote control out of ignition lock.

2. Carefully disengage locks **-1-** at the left and right using two plastic wedges **-a-** and press front camera **-2-** to the rear and out of the holder **-b-** .

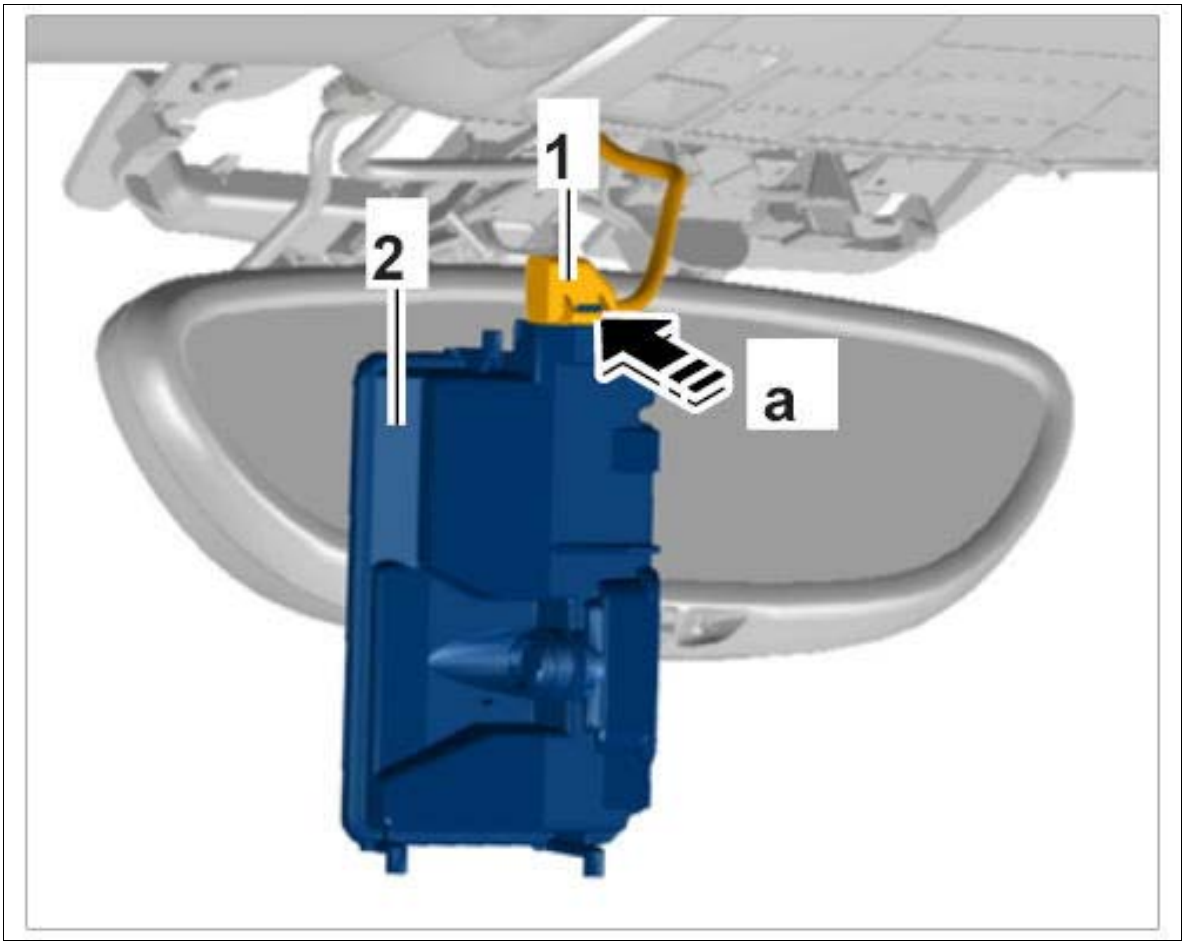
Fig 1: Removing Front Camera



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Release electric plug connection **-1-** (**-a-**) and pull it off the front camera **-2-** .

Fig 2: Disconnecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 963819 REMOVING AND INSTALLING FRONT CAMERA (ALL MODELS) > INSTALLING FRONT CAMERA

Information

Always comply with the regulations for handling ESD-sensitive components!

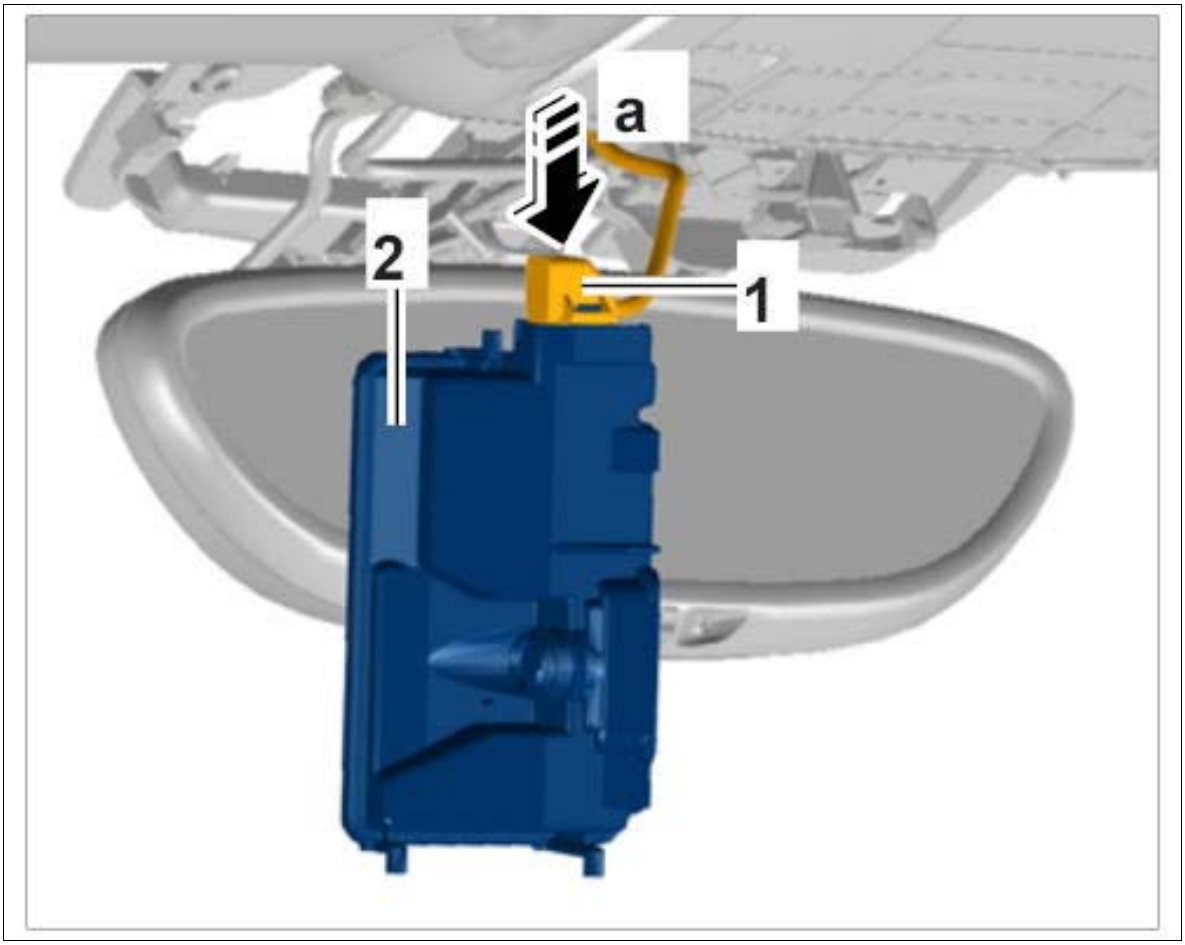
- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

Information

Do not touch the front camera lens!

1. Connect electric plug connection **-1-** on the front camera **-2-** (**-a-**) until it engages securely.

Fig 1: Connecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Install front camera.

    1. 2.1. Position front camera **-1-** on the holder in such a way that the two retaining pins at the left **-a-** and the retaining pin at the right **-b-** make contact with the mounting points.

    2. 2.2. Press front camera forward into the mounting points until the locks **-2-** engage securely.

Fig 2: Installing Front Camera

WM 963819 REMOVING AND INSTALLING FRONT CAMERA (ALL MODELS) > SUBSEQUENT WORK

1. Install trim panels over interior rear-view mirror. → Installing Interior Rear-View Mirror
2. If the front camera was replaced or the windscreen was removed and installed, calibrate the front camera. → 9638K2 CALIBRATING FRONT CAMERA

WM 9638K2 CALIBRATING FRONT CAMERA (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
Setting device with reflector	Service equipment	WE 1362		
Calibration board for lane departure warning	Service equipment	WE 1540		
PIWIS Tester II	Special tool	9818		
WM 9638K2 CALIBRATING FRONT CAMERA (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 9638K2 CALIBRATING FRONT CAMERA (ALL MODELS) > INFORMATION

When does the front camera need to be calibrated?

The front camera must be re-calibrated in the following situations:

- When removing and installing the front camera
- When removing and installing the windscreen
- When changing the height of the chassis
- When adjusting the chassis

WM 9638K2 CALIBRATING FRONT CAMERA (ALL MODELS) > PRELIMINARY WORK

Information

The exact position of the front camera with respect to the vehicle coordinate system is determined by calibrating the front camera.

- The setting device Setting device with reflector WE 1362 , the calibration board Calibration board for lane departure warning WE 1540 and a wheel alignment computer are required for the calibration process.

Information

Calibration must only be performed on a levelled wheel alignment platform or on level ground.

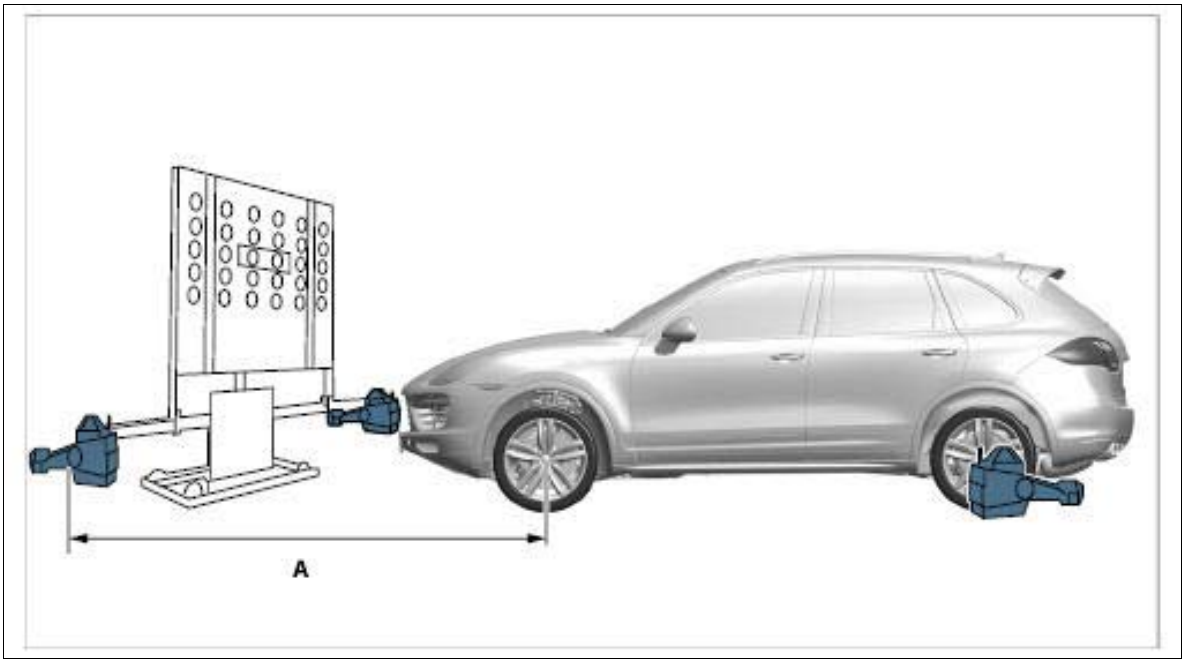
On vehicles with air suspension, switch on ignition, close the doors and set the air suspension to **Normal** .

Information

The vehicle must be empty and all doors must be closed.

1. If work was carried out on the chassis, basic initial alignment must be carried out before calibrating the front camera. → 449503 SUSPENSION ALIGNMENT, COMPLETE
2. The level must be set to **Normal** for vehicles with **air suspension** .

   Fig 1: Parking Vehicle On Wheel Alignment Platform (Shown On Cayenne)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Park the vehicle on a levelled wheel alignment platform or on a level surface and set up the calibration unit **Setting device with reflector WE 1362** in front of the vehicle in accordance with the instructions on the wheel alignment computer and PIWIS Tester.

WM 9638K2 CALIBRATING FRONT CAMERA (ALL MODELS) > CALIBRATING FRONT CAMERA

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

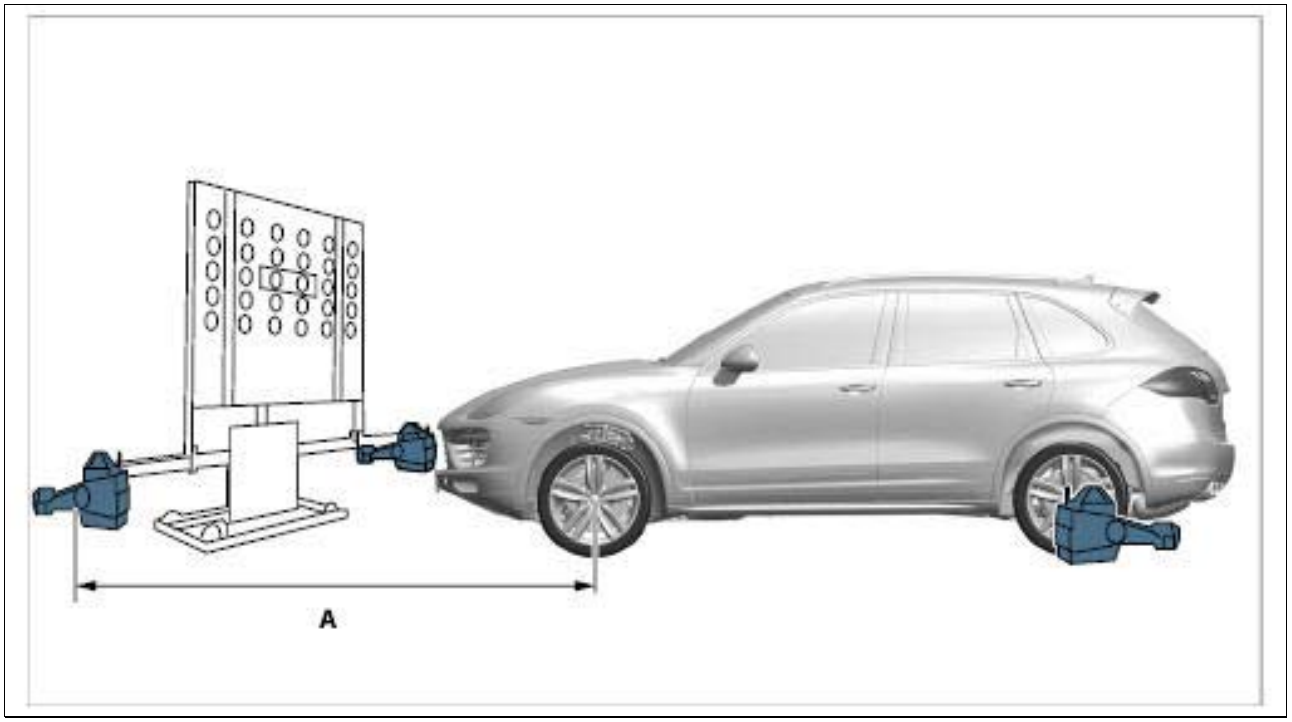
→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

Fig 1: Parking Vehicle On Wheel Alignment Platform (Shown On Cayenne)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. The following tools are required:

1. 1.1. Setting device **Setting device with reflector WE 1362**
2. 1.2. Calibration board **Lane departure warning calibration board WE 1540**
3. 1.3. Wheel alignment computer

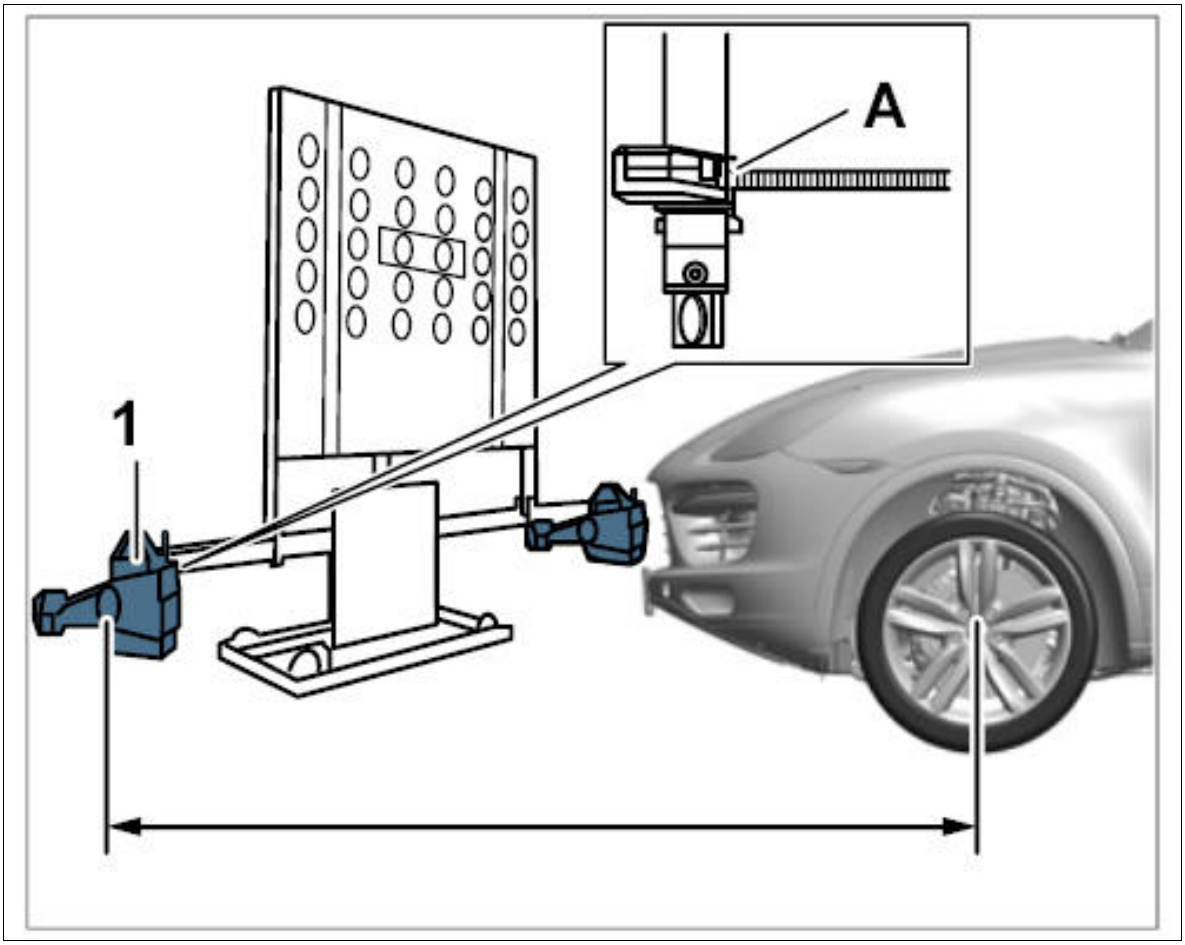
2. Select the **relevant vehicle in the wheel alignment computer.**
3. Select quick function **Calibrate front camera.**
4. Align the calibration board. Follow the steps and instructions on the wheel alignment computer.
5. The surface of the board must be clean and free of objects.

   Information

   The required height of the calibration board and the distance of the calibration board from the vehicle will not be displayed on the wheel alignment computer. These values are stored under **Front camera calibration** in the Tester.

6. Set the distance from the calibration unit to the vehicle as shown on the Tester. The distance **-A-** must always be between **1, 000 mm and 3, 000 mm** from the center of the wheel hub to the calibration unit. The difference between the right and left side must be < 5 mm.

   Fig 2: Checking Distance From Vehicle To Calibration Unit (Shown On Cayenne)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Secure measured-value pickup mounting to the rear wheels of the vehicle.

8. Fit the relevant measured-value pickups on the measured-value pickup mounting and the calibration board.

9. The height of the calibration board must be **1, 400 mm** . Make sure that the measuring stick is touching the floor. If the vehicle is on a wheel alignment platform, the height of the calibration board must be adjusted to include the height of the wheel alignment platform.

10. Before starting the calibration process, write down the height of the four wheel housing edges. These must be measured from the floor (vehicle standing level) to the highest point of each wheel housing edge and must be specified in mm.

11. The wheel alignment computer is no longer needed for the rest of the calibration process. ↓**Do not move the vehicle or calibration board from this point onwards!**

    Information

    Once all adjustment procedures are complete in the wheel alignment computer, start the calibration process in the PIWIS Tester.

12. Connect the PIWIS Tester to the vehicle and start the PIWIS Tester. Switch on ignition and press [F12] to continue.

13. Select the vehicle type and start the diagnostic application.

14. Select the **Front camera** control unit in the **overview** .

15. **Select Maintenance/repairs.**

16. **Select Calibrate front camera** and press [F12]

17. Read the warnings displayed on the Tester and follow the instructions.

18. Enter the values **Wheel housing edge height and Distance to calibration board.** Press [F12] to continue.

19. Start the calibration process by pressing [F8]. The vehicle must not be moved.

20. The Tester confirms that **calibration was completed successfully** .

    Information

    If the calibration process could not be completed successfully, one or more of the calibration values are outside of the required range. There can be a number of different reasons for this.

    1. The calibration board is not at the correct height.

    2. The vehicle and calibration board are not aligned correctly.

21. Switch ignition off and then on again.

22. Check the function of the front camera.

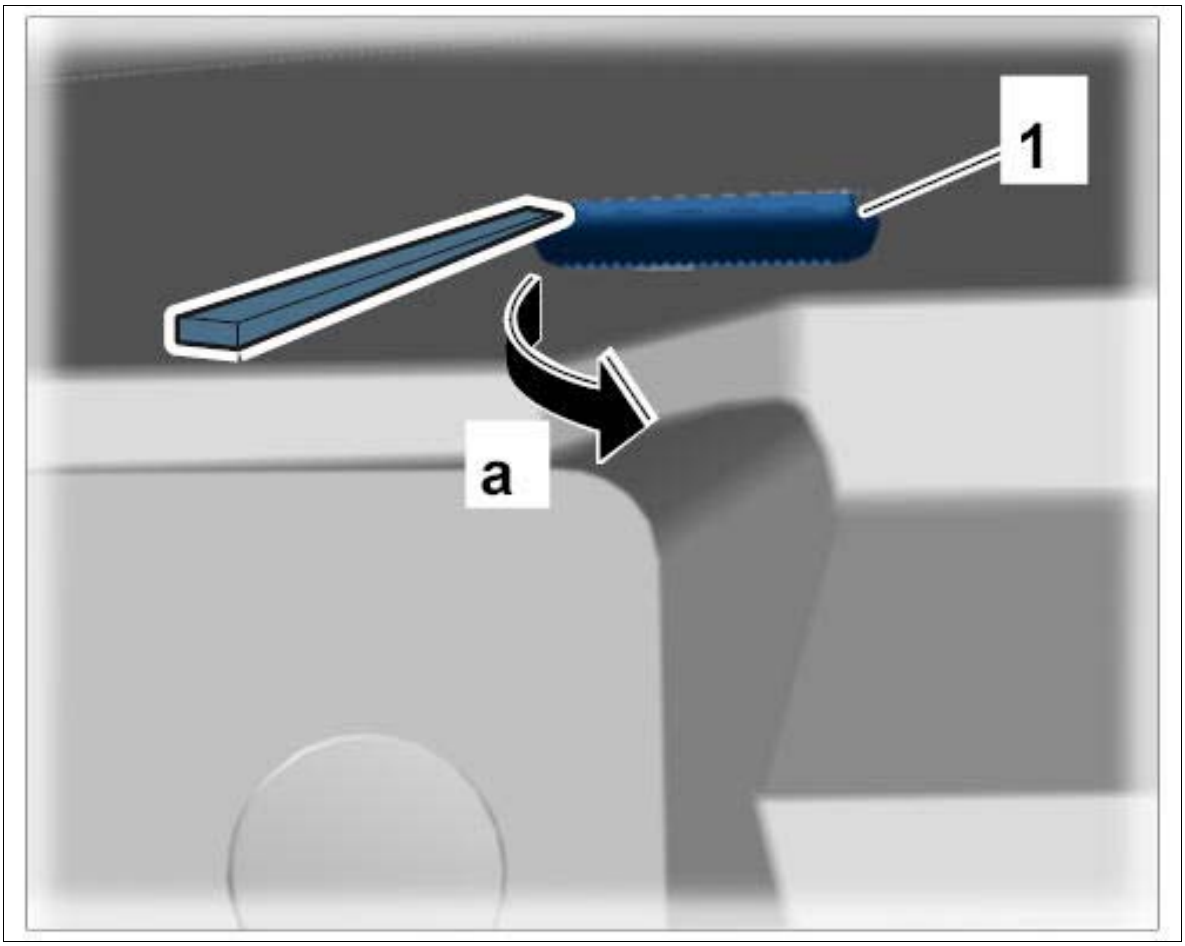
23. Read out the fault memory.

WM 964419 REMOVING AND INSTALLING GLOVE COMPARTMENT LIGHT (ALL

MODELS) > REMOVING GLOVE COMPARTMENT LIGHT

1. Switch off ignition and pull remote control out of ignition lock.
2. Open the glove compartment and unclip glove compartment light **-1-** from the glove compartment using a plastic wedge **-a-** .

   Fig 1: Loosening Glove Compartment Light



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Release electric plug connection **-1-** (**-a-**) and disconnect it from the glove compartment light **-2-** .

WM 966255 REPLACING REMOTE CONTROL (HAND-HELD TRANSMITTER) (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 966255 REPLACING REMOTE CONTROL (HAND-HELD TRANSMITTER) (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 966255 REPLACING REMOTE CONTROL (HAND-HELD TRANSMITTER) (ALL MODELS) > REPLACING REMOTE CONTROL (HAND-HELD TRANSMITTER) > REPLACING REMOTE CONTROL

Information

All remote controls (keys) are required for teaching a DME, front-end electronics (front BCM), rear-end electronics (rear BCM), electronic steering lock (ELV) control unit or remote controls (keys) for example.

Remote controls (keys) that are not taught during this teaching procedure will no longer be recognized by the vehicle.

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the PIWIS Tester to the vehicle and start the PIWIS Tester. Switch on ignition.
2. Select the menu **Diagnostics -> Online teaching function -> Engine immobilizer** on the Start page.
3. **The relevant vehicle** must now be selected. Then press [F12] to ↓continue.
4. Follow the instructions on the Tester and press [F12] to continue.
5. The vehicle identification number (VIN) is displayed. Change the vehicle identification number if necessary.
6. Enter the repair order number and press [F12] to continue.
7. Enter the PPN user name and password and press [F12] to continue.
8. Login is performed.
9. The Tester displays the message **Login successful** . Press [F12] to continue.
10. Follow the instructions on the Tester to select the required menu.
11. Once the teaching process is completed successfully, the Tester shows the following status, for example:

    2 keys taught

    Front BCM: taught

    ELV: taught

    Rear BCM: taught

DME: taught

Overall vehicle status: taught. Press [F12] to continue.

12. Press [ESC] **to end the Online teaching function** and select the **vehicle type** on the Start page.
13. Function test: Lock, open and start the vehicle using all remote controls (hand-held transmitters).
14. Read all fault memories and erase if necessary.

1. Install front apron. → Installing Front Apron
2. If the garage door opener control unit was replaced, all remote controls (e.g. for the garage door, gate to property) must be re-taught to suit the garage door opener control unit. → 967955 REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER

WM 967955 REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER(ALL MODELS) > REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER > TEACHING CONTROL UNIT FOR GARAGE DOOR OPENER

Information

If the garage door opener control unit was replaced, the remote controls for the garage door drive, for example, must be re-taught.

Information

Original remote controls for garage door system cannot be taught to operate with the HomeLink in the vehicle. OR: The teaching process was confirmed, but HomeLink will not work or only works sporadically.

- Check that the battery in the original remote control for the garage door opener is new. If in doubt, change the battery and repeat the teaching process.

The programmable HomeLink replaces up to three original remote controls for operating various equipment (e.g. garage door, gate to property, alarm system).

The buttons **I, II** and **III** can each be programmed with one frequency of an original remote control.

Prerequisites for operating and programming the HomeLink:

- The ignition is switched on.
- The hazard warning lights are switched off.

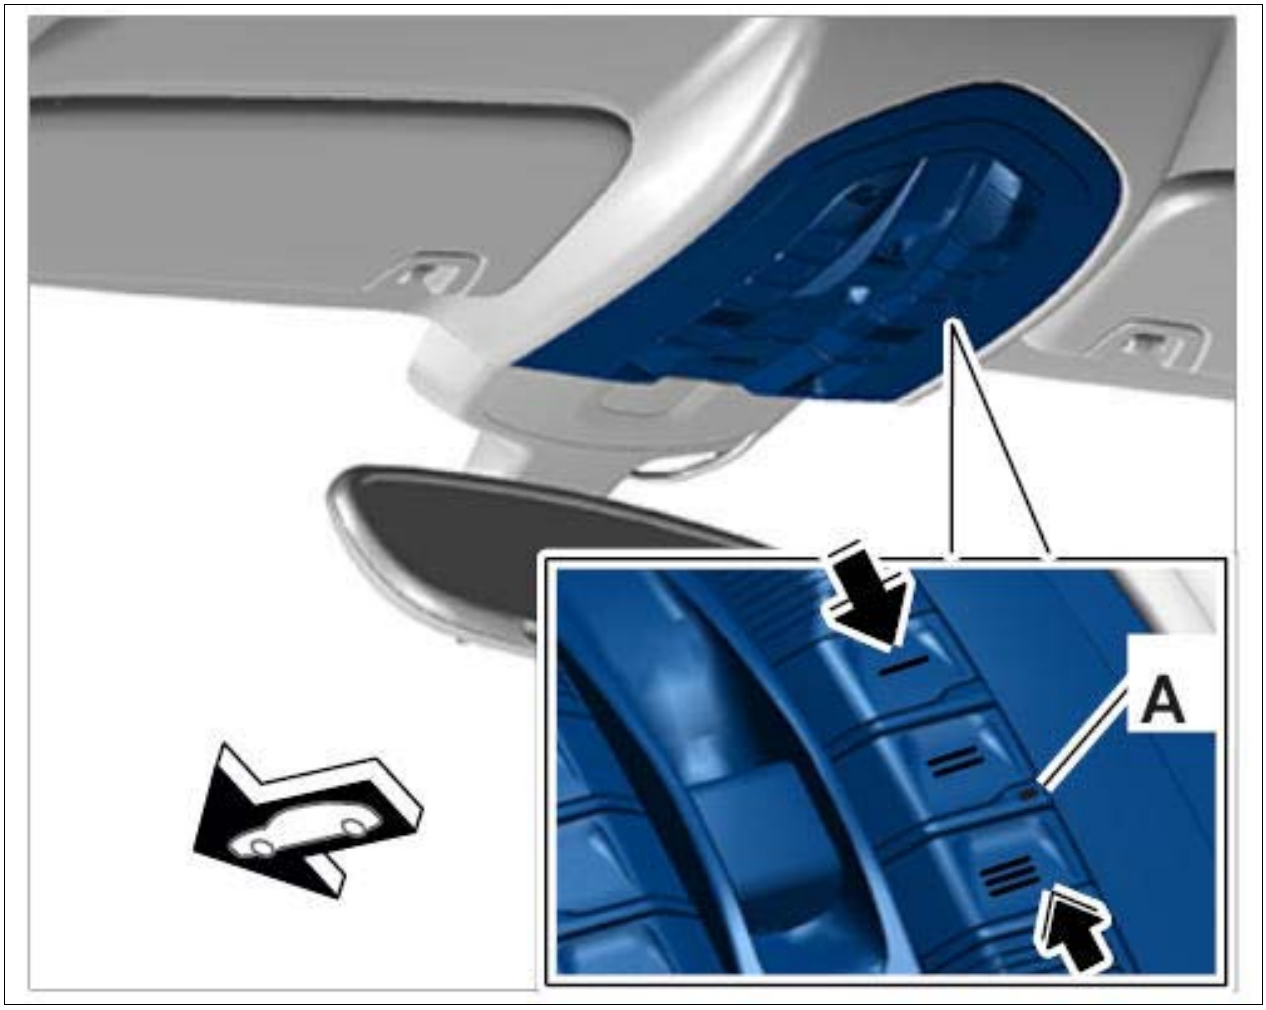
WM 967955 REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER(ALL MODELS) > REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER > DELETING STORED SIGNAL FROM THE BUTTONS

Information

This operation erases the standard codes set in the factory. Do not repeat this operation if additional signals are to be stored on the buttons.

- Hold the two outer buttons I and III down for around 20 seconds until the LED -A- starts to flash quickly. All programmed signals for the buttons are erased.

Fig 1: Overview Of Garage Door Opener Button Assignment



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 967955 REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER(ALL MODELS) > REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER > STORING GARAGE DOOR OPENER SIGNAL ON BUTTON WITH FIXED CODE SYSTEM

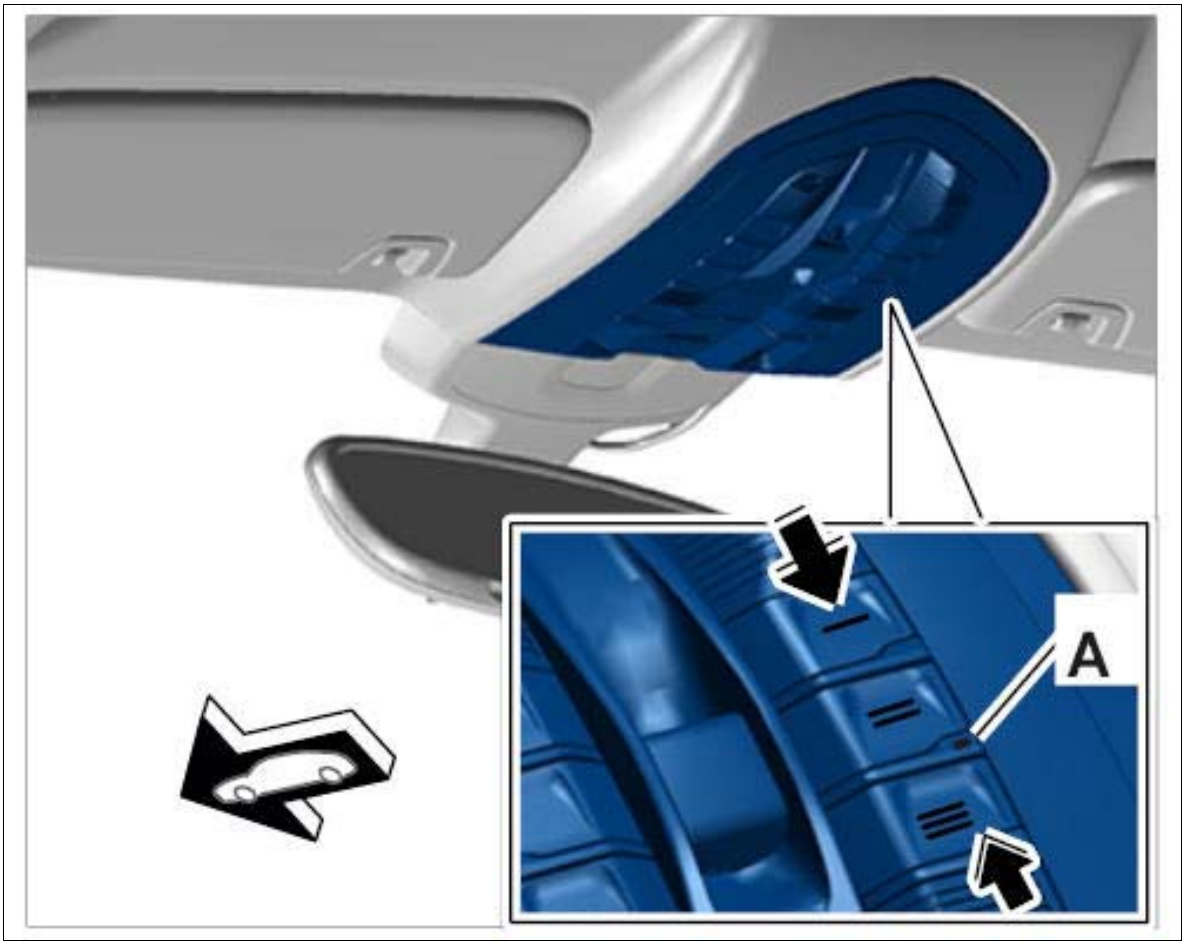
Information

A number of attempts may be necessary at different distances between the vehicle and original remote control.

The hazard warning lights flash once after 5 minutes. The programming operation must then be started from scratch.

1. The standard codes set in the factory must be erased first before any signals can be stored.
2. Press the required button on the keypad of the roof control unit until the indicator light **-A-** on button **II** flashes slowly. The button is then in learning mode for 5 minutes.

Fig 1: Overview Of Garage Door Opener Button Assignment



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Hold the original remote control at a distance of around 30 cm from the spot marked (picture) and press the Send button until the vehicle's hazard warning lights light up three times (takes up to approx. 45 seconds).

Fig 2: Identifying Remote Control Teaching Position

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Repeat Steps 2 to 4 to assign further buttons.

WM 967955 REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER(ALL MODELS) > REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER > STORING GARAGE DOOR OPENER SIGNAL ON BUTTON WITH VARIABLE CODE SYSTEM

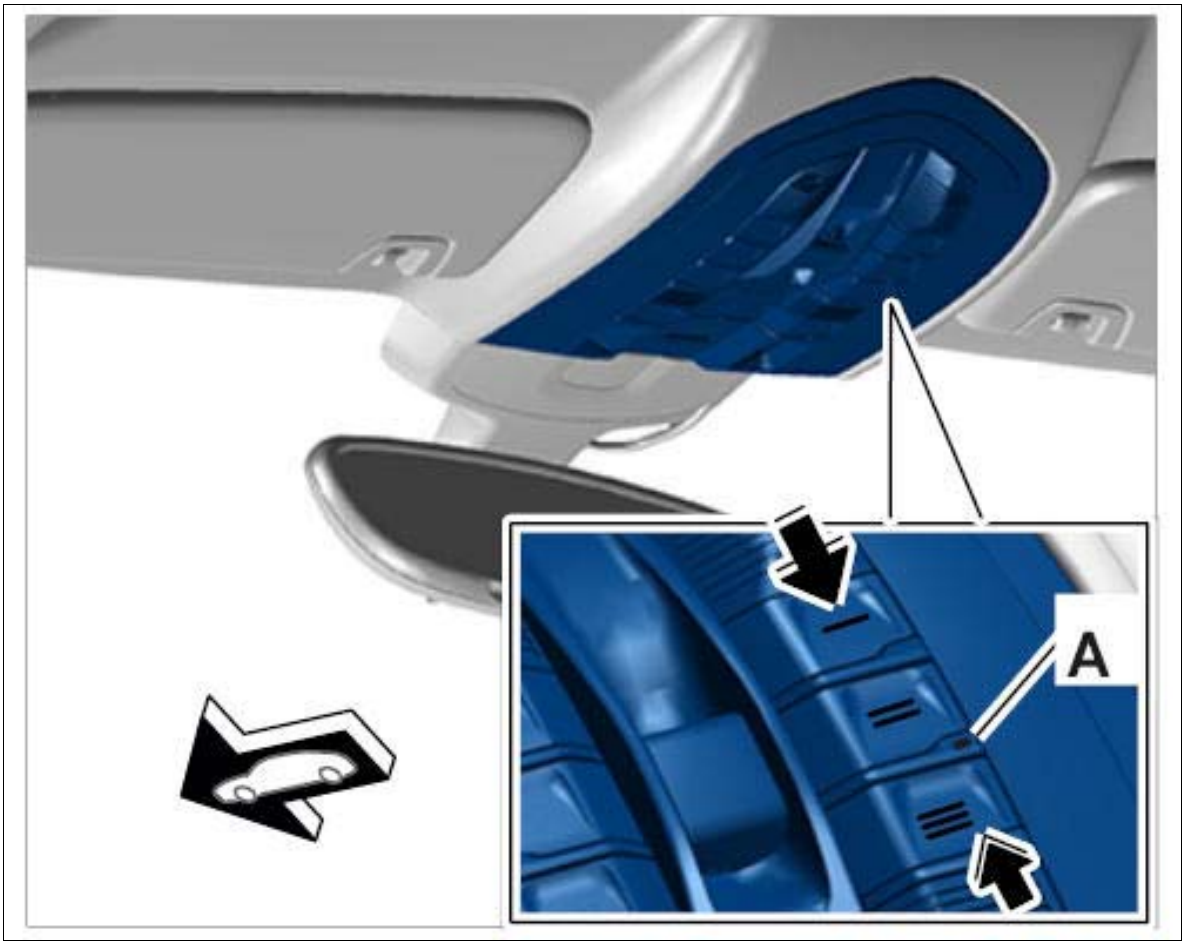
Information

Check operating instructions for the garage door drive (or other system) for specification of a variable code.

If the garage door opener control unit has been programmed to a variable code system, it will still have to be synchronised with this system on completion of programming before it will work correctly.

1. The standard codes set in the factory must be erased first before any signals can be stored.
2. Press the required button until the LED flashes slowly. You then have around 5 minutes to complete steps 3 and 4.

Fig 1: Overview Of Garage Door Opener Button Assignment



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Hold the original remote control approx. 0 - 30 cm in front of the marked position on the vehicle.

Fig 2: Identifying Remote Control Teaching Position

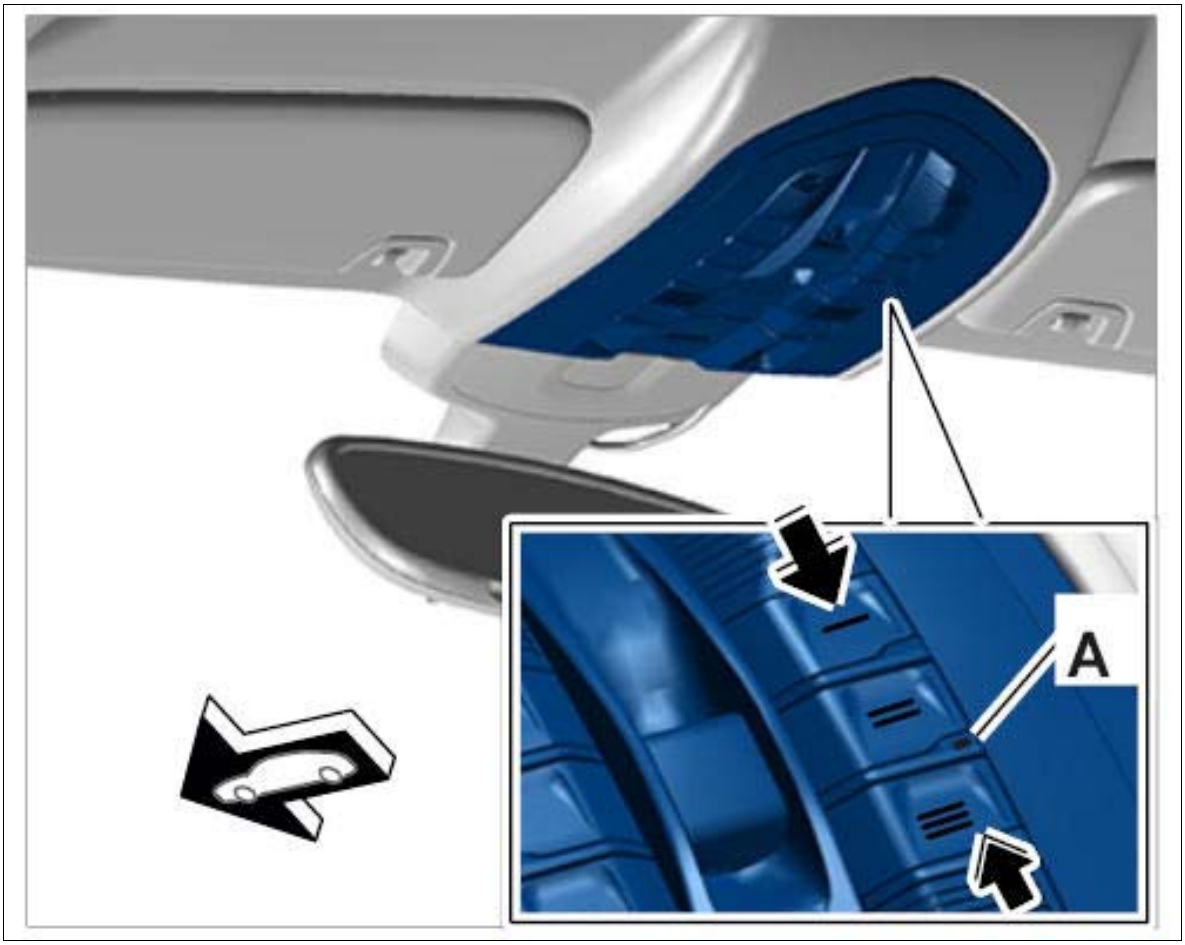
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Press the Send button on the original remote control until the hazard warning lights flash three times (up to approx. 45 seconds).
5. To synchronise the system: Press the programming button on the garage door drive receiver. You then have 30 seconds to initiate Step 6.
6. Press assigned button on the HomeLink twice. (You may have to press the button to be assigned a third time on some equipment in order to complete the setting.)
7. Repeat the programming steps to assign further buttons.

WM 967955 REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER(ALL MODELS) > REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER > RE-PROGRAMMING AN INDIVIDUAL BUTTON ON THE KEYPAD

1. Press the required button until the LED flashes slowly (approx. 20 seconds). You then have around 5 minutes to complete Steps 2 and 3.

Fig 1: Overview Of Garage Door Opener Button Assignment



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Hold the original remote control approx. 0 - 30 cm in front of the marked position on the vehicle.

Fig 2: Identifying Remote Control Teaching Position

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Press the Send button on the original remote control until the hazard warning lights flash three times (up to approx. 45 seconds).
4. Repeat Steps 1 to 3 to assign further buttons.

Information

A number of attempts may be necessary at different distances between the vehicle and original remote control.

The hazard warning lights flash once after 5 minutes. The programming operation must then be started from scratch.

WM 967955 REPLACING CONTROL UNIT FOR GARAGE DOOR OPENER(ALL MODELS) > DIAGNOSTICS

Information

Original remote controls for garage door system cannot be taught to operate with the HomeLink in the vehicle. OR: The teaching process was confirmed, but HomeLink will not work or only works sporadically.

- Check that the battery in the original remote control for the garage door opener is new. If in doubt, change the battery and repeat the teaching process.

If after carefully observing the operating instructions and following the procedures described, teaching of the garage door opener control unit is not possible, further information can be obtained from a Hotline facility. A basic requirement is to obtain the diagnostic information beforehand as follows.

Software version

1. Press button **I** or **III** (not both) and hold for 50 seconds. The LED stops flashing and goes out completely. Continue to hold the button down. A few seconds later the LED flashes several times. The number of flashes corresponds to the software version.

e.g. four flashes	e.g. version 4.0

Regional code status

2. Press button II on the roof console and hold for approx. 50 seconds until the LED goes out and stays off. Continue to hold down button II. After a few seconds the LED flashes several times. The number of flashes indicates the programmed region.

One flash	Rest of Europe
Two flashes	France
Three flashes	U.K.
Four flashes	Italy

Information

3. Provide the following additional information about the vehicle and the original remote control:
    1. Dealer, make, model and model year of the vehicle.
    2. Make, model, age and operating frequency of the original remote control.

WM 0710IN GENERAL (ALL MODELS) > GENERAL INFORMATION ON "PORSCHE DYNAMIC REPAIR"

The term "Porsche Dynamic Repair" refers to cost-effective minor repairs, which are preferred over part replacement.

These repair methods can be used to rectify small areas of damage and signs of use with little effort or cost. This usually eliminates the need for replacement parts and the removal and installation of components.

However, a cost-effective repair may have quality implications. To achieve the best repair result, always use the tool recommended by Porsche and attend the special training courses run by the tool and system suppliers. The quality of the repair also depends on a number of factors, which are listed under the relevant repair descriptions.

The individual repair methods are:

- Glass repairs
- Dent repairs
- Interior cosmetic repairs
- Paint repairs
- Alloy wheel reconditioning
- PCM repairs (process description in the Technical Sales Information)

Repairs can only be carried out independently after successfully completing a course, or should be contracted out to specialist providers. In either case, always comply with the instructions and repair restrictions for the individual repair methods.

WM 0720IN GLASS REPAIRS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
Glass Repair System D Pro	Workshop equipment	WE 1354		

WM 0720IN GLASS REPAIRS (ALL MODELS) > CONDITIONS FOR REPAIRS

NOTE: Stress from a stone chip on the inside of the window

- *Crack in the windscreen*

→ Do not press against the stone chips in the window from the inside.

Information

This repair method is a cost-effective repair that may have quality implications. To achieve the best repair result, always use the tool recommended by Porsche and attend the special training courses run by the tool/system suppliers.

Laminated glass in windscreens can only be repaired under the following conditions:

- Damage in the driver's field of vision (30 cm wide in the wiper area **-X-**) and at the edge of the windscreen (10 cm **-Y-**) must not be repaired. → Driver's field of vision

  Fig 1: Identifying Driver's Vision Field

  
  Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Only damage to the outside of the windscreen may be repaired. There must be no damage to the inner pane or plastic film.
- Repairs must be carried out as soon as possible after the damage occurs. There must be no moisture or dirt that has visibly penetrated into the damaged area.
- The crater of the point of impact must not be more than 5 mm in diameter.
- Cracks extending radially from the point of impact must not be longer than 50 mm. → Stone chip with crack

Fig 2: Identifying Stone Chip With Crack

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

A visible spot of around 1 - 2 mm in diameter will remain following repairs. → Repair result

Fig 3: Identifying Glass Repair Area

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The following damage can be satisfactorily repaired economically using this repair method:

- Bull's eye: restoration of appearance 90-99%

Fig 4: Identifying Glass Repair Area (Bull's Eye)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Bee wings: restoration of appearance 90-99%

Fig 5: Identifying Glass Repair Area (Bee Wings)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Star break: restoration of appearance 80-90%

Fig 6: Identifying Glass Repair Area (Star Break)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Shattered break: restoration of appearance 70-80%

Fig 7: Identifying Glass Repair Area (Shattered Break)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0720IN GLASS REPAIRS (ALL MODELS) > PREPARATION

Toolbox: **Glass Repair System D Pro WE 1354**

1. Clean the damaged area.
    1. 1.1. Use a dry cloth (without any window cleaner) to clean the windscreen around the area of damage, but do not wipe across the area of impact itself.
    2. 1.2. Remove loose splinters of glass from the chipped area using the hard metal stylus, but do not enlarge the impact crater unnecessarily. → Exposing stone chip

> *IMPORTANT: The more glass missing from the chipped surface, the more obvious the blemish following repairs.*

Fig 1: Identifying Stone Chip

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Secure the mirror.

   Apply gel to the suction areas of the inspection mirror and attach the mirror to the inside of the windscreen so that the procedure can be monitored from outside. → Securing mirror

Fig 2: Securing Mirror

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Drill out

   If necessary, use a drill to mill glass splinters and dirt out of the impact hole to a depth of approx. 1 mm.

> *IMPORTANT: Always hold the drill firmly with both hands! This is the only way to ensure that the drill is positioned securely.*

Fig 3: Drilling Stone Chip

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

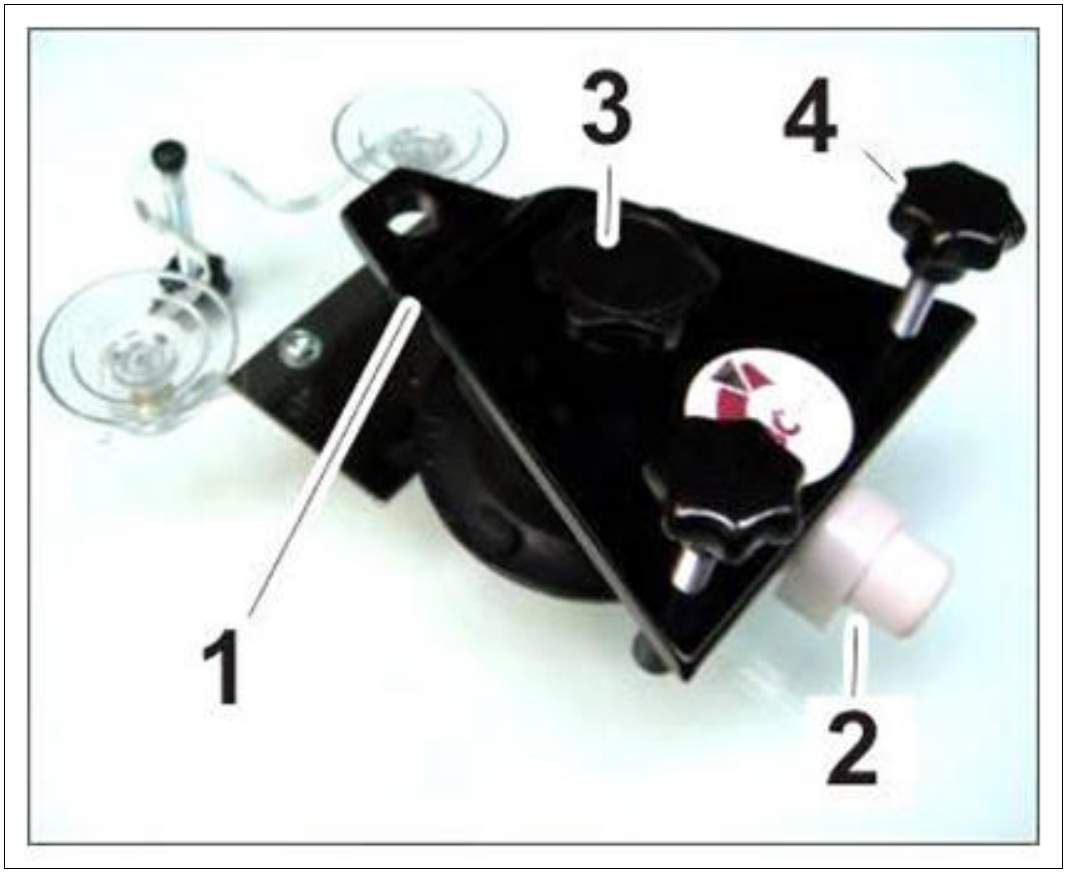
4. Secure the bridge.

    1. 4.1. Rub gel into the suction area on the bridge. This allows the tool to be repositioned after it has been secured in place.
    2. 4.2. Press the bridge **-1-** firmly onto the windscreen so that the threaded hole is directly above the point of impact.
    3. 4.3. Stick the bridge firmly onto windscreen by operating the vacuum pump until the red marking **-2-** is no longer visible.

    > *IMPORTANT: The bridge must remain firmly seated on the windscreen for the duration of the repair work. Operate the pump again if the red mark becomes visible.*

    4. 4.4. Align the bridge directly over the point of impact with respect to the windscreen and secure it in place using the central screw **-3-** .
    5. 4.5. Adjust the bridge so that it is parallel to the windscreen using the screws at the rear **-4-** .

Fig 4: Securing Bridge



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0720IN GLASS REPAIRS (ALL MODELS) > REPAIR PROCEDURE

1. Fit the bridge.

    1. 1.1. Screw injector with seal **-5-** into the bridge until the seal is touching the glass. Then press the injector against the window by completing one more turn.

Fig 1: Turning Injector Seal

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 1.2. Attach needle to the syringe and fill with approx. 0.15 ml of resin. → Filling syringe

Fig 2: Filling Syringe

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 1.3. Inject resin into the injector. → Filling injector

Fig 3: Filling Injector

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Pressurizing phase

1. 2.1. Slowly screw the plunger **-6-** into the injector **-5-** until resistance is felt and the shape of the seal changes → Seal under pressure . Keep a firm hold on the injector barrel while doing this.

2. 2.2. Leave the plunger pressed down at this position for around 5 min., in which time the plunger will automatically build up pressure.

Fig 4: Installing Plunger Into Injector

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 5: Identifying Pressure Seal

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Vacuum phase

    1. 3.1. Pull up the plunger **-6-** with one hand **-A-** and secure it in position by turning it 90° clockwise **-B-** . This allows any air to escape out of the damaged area.
    2. 3.2. Release the plunger so that pressure can build up again.
    3. 3.3. Repeat steps → 3.1. and → 3.2. about 5-10 times until there is no more air in the damaged area.

Fig 6: Pulling Plunger

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 7: Identifying Vacuum Seal

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Heating

   If the damage is more severe, the removal of trapped air can be speeded up by heating the area gently. To do this, use a lighter to heat the area of damage from the inside for 3-5 seconds.

   > *IMPORTANT: Heat during the vacuum phase only, otherwise the expanding air would cause excessive pressure in the damaged area.*

5. Remove the bridge.
   1. 5.1. Release the plunger a little (do not create a vacuum) and unscrew the injector.
   2. 5.2. Remove the bridge from the windscreen.
6. Apply finishing resin.
   1. 6.1. Add a drop of finishing resin directly onto the impact point.
   2. 6.2. Slide film across the windscreen.

Fig 8: Applying Resin

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Curing under a UV lamp

    1. 7.1. Place a UV lamp over the damaged area from the outside and switch it on. → Curing under a UV lamp
    2. 7.2. Curing takes around 10 minutes, depending on the size of the stone chip.

Fig 9: Identifying UV Lamp

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Scrape off repair resin.

    1. 8.1. Remove film and scrape off excess resin using a razor blade held at a 90 degree angle to the windscreen. → Scraping off resin

    > *IMPORTANT: Risk of damage to the windscreen. Use only blades that are in perfect condition, otherwise they could damage the windscreen.*

    2. 8.2. If there is an indentation at the point of repair, steps → 6. → 7. and → 8.1. will need to be repeated to obtain a perfect finish.

Fig 10: Removing Resin

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Polishing

Polish the repair area with polish and a soft cloth.

> *IMPORTANT: Do not polish for too long as this can wear down the repair resin and the surface will no longer be flat.*

Fig 11: Applying Polish On Glass

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Cleaning tools

    After completing repairs, clean the tools using a dry, lint-free cloth. Otherwise, the resin will damage the seals.

WM 0730IN DENT REPAIRS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	

Dent removal lever set VAS 6332 XL professional dent removal set	Workshop equipment	WE 1358		Dent removal lever set VAS 6333	Workshop equipment	WE 1359		Dent removal lever set VAS 6334	Workshop equipment	WE 1360		Dent remover VAS 6364	Workshop equipment	WE 1361		
WM 0730IN DENT REPAIRS (ALL MODELS) > DENT REPAIRS

Information

This repair method is a cost-effective repair that may have quality implications. To achieve the best repair result, always use the tool recommended by Porsche and attend the special training courses run by the tool/system suppliers.

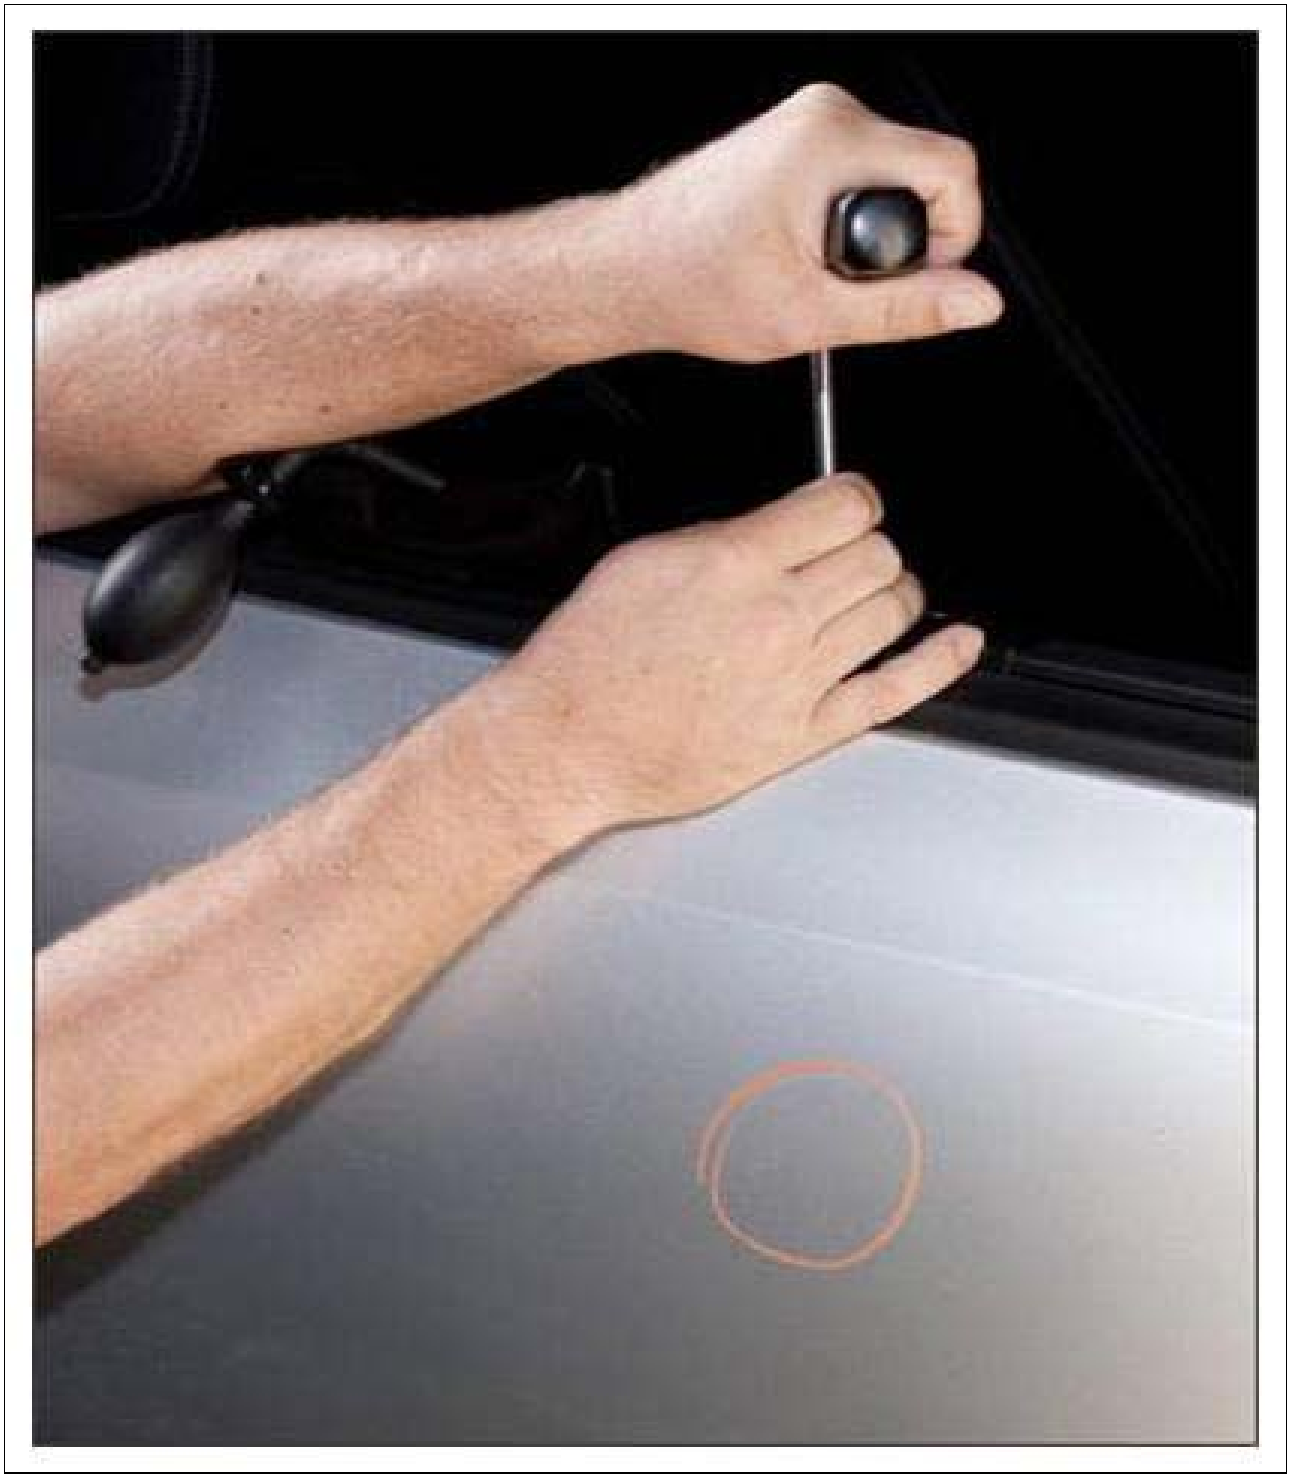
Information

Some damage cannot be worked back into shape using this method because of reinforced or bonded body parts. Each area of damage must be assessed individually.

Dents in sheet steel and aluminum panels caused by hail, bumps when parking (knocks against edge of door), chestnuts, etc. can be corrected by carrying out dent repairs using the reshaping method. With this method, dents are pressed out point-by-point from behind the metal panel using special dent removal tools and then polished.

Dent removal sets: **Dent removal lever set VAS 6332 XL professional dent removal set WE 1358, Dent removal lever set VAS 6333 WE 1359, Dent removal lever set VAS 6334 WE 1360**

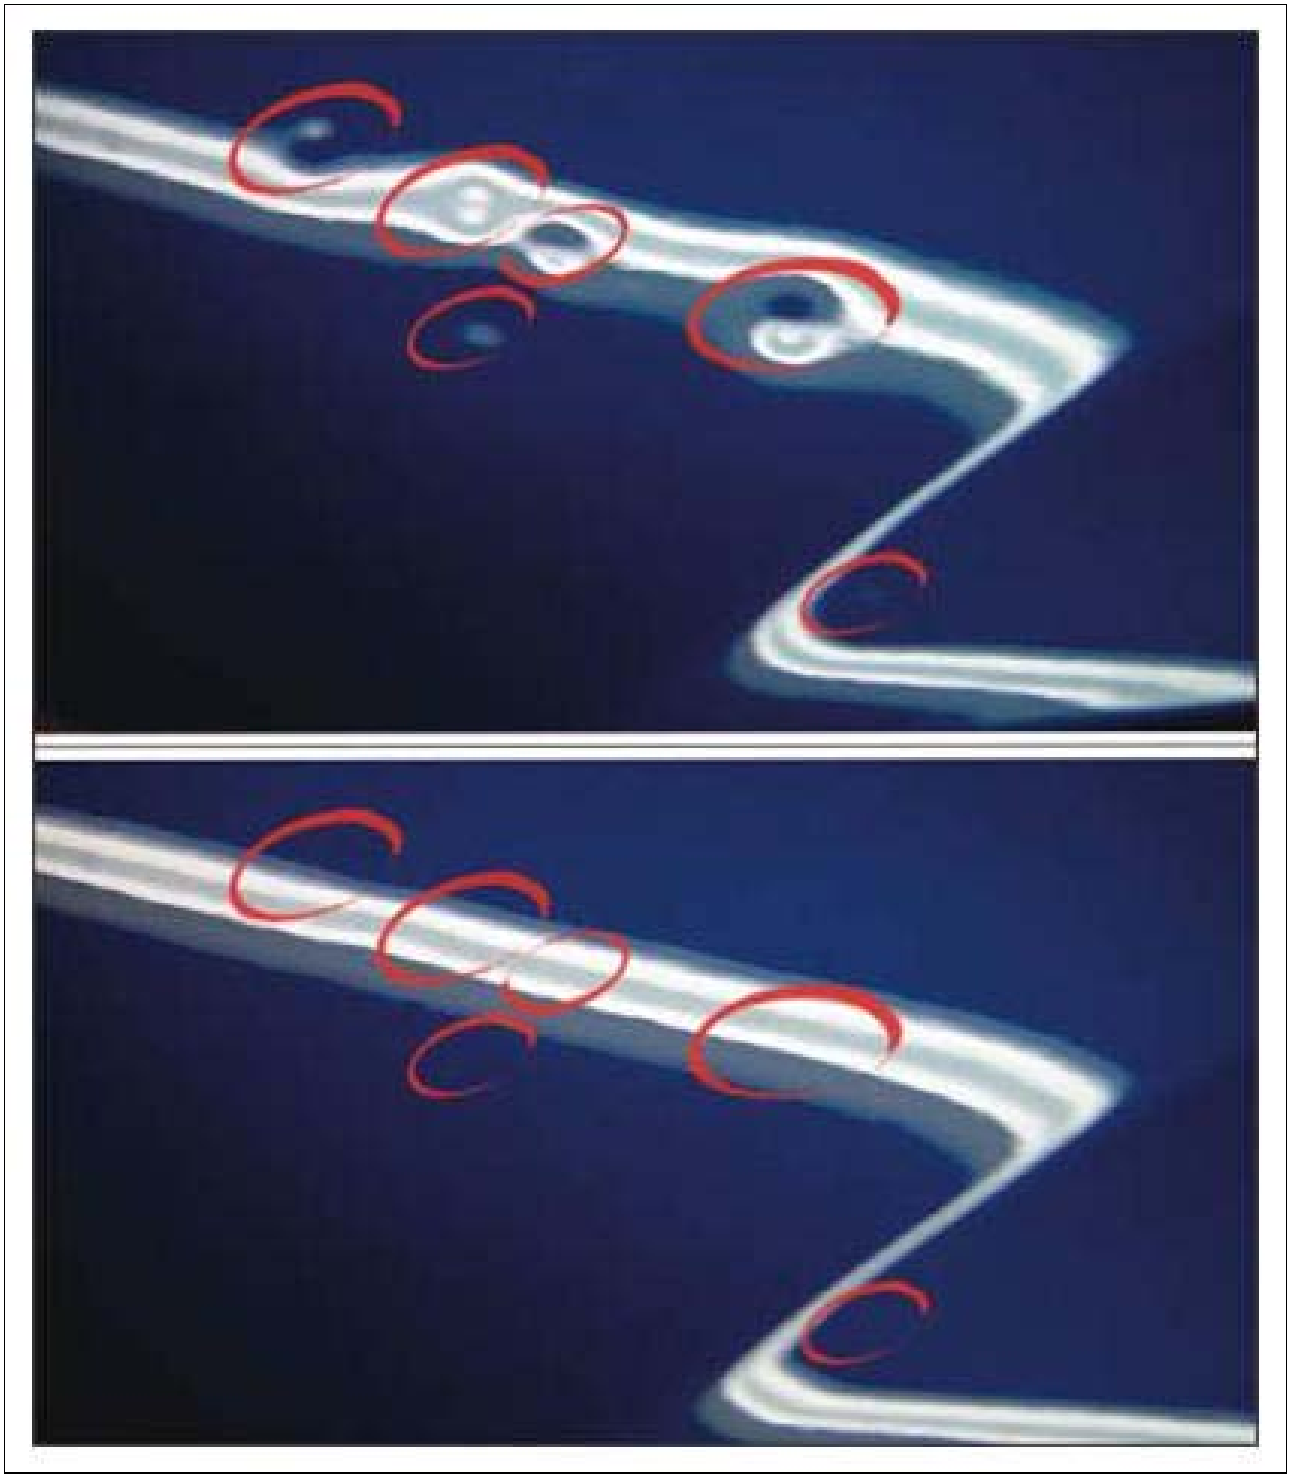
Fig 1: Removing Dent Removal Sets



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The progress of the repair work is assessed using the reflected lines of a neon lamp on the upper side of the panel. → Before and after

Fig 2: Identifying Neon Lamp Reflected Lines



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Small dents that are not accessible from the rear can be "pulled out" using bonding techniques **Dent remover VAS 6364 WE 1361** if the strength of the adhesive bond and the adhesion of the paintwork allow this. To this end, adhesive adapters are stuck to the center of the dent using special adhesive. The dent is pulled out carefully in a controlled manner using a slide hammer puller.

WM 0730IN DENT REPAIRS (ALL MODELS) > DENT REPAIRS > PREREQUISITES

- The dent must not have any cracks in the paintwork. Examine the damaged area using an illuminated magnifier or reflected-light microscope.
- Measure thickness of paint layer around the damaged area. Paint layers up to approx. 450 µm thick are straightforward. With thicker layers of paint there is a danger that the paint will crack.
- High level of workmanship and skill
- Intensive training
- Continuous practice
- Use of recommended tools

WM 0730IN DENT REPAIRS (ALL MODELS) > DENT REPAIRS > SUCCESS FACTORS

The factors below affect the outcome of the repair work considerably:

- The location of the damage
- The extent of the damage
- The shape of the damage
- The condition of the paintwork
- Skills and experience of the technician
- Color (dark colors are trickier than light colors)
- With silver colors, sharp-edged and pointed dents may cause slight changes to the color pigments (dark sports).
- Condition of tools

WM 0730IN DENT REPAIRS (ALL MODELS) > DENT REPAIRS > TECHNICAL RESTRICTIONS FOR CARRYING OUT REPAIRS

- No/poor accessibility (for safety reasons, holes must never be drilled in order to make an area more accessible.)
- Workmanship skills, lack of practice.
- Dents with paint defects/cracks cannot be repaired.
- Damage to folded edges or reinforcements usually cannot be repaired.
- Dents with crumpled edges usually cannot be corrected.
- It may not be possible to correct creased or pointed dents.

- With the bonding technique it is usually only possible to repair flat or minor dents.
- The maximum size of the dent should not exceed a diameter of 50 mm.

WM 0730IN DENT REPAIRS (ALL MODELS) > PROCEDURE > GENERAL PROCEDURE

1. Clean the surface to be treated to obtain good light reflection.
2. Mark the dent using the wax chalk.
3. Assess accessibility of the dent.
4. Try to find the best access, even if this is difficult for some areas.
5. Remove body parts in accordance with the Service information. When doing so, always be careful with safety-critical components, such as airbags, seat-belt pretensioners, electronic components, cables, etc.
6. Locate the dent using a locating lamp and find the tool tip on the metal panel.
7. Work according to the clock method described below.
8. Work calmly and patiently.
9. When working on bumps or bulges, it is much better to tap the metal gently and repeatedly rather than using one heavy strike.
10. Be very careful when using knife tools and cutter tools as these tools can easily cause the panel to buckle.
11. Sand down rough areas and high points with a sanding block (P2000 - 4000) and then polish them.
12. After removing the dent, seal the repair area with wax or cavity protection.

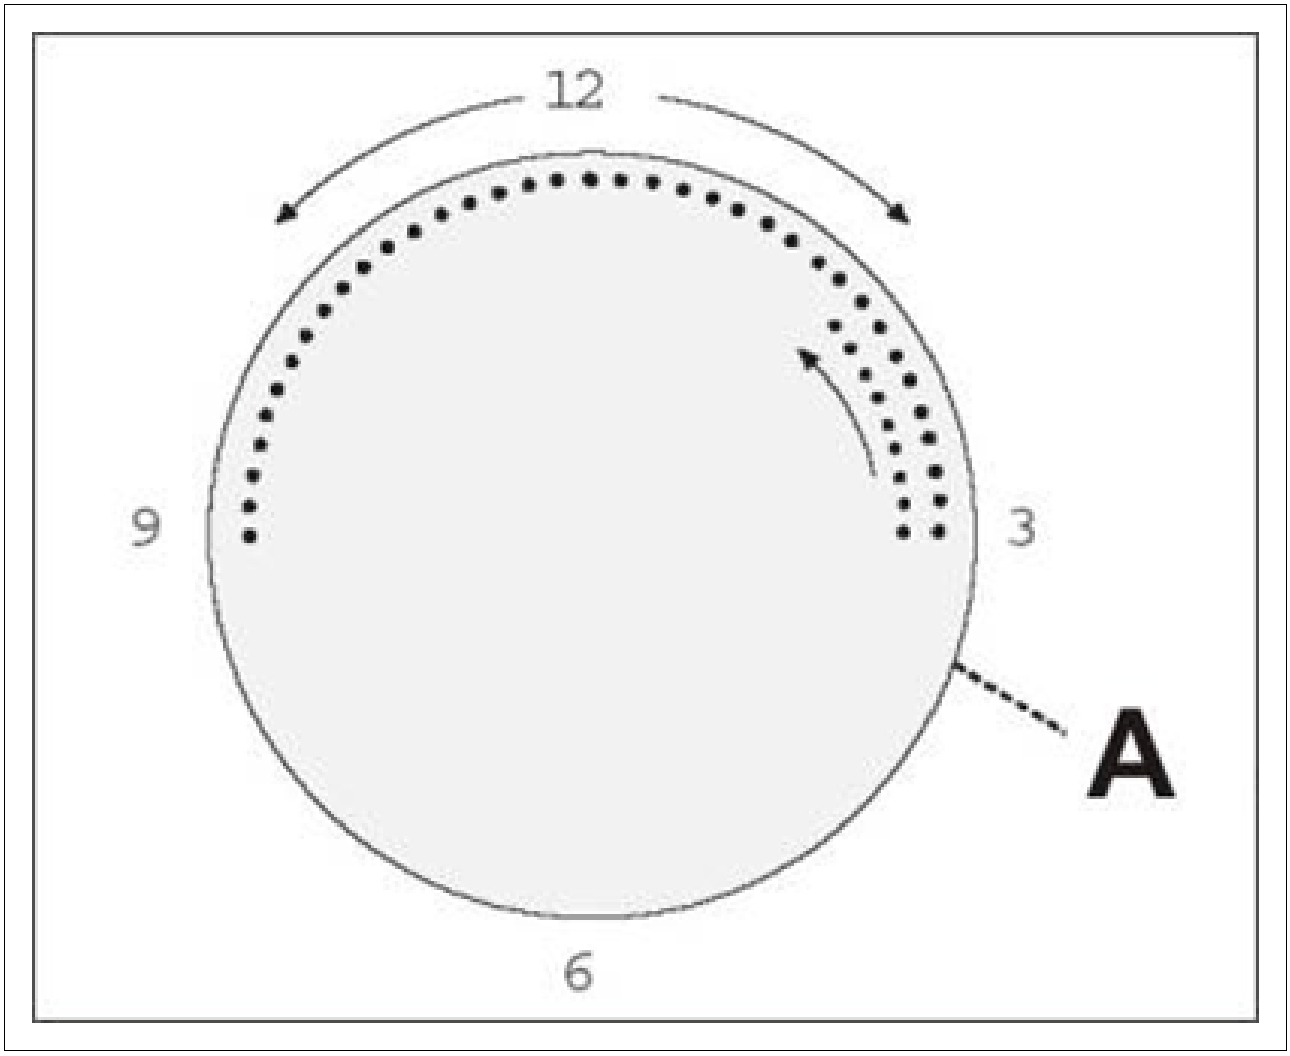
WM 0730IN DENT REPAIRS (ALL MODELS) > PROCEDURE > CLOCK METHOD

With the clock method, the lines of force running through the center of the dent are removed, with the result that the material stress is reduced and the panel is flat again.

The dent should be envisaged as a dial with "12" being the furthest away. In other words, the person performing the work is standing at 6 o'clock.

Start at the edge of the dent **-A-** at 9 o'clock and work clockwise through 12 o'clock to 3 o'clock. When doing this, always remember to press the panel at as many points as possible and as close together as possible. From 3 o'clock, move further inwards and carry on through 12 o'clock to 9 o'clock. Carry out the remaining steps in this same way.

Fig 1: Identifying Dent Repair Clock Method



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

With a dent of approx. 2 cm in diameter, it will be necessary to press the panel at around 100 - 150 points. Any point that is pressed too hard must be pushed back again before continuing. Strain can be created in the panel as a result of too many high points, with the result that the metal sheet can no longer spread out evenly.

WM 0730IN DENT REPAIRS (ALL MODELS) > PROCEDURE > DENT MASSAGE (FOR LARGER DENTS)

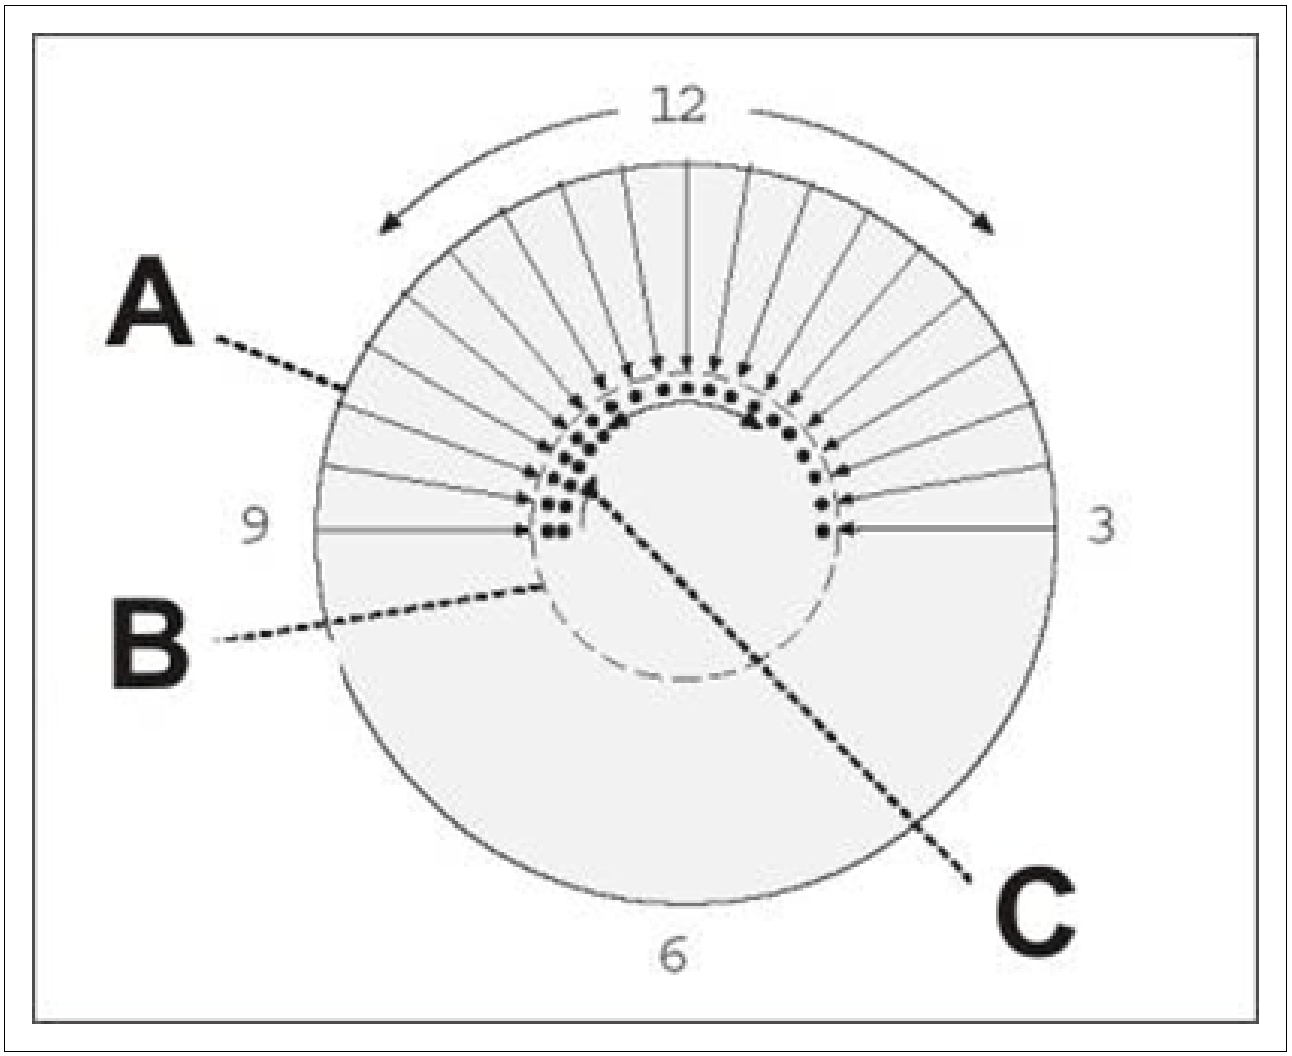
With this method, the lines of force are removed not by pressing at numerous points but instead by short movements.

For this process, first draw a boundary circle **-B-** at the center of the dent using wax chalk. This circle is to prevent the tool from being pulled too far into the center. This could cause the dent to break up into numerous tiny dents and make any further work more difficult.

Use the large ball tool with the large round plastic attachment. Place the tool at the edge of the dent **-A-** first at 12 o'clock and using gentle pressure approach the boundary circle with gradually increasing

pressure. Continue working from 11 o'clock to 1 o'clock, from 10 o'clock to 2 o'clock, etc. from the outer edge of the dent right up to the boundary circle. The pressure must not be too great as this could cause ridges. Once the dent has been shrunk back to the boundary circle, continue using the point-by-point clock method **-C-** .

Fig 1: Identifying Dent Massage Method For Larger Dents



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The various dent repair methods can only be learned through intensive training and continuous practice.

WM 0740IN INTERIOR COSMETIC REPAIRS (EXCEPT MACAN) > TOOLS

Iron temperature		Temperature	160°C		

WM 0740IN INTERIOR COSMETIC REPAIRS (EXCEPT MACAN) > GENERAL INFORMATION

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

Information

This repair method is a cost-effective repair that may have quality implications. To achieve the best repair result, always use the tool recommended by Porsche and attend the special training courses run by the tool/system suppliers.

With interior cosmetic repairs, it is possible to repair grazes, tears, scratches and burn holes in plastic and leather components in the interior. Example: → Before and after

Fig 1: Identifying Interior Cosmetic Area (Before And After)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

With this repair method, the damage is filled with special adhesives and resins and the surface structure is restored by means of a pattern imprint. The damaged area is painted over in the last step.

WM 0740IN INTERIOR COSMETIC REPAIRS (EXCEPT MACAN) > GENERAL INFORMATION > REPAIR RESTRICTIONS

- Tears and cuts in low-stressed components (e.g. dashboard, trim panels) up to around 50 mm long can be repaired.
- Tears and cuts in more heavily stressed components (e.g. seats) up to around 20 mm long can be repaired.
- Holes in low-stressed components (e.g. dashboard, trim panels) up to around 20 mm in diameter can be repaired.
- Holes in more heavily stressed components (e.g. seats) up to around 10 mm in diameter can be repaired.
- Damage in the area of a seam cannot be repaired.
- Alcantara leather cannot be repaired.
- Here too, the skills and experience of the worker are crucial for a good repair result.

WM 0740IN INTERIOR COSMETIC REPAIRS (EXCEPT MACAN) > CREATING PATTERN IMPRINT

Toolbox: **Interior repairs system B1 WE 1355**

1. Clean surface of the structural area to be copied using "Plastcleaner" and dry with warm air (approx. 60 °C).

Fig 1: Cleaning Interior Cosmetic Surface

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Evenly apply the "Moldmaker" two-component material to the surface using the mixing tube and mixing gun.
3. Spread out the compound into a thin layer (approx. 2 - 3 mm) using a spatula.

Fig 2: Applying Paint On Interior Cosmetic

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Leave pattern imprint to cure for 10 - 15 min.
5. Carefully remove pattern imprint and clean the surface using "Plastcleaner".

Fig 3: Removing Pattern Imprint

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The pattern imprint can be re-used numerous times.

The pattern imprint will not leave behind any undesirable marks and can therefore be used anywhere.

WM 0740IN INTERIOR COSMETIC REPAIRS (EXCEPT MACAN) > VINYL REPAIRS

1. Thoroughly clean the area to be repaired using "Plastcleaner" and dry with warm air (approx. 60 °C).

Fig 1: Cleaning Interior Cosmetic Surface

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Fill the damaged area with "Compound" adhesive filler right up to the upper level.

   Information

   Always test the thermal sensitivity of the vinyl in a concealed area first.

   If the damage is deep, apply the material in several layers, removing any excess compound at the edge immediately and curing between layers using an iron (→ **Temperature: 160°C**).

Fig 2: Filling Material Damage Area

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. With larger areas of damage, such as tears or holes, insert a piece of nylon fabric under the area to be repaired for reinforcement.

    1. 3.1. Cut a suitable piece of nylon fabric material to size and push it under the damaged area using the small spatula.

    2. 3.2. Rub adhesive filler into the nylon fabric and cure using the iron.

4. Lay the pattern imprint onto the top layer of adhesive filler to restore the pattern, gently press on with the heated iron for 5 - 10 seconds and wait for a few seconds before continuing.

Fig 3: Heating Adhesive Filler

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Cool down and fix the transferred pattern using a cooling block.

Fig 4: Cooling Adhesive Filler

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Carefully remove pattern imprint.

Fig 5: Removing Pattern Imprint

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. The adhesive filler has cured when it becomes slightly transparent. If the adhesive filler still looks milky, repeat steps → 4. to → 6.
8. Thoroughly clean the area to be painted using "Plastcleaner" and dry with warm air (approx. 60 °C), as "Plastcleaner" is partly water-soluble.
9. Then paint the repaired area. → Painting and dyeing

Fig 6: Applying Paint In Repaired Area

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0740IN INTERIOR COSMETIC REPAIRS (EXCEPT MACAN) > LEATHER REPAIRS

1. Thoroughly clean the area to be repaired a **number of times** using "Plastcleaner" and dry with warm air (approx. 60 °C).

Fig 1: Cleaning Interior Cosmetic Surface

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0740IN INTERIOR COSMETIC REPAIRS (EXCEPT MACAN) > LEATHER REPAIRS > REPAIRING SCRATCHES AND CREASES

1. Fill scratches or creases with "Leather Crack Filler" and allow to dry for around 1 - 2 hours before continuing with step → 7.

   If the damage is deep, apply in several layers and dry with warm air (approx. 60 °C); the "Leather Crack Filler" shrinks by up to 30% as it dries.

Fig 1: Filling Scratches

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0740IN INTERIOR COSMETIC REPAIRS (EXCEPT MACAN) > LEATHER REPAIRS > REPAIRING TEARS AND HOLES

1. Fill the damaged area with "Compound" adhesive filler right up to the upper level.

   Information

   Always test the thermal sensitivity of the leather in a concealed area first.

   If the damage is deep, apply the material in several layers, removing any excess compound at the edge immediately and curing between layers using the iron (→ **Temperature: 160°C**).

Fig 1: Filling Material Damage Area

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. With larger areas of damage, such as tears or holes, insert a piece of nylon fabric under the area to be repaired for reinforcement.

    1. 2.1. Cut a suitable piece of nylon fabric material to size and push it under the damaged area using the small spatula.

    2. 2.2 Rub adhesive filler into the nylon fabric and cure using the iron.

3. Lay the pattern imprint onto the top layer of adhesive filler to restore the pattern, gently press on with the heated iron for 5 - 10 seconds and wait for a few seconds before continuing.

Fig 2: Heating Adhesive Filler

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Cool down and fix the transferred pattern using a cooling block.

Fig 3: Cooling Adhesive Filler

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Carefully remove pattern imprint.

Fig 4: Removing Pattern Imprint

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. The adhesive filler has cured when it becomes slightly transparent. If the adhesive filler still looks milky, repeat steps → 3. to → 5.

   Information

   Leather is a natural product which must be treated individually.

   The leather must be thoroughly cleaned a number of times prior to painting as leather becomes greasy from the inside and it is not possible to rule out any previous treatment with silicon-containing products. Impregnation can also impair the adhesion of the paint.

7. Thoroughly clean leather **a number of times** with "Plastcleaner". Allow the leather to air dry for approx. 5 min. after cleaning. Clean the leather again if it is very dirty or if there is still a greasy residue.

8. Sand the damaged area with an abrasive pad or sandpaper (P400).

Fig 5: Cleaning Leather

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Then paint the repaired area. → Painting and dyeing

Fig 6: Applying Paint In Repaired Area

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0740IN INTERIOR COSMETIC REPAIRS (EXCEPT MACAN) > PAINTING AND DYEING

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

1. From the color samples choose the color that most closely matches the original.
2. Shake paint container thoroughly before mixing.
3. Mix paint on the paint **scales interior repair scales, small (0.01g scale) WE 1357** in accordance with the formulary.
4. Mix paints thoroughly and compare the color obtained with the original. To do this, dab or spray some of the paint onto the original part.

   Critically examine the color match of the paint when **dry.** It is often necessary to adapt the color mixture and sometimes this may take several attempts.
5. If necessary, match the sheen and color intensity using the additive "Opacante A". The amount of this additive that can be added to the paint must not exceed 25%.
6. Check adhesion of paint by gently scratching the dry paint.
7. If the color is correct, apply paint to the damaged area using **paint-spraying gun - Sata-Minijet WE 1146** or an airbrush gun.

   For small areas of damage, the paint can also be applied using a clean, lint-free cloth. In this case, apply the paint in several layers using a circular motion.

Fig 1: Applying Paint In Repaired Area

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Leave paint to dry at a temperature of no less than 16 °C for approx. 90 min. It may take less time to dry at warmer temperatures.

   The drying time should be increased if the paint was applied in several layers.

9. Match the lustre, if necessary:

   1. "Matt fix scan" provides a matt finish.

   2. "Gloss fix scan" provides a gloss finish.

   3. A satin finish is achieved by mixing the two gloss regulators.

      1. 9.1. Shake gloss regulators thoroughly and filter through a paper filter.

      2. 9.2. Mix "Matt fix scan" and "Gloss fix scan" thoroughly in the desired ratio.

      3. 9.3. Test gloss regulator in a concealed area.

      4. 9.4. Check the lustre when dry and adapt if necessary.

      5. 9.5. Apply the gloss regulator using **paint-spraying gun - Sata-Minijet WE 1146** or an airbrush gun.

         For small areas of damage, the gloss regulator can also be applied using a clean, lint-free cloth. Apply it using a circular motion.

10. Leave the paint to dry overnight before applying any load.

    Observe the information and instructions provided by the tool manufacturer as well.

    The various repair methods can only be learned through intensive training.

WM 0750IN PAINT REPAIRS (ALL MODELS) > GENERAL INFORMATION AND REPAIR AREAS

Information

This repair method is a cost-effective repair that may have quality implications. To achieve the best repair result, always use the tool recommended by Porsche and attend the special training courses run by the tool/system suppliers.

Paint repairs (also known as spot coating) can be used for small areas of paint damage. In this case, the damage is repaired over a small area by touching up the base and clear lacquer. The transition point from the old to the new clear lacquer is polished to achieve a match.

> *IMPORTANT: There is a danger of creating trailing edges at the transition point when polishing the area.*

Areas of application:

- Paint repairs are possible on plastic and sheet metal.

- Single-layer, double-layer and metallic paint finishes can be painted in this way.
- This painting method can be used to its full extent in areas with low light reflection (e.g. bumpers, door sills, edges of parts). **-green area-**
- Paint repairs to components with larger surfaces are only possible to a limited extent **-yellow area-** . In these areas, only small areas of damage with a diameter of up to 35 mm or a length of up to 100 mm should be repaired.
- Damage to large surface areas cannot be corrected using paint repair methods. **-red area-**

Fig 1: Identifying Paint Repairs Areas

The full repair description can be found in the → "Paint Manual" Chapter S 8.1 and G 8.1. Always follow the manufacturer's instructions.

WM 0760IN ALLOY WHEEL RECONDITIONING (ALL MODELS) > REPAIR

RESTRICTIONS AND CONDITIONS

NOTE: Thermal stripping of alloy wheels

- *Reduced rigidity of aluminum alloy*
- *Risk of breaks and irreparable damage to the rim*

→ Do not use thermal stripping procedures or heat treatment on alloy wheels

NOTE: Incorrect repair of alloy wheels

- *Reduced endurance strength*
- *Alloy wheel breaks*

→ Only repairs to the surface paint finish on alloy wheel are permitted

The alloy wheel is a highly stressed vehicle component which may be subjected to extreme loads during operation. The repair restrictions must be strictly observed in order to ensure safe operation and prevent any potential hazards.

Information

This repair method is a cost-effective repair that may have quality implications. To achieve the best repair result, always use the tool recommended by Porsche and attend the special training courses run by the tool/system suppliers.

The repair method combines paint repair methods and conventional painting methods.

When reconditioning alloy wheels, only repairs to damaged paintwork are permitted. Example: → Permissible damage , → Permissible damage

It is still imperative to avoid sanding down areas through to the base material.

Fig 1: Identifying Permissible Damage

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 2: Identifying Permissible Damage

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 0760IN ALLOY WHEEL RECONDITIONING (ALL MODELS) > REPAIR RESTRICTIONS AND CONDITIONS > REPAIR RESTRICTIONS

- The base material of the alloy wheel must not be damaged. For example: → NON-permissible damage , → NON-permissible damage
- Repairs that affect the base material of the wheel (deposit-welding, filling and metal-cutting machining) → Prohibited machining operations are not permitted.
- There must be no signs of corrosion on the alloy wheel.
- It is imperative to avoid sanding down areas through to the base material.

Information

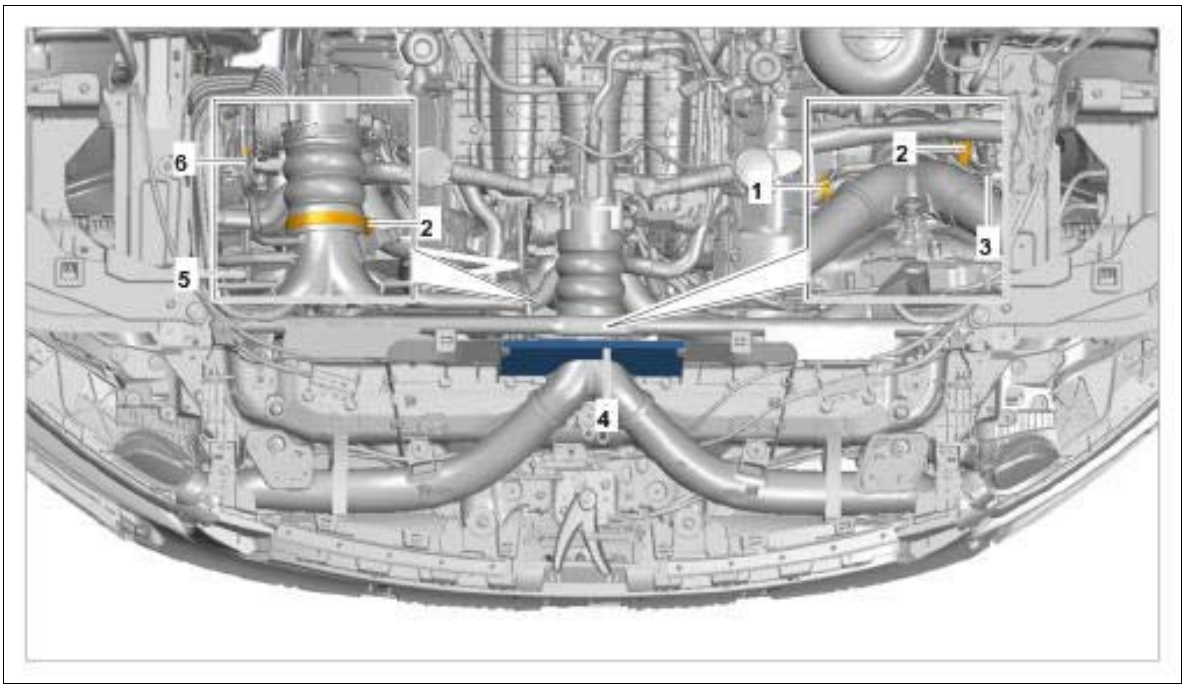
- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Disconnect battery ground strap. → 270619 REMOVING AND INSTALLING BATTERY
2. Remove engine cover.
3. Remove rubber seal **-4-** on feed-through element for pressure pipe.
4. Loosen screw-type clamp **-2-** used to secure the throttle-housing cover to the pressure pipe and pull cover off pressure pipe. → WM 243519 REMOVING AND INSTALLING THROTTLE-

HOUSING COVER (MACAN S, MACAN TURBO) .

5. Loosen clamp **-1-** and disconnect hose from pressure pipe.
6. Loosen clamp and disconnect hose **-6-** from pressure line.
7. Disconnect hose **-5-** from vacuum line for the ambient air valves.
8. Release and disconnect electric plug connection **-3-** on the pressure sensor.

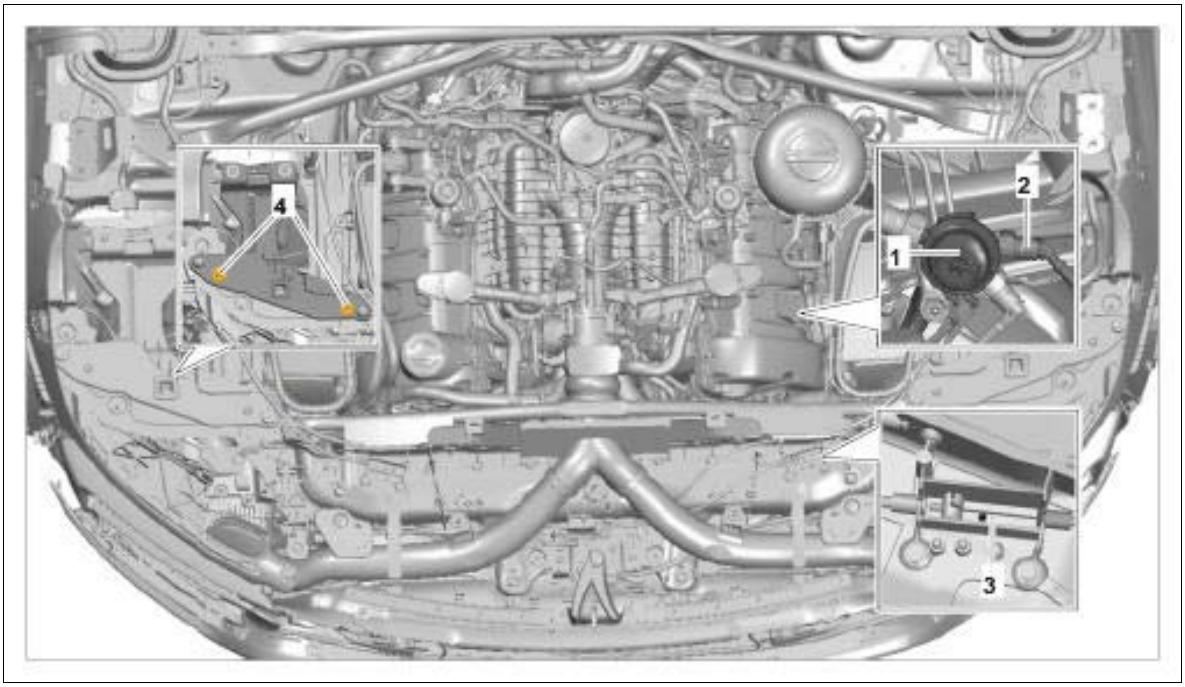
Fig 1: Identifying Lines And Pressure Pipe



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Release and disconnect coolant vent line **-2-** on the bleeder valve **-1-** .
10. Unclip and disconnect operating cable **-3-** for bonnet release from the bracket.
11. Unscrew front fastening screws **-4-** on the right headlight mounting. → 941419 REMOVING AND INSTALLING HEADLIGHT MOUNTING .

Fig 2: Identifying Vent Line, Operating Cable And Headlight Mounting Point

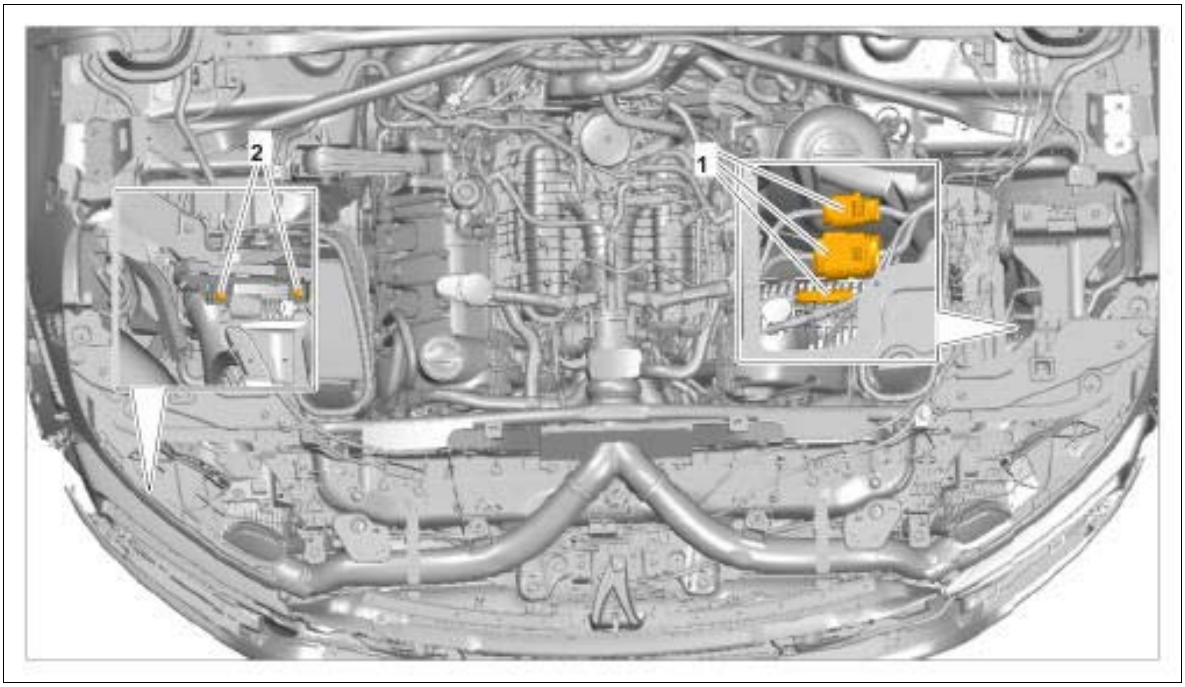


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Release and disconnect electric plug connections **-1-** for front wire harness and unclip wire harness at the body. → WM 971519 REMOVING AND INSTALLING FRONT WIRE HARNESS (ALL MODELS) .

13. Unscrew side fastening screws **-2-** on the front retaining strips.

Fig 3: Identifying Retaining Strip And Wire Harness



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Apply markings **-6-** to ensure correct installation position of lock carrier with respect to the body **-1-** during re-installation.

15. Remove upper transverse strut **-5-** for lock carrier on the body **-1-** .

    1. 15.1. Unscrew top fastening screws **-3-** .

    2. 15.2. Unscrew fastening screws **-2-** at the sides.

16. Unscrew top fastening screws **-4-** on both sides.

    Marking, threaded joint on transverse strut

17. Swivel side parts **-4-** of the air guides at the top and bottom inwards.

18. Remove control unit for garage door opener. → 967919 REMOVING AND INSTALLING CONTROL UNIT FOR GARAGE DOOR OPENER

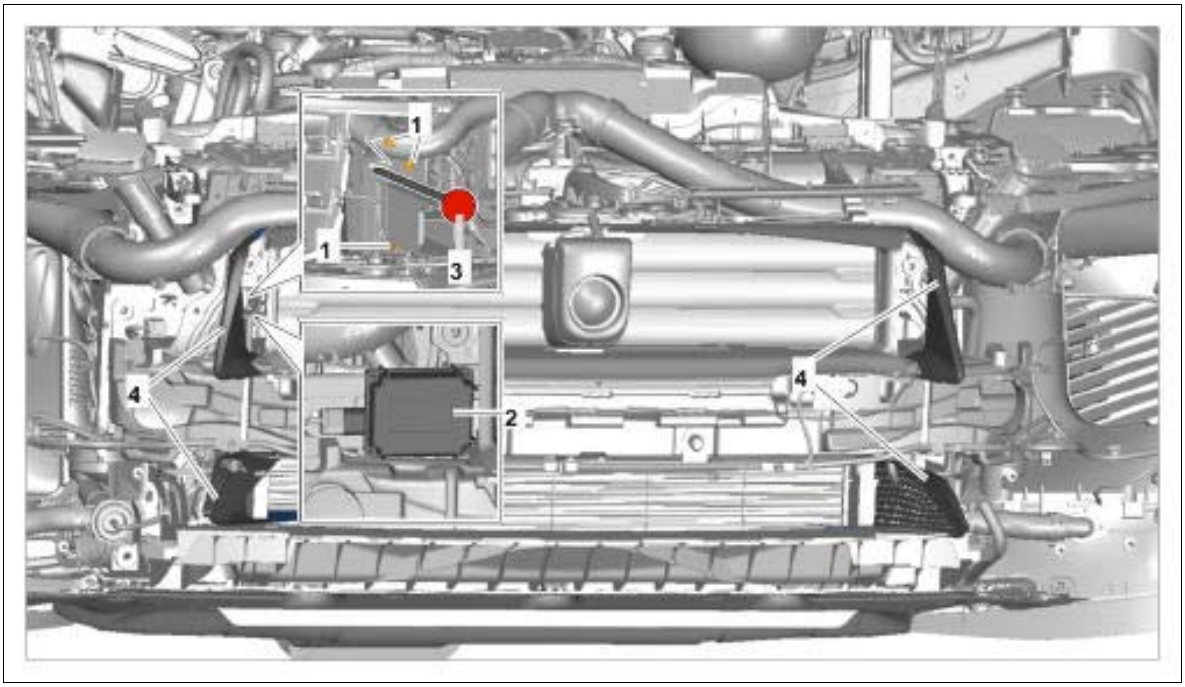
19. Unscrew fastening screw securing holder for control unit for garage door opener to lock support and remove holder.

20. Unscrew outer top fastening screw **-1-** for the bracket at the threaded bore.

21. Screw guiding rods **-3-** into the threaded bore. Tools used: Guiding rods T10093

22. Unscrew the other fastening screws **-1-** securing the bracket to the body.

    Fig 4: Identifying Bracket Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

23. Unscrew fastening screws **-1-** on supports at the lock carrier.

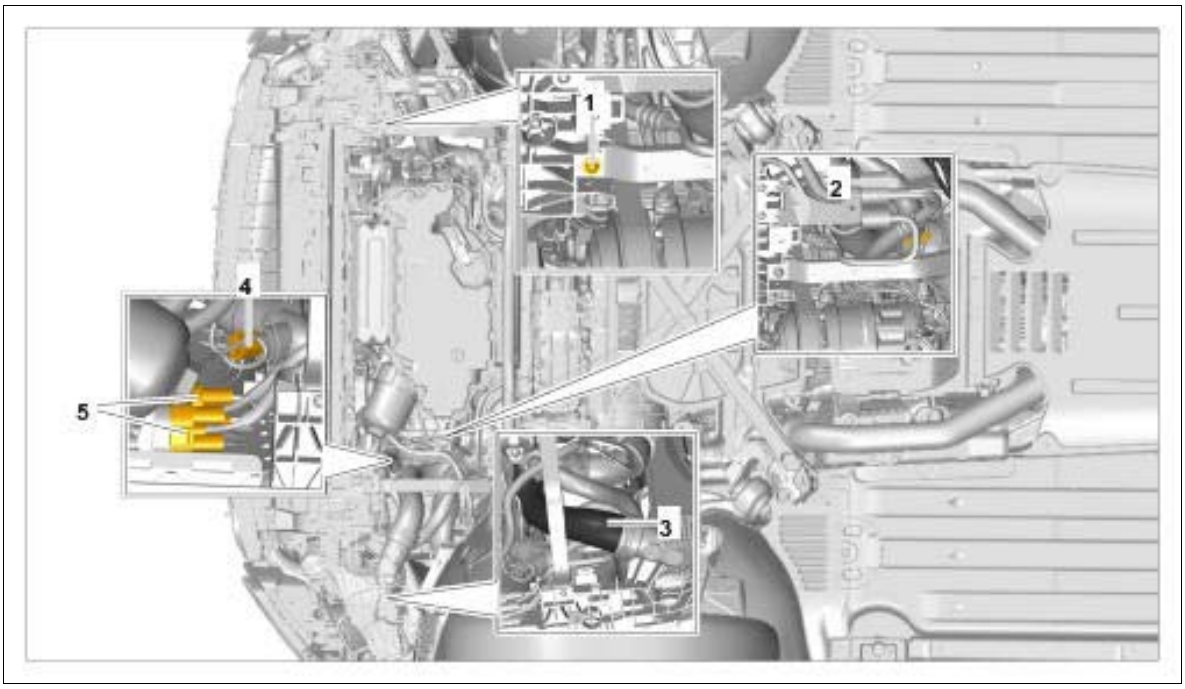
24. Disconnect charge air hose **-3-** at the charge-air cooler.

25. Disconnect hose from the recirculating air valve **-2-** on the intake manifold.

26. Release electric plug connection **-4-** at the coolant temperature sensor and disconnect it.

27. Release and disconnect electric plug connections for the electric fans **-5-** and unclip the relevant wire harness at the lock carrier.

Fig 5: Identifying Longitudinal Strut, Charge Air Pipe And Suction Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

28. Unclip wire harness **-4-** at the lock carrier.

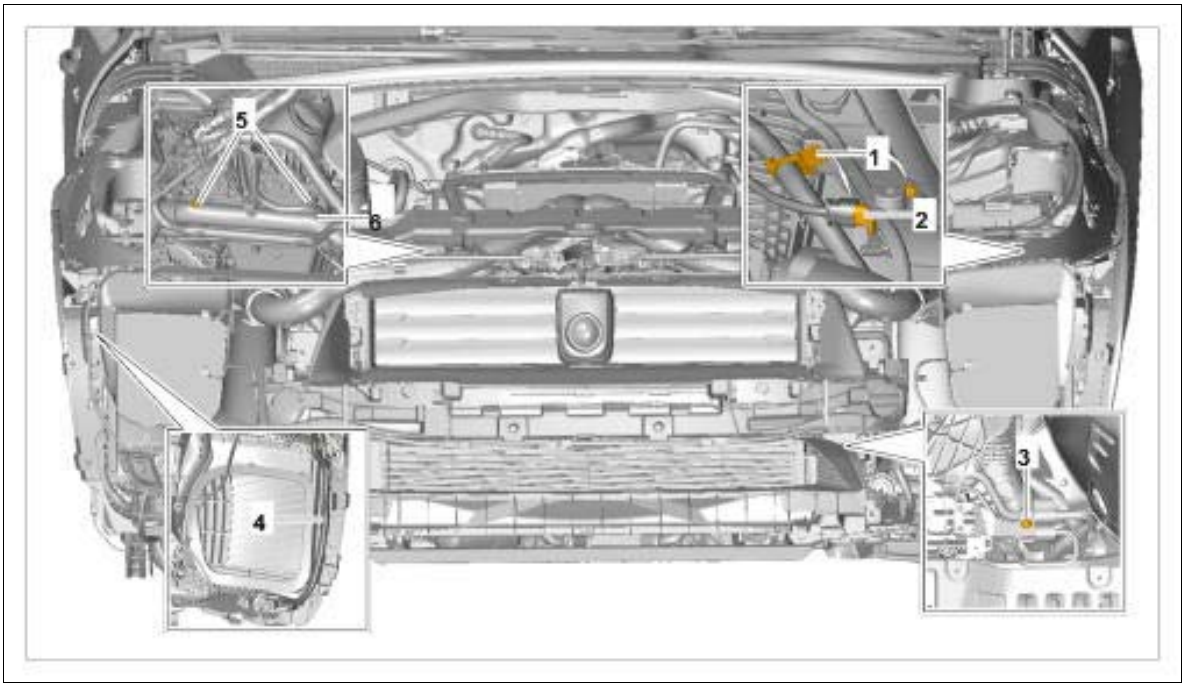
29. Unscrew fastening screw **-3-** on the bracket for refrigerant lines.

30. Release and disconnect electric plug connections **-2-** for airbag sensors.

31. Unclip hose for headlight cleaning system **-1-** at the lock carrier.

32. Unscrew fastening screws **-5-** for coolant line **-6-** on the timing-case cover.

Fig 6: Identifying Wire Harness, Coolant And Refrigerant Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

33. Pull the lock carrier forward.

    1. 33.1. Pull lock carrier on transverse strut forward. When moving the lock carrier, make sure that the hoses and lines are not overstrained. Disconnect them beforehand if necessary.

    2. 33.2. The maximum distance between the lock carrier and front bracket must not exceed 80 mm on both sides. Otherwise, the hydraulic and refrigerant lines will be overstrained.

WM 503809 LOOSENING AND SECURING LOCK CARRIER (SERVICE POSITION) (ALL MODELS) > SECURING LOCK CARRIER

Information

Check that all fixing clips are positioned fully and correctly.

Check that the fixing clips are not bent or broken.

Replace damaged or missing clips with new ones.

The lock carrier is secured in reverse order. Pay particular attention to the following:

1. Tighten fastening screws for coolant line to the specified torque. **Tightening torque 5 Nm (3.5 ftlb.)**

2. Tighten fastening screw securing refrigerant line bracket to dual clip to the specified torque. **Tightening torque 4.5 Nm (3.5 ftlb.)**

3. Tighten fastening screws securing supports to lock carrier to the specified torque. **Tightening torque 5 Nm (3.5 ftlb.)**
4. Tighten fastening screws securing bracket to body to the specified torque. **Tightening torque 55 Nm (41 ftlb.)**
5. Tighten fastening screw on holder for garage door opener control unit to the specified torque. **Tightening torque 6 Nm (4.5 ftlb.)**
6. Tighten top fastening screws securing wing strut to lock carrier to the specified torque. **Tightening torque 9.7 Nm (7.5 ftlb.)**
7. Tighten side fastening screws securing transverse strut to body to the specified torque. **Tightening torque 10 Nm (7.5 ftlb.)**
8. Tighten top fastening screws securing transverse strut to body to the specified torque. **Tightening torque 9.7 Nm (7.5 ftlb.)**
9. Tighten side fastening screws on the front retaining strips to the specified torque. **Tightening torque 9.7 Nm (7.5 ftlb.)**
10. Tighten fastening screws securing headlight mounting to body to the specified torque. **Tightening torque 9 Nm (6.5 ftlb.)**
11. Tighten screw-type clamp securing throttle-housing cover to pressure pipe to the specified torque. **Tightening torque 5.5 Nm (4 ftlb.)**

WM 503819 REMOVING AND INSTALLING LOCK CARRIER SIDE SECTION AT THE RIGHT (ALL MODELS) > INSTALLING LOCK CARRIER SIDE SECTION AT THE RIGHT

Installation is performed in reverse order. Pay particular attention to the following:

1. Tighten fastening screws securing wing strut to lock carrier to the specified torque. **Tightening torque 9.7 Nm (7.5 ftlb.)**
2. Tighten fastening screws securing upper part of lock carrier to lock carrier to the specified torque. **Tightening torque 9.7 Nm (7.5 ftlb.)**
3. Tighten fastening screw securing support to lock carrier to the specified torque. **Tightening torque 5 Nm (3.5 ftlb.)**
4. Tighten fastening nut securing support to chassis subframe to the specified torque. **Tightening torque 23 Nm (17 ftlb.)**
5. Tighten fastening screws securing lock carrier to radiator to the specified torque. **Tightening torque 4.5 Nm (3 ftlb.)**
6. Tighten fastening screws securing radiator holder to lock carrier to the specified torque. **Tightening torque 4.5 Nm (3 ftlb.)**

WM 503819 REMOVING AND INSTALLING LOCK CARRIER SIDE SECTION AT THE RIGHT (ALL MODELS) > SUBSEQUENT WORK

1. Install pedestrian protection. → INSTALLING PEDESTRIAN PROTECTION
2. Install front carrier at the right. → INSTALLING FRONT CARRIER
3. Install headlight at the right. → INSTALLING HEADLIGHTS
4. Install front right retaining strip. → INSTALLING FRONT RETAINING STRIP
5. Install front bumper. → INSTALLING FRONT BUMPER

WM 503819 REMOVING AND INSTALLING UPPER PART OF LOCK CARRIER (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Upper part of lock carrier to lock carrier		Tightening torque	9.7 Nm (7.5 ftlb.)		
Upper part of lock carrier to body		Tightening torque	9.7 Nm (7.5 ftlb.)		
Upper part of lock carrier to transverse strut		Tightening torque	9.7 Nm (7.5 ftlb.)		
Upper part of lock carrier to cooling-air flaps		Tightening torque	2.5 Nm (2 ftlb.)		

WM 503819 REMOVING AND INSTALLING UPPER PART OF LOCK CARRIER (ALL MODELS) > PRELIMINARY WORK

1. Remove pressure pipe. (Only for Turbo and S vehicles) → 214119 REMOVING AND INSTALLING PRESSURE PIPE .
2. Remove headlights → 941519 REMOVING AND INSTALLING HEADLIGHTS .
3. Remove front retaining strips → 631719 REMOVING AND INSTALLING FRONT RETAINING STRIP .
4. Remove lower part of front lid lock → 551719 REMOVING AND INSTALLING LOWER PART OF FRONT LID LOCK .

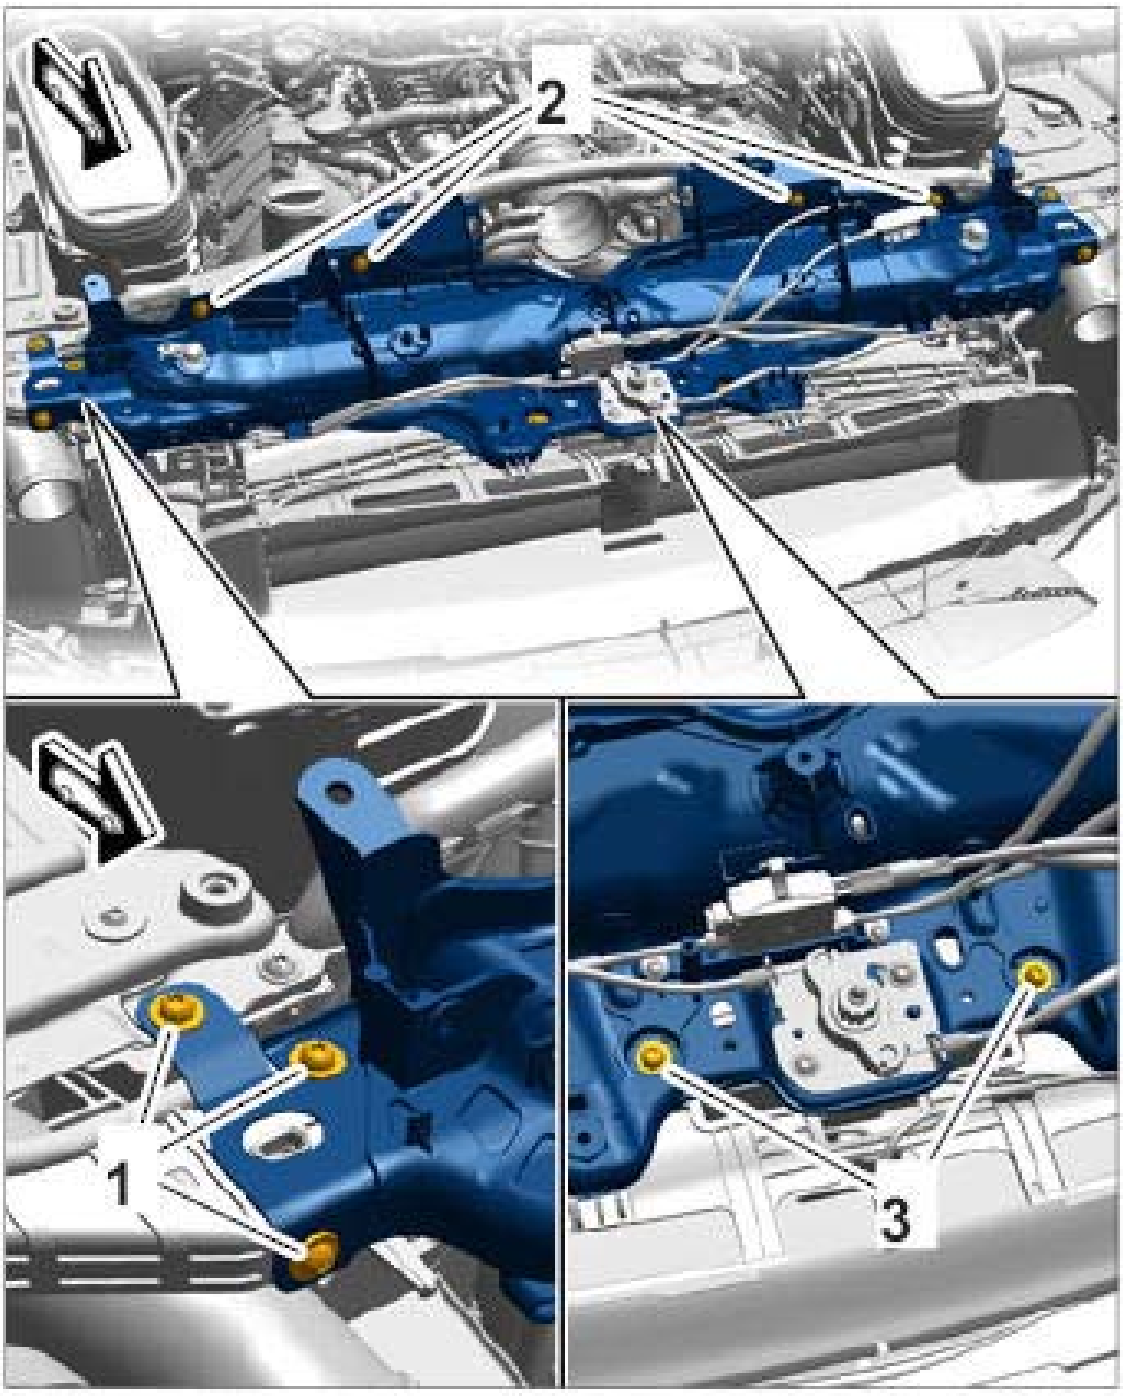
WM 503819 REMOVING AND INSTALLING UPPER PART OF LOCK CARRIER (ALL MODELS) > REMOVING UPPER PART OF LOCK CARRIER

Information

- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Unclip lid lock cable from the bracket and disengage it. → 551419 REMOVING AND INSTALLING CABLE FOR FRONT LID LOCK
2. Unscrew fastening screws **-1-** on the lock carrier and body.
3. Unscrew fastening screws **-2-** on the transverse strut.
4. Unscrew fastening screws **-3-** on cooling-air flaps.

Fig 1: Identifying Screws On Cooling-Air Flaps



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Actuate release **-arrow-** and pull out fastening plug **-1-** (**-arrow-**).

6. Unclip wire harness **-3-** on upper part of lock carrier **-2-** .

Fig 2: Pulling Out Plug

Information

- The tools for working on steel and aluminum must always be kept separate from each other. We recommend that you color code the tools using a system similar to that used for the Aluminum tool set with trolley WE 1350, for example.

Straightening set **Body alignment system package WE 1121 Measuring and alignment system, professional WE 1398**

Resistance spot welder; optional **Inverter welder MIDIspot-QSVM-12000 WE 1312, Resistance spot welder WE 1352, Resistance spot welder WE 1311, Resistance spot welder WE 1313**

Metal inert gas (MIG) welder

Pneumatic spotweld remover **Pneumatic Spotweld Remover, Vario Drill WS 90 WE 1139**

Pneumatic body saw **Body saw WE 1508**

Oscillating body saw (special electric cutter) **Special electric cutter WE 1137**

Hot-air blower **Hot-air blower WE 1119**

Hand-cartridge gun **Hand-cartridge gun WE 1141**

Spotweld drill **Spotweld drill;** Twist drill Nr.201

Countersink for rivets **Countersink Nr.202**

Blind riveting tool for high-strength rivets **Blind riveting tool TAURUS 4 WE 1348**

Safety vacuum cleaner for aluminum dust **Mobile extraction unit, aluminum WE 1507**

Star gauges for body gap dimensions Nr.127-1

Wurth Klebt und Dichtet body sealant

WM 507955 REPLACING FRONT SIDE MEMBER (ALL MODELS) > REMOVING FRONT SIDE MEMBER

Fig 1: Locating Front Side Member Position

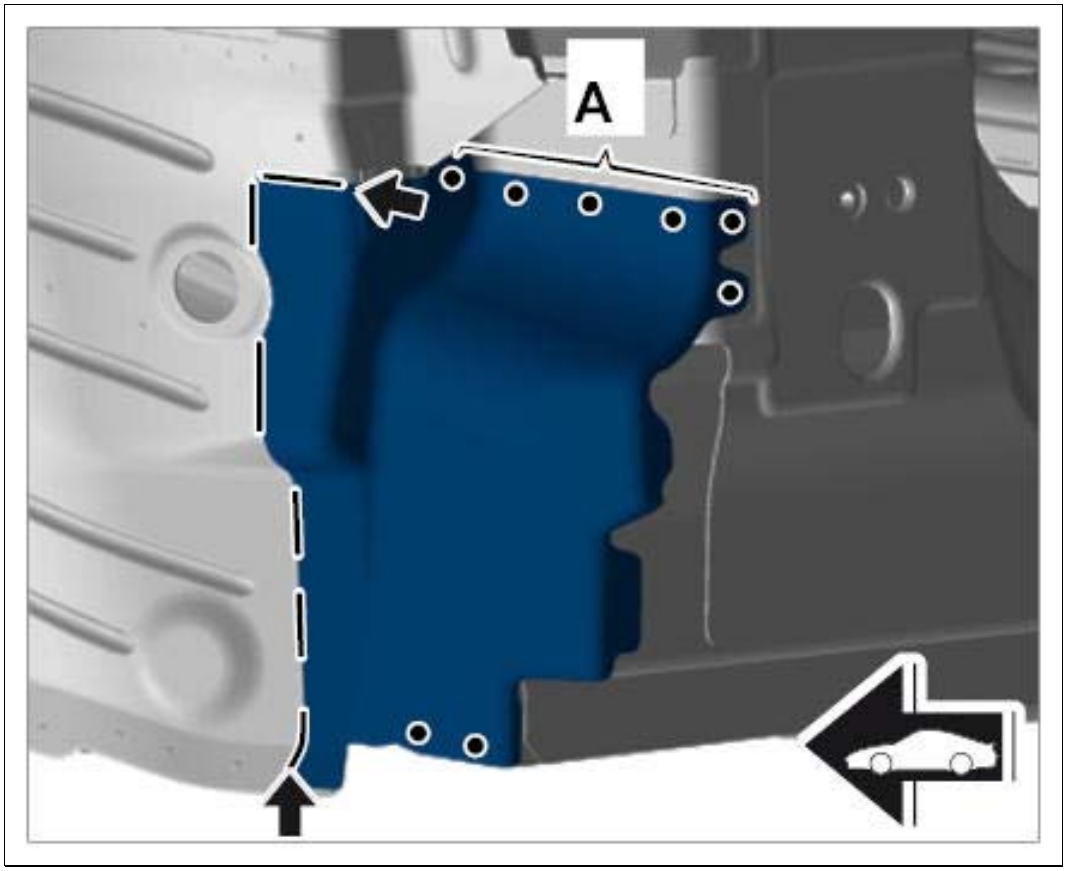
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

1. Drill out spotwelds using **spotweld drill** .
    1. 1.1. Grind down welded seams **-arrows-** .
    2. 1.2. Remove side member closing element.

Fig 2: Removing Side Member Closing Element



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

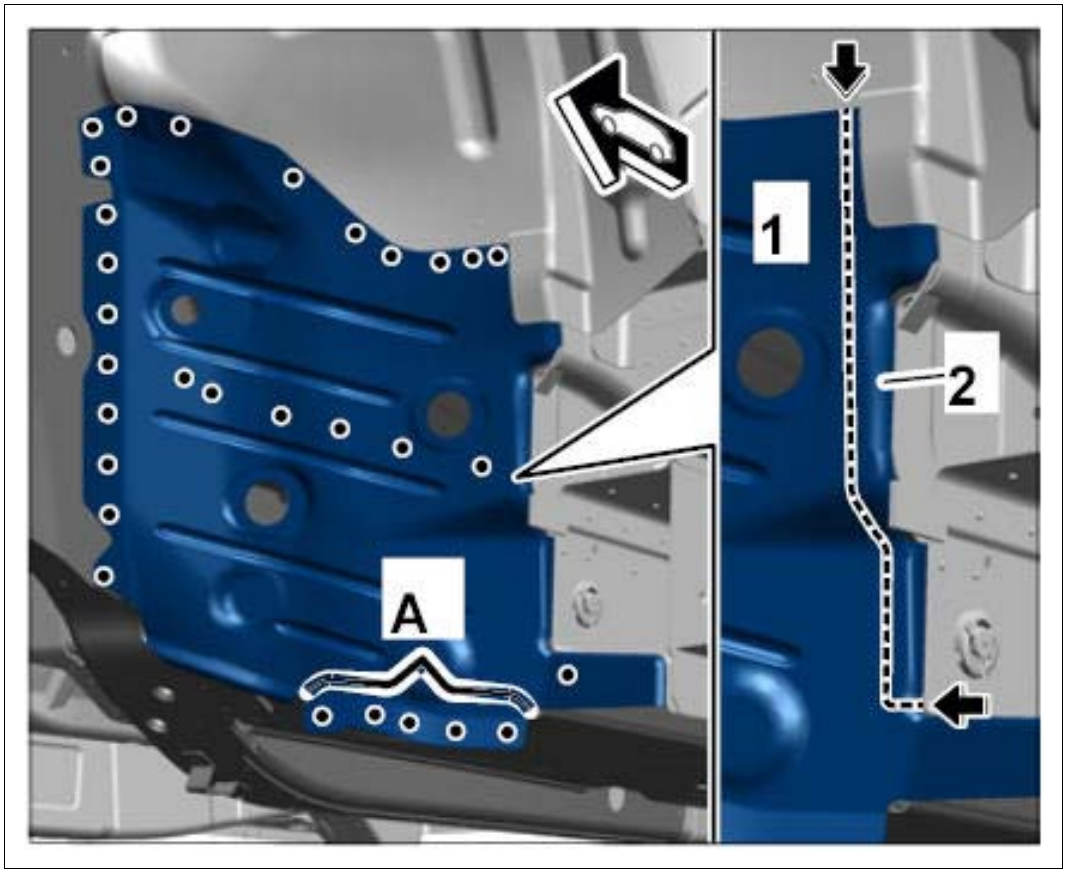
2. Drill out spotwelds using **spotweld drill** .

Information

Only make cuts in the top plate. Make sure not to damage the plate underneath when doing this.

1. 2.1. Mark and make cut **-arrows-** ().
2. 2.2. Remove extension for front wheel housing **-1-** . The remaining part **-2-** stays in the vehicle.

Fig 3: Removing Extension For Front Wheel Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

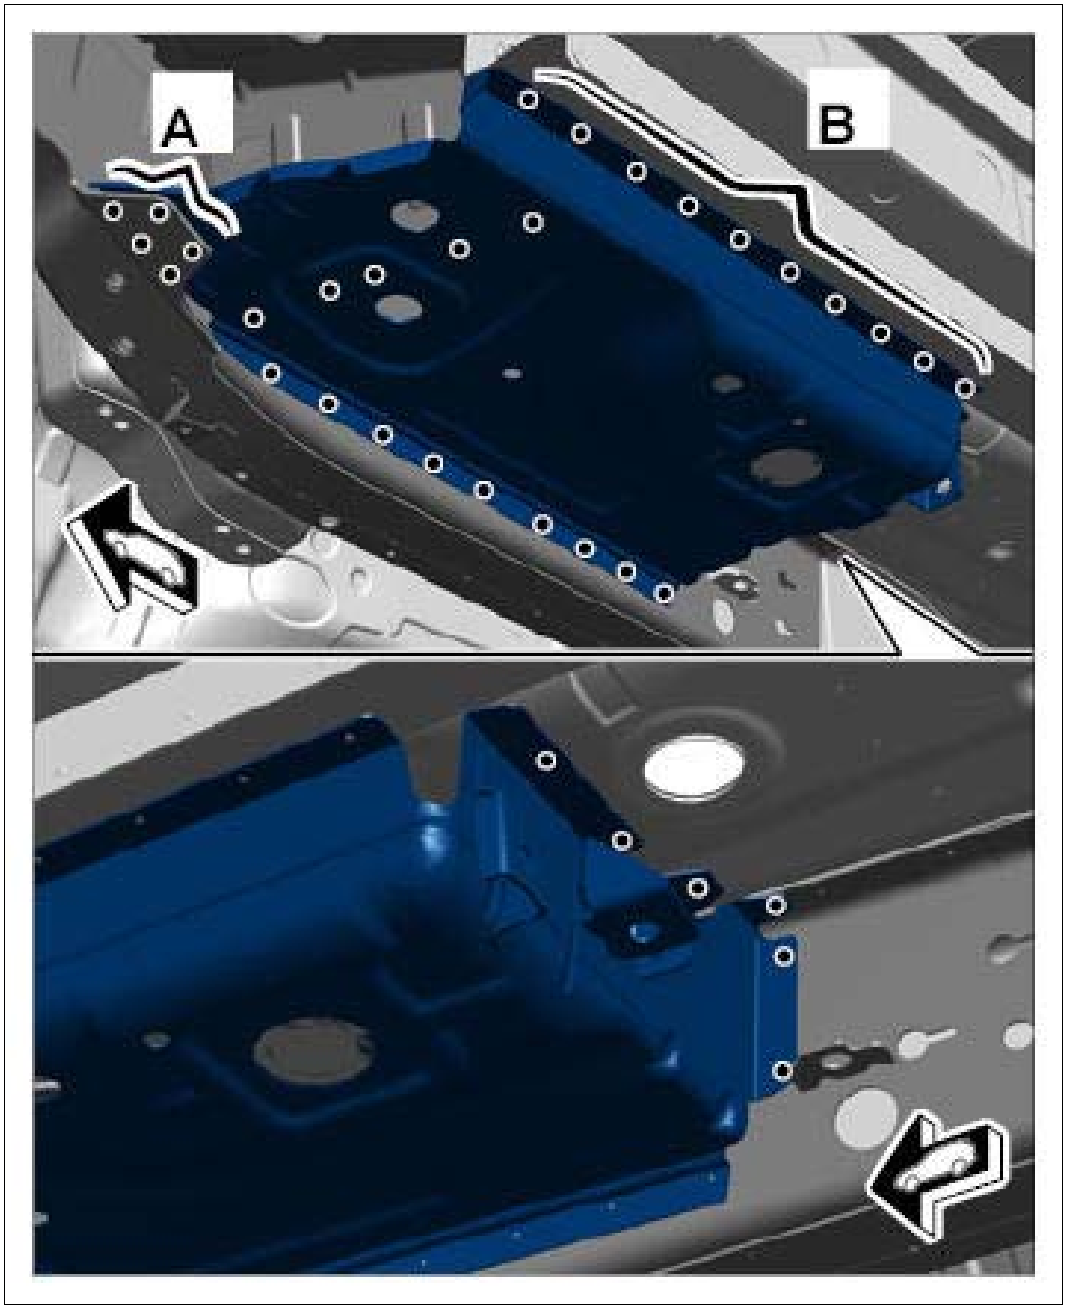
Information

Drill out the connection point on one side only. Do not damage the plate underneath.

3. Drill out spotwelds using **spotweld drill** .

    1. 3.1. Drill out spotwelds **-A-** using **spotweld drill** , by drilling through two plate thicknesses.
    2. 3.2. Drill out spotwelds **-B-** through two plate thicknesses using a → **Diameter: 6.5 mm drill bit** .
    3. 3.3. Remove mounting.

Fig 4: Removing Mounting Front Side Member



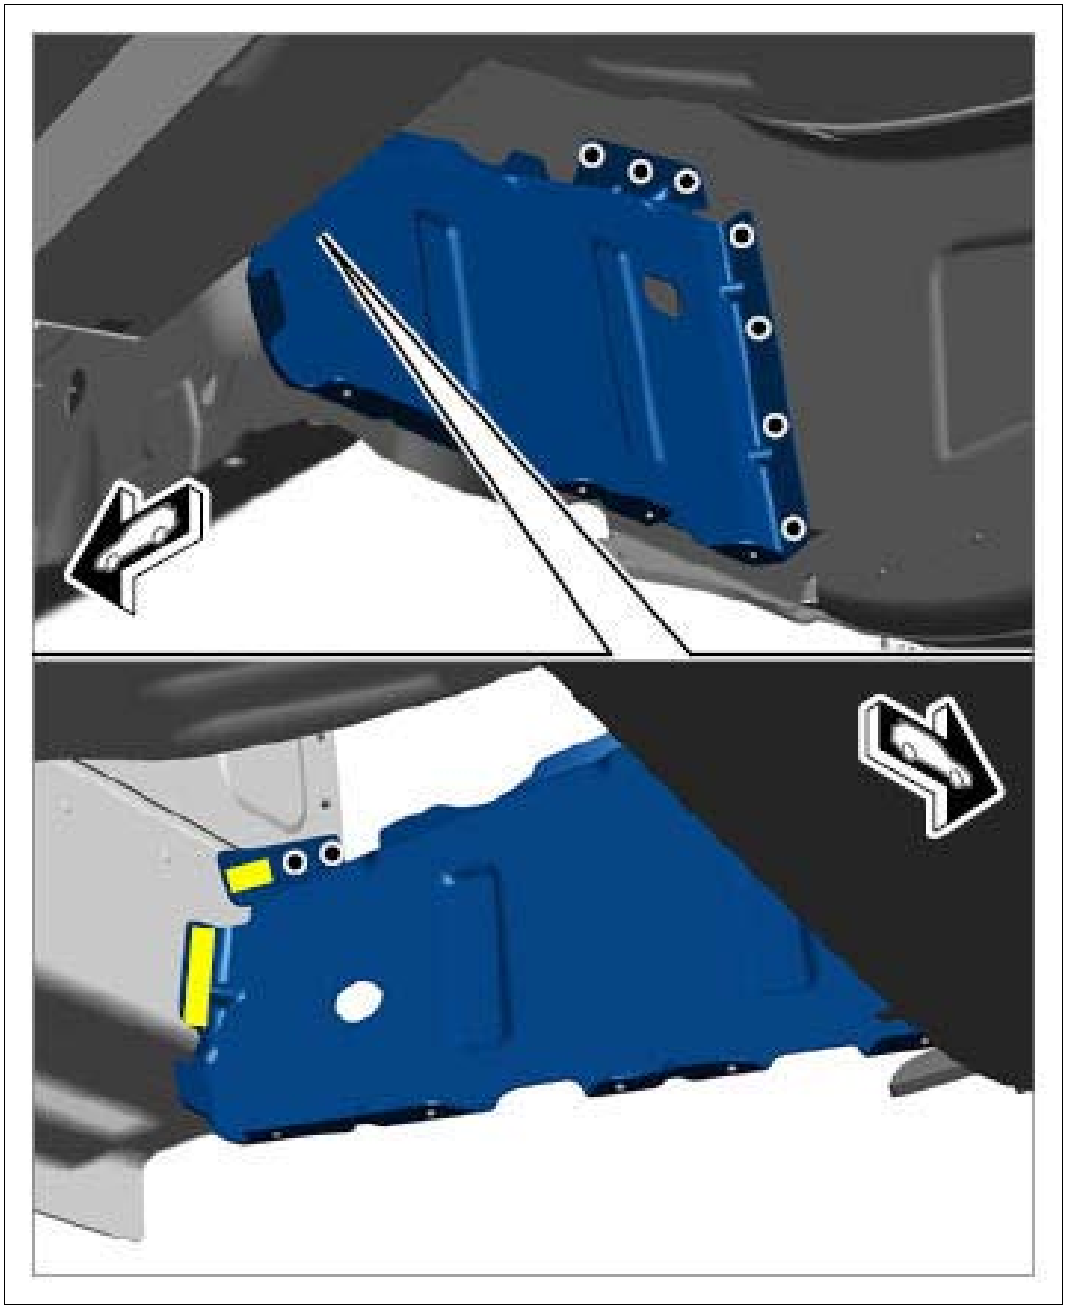
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

4. Drill out spotwelds using **spotweld drill** .
    1. 4.1. Heat the marked bonding areas.
    2. 4.2. Remove reinforcement.

Fig 5: Removing Reinforcement



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Mark and make a rough cut **-arrows-** on the longitudinal member.

WM 510355 REPLACING ROOF (WITH SLIDING ROOF) (ALL MODELS) > TOOLS AND MATERIALS > TOOLS AND MATERIALS FOR BODY REPAIRS

Information

- The tools for working on steel and aluminum must always be kept separate from each other. We recommend that you color code the tools using a system similar to that used for the Aluminum tool set with trolley WE 1350, for example.

Straightening set **Body alignment system package WE 1121 Measuring and alignment system, professional WE 1398**

Resistance spot welder; optional Inverter welder **MIDIspot-QSVM-12000 WE 1312, Resistance spot welder WE 1352, Resistance spot welder WE 1311, Resistance spot welder WE 1313**

Metal inert gas (MIG) welder

Pneumatic spotweld remover **Pneumatic Spotweld Remover, Vario Drill WS 90 WE 1139**

Pneumatic body saw **Body saw WE 1508**

Oscillating body saw (special electric cutter) **Special electric cutter WE 1137**

Hot-air blower **Hot-air blower WE 1119**

Hand-cartridge gun **Hand-cartridge gun WE 1141**

Spotweld drill **Spotweld drill** ; **Twist drill Nr.201**

Countersink for rivets **Countersink Nr.202**

Blind riveting tool for high-strength rivets **Blind riveting tool TAURUS 4 WE 1348**

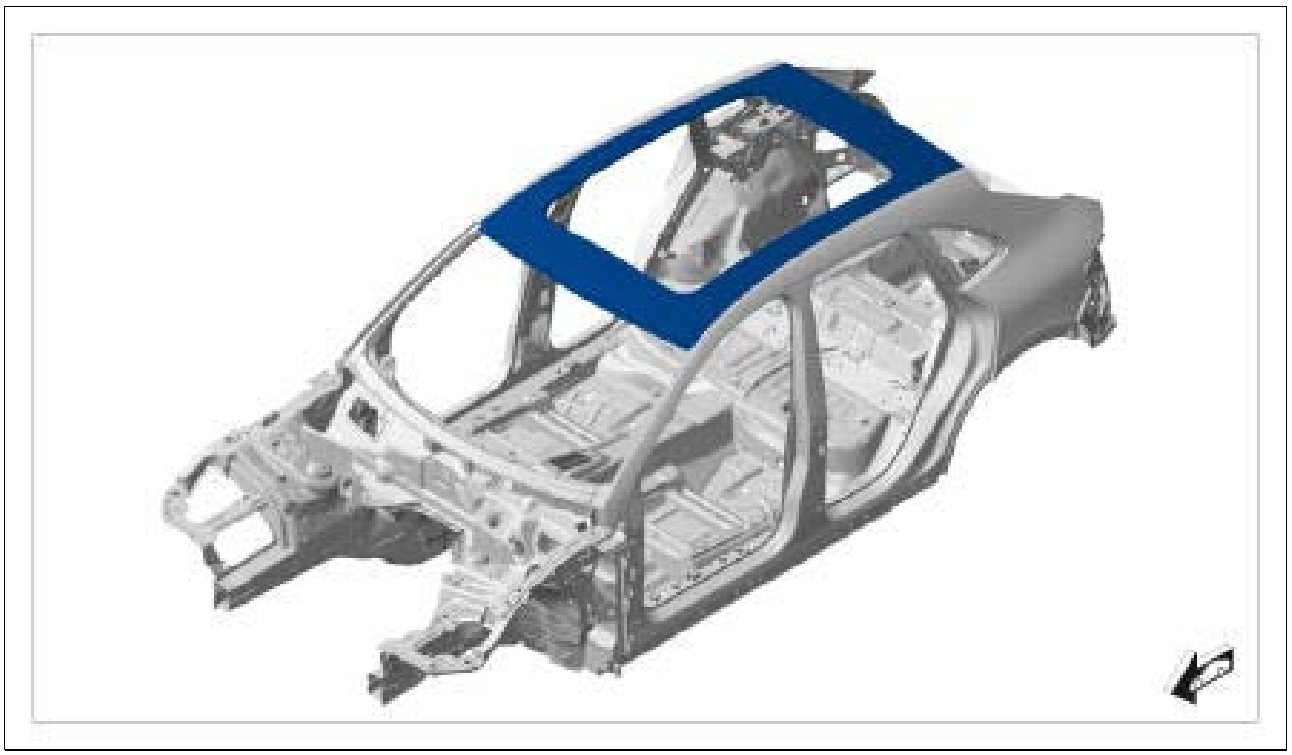
Safety vacuum cleaner for aluminum dust **Mobile extraction unit, aluminum WE 1507**

Star gauges for body gap dimensions Nr.127-1

Wurth Klebt und Dichtet body sealant

WM 510355 REPLACING ROOF (WITH SLIDING ROOF) (ALL MODELS) > REMOVING ROOF

Fig 1: Identifying Roof Installation Position



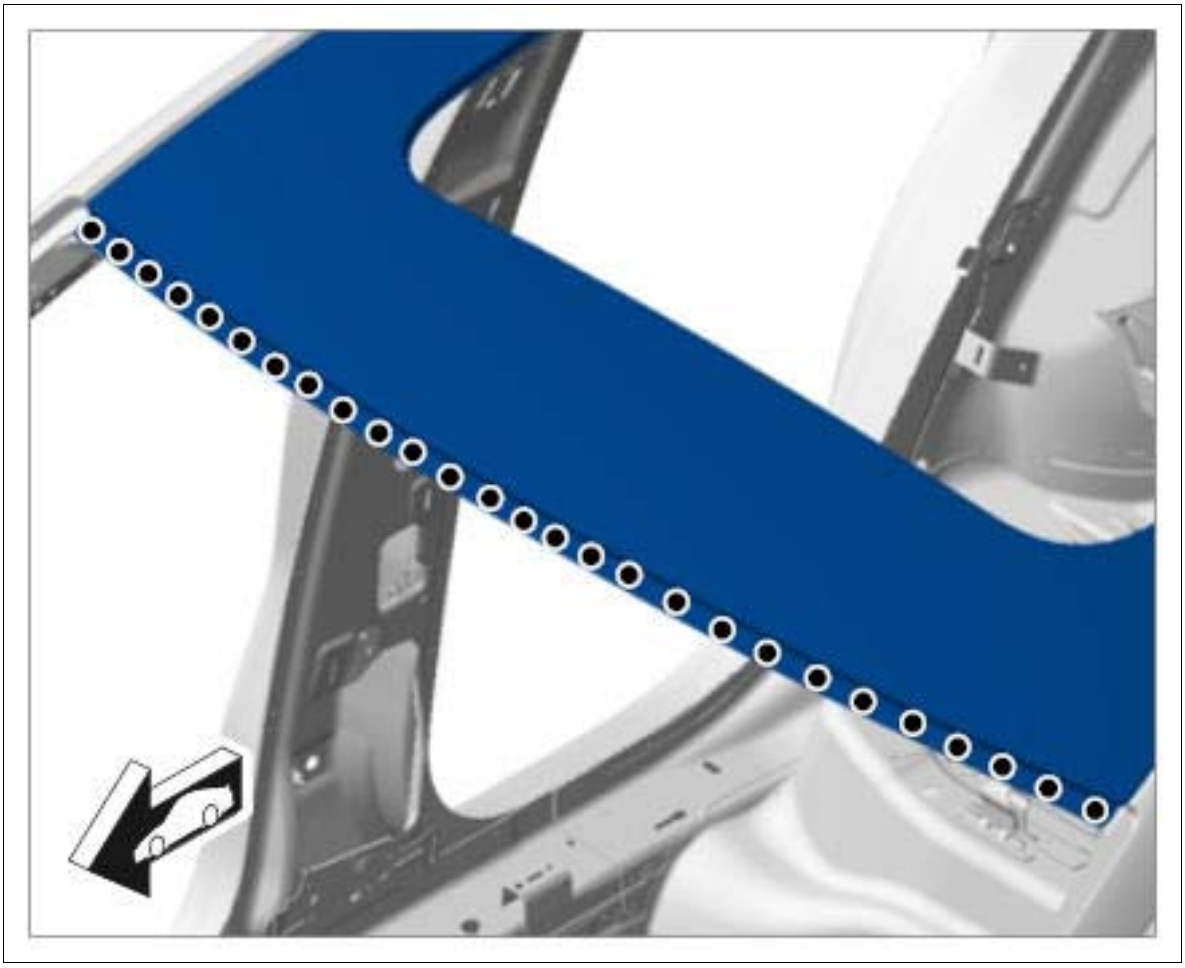
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

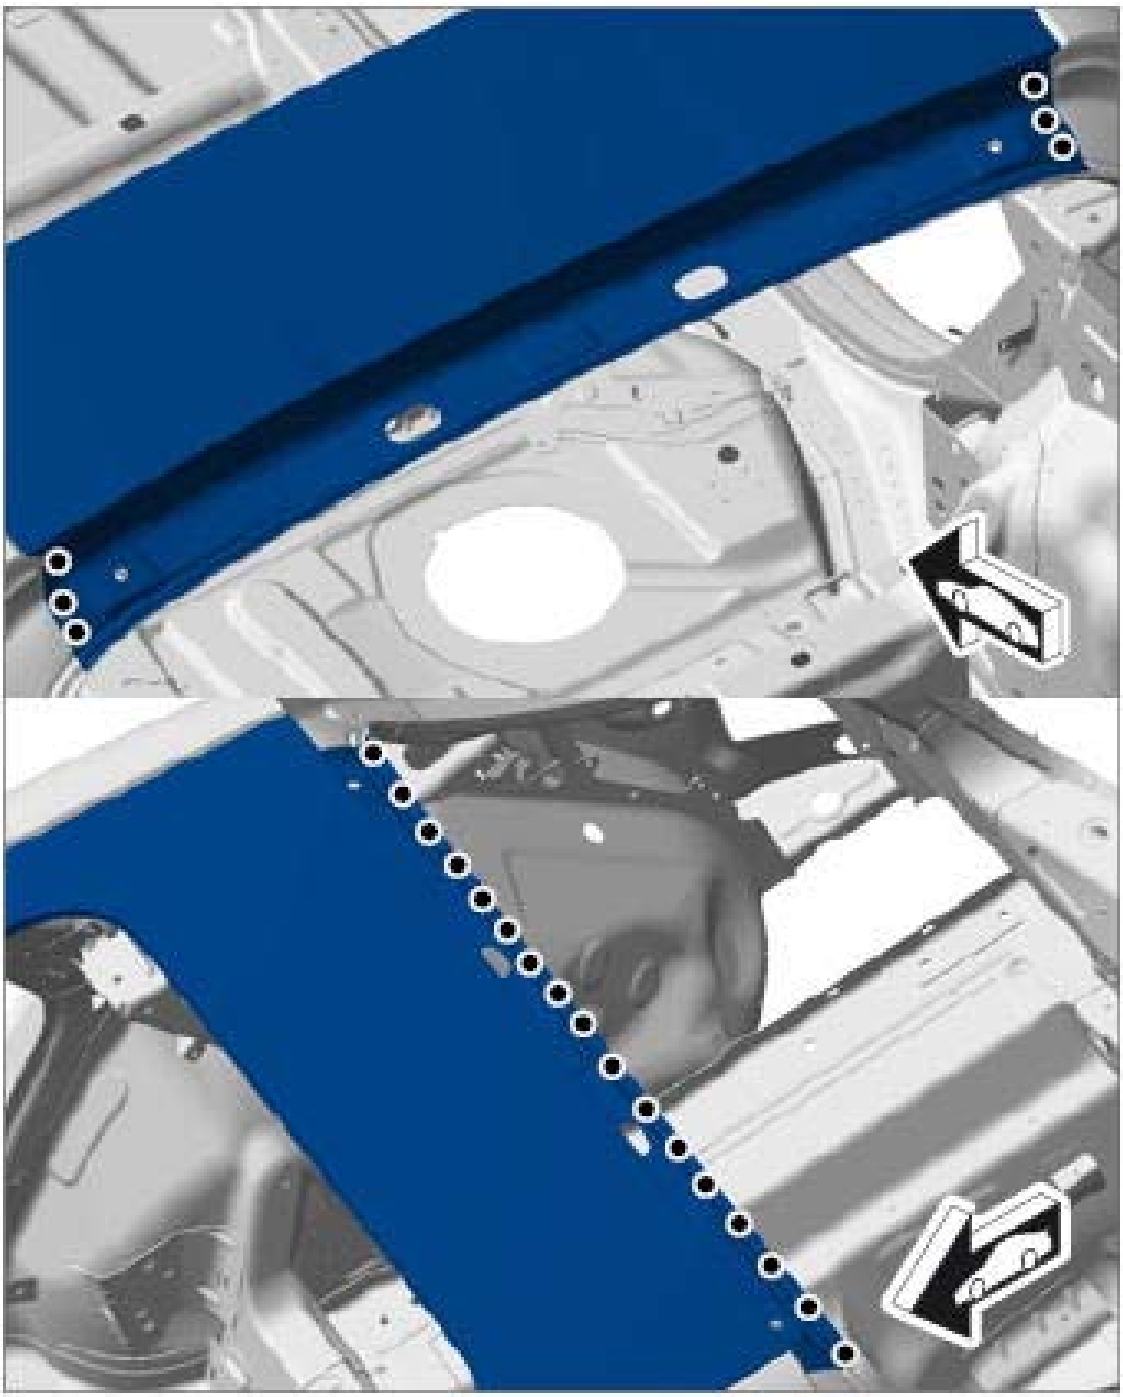
1. Drill out spotwelds using **spotweld drill**

Fig 2: Identifying Roof Spotwelds Area



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 3: Identifying Roof Spotwelds Area

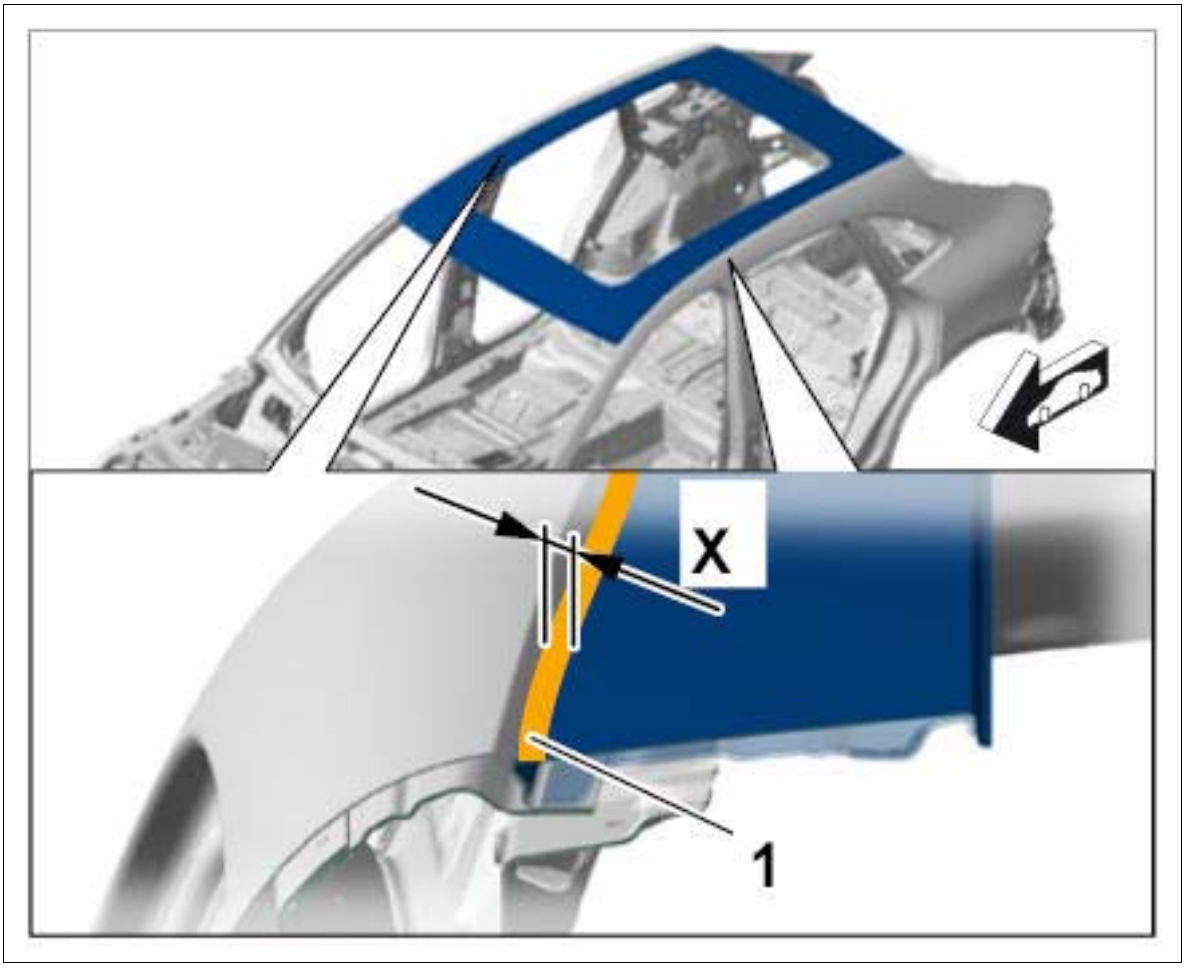


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Affix adhesive tape **-1-** along the edge of the roof on both sides at dimension **-X-** . → **Distance: 15 mm+2 mm**

   Adhesive tape serves as cut line.

Fig 4: Identifying Roof Edge Dimension



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Only make cuts in the top plate. Make sure not to damage the plate underneath when doing this.

3. Make cut on both sides.
4. Heat connection areas using the hot-air gun.

Fig 5: Identifying Roof

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 6: Identifying Roof

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

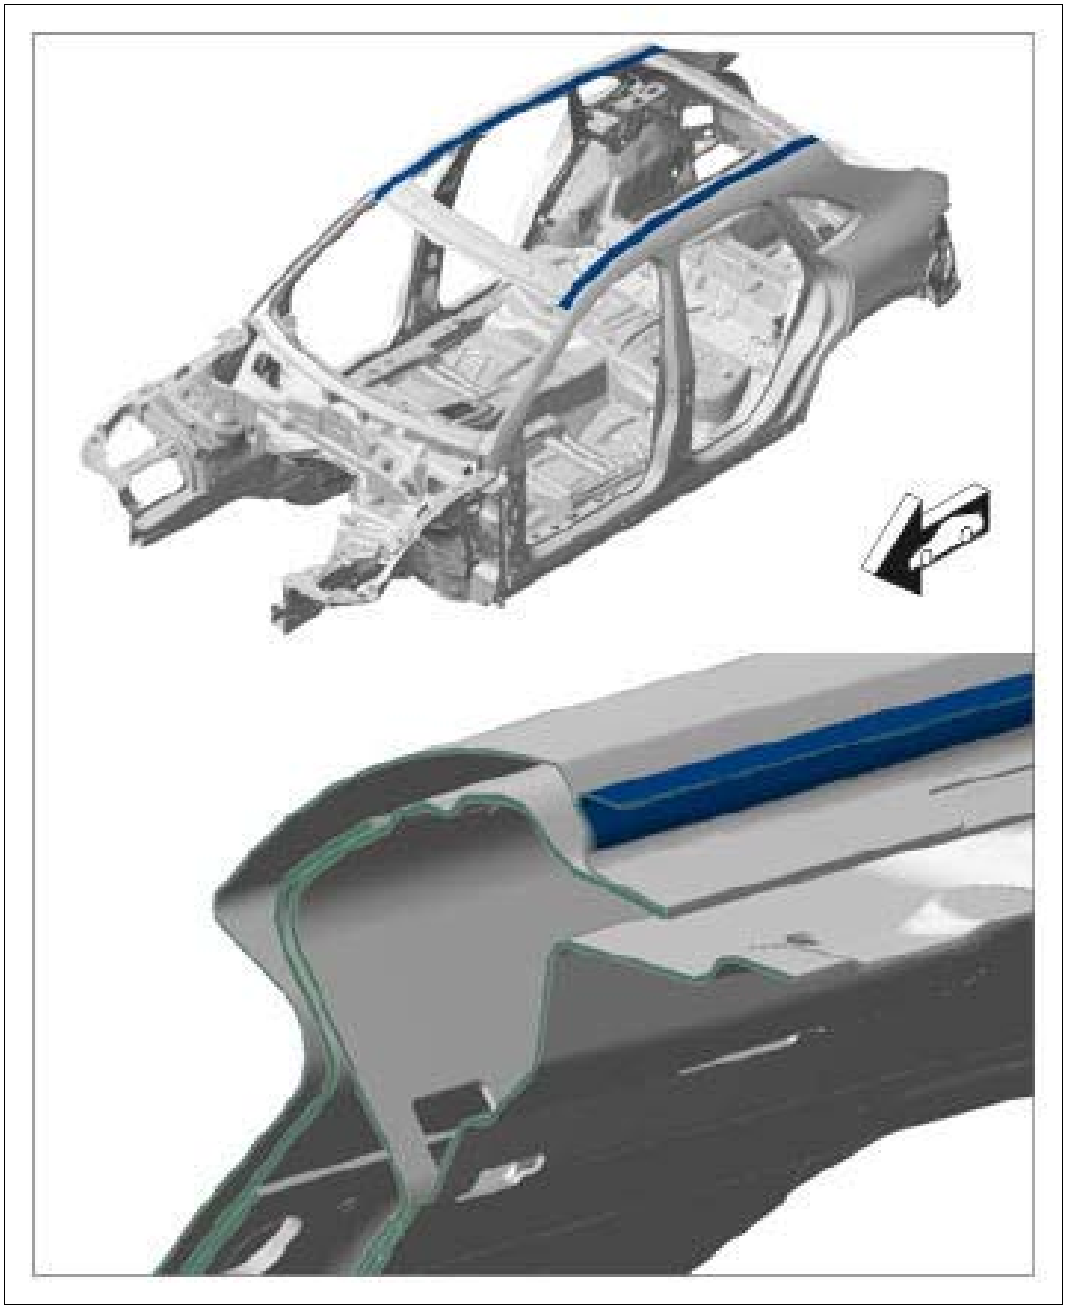
5. Remove roof (with the help of two people).

Information

1. During separation make sure that the components beneath are not damaged.

6. Remove remaining pieces of roof.
    1. 6.1. Cut off laser soldered joints on side panels.
    2. 6.2. Remove remaining pieces.

Fig 7: Identifying Roof Pieces

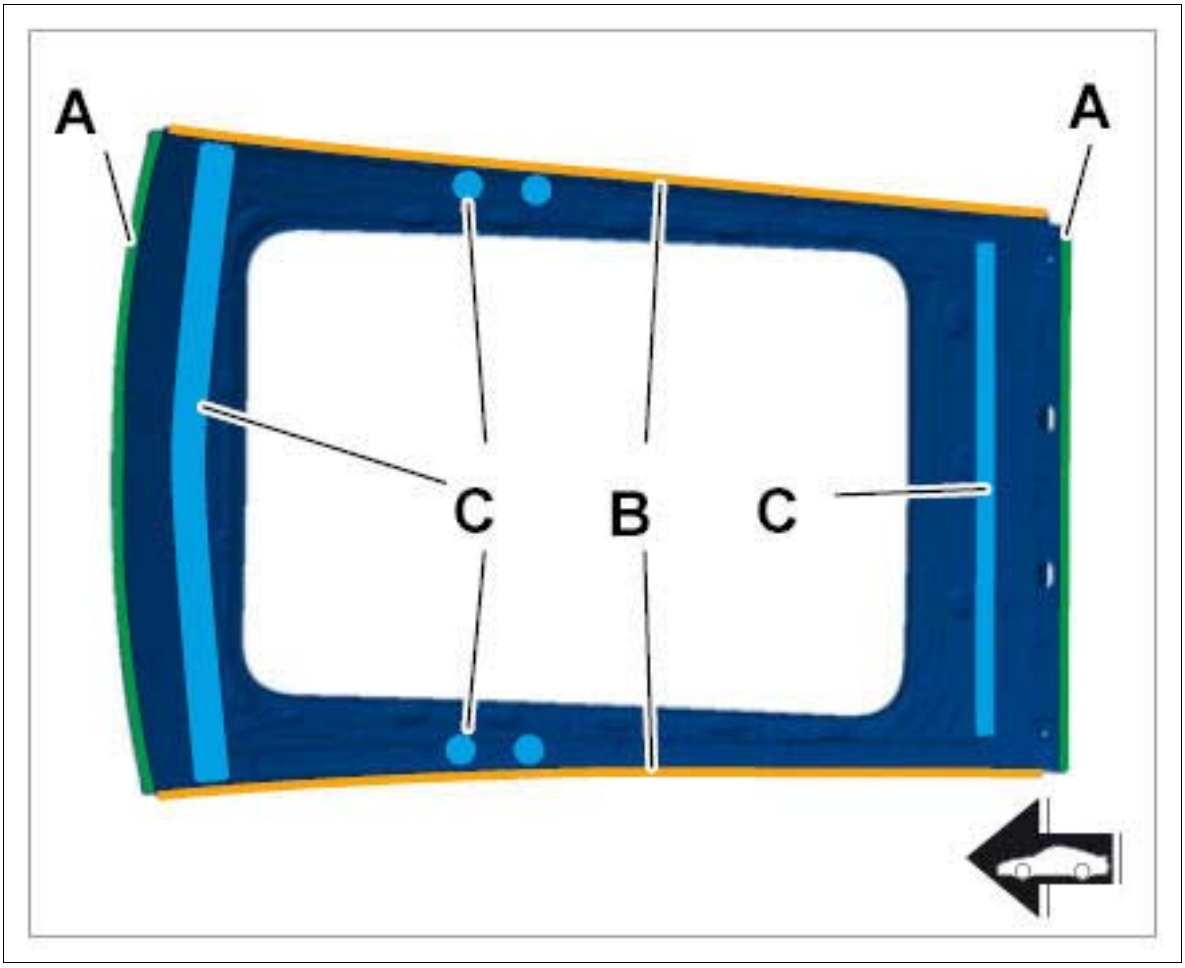


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 510355 REPLACING ROOF (WITH SLIDING ROOF) (ALL MODELS) > PREPARING ROOF FOR INSTALLATION

1. Prepare connection flanges in areas **-A-** for bonding and welding.

Fig 1: Identifying Roof Connection Flanges Areas



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Prepare bonding surfaces for applying structural adhesive **-B-** . → 5X00IN21 WORKING WITH BODY STRUCTURAL ADHESIVE
3. Clean bonding areas of support adhesive **-C-** from inside using acetone.

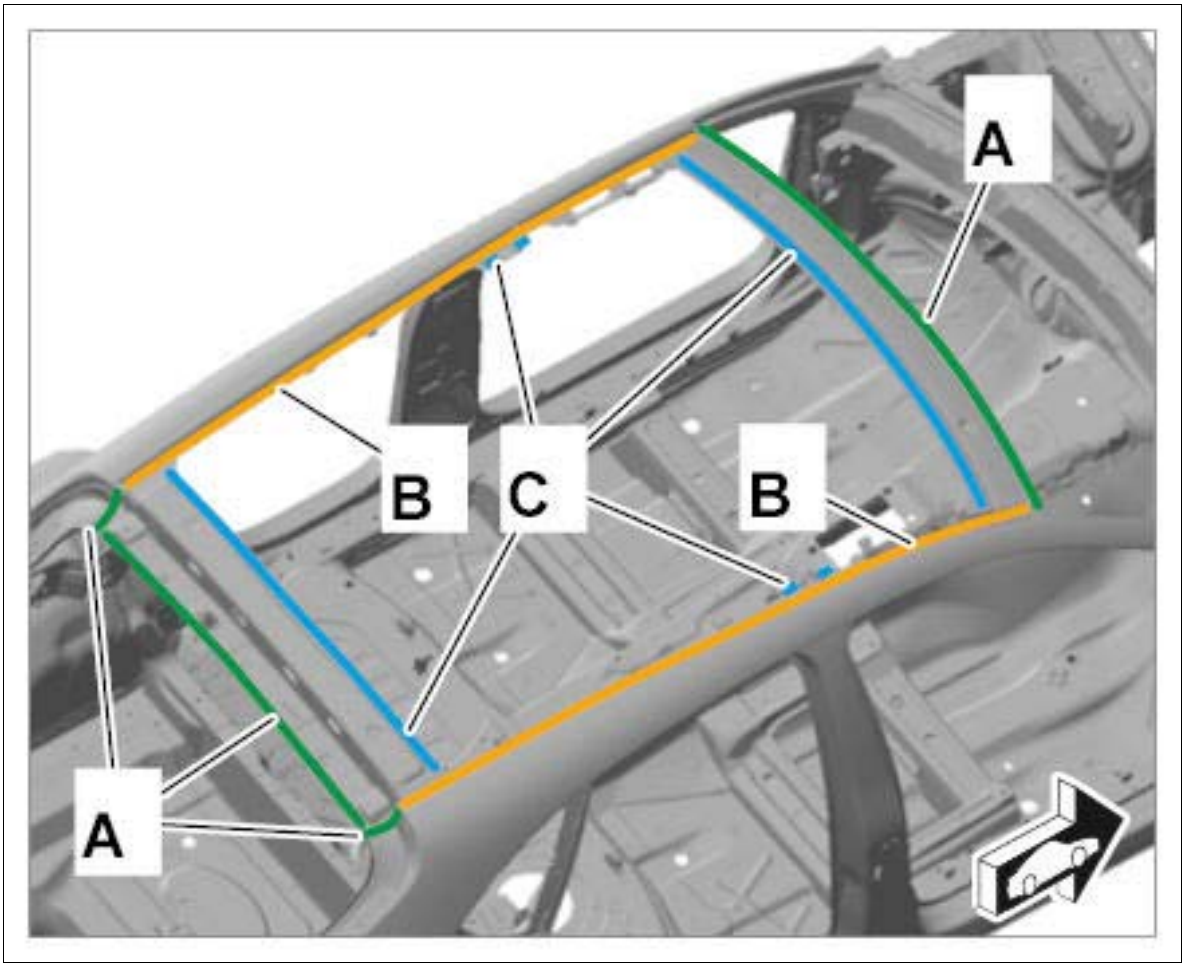
WM 510355 REPLACING ROOF (WITH SLIDING ROOF) (ALL MODELS) > PREPARING CONNECTION AREAS OF BODY FOR INSTALLING ROOF

Information

Do not apply zinc powder paint to the bonding areas.

1. Clean welding and bonding areas.

Fig 1: Identifying Body Connection Areas



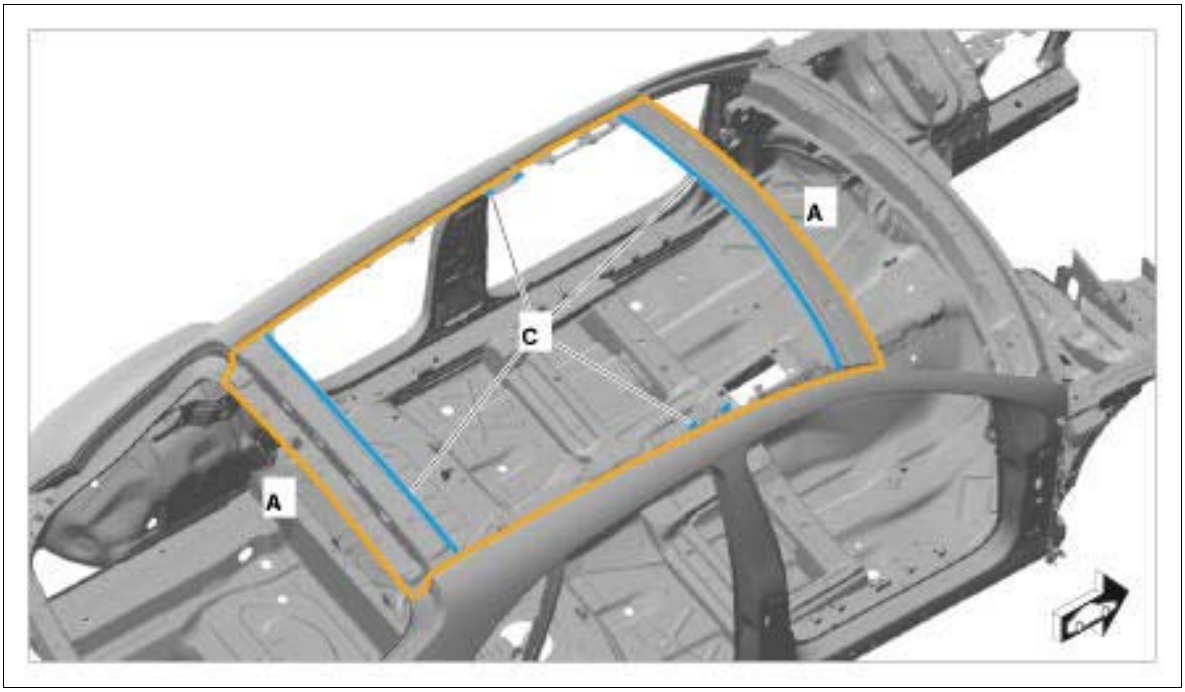
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Prepare connection flanges in areas **-A-** for resistance spot-welding and bonding.
2. 1.2. Prepare connection flanges in areas **-B-** for bonding.
3. 1.3. Prepare bonding areas of support adhesive **-C-** for bonding with window adhesive.

WM 510355 REPLACING ROOF (WITH SLIDING ROOF) (ALL MODELS) > INSTALLING ROOF

1. Apply structural adhesive and support adhesive (window adhesive).

Fig 1: Identifying Roof Adhesive Applying Areas



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Evenly apply structural adhesive to the marked areas **-A-** .

   Working with body structural adhesive → 5X00IN21 WORKING WITH BODY STRUCTURAL ADHESIVE

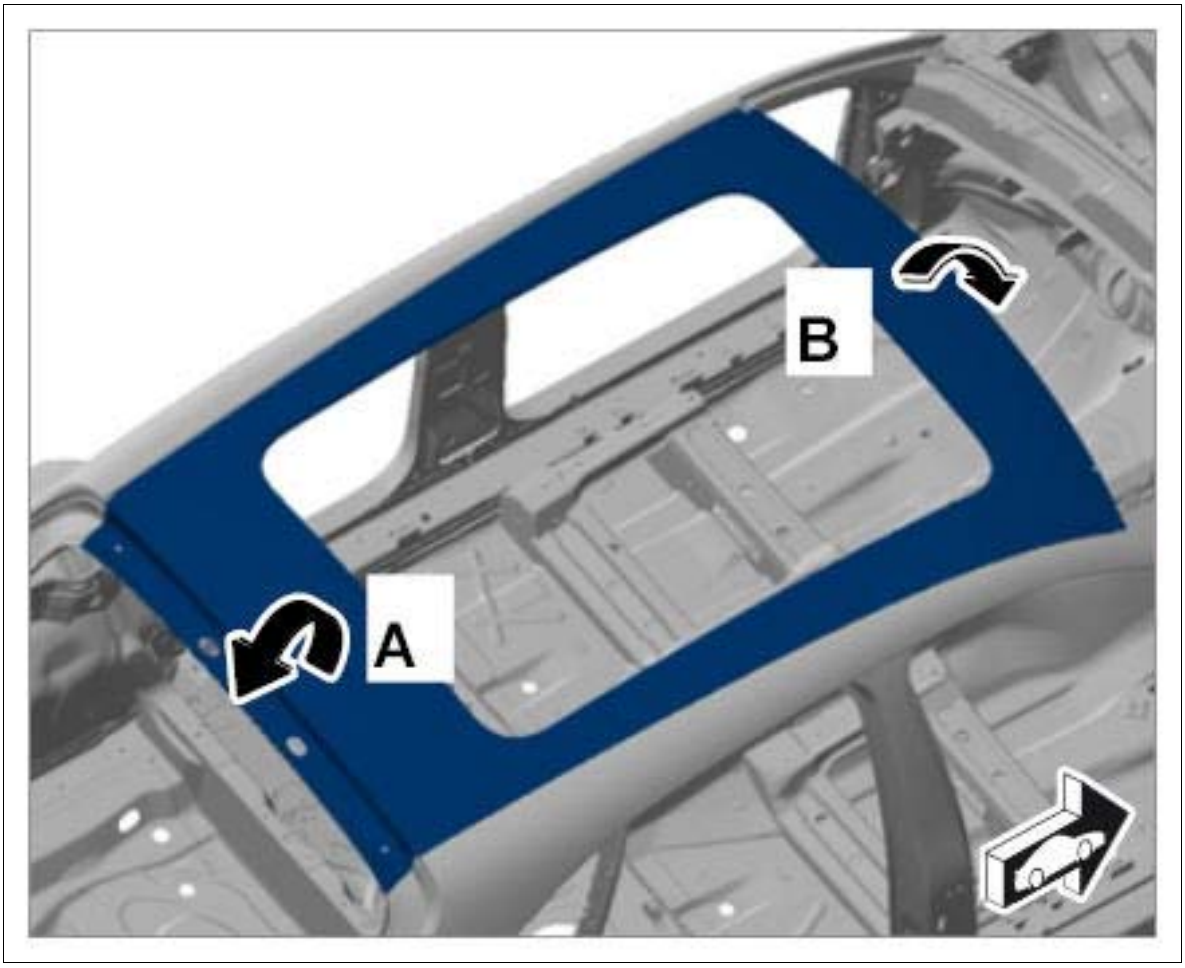
   Structural adhesive

2. 1.2. Apply support adhesive (window adhesive) to the marked areas **-C-** .

   Support adhesive

2. Place roof on rear roof frame with the help of two people **-arrow A-** and swivel it in towards the front **-arrow B-** .

Fig 2: Installing Roof



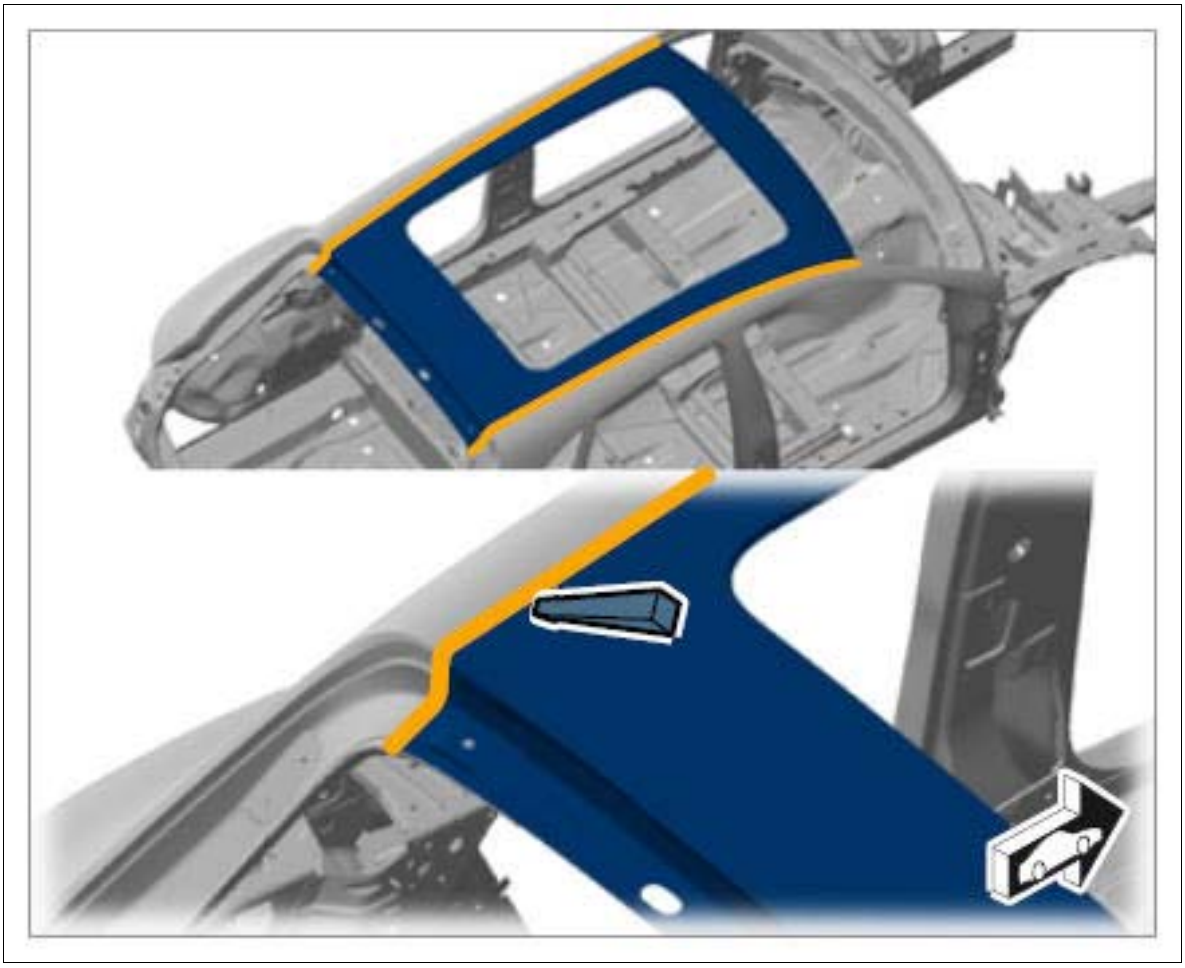
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. Have this work carried out by an assistant while at the same time starting with the welding work.

3. Clean surface of roof in the side panel area.

Fig 3: Cleaning Roof Surface



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. Remove most of the excess adhesive material with a plastic spatula or cloth.
2. 3.2. Finish cleaning visible surfaces with a cloth soaked in cleaning solution.

Fig 4: Cleaning Roof

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Resistance spot-weld the front of the roof.

Fig 5: Identifying Front Roof Spot-Weld Area

TOOLS AND MATERIALS FOR BODY REPAIRS

Information

- The tools for working on steel and aluminum must always be kept separate from each other. We recommend that you color code the tools using a system similar to that used for the Aluminum tool set with trolley WE 1350, for example.

Straightening set **Body alignment system package WE 1121 Measuring and alignment system, professional WE 1398**

Resistance spot welder; optional **Inverter welder MIDIspot-QSVM-12000 WE 1312, Resistance spot welder WE 1352, Resistance spot welder WE 1311, Resistance spot welder WE 1313**

Metal inert gas (MIG) welder

Pneumatic spotweld remover **Pneumatic Spotweld Remover, Vario Drill WS 90 WE 1139**

Pneumatic body saw **Body saw WE 1508**

Oscillating body saw (special electric cutter) **Special electric cutter WE 1137**

Hot-air blower **Hot-air blower WE 1119**

Hand-cartridge gun **Hand-cartridge gun WE 1141**

Spotweld drill **Spotweld drill** ; Twist drill Nr.201

Countersink for rivets **Countersink Nr.202**

Blind riveting tool for high-strength rivets **Blind riveting tool TAURUS 4 WE 1348**

Safety vacuum cleaner for aluminum dust **Mobile extraction unit, aluminum WE 1507**

Star gauges for body gap dimensions Nr.127-1

Wurth Klebt und Dichtet body sealant

WM 510555 REPLACING ROOF PILLAR (ALL MODELS) > REMOVING ROOF PILLAR

Installation position of roof pillar

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

1. Drill out spotwelds using **spotweld drill;**

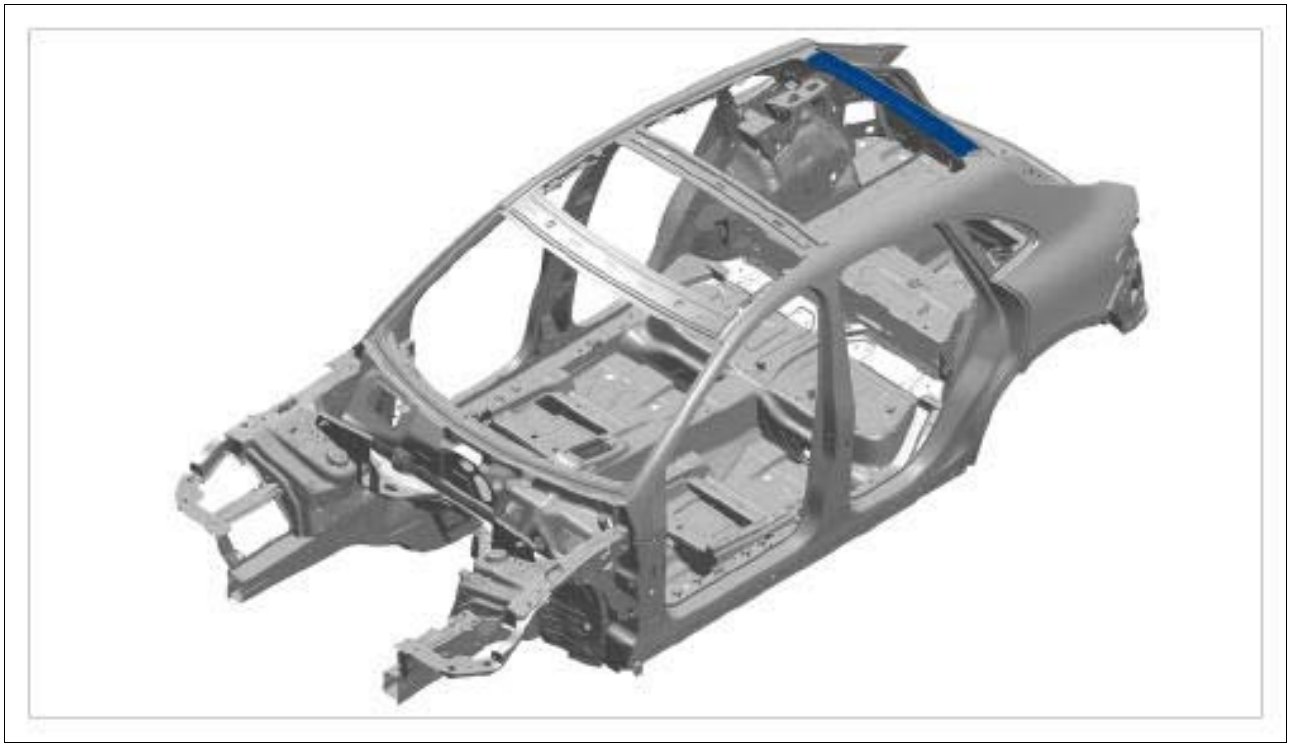
Fig 1: Identifying Rear Cross Member Installation Position



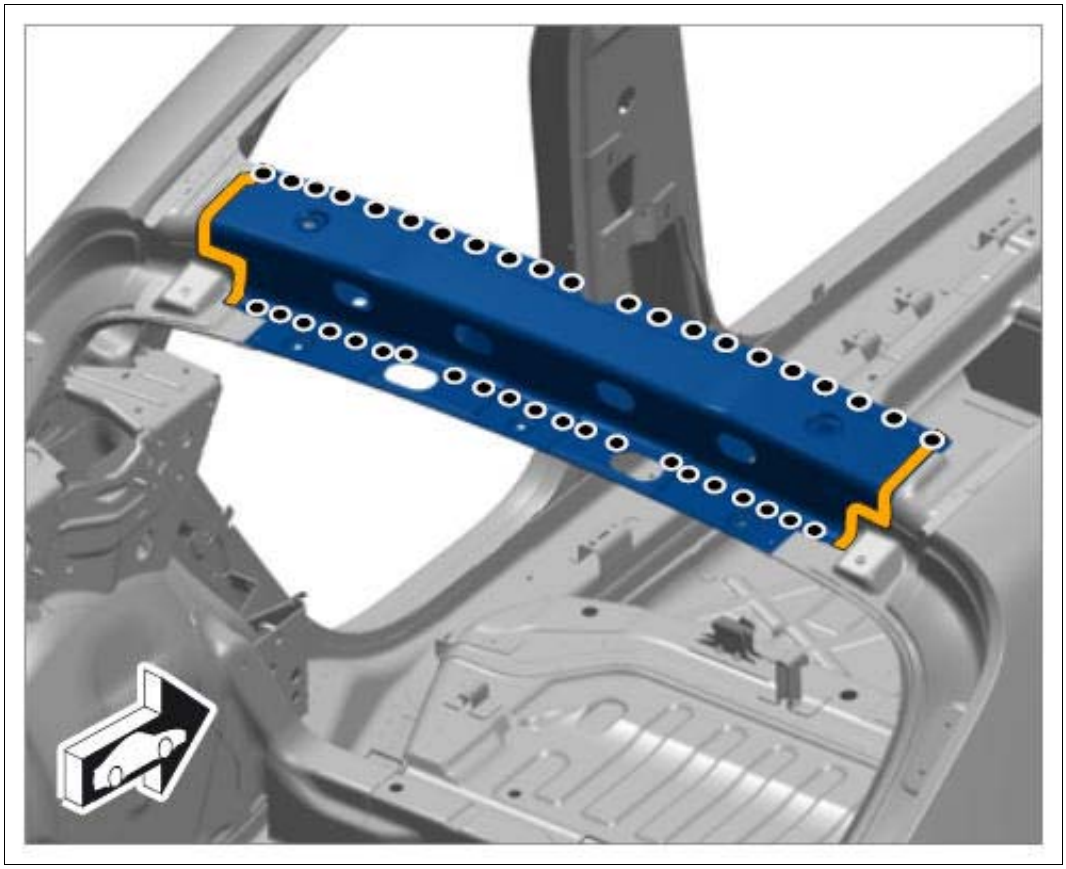
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

1. Drill out spotwelds using **spotweld drill** .
    1. 1.1. Heat bonding areas marked in yellow.
    2. 1.2. Remove upper part of rear cross member.

Fig 2: Identifying Upper Part Of Rear Cross Member



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

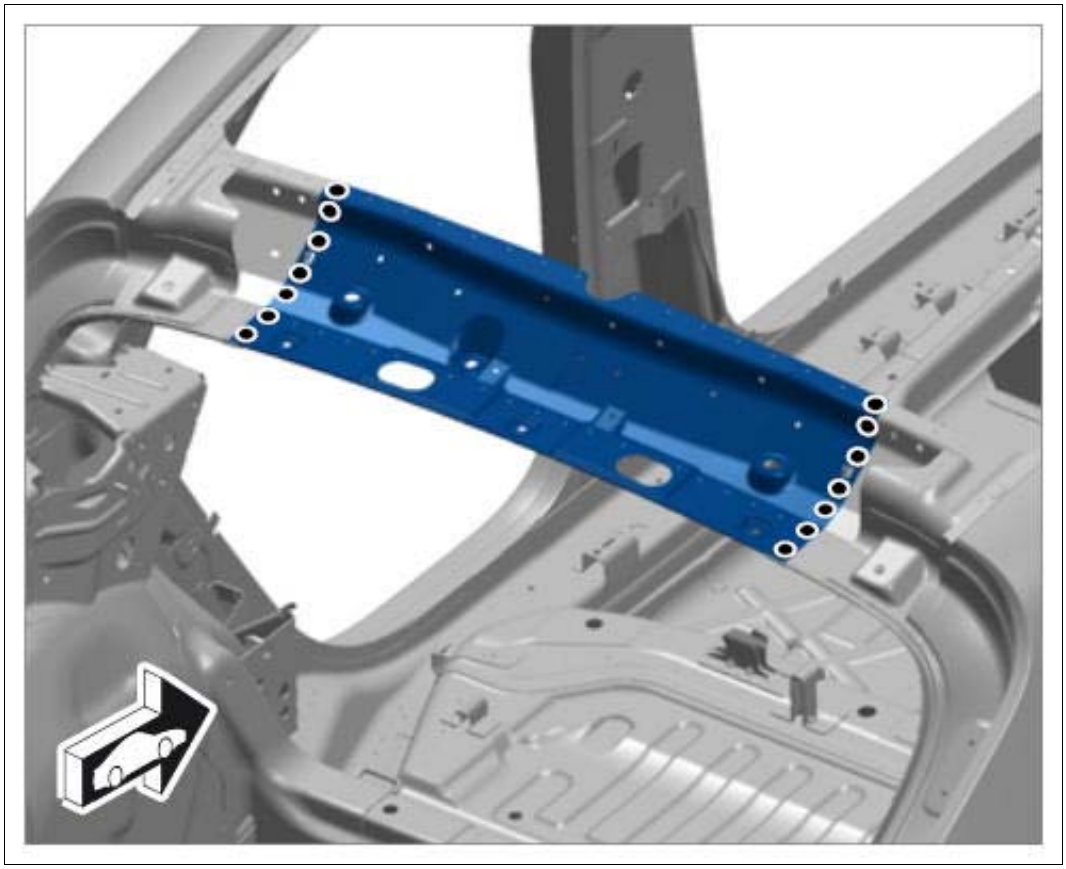
Information

Drill out the connection point on one side only. Do not damage the plate underneath.

2. Drill out spotwelds using spotweld drill .

    1. 2.1. Remove lower part of cross member.

Fig 3: Identifying Lower Part Of Rear Cross Member

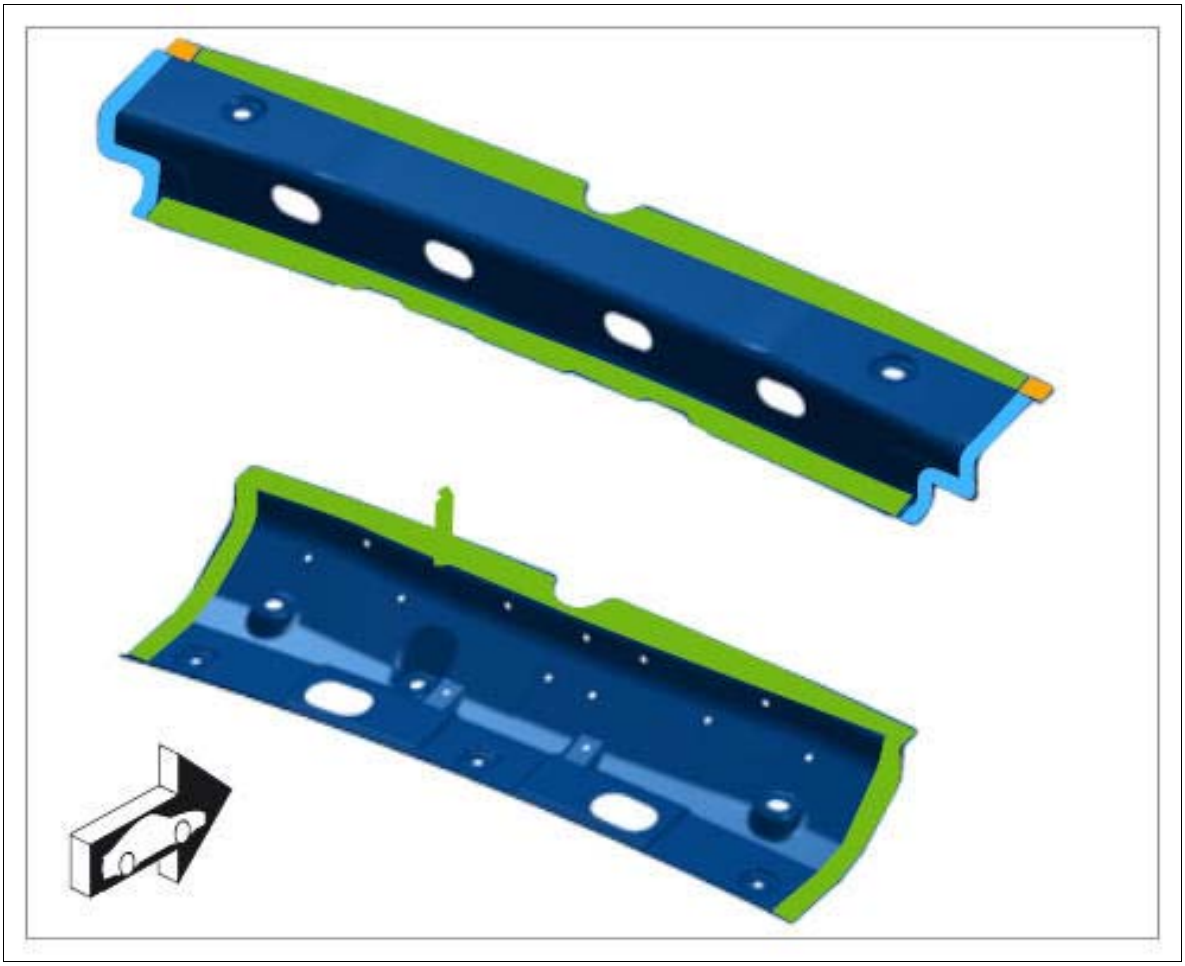


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 510955 REPLACING REAR CROSS MEMBER (ALL MODELS) > PREPARING REAR CROSS MEMBER FOR INSTALLATION

1. Fit in rear cross member.
2. Prepare rear cross member for bonding and welding.

Fig 1: Identifying Rear Cross Member



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Green	Resistance spot-welding
Blue	Bonding
Orange	Bonding + resistance spot-welding

WM 510955 REPLACING REAR CROSS MEMBER (ALL MODELS) > PREPARING CONNECTION AREAS OF THE BODY

1. Align the sealing surface and connections of the body.
2. De-burr connection points and prepare them for welding.

Information

1. Before final assembly, make sure you fully understand all the work steps involved and carry out a trial assembly without applying adhesive.
2. The bonding process can only be carried out reliably when a smooth and swift sequence of operations is guaranteed.

3. Do not begin bonding work until all materials and tools necessary for later repair work are available.

3. Prepare the marked areas for welding and bonding. → 5X00IN21 WORKING WITH BODY STRUCTURAL ADHESIVE

Fig 1: Identifying Body Connection Areas

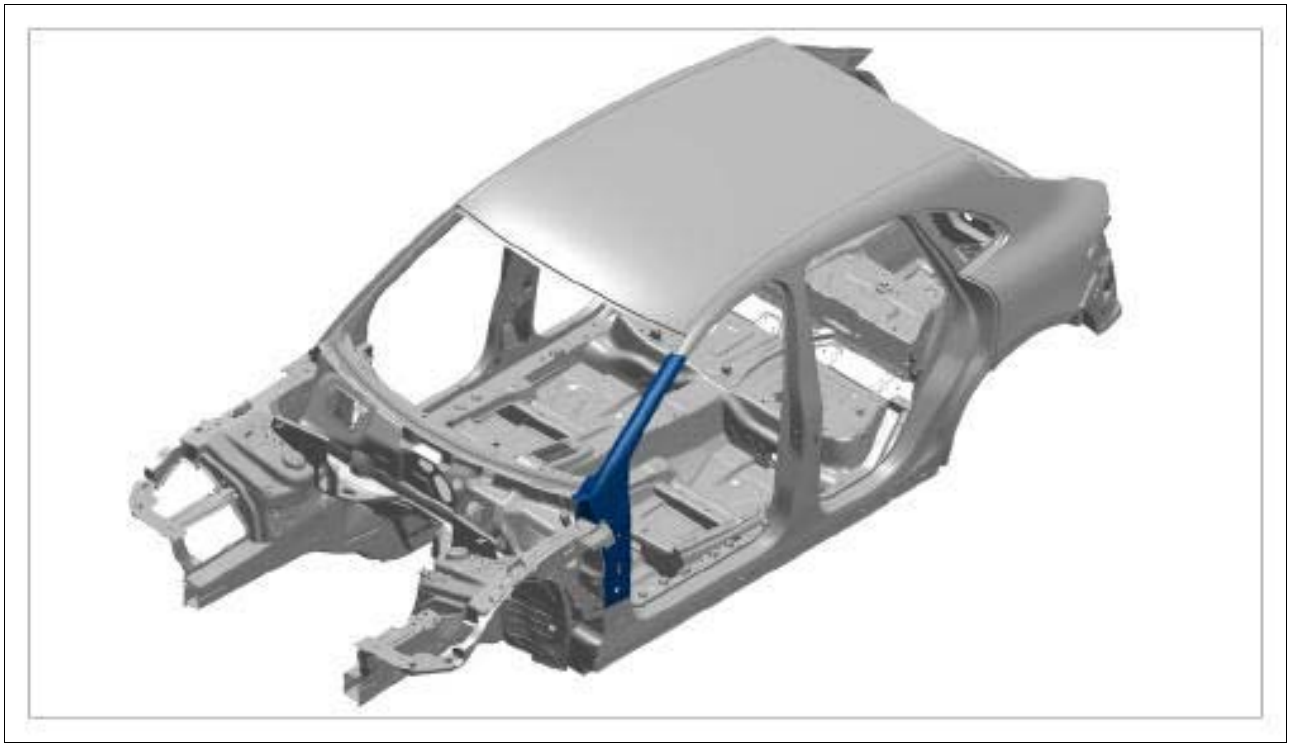
WM 511255 REPLACING A-PILLAR (ALL MODELS) > REMOVING A-PILLAR

Fig 1: Identifying A-Pillar Installation Position



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

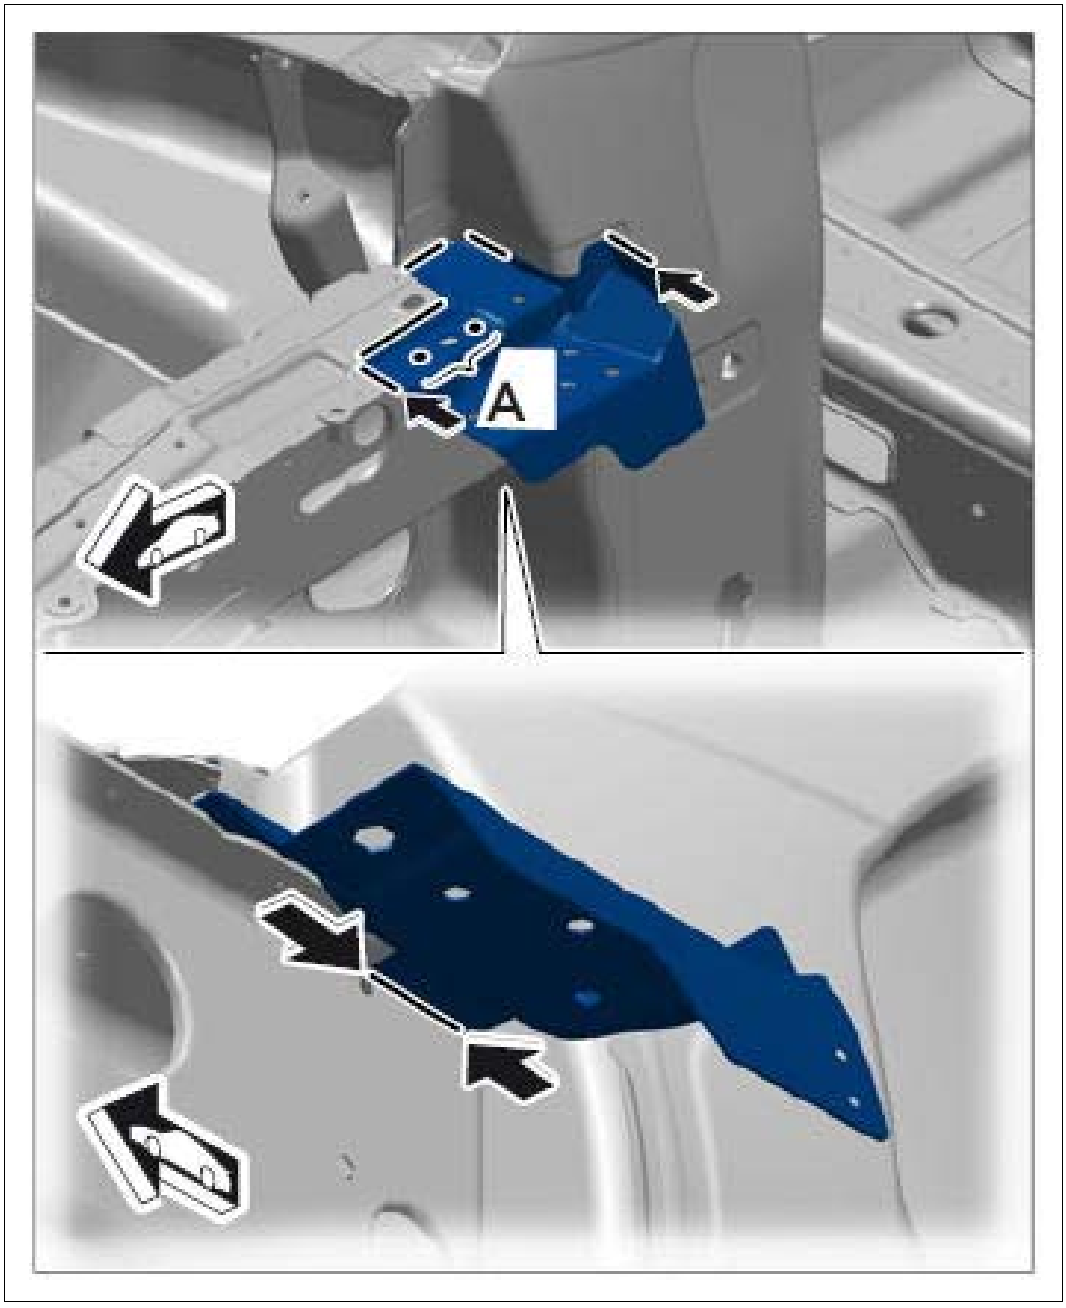
1. Remove wing bracket.

   Information

   Drill out the connection point on one side only. Do not damage the plate underneath.

   1. 1.1. Drill out spotwelds **-A-** using spotweld drill.
   2. 1.2. Grind down welded seams **-arrows-** .

Fig 2: Identifying Wing Bracket



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

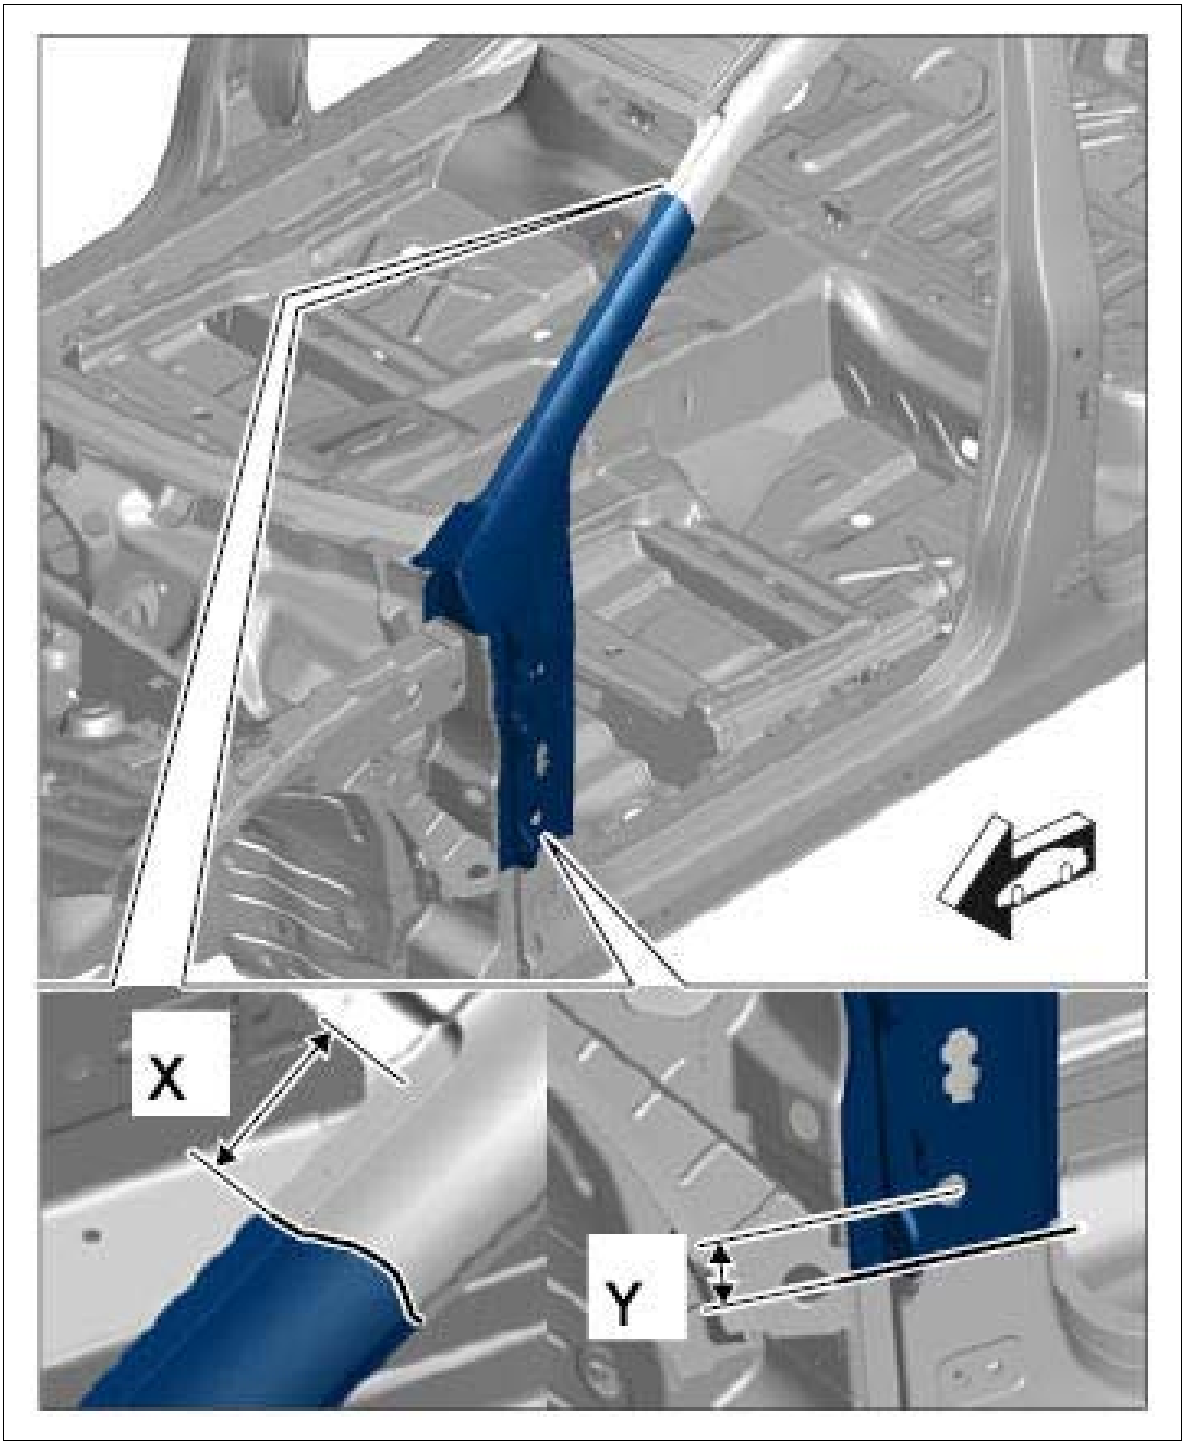
Mark cuts **X & Y** in accordance with the new part. Make sure to leave an overlap of approx. 3 cm with respect to the body.

Information

Only make cuts in the top plate. Make sure not to damage the plate underneath when doing this.

2. Mark and make cuts. → **Distance: 70 mm** → **Distance: 65 mm**

Fig 3: Identifying A-Pillar Mark Cutting Position



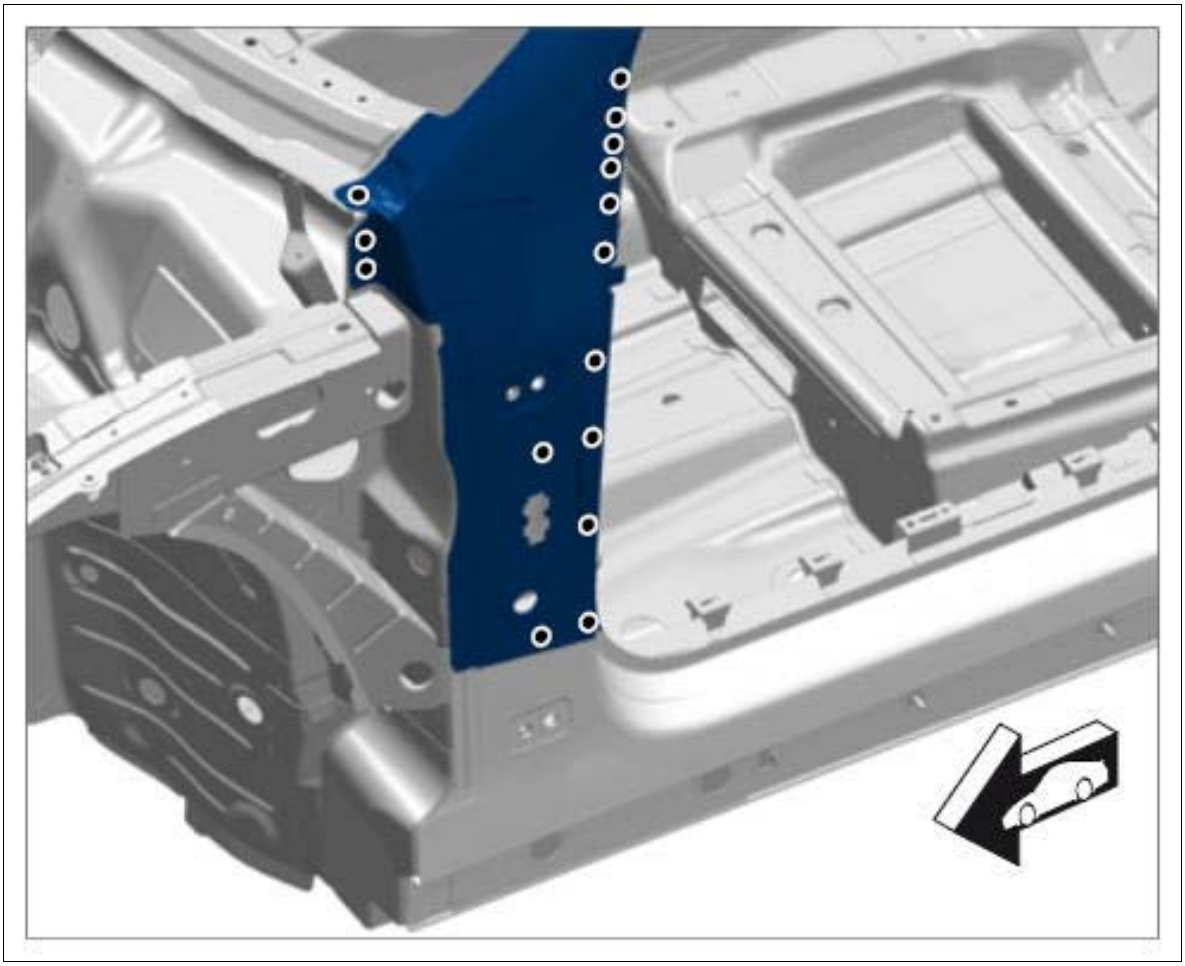
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

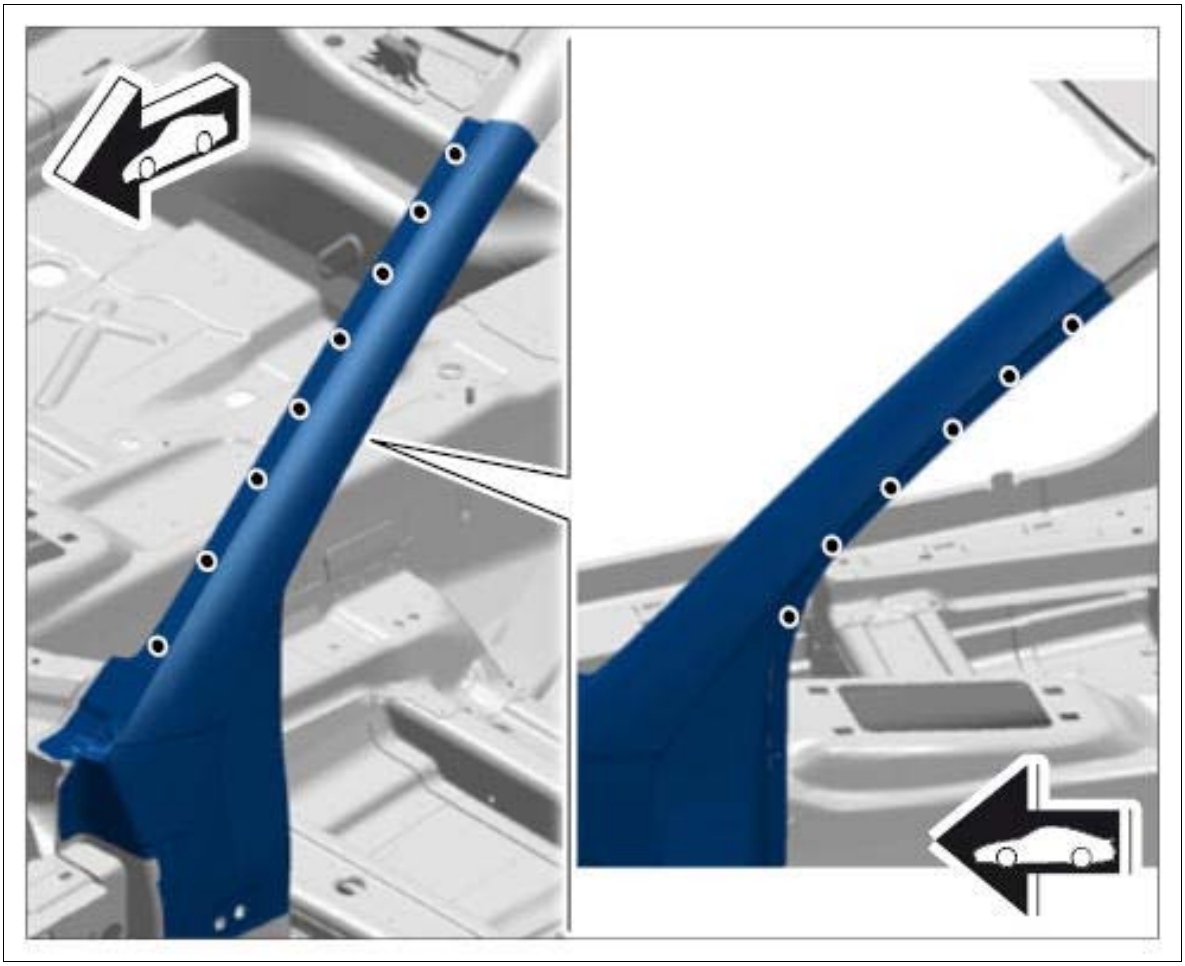
3. Drill out spotwelds using spotweld drill .

Fig 4: Identifying A-Pillar



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 5: Identifying A-Pillar



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

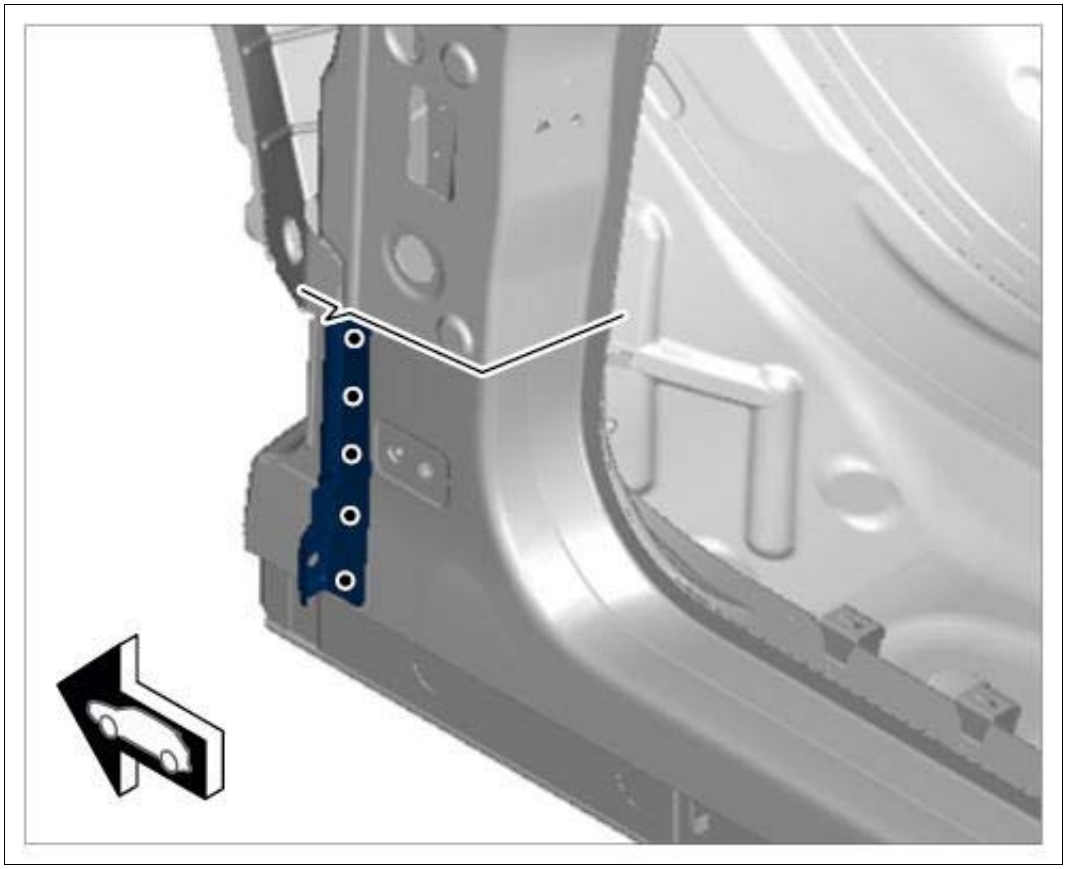
4. Remove A-pillar.
5. Remove remaining piece of wing attachment strip.

   Information

   Drill out the connection point on one side only. Do not damage the plate underneath.

   1. 5.1. Drill out spotwelds using spotweld drill .

Fig 6: Identifying Wing Attachment Strip



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 511255 REPLACING A-PILLAR (ALL MODELS) > PREPARING A-PILLAR FOR INSTALLATION

1. Fit in A-pillar.
    1. 1.1. Cut A-pillar at the transitions to the body leaving an overlap of 30 mm.
    2. 1.2. Fit in A-pillar again.
    3. 1.3. Make cuts through the A-pillar and body in the overlap areas.

Fig 1: Identifying A-Pillar

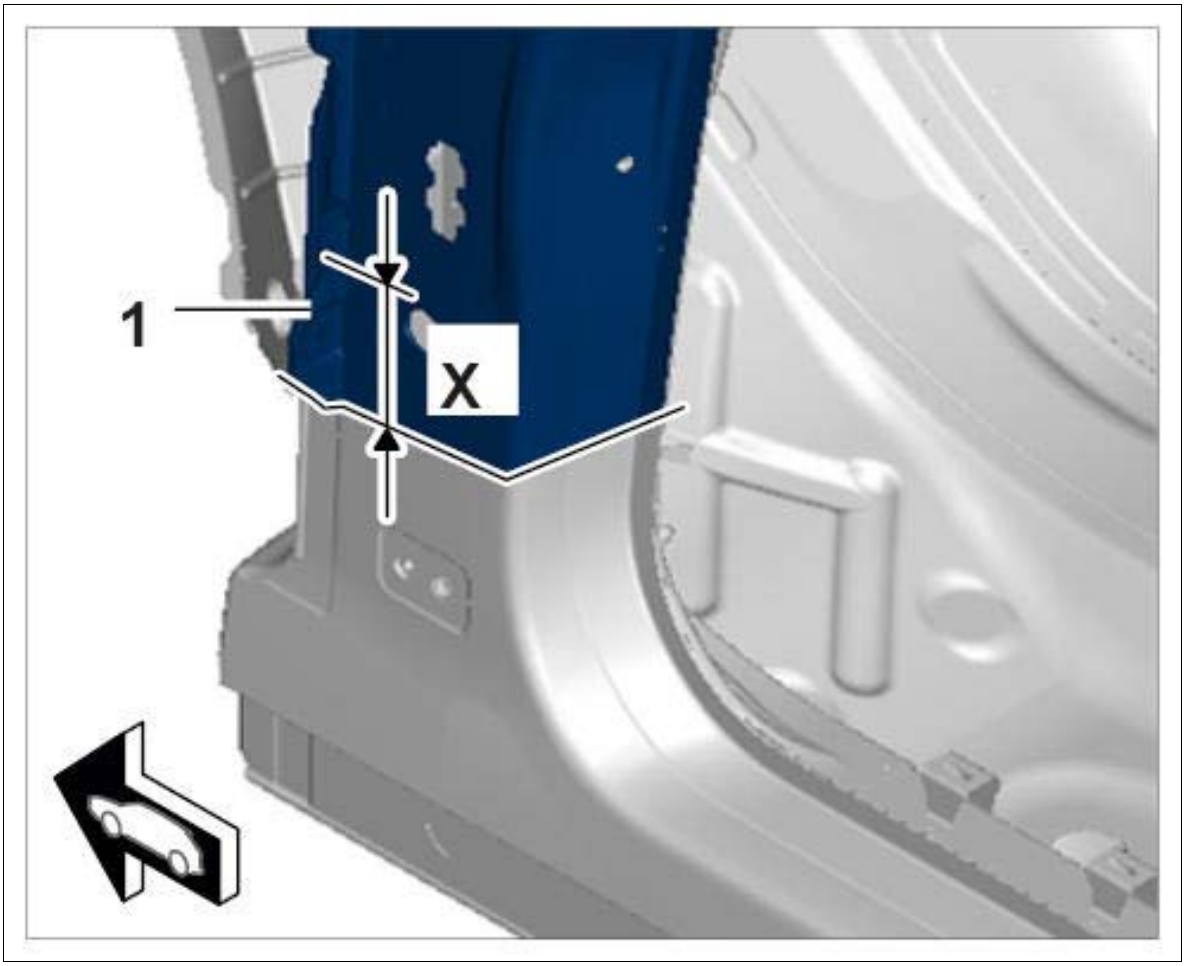
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Shorten the wing attachment strip to prevent an overlap in the welded area on the A-pillar.

2. Cut back the wing rail **-1-** . → **Dimension x: 90 mm**

Fig 2: Identifying Wing Rail Dimension



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Prepare connection areas for bonding and welding.

Fig 3: Identifying A-Pillar Connection Areas

WM 514155 REPLACING B-PILLAR (ALL MODELS) > PRELIMINARY WORK > PRELIMINARY WORK FOR BODY REPAIRS (WITHOUT STRAIGHTENING BENCH)

Information

- If it can be ensured there has been no deformation of the vehicle structure, the following repair can be carried out without the need of a straightening bench. In this case, the vehicle must not be raised when welding the component; it must stand on its wheels on an even surface.

1. Remove accessories in the repair area.

    1. 1.1. Remove accessories in the repair area according to the extent of damage to the vehicle.

2. Cover the accessories adjacent to the repair area on the vehicle.

    1. 2.1. Cover all accessories remaining on the vehicle and adjacent areas with fire-proof protective covers.

3. Reshape connection area of the sheetmetal parts to be replaced.

4. Expose joint areas.

    1. 4.1. Remove underbody protection, paint, etc. from the joint areas of the body.

WM 514155 REPLACING B-PILLAR (ALL MODELS) > SAFETY INSTRUCTIONS AND INFORMATION ON QUALITY

⚠ *CAUTION: Non-observance of safety instructions for body repairs*

- *Risk of damage to the vehicle*
- *Danger of injury*

→ Read the relevant safety instructions as well as general information and quality instructions → 5X00IN01 SAFETY INSTRUCTIONS .

WM 514155 REPLACING B-PILLAR (ALL MODELS) > TOOLS AND MATERIALS > TOOLS AND MATERIALS FOR BODY REPAIRS

Information

- The tools for working on steel and aluminum must always be kept separate from each other. We recommend that you color code the tools using a system similar to that used for the Aluminum tool set with trolley WE 1350, for example.

Straightening set **Body alignment system package WE 1121 Measuring and alignment system, professional WE 1398**

Resistance spot welder; optional **Inverter welder MIDIspot-QSVM-12000 WE 1312, Resistance spot welder WE 1352, Resistance spot welder WE 1311, Resistance spot welder WE 1313**

Metal inert gas (MIG) welder

Pneumatic spotweld remover **Pneumatic Spotweld Remover, Vario Drill WS 90 WE 1139**

Pneumatic body saw **Body saw WE 1508**

Oscillating body saw (special electric cutter) **Special electric cutter WE 1137**

Hot-air blower **Hot-air blower WE 1119**

Hand-cartridge gun **Hand-cartridge gun WE 1141**

Spotweld drill **Spotweld drill Twist drill Nr.201**

Countersink for rivets **Countersink Nr.202**

Blind riveting tool for high-strength rivets **Blind riveting tool TAURUS 4 WE 1348**

Safety vacuum cleaner for aluminum dust **Mobile extraction unit, aluminum WE 1507**

Star gauges for body gap dimensions Nr.127-1

Wurth Klebt und Dichtet body sealant

WM 514155 REPLACING B-PILLAR (ALL MODELS) > REMOVING B-PILLAR > CUT VARIANTS

Information

Cuts can be made in the defined areas on the outer B-pillar due to the parts dimensions. The purpose of the different cuts is to keep the repair area as small as possible in the event of damage.

The diagram should help you to determine the correct position of cuts.

E-F-H - Replace cuts for the B-pillar reinforcement. → 514255 REPLACING B-PILLAR REINFORCEMENT

E-F-G - Replace cuts for the B-pillar. → 514155 REPLACING B-PILLAR

Fig 1: Identifying B-Pillar Reinforcement Cutting Position

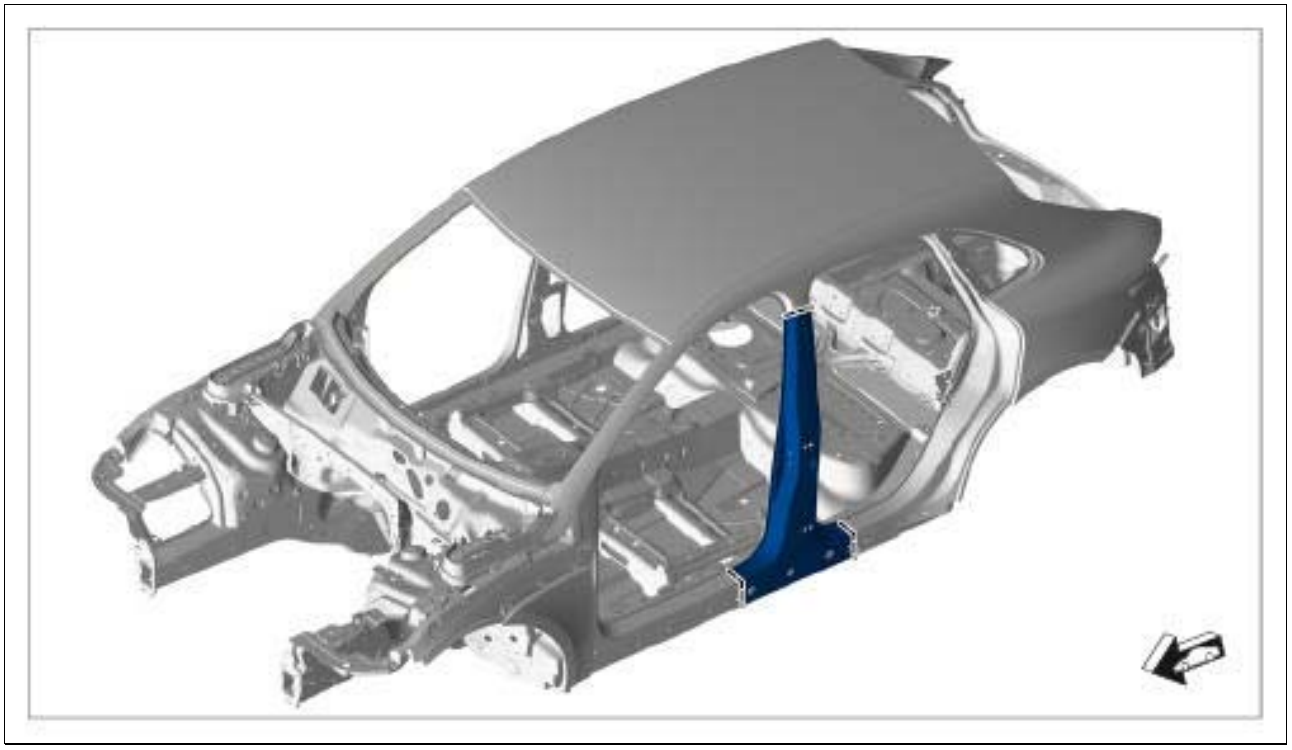
WM 514155 REPLACING B-PILLAR (ALL MODELS) > REMOVING B-PILLAR > REMOVING OUTER B-PILLAR

Fig 1: Identifying B-Pillar Installation Position



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Only make cuts in the top plate. Make sure not to damage the plate underneath when doing this.

Information

Mark cuts E, F and G in accordance with the new part. Make sure to leave an overlap of approx. 3 cm with respect to the body.

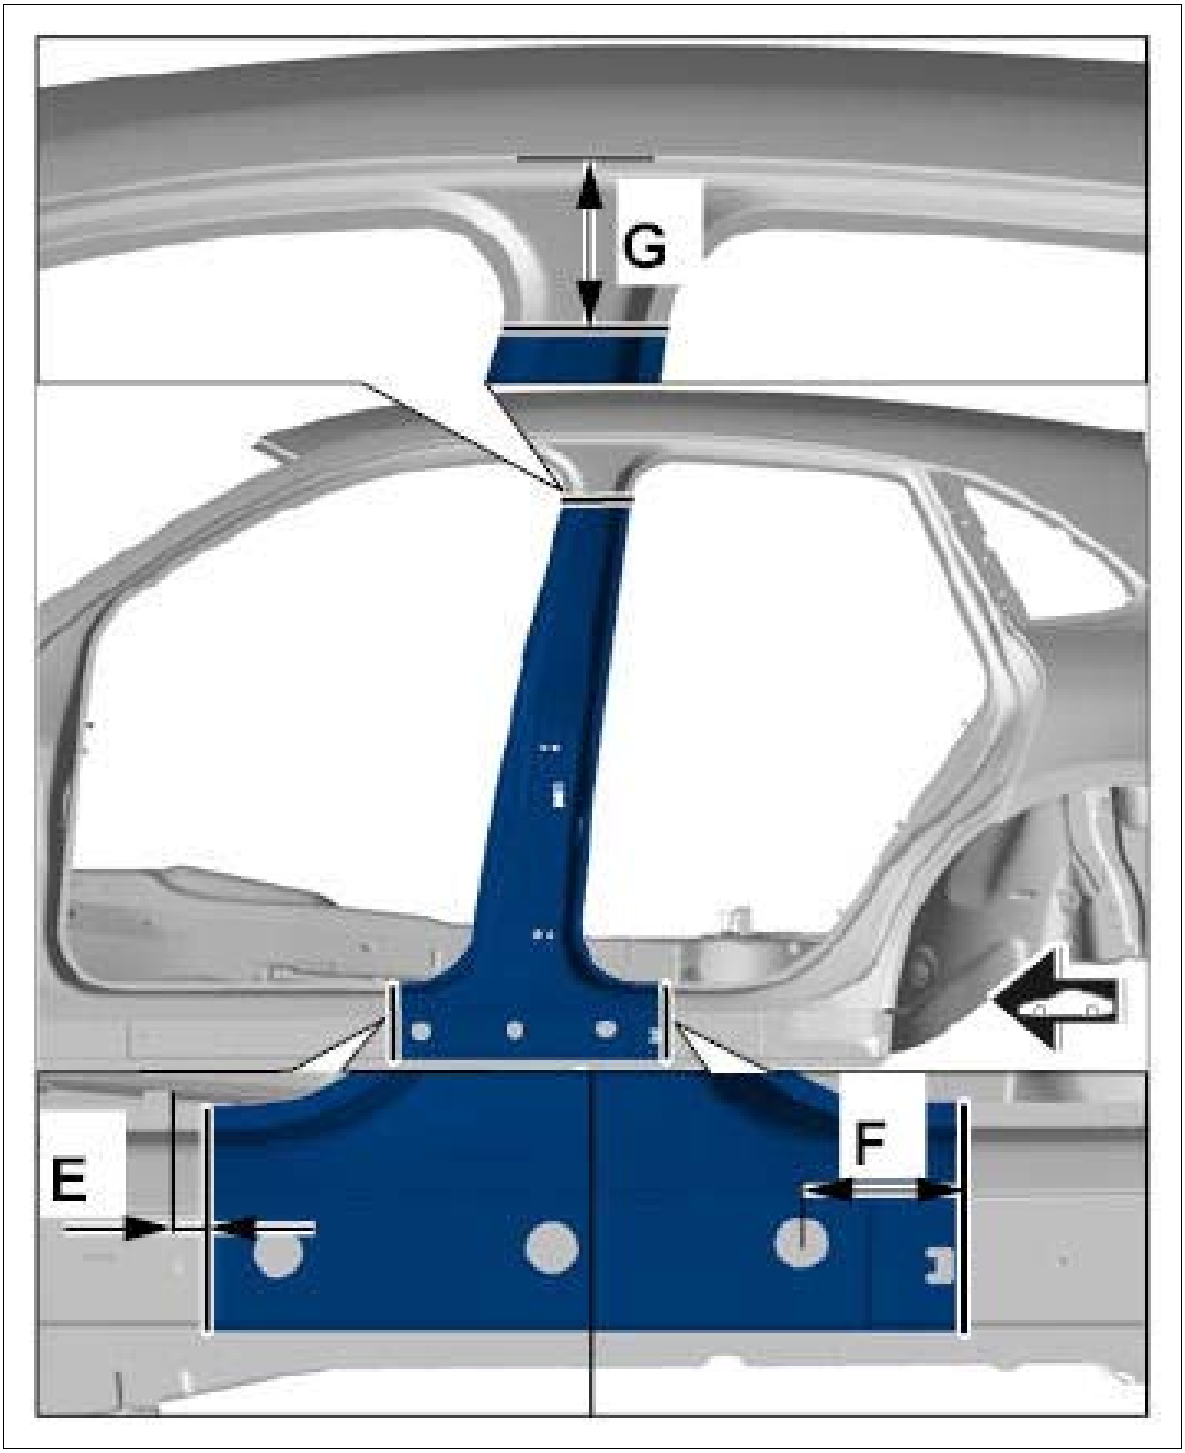
1. Mark and make cuts.

   → **Distance: 23 mm**

   → **Distance: 75 mm**

   → **Distance: 120 mm**

Fig 2: Identifying B-Pillar Mark Cutting Position



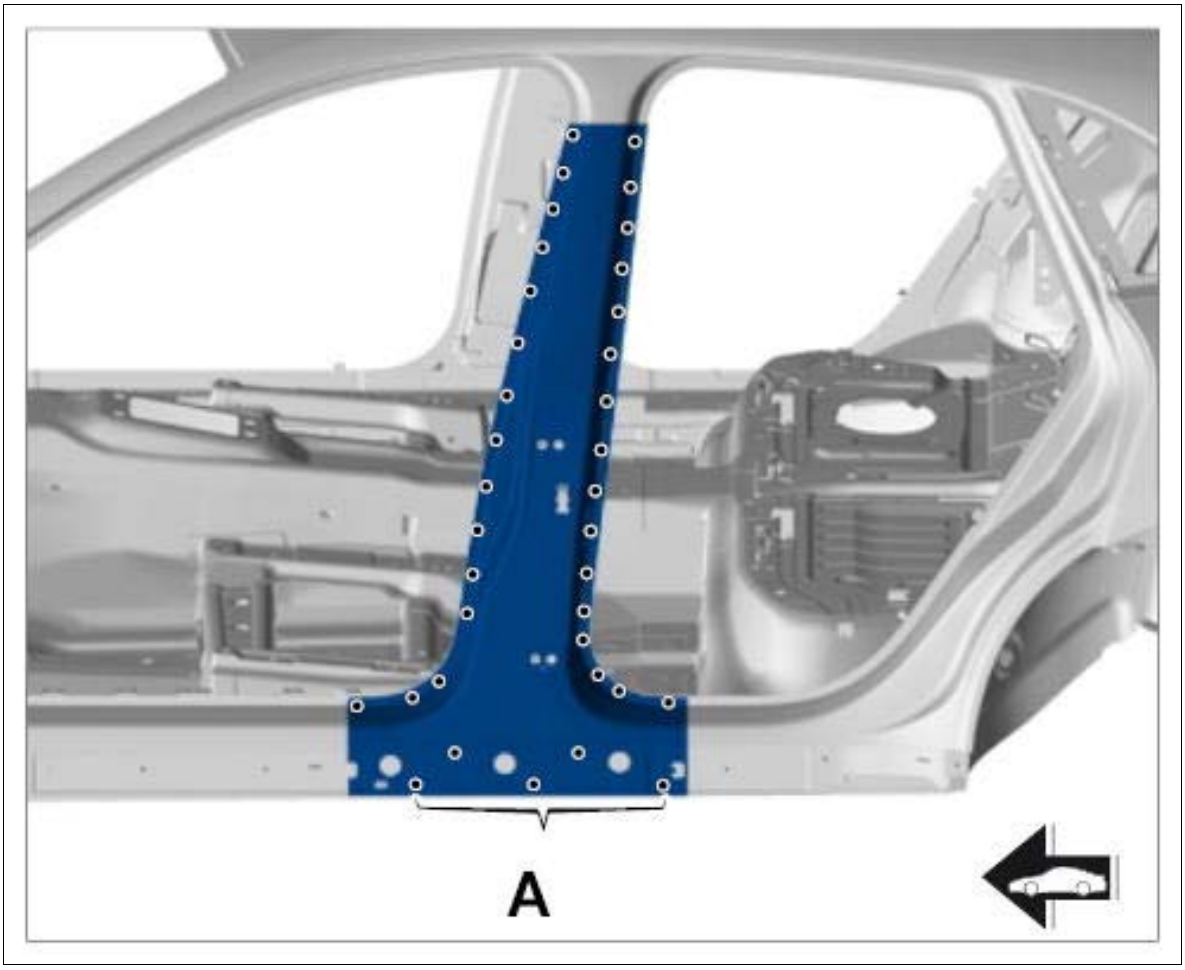
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

2. Drill out spotwelds using **spotweld drill** .

Fig 3: Identifying B-Pillar Spotwelds Area



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Heat bonding areas.

    1. 3.1. Remove B-pillar.

Fig 4: Removing B-Pillar

WM 532955 REPLACING C-PILLAR REINFORCEMENT (ALL MODELS) > TOOLS AND MATERIALS > TOOLS AND MATERIALS FOR BODY REPAIRS

Information

- The tools for working on steel and aluminum must always be kept separate from each other. We recommend that you color code the tools using a system similar to that used for the Aluminum tool set with trolley WE 1350, for example.

Straightening set **Body alignment system package WE 1121 Measuring and alignment system, professional WE 1398**

Resistance spot welder; optional **Inverter welder MIDIspot-QSVM-12000 WE 1312, Resistance spot welder WE 1352, Resistance spot welder WE 1311, Resistance spot welder WE 1313**

Metal inert gas (MIG) welder

Pneumatic spotweld remover **Pneumatic Spotweld Remover, Vario Drill WS 90 WE 1139**

Pneumatic body saw **Body saw WE 1508**

Oscillating body saw (special electric cutter) **Special electric cutter WE 1137**

Hot-air blower **Hot-air blower WE 1119**

Hand-cartridge gun **Hand-cartridge gun WE 1141**

Spotweld drill **Spotweld drill**

Countersink for rivets **Countersink Nr.202**

Blind riveting tool for high-strength rivets **Blind riveting tool TAURUS 4 WE 1348**

Safety vacuum cleaner for aluminum dust **Mobile extraction unit, aluminum WE 1507**

Star gauges for body gap dimensions Nr.127-1

Wurth glue and seals body sealant

WM 532955 REPLACING C-PILLAR REINFORCEMENT (ALL MODELS) > REMOVING C-PILLAR REINFORCEMENT

Fig 1: Identifying C-Pillar Reinforcement Position

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

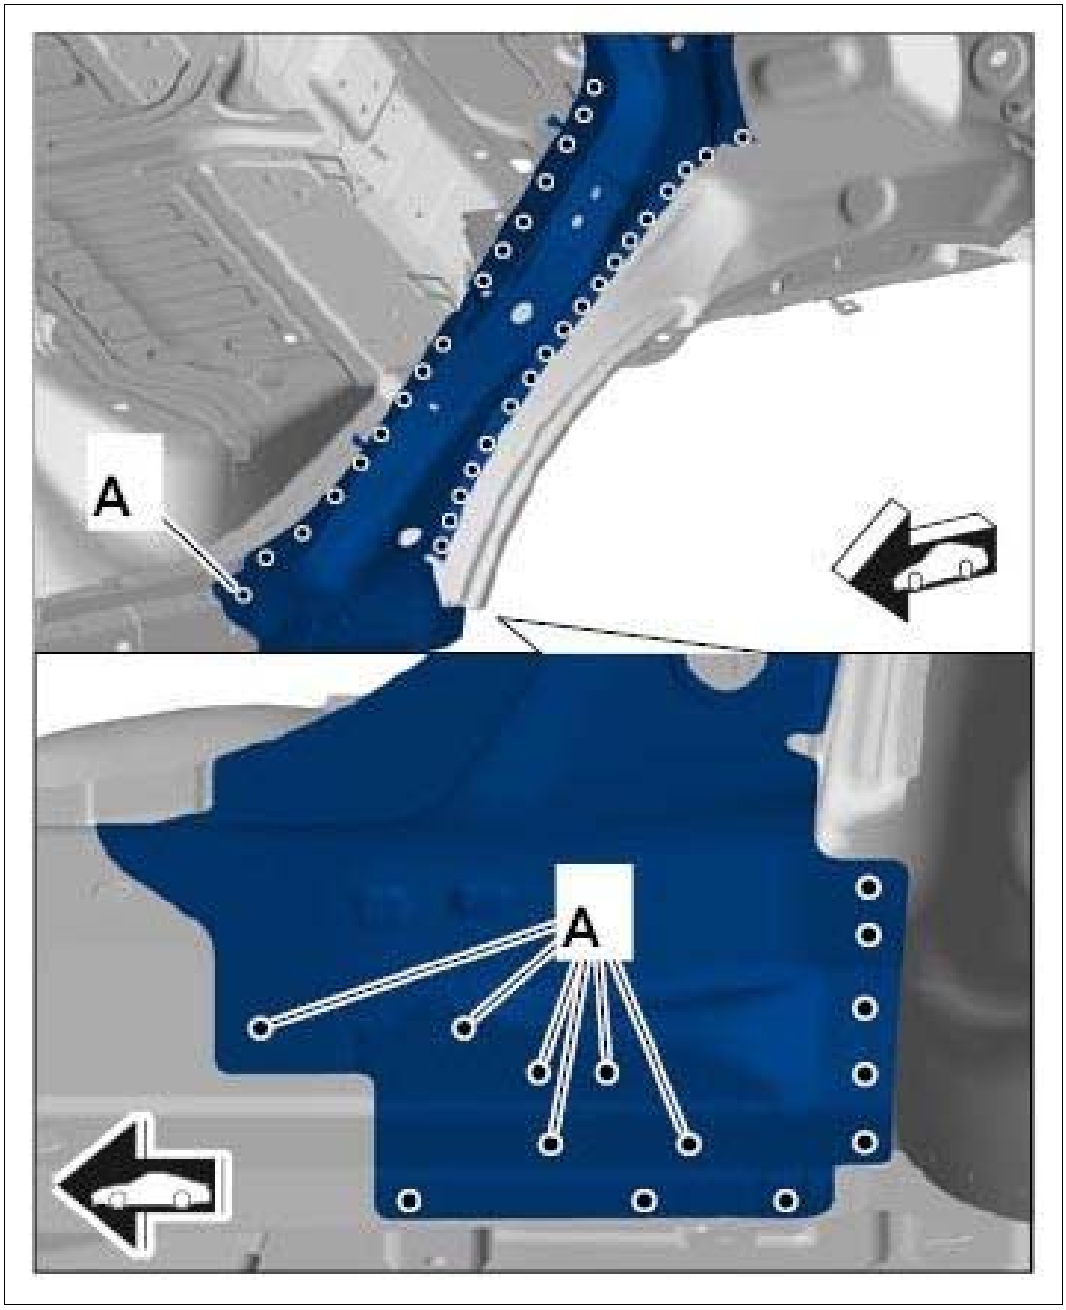
1. Remove C-pillar reinforcement.

   Information

   Drill out the connection point on one side only. Do not damage the plate underneath.

   1. 1.1. Drill out spotwelds using **spotweld drill;** .

Fig 2: Removing C-Pillar Reinforcement



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Remove side panel section **-1-** .

Information

Only make cuts in the top plate. Make sure not to damage the plate underneath when doing this.

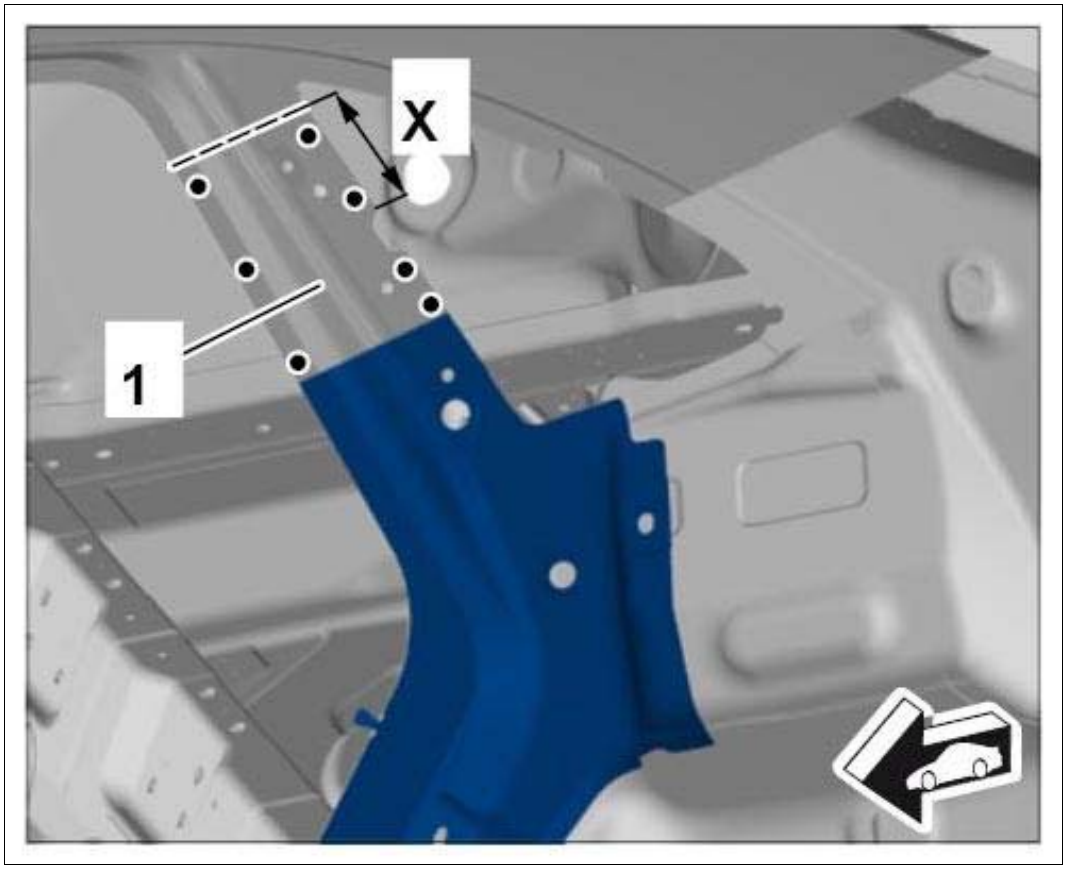
1. 2.1. Mark and make cuts. → **Distance: 100 mm**

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

2. 2.2. Drill out spotwelds using **spotweld drill;** .

Fig 3: Identifying Side Panel Section Dimension

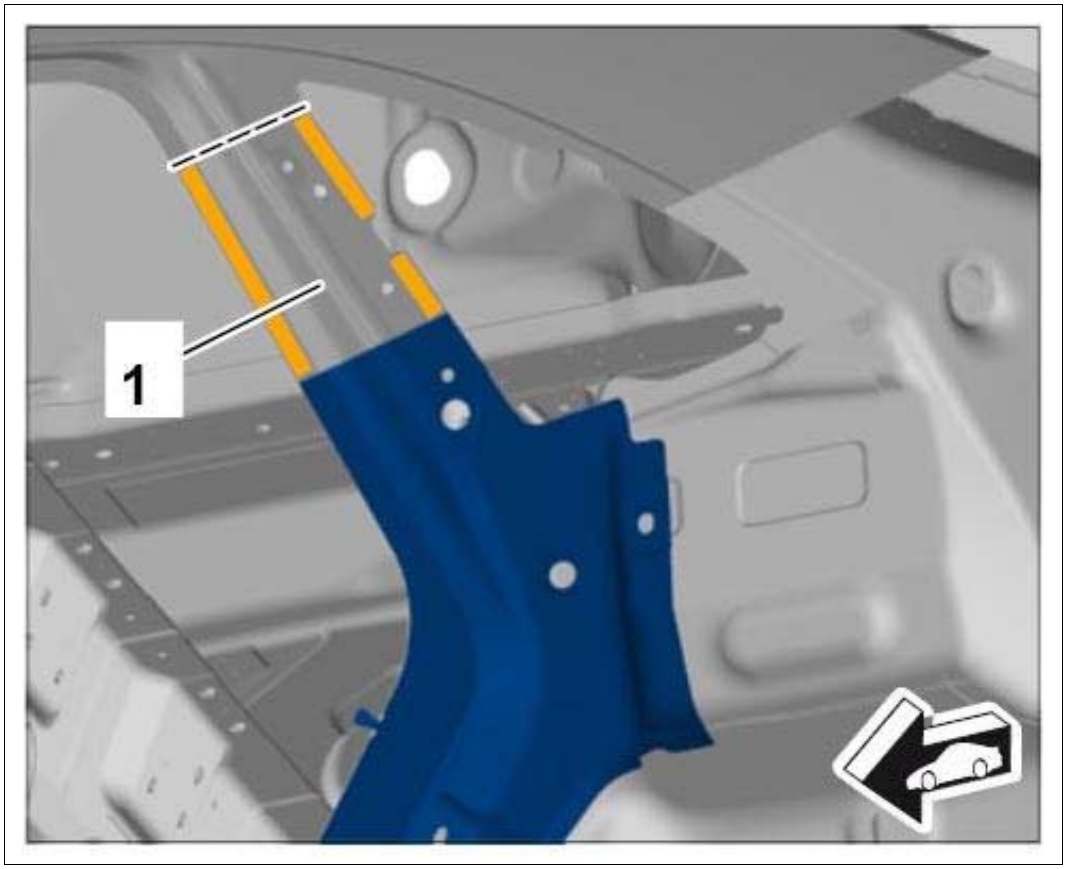


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Heat bonding areas.

1. 3.1. Remove side panel **-1-** section.

Fig 4: Removing Side Panel Section



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Only make cuts in the top plate. Make sure not to damage the plate underneath when doing this.

Information

Mark cut Y in accordance with the new part. Make sure to leave an overlap of approx. 3 cm with respect to the body.

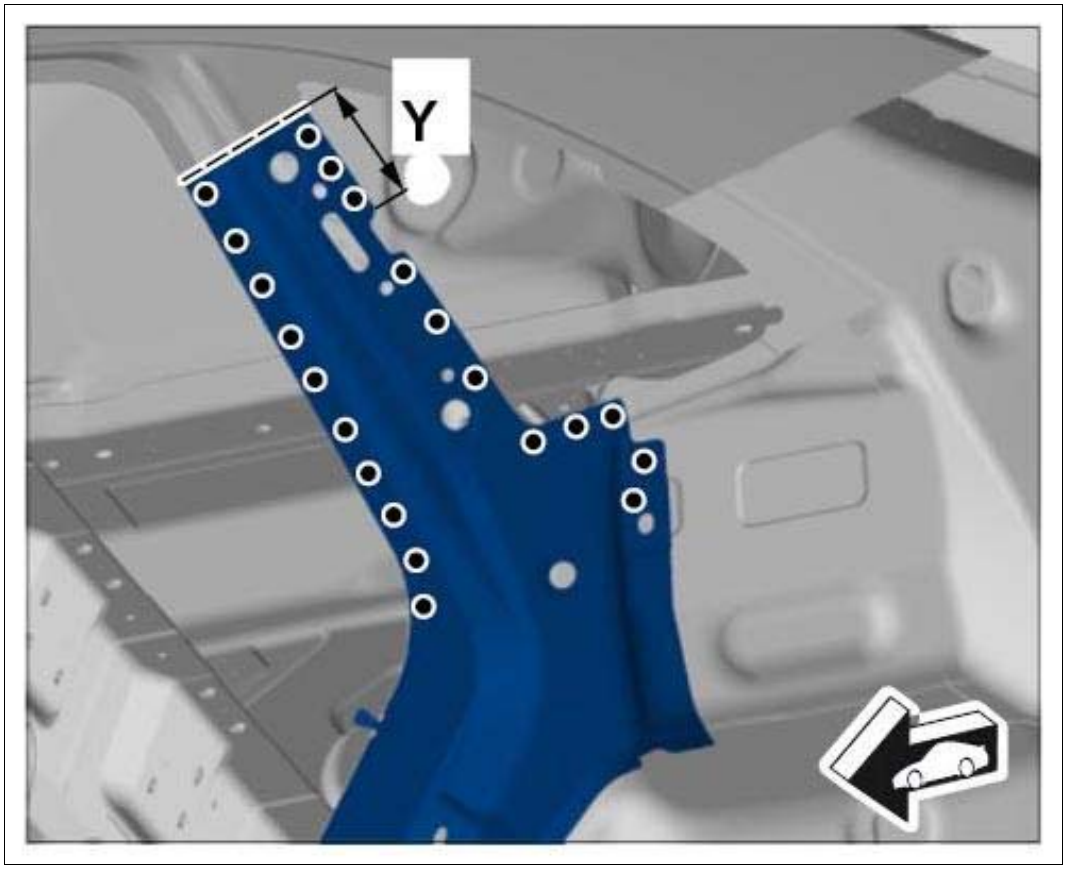
4. Mark and make cuts. → **Distance: 90 mm**

Information

Drill out the connection point on one side only. Do not damage the plate underneath.

1. 4.1. Drill out spotwelds using **spotweld drill;** .

Fig 5: Identifying C-Pillar Reinforcement Spotwelds Area

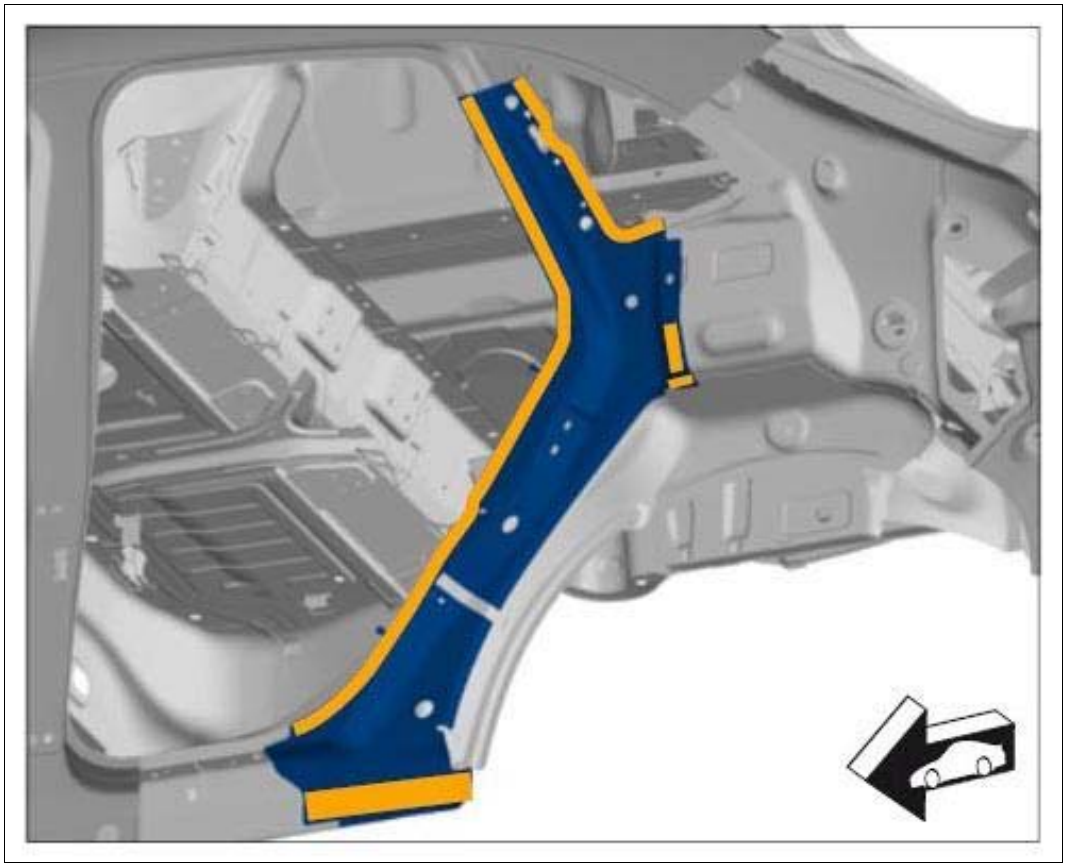


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Heat bonding areas.

    1. 5.1. Remove C-pillar reinforcement.

Fig 6: Removing C-Pillar Reinforcement

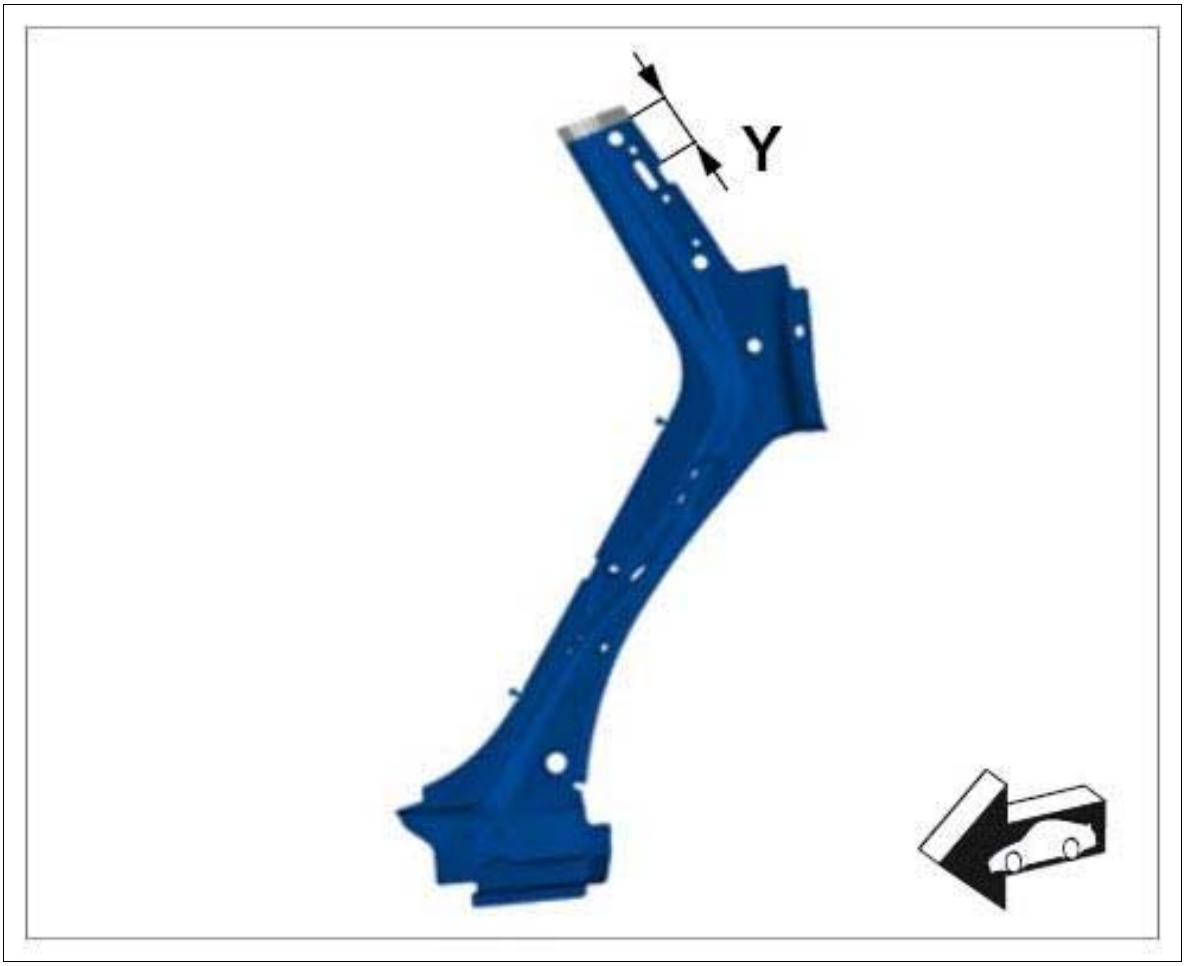


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 532955 REPLACING C-PILLAR REINFORCEMENT (ALL MODELS) > PREPARING C-PILLAR REINFORCEMENT FOR INSTALLATION

1. Cut C-pillar reinforcement in area **-Y-** leaving an overlap to the body of 30 mm.

Fig 1: Identifying C-Pillar Reinforcement Area

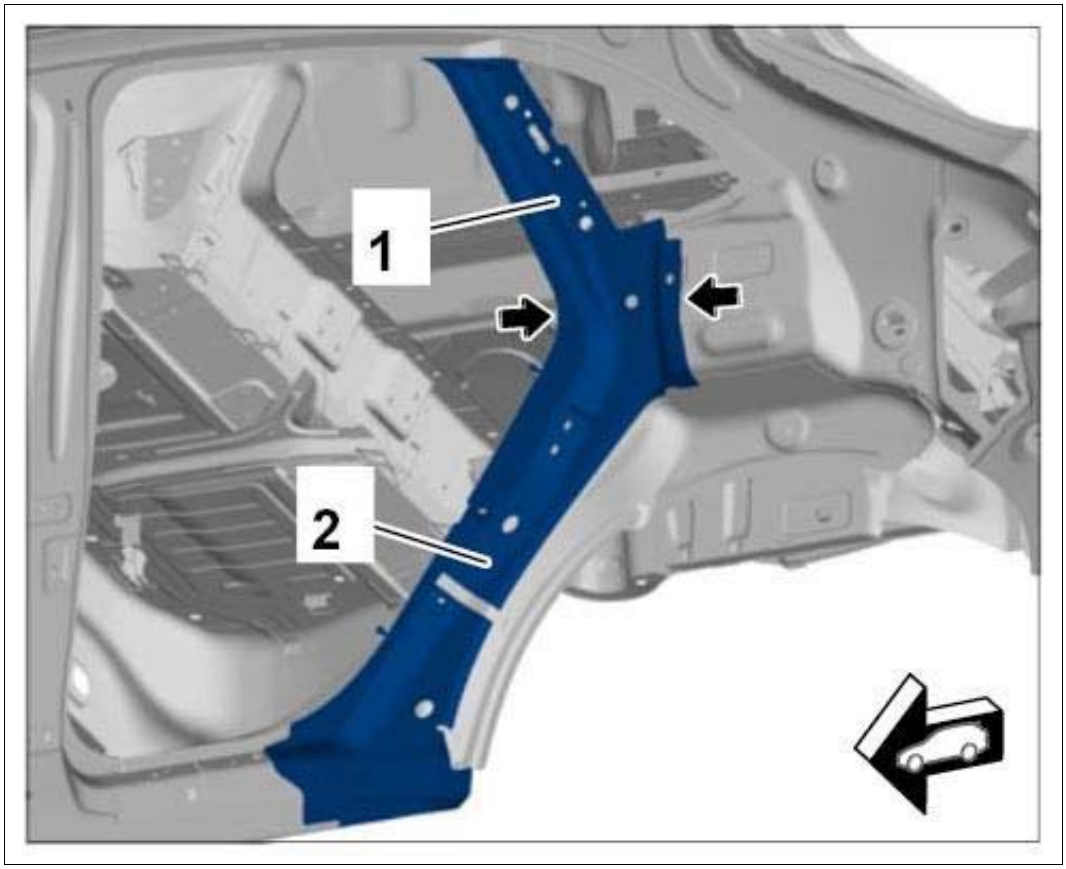


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Fit and secure C-pillar reinforcement.

    1. 2.1. Tack-weld upper part **-1-** and lower part **-2-** of C-pillar reinforcement **-arrows-** .

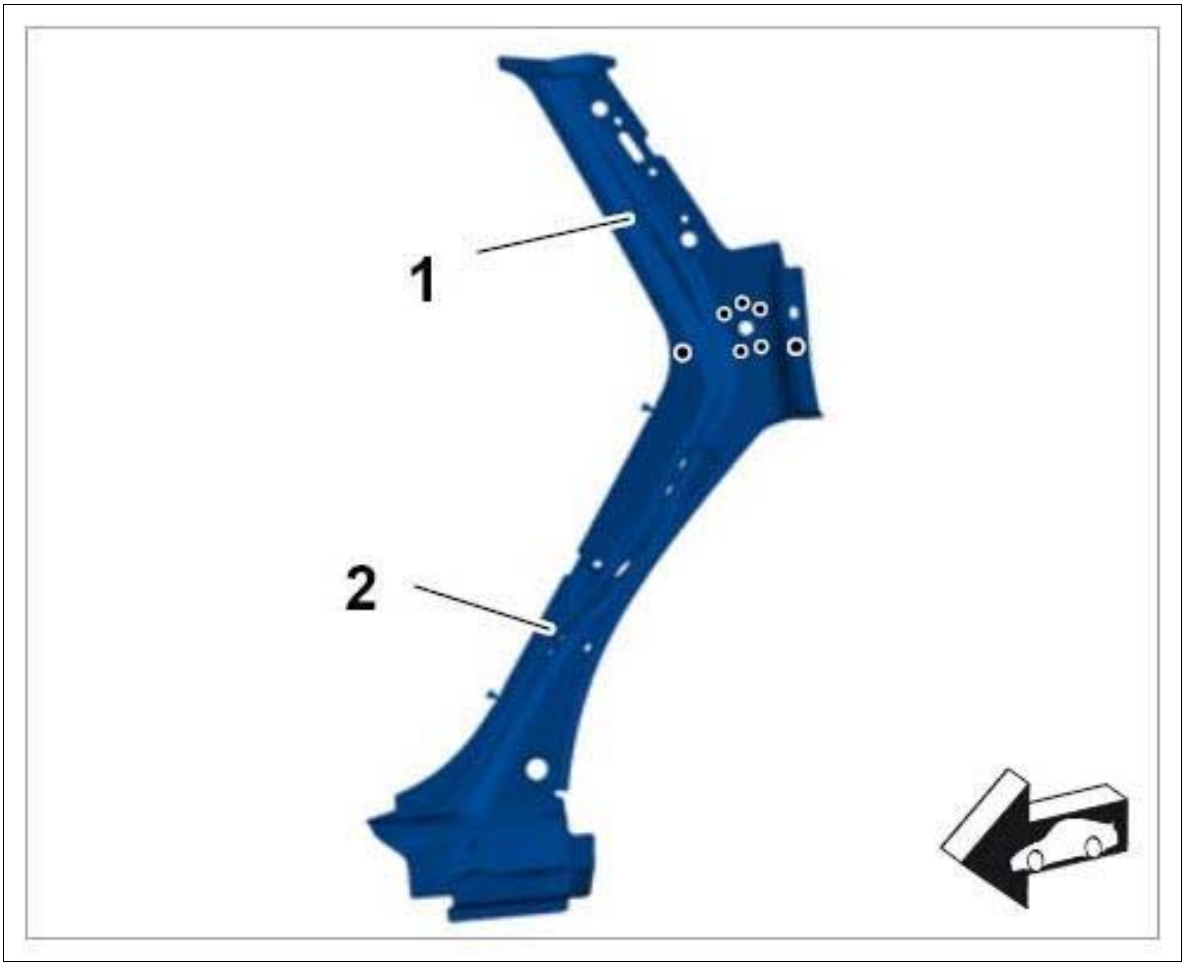
Fig 2: Locating C-Pillar Reinforcement



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove upper part and lower part of C-pillar reinforcement.
4. Resistance spot-weld upper part **-1-** and lower part **-2-** of C-pillar reinforcement in the marked area.

Fig 3: Identifying C-Pillar Reinforcement



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

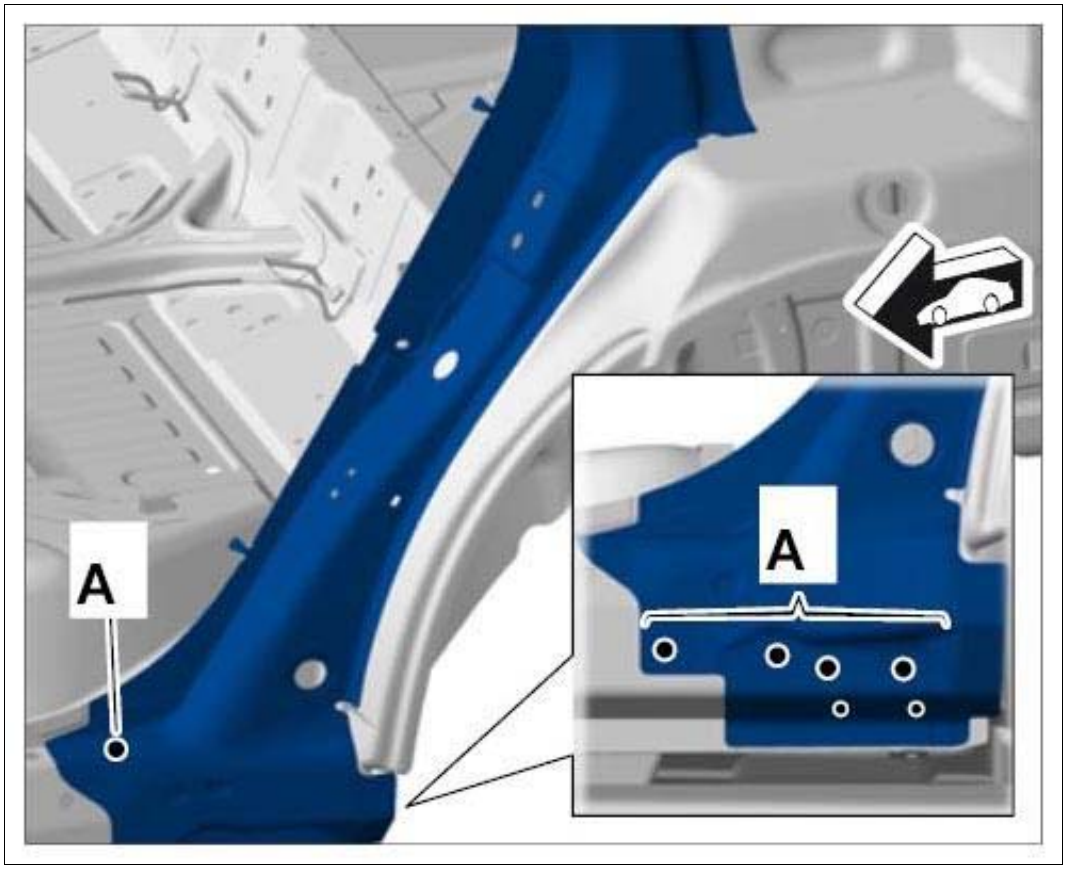
5. Prepare C-pillar reinforcement for bonding and welding.

Information

Adhesive must not be applied to areas to be plug-welded or fully welded using inert gas.

1. 5.1. Drill holes for plug-welding in the marked areas **-A-** using a drill bit with a diameter of → **Diameter: 8.0 mm.**

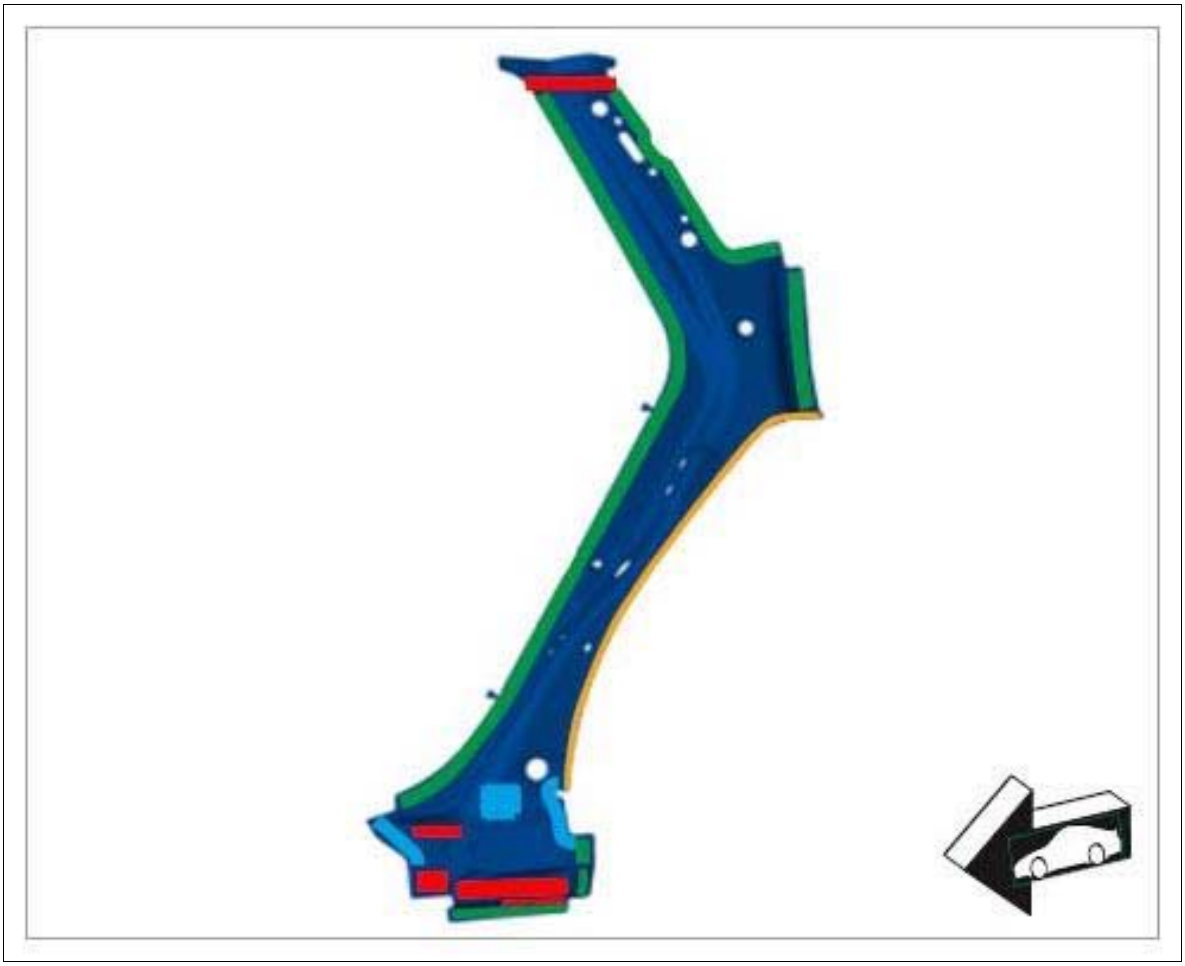
Fig 4: Identifying C-Pillar Reinforcement Holes Drilling Areas



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Prepare connection areas on both sides.

Fig 5: Identifying C-Pillar Reinforcement Connection Areas



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Red	Plug-welding/apply a full weld using inert gas without bonding
Green	Resistance spot-welding + bonding
Blue	Bonding

Orange	Resistance spot-welding

WM 532955 REPLACING C-PILLAR REINFORCEMENT (ALL MODELS) > PREPARING CONNECTION AREAS OF THE BODY FOR INSTALLATION

1. Align the sealing surface and connections of the body.
2. De-burr connection points and prepare them for welding.

Information

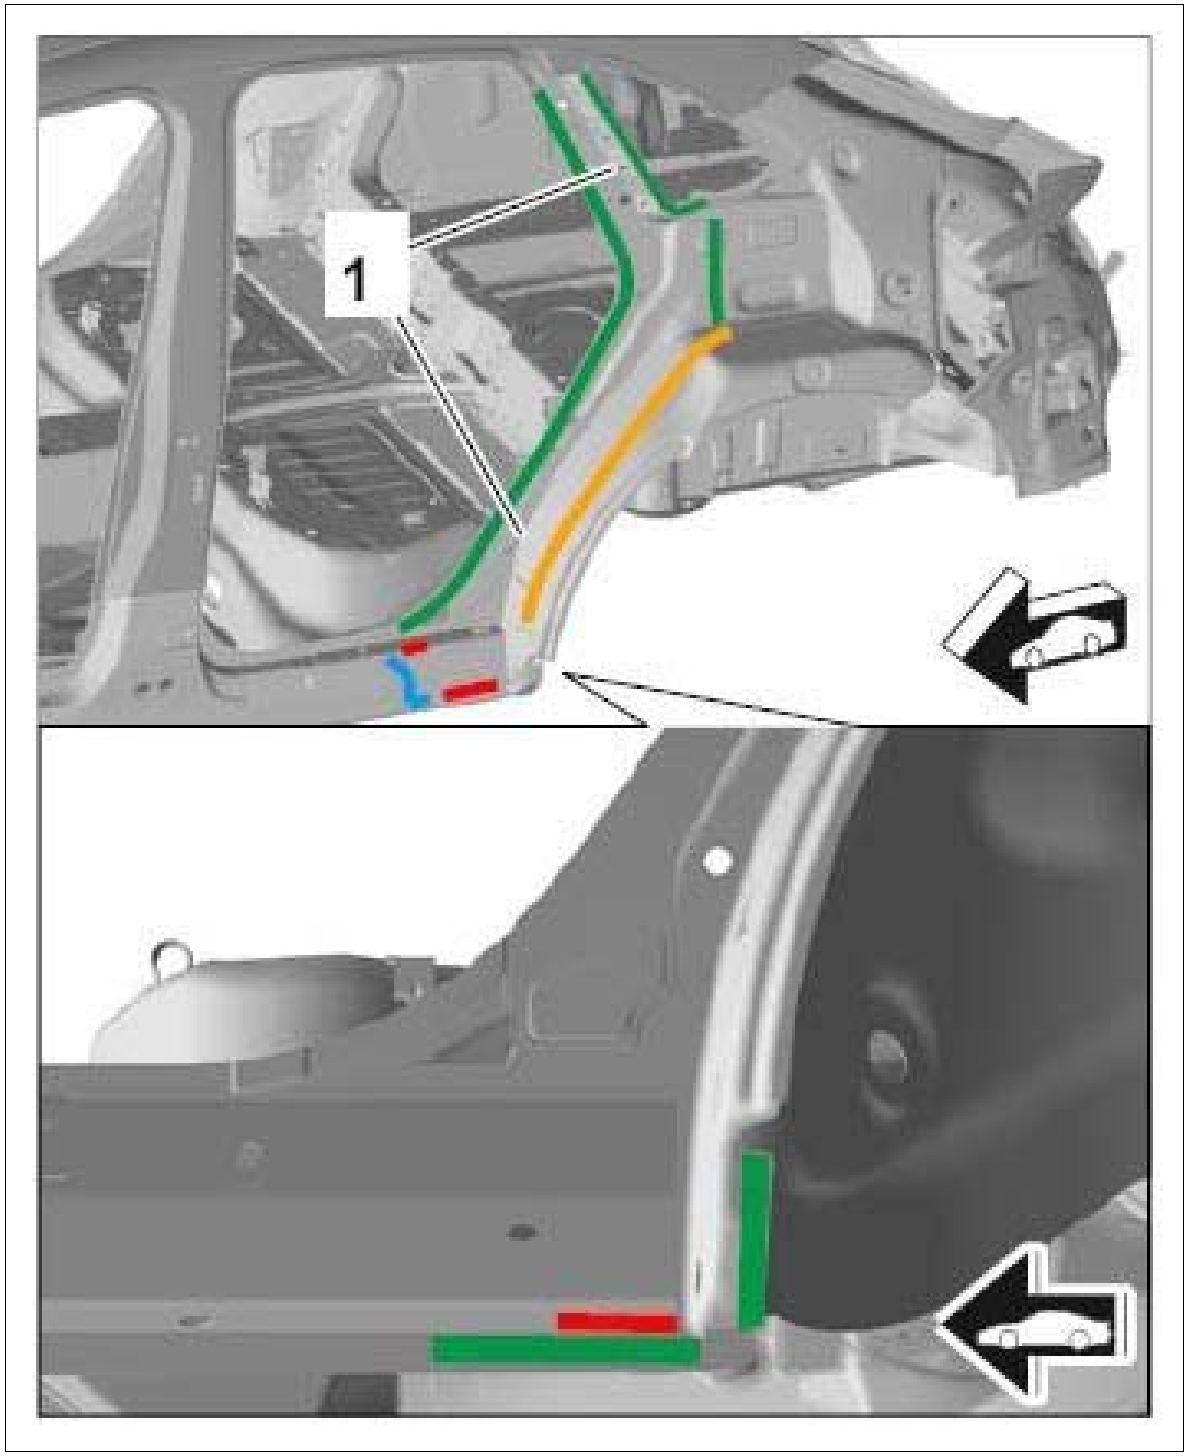
1. Before final assembly, make sure you fully understand all the work steps involved and carry out a trial assembly without applying adhesive.

2. The bonding process can only be carried out reliably when a smooth and swift sequence of operations is guaranteed.

3. Do not begin bonding work until all materials and tools necessary for later repair work are available.

3. Prepare the marked areas for welding and bonding. → Preparing Bonding Surfaces

Fig 1: Identifying Body Connection Areas



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Red	Plug-welding/apply a full weld using inert gas without bonding
Green	Resistance spot-welding + bonding
Blue	Bonding

Orange	Resistance spot-welding

WM 532955 REPLACING C-PILLAR REINFORCEMENT (ALL MODELS) > INSTALLING C-PILLAR REINFORCEMENT

Information

- Before final assembly, make sure you fully understand all the work steps involved and carry out a trial assembly without applying adhesive.
- The bonding process can only be carried out reliably when a smooth and swift sequence of operations is guaranteed.
- Do not begin bonding work until all materials and tools necessary for later repair work are available.

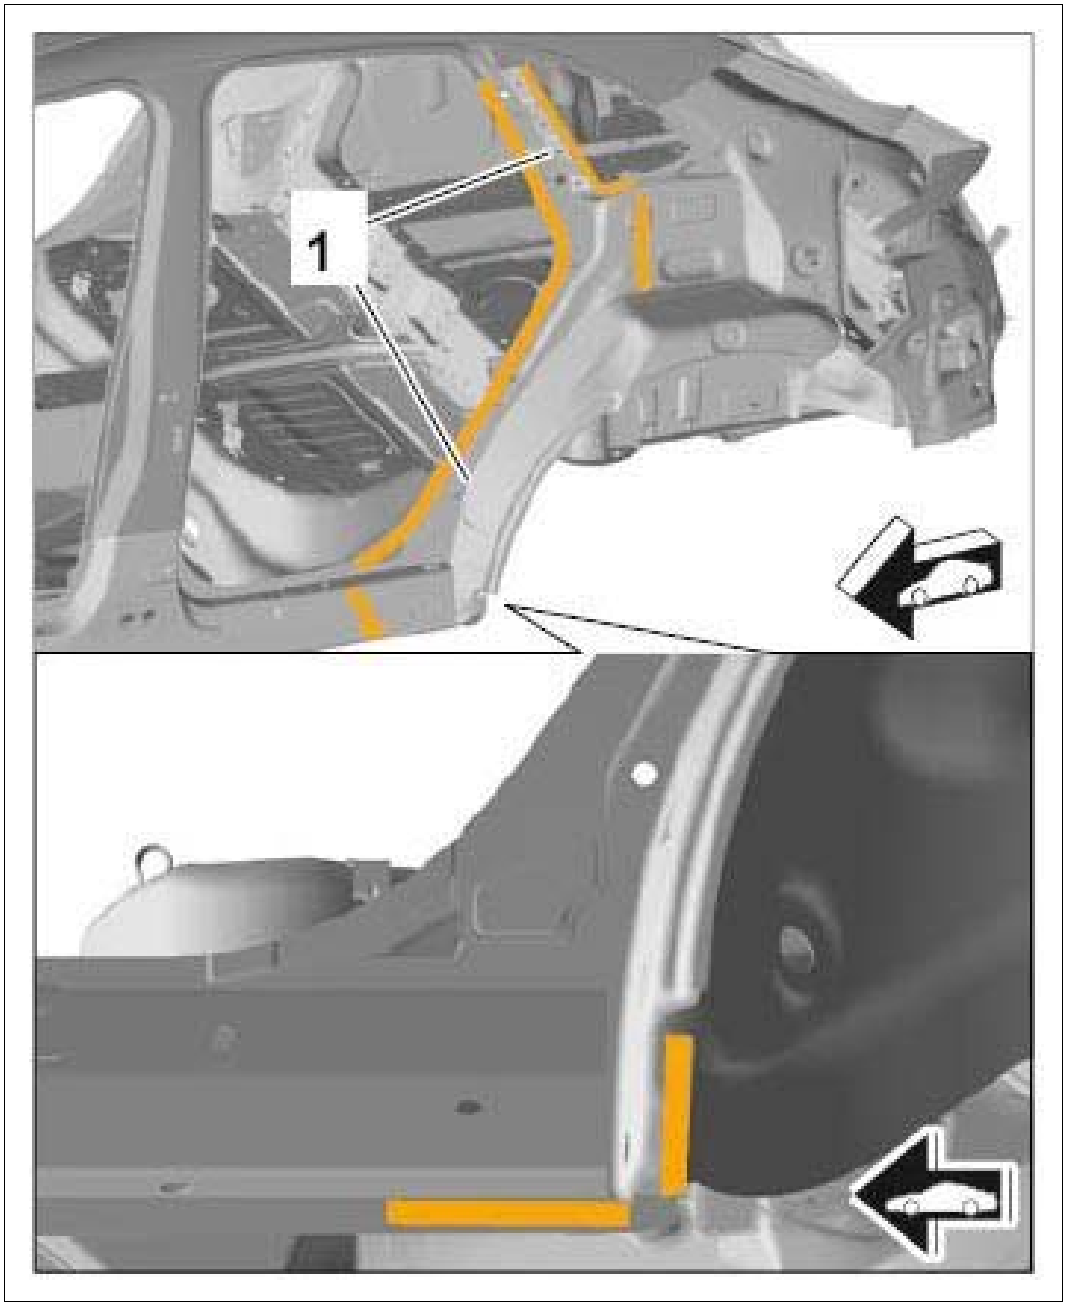
Information

Adhesive must not be applied to areas to be plug-welded or fully welded using inert gas.

1. Install outer B-pillar and check that it fits perfectly. Check gap dimensions. → 5X00IN DIAGRAM - BODY GAP DIMENSIONS
    1. 1.1. Apply foam filler to the body in area **-1-** . → 5X00IN22 WORKING WITH BODY FOAM FILLER

       Make sure that all openings and gaps between the body and C-pillar reinforcement are closed off with the sealing compound.
    2. 1.2. Apply adhesive to the areas marked in yellow. → 5X00IN21 WORKING WITH BODY STRUCTURAL ADHESIVE→ **Application depth: 3.0 mm**

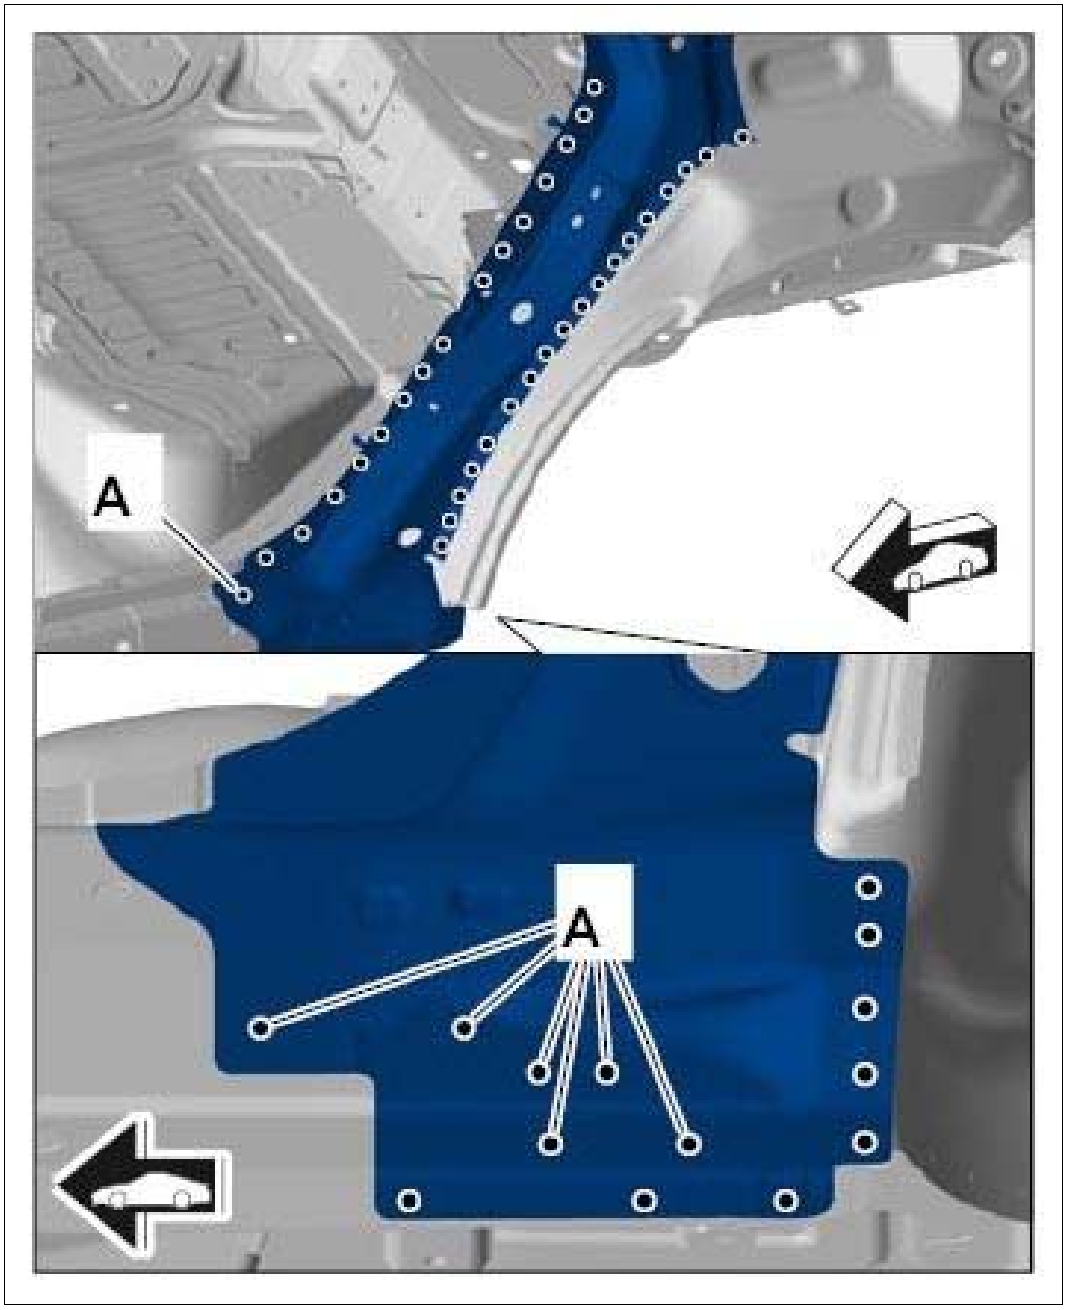
Fig 1: Identifying Adhesive Applying Areas



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Resistance spot-weld the C-pillar reinforcement.
    1. 2.1. Plug-weld area **-A-** using inert gas.

Fig 2: Identifying C-Pillar Reinforcement Plug-Weld Area

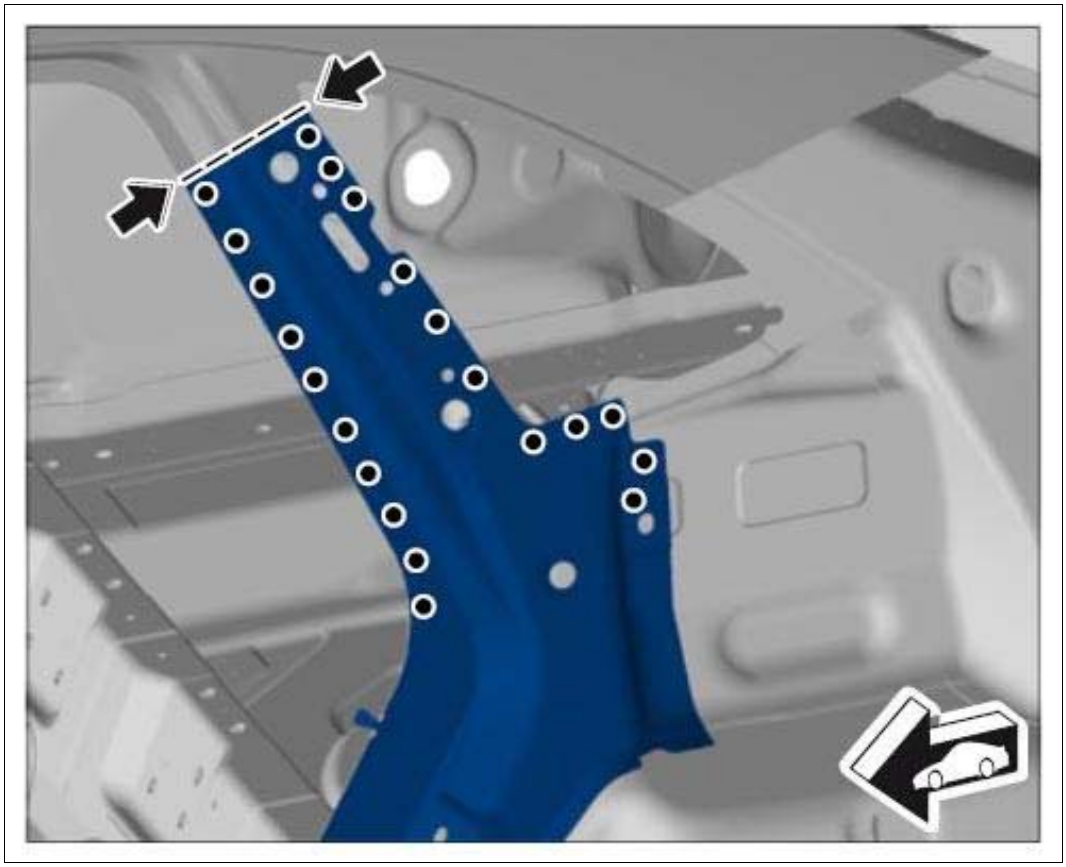


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Resistance spot-weld the C-pillar reinforcement.

    1. 3.1. Plug-weld area **-arrows-** using inert gas.

Fig 3: Identifying C-Pillar Reinforcement Plug-Weld Area



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 532955 REPLACING C-PILLAR REINFORCEMENT (ALL MODELS) > SUBSEQUENT WORK

1. Install side panel. → Installing Rear Side Section
2. Install side member. → Installing Outer Side Member

WM 532955 REPLACING C-PILLAR REINFORCEMENT (ALL MODELS) > SUBSEQUENT WORK > SUBSEQUENT WORK FOR BODY REPAIRS (WITHOUT STRAIGHTENING SYSTEM)

1. Clean joint areas and sheetmetal flanges with a wire brush.
2. Prime joint areas and sheetmetal flanges with 2K primer.
3. Restore standard seal with body sealant → 5X00IN42 SEAM SEALING .

   Also seal the repair area carefully.
4. Paint repair area and adjacent surfaces, if necessary.

5. Restore standard underbody protection with underbody sealant → 5X00IN43 UNDERBODY PROTECTION .
6. Apply standard cavity preservation → 5X00IN44 CAVITY PRESERVATION . Also apply cavity preservation to the repair area.
7. Install removed accessories in the repair area.

WM 536855 REPLACING (INNER) REAR WHEEL HOUSING (ALL MODELS) >

INSTALLING (INNER) REAR WHEEL HOUSING

Information

- Before final assembly, make sure you fully understand all the work steps involved and carry out a trial assembly without applying adhesive.
- The bonding process can only be carried out reliably when a smooth and swift sequence of operations is guaranteed.
- Do not begin bonding work until all materials and tools necessary for later repair work are available.

1. Install (inner) rear wheel housing and check that it fits perfectly. Check gap dimensions. → 5X00IN DIAGRAM - BODY GAP DIMENSIONS

    1. 1.1. Apply adhesive to the areas marked in yellow. → 5X00IN21 WORKING WITH BODY STRUCTURAL ADHESIVE→ **Application depth: 3.0 mm**

        Fig 1: Identifying Adhesive Applying Areas

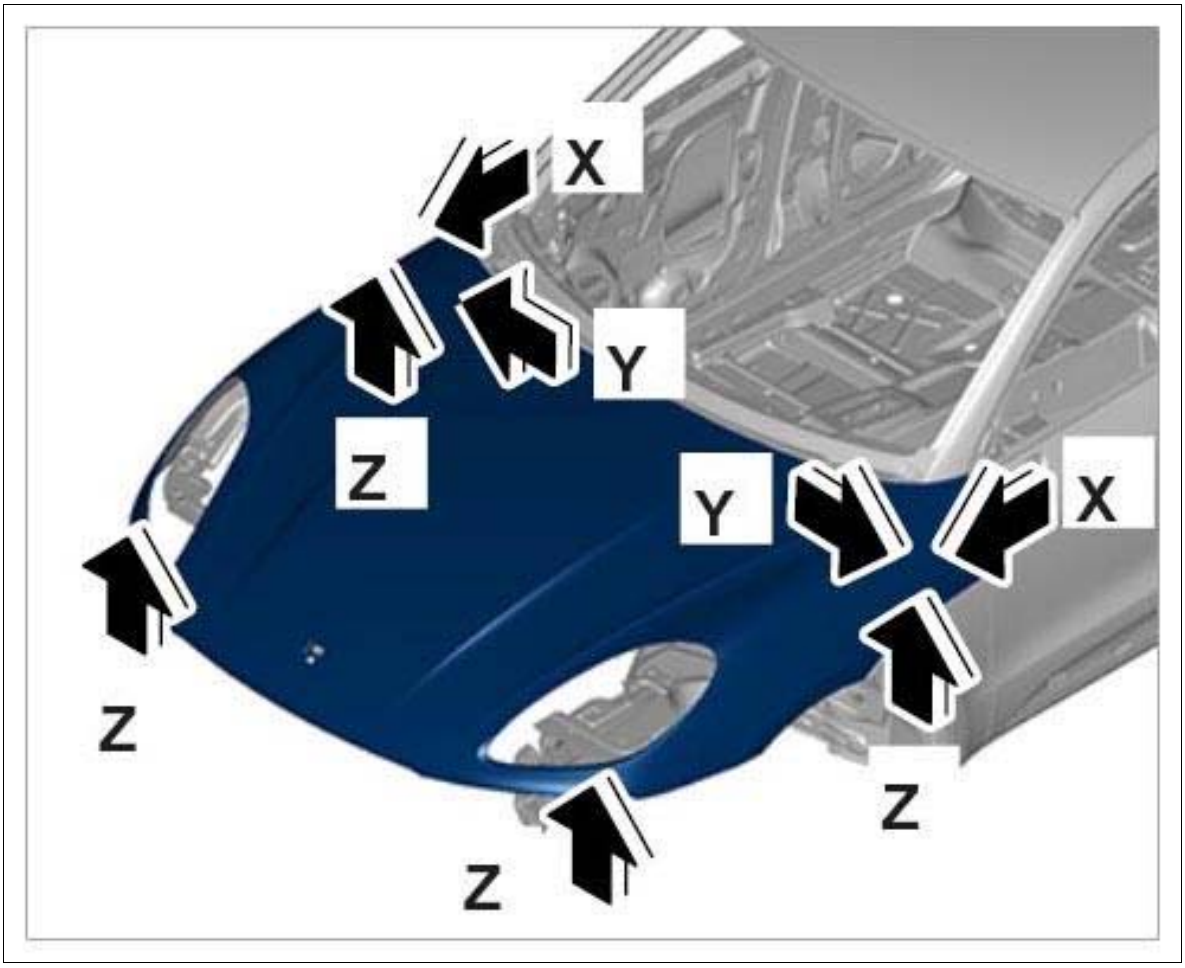
Fig 3: Identifying Front Lid Alignment



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

No.	Component	Function	Procedure
1.	Fastening nuts on upper part of lid lock **-1-**	Locking mechanism for front lid	Loosen.
2.	Fastening nuts securing lid hinge to lid **-2-**	Adjusting gap dimensions in X and Y direction	Loosen.
3.	Front lid **-3-**		Set gap dimensions in X and Y direction by moving the lid.
4.	Fastening nuts securing lid hinge to lid **-2-**	Adjusting gap dimensions in X and Y direction	Tighten fastening nuts to **Tightening torque 20 Nm (15 ftlb.)** until secure.

			 Adjusting front lid
5.	Fastening nuts on upper part of lid lock **-1-**	Locking mechanism for front lid	Tighten fastening nuts to **Tightening torque 8 Nm (6 ftlb.)** .  Adjusting front lid
6.	Fastening screws securing lid hinge to body **-4-**	Adjusting gap dimensions in Z direction, rear	Loosen.
7.	Front lid **-3-**		Set gap dimensions in Z direction at the rear by moving the lid.
8.	Fastening screws securing lid hinge to body **-4-**	Adjusting gap dimensions in Z direction, rear	Tighten fastening screws to **Tightening torque 20 Nm (15 ftlb.)** .  Adjusting front lid
9.	Guide plate on front lid **-6-**	Adjusting gap dimensions in X and Y direction	Set gap dimensions in X and Y direction by moving the lid
10.	Fastening screw for guide plate on front lid		Tighten fastening screw to **Tightening torque 8 Nm (6 ftlb.)** .

			 Adjusting front lid
11.	Rubber stop for front lid **-7-**	Adjusting gap dimensions in Z direction, rear	Tighten fastening screw to **Tightening torque 8 Nm (6 ftlb.)** .  Adjusting front lid
12.	Rubber stop **-5-**	Adjusting gap dimensions in Z direction, front	Set gap dimensions and inclination by turning the rubber stops. There must be slight preload on the lid as a result of setting the rubber stops.

WM 552215 ADJUSTING FRONT LID (MACAN, MACAN S, MACAN TURBO) > CHECKING FRONT LID LOCK

Information

The lid lock does not have an emergency release.

When working close to the front apron and on the various parts of the lock, carry out the following function test before closing the lid:

1. Check that the release cable is clipped fully into the bracket provided.
2. Lock lower part of lid lock using a screwdriver.
3. Release the lid lock using the lever in the passenger compartment.
4. Perform a visual inspection to check that the lock releases correctly.

WM 552215 ADJUSTING FRONT LID (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. For lid hinge alignment in X and Z direction

2. Check joint and gap dimensions of headlights and make adjustments if necessary. → 941415 ADJUSTING HEADLIGHT MOUNTING
3. Install cover for DME control unit. → INSTALLING DME CONTROL UNIT
4. Install cover for alarm siren. → INSTALLING ALARM SIREN
5. Install cowl panel cover. → INSTALLING COWL PANEL COVER

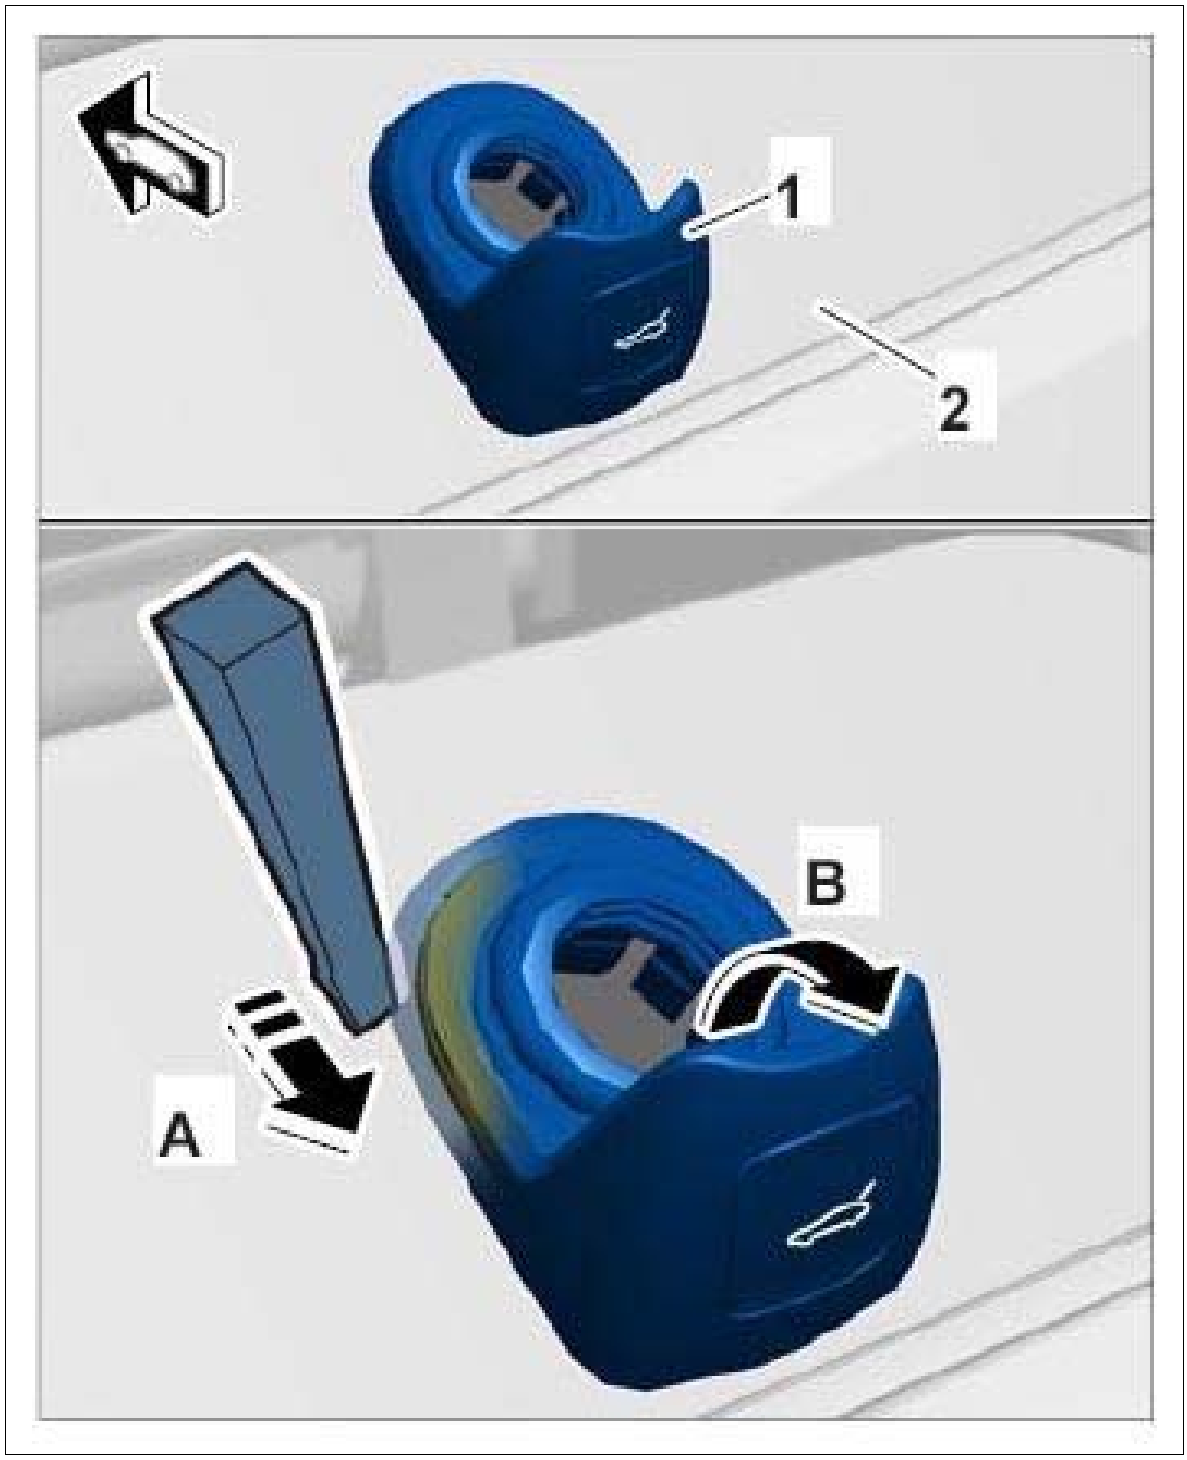
1. Release and disconnect electric plug connection.
2. Remove rear lid release.

Fig 1: Removing Release Switch



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 2.1. At the outer edge of the release switch, insert a plastic wedge no deeper than 2.5 mm between the release switch **-1-** and rear window **-2-** as shown **-arrow A-** .
2. 2.2. Push the plastic wedge straight down and unclip the release switch from the retainer plate **-arrow B-** .

Do not use force on the retainer plate.

WM 555719 REMOVING AND INSTALLING REAR LID RELEASE (MACAN, MACAN S, MACAN TURBO) > INSTALLING REAR LID RELEASE

NOTE: Incorrect installation of release switch.

- *Damage to rear window trim.*

→ Carefully press in release switch without using excessive force.

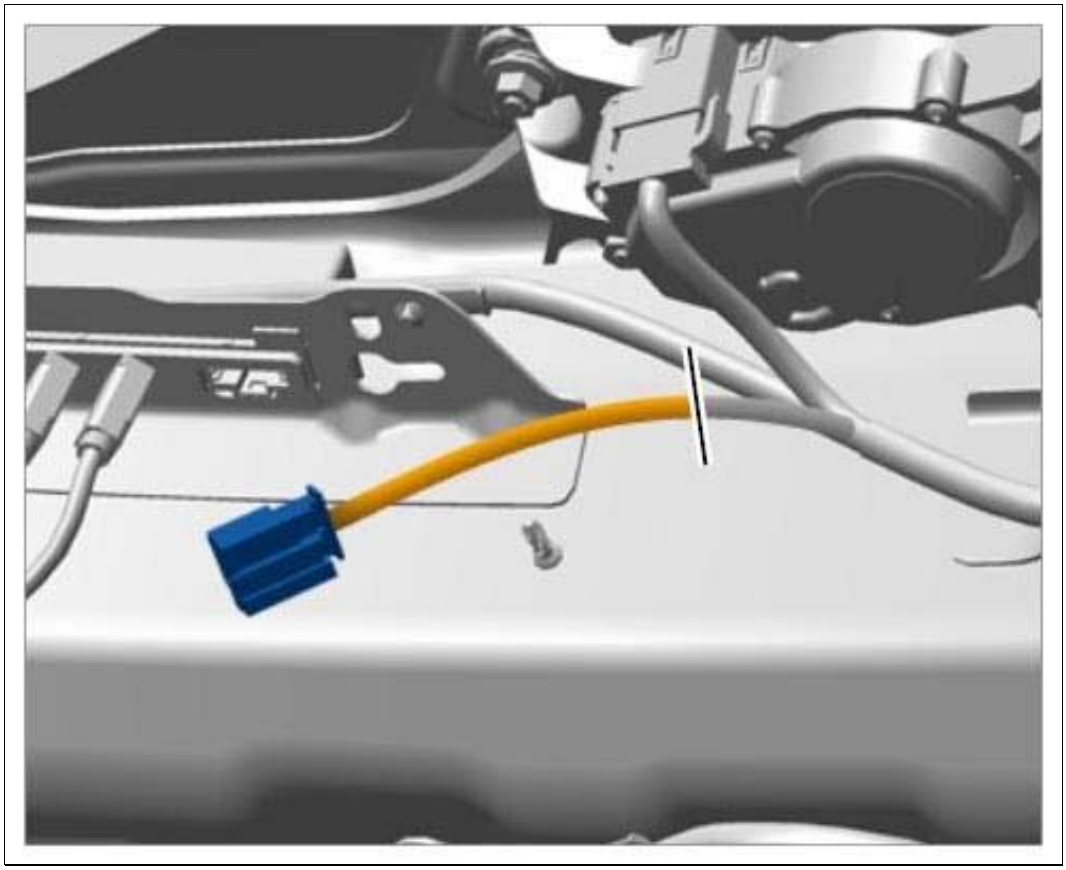
Information

Steps 1 to 1.7 described below must only be carried out if a new contact plate with round connector is installed.

1. **Replace plug connection for rear lid release on the vehicle side.**

1. 1.1. Remove fabric tape around the main wire harness as shown.

Fig 1: Removing Fabric Tape



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Select a place for the joint where there is enough space to join the individual

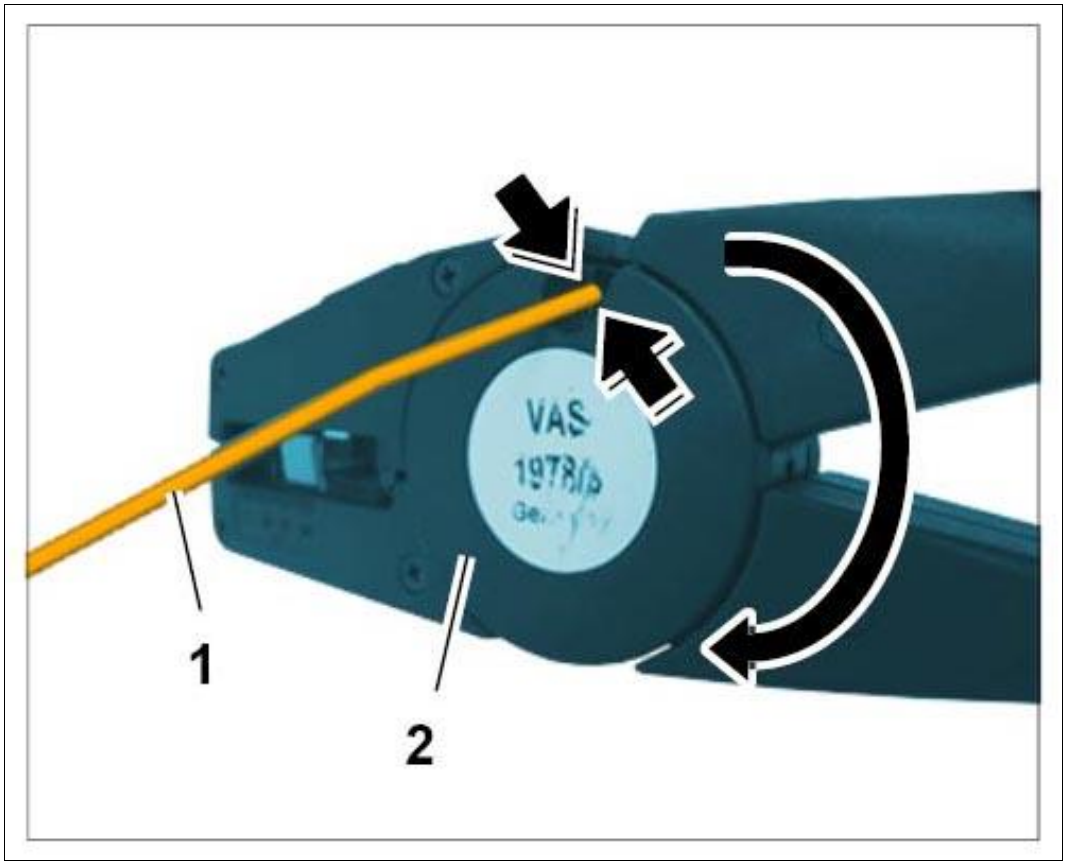
lines.

2. Mark the electric lines if necessary.

3. If the wire harness is damaged to such an extent that it cannot be repaired using a crimp connector, the individual lines of the connector must be replaced. For further information, see: → 9X00IN ORDERING AND REPAIRING ELECTRIC PLUG CONNECTIONS .

2. 1.2. Cut off connector lines **-1-** in the marked area **individually** using **stripping pliers VAS 1978/3 -2-.**

   Fig 2: Cutting Connector Line

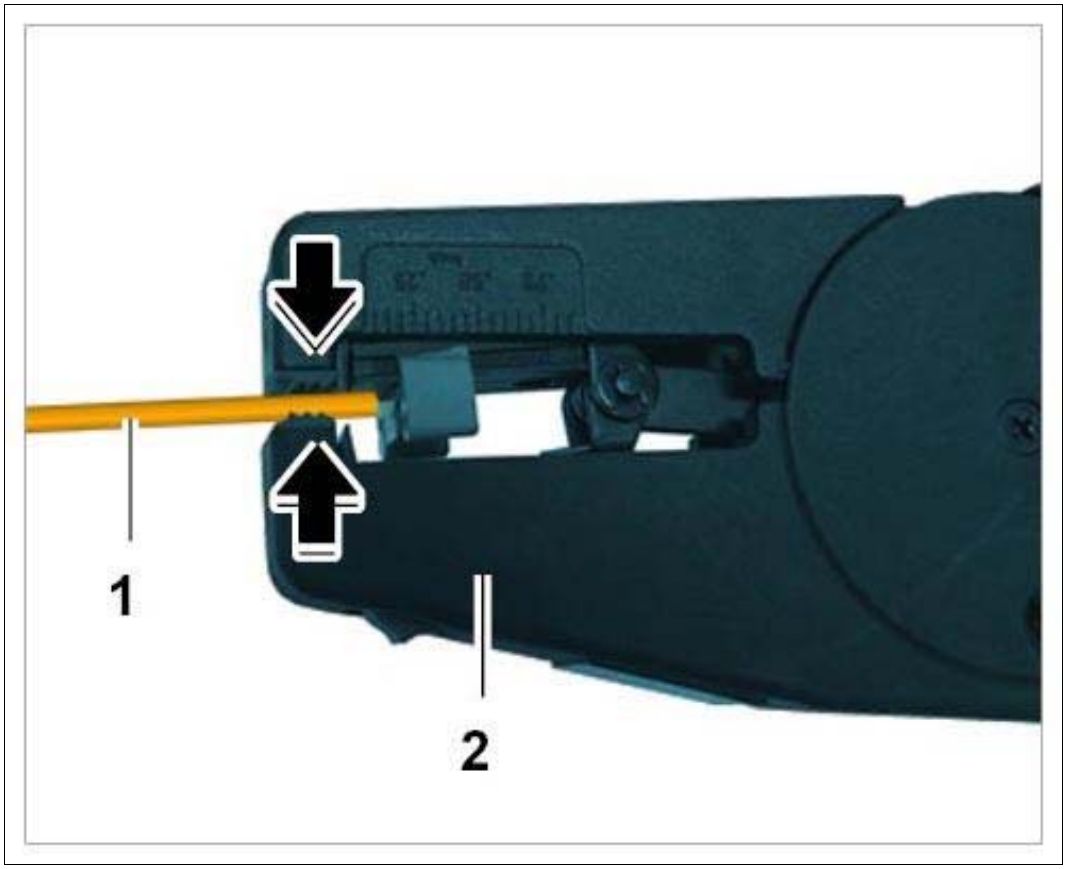


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 1.3. Strip the lines you have just cut (yellow/blue and brown) **-1-** using the **stripping pliers VAS 1978/3 -2-** .

   The green/white line in the wire harness is not used and must then be insulated using fabric tape.

Fig 3: Identifying Stripping Repair Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

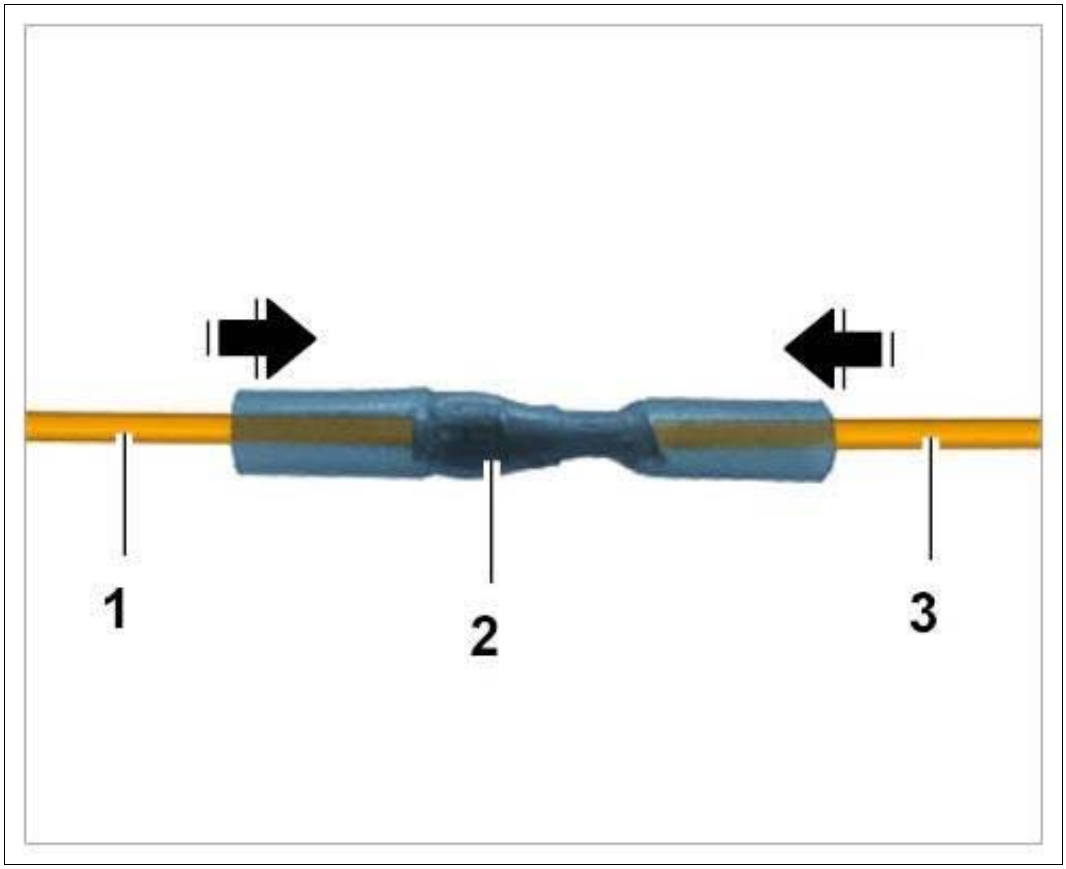
4. 1.4. Insert the stripped lines **-1-** into the corresponding crimp connector **-2-** on the repair connector, Part No. **95B.998.030** .

   Line assignment:

   Brown line of the connector to **brown/white** line of the main wire harness.

   Yellow/blue line of the connector to **yellow/blue** line of the main wire harness.

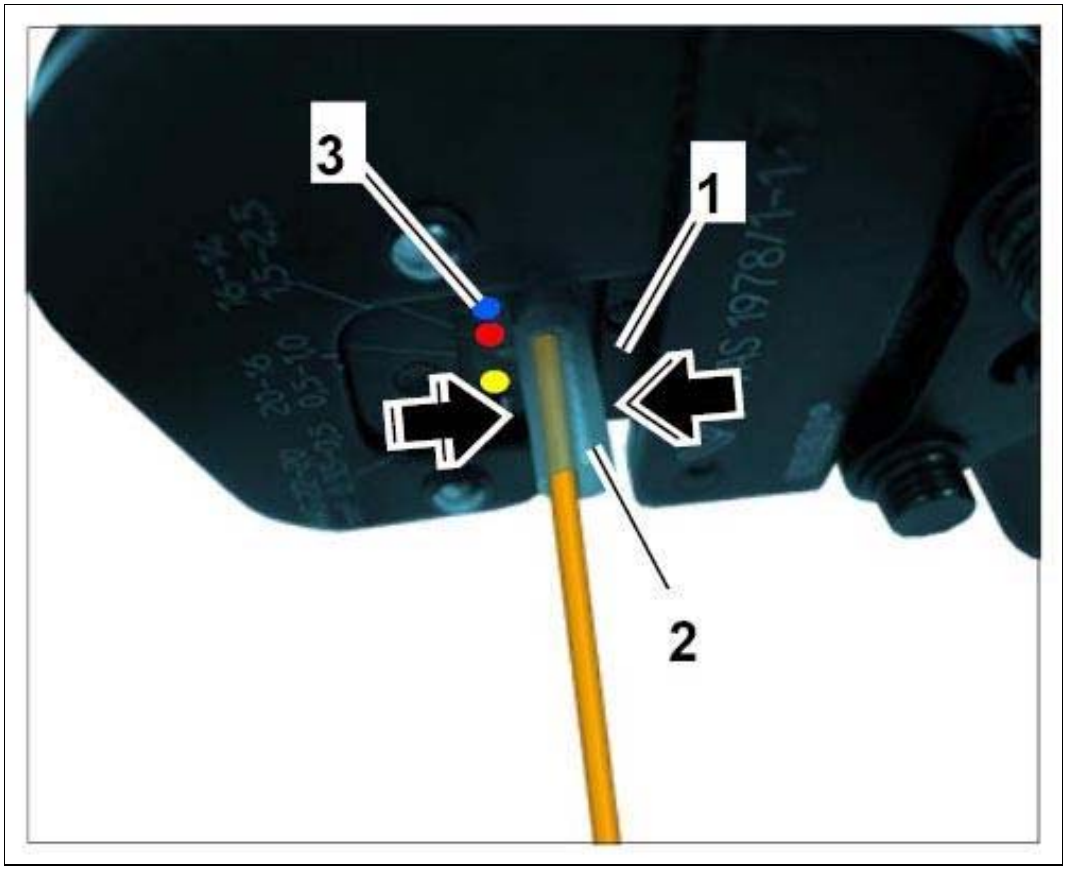
Fig 4: Inserting Lines Into Crimp Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. 1.5. Crimp on both lines using **crimping pliers VAS 1978/1-1** .

Fig 5: Locating Repair Line

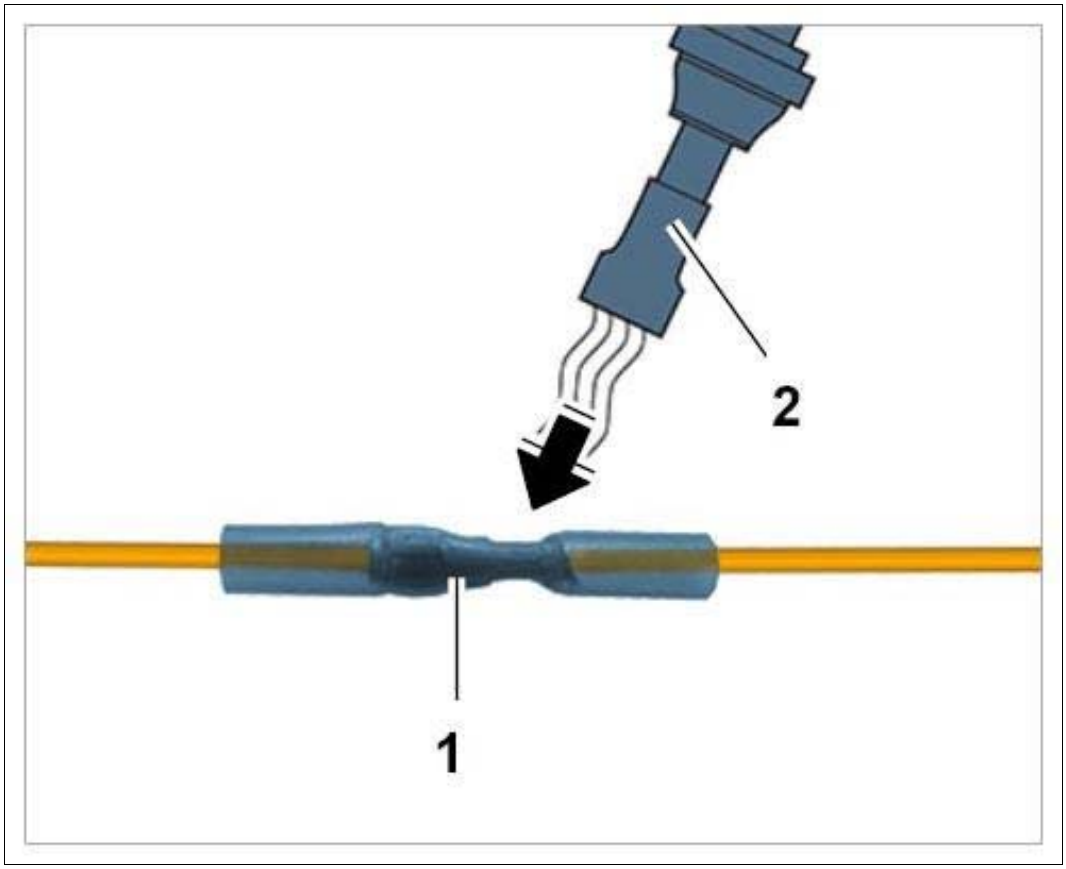


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.5.1. Insert crimping pliers insert **-1-** according to the color marking **-3-** on the crimp connector **-2-** into the **crimping pliers VAS 1978/1-1** .
2. 1.5.2. Crimp on the crimp connector **-2-** using **crimping pliers VAS 1978/1-1** .

6. 1.6. Seal shrink-fit hose on the crimp connection **-1-** using **hot-air blower VAS 1978/14A -2-** .

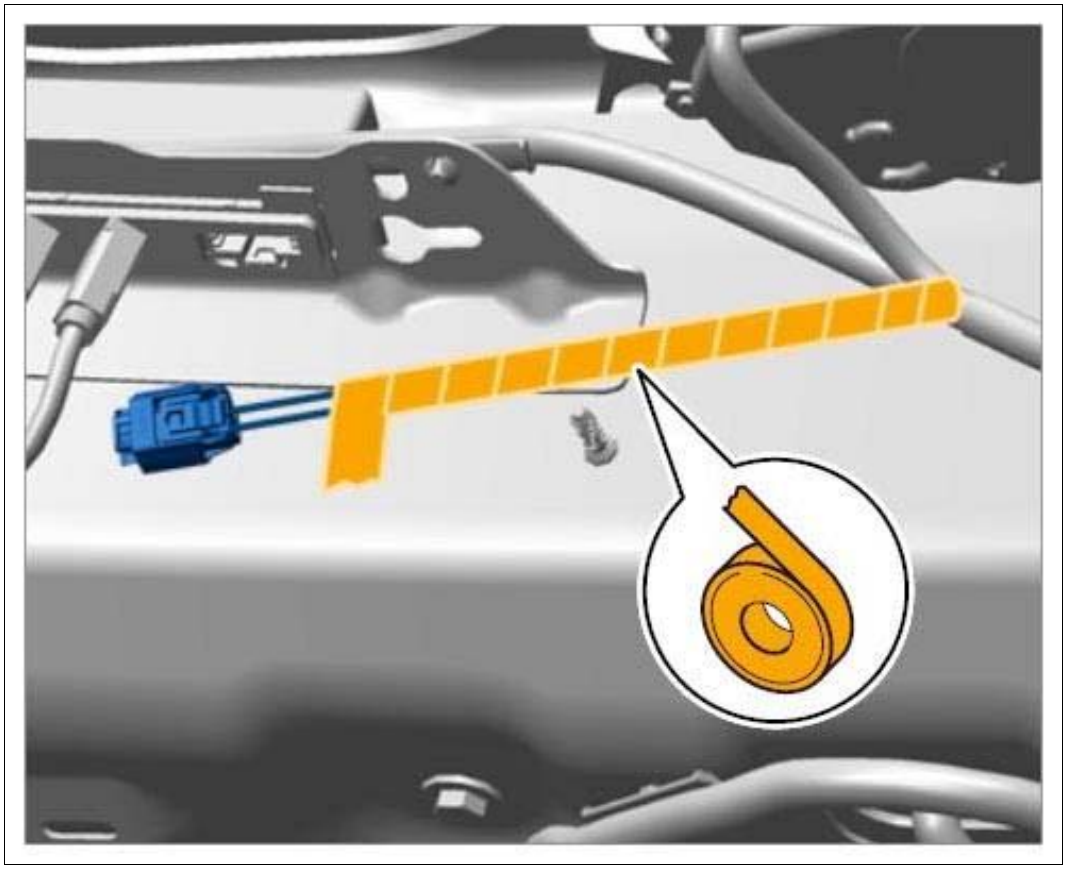
Fig 6: Heating Seal Shrink-Fit Hose On Crimp Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. 1.7. Wrap fabric tape around the main wire harness and connector lines.

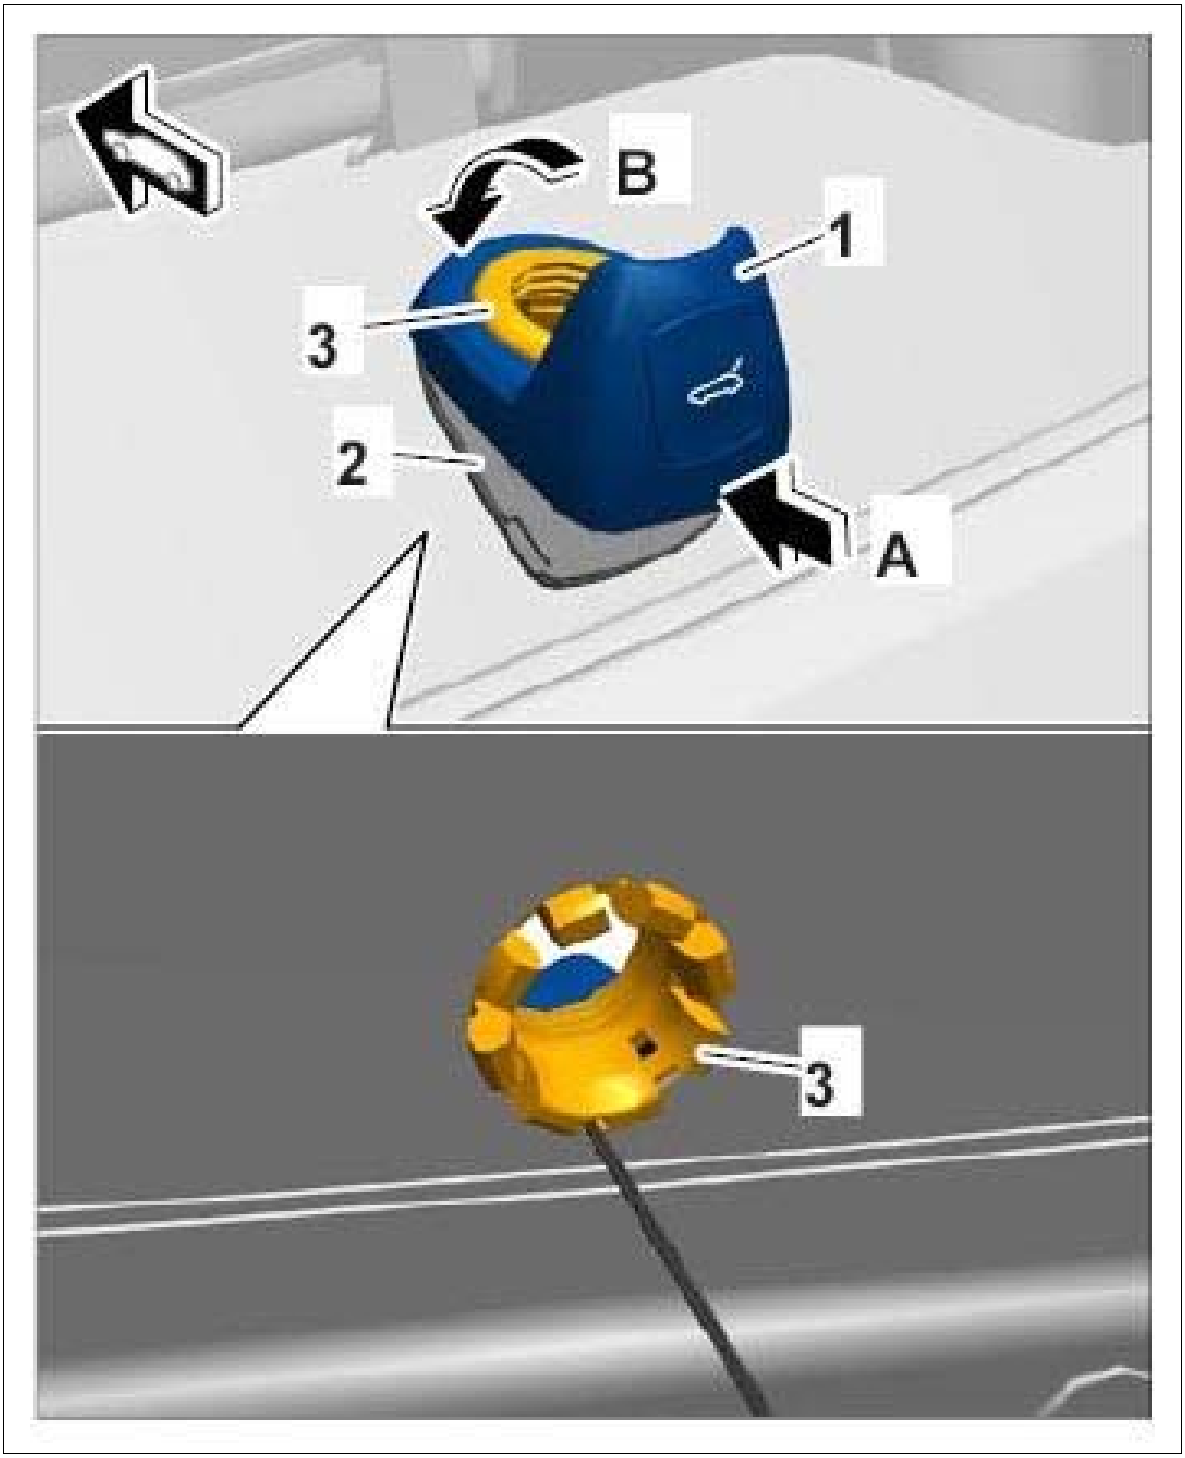
Fig 7: Wrapping Tape Around Wire Harness



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. **Install rear lid release.**

Fig 8: Installing Release Switch



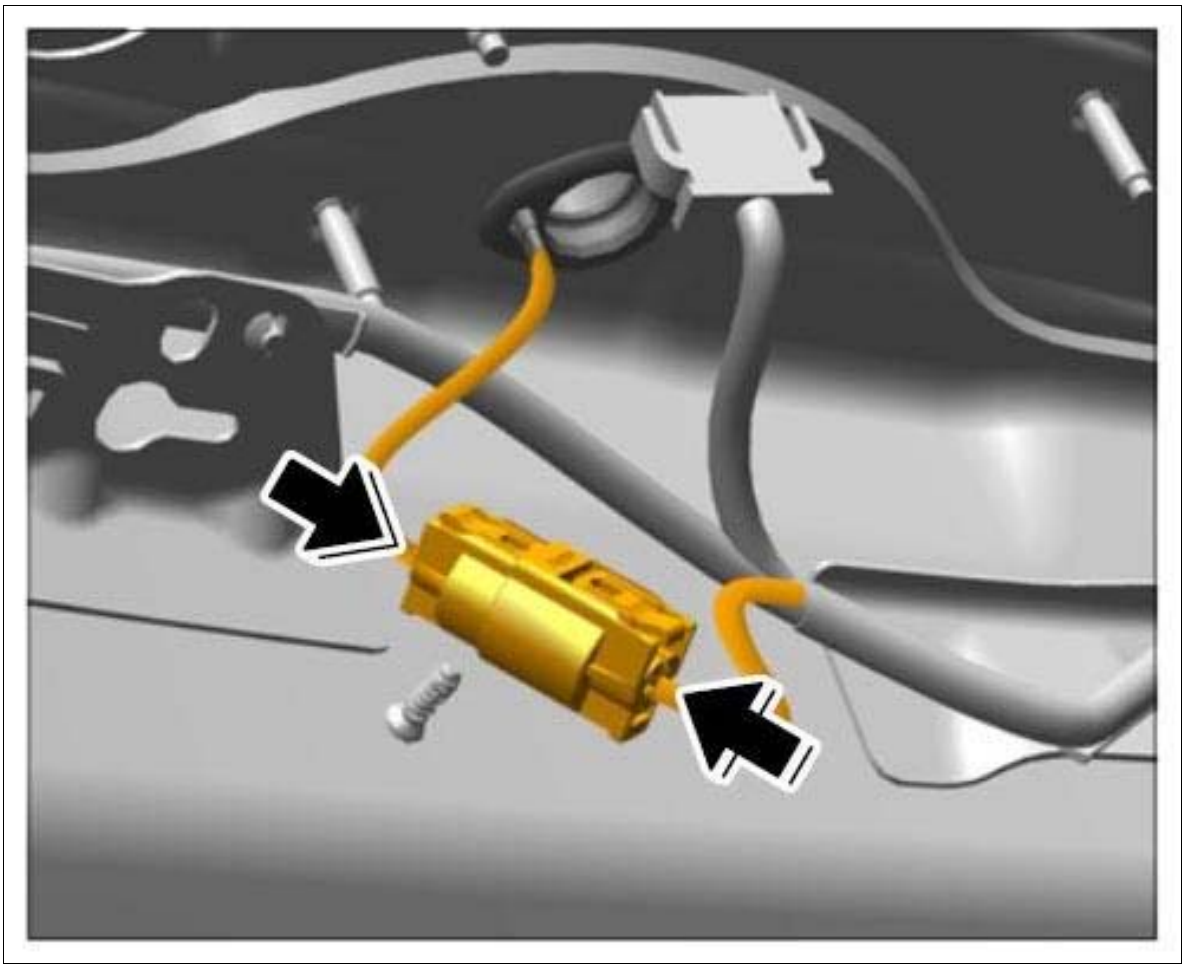
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 2.1. Coat the retainer plate **-2-** with soapy water before installing the new release switch **-1-** .
2. 2.2. Position the release switch **-1-** on the retainer plate **-2-** as shown and check that the sealing grommet **-3-** is fitted correctly in the opening for the rear window all the way around.
3. 2.3. Guide in release switch **-1-** at the bottom of the retainer plate **-2-** first **-arrow**

A- and then engage it at the top **-arrow B-** .

3. Connect electric plug connection **-arrows-** .

Fig 9: Connecting Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Perform function test on rear lid release.

WM 556855 REPLACING CONTROL UNIT FOR REAR LID (MACAN, MACAN S, MACAN TURBO) > CODING AND CALIBRATING CONTROL UNIT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the Porsche System Tester to the vehicle and start the System Tester. Switch on ignition and press [F12] to continue.
2. Select the vehicle type. The diagnostic application starts.
3. Select the required control unit, e.g. Rear lid in the overview and press [F12] to continue.
4. **Extended identification** must now be selected.
5. **Enter the vehicle identification number** and press Enter.
6. **Maintenance/repairs** must then be selected.
7. **Control unit replacement** must now be selected. Then press [F12] to continue.
8. **Select Write data,** press [F12] and then press [F8] to start. Data is installed.
9. The System Tester displays the message **Data has been written.** Press [F12] to continue.
10. **Codings/adaptations** must now be selected.
11. **Automatic coding** must now be selected. Then press [F12] to continue.
12. If the message **Coding was completed successfully** appears, press [F12] to continue.

    ⚠ *CAUTION: When you start the calibration/teaching process, the tailgate moves to its limit stops. Mechanical force limitation is not guaranteed during this process.*

    1. Danger of pinching and squashing body parts.

    2. Incorrect values for the control unit, resulting in malfunctions.

    → Take precautions to ensure that no body parts and objects can get caught in the tailgate.

13. Select **Calibration** in the **Maintenance/repairs** menu and press [F12] to continue.
14. Read the warnings, press [F12] to continue and then press [F8] to start the calibration process.
15. Read the instructions on the Tester and perform the calibration process as instructed.

16. Once the teaching process has been completed successfully, an acoustic signal will be issued.
17. **Fault memory** must be selected and erased if necessary.

WM 557319 REMOVING AND INSTALLING ACTUATING CYLINDER FOR REAR LID (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove trim panel for rear lid. → 708719 TRIM PANEL FOR REAR LID

WM 557319 REMOVING AND INSTALLING ACTUATING CYLINDER FOR REAR LID (MACAN, MACAN S, MACAN TURBO) > REMOVING ACTUATING CYLINDER FOR REAR LID > REMOVING REAR ACTUATING CYLINDERS

⚠ *CAUTION: Incorrect handling of actuating cylinders*

- *Actuating cylinders can burst*
- *Risk of eye injuries*
- *Risk of bruising*

→ The actuating cylinders must be in idle state in order to remove them.

→ Open the lid.

→ Secure the lid after removing the actuating cylinders to prevent it from closing accidentally.

→ Do not use force when opening the actuating cylinders due to the high internal pressure.

Information

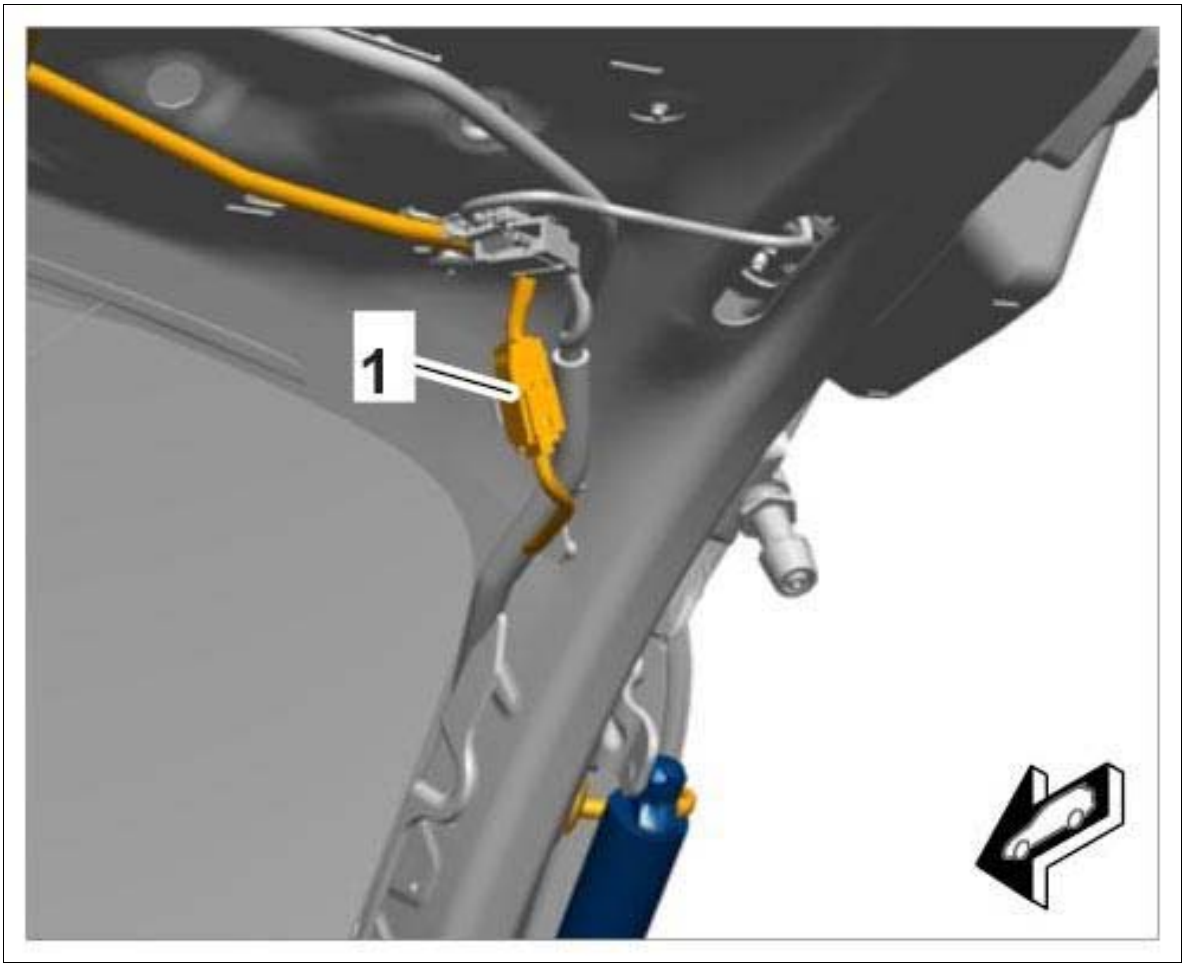
- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

Fig 1: Locating Rear Lid Actuating Cylinder Position

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Release electric plug connection **-1-** and disconnect connector.

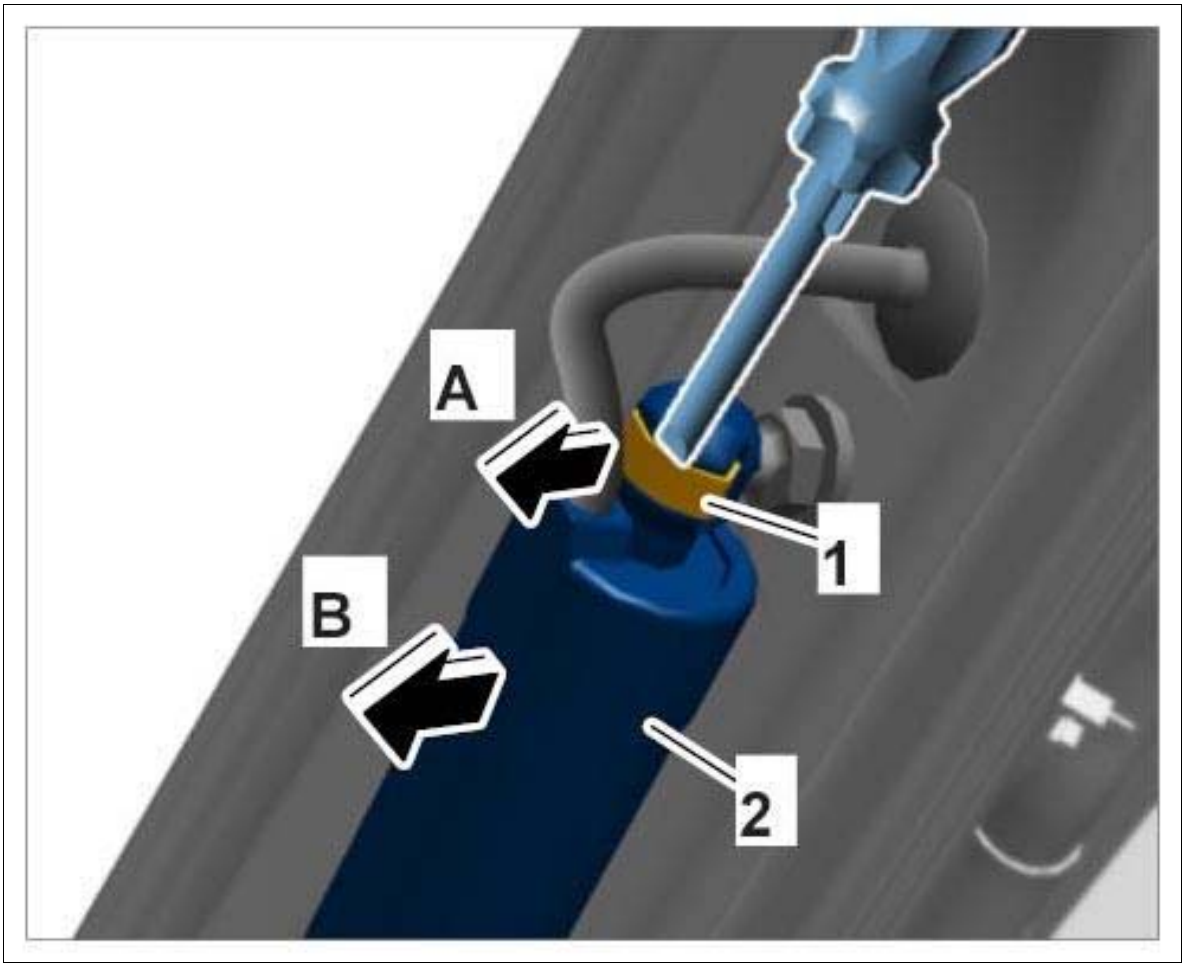
Fig 2: Disconnecting Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Press rubber sleeve out of the rear lid.
3. Guide out electric line.
4. A second person should hold the rear lid to prevent it from closing accidentally.
5. Insert a screwdriver between the actuating cylinder **-2-** and safety clip **-1-** .

Fig 3: Removing Actuating Cylinder



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Lift up the safety clip by levering the screwdriver **-A-** . The safety clip remains on the actuating cylinder.
7. Pull actuating cylinder off the ball joint **-B-** .
8. Remove actuating cylinder at the body side in the same way.

WM 557319 REMOVING AND INSTALLING ACTUATING CYLINDER FOR REAR LID (MACAN, MACAN S, MACAN TURBO) > INSTALLING ACTUATING CYLINDER FOR REAR LID

1. Installation is performed in reverse order to removal.
2. Check that the safety clips have engaged correctly. The safety clip must be directly on the head of the pneumatic spring.
3. Plug in electric plug connection until it engages securely.

WM 557319 REMOVING AND INSTALLING ACTUATING CYLINDER FOR REAR LID (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install trim panel for rear lid. → INSTALLING TRIM PANEL FOR REAR LID

WM 557319 REMOVING AND INSTALLING ACTUATING CYLINDER FOR REAR LID (MACAN, MACAN S, MACAN TURBO) > FUNCTION TEST ON REAR PNEUMATIC SPRINGS

1. Close and open the lid several times to check that the pneumatic springs are working properly and were fitted correctly.
2. Open the lid fully. The two fitted pneumatic springs must hold the lid open.
3. Close the lid.

WM 558219 REMOVING AND INSTALLING REAR LID RELEASE SWITCH (MACAN, MACAN S, MACAN TURBO) > REMOVING REAR LID RELEASE SWITCH

1. Lever rear lid release switch **-1-** out of the trim panel using a plastic wedge.
2. Disconnect electric plug connection **-2-** from the rear lid release switch.

WM 559015 ADJUSTING REAR LID (MACAN, MACAN S, MACAN TURBO) > ADJUSTING REAR LID

Information

- Set gap dimensions on lid and accessories in accordance with the gap specifications.
- Given a clearance in the opening that is too great or too small, the accessories must be centered with respect to the body.
- Ensure that the gaps do not run in a wedge-shaped fashion or do not narrow at local points.
- The given values are guidelines, which should be observed as far as possible.
- The guidelines apply to repair and assembly work.
- Use star gauges to check the gap dimensions. Star gauges for body gap dimensions NR.127-1

Fig 1: Adjusting Rear Lid

No.	Component	Function	Procedure
1.	Fastening screws **-8-** for catch bar **-9-**	Locking mechanism for rear lid	Loosen.
2.	Fastening screws securing lid hinge -1 and 2- to rear lid	Adjustment of gap dimensions in Y and Z direction	Loosen.
3.	Rear lid **-3-**		Set gap dimensions in Y and Z direction by moving the lid.
4.	Fastening screws securing lid hinge **-1-** to rear lid	Adjustment of gap dimensions in Y and Z direction	Tighten fastening screws **-1-** to **Tightening torque 10 Nm (7.5 ftlb.)** until secure.  Adjusting rear lid
5.	Fastening screws securing lid hinge to body **-2-** . If	Adjusting gap dimensions in X direction, rear	Loosen.

	adjustments are needed, detach the rear roof trim panel. → 708419 REMOVING AND INSTALLING HEADLINER .		
6.	Fastening screws securing lid hinge to body **-2-** . If adjustments are needed, detach the rear roof trim panel. → 708419 REMOVING AND INSTALLING HEADLINER .	Adjusting gap dimensions in X direction, rear	Tighten fastening screws **-2-** to **Tightening torque 23 Nm (17 ftlb.)** until secure.  Adjusting rear lid
7.	Fastening screws **-5-** for the guide wedge on the sides of the lid **-4-**	Correcting gap dimension with respect to the body	Tighten fastening screws **-5-** to **Tightening torque 6 Nm (4.5 ftlb.)** until secure.  Adjusting rear lid
8.	Lower part of lid lock l **-9-**	Locking mechanism for rear lid	Adjust latch by moving lower part of lid lock.
9.	Fastening screws **-8-** for lower part of lid lock **-9-**	Locking mechanism for rear lid	Tighten fastening screws **-8-** to **Tightening torque 18 Nm (13 ftlb.)** until secure.  Adjusting rear lid
10.	Rubber stop **-7-**	Adjusting gap dimensions and preload	Set gap dimensions and inclination by turning the rubber stops **-7-** . There must be slight preload on the lid as a result of

			setting the rubber stops **-7-** .

WM 559015 ADJUSTING REAR LID (MACAN, MACAN S, MACAN TURBO) > CHECKING REAR LID LOCK > FUNCTION TEST ON REAR LID LOCK

1. Check the function of the rear lid lock.
    1. 1.1. Lock the lid lock using a screwdriver and then unlock it again using the lid release.

       The lock must swivel out freely.
    2. 1.2. Check that the rear lid stays open automatically in the upper positions.
    3. 1.3. From the middle position, the rear lid must fall into the lock automatically and lock fully. (with gas-filled shock absorbers)
    4. 1.4. Perform a visual inspection to check that the lock releases again correctly.
2. Check electric operation of rear lid lock.
    1. 2.1. Open the lock using the electric release or remote control.
3. Check electric tailgate drive mechanism.
    1. 3.1. Check opening and closing function using the outer handle on the rear lid, the remote control and the switch in the driver's door.
    2. 3.2. It must be possible to stop rear lid operation at any time using all actuators.
    3. 3.3. Check the obstacle detection function.

       Simulate an obstacle while opening and closing by holding the rear lid firmly.

WM 559019 REMOVING AND INSTALLING REAR LID (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Fastening screw for lid hinge		Tightening torque	10 Nm (7.5 ftlb.)

WM 575115 ADJUSTING FRONT DOOR (ALL MODELS) > ADJUSTING FRONT DOOR

WARNING: Incorrect handling of safety bolts

- *Danger of injury*

- *Loss of torque*

→ Always use new fastening screws and nuts following removal.

→ Observe specified tightening torques.

→ Carry out a visual inspection of all re-used parts.

Information

Only tighten the fastening screws on the door hinges hand-tight from the inside until the doors are set correctly.

Information

- Set gap dimensions on the lids, doors and covers, or accessories in accordance with the gap specifications.
- Given a clearance in the openings that is too great or too small, the movable body parts or the accessories must be centred accordingly.
- Ensure that the gaps do not run in a wedge-shaped fashion or do not narrow at local points.
- You can use star gauges for body gap dimensions NR.127-1 for this.
- The given values are guidelines which should be observed as far as possible.
- The guidelines apply to repair and assembly work.

Information

- The door hinge must be aligned after installing the door.
- Loosen fastening screws for door hinge at the door and fastening screws for door hinge at the A-pillar so that the threaded connections can be moved.

Information

- The number of fastening screws, fixing clips, plug connections, holders and trim panels↓ can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Adjust front door with door hinge at the door.

Fig 1: Identifying Front Door Hinge On Door Side

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 577355 REPLACING DOOR CONTROL UNIT (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 577355 REPLACING DOOR CONTROL UNIT (ALL MODELS) > REPLACING DOOR CONTROL UNIT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Switch off ignition and replace control unit. → Replacing Door Control Unit
2. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition.
3. Select the vehicle type and start the diagnostic application.
4. Select the required control unit, e.g. **Driver's door** in the **overview** .
5. **Extended identification** must now be selected.
6. **Enter the vehicle identification number** and press Enter.
7. **Maintenance/repairs** must then be selected.
8. **Control unit replacement** must now be selected. Then press [F12].
9. **Select Write data,** press [F12] and then press [F8] to start. The data is now loaded.
10. The Tester displays the message **Data has been written.** Press [F12] to continue.
11. **Codings/adaptations** must now be selected.
12. **Automatic coding** must now be selected. Then press [F12] to continue.
13. When the message **Coding has been completed successfully** appears, press [F12] to continue.
14. Read out the fault memory and erase it if necessary.
15. Check the function of the door control unit.

WM 578919 REMOVING AND INSTALLING CONTROL UNIT FOR REAR-END ELECTRONICS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	

PIWIS Tester II	Special tool	9818		
WM 578919 REMOVING AND INSTALLING CONTROL UNIT FOR REAR-END ELECTRONICS (ALL MODELS) > PRELIMINARY WORK

1. Move inner part of side trim panel for rear luggage compartment on the right and connected lines aside. → Removing side trim panel for rear luggage compartment

WM 578919 REMOVING AND INSTALLING CONTROL UNIT FOR REAR-END ELECTRONICS (ALL MODELS) > REMOVING CONTROL UNIT FOR REAR-END ELECTRONICS

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

1. Unclip control unit for rear-end electronics **-1-** from the holder **-2- (-a-)** and swivel it out **-b-** .

Fig 1: Removing Control Unit For Rear-End Electronics

Current rating		Nominal value	40 A		

WM 578955 REPLACING CONTROL UNIT FOR REAR-END ELECTRONICS (ALL MODELS) > PRELIMINARY WORK

1. Switch off ignition and replace control unit. → 578919 REMOVING AND INSTALLING CONTROL UNIT FOR REAR-END ELECTRONICS

WM 578955 REPLACING CONTROL UNIT FOR REAR-END ELECTRONICS (ALL MODELS) > TEACHING CONTROL UNIT FOR REAR-END ELECTRONICS > TEACHING

REAR-END ELECTRONICS CONTROL UNIT

Information

All remote controls (keys) are required for teaching a DME, front-end electronics (front BCM), rear-end electronics (rear BCM), electronic steering lock (ELV) control unit or remote controls (keys) for example.

Remote controls (keys) that are not taught during this teaching procedure will no longer be recognized by the vehicle.

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition.
2. Select the vehicle type and start the diagnostic application.
3. Select the **Rear-end electronics** control unit in the overview.
4. **Codings/adaptations** must now be selected.
5. **Automatic coding** must be selected and then press [F12].
6. The Tester displays the message **Coding completed successfully.** Press [F12] to end the process.
7. To activate the control units, switch on the hazard warning lights.
8. Return to the Start page.
9. Select the **Online teaching function** menu on the **Diagnostics tab** .

10. Select the **Engine immobilizer** sub-menu.
11. **Vehicle** must now be selected. Then press [F12] to continue. Vehicle data will be read out.
12. Follow the instructions on the Tester and press [F12] to continue.
13. Once the teaching process is completed successfully, the Tester shows the following status, for example:

    2 keys taught

    Front BCM: taught

    ELV: taught

    Rear BCM: taught

    DME: taught

    Overall vehicle status: taught. Continue with [F12]
14. Press ESC to exit the **Online teaching function** and return to the diagnostic application.
15. **Erase the fault memory.**
16. Function test: Lock, open and start the vehicle using all remote controls (hand-held transmitters).
17. Read out the fault memory.

WM 585115 ADJUSTING REAR DOOR (ALL MODELS) > ADJUSTING REAR DOOR

WARNING: Incorrect handling of safety bolts

- *Danger of injury*

- *Loss of torque*

→ Always use new fastening screws and nuts following removal.

→ Observe specified tightening torques.

→ Carry out a visual inspection of all re-used parts.

Information

Only tighten the fastening screws on the door hinges hand-tight from the inside until the doors are set correctly.

Information

- Set gap dimensions on the lids, doors and covers, or accessories in accordance with the gap specifications.
- Given a clearance in the openings that is too great or too small, the movable body parts or the accessories must be centered accordingly.
- Ensure that the gaps do not run in a wedge-shaped fashion or do not narrow at local points.
- You can use star gauges for body gap dimensions NR.127-1 for this.
- The given values are guidelines which should be observed as far as possible.
- The guidelines apply to repair and assembly work.

Information

- The door hinge must be aligned after installing the door.
- Loosen fastening screws for door hinge at the door and fastening screws for door hinge at the B-pillar so that the threaded connections can be moved.

Information

- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Adjust rear door with door hinge at the door.

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 587355 REPLACING REAR DOOR CONTROL UNIT (ALL MODELS) > REPLACING REAR DOOR CONTROL UNIT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Switch off ignition and replace control unit. → 587355 REPLACING REAR DOOR CONTROL UNIT
2. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition.
3. Select the vehicle type and start the diagnostic application.
4. Select the required control unit, e.g. **Rear left door** in the overview.
5. **Extended identification** must now be selected.
6. **Enter the vehicle identification number** and press Enter.
7. **Maintenance/repairs** must then be selected.
8. **Control unit replacement** must now be selected. Then press [F12].
9. **Select Write data** , press [F12] and then press [F8] to start. The data is now loaded.
10. The Tester displays the message **Data has been written.** Press [F12] to continue.
11. **Codings/adaptations** must now be selected.
12. **Automatic coding** must now be selected. Then press [F12] to continue.
13. When the message **Coding has been completed successfully** appears, press [F12] to continue.
14. Read out the fault memory and erase it if necessary.
15. Check the function of the door control unit.

WM 5X00IN SAFETY NOTES (ALL MODELS) > SAFETY INSTRUCTIONS FOR RAISING VEHICLES > DANGER OF INJURY WHEN RAISING VEHICLES

WARNING: Vehicle can fall down

- *Risk of squashing or crushing*
- *Risk of damage to the vehicle*

→ Do not place any solid objects under the raised vehicle.

→ Ensure that the lifting platform is prevented from lowering.

→ Remove solid objects before lowering the vehicle.

→ Raise the vehicle only at the jacking points provided.

→ The outer jacking points should be used primarily.

WM 5X00IN SAFETY NOTES (ALL MODELS) > SAFETY INSTRUCTIONS FOR RAISING VEHICLES > DAMAGE WHEN RAISING VEHICLES

WARNING: Vehicle can fall down

- *Risk of squashing or crushing*
- *Risk of damage to the vehicle*

→ Do not place any solid objects under the raised vehicle.

→ Ensure that the lifting platform is prevented from lowering.

→ Remove solid objects before lowering the vehicle.

→ Raise the vehicle only at the jacking points provided.

→ The outer jacking points should be used primarily.

WM 5X00IN SAFETY NOTES (ALL MODELS) > GENERAL WARNING NOTES > SAFETY INSTRUCTIONS FOR GRINDING WORK

WARNING: Excessively high dust concentration during grinding work

- *Risk of explosion*

→ Remove any grinding dust using the relevant vacuum cleaner approved for use on the material.

→ Remove dust in the work area regularly.

→ Do not use compressed air to blow away dust deposits.

→ Always separate the dust from different materials (separate aluminum, steel and carbon fibre-reinforced plastic).

→ Clean the extraction system at regular intervals.

→ Never weld and grind in the same room at the same time.

→ Only use pneumatic grinders if possible.

WM 5X00IN SAFETY NOTES (ALL MODELS) > GENERAL WARNING NOTES > SAFETY INSTRUCTIONS FOR FUEL TANK

WARNING: Grinding and welding work

- *Danger of fire or explosion*

→ Avoid working in an area with highly inflammable or explosive materials.

→ Cover highly inflammable or explosive areas.

→ Remove highly inflammable or explosive parts.

WM 5X00IN SAFETY NOTES (ALL MODELS) > GENERAL WARNING NOTES > SAFETY INSTRUCTIONS FOR AIR CONDITIONING

CAUTION: Danger of injury! Bursting of the filled air-conditioning system during welding and brazing work!

- *Danger of injury due to the filled air-conditioning system bursting during welding and brazing work.*

→ No welding, brazing or hot-air heating may be performed on parts of the filled air-conditioning system!

→ While drying after painting work, the temperature burden on the vehicle must not exceed two hours at a maximum temperature of 80 °C!

→ Make sure that parts of the air-conditioning system do not heat up during welding or brazing work on the vehicle!

→ In the case of extreme heating of filled air-conditioning systems, a very strong overpressure may be caused in the system which may lead to an explosion.

WM 5X00IN SAFETY NOTES (ALL MODELS) > SAFETY INSTRUCTIONS FOR ADHESIVE BONDING > DANGER OF POISONING AND INJURY WHEN USING ADHESIVE

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WM 5X00IN SAFETY NOTES (ALL MODELS) > SAFETY INSTRUCTIONS FOR ADHESIVE BONDING > SAFETY INSTRUCTIONS FOR TEROMIX-6700 TWO-COMPONENT ADHESIVE

NOTE: Non-observance of setting time for adhesive

- *Risk of damage to side panel*

→ Weld in the new part within 30 minutes.

WM 5X00IN SAFETY NOTES (ALL MODELS) > SAFETY INSTRUCTIONS FOR INSTALLATION WORK > SAFETY INSTRUCTIONS FOR AIRBAG SYSTEM

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

WM 5X00IN SAFETY NOTES (ALL MODELS) > SAFETY INSTRUCTIONS FOR CORROSION PROTECTION > SAFETY INSTRUCTIONS FOR STOPPER LOCATION PLAN (BODY)

NOTE: Removing stoppers

- *Risk of corrosion*
- *Uncontrolled water leakage*

→ Body apertures that are sealed with stoppers at the factory must be re-sealed with the stoppers

provided following disassembly or repair work.

WM 5X00IN SAFETY NOTES (ALL MODELS) > SAFETY INSTRUCTIONS FOR CORROSION PROTECTION > SAFETY INSTRUCTIONS FOR WATER DRAINS (BODY)

NOTE: Water drain hoses not cleaned correctly

- *Water drain hoses are pushed out or pressed into the body.*

→ When cleaning water drain hoses, only blow the hoses out with light compressed-air pressure.

→ The water hoses should only be blown out when the slide/tilt roof is closed.

WM 5X00IN CORROSION PROTECTION MEASURES DURING REPAIR WORK (ALL MODELS) > MEASURES FOR MAINTAINING LONG-TERM BODY PROTECTION

Information

- Following repair work, the standard corrosion protection should only be restored using the corrosion protection agents approved by the manufacturer. The following points must be observed during body repairs.
- Always apply welding primer to both sides of the welding flange when resistance spot welding.
- Prime repair areas from outside. Prime on both sides in the accessible areas.
- Seal all sheetmetal overlaps, sheetmetal edges, butt joints, weld seams etc. with body sealant.
- Only apply body sealant to primed sheetmetal parts.
- Apply top coat paint to the inside of the outer panelling before welding. See "Paint build-up": → "Paint Manual"
- Build up paint on bare sheetmetal panels according to the painting methods described in the → "Paint Manual".
- Repair or create standard underbody protection by applying long-life undersealing material.
- Preserve cavities in the repair area with cavity preservative after applying a top coat paint.
- Check that the standard water drains (stoppers) are working correctly and clean them after the cavity preservation material has dried.

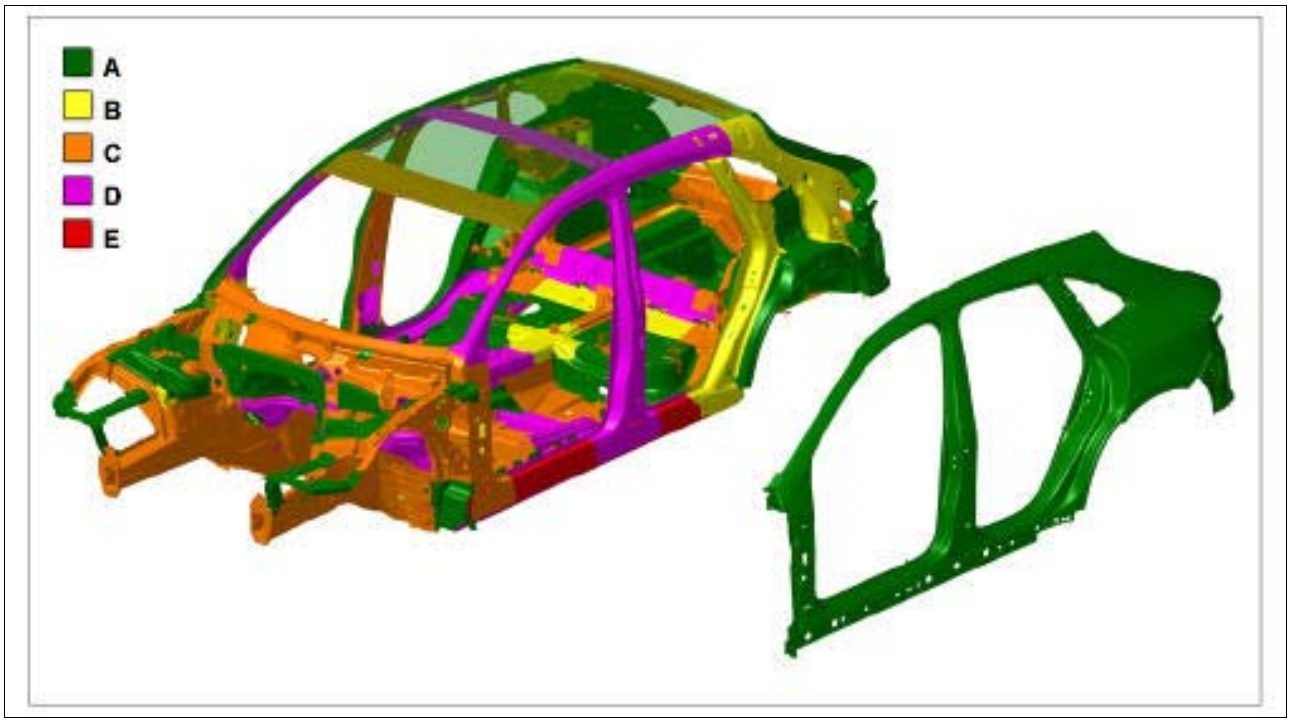
WM 5X00IN CORROSION PROTECTION MEASURES DURING REPAIR WORK (ALL MODELS) > PREREQUISITE FOR ENSURING VALIDITY OF THE LONG-LIFE GUARANTEE

Porsche long-life guarantee conditions

- All body repairs must be carried out correctly and according to the specific Porsche instructions for sheetmetal, paint and corrosion protection/preservation work.
- To avoid jeopardising the long-life guarantee, a paint condition report will be drawn up two years after delivery of the vehicle. This condition report must be drafted annually by every Official Porsche Centre.

WM 5X00IN BODY PARTS OF VARIOUS SHEET-STEEL STRENGTHS (ALL MODELS) > LIST OF MATERIALS

Fig 1: Identifying Materials



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

A - Sheet steel

B - High-strength steel

C, E - Very-high-strength steel

D - Ultra-high-strength steel

Item	Material group	Material	Proof stress (1)	Tensile strength (2)	Use/Characteristics
A	Sheet steel	DX54	120-220 N/mm^2	260-350 N/mm^2	Outer skin parts very malleable

					Can be MIG welded Part replacement as per Workshop Manual
		DX56	120-180 N/mm^2	260-350 N/mm^2	
		DX57	120-170 N/mm^2	260-350 N/mm^2	
B	High-strength steel	HX260LAD	260-330 N/mm^2	350-430 N/mm^2	Reinforcement parts moderately to not very malleable Can be MIG welded Part replacement as per Workshop Manual
		HX340LAD	340-420 N/mm^2	410-510 N/mm^2	
		HX420LAD	420-520 N/mm^2	470-590 N/mm^2	
C	Very-highs-trength steel	HCT600X	340-420 N/mm^2	> 690 N/mm^2	Reinforcement parts not malleable Can be MIG welded Can be resistance spot-welded only using approved welders Part replacement is not permitted
		HCT780X	470-600 N/mm^2	> 780 N/mm^2	
E		HCT980 C	600-750 N/mm^2	> 980 N/mm^2	
D	Ultra-high-strength steel	22MnB5	> 950 N/mm^2	> 1, 400 N/mm^2	Pillars and columns not malleable MIG welding permitted only in exceptional cases Can be resistance spot-welded only using approved welders Part replacement is not permitted

(1)	Proof stress (yield stress) is the amount of mechanical stress above which a material will extend or buckle irreversibly or deform plastically.
(2)	Tensile strength is the resistance of a material to a force tending to tear it apart. If the tensile force is greater than the tensile strength of a body, it will be damaged irreparably.

WM 5X00IN BODY PARTS OF VARIOUS SHEET-STEEL STRENGTHS (ALL MODELS) > HIGH-STRENGTH STEEL

Information

- Only "Genuine Porsche spare parts" must be used for repair work.

Body parts of high-strength steel contribute to better protection of the passenger compartment and thus increase protection of the passengers. In addition to improved crash safety, these parts also have a positive influence on fatigue strength. In terms of crash behavior, body parts made from high-strength sheet steel are characterized by their higher energy absorption. But this also means that higher reshaping force must be applied in reshaping work.

WM 5X00IN BODY PARTS OF VARIOUS SHEET-STEEL STRENGTHS (ALL MODELS) > VERY-HIGH-STRENGTH STEEL

Information

- Only "Genuine Porsche spare parts" must be used for repair work.

Damaged or deformed body parts can impair torsional rigidity, flexional resistance and crash safety. Body parts can no longer be reshaped. Straightening and reshaping is not permitted. If a body part is damaged or deformed, it must be replaced.

WM 5X00IN BODY PARTS OF VARIOUS SHEET-STEEL STRENGTHS (ALL MODELS) > ULTRA-HIGH-STRENGTH STEEL

Information

- Only "Genuine Porsche spare parts" must be used for repair work.

Information

Ultra-high-strength steel panels are extremely strong and rigid. These body parts are recast warm during manufacturing and are press-hardened in cooled recast tools. Damaged or deformed body parts can impair torsional rigidity, flexional resistance and crash safety.

Information on ultra-high-strength steel:

- Ultra-high-strength body parts must only be replaced as a complete unit.
- Ultra-high-strength body parts can no longer be reshaped.
- Straightening and reshaping is not permitted.
- Use special drill bits for drilling ultra-high-strength steel.
- Resistance spot-welding can only be carried out using the inverter welders currently approved by Porsche AG.
- Plug spot-welding ultra-high-strength steel does not produce sufficiently strong joints. If holes need to be welded, additional welding seams must be applied.
- For butt, overlap and reinforcement welding, the individual spot welds and welded seams must be at least 30 mm long.
- Resistance spotwelds can also be replaced by blind rivets and adhesive. The number of rivets must be increased for ultra-high-strength steel panels.

During repairs, always read the specific instructions in the relevant Service information.

WM 5X00IN BODY PARTS OF VARIOUS SHEET-STEEL STRENGTHS (ALL MODELS) >

SEPARATION POINTS

Information

- Separation points that influence the strength of the body, and thus also the vehicle's operating and traffic safety, must be determined according to the specifications in the relevant Service Information!
- Body reinforcements can be separated or joined together only if this is specified in the method descriptions. Otherwise, a damaged reinforcement must always be replaced with a new one!

WM 5X00IN BODY PARTS OF VARIOUS SHEET-STEEL STRENGTHS (ALL MODELS) > WELDING WORK

Information

- The oxyacetylene welding process must not be used for welding body parts made of high-strength, very-high-strength and ultra-high-strength steel!
- Carry out test-welding before starting resistance spot-welding!

All specified steel panels can be welded using the approved resistance spot-welders.

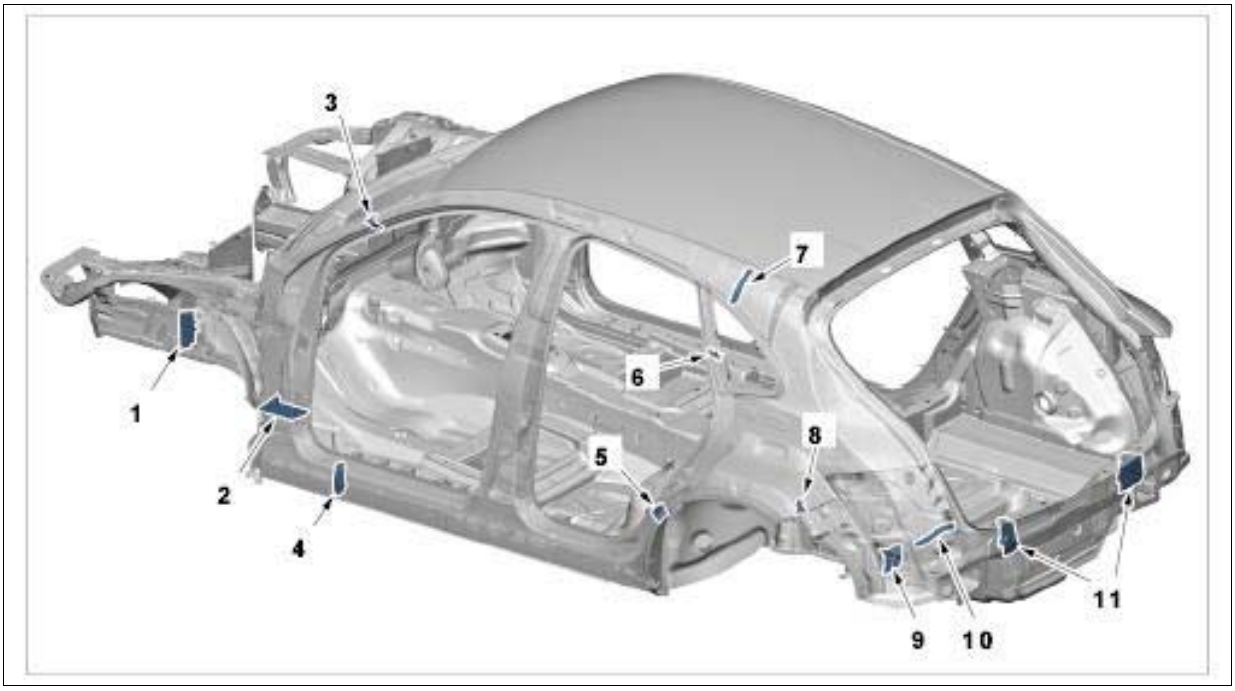
The MIG welding process can only be used on ultra-high-strength steel in exceptional cases! Details of where this process can be used can be found in the relevant repair instructions. The MIG welding process can be used without restriction on all other specified steel panels.

WM 5X00IN SEALING ELEMENTS (ALL MODELS) > SEALING ELEMENTS

Information

- Sealing elements are either bonded or filled with foam filler depending on the repair area.

Fig 1: Overview Of Sealing Elements



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Sealing element for front side member
2. Sealing element for bottom of A-pillar reinforcement
3. Sealing element for top of A-pillar reinforcement
4. Sealing element for side member reinforcement
5. Sealing element for bottom of C-pillar reinforcement
6. Sealing element for top of C-pillar reinforcement
7. Sealing element for roof pillar
8. Sealing element for rear side section
9. Sealing element for rear side member
10. Sealing element for D-pillar reinforcement
11. Sealing elements for rear end panel

WM 5X00IN GENERAL INFORMATION AND NOTES ON QUALITY (ALL MODELS) > BATTERY TRICKLE CHARGING > BATTERY TRICKLE CHARGE

Information

- In Order To Prevent The Vehicle Battery From Discharging When Visiting The Workshop, A Battery Charging Unit With A Rated Current Of At Least 40 A Must Be Connected As Soon As The Vehicle

Is Unlocked.

Refer To → 270619 Removing And Installing Battery For More Instructions About Connecting The Battery Charger.

WM 5X00IN GENERAL INFORMATION AND NOTES ON QUALITY (ALL MODELS) > INFORMATION ON ELECTRONIC CONTROL UNITS

Information

- If electronic components, e.g. ABS control module, have been removed for repair work and are then reused, they must undergo a functional check after fitting in accordance with existing specifications.

WM 5X00IN GENERAL INFORMATION AND NOTES ON QUALITY (ALL MODELS) > INFORMATION ON ELECTRONIC CONTROL UNITS > PROTECTION AGAINST OVERVOLTAGE WHEN PERFORMING WELDING WORK

To protect electronic control units from overvoltage during electric arc welding, the following work regulations must be observed:

- When performing welding work: Remove plug connections on the engine, transmission and airbag control units.
- Remove clamp from negative terminal of battery and cover the battery.
- When welding work is extensive, electronic control units in the immediate vicinity of the welding point must be removed.
- Connect the ground connection of the electric arc welding equipment as near as possible to the welding point on the part to be welded. Ensure that there are no electrically insulated parts between the ground connection and the welding point.
- Do not touch electronic control units or electric cables with the ground connection or the welding electrode.

WM 5X00IN GENERAL INFORMATION AND NOTES ON QUALITY (ALL MODELS) > INFORMATION ON ELECTRONIC CONTROL UNITS > REPLACING CONTROL UNITS

The replacement of electronic control units after an accident is necessary if at least one of the following conditions is met:

The housing is noticeably deformed or damaged.

The sealing surface or console is deformed (the unit shows no external damage).

The plug connection is damaged or corroded by moisture.

Functional checks or on-board diagnosis of the unit indicate the fault "Control unit faulty".

WM 5X00IN GENERAL INFORMATION AND NOTES ON QUALITY (ALL MODELS) > INFORMATION ON MAINTAINING LONG-LIFE CORROSION PROTECTION

Information

- Following repair work, the standard corrosion protection should only be restored using the corrosion protection agents provided and approved by the manufacturer. The following points must be observed for body repairs.
- Always apply welding primer to both sides of the welding flange when resistance spot welding.
- Prime repair areas from outside. Prime on both sides in the accessible areas.
- Seal all sheetmetal overlaps, sheetmetal edges, butt joints, weld seams etc. with body sealant.
- When replacing structurally bonded body parts, proceed according to the information in the respective repair instructions.
- Only apply body sealant to primed sheetmetal parts.
- Apply top coat paint to the inside of the outer panelling before welding. See "Paint build-up": → "Paint Manual"
- Build up paint on bare sheetmetal panels according to the painting methods described in the → "Paint Manual".
- Repair or create standard undersealing by applying long-life undersealing material.
- Preserve cavities in the repair area with cavity preservative after applying a top coat paint.
- Check that the standard water drains (stoppers) function correctly and clean them after the cavity preservation material has dried.

WM 5X00IN GENERAL INFORMATION AND NOTES ON QUALITY (ALL MODELS) > INFORMATION ON MAINTAINING LONG-LIFE CORROSION PROTECTION > PREREQUISITE FOR MAINTAINING THE LONG-LIFE GUARANTEE

All body repairs must be performed properly and according to the specific instructions defined by Porsche for sheetmetal, painting and corrosion inhibition/preservation work. To avoid jeopardising the long-life guarantee, a paint condition report will be drawn up two years after delivery of the vehicle. This condition report must be updated every two years by every Official Porsche Centre.

WM 5X00IN WORKING WITH BODY STRUCTURAL FOAM (ALL MODELS) > WORKING WITH BODY STRUCTURAL FOAM > PRODUCT DESCRIPTION

Processing time is approx. 60 - 90 minutes. The structural foam is hardened after 8 - 24 hours. The

hardening time depends on temperature, area of application, amount of foam used and exposed surface. The hardening process can be speeded up by heating the components to up to 50 °C.

WM 5X00IN WORKING WITH BODY STRUCTURAL FOAM (ALL MODELS) > WORKING WITH BODY STRUCTURAL FOAM > APPLICATIONS

The **body structural foam** is ideal for **increasing the rigidity, strength and fatigue endurance limit of cavities, plates and structural parts** , e.g. pillars, door sills and frame sections.

WM 5X00IN WORKING WITH BODY STRUCTURAL FOAM (ALL MODELS) > WORKING WITH BODY STRUCTURAL FOAM > PROCESSING

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

Information

Always observe the relevant work safety regulations when working with body structural foam.

Information

The work area must be dry and free of grease, oil and dust.

Remove loose parts.

Do not wet the area beforehand.

Observe temperature limits:

- Cartridge and ambient temperature: -40 - 90 °C
- Optimal temperature: 20 - 30 °C

Information

The volume of the structural foam will expand by approx. 0 - 30 % in cavities. When filling large cavities, the chemical reaction can cause strong heat generation.

Remove fresh foam residue immediately with a cloth soaked in acetone. Hardened foam residue can

only be removed mechanically afterwards.

- **Application from the cartridge:**
- 1. Remove safety pin from the stopper.
- 2. Screw off the top cap.
- 3. Remove the stopper.
- 4. Screw the mixing nozzle provided together with the previously removed cap onto the cartridge.
- 5. Insert the cartridge into the applicator gun.

  Information

  - To ensure that the substance is completely mixed, apply a bead of structural foam measuring approx. 30 mm in length to a piece of cardboard before use.
  - Use structural foam within the processing time.
  - Do not apply pressure on foam-filled parts until hardening is complete.
  - If the entire contents of the cartridge is not used, remove the mixing nozzle, clean the material outlet opening thoroughly and screw the stopper and cap back on. The remaining material can be used again at a later time using a new mixing nozzle.
- 6. Apply structural foam.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > INFORMATION ON THE USE OF STRUCTURAL ADHESIVES IN VEHICLE CONSTRUCTION > GENERAL

Structural bonding in the bodyshell means that the adhesive assumes functions of stiffness, crash strength and endurance strength, whereby the characteristics of the bodyshell are positively influenced in a significant way.

A high-strength, heat-hardening single-component epoxy resin adhesive, which hardens fully in the cathodic immersion paint drying oven, is used for the conventional steel bodyshell.

In the event of repairs, this adhesive is replaced by a cold-hardening two-component epoxy resin adhesive, since the hardening temperatures necessary for the single-component epoxy resin adhesive cannot be used on an assembled vehicle.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > INFORMATION ON THE USE OF STRUCTURAL ADHESIVES IN VEHICLE CONSTRUCTION > COMBINED JOINING PROCESSES

Combined joining processes are regularly used both in standard production and during repairs.

In the case of resistance-spot welding, all bonding surfaces and spot welds are replaced during repairs.

In this case, the unhardened adhesive must be displaced from the joint area by observing an appropriate holdback time before actually starting resistance-spot welding.

In the case of two-component adhesives, the hardening reaction starts immediately after mixing and application; this increases the viscosity and so there is only a certain time window in which spot-weld bonding can be performed if the process is to be reliable.

For this reason, all time-intensive preliminary work (drilling, cutting to size, fixing etc.) on the parts to be joined must be performed before application of adhesive and joining.

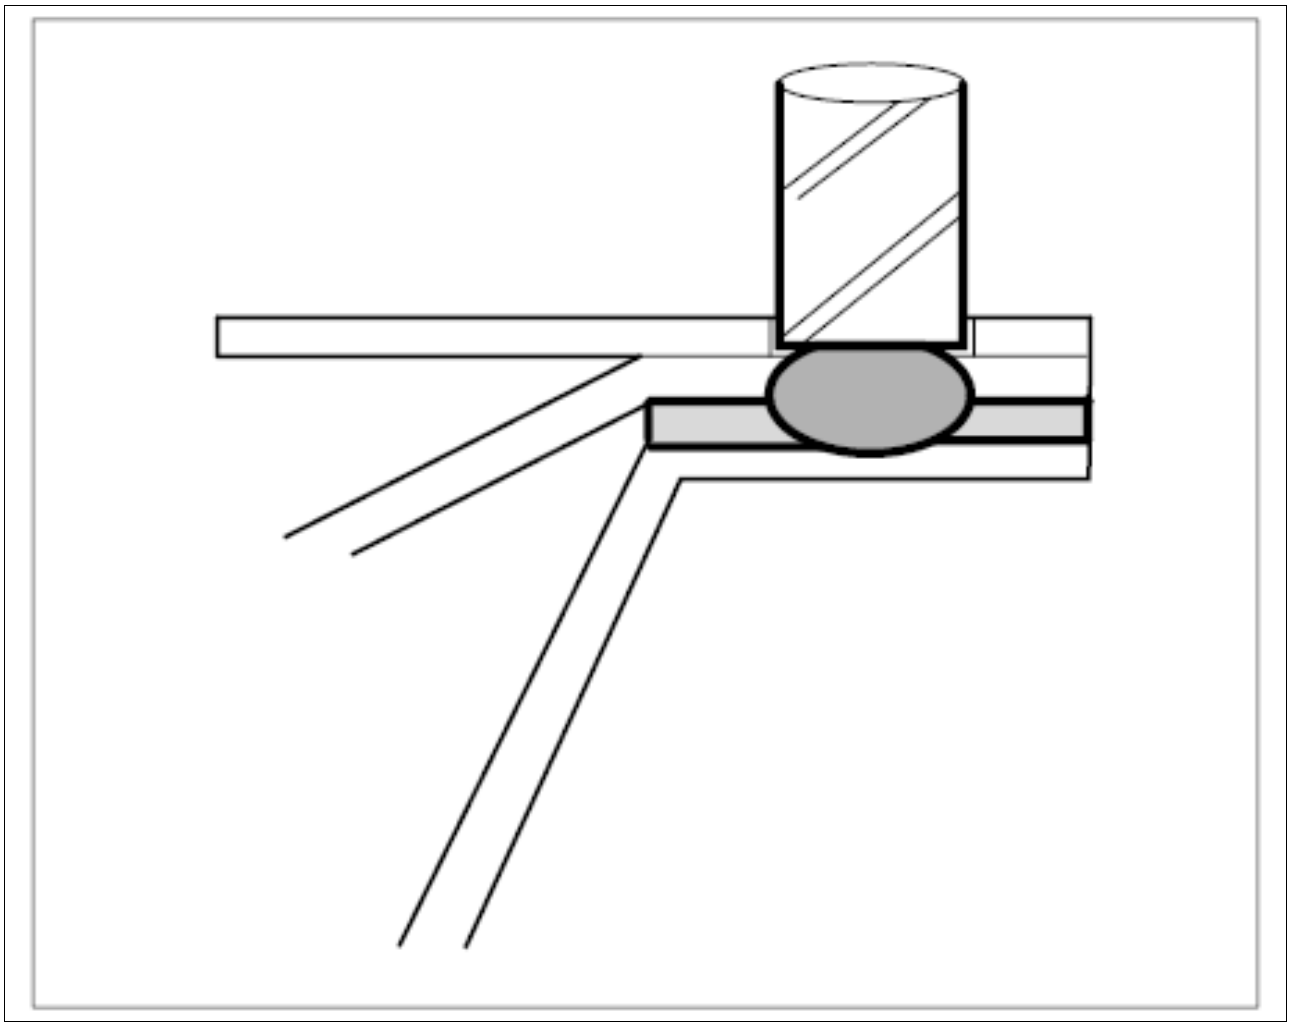
This also applies to mechanical joining processes where the adhesive has to be displaced from the joint area, e.g. riveting.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > INFORMATION ON THE USE OF STRUCTURAL ADHESIVES IN VEHICLE

CONSTRUCTION > SEPARATING BODY COMPONENTS

In the case of 3-layer spot-welded panel joints with a hardened bonded layer in which only the outer panel needs to be replaced, drill the outer panel in the area of the spotwelds sufficiently without damaging the spotweld and bonded joint in the second component layer.

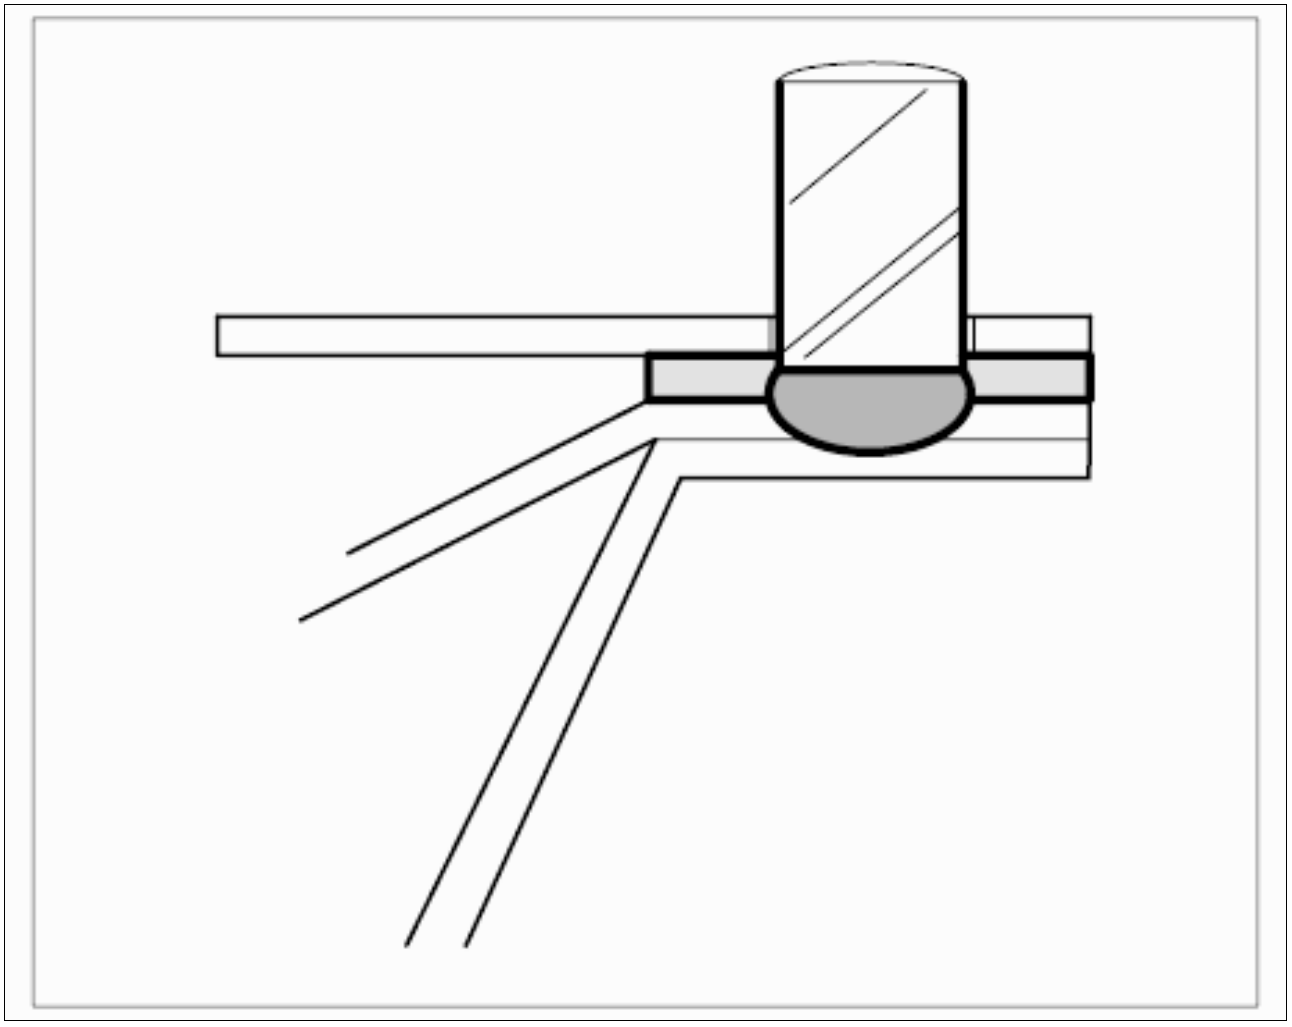
Fig 1: Separating Body Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

In the case of 3-layer spot-welded panel joints with a hardened bonded layer on the outer panel, drill the outer panel in the area of the spotwelds sufficiently without damaging the spotweld in the second component layer.

Fig 2: Separating Bonded Body Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

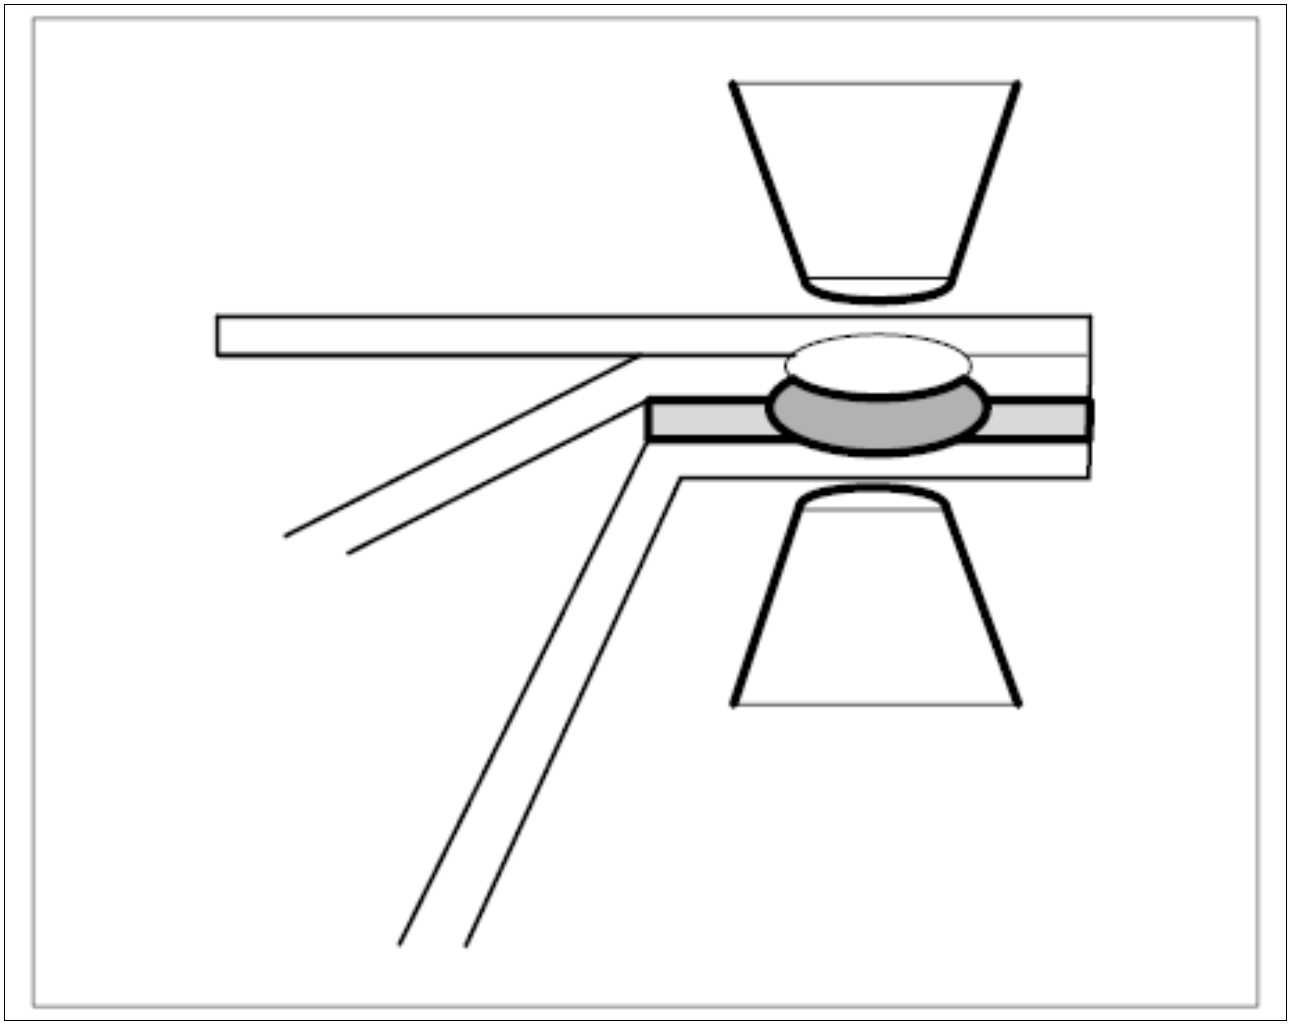
After removing the loosened body part, old adhesive must be removed and any uneven spots must be sanded down.

The flange area must then be pre-treated for bonding.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > INFORMATION ON THE USE OF STRUCTURAL ADHESIVES IN VEHICLE CONSTRUCTION > WELDING IN BODY COMPONENTS

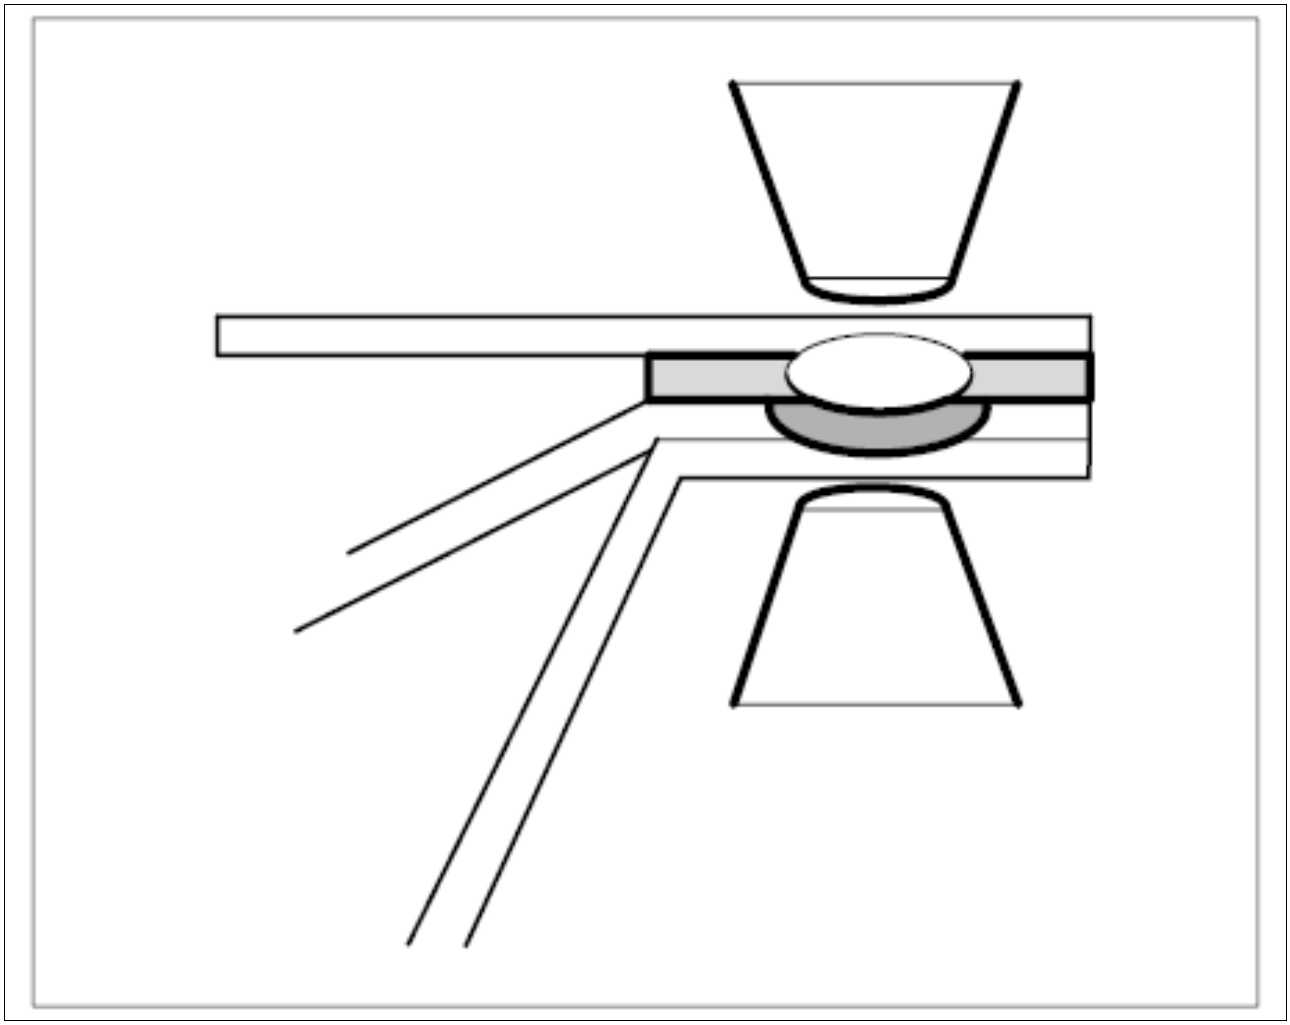
Once the spare parts have been secured, repair spotwelds must be placed on the old spotwelds because there is no current flow possible in areas with a hardened bonded layer.

Fig 1: Identifying Spot-Welding Body Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 2: Identifying Spot-Welding Body Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

- In areas in which bonded flanges are spot-welded in an unhardened state, suction devices must be used due to combustion products.
- Areas that can only be accessed from one side must be joined with MAG plug-welds or MAG welded seams. In these cases, no adhesive can be used in the vicinity of the welded seam because this would burn and would have a negative effect on the joint.
- The areas without adhesive must be protected using appropriate anti-corrosion and sealing measures.

Welding procedures other than resistance spot-welding are not permitted since the thermal effect would destroy the bonded joint over a wide area.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > GENERAL INFORMATION

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

Information

- The vehicle, components and adhesives must be brought to processing temperature (acclimatised) before getting started. Processing temperature must be maintained for approx. 30 minutes before starting to work on the bonding surfaces.
- Bonding surfaces must be free from oil, old adhesive, dirt, moisture, and layers of paint and oxide.
- Body structural adhesive and primer must only be used on bare metal parts.
- Only use abrasive products based on pure silicon carbide (SIC) for sanding/grinding down the bonding area until bare.
- Always wear clean gloves when touching the cleaned surfaces to ensure that no sweat from your hands or dirt is transferred onto the bonding surface.
- Apply primer within 5 minutes on bare surfaces, particularly on aluminum components. Work in sections on large components and carry out intermediate sanding.
- The jointing operation must take place directly after application of the adhesive in order to guarantee a high quality and reliable bond. Otherwise the adhesive bead must be removed, with pre-treatment of the surface and application of the adhesive being repeated.
- After adhesive has hardened, carefully prime accessible bonding areas and seal with body sealant. Protect bonding areas in cavities against corrosion using cavity preservation.

Information

- To check that the substance is completely mixed, apply a 30-mm long bead of fresh adhesive to a piece of cardboard before processing.
- Process the adhesive within the processing time. The adhesive must be applied and the body part must be joined within this time period. Any resistance welding or mechanical joining procedures (e.g. riveting, screwing) to be carried out in the bonding area must also be performed within this time period.
- Do not put pressure on bonded parts until hardening is complete!
- If the contents of the cartridge is not used up completely, the processing nozzle must be left on the cartridge until the adhesive hardens. If you intend to use the adhesive again later, a new processing nozzle must be used.

Information

During cold periods, overnight or in cold countries, appropriate steps must be taken to ensure that the minimum hardening temperature is reached.

- Optimize heating system settings, e.g. deactivate night-time lowering of temperature.
- Keep doors and windows closed; avoid droughts.
- Install auxiliary heaters in the body repair area.

Information

- In addition to this information, observe the relevant job descriptions for body repairs!

Information

Infrared heaters only heat small sections of the body and are therefore only suitable for minor repairs.

- Only use devices with temperature control, automatic distance measurement and measuring point display, e.g. infrared heater WE xxxx or infrared heater WE xxxx.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > PREPARING BONDING SURFACES > CLEAN

Sticky, solid layers such as dirt, rust, layers of paint (cathodic-dip layers), etc. must be removed using 100 to 150 grain sandpaper in order to improve the strength of a bonding area.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > PREPARING BONDING SURFACES > DEGREASE

To prevent possible grease residue from spreading onto the surface when grinding down the surface until bare at a later stage, the bonding surfaces must be cleaned using a lint-free cloth soaked in acetone.

Fig 1: Identifying Bonding Surfaces Grease Applying Area

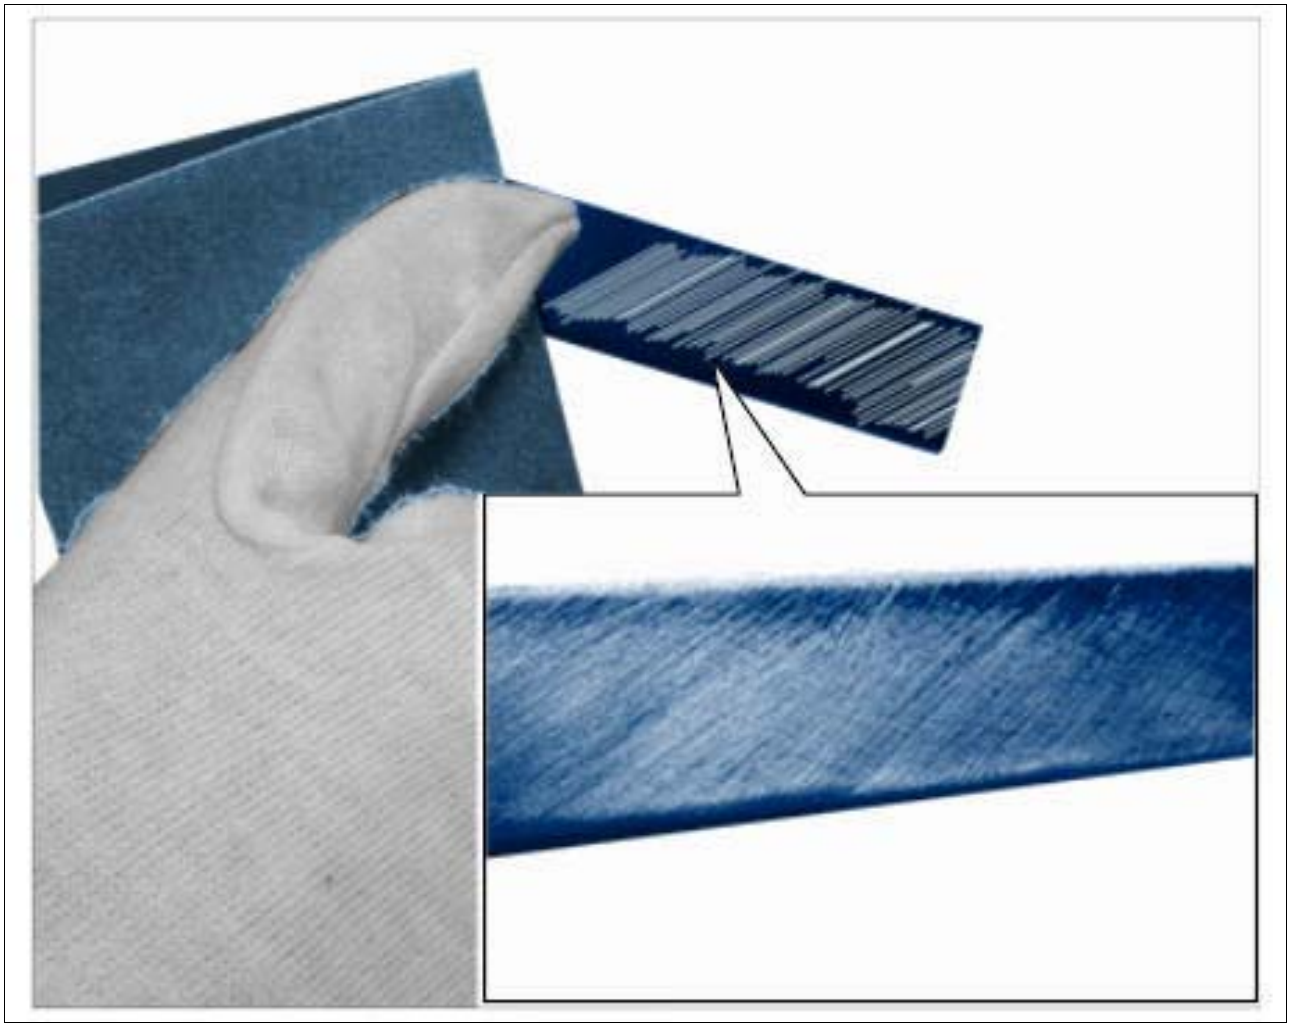
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > PREPARING BONDING SURFACES > SAND/GRIND UNTIL BARE

To improve adhesion, it is important to sand the bonding surfaces until bare using 150 to 180 grain sandpaper. The sanding effect can be improved by cross-sanding.

Only use abrasive products based on pure silicon carbide (SIC) for sanding/grinding down the bonding surface until bare.

Fig 1: Identifying Sanding Bonding Surfaces



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > PREPARING BONDING SURFACES > DEGREASE

The bare bonding flange areas must then be cleaned using a lint-free cloth soaked in acetone.

Leave cleaned surfaces to dry off for approx. 5 - 10 minutes; bonding surfaces must be completely dry.

Fig 1: Identifying Bonding Surfaces Grease Applying Area

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > PREPARING BONDING SURFACES > PRIME

Apply primer to the cleaned surfaces.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > PROCESSING CONDITIONS

During processing, the ambient and material temperature must be at least → **Minimum temperature: 15°C** and must not exceed → **Maximum temperature: 35°C.**

The optimal processing temperature is → **Minimum temperature: 18°C** to → **Maximum temperature: 23°C.**

Higher processing temperatures reduce processing time.

→ **Processing time at 15 °C: 75 min**

→ **Processing time at 18 °C: 70 min**

→ **Processing time at 20 °C: 65 min**

→ **Processing time at 23 °C: 60 min**

→ **Processing time at 25 °C: 55 min**

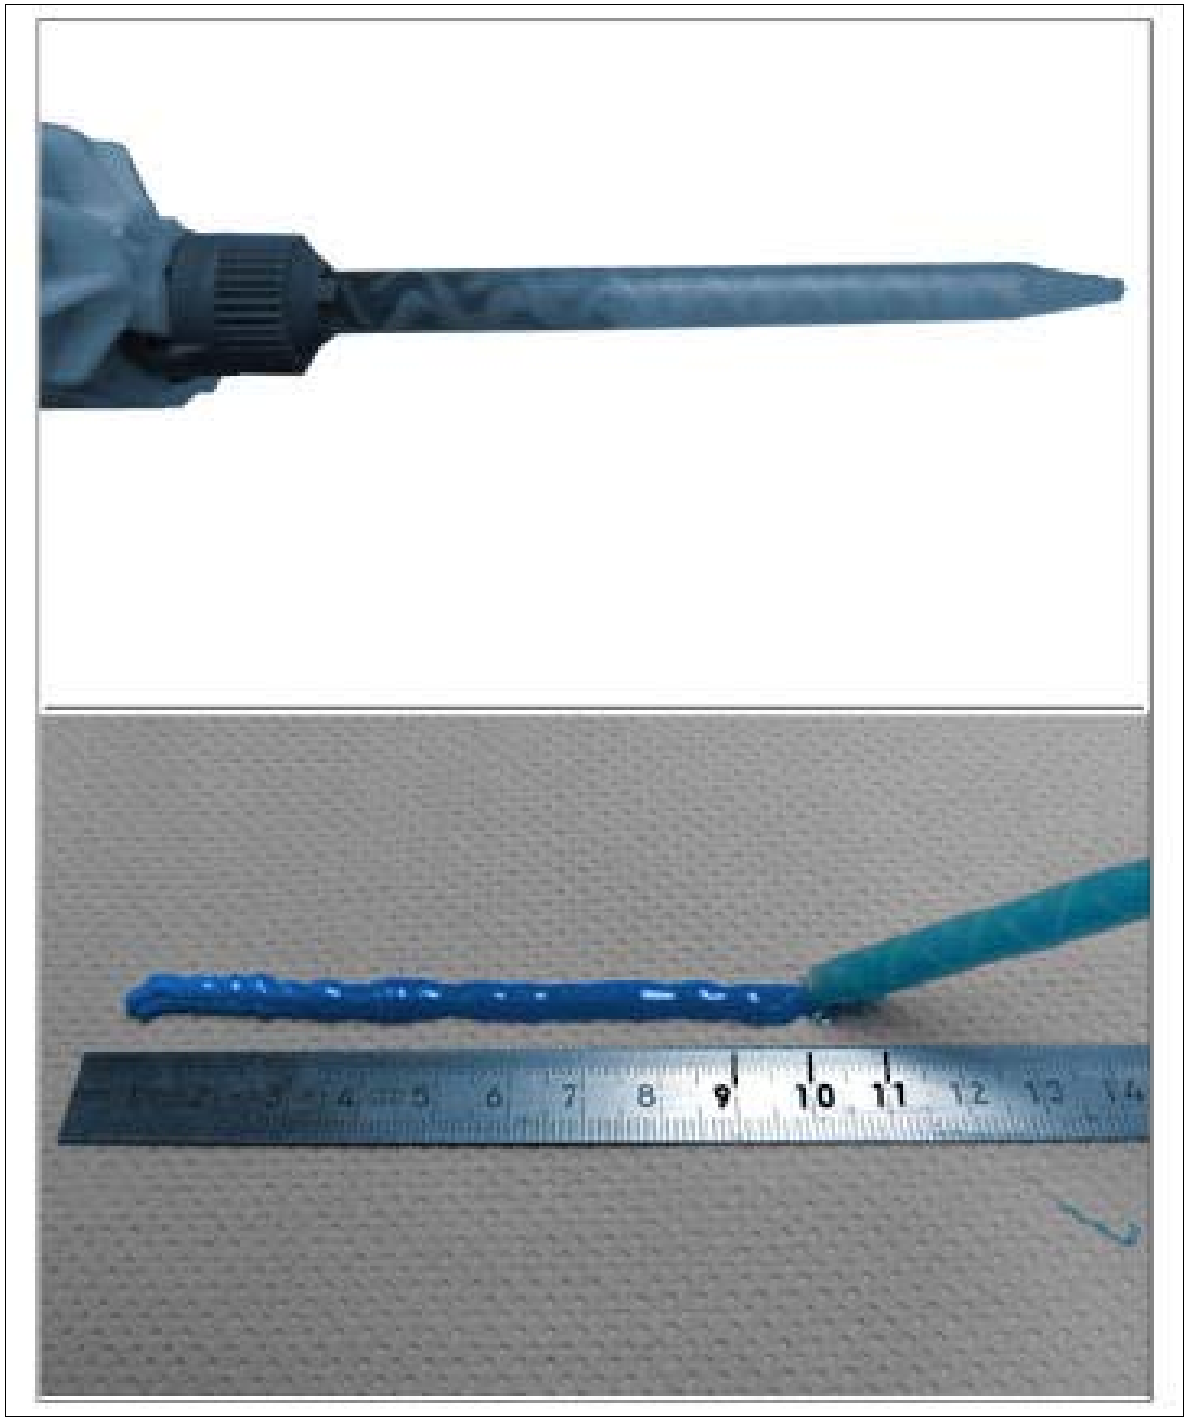
→ **Processing time at 30 °C: 45 min**

→ **Processing time at 35 °C: 35 min**

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > JOINING PROCESS

1. Check to see how much adhesive oozes out.

Fig 1: Checking Emerging Adhesive



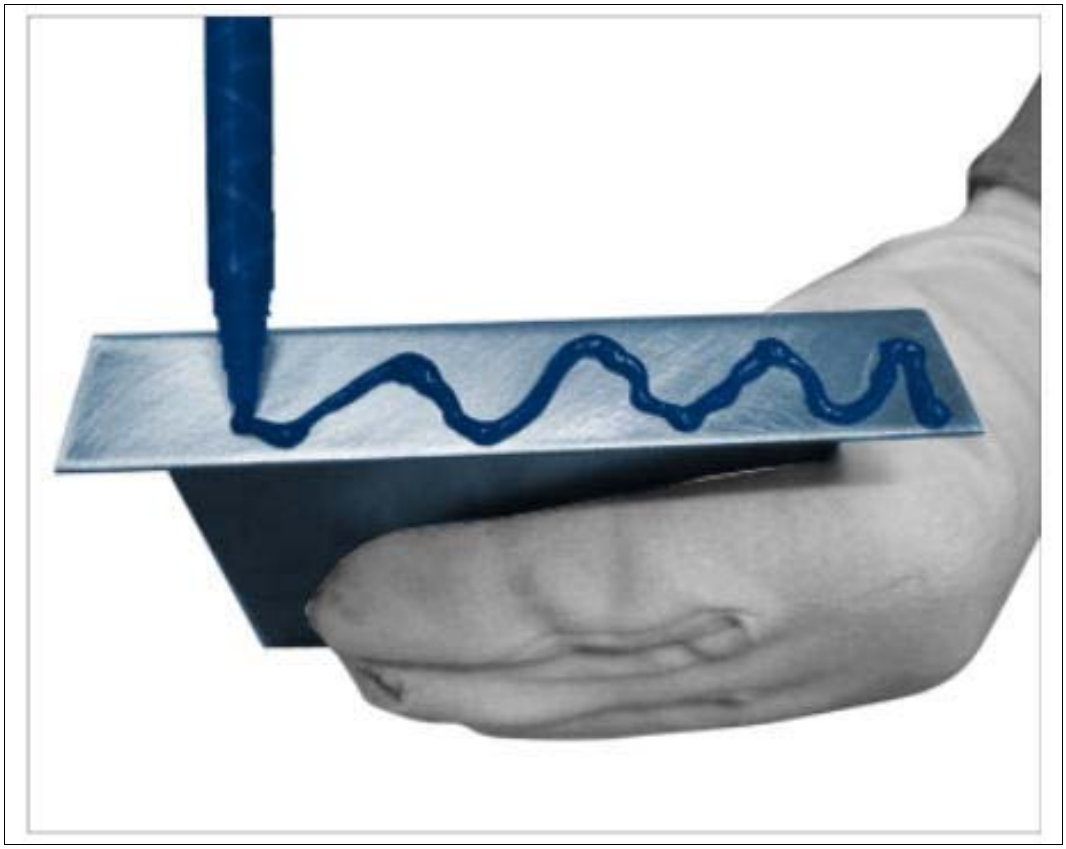
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Make sure that the two-component adhesive is mixed evenly in the mixing tube.
2. 1.2. Before applying adhesive to the joints, apply a bead of adhesive with a length of → **Length: 10 cm** to a paper towel or similar object and dispose of it later. The hardening process can also be checked using this bead.

2. Apply adhesive.

1. 2.1. Apply adhesive to the flanges of the joints.

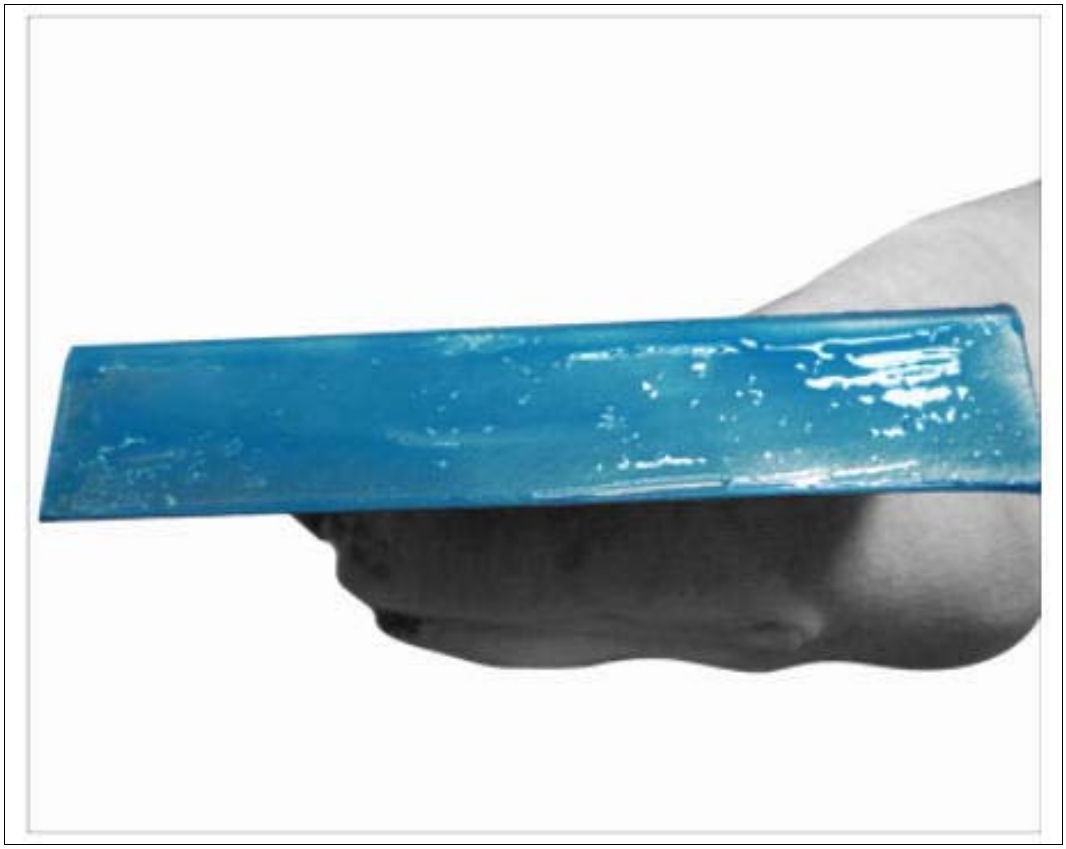
Fig 2: Applying Adhesive



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 2.2. Spread the adhesive out over the flanges of the joint. → **Application depth: 0.5 mm**

Fig 3: Identifying Spread Adhesive

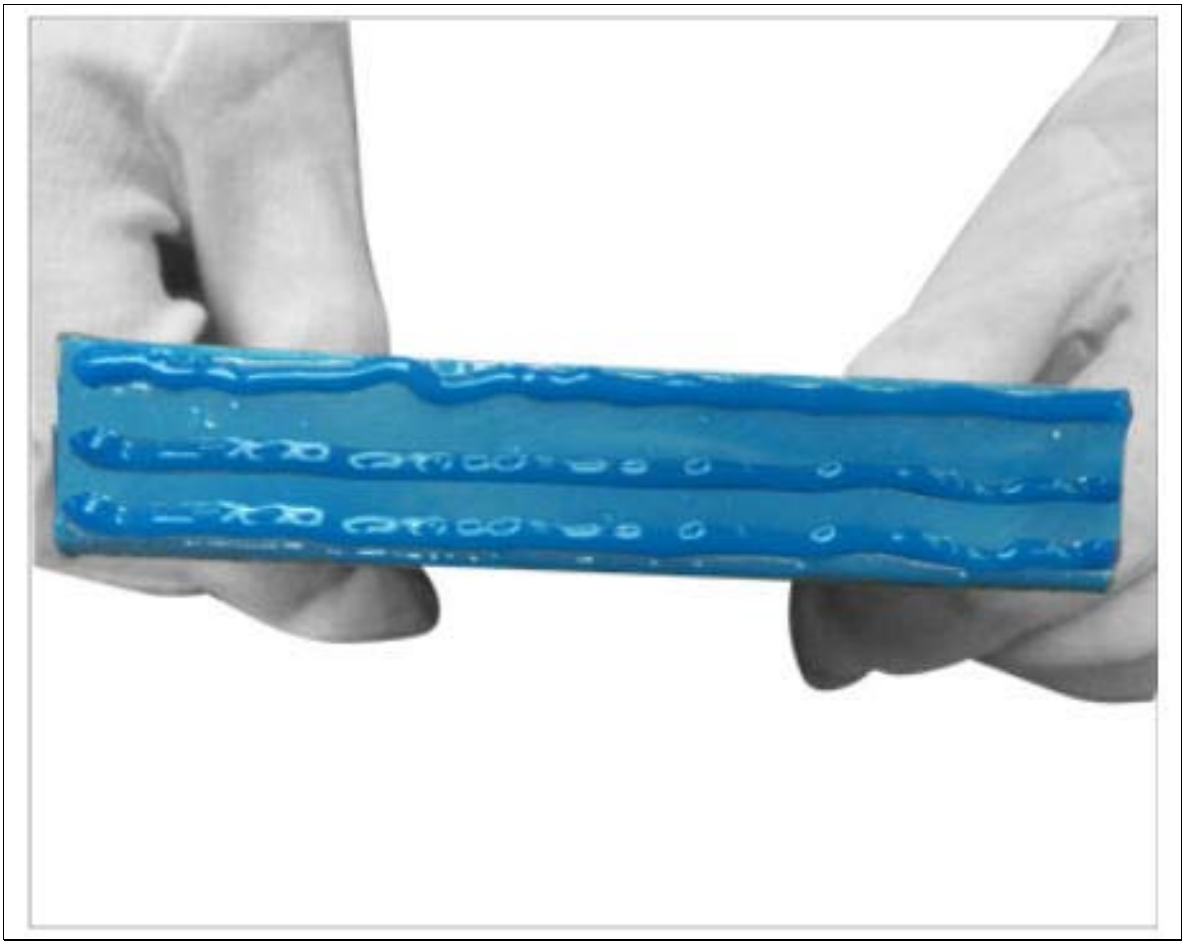


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 2.3. Areas not covered by cathodic immersion paint and exposed body panels in cavities must be brushed or filled with structural adhesive.

3. Apply adhesive to the edges.

Fig 4: Identifying Bead Of Adhesive At Edges



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. Apply additional beads of adhesive at the edges and center of the joint. → **Application depth: 3 mm**

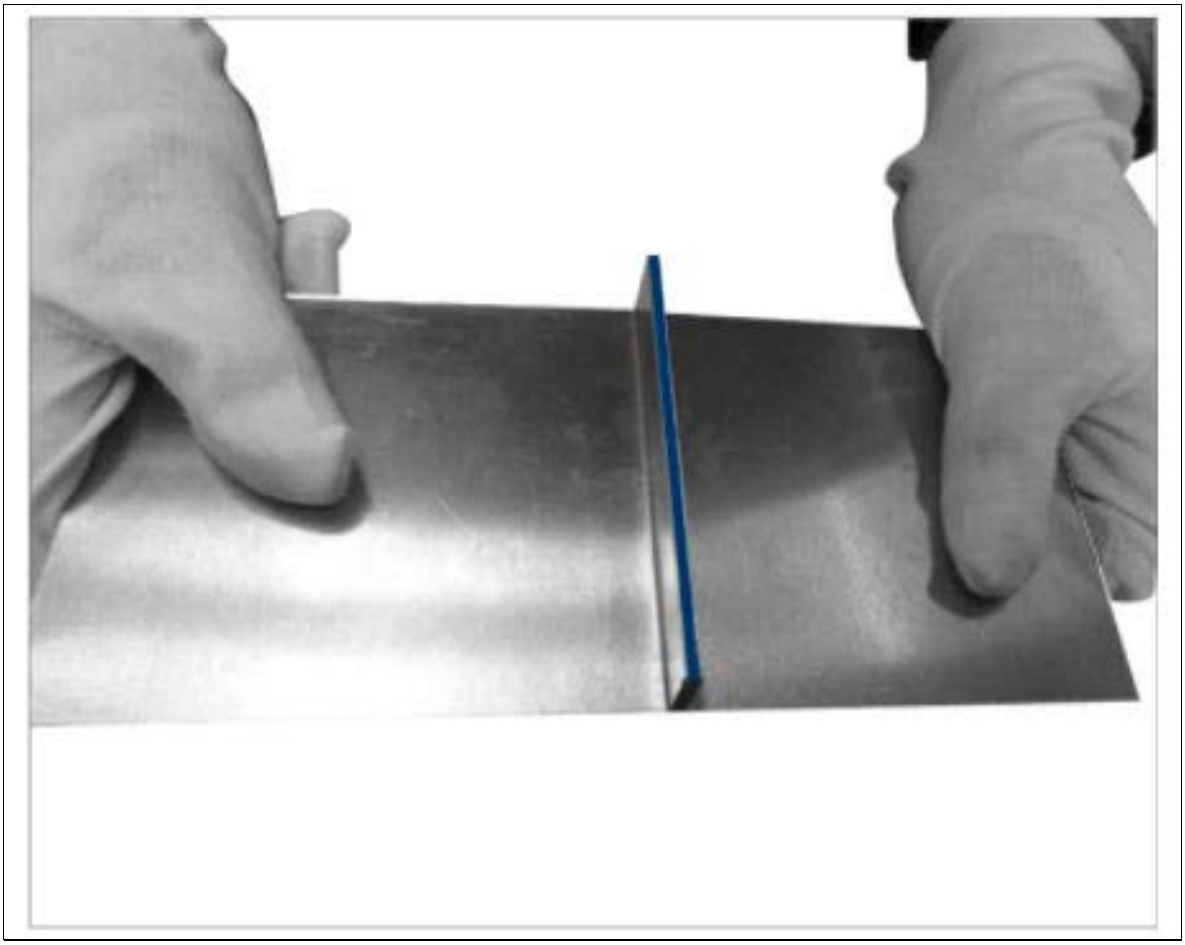
   Information

   1. When the adhesive oozes out along the entire length of the joint on both sides, enough adhesive has been applied.

   2. 1 50 ml cartridge is sufficient for a flange length of approx. 6 m.

4. Join components.

Fig 5: Identifying Structural Body Adhesive Joining Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 4.1. Join parts, secure them and weld, rivet and screw them within the processing time.

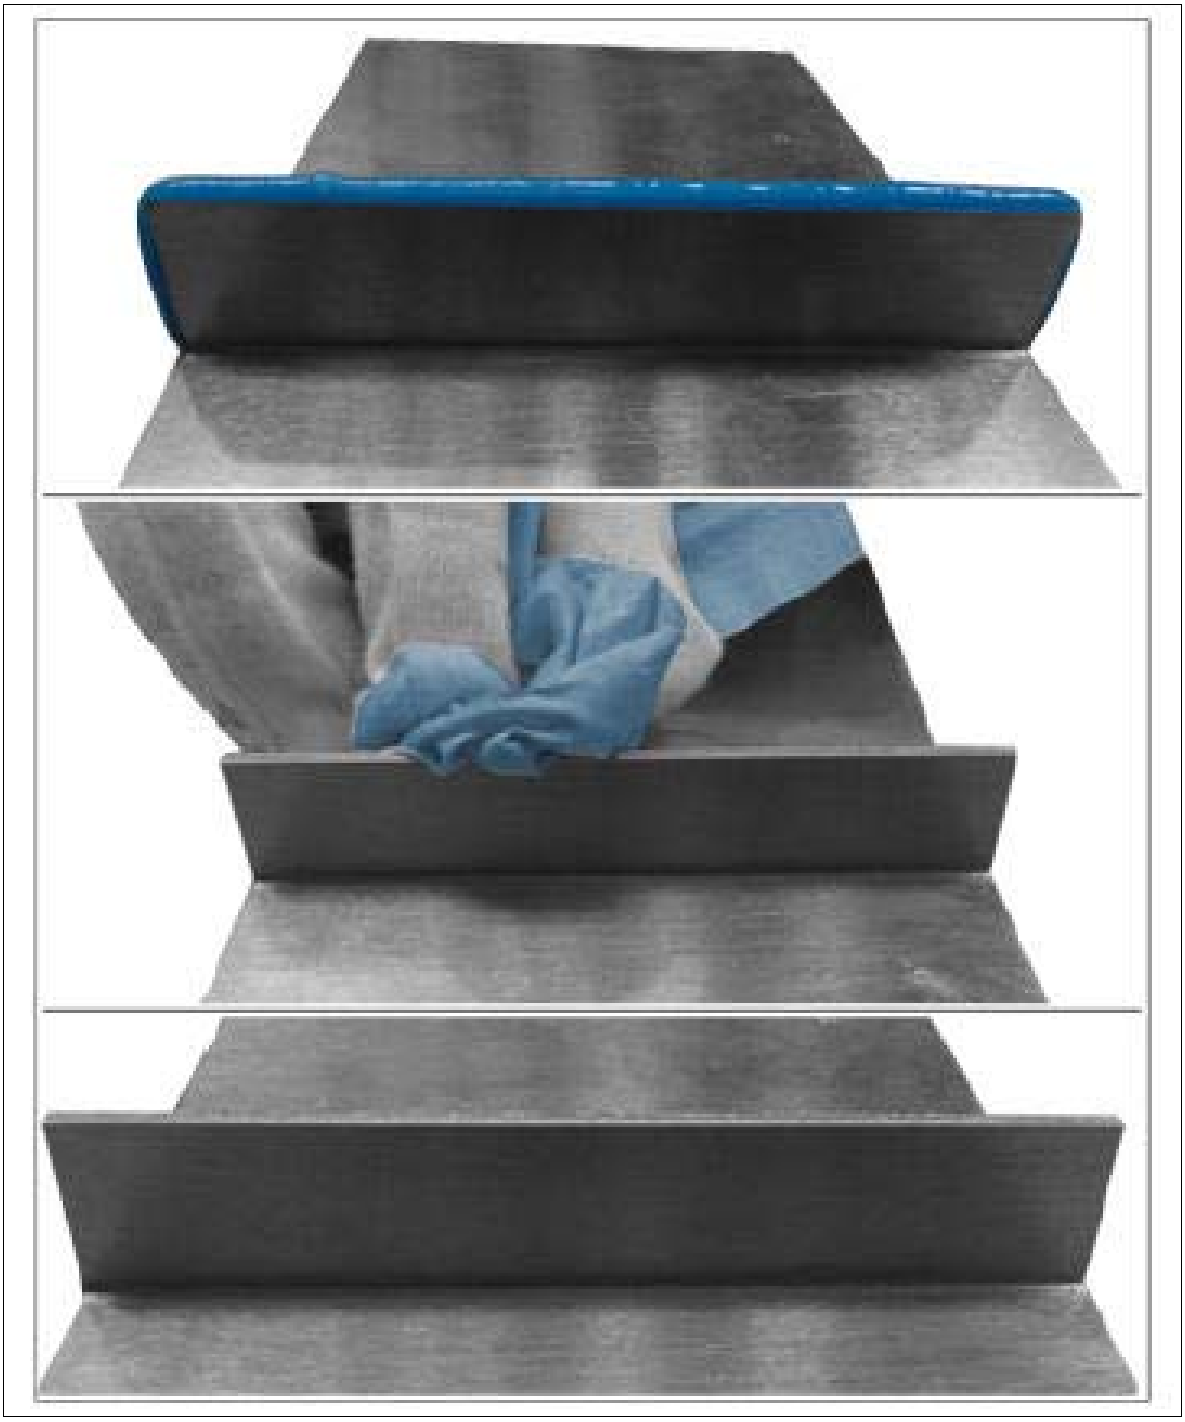
   The joining process must take place immediately after applying adhesive in order to guarantee a high quality and reliable bond.

   Otherwise the adhesive bead must be removed and pre-treatment of the surface and application of the adhesive must be repeated.

   The thickness of the layer of adhesive after joining must not exceed → **Layer thickness: 1 mm** ; spread the adhesive out on the bonding surface using a spatula if necessary.

5. Remove any excess adhesive.

Fig 6: Removing Excess Adhesive



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 5.1. Remove most of the excess material with paper or a cloth.
2. 5.2. Finish cleaning visible surfaces with a cloth soaked in acetone.

   Hardened material can only be removed by mechanical means.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) >

WORKING WITH ADHESIVES > HARDENING

The body structural adhesives used harden at temperatures of between → **Minimum temperature: 18°C** and → **Maximum temperature: 80°C.**

Information

Infrared heaters only heat small sections of the body and are therefore only suitable for minor repairs.

- Only use devices with temperature control, automatic distance measurement and measuring point display, e.g. infrared heater WE xxxx or infrared heater WE xxxx.

Hardening can be accelerated by heat (e.g. using an infrared heater or in a painting booth).

Do not put pressure on bonded parts until the required assembly strength is reached.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > ASSEMBLY STRENGTH

Information

- The object temperature must be above the minimum hardening temperature for the entire specified time period.
- If the minimum hardening temperature could not be reached within the specified time period, the standing time must be increased or additional heat must be applied to the bonded joint.
- If the hardening temperature is significantly less than the minimum hardening temperature (approx. 10 °C), this can cause irreversible damage to the bonded joint. This can have a negative effect on the strength of the bonded joint.

Information

- Once the required assembly strength is reached, the vehicle must be removed from the straightening system. Assembly work can then be performed.

The vehicle must not be moved and no further work must be carried out on the vehicle following repair bonding for at least → **Hardening time at 18 °C: 12 h** (leave to harden overnight).

The standing time can be shortened by applying heat. E.g. → **Hardening time at 60 °C: 35 min.**

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > CORROSION PROTECTION

After adhesive has hardened, carefully prime accessible bonding areas and seal with body sealant.

Protect bonding areas in cavities against corrosion using cavity preservation.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) >

WORKING WITH ADHESIVES > DISPOSAL

Small amounts remaining after mixing and complete hardening may be disposed of as industrial waste.

Dispose of used acetone-soaked cleaning cloths as special-category waste.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > WORKING WITH ADHESIVES > ENDURANCE STRENGTH

Information

- The object temperature must be above the minimum hardening temperature for the entire specified time period.
- If the minimum hardening temperature could not be reached within the specified time period, the standing time must be increased or additional heat must be applied to the bonded joint.
- If the hardening temperature is significantly less than the minimum hardening temperature (approx. 10 °C), this can cause irreversible damage to the bonded joint. This can have a negative effect on the strength of the bonded joint.

Information

After this time, the vehicle meets the crash requirements and may be driven on public roads.

The vehicle can be handed over to the customer.

The time between joining the repaired components and starting to use them must be at least → **Standing time at 18 °C: 96 h.**

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > HANDLING PRIMER > GENERAL

Primers improve the long-term durability of the bonded area

Primers reveal the actual condition of the surface to be bonded.

Primers protect the bonding surface from environmental influences, thereby increasing corrosion protection.

To achieve a better effect, apply primer only very lightly.

Primer prevents oxidation of the surface. This is particularly important when bonding aluminum.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > HANDLING PRIMER > 2-COMPONENT SIP

Information

Use the primer within 8 hours. Apply a thin, even coat to the bonded flanges and remove excess primer. Protect surfaces you have already primed from dirt and soiling. Otherwise, the bonded joint may be defective.

Information

- Primed surfaces can be exposed for up to 3 days before undergoing further processing.
- Make sure that the surfaces are not contaminated by environmental influences.
- If the primer is left exposed for more than 3 days, it must be removed and re-applied.
- For the reasons specified above, we recommend that body parts are bonded immediately after applying the primer.

1. Prepare bonded flanges for bonding. (See WORKING WITH ADHESIVES)
2. Open bottle for component A.

   Fig 1: Opening Bottle

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

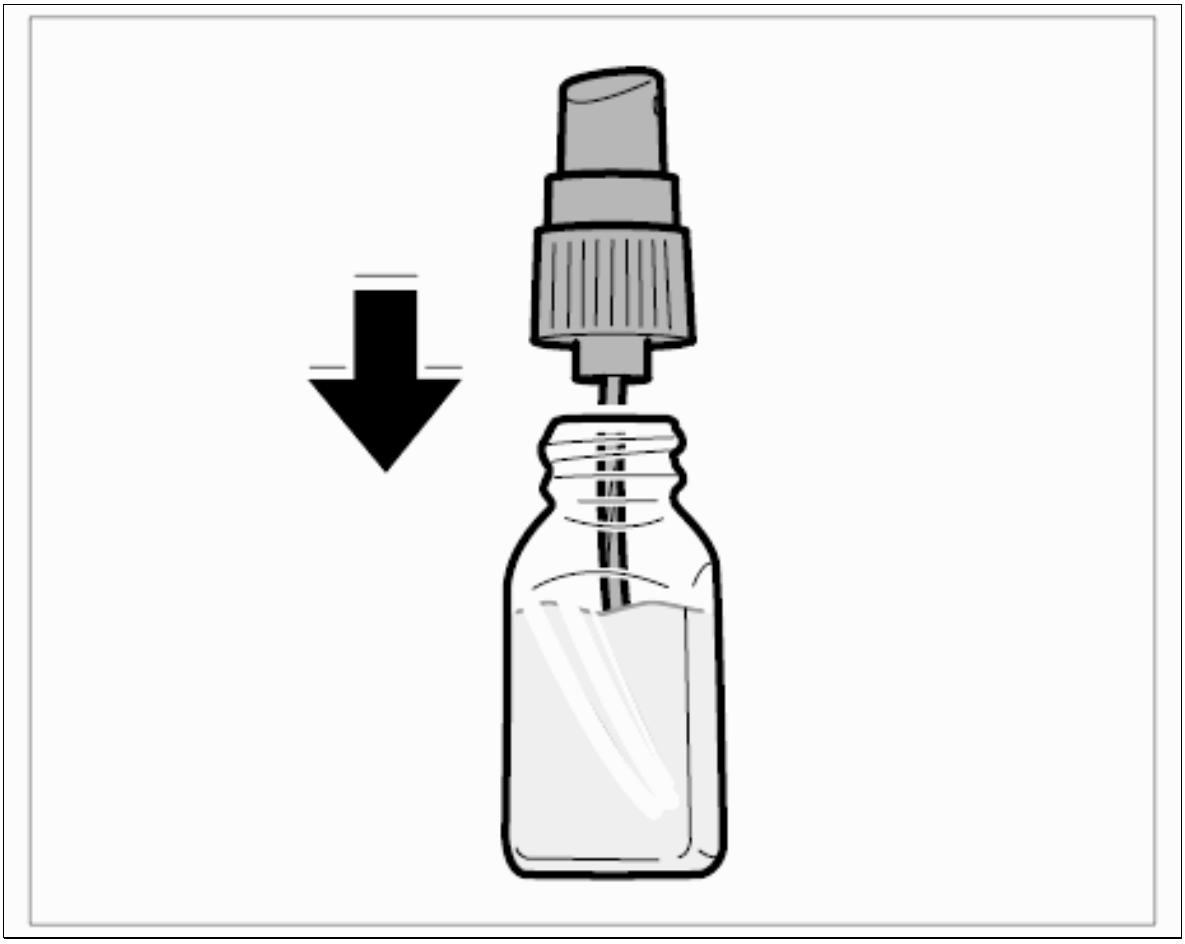
3. Fill bottle completely with component B.

Fig 2: Filling Bottle With Component B

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Screw on spray head.

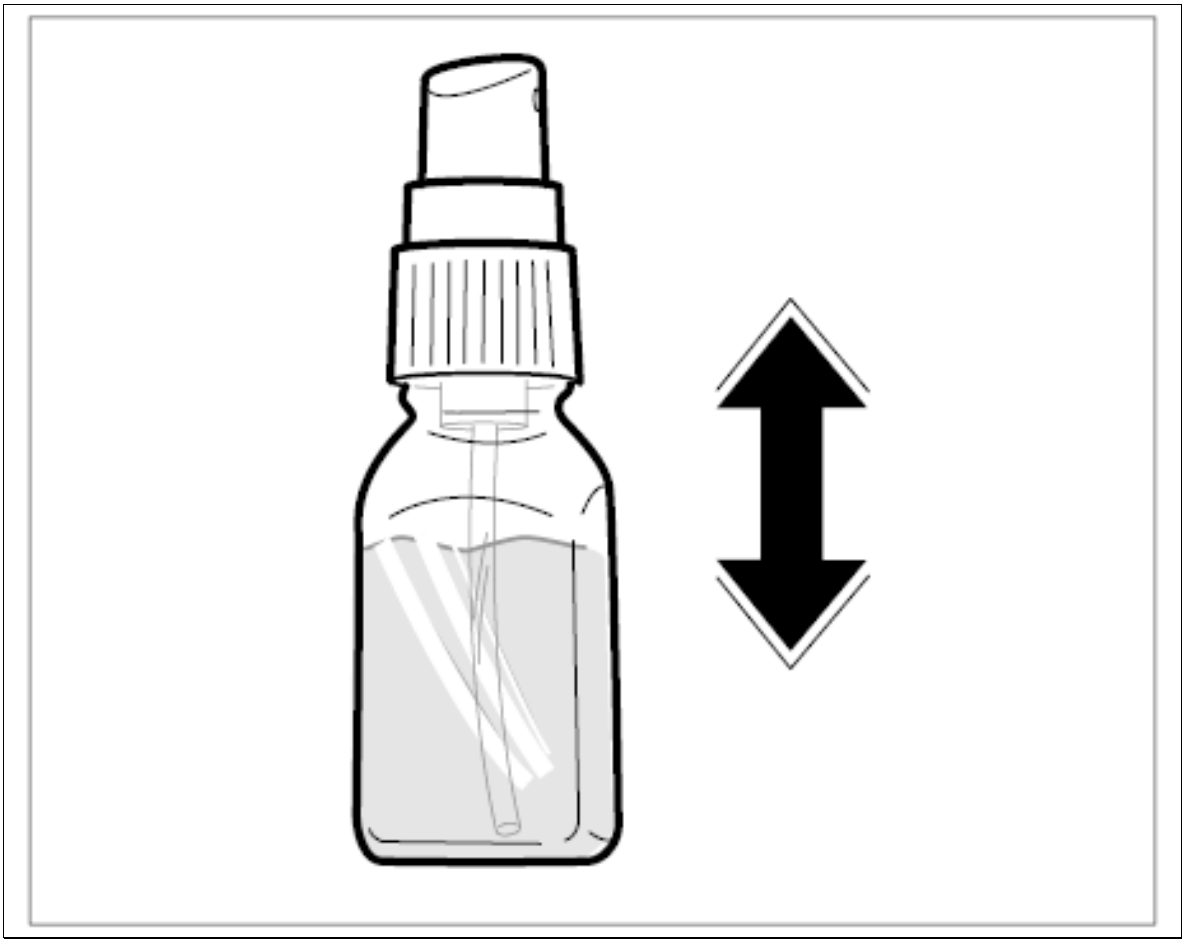
Fig 3: Screwing On Spray Head



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Mix components together by shaking vigorously.

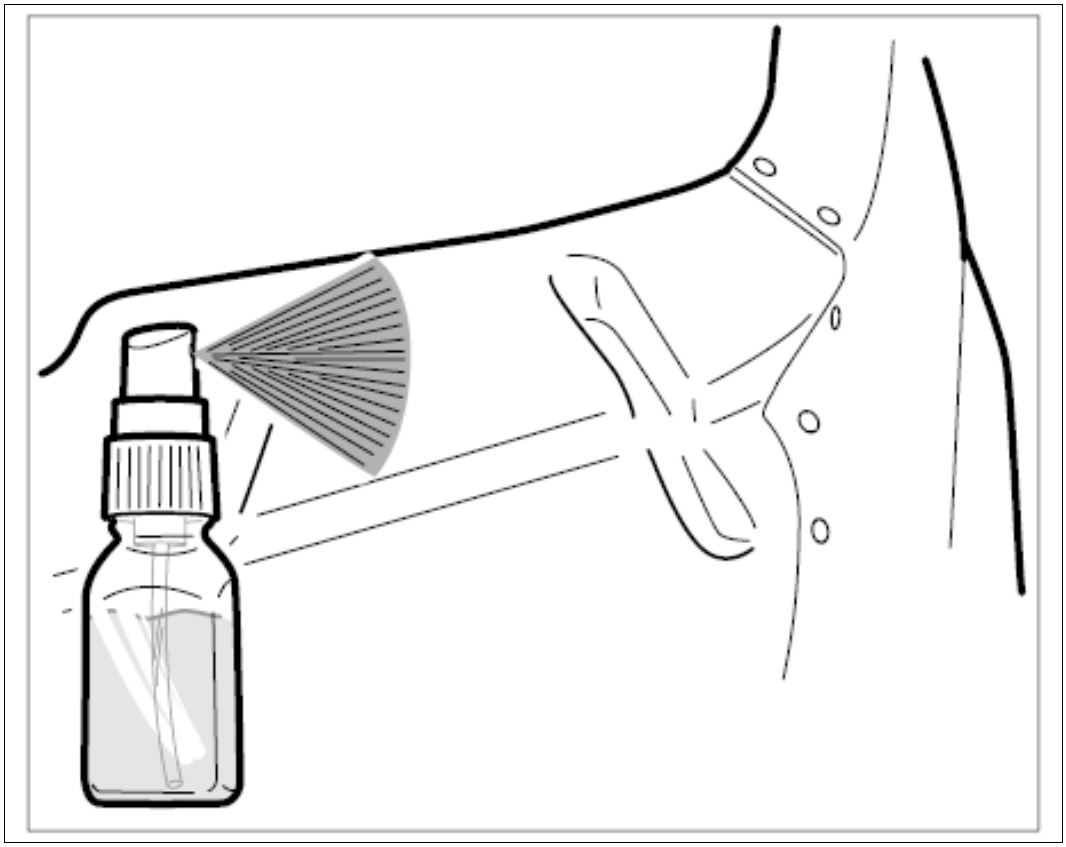
Fig 4: Mixing Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

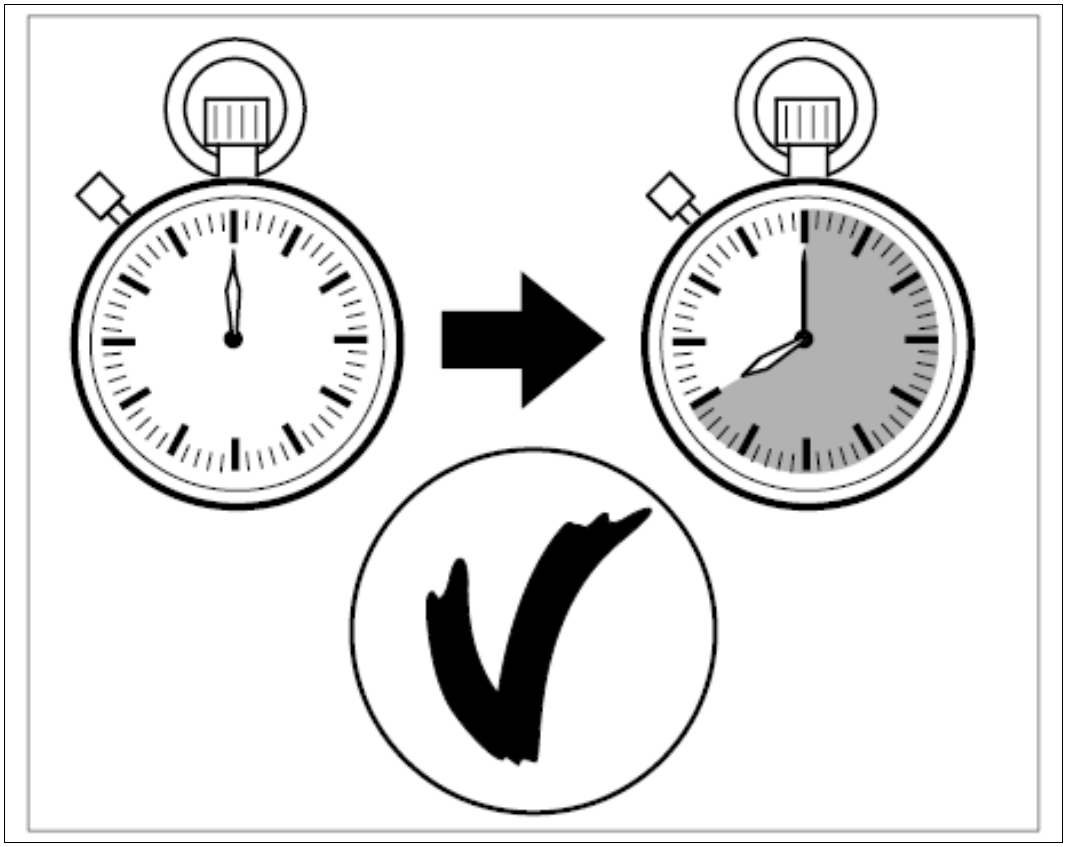
6. Clean adhesive flange with isopropanol and leave to dry off for 5-10 minutes.
7. Spray on primer in the area around the adhesive flange.
    1. 7.1. Process mixed primer within eight hours; do not keep any leftover primer.

Fig 5: Applying Primer



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 6: Identifying Working Time Of 2-Component Sip



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Check primer application.

   Bonded flanges are coated evenly with primer:

   result is OK.

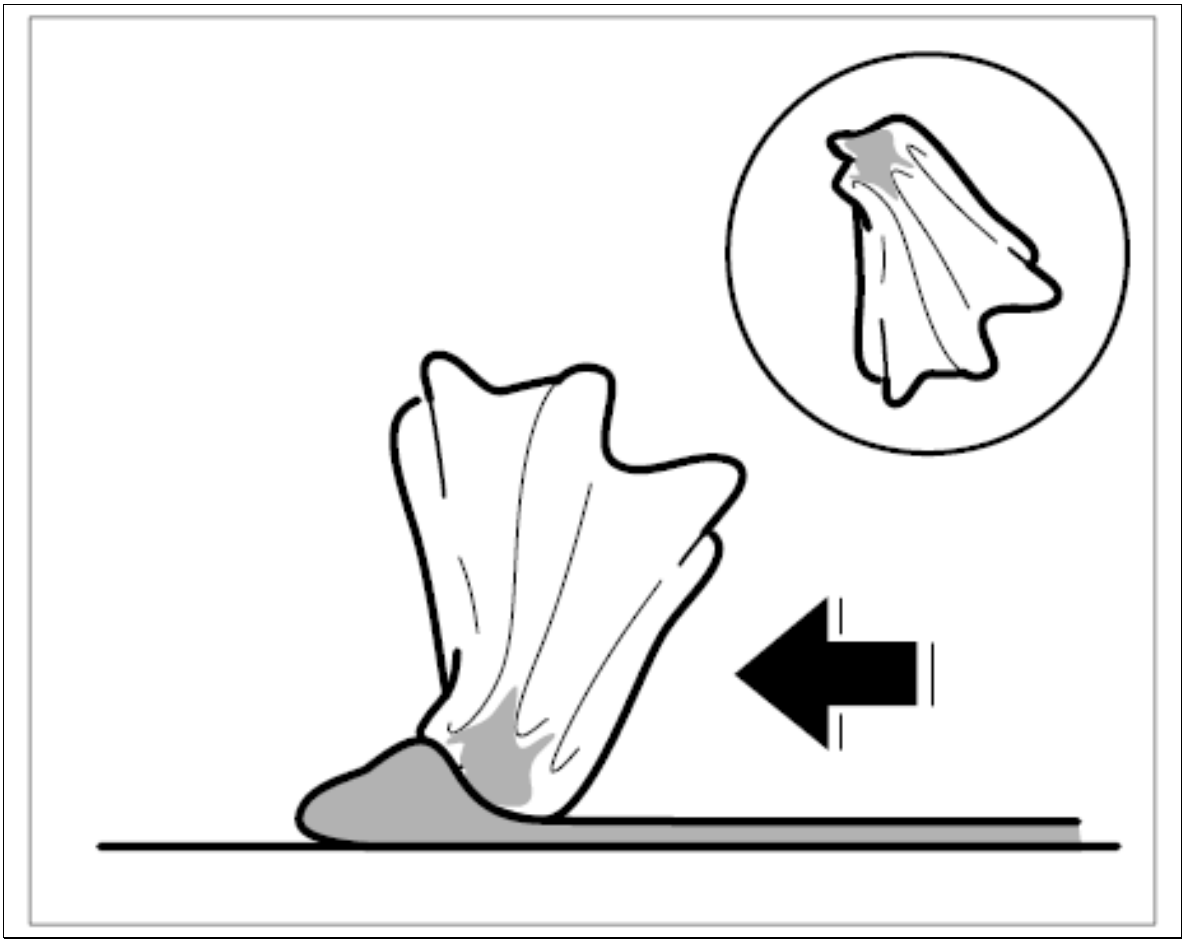
Fig 7: Identifying Primer Application OK

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Remove excess primer with a clean, dry lint-free cloth.

A thin, violet-colored coating of primer is sufficient for the bonded flanges.

Fig 8: Removing Excess Primer



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Adhesive flanges are not evenly coated (droplet formation):

result is not OK.

If an even application of primer is not obtained, the bonded flange must be completely cleaned, sanded and primed once again.

Fig 9: Identifying Primer Bonded Flange (Incorrect)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Dry primer.
    1. 9.1. Allow primer to flash off; it must be dust-dry before any adhesive is applied.

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Primer		Flash-off time	5 min		

10. Process adhesive.

WM 5X00IN PROCESSING STRUCTURAL BODY ADHESIVE (ALL MODELS) > HANDLING PROCESSING DEVICES > APPLICATOR GUN

1. Open holder.
    1. 1.1. Release holder **-arrow-** and fold up.

Fig 1: Releasing Holder

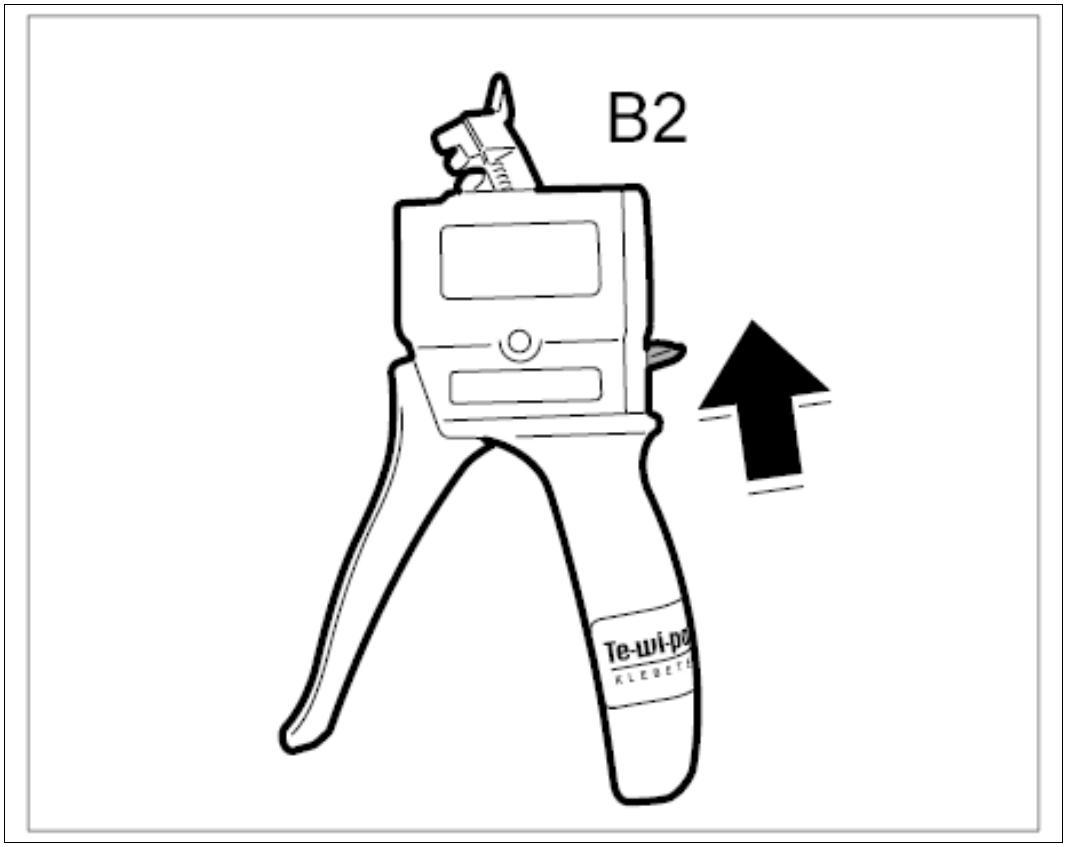
2. Press sliding lock upwards

    1. 2.1. Press sliding lock upwards in direction of arrow **-arrow-** .

Fig 2: Pressing Sliding Lock

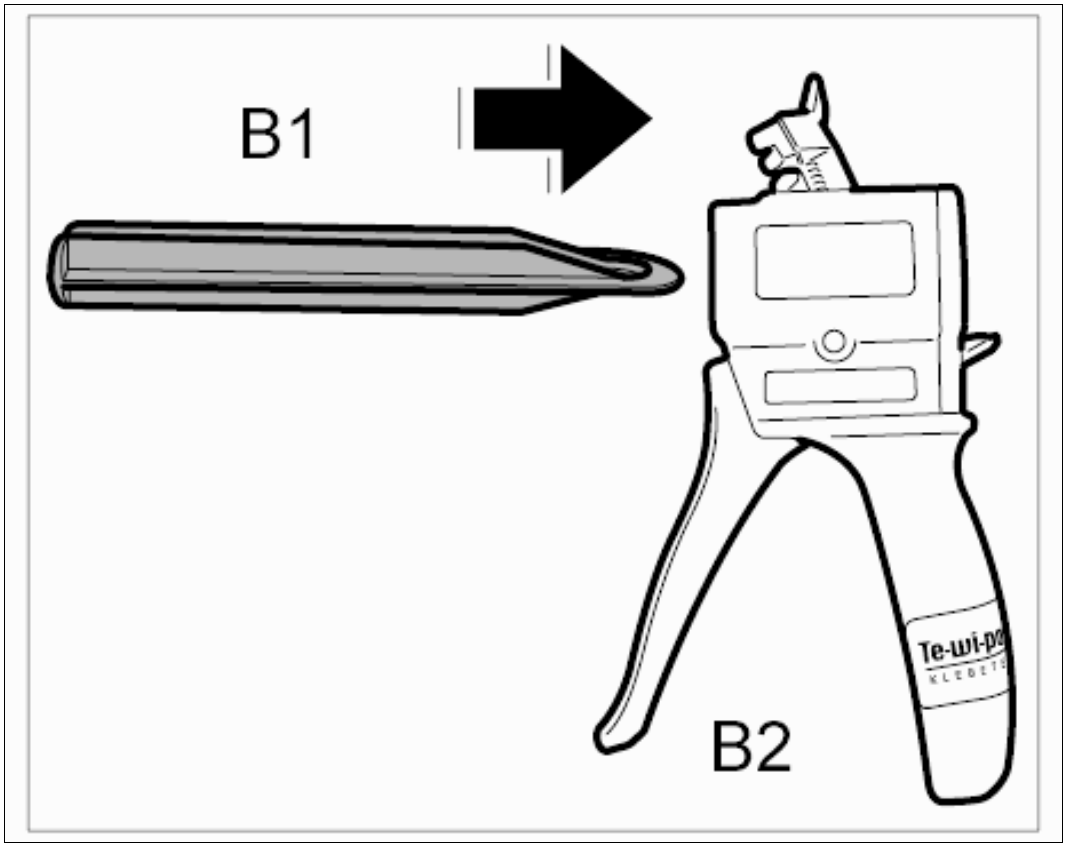


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Insert piston rod.

    1. 3.1. Hold sliding lock pressed and insert piston rod **-B1-** completely into the gun grip **-B1-** .

Fig 3: Inserting Piston Rod

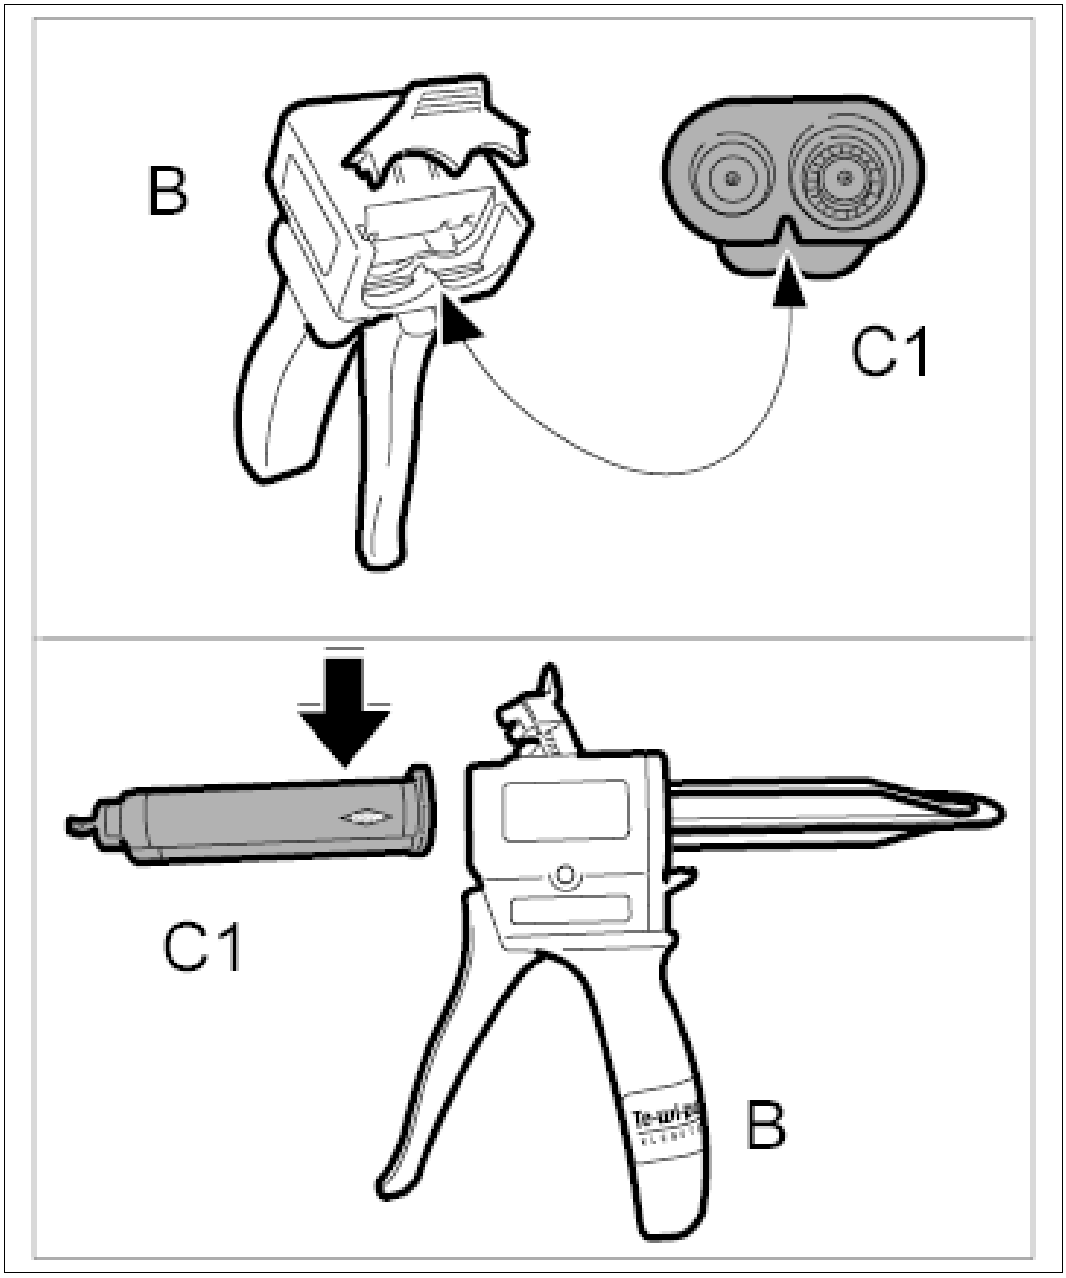


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Insert mixing cartridge.

    1. 4.1. Insert double cartridge **-C1-** into the gun **-B-** from above. Insert the cartridge until the muzzle of the gun engages in the groove of the cartridge.

Fig 4: Inserting Cartridge

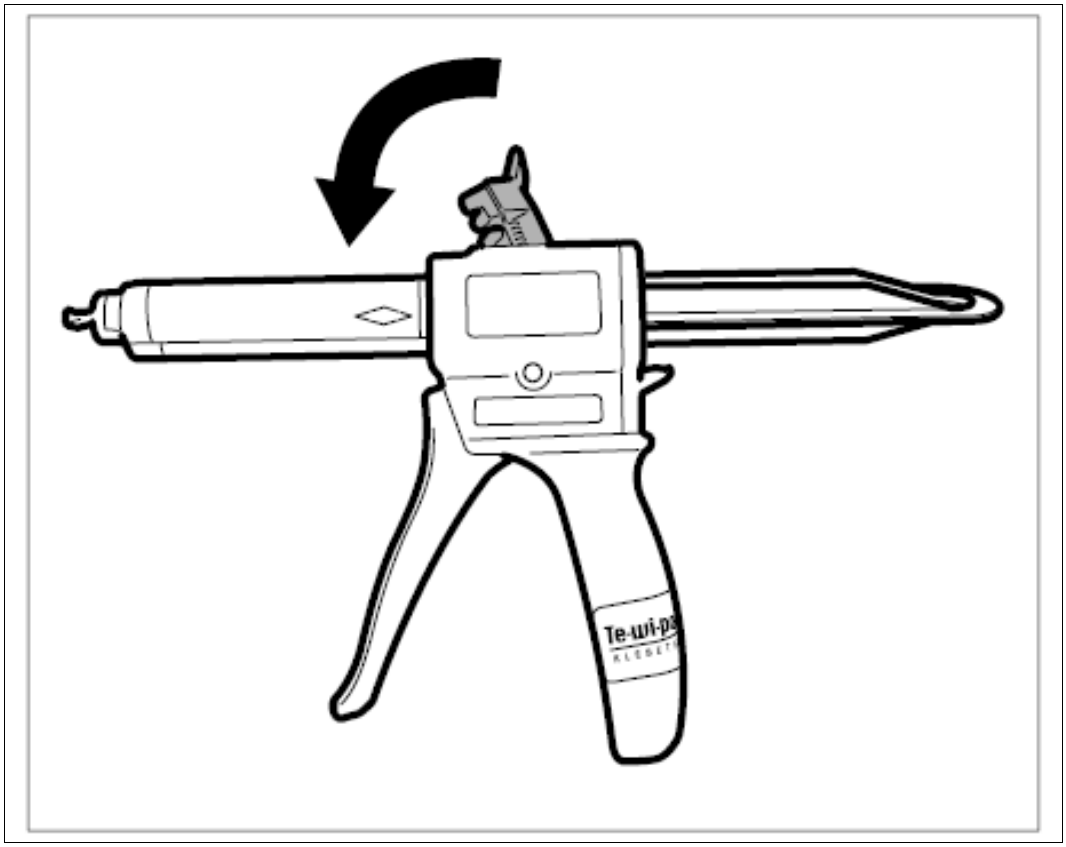


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Engage holder.

    1. 5.1. Swivel holder downward and engage on handle of gun.

Fig 5: Engaging Holder

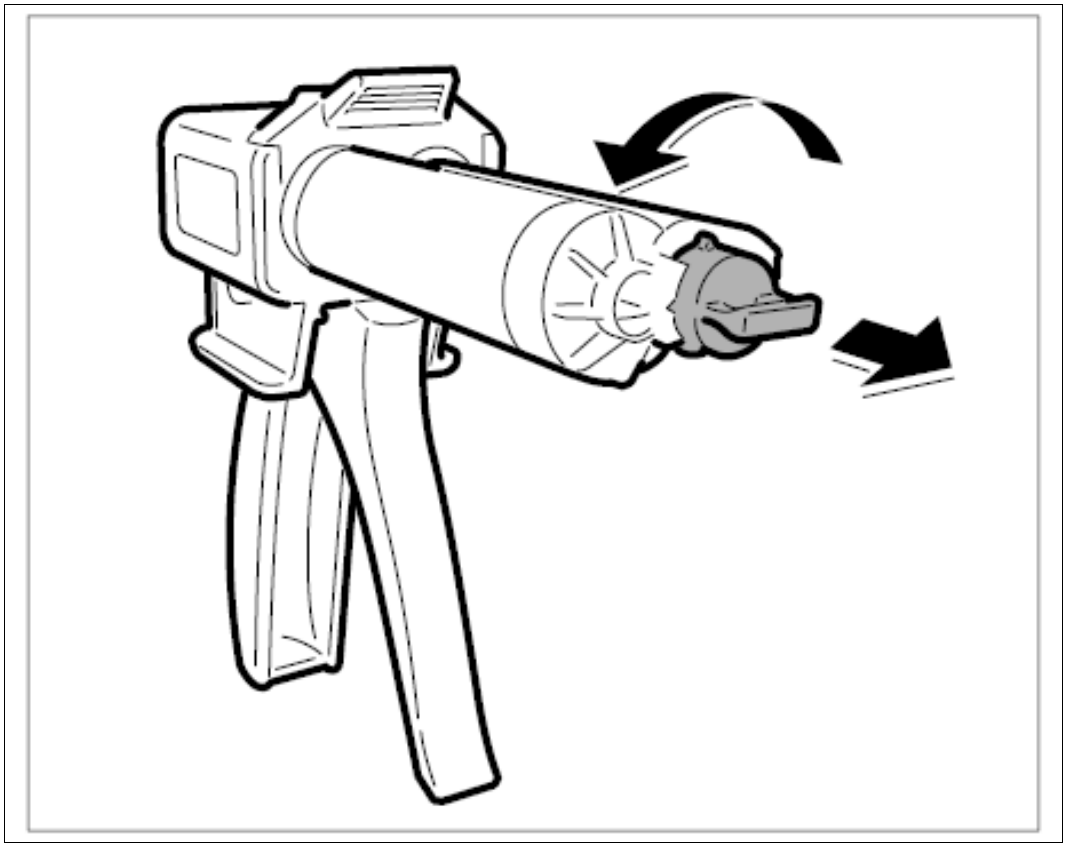


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Open cartridge.

    1. 6.1. Turn screw cap 90 ° counter-clockwise and remove.

Fig 6: Opening Cartridge



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Squeeze adhesive to the front.

    1. 7.1. Press the gun grip to allow the piston rod to move out slowly until an equal amount of both components emerges.

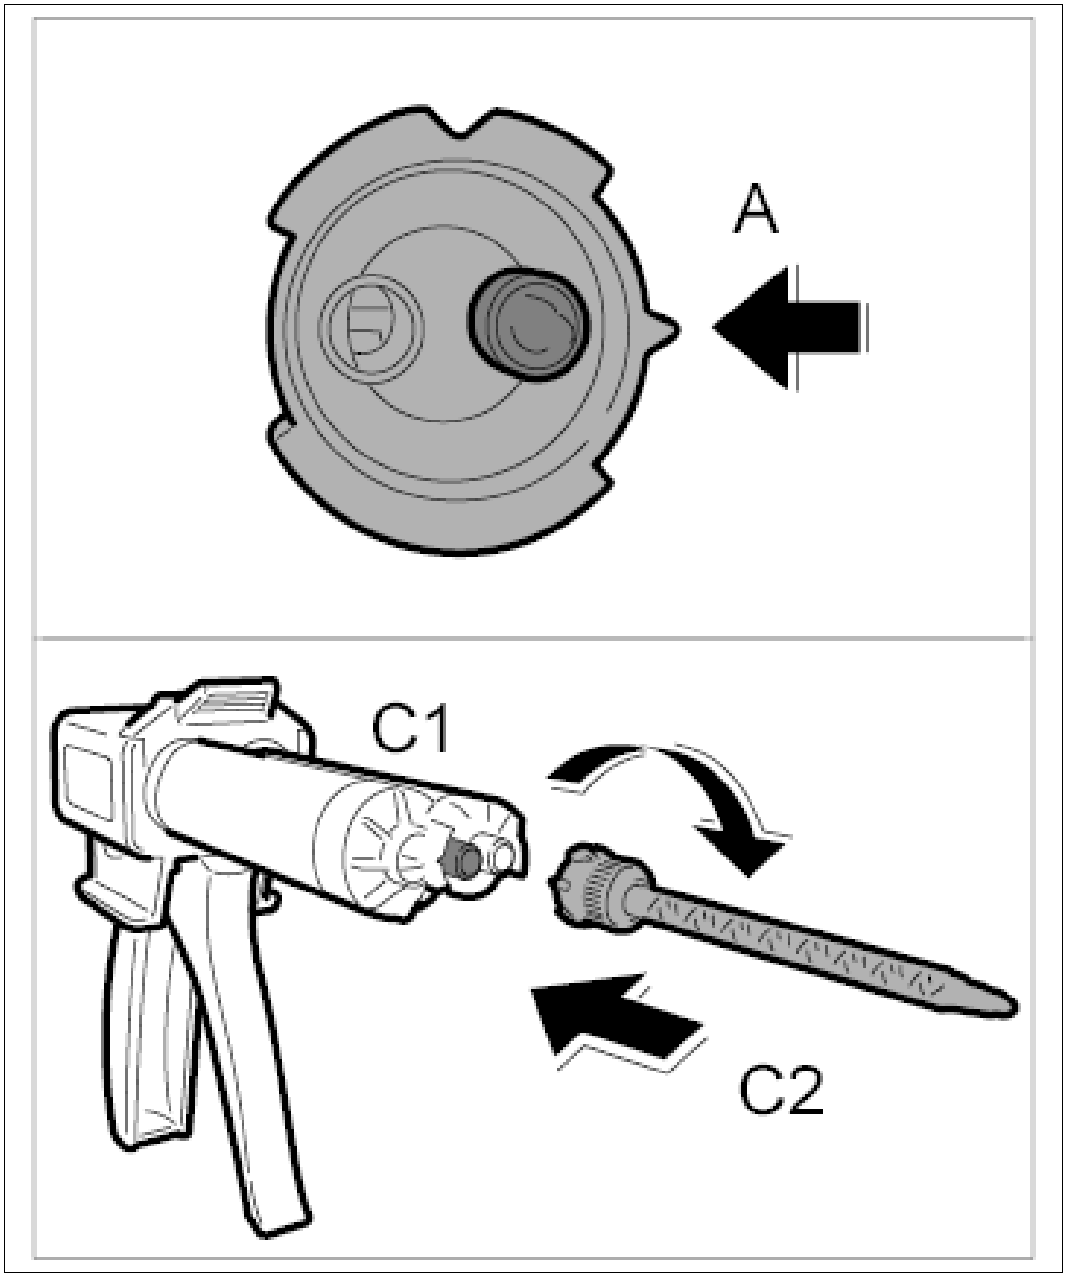
    2. 7.2. Wipe off any adhesive that emerges.

8. Fit processing nozzle.

    1. 8.1. Before fitting the processing nozzle, make sure that the muzzle **-A-** and the mixing ducts are aligned; turn the bayonet locking mechanism on the processing nozzle by 90° if necessary.

    2. 8.2. Position processing nozzle **-C2-** and turn clockwise 90°.

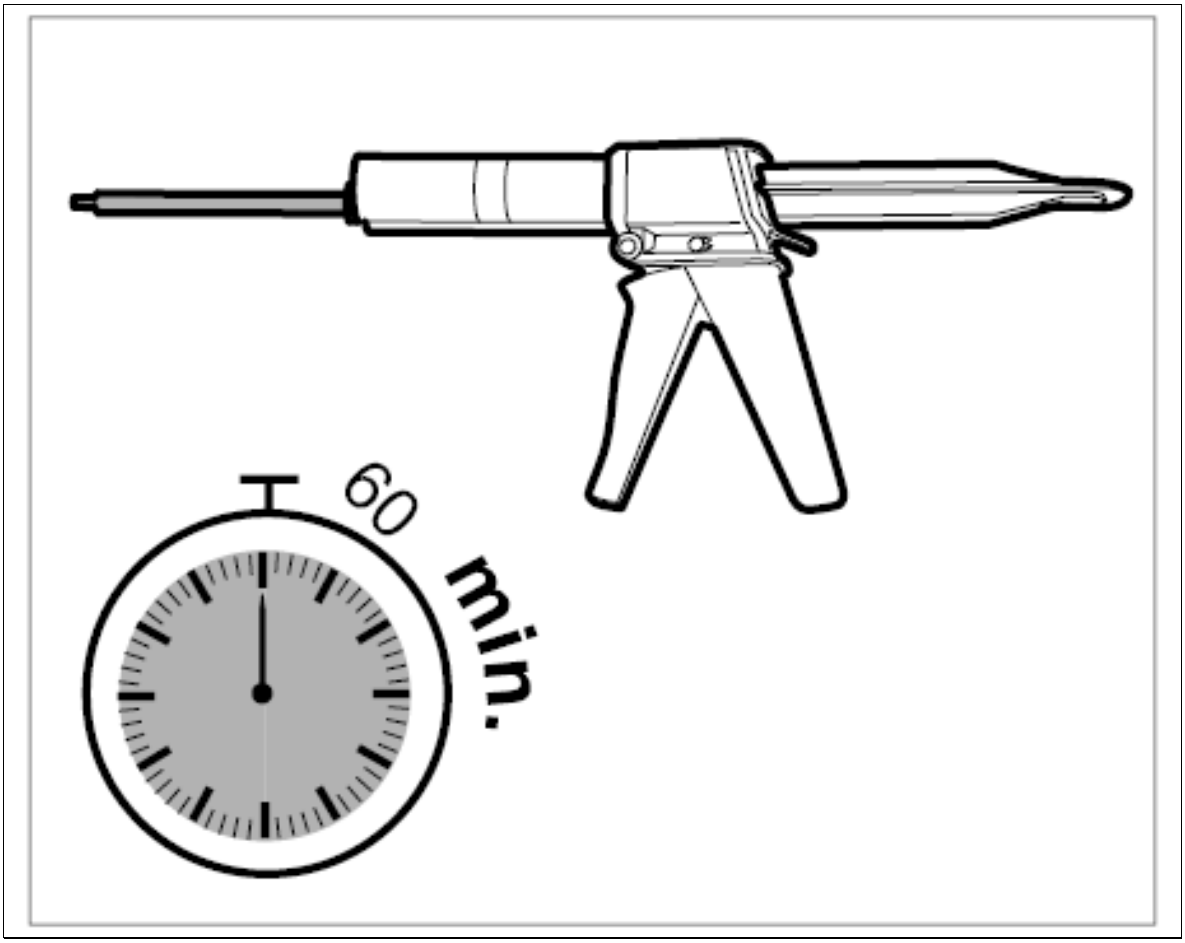
Fig 7: Fitting Nozzle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Mix adhesive components.
    1. 9.1. Press the gun grip to allow the piston rod to move out slowly until the adhesive is visible in the processing pipe.
10. Bond the body part within the specified processing time.

Fig 8: Identifying Working Time Of Structural Adhesive



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 5X00IN WORKING WITH BODY FOAM FILLER (ALL MODELS) > PRODUCT DESCRIPTION

The processing time is approx. 15-18 minutes. Processing can be interrupted briefly for up to approx. 5 minutes. The chemical reaction is essentially complete after approx. 30 minutes. The hardened foam does not swell or shrink.

WM 5X00IN WORKING WITH BODY FOAM FILLER (ALL MODELS) > APPLICATIONS

The **foam filler** is ideal for **filling, insulating and sealing cavities** , e.g. on pillars, door sills and frame sections.

WM 5X00IN WORKING WITH BODY FOAM FILLER (ALL MODELS) > PROCESSING

Information

Always observe the relevant work safety regulations when working with the foam filler.

> *WARNING: Toxic substances*
>
> - *Danger of poisoning or suffocation*
> - *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

Information

The work area must be free of dust and grease.

Remove loose parts.

Do not wet the area beforehand.

Observe temperature limits:

- Can and ambient temperature: 10-35°C
- Optimal temperature: 18-23°C

Information

Apply sparingly since the volume of the foam filler will expand by approx. 50-100% in open areas and by approx. 100-200% in cavities. Approx. 0.25 liters of foam volume is produced per second of foam time (free-foaming). The foam filler is silver-grey. Remove fresh foam residues immediately with PU cleaner. Hardened foam residues can only be removed mechanically afterwards. Always remove foam from the can following activation.

- **Activation process:**
- 1. Break open the seal on the activation lid.
- 2. Use a piece of wire to pull the activation lid out as far as it will go (approx. 11 cm up to the notch).
- 3. Break off the wire at the required rupture point (notch) over the valve.
- 4. Screw plastic adapter into the valve.
- 5. Shake can vigorously up and down (approx. 20 times).
- 6. Release foam downwards out of the can with the valve.
- **Subsequent work:**

  The hardened foam filler can be processed further by sanding, cutting or sawing. It can be painted

or varnished.

Gap dimensions for roof

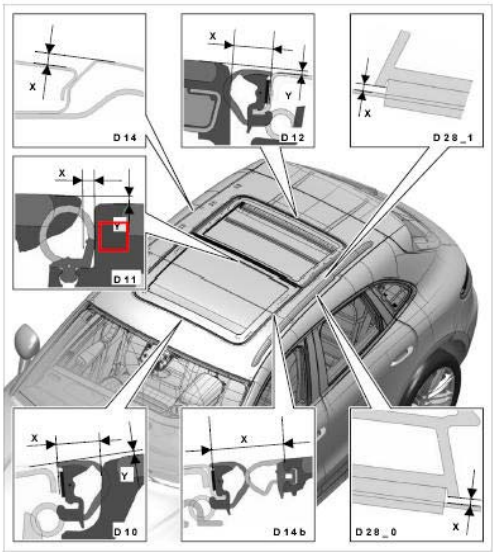
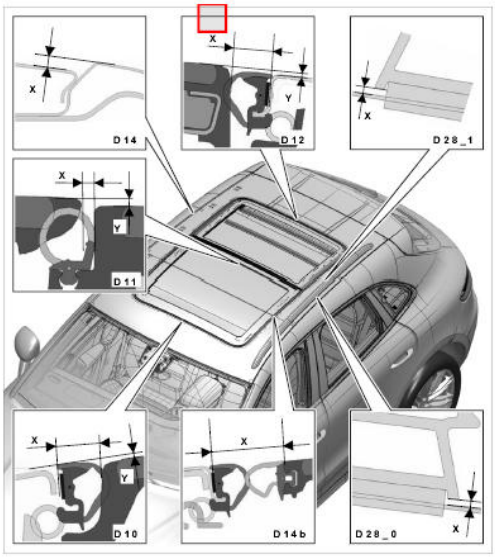
Panoramic sliding roof part 1 to part 2 (y)		Gap dimension	1 mm		



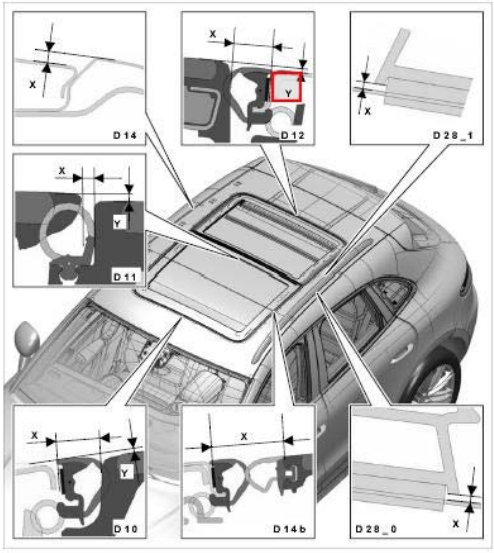
Gap dimensions for roof

Panoramic sliding roof to roof, rear (x)		Gap dimension	10 mm	+/-1.2 mm	



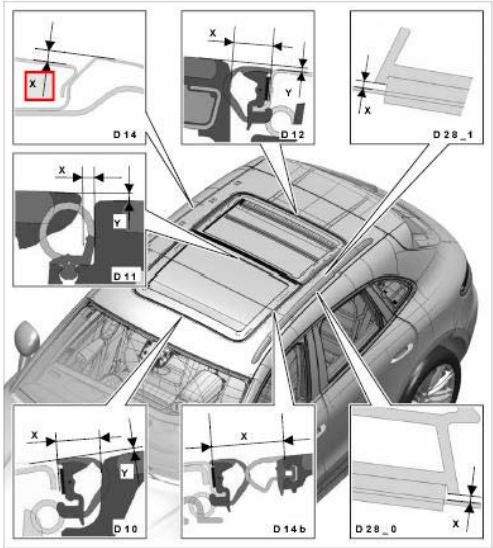
Gap dimensions for roof

Panoramic sliding roof to roof, rear (y)		Gap dimension	1 mm		



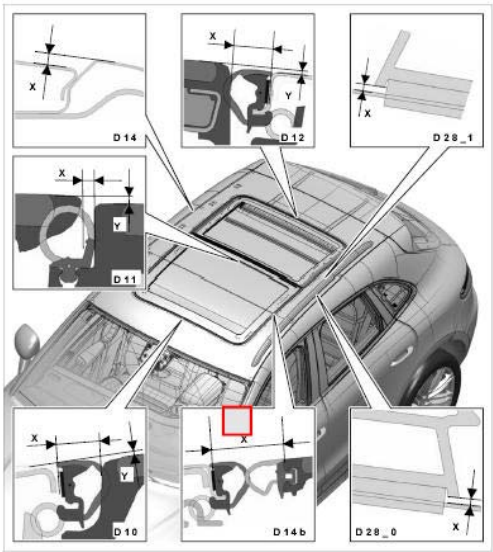
Gap dimensions for roof

Roof to side panel (x)		Gap dimension	3 mm	+/-1 mm	



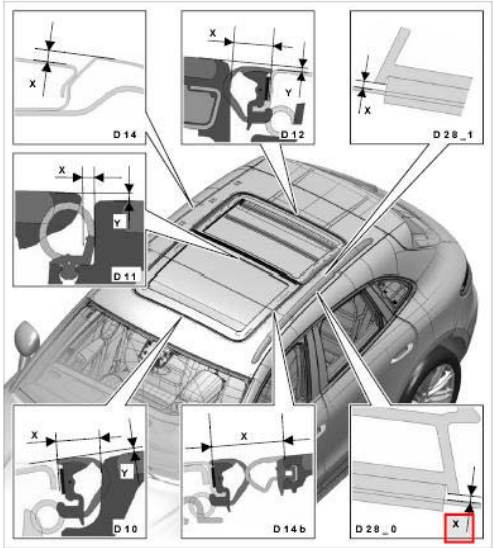
Gap dimensions for roof

Panoramic sliding roof to roof, sides (x)		Gap dimension	22 mm	+/-1.2 mm	



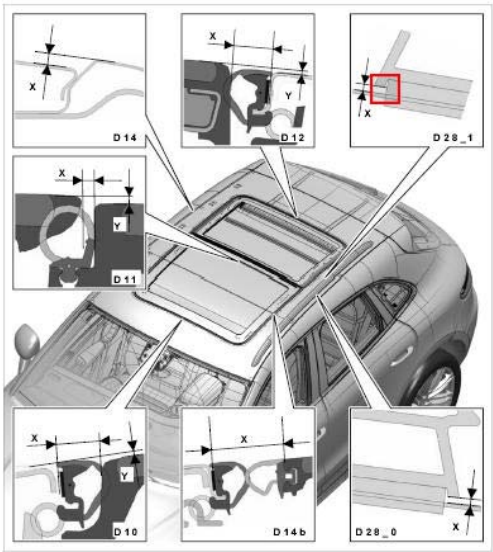
Gap dimensions for roof

Roof rail to roof, outer (x)		Gap dimension	1.5 mm	+/-0.75 mm	



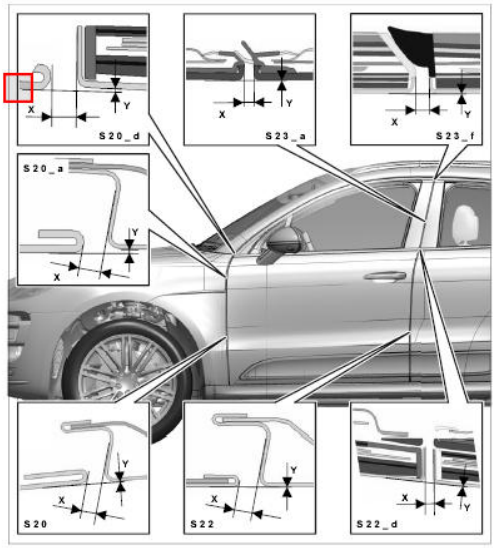
Gap dimensions for roof

Roof rail to roof, inner (x)		Gap dimension	1.5 mm	+/-0.7 mm	



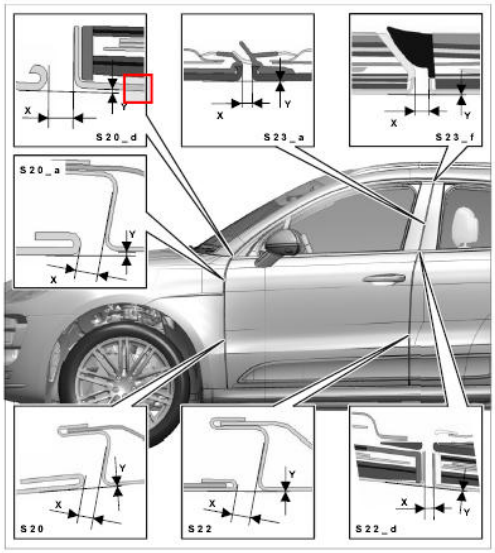
Gap dimensions for roof

Door molding, rear to front (x)		Gap dimension	4.2 mm	+/-1 mm	



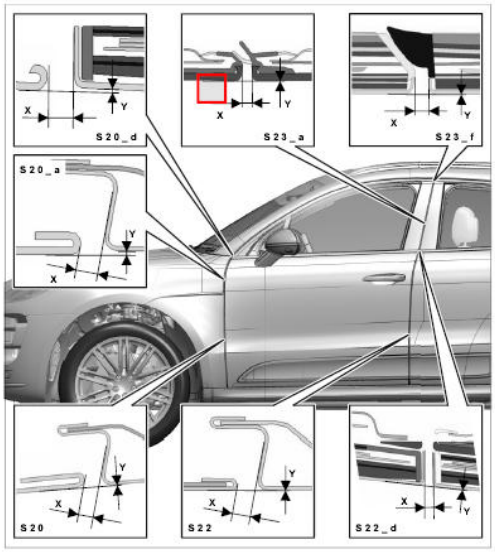
Gap dimensions for front door

Door molding, rear to front (y)		Gap dimension	1 mm		



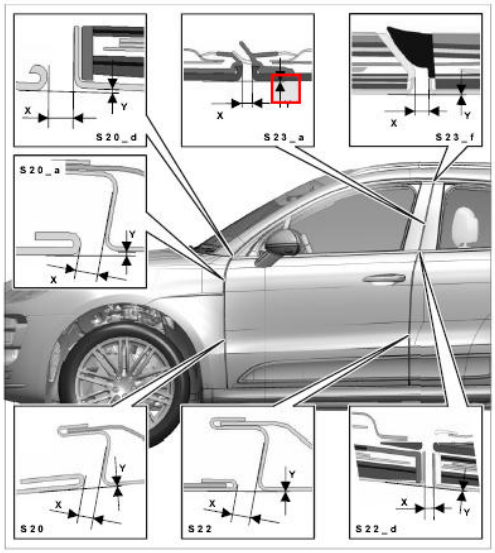
Gap dimensions for front door

B-pillar trim, rear to front (x)		Gap dimension	4.2 mm	+/-1 mm	



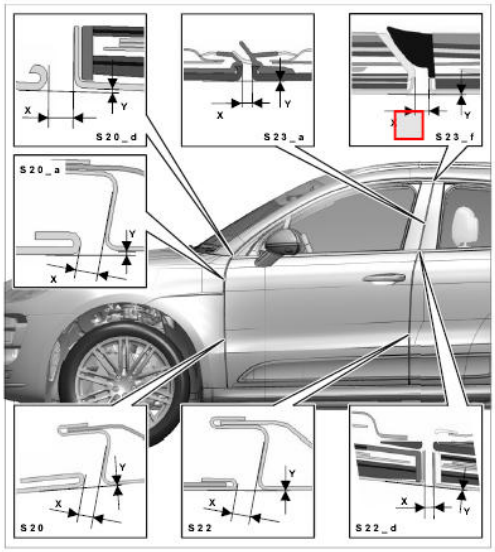
Gap dimensions for front door

B-pillar trim, rear to front (y)		Gap dimension	0 mm		



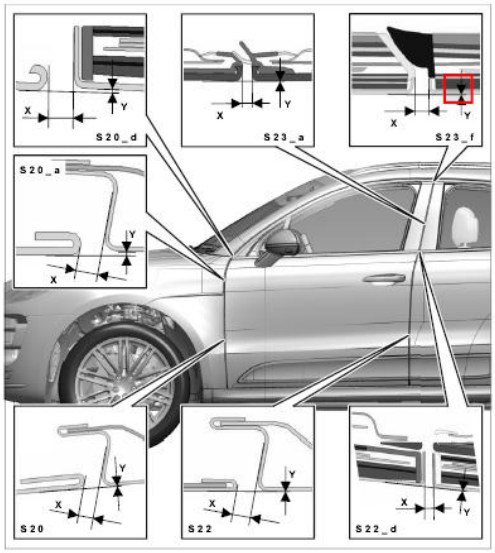
Gap dimensions for front door

Door molding, top rear to front (x)		Gap dimension	4.2 mm	+/-1 mm	



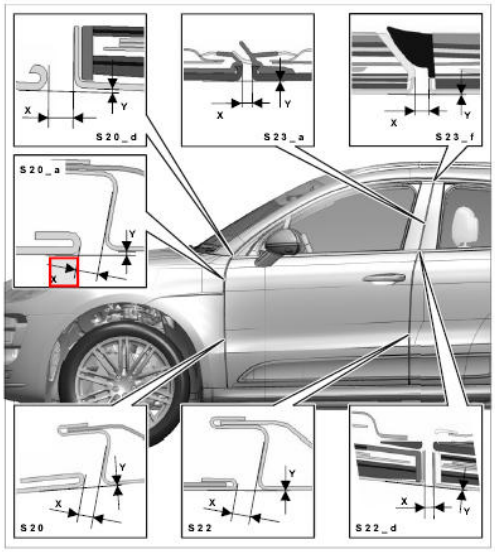
Gap dimensions for front door

Door molding, top rear to front (y)		Gap dimension	0 mm		



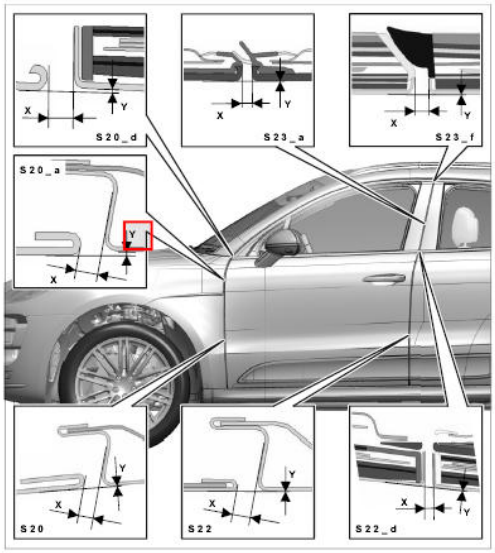
Gap dimensions for front door

Door to front lid (x)		Gap dimension	4.1 mm	+/-0.5 mm	



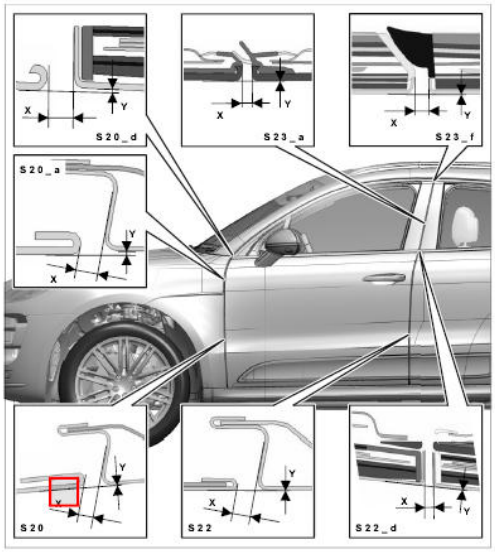
Gap dimensions for front door

Door to front lid (y)		Gap dimension	1 mm		



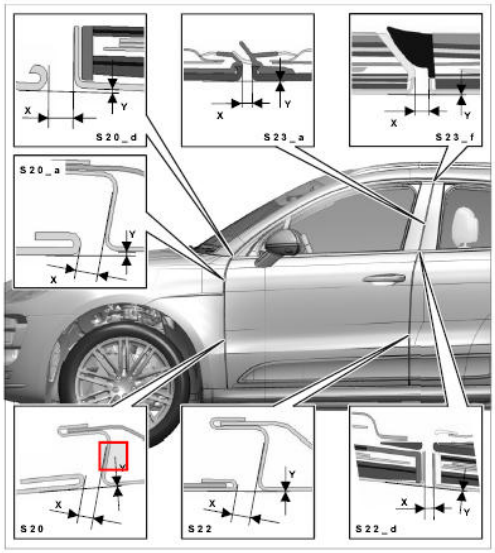
Gap dimensions for front door

Door to wing (x)		Gap dimension	4.1 mm	+/-0.5 mm	



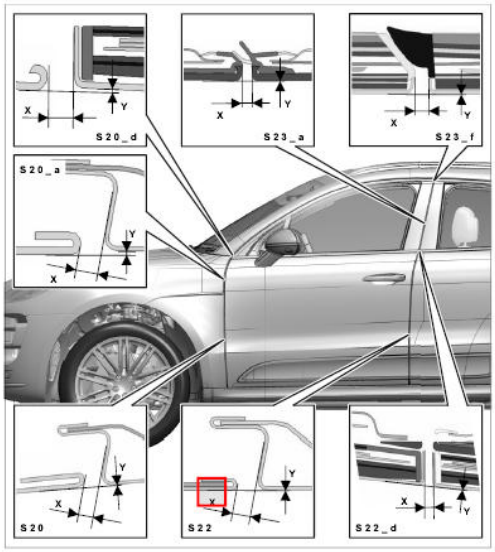
Gap dimensions for front door

Door to wing (y)		Gap dimension	0 mm		



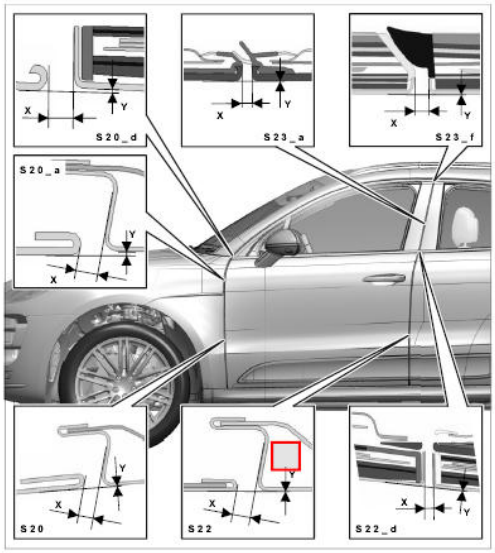
Gap dimensions for front door

Rear door to front door (x)		Gap dimension	4.2 mm	+/-0.5 mm	



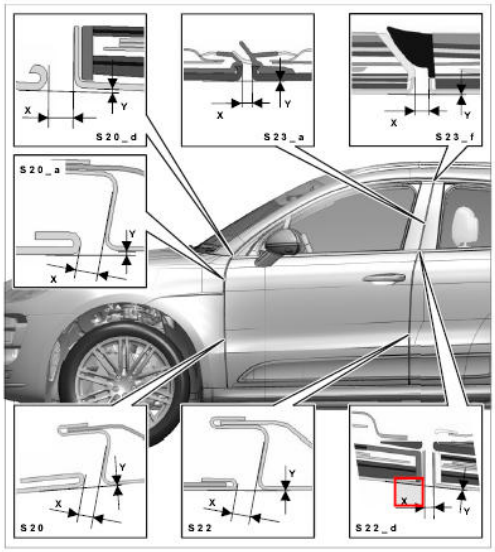
Gap dimensions for front door

Rear door to front door (y)		Gap dimension	0 mm		



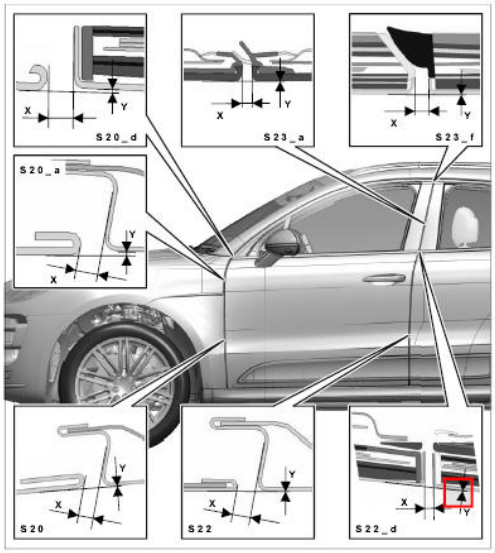
Gap dimensions for front door

Door molding, rear to front (x)		Gap dimension	4.2 mm	+/-1 mm	



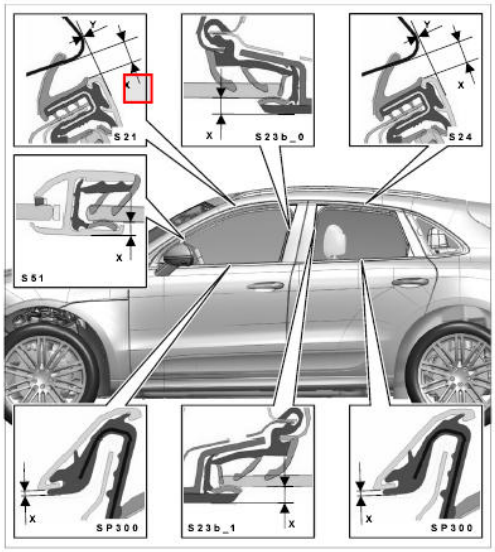
Gap dimensions for front door

Door molding, rear to front (y)		Gap dimension	0 mm		



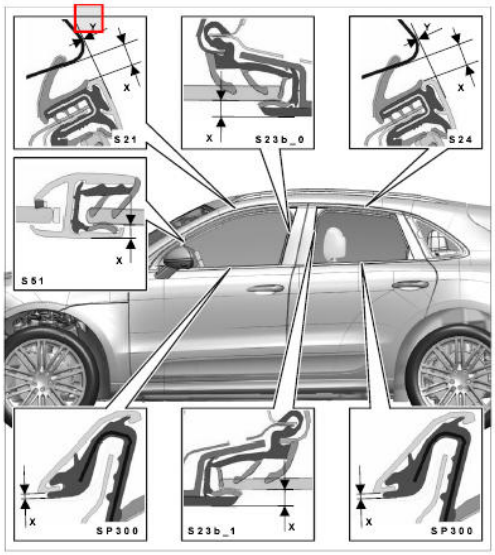
Gap dimensions for front door

Door molding, top to side panel (x)		Gap dimension	4.5 mm	+/-2 mm	



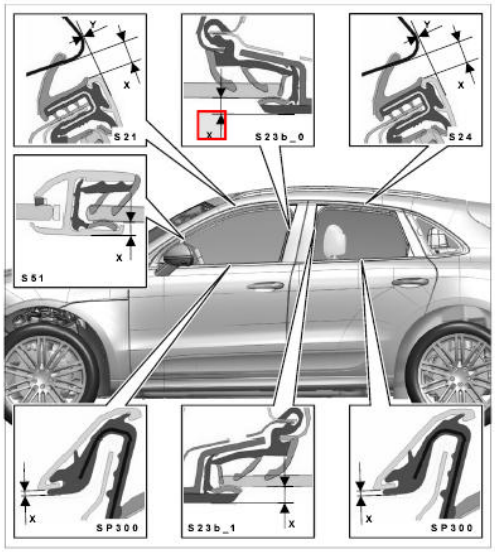
Gap dimensions for front door to rear door

Door molding, top to side panel (y)		Gap dimension	0 mm		



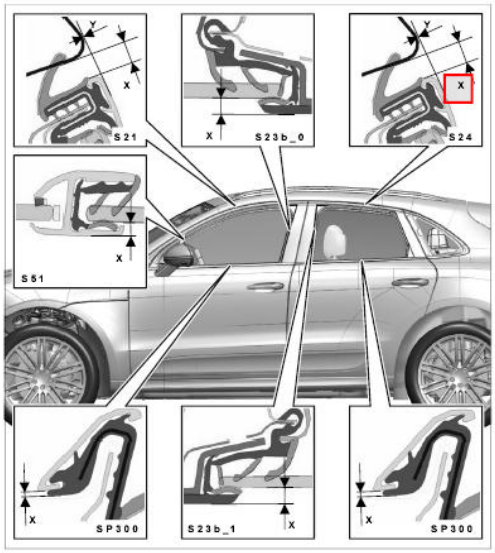
Gap dimensions for front door to rear door

B-pillar trim, front to glazing (x)		Gap dimension	4.5 mm	+/-1 mm	



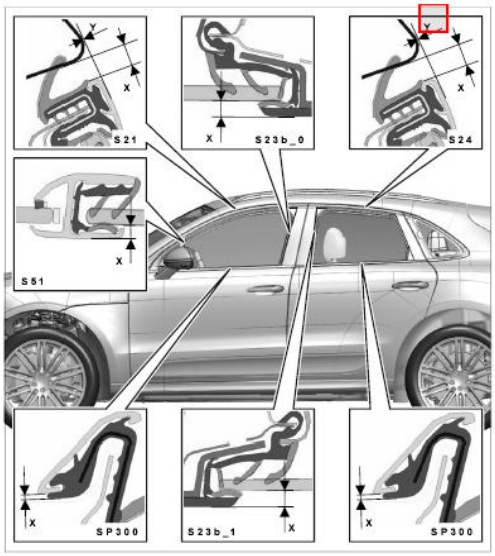
Gap dimensions of front door to rear door

Door molding, top to side panel (x)		Gap dimension	4.5 mm	+/-2 mm	



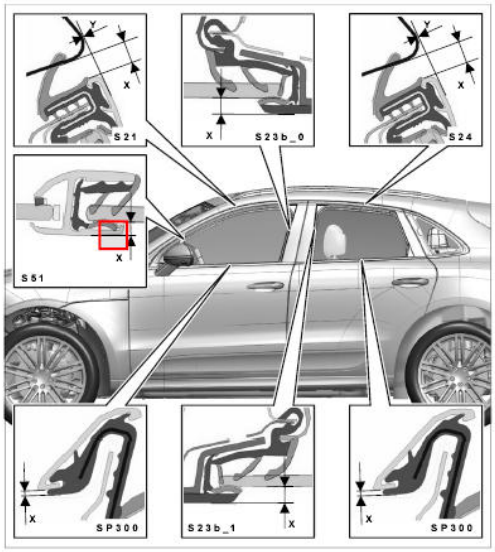
Gap dimensions for front door to rear door

Door molding, top to side panel (y)		Gap dimension	0 mm		



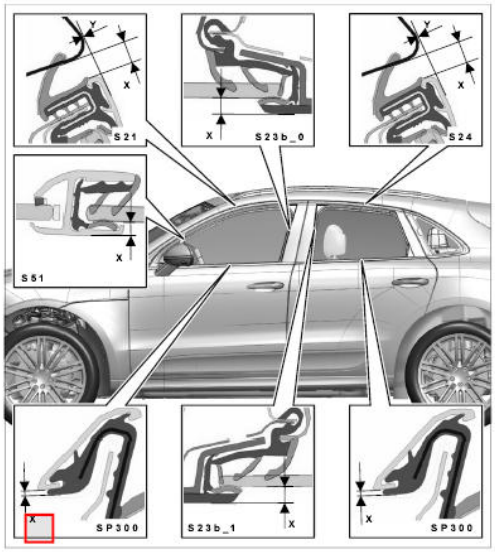
Gap dimensions for front door to rear door

Triangular window bar to glazing (x)		Gap dimension	4.1 mm	+/-1 mm	



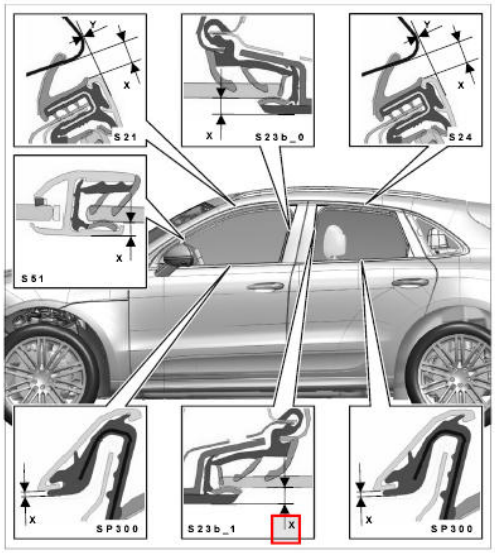
Gap dimensions for front door to rear door

Door molding, front to outer door panel (x)		Gap dimension	0.8 mm	+/-0.5 mm	



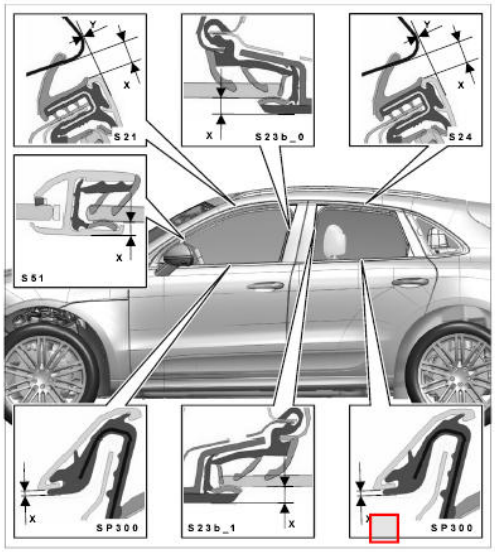
Gap dimensions for front door to rear door

B-pillar trim, rear to glazing (x)		Gap dimension	4.5 mm	+/-1 mm	



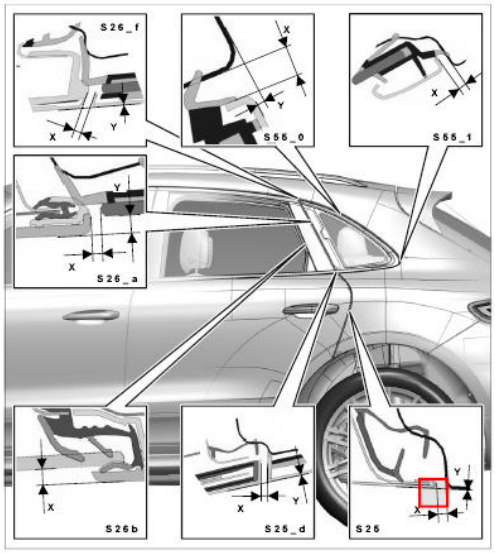
Gap dimensions for front door to rear door

Door molding, rear to outer door panel (x)		Gap dimension	0.8 mm	+/-0.5 mm	



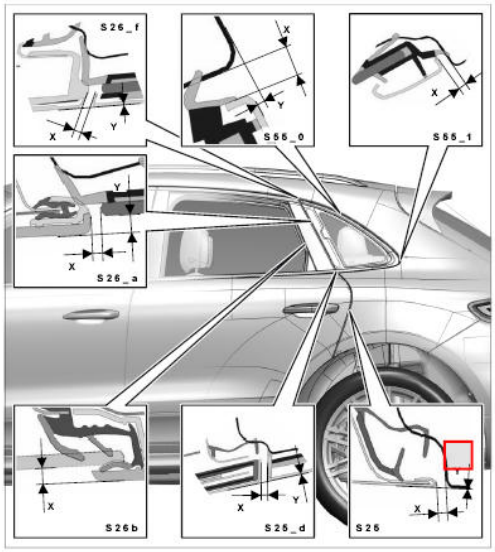
Gap dimensions for front door to rear door

Rear door to side panel (x)		Gap dimension	3.5 mm	+/-0.5 mm	



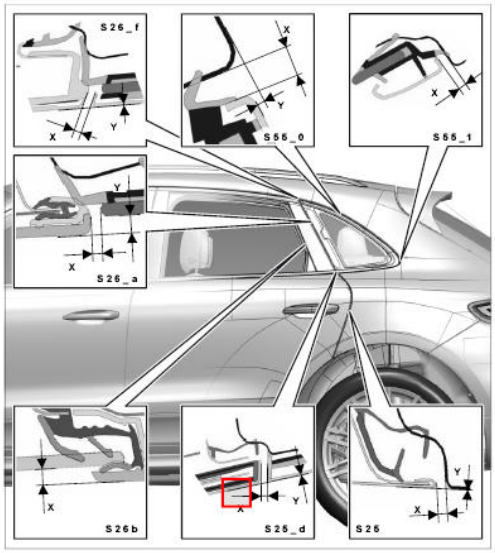
Gap dimensions for rear door/rear side window

Rear door to side panel (y)		Gap dimension	0 mm		



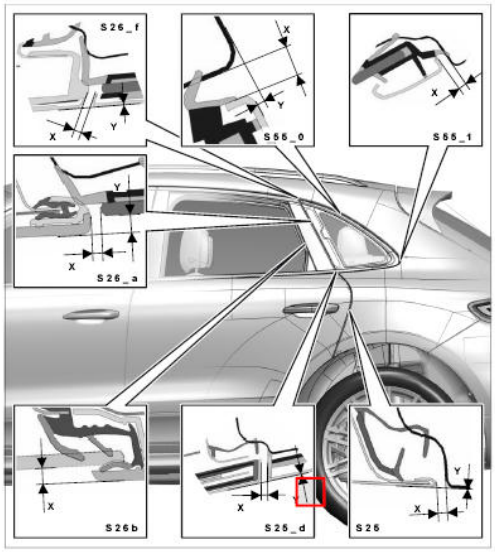
Gap dimensions for rear door/rear side window

Rear door molding to rear window molding (x)		Gap dimension	3.5 mm	+/-1 mm	



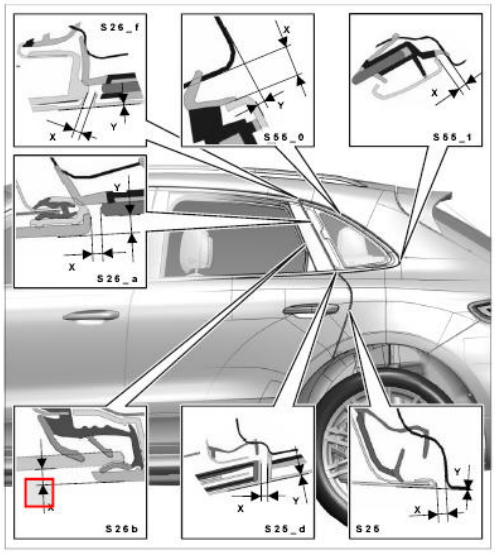
Gap dimensions for rear door/rear side window

Rear door molding to rear window molding (y)		Gap dimension	0 mm		



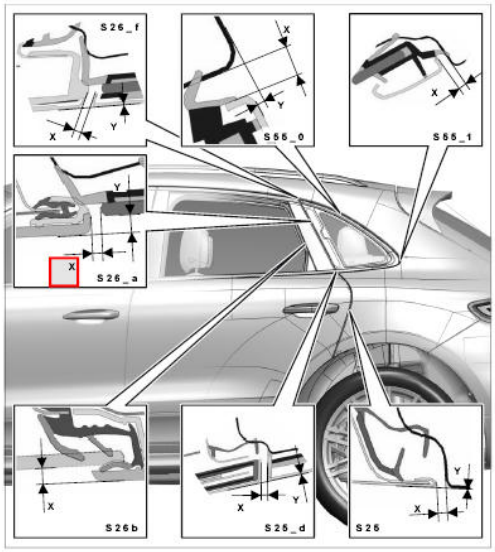
Gap dimensions for rear door/rear side window

C-pillar trim to door window (x)		Gap dimension	4.6 mm	+/-1 mm	



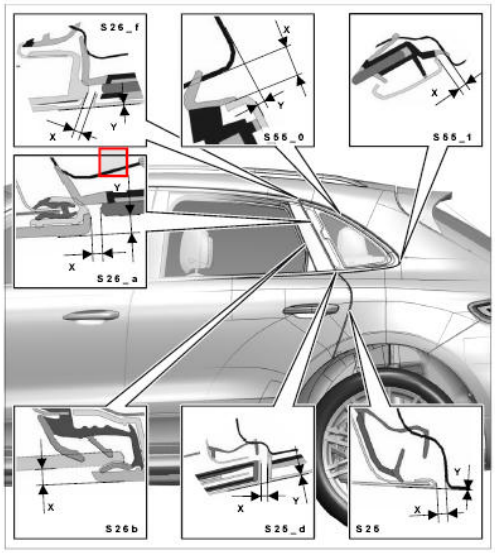
Gap dimensions for rear door/rear side window

C-pillar trim to rear window (x)		Gap dimension	3.5 mm	+/-1 mm	



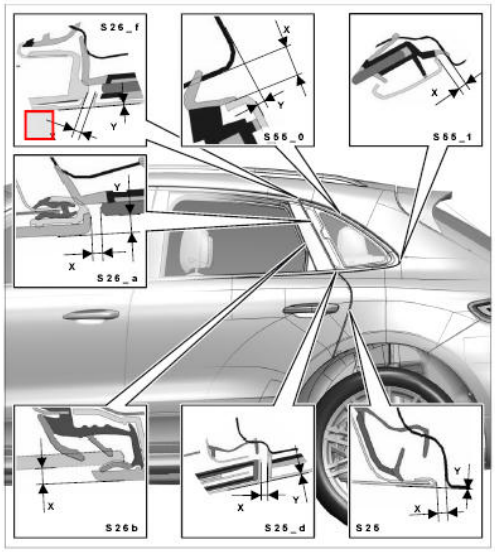
Gap dimensions for rear door/rear side window

C-pillar trim to rear window (y)		Gap dimension	4.2 mm	+/-1 mm	



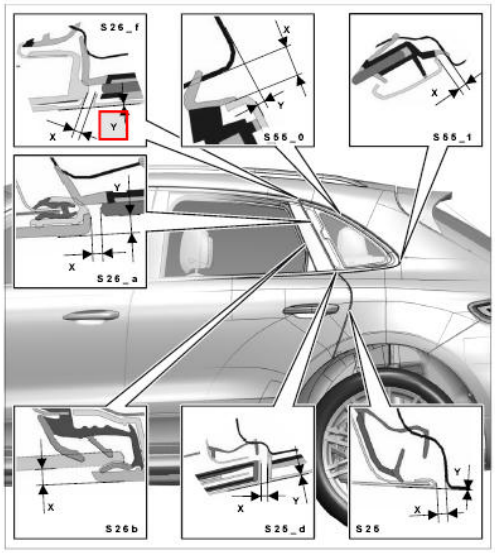
Gap dimensions for rear door/rear side window

Door molding, top to rear window molding (x)		Gap dimension	3.5 mm	+/-1 mm	



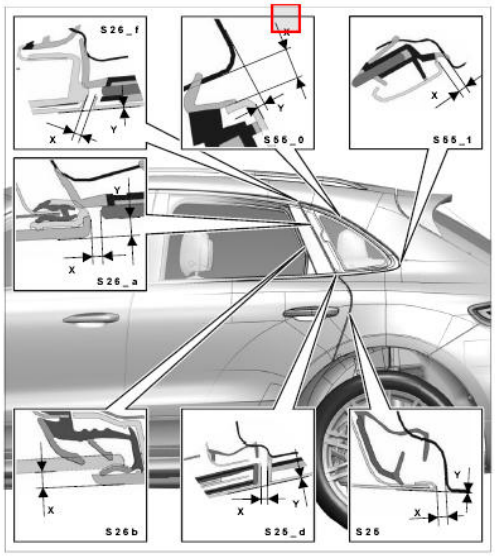
Gap dimensions for rear door/rear side window

Door molding, top to rear window molding (y)		Gap dimension	0.3 mm		



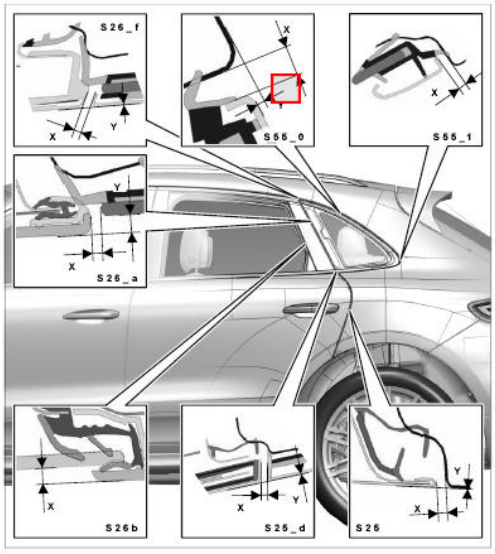
Gap dimensions for rear door/rear side window

Rear window molding to side panel (x)		Gap dimension	4.5 mm	+/-1.5 mm	



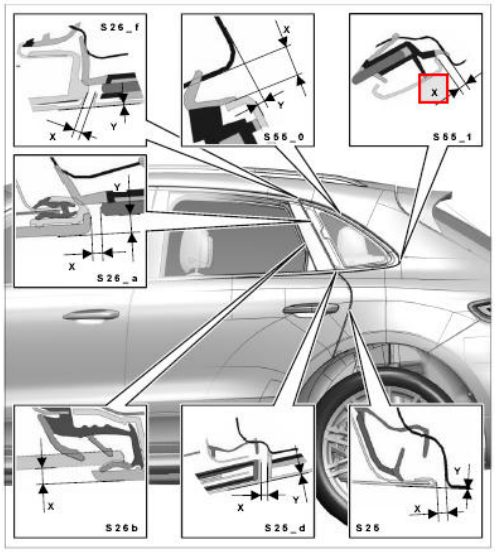
Gap dimensions for rear door/rear side window

Rear window molding to side panel (y)		Gap dimension	0.8 mm	+/-1 mm	



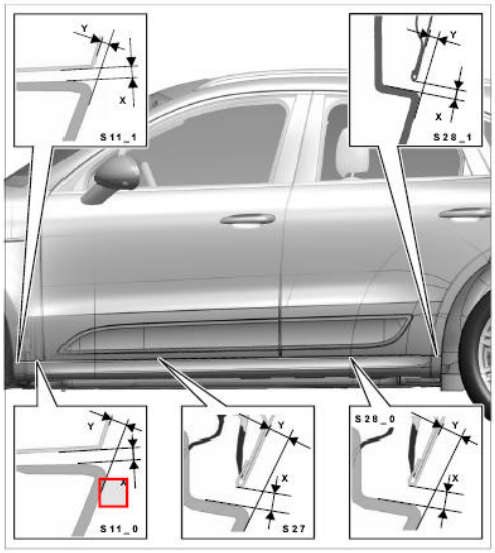
Gap dimensions for rear door/rear side window

Rear window molding to side panel (x)		Gap dimension	3.8 mm	+/-0.8 mm	



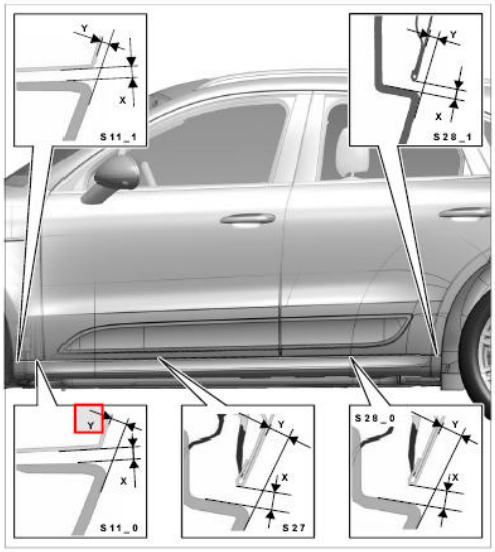
Gap dimensions for rear door/rear side window

Door sill to wing (x)		Gap dimension	4 mm	+/-1.5 mm	



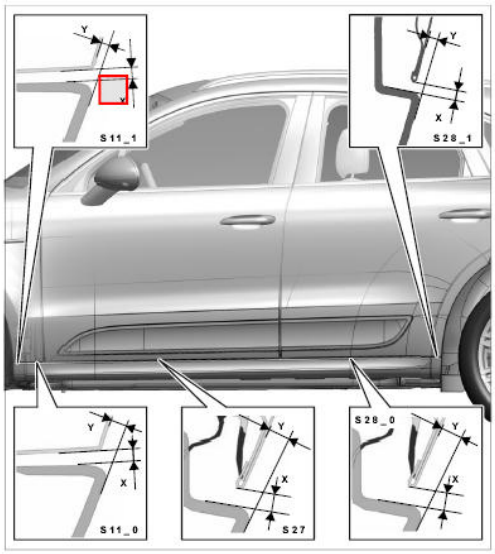
Gap dimensions for sill cover

Door sill to wing (y)		Gap dimension	5 mm	+/-1.5 mm	



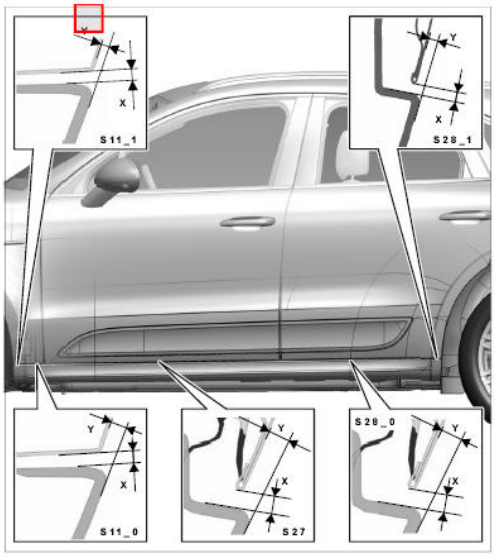
Gap dimensions for sill cover

Door sill to wing (x)		Contact force	4 mm	+/-1.5 mm	



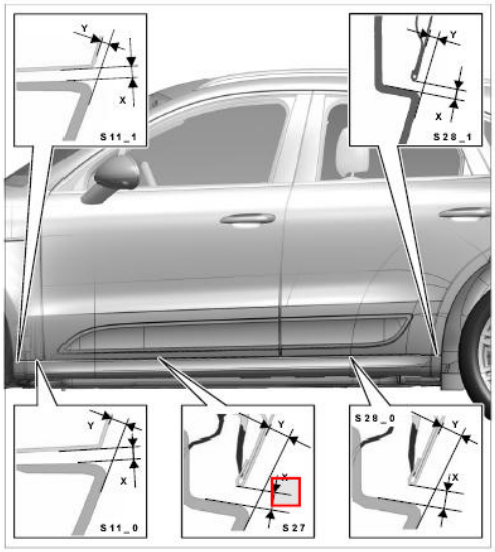
Gap dimensions for sill cover

Door sill to wing (y)		Gap dimension	5 mm	+/-1.5 mm	



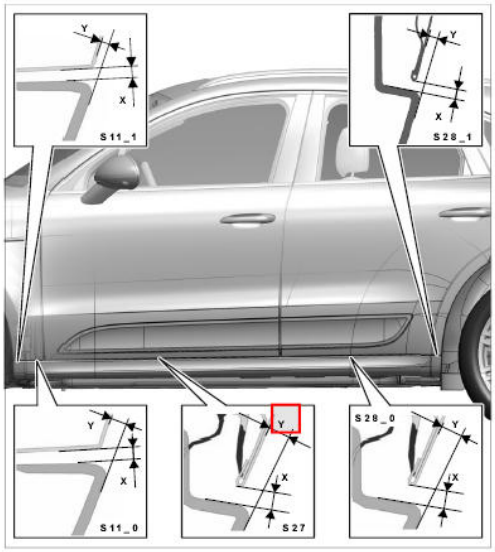
Gap dimensions for sill cover

Door sill to front door (x)		Gap dimension	4 mm	+/-1.5 mm	



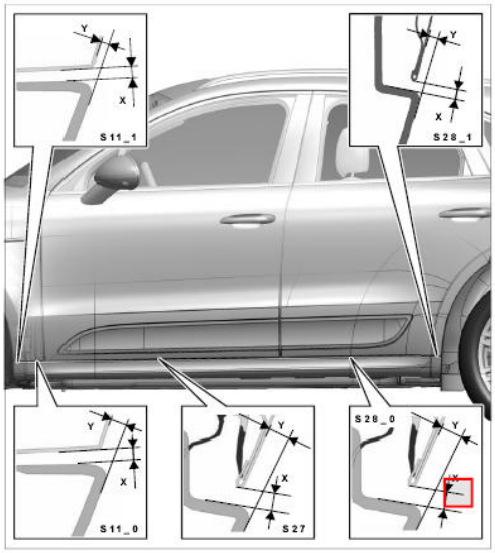
Gap dimensions for sill cover

Door sill to front door (y)		Gap dimension	5 mm	+/-1.5 mm	



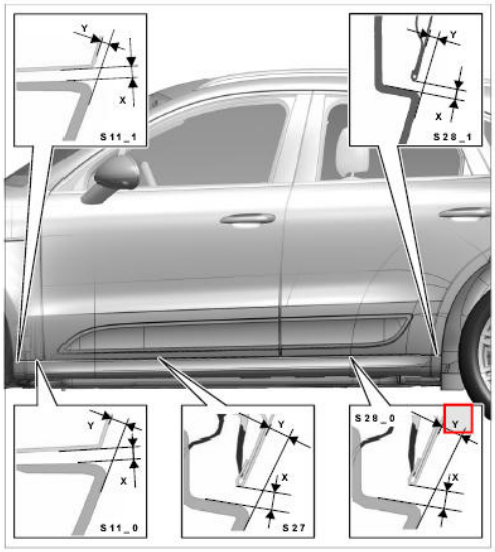
Gap dimensions for sill cover

Door sill to rear door (x)		Gap dimension	4 mm	+/-1.5 mm	



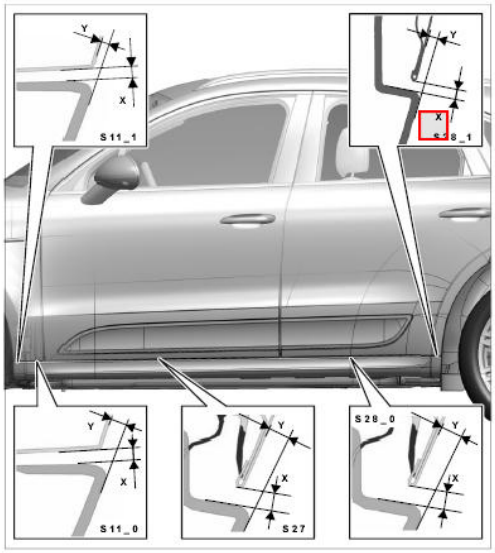
Gap dimensions for sill cover

Door sill to rear door (y)		Gap dimension	5 mm	+/-1.5 mm	



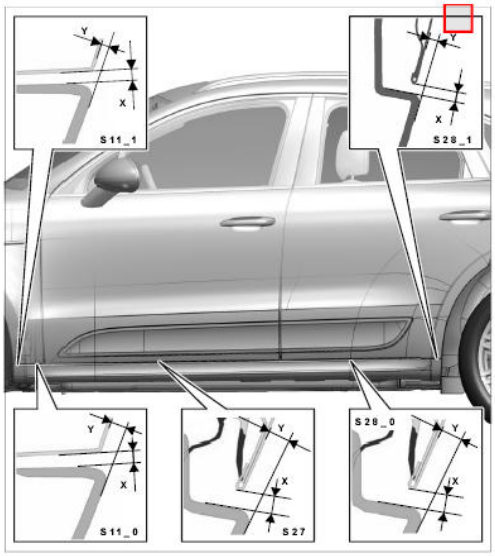
Gap dimensions for sill cover

Door sill to rear door (x)		Gap dimension	4 mm	+/-1.5 mm	



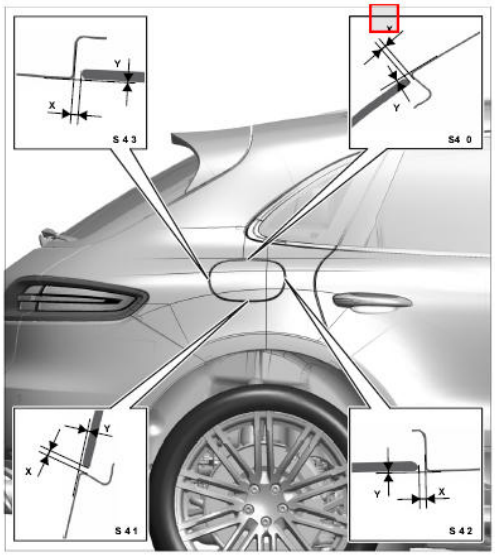
Gap dimensions for sill cover

Door sill to rear door (y)		Gap dimension	5 mm	+/-1.5 mm	



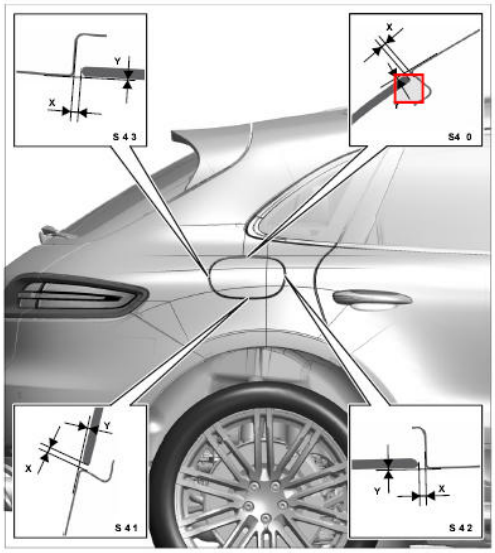
Gap dimensions for sill cover

Filler flap to side panel (x)		Gap dimension	2 mm	+/-0.5 mm	



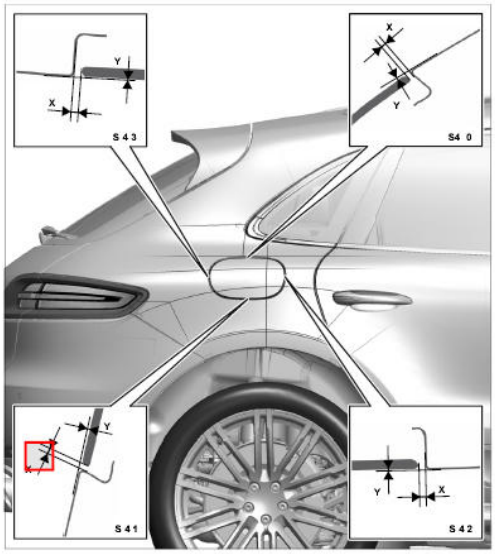
Gap dimensions for filler flap

Filler flap to side panel (y)		Gap dimension	0.25 mm		



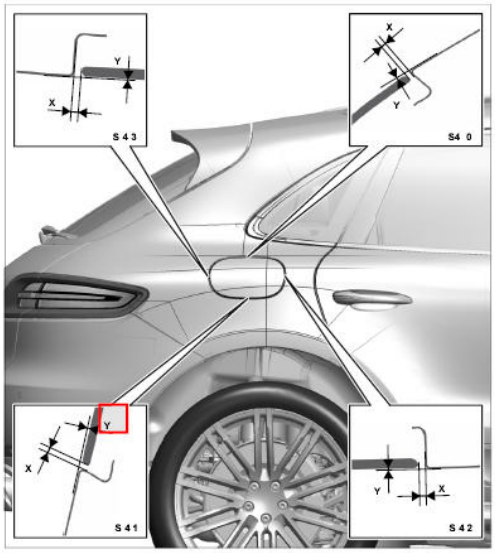
Gap dimensions for filler flap

Filler flap to side panel (x)		Gap dimension	2.3 mm	+/-0.5 mm	



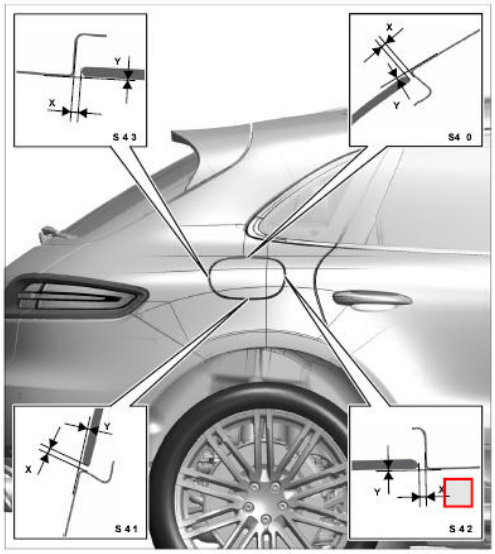
Gap dimensions for filler flap

Filler flap to side panel (y)		Gap dimension	0.25 mm		



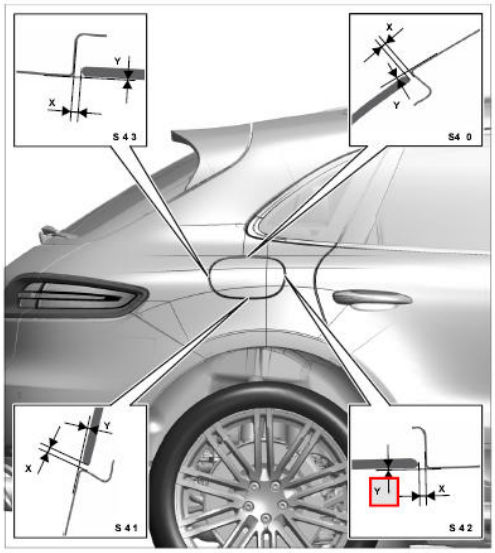
Gap dimensions for filler flap

Filler flap to side panel (x)		Gap dimension	2.3 mm	+/-0.5 mm	



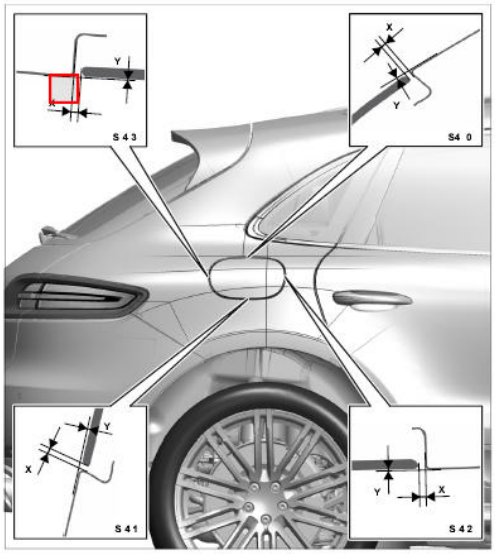
Gap dimensions for filler flap

Filler flap to side panel (y)		Gap dimension	0.25 mm		



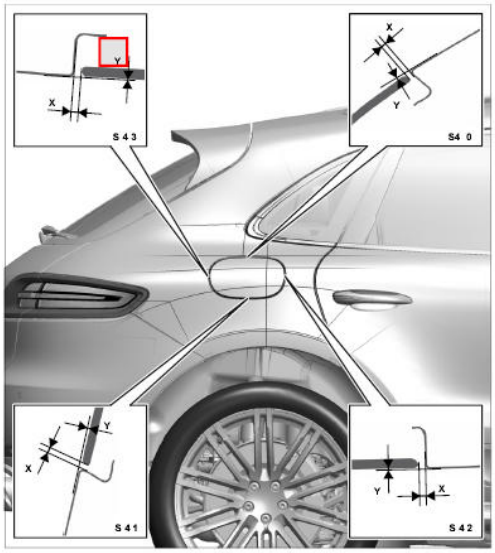
Gap dimensions for filler flap

Filler flap to side panel (x)		Gap dimension	2.3 mm	+/-0.5 mm	



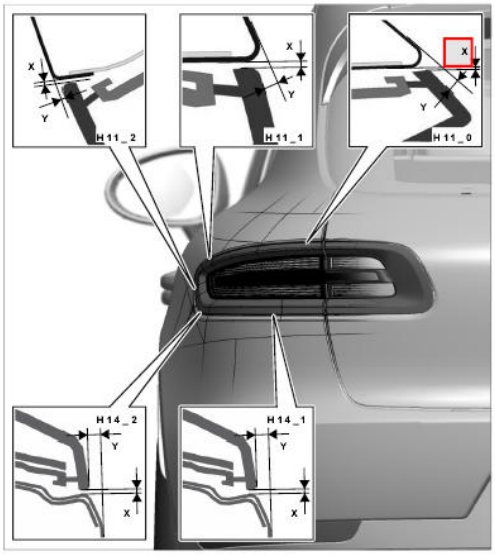
Gap dimensions for filler flap

Filler flap to side panel (y)		Gap dimension	-0.25 mm		



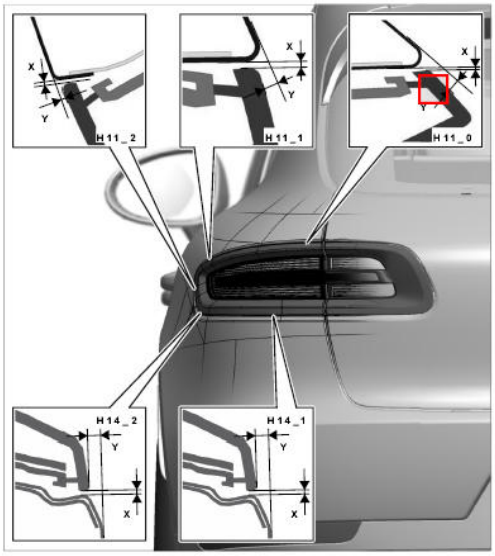
Gap dimensions for filler flap

Tail/brake/direction indicator/reversing lights Part 1 to side panel (x)		Gap dimension	1 mm	+/-0.8 mm	



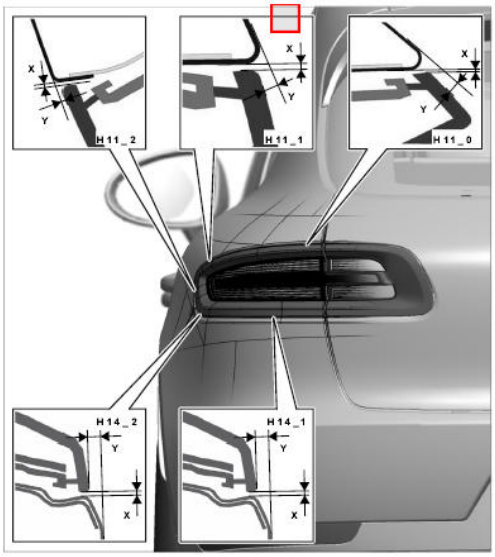
Gap dimensions for tail light

SBBR-Leuchte Part 1 to side panel (y)		Gap dimension	-4.5 mm	+/-0.5 mm	



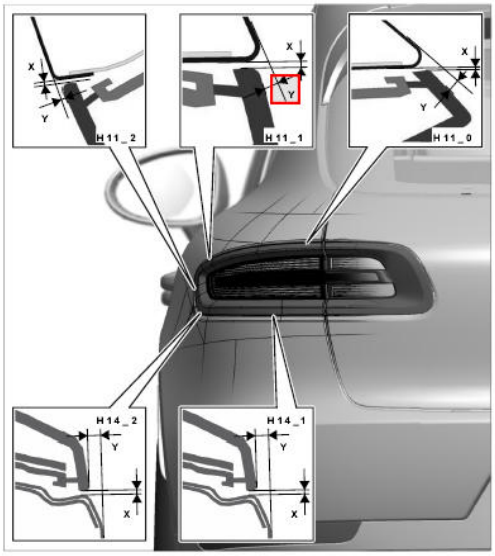
Gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to side panel (x)		Gap dimension	1 mm	+/-0.8 mm	



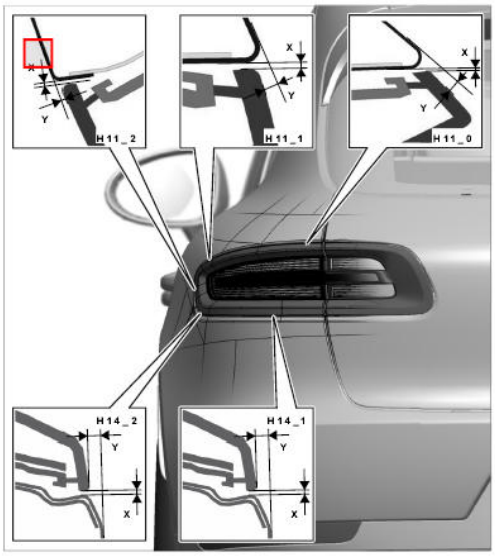
Gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to side panel (y)		Gap dimension	-2 mm	+/-0.5 mm	



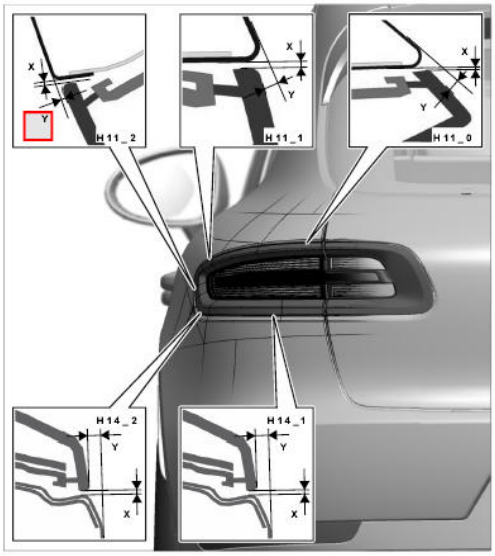
Gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to side panel (x)		Gap dimension	1 mm	+/-0.8 mm	



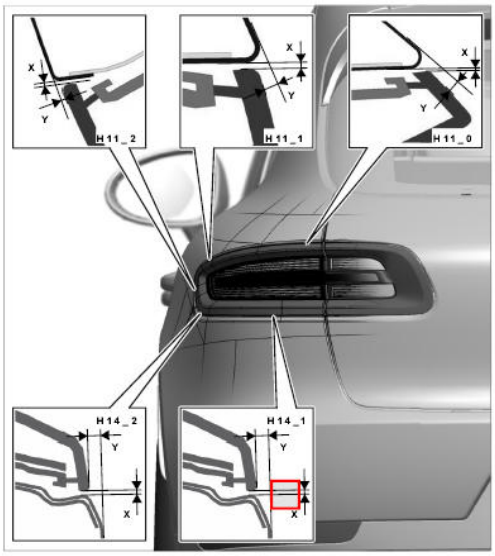
Gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to side panel (y)		Gap dimension	1 mm	+/-0.8 mm	



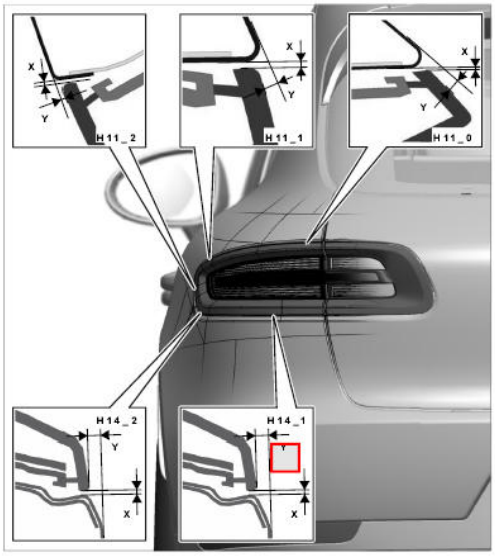
Gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to rear apron (x)		Gap dimension	1 mm	+/-0.8 mm	



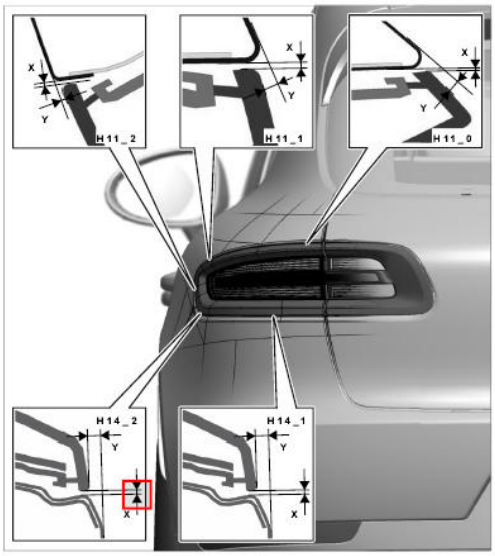
Gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to rear apron (y)		Gap dimension	-3.8 mm	+/-0.5 mm	



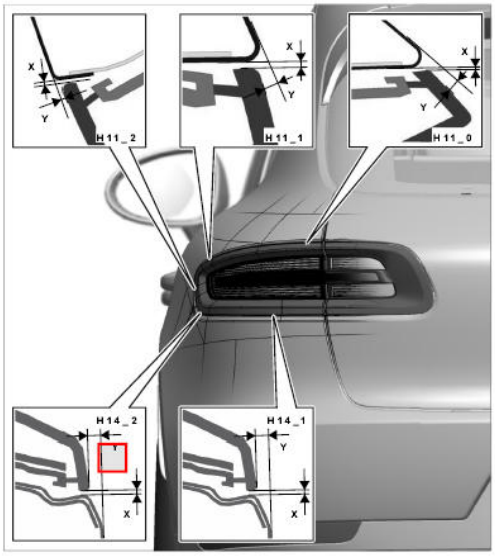
Gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to rear apron (x)		Gap dimension	1 mm	+/-0.5 mm	



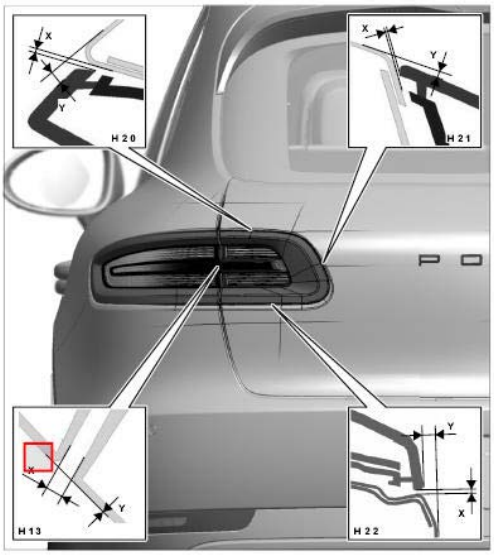
Gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to rear apron (y)		Gap dimension	1 mm	+/-0.5 mm	



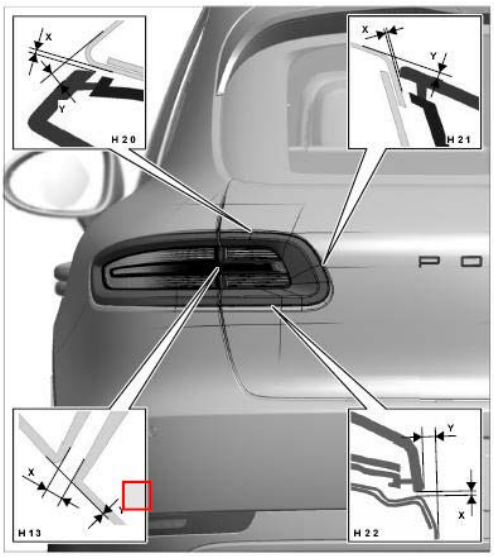
Gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to part 2 (x)		Gap dimension	4 mm	+/-0.8 mm	



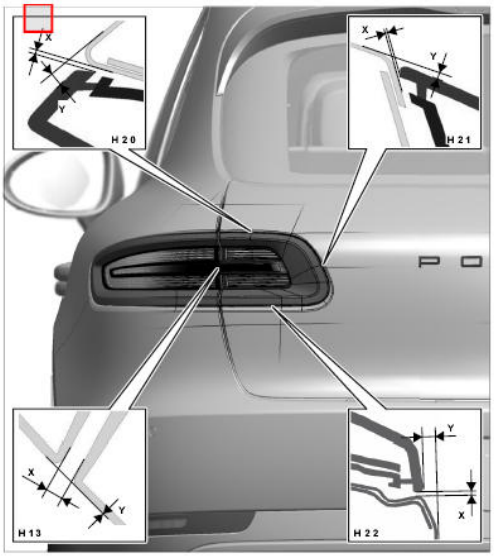
Inner gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 1 to part 2 (y)		Gap dimension	0 mm	+/-0.8 mm	



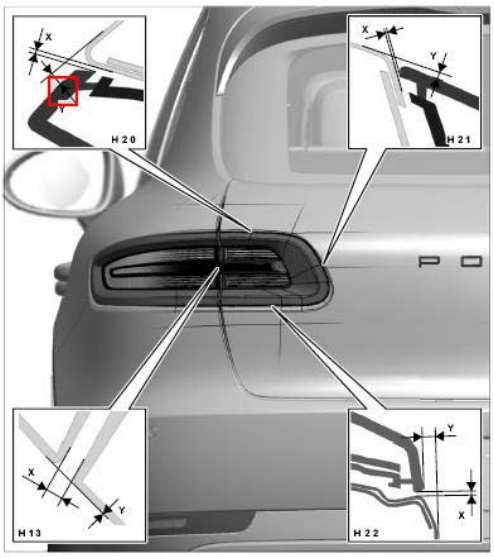
Inner gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 2 to rear lid (x)		Gap dimension	1 mm	+/-0.8 mm	



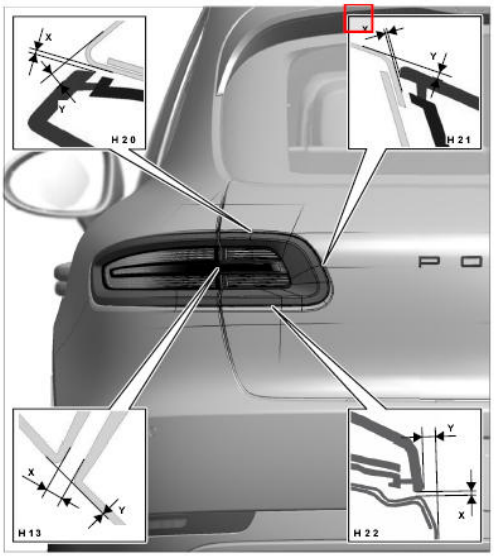
Inner gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 2 to rear lid (y)		Gap dimension	-4.5 mm	+/-0.5 mm	



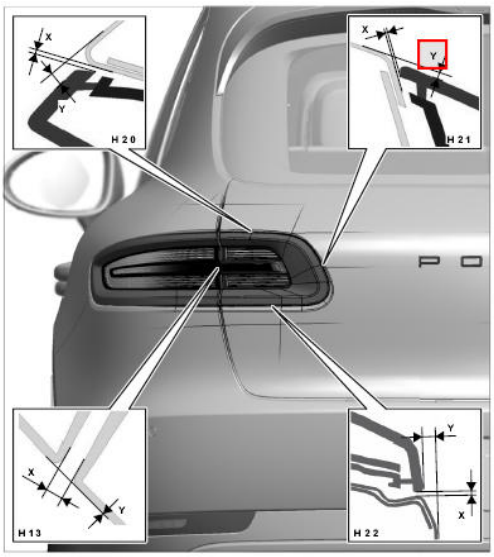
Inner gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 2 to rear lid (x)		Gap dimension	1 mm	+/-0.8 mm	



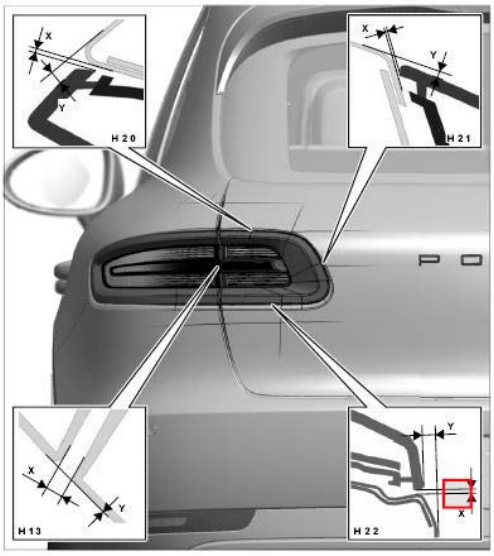
Inner gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 2 to rear lid (y)		Gap dimension	-2 mm	+/-0.5 mm	



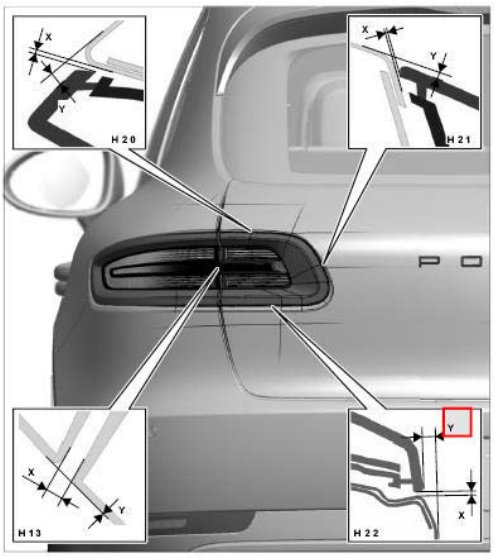
Inner gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 2 to rear lid (x)		Gap dimension	1 mm	+/-0.8 mm	



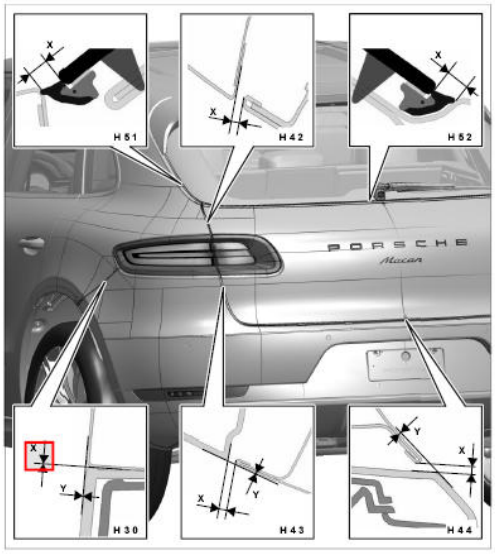
Inner gap dimensions for tail light

Tail/brake/direction indicator/reversing lights Part 2 to rear lid (y)		Gap dimension	-3.8 mm	+/-0.5 mm	



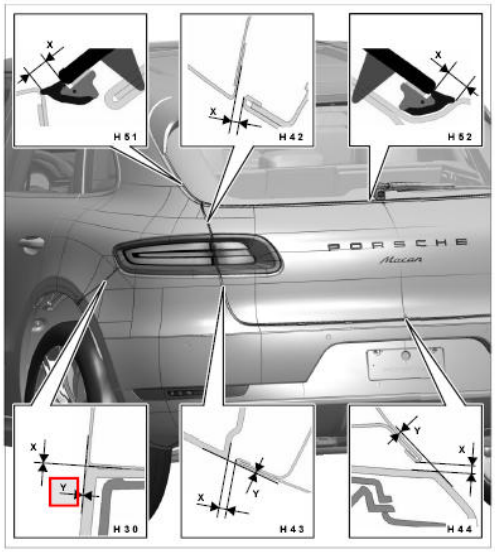
Gap dimensions for tail light

Rear apron to side panel (x)		Gap dimension	0 mm	+0.5 mm	



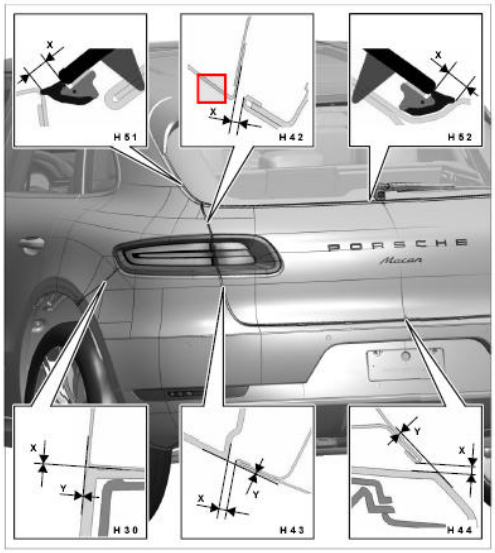
Gap dimensions for rear end

Rear apron to side panel (y)		Gap dimension	0 mm	+/-0.8 mm	



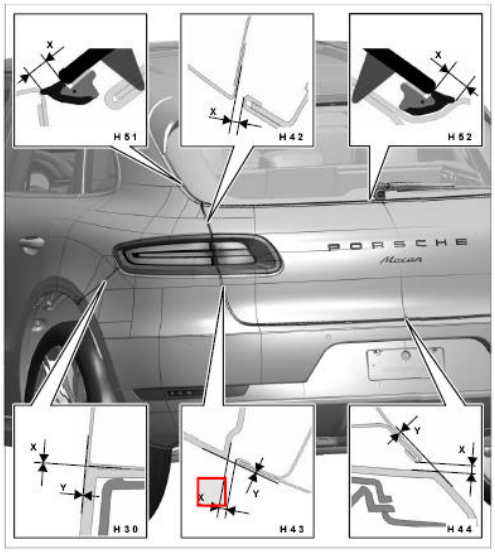
Gap dimensions for rear end

Rear lid to side panel (x)		Gap dimension	4 mm	+0.7 mm	-0.9 mm



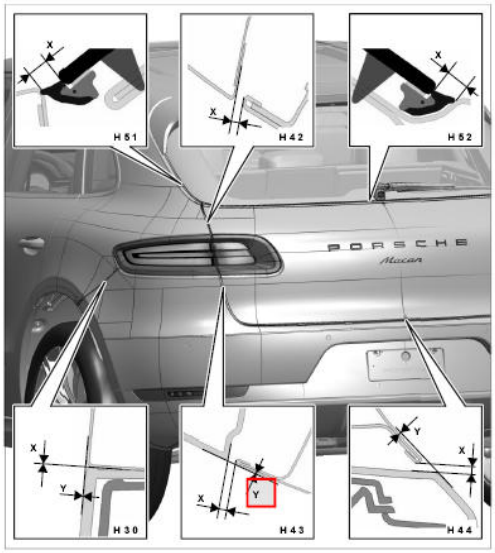
Gap dimensions for rear end

Rear lid to side panel (x)		Gap dimension	4 mm	+/-0.8 mm	



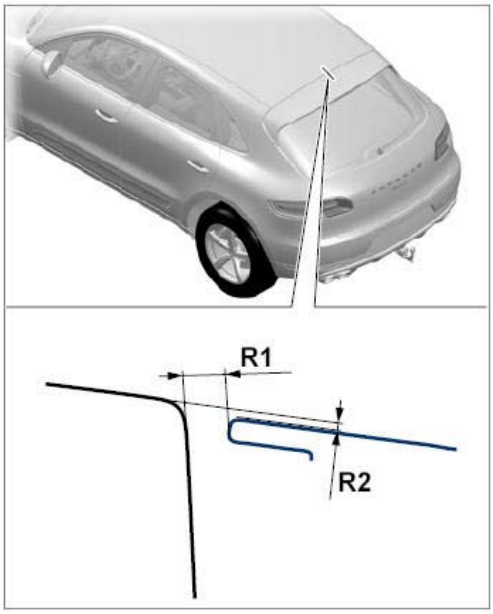
Gap dimensions for rear end

Rear lid to side panel (y)		Gap dimension	4 mm	+/-0.8 mm	



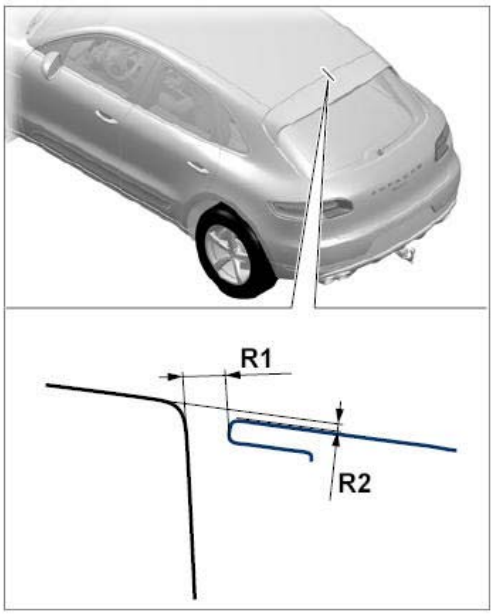
Gap dimensions for rear end

Rear lid/rear spoiler to roof	R1 (gap)	Gap dimension	6 mm	+/-1.1 mm	



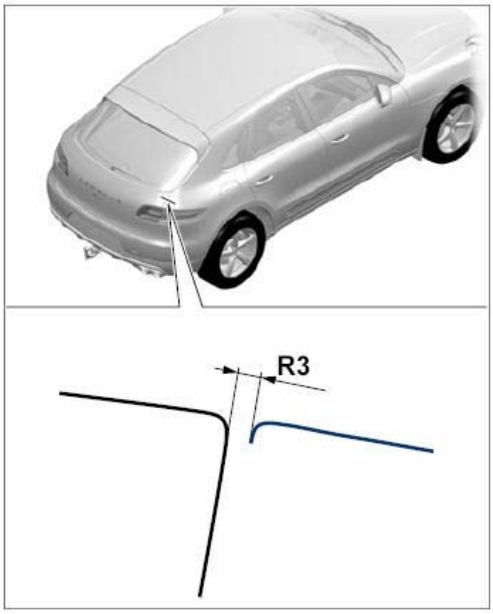
Rear lid/rear spoiler

Rear lid/rear spoiler to roof	R2 (offset)	Gap dimension	-1.5 mm	+/-1.1 mm	



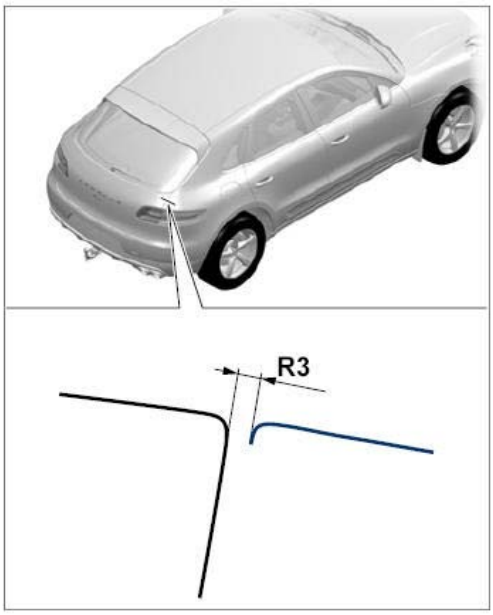
Rear lid/rear spoiler to roof

Rear lid to side panel	R3 (gap)	Gap dimension	4 mm	+0.7 mm	-0.9 mm



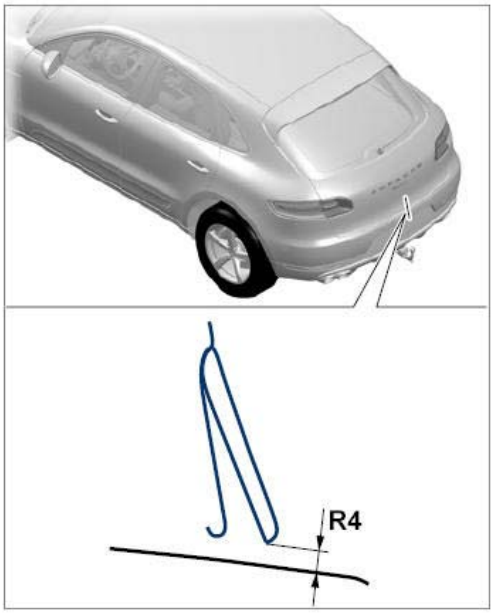
Rear lid to side panel

Rear lid to side panel	R3b (offset)	Gap dimension	0 mm	+/-0.6 mm	



Rear lid to side panel

Rear lid to rear apron	R4 (gap)	Gap dimension	4 mm	+/-0.8 mm	



Rear lid to rear apron

Overview of outer gap dimension for body

WM 5X00IN WORK SEQUENCE FOR ACCIDENT REPAIRS (ALL MODELS) > WORK SEQUENCE FOR ACCIDENT REPAIRS > PROCEDURE FOR ACCIDENT REPAIRS

1. Determine scope of damage
2. Expose the area to be repaired
3. Make an economic or technical decision: Should parts be repaired or replaced?
4. Determine the scope of replacement parts and order the parts

See "REPAIRS " below.

See "REPLACEMENT " below.

5. If necessary, prime and seal the seam areas
6. If necessary, renew the stone impact protection
7. Paint the repaired area
8. If necessary, touch up the undersealing
9. Seal cavities
10. Fit accessories

WM 5X00IN WORK SEQUENCE FOR ACCIDENT REPAIRS (ALL MODELS) > WORK SEQUENCE FOR ACCIDENT REPAIRS > REPAIR

1. Cover undamaged areas of the vehicle
2. Reshape damaged areas
3. Fill or apply body solder to reshaped areas
4. Apply fine filler on repair areas

WM 5X00IN WORK SEQUENCE FOR ACCIDENT REPAIRS (ALL MODELS) > WORK SEQUENCE FOR ACCIDENT REPAIRS > REPLACEMENT

1. Cover undamaged areas of the vehicle so that they are protected against fire
2. Disconnect battery
3. Pre-paint new parts from the inside
4. Roughly cut out damaged areas
5. Cut out remaining pieces
6. Fit new parts in, then check the gap dimensions with the accessories fitted
7. Protect panel flanges against corrosion
8. Weld in new parts
9. Grind visible weld seams flat; if necessary apply body solder or filler

WM 5X00IN PROCEDURE FOR DAMAGE DIAGNOSIS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
Measuring unit, professional	Workshop equipment	WE 1397		

WM 5X00IN PROCEDURE FOR DAMAGE DIAGNOSIS (ALL MODELS) > INSTRUCTIONS

Information

- Porsche AG recommends that you perform damage diagnosis using an electronic measuring system (e.g. Measuring unit, professional WE 1397).

Information

- A body is constructed so that it has deformation zones in the front and rear areas. These deformation zones enable absorption of impact energy through their special design. The bearing structure in these areas is adapted to provide optimum energy reduction in the event of a crash.
- Due to the vehicle dimensions in the side area of the body, deformation zones cannot be provided for absorbing energy. The impact energy can only be absorbed to a lesser extent here through the deformation of doors and pillars. This is also the case for the roof area where only the roof skin can absorb impact energy to a very small extent. In these areas, occupant protection is guaranteed by a rigid design of the passenger cell.
- The aim of this design is to absorb the impact energy in defined areas to keep the passenger cell as free of damage as possible in the event of a crash. If the passenger cell has been deformed as a result of a crash, the damage in this case can often only be repaired by replacing body parts.
- In general, an impact occurs diagonally or offset to the vehicle axle so that mixed forms are usually the result of a front and side impact or a rear and side impact. The deformation is not always restricted to the impact area. Due to inertia forces of masses, such as the chassis, drive line, occupants of the vehicle and load or the body itself, deformation can also occur in the opposite areas.
- The following work sequence is designed to help you to correctly determine the scope of damage to vehicles damaged in an accident.

WM 5X00IN PROCEDURE FOR DAMAGE DIAGNOSIS (ALL MODELS) > PROCEDURE FOR DAMAGE DIAGNOSIS

1. Identify impact points on the exterior panelling or wheels.
2. Remove accessories that restrict the view of the impact area.
3. Check unit mounts, chassis parts and steering parts for deformation and cracks.
4. Determine the scope of damage to the body.

   See: IDENTIFIABLE DEFORMATIONS ON THE BODY STRUCTURE

See: NO IDENTIFIABLE DEFORMATIONS ON THE BODY STRUCTURE

5. Repair vehicle, if necessary.

WM 5X00IN PROCEDURE FOR DAMAGE DIAGNOSIS (ALL MODELS) > IDENTIFIABLE DEFORMATIONS ON THE BODY STRUCTURE

1. Visual inspection of the structural parts for creasing and bending, starting from the point of impact toward the center of the vehicle
2. Visual inspection of the structural parts at the joints for gaping panel joints (e.g. entry area at the side member under the rubber seal of the door)
3. Check the body structure using an electronic measuring system or a straightening bench system.
4. Decide whether the vehicle is technically repairable
5. Decide whether the vehicle is economically repairable

   Repair vehicle, if necessary.

WM 5X00IN PROCEDURE FOR DAMAGE DIAGNOSIS (ALL MODELS) > NO IDENTIFIABLE DEFORMATIONS ON THE BODY STRUCTURE

1. Check seam joining line on the accessories

   → WM 5X00IN GAP DIMENSIONS
2. Check accessories for paint abrasion (accessories that were impacted during the crash)
3. Drive the vehicle onto a lifting platform and raise it. Measure screw points using an electronic measuring system (e.g. **Measuring unit, professional WE 1397**) and compare with the required values.
4. Determine the extent of any damage to chassis components

   Measure the chassis electronically if necessary

   → 449503 SUSPENSION ALIGNMENT, COMPLETE
5. Decide whether the vehicle has to be repaired

Repair the vehicle, if necessary.

WM 600619 REMOVING AND INSTALLING ROOF ASSEMBLY (PANORAMA ROOF) (ALL MODELS) > SUBSEQUENT WORK

1. Install headliner. → Installing headliner
2. Teach the end position. → 601419 REMOVING AND INSTALLING MOTOR FOR GLASS SLIDING ROOF

WM 600625 PROGRAMMING/TEACHING ROOF ASSEMBLY (PANORAMA ROOF) (ALL MODELS) > PROGRAMMING/TEACHING ROOF ASSEMBLY (PANORAMA ROOF) END POSITION

Information

The end positions are lost and must be re-taught in the following situations:

- After disconnecting or connecting the vehicle battery
- When the vehicle battery is completely flat or after jump-lead starting
- After emergency operation

- After changing the electric fuse
- After replacing the glass panel, motor, powered sunroof mechanism or sun blind

NOTE: Electrically moved components

- *Risk of damage to components*

→ Move objects out of the range of movement.

The force limiters are not available when storing the end positions. The panorama roof and sun blind therefore close with full force!

1. Park the vehicle and start the engine.

   Information

   When storing the end positions, always save the settings for the panorama roof and sun blind fully one after the other. If one of the processes is interrupted, it is not possible to start the process for the other drive mechanism.

2. Press the actuating button for the panorama roof forward towards Close and keep it pressed until the panorama roof is closed fully and has stopped moving. The process for storing the end position will start after approx. 10 seconds.
3. Press the actuating button for the sun blind forward towards Close and keep it pressed until the sun blind is closed fully and has stopped moving. The process for storing the end position will start after approx. 10 seconds.
4. Check that the panorama roof and sun blind operate correctly.

WM 601219 REMOVING AND INSTALLING SWITCH FOR SLIDING ROOF (ALL MODELS) > INFORMATION

1. The sliding roof switch is integrated into the front roof trim panel and cannot be replaced separately.

   → Removing front roof trim panel

WM 601419 REMOVING AND INSTALLING MOTOR FOR GLASS SLIDING ROOF (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Glass sunroof motor to glass sunroof frame	Internal Torx screw, M5 x 28, replace	Tightening torque	2 Nm (1.5 ftlb.)		

WM 601419 REMOVING AND INSTALLING MOTOR FOR GLASS SLIDING ROOF (ALL MODELS) > PRELIMINARY WORK

1. Detach front roof trim panel with lines still connected from the headliner. → Removing front roof trim panel

WM 601419 REMOVING AND INSTALLING MOTOR FOR GLASS SLIDING ROOF (ALL MODELS) > REMOVING MOTOR FOR GLASS SLIDING ROOF

WARNING: Electrically moved components

- *Danger of limbs being trapped or severed*

→ Switch off electric power to drive motor.

→ Make sure it does not switch on again.

→ Check that there is no electric charge.

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

Information

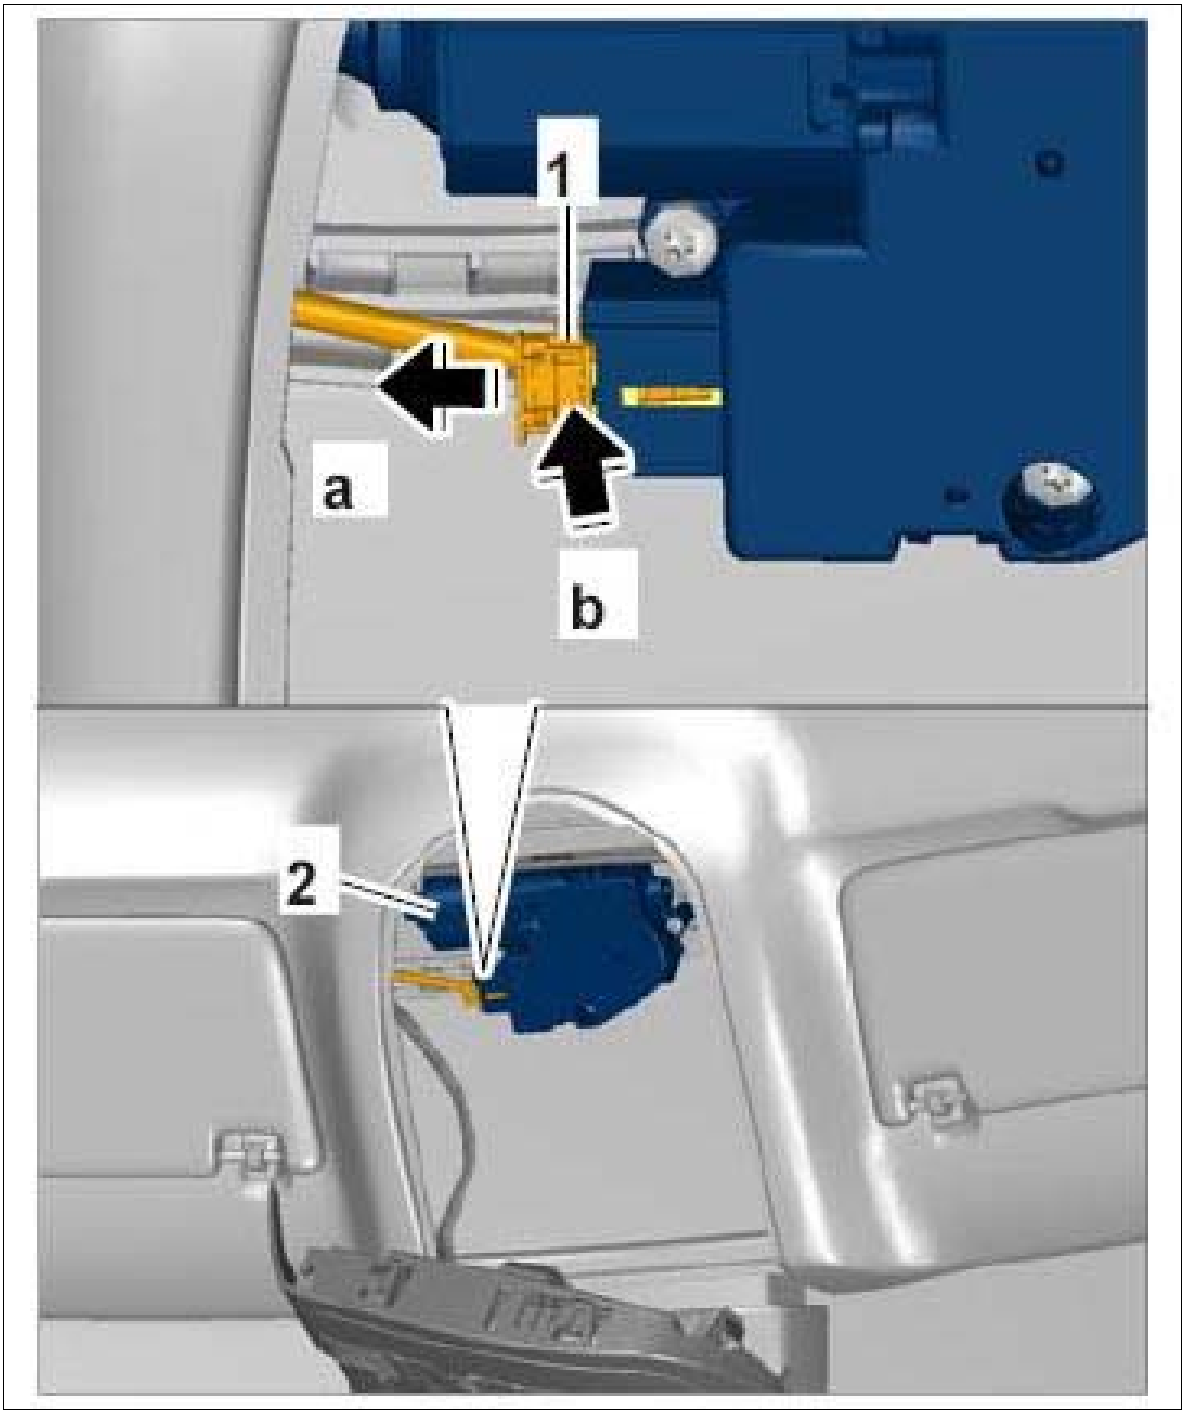
The glass sliding roof motor is located on the glass sliding roof frame at the front.

The sun blind motor is located on the glass sliding roof frame at the rear.

The control units for the panorama roof system are installed in the glass sliding roof motor and sun blind motor.

1. Switch off ignition and pull remote control out of ignition lock.
2. Pull out locking mechanism on electric plug connection **-1- (-a-)** , press release **-b-** and pull electric plug connection off the motor for the glass sliding roof **-2-** .

Fig 1: Disconnecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew fastening screws **-1-** and remove motor for glass sliding roof **-2-** from the glass sliding roof frame.

WM 607019 REMOVING AND INSTALLING SUN BLIND (ALL MODELS) > INSTALLING SUN BLIND

1. Installation is performed in reverse order to removal.
2. Tighten fastening screw for sun blind to **Tightening torque 2.5 Nm (2 ftlb.)** until secure.

WM 607019 REMOVING AND INSTALLING SUN BLIND (ALL MODELS) > SUBSEQUENT WORK

Information

After installing the sun blind, check that it moves perfectly and smoothly. To do this, move the sun blind drive mechanism forwards and backwards at the motor by hand by actuating it manually using a commercially available hexagon wrench and check that the sun blind fabric folds and moves correctly.

1. Install rear panel. → Installing Rear Sliding-Roof Panel
2. Install headliner. → Installing headliner
3. **Carry out standardization if necessary**
4. Switch on ignition.
5. Reinitializes end positions of the sun blind.
    1. 5.1. Press sun blind button forward and keep it pressed.
    2. 5.2. The sun blind closes as far as its limit stop and then opens again.
    3. 5.3. The sun blind button must remain pressed for the entire duration of the standardization run.
    4. 5.4. Release the sun blind when the standardization run is complete.

WM 607219 REMOVING AND INSTALLING MOTOR FOR SUN BLIND (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Sun blind motor to glass sunroof frame	Internal Torx screw, M5 x 28, replace	Tightening torque	2 Nm (1.5 ftlb.)		

WM 607219 REMOVING AND INSTALLING MOTOR FOR SUN BLIND (ALL MODELS) > PRELIMINARY WORK

1. Remove headliner. → Removing headliner

WM 607219 REMOVING AND INSTALLING MOTOR FOR SUN BLIND (ALL MODELS) > REMOVING MOTOR FOR SUN BLIND

WARNING: Electrically moved components

- *Danger of limbs being trapped or severed*

→ Switch off electric power to drive motor.

→ Make sure it does not switch on again.

→ Check that there is no electric charge.

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

Information

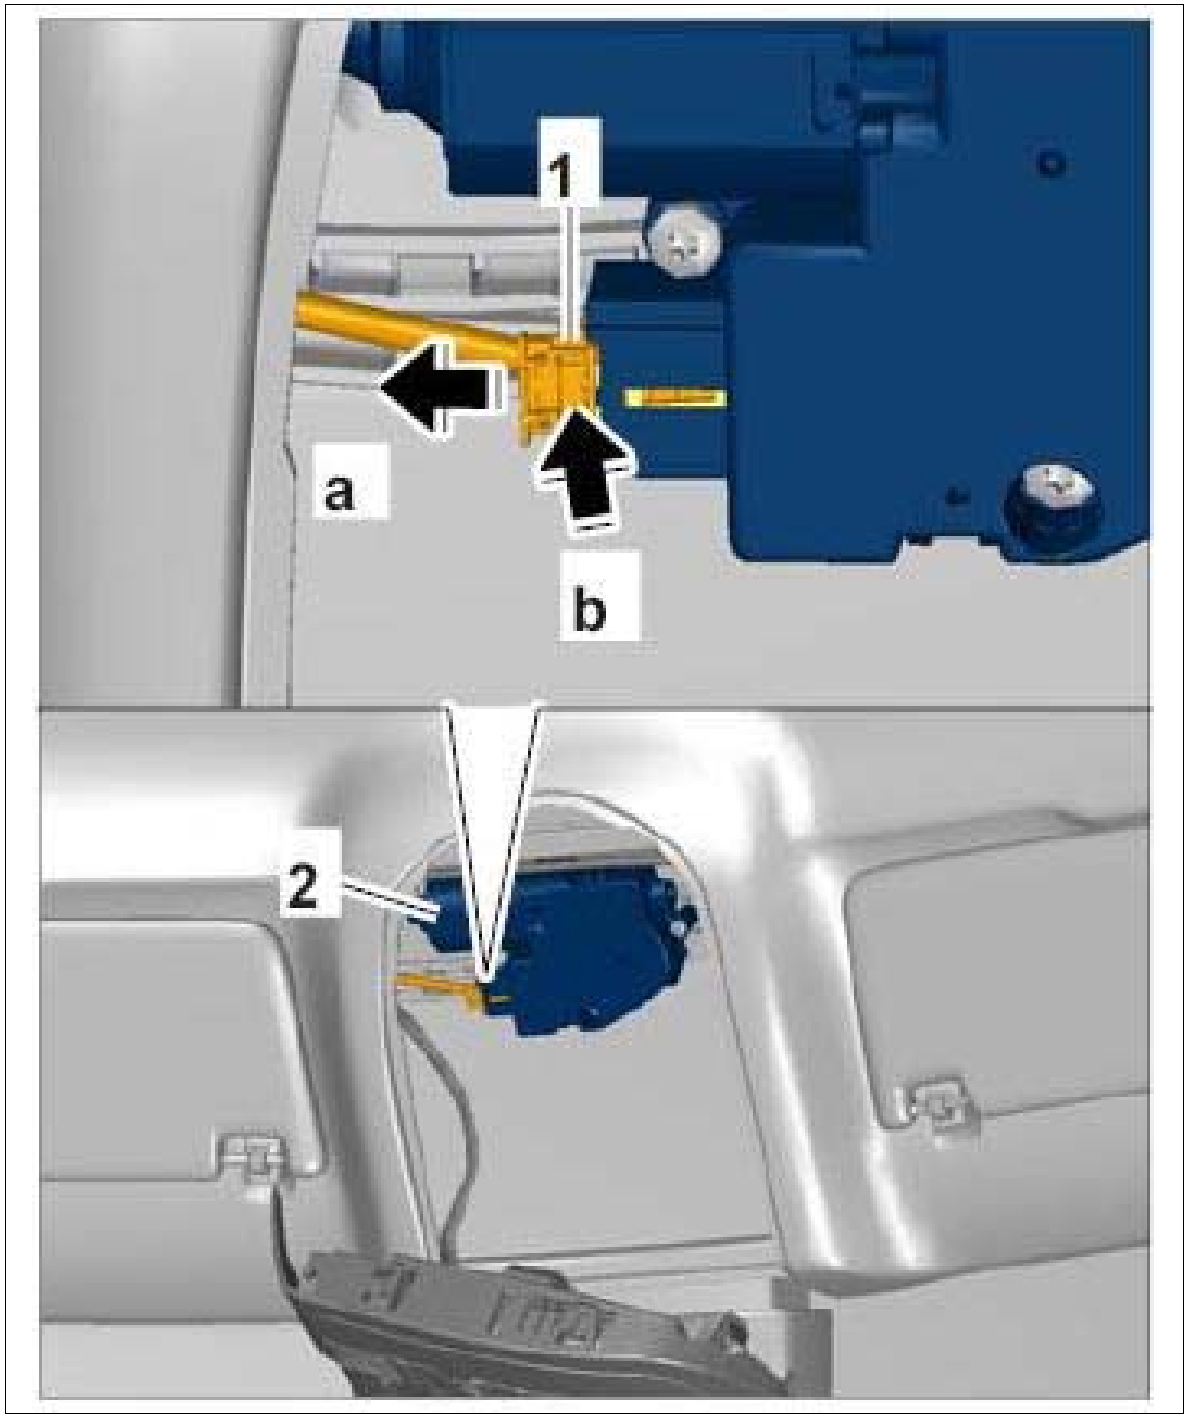
The glass sliding roof motor is located on the glass sliding roof frame at the front.

The sun blind motor is located on the glass sliding roof frame at the rear.

The control units for the panorama roof system are installed in the glass sliding roof motor and sun blind motor.

1. Switch off ignition and pull remote control out of ignition lock.
2. Pull out locking mechanism on electric plug connection **-1- (-a-)** , press release **-b-** and pull electric plug connection off the motor for the sunblind **-2-** .

Fig 1: Disconnecting Sun Blind Motor Electric Plug Connection (Glass Sliding Roof Motor)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew fastening screws **-1-** and remove motor for sun blind **-2-** from the glass sliding roof frame.

WM 607219 REMOVING AND INSTALLING MOTOR FOR SUN BLIND (ALL MODELS) > INSTALLING MOTOR FOR SUN BLIND

WARNING: Electrically moved components

- *Danger of limbs being trapped or severed*

→ Switch off electric power to drive motor.

→ Make sure it does not switch on again.

→ Check that there is no electric charge.

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes

approved by Porsche.

- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

1. Installation is performed in reverse order to removal.
2. Replace and tighten fastening screws securing motor for sun blind to glass sliding roof frame. **Tightening torque 2 Nm (1.5 ftlb.)**

WM 607219 REMOVING AND INSTALLING MOTOR FOR SUN BLIND (ALL MODELS) > SUBSEQUENT WORK

1. Install headliner. → Installing headliner

A - Removal kit for flush bonded windows VAG 1474 B, contains set components A1-A9

B - Cutting thread

A1 - Guide rail

A2 - Cutting tool (wire holder)

A3 - Spooling device

A4 - Awl

A5 - Guide rail

A6 - Spatula

A7 - Steering roller with arm bracket

A8 - Handle

A9 - Square cutting wire

WM 641219 REMOVING AND INSTALLING WINDSCREEN (ALL MODELS) > REMOVING WINDSCREEN

WARNING: Vehicle windows removed and installed incorrectly

- *Danger of cuts*

- *Risk of eye injuries*

→ Wear personal protective gear.

→ Always shut off power supply when replacing cutting knife.

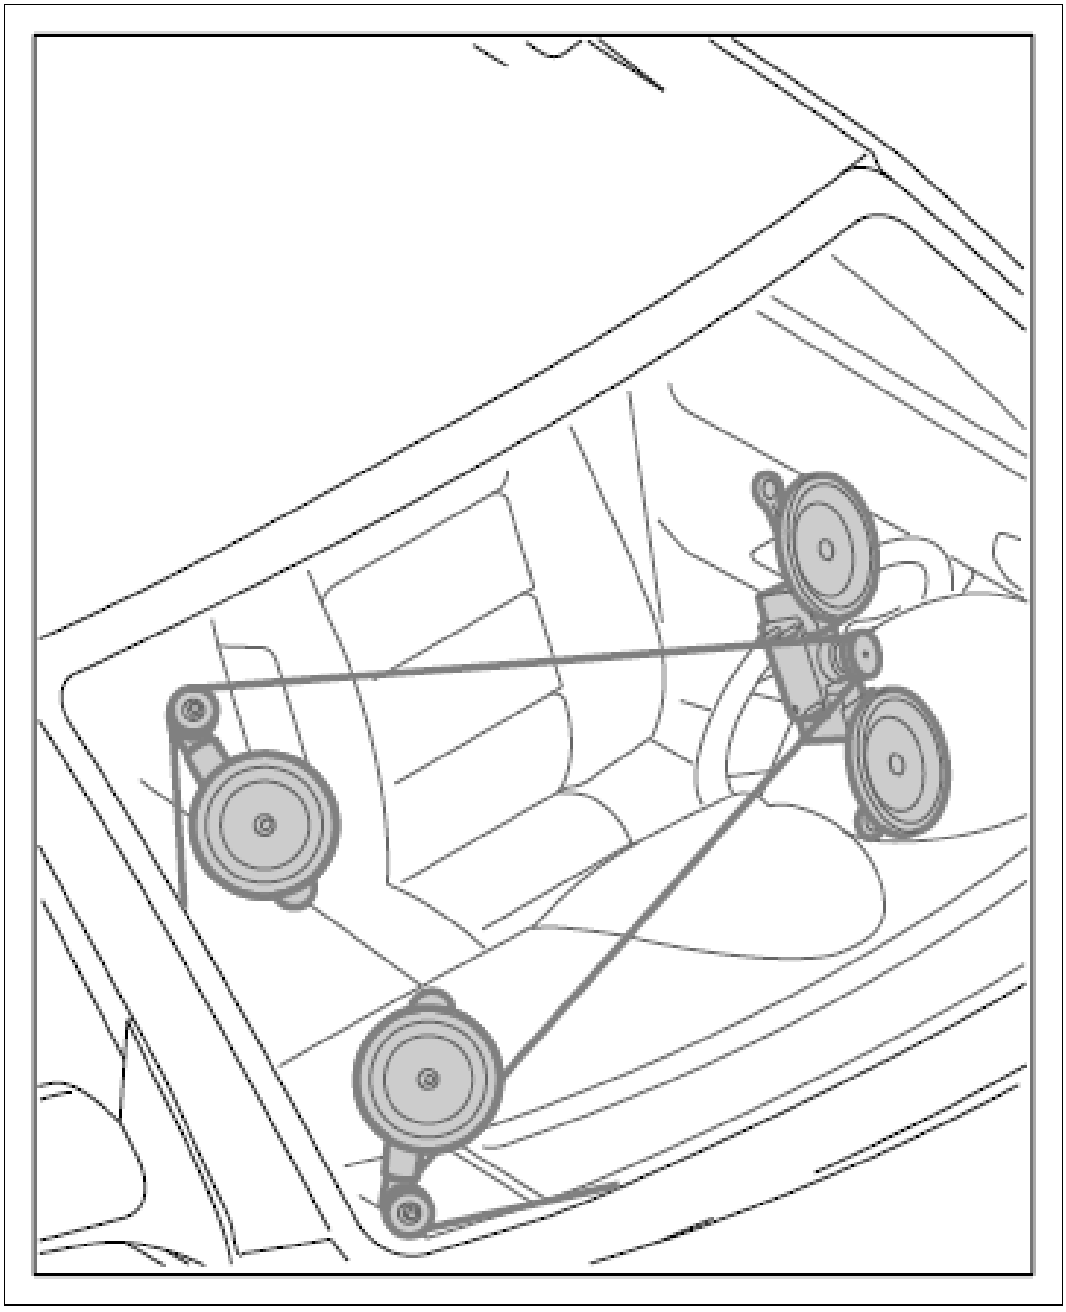
1. Remove the windscreen.

    1. 1.1. Remove the windscreen using the cutting-wire separating device.

        Information

        1. The procedure for removing car windows is described in → 6X00IN GENERAL INFORMATION ON REMOVING CAR WINDOWS.

Fig 1: Removing Windscreen



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 641219 REMOVING AND INSTALLING WINDSCREEN (ALL MODELS) > PREPARING WINDOW APERTURE FOR INSTALLATION

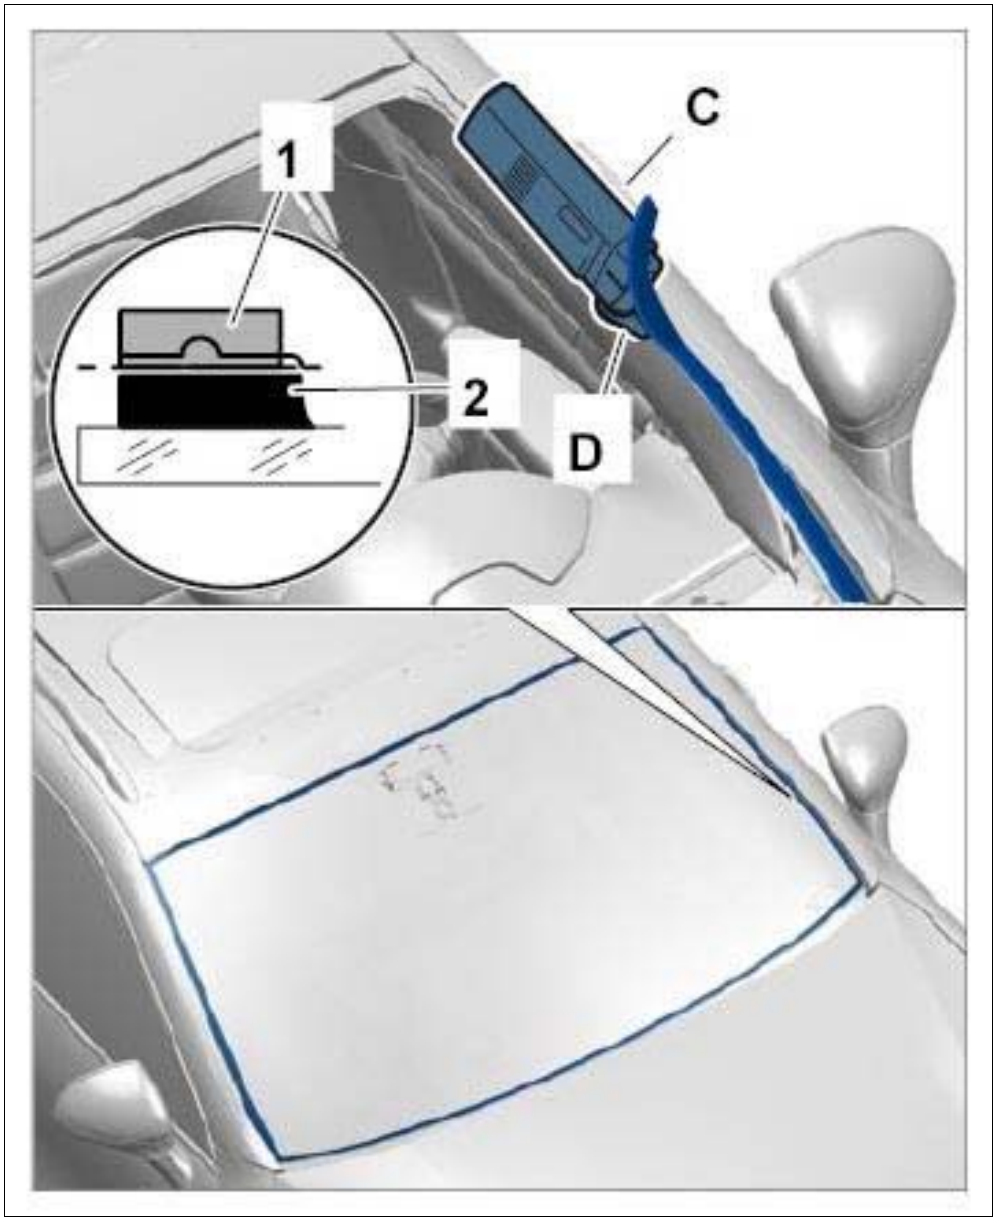
1. Remove adhesive from the body.

    1. 1.1. When removing adhesive residue **-1-** from the body using the cutting tool **-C-** and flashing knife **-D-** , ensure that only a surface coating of adhesive remains **-2-** .

    Information

1. The surface coating of adhesive residue helps new adhesive to stick. Keep cut surfaces clean and free of grease and do not clean with cleaning solution.

   Fig 1: Removing Adhesive



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

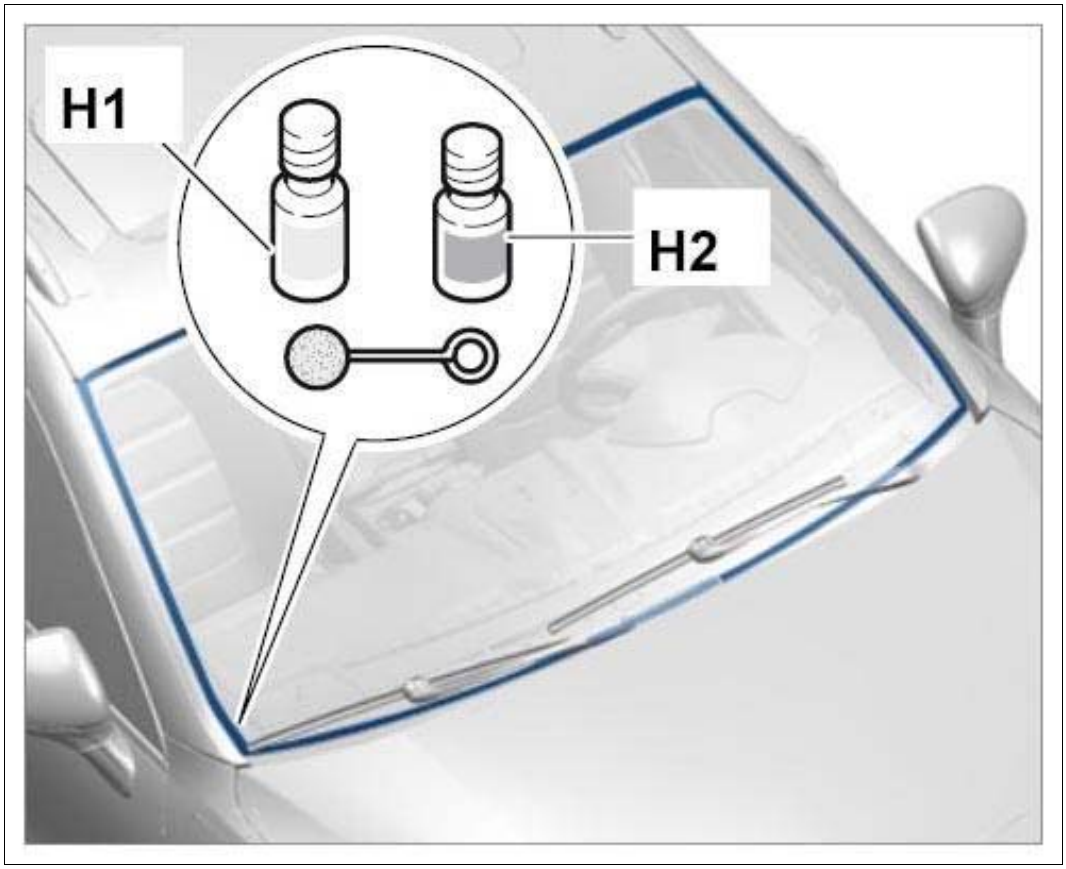
2. Clean and prime paint damage and newly built-up paint surfaces in the window aperture of the body.

    1. 2.1. Clean new paint surfaces and damage to the top coat paint in the non-visible area of the window aperture in the body with cleaning solution **-H1-** and touch up with primer **-H2-** .

       Information

        1. A drying time of at least 10 minutes must be observed between cleaning the bonding surface and applying primer! Always ensure that no cleaning solution residues remain on the body.

Fig 2: Cleaning Window Aperture And Activating Adhesive



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

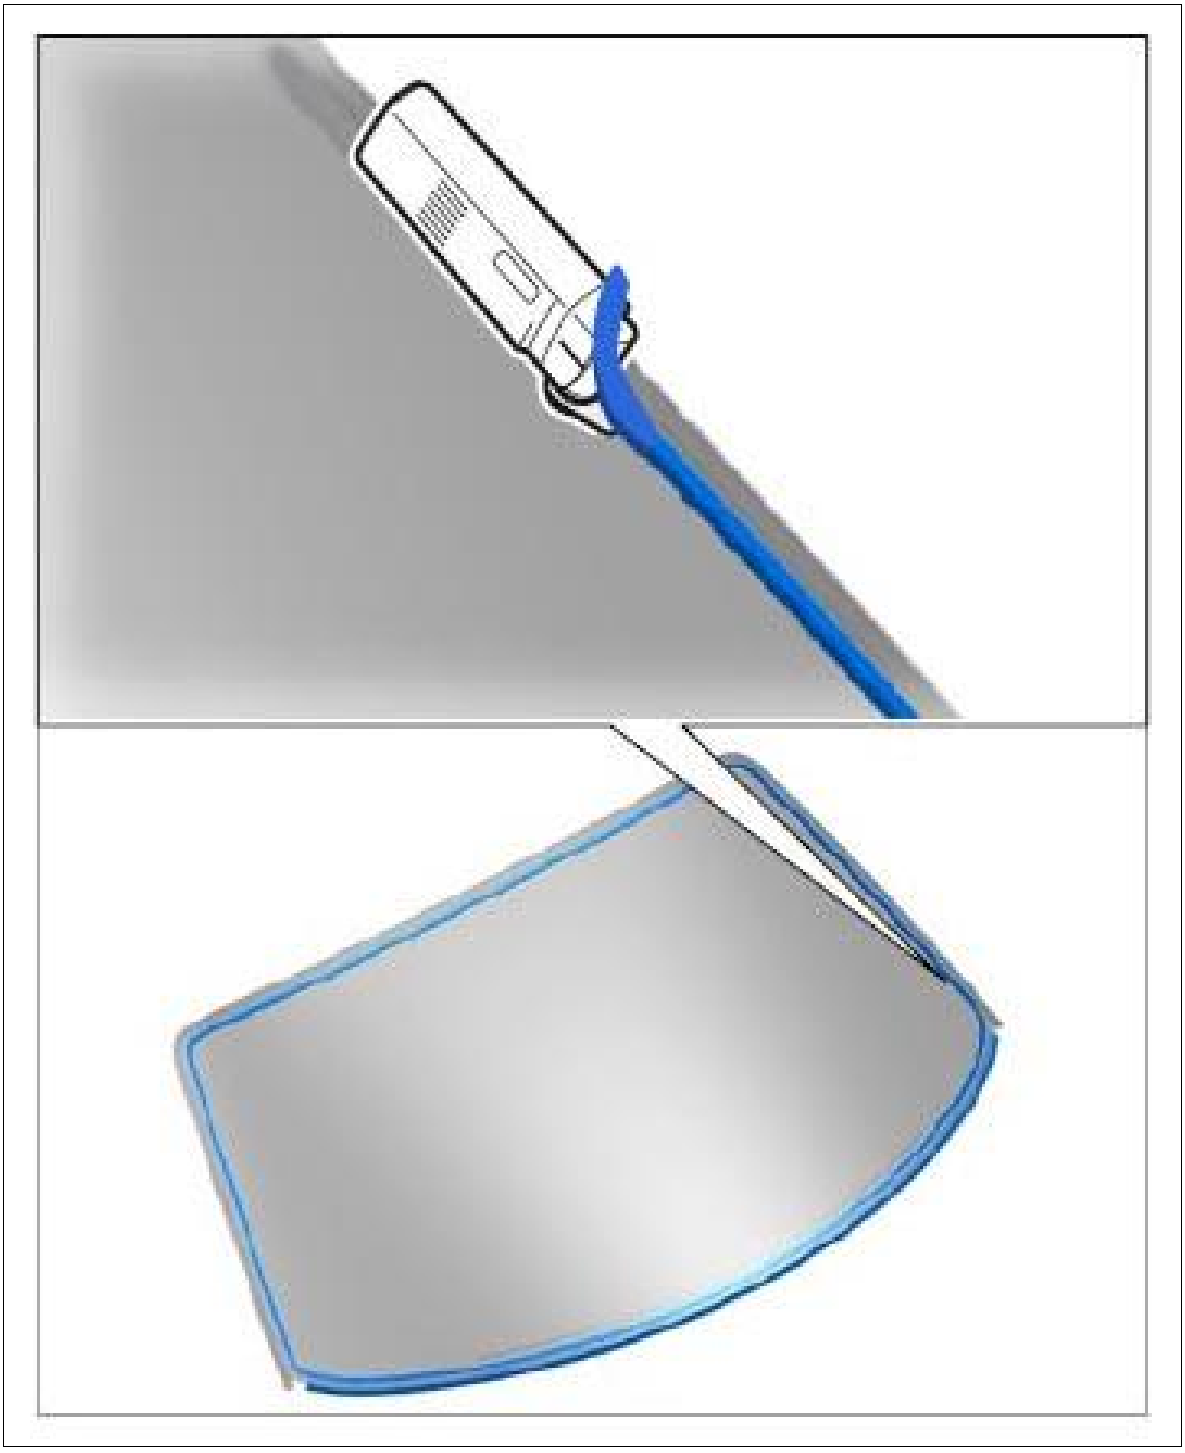
WM 641219 REMOVING AND INSTALLING WINDSCREEN (ALL MODELS) > PREPARING WINDSCREEN FOR INSTALLATION > PREPARING WINDSCREEN FOR INSTALLATION (RE-INSTALLATION ONLY)

Information

- The removed windscreen can be reinstalled if there was no prior damage to the windscreen and the windscreen was removed without damage.

1. Remove adhesive from the windscreen.

Fig 1: Removing Adhesive From Windscreen



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Fit cutter **-C-** with the flashing knife **-D-** and remove adhesive residue from the windscreen, ensuring that a surface coating of adhesive remains.

   Information

   1. The remaining adhesive helps new adhesive to stick. Keep cut surfaces clean and free of grease and do not clean with cleaning solution.

2. Check the foam element around the chassis number for damage and replace it if necessary.

3. Activate the bonding section of the windscreen.

    1. 3.1. During long idle periods, apply activator to the adhesive residue that was cut back.

        Fig 2: Applying Activator

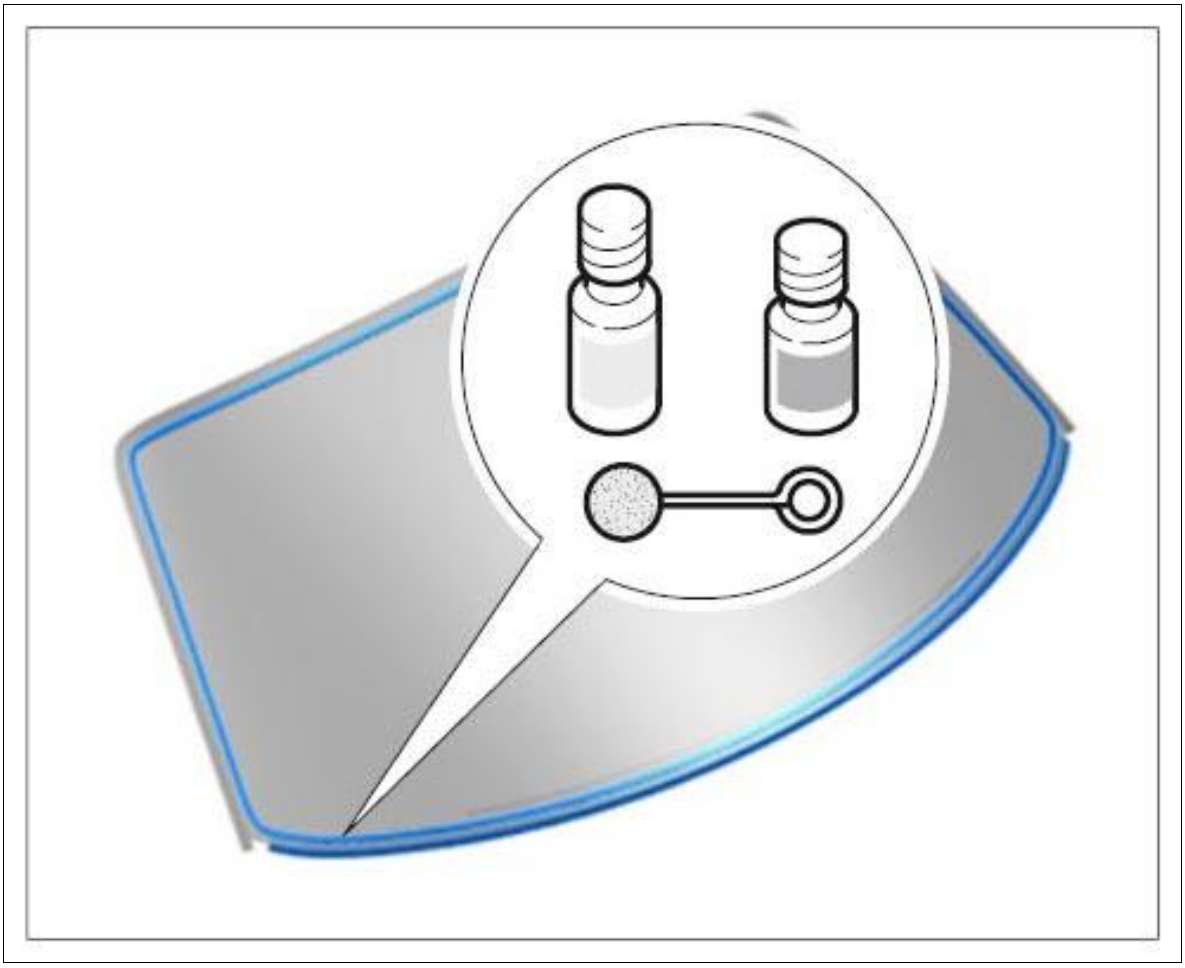
WM 641219 REMOVING AND INSTALLING WINDSCREEN (ALL MODELS) > PREPARING WINDSCREEN FOR INSTALLATION > PREPARING WINDSCREEN FOR INSTALLATION (NEW WINDSCREEN)

1. Clean and prime the window.

Fig 1: Cleaning Windscreen



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Clean glass with cleaning solution.
2. 1.2. Apply primer to the marked area of the window flange.

Information

1. A ventilation period of at least 10 minutes must be observed between the cleaning of the glass and the application of primer! No cleaning solution residues may remain on the windscreen.

WM 641219 REMOVING AND INSTALLING WINDSCREEN (ALL MODELS) > INSTALLING WINDSCREEN

Information

- Only with new windscreens

Information

- The removed windscreen can be reinstalled if there was no prior damage to the windscreen and

the windscreen was removed without damage.

Information

- Two persons are needed to insert and adjust the windscreen.

⚠ *CAUTION: Danger of material damage if specified curing time of adhesive is not observed! In order to ensure that the bonded joint is sufficiently strong, the following conditions must be adhered to:*

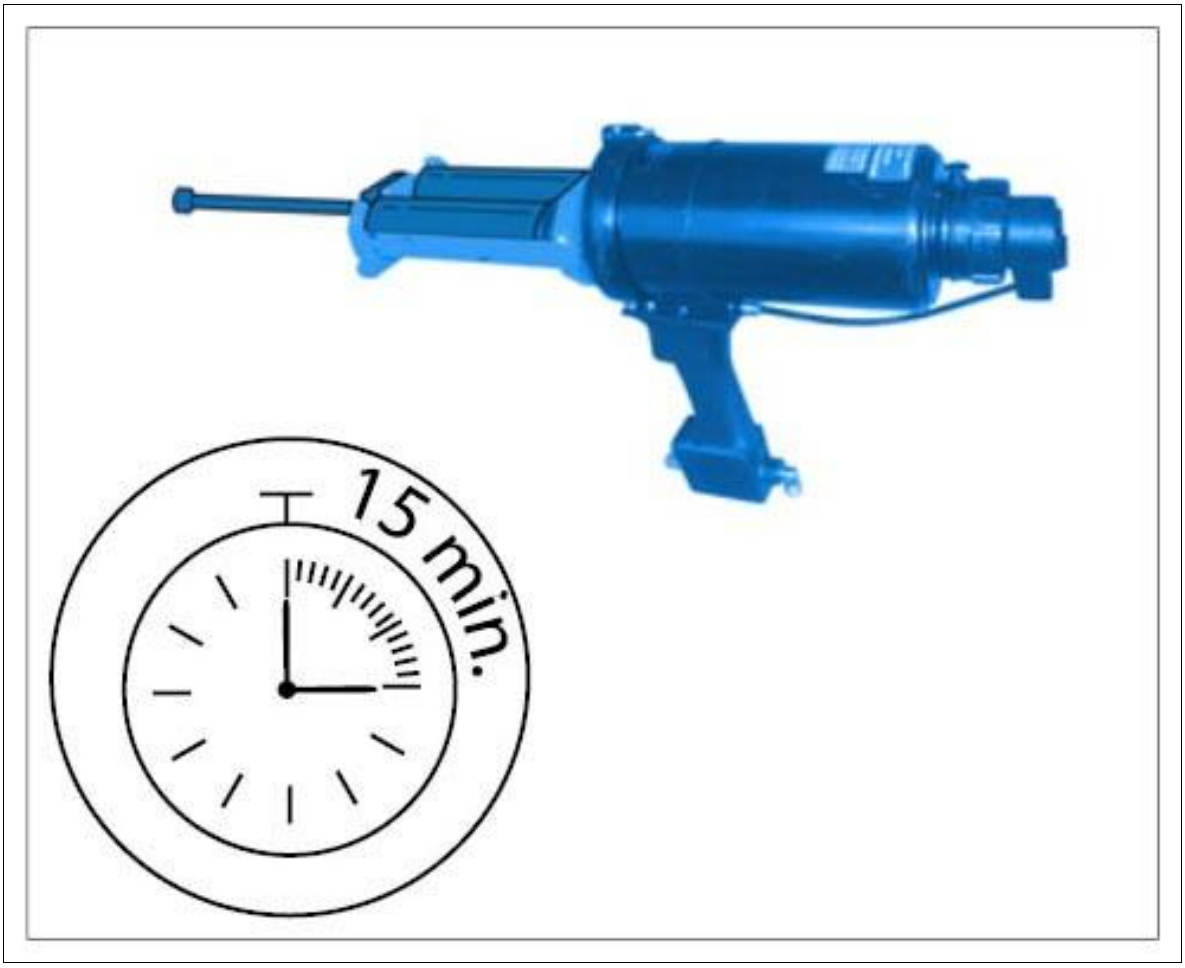
- *The vehicle must not be used until the curing time has elapsed.*
- *Curing time: 2 hours*
- *Temperature: at least 10 °C*
- *Fixing time: approx. 1 hour*

1. Prepare 2-component adhesive for processing. → 6X00IN WORKING WITH PORSCHE 2-COMPONENT WINDOW ADHESIVE

   Information

   1. The adhesive has an open time of -15 min- , which means that the bonding material must be applied and the component must be affixed within this period of time.
   2. When applying the adhesive, it is essential to ensure that the adhesive bead overlaps by approx. 30 mm at the beginning and at the end.

Fig 1: Identifying Adhesive Bead



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

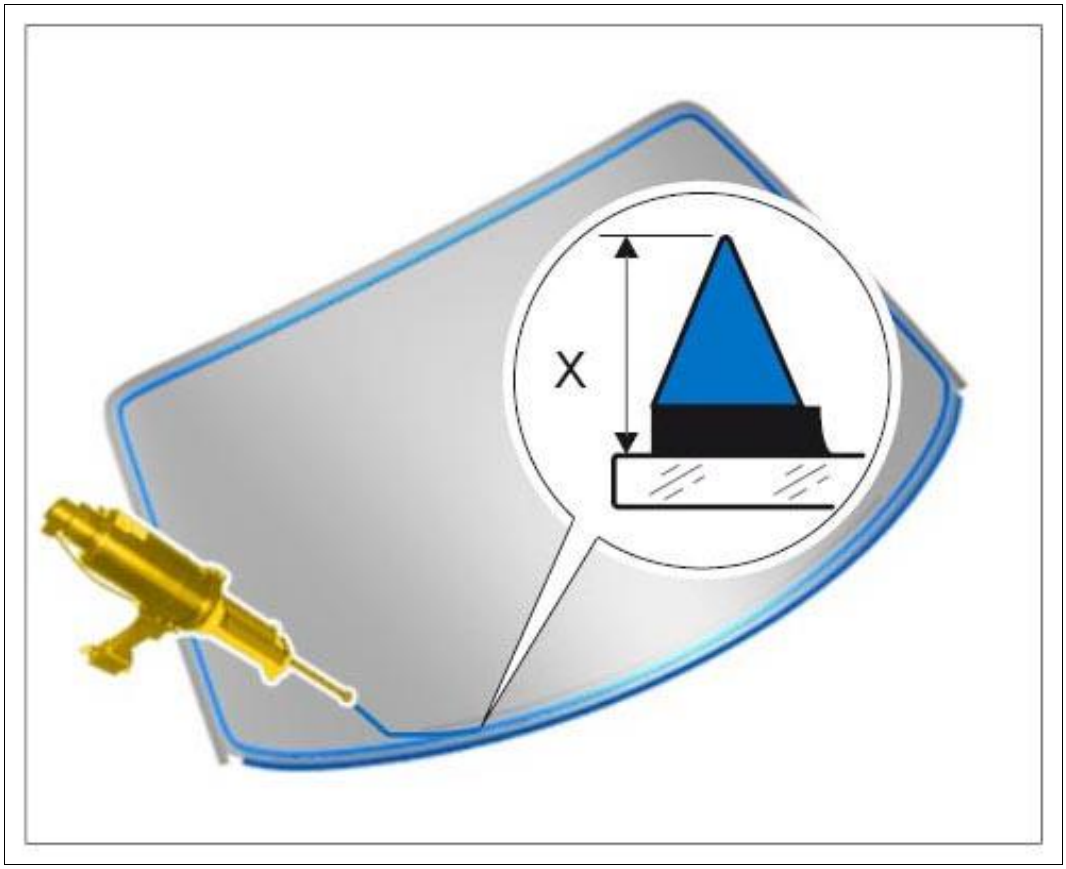
Information

1. To ensure that the substance is completely mixed, apply a 30-mm long bead of fresh adhesive to a piece of cardboard before processing.

2. Apply adhesive to the windscreen.

    1. 2.1. Using a bonding gun **-A-** , apply 2-component adhesive to the rear window along the preliminary coat and on the primer in the form of a triangular bead measuring **-X = approx. 15 mm-** .

Fig 2: Applying Adhesive To Windscreen



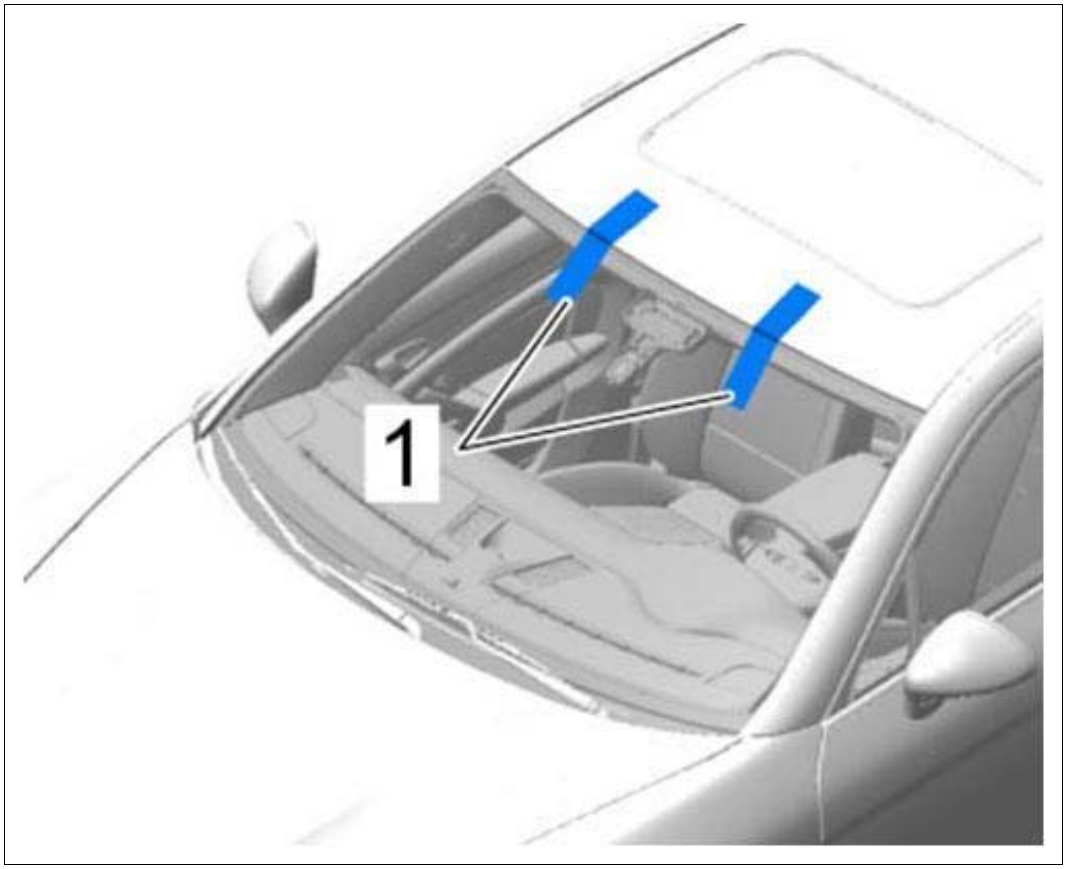
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Insert the windscreen into the body.
    1. 3.1. Affix suction cups to the windscreen.
    2. 3.2. Guide the windscreen into the window aperture.
    3. 3.3. Push the windscreen up against the seal.
    4. 3.4. Insert the windscreen at the sides of the window aperture and lower it (**do not press at the sides**).
    5. 3.5. Press the bottom of the windscreen onto the body as far as the guide stop.
    6. 3.6. Adjust gap dimension of windscreen with respect to the roof. → 641219 REMOVING AND INSTALLING WINDSCREEN

        Information

        1. Only if the windscreen is re-installed
    7. 3.7. Secure the windscreen with adhesive tape **-1-** to prevent it from slipping.

Fig 3: Securing Windscreen



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Adhesive that has oozed out must be removed immediately and the affected fields of vision must be cleaned using cleaning solution **-H1-** .

WM 642949 REWORKING (COATING) FRONT CORNER WINDOW PANE (ALL MODELS) > GENERAL WARNING NOTES > WARNING NOTE FOR HYDROPHOBIC WINDOW

NOTE: Smears

- *Impaired vision and dazzling*

→ A coating may only be applied to the side windows.

→ Never apply a coating on the windscreen in particular.

WM 642949 REWORKING (COATING) FRONT CORNER WINDOW PANE (ALL MODELS) > PRELIMINARY WORK

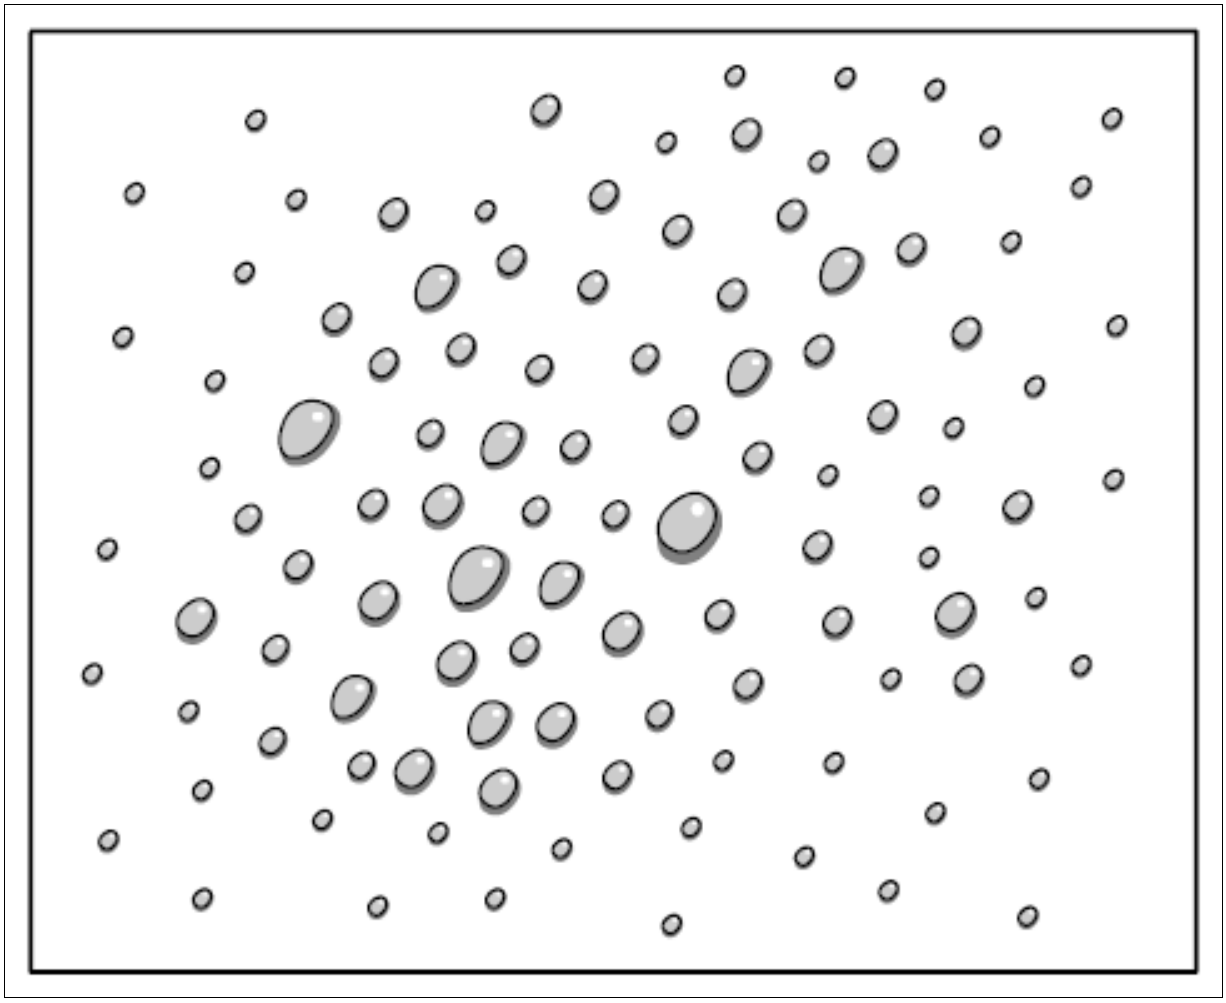
Information

- The hydrophobic coating is extremely durable. If the hydrophobic characteristics are reduced, a new coating can be applied to the windows without any special measures.
- Check whether new coating needs to be applied by examining drops of water on the windows.

Spray on water using a water spray bottle with an atomiser and check the hydrophobic coating by examining the drops.

- Drop size if hydrophobic coating is OK

  Fig 1: Identifying Drop Size - Hydrophobic Coating OK



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Drop size if coating is worn.

Fig 2: Identifying Drop Size - Hydrophobic Coating Worn

WM 642949 REWORKING (COATING) FRONT CORNER WINDOW PANE (ALL MODELS) > CHECKING WINDOW GLASS

Information

Mixed hydrophobic coating agent must be used within 24 hours!

1. Pour the entire contents of the Component 2 bottle into the Component 1 bottle.
2. Close the bottle tightly again and shake well immediately for at least three minutes.

WM 642949 REWORKING (COATING) FRONT CORNER WINDOW PANE (ALL MODELS) > CHECKING WINDOW GLASS > CLEANING WINDOW SURFACES

Information

The window must be coated immediately after being polished.

1. Clean the window using commercially available glass cleaner.
2. Shake the polish well before use.
3. Dampen polishing cloths with water, apply polish and buff for several minutes.
4. Allow the film of polish to dry and then wipe it off completely.

WM 642949 REWORKING (COATING) FRONT CORNER WINDOW PANE (ALL MODELS) > APPLYING COATING

Information

- The hydrophobic coating must not come into contact with water or other fluids for at least 30 minutes after applying the coating.
  1. Apply hydrophobic coating agent as a flat liquid film and rub immediately and uniformly with a paper towel.
  2. A grey fog forms on the treated surface following application. Polish off this grey fog completely using a new, dry and clean paper towel.
  3. The coating must not come into contact with water or other fluids for at least 30 minutes.
- Dried-on coating agent can be softened by rubbing it with the cloth soaked in coating agent and then wiping it off with a clean paper towel.

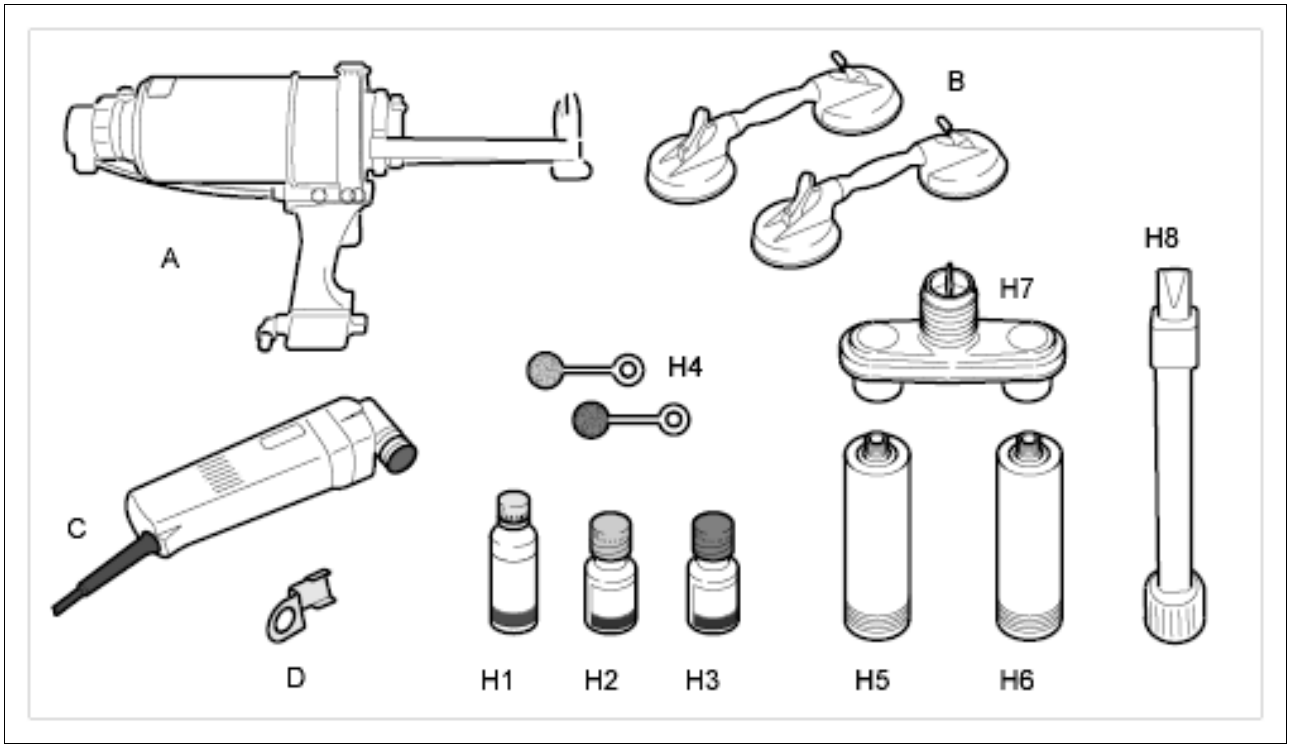
WM 648619 REMOVING AND INSTALLING REAR WINDOW (ALL MODELS) > TOOLS AND MATERIALS

The following tools and materials are required for removing and installing the rear window with 2-component adhesive:

Fig 1: Identifying Special Tools Kit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

A - Double cartridge gun VAS 5237

B - Suction cups VAG 1344

C - Special electric cutter (fine) VAG 1561 A

D - Flashing knife, U-type 639.031.130.22

H - 2-component window adhesive 000.043.300.94, contains set components H1-H8

H1 - Cleaning solution

H2 - Primer

H3 - Activator

H4 - Swab

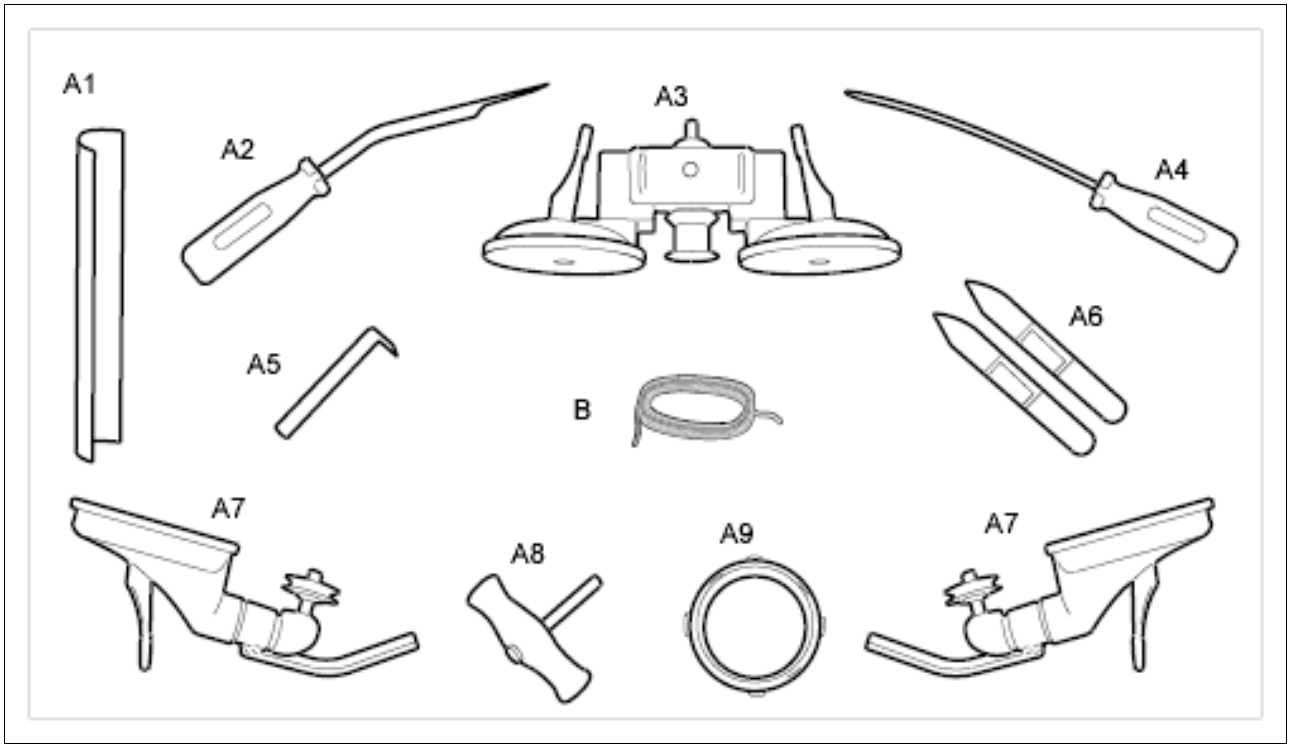
H5 - Cartridge, component A

H6 - Cartridge, component B

H7 - Mixing nozzle

H8 - Processing nozzle

Fig 2: Identifying Special Tools Kit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

A - Removal kit for flush bonded windows VAG 1474 B, contains set components A1-A9

B - Cutting thread

A1 - Guide rail

A2 - Cutting tool (wire holder)

A3 - Spooling device

A4 - Awl

A5 - Guide rail

A6 - Spatula

A7 - Steering roller with arm bracket

A8 - Handle

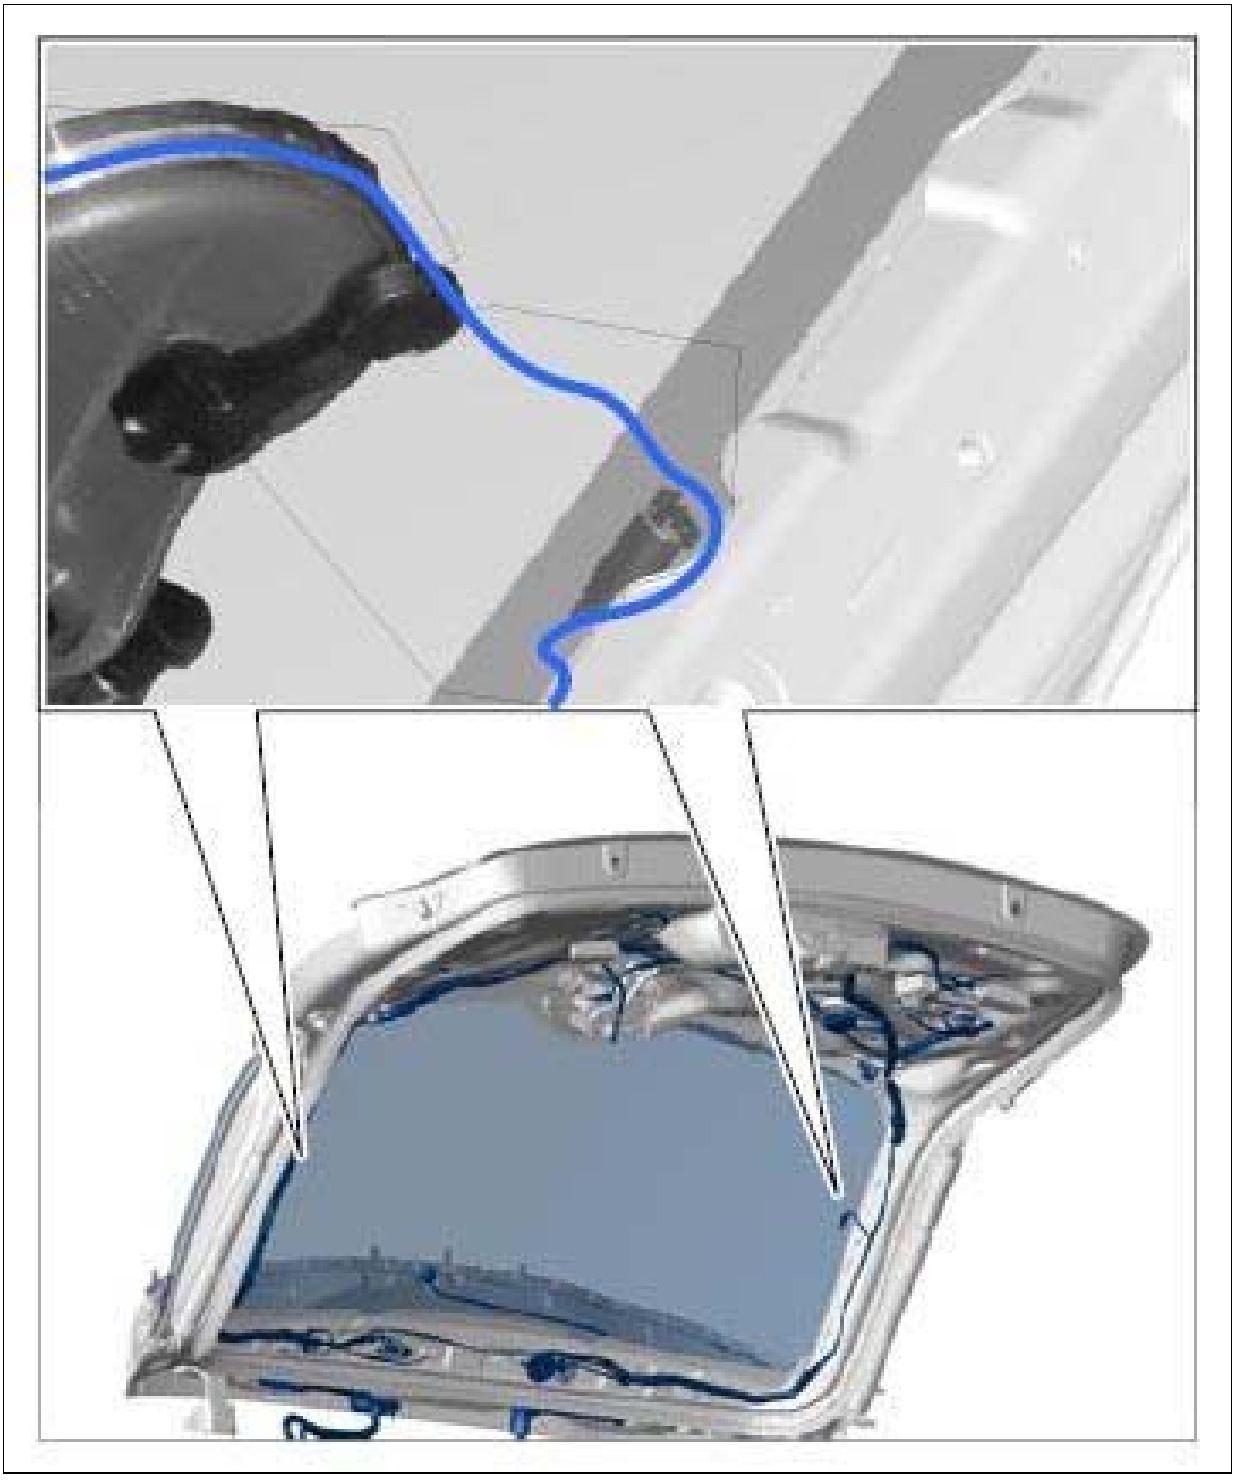
A9 - Square cutting wire

WM 648619 REMOVING AND INSTALLING REAR WINDOW (ALL MODELS) > REMOVING REAR WINDOW

Information

- Make sure not to damage the heated rear window connections when removing the glass with the cutting wire.
- Cut up to just before the connection.
- Slacken the cutting wire.
- Guide the cutting wire past the connection on the inside.

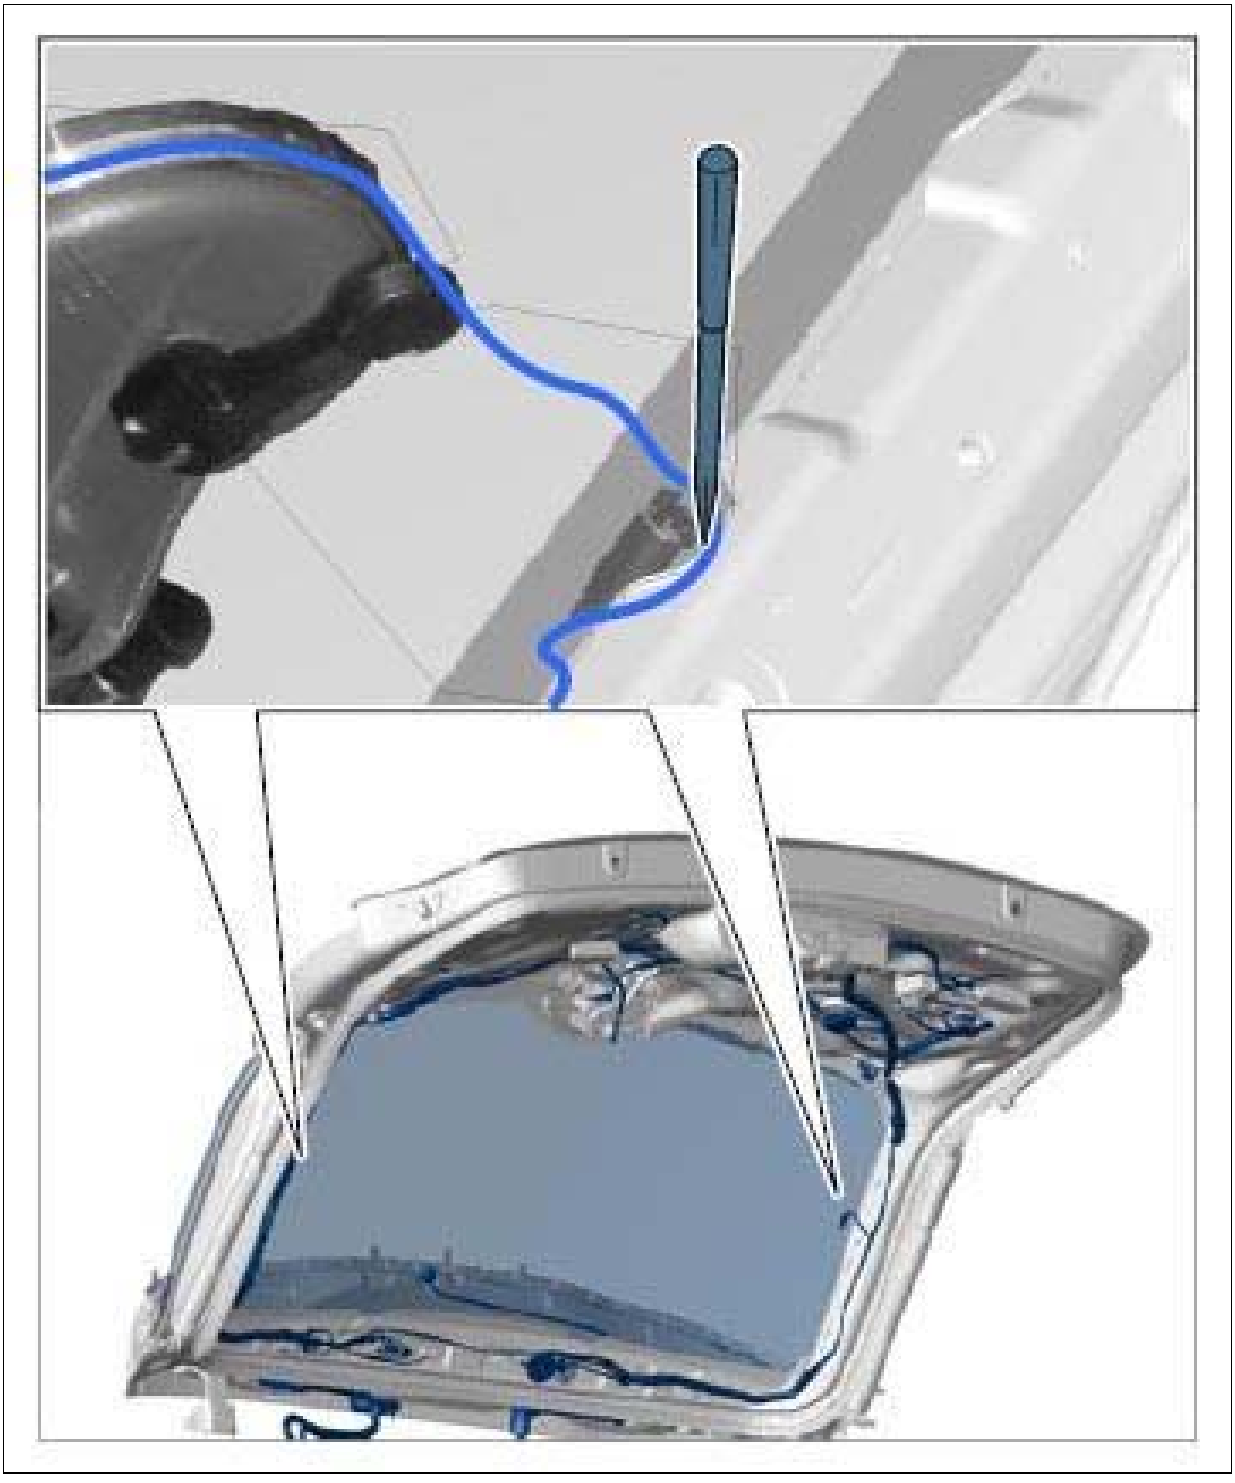
Fig 1: Cutting Wire Past Electric Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Counter with an awl.

Fig 2: Identifying Counter With AWL



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

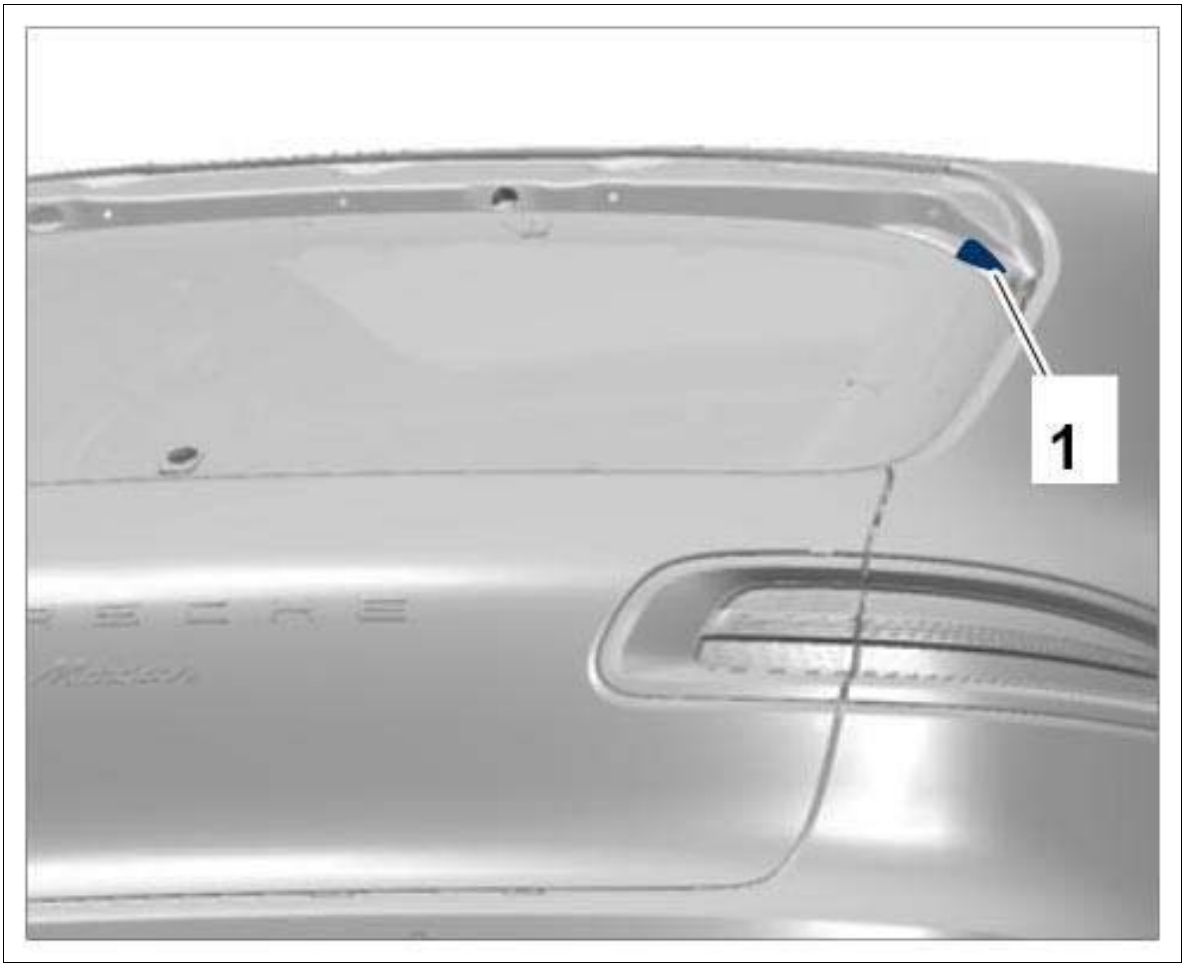
- Make sure that the cutting wire does not press against the electric connection when separating the glass.
- Continue separating the window glass.
    1. Remove rubber sleeve from the wiper arm.
    2. Release and disconnect electric plug connections for the antenna amplifier control unit.

→ Removing antenna control unit

3. Release and disconnect electric plug connections on antenna amplifier. → Removing antenna amplifier
4. Disconnect electric plug connections for rear window heating. → Removing wire harness for tailgate at the left
5. Release and disconnect electric plug connections on actuating cylinders for the rear lid.

   → Removing actuating cylinder for rear lid
6. Fix plug connections for the antenna amplifier control unit and antenna amplifier in place on the rear window using adhesive tape.
7. Affix adhesive tape **-1-** to the top right corner of the rear window at the rear lid.

Fig 3: Identifying Adhesive Tape Position



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WARNING: Vehicle windows removed and installed incorrectly

1. Danger of cuts

2. Risk of eye injuries

→ Wear personal protective gear.

→ Always shut off power supply when replacing cutting knife.

8. Apply a bead of adhesive from inside out in the area protected by the adhesive tape using the scratch awl.

   Information

   1. The procedure for removing car windows is described in → 6X00IN GENERAL INFORMATION ON REMOVING CAR WINDOWS .

9. Remove rear window using the cutting-wire separating device.

   Fig 4: Removing Rear Window Using Cutting-Wire Separating Device

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 648619 REMOVING AND INSTALLING REAR WINDOW (ALL MODELS) > PREPARING WINDOW APERTURE FOR INSTALLATION

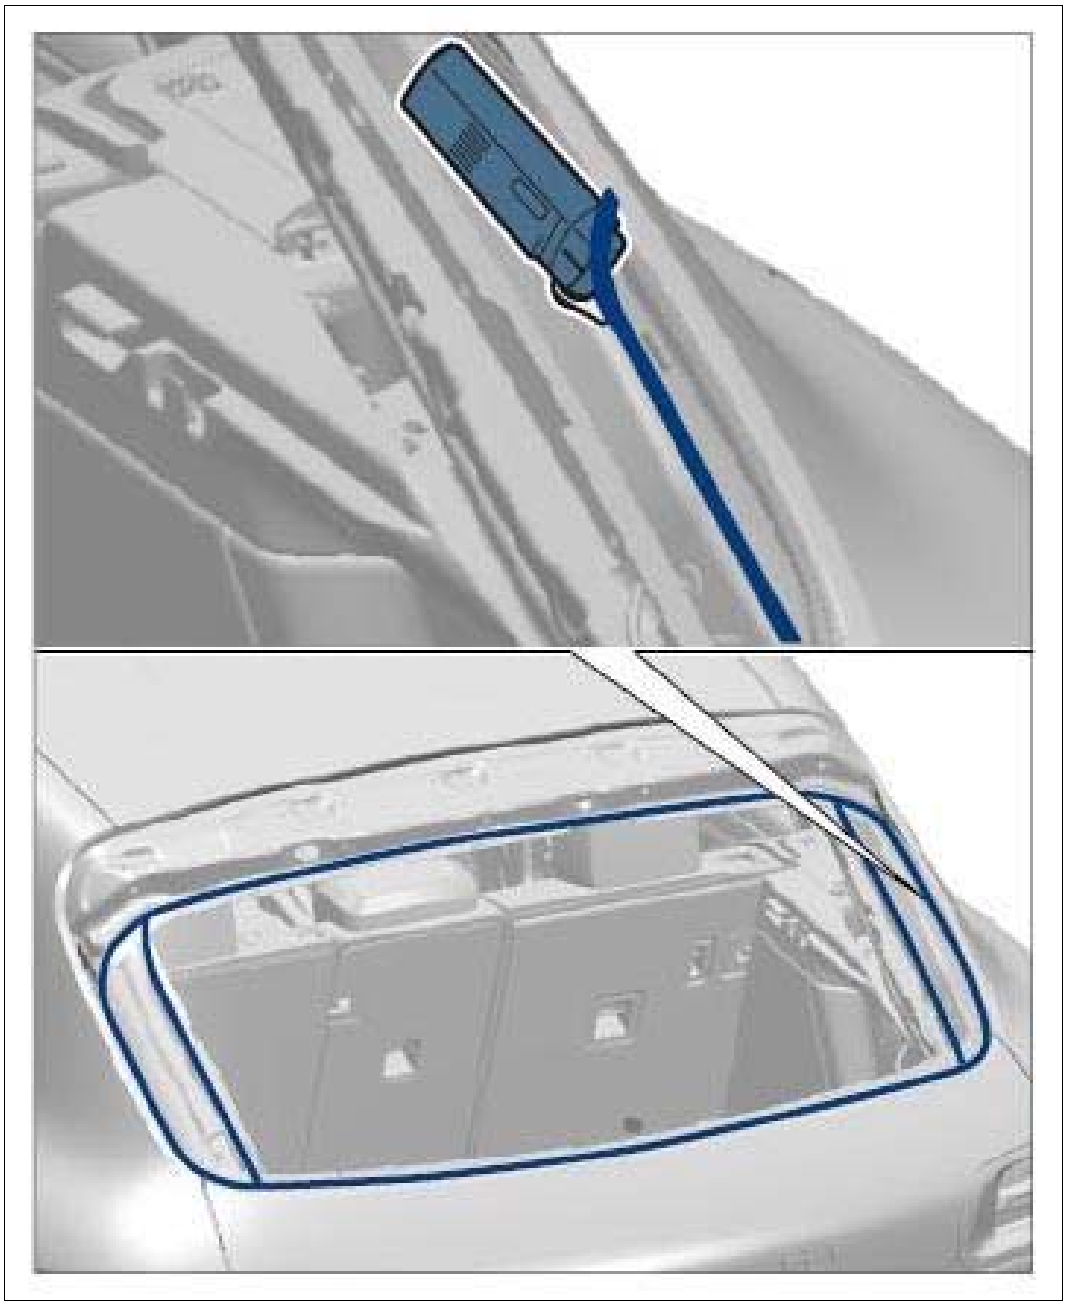
1. Remove adhesive on the body.

   Information

1. The surface coating of adhesive residue helps new adhesive to stick. Keep cut surfaces clean and free of grease and do not clean with cleaning solution.

    1. 1.1. When removing adhesive residue from the body using a cutter and flashing knife, ensure that a surface coating of adhesive remains.

    Fig 1: Removing Adhesive Residue From Rear Lid



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

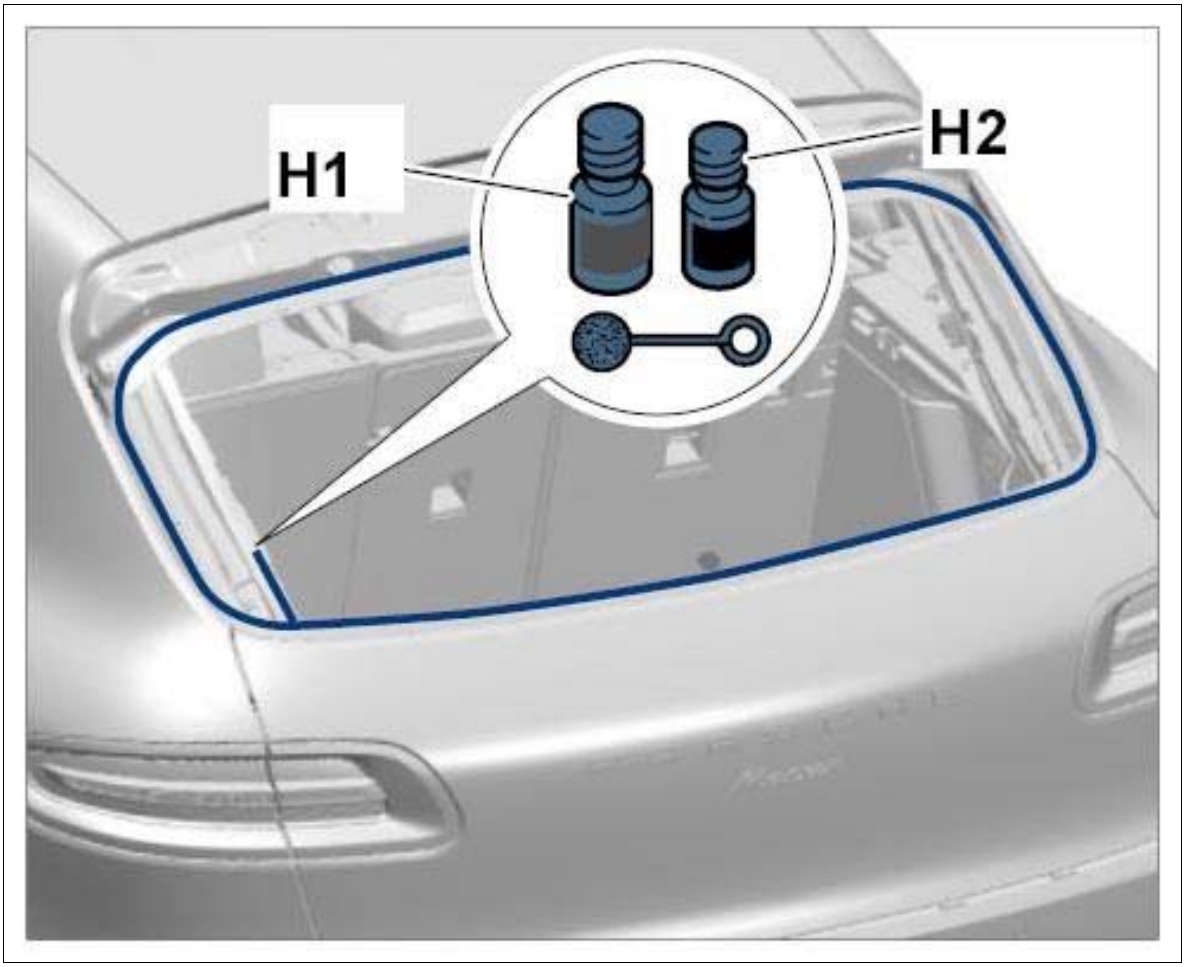
2. Clean new paint areas or damaged paint surfaces in the non-visible area of the window aperture in the body with cleaning solution **-H1-** and coat with primer **-H2-** .

Information

1. A drying time of at least 10 minutes must be observed between cleaning the bonding surface and applying primer! Always ensure that no cleaning solution residues remain on

the body.

Fig 2: Identifying Window Paint Damage Area



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 648619 REMOVING AND INSTALLING REAR WINDOW (ALL MODELS) > PREPARING REAR WINDOW FOR INSTALLATION

Information

- The removed rear window can be reinstalled if there was no prior damage to the rear window and the rear window was removed without damage.

Information

- Replace the seal at the bottom of the rear window.

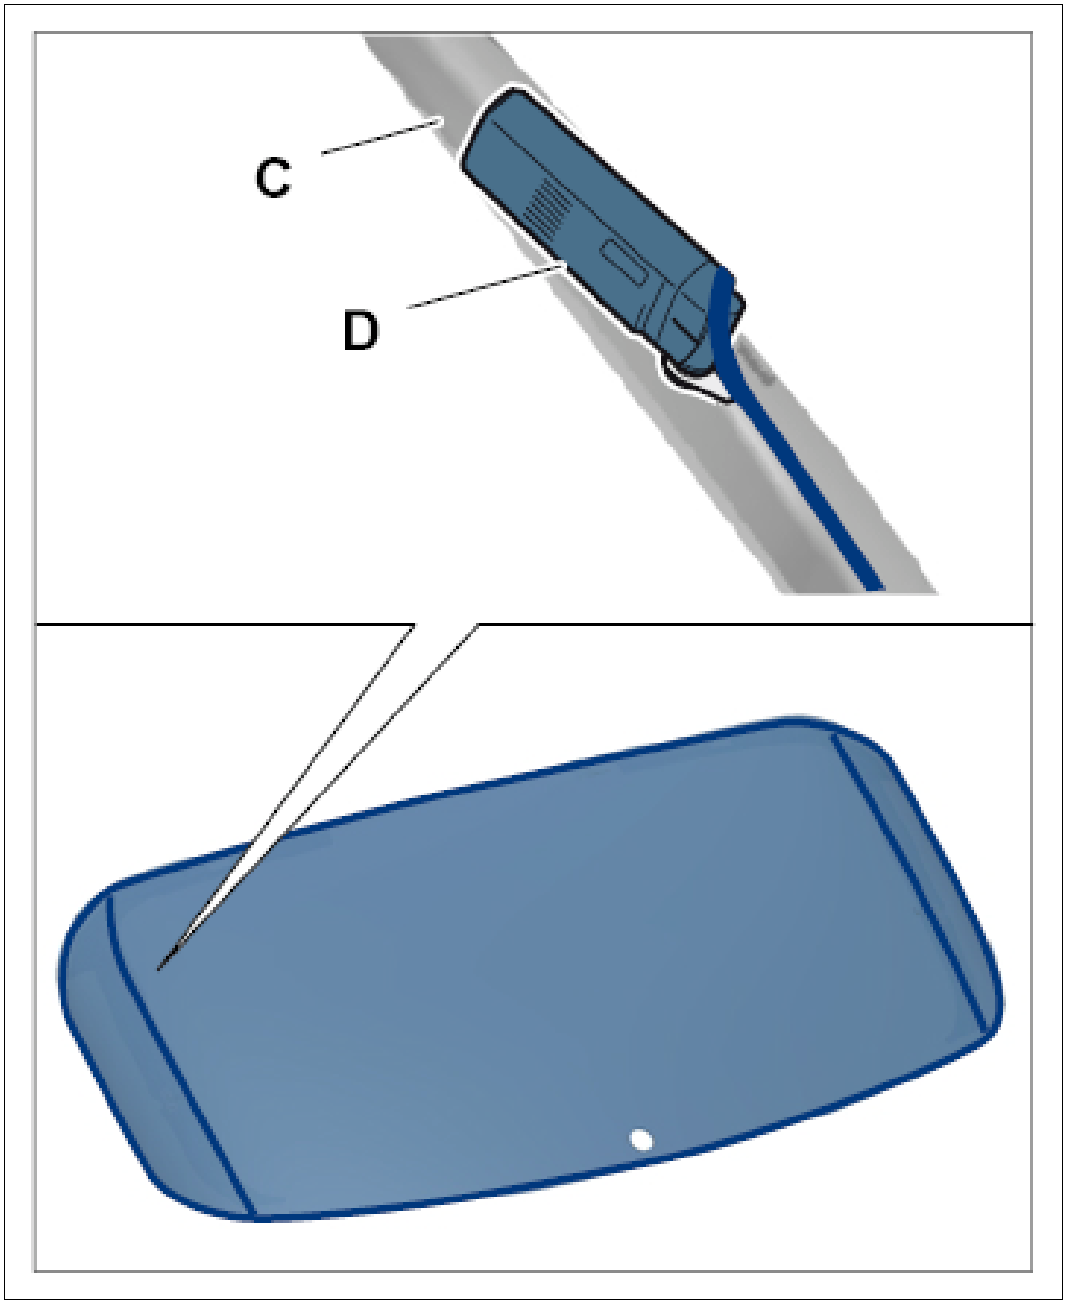
1. Remove adhesive from the rear window.

    1. 1.1. Fit cutter **-C-** with the flashing knife **-D-** and remove adhesive residue from the rear window, ensuring that a surface coating of adhesive remains.

        Information

1. The remaining adhesive helps new adhesive to stick. Keep cut surfaces clean and free of grease and do not clean with cleaning solution.

Fig 1: Removing Adhesive From Rear Window

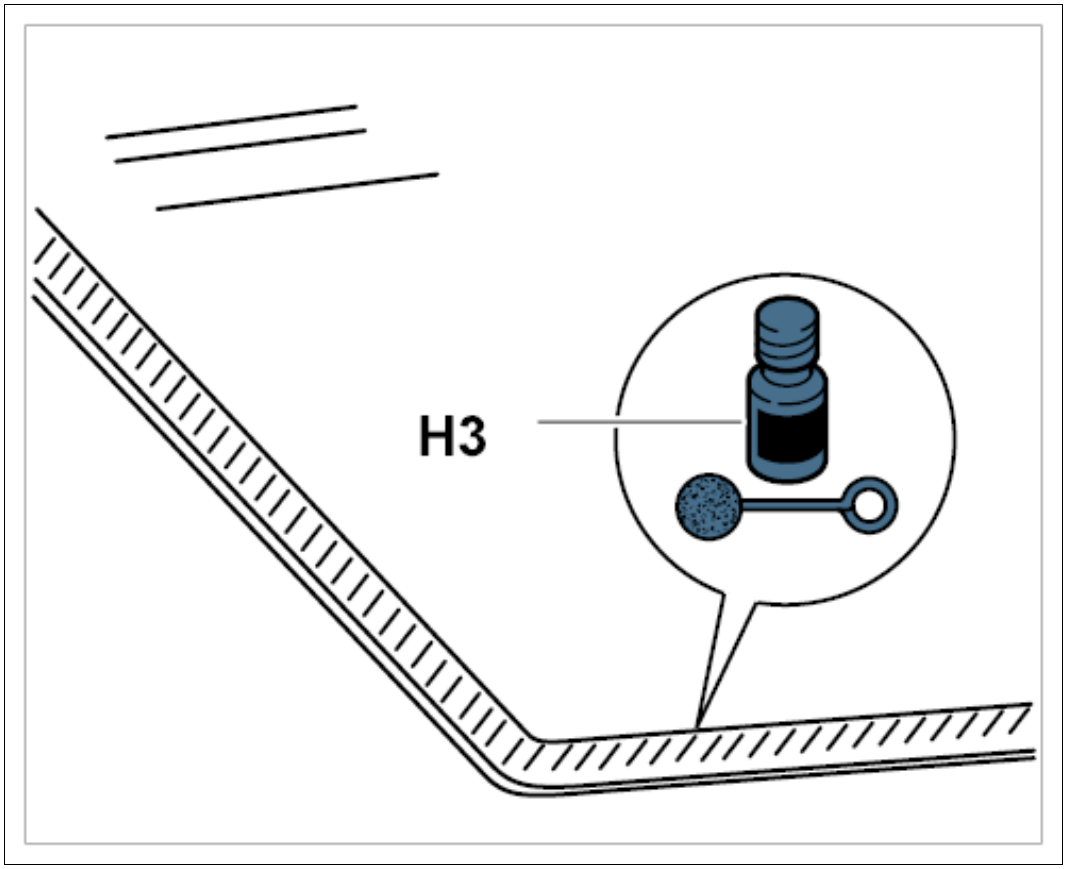


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Apply activator to the bonding section of the rear window.

    1. 2.1. During long idle periods, apply activator **-H3-** to the remaining adhesive.

Fig 2: Applying Activator

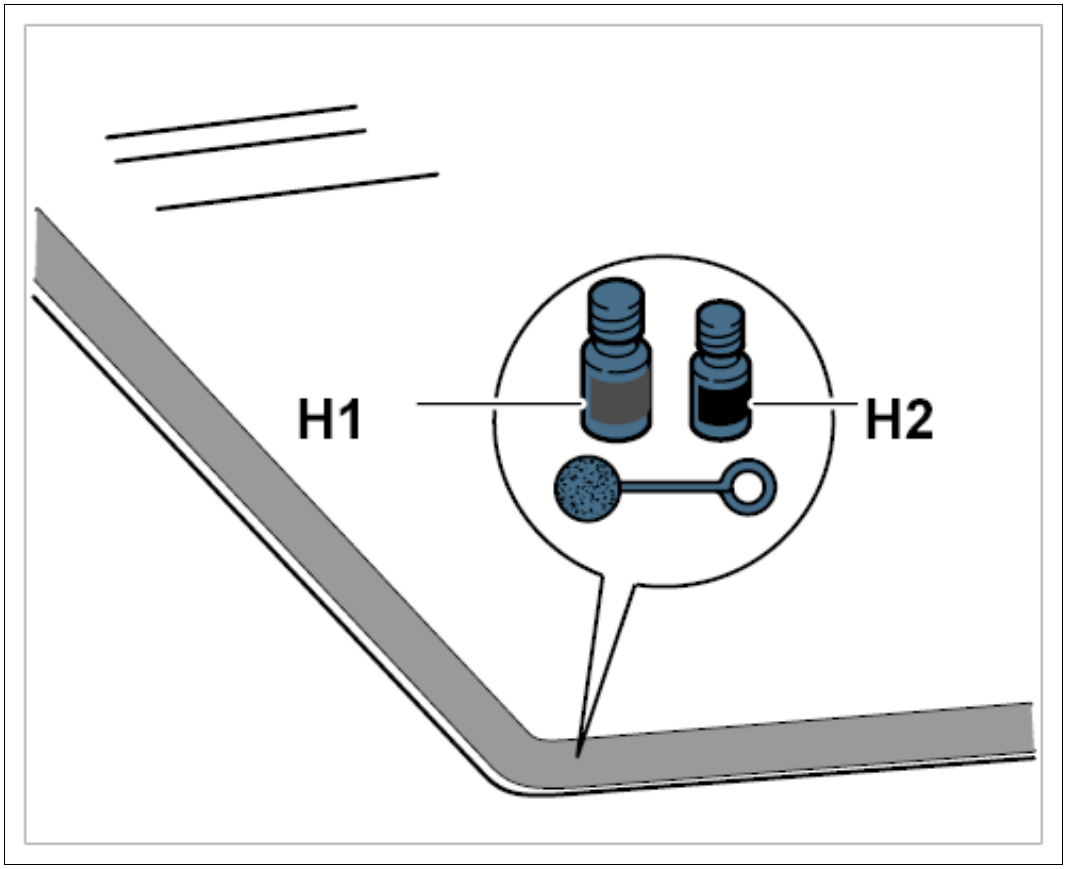


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 648619 REMOVING AND INSTALLING REAR WINDOW (ALL MODELS) > PREPARING REAR WINDOW FOR INSTALLATION > PREPARING REAR WINDOW FOR INSTALLATION (NEW REAR WINDOW)

1. Clean and prime the glass.
    1. 1.1. Clean the window glass with cleaning solution **-H1-** .
    2. 1.2. Apply primer **-H2-** to the glass flange close to the marking.

Fig 1: Cleaning Glass



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. A ventilation period of at least 10 minutes must be observed between the cleaning of the glass and the application of primer! No cleaning solution residues may remain on the windscreen.

WM 648619 REMOVING AND INSTALLING REAR WINDOW (ALL MODELS) > INSTALLING REAR WINDOW

⚠ *CAUTION: Danger of material damage if specified curing time of adhesive is not observed! In order to ensure that the bonded joint is sufficiently strong, the following conditions must be adhered to:*

- *The vehicle must not be used until the curing time has elapsed.*
- *Curing time: 2 hours*
- *Temperature: at least 10 °C*
- *Fixing time: approx. 1 hour*

Information

- The removed rear window can be reinstalled if there was no prior damage to the rear window and the rear window was removed without damage.

Information

- Check stop bits.
- Replace damaged or missing stop bits.

1. Prepare 2-component adhesive for processing. → 6X00IN WORKING WITH PORSCHE 2-COMPONENT WINDOW ADHESIVE

   Information

   1. The adhesive has an open time of -15 min- , which means that the bonding material must be applied and the component must be affixed within this period of time.
   2. To ensure that the substance is completely mixed, apply a 30-mm long bead of fresh adhesive to a piece of cardboard before processing.

      Fig 1: Identifying Adhesive Bead

      
      Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Apply adhesive to the rear window.

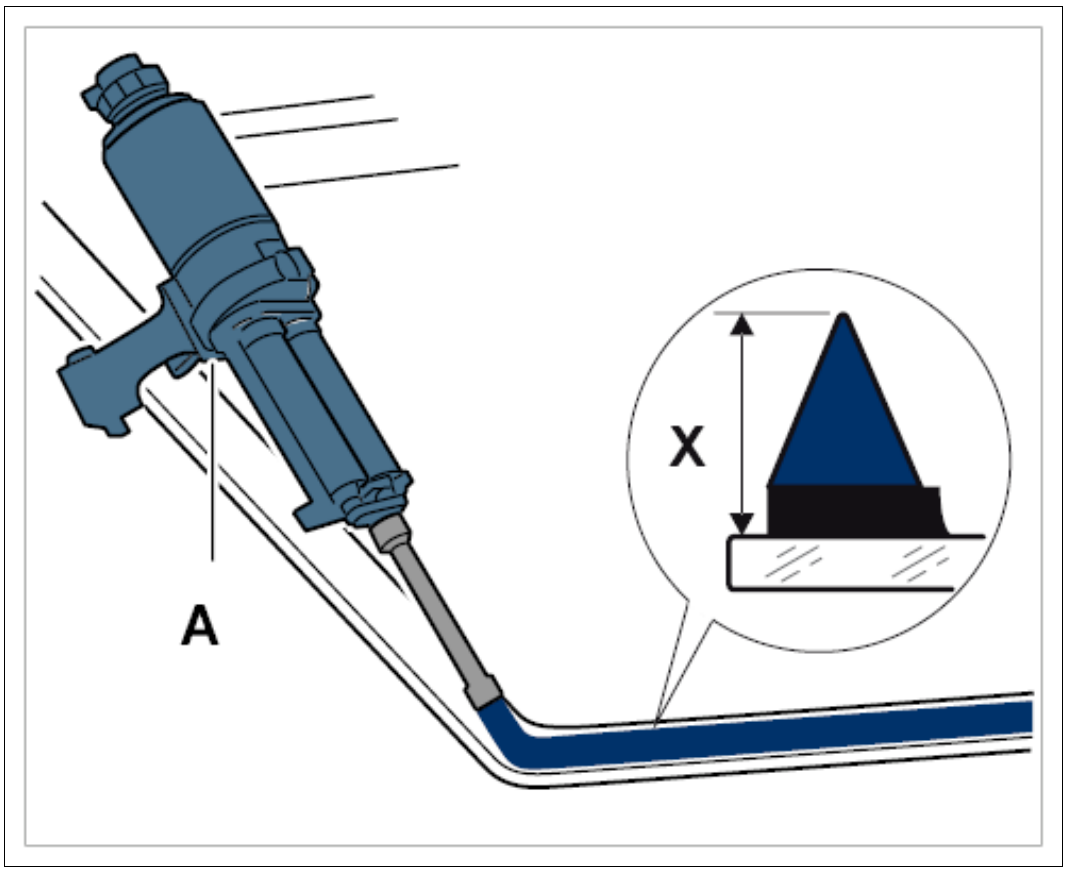
   1. 2.1. Apply 2-component adhesive using the bonding gun **-A-** to the rear window along the precoating or on the primer in the form of a triangular bead measuring **-X =**

approx. 15 mm- .

Information

1. When applying the adhesive, it is essential to ensure that the adhesive bead overlaps by approx. 30 mm at the beginning and at the end.

Fig 2: Applying Adhesive To Rear Window



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. Two persons are needed to insert, position and secure the rear window.

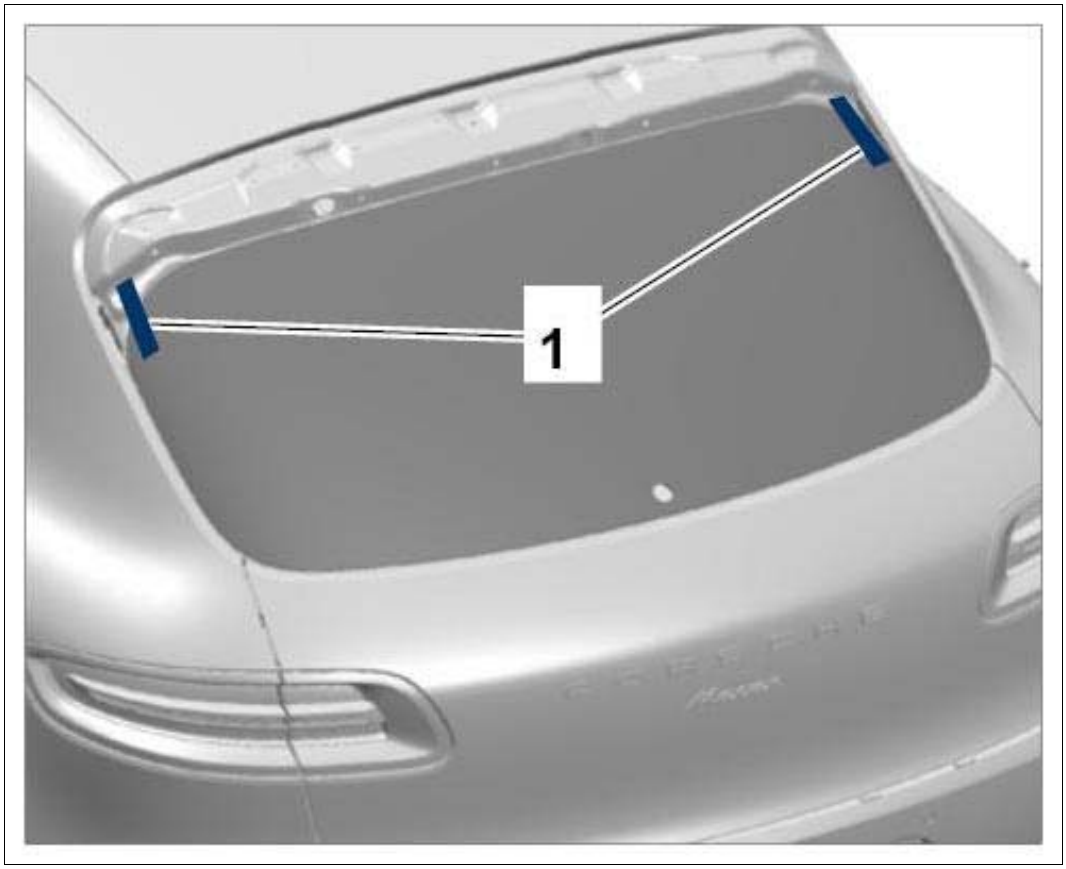
3. Close the rear lid and insert the rear window into the body.

Fig 3: Inserting Rear Window

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. Affix suction cups to the rear window.
2. 3.2. Guide the rear window into the window aperture at the top.
3. 3.3. Insert the rear window at the sides of the window aperture and lower it.
4. 3.4. Press the rear window uniformly into the body.
5. 3.5. Adjust the size of the gap by moving the rear window. → 648619 REMOVING AND INSTALLING REAR WINDOW - section on "Technical values"
6. 3.6. Secure the rear window to the top of the rear lid with adhesive tape **-1-** to prevent it from slipping.

Fig 4: Securing Rear Window

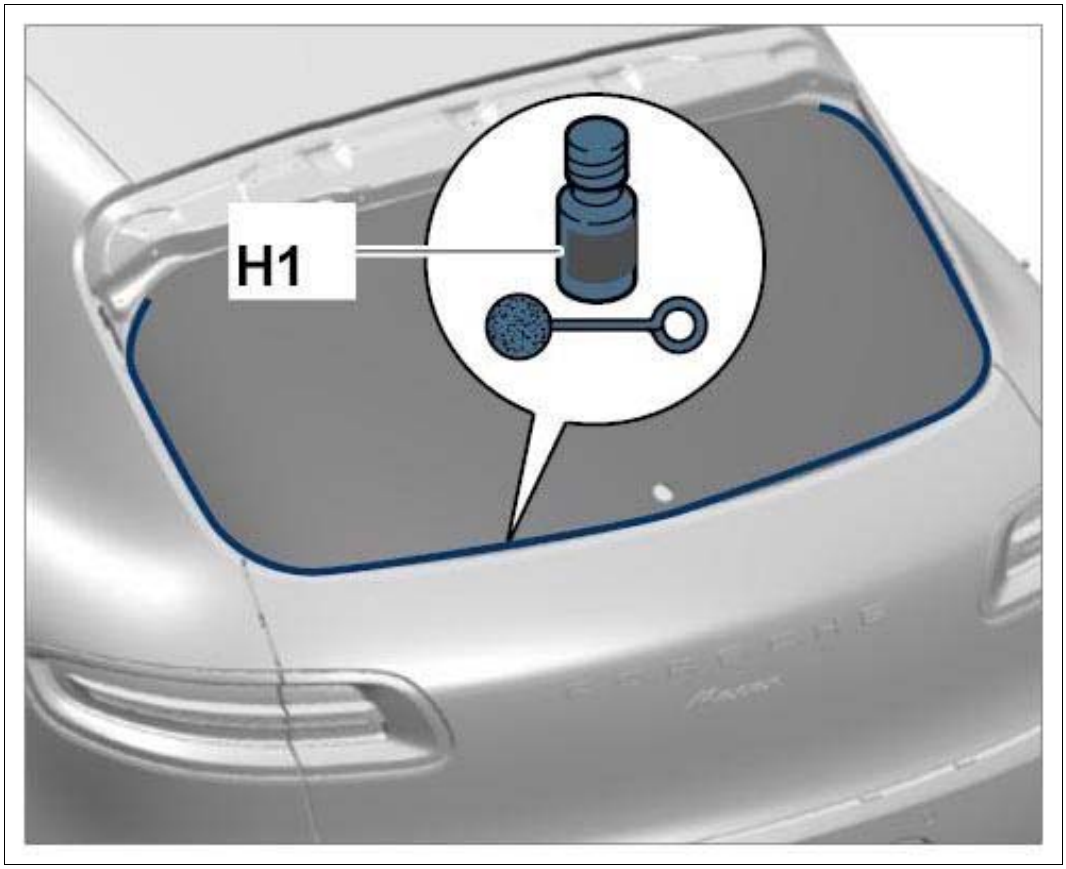


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Clean visible areas.

    1. 4.1. Adhesive that has oozed out must be removed immediately and the affected fields of vision must be cleaned using cleaning agent **-H1-** .

Fig 5: Removing Adhesive Compound



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Fit rubber sleeve on the wiper arm.
6. Plug in and lock electric plug connections for the antenna amplifier control unit. → Installing antenna control unit

WM 663119 REMOVING AND INSTALLING DOOR ENTRY GUARD (ALL MODELS) > INSTALLING DOOR ENTRY GUARD > INSTALLING SUPPORT RAIL FOR DOOR ENTRY GUARD

1. Position support rail, starting at the front, and tighten fastening nuts at the front and rear to **Tightening torque 6 Nm (4.5 ftlb.)** .

WM 663119 REMOVING AND INSTALLING DOOR ENTRY GUARD (ALL MODELS) > INSTALLING DOOR ENTRY GUARD > INSTALLING DOOR ENTRY GUARD

Information

The door entry guard can only be installed and removed when the doors are open. The illustration shows the vehicle without doors for the sake of clarity.

Information

Cover add-on parts and adjacent areas.

Protect components against scratching and damage.

1. Installation is performed in reverse order to removal.
2. Clip in door entry guard until the clips lock with an audible click. Check that the door entry guard is fitted correctly.
3. Tighten fastening screws securing door entry guard to the underbody to **Tightening torque 2.5 Nm (2 ftlb.)** .

WM 663119 REMOVING AND INSTALLING DOOR ENTRY GUARD (ALL MODELS) > SUBSEQUENT WORK

1. Secure front wheel housing liner. →Installing front wheel housing liner

WM 663355 REPLACING ROOF MOLDING (ALL MODELS) > PRELIMINARY WORK

1. Remove rear window channel seal.

WM 663355 REPLACING ROOF MOLDING (ALL MODELS) > REMOVING REAR DOOR MOLDING > REMOVING ROOF MOLDING

Information

- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

Information

The molding cannot be removed without damaging it irreparably and must always be replaced.

Fig 1: Identifying Roof Molding Installation Position

WM 669419 REMOVING AND INSTALLING B-PILLAR COVER (ALL MODELS) > REMOVING B-PILLAR COVER

Information

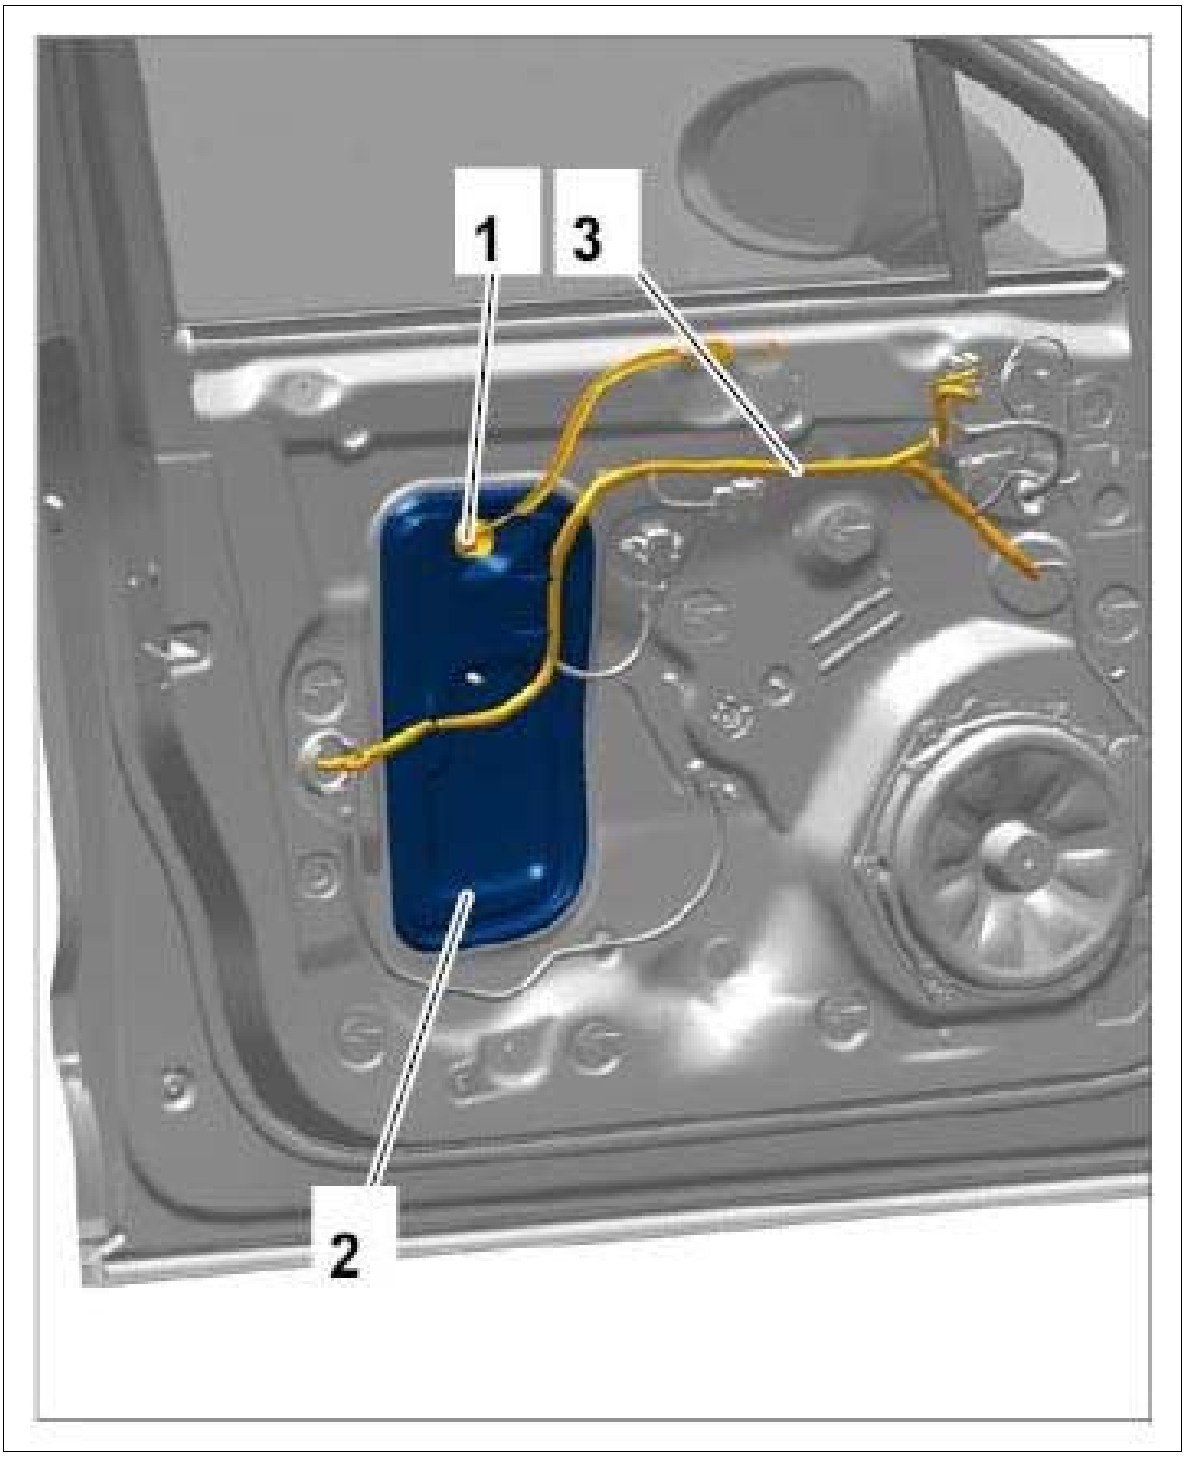
- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Guide out rubber seal **-1-** at the cover **-2-** .

2. Guide out wire harness **-3-** at the brackets for the cover **-2-** .

3. Unclip cover **-2-** from door inner panel, guide out door release cable at the cover **-2-** and remove cover **-2-** .

Fig 1: Identifying Cover On Front Door Inner Panel



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Loosen and remove window frame cover from the door.

Fig 2: Identifying Window Frame Cover

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Slide the window down until the mountings **-4-** are accessible through the cut-outs in the door inner panel.

6. Loosen door window glass **-1-** from the relevant mounting points **-4-** on the power windows mechanism.

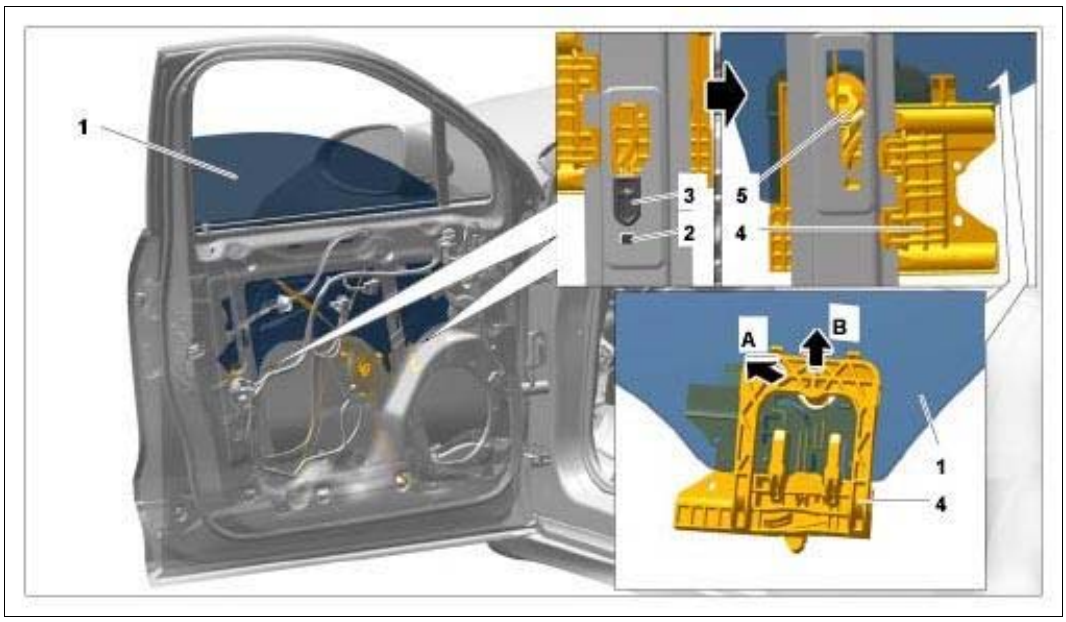
    1. 6.1. Actuate locking mechanism **-2-** and remove limit stop **-3-** on the power windows mechanism.

Move door window glass **-1-** down until the locking mechanism **-5-** is accessible.

Actuate locking mechanism **-5-** using a suitable tool **-arrow A-** and carefully raise the door window glass **-1- (-arrow B-)** .

2. 6.2. Pull door window glass **-1-** fully up **-arrow B-** out of the mounting points **-4-** .

Fig 3: Releasing Door Window Mounting



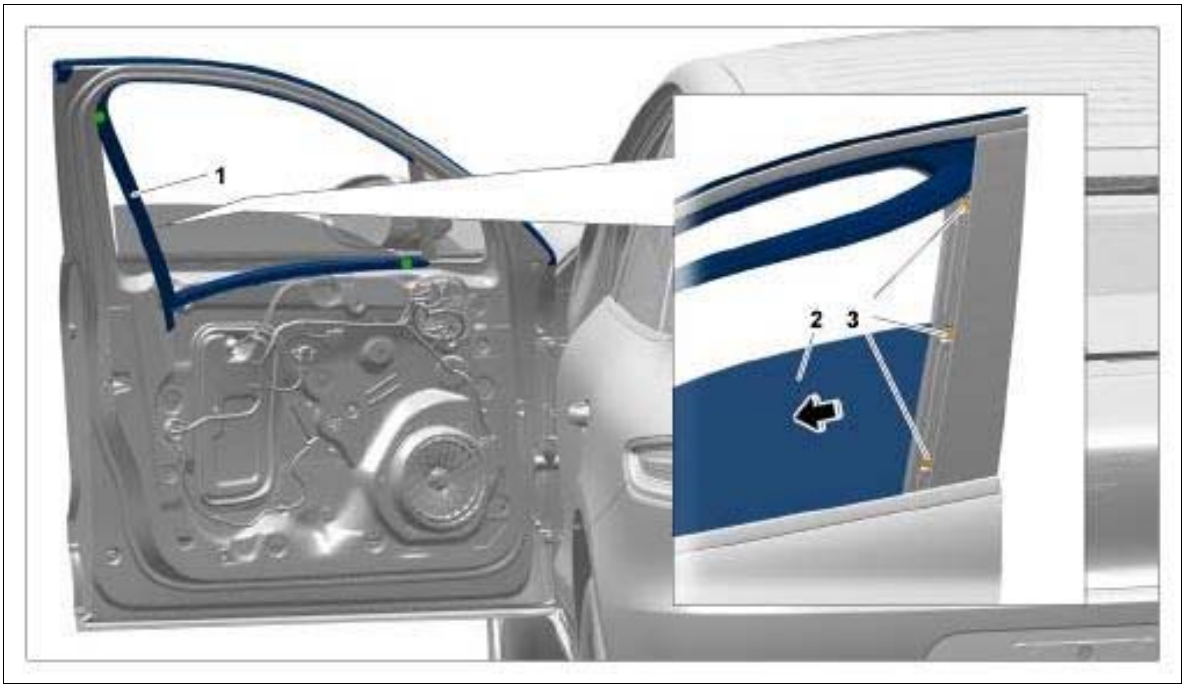
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Pull inner rubber seal **-1-** in the side area of the cover and at the bottom out of the door frame.

8. Carefully adjust the door window glass **-2-** until the screws **-3-** are accessible.

9. Unscrew screws **-3-** .

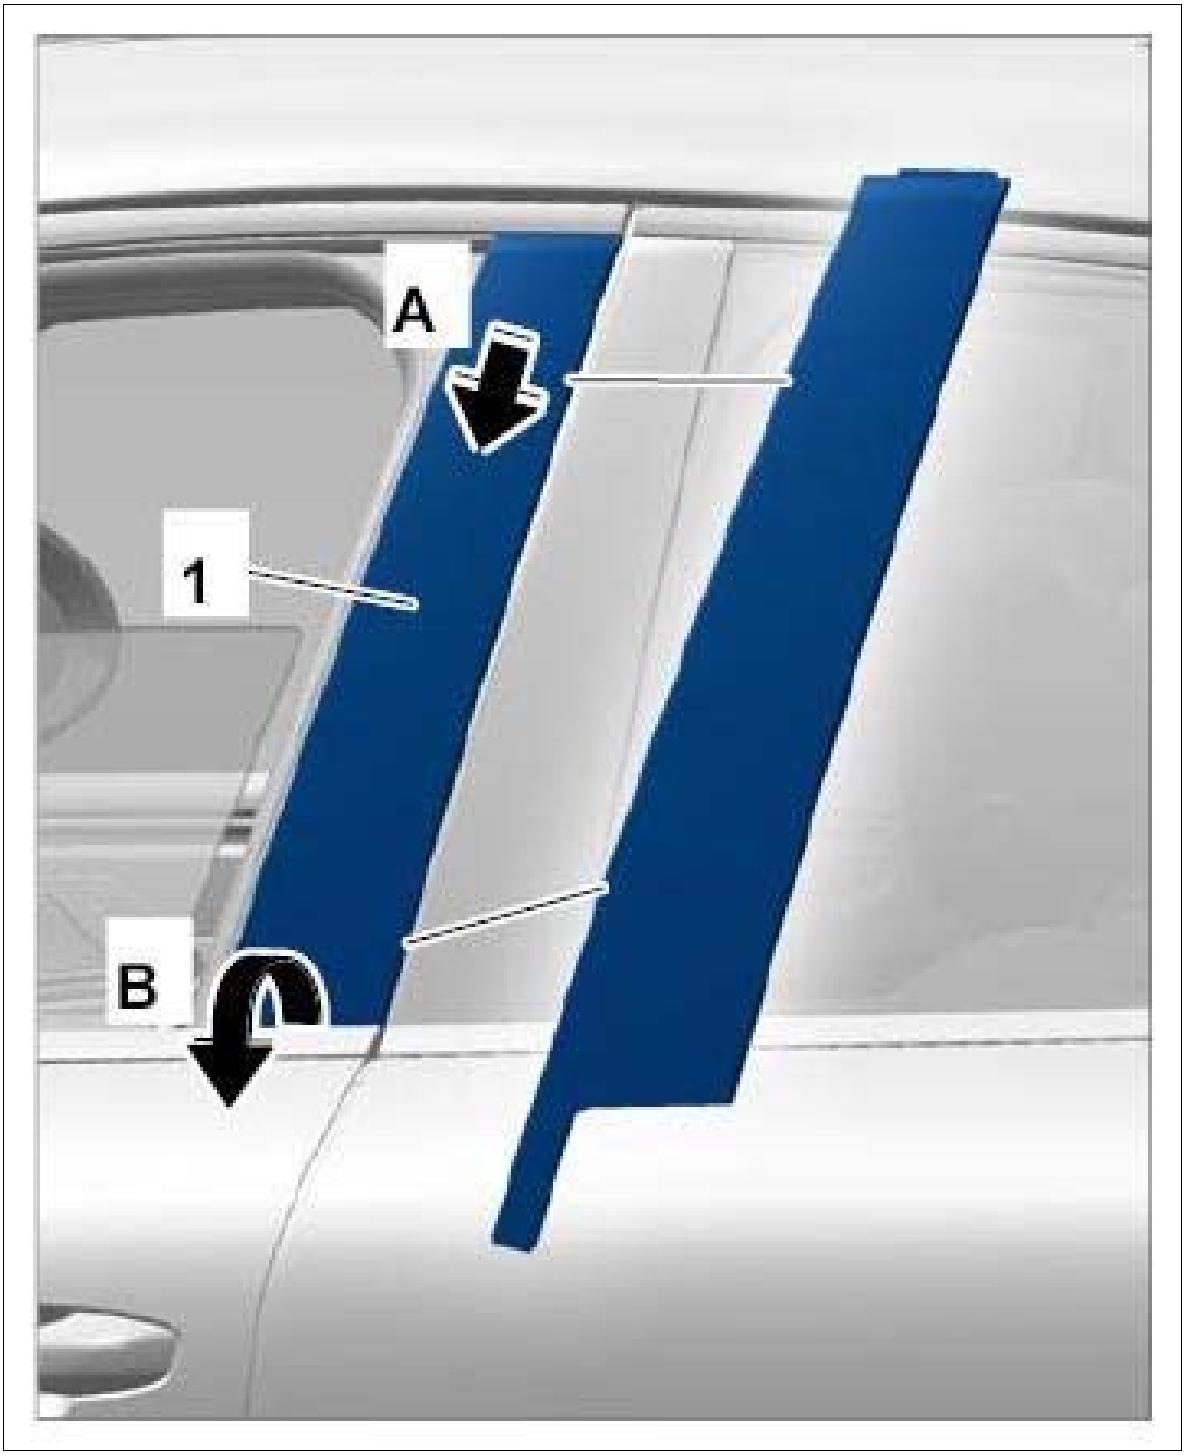
Fig 4: Loosening Rubber Seal And Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Slide the cover **-1-** down slightly **-arrow A-** , detach it from the door and then guide it up and out **-arrow B-** .

Fig 5: Sliding Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 669419 REMOVING AND INSTALLING B-PILLAR COVER (ALL MODELS) > INSTALLING B-PILLAR COVER

Information

Check that all fixing clips are positioned fully and correctly.

Check that the fixing clips are not bent or broken.

Replace damaged or missing clips with new ones.

Installation is performed in reverse order. Pay particular attention to the following:

1. Tighten screws to the specified torque. **Tightening torque 2.5 Nm (2 ftlb.)**
2. Check that all rubber guides are fitted correctly.

WM 669419 REMOVING AND INSTALLING B-PILLAR COVER (ALL MODELS) > SUBSEQUENT WORK

1. Install front loudspeakers. → Installing front loudspeakers
2. Install power window motor. → Installing Power Window Motor
3. Install front door panel. → Installing front door panel

WM 669619 REMOVING AND INSTALLING TRAILER HITCH CONTROL UNIT (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 669619 REMOVING AND INSTALLING TRAILER HITCH CONTROL UNIT (ALL MODELS) > PRELIMINARY WORK

1. Remove inner part of side trim panel for rear luggage compartment at the right. → Removing side trim panel for rear luggage compartment

WM 669619 REMOVING AND INSTALLING TRAILER HITCH CONTROL UNIT (ALL MODELS) > REMOVING TRAILER HITCH CONTROL UNIT

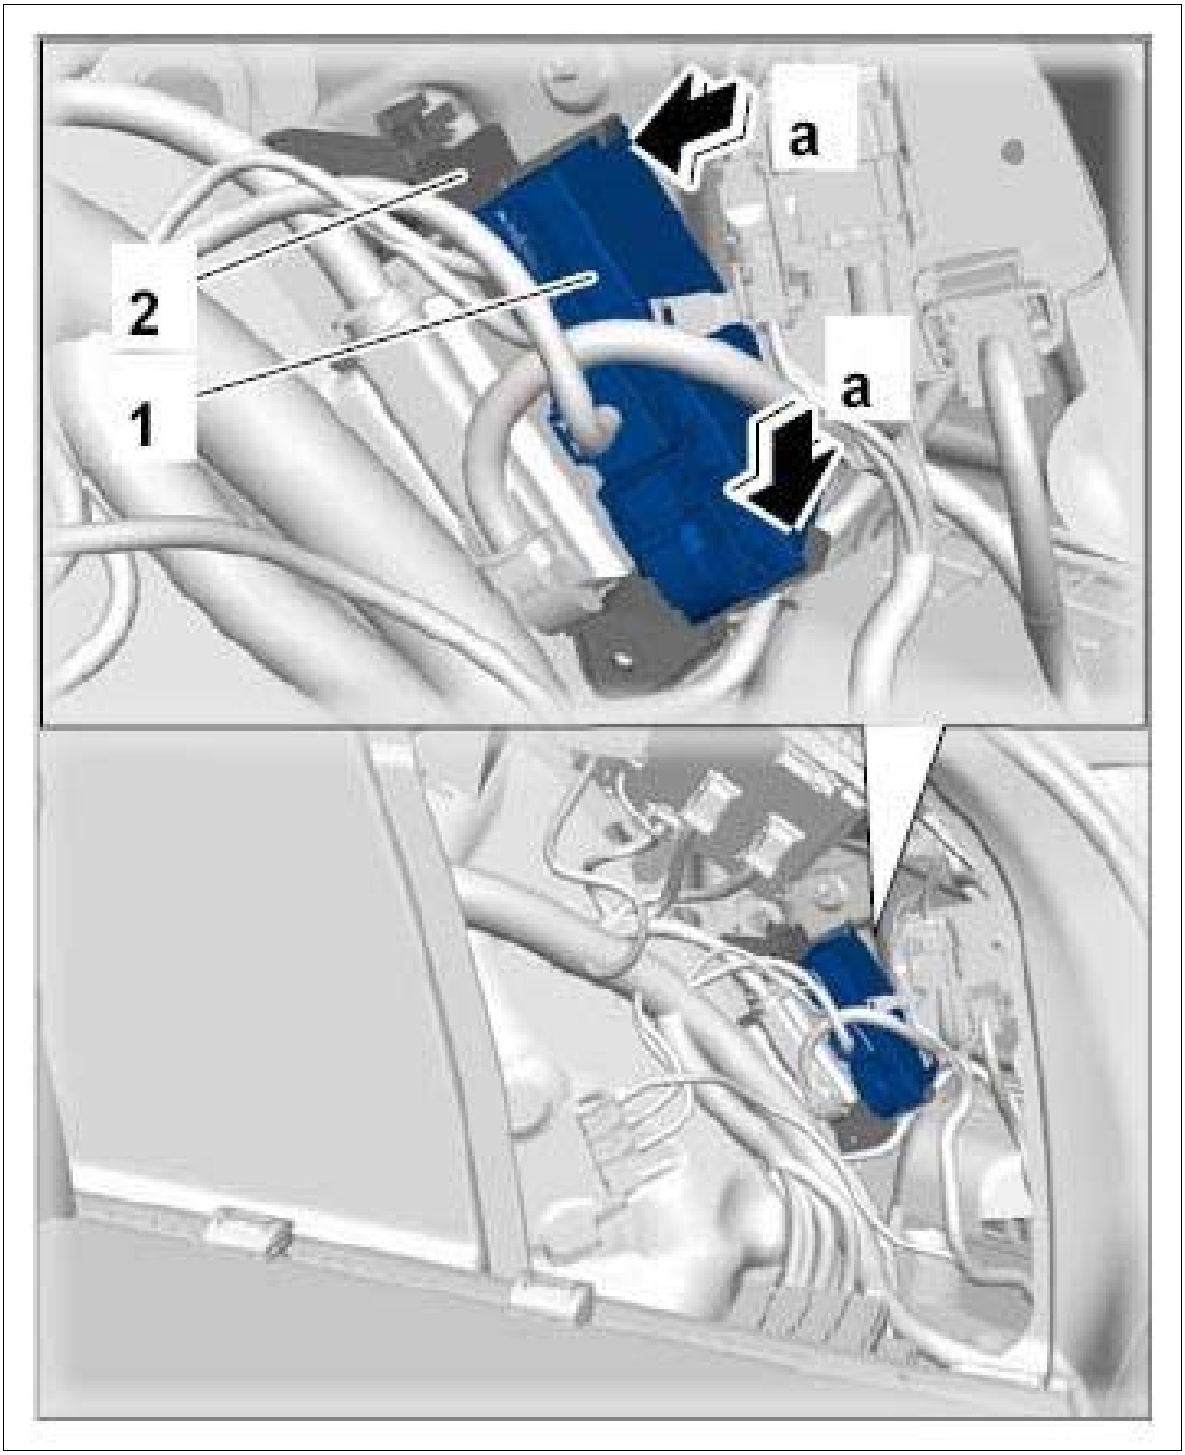
NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

1. Switch off ignition and pull remote control out of ignition lock.
2. Disengage retaining clips **-a-** and remove trailer hitch control unit **-1-** from the holder **-2-** .

Fig 1: Loosening Trailer Hitch Control Unit From Holder



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Always comply with the regulations for handling ESD-sensitive components!

1. Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
2. The new part must only be removed from the ESD (electrostatic discharge) protective

packaging just before installation and at the position at which the part is to be installed.

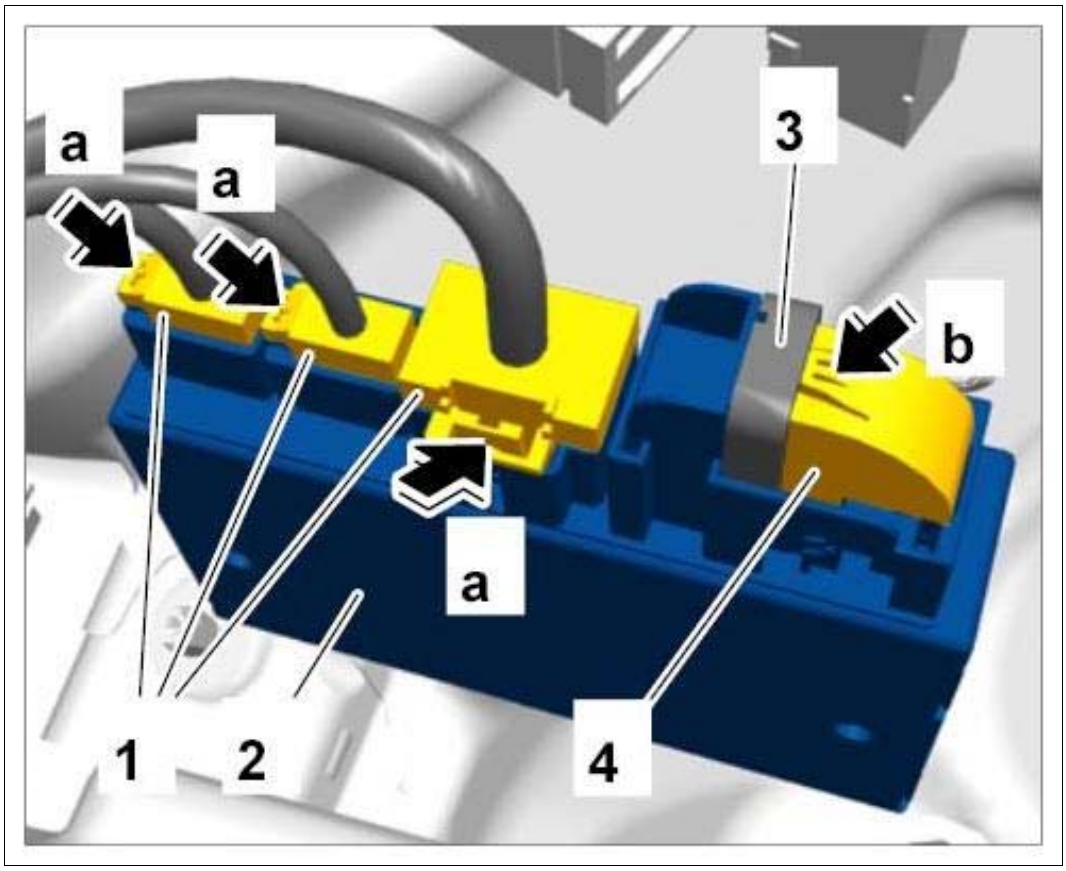
3. Never touch the electric pins and plug contacts.

3. Disconnect electric plug connections.

1. 3.1. Press release tabs **-a-** and disconnect electric plug connections **-1-** from the trailer hitch control unit **-2-** .

2. 3.2. Press release tab **-b-** , swivel clip **-3-** aside and disconnect electric plug connection **-4-** .

Fig 2: Disconnecting Electric Plug Connections



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 669619 REMOVING AND INSTALLING TRAILER HITCH CONTROL UNIT (ALL MODELS) > INSTALLING TRAILER HITCH CONTROL UNIT

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.

- Never touch the electric pins and plug contacts.

1. Installation is performed in reverse order to removal.

WM 669619 REMOVING AND INSTALLING TRAILER HITCH CONTROL UNIT (ALL MODELS) > SUBSEQUENT WORK

1. Install inner part of side trim panel for rear luggage compartment at the right. → Installing side trim panel for rear luggage compartment
2. If the trailer hitch control unit was replaced, teach the new trailer hitch control unit to suit the vehicle using **PIWIS Tester II 9818** . → 669655 REPLACING TRAILER HITCH CONTROL UNIT

WM 669655 REPLACING TRAILER HITCH CONTROL UNIT (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 669655 REPLACING TRAILER HITCH CONTROL UNIT (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 669655 REPLACING TRAILER HITCH CONTROL UNIT (ALL MODELS) > PRELIMINARY WORK

1. Replace trailer hitch control unit. → 669619 REMOVING AND INSTALLING TRAILER HITCH CONTROL UNIT

WM 669655 REPLACING TRAILER HITCH CONTROL UNIT (ALL MODELS) > REPLACING TRAILER HITCH CONTROL UNIT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. **PIWIS Tester II 9818** must be connected to the vehicle before starting **PIWIS Tester II 9818** . Switch on ignition.
2. Start the diagnostic application and select the required vehicle type.
3. Select the **Trailer hitch (AHK)** control unit in the **overview** .
4. **Codings/adaptations** must now be selected. Then press [F12] to continue.
5. Wait for confirmation that **coding was completed successfully** . Then press [F12] to continue.
6. **Drive links/checks** must now be selected.
7. **Select Initialisation of trailer hitch control unit.**
8. Select the status **All adoption values** and press [F8] to start the standardisation process.
9. Erase the fault memory and switch off ignition.
10. **PIWIS Tester II 9818** must now be disconnected from the vehicle.
11. Disconnect the battery charger from the vehicle.

WM 680519 REMOVING AND INSTALLING FRONT INNER DOOR SILL TRIM (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Front door sill trim to body		Tightening torque	2.5 Nm (2 ftlb.)		

WM 680519 REMOVING AND INSTALLING FRONT INNER DOOR SILL TRIM (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove release handle for front lid.
2. Remove front left side-section trim panel. → 702419 REMOVING AND INSTALLING FRONT SIDE-SECTION TRIM PANEL .

WM 680519 REMOVING AND INSTALLING FRONT INNER DOOR SILL TRIM (MACAN, MACAN S, MACAN TURBO) > REMOVING FRONT INNER DOOR SILL TRIM

Information

- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Unscrew fastening screw **-3-** .
2. Lift up door sill trim **-1-** in the rear area **-arrow-** and unclip it.
3. Unclip fixing clips **-4-** on the side member and lift door sill trim **-1-** up slightly.
4. Unclip fixing clips **-5-** on the body.
5. Guide out door sill trim **-1-** at the release mechanism **-2-** and footrest and remove it.

WM 680519 REMOVING AND INSTALLING REAR INNER DOOR SILL TRIM (MACAN,

MACAN S, MACAN TURBO) > INSTALLING REAR INNER DOOR SILL TRIM

Information

Check that all fixing clips are positioned fully and correctly.

Check that the fixing clips are not bent or broken.

Replace damaged or missing clips with new ones.

Installation is performed in reverse order. Pay particular attention to the following:

1. Place rubber door seal over trim panel.
2. Tighten fastening screw to the specified torque. **Tightening torque: 5.6 Nm (4 ftlb.)**

WM 680519 REMOVING AND INSTALLING REAR INNER DOOR SILL TRIM (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install lower part of B-pillar trim panel. → INSTALLING LOWER PART OF B-PILLAR TRIM PANEL .
2. Install side trim panel for rear luggage compartment. → INSTALLING SIDE TRIM PANEL FOR REAR LUGGAGE COMPARTMENT .
3. Install rear backrest. → INSTALLING REAR BACKREST .
4. Install rear seat airbag. → INSTALLING REAR SIDE AIRBAG .

WM 681119 REMOVING AND INSTALLING GLOVE COMPARTMENT LOCK (MACAN, MACAN S, MACAN TURBO) > REMOVING GLOVE COMPARTMENT LOCK

Information

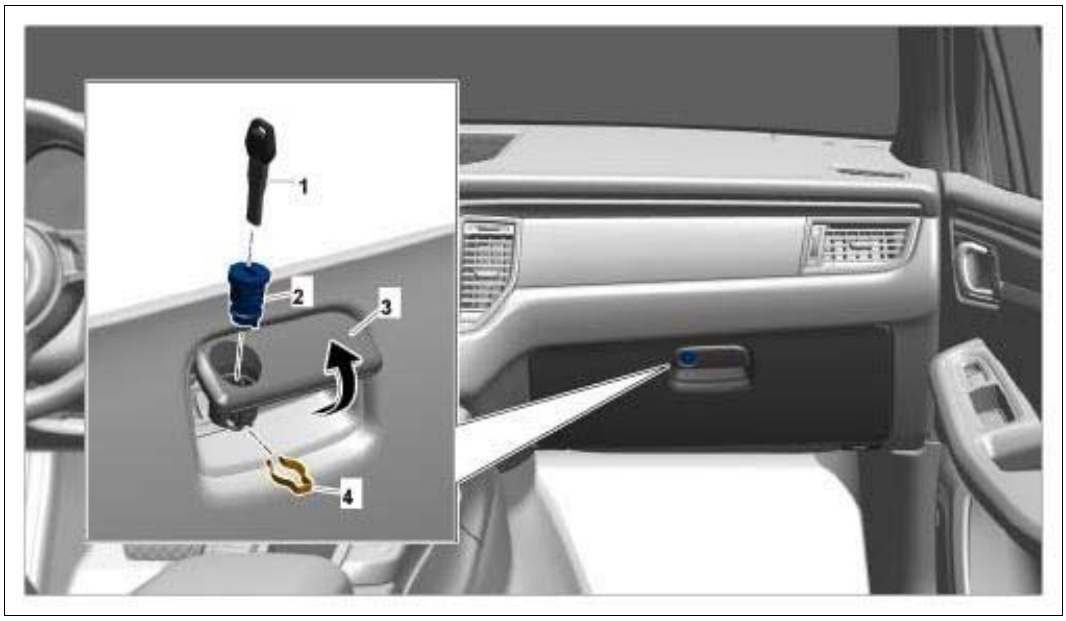
- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Move passenger seat to the rearmost position.
2. Remove key bit **-1-** from the ignition key and insert it into the lock cylinder **-2-** .
3. Press and hold the release handle **-3-** .
4. Pull out safety clip **-4-** .

5. Remove lock cylinder **-2-** by pulling it forward.

    1. 5.1. Push the lock cylinder **-2-** forward from the back using a screwdriver and remove it.

    Fig 1: Removing Glove Compartment Lock



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 681119 REMOVING AND INSTALLING GLOVE COMPARTMENT LOCK (MACAN, MACAN S, MACAN TURBO) > INSTALLING GLOVE COMPARTMENT LOCK

1. Press and hold the release handle.
2. Insert safety clip into cut-out.
3. Insert lock cylinder into the cut-out and engage by turning it.
4. Checking that the lock is working properly.
5. Pull off key bit and fit on the ignition key.
6. Move passenger seat into its initial position.

WM 681419 REMOVING AND INSTALLING CENTER CONSOLE TRIM (MACAN, MACAN S, MACAN TURBO) > REMOVING CENTER CONSOLE TRIM

Information

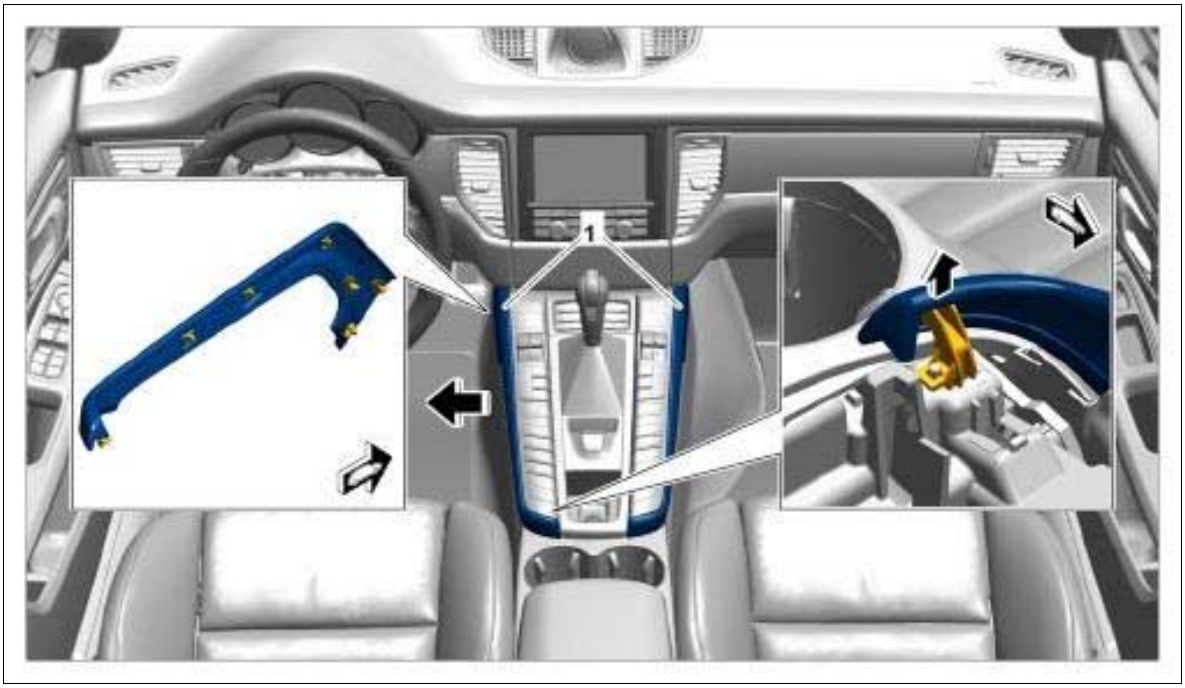
- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment

variant and may differ from the actual equipment variant.

- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Move front seats to the rearmost position.
2. Pull up trim **-1-** in the rear area and unclip it on the center console.
3. Unclip and remove trim **-1-** at the side of the center console.

Fig 1: Removing Center Console Trim



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 682319 REMOVING AND INSTALLING SUN VISOR (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Center bearing for sun visor on body		Tightening torque	5 Nm (3.5 ftlb.)		

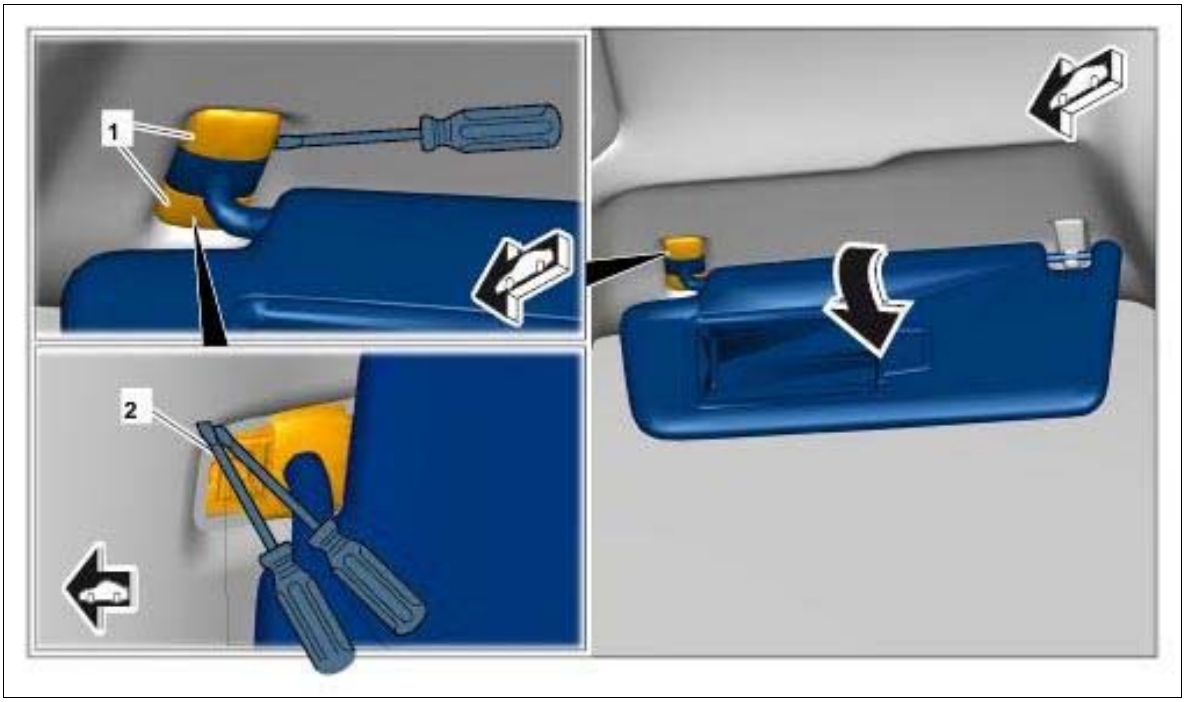
WM 682319 REMOVING AND INSTALLING SUN VISOR (MACAN, MACAN S, MACAN TURBO) > REMOVING SUN VISOR

Information

- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Swivel sunvisor down.
2. Unclip covers **-1-** .
3. Adjust the sun visor so that the front fixing clip **-2-** is accessible.

Fig 1: Removing Sunvisor Clip Covers



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

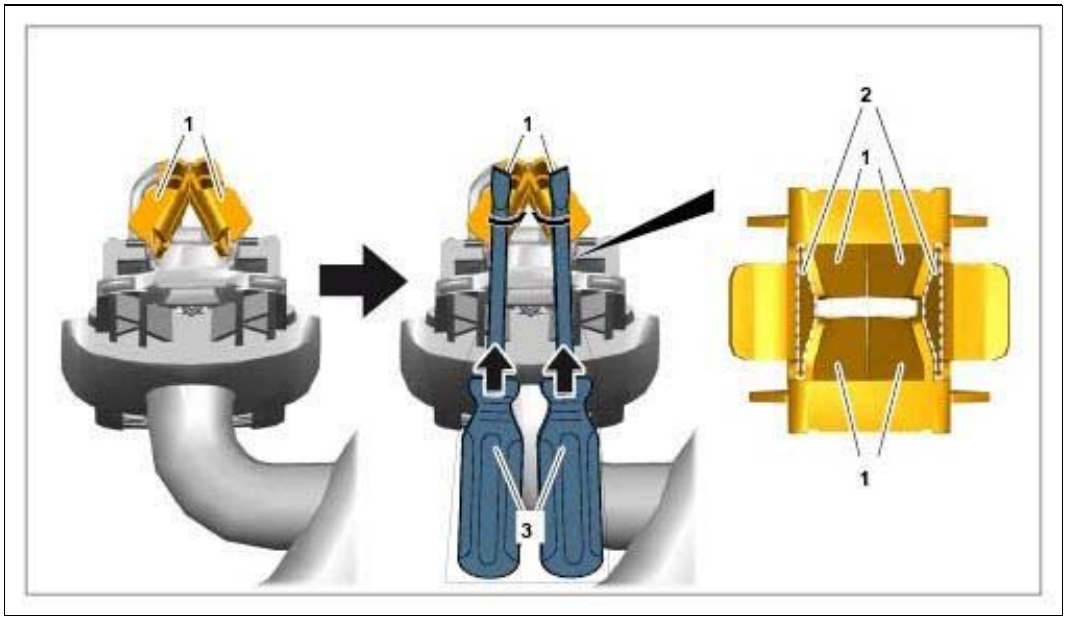
Pull sun visor down slightly and leave it there to facilitate further disassembly. This will prevent the fixing clips from locking again.

4. Loosen front fixing clip from the roof lining.

    1. 4.1. Guide two screwdrivers (1.2 x 6.5 mm) **-3-** into the openings **-2-** on the fixing clip. This actuates the tabs **-1-** on the fixing clip and moves them inwards.

    2. 4.2. Pull the sun visor down until the front fixing clip is loosened from the roof lining.

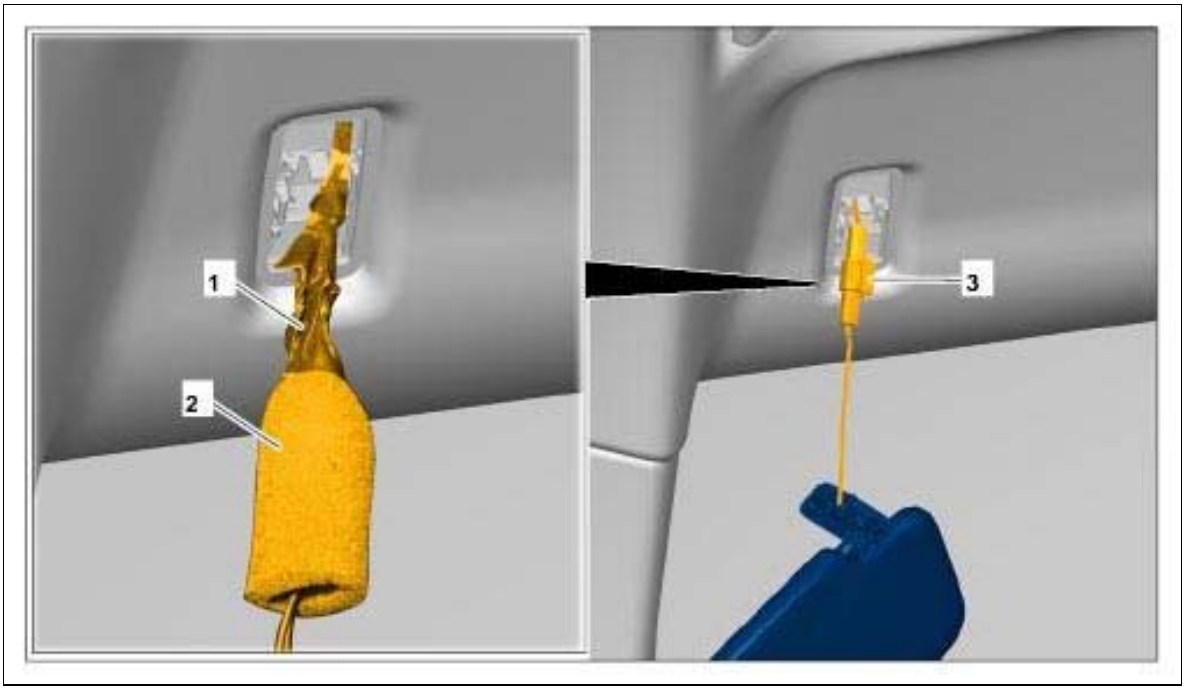
        Fig 2: Pulling Sun Visor Fixing Clip



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove screwdriver from the front fixing clip and loosen rear fixing clip from the roof lining.
6. Unclip sun visor at the center bearing.
7. Pull the sun visor down until the two fixing clips are loosened completely from the roof lining.
8. Loosen adhesive tape on the inner roof lining and guide electric line through the opening in the roof lining until the electric plug connection **-3-** is accessible.
9. Loosen electric plug connection **-3-** from the foam sleeve **-2-** , loosen adhesive tape **-1-** if necessary and disconnect plug connection **-3-** .
10. Remove sun visor.

Fig 3: Identifying Electric Line

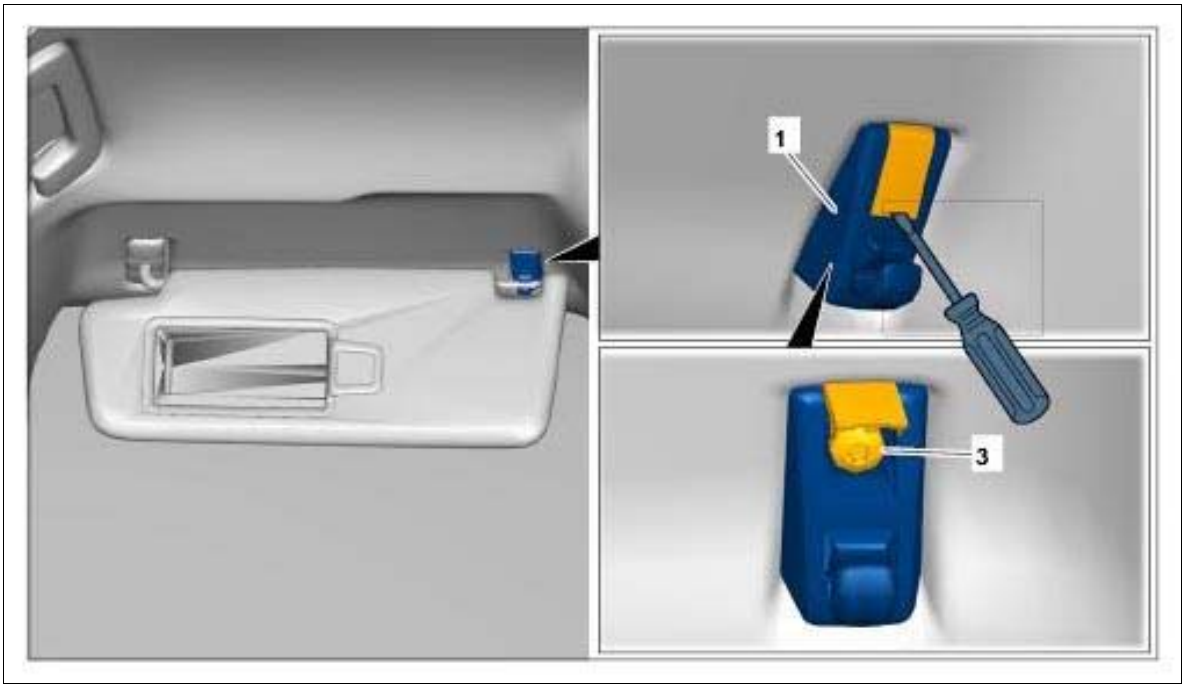


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 682319 REMOVING AND INSTALLING SUN VISOR (MACAN, MACAN S, MACAN TURBO) > REMOVING SUN VISOR > REMOVING CENTER BEARING FOR SUN VISOR

1. Unclip cover **-2-** in the upper area and swivel it upwards.
2. Unscrew fastening screw **-3-** .
3. Guide center bearing **-1-** out of the roof lining and remove it.

Fig 1: Removing Sun Visor Center Bearing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 682319 REMOVING AND INSTALLING SUN VISOR (MACAN, MACAN S, MACAN TURBO) > INSTALLING SUN VISOR > INSTALLING CENTER BEARING FOR SUN VISOR

Installation is performed in reverse order. Pay particular attention to the following:

1. Tighten fastening screw to the specified torque. **Tightening torque: 5 Nm (3.5 ftlb.)**

WM 682319 REMOVING AND INSTALLING SUN VISOR (MACAN, MACAN S, MACAN TURBO) > INSTALLING SUN VISOR > INSTALLING SUN VISOR

Information

Check that all fixing clips are positioned fully and correctly.

Check that the fixing clips are not bent or broken.

Replace damaged or missing clips with new ones.

Installation is performed in reverse order. Pay particular attention to the following:

1. Check that the fixing clips have engaged correctly.
2. Perform a function test on the light.

WM 708355 REPLACING ROOF CONSOLE (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
Battery charger 45A	Service equipment	WE 1393		
PIWIS Tester II	Special tool	9818		
WM 708355 REPLACING ROOF CONSOLE (ALL MODELS) > PRELIMINARY WORK

1. Remove and install roof console. →Removing Front Roof Trim Panel

WM 708355 REPLACING ROOF CONSOLE (ALL MODELS) > TEACHING ROOF CONSOLE

Tools:

- **PIWIS Tester II 9818** with PIWIS Tester test software version **14.300** (or higher) installed.
- Suitable battery charger (charging current of at least 40 A), e.g. **Battery charger 45A WE 1393**

Procedure:

Information

The procedure described here is based on the PIWIS Tester II test software version **14.300** .

The PIWIS Tester instructions take precedence and in the event of a discrepancy, these are the instructions that must be followed.

A discrepancy may arise with later software versions for example.

1. Connect a battery charger with a current rating of **at least 40 A** to the jump-start terminals in the engine compartment.
2. Switch on the ignition using the **original driver's key.**

   To do this, replace the control panel in the ignition lock with the original driver's key if necessary.
3. **PIWIS Tester II 9818** with software version **14.300** (or higher) installed must be connected to the vehicle communication module (VCI) via the **USB cable.** Then, connect the communication

module to the vehicle and switch on the PIWIS Tester.

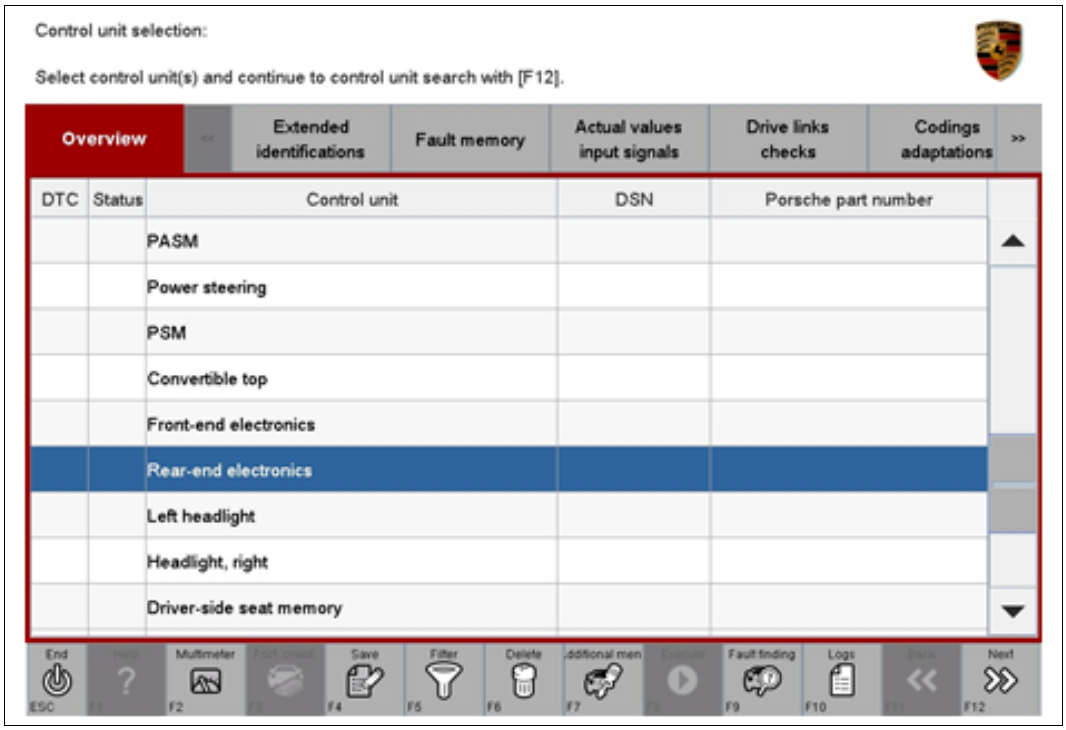
4. On the PIWIS Tester start screen, call up the → **'Diagnostics'** menu and select the relevant vehicle type.

   The diagnostic application is then started and the control unit selection screen is populated.

5. Re-code rear-end electronics control unit automatically.

    1. 5.1. In the control unit selection screen (→ **'Overview'** menu), select the → **'Rear-end electronics'** control unit and press [>>] to confirm your selection → see Fig 1.

       Fig 1: Screen Display - Control Unit Selection - Rear-End Electronics

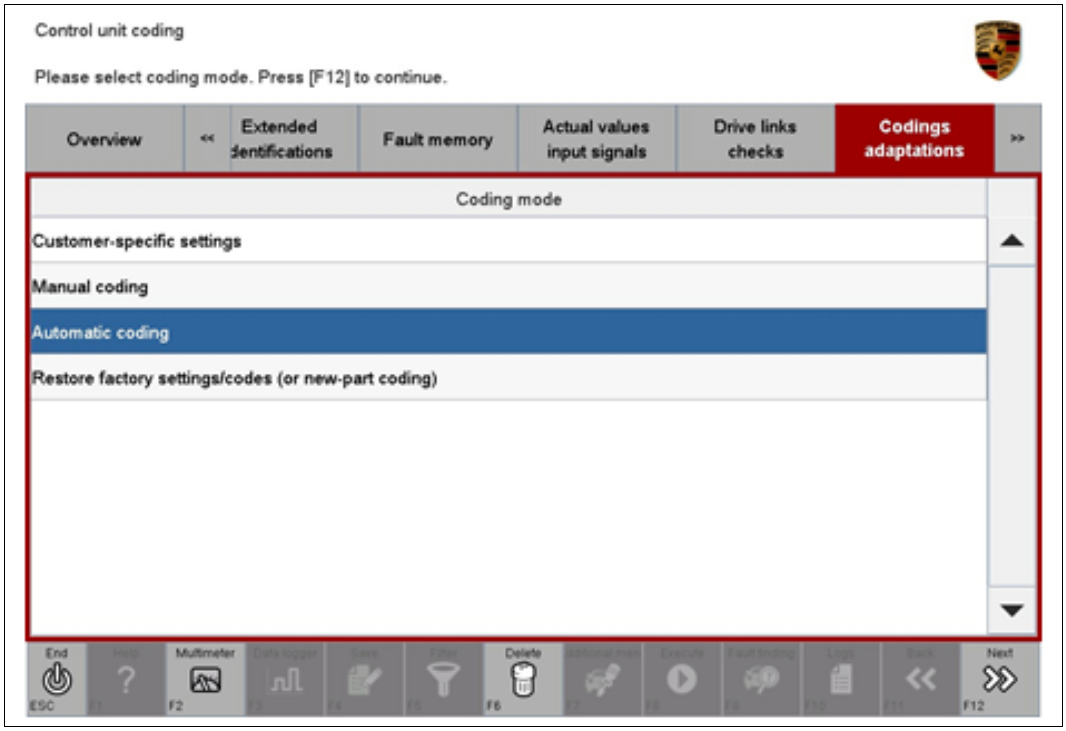


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

    2. 5.2. Once the 'Rear-end electronics' control unit has been found and is displayed in the overview, select the → **'Codings/adaptations'** menu.

    3. 5.3. Select the → **'Automatic coding'** function and press [>>] to start coding → see Fig 2.

Fig 2: Screen Display - Automatic Coding

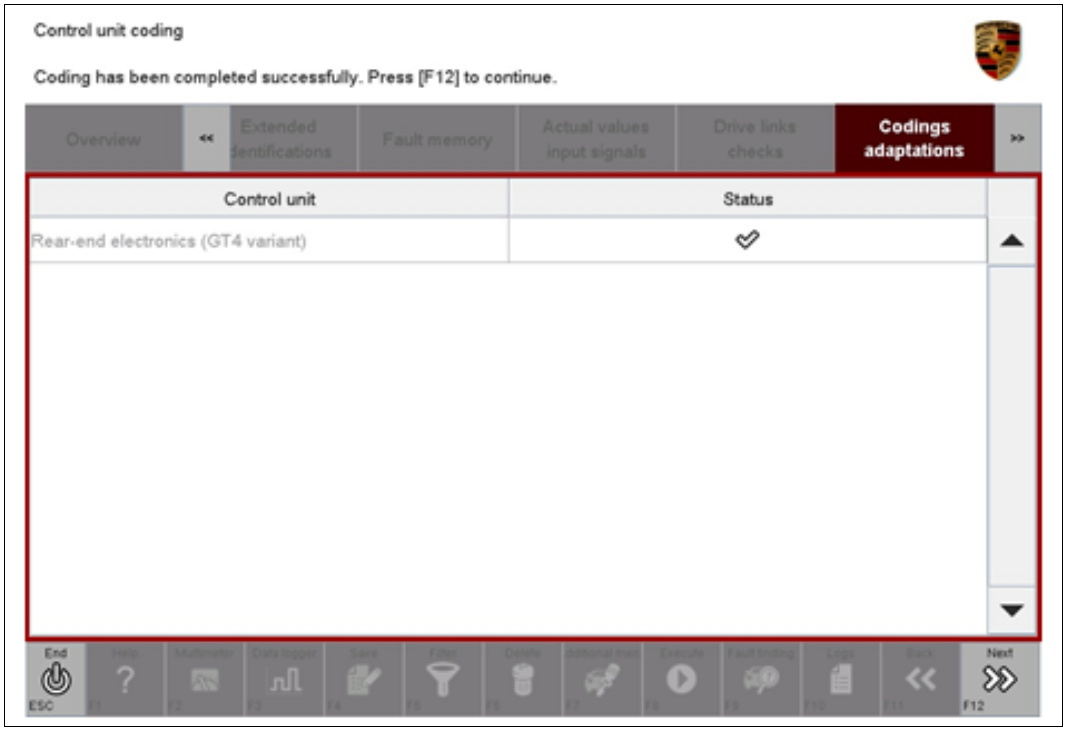


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. 5.4. When coding is complete, the message "Coding has been completed successfully" is displayed and a tick appears in the 'Status' box → see Fig 3.

   If coding is not completed successfully (error message "Coding was not completed successfully"), coding must be **repeated** .

Fig 3: Screen Display - Coding Successful



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

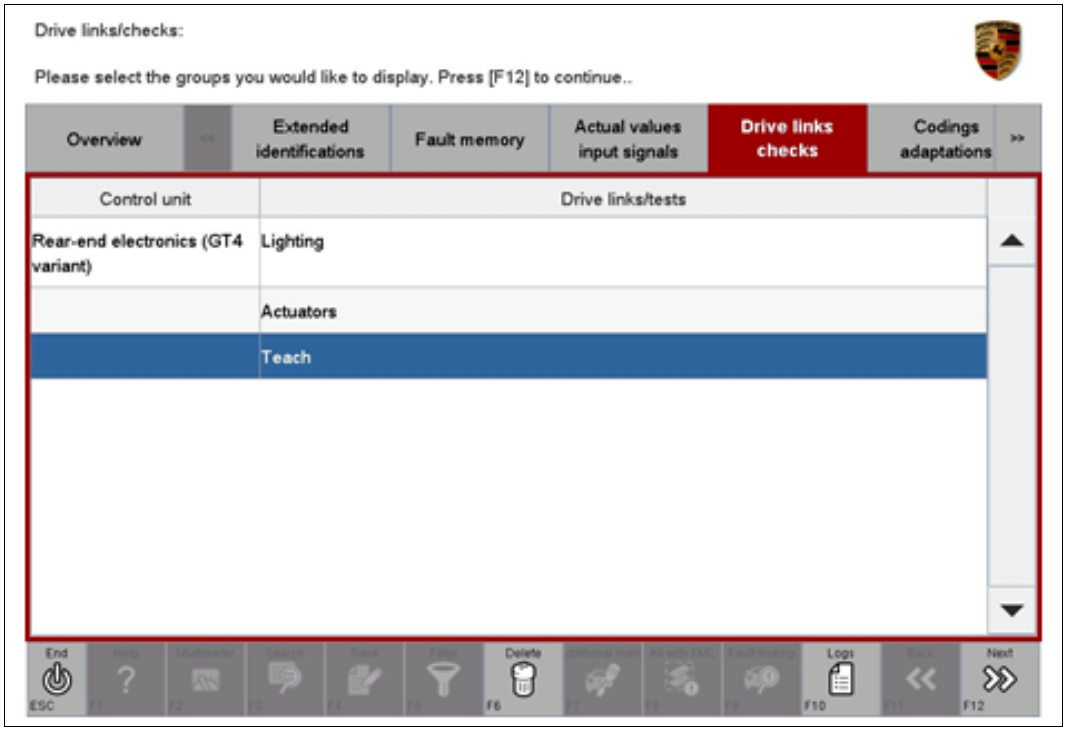
5. 5.5. Once coding has been completed successfully, press [>>] to return to the start page of the → **'Codings/adaptations'** menu.

6. Teach the roof console to suit the vehicle.

    1. 6.1. Select the → **'Drive links/checks'** menu on the PIWIS Tester.

    2. 6.2. Select the → **'Teach'** function and press [>>] to confirm your selection → see Fig 4.

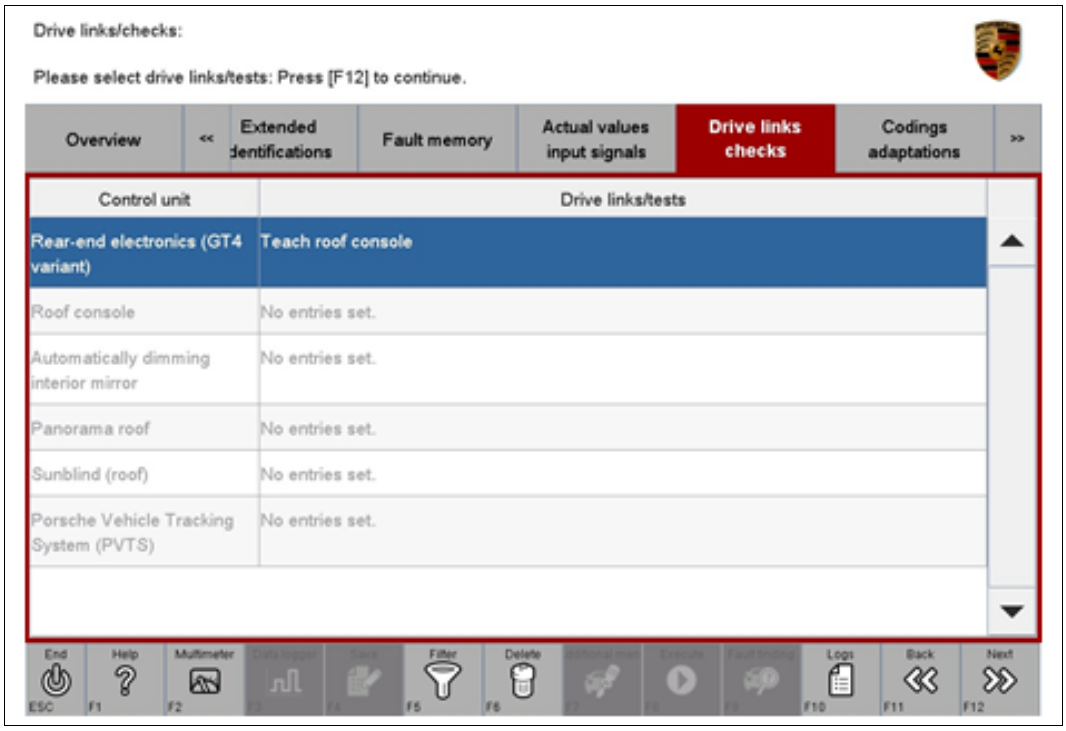
Fig 4: Screen Display - Teach Function



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 6.3. Select the → **'Teach roof console'** function and press [>>] to confirm your selection → see Fig 5.

   Fig 5: Screen Display - Teaching Roof Console



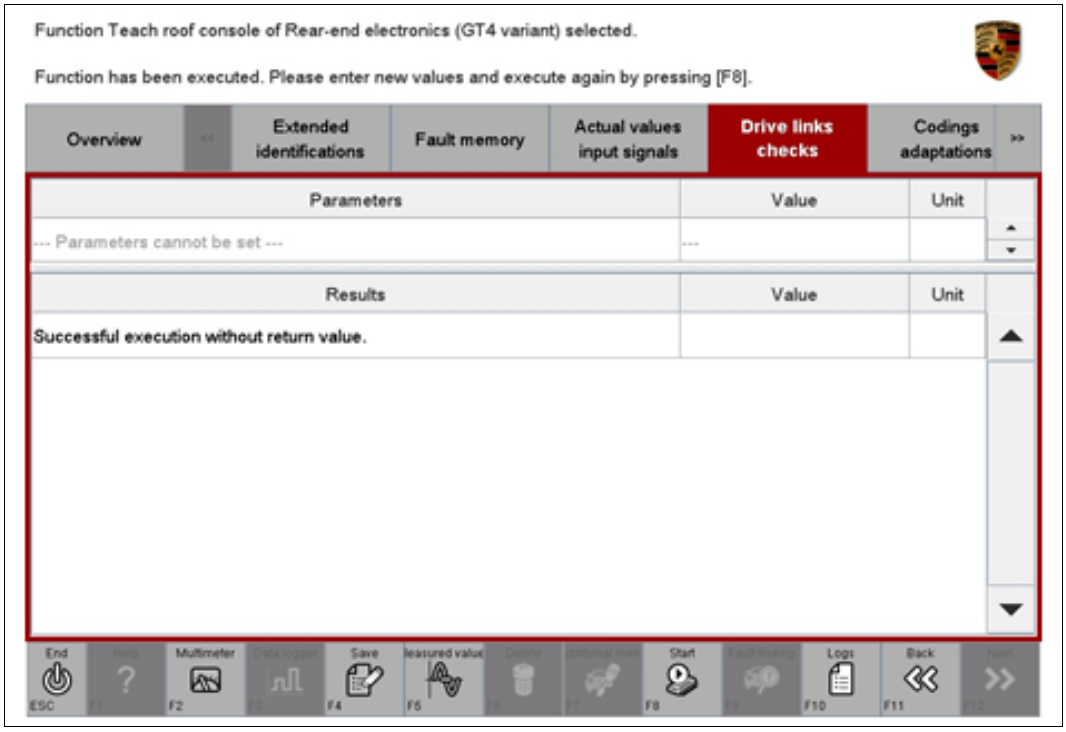
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. 6.4. Start the → **'Teach roof console'** function by pressing [F8].

Once the roof console has been taught, the message **"Successful execution without return value"** appears in the PIWIS Tester display → see Fig 6.

If the roof console cannot be taught successfully, the process must be **repeated** .

Fig 6: Screen Display - Roof Console Taught Successfully



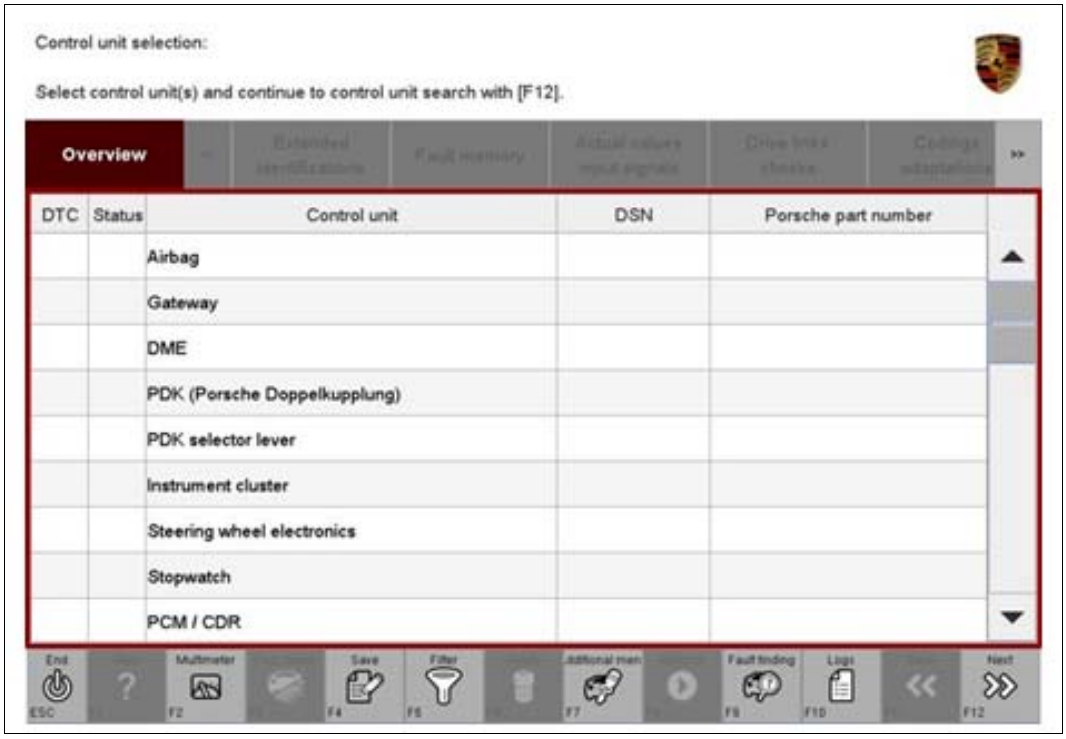
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. 6.5. Once the roof console has been taught successfully, press [<<] to return to the start page of the → **'Drive links/checks'** menu.
6. 6.6. Select the → **'Overview'** menu and press [<<] to return to the control unit selection screen.

7. Read out and erase fault memories.

1. 7.1. In the control unit selection screen (→ **'Overview'** menu), press [F7] to call up the → **'Additional menu'** (→ see Fig 7).

Fig 7: Screen Display - Control Unit Selection

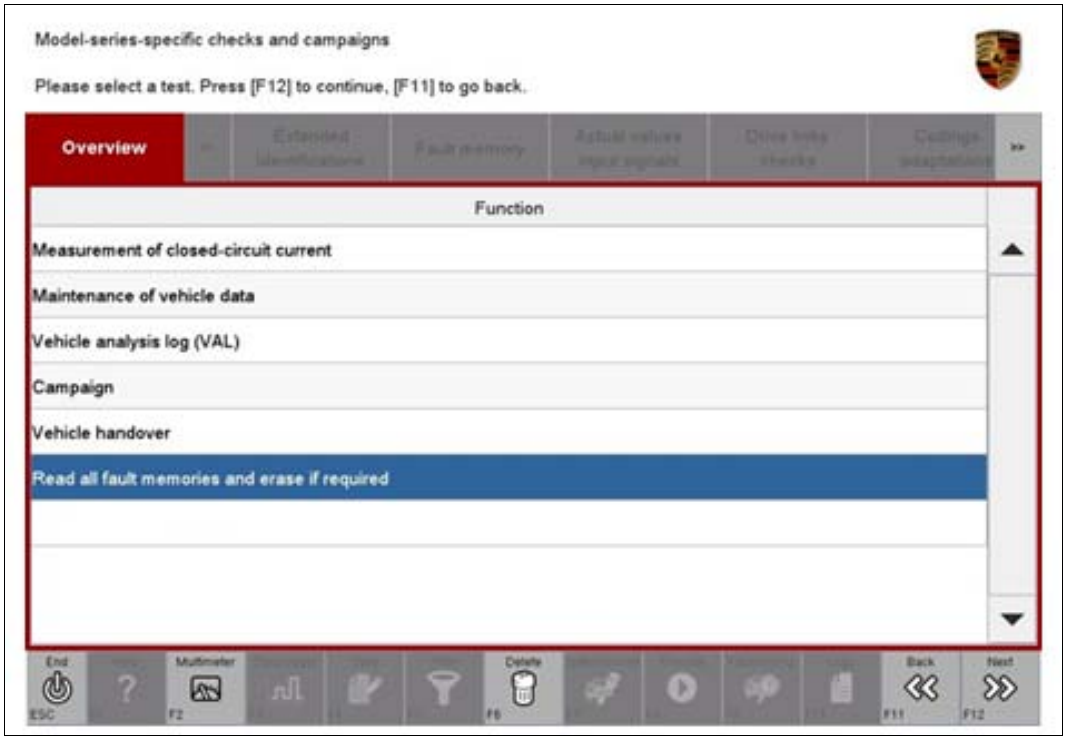


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 7.2. Select the function → **'Read all fault memories and erase if required'** and press [>>] to confirm → see Fig 8.

   The fault memories of the control units are read out.

Fig 8: Screen Display - Erasing Fault Memories



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 7.3. Once you have read out the fault memories, delete the fault memory entries by pressing [F8].
4. 7.4. Confirm the query as to whether you really want to delete all fault memory entries and press [>>] ("Yes") to confirm.

   The faults stored in the fault memories of the various control units are deleted.

   Information

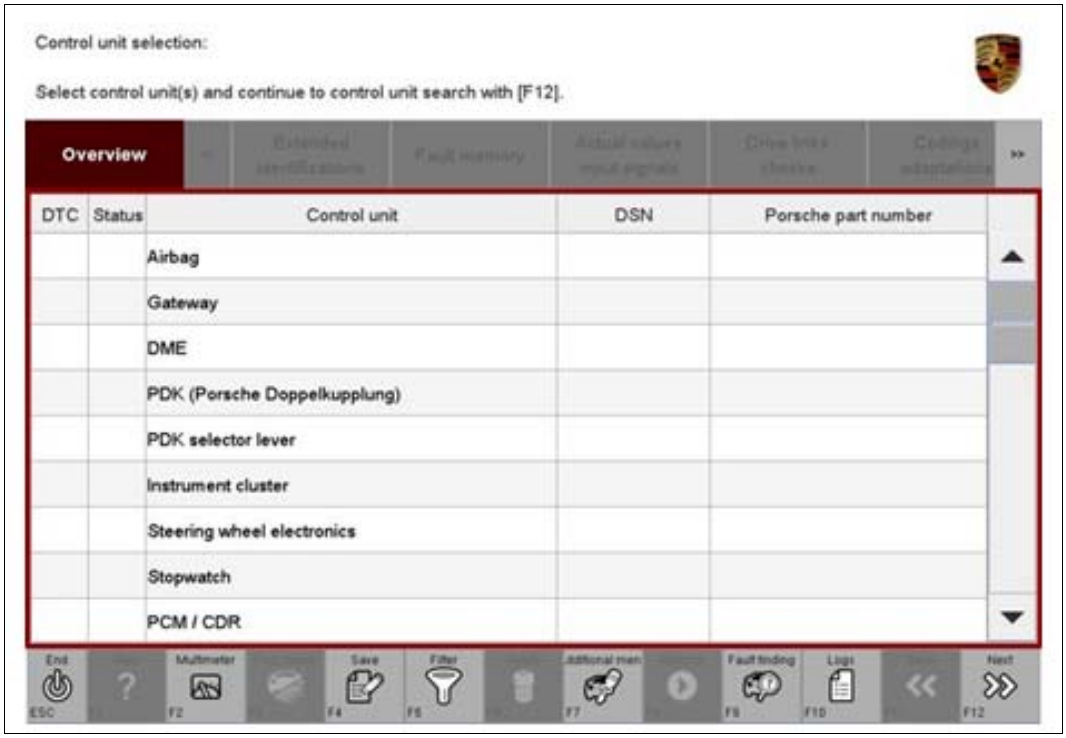
   The fault memories of individual control units (e.g. fault memories of the control units for front-end electronics, rear-end electronics, etc.) cannot be erased, proceed as follows:

   1. Switch off ignition.
   2. Disconnect the PIWIS Tester diagnostic connector from the diagnostic socket.
   3. Lock the vehicle using the driver's key.
   4. Wait approx. 1 minute before unlocking the vehicle again.
   5. Plug the PIWIS Tester diagnostic connector into the diagnostic socket again and restore communication with the vehicle.
   6. Read out the fault memories of these control units again and erase the fault memories separately.

   If control units are found to have faults, which cannot be erased and are not caused by replacing the roof console, these faults must be found and corrected.

5. 7.5. Once you have erased the fault memories, select the → **'Overview'** menu and press [<<] to return to the control unit selection screen → see Fig 9.

Fig 9: Screen Display - Control Unit Selection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Switch off ignition.
9. Disconnect the PIWIS Tester from the vehicle.
10. Switch off and disconnect the battery charger.
11. On vehicles with Porsche Entry & Drive, replace the original driver's key in the ignition lock with the control panel again.

WM 720119 REMOVING AND INSTALLING FRONT SEAT (ALL MODELS) > REMOVING FRONT SEAT

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

Information

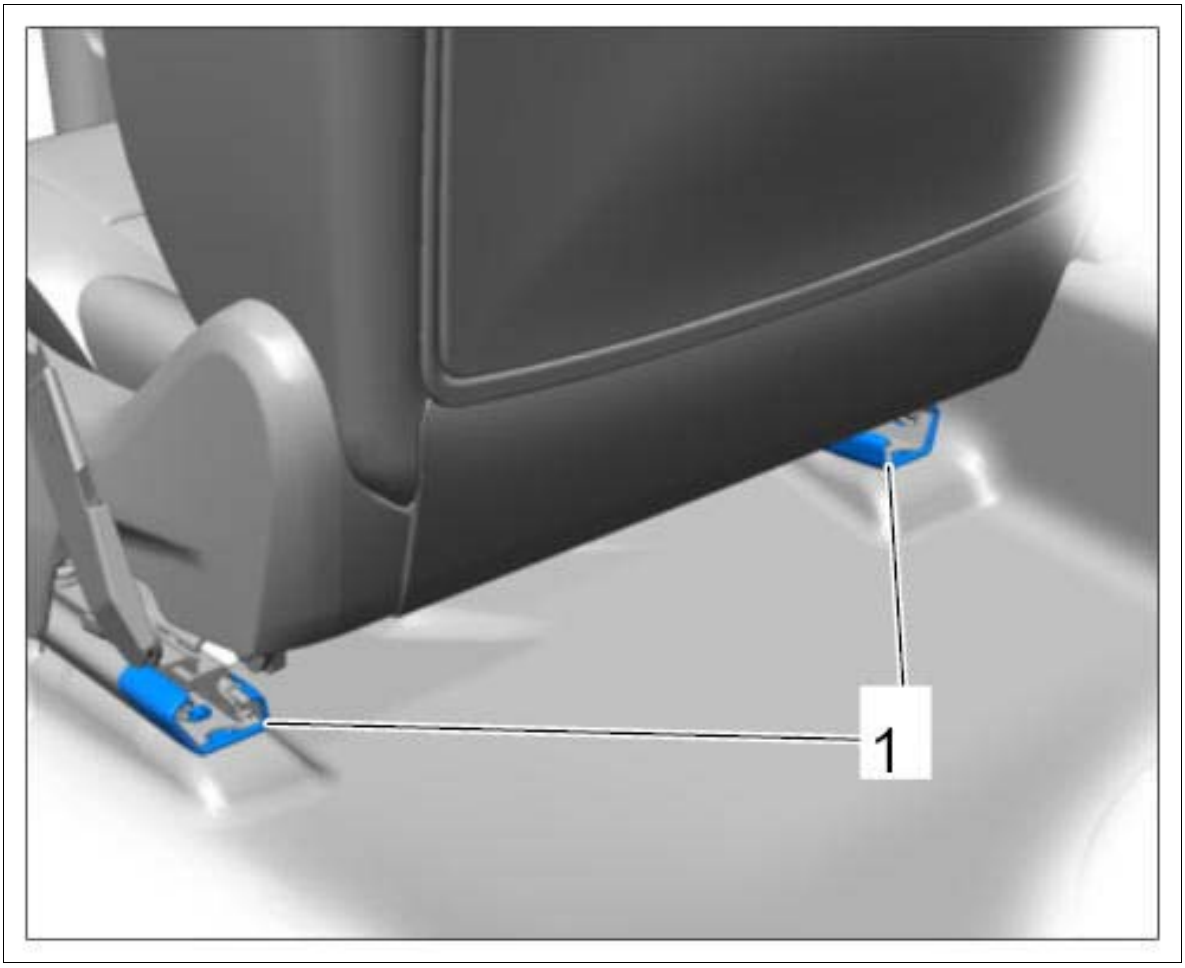
In the case of faulty fore-and-aft or vertical adjustment, the seat can only be removed together with the seat frame. → 720919 REMOVING AND INSTALLING FRONT SEAT FRAME

Information

- Some of the repair illustrations show only one side of the vehicle.
- Naturally, some steps also have to be performed on the opposite side of the vehicle as well.

1. Move backrest all the way forward. Move front seat all the way up and all the way forward.
2. Release caps **-1-** by pulling them upwards and pull them off the rear seat rails.

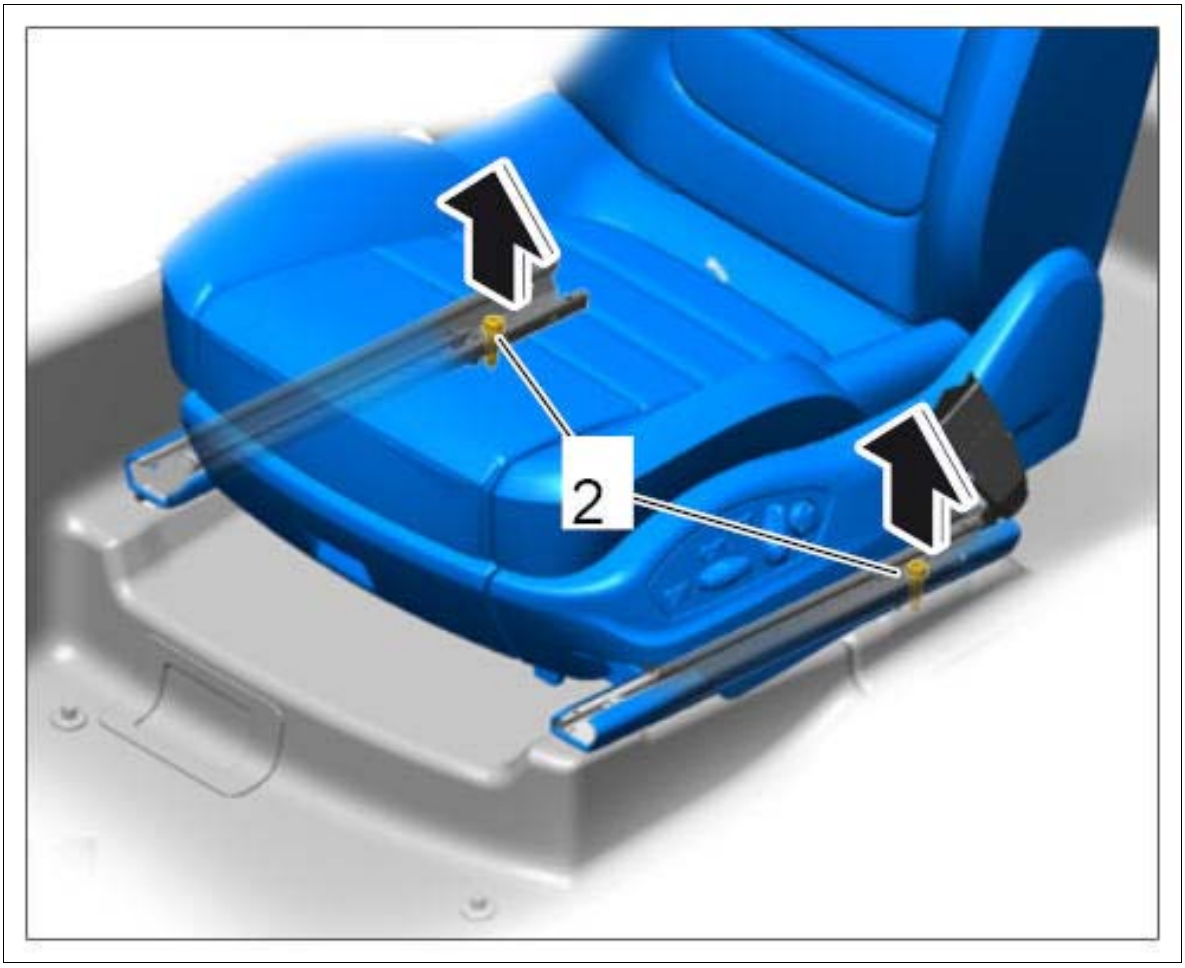
Fig 1: Identifying Caps On Rear Seat Rail



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew fastening screws on the rear seat rails **-2-** .

Fig 2: Removing Fastening Screws On Rear Seat Rail

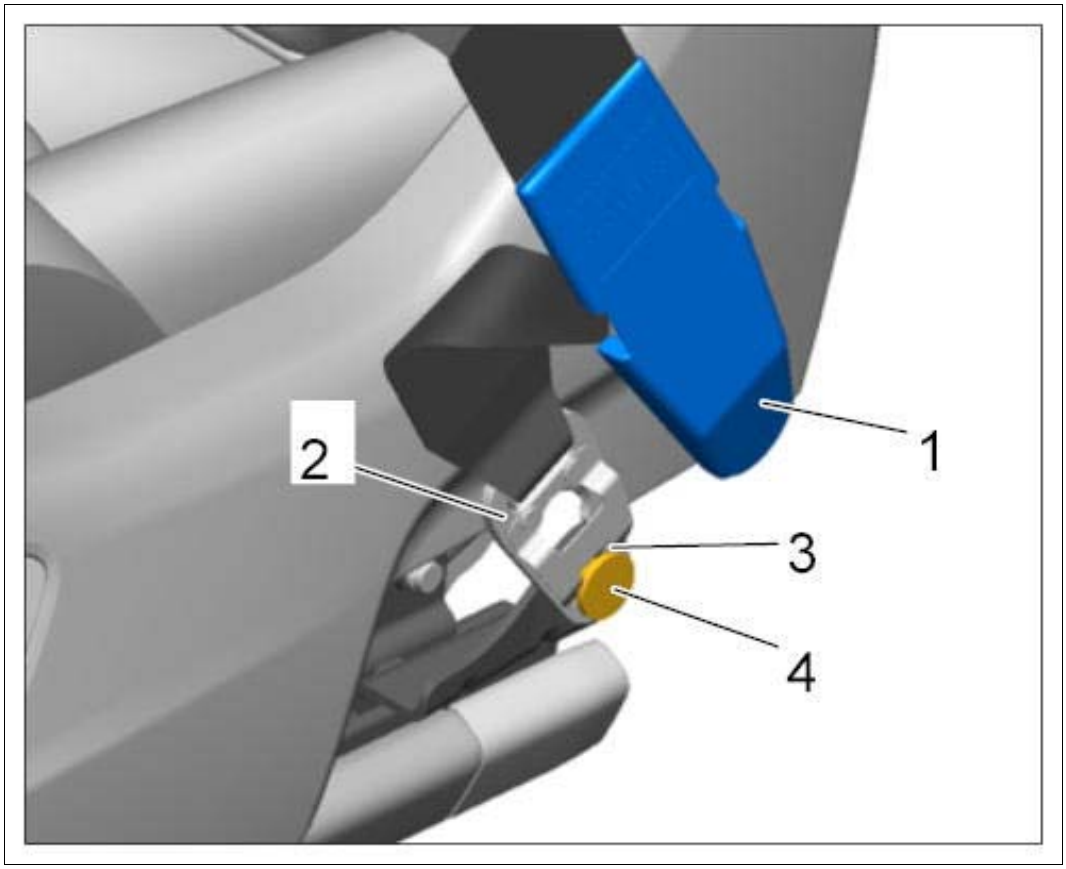


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove seat belt mount.

    1. 4.1. Disengage cap **-1-** and slide it over the seat belt mount **-2-** .

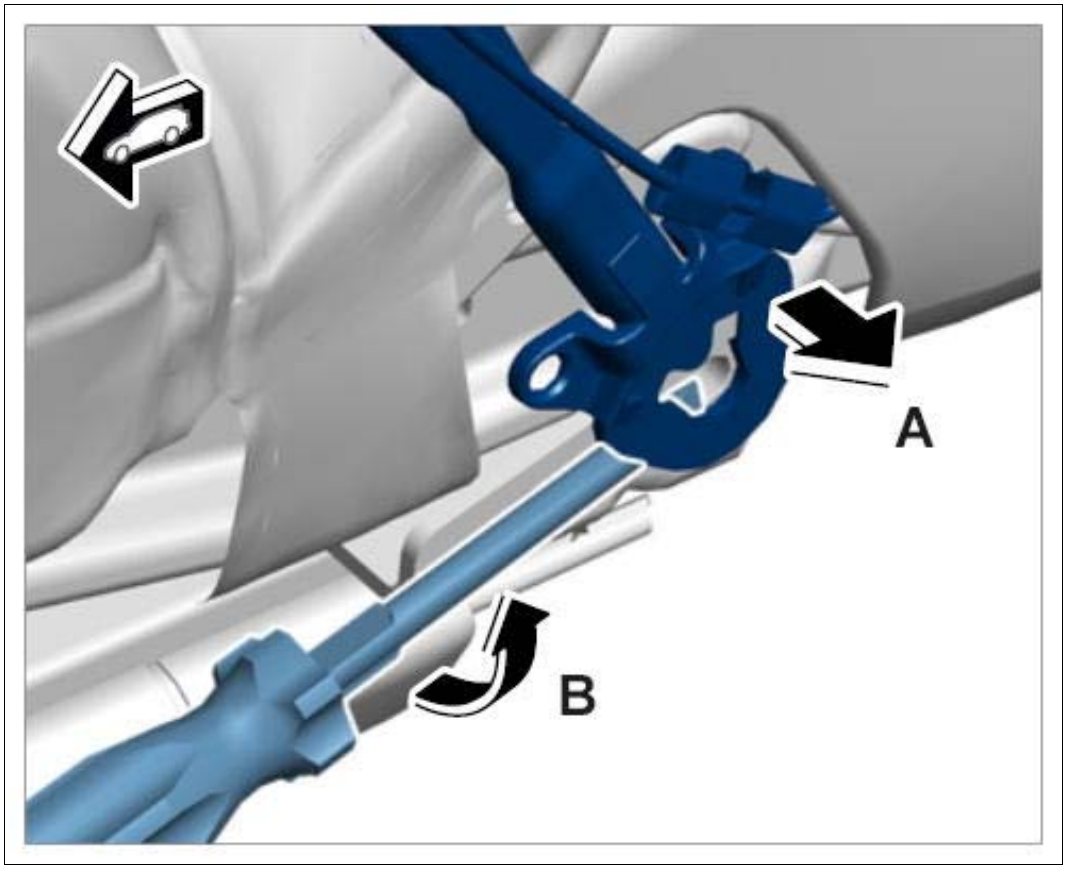
Fig 3: Identifying Seat Belt Mount On Front Seat



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 4.2. Release retaining clip **-3-** on the seat belt mount using a suitable screwdriver **-arrow A-** .
3. 4.3. Push seat belt mount over the retaining pin **-arrow B-** until the locking lug under the retaining pin loosens the clip.

Fig 4: Releasing Seat Belt Mount



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

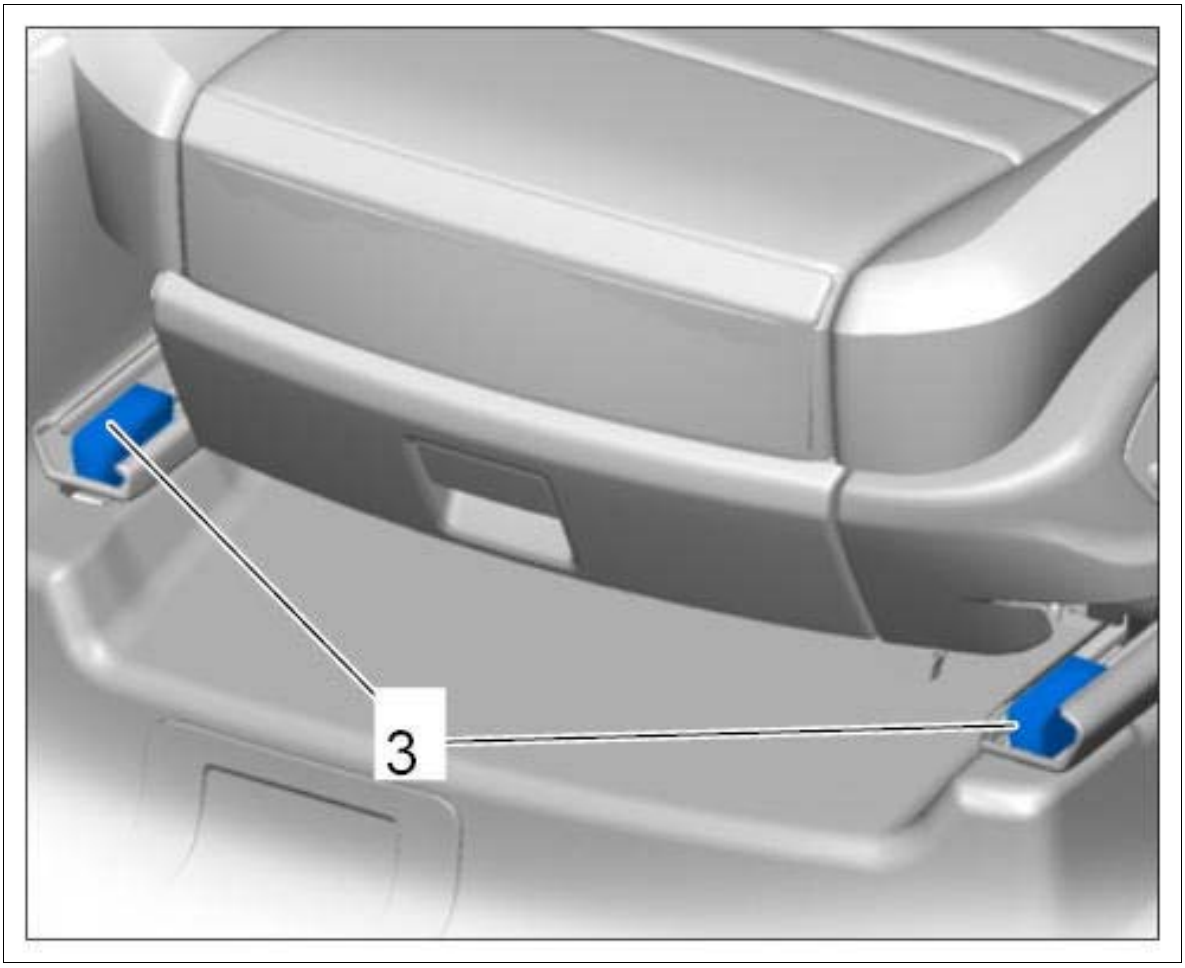
4. 4.4. Remove seat belt mount from the retaining pin.

5. Move the front seat back fully and lower the rear seat surface.

6. Remove remote control. Disconnect the battery. Route or isolate ground strap so that all contact with a ground carrier (e.g. body, seat frame) is avoided. → 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY .

7. Release caps **-3-** and remove them from the front seat rails.

Fig 5: Identifying Caps On Front Seat Rail



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

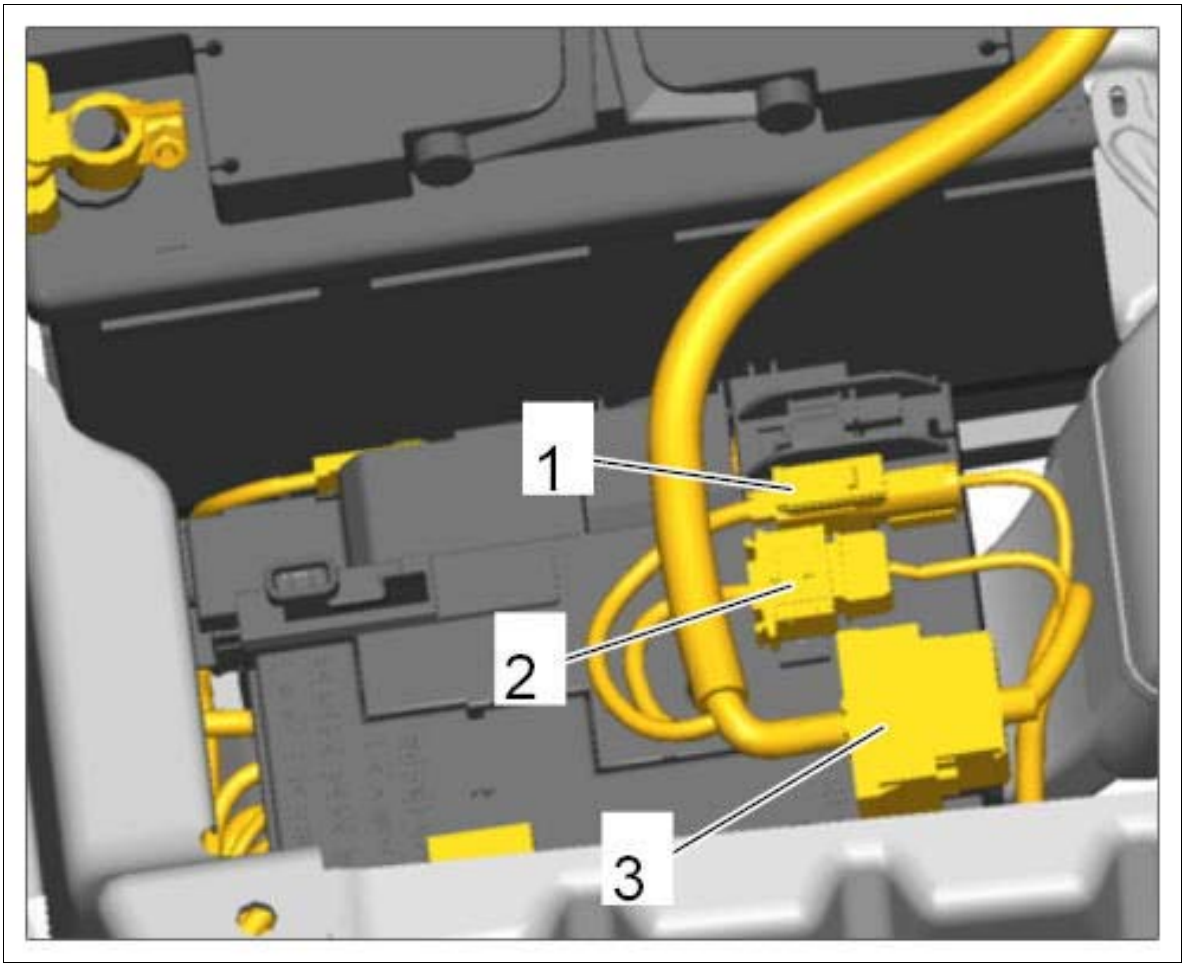
8. Unscrew and remove fastening screws on the front seat rail **-4-** .

Fig 6: Removing Fastening Screws On Front Seat Rail

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Fold the front seat back.
10. Release and disconnect electric plug connections for the front seat **-1, 2 and 3-** .

Fig 7: Identifying Electric Plug Connections



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

The number of electric plug connections can vary, depending on equipment.

11. Carefully remove the front seat.

WM 720119 REMOVING AND INSTALLING FRONT SEAT (ALL MODELS) > INSTALLING FRONT SEAT

WARNING: Incorrect handling of safety bolts

- *Danger of injury*
- *Loss of torque*

→ Always use new fastening screws and nuts following removal.

→ Observe specified tightening torques.

→ Carry out a visual inspection of all re-used parts.

Information

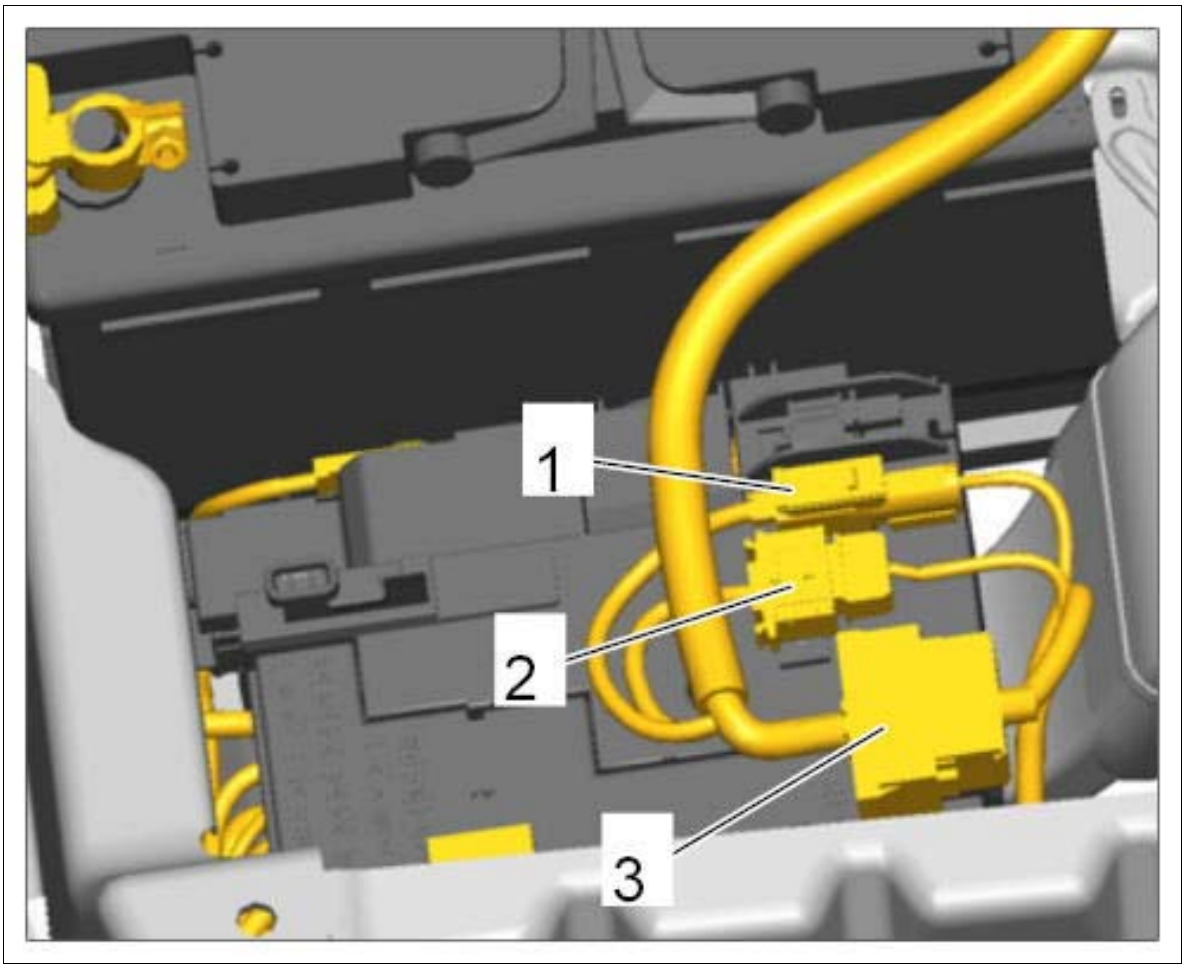
- Some of the repair illustrations show only one side of the vehicle.
- Naturally, some steps also have to be performed on the opposite side of the vehicle as well.

Information

Always replace the fastening screws on the front seat after customer service and reworking. The micro-self-locking or self-tapping screws must not be treated, greased or loosened and then screwed on again.

1. Place front seat in the vehicle and tilt it backwards.
2. Plug in electric plug connections for driver's seat **-1, 2 and 3-** .

   Fig 1: Identifying Driver Seat Electric Plug Connections



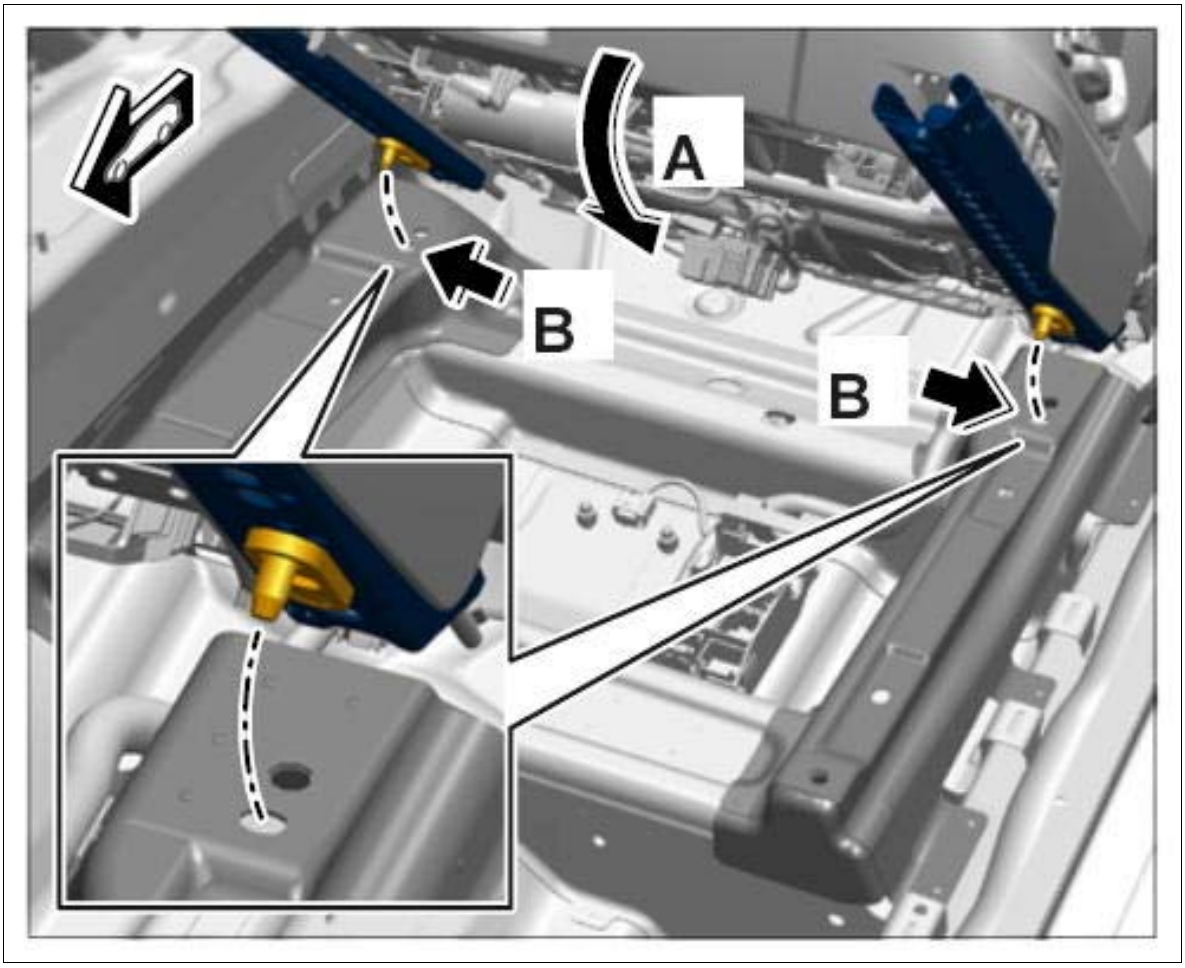
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

The number of electric plug connections can vary, depending on equipment.

3. Fold the front seat forward **-arrow A-** and align it on the seat frame with the centering pins **-arrow B-** .

Fig 2: Positioning Front Seat On Seat Frame



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Connect the battery → 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY .

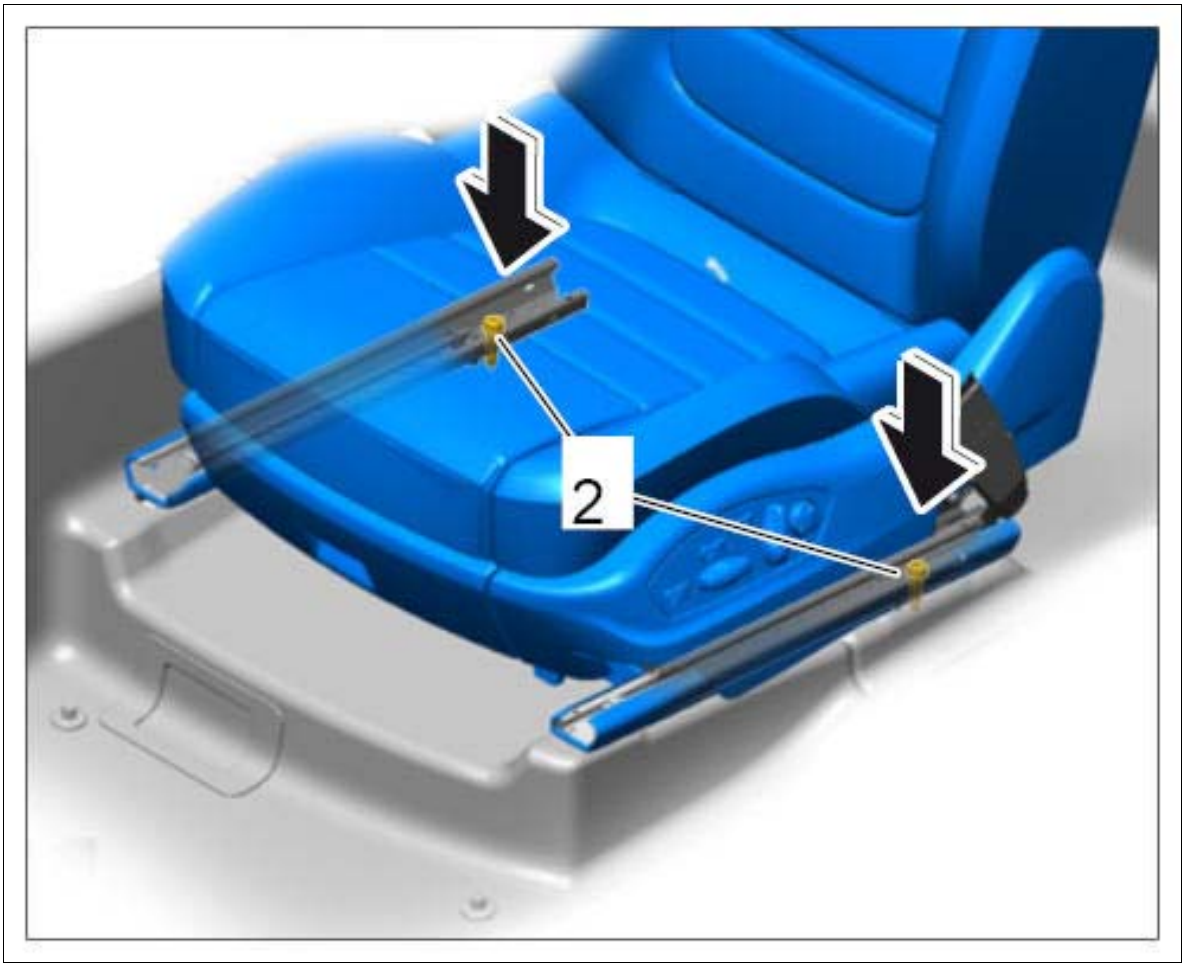
5. Move front seat all the way back. Screw in front fastening screws **-4-** only until the seat rails are touching the seat frame.

Fig 3: Tightening Fastening Screws On Front Seat Rail

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Move the front seat all the way forward and secure it to the seat frame at the rear with the fastening screws **-2-** . **Tightening torque 50 Nm (37 ftlb.) +/-7.5 Nm (+/-5.5 ftlb.)** .

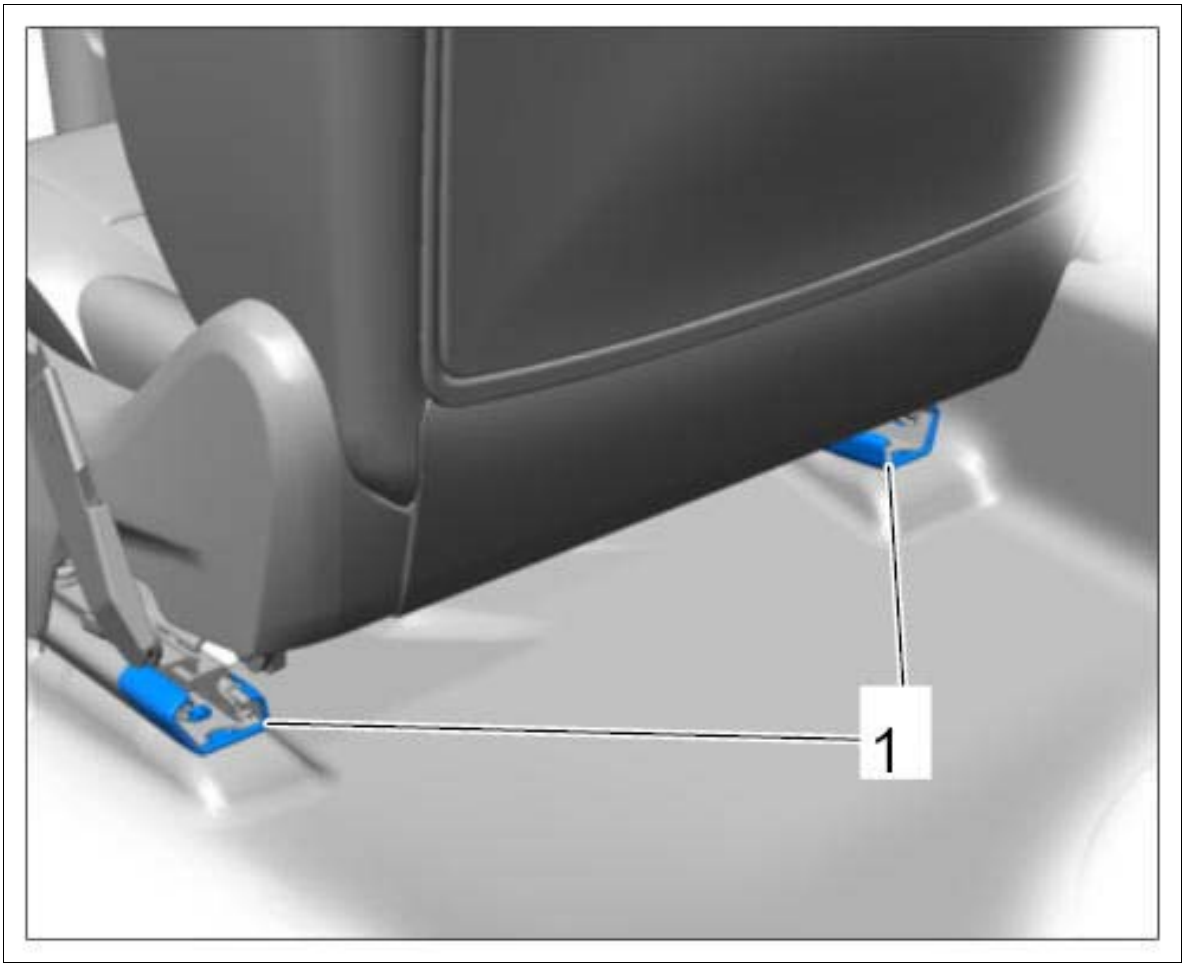
Fig 4: Securing Front Seat To Seat Frame (Rear)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Carefully fit the rear caps **-1-** .

Fig 5: Identifying Caps On Rear Seat Rail



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

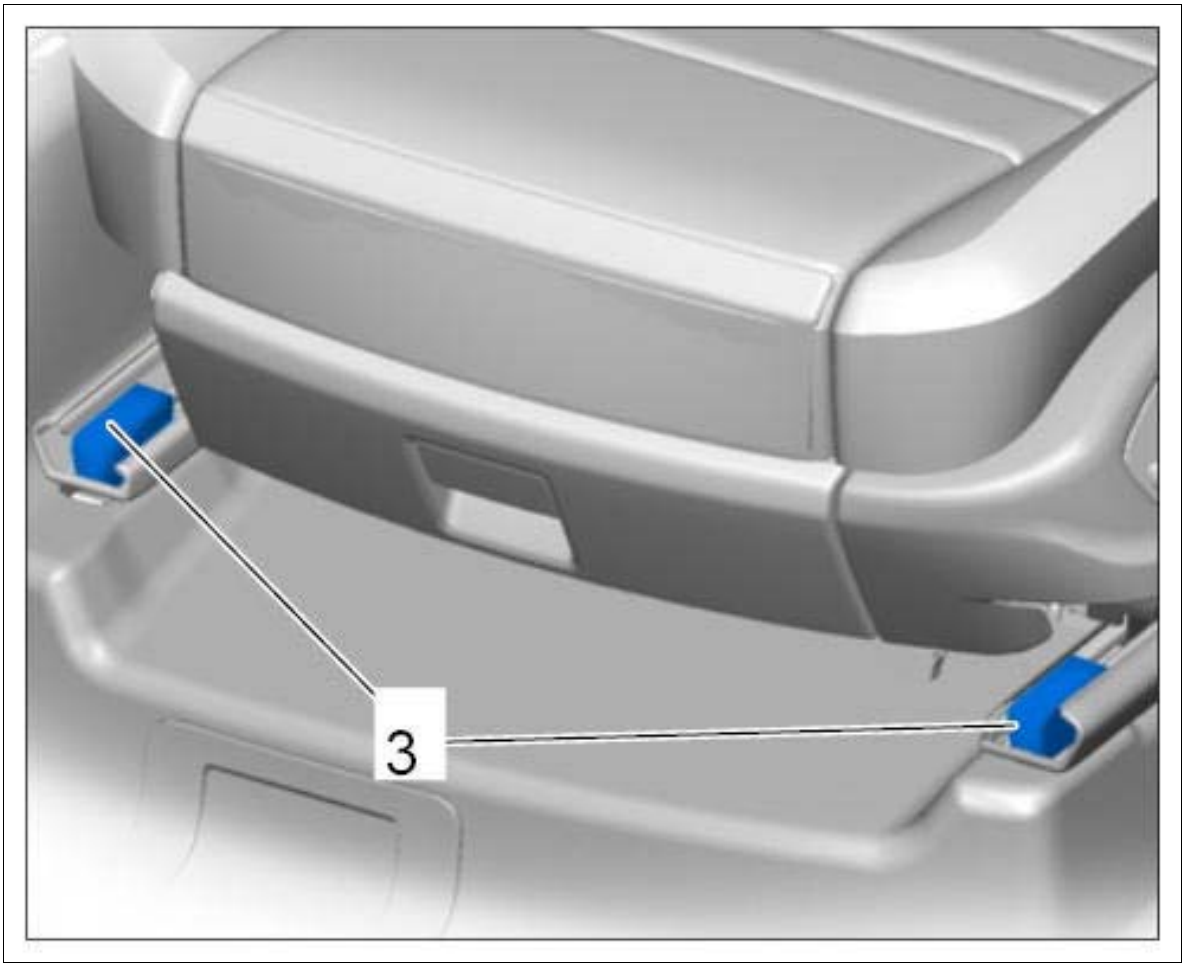
8. Move the front seat all the way back and secure it to the seat frame at the front by tightening the fastening screws **-4-** to **Tightening torque 50 Nm (37 ftlb.) +/-7.5 Nm (+/-5.5 ftlb.)** .

Fig 6: Tightening Fastening Screws On Front Seat Rail

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Fit the caps at the front **-3-** on the seat rail.

Fig 7: Identifying Caps On Front Seat Rail



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Do not twist the three-point belt during installation!

10. Install seat belt mount.

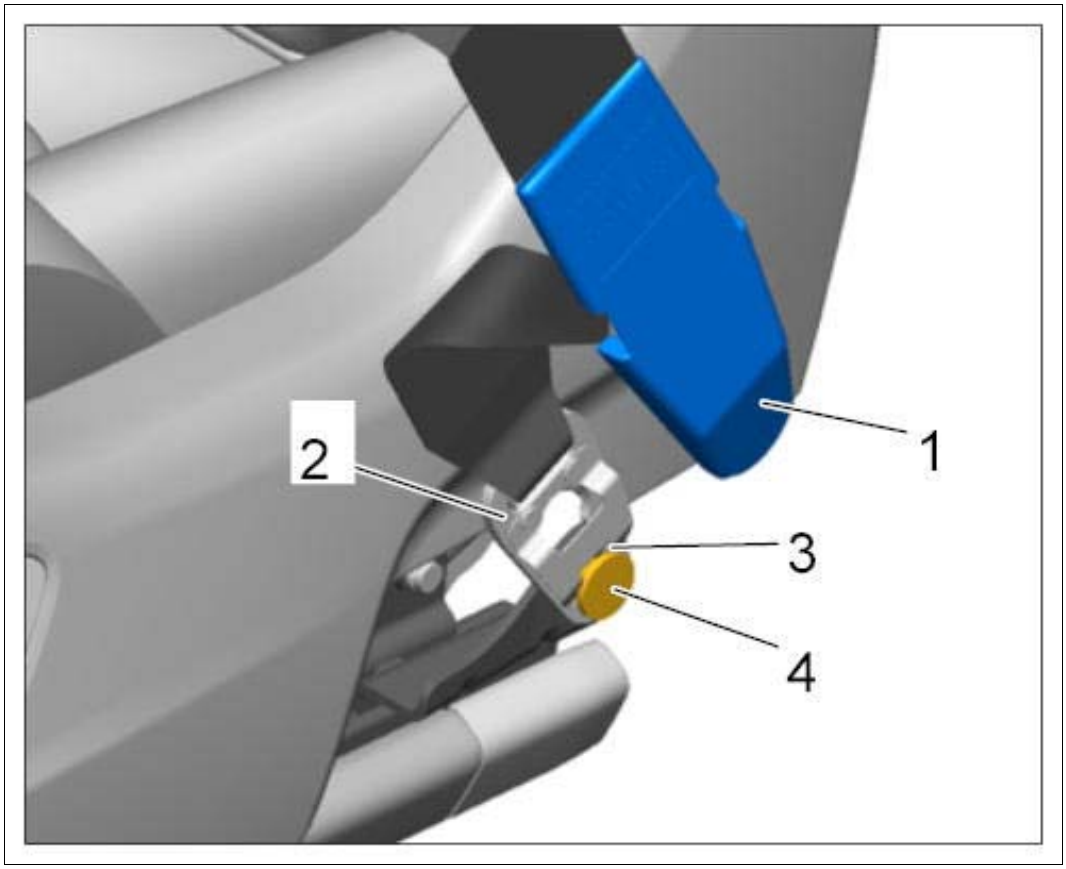
> *NOTE: Incorrect handling of spring plate on seat belt mount*
>
> *1. The seat belt must be replaced.*

→ Only bend the spring plate up as far as required to allow you to push the seat belt mount off the mounting pin.

→ The spring plate must be touching the mounting pin during installation with preload.

1. 10.1. Position seat belt mount **-2-** on the retaining pin **-4-** and pull upward until the retaining clip **-3-** locks with an audible click.

Fig 8: Identifying Seat Belt Mount On Front Seat



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 10.2. Pull on the belt strap. The retaining clip **-3-** must engage fully on the holder.
3. 10.3. Push the cap **-1-** over the seat belt mount **-2-** and lock it. The label on the seat belt must be pushed into the cap when you push the cover down.

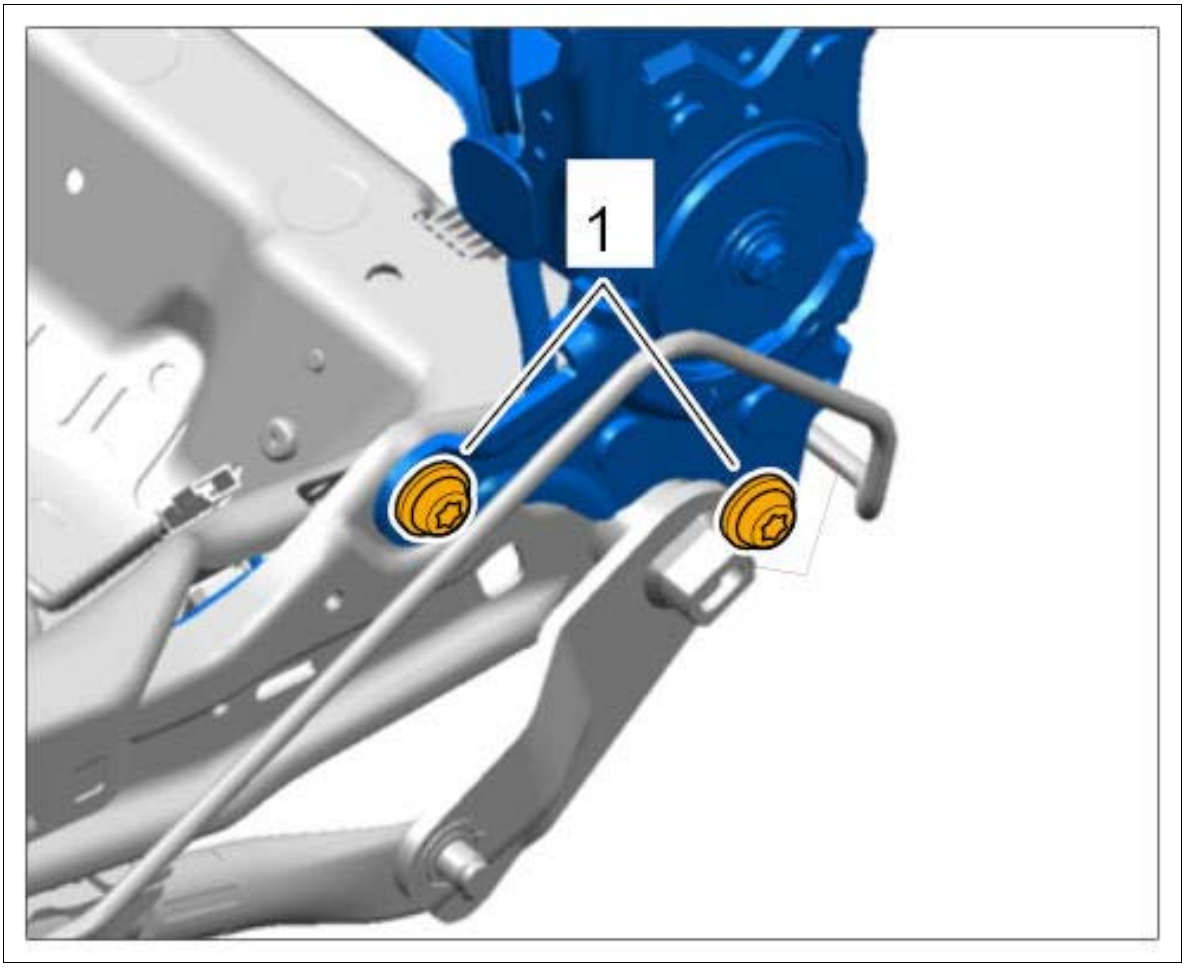
5. **Second mechanic:** Pull electric lines through between the seat frame and seat padding.

WM 721919 REMOVING AND INSTALLING BACKREST FRAME (ALL MODELS) > INSTALLING BACKREST FRAME

A second mechanic is required:

1. **First mechanic:** Fit backrest frame.
    1. 1.1. Fit backrest frame on seat frame.
    2. 1.2. Pull electric line through between the seat frame and seat padding.
2. **Second mechanic:** Tighten two fastening screws **-1-** for the backrest frame on both sides **Tightening torque 33 Nm (24 ftlb.) +/-3 Nm (+/-2 ftlb.)** .

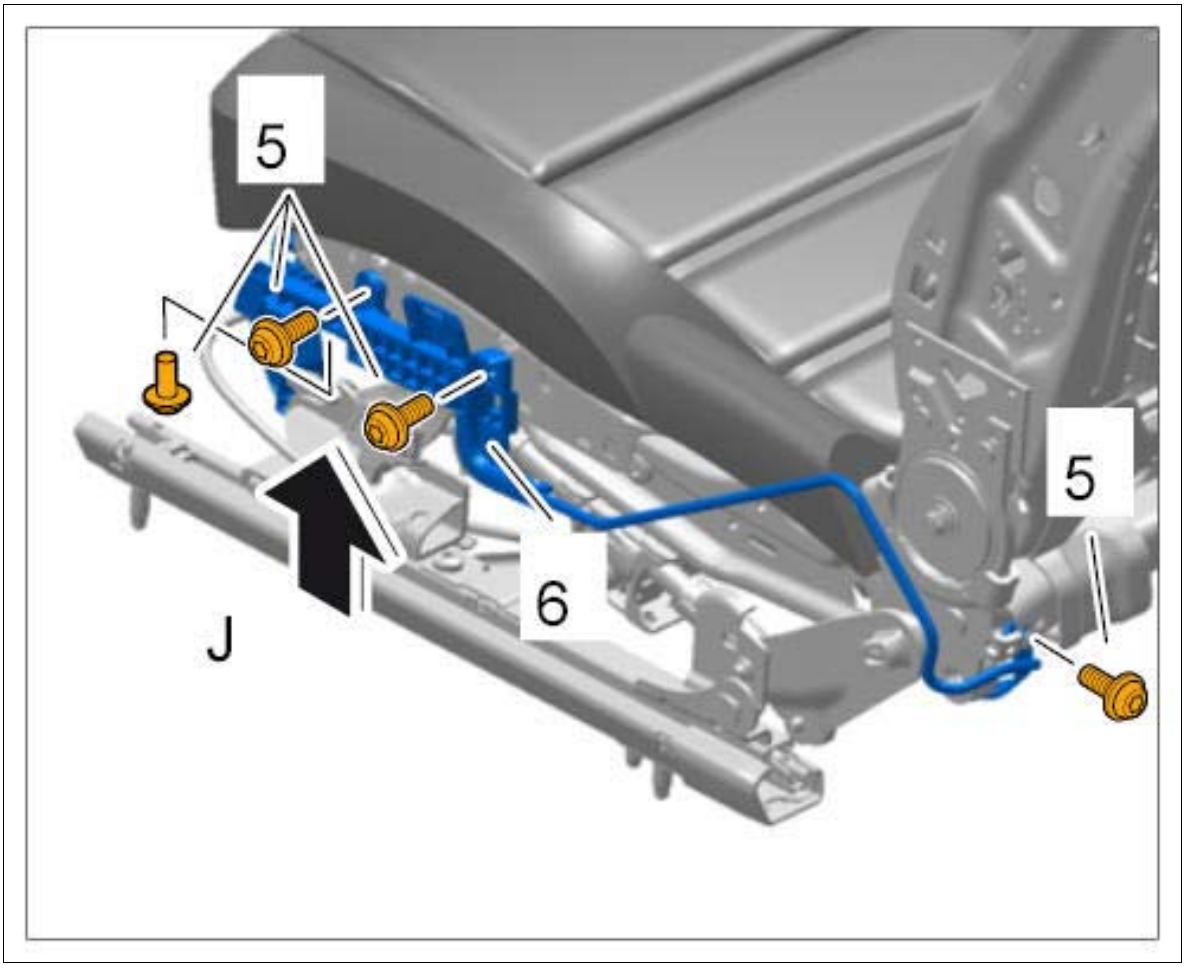
Fig 1: Removing Backrest Frame



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Engage the bracket **-6-** from below **-arrow J-** .
4. Tighten fastening screws **-5-** (**Tightening torque 7.5 Nm (5.5 ftlb.) +/-0.5 Nm (+/-0.5 ftlb.)**).

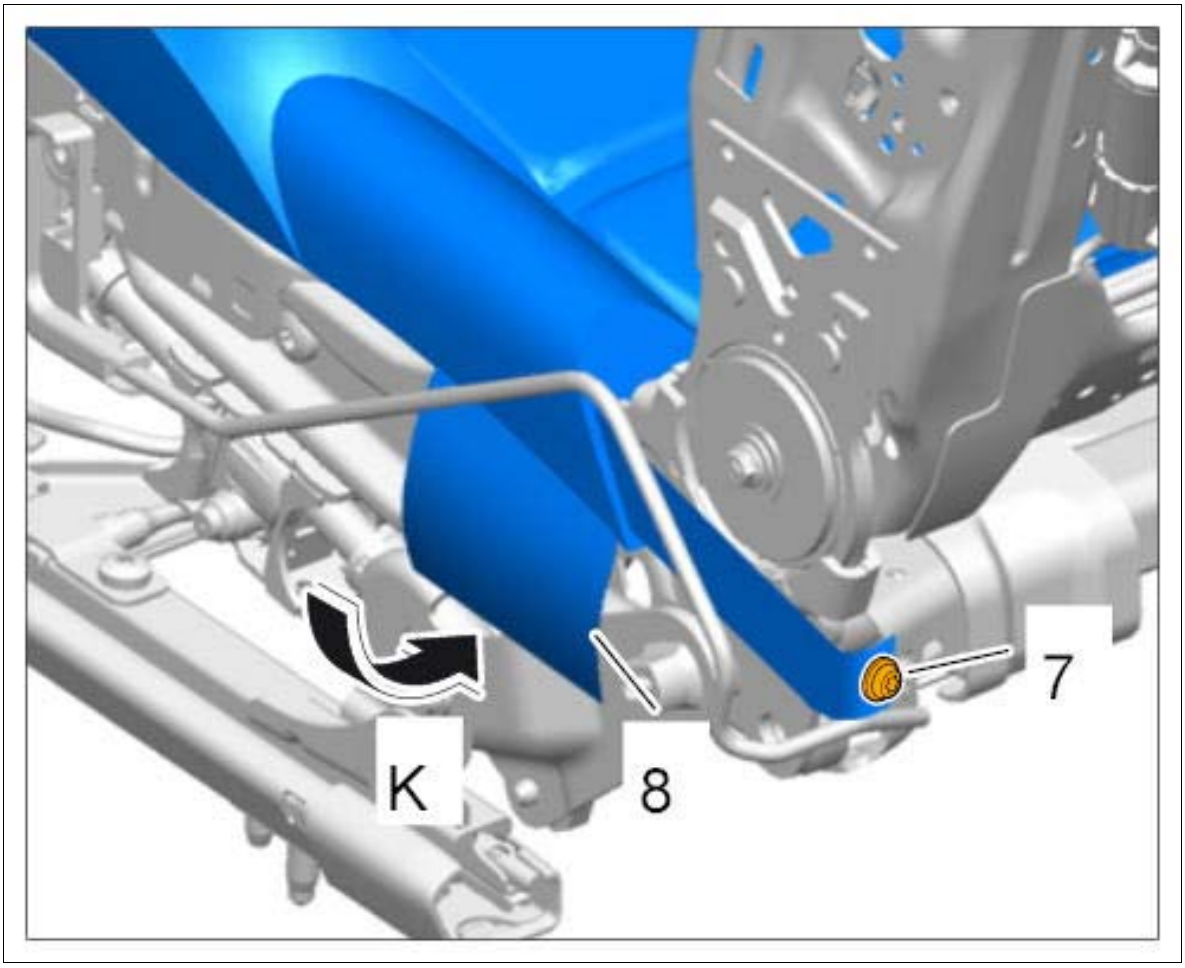
Fig 2: Securing Bracket (Sides)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Fit fixing clip **-7-** .
6. Engage rear side cover **-8-** on the seat frame **-arrow K-** .

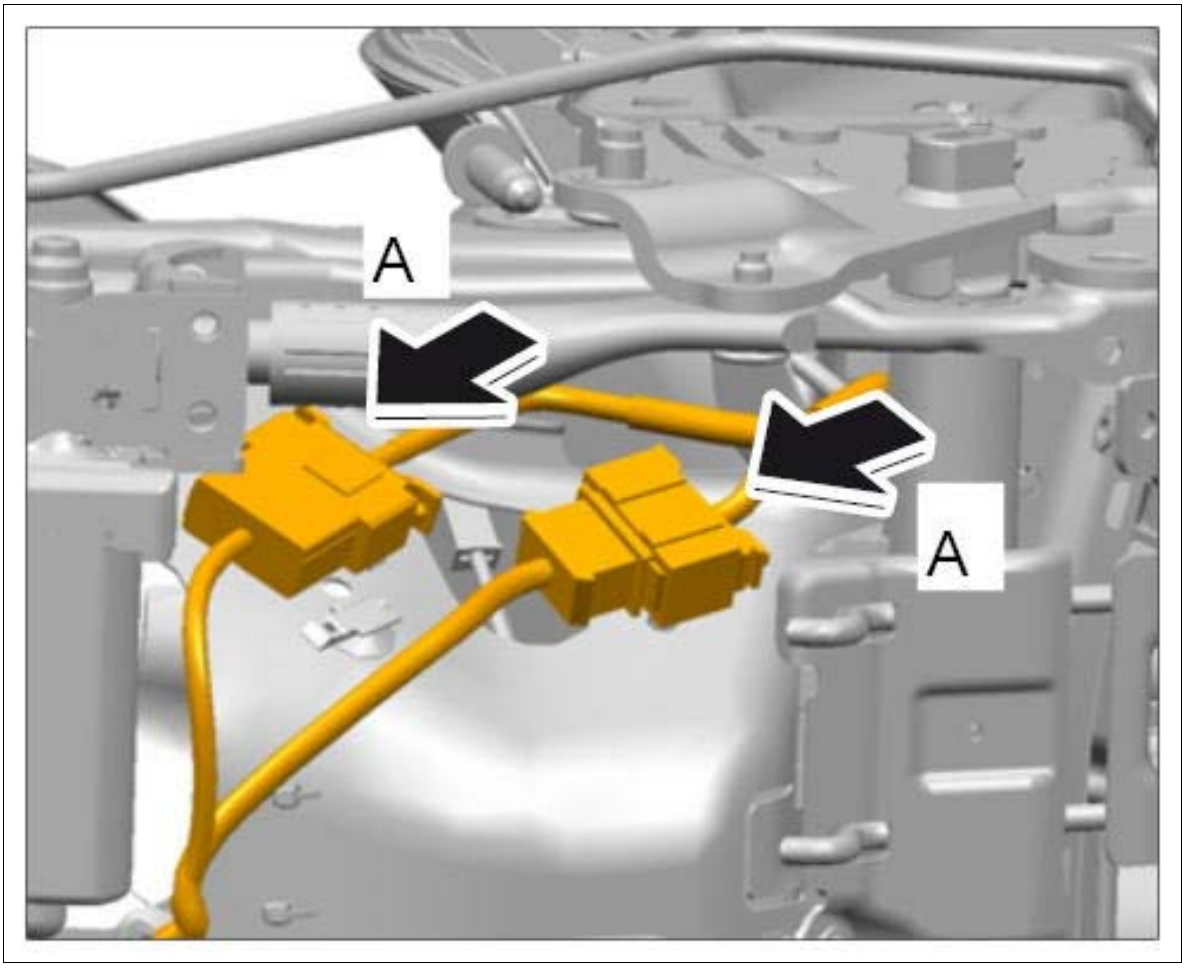
Fig 3: Securing Cover (Back)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Plug in two electric plug connections on the underside of the seat **-arrows A-** until the connector engages securely.

Fig 4: Installing Backrest Wire Harness Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 721919 REMOVING AND INSTALLING BACKREST FRAME (ALL MODELS) > SUBSEQUENT WORK

Information

The required preliminary work and subsequent work can vary depending on equipment.

The instructions provided in the document are for vehicles with the maximum possible equipment.

1. **On vehicles with heated seats:** Connect electric plug connection for seat heating for backrest and secure wire harness. → Installing Padding For Front Backrest
2. Secure wire harness for side airbag at the underside of the seat. → Installing side airbag
3. Secure pressure line (red) under the seat. → Installing Control Valve For Air Cushion
4. Install side trim panel for front seat, without storage tray. → Installing Trim Panel For Seat 1
5. Install side cover for backrest and engage rear cover for backrest at the underside of the seat. → Installing Cover For Backrest

WM 721955 REPLACING BACKREST FRAME (ALL MODELS) > COMPONENT INFORMATION > INSTALLATION POSITION

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

1. Release clip **-1- (-a-)** , swivel it aside **-b-** and remove electric plug connection from the control unit for memory seat adjustment **-2-** .
2. Release electric plug connection **-3- (-c-)** and pull it off the control unit for memory seat adjustment.

WM 729355 REPLACING CONTROL UNIT FOR MEMORY SEAT ADJUSTMENT (ALL MODELS) > REPLACING CONTROL UNIT FOR MEMORY SEAT ADJUSTMENT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the PIWIS Tester to the vehicle and start the diagnostic application. Switch on ignition.
2. Select vehicle type.
3. Select the **Driver/Passenger seat memory** control unit in the **overview** and press [F12] to continue.
4. **Codings/adaptations** must now be selected.
5. **Automatic coding** must now be selected. Then press [F12] to continue.
6. The Tester displays the message **Automatic coding has been completed successfully.** Press [F12] to continue.
7. **Maintenance/repairs** must then be selected.

   Information

   For some equipment variants, standardization must be performed on both the driver's side and passenger's side.
8. Select **Standardize seat motors.** Press [F12] and start by pressing [F8].
9. Follow the instructions on the Tester.
10. The seat automatically moves to various seat positions. When the seat remains stationary for a few minutes, press [F12] to continue.

11. Read out the fault memory and erase it if necessary.
12. Carry out a function test.

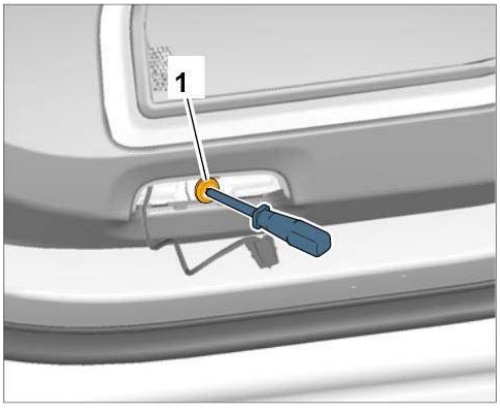
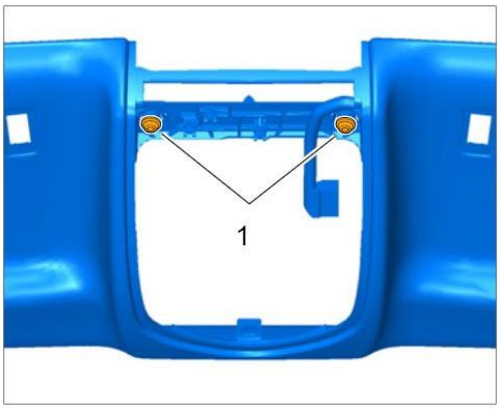
Fastening screw for door panel, bottom		Tightening torque	3.5 Nm (2.5 ftlb.)	+/-0.5 Nm (+/-0.5 ftlb.)	



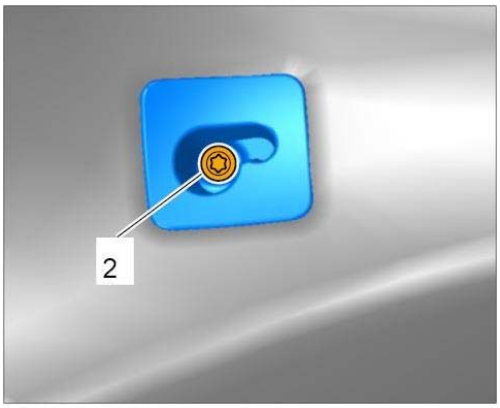
Mounting at bottom of door

A-pillar trim panel to body		Tightening torque	5.6 Nm (4 ftlb.)		
Fastening screw for lower roof console		Tightening torque	5 Nm (3.5 ftlb.)		



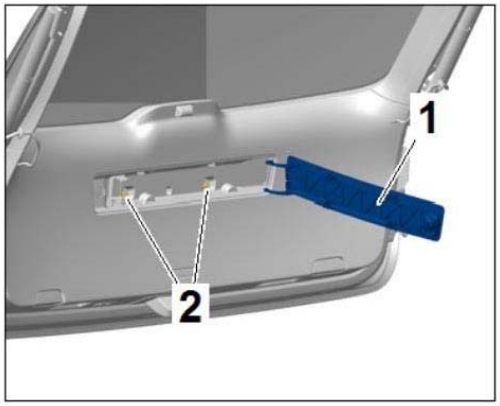
Screws securing roof console to headliner

Fastening screw for luggage net cover holder		Tightening torque	9 Nm (6.5 ftlb.)		



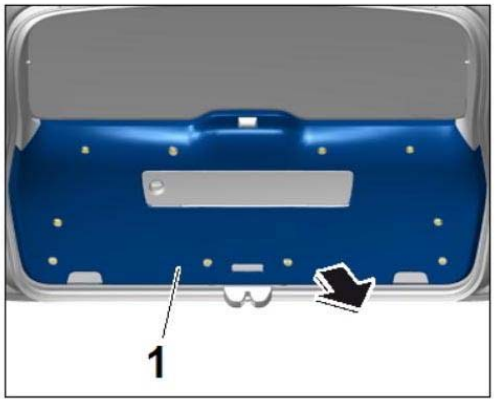
Screws securing holder for rear luggage net cover

Fastening screws for storage box		Tightening torque	1.5 Nm (1 ftlb.)		



Storage box lid

Fastening screw for finger plate		Tightening torque	1.5 Nm (1 ftlb.)		



Arrangement of retaining clips
