WM 7X00IN INSTRUCTIONS FOR THE CARE OF SOFT-TOUCH PAINT SURFACES (ALL MODELS)

⚠ *CAUTION: Risk of damage to the soft-look paint coat if the cleaning agents or solvents available as accessories for cleaning the vehicle interior are used. This also applies to the use of plastic polish from the Tequipment care set. The contents of these agents etch the paint coat (paint swells, rubber-like texture).*

- *Consequently, the paint coat can separate from the substrate when a mechanical load is applied. Furthermore, the surface may shine brightly after using the cleaning agents.*

→ The following procedure is recommended for the care or cleaning of soft-look paint surfaces.

WM 7X00IN INSTRUCTIONS FOR THE CARE OF SOFT-TOUCH PAINT SURFACES (ALL MODELS) > LIGHT SOILING (E.G. DUST)

It is possible to clean light soiling by selecting an option from the following cleaning tools and cleaning fluids:

Cleaning tools	Cleaning fluid	Cleaning procedure
Soft household sponge	Clean water	Gentle wiping movements, do not apply pressure
Soft, lint-free cloth	Water with a small amount of commercially available washing-up liquid added	

	Interior window cleaner (from Porsche care set) *NOTE: Observe cleaning instructions, wipe down with clean water if necessary*	

WM 7X00IN INSTRUCTIONS FOR THE CARE OF SOFT-TOUCH PAINT SURFACES (ALL MODELS) > HEAVY SOILING

It is possible to clean heavy soiling by selecting an option from the following cleaning tools and cleaning fluids:

Cleaning tools	Cleaning fluid	Cleaning procedure
Soft household sponge	Water with a small amount of commercially available washing-up liquid added	Gentle wiping movements, do not apply pressure
Soft, lint-free cloth	Interior window cleaner (from Porsche care set) *NOTE: Observe cleaning instructions, wipe down with clean water if necessary*	
	Solvent naphtha *NOTE: Use solvent naphtha only! Other solvents must not be used!*	

WM 451155 REPLACING FRONT SPEED SENSOR (ALL MODELS) > TECHNICAL VALUES

PIWIS Tester II	Special tool	9818		
WM 453019 REMOVING AND INSTALLING HYDRAULIC UNIT (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Brake line to hydraulic unit (left-hand drive)	All lines on hydraulic unit	Tightening torque	14 Nm (10.5 ftlb.)		
Brake line to hydraulic unit (right-hand drive)	Line: Brake calliper - hydraulic unit	Tightening torque	14 Nm (10.5 ftlb.)		
Brake line to hydraulic unit (right-hand drive)	Line: Brake master cylinder - hydraulic unit	Tightening torque	18 Nm (13 ftlb.)		

WM 453019 REMOVING AND INSTALLING HYDRAULIC UNIT (ALL MODELS) > PRELIMINARY WORK

1. Remove front left trim panel → Removing front trim panel .

WM 453019 REMOVING AND INSTALLING HYDRAULIC UNIT (ALL MODELS) > REMOVING AND INSTALLING HYDRAULIC UNIT > REMOVING HYDRAULIC UNIT

NOTE: Replacing the hydraulic unit/control unit

- *The hydraulic unit forms a single unit with the control unit.*
- *The hydraulic unit and control unit are always replaced together.*
- *When replacing the hydraulic unit/control unit, the new assembly must be to hand before the old one is removed.*
- *The data as well as the coding of the old control unit must be transferred to the new unit before the old one is removed.*

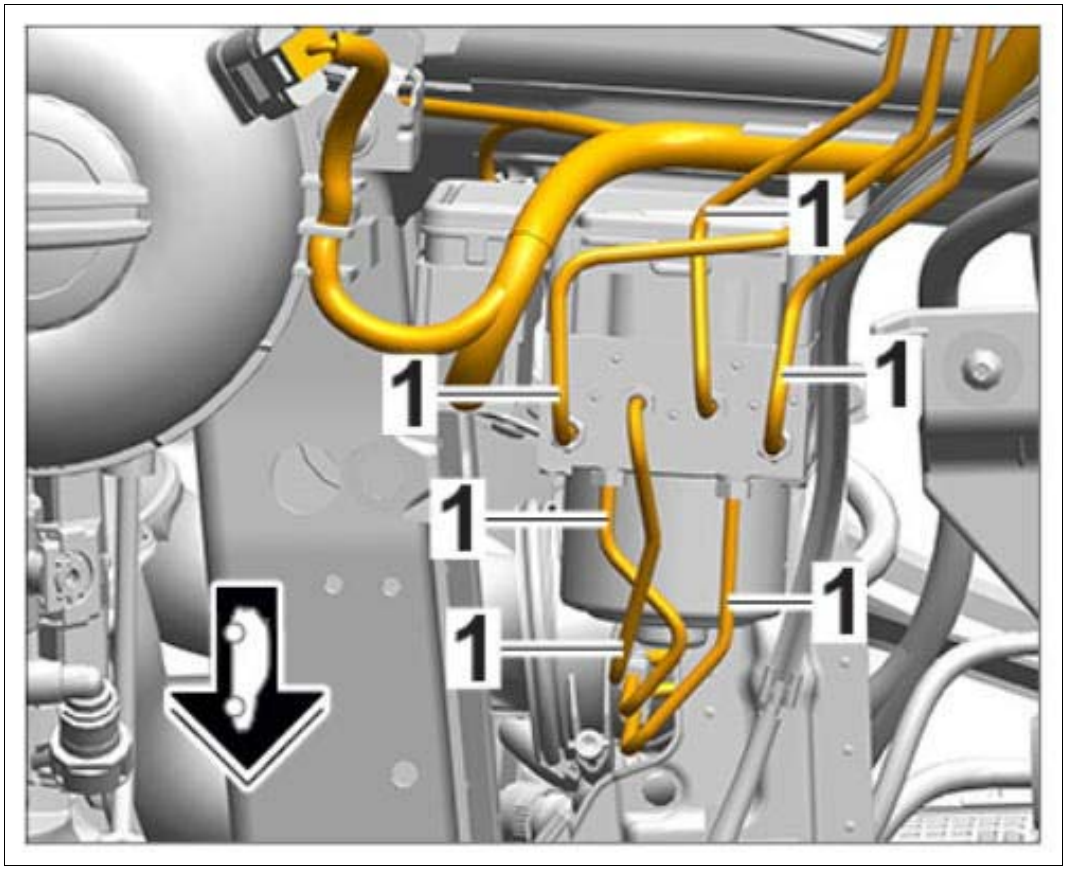
→ When replacing, note the following: → 453055 REPLACING HYDRAULIC UNIT/CONTROL UNIT .

Information

- When fitting the hydraulic connections, the electric plug connections on the control units must remain connected as long as possible. This prevents the plug connections on the hydraulic unit or in the connectors inside from being splashed with brake fluid or water.
- Any damp connector must be wiped dry before being disconnected from the connector on the hydraulic unit. If necessary, provide the connector with a suitable protector.
- Brake fluid on electrical contacts (even thinned brake fluid) leads to corrosion and may cause faults in the system.
- The brake lines must not be bent in the area of the hydraulic unit.
- Clean the interfacing points of the brake lines, but not with cleaning agents.
- Rinse off any brake fluid emerging thoroughly with water.

1. Place a suitable cloth underneath to catch any emerging brake fluid.
2. Disconnect brake lines **-1-** .
    1. 2.1. Mark the brake lines to prevent them from being confused.
    2. 2.2. Unscrew cap screws for the brake lines.
    3. 2.3. Pull brake lines **-1-** out of the bores and close off **immediately** using suitable stoppers.
    4. 2.4. Lay brake lines aside **carefully** , fixing them in place if necessary.

Fig 1: Disconnecting Brake Lines

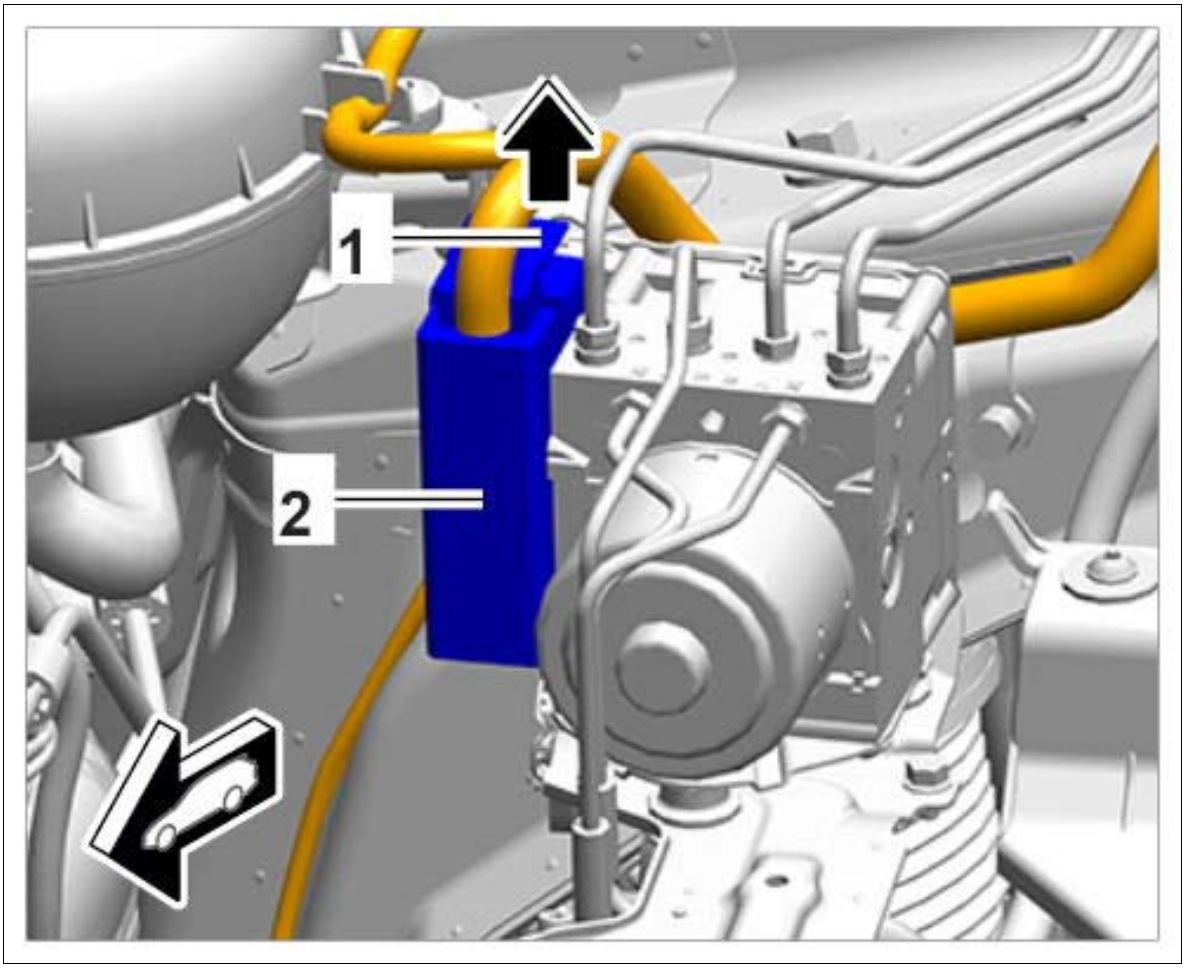


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Pull off electric push-on connector **-2-** .

    1. 3.1. Pull slide lock **-1-** up **-arrow-** .
    2. 3.2. Pull off electric push-on connector **-2-** .

Fig 2: Pulling Electric Push-On Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Pull hydraulic unit together with control unit and holder up and off.

WM 453019 REMOVING AND INSTALLING HYDRAULIC UNIT (ALL MODELS) > REMOVING AND INSTALLING HYDRAULIC UNIT > INSTALLING HYDRAULIC UNIT

1. Installation is performed in reverse order.

   Observe specified tightening torques:

   Only for left-hand drive (LHD) vehicles:

   Brake lines to hydraulic unit: **Tightening torque 14 Nm (10.5 ftlb.)**

   Only for right-hand drive (RHD) vehicles:

   Brake lines (from brake calliper) to hydraulic unit: **Tightening torque 14 Nm (10.5 ftlb.)**

   Brake lines (from brake master cylinder) to hydraulic unit: **Tightening torque 18 Nm (13 ftlb.)**

WM 453019 REMOVING AND INSTALLING HYDRAULIC UNIT (ALL MODELS) > SUBSEQUENT WORK

1. Bleed the brake system
2. Install front left trim panel → Installing front trim panel .
3. Bleed the brake lines **again (following conventional bleeding)** using **PIWIS Tester II 9818** (secondary brake circuit bleeding).

   To do this, select:

   > Control unit overview

   > PSM

   > Maintenance/repairs

   > Bleed brakes

   To finish, follow the menu guidance in **PIWIS Tester II 9818.**
4. If the hydraulic unit was replaced, code the control unit for the hydraulic unit → 453055 REPLACING HYDRAULIC UNIT .
5. Carry out a swap test using **PIWIS Tester II 9818.**

   To do this, select:

   > Control unit overview

   > PSM

   > Maintenance/repairs

   > Hydraulic swap test

   To finish, follow the menu guidance in **PIWIS Tester II 9818.**
6. Perform a function test.
    1. 6.1. During the test drive, perform at least one ABS control operation, taking the road conditions into consideration.
    2. 6.2. On vehicles with PDK transmission, test the HOLD function if possible. If the combination sensor has been taught incorrectly, the Hold function will not be active for inclines of more than 5%!
    3. 6.3. Read out the fault memory. There must not be any stored faults.

WM 453055 REPLACING HYDRAULIC UNIT (ALL MODELS) > TOOLS

Designation	Type	Number	Description	

PIWIS Tester II	Special tool	9818		
WM 453055 REPLACING HYDRAULIC UNIT (ALL MODELS) > INFORMATION

NOTE: Replacing the hydraulic unit/control unit

- *The hydraulic unit forms a single unit with the control unit.*
- *The hydraulic unit and control unit are always replaced together.*
- *When replacing the hydraulic unit/control unit, the new assembly must be to hand before the old one is removed.*
- *The data as well as the coding of the old control unit must be transferred to the new unit before the old one is removed.*
- *The hydraulic unit/control unit must be calibrated (calibration of hydraulic unit/control unit with combination sensor). Without calibrating, the PSM will have incorrect values or no values.*

→ Procedure

→ The Porsche System Tester must not be disconnected from the diagnostic socket when replacing the hydraulic unit.

→ Read out data from old hydraulic unit/control unit. Switch off the ignition. Pull off connector for hydraulic unit and connect connector to the new hydraulic unit. Switch on ignition. Transfer data.

WM 453055 REPLACING HYDRAULIC UNIT (ALL MODELS) > CODING AND CALIBRATING HYDRAULIC UNIT/CONTROL UNIT > CODING HYDRAULIC UNIT/CONTROL UNIT

Information

Always read the information. → 453055 REPLACING HYDRAULIC UNIT/CONTROL UNIT

- If the hydraulic unit is replaced, the control unit of the hydraulic unit must be coded and calibrated.

- When replacing the hydraulic unit, there are a number of ways to code the hydraulic unit/control unit.

    1. **Control unit replacement**
    2. **Automatic coding using coding rules**
    3. **Manual coding of hydraulic unit using coding rules from the >vehicle I-passport<**

Information

If the hydraulic unit is replaced, the PSM control unit must be coded using the Porsche System Tester. Hydraulic unit and PSM control unit form one unit.

1. **Control unit replacement**

    > Control unit overview

    > PSM

    > Maintenance/repairs

    > Control unit replacement

    If the control unit is faulty (electrical fault) and cannot be read out, continue with Step 2!

2. **Automatic coding of hydraulic unit**

    > Control unit overview

    > PSM

    > Codings/adaptations

    > Automatic coding

    If faults or discrepancies occur during automatic coding, carry out >Manual coding of hydraulic unit< (see Step 3 below).

3. **Manual coding of the hydraulic unit using coding rules from the >vehicle I-passport<**

    Get the vehicle data (coding rules) from the >vehicle I-passport<.

    Carry out >Manual coding of hydraulic unit< using coding rules from the >vehicle I-passport<.

    > Control unit overview

    > PSM

    > Codings/adaptations

    > Manual coding with coding rules

    > Product code

    Select engine variant > [F12]

    Select equipment > [>>]

This completes manual coding.

WM 453055 REPLACING HYDRAULIC UNIT (ALL MODELS) > CODING AND CALIBRATING HYDRAULIC UNIT/CONTROL UNIT > CALIBRATING HYDRAULIC UNIT/CONTROL UNIT

Information

Always read the information. → 453055 REPLACING HYDRAULIC UNIT/CONTROL UNIT

- If the hydraulic unit is replaced, the control unit of the hydraulic unit must be coded and calibrated.

1. Calibrate the combination sensor (includes lateral and axial acceleration sensor and yaw rate sensor) using **PIWIS Tester II 9818.**

   To do this, select:

   > Control unit overview

   > PSM

   > Drive links/checks

   > Calibration of combination sensor

   This completes the calibration process.

WM 456005 INITIALIZING AND CALIBRATING STEERING-ANGLE SENSOR (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 456005 INITIALIZING AND CALIBRATING STEERING-ANGLE SENSOR (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 456005 INITIALIZING AND CALIBRATING STEERING-ANGLE SENSOR (ALL MODELS) > CHECKING STEERING-ANGLE SENSOR > INITIALIZING STEERING-ANGLE SENSOR

WARNING: Steering-angle sensor not calibrated or calibrated incorrectly

- *Unexpected vehicle handling*
- *Steering-angle sensor does not function*
- *Malfunction in steering-angle sensor*

→ After working on wheel suspension parts, when replacing the steering-angle sensor and after changing the wheel alignment values, calibrate the steering-angle sensor using **PIWIS Tester II 9818.**

→ Keep the front wheels in straight-ahead position on the measuring platform during calibration.

→ On vehicles with electromechanical steering, also re-teach the electric steering lock settings.

NOTE: Voltage drop

- *Fault entries in the control unit*
- *Coding in the control unit is aborted*

→ Prior to disconnecting the control unit, switch off the ignition and remove the ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

- The steering-angle sensor is integrated into the steering column switch and records the movements of the steering wheel (steering wheel angle). The data is transmitted to the PSM control unit via the CAN bus.
- During initialization, the steering-angle sensor learns its current position (straight-ahead position).
- Calibration must be performed when working on or carrying out subsequent work on the chassis. This is described in detail in the information→ 456005 INITIALIZING AND CALIBRATING STEERING-ANGLE SENSOR

- The calibration results in zero point balancing (exactly straight ahead).
- The steering-angle sensor is calibrated when first fitted and when any work has been carried out on steering and chassis. Examples of this would be opening the steering wiring and alterations to toe and camber.
- Calibration includes initialization.
    1. Turn wheels to straight-ahead position.
    2. From the straight-ahead position, turn steering wheel approx. 6° to the left and 6° to the right (past straight-ahead position).

Following successful initialization, the stored fault code is set to "not present". The PSM indicator light in the instrument cluster goes out.

WM 456005 INITIALIZING AND CALIBRATING STEERING-ANGLE SENSOR (ALL MODELS) > ADJUSTING STEERING-ANGLE SENSOR > CALIBRATING STEERING-ANGLE SENSOR

Information

- The steering-angle sensor must be recalibrated on the measuring platform following repairs to or work on the chassis/steering or if the steering-angle sensor/steering column switch is replaced.
- Calibration includes initialization.
- In order to calibrate the steering-angle sensor correctly, the vehicle must be on the measuring platform, the wheel alignment values must be correct and the steering must be in the straight-ahead position.
- Calibrate the steering-angle sensor by selecting >>Steering wheel electronics>>Maintenance/repairs>>Steering-angle sensor calibration<< in the PIWIS Tester II control unit overview.

The steering-angle sensor must be calibrated by selecting the relevant menu on the Porsche System Tester under the specified test conditions:

1. The chassis is adjusted according to Porsche specifications.
2. Switch on ignition.
3. Turn wheels and steering wheel to straight-ahead position.

   In the straight-ahead position, the steering wheel may be turned by max. ± 2.0° from the horizontal position (steering center position).
4. Enter the security code under the >>Calibrate<< menu in the Porsche System Tester.
5. Turn the steering wheel out of the straight-ahead position (approx. 6° to the left/right) in accordance with the instructions on the Porsche System Tester. Turn the wheels back to the straight-ahead position and follow the instructions on the Porsche System Tester.
6. Following successful calibration, the stored fault code is erased from the fault memory. The

PSM indicator light in the instrument cluster goes out.

7. Once you have calibrated the steering-angle sensor, re-teach the electric steering lock settings. → 489025 POWER-STEERING GEAR: TEACHING STEERING LOCK SETTINGS

WM 456055 REPLACING STEERING-ANGLE SENSOR (ALL MODELS) > REPLACING STEERING-ANGLE SENSOR

The steering-angle sensor is integrated in the steering wheel electronics control unit. See → 916255 REPLACING CONTROL UNIT FOR STEERING WHEEL ELECTRONICS

WM 456155 REPLACING COMBINATION SENSOR (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 456155 REPLACING COMBINATION SENSOR (ALL MODELS) > PRELIMINARY WORK

1. Remove left front seat → Removing front seat .

WM 456155 REPLACING COMBINATION SENSOR (ALL MODELS) > REPLACING COMBINATION SENSOR

WARNING: Combination sensor not calibrated or calibrated incorrectly

- *Unexpected vehicle handling*
- *Combination sensor does not work*
- *Malfunction in combination sensor*

→ Calibrate the vehicle after installing or replacing the combination sensor using **PIWIS Tester II 9818.**

→ Only perform calibration when the vehicle is positioned horizontally and the brake is not actuated.

Information

The combination sensor is located under the driver seat.

The functions listed below are integrated in the combination sensor:

- Rotation-rate sensor
- Lateral-acceleration sensor
- Axial-acceleration sensor.

1. Cut the bar on the carpet using a sharp knife or scissors → Cutting bar .

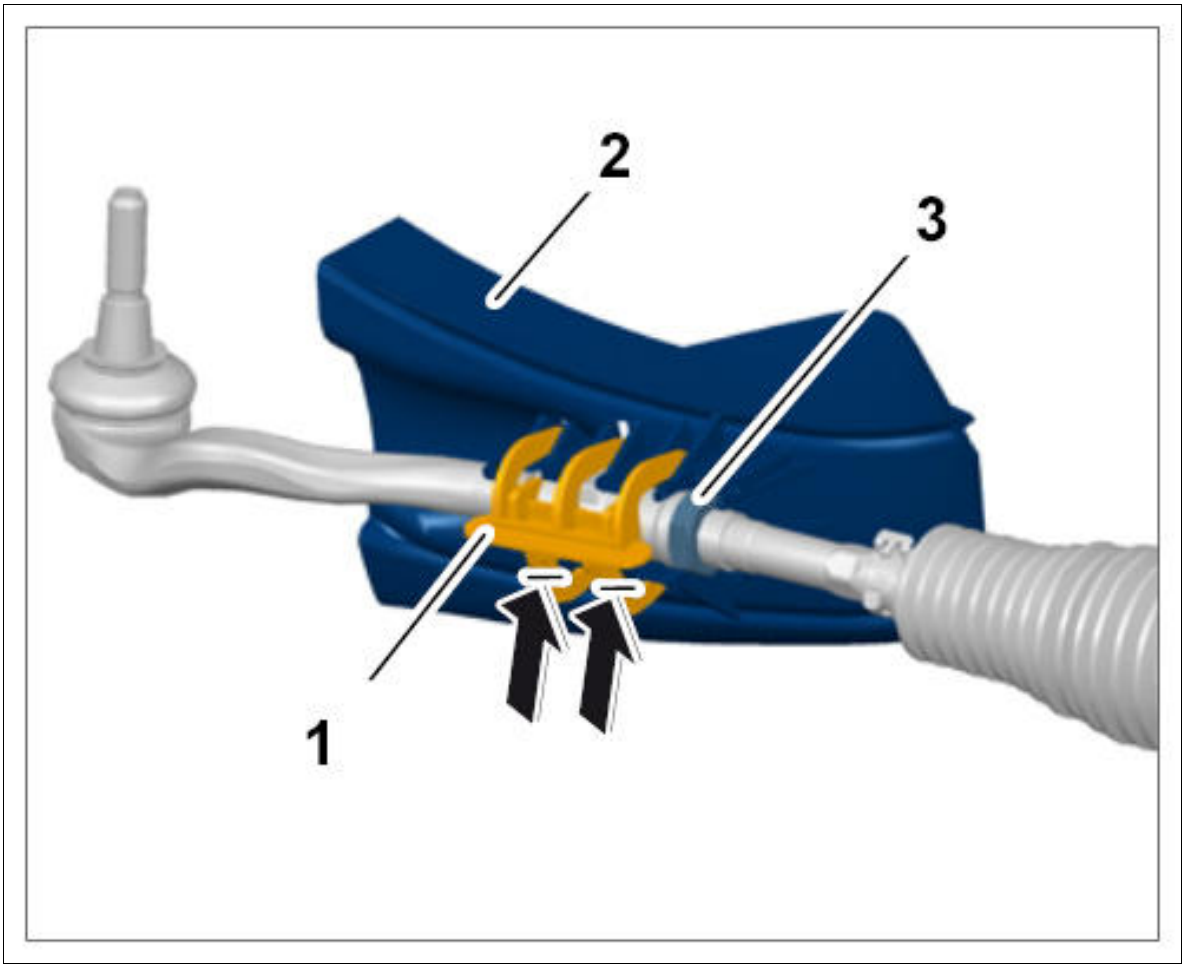
WM 461619 REMOVING AND INSTALLING AIR GUIDE FOR BRAKE DISC (ALL MODELS) > REMOVING AND INSTALLING AIR GUIDE FOR BRAKE DISC

Information

The air guide will be damaged irreparably during removal. A new air guide must therefore be fitted whenever the airbag is removed.

1. Remove air guide **-2-** from the tie rod.

Fig 1: Locating Air Guide On Tie Rod



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Cut through the lower arms of the clamp **-1-** at the marked positions **-arrows-**

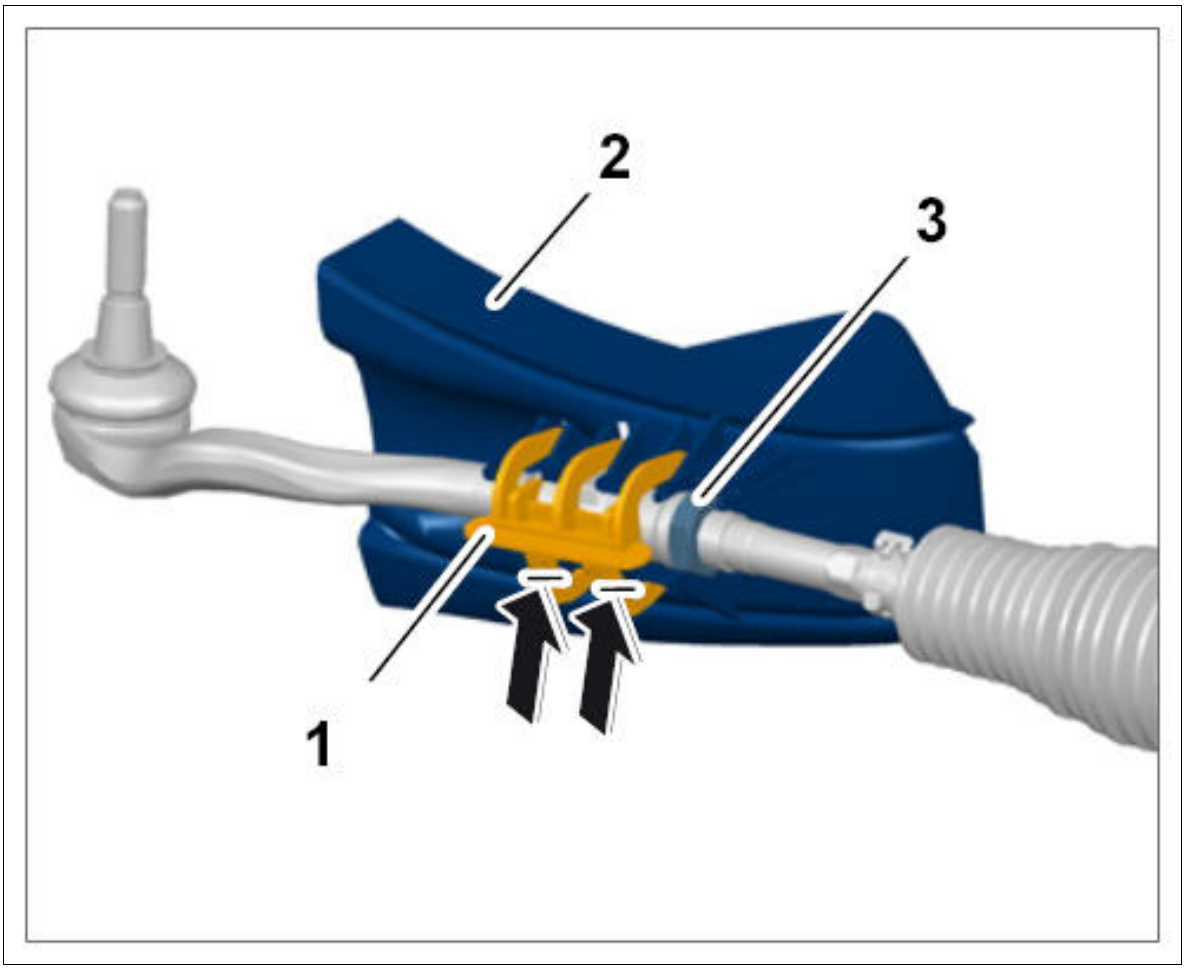
using a suitable tool.

2. 1.2. Remove air guide **-2-** .

WM 461619 REMOVING AND INSTALLING AIR GUIDE FOR BRAKE DISC (ALL MODELS) > REMOVING AND INSTALLING AIR GUIDE FOR BRAKE DISC > INSTALLING AIR GUIDE FOR BRAKE DISC

1. Fit new air guide on the tie rod.

Fig 1: Locating Air Guide On Tie Rod



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Push the air guide **-2-** onto the tie-rod ball from the front.

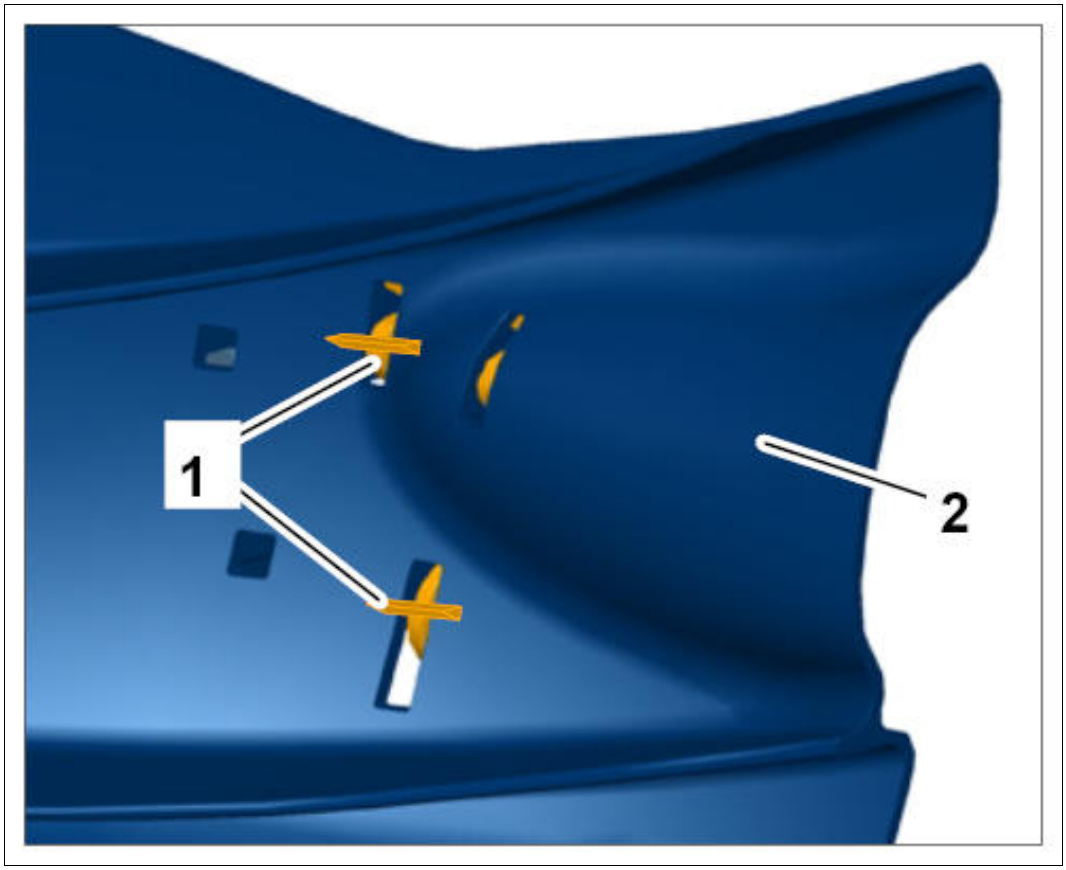
   Check position of the lock nut **-3-** in the cut-out of the air guide **-2-** .

2. 1.2. Secure the air guide with a new clamp.

   Check that the clamp locks correctly.

   Check that the clamp is locked correctly through the test lugs **-1-** in the air guide **-2-** .

Fig 2: Identifying Clamp Test Lugs



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 463402 PCCB - CHECKING FRONT BRAKE PAD (ALL MODELS) > INFORMATION

Procedure during intermediate maintenance:

Visually inspect the brake pads for wear. **There is no need to remove the wheels unless the brake fluid needs to be changed at the same time.**

Outside of brake pad: Visual inspection through the cut-outs in the rim.

Inside of brake pad: Visual inspection from below with vehicle raised.

Without an aid, the inner brake pad is not or is only partly visible on the rear axle (with the wheel fitted).

A mirror can be used as an aid **-arrow-** .

Fig 1: Checking Brake Pads

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Procedure during maintenance:

Raise the vehicle → 4X00IN LIFTING THE VEHICLE .

NOTE: Removing/fitting wheels

- *Risk of damage to (ceramic) brake discs*

→ Use two assembly pins when removing and fitting the wheel.

→ Carefully guide the wheel towards the wheel hub, thereby preventing any heavy impact on the (ceramic) brake disc.

Screw the two assembly aids (assembly pins) **-1-** , instead of two wheel bolts, into the wheel hub before removing/fitting the wheel. During removal, first remove the three remaining wheel bolts and remove the wheel carefully without touching the brake discs.

Remove wheel. Use assembly aids (assembly pins) **-1-** .

→ 440519 REMOVING AND INSTALLING WHEEL .

Fig 2: Identifying Assembly Aids (Wheel Bolts)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Check brake pad thickness for wear. If in doubt following a visual inspection, you may have to measure the brake pads.

WM 463402 PCCB - CHECKING FRONT BRAKE PAD (ALL MODELS) > CHECKING THICKNESS OF BRAKE PADS

WARNING: Installation of brake pads with the wrong brake pad quality

- *Longer braking distance*
- *More wear on brake pads*

→ Only use the type-specific brake pads.

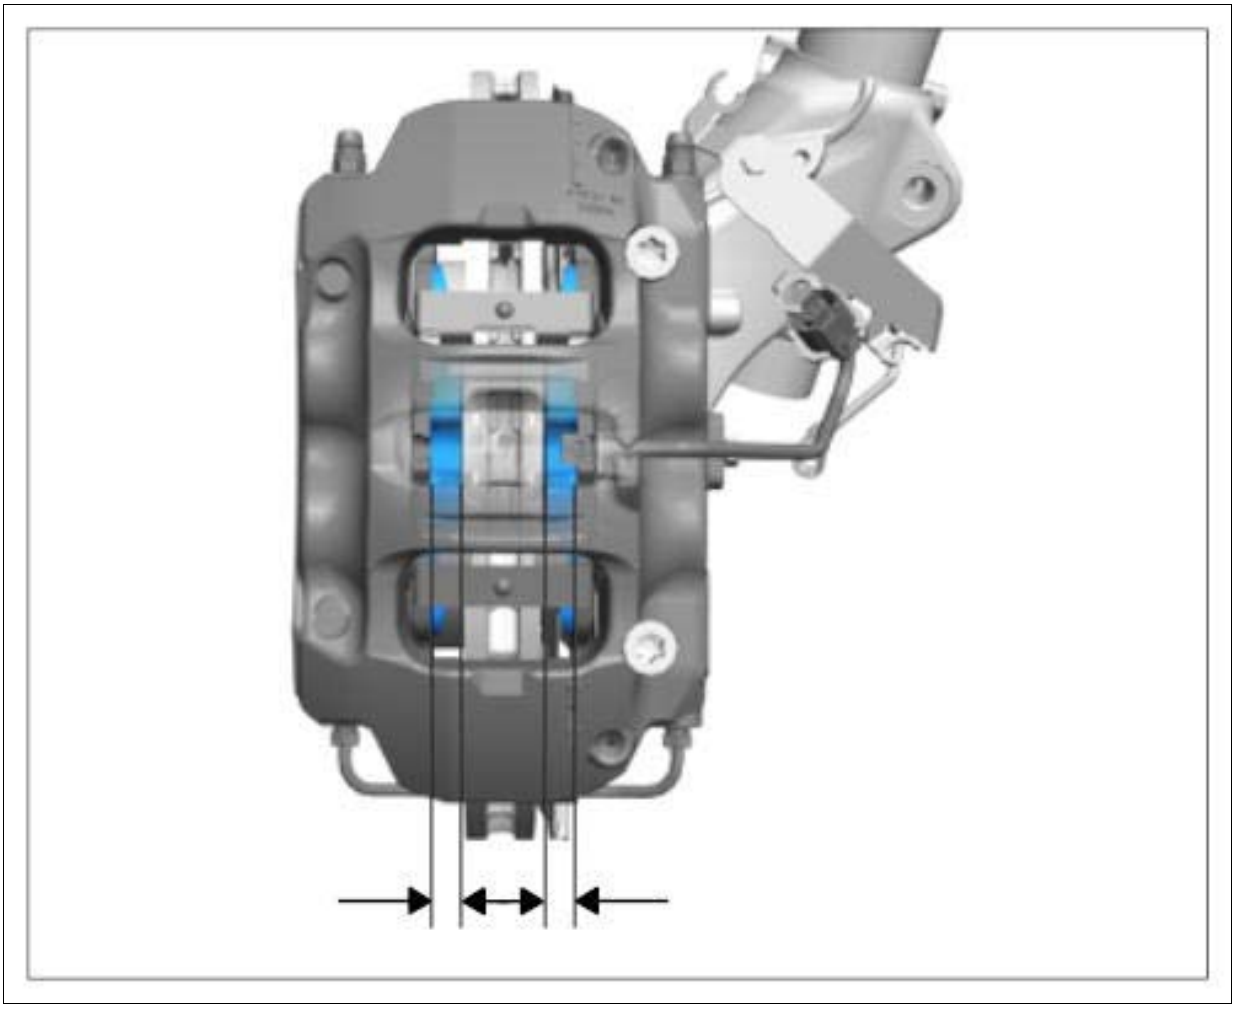
→ Replace the brake pads when the brake pad wear indicator light comes on, but no later than when there is a residual pad thickness of 2 mm on each axle.

→ Replace the brake discs on each axle upon reaching the wear limits.

Information

- If brake pad wear is indicated by the warning light, the warning contact (sender including wire and plug connection) must also be replaced.
- Replacement of the warning contact can be avoided by replacing the brake pads no later than when the pad thickness is 2.5 mm -arrows- .

  Fig 1: Identifying Thickness Of Brake Pads



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Warning contacts must be replaced if the core of the wire is worn.
- However, if only the plastic part of the warning contact is worn, there is no need to replace it.

1. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .
2. Remove wheel. Use assembly aids (assembly pins) **-1-** .

   → 440519 REMOVING AND INSTALLING WHEEL .

Fig 2: Identifying Assembly Aids (Wheel Bolts)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Visually inspect the brake pads for wear.

3. Remove brake calliper and suspend it at a suitable position in the wheel housing (do not open the brake hydraulic system!) → 473919 REMOVING AND INSTALLING FRONT BRAKE CALLIPER .

WM 463656 REPLACING FRONT DISC BRAKE PADS (MACAN S, MACAN TURBO) > REMOVING AND INSTALLING FRONT DISC BRAKE PADS > REMOVING FRONT DISC BRAKE PADS

NOTE: Removing/fitting wheels

- *Risk of damage to (ceramic) brake discs*

→ Carefully guide the wheel towards the wheel hub, thereby preventing any heavy impact on the (ceramic) brake disc.

Information

- To gain better access for assembly work, it is a good idea to turn the wheels fully either to the right or left!

NOTE: Removal of brake calliper

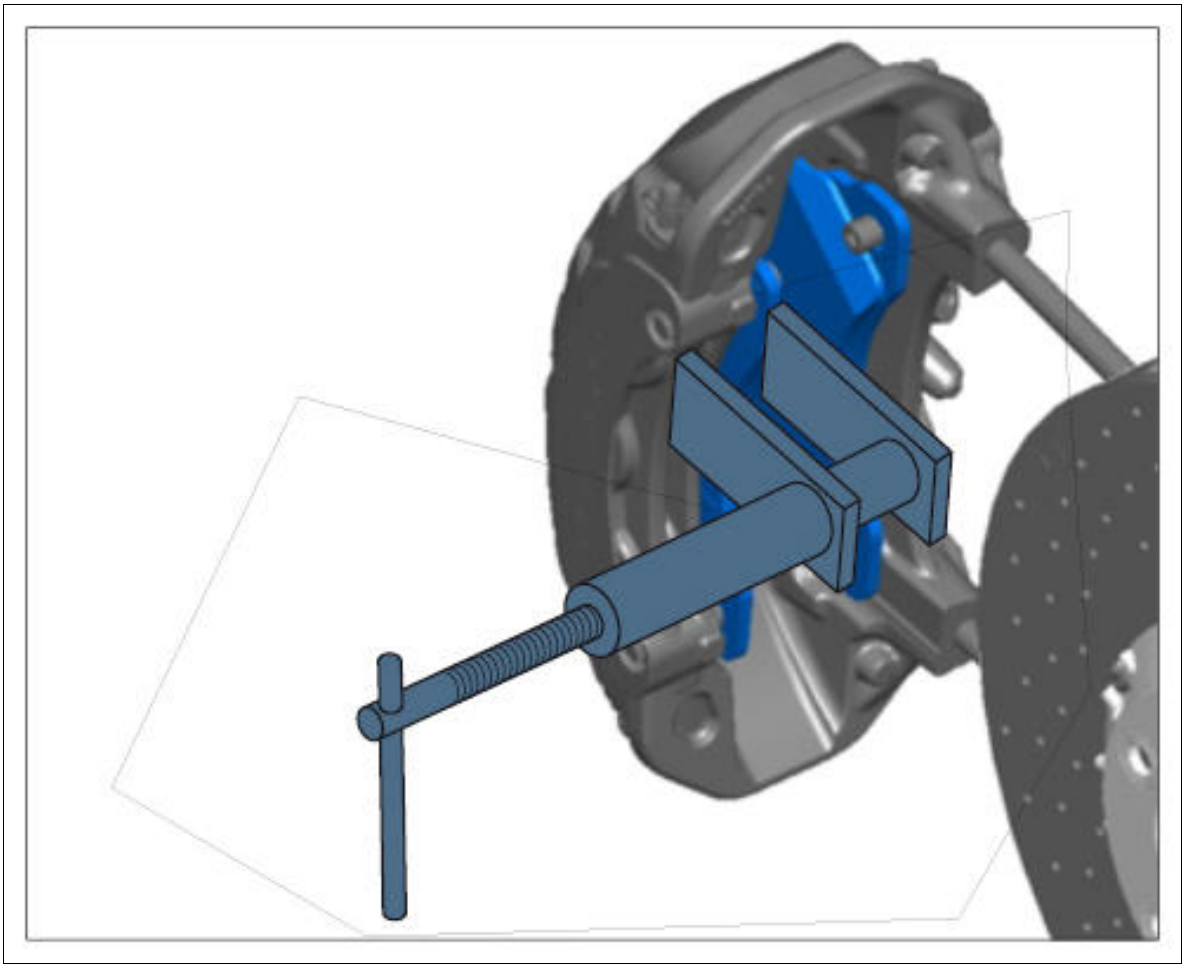
- *Paint defects on brake calliper*

→ Proceed with care when setting back the brake pads.

→ Protect brake calliper from paint defects using a suitable cloth.

1. Carefully set the disc brake pads back slightly and evenly using water pump pliers.
2. Loosen warning contact from the brake calliper.
3. Fit brake piston on the brake calliper between the disc brake pads using **piston reset tool (replaces P83) Nr.144** . Then press the brake pads evenly → Pressing back brake pads .

   Fig 1: Pressing Brake Pads



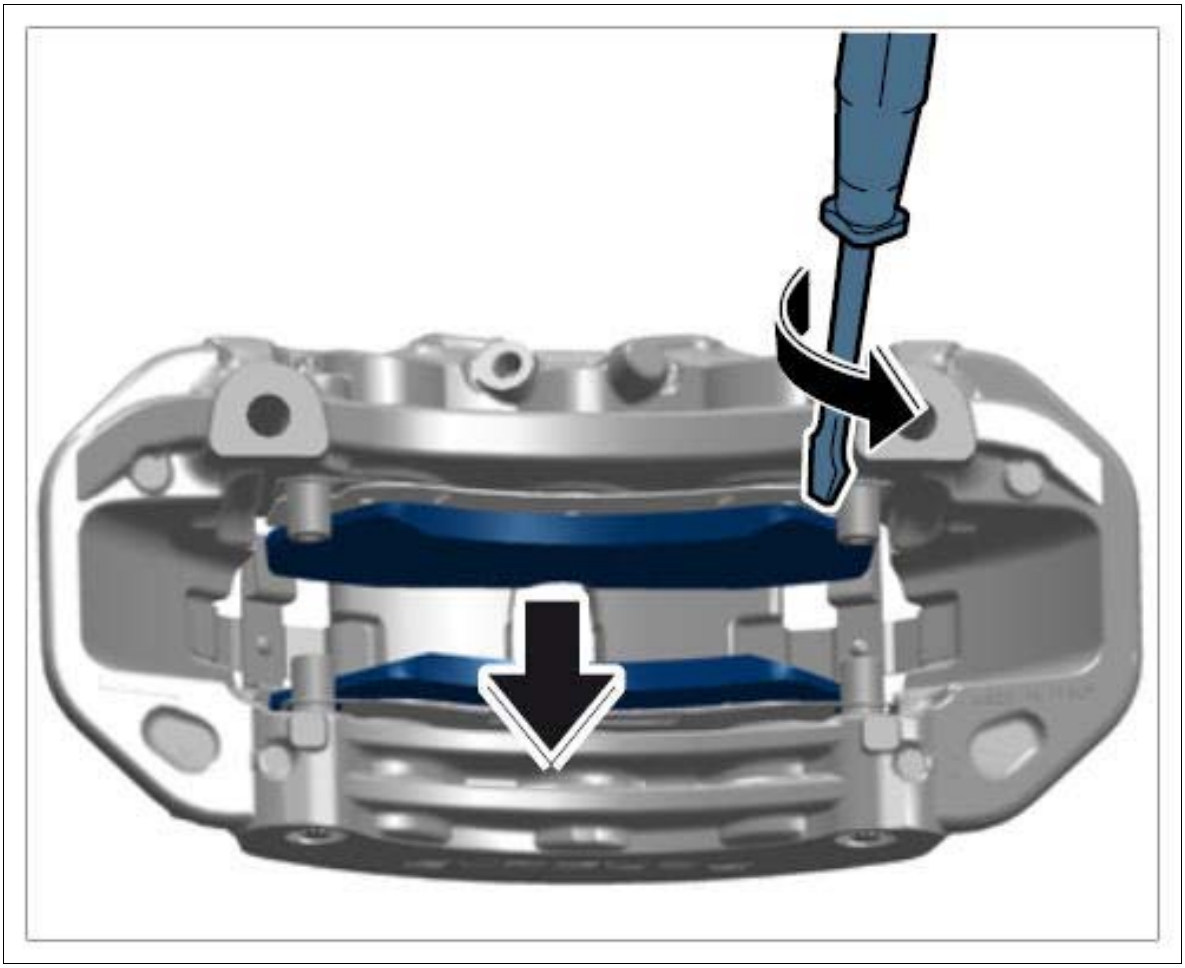
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

If the disc brake pads are still to be used, mark their installation position.

4. Carefully slide a commercially available screwdriver between the disc brake pad/brake calliper and lever the disc brake pad out by turning the screwdriver slightly **-arrows-** . When doing this, make sure not to damage the dust boots on the brake pistons.

   Fig 2: Removing Brake Pads



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove pad retaining springs.

WM 463656 REPLACING FRONT DISC BRAKE PADS (MACAN S, MACAN TURBO) > REMOVING AND INSTALLING FRONT DISC BRAKE PADS > INSTALLING FRONT DISC BRAKE PADS

WARNING: Old mounting parts fitted on the brake calliper

- *Reduced braking effect*
- *Risk of damage to the brake calliper*

→ Fit new pad retaining springs

→ Fit new fastening screws

WARNING: Installation of brake pads with the wrong brake pad quality

- *Longer braking distance*
- *More wear on brake pads*

→ Only use the type-specific brake pads.

→ Replace the brake pads when the brake pad wear indicator light comes on, but no later than when there is a residual pad thickness of 2 mm on each axle.

→ Replace the brake discs on each axle as soon as the brake pad wear limit is reached.

Information

Applies only to 17" brakes (brake calliper color: Black):

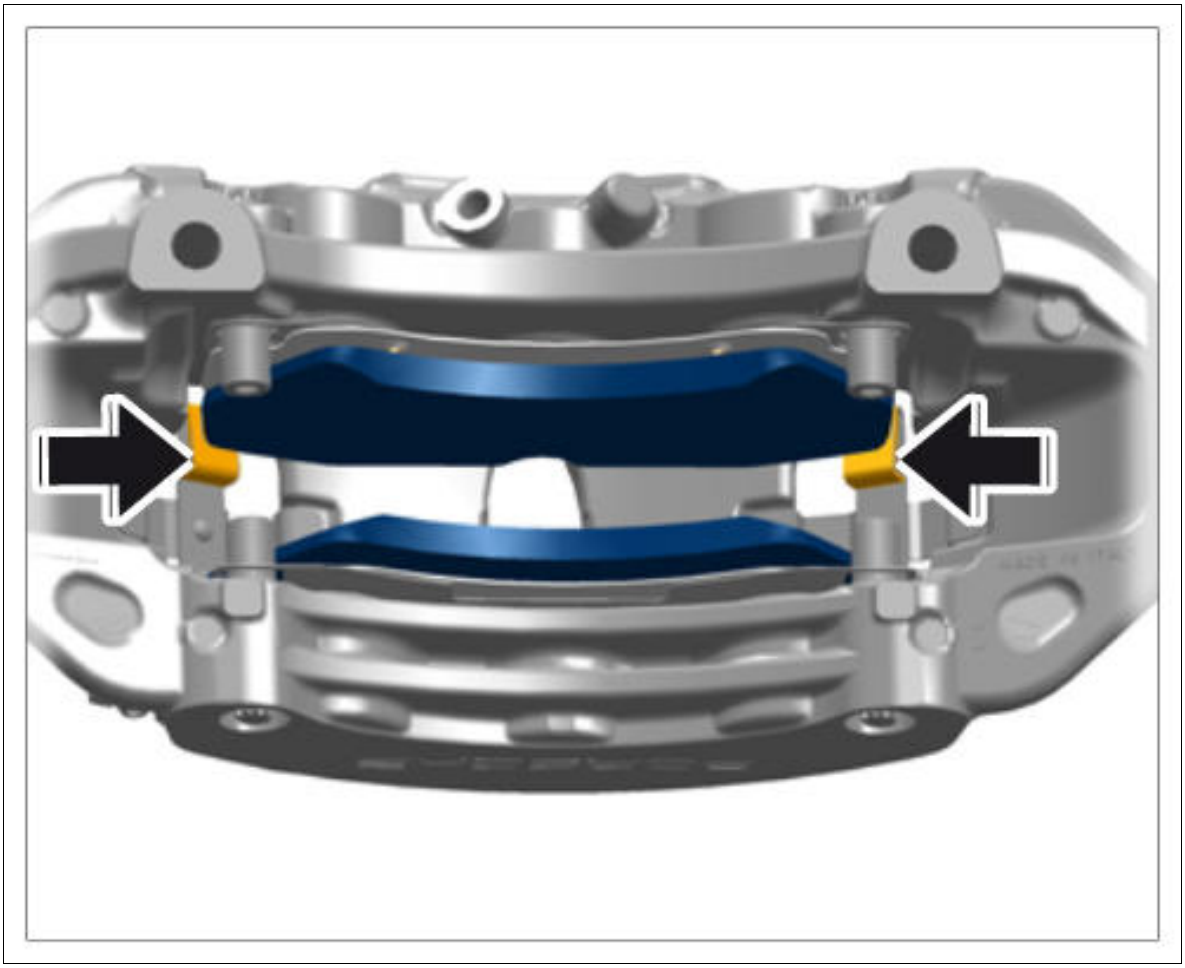
- Brake pads are bonded to the brake piston. Before installation, pull off the protective film on the new brake pads and remove adhesive residue on the brake piston.
- Check running direction of brake pads (marked on brake pad by an arrow)!

Applies to all brakes:

- The back of the pad backing plates must not be greased.
- Check the brake discs for wear. For wear limits, see → 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) → 465102 CHECKING FRONT PCCB BRAKE DISCS (WEAR ASSESSMENT) .
- Brake discs must be clean and free of grease.
- The core of the warning contact wire must not be left exposed! Worn insulation is not important.
- If necessary, remove a little brake fluid from the reservoir by suction in order to prevent an overflow when the disc brake pads are pushed back.
- Use a new repair kit.

1. Fit new pad retaining springs.
2. Place disc brake pad onto the sealing surfaces of the pad retaining springs **-arrows-** .

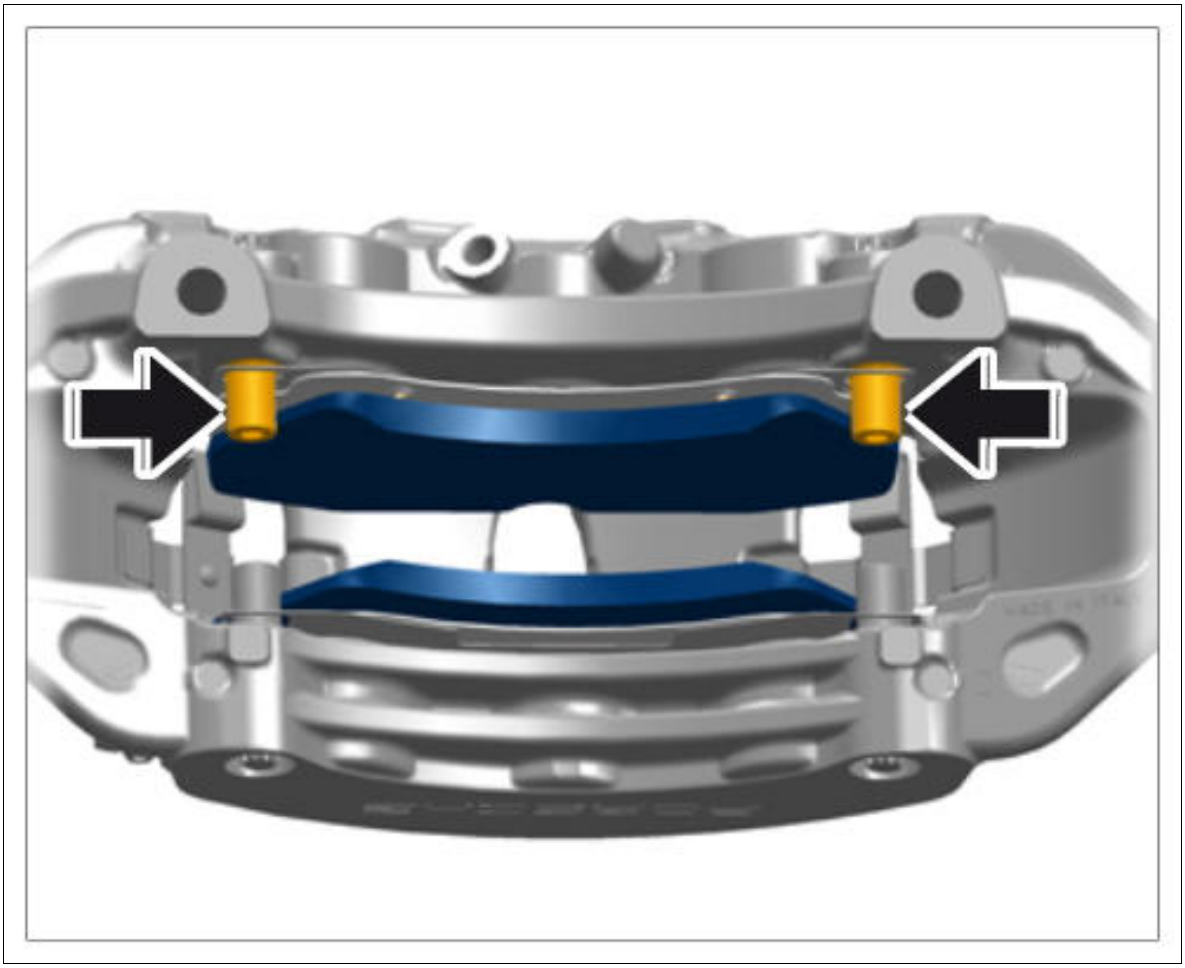
Fig 1: Installing Brake Pad



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Press brake pad into the brake calliper with slight pressure and slide it onto the pad retaining pins **-arrows-** .

Fig 2: Positioning Brake Pad



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Fit disc brake pad **-arrow-** .

Fig 3: Installing Brake Pad

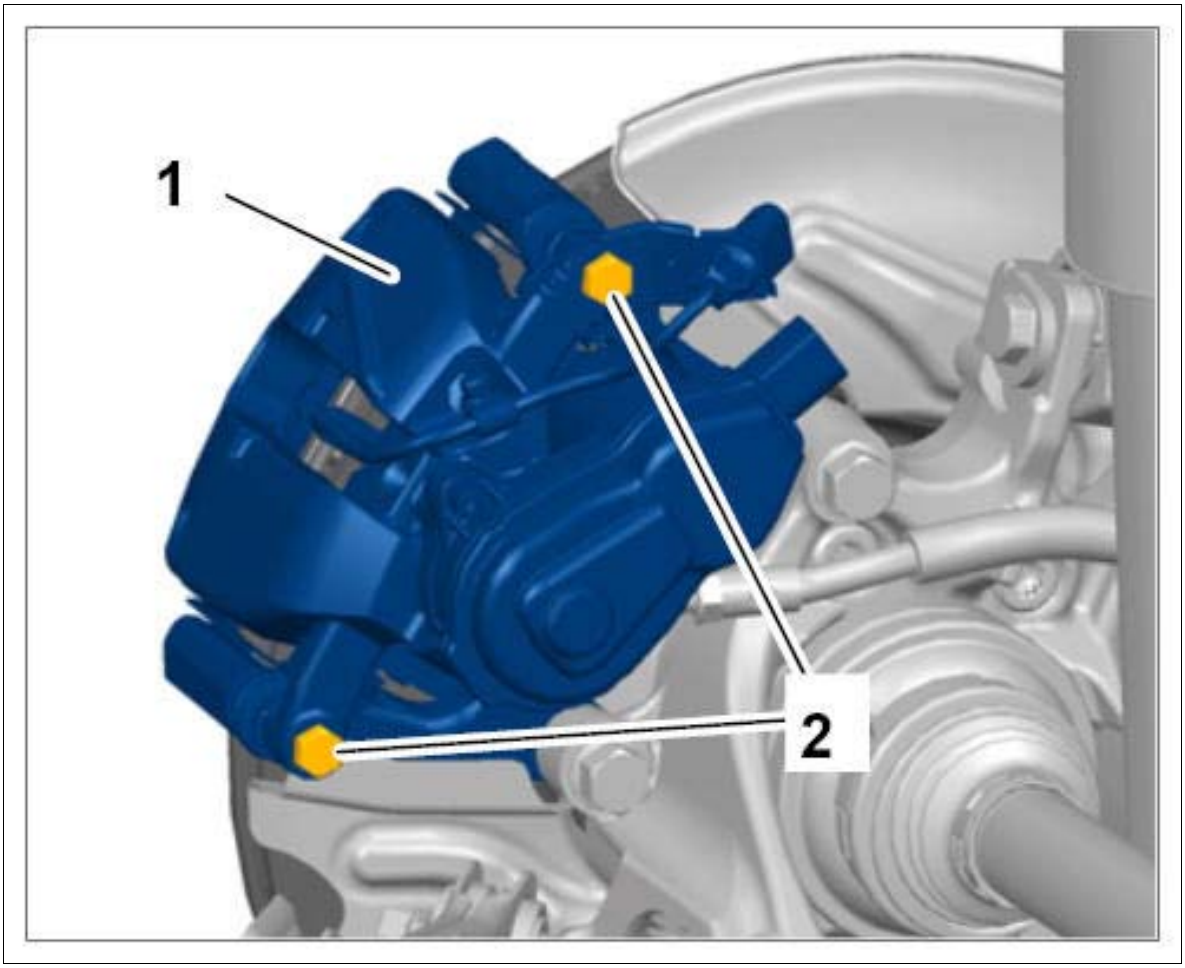
5. Unscrew fastening screws **-2-** for the brake calliper on the calliper carrier. Counter at the guide pin at the same time.

Fig 6: Identifying Brake Caliper Mounting Fastening Screws



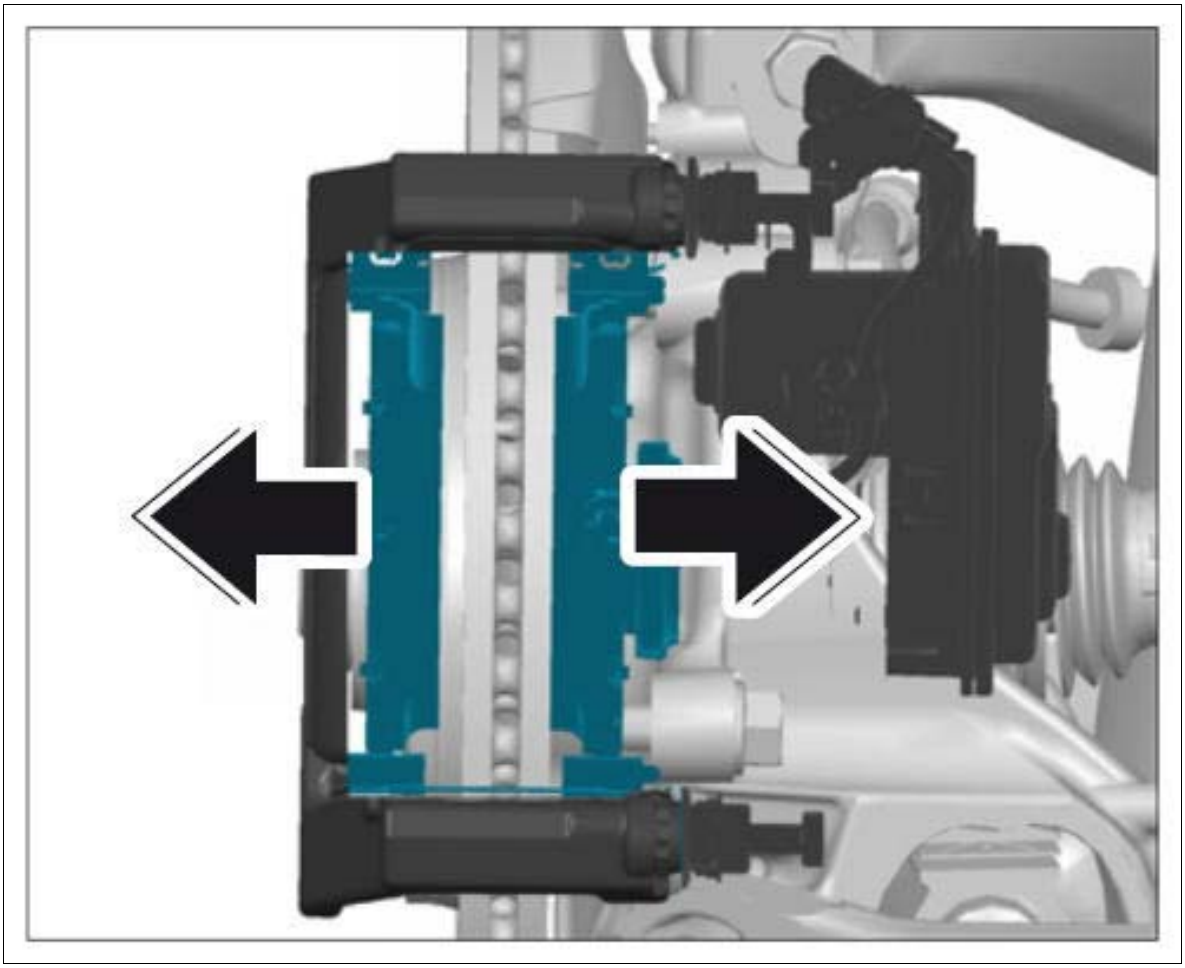
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. Do not leave the brake calliper with calliper carrier hanging at the brake hose. The weight must not put excessive strain on the brake hose.
2. A damaged brake hose must be replaced.
3. The brakes and electric parking brake (EPB) must not be actuated when the brake calliper is removed.

6. Remove brake calliper.
7. Remove disc brake pads and pad retaining brackets to the side **-arrows-** .

Fig 7: Identifying Disc Brake Pads & Retaining Brackets



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 463856 REPLACING REAR DISC BRAKE PADS (ALL MODELS) > REPLACING REAR DISC BRAKE PADS > INSTALLING REAR DISC BRAKE PADS

WARNING: Installation of brake pads with the wrong brake pad quality

- *Longer braking distance*
- *More wear on brake pads*

→ Only use the type-specific brake pads.

→ Replace the brake pads when the brake pad wear indicator light comes on, but no later than when there is a residual pad thickness of 2 mm on each axle.

→ Replace the brake discs on each axle as soon as the brake pad wear limit is reached.

WARNING: Old mounting parts fitted on the brake calliper

- *Reduced braking effect*
- *Risk of damage to the brake calliper*

→ Fit new pad retaining springs

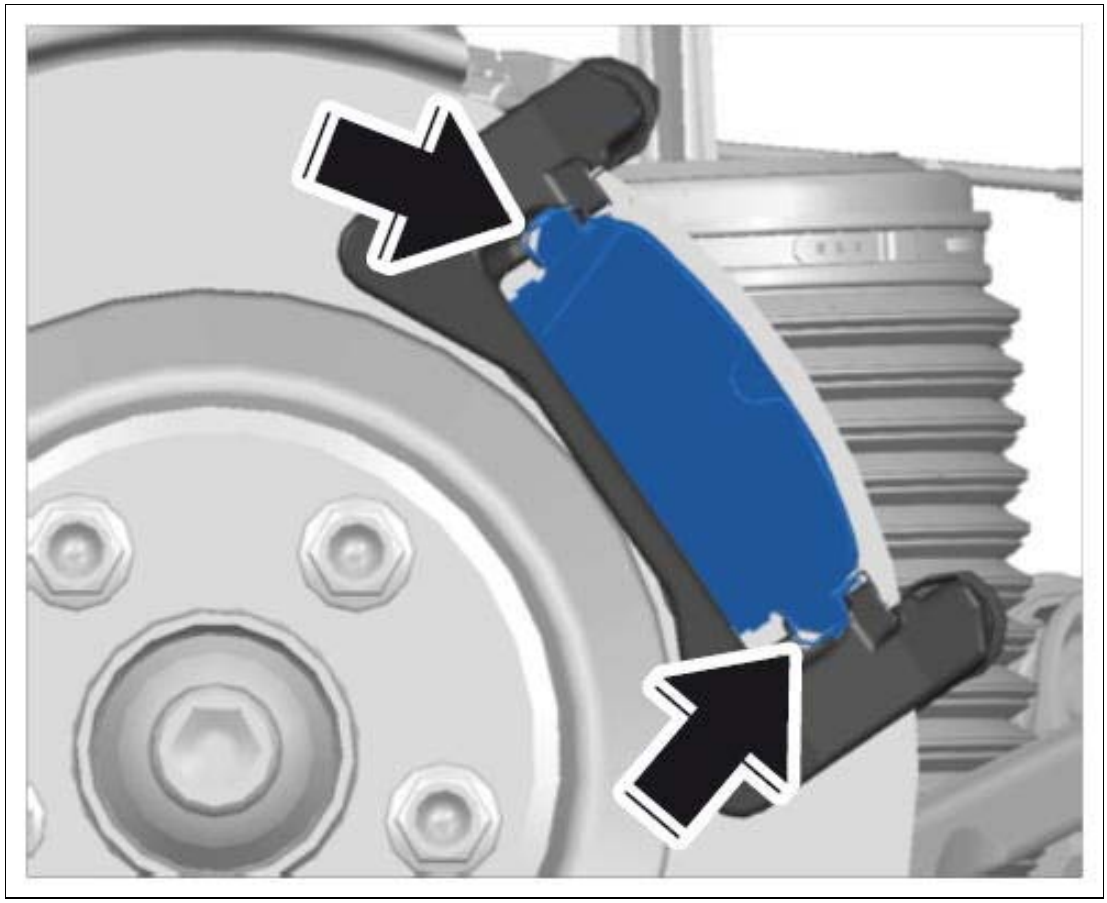
Information

When replacing the brake pads, always pay attention to the following:

- The back of the pad backing plates must not be greased.
- Check brake discs for wear. For details of wear limits, see → 465302 CHECKING REAR BRAKE DISCS (WEAR ASSESSMENT) .
- Disc brakes must be clean and free of grease.
- The core of the warning contact wire must not be left exposed! Worn insulation is not important.
- Use a new repair kit (only replace the brake pads on the same axle).

1. Installation is performed in reverse order. Pay particular attention to the following:
    1. Check that all parts are in perfect condition (visual inspection) and replace them if necessary.
    2. Fit new pad retaining brackets.
    3. Make sure that the disc brake pads are seated correctly in the pad retaining brackets **-arrows-** .

Fig 1: Locating Disc Brake Pads



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Make sure that the brake hose and electric line are clipped in and secured correctly in the combination holder at the wheel bearing housing so that the brake hose and electric line cannot come out of the holders.

4. Clip brake hose dry (without using sliding compound) into the holder at the wheel bearing housing.
5. Observe specified tightening torques:

   Brake calliper to calliper carrier: **Tightening torque 35 Nm (26 ftlb.)**

WM 463856 REPLACING REAR DISC BRAKE PADS (ALL MODELS) > SUBSEQUENT WORK

1. Fit wheel. → Installing Wheel
2. Use **PIWIS Tester II 9818** to start up the electric parking brake (EPB).
    1. 2.1. Select >>Parking brake<< in the control unit overview.

2. 2.2. Select >>Maintenance/repairs<< >>Start-up<<.

WM 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) (ALL MODELS) > INFORMATION > NOTE ON PICTURES SHOWN

Information

- The pictures shown in this document may differ from the original.

WM 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) (ALL MODELS) > INFORMATION > BRAKE DISC WEAR ASSESSMENT - GENERAL

Normally, brake disc replacement is necessary if the thickness is less than the minimum thickness. In rare, isolated cases (of very high loads for long periods) replacement may be necessary due to crack formation. To a certain extent these cracks may be rated as not important. The following service information describe when to replace the brake discs.

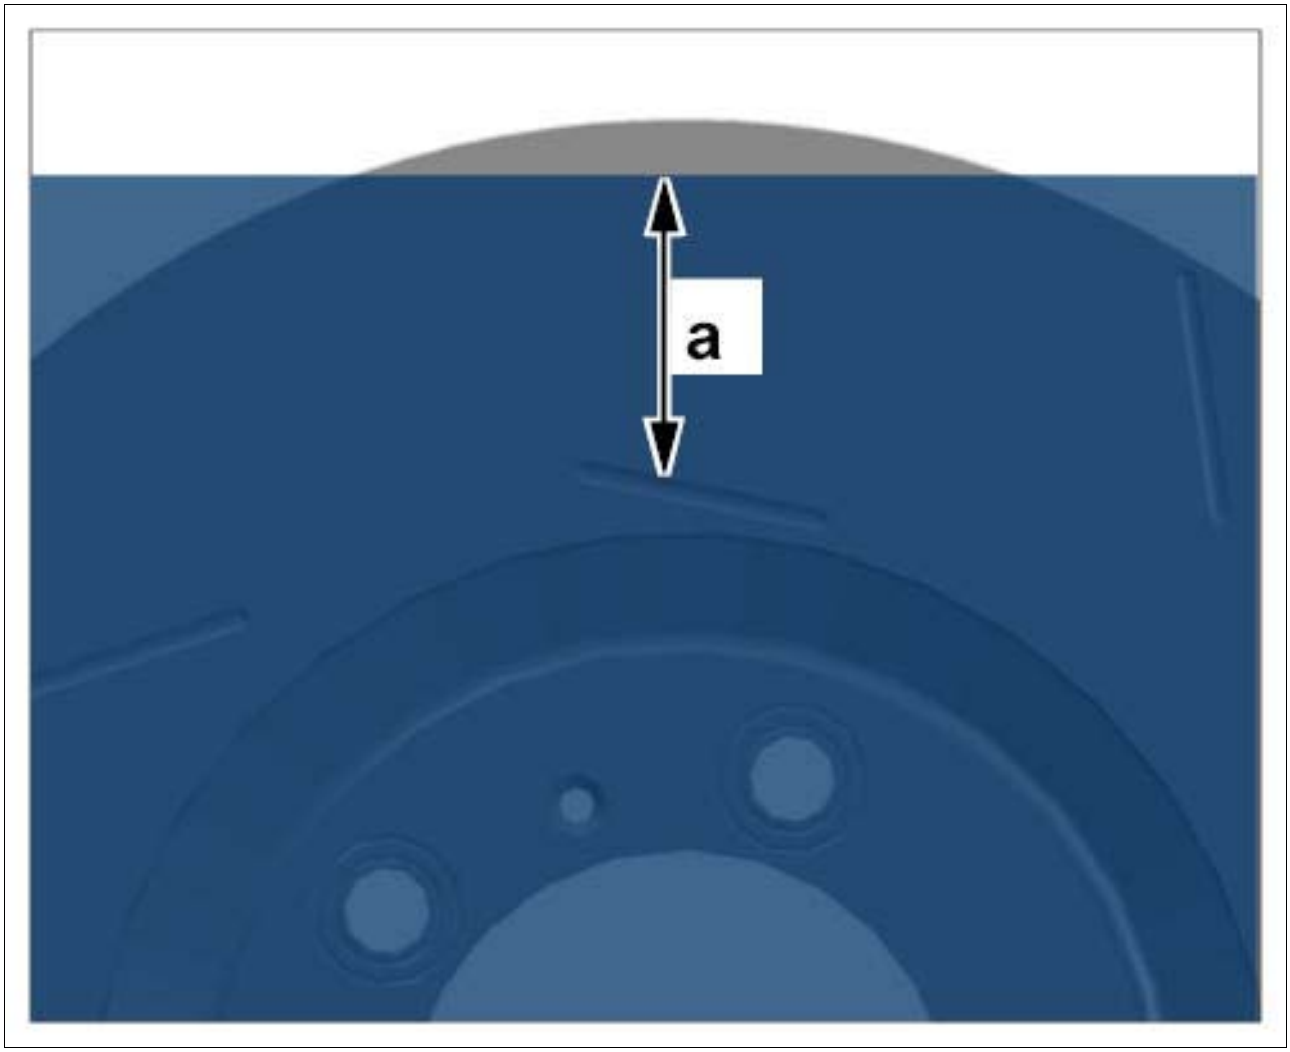
Cracks occur as a result of material fatigue due to frequent and extreme thermal expansion fluctuations. Particularly in cases of very high loads for long periods, these thermal expansion fluctuations produce internal stresses. The result may be cracks in the friction surface. These cracks allow relaxation of the friction disc, so that the speed at which the cracks develop is very slow.

The cracks run from the center of the friction surface to the (inner and outer) edges of the brake disc. As different vehicle types have different brake disc sizes, differences arise for the maximum crack length limits.

The maximum crack length limit is calculated as follows:

0.5 x a (**-a-** = width of friction surface in mm).

Fig 1: Identifying Brake Disc Friction Surface Width



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Larger cracks impair braking comfort and reduce brake disc strength, therefore making brake disc replacement necessary as a precaution.

Irrespective of the crack length, the brake disc must be replaced if the crack has extended as far as the outer and/or inner edge of the disc.

WM 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) (ALL MODELS) > INFORMATION > BEDDING IN THE BRAKE PADS AND BRAKE DISCS

New brake pads require a bedding-in time of approx. 200 km (124 miles)! Only then do they achieve their best friction coefficient and wear values. During this time, the brakes should be subjected to full stress when travelling at high speed only in emergencies. The slightly reduced braking effect must be compensated for by increased pressure on the brake pedal. The same also applies after replacing or machining brake discs.

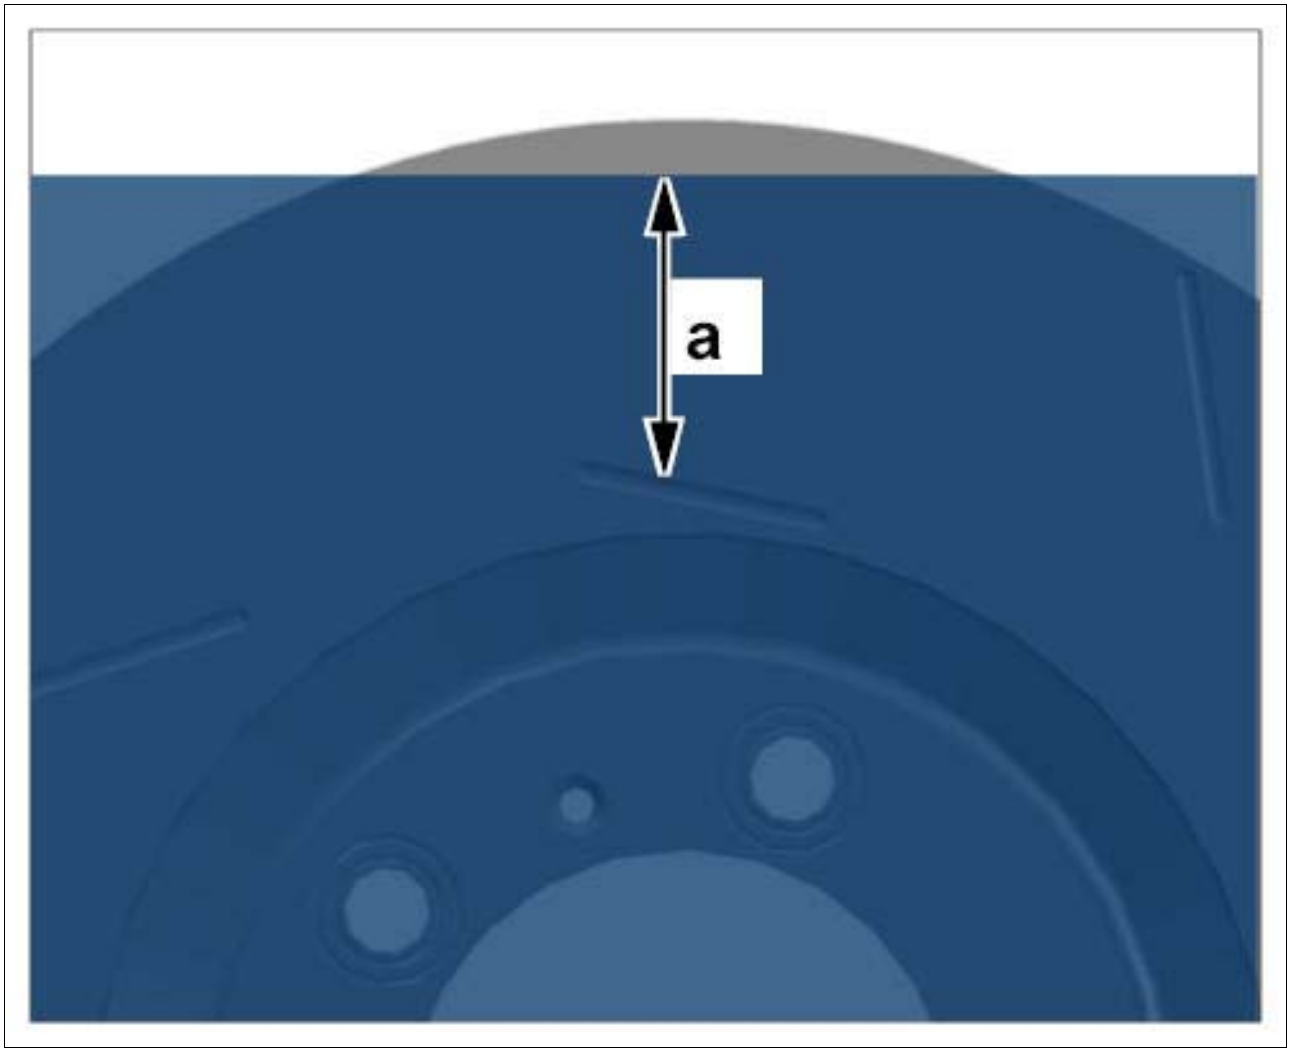
WM 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) (ALL MODELS) > CHECKING > CHECKING FRONT BRAKE DISCS - EVALUATING CRACKS

Different vehicle types have different brake disc sizes. This results in differences in terms of maximum crack length limits.

The maximum crack length limit is calculated as follows:

0.5 x a (**-a-** = width of friction surface in mm).

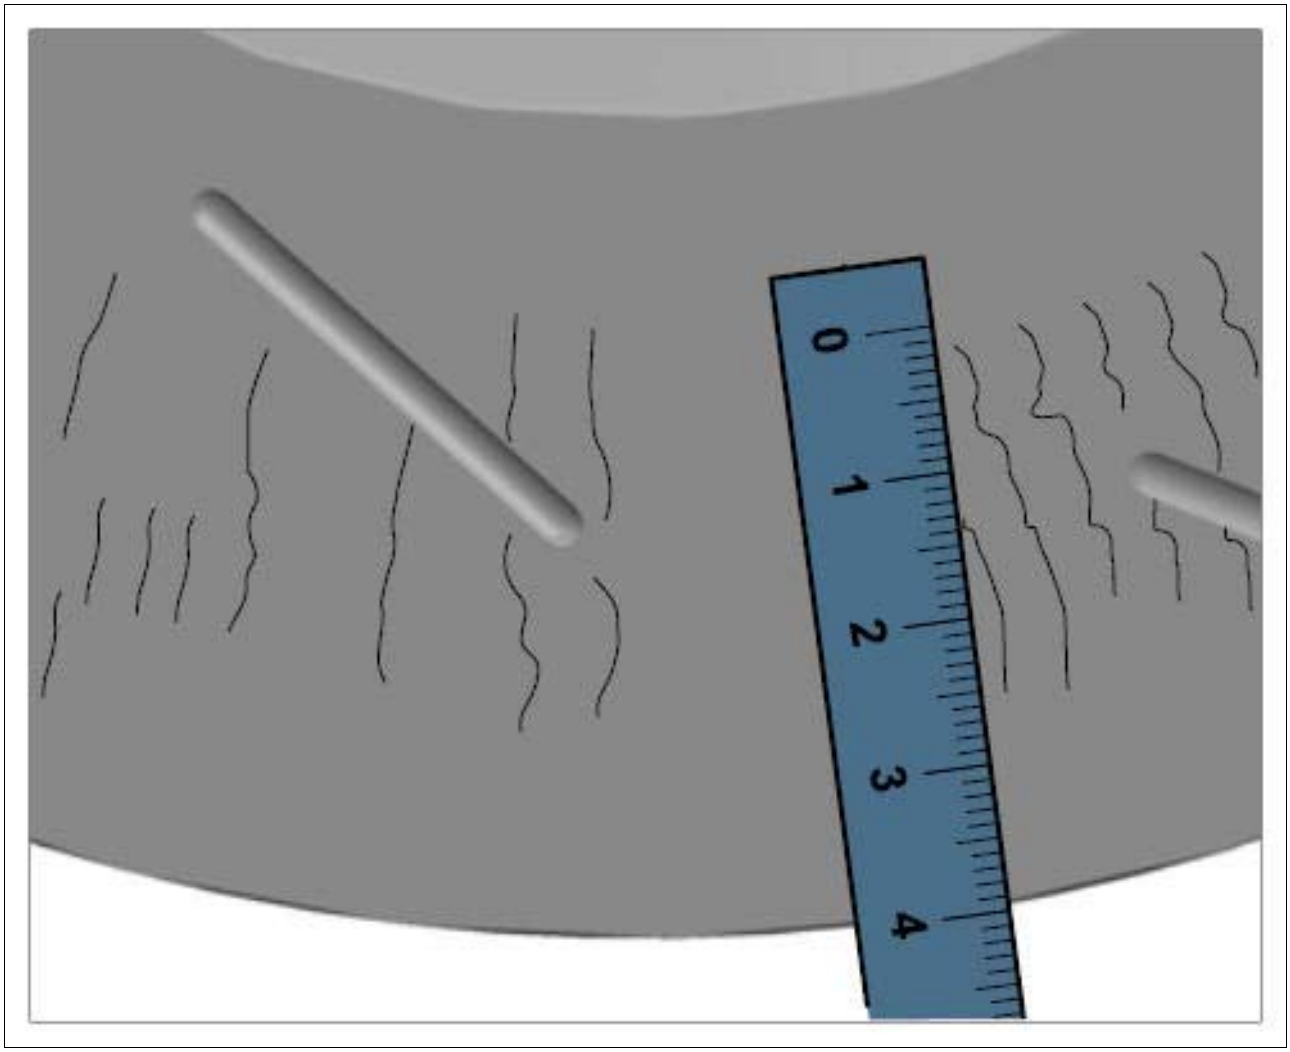
Fig 1: Identifying Brake Disc Friction Surface Width



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The length of a crack can be measured with a steel rule, for example. → Brake discs

Fig 2: Identifying Brake Discs Crack



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Irrespective of the crack length, the brake disc must be replaced if the crack has extended as far as the outer and/or inner edge of the disc.

As a precaution, brake discs must be replaced when:

- the → **Maximum crack length: 0.5 x a mm** (a = friction surface width in mm) is exceeded!
- the → **Maximum crack width: 1 mm** is exceeded!
- the → **Maximum crack depth: 1.5 mm** is exceeded!

WM 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) (ALL MODELS) > CHECKING > CHECKING FRONT BRAKE DISCS - MINIMUM THICKNESS

Information

Normally, brake discs are used until the maximum wear dimension is reached. → WM 4650TW TECHNICAL DATA/BRAKE WEAR LIMIT . Only in a few exceptional cases is it advisable to skim the brake discs (if there is deep scoring or corrosion of the friction surface). In this case only the disc brake dressing machines approved by Porsche AG are to be used .

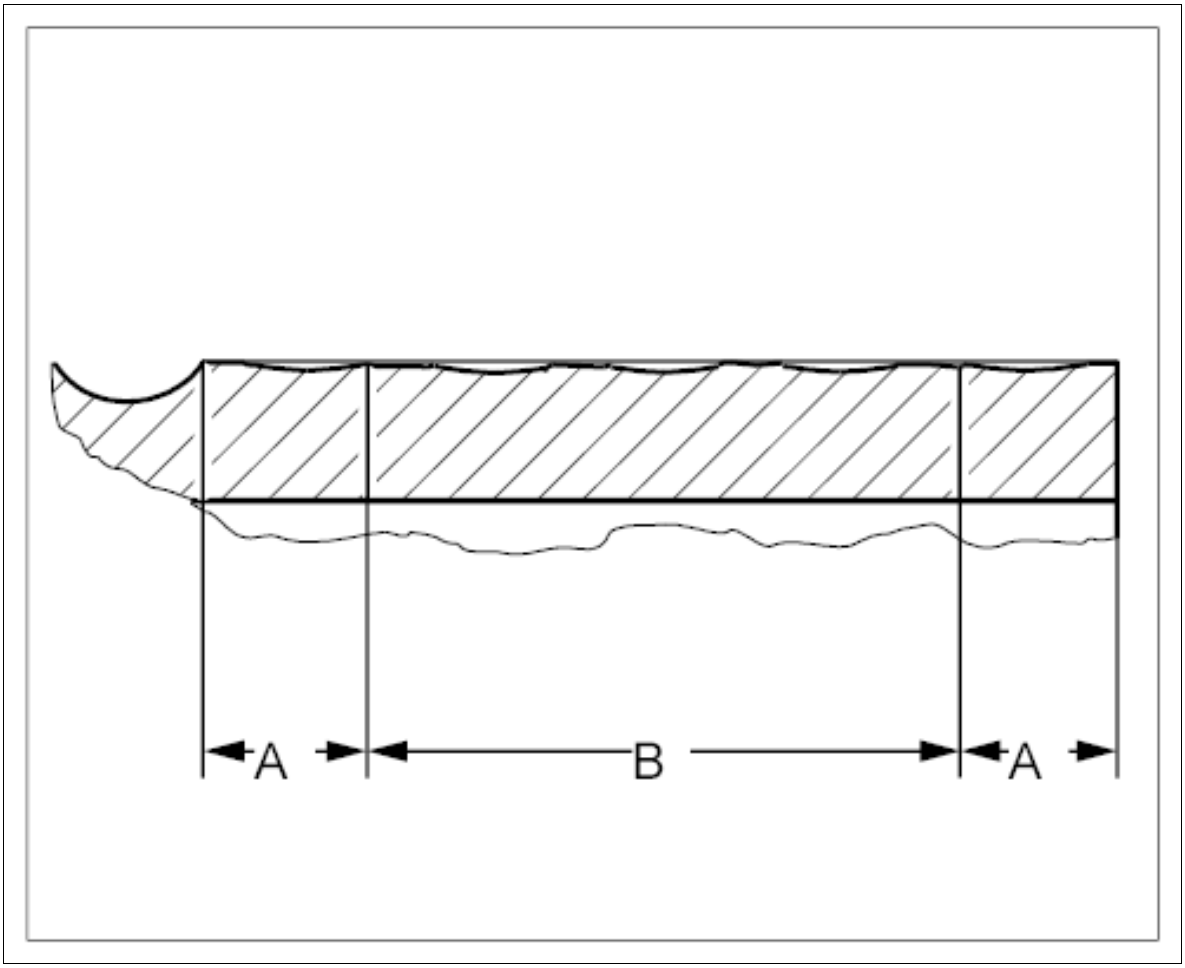
- Only as new brake discs may be reworked!
- Only rework the brake discs symmetrically, evenly from both sides!

As the pressure force of a brake piston on the brake pad varies in magnitude, different areas of wear arise on the friction surface. The brake disc can basically be divided into two areas of wear:

-A- Outer and inner wear area.

-B- Central wear area.

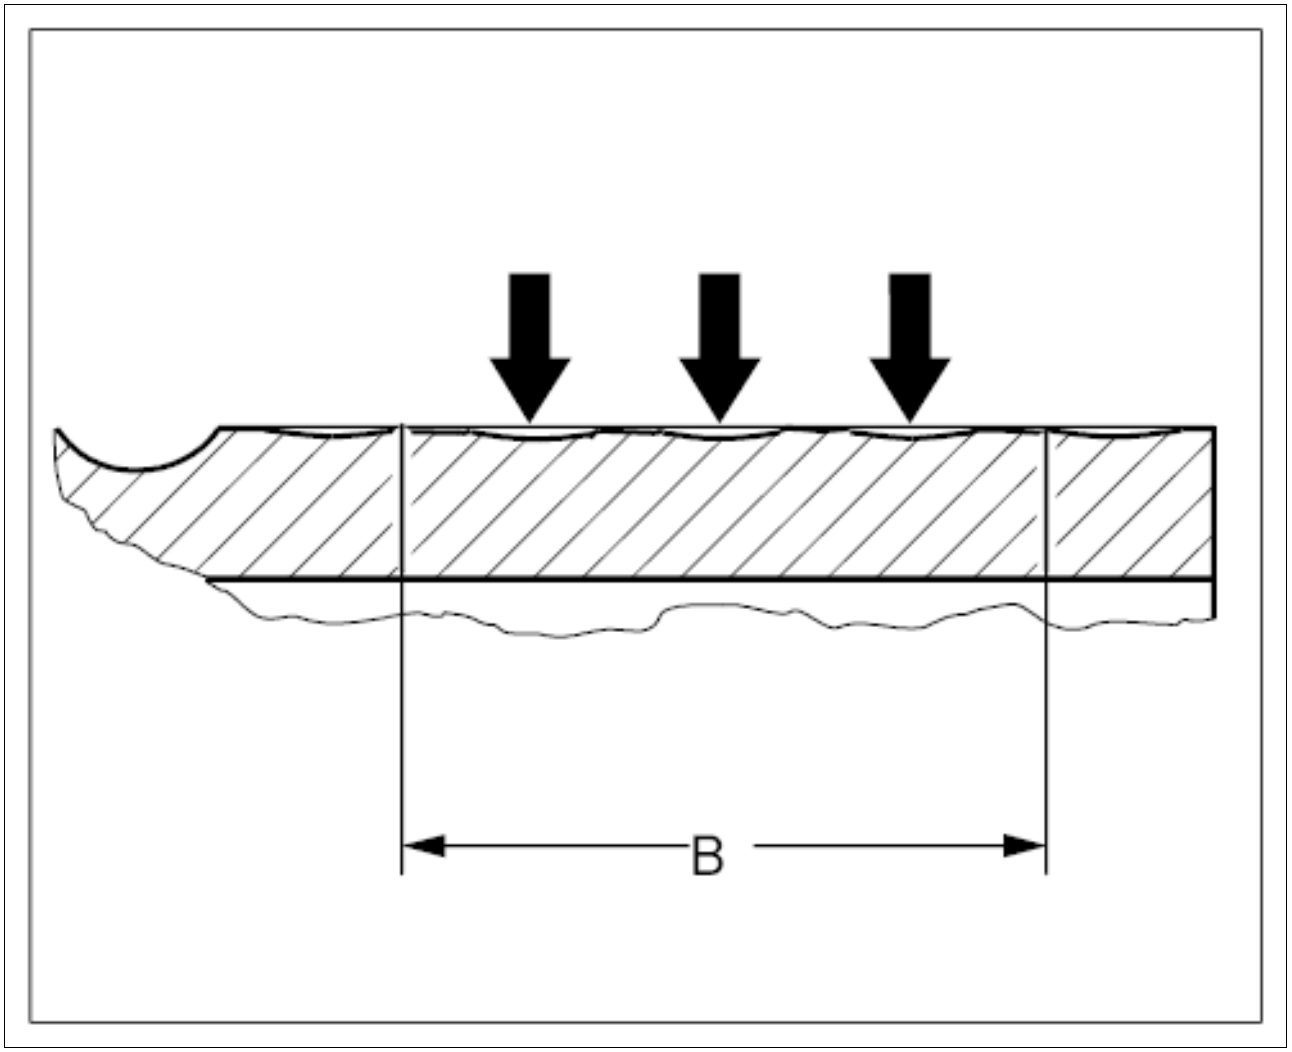
Fig 1: Identifying Brake Disc Wear Areas



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The central wear area **-B-** is the area with the highest degree of wear.

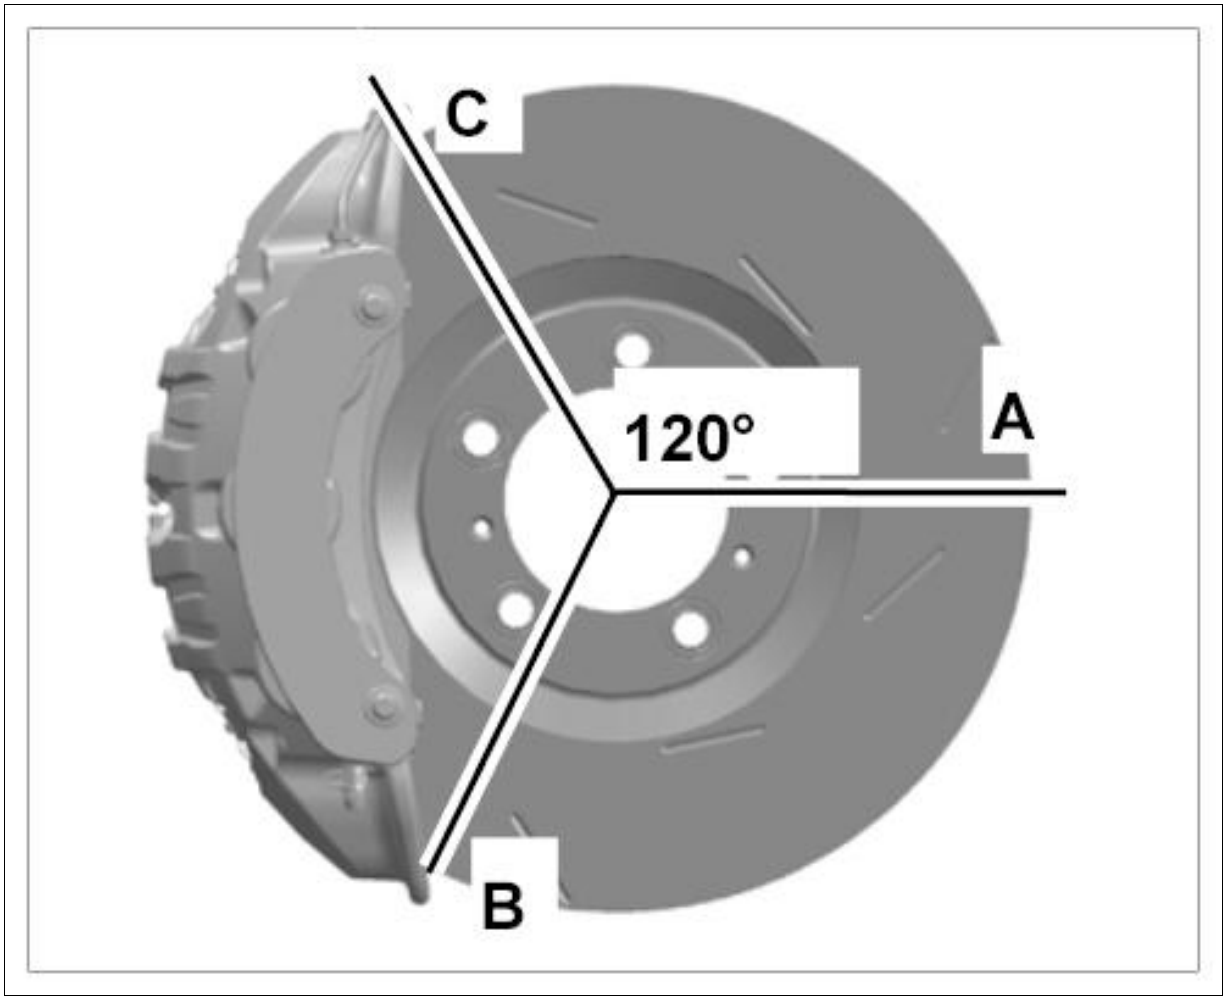
Fig 2: Identifying Brake Disc Central Wear Area



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Measure the brake discs using a suitable micrometer at a minimum of three different places (**-A, B, C-**), offset by 120°.

Fig 3: Identifying Brake Disc Thickness Measurement Points



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) (ALL MODELS) > CHECKING > CHECKING LATERAL RUNOUT (BRAKE DISC/WHEEL HUB) AND THICKNESS TOLERANCE

Information

Fasten dial gauge set with ball joint arm to wheel bearing housing.

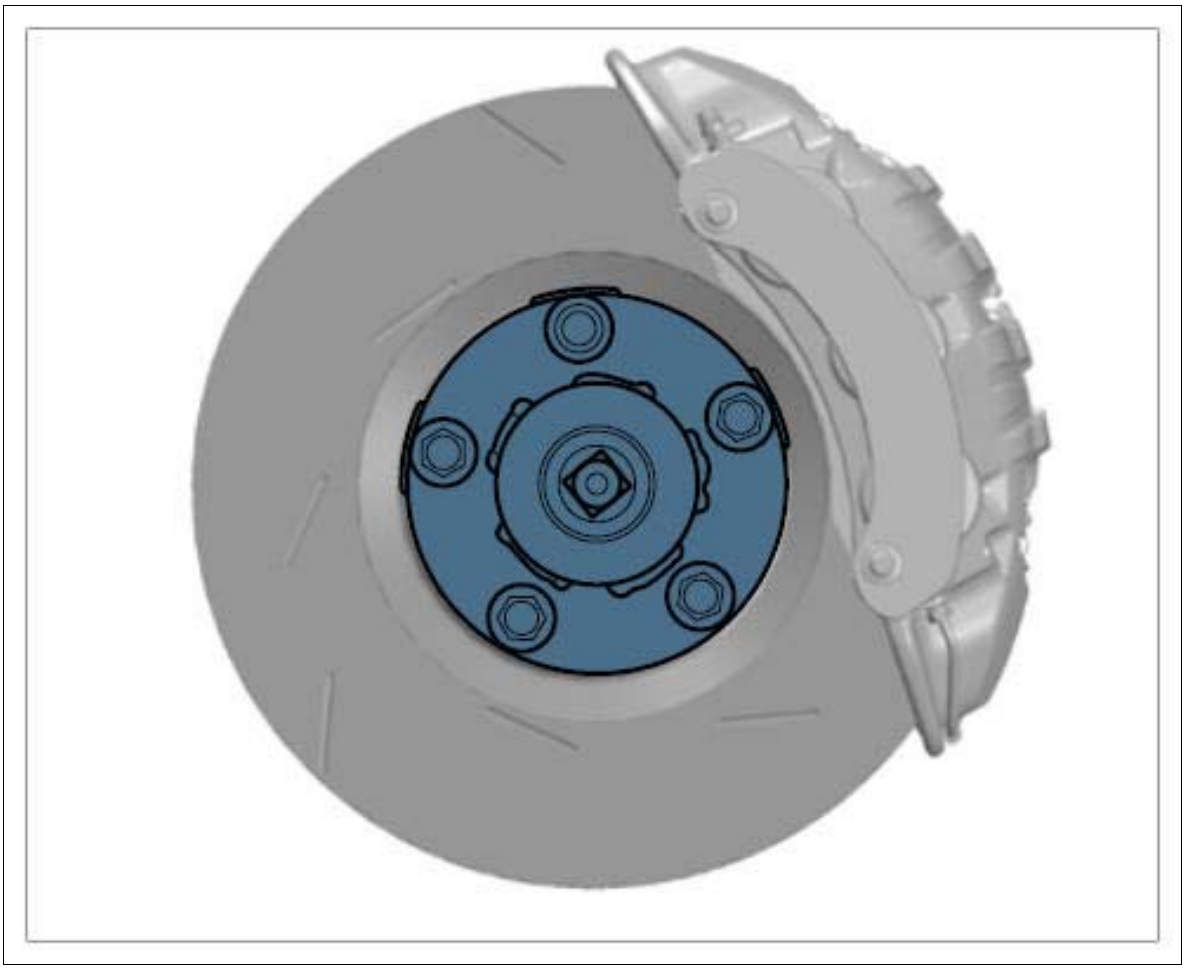
Two adapters are used for checking lateral runout. The brake disc and wheel hub can be measured with these.

WM 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) (ALL MODELS) > CHECKING > CHECKING LATERAL RUNOUT (BRAKE DISC/WHEEL HUB) AND THICKNESS TOLERANCE > BRAKE DISC LATERAL RUNOUT

1. Remove wheel → 440519 REMOVING AND INSTALLING WHEEL

2. **Adapter plate 9510/2** must be fitted and tightened to tightening torque 160 Nm (118 ftlb.). → Adapter plate on wheel hub

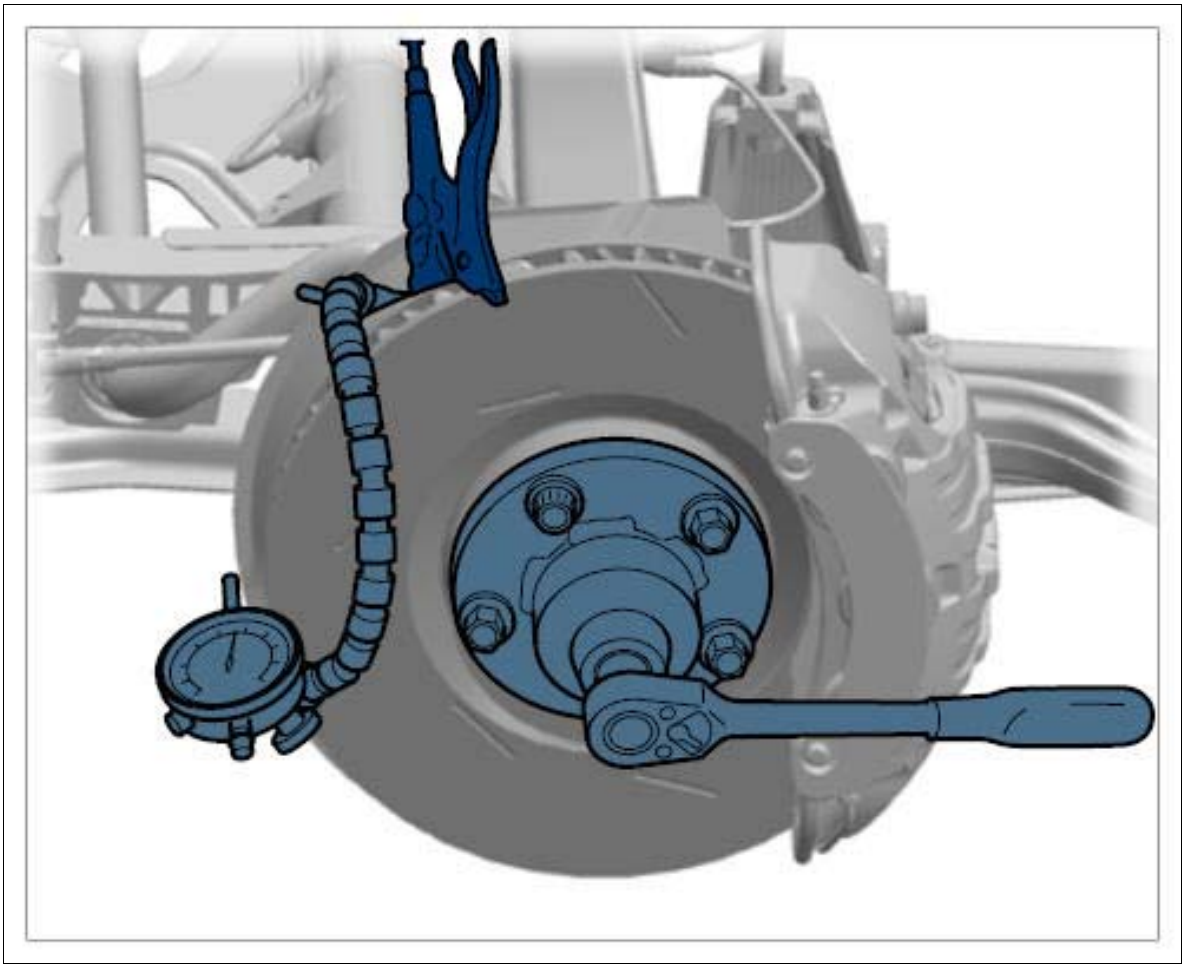
   Fig 1: Identifying Wheel Hub Adapter Plate



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Fit adapter **dial gauge set with ball joint arm Nr.147-1** at a suitable position on the wheel bearing housing. → Dial gauge on brake disc (shown as an example)

Fig 2: Dial Gauge On Brake Disc



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Fit the dial gauge with some preload and measure the lateral runout at the greatest external diameter of the brake disc.

WM 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) (ALL MODELS) > CHECKING > CHECKING LATERAL RUNOUT (BRAKE DISC/WHEEL HUB) AND THICKNESS TOLERANCE > WHEEL HUB LATERAL RUNOUT

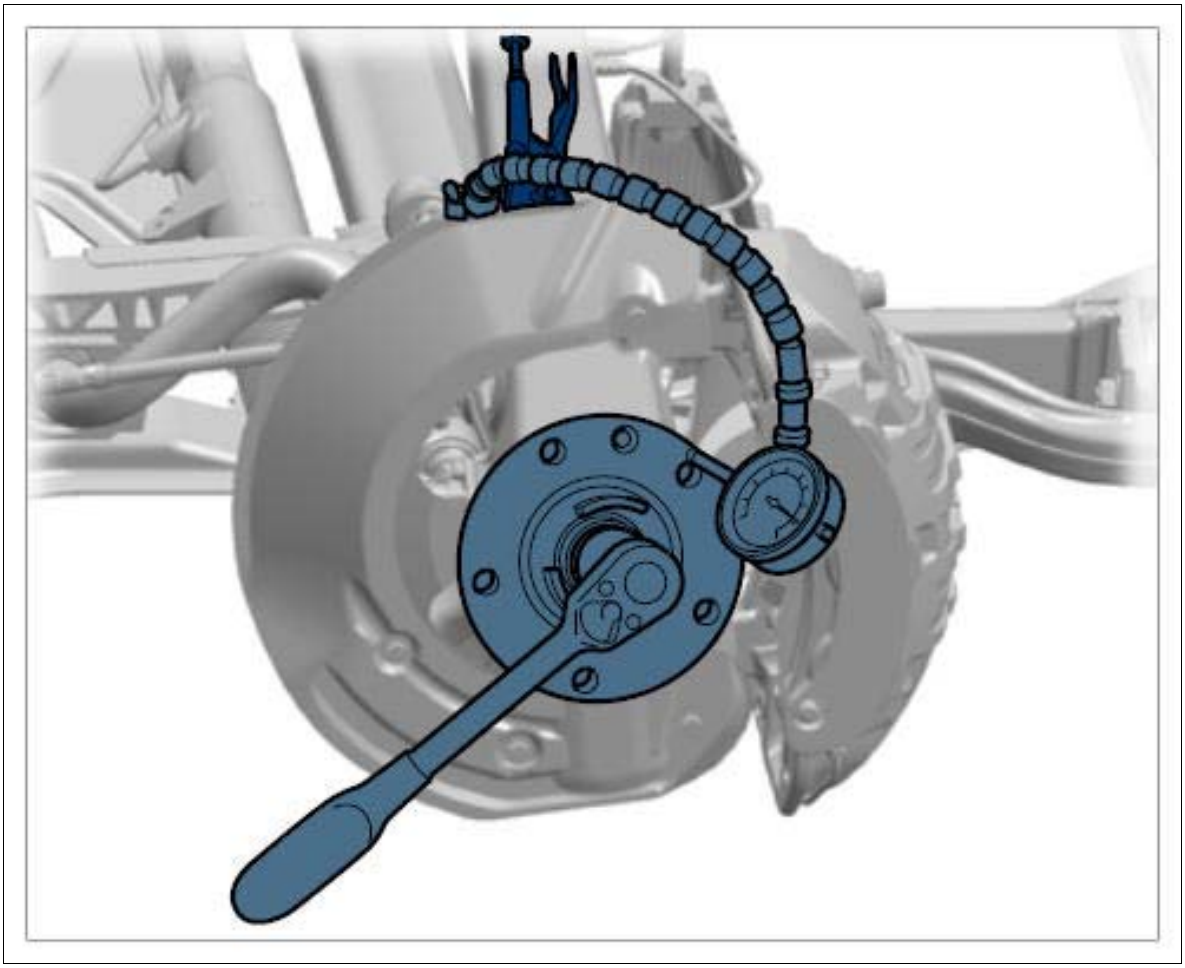
Information

The front face of the wheel hub must not be corroded. If necessary, clean with fine emery cloth.

- Measure the wheel hub lateral runout at the front face of the wheel hub. You should always measure the external and internal diameters of the wheel bolt area.

1. Remove brake disc. → 465019 REMOVING AND INSTALLING FRONT BRAKE DISC
2. Fit adapter **dial gauge set with ball joint arm Nr.147-1** at a suitable position on the wheel bearing housing. Fit the dial gauge with some preload. → Dial gauge on wheel hub

Fig 1: Dial Gauge On Wheel Hub



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) (ALL MODELS) > CHECKING > CHECKING LATERAL RUNOUT (BRAKE DISC/WHEEL HUB) AND THICKNESS TOLERANCE > BRAKE DISC THICKNESS TOLERANCE

- For details of brake disc thickness tolerance, see Technical data/brake wear limits → 4650TW TECHNICAL DATA/BRAKE WEAR LIMIT .
- Use a suitable micrometer screw gauge to measure the thickness tolerance at approx. 8 points within the braking surface.

WM 465019 REMOVING AND INSTALLING FRONT BRAKE DISC (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Brake disc to	M6 x 16 thread	Tightening	10 Nm (7.5		

wheel hub		torque	ftlb.)		

WM 465019 REMOVING AND INSTALLING FRONT BRAKE DISC (ALL MODELS) > PRELIMINARY WORK

1. Remove brake calliper and suspend it at a suitable position in the wheel housing (do not open the brake hydraulic system!) → 473919 REMOVING AND INSTALLING FRONT BRAKE CALLIPER .

WM 465019 REMOVING AND INSTALLING FRONT BRAKE DISC (ALL MODELS) > REMOVING AND INSTALLING FRONT BRAKE DISC > REMOVING FRONT BRAKE DISC

NOTE: Removal of brake calliper

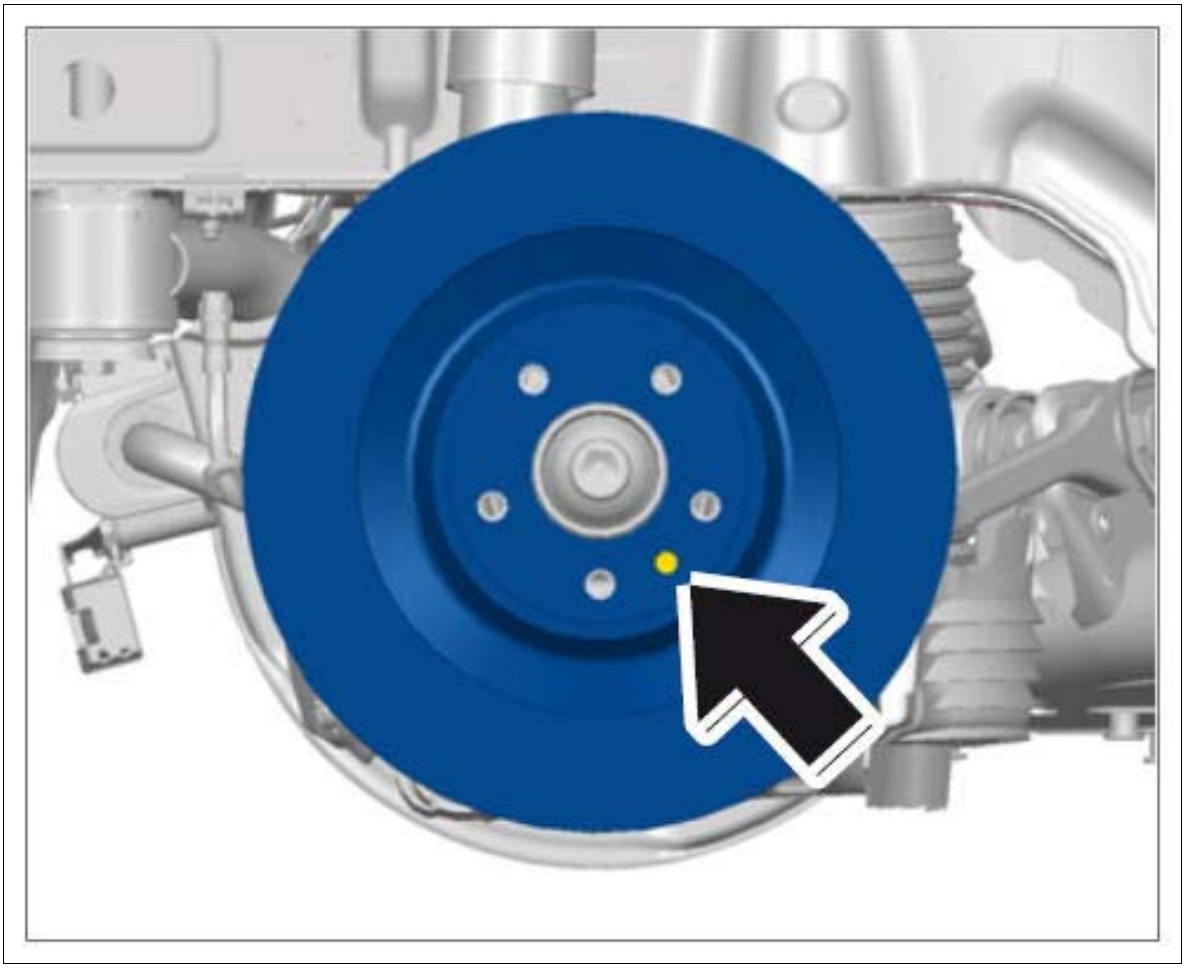
- *Paint defects on brake calliper*

→ Proceed with care when setting back the brake pads.

→ Protect brake calliper from paint defects using a suitable cloth.

1. Loosen fastening screw **-arrow-** and remove brake disc.

Fig 1: Locating Brake Disc Mounting Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

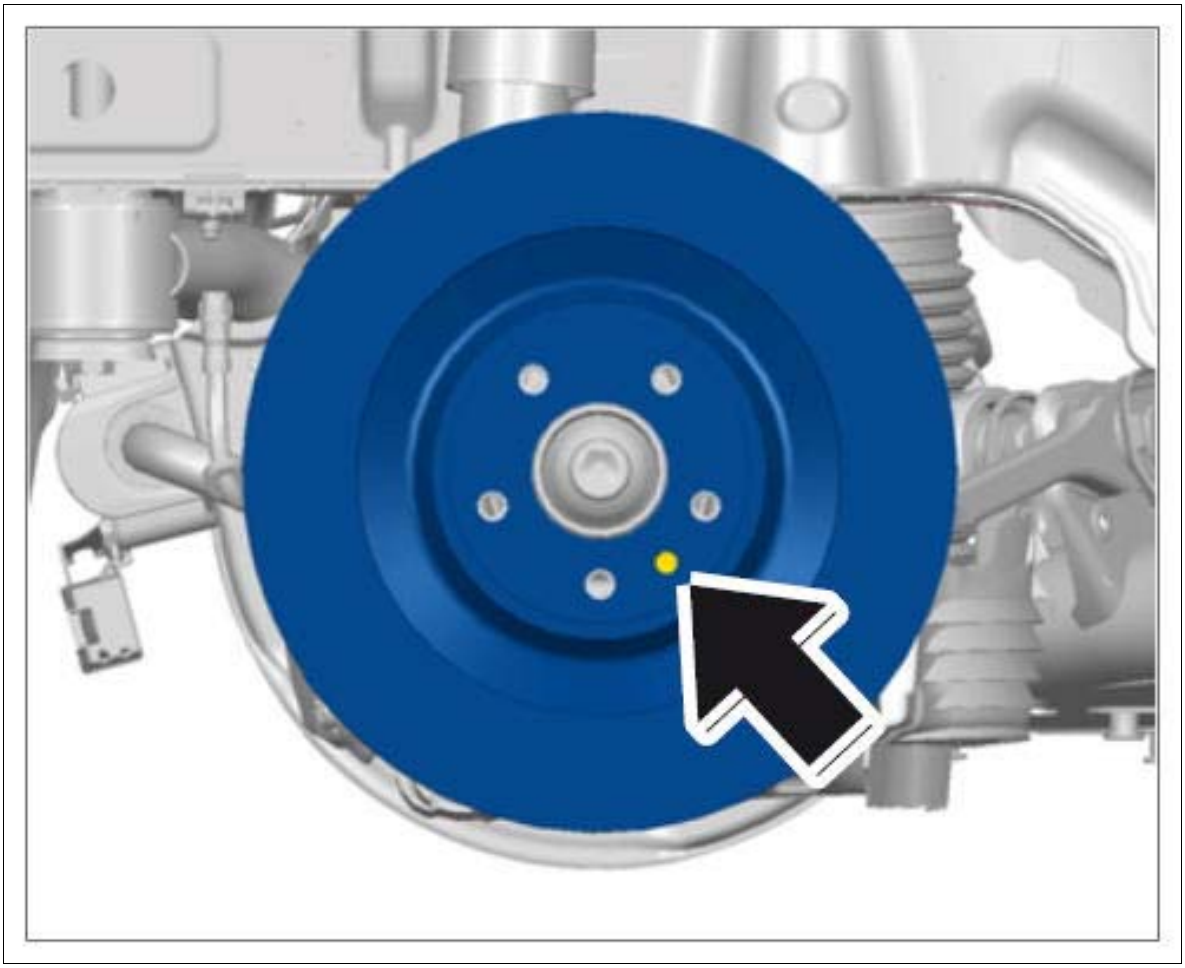
WM 465019 REMOVING AND INSTALLING FRONT BRAKE DISC (ALL MODELS) > REMOVING AND INSTALLING FRONT BRAKE DISC > INSTALLING FRONT BRAKE DISC

Do not confuse left and right brake discs during assembly!

Distinguishing feature: Part number! The flat surface of the brake discs is marked with R = right or L = left.

1. Check that all parts are in perfect condition (visual inspection) and replace them if necessary.
2. Clean the flat and centering surfaces on the brake disc and wheel hub.
3. Fit brake disc and tighten fastening screw **-arrow-** . **Tightening torque 10 Nm (7.5 ftlb.)**

Fig 1: Locating Brake Disc Mounting Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 465019 REMOVING AND INSTALLING FRONT BRAKE DISC (ALL MODELS) > SUBSEQUENT WORK

1. Install brake calliper → Installing Rear Brake Calliper .

WM 4650TW TECHNICAL DATA/BRAKE WEAR LIMIT (ALL MODELS) > TEST VALUES AND WEAR LIMITS > TEST VALUES AND WEAR LIMITS FOR MACAN S/DIESEL S BRAKE SYSTEM

Information

Depending on the extent of wear on cast iron brake discs, two condition criteria can make replacement necessary:

- Formation of cracks at advanced stage on the brake disc friction surfaces.

- Minimum brake disc thickness is not retained due to wear (material erosion due to friction) . → 46500200 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT) → 46530250 CHECKING REAR BRAKE DISCS (WEAR ASSESSMENT)

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Pad thickness, front	Wear limit 2 mm		approx. 9.5 mm		
Pad thickness, rear	Wear limit 2 mm		approx. 11.5 mm		
Brake disc minimum thickness after machining, front	Only as-new brake discs may be reworked! Only rework the brake disc symmetrically, evenly from both sides!		33, 6 mm		
Brake disc minimum thickness after machining, rear	Only as-new brake discs may be reworked! Only rework the brake disc symmetrically, evenly from both sides!		21, 6 mm		
Brake disc wear dimension, front			32 mm		
Brake disc wear dimension, rear			20 mm		
Peak-to-valley surface roughness of brake disc after machining, max.			0.006 mm		
Thickness tolerance of brake discs after machining, max.			0.02 mm		
Lateral runout of brake disc, max.			0.03 mm		
Lateral runout of wheel hub, max.			0.02 mm		
Lateral runout of brake disc when installed, max.			0.06 mm		

Possible complaints

- Damage due to lack of use (rusting). This causes vibrations in the steering wheel, noises and brake pedal pulsation.
- Brake disc becomes distorted as a result of serious driving.
- Too much lateral runout when new brake discs are fitted on dirty or distorted wheel hubs.

Procedure

- Check brake disc for cracks, minimum thickness, lateral runout, thickness tolerance, flatness and surface roughness.
- If necessary, (depending on the actual brake disc thickness and the brake disc wear limit) machine the brake disc using one of the disc brake dressing machines approved by Porsche.
- The brake disc must only be reworked symmetrically, i.e. evenly from both sides! Read the operating instructions for the disc brake dressing machine!

WM 4650TW TECHNICAL DATA/BRAKE WEAR LIMIT (ALL MODELS) > TEST VALUES AND WEAR LIMITS > TEST VALUES AND WEAR LIMITS FOR MACAN TURBO BRAKE SYSTEM

Information

Depending on the extent of wear on cast iron brake discs, two condition criteria can make replacement necessary:

WM 4650TW TECHNICAL DATA/BRAKE WEAR LIMIT (ALL MODELS) > TEST VALUES AND WEAR LIMITS > TEST VALUES AND WEAR LIMITS FOR PCCB BRAKE SYSTEM

Information

The following condition criteria can make replacement necessary depending on the wear of the PCCB brake discs:

- Surface changes in the brake disc friction surfaces at an advanced stage.
- Minimum brake disc thickness is not retained due to wear (material erosion due to friction).

Information

The PCCB brake disc must not be machined.

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Pad thickness, front	Wear limit 9.9 mm		approx. 15.8 mm		
Pad thickness, rear	Wear limit 8.8 mm		approx. 17.6 mm		
Lateral runout of brake disc, max.		New	0.025 mm		
Lateral runout of wheel hub, max.		New	0.02 mm		
Lateral runout of brake disc when installed, max.		New	0.07 mm		

Possible complaints

- Brake disc becomes distorted as a result of serious driving.
- Too much lateral runout when new brake discs are fitted on dirty or distorted wheel hubs.

Procedure

- Check brake disc for cracks, lateral runout, thickness tolerance, flatness and surface roughness.

WM 465102 CHECKING FRONT PCCB BRAKE DISCS (WEAR ASSESSMENT USING TEST EQUIPMENT VAS 6813) (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
test equipment for PCCB brake discs	Workshop equipment	WE 1578		

WM 465102 CHECKING FRONT PCCB BRAKE DISCS (WEAR ASSESSMENT USING TEST EQUIPMENT VAS 6813) (ALL MODELS) > INFORMATION > PCCB BRAKE DISCS WITH NEW FRICTION COATING TECHNOLOGY

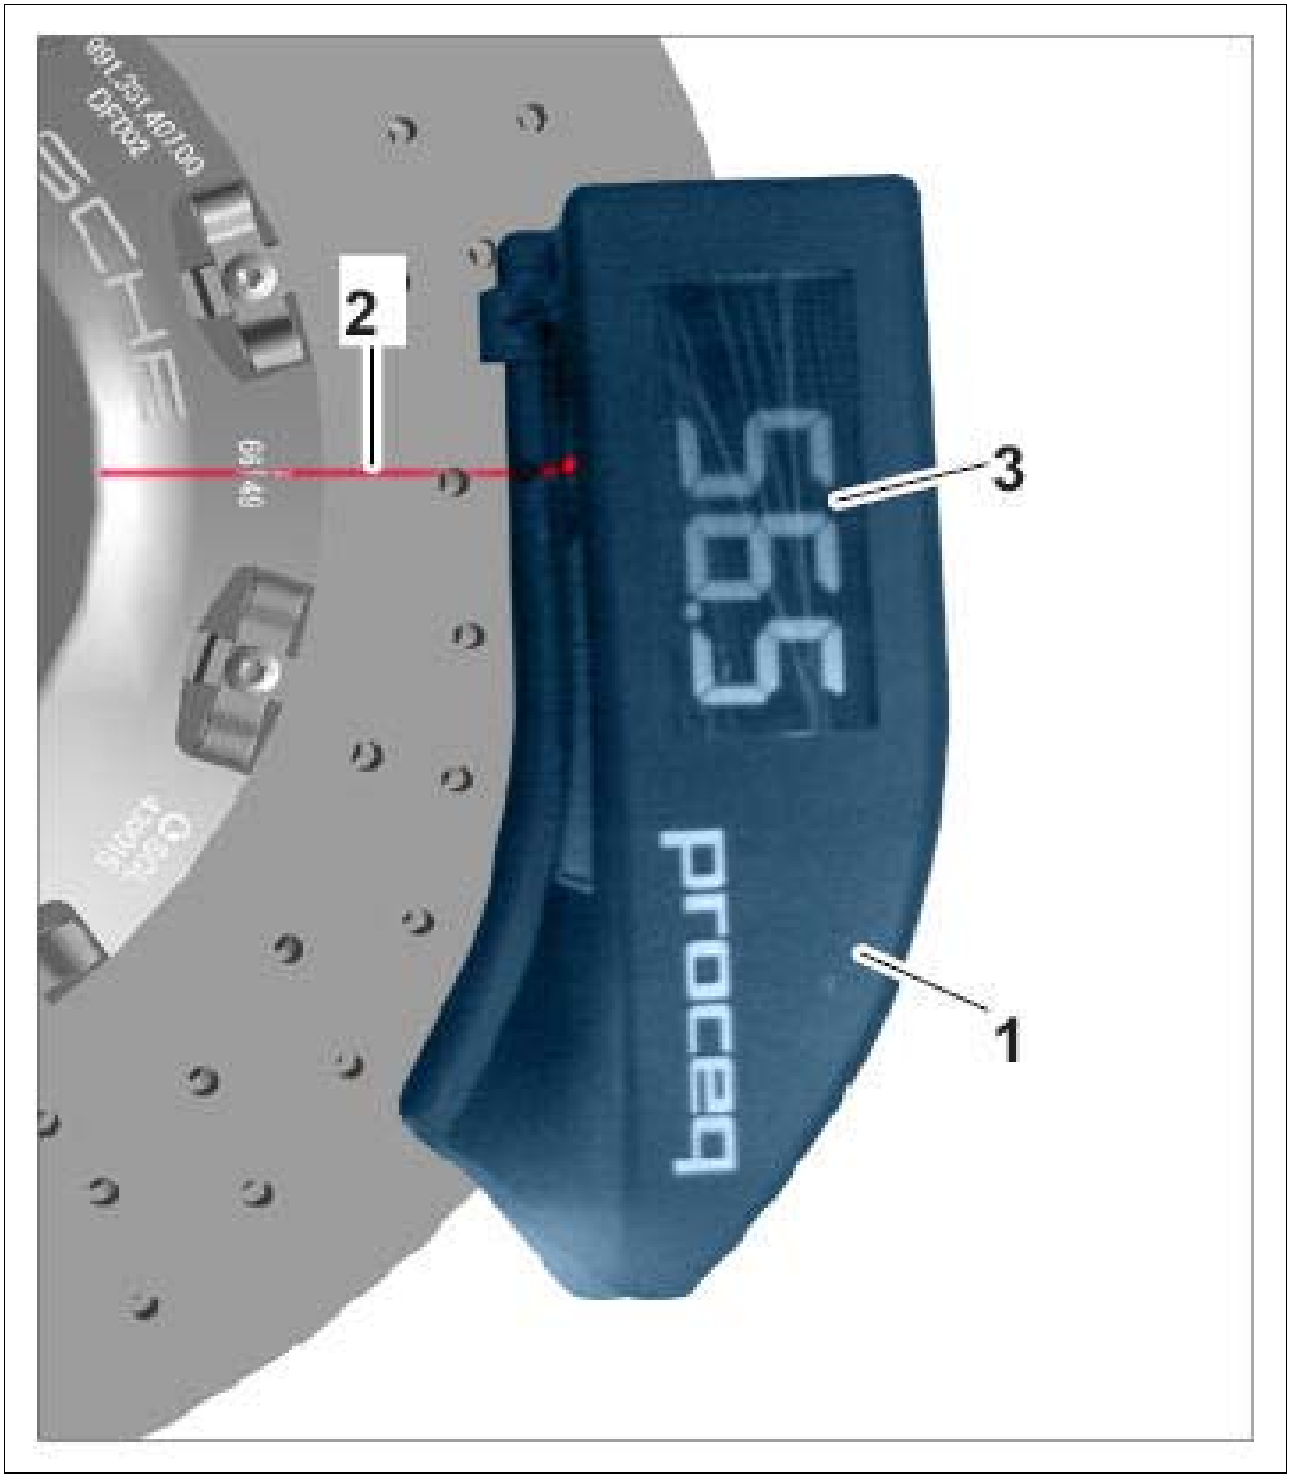
Information

The pictures shown in this document may differ from the original.

New measuring method for wear assessment. Wear assessment is performed using **test equipment for PCCB brake discs WE 1578** .

1. Test equipment VAS 6813
2. Laser beam for positioning
3. Measured value display

Fig 1: Identifying Test Equipment VAS 6813



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

- Validity (of measuring method using test equipment VAS 6813) for PCCB brake discs with new friction coating technology. Recognizable by the three markings and values lasered at an offset of 120° (on the brake disc hub) -arrows- .

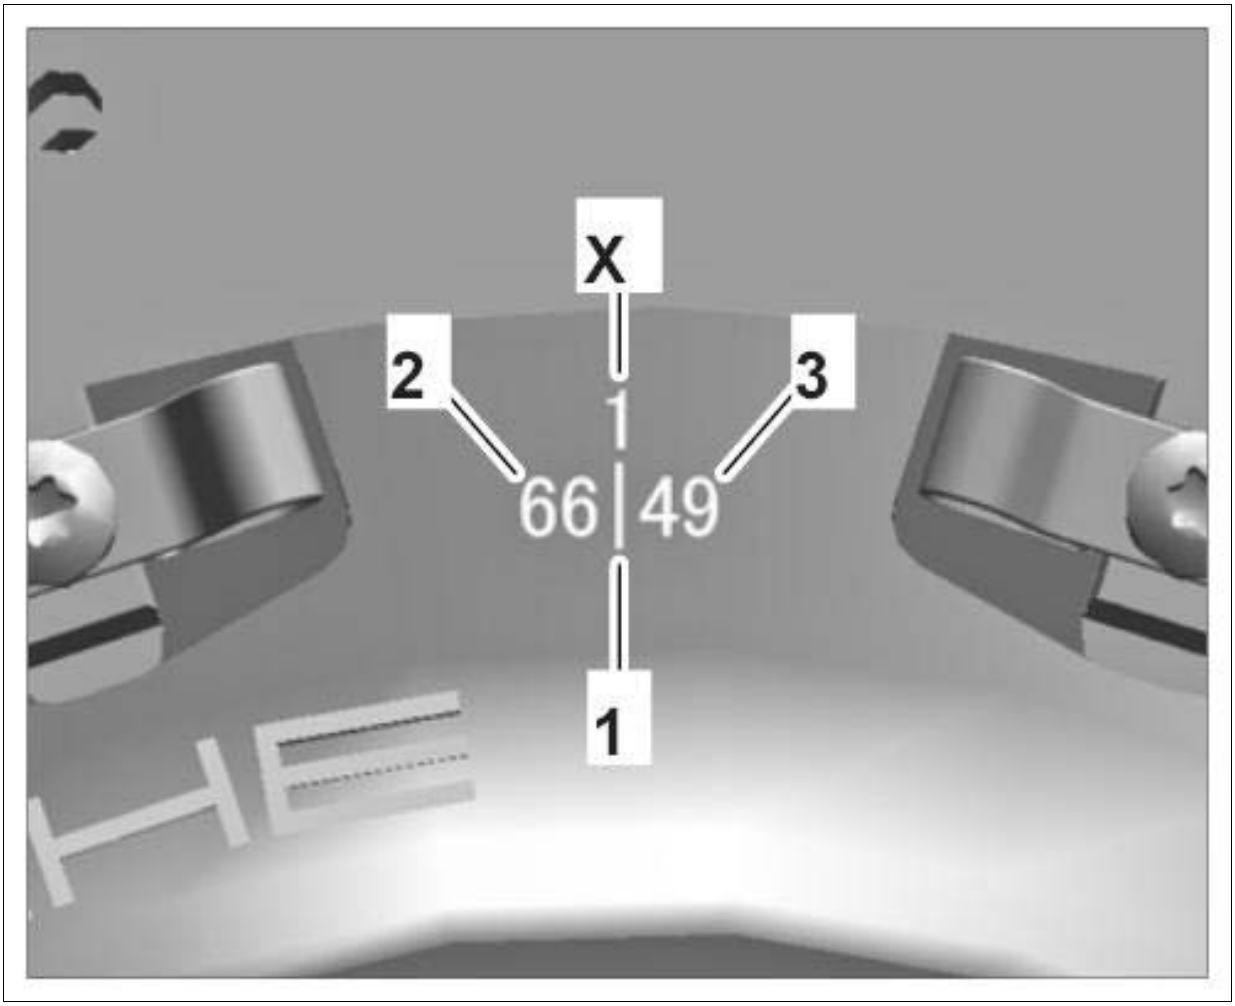
Fig 2: Locating Friction Coating Technology Mark

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- VAS 6813 is used to measure the damage to the carbon fibre-reinforced material. The lower this value, the more carbon fibres in the internal structure of the brake disc are damaged (wear caused by the effects of temperature).
- The markings consist of the measuring point numbers 1 to 3 -X- (figure shows number 1), the measurement marking -1- (line), the new value -2- and the wear value -3- .

- If one of the three wear values is reached or if the measured value is less than one of the three wear values, replace the brake discs on both sides of the axle.

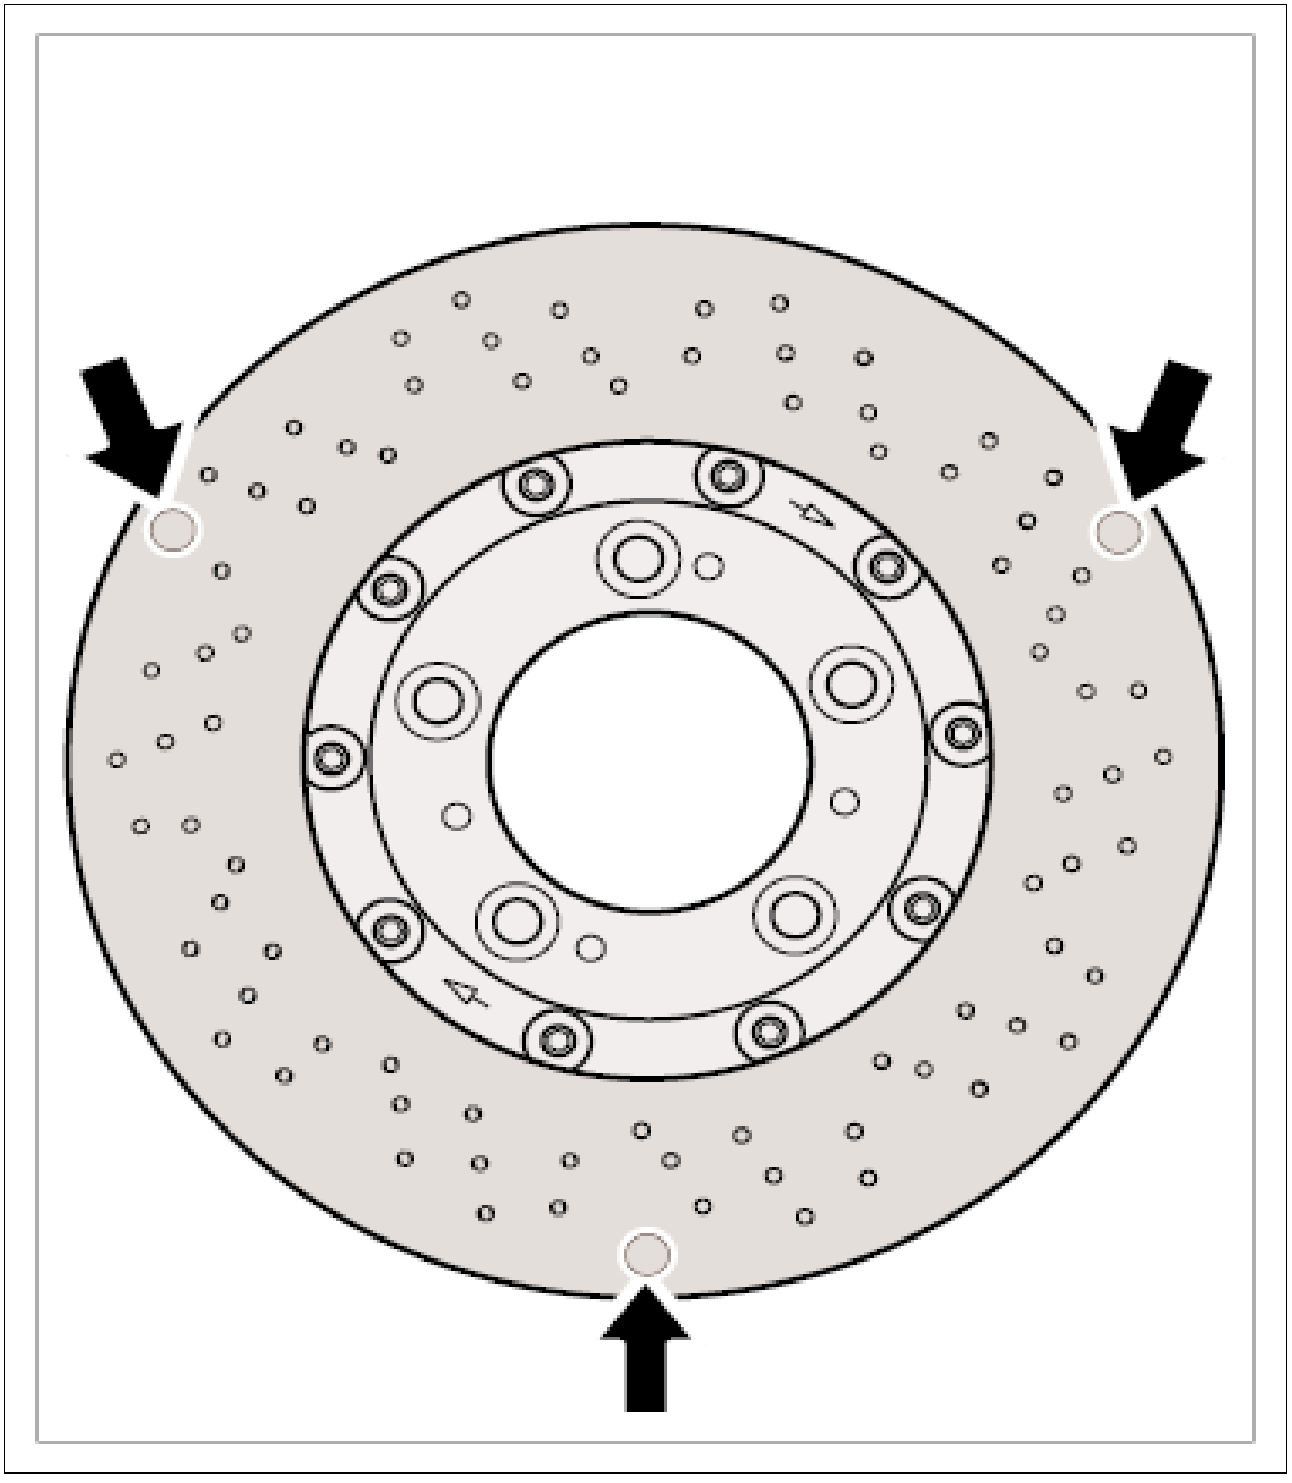
Fig 3: Identifying Brake Disc Markings



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Wear indicator plates **-arrows-** on the friction surfaces are **no longer** required with the new friction coating technology.

Fig 4: Locating Brake Disc Wear Indicators



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 465102 CHECKING FRONT PCCB BRAKE DISCS (WEAR ASSESSMENT USING TEST EQUIPMENT VAS 6813) (ALL MODELS) > INFORMATION > INFORMATION ON THE TEST STEPS

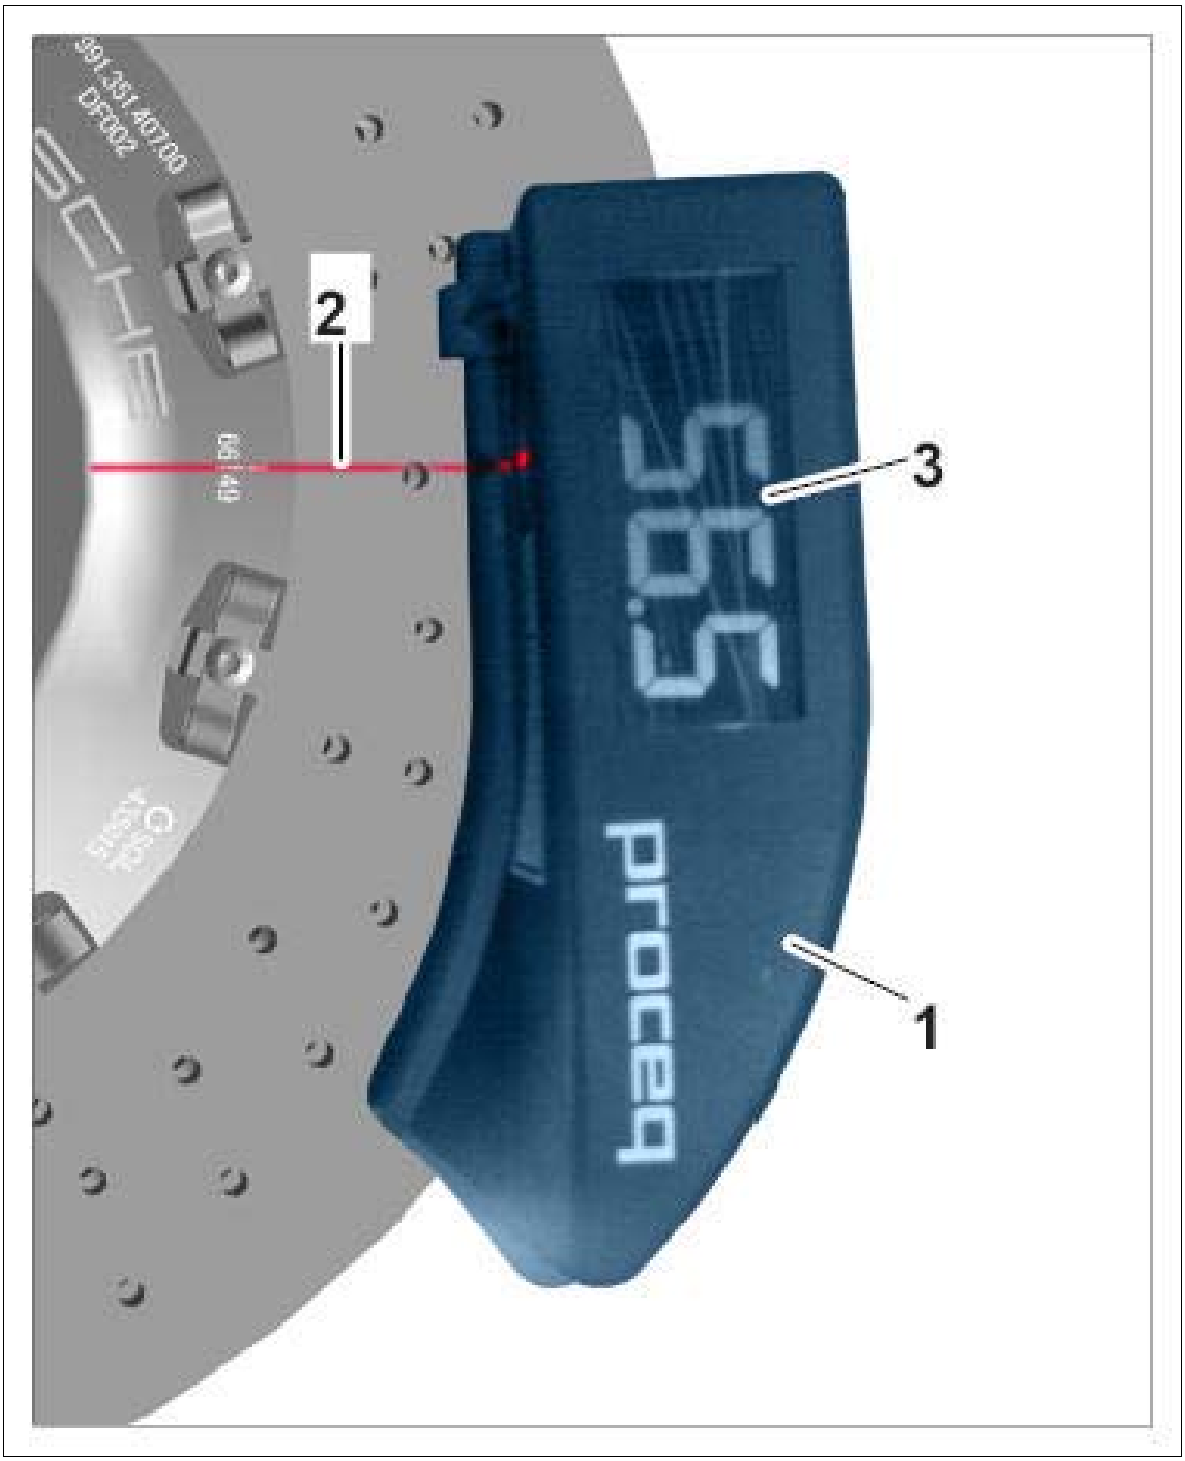
Checking involves the following tasks:

1. Determining current actual values (wear condition) using tester VAS 6813 (at the three measurement markings).

   Aligning/positioning tester VAS 6813 **-1-** using a laser beam **-2-** at the measurement marking.

   Observe the required conditions! See: → 465102 CHECKING FRONT PCCB BRAKE DISCS (WEAR ASSESSMENT USING TEST EQUIPMENT VAS 6813)

   Fig 1: Positioning Tester On PCCB Brake Disc



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. **Visual inspection of the brake disc friction surfaces for surface changes.**

   Flaking/fractures as a result of unusual usage conditions (e.g. stone chip damage).

   Max. 1.0 cm^2 permitted!

   Surface roughness.

   Surface roughness (Rk), max. 80 µm permitted since this affects braking comfort (noises), braking behavior/pedal pressure and brake pad service life.

   Information

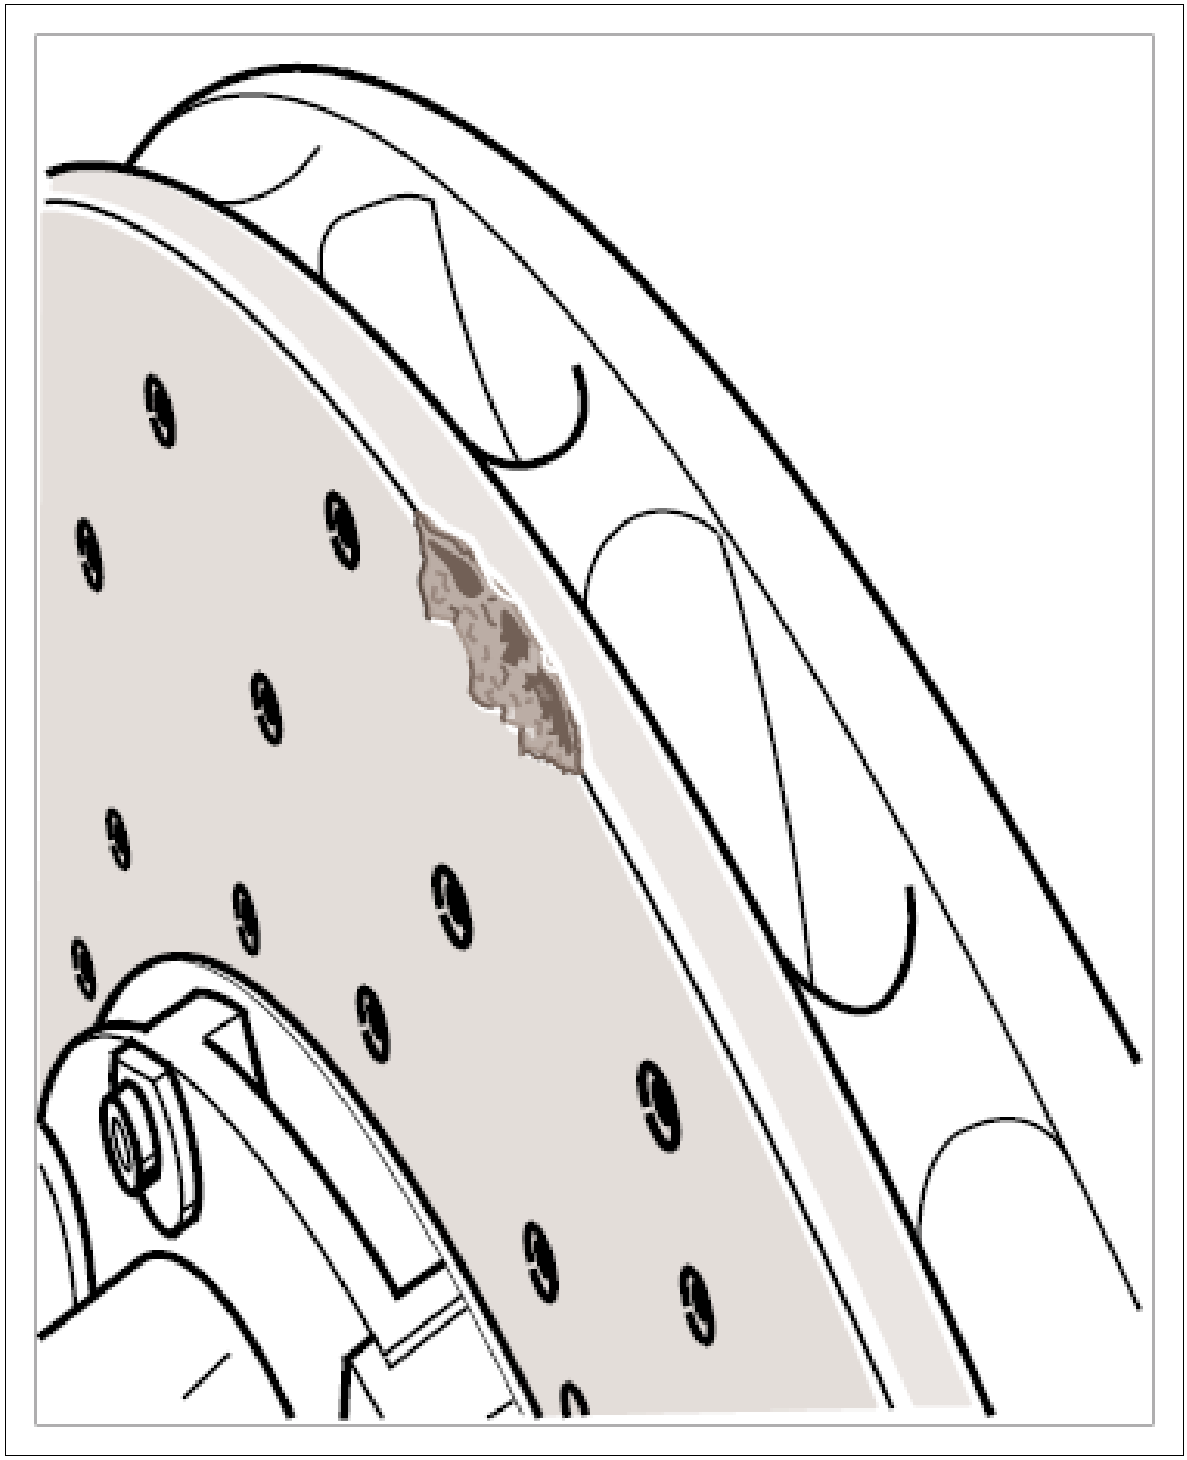
   1. Checking of the minimum brake disc thickness is no longer necessary (measurement no longer shown on brake disc hub).

   Information

   1. Irrespective of wear, a brake disc change may be necessary due to edge damage on the brake disc friction surfaces.
   2. In this case, only one brake disc can be replaced if the measured value (determined using test equipment VAS 6813) and the friction surface of the other PCCB brake disc are still perfectly OK.

3. Check brake discs for edge damage -see Fig 2- (damage due to improper use).

Fig 2: Identifying PCCB Brake Disc Edge Damage Area



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Max. permissible width/depth = 2 mm (0.08 inches)
2. Max. permitted length = 10 mm (0.39 inches)
3. Max. 3 damaged edge areas permissible

WM 465102 CHECKING FRONT PCCB BRAKE DISCS (WEAR ASSESSMENT USING TEST EQUIPMENT VAS 6813) (ALL MODELS) > BASIC INFORMATION > CRACKS (STRESS-RELIEF MICROSTRUCTURE) IN THE BRAKE DISC FRICTION SURFACE

Cracks in the brake disc friction surfaces are viewed differently to cracks in grey cast iron brake discs. Cracks in PCCB brake discs do not constitute a wear criterion but exist already in new brake discs because of the way in which they are manufactured.

Fig 1: Identifying PCCB Brake Disc Friction Surfaces Area

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

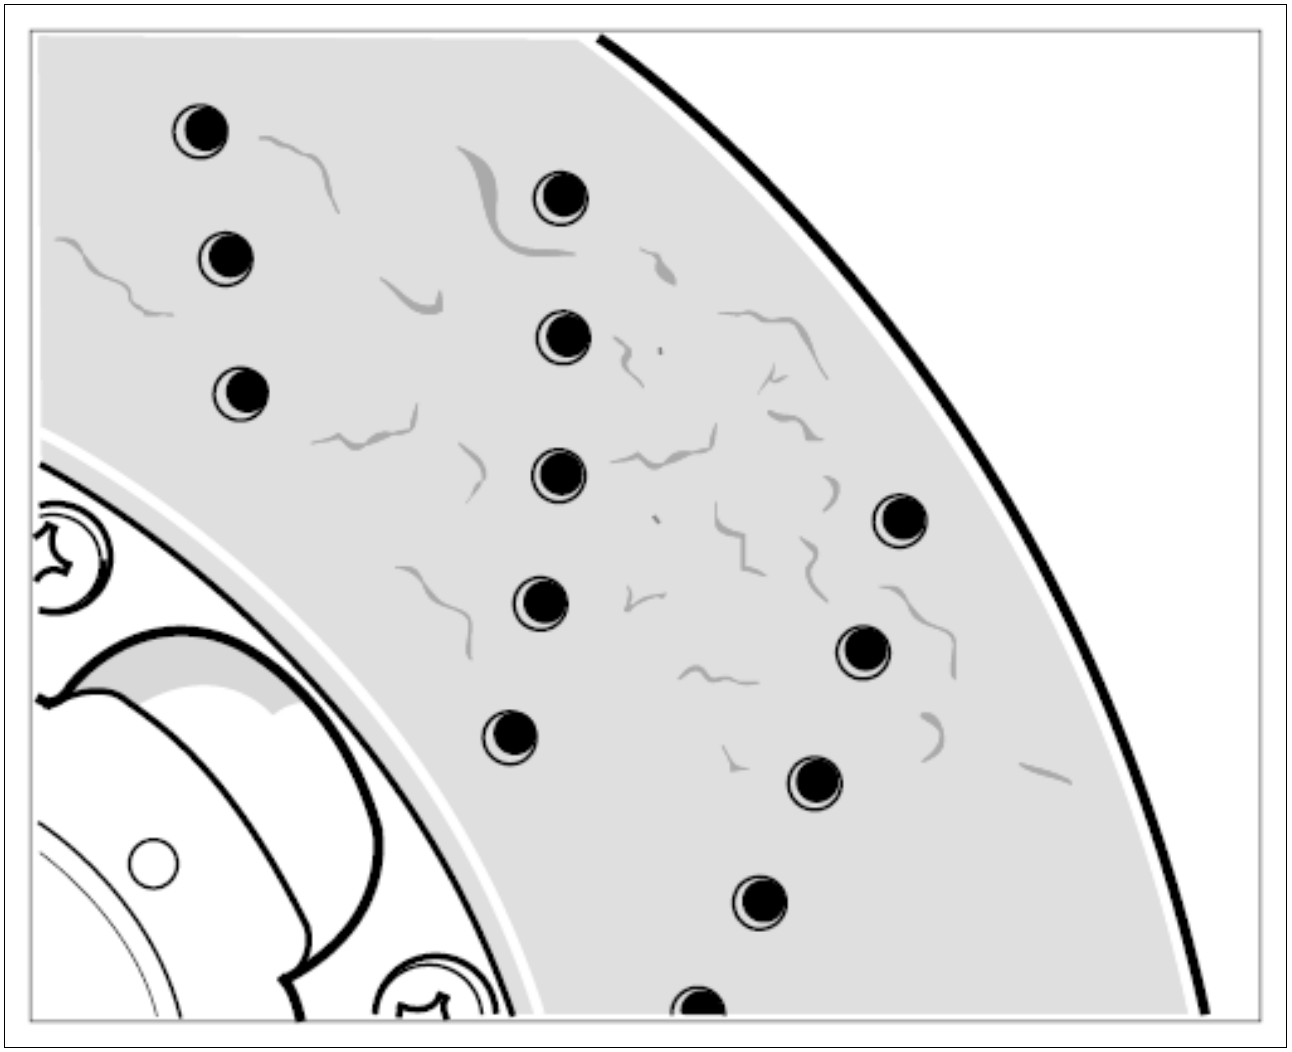
Information

- Due to the composition of different materials in the friction layer and support body, the friction surfaces (even when new) are coated with an uncritical crack pattern (stress-relief microstructure). Individual relaxation cracks sometimes run along the perforated bores.
- The stress-relief microstructure results from the way in which the brake disc surface is manufactured and does not pose a risk to safety. There is also no danger of the friction layers flaking off from the support body, since the friction layers are almost free of internal stresses as a result of the stress-relief microstructure.
- The stress-relief microstructure is sometimes clearly visible in new brake discs and the brake disc chamber side and the side that is opposite to the chamber can differ significantly from one another.

WM 465102 CHECKING FRONT PCCB BRAKE DISCS (WEAR ASSESSMENT USING TEST EQUIPMENT VAS 6813) (ALL MODELS) > BASIC INFORMATION > COATING ON THE PCCB BRAKE DISCS (POSSIBLE CAUSES)

The coating on the PCCB brake discs arises as a result of a high load and high temperatures, for example on a racing circuit. Check the following in such cases:

Fig 1: Identifying Brake Disc Friction Surface Bores



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Ventilation (brake cooling): All components are present, secured correctly and undamaged.
- Brake pad quality: Use the appropriate brake pads if the vehicle is being used on a racing circuit.
- The perforation bores -see Fig 1- in the brake discs must not be blocked. Clear them if necessary. To do this, observe the following note.
- If there is a coating on the pads, the brake discs can still be used provided the wear criteria of the brake discs are OK.

WM 465102 CHECKING FRONT PCCB BRAKE DISCS (WEAR ASSESSMENT USING TEST EQUIPMENT VAS 6813) (ALL MODELS) > BASIC INFORMATION > WORKING ON BORES (PERFORATIONS) IN THE BRAKE DISC FRICTION SURFACE

Observe the following warning when cleaning or exposing the bores in the brake disc friction surface!

NOTE: Work cannot be carried out on the bores in the brake disc friction surface

- *Damage to brake discs*

→ Clean the bores on PCCB brake discs with high-pressure cleaning equipment if necessary. Observe the relevant environmental and safety regulations.

→ Do not machine the bores. Drilling or counter-sinking is not permitted.

WM 465102 CHECKING FRONT PCCB BRAKE DISCS (WEAR ASSESSMENT USING TEST EQUIPMENT VAS 6813) (ALL MODELS) > CHECKING PCCB BRAKE DISCS (WEAR ASSESSMENT) > CHECKING BRAKE DISCS FOR MINIMUM WEAR VALUE

Information

The pictures shown in this document may differ from the original.

Information

- PCCB brake discs must be checked for wear during every service and whenever the brake pads are changed! Brake disc remains installed.
- Carry out wear assessment on the brake discs and check the condition of the brake pads before and after every race track use (component temperatures are significantly higher than temperatures during "normal" driving).
- The brake disc temperature must be in the range between 0 and 40 °C during the measurement.
- Check tester before taking measurements and calibrate it if necessary. Follow the operating instructions provided by the equipment manufacturer!
- Position tester on the brake disc.
- Take measurements at three points marked on the brake disc hub.
- Quick measurement with brake calliper fitted.
- Exact measurement in this area with brake calliper removed.
- If the measured value is more than 5 units above the wear value, the quick measurement is sufficient. If the measured values are smaller, remove the brake calliper and perform an exact measurement.

- Note on quick measurement: A metallic heat shield will lower the measured value.

1. Measure values using **test equipment for PCCB brake discs WE 1578** at the three marked measuring points **-arrows-** with the brake disc installed.

   The following description distinguishes between quick measurement (as in 2.) and exact measurement (as in 3.).

   Fig 1: Locating Brake Disc Friction Coating Technology Marking

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. The drop in the value using a brake pad set depends very much on the driving conditions.
2. The remaining service life of the brake disc can be estimated using the previously stored data and measured values recorded during service intervals/workshop visits based on the mileage.
3. The value is reduced by 2 to 5 units (depending on axle) for each brake pad set. Not valid for race track use and if brake pads not approved by Porsche are used.
4. Carry out wear assessment on the brake discs and check the condition of the brake pads before and after every race track use (component temperatures are significantly higher than temperatures during "normal" driving).

2. **Quick measurement:** Brake calliper fitted (with or without wheel).

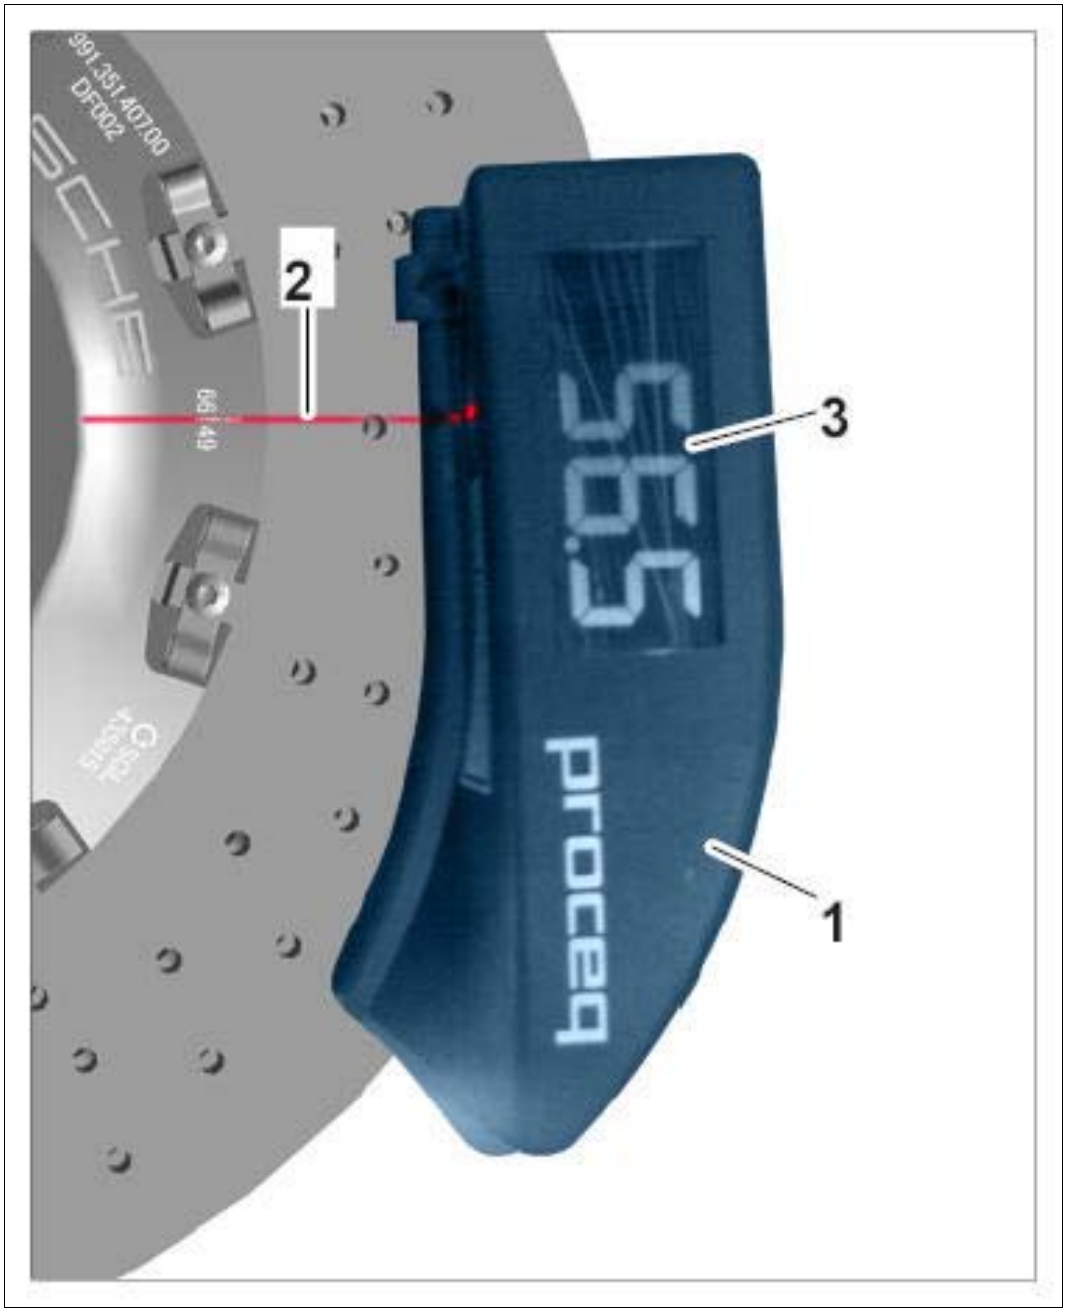
Fig 2: Locating Quick Measurement Tool With Wheel

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 2.1. Measuring procedure: Align laser beam **-2-** onto the measurement marking on the brake disc hub.
    1. Test equipment VAS 6813
    2. Laser beam for positioning

3. Measured value display

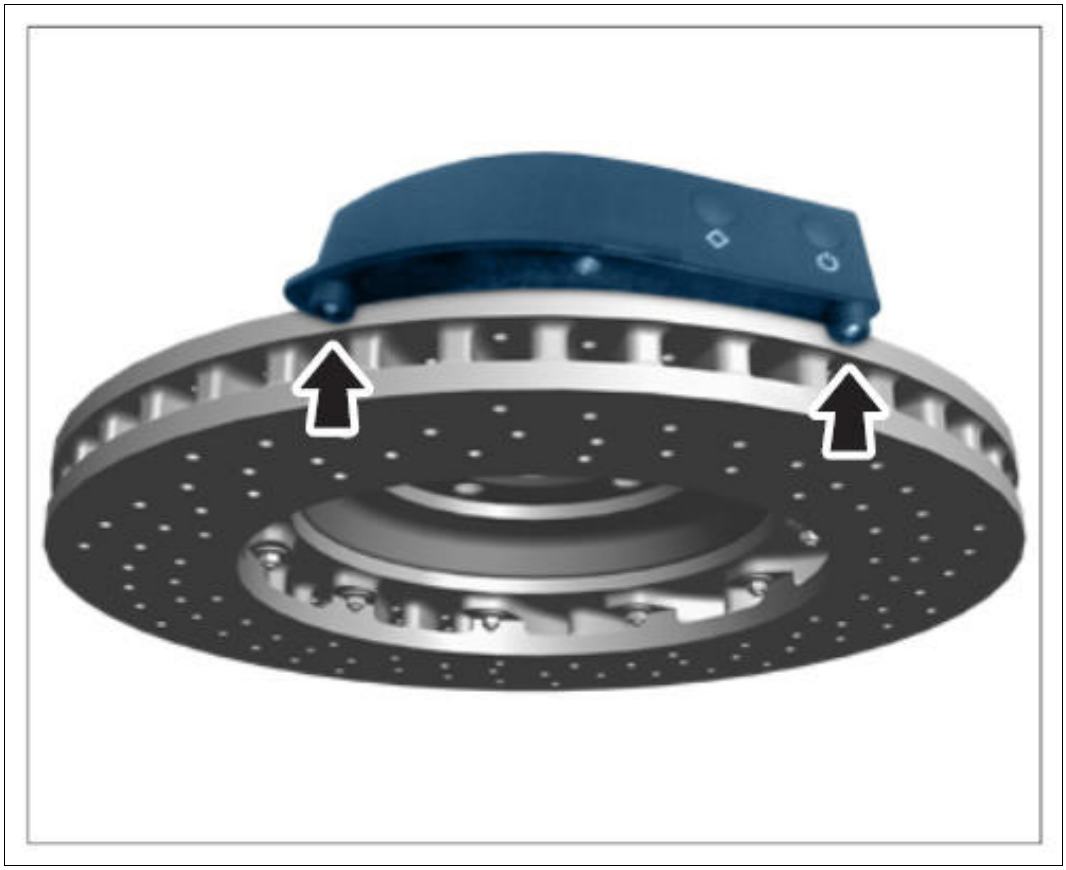
Fig 3: Positioning Tester On Brake Disc



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

When taking measurements, the tester must be positioned over the entire surface of the brake disc with the roller stops and the underside of the device.

Fig 4: Locating Tester On Brake Disc

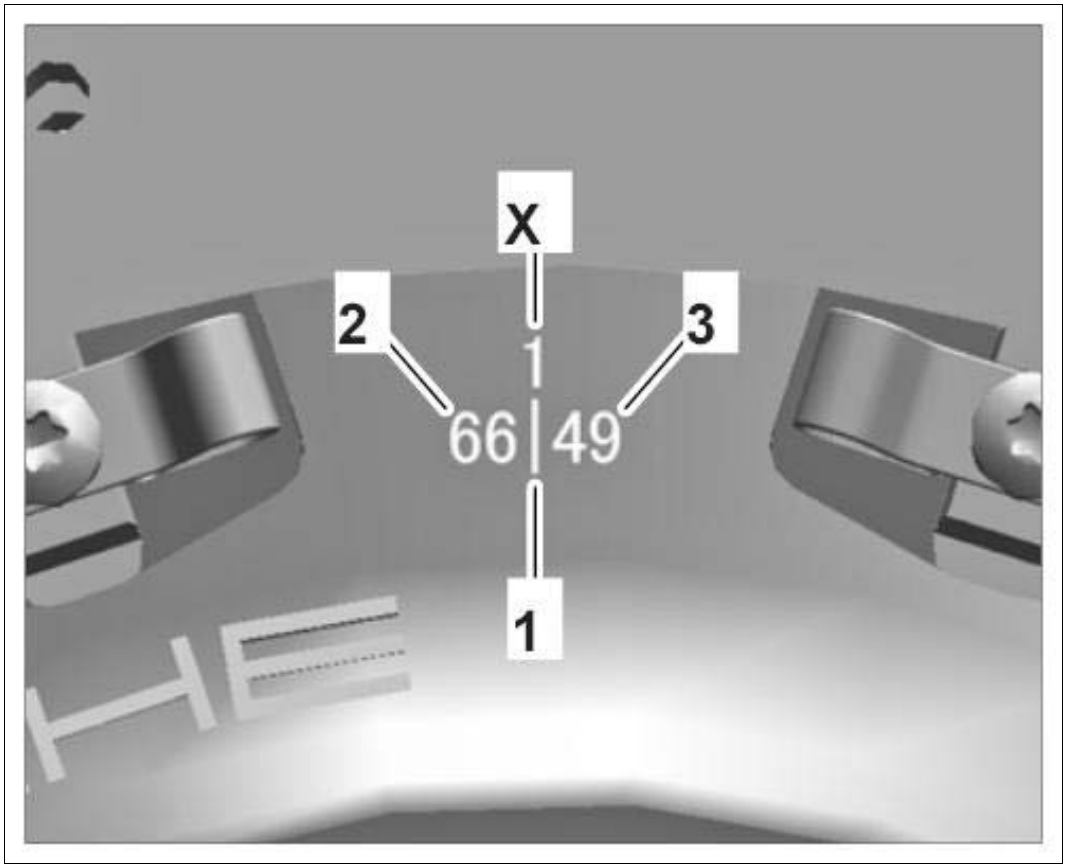


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 2.2. Compare the values you read off with the wear value **-3-** (lower value).

   If the wear value (lower value) is reached or if the measured value is less than the wear value at a measuring point, **carry out an exact measurement** .

Fig 5: Identifying Brake Disc Markings And Values



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. **Exact measurement: Wheel and brake calliper removed.**

   Turn the measurement marking and brake disc so that the tester can be placed at the position at which the brake calliper was removed.

   The removed brake calliper must not be placed closer than 50 mm to the back of the brake disc when taking measurements.

   Always follow the operating instructions for the tester to make sure you are using it correctly.

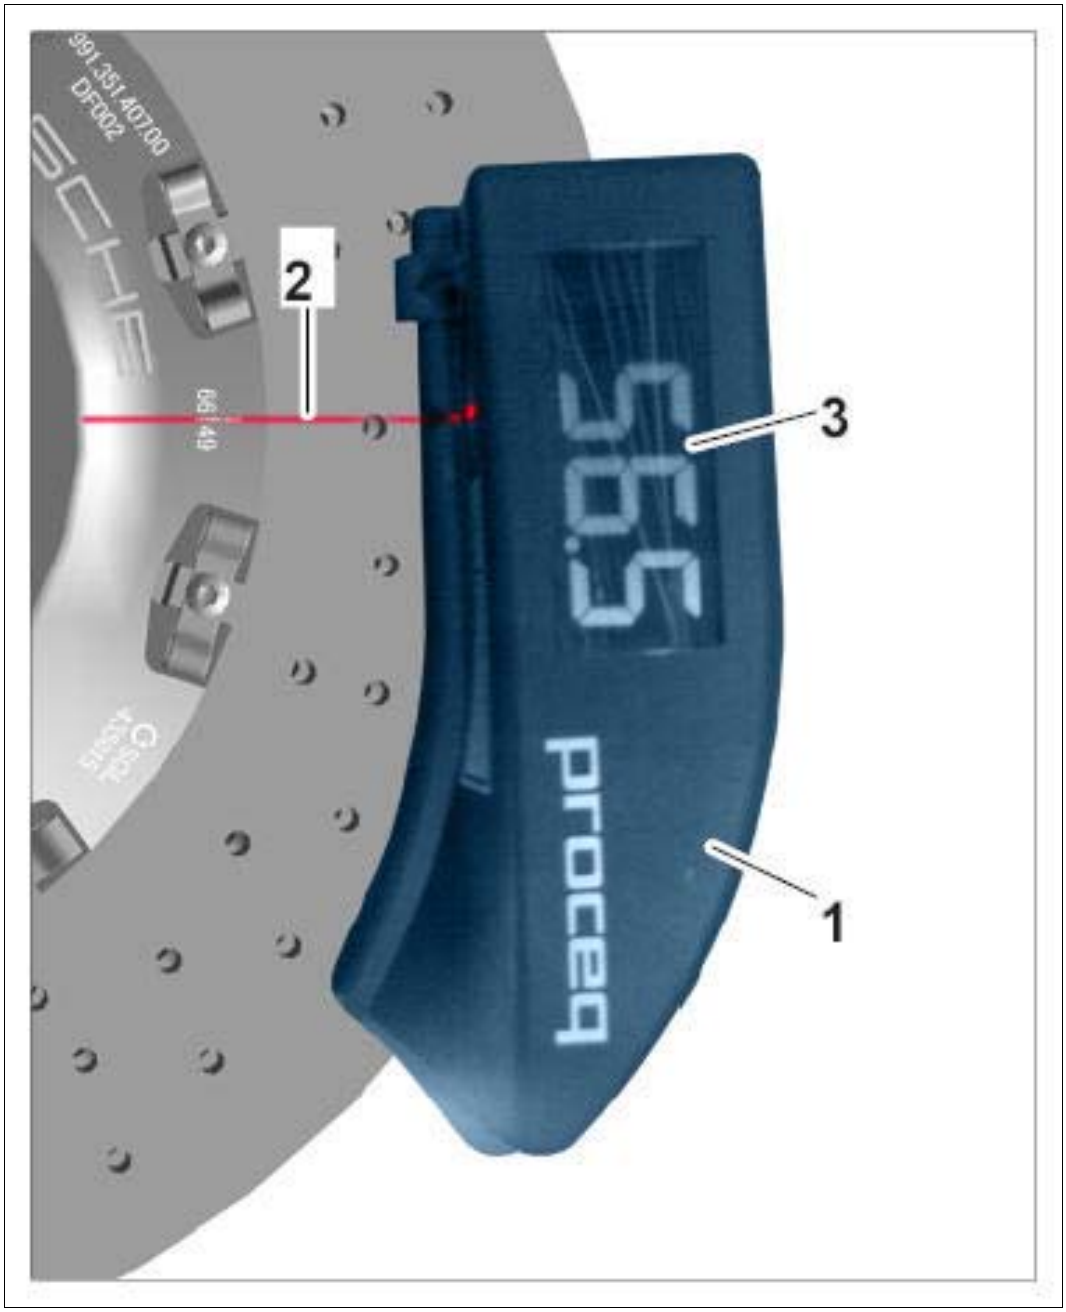
   1. 3.1. Measuring procedure: Align laser beam **-2-** onto the measurement marking on the brake disc hub.

      1. Test equipment VAS 6813

      2. Laser beam for positioning

      3. Measured value display

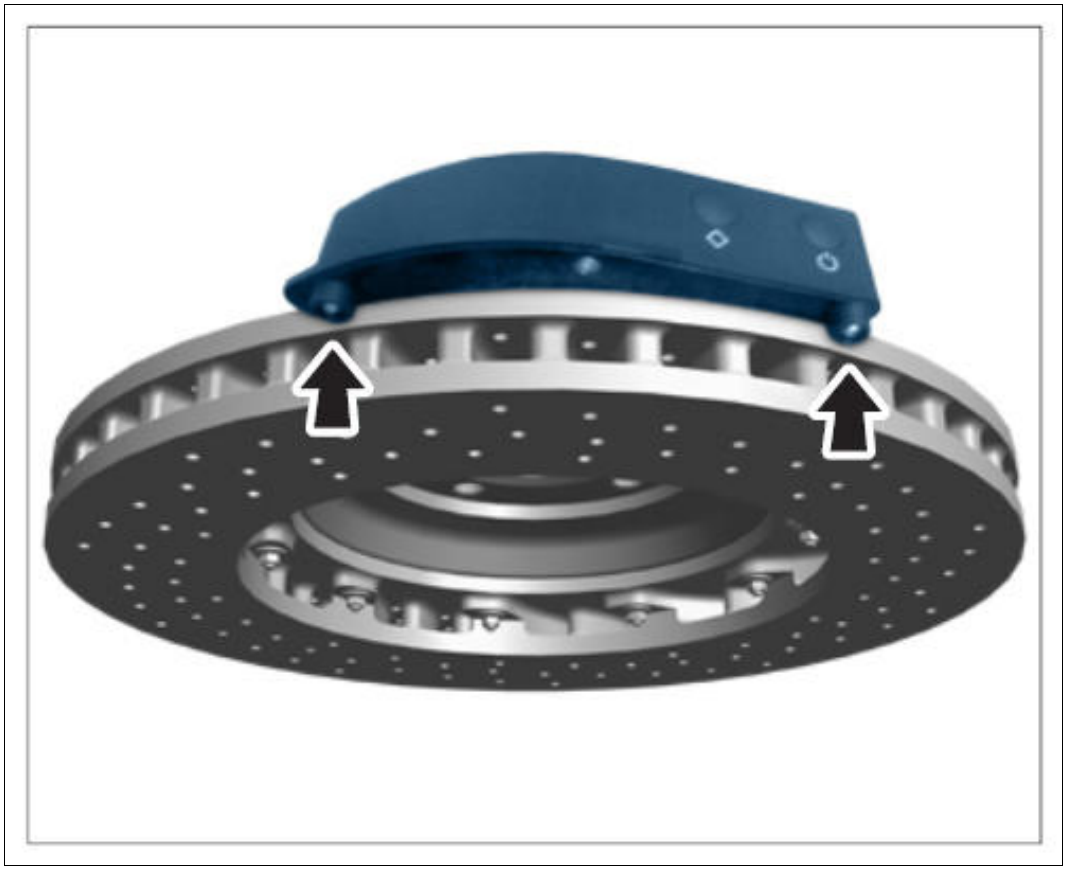
Fig 6: Positioning Tester On Brake Disc



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

When taking measurements, the tester must be positioned over the entire surface of the brake disc with the roller stops and the underside of the device.

Fig 7: Locating Tester On Brake Disc



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 3.2. Compare the values you read off with the wear value **-3-** (lower value).

   If the wear value (lower value) is reached or if the measured value is less than the wear value at a measuring point, replace the brake discs on both sides of the axle.

   Applies to exact measurement (not quick measurement).

Current rating		Nominal value	40 A		

WM 466255 REPLACING CONTROL UNIT FOR ELECTRIC PARKING BRAKE (ALL MODELS) > PRELIMINARY WORK

1. Switch off ignition and replace control unit. → 466219 REMOVING AND INSTALLING CONTROL UNIT FOR ELECTRIC PARKING BRAKE .

WM 466255 REPLACING CONTROL UNIT FOR ELECTRIC PARKING BRAKE (ALL MODELS) > CODING CONTROL UNIT FOR ELECTRIC PARKING BRAKE

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*

- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the PIWIS Tester to the vehicle and start the PIWIS Tester. Switch on ignition and press [F12] to continue.
2. Select the vehicle type and start the diagnostic application.
3. Select the required control unit, e.g. **Parking brake** in the **overview** .
4. **Maintenance/repairs** must then be selected.
5. **Select Start-up** and press [F12] to continue.
6. Follow the instructions on the Tester.
7. The Tester displays the message **Coding has been completed successfully** . Press [F12] to continue.
8. The Tester confirms that **start-up was completed successfully** . Press [F12] to continue.
9. **Read out the fault memory** and erase it if necessary.
10. Check function of electric parking brake by actuating the lever. The LED in the button may flash after the first function test.
    1. 10.1. If the LED in the button starts flashing after the first function test:
        1. 10.1.1. Perform a further function test. Check function of electric parking brake by actuating the lever.
11. Perform a test drive, check function of electric parking brake by actuating the lever and read out the fault memory.

WM 471519 REMOVING AND INSTALLING BRAKE MASTER CYLINDER (ALL MODELS) > REMOVING AND INSTALLING BRAKE MASTER CYLINDER > REMOVING BRAKE MASTER CYLINDER

Information

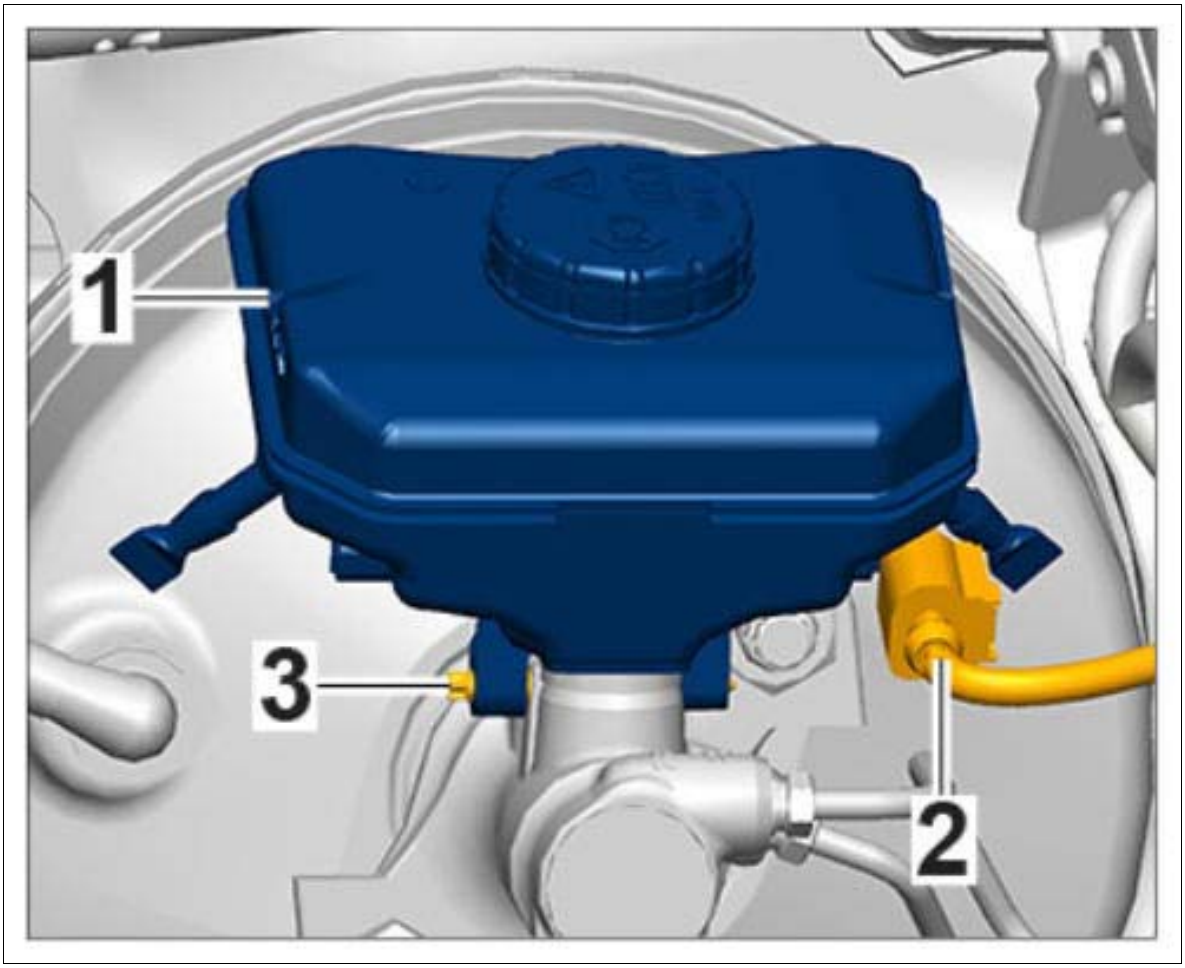
- In the event of assembly work at the hydraulic connections, all electric plug connections in the area of the connection point must always be connected. This prevents the inside of the plug connections from being splashed with brake fluid or water.
- Clean any plug connections that have become dirty or damp during removal and fitting using a

lint-free cloth, for example.

- Brake fluid on electrical contacts (even thinned brake fluid) leads to corrosion and can cause faults in the system.
- Remove any escaping brake fluid immediately; rinse with water and dry thoroughly if necessary.

1. Place a suitable cloth underneath to catch any emerging brake fluid.
2. Drain brake fluid from the brake fluid reservoir using a suitable tool, e.g. a double-action hand pump.
3. Remove brake fluid reservoir **-1-** .

Fig 1: Identifying Brake Fluid Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. Release and disconnect connector **-2-** (protect against contact with brake fluid if necessary).
2. 3.2. Unscrew locking pin **-3-** .
3. 3.3. Remove brake fluid reservoir **-1-** .
4. 3.4. Wipe up any escaping brake fluid immediately and rinse away residues using plenty of water.

4. Screw off brake lines **-2-** on the brake master cylinder

    1. 4.1. Unscrew union nuts.

    2. 4.2. Pull brake lines out of the brake master cylinder.

    3. 4.3. Close off brake lines using suitable stoppers.

5. Screw off fastening nuts **-1-** .

Fig 2: Identifying Brake Master Cylinder

Information

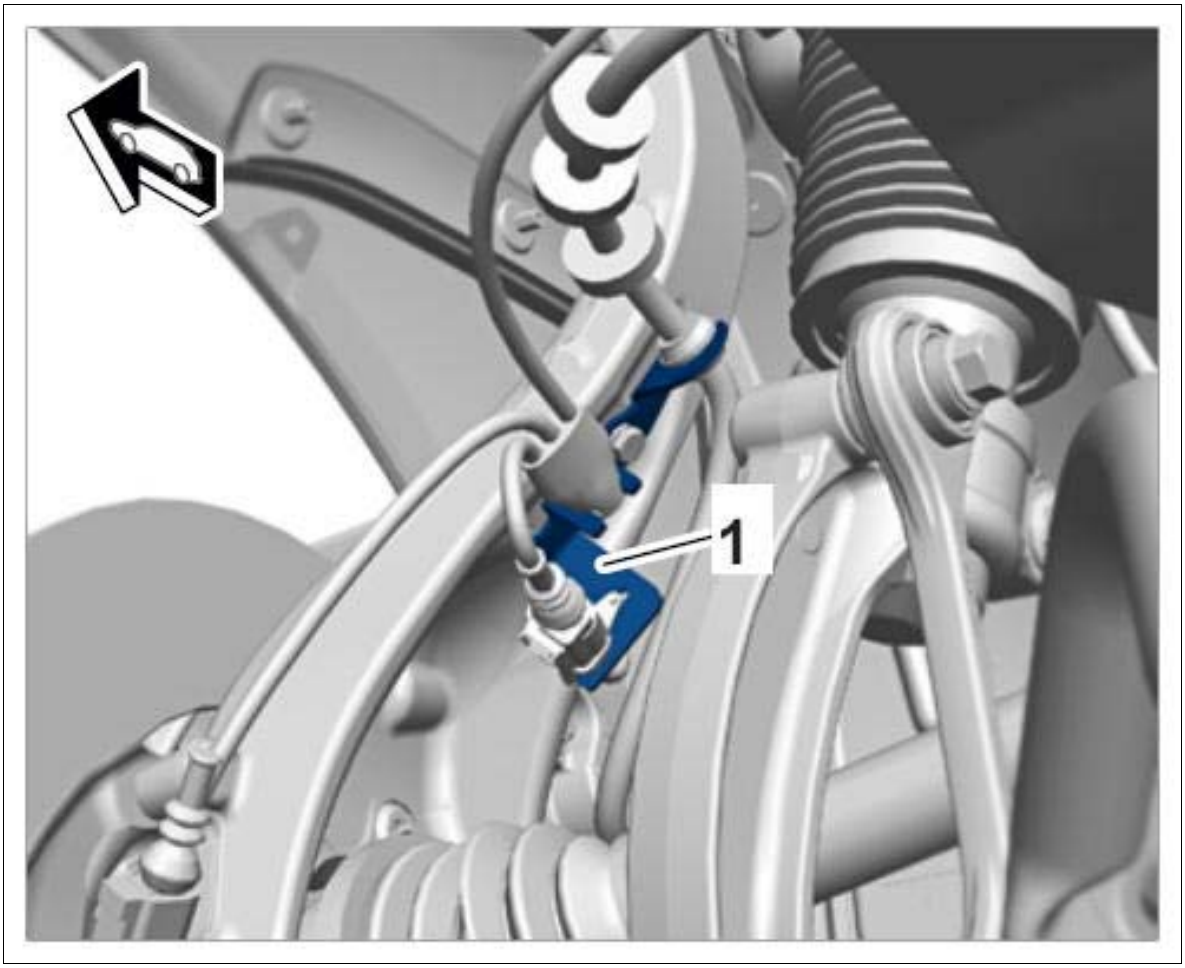
- To gain better access for removal of the brake calliper, turn the steering fully either to the right or left.

Fig 1: Identifying Front Brake Calliper

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Loosen holder **-1-** for brake line, wear indicator and speed sensor on the wheel bearing housing.

Fig 2: Identifying Holder On Wheel Bearing Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Carefully pull contact for brake pad wear indicator out of the brake calliper and disconnect it at the holder.

NOTE: Removal of brake calliper

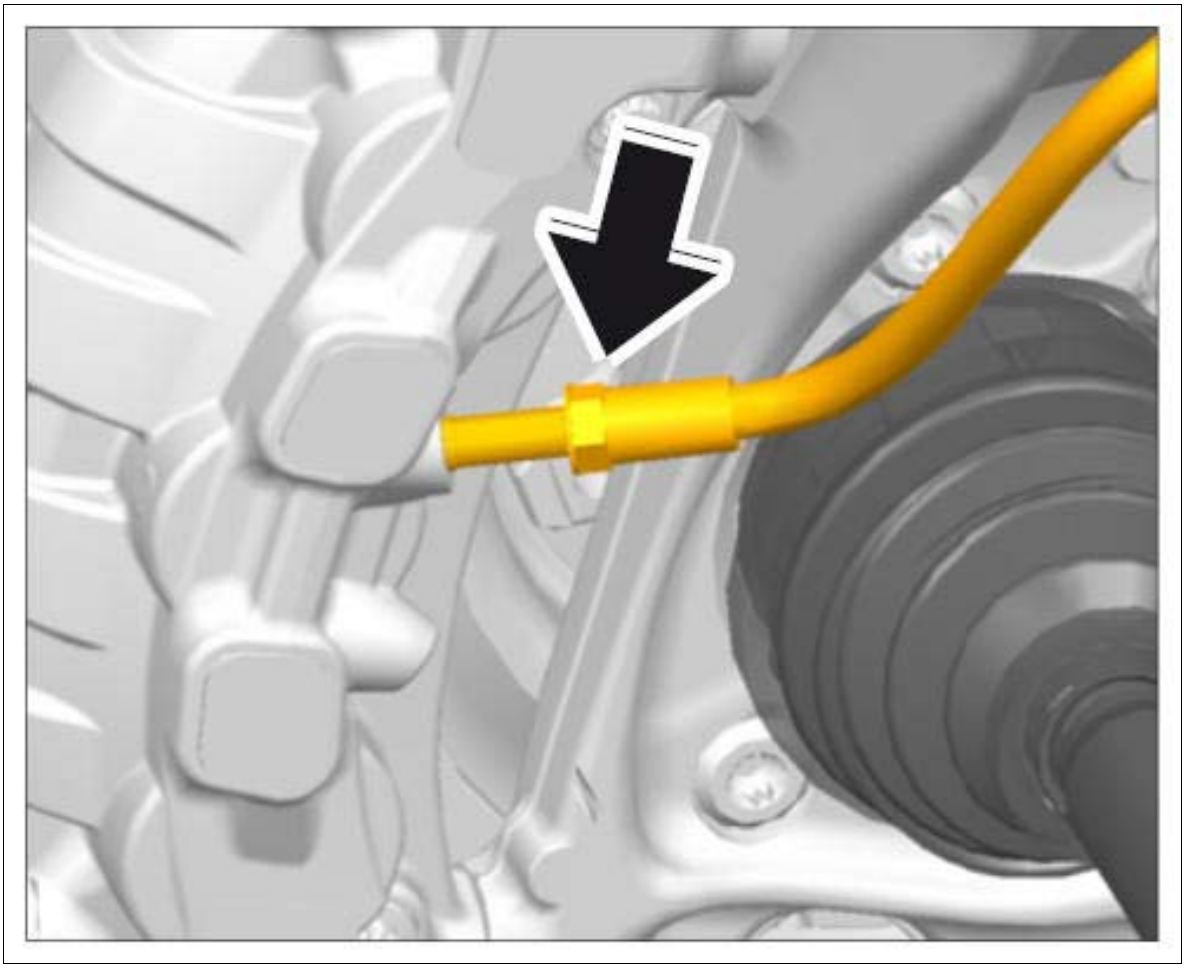
1. Paint defects on brake calliper

→ Proceed with care when setting back the brake pads.

→ Protect brake calliper from paint defects using a suitable cloth.

2. Set the disc brake pads back slightly and uniformly using water pump pliers.
3. Disconnect the brake line **-arrow-** at the brake calliper and collect brake fluid in a suitable container.

Fig 3: Locating Brake Line On Brake Calliper



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

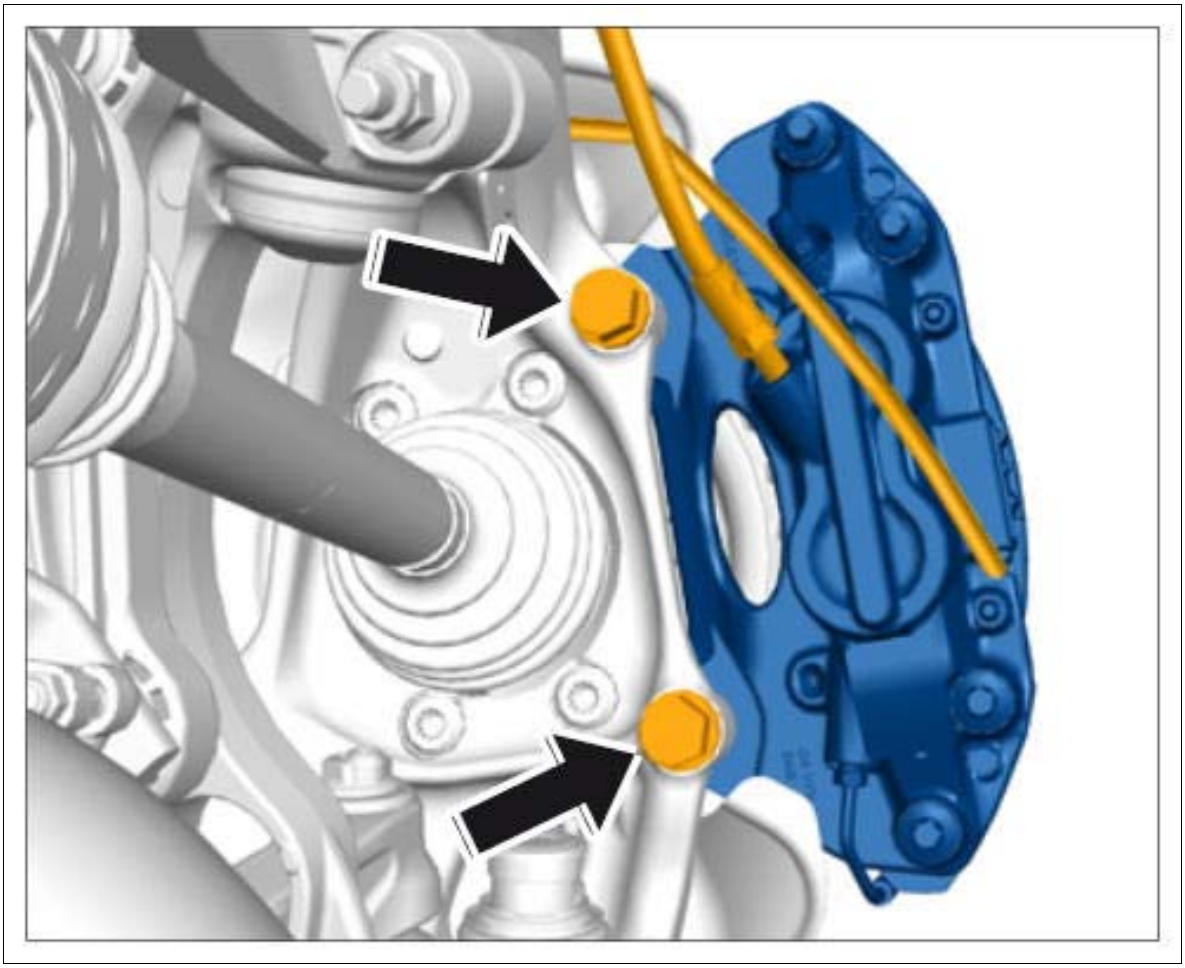
4. Close off brake line using a suitable stopper.

   Information

   Never use an impact bolter to loosen and tighten the brake calliper on the wheel carrier.

5. Loosen fastening screws **-arrows-** and remove brake calliper from the wheel carrier.

Fig 4: Locating Brake Calliper Bolts



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 473919 REMOVING AND INSTALLING FRONT BRAKE CALLIPER (ALL MODELS) > REMOVING AND INSTALLING FRONT BRAKE CALLIPER > INSTALLING FRONT BRAKE CALLIPER

Do not bend the brake lines.

- Secure brake line holders at the wheel carrier.
- For easier access to the holders, turn in the wheel carrier as required.

WARNING: Old mounting parts fitted on the brake calliper

- *Reduced braking effect*
- *Risk of damage to the brake calliper*

→ Fit new pad retaining springs

Information

- Never use an impact bolter to loosen and tighten the brake calliper on the wheel carrier.
- Carry out a visual inspection on the thread for the brake calliper and blow it out carefully if necessary using compressed air. Use goggles!
- Replace screws for securing the brake calliper.

1. Check that all parts are in perfect condition (visual inspection) and replace them if necessary.
2. Installation is performed in reverse order. Pay particular attention to the following:

   Tightening torques:

   Brake calliper to wheel bearing housing (17-inch - black): **Tightening torque 196 Nm (145 ftlb.)**

   Brake calliper to wheel bearing housing (18-inch - red/silver): **Initial tightening 30 Nm (22 ftlb.) Final tightening +90°**

Brake calliper to wheel bearing housing (PCCB): **Initial tightening 30 Nm (22 ftlb.) Final tightening +90°**

Brake line to brake calliper: **Tightening torque 20 Nm (15 ftlb.)**

Holder to wheel bearing housing: **Tightening torque 10 Nm (7.5 ftlb.)**

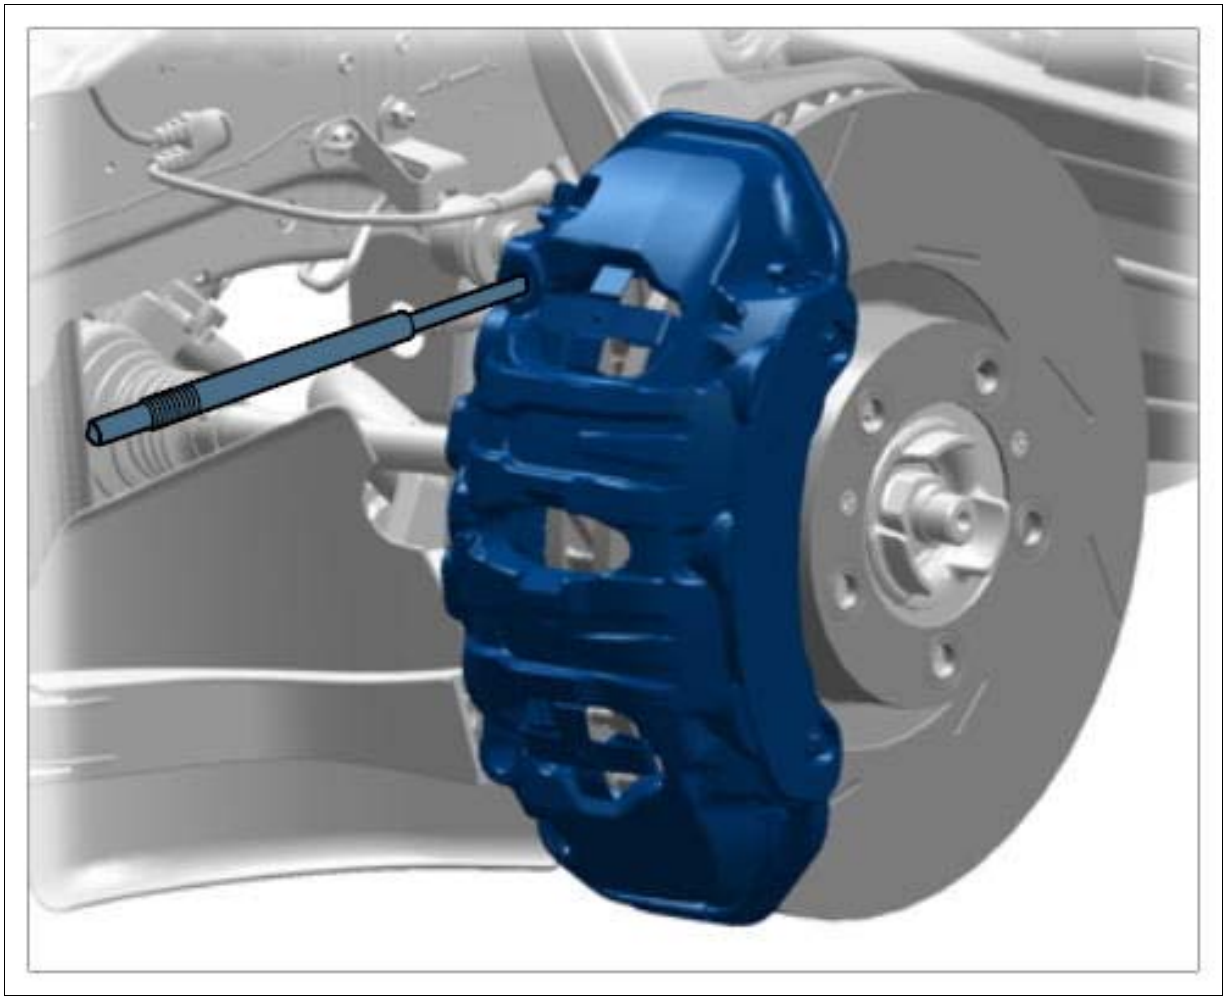
To make it easier to install the brake calliper, assembly pins T10439 → Assembly pin for brake calliper can be used (not for 17-inch brake calliper).

Fig 1: Identifying Brake Calliper Pin

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Carefully fit the brake calliper and screw in assembly pin only in the top thread by hand (this protects the thread!). → Assembly pin for brake calliper (top) fitted

Fig 2: Fitting Pin For Brake Calliper



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Screw in bottom brake calliper screws several turns by hand (this protects the thread!).
- Remove assembly pin and screw in top brake calliper screw several turns by hand (this protects the thread!).
- Screw in both brake calliper screws fully and tighten to the specified tightening torque.

WM 473919 REMOVING AND INSTALLING FRONT BRAKE CALLIPER (ALL MODELS) > SUBSEQUENT WORK

Information

New disc brake pads require a bedding-in time of approx. 200 km (125 miles)! Only then do they achieve their best friction coefficient and wear value! During this period, the brakes should only be subjected to full stress at high speed in emergencies!

1. Position disc brake pads by operating the brake several times.
2. Bleed the brake system .

3. Fit wheel. Use assembly aids (assembly pins) **-1-** .

→ Installing Wheel .

WM 474119 REMOVING AND INSTALLING REAR BRAKE CALLIPER (ALL MODELS) > REMOVING AND INSTALLING REAR BRAKE CALLIPER > INSTALLING REAR BRAKE CALLIPER

WARNING: Old mounting parts fitted on the brake calliper

- *Reduced braking effect*
- *Risk of damage to the brake calliper*

→ Fit new pad retaining springs

Information

When replacing the brake pads, always pay attention to the following:

- The back of the pad backing plates must not be greased.

- Check brake discs for wear. For details of wear limits, see → 465302 CHECKING REAR BRAKE DISCS (WEAR ASSESSMENT) .
- Disc brakes must be clean and free of grease.
- The core of the warning contact wire must not be left exposed! Worn insulation is not important.
- Use a new repair kit (only replace the brake pads on the same axle).

1. Check that all parts are in perfect condition (visual inspection) and replace them if necessary.
2. Installation is performed in reverse order. Pay particular attention to the following:

   Information

   Make sure that the brake hose and electric line are clipped in and secured correctly in the combination holder at the wheel bearing housing so that the brake hose and electric line cannot come out of the holders.

   1. Clip brake hose dry (without using sliding compound) into the holder at the wheel bearing housing.
   2. Observe specified tightening torques:

   Calliper carrier to wheel bearing housing: **Initial tightening 100 Nm (74 ftlb.) Final tightening +90°**

   Brake line to brake calliper: **Tightening torque 20 Nm (15 ftlb.)**

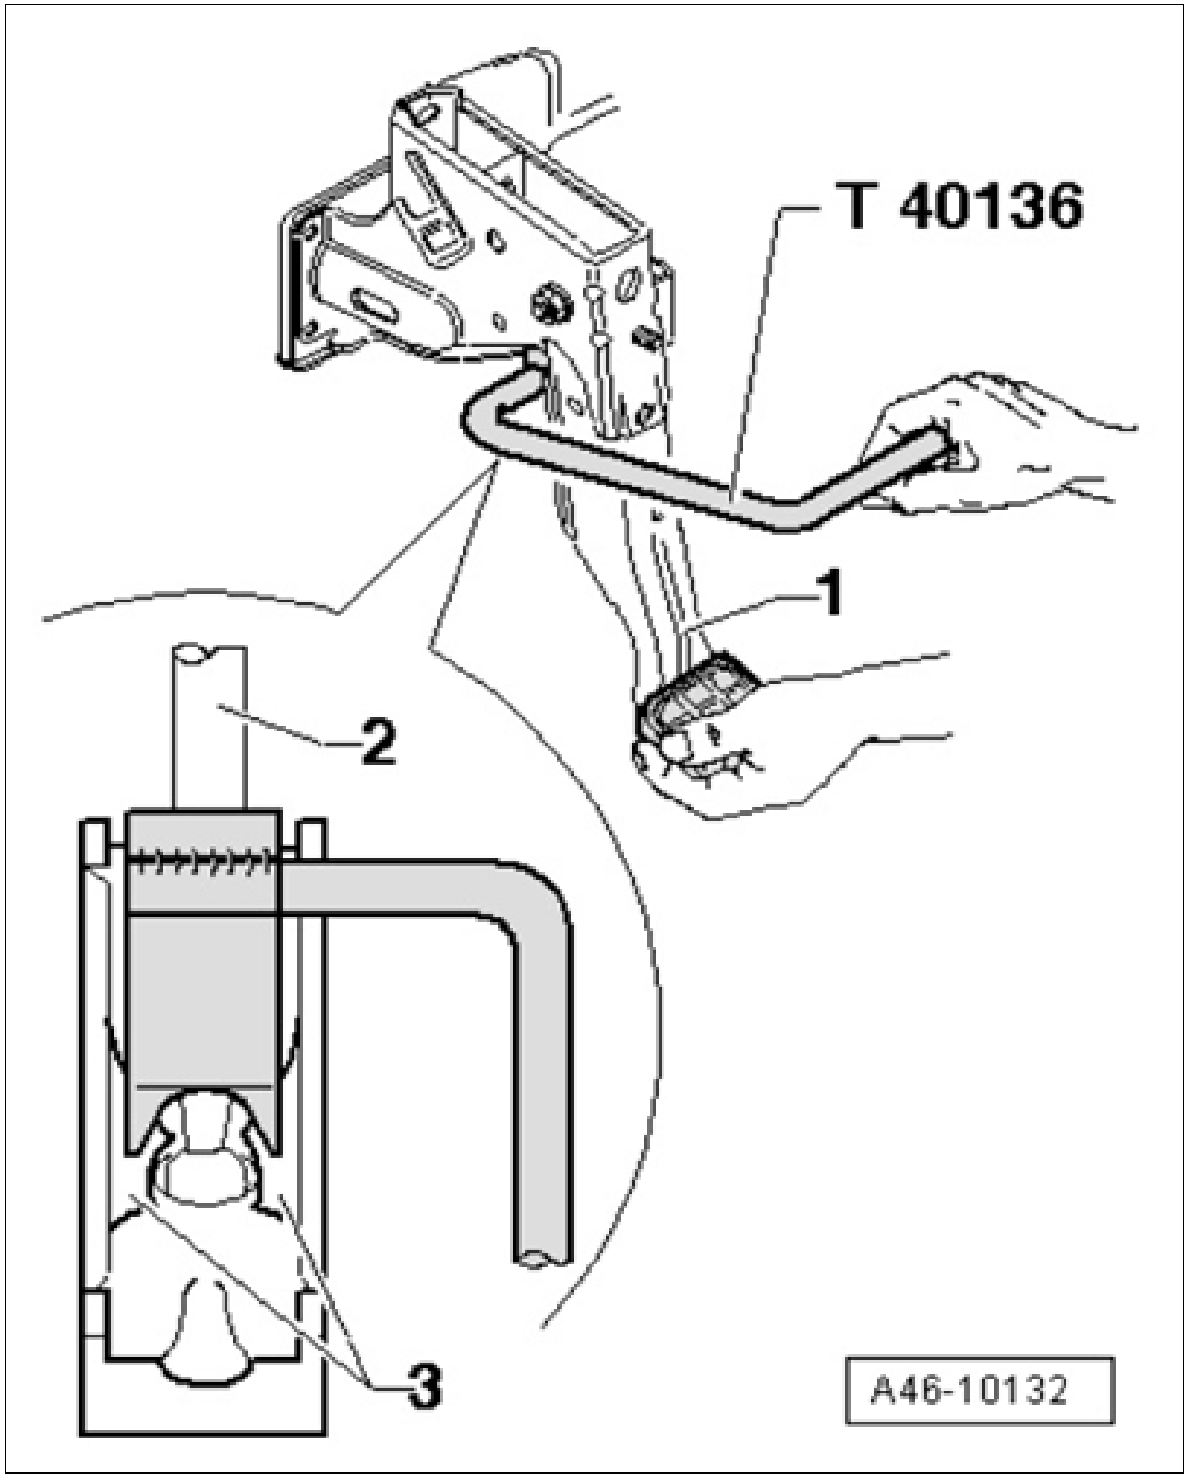
1. Actuate the brake pedal as often as required until there is no more brake force boosting (brake booster is "empty", brake pedal becomes hard).
2. Remove brake light switch → 943619 REMOVING AND INSTALLING BRAKE LIGHT SWITCH .
3. Remove cowl panel cover → 508719 REMOVING AND INSTALLING COWL PANEL COVER .
4. Remove cross panel → 508119 REMOVING AND INSTALLING CROSS PANEL (DISASSEMBLING PLENUM PANEL) .

5. Remove brake master cylinder → 471519 REMOVING AND INSTALLING BRAKE MASTER CYLINDER .

WM 477019 REMOVING AND INSTALLING BRAKE BOOSTER (ALL MODELS) > REMOVING AND INSTALLING BRAKE BOOSTER > REMOVING BRAKE BOOSTER

1. Separate brake pedal from brake booster.
    1. Brake pedal
    2. Push rod
    3. Retaining lugs

Fig 1: Separating Brake Pedal From Booster



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Press the brake pedal **-1-** towards the brake booster
2. 1.2. **Release tool T40136** must be fitted on the ball joint on the push rod **-2-** .
3. 1.3. To press the retaining lugs **-3-** on the mounting off the ball joint on the push rod **-2-** , pull release tool **T40136** towards the driver's seat and counter at the brake pedal **-1-** at the same time (the brake pedal must not move towards the driver's

seat).

4. 1.4. **Release tool T40136** and brake pedal must both be pulled towards the driver's seat.

2. Pull vacuum line **-2-** out of the brake booster.

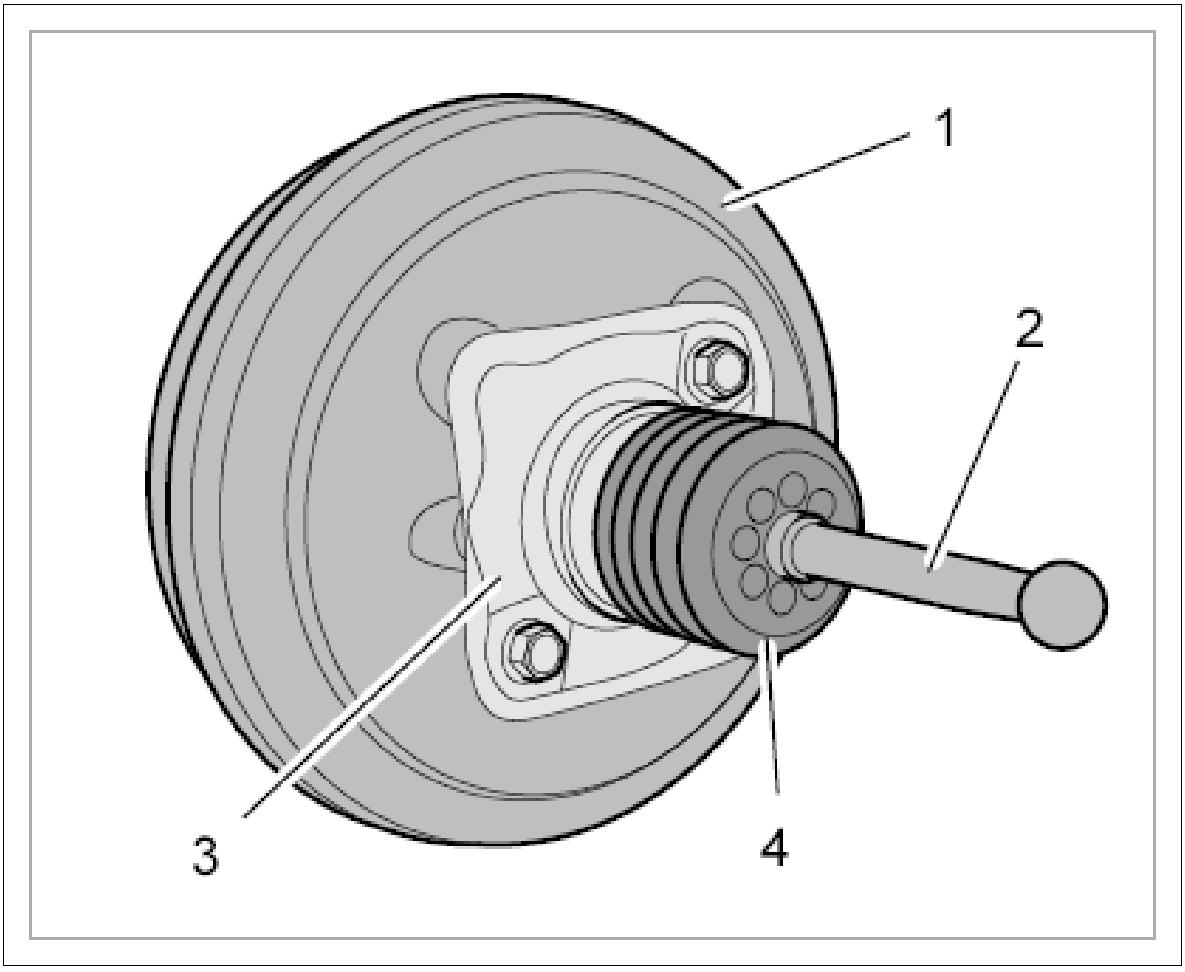
3. Unscrew fastening screws **-1-** for the mounting saddle.

Information

1. When fitting the brake booster -1- , make sure not to damage the seal -3- and the boot -4- on the push rod -2- .

2. Check retaining lugs for the push rod through the opening in the plenum panel for signs of damage.

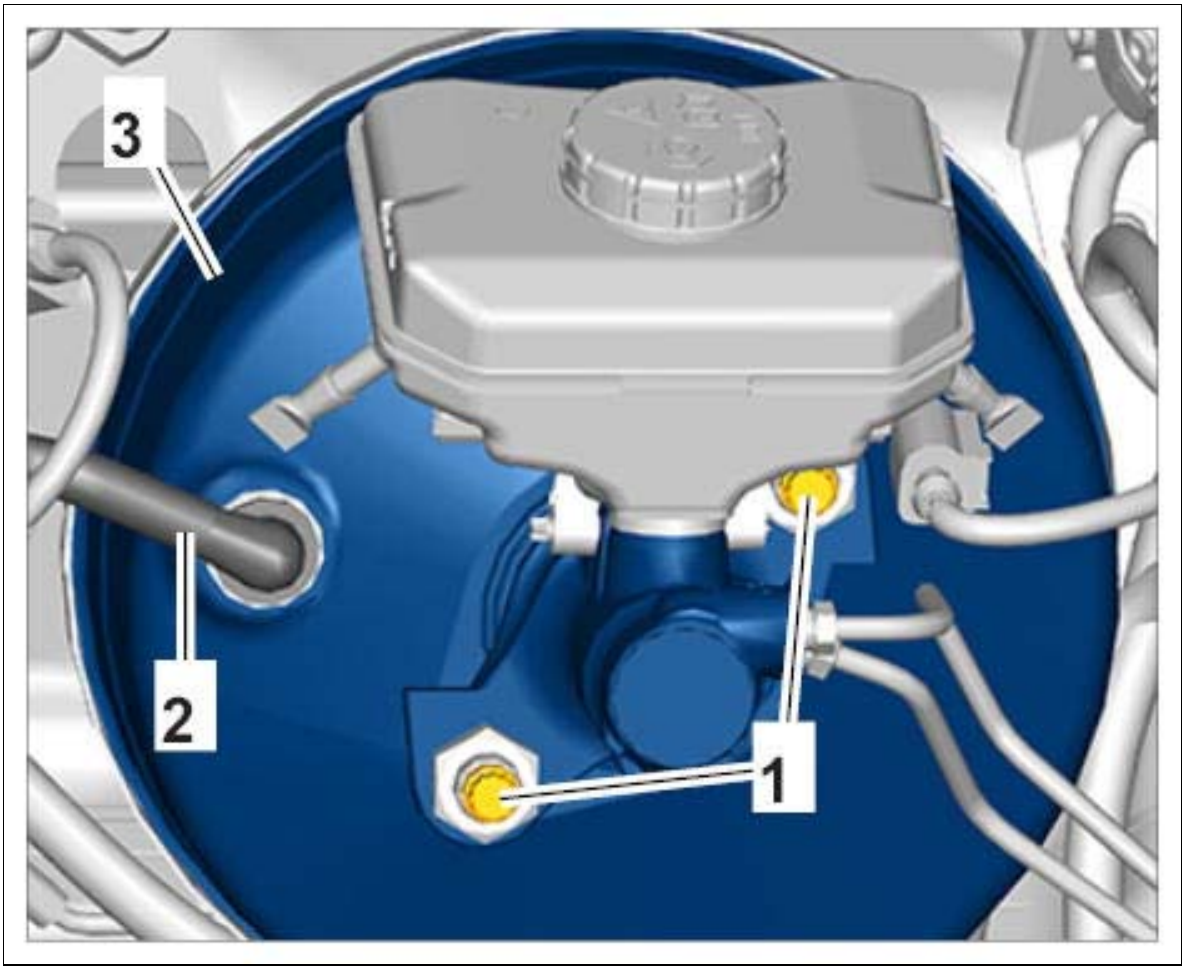
Fig 2: Identifying Brake Booster, Seal And Boot



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove brake booster **-3-** .

Fig 3: Identifying Brake Booster



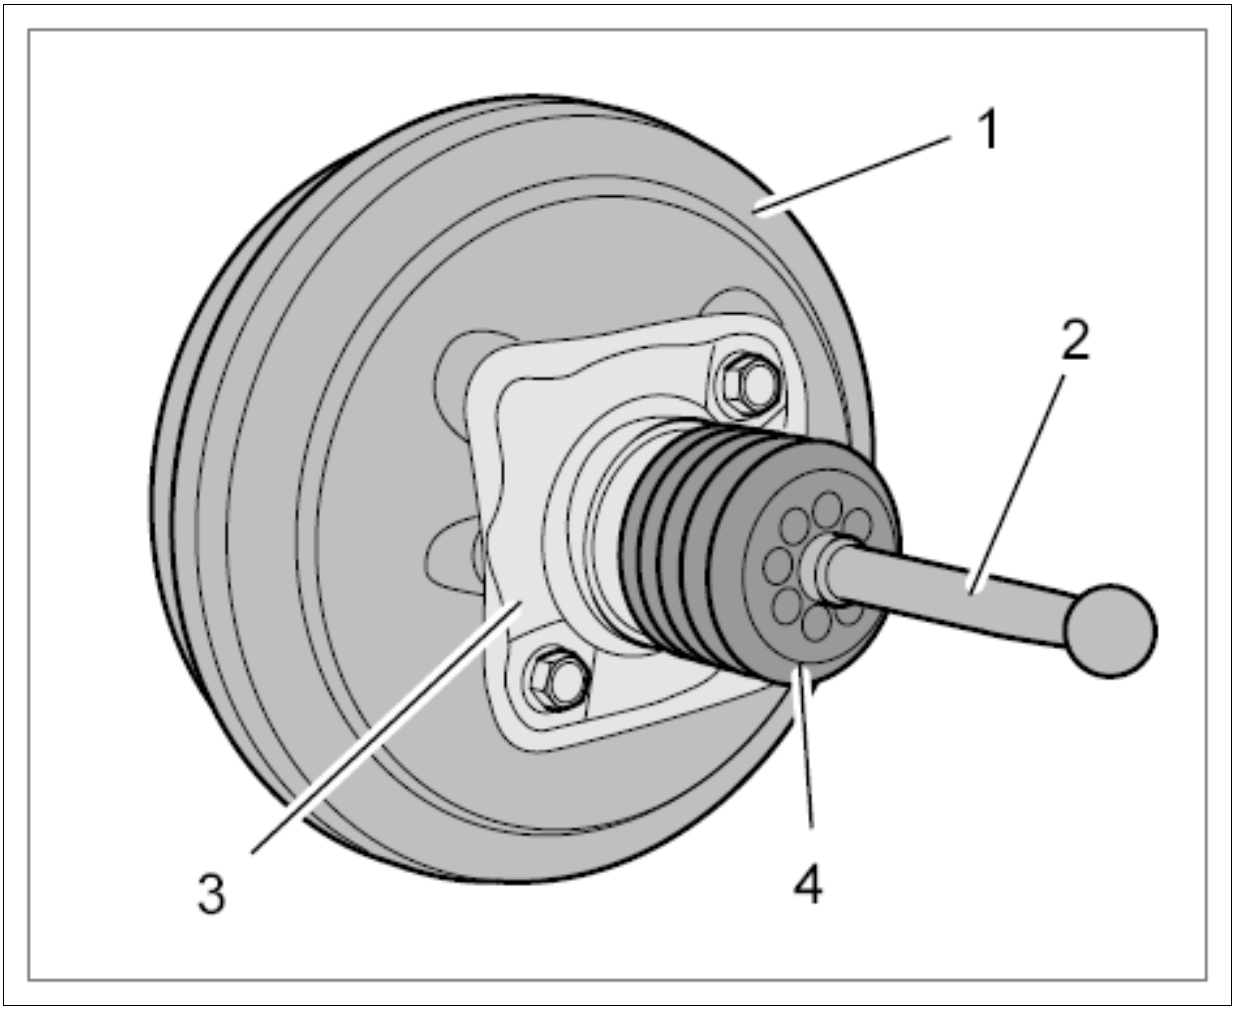
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 477019 REMOVING AND INSTALLING BRAKE BOOSTER (ALL MODELS) > REMOVING AND INSTALLING BRAKE BOOSTER > INSTALLING BRAKE BOOSTER

Information

- When fitting the brake booster -1- , make sure not to damage the seal -3- and the boot -4- on the push rod -2- .
- Check retaining lugs for the push rod through the opening in the plenum panel for signs of damage.

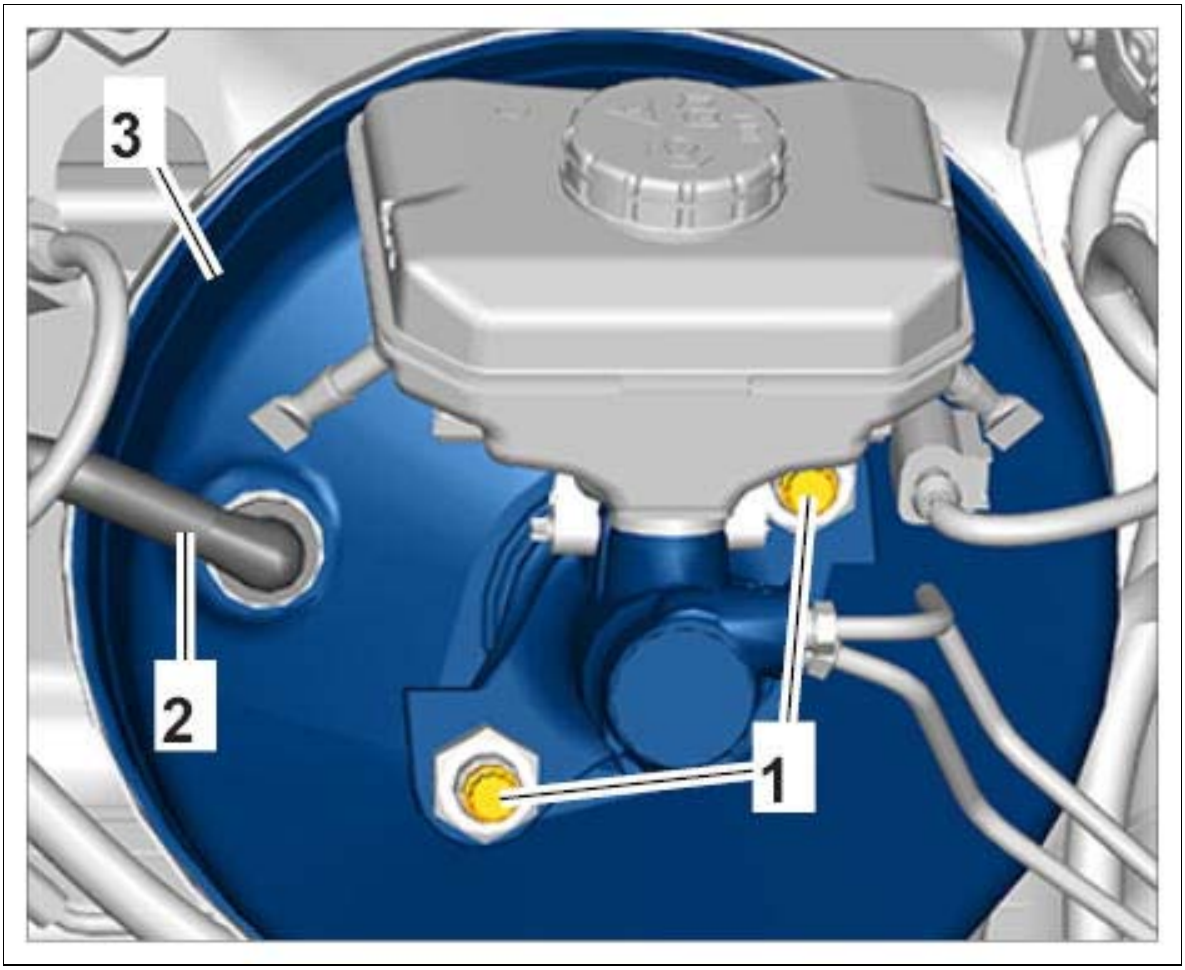
Fig 1: Identifying Brake Booster, Seal And Boot



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Fit the brake booster into the vehicle. Check that the boot is seated correctly when doing so.
2. Tighten fastening screws **-1-** securing the brake booster **-3-** to the mounting saddle.
   Tightening torque 25 Nm (19 ftlb.)

Fig 2: Identifying Brake Booster



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

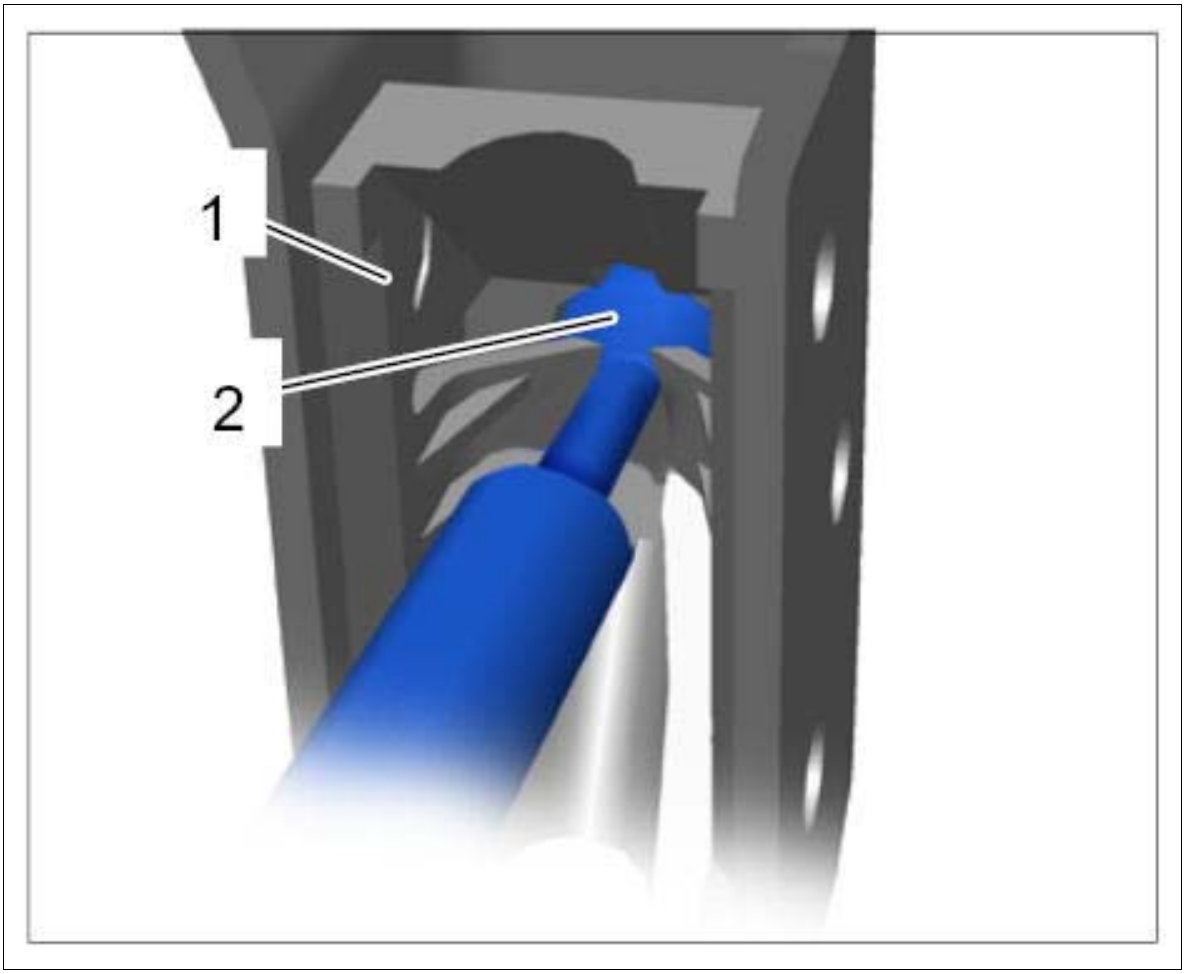
Damage when installing a new brake booster:

If the brake booster was replaced, the stopper at the vacuum line connection must be removed before connecting the brake pedal to the brake booster.

If this is not done, there is a risk of damage to the brake booster.

3. Connect brake pedal to the brake booster.

Fig 3: Positioning Brake Pedal On Push Rod



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. Position brake pedal on the push rod for the brake booster.
2. 3.2. Press the brake pedal fully until the push rod **-2-** engages with an audible click in the holder **-1-** on the brake pedal.
3. 3.3. Check that the push rod **-2-** is fully engaged in the holder **-1-** .

WM 477019 REMOVING AND INSTALLING BRAKE BOOSTER (ALL MODELS) > SUBSEQUENT WORK

1. Install brake master cylinder → Installing Brake Master Cylinder .
2. Install cross panel → Installing Cross Panel .
3. Install cowl panel cover → 508719 REMOVING AND INSTALLING COWL PANEL COVER .
4. Install brake light switch → 943619 REMOVING AND INSTALLING BRAKE LIGHT SWITCH .
5. **If the brake booster was replaced:** Check the brake booster in accordance with the instructions below.

WM 477019 REMOVING AND INSTALLING BRAKE BOOSTER (ALL MODELS) > SUBSEQUENT WORK > CHECKING BRAKE BOOSTER

1. Connect a battery charger with a current rating of at least 40 A to the jump-start terminals in the engine compartment.

2. Switch on ignition.

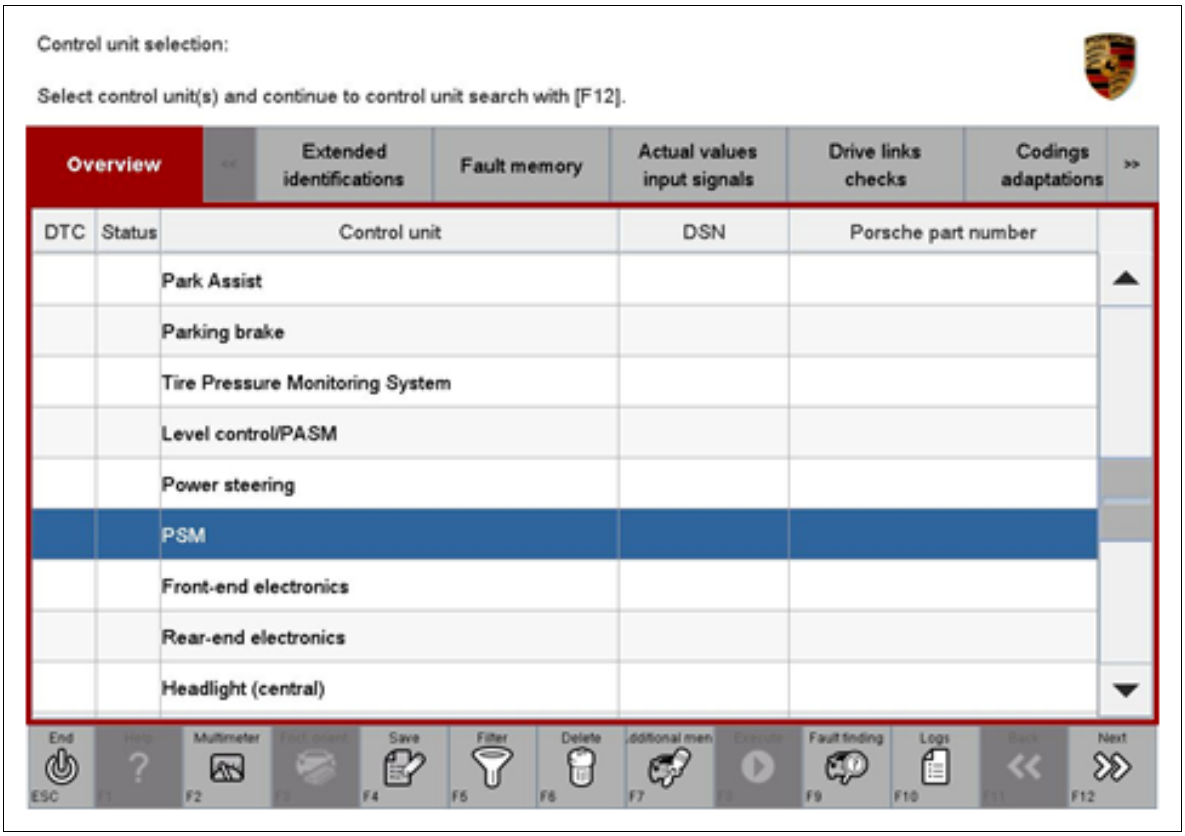
3. **PIWIS Tester II 9818** with the current software version installed must be connected to the vehicle communication module (VCI) via the **USB cable** . Then, connect the communication module to the vehicle and switch on the PIWIS Tester.

4. On the PIWIS Tester start screen, call up the ==> **'Diagnostics'** menu and select the vehicle type ==> **'Macan'** .

   The diagnostic application is then started and the control unit selection screen is populated.

1. Select the control unit ==> **'PSM'** in the control unit selection screen (**==> 'Overview'** menu) and press [>>] to confirm your selection → see Fig 1.

   Fig 1: Display - Control Unit Selection Screen



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Press [F11] to skip the question as to whether you want to create a vehicle analysis log (VAL).

3. Press [>>] to acknowledge the message that may appear informing you that campaigns for the vehicle are stored in the PIWIS information system.

4. Once the PSM control unit has been found and is displayed in the overview, select the ==> 'Actual values/input signals' menu → see Fig 2.

   Selecting Actual values/input signals

5. In the 'Actual values/input signals' menu, highlight the sensors to be checked **==> 'Brake pressure (hydraulic unit sensor)' and ==> 'Brake booster vacuum (vacuum sensor)'** and press [F12] to confirm.

6. Start the engine in selector-lever position "P" and leave it running for approx. 30 seconds at idle speed until the **'Vacuum'** is no longer increasing and remains constant.

   Information

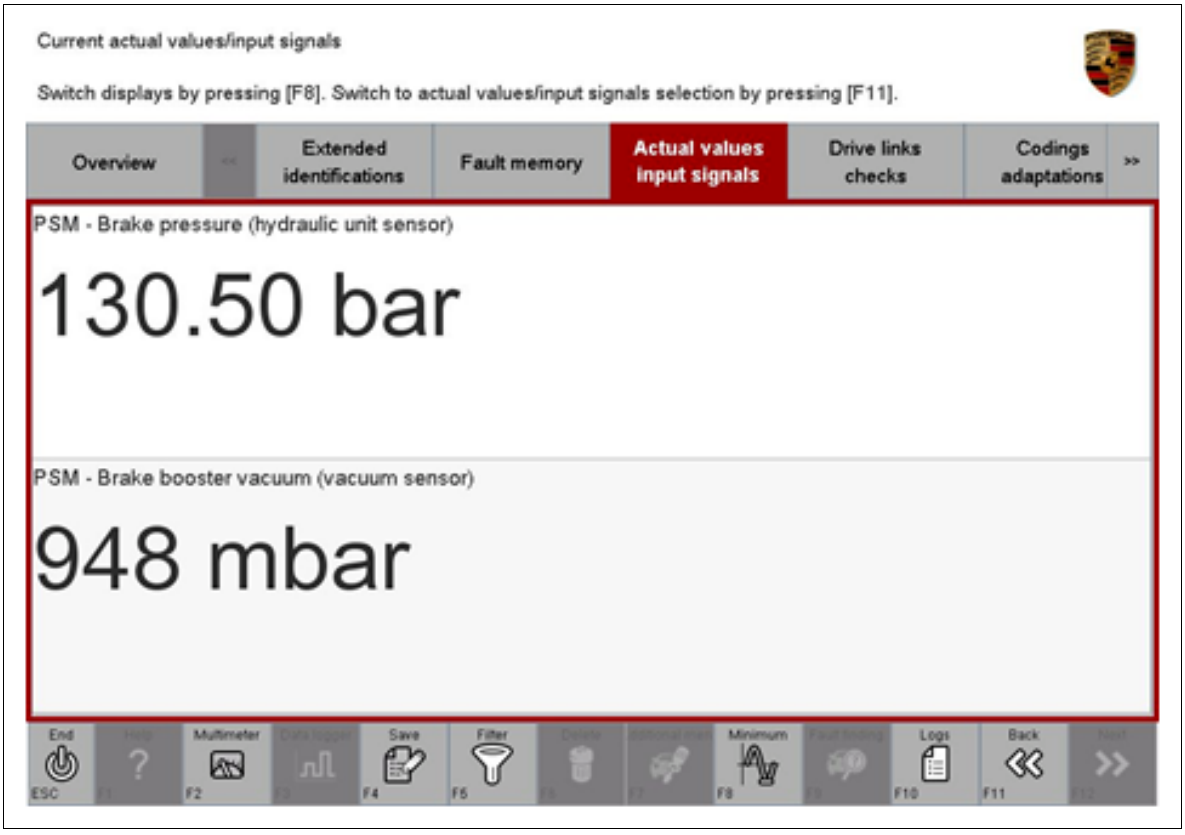
   At **sea level, a vacuum of at least 900 mbar** must be reached at idle speed in the brake booster. The **higher the position** above sea level, the **lower** the ambient pressure, and thus the lower the **vacuum to be reached** in the brake booster.

   The vacuum in the brake booster drops by approx. 10 mbar for every 100 m increase in height.

   This means, for example, that a vehicle **at 1, 000 m** above sea level **still only reaches a vacuum of at least 800 mbar** in the brake booster.

7. Set the measured value for **'Brake pressure'** to approx. **130 bar** by pressing the brake pedal, keep the brake pressure at approx. 130 bar for 5 seconds and check the displayed measured values → see Fig 2.

   Fig 2: Display - Measured Values Screen



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. If the vacuum **drops by less than approx. 100 mbar** from the starting value **after setting the brake pressure** and then **increases again** or remains constant, the **brake booster is OK** . Continue with **Step 8** .

2. If the vacuum **drops quickly by more than approx. 100 mbar from the starting value** when checking the **brake booster,** the brake booster must be **replaced** .

8. Stop the engine and switch off the ignition.

9. Disconnect the PIWIS Tester from the vehicle.

10. Switch off and disconnect the battery charger.

WM 477055 REPLACING BRAKE BOOSTER (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		Release tool	VW tool	T40136		
WM 477055 REPLACING BRAKE BOOSTER (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Brake line to brake master cylinder	Union nut	Tightening torque	14 Nm (10.5 ftlb.)		

(left-hand drive)					
Brake line to brake master cylinder (right-hand drive)	Union nut	Tightening torque	18 Nm (13 ftlb.)		
Brake booster to pedals	12 point socket	Tightening torque	25 Nm (19 ftlb.)		

WM 477055 REPLACING BRAKE BOOSTER (ALL MODELS) > PRELIMINARY WORK

1. Actuate the brake pedal as often as required until there is no more brake force boosting (brake booster is "empty", brake pedal becomes hard).
2. Remove brake light switch → 943619 REMOVING AND INSTALLING BRAKE LIGHT SWITCH .
3. Unclip cowl panel cover → 508719 REMOVING AND INSTALLING COWL PANEL COVER .
4. Remove cross panel → 508119 REMOVING AND INSTALLING CROSS PANEL (DISASSEMBLING PLENUM PANEL) .

WM 477055 REPLACING BRAKE BOOSTER (ALL MODELS) > REPLACING BRAKE BOOSTER

Information

- In the event of assembly work at the hydraulic connections, all electric plug connections in the area of the connection point must always be connected. This prevents the inside of the plug connections from being splashed with brake fluid or water.
- Clean any plug connections that have become dirty or damp during removal and fitting using a lint-free cloth, for example.
- Brake fluid on electrical contacts (even thinned brake fluid) leads to corrosion and can cause faults in the system.
- Remove any escaping brake fluid immediately; rinse with water and dry thoroughly if necessary.

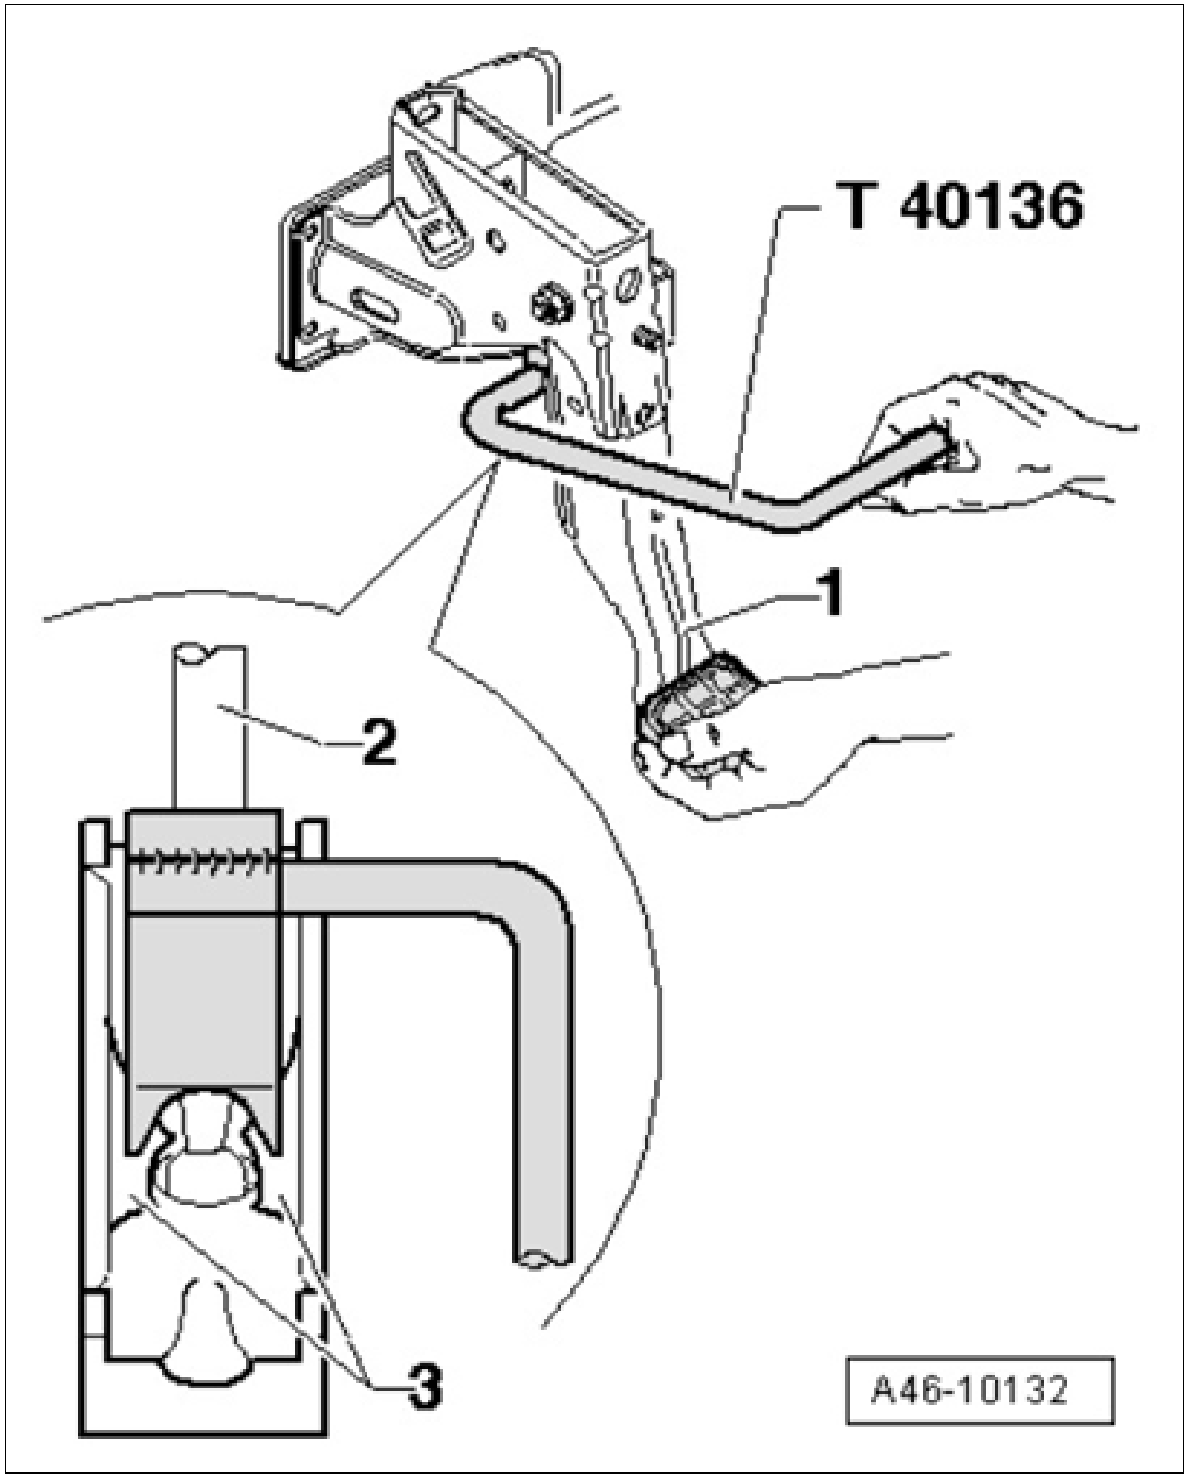
Information

The following repair instructions describe the procedure for replacing the brake booster together with the brake master cylinder and brake fluid reservoir.

The brake master cylinder and brake fluid reservoir remain fitted on the brake booster.

1. Separate brake pedal from brake booster.

Fig 1: Separating Brake Pedal From Brake Booster



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

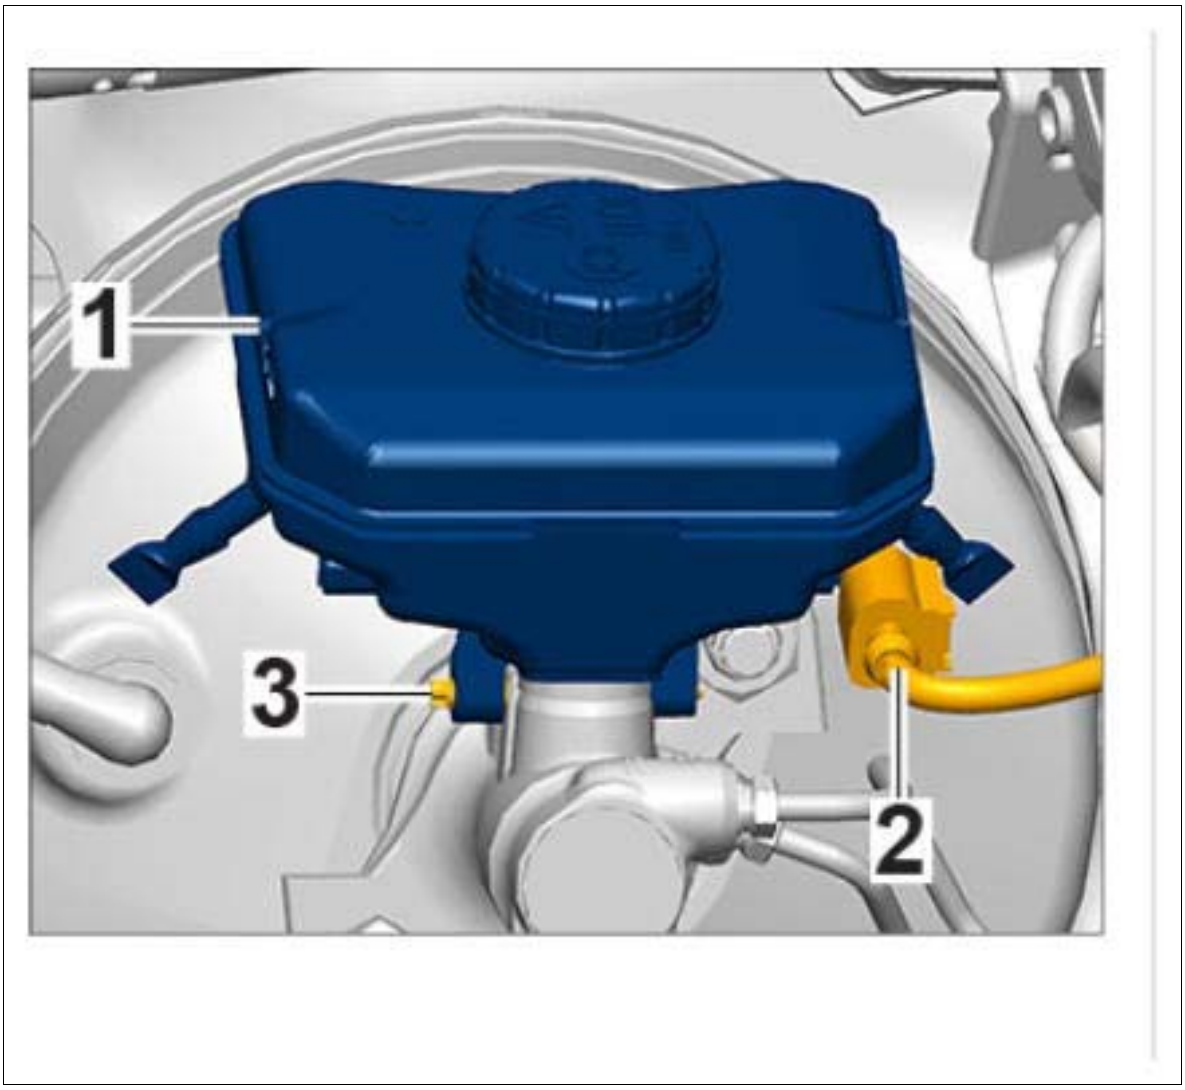
1. 1.1. Press the brake pedal **-1-** towards the brake booster.
2. 1.2. **Release tool T40136** must be fitted on the ball joint on the push rod **-2-** .
3. 1.3. To press the retaining lugs **-3-** on the mounting off the ball joint on the push rod **-2-** , pull **release tool T40136** towards the driver's seat and counter at the brake pedal **-1-** at the same time (the brake pedal must not move towards the driver's

seat).

4. 1.4. Release tool T40136 and brake pedal must both be pulled towards the driver's seat.

2. Place a suitable cloth under the brake fluid reservoir to soak up emerging brake fluid.
3. Drain brake fluid from the brake fluid reservoir using a suitable tool, e.g. a double-action hand pump.
4. Release and disconnect connector **-2-** (protect against contact with brake fluid if necessary).

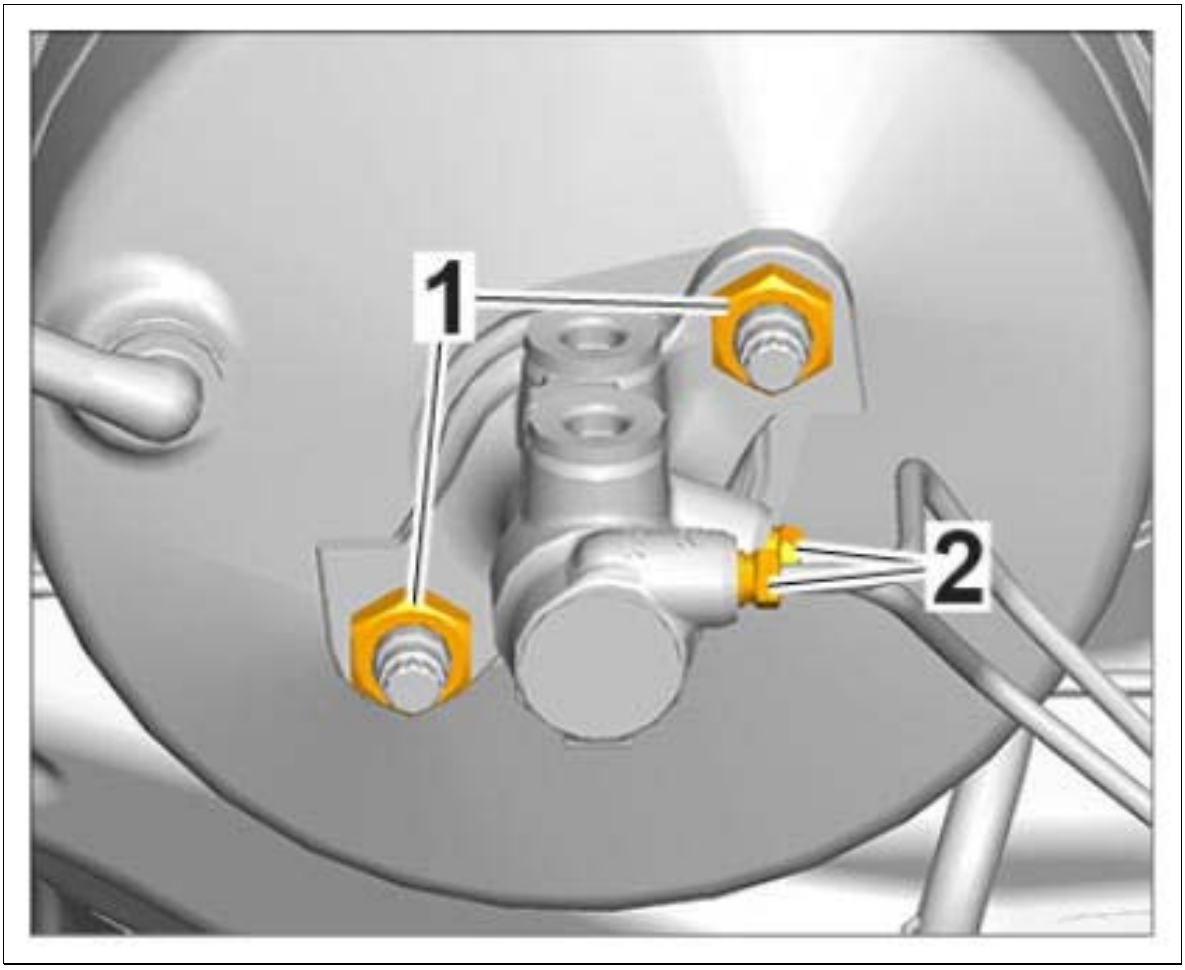
Fig 2: Identifying Connector On Brake Fluid Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Screw off brake lines **-2-** on the brake master cylinder

Fig 3: Identifying Brake Lines On Brake Master Cylinder

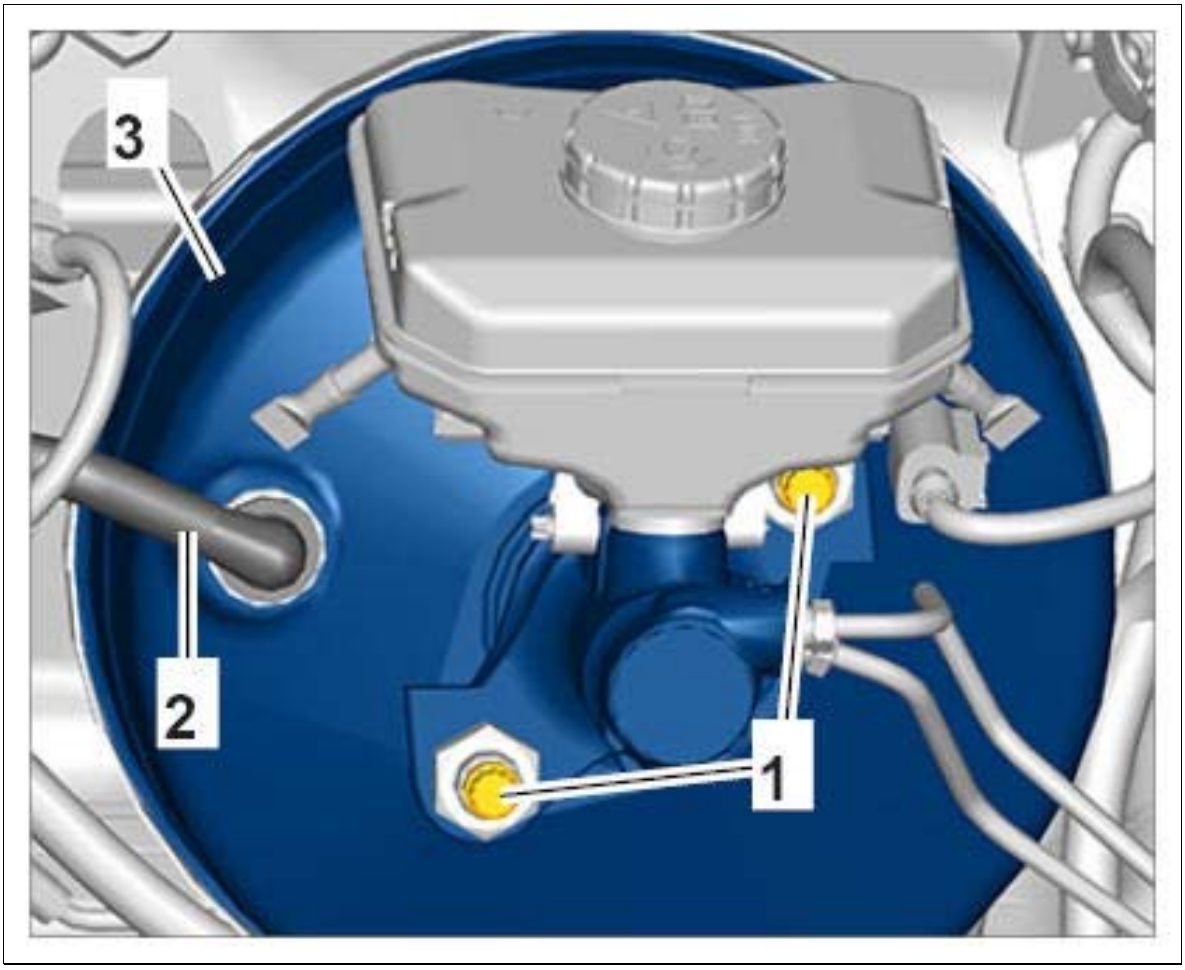


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 5.1. Unscrew union nuts.
2. 5.2. Pull brake lines out of the brake master cylinder.
3. 5.3. Close off brake lines and brake master cylinder using suitable stoppers.

6. Remove brake booster **-3-** .

Fig 4: Identifying Brake Booster Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

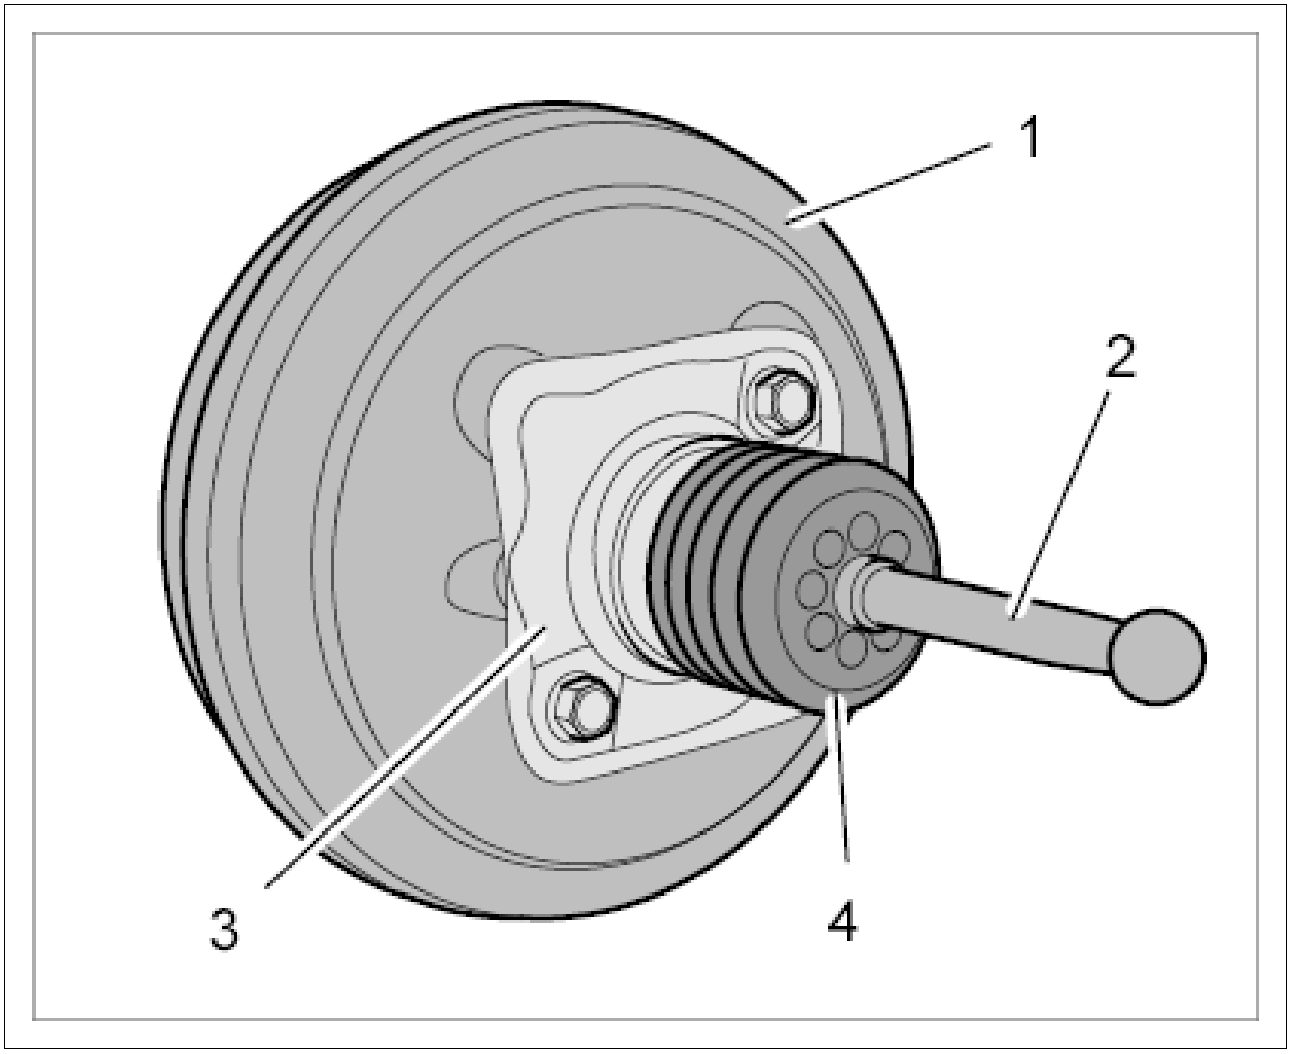
1. 6.1. Pull vacuum line **-2-** out of the brake booster.
2. 6.2. Unscrew fastening screws **-1-** for the mounting saddle.
3. 6.3. Remove brake booster **-3-** with brake master cylinder and brake fluid reservoir.

WM 477055 REPLACING BRAKE BOOSTER (ALL MODELS) > REPLACING BRAKE BOOSTER > INSTALLING BRAKE BOOSTER

Information

- When fitting the brake booster -1- , make sure not to damage the seal -3- and the boot -4- on the push rod -2- .
- Check retaining lugs for the push rod through the opening in the plenum panel for signs of damage.

Fig 1: Identifying Brake Booster, Seal And Boot



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Fit the brake booster into the vehicle. Check that the boot is seated correctly when doing so.
2. Tighten fastening screws **-1-** securing the brake booster **-3-** to the mounting saddle.
   Tightening torque 25 Nm (19 ftlb.)

2. Press [F11] to skip the question as to whether you want to create a vehicle analysis log (VAL).
3. Press [>>] to acknowledge the message that may appear informing you that campaigns for the vehicle are stored in the PIWIS information system.
4. Once the PSM control unit has been found and is displayed in the overview, select the **==> 'Actual values/input signals'** menu → see Fig 2.

Selecting Actual values/input signals

5. In the 'Actual values/input signals' menu, highlight the sensors to be checked ==> **'Brake pressure (hydraulic unit sensor)'** and ==> **'Brake booster vacuum (vacuum sensor)'** and press [F12] to confirm.

6. Start the engine in selector-lever position "P" and leave it running for approx. 30 seconds at idle speed until the **'Vacuum'** is no longer increasing and remains constant.

   Information

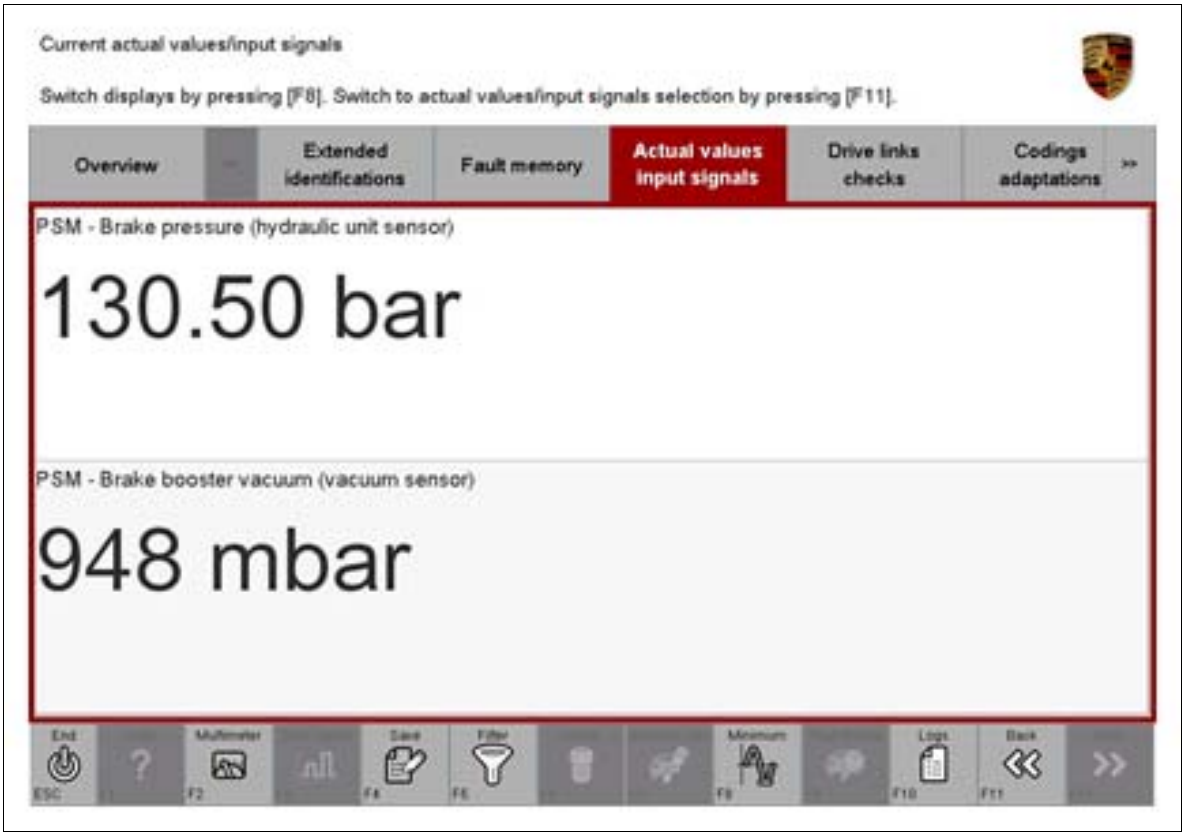
   At **sea level, a vacuum of at least 900 mbar** must be reached at idle speed in the brake booster. The **higher the position** above sea level, the lower the ambient pressure, and thus the lower the **vacuum to be reached** in the brake booster.

   The vacuum in the brake booster drops by approx. 10 mbar for every 100 m increase in height.

   This means, for example, that a vehicle at 1, 000 m above sea level **still only reaches a vacuum of at least 800 mbar** in the brake booster.

7. Set the measured value for **'Brake pressure'** to approx. **130 bar** by pressing the brake pedal, keep the brake pressure at approx. 130 bar for 5 seconds and check the displayed measured values → see Fig 2.

   Fig 2: Display - Measured Values Screen



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. If the vacuum **drops by less than approx. 100 mbar** from the starting value **after setting the brake pressure** and then **increases again** or remains constant, the **brake**

booster is OK. Continue with Step 8.

2. If the vacuum **drops quickly by more than approx. 100 mbar from the starting value** when checking the **brake booster,** the brake booster must be replaced.

8. Stop the engine and switch off the ignition.
9. Disconnect the PIWIS Tester from the vehicle.
10. Switch off and disconnect the battery charger.

WM 477601 CHECKING VACUUM PUMP (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
tester	Special tool	9160/1		
WM 477601 CHECKING VACUUM PUMP (ALL MODELS) > CHECKING VACUUM PUMP

Information

This check mainly involves examining the secondary load connection due to problems. The main connection (brake booster) is not checked. Defects in the main connection would be apparent immediately due to increasing pedal forces during braking (similar to a defective brake booster).

1. Connect vacuum gauge **tester 9160/1** to the secondary load connection.
2. Set vacuum tester to Vacuum position (lever set to Open).
3. Start engine and leave it running at idle speed with slightly changing revs.
4. The vacuum pump must create a vacuum of at least 600 mbar or 0.6 bar.
5. If the vacuum is not maintained, i.e. the pointer moves towards 0 bar, the vacuum pump is faulty. Replace vacuum pump. → 477619 REMOVING AND INSTALLING VACUUM PUMP
6. This defect can cause engine oil to get into the vacuum system. In this case, the lines and switching valves must be checked visually and replaced if necessary or cleaned with solvent naphtha.

WM 477619 REMOVING AND INSTALLING VACUUM PUMP (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Vacuum pump to engine		Tightening torque	9 Nm (6.5 ftlb.)

2. Remove exhaust system. → 260119 REMOVING AND INSTALLING EXHAUST SYSTEM
3. Loosen cardan shaft on the rear final drive and make sure that it does not become kinked. → 393519 REMOVING AND INSTALLING REAR CARDAN SHAFT

WM 390119 REMOVING AND INSTALLING REAR FINAL DRIVE (MACAN, MACAN S,

MACAN TURBO) > REMOVING REAR FINAL DRIVE

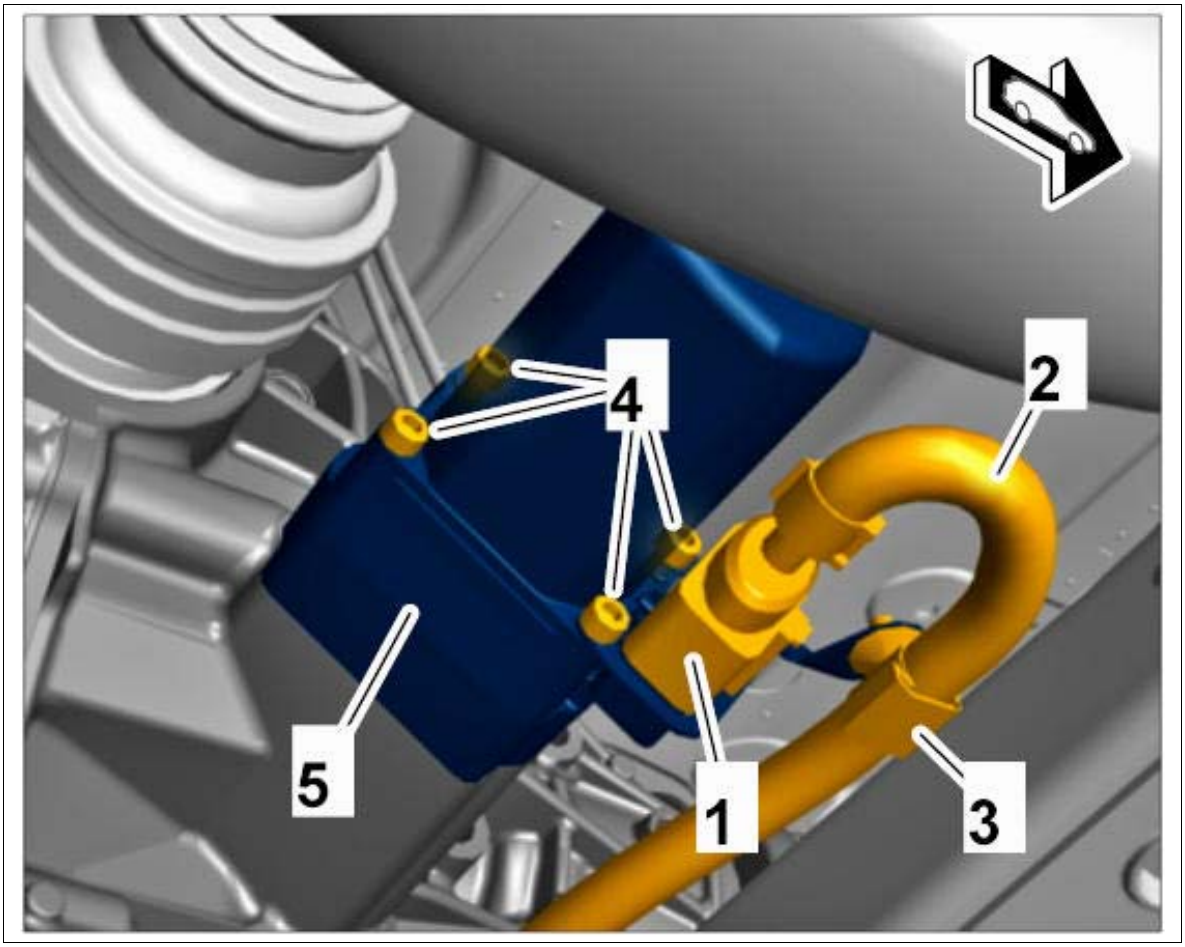
WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

1. Release and disconnect electric connector for servo motor for rear-differential lock **-1-** .

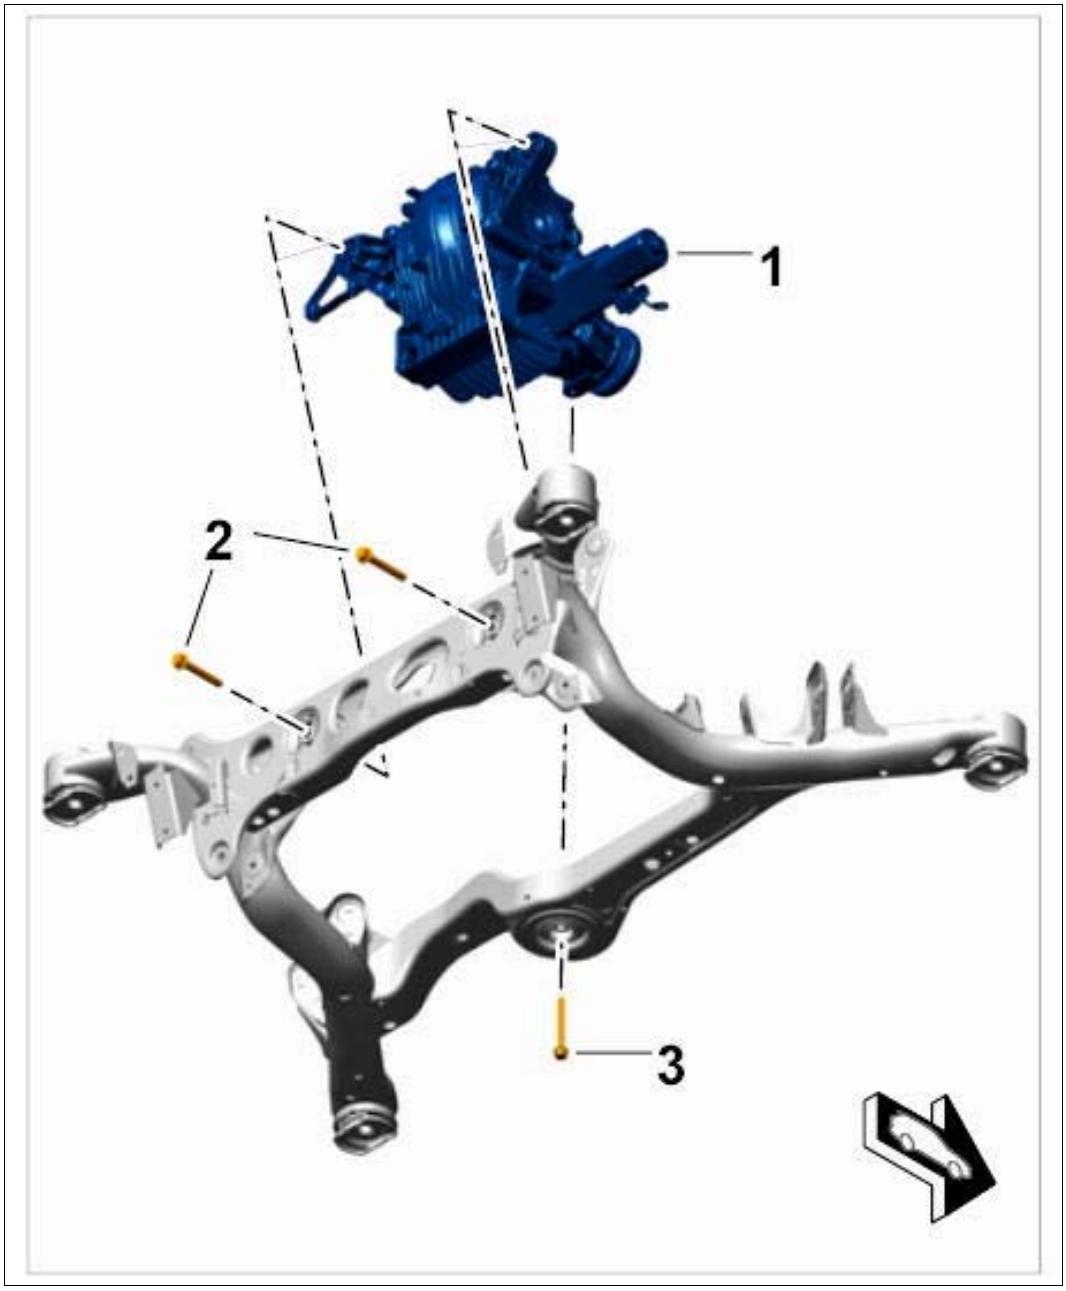
   Fig 1: Identifying Rear-Differential Lock Servo Motor Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Support rear final drive using **transmission jack WE 1082** , for example.
3. Remove rear final drive **-1-** .
   1. 3.1. Unscrew screws **-2-** on rear axle carrier.
   2. 3.2. Unscrew screw **-3-** on final drive bearing.
   3. 3.3. Remove rear final drive by tilting it downwards.

Fig 2: Identifying Rear Final Drive Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 390119 REMOVING AND INSTALLING REAR FINAL DRIVE (MACAN, MACAN S, MACAN TURBO) > INSTALLING REAR FINAL DRIVE

Information

Information for replacing the final drive/servo motor.

- If the final drive as well as the servo motor (control unit) is replaced, there is no need to reload data (classification data).

- Classification data can be read out of the control unit using the PIWIS Tester.
- If only the servo motor is replaced, the classification data must be re-written into the control unit.
- Classification data can be found on the final-drive housing.

1. Installation is performed in reverse order.

    1. 1.1. Tightening torque for rear screws: **Tightening torque: 95 Nm (70 ftlb.)**
    2. 1.2. Tightening torque for lower front screw: **Initial tightening 40 Nm (30 ftlb.) Final tightening +90°**

       Use a new screw!

WM 390119 REMOVING AND INSTALLING REAR FINAL DRIVE (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Secure cardan shaft to the rear final drive. → INSTALLING REAR CARDAN SHAFT
2. Install exhaust system. → INSTALLING EXHAUST SYSTEM

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 391355 REPLACING TRANSFER GEAR CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Switch off ignition and replace control unit.

WM 391355 REPLACING TRANSFER GEAR CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > CODING TRANSFER GEAR CONTROL UNIT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. PIWIS Tester must be connected to the vehicle before starting the Tester. Switch on ignition.
2. Select the vehicle type and start the diagnostic application.
3. Select the **All-wheel** control unit in the **overview** .
4. **Extended identification** must now be selected.
5. **Enter the vehicle identification number** and press [Enter] to confirm your entry.
6. **Select Programming** and press [F12] to continue.
7. **Automatic programming** must now be selected. Then press [F12] to continue.
8. Follow the instructions on the Tester and press [F12] to continue.

9. **Maintenance/repairs** must then be selected.
10. **Control unit replacement** must now be selected. Then press [F12] to continue.

    Information

    Only select the function if just the control unit will be replaced. If the control unit and transfer gear will be replaced, "Control unit and transmission replacement (together)" must be selected.
11. **Write data to new control unit/Start-up** must be selected. Then press [F12] to continue.
12. Enter the chassis number and press [F12] to continue.
13. Follow the instructions on the Tester and press [F12] to continue.
14. **Select Write data** and press [F8] to start. The data is now loaded.
15. The Tester displays the message **Data was written successfully to the control unit** . Press [F12] to continue.
16. Switch off ignition and press [F12]
17. Start the engine and press [F12] to continue.
18. Perform a function test on the transmission.
19. Read out the fault memory and erase it if necessary.

WM 392519 REMOVING AND INSTALLING HALFSHAFT FLANGE (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove transmission. → REMOVING PORSCHE DOPPELKUPPLUNG (PDK)

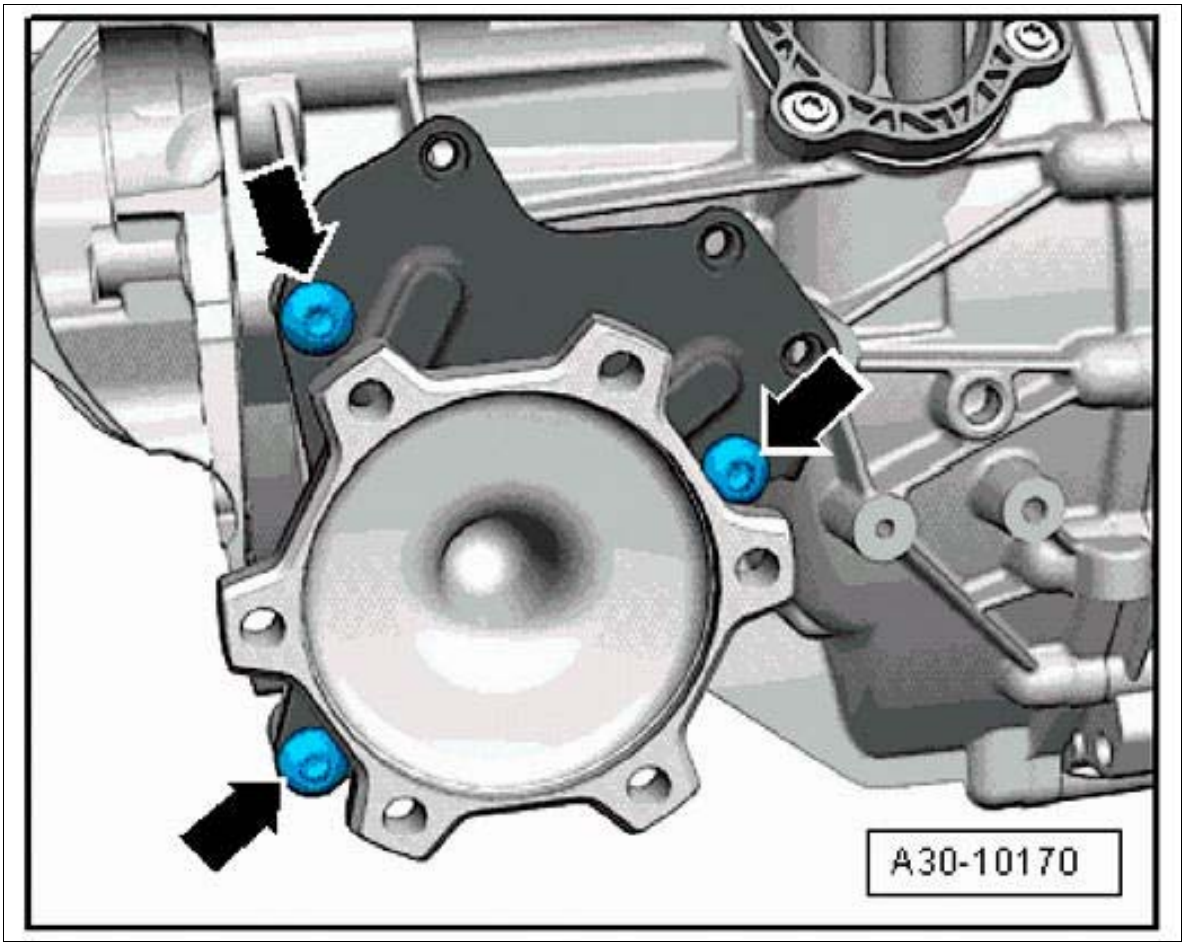
WM 392519 REMOVING AND INSTALLING HALFSHAFT FLANGE (MACAN, MACAN S, MACAN TURBO) > REMOVING HALFSHAFT FLANGE > REMOVING LEFT HALFSHAFT FLANGE

Information

- Check the shaft sealing ring on the differential for damage.
- Replace the shaft sealing ring if damaged.

1. Tilt the transmission on the gear support backwards slightly so that the transmission oil does not leak out.
2. Unscrew the fastening screws **-arrows-** .

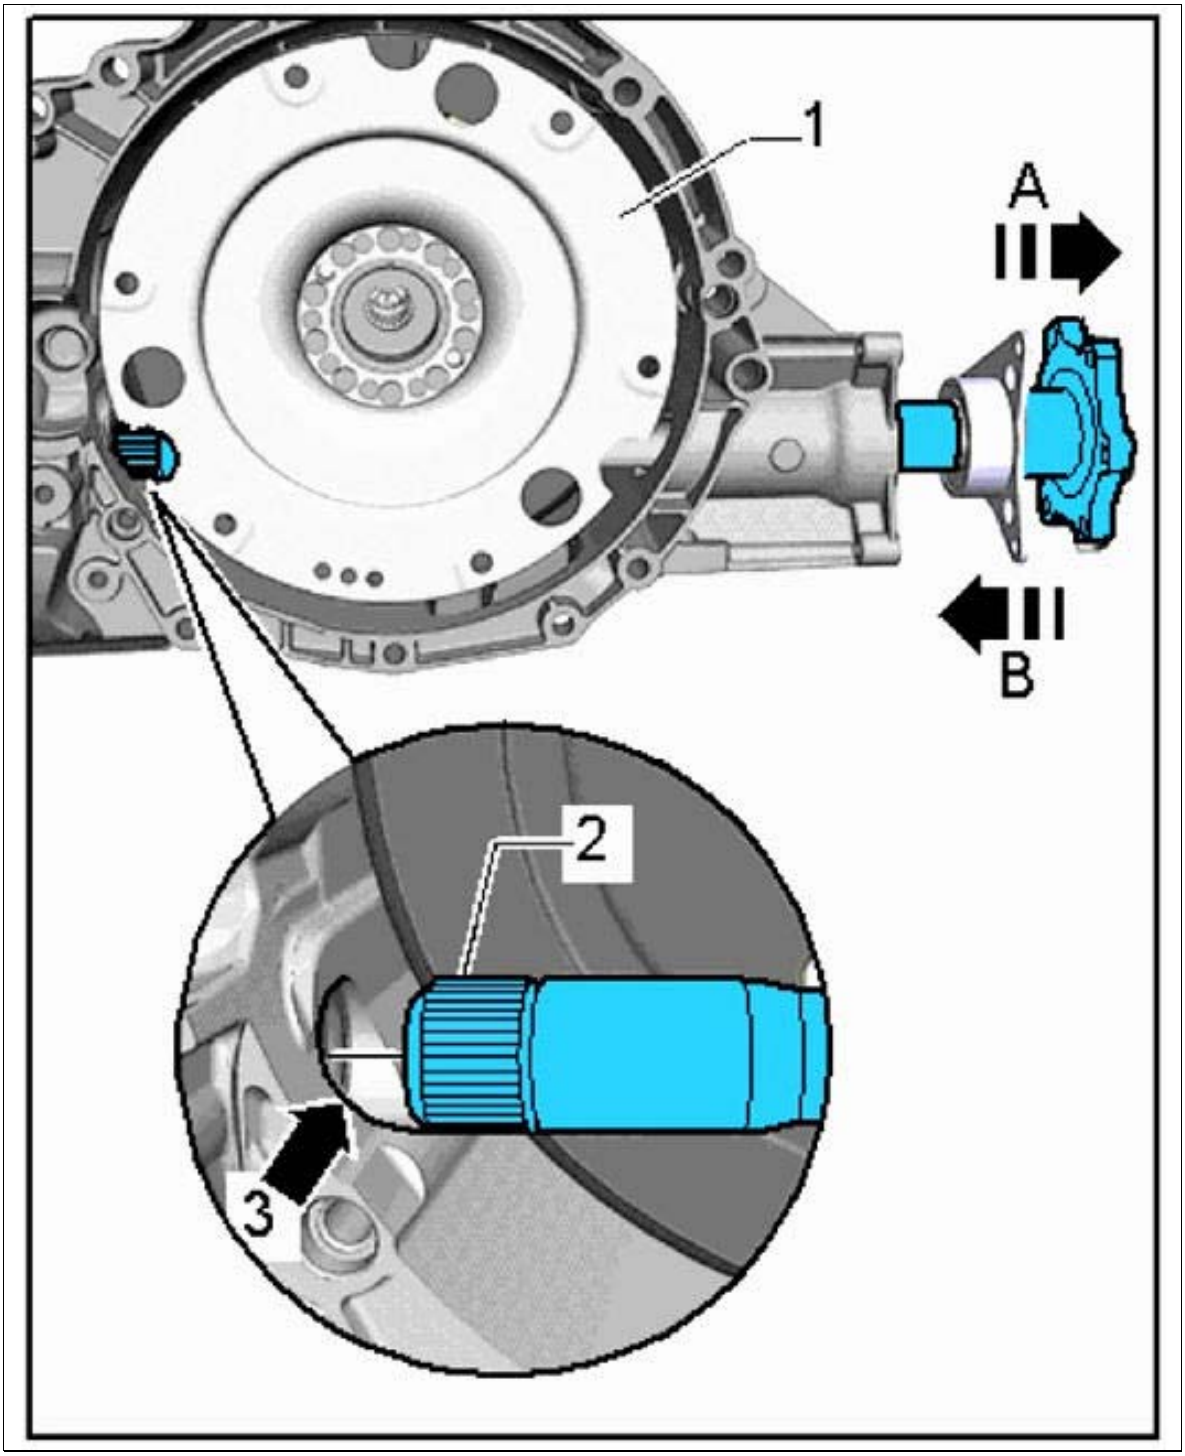
Fig 1: Locating Halfshaft Flange Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove the halfshaft flange **-2-** slowly and carefully in **-direction of arrow A-** from the transmission.

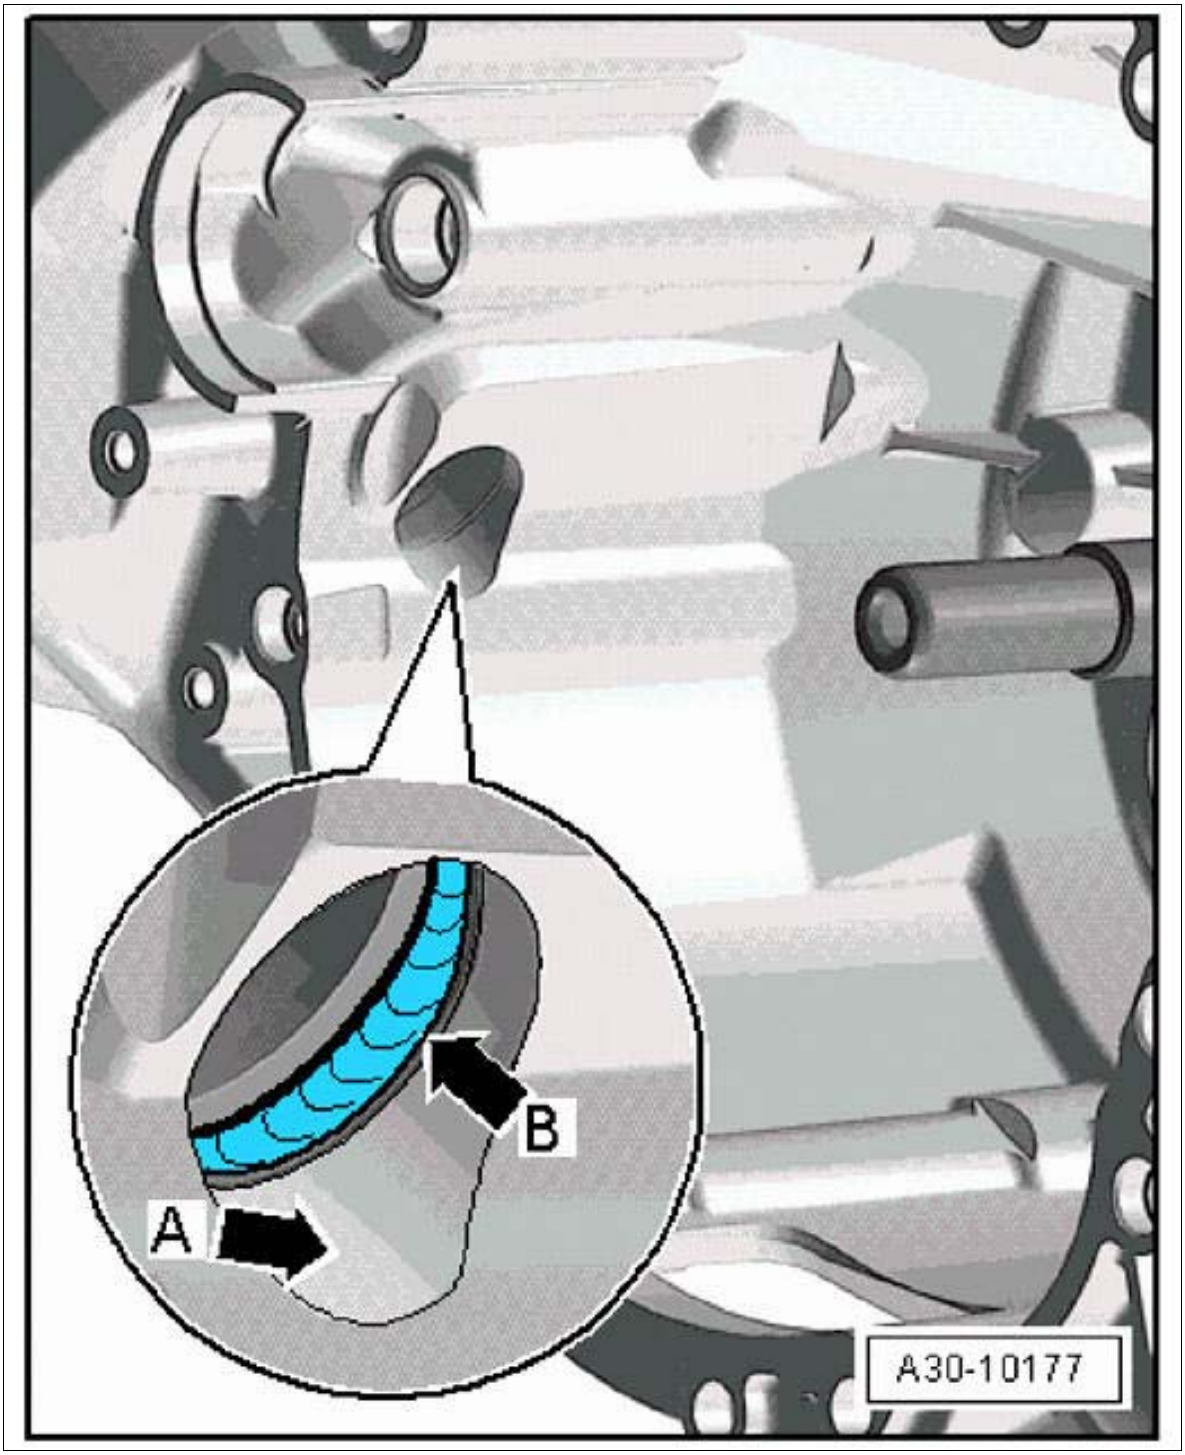
Fig 2: Removing Halfshaft Flange



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove the flywheel. → 136019 REMOVING AND INSTALLING FLYWHEEL
5. Clean the halfshaft flange and place it on a clean surface.
6. Clean the connection area to the differential **-arrow A-** and the shaft sealing ring **-arrow B-** on the transmission housing.

Fig 3: Locating Shaft Sealing Ring



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 392519 REMOVING AND INSTALLING HALFSHAFT FLANGE (MACAN, MACAN S, MACAN TURBO) > REMOVING HALFSHAFT FLANGE > REMOVING RIGHT HALFSHAFT FLANGE

Information

- Replace the circlip for the right halfshaft flange.

  1. Place the collection container under the right halfshaft flange.
  2. Pull off the halfshaft flange.

     1. 2.1. Screw in the fastening screws **-2-** on the halfshaft flange **-3-** .
     2. 2.2. Pull off the halfshaft flange **-3-** using a **puller T10037** .

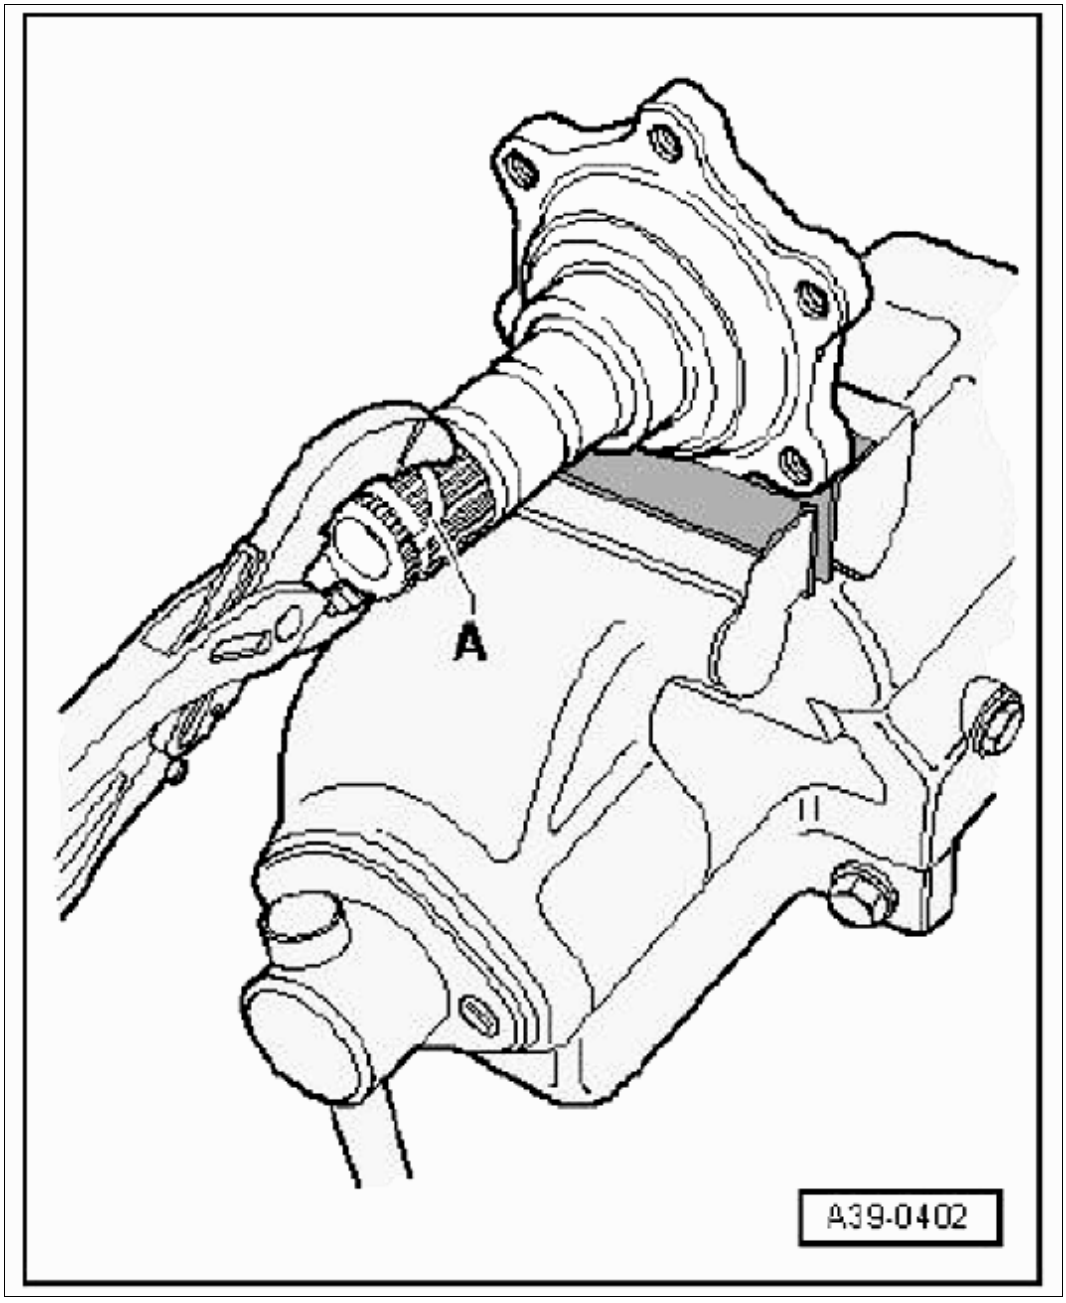
        Fig 1: Pulling Halfshaft Flange

        
        Courtesy of PORSCHE CARS NORTH AMERICA, INC.

  3. Replace the circlip **-A-** .

     1. 3.1. Clamp the halfshaft flange in a vice using protective jaws.
     2. 3.2. Replace the circlip **-A-** .

Fig 2: Replacing Circlip



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

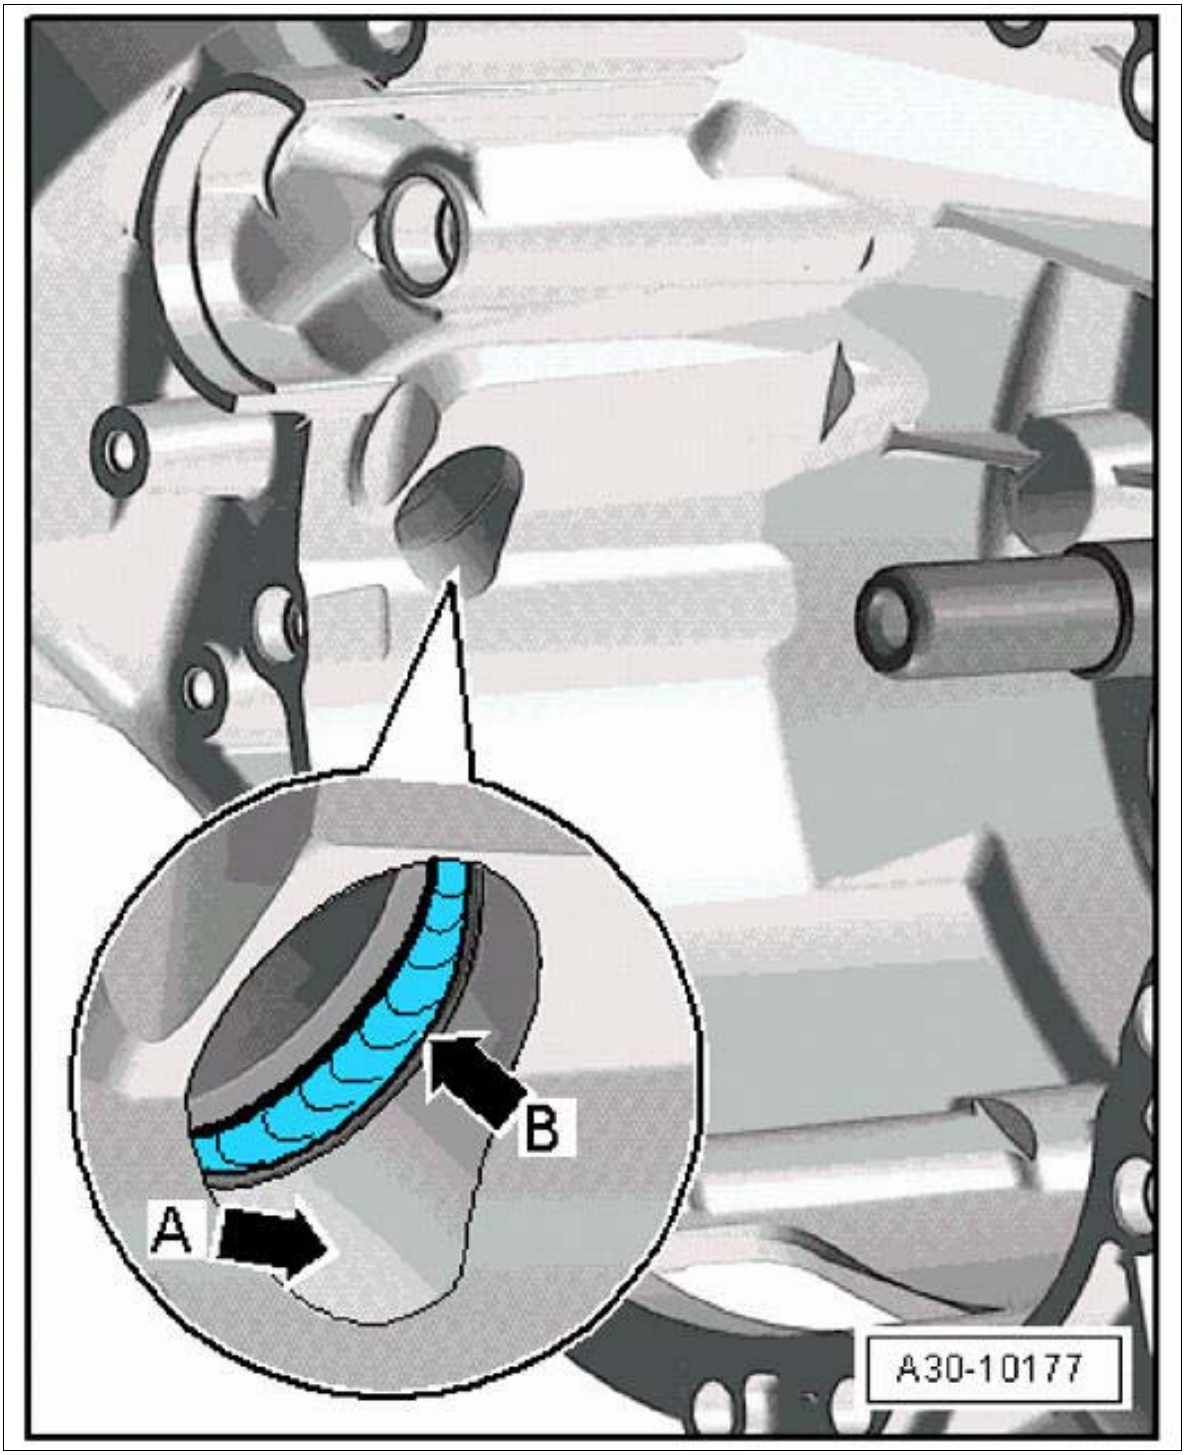
WM 392519 REMOVING AND INSTALLING HALFSHAFT FLANGE (MACAN, MACAN S, MACAN TURBO) > INSTALLING HALFSHAFT FLANGE > INSTALLING LEFT HALFSHAFT FLANGE

Information

- Check the shaft sealing ring on the differential for damage.
- Replace the shaft sealing ring if damaged.

1. Check shaft sealing ring **-arrow B-** for damage.

Fig 1: Locating Shaft Sealing Ring



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Install flywheel. → INSTALLING FLYWHEEL

3. Install halfshaft flange **-2-** .

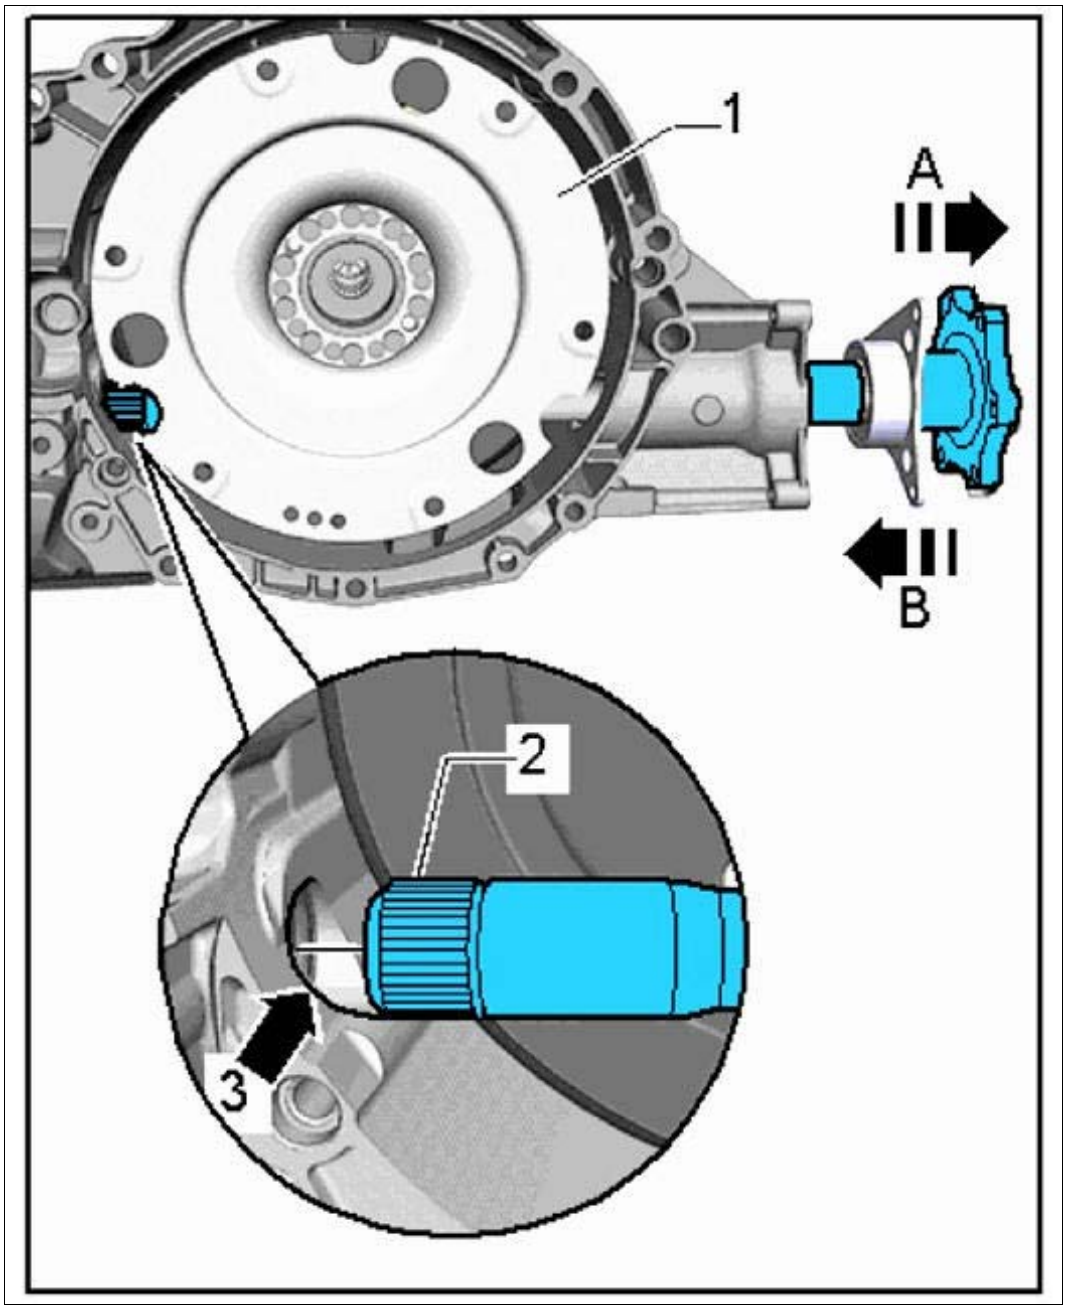
    1. 3.1. Turn the flywheel until the opening for entering the differential is visible.

    2. 3.2. Guide the halfshaft flange **-2-** centrally in **-direction of arrow B-** into the shaft

sealing ring on the differential.

3. 3.3. Carefully insert the halfshaft flange as far as it will go.

Fig 2: Removing Halfshaft Flange



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Insert and tighten **new** fastening screws **-arrows -** .
    1. step **Initial tightening 15 Nm (11 ftlb.)**
    2. step **Final tightening 45°**

Fig 3: Locating Halfshaft Flange Screws

WM 393519 REMOVING AND INSTALLING REAR CARDAN SHAFT (MACAN, MACAN S, MACAN TURBO) > REMOVING REAR CARDAN SHAFT

Information

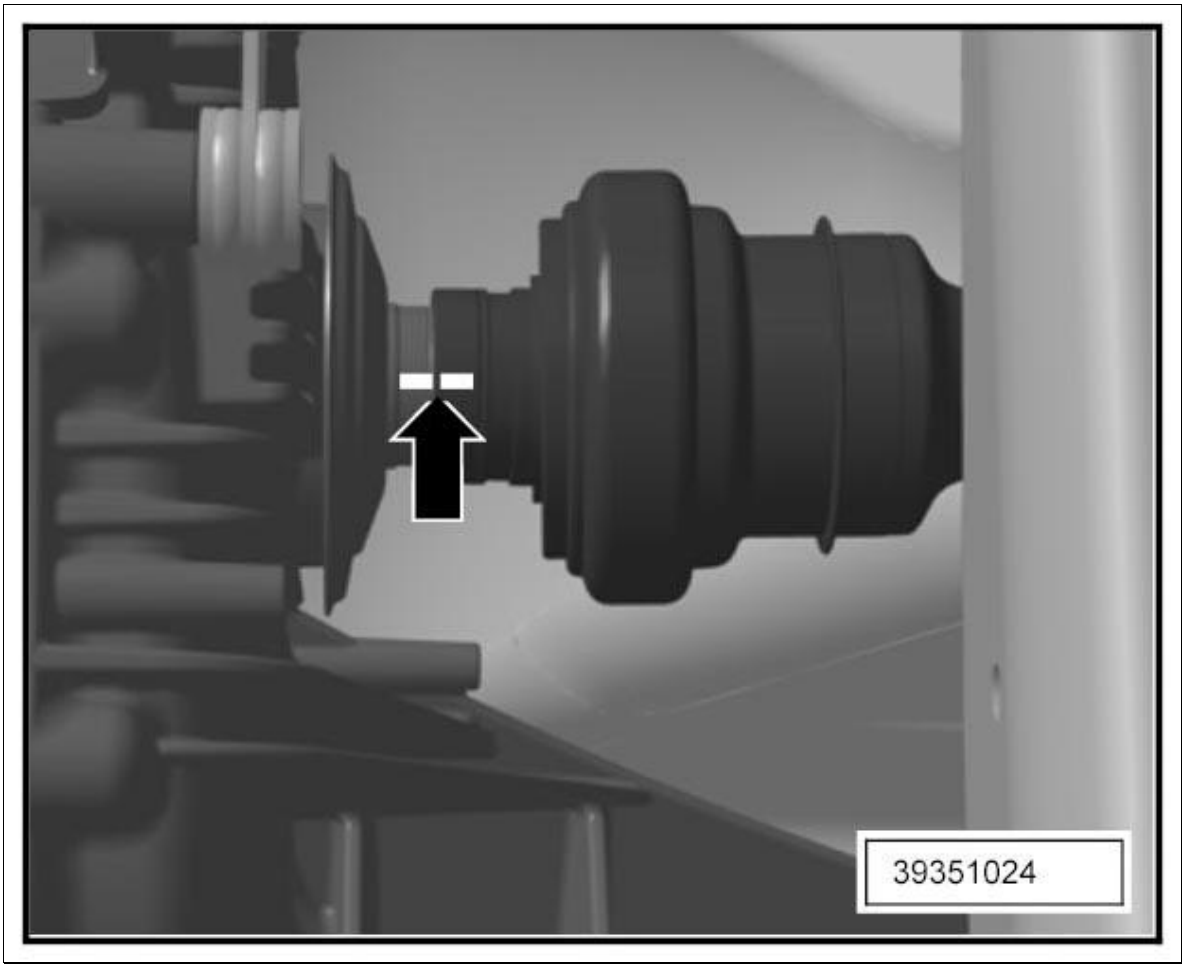
- Mark the positions of all parts in relation to each other prior to removal. If the parts are not re-installed in the same position, this will result in too much imbalance, which could cause damage to the mount and humming noises.

Information

- Do not kink the cardan shaft; only store it facing upwards in elongated position with the center bearing holder.
- The cardan shaft is held by a single-lug clip, which must be removed before disassembly.
- To prevent damage to the cardan shaft, get a second mechanic to help.
- The cardan shaft must not be repaired.

1. Mark the installation position of the cardan shaft **-arrow-** on the transmission and on the rear axle differential.

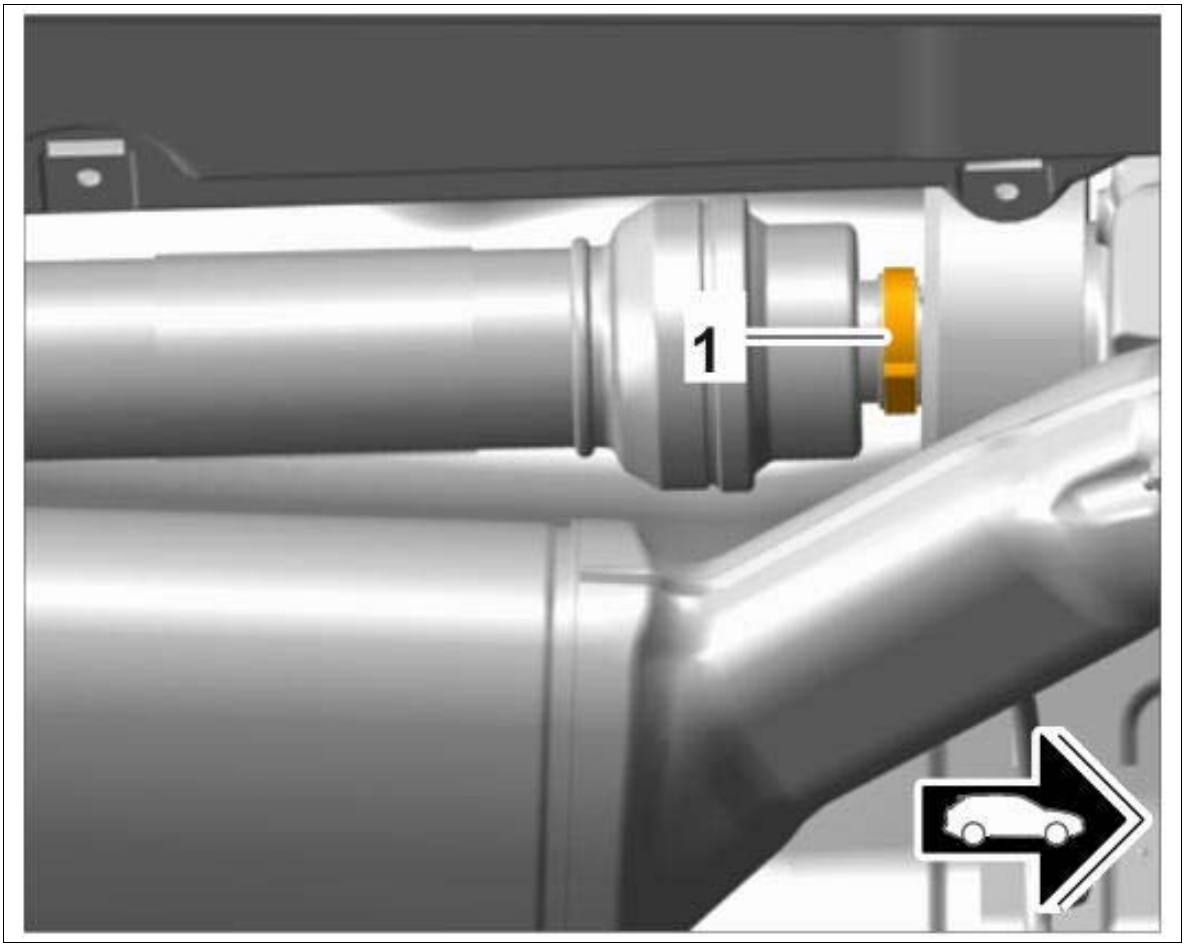
   Fig 1: Locating Cardan Shaft Installation Position Mark



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen single-lug clip **-1-** on the cardan shaft at the transmission side.

Fig 2: Identifying Cardan Shaft Single-Lug Clip



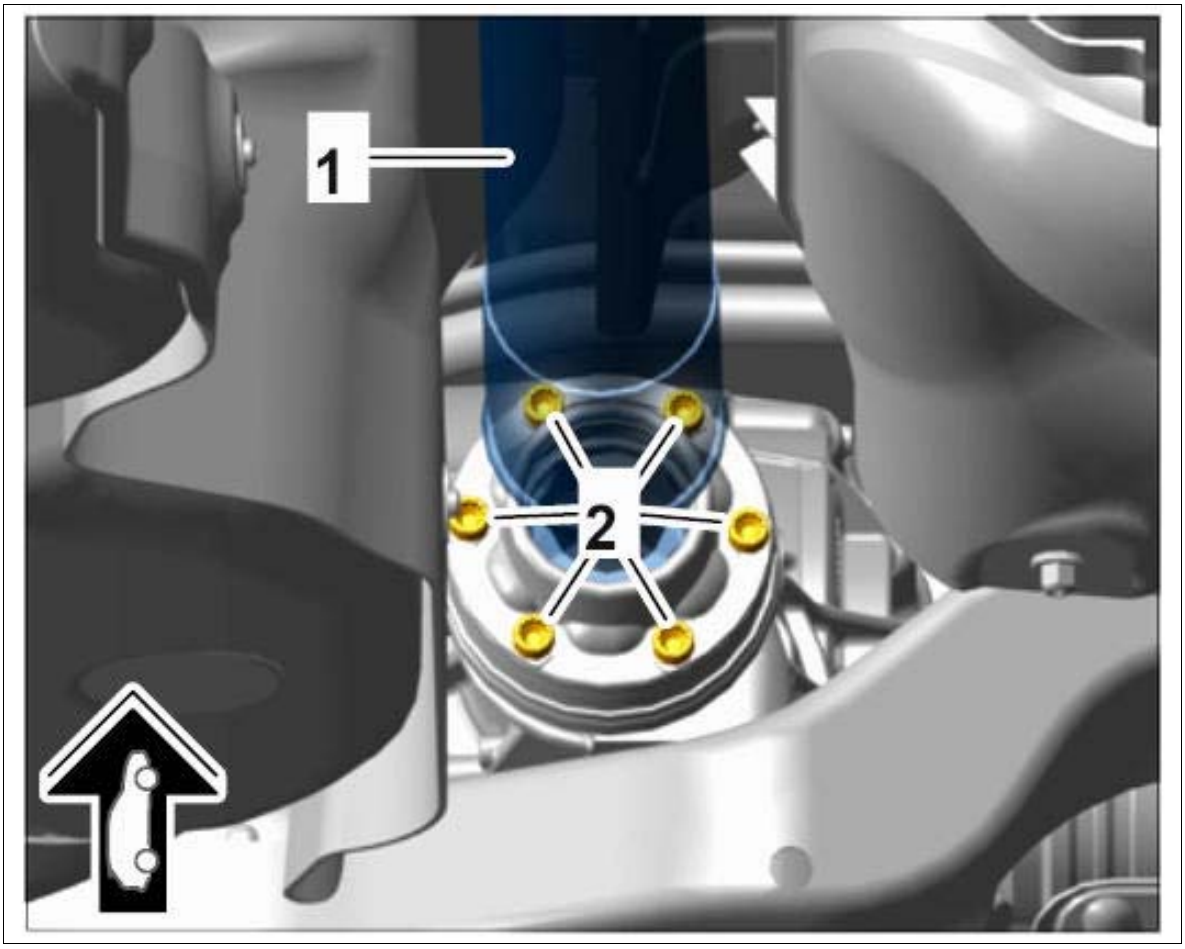
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. Replace fastening screws.
2. Clean and blow out threaded bores.
3. Clean flange surface on rear axle differential and cardan shaft to remove grease.

3. Unscrew fastening screws **-2-** on the cardan shaft **-1-** .

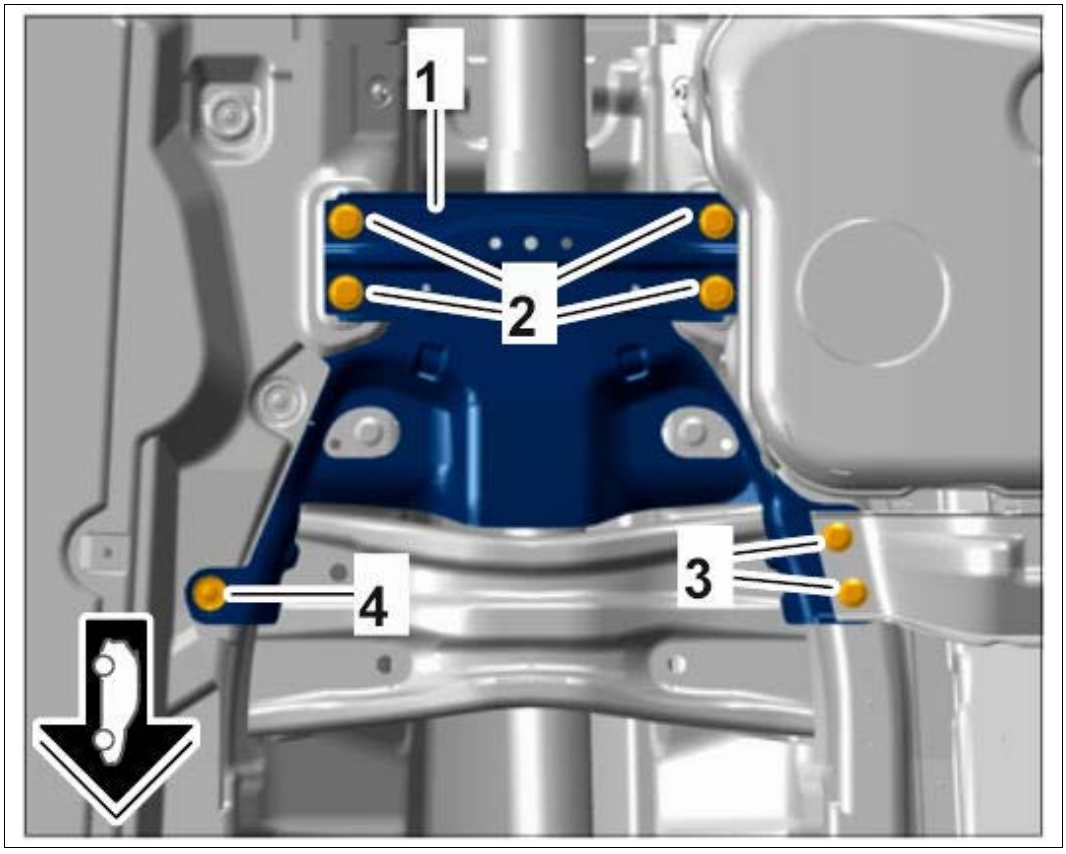
Fig 3: Identifying Cardan Shaft Fastening Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove heat shield and rear tunnel cross member **-1-** .
    1. 4.1. Unscrew fastening screws **-2-** and **-3-** .
    2. 4.2. Unscrew fastening nut **-4-** .
    3. 4.3. Remove heat shield and cross member **-1-** .

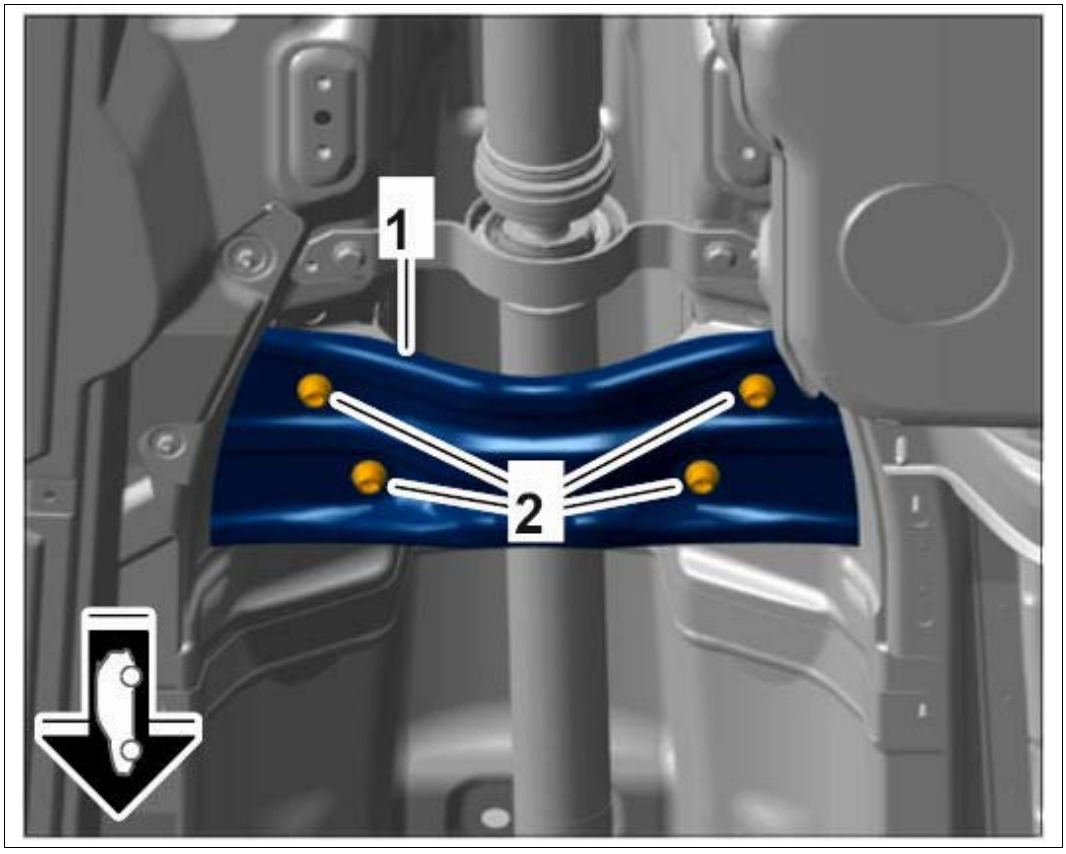
Fig 4: Identifying Heat Shield And Rear Tunnel Cross Member Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove front tunnel support **-1-** .
    1. 5.1. Unscrew fastening screws **-2-** .
    2. 5.2. Remove support **-1-** .

Fig 5: Identifying Front Tunnel Support Screws



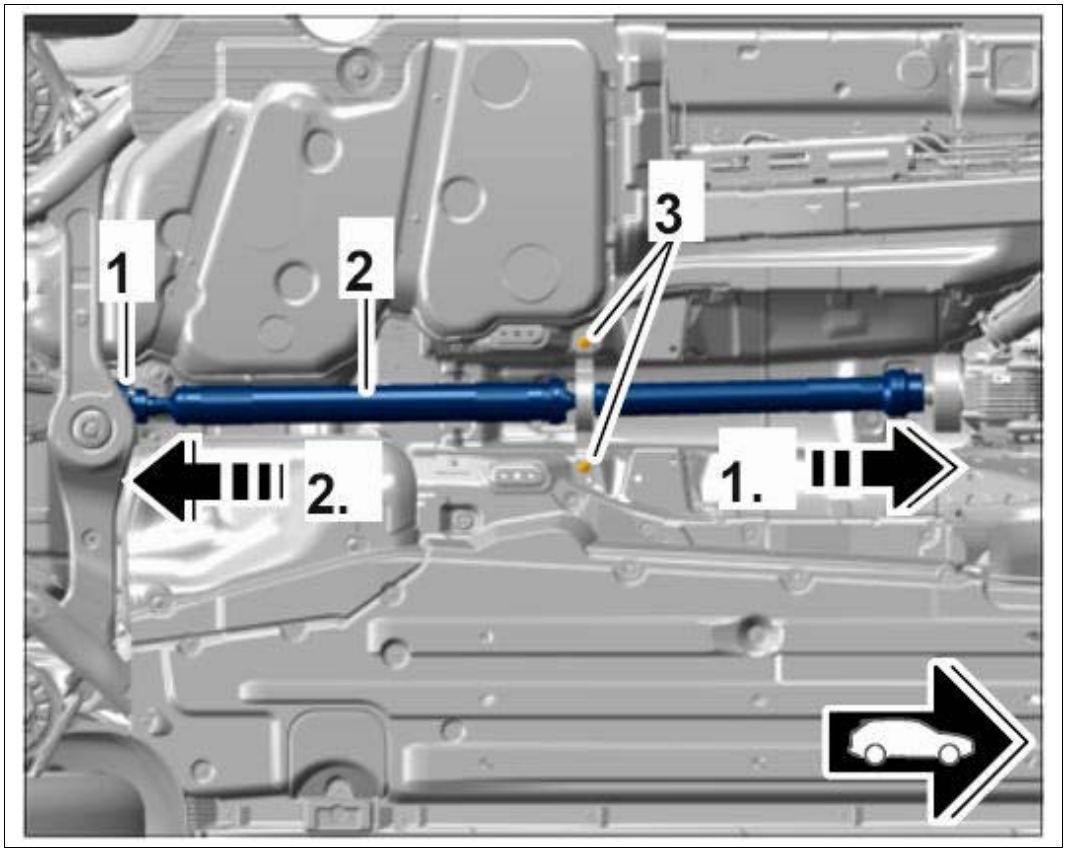
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Remove cardan shaft **-2-** .

The help of another person is required.

1. 6.1. Unscrew fastening screws **-3-** on the center bearing.
2. 6.2. Press cardan shaft **-2-** in **-direction of arrow 1-** .
3. 6.3. Pull cardan shaft flange **-1-** down and expose it.
4. 6.4. Remove cardan shaft **-2-** in **-direction of arrow 2-** .

Fig 6: Removing Cardan Shaft

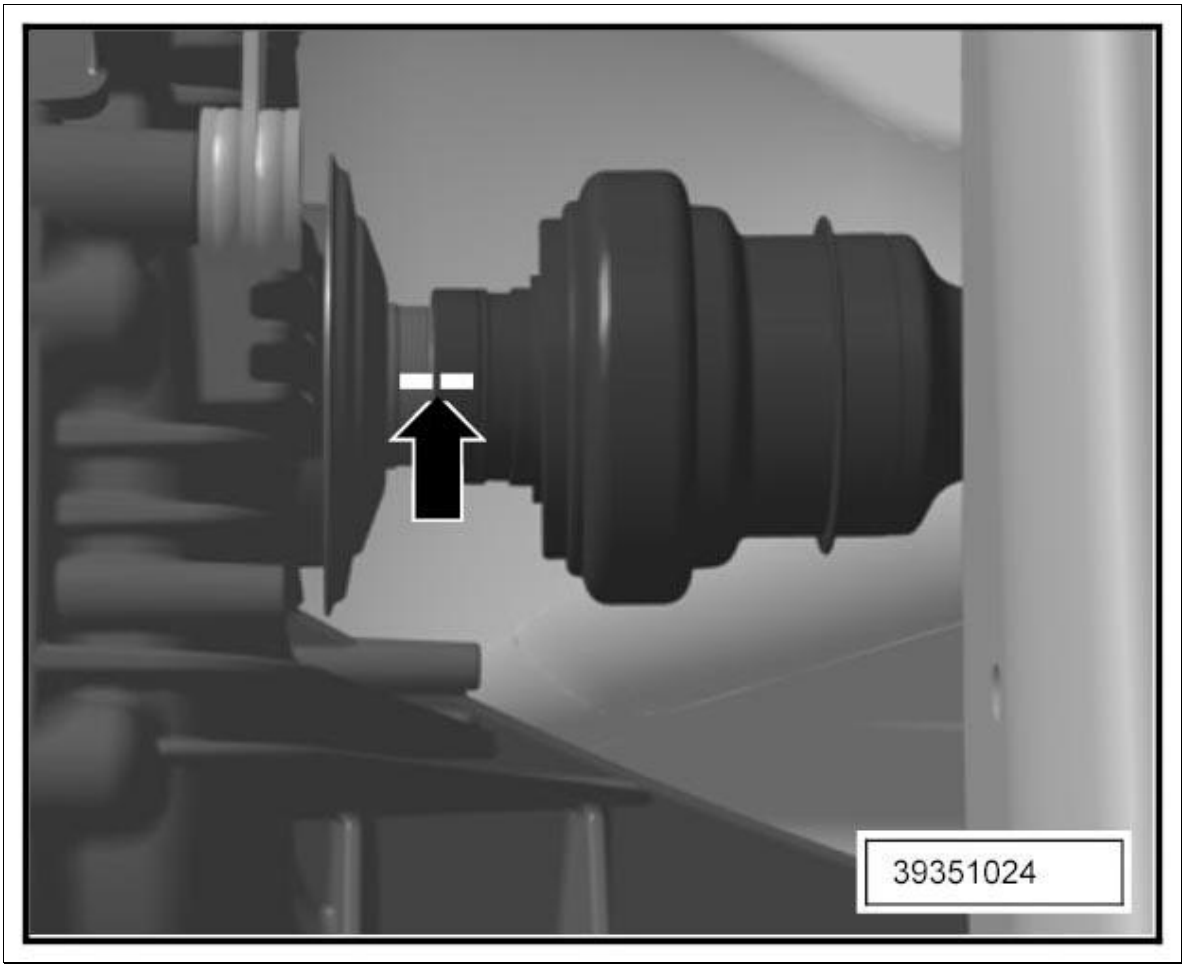


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 393519 REMOVING AND INSTALLING REAR CARDAN SHAFT (MACAN, MACAN S, MACAN TURBO) > INSTALLING REAR CARDAN SHAFT

1. Clean rear connecting flange of the cardan shaft to remove grease.
2. Observe previously marked installation position of the cardan shaft **-arrow-** on the transmission and on the rear axle differential.

Fig 1: Locating Cardan Shaft Installation Position



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

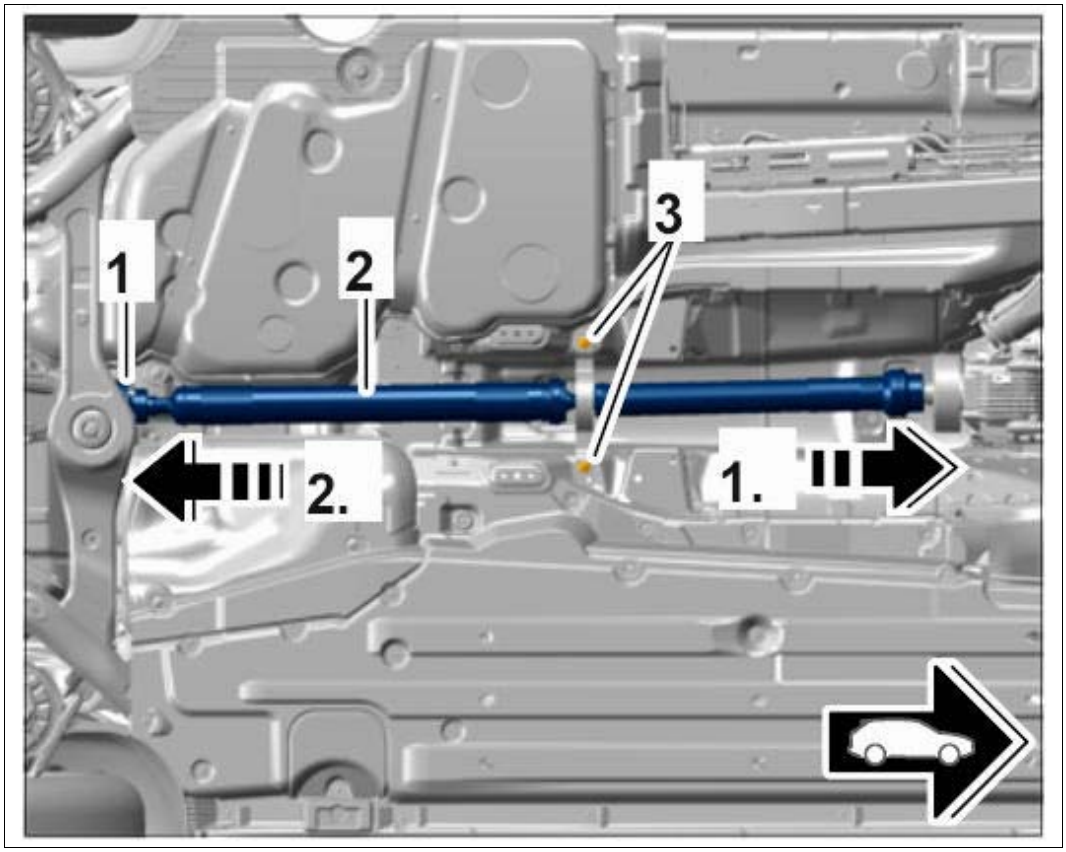
1. Replace fastening screws.
2. Clean and blow out threaded bores.
3. Clean flange surface on rear axle differential and cardan shaft to remove grease.

3. Install cardan shaft **-2-** .

The help of another person is required.

1. 3.1. **Fit new** single-lug clip on the cardan shaft.
2. 3.2. Push cardan shaft in **-direction of arrow 1-** onto the splines on the transmission.
3. 3.3. Press on cardan shaft in **-direction of arrow 1-** .
4. 3.4. Position cardan shaft flange **-1-** on the rear axle differential.
5. 3.5. Fit and tighten fastening screws on the center bearing **-3-** .

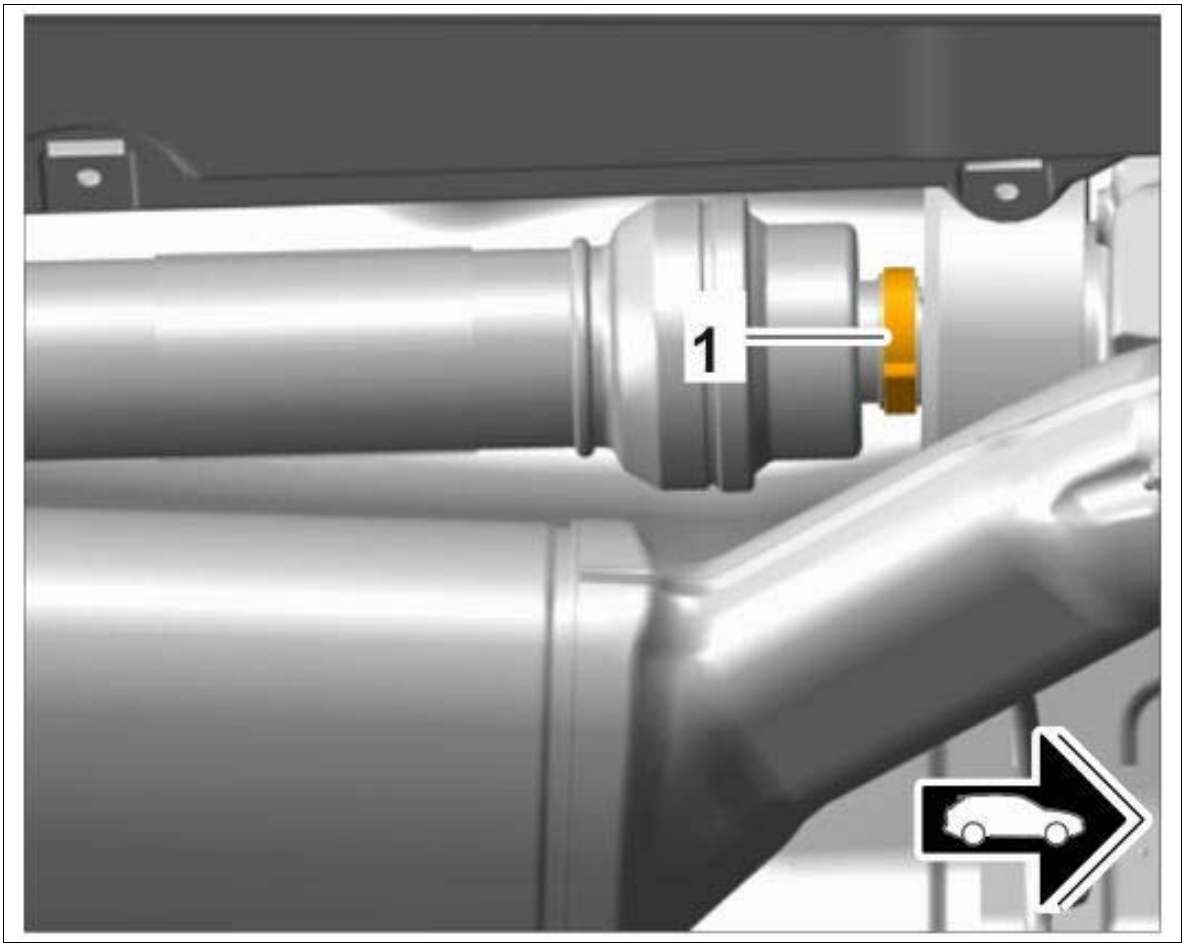
Fig 2: Installing Cardan Shaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Fasten single-lug clip **-1-** on the cardan shaft.

Fig 3: Identifying Cardan Shaft Single-Lug Clip



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. Replace fastening screws.
2. Clean and blow out threaded bores.
3. Clean flange surface on rear axle differential and cardan shaft to remove grease.

5. **Fit new** fastening screws **-2-** with a **new** seal and **new** plates at the rear of the rear axle differential and tighten using special tool **electronic torque wrench, 2 - 100 Nm/1.5 - 74 ftlb 9768.**

   Step 1

   Step 2 **Tightening torque: 21 Nm (16 ftlb.)**

   Final tightening **Torque angle +90°**

Fig 4: Identifying Cardan Shaft Fastening Screws

Information

Information for replacing the final drive/servo motor.

- If the final drive as well as the servo motor (control unit) is replaced, there is no need to reload data (classification data).
- Classification data can be read out of the control unit using the PIWIS Tester.
- If only the servo motor is replaced, the classification data must be re-written into the control unit.
- Classification data can be found on the final-drive housing.

1. Installation is performed in reverse order. Pay particular attention to the following:

   Information

   1. Replace O-rings.
   2. Grease O-rings with a light coating of Kluber Syntheso Glep (Part No.: 000.043.204.68).
      1. 1.1. Replace sealing ring on servo motor shaft **-arrow -** .
      2. 1.2. Tightening torque:

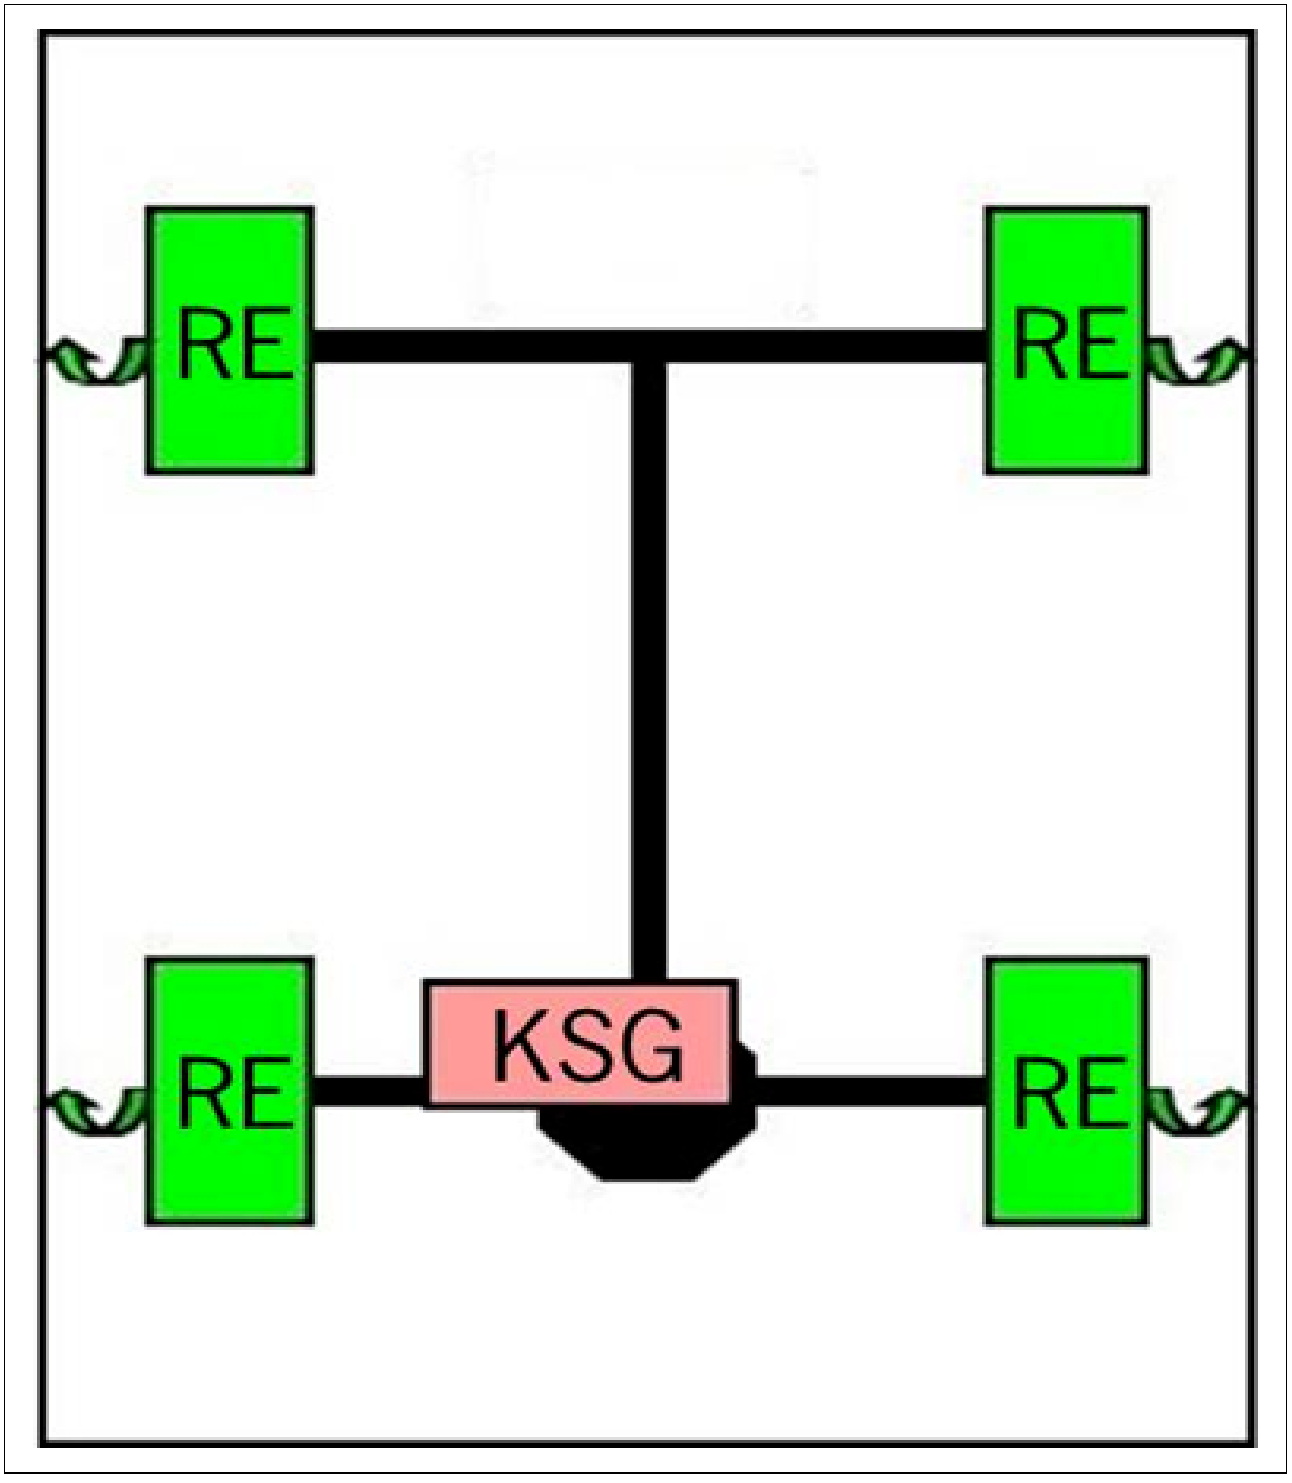
WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TOOLS

Designation	Type	Number	Description	

PIWIS Tester II	Special tool	9818		
WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) > DESIGN AND OPERATING PRINCIPLE > DESIGN

Fig 1: Identifying 3RD Generation TPM System Design



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The 3rd generation TPM system consists of:

- 4 wheel electronics units screwed onto the wheels
- 4 TPM valves and
- 1 TPM control unit (KSG) with integrated central antenna (installed on the rear axle)

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) > DESIGN AND OPERATING PRINCIPLE > OPERATING PRINCIPLE

The 3rd generation TPM system operates on the principle of unidirectional communication between the wheel electronics and control unit. This means that the wheel electronics can communicate with the control unit, but the control unit cannot communicate with the wheel electronics.

The wheel electronics units send the currently measured tire pressure, the direction of rotation, the temperature of the air in the tire and the remaining service life (of the battery) as well as a specific ID from the wheel that is currently turning at specified intervals.

The wheel position is learned automatically from the side and axle specifications. The direction of rotation of a wheel is detected by acceleration sensors in the wheel electronics (left/right detection). Axle sensing (front axle/rear axle detection) is performed based on differentiated sound levels between the front and rear axle, where the central antenna is fitted close to one axle (high level). The levels received from the other axle are correspondingly low.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) > DESIGN AND OPERATING PRINCIPLE > TRANSMISSION MODES

The wheel electronics units communicate with the control unit in various modes. Depending on the current mode of a wheel electronics unit, it sends telegrams to the control unit at defined intervals.

- **Normal mode:** Normal mode is active while the vehicle is driving (after Burst mode has ended).
- **Sleep mode:** Sleep mode is activated as soon as the vehicle remains stationary for longer than 5 minutes. The wheel electronics then send no more telegrams. If the ignition is switched on while the wheel electronics units are in Sleep mode, no tire pressures are displayed (display in instrument cluster: "-.-"). Tire pressures are only displayed again when the vehicle is driving (see Burst mode).
- **Burst mode:** If the wheel electronics units are in Sleep mode and the vehicle is accelerated to over 25 km/h (15 mph) from stationary, the wheel electronics units switch to Burst mode. The wheel electronics units send their telegrams for 60 seconds at fast intervals.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > GENERAL INFORMATION

If a new set of wheels is used or wheel electronics units were replaced, the TPM system must be taught. When teaching the TPM system, the control unit stores the wheel IDs of the wheel electronics units and assigns a position to them.

New wheel electronics units can be taught by selecting a new set of wheels in the instrument cluster.

The system is then in learning mode and re-assigns the wheel IDs that are received.

But the system also detects a wheel change if the stored information does not correspond to the information received. The control unit then displays a message on the instrument cluster prompting you to select the newly fitted set of wheels.

The wheel electronics units can be taught while the vehicle is driving and while it is stationary. Teaching while driving is recommended.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > TEACHING WHILE DRIVING

A procedure in **PIWIS Tester II 9818** can be used to teach the wheel IDs while driving: >>Tyre Pressure Monitoring (TPM) system << >>Maintenance/repairs<< >>Teach wheel IDs<< >>Teach wheel IDs while driving<<.

The wheel IDs can also be taught without using the System Tester.

The following points must always be observed:

- Allow an idle time of at least 5 minutes before teaching the wheel IDs (wheel electronics units are then in Sleep mode).
- Briefly accelerate the vehicle to over 25 km/h (15 mph) in order to teach the wheel IDs (wheel electronics units are then in Burst mode).
- Then continue driving at any speed (even < 25 km/h or 15 mph) for max. 10 minutes.
- Teaching was successful if a pressure reading is displayed in the instrument cluster for all wheel positions.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > TEACHING WHILE STATIONARY

Information

If the TPM system is to be taught while the vehicle is stationary, it is advisable to take note of the wheel IDs and the position of all wheels and store the information together with the wheels. This can significantly reduce the teaching time for the next wheel change.

The wheel IDs and position can be read out using **PIWIS Tester II 9818** if this information is already stored in the control unit. >>Tyre Pressure Monitoring (TPM) system<< >>Actual values and input signals<<

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > TEACHING

WHILE STATIONARY > IF WHEEL IDS ARE KNOWN

Allocation of wheel electronics units using the **PIWIS Tester II 9818:** >>Tyre Pressure Monitoring (TPM) system<< >>Maintenance/repairs<< >>Teach wheel IDs<< >>Teach wheel IDs while vehicle is stationary<< >>Wheel IDs known<<.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > TEACHING WHILE STATIONARY > IF WHEEL IDS ARE UNKNOWN

Allocation of wheel electronics units using the **PIWIS Tester II 9818:** >>Tyre Pressure Monitoring (TPM) system<< >>Maintenance/repairs<< >>Teach wheel IDs<< >>Teach wheel IDs while vehicle is stationary<< >>Wheel IDs unknown<<.

Always observe the following procedure (instructions on the System Tester always take precedence!):

- Allow an idle time of at least 5 minutes before teaching the wheel IDs (wheel electronics units are then in Sleep mode).
- As per instructions on the System Tester, pressure (at least 0.2 bar and approx. 5 seconds) at the wheels must be reduced.
- The wheel electronics registers the pressure difference (after 2 minutes at the latest) and switches to Burst mode.
- The control unit receives the telegrams from the activated wheel electronics unit and writes its wheel ID to the specified position.

WM 4X00IN INFORMATION ON PSM (ALL MODELS) > INFORMATION ON PSM

PSM is an active control system for stabilizing the vehicle at the limit of driving dynamics. Sensors continuously determine:

- Vehicle speed
- Direction of travel (steering angle)
- Lateral acceleration
- Longitudinal acceleration
- Rotation rate

Information

- The PSM (Porsche Stability Management) is automatically ready/switched on after each engine start.

WM 4X00IN INFORMATION ON PSM (ALL MODELS) > INFORMATION ON PSM >

INFORMATION ON PSM

The vehicles are equipped with a new PSM generation with enhanced functions, which considerably improve active safety.

- Enhanced braking readiness
- Brake assist function
- Enhanced Trailer Stability Management
- New ABS tuning for braking on loose surfaces

With enhanced braking readiness, the brake system builds up slight pressure when the accelerator is released quickly and places the brake pads lightly on the brake discs. If the driver now presses the brake, braking power can be achieved more quickly. This results in a shorter stopping distance. Enhanced braking readiness always remains active, irrespective of whether PSM is on or off.

On identifying full braking - when a defined pedal pressure is exceeded - brake assist supplies the required pressure for maximum deceleration via the PSM hydraulic unit. Brake assist can be deactivated by switching off PSM.

Enhanced Trailer Stability Management is a support function of PSM for driving with a trailer. The system detects swaying movements of the trailer and tries to minimize these through targeted braking. Trailer Stability Management can be switched off by switching off PSM. When the driver presses the brake pedal, Trailer Stability Management is activated even if PSM is switched off.

The ABS control strategy has been modified for braking on loose surfaces. A brake barrier, which helps to reduce braking distance on gravel or snow for example, is created in front of the tires by blocking the wheels short.

WM 4X00IN INFORMATION ON PSM (ALL MODELS) > INFORMATION ON PSM > SWITCHING OFF PSM

Press the PSM button. PSM switches off after a short delay.

When PSM is off, the PSM OFF warning light in the instrument panel and the indicator light in the switch light up.

- When braking, the vehicle is also stabilized when PSM is switched off!
- One-sided wheel spin is also prevented when PSM is switched off!

PSM should always be switched on for normal driving.

In the following exceptional cases, it can be advantageous to switch off the PSM temporarily:

- On a loose surface and in deep snow
- When rocking the vehicle free
- When using snow chains
- On extremely rough ground (if one or more wheels have little or no road grip - engine performance

is reduced)

WM 4X00IN INFORMATION ON PSM (ALL MODELS) > INFORMATION ON PSM > SWITCHING PSM BACK ON

Press the PSM button. PSM switches on after a short delay.

WM 4X00IN LIFTING THE VEHICLE (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 4X00IN LIFTING THE VEHICLE (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Switching on the levelling system	Speed > 7 km/h (4 mph), the levelling system switches on automatically.	Speed greater than	+7 km/h (4 mph)		

WM 4X00IN LIFTING THE VEHICLE (ALL MODELS) > LIFTING THE VEHICLE > GENERAL INFORMATION

NOTE: Air springs can become kinked/fall out

- *Risk of damage to air springs*

→ Switch off the levelling system (press and hold the levelling system button for at least 10 seconds).

→ Check the bellows before lowering the vehicle.

Information

Always pay particular attention to the following before raising the vehicle:

- Deactivate the levelling system before raising the vehicle (press and hold the levelling system button for at least 10 seconds).
- If a transmission range is engaged while the vehicle is raised, the levelling system must first be deactivated using PIWIS Tester II 9818. To do this, select >>Levelling system/PASM<< >>Drive links/checks<< >>Activate/deactivate vehicle<< in the control unit overview. Select the value "Deactivate levelling system (permanently)" and press "Start" [F8] to execute the function. Re-activate the levelling system when the work is complete. To do this, select the value "Activate levelling system" in the same menu item and press "Start" [F8] to execute the function.

WM 4X00IN LIFTING THE VEHICLE (ALL MODELS) > LIFTING THE VEHICLE > LIFTING THE VEHICLE

1. Drive vehicle onto the lifting platform. Pay particular attention to the following:
    1. When driving onto a lifting platform, ensure that there is sufficient distance between the lifting platform and the vehicle.
    2. If work has to be done in the front footwell, the vehicle should be positioned in such a way that the doors can be opened far enough.
2. On vehicles with air suspension/levelling system: Switch off the levelling system.
    1. 2.1. Switch on ignition.
    2. 2.2. Press and hold the levelling system button until the message >>Levelling system switched off<< appears on the instrument cluster.

Fig 1: Identifying Levelling System Button

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WARNING: Vehicle can fall down

1. Risk of squashing or crushing

2. Risk of damage to the vehicle

→ Do not place any solid objects under the raised vehicle.

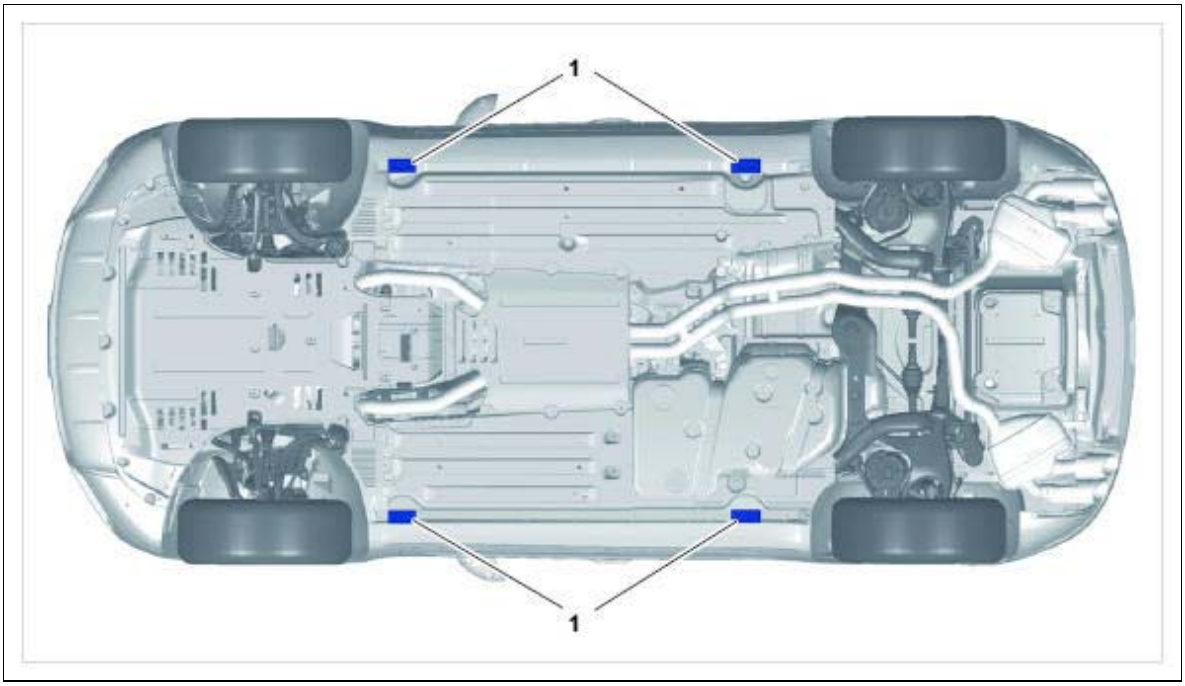
→ Ensure that the lifting platform is prevented from lowering.

→ Remove solid objects before lowering the vehicle.

→ Raise the vehicle only at the take-up points provided.

3. Raise the vehicle at the four jacking points **-1-** .

Fig 2: Identifying Vehicle Jacking Points



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 4X00IN LIFTING THE VEHICLE (ALL MODELS) > SUBSEQUENT WORK > SWITCHING ON THE LEVELLING SYSTEM

1. Lower the vehicle.
2. Switch on ignition.
3. Press and hold the levelling system button until the message >>Levelling system switched on<< appears on the instrument cluster.

   Alternatively, the levelling system will switch on automatically while driving **(→ Speed greater than: +7 km/h (4 mph))** .

Fig 1: Identifying Levelling System Button

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > FITTING CHASSIS COMPONENTS

WARNING: Incorrect handling of safety bolts

- *Danger of injury*
- *Loss of torque*

→ Always use new fastening screws and nuts following removal.

→ Observe specified tightening torques.

→ Carry out a visual inspection of all re-used parts.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > SPRING STRUTS/COIL SPRINGS

WARNING: Installation of incorrect or damaged coil springs

- *Different vehicle handling*
- *Coil springs can break*

→ Examine the components carefully before installation.

→ When installing new coil springs/spring struts, make sure they are assigned correctly.

→ Only use a suitable tool for removing and installing coil springs.

→ Do not weld or grind, or use a hammer close to the spring struts.

→ Do not apply color markings to the coil springs.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > WHEELS AND TIRES

WARNING: High tire seating pressure

- *Risk of squashing or bruising*

→ Use a tire filling cage.

Information

- Newly mounted tires require a bedding-in period to remove the vulcanization layer.
- Customers must be informed that the full performance of new tires is achieved only after a distance of 100 to 200 km (60 to 120 miles) has been driven. Avoid extreme driving maneuvers (acceleration, braking) during this time.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > WORKING ON VEHICLES WITH PSM

WARNING: Steering-angle sensor not calibrated or calibrated incorrectly

- *Unexpected vehicle handling*
- *Steering-angle sensor does not function*
- *Malfunction in steering-angle sensor*

→ After working on wheel suspension parts, when replacing the steering-angle sensor and after changing the wheel alignment values, calibrate the steering-angle sensor using **PIWIS Tester II 9818** .

→ Keep the front wheels in straight-ahead position on the measuring platform during calibration.

→ On vehicles with electromechanical steering, also re-teach the electric steering lock settings.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > BRAKE SYSTEM

WARNING: Installation of brake pads with the wrong brake pad quality

- *Longer braking distance*
- *More wear on brake pads*

→ Only use the type-specific brake pads.

→ Replace the brake pads when the brake pad wear indicator light comes on, but no later than when

there is a residual pad thickness of 2 mm on each axle.

→ Replace the brake discs on each axle as soon as the brake pad wear limit is reached.

Information

- Observe brake fluid quality. Use only new DOT 4 brake fluid.
- The brake-fluid change interval using Super DOT4 brake fluid is two years.
- This brake fluid is available under the following part numbers: Container quantity: 1 liter = 000.043.203.66. 30 liters = 000.043.203.67.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > HANDLING AIRBAG SYSTEMS

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

WM 270419 REMOVING AND INSTALLING DC/DC CONVERTER (ALL MODELS) > PRELIMINARY WORK

1. Remove trim panel for luggage compartment (luggage compartment cover) at the right side. → Removing center trim panel for luggage compartment (luggage compartment cover)

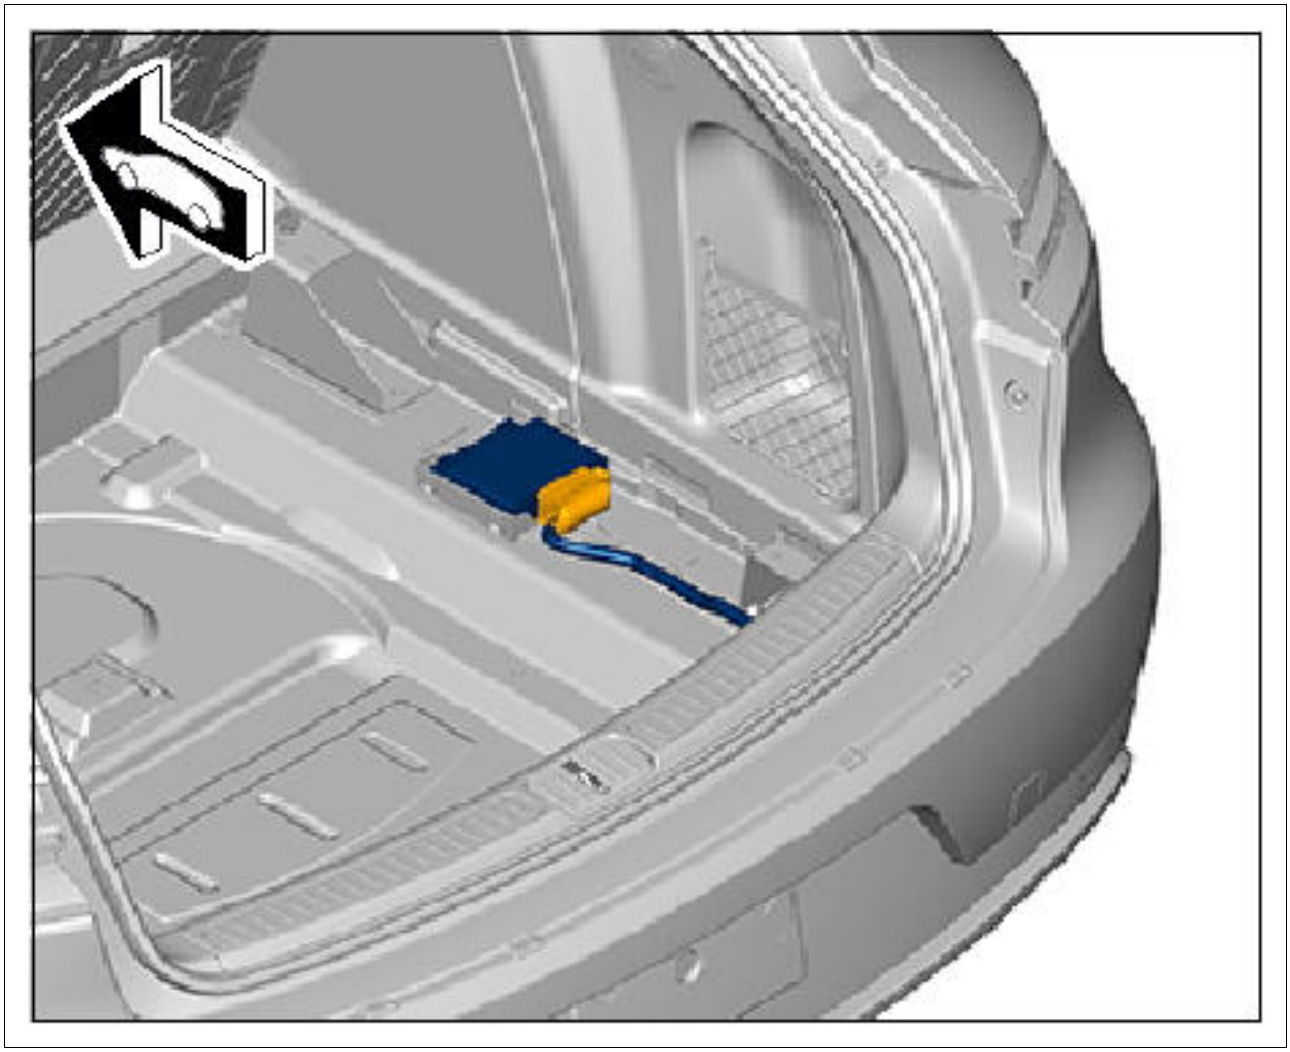
WM 270419 REMOVING AND INSTALLING DC/DC CONVERTER (ALL MODELS) > REMOVING DC/DC CONVERTER

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

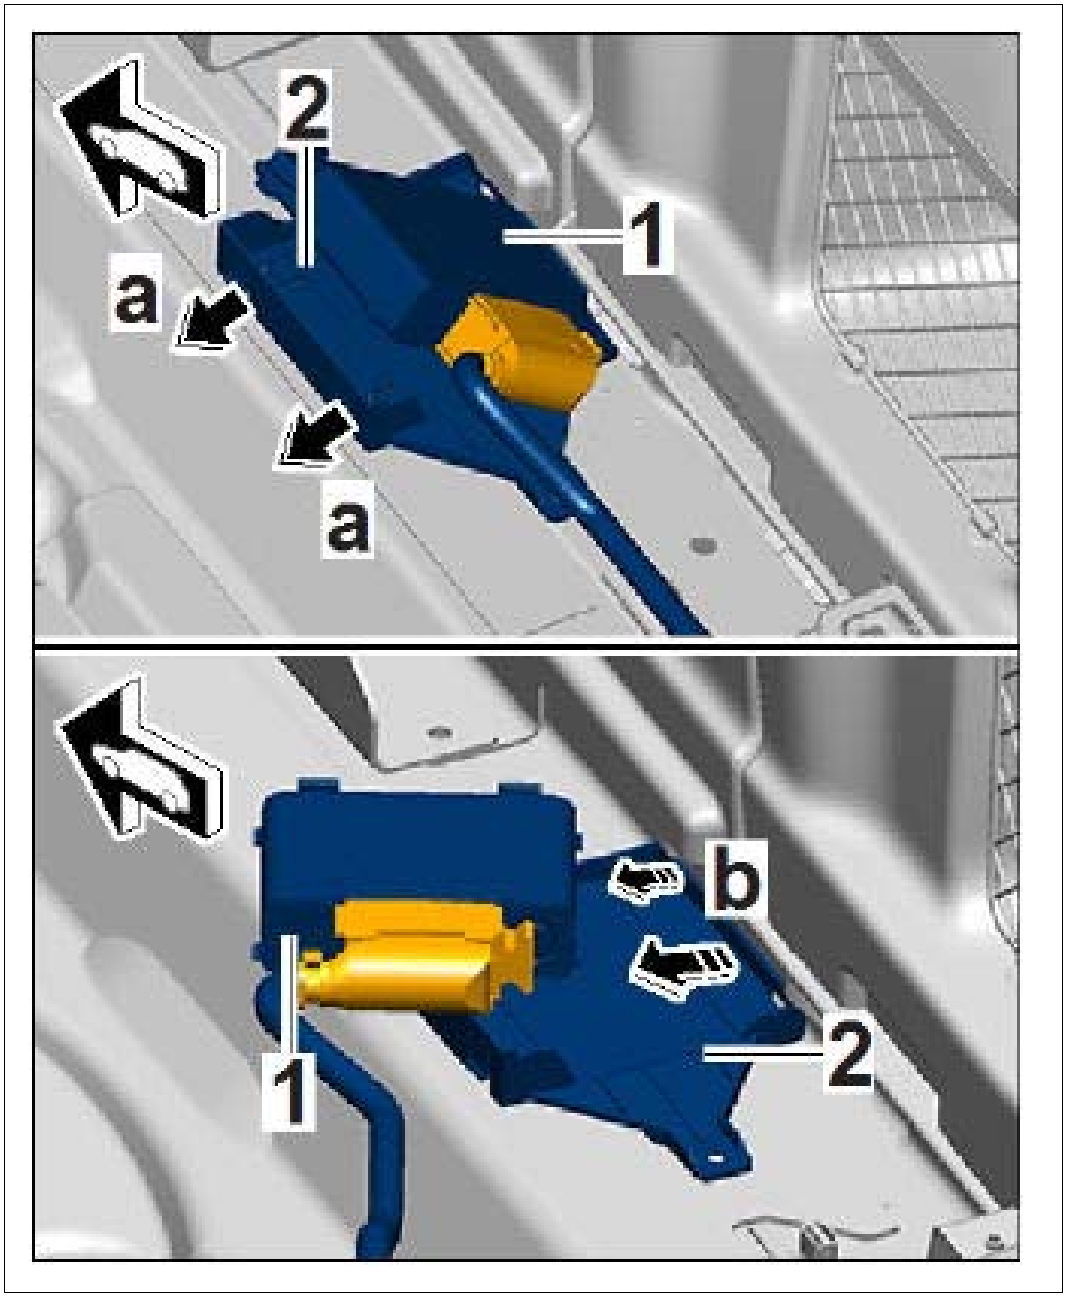
Fig 1: Identifying DC/DC Converter Position



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Switch off ignition and pull remote control out of ignition lock.
2. Take DC/DC converter **-1-** out of the holder **-2-** .
    1. 2.1. Disengage retaining lugs **-a-** .
    2. 2.2. Lift DC/DC converter up slightly at the left.
    3. 2.3. Pull DC/DC converter at the right out of the holder **-b-** .

Fig 2: Removing DC/DC Converter



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Always comply with the regulations for handling ESD-sensitive components!

1. Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
2. The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
3. Never touch the electric pins and plug contacts.

3. Pull slide **-2-** out of the electric plug connection **-1-** (**-a-**) and disconnect electric plug connection from the DC/DC converter **-A-** .

Fig 3: Disconnecting Electric Plug Connection (Shown On 991)

WM 270619 REMOVING AND INSTALLING BATTERY (ALL MODELS) > REMOVING BATTERY

WARNING: Static battery charge

- *Battery can explode*
- *Electrical discharges*

→ Do not rub the battery with a dry cloth.

NOTE: Using charging cables/jump leads directly on the vehicle battery.

- *Risk of damage to battery sensors.*

→ Always connect charging cables/jump leads to the external power supply for jump-lead starting.

Information

Switch off all loads and remove the ignition key.

- Do not disconnect the battery while the engine is running.
- Disconnect and reconnect battery with extreme caution.
- Do not rub the battery with a dry cloth.

1. Switch off ignition and pull remote control out of ignition lock.
2. Switch off electrical loads.
3. Remove luggage compartment floor.
4. Remove collapsible wheel, if necessary.
5. Lift carpet **-1-** .
6. Disengage cover **-2-** (**-arrows-**) and fold it forward.

Fig 1: Opening Battery Cover

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. **Danger of short circuit when loosening the terminal clamps!**

    1. 7.1. **First** open the cover on the negative terminal and disconnect **terminal clamp -1- for the ground strap from the battery terminal!**
    2. 7.2. Insulate terminal clamp or route ground strap to prevent any contact with the battery terminal!
    3. 7.3. Open cover on the positive terminal and disconnect terminal clamp **-2-** for the B+ line from the battery terminal.

Fig 2: Identifying Battery Terminal Clamps

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Unscrew fastening screw **-1-** , remove clamp support **-2-** and move it forward with a rebound strap.

Fig 3: Identifying Battery Clamp Support Screw

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Disengage cover **-1-** (**-arrows-**) and remove it.

Fig 4: Removing Battery Cover

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Pull breather hose **-1-** off the battery **-2-** .
11. Bend up support clips **-3-** and lift the battery out. Get another person to help if necessary.

Fig 5: Identifying Battery And Breather Hose

WM 270619 REMOVING AND INSTALLING BATTERY (ALL MODELS) > INSTALLING BATTERY

WARNING: Static battery charge

- *Battery can explode*
- *Electrical discharges*

→ Do not rub the battery with a dry cloth.

Information

Switch off all loads and remove the ignition key.

- Do not disconnect the battery while the engine is running.

- Disconnect and reconnect battery with extreme caution.
- Do not rub the battery with a dry cloth.

1. Installation is performed in reverse order to removal.
2. Tighten fastening screw for clamp support securing battery to the body. **Tightening torque 23 Nm (17 ftlb.)**
3. Tighten fastening nuts on terminal clamps. **Tightening torque 5 Nm (3.5 ftlb.)**

WM 270619 REMOVING AND INSTALLING BATTERY (ALL MODELS) > SUBSEQUENT WORK > VEHICLES WITH SOUND SYSTEM

1. Install subwoofer. → Installing subwoofer
2. If the battery was replaced, write new battery data into the gateway control unit using **PIWIS Tester II 9818.** → WM 270619 REMOVING AND INSTALLING BATTERY
3. Follow work instructions after disconnecting the battery. → 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY

WM 2706IN EXTERNAL POWER CONNECTION, JUMP-LEAD STARTING (ALL MODELS) > INFORMATION > EXTERNAL POWER CONNECTION, JUMP-LEAD STARTING

WARNING: Live jump leads

- *Risk of electric shock*
- *Risk of short circuit*

→ Route the jump leads so that they do not become entangled in moving parts in the engine compartment.

→ There must be no contact between the vehicles.

NOTE: Using charging cables/jump leads directly on the vehicle battery.

- *Risk of damage to battery sensors.*

→ Always connect charging cables/jump leads to the external power supply for jump-lead starting.

Information

- If the battery is flat, jump leads can be used together with the battery of another vehicle to start the

car or to supply external power to the vehicle.

Information

Both batteries must be 12 V batteries.

The capacity (AH) of the donor battery must not be significantly lower than that of the flat battery.

The flat battery must be properly connected to the vehicle electrical system.

1. Open protective cover on the positive terminal for jump-lead starting **-+-** (**-arrow-**).
2. Connect the positive cable to the positive terminal for jump-lead starting **-+-** , then to the positive terminal of the donor battery.
3. First, connect the negative cable to the negative terminal of the donor battery, then to the ground point for jump-lead starting **-** .

Fig 1: Connecting Battery To Vehicle Electrical System

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Leave the engine of the vehicle supplying the power running at higher revs.
5. Start the engine. Do not spend longer than 15 seconds trying to start the vehicle with the jump leads, then wait for at least one minute before trying again.
6. Disconnect the two jump leads in reverse order when the engine is running.
7. Close protective cover.

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Battery terminal		Torque	5 Nm (3.5 ftlb.)		

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > INFORMATION

NOTE: A battery charger for providing an external power supply or for jump-lead starting is connected directly to the battery in the vehicle.

- *Risk of damage to the battery sensor.*
- *Battery sensor sends incorrect battery values to the vehicle electrical system.*

→ Always connect a battery charger for providing an external power supply or for jump-lead starting to the defined connections in the engine compartment. → 2X00IN BATTERY TRICKLE CHARGING

Information

The AGM (**A** bsorbent **G** lass **M** at) battery is a **maintenance-free, sealed** battery.

- This battery must not be opened. If the battery is opened, it must be replaced.

- There is a serial number -A- and a part number -B- on the top right-hand side of the battery.

  Fig 1: Identifying Battery Serial And Part Number

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- After replacing the battery, the serial number and part number as well as the battery size and manufacturer must be entered using the PIWIS Tester under: Gateway/Maintenance/repairs /Change battery.
- The battery size and battery manufacturer must also be entered when changing the battery.

Information

- To prevent contact corrosion, only approved bolts, nuts, washers, etc. should be used. These elements have a special surface coating and must be stored separately.

The battery is one of the most important electrical components in the vehicle. Fault-free functioning of the battery contributes greatly to customer satisfaction. To guarantee long and efficient operation, the battery must be checked and maintained according to the instructions provided here.

Besides starting the vehicle, the battery also acts as a buffer and supplier of electrical power for the entire vehicle electrical system.

An AGM (**A** bsorbent **G** lass **M** at) battery is used as standard. The AGM battery offers the following advantages, for example:

- Sealed, valve-controlled battery
- High-cycle battery
- High cold-start performance
- Cannot leak or tilt
- Totally maintenance-free
- Shake-resistant
- No acid leakage if the housing is damaged
- Flexible installation and safe to handle
- High load capacity and longer service life
- Ideal for Start/Stop function

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > INFORMATION > INSTRUCTIONS FOR HANDLING BATTERIES

Information

- Battery terminals do not need to be greased.
- The battery terminal clamps should only be attached by hand - without excessive force - to prevent damage to the battery.
- The tightening torque for the battery terminals is → Torque: 5 Nm (3.5 ftlb.).
- If the battery is reconnected, proceed according to → 2X0000 WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY .

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > INFORMATION > WARNING NOTES AND SAFETY REGULATIONS FOR BATTERIES

1. **-1-** No fire, sparks, naked flames or smoking:
    1. Avoid sparking when using cables and electrical devices.
    2. Avoid short circuits.
    3. On batteries with central venting, there is an increased concentration of oxyhydrogen gas at the hose opening. The vent hose should not be bent or blocked by dirt.
2. **-2-** Wear eye protection.
3. **-3-** Keep children away from acids and batteries.
4. **-4-** Risk of acid burns:

1. Battery acid is highly caustic, so wear protective gloves.
2. Do not tip battery; acid can emerge from the vent opening.

Fig 1: Identifying Battery Symbols

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. First aid: Rinse acid splashes in the eyes immediately with clean water for a few minutes. Consult a doctor immediately. Neutralize acid splashes on the skin or clothing immediately with soap suds and rinse again with plenty of water. If acid has been drunk unintentionally, consult a doctor immediately.

5. **-5-** Follow the instructions on the battery, in the Technical Information and in the Driver's Manual.
6. **-6-** Risk of explosion:
    1. A highly explosive detonating gas mixture is formed when charging batteries.
7. **-7-** Disposal:
    1. Hand in old batteries at a collection point.
8. **-8-** Never dispose of old batteries in domestic rubbish!

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > NOTES ON REMOVING AND INSTALLING THE BATTERY

NOTE: A battery charger for providing an external power supply or for jump-lead starting is connected directly to the battery in the vehicle.

- *Risk of damage to the battery sensor.*
- *Battery sensor sends incorrect battery values to the vehicle electrical system.*

→ Always connect a battery charger for providing an external power supply or for jump-lead starting to the defined connections in the engine compartment. → 2X00IN BATTERY TRICKLE CHARGING

Information

- The battery is located in the luggage compartment under the loadspace floor.
- In order to avoid triggering the siren in vehicles with an additional alarm siren, the battery must be disconnected while the ignition is on!
- All loads must be switched off beforehand! Remove ignition key!
- Never disconnect battery with engine running!
- Never start engine without a securely connected battery!
- To prevent damage to the battery, the battery terminal clamps should only be attached by hand - without excessive force.
- Check that the battery is seated correctly after installation. A loose battery presents other dangers, such as: - Reduced service life due to vibration damage. - Noises. - Damage to the battery housing from mounting parts. - Inadequate crash safety.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > NOTES ON REMOVING AND INSTALLING THE BATTERY > OPERATING PRINCIPLE OF CENTRAL VENTING

Information

- State-of-the-art batteries have central venting -A- .
- In certain battery states, the gas produced during charging can emerge centrally through an opening on the upper cover side. Backfire protection is integrated at the same position and prevents the combustible gas in the battery from igniting.
- On batteries with a vent hose -A- , check that the vent hose is not disconnected or pinched. Only then can the battery be freely vented.

Fig 1: Identifying Battery Vent Hose

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > VISUAL INSPECTION

A visual inspection of the battery must be performed before taking measurements, e.g. measuring the open-circuit voltage, or before carrying out the battery load test.

This test can be used to determine:

- Whether the battery housing is damaged. Leak-free operation and function of the battery cannot be guaranteed if the housing is damaged.
- Whether the battery terminals (battery line connections) are damaged. The line connections might not make contact if the battery terminals are damaged. This can cause the lines to catch fire and can result in malfunctions in the electrical system.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) >

CHECKING BATTERY VENT HOSE

Information

- Make sure that the vent hose -A- is not kinked or damaged. If in doubt, replace it.
- The vent hose -A- must be inserted in the battery and in the battery box.

Fig 1: Identifying Vent Hose (Panamera)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > OPEN-CIRCUIT VOLTAGE MEASUREMENT

Information

- Compared with the value from PIWIS Tester II 9818, the battery voltage can be measured using a hand-held multimeter.
- Proceed as follows:

Information

The open-circuit voltage measurement should be read out using **PIWIS Tester II 9818** in the **Gateway** control unit by selecting **Energy management, Quick closed-circuit current measurement** in the menu.

1. Switch off ignition and remove ignition key.
2. Disconnect ground strap on the battery.

   Information

   1. After charging and waiting for at least 2 hours, during which time the battery should neither be loaded nor charged:
3. Measure the battery voltage with a hand-held multimeter.
   1. The battery open-circuit voltage should not fall below 12.5 V.
   2. If the hand-held multimeter shows 12.5 V or more, the battery voltage is OK.
   3. If the hand-held multimeter shows a battery voltage below 12.5 V: Charge the battery.

Charging the battery

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapors.

→ Attach warning sign in a clearly visible position.

Information

- A battery charger is required.
- Read operating instructions for the charger.
- The battery must have a minimum temperature of 0 °C.
- If possible, do not rapid-charge batteries as this can damage them.
- If exhaustively discharged batteries are charged quickly, they will not take up a charge current or they will be identified too early as full due to the so-called "surface charge".

NOTE: A battery charger for providing an external power supply or for jump-lead starting is connected directly to the battery in the vehicle.

- *Risk of damage to the battery sensor.*
- *Battery sensor sends incorrect battery values to the vehicle electrical system.*

→ Always connect a battery charger for providing an external power supply or for jump-lead starting to the defined connections in the engine compartment. → 2X00IN BATTERY TRICKLE CHARGING

1. Switch off the battery charger.
2. Switch off ignition and remove ignition key.
3. Connect cables from the charger to the external power supply points.
4. Set the charge current on the battery charger according to the battery capacity.
5. Switch on the battery charger.

   Procedure for charging exhaustively discharged batteries:

   Batteries that have not been used for a long time discharge automatically.

   A battery is exhaustively discharged if the open-circuit voltage has dropped below 11.6 V, see OPEN-CIRCUIT VOLTAGE MEASUREMENT

   In exhaustively discharged batteries, the battery acid (sulfuric acid and water mixture) consists of virtually only water, as the sulfuric acid proportion is considerably reduced.

   Exhaustively discharged batteries sulphatise, i.e. the entire plate surfaces of the batteries harden.

   If exhaustively discharged batteries are immediately recharged after an exhaustive discharge, the sulphatisation recedes again.

   If these batteries are not recharged, the plates continue to harden and charge take-up ability is limited. This results in reduced battery performance.

   Exhaustively discharged batteries must be charged using a low charge current as follows:

   1. Set the charge current to maximum 10% of battery capacity, i.e. with a 95 AH battery, the charge current is max. 9.5 A.

6. Charge the battery.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > BATTERY TRICKLE CHARGING

Information

- When working or carrying out tests on the vehicle or when the vehicle is in the workshop, a battery charger with a rated current of at least 40 A must be connected.
- As soon as the vehicle is unlocked, e.g. the vehicle is in the workshop or salesroom, it must be trickle charged with a battery charging device.

1. Switch off the battery charger.
2. Switch off ignition and remove remote control (hand-held transmitter).
3. Switch off all electrical loads (e.g. lights).

4. Open protective cover on the positive terminal for jump-lead starting.
5. First, connect the positive cable to the positive terminal for jump-lead starting, then to the positive terminal of the donor battery.
6. First, connect the negative cable to the negative terminal of the donor battery, then to the ground point for jump-lead starting.
7. Set the charge current on the battery charger according to the battery capacity.
8. Switch on the battery charger.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > CONNECTING THE BATTERY FOR TRICKLE CHARGING

A charger with a current rating of at least 40 A must be connected to the external power supply points/jump-lead starting points.

Set the charger to maximum A (amps).

Switch off all unnecessary loads (e.g. lights).

When working on the vehicle for more than 15 minutes.

When running diagnostics using the Porsche System Tester.

When adjusting the headlights.

When working on or with the Infotainment system.

If the doors, bonnet and rear lid are open for a long period of time or if these components are actuated frequently.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
wheel alignment system ML 5000 Porsche	Service equipment	WE 1272		
axle alignment system with DSP508XF sensors	Service equipment	WE 1328		adjustment device with reflector VAS 6430/1	Service equipment	WE 1362		
T-socket wrench for ACC sensor VAS 6190/2	Service equipment	WE 1364		
PIWIS Tester II	Special tool	9818		
WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > PRELIMINARY WORK > WHEN DOES DISTANCE MEASURING SENSOR CONTROL UNIT NEED TO BE ADJUSTED?

The distance measuring sensor control unit must be re-adjusted in the following situations:

1. Suspension was aligned and adjusted.
2. Distance measuring sensor control unit or distance measuring sensor control unit holder was loosened or removed and installed.
3. Bumper was loosened or removed and installed.
4. The front end is damaged.
5. Fault memory entry: ACC sensor incorrectly adjusted (D00004).
    1. 5.1. The misalignment angle is outside of the range -1.5° to +1.5°.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > PRELIMINARY WORK > REQUIREMENTS FOR TESTING AND ADJUSTMENT

1. Tyre tread depth of the tires of one axle must not deviate by more than 2 mm.
2. Tyre inflation pressure in accordance with regulations ("Comfort" or "Normal" tire pressure).
3. As with complete suspension alignment, make sure that there is no sliding base or turnplate at the end stop during alignment.
    1. 3.1. Take the track width and wheel base into consideration.
4. Check that vehicle weight corresponds to empty weight. Weight of the vehicle ready for driving (completely full fuel tank, reducing agent tank and water reservoir for the windscreen washer/headlight cleaning system, spare wheel, tool kit, jack) without driver.
5. Spare wheel, tool kit and jack must be located at the positions specified by the vehicle manufacturer.
6. Vehicle aligned correctly, having been bounced multiple times.
7. Wheel suspension, steering and steering linkage show no signs of play or damage.
    1. 7.1. Check for play and damage and carry out repairs if necessary.
8. Set vehicles with air suspension to normal level.
    1. 8.1. Switch off ignition, close and lock all doors.
    2. 8.2. Wait 15 seconds until vehicle has settled in normal level.
    3. 8.3. Open door and leave it open during the measurement, switch on ignition.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > PRELIMINARY WORK > SETTING UP THE MEASURING SYSTEM

Information

Check that there is sufficient floor space between the vehicle and the adjustment device - the gap between the adjustment device and vehicle must be approx. 120 cm.

The vehicle can be reversed onto the axle alignment platform if there is not enough floor space in front of the measuring platform.

The vehicle must be positioned so that the front and rear axles are centered on turnplates/sliding plates.

Information

The procedure described here is for the **wheel alignment system ML 5000 Porsche WE 1272 and the axle alignment system with DSP508XF sensors WE 1328.**

Deviations can occur with other alignment systems.

1. Select **the relevant vehicle in the wheel alignment computer.**
2. Select quick function **Calibrate distance measuring sensor** .
3. Fit instrument holders onto the wheels on the rear axle.
4. Fit the rear sensors onto the rear axle using the spoiler adapter (Beissbarth only, this sets the sensors to a lower position).
5. Align the rear sensors on the rear axle using the spirit level and clamp the instrument holders using the wing screws.

   Information

   Once the vehicle and adjustment tool are aligned, the vehicle and adjustment tool must no longer be moved.

   1. The vehicle is standing on turnplates/sliding plates that are released on one side , allowing the vehicle to be moved slightly.
   2. If the vehicle is moved while taking measurements on the turnplates, the measurement process must be repeated.
   3. If the adjustment tool is moved following alignment, the measurement process must be repeated.
6. Attach the front sensors to the measuring mirror, align using the spirit level and clamp.

   1. 6.1. Centre the adjustment tool.
   2. 6.2. Set distance of adjustment tool and vehicle in accordance with the specifications provided by the measuring equipment manufacturer.
   3. 6.3. The distance between the left sensor and the vehicle **-Bl-** should be identical to the distance between the right sensor and the vehicle **-Br-** .

Fig 1: Identifying Right Sensor Dimension

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Switch on (initialize) the sensors.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > PRELIMINARY WORK > PREPARATION FOR ADJUSTING DISTANCE MEASURING SENSOR

1. Connect a battery charger with a current rating of at least 40 A to the external power feed points.
2. Read out the fault memory using **PIWIS Tester II 9818** , create a vehicle analysis log if necessary → 0X03IN CREATING VEHICLE ANALYSIS LOG (VAL) and correct any faults.
3. Remove trim cover **-1-** from the distance measuring sensor control unit.
    1. 3.1. Push trim cover up **-a-** .
    2. 3.2. Pull trim cover forward and remove it **-b-** .

Fig 1: Removing Trim Cover

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Clean distance measuring sensor control unit and trim cover using commercially available cleaning agent.

5. Fit the front sensors onto the adjustment device, align using the spirit levels and clamp using the wing screws, and switch them on (initialize).

6. Set the distance between the **adjustment device with reflector VAS 6430/1 WE 1362** and the **vehicle** in accordance with the specifications provided by the measuring equipment manufacturer.

    1. 6.1. The distance between the left sensor and the vehicle **-Bl-** should be identical to the distance between the right spirit level and the vehicle **-Br-** .

Fig 2: Identifying Right Sensor Dimension

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. On the adjustment device, move the mirror into the position **-2-** in alignment with the marking (**-A-** the number 2 on the rotary knob must point towards the vehicle).

Fig 3: Identifying Adjustment Device Position

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Once the vehicle and adjustment tool are aligned, the vehicle and adjustment tool must no longer be moved.

1. The vehicle is standing on turnplates/sliding plates that are released on one side, allowing the vehicle to be moved.

2. If the vehicle is moved while taking measurements on the turnplates, the measurement process must be repeated.

3. If the adjustment tool is moved following alignment, the measurement process must be repeated.

8. Release turnplates/sliding plates on **one side of the vehicle** .

9. Start the menu for adjusting the distance measuring sensor control unit, see **operating instructions for measuring platform** .

10. Before starting the adjustment process, use the laser beam at the mirror **-3-** on the adjustment device (for switching on the laser beam, see operating instructions for adjustment device) to check that the laser beam strikes the sensor lens. Info:

    1. 10.1. The adjustment device is positioned correctly if the laser beam still strikes the sensor lens even after the identical individual toe values have been set.

    2. 10.2. If the laser beam does not strike the sensor lens, the alignment of the adjustment device must be repeated.

Fig 4: Identifying Adjustment Device Position

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

11. Align adjustment device at the side:

    1. 11.1. The laser beam of the adjustment device must strike the center of the sensor lens.

Fig 5: Aligning Adjustment Device

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Use the adjusting screws **-1, 2, 3, 4, 5-** on the adjustment device to level the mirror's spirit levels **-A, B-** horizontally.

13. Use the crank **-arrow-** on the adjustment device to adjust the mirror so that the laser beam strikes the center of the sensor lens on the vertical line.

Fig 6: Aligning Mirror's Spirit Levels

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Turn the adjustment bar on the adjustment device to the side using the adjustment screw **-5-** until the green indicator on the adjustment bar is displayed on the measuring platform screen.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR

1. Connect **PIWIS Tester II 9818** to the vehicle and start it.
2. Switch on ignition.
3. Select the required vehicle and the **Adaptive cruise control** control unit. Press [F12] to continue.
4. Select the **Maintenance/repairs** sub-menu in the **Adaptive cruise control** menu. Press [F12] to continue.
5. Follow the instructions on **PIWIS Tester II 9818** and adjust the distance measuring sensor control unit **-1-** as required using adjustment tool **T-socket wrench for ACC sensor VAS 6190/2 WE 1364 -2-** by turning the relevant adjusting screw **-3-** according to specifications.

Fig 1: Identifying Sensor Control Unit Adjusting Screws

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Repeat the process until PIWIS Tester II 9818 displays the message Adjustment successful.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > SUBSEQUENT WORK

1. Switch off ignition and pull remote control out of ignition lock.
2. **PIWIS Tester II 9818** must now be disconnected from the vehicle.
3. Disconnect battery charger.
4. Remove sensors and instrument holders.

   Information

   Before and after fitting the trim cover for the distance measuring sensor control unit, check the following points:

   1. The holder for the distance measuring sensor control unit must not show any signs of deformation, which may have been caused, for example, by removing or installing the trim

cover for the distance measuring sensor control unit. If the holder for the distance measuring sensor control unit is deformed, carefully push it back into shape.

2. If the trim cover is damaged or cracked, replace the trim cover.

3. After fitting the trim cover, check that it is seated correctly and securely.

5. Install trim cover **-1-** on the distance measuring sensor control unit.

1. 5.1. Fit trim cover **-a-** .

2. 5.2. Push trim cover down **-b-** until it engages securely.

Fig 1: Installing Trim Cover On Distance Measuring Sensor Control Unit

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Perform a test drive and check operation of distance measuring sensor control unit.

7. Read out the fault memory of the distance measuring sensor control unit.

WM 278519 REMOVING AND INSTALLING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Holder for distance measuring sensor control unit to closing panel	Internal Torx screw, M6 x 12	Tightening torque	8 Nm (6 ftlb.)		
Holder for distance measuring sensor control unit, lower to plastic bracket	Internal Torx screw, Ø 5 x 16	Tightening torque	2.5 Nm (2 ftlb.)		

WM 278519 REMOVING AND INSTALLING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > PRELIMINARY WORK

1. Remove front apron. → Removing Front Apron

WM 278519 REMOVING AND INSTALLING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > REMOVING CONTROL UNIT FOR DISTANCE MEASURING SENSOR

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

1. Switch off ignition and pull remote control out of the ignition lock.
2. Disengage trim cover **-1-** at the left and right of the holder **-2-** for the distance measuring sensor control unit **-3-** and remove it.

Fig 1: Removing Distance Measuring Sensor Control Unit Cover

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Always comply with the regulations for handling ESD-sensitive components!

1. Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.

2. The new part must only be removed from the ESD (electrostatic discharge) protective

packaging just before installation and at the position at which the part is to be installed.

3. Never touch the electric pins and plug contacts.

3. Release electric plug connection **-1-** (**-2-**) and disconnect it from the distance measuring sensor control unit **-3-** .

4. Unclip bracket for electric line **-4-** at the holder for the distance measuring sensor control unit and set electric line aside.

Fig 2: Disconnecting Electric Plug Connection

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Loosen air guide **-1-** close to the distance measuring sensor control unit **-2-** at the lock carrier.

6. Unscrew fastening screws **-3-** and remove distance measuring sensor control unit and holder.

Fig 3: Identifying Distance Measuring Sensor Control Unit

WM 278519 REMOVING AND INSTALLING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > INSTALLING CONTROL UNIT FOR DISTANCE MEASURING SENSOR

Information

Before and after fitting the trim cover for the distance measuring sensor control unit, check the following points:

- The holder for the distance measuring sensor control unit must not show any signs of deformation, which may have been caused, for example, by removing or installing the trim cover for the distance measuring sensor control unit. If the holder for the distance measuring sensor control unit is deformed, carefully push it back into shape.
- If the trim cover is damaged or cracked, replace the trim cover.
- After fitting the trim cover, check that it is seated correctly and securely.

1. Installation is performed in reverse order to removal.
2. Tighten fastening screw at the bottom of the holder for the distance measuring sensor control unit. **Tightening torque 2.5 Nm (2 ftlb.)**
3. Tighten fastening screw at the top of the holder for the distance measuring sensor control unit. **Tightening torque 8 Nm (6 ftlb.)**

WM 278519 REMOVING AND INSTALLING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > SUBSEQUENT WORK

1. The distance measuring sensor control unit must be adjusted whenever it is removed and installed. → 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR

WM 2X00IN BATTERY TRICKLE CHARGING (ALL MODELS) > BATTERY TRICKLE CHARGING > INFORMATION

→ "Workshop Equipment and Special Tools Information" Battery chargers.

Information

- When working or carrying out tests on the vehicle or when the vehicle is in the workshop, a battery charger with a rated current of at least 40 A must be connected.
- As soon as the vehicle is unlocked, e.g. the vehicle is in the workshop or salesroom, it must be trickle charged with a battery charging device.

NOTE: Using charging cables/jump leads directly on the vehicle battery.

- *Risk of damage to battery sensors.*

→ Always connect charging cables/jump leads to the external power supply for jump-lead starting.

1. Open protective cover on the positive terminal for jump-lead starting.
2. First, connect the positive cable from the charger to the positive terminal.
3. Connect the negative cable from the charger to the ground point for jump-lead starting.
4. Read the operating instructions for the charger.
5. Switch off all electrical loads.
6. Switch on the charger.

WM 2X00IN BATTERY TRICKLE CHARGING (ALL MODELS) > BATTERY TRICKLE CHARGING > CONNECTING THE BATTERY FOR TRICKLE CHARGING

A suitable battery charger must be connected to the vehicle electrical system when performing the following tasks. All unnecessary electrical loads must be switched off.

When working on the vehicle for more than 15 minutes.

When running diagnostics using the Porsche System Tester.

When adjusting the headlights.

When working on or with the Infotainment system.

If the doors, bonnet and rear lid are open for a long period of time or if these components are actuated frequently.

Fastening screw securing generator to engine		Tightening torque	23 Nm (17 ftlb.)		
Fastening nut securing B+ line to generator		Tightening torque	16 Nm (12 ftlb.)		
Fastening screw for ignition coil		Tightening torque	10 Nm (7.5 ftlb.)		
Spark plug - NEW	Initial tightening/do not use lubricant	Tightening torque	25 Nm (19 ftlb.)		
Spark plug	Re-use/do not use lubricant	Tightening torque	30 Nm (22 ftlb.)		
Fastening screw for knock sensor	Replace	Tightening torque	20 Nm (15 ftlb.)		
Fastening screw for pulse sender		Tightening torque	10 Nm (7.5 ftlb.)		
Fastening screw for hall sender		Tightening torque	9 Nm (6.5 ftlb.)		
Fastening nut securing ground line to ignition coil		Tightening torque	10 Nm (7.5 ftlb.)		

WM 2X00IN TECHNICAL VALUES (MACAN) > OVERVIEW

Information

- The tightening steps in the tightening sequences relate to tightening screws uniformly, i.e. all affected screws must first be tightened uniformly to the first torque value, then all screws are tightened one stage further, and so on.
- Replace all O-rings following removal!

The torques in the table below generally apply to screws that are not specifically listed =>

The bolt quality is indicated on the screw head at the top as a decimal number, e.g. "8.8" or "12.9".

Bolt quality 8.8		Bolt quality 10.9		Bolt quality 12.9	
Thread	[Nm (ftlb.)]	Thread	[Nm (ftlb.)]	Thread	[Nm (ftlb.)]
M4	3 (2)	M4	4 (3)	M4	5 (3.5)
M5	6 (4.5)	M5	8 (6)	M5	10 (7.5)
M6	10 (7.5)	M6	13 (9.5)	M6	16 (12)
M8	23 (17)	M8	33 (24)	M8	39 (29)
M10	45 (33)	M10	65 (48)	M10	80 (59)
M10 x 1.25	50 (37)	M10 x 1.25	70 (52)	M10 x 1.25	85 (63)
M12	80 (59)	M12	115 (85)	M12	135 (100)
M12 x 1.25	90 (67)	M12 x 1.25	125 (93)	M12 x 1.25	150 (111)
M12 x 1.5	85 (63)	M12 x 1.5	120 (89)	M12 x 1.5	145 (107)
M14	130 (96)	M14	180 (133)	M14	220 (163)
M16	200 (148)	M16	280 (207)	M16	335 (248)

Aluminum screws

Thread	Strength	Tightening procedure
M6	AL9	→ **Initial tightening: 4 Nm (3 ftlb.)** and → **Final tightening: 90°** or yield-point wrench.
M8	AL9	→ **Initial tightening: 10 Nm (7.5 ftlb.)** and → **Final tightening: 90°** or yield-point wrench.
M10	AL9	→ **Initial tightening: 20 Nm (15 ftlb.)** and → **Final tightening: 90°** or yield-point wrench.

WM 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Terminal clamp to battery terminal	M6 nut	Tightening torque	5 Nm (3.5 ftlb.)		

WM 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY (ALL MODELS) > INFORMATION > DISCONNECTING THE BATTERY

WARNING: Static battery charge

- *Battery can explode*
- *Electrical discharges*

→ Do not rub the battery with a dry cloth.

Information

Switch off all loads and remove the ignition key.

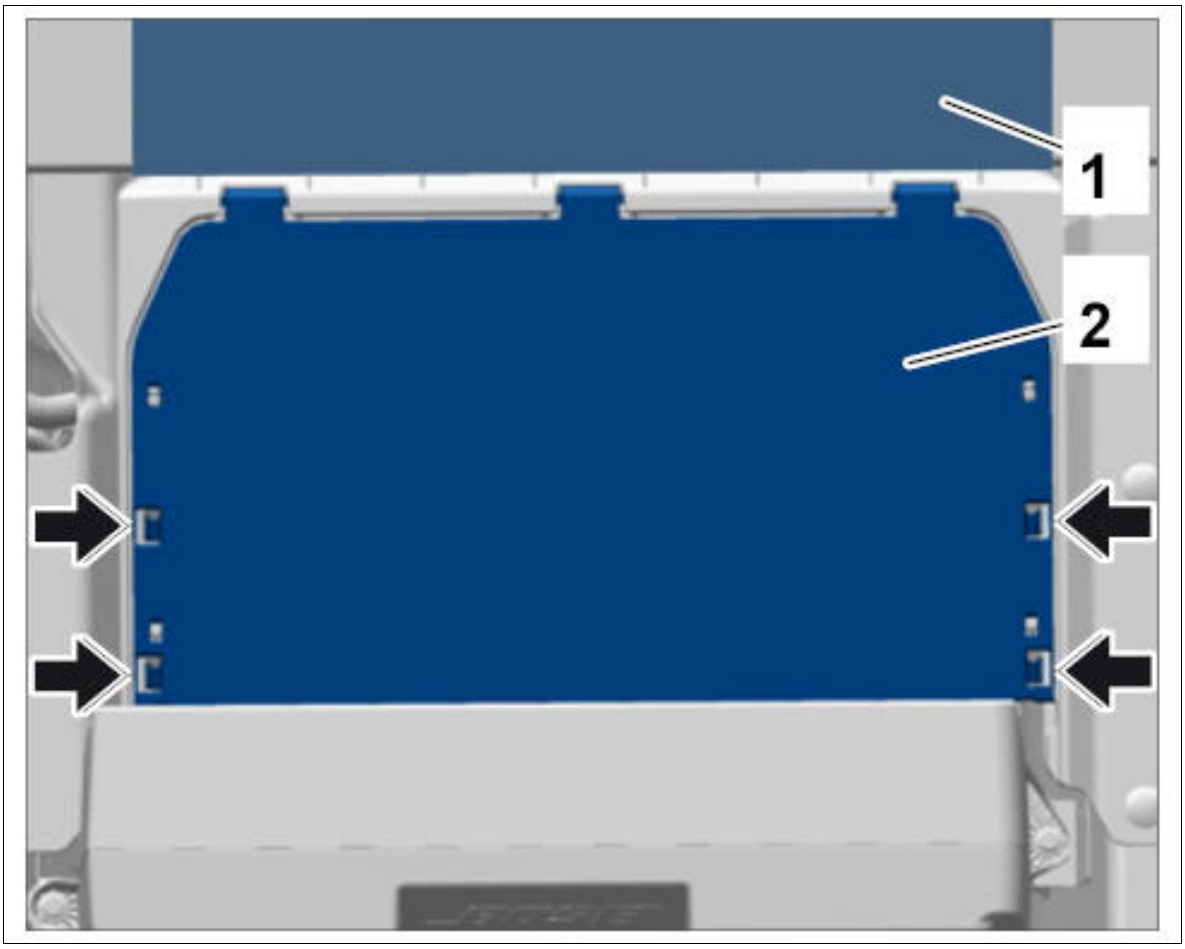
- Do not disconnect the battery while the engine is running.
- Disconnect and reconnect battery with extreme caution.
- Do not rub the battery with a dry cloth.

Information

The battery is located in the luggage compartment under the storage floor.

1. Switch off ignition and pull remote control out of ignition lock.
2. Switch off electrical loads.
3. Remove luggage compartment floor.
4. Remove collapsible wheel, if necessary.
5. Lift carpet **-1-** .
6. Disengage cover **-2-** (**-arrows-**) and fold it forward.

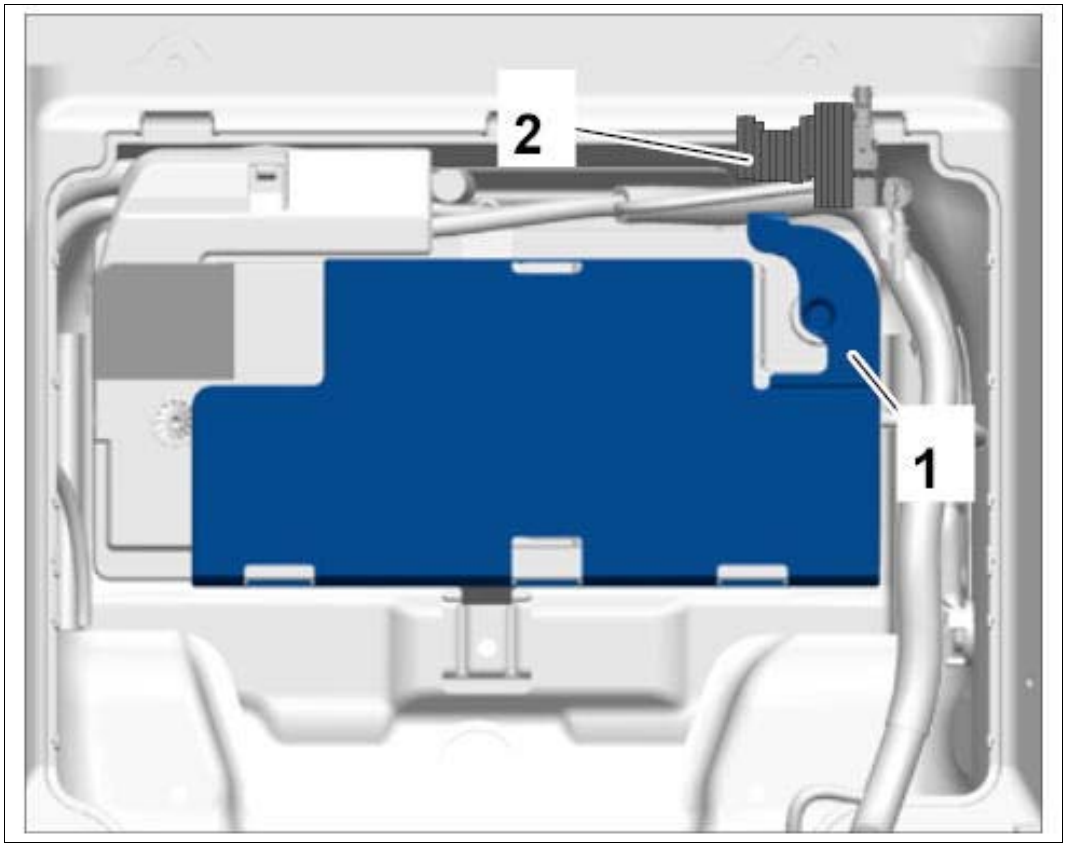
   Fig 1: Locating Battery Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. **Risk of short circuit! Disconnect the ground line at the battery!**
   1. 7.1. Open cover **-1-** on the negative terminal.
   2. 7.2. Loosen terminal clamp **-2-** for the ground line from the negative terminal.
   3. 7.3. Insulate terminal clamp or route ground line to prevent any contact with the negative terminal!

Fig 2: Identifying Battery Terminal Clamp And Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY (ALL MODELS) > INFORMATION > CONNECTING THE BATTERY

WARNING: Static battery charge

- *Battery can explode*
- *Electrical discharges*

→ Do not rub the battery with a dry cloth.

Information

Switch off all loads and remove the ignition key.

- Do not disconnect the battery while the engine is running.
- Disconnect and reconnect battery with extreme caution.
- Do not rub the battery with a dry cloth.

1. The battery is connected in reverse order to the steps described for disconnecting.
2. Tighten fastening nut on the terminal clamp for the ground line. **Tightening torque 5 Nm (3.5 ftlb.)**

WM 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY (ALL MODELS) > INFORMATION > EFFECT OF DISCONNECTION OR TOTAL DISCHARGE OF BATTERY ON ELECTRICAL SYSTEMS IN THE VEHICLE AND THE PRECAUTIONS TO BE TAKEN

Information

Control unit memories

Values and faults stored in the control units can be deleted if the battery is disconnected or completely discharged.

- If possible, all fault memories should be checked and, if necessary, printed out before the battery is disconnected.

Information

Supply voltage fault entry

The entry "supply voltage" may be stored in various control units if the battery has been completely discharged.

- Delete the "supply voltage" entry from the control units in question.

Information

Ready status

In some countries (presently the U.S.A. and Canada), after disconnecting the battery, it is necessary to reach the Ready status by a test drive and/or by using the Porsche System Tester DME control module menu). If in doubt about this, contact the relevant importer.

Information

2470 DME control module

With all DME systems, the engine must run for several minutes before the engine control module can relearn the idle speed and mixture adaptation values!

After disconnection of the power supply, the idle speed might change or fluctuate briefly until the throttle valve adjusting unit has been readapted.

The mixture adaptation is also lost.

After the battery is connected:

With the DME, it is necessary to carry out a learning and adaptation routine as described below:

- Switch ignition on for 30 seconds without starting the engine.

- Do not actuate accelerator pedal.

This completes the adaptation of the throttle valve adjusting unit.

Information

Tyre pressure monitoring system

When the battery is disconnected and connected, the tire pressure is first displayed as "- - - ".

- Once the battery has been disconnected and work is complete, the vehicle must be driven for a short distance.

The actual pressures will then be displayed again.

Information

4560 Steering angle sensor

The steering angle sensor must be re-initialized when the battery is disconnected and connected.

- Turn wheels to straight-ahead position.
- Switch ignition off and then on again twice.
- Start engine.
- From the straight-ahead position, turn steering wheel approx. 20° to the right, past the straight-ahead position.
- Drive the vehicle straight ahead for at least one second at a speed above 4 km/h (2.5 mph).

The steering angle sensor segment is recognized again in this process.

Once the sensor has been successfully initialized, the fault code that is stored in the fault memory is documented using the fault deletion counter.

The fault memory erases itself automatically.

The PSM indicator light in the instrument cluster goes out.

Information

6014 Motor for sunroof

The limit positions of the sunroof are deleted from the control unit when the battery is disconnected and connected.

- Switch on ignition.
- Press the sunroof button for several seconds in direction of travel.
- After approx. 10 seconds, the sunroof performs an automatic standardization process an↓d resets all positions.
- Keep the button pressed during the standardization process.

Afterwards, the sunroof is standardized correctly.

Information

6452 Power windows

The limit positions of the power windows are deleted from the control unit when the battery is disconnected and connected.

Perform the following procedure for all power windows:

- Pull rocker switch and fully close window once.
- Pull rocker switch once more.

The upper end position of the window is stored.

- Press rocker switch and fully open window once.
- Press rocker switch once more.

The lower end position of the window is stored.

Information

4815 Electrical steering column adjustment (ELVS)

The electrical steering column adjustment end positions (ELVS) are deleted when the battery is disconnected and connected.

The following buttons must be pressed in sequence in order to re-initialize electrical steering column adjustment.

- Press the extend button three times (extend towards the driver).
- Press the retract button once.
- Press the extend button once (towards the driver).
- Press the up button once.
- Press the down button once.

Once the buttons have been pressed correctly, the steering column automatically moves all axles and stops at the center position (only works when the vehicle is stationary).

1. Erase error messages from the control units.
2. Perform the required initialization steps, depending on vehicle equipment.

WM 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY (ALL MODELS) > INFORMATION > TEST DRIVE AFTER DISCONNECTING AND CONNECTING THE BATTERY

Information

Depending on the vehicle equipment fitted, all these work steps are carried out during the test drive.

Read out the fault memories of all control units after the test drive.

- If there is a fault present, check to see if the fault was caused by an undervoltage.
- If faults were caused by an undervoltage (or CAN timeout error), erase the fault memory, perform another test drive and read out the fault memory.
- If faults were not caused by an undervoltage, correct the faults in accordance with GFF (Guided Fault Finding).

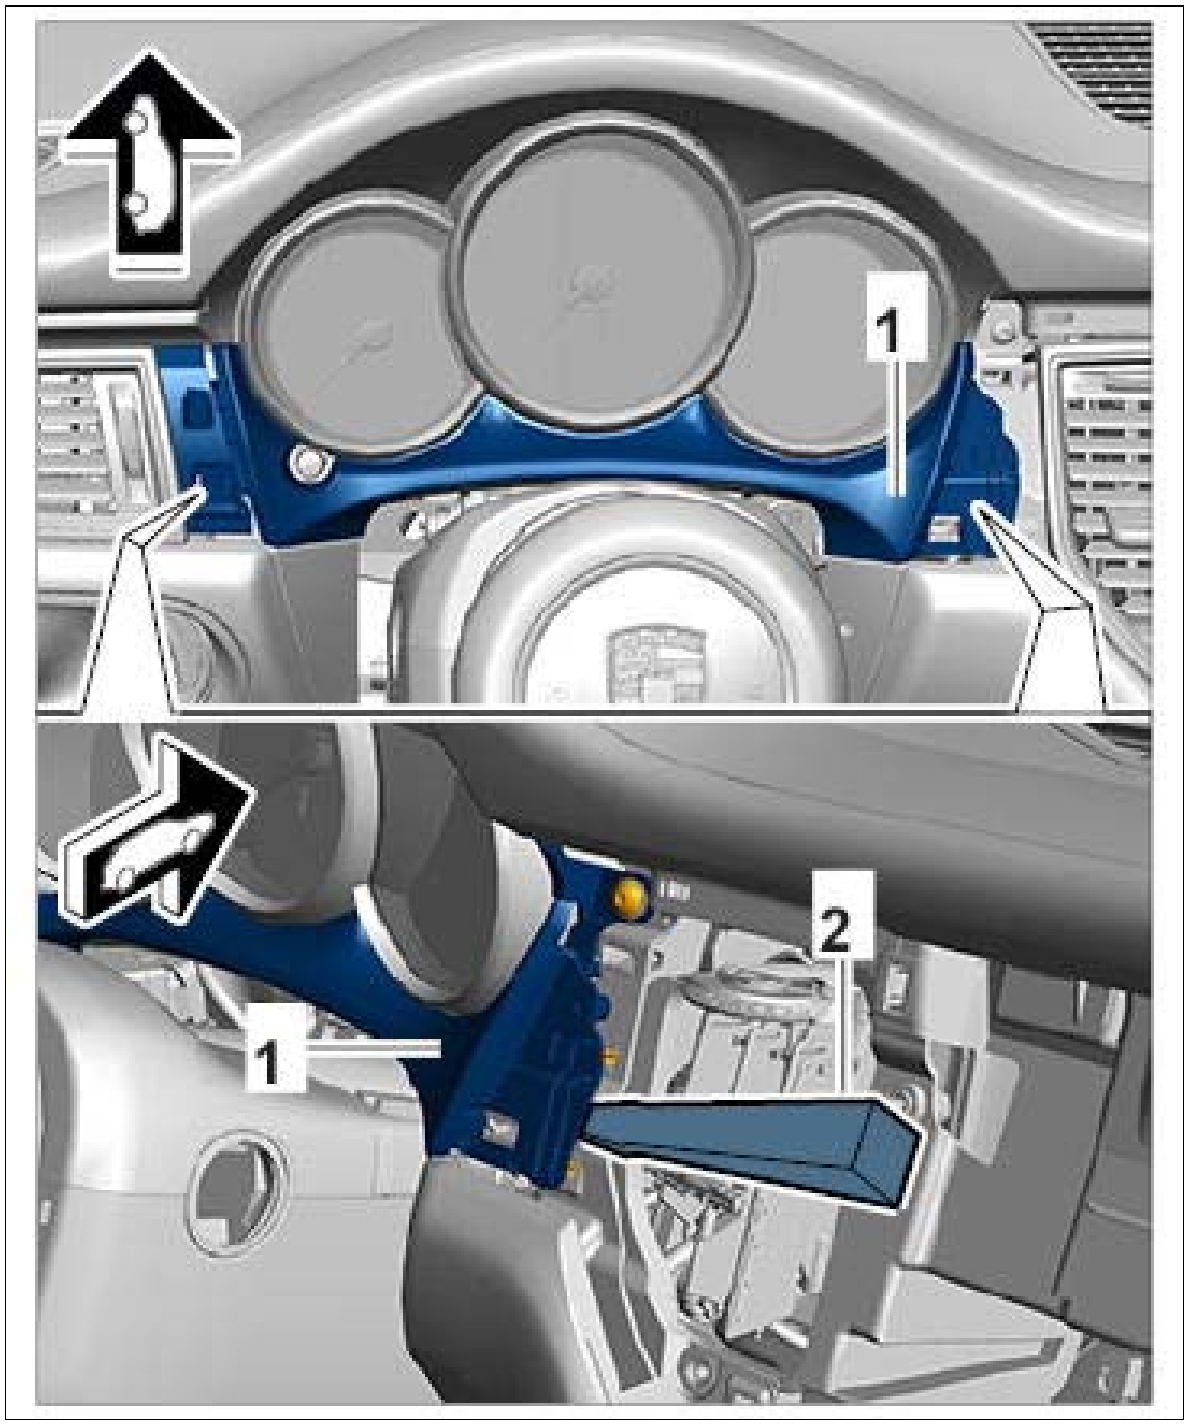
    1. Perform a test drive.

Service Manual: 90 - INSTRUMENTS -- (95B) - MACAN

WM 900319 REMOVING AND INSTALLING DASHBOARD INSET (MACAN, MACAN S, MACAN TURBO) > REMOVING DASHBOARD INSET

1. Move steering column to its lowest, rearmost position.
2. Unclip bottom of dashboard inset **-1-** at the left, right and in the middle from the dashboard using a plastic wedge **-2-** .

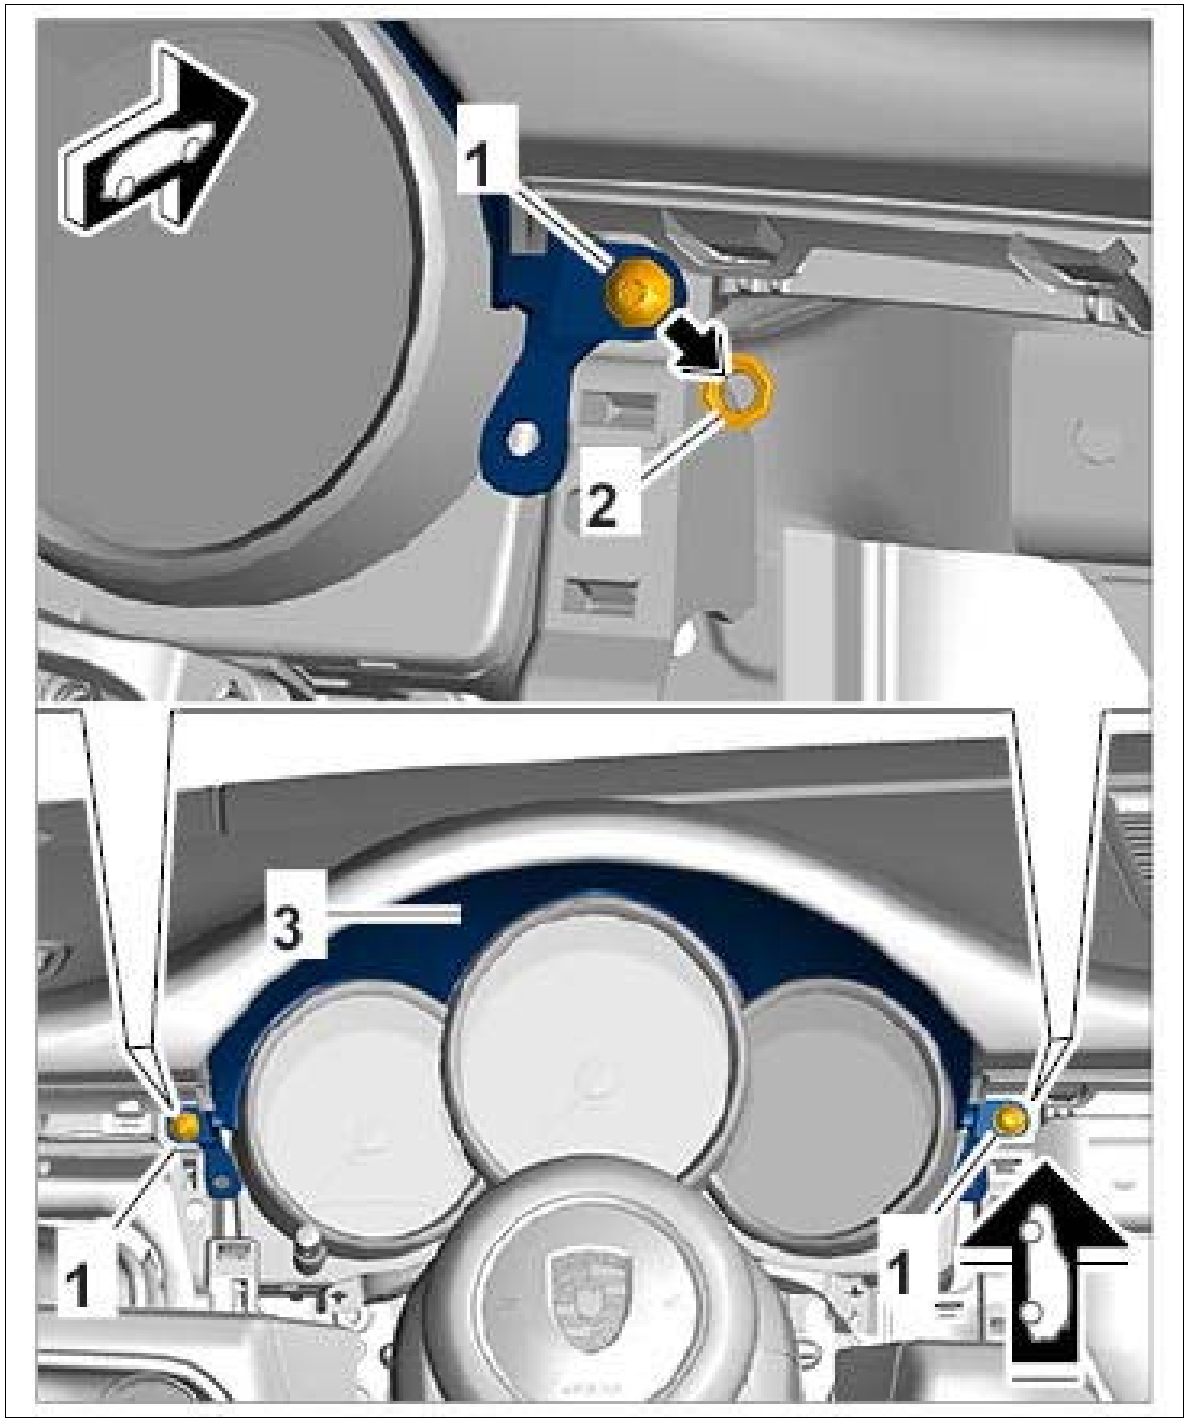
Fig 1: Locating Dashboard Inset Clips (Bottom)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew fastening screws **-1-** and remove plastic damping plates **-2-** from between the dashboard inset **-3-** and dashboard.

Fig 2: Identifying Dashboard Inset Fastening Screws (Top)

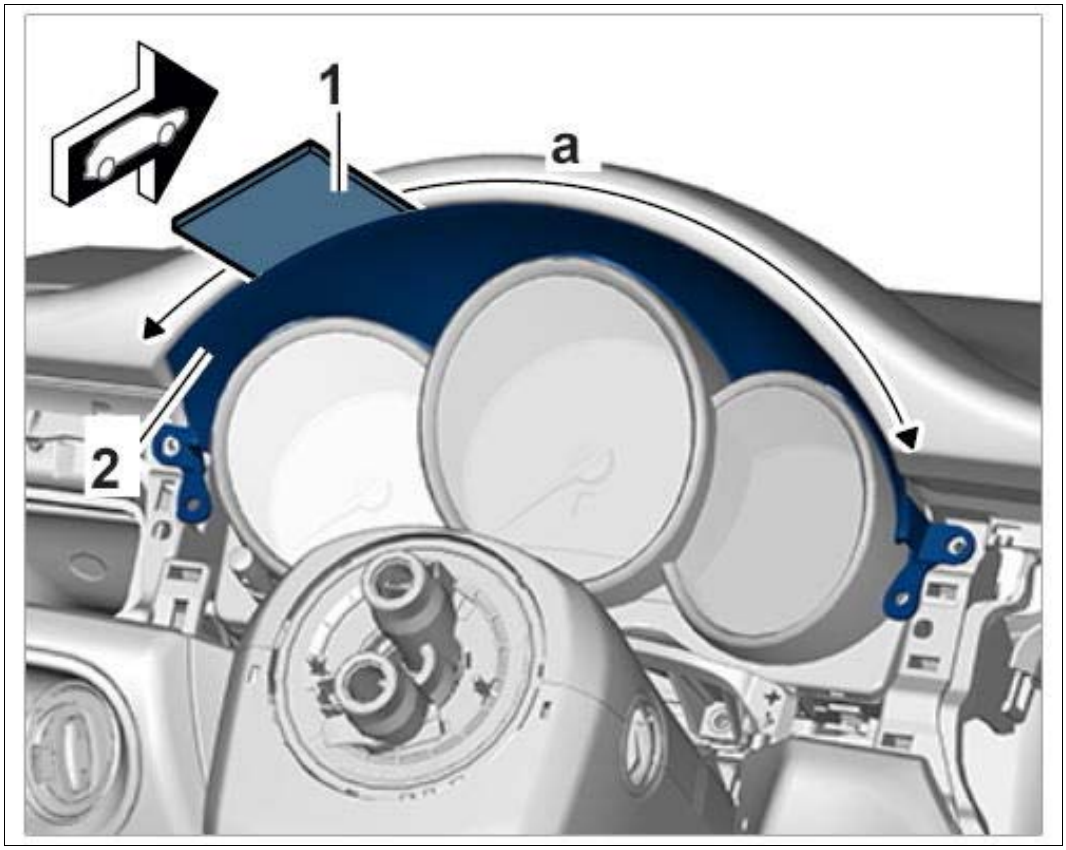


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Loosen dashboard inset at top and detach it from the dashboard.

    1. 4.1. Carefully push a plastic squeegee **-1-** in between the top of the dashboard inset **-2-** and dashboard and loosen top of dashboard inset in area **-a-** .

Fig 3: Loosening Dashboard Inset (Top) Using Plastic Squeegee



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove dashboard inset at the top **-1-** .

    1. 5.1. Position a plastic squeegee **-2-** and plastic wedge **-3-** close to the fastening pins **-a-** between the top of the dashboard inset and the dashboard.

    2. 5.2. Disengage fastening pins **-a-** at the left and right by pulling them horizontally to the rear.

    3. 5.3. Remove dashboard inset at the top.

1. Remove dashboard inset. → 900319 REMOVING AND INSTALLING DASHBOARD INSET .

WM 902519 REMOVING AND INSTALLING INSTRUMENT CLUSTER (MACAN, MACAN S, MACAN TURBO) > REMOVING INSTRUMENT CLUSTER

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

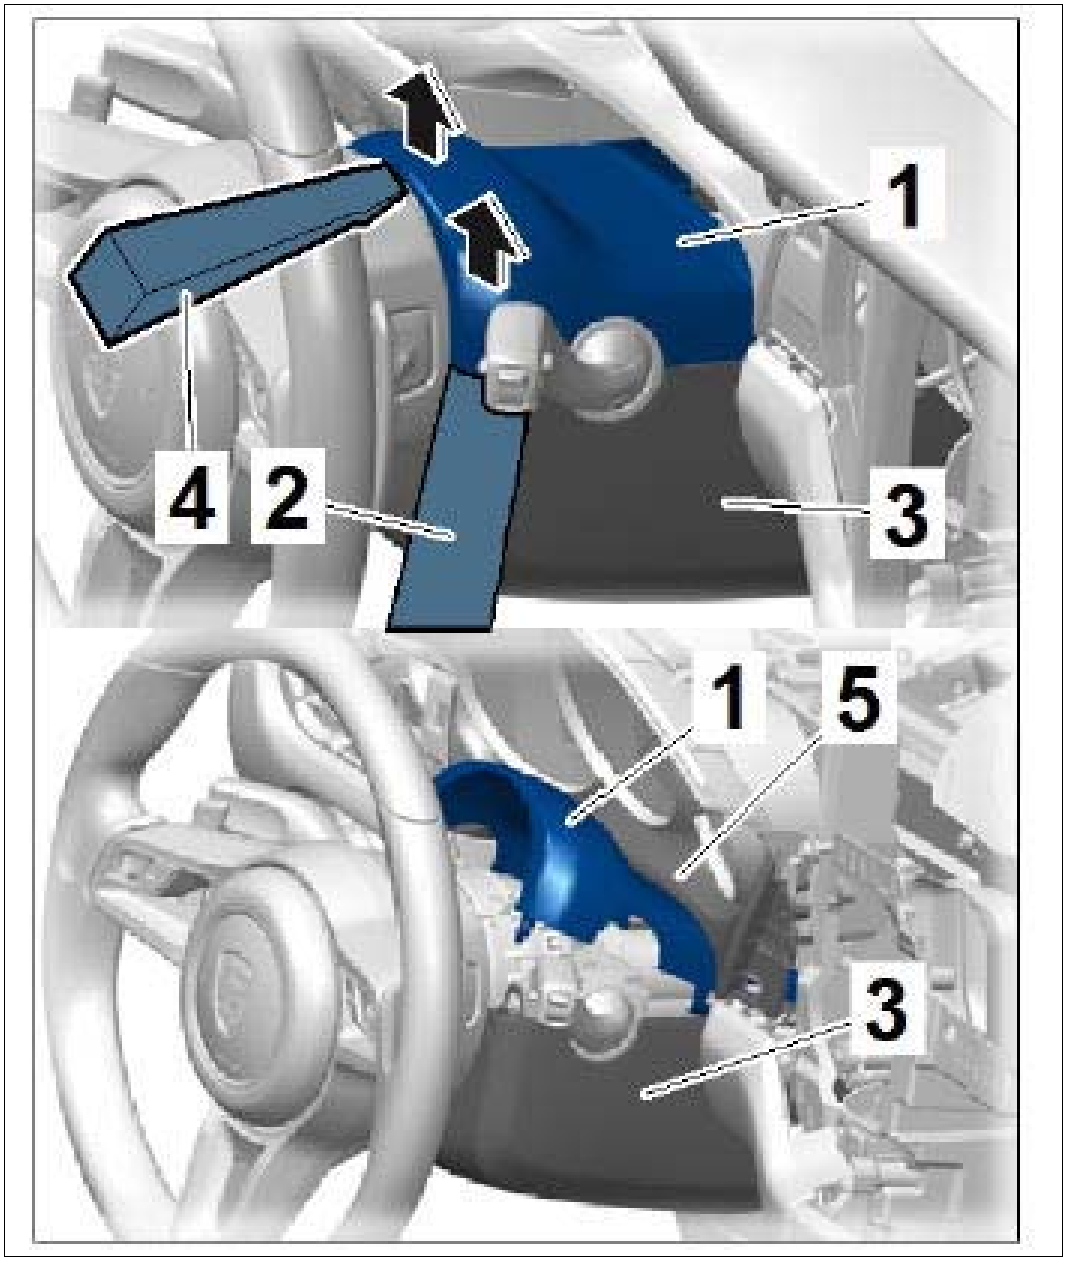
Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

1. Move steering column to its lowest, rearmost position.
2. Remove upper part of steering column casing **-1-** .
    1. 2.1. Lift up upper part of steering column casing at the center using a plastic wedge **-4-** and use a plastic squeegee **-2-** at the left and right to unclip it from the lower part of the steering column casing **-3-** .
    2. 2.2. Disengage upper part of steering column casing from lower part of steering column casing and remove with the trim panel under the instrument cluster **-5-** .

Fig 1: Removing Upper Part Of Steering Column Casing

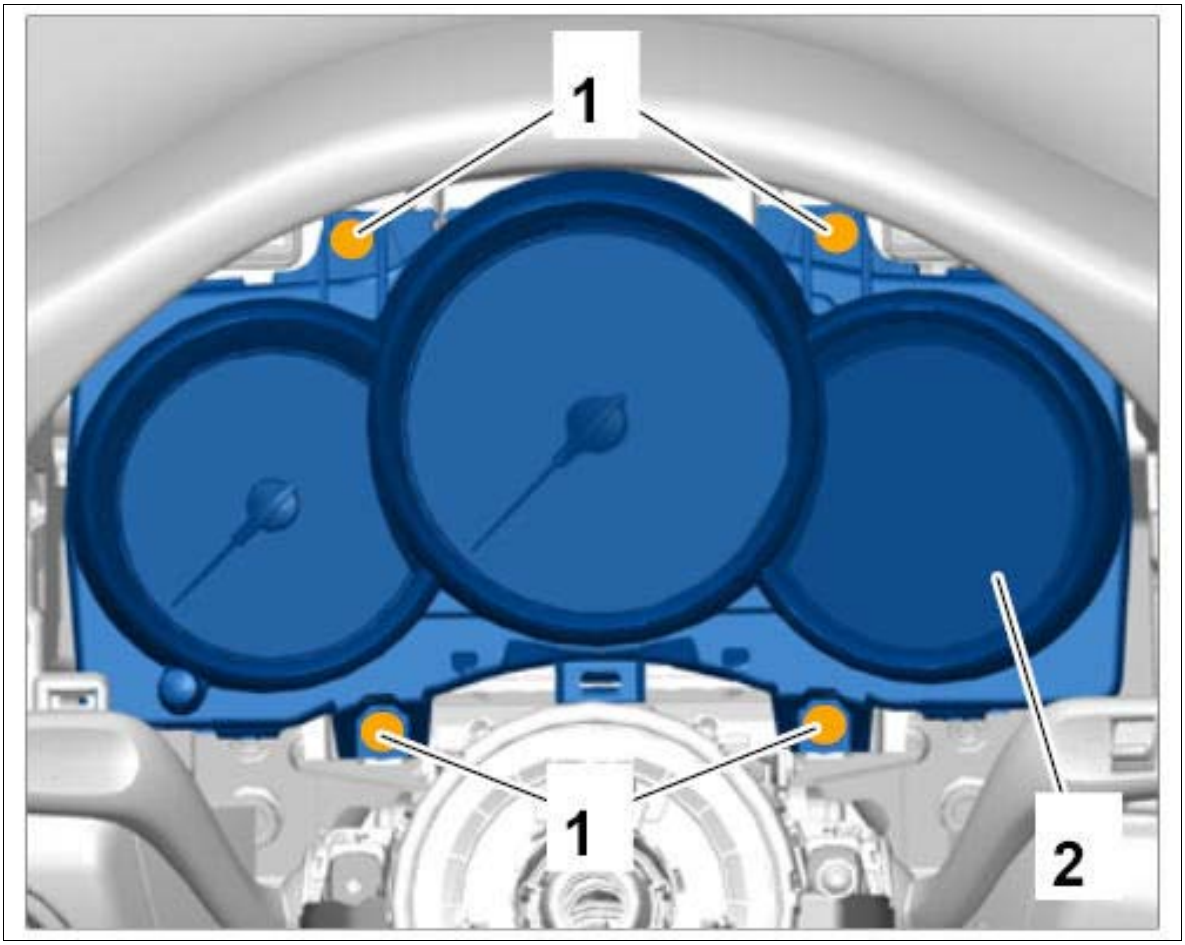


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Cover steering column with a clean, soft cloth.

4. Unscrew fastening screws **-1-** from the instrument cluster **-2-** .

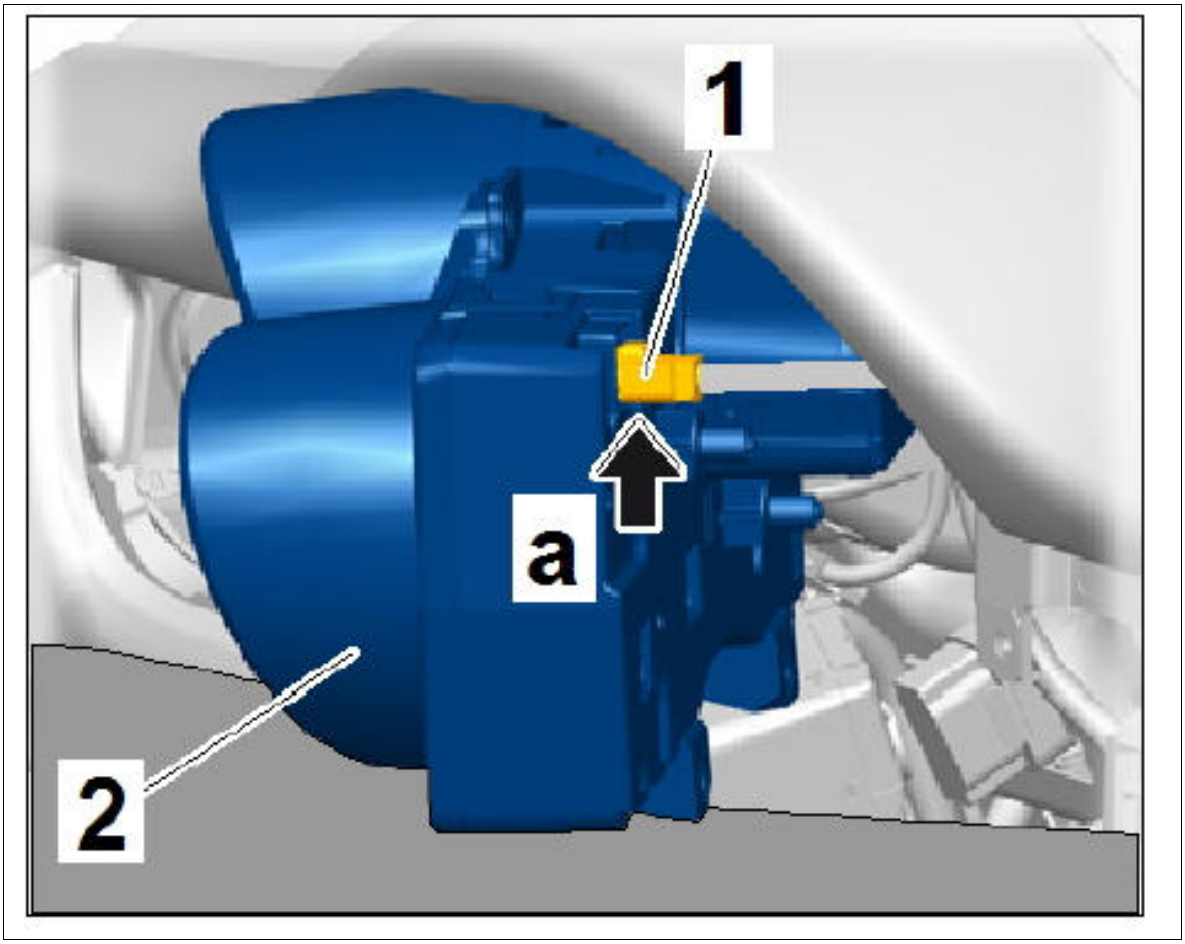
Fig 2: Locating Instrument Cluster Fastening Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Carefully pull instrument cluster at the right out of the dashboard.
6. Release electric plug connection **-1-** (**-a-**) and pull it off the instrument cluster **-2-** .

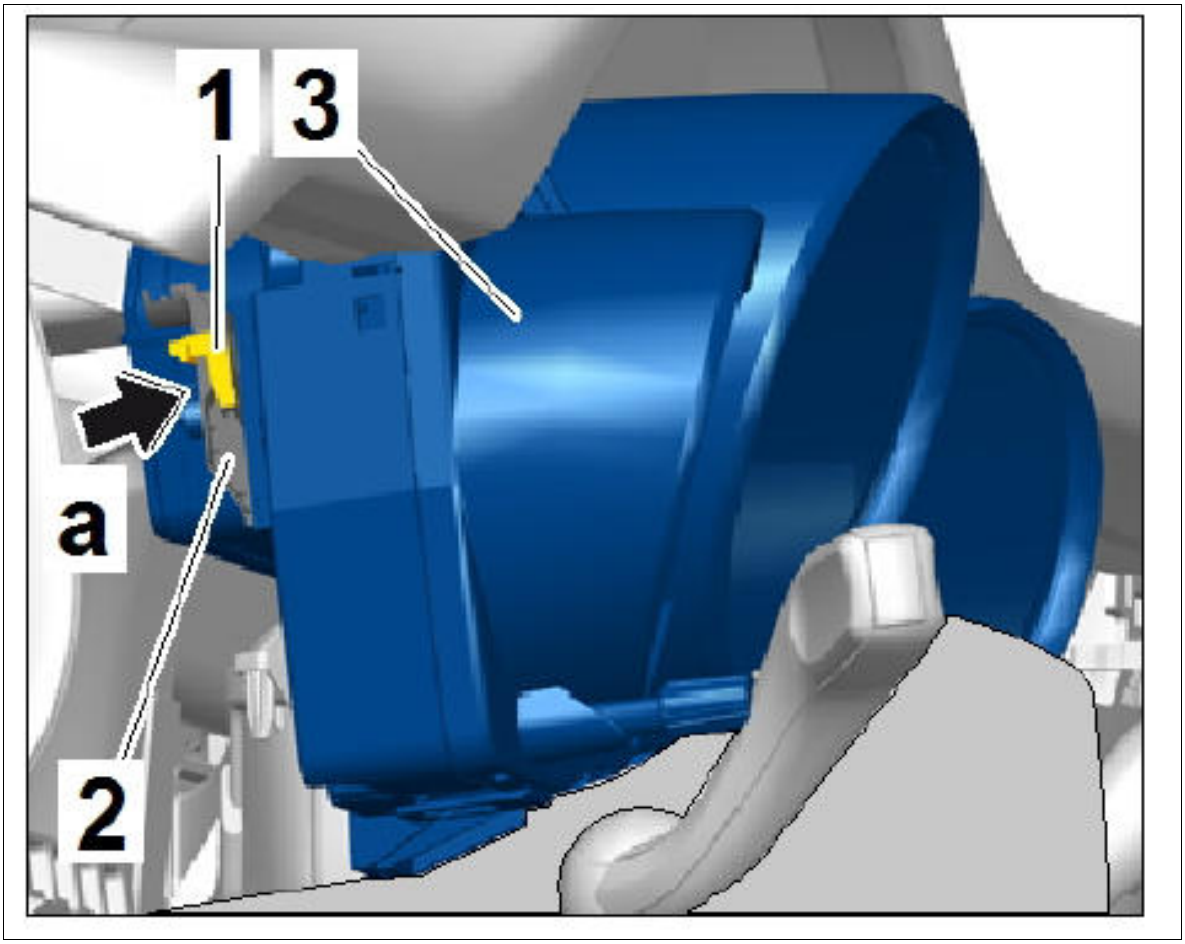
Fig 3: Disconnecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Carefully pull instrument cluster at the left out of the dashboard.
8. Release clip **-1-** (**-a-**), swivel it down and disconnect electric plug connection **-2-** from the instrument cluster **-3-** .

Fig 4: Disconnecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Remove instrument cluster by pulling it to the left.

WM 902519 REMOVING AND INSTALLING INSTRUMENT CLUSTER (MACAN, MACAN S, MACAN TURBO) > INSTALLING INSTRUMENT CLUSTER

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

1. Installation is performed in reverse order to removal.
2. Tighten fastening screws securing instrument cluster to dashboard. **Tightening torque: 3.2 Nm (2 ftlb.)**

WM 902519 REMOVING AND INSTALLING INSTRUMENT CLUSTER (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install dashboard inset. → INSTALLING DASHBOARD INSET .
2. If the instrument cluster was replaced, teach the new instrument cluster to suit the vehicle using **PIWIS Tester II 9818** . → 902555 REPLACING INSTRUMENT CLUSTER

WM 902555 REPLACING INSTRUMENT CLUSTER (MACAN, MACAN S, MACAN TURBO) > TOOLS

PIWIS Tester II	Special tool	9818		
WM 902555 REPLACING INSTRUMENT CLUSTER (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 902555 REPLACING INSTRUMENT CLUSTER (MACAN, MACAN S, MACAN TURBO) > REPLACING INSTRUMENT CLUSTER

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*

- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition.
2. Select the vehicle type and start the diagnostic application.
3. Select the required control unit **Instrument cluster** in the **overview** .
4. **Maintenance/repairs** must then be selected.
5. Select the **Set total mileage** function and press [F12].
6. Read the warning on the Tester and press [F12].
7. **Read off and take note of the total mileage.**
8. Switch off ignition and replace control unit. → 902519 REMOVING AND INSTALLING INSTRUMENT CLUSTER .
9. Switch on ignition.
10. Select the vehicle type and start the diagnostic application.
11. Select the required control unit **Instrument cluster** in the **overview** .
12. **Extended identification** must now be selected.
13. Select the **Vehicle identification number** field.
14. **Enter the vehicle identification number** and press "Enter" to confirm your entry.
15. **Maintenance/repairs** must then be selected.
16. Select the **Set total mileage** function and press [F12].
17. Read the warning on the Tester and press [F12].
18. **Select Total mileage** and enter the value that was read out in Step 7. Then press "Enter" to confirm your entry and press [F8] to write data.

19. **Coding/adaptations** must then be selected.
20. **Select Automatic coding** and press [F12].
21. Wait until coding has been completed, then press [F12] to continue.
22. **Maintenance/repairs** must then be selected.
23. **Select Fuel tank calibration** and press [F12] to continue.
24. Read the information displayed on the Tester, then start by pressing [F8].
25. **Read out the fault memory** and erase it if necessary.
26. Return to the **control unit overview** .
27. Check the function of the instrument cluster and fuel level gauge during the test drive.

2. Tighten fastening screw securing gateway control unit to the body. **Tightening torque: 9 Nm (6.5 ftlb.)**

WM 903519 REMOVING AND INSTALLING GATEWAY CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install rear seat. → INSTALLING REAR SEAT .
2. If the gateway control unit was replaced, teach the new gateway control unit to suit the vehicle using **PIWIS Tester II 9818** . → 903555 REPLACING GATEWAY CONTROL UNIT .

WM 903555 REPLACING GATEWAY CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 903555 REPLACING GATEWAY CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 903555 REPLACING GATEWAY CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > REPLACING GATEWAY CONTROL UNIT > CODING THE GATEWAY CONTROL UNIT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*

- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Switch off ignition and replace control unit. → 903519 REMOVING AND INSTALLING GATEWAY CONTROL UNIT .
2. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition.
3. Select the vehicle type and start the diagnostic application.
4. Select the required control unit **Gateway** in the **overview** and press [F12] to continue.
5. **Extended identification** must now be selected.
6. **Enter the vehicle identification number** and press [Enter].
7. **Maintenance/repairs** must then be selected.
8. **Control unit replacement** must now be selected. Then press [F12] to continue.
9. **Select Write data** , press [F12] and then press [F8] to start. Data is installed.
10. As soon as the Tester confirms that **data has been written** , switch the ignition off and on again.
11. Go back to the **overview** by pressing [F7].
12. **Select Maintenance of vehicle data** and press [F12] to continue.
13. **Enter data in the required fields** and press [F12] to continue.
14. **Maintenance/repairs** must then be selected.
15. **Required & Actual configuration** must now be selected. Then press [F12] to continue.
16. Check the list of components that are actually installed and accept it by pressing [F8].
17. **Codings/adaptations** must now be selected. Then press [F12] to continue.
18. **Automatic coding** must now be selected. Then press [F12] to continue.

19. The Tester displays the message **Coding has been completed successfully** . Press [F12] to continue.

20. Read out the fault memory and erase it if necessary.

WM 905019 REMOVING AND INSTALLING HORN (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Holder for horn to front bumper	Internal serration screw, M8 x 20	Tightening torque	20 Nm (15 ftlb.)		

WM 905019 REMOVING AND INSTALLING HORN (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove front wheel housing liner. → 505619 REMOVING AND INSTALLING FRONT WHEEL HOUSING LINER .

WM 905019 REMOVING AND INSTALLING HORN (MACAN, MACAN S, MACAN TURBO) > REMOVING HORN

Information

- Some of the repair illustrations show only one side of the vehicle.
- Naturally, some steps also have to be performed on the opposite side of the vehicle as well.

1. Remove horn **-1-** .
    1. 1.1. Release electric plug connection **-2-** and pull it off the horn.
    2. 1.2. Unscrew fastening screw **-3-** and remove horn.

WM 906425 ACTIVATING PCC/PVTS (MACAN, MACAN S, MACAN TURBO) > ACTIVATING PCC/PVTS

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms; different text or additions may

appear in **PIWIS Tester II 9818** .

Information

PCC/PVTS should be activated just before vehicle hand over as the customer has access to the vehicle and the term of the PCC/PVTS contract begins following activation.

1. Get installation code from the customer.

   Information

   If the installation code is not available, PCC/PVTS activation must be carried out during vehicle hand over.

2. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition.
3. Select the vehicle type and start the diagnostic application.
4. Check the chassis number and press [F12] to start.
5. Select **Vehicle functions** in the menu by pressing [F7].
6. Start the Tester sequence **Activate PCC/PVTS** by pressing [F12].
7. Follow the steps/instructions shown on the PIWIS Tester.
8. Log PCC/PVTS activation.
9. Switch off ignition.
10. **Read out the fault memory** and erase it if necessary.
11. Perform a function test if necessary.

1. Installation position of main wire harness in luggage compartment at the right
2. Installation position of main wire harness in luggage compartment at the left

WM 970909 LOOSENING AND SECURING MAIN WIRE HARNESS IN LUGGAGE COMPARTMENT (ALL MODELS) > LOOSENING MAIN WIRE HARNESS IN LUGGAGE COMPARTMENT AT THE RIGHT

NOTE: Incorrect handling of main wire harness

- *Risk of damage to lines*

→ The main wire harness contains all airbag lines, antenna lines and optical waveguides.

→ The main wire harness must not be separated and is always replaced as a complete wire harness when carrying out extensive repairs.

→ If individual lines are damaged, shut off these lines and install new lines. Lay the new lines along the main wire harness and secure them to the main wire harness.

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

    → 824519 REMOVING AND INSTALLING FUEL PUMP FOR AUXILIARY HEATING .

WM 970909 LOOSENING AND SECURING MAIN WIRE HARNESS IN PASSENGER COMPARTMENT AT THE RIGHT (ALL MODELS) > LOOSENING MAIN WIRE HARNESS IN PASSENGER COMPARTMENT AT THE RIGHT

NOTE: Incorrect handling of main wire harness

- *Risk of damage to lines*

→ The main wire harness contains all airbag lines, antenna lines and optical waveguides.

→ The main wire harness must not be separated and is always replaced as a complete wire harness when carrying out extensive repairs.

→ If individual lines are damaged, shut off these lines and install new lines. Lay the new lines along the main wire harness and secure them to the main wire harness.

NOTE: Incorrect handling of optical waveguides

- *Risk of damage to optical waveguide*

→ Observe the requirements for working with and installing optical waveguides.

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

Information

Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

Information

- The number of plug connections and holders on the wire harness can vary depending on vehicle equipment.
- The illustrations show only one side of the vehicle and one equipment variant. Other sides of the vehicle and other equipment variants may differ.

1. Release electric plug connection **-1-** (**-a-**) and pull it down off the front door control unit **-2-** .
2. Release electric plug connection **-1-** (**-b-**) and disconnect it.

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

1. Screw off fastening nuts **-1-** .
2. Removing cutoff relay **-2-** from the power distributor.

Fig 1: Removing Cutoff Relay

WM 974619 REMOVING AND INSTALLING CUTOFF RELAY (ALL MODELS) > INSTALLING CUTOFF RELAY

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

1. Installation is performed in reverse order to removal.
2. Tighten fastening nuts used to secure cutoff relay on power distributor. **Tightening torque 8 Nm (6 ftlb.)**

Information

Do not confuse the plug connection at the actuators for camshaft control. Given the similar design of the plug connections on the intake and outlet camshafts, these must be marked for re-installation during removal.

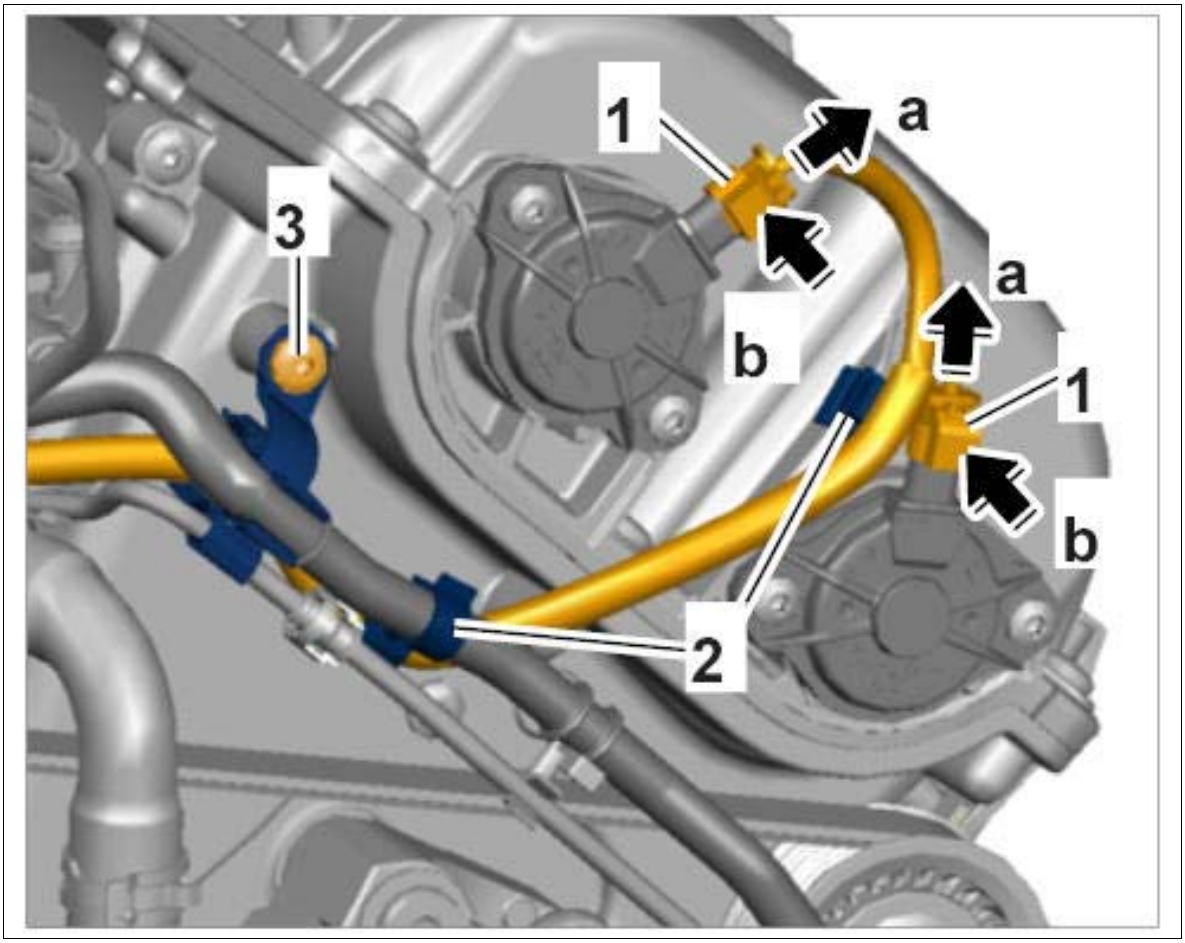
43. Mark electric plug connections **-1-** on actuators for cylinders 1-3 and on actuators for cylinders 4-6 so that they do not get mixed up.

44. Release locking mechanisms for electric plug connections **-1-** on actuators for cylinders 1-3 and cylinders 4-6 **-a-** , press locking mechanisms **-b-** and pull them off.

45. Unclip wire harness holders **-2-** at the cylinder head and vacuum line.

46. Loosen fastening screw **-3-** on holder for the left cylinder head.

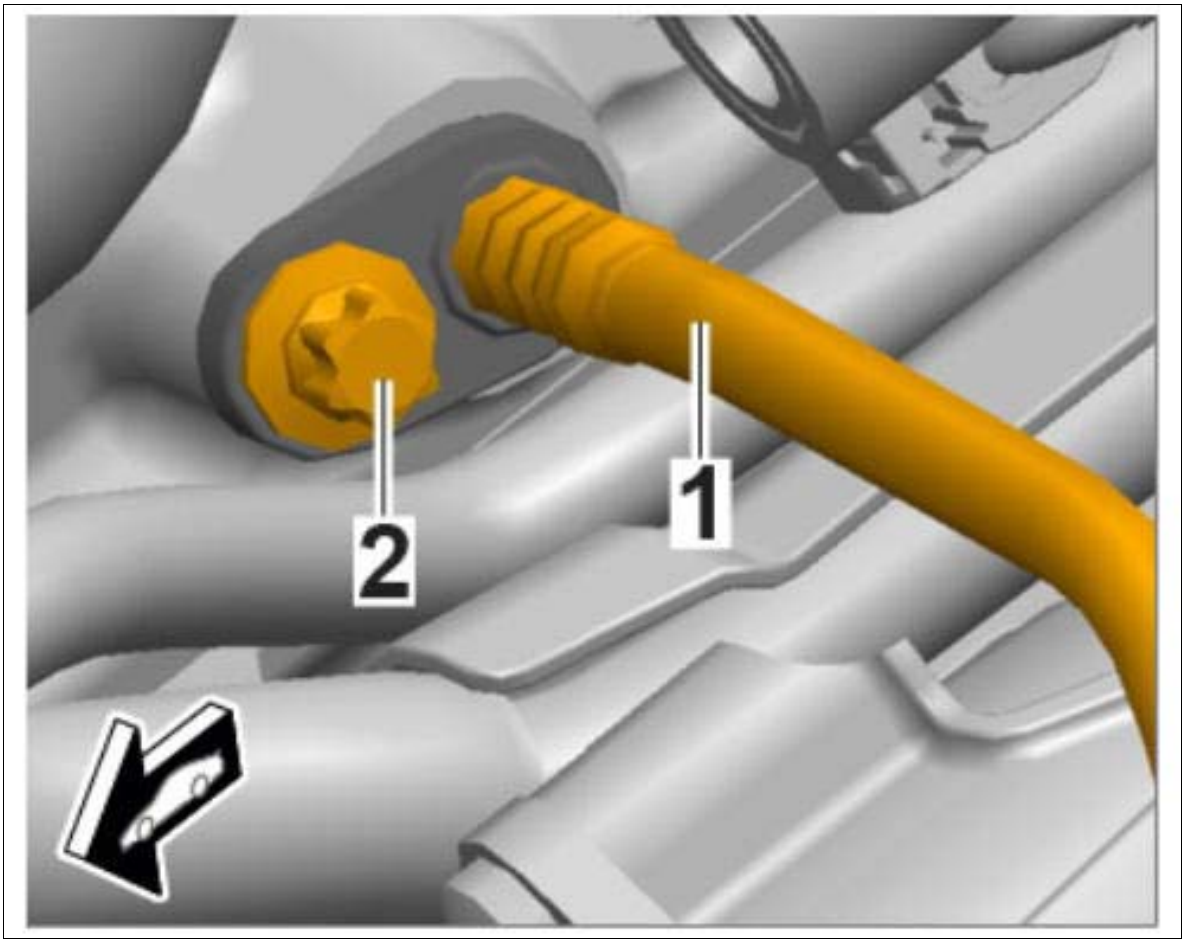
Fig 25: Disconnecting Electric Plug Connections On Valve Lift Adjustment Solenoid Hydraulic Valves



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

47. Unscrew fastening screw **-2-** and disconnect coolant vent line **-1-** .

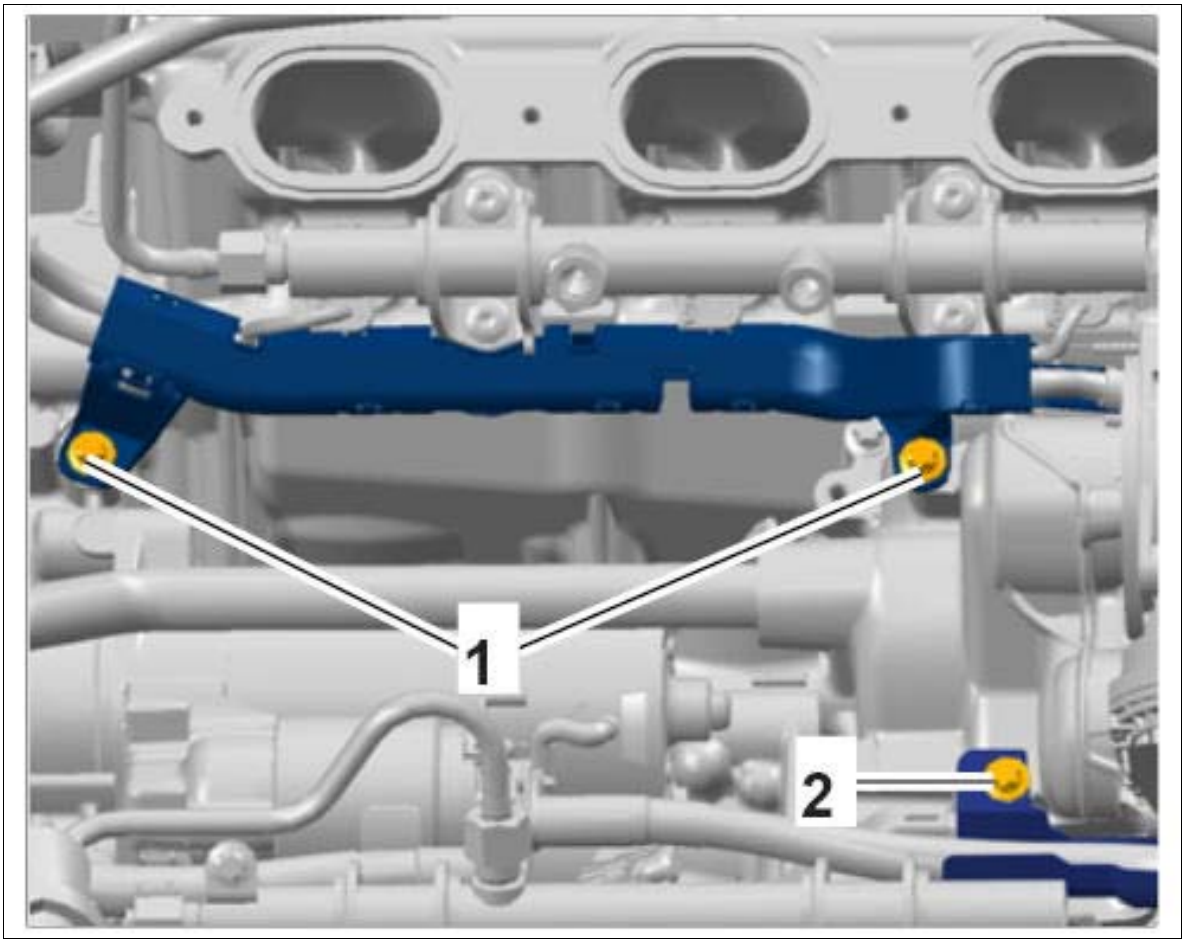
Fig 26: Identifying Coolant Vent Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

48. Unscrew fastening screws **-1, 2-** from wiring ducts and remove them.

Fig 27: Identifying Cable Duct Mounting

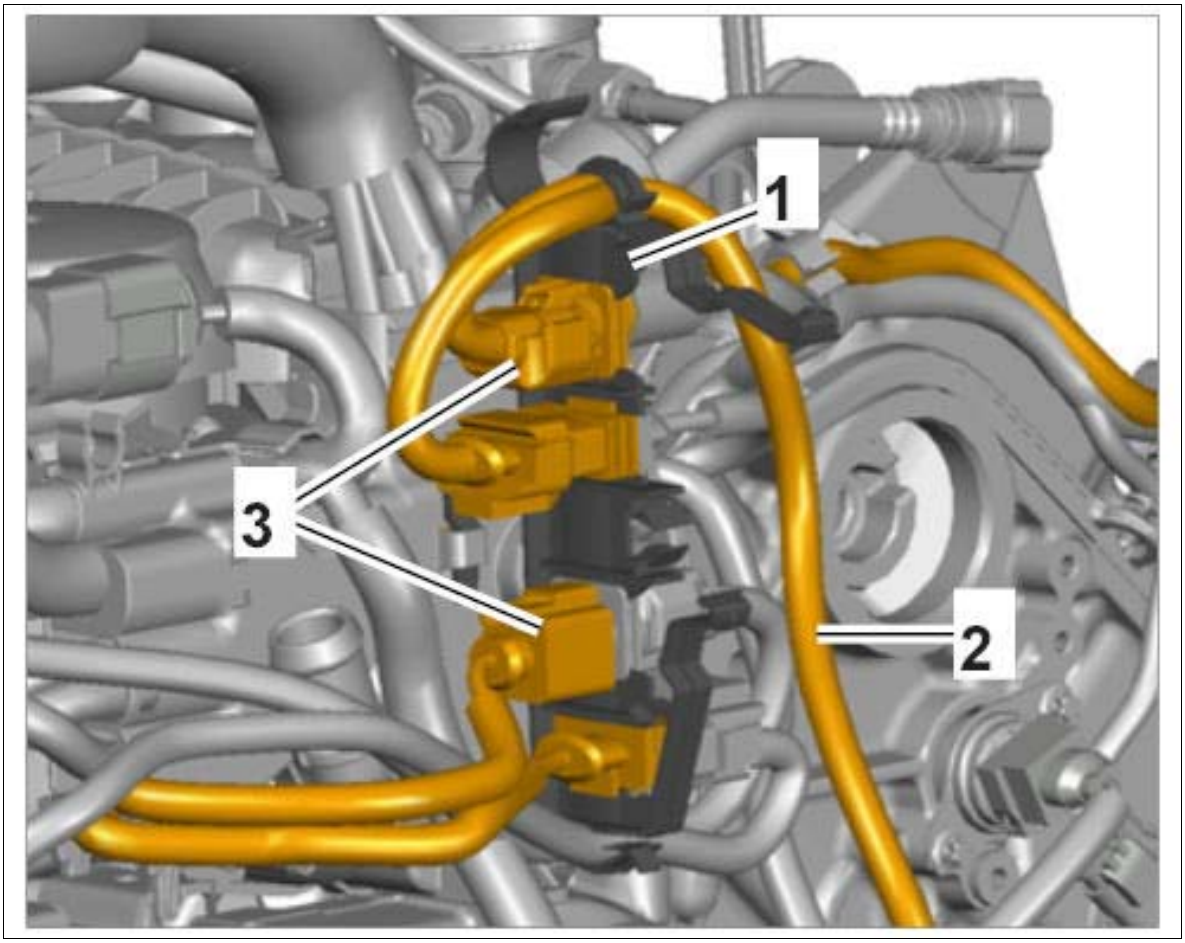


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

49. Disengage line bracket **-1-** on the engine wire harness **-2-** and pull it off in an upward direction.

50. Open line bracket and remove electric connector **-3-** .

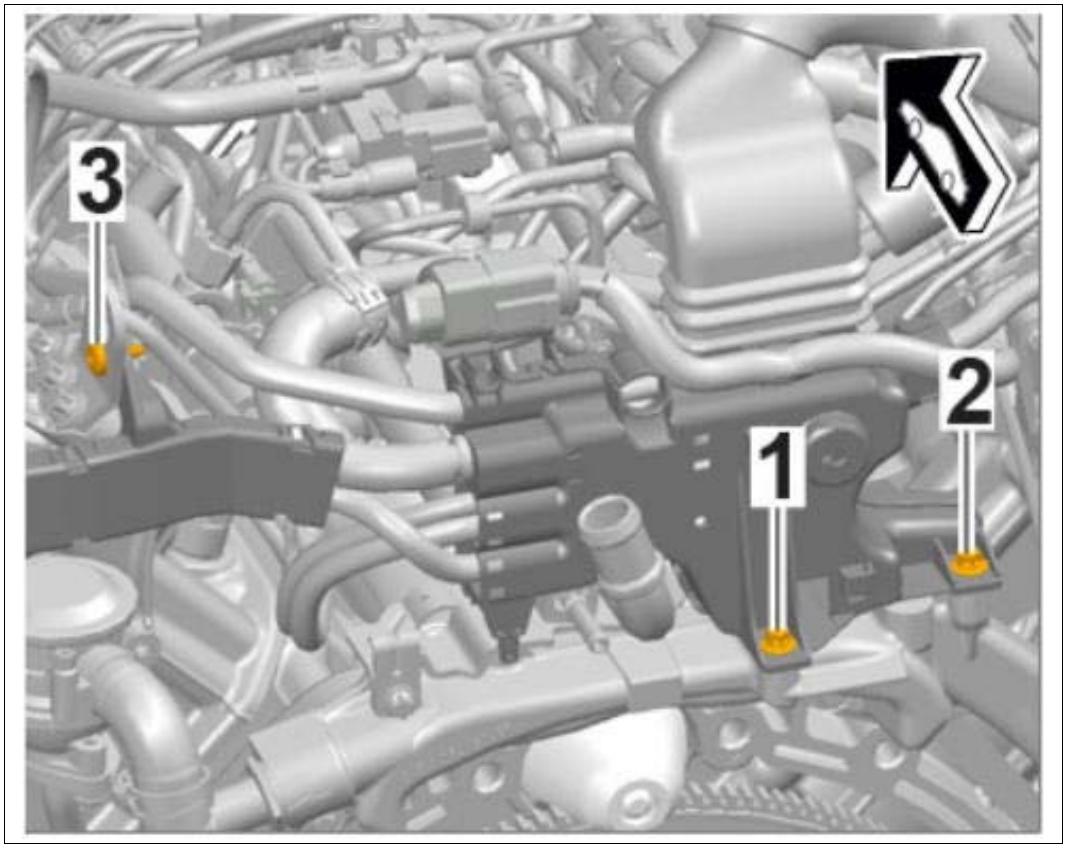
Fig 28: Removing Electric Connectors From Line Bracket



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

51. Unscrew fastening screws **-1, 2, 3-** on the wiring ducts.
52. Carefully remove engine wire harness from the engine.
    1. 52.1. Remove terminal 30 line from the connection at the starter.

Fig 29: Loosening Wiring Ducts



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 975219 REMOVING AND INSTALLING WIRE HARNESS FOR ENGINE (MACAN S, MACAN TURBO) > INSTALLING WIRE HARNESS FOR ENGINE

1. Installation is performed in reverse order to removal.
    1. 1.1. Make sure that the individual sub-parts of the engine wire harness are not twisted or entangled.
    2. 1.2. Check that the wire harness is routed correctly and without tension so that no chafing occurs.
    3. 1.3. Connect all electric plug connections until they engage securely.
    4. 1.4. Lock all electric plug connections by hand using the manual slide lock.
    5. 1.5. Clip in all sections of the engine wire harness securely at the relevant positions.
2. Tighten fastening screws for the wiring ducts at the left and right on the cylinder head.
3. Tighten fastening screws for the wiring ducts at the left and right on the valve cover.
4. Tighten fastening screws for the wiring ducts on the thermostat housing.
5. Tighten fastening screws for the wiring ducts on the crankcase.

6. Tighten fastening screw for the vent line on the cylinder head. **Tightening torque 10 Nm (7.5 ftlb.)**
7. Tighten fastening screw securing holder to left cylinder head.
8. Tighten fastening nut used to secure the electric B+ line to the starter. **Tightening torque 18 Nm (13 ftlb.)**
9. Tighten fastening nut used to secure the electric line for terminal 50 to the starter. **Tightening torque 10 Nm (7.5 ftlb.)**
10. Tighten fastening screw securing wiring duct to the timing chain housing cover.
11. Tighten fastening screws securing coolant line to the timing chain housing cover.

Installing optical waveguide (PCM to TV tuner)

Information

- The new lines will be secured to the fastening points for the old lines.
- The old wire harness remains installed in the vehicle.
- The old wire harness will only be disconnected/unplugged directly at the connected components.

Information

- When installing the wire harness, make sure the insulation of the line is not damaged.

Information

The range of spare parts available for optical waveguides depends on the vehicle equipment. Depending on the vehicle equipment, there is a specific set containing the individual optical waveguides.

Select the required optical waveguide and remove it from the set.

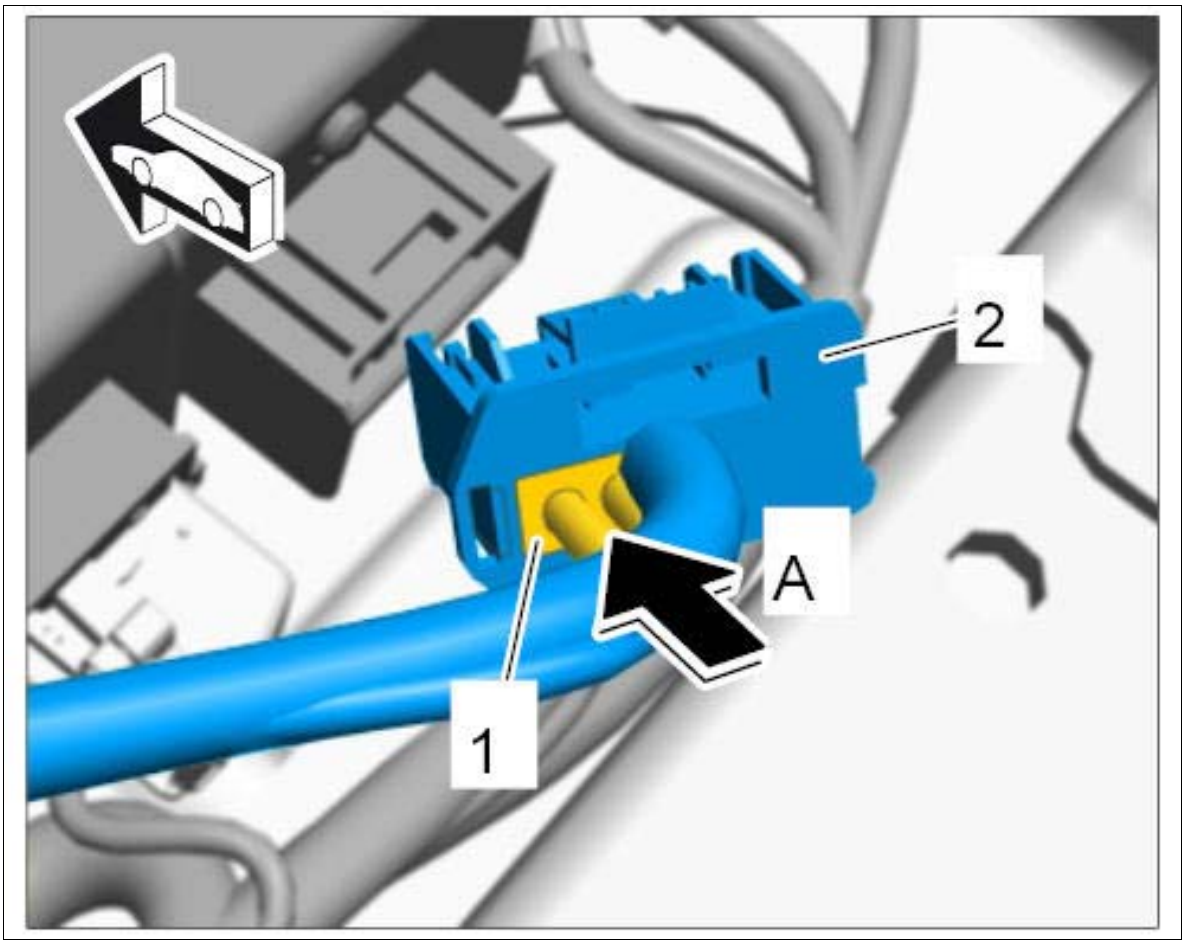
Information

Before routing a new optical waveguide:

- Visually check the locks, connector housing and contacts for damage.
- Replace damaged parts if necessary.

1. Cut off optical contacts of the damaged optical waveguide, isolate it and tie it to the main wire harness.
2. Route new optical waveguide along the main wire harness, guide it through the existing cable ducts and tie it to the main wire harness using tie-wraps.
3. Plug electric plug connection **-1-** for the optical waveguide into the compact connector **-2-** for the TV tuner **-A-** until the electric plug connection engages securely.

   Fig 3: Plugging Electric Plug Connection Into TV Tuner Compact Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Plug electric plug connection **-1-** for the optical waveguide into the compact connector **-2-** for the PCM display and operator control unit **-A-** until the electric plug connection engages securely.

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

1. Open cover **-1-** on the positive terminal.
2. Loosen terminal clamp **-2-** for the power distributor from the battery terminal.

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

1. Installation is performed in reverse order to removal.
2. Tighten M6 fastening nuts used to secure electric lines to the power distributor. **Tightening torque 7.5 Nm (5.5 ftlb.)**
3. Tighten M8 fastening nut used to secure electric line to the power distributor. **Tightening torque 16 Nm (12 ftlb.)**
4. Tighten fastening screw used to secure electric line to the power distributor. **Tightening torque 7.5 Nm (5.5 ftlb.)**

WM 9X00IN BASIC INSTRUCTIONS AND PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
battery charger HFL 65	Service equipment	WE 1353		PIWIS Tester II	Special tool	9818		
WM 9X00IN BASIC INSTRUCTIONS AND PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER (ALL MODELS) > BASIC INFORMATION AND INSTRUCTIONS FOR CONTROL UNIT PROGRAMMING > BASIC INFORMATION ON CONTROL UNIT PROGRAMMING

Information

There are basically two different ways of carrying out control unit programming:

- Using the "Programming" menu for the relevant control unit (e.g. for the DME and PDK control units).

or

- Using the "Campaign" function in the Additional menu on the PIWIS Tester by entering a specific programming code.

The type of control unit programming to be used is described in the relevant Service Information or in the relevant Technical Information.

WM 9X00IN BASIC INSTRUCTIONS AND PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER (ALL MODELS) > BASIC INFORMATION AND INSTRUCTIONS FOR CONTROL UNIT PROGRAMMING > BASIC INSTRUCTIONS FOR CONTROL UNIT PROGRAMMING

NOTE: Fault entry in the fault memory and control unit programming aborted due to undervoltage.

- *Increased current draw during diagnosis or control unit programming can cause a drop in voltage, which can result in one or more fault entries and the abnormal termination of the programming process.*

→ Before commencing work, connect a suitable battery charger with a current rating of at least 40 A to the jump-start terminals in the engine compartment.

NOTE: Control unit programming will be aborted if the WLAN connection is unstable.

- *An unstable WLAN connection can interrupt communication between PIWIS Tester II and the vehicle communication module (VCI). As a result, control unit programming may be aborted.*

→ During control unit programming, always connect PIWIS Tester II to the vehicle communication module (VCI) via the USB cable.

NOTE: Control unit programming will be aborted if the vehicle key is not recognized

- *If the vehicle key is not recognized in vehicles with Porsche Entry & Drive, programming cannot be started or will be interrupted.*

→ Switch on the ignition using the original vehicle key. To do this, replace the control panel in the ignition lock with the original vehicle key if necessary.

WM 9X00IN BASIC INSTRUCTIONS AND PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER (ALL MODELS) > GENERAL PRELIMINARY WORK

1. Connect a battery charger with a current rating of **at least 40 A** (e.g. **battery charger HFL 65 WE 1353)** to the jump-start terminals in the engine compartment and switch it on.

2. Switch on the ignition using the **original driver's key.**

   On vehicles with "Porsche Entry & Drive", do this by replacing the control panel in the ignition lock with the original driver's key if necessary.

3. **PIWIS Tester II 9818** must be connected to the vehicle communication module (VCI) via the **USB cable.** Then, connect the communication module to the vehicle and switch on the PIWIS Tester.

WM 9X00IN BASIC INSTRUCTIONS AND PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER (ALL MODELS) > BASIC PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER > INFORMATION ON THE PROCEDURE FOR CONTROL UNIT PROGRAMMING

Information

There are basically two different ways of carrying out control unit programming using the PIWIS Tester:

- Using the "Programming" menu for the relevant control unit (e.g. for the DME and PDK control units) → Control unit programming using the "Programming" menu.

or

- Using the "Campaign" function in the Additional menu on the PIWIS Tester by entering a specific programming code → Control unit programming using the "Campaign" function in the Additional menu on the PIWIS Tester.

The type of control unit programming to be used is described in the relevant Service Information or in the relevant Technical Information.

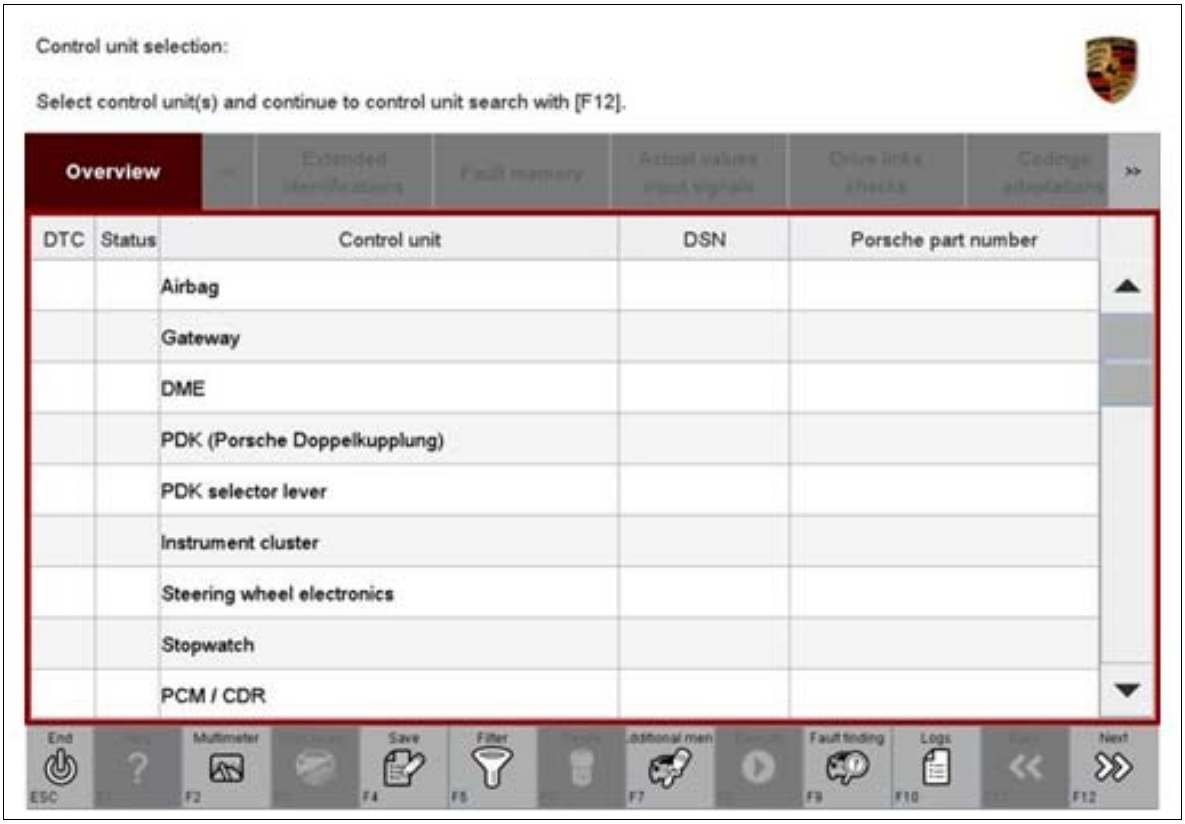
WM 9X00IN BASIC INSTRUCTIONS AND PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER (ALL MODELS) > BASIC PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER > CONTROL UNIT PROGRAMMING USING THE "PROGRAMMING" MENU

1. On the PIWIS Tester start screen, call up the **==> 'Diagnostics'** menu and select the relevant vehicle type.

   The diagnostic application is then started and the control unit selection screen is populated.

2. Select the control unit to be programmed in the control unit selection screen (**==> "Overview"** menu) and press [>>] to confirm your selection → see Fig 1.

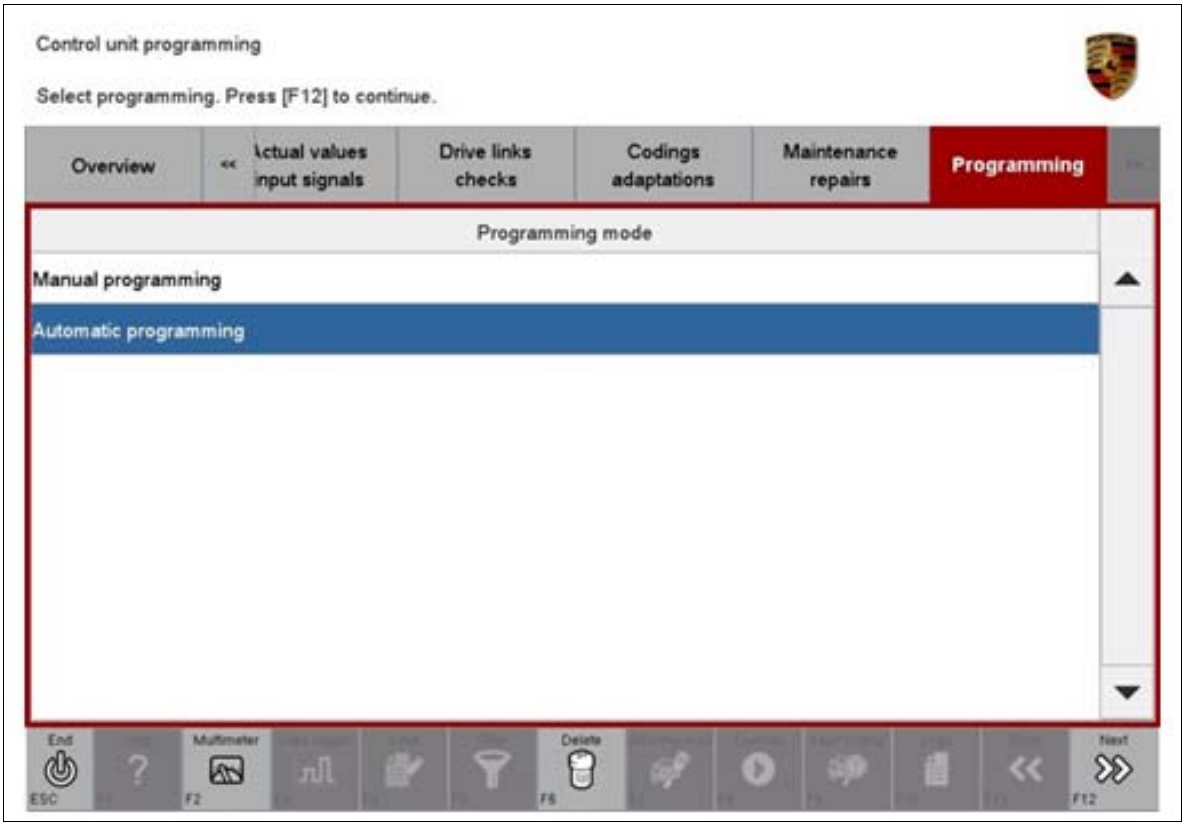
Fig 1: Screen Display - Control Unit Selection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. When the question "Create Vehicle Analysis Log (VAL)?" appears, either press [F12] to create a VAL or press [F11] if you do not want to create a VAL.
4. Press [>>] to acknowledge the message that may appear informing you that campaigns for the vehicle are stored in the PIWIS information system.
5. Once the control unit to be programmed has been found, select the **==> 'Programming'** menu.
6. Select the **==> 'Automatic programming'** function and press [>>] to confirm your selection and start the guided programming sequence → see Fig 2.

Fig 2: Screen Display - Automatic Programming



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Read and follow the **information and instructions on the PIWIS Tester** during the guided programming sequence. Then press [>>] to continue.

   During the programming sequence, the control unit is re-programmed and then re-coded automatically if necessary.

   Do not interrupt programming and coding.

   Once control unit programming - and coding if necessary - is complete, you will be prompted to switch the ignition off and then back on again after a specified waiting time.

   Information

   Once programming is completed successfully, the work described under **==> "General subsequent work"** must always be carried out.

   If other specific subsequent work is required, this is described in the relevant Service Information or in the relevant Technical Information.

   Information

   1. If an error message is displayed during programming (e.g. "Campaign does not exist", "No suitable programming rules found" or "Vehicle data could not be read", etc.), please read and follow the appropriate instructions provided under → Troubleshooting.

   2. If programming is interrupted (e.g. due to a voltage drop or if communication is aborted, etc.) or if programming could not be carried out successfully (error message

"Programming unsuccessful"), programming must be repeated .

3. If coding is not carried out successfully during the guided programming sequence, the control unit must be re-coded again separately once the guided programming sequence is complete. To do this, select the relevant control unit in the control unit selection screen ("Overview" menu) and press [>>] to confirm your selection. Once the control unit has been found, select the "Codings/adaptations" menu and re-code the control unit using the 'Automatic coding' function.

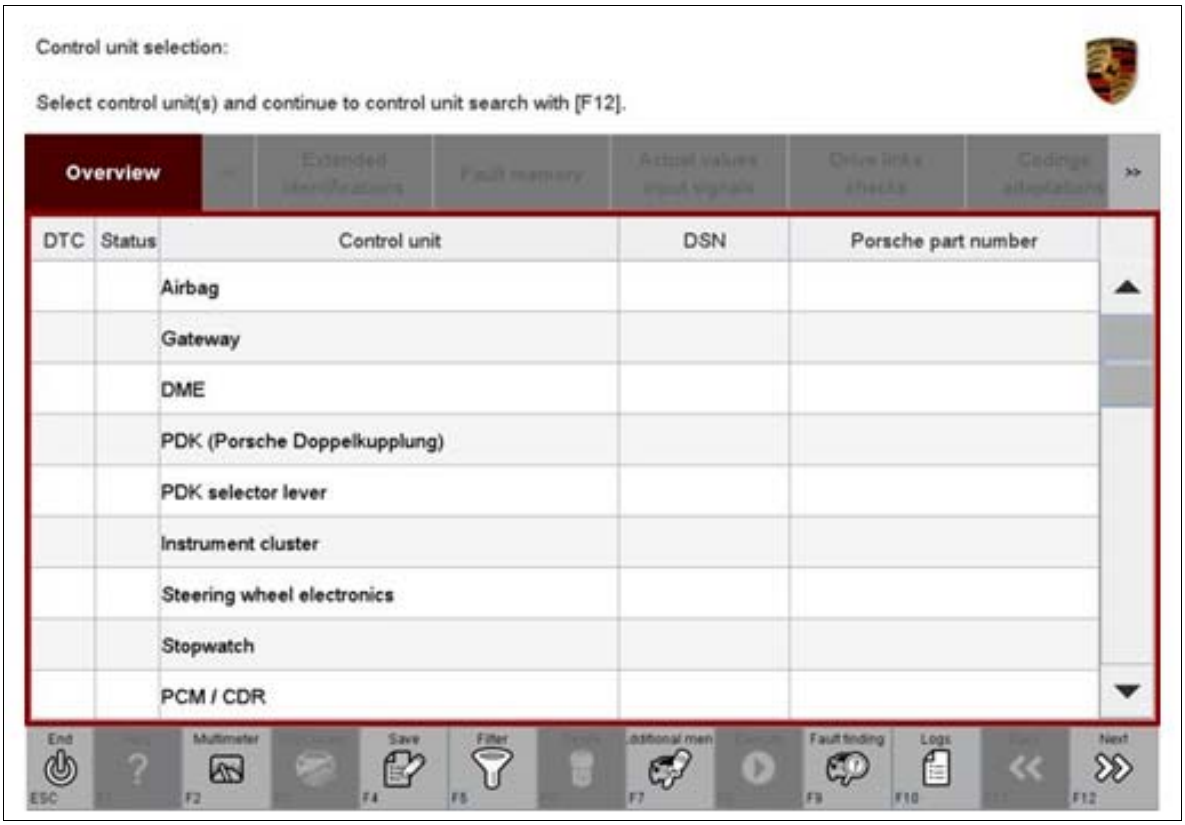
WM 9X00IN BASIC INSTRUCTIONS AND PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER (ALL MODELS) > BASIC PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER > CONTROL UNIT PROGRAMMING USING THE "CAMPAIGN" FUNCTION IN THE ADDITIONAL MENU ON THE PIWIS TESTER

1. On the PIWIS Tester start screen, call up the **==> 'Diagnostics'** menu and select the relevant vehicle type.

   The diagnostic application is then started and the control unit selection screen is populated.

2. In the control unit selection screen ("Overview" menu), press [F7] to call up the **==> 'Additional menu'** (→ see Fig 1).

   Fig 1: Screen Display - Control Unit Selection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. When the question "Create Vehicle Analysis Log (VAL)?" appears, either press [>>] to create a

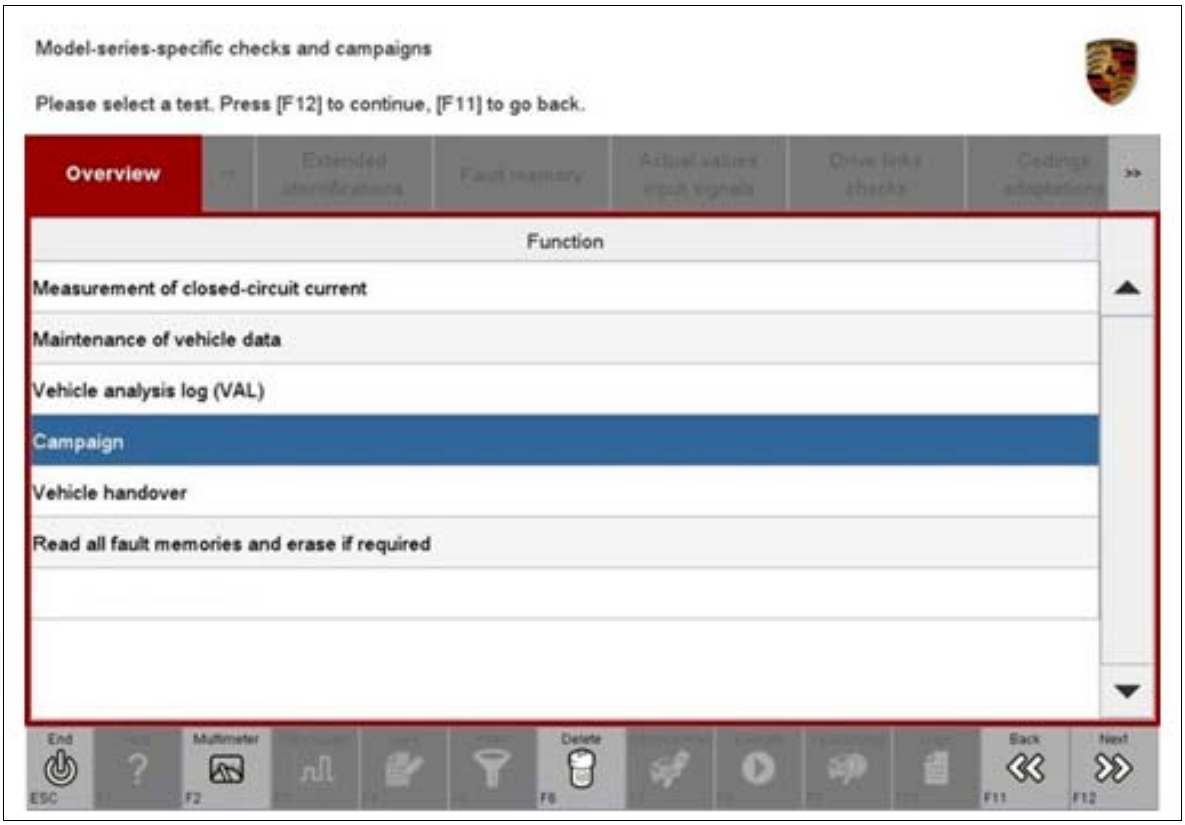
VAL or press [F11] if you do not want to create a VAL.

4. Press [>>] to acknowledge the message that may appear informing you that campaigns for the vehicle are stored in the PIWIS information system.

5. Select the **==> 'Campaign'** function and press [>>] to confirm your selection → see Fig 2.

   You are then prompted to enter a programming code.

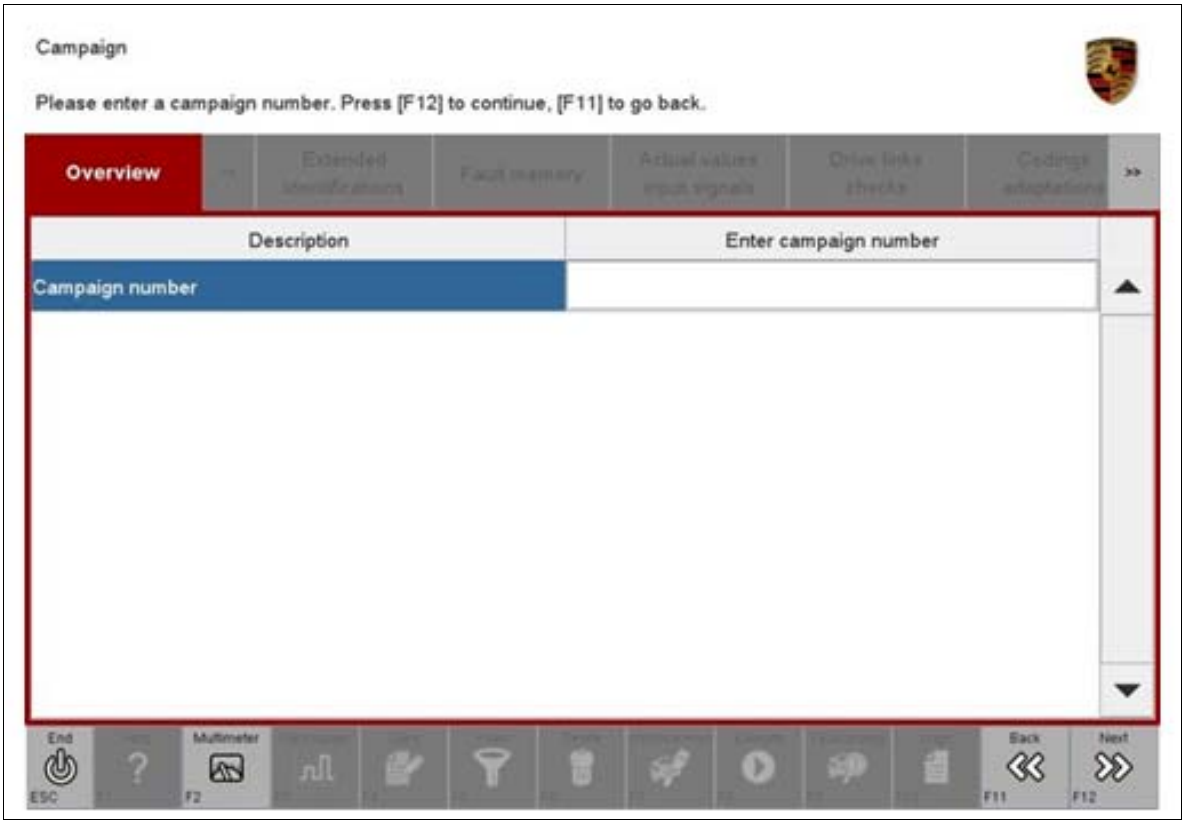
   Fig 2: Screen Display - Additional Menu - Campaign



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. To enter the programming code, click in the relevant text box so that the cursor starts to flash → see Fig 3.

Fig 3: Screen Display - Programming Code Input Field



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Enter the **programming code** specified in the relevant description (Technical Information, Service Information) and press Enter to confirm your entry.

   The text box turns blue.

8. Press [>>] to start the guided programming sequence.

   Read and follow the **information and instructions on the PIWIS Tester** during the guided programming sequence. Then press [>>] to continue.

   During the programming sequence, the control unit is re-programmed and then re-coded automatically if necessary.

   Do not interrupt programming and coding.

   Once control unit programming - and coding if necessary - is complete, you will be prompted to switch the ignition off and then back on again after a specified waiting time.

   Information

   Once programming is completed successfully, the work described under **==> "General subsequent work"** must always be carried out.

   If other specific subsequent work is required, this is described in the relevant Service Information or in the relevant Technical Information.

   Information

1. If an error message is displayed during programming (e.g. "Campaign does not exist", "No suitable programming rules found" or "Vehicle data could not be read", etc.), please read and follow the appropriate instructions provided under → Troubleshooting.

2. If programming is interrupted (e.g. due to a voltage drop or if communication is aborted, etc.) or if programming could not be carried out successfully (error message "Programming unsuccessful"), programming must be repeated by entering the programming code again (Additional menu > Campaign >> Enter campaign number). It is not possible to program the control units manually.

3. If coding is not carried out successfully during the guided programming sequence, the control unit must be re-coded again separately once the guided programming sequence is complete. To do this, select the relevant control unit in the control unit selection screen ("Overview" menu) and press [>>] to confirm your selection. Once the control unit has been found, select the "Codings/adaptations" menu and re-code the control unit using the 'Automatic coding' function.

WM 9X00IN BASIC INSTRUCTIONS AND PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER (ALL MODELS) > GENERAL SUBSEQUENT WORK

1. Read out and erase all fault memories.

    1. 1.1. In the control unit selection screen (**==> 'Overview'** menu), press [F7] to call up the **==> 'Additional menu'** (→ see Fig 1).

        Fig 1: Screen Display - Control Unit Selection

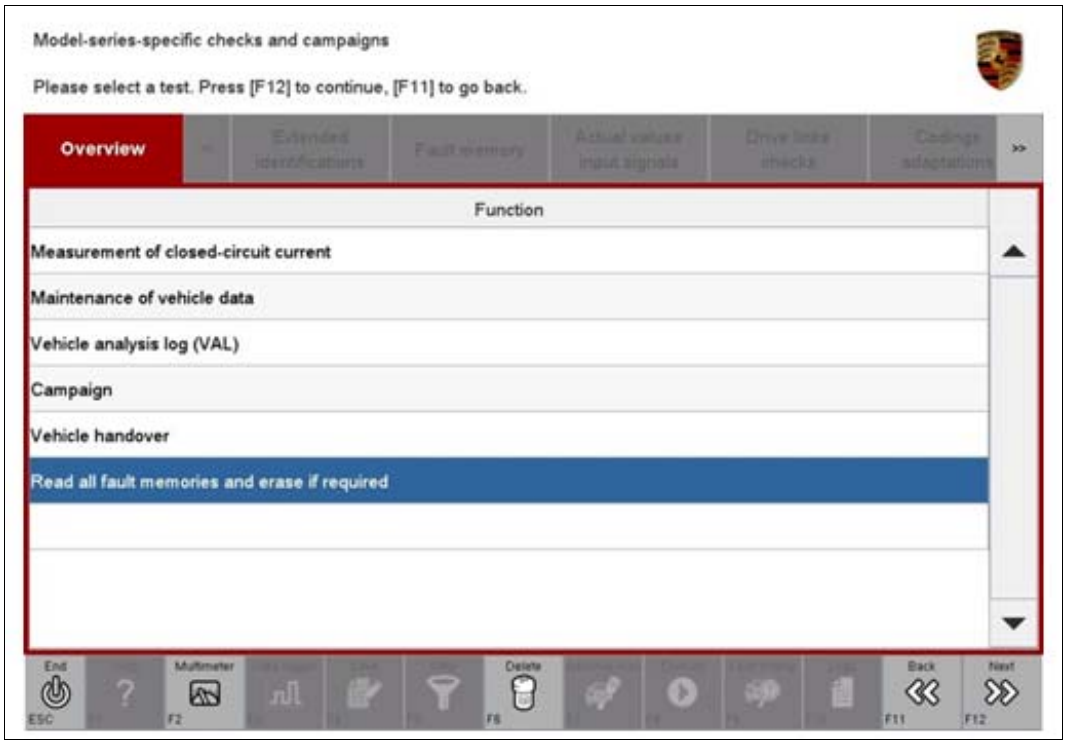
        
        Courtesy of PORSCHE CARS NORTH AMERICA, INC.

    2. 1.2. Select the function **==> 'Read all fault memories and erase if required' and**

press [>>] to confirm → see Fig 2.

The fault memories of the control units are read out.

Fig 2: Screen Display - Erasing Fault Memories



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 1.3. Once you have read out the fault memories, delete the fault memory entries by pressing [F8].
4. 1.4. Press [>>] ("Yes") in response to the question as to whether you really want to delete all fault memory entries.

   The faults stored in the fault memories of the various control units are deleted.

   Information

   If there are still fault memory entries in individual control units, start the engine briefly and then switch it off again. Wait for approx. 10 seconds before switching the ignition on again and re-establish the connection between the PIWIS Tester and the vehicle. Then read out and erase the fault memories of the affected control units again separately.

   If the control units are found to have other faults, which cannot be erased and are **not caused by control unit programming,** these faults must be found and corrected.

1. Switch off ignition.
2. Disconnect the PIWIS Tester from the vehicle.
3. Switch off and disconnect the battery charger.

4. On vehicles with Porsche Entry & Drive, replace the original driver's key in the ignition lock with the control panel again.

WM 9X00IN BASIC INSTRUCTIONS AND PROCEDURE FOR CONTROL UNIT PROGRAMMING USING THE PIWIS TESTER (ALL MODELS) > FAULT FINDING

Information

This information describes possible **causes and remedial action for error messages** that can occur both during control unit programming using the **'Campaign'** function and during control unit programming using the **'Automatic programming'** function.

Error message after starting programming	Possible causes	Remedial action
Specified campaign does not exist	• PIWIS Tester software is not up-to-date	• Update PIWIS Tester software to the software version specified in the Technical Information (or a higher software version). Then enter the programming code again and start programming.
	• Wrong vehicle type selected	• Close the diagnostic application. Select the correct vehicle type and restart the diagnostic application. Then enter the programming code again and start programming.
	• Incorrect programming code entered or programming code not entered correctly	• Enter the programming code specified in the Technical Information correctly.
No suitable programming rules found. Cause: **Part number of the control unit** is not in the programming rules.	• Campaign must not be carried out on the vehicle or campaign was already carried out.	• Check vehicle assignment to the campaign in **PIWIS > Vehicle information** .
	• Replacement control unit with up-to-date software version was installed	• Check Porsche part number of the relevant control unit in the ==> "Extended

		identification" menu.
	• Software version of the installed control unit is already up-to-date	Information about the current Porsche part numbers and software versions of the affected control unit can be found in the relevant Service Information or in the relevant Technical Information.
	• Software version of the control unit is a version that is not intended for carrying out the campaign.	
No suitable programming rules found. Cause: **Current vehicle equipment** is not shown in the programming rules. Please check vehicle order and change it if necessary.	• Campaign must not be carried out on the vehicle.	• Check vehicle assignment to the campaign in **PIWIS > 'Vehicle Information'** menu.
	• Vehicle order is wrong.	• Check vehicle order and correct it if necessary (PIWIS Tester > Additional menu [>>] Maintenance of vehicle data). Then enter the programming code again and start programming.
Vehicle data could not be read	• Ignition not switched on	• Switch on ignition and close and restart the diagnostic application. Then enter the programming code again and start programming.

WM 9X00IN BULB TABLE AND INSTALLATION INSTRUCTIONS (ALL MODELS) > INFORMATION > INSTALLATION INSTRUCTIONS

WARNING: Live components

- *Risk of electric shock*

→ Remove electric charge from component.

→ Make sure it does not switch on again.

→ Check that there is no electric charge

→ Cover adjacent live parts.

> *NOTE: Incorrect handling of bulbs*
>
> - *Risk of damage to bulbs and the bulb housing*

→ Switch off ignition and remove ignition key.

→ Switch off the relevant loads when changing bulbs.

→ Only use bulbs listed in the bulb table.

→ Only install clean bulbs that are free of grease.

→ Always use a cloth or soft paper when working with bulbs.

→ Observe the safety instructions when changing a bulb in a Bi-Xenon headlight.

→ In certain states, it is compulsory to carry spare light bulbs.

WM 9X00IN ORDERING AND REPAIRING ELECTRIC PLUG CONNECTIONS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 9X00IN ORDERING AND REPAIRING ELECTRIC PLUG CONNECTIONS (ALL MODELS) > INFORMATION > GENERAL INFORMATION ON ORDERING CONNECTOR HOUSINGS AND REPAIR LINES

Information

- Spare parts for repairing electric plug connections can be purchased in the TKR Automotive GmbH online shop. Link: **www.tkr-connector.com**
- The spare parts available there include: Connector housings, individual lines with crimped-on contact, crimp connectors, cable seals and dummy plugs.
- Initially, only the electric plug connections installed in the Macan are available in the online shop.
- Only spare parts for repairing electric plug connections are available in the online shop. The tools that are available there must be purchased using the usual procurement process for tools.
- Only one account for ordering connectors should be set up for the online shop for every Porsche Centre, but the account can be used many times internally in the Porsche Centre.

Fig 1: Screen Display - Online Shop

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 9X00IN ORDERING AND REPAIRING ELECTRIC PLUG CONNECTIONS (ALL MODELS) > INFORMATION > IDENTIFICATION OF REQUIRED ELECTRIC PLUG CONNECTION

Information

- The correct individual line is identified based on the relevant connector housing.
- The correct individual lines and the correct tool for loosening the primary and secondary locks on the connector are displayed for every connector housing.
- The following options are available for identifying the connector housing in the online shop
  - Perform a search in the search field using the part number shown on the connector .

IMPORTANT: Enter the part number without spaces or punctuation

- Perform a search based on the number and arrangement of the pins and comparison with colored photos
- Perform a search based on the position of the connector in the vehicle and comparison with colored photos
- Identify the part number using wiring diagrams → "Wiring Diagrams" in PIWIS Tester II 9818 and perform a search in the search field based on the part number that is read out.

- The correct crimp connectors are identified based on the color coding of the line diameters in the online shop. The color coding corresponds to the color of the crimp connector.

WM 9X00IN ORDERING AND REPAIRING ELECTRIC PLUG CONNECTIONS (ALL MODELS) > INFORMATION > REPAIRING ELECTRIC PLUG CONNECTION

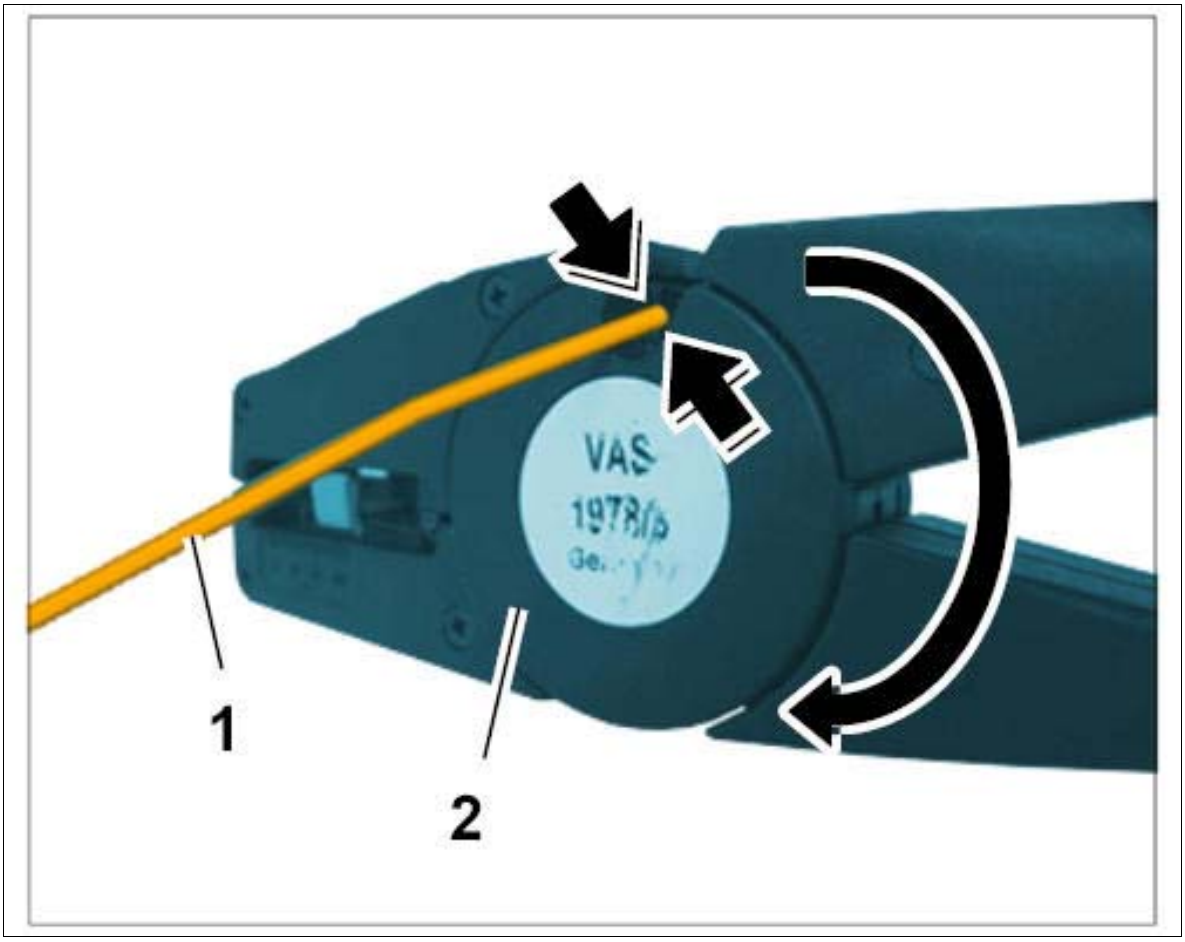
NOTE: Risk of damage to connector contacts or locking lugs

- *Corrosion on connector contacts*
- *Contact problems*

→ Only use the recommended press-out tool

1. Release secondary lock on electric plug connection using the specified press-out tool.
2. Release primary lock on electric plug connection using the specified press-out tool.
3. Cut off faulty line **-1-** using **stripping pliers VAS 1978/3 -2-** .

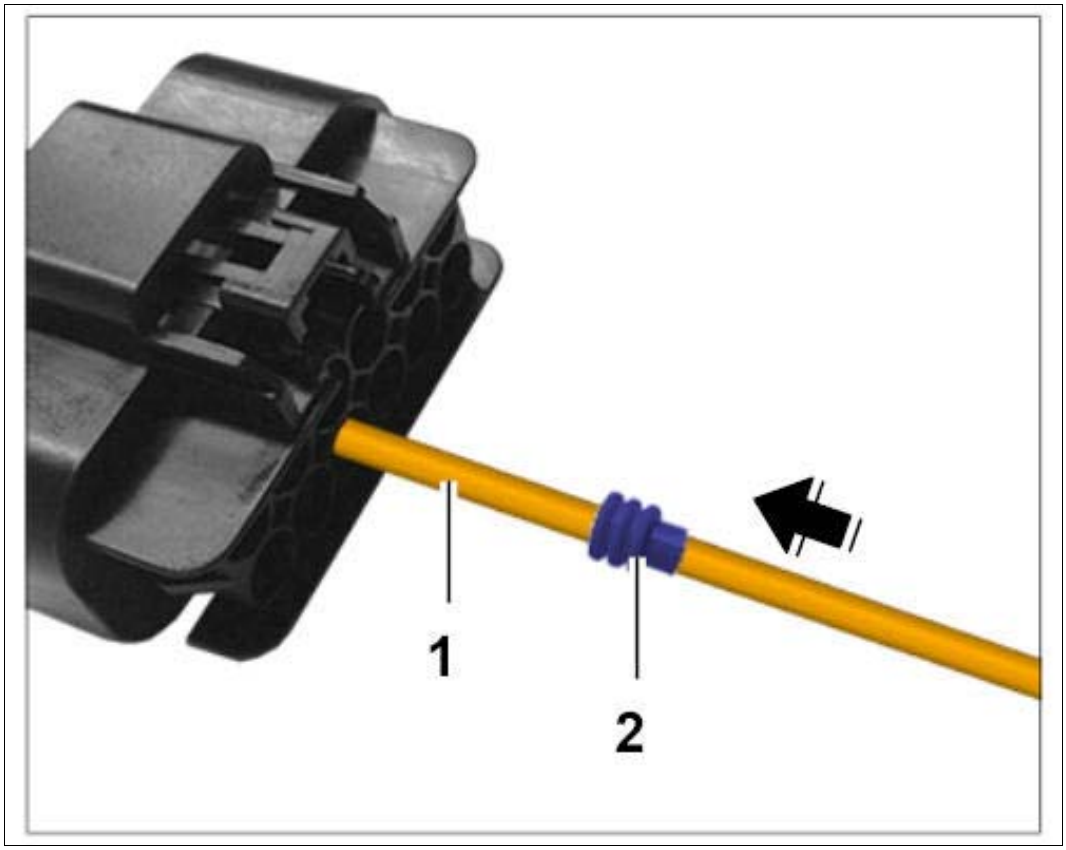
Fig 1: Cutting Line Using Stripping Pliers



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Cut repair line with crimped-on contacts on both sides to the required length.
5. Insert contact on the repair line into the connector housing until the contact engages securely.
6. Guide a suitable line seal **-2-** onto the repair line **-1-** if necessary.
    1. 6.1. The wide end of the line seal is guided on first.
    2. 6.2. The diameter of the line seal must be smaller than the diameter of the line to ensure that the line seal fits securely.
    3. 6.3. A suitable tool can be used as an aid for guiding on the line seal.
    4. 6.4. Guide the line seal on as far as required until the line seal is fitted fully and securely in the sealing chamber.

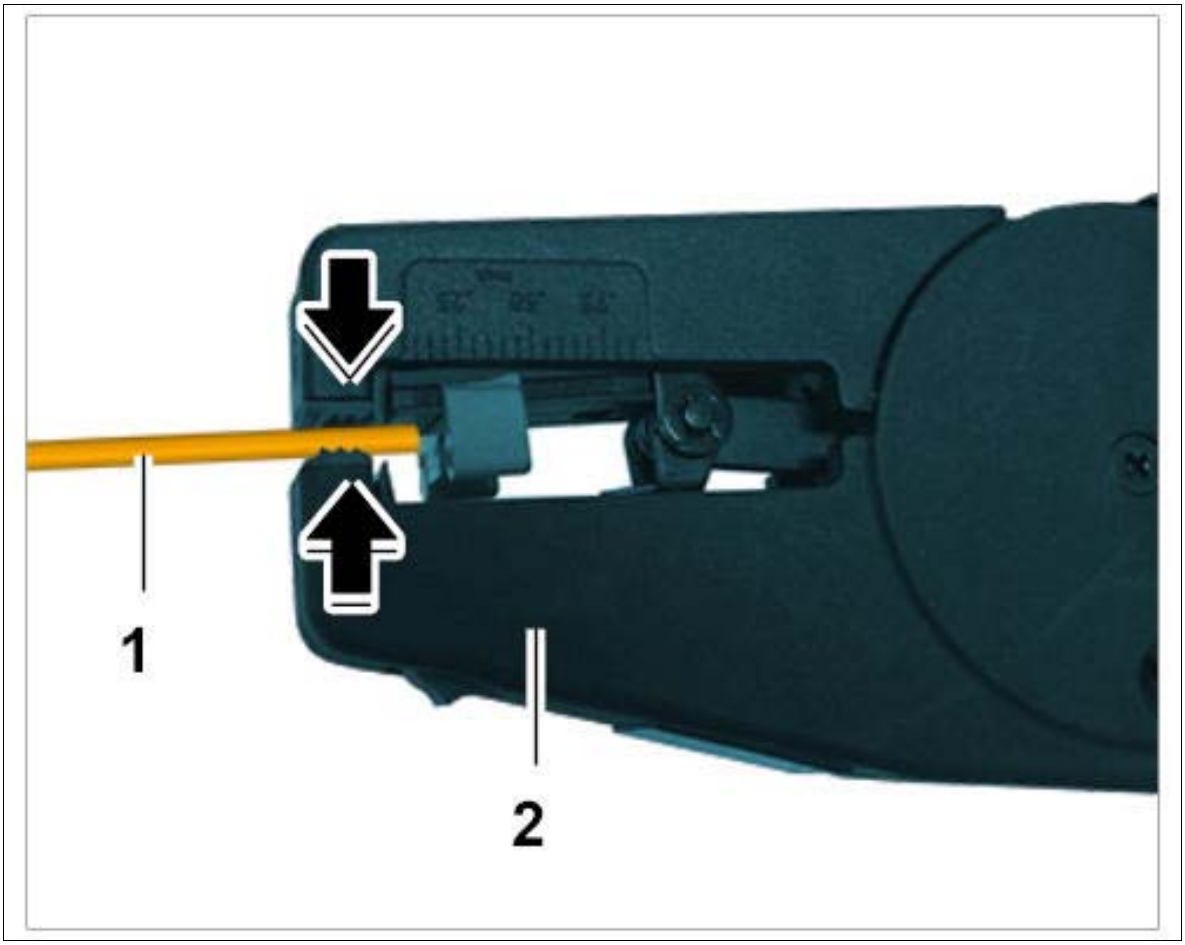
Fig 2: Installing Seals



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Strip the repair line **-1-** and the line that was cut using **stripping pliers VAS 1978/3 -2-** .

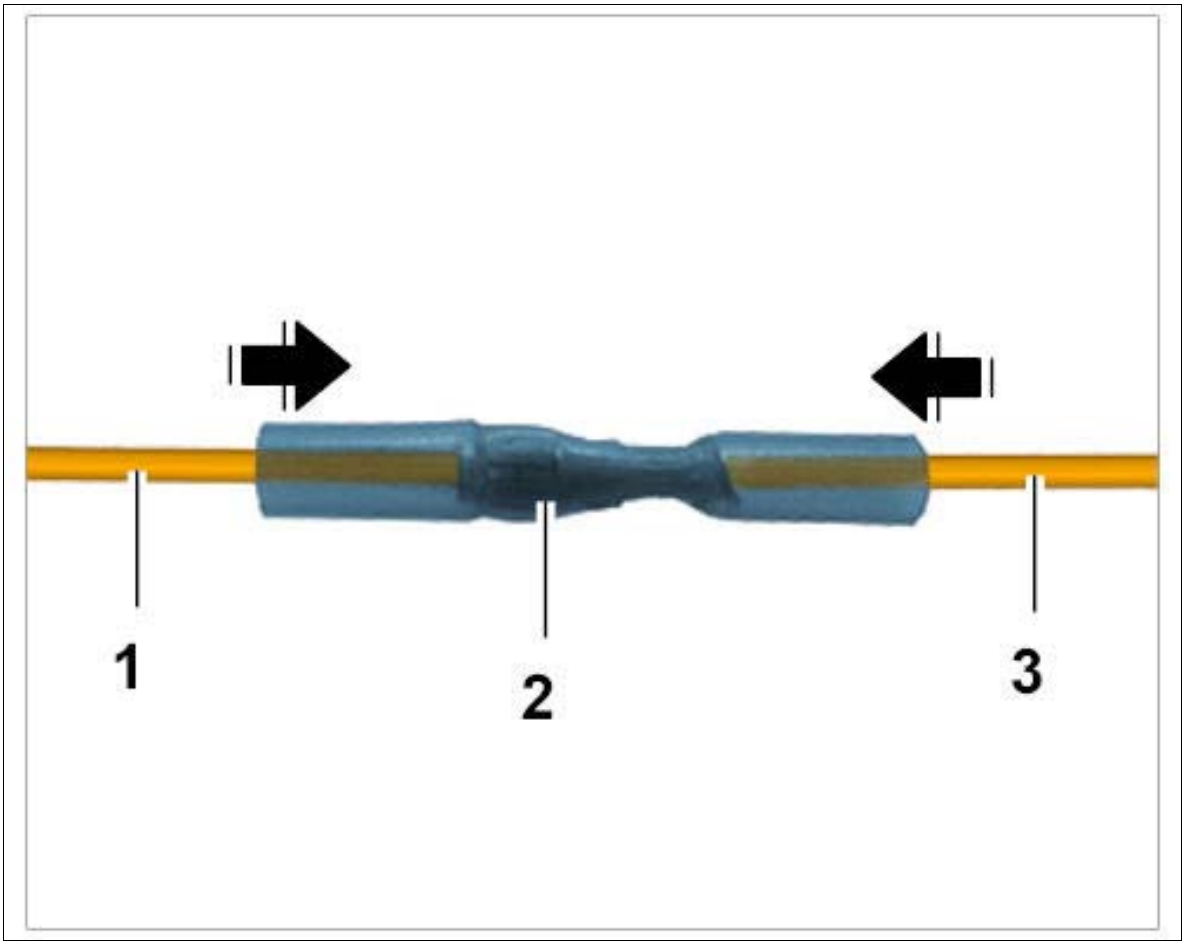
Fig 3: Cutting Repair Line Using Stripping Pliers



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Insert stripped part of the repair line **-1-** and stripped part of the line to be repaired **-3-** into a suitable crimp connector **-2-** .

Fig 4: Inserting Repair Lines Into Crimp Connectors



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Crimp on both repair lines using **crimping pliers VAS 1978/1-1** .

    1. 9.1. Fit crimping pliers insert **-1-** according to the color marking **-3-** on the crimp connector **-2-** into the **crimping pliers VAS 1978/1-1** .

    2. 9.2. Crimp on the crimp connector **-2-** using **crimping pliers VAS 1978/1-1** .

WM 100119 REMOVING AND INSTALLING ENGINE (MACAN) > TOOLS

Designation	Type	Number	Description	
support bracket	VW tool	10-222 A		workshop crane	Workshop equipment	WE 1188		
Lifting tackle	VW tool	2024 A		
gearbox support	VW tool	3147		
WM 100119 REMOVING AND INSTALLING ENGINE (MACAN) > PRELIMINARY WORK

1. Remove ignition key.
2. Disconnect the battery. → 270619 REMOVING AND INSTALLING BATTERY
3. Remove engine cover.
4. Loosen drive belt. → 137819 REMOVING AND INSTALLING DRIVE BELT
5. Remove cowl panel cover. → 508719 REMOVING AND INSTALLING COWL PANEL COVER
6. Remove filler neck from windscreen-washer reservoir. → 926019 REMOVING AND INSTALLING WINDSCREEN-WASHER RESERVOIR
7. Remove front strut. → 408619 REMOVING AND INSTALLING FRONT STRUT
8. Remove front wheels. → 440519 REMOVING AND INSTALLING WHEEL
9. Remove front wheel housing liner. → 505619 REMOVING AND INSTALLING FRONT WHEEL HOUSING LINER
10. Remove cover for front underbody. → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY
11. Drain coolant. → 193817 DRAINING AND FILLING COOLANT
12. Remove cross panel. → 508119 REMOVING AND INSTALLING CROSS PANEL (DISASSEMBLING PLENUM PANEL)
13. Remove catalytic converter. → 267319 REMOVING AND INSTALLING CATALYTIC CONVERTER

WM 100119 REMOVING AND INSTALLING ENGINE (MACAN) > REMOVING ENGINE

WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

WARNING: Hot fluid

- *Danger of scalding*

→ Let the fluid cool down.

→ Wear personal protective gear.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapors.

→ Attach warning sign in a clearly visible position.

CAUTION: Hot components

- *Risk of burns*

→ Let hot components cool down.

→ Wear personal protective gear.

NOTE: Aggressive fluids

- *Risk of damage to components and surfaces*

→ Do not spill fluids.

→ In the event of contact, wash the component or surface with water.

→ Replace components that are already damaged.

Information

- Close off open connections and lines using suitable stoppers or caps.

Information

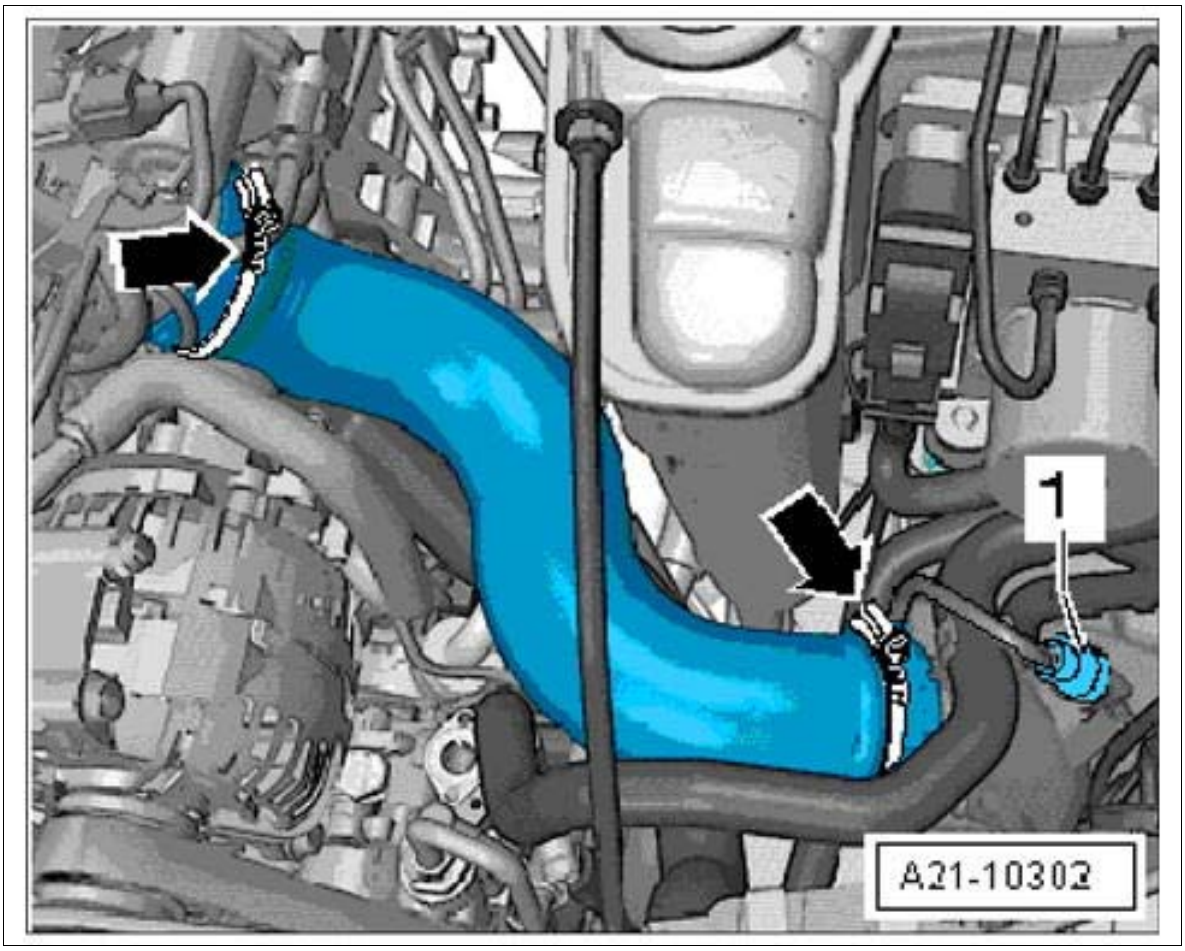
Place a cloth underneath to catch escaping fuel.

Information

- The pictures shown in this document may differ from the original.

1. Loosen screw-type clamps and pull off pressure hose.

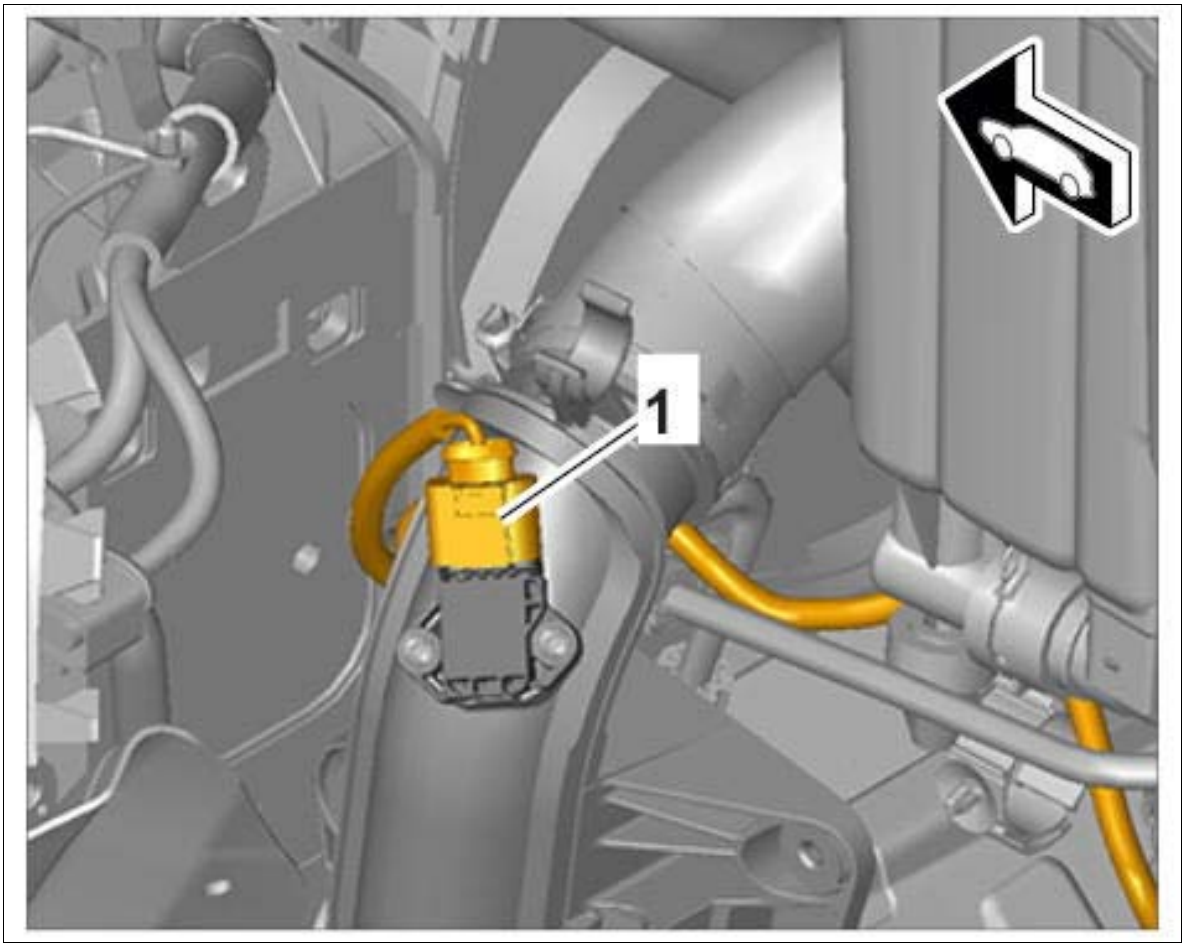
   Fig 1: Locating Charge-Air Cooler/Throttle Valve Pressure Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Release and disconnect electric connector **-1-** for the boost pressure sensor.

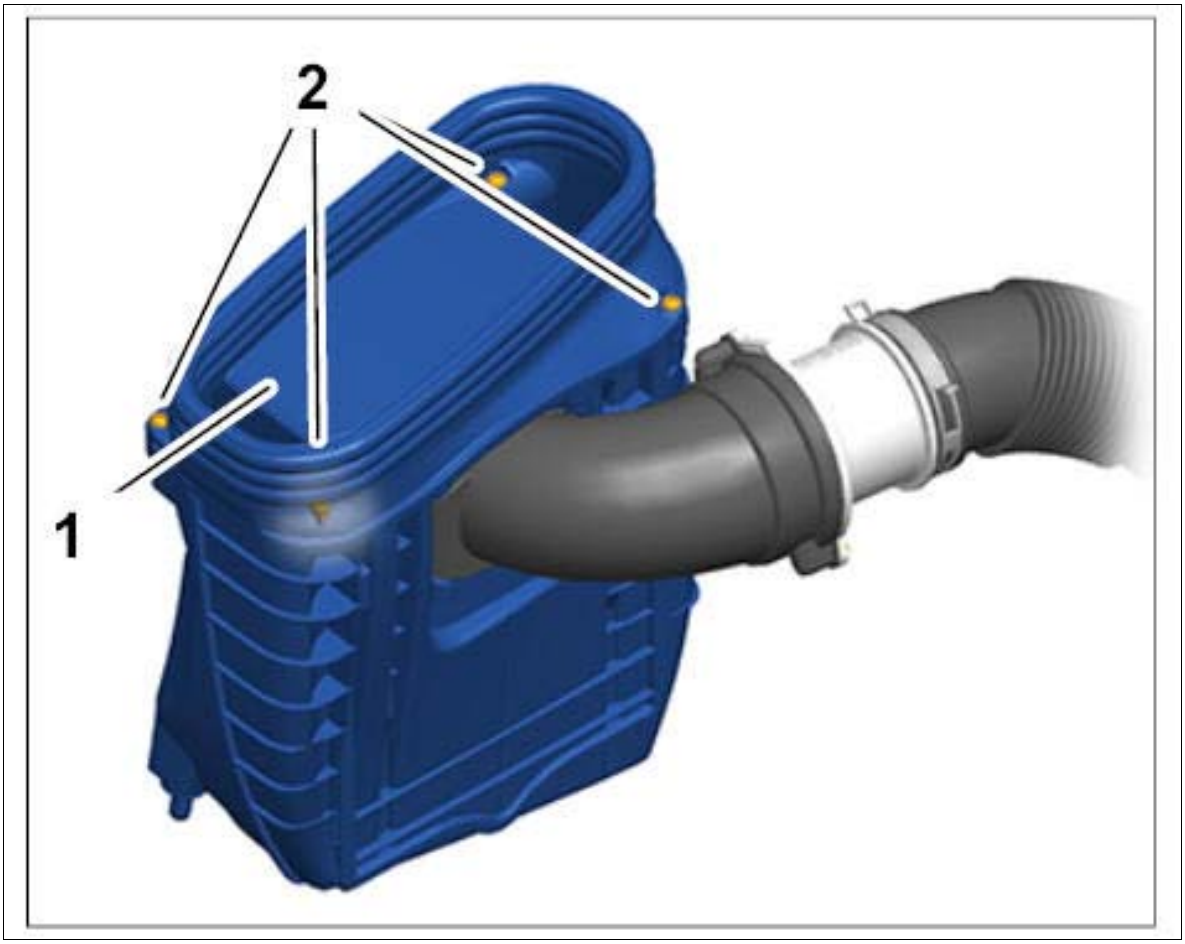
Fig 2: Identifying Boost Pressure Sensor Electric Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Loosen fastening screws **-2-** and remove air cleaner housing cover **-1-** .

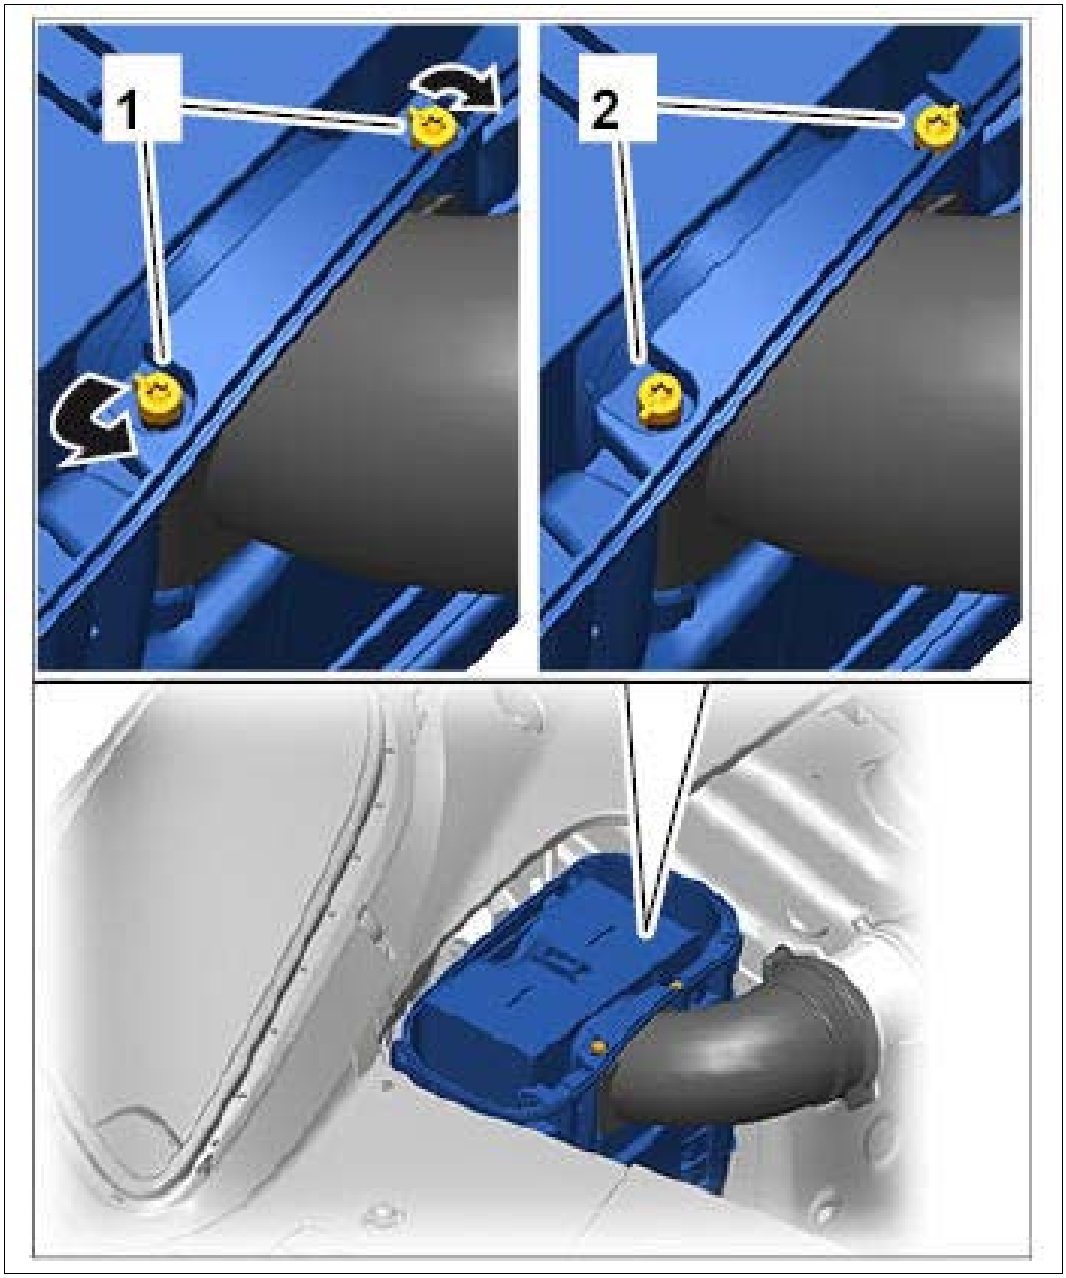
Fig 3: Identifying Air Cleaner Housing Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove fastening bolts.
    1. 4.1. Press fastening bolts **-1-** down slightly and turn 90° in **-direction of arrow-** .
    2. 4.2. Pull out loosened fastening bolt **-2-** .

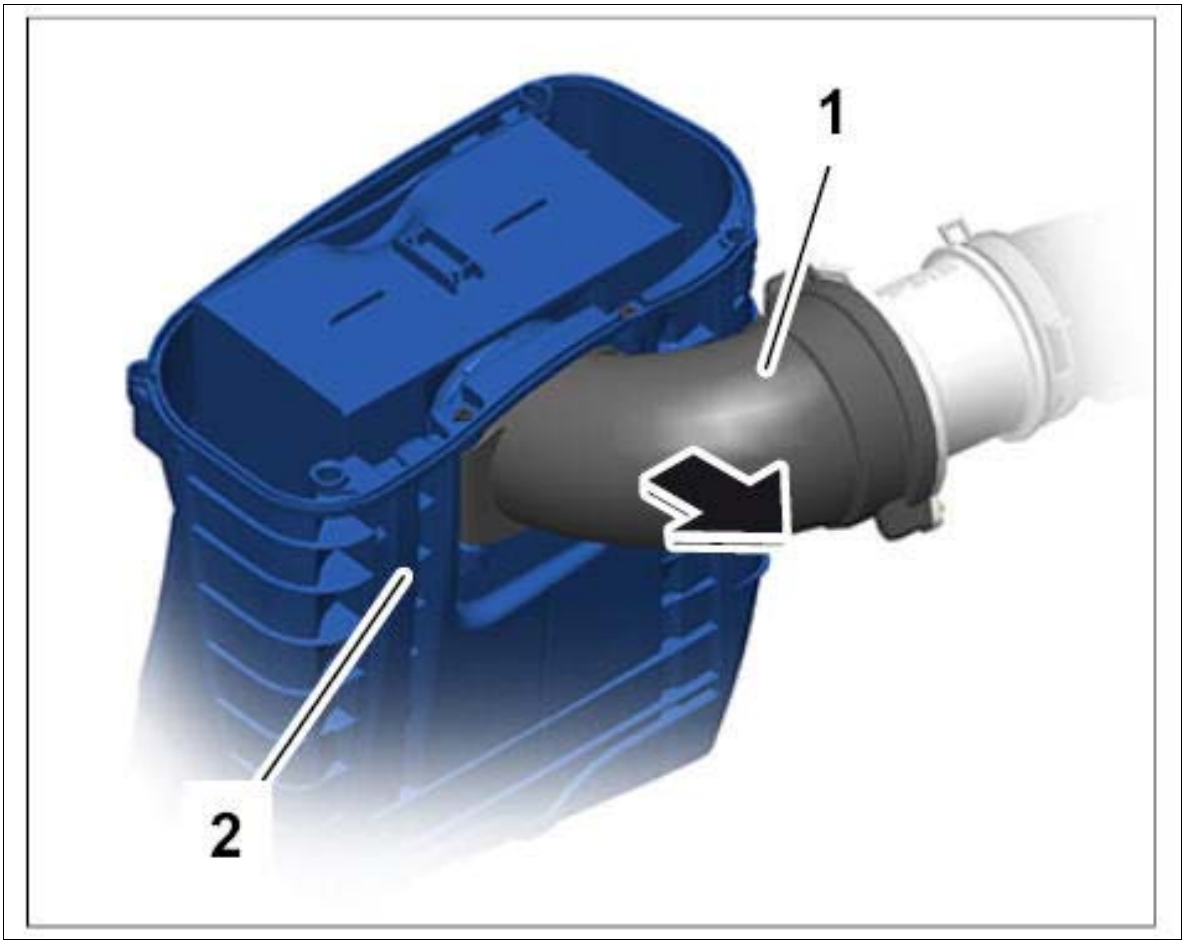
Fig 4: Identifying Engine Fastening Bolts



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Loosen air guide **-1-** from the air cleaner housing **-2-** in **-direction of arrow-** .

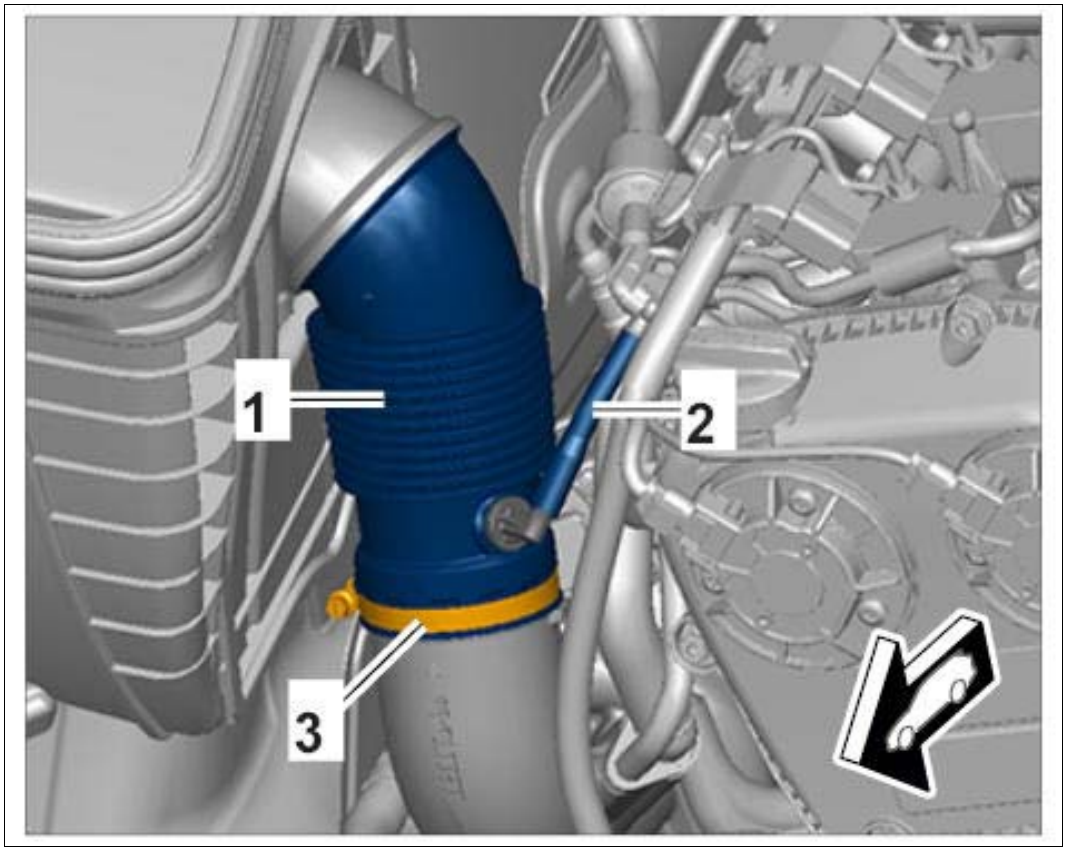
Fig 5: Loosening Air Guide



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Remove air box for air cleaner **-1-** (air cleaner/turbocharger).
    1. 6.1. Disconnect vacuum line **-2-** and loosen screw-type clamp **-3-** .
    2. 6.2. Lift air box for air cleaner up and remove it.

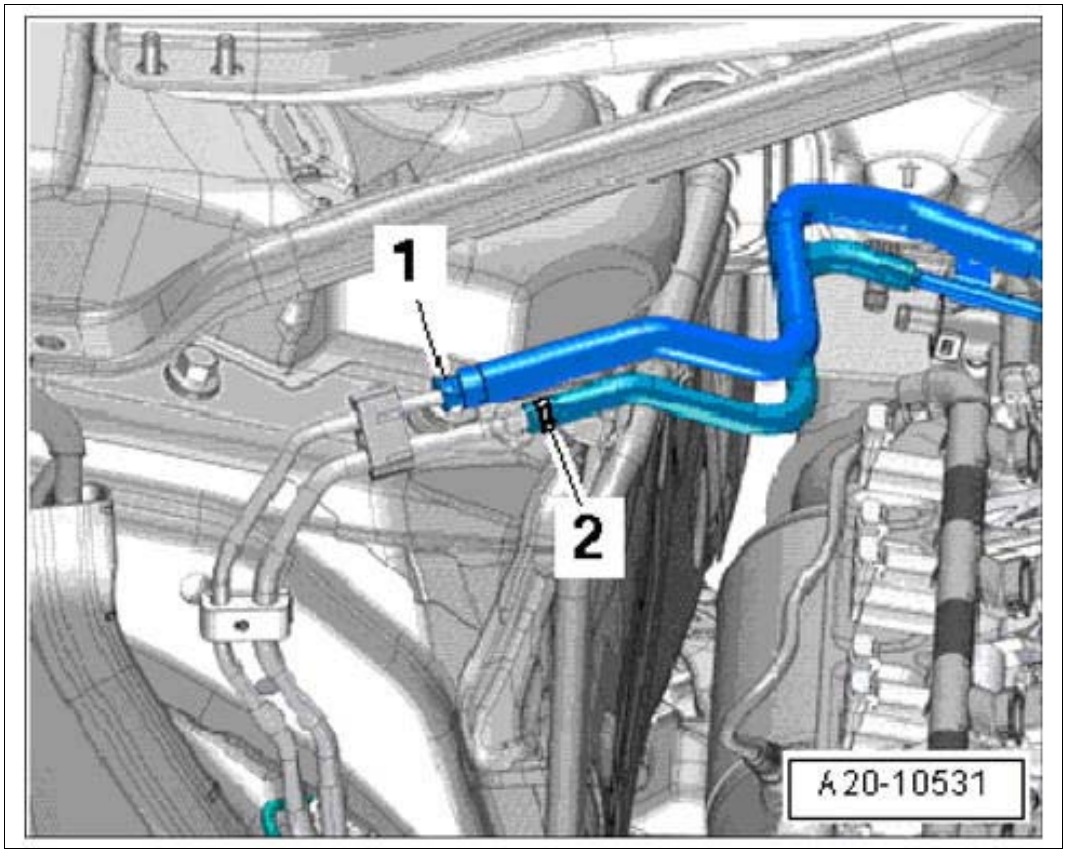
Fig 6: Identifying Air-Cleaner And Vacuum Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Disconnect fuel lines at the front.
    1. 7.1. Press unlocking ring **-1-** and disconnect fuel supply line.
    2. 7.2. Loosen clamp **-2-** and pull hose off the carbon canister.

Fig 7: Identifying Fuel Lines Clamp

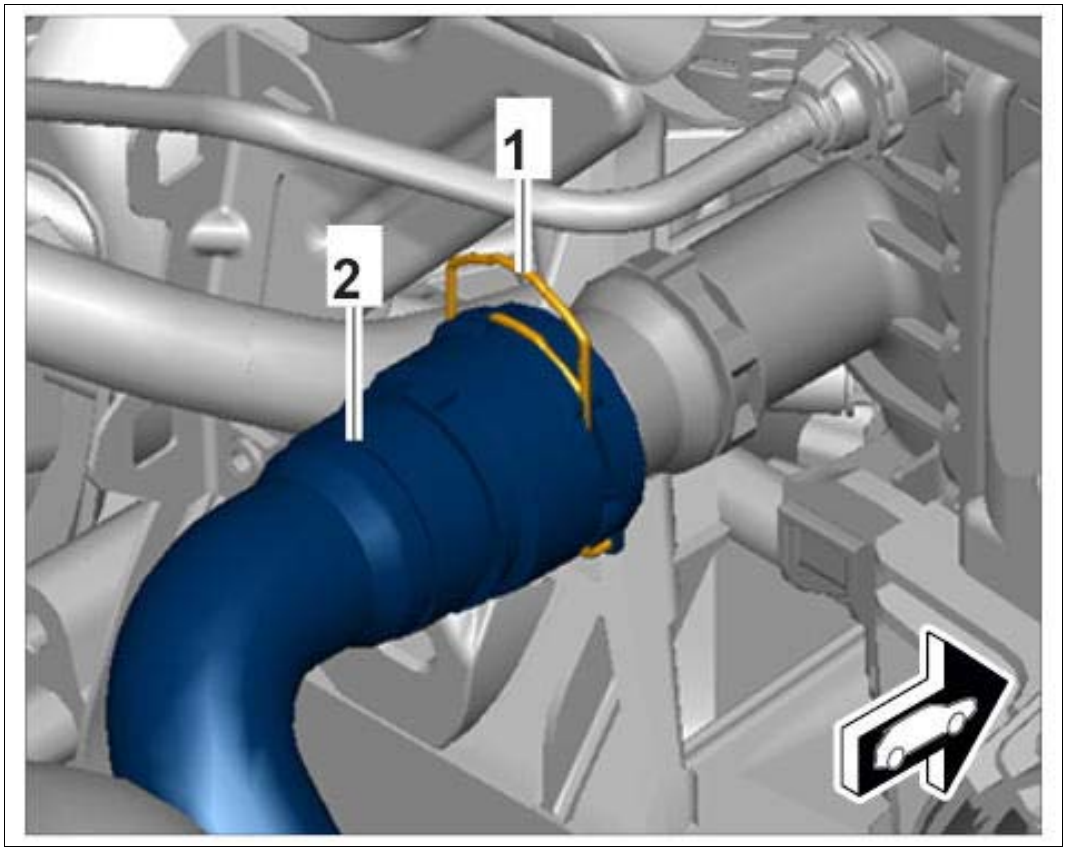


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Disconnect coolant line at the radiator.

    1. 8.1. Lift up retaining clip **-1-** and pull off coolant line **-2-** .

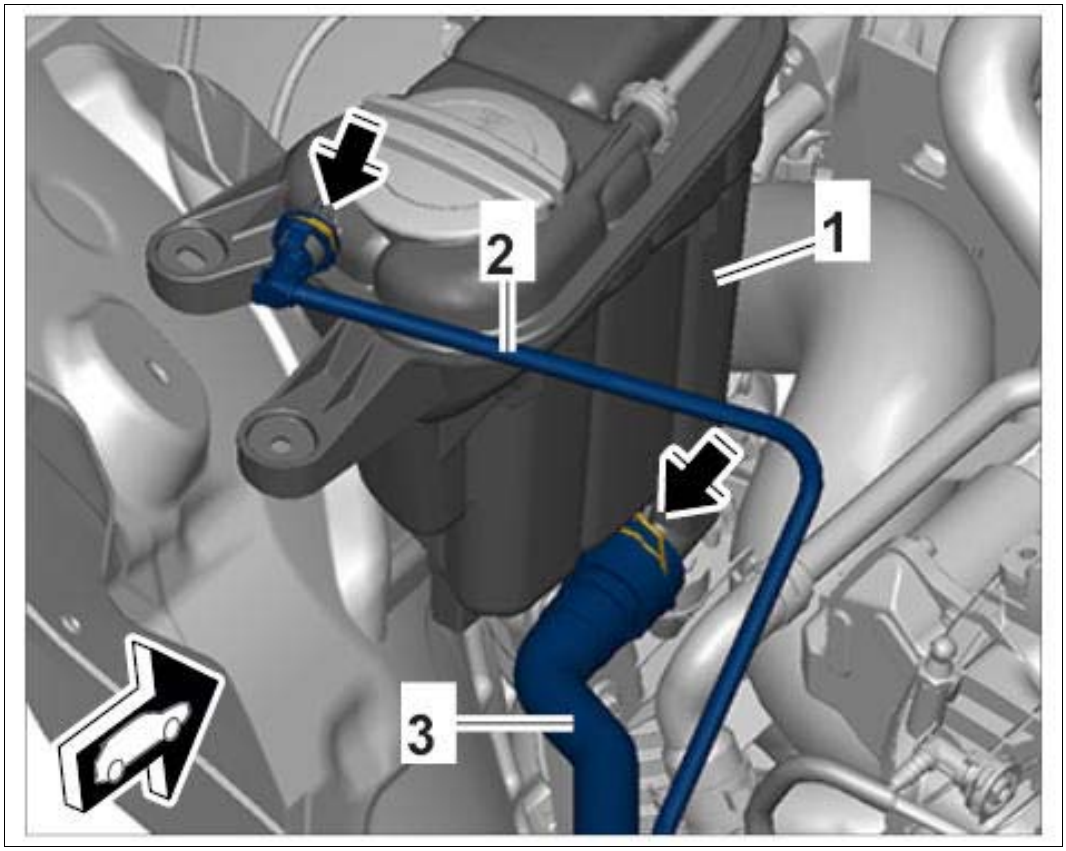
Fig 8: Identifying Radiator Coolant Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Disconnect lines on the coolant reservoir **-1-** .
    1. 9.1. Lift up retaining clip **-arrow-** and pull off vent line **-2-** .
    2. 9.2. Lift up retaining clip **-arrow-** and pull off coolant line **-3-** .

Fig 9: Locating Coolant Reservoir Lines

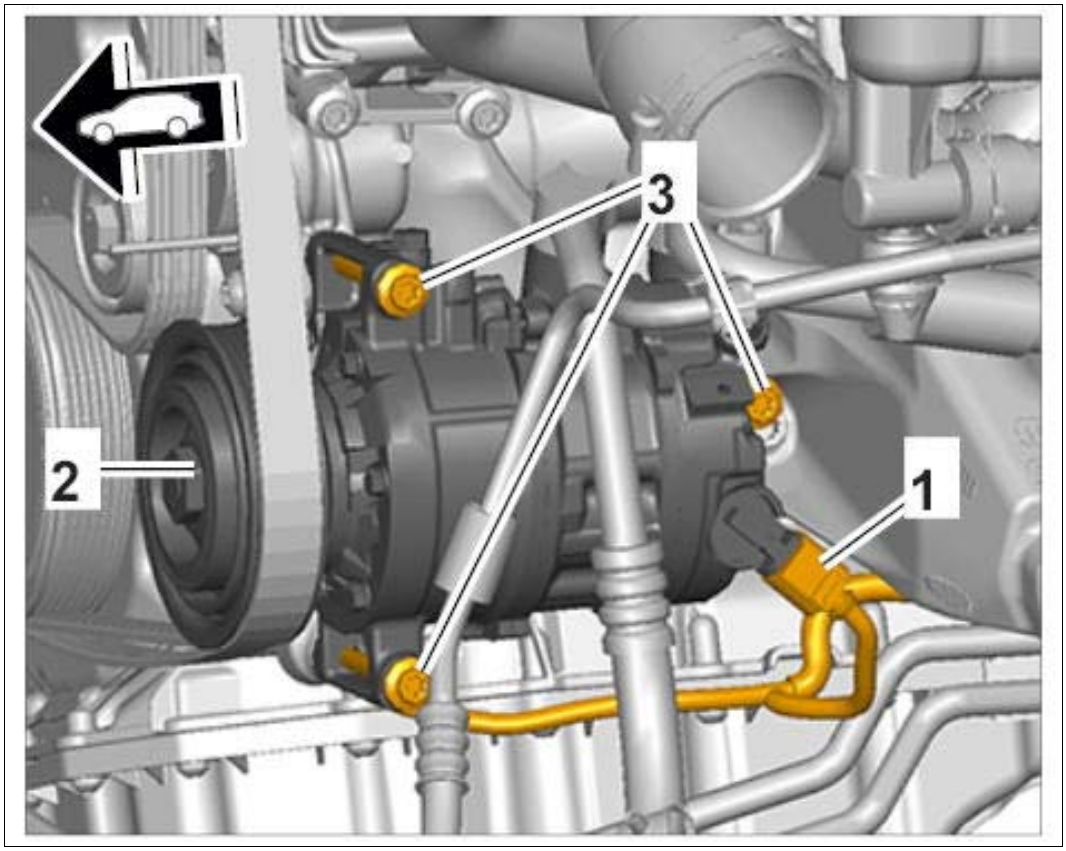


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Loosen air-conditioning compressor and secure it to the side member.

    1. 10.1. Release and disconnect electric connector **-1-** on the air-conditioning compressor **-2-** .
    2. 10.2. Unscrew screws **-3-** .
    3. 10.3. Secure air-conditioning compressor using tie-wraps on the longitudinal member for example.

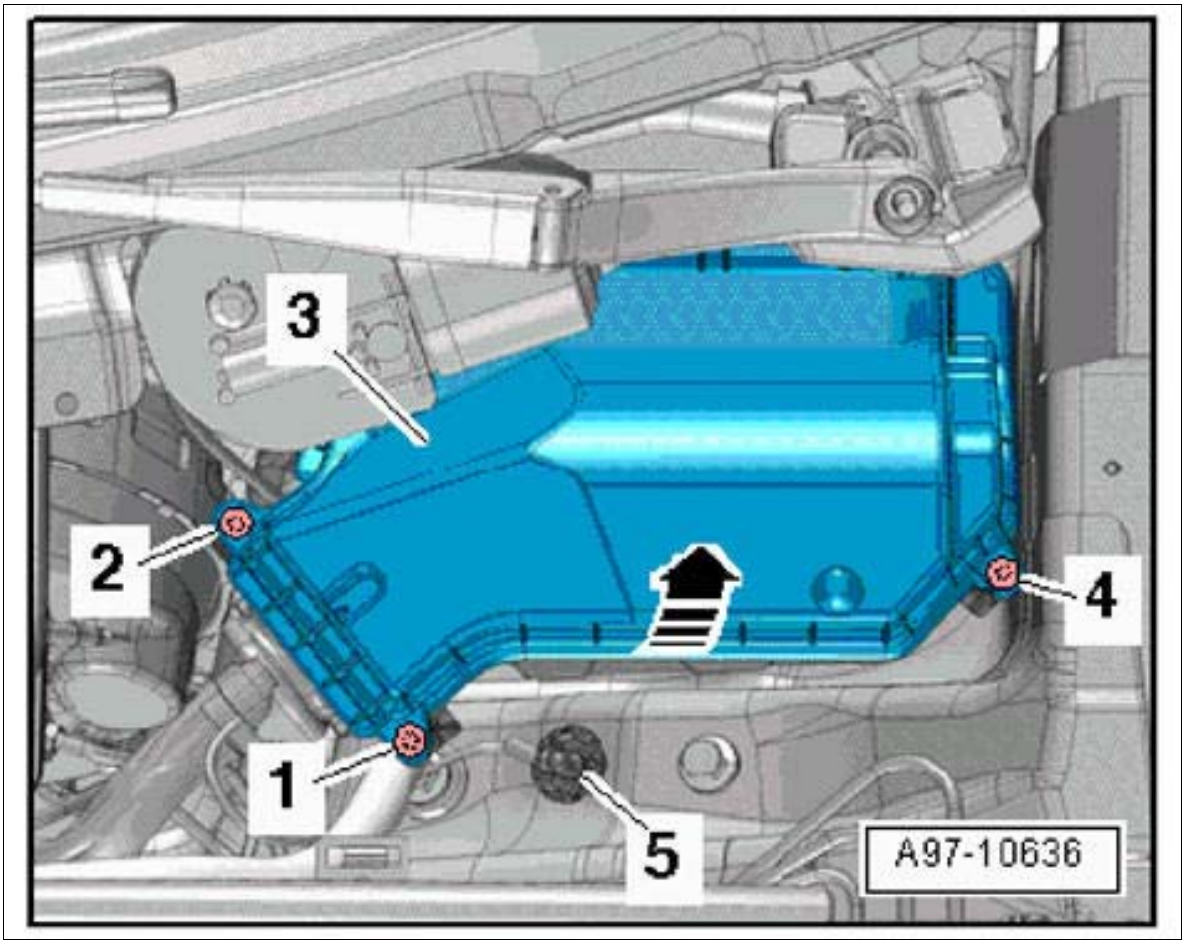
Fig 10: Identifying Air-Conditioning Compressor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

11. Unscrew fastening screws **-1, 2 and 4-** and remove cover **-3-** on the fuse box.

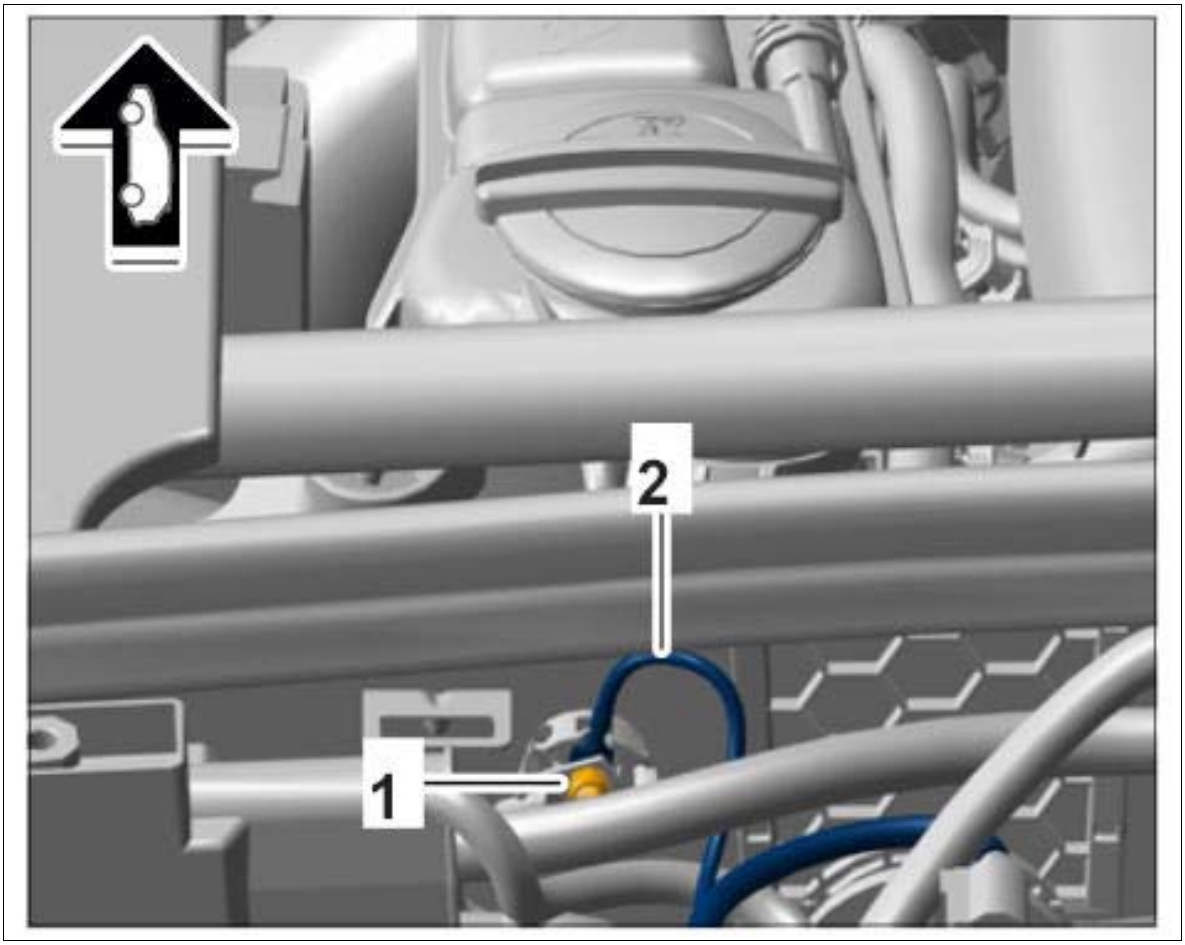
Fig 11: Removing E-Box Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Unscrew fastening nut **-1-** , disconnect ground line **-2-** and set it aside.

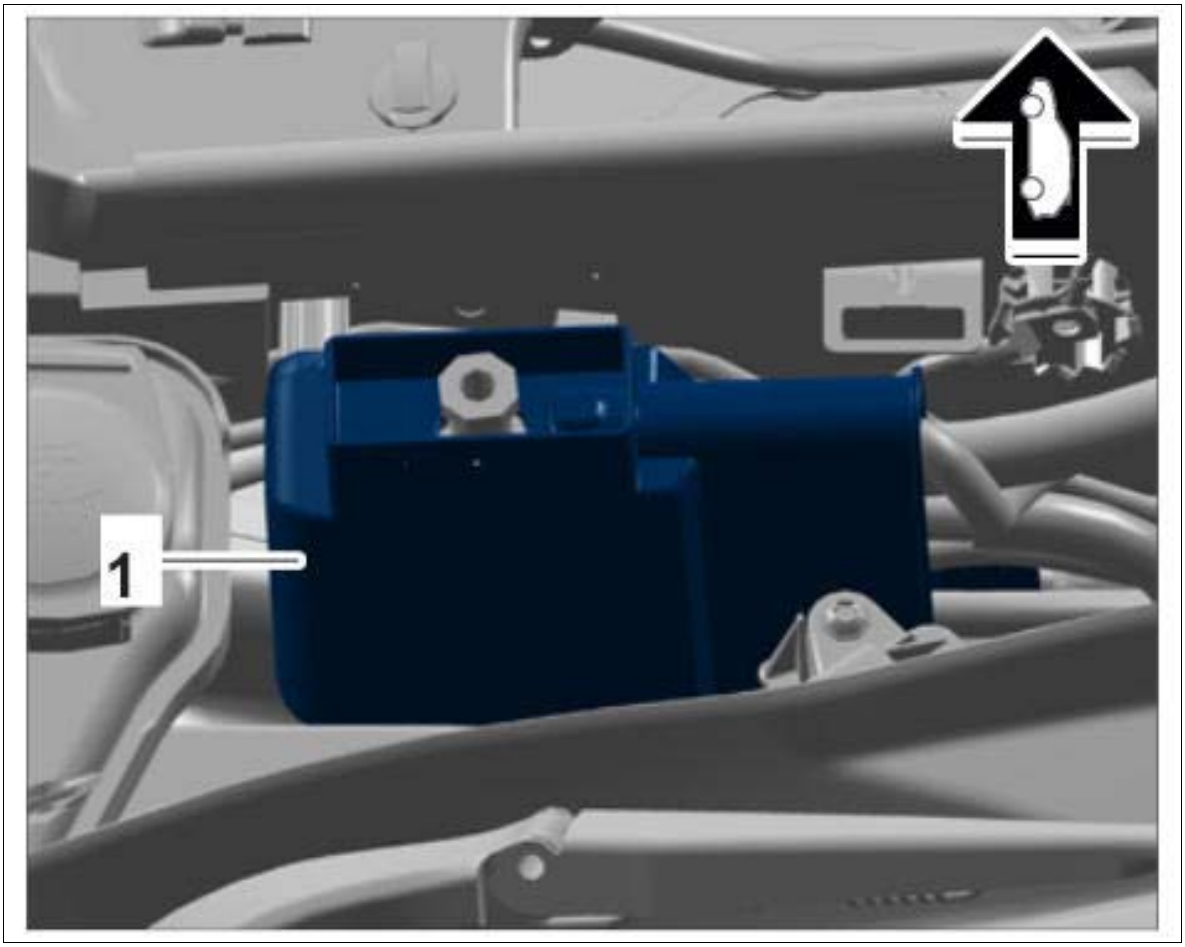
Fig 12: Identifying Engine Ground Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

13. Remove cover for B+ line **-1-** .

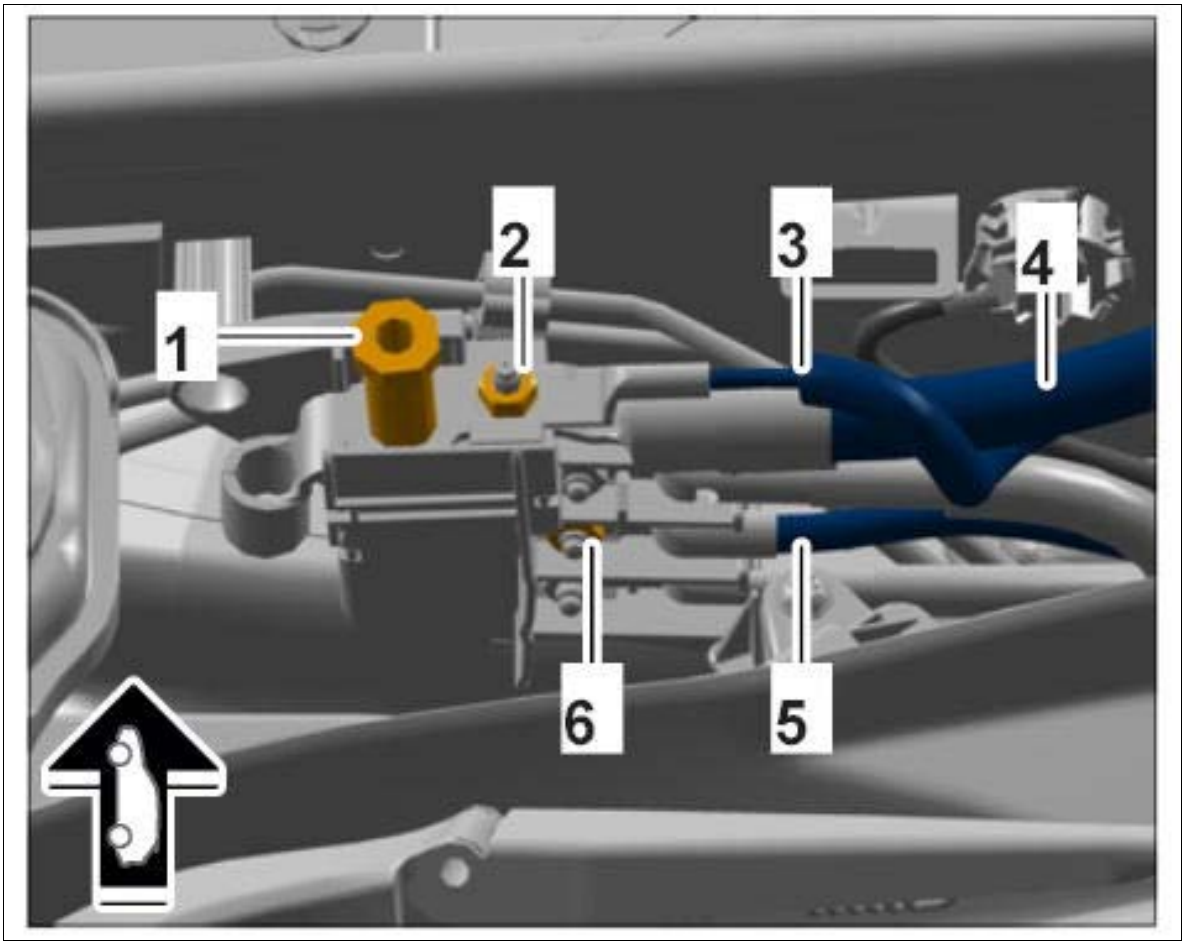
Fig 13: Identifying Engine Cover B+ Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Unscrew fastening nut **-1-** and move line **-4-** aside.

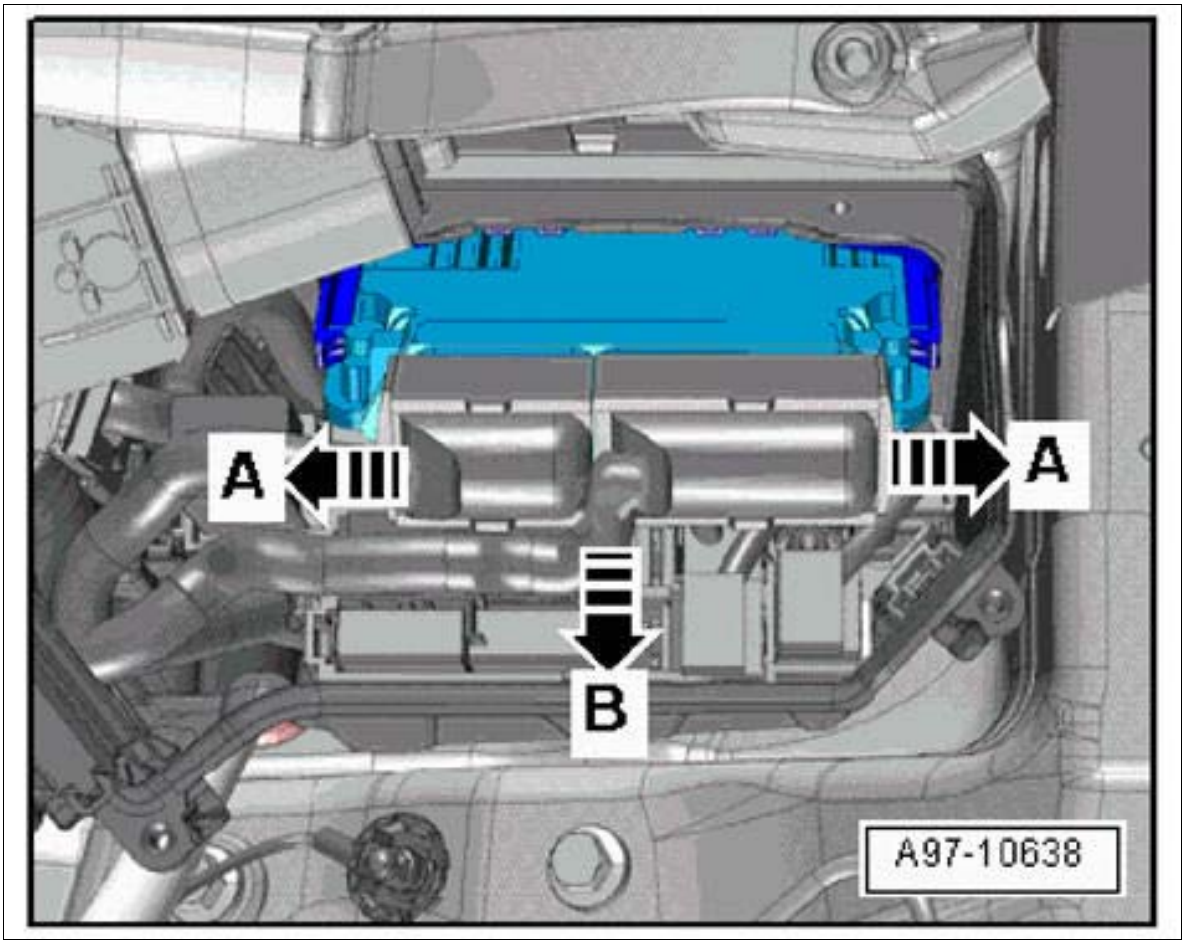
Fig 14: Identifying Engine B+ Line And Nut



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

15. Release electric plug connections **-A-** in direction of arrow and remove DME control unit in **-direction of arrow B-** .

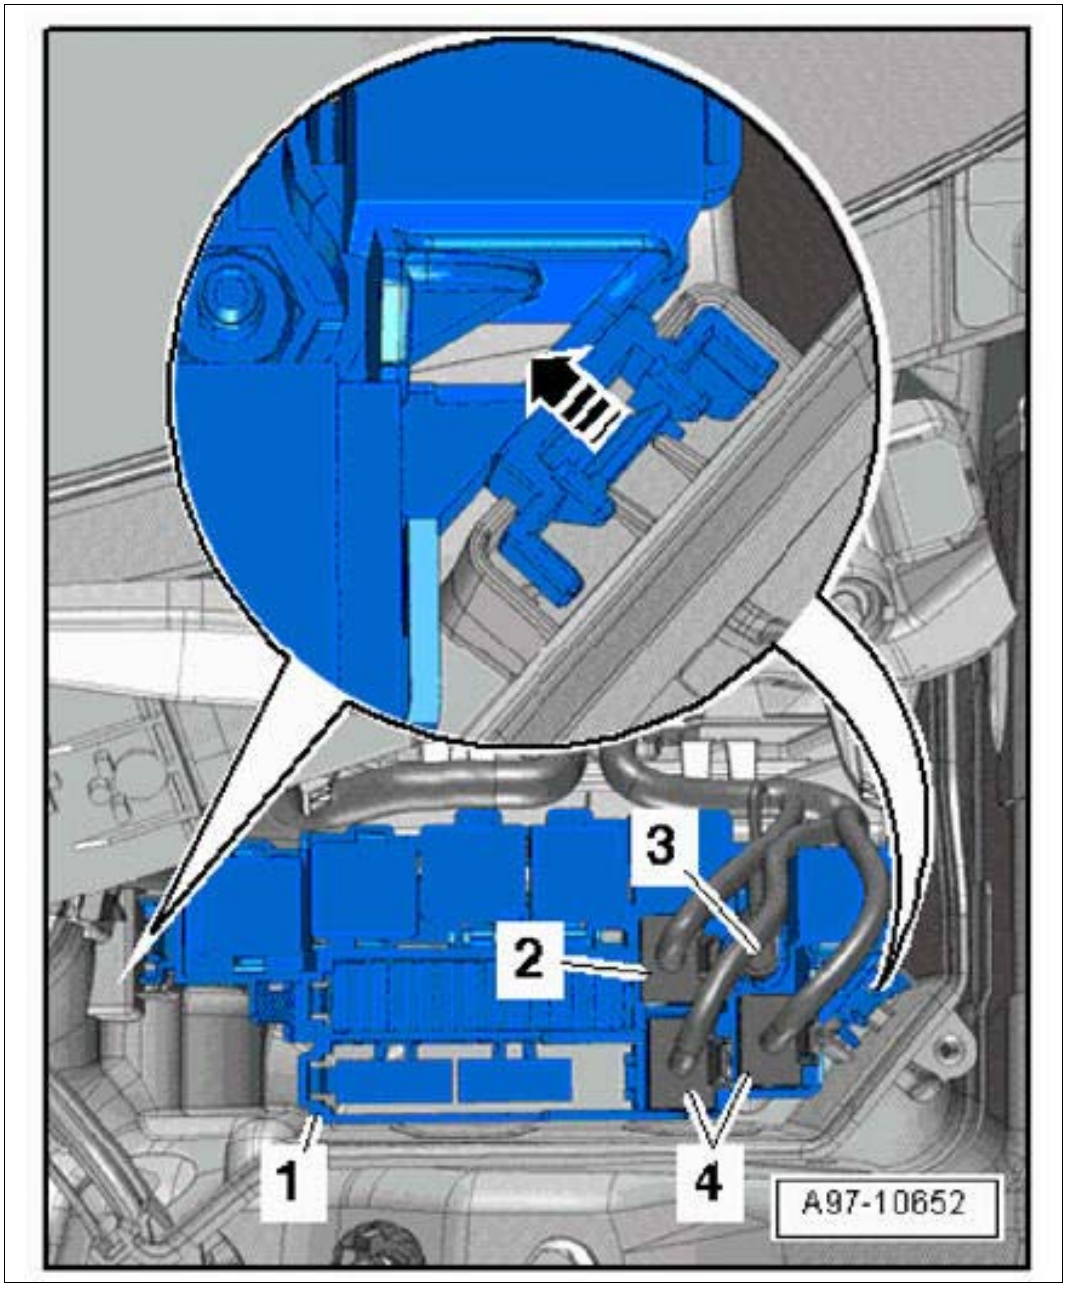
Fig 15: Removing DME Control Unit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

16. Loosen the fuse box.
    1. 16.1. Disconnect electric plug connections **-2-** and **-4-** .
    2. 16.2. Unscrew fastening nut **-3-** .
    3. 16.3. Press locking lug **-arrow-** and remove the fuse box by pulling it upwards.

Fig 16: Removing Relay And Fuse Box

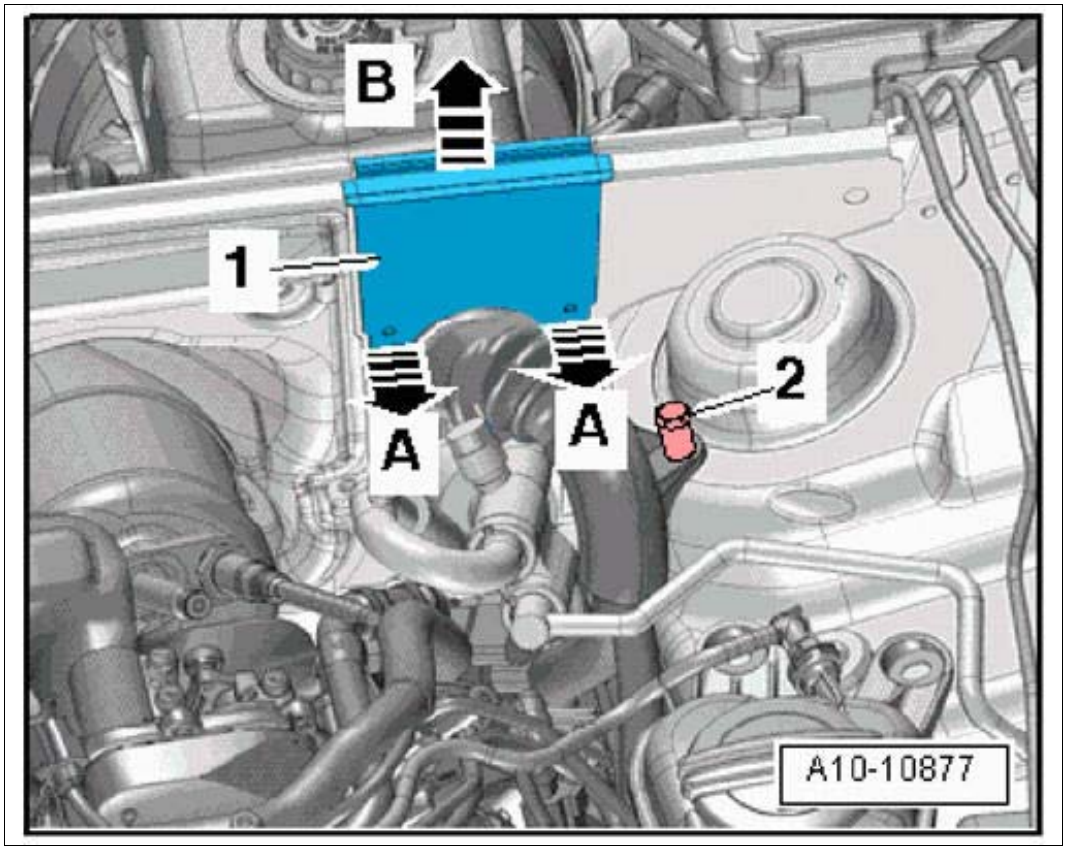


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

17. Remove cable bushing **-1-** .

    1. 17.1. Pull off rubber seal on the firewall.
    2. 17.2. Carefully unclip clips **-arrow A-** .
    3. 17.3. Remove cable bushing **-1-** in **-direction of arrow B-** .

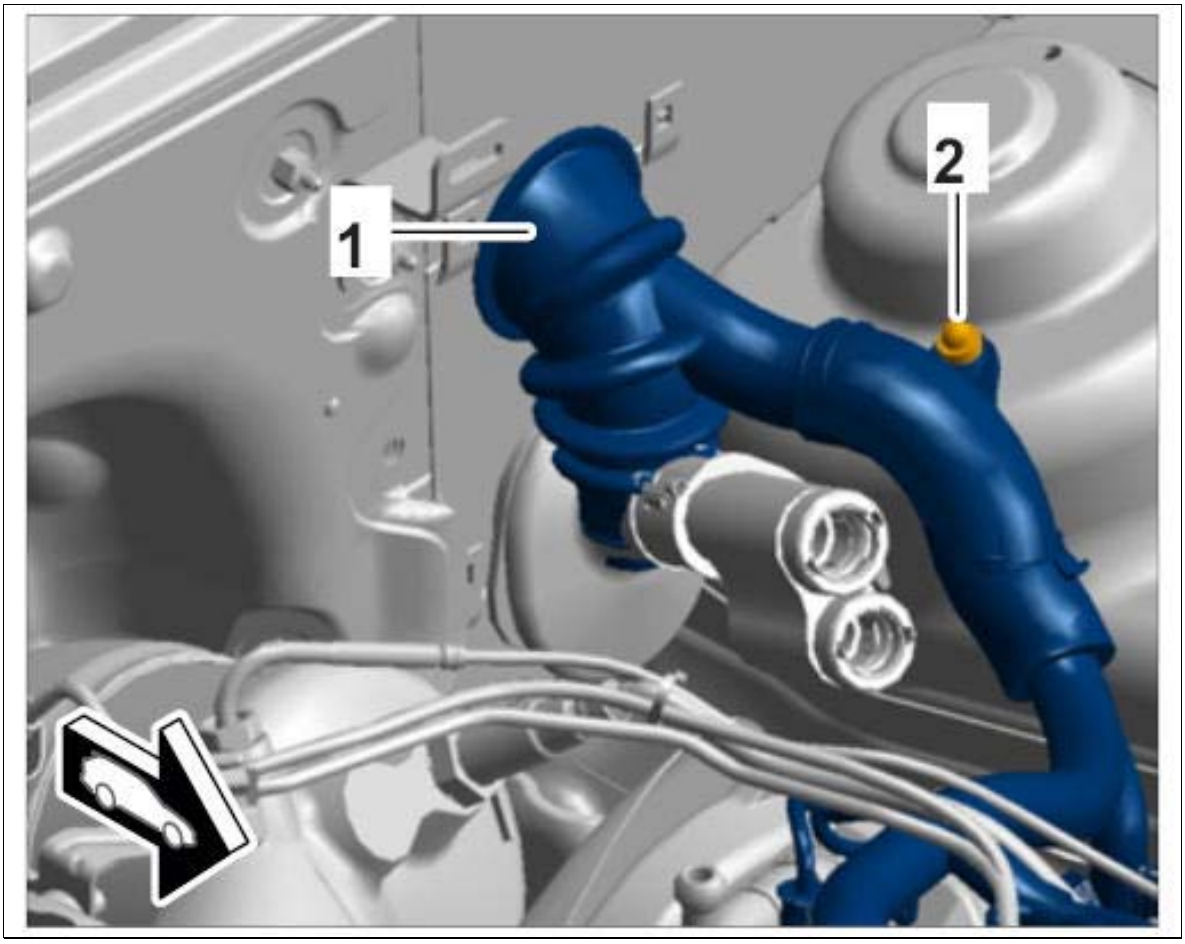
Fig 17: Removing Cable Bushing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

18. Unscrew fastening nut **-2-** and loosen engine wire harness **-1-** from the guide.

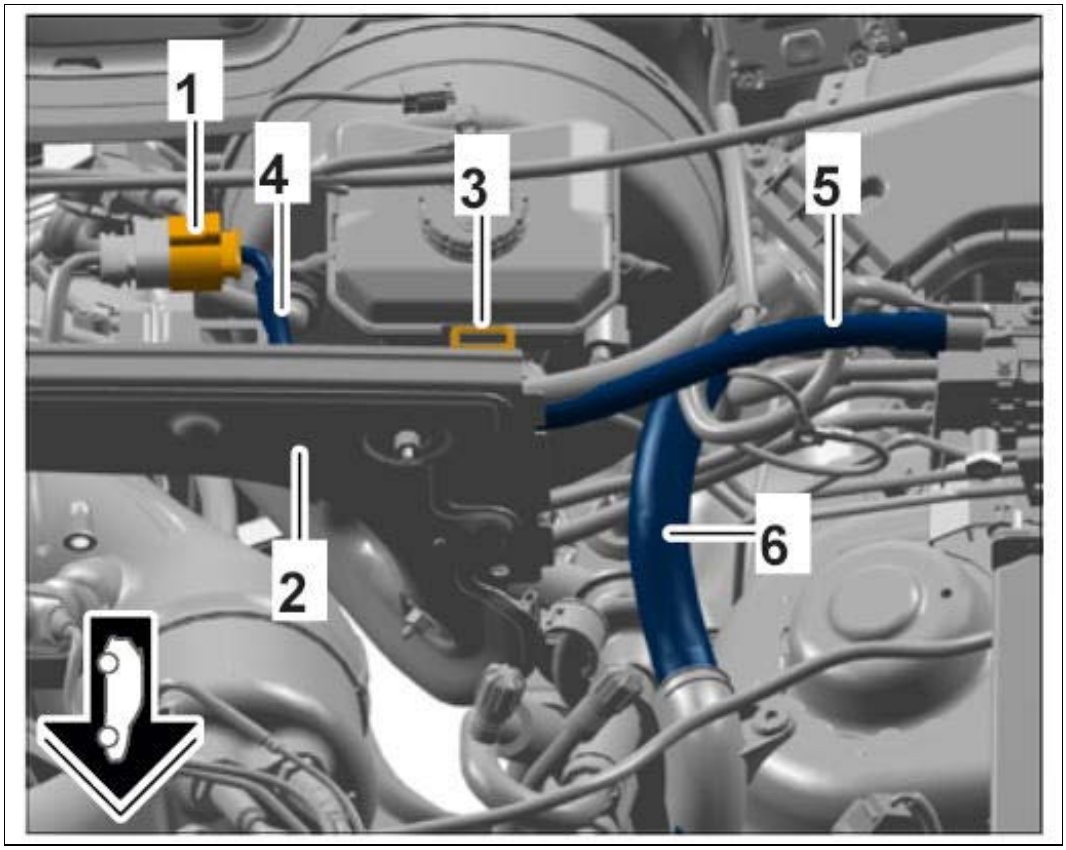
Fig 18: Identifying Engine Wire Harness



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

19. Expose engine wire harness **-6-** .
    1. 19.1. Disconnect electric plug connection **-1-** .
    2. 19.2. Unclip electric line **-4-** from the cross panel **-2-** (**-3-**) and set it aside.
    3. 19.3. Guide engine wire harness **-6-** with relay and fuse box under the B+ line **-5-** and place it on the engine.

Fig 19: Identifying Engine Wire Harness And Plug Connection

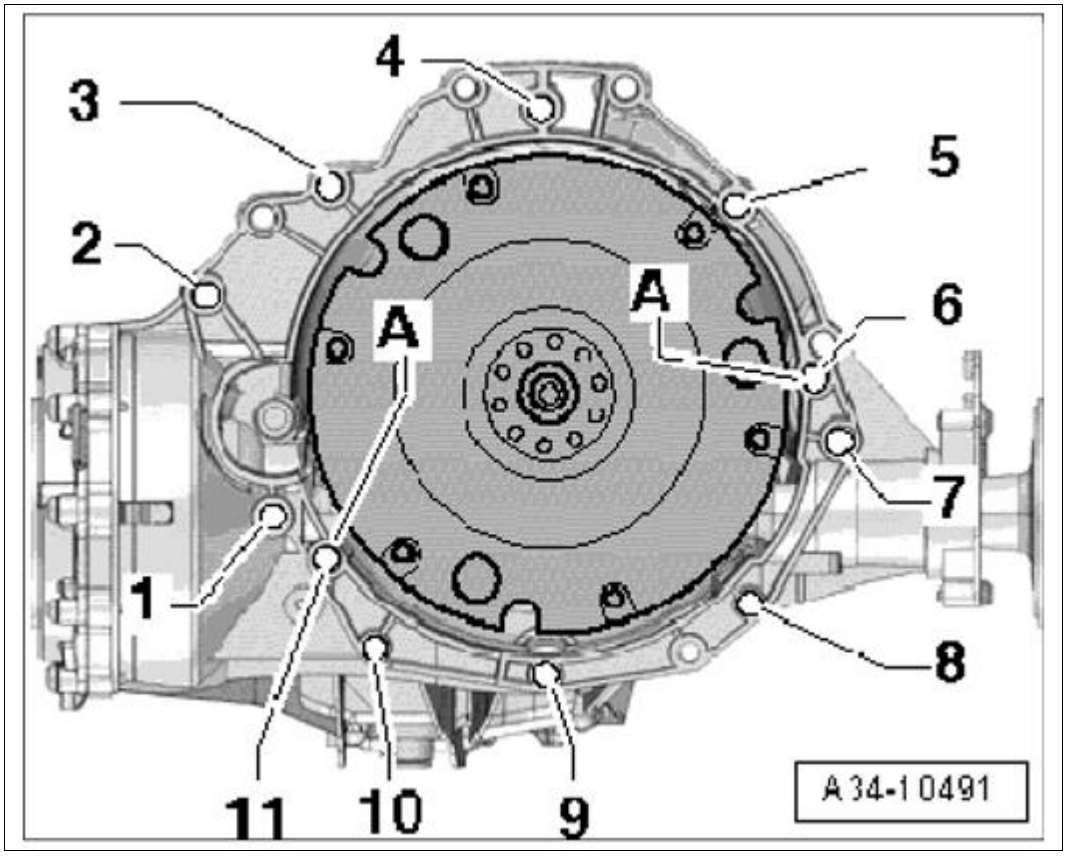


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

20. Loosen flange screws securing engine to transmission.

    1. 20.1. Unscrew screws **-2... 5-** .

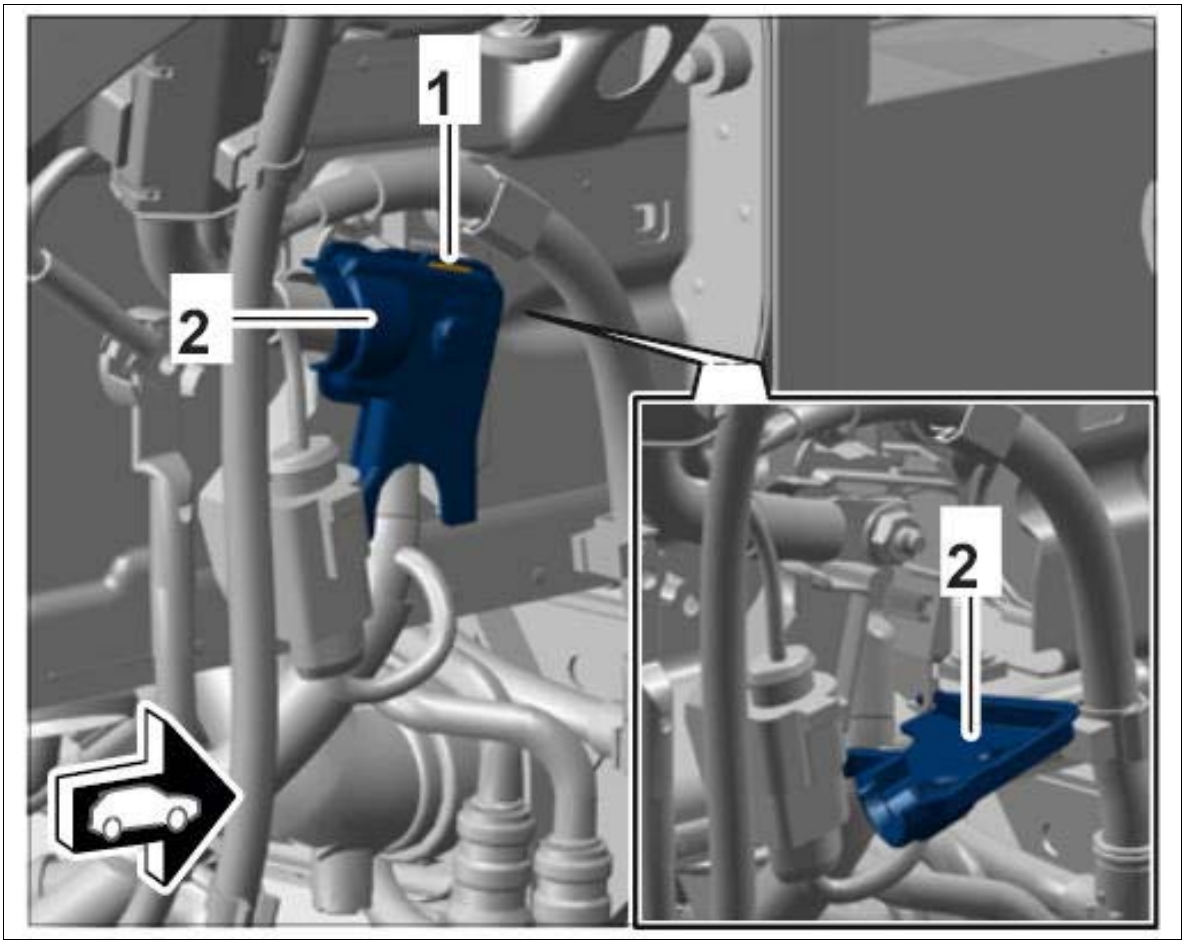
Fig 20: Engine To Transmission Flange Screws Loosening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

21. Open locking lug **-1-** with a screwdriver, open housing cover **-2-** on the right longitudinal member and remove it.

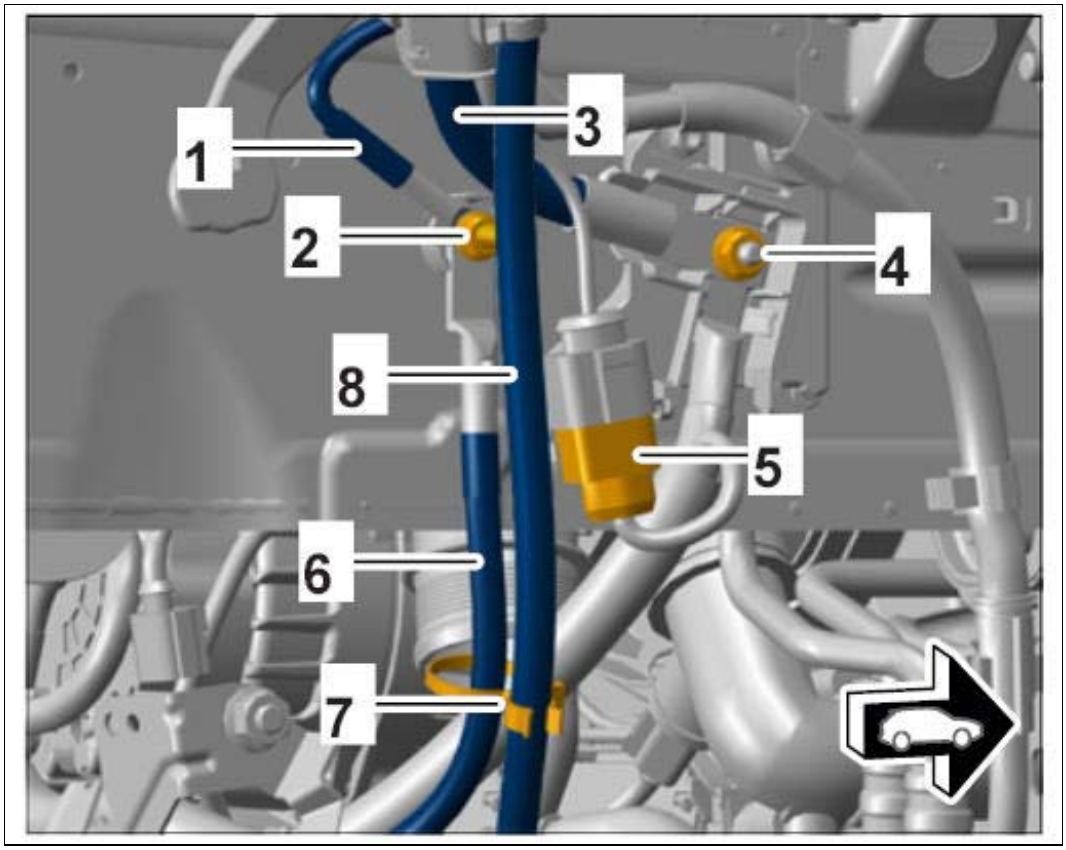
Fig 21: Identifying Housing Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

22. Disconnect electric lines on the right longitudinal member.
    1. 22.1. Unclip headlight vent line **-8-** at the clip **-7-** and set it aside.
    2. 22.2. Unscrew fastening nut **-2-** and move ground lines **-1 and 6-** aside.
    3. 22.3. Disconnect electric plug connection **-5-** and pull it out of the clip.
    4. 22.4. Unscrew fastening nut **-4-** , remove ground line **-3-** and set it aside.

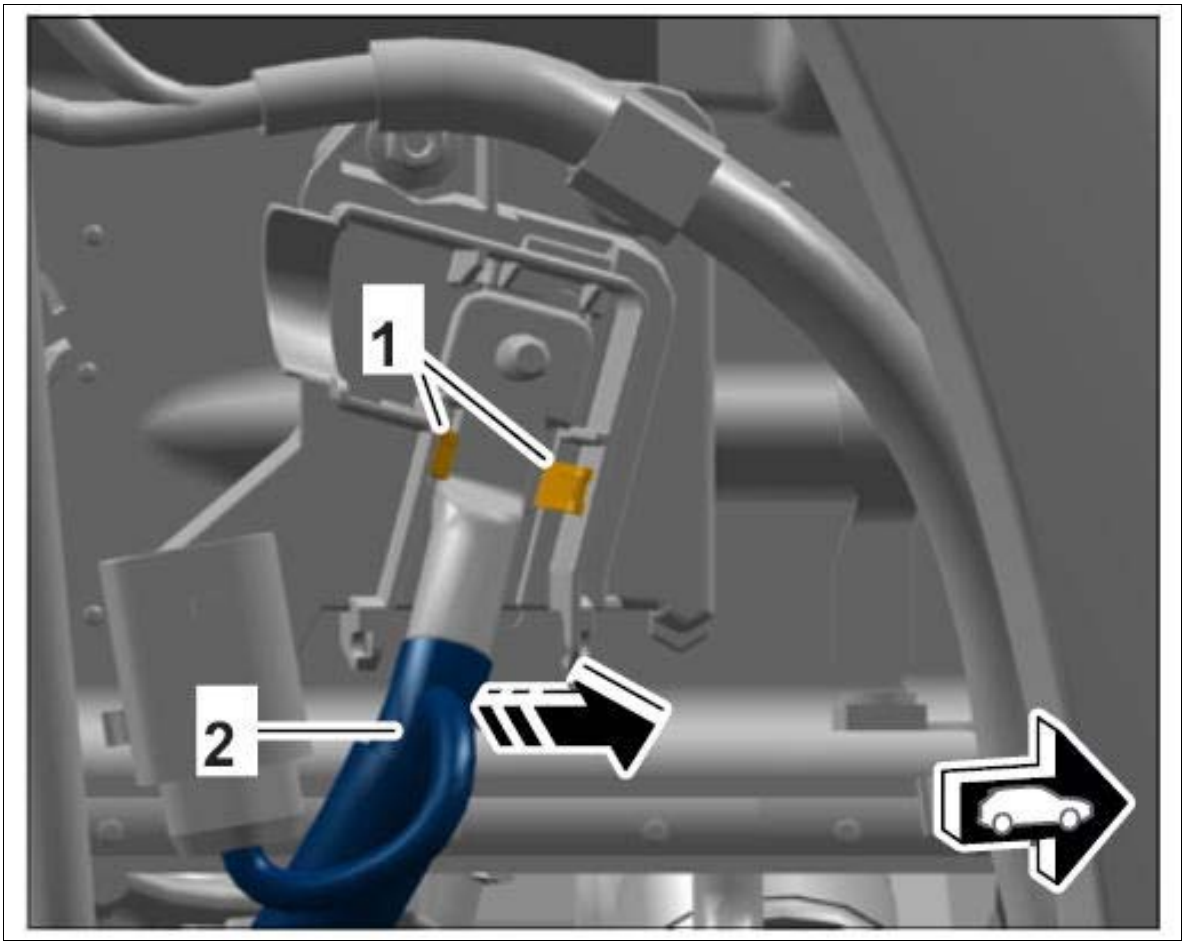
Fig 22: Identifying Longitudinal Member Electric Lines Nut



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

23. Press in locking lugs **-1-** , pull out ground line **-2-** in **-direction of arrow -** and set it aside.

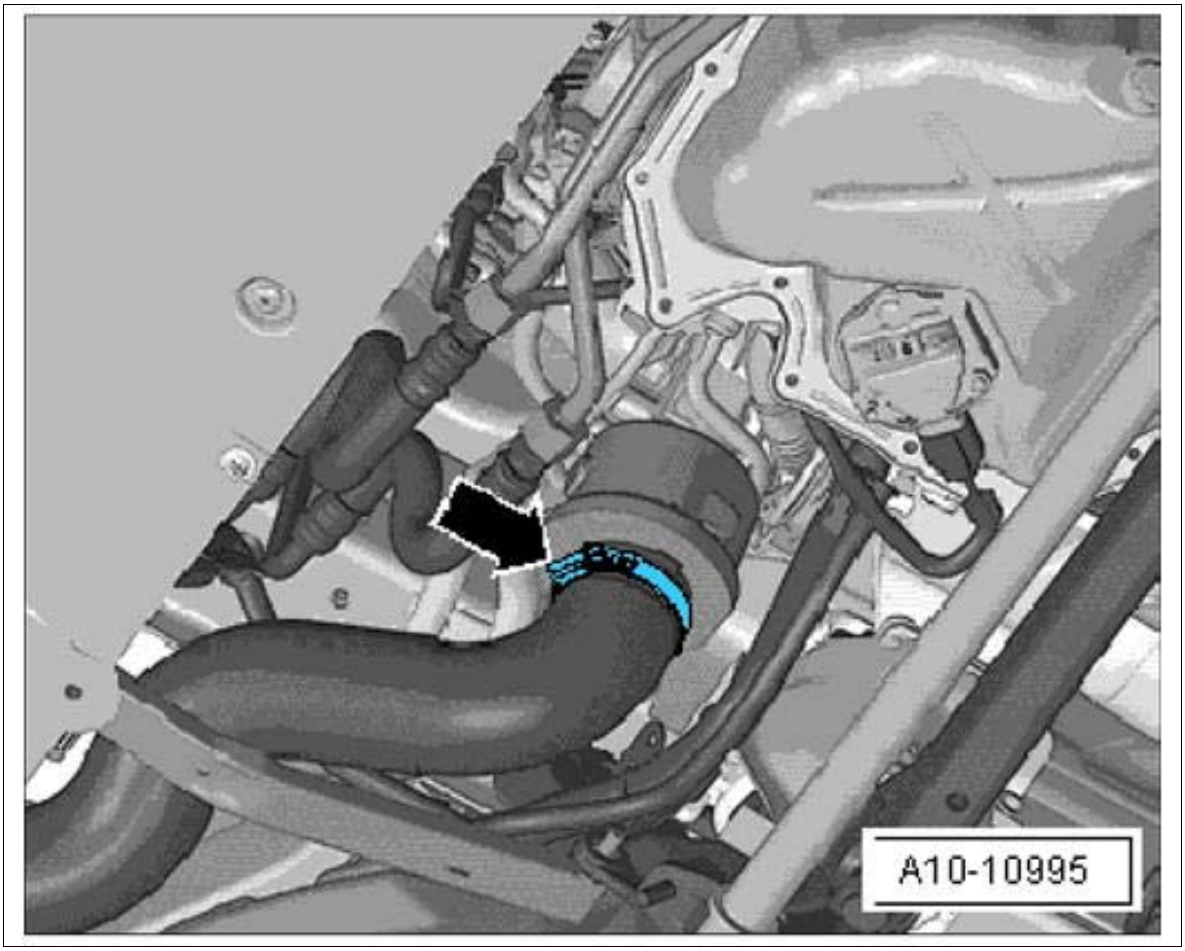
Fig 23: Pulling Ground Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

24. Loosen screw-type clamp **-arrow-** and pull intake pipe off the turbocharger.

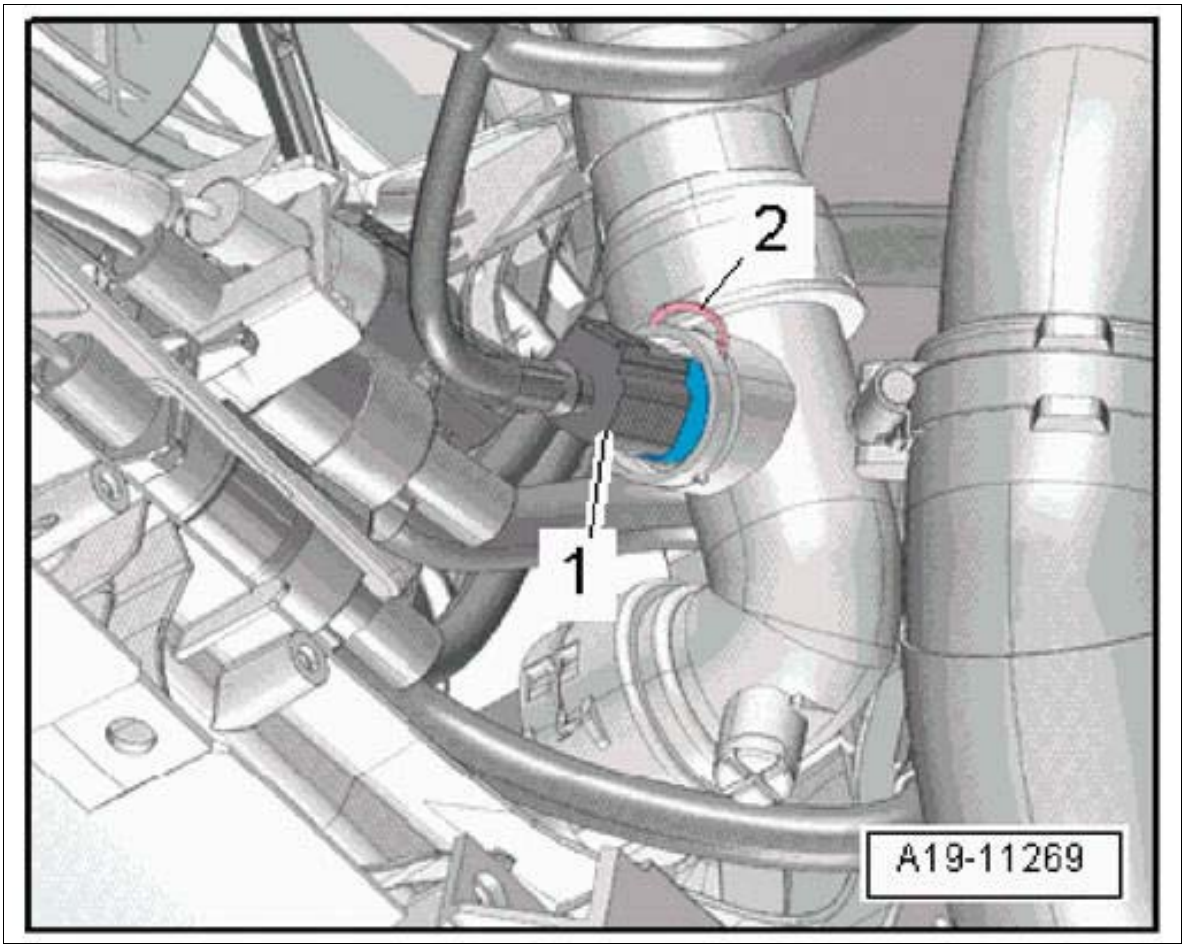
Fig 24: Locating Turbocharger Intake Pipe



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

25. Disconnect electric plug connection **-1-** on the coolant temperature sensor, unclip line and set it aside.

Fig 25: Identifying Coolant Temperature Sensor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

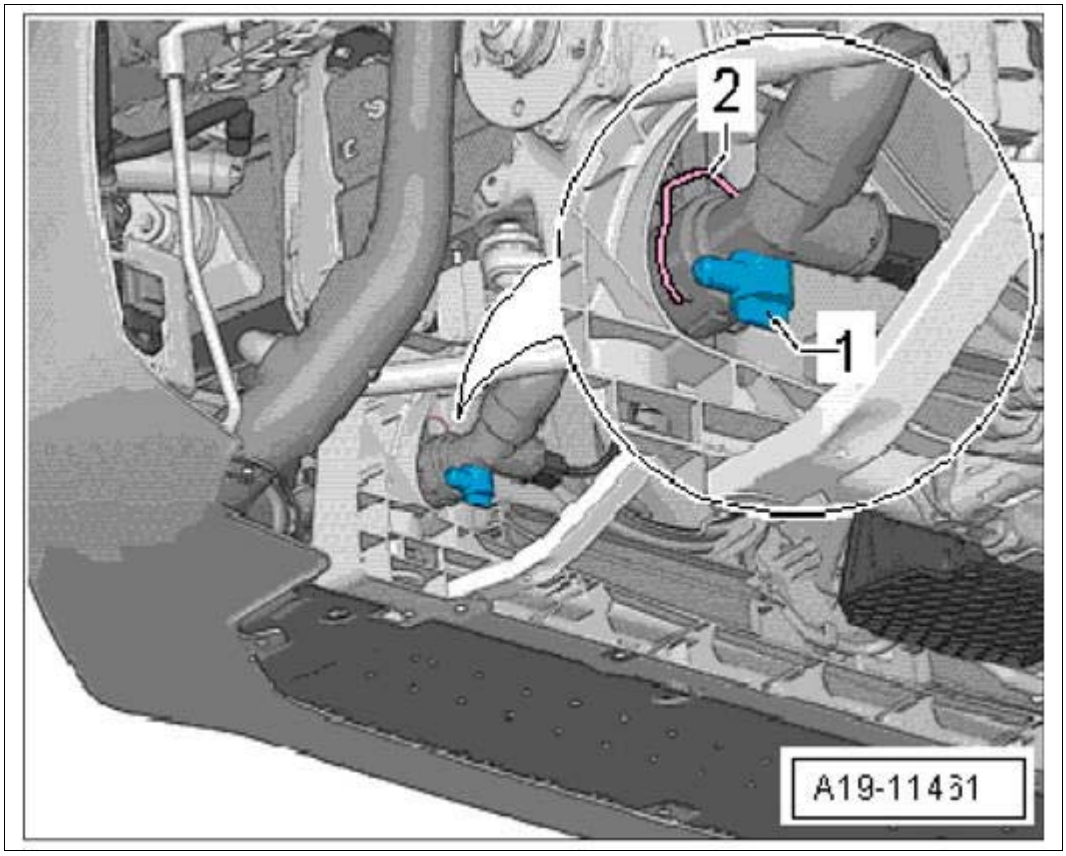
26. Disconnect electric lines.

    1. 26.1. Disconnect electric connectors for the engine mount and expose line. → 975219 REMOVING AND INSTALLING WIRE HARNESS FOR ENGINE

27. Disconnect coolant line at the bottom of the radiator.

    1. 27.1. Lift up retaining clip **-2-** and pull off the coolant hose.

Fig 26: Identifying Radiator Coolant Line

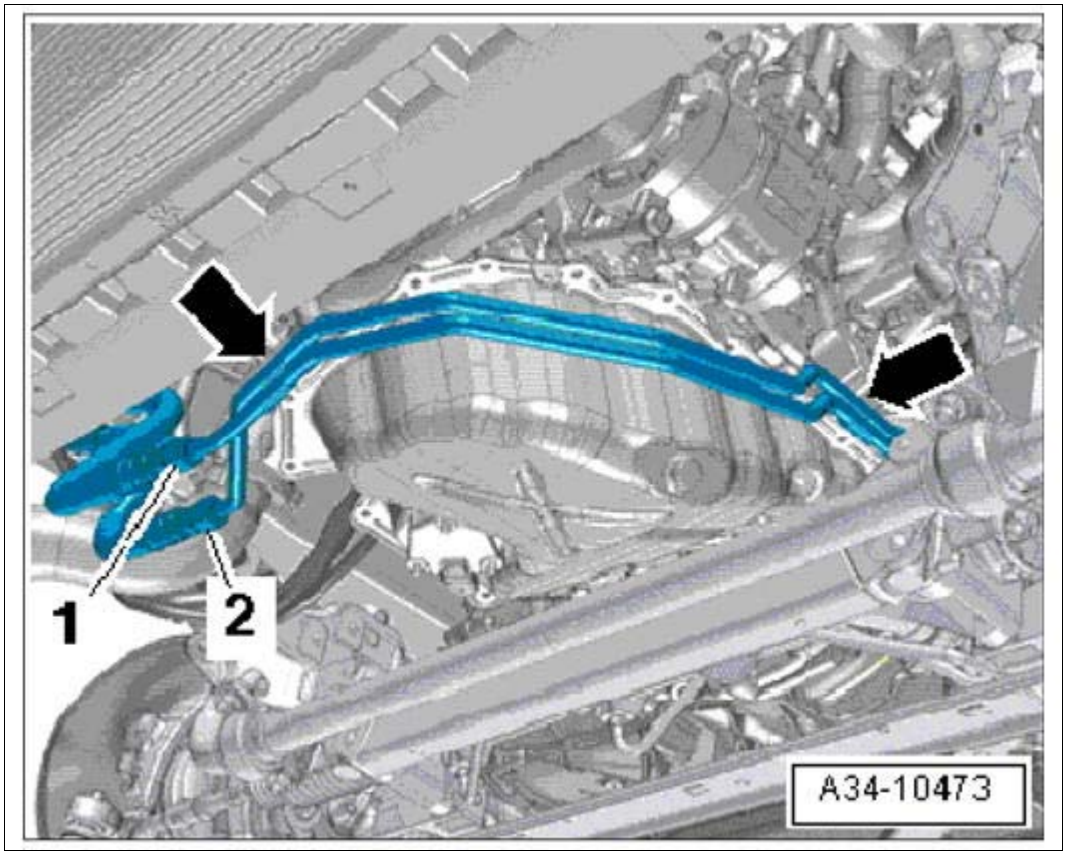


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

28. Disconnect ATF lines **-1 and 2-** on the engine.

    1. 28.1. Unscrew screws **-arrows-** .

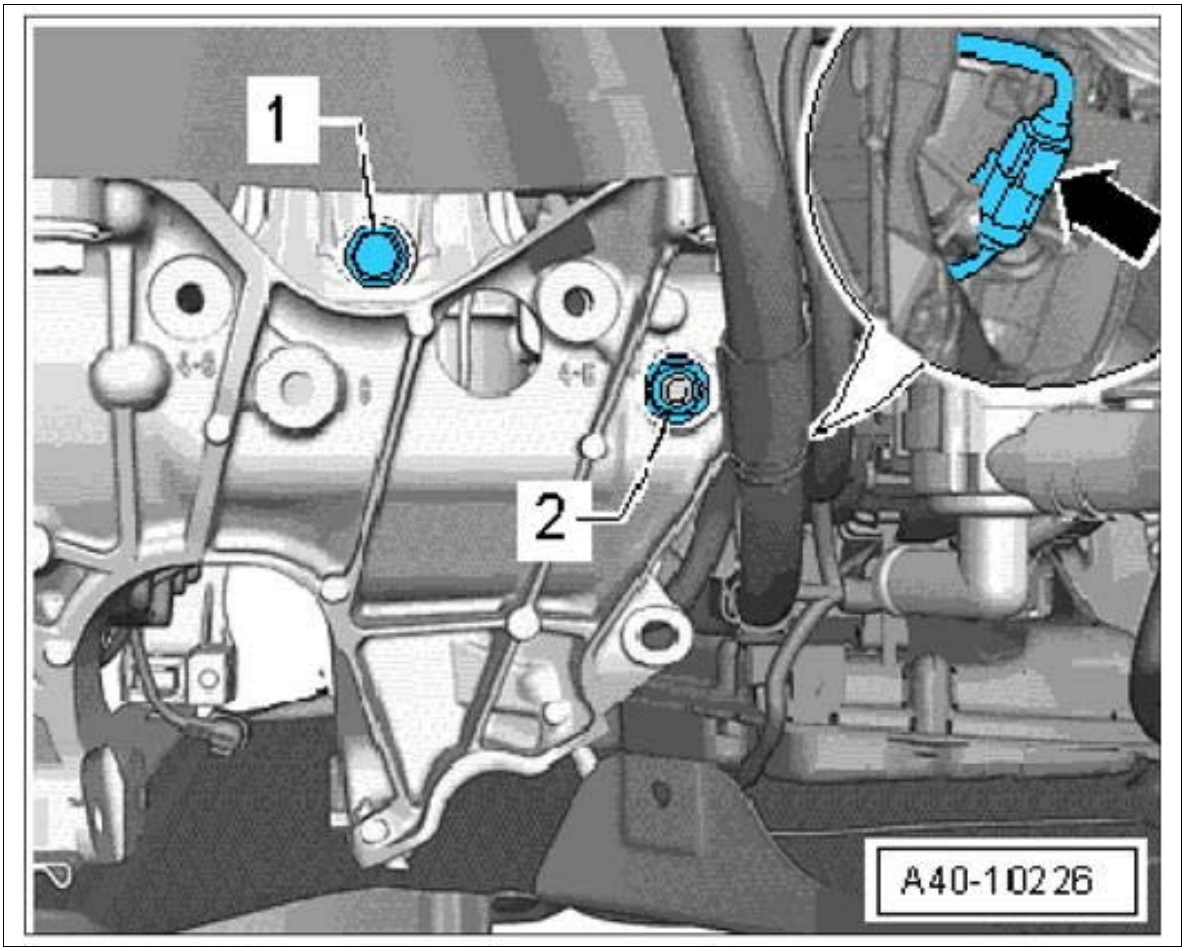
Fig 27: Locating Front ATF Lines



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

29. Unscrew screws **-1-** on the left and right engine mount.

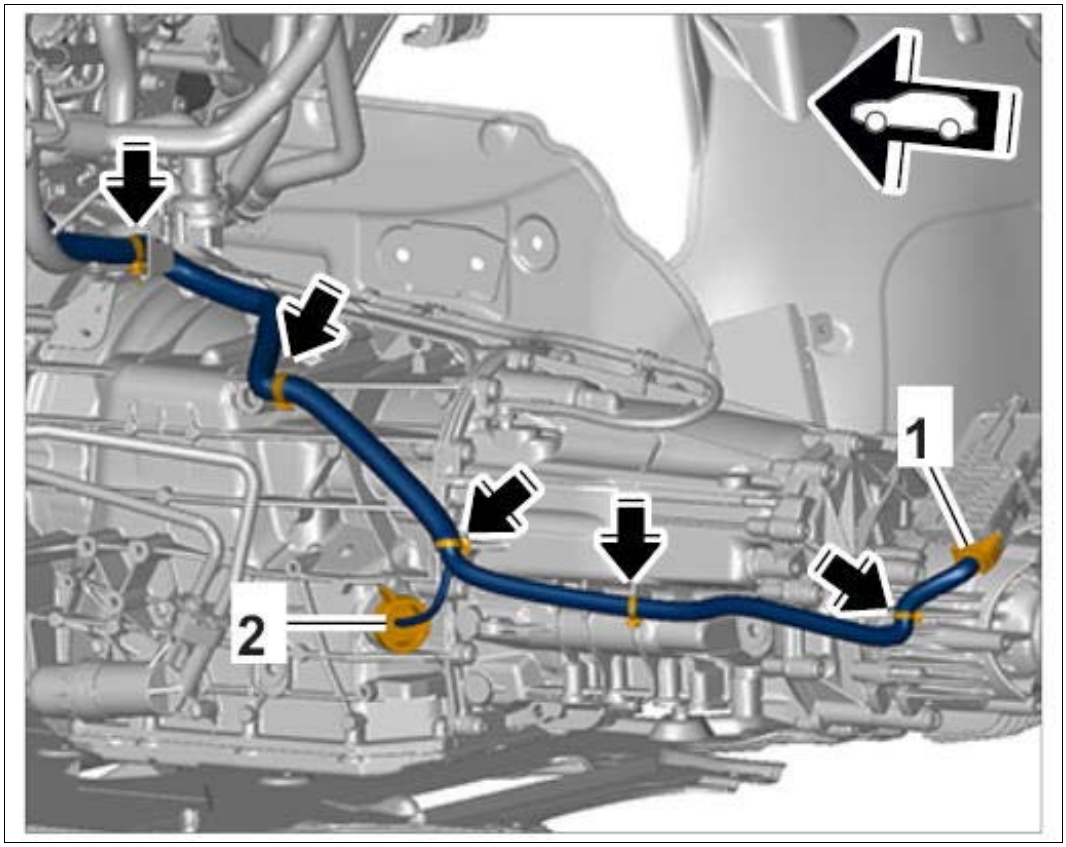
Fig 28: Identifying Engine Mount



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

30. Disconnect wiring harness at the transmission.
    1. 30.1. Release and disconnect electric connectors **-1 and 2-** .
    2. 30.2. Loosen holder **-arrows-** for wiring harness and expose it.

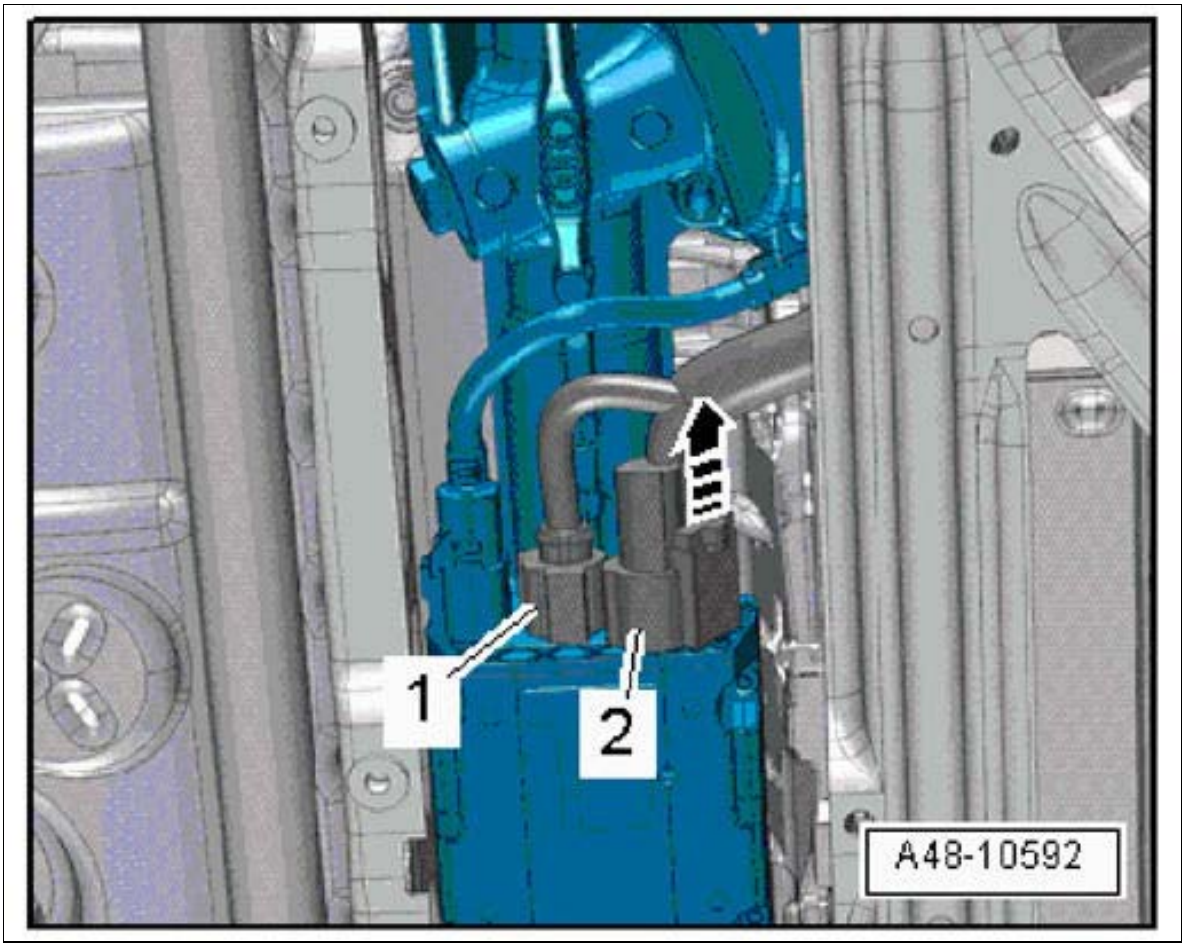
Fig 29: Locating Engine Transmission Wire Harness



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

31. Disconnect electric plug connections **-1 and 2-** and expose wiring harness in **-direction of arrow -** .

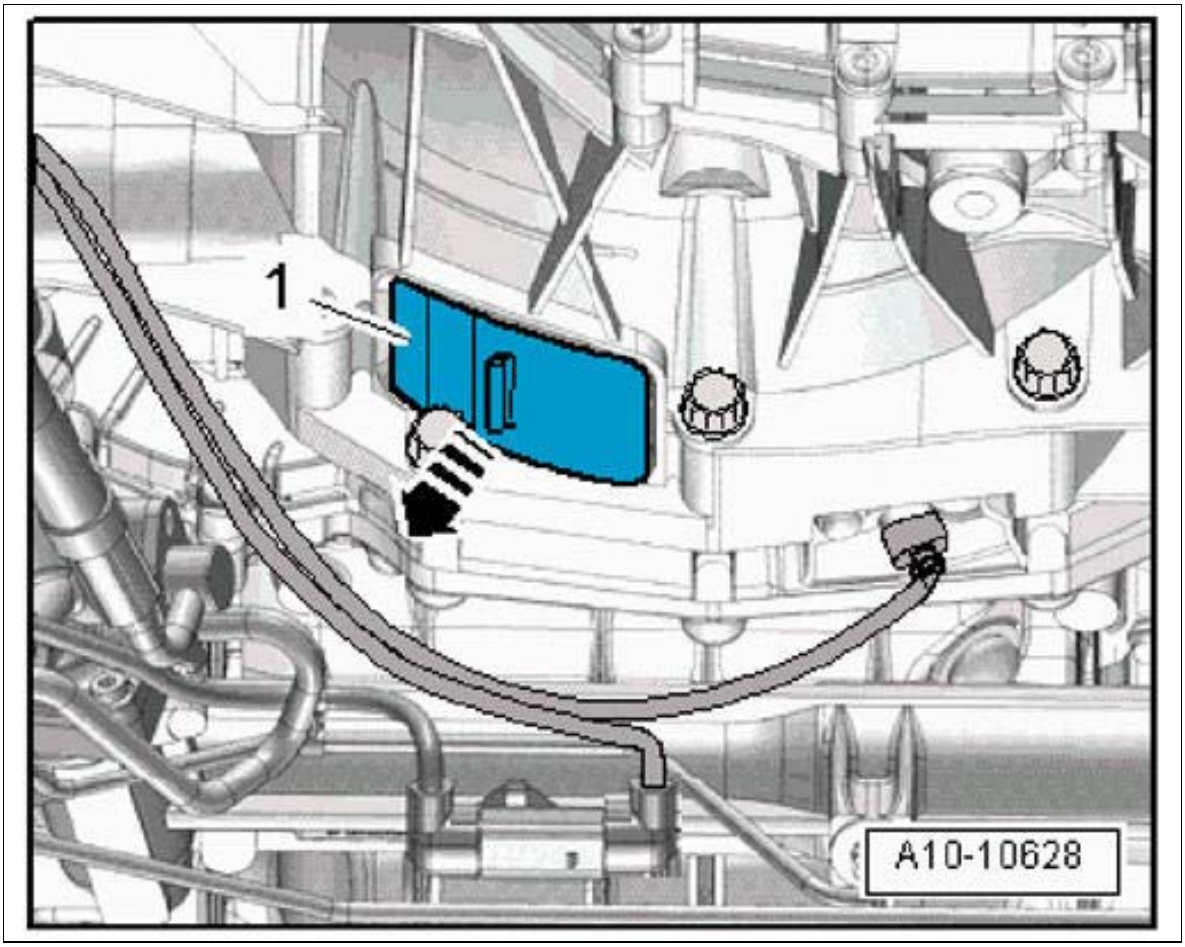
Fig 30: Disconnecting Steering Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

32. Pull off cover **-1-** on the underside of the transmission.

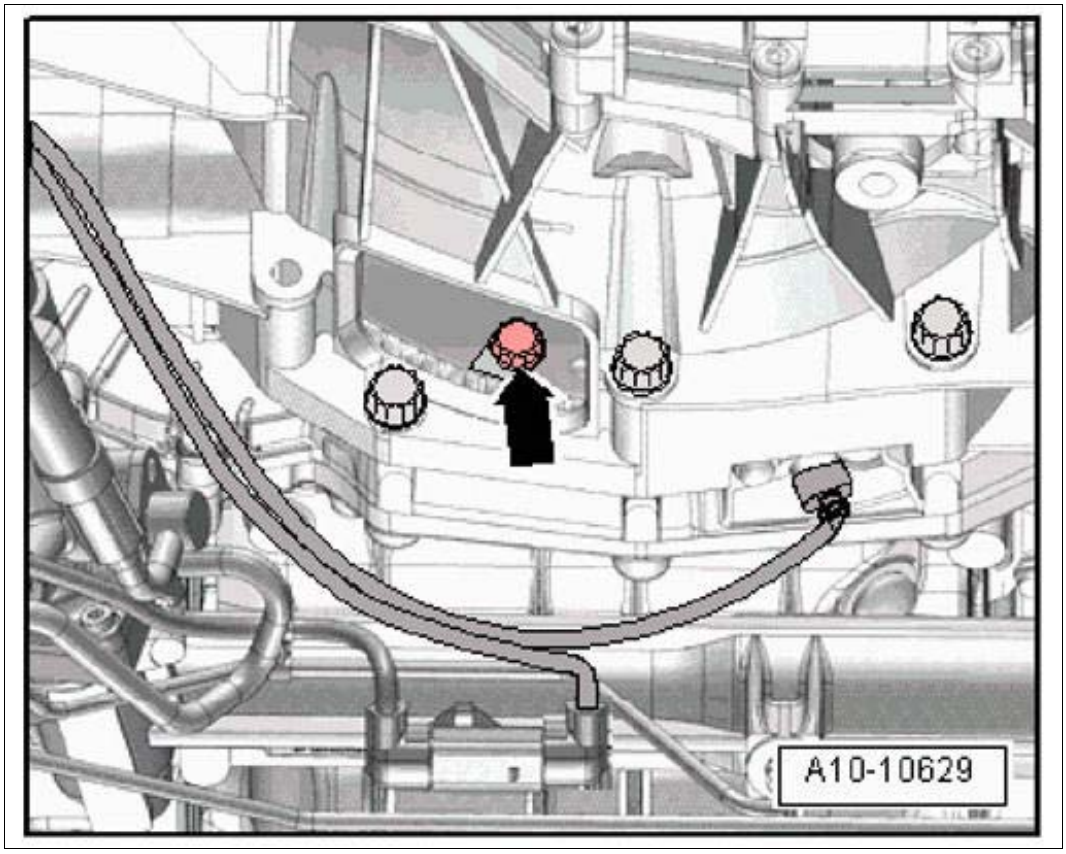
Fig 31: Pulling Drive Plate Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

33. Loosen flywheel from the transmission.
    1. 33.1. Unscrew screws **-arrow-** at the transmission opening.
    2. 33.2. Turn the crankshaft a further 120° in direction of rotation of the engine.
    3. 33.3. Counter at the crankshaft pulley.

Fig 32: Locating Flywheel Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

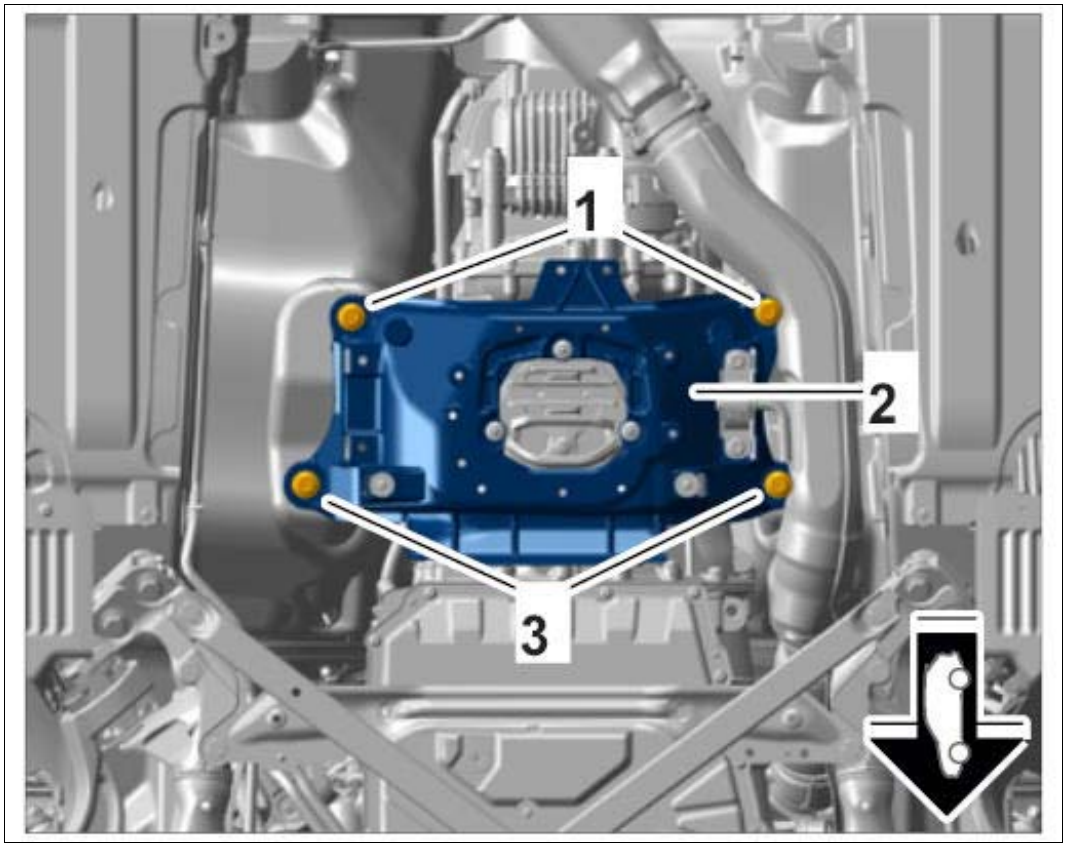
34. Loosen fastening screws **-1 and 3-** on gear support **-2-** .

    1. 34.1. Before loosening the fastening screws, mark the installation position of the gear support with a felt-tip pen.

    2. 34.2. Loosen fastening screws **-1 and 3-** .

       Do not unscrew fastening screws fully!

Fig 33: Identifying Gear Support Screws

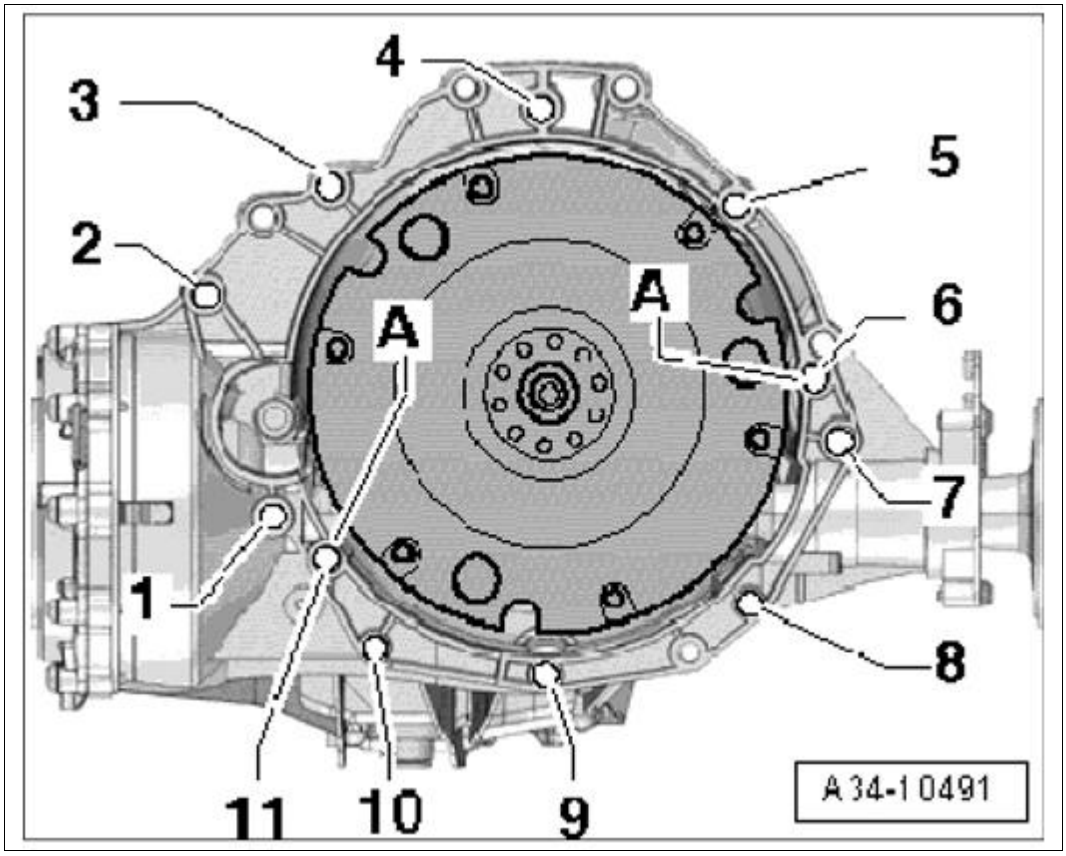


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

35. Loosen flange screws securing engine to transmission.

    1. 35.1. Unscrew screw **-1-** for the starter from the engine side.
    2. 35.2. Unscrew screws **-6... 11-** .
    3. 35.3. Pull the starter off the transmission and leave it in installation position.

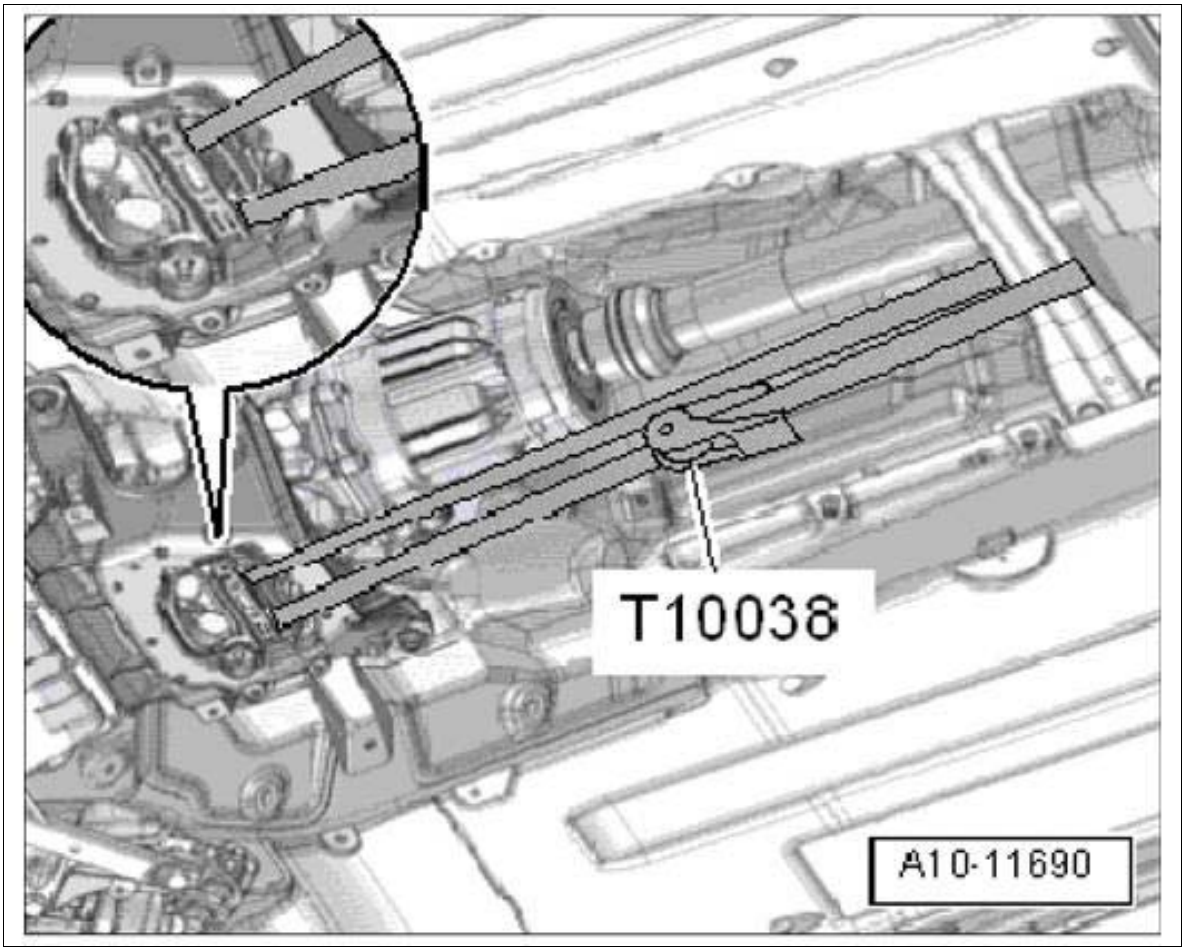
Fig 34: Engine Transmission Flange Screws Loosening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

36. Tighten tension strap on the transmission mount and tunnel transverse strut as shown.

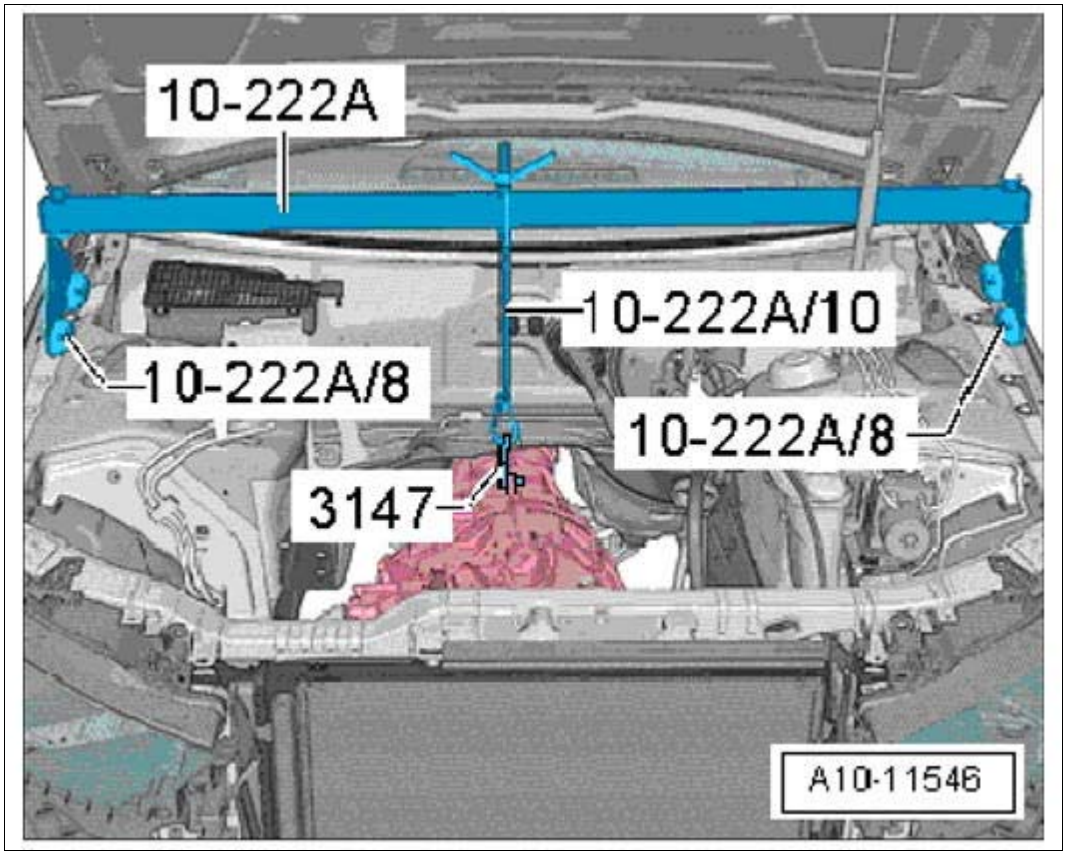
Fig 35: Identifying Transmission Mount And Tunnel Transverse Strut Tension Strap



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

37. Support transmission on the body using **support bracket 10-222 A** .
    1. 37.1. Secure 10-222 A to the adapters 10-222 A/8 using wing screws.
    2. 37.2. Fit 10-222 A using adapters 10-222 A/8 to the spring strut domes at the left and right.
    3. 37.3. Join transmission and spindle using **gearbox support 3147** .

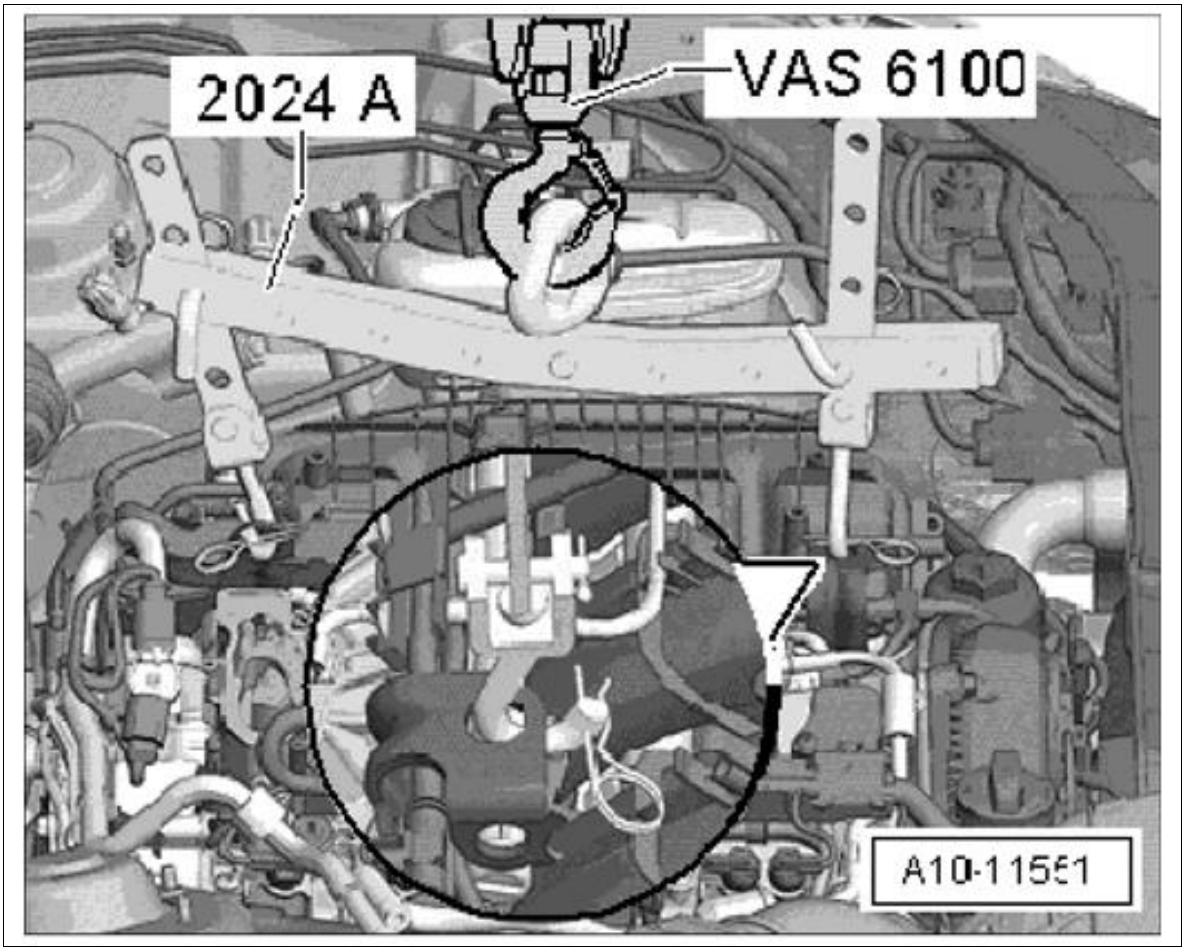
Fig 36: Supporting Transmission Using Support Bracket



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

38. **Lifting tackle 2024 A** must be engaged on the engine and on the **workshop crane WE 1188** as shown.

Fig 37: Lifting Tackle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

39. Raise the engine until the engine mounts are free.
40. Turn the spindle of the **support bracket 10-222 A** further.
41. Pre-tension the tension strap.
42. Remove engine from transmission and lift it up out of the engine compartment.
    1. 42.1. Checking clearance of the engine in the engine compartment.
    2. 42.2. Check that all hose and line connections between the engine, transmission, unit carrier and body are disconnected.
    3. 42.3. Guide ATF lines past the oil pan.
43. Close off open lines with stoppers from outside.

WM 100119 REMOVING AND INSTALLING ENGINE (MACAN) > INSTALLING ENGINE

WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

Information

Tightening torques, tightening sequence and assembly overviews for the engine and transmission:

- Group 1: → 1X00IN TECHNICAL VALUES
- Group 2: → 2X00IN TECHNICAL VALUES
- Group 3: → 3X00IN TECHNICAL VALUES

Information

- Check O-rings on the plug-in couplings and replace them if necessary.
- Clean plug connection and coolant hoses before assembly.
- Coat O-rings and coolant hoses with Kluber Plus Gel (Part No. 000.043.205.93).
- Remove stoppers before fitting the coolant lines and hoses.

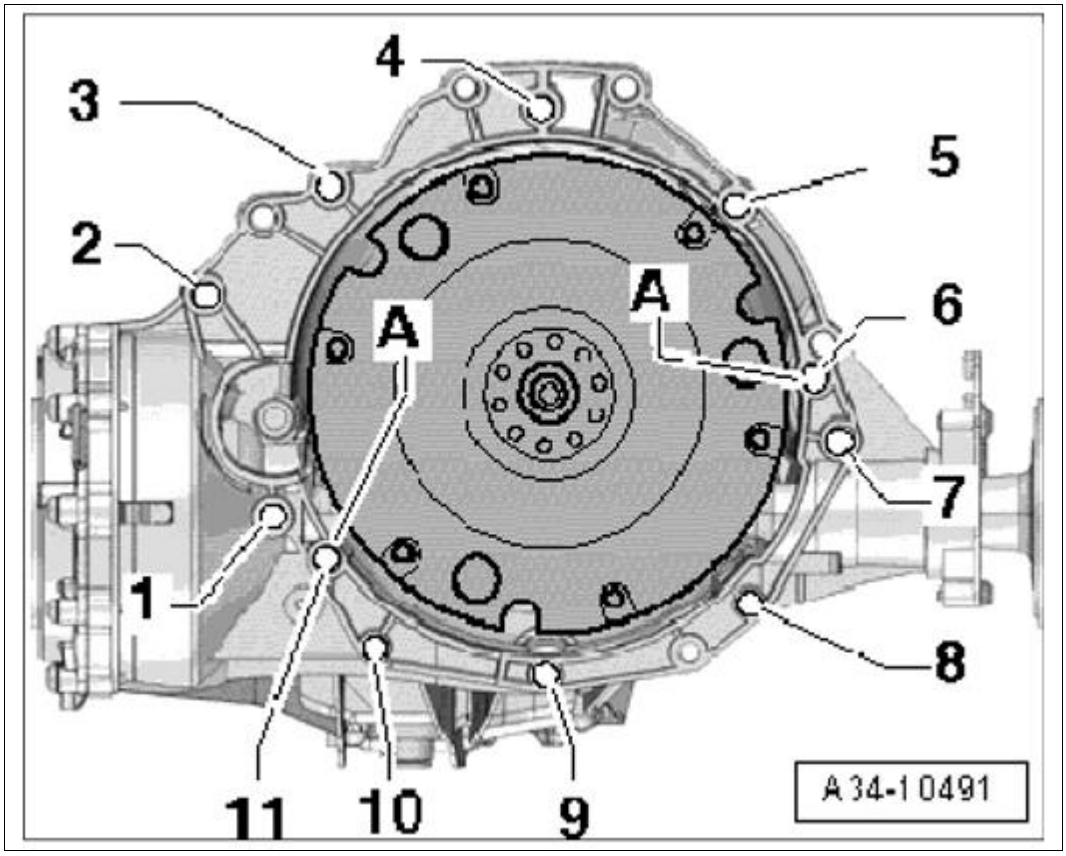
Information

- Replace O-rings.
- Grease O-rings with a light coating of Kluber Syntheso Glep (Part No.: 000.043.204.68).

1. Check that the intermediate plate on the joint flange is engaged and pushed onto the dowel sleeves.
2. Check that dowel sleeves **-A-** for centering the engine and transmission are fitted in the cylinder block.

    1. 2.1. Insert missing dowel sleeves.

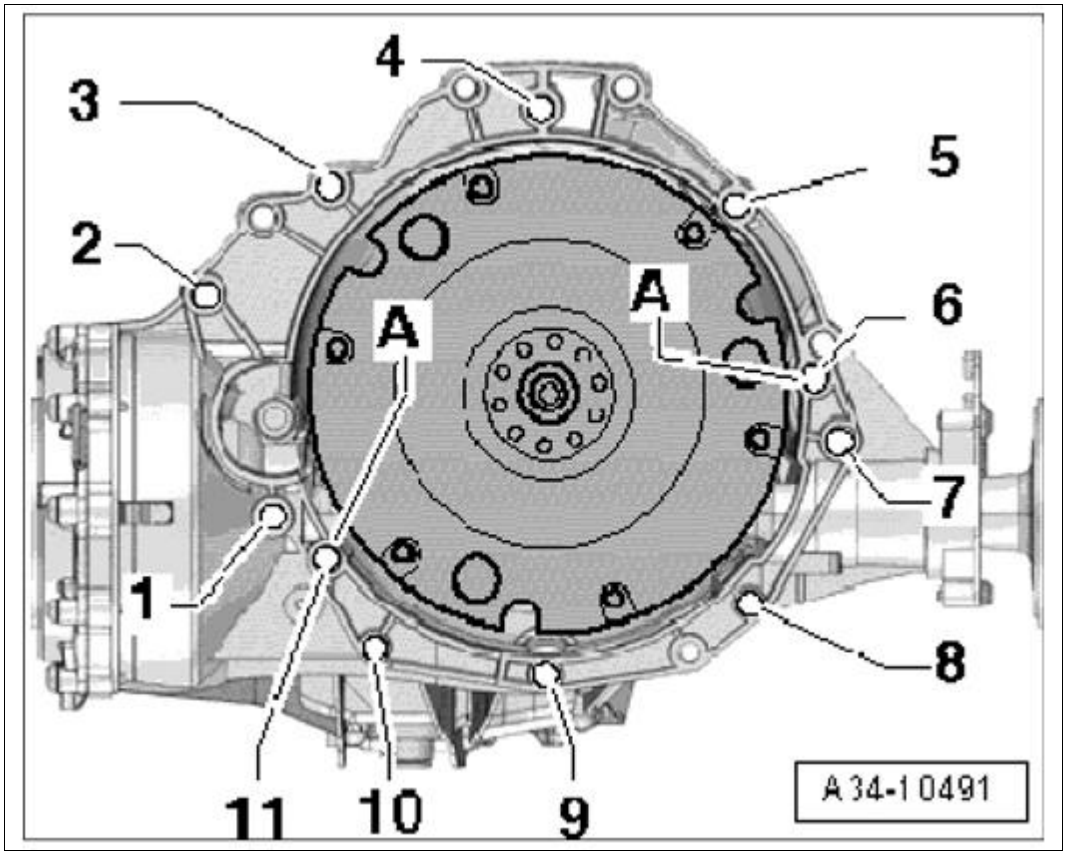
Fig 1: Engine Transmission Flange Screws Tightening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Place starter in installation position.
    1. 3.1. Fit bottom screw before fitting the engine at the starter!
4. Guide engine into the engine compartment using workshop crane WE 1188.
    1. 4.1. Guide oil pan past the ATF lines.
5. Mount engine on transmission.
    1. 5.1. Loosen tension strap.
    2. 5.2. Tighten screws **-3... 5-** .

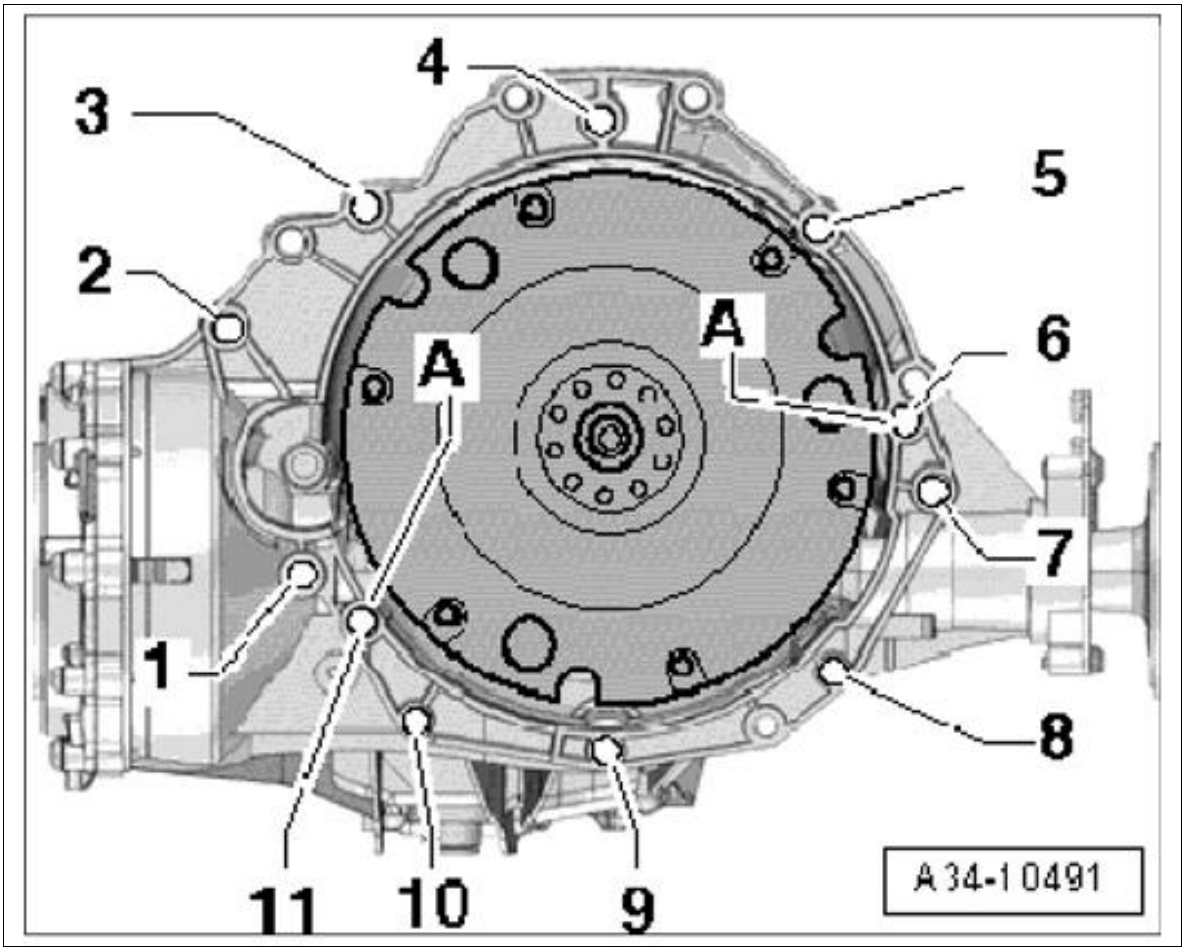
Fig 2: Engine Transmission Flange Screws Tightening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Place engine and transmission in installation position.
    1. 6.1. Relieve spindle of the **support bracket 10-222 A** .
    2. 6.2. Lower the workshop crane and lower the engine and transmission onto the engine mounts.
    3. 6.3. Remove workshop crane and support bracket.
7. Secure the engine to the engine mounts.
    1. 7.1. Replace screw.
8. Tighten screws **-6... 11-** .

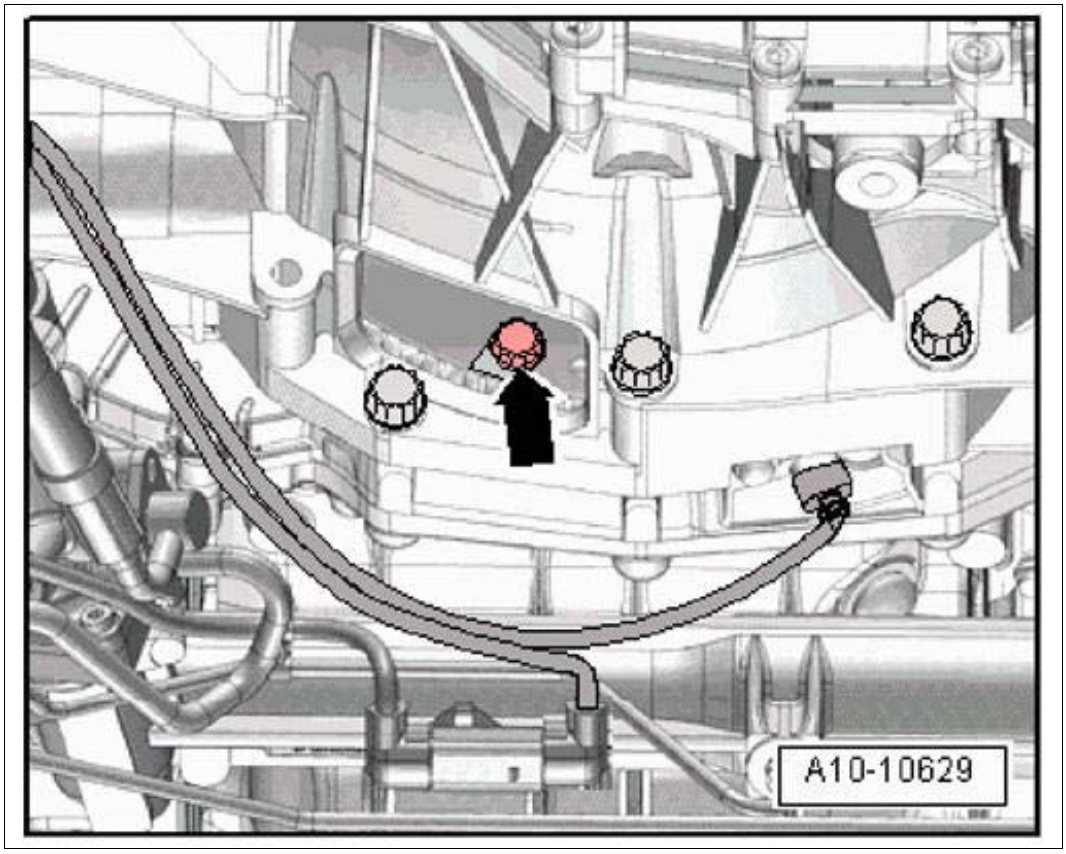
Fig 3: Engine Transmission Flange Screws Tightening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Secure the flywheel on the transmission.
    1. 9.1. Screw in screw **-arrow-** hand-tight.
    2. 9.2. Turn the crankshaft a further 120° in direction of rotation of the engine.
    3. 9.3. Screw in second screw hand-tight.
    4. 9.4. Turn the crankshaft a further 120° in direction of rotation of the engine.
    5. 9.5. Tighten third screw to the specified tightening torque.
    6. 9.6. Tighten the remaining screws to the specified tightening torque.

Fig 4: Locating Flywheel Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Further installation is performed in reverse order. Pay particular attention to the following:
    1. 10.1. Replace seals and O-rings.
    2. 10.2. Replace tie-wraps that were removed.
    3. 10.3. Always use new aluminum screws.
    4. 10.4. Coat O-rings with a suitable agent.
11. When installing a reconditioned engine, check the engine-oil level before starting the engine. → 170101 CHECKING ENGINE-OIL LEVEL

WM 100119 REMOVING AND INSTALLING ENGINE (MACAN) > SUBSEQUENT WORK

1. Install catalytic converter. → INSTALLING CATALYTIC CONVERTER
2. Install cross panel. → INSTALLING CROSS PANEL
3. Install front strut. → INSTALLING FRONT STRUT
4. Install cowl panel cover. → INSTALLING COWL PANEL COVER

WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

Information

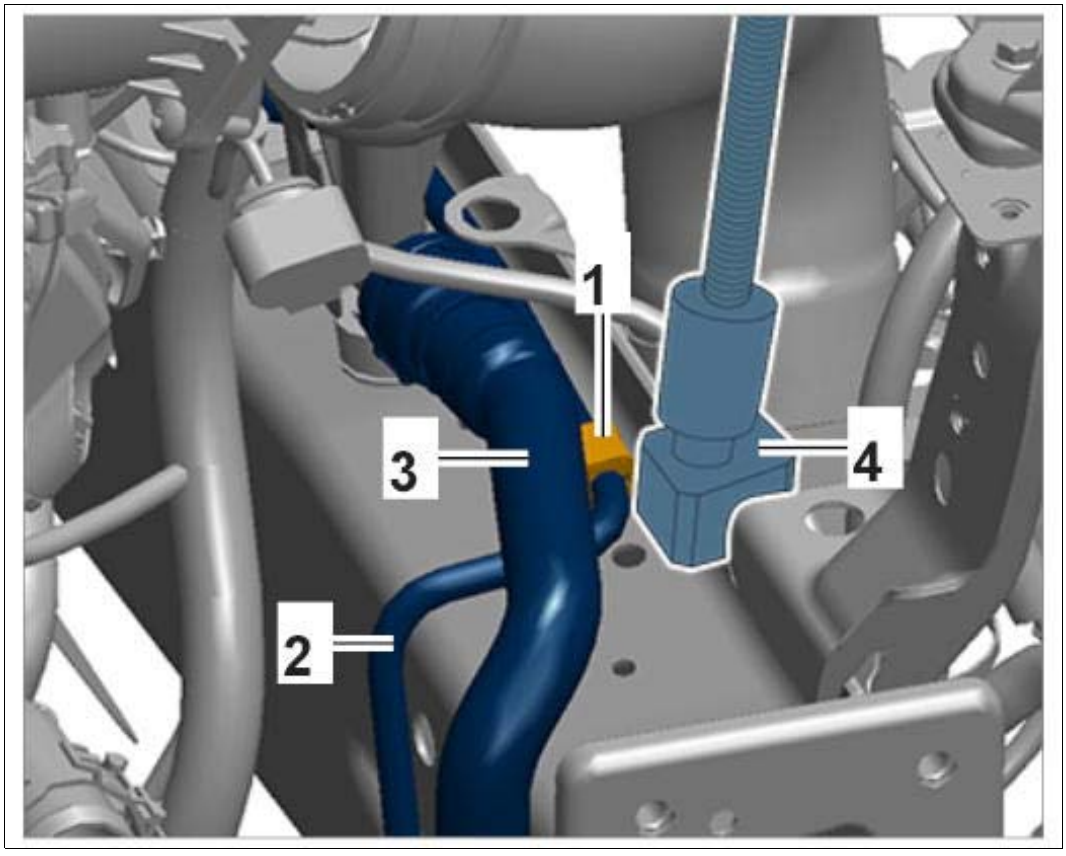
A unit lift, such as **transmission jack V.A.G 1383 A WE 1082** or **transmission and unit jack Junior Jack 2.0 WE 1223** with **GA passenger-vehicle transmission plate WE 1224** , can also be used to support the raised vehicle while you are working.

Information

The engine must be supported on the body in order to remove the front axle, oil guide housing, oil pump or similar components.

1. Remove refrigerant line **-2-** from the guide.
    1. 1.1. Open the clip **-1-** .
    2. 1.2. Lift refrigerant line **-2-** out of the guide and set it aside.
    3. 1.3. Move refrigerant line **-3-** aside.

    Fig 1: Identifying Refrigerant Line And Clip



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Screw in supports **-1-, support T40091/50-51** on the **engine safety device supplement T40091/54** and **engine safety device supplement T40091/55** .

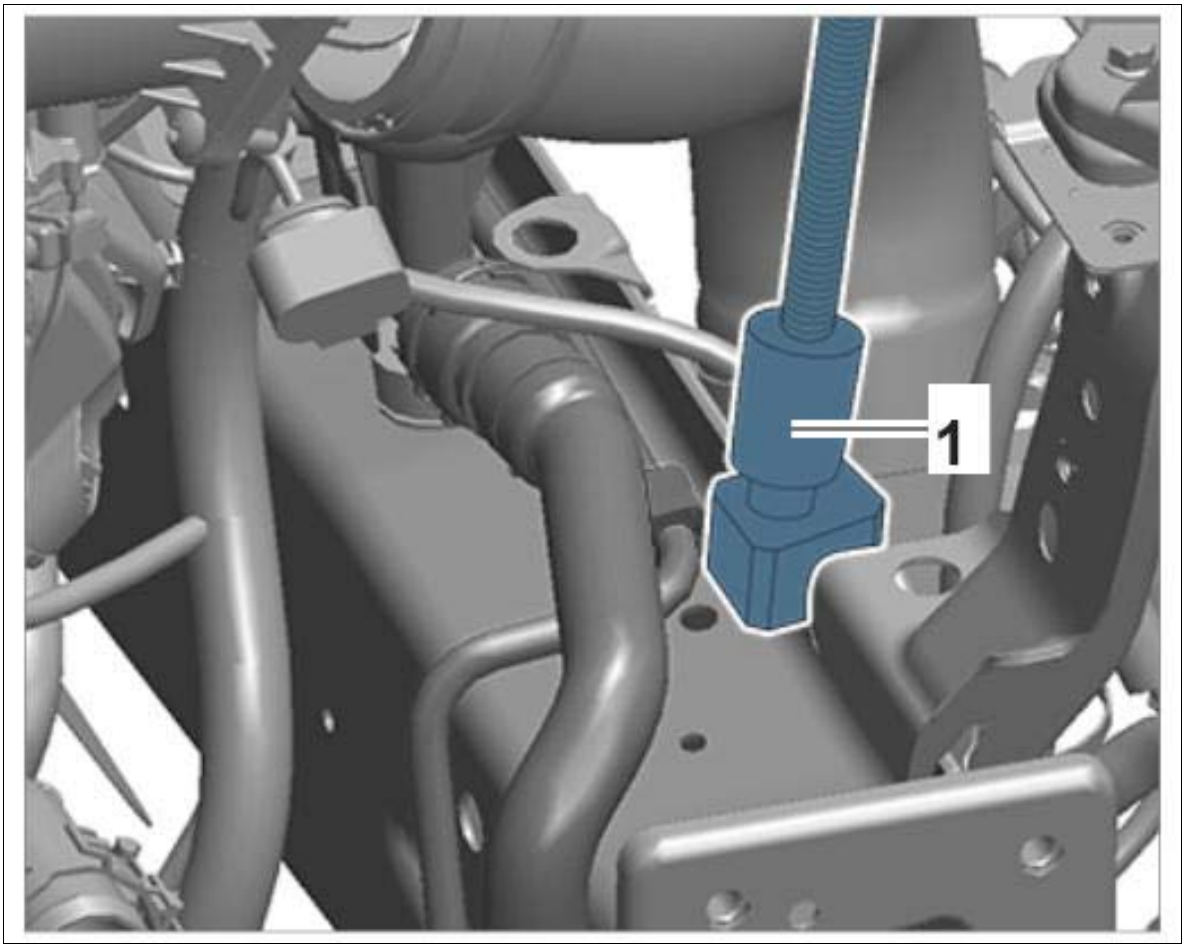
3. Place supports **-1-, support T40091/50-51** with the **engine safety device supplement T40091/54** and **engine safety device supplement T40091/55** onto the free spring strut domes.

4. Undo air hose from the throttle housing and set it aside.

5. Press coolant hose aside.

6. Position on the **left** longitudinal member, **adjustable foot T40093/51, -1-** .

   Fig 2: Identifying Left Longitudinal Member

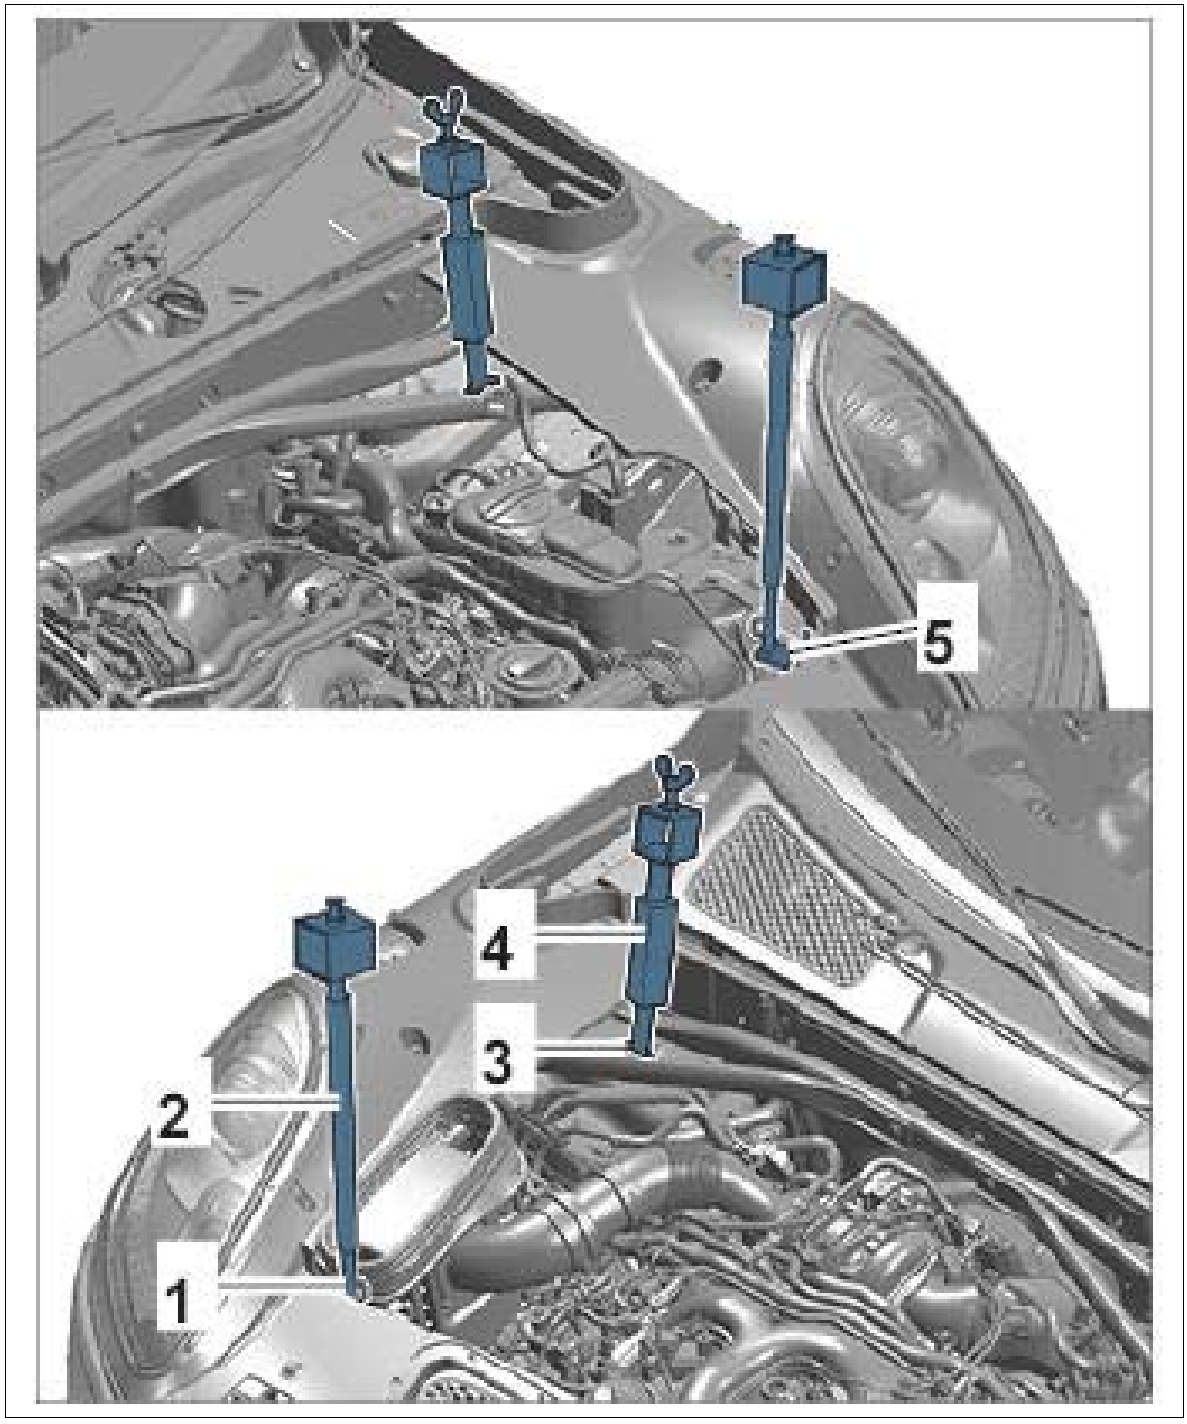


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Position on the **right** longitudinal member, **base T40093/50, -1-** .

8. **Support T40093/3P** Screw in, **-2-** , onto **adjustable foot T40093/51, -5-** , and **base T40093/50 -1-** , and correct to a height.

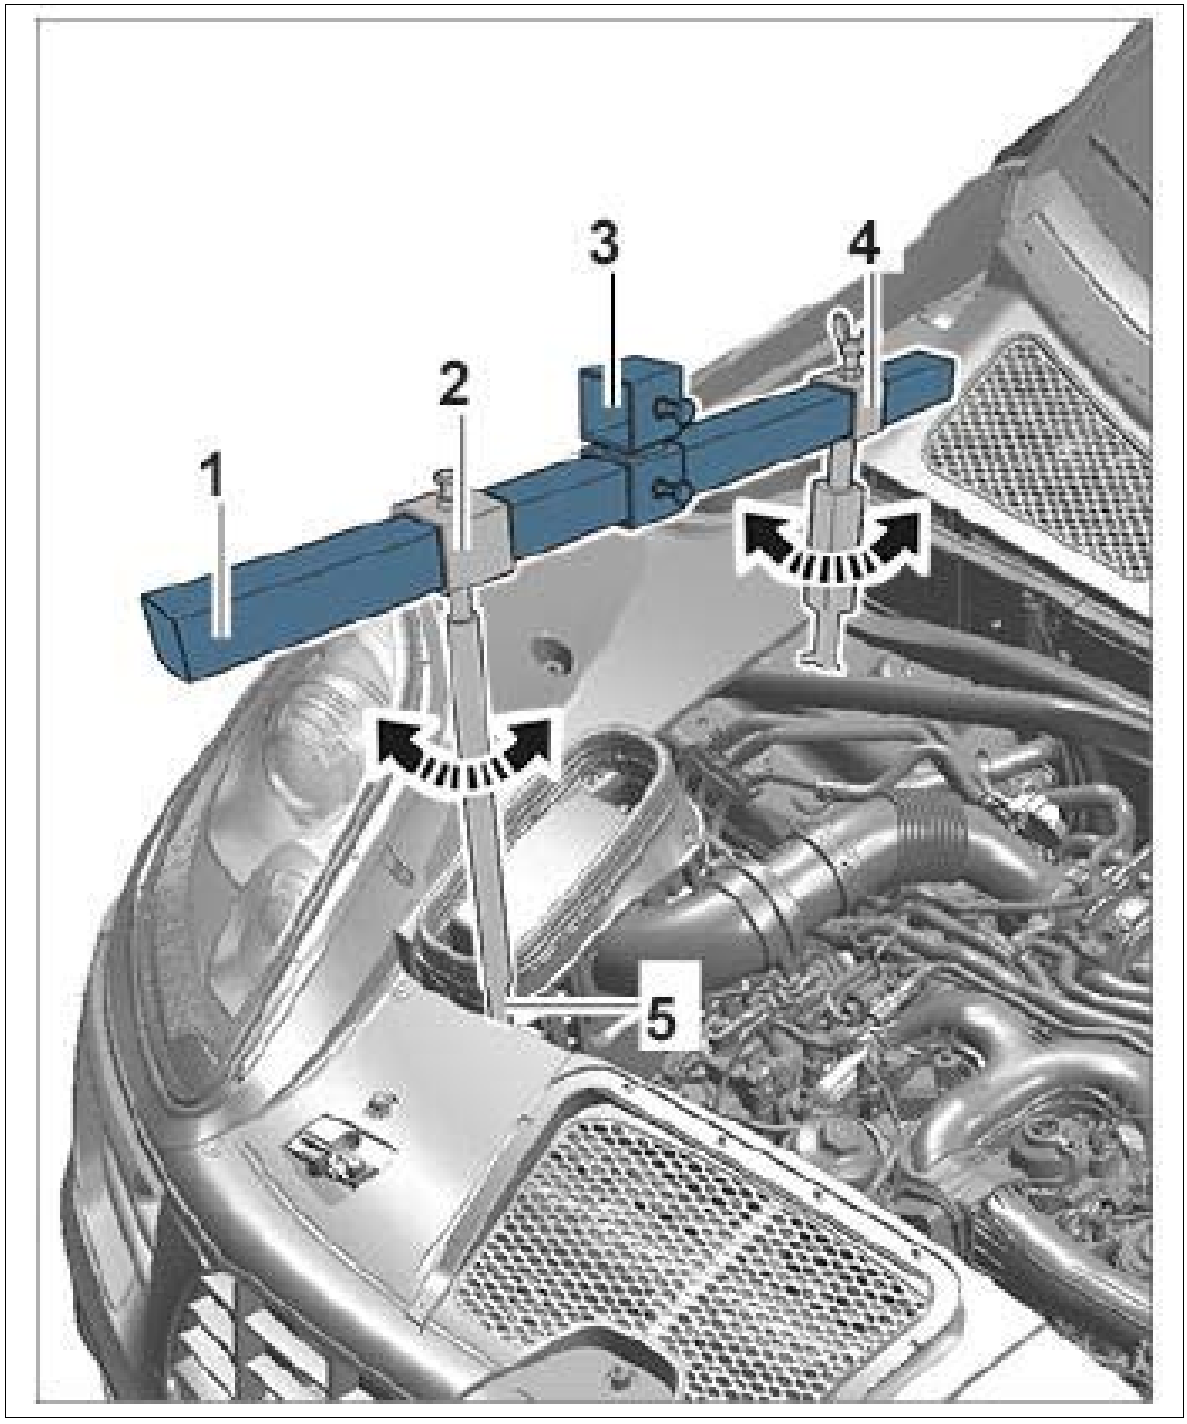
Fig 3: Identifying Right Longitudinal Member And Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. **Pipe T40091/1** Push through, **-1-** , at both ends through the **support T40093/3P** until the middle.
10. At both ends of the two **pipes pipe T40091/1, -1-** , attach the **joiners T40091/3, -3-** .
11. **Pipe T40091/1** Push through, **-1-** , further and up to the **support T40091/50-51, -4-** .

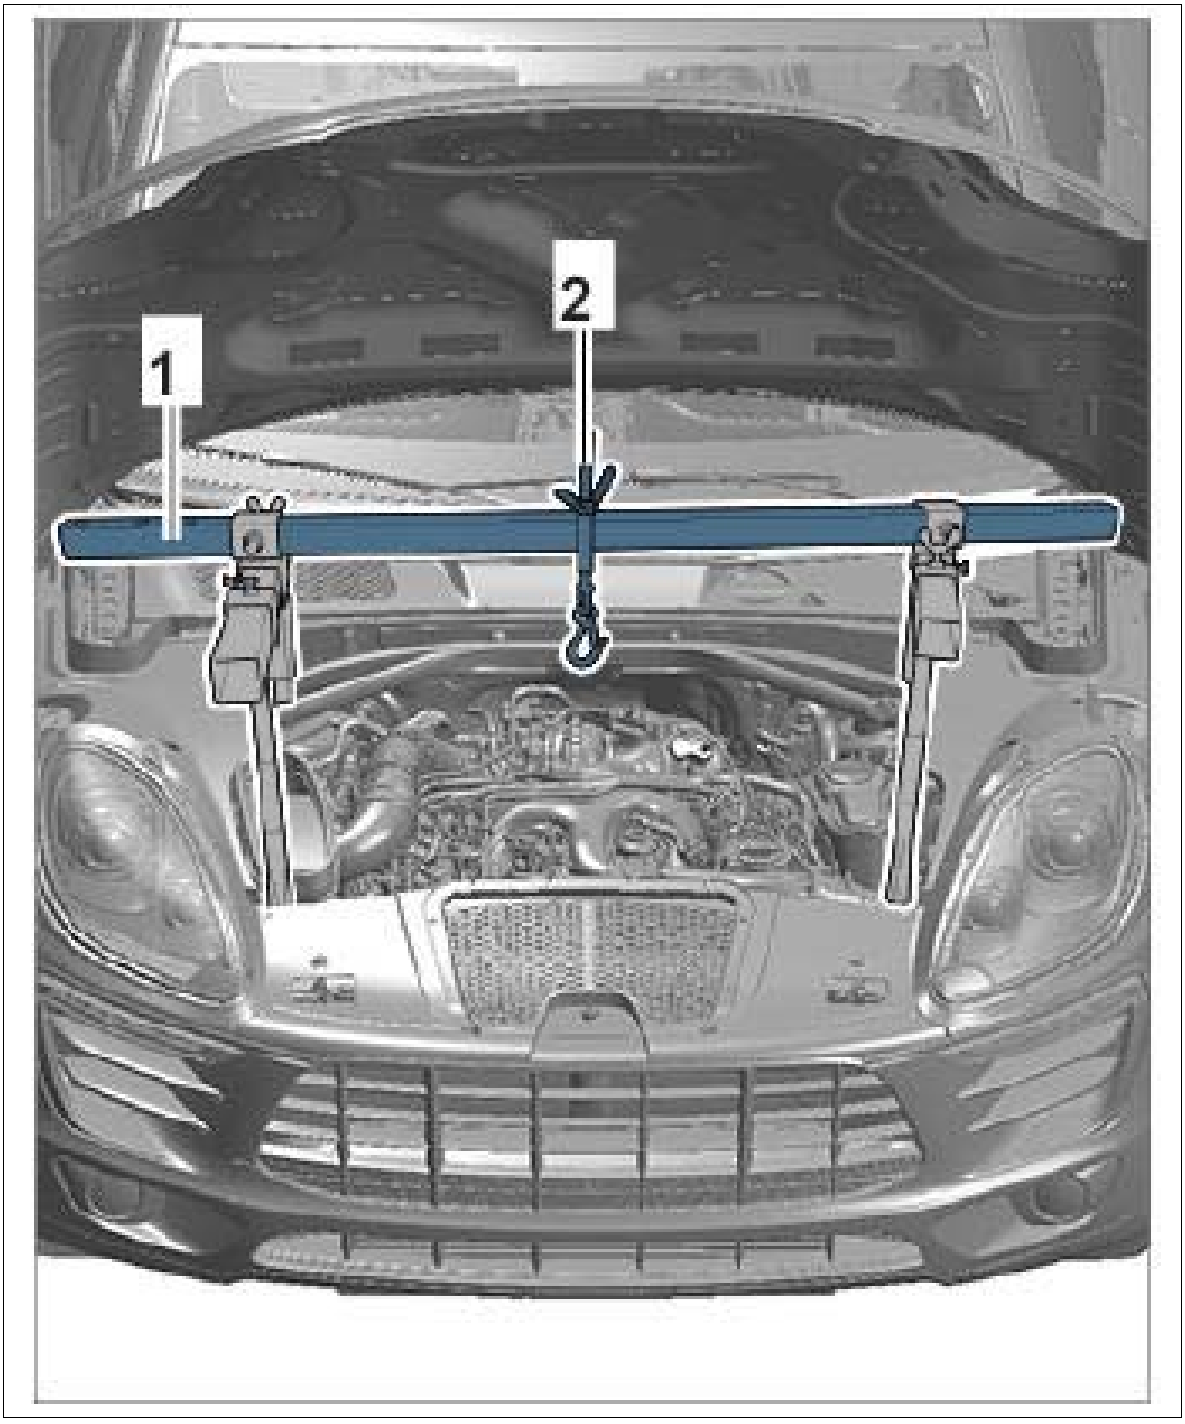
Fig 4: Attaching Joiners T40091/3



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. **Safety device 10-222 A** Push, **-1-** , crossways through the **joiner T40091/3** .

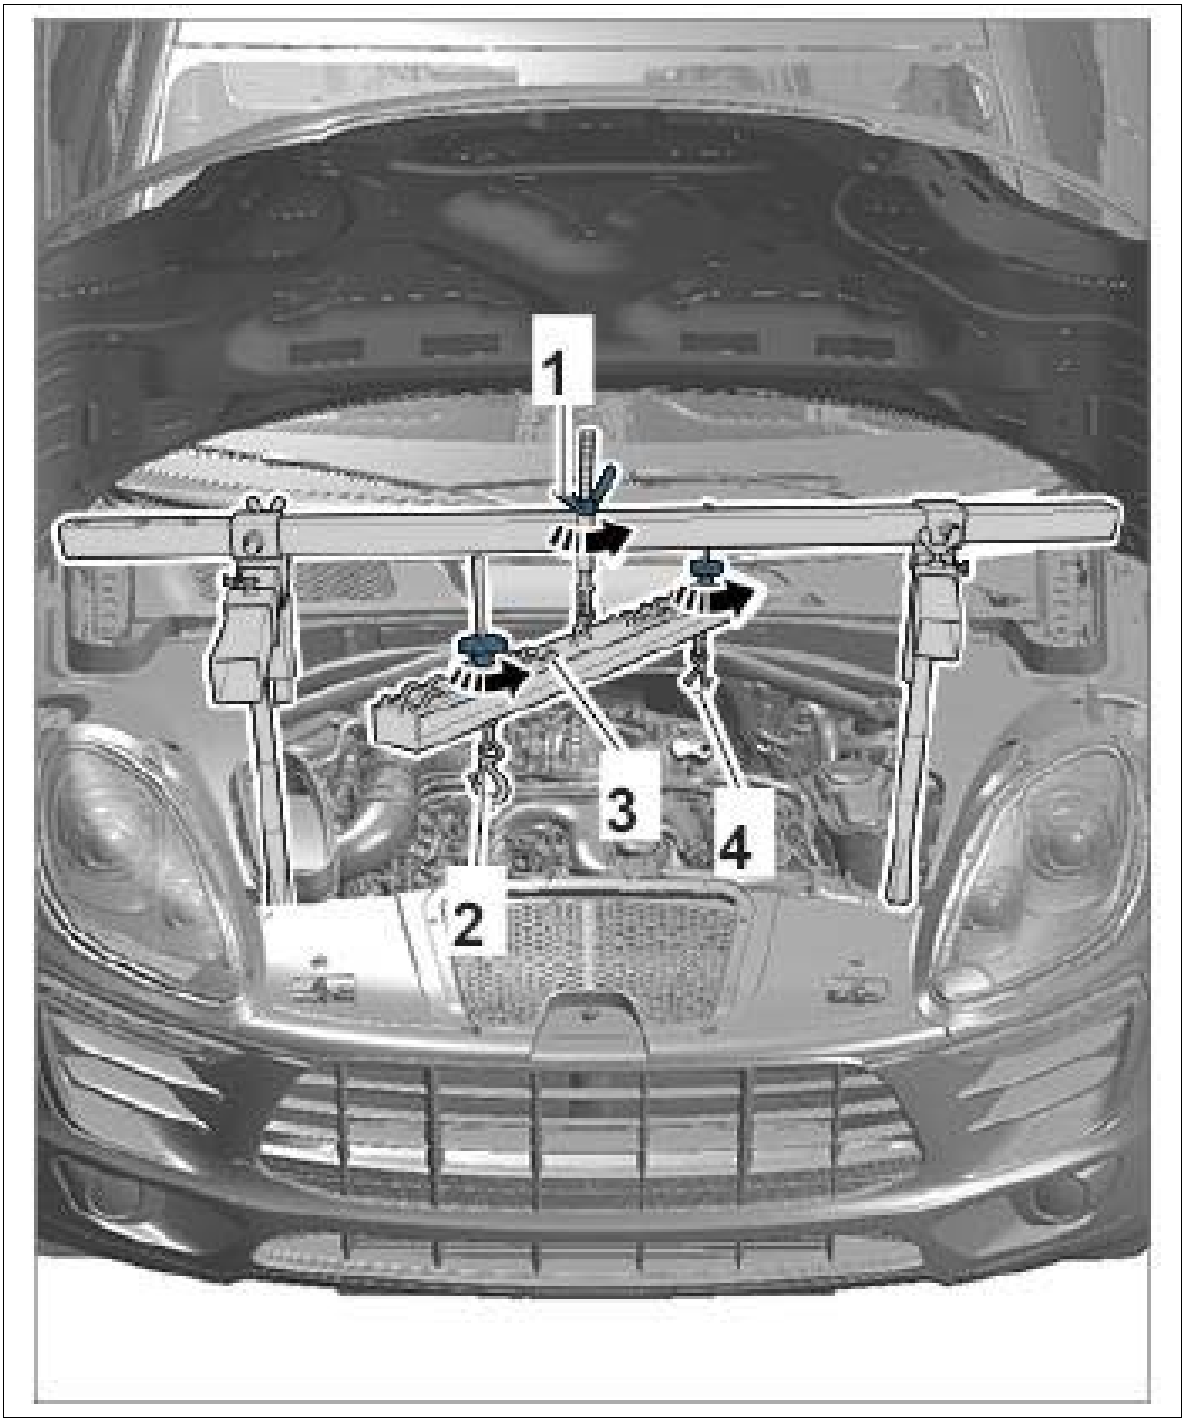
Fig 5: Identifying Safety Device



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

13. **Lifting tackle 3033** Fasten, **-3-** , to the spindle of the **safety device 10-222 A, -1-** .
14. Fasten engine at the fastening points **-2-** and **-4-** pretension slightly.

Fig 6: Lifting Tackle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 1001IN SUPPORTING ENGINE ON THE BODY (ENGINE SAFETY DEVICE) (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Secure the air-conditioning line on the left longitudinal member.
2. Install the front strut. → INSTALLING FRONT STRUT

3. Install the air cleaner housing. → INSTALLING AIR CLEANER HOUSING
4. Install the engine cover.

WM 100433 COMPLETING RECONDITIONED ENGINE (MACAN) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Fastening screw	Engine support	Tightening torque	40 Nm (30 ftlb.)		

WM 100433 COMPLETING RECONDITIONED ENGINE (MACAN) > PRELIMINARY WORK

1. Secure engine to assembly support.
2. Remove turbocharger from the oil engine. → 213019 REMOVING AND INSTALLING TURBOCHARGER

WM 100433 COMPLETING RECONDITIONED ENGINE (MACAN) > COMPLETING RECONDITIONED ENGINE

Information

Tightening torques, tightening sequence and assembly overviews for the engine and transmission:

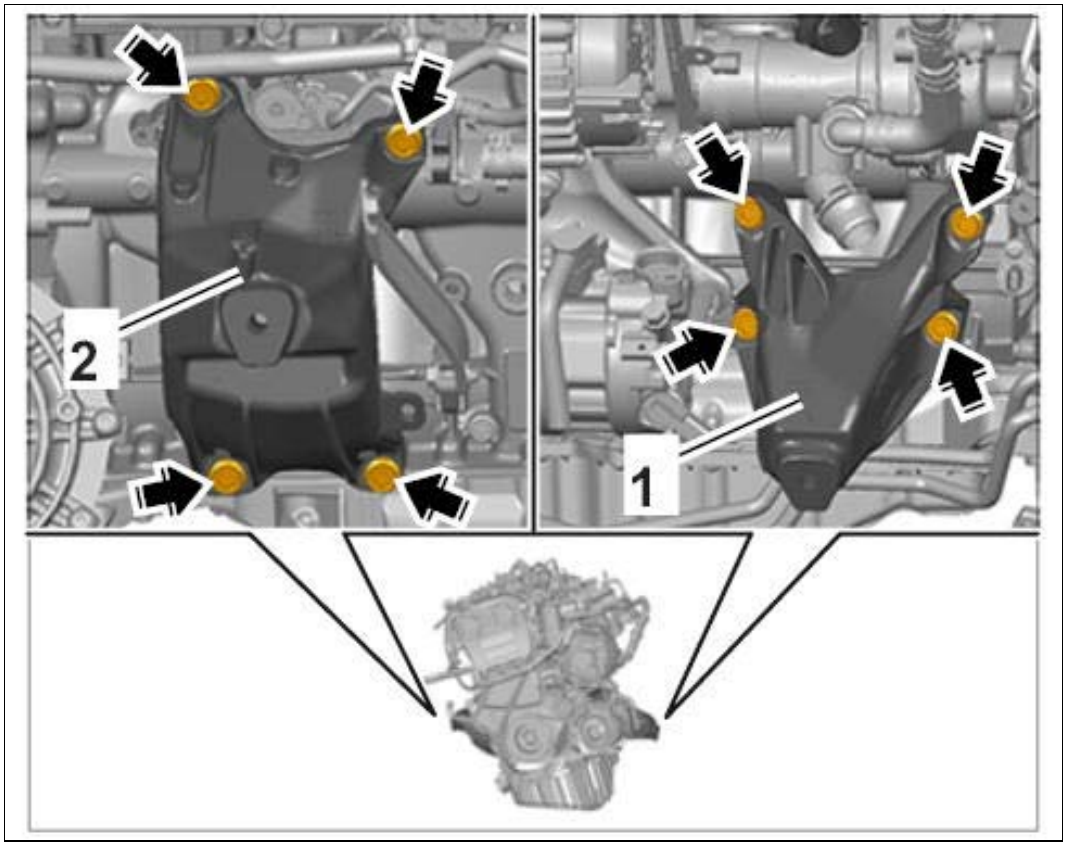
- Group 1: → 1X00IN TECHNICAL VALUES
- Group 2: → 2X00IN TECHNICAL VALUES
- Group 3: → 3X00IN TECHNICAL VALUES

Information

- Replace O-rings.
- Grease O-rings with a light coating of Kluber Syntheso Glep (Part No.: 000.043.204.68).

1. Convert engine mount supports.
    1. 1.1. Unscrew screws **-arrows-** and remove supports **-1-** and **-2-** .
    2. 1.2. Tightening torque: **Tightening torque: 40 Nm (30 ftlb.)**

Fig 1: Locating Engine Mount



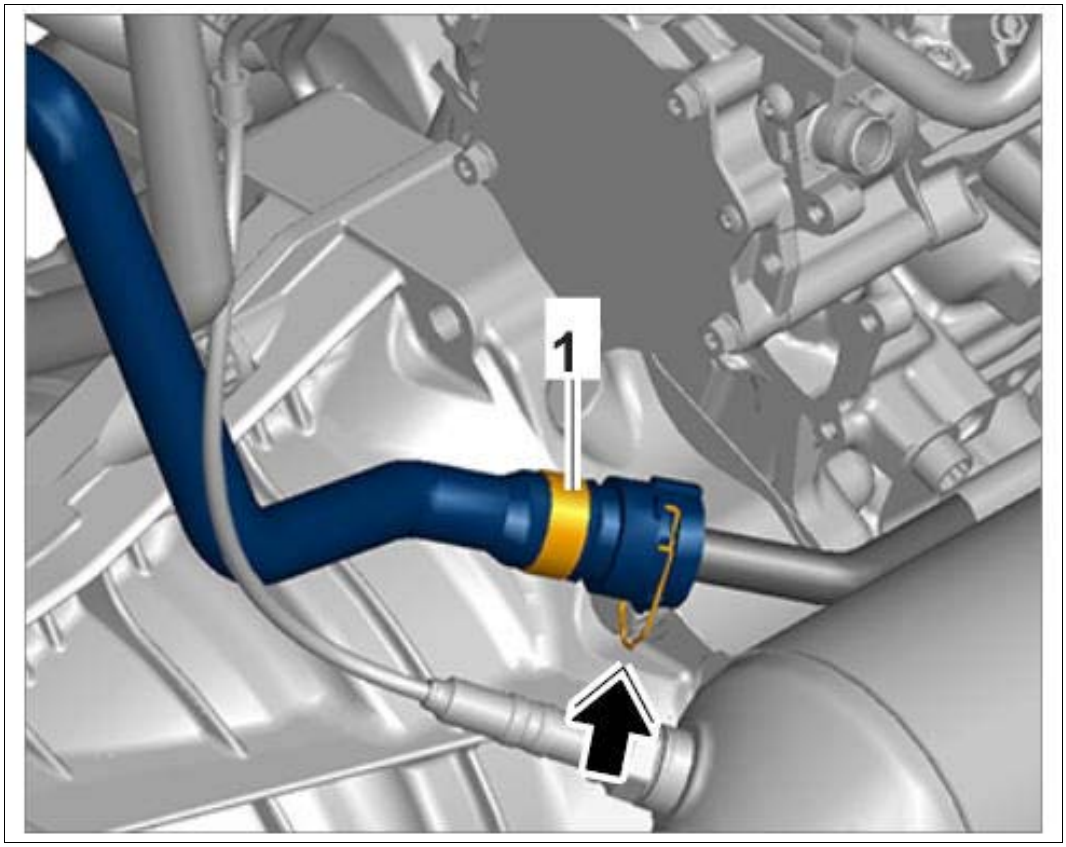
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Convert engine wire harness. → 975219 REMOVING AND INSTALLING WIRE HARNESS FOR ENGINE
3. Convert the generator. → 272219 REMOVING AND INSTALLING GENERATOR
4. Remove turbocharger on new engine. → 213019 REMOVING AND INSTALLING TURBOCHARGER
5. Remove and convert the starter. → 276019 REMOVING AND INSTALLING STARTER
    1. 5.1. Disconnect electric lines.
6. Install turbocharger from the new engine again. → INSTALLING TURBOCHARGER

    Information

    1. Check O-rings on the plug-in couplings and replace them if necessary.
    2. Clean plug connection and coolant hoses before assembly.
    3. Coat O-rings and coolant hoses with Kluber Plus Gel (Part No. 000.043.205.93).
    4. Remove stoppers before fitting the coolant lines and hoses.
7. Convert coolant hose heater.
    1. 7.1. Loosen retaining clip **-arrow-** and pull off coolant line **-1-** .

Fig 2: Locating Heater Coolant Line



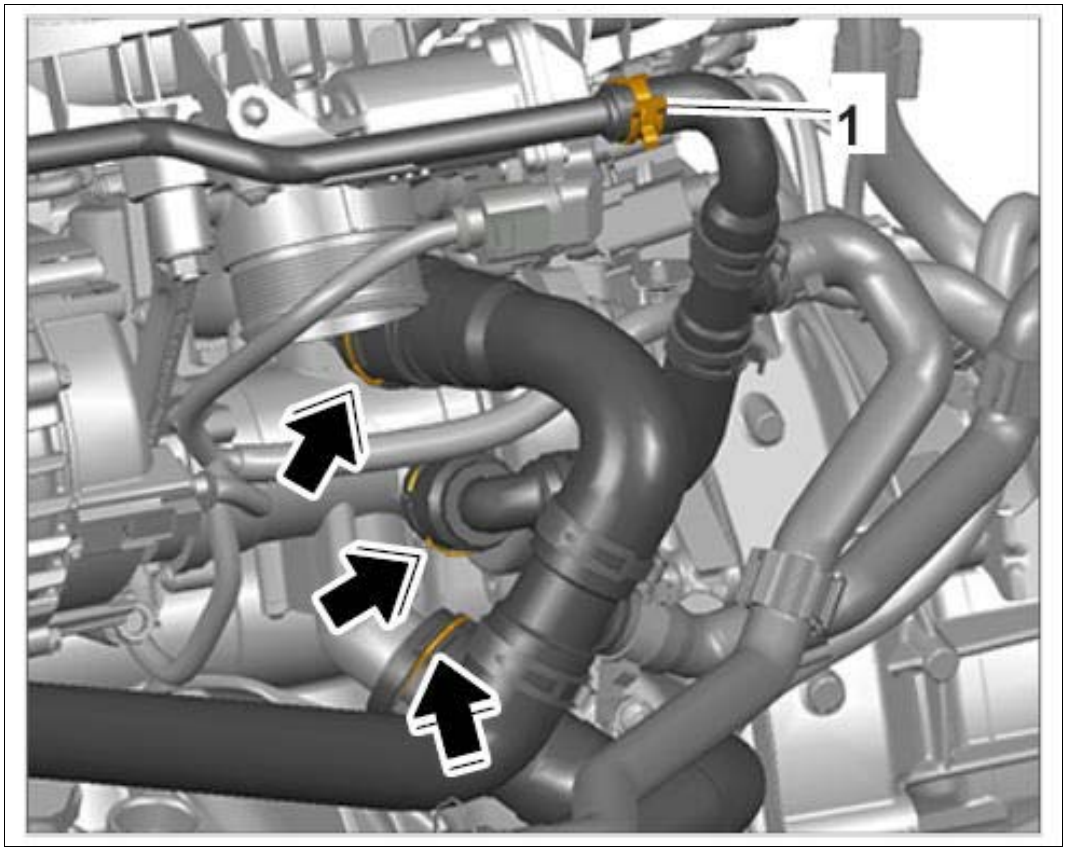
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. Check O-rings on the plug-in couplings and replace them if necessary.
2. Clean plug connection and coolant hoses before assembly.
3. Coat O-rings and coolant hoses with Kluber Plus Gel (Part No. 000.043.205.93).
4. Remove stoppers before fitting the coolant lines and hoses.

8. Disconnect and convert coolant lines on the coolant pump.
    1. 8.1. Lift up retaining clips **-arrows-** and pull off coolant lines.
    2. 8.2. Loosen clamp **-1-** and pull off coolant line.

Fig 3: Locating Coolant Pump Lines



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 100433 COMPLETING RECONDITIONED ENGINE (MACAN) > SUBSEQUENT WORK

1. Install engine. → INSTALLING ENGINE
2. Add engine oil and check oil level. → FILLING ENGINE OIL

WM 101031 CONVERTING CRANKCASE (DOWEL SLEEVES) (MACAN S, MACAN TURBO) > CONVERTING DOWEL SLEEVES

Information

As of a certain engine number, longer dowel sleeves are installed in the crankcase and cannot be fitted on the old transmission.

The long dowel sleeves must be replaced with short dowel sleeves when installing new engines on the old transmission.

Model/type	Engine number

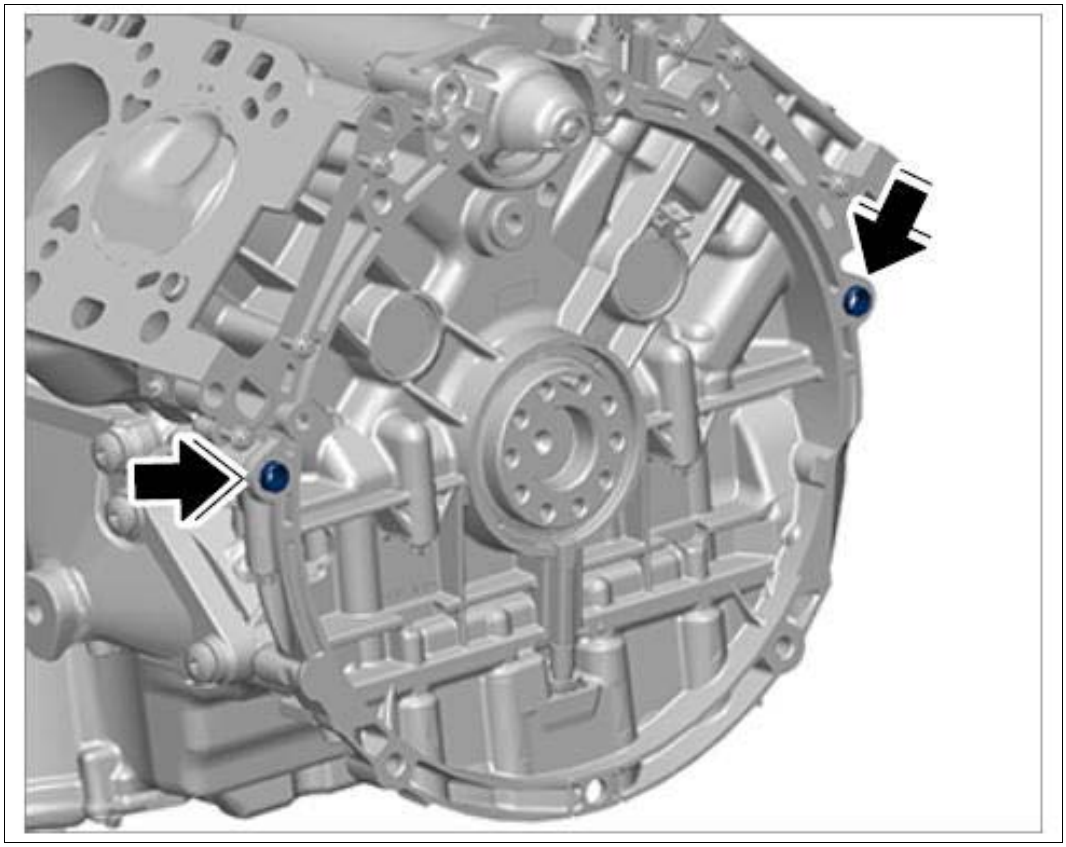
Macan S 3.0	CTM023880
Macan Turbo 3.6	CTL010398

1. Convert dowel sleeves **-arrows-** on the crankcase

    1. 1.1. Pull long **16.5-mm** dowel sleeves out of the crankcase by turning them back and forth using a vice-grip wrench or water pump pliers.

    2. 1.2. Carefully tap short **15-mm** dowel sleeves into the crankcase using a plastic hammer.

    Fig 1: Locating Crankcase Dowel Sleeves



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 101320 REMOVING AND INSTALLING OIL SPRAY JETS (MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Splash valves to upper part of crankcase	M6	Tightening torque	13 Nm (9.5 ftlb.)		

WM 101320 REMOVING AND INSTALLING OIL SPRAY JETS (MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove crankshaft.

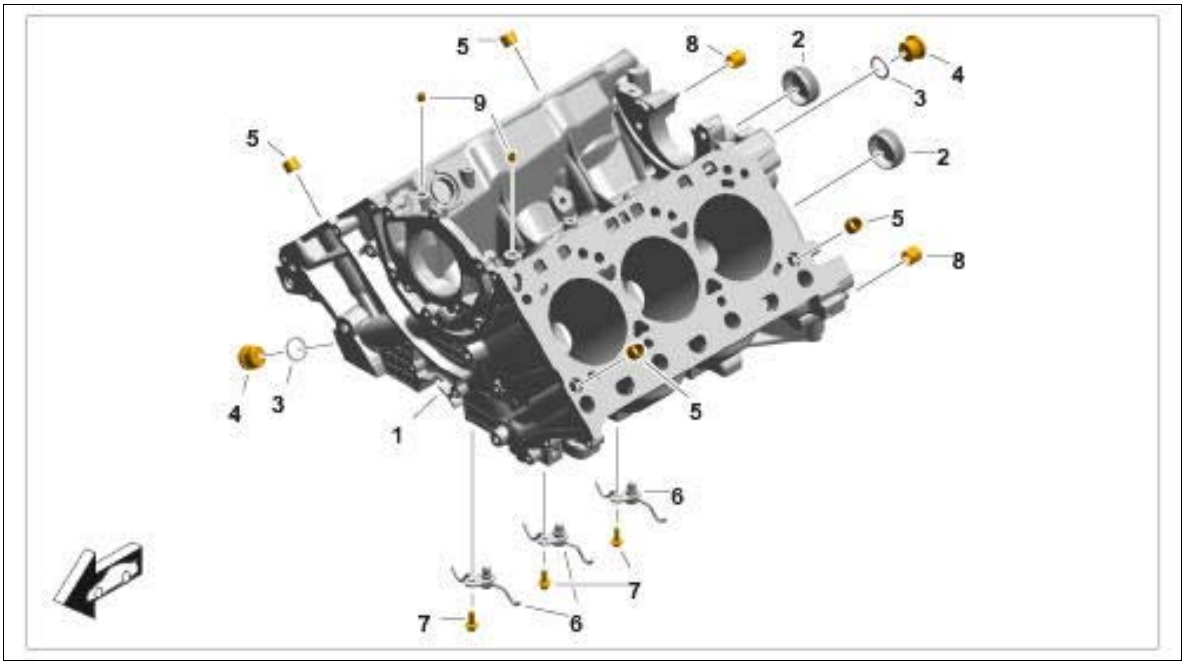
WM 101320 REMOVING AND INSTALLING OIL SPRAY JETS (MACAN S, MACAN TURBO) > REMOVING OIL SPRAY JETS > OIL SPRAY JETS

Information

- The type of oil spray jets used depends on the engine number. Always check the engine number when ordering new oil spray jets.
- Adapted software must be installed on the control unit if necessary due to modified oil pressures.

1. Unscrew screws **-7-** and remove oil spray jets **-6-** .

Fig 1: Identifying Crankcase Upper Part



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 101320 REMOVING AND INSTALLING OIL SPRAY JETS (MACAN S, MACAN TURBO) > INSTALLING OIL SPRAY JETS

Information

- The type of oil spray jets used depends on the engine number. Always check the engine number when ordering new oil spray jets.
- Adapted software must be installed on the control unit if necessary due to modified oil pressures.

1. Insert oil spray jets into the upper part of the crankcase with new sealing rings and screw them on.

   To do this, grease sealing ring with Kluber Syntheso GLEP 1 and fit it. Check that oil spray jets are pointing in the correct direction of spray toward the inside of the piston crown. The oil spray jet must be aimed at the piston crown. → Spray direction → Spray direction at the side **Tightening torque: 13 Nm (9.5 ftlb.)**

   Fig 1: Inserting Oil Spray Jets

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 2: Identifying Oil Spray Jet Direction

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 101320 REMOVING AND INSTALLING OIL SPRAY JETS (MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install crankshaft.
2. Assemble engine.
3. After completing the required work, load a new DME data version if necessary (oil jet opening pressure). This may also apply after replacing the engine.

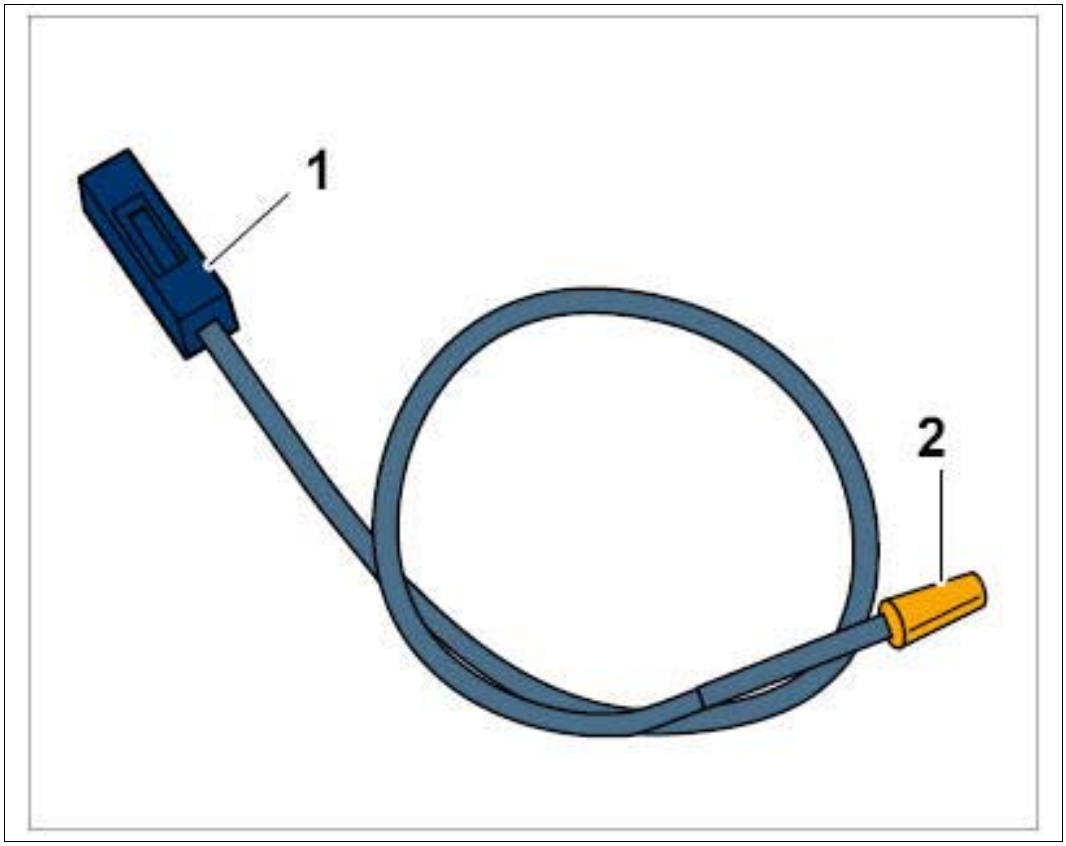
WM 101802 PRESSURE LOSS TEST (MACAN) > TOOLS

Designation	Type	Number	Description	

Pressure loss tester Bosch EFAW 210 A	Workshop equipment	WE 1066		
WM 101802 PRESSURE LOSS TEST (MACAN) > PRELIMINARY WORK

1. Unscrew and remove all spark plugs. → 287020 REMOVING AND INSTALLING SPARK PLUGS
2. Position cylinder to be tested to ignition TDC and remove tool (dead center finder).
    1. 2.1. The dead center finder or "cylinder pipe" consists of a glass tube (inspection glass) with a piston **-1-** , hose and a rubber cone **-2-**

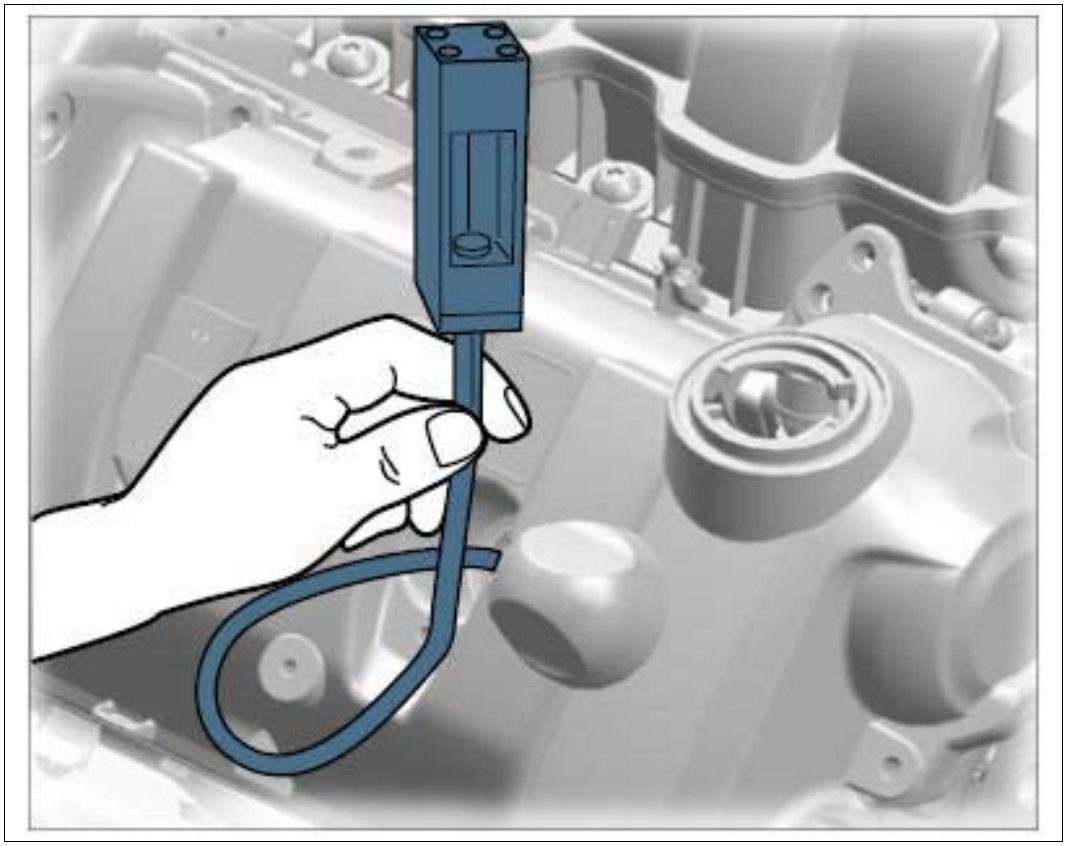
Fig 1: Identifying Dead Center Finder (Cylinder Pipe)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 2.2. The rubber taper is pressed onto the spark plug hole. The inspection glass is either held by a helper → Tool setup - dead center finder (similar to illustration) or is secured vertically in a clearly visible position with a magnet.

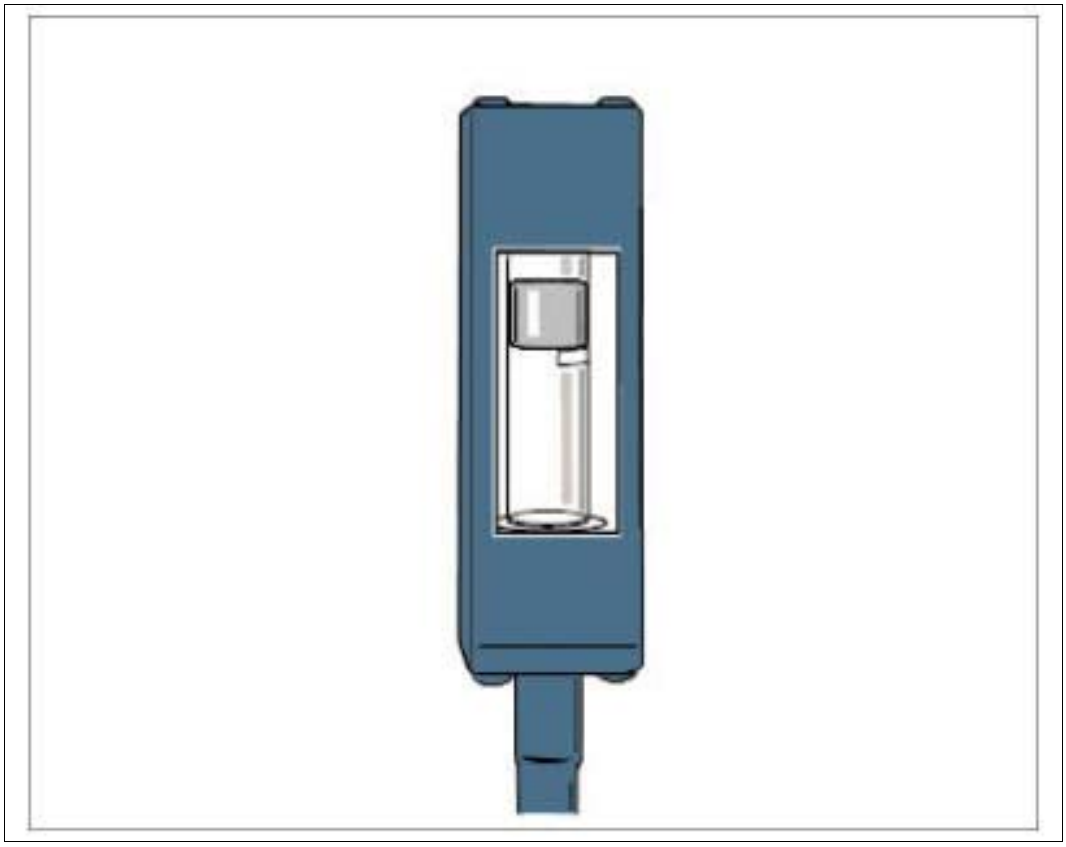
Fig 2: Installing Tool (Dead Center Finder)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

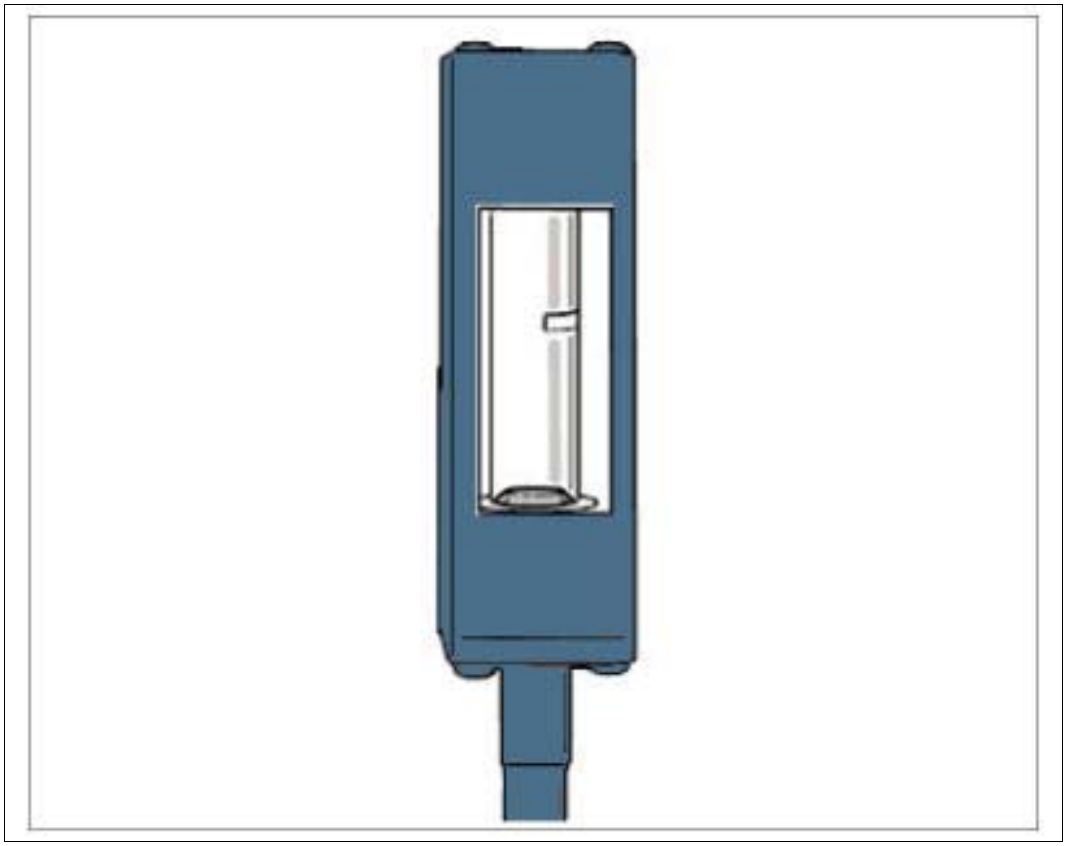
3. 2.3. If the engine is now turned in direction of rotation on the crankshaft, the piston in the inspection glass is pressed up in the compression cycle → Plunger up in order to go back down immediately upon reaching the TDC. The piston in the inspection glass stays down in overlapping TDC → Plunger down .

Fig 3: Identifying Plunger (Up Position)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 4: Identifying Plunger (Down Position)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 101802 PRESSURE LOSS TEST (MACAN) > TEST EVALUATION

- The test does not show any meaningful result on a new engine (i.e. one that hasn't been run in).
- A difference in pressure loss between the individual cylinders of approx. 5% is not significant.
- If the test shows an excessive loss of pressure (> 30%), a few drops of oil can be sprayed into the combustion chamber. Repeat the test. If the loss in pressure is now significantly less, the seal between the piston and cylinder is damaged.
- The air that is escaping causes hissing noises, which provide information about the component that is causing the damage.

If the limit values are exceeded, the engine must be started and the test repeated.

Potentially faulty component	Location of noise
Pistons, piston rings, cylinder line	Oil filler neck, positive crankcase ventilation
Cylinder head gasket, cylinder head	Coolant expansion tank
Exhaust valve	Exhaust system
Inlet valve	Intake system

WM 101802 PRESSURE LOSS TEST (MACAN) > TESTING PRESSURE LOSS ON THE ENGINE

WARNING: Rotating components

- *Danger of limbs being trapped or severed*

→ Do not reach into the danger area.

Information

- The check for loss of pressure can be used to assess the mechanical condition of a combustion engine.
- A pressure loss test is more meaningful than the compression pressure check.
- The percentage leakage quantity can be used to establish whether the leaks in the combustion chamber in question are so large that the combustion chamber must be repaired.
- The worn components (e.g. piston rings) can be identified by the compressed air that is escaping.

Information

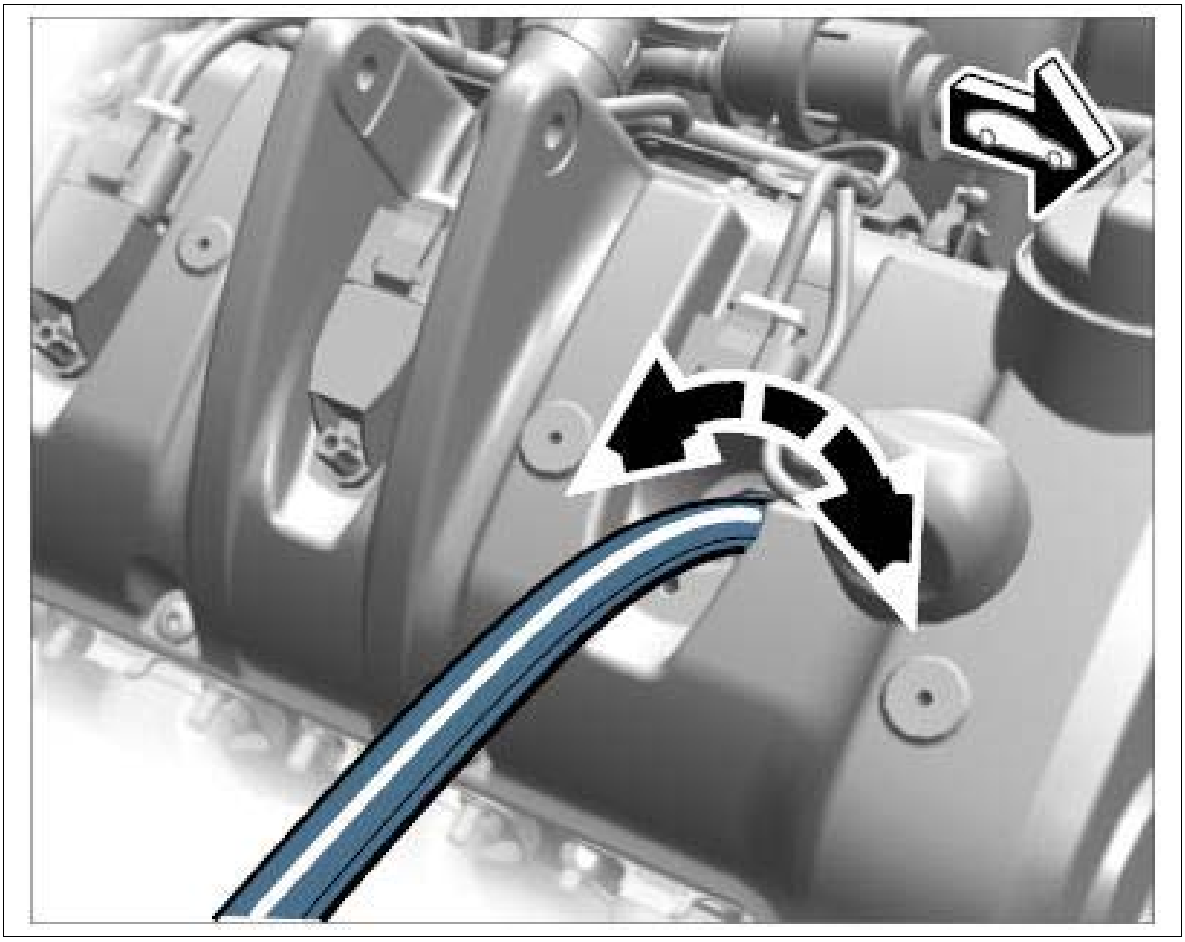
The piston must be exactly at the upper return point when checking pressure loss. Do not touch any components of the belt drive and do not put any tools on the crankshaft pulley while performing the check.

Information

Read the work steps and tips in the operating instructions for the Bosch tester before performing the pressure loss test. The described Bosch tester is used as an example for all suitable pressure loss testers. Details of calibration and use can be found in the relevant operating instructions.

1. Get the tester ready. **Pressure loss tester Bosch EFAW 210 A WE 1066**
2. Screw the test hose into the spark plug thread of cylinder 1 by hand (compression TDC) and tighten hand-tight.

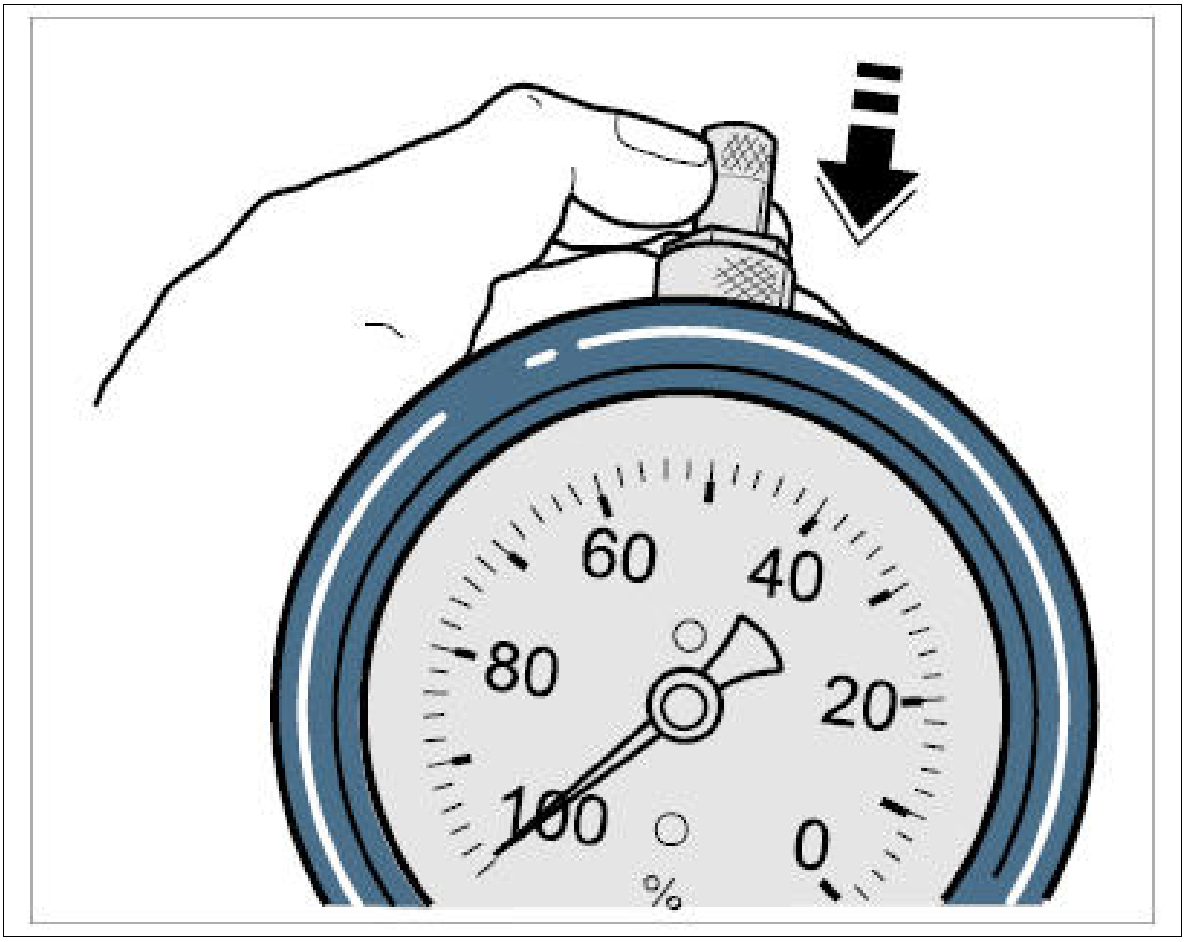
Fig 1: Adjusting Test Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Connect the pressure loss tester to the compressed air system.
4. Adjust the scale. To do this, insert the test nozzle at the front into the device.

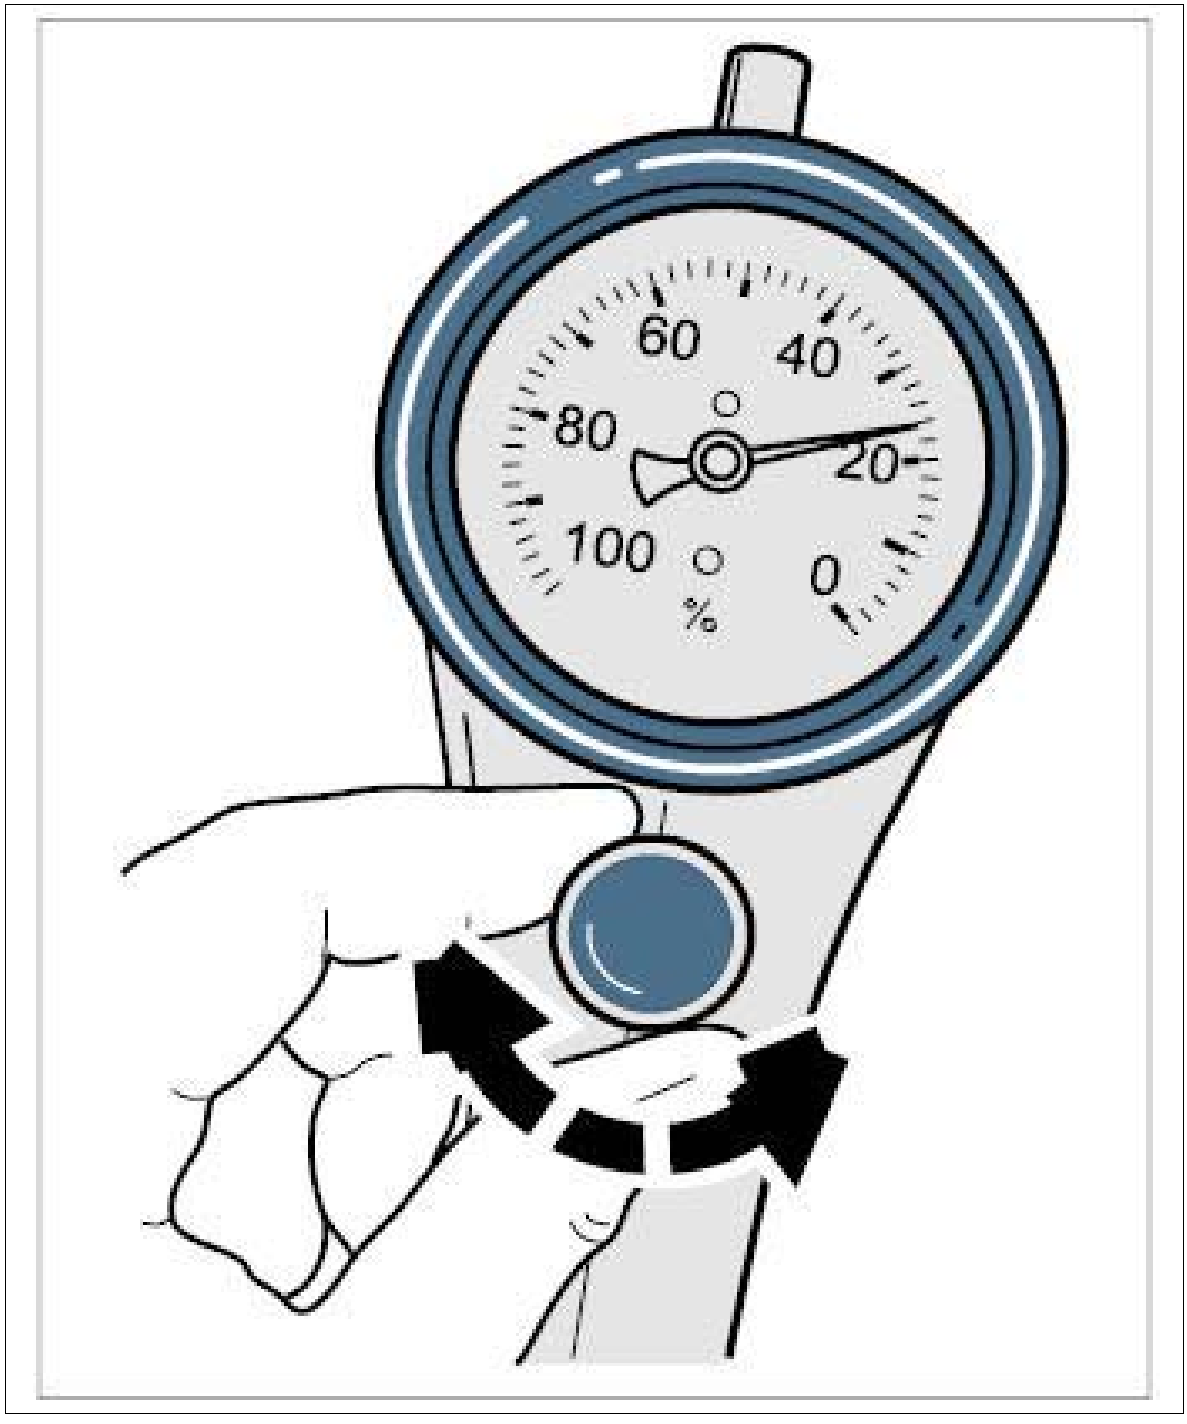
Fig 2: Adjusting Scale



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Turn the adjusting wheel until the scale pointer is at the "cal." marking or "23%". The pressure is then equal in the two test chambers of the tool.

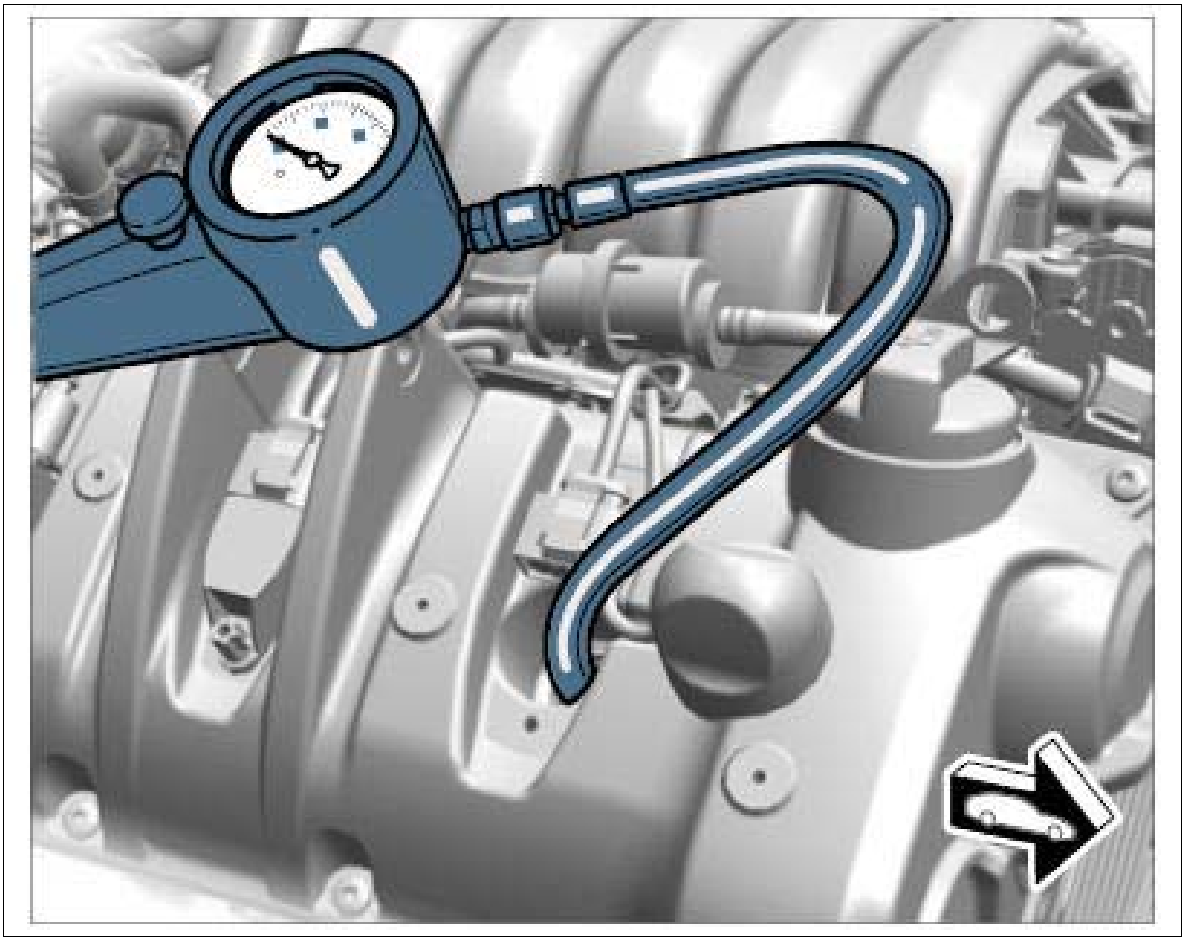
Fig 3: Adjusting Wheel



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Remove test nozzle and check that the pointer falls back. Then connect the test hose. The value that is displayed should not be greater than 25%. If the loss in pressure is greater, it is safe to assume that the engine needs an overhaul.

Fig 4: Checking Pressure Loss



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Interrupt the compressed air supply and unscrew the test hose.
8. Check the next cylinder by turning the crankshaft through another 180° and check the next cylinder in the firing order following the instructions provided.

Firing order: 1 - 3 - 4- 2

WM 101802 PRESSURE LOSS TEST (MACAN) > SUBSEQUENT WORK

1. Remove the test hose once the test is complete.
2. Fit all spark plugs. → 287020 REMOVING AND INSTALLING SPARK PLUGS

WM 103519 REMOVING AND INSTALLING ENGINE MOUNT (MACAN) > PRELIMINARY WORK

1. Remove front wheel. → 440519 REMOVING AND INSTALLING WHEEL
2. Remove front wheel housing liner. → 505619 REMOVING AND INSTALLING FRONT WHEEL

HOUSING LINER

3. Remove underbody panelling. → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY

4. Support the engine on the body. → 1001IN SUPPORTING ENGINE ON THE BODY (ENGINE SAFETY DEVICE)

WM 103519 REMOVING AND INSTALLING ENGINE MOUNT (MACAN) > REMOVING ENGINE MOUNT

WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

Information

- This work can only be performed when the engine has been suspended on the body.

Information

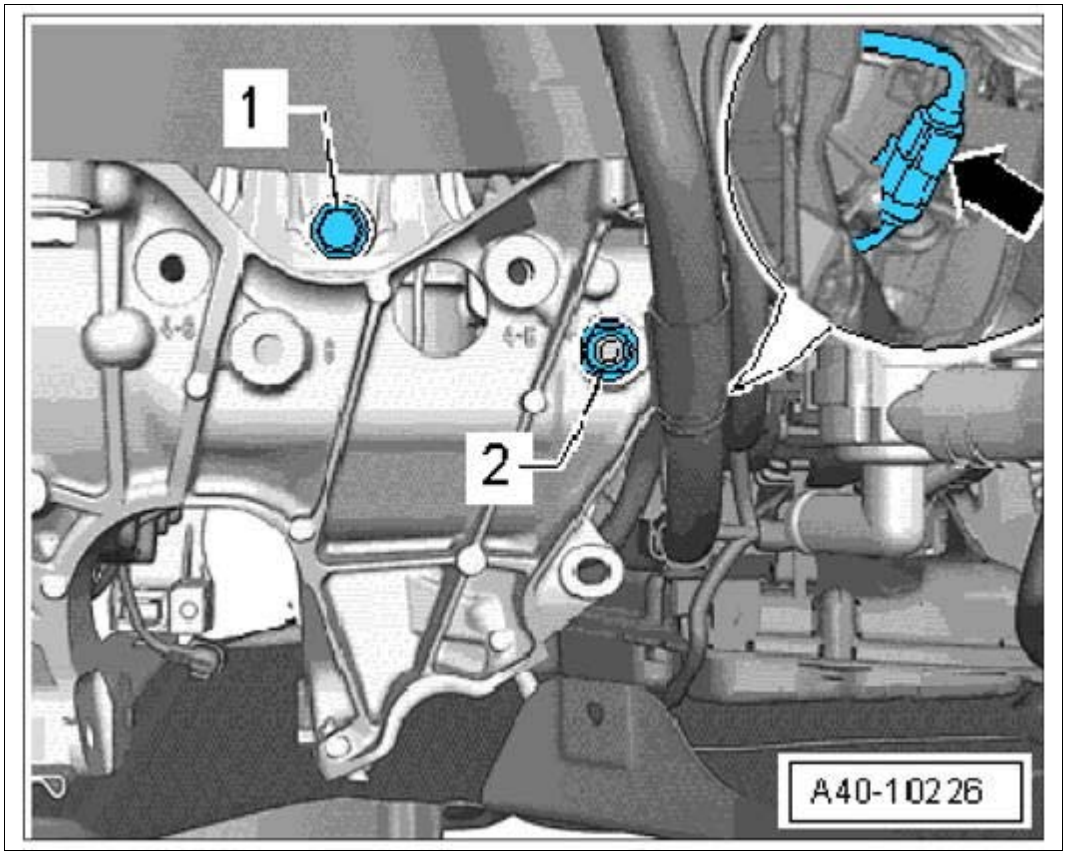
- The engine mounts must be replaced only in pairs.
- If an engine mount is defective, the heat shield must also be replaced.

Information

The procedure for removing and installing is described for one side as an example. The procedure for the other side is practically identical.

1. Pre-tension the engine with the support bracket.
2. Expose electric wire harness.
    1. 2.1. Disconnect electric plug connection **-arrow-** and move it aside.

Fig 1: Locating Electric Plug Connection

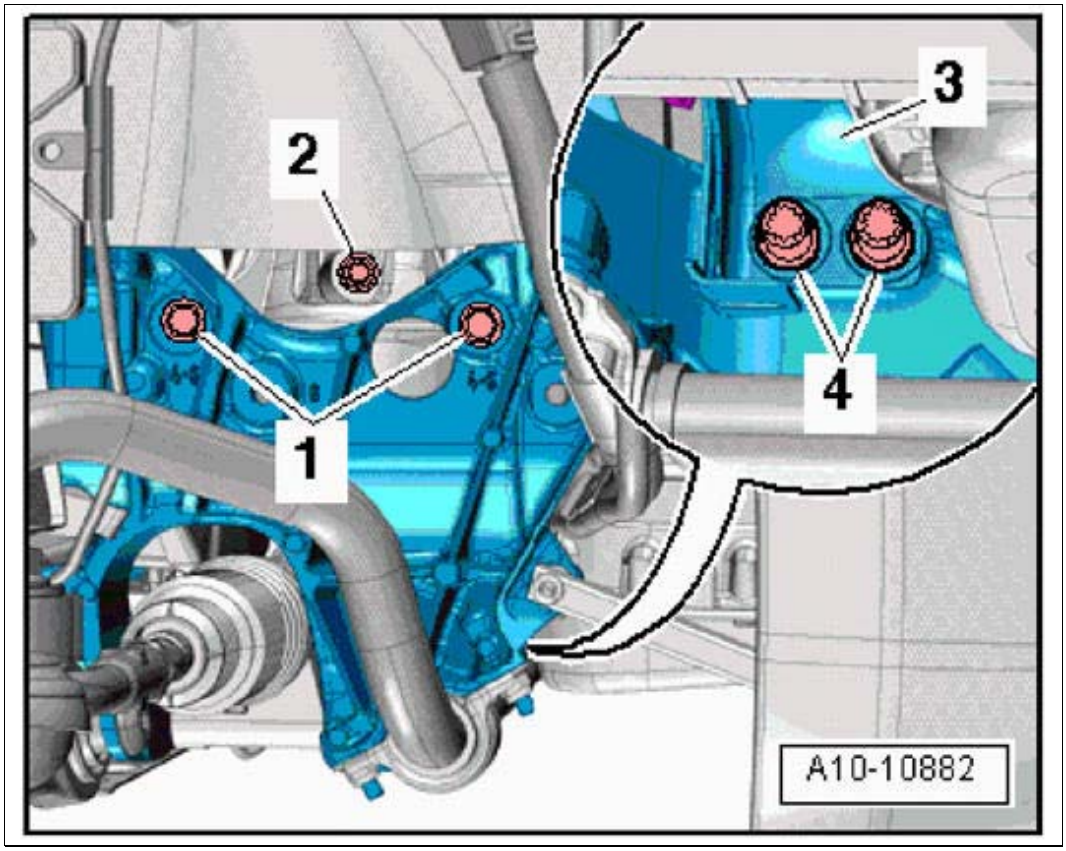


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Expose engine mount.

    1. 3.1. Unscrew fastening screws **-4-** .
    2. 3.2. Unscrew fastening screws **-1-** .
    3. 3.3. Move retainer plate **-3-** aside.
    4. 3.4. Unscrew fastening screw **-2-** .

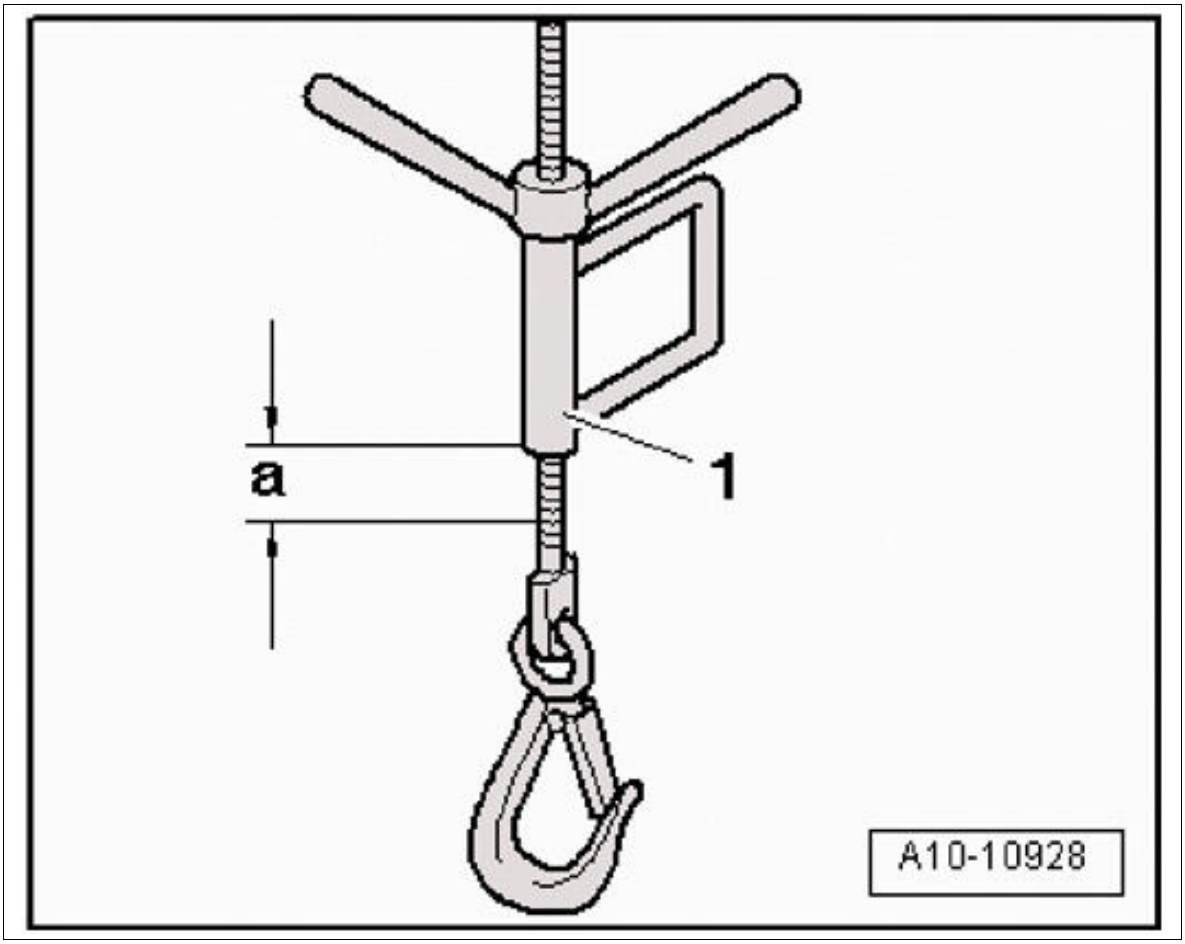
Fig 2: Identifying Engine Mount Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Raise the engine at the spindle **-1-** by about 20 mm.

Fig 3: Identifying Spindle Dimension



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove engine mount with retainer plate.

WM 103519 REMOVING AND INSTALLING ENGINE MOUNT (MACAN) > INSTALLING ENGINE MOUNT

WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

Information

- This work can only be performed when the engine has been suspended on the body.

Information

- The engine mounts must be replaced only in pairs.

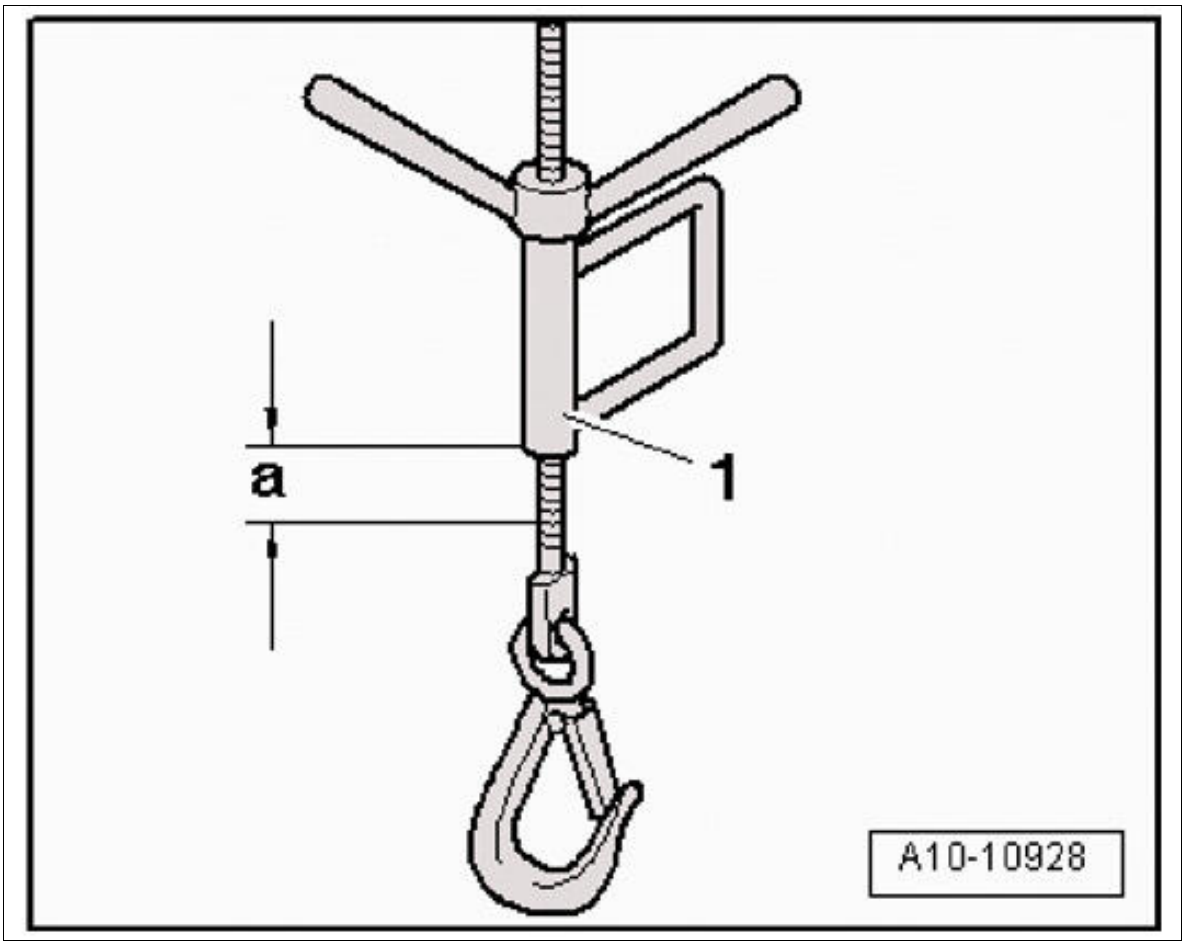
- If an engine mount is defective, the heat shield must also be replaced.

Information

The procedure for removing and installing is described for one side as an example. The procedure for the other side is practically identical.

1. Position engine mount with holder.
2. Lower the engine on the spindle by approx. 20 mm again.

   Fig 1: Identifying Spindle Dimension



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Secure engine mount.
   1. 3.1. Fit fastening screw **-2-** by hand and screw in as far as it will go.
   2. 3.2. Fit fastening screws **-1-** by hand and screw in as far as they will go.
   3. 3.3. Fit fastening screws **-4-** by hand and screw in as far as they will go.
   4. 3.4. Tighten fastening screw **-2-** .

      Step 1

      Step 2

5. 3.5. Tighten fastening screws **-1-** .
6. 3.6. Tighten fastening screws **-4-** .

Fig 2: Identifying Engine Mount And Screws

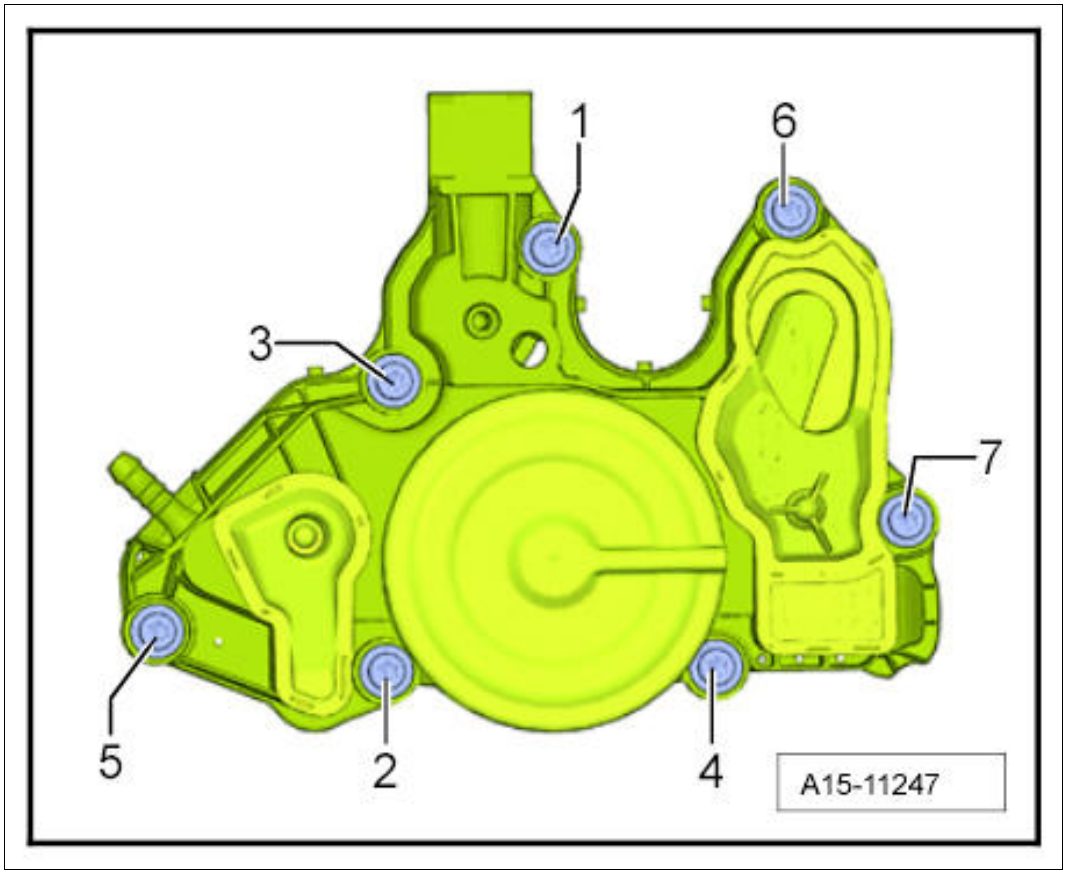
WM 105519 REMOVING AND INSTALLING OIL SEPARATOR (MACAN) > INSTALLING > INSTALLING OIL SEPARATOR

1. Fit oil separator. **Replace seal** .
2. Secure oil separator.
    1. 2.1. Screw in screws by hand and tighten one after the other. **Tightening torque: 9 Nm (6.5 ftlb.)**

Fig 1: Oil Separator Screws Tightening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 105519 REMOVING AND INSTALLING OIL SEPARATOR (MACAN) > SUBSEQUENT WORK

1. Fit positive crankcase ventilation hose on the oil separator and screw in fastening screw. **Tightening torque: 4 Nm (3 ftlb.) Replace seals**
2. Fit hose from solenoid valve for carbon canister and tighten hose clamp.
3. Install ignition coils for cylinders 3 and 4. → INSTALLING IGNITION COILS

WM 131020 REMOVING AND INSTALLING PISTONS (MACAN) > TOOLS

Designation	Type	Number	Description	
piston-ring restraining strap	Commercially available tool	Nr.57		
piston ring pliers	Commercially available tool	Nr.58		drift	VW tool	VW 222 A		
WM 131020 REMOVING AND INSTALLING PISTONS (MACAN) > PRELIMINARY WORK

1. Remove engine. → Removing engine

2. Secure engine to assembly support. → 1001IN SECURING ENGINE TO ASSEMBLY SUPPORT (MOUNTING BRACKET)
3. Remove cylinder head. → Removing cylinder head
4. Remove oil pan. → Removing lower part of oil pan

WM 131020 REMOVING AND INSTALLING PISTONS (MACAN) > REMOVING PISTONS

1. Mark installation position of the piston and its allocation to the relevant cylinder.

   Installation position: Arrow on piston crown is pointing to the pulley.
2. Mark installation position of the connecting rod and its allocation to the relevant cylinder.
3. Remove connecting-rod bearing cap and pull piston with connecting rod up and out.
4. Remove circlips from the piston pin eye.

   Information

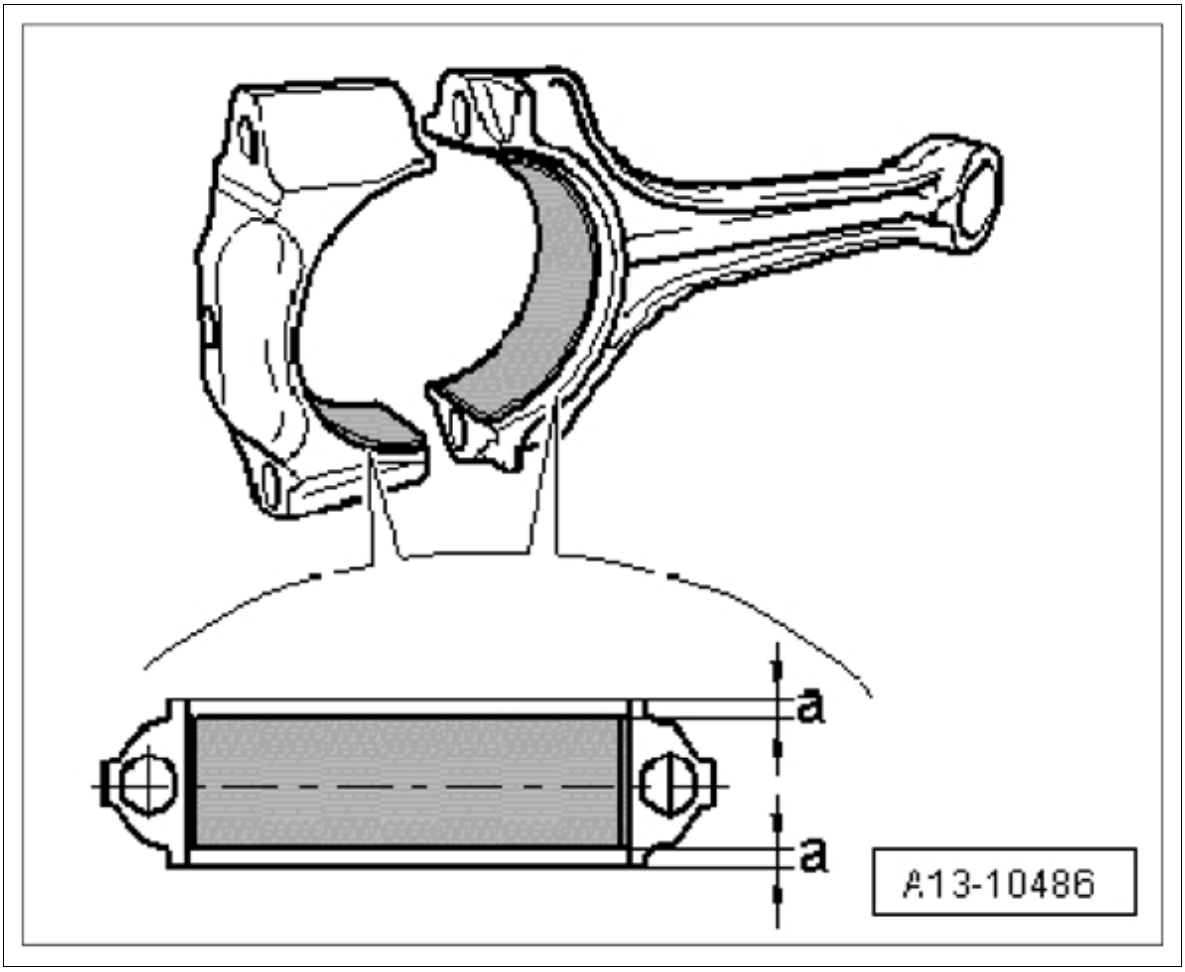
   1. If the piston pin is stiff, heat the piston to arround 60 °C (140°F).
5. Drive out piston pin using **drift VW 222 A.**

WM 131020 REMOVING AND INSTALLING PISTONS (MACAN) > INSTALLING PISTONS

1. Fit piston pin using **drift VW 222 A.**
2. **Fit new** circlips in the piston pin eye.
3. Install piston rings offset by 120° using **piston ring pliers Nr.58.**
4. Insert bearing shells into the connecting rod and connecting-rod bearing cap. **Do not mix up worn bearing shells.**

   Dimension **-a-** must be the same at the left and right.

Fig 1: Identifying Bearing Shell Position



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Oil the running surfaces of the bearing shells.
6. Install piston using **piston-ring restraining strap Nr.57.**

   Check installation position: Arrow on piston crown is pointing to the pulley.
7. Install connecting-rod bearing cap with **new** fastening screws.

   Check installation position.

   Step 1:

   Step 2:

WM 131020 REMOVING AND INSTALLING PISTONS (MACAN) > SUBSEQUENT WORK

1. Install oil pan. → Installing
2. Install cylinder head. → Installing cylinder head

WM 135919 REMOVING AND INSTALLING CRANKSHAFT-FLYWHEEL SEALING RING (MACAN) > TOOLS

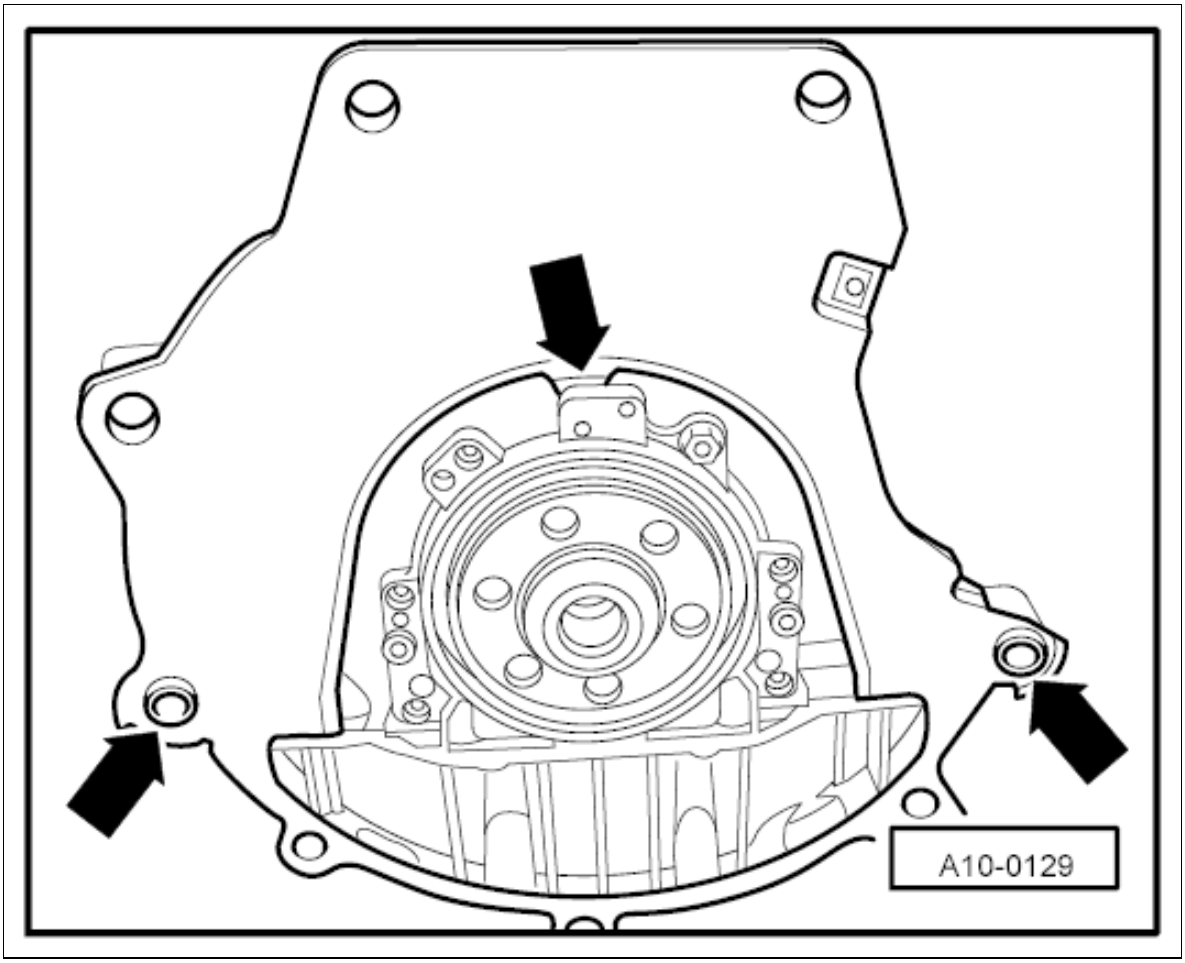
Designation	Type	Number	Description	
Assembly sleeve	VW tool	T20097		
WM 135919 REMOVING AND INSTALLING CRANKSHAFT-FLYWHEEL SEALING RING (MACAN) > PRELIMINARY WORK

1. Remove transmission. → WM 373455 REPLACING PORSCHE DOPPELKUPPLUNG (PDK)
2. Remove flywheel. → Removing Flywheel

WM 135919 REMOVING AND INSTALLING CRANKSHAFT-FLYWHEEL SEALING RING (MACAN) > REMOVING CRANKSHAFT-FLYWHEEL SEALING RING

1. Disengage intermediate plate on the sealing ring and on the dowel sleeves **-arrows-** .

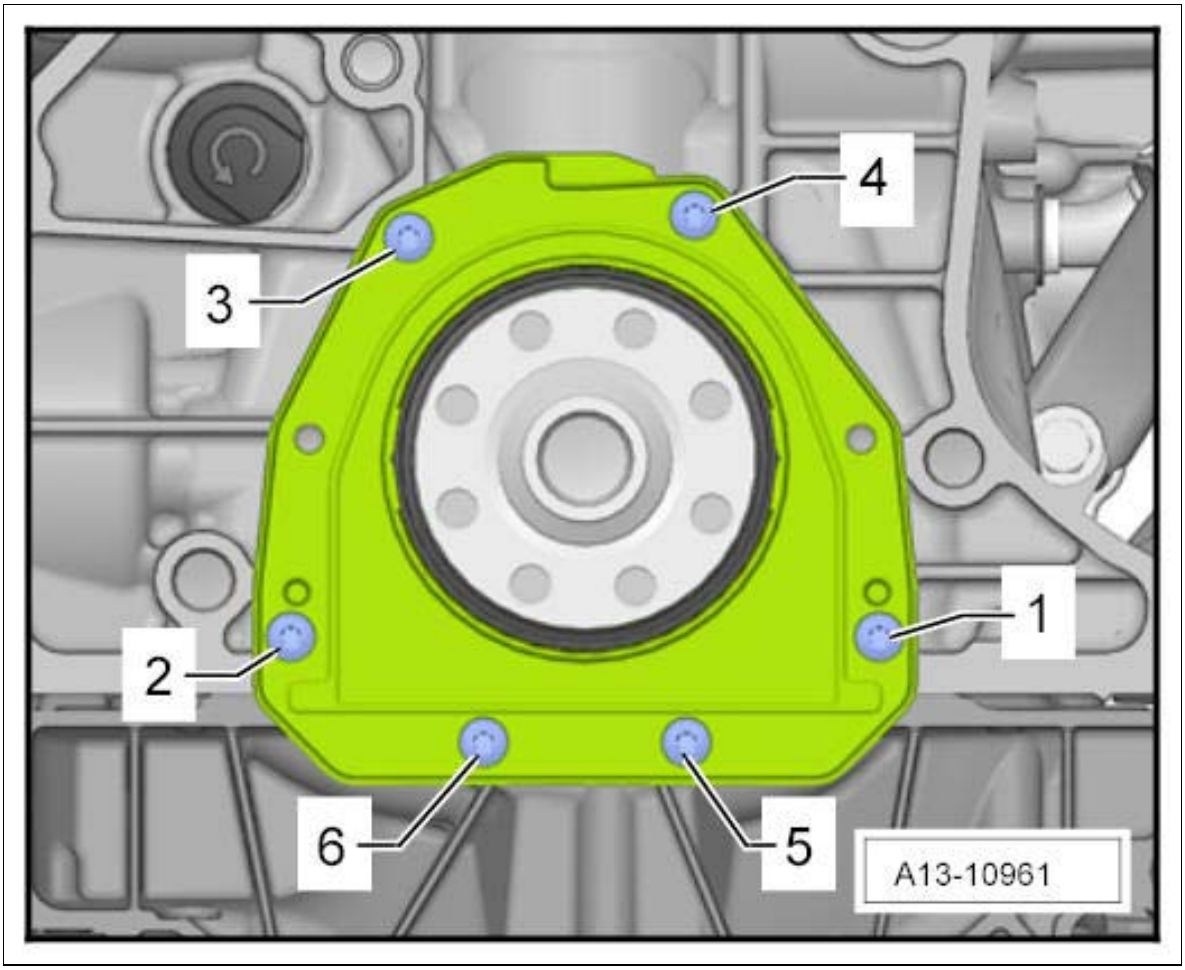
Fig 1: Locating Crankshaft/Flywheel Sealing Ring Intermediate Plate



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Unscrew fastening screws **-1...6-** .

Fig 2: Crankshaft/Flywheel Sealing Ring Screws Loosening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove sealing ring.

WM 135919 REMOVING AND INSTALLING CRANKSHAFT-FLYWHEEL SEALING RING (MACAN) > INSTALLING CRANKSHAFT-FLYWHEEL SEALING RING

Information

After fitting the sealing ring, leave the silicone sealant to dry for 30 minutes.

Engine oil must not be filled in until the sealing compound has been allowed to dry for the specified time.

1. Remove sealant residue on the cylinder block using a scraper.
2. Clean sealing faces to remove any oil and grease.
3. Cut off the nozzle on the tube at the front marking. (The nozzle diameter is approx. 2 mm).

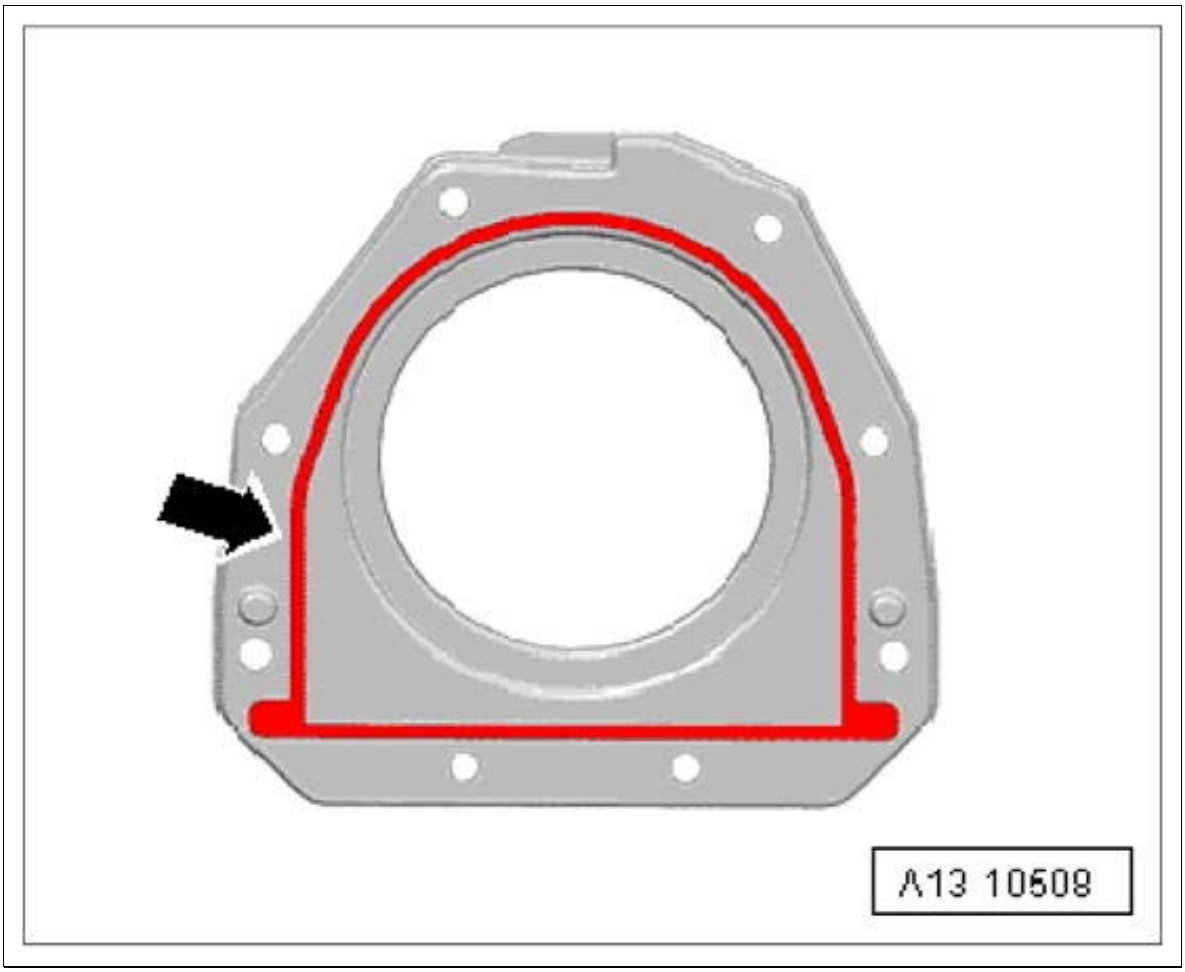
   Information

   The sealing ring must be fitted within 5 minutes of applying the silicone sealant.

4. Apply silicone sealant to the clean sealing face. → Applying sealant

   Sealant bead thickness: 2...3 mm.

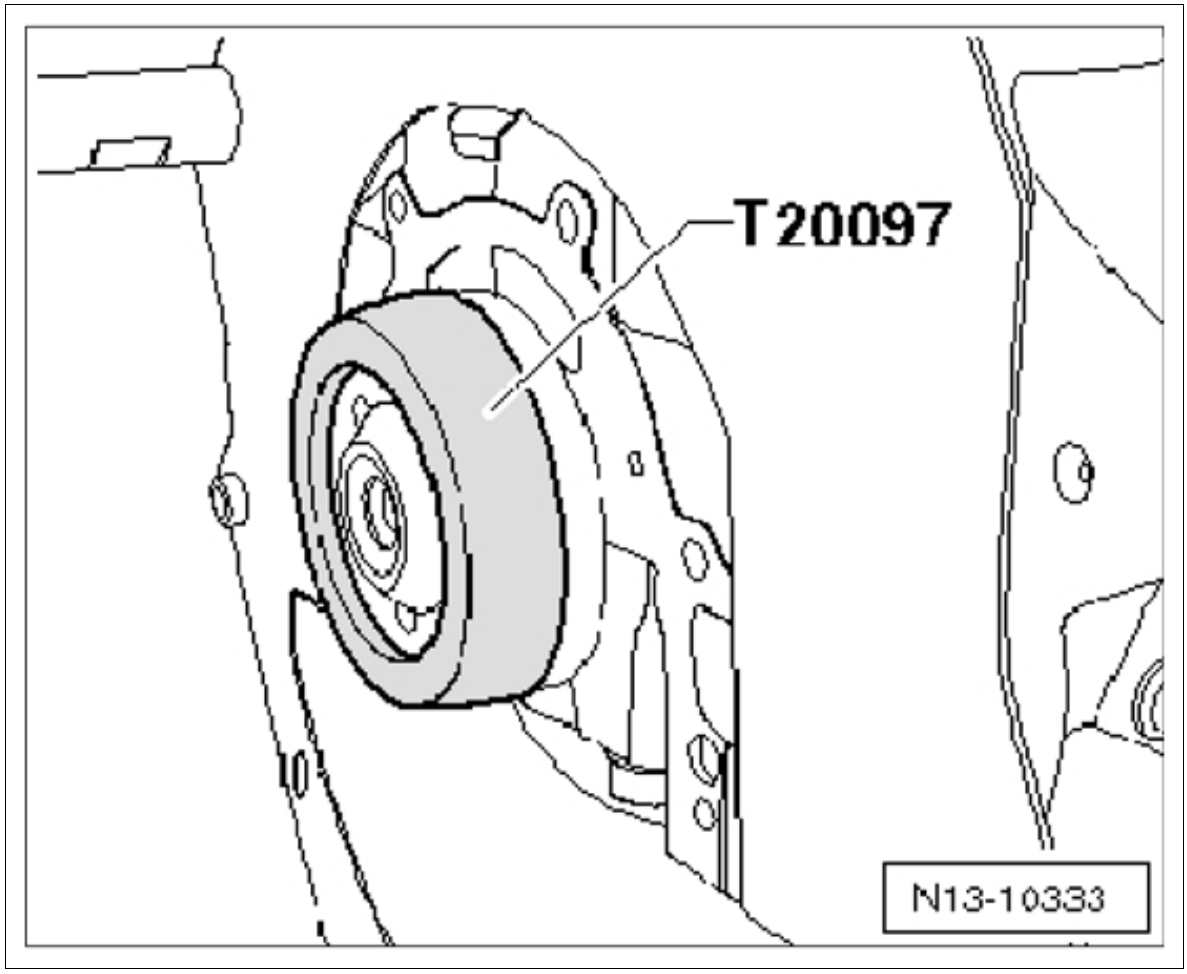
   Fig 1: Locating Sealant Applying Area



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. **Assembly sleeve T20097** must now be fitted on the crankshaft journal. → Assembly sleeve on crankshaft journal

Fig 2: Installing Assembly Sleeve On Crankshaft Journal



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

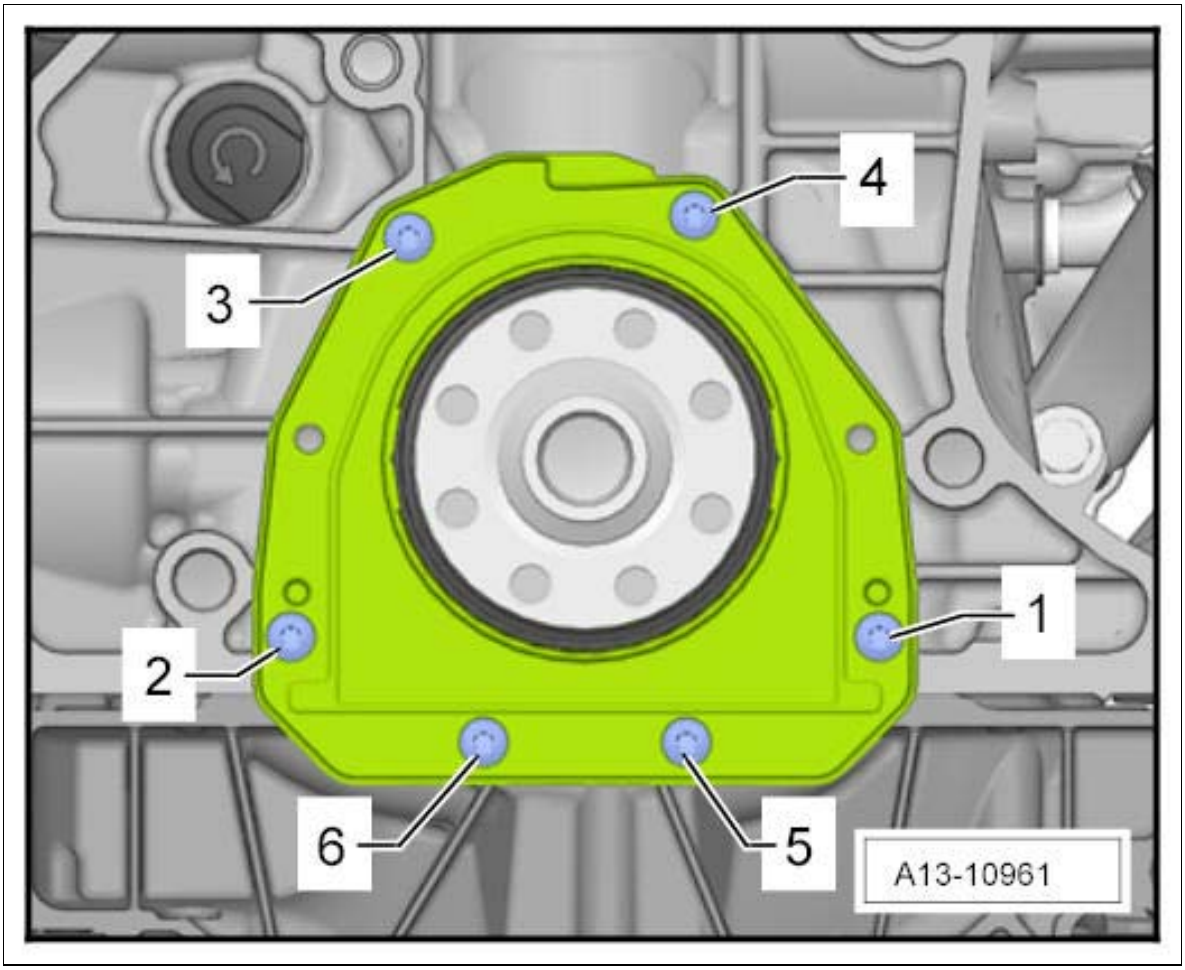
6. Slide the sealing ring onto the crankshaft journal using **assembly sleeve T20097** and fit and tighten **new** fastening screws.

   Observe tightening sequence **-1...6-** .

   Step 1: Screw in as far as it will go by hand.

   Step 2:

Fig 3: Crankshaft/Flywheel Sealing Ring Screw Tightening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. **Assembly sleeve T20097** must now be removed.
8. Engage intermediate plate on the sealing ring and dowel sleeves **-arrows-** .

counter-hold tool	VW tool	T10355		
WM 137619 REMOVING AND INSTALLING PULLEY (MACAN) > PRELIMINARY WORK

1. Remove engine cover (design cover).
2. Remove cover for front underbody. → Removing cover for front underbody
3. Remove drive belt. → Removing Drive Belt

WM 137619 REMOVING AND INSTALLING PULLEY (MACAN) > REMOVING PULLEY

NOTE: Incorrect handling of tools

- *Risk of damage to the body*

→ Only use tools approved by Porsche.

→ Always ensure that the tool is seated correctly.

→ Protect the body and interior of the vehicle from damage with protective covers.

→ Cover delicate components with cardboard or sheetmetal panels.

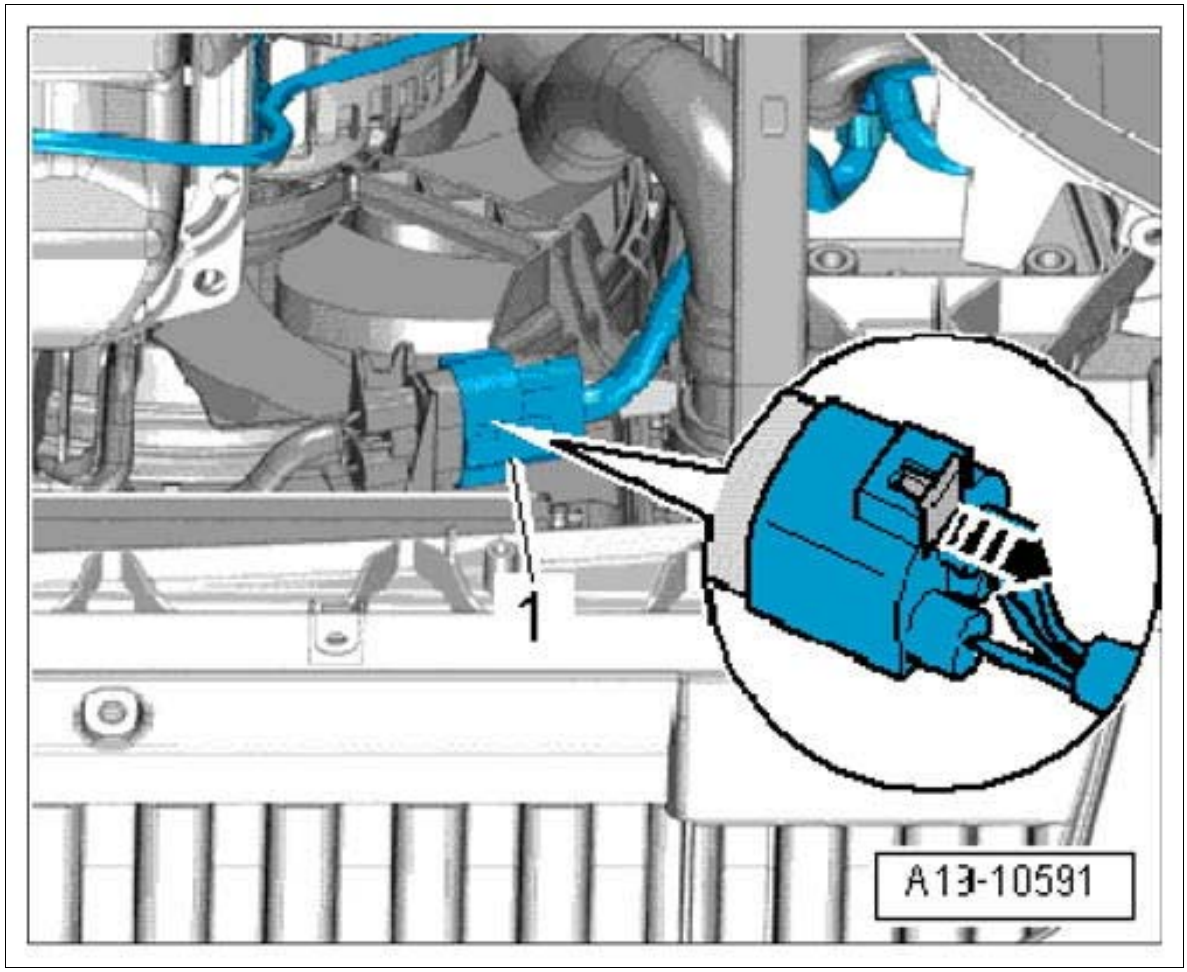
Information

- Risk of irreparable damage to engine

When the pulley is removed, do not turn the crankshaft out of "TDC" position as this will adjust the timing.

1. Disconnect electric plug connection **-1-** and detach line.

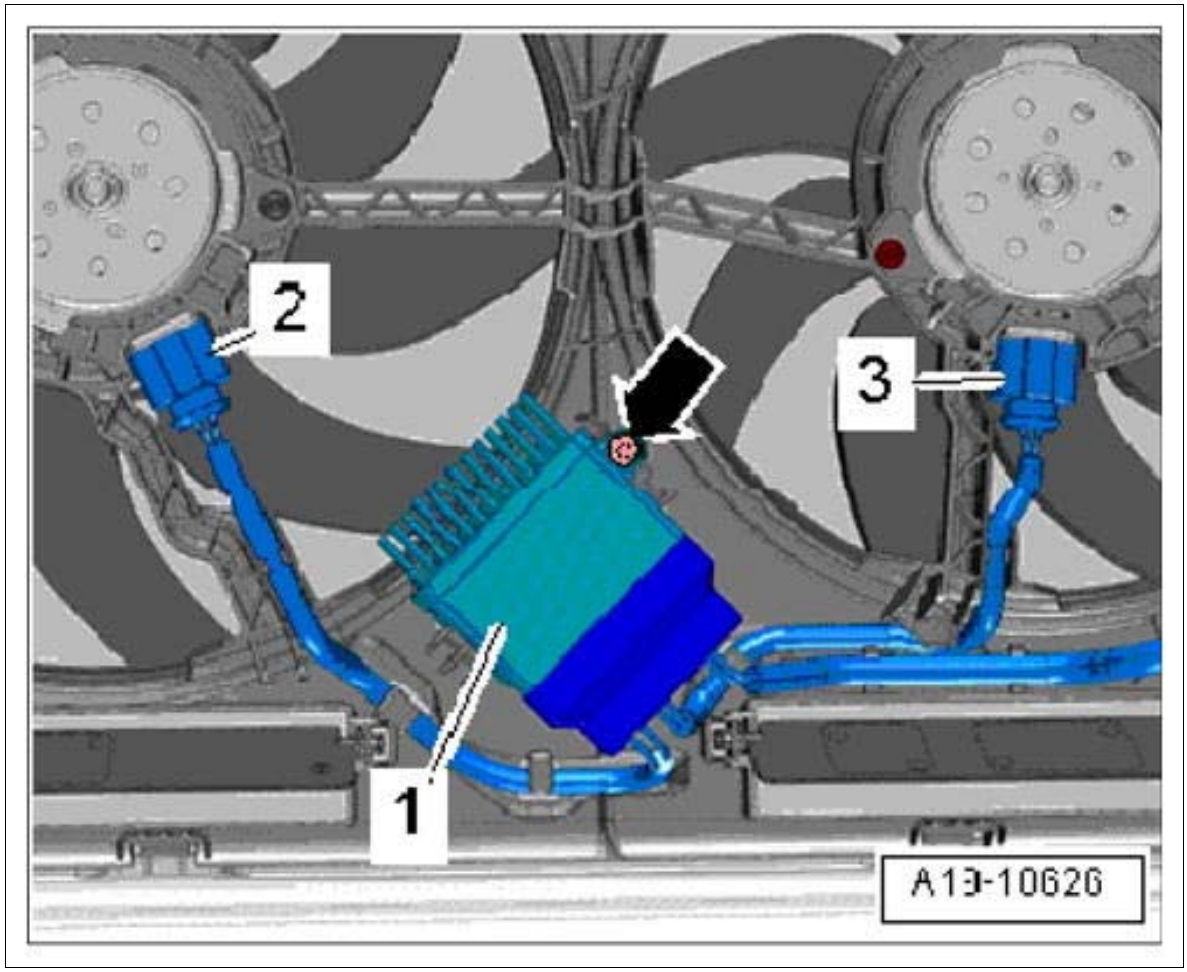
Fig 1: Disconnect Fan Control Unit Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Disconnect electric plug connections **-2 and 3-** and unscrew fastening screw **-arrow-** .

Fig 2: Locating Fan Control Unit Screw

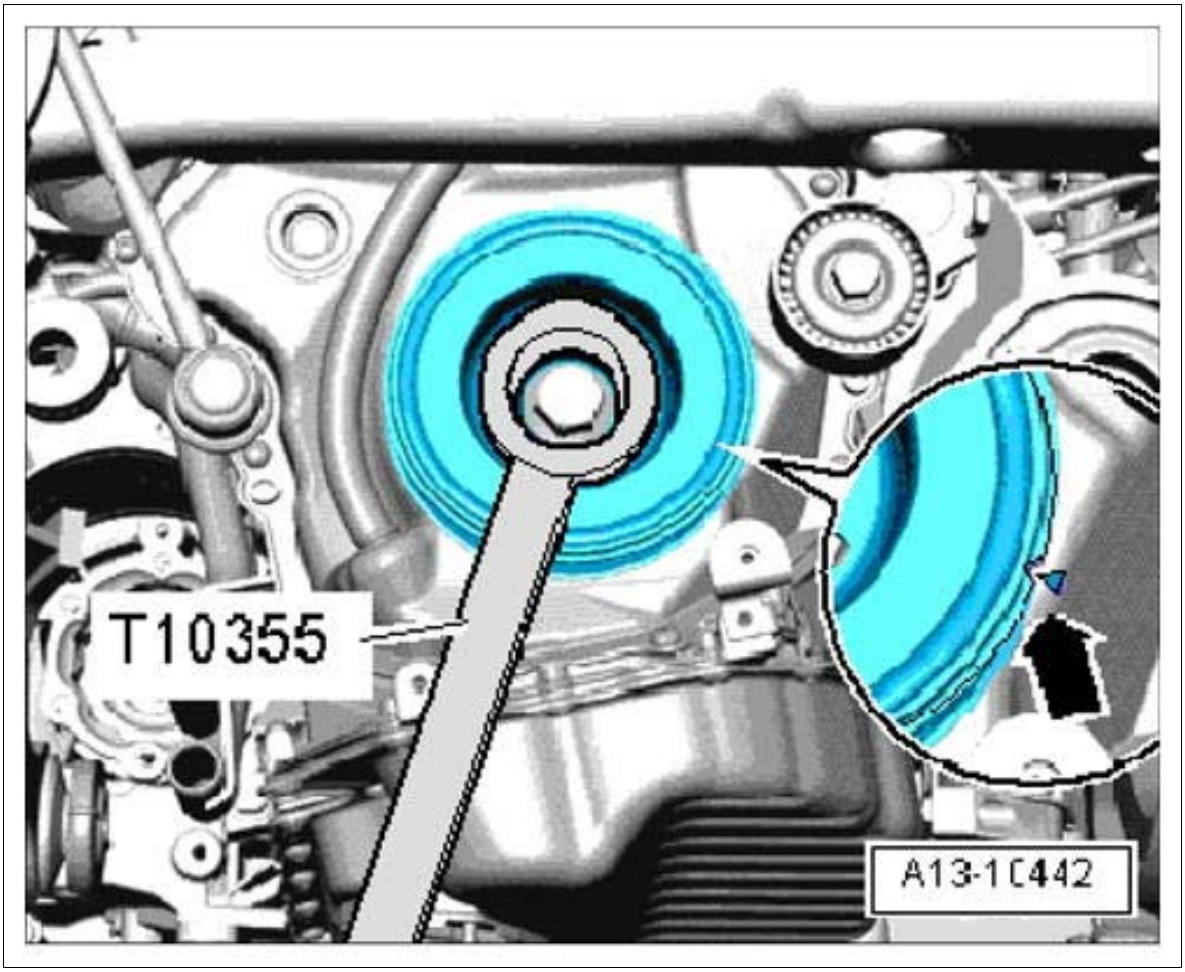


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove control unit for fan.
4. Use **counter-hold tool T10355** to turn the pulley to **TDC** position.

   The notch on the pulley and the marking on the chain housing cover must be opposite each other. → TDC marking on pulley

Fig 3: Turning Pulley To TDC Marking



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Unscrew fastening screw for the pulley.

   Counter the pulley using counter-hold tool T10355.

WM 137619 REMOVING AND INSTALLING PULLEY (MACAN) > INSTALLING PULLEY

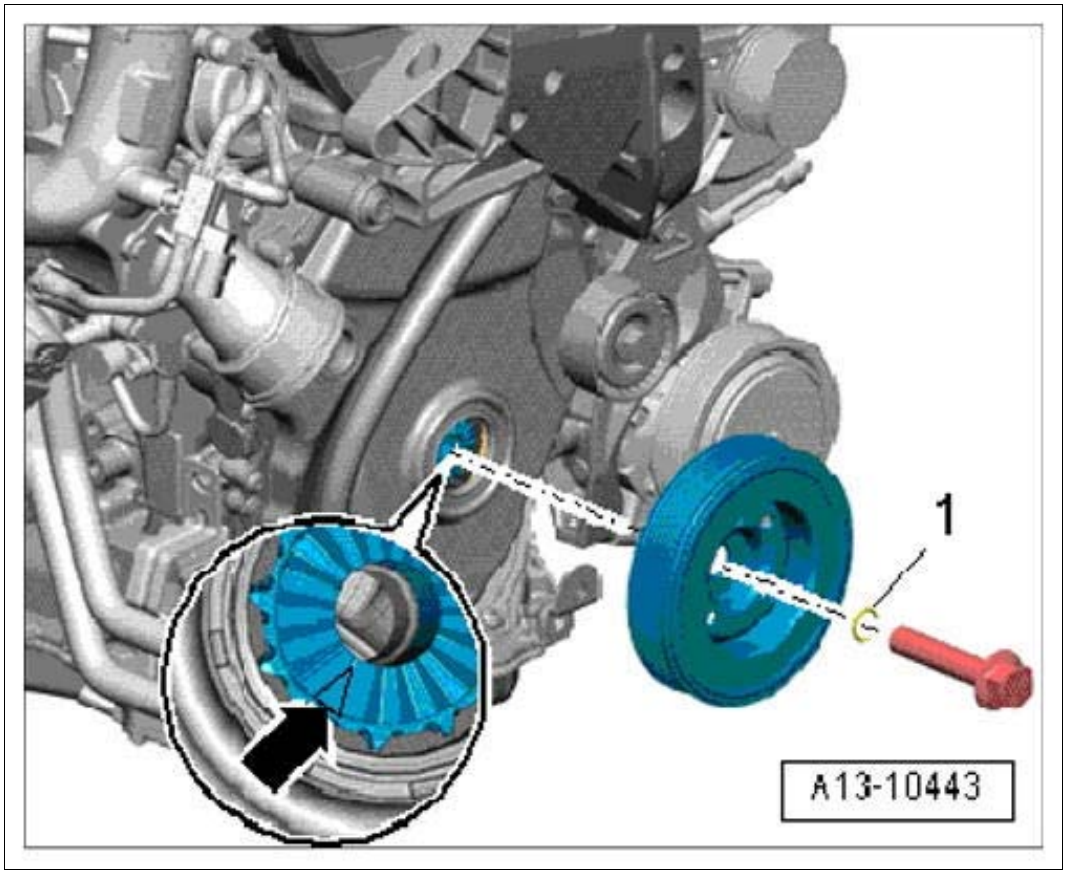
1. Coat sealing lip on the shaft sealing ring with engine oil.
2. Install pulley.
    1. 2.1. Position pulley.

       Check tooth contour -arrow -.
    2. 2.2. **Fit a new** fastening screw.

       The fastening screw is supplied with a new O-ring **-1-** .

       Coat O-ring with engine oil before fitting it.

Fig 1: Installing Pulley



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Counter the pulley with **counter-hold tool T10355** and tighten fastening screw.

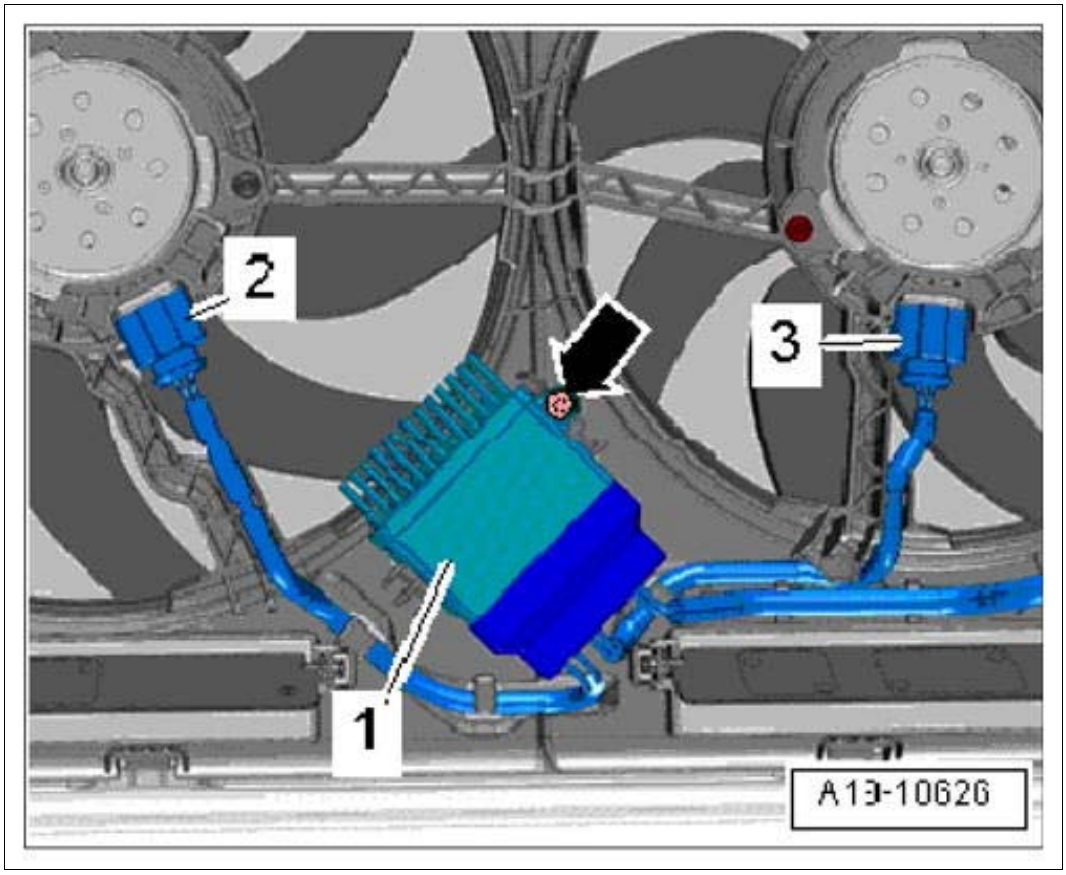
   Step 1:

   Step 2:

4. Install control unit for fan.

   1. 4.1. Position control unit **-1-** and fit and tighten fastening screw **-arrow-** .
   2. 4.2. Connect electric plug connections **-2 and 3-** .

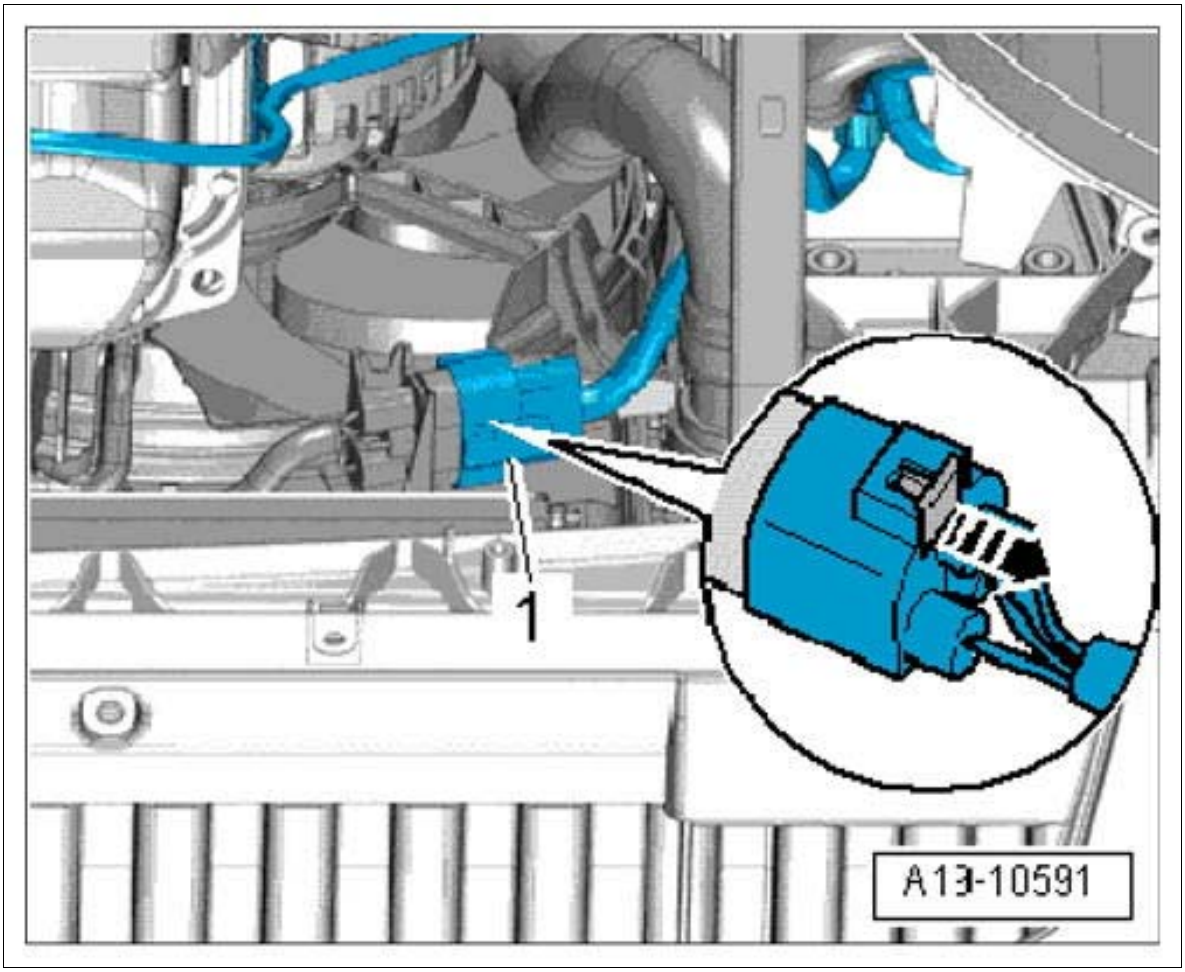
Fig 2: Locating Fan Control Unit Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Connect electric plug connection **-1-** and engage it in the holder.

Fig 3: Connecting Fan Control Unit Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 137619 REMOVING AND INSTALLING PULLEY (MACAN) > SUBSEQUENT WORK

1. Install drive belt. → Installing Drive Belt
2. Install engine cover (design cover).

WM 137801 CHECKING DRIVE BELT (MACAN) > CHECKING DRIVE BELT

NOTE: Drive belt removed incorrectly

- *Risk of damage to drive belt*

→ Only remove the drive belt when it is cold.

→ Replace damaged drive belt.

NOTE: Drive belt breaks and becomes jammed

- *Risk of damage to components (trim panels, electric cables, etc.)*
- *Sealing ring on crankshaft vibration balancer can start to leak*
- *Vibration balancer can overheat and lose its strength*

→ Following belt breakage, check adjacent components and the interior of the engine compartment for damage, and repair or replace damaged parts if necessary.

→ Find out why the belt broke. Check deflection rollers or crankshaft vibration balancer for prior damage.

→ If the drive belt is jammed, replace vibration balancer.

WARNING: Rotating components

- *Danger of limbs being trapped or severed*

→ Disconnect power supply to the drive motor of components or to the battery.

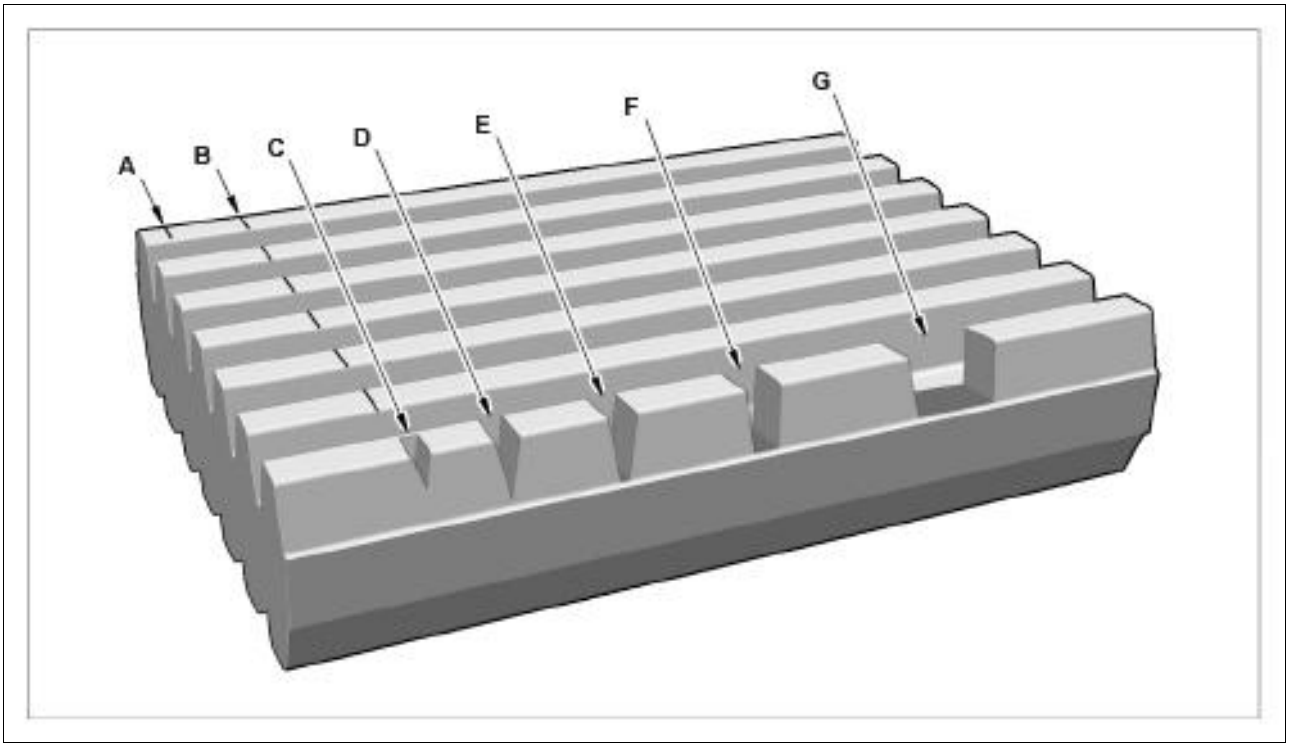
Information

- If spark plugs must be changed in the course of maintenance operations, the drive belt should be checked when the spark plugs are removed. The engine can then be cranked easier.

Information

- The following table indicates damage which necessitates replacement.

Fig 1: Identifying Drive Belts Damage Area



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Item	Type of damage	Explanation
-A-	Slight crack in a rib.	Drive belt is OK.
-B-	Hairline crack that runs across the entire belt width, or the butt seam is damaged.	Replace drive belt.
-C-	Crack running down to half of rib height.	Drive belt must be replaced if there is more than one crack running down to half of rib height.
-D-	Crack running to base of rib	Replace drive belt.
-E-	Crack running to traction cord, or edges so worn that the traction cord becomes visible.	Replace drive belt.
-F-	Rib detachment	Replace drive belt.
-G-	Rib fracture	Replace drive belt.

1. Using chalk, mark the drive belt in the area around the tensioning roller.
2. Turn engine at the vibration damper in rolling direction using a socket wrench until the chalk mark is at the same place again. While turning at the crankshaft, check the drive belt for signs of damage.

WM 137819 REMOVING AND INSTALLING DRIVE BELT (MACAN) > TOOLS

WM 137819 REMOVING AND INSTALLING DRIVE BELT (MACAN) > REMOVING DRIVE BELT

NOTE: Drive belt removed incorrectly

- *Risk of damage to drive belt*

→ Only remove the drive belt when it is cold.

→ Replace damaged drive belt.

NOTE: Drive belt breaks and becomes jammed

- *Risk of damage to components (trim panels, electric cables, etc.)*
- *Sealing ring on crankshaft vibration balancer can start to leak*
- *Vibration balancer can overheat and lose its strength*

→ Following belt breakage, check adjacent components and the interior of the engine compartment for damage, and repair or replace damaged parts if necessary.

→ Find out why the belt broke. Check deflection rollers or crankshaft vibration balancer for prior damage.

→ If the drive belt is jammed, replace vibration balancer.

WARNING: Rotating components

- *Danger of limbs being trapped or severed*

→ Disconnect power supply to the drive motor of components or to the battery.

Information

- Danger of irreparable damage if a previously used drive belt is set to move in the opposite rolling direction.

Before removing the drive belt, mark the rolling direction for re-installation with chalk or a felt-tipped pen.

1. Mark the rolling direction of the drive belt with chalk.
2. Remove drive belt.
    1. 2.1. Turn the belt tensioner in **-direction of arrow-** to relieve tension on the drive belt.
    2. 2.2. Lock the tensioning device using **locking pin T10060 A.**
    3. 2.3. Remove drive belt.

Fig 1: Removing Drive Belt

staking tool	VW tool	**T40267**		
Camshaft clamp	VW tool	**T40271**		
WM 150505 CHECKING AND ADJUSTING CAMSHAFTS (MACAN, MACAN S, MACAN TURBO) > CHECKING CAMSHAFTS

NOTE: Timing not set correctly

- *Risk of engine damage*
- *Rough running engine*
- *Loss of engine power*

→ Do not use force when fitting the staking tool.

→ Make sure that the gap is equal on both sides.

→ When inserting the staking tools, do not use force to turn the camshafts against any resistance.

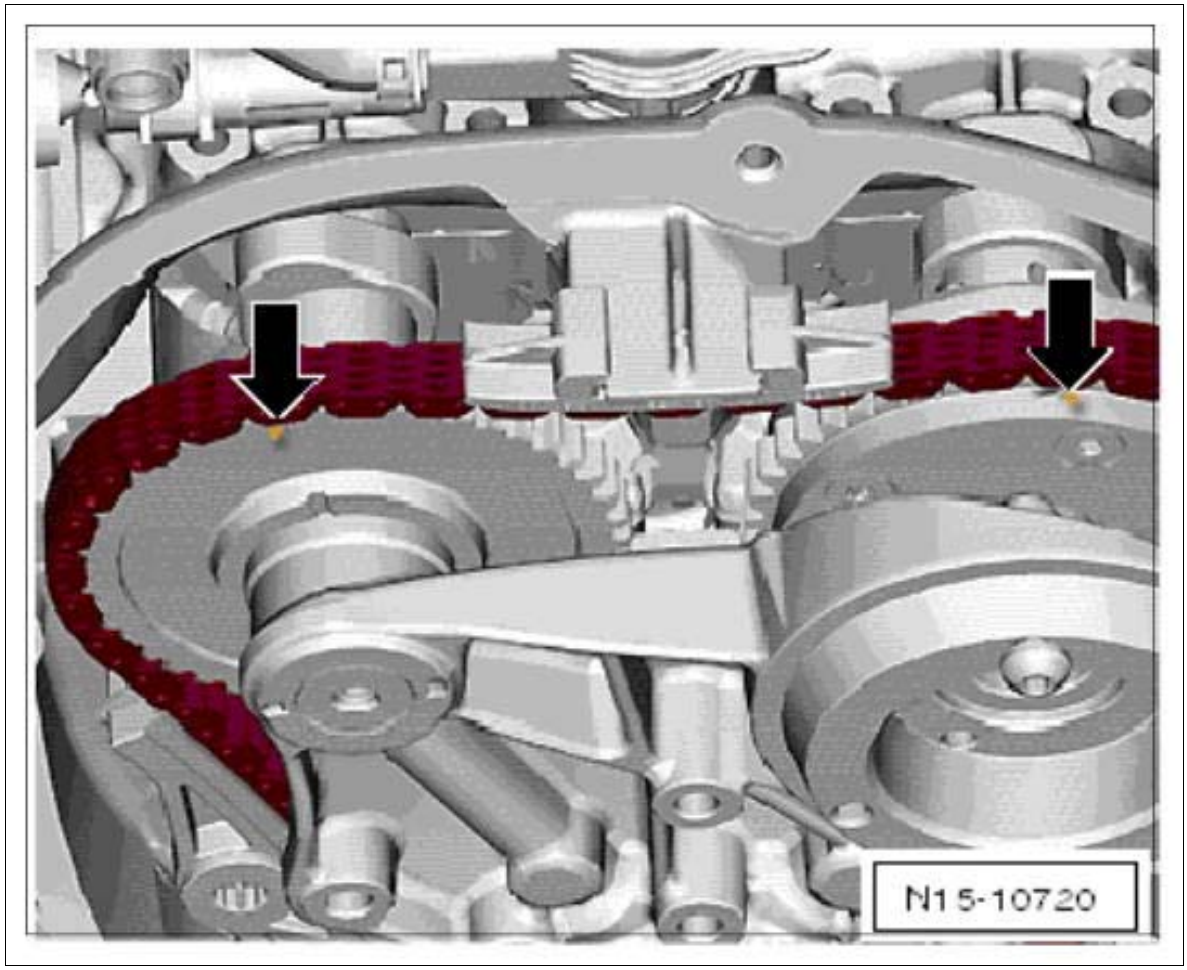
→ The engine must be exactly at top dead center.

→ The opposite cylinder must be at ignition TDC.

1. Remove engine cover (design cover).
2. Remove front underbody cover. → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY
3. Remove upper timing-case cover. → 153319 REMOVING AND INSTALLING TIMING-CASE COVER
4. Use **counter-hold tool T10355** to turn the crankshaft in direction of rotation of the engine until the markings **-arrows-** are at the top.

   Markings on timing chain

Fig 1: Identifying TDC Position Of Cylinder 1



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove spark plug for cylinder 1. → 287020 REMOVING AND INSTALLING SPARK PLUGS
6. Set TDC position of cylinder 1.
    1. 6.1. **Dial gauge adapter T10170 A** must be screwed as far as it will go into the spark plug thread.
    2. 6.2. **Dial gauge Nr.136 Pos.1** with **dial gauge adapter T10170 A** must be inserted as far as it will go and secured with a clamping nut **-arrow-** .

        Information

        If the crankshaft was turned beyond the TDC position, turn the pulley another two turns in **direction of rotation of the engine.**

        Do not turn engine against the direction of rotation of the engine.

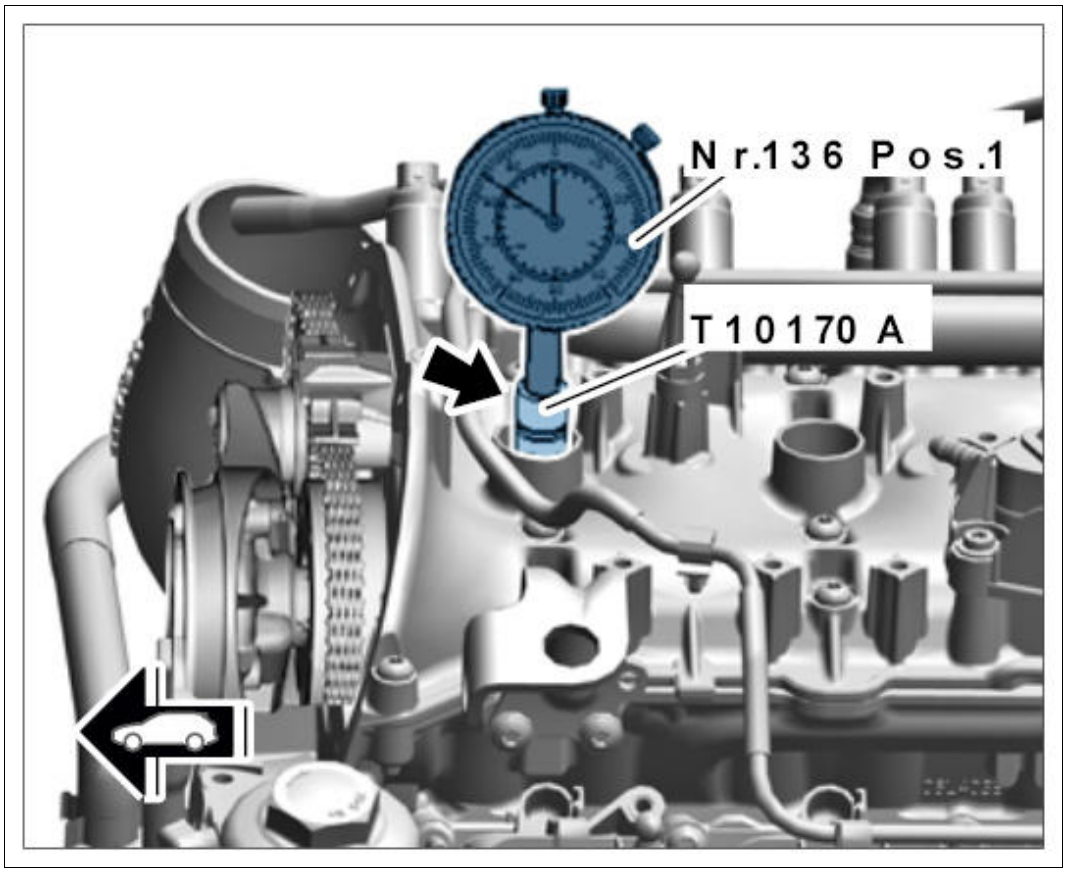
        Information

        Use a ratchet with socket-wrench insert a/f 24 or **counter-hold tool T10355** to turn the pulley.
    3. 6.3. Turn the crankshaft slowly in direction of rotation of the engine until maximum

pointer deflection (reversing point of the pointer) is reached.

4. 6.4. Once maximum pointer deflection is reached, the piston is at top dead center.

Fig 2: Identifying TDC Position Of Cylinder 1

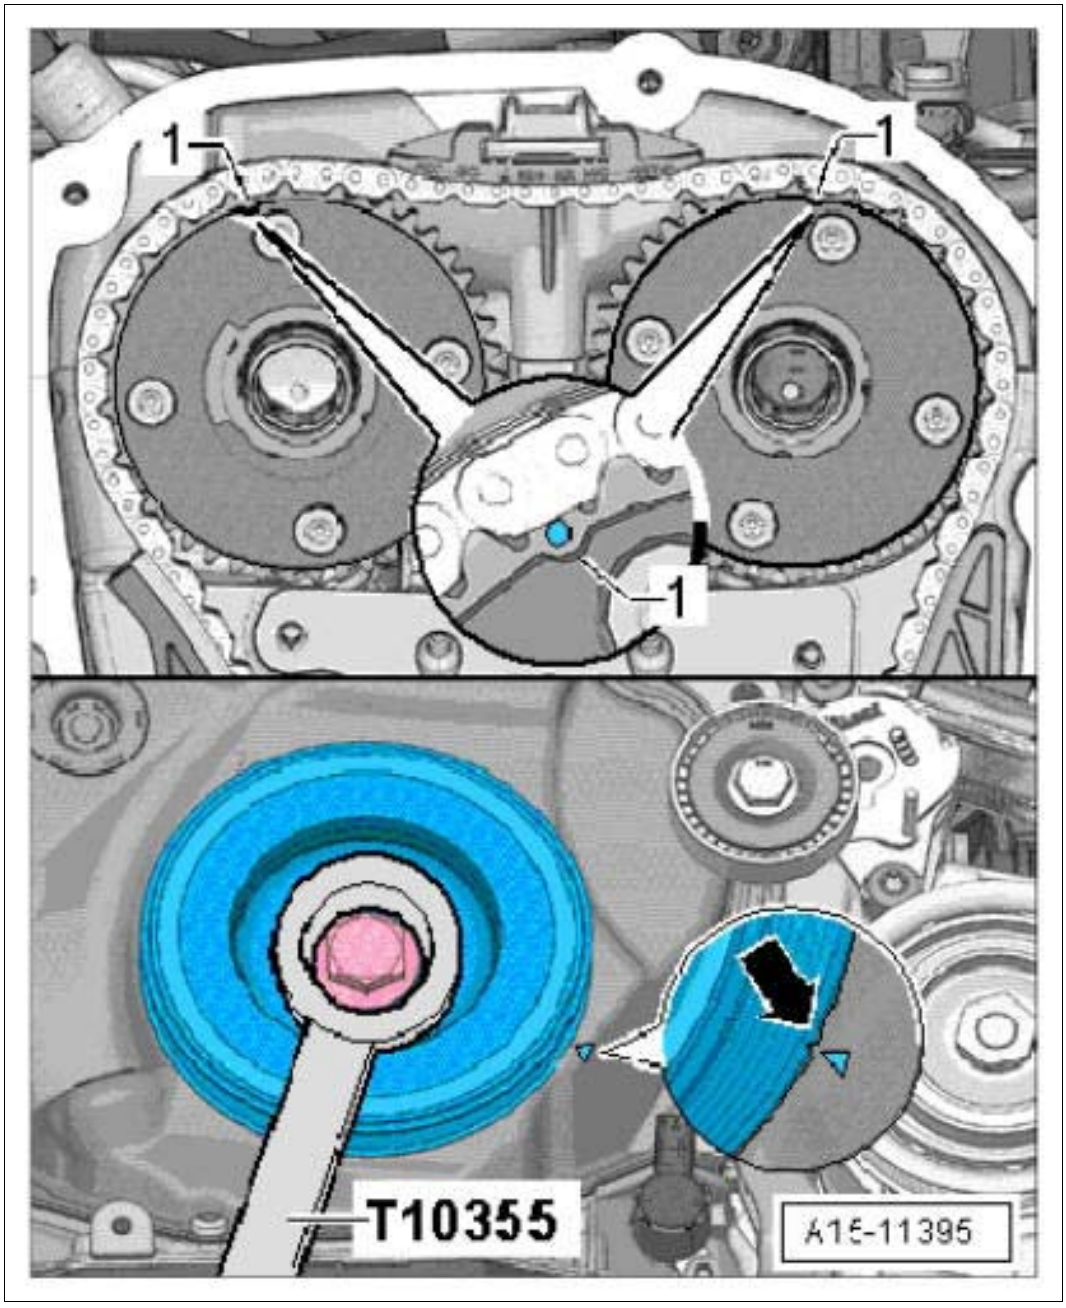


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Check markings.

    1. 7.1. The notch on the pulley and the marking on the lower timing-case cover must be aligned. **-arrow-**
    2. 7.2. The markings **-1-** on the camshaft sprockets must be facing upwards.

Fig 3: Identifying Top Dead Center Markings



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Measure the distance from the edge **-1-** to the marking **-2-** on the outlet camshaft sprocket.

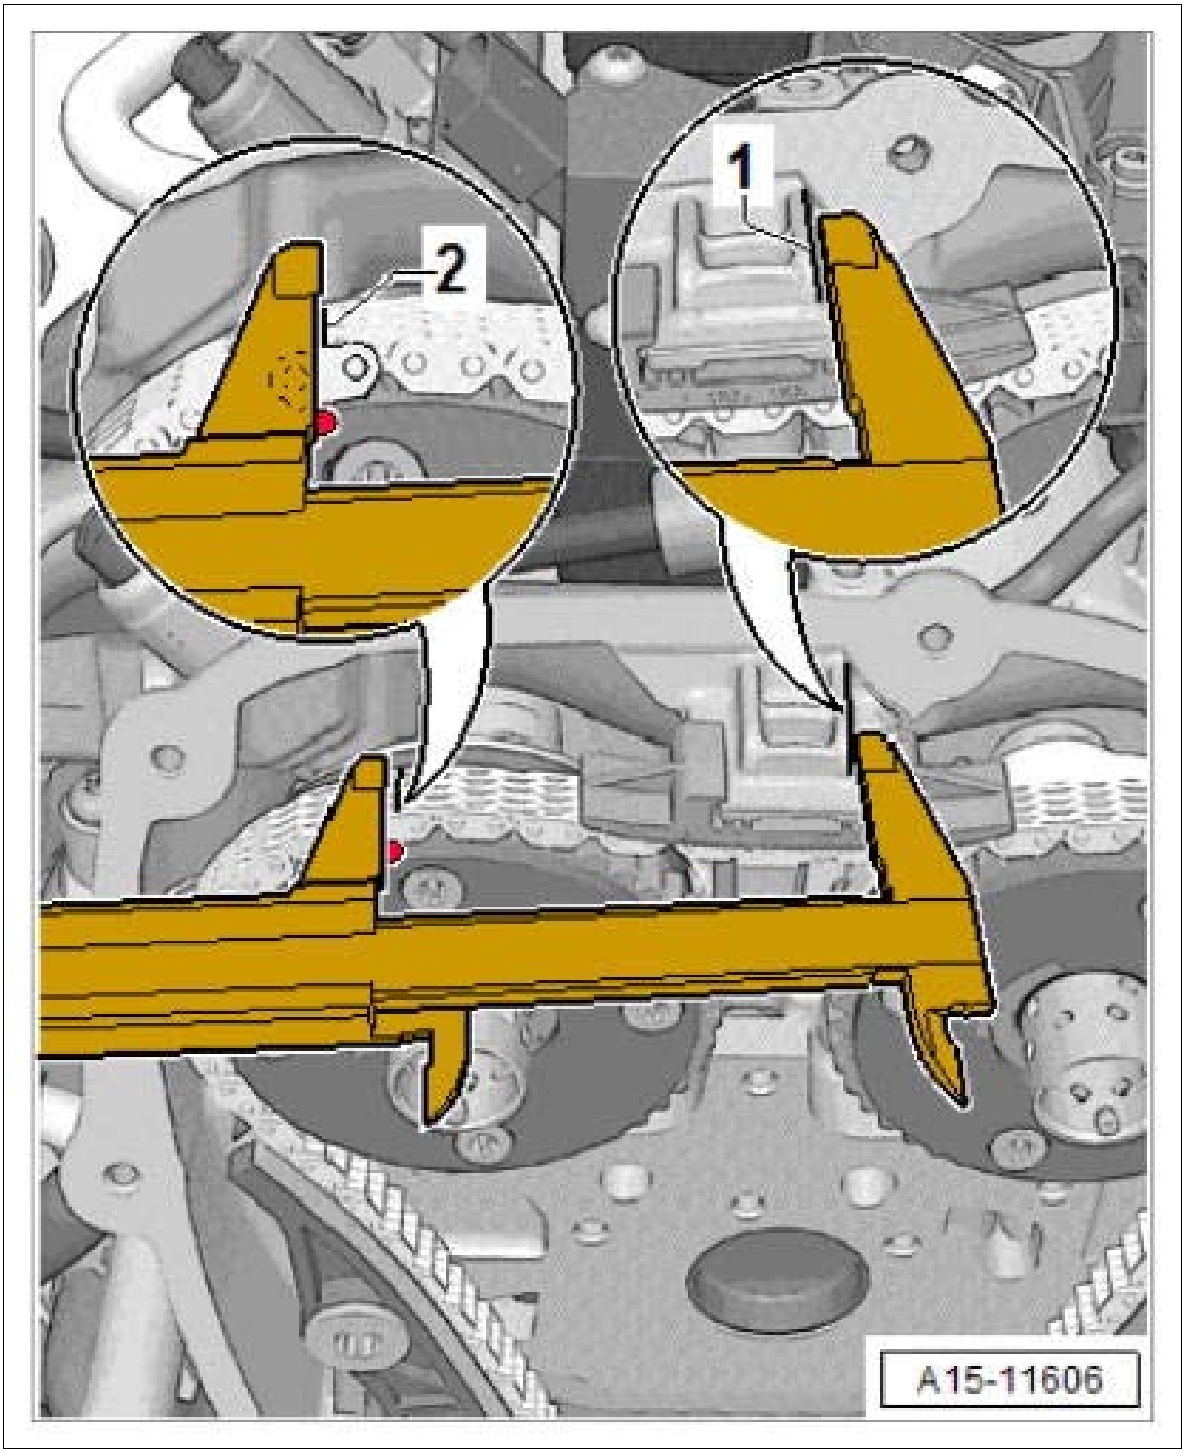
   Information

   An offset from one tooth indicates a deviation from the setpoint value of approx. 6 mm.

   If an offset is detected, the timing chain must be re-fitted.

   Nominal value: 74... 77 mm.

Fig 4: Measuring Outlet Camshaft Distance



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Once the nominal value is reached, measure the distance between the marking on the outlet camshaft sprocket **-3-** and the marking on the intake camshaft sprocket **-4-** .

Information

An offset from one tooth indicates a deviation from the setpoint value of approx. 6 mm.

If an offset is detected, the timing chain must be re-fitted.

Nominal value: 124... 127 mm.

WM 150505 CHECKING AND ADJUSTING CAMSHAFTS (MACAN, MACAN S, MACAN TURBO) > ADJUSTING CAMSHAFTS

NOTE: Timing not set correctly

- *Risk of engine damage*
- *Rough running engine*
- *Loss of engine power*

→ Do not use force when fitting the staking tool.

→ Make sure that the gap is equal on both sides.

→ When inserting the staking tools, do not use force to turn the camshafts against any resistance.

→ The engine must be exactly at top dead center.

→ The opposite cylinder must be at ignition TDC.

1. Remove engine cover (design cover).
2. Remove front underbody cover. → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY
3. Remove upper timing-case cover. → 153319 REMOVING AND INSTALLING TIMING-CASE COVER
4. Remove camshaft actuators. → 158419 REMOVING AND INSTALLING ACTUATOR FOR CAMSHAFT
5. Unscrew fastening screws **-arrows-** and remove bearing saddle.

Fig 1: Identifying Bearing Saddle

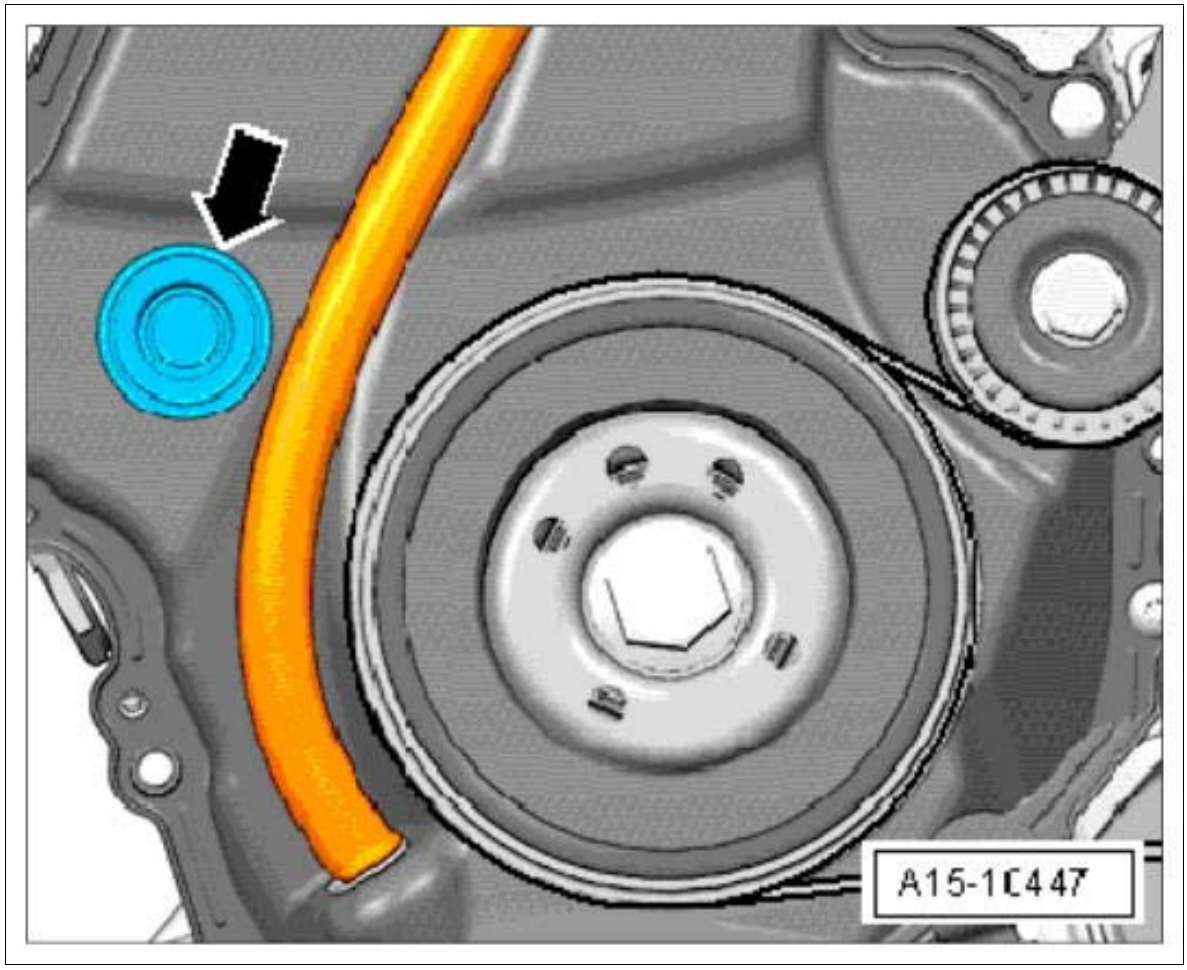
6. Remove stopper **-arrow-** .

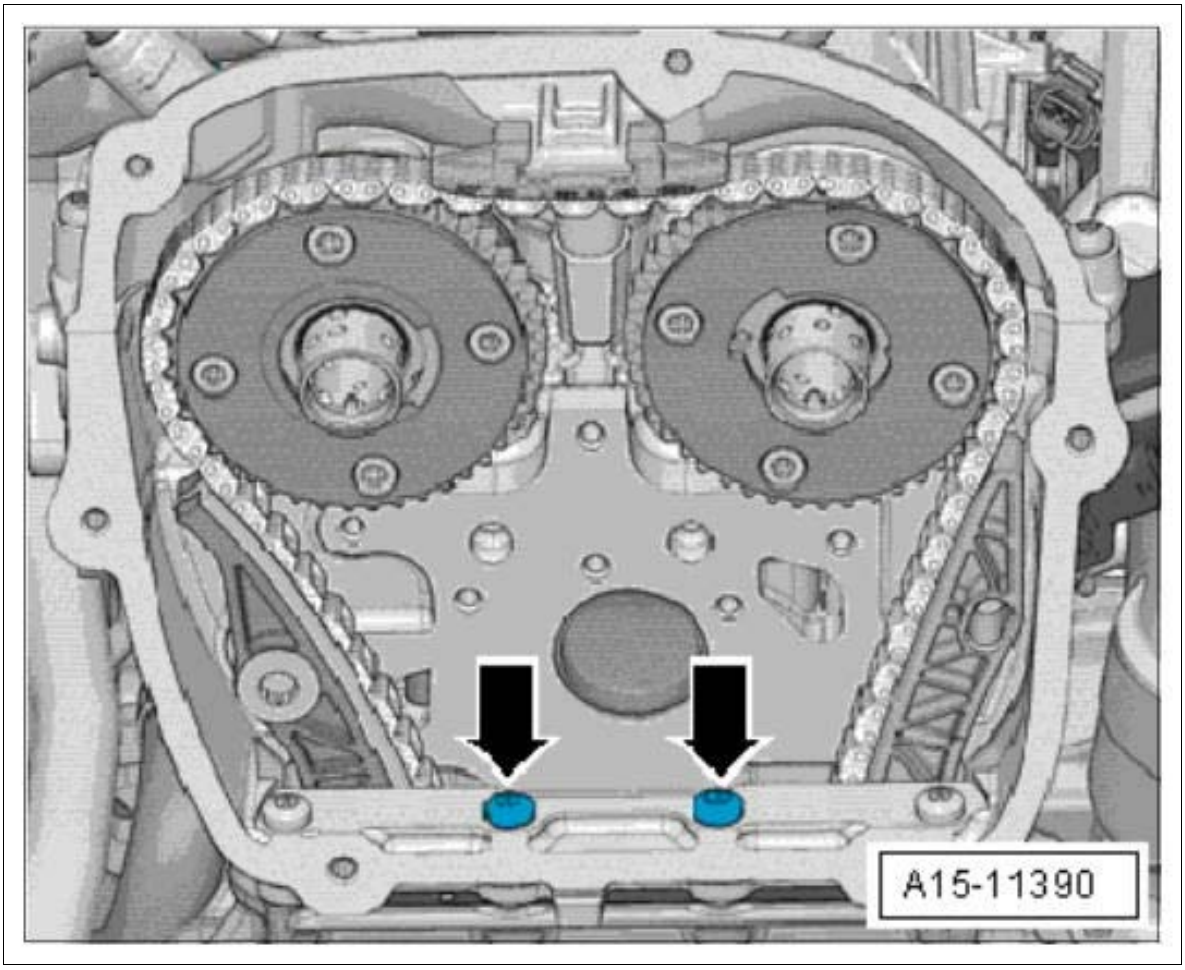
Fig 2: Identifying Chain Tensioner



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Unscrew fastening screws **-arrows-** .

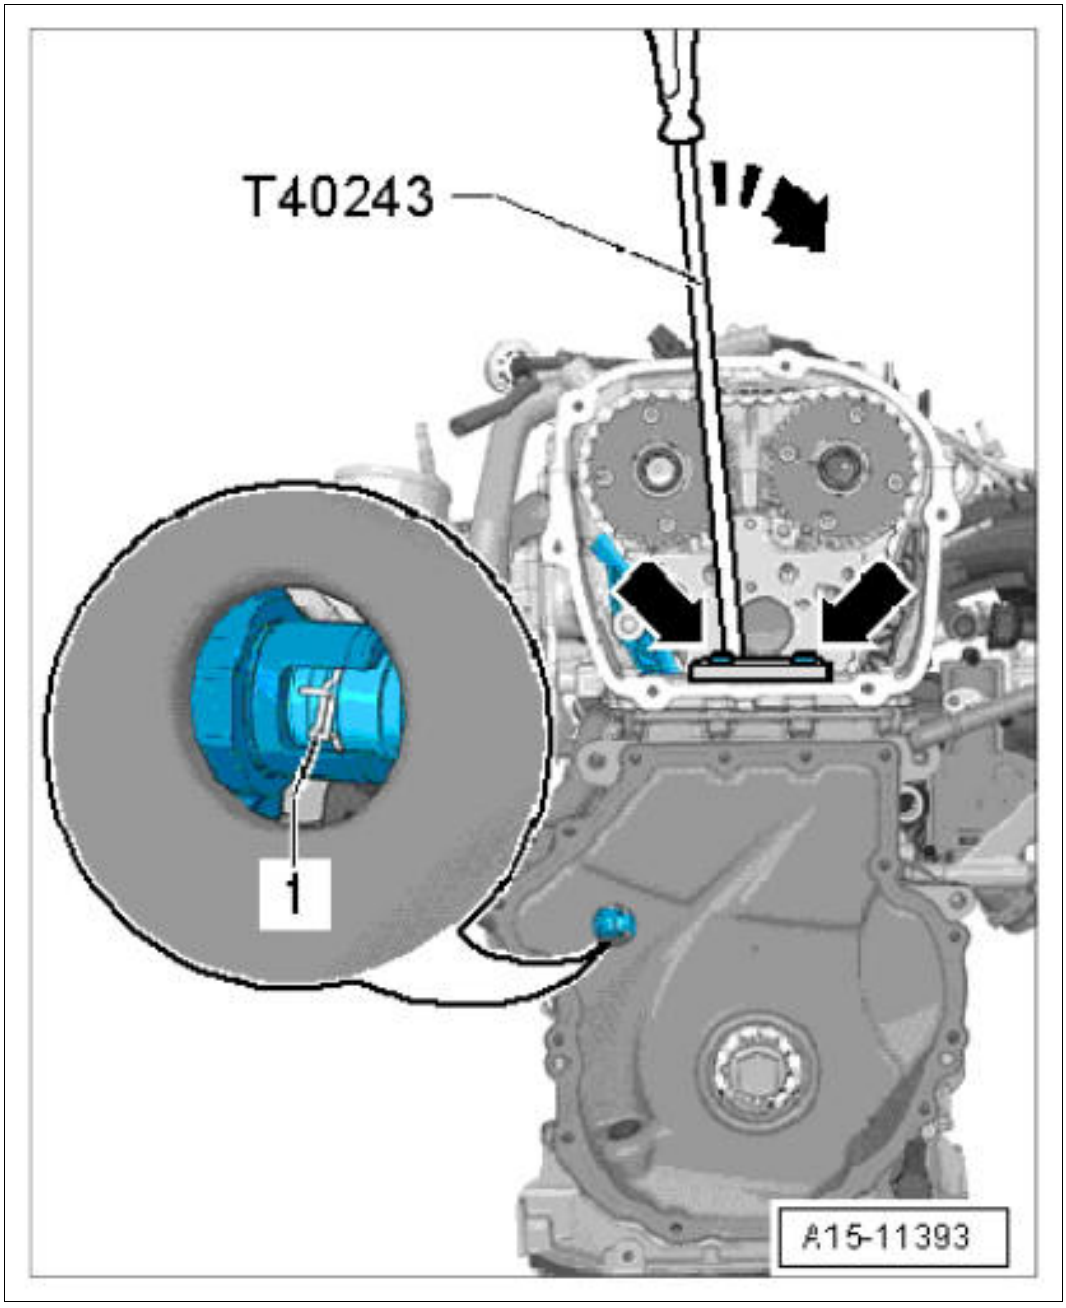
Fig 3: Identifying Chain Tensioner Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Tighten chain tensioner.
    1. 8.1. **Lever T40243** must now be screwed in. **-arrows-**
    2. 8.2. Press and hold the circlip **-1-** on the chain tensioner.
    3. 8.3. **Lever T40243** must now be pressed slowly in **-direction of arrow-** and held securely.

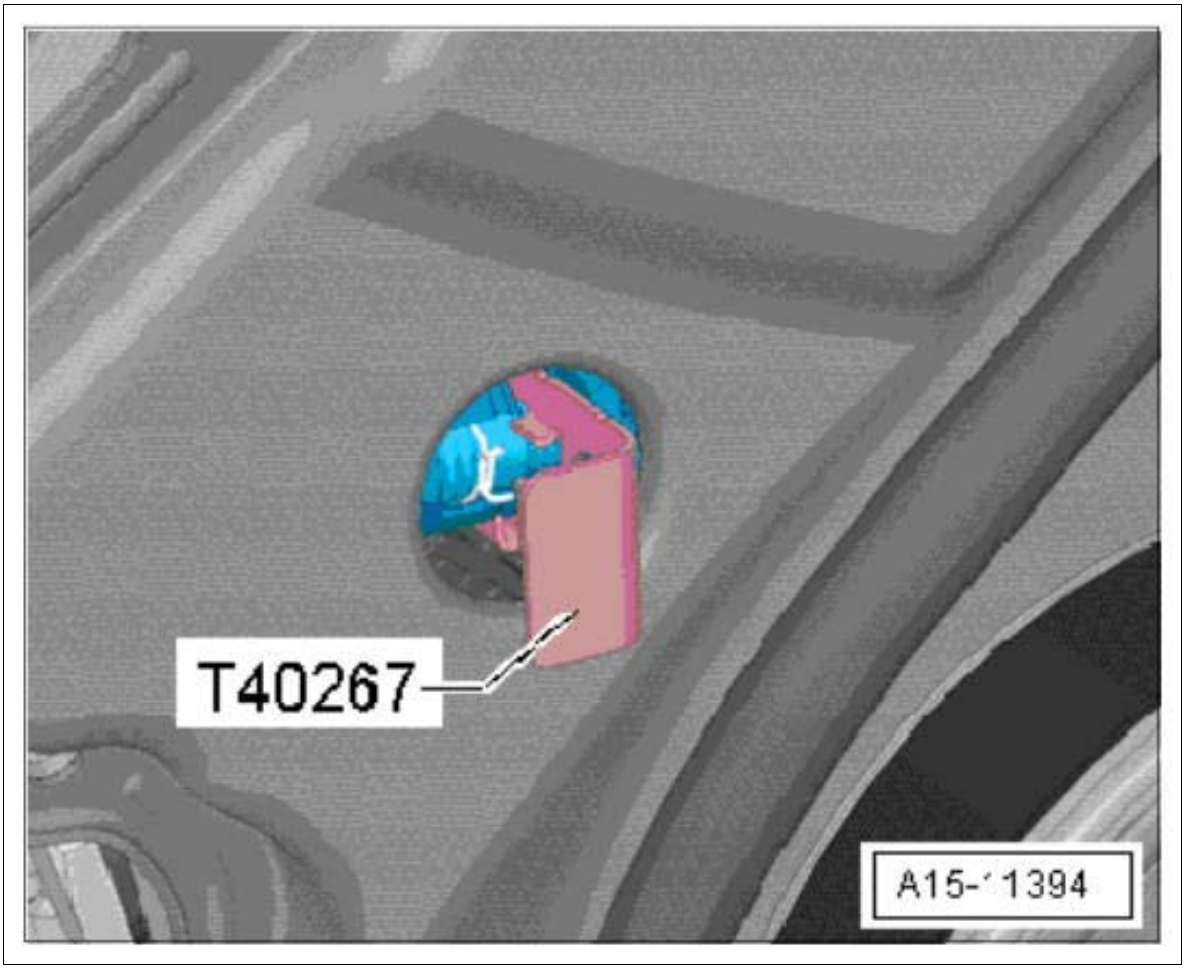
Fig 4: Tightening Chain Tensioner



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Secure the chain tensioner with staking tool T40267.

Fig 5: Securing Chain Tensioner

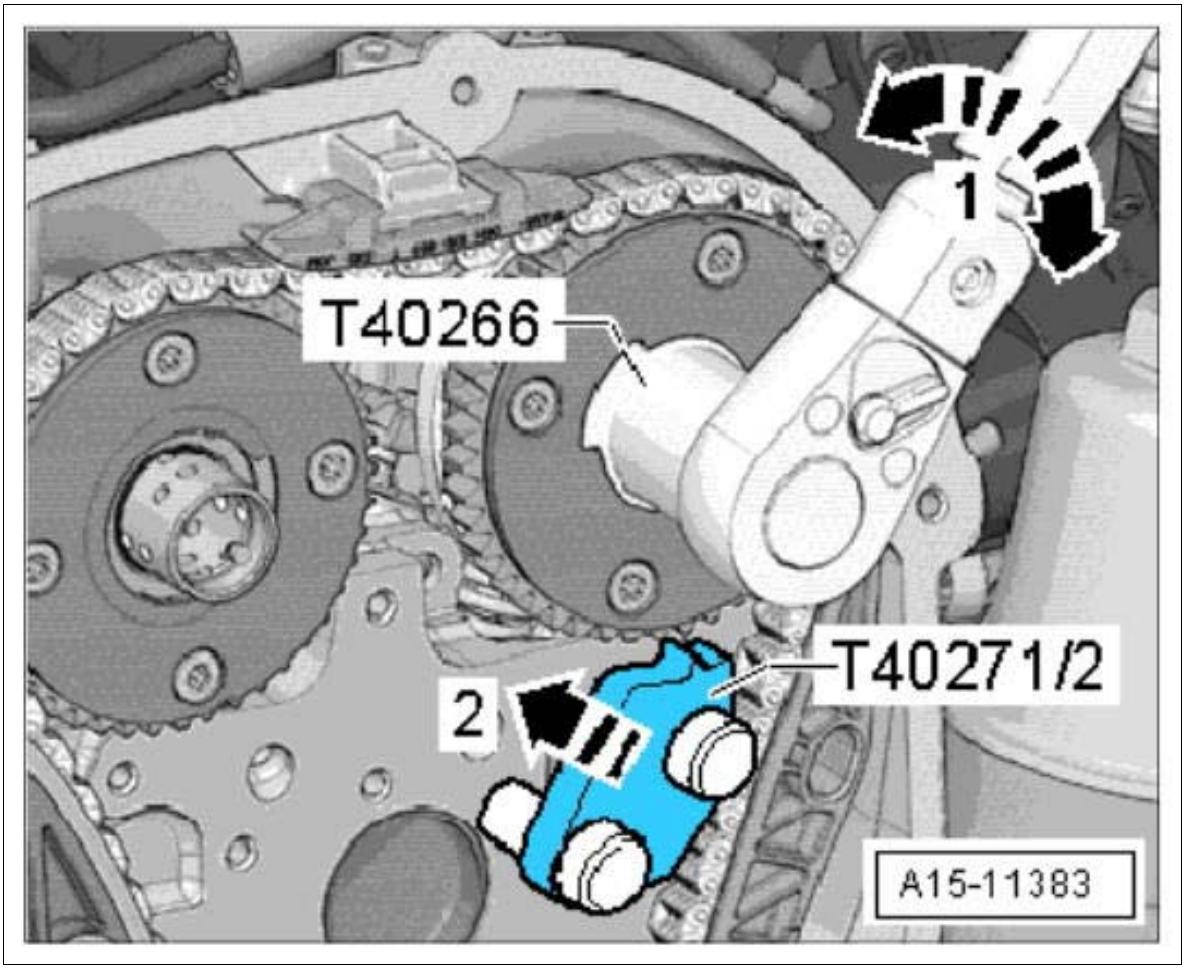


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. **Lever T40243** must now be removed.
11. **Camshaft clamp T40271** /2 must be screwed onto the cylinder head and then pushed into the toothing on the sprocket in **-direction of arrow 2-** .

    Use **adapter T40266** to turn the intake camshaft in **-direction of arrow 1-** if necessary.

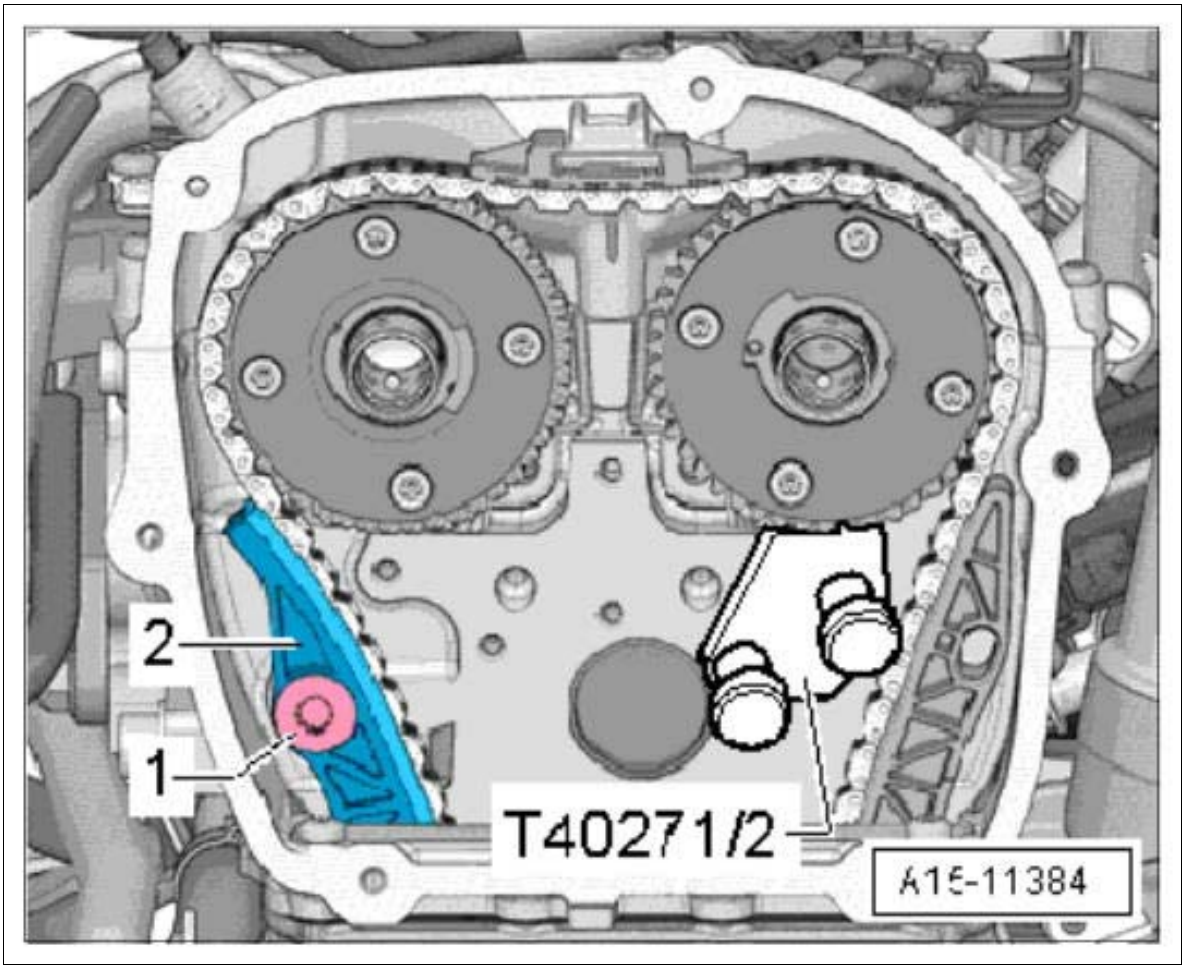
Fig 6: Securing Intake Camshaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Unscrew guide pin **-1-** and guide tensioning rail **-2-** down.

Fig 7: Loosening Tensioning Rail



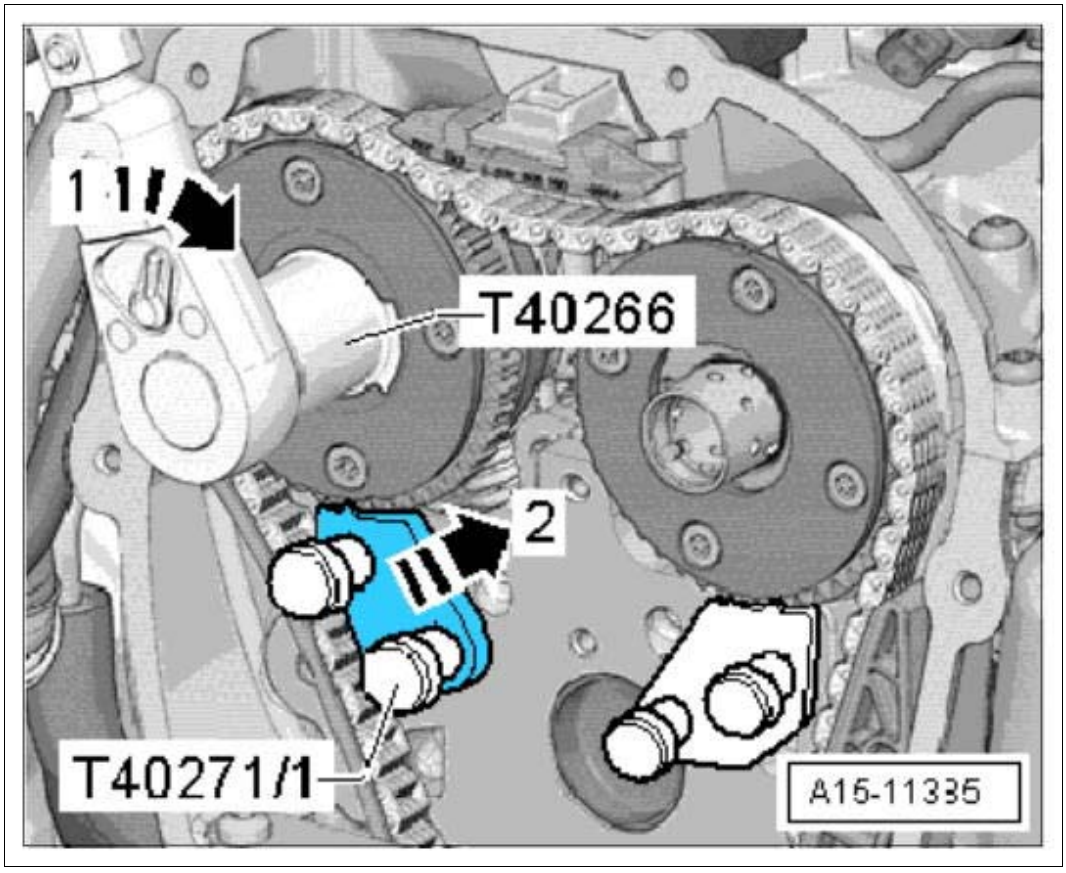
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

13. Secure the outlet camshaft.

    1. 13.1. **The camshaft clamp T40271** /1 must be screwed onto the cylinder head. → Securing outlet camshaft

    2. 13.2. Use **adapter T40266** to turn the outlet camshaft in **-direction of arrow 1-** and push **camshaft clamp T40271** /1 onto the toothing in **-direction of arrow 2-** .

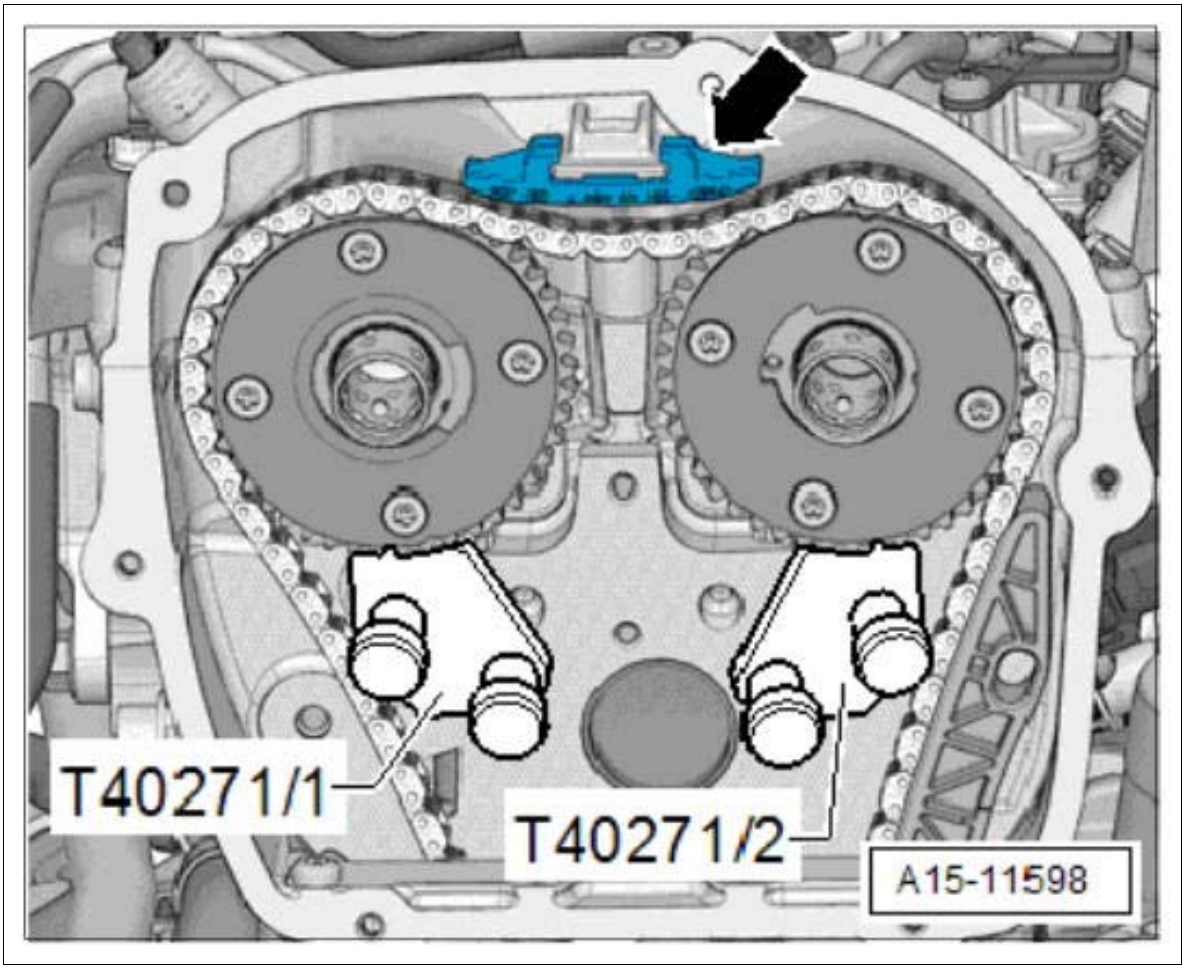
Fig 8: Securing Outlet Camshaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Release the catch and press upper guide rail **-arrow-** forward and off.

Fig 9: Pressing Upper Guide Rail

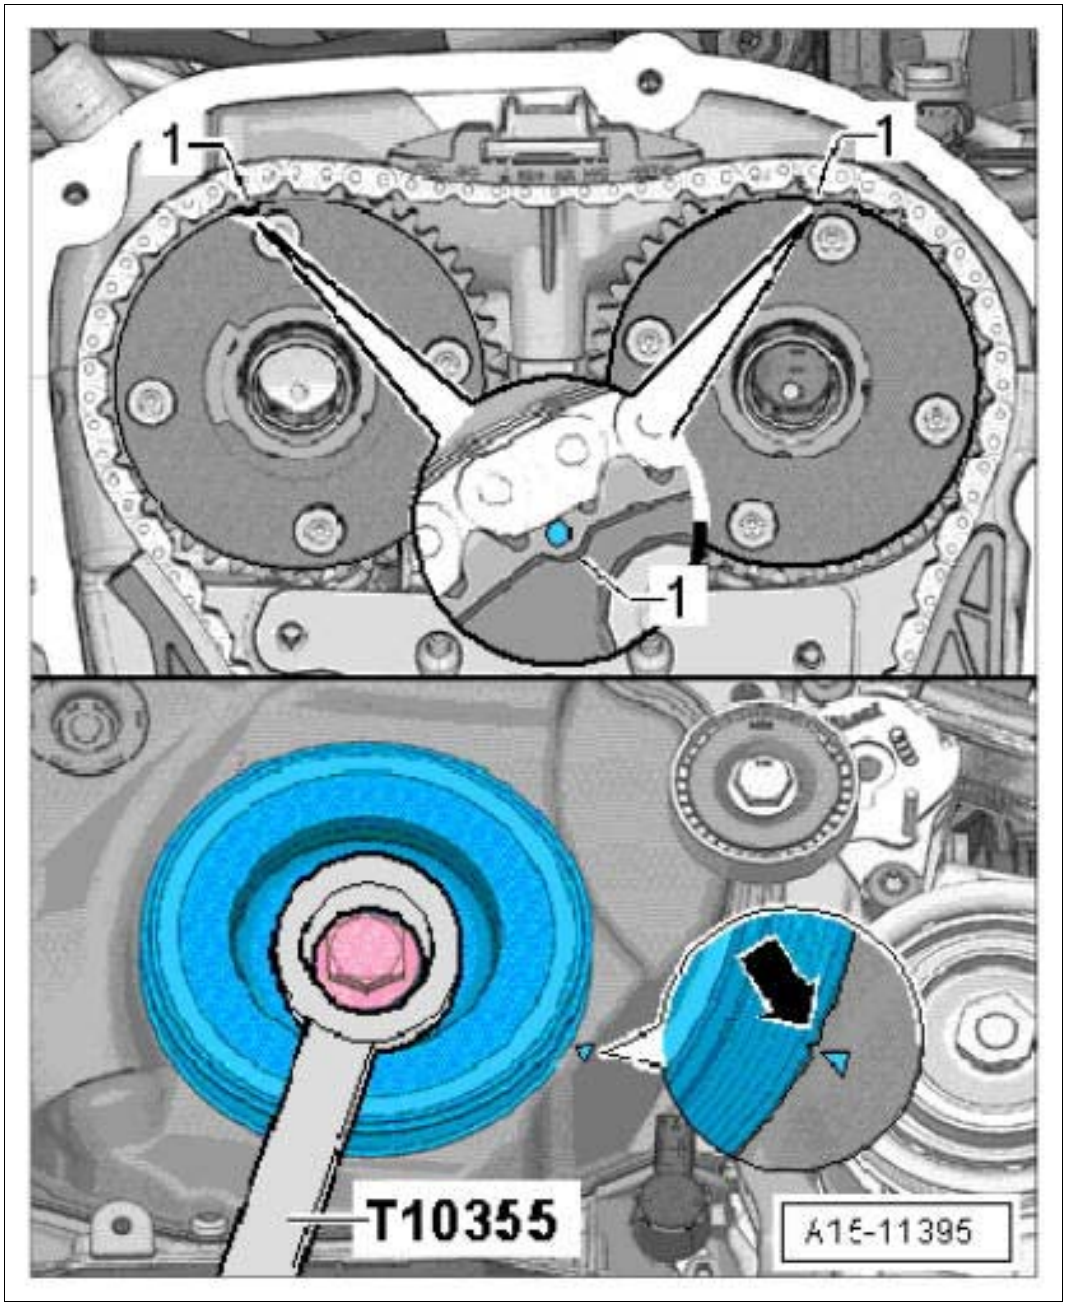


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

15. Re-position timing chain.

    1. 15.1. The colored chain links must match the markings on the sprockets. **-1-**

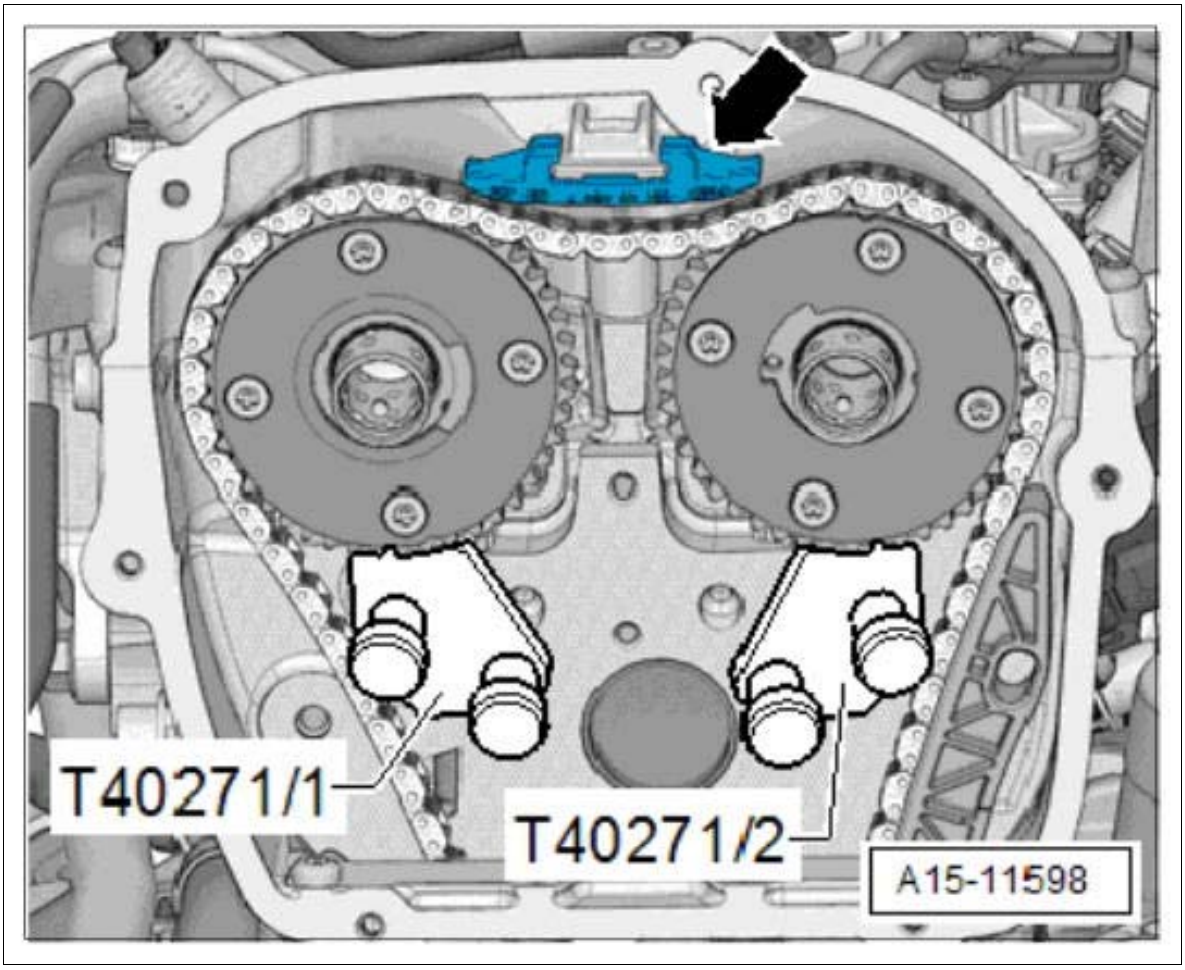
Fig 10: Identifying Markings On Timing Chain



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

16. Install upper guide rail **-arrow-** .

Fig 11: Installing Upper Guide Rail

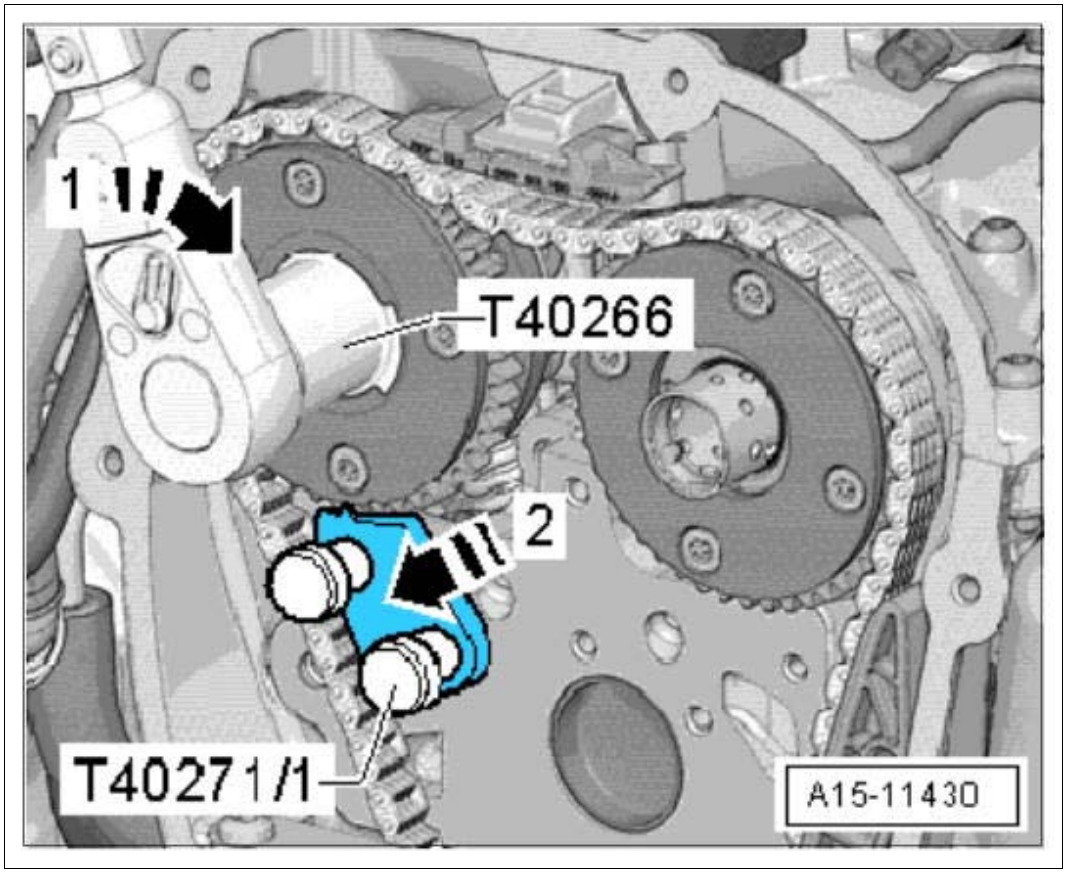


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

17. **Camshaft clamp T40271** /1 can now be removed.

    1. 17.1. Use **adapter T40266** to turn the outlet camshaft in **-direction of arrow 1-** .
    2. 17.2. **Camshaft clamp T40271** /1 must be pushed out of the toothing on the sprocket in **-direction of arrow 2-** .
    3. 17.3. Relieve the camshaft and remove **camshaft clamp T40271** /1.

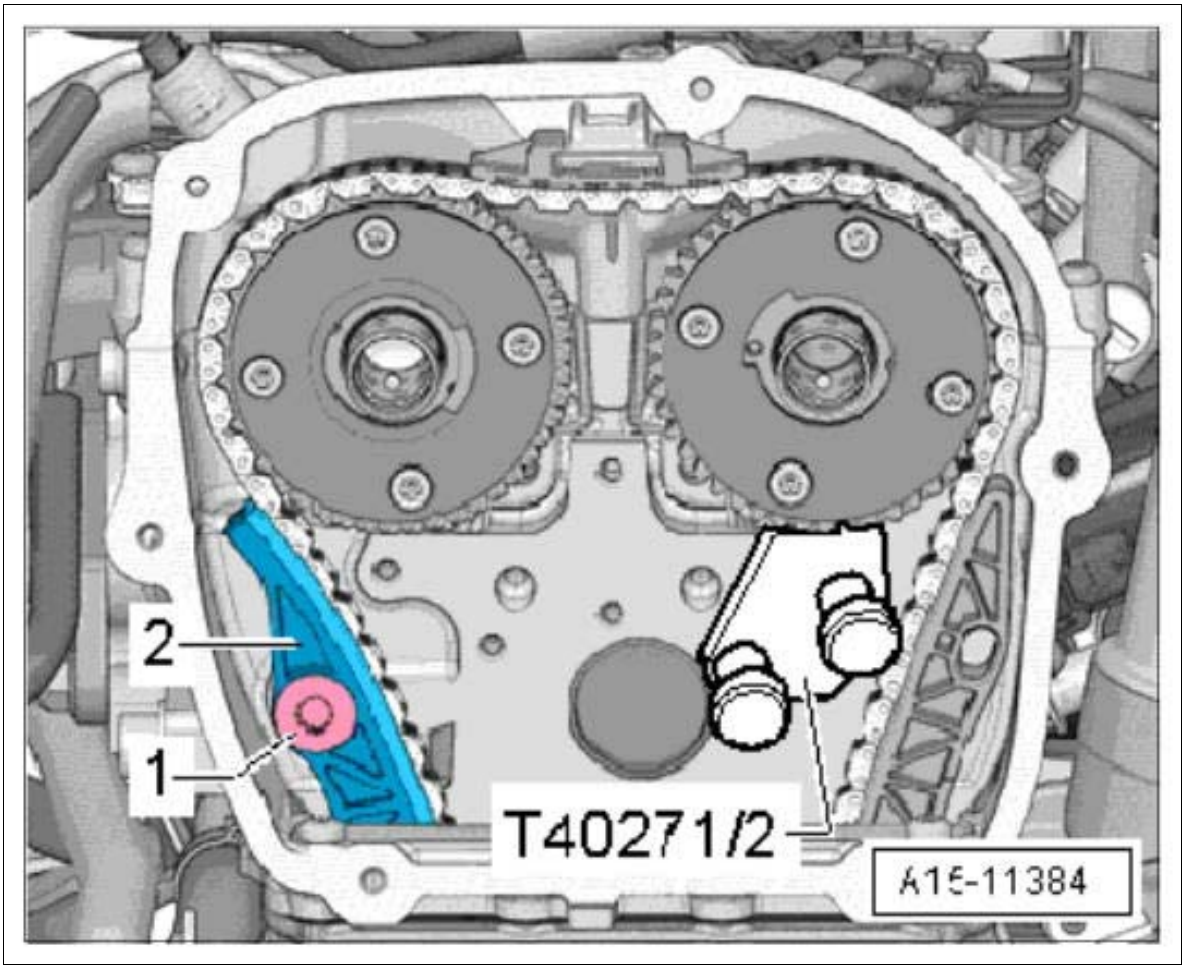
Fig 12: Removing Camshaft Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

18. Guide tensioning rail **-2-** up and fit and tighten the guide pin **-1-** .

Fig 13: Securing Tensioning Rail

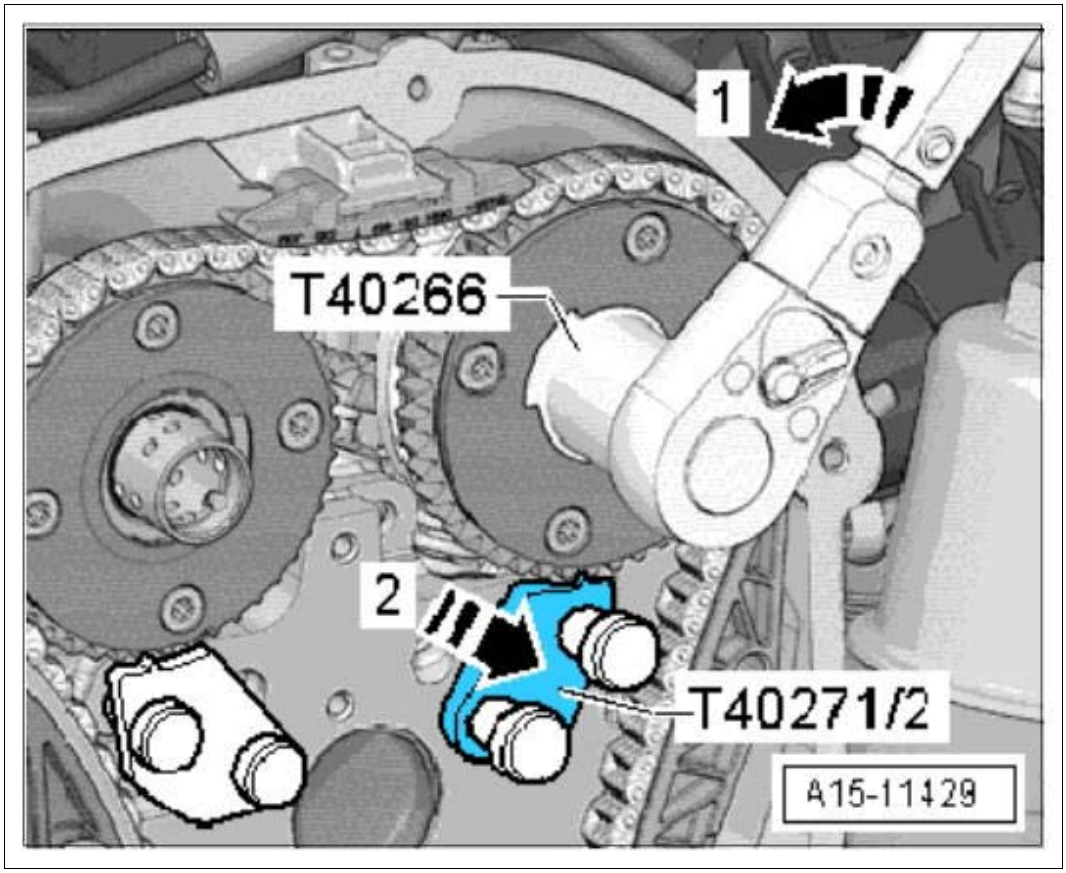


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

19. **Camshaft clamp T40271** /2 can now be removed.

    1. 19.1. Use **adapter T40266** to turn the intake camshaft in **-direction of arrow 1-** .
    2. 19.2. **Camshaft clamp T40271** /2 must be pushed out of the toothing on the sprocket in **-direction of arrow 2-** .
    3. 19.3. Relieve the camshaft and remove **the camshaft clamp T40271** /2.

Fig 14: Removing Intake Camshaft Fixing Device



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

20. **Staking tool T40267** must be pulled out.

Fig 15: Securing Chain Tensioner

24. Install camshaft actuators. → INSTALLING ACTUATOR FOR CAMSHAFT
25. Install upper timing-case cover. → INSTALLING CHAIN HOUSING COVER
26. Install front underbody cover. → INSTALLING COVER FOR FRONT UNDERBODY
27. Install engine cover (design cover).

WM 150516 SETTING TIMING FOR CAMSHAFTS (MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	

Locating pins	Special tool	9595/1		Auxiliary chain tensioner	Special tool	9683/1		Staking tool for valve timing	Special tool	9861		
WM 150516 SETTING TIMING FOR CAMSHAFTS (MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Central screw securing camshaft controller to camshaft		Initial tightening	30 Nm (22 ftlb.)		

Central screw securing camshaft controller to camshaft		Final tightening	+40°		

WM 150516 SETTING TIMING FOR CAMSHAFTS (MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove cylinder head cover. → 158219 REMOVING AND INSTALLING CYLINDER HEAD COVER
2. The spark plugs can be removed so that it will be easier to turn the crankshaft. → 287020 REMOVING AND INSTALLING SPARK PLUGS

WM 150516 SETTING TIMING FOR CAMSHAFTS (MACAN S, MACAN TURBO) > SETTING TIMING FOR CAMSHAFTS

NOTE: Incorrect handling of crankshafts

- *Risk of damage to the timing system*

→ Never turn the crankshaft against the rolling direction or when the chain tensioner is removed.

→ Proceed carefully with your work.

→ Only turn the engine at the crankshaft.

→ After working on the camshaft, re-set the valve timing.

→ Observe general warning notes and working regulations.

NOTE: Timing not set correctly

- *Risk of engine damage*
- *Rough running engine*
- *Loss of engine power*

→ Do not use force when fitting the staking tool.

→ Make sure that the gap is equal on both sides.

→ When inserting the staking tools, do not use force to turn the camshafts against any resistance.

→ The engine must be exactly at top dead center.

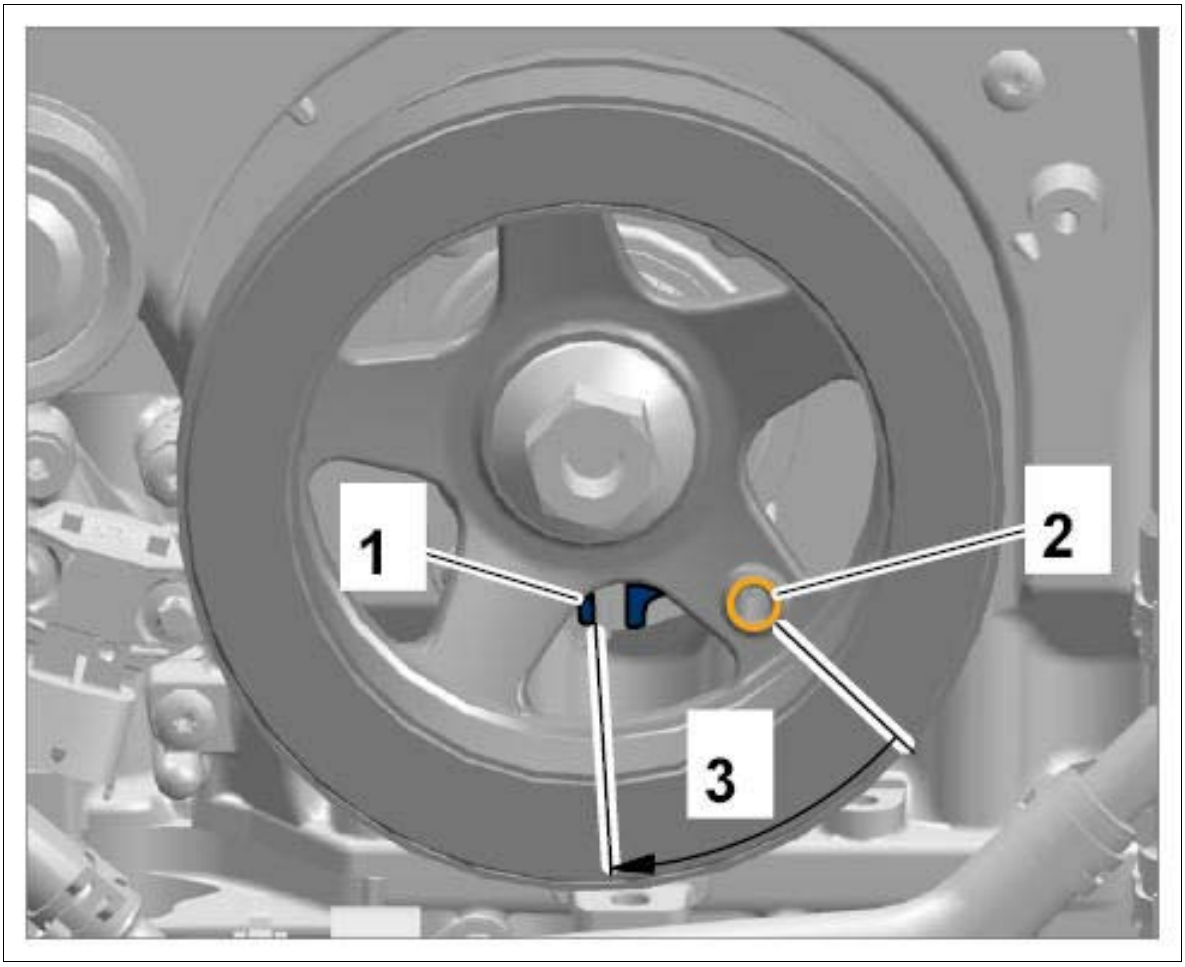
→ The opposite cylinder must be at ignition TDC.

Information

- The adjustment of the oil pump with balance shaft with respect to the crankshaft must be correct.
- Correct adjustment of the balance shaft with respect to the crankshaft is a prerequisite for the valve timing of the camshafts.
- If the engine has vibrations in the crank drive, also check that the balance shaft is set correctly. For details of how to adjust the balance shaft , → 172019 REMOVING AND INSTALLING OIL PUMP .

1. Turn the crankshaft at the vibration balancer so that the vibration balancer's staking bore **-2-** is located approx. 45° degrees in front of the lower staking point on the timing-case cover **-1-** .

   Fig 1: Identifying Staking Bore Angle



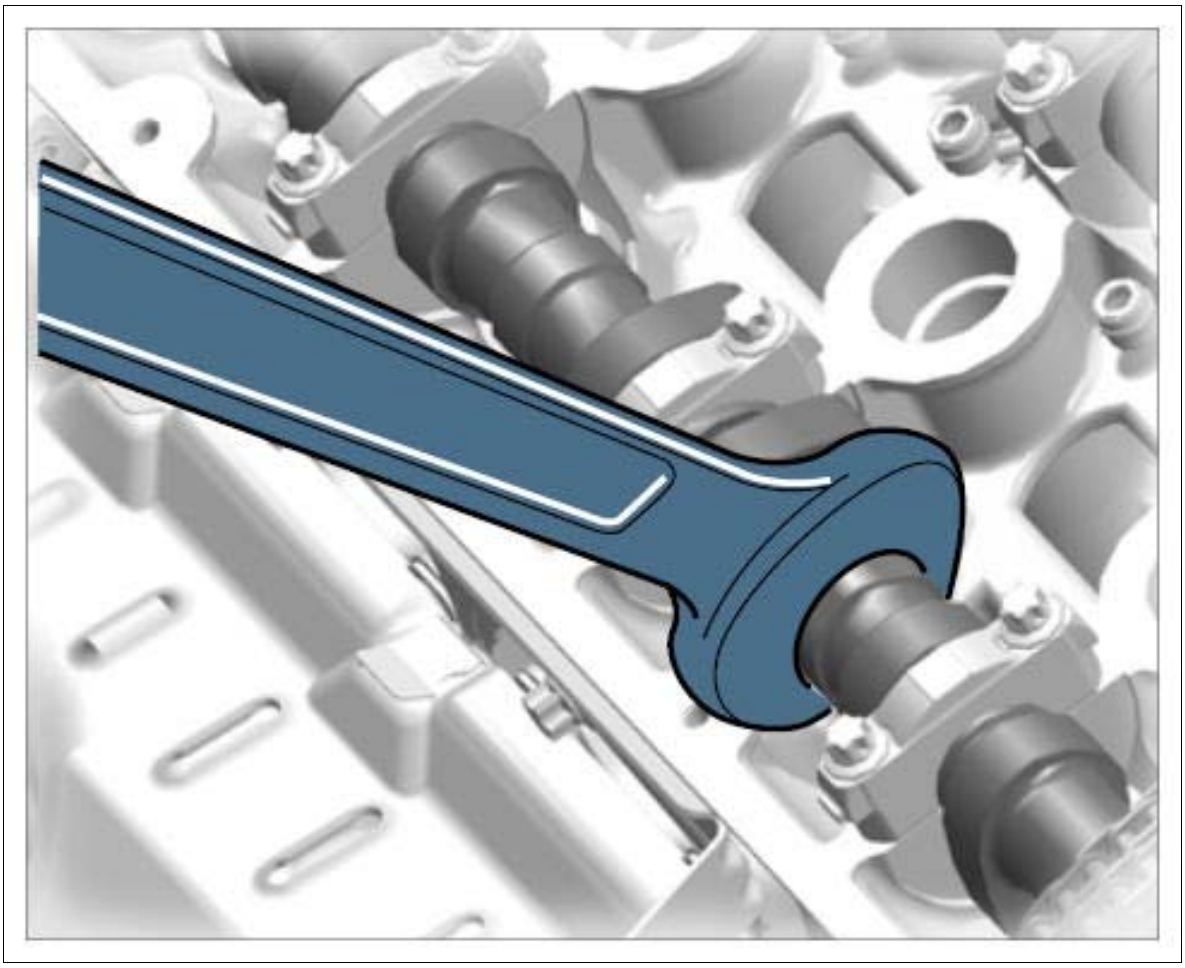
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen central screws on the four camshaft controllers.
3. Remove chain tensioner. → 153619 REMOVING AND INSTALLING CHAIN TENSIONER
4. **Auxiliary chain tensioner 9683/1** must be screwed in hand-tight. Connect 1 bar of compressed air and slowly increase to 5.0 up to 5.5 bar (prevents the assembly chain

tensioner from "crashing" against the timing chain).

5. Turn the camshafts at the hexagon until the flat surfaces are pointing upwards.

   Fig 2: Turning Hexagon Camshaft

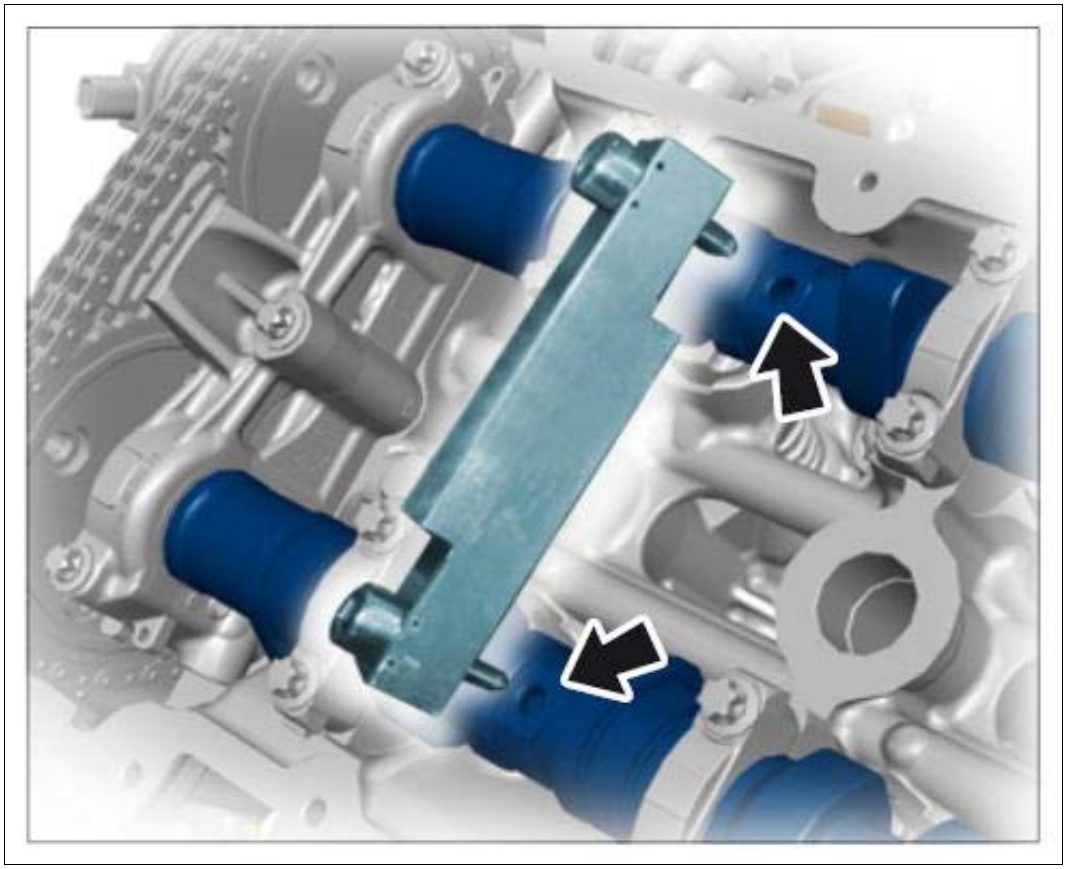


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. **Staking tool for valve timing 9861** must be fitted on the camshafts.

    1. 6.1. Tighten screws to **20 Nm (15 ftlb.)** so that the camshafts are moved over the flat surfaces **-arrows-** into the exact position.

Fig 3: Locating Camshaft Flat Surface

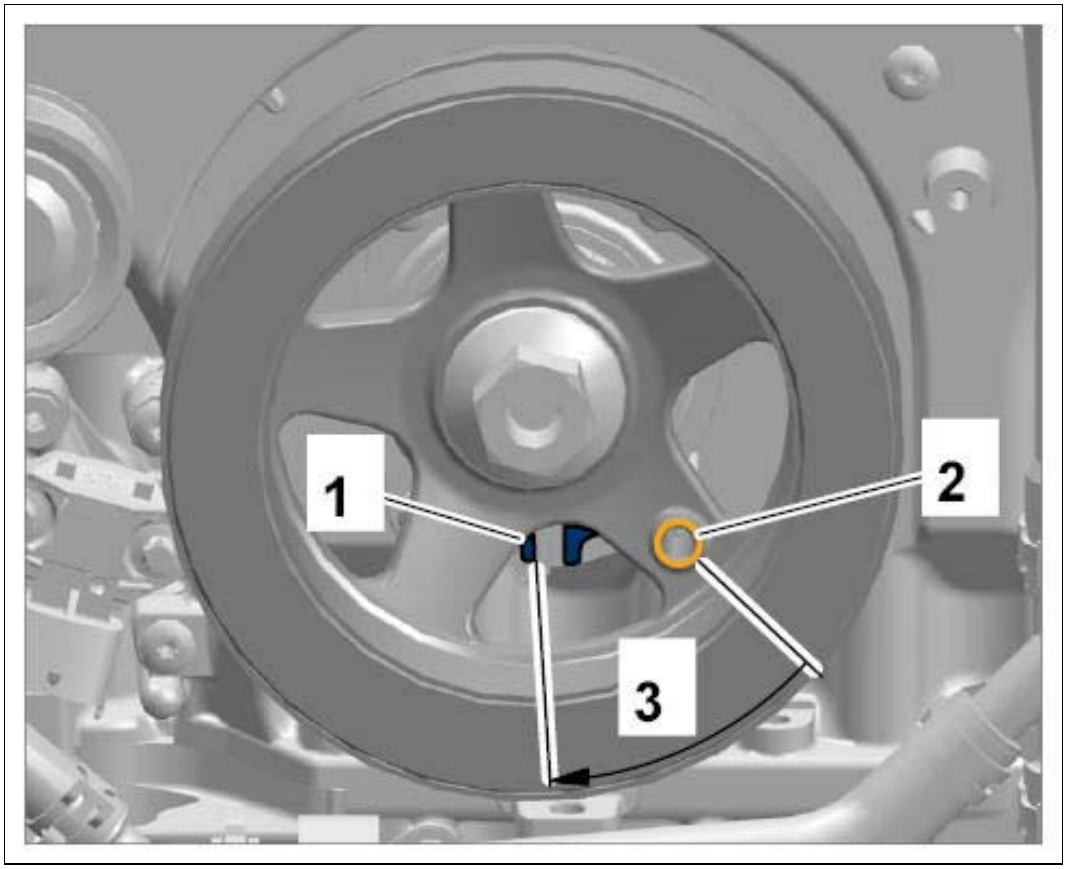


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Secure the crankshaft.

    1. 7.1. **Locating pins 9595/1** must be inserted into the staking bore on the vibration balancer **-2-** .
    2. 7.2. Turn the crankshaft at the vibration balancer (approx. 45°) **-3-** so that the staking pin in the vibration balancer slips into the lower staking point on the timing-case cover **-1-** .
    3. 7.3. At the same time, exert gentle pressure on the staking pin while turning.

Fig 4: Identifying Vibration Balancer Bore



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. **If you accidentally turn the vibration balancer too far, do not try to turn it back again!**
    1. 8.1. The staking tools must be removed and the camshafts must be turned in such a way that there is only the slightest pressure on the valve springs.
    2. 8.2. Turn the crankshaft once and start the setting procedure again.
9. Camshafts and crankshaft are fixed correctly.
    1. 9.1. Screwed-in assembly chain tensioner with approx. 5.0 to 5.5 bar pressure.
    2. 9.2. Two fixed staking tools on the camshafts.
    3. 9.3. Staking pin secures crankshaft in TDC of cylinder 1.
10. Tighten central screws on the four camshafts as instructed. To do this, counter at the hexagon on the camshaft controllers and observe the specified sequence!
    1. 10.1. Tightening torque: **Initial tightening 30 Nm (22 ftlb.) Final tightening +40°**
    2. 10.2. Tightening sequence:

Tightening sequence for central screw for camshaft controller (item 2)		
Result:	Cylinder bank:	Camshaft:

1	Bank 1, cylinders 1-3	Outlet
2	Bank 1, cylinders 1-3	Intake
3	Bank 2, cylinders 4-6	Intake
4	Bank 2, cylinders 4-6	Outlet

11. Remove tools.
12. Install chain tensioner.
13. Check by turning the engine twice.

WM 150516 SETTING TIMING FOR CAMSHAFTS (MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install spark plugs. → INSTALLING SPARK PLUGS
2. Install cylinder head cover. → INSTALL THE CYLINDER HEAD COVER

WM 153319 REMOVING AND INSTALLING CHAIN HOUSING COVER (MACAN, MACAN S, MACAN TURBO) > INSTALLING CHAIN HOUSING COVER > INSTALLING UPPER CHAIN HOUSING COVER

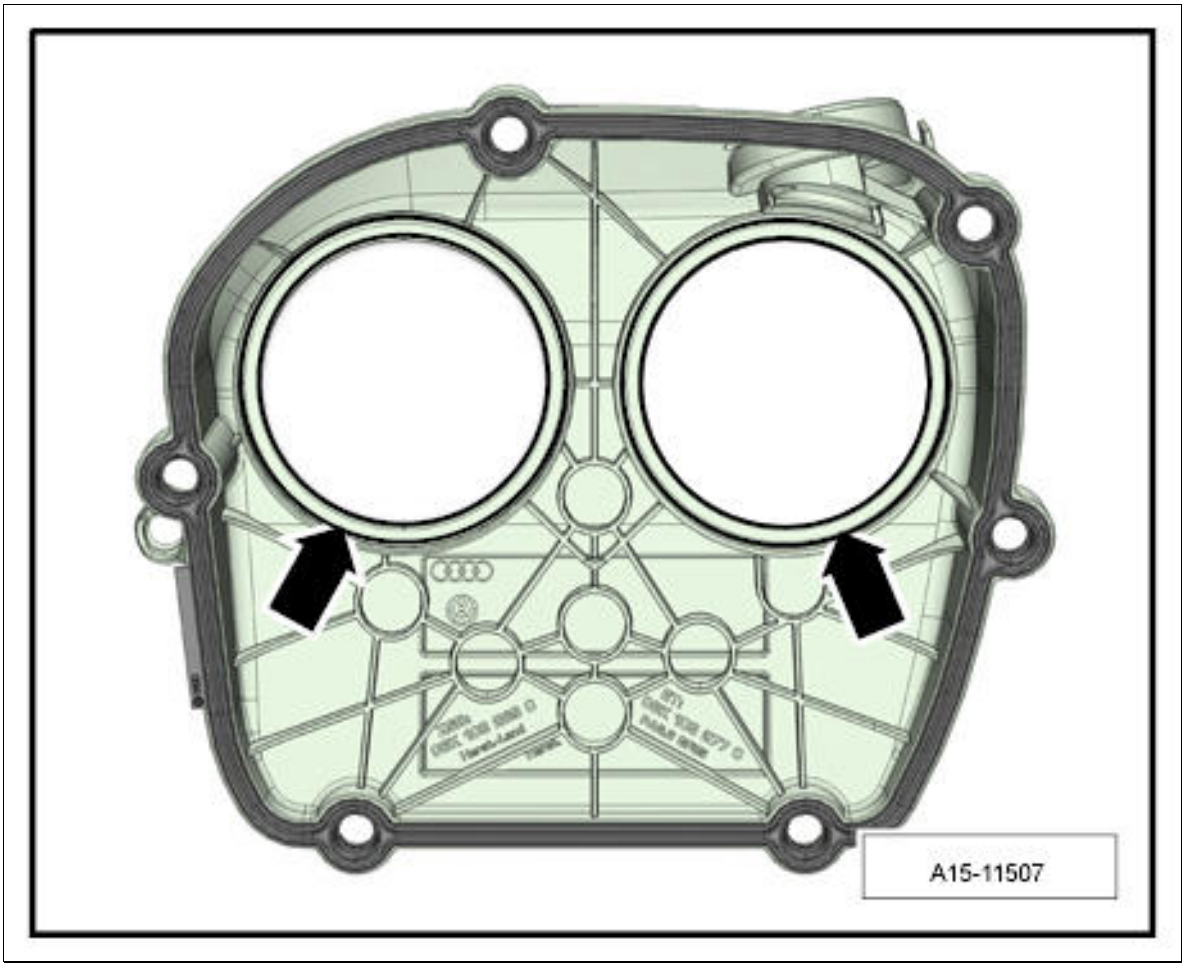
1. Remove sealant residue on the bearing saddle.
2. Clean sealing faces to remove any oil and grease.
3. Cut off the nozzle on the tube at the front marking. (The nozzle diameter is approx. 1.5 mm).

   Information

   The chain housing cover must be installed within 5 minutes of applying the sealant.
4. Apply beads of sealant to the clean sealing rings **-arrows-** .

   Sealant bead thickness: 2 mm.

   Fig 1: Identifying Sealant Area

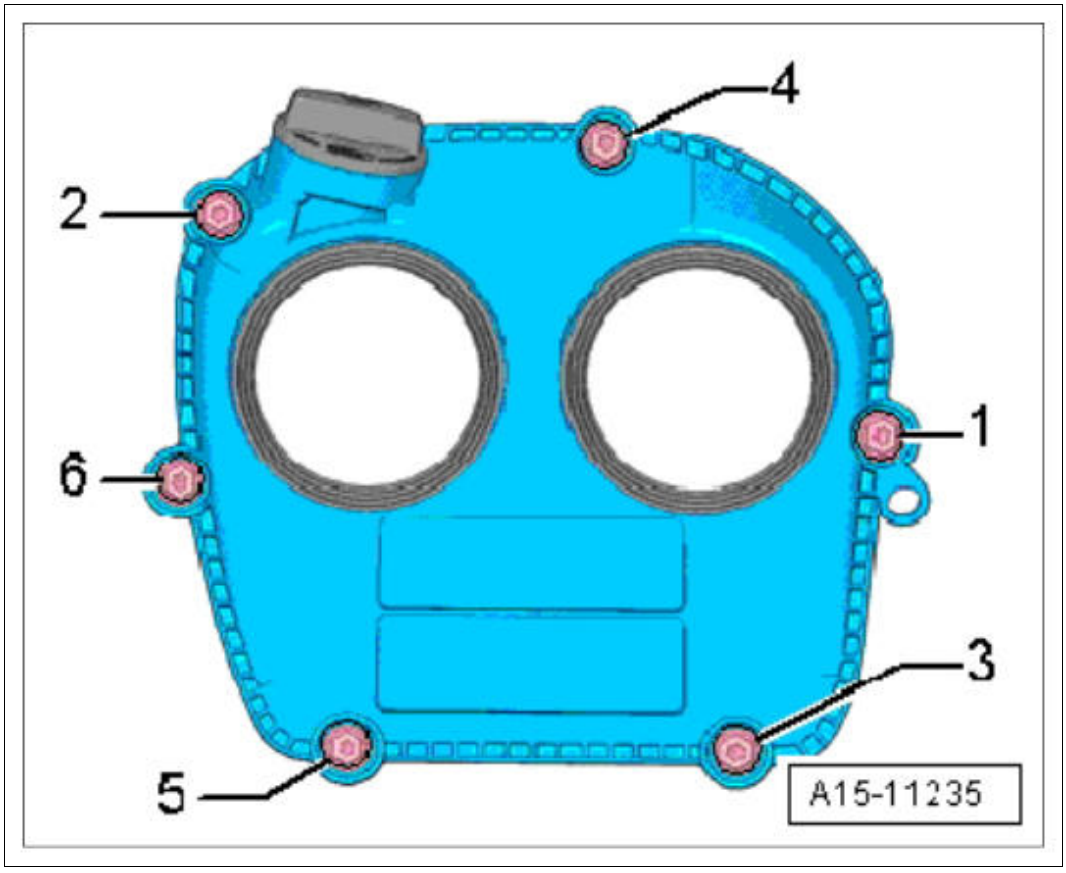


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Install chain housing cover.
   1. 5.1. Fit chain housing cover with **new** O-rings.
   2. 5.2. Fit and tighten fastening screws **-1...6-** . **Tightening torque 9 Nm (6.5 ftlb.)**

      Observe tightening sequence **-1...6-** .

Fig 2: Identifying Upper Chain Housing Cover Fastening Screws

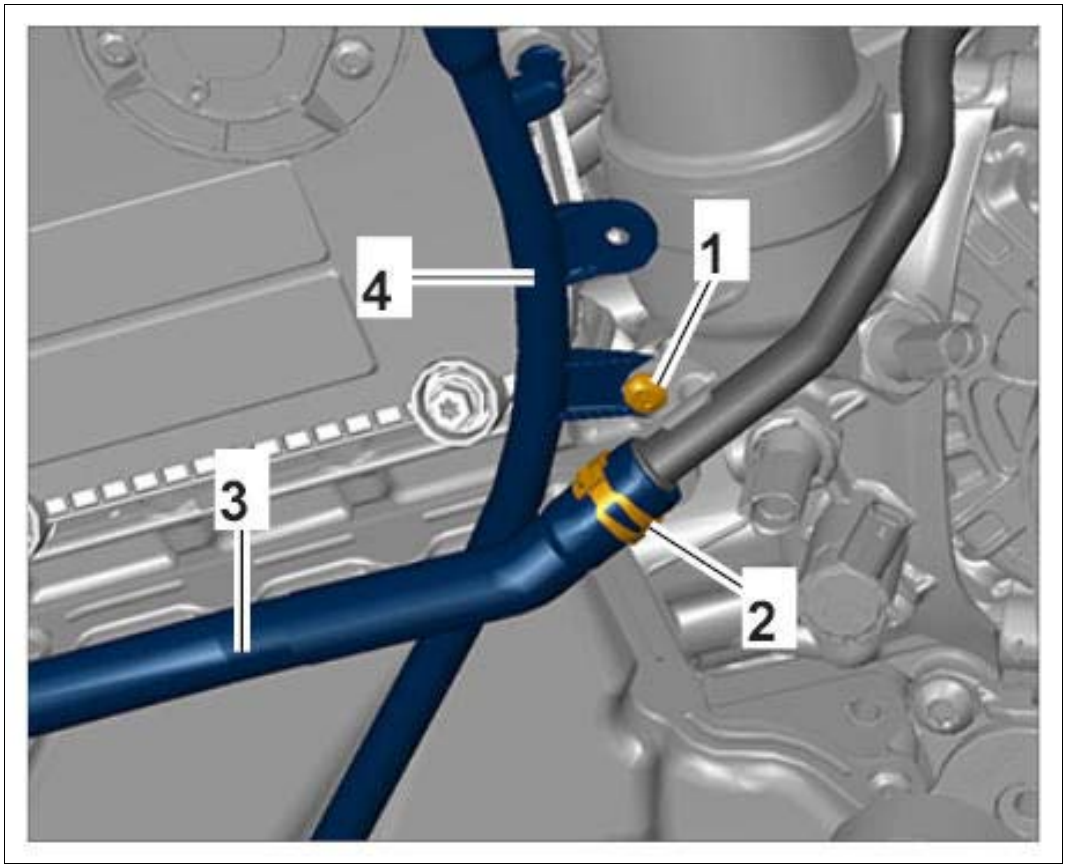


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Secure the coolant line.

    1. 6.1. Install guide tube for oil dipstick **-4-** with a **new** seal.
    2. 6.2. Fit and tighten fastening screw **-1-** . **Tightening torque 9 Nm (6.5 ftlb.)**

Fig 3: Identifying Coolant Hose And Guide Tube For Oil Dipstick



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

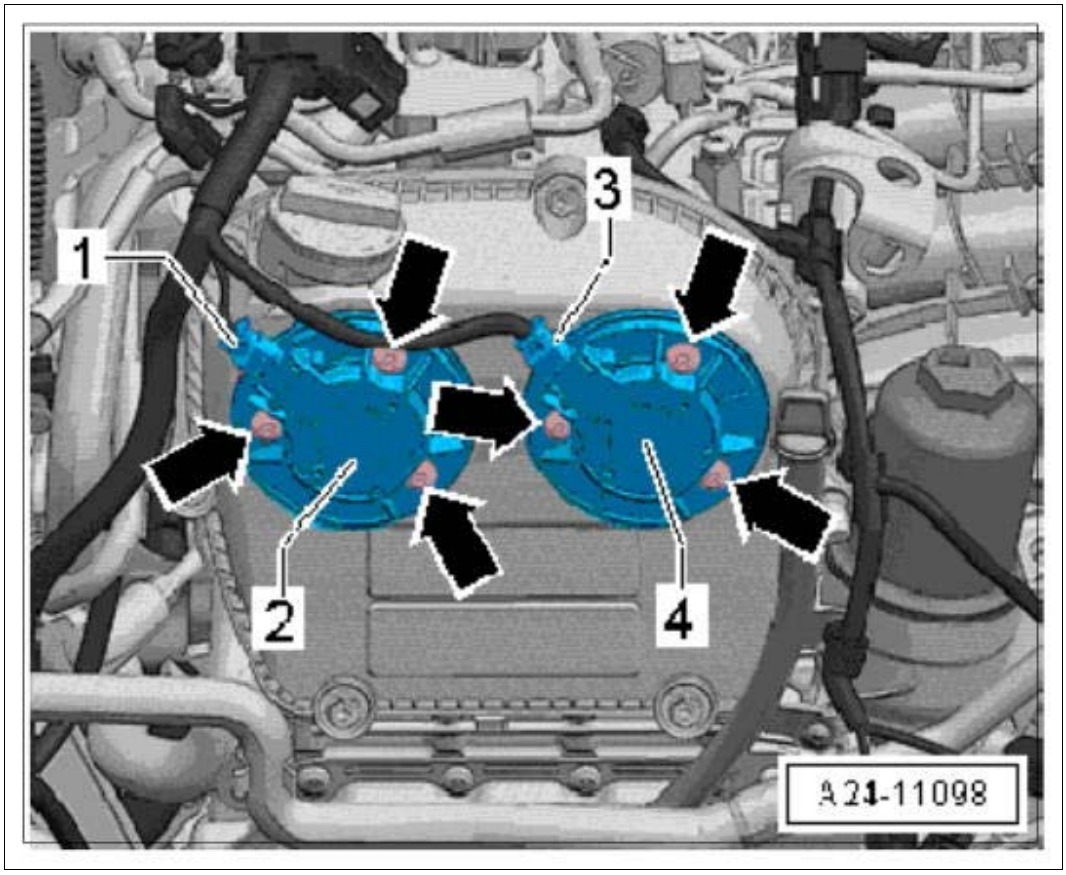
7. Install actuators for camshaft.

    1. 7.1. Position actuators for camshaft **-2 and 4-** .
    2. 7.2. **Fit and tighten new** fastening screws **-arrows-** .

       Step 1: **Initial tightening 4 Nm (3 ftlb.)**

       Step 2: **Final tightening +45°**
    3. 7.3. Connect electric plug connections **-1 and 3-** .

Fig 4: Identifying Electric Plug Connections For Camshaft Actuators



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

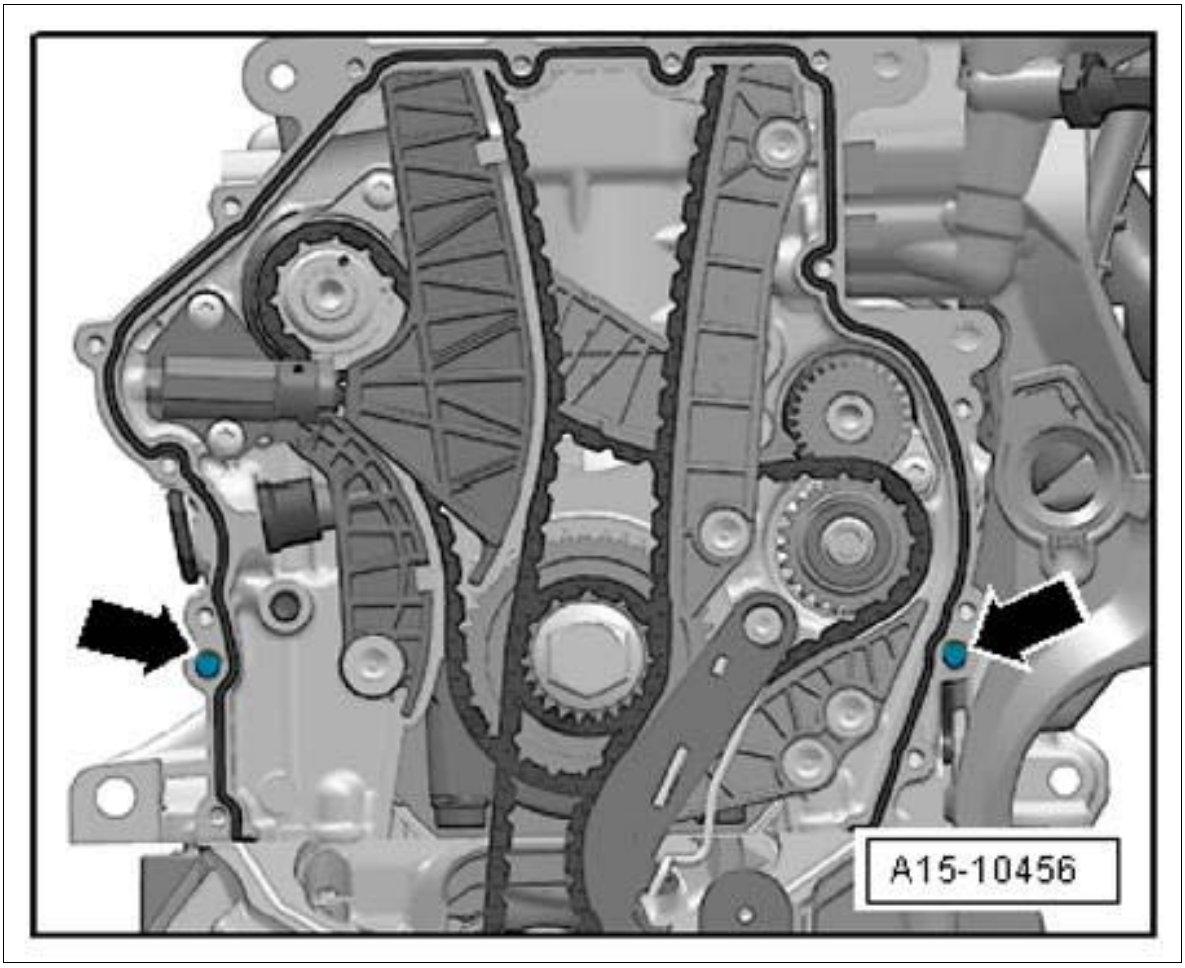
WM 153319 REMOVING AND INSTALLING CHAIN HOUSING COVER (MACAN, MACAN S, MACAN TURBO) > INSTALLING CHAIN HOUSING COVER > INSTALLING LOWER CHAIN HOUSING COVER

Information

The lower chain housing cover must be replaced.

1. Remove sealant residue on the cylinder block using a flat scraper.
2. Clean sealing faces to remove any oil and grease.
3. Check that dowel pins for centering **-arrows-** are available.

Fig 1: Identifying Centering Chain Housing Cover Dowel Pins



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Cut off the nozzle on the sealant tube at the front marking. (The nozzle diameter is approx. 3 mm).

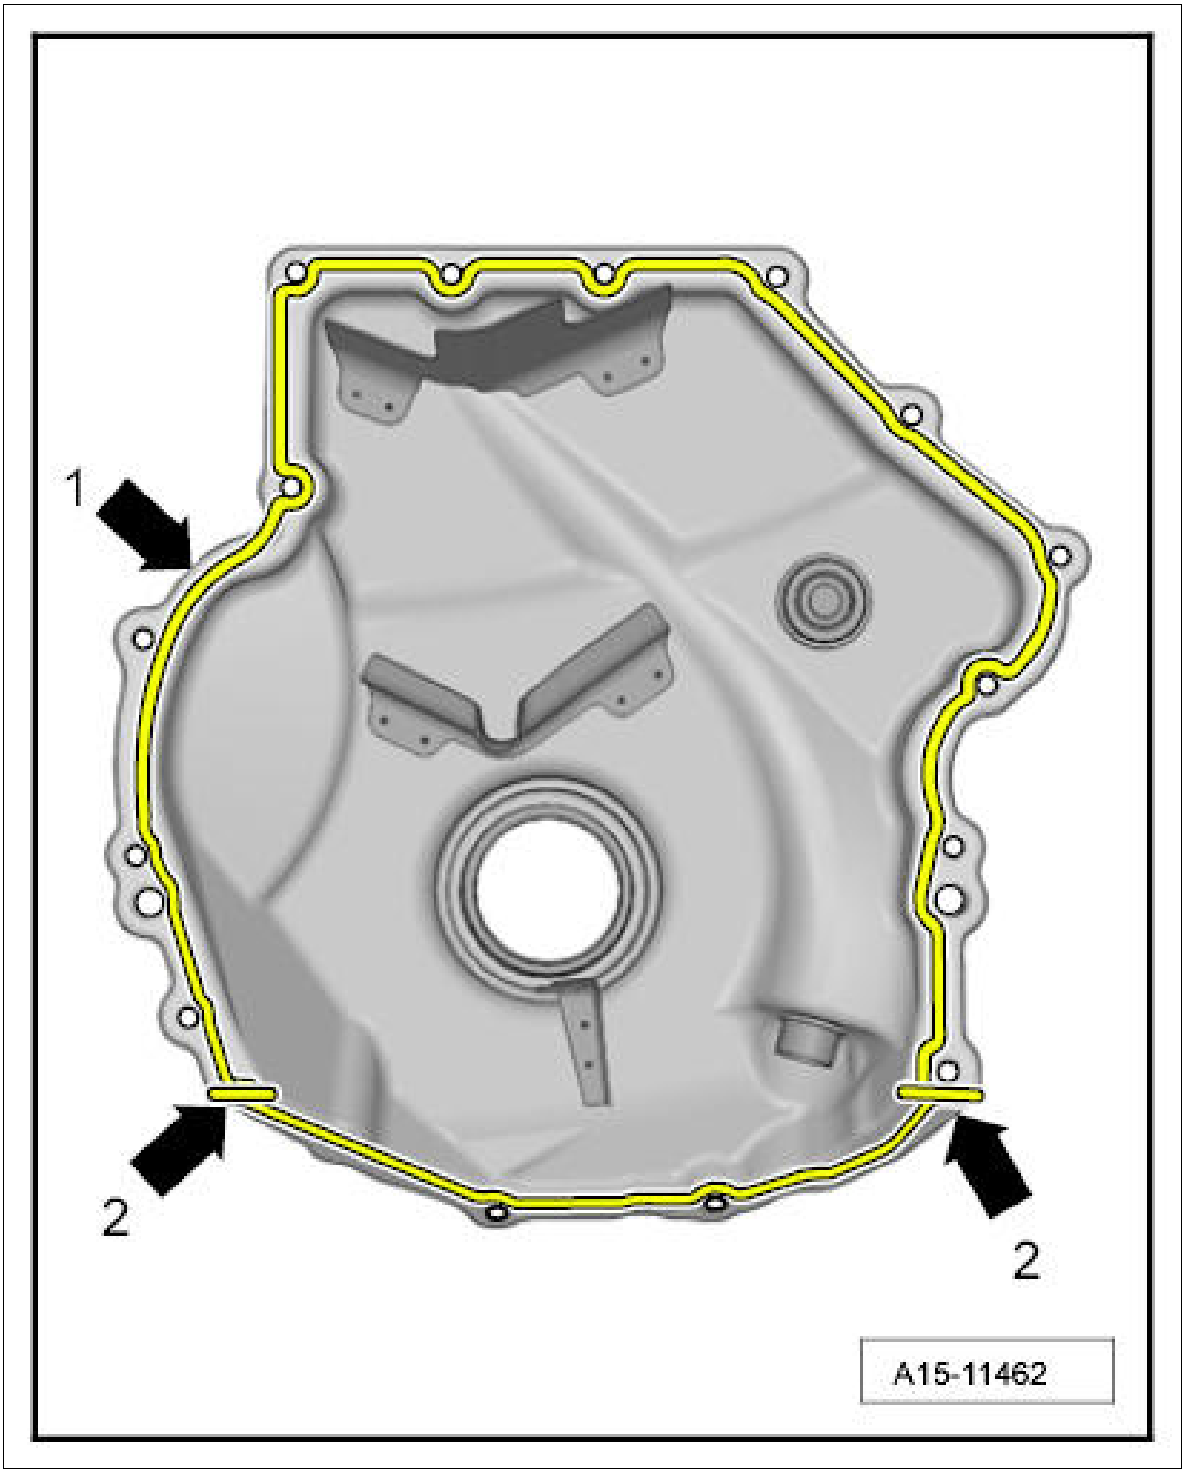
   Information

   The chain housing cover must be installed within 5 minutes of applying the sealant.

5. Apply sealant to the sealing face **-arrow 1-** and edges **-arrows 2-** of the new cover.

   Sealant bead thickness: 2...3 mm.

Fig 2: Identifying Sealant Applying Area



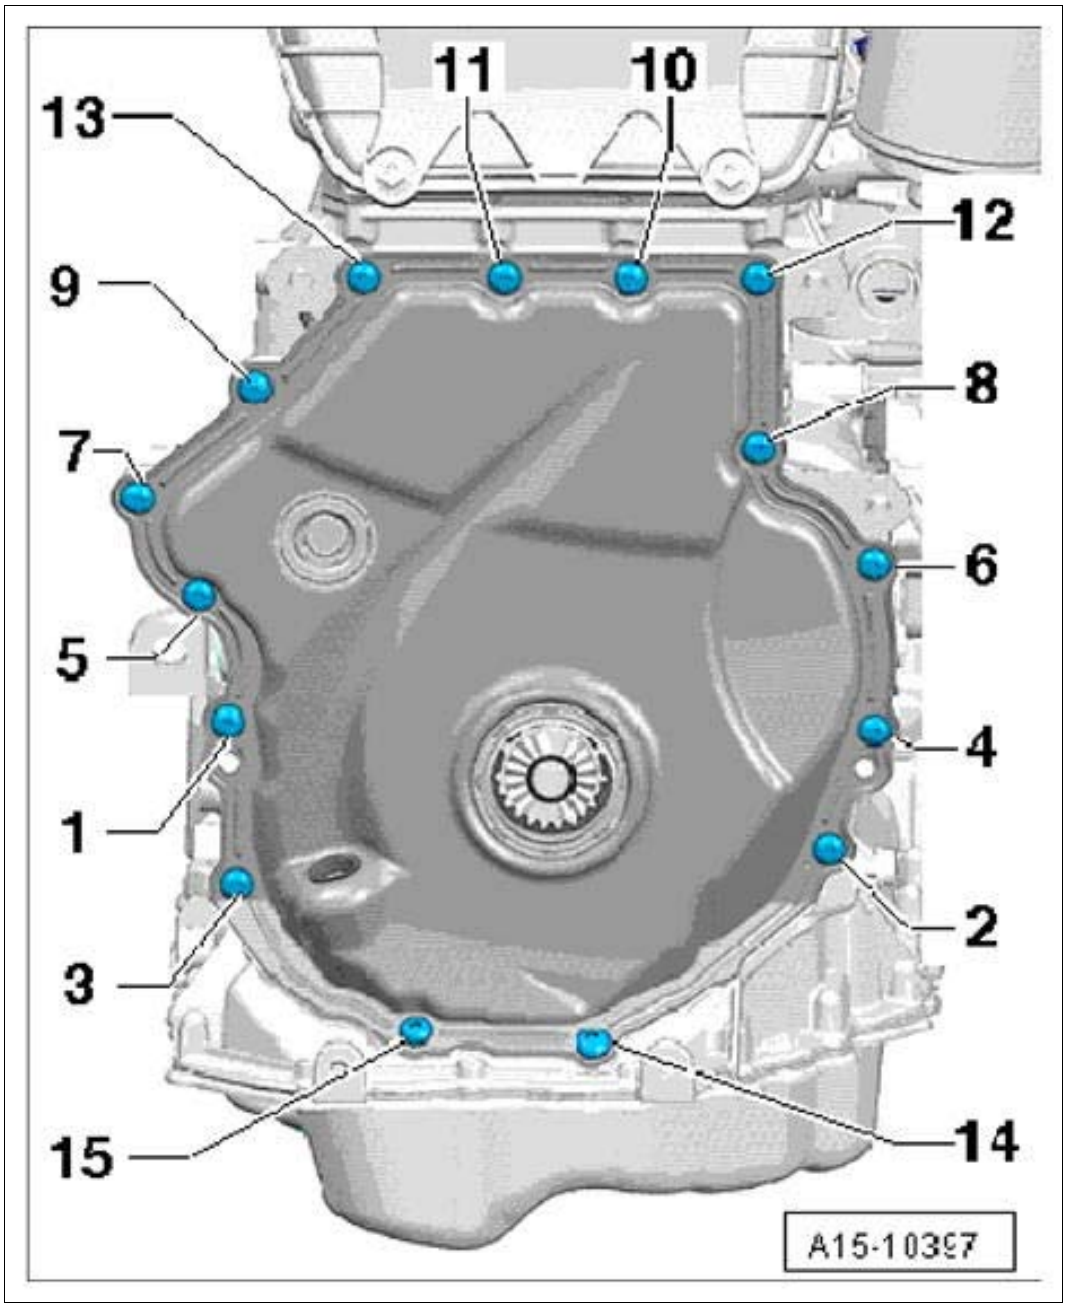
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. **Install new** chain housing cover.
    1. 6.1. Position chain housing cover and fit **new** fastening screws **-1...15-** .
    2. 6.2. Tighten fastening screws in the sequence **-1...15-** .

        Step 1: **Initial tightening 8 Nm (6 ftlb.)**

Step 2: **Final tightening +45°**

Fig 3: Identifying Lower Chain Housing Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Secure the coolant line.

    1. 7.1. Install guide tube for oil dipstick **-4-** with a new seal.
    2. 7.2. Fit and tighten fastening screw **-1-** . **Tightening torque 9 Nm (6.5 ftlb.)**

WM 155519 REMOVING AND INSTALLING HYDRAULIC VALVE FOR VALVE LIFT SWITCHOVER (MACAN S, MACAN TURBO) > PRELIMINARY WORK

Information

Guided Fault Finding using the PIWIS Tester as well as the DME short test "Valve lift" must be performed before replacing the hydraulic valve. This is essential in order to avoid replacing the hydraulic valve unnecessarily.

The hydraulic valves are on the rear side of the cylinder heads facing the plenum panel.

1. Remove cross panel. → 508119 REMOVING AND INSTALLING CROSS PANEL (DISASSEMBLING PLENUM PANEL) .
2. **Cylinder bank 1 to 3:**

   Remove vacuum pump → 477619 REMOVING AND INSTALLING VACUUM PUMP .
3. **Cylinder bank 4 to 6:**

   Disconnect coolant pipe.

   1. 3.1. Loosen coolant pipe holder.

WM 155519 REMOVING AND INSTALLING HYDRAULIC VALVE FOR VALVE LIFT SWITCHOVER (MACAN S, MACAN TURBO) > REMOVAL > REMOVING HYDRAULIC VALVE FOR VALVE LIFT SWITCHOVER

1. Disconnect electric plug connection on the hydraulic valve **-3-** .
2. Loosen fastening screws **-4-** .
3. Pull hydraulic valve **-3-** out of the cylinder head.

   1. 3.1. Make sure that the sealing ring is also removed.

Fig 1: Identifying Valve Drive Components (Cylinders 1-3)

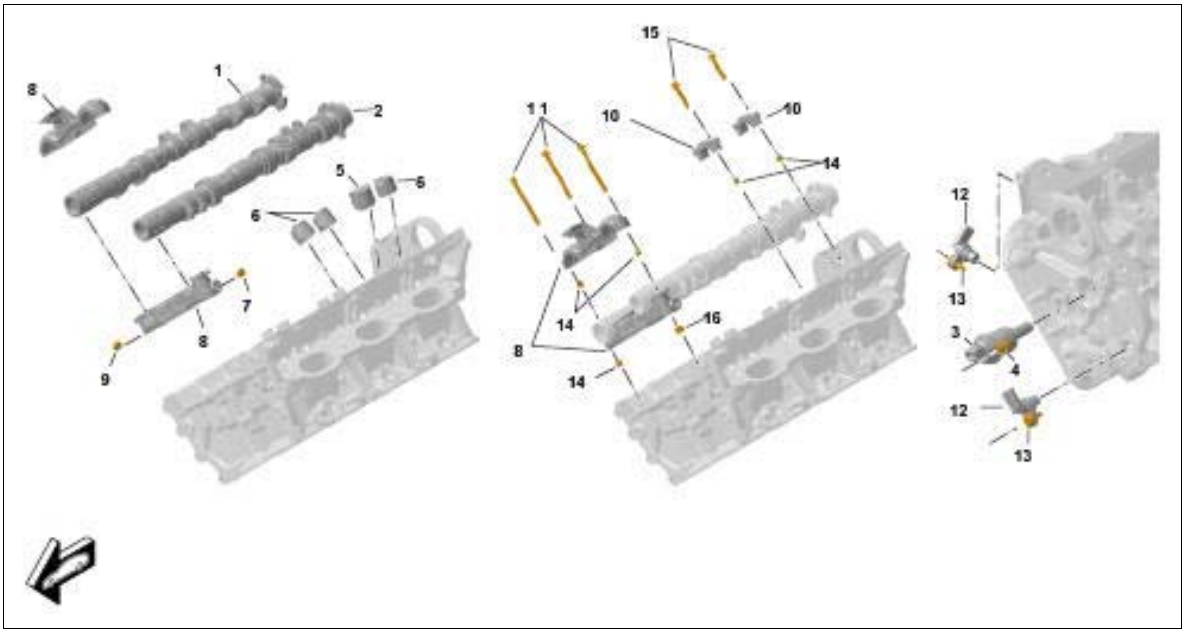
WM 155519 REMOVING AND INSTALLING HYDRAULIC VALVE FOR VALVE LIFT SWITCHOVER (MACAN S, MACAN TURBO) > INSTALLATION > INSTALLING HYDRAULIC VALVE FOR VALVE LIFT SWITCHOVER

1. Install hydraulic valve **-3-** with new sealing ring in correct position.

   Sealing ring must not slip out of place.

2. Fit and tighten fastening screws **-4-** . **Tightening torque 6 Nm (4.5 ftlb.)**

Fig 1: Identifying Valve Drive Components (Cylinders 1-3)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 155519 REMOVING AND INSTALLING HYDRAULIC VALVE FOR VALVE LIFT SWITCHOVER (MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. **Cylinder bank 1 to 3:**

   Install vacuum pump → INSTALLING VACUUM PUMP .

2. **Cylinder bank 4 to 6:**

   Secure coolant pipe.

   1. 2.1. Secure coolant pipe holder.

3. Remove cross panel. → 508119 REMOVING AND INSTALLING CROSS PANEL (DISASSEMBLING PLENUM PANEL)

WM 156355 REPLACING VALVE-STEM SEALS (MACAN) > PRELIMINARY WORK

Information

The new valve stem seals have a plastic sleeve **-3-** .

Information

- Mark allocation of rocker arms and hydraulic compensating elements for re-installation.
- Rocker arms must be set aside in such a way that they cannot be mixed up.

- Remove rocker arms together with the hydraulic compensating elements and set them down on a clean surface.

    1. Remove spark plugs. → 287020 REMOVING AND INSTALLING SPARK PLUGS
    2. Remove camshafts. → 150520 REMOVING AND INSTALLING CAMSHAFTS
    3. Take hydraulic tappets and rocker arms out of the cylinder head.

WM 156355 REPLACING VALVE-STEM SEALS (MACAN) > REMOVING VALVE-STEM SEALS

Information

Set pistons of the respective cylinder to **bottom dead center** .

1. Screw guide plate **-VAS 5161/19B-** with the knurled screws **-VAS 5161/12-** on the cylinder head as shown.

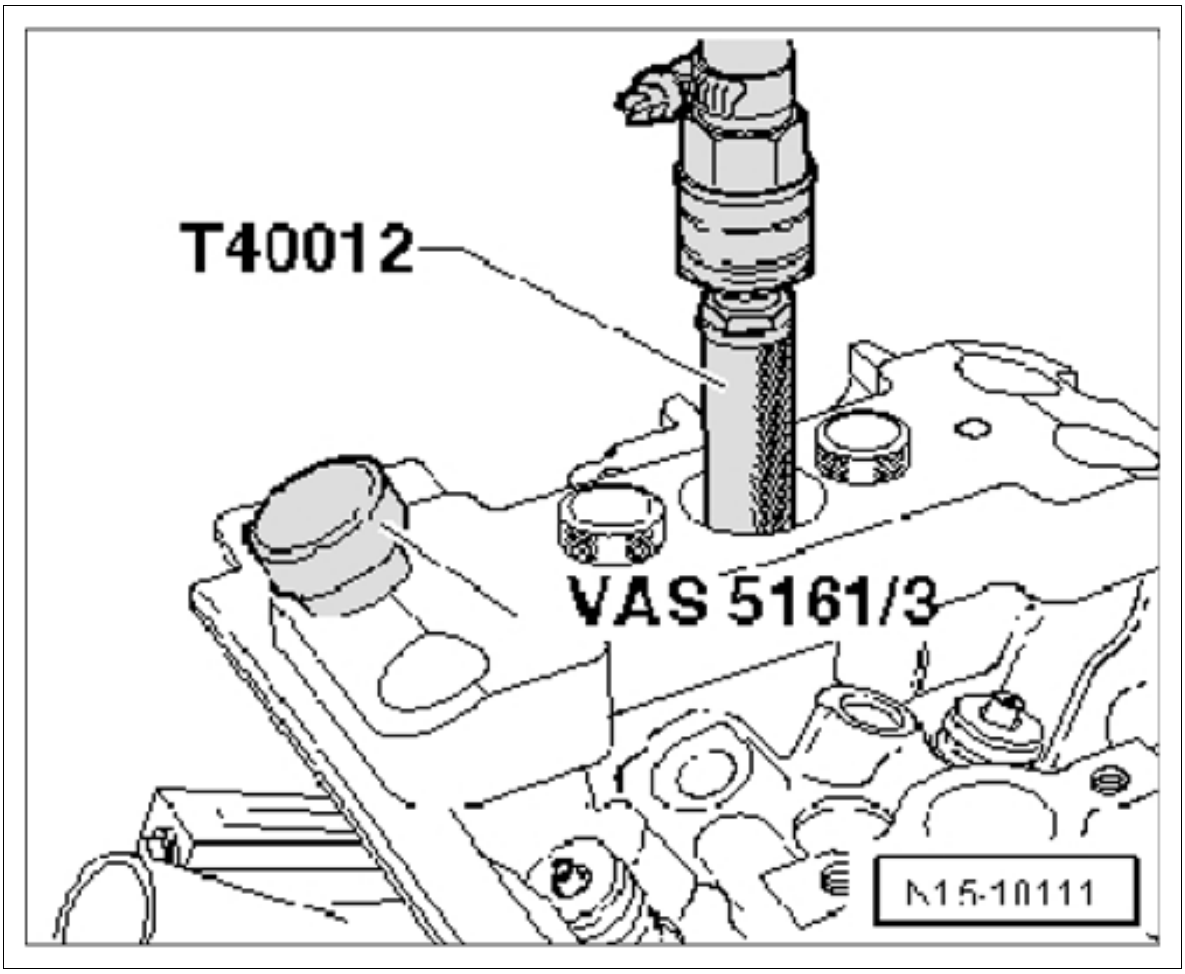
   Fig 1: Identifying Guide Plate 1

   
   Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Screw adapter **-T40012-** into the spark plug thread.

3. Connect compressed air of at least 6 bar overpressure.
4. Loosen any tight valve collets using the impact mandrel **-VAS 5161/3-** and a plastic hammer.

Fig 2: Identifying Adapter

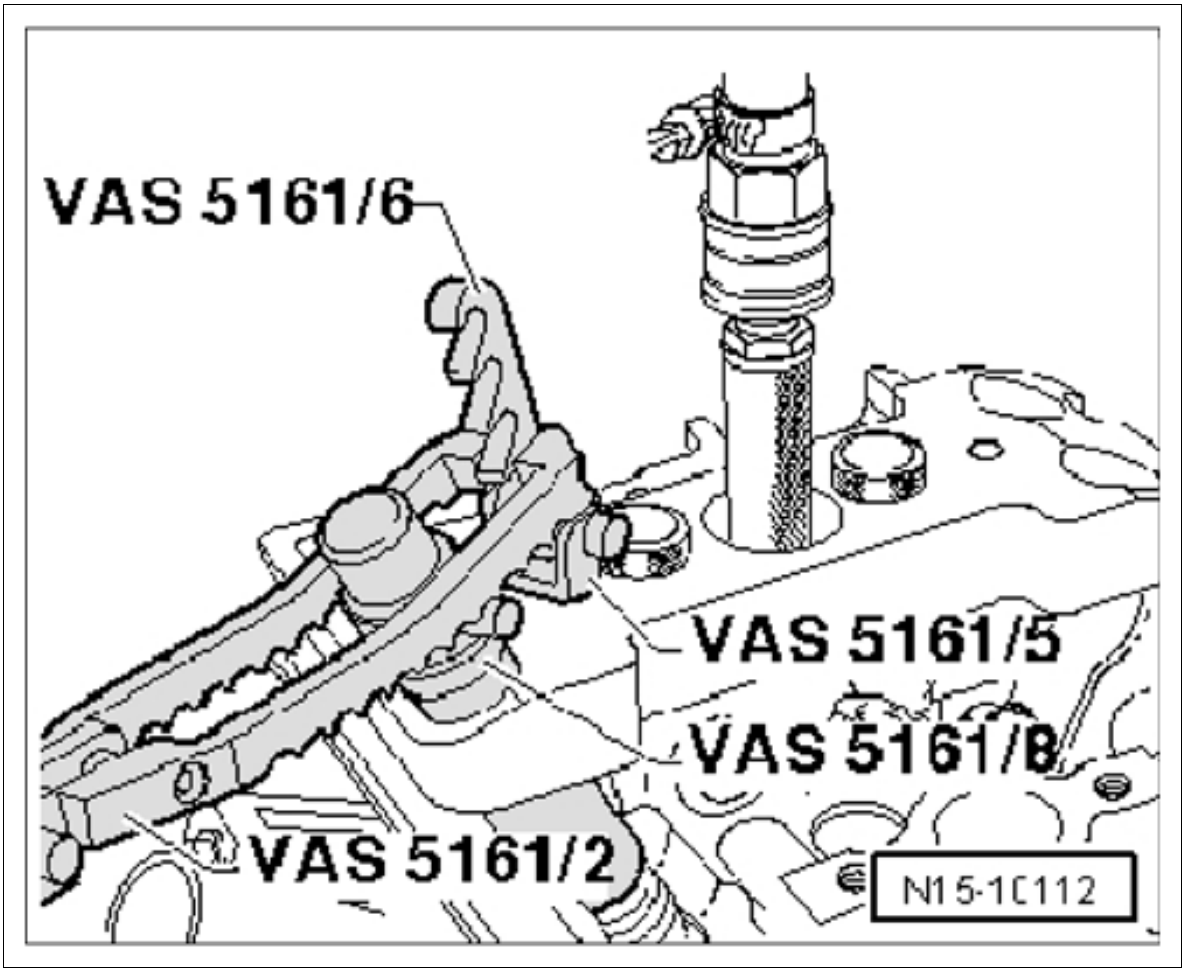


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

For intake side

5. Screw retainer **-VAS 5161/6-** with attachment fork **-VAS 5161/5-** into the center thread of the guide plate **-VAS 5161/19B-** .
6. Fit assembly cartridge **-VAS 5161/8-** into the guide plate **-VAS 5161/19B-** .
7. Engage pressure fork **-VAS 5161/2-** on the retainer **-VAS 5161/6-** .

Fig 3: Identifying Retainers

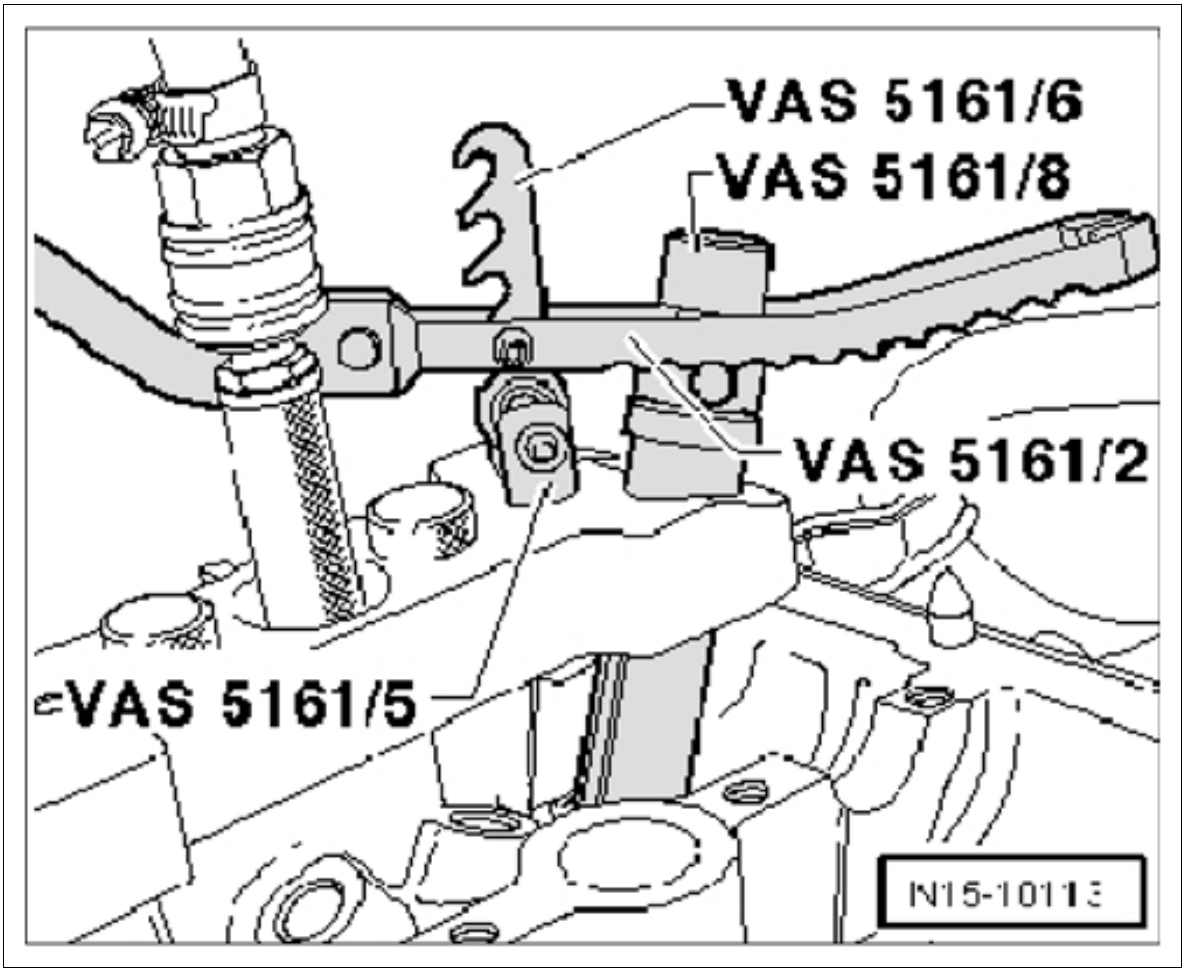


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

For outlet side

8. Screw retainer **-VAS 5161/6-** with attachment fork **-VAS 5161/5-** into the outer thread of the guide plate **-VAS 5161/19B-** .
9. Press assembly cartridge **-VAS 5161/8-** down and turn the knurled screw for the assembly cartridge **-VAS 5161/8-** to the right at the same time until the tips engage in the valve collets.
10. Move knurled screw back and forth slightly to press the valve collets apart and engage them in the assembly cartridge.
11. Release pressure fork **-VAS 5161/2-** .
12. Remove assembly cartridge **-VAS 5161/8-** .

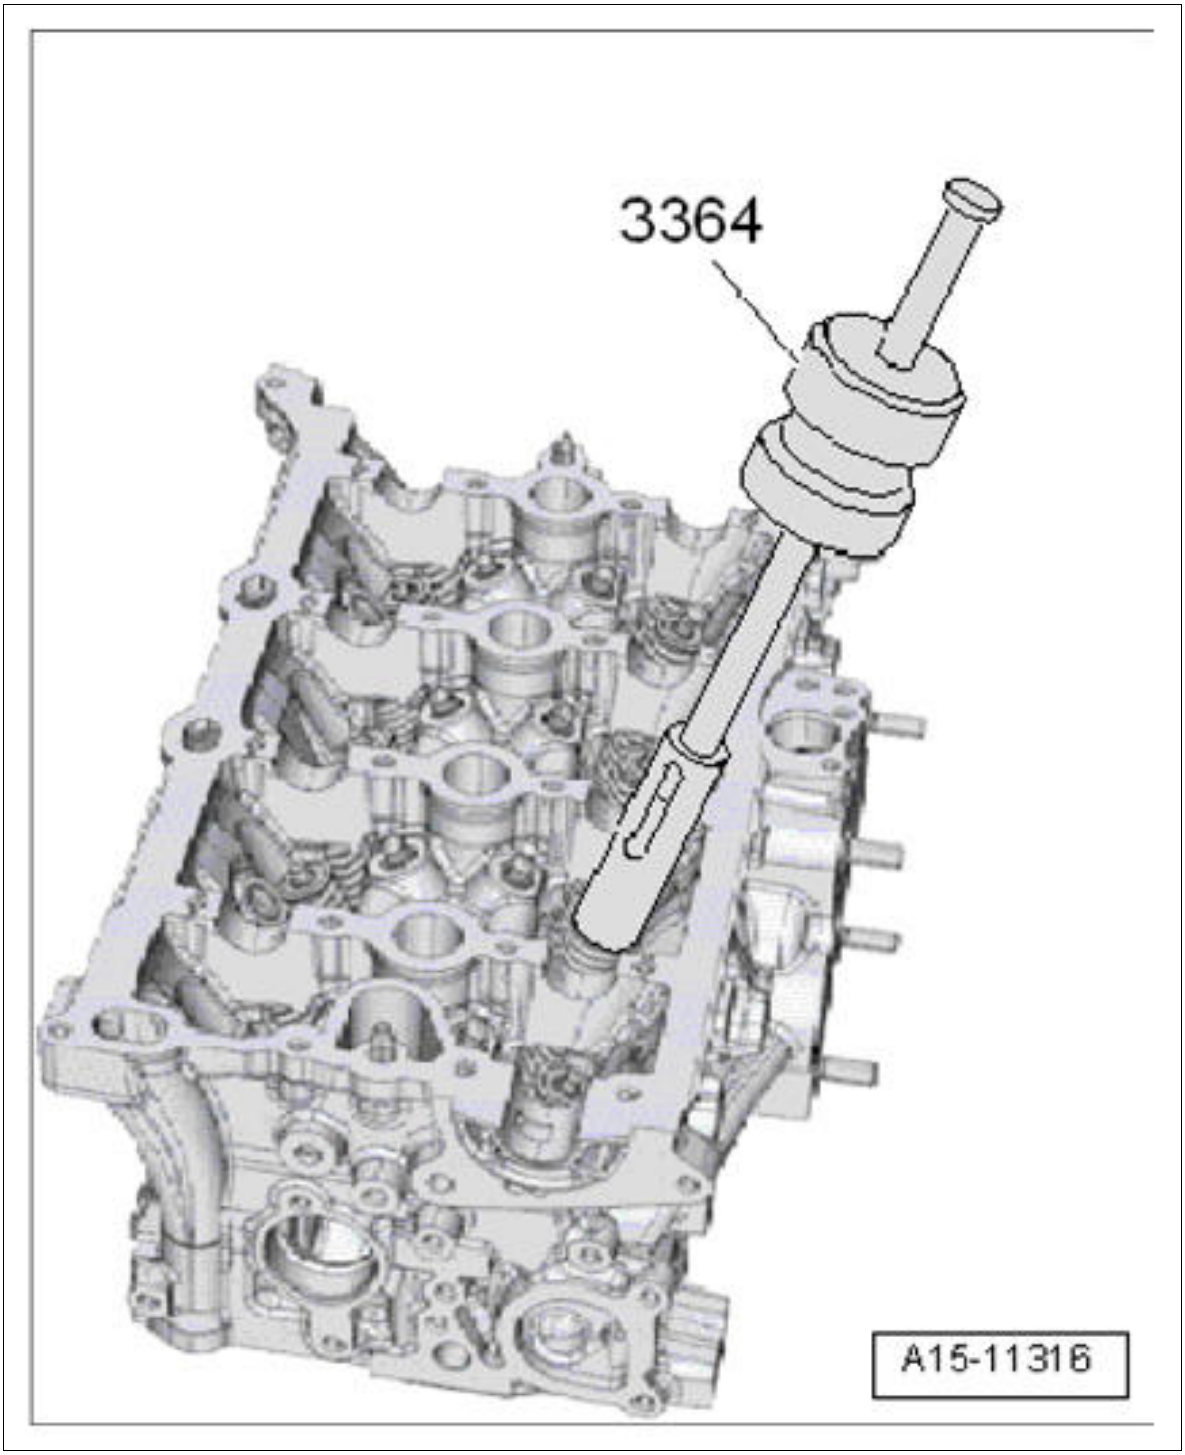
Fig 4: Identifying Assembly Cartridge



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

13. Pull off valve stem seals using valve-stem seal puller **-3364-** .

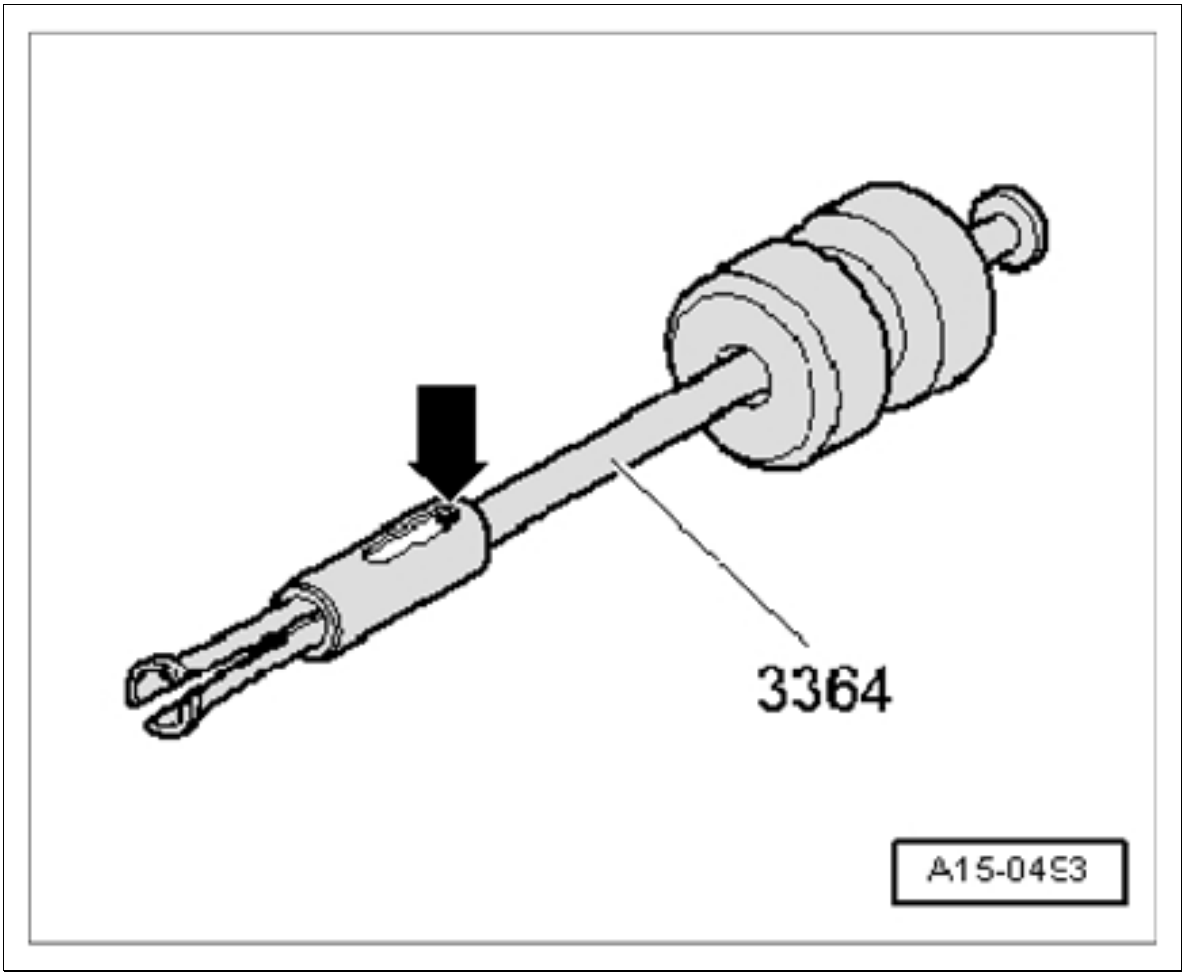
Fig 5: Identifying Puller



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. If you cannot use the valve-stem seal puller **-3364-** due to lack of space, tap out the roll pin **-arrow-** using a mandrel and remove the puller attachment.

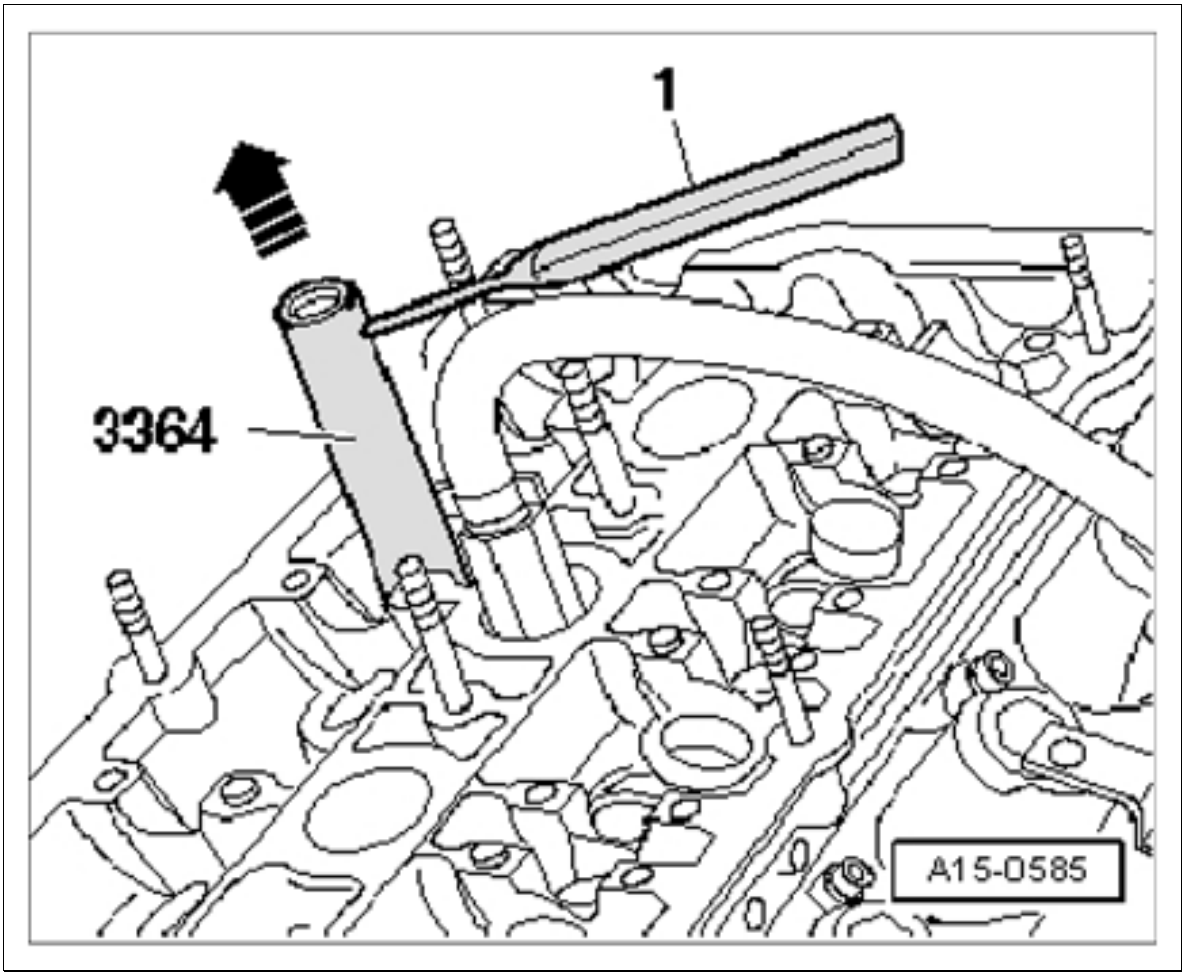
Fig 6: Identifying Puller



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

15. Fit lower part of valve-stem seal puller **-3364-** on the valve stem seal.
16. Fit mandrel **-1-** into the bore in the lower part of puller.
17. Fit assembly lever on the puller and pull out the valve stem seal. **-arrow-**

Fig 7: Pulling Valve Stem Seal



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 156355 REPLACING VALVE-STEM SEALS (MACAN) > INSTALLING VALVE STEM SEALS

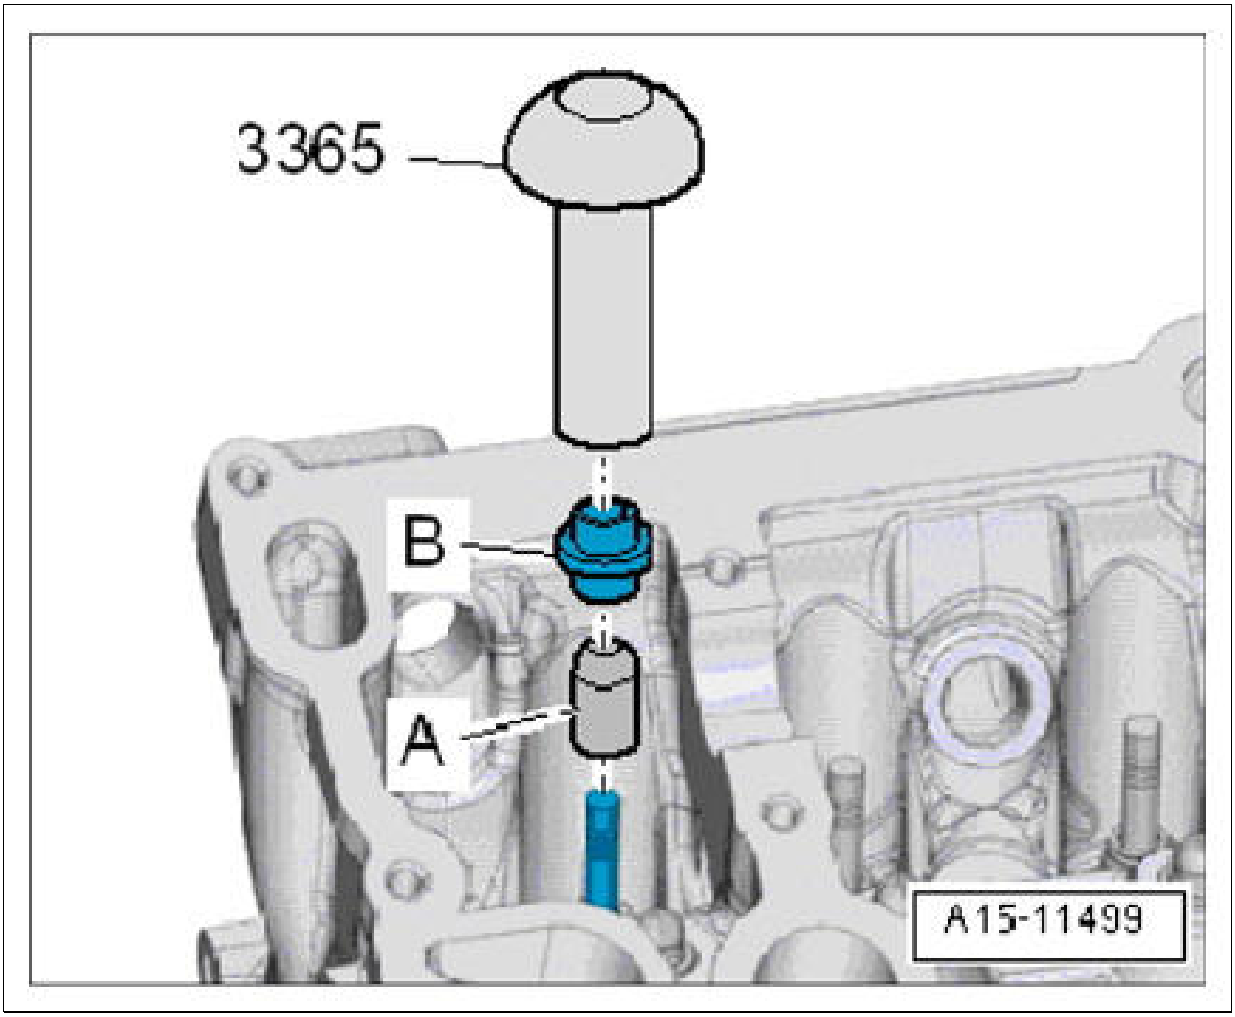
Information

Risk of damage when installing valve stem seals.

Place plastic sleeve **-A-** , included with the new valve stem seals **-B-** , onto the valve stem.

- Lightly oil sealing lip of valve stem seal.
- Slide the valve stem seal -B- onto the plastic sleeve -A- .

Fig 1: Identifying Plastic Sleeve And Stem Seal

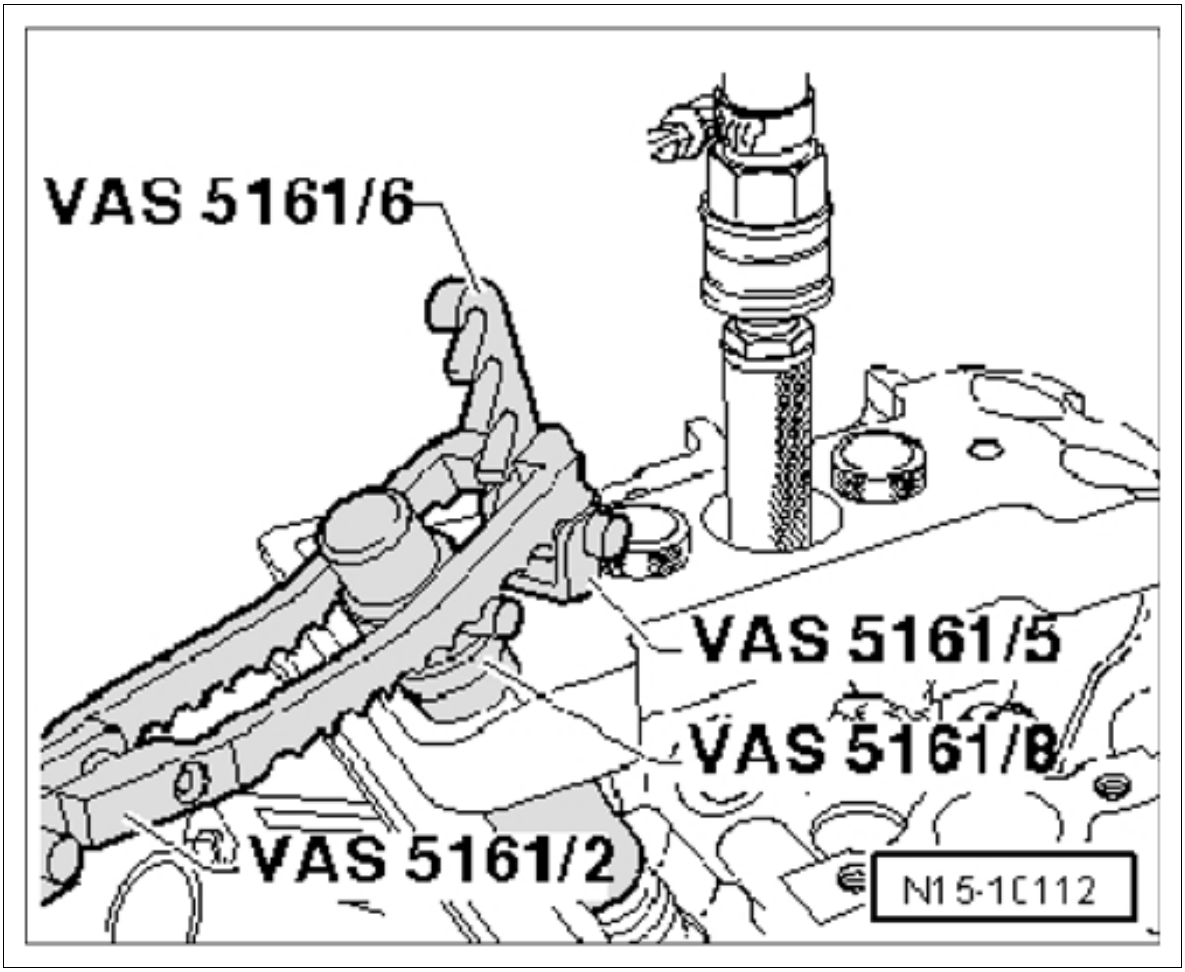


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Carefully press valve stem seal onto the valve guide using valve-stem seal fitting tool **-3365-** .
2. Remove plastic sleeve.
3. Insert valve spring and valve-spring plate.
4. Set up removal and installation device **-VAS 5161-** .

   Intake side

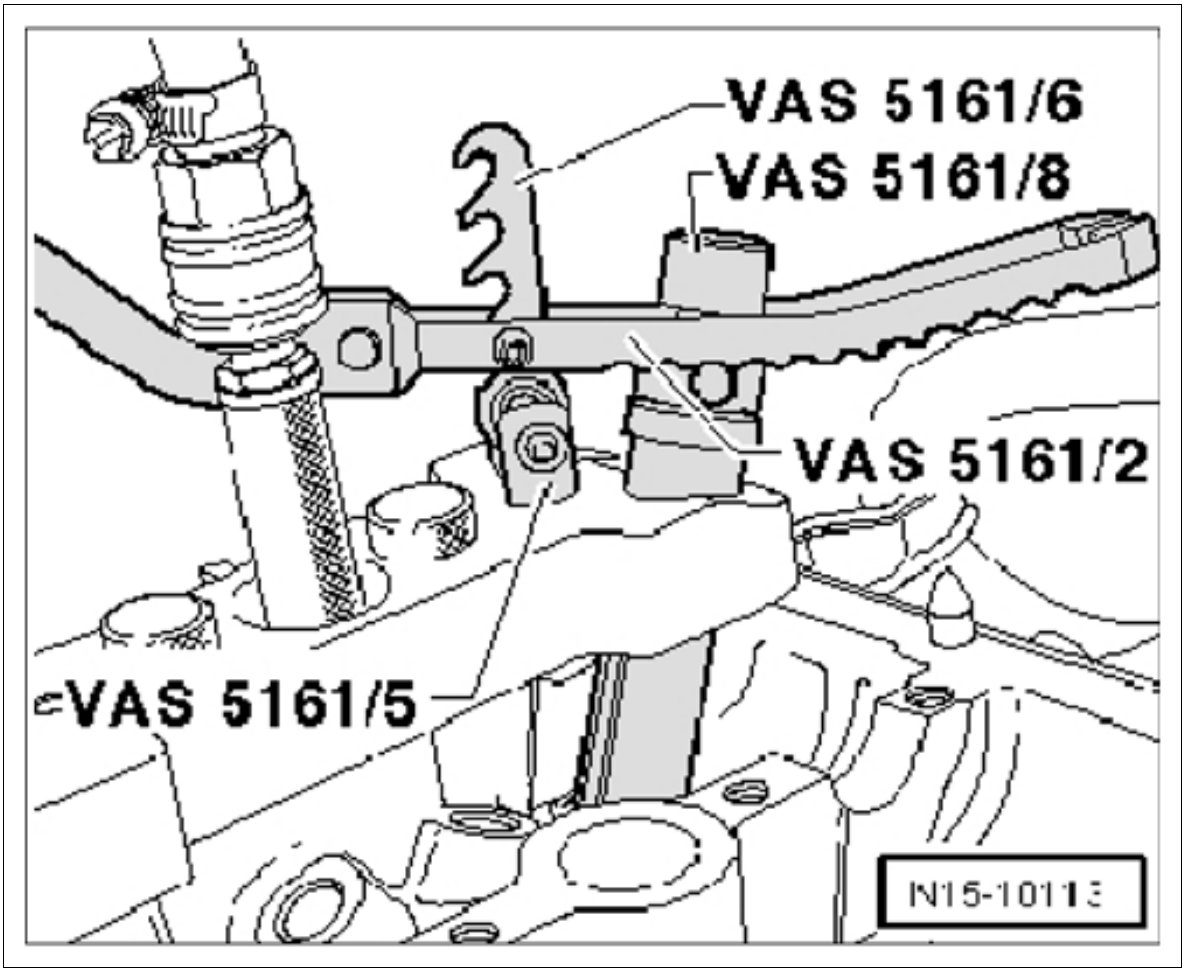
Fig 2: Identifying Retainer



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Outlet side

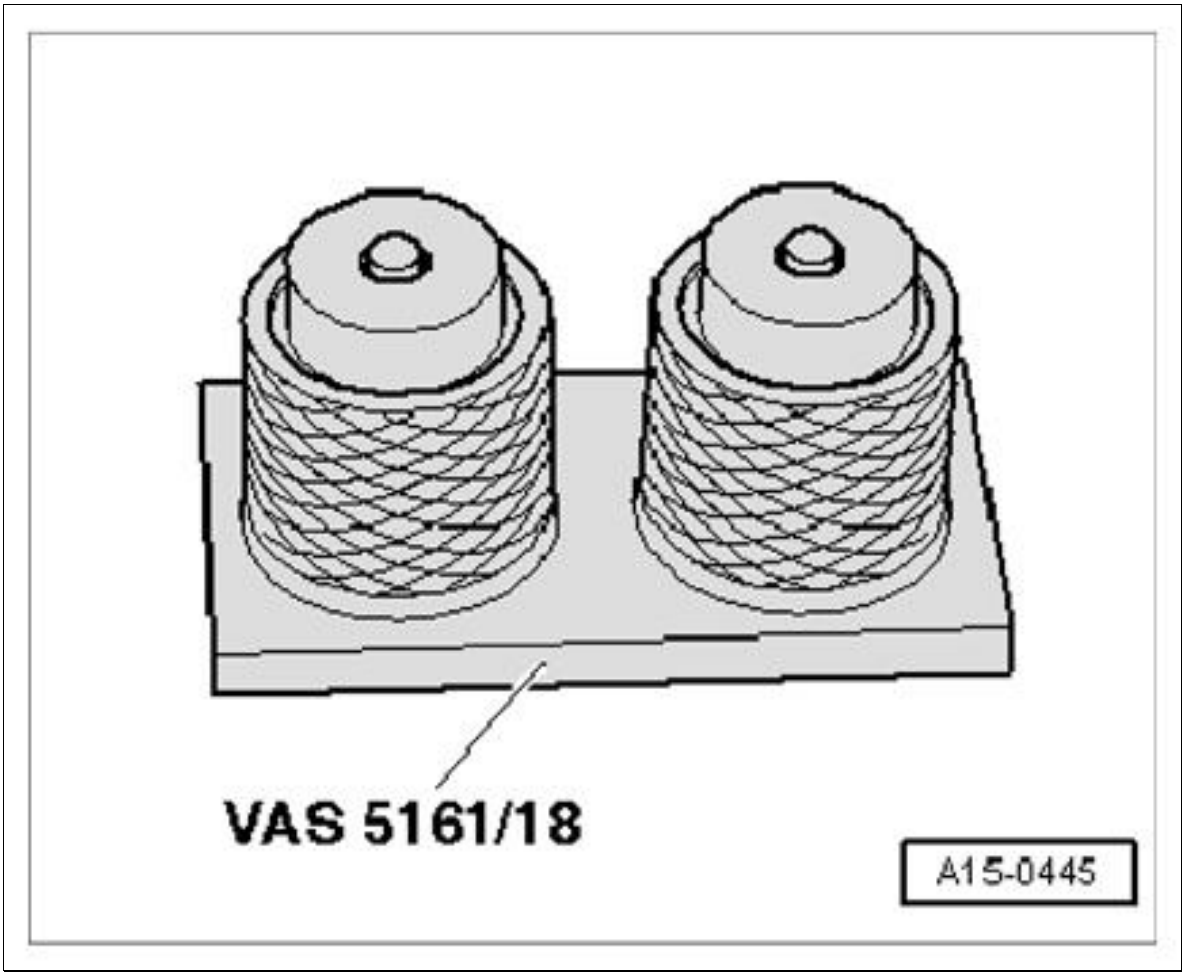
Fig 3: Identifying Assembly Cartridge



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

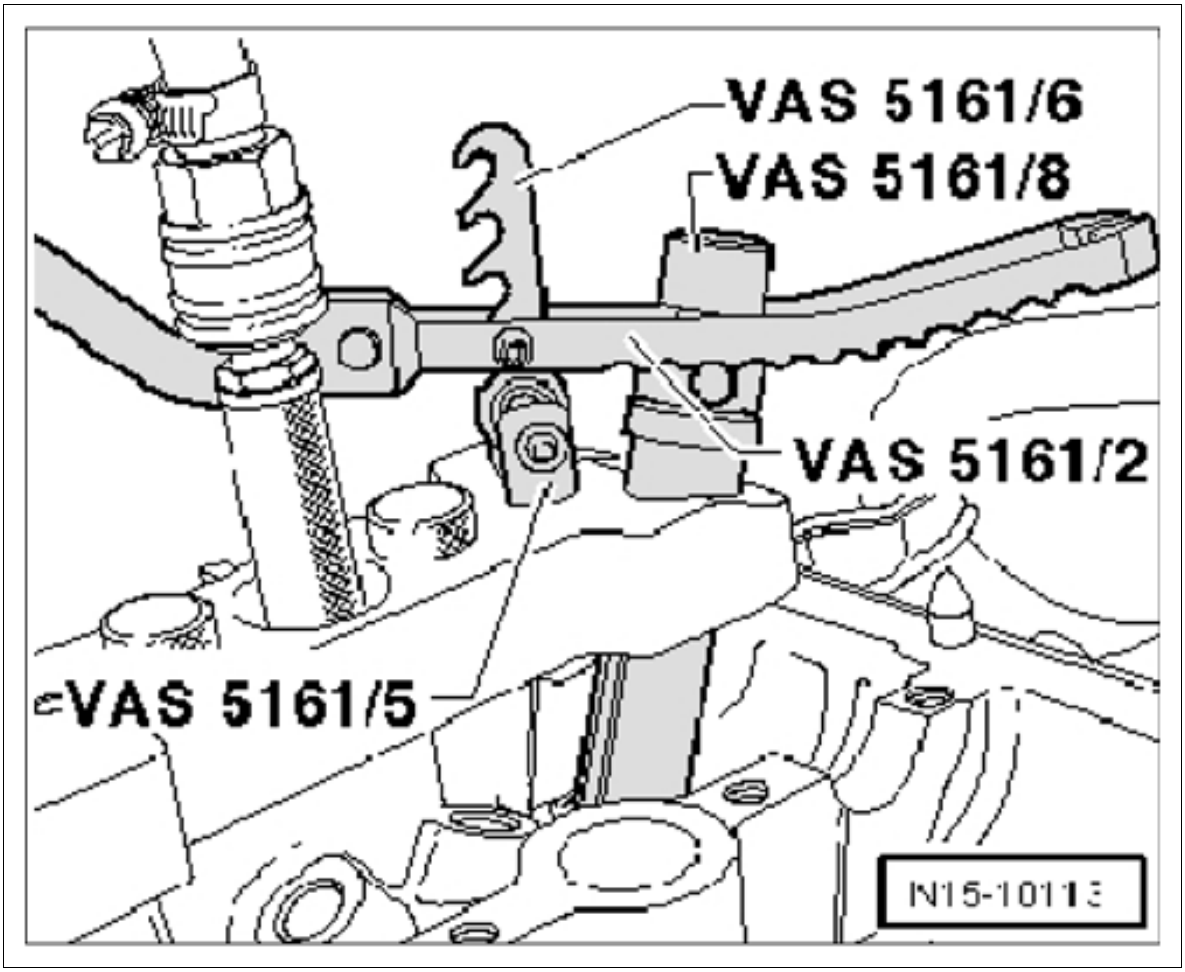
5. If the valve collets were removed from the assembly cartridge **-VAS 5161/8-** , they must first be inserted into the insertion device **-VAS 5161/18-** .
6. Press assembly cartridge **-VAS 5161/8-** onto the insertion device **-VAS 5161/18-** from above and pick up the valve collets.

Fig 4: Identifying Insertion Device



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 5: Identifying Assembly Cartridge



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Press assembly cartridge **-VAS 5161/8-** down using the pressure fork **-VAS 5161/2-** and turn knurled screw on the assembly cartridge back and forth and pull upwards at the same time.
8. Reduce pressure on the pressure fork **-VAS 5161/2-** while pulling on the knurled screw.
9. Remove removal and installation device **-VAS 5161-** .

WM 156355 REPLACING VALVE-STEM SEALS (MACAN) > SUBSEQUENT WORK

1. Fit hydraulic tappets and rocker arms on the cylinder head.
2. Install camshafts. → INSTALLING CAMSHAFTS
3. Install spark plugs. → INSTALLING SPARK PLUGS

WM 155920 REMOVING AND INSTALLING VALVE LIFTERS (MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove camshafts. → 150520 REMOVING AND INSTALLING CAMSHAFTS

WM 155920 REMOVING AND INSTALLING VALVE LIFTERS (MACAN S, MACAN TURBO) > REMOVING VALVE LIFTERS (HYDRAULIC TAPPETS)

Information

The procedure for removing and installing is described for one side as an example. The procedure for the other side is practically identical.

Information

- The pictures shown in this document may differ from the original.

Information

- If the hydraulic tappets are to be re-used, they must be marked according to installation position using a water-resistant felt-tip pen and set aside in such a way that they cannot be mixed up!
- If the hydraulic tappets are to be re-used, they must be installed at the same position!

1. Pull the hydraulic tappets out of the cylinder head one after the other → Hydraulic tappet and set them aside in such a way that they cannot be mixed up → Putting components down without mixing them up (cylinder bank 5-8 shown here as an example) .

Fig 1: Identifying Hydraulic Tappet

1. **Puller 3364** => only for removing valve-stem seals.
2. **Assembly driver 9606/1** => only for fitting valve-stem seals.
3. Universal assembly bar with universal assembly driver **Valve key fitting and removal tool Nr.54 Pos.1**
4. Hooking piece (fitting hook) with holder (several possible)
5. Plastic guide for intake and outlet valve **guide bush, 31 mm Nr.54 Pos.1A and guide bush, 28 mm Nr.54 Pos.1B**
6. Assembly fixture for valve keys
7. Assembly cartridge for valve keys
8. Assembly bar (hook) with adjustable lever

WM 156120 REMOVING AND INSTALLING VALVES (MACAN S, MACAN TURBO) > REMOVING VALVES

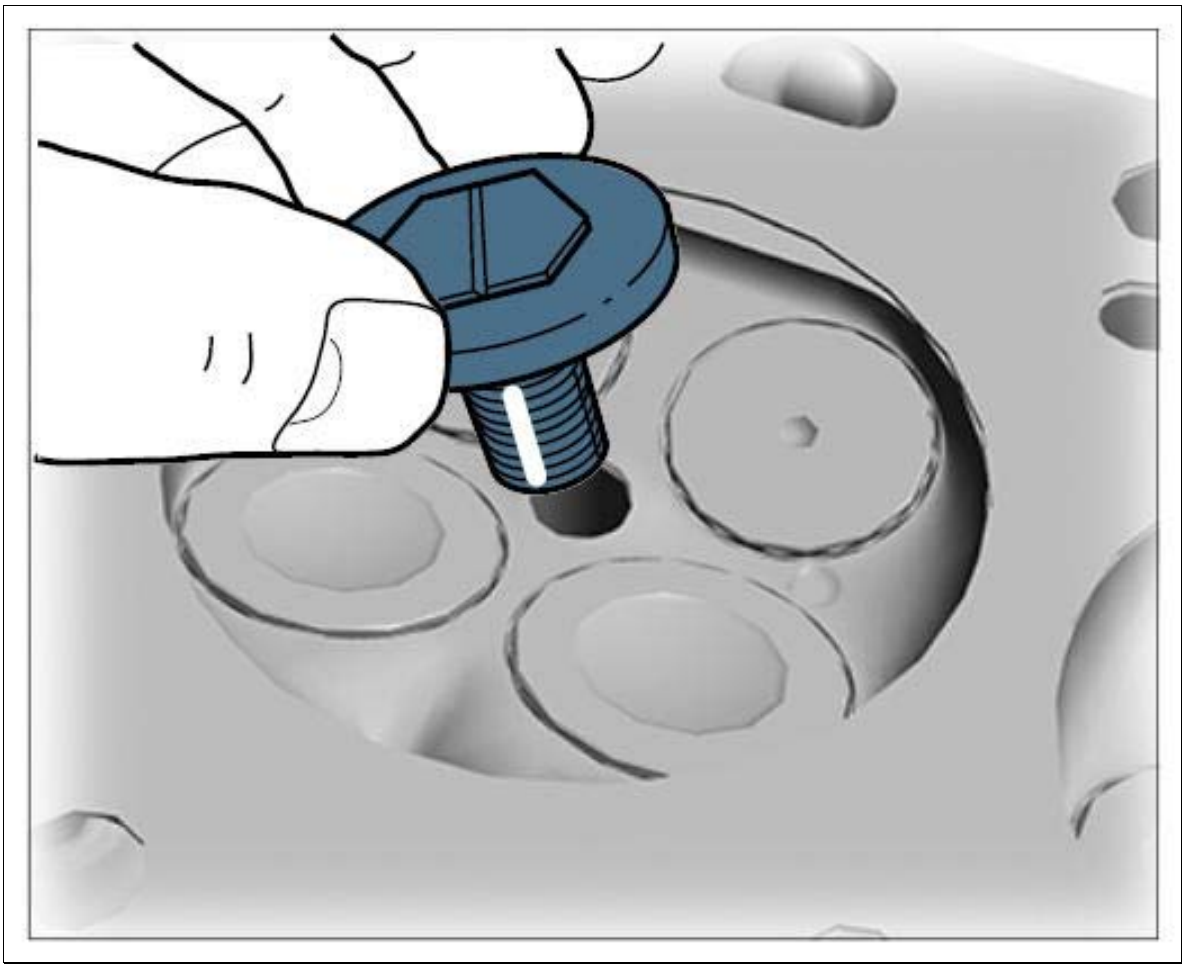
Information

- Secure the cylinder head on a level surface, which allows easy access to the valves from underneath.
- No valves should be hidden by the surface under the cylinder head.

- The cylinder head fastening must not tip over when tools are used.

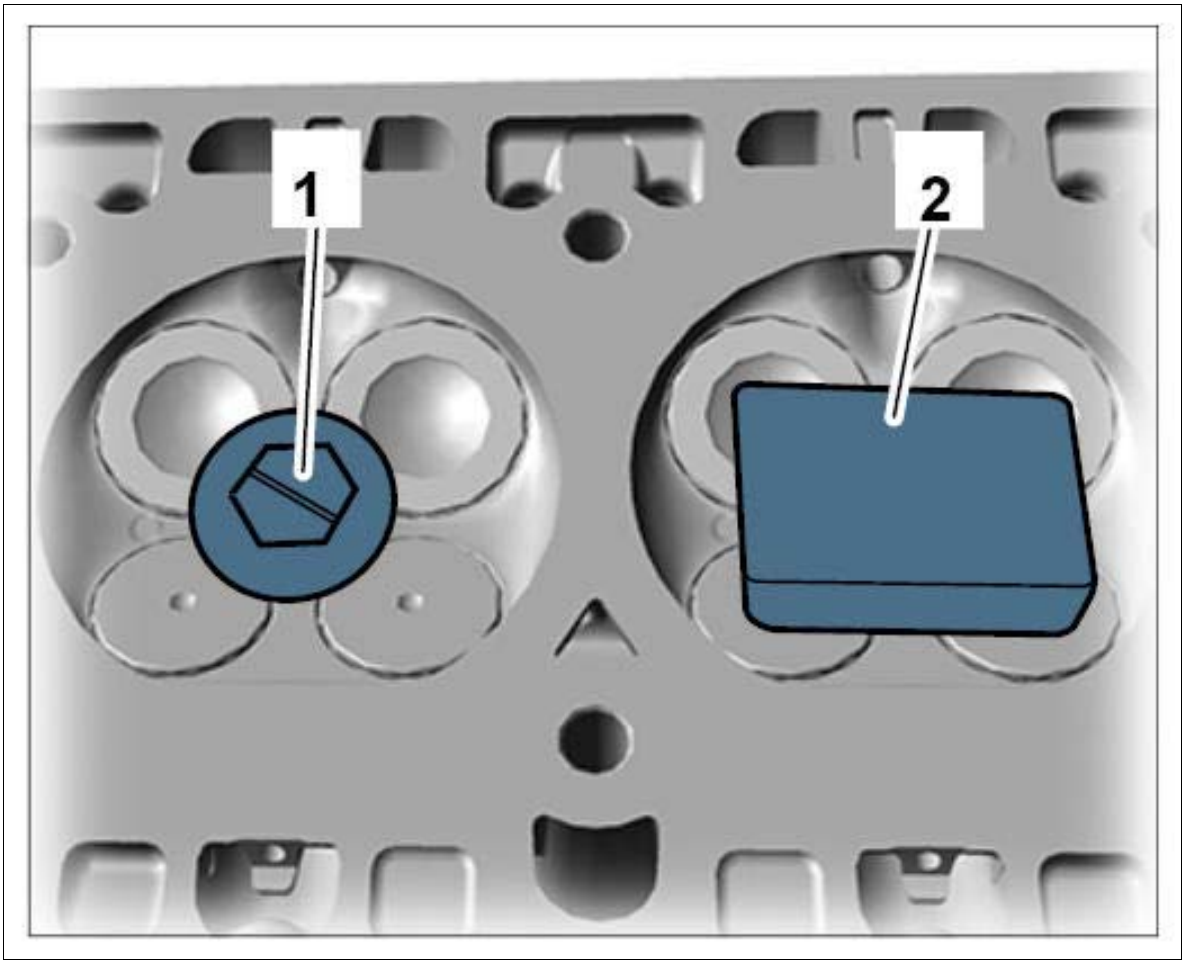
1. The spark plugs must be removed and the valve lock screwed in before the valves are removed → Screwing in tool . The valve lock prevents the valves from being opened while being pressed down. Alternatively, a rubber plate placed underneath helps if the cylinder head surface is smooth **-2-** .

   Fig 1: Installing Valve Lock Tool



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 2: Identifying Valves, Valve Lock And Rubber Plate

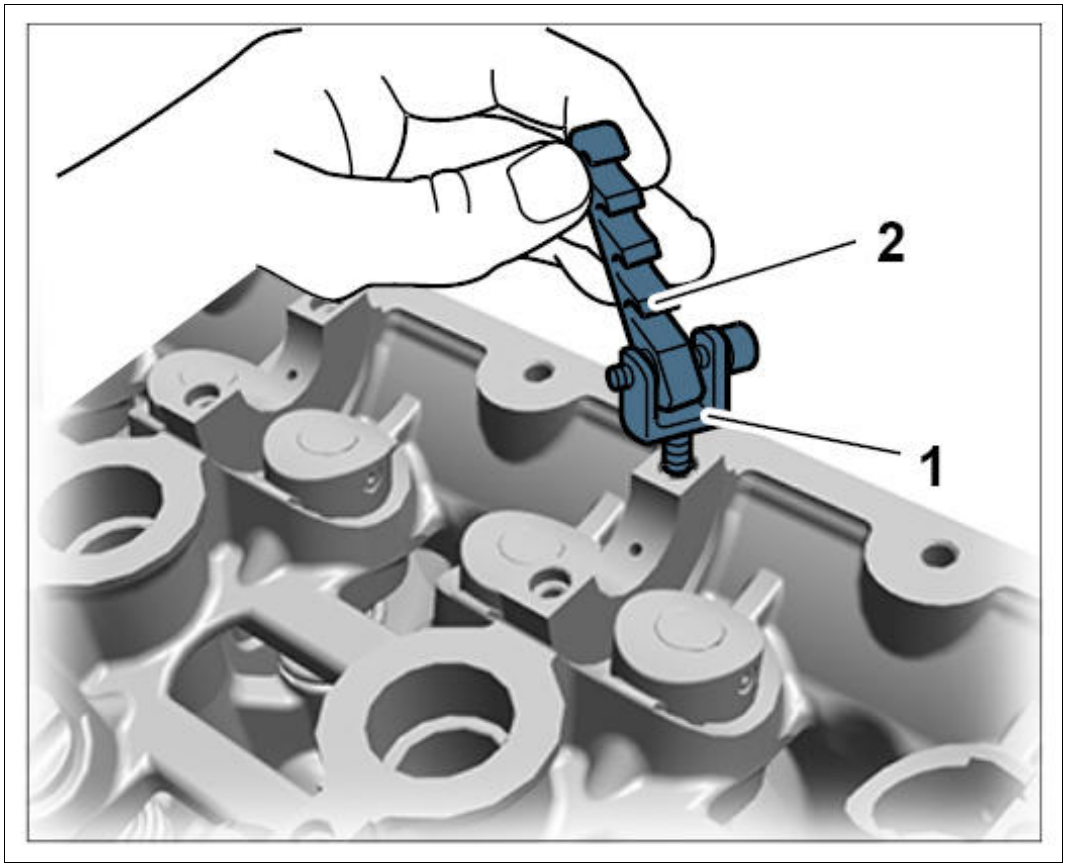


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Fit the tool on the cylinder head and adjust it.

    1. 2.1. Screw holder **-1-** with the appropriate thread into its matching thread on the cylinder head. The hook piece **-2-** is pre-fitted in the holder.

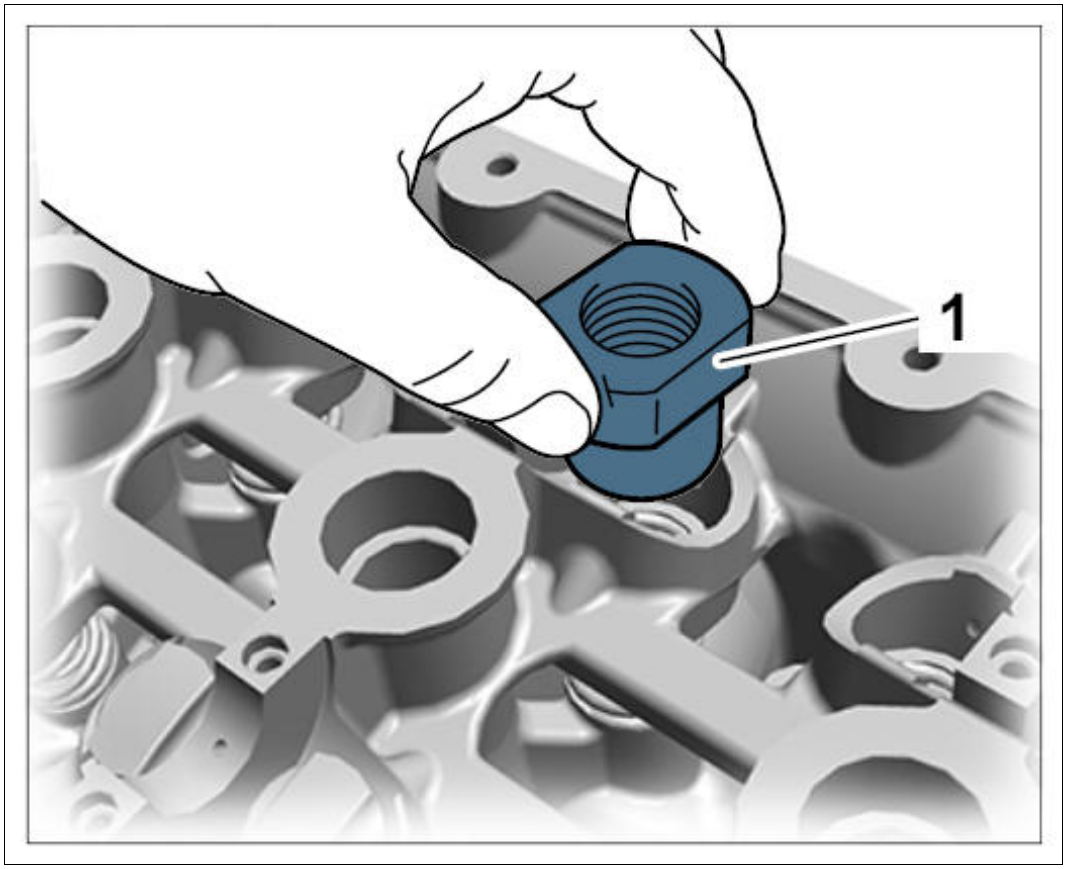
Fig 3: Fitting Tool On Cylinder Head



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 2.2. Insert a suitable plastic guide **-1-** instead of the tappet.

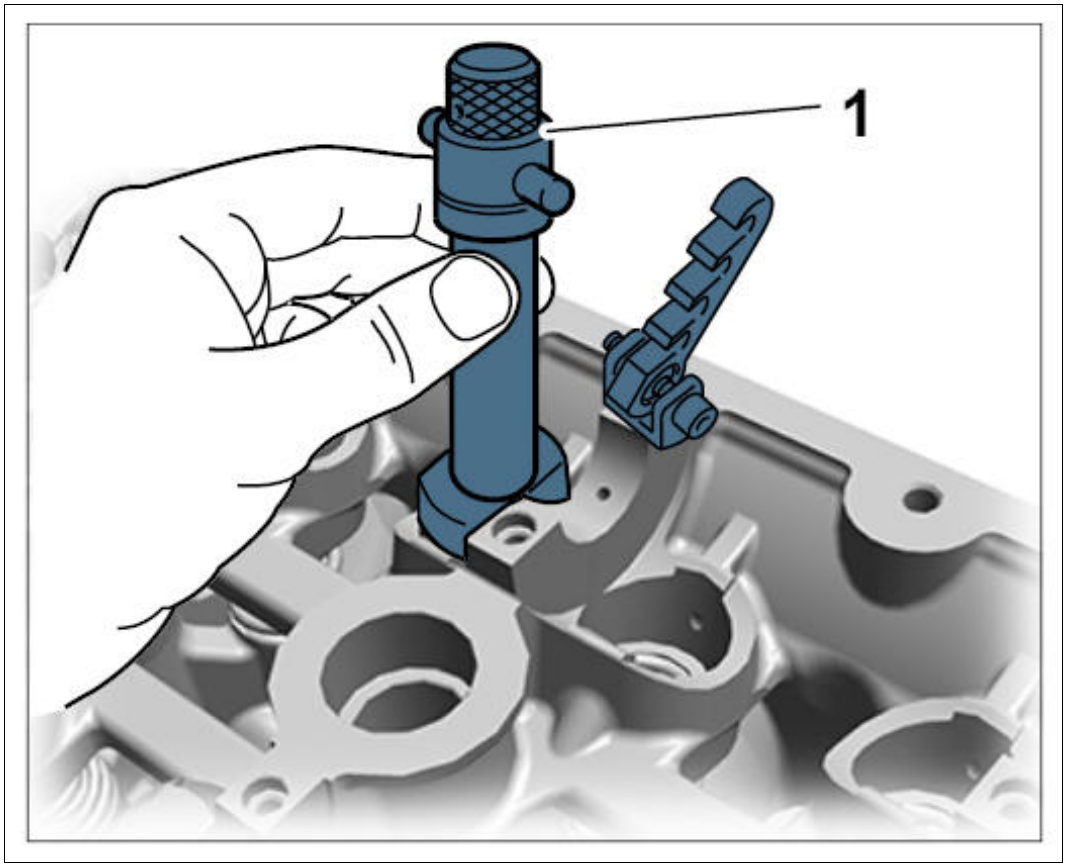
Fig 4: Inserting Plastic Guide



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 2.3. Insert assembly cartridge **-1-** for the valve keys into the plastic guide.

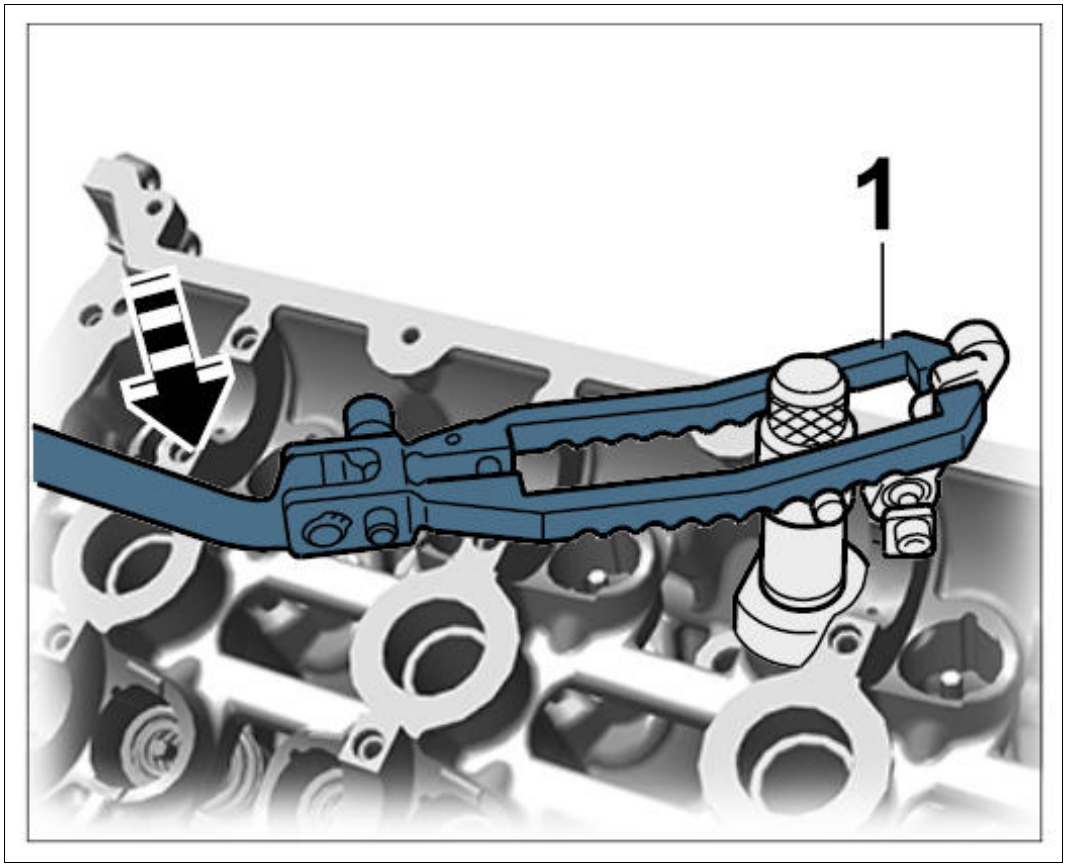
Fig 5: Inserting Cartridge Assembly



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. 2.4. Hook the lever (assembly bar) **-1-** into the hook and place correctly onto the assembly cartridge. Make sure that the tool and equipment can be used without tilting.

Fig 6: Installing Assembly Bar

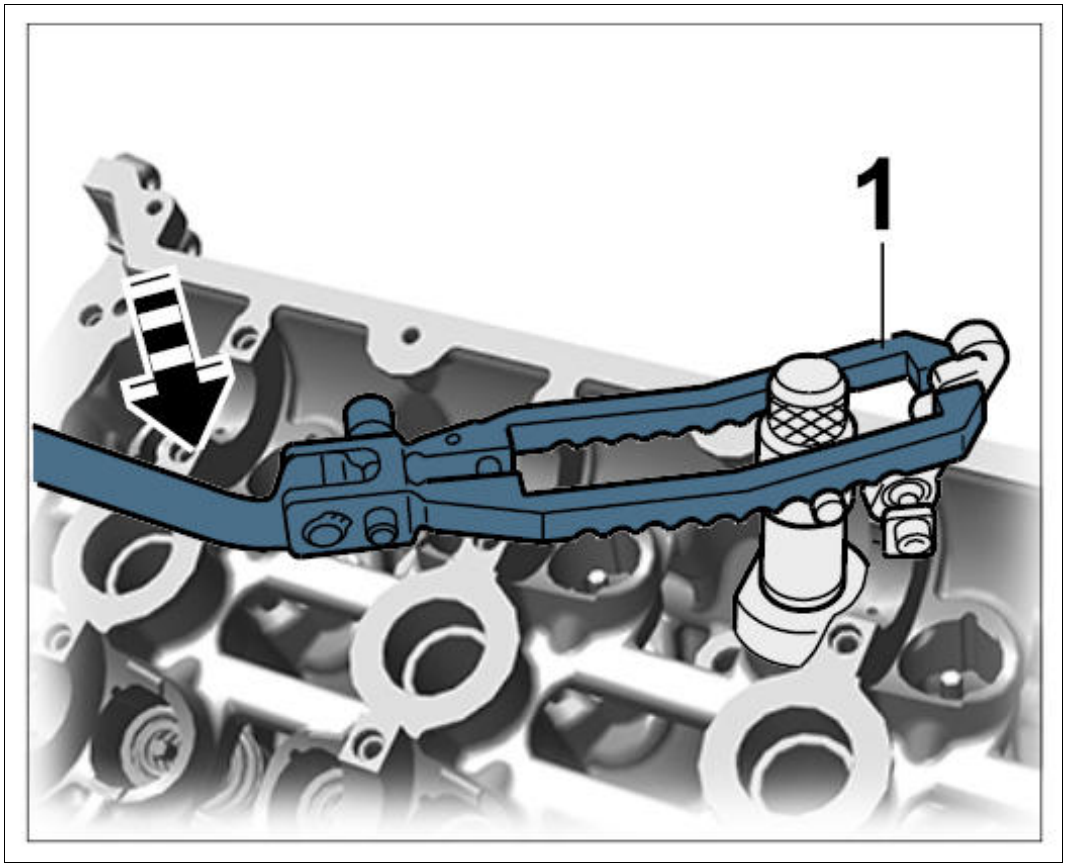


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove valve keys.

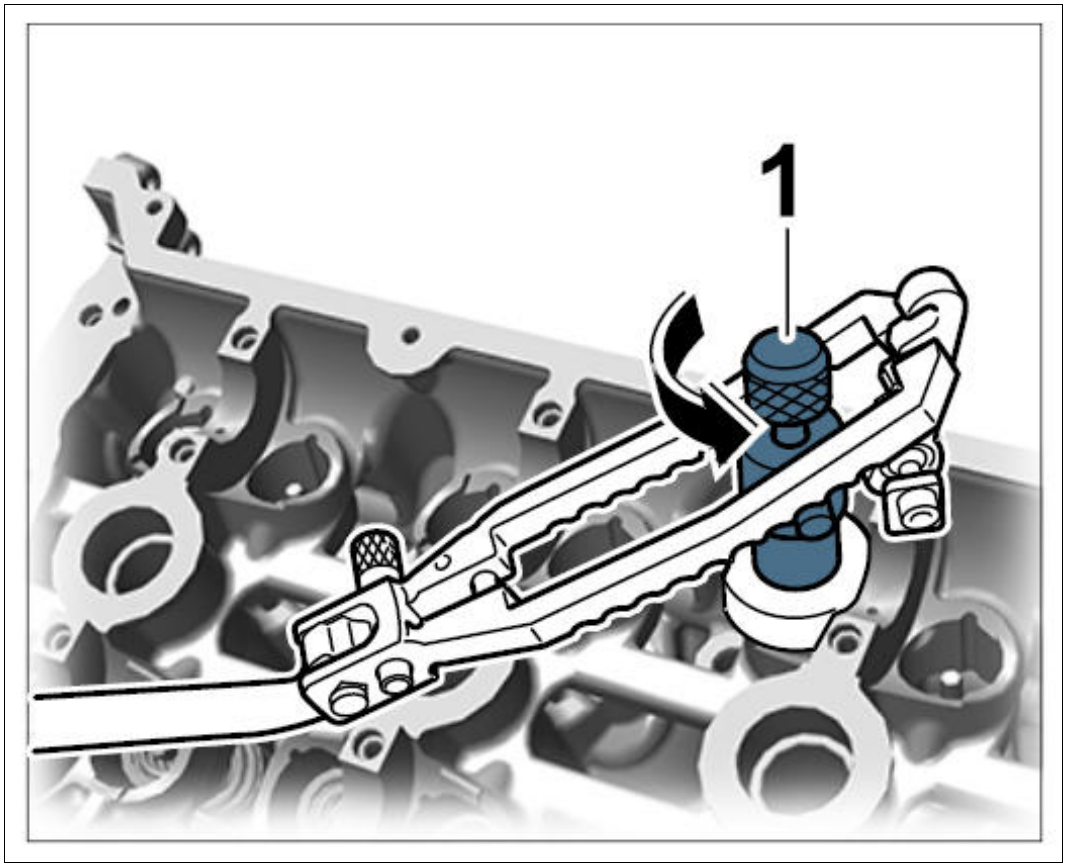
    1. 3.1. Press assembly cartridge with the lever (assembly bar) against the force of the valve spring and keep it pressed → Tool fitted correctly . The knurled screw of the assembly cartridge pushes forward **-1-** .

Fig 7: Pressing Assembly Cartridge



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 8: Pressing Down Lever And Knurled Screw



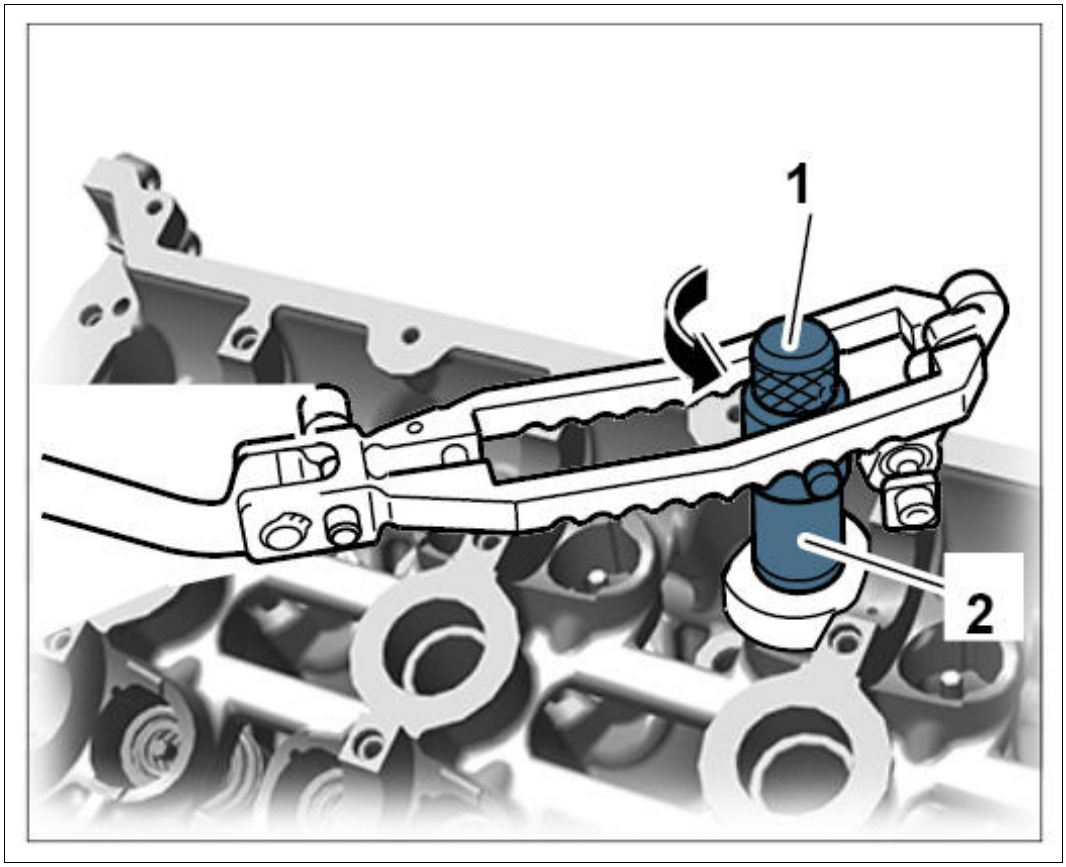
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

The mechanic must practise for use of the assembly cartridge to be effective. Some repetitions must be made to ensure that the valve keys are correctly held in place.

2. 3.2. Turn the knurled screw back and forth **-1-** until the valve keys snap into place in the assembly cartridge **-2-** and are held there. The knurled screw retracts.

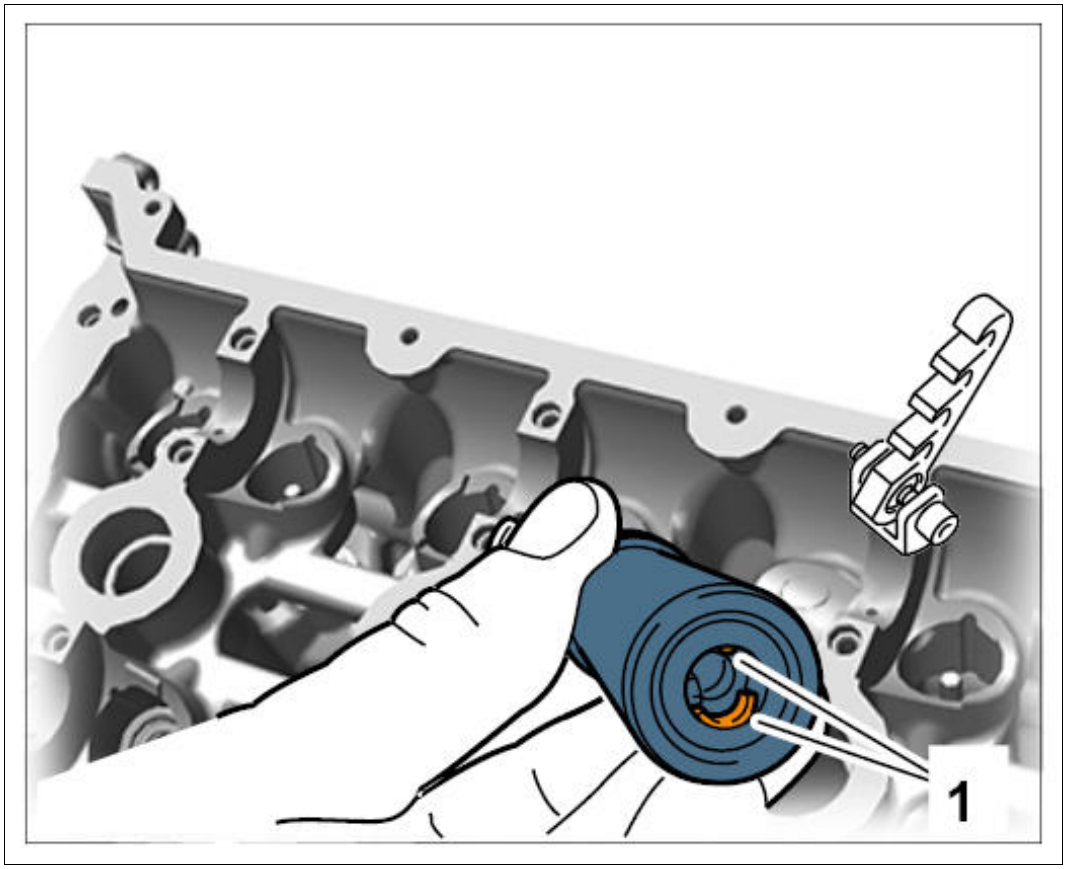
Fig 9: Turning Knurled Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 3.3. Remove assembly cartridge and check correct position of both valve keys **-1-** .

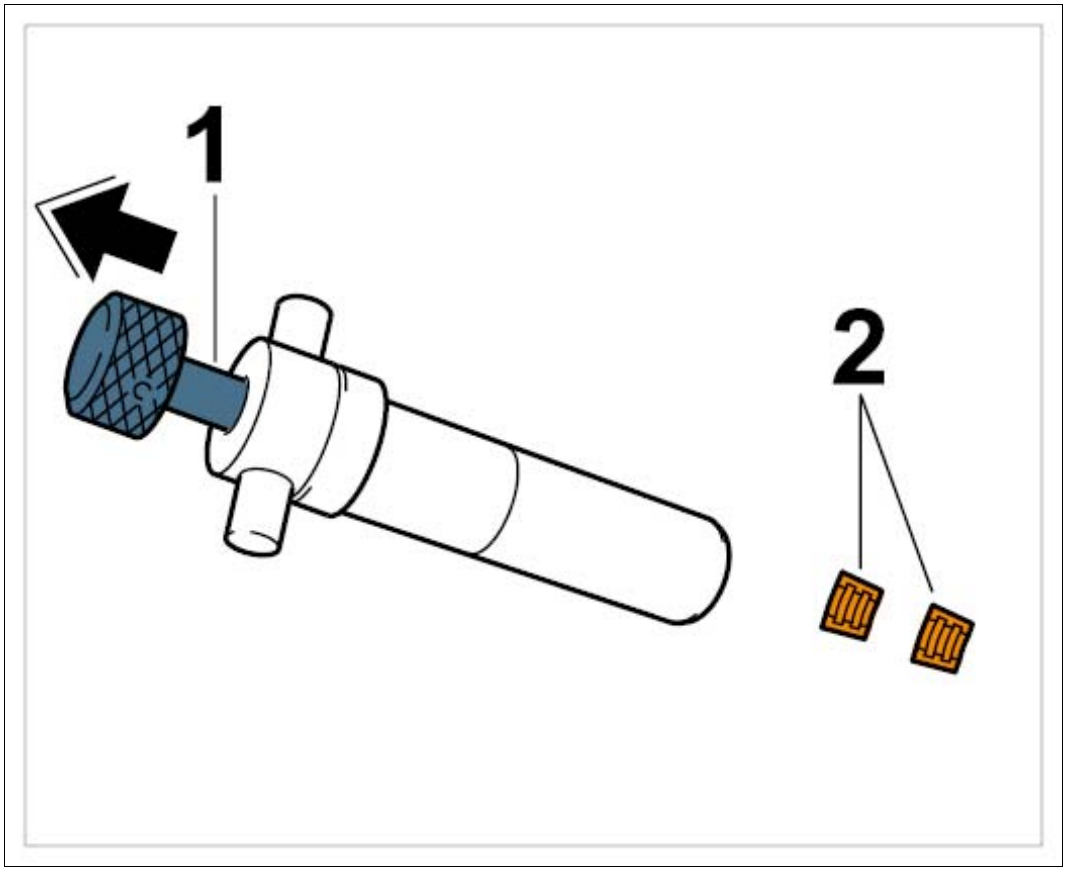
Fig 10: Placing Valve Keys In Assembly Cartridge



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. 3.4. Pull out the knurled screw from the assembly cartridge **-1-** and tap out the valve keys **-2-** .

Fig 11: Removing Valve Keys



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove valve springs, concave washer and valve keys from the cylinder head.
5. Remove valve locks and push the valves to the side of the combustion chamber.

WM 156120 REMOVING AND INSTALLING VALVES (MACAN S, MACAN TURBO) > INSTALLING VALVES

NOTE: Valve grinding paste not removed

- *Risk of damage to sealing face on intake valve*

→ Remove all valve grinding paste fully after grinding.

Information

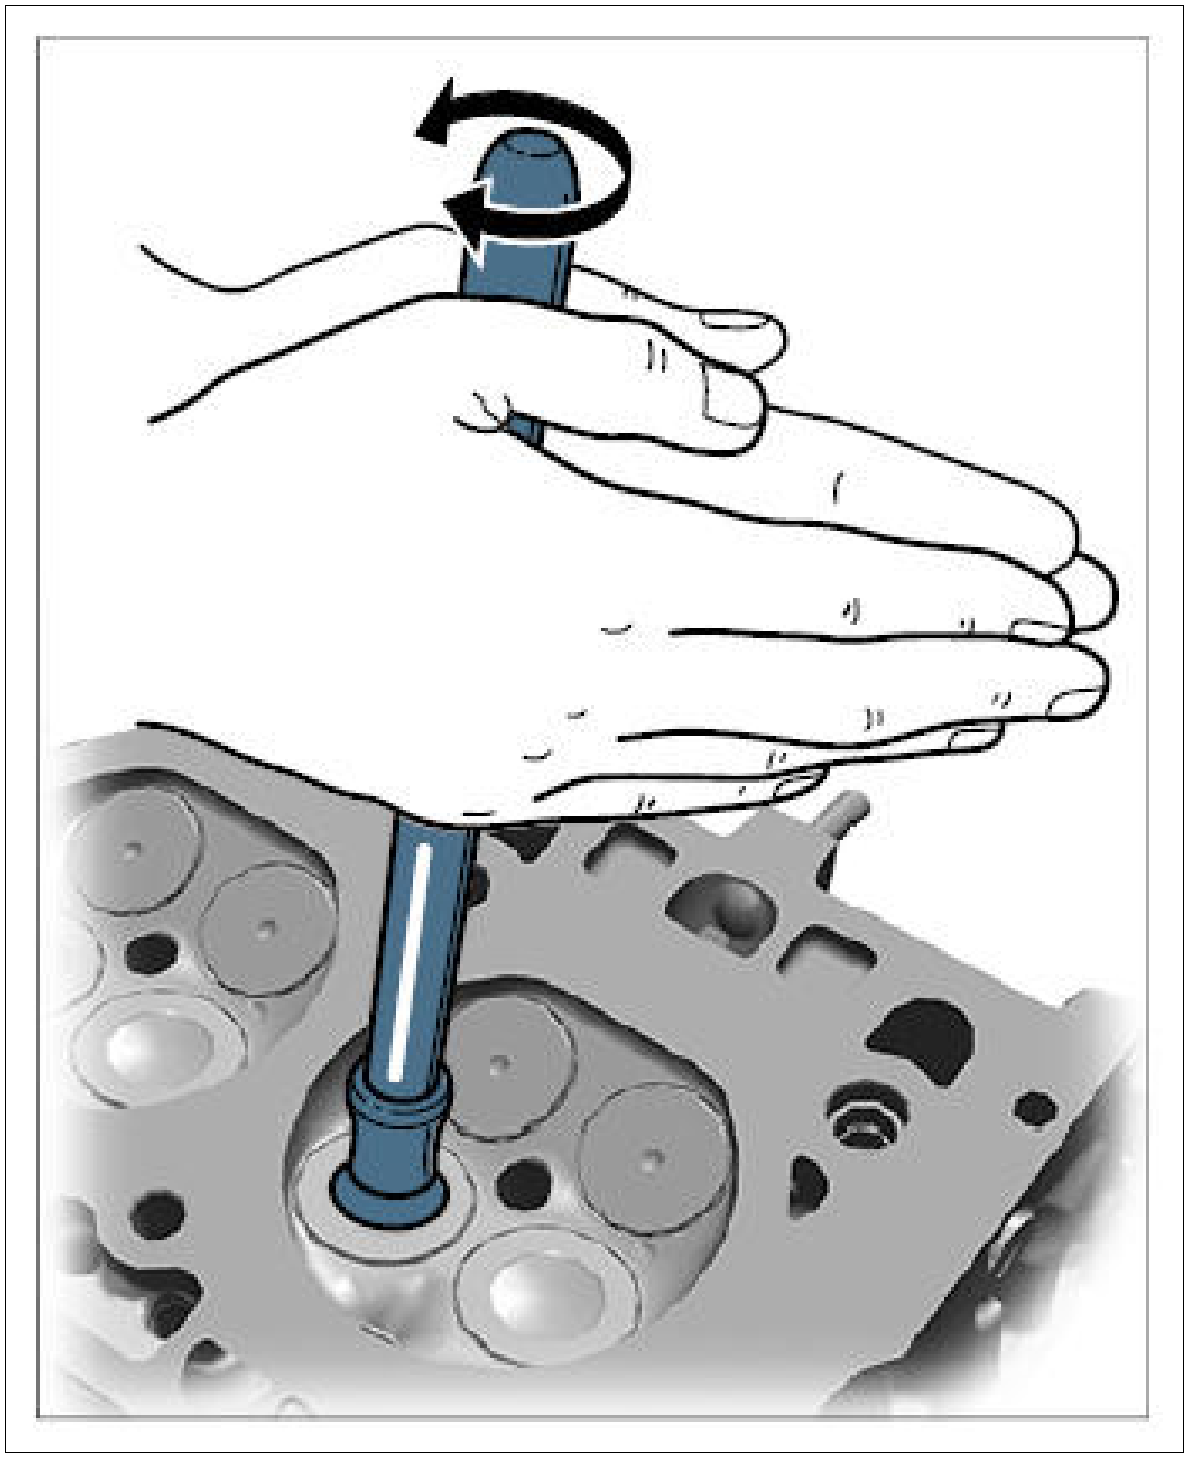
- The valves cannot be touched up afterwards.
- The valves can be grinded using commercially available valve grinding paste.

1. Apply a small amount of valve grinding paste to the valve seat.

2. Oil the valve stem of a new valve and insert it into the valve guide from the combustion chamber. Push the valve in until it is seated securely in the valve seat of the cylinder head.

3. Grind the valve with a commercially available valve grinder (with rubber suction head) using rotating movements. To do this, hold the valve grinder between the palms of both hands and press against the valve seat with rotating movements → Grinding valve seat .

Fig 1: Turning Valve Seat



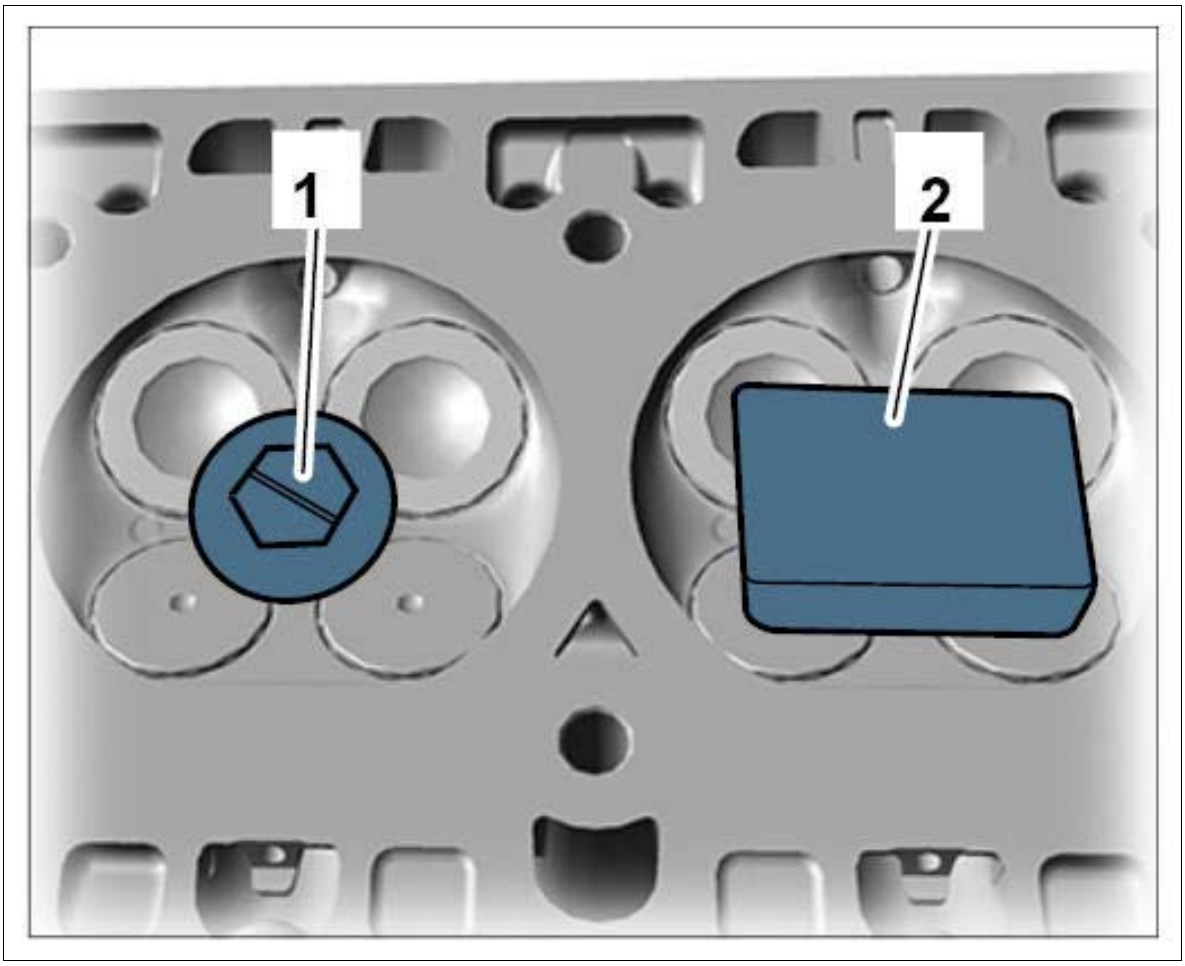
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Carry out the grinding operation for each valve that is replaced. Check for leaks using some fuel and installed spark plugs. The fuel must not escape through the valve seat. Carefully

remove valve grinding paste.

5. Fit valve lock. → Locking valves

Fig 2: Identifying Valves



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Replace valve stem seals. For details, → 156355 REPLACING VALVE-STEM SEALS

7. Fit valve springs, concave washers and valve keys. To do this, place valve springs (there are two in the outlet valve in the turbo engine) on the bottom concave washer. Place top concave washer in position.

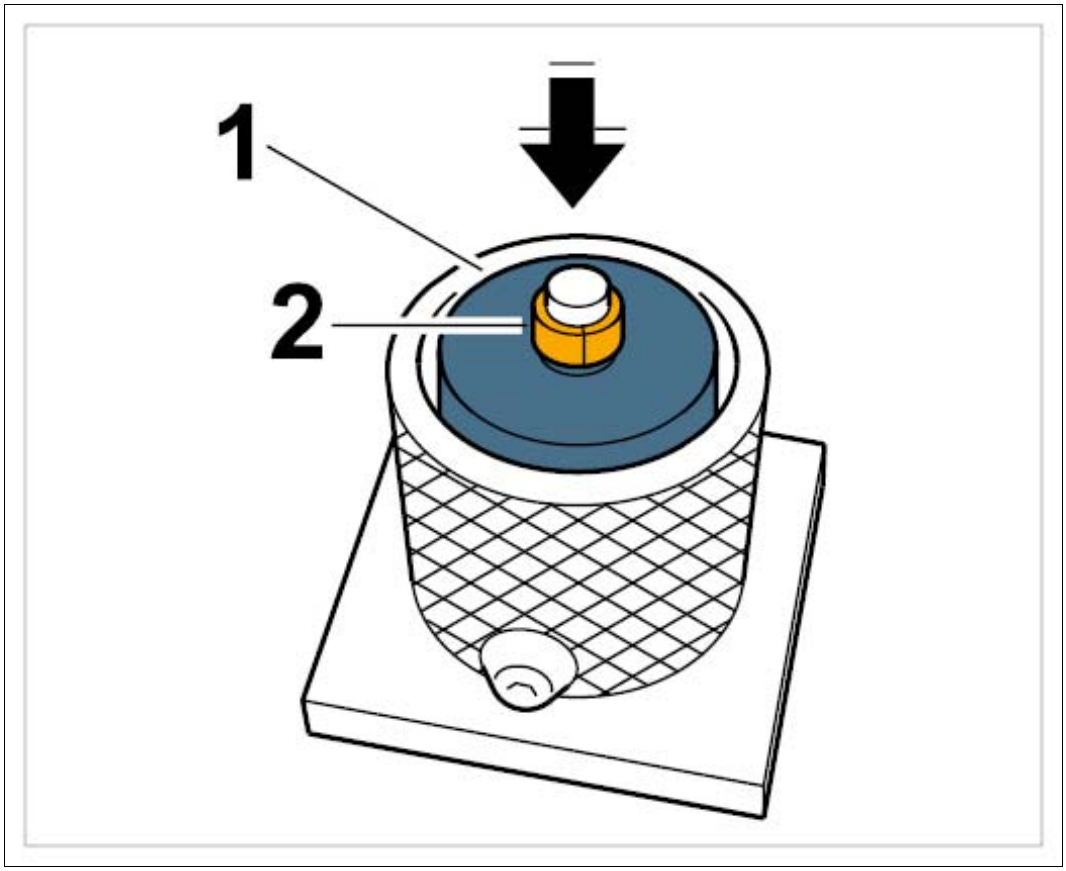
Information

The mechanic must practise for use of the assembly cartridge to be effective. Some repetitions must be made to ensure that the valve keys are correctly held in place.

8. Insert valve keys into the assembly cartridge.

    1. 8.1. Press the spring washer of the assembly fixture downwards **-1-** and insert the valve keys **-2-** with the narrow end pointing downwards.

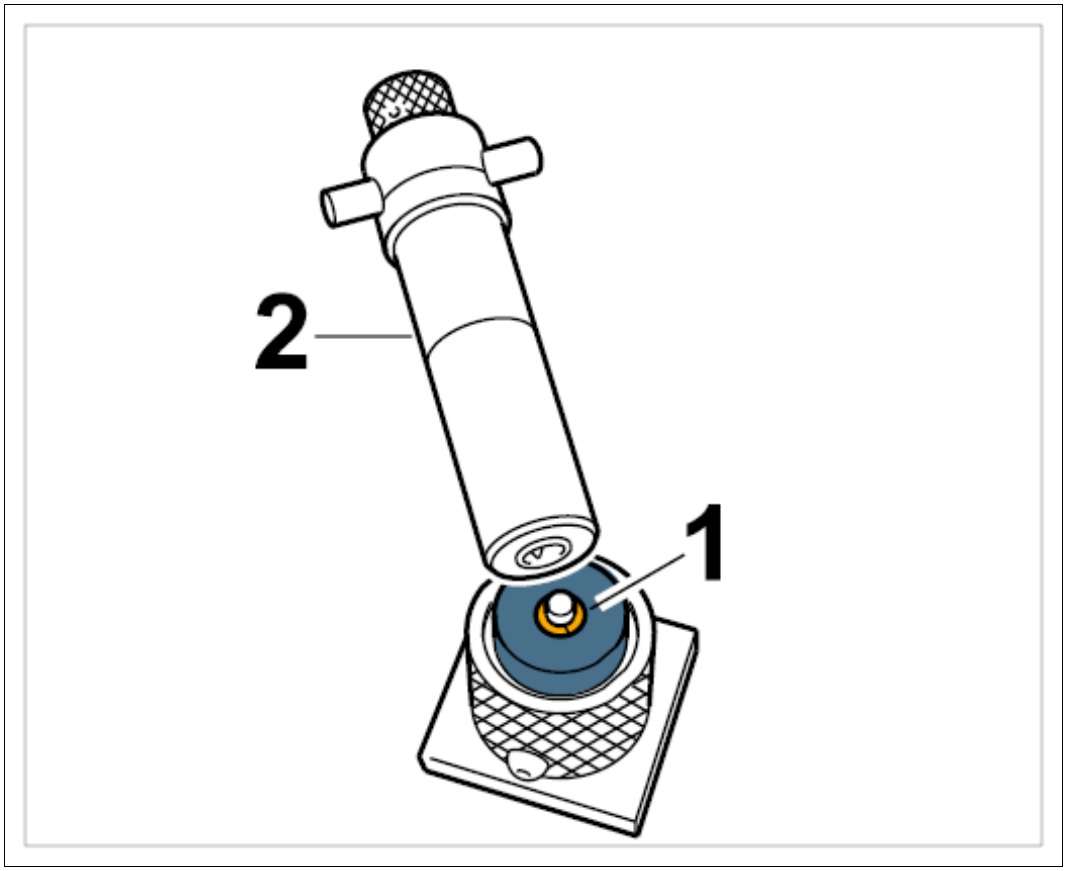
Fig 3: Installing Valve Keys In Assembly Fixture



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 8.2. Ensure that the valve keys fit symmetrically and are inserted as far as they will go in the tool. The spring washer automatically locks the valve keys in place.
3. 8.3. Place the assembly cartridge **-2-** onto the center of the assembly fixture. Observe installation position of the valve keys **-1-** .

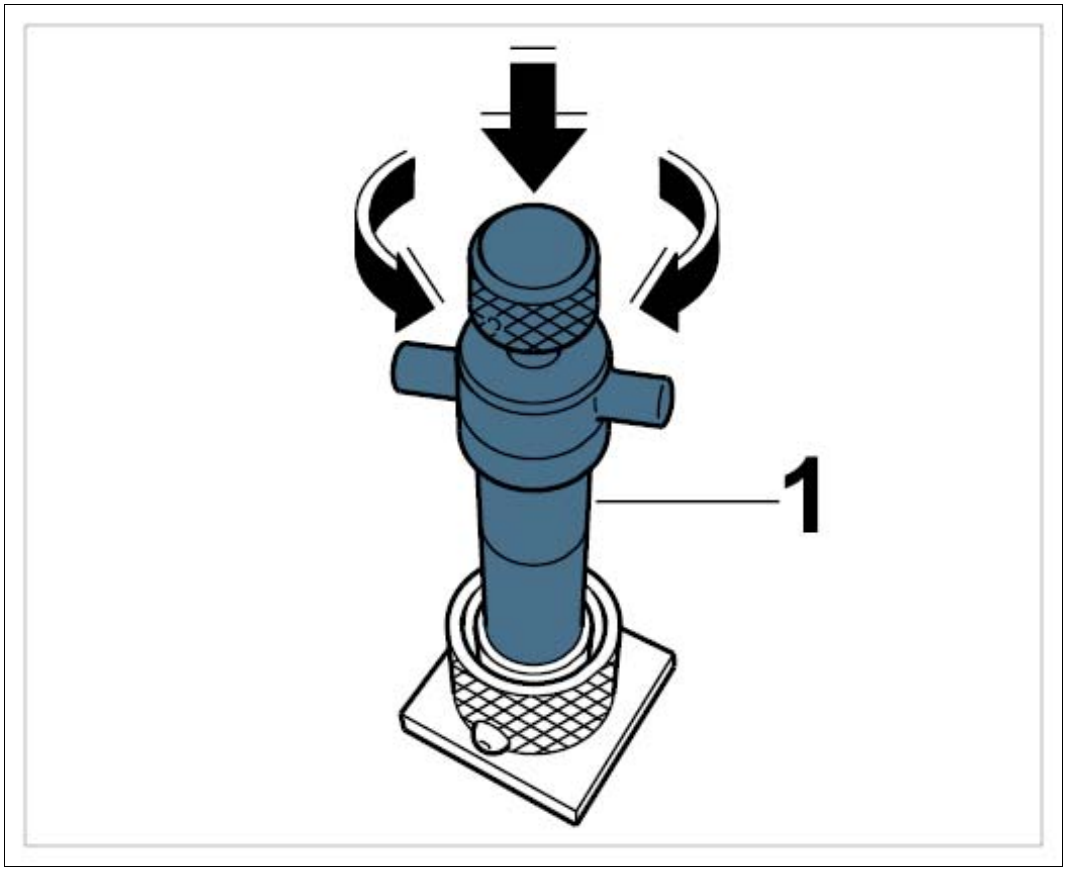
Fig 4: Identifying Assembly Cartridge



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. 8.4. Press the assembly cartridge against the spring force onto the assembly fixture. The knurled screw moves forward. When doing so, turn the knurled screw back and forth until the valve keys snap into place. Repeat as required. → Assembly cartridge with valve keysFig 5

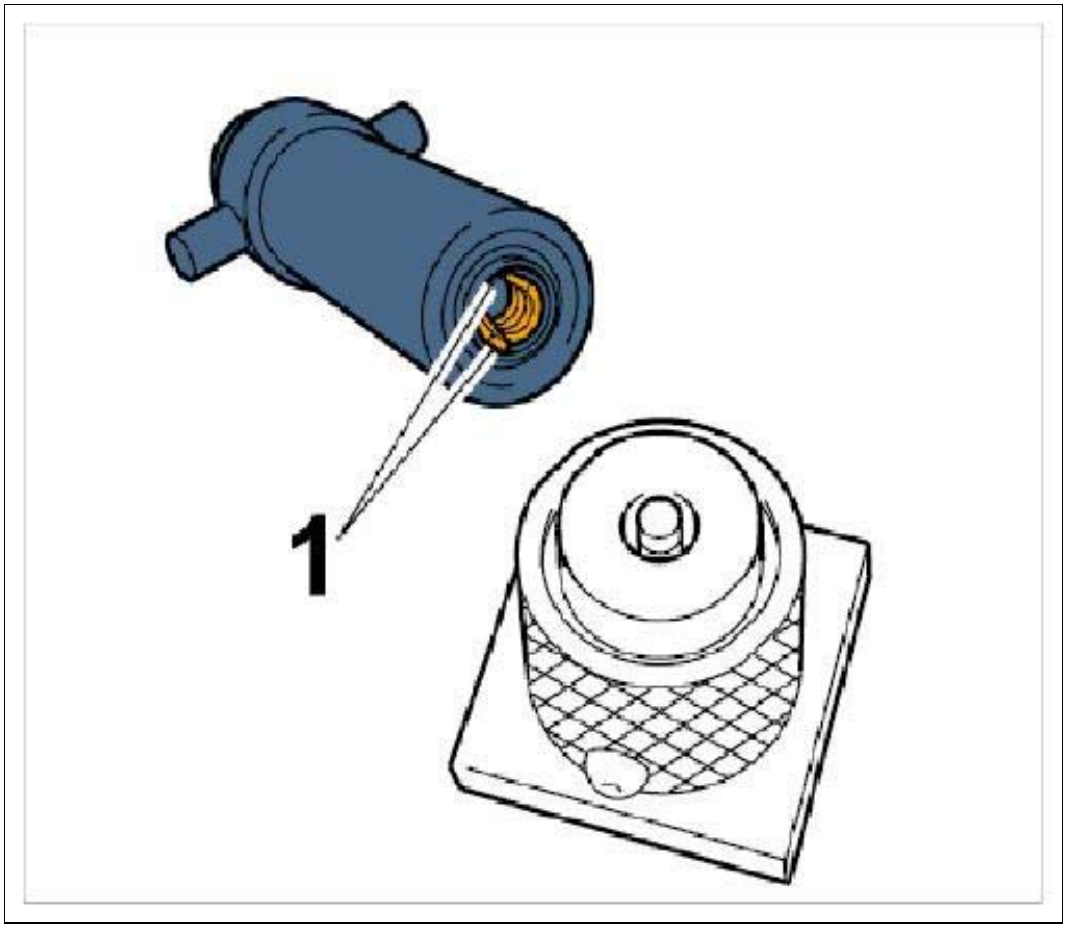
Fig 5: Pressing Assembly Cartridge



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. 8.5. Make sure the valve keys are held symmetrically in place in the assembly cartridge **-1-** .

Fig 6: Identifying Valve Keys Inserted Tool

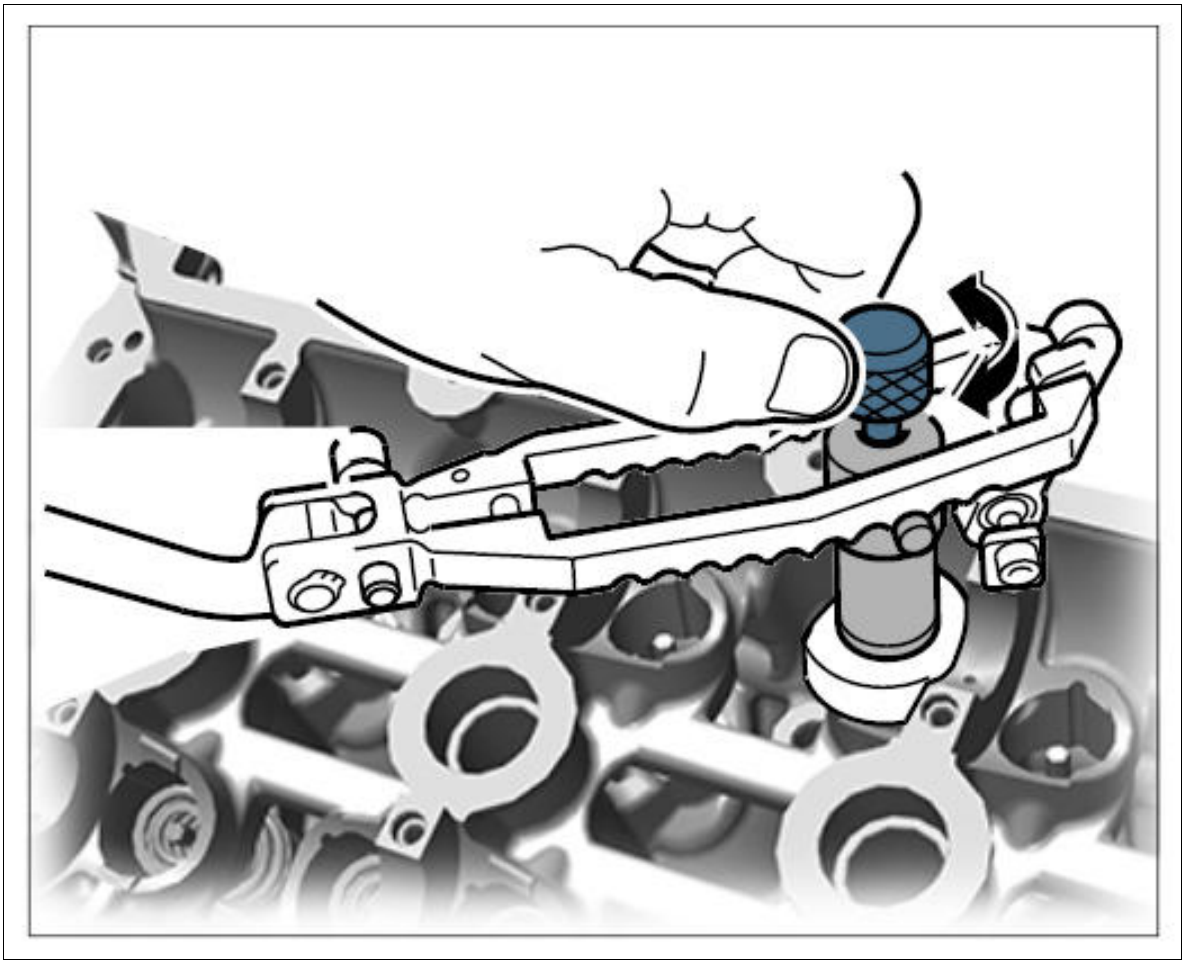


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Place the valve key assembly cartridge onto the cylinder head (same as removal of valve) and position it on the top concave washer.

10. Press assembly cartridge with the lever (assembly bar) against the force of the valve spring and keep it pressed. The knurled screw moves forward. When doing so, turn the knurled screw back and forth until the valve keys snap into place → Installing valve keysFig 7. Repeat as required.

Fig 7: Installing Valve Keys



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

11. When installing the valve keys, check that they are positioned correctly.

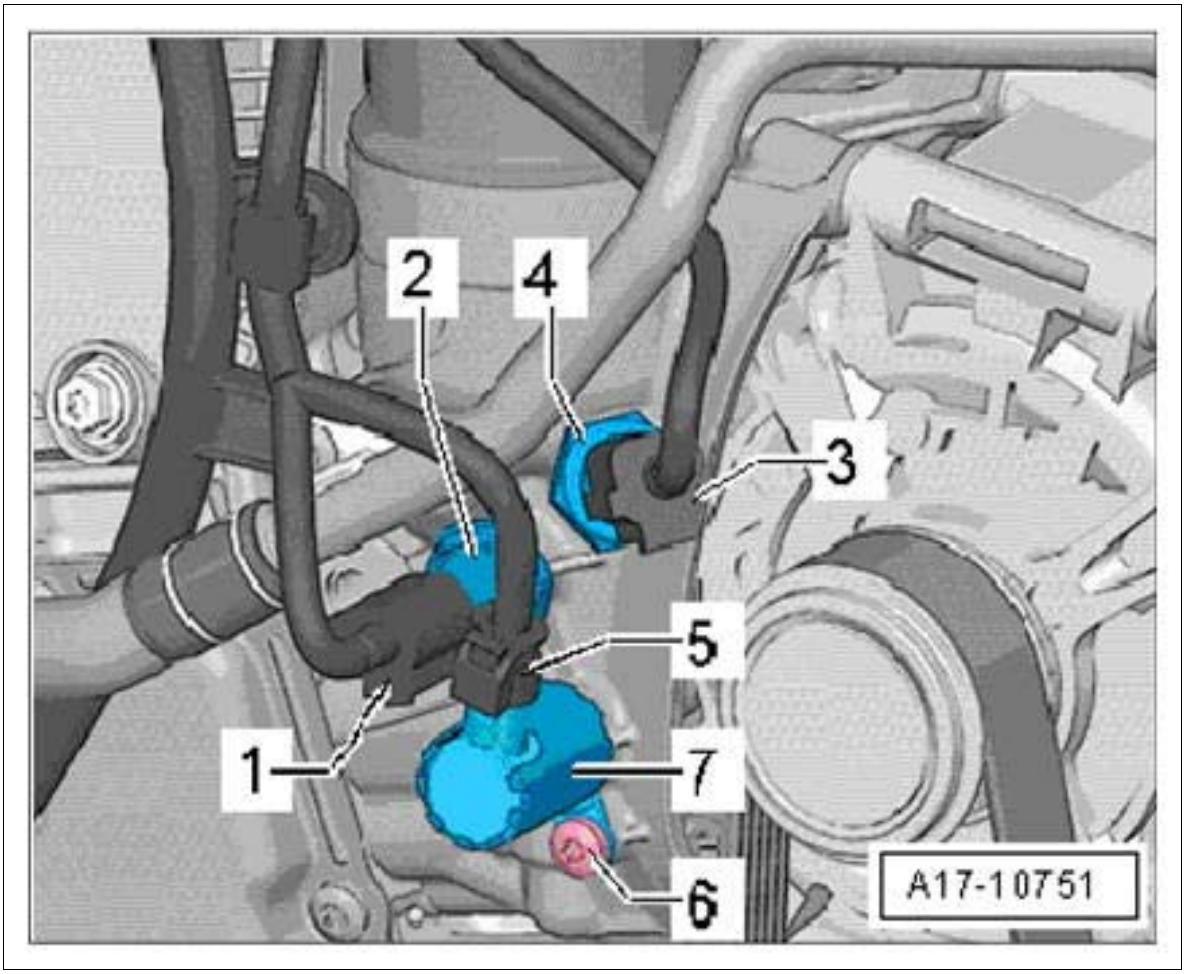
Fig 12: Identifying Oil Pressure Switch Electric Plug Connections



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

13. Remove spark plugs using **spark plug wrench 3122 B** .

    Information

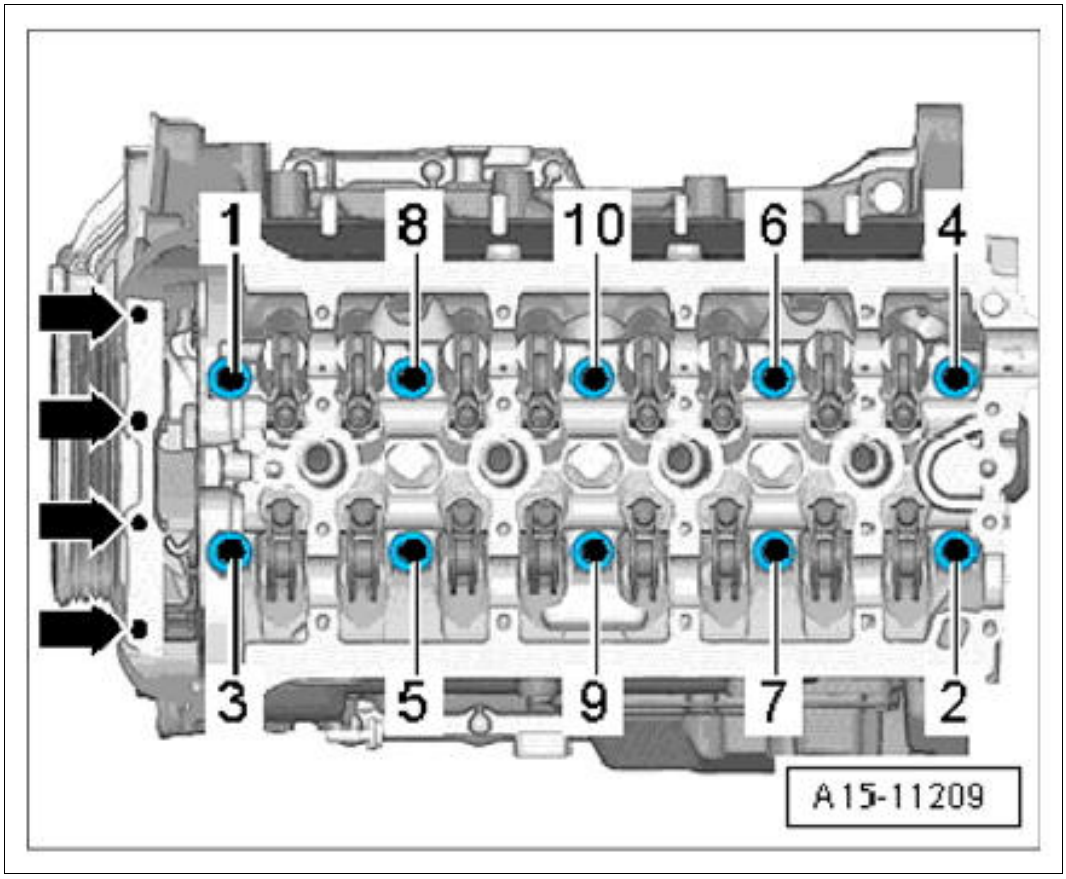
    1. Be careful of the tensioning and guide rails when lifting off the cylinder head.
    2. Check that all lines and cables are disconnected.

14. Remove cylinder head.

    1. 14.1. Unscrew fastening screws **-arrows-** .
    2. 14.2. Unscrew fastening screws **-1...10-** for cylinder head using **socket-wrench insert, Polydrive T10070.**

       Observe the sequence -1...10-.
    3. 14.3. Remove cylinder head and place it on a soft surface.

Fig 13: Cylinder Head Screws Loosening Sequence

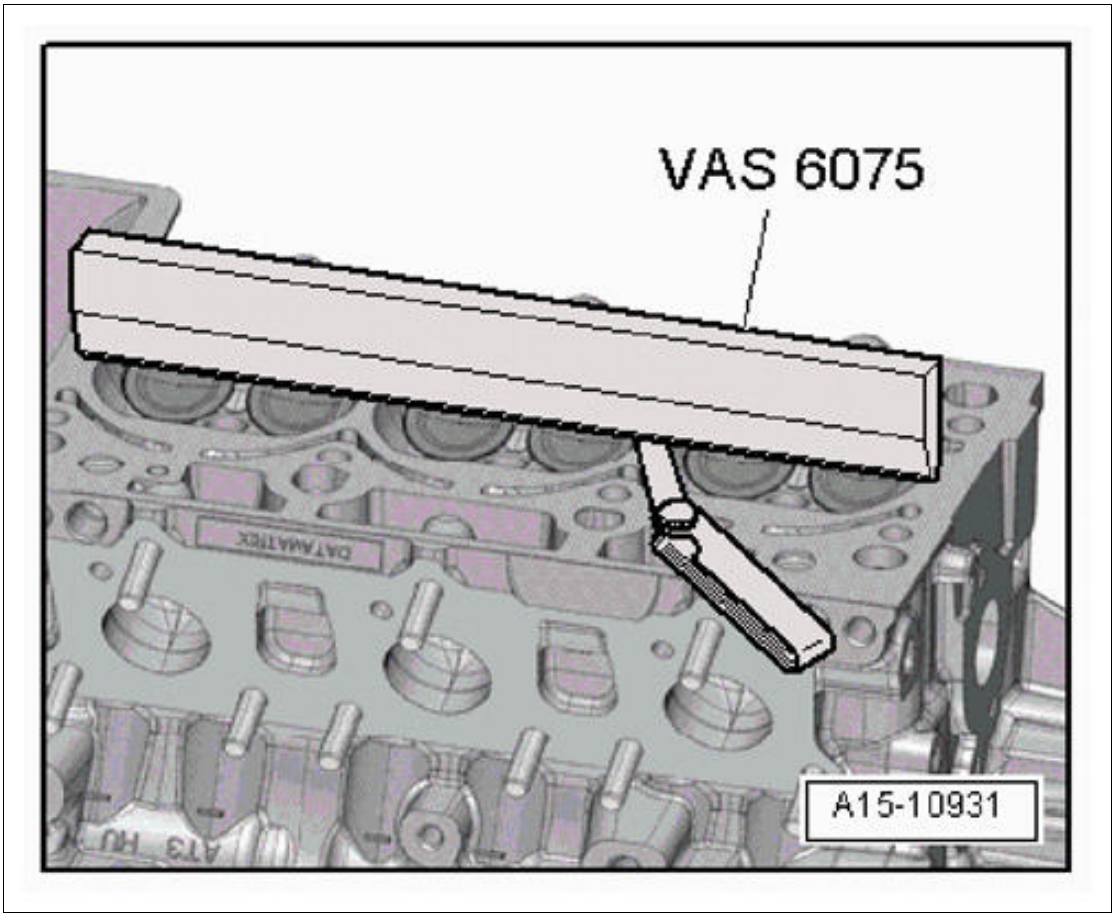


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

15. Check the cylinder head for distortion at several places using a straight-edge. → Measuring distortion on cylinder head

    1. Maximum permitted distortion: 0.05 mm

Fig 14: Measuring Cylinder Head Distortion



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 157019 REMOVING AND INSTALLING CYLINDER HEAD (MACAN) > INSTALLING CYLINDER HEAD

NOTE: Risk of damage if components are not cleaned and handled correctly when fitting the cylinder head.

- *Risk of damage to sealing faces.*
- *Risk of damage to the crankcase.*
- *Risk of leaks at the cylinder-head gasket.*
- *Risk of damage to open valves.*
- *Risk of damage to valves and piston crowns after working on the valve drive.*

→ Carefully remove any residual sealant from the cylinder head and crankcase. Make sure there are no long scores or scratches.

→ Carefully remove lubricating gel and sanding residues.

→ There must be no oil or coolant in the blind holes for the cylinder-head fastening screws in the crankcase.

→ To prevent damage to the silicone layer and seam area of the cylinder-head gasket, do not remove the new cylinder head-gasket from its packaging until just before installation and handle with extreme care.

→ If you are using a replacement head, do not remove the plastic socket used to protect the open valves until just before you install the cylinder head.

→ To prevent valve problems when starting the engine, carefully turn the engine with your hand for at least two turns.

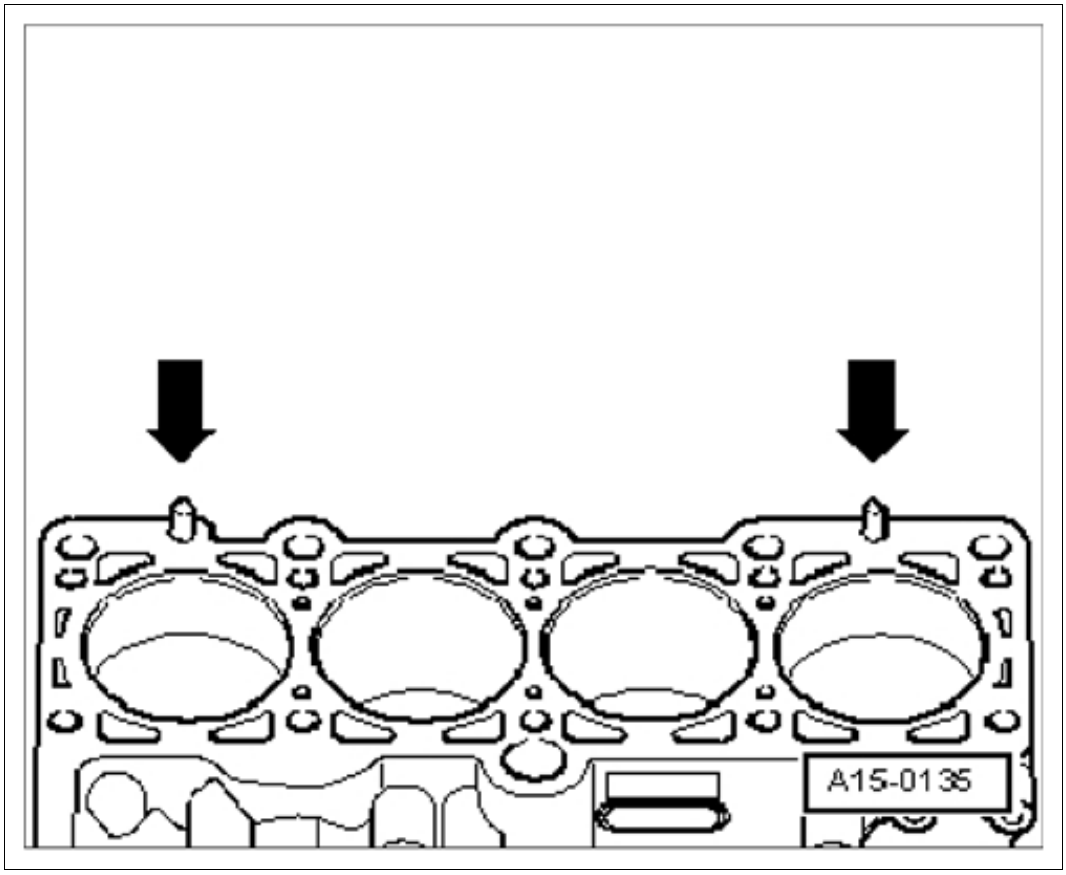
Information

- If you are installing a replacement cylinder head, the contact surfaces between the hydraulic compensating elements, rocker arms and running surfaces of cams must be oiled before installing the cylinder head cover.
- If you are replacing the cylinder head or cylinder-head gasket, change the coolant and engine oil.
- Replace screws that are tightened to an additional torque angle.
- Replace self-locking nuts as well as sealing rings, seals and O-rings.
- Note the different sealants for sealing surfaces and cylinder head screws .
- Secure all hose connections with standard hose clamps .

1. Fit cylinder head.

    1. 1.1. **Fit new** cylinder-head gasket. **Check installation position of cylinder-head gasket** .
    2. 1.2. Check centering pins **-arrows-** in the cylinder block.
    3. 1.3. Fit cylinder head.

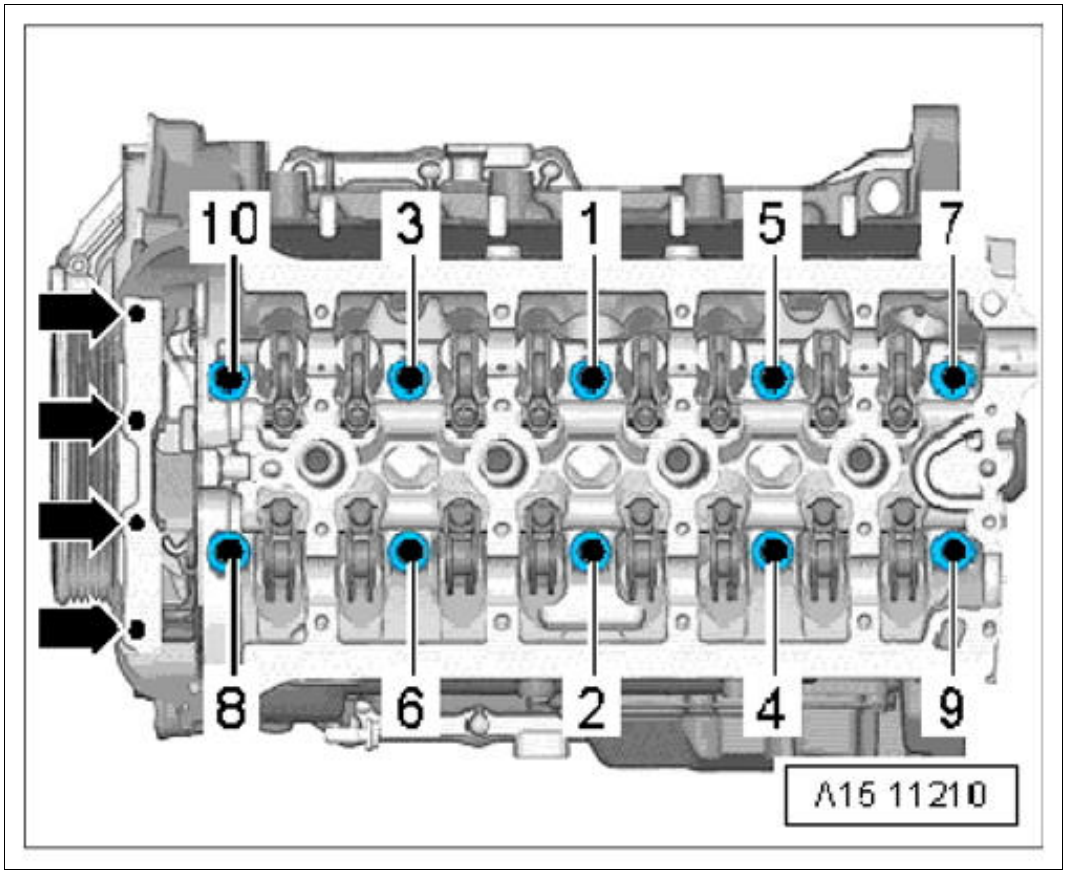
Fig 1: Locating Cylinder Block Centering Pins



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. **Fit new** cylinder head screws and tighten hand-tight.
3. Tighten cylinder head screws using **socket-wrench insert, Polydrive T10070** in the sequence **-1...10-** .
    1. **Tighten new** cylinder head screws **-arrows-** .

Fig 2: Cylinder Head Screws Tightening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Use **counter-hold tool T10355** to turn the pulley to **TDC** position.

   The notch **-arrow-** on the pulley and the marking on the chain housing cover must be opposite each other.

Fastening screw on cylinder head cover	Observe specified sequence	Final tightening	+90°		
Fastening screw for oil separator	Observe specified sequence	Tightening torque	9 Nm (6.5 ftlb.)		

WM 158219 REMOVING AND INSTALLING CYLINDER HEAD COVER (MACAN) > PRELIMINARY WORK

1. Remove the engine cover (design cover).
2. Remove the cover for the front underbody. → 519219 REMOVING AND INSTALLING THE COVER FOR THE FRONT UNDERBODY
3. Remove the air cleaner housing. → 242519 REMOVING AND INSTALLING THE AIR CLEANER HOUSING
4. Remove the upper timing-case cover. → 153319 REMOVING AND INSTALLING THE TIMING-CASE COVER
5. Remove the actuators for the camshaft. → 158419 REMOVING AND INSTALLING THE ACTUATOR FOR THE CAMSHAFT

6. Remove the hydraulic valves for the valve lift switchover. → 155519 HYDRAULIC VALVE FOR THE VALVE LIFT SWITCHOVER

7. Remove the ignition coils. → 282020 REMOVING AND INSTALLING THE IGNITION COILS

WM 158219 REMOVING AND INSTALLING CYLINDER HEAD COVER (MACAN) > REMOVE THE CYLINDER HEAD COVER

NOTE: Dirt and contamination

- *Risk of damage to units or components*

→ Protect components from dirt and contamination.

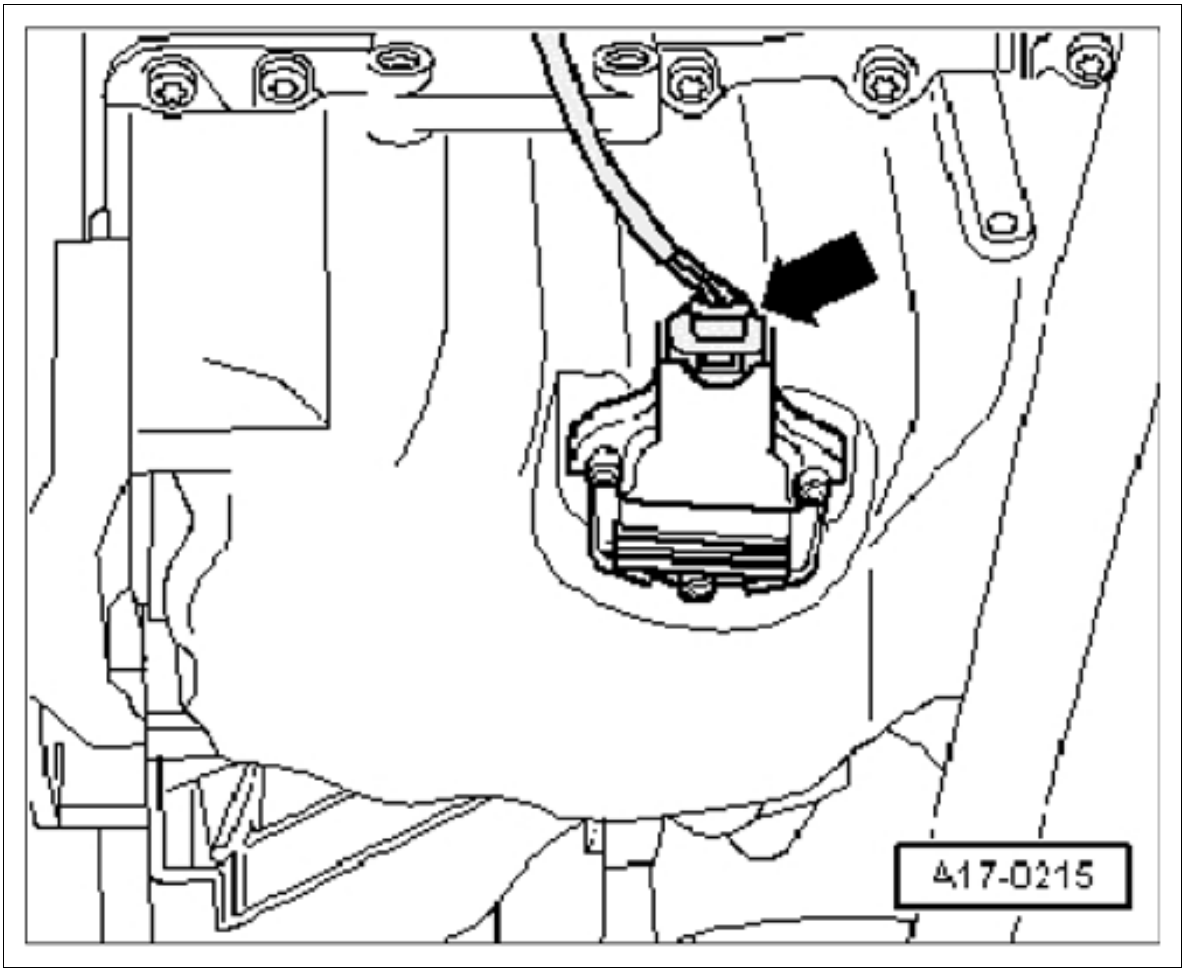
→ Clean or replace dirty components.

Information

- Close off open connections and lines using suitable stoppers or caps.

1. Disconnect the electric plug connection **-arrow-** to the oil level sensor.

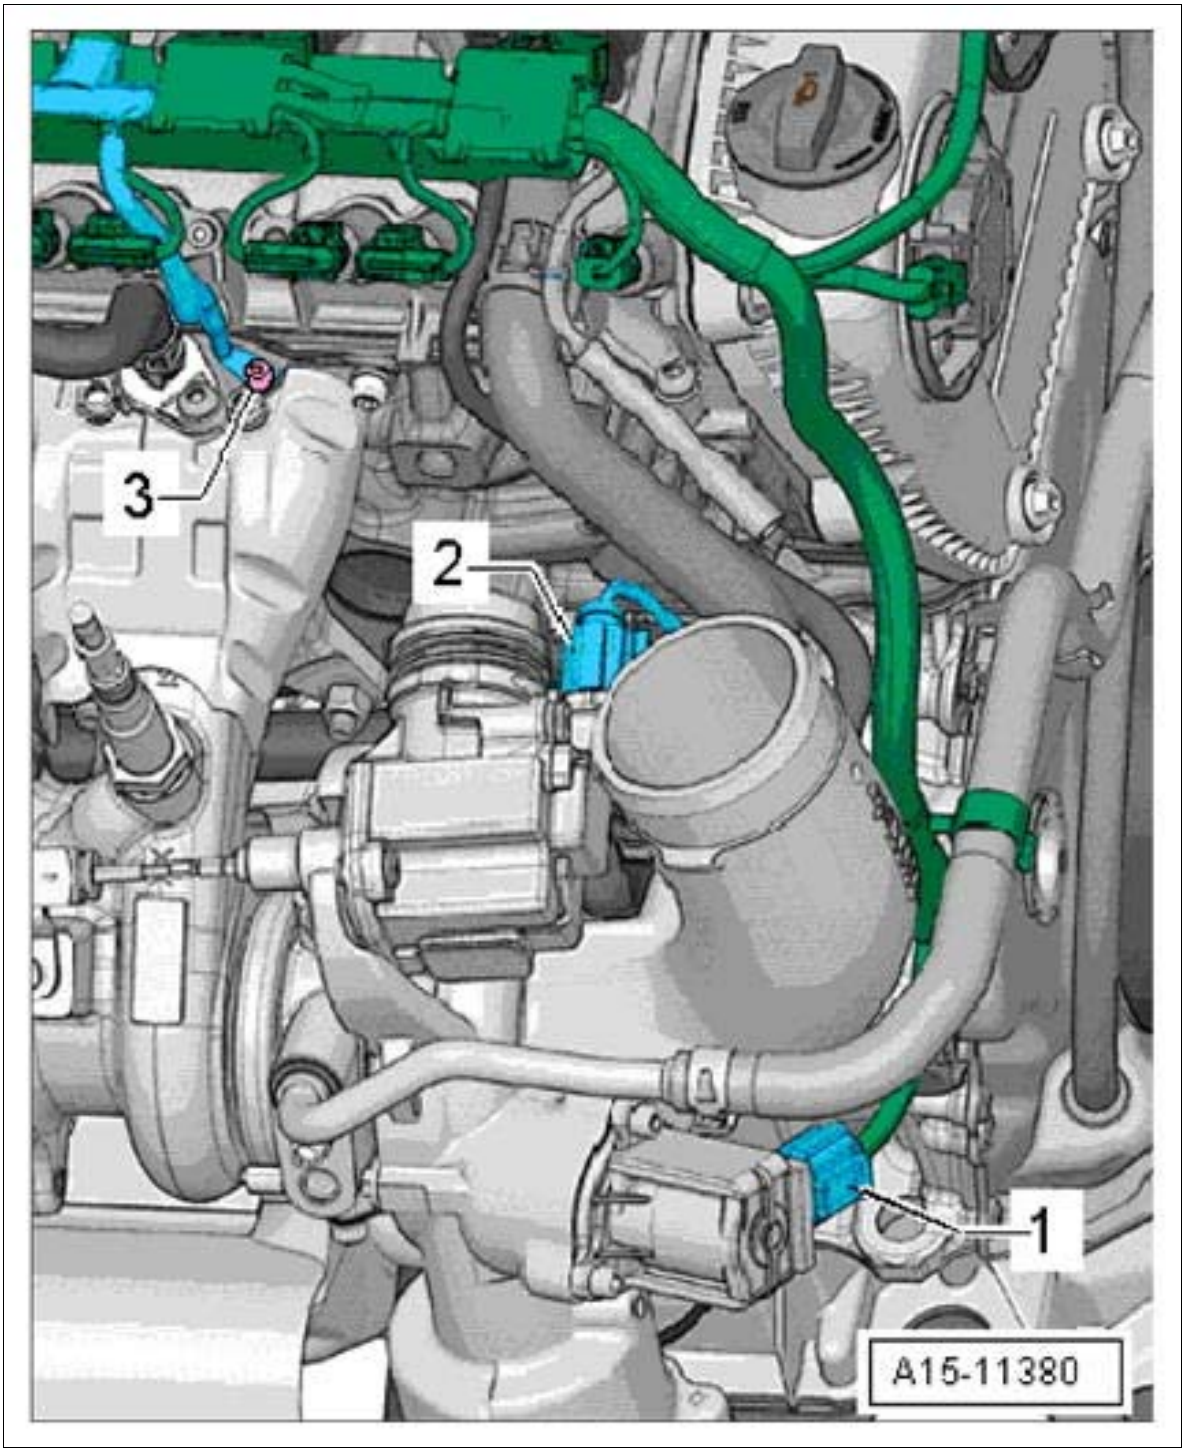
Fig 1: Locating Oil Level Sensor Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Disconnect the electric plug connections **-1 and 2-** .

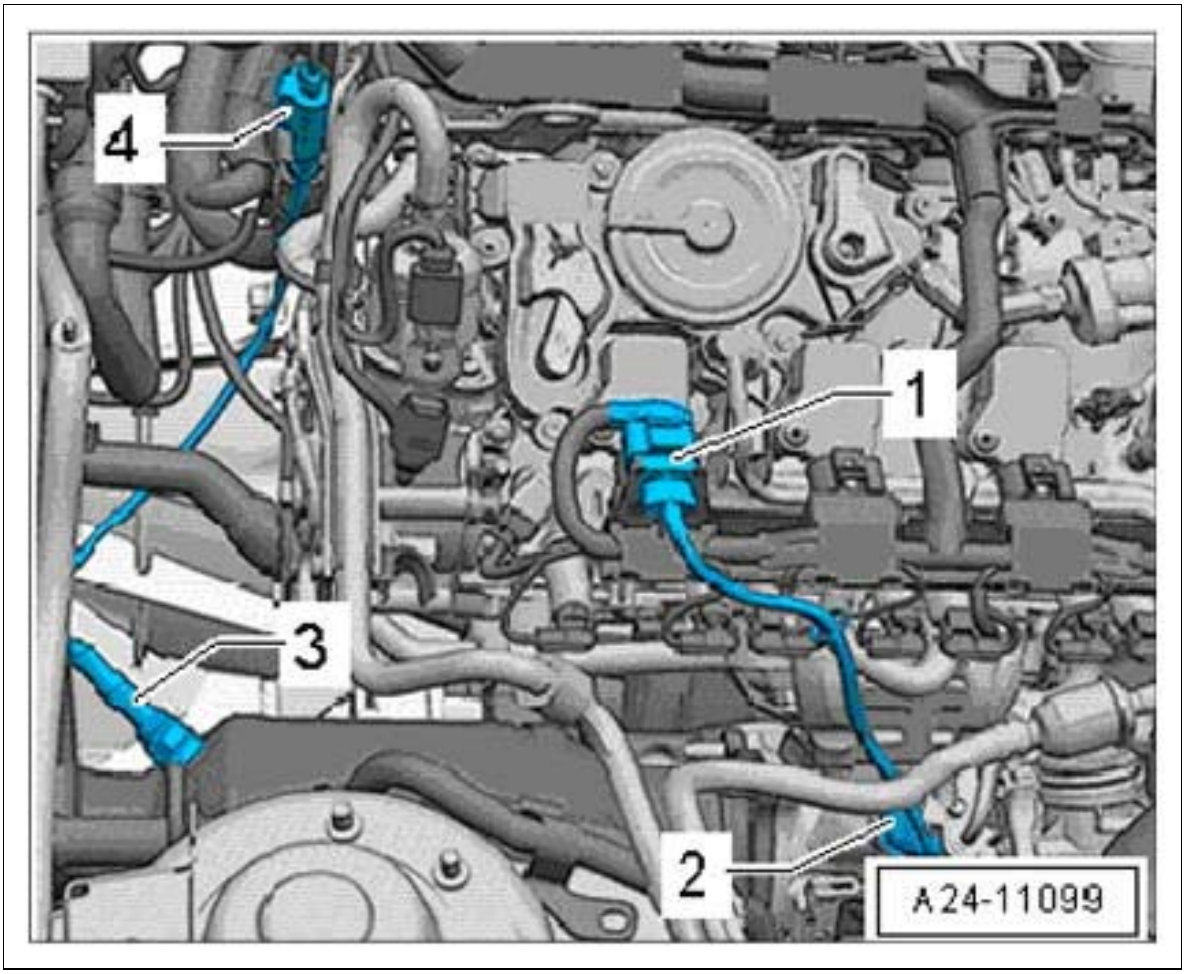
Fig 2: Identifying Turbocharger Electric Lines



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Take the electric plug connection **-1-** out of the holder and disconnect it.

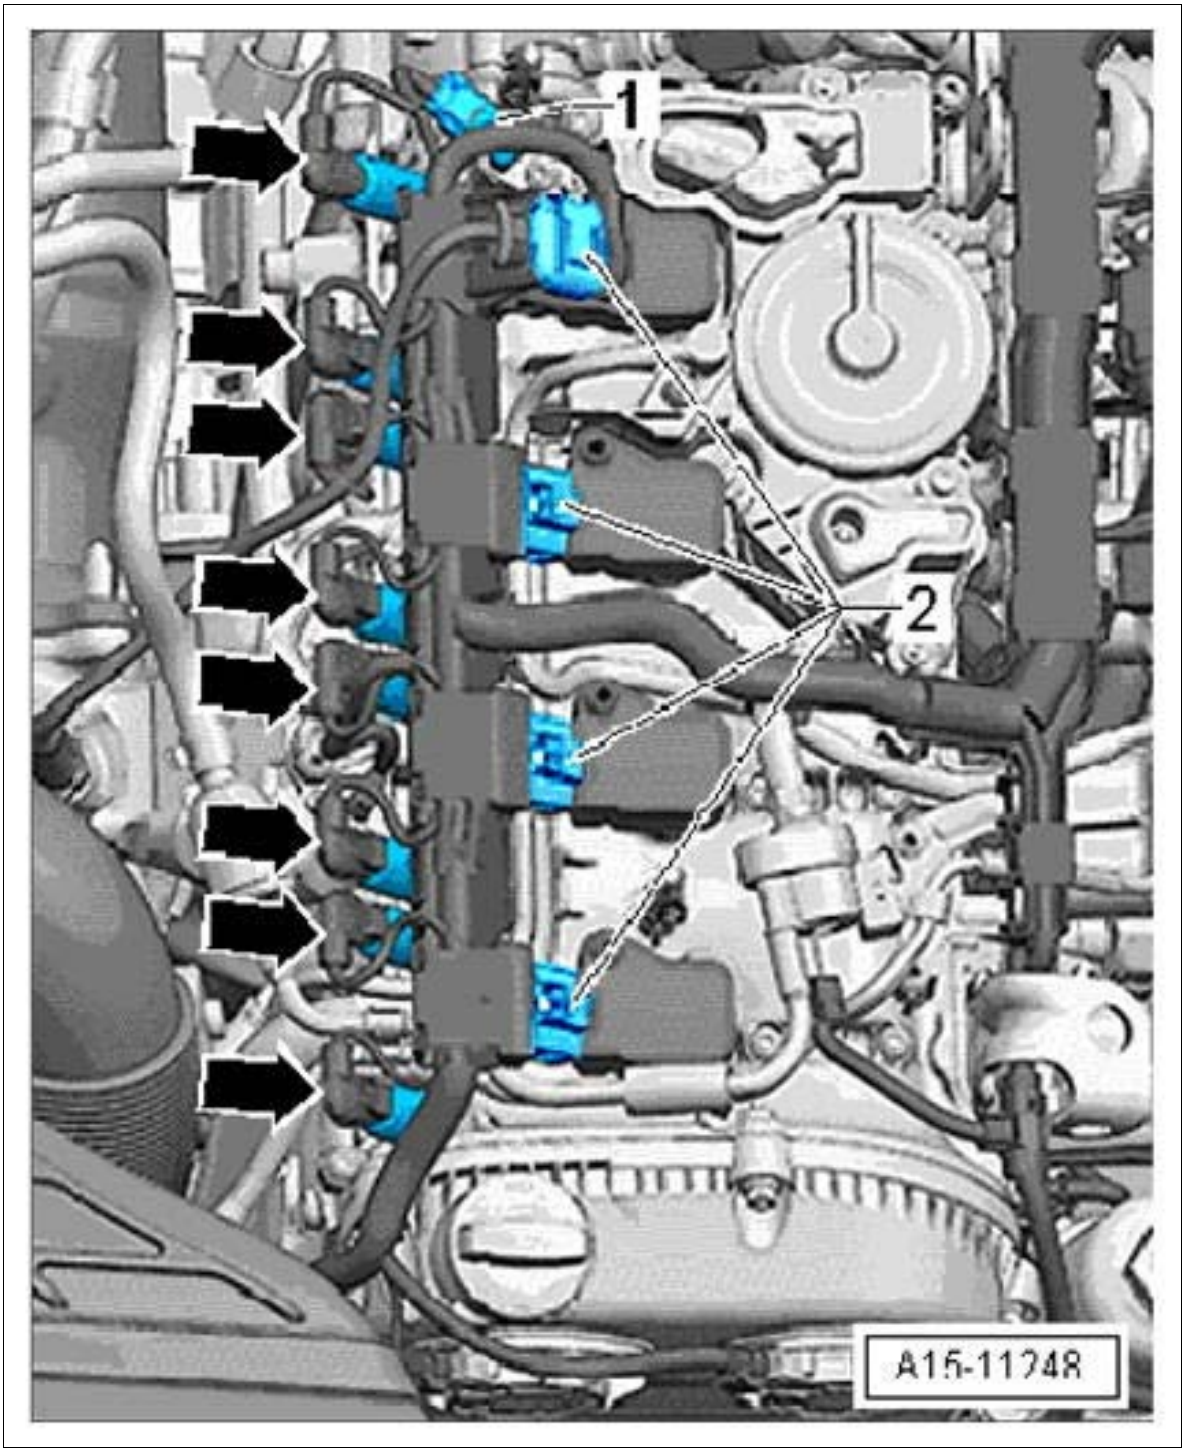
Fig 3: Identifying Oxygen Sensor Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Disconnect the electric plug connection **-1-** of the hall sender.

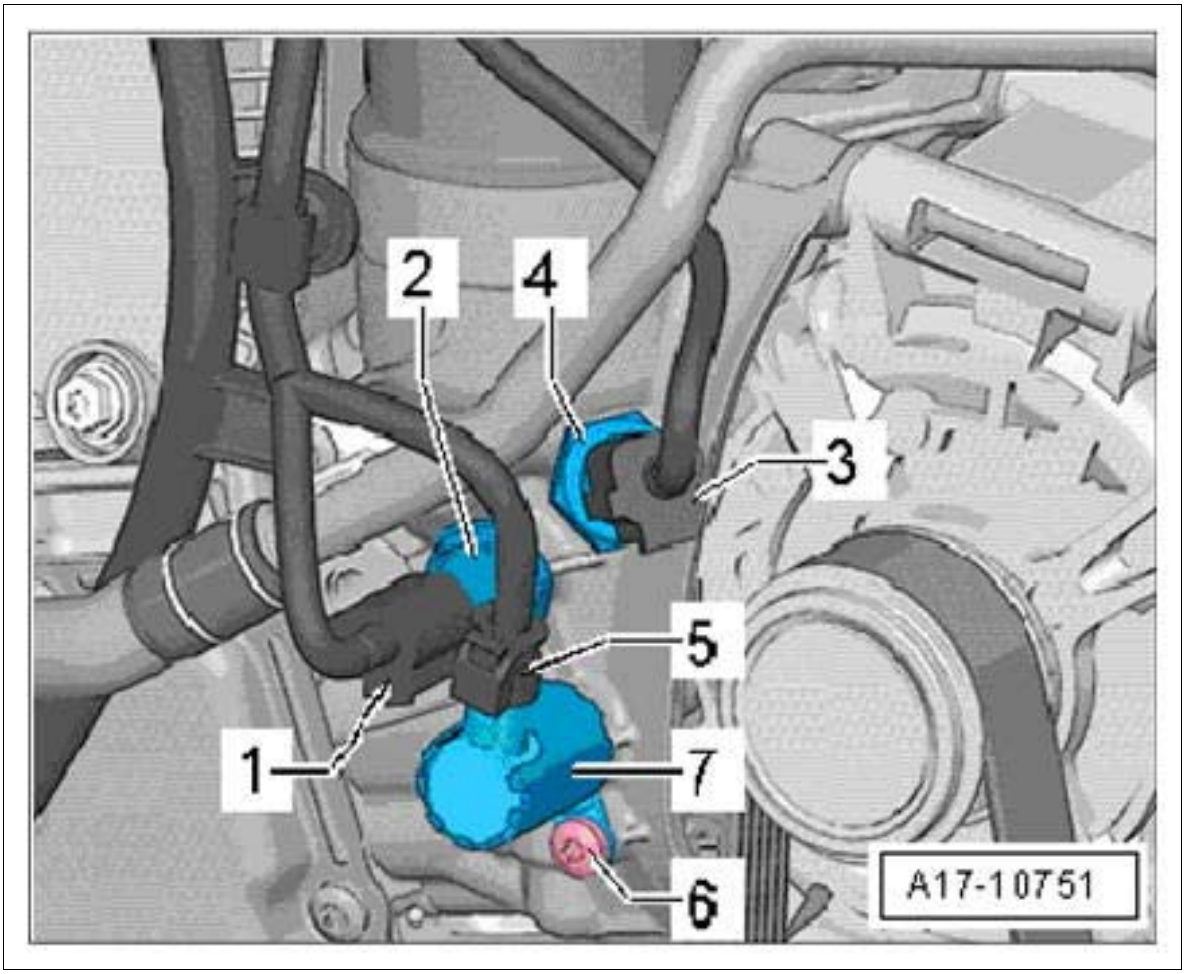
Fig 4: Locating Hall Sender Electric Plug Connections



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Disconnect the electric plug connections **-1, 3 and 5-** .

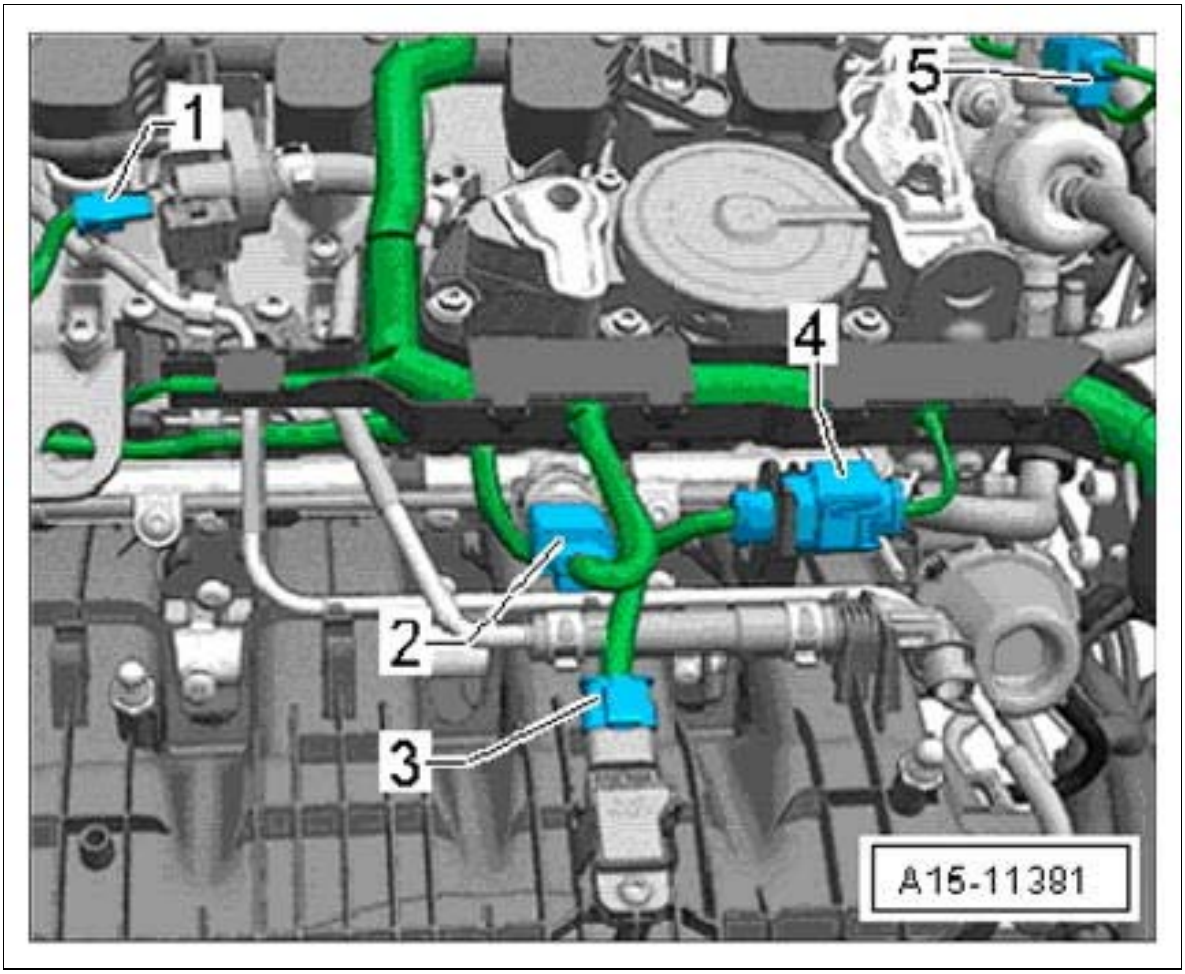
Fig 5: Identifying Electric Plug Connections



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Disconnect the electric plug connections **-1...5-** and expose the lines.

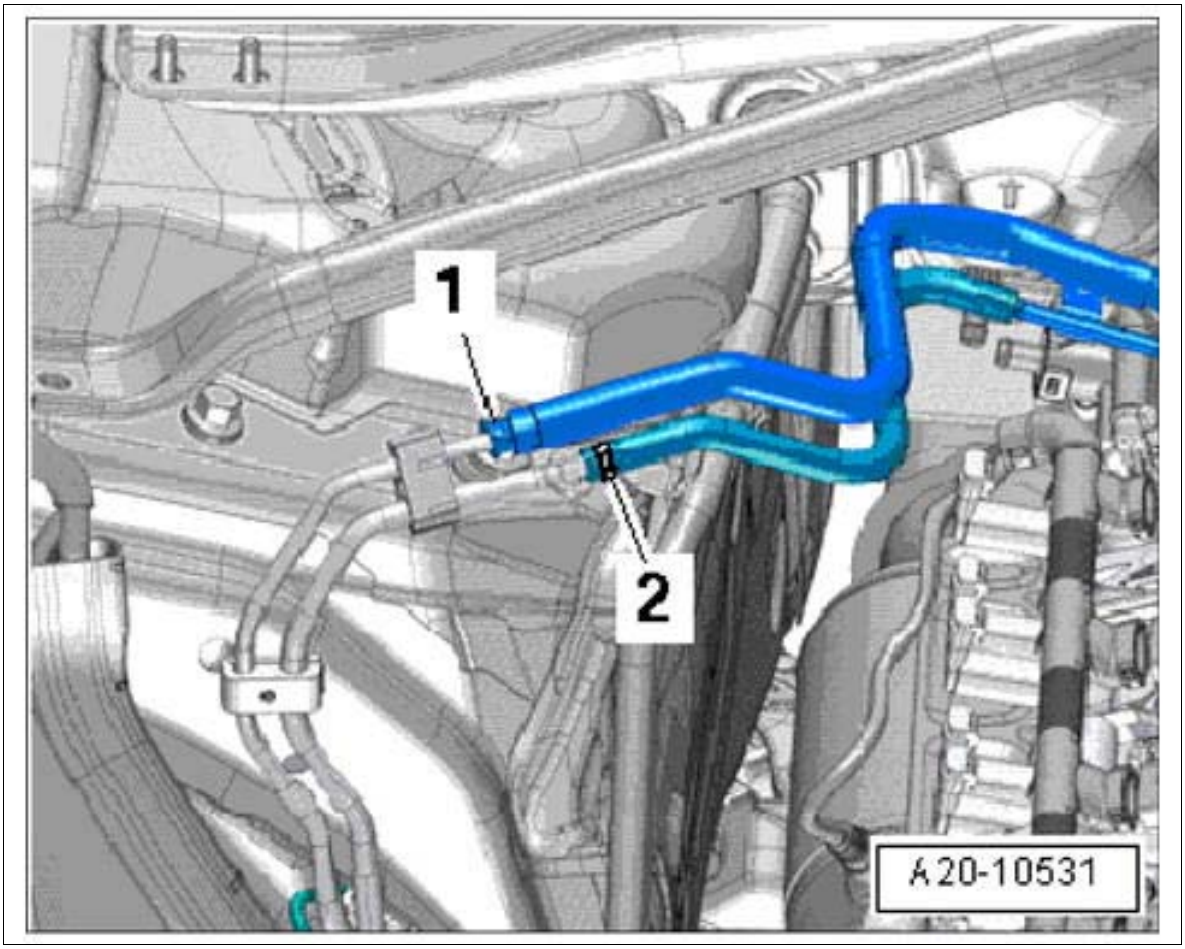
Fig 6: Identifying Intake-Air Distributor Electric Plug Connections



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Loosen the spring band clamp **-2-** and pull the hose off the carbon canister.

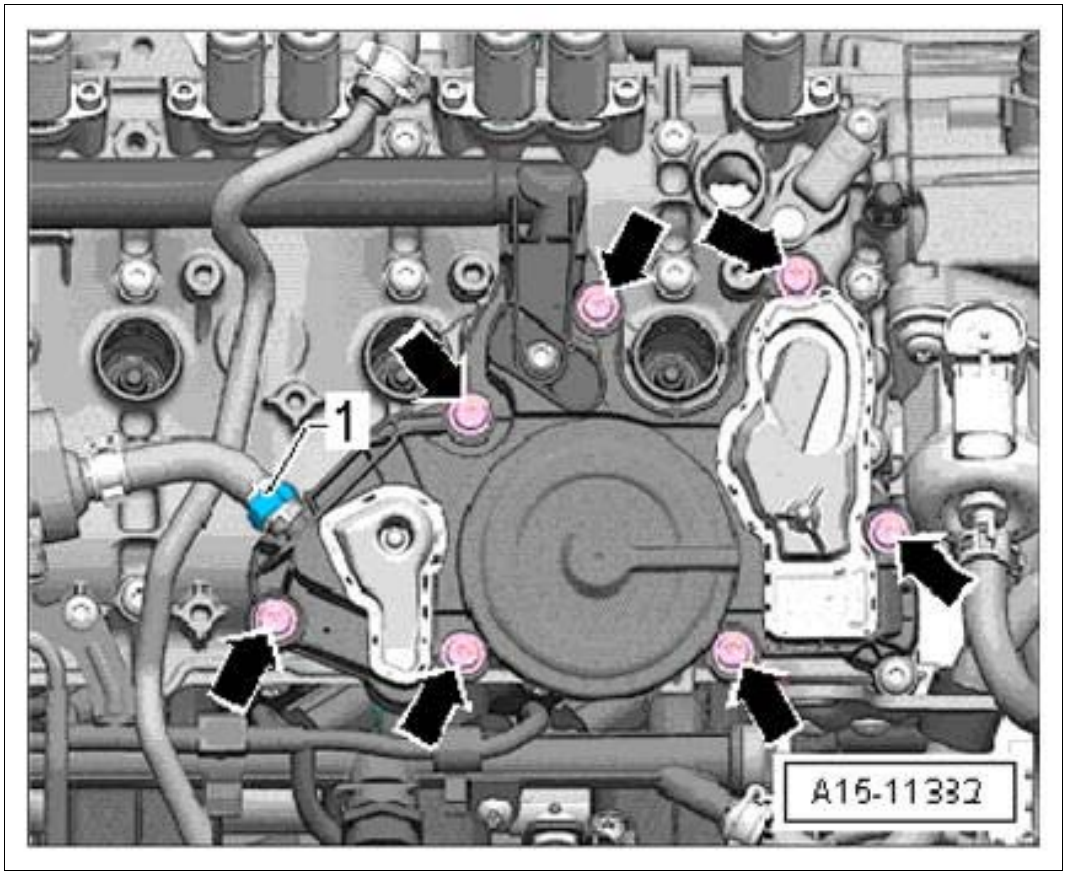
Fig 7: Identifying Front Fuel Lines



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Remove the positive crankcase ventilation.
    1. 8.1. Loosen the single-lug clip **-1-** and pull the hose off the carbon canister.
    2. 8.2. Unscrew the fastening screws **-arrows-** and remove the positive crankcase ventilation.
    3. 8.3. Expose the vacuum lines.

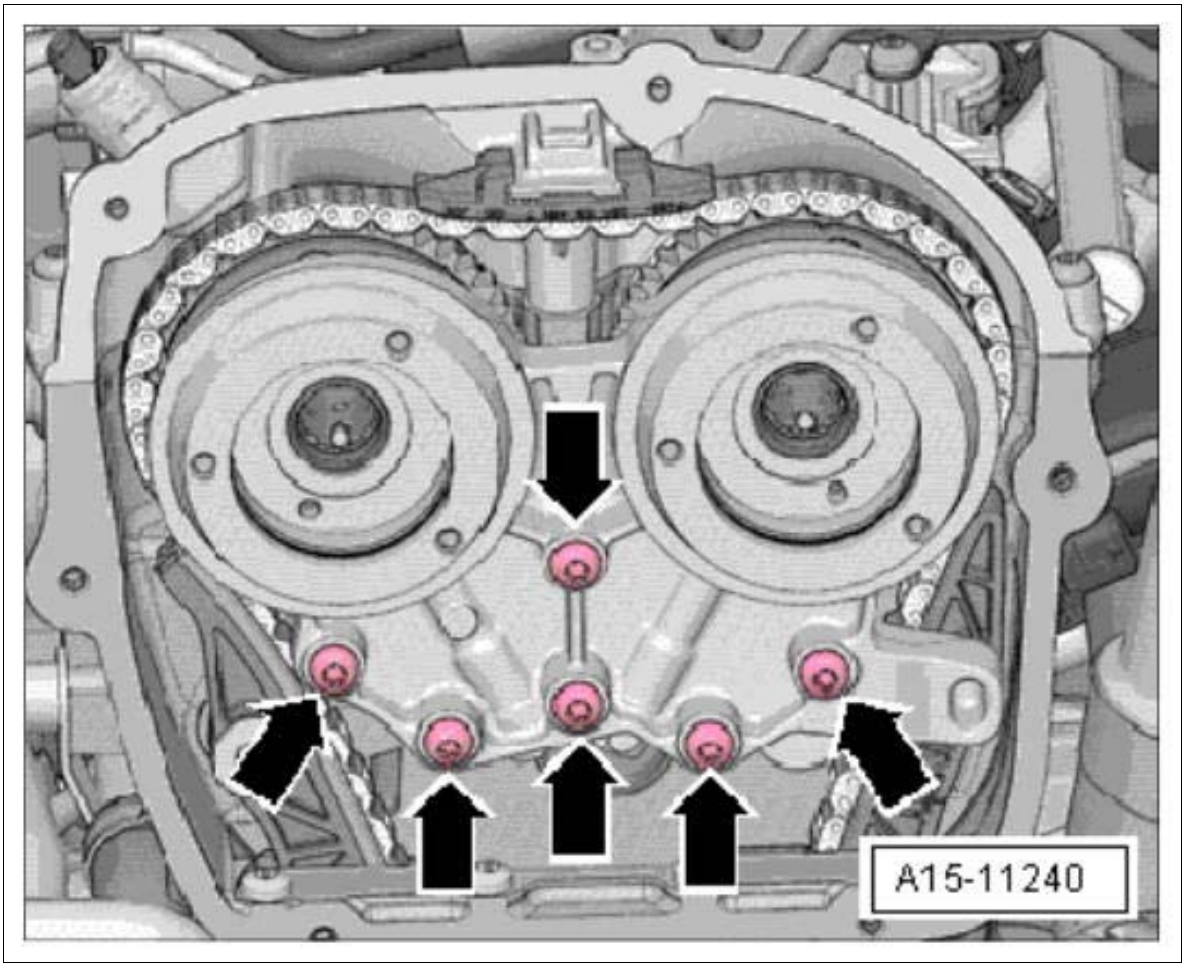
Fig 8: Locating Positive Crankcase Ventilation Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Unscrew the fastening screws **-arrows-** and remove the bearing saddle.

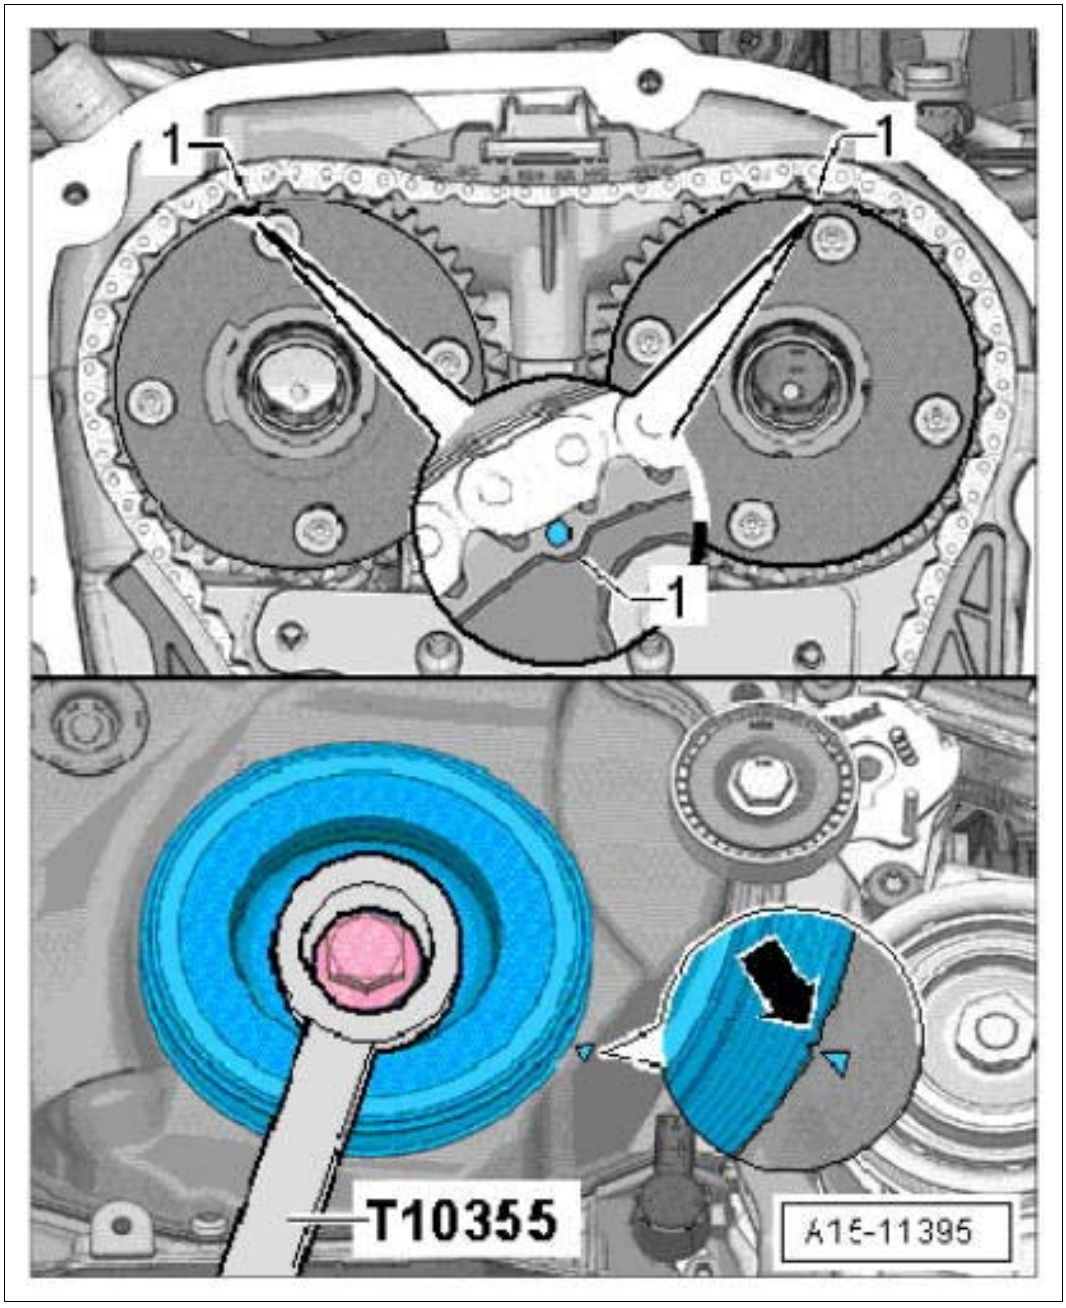
Fig 9: Locating Bearing Saddle Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Turn the pulley using **the counter-hold tool T10355** to the "top dead center" position.
    1. 10.1. Markings **-1-** on the camshaft are pointing upwards.
    2. 10.2. The notch on the pulley and the marking on the timing-case cover are aligned **-arrow-** .

Fig 10: Locating Top Dead Center Markings



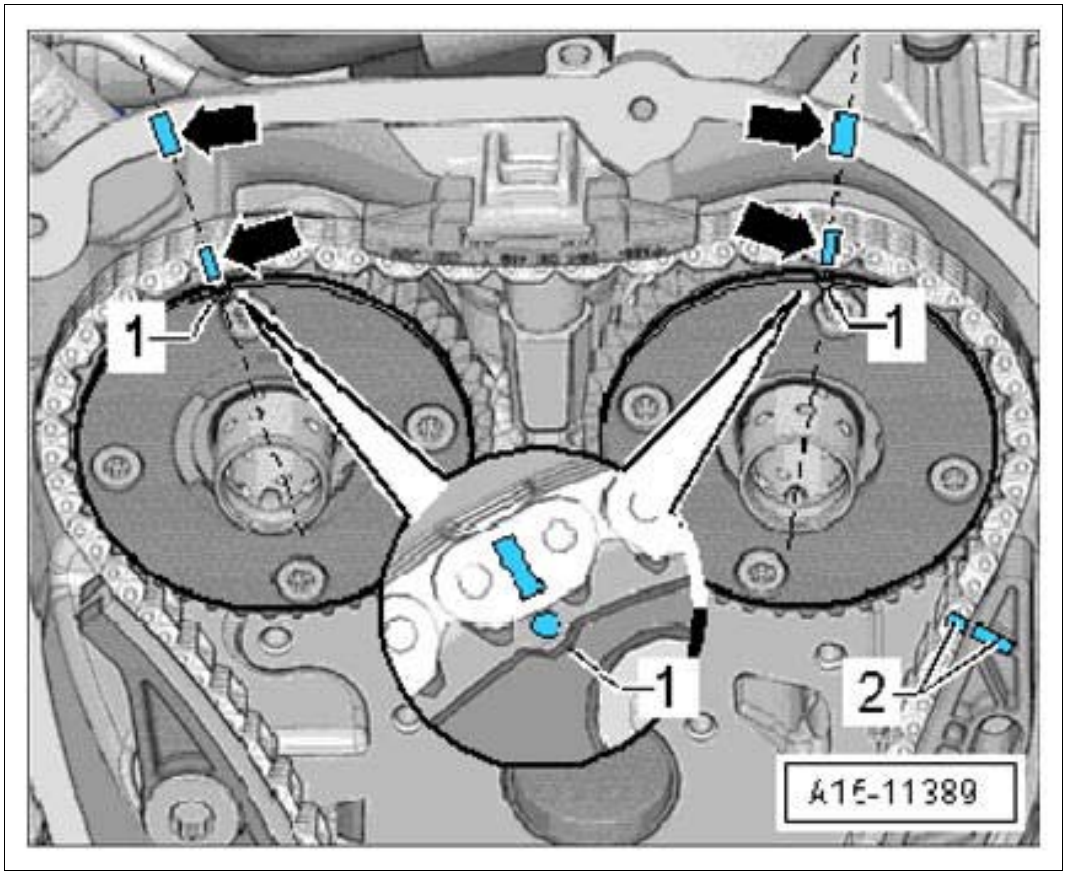
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

11. Copy the markings.

    1. 11.1. Identify the timing chain and cylinder head **-arrows-** with the markings on the sprockets **-1-** by using a water-resistant marker.

    2. 11.2. Mark timing chain on guide rail by using a water-resistant marker. **-2-**

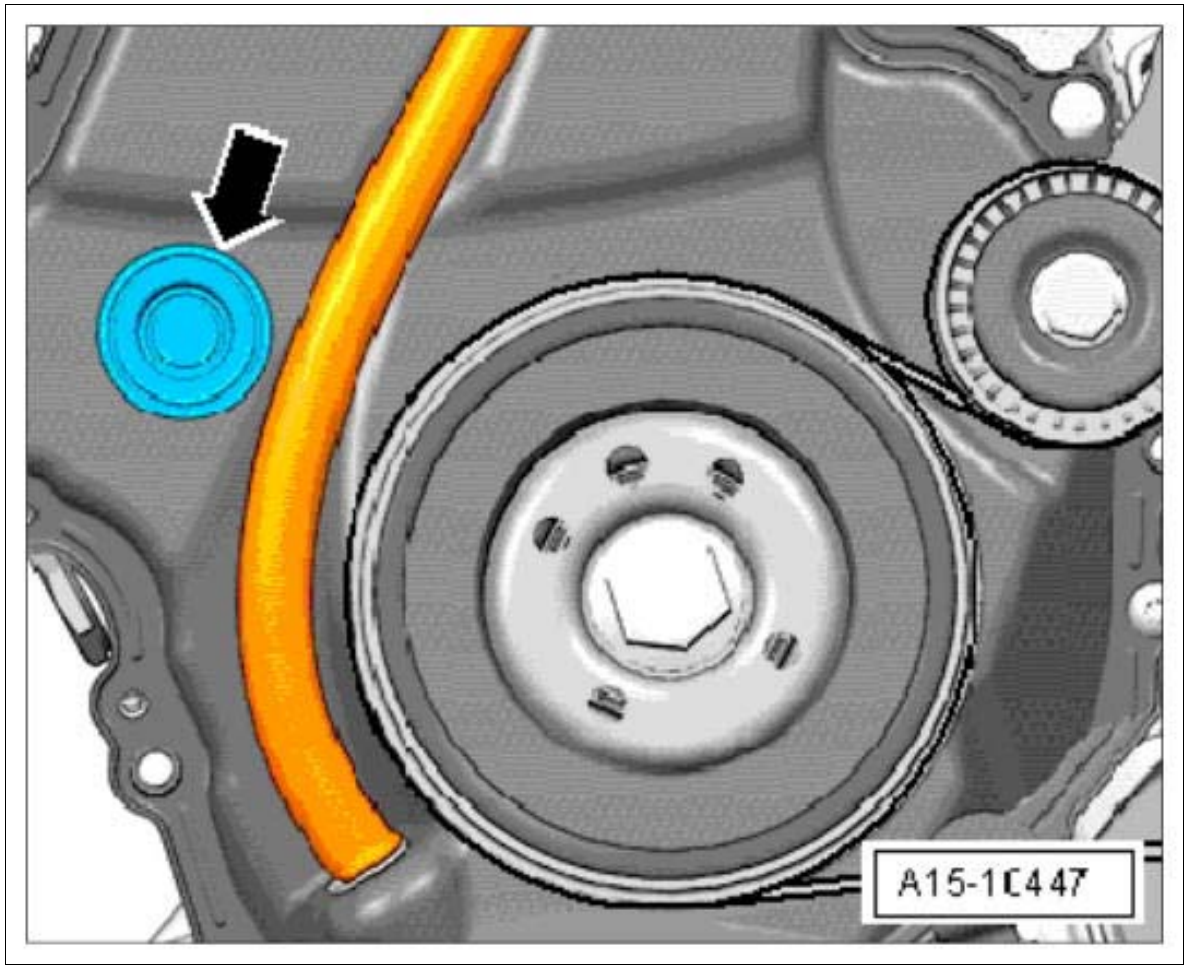
Fig 11: Locating TDC Markings



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Remove the stopper **-arrow-** .

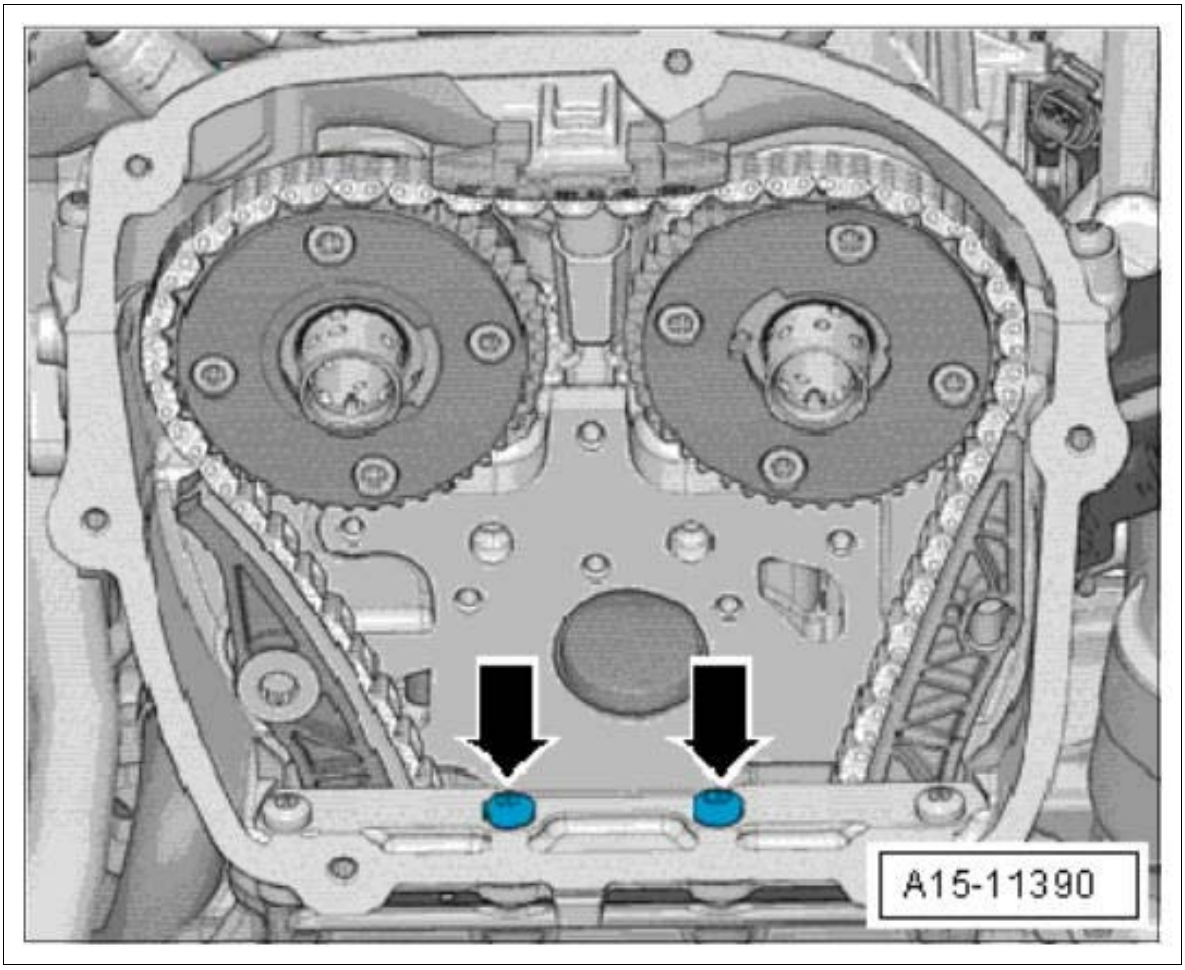
Fig 12: Locating Chain Tensioner Stopper



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

13. Unscrew the fastening screws **-arrows-** .

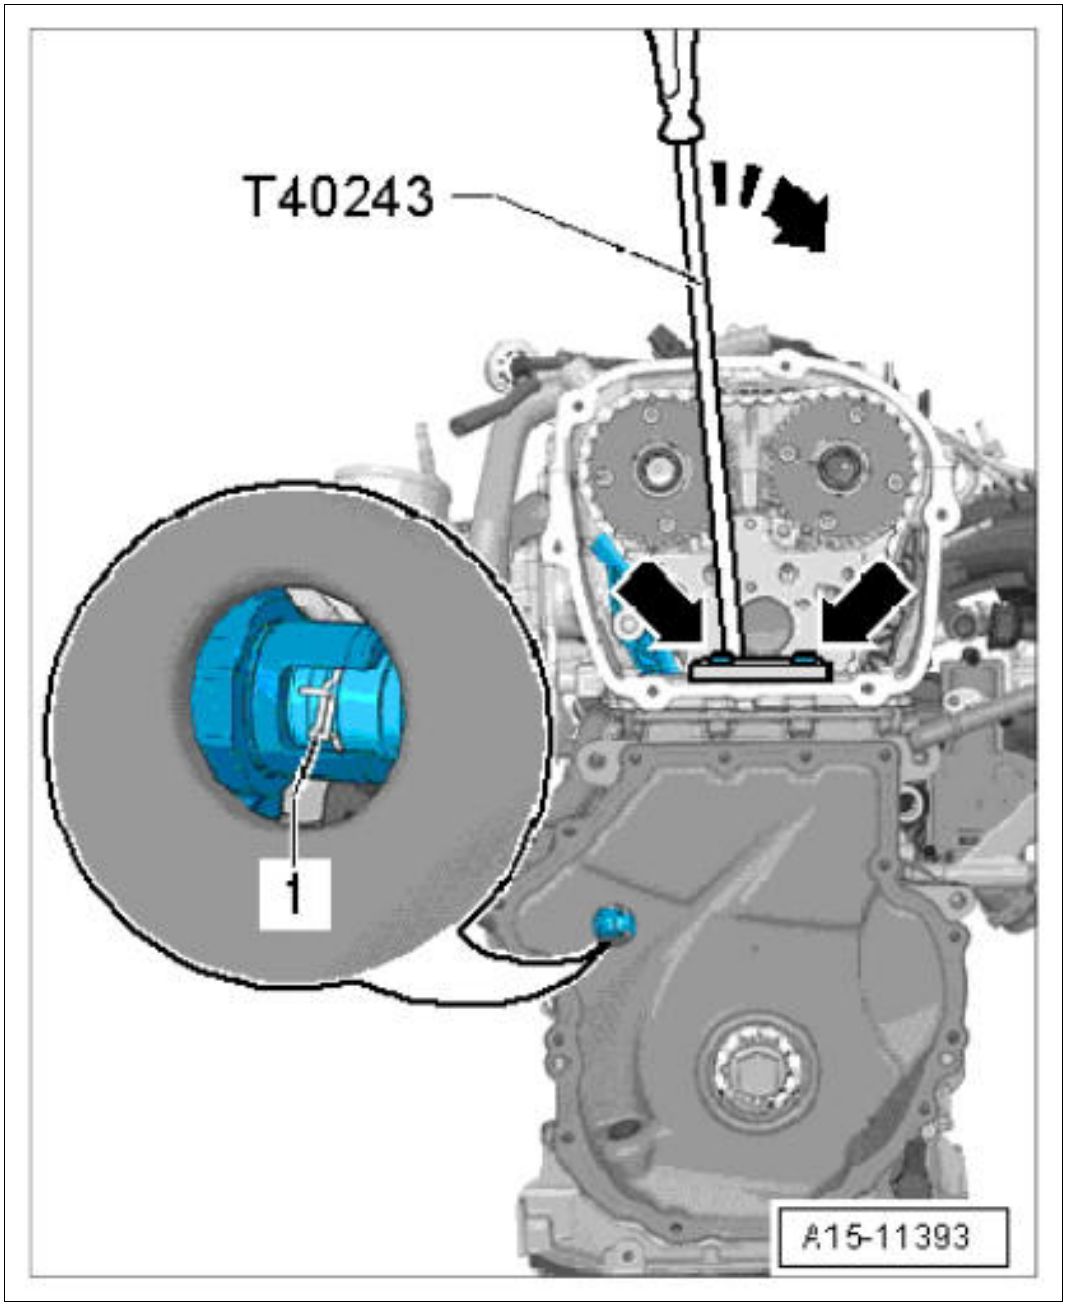
Fig 13: Locating Timing Chain Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Tighten the chain tensioner.
    1. 14.1. **Lever T40243** must now be screwed in. **-arrows-**
    2. 14.2. Press and hold the circlip **-1-** on the chain tensioner.
    3. 14.3. **Lever T40243** must now be pressed slowly in **-direction of arrow-** and held securely.

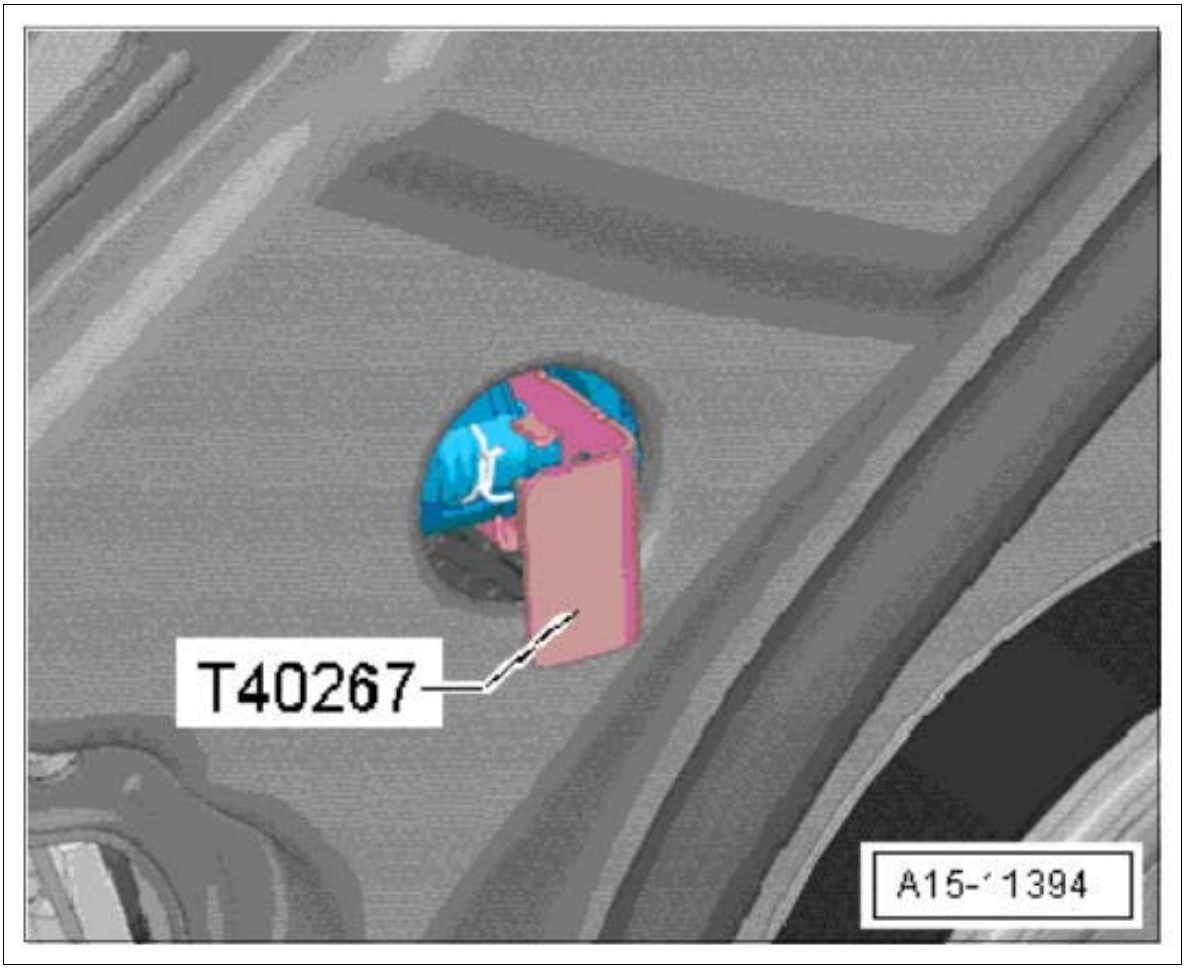
Fig 14: Tightening Chain Tensioner



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

15. Secure the chain tensioner with the staking tool T40267.

Fig 15: Securing Chain Tensioner



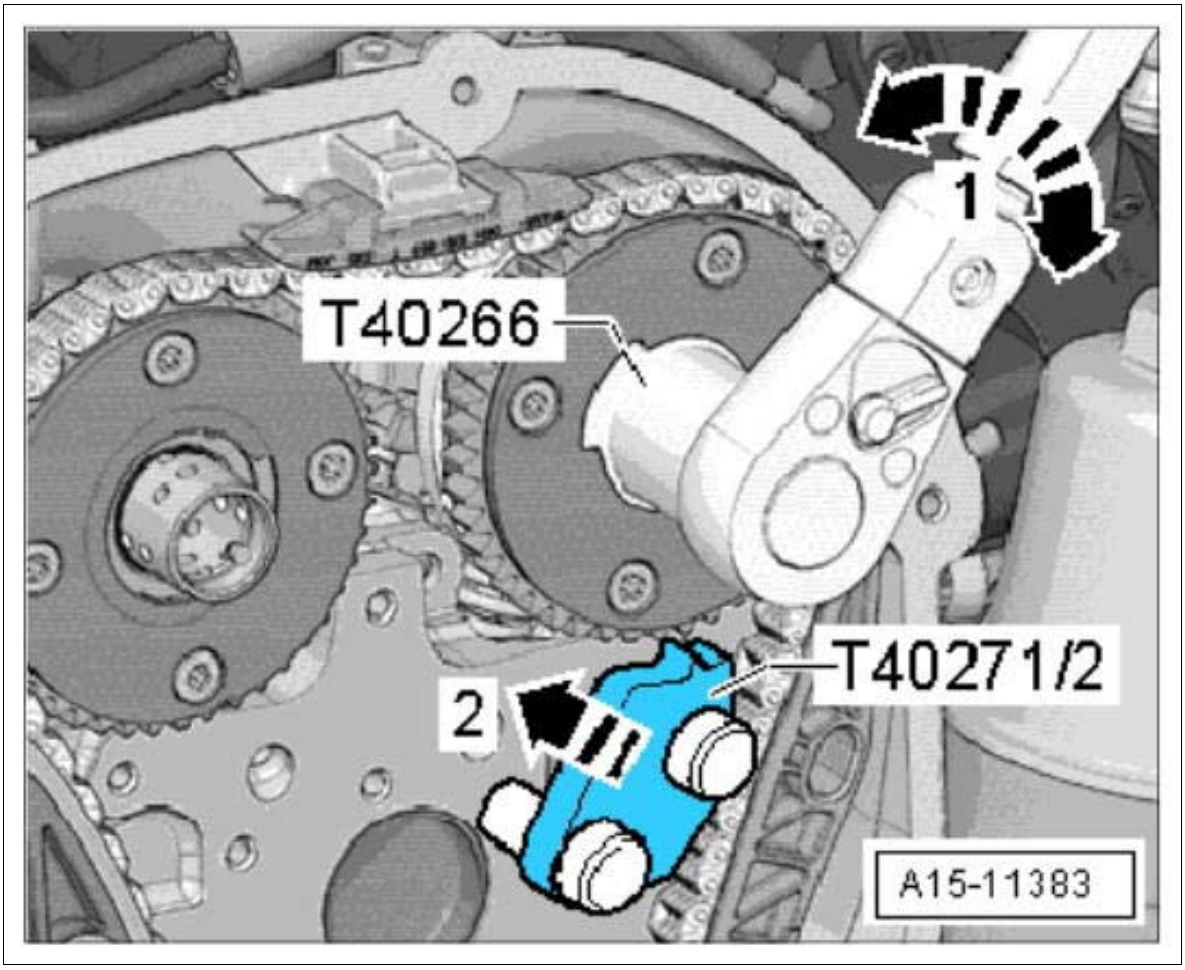
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

16. **Remove the lever T40243** .

17. **The camshaft clamp T40271** /2 must be screwed onto the cylinder head and then pushed into the toothing on the sprocket in **-direction of arrow 2-** .

    Use **adapter T40266** to turn the intake camshaft in **-direction of arrow 1-** if necessary.

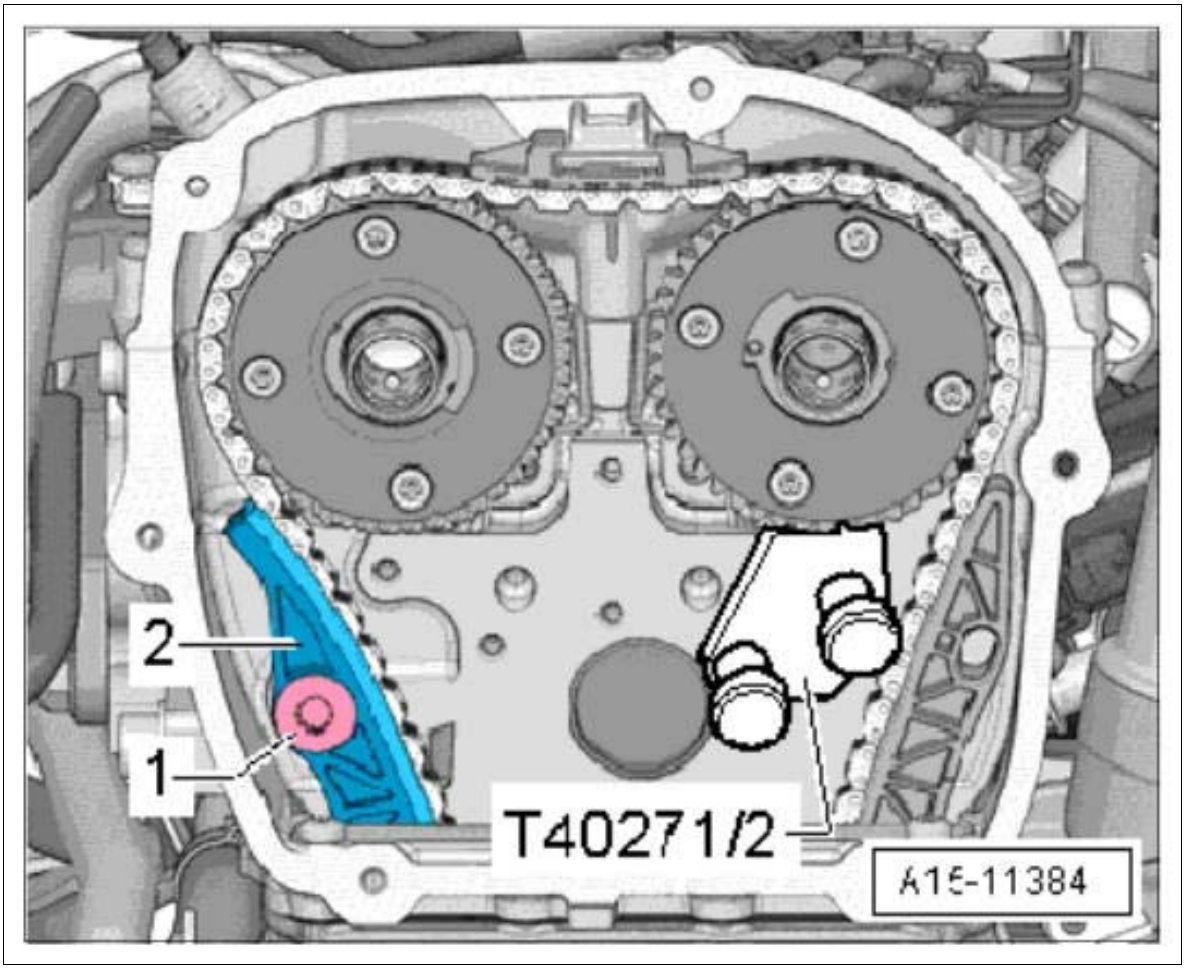
Fig 16: Securing Intake Camshaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

18. Unscrew the guide pin **-1-** and guide the tensioning rail **-2-** down.

Fig 17: Loosening Tensioning Rail



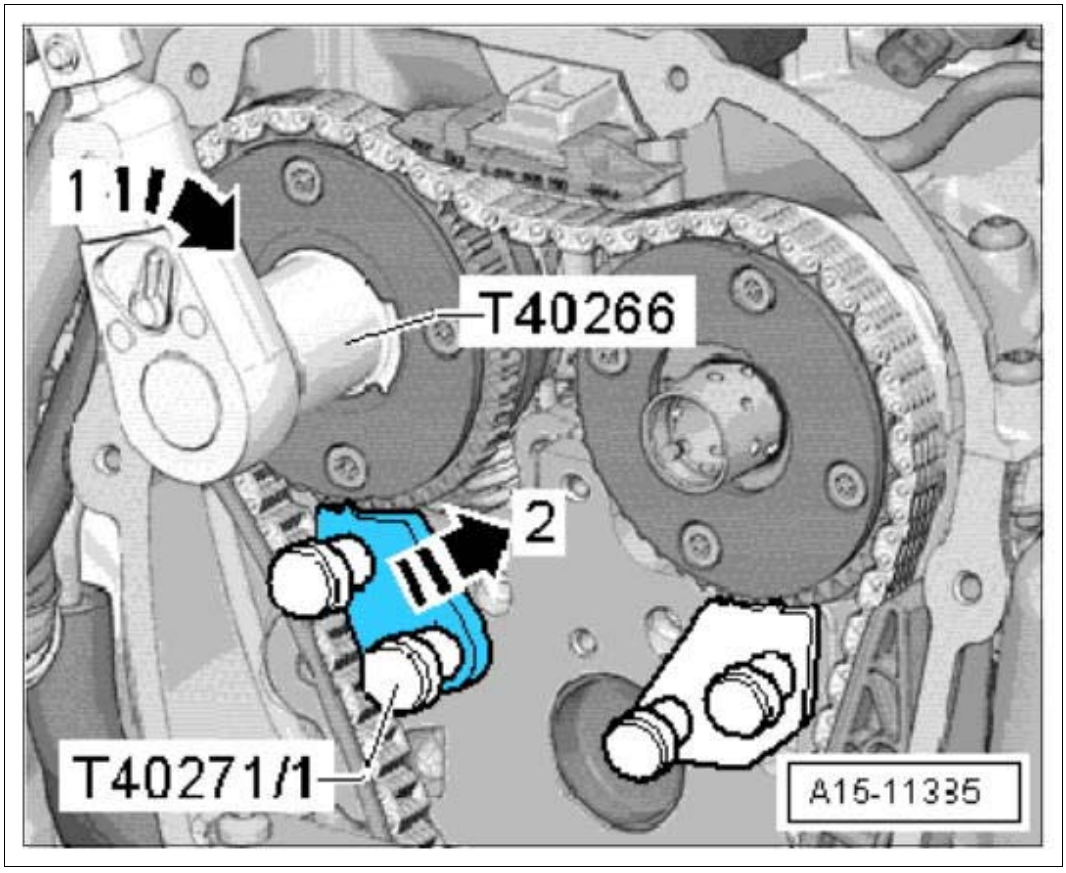
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

19. Secure the outlet camshaft.

    1. 19.1. The **camshaft clamp T40271** /1 must be screwed onto the cylinder head. → Secure the outlet camshaft

    2. 19.2. Use adapter T40266 to turn the outlet camshaft in **-direction of arrow 1-** and push **camshaft clamp T40271** /1 onto the toothing in **-direction of arrow 2-** .

Fig 18: Securing Outlet Camshaft

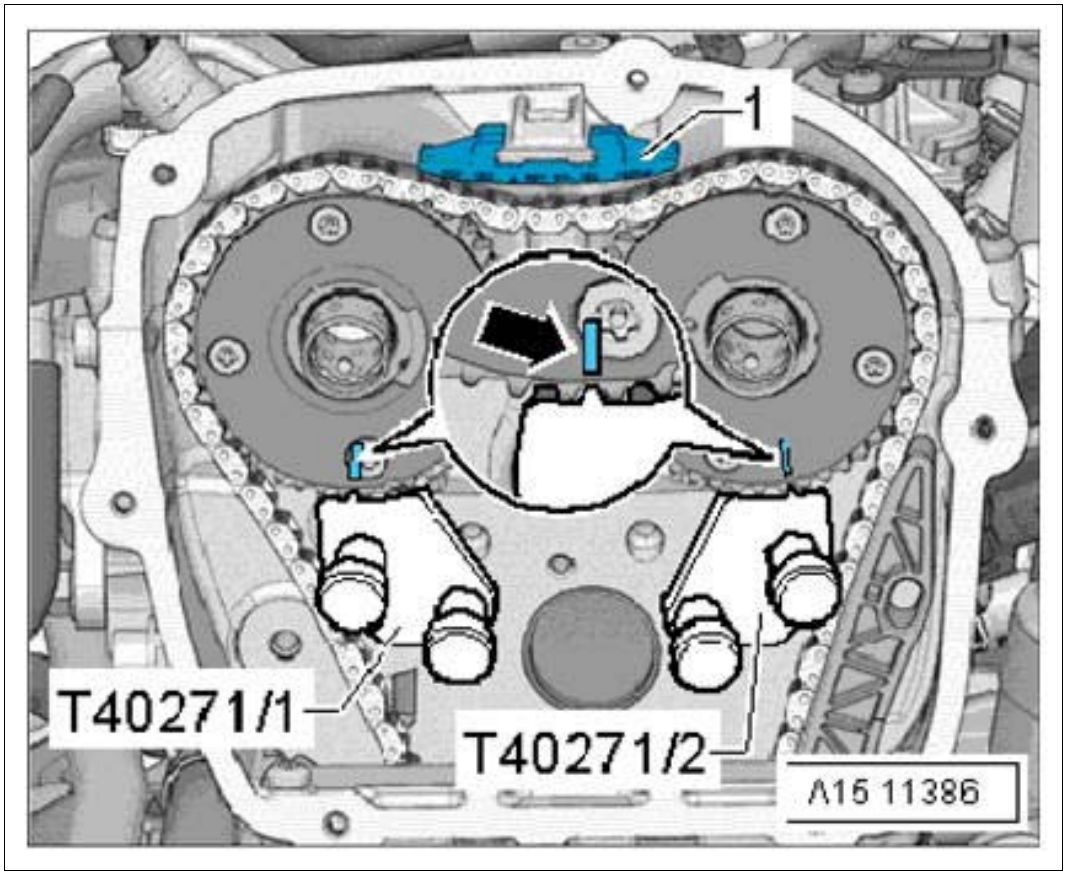


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

20. Transfer the markings onto the camshaft clamps

    1. 20.1. Mark the sprockets to **camshaft clamps T40271** /1 and 2. **-arrow-**
    2. 20.2. Release the catch on the upper guide rail **-1-** and remove the upper guide rail.
    3. 20.3. Remove the timing chain from the sprockets.

Fig 19: Locating Camshaft Clamps Markings

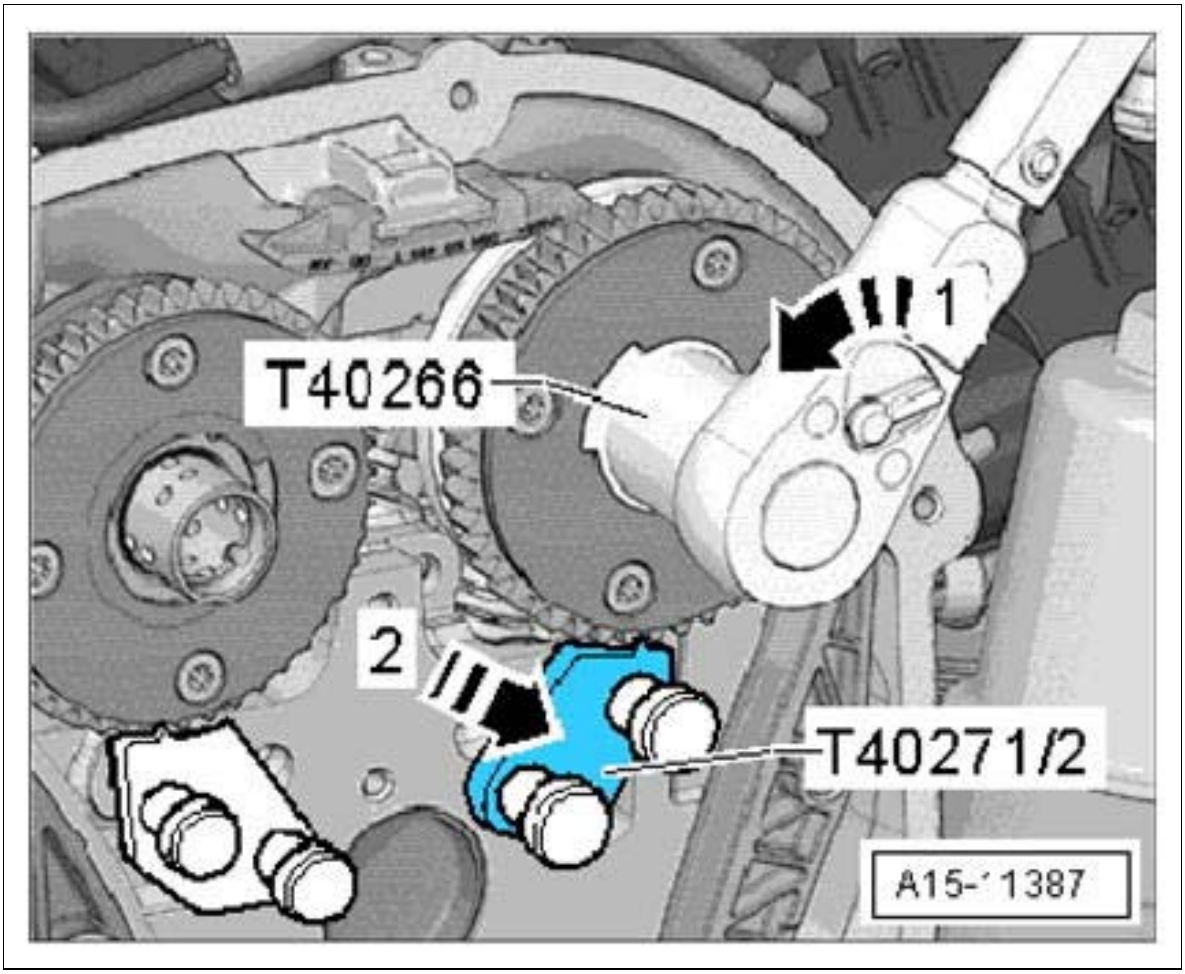


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

21. Turn the pulley, **against the direction of rotation of the engine** , out of TDC position.

22. Turn camshaft in **-direction of arrow 1-** with adapter T40266, push **camshaft clamps T40271** /2 in **-direction of arrow 2-** and fit camshaft into normal position.

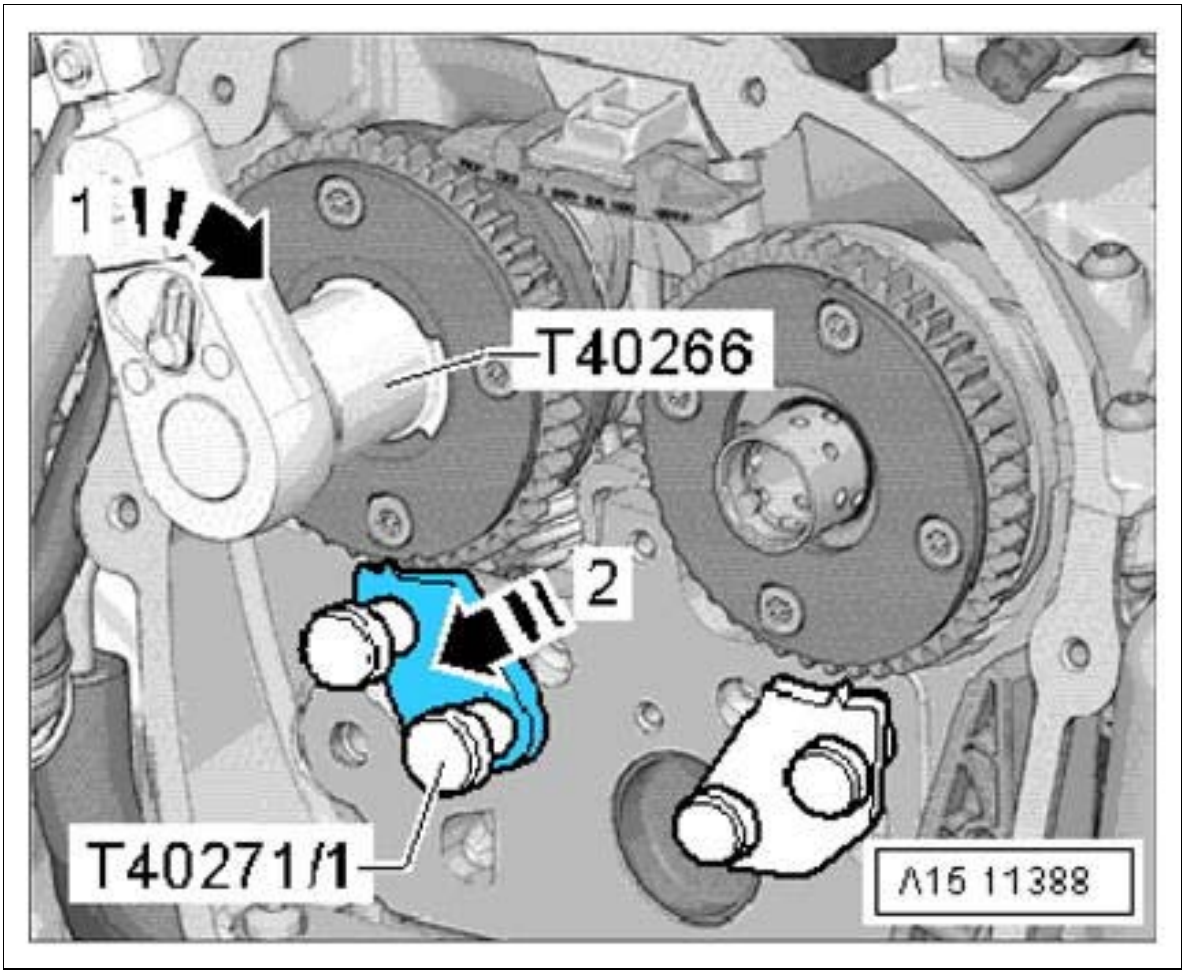
Fig 20: Securing Intake Camshaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

23. Turncamshaft in **-direction of arrow 1-** with **adapter T40266** , push **camshaft clamps T40271** /1 in **-direction of arrow 2-** and fit camshaft into normal position.

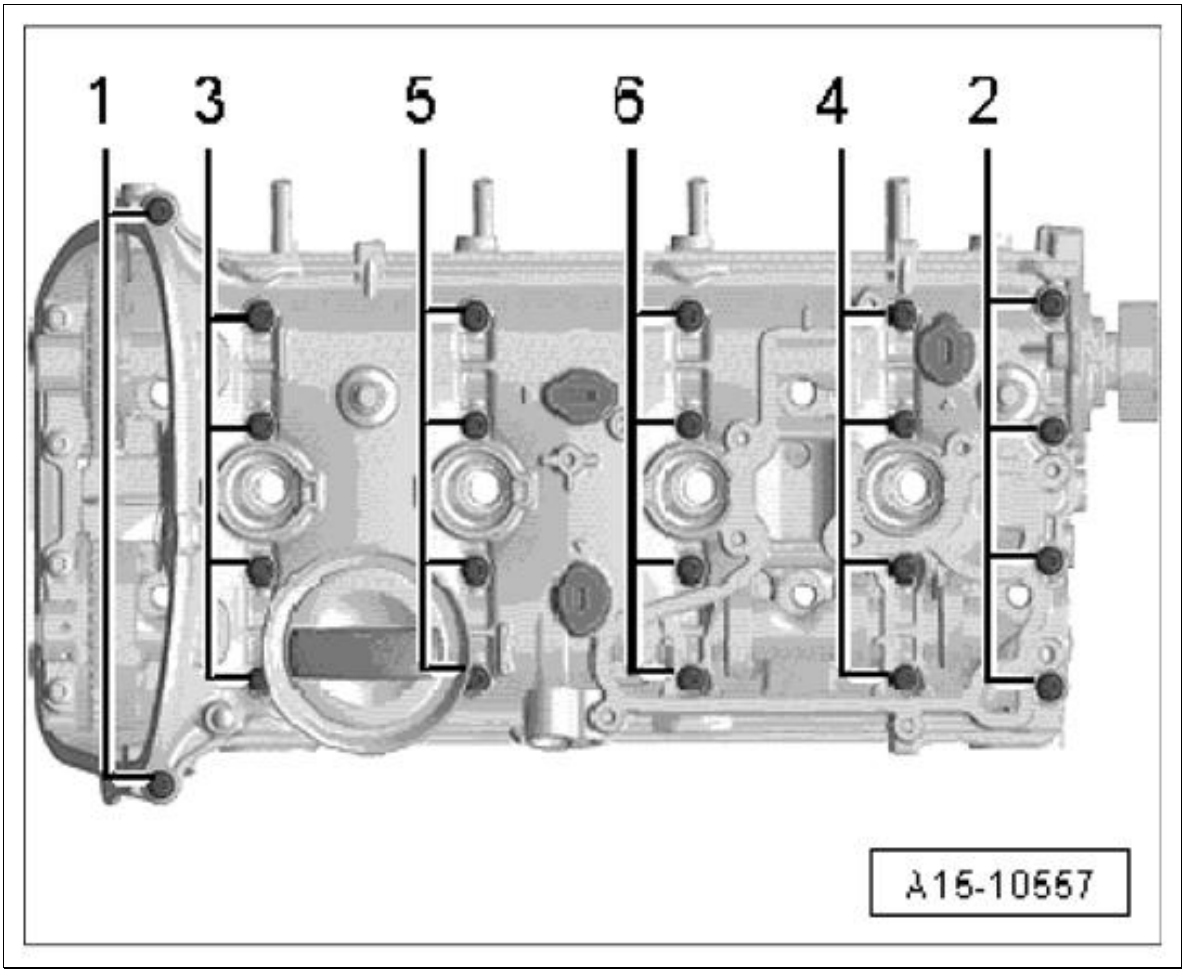
Fig 21: Securing Outlet Camshaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

24. Remove the high-pressure pump. → 246319 REMOVING AND INSTALLING THE HIGH-PRESSURE PUMP
25. Remove the vacuum pump. → 477619 REMOVING AND INSTALLING THE VACUUM PUMP
26. Unscrew the fastening screws on the cylinder head cover in the sequence **-1...6-** .

Fig 22: Cylinder Head Cover Screws Loosening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

27. Guide the cylinder head cover under permanent ventilation.
28. Remove the camshafts.

WM 158219 REMOVING AND INSTALLING CYLINDER HEAD COVER (MACAN) > INSTALL THE CYLINDER HEAD COVER

WARNING: Preloaded or pressurized components

- *Risk of eye injuries*
- *Risk of bruising*

→ Wear personal protective gear.

→ Secure components to prevent them from falling off suddenly.

NOTE: Dirt and contamination

- *Risk of damage to units or components*

→ Protect components from dirt and contamination.

→ Clean or replace dirty components.

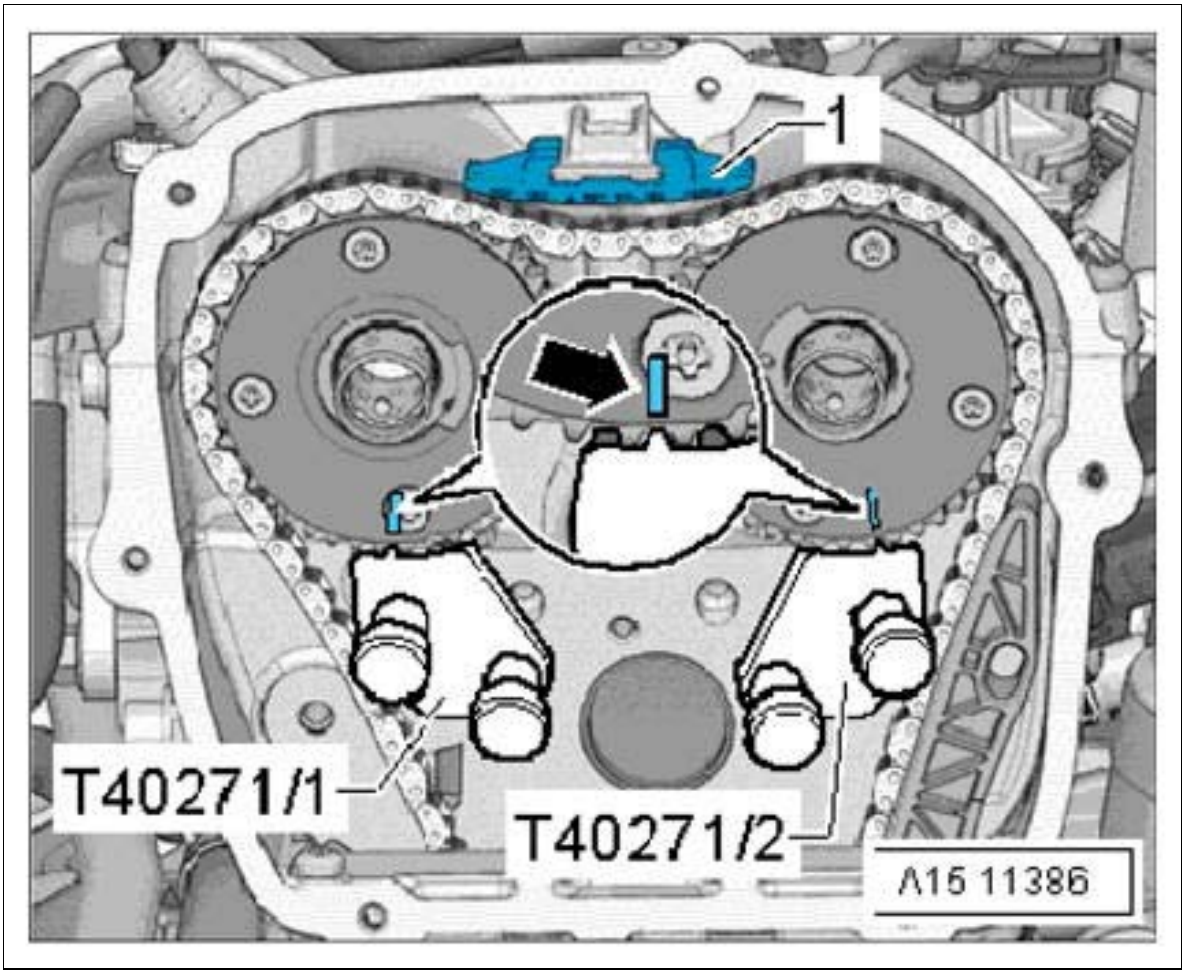
Information

- Sealing faces must be free of oil and grease.
- The rocker arms must rest properly on the valve stem ends.
- The crankshaft must not be at the TDC position.

If the crankshaft has been turned, the piston of the 1st cylinder must be set to the top dead center and the crankshaft must be turned back again slightly.

1. Remove any sealant residue on the cylinder block using a flat scraper.
2. Remove any sealant residue from the groove on the cylinder head cover and from the sealing faces.
3. Oil the running surfaces of the camshafts.
4. When replacing the camshafts, transfer the markings **-arrow-** onto the new camshafts.

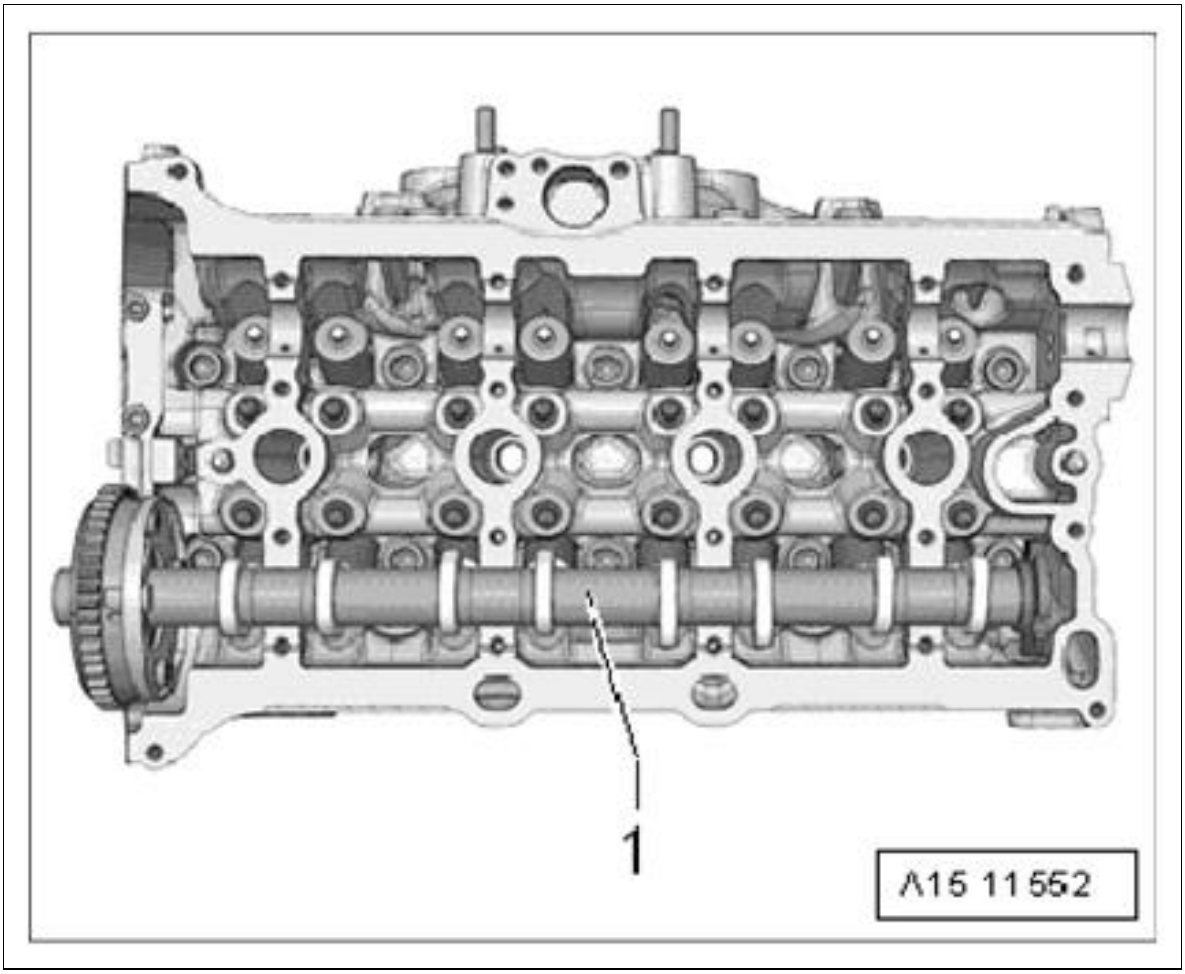
Fig 1: Locating Camshaft Clamps Markings



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Insert the intake camshaft **-1-** into the cylinder head.

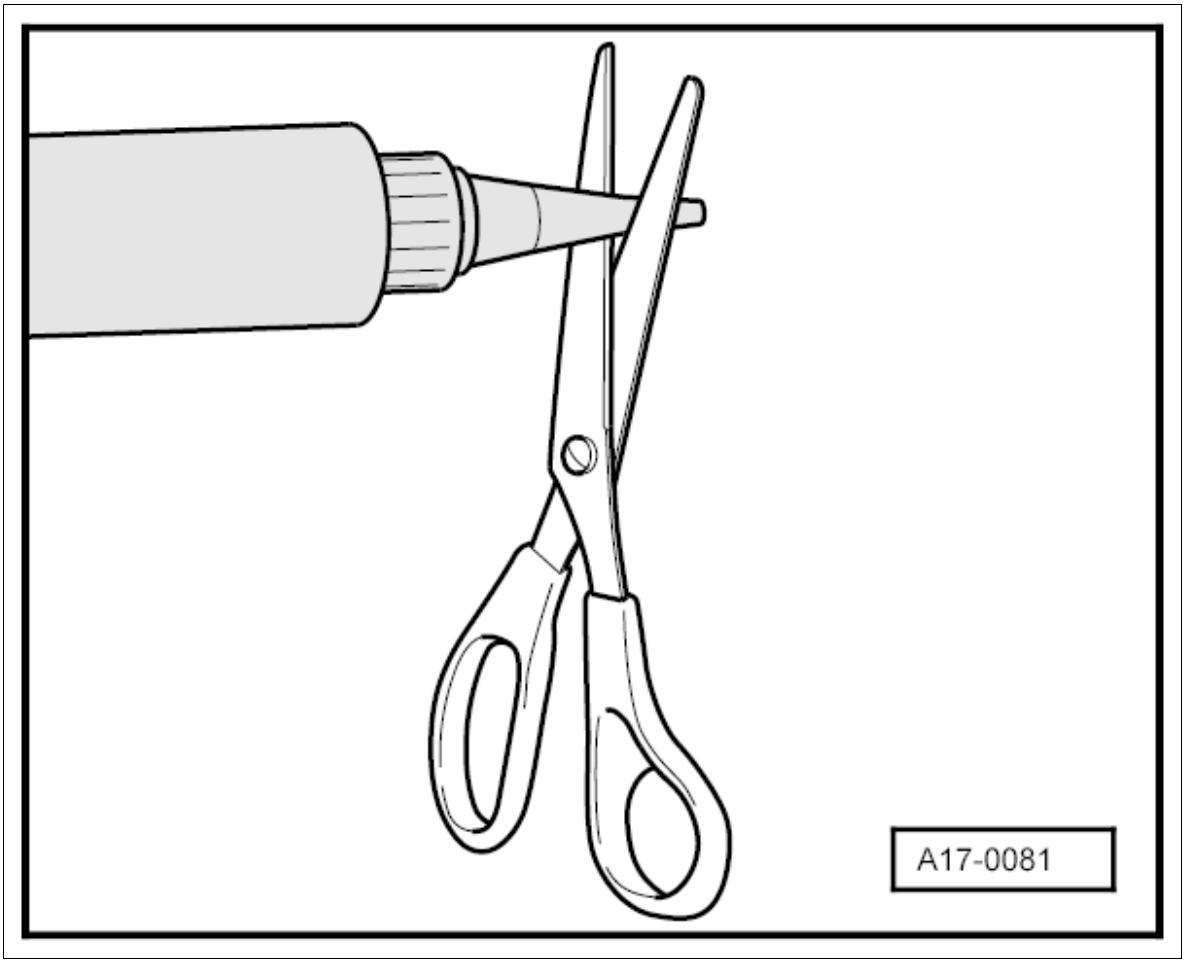
Fig 2: Identifying Intake Camshaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Cut the nozzle off the sealant tube at the front marking (nozzle ø is approx. 2 mm).

Fig 3: Cutting Sealant Tube Nozzle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

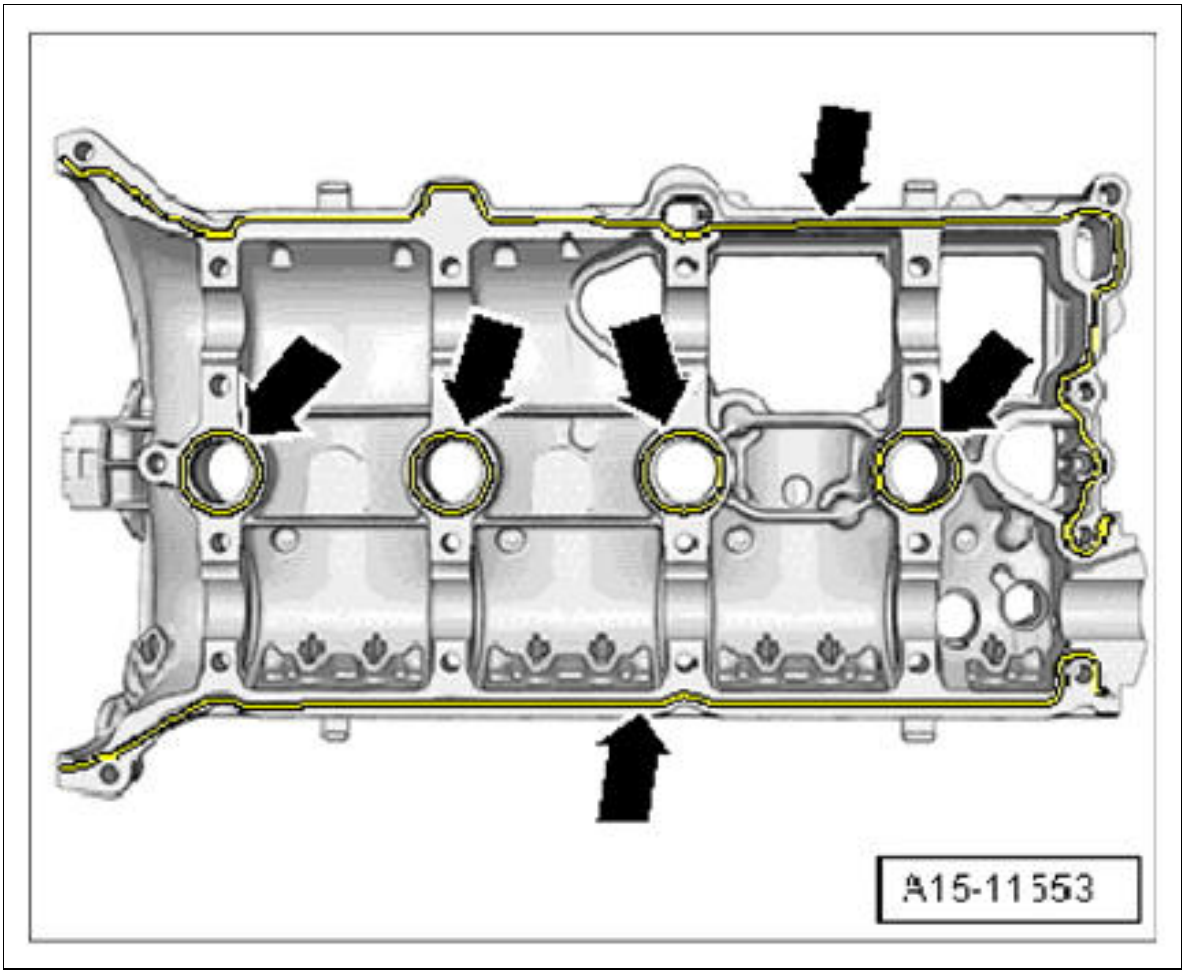
Information

1. The cylinder head cover must be installed within 5 minutes of applying the sealant.
2. The bead of sealant must not be thicker than the prescribed thickness.
3. Observe the use-by date of the sealant.

7. Apply silicone sealant to clean sealing faces **-arrows-** .

   Sealant bead thickness: 2... 3 mm.

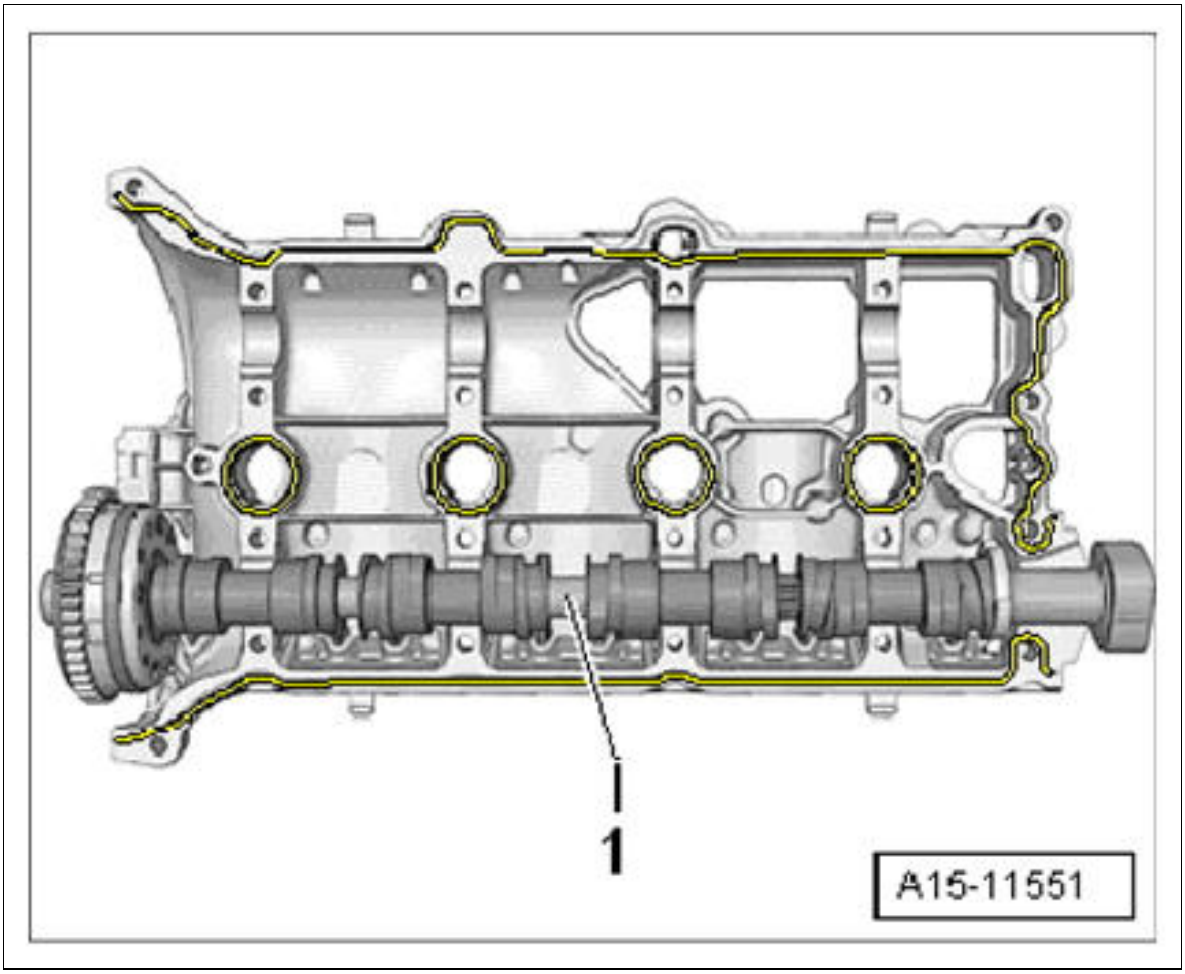
Fig 4: Locating Sealant Bead



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Insert the outlet camshaft **-1-** into the cylinder head cover.

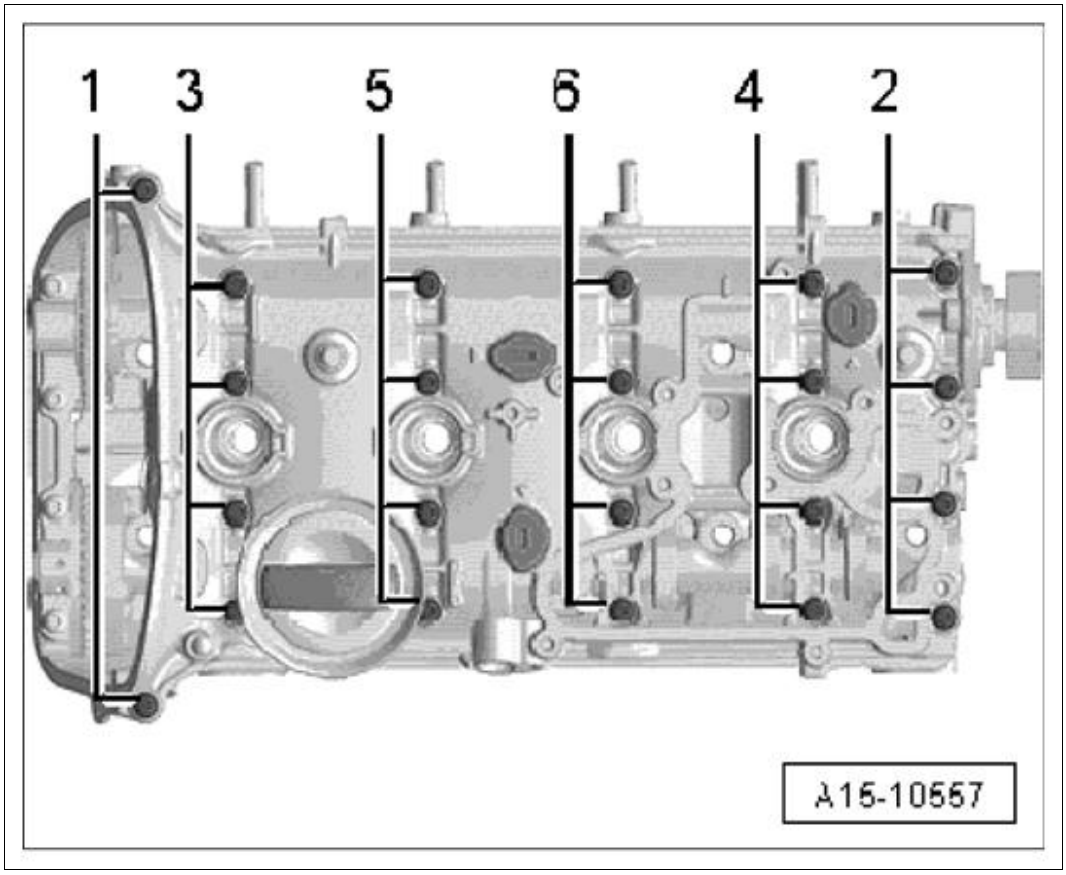
Fig 5: Identifying Outlet Camshaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Place the cylinder head cover and camshaft onto the cylinder head.
10. **Tighten the new** fastening screws in several steps in the sequence **-1...6-** .
    1. step: Screw in the fastening screws hand-tight.
    2. step: **Initial tightening 8 Nm (6 ftlb.)**
    3. step: **Final tightening +90°**

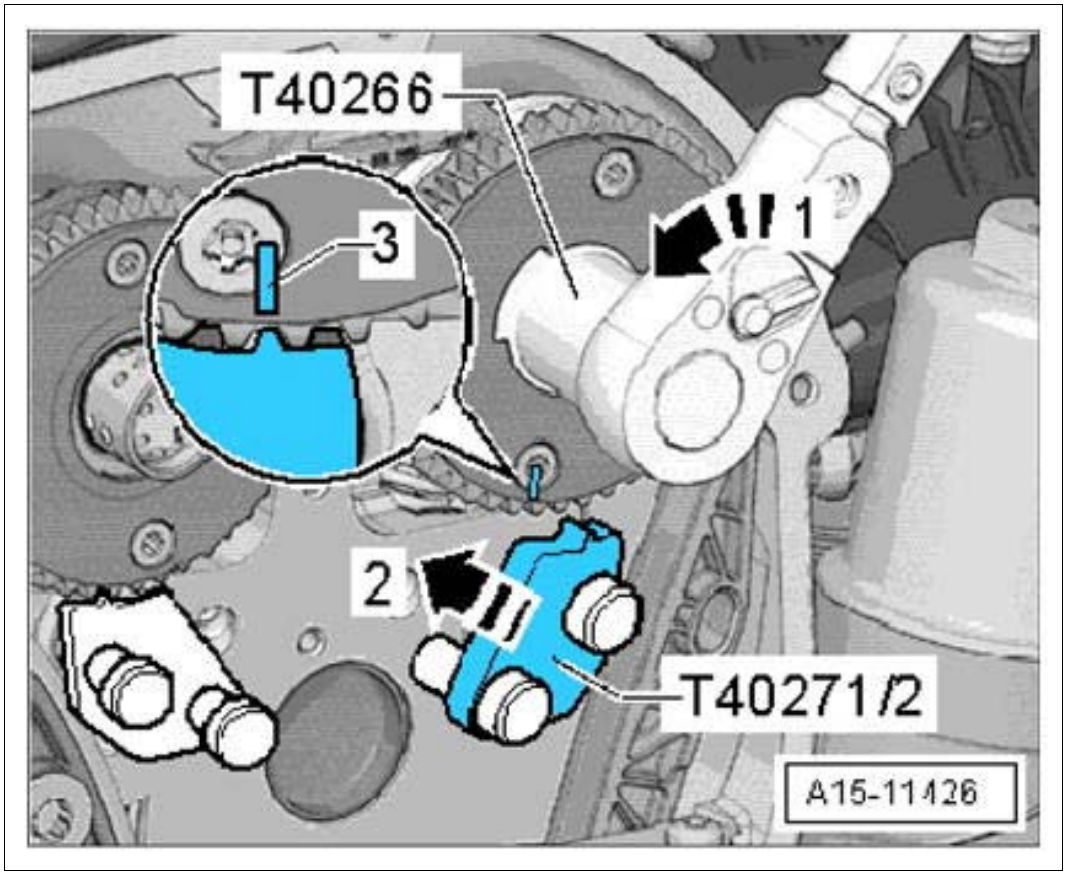
Fig 6: Cylinder Head Cover Screws Tightening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

11. Align the intake camshaft.
    1. 11.1. Turn the intake camshaft in **-direction of arrow 1-** until the marking **-3-** aligns with the **camshaft clamps T40271/2** .
    2. 11.2. **Push the camshaft clamp T40271** /2 in **-direction of arrow 2-** onto the splines of the sprocket.

Fig 7: Aligning Intake Camshaft



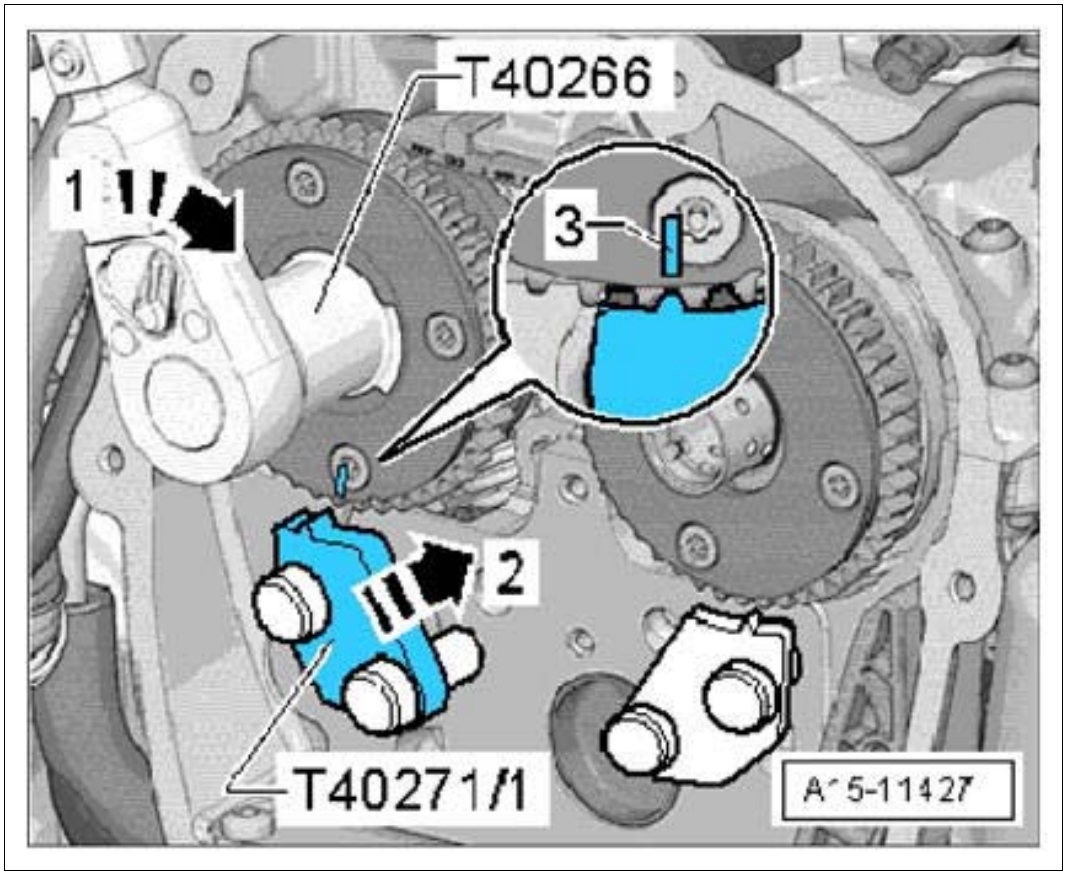
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Align the outlet camshaft.

    1. 12.1. Turn the outlet camshaft in the direction of the arrow **-direction of arrow 1-** until the marking **-3-** aligns with the **camshaft clamps T40271** /1.

    2. 12.2. **Push the camshaft clamp T40271** /1 in **-direction of arrow 2-** onto the splines of the sprocket.

Fig 8: Aligning Outlet Camshaft

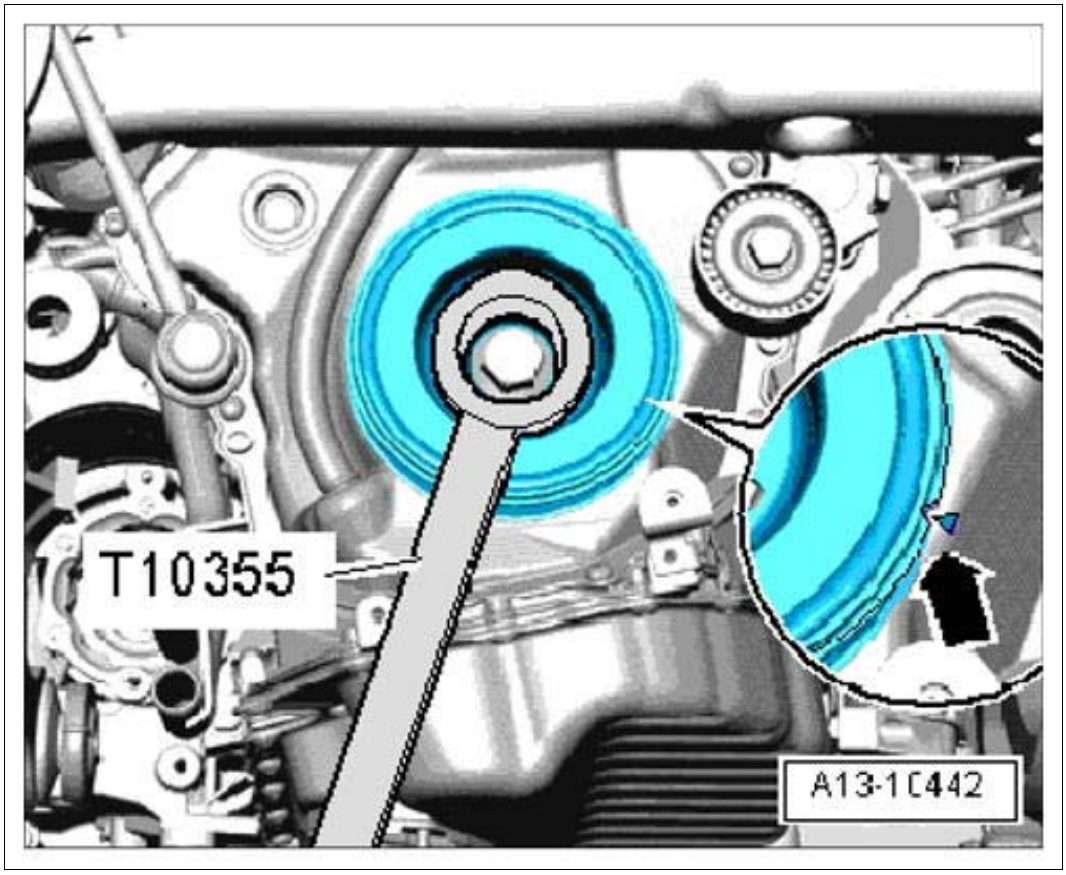


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

13. Turn the pulley using **counter-hold tool T10355** to set to the TDC position.

    1. 13.1. The notch on the pulley and the marking on the timing-case cover **-arrow-** must be aligned.

Fig 9: Locating TDC Marking On Pulley

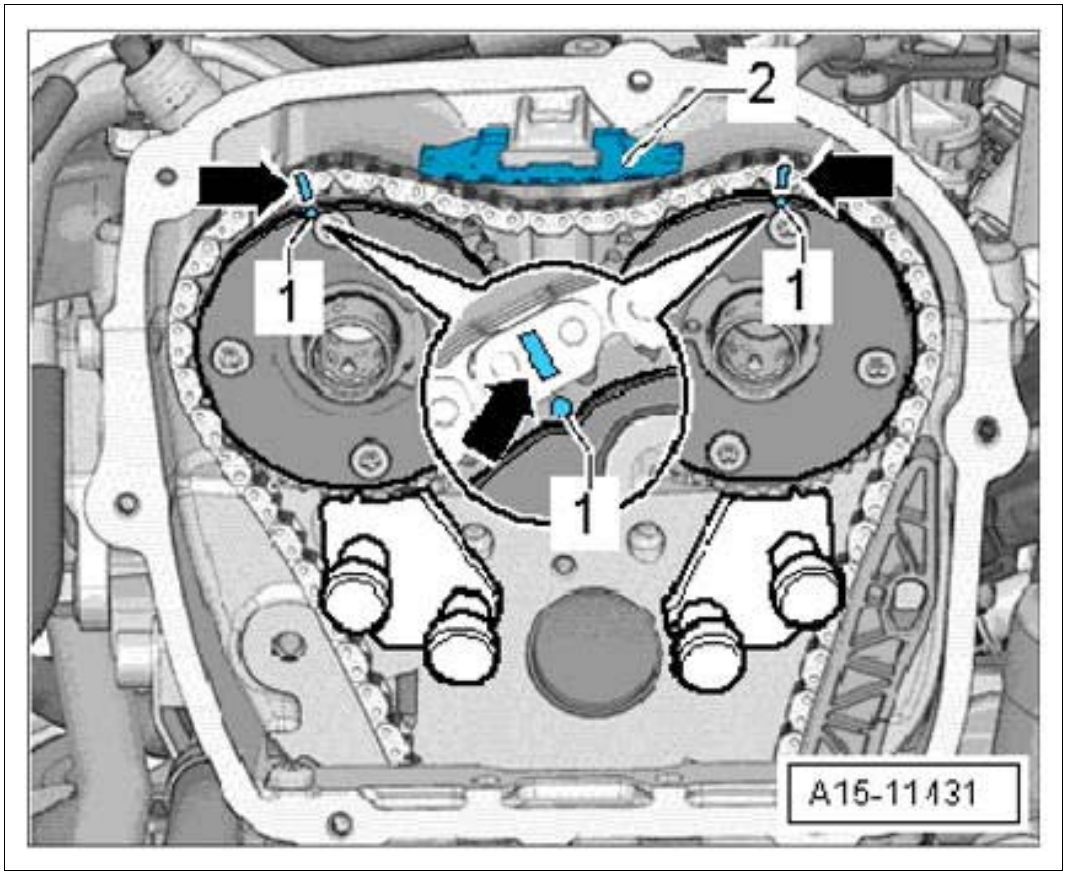


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Install the timing chain.

    1. 14.1. Position the markings on the chain links **-arrows-** at the markings on the sprockets **-1-** .
    2. 14.2. Install the upper guide rail **-2-** .

Fig 10: Locating Sprockets Marking

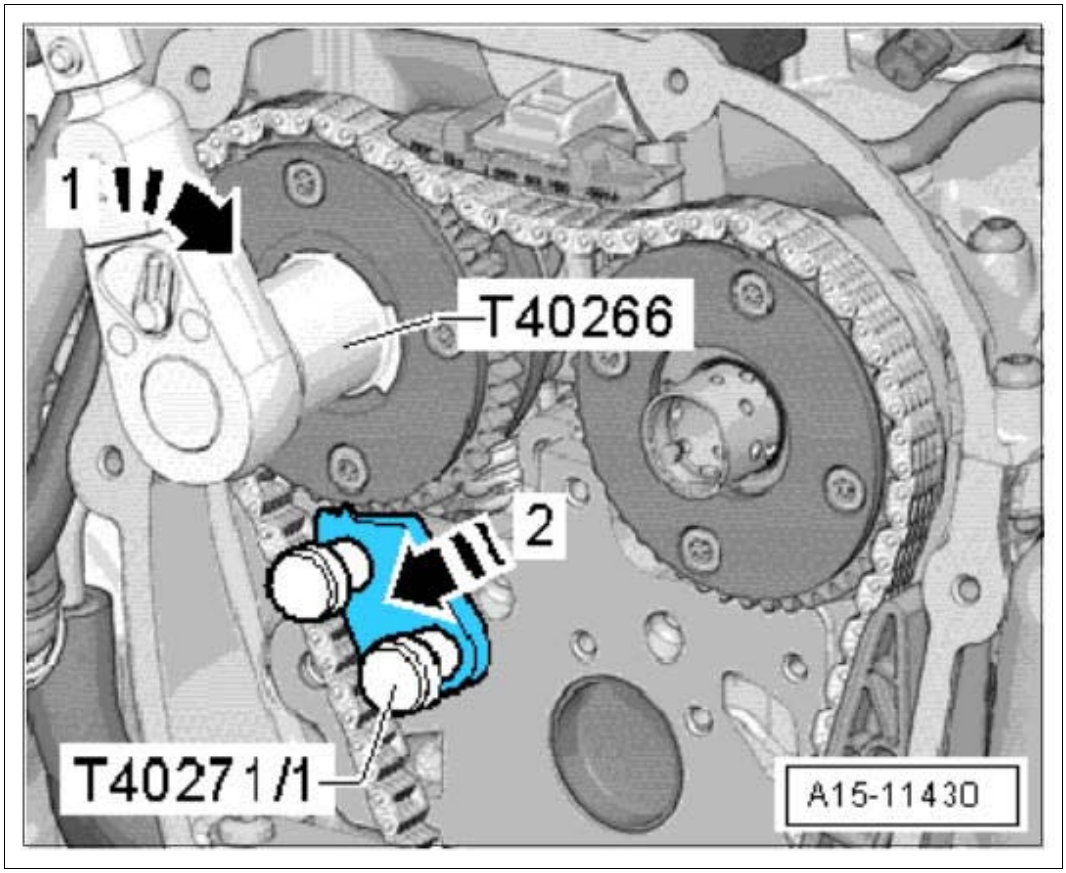


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

15. **Camshaft clamp T40271** /1 can now be removed.

    1. 15.1. **Use adapter T40266** to turn the outlet camshaft in **-direction of arrow 1-** .
    2. 15.2. **Camshaft clamp T40271** /1 must be pushed out of the toothing on the sprocket in **-direction of arrow 2-** .
    3. 15.3. Relieve the camshaft and remove **camshaft clamp T40271** /1.

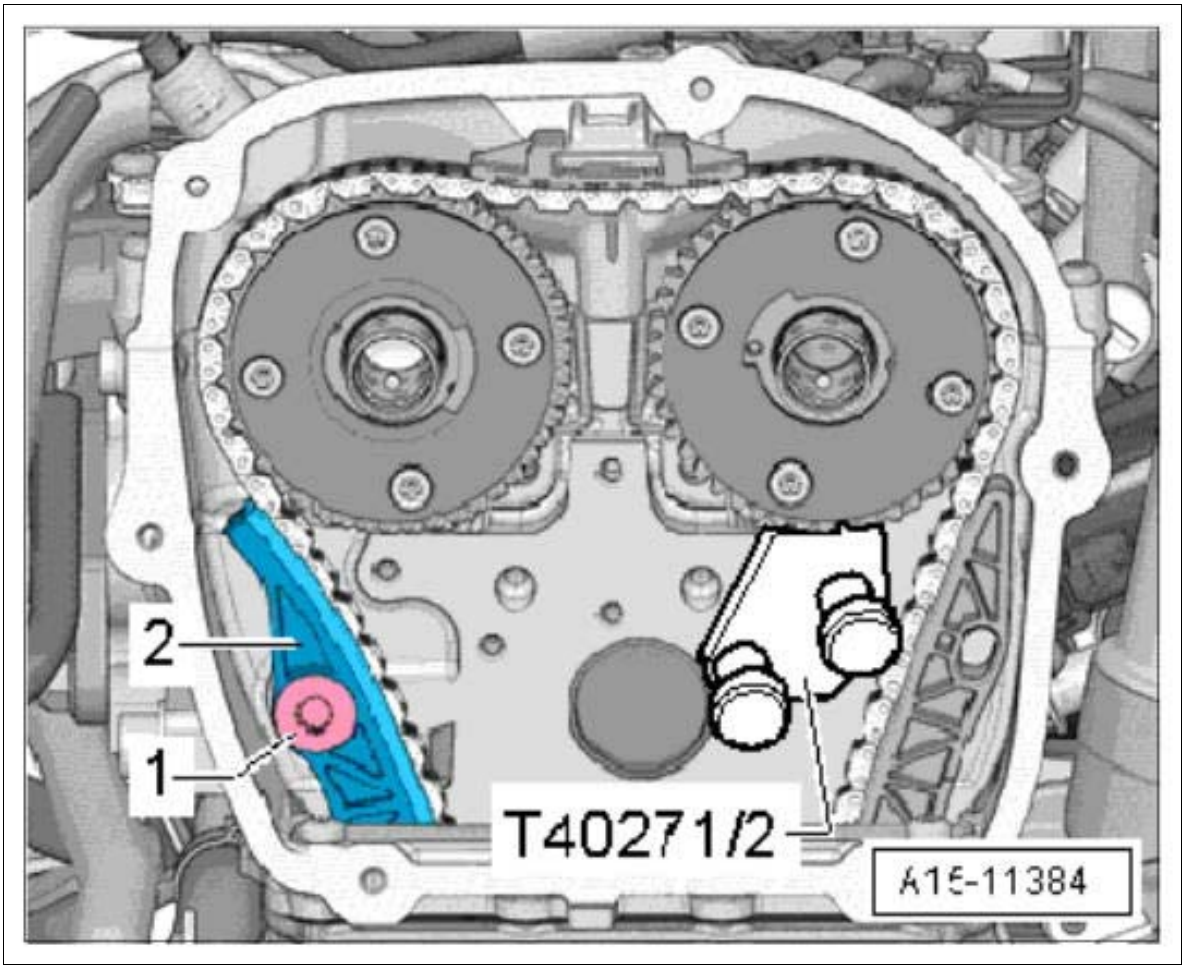
Fig 11: Removing Outlet Camshaft Fixing Device



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

16. Guide the tensioning rail **-2-** up, fit and tighten the guide pin **-1-** .

Fig 12: Securing Tensioning Rail

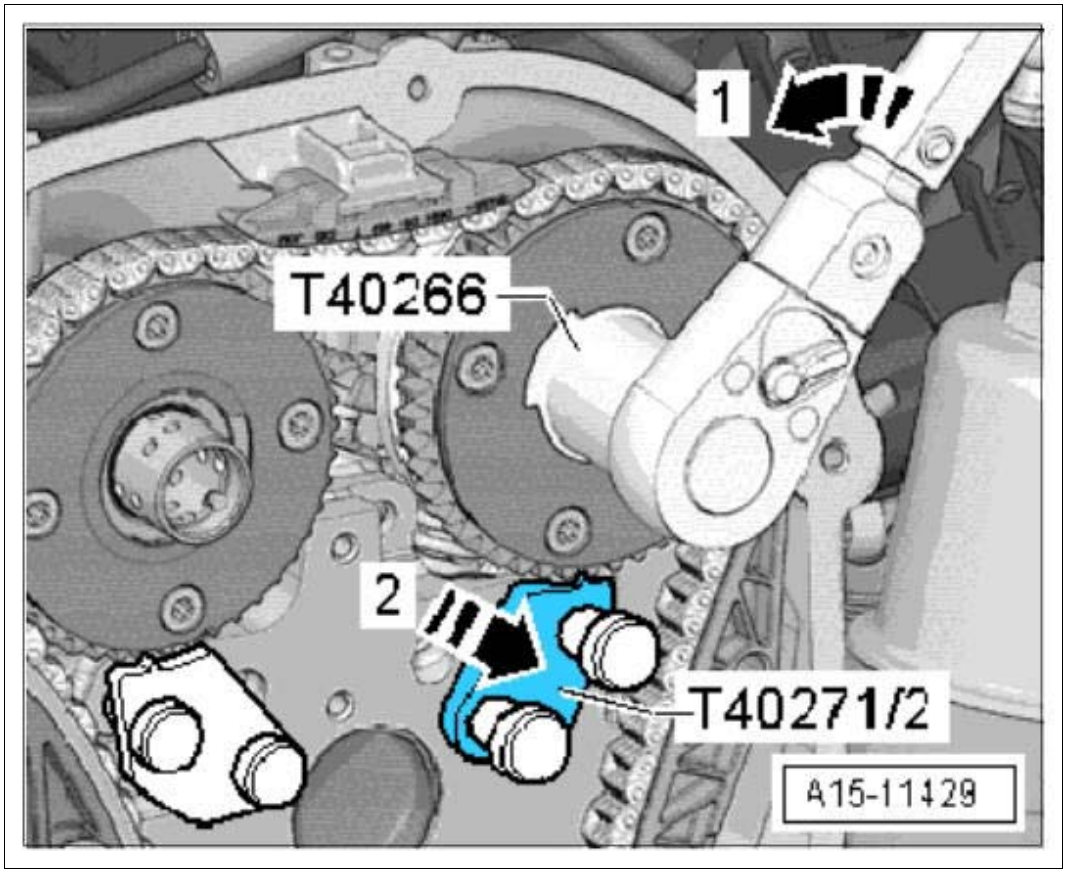


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

17. **The camshaft clamp T40271** /2 can now be removed.

    1. 17.1. **Use adapter T40266** to turn the intake camshaft in **-direction of arrow 1-** .
    2. 17.2. **The camshaft clamp T40271** /2 must be pushed out of the toothing on the sprocket in **-direction of arrow 2-** .
    3. 17.3. Relieve the camshaft and remove the **camshaft clamp T40271** /2.

Fig 13: Removing Intake Camshaft Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

18. Check the timing.

    1. 18.1. The timing chain and cylinder head **-arrows-** must align with the markings on the sprockets **-1-** .
    2. 18.2. The markings on the timing chain and guide rail **-2-** must be aligned.
    3. 18.3. The notch on the pulley must be aligned with the marking on the timing-case cover **-3-** .
    4. 18.4. If the markings applied are no longer visible, the timing must be checked. → 150516 ADJUST THE CAMSHAFTS

Fig 14: Locating Sprockets Marking

WM 170101 CHECKING ENGINE-OIL LEVEL (MACAN) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester 2	Special tool	9818		
WM 170101 CHECKING ENGINE-OIL LEVEL (MACAN) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
First fill of engine oil		Filling capacity	5.4 Liter		
Engine oil change quantity with filter (MAX)		Filling capacity	4.7 Liter		
Engine oil change quantity with filter (MIN)		Filling capacity	3.7 Liter		

WM 170101 CHECKING ENGINE-OIL LEVEL (MACAN) > INFORMATION > ENGINE OIL

Specification	Macan (2.0)
Engine oil specification - Europe	A40 (Porsche approval list) SAE 0W-40
Engine oil specification - USA/RoW	A40 (Porsche approval list) SAE 0W-40
Filling capacities:	
First fill	**→ Filling capacity: 5.4 Liter**
Change quantity with filter (MAX)	**→ Filling capacity: 4.7 Liter**
Change quantity with filter (MIN)	**→ Filling capacity: 3.7 Liter**

WM 170101 CHECKING ENGINE-OIL LEVEL (MACAN) > CHECKING ENGINE OIL

- The vehicle must be horizontal.
- The engine must be at operating temperature.
- Always check that there is enough engine oil in the engine.

> *NOTE: Incorrect oil level*
>
> - *Risk of damage to engine or catalytic converter*

→ Check the oil level regularly.

→ The oil level must not fall below the Minimum marking or rise above the Maximum marking.

→ Only use engine oil approved by Porsche.

Information

- The engine-oil level can be checked on the instrument cluster display or using PIWIS Tester 2 9818 .

  1. For details of checking the oil level using the instrument cluster, see Driver's Manual.
  2. To check the engine-oil level using **PIWIS Tester II 9818** , select [DME], [Maintenance/repairs], [Oil filling]. Follow the instructions for oil fill measurement on the Tester. If the engine oil has not yet reached measuring temperature, it can be heated to operating temperature by leaving the vehicle running while stationary or test-driving the vehicle. Check the engine-oil level after the test drive using the Tester. The Tester shows the oil level as a percentage and recommends a top-up quantity in liters.

WM 170117 DRAINING AND FILLING ENGINE OIL (MACAN) > PRELIMINARY WORK

1. Remove underbody panelling → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY

WM 170117 DRAINING AND FILLING ENGINE OIL (MACAN) > PRELIMINARY WORK > DRAINING ENGINE OIL

Information

When changing engine oil, drain the oil when it is hot because hot oil is more fluid than cold oil and all dirt particles and suspended matter can be cleaned out. Position the collecting container as close as possible to the drain outlet of the oil pan.

WARNING: Hot fluid

- *Danger of scalding*

→ Let the fluid cool down.

→ Wear personal protective gear.

1. Drain oil.
    1. 1.1. Position collection container under the stopper.
    2. 1.2. Unscrew stopper and drain oil.
2. Insert stopper with a new O-ring and turn it as far as it will go. Coat new O-ring with engine oil.
    1. 2.1. Stopper engages at the lock.

WM 170117 DRAINING AND FILLING ENGINE OIL (MACAN) > FILLING ENGINE OIL > ENGINE OIL

Filling capacities:	
First fill	**→ Filling capacity: 5.4 Liter**
Change quantity with filter (MAX)	**→ Filling capacity: 4.7 Liter**
Change quantity with filter (MIN)	**→ Filling capacity: 3.7 Liter**

WM 170117 DRAINING AND FILLING ENGINE OIL (MACAN) > FILLING ENGINE OIL > FILLING ENGINE OIL

NOTE: Incorrect oil level

- *Risk of damage to engine or catalytic converter*

→ Check the oil level regularly.

→ The oil level must not fall below the Minimum marking or rise above the Maximum marking.

→ Only use engine oil approved by Porsche.

1. Fill in engine oil.

WM 170117 DRAINING AND FILLING ENGINE OIL (MACAN) > SUBSEQUENT WORK

1. Install underbody panelling. → INSTALLING COVER FOR FRONT UNDERBODY

WM 170301 CHECKING OIL PRESSURE (ENGINE OIL) (MACAN) > TOOLS

Designation	Type	Number	Description	
oil pressure tester	Workshop equipment	WE 1068		

WM 170301 CHECKING OIL PRESSURE (ENGINE OIL) (MACAN) > PRELIMINARY WORK

1. Remove engine cover.

WM 170301 CHECKING OIL PRESSURE (ENGINE OIL) (MACAN) > CHECKING > CHECKING OIL PRESSURE

Test prerequisites:

- Park the vehicle on a level surface
- Oil level OK.
- Oil temperature 80 °C (radiator fan must have come on once)

1. Disconnect plug connection **-3-** on oil pressure switch for reduced oil pressure.

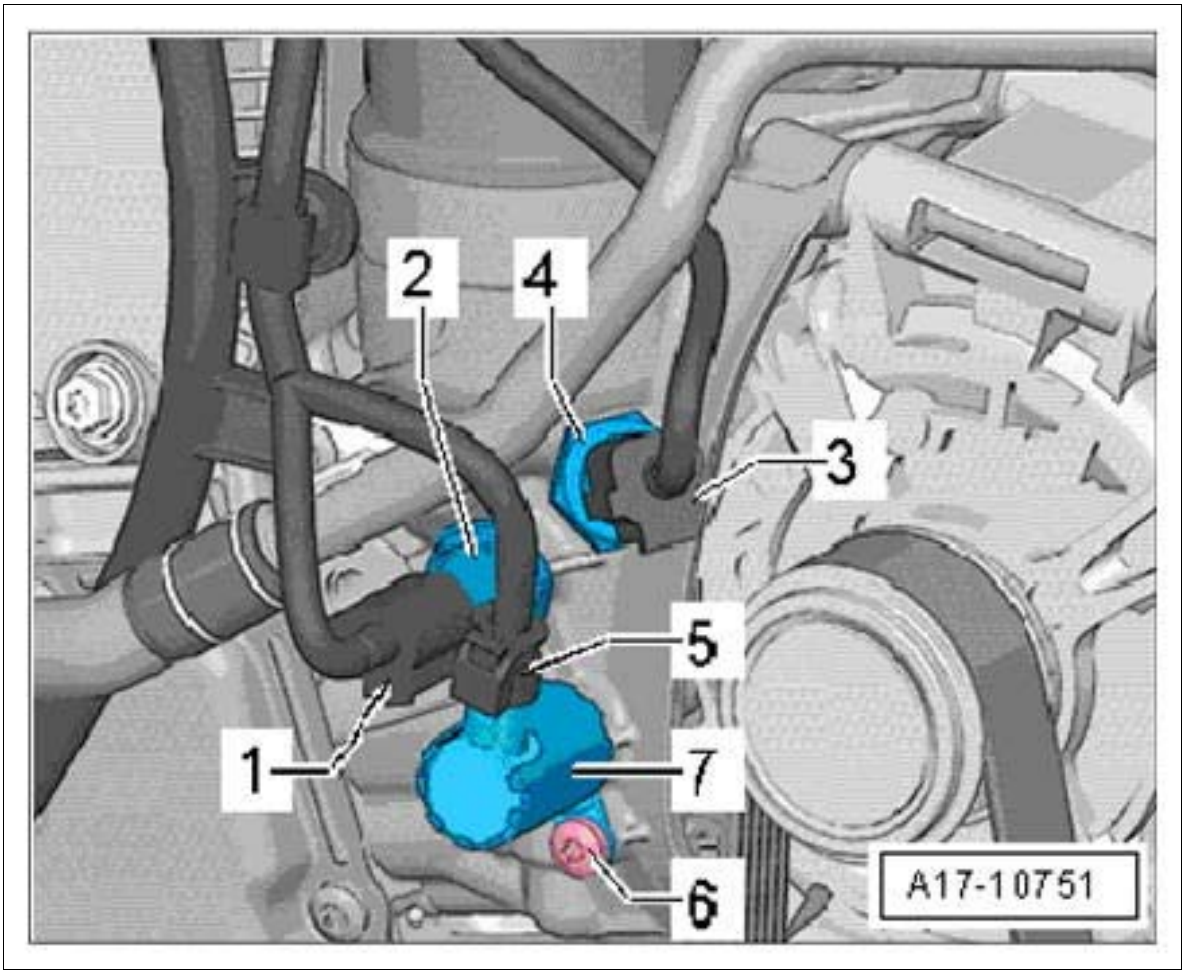
> *WARNING: Hot fluid*
>
> *1. Danger of scalding*

→ Let the fluid cool down.

→ Wear personal protective gear.

2. Unscrew and remove oil pressure switch for reduced oil pressure **-4-** .

Fig 1: Locating Oil Pressure Switch



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Screw in oil pressure tester **oil pressure tester WE 1068** instead of the oil pressure switch **-4-** .
    1. 3.1. Screw oil pressure switch for reduced oil pressure into the oil pressure tester.
    2. 3.2. Connect plug connection for oil pressure switch again.
4. Start the engine and read off the oil pressure.
    1. Oil pressure at idle speed: 1.2 to 2.1 bar
    2. Oil pressure at 2, 000 RPM: 1.6 to 2.1 bar **(3.0 to 4.0 bar possible during the intake phase).**
    3. Oil pressure at 3, 700 RPM: 3.0 to 4.0 bar

WM 170301 CHECKING OIL PRESSURE (ENGINE OIL) (MACAN) > SUBSEQUENT WORK

1. Remove oil pressure tester.

2. Install oil pressure switch for reduced oil pressure.
3. Install engine cover.

WM 170301 CHECKING OIL PRESSURE (MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
Oil pressure tester V.A.G 1342	Workshop equipment	WE 1068		
WM 170301 CHECKING OIL PRESSURE (MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Oil pressure measurement temperature	Minimum	Engine temperature	90°C		

WM 170301 CHECKING OIL PRESSURE (MACAN S, MACAN TURBO) > PRELIMINARY WORK

Information

If vehicles have fault entries relating to oil pressure, oil pump activation, oil pressure monitoring, etc. in the DME control unit (and a warning light comes "on" on the instrument cluster), proceed as follows:

- Check the oil level.
- Delete related faults.

- Do not replace components, such as the oil pump, oil pressure sensor or oil pressure control valve if you suspect that they are faulty.

If the vehicle has not been driven for a long time (months), the control mechanism in the oil pump can become stiff ("stick").

Very short trips and a lot of loading/maneuvering can cause the oil to become very diluted => Oil pressure very low. For example, 20 cold starts in quick succession can reduce the viscosity of the engine oil by 30%.

- Change the engine oil. Test-drive the vehicle.
- If error messages/warnings are displayed again, proceed in accordance with the instructions under Guided Fault Finding in the PIWIS Tester.

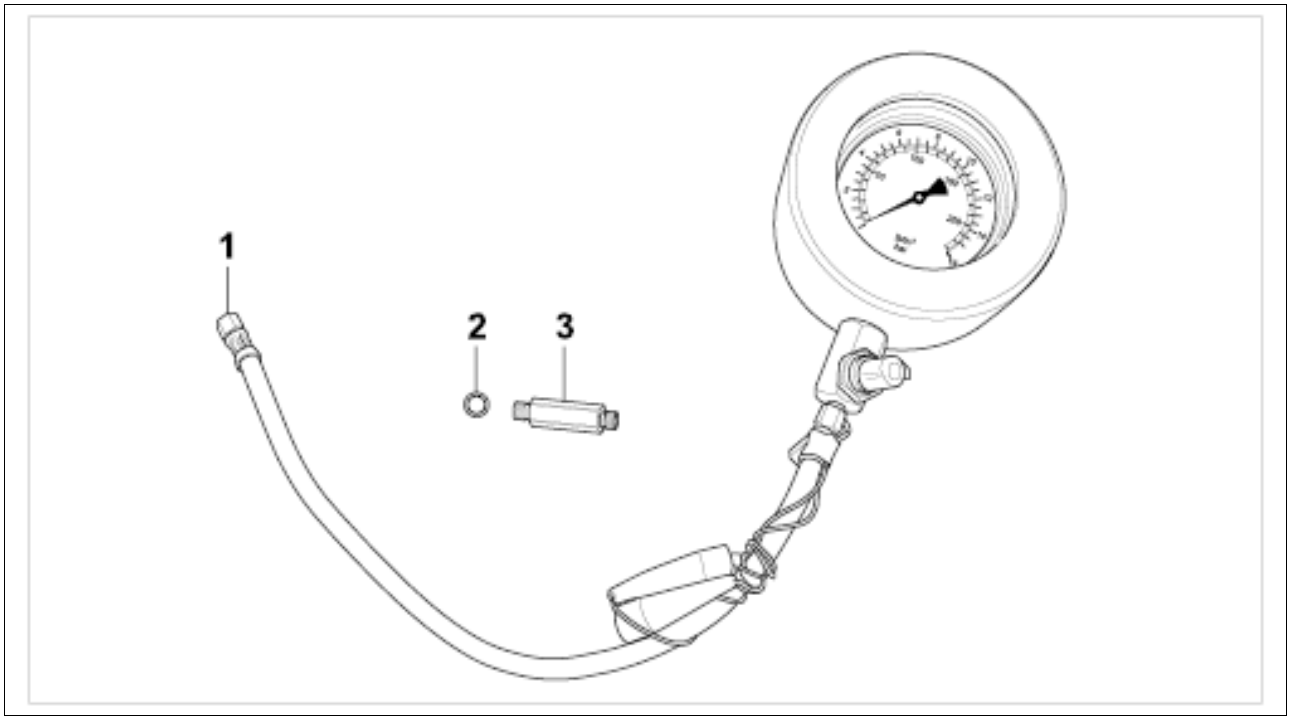
Information

- The oil pressure can be displayed and checked for any engine speeds using the PIWIS Tester.
- The pressure readings can be shown graphically in the data logger.
- If an oil-pressure gauge needs to be connected for further tests, proceed according to the instructions starting from "Preliminary Work".
- For details of measured values, see below.

1. Remove cover for front underbody. → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY

WM 170301 CHECKING OIL PRESSURE (MACAN S, MACAN TURBO) > TOOLS AND MATERIALS > TOOLS

Fig 1: Identifying Oil Pressure Tester



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. **Oil pressure tester V.A.G 1342 WE 1068**
2. Sealing ring
3. Adapter

WM 170301 CHECKING OIL PRESSURE (MACAN S, MACAN TURBO) > CHECKING OIL PRESSURE

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WARNING: Hot fluid

- *Danger of scalding*

→ Let the fluid cool down.

→ Wear personal protective gear.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapors.

→ Attach warning sign in a clearly visible position.

Information

The oil pressure may be too low for a number of reasons:

- Oil is diluted (e.g. fuel gets into the oil due to too many cold starts without warming up the engine afterwards).
- Oil pump is faulty.
- Too much bearing clearance (e.g. crankshaft bearing).
- Oil level is too low.
- Oil pressure regulating valve is faulty.
- Oil pressure sensor is faulty.
- Incorrect oil has been used. Use only oil that has been approved by Porsche for the measurement.

Information

The oil pressure may be too high for a number of reasons:

- Oil has thickened or is very cold after a cold start and high engine speeds.
- Oil pump is faulty.
- Mechanical oil pump pressure relief valve is faulty (oil pump needs to be replaced).
- Oil pressure regulating valve is faulty.
- Cable plug of oil pressure regulating valve has fallen off or open circuit between it and the control unit (oil pressure may be up to 11 bar, engine loses approximately 10 kW of engine power)
- Oil pressure sensor is faulty.
- Incorrect oil has been used. Use only oil that has been approved by Porsche for the

measurement.

1. Unscrew screw plug at the measuring point **-5-** . When doing so, make sure that the sealing ring **-6-** does not fall off.

    1. 1.1. Soak up emerging engine oil with a cloth.

    Fig 1: Identifying Oil Pressure Sensor And Oil Pressure Measuring Point

    
    Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Screw adapter for oil-pressure gauge **-1-** with sealing ring **-2-** into the measuring point. Carefully tighten to max. 10 Nm (7.5 ftlb.).

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Screw oil-pressure gauge **-3-** onto the adapter **-2-** . Counter screw torque using an open-ended wrench **-1-** .

Fig 4: Installing Oil-Pressure Gauge On Adapter

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Secure oil-pressure gauge.
    1. 4.1. Secure oil-pressure gauge to the oil filter or coolant line using tie-wraps/wire.
    2. 4.2. Make sure that the oil-pressure gauge and hose are not touching any rotating components.
5. Complete the engine for taking measurements.
6. Check that there are no rotating components touching the measuring hose and that the pressure gauge is easy to read when positioned.
7. Connect the PIWIS Tester and battery charger.
    1. Use the PIWIS Tester to display the actual values for oil pressure, engine temperature and engine speed in DME. The oil pressure displayed in the PIWIS Tester is always higher than that on the pressure gauge by the value of the ambient pressure (depending on the altitude, e.g. 1, 000 hPa).
    2. The pressure display on the oil-pressure gauge must be the same as the value on the PIWIS Tester once adjusted by the ambient pressure value.
    3. The pressure display on the oil-pressure gauge is much slower than that on the PIWIS Tester. The measured value on the PIWIS Tester fluctuates rapidly. The trend between

the two measuring instruments is significant.

4. The measured oil pressure remains virtually constant over different rev ranges. The measurement using the oil-pressure gauge merely confirms that the oil pressure sensor's display is correct.

5. The pressure readings can be shown graphically in the data logger.

8. Start the engine and leave it running until it reaches the measurement temperature. → **Engine temperature: 90°C**

   Measured values (examples)

   1. For a cold start (e.g. 24 °C), pressure immediately jumps to 8 bar briefly (oil-pressure gauge).

   2. Following a cold start, oil pressure drops briefly to 3 bar (oil-pressure gauge) - 4, 000 hPa (PIWIS Tester).

   3. During warm-up phase at idle speed, pressure drops from 3 bar to 1.8 bar (oil-pressure gauge) - 4, 000 hPa drops to 2, 800 hPa (PIWIS Tester).

   4. At engine temperature of 90 °C at idle speed, pressure is 1.5 to 1.6 bar (oil-pressure gauge) - 2, 600 hPa (PIWIS Tester).

   5. At engine temperature of 90 °C at 1, 000 RPM, pressure is 2.8 bar (oil-pressure gauge) - 3, 800 hPa (PIWIS Tester).

   6. At engine temperature of 90 °C at between 2, 000 RPM and 4, 000 RPM, the oil pressure is almost constant at 3.0 bar (oil-pressure gauge) - 4, 000 hPa (PIWIS Tester). The value can fluctuate by 0.1 bar (100 hPa).

WM 170301 CHECKING OIL PRESSURE (MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Remove oil-pressure gauge and adapter again.

2. Refit screw plug with a new sealing ring.

3. Install cover for front underbody. → INSTALLING COVER FOR FRONT UNDERBODY

WM 170419 REMOVING AND INSTALLING OIL-PRESSURE SENDER (MACAN S, MACAN TURBO) > PRELIMINARY WORK

Information

If vehicles have fault entries relating to oil pressure, oil pump activation, oil pressure monitoring, etc. in the DME control unit (and a warning light comes "on" on the instrument cluster), proceed as follows:

- Check the oil level.
- Delete related faults.

- Do not replace components, such as the oil pump, oil pressure sensor or oil pressure control valve if you suspect that they are faulty.

If the vehicle has not been driven for a long time (months), the control mechanism in the oil pump can become stiff ("stick").

Very short trips and a lot of loading/maneuvering can cause the oil to become very diluted => Oil pressure very low. For example, 20 cold starts in quick succession can reduce the viscosity of the engine oil by 30%.

- Change the engine oil. Test-drive the vehicle.
- If error messages/warnings are displayed again, proceed in accordance with the instructions under Guided Fault Finding in the PIWIS Tester.

1. Remove cover for front underbody.

   → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY

2. Remove lower pedestrian protection. → 697019 REMOVING AND INSTALLING PEDESTRIAN PROTECTION

WM 170419 REMOVING AND INSTALLING OIL-PRESSURE SENDER (MACAN S, MACAN TURBO) > REMOVING OIL-PRESSURE SENDER

WARNING: Hot fluid

- *Danger of scalding*

→ Let the fluid cool down.

→ Wear personal protective gear.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapors.

→ Attach warning sign in a clearly visible position.

Information

- Oil pressure may be too low for a number of reasons:
- Oil is diluted.

- Oil pump is faulty.
- Bearing clearance is too large (e.g. crankshaft bearing)
- Oil level is too low.
- Oil pressure regulating valve is faulty.
- Incorrect oil has been used. Only use oil that has been approved by Porsche for the measurement.

Information

- When the oil-pressure sender is unscrewed, approx. 0.3 liters of engine oil will escape.

Collect emerging oil and dispose of it in accordance with the applicable national laws.

1. Release and disconnect electric connector on the oil-pressure sender.
2. Unscrew screws **-6-** and remove oil-pressure sender **-5-** .
    1. 2.1. Remove adapter **-3-** .
    2. 2.2. Soak up emerging oil with a cloth.

1. Drain engine oil. → 170117 DRAINING AND FILLING ENGINE OIL

WM 173055 CHANGING OIL FILTER (MACAN S, MACAN TURBO) > CHANGING OIL FILTER

NOTE: Incorrect oil level

- *Risk of damage to engine or catalytic converter*

→ Check the oil level regularly.

→ The oil level must not fall below the Minimum marking or rise above the Maximum marking.

→ Only use engine oil approved by Porsche.

WARNING: Hot fluid

- *Danger of scalding*

→ Avoid contact with hot fluid.

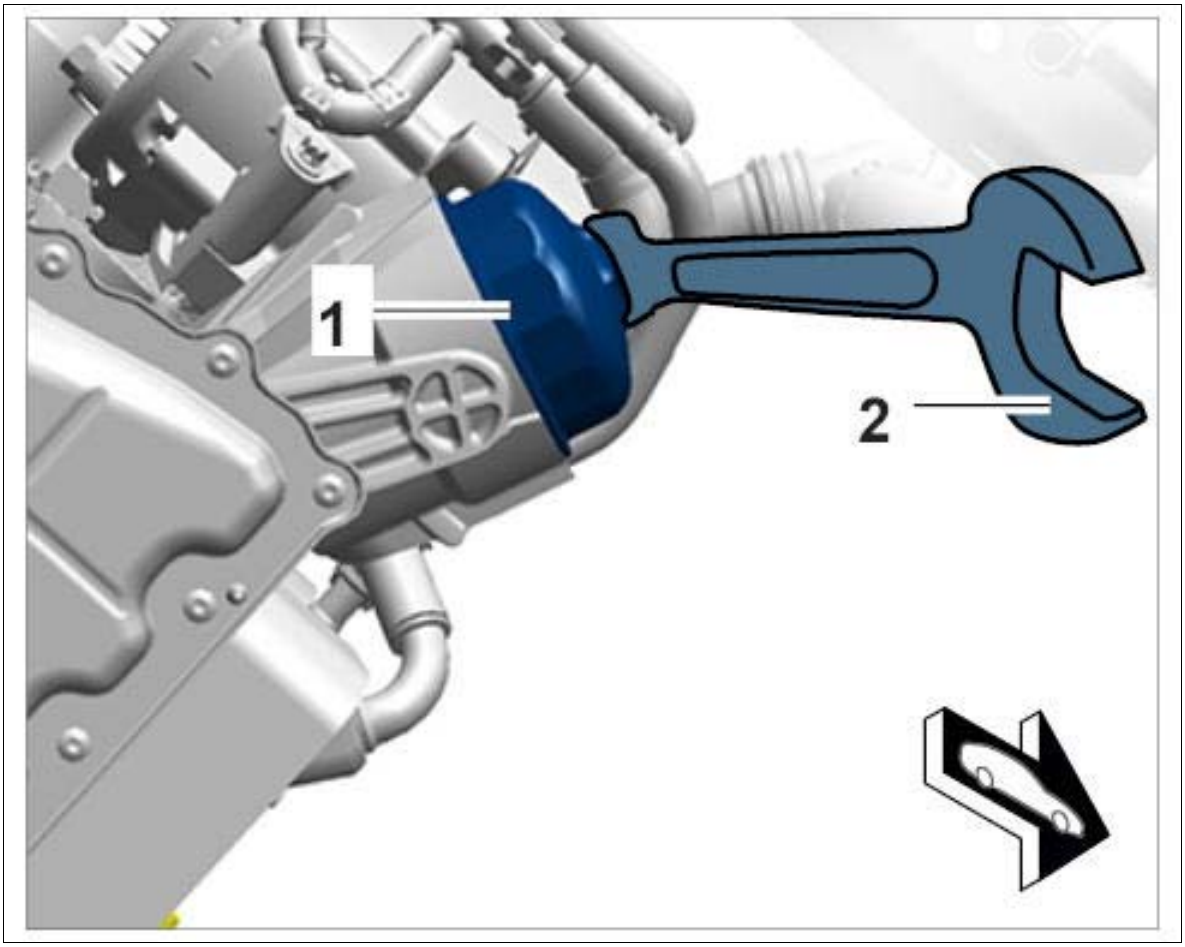
→ Wear personal protective gear.

Information

- Do not remove the sealing ring with a sharp object.
- The oil filter cover contains a cut-out through which the O-ring can be removed.
- Position collecting container as close as possible to the oil filter so that no hot oil sprays out at the side!
- Have sufficient cleaning cloths ready.
- Cover chassis hoses with cleaning cloths.

1. Loosen the oil filter cover **-1-** using a suitable hexagon socket or ring wrench **-2-** and unscrew and remove it.

Fig 1: Loosening Oil Filter Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Slowly open the oil filter cover. Drain the remaining oil into a container.
3. Remove filter element. Dispose of the filter in accordance with legal requirements.
4. Clean the oil filter cover thoroughly inside and outside and replace the sealing ring. Carefully lever off the sealing ring → see Fig 2. Do not damage the oil filter cover.

Fig 2: Removing Oil Filter Cover Sealing Ring

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. First fit the filter element into the oil guide housing.
6. Lightly coat the sealing ring on the oil filter cover with engine oil. Screw in the oil filter cover and tighten it hand-tight using a suitable ring wrench.
    1. 6.1. Tightening torque for oil filter cover:

1. Applying sealant
    1. Sealant bead diameter: 1.6... 1.8 mm
    2. Processing time following application: max. 5 minutes
    3. The sealing faces must be completely free of oil, grease, residues and burrs before applying sealant.
    4. Always ensure that sealant is applied completely.

WM 175019 REMOVING AND INSTALLING OIL PAN (OIL GUIDE HOUSING) (MACAN S, MACAN TURBO) > INSTALLING OIL PAN (OIL GUIDE HOUSING) > INSTALLING OIL PAN (OIL GUIDE HOUSING)

Information

Tightening torques, tightening sequence and assembly overviews for the engine and transmission:

- Group 1: → 1X00IN TECHNICAL VALUES
- Group 2: → 2X00IN TECHNICAL VALUES
- Group 3: → 3X00IN TECHNICAL VALUES

1. Prepare oil pan for installation.
    1. 1.1. Clean sealing faces on upper part of oil pan and lower part of crankcase.
    2. 1.2. Apply sealant.
2. Install oil pan.
    1. 2.1. Always use new aluminum screws.
    2. 2.2. Fit screws from the inside out in diagonally opposite sequence by hand.
    3. 2.3. Tighten screws from the inside out in diagonally opposite sequence to the specified torque.

WM 175019 REMOVING AND INSTALLING OIL PAN (OIL GUIDE HOUSING) (MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install lower part of oil pan. → INSTALLING LOWER PART OF OIL PAN
2. Install pulley. → INSTALLING PULLEY (vibration balancer)
3. Install sender for oil level sensor. → INSTALLING OIL LEVEL SENSOR
4. Install oil-pressure sender. → INSTALLING OIL-PRESSURE SENDER
5. Install crankshaft pulse sender. → INSTALLING PULSE SENDER
6. Install engine supports at the left and right.
7. Install air-conditioning compressor. → INSTALLING AIR-CONDITIONING COMPRESSOR
8. Install generator. → INSTALLING GENERATOR
9. Install turbocharger. → INSTALLING TURBOCHARGER
10. Install engine. → INSTALLING ENGINE
11. Fill in engine oil. → FILLING ENGINE OIL

WM 175019 REMOVING AND INSTALLING OIL PAN (UPPER PART) (MACAN) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Fastening screw for lower part of oil pan		Initial tightening	8 Nm (6 ftlb.)		
Fastening screw for oil plate		Initial tightening	4 Nm (3 ftlb.)		

Fastening screw for oil plate		Final tightening	+45°		
Fastening screw for upper part of oil pan		Contact force	8 Nm (6 ftlb.)		
Fastening screw for upper part of oil pan		Final tightening	+45°		
Fastening screw for upper part of oil pan		Final tightening	+180°		
Fastening screw for upper part of oil pan		Final tightening	+90°		

WM 175019 REMOVING AND INSTALLING OIL PAN (UPPER PART) (MACAN) > PRELIMINARY WORK

1. Remove transmission. → WM 373427 REMOVING AND MOUNTING PORSCHE DOPPELKUPPLUNG (PDK)
2. Remove oil pan (lower part). → 175019 REMOVING AND INSTALLING OIL PAN
3. Remove rear joint flange.
4. Remove oil pump. → 172019 REMOVING AND INSTALLING OIL PUMP
5. Disconnect electric plug connection **-1-** .

WM 175019 REMOVING AND INSTALLING OIL PAN (UPPER PART) (MACAN) > INSTALLING OIL PAN (UPPER PART)

Information

- Check best-before date on the silicone sealant.
- Upper part of oil pan must be installed within 5 minutes of applying the silicone sealant.
- Replace screws that are tightened to an additional torque angle.
- Replace sealing rings, seals and self-locking nuts.
- Remove any residual sealant on the cylinder block using a flat scraper.

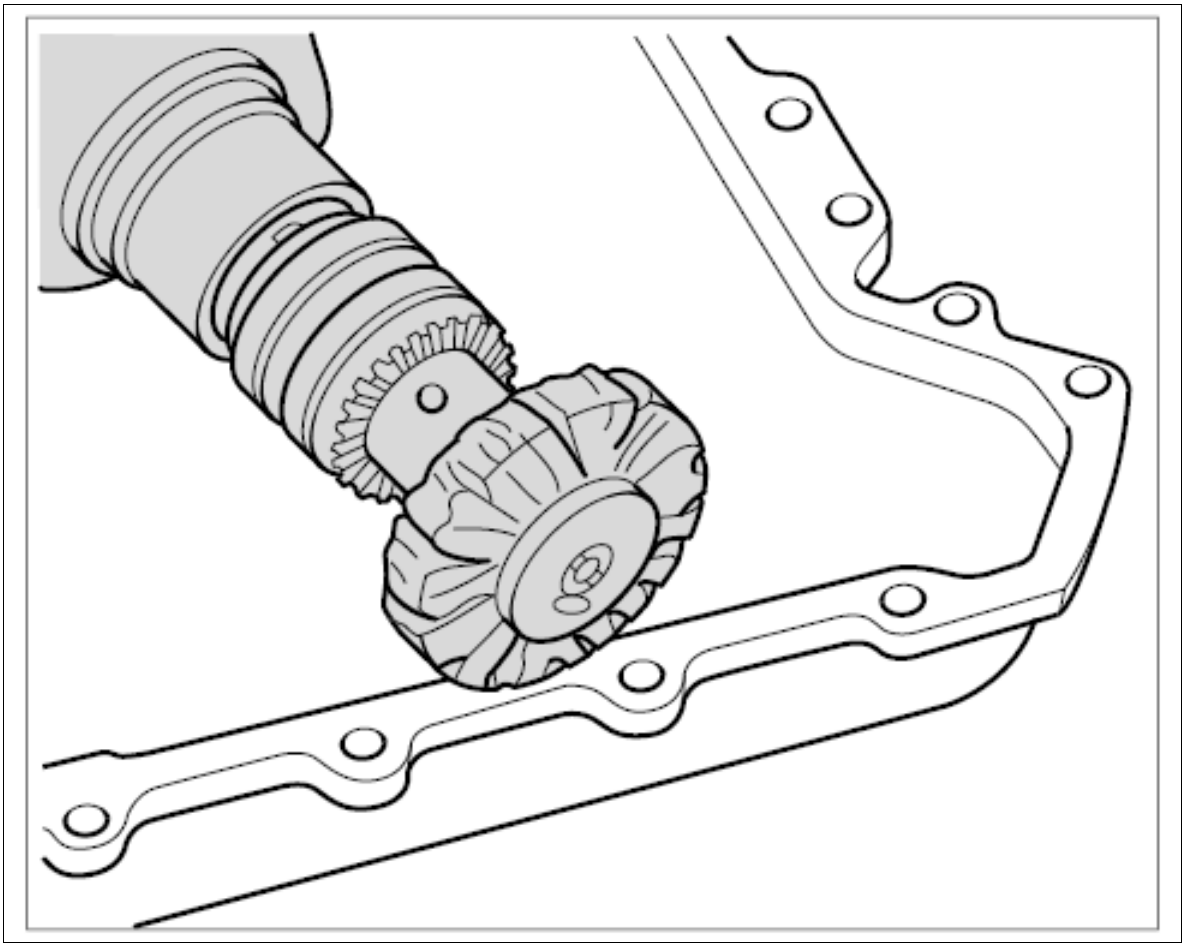
WARNING: Risk of damage or injury from foreign bodies flying around during grinding, drilling and milling

- *Risk of eye injuries*

→ Wear protective goggles.

1. Remove residual sealant on upper part of oil pan and on the lower timing chain cover using a rotating plastic brush for example.

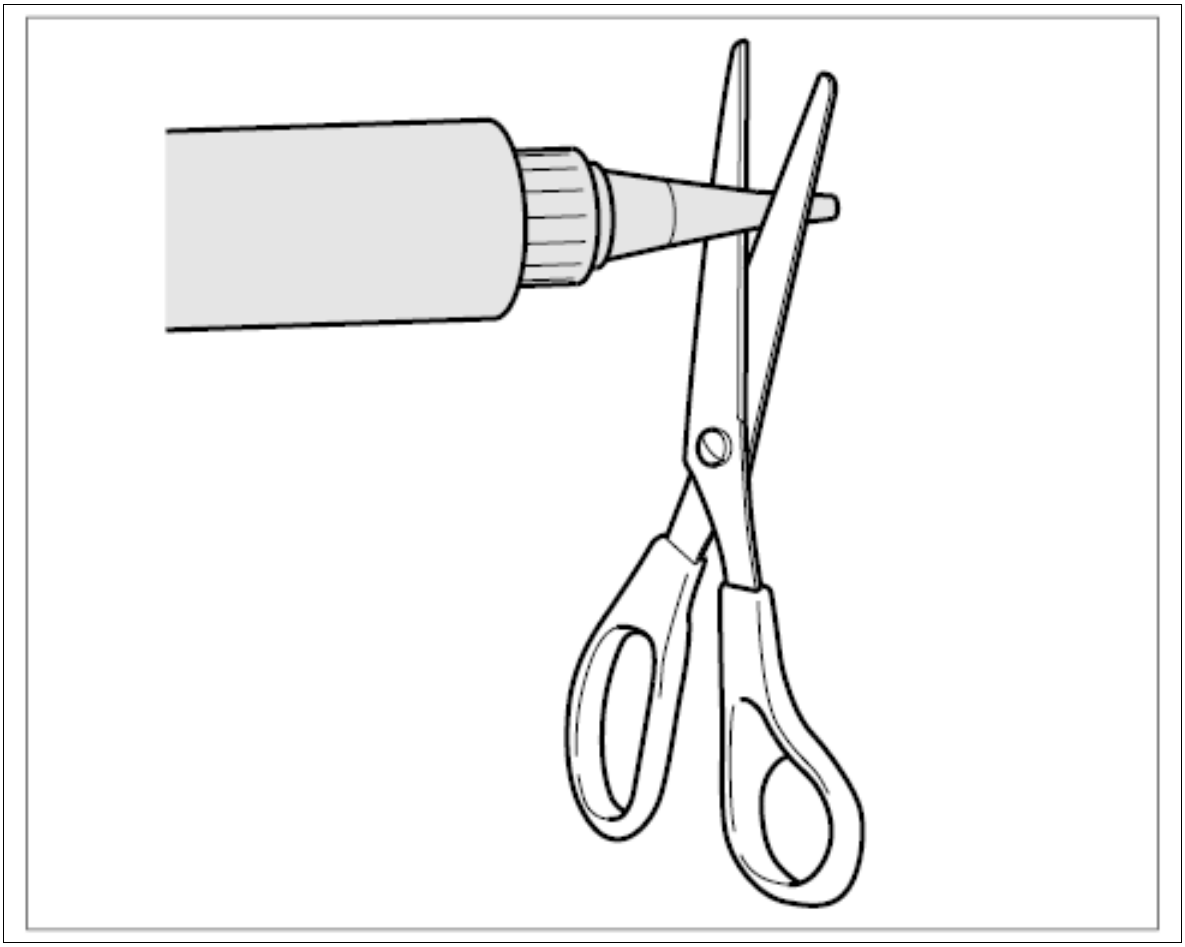
   Fig 1: Cleaning Sealing Faces Using Plastic Brush



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Clean sealing faces to remove any oil and grease.
3. Check oil ducts in upper part of oil pan and in the cylinder crankcase for dirt.
4. Cut off the nozzle on the tube → Cutting off nozzle on tube at the front marking (nozzle diameter is approx. 2 mm).

Fig 2: Cutting Tube Nozzle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

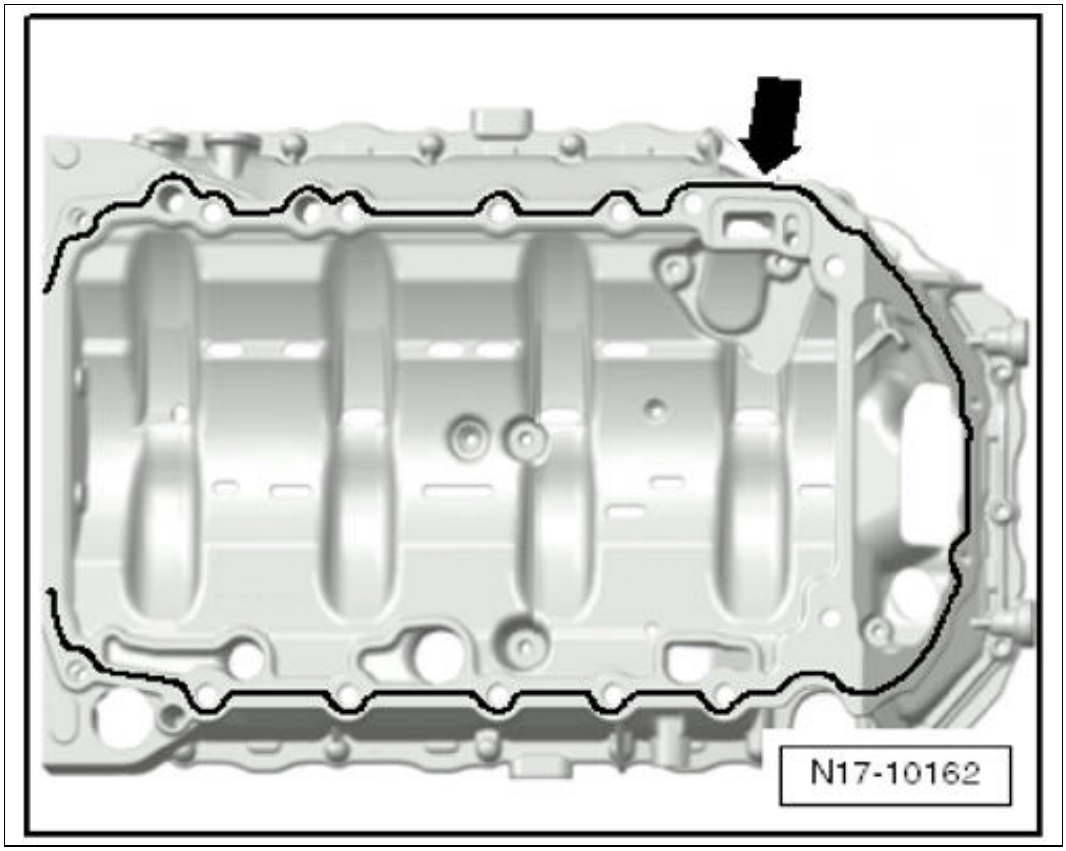
1. The bead of sealant must not be thicker than the specified thickness because otherwise excess sealant can get into the oil pan and can block the strainer in the oil pump.

2. The oil pan must be installed within 5 minutes of applying the sealant.

5. Apply silicone sealant to the clean sealing face on the upper part of the oil pan as shown **-arrow-** .

    1. 5.1. Sealant bead thickness: 2... 3 mm.

Fig 3: Applying Silicone Sealant Bead To Pan Oil



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

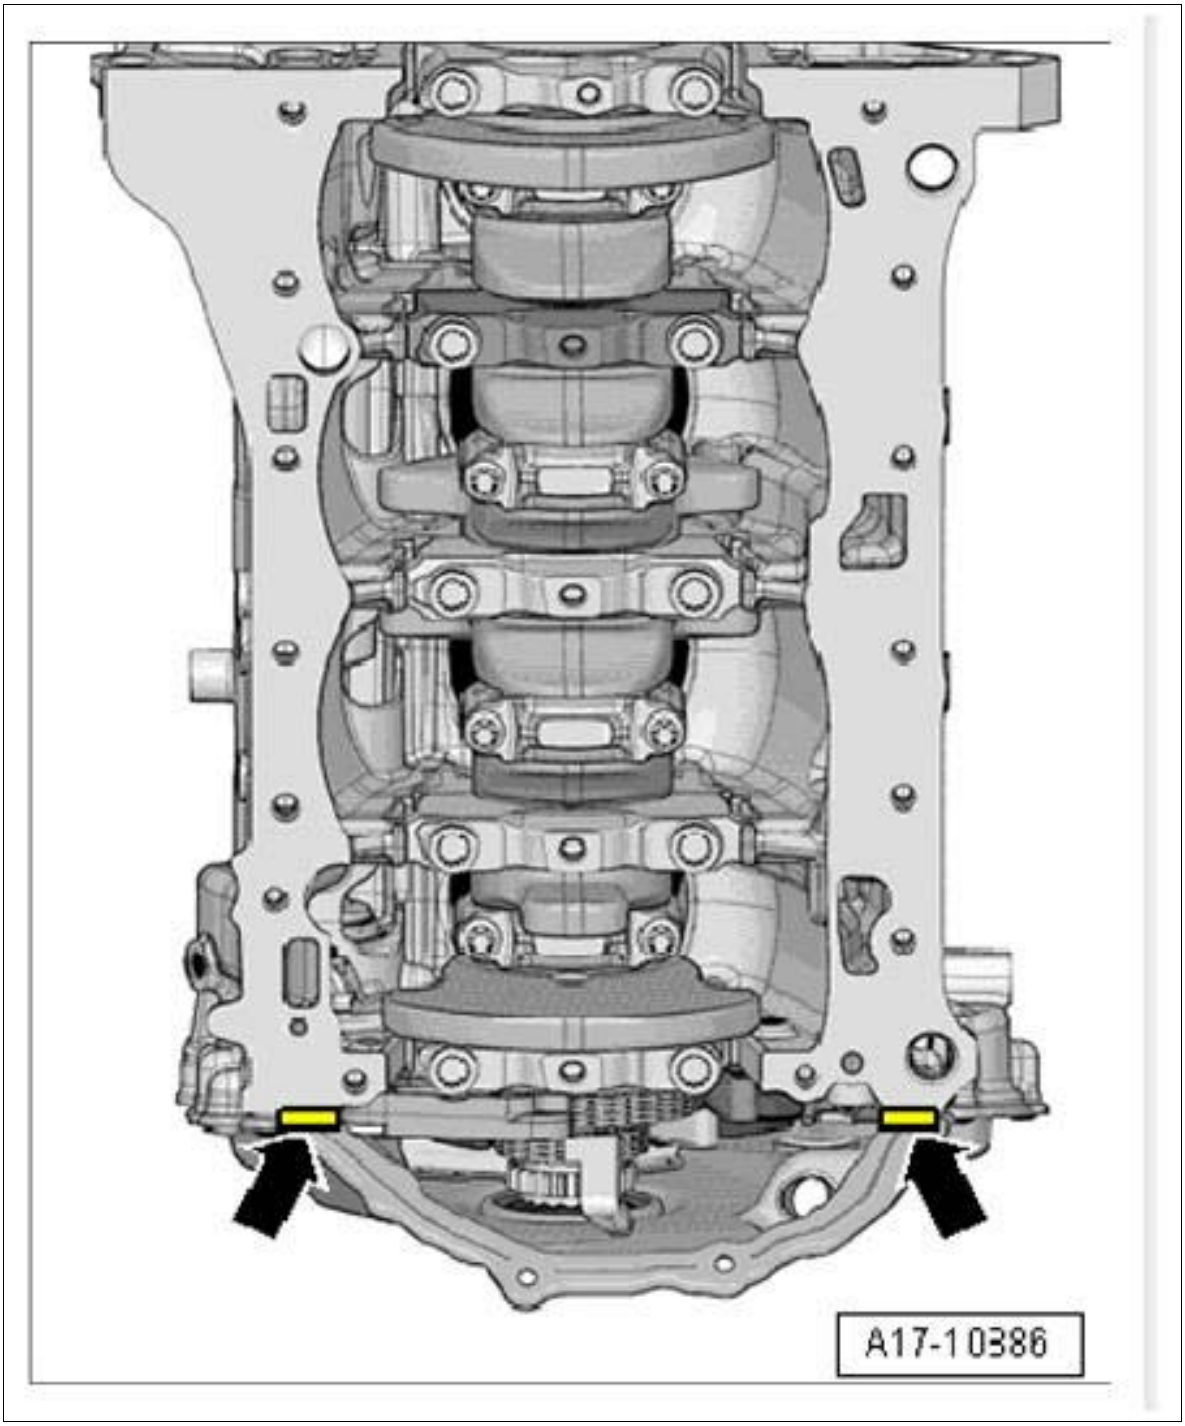
Information

1. The bead of sealant must not be thicker than the specified thickness because otherwise excess sealant can get into the oil pan and can block the strainer in the oil pump.

2. The oil pan must be installed within 5 minutes of applying the sealant.

6. Apply silicone sealant as shown in Fig. **-arrows-** between the cylinder block and lower timing chain cover.

Fig 4: Applying Silicone Sealant Bead To Cylinder Block



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Upper part of oil pan and crankcase must be flush on the transmission side.
8. Fit upper part of oil pan immediately and tighten screws.
    1. 8.1. Screws 1 to 14. **Initial tightening 8 Nm (6 ftlb.)**
    2. 8.2. Screws 1 and 2. **Final tightening +180°**
    3. 8.3. Screws 3 to 9. **Final tightening +45°**

4. 8.4. Screw 10. **Final tightening +180°**
5. 8.5. Screws 11 to 14. **Final tightening +90°**

1. Install oil filter. → INSTALLING OIL FILTER .
2. Install air-conditioning compressor.
3. Install generator. → INSTALLING GENERATOR
4. Install coolant pipe.

5. Install drive belt. → INSTALLING DRIVE BELT

6. Fill in coolant. → FILLING COOLANT

7. Check oil level. → 170101 CHECKING ENGINE-OIL LEVEL

Service Manual: 19 - ENGINE - COOLING -- (95B) - MACAN

WM 190101 CHECKING THE COOLING SYSTEM (MACAN) > TOOLS

Designation	Type	Number	Description	
Cooling system tester	Workshop equipment	WE 1069		filling device	Special tool	9696		
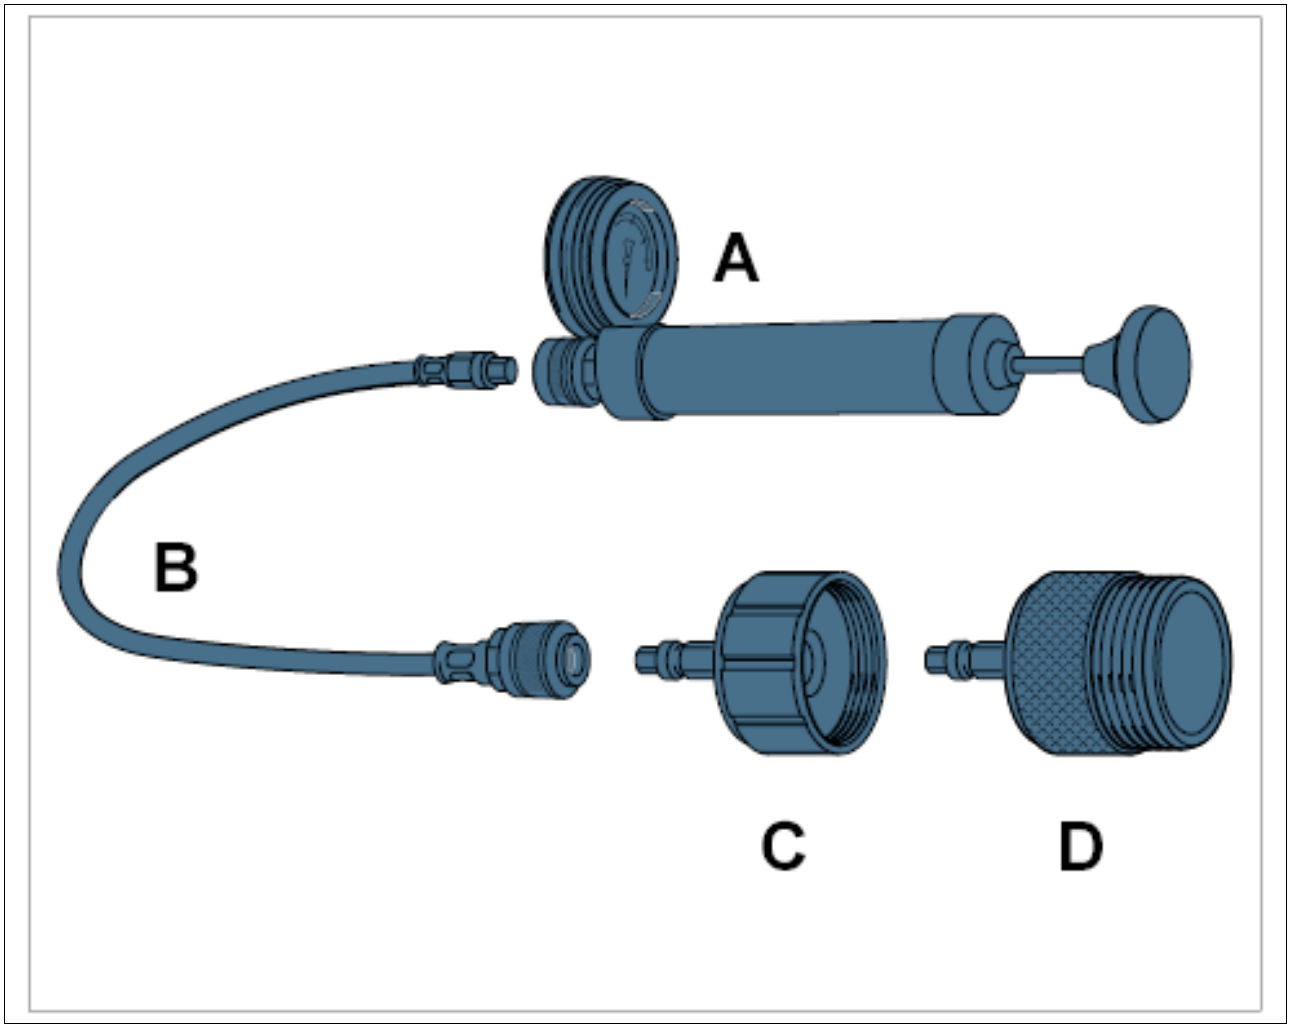
WM 190101 CHECKING THE COOLING SYSTEM (MACAN) > TOOLS AND MATERIALS > TEST EQUIPMENT

Fig 1: Identifying Cooling System Tester



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

-A- - Cooling system leak tester (pump) **Cooling system tester WE 1069**

-B- - Hose extension FZ 100

-C- - Cap adapter K22 (for Sports Cars)

-D- - Cap adapter K65 (supplied with filling device 9696).

WM 190101 CHECKING THE COOLING SYSTEM (MACAN) > CHECKING ENGINE COOLANT LEVEL

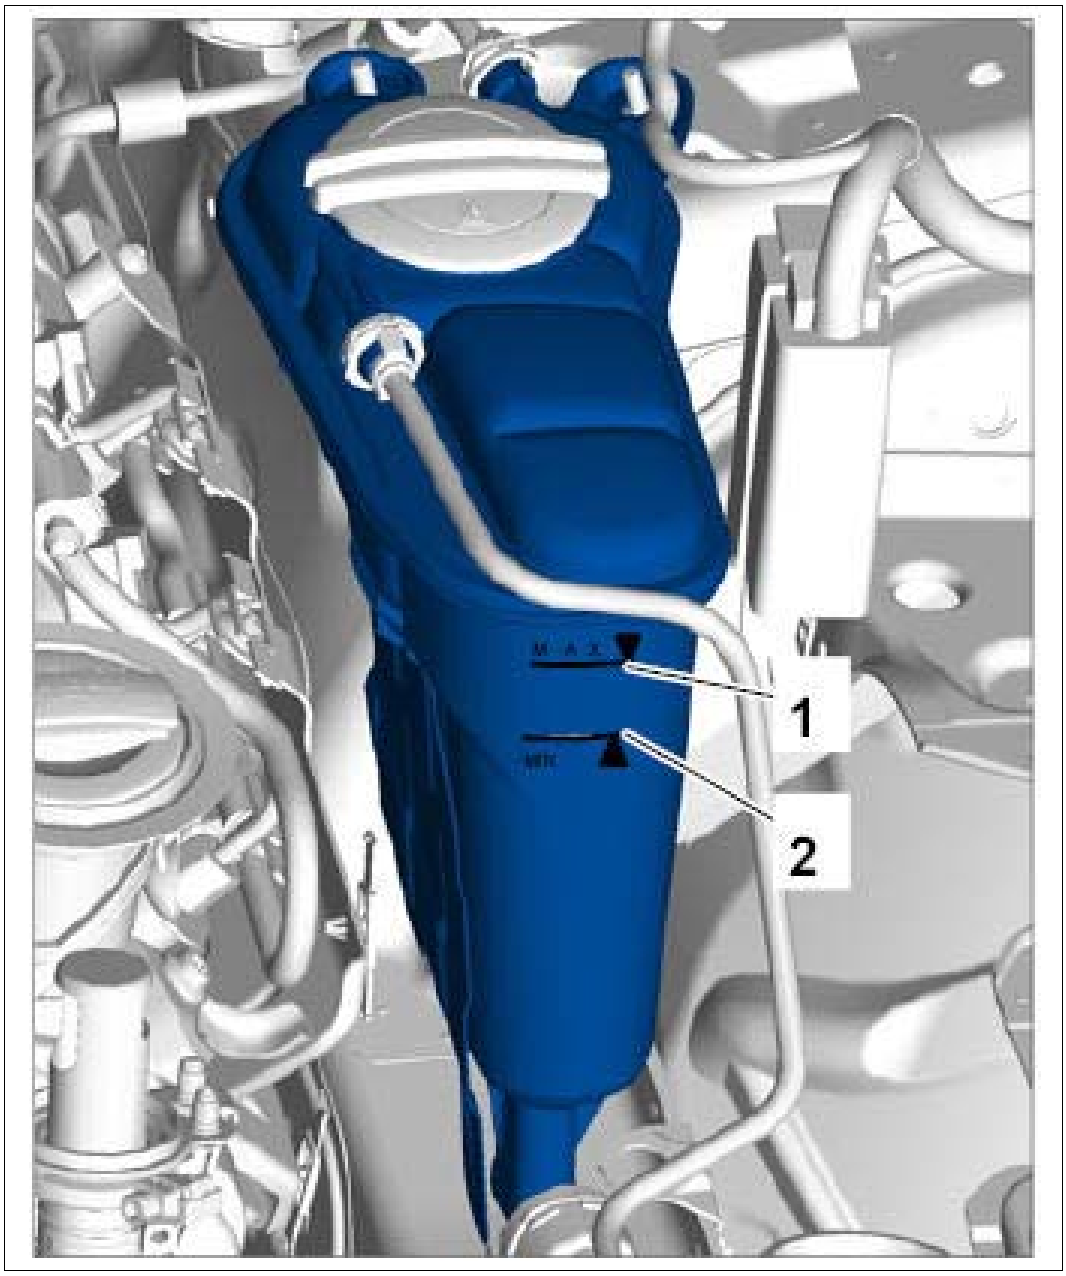
- Engine cold.
- Vehicle horizontal.

1. Check coolant level at the reservoir.

    1. 1.1. The ideal level must be between the -MAX- marking **-1-** and -MIN- marking **-2-** .

2. 1.2. If the level is under -MIN-, the level must be corrected.
3. 1.3. If the level is above -MAX-, some coolant must be extracted.

Fig 1: Identifying Coolant Reservoir



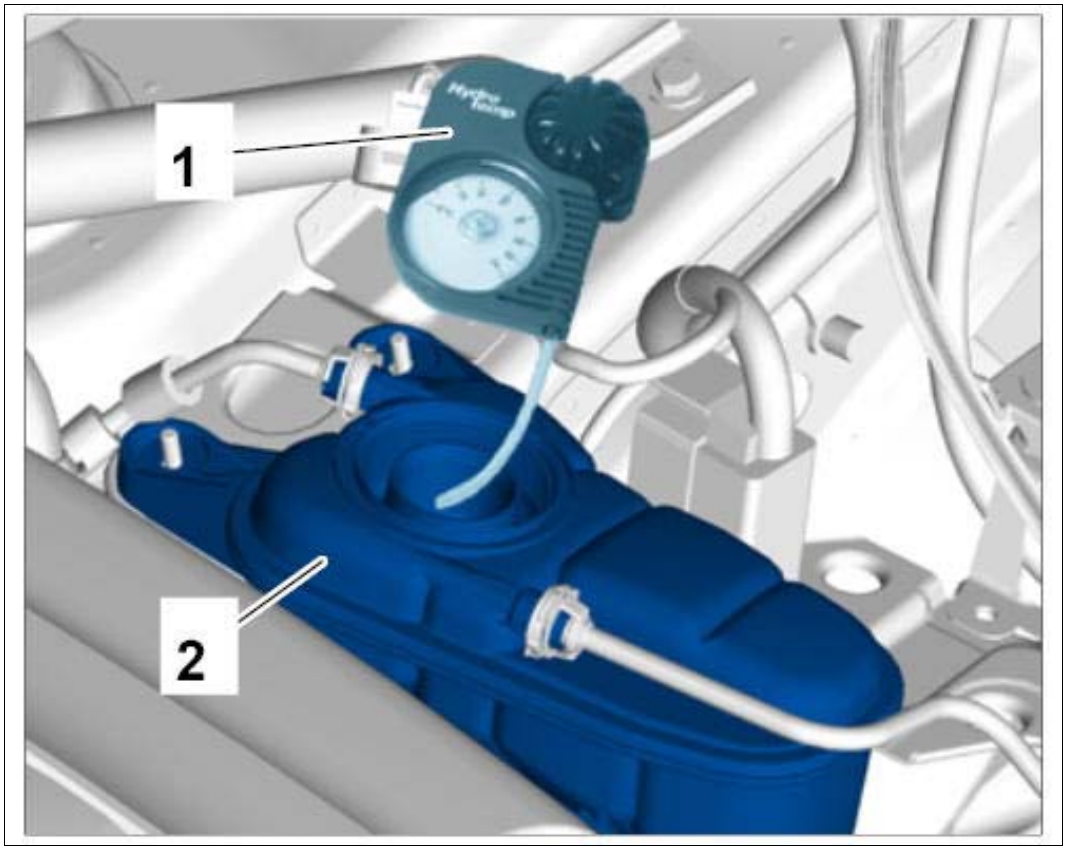
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 190101 CHECKING THE COOLING SYSTEM (MACAN) > CHECKING ENGINE COOLANT LEVEL > CHECKING ANTIFREEZE IN COOLANT

1. Check antifreeze content.
    1. 1.1. Check antifreeze content using antifreeze tester **-1-** .
    2. 1.2. If it is below -35 °C, correct the antifreeze content by increasing the proportion

of pure coolant accordingly.

Fig 1: Identifying Antifreeze Tester



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Close the maintenance flap.

Measured antifreeze protection in °C	Antifreeze quantity to be added (in liters)
- 5	9
- 10	8, 5
- 15	7, 5
- 20	7
- 25	5
- 30	3, 5
- 35	1, 5

WM 190101 CHECKING THE COOLING SYSTEM (MACAN) > CHECKING ENGINE COOLANT LEVEL > CHECKING THE COOLING SYSTEM FOR LEAKS

1. Check the engine coolant level. Top up to the maximum fill level if necessary. → CHECKING ENGINE COOLANT LEVEL .

2. Screw adapter K65 onto the coolant expansion tank. Then apply a test pressure of approx. 1.5 bar using the cooling system test device and check the hose connections, connection pieces, cooling system components for leaks. The pressure must not drop. There must be no drops of coolant.

WM 190101 CHECKING THE COOLING SYSTEM (MACAN) > CHECKING ENGINE COOLANT LEVEL > CHECKING COOLING SYSTEM FOR DIRT

1. Check radiator for external dirt. The radiators should not be excessively dirty. They can be cleaned using a vacuum cleaner with a brush attachment if necessary.
2. Check charge air coolers for external dirt. The charge air coolers should not be excessively dirty. They can be cleaned using a vacuum cleaner with a brush attachment if necessary.
3. Check air guides to the radiators for external dirt and collected leaves. They can be cleaned using a vacuum cleaner with a brush attachment if necessary.

WM 190101 CHECKING THE COOLING SYSTEM (MACAN) > SUBSEQUENT WORK

1. Close the cap on the reservoir → Reservoir (similar to illustration) .

3. **Adaptation of cooling-air flaps:**

    1. 3.1. Perform cooling-air flap adaptation using **PIWIS Tester II 9818.**

    2. 3.2. Select Overview -> DME -> Drive links/checks -> Drive links and press [F12]

    3. 3.3. Select Radiator shutter and press [F12]

    4. 3.4. Start radiator shutter adaptation by pressing [F8].

    5. 3.5. Adaptation takes 30 seconds.

6. 3.6. Adaptation complete.

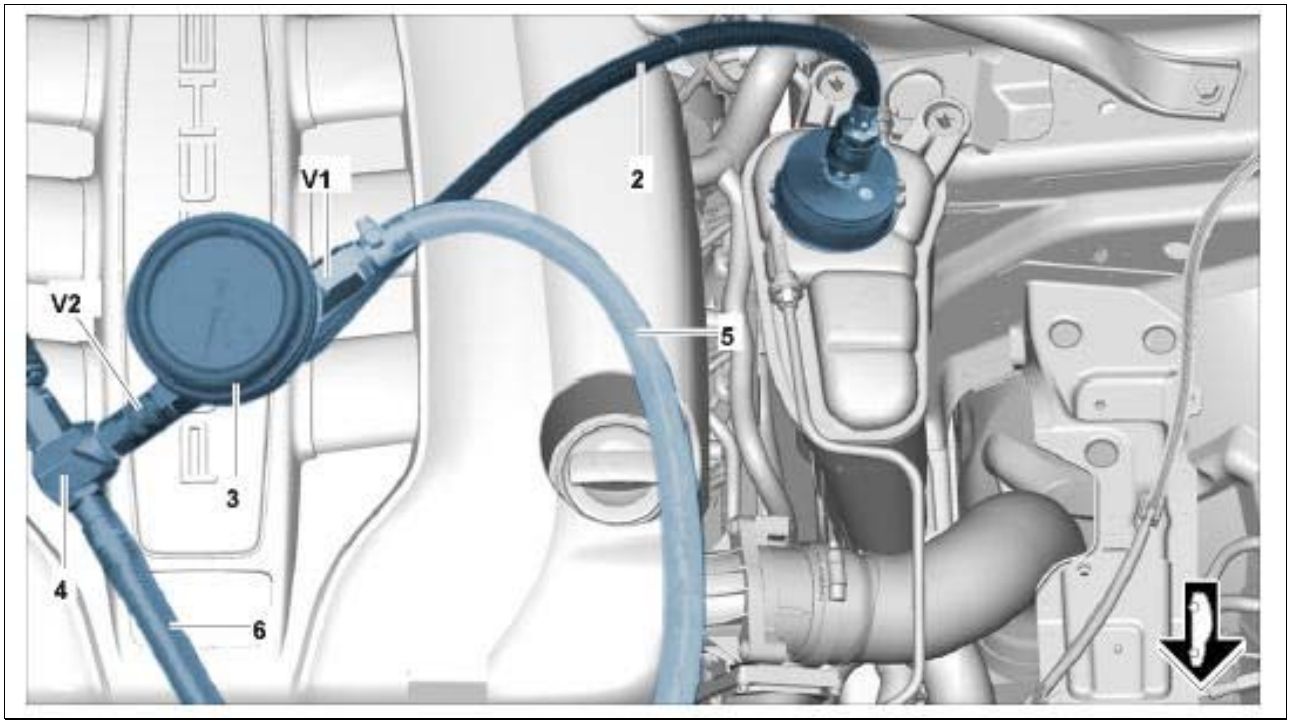
WM 193817 DRAINING AND FILLING COOLANT (MACAN) > TOOLS

Designation	Type	Number	Description	
adapter for the cooling system tester	Workshop equipment	WE 1386		
pipe for coolant cooling system tester	Workshop equipment	WE 1387		
Filling device	Special tool	9696		
WM 193817 DRAINING AND FILLING COOLANT (MACAN) > TOOLS AND MATERIALS > OVERVIEW AND SETUP - FILLING DEVICE

Information

- Note special features in the corresponding information for vehicles with auxiliary heater.

Fig 1: Identifying Vacuum-Filling Device Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

-1- - Adapter K65 (Fitted instead of the cap on the coolant expansion tank.)

2 - Hose extension FZ100 (Fitted between K65 and KVB01.)

3 - KVB 01 (Vacuum gauge with two shut-off valves.) **Filling device 9696**

V1 - Shut-off valve V1 (Shutoff valve for the filler hose.)

V2 - Shut-off valve V2 (Shutoff valve for the filler hose - outlet to Venturi nozzle.)

4 - Venturi nozzle (A vacuum is produced in this component by means of compressed air. Pressure of between 6 and 10 bar must be present. The higher the pressure, the better the vacuum in the vehicle cooling system.)

5 - Filler hose (The cooling system is refilled via this hose.)

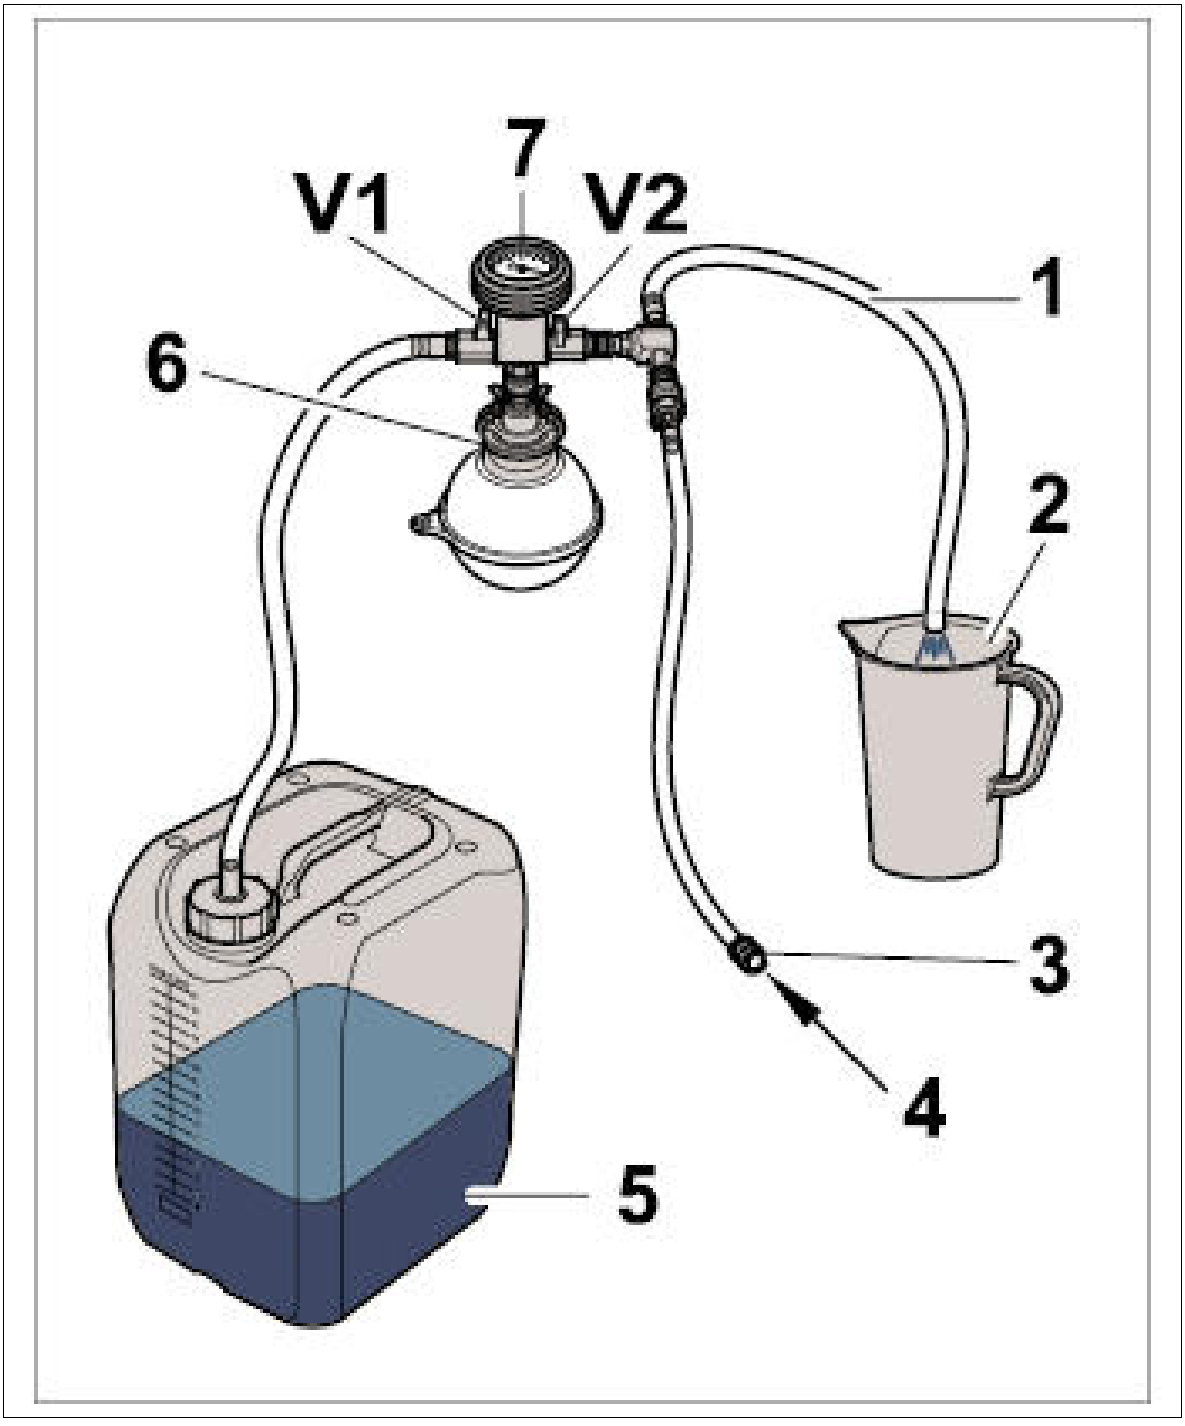
6 - Return lines (The compressed air and extracted coolant are drawn off via this hose.)

-

1. Return lines
2. Overflow container (bucket or canister)
3. Compressed air connection
4. Compressed air connection (Pressure of between 6 and 10 bar must be present. The higher the pressure, the better the vacuum in the vehicle cooling system.)
5. Filling canister with coolant (It is best to position the canister higher than the reservoir).

6. Adapter K 65 (Fitted instead of the cap on the coolant expansion tank). General illustration provided here. Use an intermediate cable/extension (FZ 100).

Fig 2: Identifying Vacuum-Filling Device Setup



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. KVB 01 (Vacuum gauge with two shut-off valves V1 and V2)

V1 - Shut-off valve V1 (Shutoff valve for the filler hose.)

V2 - Shut-off valve V2 (Shutoff valve for the filler hose - outlet to Venturi nozzle.)

WM 193817 DRAINING AND FILLING COOLANT (MACAN) > INFORMATION > COOLANT MIXTURE RATIO

Coolant additive	Water content	Antifreeze content
40%	60%	- 25 °C
50%	50%	- 35 °C

WM 193817 DRAINING AND FILLING COOLANT (MACAN) > PRELIMINARY WORK

1. Switch off ignition.
2. Remove upper engine cover.
3. Remove cover for front underbody. → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY

Remove cowl panel cover. → 508719 REMOVING AND INSTALLING COWL PANEL COVER

WM 193817 DRAINING AND FILLING COOLANT (MACAN) > DRAINING COOLANT

WARNING: Hot fluid

- *Danger of scalding*

→ Avoid contact with hot fluid.

→ Wear personal protective gear.

NOTE: Cooling circuit not filled correctly

- *Risk of damage to vehicle components*

→ Do not start the engine after relieving the system pressure.

→ Fill the cooling system correctly and bleed it before starting the engine.

Information

- Cooling systems with thermal management (controlled thermostats or coolant valves for controlling engine temperature) must be vacuum-filled.
- The thermostat must not be activated or electric current must not be applied to the thermostat since this can cause irreparable damage to the thermoelectric couple.

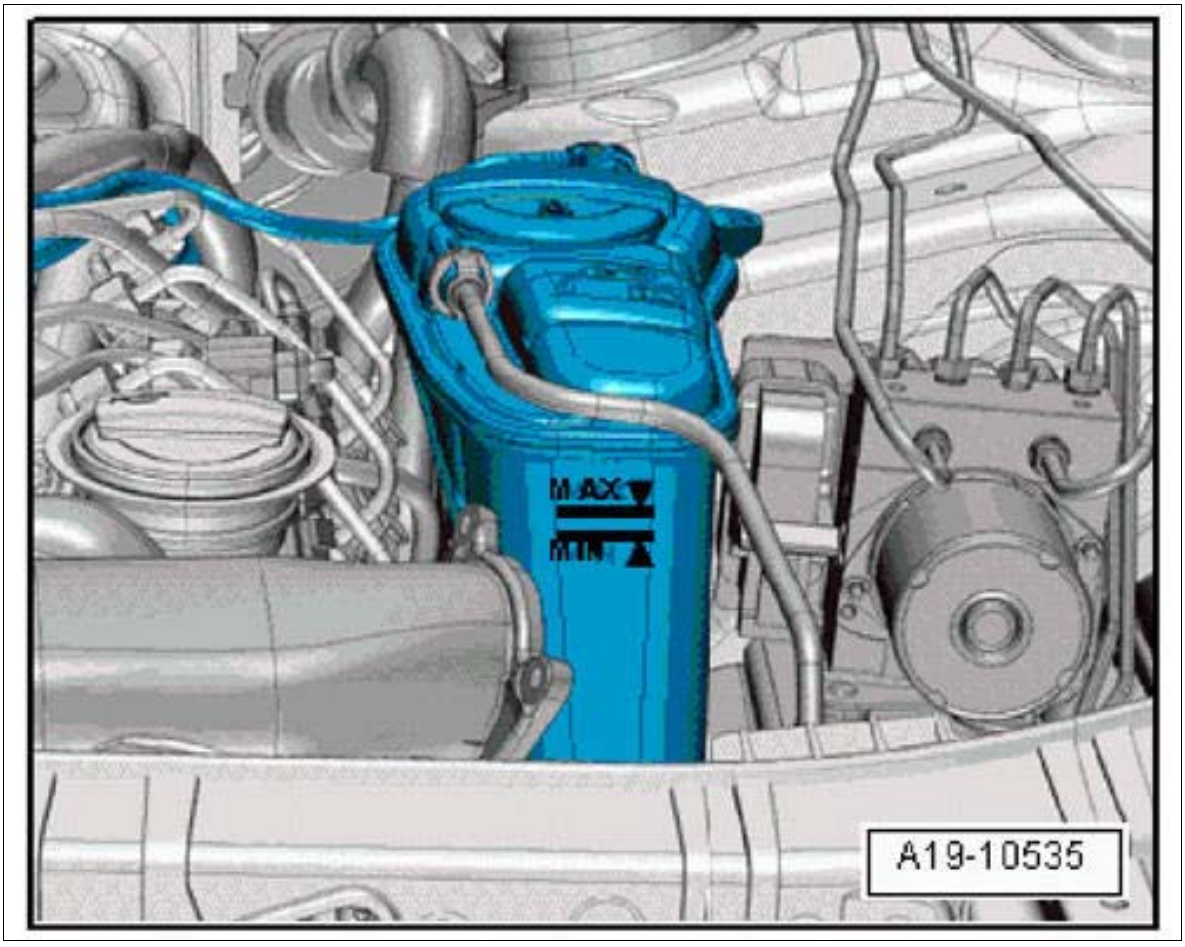
- Filling with a watering can only does not always guarantee a complete fill (trapped air - overheating).
- Clamps on cooling system components should be examined carefully following refilling (check the coolant level while cold and top up several times as required).
- Clamps on cooling system components must also be vacuum-filled if significant amounts of coolant are drained. Drain at least two liters of coolant for vacuum-filling because otherwise the correct vacuum cannot be built up.

Information

- Note special features in the corresponding information for vehicles with auxiliary heater.

1. Slowly open the cap on the reservoir → Reservoir .

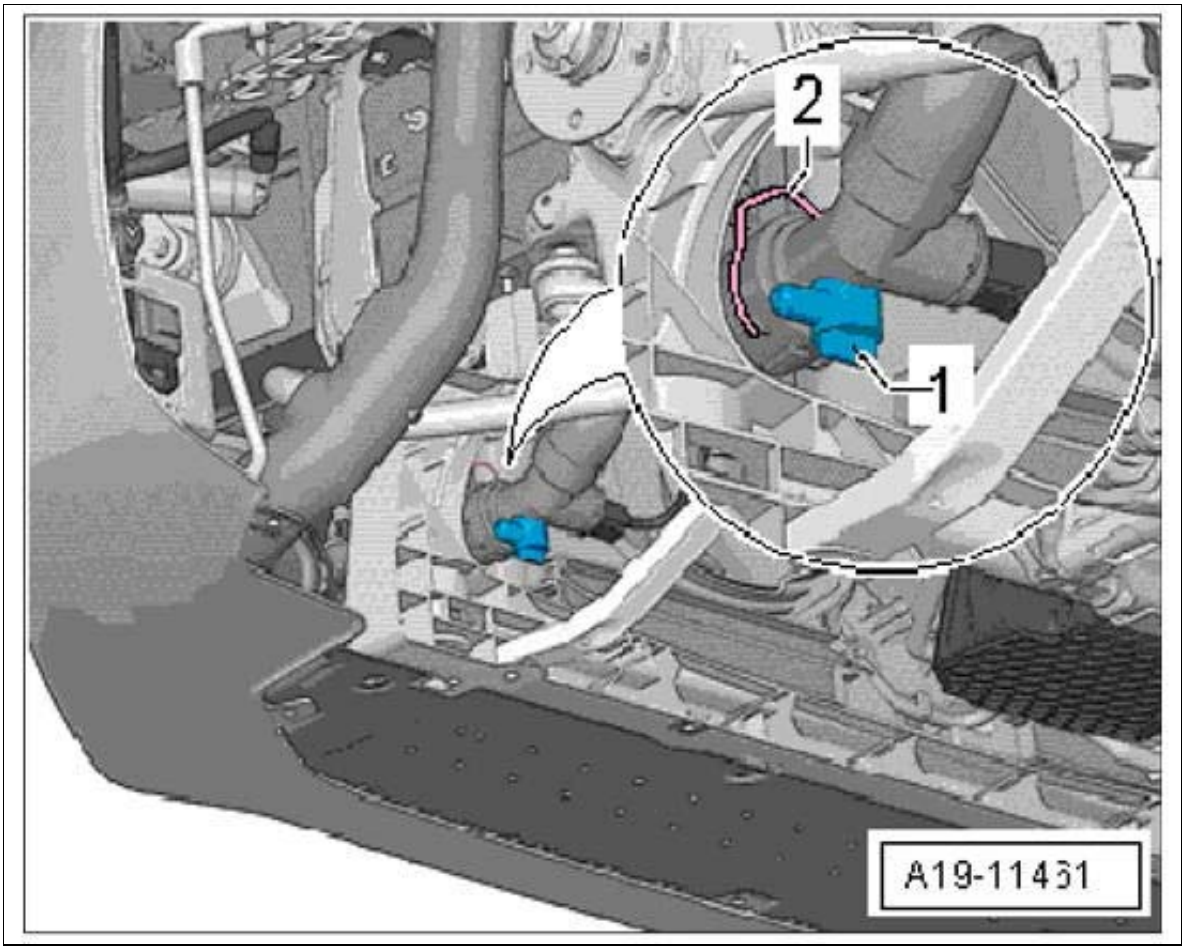
   Fig 1: Identifying Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Place drip pan under the radiator.
3. Open drain plug **-1-** on the adapter and drain coolant.

Fig 2: Identifying Coolant Drain Plug



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 193817 DRAINING AND FILLING COOLANT (MACAN) > FILLING COOLANT

Information

- The amount of coolant available must be approx. 2 liters more than the amount to be filled in.
- Because different quantities of coolant can drain away during different types of repairs, the filling capacity can vary greatly. Recommendation: To be on the safe side, fill the canister to 30 l, then bleed the cooling system. The difference after bleeding is the coolant quantity that is sucked in. Check the volume scale on the canister.
- An antifreeze content of -35 °C corresponds to a mixture of 50: 50 (antifreeze: water).

Information

- The filling process is completed more quickly if the canister is positioned at roughly the same height as the coolant reservoir.

Information

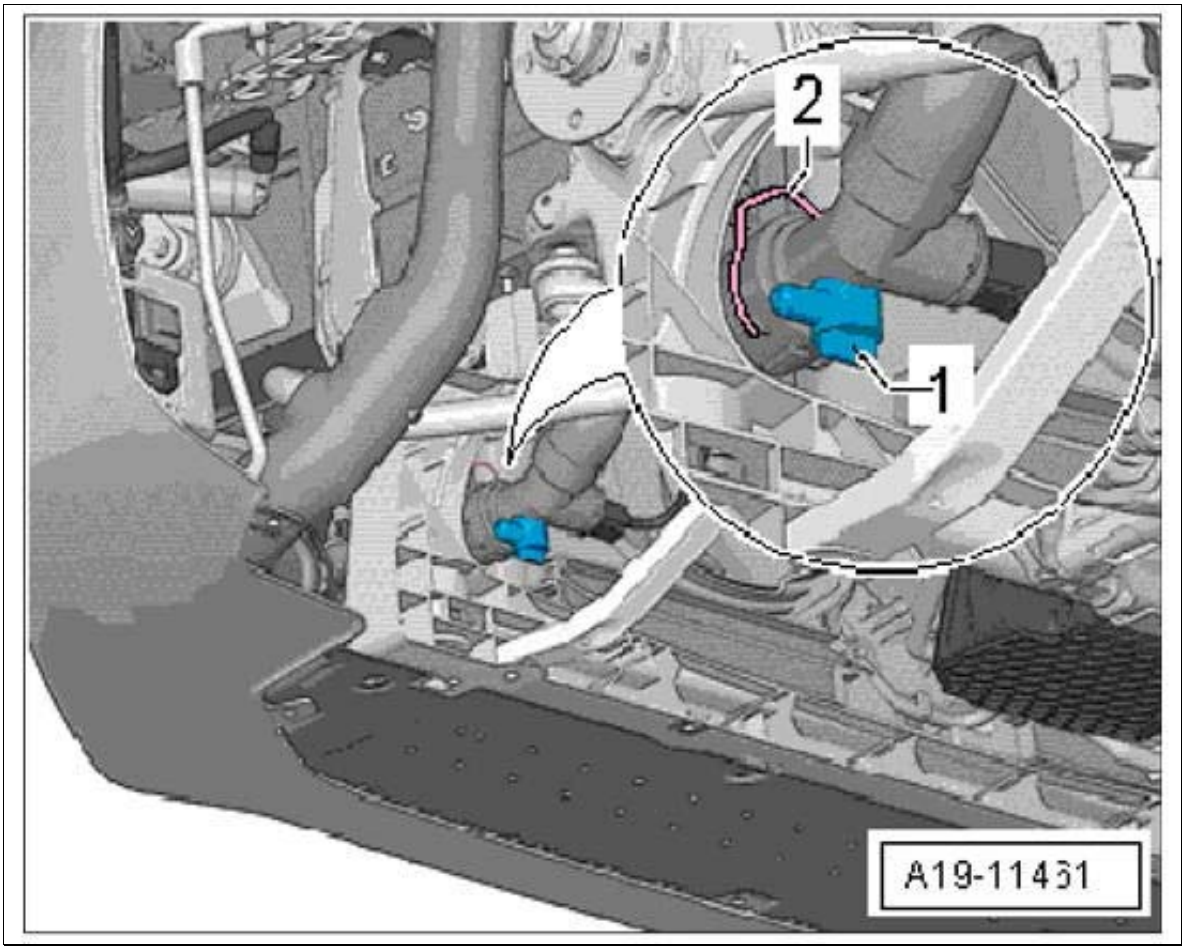
- A hissing sound after connecting the compressed air supply is usual.

Information

- If no vacuum is generated (the pointer does not move to the green area), there is a leak in the cooling system.
- If a vacuum is still not established, there is a blockage in the tool. Clean the device, use clean compressed air.
- Deformation of the rubber hoses of the cooling system is normal.
- Pressure of between 6 and 10 bar must be present. The higher the pressure, the better the vacuum in the vehicle cooling system.
- When the pressure gauge pointer is in the green area of the display scale, a sufficient vacuum has been built up.
- After both shutoff valves on the vacuum pressure gauge have been closed and the compressed air supply has been disconnected, the vacuum must not drop. If the vacuum drops within approx. 30 seconds, there is a leak in the coolant circuit.

1. Tighten drain plug **-1-** on the adapter.

   Fig 1: Identifying Coolant Drain Plug



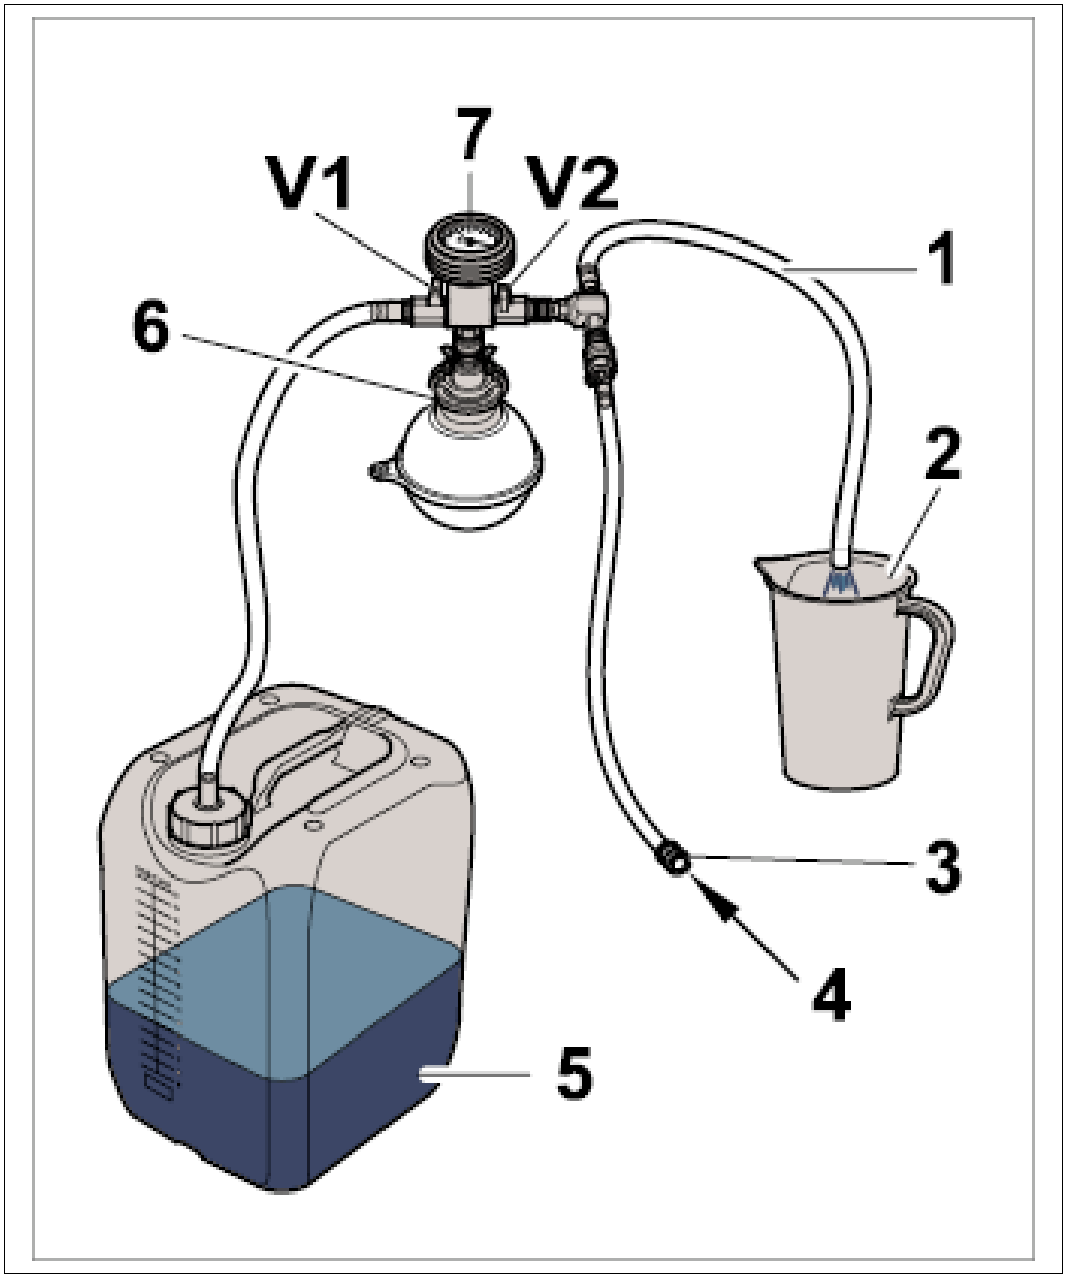
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Set up and connect vacuum filling device.

1. 2.1. Fill coolant reservoir **-5-** with at least 12 liters of pre-mixed coolant in the correct mixture ratio.
2. 2.2. Screw cap adapter K65 **-6-** for the coolant reservoir onto the reservoir.
3. 2.3. Connect the flexible extension (FZ 100) to the cap.
4. 2.4. Connect the vacuum gauge **-7-** of the bleeder tool to the flexible extension and make sure that both shut-off valves **-V1-** and **-V2-** are closed.

   V1 and V2 are at a 90° angle to the flow direction
5. 2.5. Connect the Venturi nozzle to the vacuum gauge.
6. 2.6. Push the filler hose of the vacuum gauge onto the canister connection.
7. 2.7. Route the return line **-1-** from the Venturi nozzle to a second container **-2-** .
8. 2.8. Connect the compressed air supply **-4-** to the filler hose **-3-** .
9. 2.9. Build up overpressure of 6 to 10 bar.

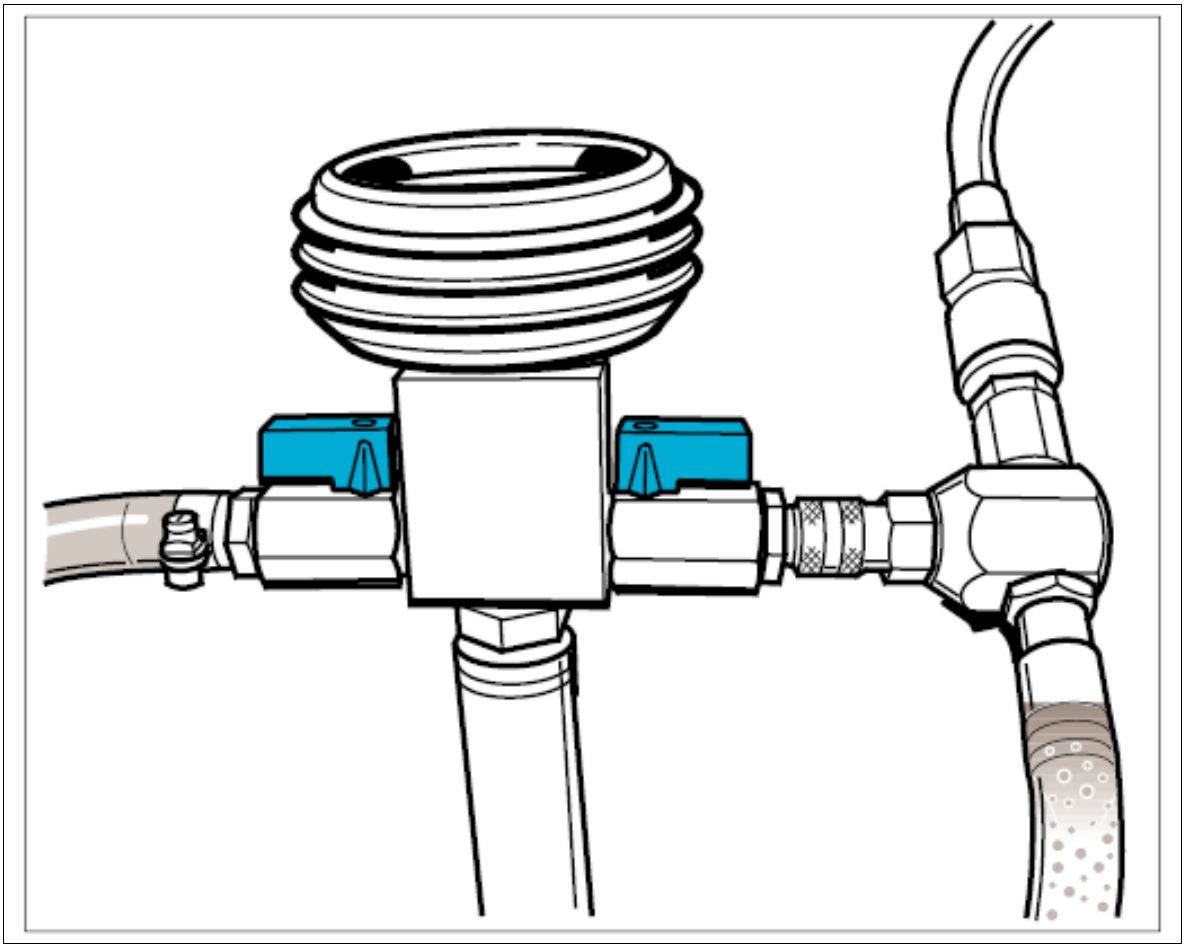
Fig 2: Identifying Vacuum-Filling Device Setup



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Open both shut-off valves on the vacuum gauge until the transparent filler hose has completely filled with coolant.

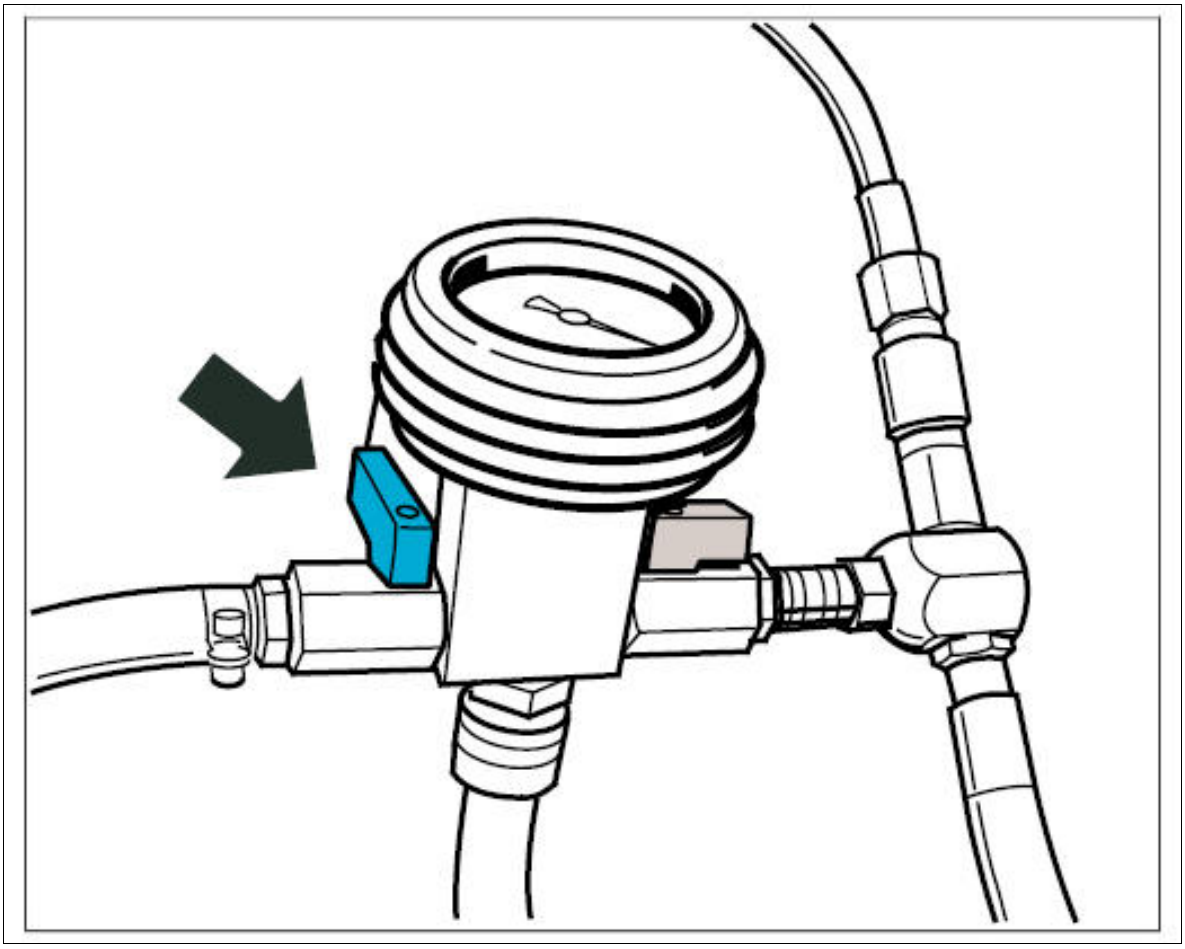
Fig 3: Identifying Shut-Off Valve



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Close the left shutoff valve (V1) **-arrow-** on the vacuum gauge and allow a vacuum to build up in the coolant circuit.

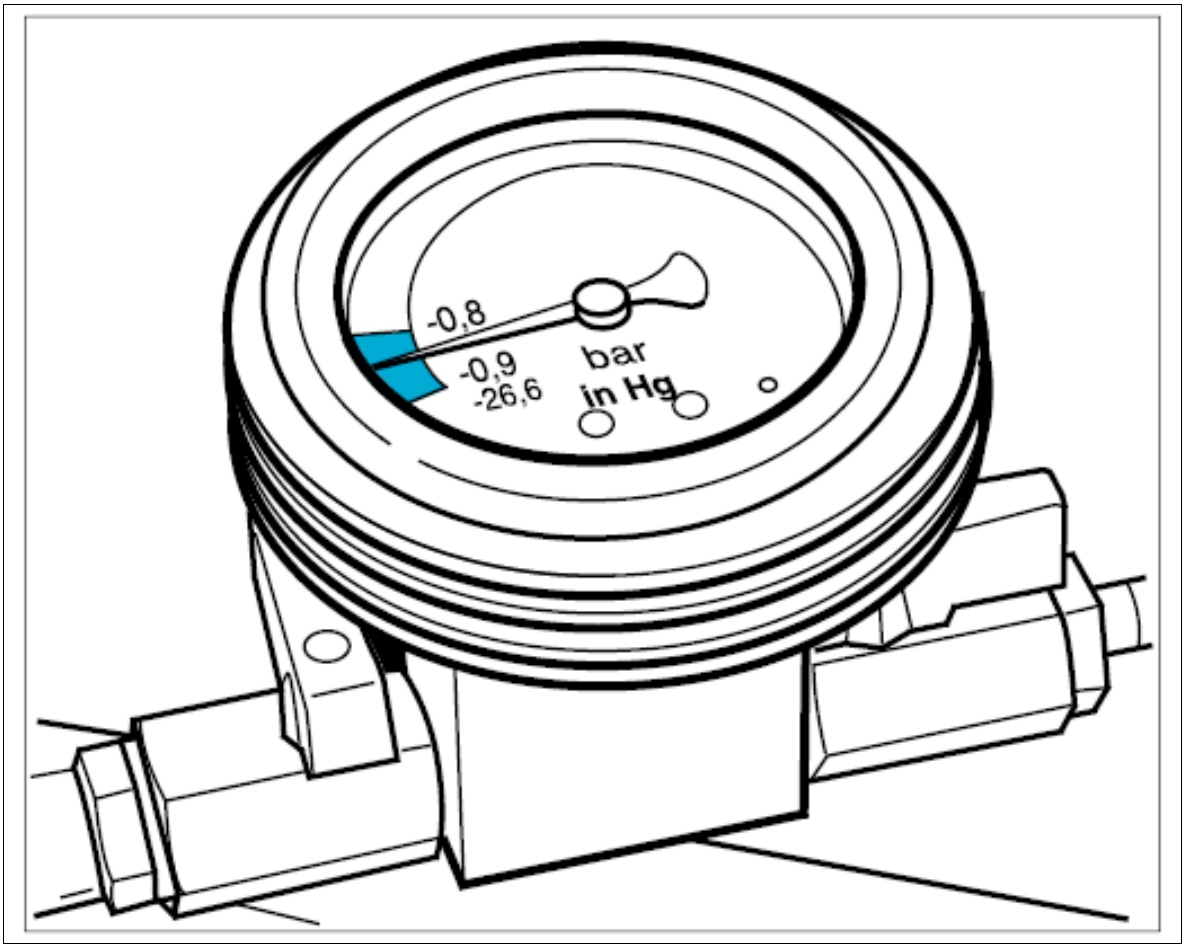
Fig 4: Locating Shut-Off Valve On Filler Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Allow a sufficient vacuum to build in the cooling system (pointer is in the green area) → Vacuum built up (pointer in green area) .

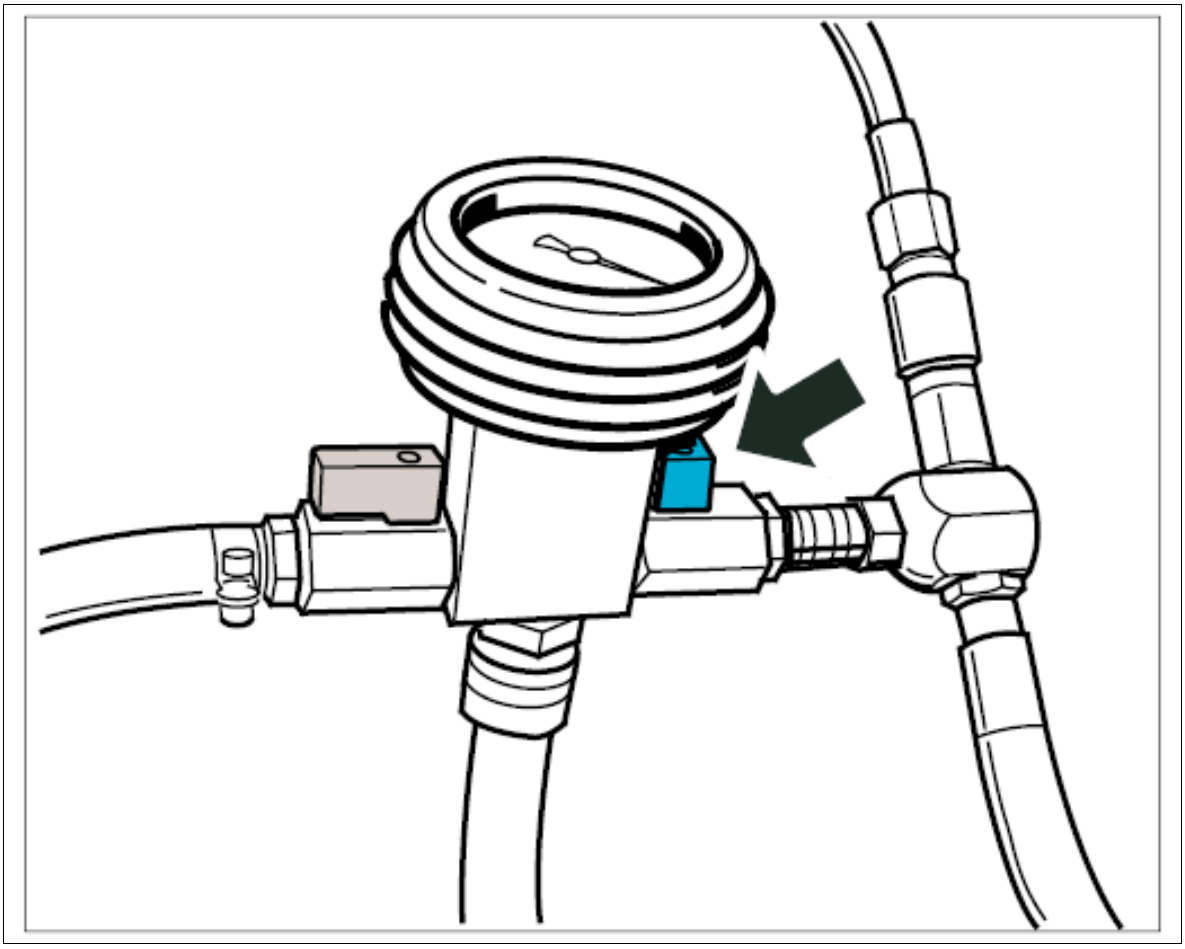
Fig 5: Identifying Vacuum Built Up (Pointer In Green Area)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Close the right shut-off valve (V2) **-arrow-** and then disconnect the compressed air supply.

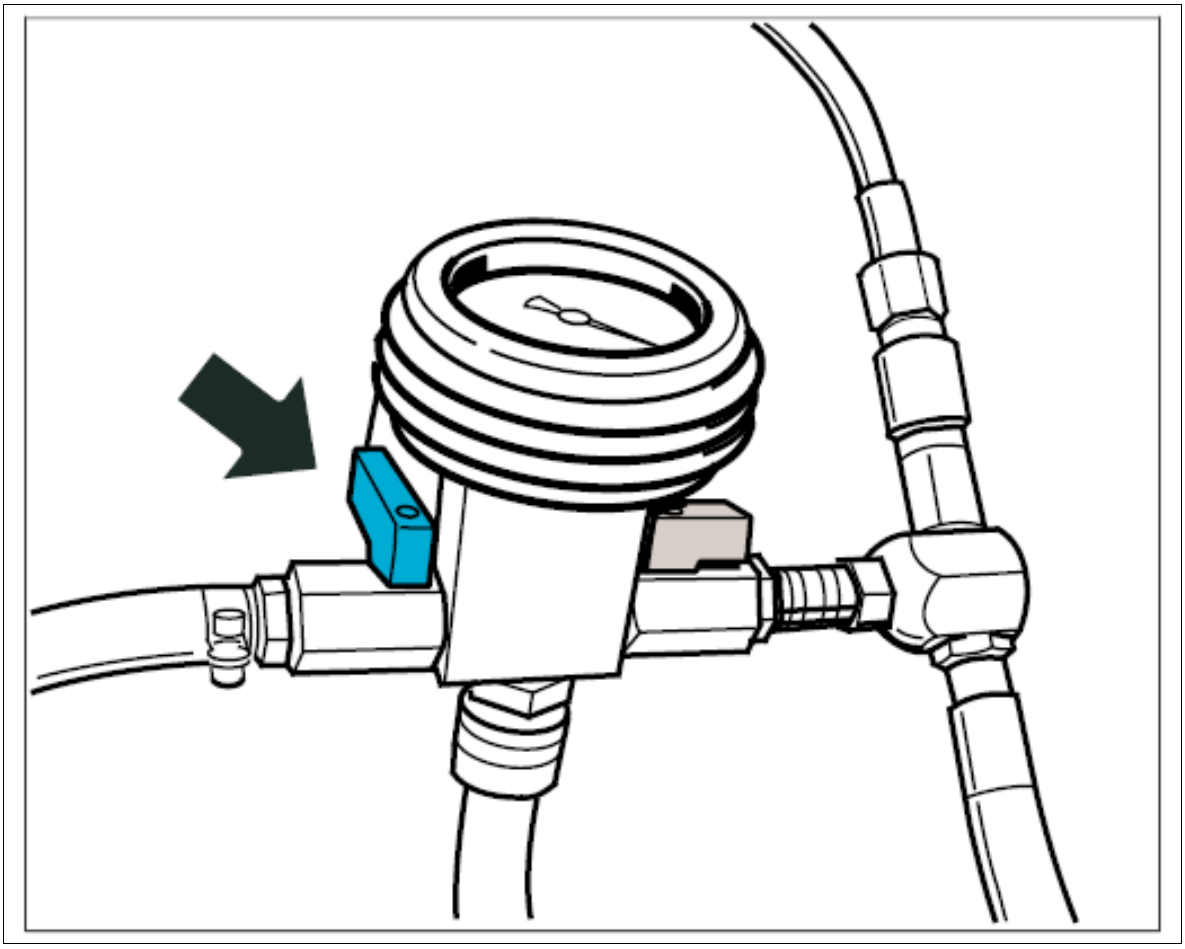
Fig 6: Locating Shut-Off Valve For Filler Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Open the left shut-off valve (V1) **-arrow-** on the vacuum gauge again. The cooling system is now filled.

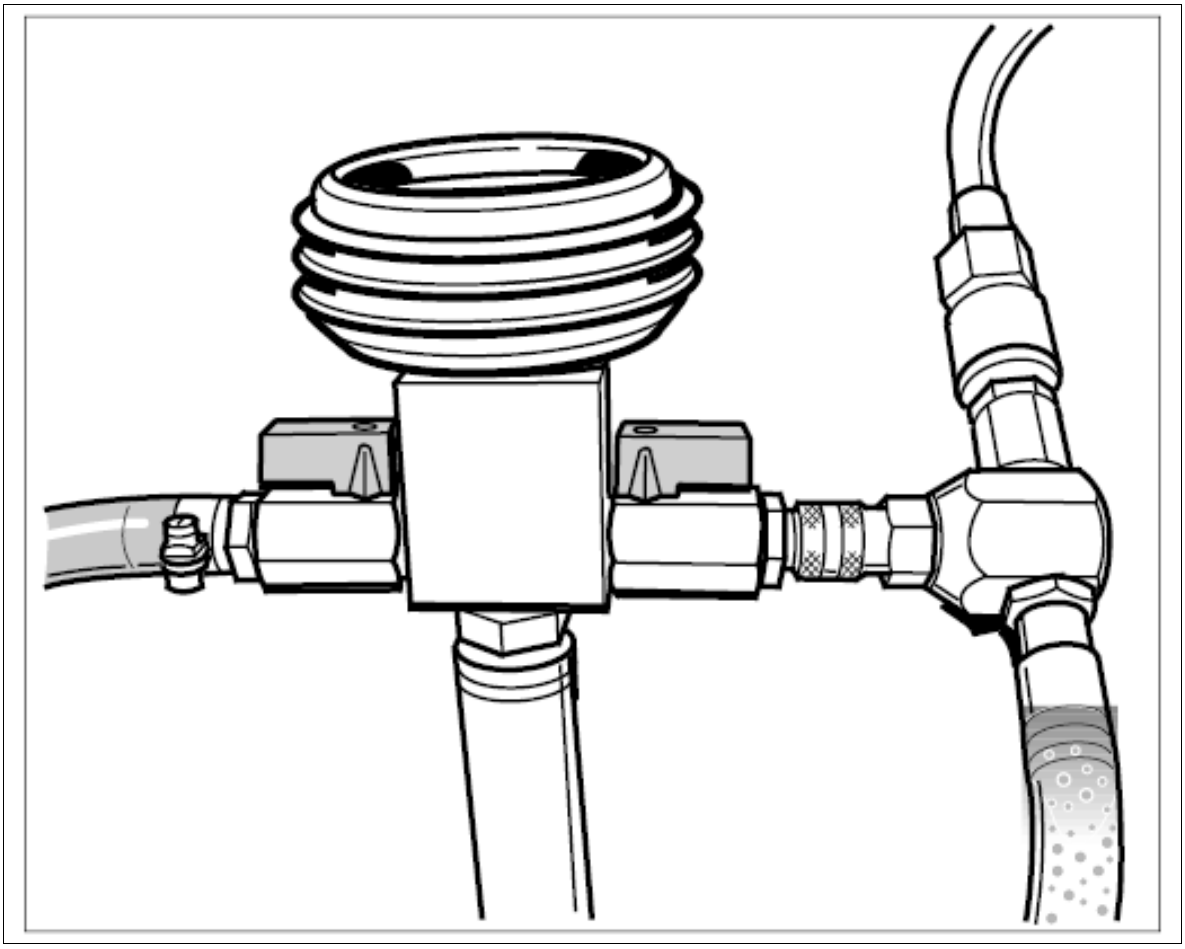
Fig 7: Locating Shut-Off Valve On Filler Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. When there is no trace of vacuum present and no more coolant is being drawn from the canister, open the right shut-off valve (V2). → Opening right shut-off valve

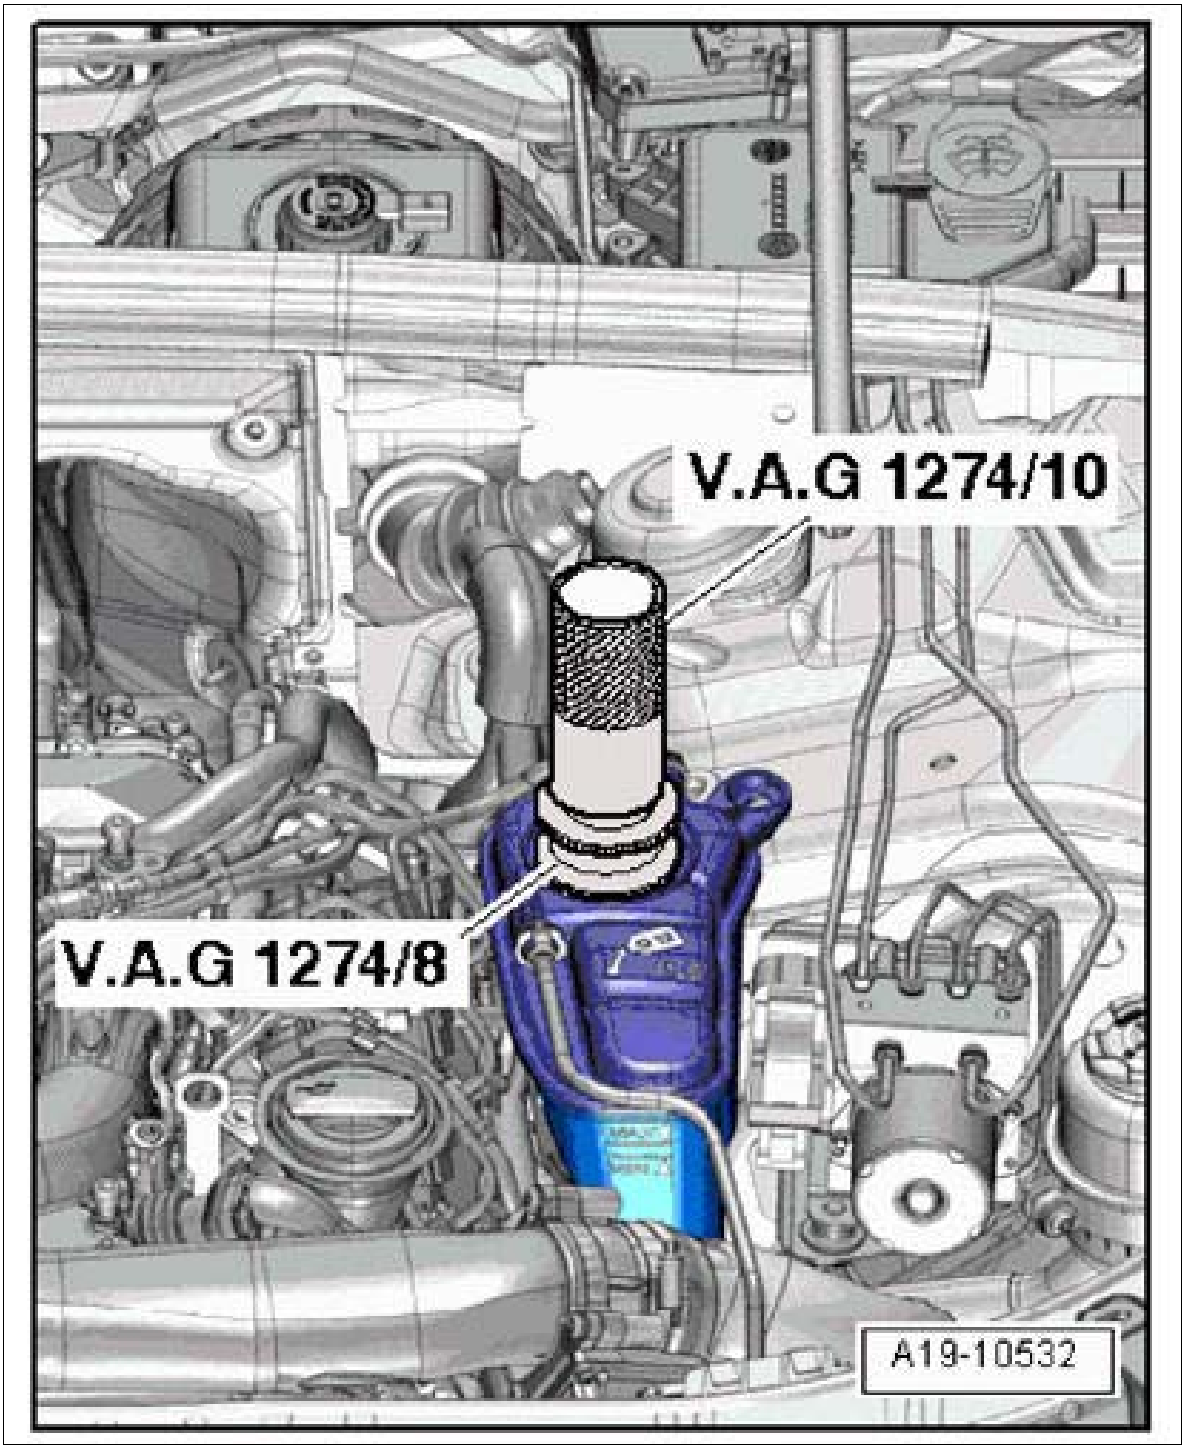
Fig 8: Identifying Right Shut-Off Valve



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Then remove the complete filling tool (including the adapter K65).
10. Connect pipe, **pipe for coolant cooling system tester WE 1387 to the adapter for the cooling system tester WE 1386** .

Fig 9: Identifying Cooling System Tester



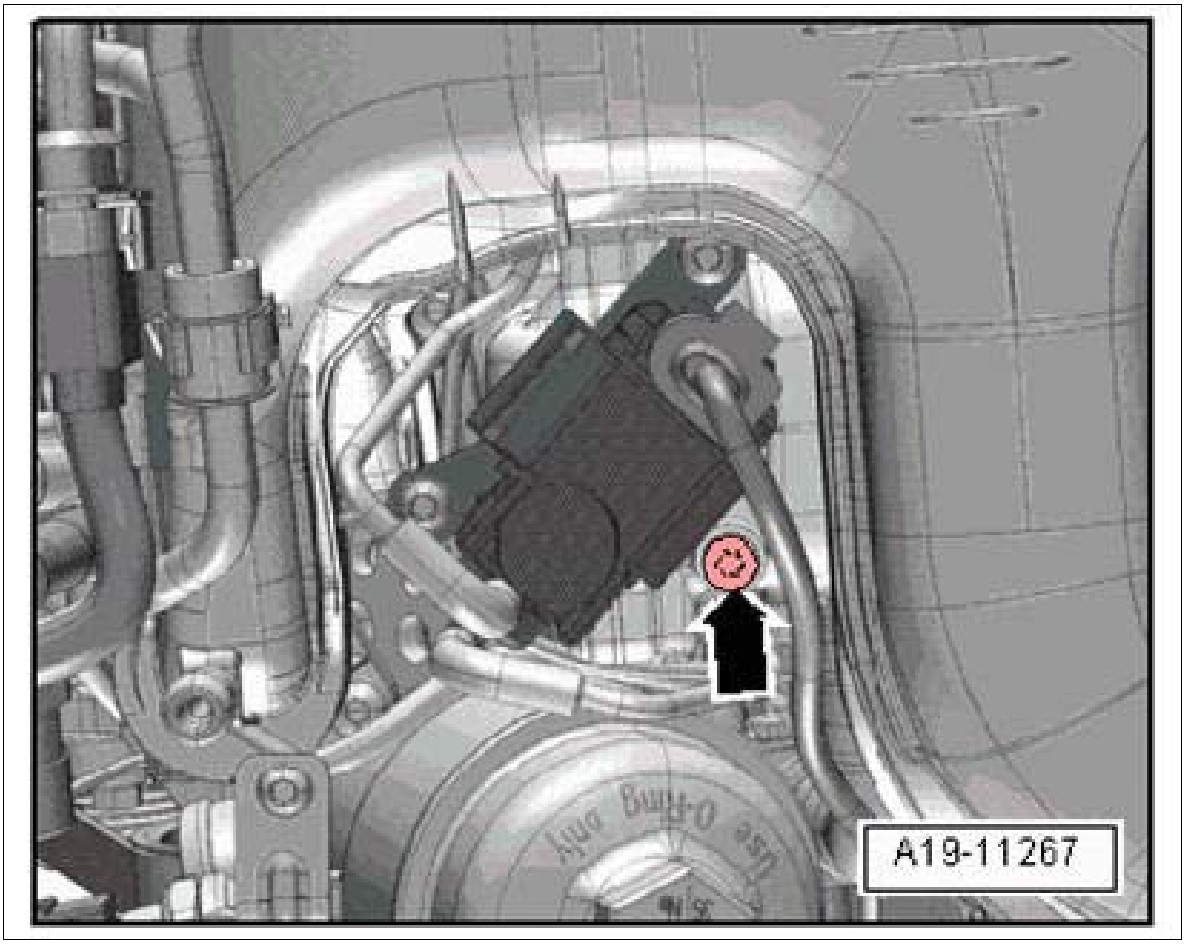
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

11. Fill in coolant until the pipe for the coolant system tester is full.

    Can be topped up during the bleeding process if necessary.

12. Open the front bleeder screw **-arrow-** on the exhaust gas recirculation cooler until coolant emerges and then close it again.

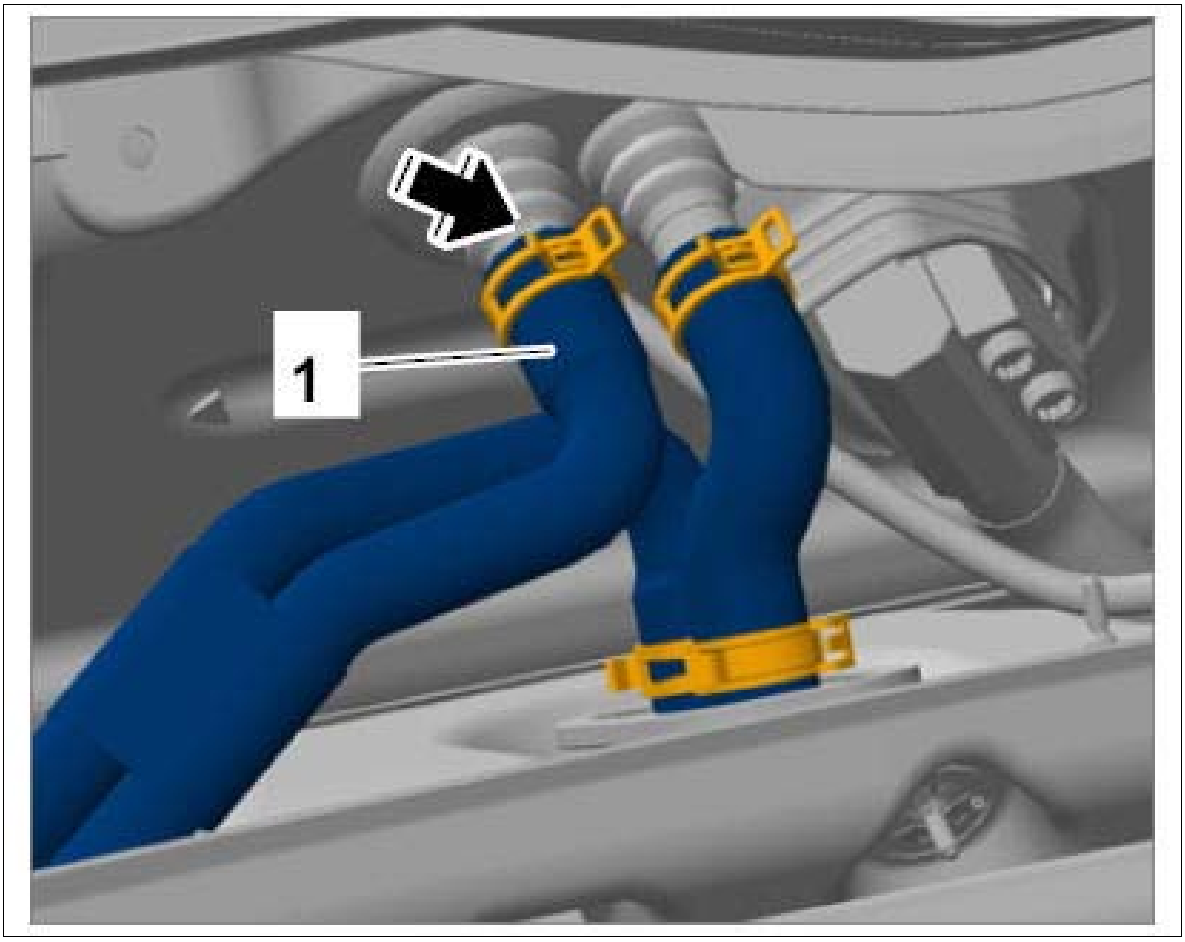
Fig 10: Locating Front Bleeder Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

13. Loosen and pull back the coolant hose to the heat exchanger for the heater until coolant emerges from the ventilation bore **-1-** in the coolant hose.

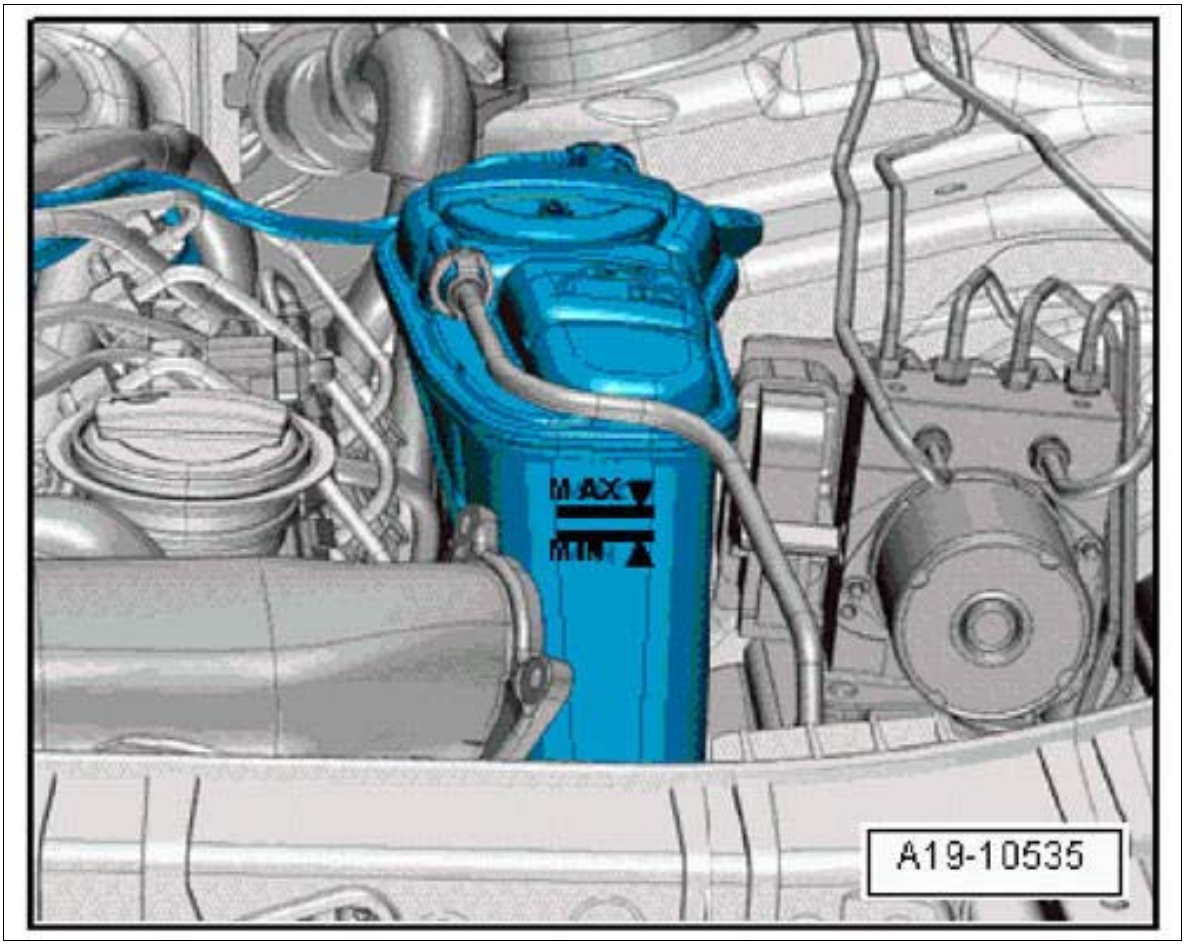
Fig 11: Locating Coolant Hose On Firewall



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Push coolant hose onto the adapter and secure with the spring band clamp.
15. For vehicles with an auxiliary heater, switch this on and allow it to run for approx. 30 seconds.
16. Close the cap on the reservoir.

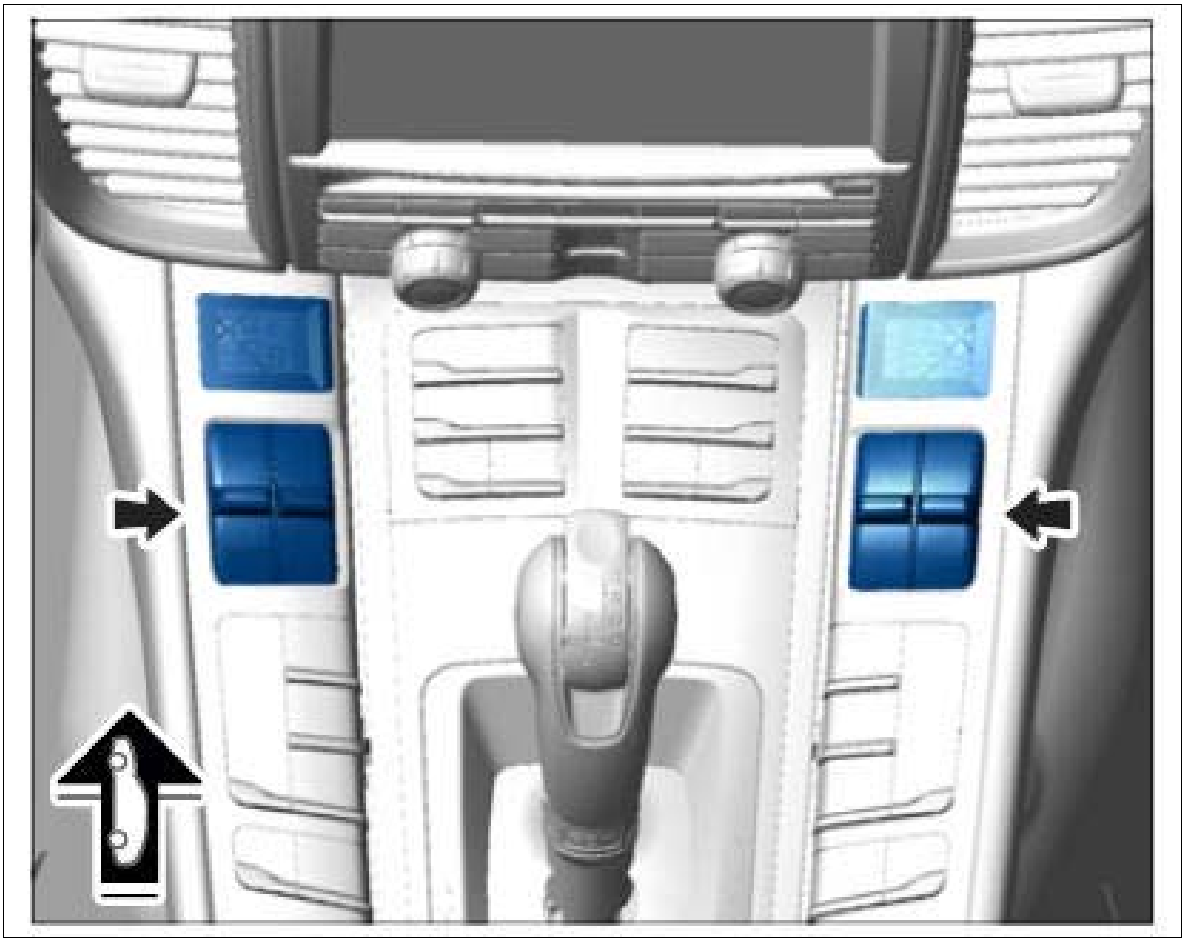
Fig 12: Identifying Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

17. Start the engine and leave it running at idle speed. Move the selector lever to position "P" and allow the engine to warm up.
18. Switch on cabin heating **-arrows-** .

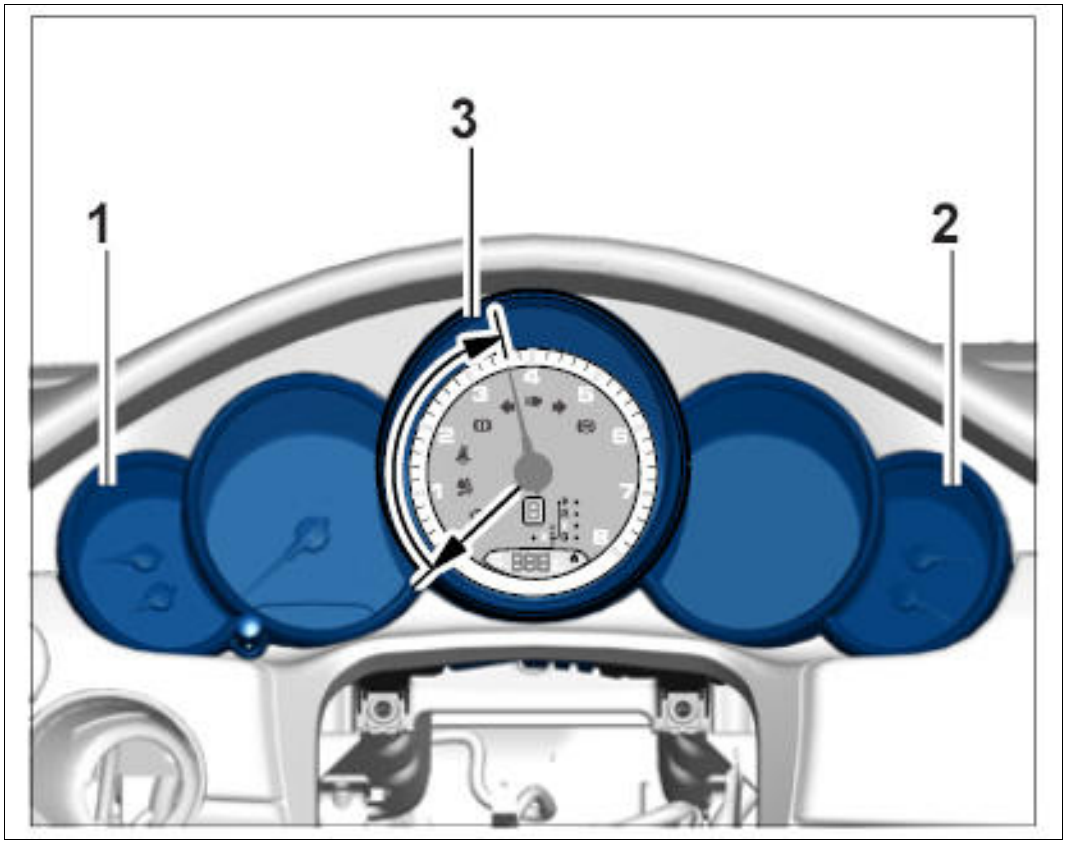
Fig 13: Locating Heater Control In Passenger Compartment



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

19. Press the "Sport button". Leave "Sport" mode activated during the bleeding process.
20. Check the following while the vehicle is warming up.
    1. 20.1. Coolant temperature **-2-** and engine oil temperature **-1-** in the instrument cluster. Figure shows normal, acceptable values.

Fig 14: Identifying Instrument Cluster



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

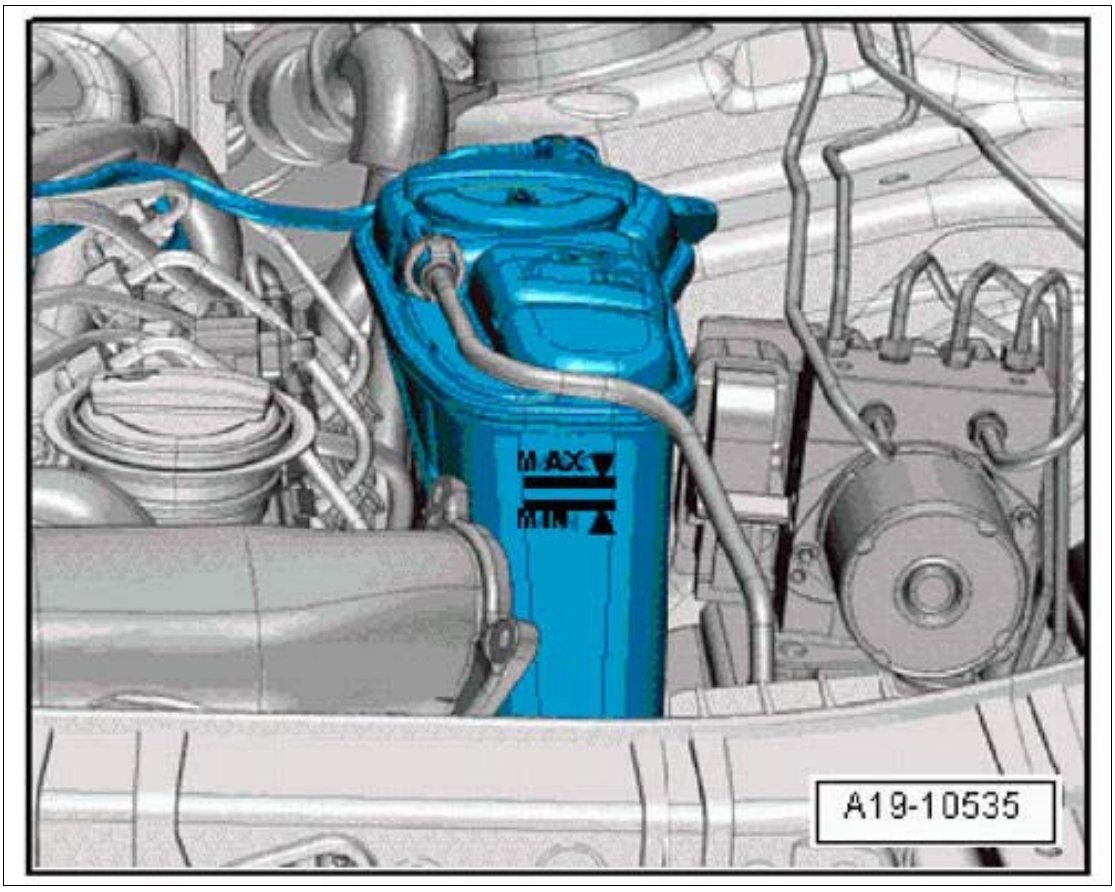
Duration	Engine speed	Conditions
3 minutes	2, 000 rpm	1. With air conditioning "Off" 2. Heater "HI", blower setting at one bar
until both coolant hoses on the radiator are warm	Idle speed	1. With air conditioning "Off" 2. Heater "HI"
2 minutes	2, 000 rpm	1. With air conditioning "Off" 2. Heater "HI"

21. The cooling system has been filled and bled correctly if:
    1. All coolant hoses are uniformly warm.
    2. The temperature display in the instrument cluster is in the normal range.

3. The passenger compartment heater is warm.
4. The electric fan for engine cooling comes on.

22. Correct level:
    1. When the engine is cold, the coolant level must be up to the -MAX- marking.
    2. When the engine is at operating temperature, the engine coolant level may be above the -MAX- marking.

Fig 15: Identifying Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 193817 DRAINING AND FILLING COOLANT (MACAN) > SUBSEQUENT WORK

1. Install cowl panel cover. → INSTALLING COWL PANEL COVER .
2. Install cover for front underbody. → INSTALLING COVER FOR FRONT UNDERBODY .

> - *Possible danger of injury or damage (swollen hoses, skin irritation, danger of slipping, etc.)*

→ Before lines are opened, place a cloth underneath them!

→ Components that come into contact with ATF must be cleaned IMMEDIATELY with water!

→ Take appropriate protective measures (e.g. use gloves, safety goggles, oil binding material)

→ Collect emerging ATF!

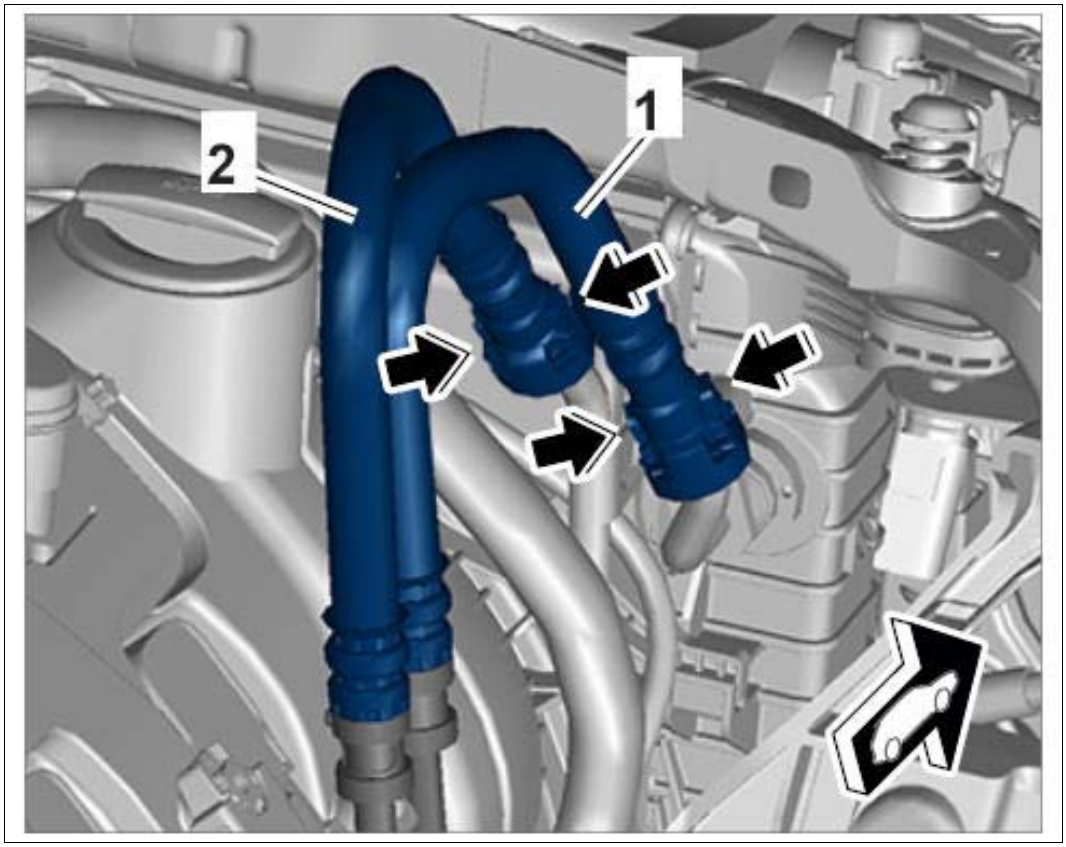
> *CAUTION: Hot components*
>
> - *Risk of burns*

→ Let hot components cool down.

→ Wear personal protective gear.

1. Release ATF lines **-1 and 2-** at the top of the engine compartment **-arrows-** and disconnect them.
    1. 1.1. Soak up emerging ATF with a cloth.

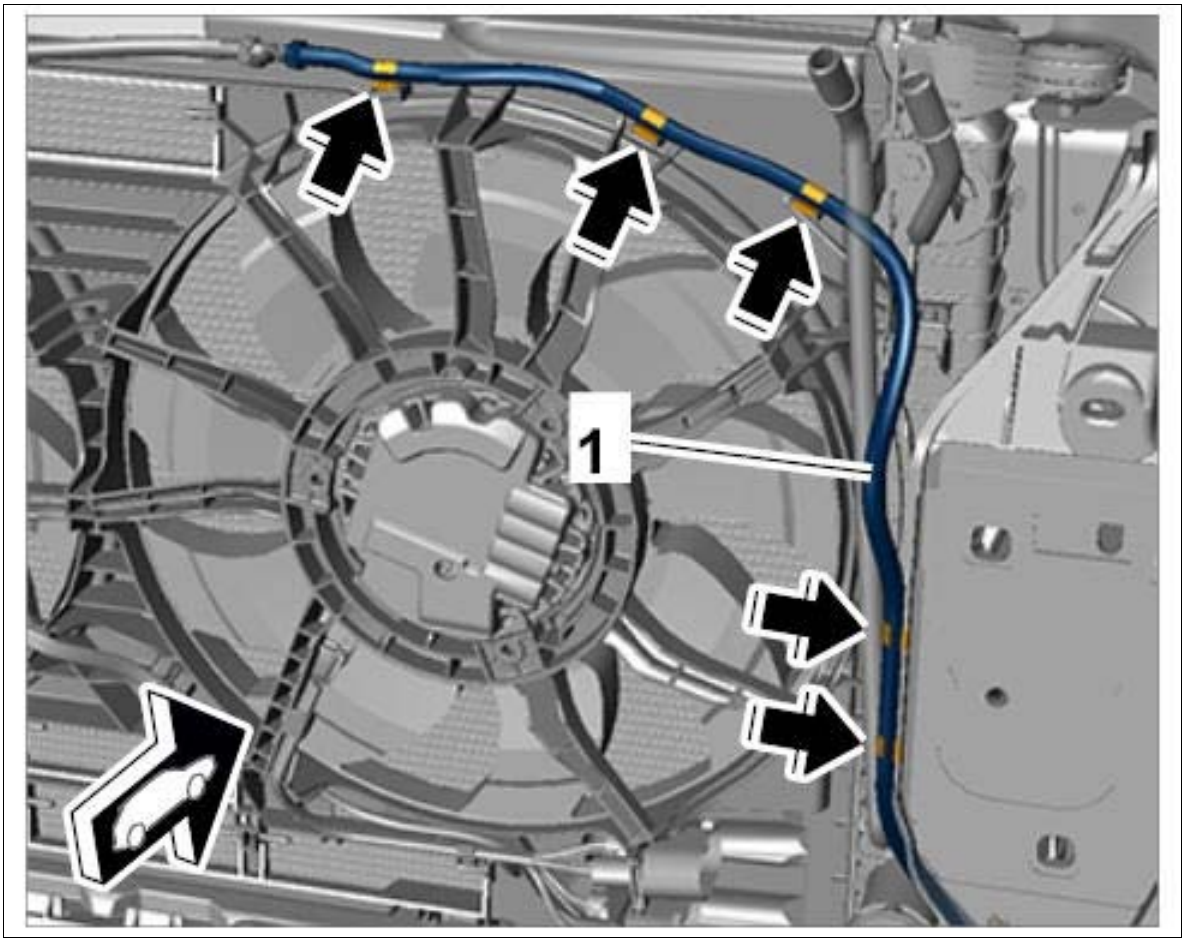
Fig 1: Locating ATF Lines



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Release vacuum line **-1-** from the holders **-arrows-** .

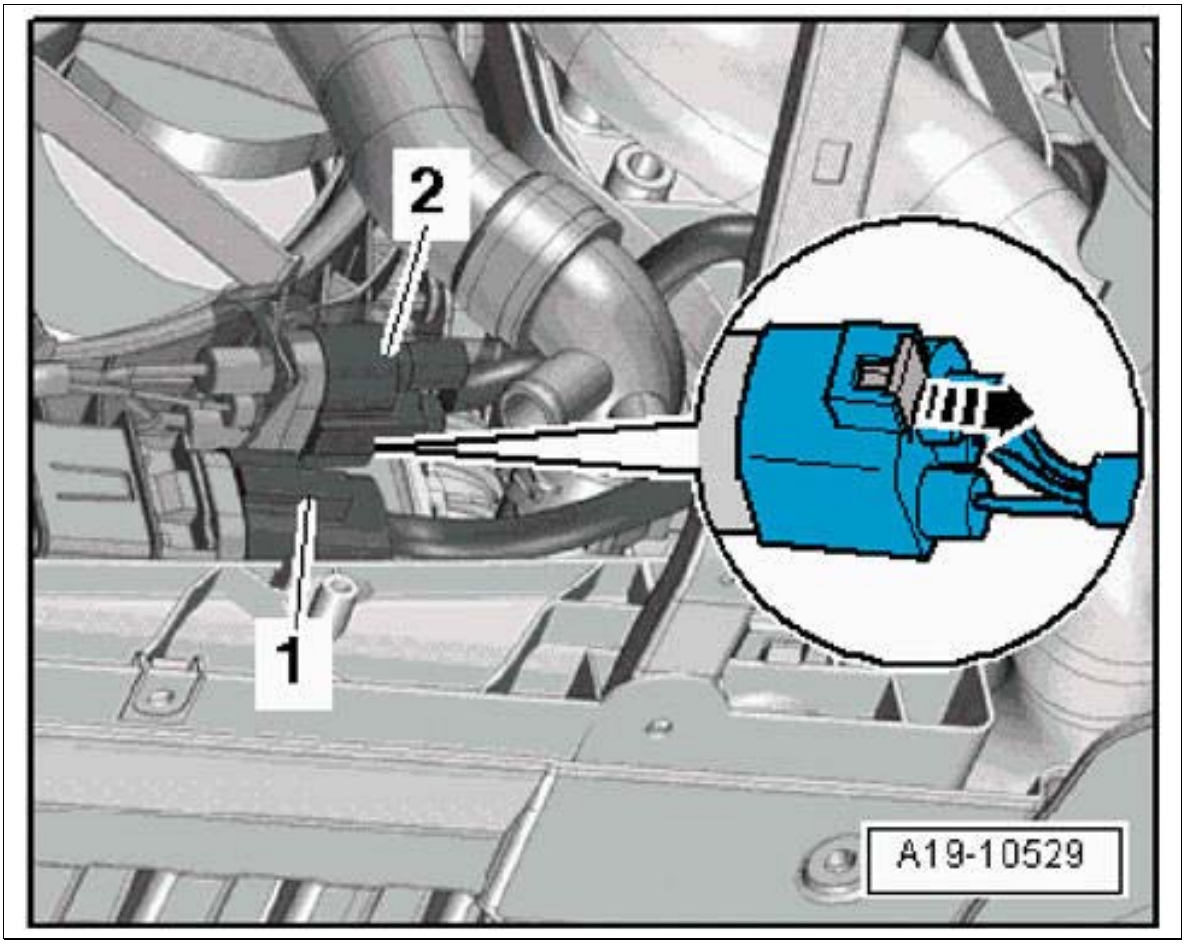
Fig 2: Locating Vacuum Line On Radiator



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Release and disconnect electric connectors for fans **-1, 2-** .

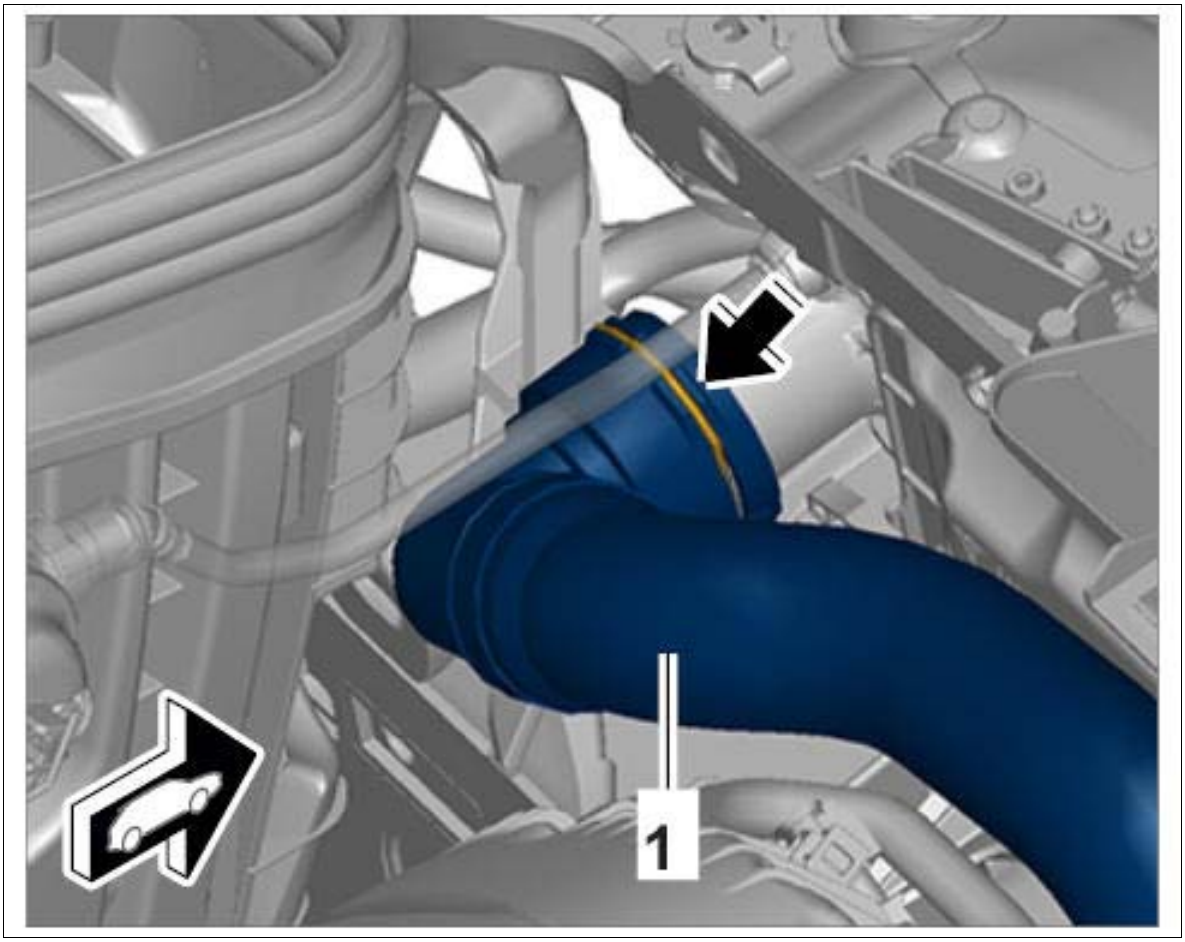
Fig 3: Disconnecting Fan Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Release retaining clip **-arrows-** and disconnect upper coolant line **-1-** from the radiator.

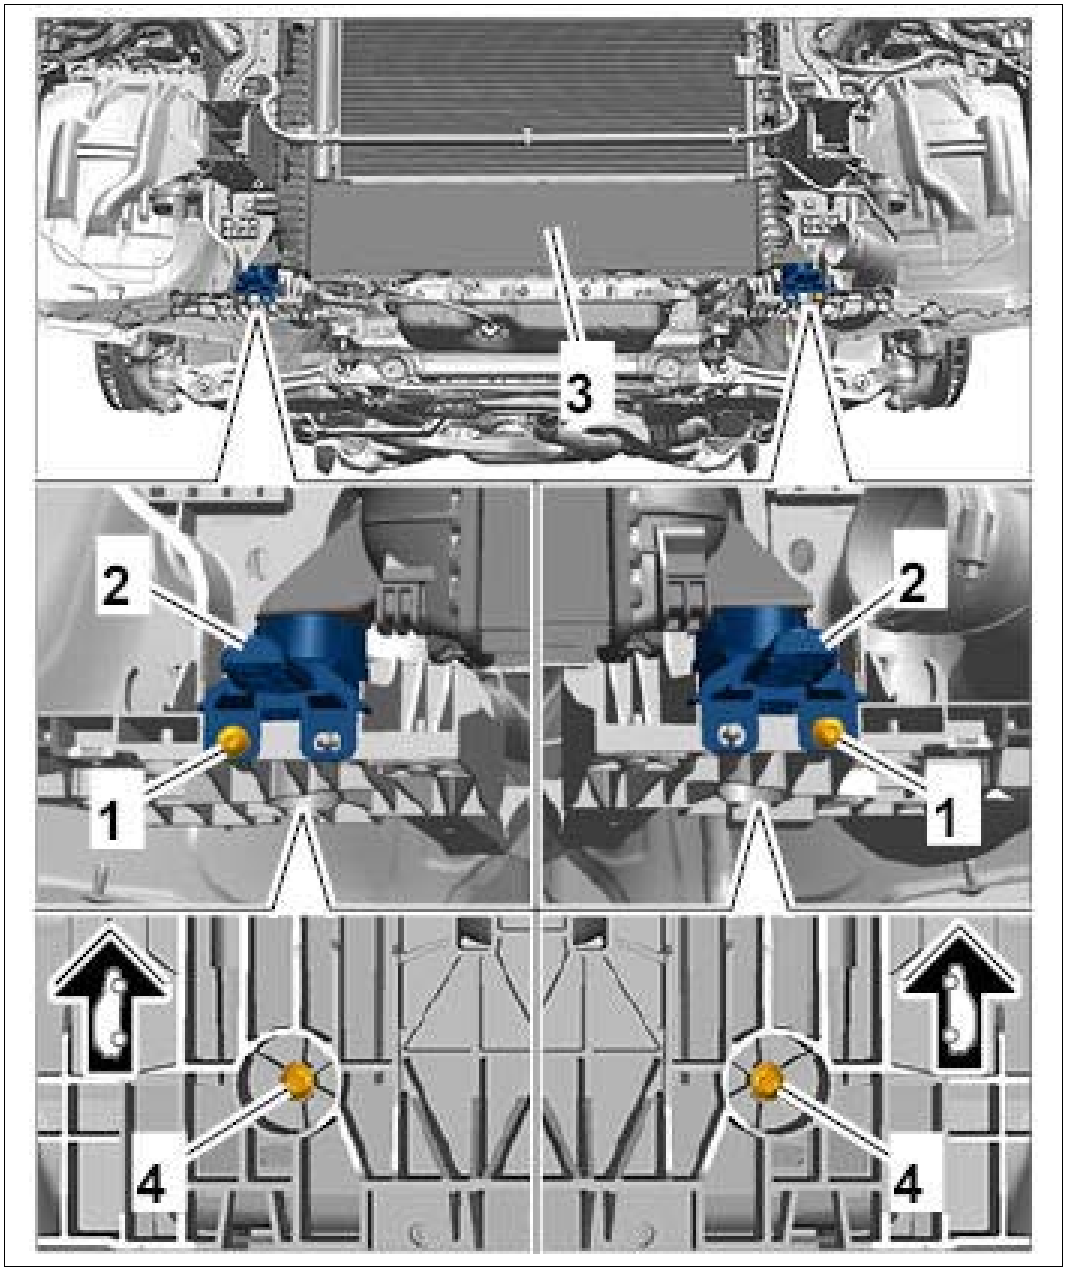
Fig 4: Locating Radiator Coolant Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Disconnect lower coolant line from the radiator.
6. Unscrew screws on the radiator holder.
    1. 6.1. Unscrew screws **-1-** on the holder **-2-** .
    2. 6.2. Unscrew screws **-4-** at the bottom.
    3. 6.3. Lift radiator **-3-** up in direction of travel and remove it by pulling it forward.

Fig 5: Locating Radiator Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

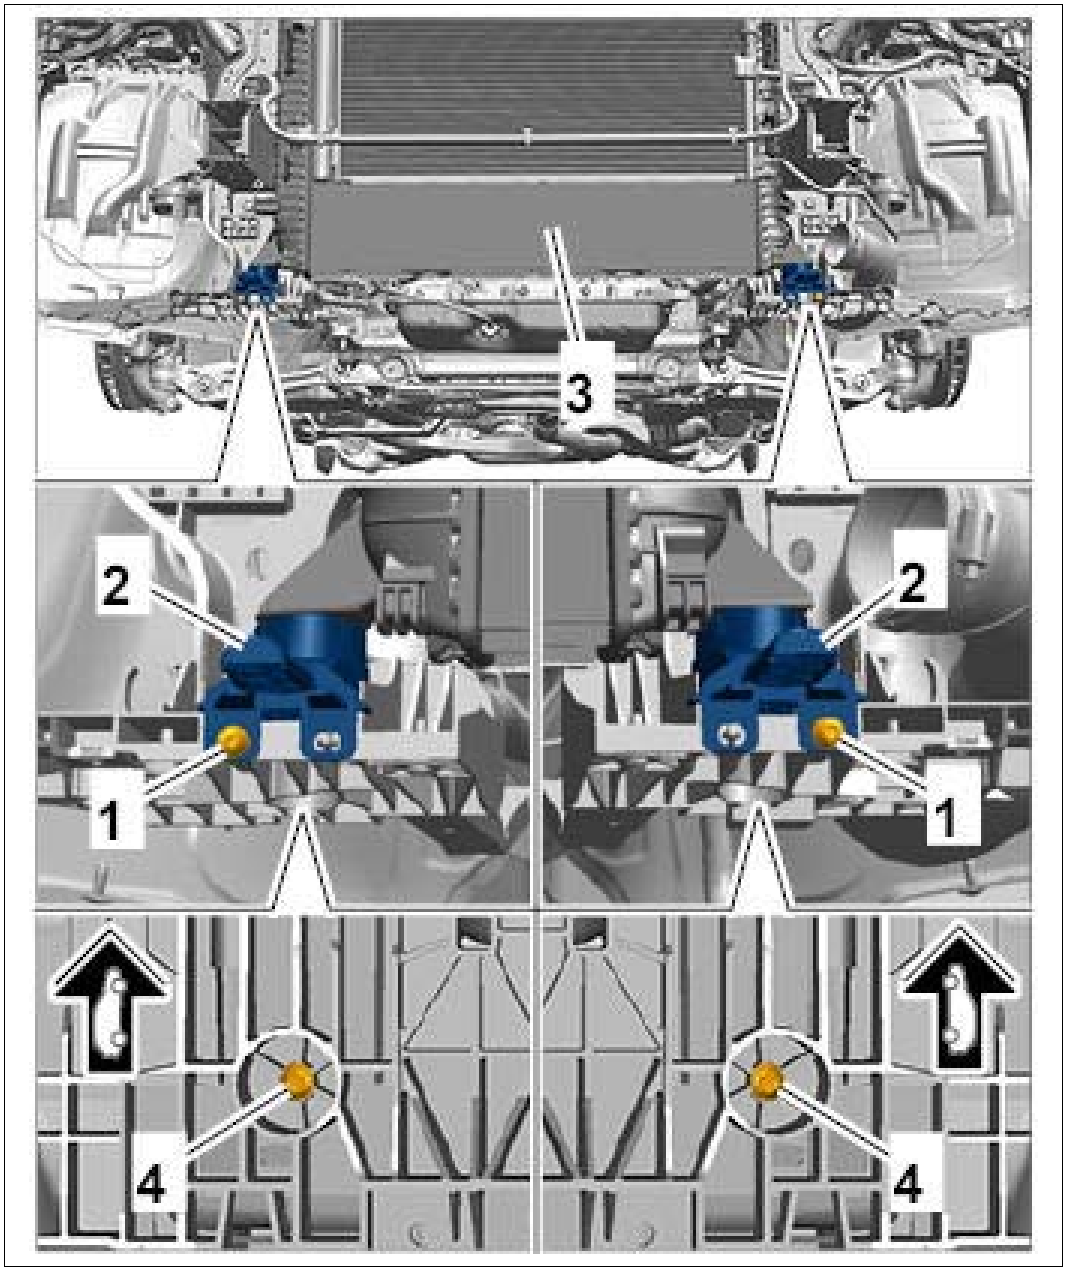
WM 197019 REMOVING AND INSTALLING RADIATOR (MACAN S, MACAN TURBO) > INSTALLING RADIATOR

1. Installation is performed in reverse order. Pay particular attention to the following:

    1. 1.1. Tightening torque for screw 1: **Tightening torque: 4.5 Nm (3 ftlb.) +/-0.5 Nm (+/-0.5 ftlb.)**

    2. 1.2. Tightening torque for screw 4: **Tightening torque: 4.5 Nm (3 ftlb.) +/-0.5 Nm (+/-0.5 ftlb.)**

Fig 1: Locating Radiator Mounting



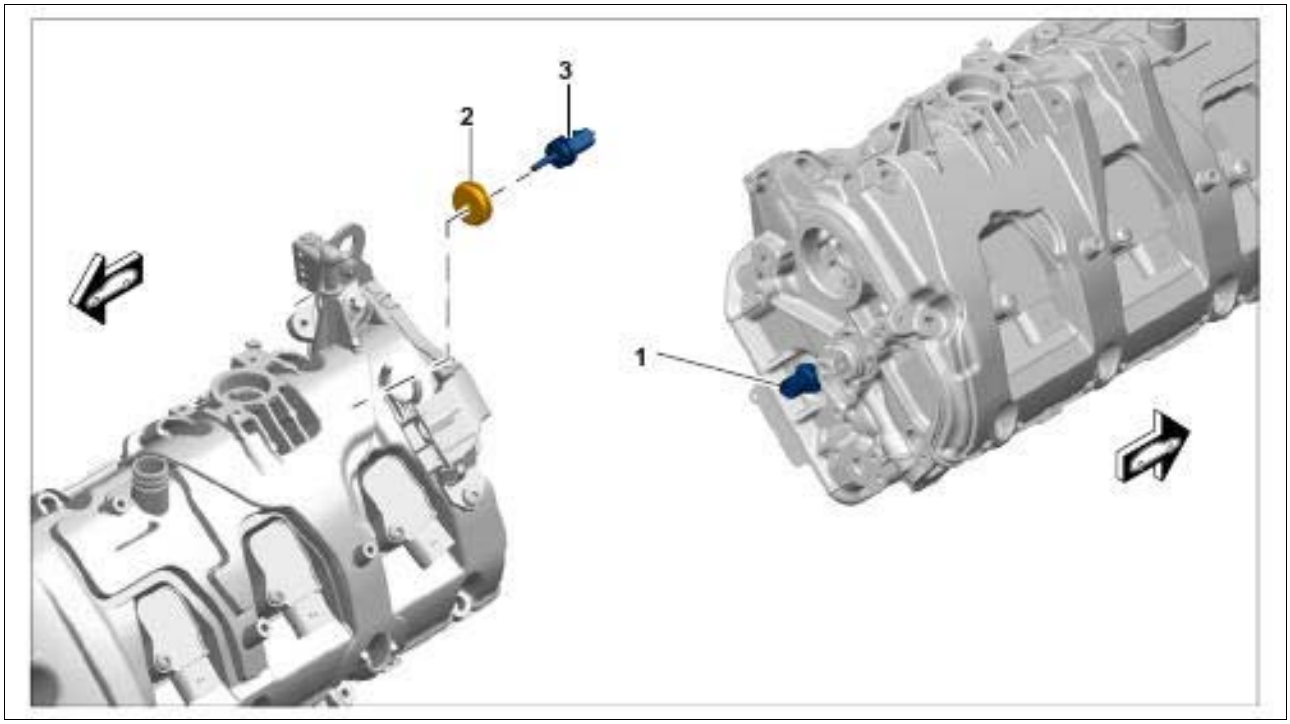
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 197019 REMOVING AND INSTALLING RADIATOR (MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install condenser. → INSTALLING CONDENSER .
2. Secure air guide. → INSTALLING AIR GUIDE .
3. Fill in coolant. → FILLING COOLANT includes bleeding.
4. Check and top up ATF. → 370235 CHECKING AND TOPPING UP ATF

WM 197819 REMOVING AND INSTALLING TEMPERATURE SENSOR (MACAN S, MACAN TURBO) > INFORMATION > COMPONENT OVERVIEW

Fig 1: Overview Of Temperature Sensor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Temperature sensor (installation position, cylinder 3)
2. Grommet
3. Temperature sensor for engine compartment (installation position, cylinder 6)

The removal and installation instructions in this section relate to the coolant temperature sensor.

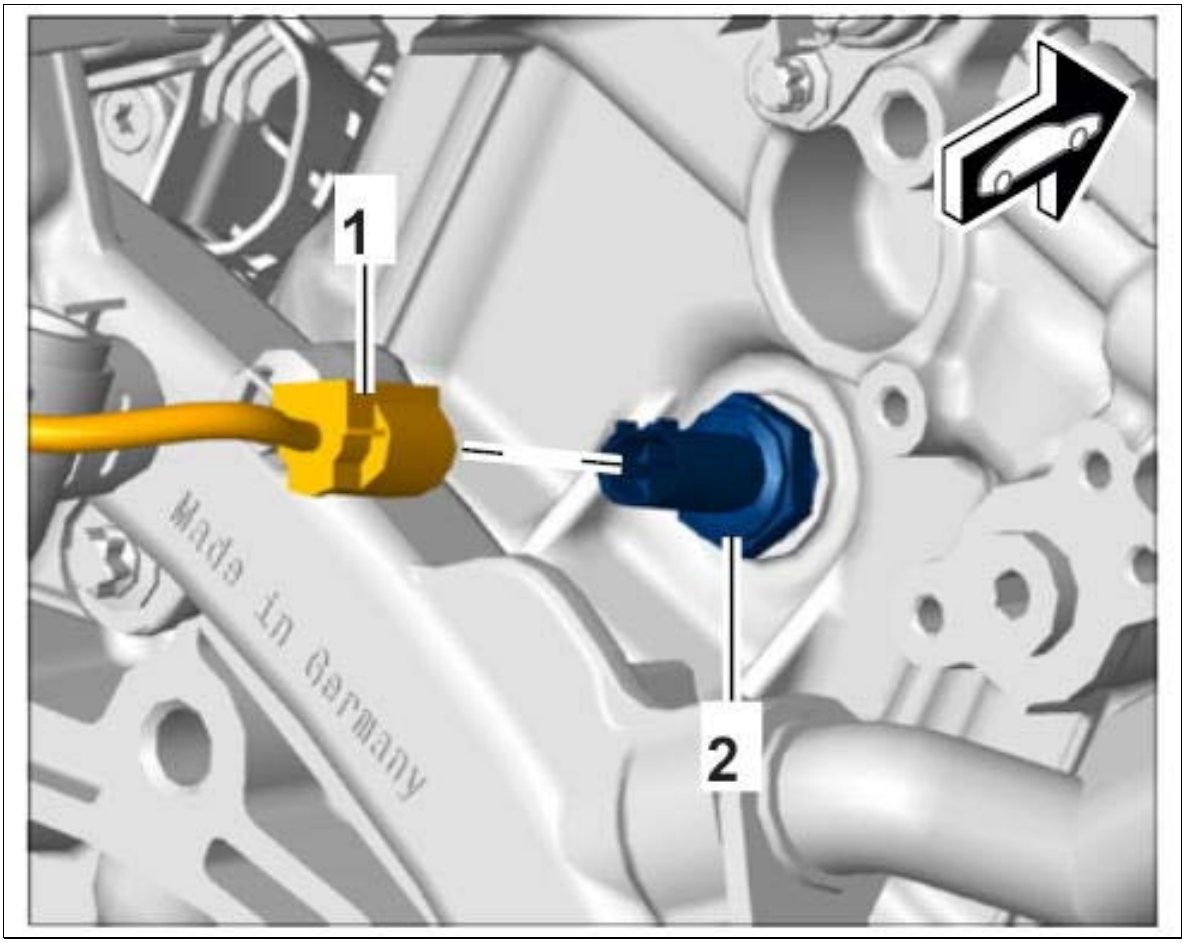
WM 197819 REMOVING AND INSTALLING TEMPERATURE SENSOR (MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove design cover.
2. Drain coolant. → 193817 DRAINING AND FILLING COOLANT (INCLUDES BLEEDING)

WM 197819 REMOVING AND INSTALLING TEMPERATURE SENSOR (MACAN S, MACAN TURBO) > REMOVING TEMPERATURE SENSOR

1. Release and disconnect electric plug connection **-1-** on the temperature sensor **-2-** .

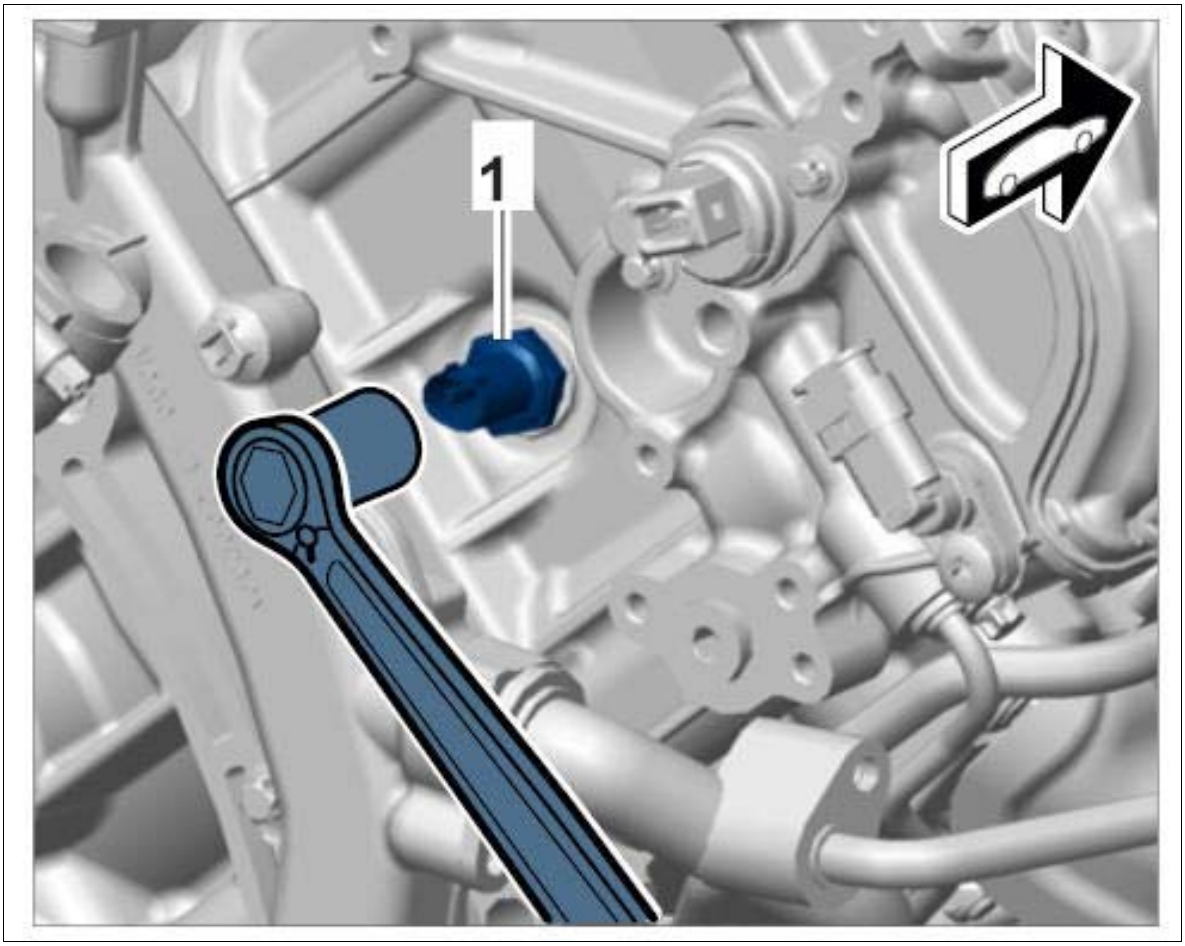
Fig 1: Disconnecting Electric Plug Connection For Temperature Sensor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Unscrew temperature sensor **-1-** from the cylinder head.

Fig 2: Removing Temperature Sensor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 197819 REMOVING AND INSTALLING TEMPERATURE SENSOR (MACAN S, MACAN TURBO) > INSTALLING TEMPERATURE SENSOR

1. Fit temperature sensor into the cylinder head and screw it in. Tighten temperature sensor.
2. Plug in and lock electric plug connection on the temperature sensor.

WM 197819 REMOVING AND INSTALLING TEMPERATURE SENSOR (MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Fill in coolant and bleed the system. → FILLING COOLANT includes bleeding.
2. Install engine cover.

Service Manual: 1X - ENGINE - GENERAL -- (95B) - MACAN

Fastening screw for left coolant pipe		Tightening torque	9 Nm (6.5 ftlb.)		

WM 1X00IN TECHNICAL VALUES (MACAN) > OVERVIEW

Information

- The tightening steps in the tightening sequences relate to tightening screws uniformly, i.e. all affected screws must first be tightened uniformly to the first torque value, then all screws are tightened one stage further, and so on.
- Replace all O-rings following removal!

The torques in the table below generally apply to screws that are not specifically listed =>

The bolt quality is indicated on the screw head at the top as a decimal number, e.g. "8.8" or "12.9".

Bolt quality 8.8		Bolt quality 10.9		Bolt quality 12.9	
Thread	[Nm (ftlb.)]	Thread	[Nm (ftlb.)]	Thread	[Nm (ftlb.)]
M4	3 (2)	M4	4 (3)	M4	5 (3.5)
M5	6 (4.5)	M5	8 (6)	M5	10 (7.5)
M6	10 (7.5)	M6	13 (9.5)	M6	16 (12)
M8	23 (17)	M8	33 (24)	M8	39 (29)

M10	45 (33)	M10	65 (48)	M10	80 (59)
M10 x 1.25	50 (37)	M10 x 1.25	70 (52)	M10 x 1.25	85 (63)
M12	80 (59)	M12	115 (85)	M12	135 (100)
M12 x 1.25	90 (67)	M12 x 1.25	125 (93)	M12 x 1.25	150 (111)
M12 x 1.5	85 (63)	M12 x 1.5	120 (89)	M12 x 1.5	145 (107)
M14	130 (96)	M14	180 (133)	M14	220 (163)
M16	200 (148)	M16	280 (204)	M16	335 (248)

Aluminum Screws

Thread	Strength	Tightening procedure
M6	AL9	→ **Initial tightening: 4 Nm (3 ftlb.)** and → **Final tightening: 90°** or yield-point wrench.
M8	AL9	→ **Initial tightening: 10 Nm (7.5 ftlb.)** and → **Final tightening: 90°** or yield-point wrench.
M10	AL9	→ **Initial tightening: 20 Nm (15 ftlb.)** and → **Final tightening: 90°** or yield-point wrench.

WM 200101 CHECKING FUEL SYSTEM (HIGH-PRESSURE SIDE) FOR LEAKS (EXCEPT MACAN) > TOOLS

Designation	Type	Number	Description	
Air-spring strut filling unit VAS 6231	Service equipment	WE 1282		K-Jetronic Tester	Service equipment	WE 1291		
adapter	Special tool	9759		24  9759 000 721 975 90

WM 200101 CHECKING FUEL SYSTEM (HIGH-PRESSURE SIDE) FOR LEAKS (EXCEPT MACAN) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
High-pressure pump		Pressure	10 bar		

Fuel supply line	Thread M16 x 1.5	Tightening torque	35 Nm (26 ftlb.)		

WM 200101 CHECKING FUEL SYSTEM (HIGH-PRESSURE SIDE) FOR LEAKS (EXCEPT MACAN) > PRELIMINARY WORK

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapours.

→ Attach warning sign in a clearly visible position.

NOTE: Dirt on injection system components

- *Material damage*
- *Rough-running engine*
- *Bad exhaust emissions*

→ Thoroughly clean connection points and adjacent areas before loosening them. If the engine is very dirty, wash it before starting disassembly work.

→ Lay removed parts on a clean surface and cover them. Do not use fibre-shedding cloths.

→ Carefully cover components or seal them if repair work will not be carried out immediately. Place rubber caps on connections. Seal intake openings with film or adhesive tape.

→ Only install clean parts. Do not take spare parts out of the packaging until just before installation.

→ Never use compressed air when the system is open. Do not move the vehicle.

WARNING: Leaking fuel supply lines

- *Emerging fuel*
- *Risk of fire*

→ Perform leak test.

Information

- Do not bend high-pressure lines. Always remove the high-pressure distributor pipe and other fuel-supply components in the high-pressure area completely. Check that the connection points are not damaged and are perfectly clean and make sure there is no thread damage. Fit union nuts on all connection points by hand before screwing in screws or bolts. Remove dirt on the conical/ball joints. Check connection points for leaks following fitting.

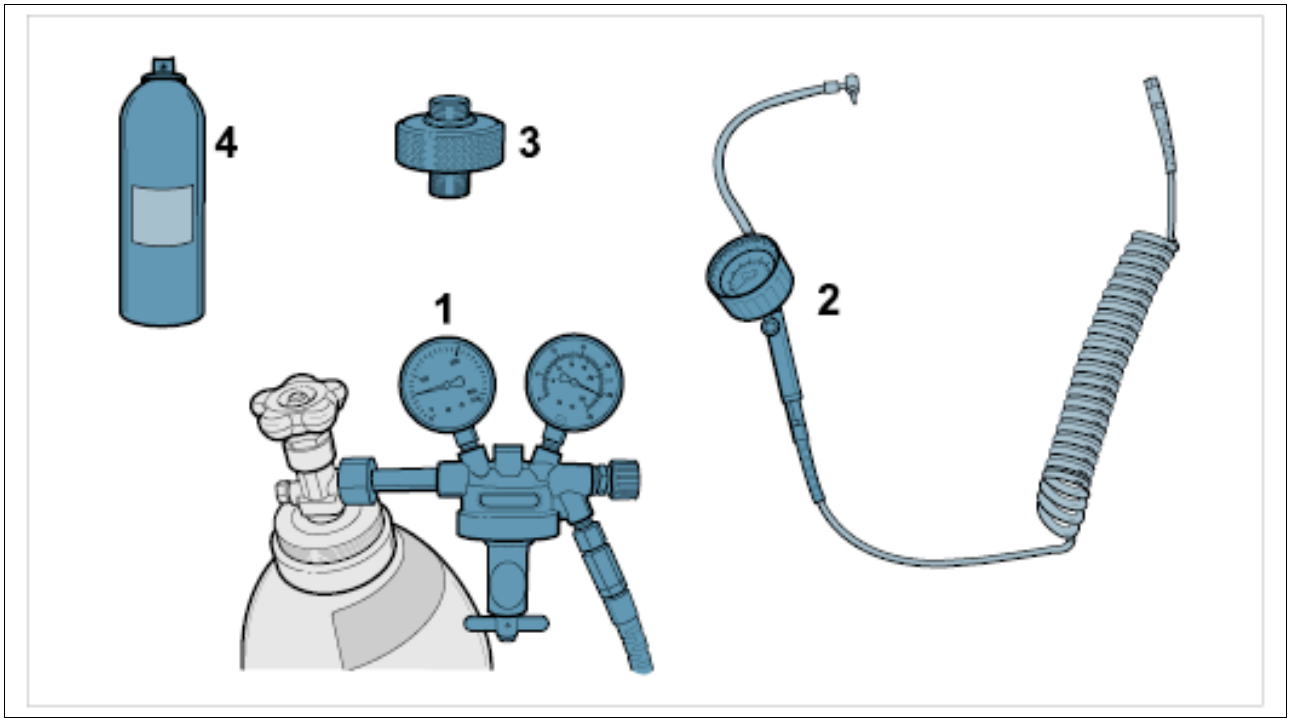
Information

- The ignition must be switched off when working on the fuel system.
- Absorb any escaping fuel using a suitable binding material or a cloth.
- Cloths which have absorbed fuel must be disposed of according to the applicable national laws.
- The fuel system must be depressurised before starting work on it.
- Only work on the fuel system in well-ventilated rooms.
- Any seals which have been removed must always be replaced.
- After disassembly work on the high-pressure injection system, fit the components to the prescribed torques.
- Visible threaded joints must be checked for leaks with the engine idling after a test drive.
- For the check to be performed correctly, the components to be checked must not contain any fuel. Remove fuel from the lines during disassembly work.

  1. Remove rear engine compartment cover. → Removing front trim panel
  2. Pull out fuse for the fuel pump in the central electrical system or disconnect the battery. This ensures that the fuel pump does not start up when a door is opened.

WM 200101 CHECKING FUEL SYSTEM (HIGH-PRESSURE SIDE) FOR LEAKS (EXCEPT MACAN) > TOOLS AND MATERIALS

Fig 1: Identifying Leak Test Tools



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. The required pressure is set on the compressed gas bottle using the commercially available pressure gauge unit (pressure reducer). The commercially available compressed gas bottle must be filled only with approved leak-locating gases.
2. **Air-spring strut filling unit VAS 6231 WE 1282** with air-spring filling unit; the connection is fitted between the pressure reducer and adapter. Perform the leak test using individual bursts of pressure.
3. **K-Jetronic Tester WE 1291** adapter **V.A.G 1318/11** for fitting on the fuel supply line.
4. Commercially available leak-locating spray for detecting gas leaks.

Approved leak-locating gases (test media)

Leak-locating gas (test medium)	Designation	Composition/purity
Helium He (gaseous, compressed)	• 4.6 (minimum quality) • 5.0, etc. **not balloon gas!**	• 99.996 volume % (4.6) He • 99.999 volume % (5.0) He
Forming gas	• Forming gas 5	• 95% nitrogen N_2 and 5% hydrogen H_2

WM 200101 CHECKING FUEL SYSTEM (HIGH-PRESSURE SIDE) FOR LEAKS (EXCEPT MACAN) > CHECKING FUEL SYSTEM FOR LEAKS

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapours.

→ Attach warning sign in a clearly visible position.

WARNING: Leaking fuel supply lines

- *Emerging fuel*
- *Risk of fire*

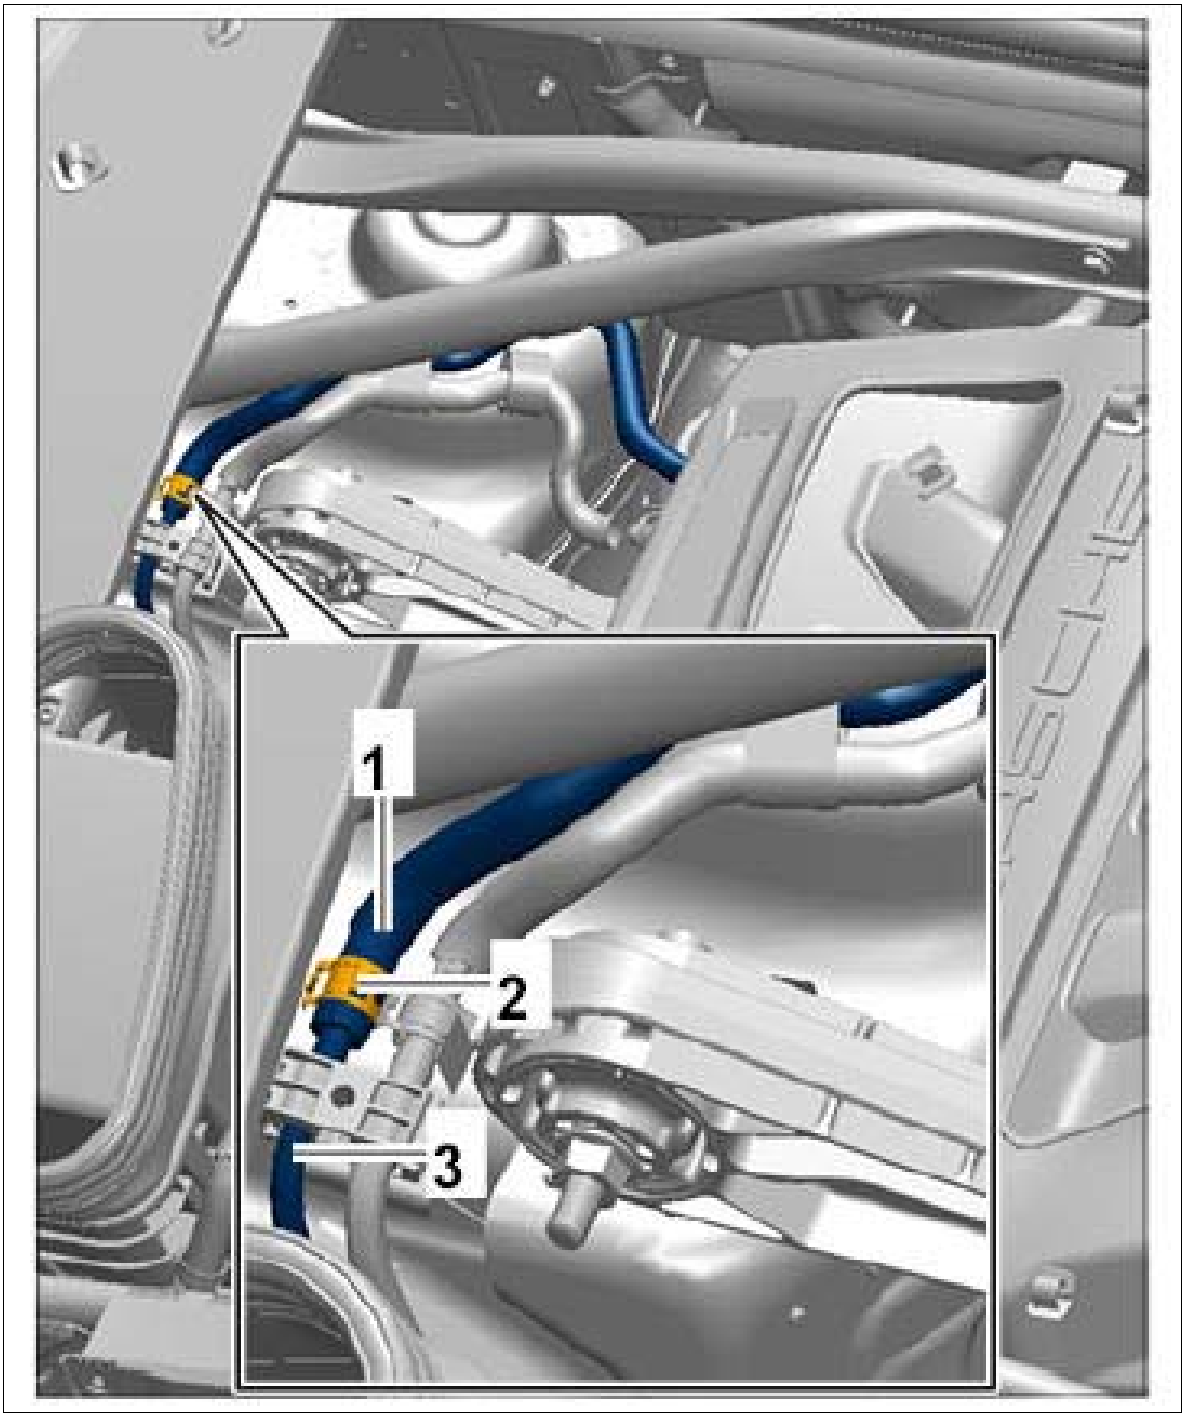
→ Perform leak test.

1. Loosen hose clamp **-2-** and remove fuel supply line **-1-** from the fuel pipe **-3-** . Absorb escaping fuel.

   Connection point for fuel supply line **-1-** is located close to the torque support.

   Fuel supply line **-1-** must not be damaged, otherwise fuel supply line **-1-** must be replaced.

Fig 1: Identifying Low-Pressure Fuel Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. Check that the tool fittings are clean before starting the leak test.
2. Blow out the tool fittings before assembly using gentle bursts of pressure to prevent dust and foreign bodies from getting into the high-pressure system during the leak test.
3. Ensure that the tools for the leak test remain clean and free of dirt when stored.

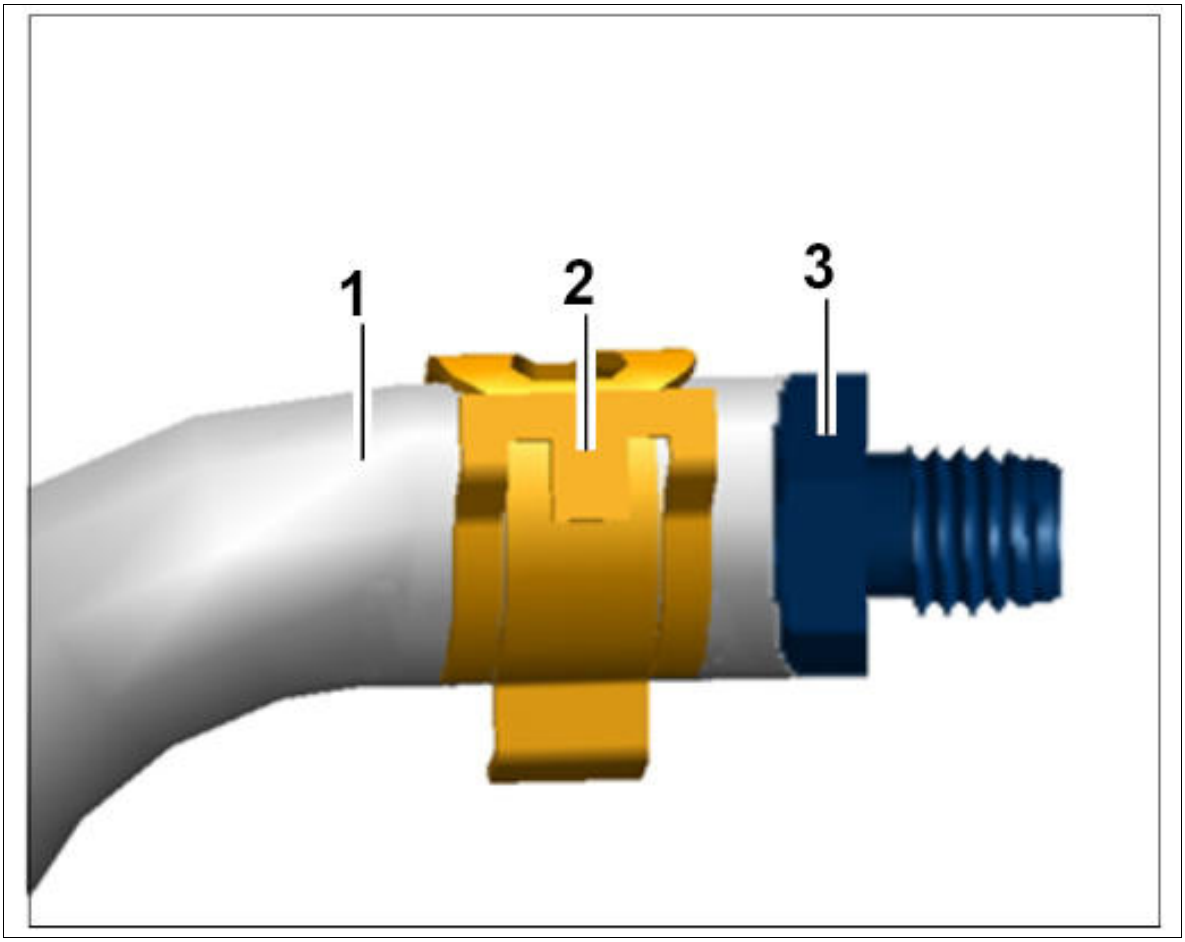
2. Fit adapter → Adapter VAG 1318/11 **to the fuel supply line -1-** . Tighten hose clamp **-2-** .

The fuel supply line **-1-** must not be damaged, otherwise the fuel supply line must be replaced.

Fig 2: Identifying Adapter VAG 1318/11

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 3: Identifying Fuel Supply Line Adapter VAG 1318/11



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

NOTE: Test pressure is exceeded

1. Risk of damage to high-pressure pump

→ The test gas test pressure must be set to less than → **Pressure: 10 bar** on the pressure reducer on the test gas bottle.

WARNING: Working with compressed air

1. Risk of eye injuries

2. Risk of damaging and dirtying components

→ Wear protective goggles with side eye protection.

→ Protect the point at which the compressed air emerges with suitable material.

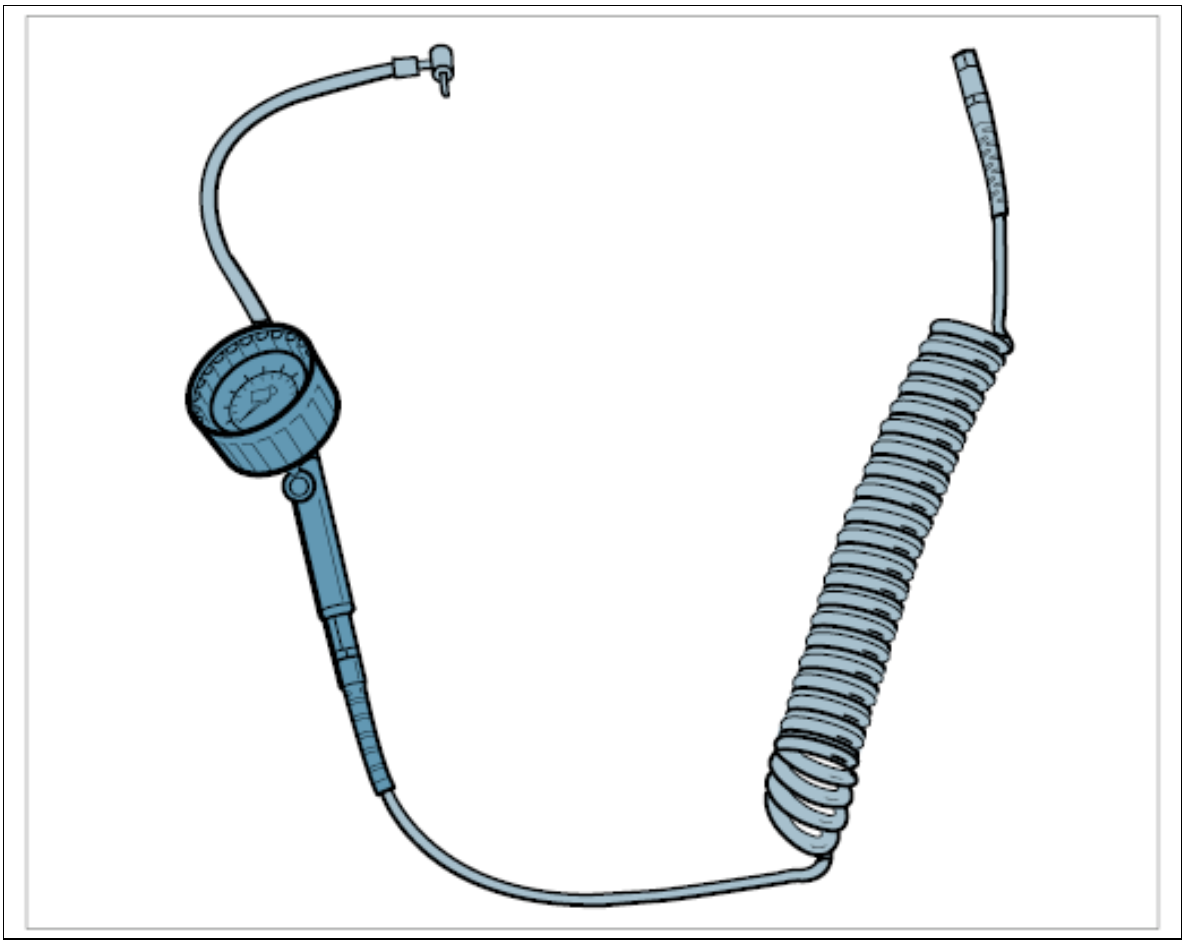
→ Place the point at which the compressed air emerges on suitable surfaces.

Information

The use of unapproved test gases results in incorrect test results. Only approved test gases guarantee comparability with fuel high-pressure systems at pressures of up to **10 bar** .

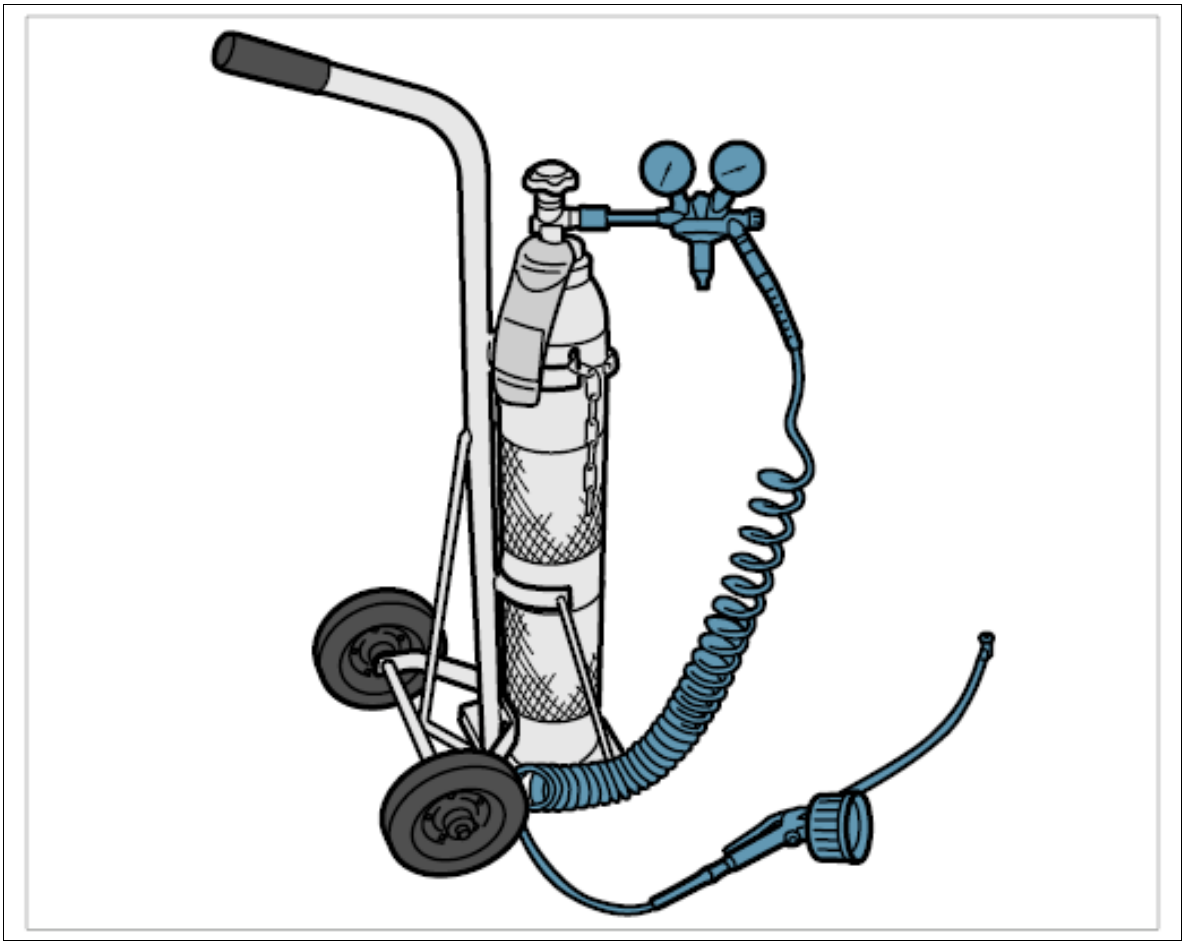
3. Fit test gas bottle with pressure reducer and **air-spring strut filling unit VAS 6231 WE 1282** securely so that no gas can escape → Test equipment setup . Set pressure reducer to max. 10 bar pressure → Adjusting pressure reducer to between 7 and 9 bar of test gas pressure .

Fig 4: Identifying Air-Spring Strut Filling Unit VAS 6231



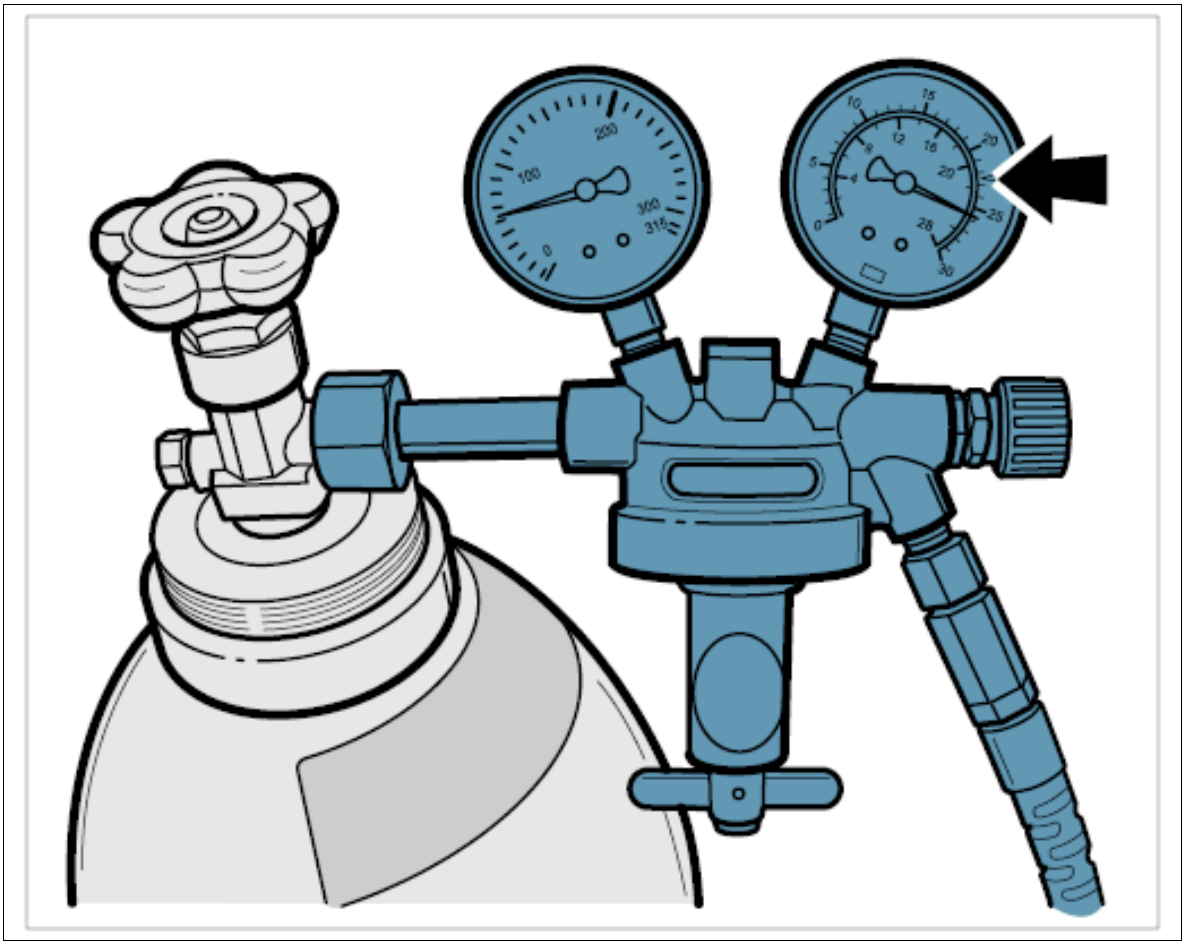
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 5: Identifying Test Equipment Setup



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

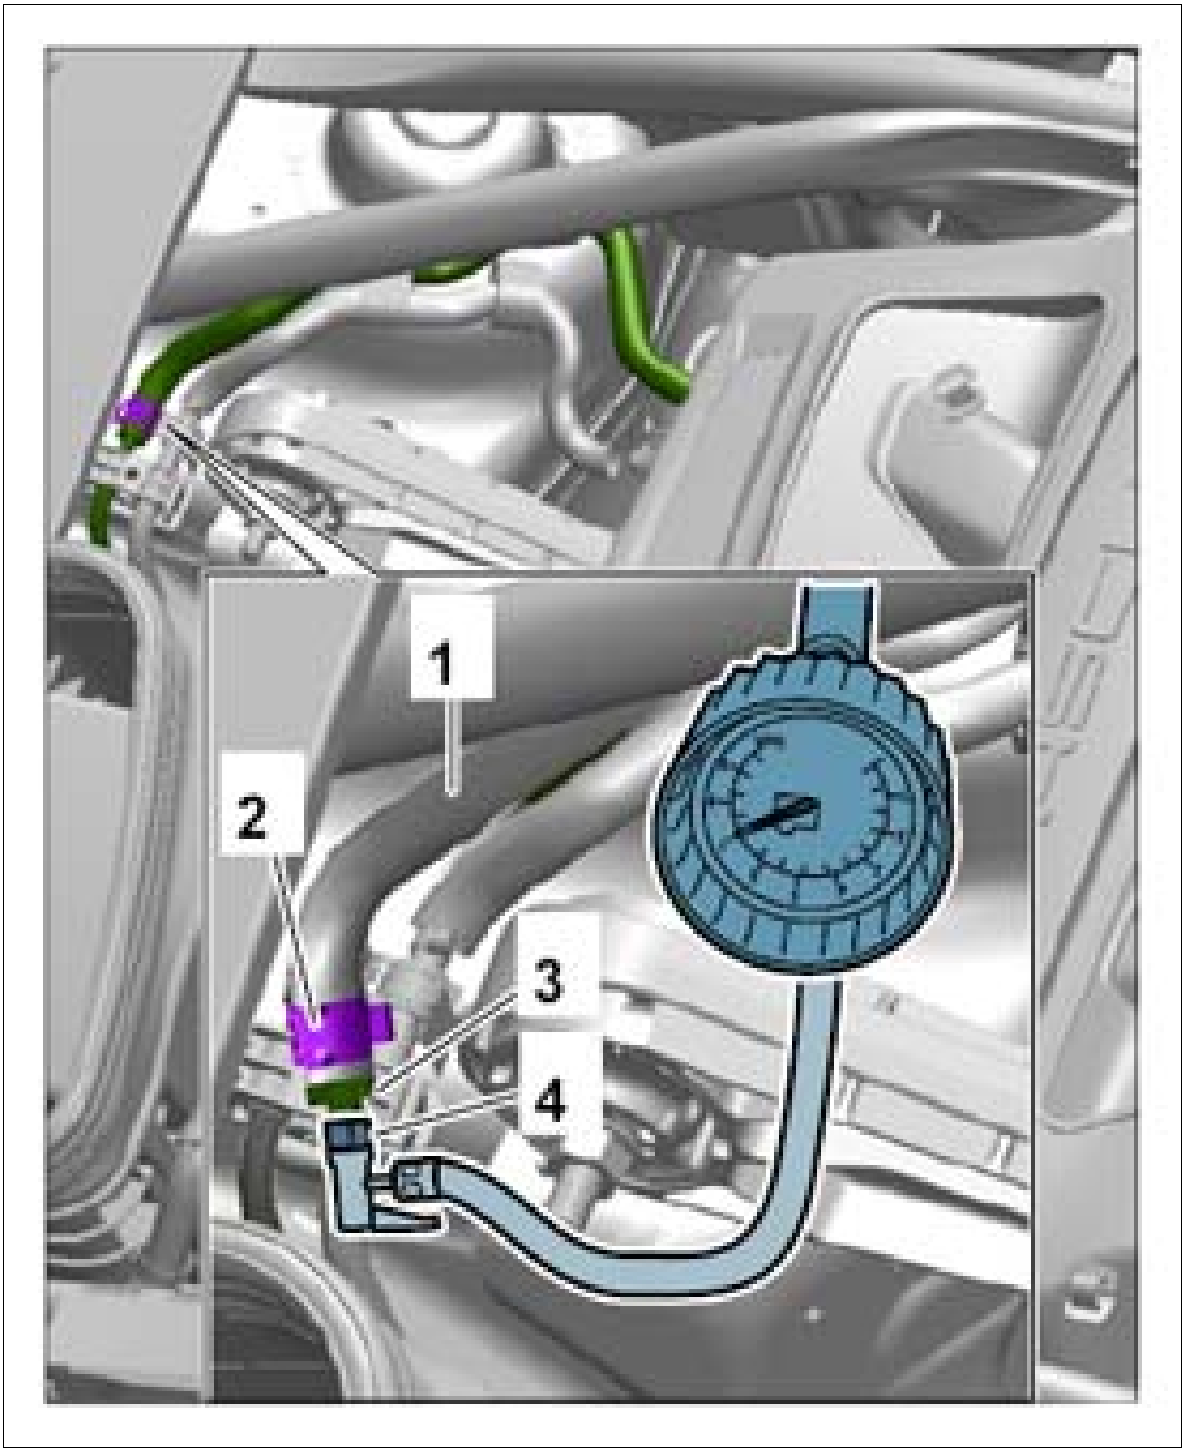
Fig 6: Adjusting Pressure Reducer Tool



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. **Air-spring strut filling unit VAS 6231 WE 1282** must then be connected to the **adapter 9759** (→ Connecting test equipment). Tighten the connection **-4-** if necessary.

Fig 7: Connecting Test Equipment



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

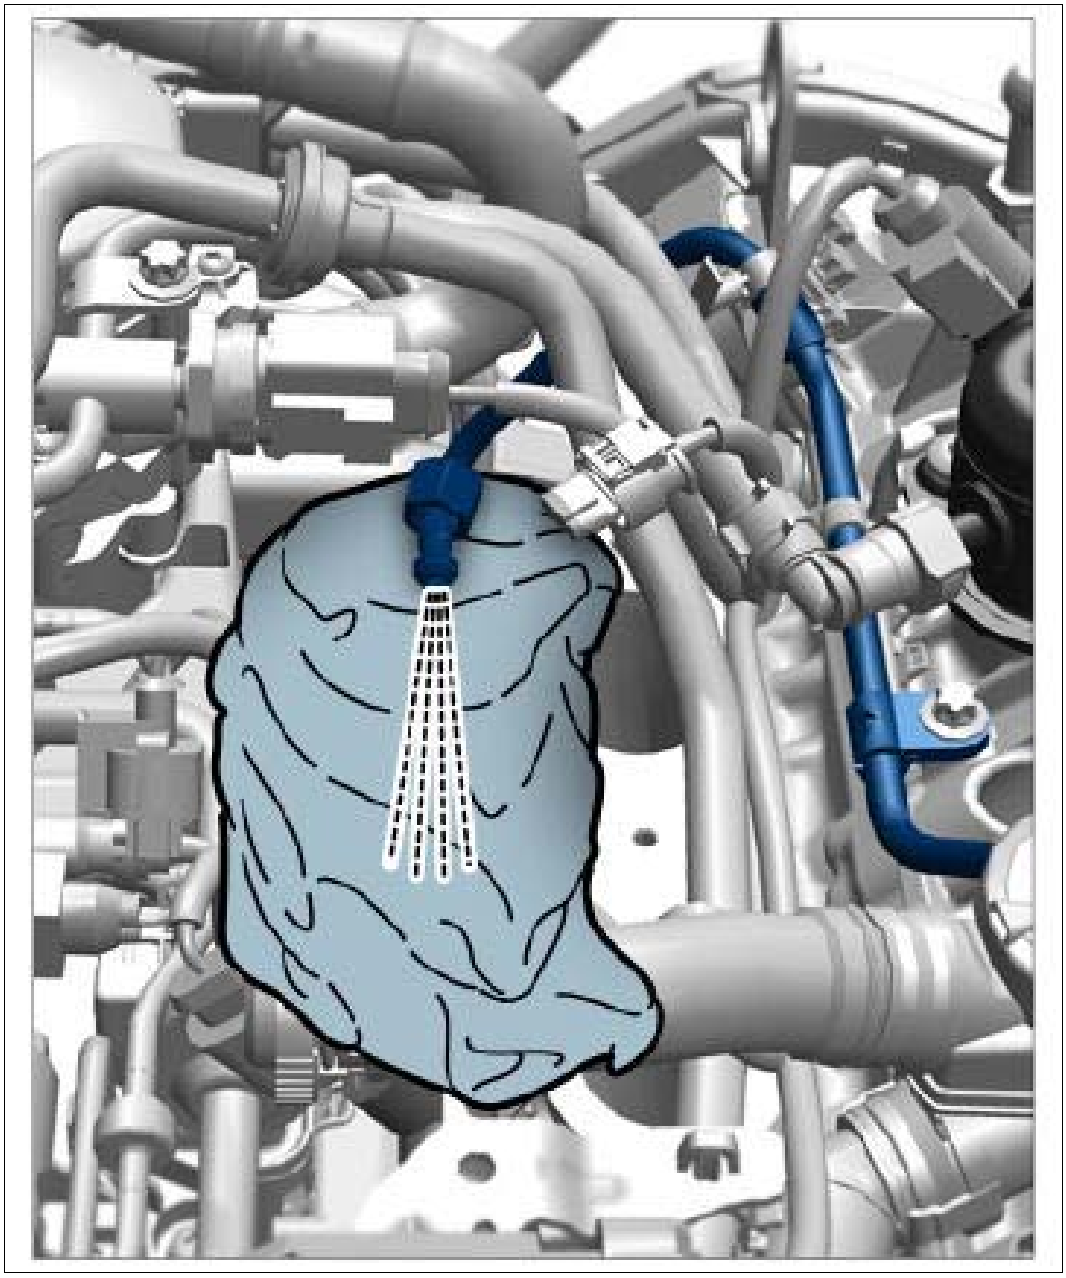
5. Depending on the high-pressure connections that were loosened (removed fuel distributor pipe or removed high-pressure pump), complete the following steps =>

   If the fuel distributor pipe (high-pressure rail) was removed =>

6. Before screwing the fuel distributor pipe (high-pressure rail) to the engine, quickly blow out residual fuel from the high-pressure pump and high-pressure line (intake) to the high-pressure rail.

1. 6.1. Apply a quick burst of pressure using the filling unit and blow residual fuel out of the high-pressure pump and high-pressure line. Absorb escaping fuel. → Blowing out high-pressure line

   Fig 8: Identifying High-Pressure Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 6.2. Drain residual fuel from the high-pressure distributor pipe before fitting it. Absorb escaping fuel.

7. Fit high-pressure distributor pipe (high-pressure rail) and tighten it to the correct tightening torques. → Installing fuel collection pipe

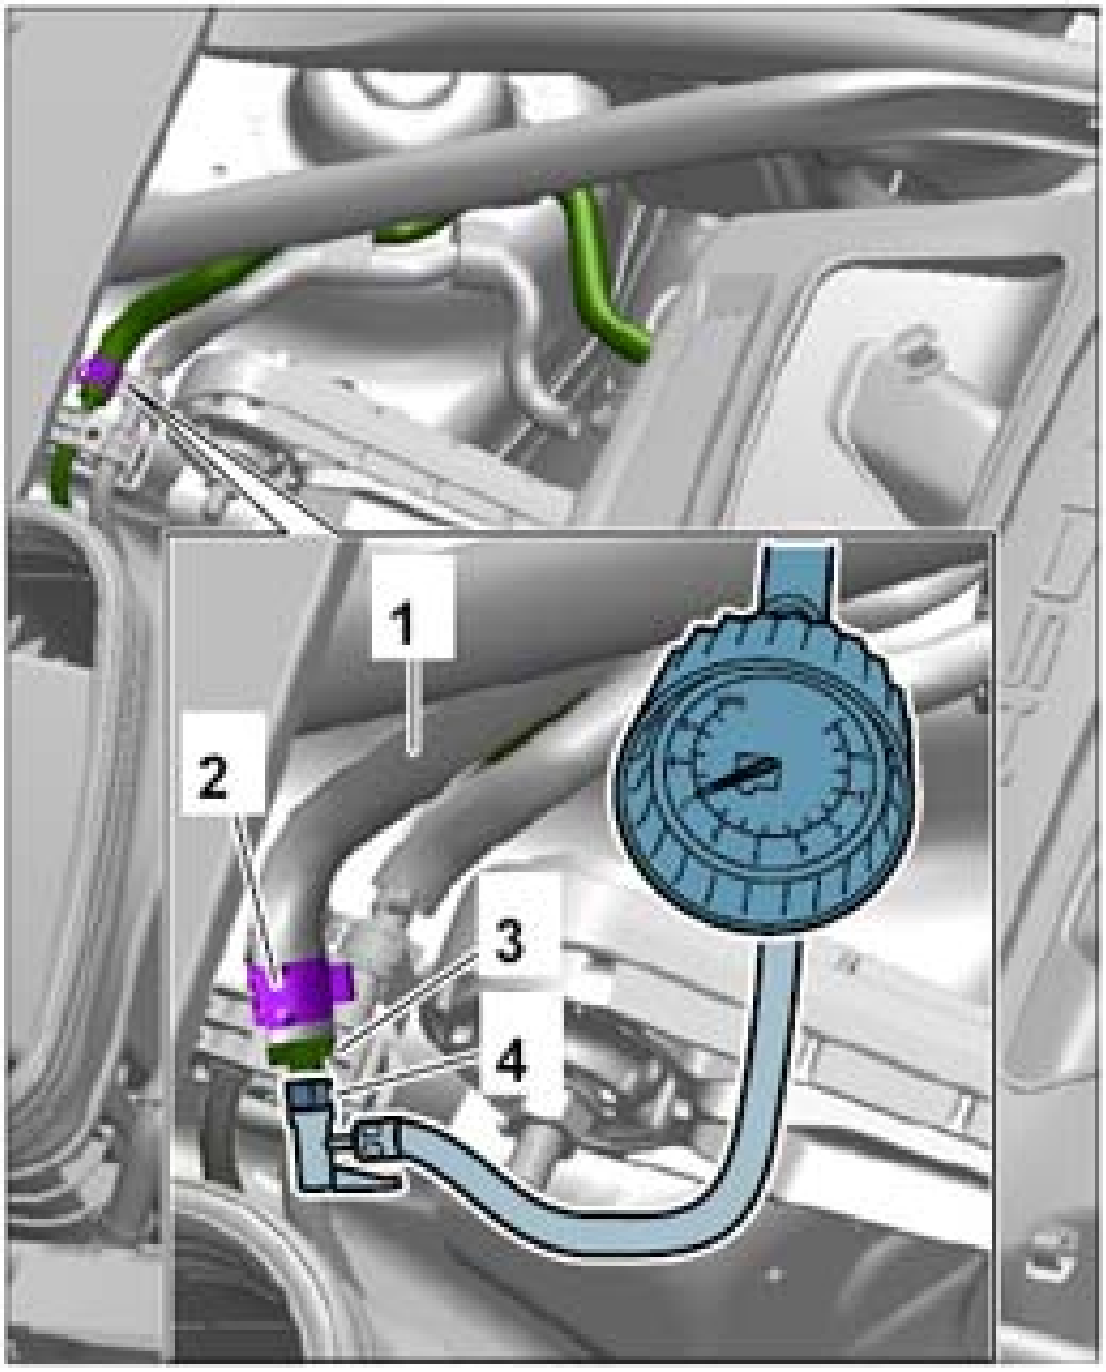
NOTE: Test pressure is exceeded

1. Risk of damage to high-pressure pump

→ The test gas test pressure must be set to less than → **Pressure: 10 bar** on the pressure reducer on the test gas bottle.

8. Use **air-spring strut filling device VAS 6231 WE 1282** to apply test gas pressure of between 7 and just under 10 bar to the completely fitted high-pressure system. The pressure is distributed slowly in the system and can increase slightly on the pressure gauge → Building up pressure . If there is a constant drop in pressure, there is a leak in the system.

Fig 9: Testing Gas Pressure Using Tool

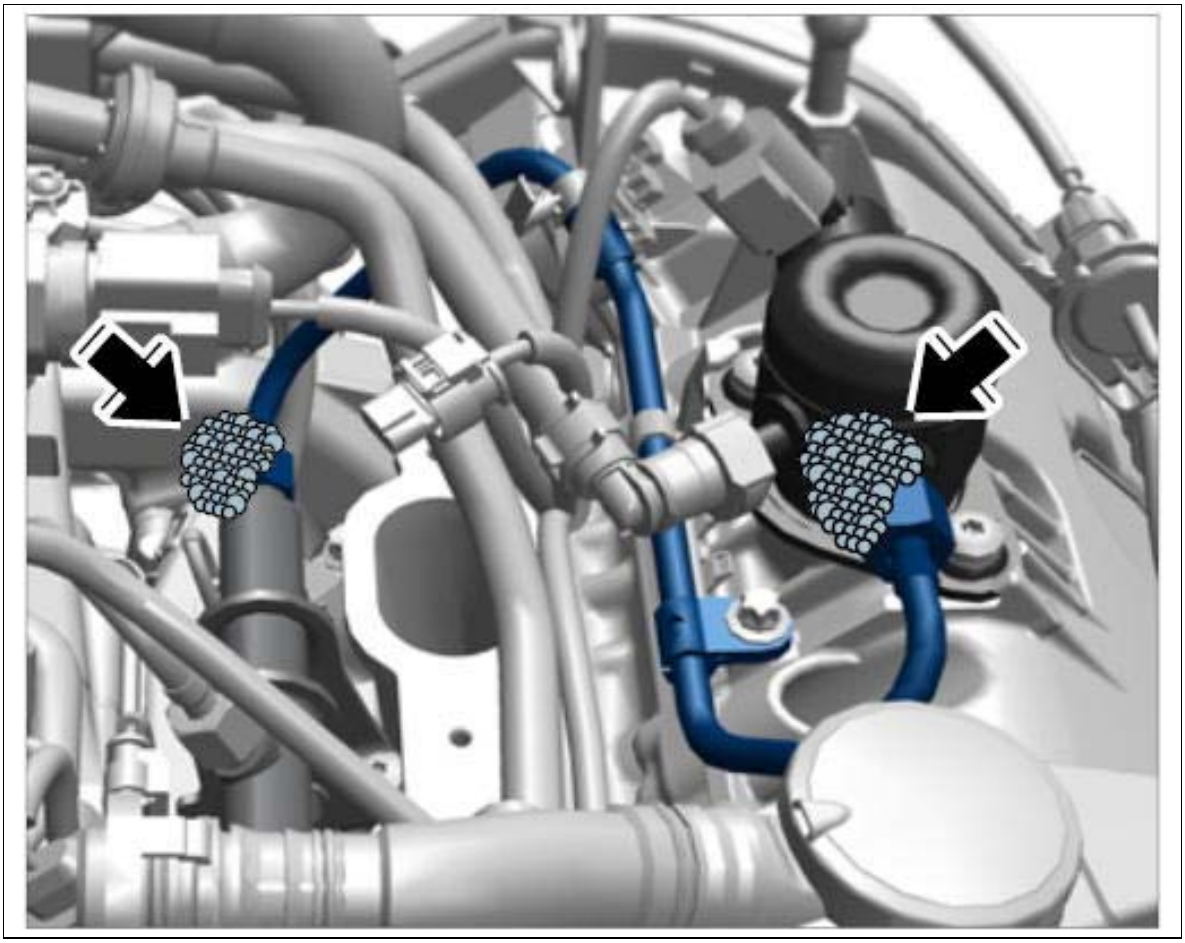


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Spray all connection points in the high-pressure system with commercially available leak-locating spray. If the pressure drops even though the threaded joints are perfectly sealed, also spray the soldered joints and connecting pipes as well as the high-pressure pump and test equipment with leak-locating spray.

10. If there is a leak, **gently sashaying, moving and growing** air bubbles → Leaks will emerge. These could be caused by a damaged seal, loose connections or incorrectly fitted union nuts, for example. The cause must be determined and corrected.

    Fig 10: Locating Pressure Line Leaks



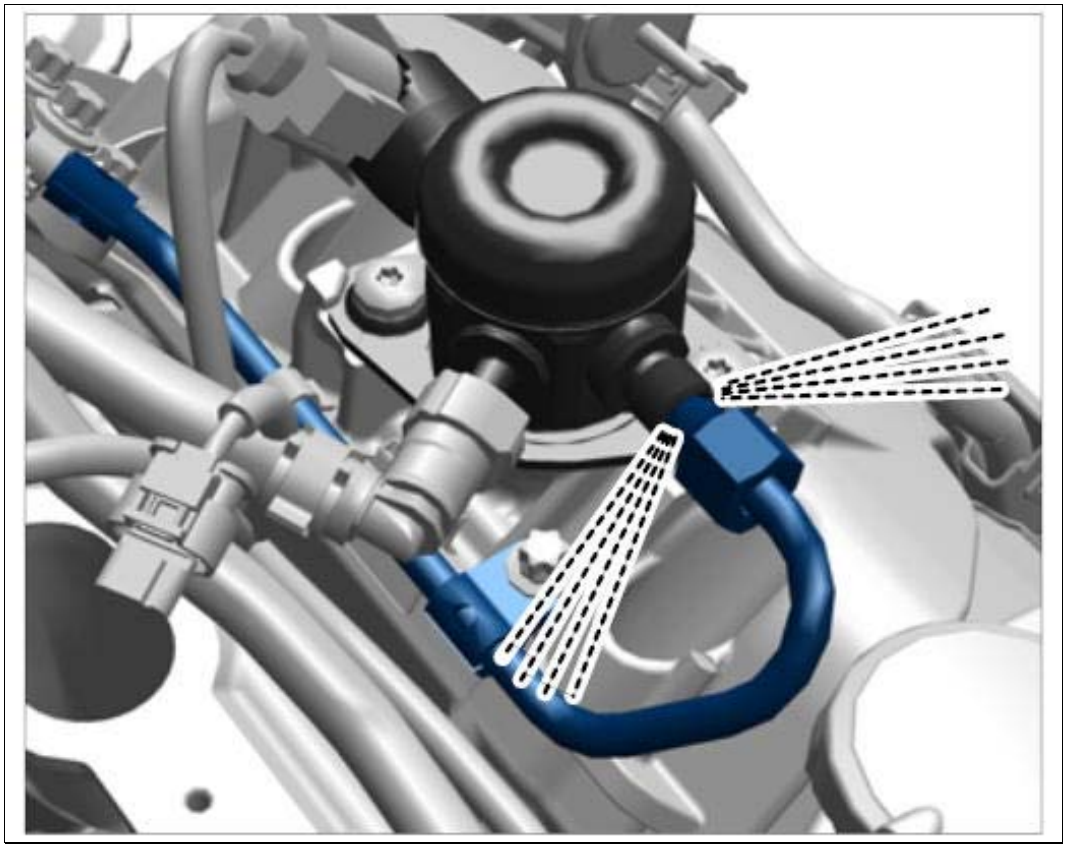
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

If the high-pressure pump was removed =>

11. Before screwing the high-pressure line (intake) to the high-pressure pump, residual fuel must be blown out of the high-pressure pump.

    1. 11.1. Apply a quick burst of pressure using the filling unit and blow any fuel out of the high-pressure pump → Blowing out high-pressure pump . Absorb escaping fuel. → Blowing out high-pressure pump

Fig 11: Applying Pressure Using Filling Unit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

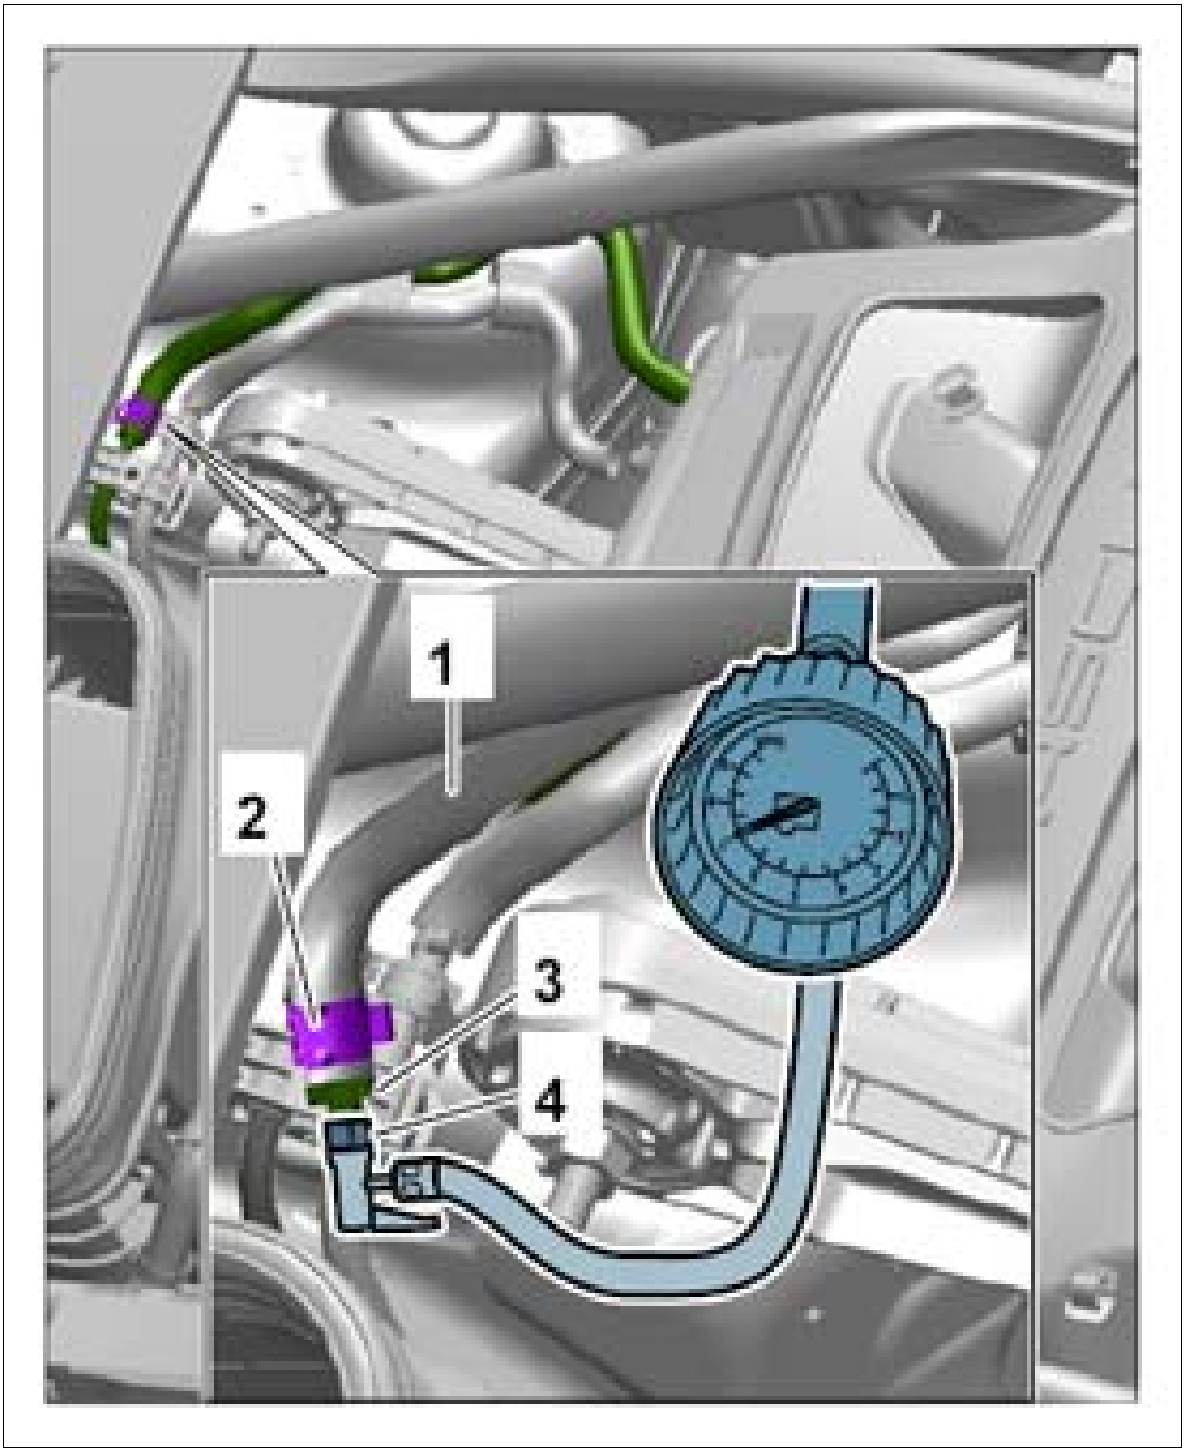
12. Screw high-pressure line correctly to the high-pressure pump. → Installing high-pressure pump

> *NOTE: Test pressure is exceeded*
>
> *1. Risk of damage to high-pressure pump*

→ The test gas test pressure must be set to less than → **Pressure: 10 bar** on the pressure reducer on the test gas bottle.

13. Use **air-spring strut filling device VAS 6231 WE 1282** to apply test gas pressure of between 7 and just under 10 bar to the fitted high-pressure pump. The pressure is distributed slowly in the system and can increase slightly on the pressure gauge → Building up pressure . If there is a constant drop in pressure, there is a leak in the system.

Fig 12: Applying Pressure



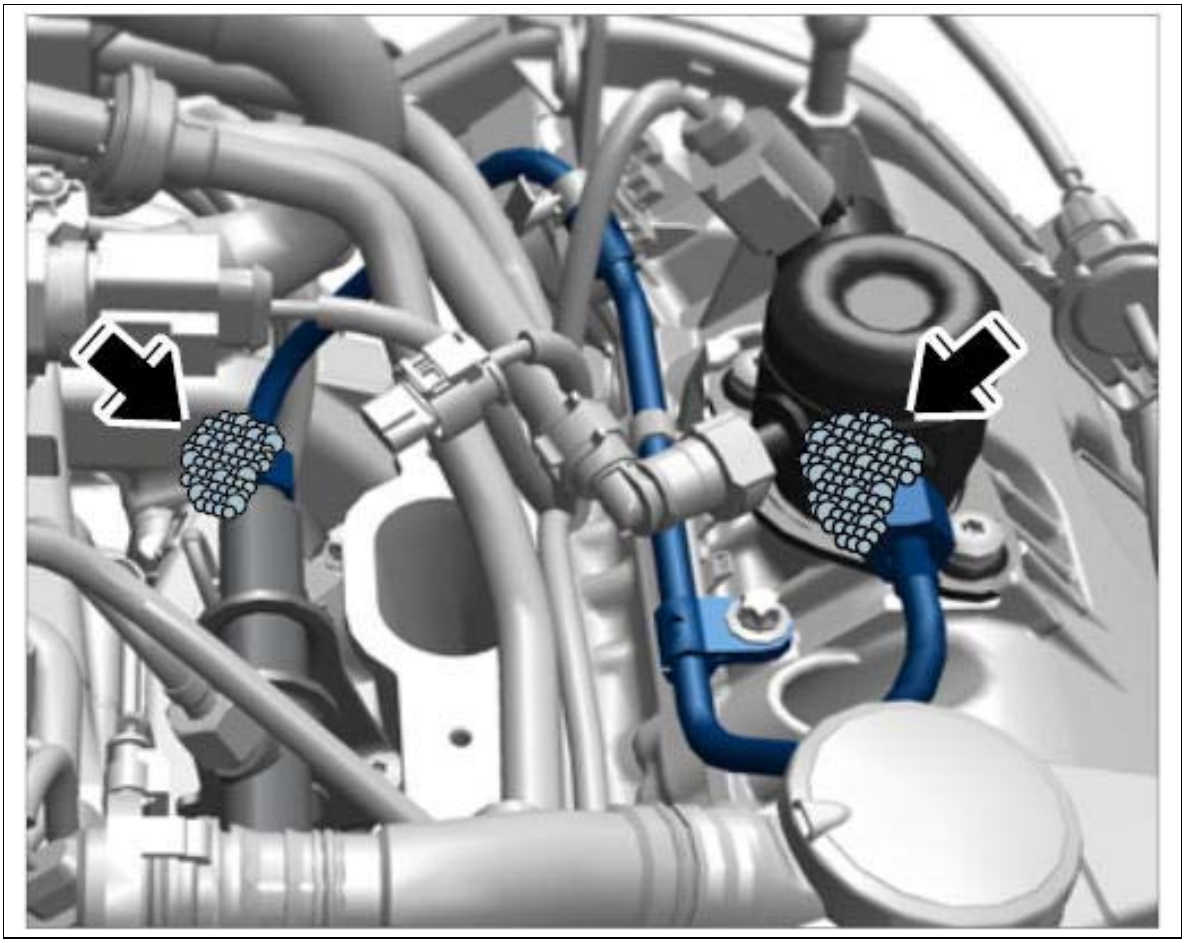
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Spray all connection points for the high-pressure pump with commercially available leak-locating spray. If the pressure drops even though the threaded joints are perfectly sealed, also spray other connection points as well as the high-pressure pump and test equipment with leak-locating spray.

15. If there is a leak, **gently sashaying, moving and growing** air bubbles will emerge (union nut on injector is shown) → Leaks . These could be caused by a damaged seal, loose connections or incorrectly fitted union nuts, for example. The cause must be determined and

corrected.

Fig 13: Locating Pressure Line Leaks



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 200101 CHECKING FUEL SYSTEM (HIGH-PRESSURE SIDE) FOR LEAKS (EXCEPT MACAN) > SUBSEQUENT WORK

1. Remove tool setup.
2. Fit the fuel line. To do this, fit the fuel supply line (low pressure) at the marking correctly. Counter while fitting. → **Tightening torque: 35 Nm (26 ftlb.)**
3. Fit engine cover. For details, see → Installing front trim panel
4. Fit the fuse or connect the battery.
5. Bleed the fuel high-pressure system. → REMOVING FUEL COLLECTION PIPE

WM 200201 CHECKING FUEL PRESSURE (EXCEPT MACAN) > TOOLS

Designation	Type	Number	Descriptions	

K-Jetronic Tester	Service equipment	WE 1291	Graphic not available
PIWIS Tester II	Special tool	9818	Connecting lines	Special tool	P378c	
WM 200201 CHECKING FUEL PRESSURE (EXCEPT MACAN) > CHECKING FUEL PRESSURE (LOW PRESSURE) USING THE PIWIS TESTER (QUICK TEST)

Information

- Faults in the fuel high-pressure injection system can also be caused by defects in the pre-delivery system (fuel low pressure)
- In the event of problems in the fuel high-pressure injection system, the pre-delivery system should be checked first

Information

A leak in the fuel high-pressure pump supplying the engine (mechanical drive) dilutes the oil. Check the engine oil and initiate appropriate remedial action if necessary.

Information

The fuel delivery pressure (low pressure) cannot be measured during a test drive. When you drive the vehicle, only the measured value **Fuel high pressure actual value** can be read out with the PIWIS Tester in the DME control unit via the high-pressure sensor. There is no "low pressure" actual value

Information

The fuel system contains a fuel pump, which is controlled according to demand by a control unit, and one

or two supply-driven sucking jet pumps, depending on model.

Information

If you suspect that a pump in the fuel tank is defective (particularly if symptoms include a very low fuel level), always check the sucking jet pumps for dirt or blockages.

Information

- Checking the low-pressure area with the high-pressure sensor cannot be used as the sole reference.
- The high-pressure sensor has a certain percent inaccuracy in the low-pressure area.
- It is best to check the low-pressure area using both test methods (Tester and pressure gauge).

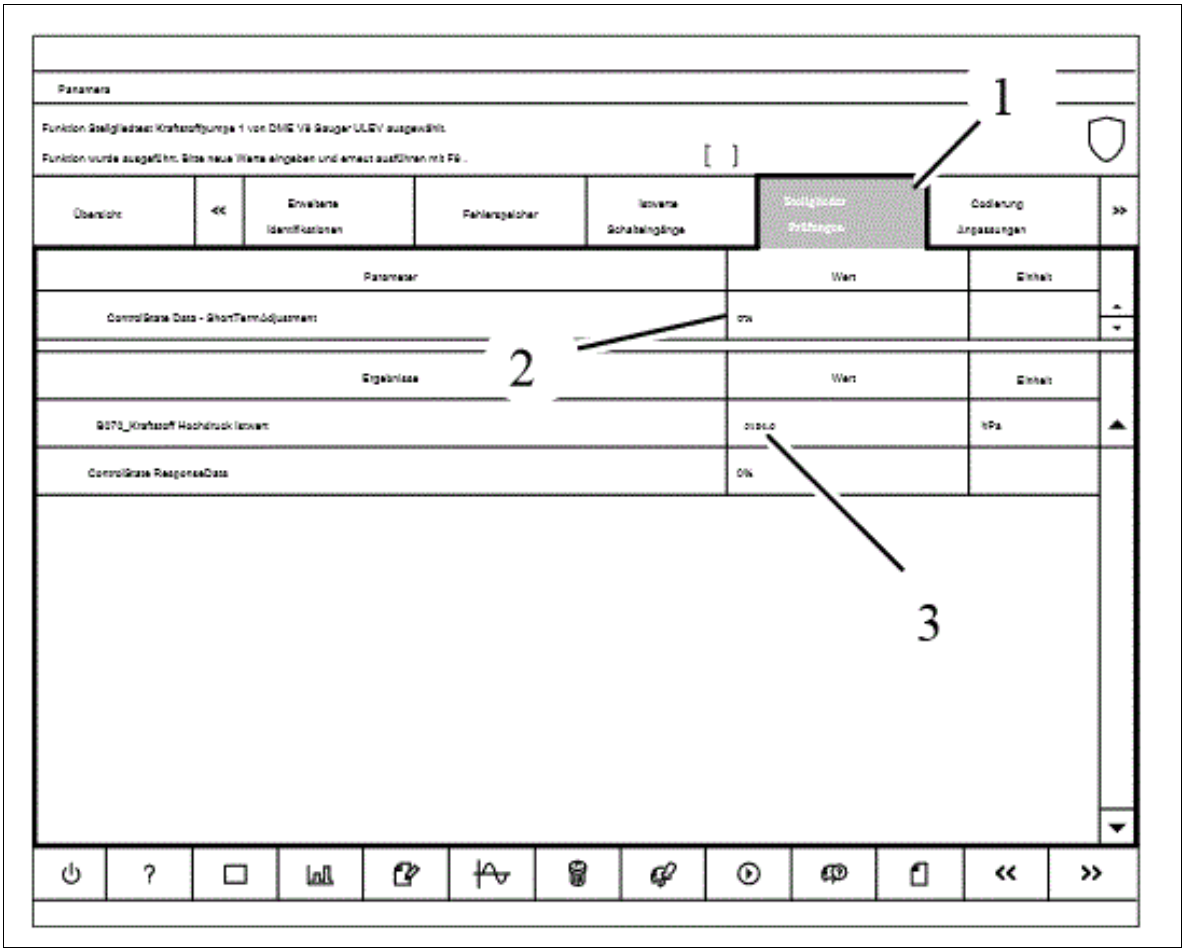
General information on converting pressure =>

- 10000 hPa = 10 bar = 10000 mbar
- 1000 kPa = 10 bar = 10000 mbar
- 1 MPa = 10 bar = 10, 000 mbar

1. Connect the Tester and get it ready. **PIWIS Tester II 9818**
    1. 1.1. Connect a charger to the vehicle battery. The voltage should be approx. 12.5 V (no rapid charging allowed because the voltage is too high!).
    2. 1.2. The fuel pump can be activated and deactivated as follows:
    3. 1.3. **DME** => **Drive link test/checks** => **Drive links** => **Fuel pump 1**
    4. 1.4. 100% is displayed. The fuel pump starts to deliver fuel when you press **Start** .
    5. 1.5. The fuel pump stops when the percentage value changes to 0%. Press **Start** again.
2. Call up the test value **B070 Fuel high pressure actual value** .
    1. 2.1. **DME** => **Actual values/input signals** => **B070 Fuel high-pressure actual value**

Fuel pressure is approx. 5500.0 hPa to 5800.0 hPa when the pump is running.

Fig 1: View Of Both Values One Under The Other On The PIWIS Tester (German illustration)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Drive links/tests
2. Fuel pump status (0% when pump is off - 100% when pump is running). Always confirm by pressing **Start** .
3. Fuel pressure in hPa (figure shows holding pressure shortly after switching pump off).

Information

The fuel holding pressure must only drop by max. 1 bar (1000 mbar) in one hour.

1. **Step 2: Check the fuel system for leaks =>**
    1. 1.1 Read out the **fuel high pressure actual value** in the DME control unit using the PIWIS Tester.
        1. Nominal pressure is approx. 5000 to 5500.0 hPa. Monitor the fuel pressure for about 5 to 10 minutes.
        2. The pressure is **not** maintained. In other words: the **fuel high-pressure actual value** has dropped considerably. There is an internal or external leak in the fuel system.
        3. The pressure is maintained. In other words: the **fuel high-pressure**

actual value has only dropped slightly.

WM 200201 CHECKING FUEL PRESSURE (EXCEPT MACAN) > TOOLS AND MATERIALS > TEST TOOL SETUP

Example; other variants are possible.

Fig 1: Tool setup for pressure test

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Pressure gauge test equipment **K-Jetronic Tester WE 1291**
2. Adapter VAG 1318/12
3. Connecting line **Connecting lines P378c**
4. Adapter VAG 1318/11

5. Connecting line **Connecting lines P378c**
6. Adapter VAG 1318/17
7. Connecting line with 8-mm double socket
8. Connecting line with connector 7.89

WM 200201 CHECKING FUEL PRESSURE (EXCEPT MACAN) > CHECKING FUEL PRESSURE (LOW-PRESSURE) USING THE PRESSURE GAUGE > CHECKING FUEL PRESSURE USING THE PRESSURE GAUGE

WARNING: ***Toxic substances***

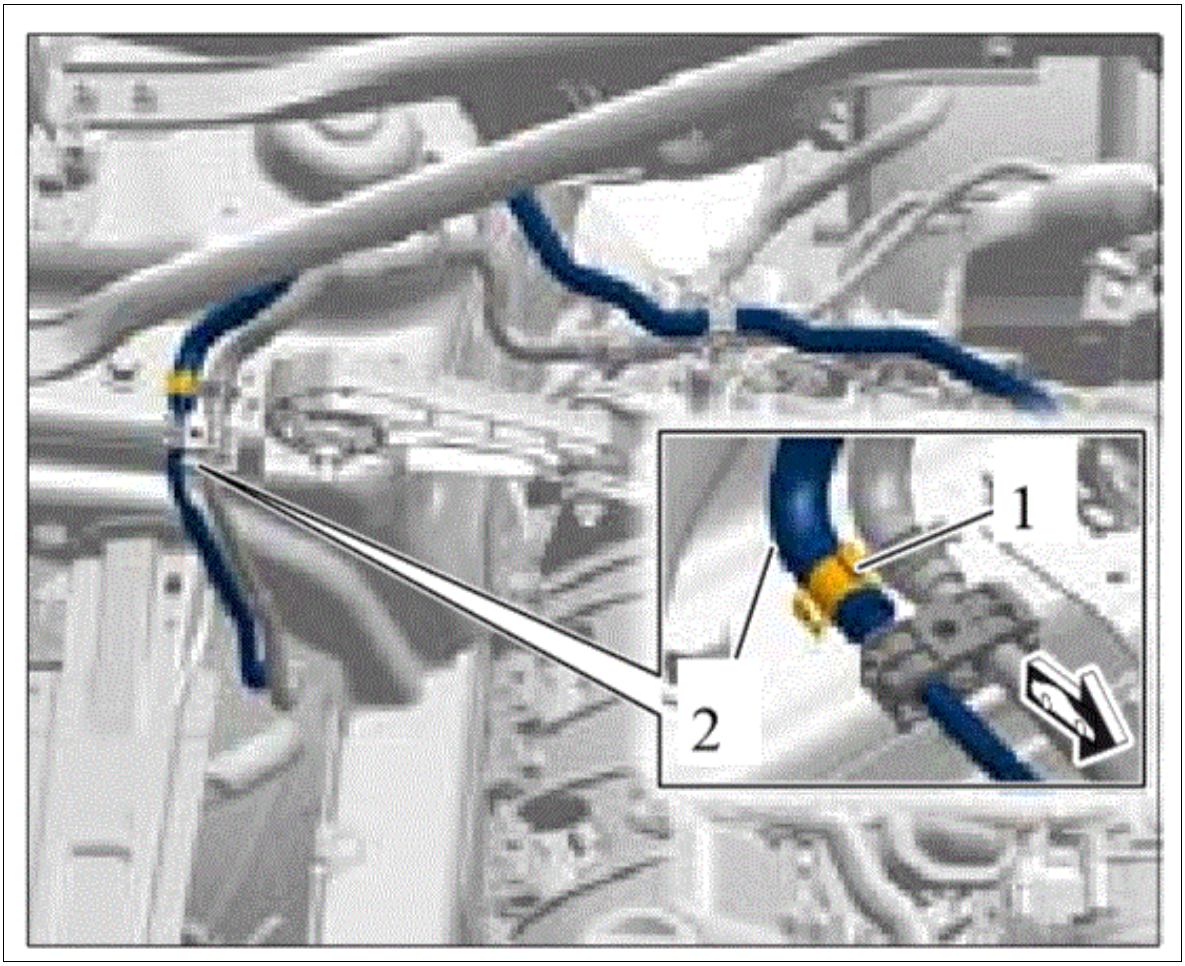
- **Danger of poisoning or suffocation**
- **Danger of burns to the eyes and skin**
  - Ventilate the work area well.
  - Never ingest or inhale.
  - Read specific information on the Hazard Sheet.
  - Do not smoke, eat or drink in the work area.

WARNING: ***Highly inflammable or explosive materials***

- ***Danger of fire or explosion***
  - *Avoid contact with hot parts or sources of ignition.*
  - *Use suction to remove ignitable vapours.*
  - *Attach warning sign in a clearly visible position.*

1. Remove engine compartment trim panel at the front right. → REMOVING FRONT TRIM PANEL
2. Disconnect fuel low-pressure line **-2-** at the front left of the wheel housing.
    1. 2.1 Loosen clamp **-1-** and pull off line **-2-** .
    2. 2.2 Collect escaping fuel.

Fig 1: Fuel Supply Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

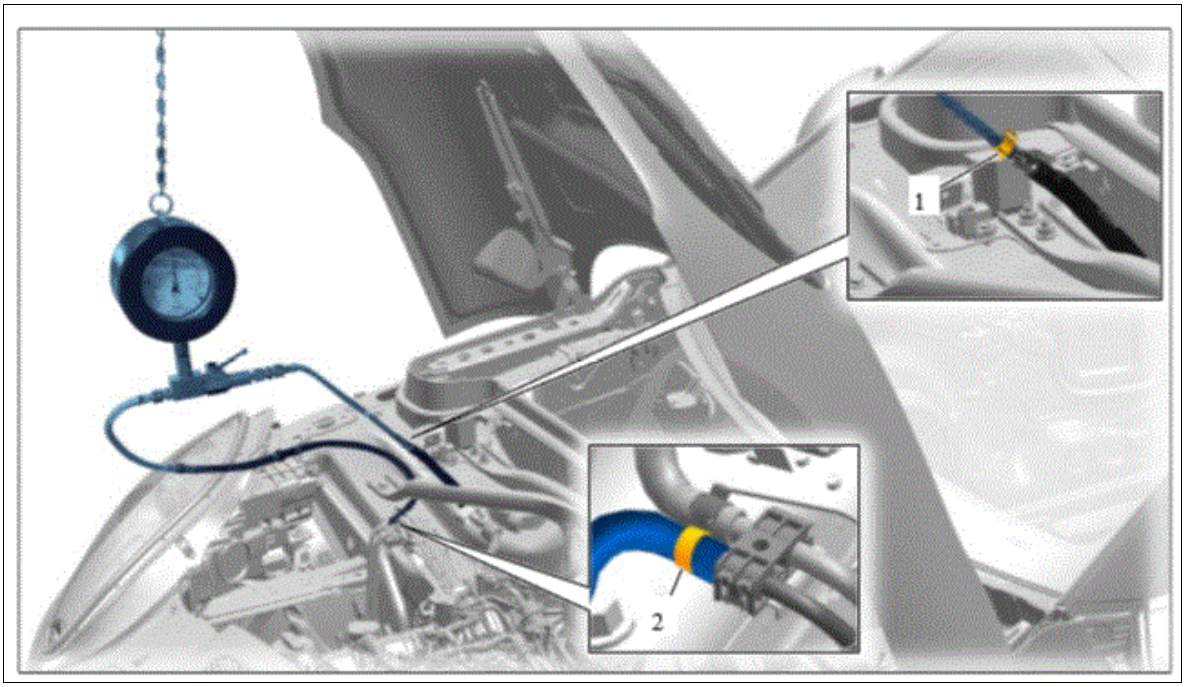
3. **Check fuel supply pressure (low-pressure) =>**

    1. 3.1 Connect test equipment and secure connections with a clamp -1- or screw-type clamp **-2-** .

    2. 3.2 The tool setup must be fitted with sealing rings (copper, aluminium, or plastic, etc.) between the individual components. The setup must be fully sealed.

    3. 3.3. Start the engine and leave it running at idle speed. Read off the fuel pressure on the pressure gauge. The pressure gauge pointer can oscillate slightly at idle speed. With increased idle speed (accelerator pressed slightly), the pointer deflection calms down. The fuel low-pressure system operates at a **fuel pressure of 5.5 to 5.8 bar** . The pointer oscillates at around this value. Measurements under load can even generate values of below 5 bar (4.5 bar) briefly. This is not a sign of a defect.

Fig 2: Connection For Measuring Pressure On The Vehicle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. **Check fuel retaining pressure (low-pressure) =>**
    1. Engine cold
    2. Workshop air-conditioned to normal temperature
    3. Fluctuations may occur if the engine is warm or if the outside temperature is high
    4. Fully sealed measuring tool setup
        1. 6.1 Same tool setup and connection as for measuring the fuel delivery pressure (see above).
        2. 6.2. Allow engine to run for a few minutes. Switch off engine. Check the pressure drop. Drop in fuel pressure after "ignition is switched off" must not exceed **1 bar after 1 hour** . Make sure that the tool setup itself does not have any leaks (even the slightest leak). The fuel retaining pressure will decrease extremely rapidly and falsify the measured result with even the tiniest leak.

WM 200201 CHECKING FUEL PRESSURE (EXCEPT MACAN) > SUBSEQUENT WORK

WARNING: ***Toxic substances***

- ***Danger of poisoning or suffocation***
- ***Danger of burns to the eyes and skin***
    - *Ventilate the work area well.*

- *Never ingest or inhale.*
- *Read specific information on the Hazard Sheet.*
- *Do not smoke, eat or drink in the work area.*

WARNING:

Highly inflammable or explosive materials

- ***Danger of fire or explosion***
  - *Avoid contact with hot parts or sources of ignition.*
  - *Use suction to remove ignitable vapours.*
  - *Attach warning sign in a clearly visible position.*

1. Remove pressure gauge test equipment.
    1. 1.1 Lines are pressurised.
    2. 1.2 Collect escaping fuel.
2. Connect fuel supply line and secure with a clamp.
3. Install engine compartment trim panel at the front right. → INSTALLING FRONT TRIM PANEL

WM 200301 CHECKING FUEL QUALITY (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
Fuel identification unit	Service equipment	WE 1494		

WM 200301 CHECKING FUEL QUALITY (ALL MODELS) > TOOLS AND MATERIALS

Overview of individual components of **Fuel identification unit WE 1494**

Fig 1: Identifying Fuel Identification Unit VAS 6774

1. VAS 6774/1: Spindle (density gauge)
2. VAS 6774/2: Measuring cylinder
3. VAS 6774/3: Fuel detector (for measuring diesel)
4. VAS 6774/4: Cleaning brush
5. VAS 6774/5: Adapter with clamps for connecting a 12-volt battery
6. VAS 6774/6: Filter pads for fuel detector
7. Case

WM 200301 CHECKING FUEL QUALITY (ALL MODELS) > CHECKING FUEL QUALITY

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapours.

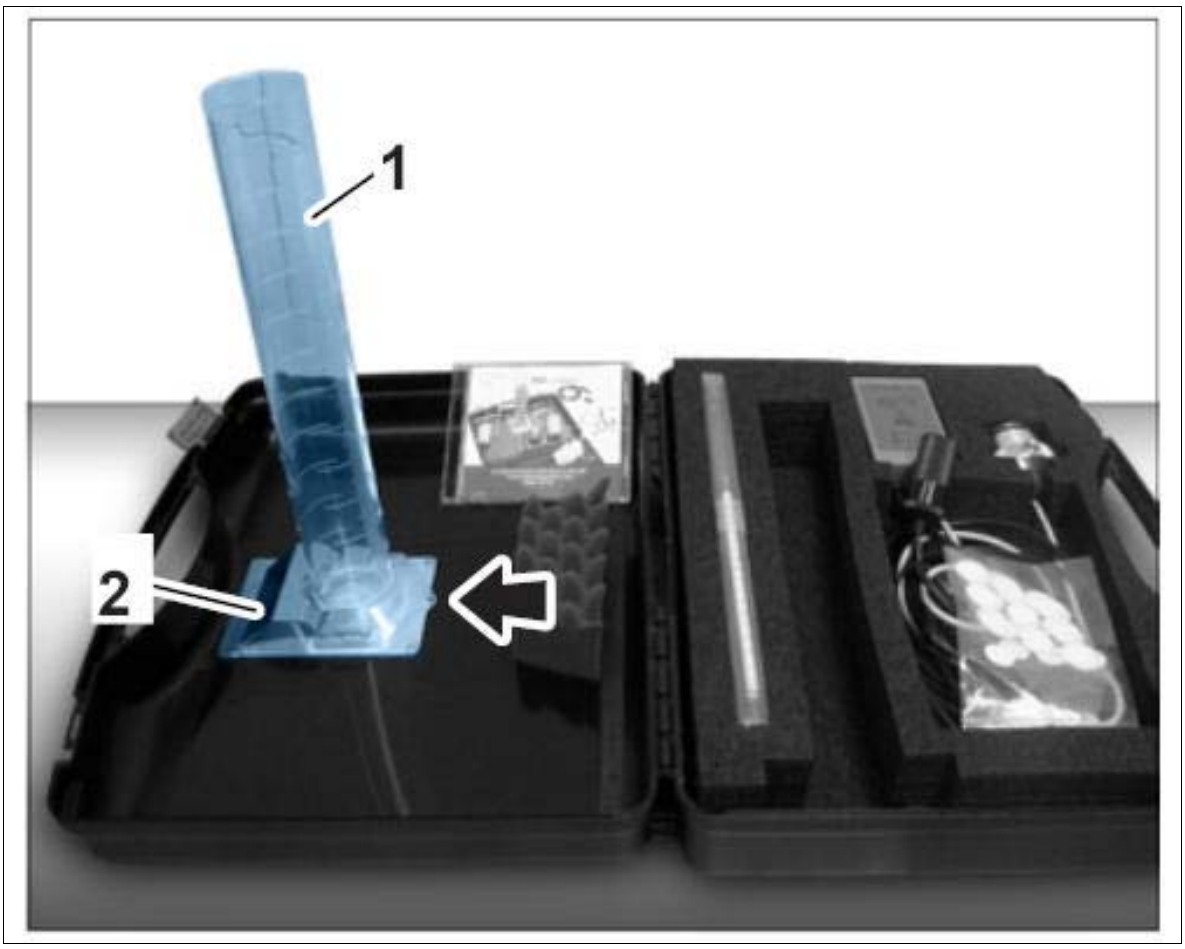
→ Attach warning sign in a clearly visible position.

Information

- Only carry out the analysis in well-ventilated rooms and at room temperature (20° Celsius).
- Before starting the analysis, have a good look at the information on the CD and read the leaflet (supplied in the case) carefully.
- This analysis can only determine a reference value; a laboratory test is required for an exact analysis.
- The analysis does not constitute a legal basis; it is the starting point for further steps.

1. Push the measuring cylinder **-1-** into the fixing clip **-2-** in the case **-arrow-** .

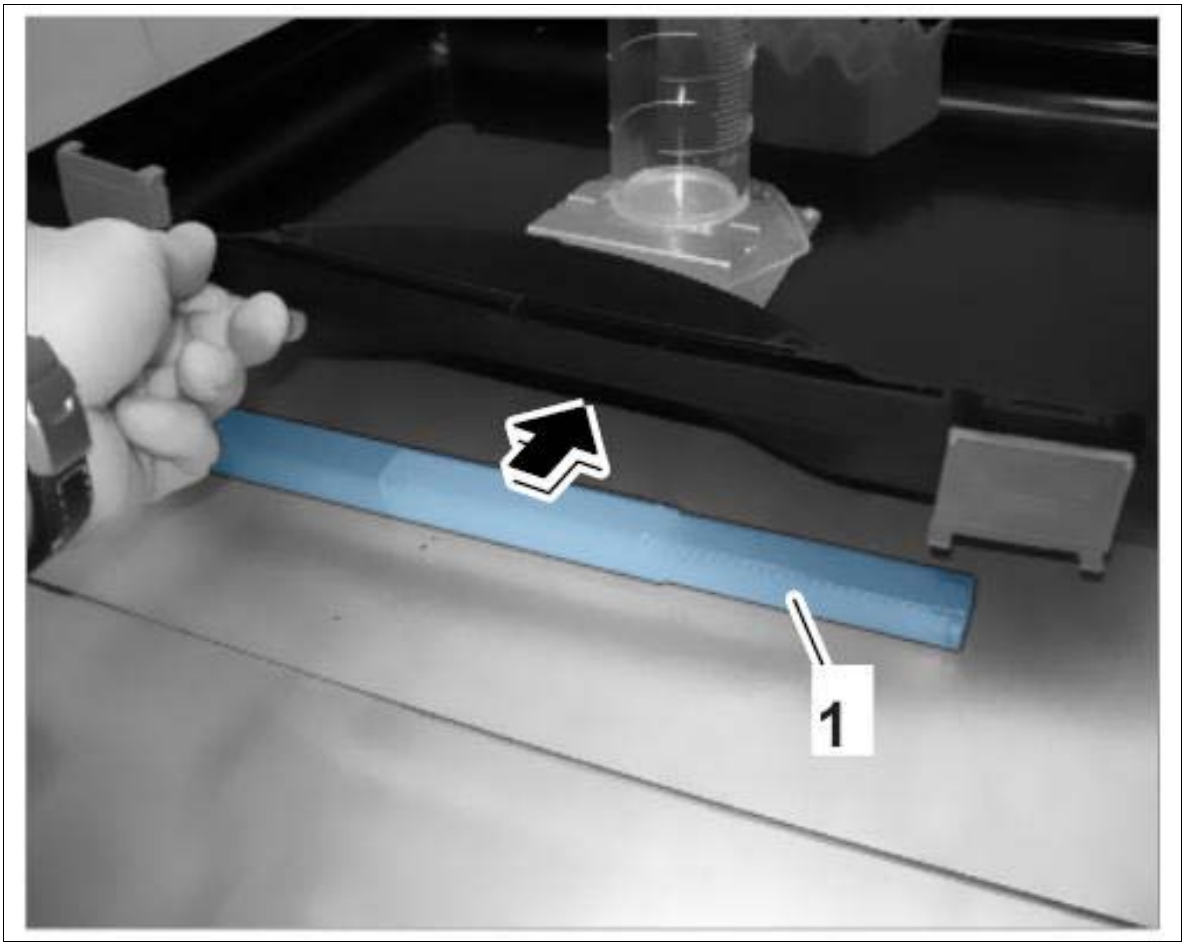
   Fig 1: Pushing Cylinder Into Fixing Clip



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Place the spindle sleeve **-1-** under the lid of the case **-arrow-** so that the measuring cylinder is horizontal.

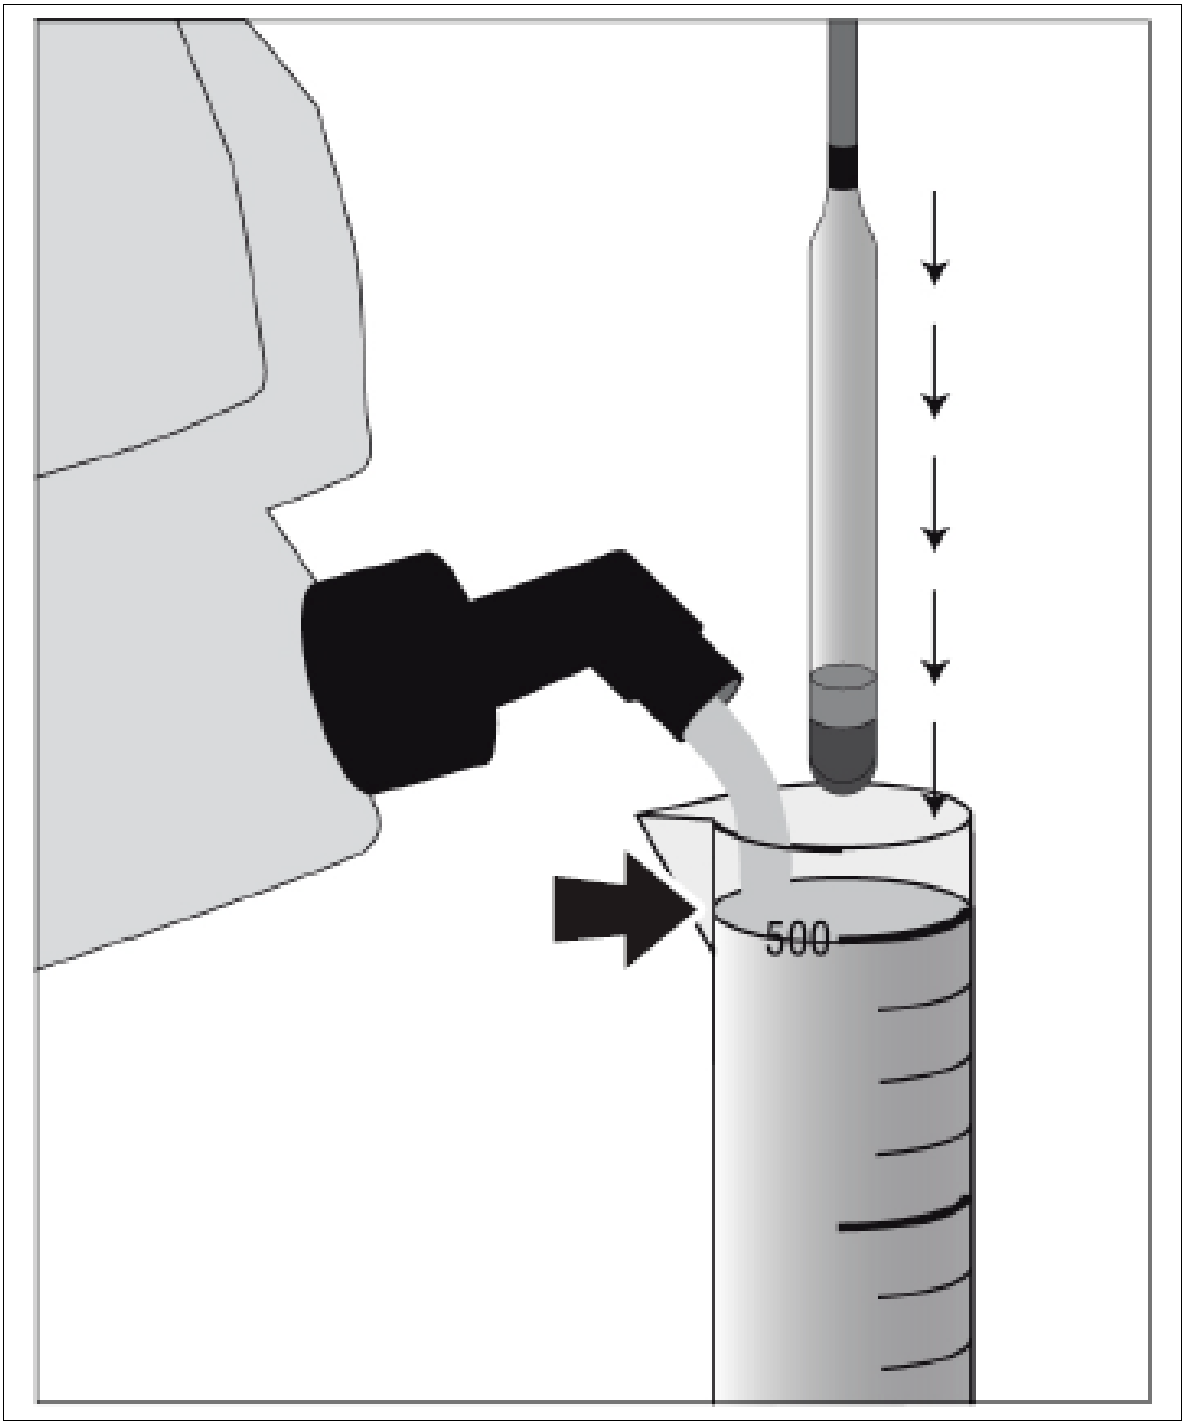
Fig 2: Placing Spindle Sleeve Under Case Lid



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Pour 500 millilitres (ml) **-arrow-** of fuel into the measuring cylinder.

Fig 3: Filling Fuel Into Measuring Cylinder

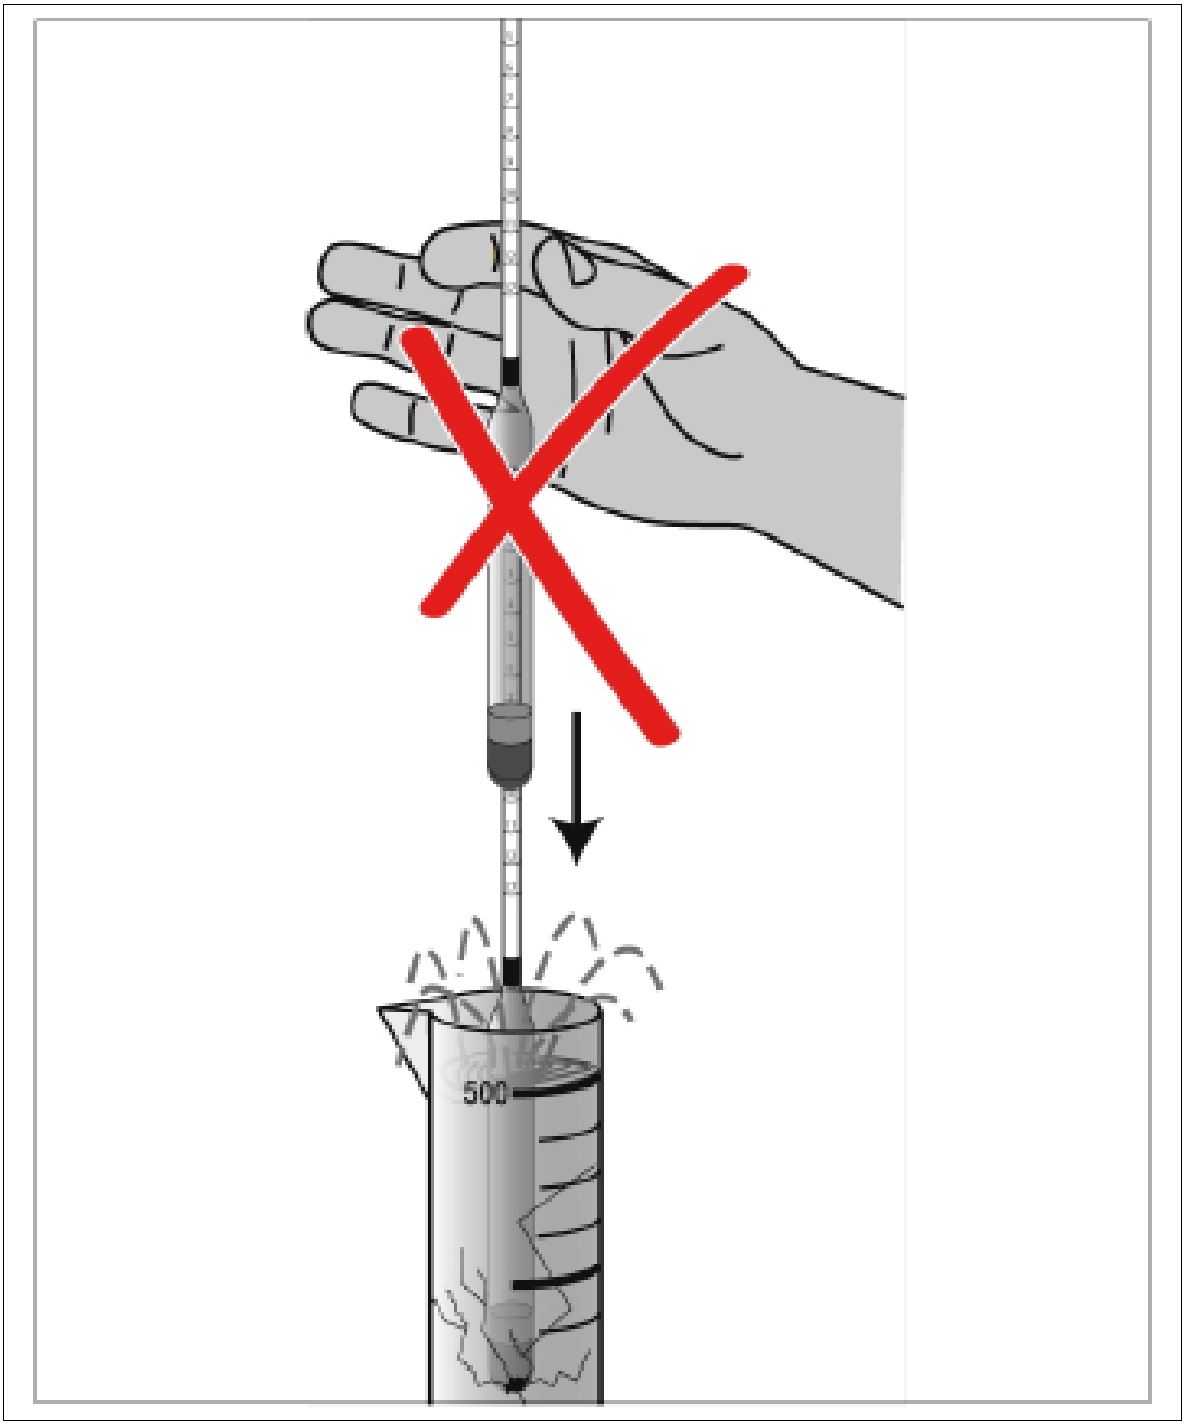


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Carefully immerse the measuring spindle into the liquid and let it go.

   Do not drop the measuring spindle!

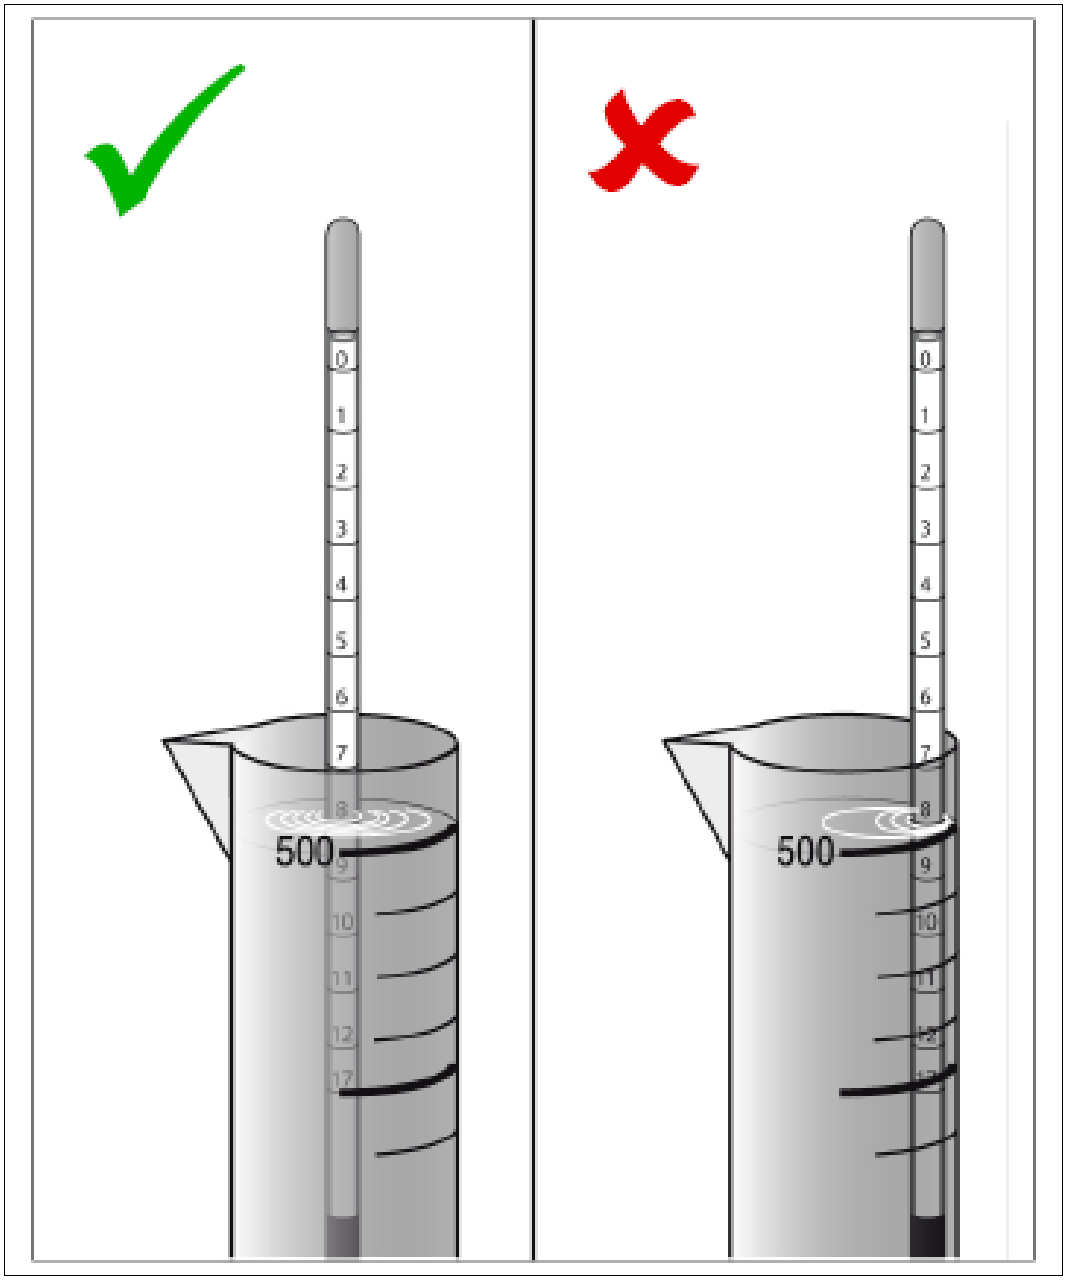
Fig 4: Caution - Do Not Drop Measuring Spindle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 4.1. The spindle must be floating in the middle in order to read off the scale value.

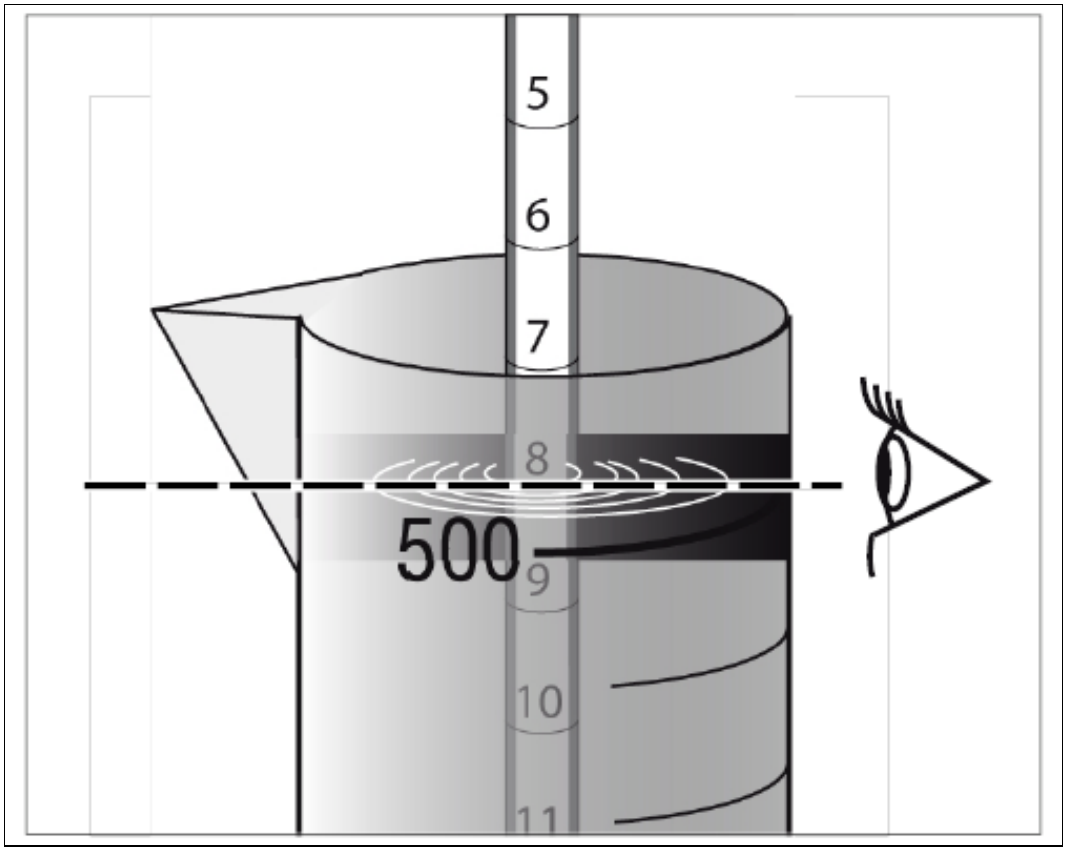
Fig 5: Identifying Correct And Incorrect Spindle Position



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 4.2. Read off the scale value.

Fig 6: Checking Scale Value On Measuring Spindle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Assign the scale value using the table below.

Scale value (at 20° Celsius)	Assessment	Comment
below 0	Case for fuel laboratory (neither petrol nor diesel)	Laboratory test required
0... 5.5	Petrol EN 228	
4.5... 6.5	E 85	
approx. 7	E 100 (pure ethanol)	
7... 9	No evaluation possible (neither petrol nor diesel)	Laboratory test required
9... 11	Diesel in Asia (Russia/India)	
10... 13	Diesel in accordance with EN 590 (Europe)	
13... 15	No evaluation possible, "wild mix"	Laboratory test required
15... 17	Biodiesel	Laboratory test required

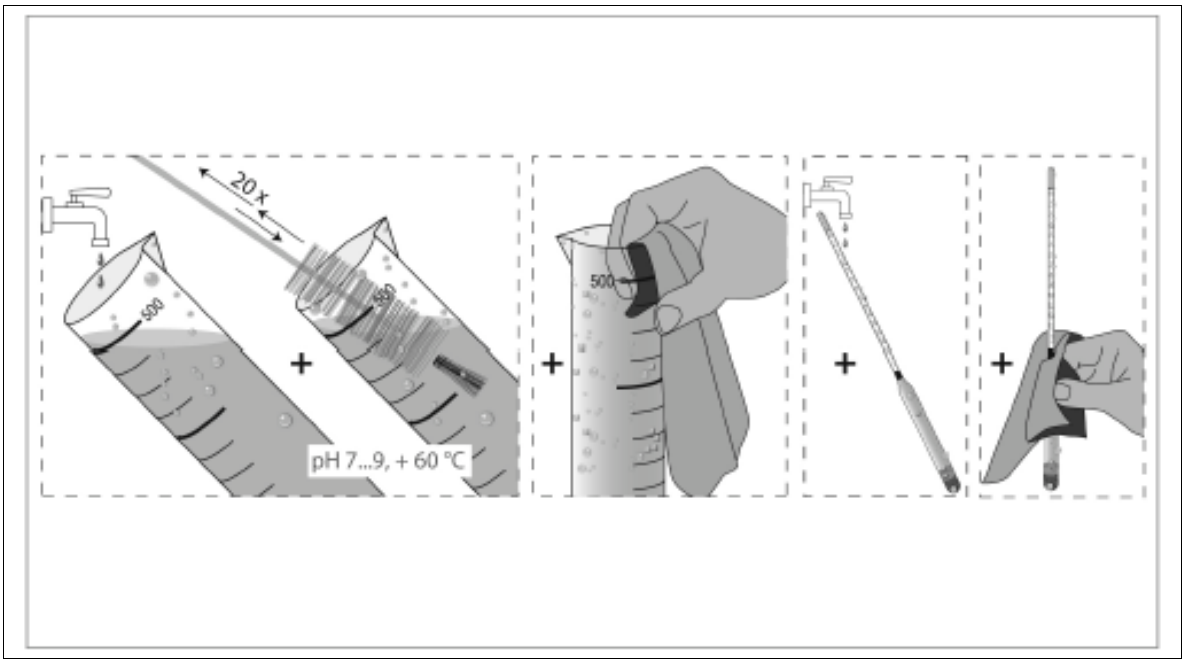
above 17	Measuring spindle does not stay in the fuel (water-like density)	Laboratory test required

Information

1. Dispose of fuel, fuel mixes and cleaning mixes according to the applicable national regulations!

6. After testing the fuel, wash out and wash off measuring equipment thoroughly using the cleaning brush, washing-up liquid and hot water.

Fig 7: Cleaning Measuring Equipment



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. After analysing the fuel quality, carry out the required measures.

WM 201019 REMOVING AND INSTALLING FUEL TANK (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
transmission jack	Service equipment	WE 1082		

Master Gear unit elevating platform	Service equipment	WE 1206		

WM 201019 REMOVING AND INSTALLING FUEL TANK (ALL MODELS) > PRELIMINARY WORK

1. Drain the fuel tank. → Emptying The Fuel Tank
2. Remove rear seat. → Removing rear seat
3. Disconnect battery ground terminal.
4. Remove rear axle. → Removing rear axle housing
5. Remove rear wheel housing liner at the right. → Removing rear wheel housing liner
6. Remove heat protection.
    1. 6.1. Unscrew nuts **-1-** and remove heat protection panel at the centre rear **-2-** .
    2. 6.2. Unscrew nut **-3-** and remove heat protection panel at the right **-4-** .

Fig 1: Identifying Heat Protection Panel Nut

WM 201019 REMOVING AND INSTALLING FUEL TANK (ALL MODELS) > REMOVING FUEL TANK

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapours.

→ Attach warning sign in a clearly visible position.

CAUTION: Risk of damaging fuel lines!

- *Lines can become kinked or can crack.*

→ Never leave the carbon canister hanging freely on the lines.

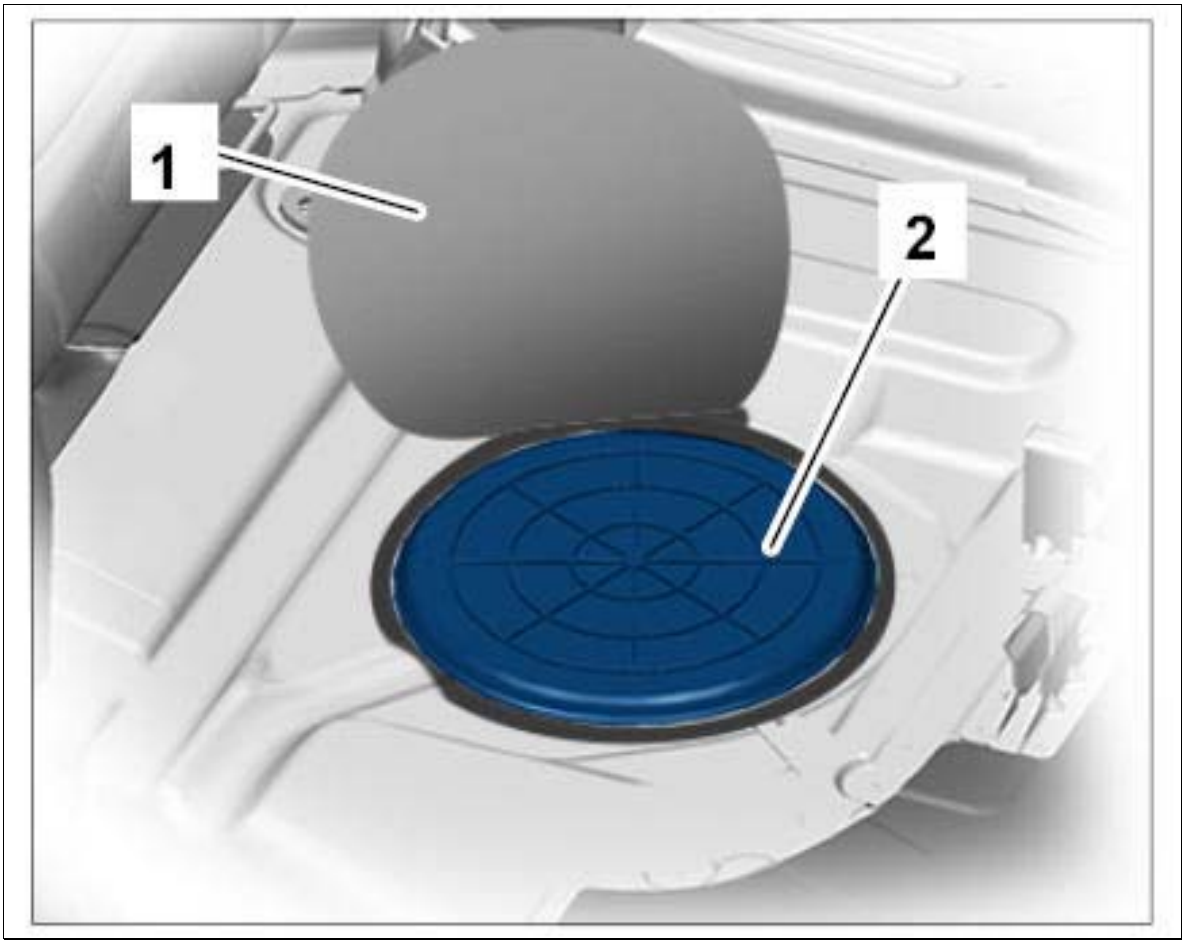
→ A second person must hold the carbon canister during removal.

Information

- Absorb any escaping fuel using a suitable binding material or a cloth.
- Cloths which have absorbed fuel must be disposed of according to the applicable national laws.
- The fuel system must be depressurised before starting work on it.
- Only work on the fuel system in well-ventilated rooms.
- Any seals which have been removed must always be replaced.
- Do not use any sealant containing silicone or silicone spray when the injection system is open. Traces of silicone drawn in by the engine are not combusted and damage the oxygen sensors.

1. Fold protective mat **-1-** aside and open the cover **-2-** .

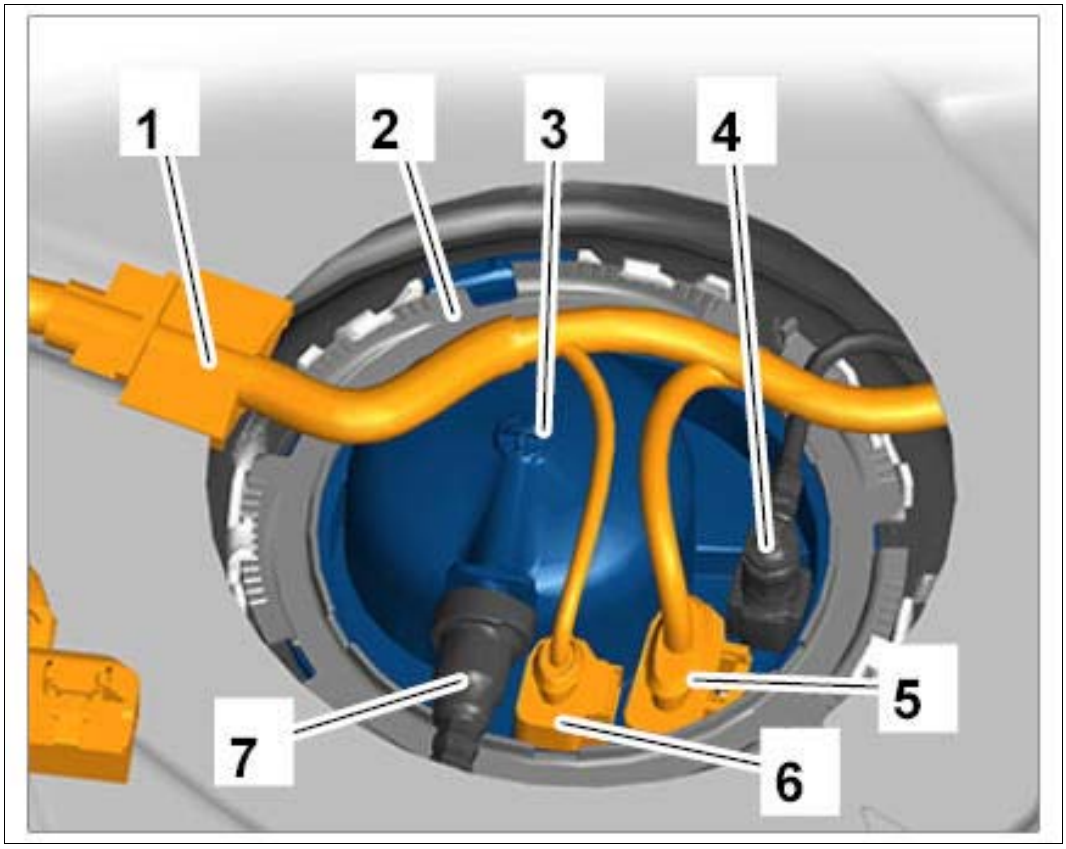
Fig 1: Identifying Fuel Tank Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen connections on the fuel pressure regulator.
    1. 2.1. Release and disconnect electric lines **-5, 6-** .
    2. 2.2. Release and pull off fuel line **-7-** .
    3. 2.3. **If auxiliary heater is installed:** Release and disconnect supply line for auxiliary heater **-4-** .
    4. 2.4. Soak up emerging fuel with a cloth.

Fig 2: Identifying Fuel Pump Connections

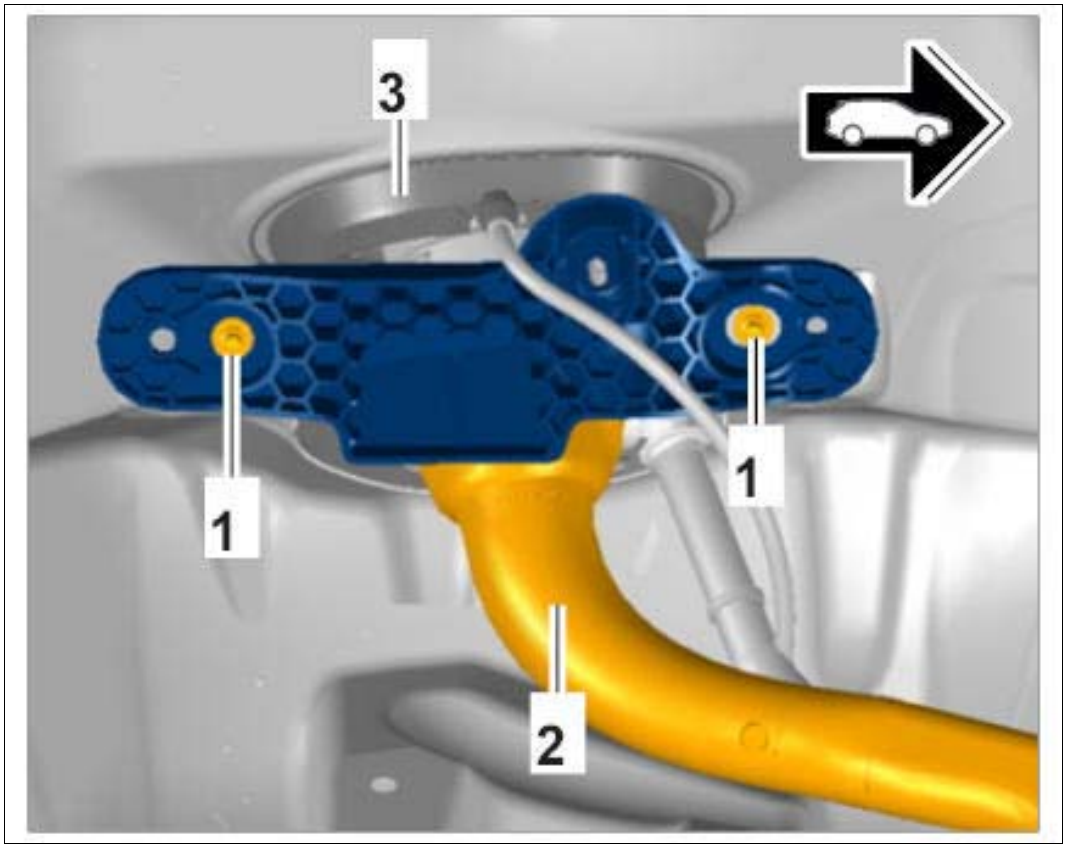


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Loosen tank filler neck.

    1. 3.1. Screw off the cap.
    2. 3.2. Unscrew screws **-1-** on the holder in the wheel housing.
    3. 3.3. Pull tank filler neck **-2-** out of the rubber sleeve **-3-** .

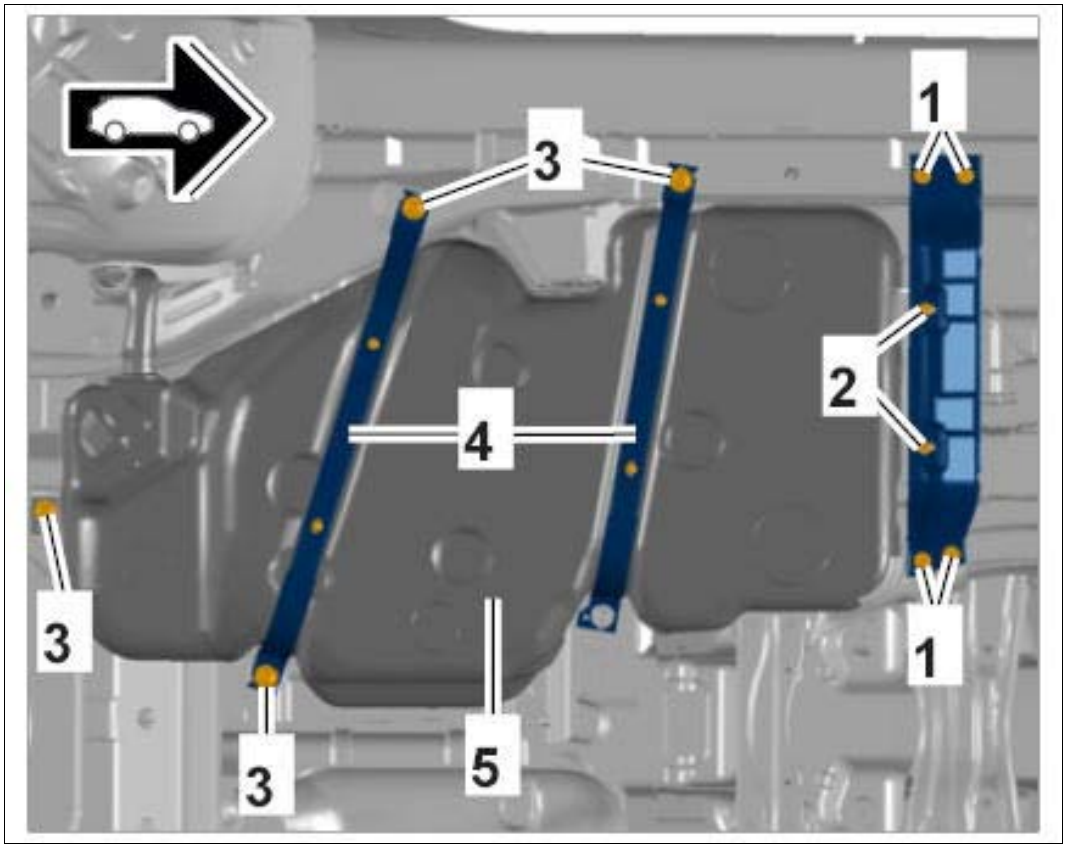
Fig 3: Identifying Tank Filler Neck, Sleeve And Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Support the fuel tank using **Master Gear unit elevating platform WE 1206** or **transmission jack WE 1082** .
5. Loosen holder and restraining straps on the fuel tank.
    1. 5.1. Unscrew screws **-1-** on the stone guard **-2-** .
    2. 5.2. Unscrew screws **-3-** on the tank restraining straps **-4-** .
    3. 5.3. Lower the fuel tank **-5-** slightly.

Fig 4: Identifying Fuel Tank Holder

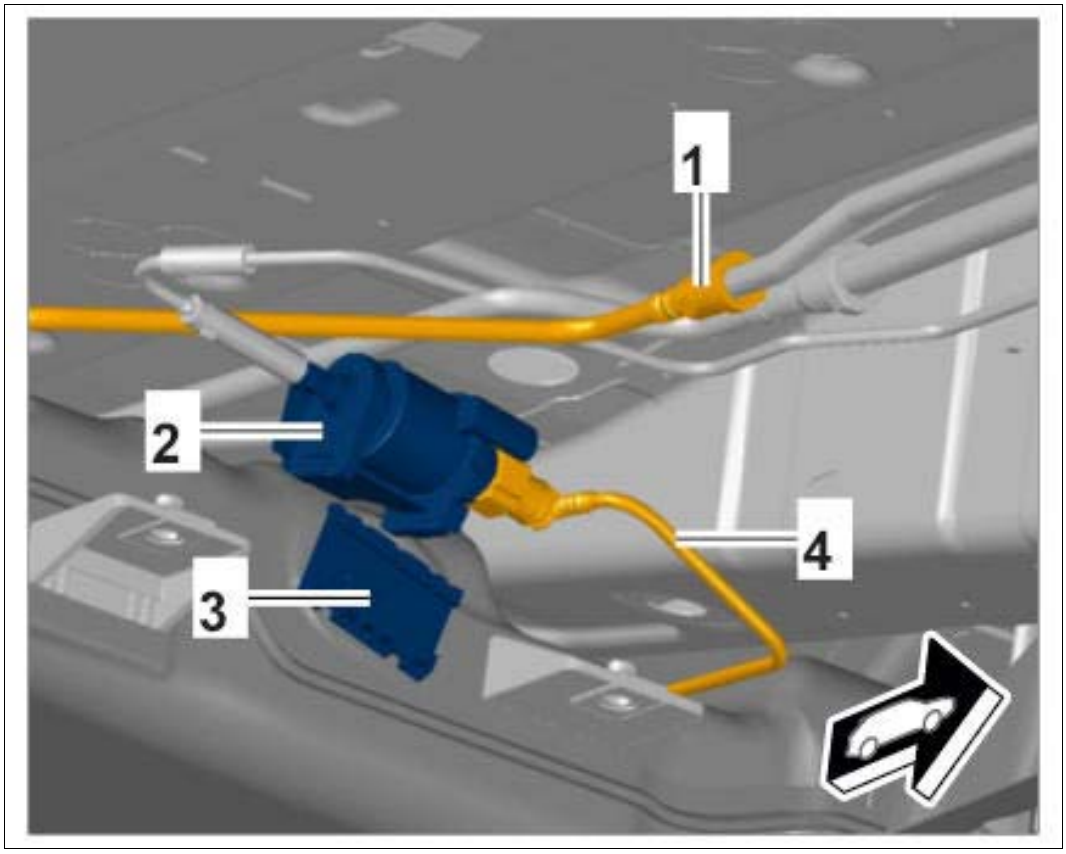


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Release and disconnect supply line **-1-** on the underbody at the right.

    1. 6.1. If auxiliary heater is installed: Loosen auxiliary heater pump **-2-** from the holder **-3-** and disconnect line **-4-** .

Fig 5: Identifying Fuel Supply Line



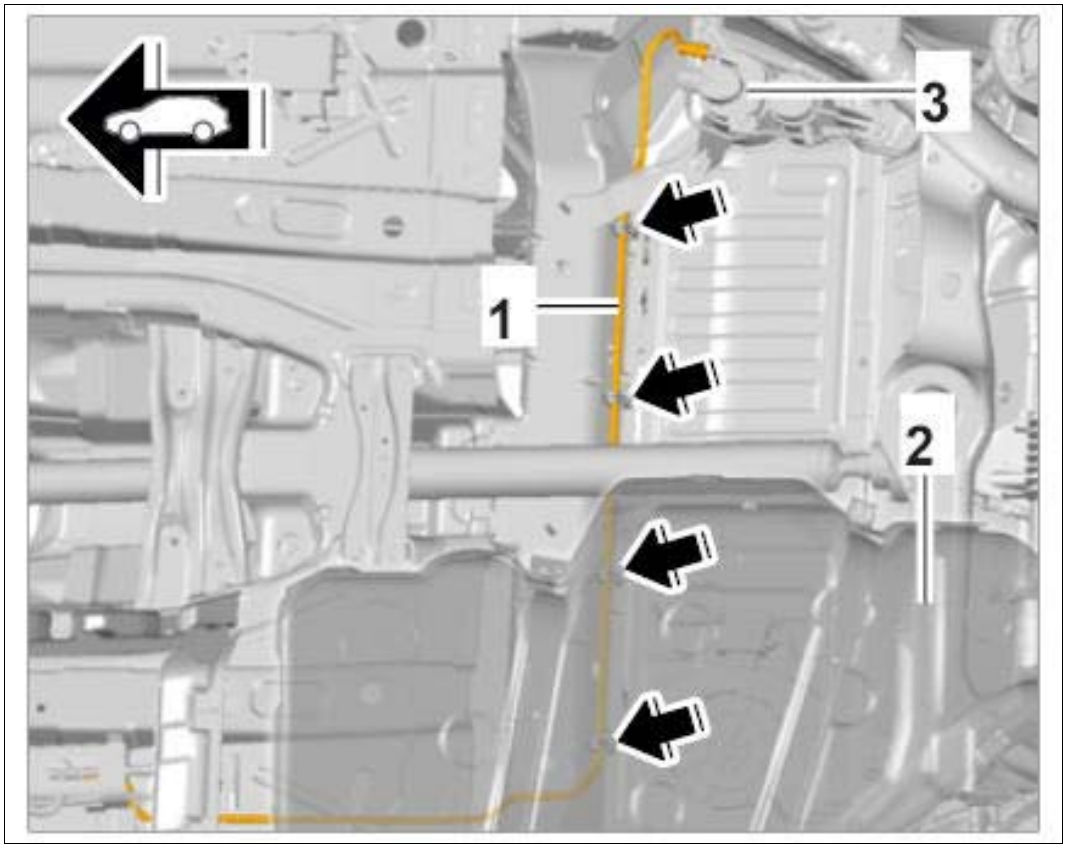
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Disconnect lines for carbon canister.

    1. 7.1. Loosen line for carbon canister **-1-** at the fuel tank **-2-** and underbody from the holder **-arrows-** .

    2. 7.2. Release and pull off line **-1-** at the carbon canister **-3-** .

Fig 6: Locating Carbon Canister Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Slowly lower the fuel tank.

WM 201019 REMOVING AND INSTALLING FUEL TANK (ALL MODELS) > INSTALLING FUEL TANK

Information

Tightening torques, tightening sequence and assembly overviews for the engine and transmission:

- Group 1: → 1X00IN TECHNICAL VALUES
- Group 2: → 2X00IN TECHNICAL VALUES
- Group 3: → 3X00IN TECHNICAL VALUES

1. Installation is performed in reverse order. Pay particular attention to the following:
    1. 1.1. Tightening torque for securing restraining straps to the body:
    2. 1.2. Tightening torque for securing the stone guard to the body:
    3. 1.3. Tank filler neck holder to body:

WM 2010EN EMPTYING AND FILLING THE FUEL TANK (MACAN) > PRELIMINARY WORK > PRELIMINARY WORK FOR EMPTYING FUEL TANK USING VAS 5190A FUEL EXTRACTOR

Information

Fuel can be pumped out using the following methods:

> By activating the fuel pump using PIWIS Tester II when the flange/fuel level sender is installed.

> Directly at the fuel tank when the flange/fuel level sender is removed.

1. Remove fuel level sender. → Removing Fuel Level Sender

WM 2010EN EMPTYING AND FILLING THE FUEL TANK (MACAN) > EMPTYING THE FUEL TANK > EMPTYING FUEL TANK USING VAS 5190 A FUEL EXTRACTOR

WARNING: Toxic substances

- *Danger of poisoning or suffocation*

- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapours.

→ Attach warning sign in a clearly visible position.

Information

Place a cloth underneath to catch escaping fuel.

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapours.

→ Attach warning sign in a clearly visible position.

Information

- Absorb any escaping fuel using a suitable binding material or a cloth.
- Cloths which have absorbed fuel must be disposed of according to the applicable national laws.
- The fuel system must be depressurised before starting work on it.
- Only work on the fuel system in well-ventilated rooms.
- Any seals which have been removed must always be replaced.
- Do not use any sealant containing silicone or silicone spray when the injection system is open. Traces of silicone drawn in by the engine are not combusted and damage the oxygen sensors.

Information

- If the tank must be opened for emptying, disconnect all connections.

Information

- The guiding rod of the fuel level sender must not be deformed.
- If the guiding rod is deformed, the fuel level sender must be replaced.

1. Remove fuel level sender **-3-** .
    1. 1.1. Disconnect electric plug connection **-2-** .
    2. 1.2. Remove line **-1-** from the guide.
    3. 1.3. Press locking lugs **-4-** back using a screwdriver.
    4. 1.4. Remove fuel level sender **-3-** in **-direction of arrow -** .

WM 201519 REMOVING AND INSTALLING FUEL LEVEL SENDER (MACAN) > SUBSEQUENT WORK

1. Install fuel pump. → Installing Fuel Pump
2. Connect the battery. → Installing Battery
3. Adjust fuel level sender. → Calibrating Fuel Level Sender

WM 2015K2 CALIBRATING FUEL LEVEL SENDER (ALL MODELS) > CALIBRATING FUEL LEVEL SENDER > INFORMATION

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapours.

→ Attach warning sign in a clearly visible position.

WARNING: Caustic fluids

- *Danger of chemical burns*

→ Avoid contact with caustic fluid.

→ Wear personal protective gear.

→ Ensure that there is good ventilation.

→ If you do come into contact, wash off immediately with plenty of warm water and contact a doctor if necessary.

Information

- Calibration of the fuel level sender is required after replacing the fuel tank, the fuel level sender or the instrument cluster. Calibrate the sender - after replacing the instrument cluster - only if the function Read out values cannot be performed!
- The fuel level sender does not have to be calibrated if the battery was disconnected or a plug connection on the instrument cluster or sender was disconnected. The values remain stored in the instrument cluster.
- A range on remaining fuel of less than 15 km (9 miles) is not displayed in the instrument cluster.

WM 2015K2 CALIBRATING FUEL LEVEL SENDER (ALL MODELS) > CALIBRATING FUEL LEVEL SENDER > CALIBRATING FUEL LEVEL SENDER

1. Empty the fuel tank. → Emptying The Fuel Tank
2. Wait for a short time (approx. 1 minute) to allow the fuel-level sensor to settle at the current level.
3. Connect the Porsche System Tester to the vehicle and start the System Tester. Switch on ignition. [>>] to continue.
4. Select the vehicle type.
5. Select **Instrument cluster** control unit, then press [>>].
6. Select the **Maintenance/repairs** menu and press [>>].
7. Select **Fuel tank calibration** menu and press [F8] to start the calibration process.
8. The message **Fuel tank calibration completed successfully** appears on the Tester screen.
9. Press [F12] to exit.
10. Fill the vehicle with fuel and check the fuel gauge in the instrument cluster. Wait a few minutes. Fuel gauge shows full.
11. Change terminals.

1. 11.1. Switch off ignition.
2. 11.2. Wait approx. 30 seconds.
3. 11.3. Switch on ignition.

12. Check the fuel gauge in the instrument cluster again. Fuel gauge shows full.

WM 202519 REMOVING AND INSTALLING CARBON CANISTER (ALL MODELS) > PRELIMINARY WORK

WM 213019 REMOVING AND INSTALLING TURBOCHARGER (MACAN) > TOOLS

Designation	Type	Number	Description	
Special inserts	Commercially available tool	Nr.170		

WM 213019 REMOVING AND INSTALLING TURBOCHARGER (MACAN) > PRELIMINARY WORK

1. Drain coolant.
2. Remove air cleaner housing. → 242519 REMOVING AND INSTALLING AIR CLEANER HOUSING
3. Remove catalytic converter. → 267319 REMOVING AND INSTALLING CATALYTIC CONVERTER

WM 213019 REMOVING AND INSTALLING TURBOCHARGER (MACAN) > REMOVING TURBOCHARGER

Information

- Replace gaskets, sealing rings and O-rings.
- Hose adapters and hoses for the charge air system must be free of oil and grease before being fitted.
- Secure all hose connections with standard hose clamps.
- To fasten the charge air hoses securely to their adapters, spray the threaded parts of previously used screw-type clamps with anti-rust agent before installation.
- Refit all heat protection boots at the same position during installation.
- Leave the engine running at idle speed for about 1 minute and avoid revving the engine after

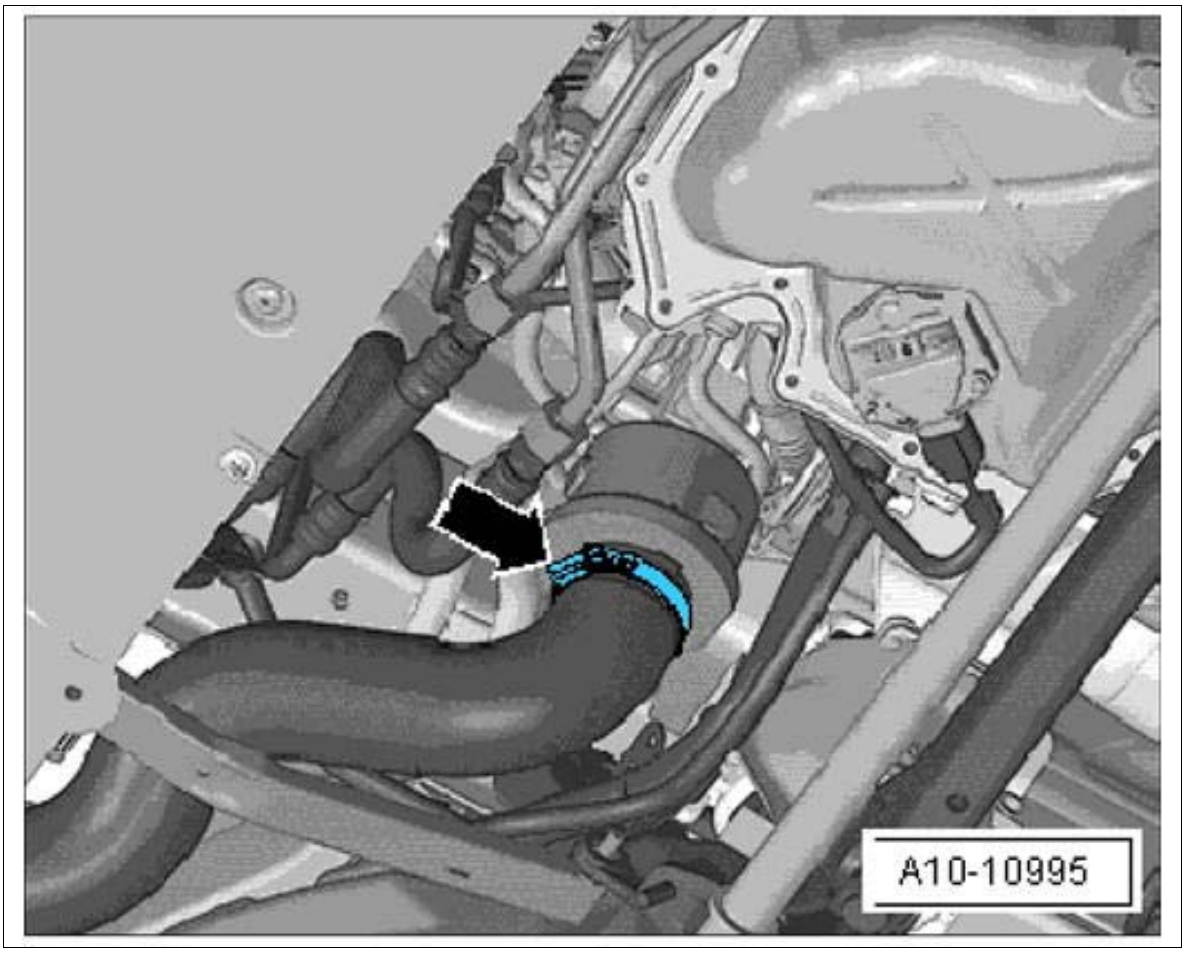
installing the turbocharger to ensure an adequate oil supply for the turbocharger.

Information

Do not damage O-rings!

1. Open cap on reservoir.
2. Loosen spring band clamp **-arrow-** , pull off molded hose on the turbocharger and swivel it aside.

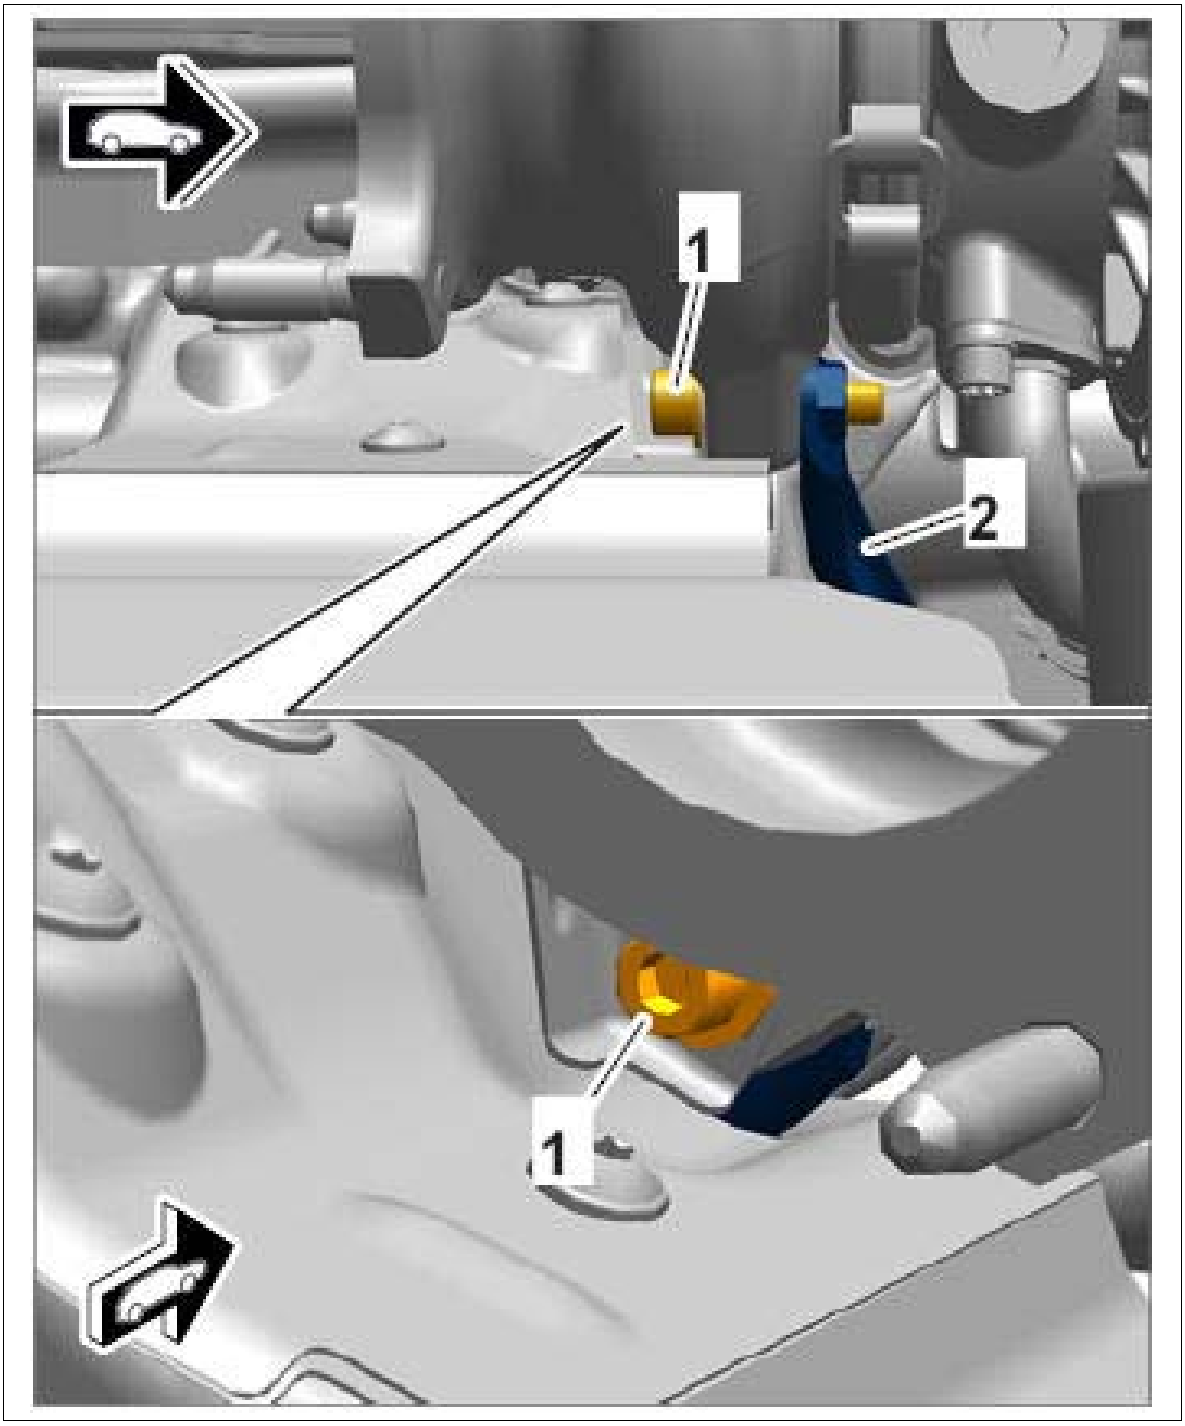
   Fig 1: Locating Turbocharger Spring Band Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Loosen fastening screw **-1-** on support for turbocharger **-2-** .

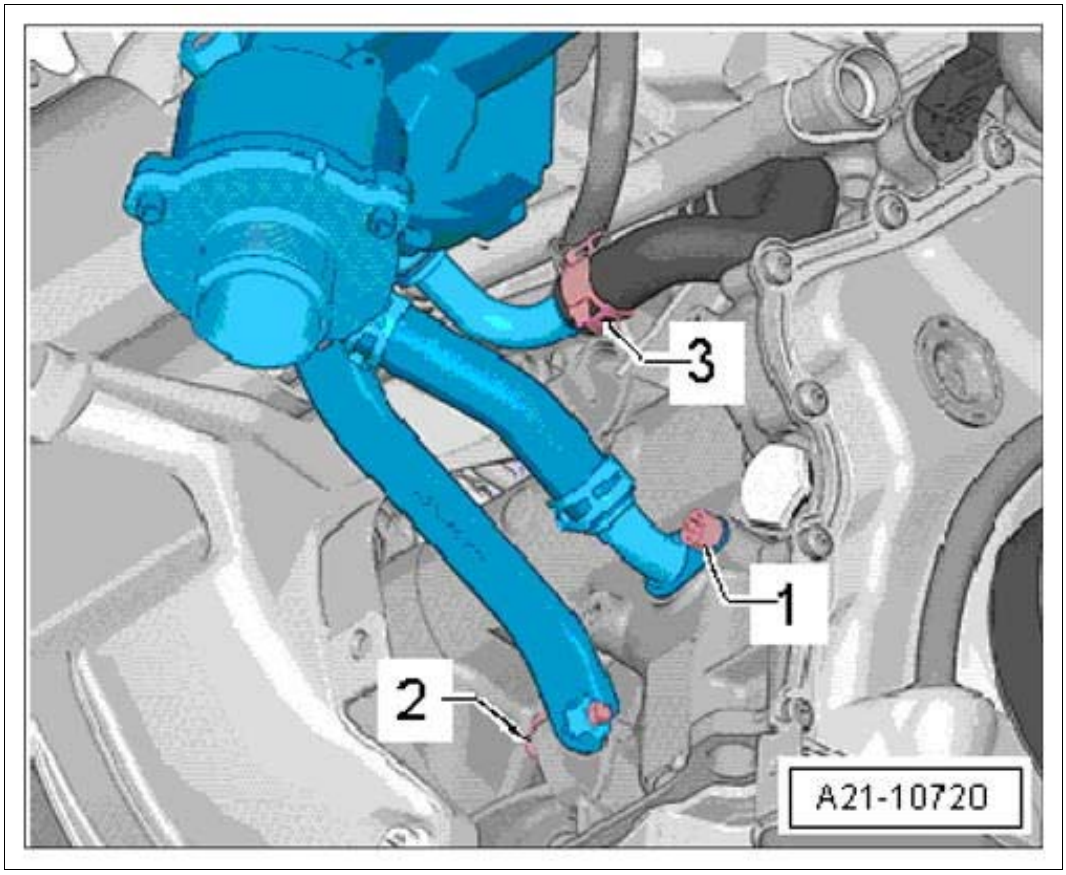
Fig 2: Identifying Turbocharger Support Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Disconnect oil return line on the turbocharger.
    1. 4.1. Unscrew fastening screw **-1-** .
    2. 4.2. Pull off oil line at the engine and close off connections.
    3. 4.3. Unscrew fastening screw **-2-** on turbocharger support.

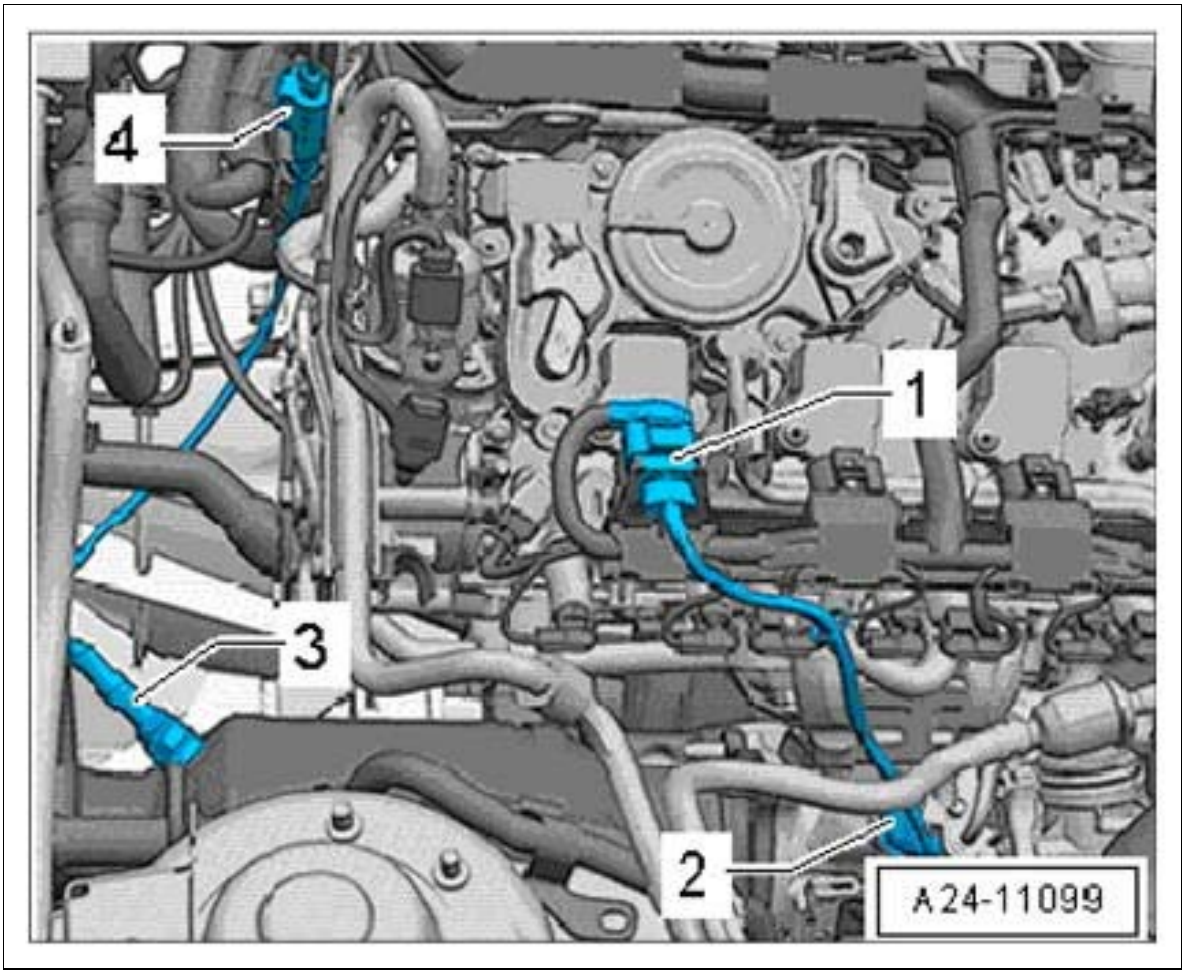
Fig 3: Identifying Turbocharger Oil Return Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Take electric plug connection **-1-** out of the holder and disconnect it.

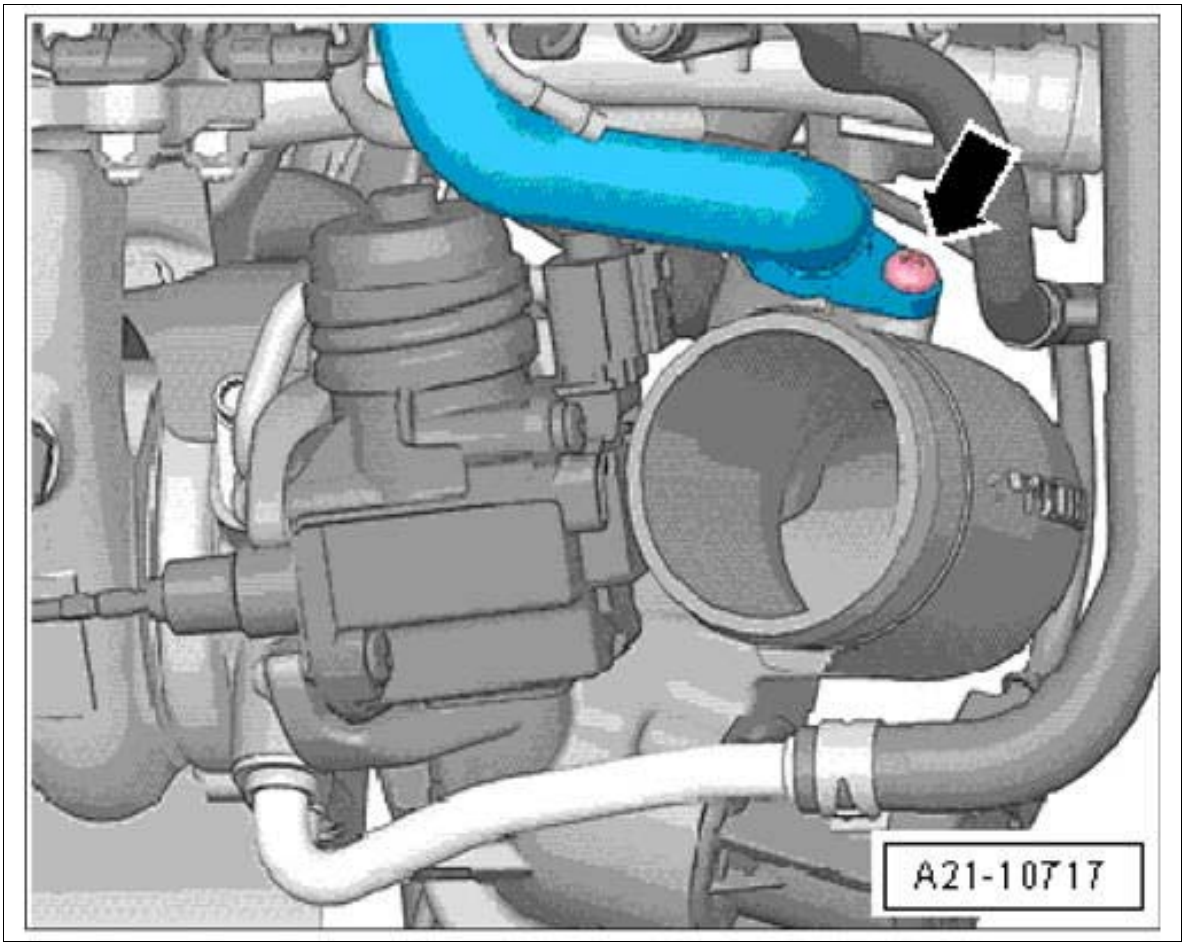
Fig 4: Identifying Oxygen Sensor Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Unscrew fastening screw **-arrow-** for positive crankcase ventilation at the turbocharger and pull off the line.

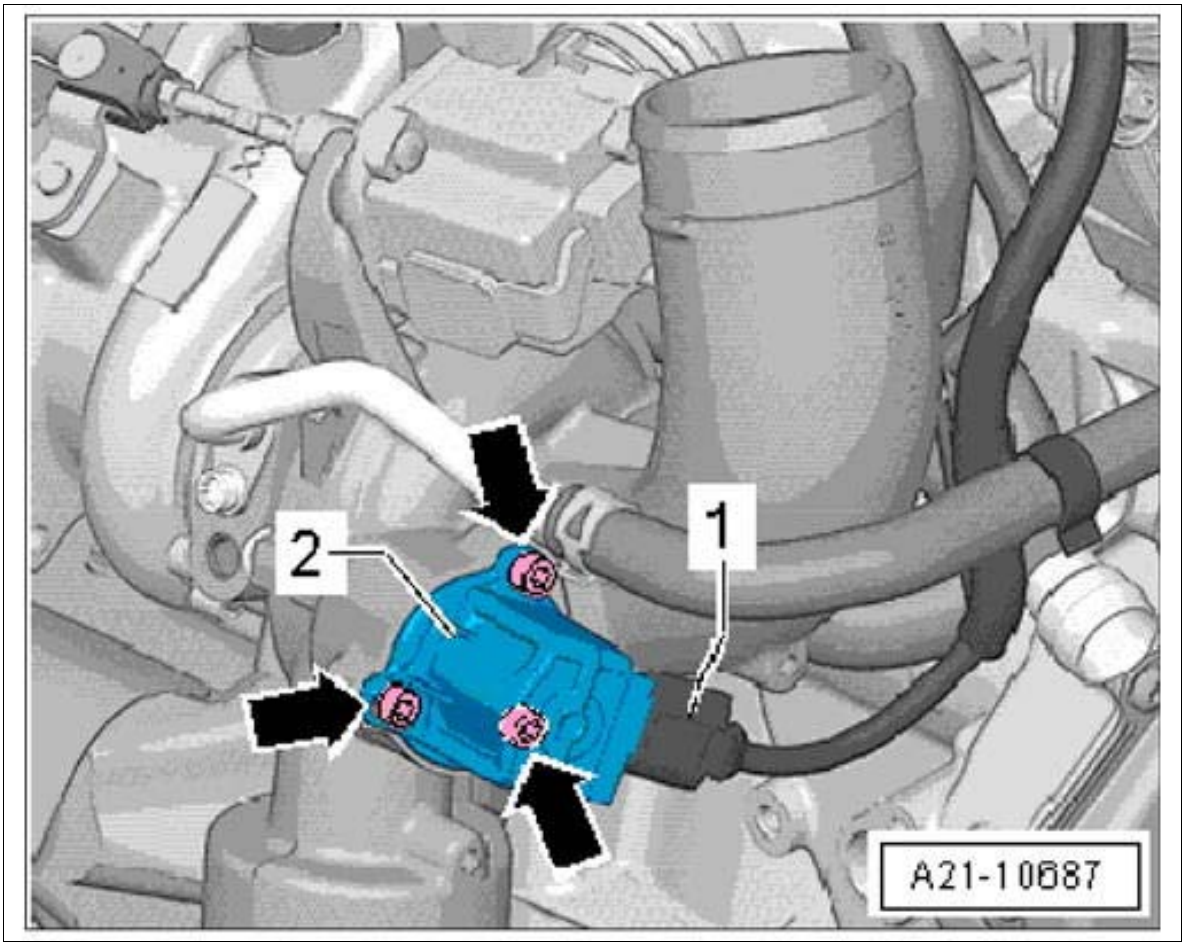
Fig 5: Locating Turbocharger Positive Crankcase Ventilation Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Disconnect electric plug connection **-1-** for recirculating air valve.

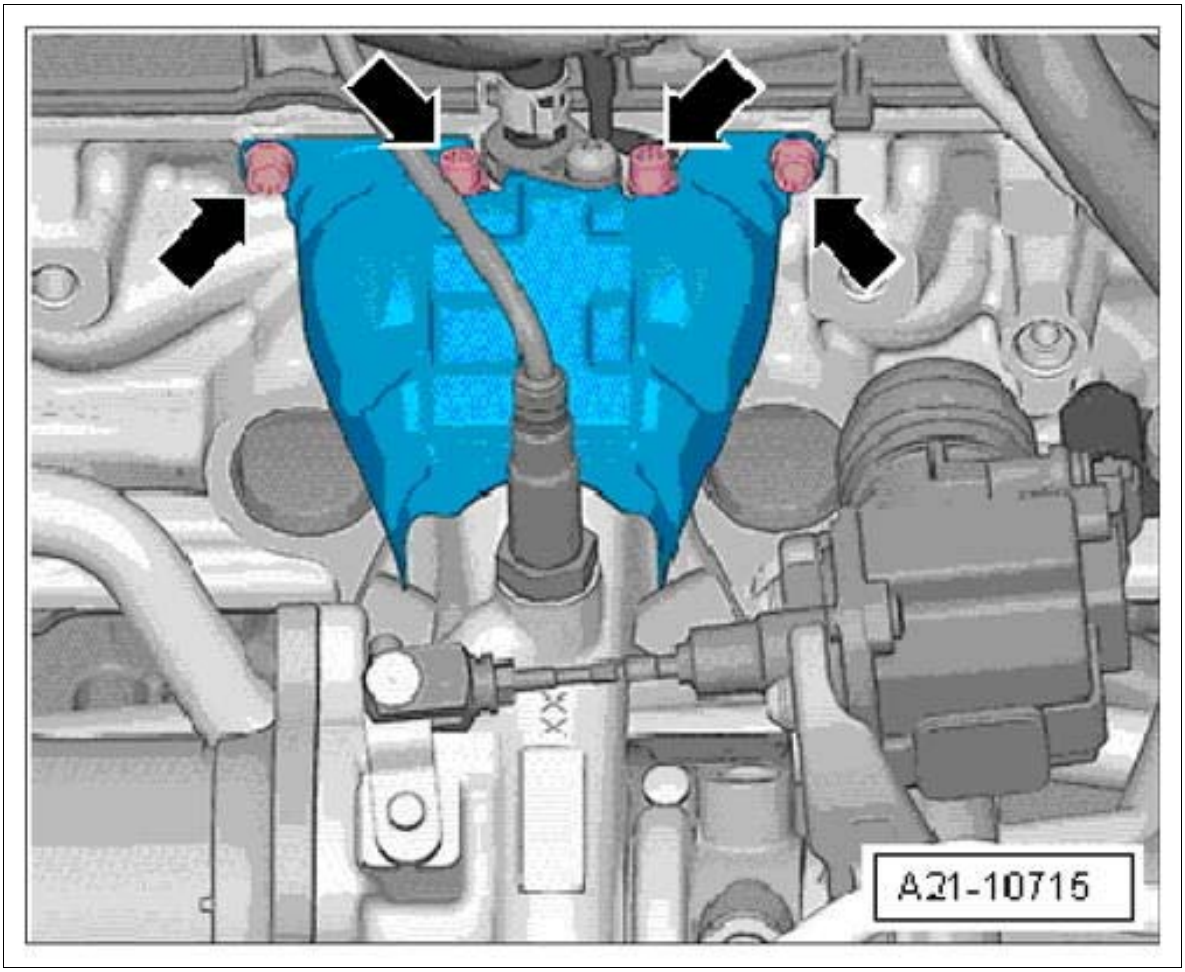
Fig 6: Locating Turbocharger Recirculating Air Valve Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Unscrew fastening screws **-arrows-** and remove heat shield.

Fig 7: Locating Heat Shield On Turbocharger Screws



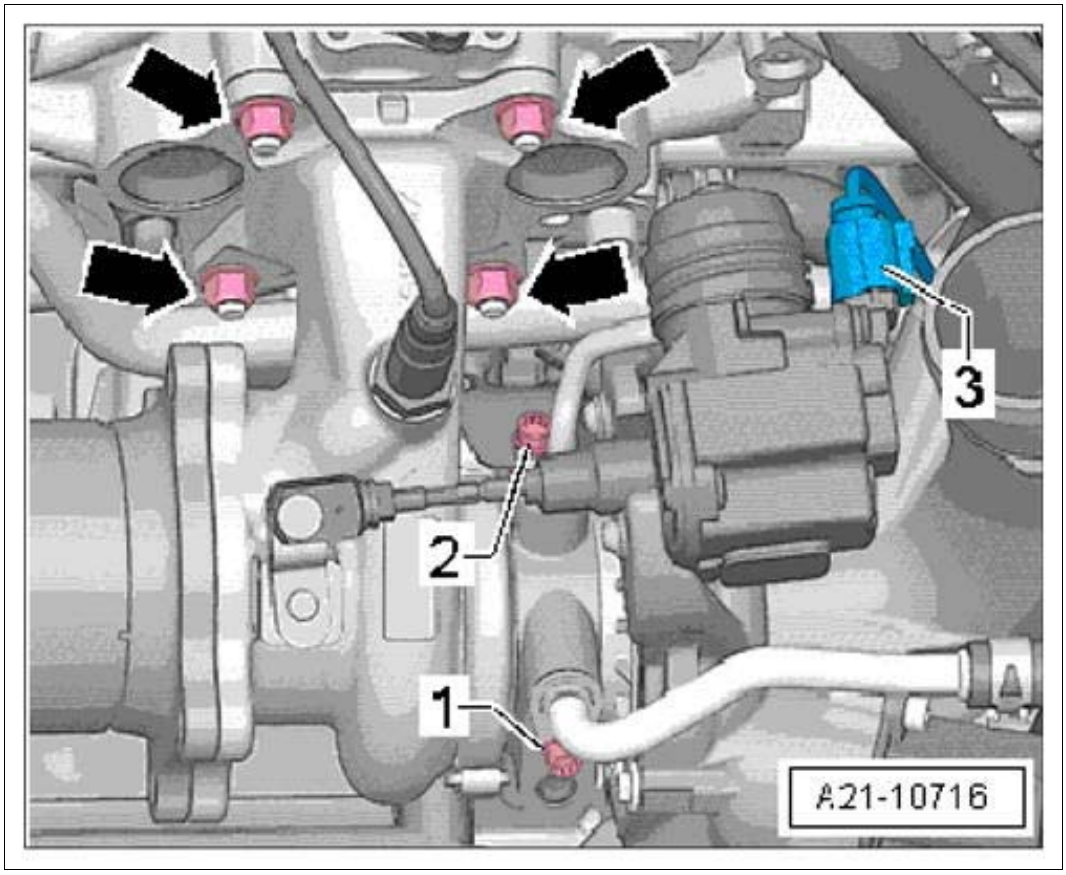
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Loosen accessories from the turbocharger.
    1. 9.1. Unscrew fastening screw **-1-** and pull off coolant return pipe.

       Tool recommendation: **Special inserts Nr.170**
    2. 9.2. Unscrew fastening screw **-2-** and pull off oil feed line for turbocharger.

       Tool recommendation: **Special inserts Nr.170**
    3. 9.3. Disconnect electric plug connection **-3-** at the electronic adjuster for the turbocharger.
    4. 9.4. Unscrew fastening nuts **-arrows-** .

Fig 8: Locating Turbocharger Accessories Screws

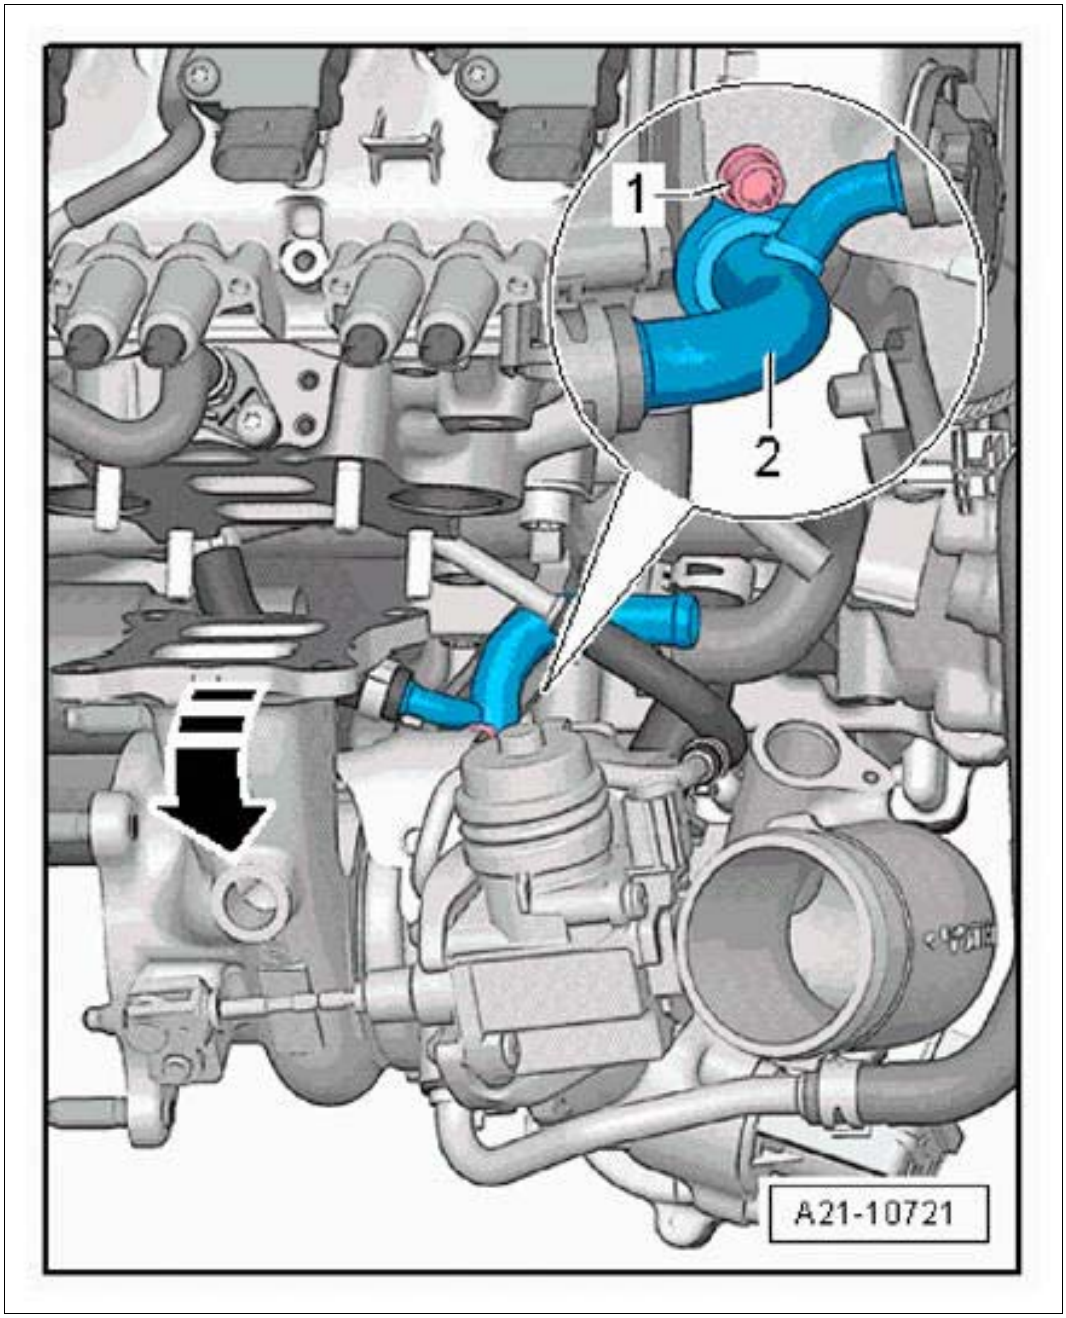


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Remove turbocharger.

    1. 10.1. Pull turbocharger off the studs in **-direction of arrow-** and get a second mechanic to hold it.
    2. 10.2. Unscrew fastening screw **-1-** and pull off coolant supply pipe **-2-** .
    3. 10.3. Close off open lines and connections using stoppers.
    4. 10.4. Lift the turbocharger up and out.

Fig 9: Removing Turbocharger



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 213019 REMOVING AND INSTALLING TURBOCHARGER (MACAN) > INSTALLING TURBOCHARGER

Information

- Replace gaskets, sealing rings and O-rings.
- Hose adapters and hoses for the charge air system must be free of oil and grease before being fitted.

- Secure all hose connections with standard hose clamps.
- To fasten the charge air hoses securely to their adapters, spray the threaded parts of previously used screw-type clamps with anti-rust agent before installation.
- Refit all heat protection boots at the same position during installation.
- Leave the engine running at idle speed for about 1 minute and avoid revving the engine after installing the turbocharger to ensure an adequate oil supply for the turbocharger.

Information

Do not damage O-rings!

1. Position the turbocharger.

    1. 1.1. Position the turbocharger and fit coolant supply pipe **-2-** with a **new O-ring** under the heat shield.

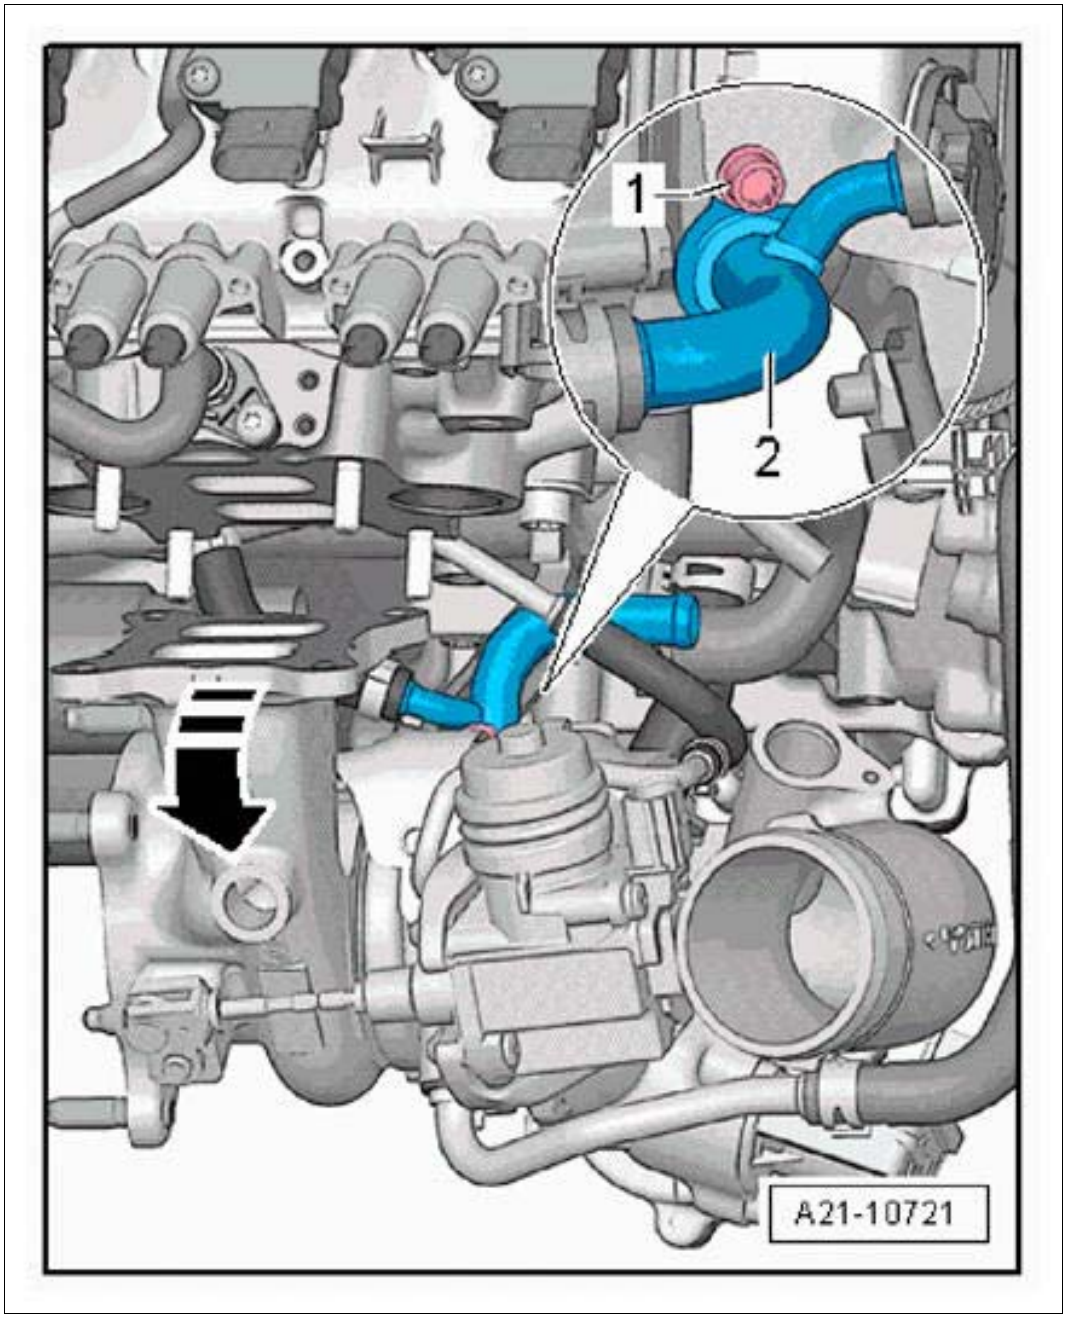
       Coat O-ring with coolant.

    2. 1.2. Fit and tighten fastening screw **-1-** over the heat shield.

    3. 1.3. **Fit new** seal at the connection point between the turbocharger and exhaust manifold.

    4. 1.4. Fit the turbocharger on the studs in the opposite direction to the **-direction of arrow-** .

Fig 1: Installing Turbocharger



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Install turbocharger.

    1. 2.1. Coat studs with high-temperature paste.
    2. 2.2. **Fit and tighten new** fastening nuts **-arrows-** .
    3. 2.3. Fill the turbocharger with engine oil at the oil supply line adapter.
    4. 2.4. Fit oil supply line with **new O-ring** over the heat shield and press it into position.

       Coat O-ring with engine oil.
    5. 2.5. Fit and tighten fastening screw **-2 -** .

Tool recommendation: **Special inserts Nr.170**

6. 2.6. Fit coolant return pipe with a **new O-ring** .

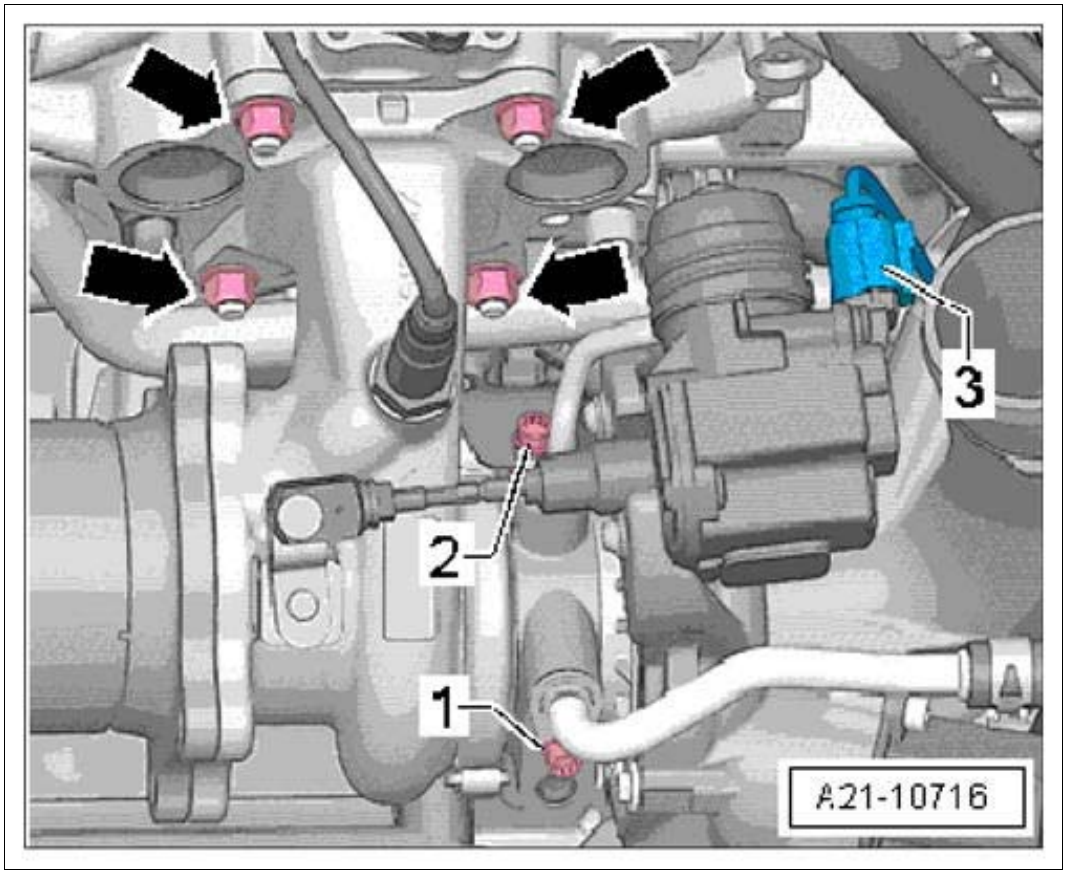
   Coat O-ring with coolant.

7. 2.7. Fit and tighten fastening screw **-1-** .

   Tool recommendation: **Special inserts Nr.170**

8. 2.8. Connect electric plug connection **-3-** at the electronic adjuster for the turbocharger.

Fig 2: Locating Turbocharger Accessories Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Position heat shield and fit and tighten fastening screws **-arrows -** .

Fig 3: Locating Turbocharger Heat Shield Screws

WM 240919 REMOVING AND INSTALLING FUEL PRESSURE SENSOR (HIGH-PRESSURE) TOOLS (MACAN) > REMOVING FUEL PRESSURE SENSOR (HIGH-PRESSURE)

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapors.

→ Attach warning sign in a clearly visible position.

WARNING: Leaking fuel supply lines

- *Emerging fuel*
- *Risk of fire*

→ Perform leak test.

NOTE: Dirt on injection system components

- *Material damage*
- *Rough-running engine*
- *Bad exhaust emissions*

→ Thoroughly clean connection points and adjacent areas before loosening them. If the engine is very dirty, wash it before starting disassembly work.

→ Lay removed parts on a clean surface and cover them. Do not use fibre-shedding cloths.

→ Carefully cover components or seal them if repair work will not be carried out immediately. Place rubber caps on connections. Seal intake openings with film or adhesive tape.

→ Only install clean parts. Do not take spare parts out of the packaging until just before installation.

→ Never use compressed air when the system is open. Do not move the vehicle.

1. Release and disconnect electric plug connection from fuel pressure sensor **-1-** . **Assembly tool T10118**
2. Unscrew fuel pressure sensor **-1-** . **Bit, a/f 27 T40218**

WM 243019 REMOVING AND INSTALLING FUEL COLLECTION PIPE (MACAN S, MACAN TURBO) > REMOVING FUEL COLLECTION PIPE

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapors.

→ Attach warning sign in a clearly visible position.

WARNING: Leaking fuel supply lines

- *Emerging fuel*
- *Risk of fire*

→ Perform leak test.

NOTE: Dirt on injection system components

- *Material damage*
- *Rough-running engine*
- *Bad exhaust emissions*

→ Thoroughly clean connection points and adjacent areas before loosening them. If the engine is very dirty, wash it before starting disassembly work.

→ Lay removed parts on a clean surface and cover them. Do not use fibre-shedding cloths.

→ Carefully cover components or seal them if repair work will not be carried out immediately. Place rubber caps on connections. Seal intake openings with film or adhesive tape.

→ Only install clean parts. Do not take spare parts out of the packaging until just before installation.

→ Never use compressed air when the system is open. Do not move the vehicle.

Information

- Do not bend high-pressure lines. Check that the connection points are not damaged and are perfectly clean and make sure there is no thread damage. Fit union nuts on all connection points by hand before screwing in screws or bolts. Remove dirt on the conical/ball joints. Check connection points for leaks following fitting.

Information

- The ignition must be switched off when working on the fuel system.
- Absorb any escaping fuel using a suitable binding material or a cloth.
- Cloths which have absorbed fuel must be disposed of according to the applicable national laws.
- The fuel system must be depressurized before starting work on it.
- Only work on the fuel system in well-ventilated rooms.
- Any seals which have been removed must always be replaced.

1. Unscrew fastening screws **-5-** .

   Fig 1: Identifying Fuel Injectors Components

WM 243019 REMOVING AND INSTALLING FUEL COLLECTION PIPE (MACAN S, MACAN TURBO) > INSTALLING FUEL COLLECTION PIPE

WARNING: Loose purge connection

- *Emerging fuel*
- *Risk of fire*

→ Check that the purge connection of the fuel distribution pipe is seated securely.

→ Tighten the purge connection of the fuel distribution pipe to the correct tightening torque.

Information

- Do not bend high-pressure lines. Check that the connection points are not damaged and are perfectly clean and make sure there is no thread damage. Fit union nuts on all connection points by hand before screwing in screws or bolts. Remove dirt on the conical/ball joints. Check connection points for leaks following fitting.

Information

- The ignition must be switched off when working on the fuel system.
- Absorb any escaping fuel using a suitable binding material or a cloth.
- Cloths which have absorbed fuel must be disposed of according to the applicable national laws.

- The fuel system must be depressurized before starting work on it.
- Only work on the fuel system in well-ventilated rooms.
- Any seals which have been removed must always be replaced.

1. Fit retaining clips **-3-** on the fuel injectors.

   For cylinders 1 - 3

2. Position fuel collection pipe **-1-** .

   For cylinders 4 - 6

3. Position fuel collection pipe **-2-** .
4. Tighten fastening screws **-5-** .
5. Clip in retaining clips **-3-** .

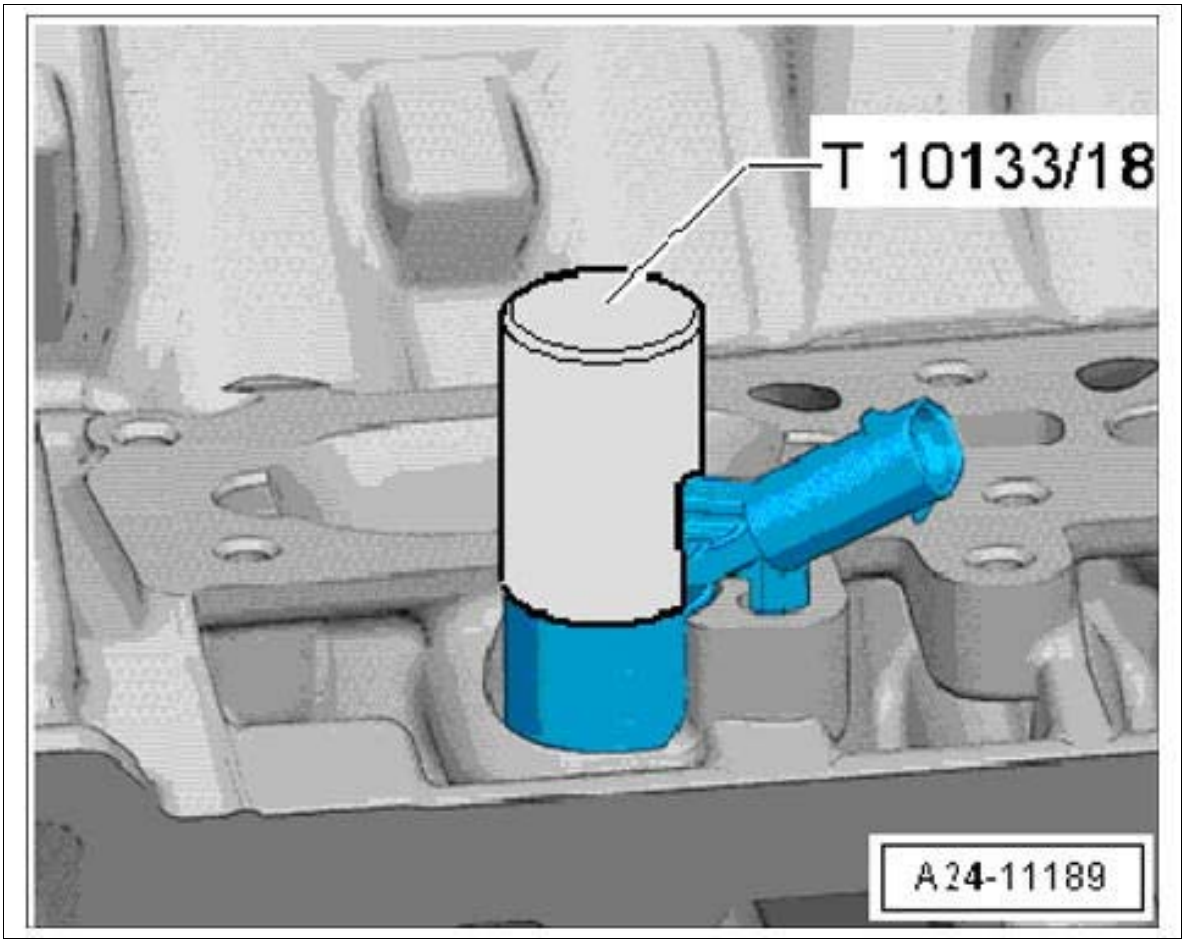
Information

- Close off open connections and lines using suitable stoppers or caps.

If fuel injectors remain in the cylinder head, the following procedure applies.

1. Push sleeve **T10133/18** over the fuel injector.

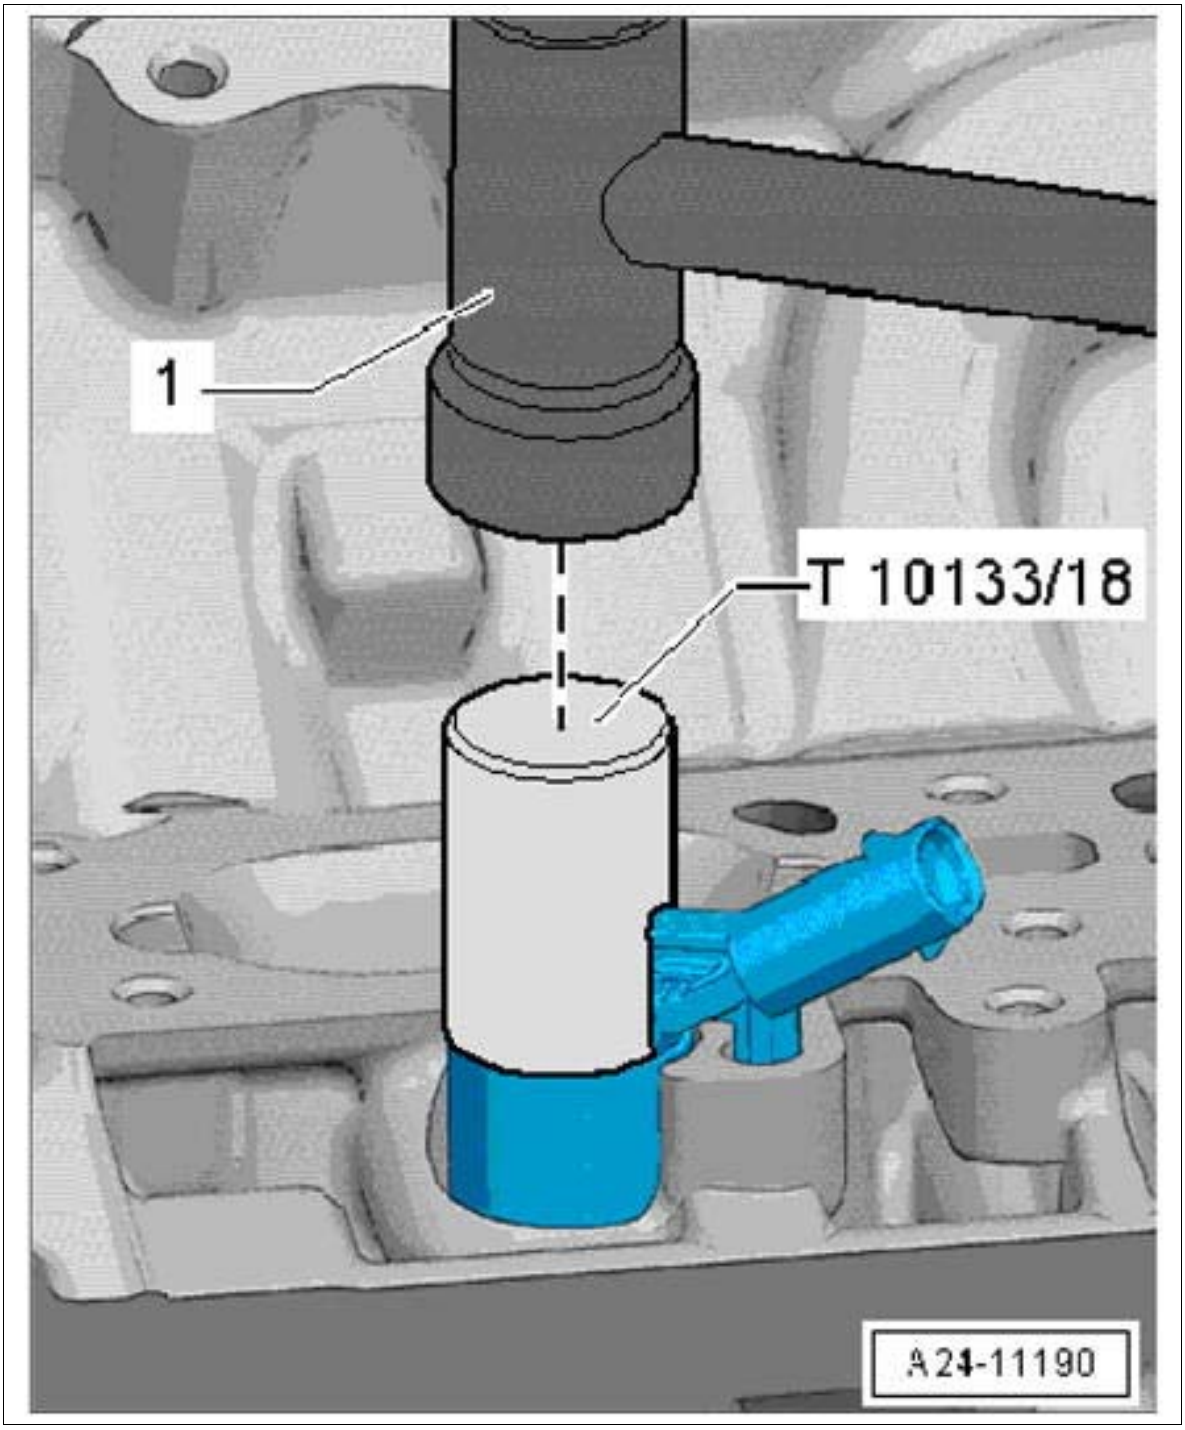
Fig 1: Identifying Sleeve T10133/18



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Carefully tap several times on the sleeve around the fuel injector to loosen it.

Fig 2: Tapping Fuel Injector Sleeve



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Loosen fuel injector.
    1. 3.1. Guide puller **T10133/2A** into the groove on the fuel injector.
    2. 3.2. Fit puller **T10133/16A** .
    3. 3.3. Adjust the torque wrench to **5 Nm (3.5 ftlb.)** .
    4. 3.4. Turn the screw with the torque wrench and remove the fuel injector.

5. 3.5. If the torque limit of **5 Nm (3.5 ftlb.)** is reached and the fuel injector is still not loosened, remove the extraction tool and loosen the fuel injector again using the sleeve.

   Non-observance of the specified torque can cause irreparable damage to the fuel injector.

WM 244019 REMOVING AND INSTALLING FUEL INJECTOR (MACAN) > INSTALLING FUEL INJECTORS > INSTALLING FUEL INJECTORS FOR DIRECT FUEL INJECTION (DFI)

NOTE: Incorrect handling of sealing rings and covers

- *Leaks*
- *Risk of damage to components*

→ Use clean tools without burrs.

→ Make sure not to leave any scores or scratches when cleaning.

Information

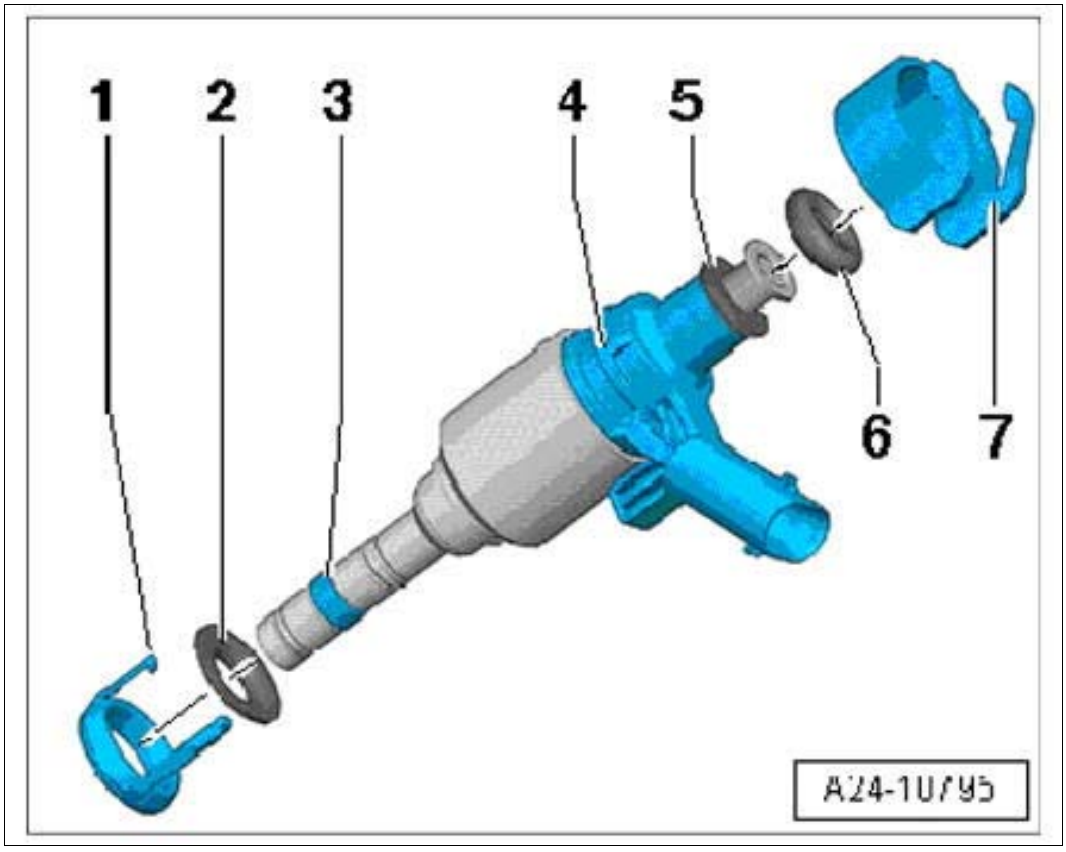
The combustion chamber sealing ring widens out as you slide it onto the fuel injector. It must therefore be closed in again in two steps after fitting.

1. The following work must be carried out before installing the fuel injector.

1. 1.1. Replace intermediate ring **-1-** .
2. 1.2. Replace mounting **-2-** .
3. 1.3. Carefully remove the combustion chamber seal **-3-** by cutting the seal with a knife or widening it with a small screwdriver and then pulling it forward.

   If the groove on the fuel injector is damaged, the fuel injector must be replaced!
4. 1.4. Replace spacer ring **-5-** .
5. 1.5. Replace O-ring **-6-** and coat with clean engine oil.
6. 1.6. Replace support ring **-7-** .

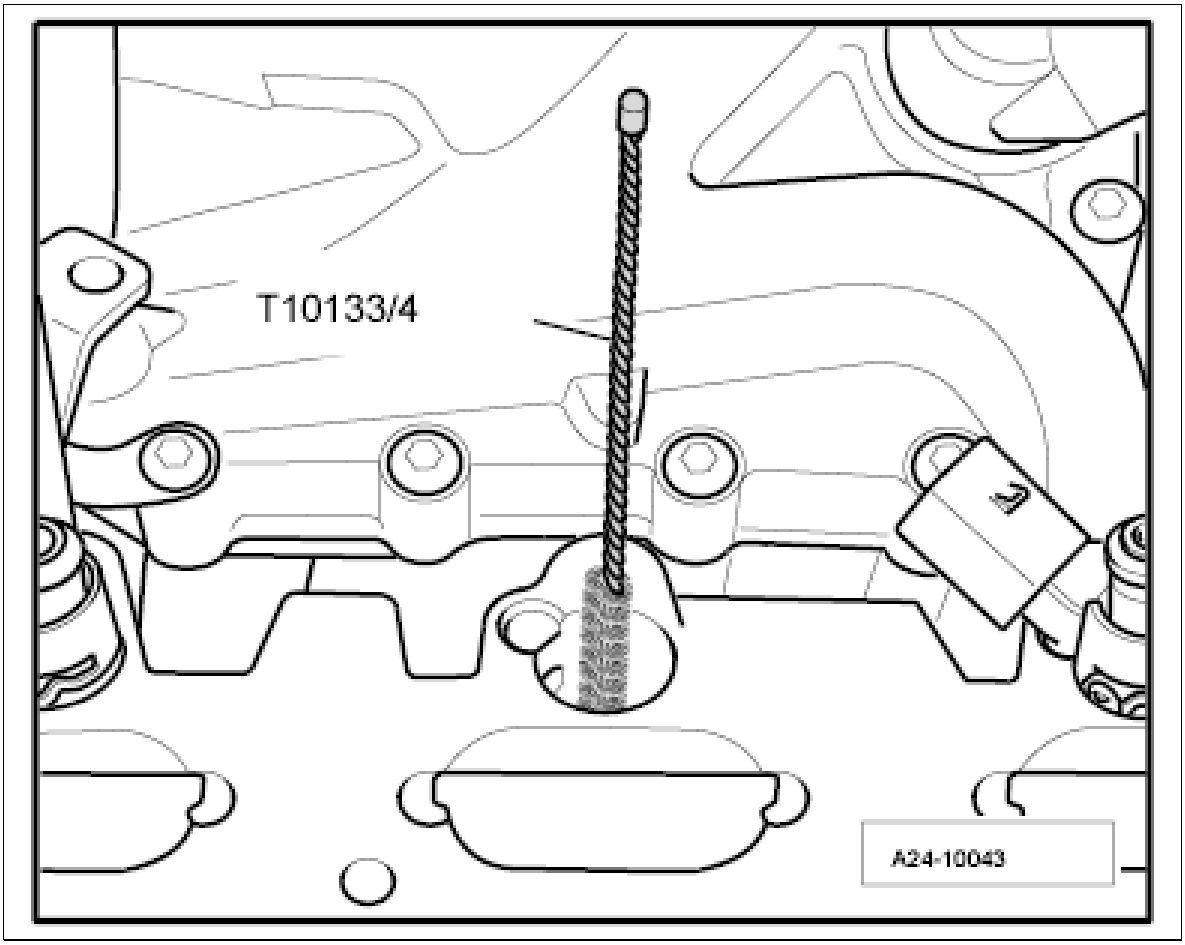
Fig 1: Identifying Fuel Injector Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Clean the bore in the cylinder head using the nylon cylinder brush **-T10133/4-** .

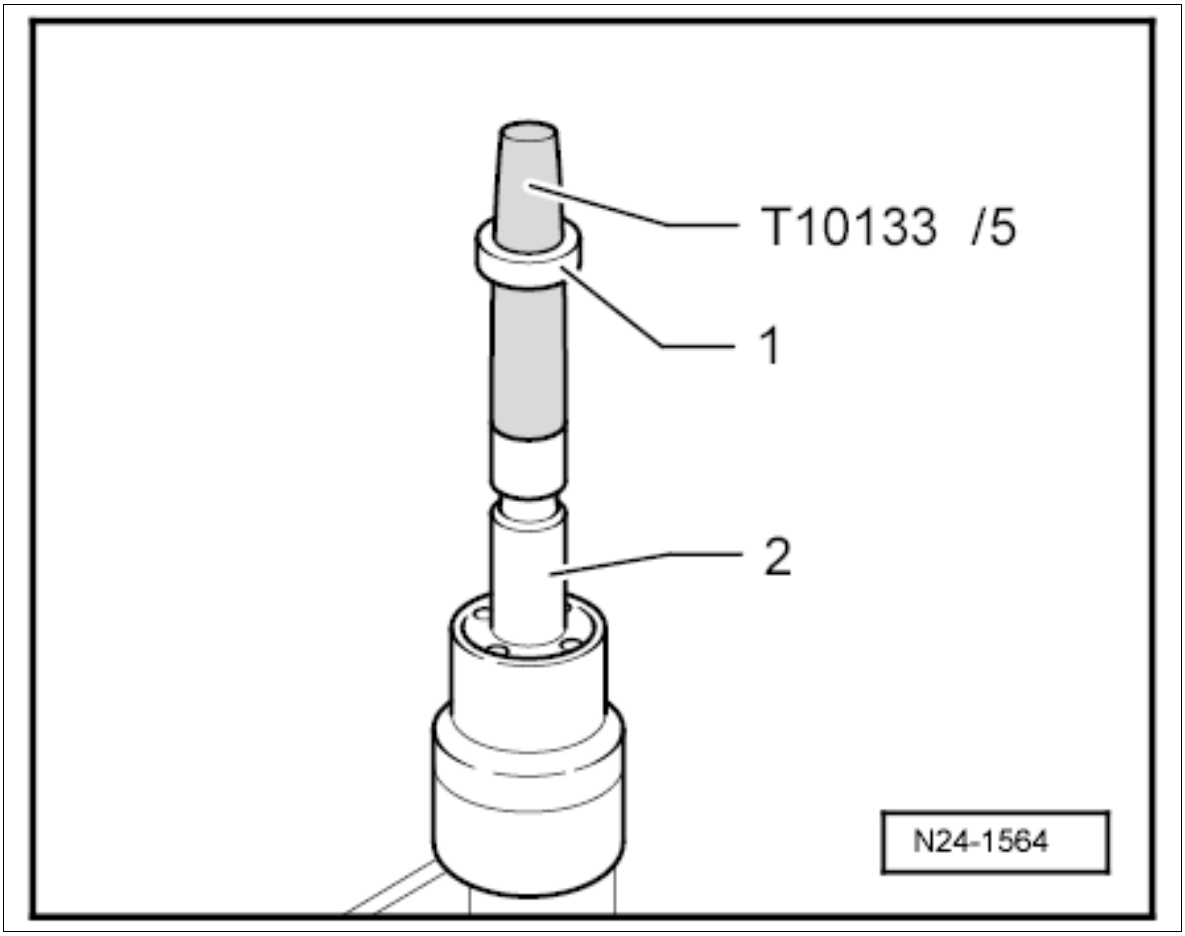
Fig 2: Cleaning Fuel Injector Bore



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Fit mounting code **-T 10133/5-** with the new combustion chamber sealing ring **-1-** from the repair kit onto the fuel injector **-2-** .

Fig 3: Identifying Mounting Cone T 10133/5

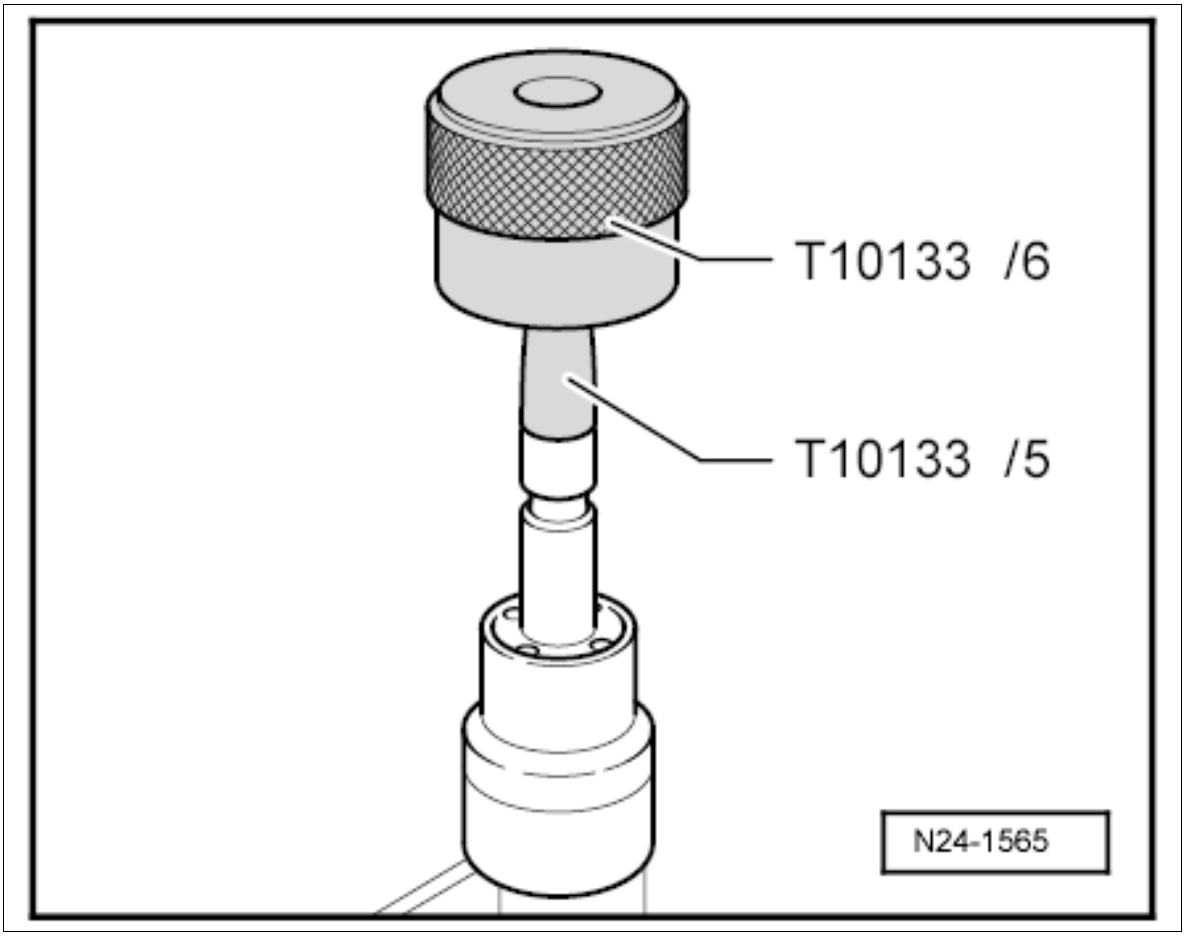


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Slide combustion chamber seal with assembly sleeve **-T 10133/6-** onto assembly cone **-T 10133/5-** as far as it will go.

   Turn the assembly sleeve **-T 10133/6-** around and slide the combustion chamber sealing ring into the sealing ring groove.

Fig 4: Identifying Assembly Sleeve

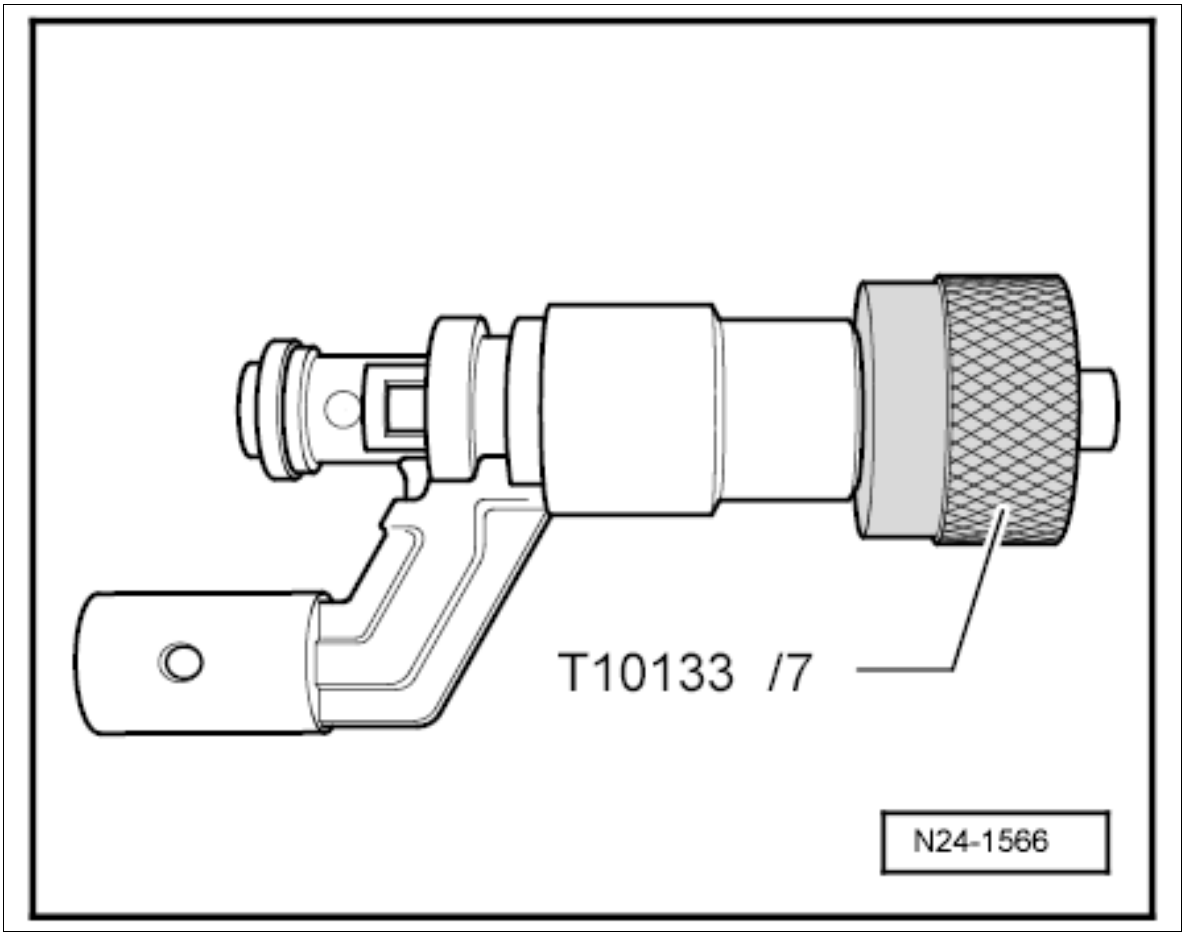


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Press the calibrating nozzle **-T10133/7-** with a slight rotary movement (approx. 180°) as far as it will go onto the fuel injector.

   Pull the calibrating sleeve off again by turning it in the opposite direction.

Fig 5: Identifying Sleeve T10133/7

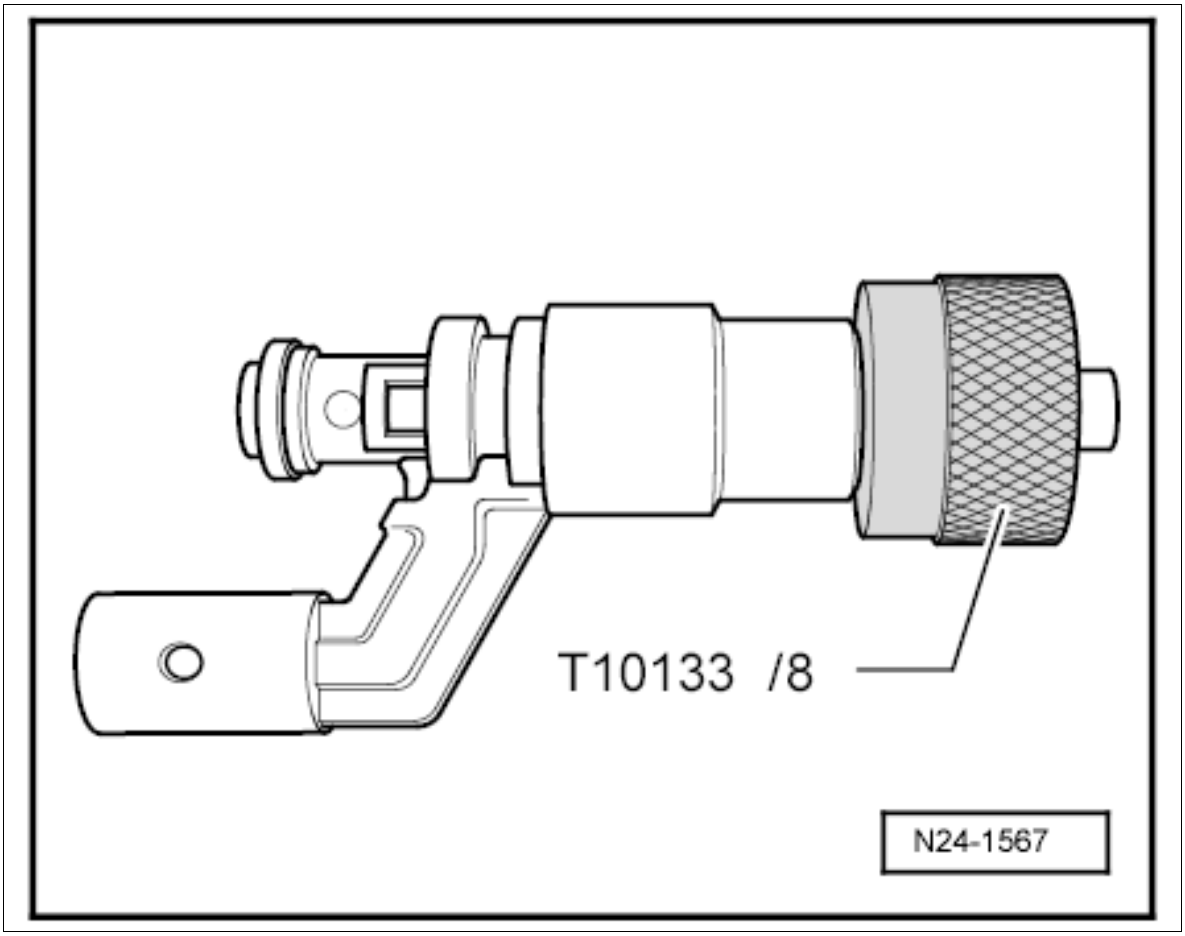


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Press the calibrating nozzle **-T10133/8-** with a slight rotary movement (approx. 180°) as far as it will go onto the fuel injector.

   Pull the calibrating sleeve off again by turning it in the opposite direction.

Fig 6: Identifying Sleeve T10133/8

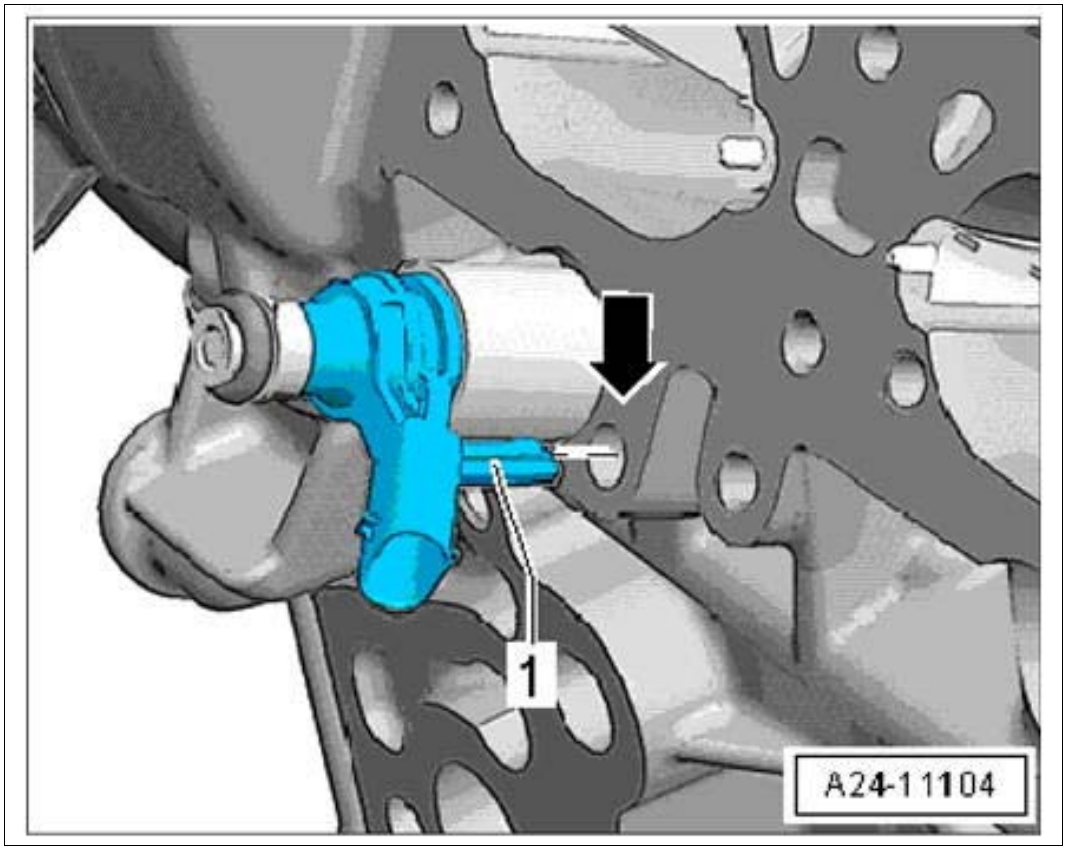


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Install fuel injector.
    1. 7.1.
    2. 7.2. Press the fuel injector as far as it will go into the bore on the cylinder head with your hand.

       Make sure that the fuel injectors are positioned correctly in the cylinder head.
    3. 7.3. The lug **-1-** and the bore in the cylinder head must be aligned.

Fig 7: Locating Fuel Injector Position

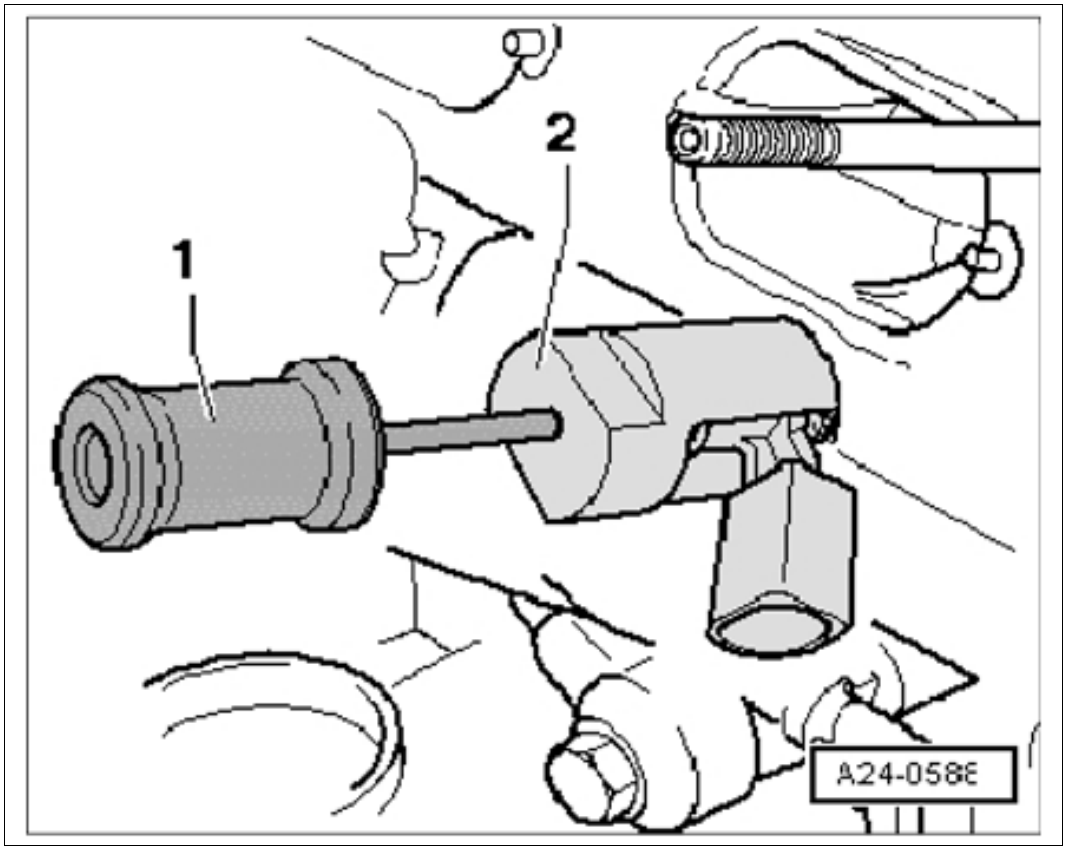


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. If the fuel injector cannot be inserted by hand the following procedure must be performed.

    1. 8.1. Use the puller **T10133/2A -2-** with impact hammer **T10133/3 -2-** to guide in the fuel injector.

Fig 8: Identifying Puller T10133/2A And Impact Hammer T10133/3



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Further installation is performed in reverse order.

WM 244019 REMOVING AND INSTALLING FUEL INJECTOR (MACAN) > INSTALLING FUEL INJECTORS > INSTALLING FUEL INJECTORS FOR INTAKE MANIFOLD INJECTION

NOTE: Incorrect handling of sealing rings and covers

- *Leaks*
- *Risk of damage to components*

→ Use clean tools without burrs.

→ Make sure not to leave any scores or scratches when cleaning.

1. The fuel injector is installed in reverse order to removal.
    1. 1.1. Replace O-ring **-1-** .
    2. 1.2. Replace O-ring **-4-** and coat with clean engine oil.

3. 1.3. Replace damaged retaining clips **-3-** .

WM 246319 REMOVING AND INSTALLING HIGH-PRESSURE PUMP (MACAN) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Fastening screw for high-pressure pump	Replace	Tightening torque	20 Nm (15 ftlb.)		

Fuel line adapter	Replace	Tightening torque	40 Nm (30 ftlb.)		
Union nut on fuel line		Tightening torque	20 Nm (15 ftlb.)		

WM 246319 REMOVING AND INSTALLING HIGH-PRESSURE PUMP (MACAN) > PRELIMINARY WORK

1. Disconnect the battery.
2. Remove engine cover.

WM 246319 REMOVING AND INSTALLING HIGH-PRESSURE PUMP (MACAN) > REMOVING HIGH-PRESSURE PUMP

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapors.

→ Attach warning sign in a clearly visible position.

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

Information

- Absorb any escaping fuel using a suitable binding material or a cloth.
- Cloths which have absorbed fuel must be disposed of according to the applicable national laws.

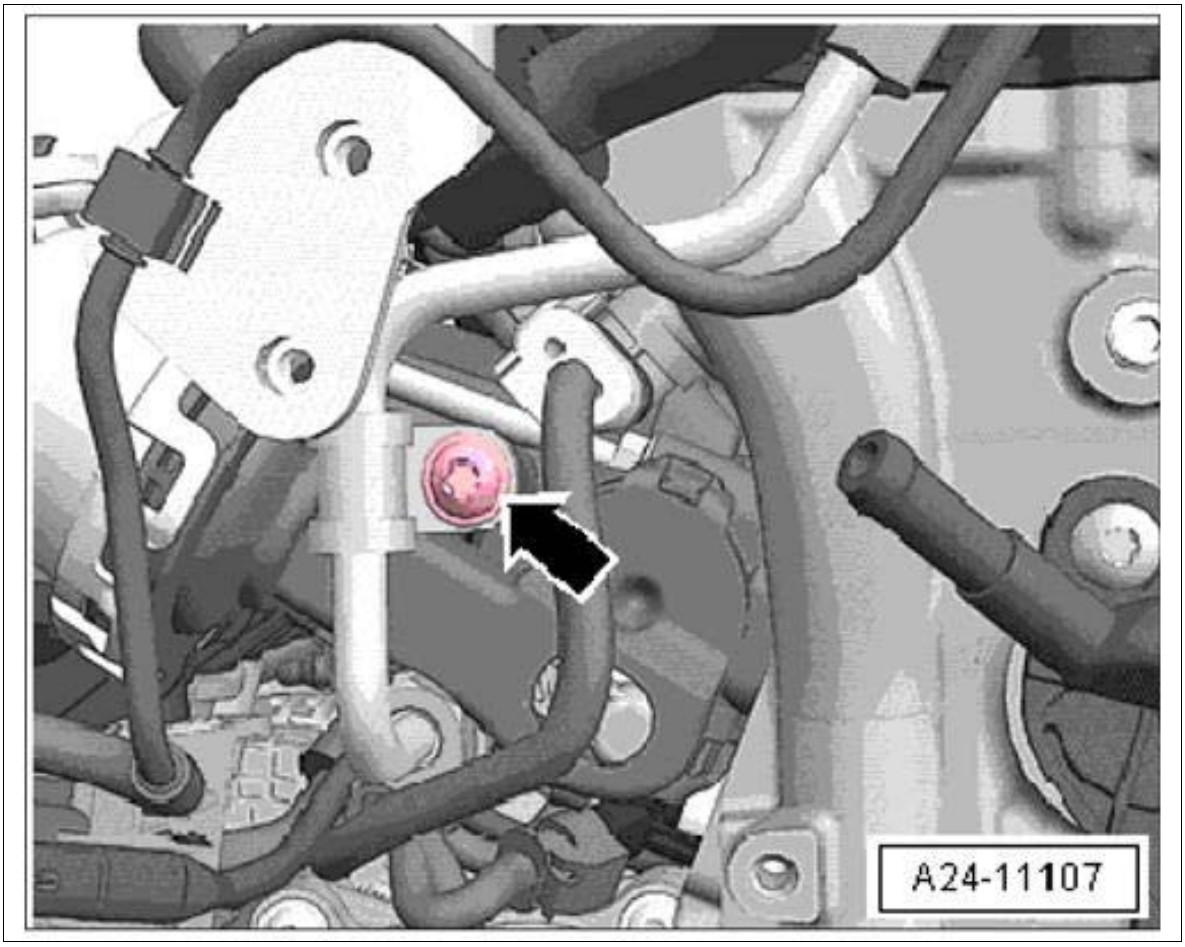
- The fuel system must be depressurized before starting work on it.
- Only work on the fuel system in well-ventilated rooms.
- Any seals which have been removed must always be replaced.
- Do not use any sealant containing silicone or silicone spray when the injection system is open. Traces of silicone drawn in by the engine are not combusted and damage the oxygen sensors.

Information

- Close off open connections and lines using suitable stoppers or caps.

1. Unscrew screw **-arrow-** and loosen holding clamp on fuel high-pressure line.

   Fig 1: Locating High-Pressure Line Holding Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Remove high-pressure pump.

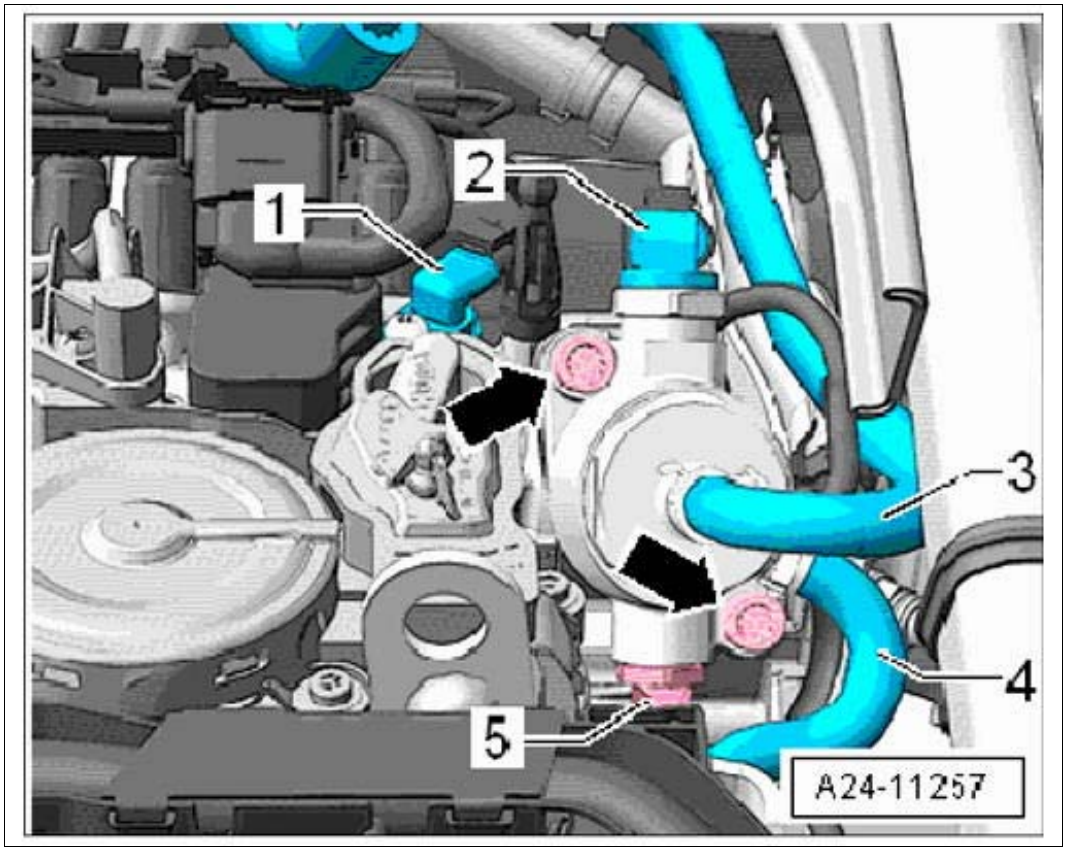
    1. 2.1. Release and disconnect electric connector **-2-** for the fuel pressure sensor.
    2. 2.2. Loosen clamps and pull off fuel lines **-3-** and **-4-** .
    3. 2.3. Unscrew union nut and loosen fuel high-pressure line **-5-** at the adapter.

       Replace adapter on the high-pressure pump.

4. 2.4. Unscrew screws **-arrows-** and remove high-pressure pump.

   The roller tappet can remain in the vacuum pump.

   Fig 2: Locating High-Pressure Pump Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 246319 REMOVING AND INSTALLING HIGH-PRESSURE PUMP (MACAN) > INSTALLING HIGH-PRESSURE PUMP

Information

An adaptation must be performed after replacing the high-pressure pump and/or the fuel pressure control valve. Use the vehicle diagnostic tester to do this.

1. Install high-pressure pump.
    1. 1.1. Replace O-ring on high-pressure pump.
    2. 1.2. Fit roller tappet into the vacuum pump.
    3. 1.3. Turn the crankshaft until the roller tappet is set to the lowest point.
    4. 1.4. Replace adapter for high-pressure pump. **Tightening torque 40 Nm (30 ftlb.)**
    5. 1.5. Insert high-pressure pump into the vacuum pump and tighten screws hand-tight.

6. 1.6. Tighten screws to the specified tightening torque. **Tightening torque 20 Nm (15 ftlb.)**

2. Install fuel high-pressure line.

    1. 2.1. Tighten union nut on high-pressure line hand-tight.
    2. 2.2. Secure holding clamp for high-pressure line.
    3. 2.3. Align high-pressure line without tension and tighten to the specified tightening torque. **Tightening torque 20 Nm (15 ftlb.)**
    4. 2.4. Tighten screw on the holding clamp.

3. Further installation is performed in reverse order.

WM 246319 REMOVING AND INSTALLING HIGH-PRESSURE PUMP (MACAN) > SUBSEQUENT WORK

1. Connect the battery.
2. Check the fuel system for leaks.
3. Install engine cover.

WM 246919 REMOVING AND INSTALLING OXYGEN SENSOR UPSTREAM OF CATALYTIC CONVERTER (MACAN) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Oxygen sensor upstream of catalytic converter	Grease thread with high-temperature paste.	Tightening torque	55 Nm (41 ftlb.)		

WM 246919 REMOVING AND INSTALLING OXYGEN SENSOR UPSTREAM OF CATALYTIC CONVERTER (MACAN) > PRELIMINARY WORK

1. Remove engine cover.

WM 246919 REMOVING AND INSTALLING OXYGEN SENSOR UPSTREAM OF CATALYTIC CONVERTER (MACAN) > REMOVING OXYGEN SENSOR UPSTREAM OF CATALYTIC CONVERTER

NOTE: Incorrect handling of oxygen sensors

- *Damage to oxygen sensors*
- *Different exhaust emission behavior*

→ Do not remove the plastic cap on the thread until just prior to fitting.

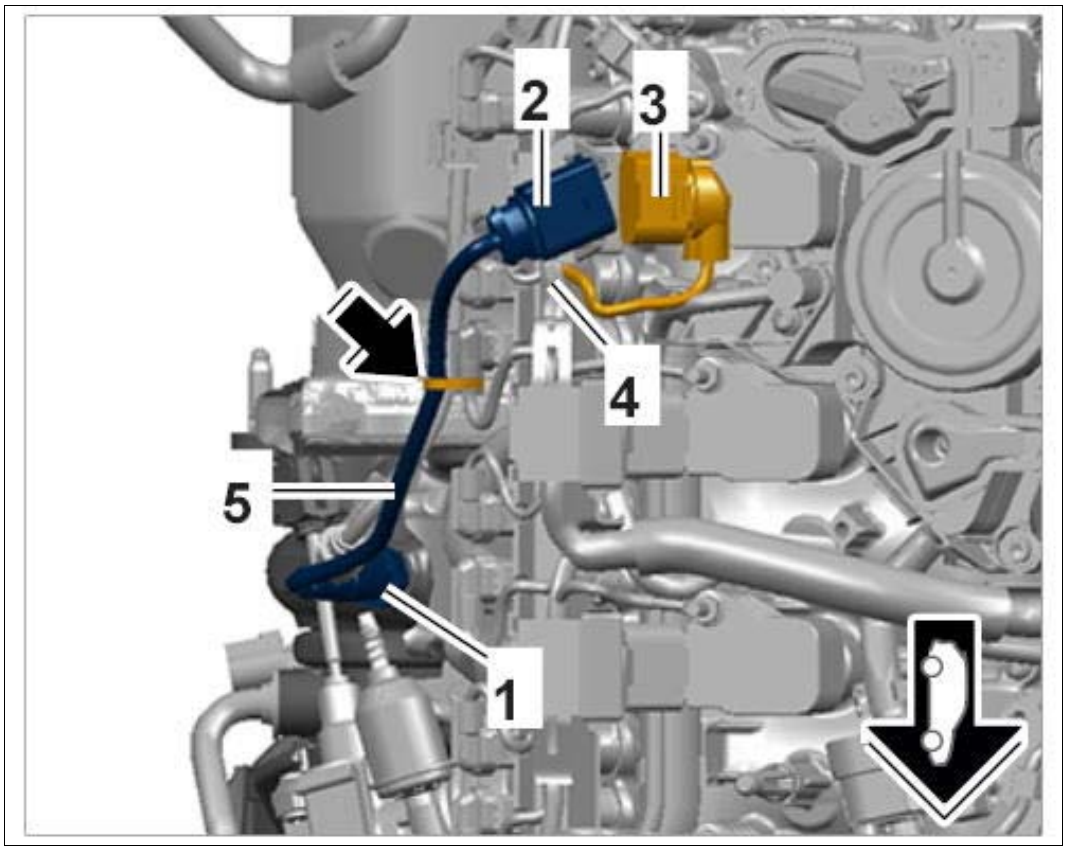
→ Protect oxygen sensors from impact of any kind.

→ Do not kink or twist the cables when screwing in the sensors.

→ Do not re-use dirty or damaged components.

1. Remove oxygen sensor **-1-** .
    1. 1.1. Release and disconnect electric connector **-3-** .
    2. 1.2. Loosen connector housing **-2-** from the holder **-4-** .
    3. 1.3. Loosen electric line **-5-** at the holder **-arrow-** and expose line.
    4. 1.4. Unscrew and remove oxygen sensor.

Fig 1: Locating Catalytic Converter Oxygen Sensor Upstream Electric Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 246919 REMOVING AND INSTALLING OXYGEN SENSOR UPSTREAM OF CATALYTIC CONVERTER (MACAN) > INSTALLING OXYGEN SENSOR UPSTREAM OF CATALYTIC CONVERTER

NOTE: Incorrect handling of oxygen sensors

- *Damage to oxygen sensors*
- *Different exhaust emission behavior*

→ Do not remove the plastic cap on the thread until just prior to fitting.

→ Protect oxygen sensors from impact of any kind.

→ Do not kink or twist the cables when screwing in the sensors.

→ Do not re-use dirty or damaged components.

1. Installation is performed in reverse order. Pay particular attention to the following:
    1. 1.1. Coat oxygen sensor thread with assembly grease 000.043.207.07.
    2. 1.2. Tightening torque: **Tightening torque 55 Nm (41 ftlb.)**

Filler neck for windscreen washer system to body	Internal Torx screw, M6 x 14	Tightening torque	7 Nm (5 ftlb.)		
Cover on fuse box in the plenum panel	Internal Torx screw,	Tightening torque	3.5 Nm (2.5 ftlb.)		

WM 247019 REMOVING AND INSTALLING DME CONTROL UNIT (MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove cowl panel cover. → 508719 REMOVING AND INSTALLING COWL PANEL COVER

WM 247019 REMOVING AND INSTALLING DME CONTROL UNIT (MACAN S, MACAN TURBO) > REMOVING DME CONTROL UNIT

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

Information

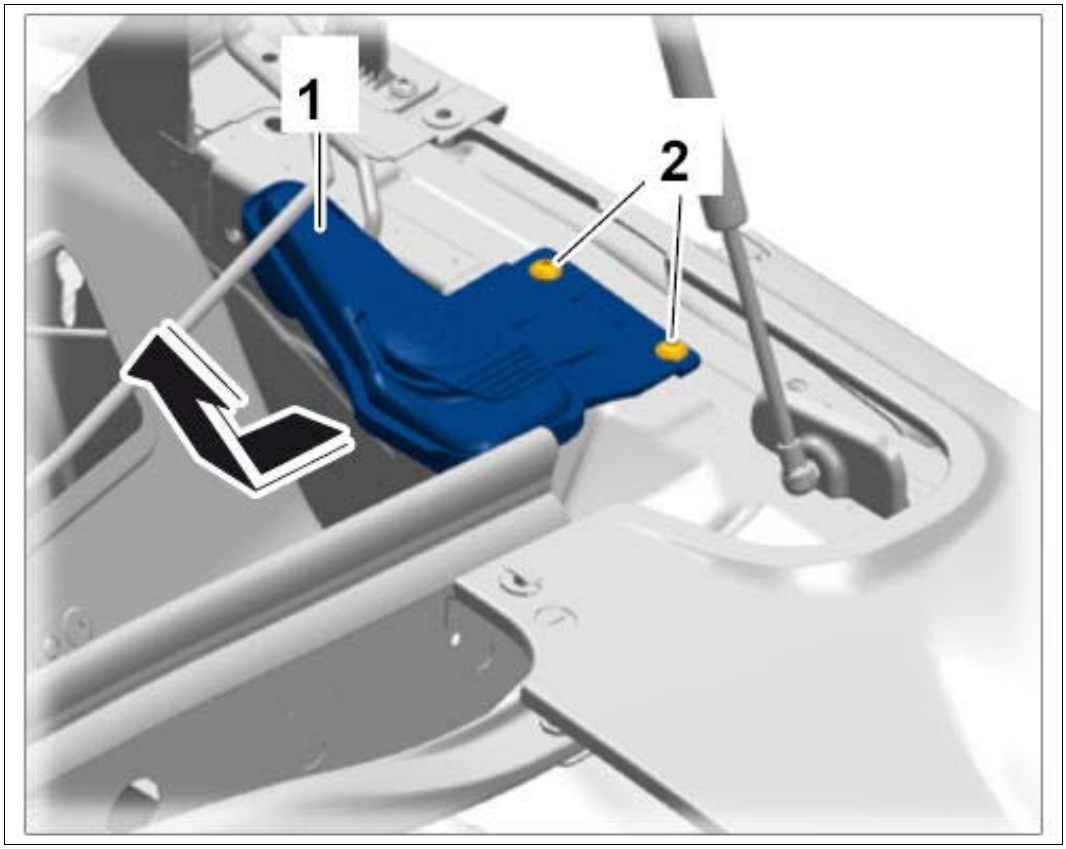
Always comply with the regulations for handling ESD-sensitive components!

- Assembly work may only be carried out if the mechanic is wearing the working clothes and shoes approved by Porsche.
- The new part must only be removed from the ESD (electrostatic discharge) protective packaging just before installation and at the position at which the part is to be installed.
- Never touch the electric pins and plug contacts.

1. Switch off ignition and pull remote control out of ignition lock.
2. Remove filler neck from the windscreen-washer reservoir **-1-** .
    1. 2.1. Unscrew fastening screws **-2-** .

2. 2.2. Pull filler neck out of the windscreen-washer reservoir and remove it.

Fig 1: Removing Filler Neck From Windscreen-Washer Reservoir



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew fastening screws **-1, 2 and 4-** and remove cover **-3-** on the fuse box.

4. High-pressure connecting line/**After opening the conical/ball joints, always replace high-pressure line with the latest type**
5. High-pressure line, cylinder 4-6/**After opening the conical/ball joints, always replace high-pressure line with the latest type**

Tightening specifications for fuel lines to high-pressure pump and fuel gallery:

1. Fit union nuts hand-tight.
2. Screw in and align holder/clamp.
3. Tighten union nuts to → **Initial tightening: 20 Nm (15 ftlb.)**
4. Tighten holder/clamp to → **Tightening torque: 10 Nm (7.5 ftlb.).**
5. Tighten union nuts to → **Final tightening: +35 Nm (+26 ftlb.)** until secure.

WM 249019 REMOVING AND INSTALLING FUEL LINE (HIGH-PRESSURE) (MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove intake-air distributor. → 244619 REMOVING AND INSTALLING INTAKE-AIR DISTRIBUTOR

WM 249019 REMOVING AND INSTALLING FUEL LINE (HIGH-PRESSURE) (MACAN S, MACAN TURBO) > REMOVING FUEL LINE (HIGH-PRESSURE)

WARNING: Hot fuel and hot fuel lines.

- *Danger of scalding*

→ Allow the fuel to cool down before opening line connections.

→ Wear protective gloves.

→ Wear protective goggles.

Information

Always read the rules relating to cleanliness and instructions for working on the fuel system.

These instructions must always be observed before and while working on the fuel system.

Information

- Close off open connections and lines using suitable stoppers or caps.

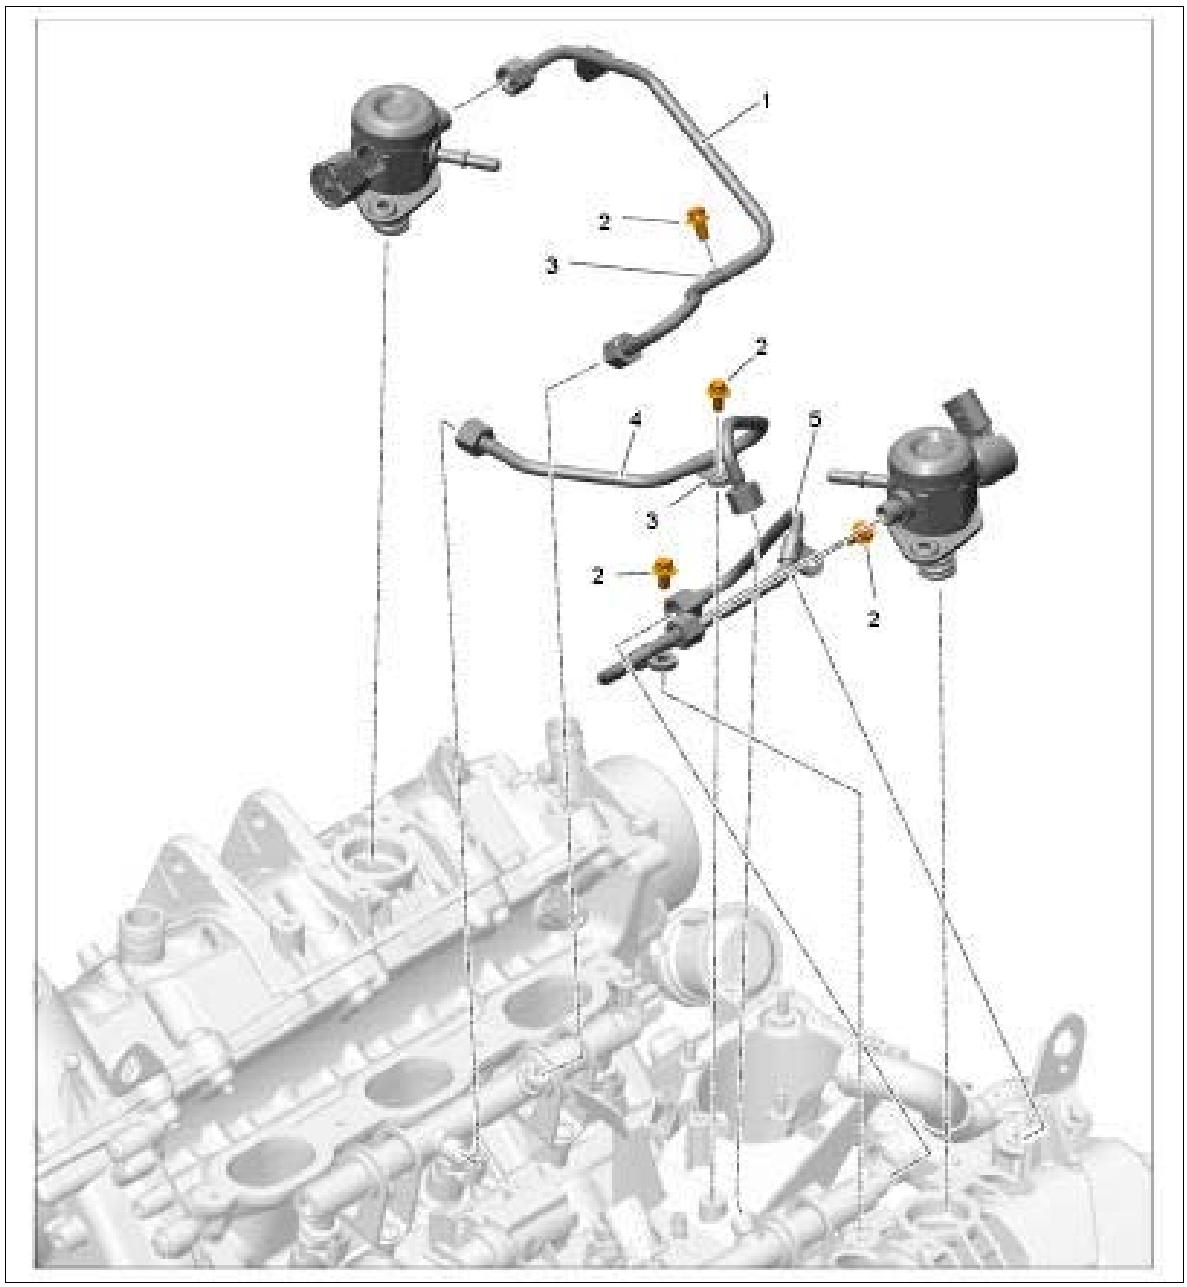
1. Unscrew fastening screws **-2-** for the high-pressure lines **-1, 4 and 5-** .
2. Loosen union nuts on high-pressure line **-1-** .
    1. 2.1. Remove high-pressure line **-1-** .
3. Loosen union nuts on high-pressure line **-4-** .
    1. 3.1. Remove high-pressure line **-4-** .

4. Loosen union nuts on high-pressure line **-5-** .

    1. 4.1. Remove high-pressure line **-5-** .

5. Place high-pressure lines **-1, 4 and 5-** on a clean surface.

Fig 1: Identifying High-Pressure Pump With High-Pressure Lines



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 249019 REMOVING AND INSTALLING FUEL LINE (HIGH-PRESSURE) (MACAN S, MACAN TURBO) > INSTALLING FUEL LINE (HIGH-PRESSURE)

Information

- Observe cylinder-specific markings if high-pressure lines are to be reused.

- High-pressure lines can always be reused.
- Check the sealing cone of each high-pressure line for deformities and tears before installation.
- The line bore must not be deformed, narrowed or damaged.

1. Remove dirt from the sealing cone on the fuel collection pipe by suction.
2. Clean high-pressure lines and line heads with a cold-cleaning product and blow-dry with compressed air.
3. Coat the thread on the union nuts with fuel.
4. Install high-pressure lines.

    1. 4.1. Observe specified tightening sequence.

WM 249019 REMOVING AND INSTALLING FUEL LINE (HIGH-PRESSURE) (MACAN S, MACAN TURBO) > SUBSEQUENT WORK

Information

- The high-pressure connections do not have to be opened in order to bleed the system. The fuel system is bled automatically.
- If there is still air in the fuel system, the engine can switch to emergency operation during the test drive. Switch off the engine and erase the fault memory. Then continue to test drive the vehicle.

1. Bleed the fuel system and perform a leak test.

    1. 1.1. Leave the engine running at idle speed for a few minutes without pressing the accelerator.
    2. 1.2. Switch off the engine and turn off the ignition.
    3. 1.3. Carefully check the entire high-pressure area of the injection system.
    4. 1.4. Then perform a test drive for more than 20 km (12 miles) with at least one full-throttle acceleration. Then check the high-pressure area for leaks again.
2. Install engine cover (design cover).

4. Remove exhaust system.

WM 260119 REMOVING AND INSTALLING EXHAUST SYSTEM (MACAN) > INSTALLING EXHAUST SYSTEM

1. Installation is performed in reverse order. Pay particular attention to the following:
    1. 1.1. Tightening torque for nuts securing rear silencer holder to body: **Tightening torque 20 Nm (15 ftlb.)**
    2. 1.2. Tightening torque for screws securing rear silencer holder to rear body: **Tightening torque 20 Nm (15 ftlb.)**
    3. 1.3. Tightening torque for nuts on clamp: **Tightening torque 33 Nm (24 ftlb.)**
    4. 1.4. Align clamp.

WM 260119 REMOVING AND INSTALLING EXHAUST SYSTEM (MACAN) >

SUBSEQUENT WORK

1. Install cover for center underbody. → Installing Cover For Center Underbody

WM 261019 REMOVING AND INSTALLING EXHAUST MANIFOLD (MACAN S, MACAN TURBO) > REMOVING AND INSTALLING EXHAUST MANIFOLD

The procedure for removing and installing the exhaust manifold is described under → 213019 REMOVING AND INSTALLING TURBOCHARGER .

Information

- For more information, see P ORSCHE E LECTRONIC PAR T S CATALOGUE "PET"

The exhaust manifold and turbocharger are integrated components and cannot be replaced individually.

WM 262519 REMOVING AND INSTALLING FRONT SILENCER (MACAN) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Clamping sleeve, D65		Tightening torque	33 Nm (24 ftlb.)		
Fastening nuts securing front silencer to catalytic converter	Replace	Tightening torque	23 Nm (17 ftlb.)		

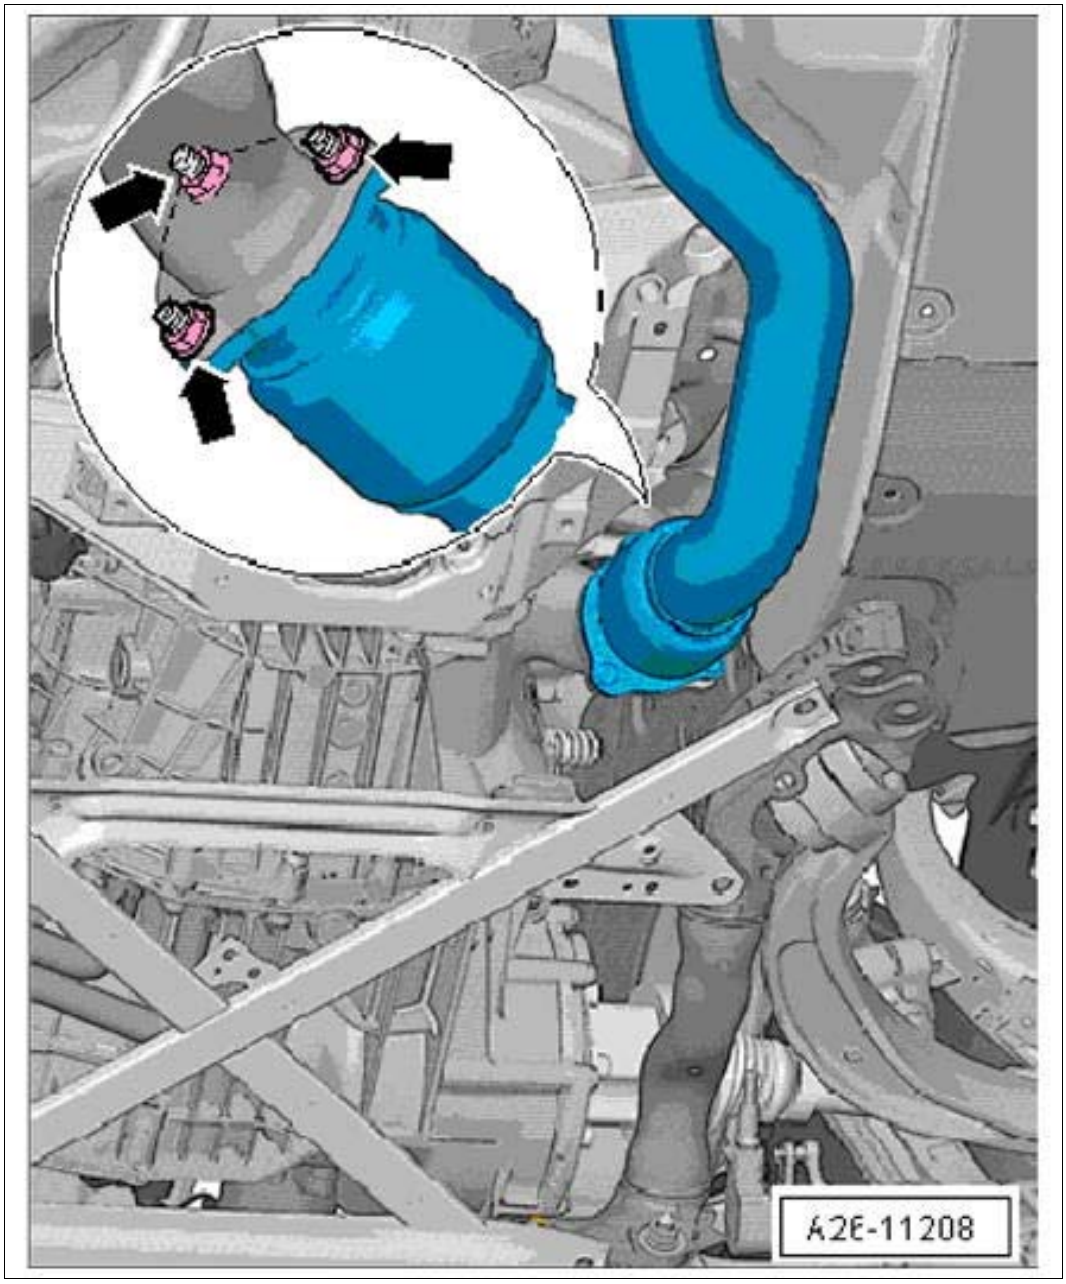
WM 262519 REMOVING AND INSTALLING FRONT SILENCER (MACAN) > PRELIMINARY WORK

1. Remove engine cover.
2. Remove underbody panelling.

WM 262519 REMOVING AND INSTALLING FRONT SILENCER (MACAN) > REMOVING FRONT SILENCER

1. Loosen front silencer at the catalytic converter.
    1. 1.1. The two upper screws are accessible from above through the engine compartment.

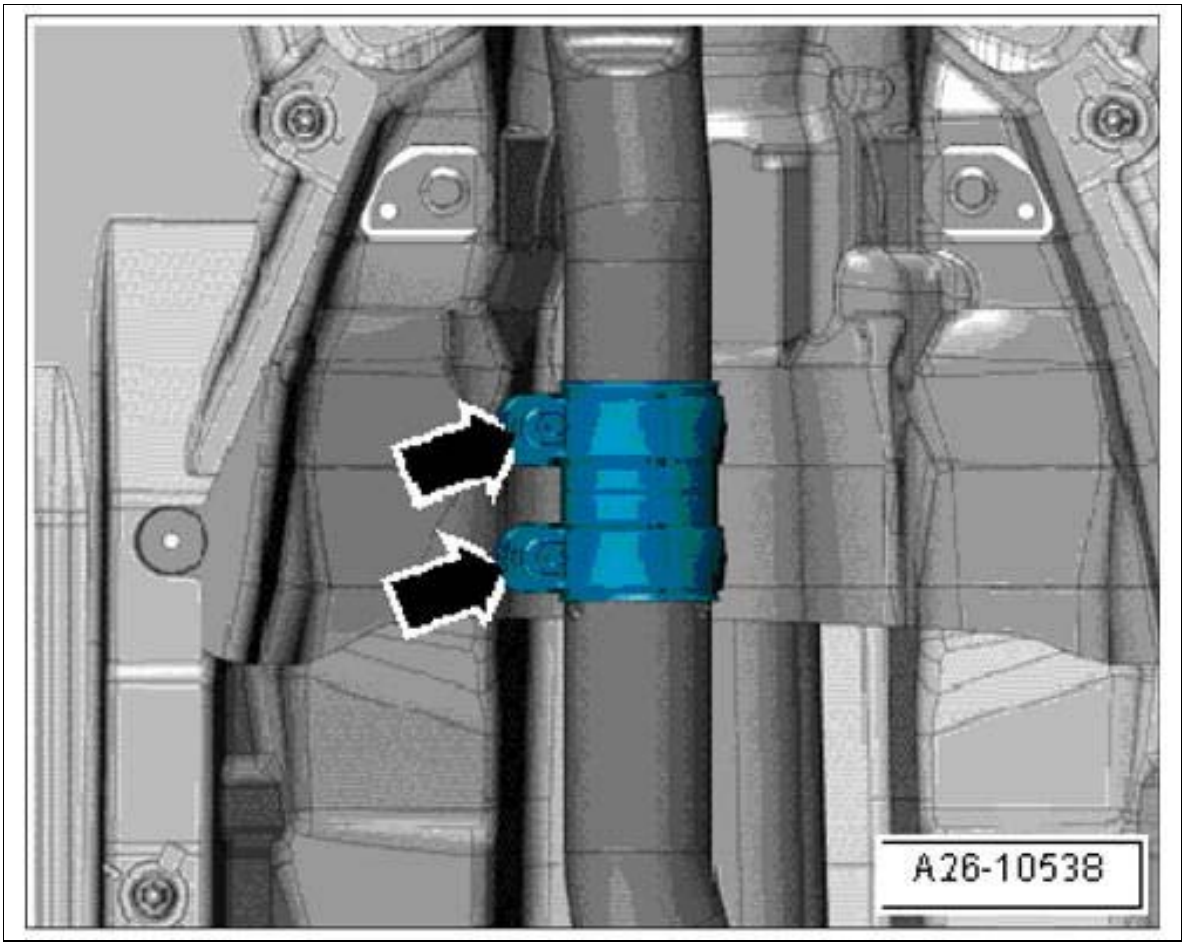
Fig 1: Locating Catalytic Converter Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen clamping sleeve and push it to the rear.

Fig 2: Locating Front Silencer Clamping Sleeve



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove front silencer by pulling it downwards.

WM 262519 REMOVING AND INSTALLING FRONT SILENCER (MACAN) > INSTALLING FRONT SILENCER

1. Installation is performed in reverse order. Pay particular attention to the following:
    1. 1.1. Replace nuts.
    2. 1.2. Replace seal.
    3. 1.3. Tightening torque: **Tightening torque 23 Nm (17 ftlb.)**
    4. 1.4. Tightening torque for clamping sleeve: **Tightening torque 33 Nm (24 ftlb.)**

WM 262519 REMOVING AND INSTALLING FRONT SILENCER (MACAN) > SUBSEQUENT WORK

1. Install underbody panelling.
2. Install engine cover.

WM 263355 REPLACING REAR SILENCER (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
chain pipe cutters	Commercially available tool	Nr.166		
ratchet-type pipe cutters	Commercially available tool	Nr.166-1		

WM 263355 REPLACING REAR SILENCER (ALL MODELS) > REPLACING REAR SILENCER

⚠ *CAUTION: Hot components*

- *Risk of burns*

→ Let hot components cool down.

→ Wear personal protective gear.

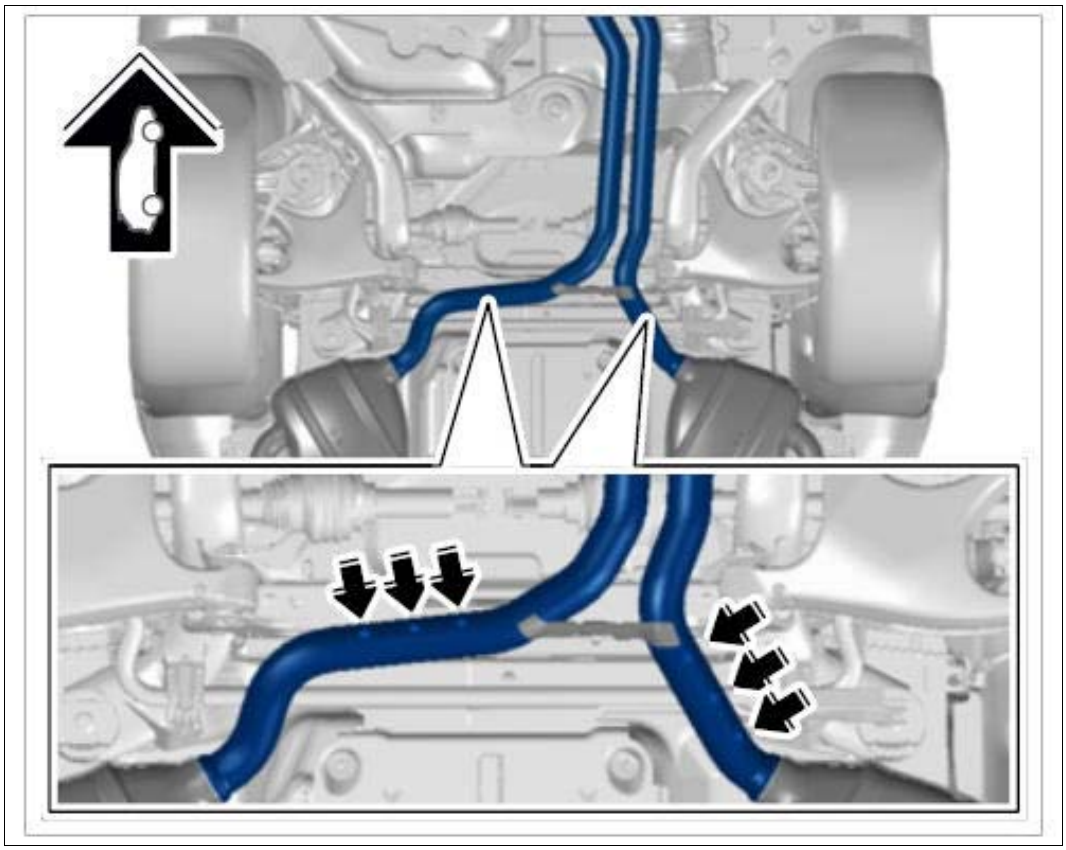
Information

- Before the rear silencer is released, the exhaust system must be supported with a transmission jack or held by another person.

1. On the underside of each exhaust pipe, there are three grooves **-arrows-** marking the connection points.

    1. 1.1. Use the center groove.

    Fig 1: Locating Rear Silencer Connection Point Marking



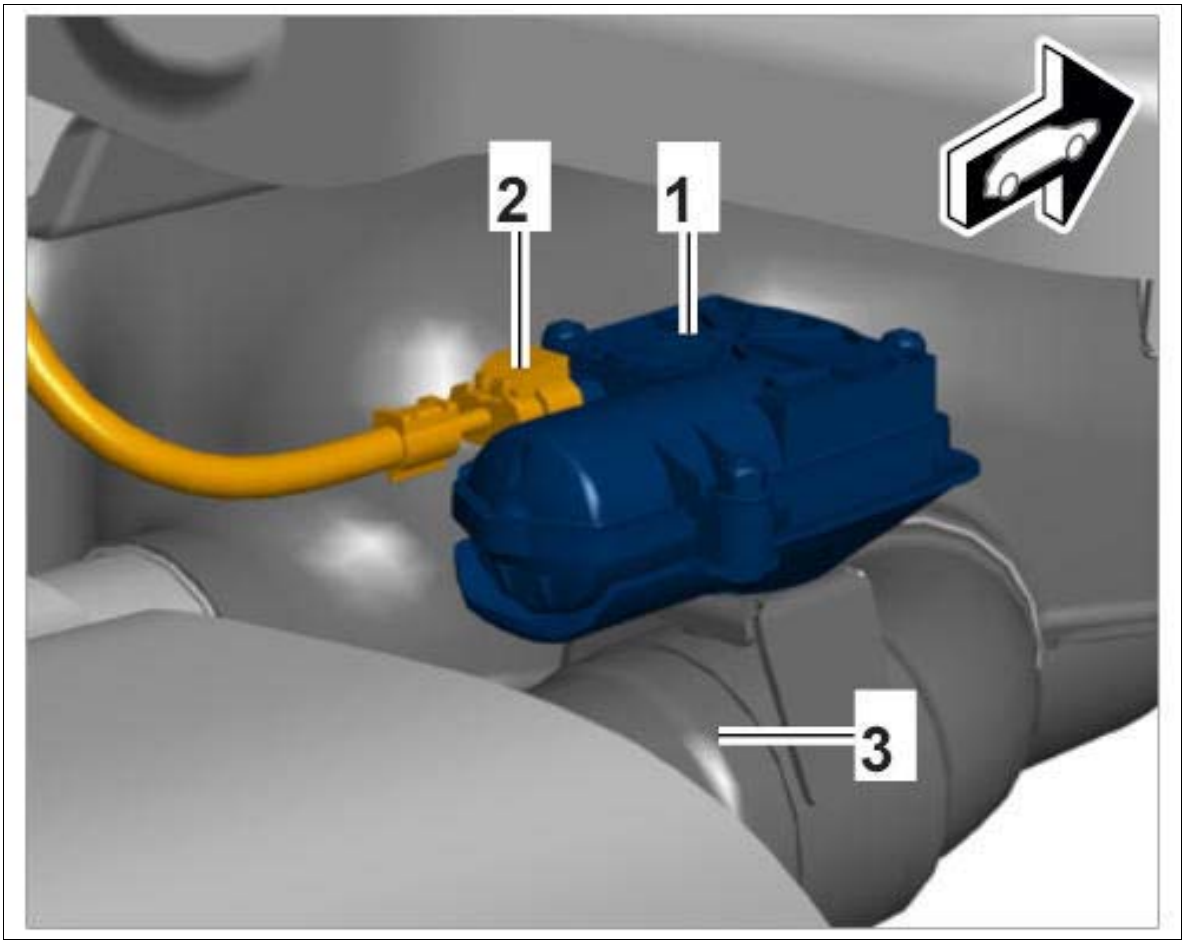
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Disconnect exhaust pipe at the connection point marking using **chain pipe cutters Nr.166 or ratchet-type pipe cutters Nr.166-1** (or a similar tool).

    Only for installing sports exhaust system:

3. At the servo motor for exhaust flap control **-1-** , release and disconnect electric connector **-2-** .

Fig 2: Identifying Exhaust Flap Control & Connector

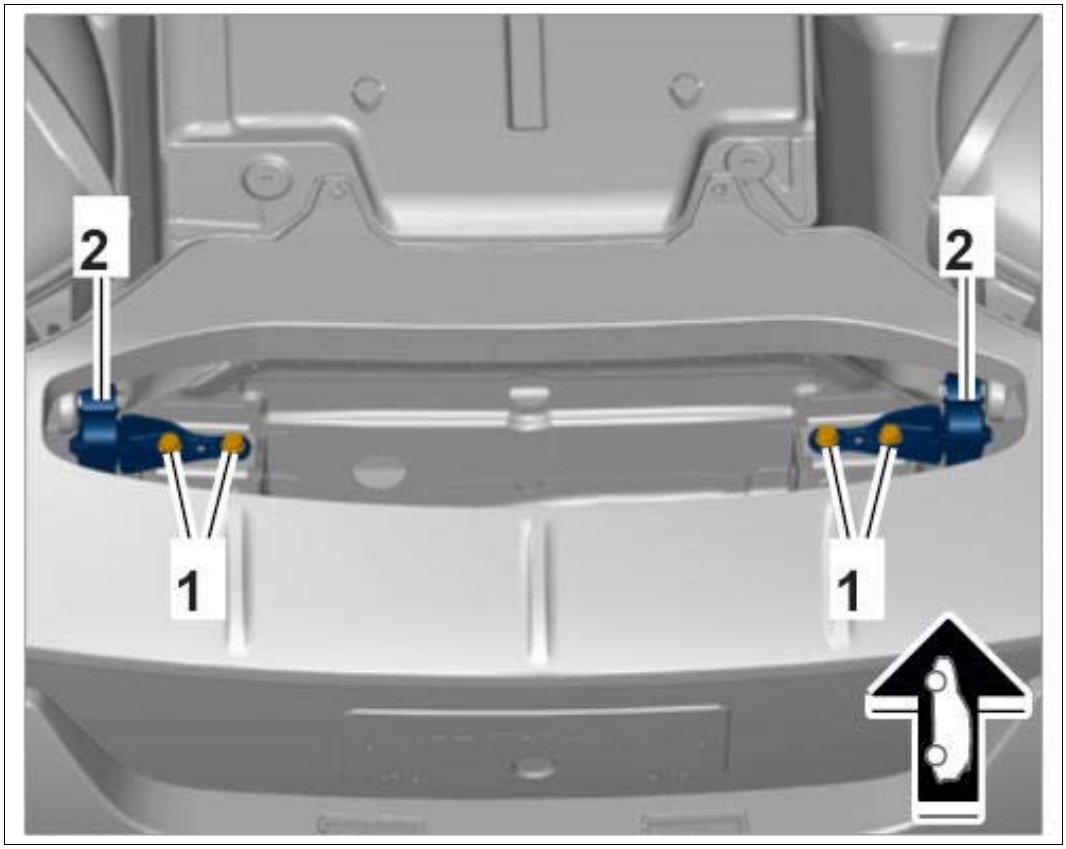


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Unscrew screws **-1-** on holder **-2-** for the rear silencer.

    1. 4.1. **If replacing only one rear silencer:** Unscrew screws on the relevant side.

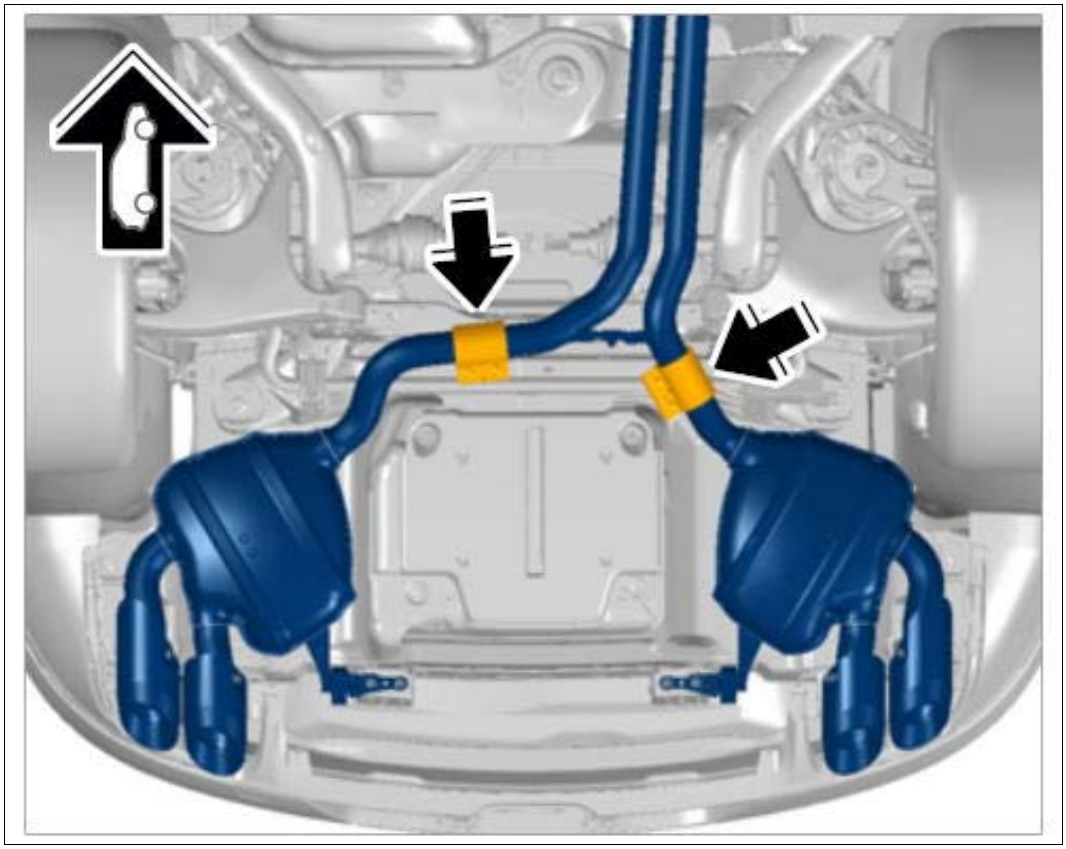
Fig 3: Identifying Rear Silencer Holder Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove rear silencer by pulling it downwards.
6. De-burr cut on inside and outside of the exhaust pipe. If necessary, remove rust from exhaust pipe using suitable polishing agents and manually restore its round shape.
7. Convert rear holder for rear silencer.
    1. 7.1. Fit new support rubbers or holders if necessary.
8. Push new clamping sleeve onto the exhaust pipe.
9. Lift the rear silencer into installation position with the help of another person or a transmission jack. Tighten two fastening screws on each holder to the specified tightening torque.
    1. 9.1. Tightening torque for screws securing holder for rear silencer to rear body:
10. Position clamping sleeves **-arrows-** in the center of the cutting point during installation.
    1. 10.1. Align clamping sleeve.
    2. 10.2. Tightening torque for clamping sleeve:

Fig 4: Locating Rear Silencer Clamping Sleeves



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. **1 - 3** mm/Clip contour must not be lower than the lower edge of the clamping sleeve.

1. Remove subwoofer. → Removing subwoofer

WM 270619 REMOVING AND INSTALLING BATTERY (ALL MODELS) > REMOVING BATTERY

WARNING: Static battery charge

- *Battery can explode*
- *Electrical discharges*

→ Do not rub the battery with a dry cloth.

NOTE: Using charging cables/jump leads directly on the vehicle battery.

- *Risk of damage to battery sensors.*

→ Always connect charging cables/jump leads to the external power supply for jump-lead starting.

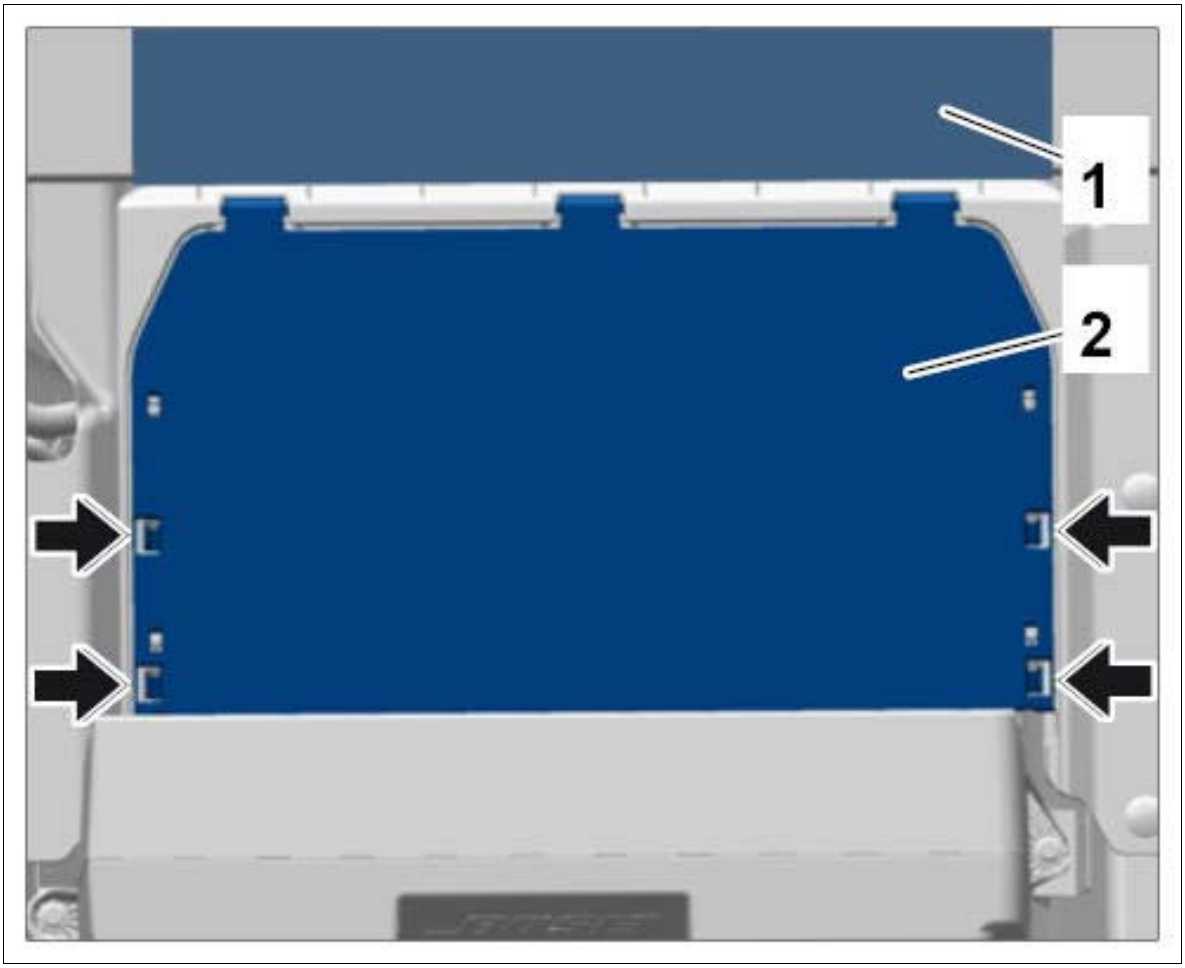
Information

Switch off all loads and remove the ignition key.

- Do not disconnect the battery while the engine is running.
- Disconnect and reconnect battery with extreme caution.
- Do not rub the battery with a dry cloth.

1. Switch off ignition and pull remote control out of ignition lock.
2. Switch off electrical loads.
3. Remove luggage compartment floor.
4. Remove collapsible wheel, if necessary.
5. Lift carpet **-1-** .
6. Disengage cover **-2-** (**-arrows-**) and fold it forward.

Fig 1: Opening Battery Cover

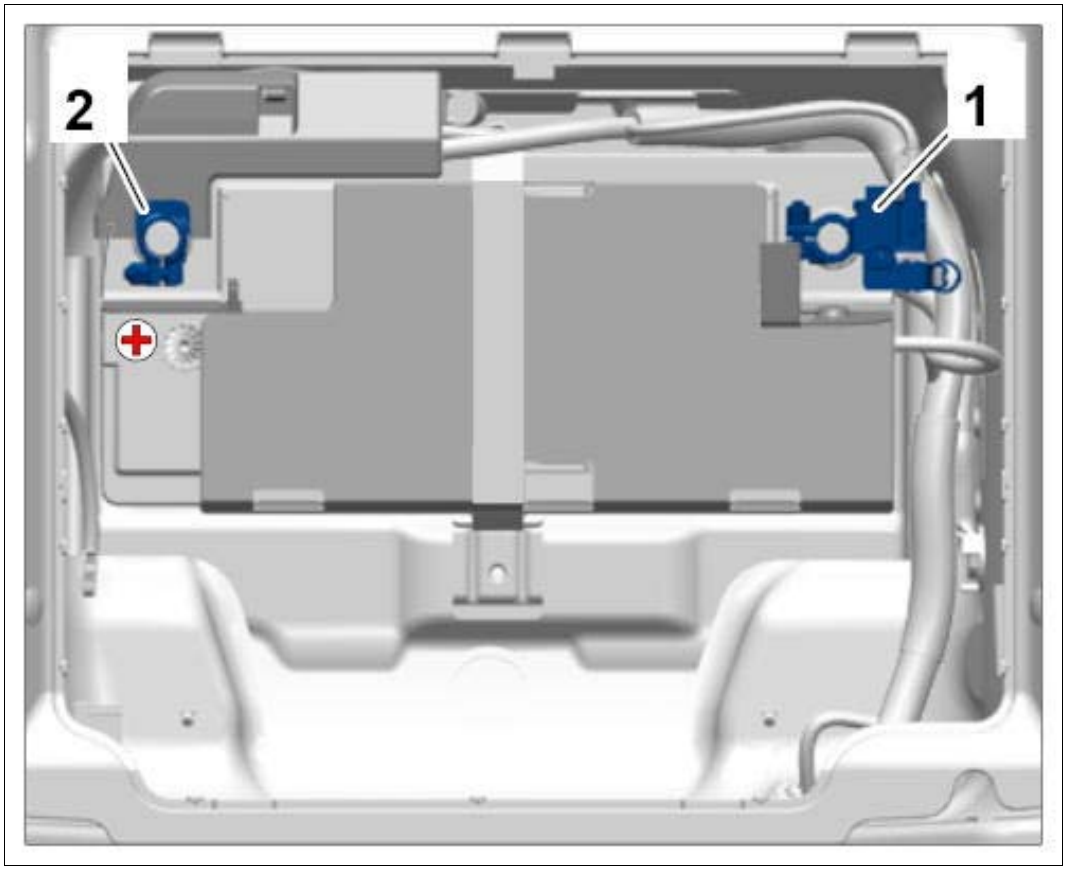


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. **Danger of short circuit when loosening the terminal clamps!**

    1. 7.1. **First** open the cover on the negative terminal and disconnect **terminal clamp -1- for the ground strap from the battery terminal!**
    2. 7.2. Insulate terminal clamp or route ground strap to prevent any contact with the battery terminal!
    3. 7.3. Open cover on the positive terminal and disconnect terminal clamp **-2-** for the B+ line from the battery terminal.

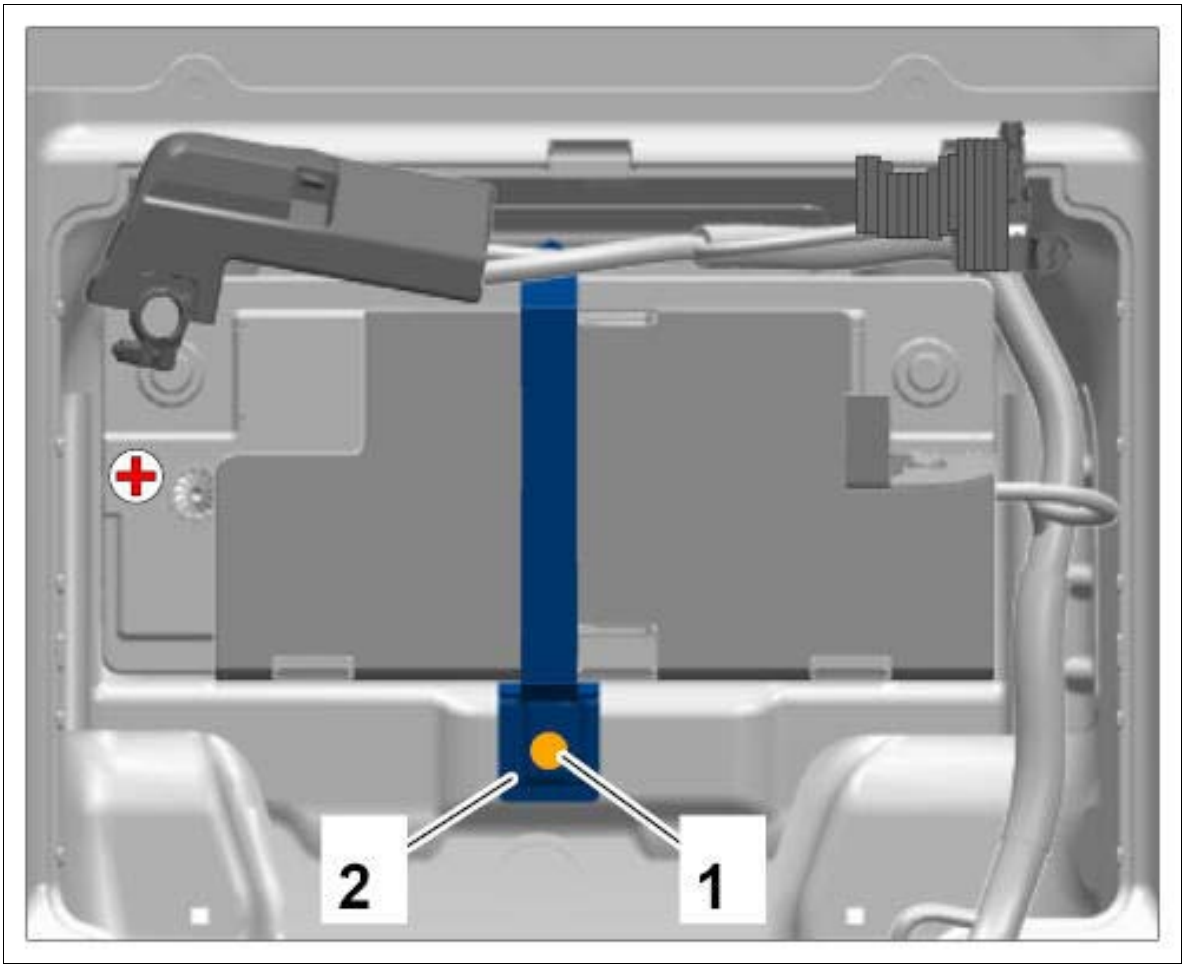
Fig 2: Identifying Battery Terminal Clamps



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Unscrew fastening screw **-1-** , remove clamp support **-2-** and move it forward with a rebound strap.

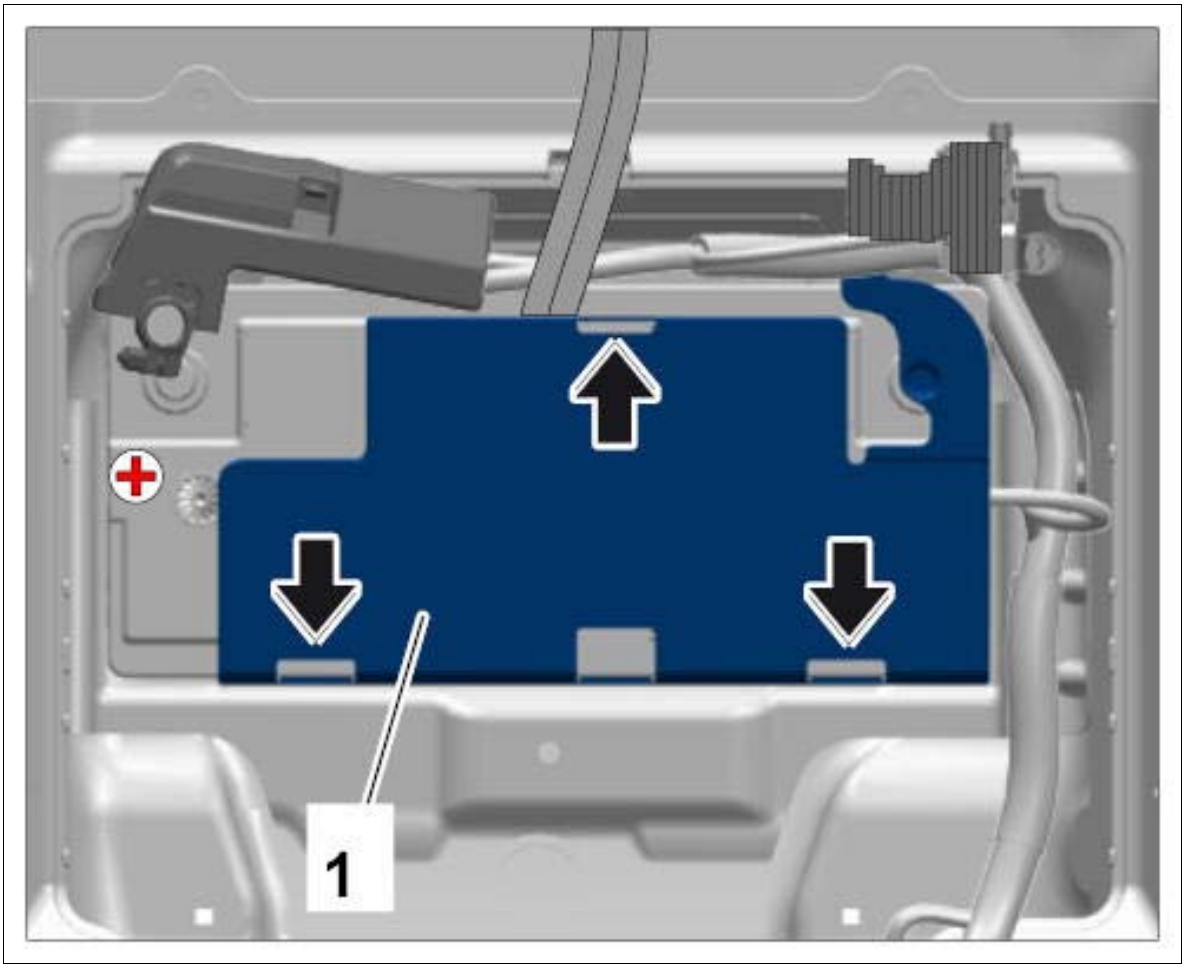
Fig 3: Identifying Battery Clamp Support Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Disengage cover **-1-** (**-arrows-**) and remove it.

Fig 4: Removing Battery Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Pull breather hose **-1-** off the battery **-2-** .
11. Bend up support clips **-3-** and lift the battery out. Get another person to help if necessary.

Fig 5: Identifying Battery And Breather Hose

WM 270619 REMOVING AND INSTALLING BATTERY (ALL MODELS) > INSTALLING BATTERY

WARNING: Static battery charge

- *Battery can explode*
- *Electrical discharges*

→ Do not rub the battery with a dry cloth.

Information

Switch off all loads and remove the ignition key.

- Do not disconnect the battery while the engine is running.

- Disconnect and reconnect battery with extreme caution.
- Do not rub the battery with a dry cloth.

1. Installation is performed in reverse order to removal.
2. Tighten fastening screw for clamp support securing battery to the body. **Tightening torque 23 Nm (17 ftlb.)**
3. Tighten fastening nuts on terminal clamps. **Tightening torque 5 Nm (3.5 ftlb.)**

WM 270619 REMOVING AND INSTALLING BATTERY (ALL MODELS) > SUBSEQUENT WORK > VEHICLES WITH SOUND SYSTEM

1. Install subwoofer. → Installing subwoofer
2. If the battery was replaced, write new battery data into the gateway control unit using **PIWIS Tester II 9818.** → WM 270619 REMOVING AND INSTALLING BATTERY
3. Follow work instructions after disconnecting the battery. → 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY

WM 2706IN EXTERNAL POWER CONNECTION, JUMP-LEAD STARTING (ALL MODELS) > INFORMATION > EXTERNAL POWER CONNECTION, JUMP-LEAD STARTING

WARNING: Live jump leads

- *Risk of electric shock*
- *Risk of short circuit*

→ Route the jump leads so that they do not become entangled in moving parts in the engine compartment.

→ There must be no contact between the vehicles.

NOTE: Using charging cables/jump leads directly on the vehicle battery.

- *Risk of damage to battery sensors.*

→ Always connect charging cables/jump leads to the external power supply for jump-lead starting.

Information

- If the battery is flat, jump leads can be used together with the battery of another vehicle to start the

car or to supply external power to the vehicle.

Information

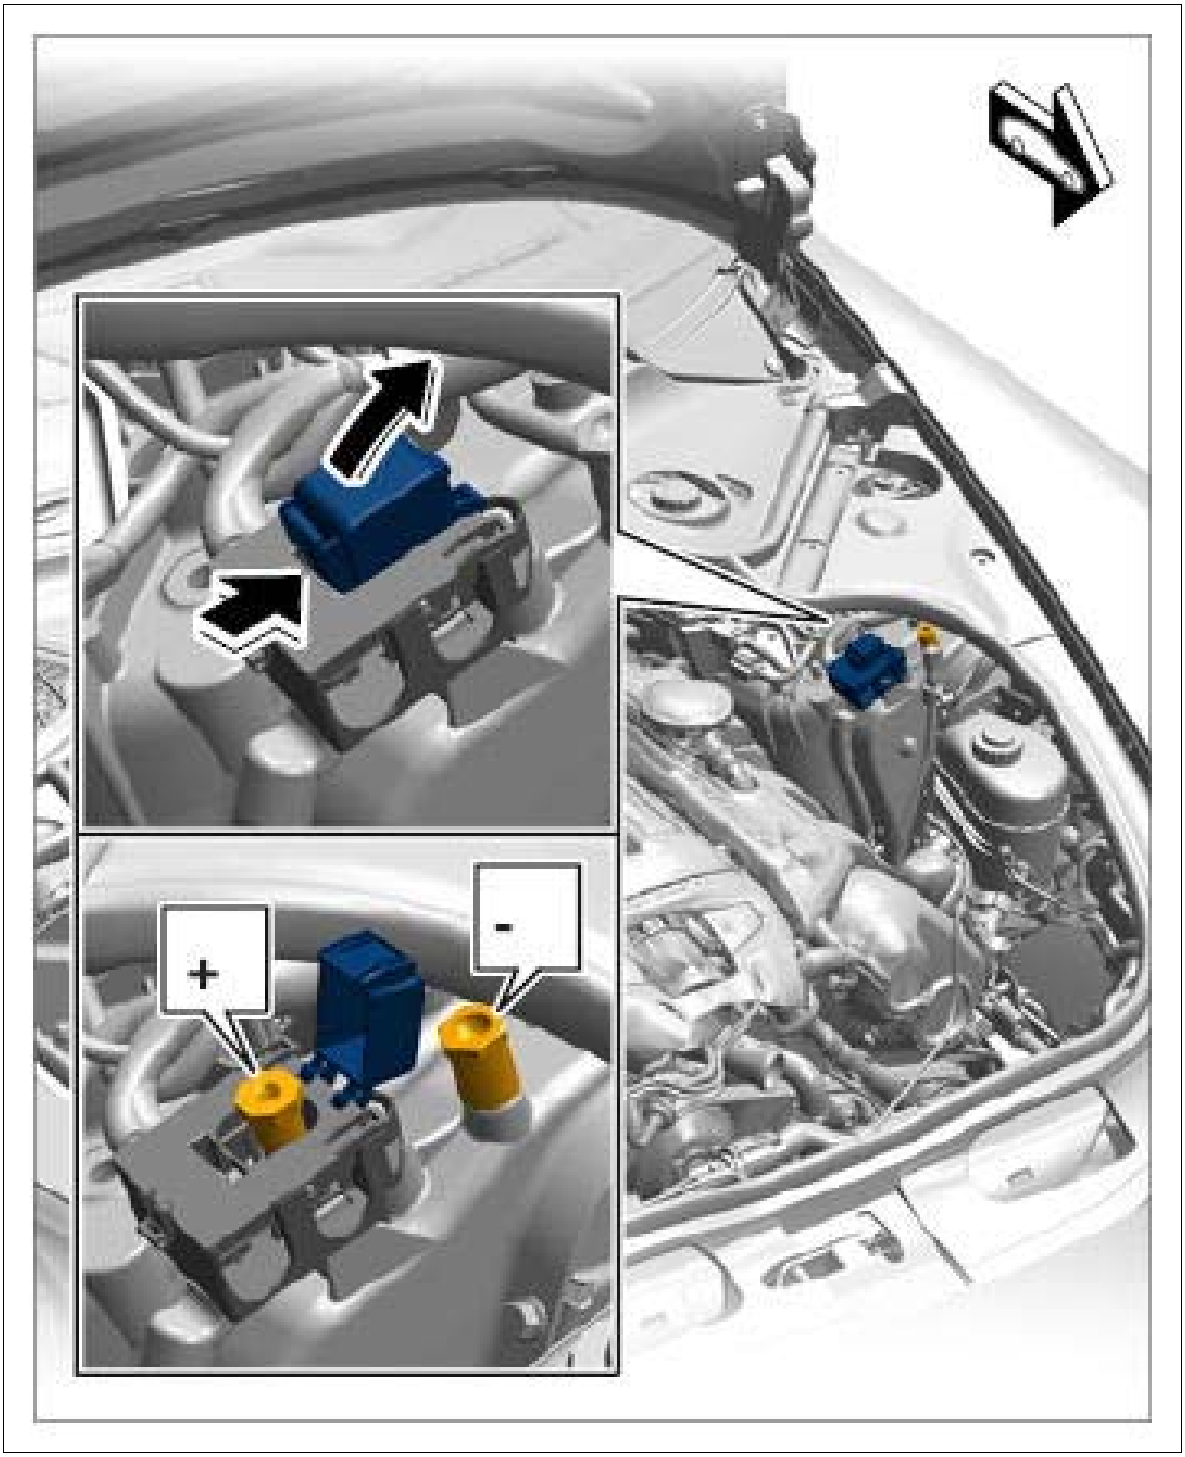
Both batteries must be 12 V batteries.

The capacity (AH) of the donor battery must not be significantly lower than that of the flat battery.

The flat battery must be properly connected to the vehicle electrical system.

1. Open protective cover on the positive terminal for jump-lead starting **-+-** (**-arrow-**).
2. Connect the positive cable to the positive terminal for jump-lead starting **-+-** , then to the positive terminal of the donor battery.
3. First, connect the negative cable to the negative terminal of the donor battery, then to the ground point for jump-lead starting **-** .

Fig 1: Connecting Battery To Vehicle Electrical System



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Leave the engine of the vehicle supplying the power running at higher revs.
5. Start the engine. Do not spend longer than 15 seconds trying to start the vehicle with the jump leads, then wait for at least one minute before trying again.
6. Disconnect the two jump leads in reverse order when the engine is running.
7. Close protective cover.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Battery terminal		Torque	5 Nm (3.5 ftlb.)		

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > INFORMATION

NOTE: A battery charger for providing an external power supply or for jump-lead starting is connected directly to the battery in the vehicle.

- *Risk of damage to the battery sensor.*
- *Battery sensor sends incorrect battery values to the vehicle electrical system.*

→ Always connect a battery charger for providing an external power supply or for jump-lead starting to the defined connections in the engine compartment. → 2X00IN BATTERY TRICKLE CHARGING

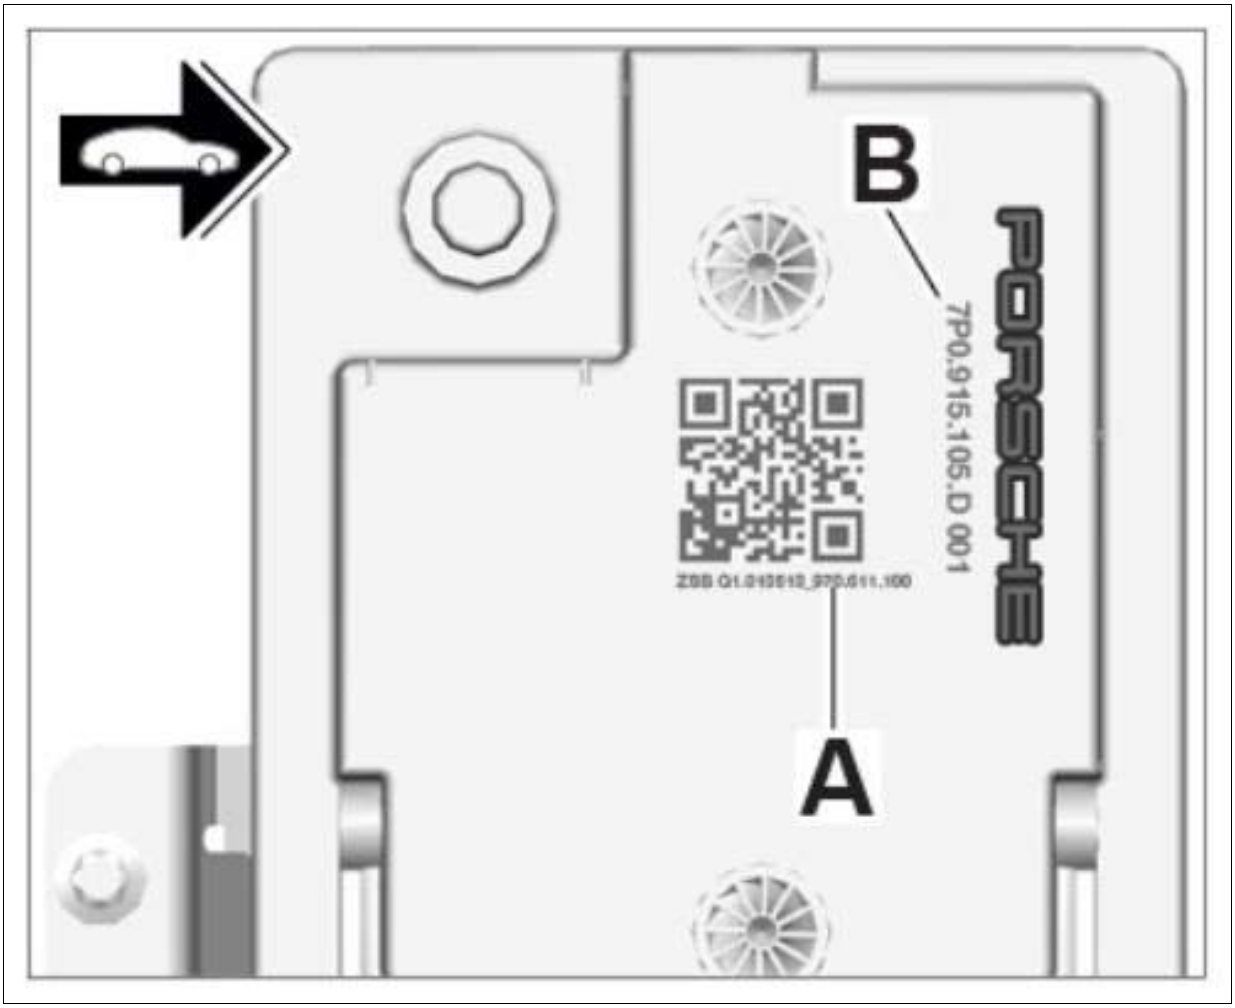
Information

The AGM (**A** bsorbent **G** lass **M** at) battery is a **maintenance-free, sealed** battery.

- This battery must not be opened. If the battery is opened, it must be replaced.

- There is a serial number -A- and a part number -B- on the top right-hand side of the battery.

  Fig 1: Identifying Battery Serial And Part Number



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- After replacing the battery, the serial number and part number as well as the battery size and manufacturer must be entered using the PIWIS Tester under: Gateway/Maintenance/repairs /Change battery.
- The battery size and battery manufacturer must also be entered when changing the battery.

Information

- To prevent contact corrosion, only approved bolts, nuts, washers, etc. should be used. These elements have a special surface coating and must be stored separately.

The battery is one of the most important electrical components in the vehicle. Fault-free functioning of the battery contributes greatly to customer satisfaction. To guarantee long and efficient operation, the battery must be checked and maintained according to the instructions provided here.

Besides starting the vehicle, the battery also acts as a buffer and supplier of electrical power for the entire vehicle electrical system.

An AGM (**A** bsorbent **G** lass **M** at) battery is used as standard. The AGM battery offers the following advantages, for example:

- Sealed, valve-controlled battery
- High-cycle battery
- High cold-start performance
- Cannot leak or tilt
- Totally maintenance-free
- Shake-resistant
- No acid leakage if the housing is damaged
- Flexible installation and safe to handle
- High load capacity and longer service life
- Ideal for Start/Stop function

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > INFORMATION > INSTRUCTIONS FOR HANDLING BATTERIES

Information

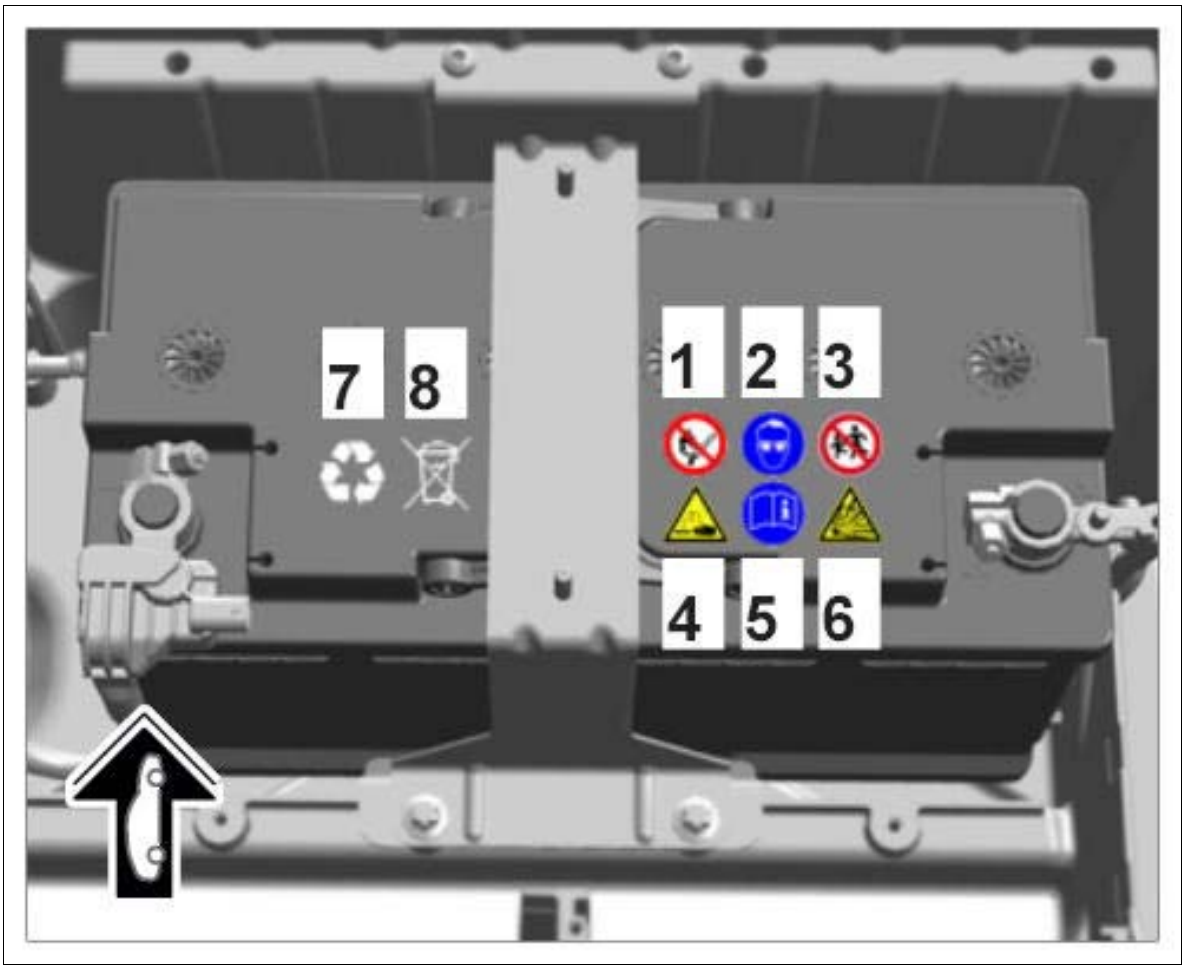
- Battery terminals do not need to be greased.
- The battery terminal clamps should only be attached by hand - without excessive force - to prevent damage to the battery.
- The tightening torque for the battery terminals is → Torque: 5 Nm (3.5 ftlb.).
- If the battery is reconnected, proceed according to → 2X0000 WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY .

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > INFORMATION > WARNING NOTES AND SAFETY REGULATIONS FOR BATTERIES

1. **-1-** No fire, sparks, naked flames or smoking:
    1. Avoid sparking when using cables and electrical devices.
    2. Avoid short circuits.
    3. On batteries with central venting, there is an increased concentration of oxyhydrogen gas at the hose opening. The vent hose should not be bent or blocked by dirt.
2. **-2-** Wear eye protection.
3. **-3-** Keep children away from acids and batteries.
4. **-4-** Risk of acid burns:

1. Battery acid is highly caustic, so wear protective gloves.
2. Do not tip battery; acid can emerge from the vent opening.

Fig 1: Identifying Battery Symbols



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. First aid: Rinse acid splashes in the eyes immediately with clean water for a few minutes. Consult a doctor immediately. Neutralize acid splashes on the skin or clothing immediately with soap suds and rinse again with plenty of water. If acid has been drunk unintentionally, consult a doctor immediately.

5. **-5-** Follow the instructions on the battery, in the Technical Information and in the Driver's Manual.
6. **-6-** Risk of explosion:
    1. A highly explosive detonating gas mixture is formed when charging batteries.
7. **-7-** Disposal:
    1. Hand in old batteries at a collection point.
8. **-8-** Never dispose of old batteries in domestic rubbish!

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > NOTES ON REMOVING AND INSTALLING THE BATTERY

NOTE: A battery charger for providing an external power supply or for jump-lead starting is connected directly to the battery in the vehicle.

- *Risk of damage to the battery sensor.*
- *Battery sensor sends incorrect battery values to the vehicle electrical system.*

→ Always connect a battery charger for providing an external power supply or for jump-lead starting to the defined connections in the engine compartment. → 2X00IN BATTERY TRICKLE CHARGING

Information

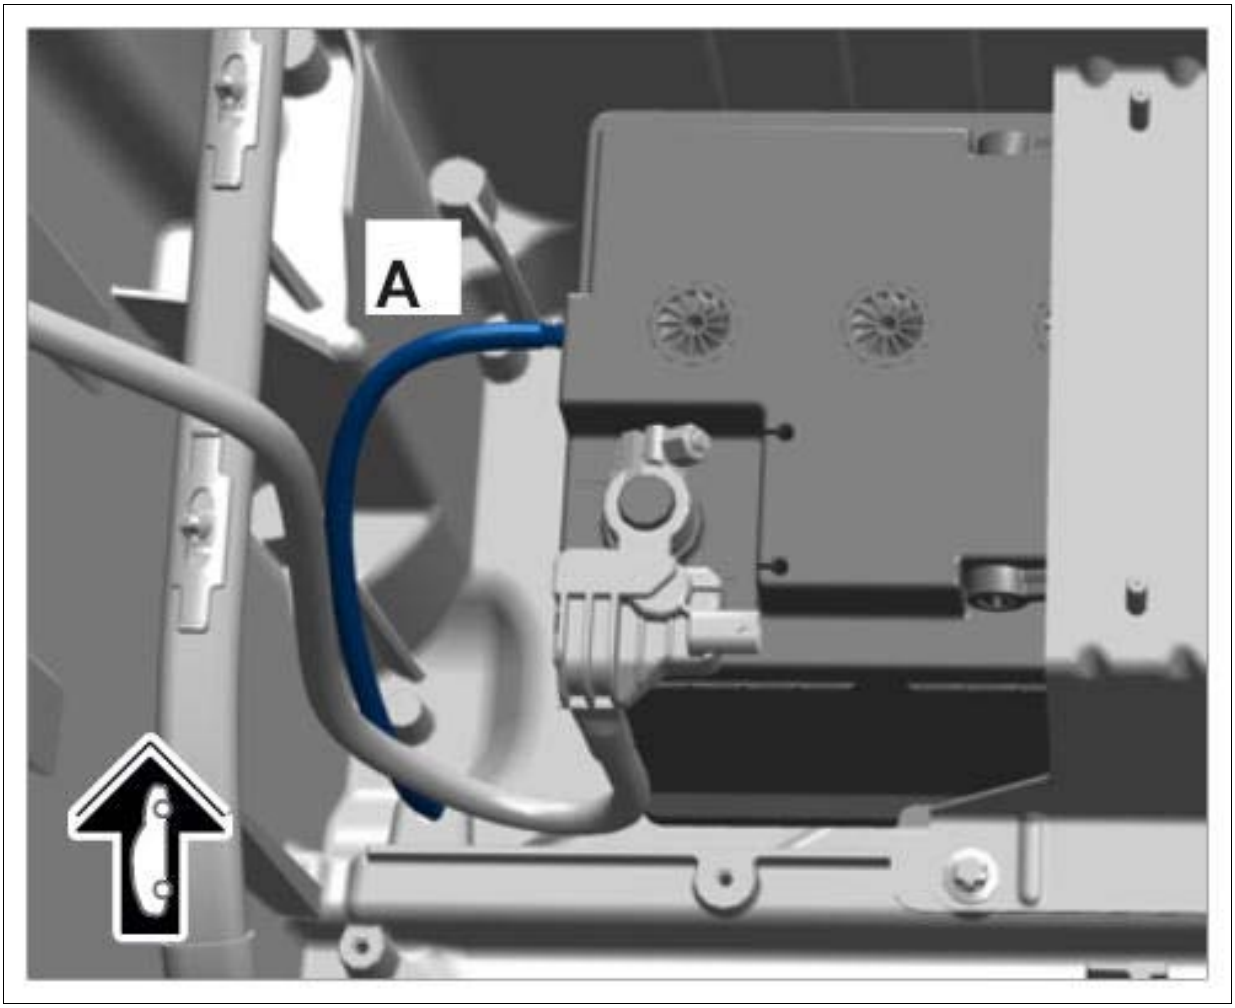
- The battery is located in the luggage compartment under the loadspace floor.
- In order to avoid triggering the siren in vehicles with an additional alarm siren, the battery must be disconnected while the ignition is on!
- All loads must be switched off beforehand! Remove ignition key!
- Never disconnect battery with engine running!
- Never start engine without a securely connected battery!
- To prevent damage to the battery, the battery terminal clamps should only be attached by hand - without excessive force.
- Check that the battery is seated correctly after installation. A loose battery presents other dangers, such as: - Reduced service life due to vibration damage. - Noises. - Damage to the battery housing from mounting parts. - Inadequate crash safety.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > NOTES ON REMOVING AND INSTALLING THE BATTERY > OPERATING PRINCIPLE OF CENTRAL VENTING

Information

- State-of-the-art batteries have central venting -A- .
- In certain battery states, the gas produced during charging can emerge centrally through an opening on the upper cover side. Backfire protection is integrated at the same position and prevents the combustible gas in the battery from igniting.
- On batteries with a vent hose -A- , check that the vent hose is not disconnected or pinched. Only then can the battery be freely vented.

Fig 1: Identifying Battery Vent Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > VISUAL INSPECTION

A visual inspection of the battery must be performed before taking measurements, e.g. measuring the open-circuit voltage, or before carrying out the battery load test.

This test can be used to determine:

- Whether the battery housing is damaged. Leak-free operation and function of the battery cannot be guaranteed if the housing is damaged.
- Whether the battery terminals (battery line connections) are damaged. The line connections might not make contact if the battery terminals are damaged. This can cause the lines to catch fire and can result in malfunctions in the electrical system.

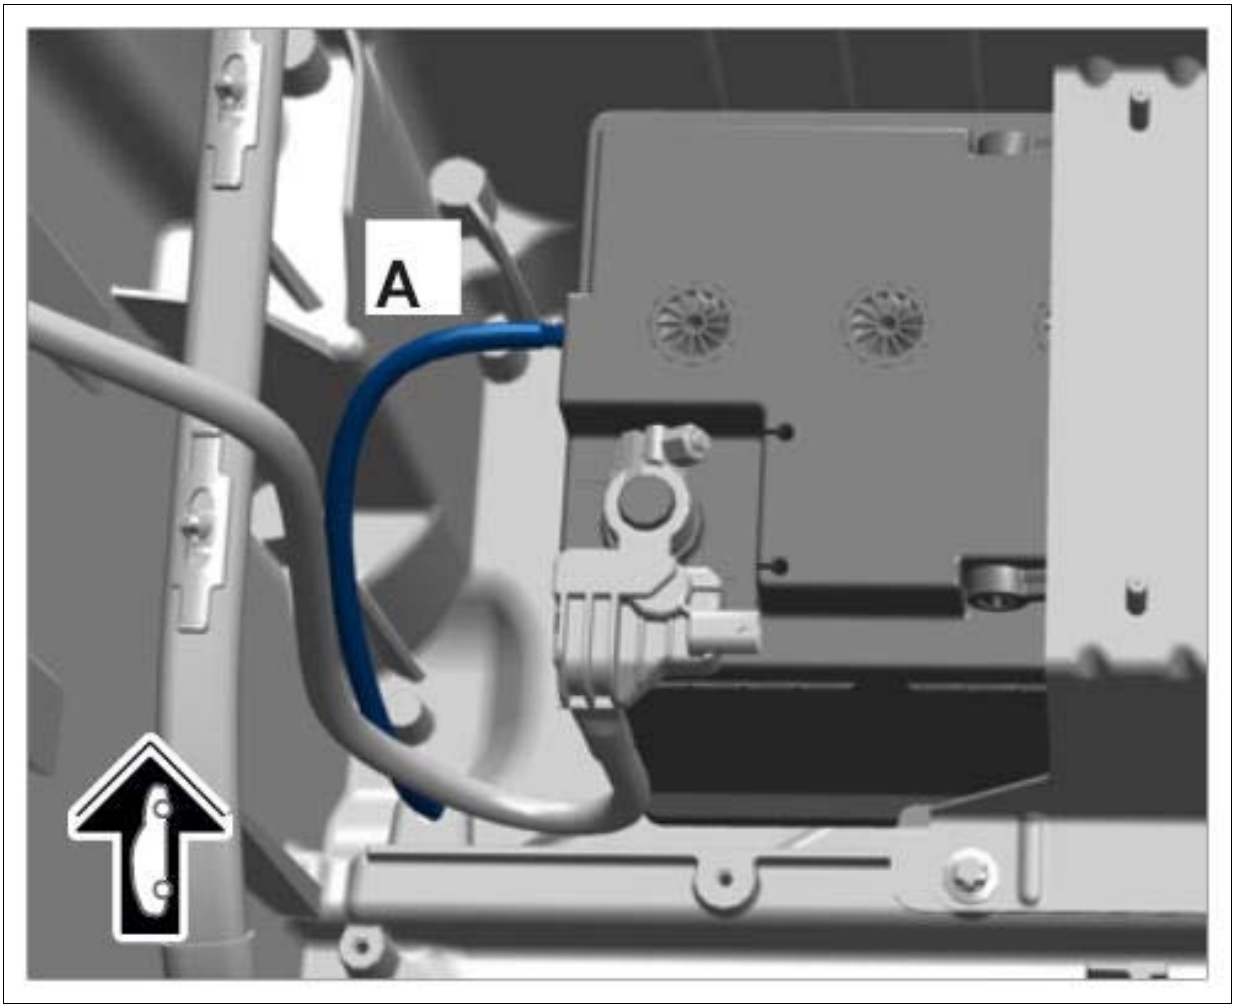
WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) >

CHECKING BATTERY VENT HOSE

Information

- Make sure that the vent hose -A- is not kinked or damaged. If in doubt, replace it.
- The vent hose -A- must be inserted in the battery and in the battery box.

Fig 1: Identifying Vent Hose (Panamera)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > OPEN-CIRCUIT VOLTAGE MEASUREMENT

Information

- Compared with the value from PIWIS Tester II 9818, the battery voltage can be measured using a hand-held multimeter.
- Proceed as follows:

Information

The open-circuit voltage measurement should be read out using **PIWIS Tester II 9818** in the **Gateway** control unit by selecting **Energy management, Quick closed-circuit current measurement** in the menu.

1. Switch off ignition and remove ignition key.
2. Disconnect ground strap on the battery.

   Information

   1. After charging and waiting for at least 2 hours, during which time the battery should neither be loaded nor charged:
3. Measure the battery voltage with a hand-held multimeter.
   1. The battery open-circuit voltage should not fall below 12.5 V.
   2. If the hand-held multimeter shows 12.5 V or more, the battery voltage is OK.
   3. If the hand-held multimeter shows a battery voltage below 12.5 V: Charge the battery.

Charging the battery

WARNING: Highly inflammable or explosive materials

- *Danger of fire or explosion*

→ Avoid contact with hot parts or sources of ignition.

→ Use suction to remove ignitable vapors.

→ Attach warning sign in a clearly visible position.

Information

- A battery charger is required.
- Read operating instructions for the charger.
- The battery must have a minimum temperature of 0 °C.
- If possible, do not rapid-charge batteries as this can damage them.
- If exhaustively discharged batteries are charged quickly, they will not take up a charge current or they will be identified too early as full due to the so-called "surface charge".

NOTE: A battery charger for providing an external power supply or for jump-lead starting is connected directly to the battery in the vehicle.

- *Risk of damage to the battery sensor.*
- *Battery sensor sends incorrect battery values to the vehicle electrical system.*

→ Always connect a battery charger for providing an external power supply or for jump-lead starting to the defined connections in the engine compartment. → 2X00IN BATTERY TRICKLE CHARGING

1. Switch off the battery charger.
2. Switch off ignition and remove ignition key.
3. Connect cables from the charger to the external power supply points.
4. Set the charge current on the battery charger according to the battery capacity.
5. Switch on the battery charger.

   Procedure for charging exhaustively discharged batteries:

   Batteries that have not been used for a long time discharge automatically.

   A battery is exhaustively discharged if the open-circuit voltage has dropped below 11.6 V, see OPEN-CIRCUIT VOLTAGE MEASUREMENT

   In exhaustively discharged batteries, the battery acid (sulfuric acid and water mixture) consists of virtually only water, as the sulfuric acid proportion is considerably reduced.

   Exhaustively discharged batteries sulphatise, i.e. the entire plate surfaces of the batteries harden.

   If exhaustively discharged batteries are immediately recharged after an exhaustive discharge, the sulphatisation recedes again.

   If these batteries are not recharged, the plates continue to harden and charge take-up ability is limited. This results in reduced battery performance.

   Exhaustively discharged batteries must be charged using a low charge current as follows:

   1. Set the charge current to maximum 10% of battery capacity, i.e. with a 95 AH battery, the charge current is max. 9.5 A.

6. Charge the battery.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > BATTERY TRICKLE CHARGING

Information

- When working or carrying out tests on the vehicle or when the vehicle is in the workshop, a battery charger with a rated current of at least 40 A must be connected.
- As soon as the vehicle is unlocked, e.g. the vehicle is in the workshop or salesroom, it must be trickle charged with a battery charging device.

1. Switch off the battery charger.
2. Switch off ignition and remove remote control (hand-held transmitter).
3. Switch off all electrical loads (e.g. lights).

4. Open protective cover on the positive terminal for jump-lead starting.
5. First, connect the positive cable to the positive terminal for jump-lead starting, then to the positive terminal of the donor battery.
6. First, connect the negative cable to the negative terminal of the donor battery, then to the ground point for jump-lead starting.
7. Set the charge current on the battery charger according to the battery capacity.
8. Switch on the battery charger.

WM 2706IN GENERAL INFORMATION ON AGM VEHICLE BATTERY (ALL MODELS) > CONNECTING THE BATTERY FOR TRICKLE CHARGING

A charger with a current rating of at least 40 A must be connected to the external power supply points/jump-lead starting points.

Set the charger to maximum A (amps).

Switch off all unnecessary loads (e.g. lights).

When working on the vehicle for more than 15 minutes.

When running diagnostics using the Porsche System Tester.

When adjusting the headlights.

When working on or with the Infotainment system.

If the doors, bonnet and rear lid are open for a long period of time or if these components are actuated frequently.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
wheel alignment system ML 5000 Porsche	Service equipment	WE 1272		
axle alignment system with DSP508XF sensors	Service equipment	WE 1328		adjustment device with reflector VAS 6430/1	Service equipment	WE 1362		
T-socket wrench for ACC sensor VAS 6190/2	Service equipment	WE 1364		
PIWIS Tester II	Special tool	9818		
WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > PRELIMINARY WORK > WHEN DOES DISTANCE MEASURING SENSOR CONTROL UNIT NEED TO BE ADJUSTED?

The distance measuring sensor control unit must be re-adjusted in the following situations:

1. Suspension was aligned and adjusted.
2. Distance measuring sensor control unit or distance measuring sensor control unit holder was loosened or removed and installed.
3. Bumper was loosened or removed and installed.
4. The front end is damaged.
5. Fault memory entry: ACC sensor incorrectly adjusted (D00004).
    1. 5.1. The misalignment angle is outside of the range -1.5° to +1.5°.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > PRELIMINARY WORK > REQUIREMENTS FOR TESTING AND ADJUSTMENT

1. Tyre tread depth of the tires of one axle must not deviate by more than 2 mm.
2. Tyre inflation pressure in accordance with regulations ("Comfort" or "Normal" tire pressure).
3. As with complete suspension alignment, make sure that there is no sliding base or turnplate at the end stop during alignment.
    1. 3.1. Take the track width and wheel base into consideration.
4. Check that vehicle weight corresponds to empty weight. Weight of the vehicle ready for driving (completely full fuel tank, reducing agent tank and water reservoir for the windscreen washer/headlight cleaning system, spare wheel, tool kit, jack) without driver.
5. Spare wheel, tool kit and jack must be located at the positions specified by the vehicle manufacturer.
6. Vehicle aligned correctly, having been bounced multiple times.
7. Wheel suspension, steering and steering linkage show no signs of play or damage.
    1. 7.1. Check for play and damage and carry out repairs if necessary.
8. Set vehicles with air suspension to normal level.
    1. 8.1. Switch off ignition, close and lock all doors.
    2. 8.2. Wait 15 seconds until vehicle has settled in normal level.
    3. 8.3. Open door and leave it open during the measurement, switch on ignition.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > PRELIMINARY WORK > SETTING UP THE MEASURING SYSTEM

Information

Check that there is sufficient floor space between the vehicle and the adjustment device - the gap between the adjustment device and vehicle must be approx. 120 cm.

The vehicle can be reversed onto the axle alignment platform if there is not enough floor space in front of the measuring platform.

The vehicle must be positioned so that the front and rear axles are centered on turnplates/sliding plates.

Information

The procedure described here is for the **wheel alignment system ML 5000 Porsche WE 1272 and the axle alignment system with DSP508XF sensors WE 1328.**

Deviations can occur with other alignment systems.

1. Select **the relevant vehicle in the wheel alignment computer.**
2. Select quick function **Calibrate distance measuring sensor** .
3. Fit instrument holders onto the wheels on the rear axle.
4. Fit the rear sensors onto the rear axle using the spoiler adapter (Beissbarth only, this sets the sensors to a lower position).
5. Align the rear sensors on the rear axle using the spirit level and clamp the instrument holders using the wing screws.

   Information

   Once the vehicle and adjustment tool are aligned, the vehicle and adjustment tool must no longer be moved.

   1. The vehicle is standing on turnplates/sliding plates that are released on one side , allowing the vehicle to be moved slightly.
   2. If the vehicle is moved while taking measurements on the turnplates, the measurement process must be repeated.
   3. If the adjustment tool is moved following alignment, the measurement process must be repeated.
6. Attach the front sensors to the measuring mirror, align using the spirit level and clamp.

   1. 6.1. Centre the adjustment tool.
   2. 6.2. Set distance of adjustment tool and vehicle in accordance with the specifications provided by the measuring equipment manufacturer.
   3. 6.3. The distance between the left sensor and the vehicle **-Bl-** should be identical to the distance between the right sensor and the vehicle **-Br-** .

Fig 1: Identifying Right Sensor Dimension

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Switch on (initialize) the sensors.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > PRELIMINARY WORK > PREPARATION FOR ADJUSTING DISTANCE MEASURING SENSOR

1. Connect a battery charger with a current rating of at least 40 A to the external power feed points.
2. Read out the fault memory using **PIWIS Tester II 9818** , create a vehicle analysis log if necessary → 0X03IN CREATING VEHICLE ANALYSIS LOG (VAL) and correct any faults.
3. Remove trim cover **-1-** from the distance measuring sensor control unit.
    1. 3.1. Push trim cover up **-a-** .
    2. 3.2. Pull trim cover forward and remove it **-b-** .

Fig 1: Removing Trim Cover

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Clean distance measuring sensor control unit and trim cover using commercially available cleaning agent.

5. Fit the front sensors onto the adjustment device, align using the spirit levels and clamp using the wing screws, and switch them on (initialize).

6. Set the distance between the **adjustment device with reflector VAS 6430/1 WE 1362** and the **vehicle** in accordance with the specifications provided by the measuring equipment manufacturer.

    1. 6.1. The distance between the left sensor and the vehicle **-Bl-** should be identical to the distance between the right spirit level and the vehicle **-Br-** .

Fig 2: Identifying Right Sensor Dimension

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. On the adjustment device, move the mirror into the position **-2-** in alignment with the marking (**-A-** the number 2 on the rotary knob must point towards the vehicle).

Fig 3: Identifying Adjustment Device Position

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Once the vehicle and adjustment tool are aligned, the vehicle and adjustment tool must no longer be moved.

1. The vehicle is standing on turnplates/sliding plates that are released on one side, allowing the vehicle to be moved.

2. If the vehicle is moved while taking measurements on the turnplates, the measurement process must be repeated.

3. If the adjustment tool is moved following alignment, the measurement process must be repeated.

8. Release turnplates/sliding plates on **one side of the vehicle** .

9. Start the menu for adjusting the distance measuring sensor control unit, see **operating instructions for measuring platform** .

10. Before starting the adjustment process, use the laser beam at the mirror **-3-** on the adjustment device (for switching on the laser beam, see operating instructions for adjustment device) to check that the laser beam strikes the sensor lens. Info:

    1. 10.1. The adjustment device is positioned correctly if the laser beam still strikes the sensor lens even after the identical individual toe values have been set.

    2. 10.2. If the laser beam does not strike the sensor lens, the alignment of the adjustment device must be repeated.

Fig 4: Identifying Adjustment Device Position

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

11. Align adjustment device at the side:

    1. 11.1. The laser beam of the adjustment device must strike the center of the sensor lens.

Fig 5: Aligning Adjustment Device

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Use the adjusting screws **-1, 2, 3, 4, 5-** on the adjustment device to level the mirror's spirit levels **-A, B-** horizontally.

13. Use the crank **-arrow-** on the adjustment device to adjust the mirror so that the laser beam strikes the center of the sensor lens on the vertical line.

Fig 6: Aligning Mirror's Spirit Levels

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Turn the adjustment bar on the adjustment device to the side using the adjustment screw **-5-** until the green indicator on the adjustment bar is displayed on the measuring platform screen.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR

1. Connect **PIWIS Tester II 9818** to the vehicle and start it.
2. Switch on ignition.
3. Select the required vehicle and the **Adaptive cruise control** control unit. Press [F12] to continue.
4. Select the **Maintenance/repairs** sub-menu in the **Adaptive cruise control** menu. Press [F12] to continue.
5. Follow the instructions on **PIWIS Tester II 9818** and adjust the distance measuring sensor control unit **-1-** as required using adjustment tool **T-socket wrench for ACC sensor VAS 6190/2 WE 1364 -2-** by turning the relevant adjusting screw **-3-** according to specifications.

Fig 1: Identifying Sensor Control Unit Adjusting Screws

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Repeat the process until PIWIS Tester II 9818 displays the message Adjustment successful.

WM 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR (ALL MODELS) > SUBSEQUENT WORK

1. Switch off ignition and pull remote control out of ignition lock.
2. **PIWIS Tester II 9818** must now be disconnected from the vehicle.
3. Disconnect battery charger.
4. Remove sensors and instrument holders.

   Information

   Before and after fitting the trim cover for the distance measuring sensor control unit, check the following points:

   1. The holder for the distance measuring sensor control unit must not show any signs of deformation, which may have been caused, for example, by removing or installing the trim

cover for the distance measuring sensor control unit. If the holder for the distance measuring sensor control unit is deformed, carefully push it back into shape.

2. If the trim cover is damaged or cracked, replace the trim cover.

3. After fitting the trim cover, check that it is seated correctly and securely.

5. Install trim cover **-1-** on the distance measuring sensor control unit.

1. 5.1. Fit trim cover **-a-** .

2. 5.2. Push trim cover down **-b-** until it engages securely.

Fig 1: Installing Trim Cover On Distance Measuring Sensor Control Unit

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Perform a test drive and check operation of distance measuring sensor control unit.

7. Read out the fault memory of the distance measuring sensor control unit.

Installation dimension	Reference point 1	Reference point 2
2.9 mm	Crankshaft	Hall-sender rotor
7.5 mm	Crankcase	Crankshaft sealing ring
13.0 mm	Crankshaft	Crankshaft sealing ring

WM 284419 REMOVING AND INSTALLING HALL-SENDER ROTOR (MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove drive plate. → 136319 REMOVING AND INSTALLING DRIVE PLATE
2. Remove crankshaft pulse sender. → 287319 REMOVING AND INSTALLING CRANKSHAFT PULSE SENDER

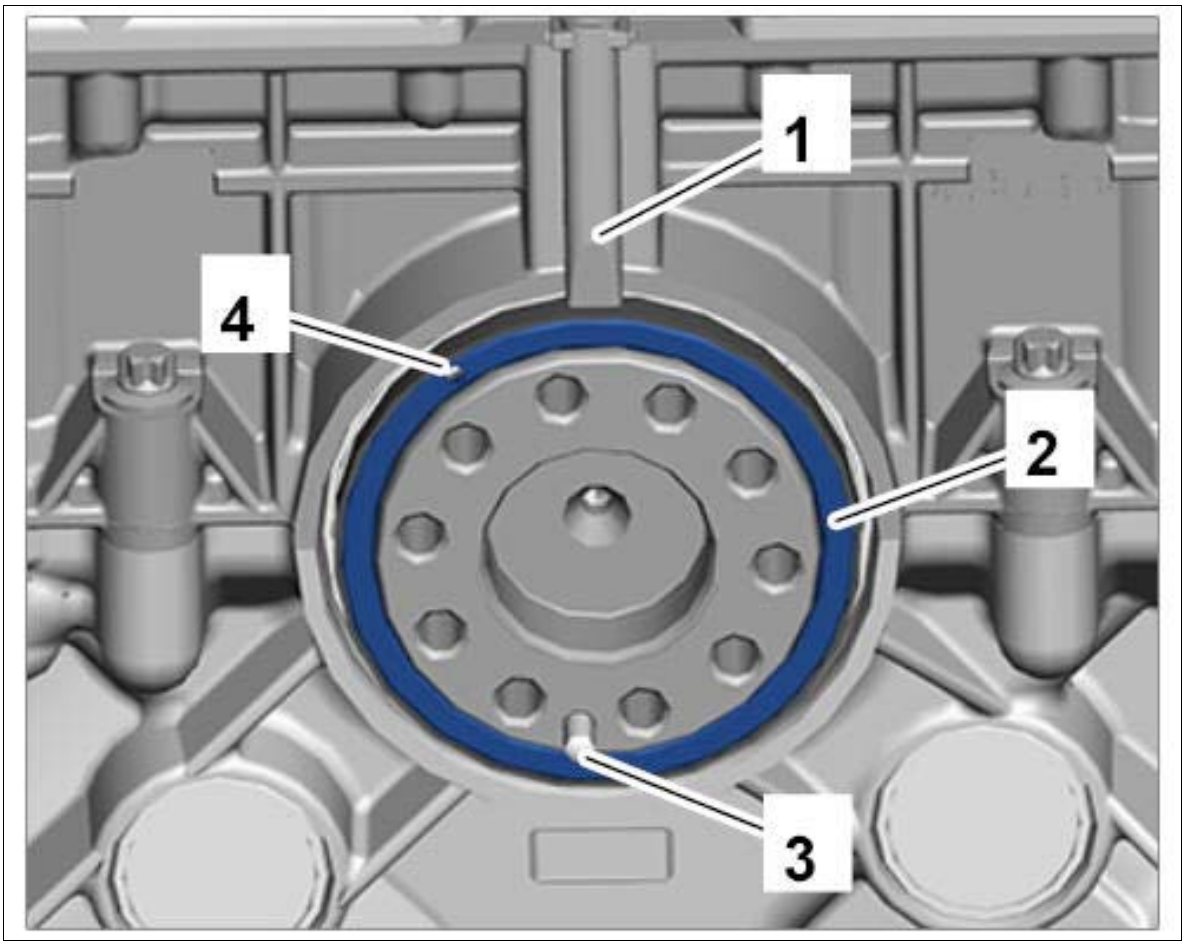
WM 284419 REMOVING AND INSTALLING HALL-SENDER ROTOR (MACAN S, MACAN TURBO) > REMOVING HALL-SENDER ROTOR

Information

- The work steps for the hall-sender rotor and sealing ring are identical

1. Pull out the crankshaft pulse sender **-1-** slightly.

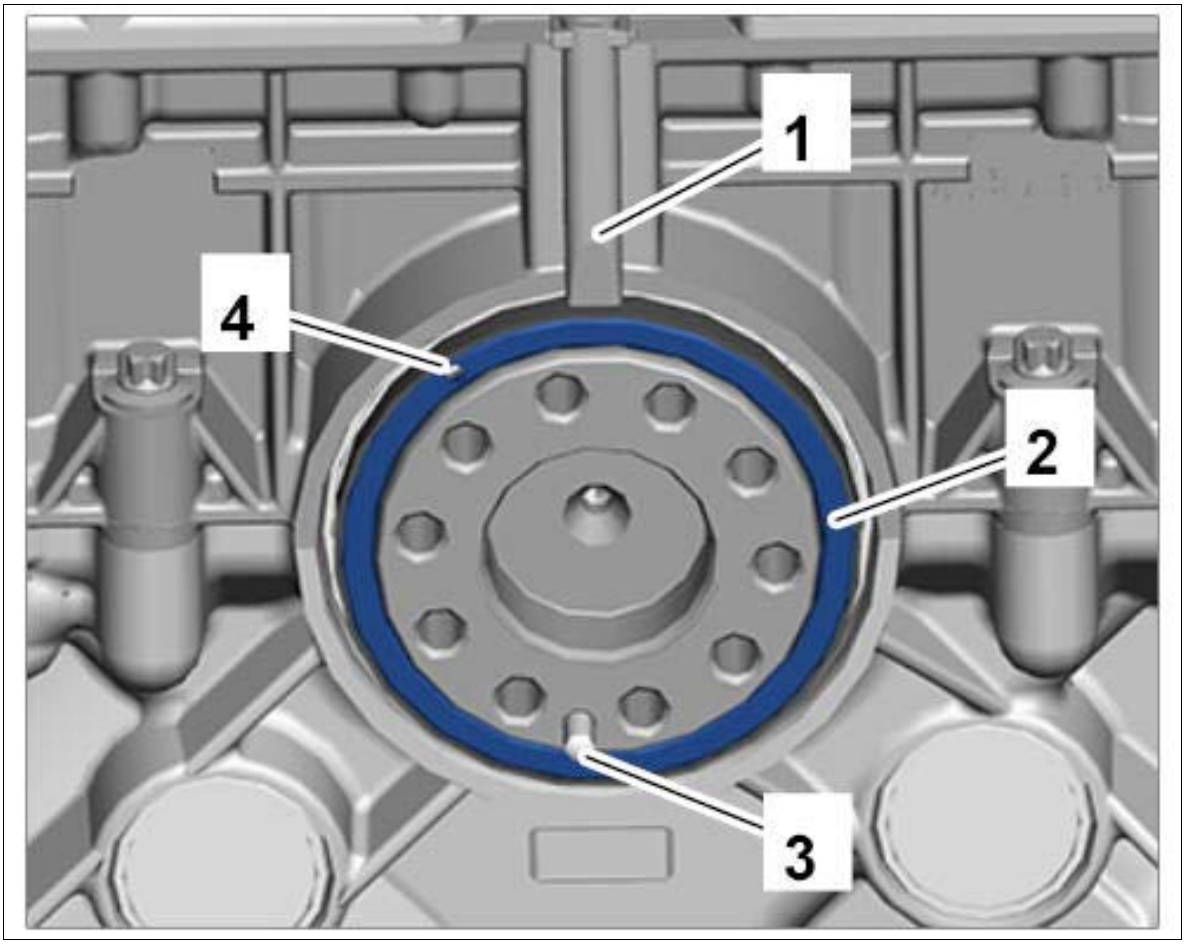
   Fig 1: Identifying Crankshaft Pulse Sender And Hall-Sender Rotor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Screw in the extractor tip in the "TDC marking" **-4-** .

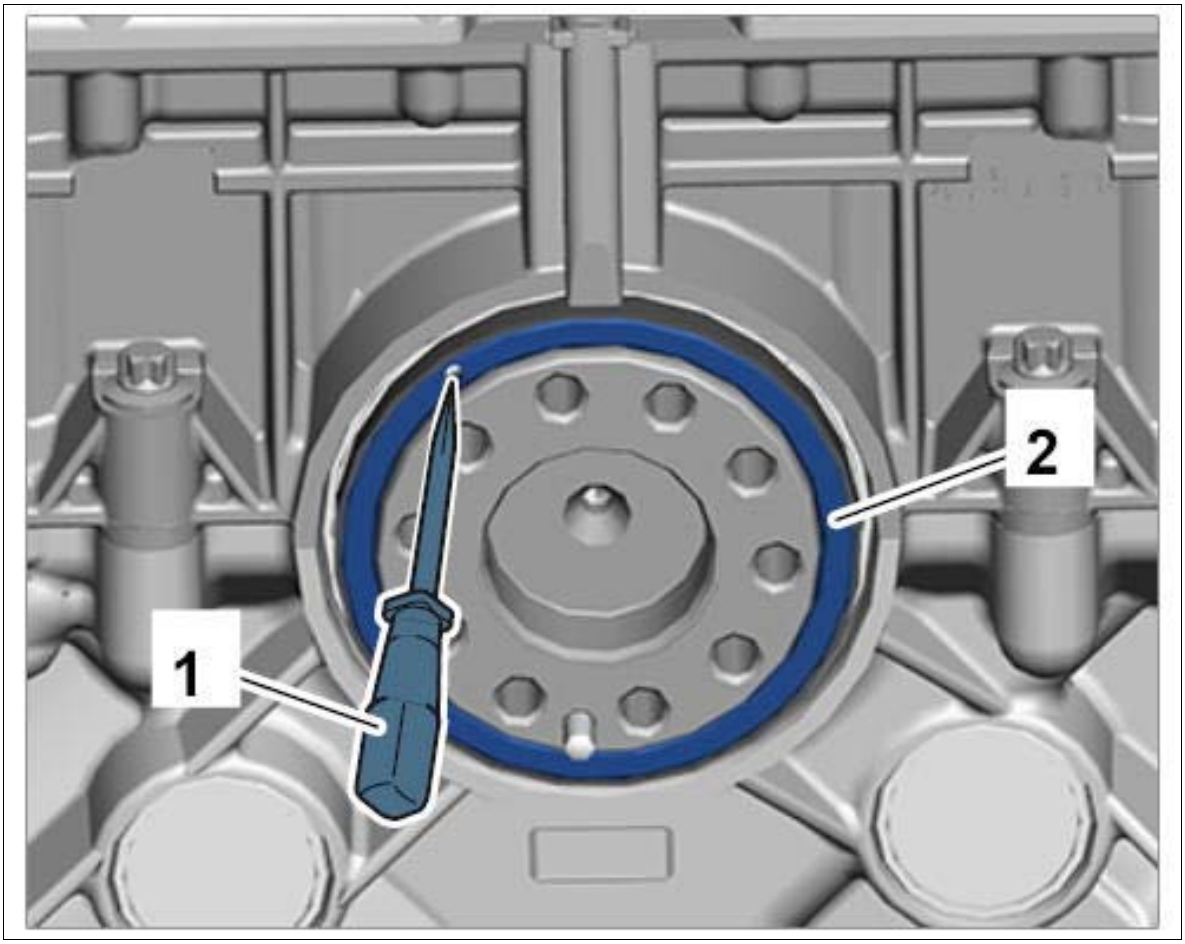
Fig 2: Identifying Hall-Sender Rotor Extractor Tip



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Use the **slide hammer kit Nr.168** to knock out the extractor tip **-1-** together with the hall-sender rotor **-2-** .

Fig 3: Removing Hall-Sender Rotor Extractor Tip

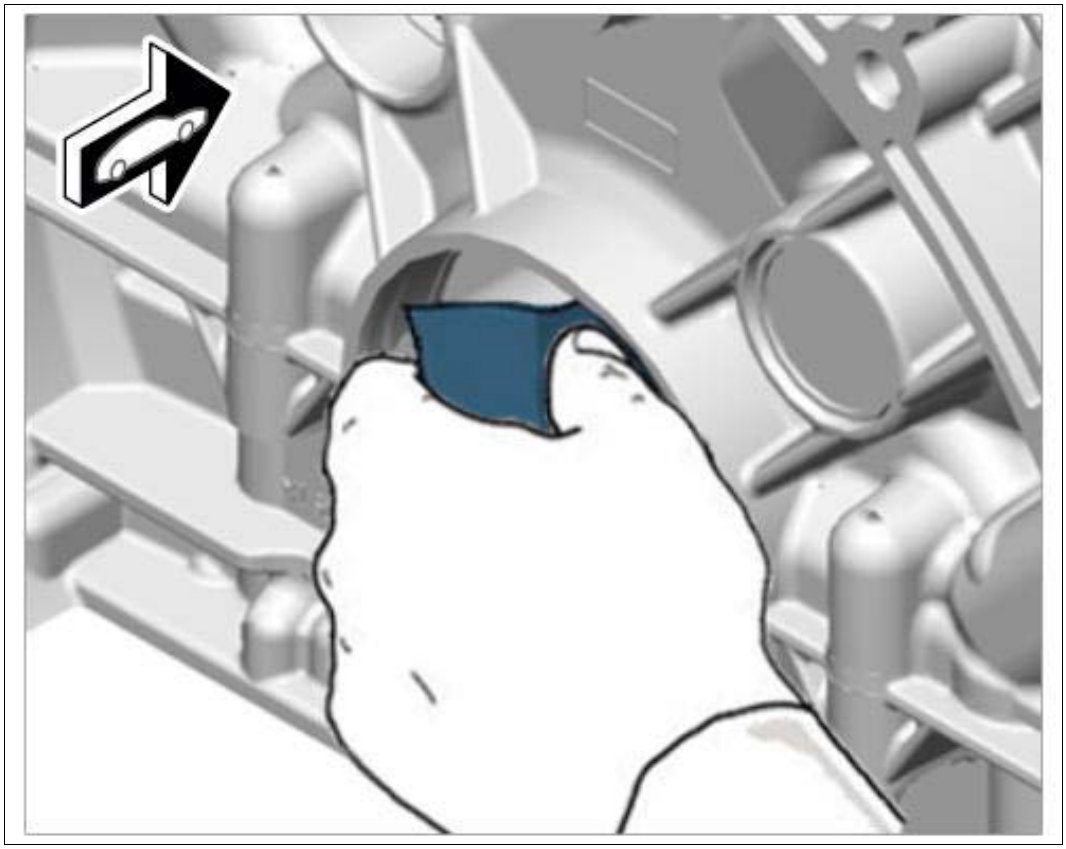


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Clean the crankshaft flange. → Cleaning crankshaft flange

    1. 4.1. The crankshaft flange must not be dirty or rusty.
    2. 4.2. If necessary clean with brake cleaner and remove rust with a metal-polishing pad.

Fig 4: Cleaning Crankshaft Flange



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 284419 REMOVING AND INSTALLING HALL-SENDER ROTOR (MACAN S, MACAN TURBO) > CHECKING HALL-SENDER ROTOR > CHECKING ROTOR FOR HALL SENDER

Information

- Check the hall-sender rotor before installing it.
- The hall-sender rotor must not come into contact with a magnet.
- If the hall-sender rotor does come into proximity of a magnet, replace it without exception.

1. Check the condition of the new hall-sender rotor using the **test card T10473** tool.
    1. 1.1. Hold the **test card T10473 -2-** over the hall-sender rotor **-1-** and turn it.
    2. 1.2. Continuous stripes **-arrows-** on undamaged hall-sender rotor **-1-** .

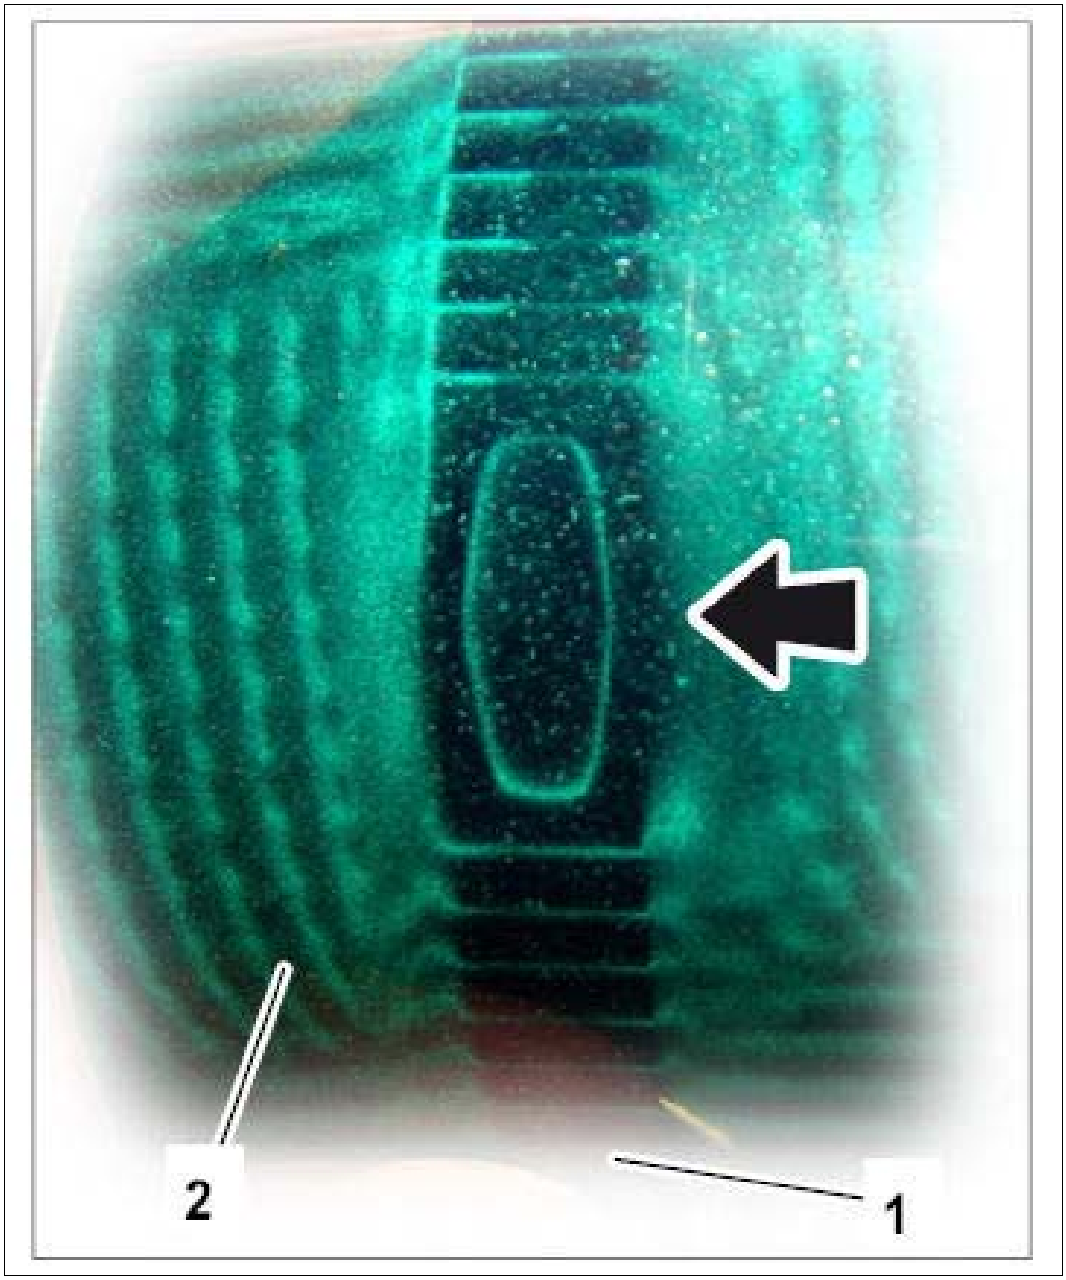
Fig 1: Locating Hall-Sender Rotor Stripes

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Only use undamaged hall-sender rotors.

    1. 2.1. "TDC marking" **-arrow-** on undamaged hall-sender rotor.

Fig 2: Locating Hall-Sender Rotors TDC Marking (Undamaged)

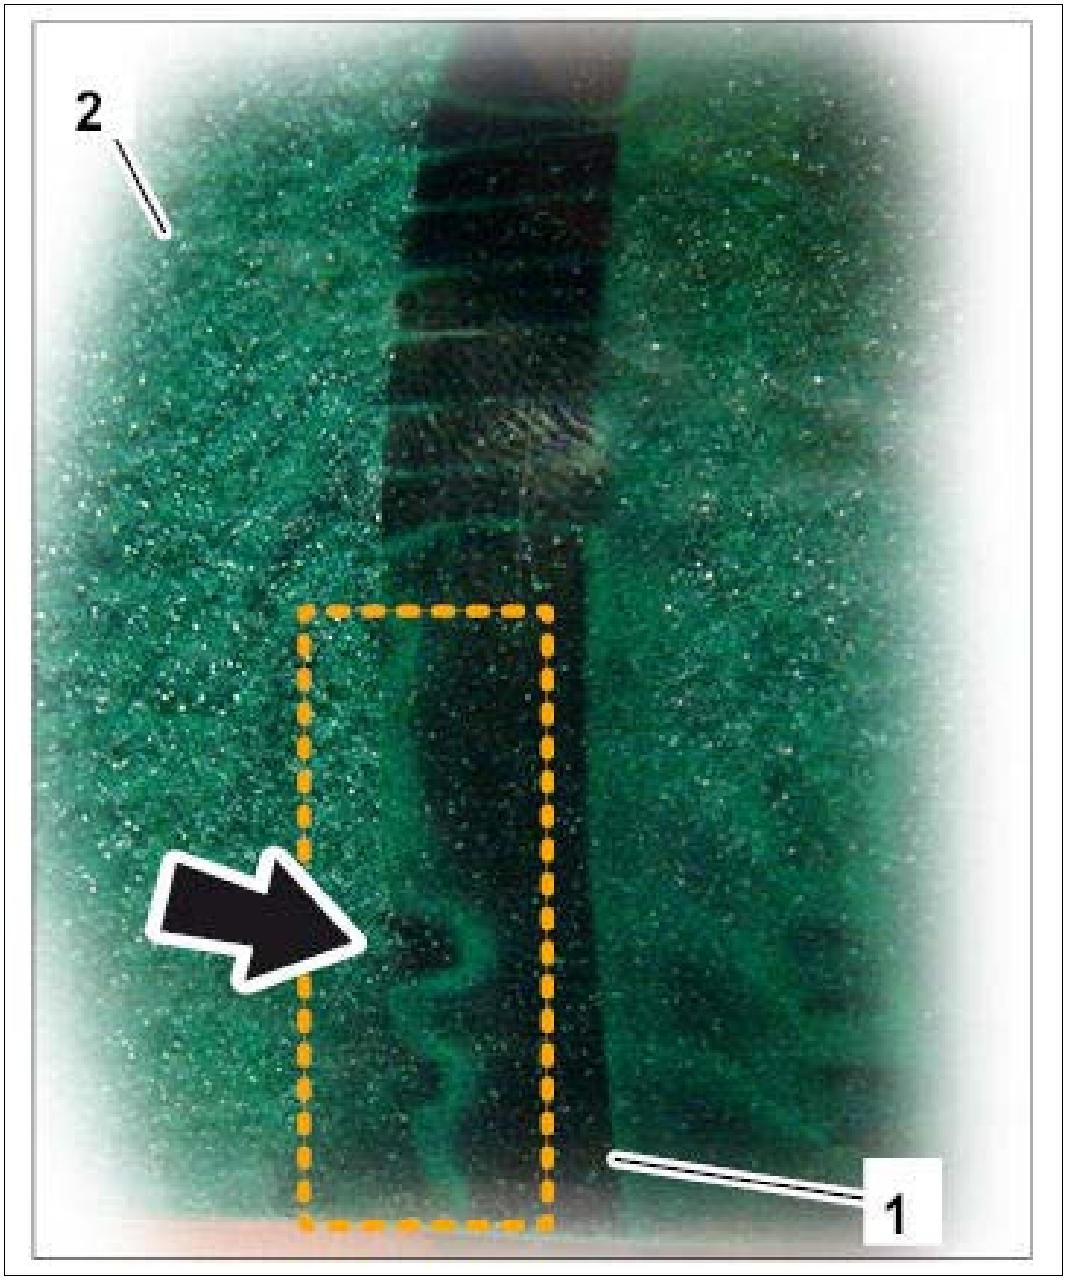


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. A damaged hall-sender rotor must be replaced.

    1. 3.1. The stripes **-arrow-** cannot be seen on damaged hall-sender rotors.

Fig 3: Locating Hall-Sender Rotors TDC Marking (Damaged)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 284419 REMOVING AND INSTALLING HALL-SENDER ROTOR (MACAN S, MACAN TURBO) > INSTALLING HALL-SENDER ROTOR > INSTALLING ROTOR FOR HALL SENDER

Information

- Check the hall-sender rotor before installing it.
- The hall-sender rotor must not come into contact with a magnet.

- If the hall-sender rotor does come into proximity of a magnet, replace it without exception.

Information

Sealing rings become damaged as a result of improper fitting. Do not oil sealing rings on the running surface and do not pull sealing rings off the plastic sleeve.

1. Fit hall-sender rotor to crankshaft flange using the **insertion tool 9837.**

    1. 1.1. While doing so align the centering notch **-1-** of the **insertion tool 9837** to the centering pin of the crankshaft flange.

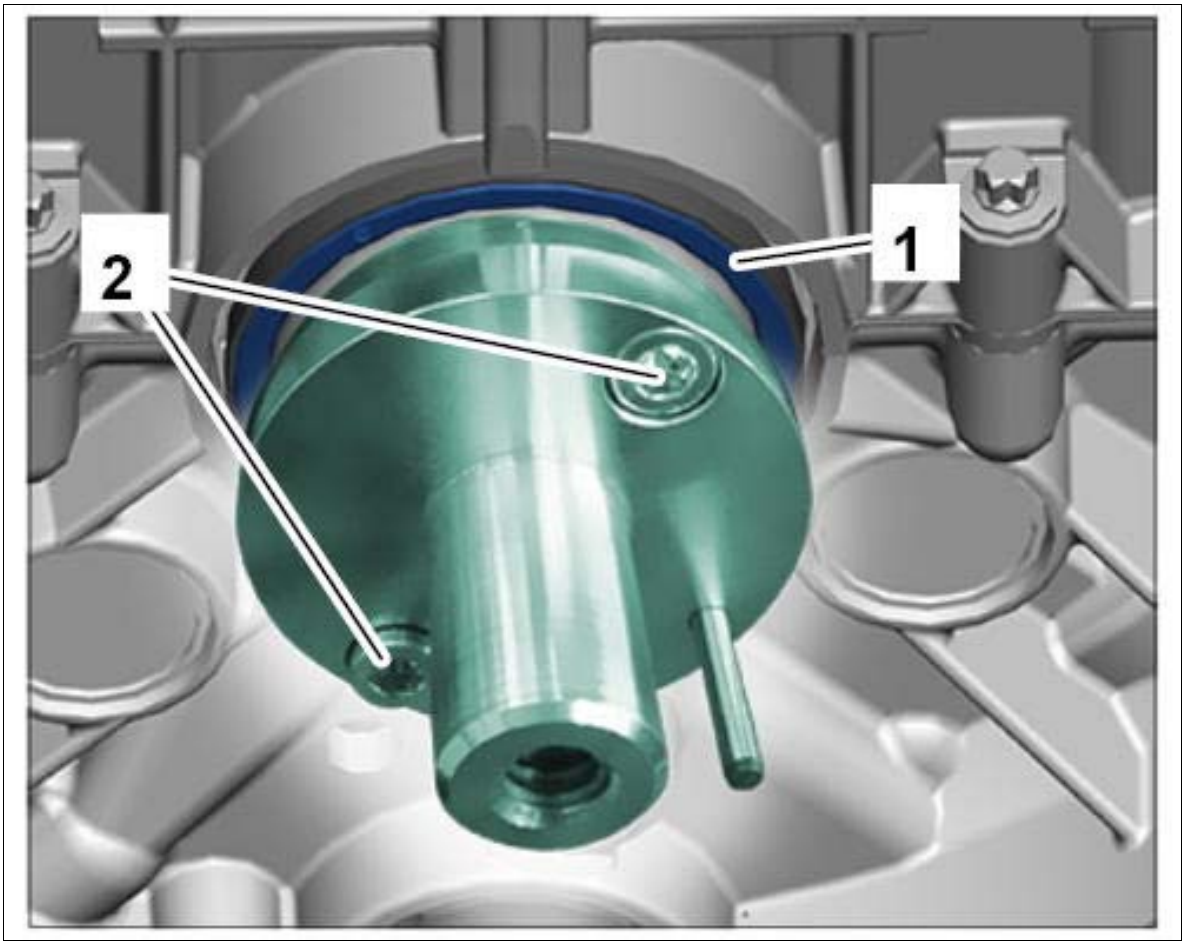
    2. 1.2. Press rotor for hall sender only slightly onto the crankshaft flange in order to align the TDC marking.

        Fig 1: Identifying Insertion Tool (9837)

        
        Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Tighten the screws **-2-** .

Fig 2: Installing Insertion Tool To Crankshaft Flange

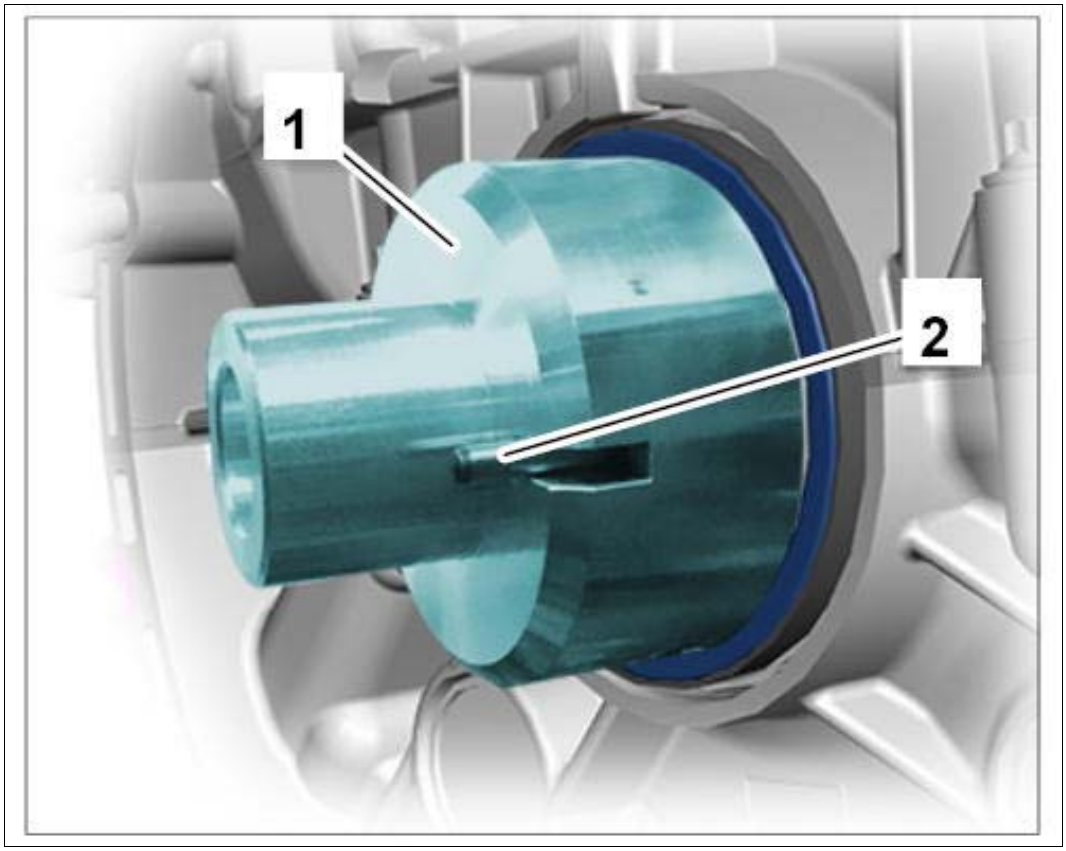


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Slide the upper **insertion tool 9837 -1-** onto the lower **insertion tool 9837** .

    1. 3.1. Pay attention to the centering pin **-2-** .

Fig 3: Identifying Insertion Tool And Centering Pin

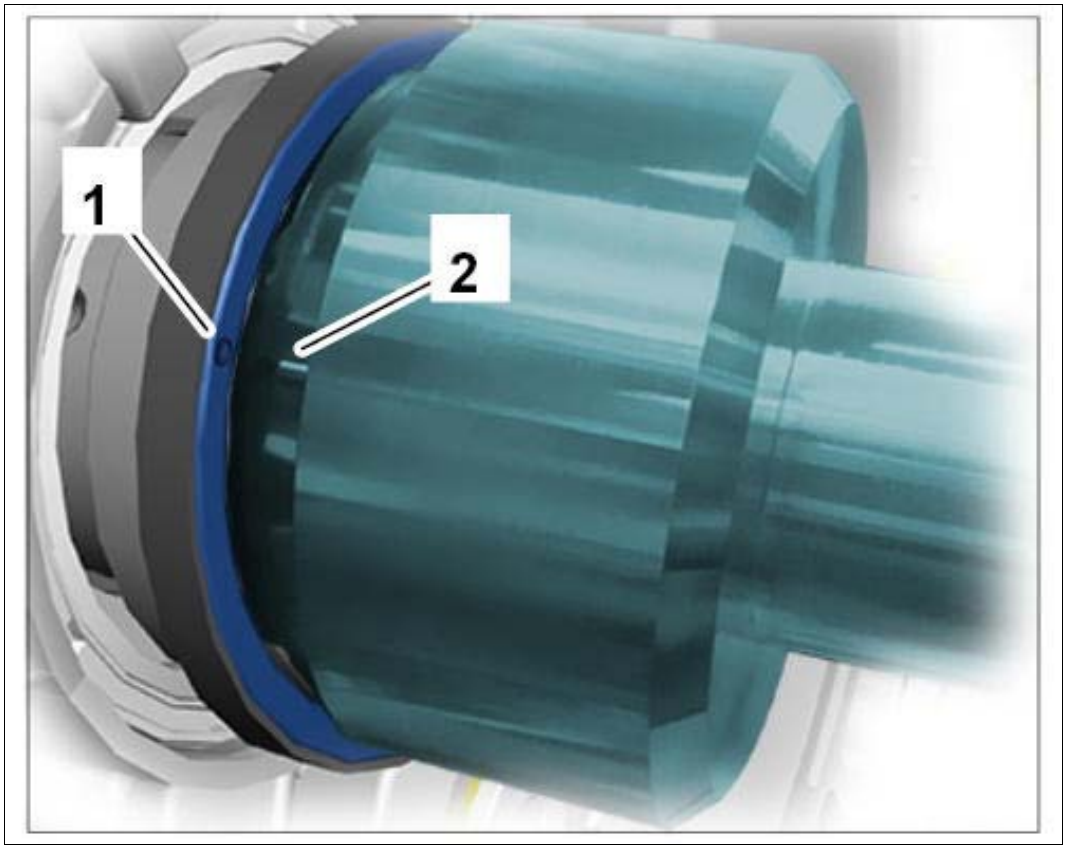


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Push centering pin **-2-** into the "TDC marking" **-1-** on the hall-sender rotor.

    1. 4.1. Turn the hall-sender rotor slightly if necessary.

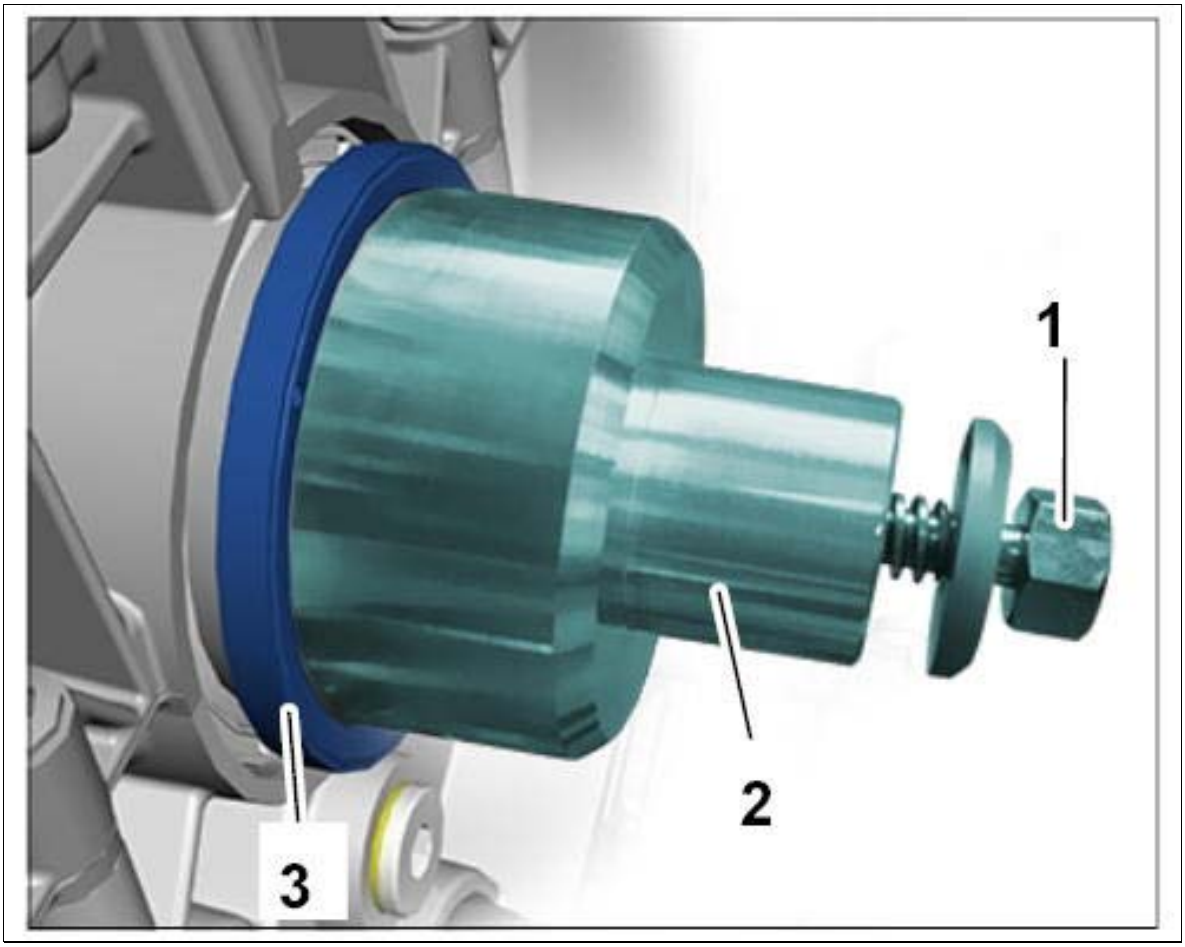
Fig 4: Identifying Hall-Sender Rotor Centering Pin And TDC Marking



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Tighten central screw **-1-** as far as possible and press in the hall-sender rotor **-3-** .

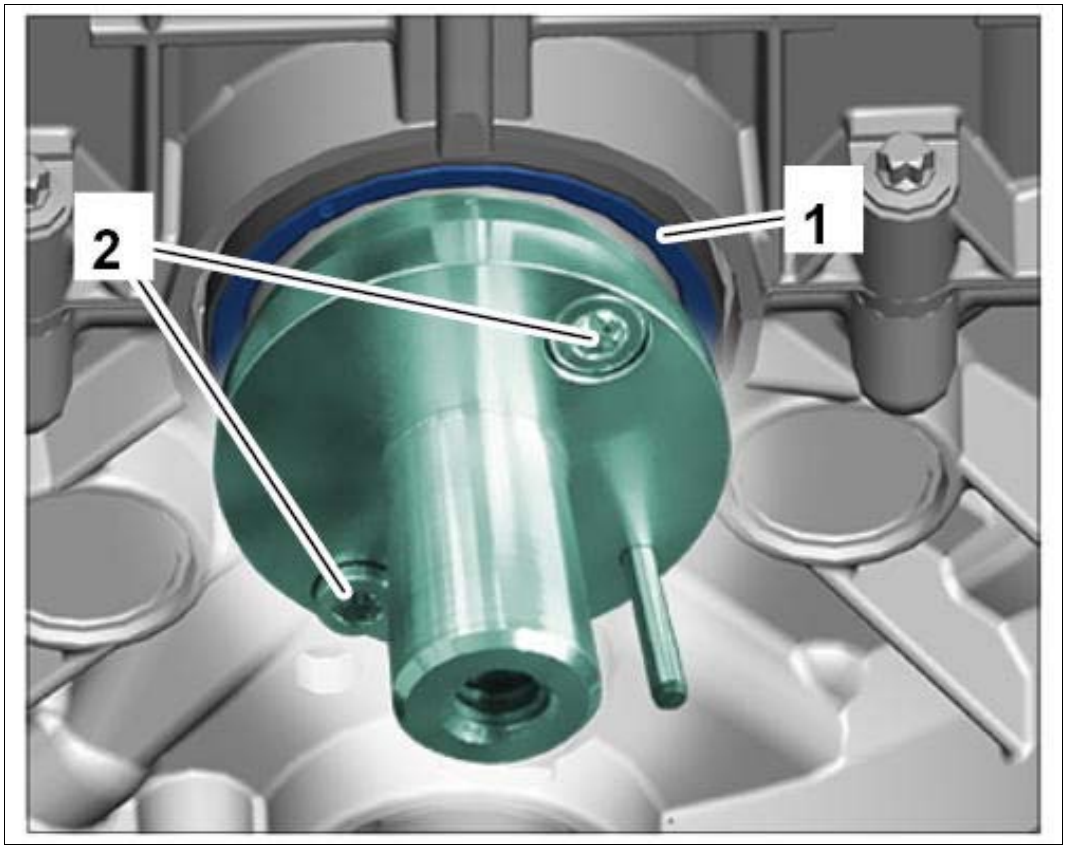
Fig 5: Identifying Insertion Tool



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Unscrew the **insertion tool 9837** central screw.
    1. 6.1. Remove the upper **insertion tool 9837** .
    2. 6.2. Undo the screws **-2-** and remove the lower **insertion tool 9837** .

Fig 6: Removing Crankshaft Flange Insertion Tool



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Slide the crankshaft pulse sender **-1-** onto the hall-sender rotor **-2-** .

Service Manual: 82 - AUXILIARY HEATING -- (95B) - MACAN

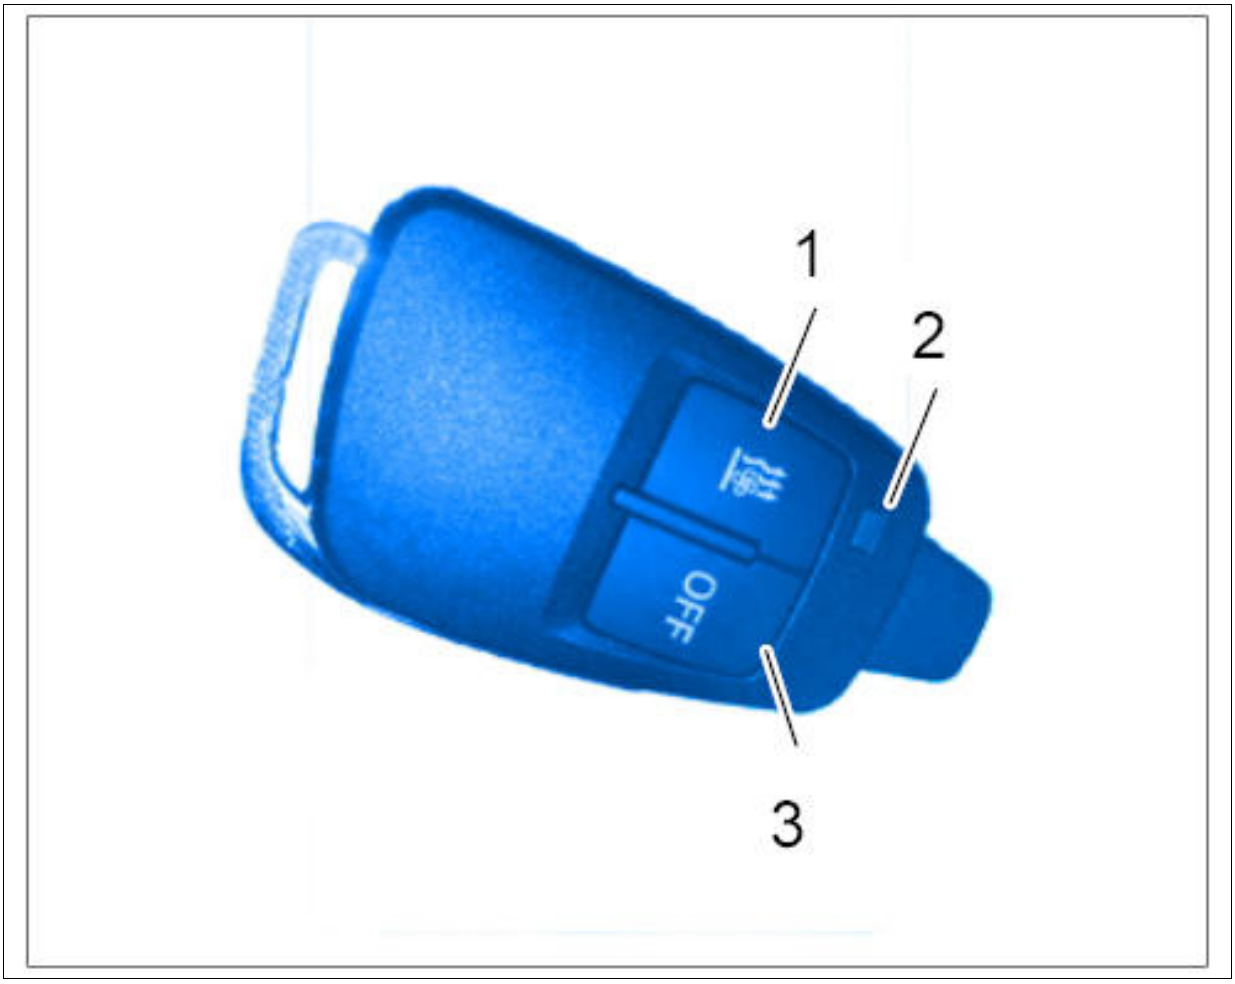
WM 8209AN TEACHING REMOTE CONTROL FOR AUXILIARY HEATING (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 8209AN TEACHING REMOTE CONTROL FOR AUXILIARY HEATING (ALL MODELS) > TEACHING REMOTE CONTROL FOR AUXILIARY HEATING

Information

- The remote control for the auxiliary heater can only be taught using the Porsche System Tester.
- A maximum of three remote controls can be taught per vehicle.

Fig 1: Identifying Auxiliary Heating Remote Control



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. ON button
2. LED
3. OFF button

1. **PIWIS Tester II 9818** must be connected to the vehicle before starting the System Tester. Switch on ignition.
2. Select the vehicle type.
3. Select the **Drive links/checks** menu and press [F12] to continue.
4. Select the **Teach remote control to receiver** menu, press [F12] and follow the instructions on the System Tester.
5. Press [F8] to start the teaching process.
6. After the **SEND** message appears, press the [OFF] button **-3-** on the remote control within 5 seconds until the "saved" message appears. The remote control is now taught.
7. To teach other remote controls, repeat the process.

8. Carry out a function test on the remote control and then read out the fault memory.
9. **PIWIS Tester II 9818** must now be disconnected from the vehicle.

WM 8209AN TEACHING REMOTE CONTROL FOR AUXILIARY HEATING (ALL MODELS) > SWITCHING AUXILIARY HEATING ON AND OFF WITH REMOTE CONTROL > SWITCHING ON AUXILIARY HEATING WITH REMOTE CONTROL

1. [ON] button **-1-** must be pressed for approx. 2 seconds. The LED **-2-** flashes green and goes out once the auxiliary heater is started completely.

    1. ON button
    2. LED
    3. OFF button

Heater holder to body	M6 x 30 thread	Tightening torque	20 Nm (15 ftlb.)		

WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > INFORMATION > INSTALLATION POSITION OF HEATER

The heater is behind the wheel housing liner in the front right wheel housing.

Fig 1: Overview Of Heater Wheel Housing

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > PRELIMINARY WORK

1. Remove right front wheel → Removing Wheel
2. Remove front wheel housing liner at the right → Removing front wheel housing liner

WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > REMOVING AND INSTALLING HEATER > REMOVING HEATER

NOTE: Danger of scalding

- *Coolant can be very hot.*
- *Coolant may be pressurized.*

→ Only remove the heater when the cooling system has cooled down.

→ By carefully opening the catch on the reservoir, make sure that the cooling system is depressurized.

NOTE: Danger of slipping due to emerging coolant

- *The emerging coolant will make the floor of the workshop slippery and may cause people to slip and fall over.*

→ Collect emerging coolant in a suitable pan.

1. Remove coolant hoses.

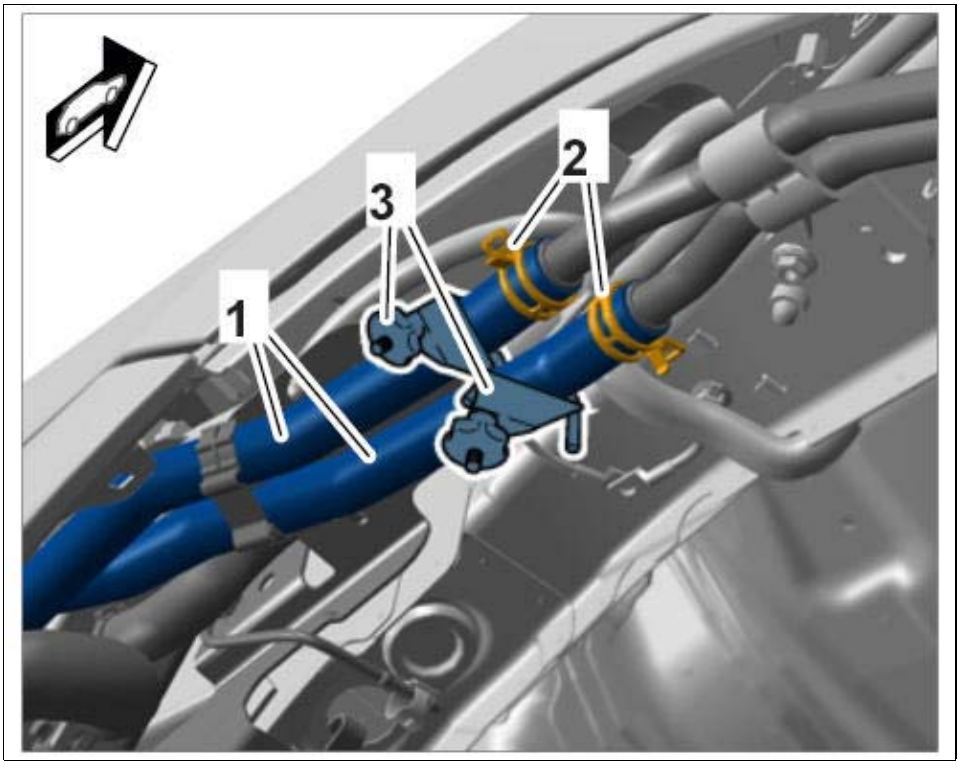
    1. 1.1. Clamp coolant hoses **-1-** using hose clamp 3094 **-3-** .

    2. 1.2. Loosen spring band clamps **-2-** using assembly pliers Nr.72 Pos.1 and pull off coolant hoses **-1-** .

WARNING: Emerging fuel

1. Risk of fire

Fig 1: Identifying Coolant Hoses



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

→ Avoid contact with hot parts or sources of ignition.

→ Collect emerging fuel, absorb it if necessary with a suitable binding material and dispose of properly.

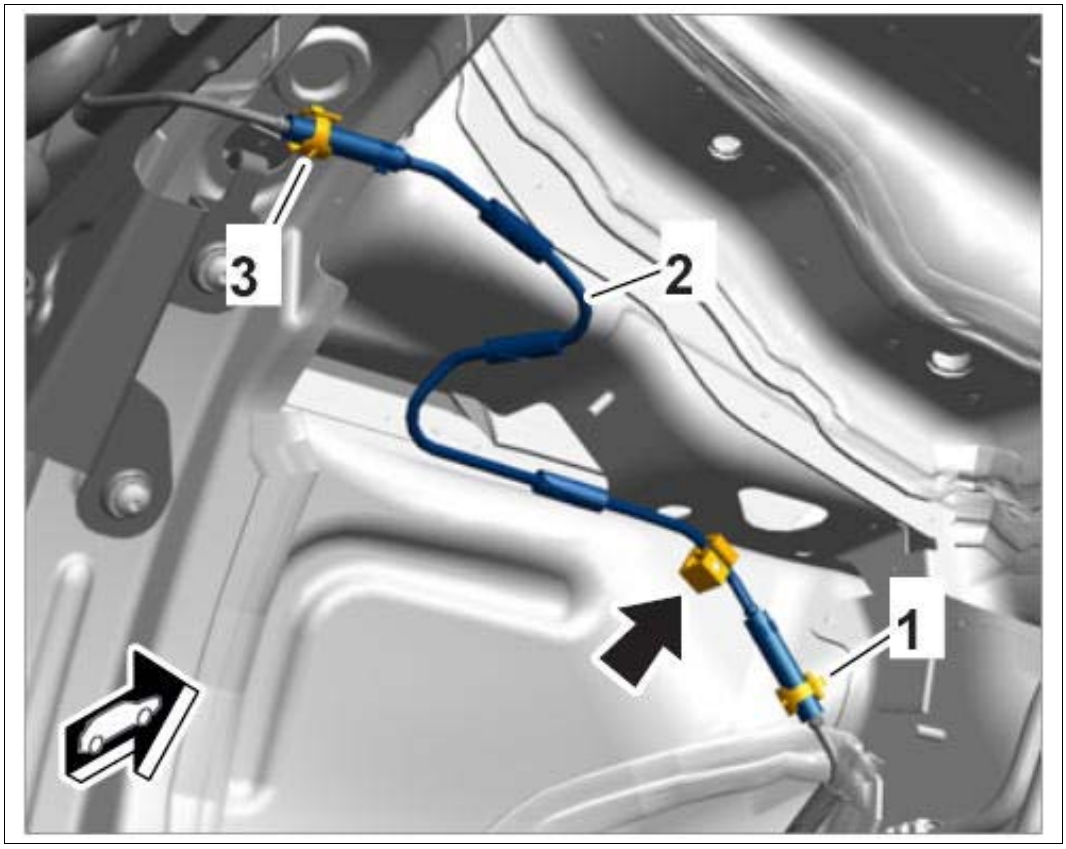
→ Use suction to remove ignitable vapors.

→ Attach warning sign to vehicle in a clearly visible position.

2. Disconnect fuel line.

1. 2.1. Loosen spring band clamp **-3-** using **assembly pliers Nr.72 Pos.1** and disconnect fuel line **-2-** .

Fig 2: Locating Fuel Line In Wheel Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Disconnect exhaust pipe from silencer.

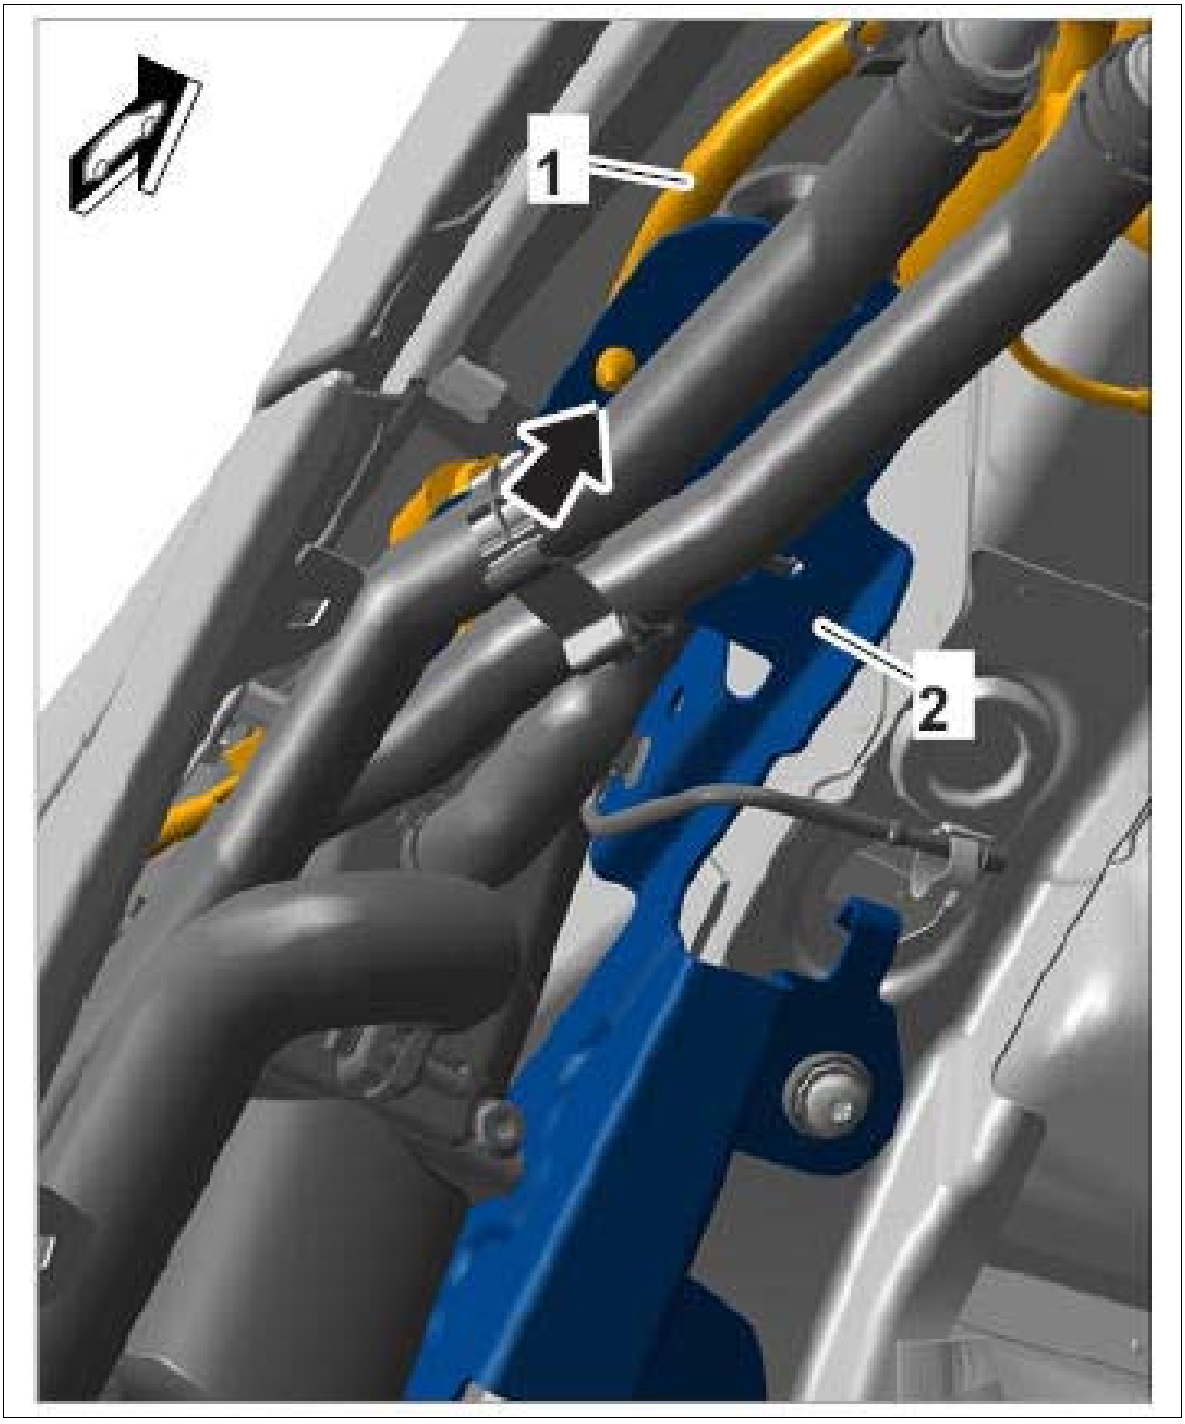
1. 3.1. Loosen screw-type clamp **-1-** .
2. 3.2. Pull flexi-pipe **-2-** off the silencer pipe **-3-** .

Fig 3: Identifying Exhaust Pipe On Silencer

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Unclip wiring harness **-1-** at position **-arrow-** and remove it from the holder **-2-** .

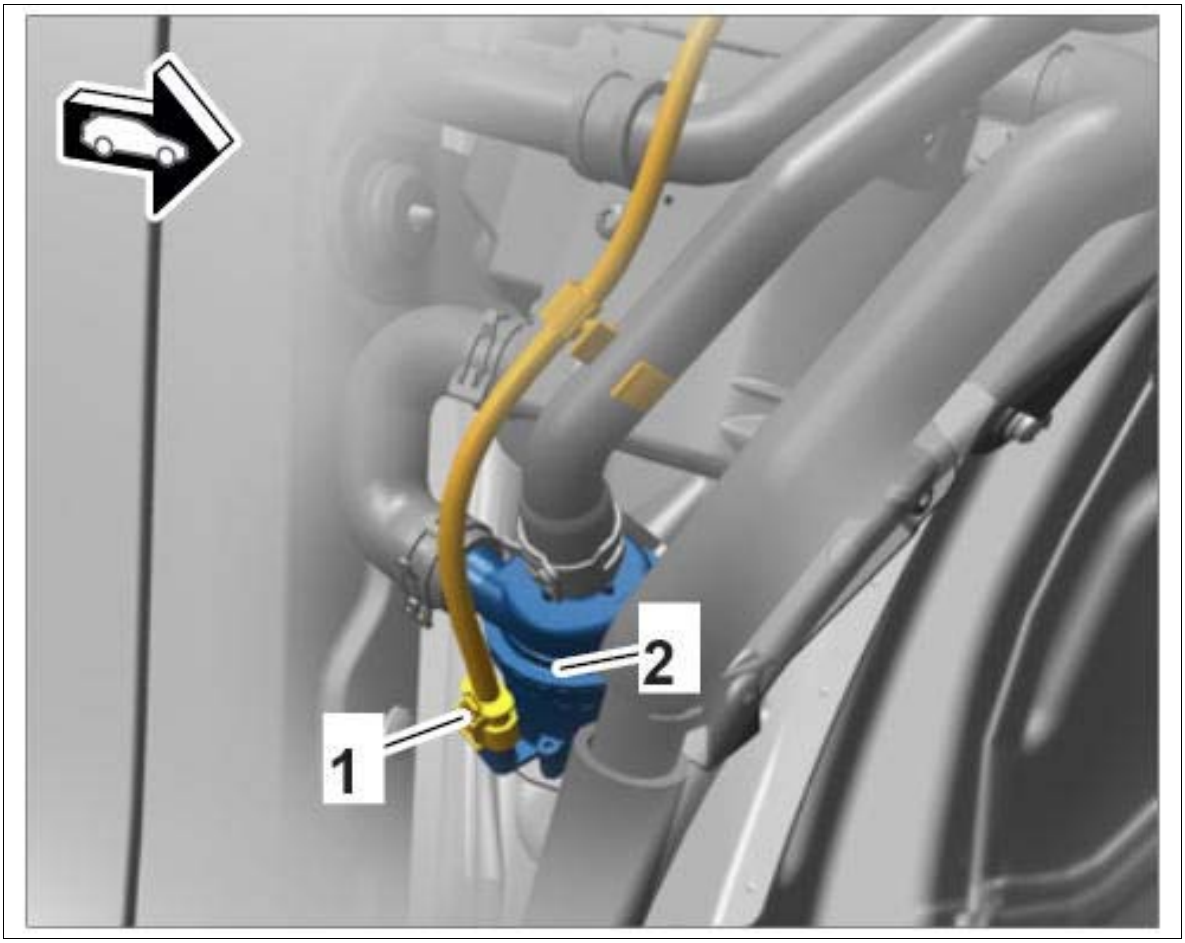
Fig 4: Locating Wiring Harness On Holder



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Release electric plug connection **-1-** from the circulating pump **-2-** and disconnect it.

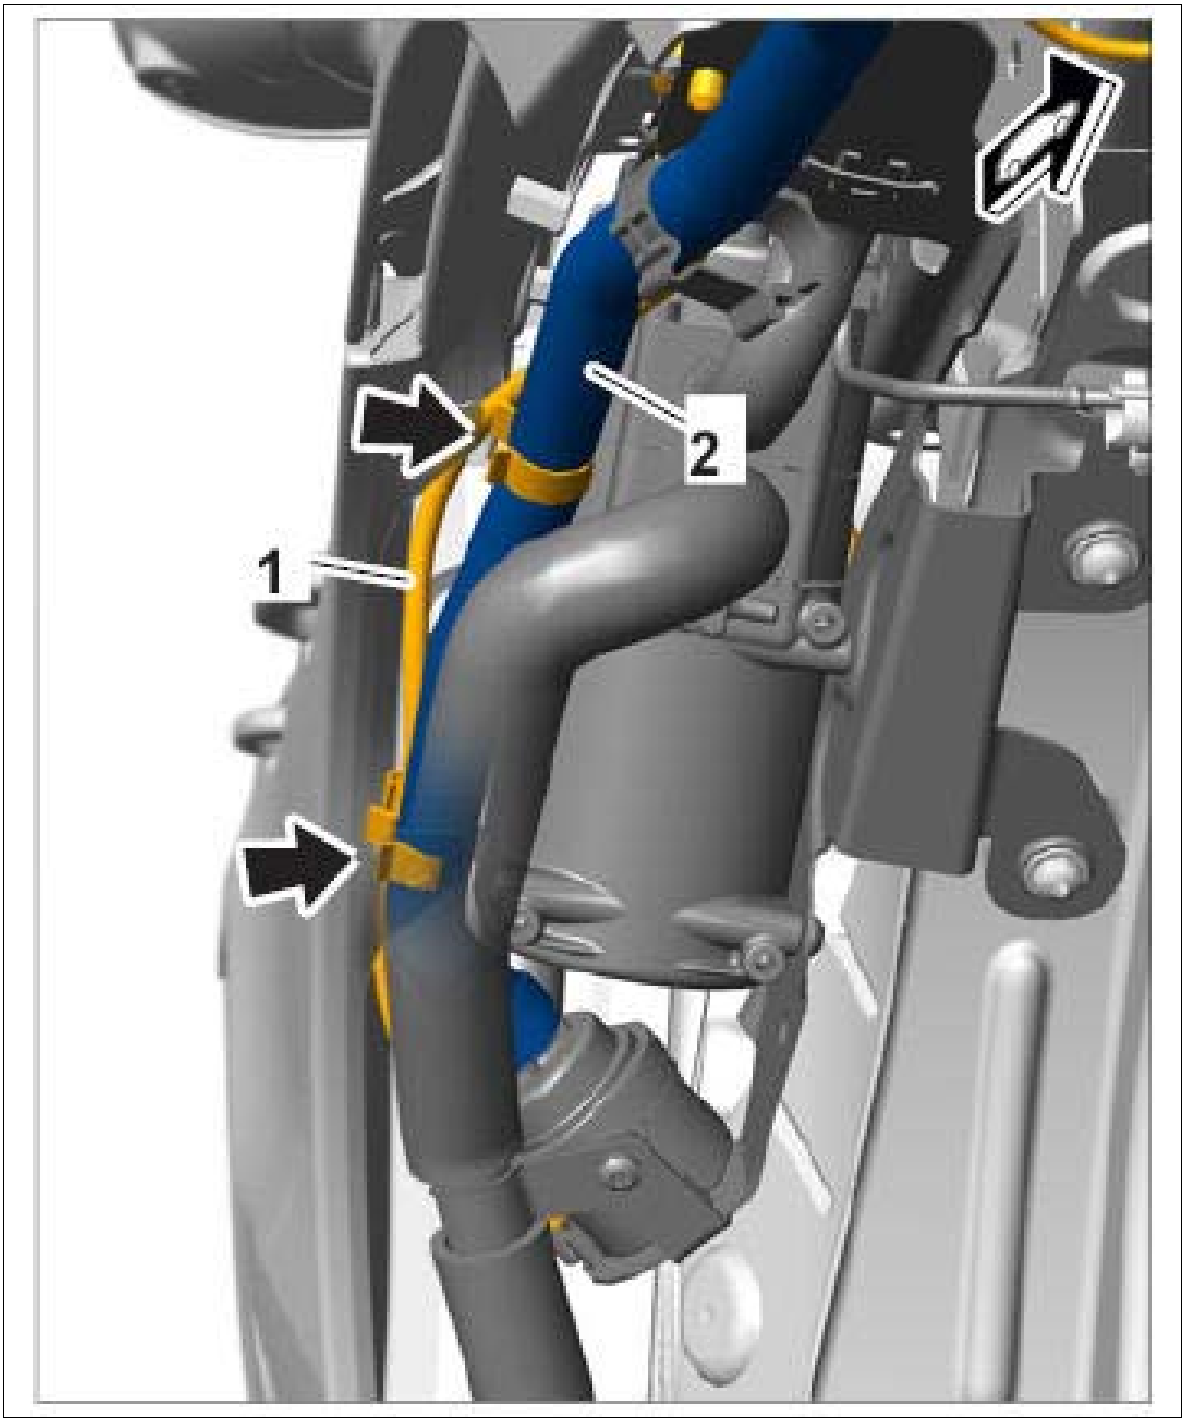
Fig 5: Identifying Circulating Pump Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Unclip wiring harness **-1-** from the coolant hose **-2-** at the marked positions **-arrows-** .

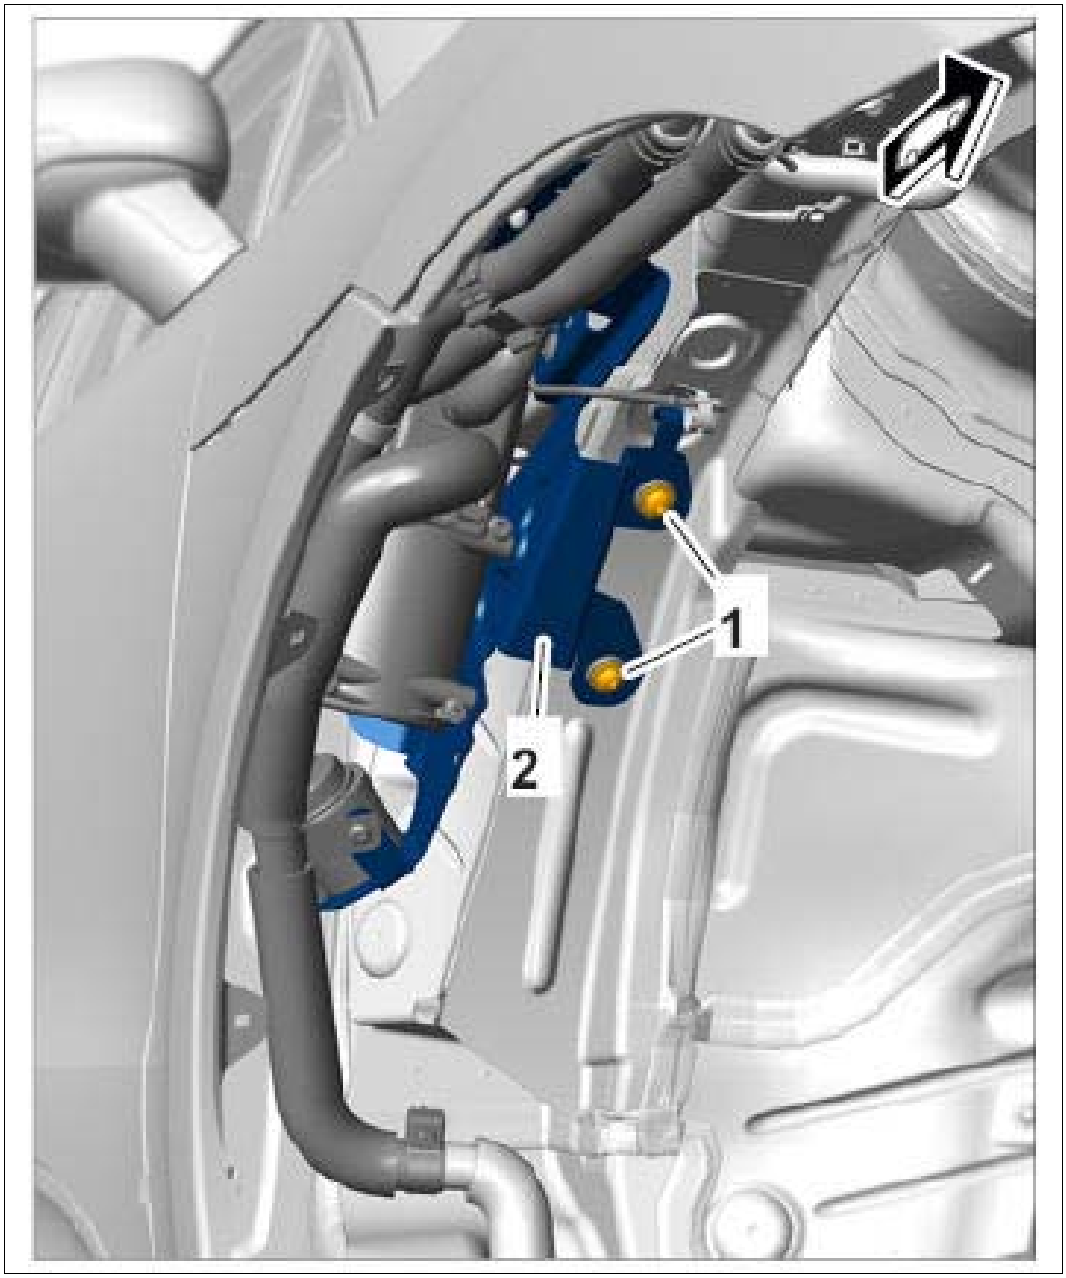
Fig 6: Locating Wiring Harness On Coolant Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Remove heater.
    1. 7.1. Unscrew fastening screws **-1-** .
    2. 7.2. Remove heater with holder **-2-** and pull it forward slightly.

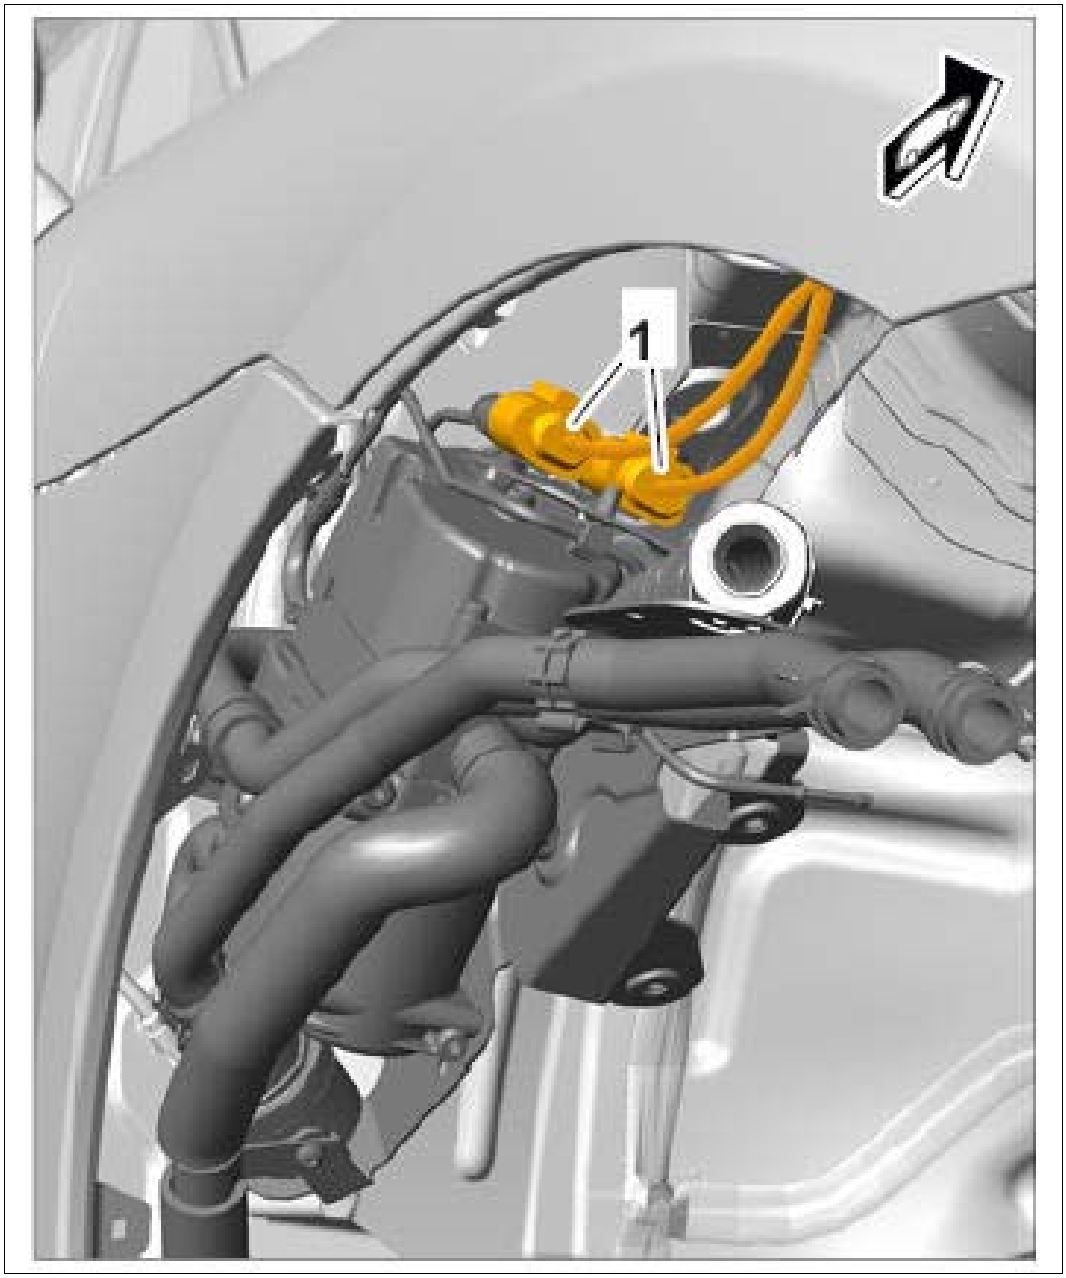
Fig 7: Identifying Heater



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 7.3. Release and disconnect electric plug connections **-1-** .

Fig 8: Identifying Heater Connectors



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

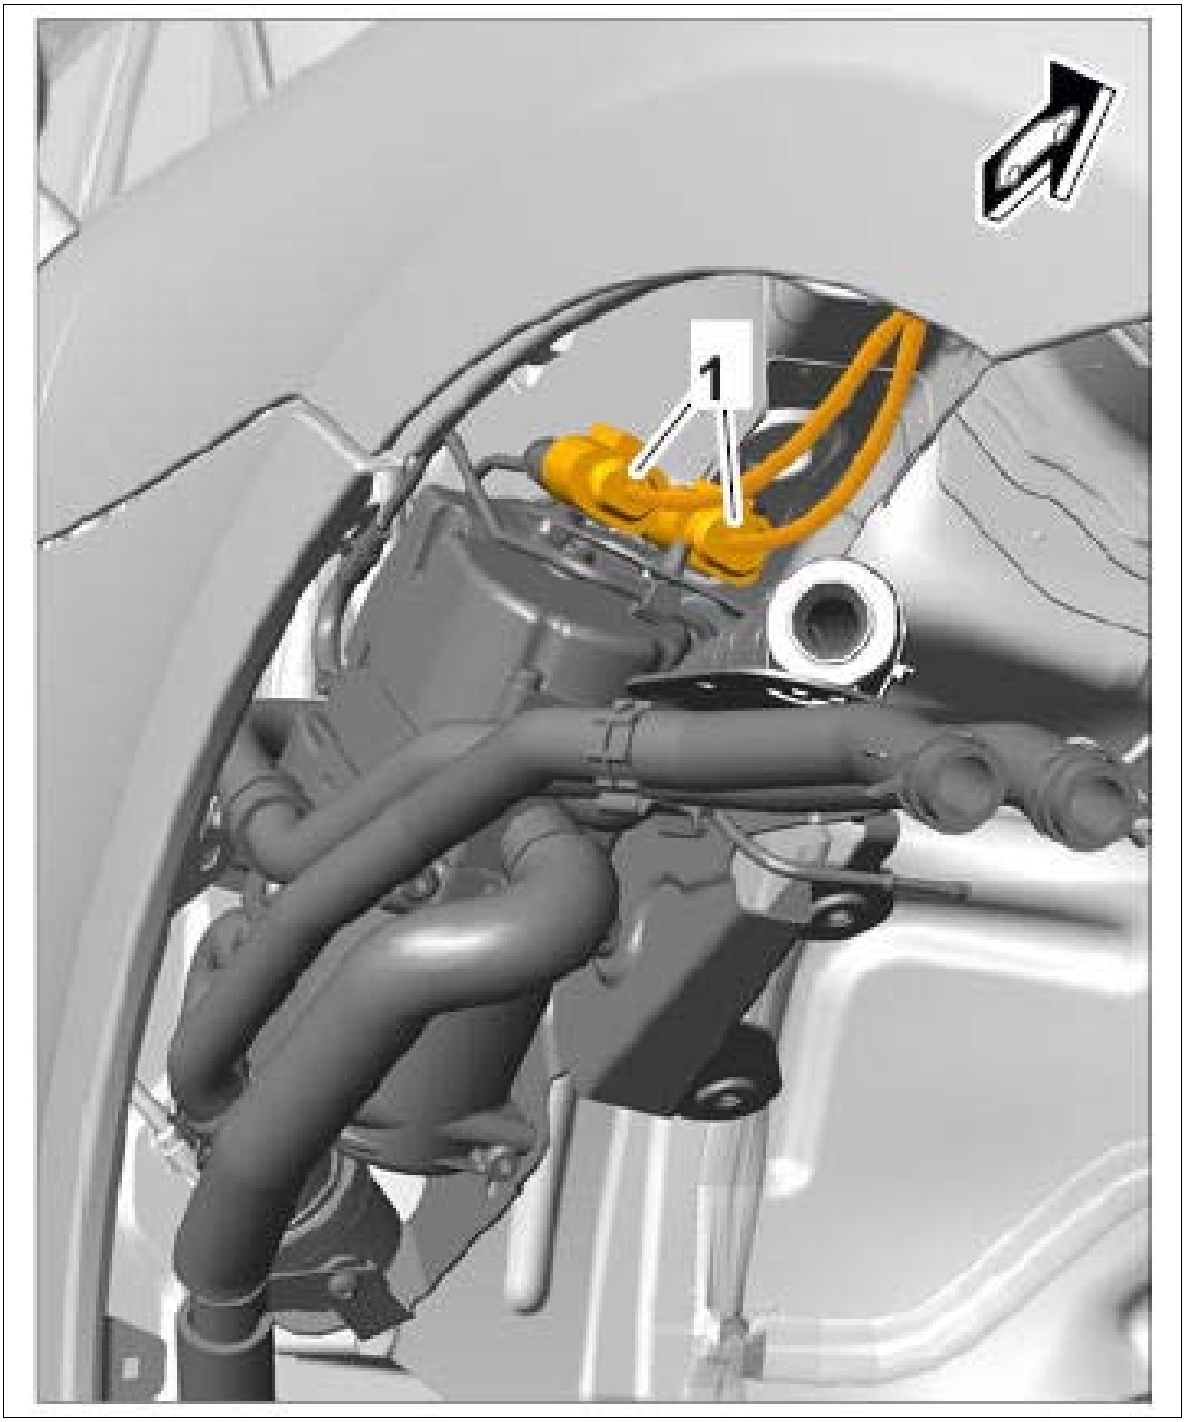
WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > REMOVING AND INSTALLING HEATER > INSTALLING HEATER

Information

- There is no guarantee that re-used clamps will secure the component properly.
- Removed clamps must be replaced.
- Always use new clamps during installation.

1. Connect electric plug connections **-1-** until they engage securely.

Fig 1: Identifying Heater Connectors

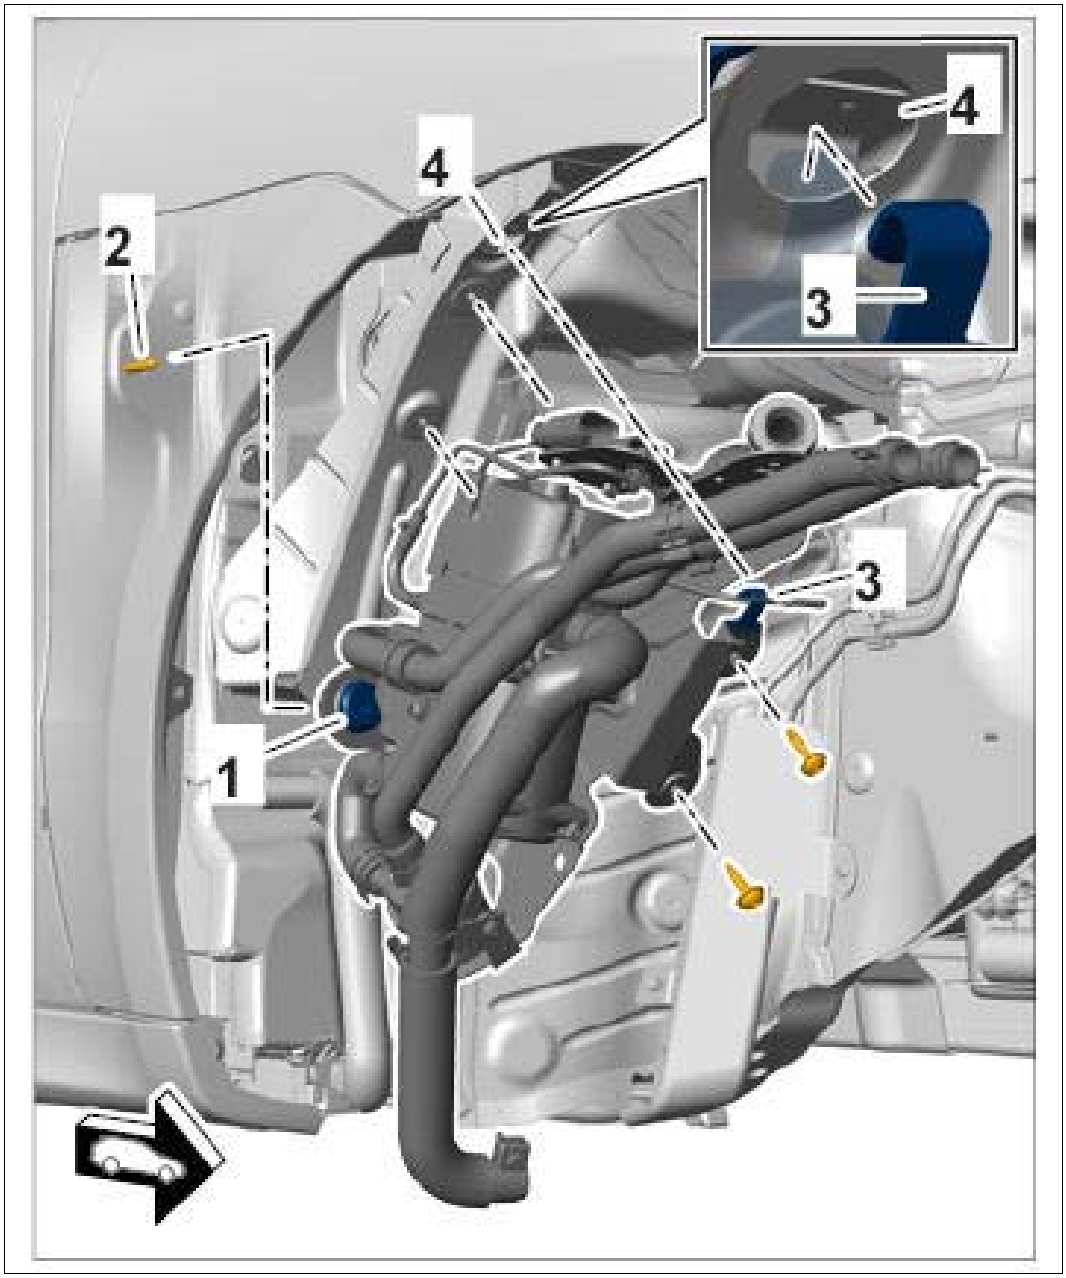


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Position the heater.

    1. 2.1. Position rubber sleeve **-1-** on the retaining pin **-2-** .
    2. 2.2. Engage clip **-3-** for the holder in the cut-out **-4-** .

Fig 2: Positioning Heater

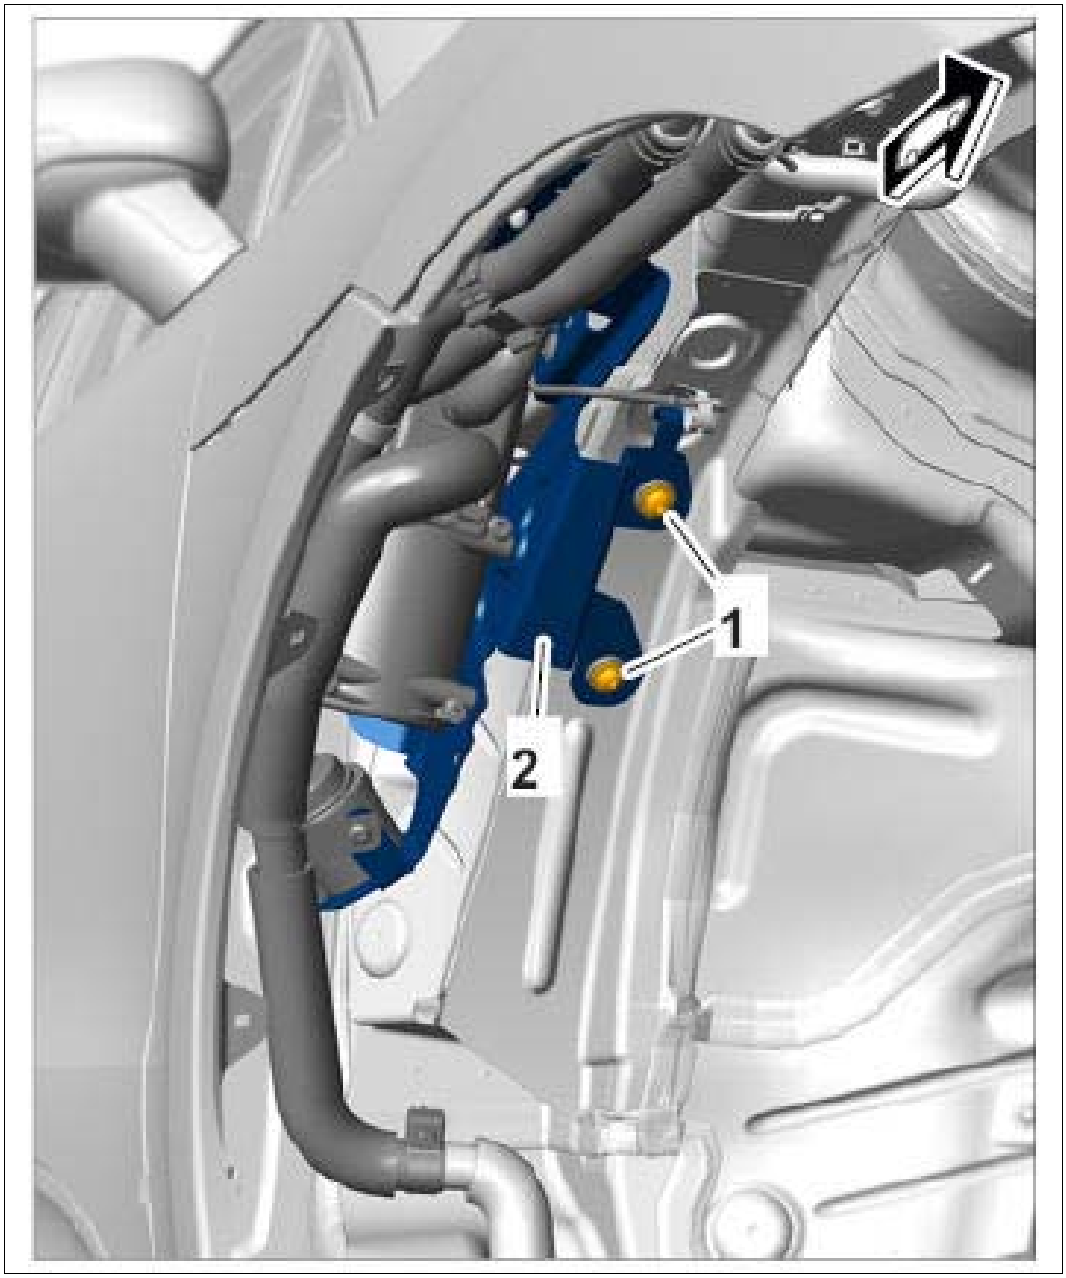


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Secure the heater.

    1. 3.1. Loosely fit fastening screws **-1-** for the holder **-2-** at the top and bottom.

Fig 3: Identifying Heater Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 3.2. Slide flexi-pipe **-2-** and screw-type clamp **-1-** onto the silencer pipe **-3-** .

Fig 4: Identifying Exhaust Pipe On Silencer

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 3.3. Tighten fastening screws **-1-** on the holder **-2-** to the prescribed tightening torque. **Tightening torque 20 Nm (15 ftlb.)**

4. 3.4. Tighten screw-type clamp **-1-** .

4. Secure coolant hoses.

1. 4.1. Push coolant hoses **-1-** as far as they will go over the adapters.

2. 4.2. Tighten spring band clamps **-2-** using **assembly pliers Nr.72 Pos.1.**

3. 4.3. **Hose clamp 3094 -3-** must then be removed from the coolant hoses **-1-** .

Fig 5: Identifying Coolant Hoses

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Clip wiring harness **-1-** onto the coolant hose **-2-** at the marked positions **-arrows-** .

Fig 6: Locating Wiring Harness On Coolant Hose

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Connect electric plug connection **-1-** to the circulating pump **-2-** until it engages securely.

Fig 7: Identifying Circulating Pump Connector

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Clip wiring harness **-1-** into the holder **-2-** at position **-arrow-** .

Fig 8: Locating Wiring Harness On Holder

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Secure the fuel line to the heater.

Fig 9: Locating Fuel Line In Wheel Housing

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 8.1. Push on fuel line **-2-** as far as it will go or up to the marking - minimum overlap: 25 mm.
2. 8.2. Tighten spring band clamp **-3-** using **assembly pliers Nr.72 Pos.1.**

9. The fuel system must also be pre-filled. To do this, connect **PIWIS Tester II 9818** to the vehicle.
10. Switch on ignition.
11. Select the vehicle type and start the PIDT.
12. Select the **auxiliary heater** control unit in the **overview** .
13. **Maintenance/repairs** must then be selected.
14. **Line filling** must now be selected. Then press [Next].

WM 824519 REMOVING AND INSTALLING FUEL PUMP FOR AUXILIARY HEATING (ALL MODELS) > PRELIMINARY WORK

1. Remove cover for center underbody at the right side → Removing cover for center underbody .

WM 824519 REMOVING AND INSTALLING FUEL PUMP FOR AUXILIARY HEATING (ALL MODELS) > REMOVING AND INSTALLING FUEL PUMP FOR AUXILIARY HEATING > REMOVING FUEL PUMP FOR AUXILIARY HEATING

WARNING: Emerging fuel

- *Risk of fire*

→ Disconnect the battery.

→ Avoid contact with hot parts or sources of ignition.

→ Allow engine to cool down.

→ Relieve the fuel pressure before opening the fuel lines.

→ Collect emerging fuel, absorb it if necessary with a suitable binding material and dispose of properly.

→ Use suction to remove ignitable vapors.

→ Attach warning sign to vehicle in a clearly visible position.

1. Loosen fuel pump **-1-** from the holder **-2-** .
2. Release and disconnect connector **-5-** .
3. Disconnect line **-3-** for the auxiliary heating and pull it off the fuel pump.
4. Disconnect fuel line **-4-** to the fuel tank.

5. Remove fuel pump **-1-** .

Fig 1: Identifying Auxiliary Heating Fuel Pump

Information

- There is no guarantee that re-used clamps will secure the component properly.
- Removed clamps must be replaced.
- Always use new clamps during installation.

1. Installation is performed in reverse order to removal.

   Pay particular attention to the following:

   Push on fuel line **-2-** as far as it will go or up to the marking - minimum overlap: 25 mm.

   Fig 1: Locating Fuel Line In Wheel Housing

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. The fuel system must also be pre-filled. To do this, connect **PIWIS Tester II 9818** to the vehicle.

4. Secure line **-1-** to the silencer holder **-2-** .
5. Slide flexi-pipe **-2-** onto the silencer pipe **-3-** .

Fig 3: Identifying Silencer Holder

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Tighten screw-type clamp **-1-** .

Fig 4: Identifying Exhaust Pipe On Silencer

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 825919 REMOVING AND INSTALLING MUFFLER (SILENCER) (ALL MODELS) > SUBSEQUENT WORK

1. Install right side panel cover for center underbody → Installing cover for center underbody .
2. Install central cover for center underbody → Installing cover for center underbody

3. Install front wheel housing liner at the right → Installing front wheel housing liner .

4. Fit right front wheel → Installing Wheel .

WM 826019 REMOVING AND INSTALLING EXHAUST PIPE (ALL MODELS) > INFORMATION > INSTALLATION POSITION OF EXHAUST PIPE

The exhaust pipe is on the heater in the front right wheel housing, behind the wheel housing liner.

WM 826019 REMOVING AND INSTALLING EXHAUST PIPE (ALL MODELS) > PRELIMINARY WORK

1. Loosen heater with holder → Loosening Heater With Holder .

WM 826019 REMOVING AND INSTALLING EXHAUST PIPE (ALL MODELS) > REMOVING AND INSTALLING EXHAUST PIPE > REMOVING EXHAUST PIPE

1. Unscrew fastening screw **-2-** on the exhaust pipe **-1-** .

Fig 1: Identifying Exhaust Pipe On Holder

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Remove exhaust pipe from heater.
    1. 2.1 Loosen screw-type clamp **-1-** .
    2. 2.2 Remove exhaust pipe **-2-** from heater.

Fig 2: Identifying Exhaust Pipe On Heater

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 826019 REMOVING AND INSTALLING EXHAUST PIPE (ALL MODELS) > REMOVING AND INSTALLING EXHAUST PIPE > INSTALLING EXHAUST PIPE

1. Fit exhaust pipe on heater.
    1. 1.1. Position exhaust pipe **-2-** on the heater.
    2. 1.2. Tighten screw-type clamp **-1-** .

Fig 1: Identifying Exhaust Pipe On Heater

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Tighten fastening screw **-2-** on the exhaust pipe **-1-** .

Fig 2: Identifying Exhaust Pipe On Holder

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 826019 REMOVING AND INSTALLING EXHAUST PIPE (ALL MODELS) > SUBSEQUENT WORK

1. Secure heater with holder → Securing Heater With Holder .

WM 827219 REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
hose clamp	VW tool	3094		assembly pliers	Commercially available tool	Nr.72 Pos.1		

WM 827219 REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER (ALL MODELS) > INFORMATION > INSTALLATION POSITION

The circulating pump is behind the right front wheel housing liner under the heater.

WM 827219 REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER (ALL MODELS) > PRELIMINARY WORK

1. Loosen heater with holder → Loosening Heater With Holder .

WM 827219 REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER (ALL MODELS) > REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER > REMOVING CIRCULATING PUMP FOR AUXILIARY HEATER

NOTE: Danger of scalding

- *Coolant can be very hot.*
- *Coolant may be pressurized.*

→ Only remove the heater when the cooling system has cooled down.

→ By carefully opening the catch on the reservoir, make sure that the cooling system is depressurized.

1. Release electric plug connection **-1-** from the circulating pump **-2-** and disconnect it.

   Fig 1: Identifying Circulating Pump Connector

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Clamp both coolant hoses **-2-** and **-4-** using **hose clamp 3094.** → Mounting for coolant hoses on circulating pump

Fig 2: Identifying Coolant Hoses On Circulating Pump

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

NOTE: Danger of slipping due to emerging coolant

1. *The emerging coolant will make the floor of the workshop slippery and may cause people to slip and fall over.*

→ Collect emerging coolant in a suitable pan.

3. Loosen spring band clamps **-1-** and **-3-** using **assembly pliers Nr.72 Pos.1** and pull off coolant hoses **-2-** and **-4-** .

4. Unscrew fastening screws **-1-** and remove circulating pump **-2-** .

Fig 3: Identifying Circulating Pump On Holder

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 827219 REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER (ALL MODELS) > REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER > INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER

1. Position circulating pump **-2-** on the holder and tighten fastening screws **-1-** .

Fig 1: Identifying Circulating Pump On Holder

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Secure coolant hoses.

    1. 2.1. Push coolant hoses **-2-** and **-4-** as far as they will go over the adapters.

       Tighten spring band clamps **-1-** and **-3-** using **assembly pliers Nr.72 Pos.1.**

Fig 2: Identifying Coolant Hoses On Circulating Pump

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 2.2. **Hose clamp 3094** must then be removed from the coolant hoses **-2-** and **-4-** .

3. Connect electric plug connection **-1-** to the circulating pump **-2-** until it engages securely.

Fig 3: Identifying Circulating Pump Connector

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 827219 REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER (ALL MODELS) > SUBSEQUENT WORK

1. Secure heater with holder → Securing Heater With Holder
2. Add coolant and bleed the cooling system → Filling Coolant .

WM 827419 REMOVING AND INSTALLING DIRECTIONAL-CONTROL VALVE (ALL MODELS) > PRELIMINARY WORK

1. Drain coolant → Draining Coolant .
2. Remove cowl panel cover → Removing cowl panel cover .

WM 827419 REMOVING AND INSTALLING DIRECTIONAL-CONTROL VALVE (ALL

MODELS) > REMOVING AND INSTALLING DIRECTIONAL-CONTROL VALVE > REMOVING DIRECTIONAL-CONTROL VALVE

1. Unscrew fastening screws **-1-** and remove air inlet housing cover **-2-** .

   Fig 1: Identifying Air Inlet Housing Cover

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Disconnect connector **-1-** .
3. Loosen spring band clamps **-2- (-arrows-)** .
4. Pull off hoses.
5. Unscrew fastening screws.
6. Remove directional-control valve **-5-** .

Fig 2: Removing Directional-Control Valve

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 827419 REMOVING AND INSTALLING DIRECTIONAL-CONTROL VALVE (ALL MODELS) > REMOVING AND INSTALLING DIRECTIONAL-CONTROL VALVE > INSTALLING DIRECTIONAL-CONTROL VALVE

1. Installation is performed in reverse order.

WM 827419 REMOVING AND INSTALLING DIRECTIONAL-CONTROL VALVE (ALL MODELS) > SUBSEQUENT WORK

1. Install cowl panel cover → Installing cowl panel cover .
2. Fill in coolant → Filling Coolant .

Service Manual: STATE EMISSION STANDARDS - DIESEL

ARIZONA

NOTE: Because of frequent revisions in state emission standards, the emission standards listed in this article should only be used as a guide.

ARIZONA EMISSION STANDARDS - PHOENIX & TUCSON AREA (DIESEL OPACITY LOADED CRUISE TEST)

Application	Altitude (Feet)	Opacity (% For 10 Seconds)
Light Duty Vehicles (8500 GVWR Or Less)		
All Years	Less Than 2000	20 Or Less
	2001-4000	30 Or Less
	Greater Than 4000	40 Or Less

ARIZONA EMISSION STANDARDS - PHOENIX & TUCSON AREA (DIESEL J1667 SNAP IDLE TEST)

Application	Altitude (Feet)	Opacity (% For 10 Seconds)
Heavy Duty Vehicles (8500 GVWR Or Greater)		
1990 & Earlier	All	55
1991 & Newer	All	40

COLORADO

COLORADO EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
14,000 GVWR Or Less	
Non-Turbo	40
Turbo	35
14,000 GVWR Or More	
Non-Turbo	35
Turbo	20

CONNECTICUT

CONNECTICUT EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
10,000 GVWR Or Less	
1979 & Newer	20
26,000 GVWR Or More	
1974 & Earlier	70
1974-90	55
1991 & Newer	40

IDAHO

IDAHO EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
All Weight Range	
1965-74	70
1975-91	55
1992 & Newer	40

KENTUCKY

KENTUCKY EMISSION STANDARDS - BOONE, CAMPBELL & KENTON COUNTIES (DIESEL OPACITY)

Application	Opacity
18,000 GVWR Or Less	
All Years	10% @ Idle

MASSACHUSETTS

MASSACHUSETTS EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
Light Duty (8500 GVWR Or Less)	
1984 & Newer	20
Light Duty (8501-10,000 GVWR Or Less)	
1984 & Newer	40
Heavy Duty Buses (10,000 GVWR Or More)	
1984-93	40
1994 & Newer	30
Heavy Duty Trucks (10,000 Or Less GVWR)	
1984-90	55
1991 & Newer	40

NEW YORK

NEW YORK EMISSION STANDARDS - DIESEL OPACITY TEST

Service Manual: STATE EMISSION STANDARDS - GAS

ALASKA

> *NOTE: Because of frequent revisions in state emission standards, the emission standards listed in this article should only be used as a guide.*

> *NOTE: As of March 1, 2012, Alaska is not testing for tailpipe emissions.*

ALASKA EMISSION STANDARDS - ANCHORAGE & FAIRBANKS (2-SPEED IDLE TEST)

Application	Idle HC ppm (CO %)	2500 RPM HC ppm (CO %)
Passenger Cars (1)		
1968-71	1000 (5.0)	1000 (4.0)
1972-74	1000 (4.0)	1000 (3.0)
1975-80	1000 (2.0)	1000 (2.0)
1981-83	1000 (1.0)	1000 (1.0)
1984-93	750 (1.0)	750 (1.0)
1994-	200 (0.5)	200 (0.5)
Light & Medium Duty Trucks (1)		
1968-72	1000 (5.0)	1000 (4.0)
1973-78	1000 (4.0)	1000 (3.0)
1979-83	1000 (2.0)	1000 (2.0)
1984-93	750 (1.0)	750 (1.0)
1994-	220 (0.5)	220 (0.5)
Heavy Duty Vehicles (2)		
1968-73	1000 (5.0)	1000 (5.0)
1974-93	1000 (4.0)	1000 (4.0)
1994-	220 (1.0)	220 (1.0)

(1) 8500 GVWR or less.

(2) 8500 GVWR or more.

ARIZONA

NOTE: Curb idle only test are for vehicles with full-time 4WD, non-defeatable traction control and motorcycles. Curb idle and loaded cruise tests are performed on 1967-80 light-duty gasoline powered vehicles and all heavy-duty gasoline powered vehicles.

ARIZONA EMISSION STANDARDS - PHOENIX AREA (CURB IDLE & LOADED CRUISE TESTS)

Application (1)	Idle HC ppm (CO %)	(2) Loaded/Cruise HC ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)		
1967-71 4-Cyl. Or Less	500 (5.50)	500 (4.20)
1967-71 More Than 4-Cyl.	450 (5.00)	450 (3.75)
1972-74 4-Cyl. Or Less	400 (5.50)	400 (4.20)
1972-74 More Than 4-Cyl.	400 (5.00)	400 (3.75)
1975-78 4-Cyl. Or Less	250 (2.20)	250 (1.65)
1975-78 More Than 4-Cyl.	250 (2.00)	250 (1.50)
Light Duty Vehicles (8500 GVWR Or Less)		
1979 4-Cyl. Or Less	220 (2.20)	220 (1.65)
1979 More Than 4-Cyl.	220 (2.20)	220 (1.50)
1980	220 (1.20)	220 (1.20)
1981 & Newer	220 (1.20)	.....
Light Duty Trucks (6000 GVWR Or Less)		
1967-80	(3)	(3)
Light Duty Trucks (6001-8500 GVWR)		
1967-74	(3)	(3)
1975-78	350 (4.00)	350 (3.00)
1979 4-Cyl. Or Less	220 (2.20)	220 (1.65)
1979 More Than 4-Cyl.	220 (2.00)	220 (1.50)
1980	220 (1.20)	220 (1.20)
1981 & Newer	220 (1.20)	.....
Heavy Duty Trucks (Greater Than 8500 GVWR)		
1967-74	(3)	(3)
1975-78	350 (4.00)	350 (3.00)

1979 & Newer	300 (4.00)	300 (3.00)
Motorcycles		
1967 & Newer	1800 (5.50)	.....

(1)	4-stroke engines only.
(2)	Except AWD, non-defeatable traction control and motorcycles.
(3)	Same as light duty vehicles.

ARIZONA EMISSION STANDARDS - PHOENIX AREA (IM147 TEST)

Application	HC gpm (CO gpm)	NOx gpm
Light Duty Vehicles		
1981-82	3.0 (25.0)	3.5
1983-85	2.4 (20.0)	3.5
1986-89	1.6 (15.0)	2.5
1990-93	1.0 (12.0)	2.5
1994 & Newer	0.8 (12.0)	2.0
Light Trucks (6000 GVWR Or Less)		
1981-85	4.0 (40.0)	5.5
1986-89	3.0 (25.0)	4.5
1990-93	2.0 (20.0)	4.0
1994 & Newer	1.6 (20.0)	3.0
Light Duty Trucks (6000-8500 GVWR)		
1981-85	4.4 (48.0)	7.0
1986-87	4.0 (40.0)	5.5
1988-89	3.0 (25.0)	5.5
1990-93	3.0 (25.0)	5.0
1994 & Newer	2.4 (25.0)	4.0

NOTE: Curb idle test only for 1967-80 light-duty gasoline vehicles, all vehicles with full-time 4WD and/or non-defeatable traction control and motorcycles. Curb idle and loaded cruise tests are performed on all 1981 and later vehicles except those with full-time 4WD and/or non-defeatable traction control.

CALIFORNIA > LEGEND

ESC - Emission Standard Category

GVWR - Manufacture's Gross Vehicle Weight Rating

LVW - Loaded Vehicle Weight

PC - Passenger Car

LDT1 - Light-Duty Truck up through 3750 LVW and GVWR no greater than 6000 lbs.

LDT2 - Light-Duty Truck greater than 3750 LVW and GVWR no greater than 6000 lbs.

MDV - Medium-Duty Vehicle, GVWR from 6001 to 8500 lbs.

HC - Hydrocarbon, ppm

CO - Carbon Monoxide, %

NO - Nitric Oxide, ppm

CALIFORNIA > PASS/FAIL EMISSION STANDARDS = A+B / VTW

PASS/FAIL STANDARDS - Emission standards used to determine if a vehicle passes the emission inspection. A vehicle passes if the emission levels are equal to or less than the standards for HC, CO and NO for ASM 5015 and ASM 2525.

GROSS POLLUTER STANDARDS - Emission standards used to designate a vehicle as a gross polluter. A vehicle is designated as a gross polluter if the emission levels at the time of the initial inspection, before repairs are greater than the gross polluter standards for HC, CO or NO for ASM 5015 or ASM 2525.

NOTE: If test data on emission pass/fail rates or gross polluter identification rates

indicate adjustments are required, the emission standards may be increased or decreased by the bureau by 30% or by the following tolerances, or standards may be set for any specific vehicle and engine configuration which the bureau determines has excessive errors of commission of omission, whichever is necessary to comply with Section 44001.5 of the Health and Safety Code.

COLORADO

COLORADO EMISSION STANDARDS - ENHANCED PROGRAM (IM240)

Application	HC gpm	CO gpm	NOx gpm
Passenger Cars			
1982	3.5	45	5.0
1983	3.5	30	4.5

CONNECTICUT

CONNECTICUT EMISSION STANDARDS - IDLE TEST

Application	HC ppm (CO)
10,000 GVWR Or Less	
1979	250 (2.1)
1980	225 (2.0)
1981-82	200 (1.2)
1983	175 (1.0)
1984-87	150 (1.0)
1988 & Newer	125 (1.0)

DELAWARE

DELAWARE EMISSION STANDARDS - KENT, NEW CASTLE & SUSSEX COUNTIES (IDLE TEST)

Application	HC ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)	
1968-70	900 (9.0)
1971-74	600 (6.0)
1975-79	400 (4.0)
1980	220 (2.0)
1981 & Newer	220 (1.2)
Light Duty Trucks (6001-8500 GVWR)	
1970-72	900 (9.0)
1973-78	600 (6.0)
1979-83	400 (4.0)
1984 & Newer	220 (1.2)

DISTRICT OF COLUMBIA

DISTRICT OF COLUMBIA EMISSION STANDARDS - IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles & Trucks (26000 GVWR Or Less)	
1968-70	1250 (11.0)
1971-74	1200 (9.0)
1975-79	600 (6.5)
1980	300 (1.5)
1981 & Newer	220 (1.2)

GEORGIA

NOTE: The Georgia program incorporates original U.S. EPA recommended start-up ASM2525 and ASM5015 standards for 1995 and older model year vehicles. Refer to appropriate model year range in appropriate table. See U. S. EPA ASM2525 & ASM5015 START-UP EMISSION STANDARDS .

GEORGIA EMISSION STANDARDS - 2-SPEED IDLE TEST

Application [1]	HC ppm (CO %)
1979	500 (5.0)
1980	350 (3.5)
1981-83	250 (1.5)
1984 & Newer	220 (1.2)

[1] 8500 GVWR or less.

IDAHO

IDAHO EMISSION STANDARDS - 2-SPEED IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles	
8500 GVWR Or Less	
1965-74	900 (5.0)
1975-79	700 (3.0)
1980	400 (1.5)
1981 & Newer	220 (1.2)
Heavy Duty Trucks	
8501 GVWR Or More	
1965-74	900 (6.0)
1975-80	700 (5.0)
1981 & Newer	500 (3.0)

ILLINOIS

ILLINOIS EMISSION STANDARDS - IM240 TEST

Application	HC gpm	CO gpm
Light Duty Vehicles (6000 GVWR Or Less)		
1981-82	2.00	60.0

1983-87	2.00	30.0
1988-95	0.80	15.0
1996 & Newer	0.60	10.0
Light Duty Trucks (6000 GVWR Or Less)		
1981-83	7.50	100.0
1984-87	3.20	80.0
1988-95	1.60	40.0
1996 & Newer (3750 LVW Or More) (1)	0.80	13.0
1996 & Newer (3750 LVW Or Less) (1)	0.60	10.0
Light Duty Trucks (6001-6500 GVWR)		
1981-83	7.50	100.0
1984-87	3.20	80.0
1988-95	1.60	40.0
1996 & Newer (5750 ALVW Or More)	0.80	15.0
1996 & Newer (5750 ALVW Or Less)	0.80	13.0
(1) Loaded Vehicle Weight (LVW) is vehicle curb weight plus 300 lbs.

U. S. EPA REVISED FINAL ASM EMISSION STANDARDS (ASM5015 & ASM2525)

NOTE: EPA has not published a revised final standards for High Altitude, Light Duty Trucks 2 (6000-8500 GVWR), or vehicles older than 1980 model year. EPA guidance as of February 2003 states that a program may choose to use combinations of the Original and the Revised Final Standards.

U.S. EPA REVISED FINAL ASM EMISSION STANDARDS

Application	ASM5015		ASM2525	
	HC ppm (CO %)	NOx ppm	HC ppm (CO %)	NOx ppm
Passenger Cars				
1980	275 (1.3)	8500	500 (2.3)	4750
1981-82	275 (1.3)	3600	500 (2.3)	3500
1983-89	275 (1.1)	3600	500 (1.6)	3500
1990 & Newer	275 (1.1)	3600	300 (1.6)	3500

Light Duty Trucks (Less Than 6000 GVWR)				
1980-83	1140 (9.7)	14,145	340 (23.28)	32,200
1984-87	537 (5.4)	14,145	160 (12.96)	32,200
1988-95	537 (5.4)	7380	160 (12.96)	16,800
1996 & Newer	275 (1.1)	6150	82 (4.40)	14,000

U.S. EPA IM240 EMISSION STANDARDS > START-UP STANDARDS

Start-up standards should be used during the first 2 years of program operation. Tier 1 standards are recommended for all 1996 and newer vehicles and may be used for 1994 and newer vehicles certified to Tier 1 standards as well.

U.S. EPA IM240 HYDROCARBONS EMISSION START-UP STANDARDS

Application	Hydrocarbons (Grams/Mile)	
Composite		Phase 2
Light Duty Vehicles		
1996 & Newer	0.80	0.50

Service Manual: 80 - HEATING -- (95B) - MACAN

WM 803019 REMOVING AND INSTALLING HEAT EXCHANGER SUPPLY HOSE (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Drain refrigerant → 870317 DRAINING AND FILLING REFRIGERANT .
2. Remove cowl panel cover → 508719 REMOVING AND INSTALLING COWL PANEL COVER .

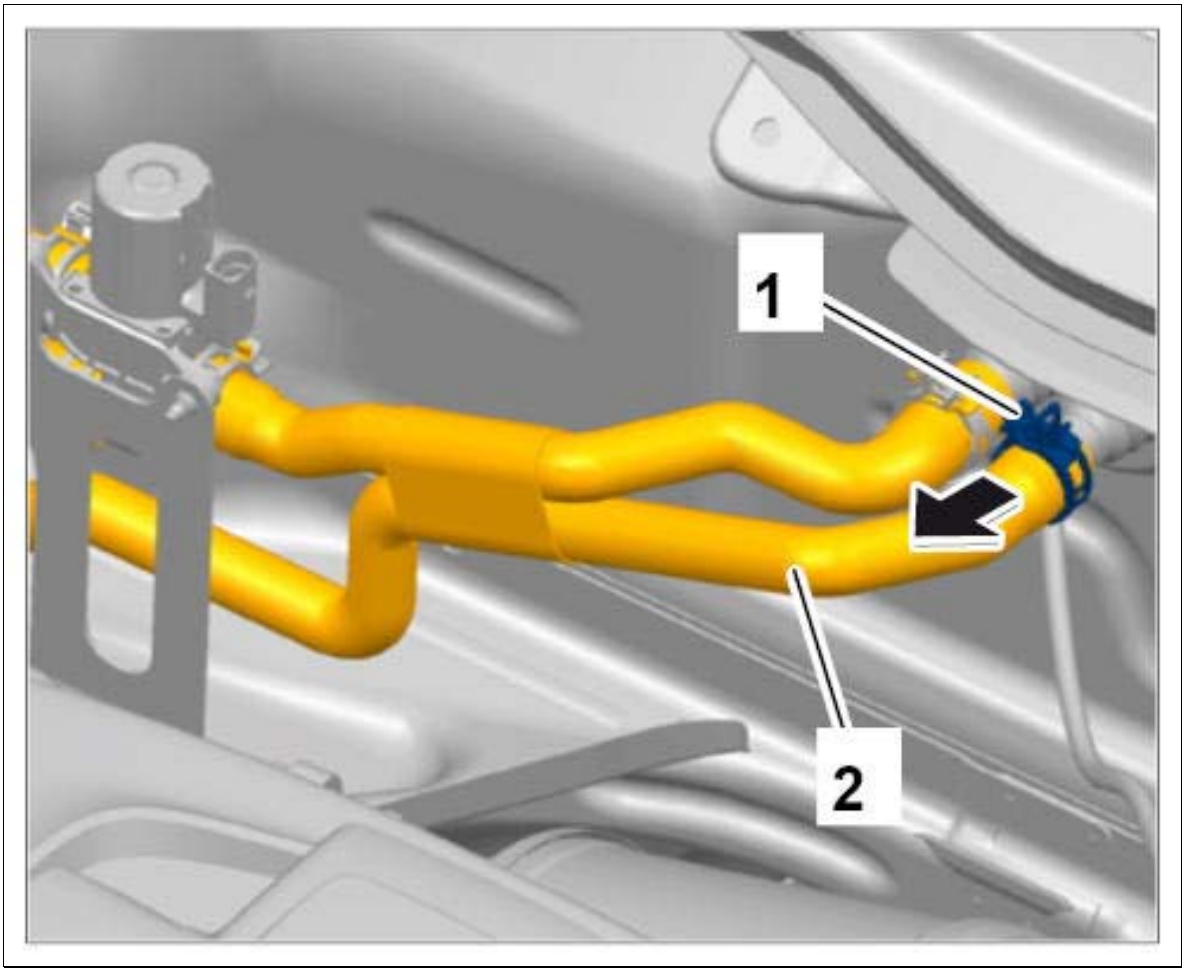
WM 803019 REMOVING AND INSTALLING HEAT EXCHANGER SUPPLY HOSE (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING HEAT EXCHANGER SUPPLY HOSE > REMOVING HEAT EXCHANGER SUPPLY HOSE

Information

The procedure for removal and installation can be different for other vehicle types.

1. Loosen spring band clamp **-1- (-arrow-)** .
2. Pull hose **-2-** off the heat exchanger connection piece.

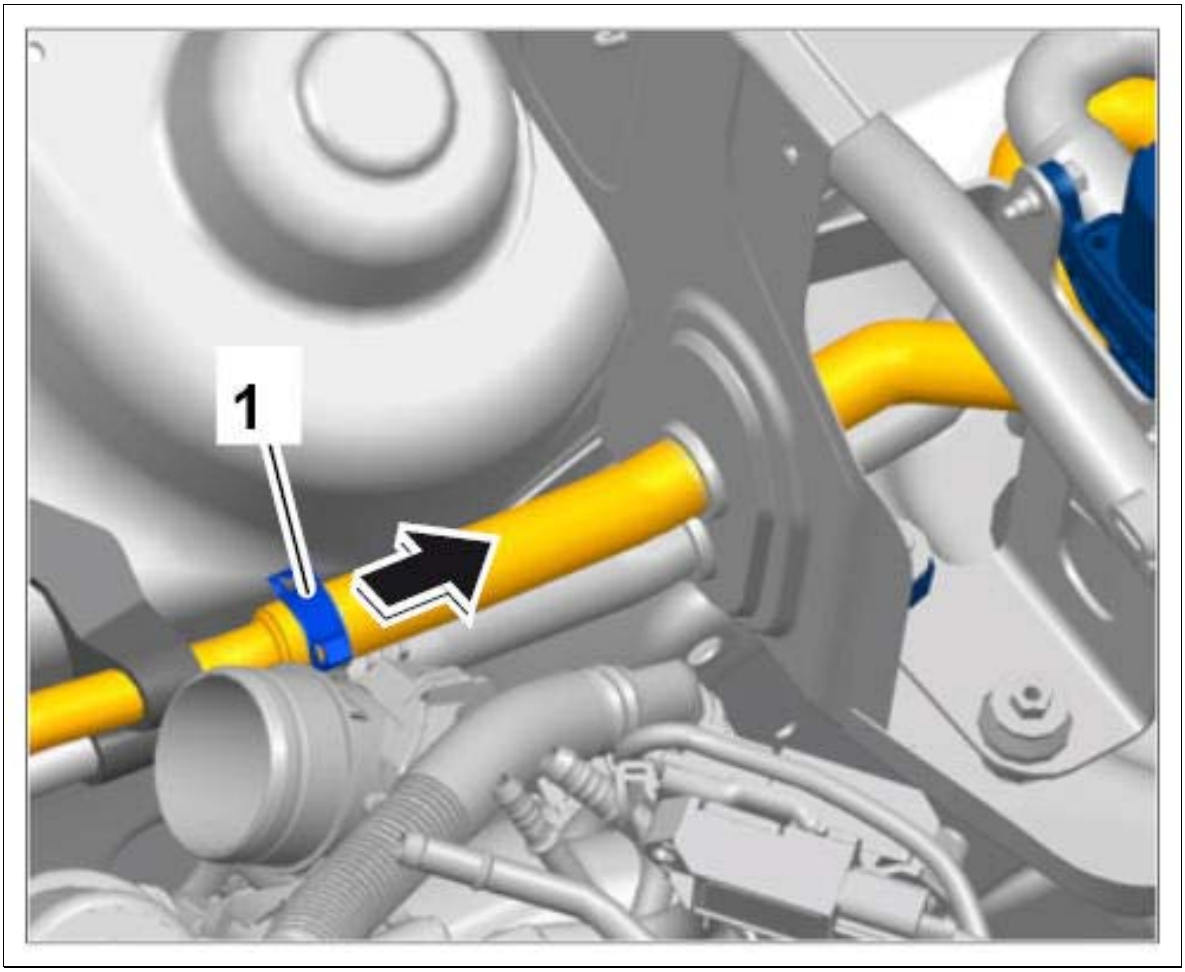
Fig 1: Removing Heat Exchanger Hose Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Loosen spring band clamp **-1- (-arrow-)** .

Fig 2: Loosening Spring Band Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Pull hose through the grommet in the plenum panel wall and remove it.

WM 803019 REMOVING AND INSTALLING HEAT EXCHANGER SUPPLY HOSE (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING HEAT EXCHANGER SUPPLY HOSE > INSTALLING HEAT EXCHANGER SUPPLY HOSE

1. Installation is performed in reverse order.

WM 803019 REMOVING AND INSTALLING HEAT EXCHANGER SUPPLY HOSE (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install cowl panel cover → INSTALLING COWL PANEL COVER .
2. Fill in refrigerant → DRAINING AND FILLING REFRIGERANT .

WM 803219 REMOVING AND INSTALLING HEAT EXCHANGER RETURN HOSE (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Drain refrigerant → 870317 DRAINING AND FILLING REFRIGERANT .
2. Remove cowl panel cover → 508719 REMOVING AND INSTALLING COWL PANEL COVER .

WM 803219 REMOVING AND INSTALLING HEAT EXCHANGER RETURN HOSE (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING HEAT EXCHANGER RETURN HOSE > REMOVING HEAT EXCHANGER RETURN HOSE

Information

The procedure for removal and installation can be different for other vehicle types.

1. Loosen spring band clamps **-1- (-arrows-)** .
2. Pull hose **-2-** off the heat exchanger return connection piece and directional-control valve connection piece.

Fig 1: Removing Heat Exchanger Return Hose

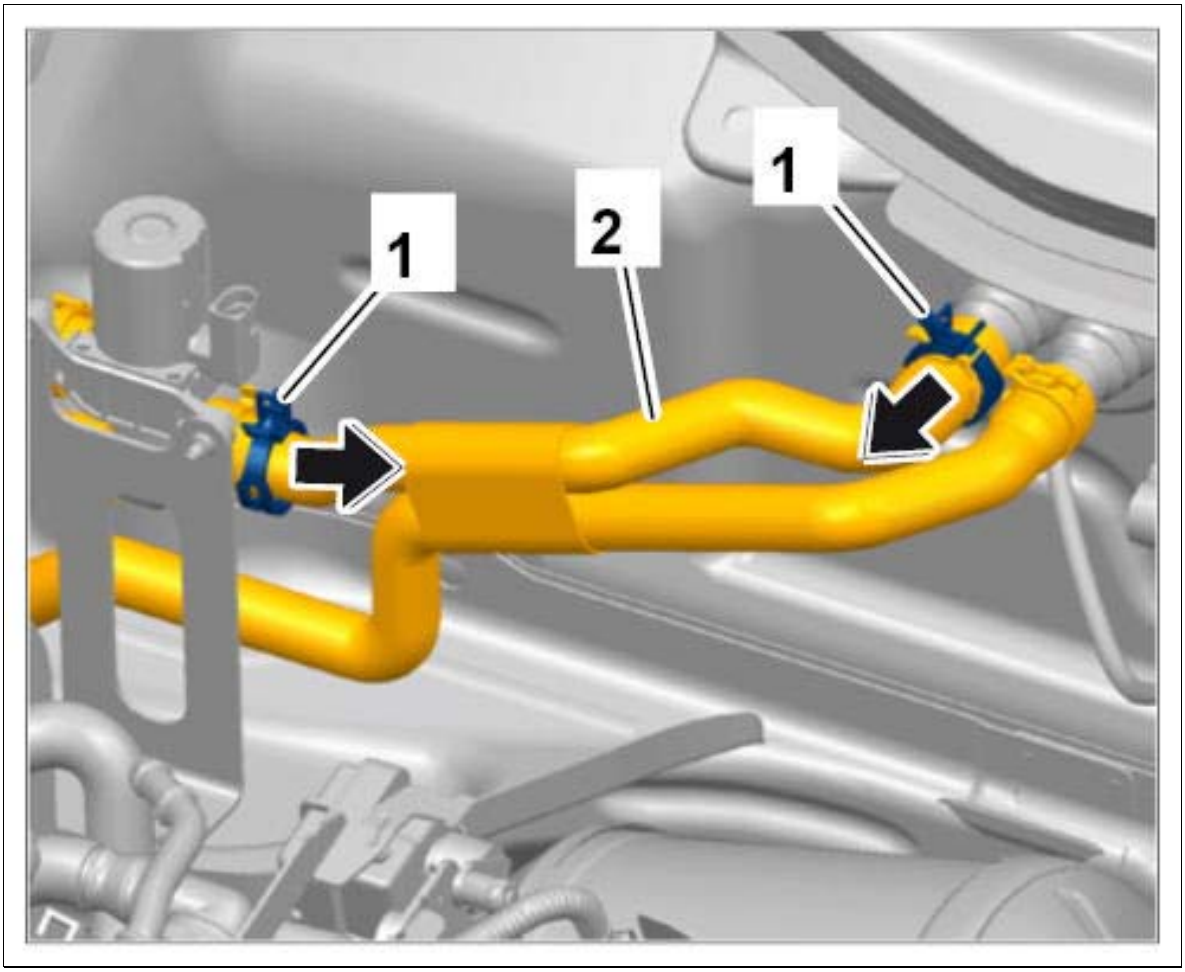
WM 803219 REMOVING AND INSTALLING HEAT EXCHANGER RETURN HOSE (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING HEAT EXCHANGER RETURN HOSE > REMOVING HEAT EXCHANGER RETURN HOSE (AUXILIARY HEATING)

If auxiliary heating system is installed:

1. Loosen spring band clamps **-1- (-arrows-)** .
2. Pull hose **-2-** off the heat exchanger return connection piece and directional-control valve connection piece.

Fig 1: Removing Heat Exchanger Return Hose

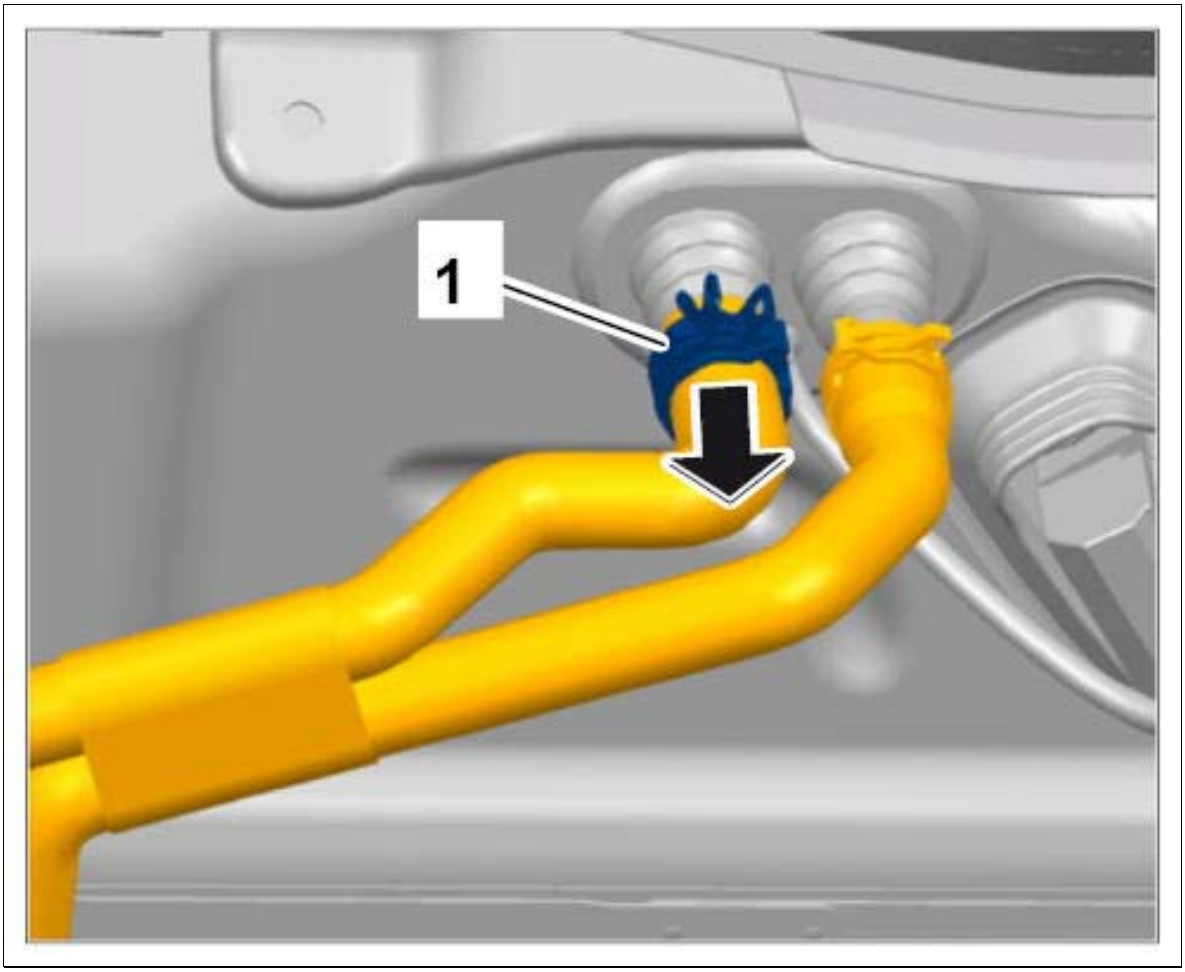


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

If auxiliary heating system is not installed:

3. Disconnect spring band clamp **-1-** on heat exchanger return connection piece **-arrow-** .

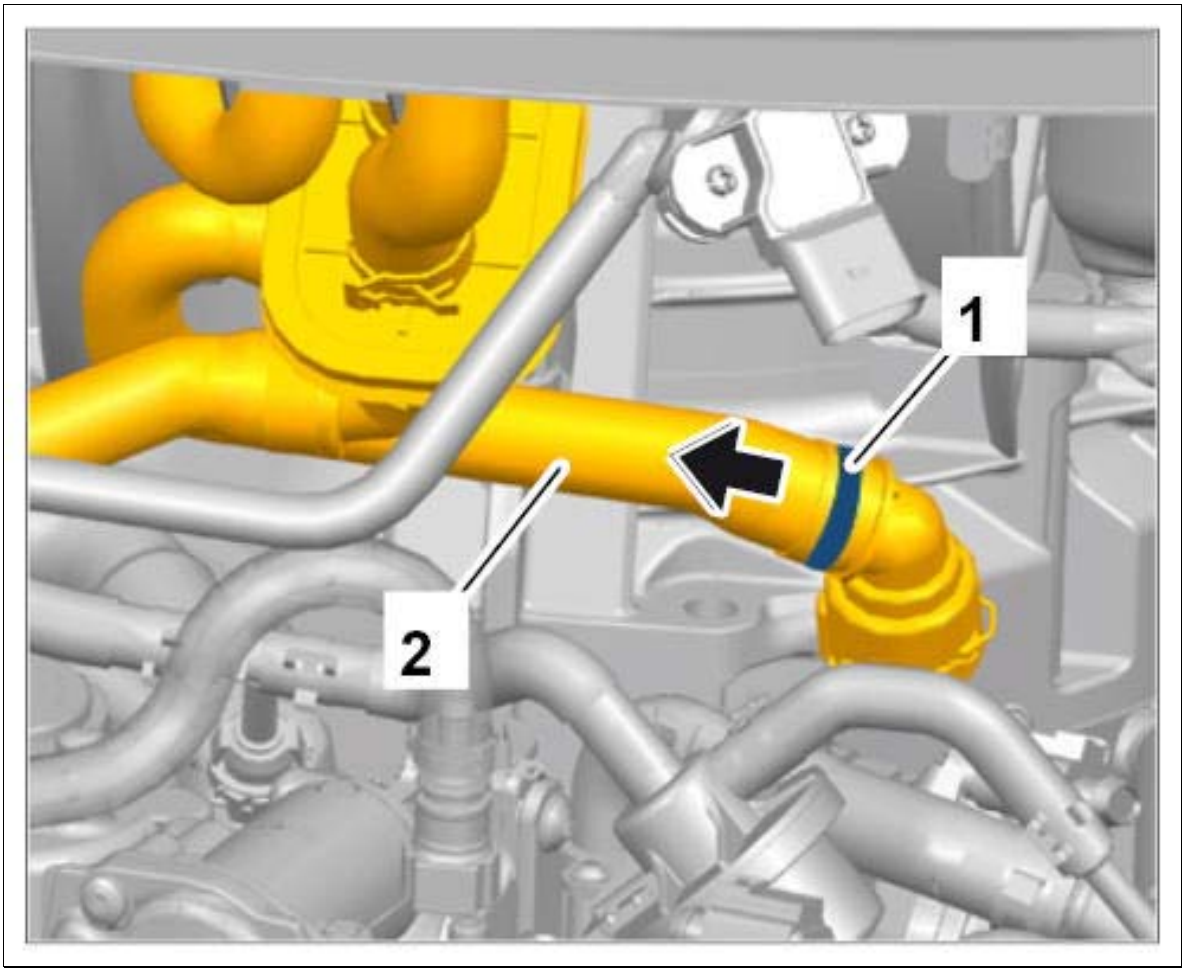
Fig 2: Disconnecting Spring Band Clamp On Heat Exchanger Return Hose Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Loosen spring band clamp **-1-** on the auxiliary pump connection piece **-arrow-** .

Fig 3: Loosening Spring Band Clamp On Auxiliary Pump Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Pull heat exchanger return hose **-2-** through the grommet in the plenum panel wall and remove it.

WM 803219 REMOVING AND INSTALLING HEAT EXCHANGER RETURN HOSE (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING HEAT EXCHANGER RETURN HOSE > INSTALLING HEAT EXCHANGER RETURN HOSE

1. Installation is performed in reverse order.

WM 803219 REMOVING AND INSTALLING HEAT EXCHANGER RETURN HOSE (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install cowl panel cover → 508719 REMOVING AND INSTALLING COWL PANEL COVER .
2. Fill in refrigerant → DRAINING AND FILLING REFRIGERANT .

WM 805519 REMOVING AND INSTALLING FRONT FOOTWELL OUTLET VENTS (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. **Applies to left footwell outlet vent:**

   Remove trim panel under dashboard at the left → 70191901 REMOVING AND INSTALLING TRIM PANEL UNDER DASHBOARD AT THE LEFT .

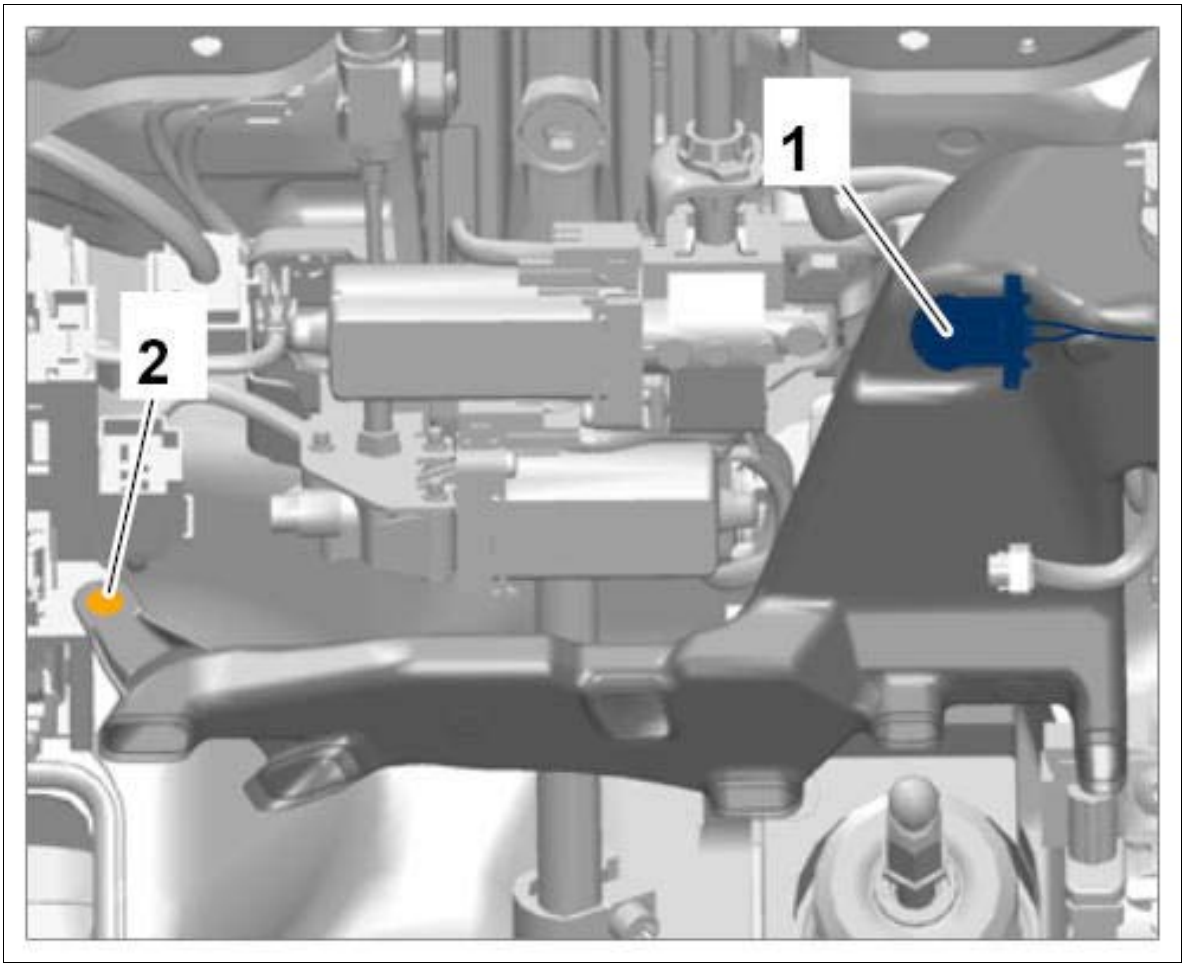
   Applies to right footwell outlet vent:

   Remove glove compartment → 681519 REMOVING AND INSTALLING GLOVE COMPARTMENT .

WM 805519 REMOVING AND INSTALLING FRONT FOOTWELL OUTLET VENTS (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING FRONT LEFT FOOTWELL OUTLET VENTS > REMOVING FRONT LEFT FOOTWELL OUTLET VENT

1. Release and disconnect connector **-1-** for the temperature sensor.
2. Unscrew fastening screw **-2-** .
3. Guide footwell outlet vent out to the left **-arrow-** .

Fig 1: Identifying Front Left Footwell Outlet Vent Temperature Sensor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. If the footwell outlet vent will be replaced, the temperature sensor must be converted beforehand. → Temperature sensor

Fig 2: Identifying Temperature Sensor

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

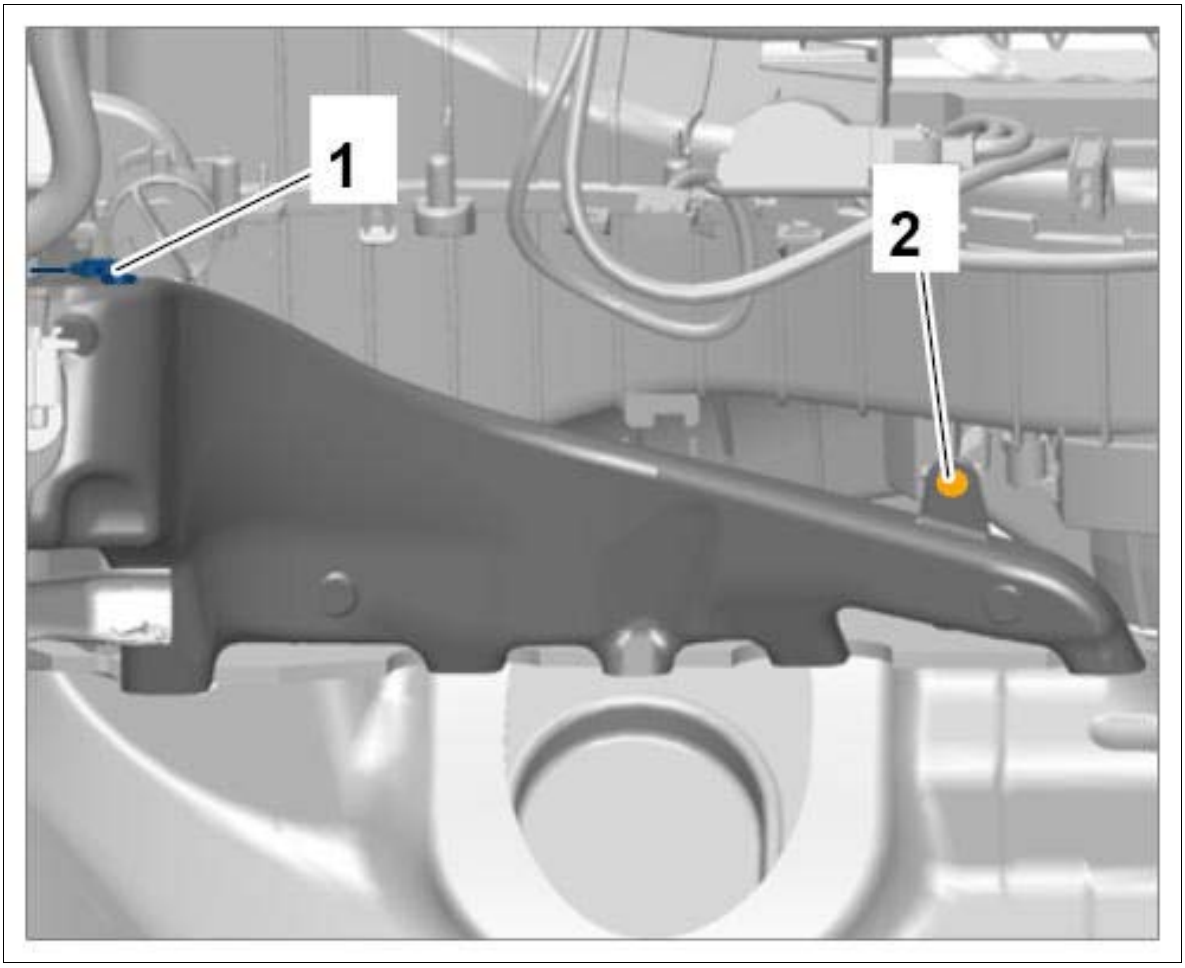
WM 805519 REMOVING AND INSTALLING FRONT FOOTWELL OUTLET VENTS (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING FRONT LEFT FOOTWELL OUTLET VENTS > INSTALLING FRONT LEFT FOOTWELL OUTLET VENT

1. Installation is performed in reverse order.

WM 805519 REMOVING AND INSTALLING FRONT FOOTWELL OUTLET VENTS (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING FRONT RIGHT FOOTWELL OUTLET VENTS > REMOVING FOOTWELL OUTLET VENT AT THE FRONT RIGHT

1. Release and disconnect connector **-1-** for the temperature sensor.
2. Unscrew fastening screw **-2-** .
3. Guide footwell outlet vent out to the right **-arrow-** .

Fig 1: Identifying Front Right Footwell Outlet Vent Temperature Sensor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. If the footwell outlet vent will be replaced, the temperature sensor must be converted beforehand. → Temperature sensor

Fig 2: Identifying Temperature Sensor

WM 805519 REMOVING AND INSTALLING FRONT FOOTWELL OUTLET VENTS (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING FRONT RIGHT FOOTWELL OUTLET VENTS > INSTALLING FOOTWELL OUTLET VENT AT THE FRONT RIGHT

1. Installation is performed in reverse order.

   Observe specified tightening torques:

   Left footwell outlet vent to body:

   Right footwell outlet vent to air conditioner:

WM 805519 REMOVING AND INSTALLING FRONT FOOTWELL OUTLET VENTS (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. **Applies to left footwell outlet vent:**

   Install trim panel under dashboard at the left → INSTALLING TRIM PANEL UNDER DASHBOARD AT THE LEFT .

   Applies to right footwell outlet vent:

   Install glove compartment → INSTALLING GLOVE COMPARTMENT .

Service Manual: 82 - AUXILIARY HEATING -- (95B) - MACAN

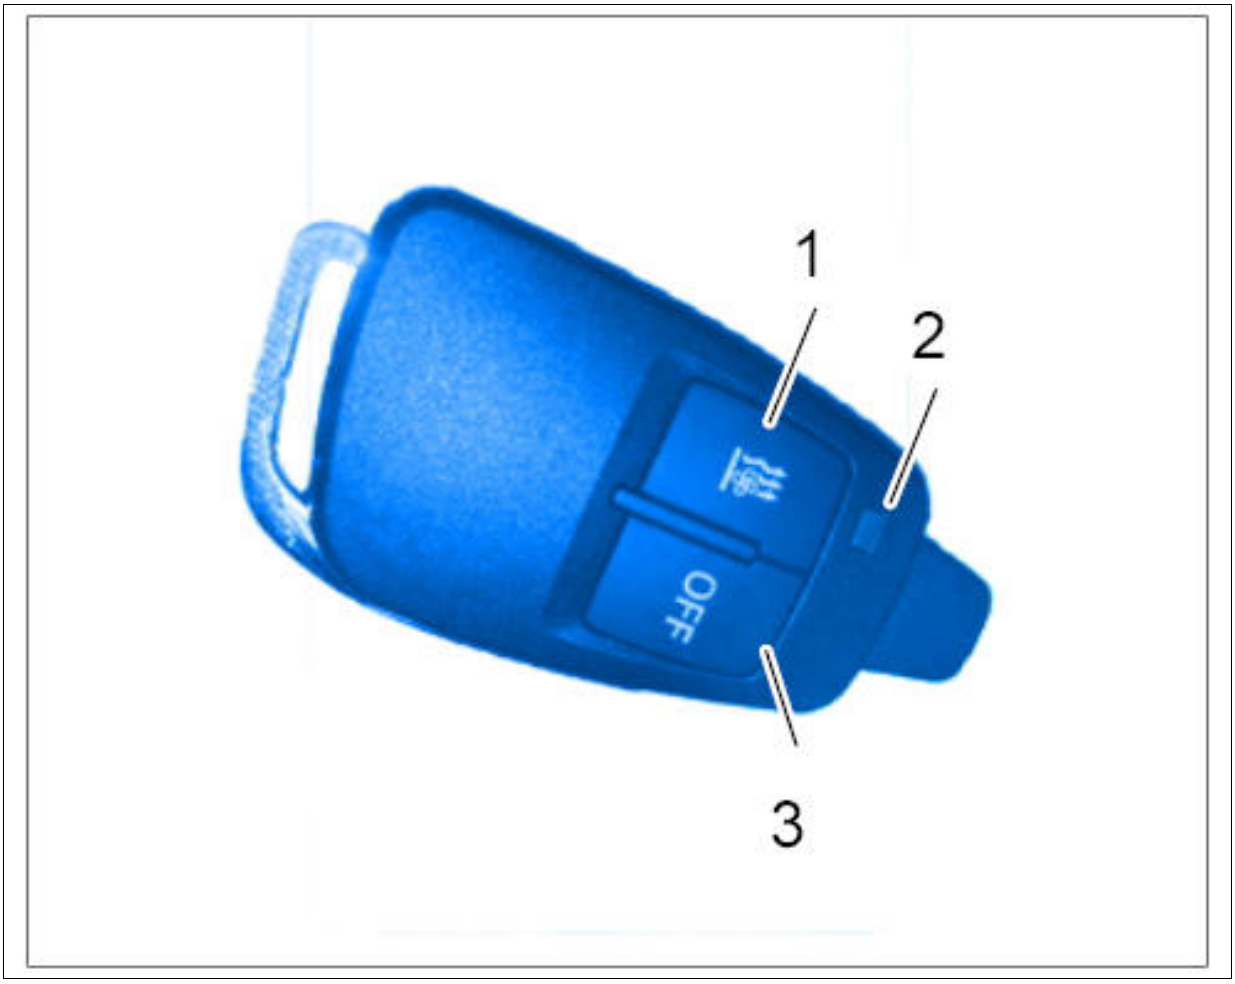
WM 8209AN TEACHING REMOTE CONTROL FOR AUXILIARY HEATING (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 8209AN TEACHING REMOTE CONTROL FOR AUXILIARY HEATING (ALL MODELS) > TEACHING REMOTE CONTROL FOR AUXILIARY HEATING

Information

- The remote control for the auxiliary heater can only be taught using the Porsche System Tester.
- A maximum of three remote controls can be taught per vehicle.

Fig 1: Identifying Auxiliary Heating Remote Control



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. ON button
2. LED
3. OFF button

1. **PIWIS Tester II 9818** must be connected to the vehicle before starting the System Tester. Switch on ignition.
2. Select the vehicle type.
3. Select the **Drive links/checks** menu and press [F12] to continue.
4. Select the **Teach remote control to receiver** menu, press [F12] and follow the instructions on the System Tester.
5. Press [F8] to start the teaching process.
6. After the **SEND** message appears, press the [OFF] button **-3-** on the remote control within 5 seconds until the "saved" message appears. The remote control is now taught.
7. To teach other remote controls, repeat the process.

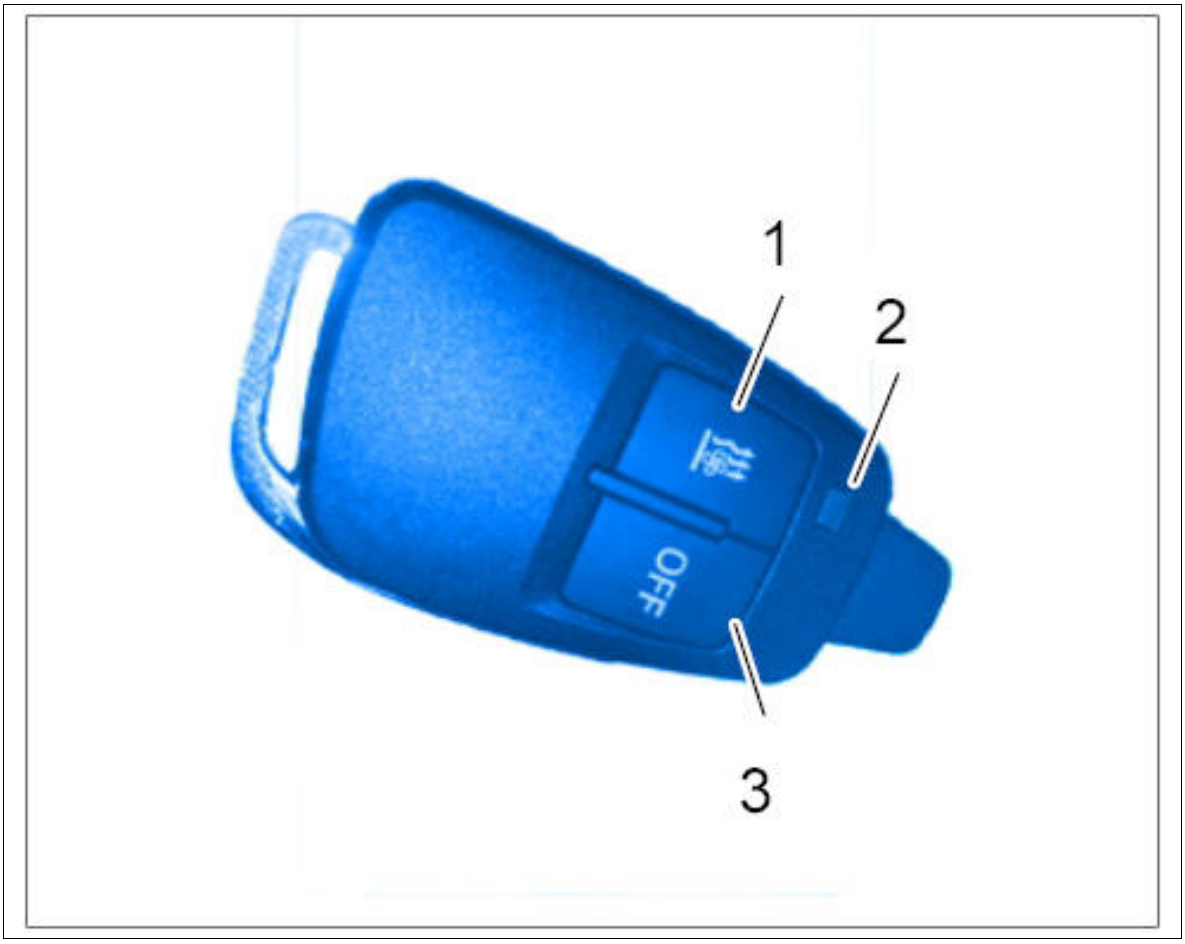
8. Carry out a function test on the remote control and then read out the fault memory.
9. **PIWIS Tester II 9818** must now be disconnected from the vehicle.

WM 8209AN TEACHING REMOTE CONTROL FOR AUXILIARY HEATING (ALL MODELS) > SWITCHING AUXILIARY HEATING ON AND OFF WITH REMOTE CONTROL > SWITCHING ON AUXILIARY HEATING WITH REMOTE CONTROL

1. [ON] button **-1-** must be pressed for approx. 2 seconds. The LED **-2-** flashes green and goes out once the auxiliary heater is started completely.

    1. ON button
    2. LED
    3. OFF button

Fig 1: Identifying Auxiliary Heating Remote Control



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 8209AN TEACHING REMOTE CONTROL FOR AUXILIARY HEATING (ALL

MODELS) > SWITCHING AUXILIARY HEATING ON AND OFF WITH REMOTE CONTROL > SWITCHING OFF AUXILIARY HEATING WITH REMOTE CONTROL

1. [OFF] button **-3-** must be pressed for approx. 2 seconds. The LED **-2-** flashes red and goes out once the auxiliary heater is shut down completely.

    1. ON button
    2. LED
    3. OFF button

WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
hose clamp	VW tool	3094		
PIWIS Tester II	Special tool	9818		assembly pliers	Commercially available tool	Nr.72 Pos.1		

WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Heater holder to body	M6 x 30 thread	Tightening torque	20 Nm (15 ftlb.)		

WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > INFORMATION > INSTALLATION POSITION OF HEATER

The heater is behind the wheel housing liner in the front right wheel housing.

Fig 1: Overview Of Heater Wheel Housing

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > PRELIMINARY WORK

1. Remove right front wheel → Removing Wheel
2. Remove front wheel housing liner at the right → Removing front wheel housing liner

WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > REMOVING AND INSTALLING HEATER > REMOVING HEATER

NOTE: Danger of scalding

- *Coolant can be very hot.*
- *Coolant may be pressurized.*

→ Only remove the heater when the cooling system has cooled down.

→ By carefully opening the catch on the reservoir, make sure that the cooling system is depressurized.

NOTE: Danger of slipping due to emerging coolant

- *The emerging coolant will make the floor of the workshop slippery and may cause people to slip and fall over.*

→ Collect emerging coolant in a suitable pan.

1. Remove coolant hoses.

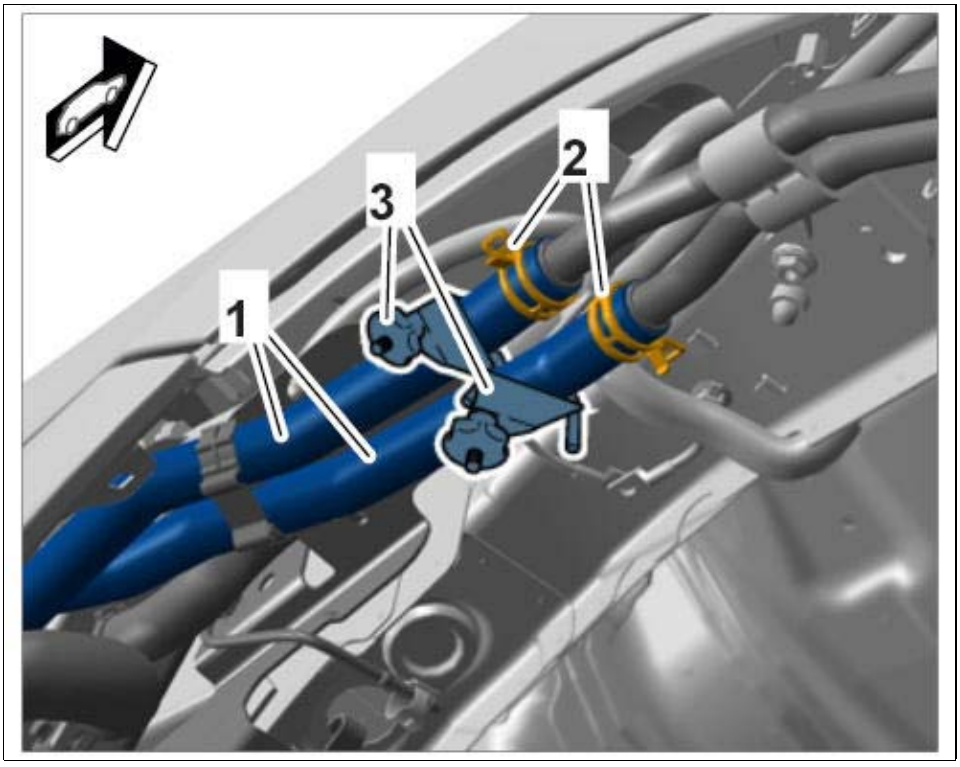
    1. 1.1. Clamp coolant hoses **-1-** using hose clamp 3094 **-3-** .

    2. 1.2. Loosen spring band clamps **-2-** using assembly pliers Nr.72 Pos.1 and pull off coolant hoses **-1-** .

WARNING: Emerging fuel

1. Risk of fire

Fig 1: Identifying Coolant Hoses



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

→ Avoid contact with hot parts or sources of ignition.

→ Collect emerging fuel, absorb it if necessary with a suitable binding material and dispose of properly.

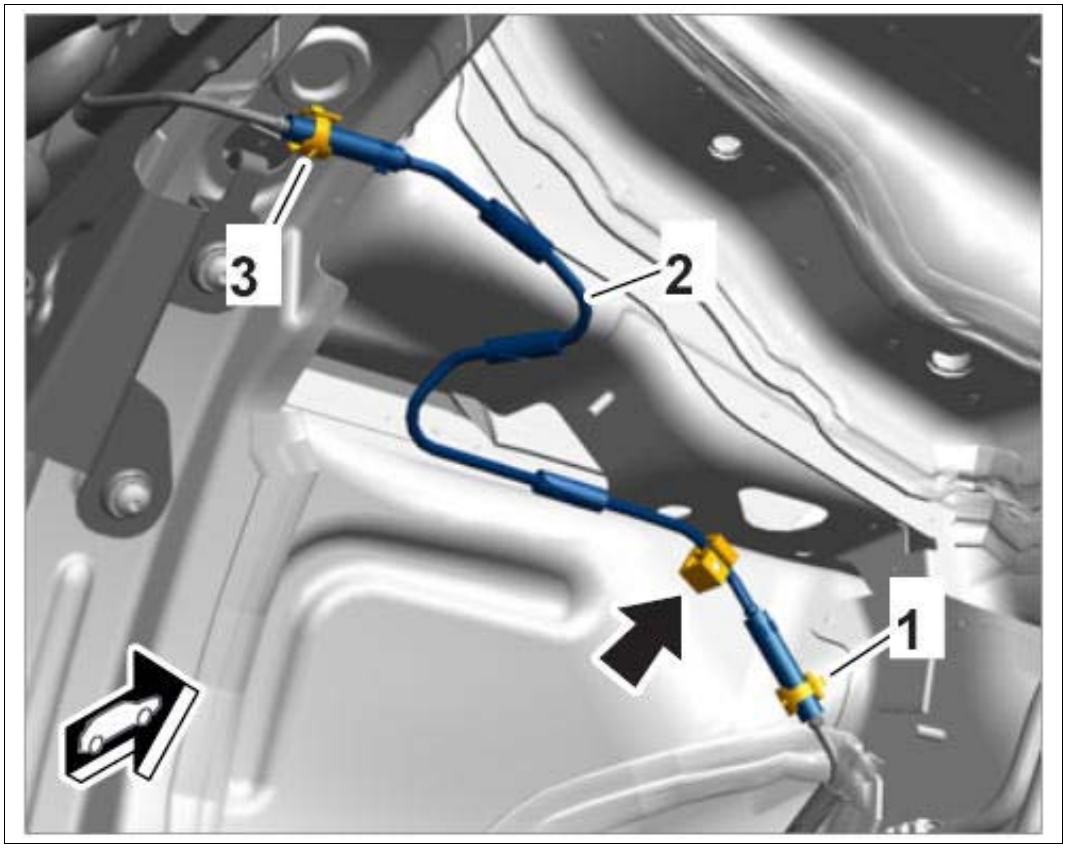
→ Use suction to remove ignitable vapors.

→ Attach warning sign to vehicle in a clearly visible position.

2. Disconnect fuel line.

1. 2.1. Loosen spring band clamp **-3-** using **assembly pliers Nr.72 Pos.1** and disconnect fuel line **-2-** .

Fig 2: Locating Fuel Line In Wheel Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Disconnect exhaust pipe from silencer.

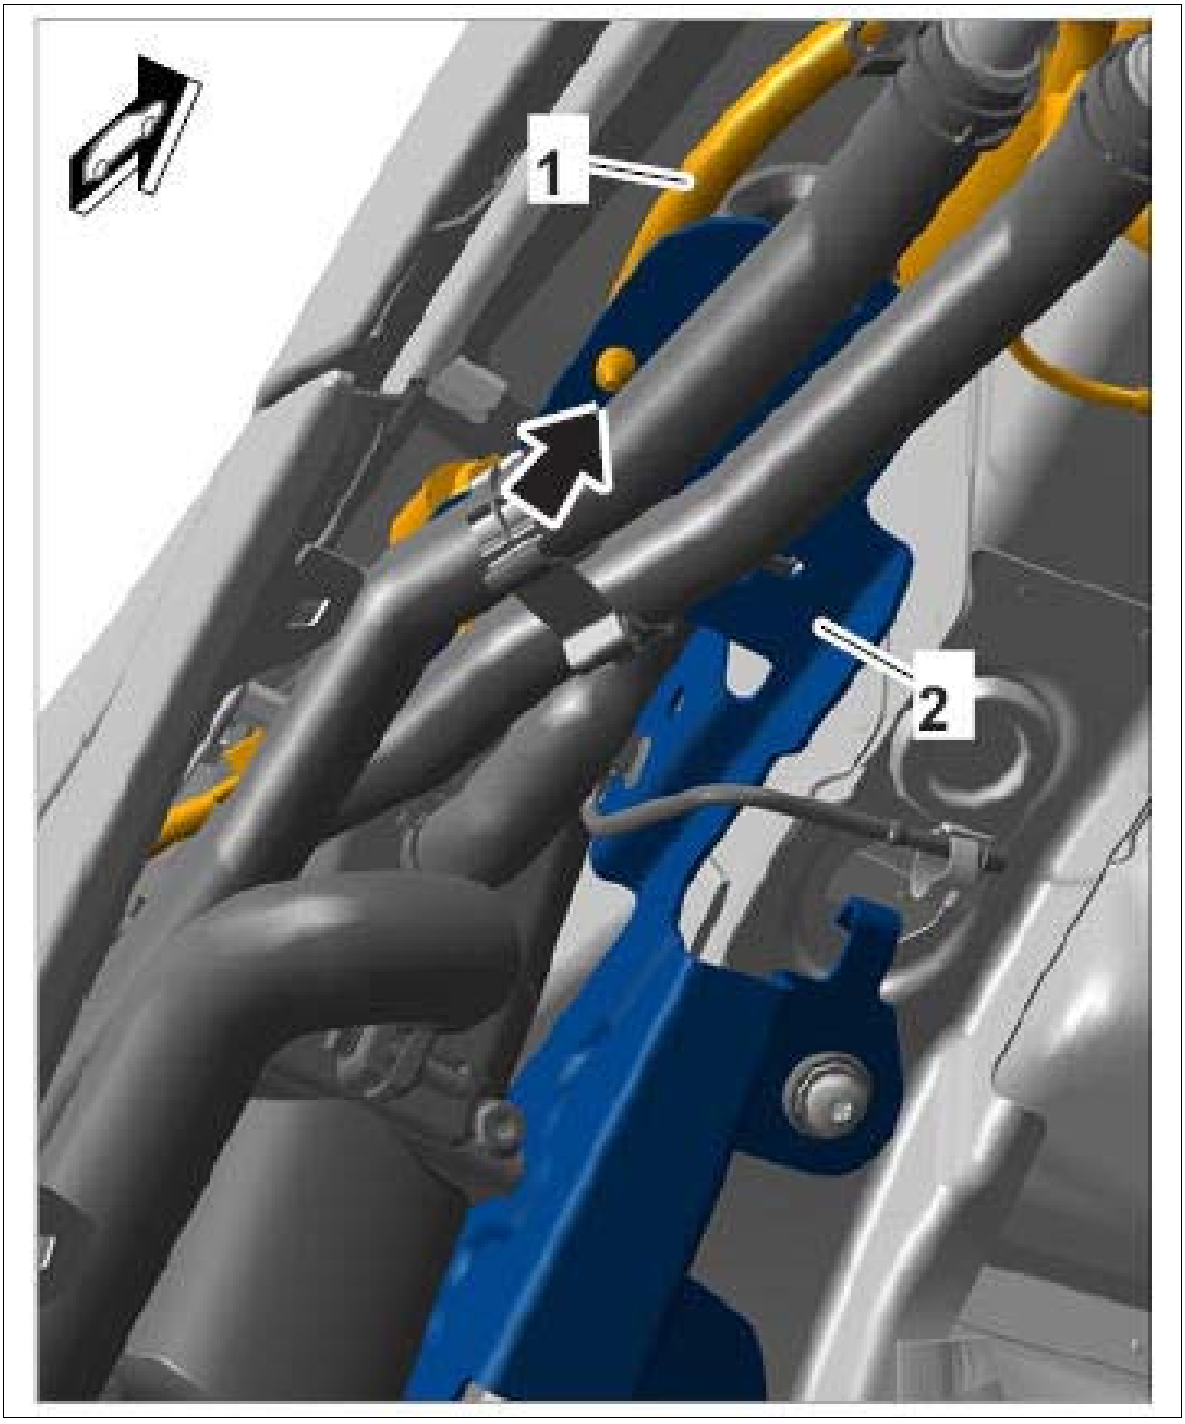
1. 3.1. Loosen screw-type clamp **-1-** .
2. 3.2. Pull flexi-pipe **-2-** off the silencer pipe **-3-** .

Fig 3: Identifying Exhaust Pipe On Silencer

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Unclip wiring harness **-1-** at position **-arrow-** and remove it from the holder **-2-** .

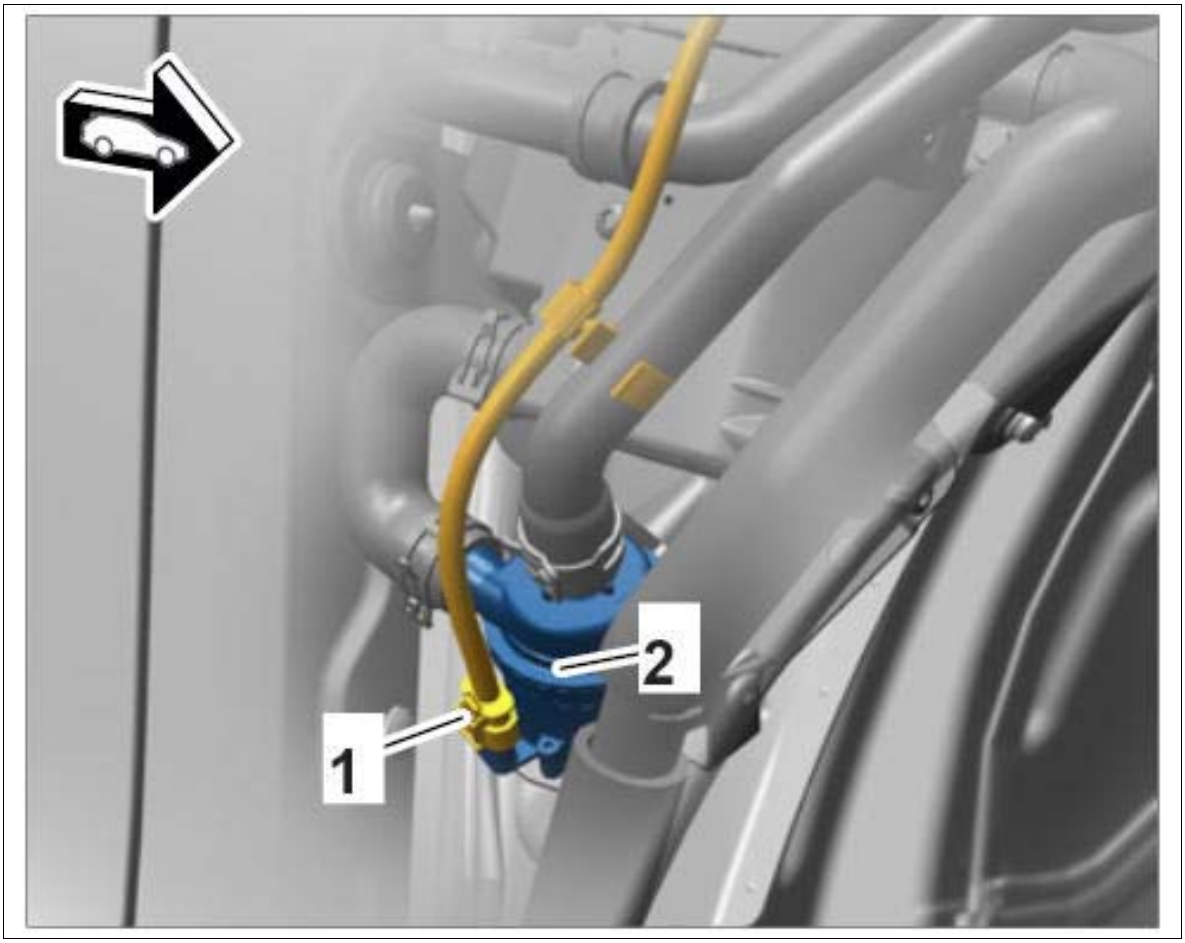
Fig 4: Locating Wiring Harness On Holder



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Release electric plug connection **-1-** from the circulating pump **-2-** and disconnect it.

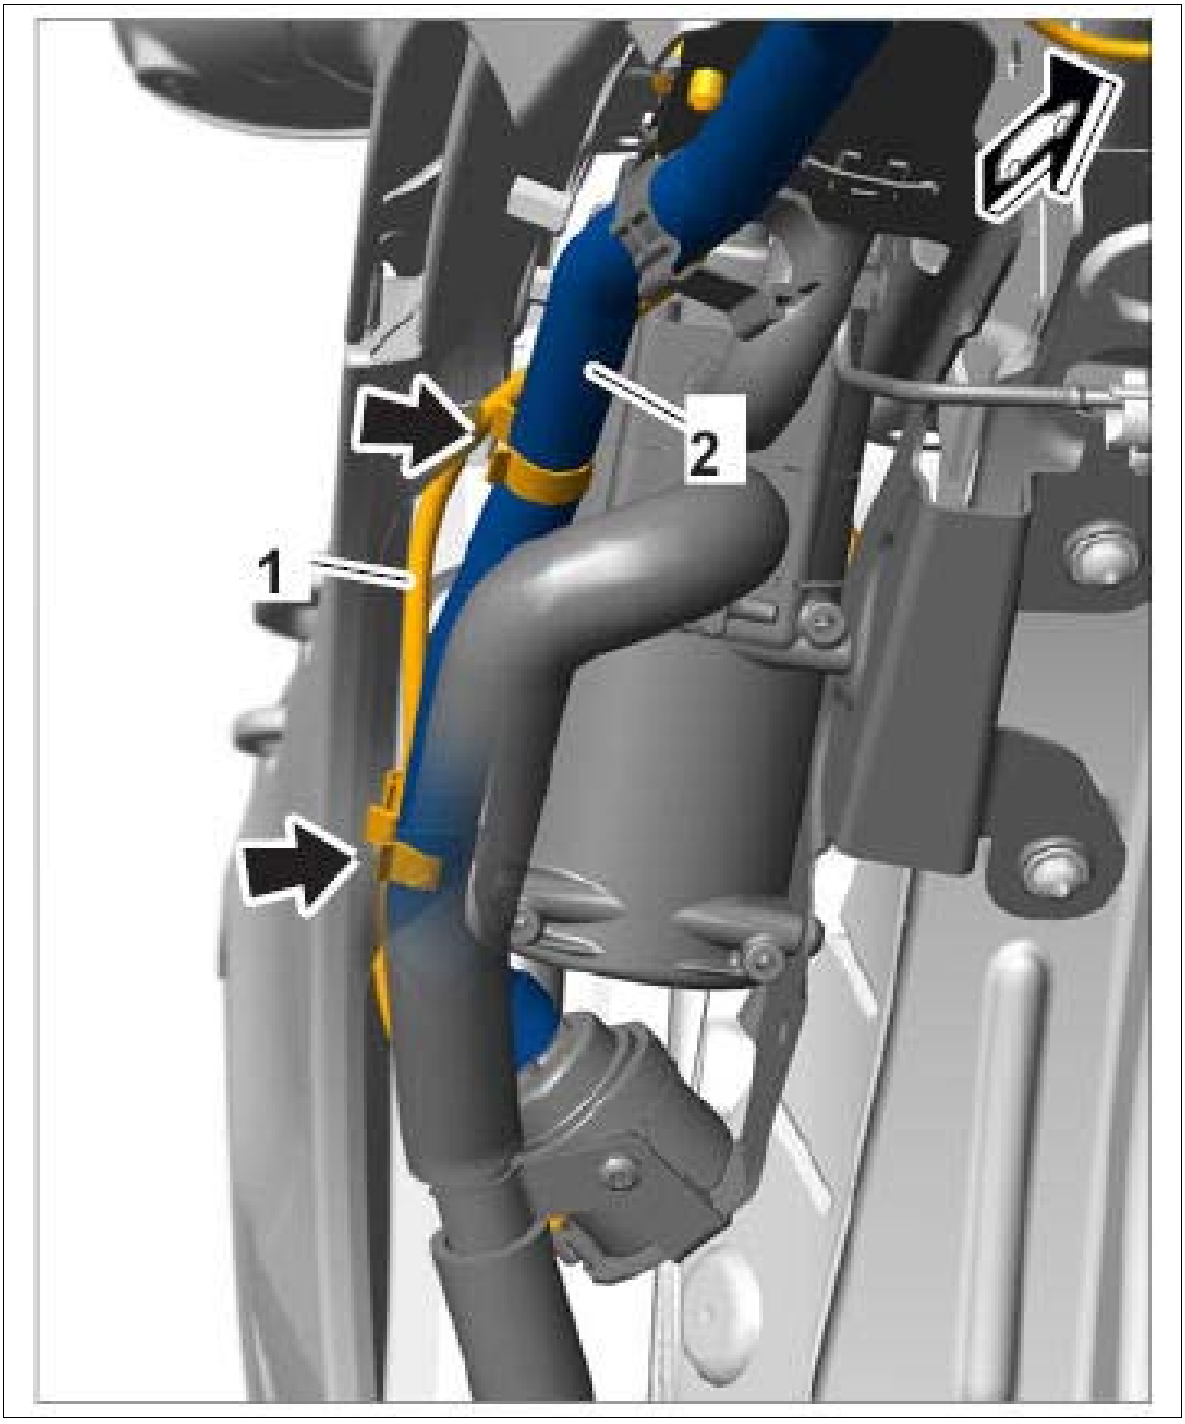
Fig 5: Identifying Circulating Pump Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Unclip wiring harness **-1-** from the coolant hose **-2-** at the marked positions **-arrows-** .

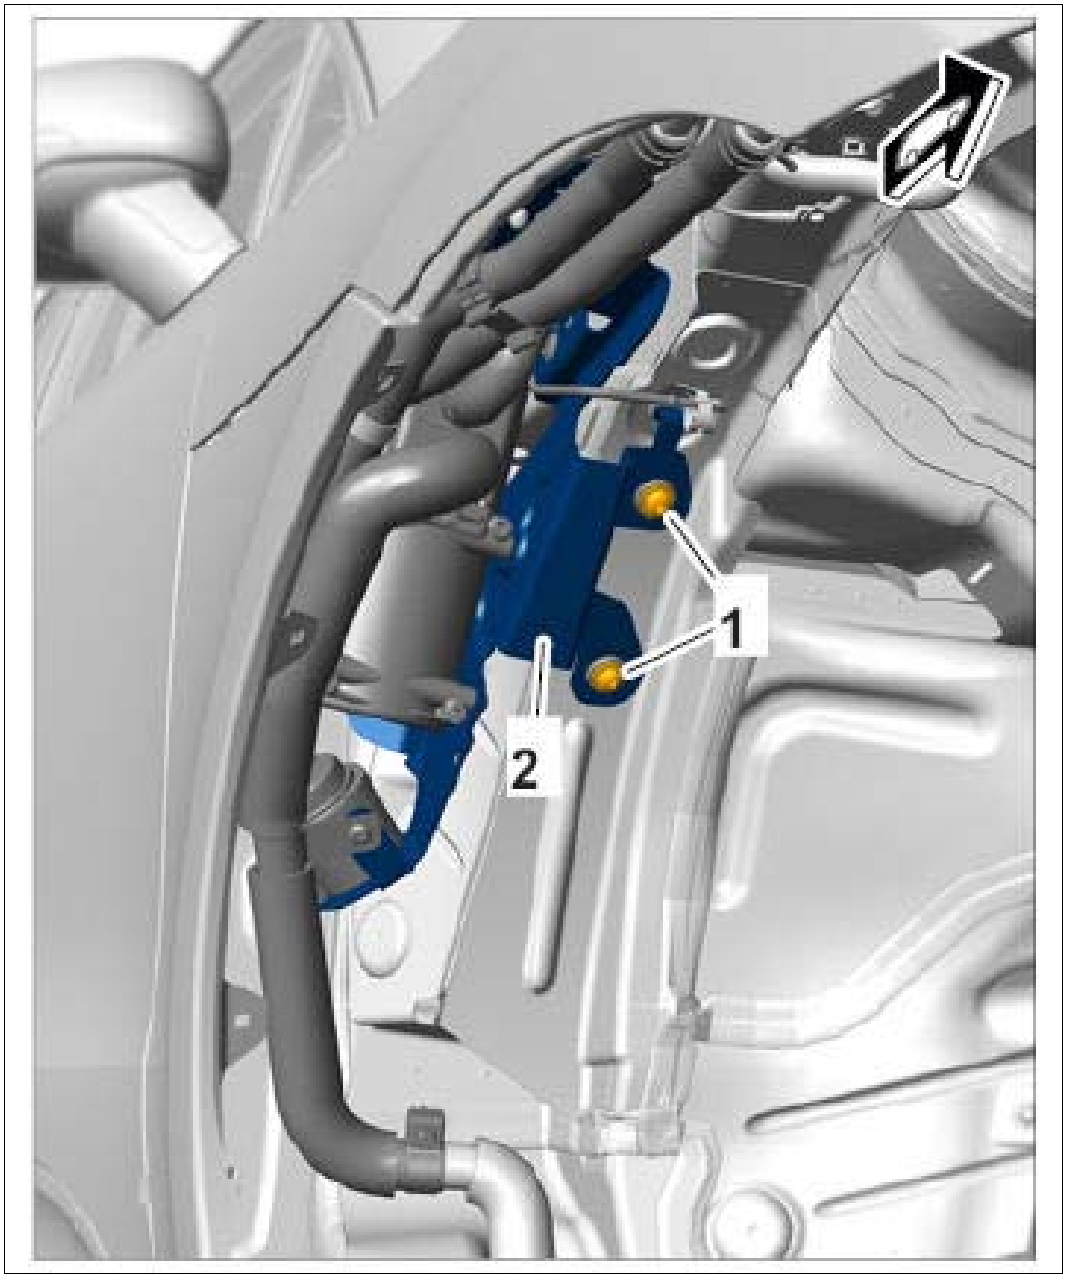
Fig 6: Locating Wiring Harness On Coolant Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Remove heater.
    1. 7.1. Unscrew fastening screws **-1-** .
    2. 7.2. Remove heater with holder **-2-** and pull it forward slightly.

Fig 7: Identifying Heater



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 7.3. Release and disconnect electric plug connections **-1-** .

Fig 8: Identifying Heater Connectors

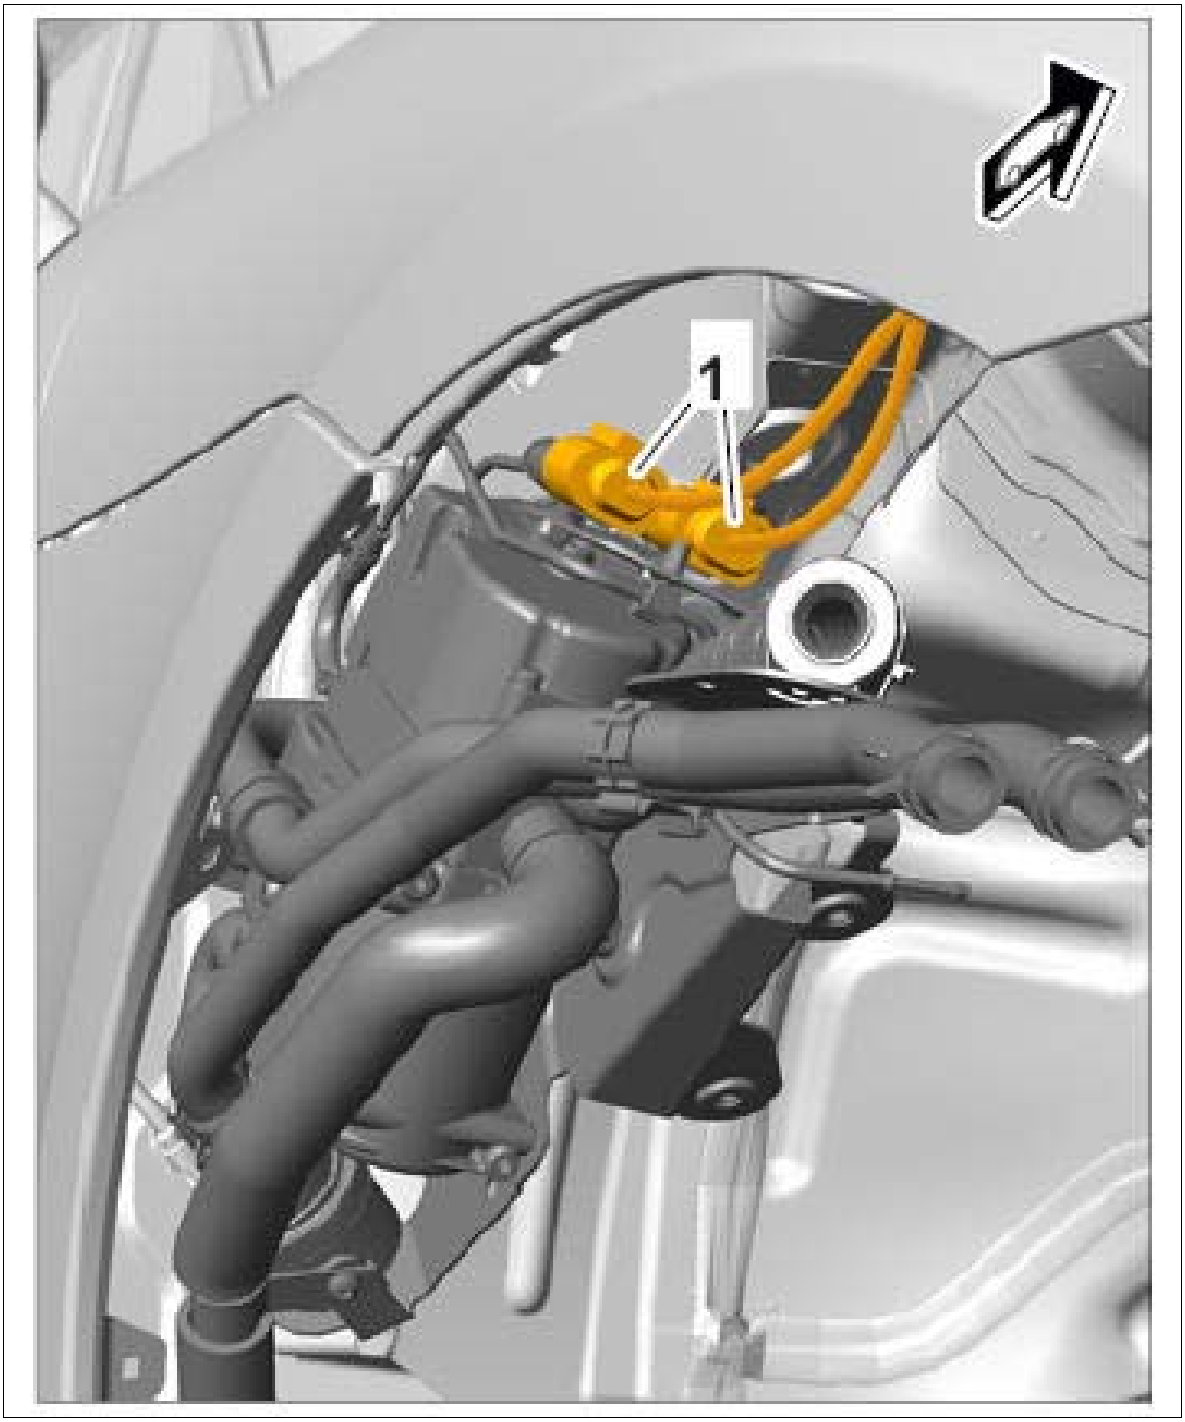
WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > REMOVING AND INSTALLING HEATER > INSTALLING HEATER

Information

- There is no guarantee that re-used clamps will secure the component properly.
- Removed clamps must be replaced.
- Always use new clamps during installation.

1. Connect electric plug connections **-1-** until they engage securely.

Fig 1: Identifying Heater Connectors

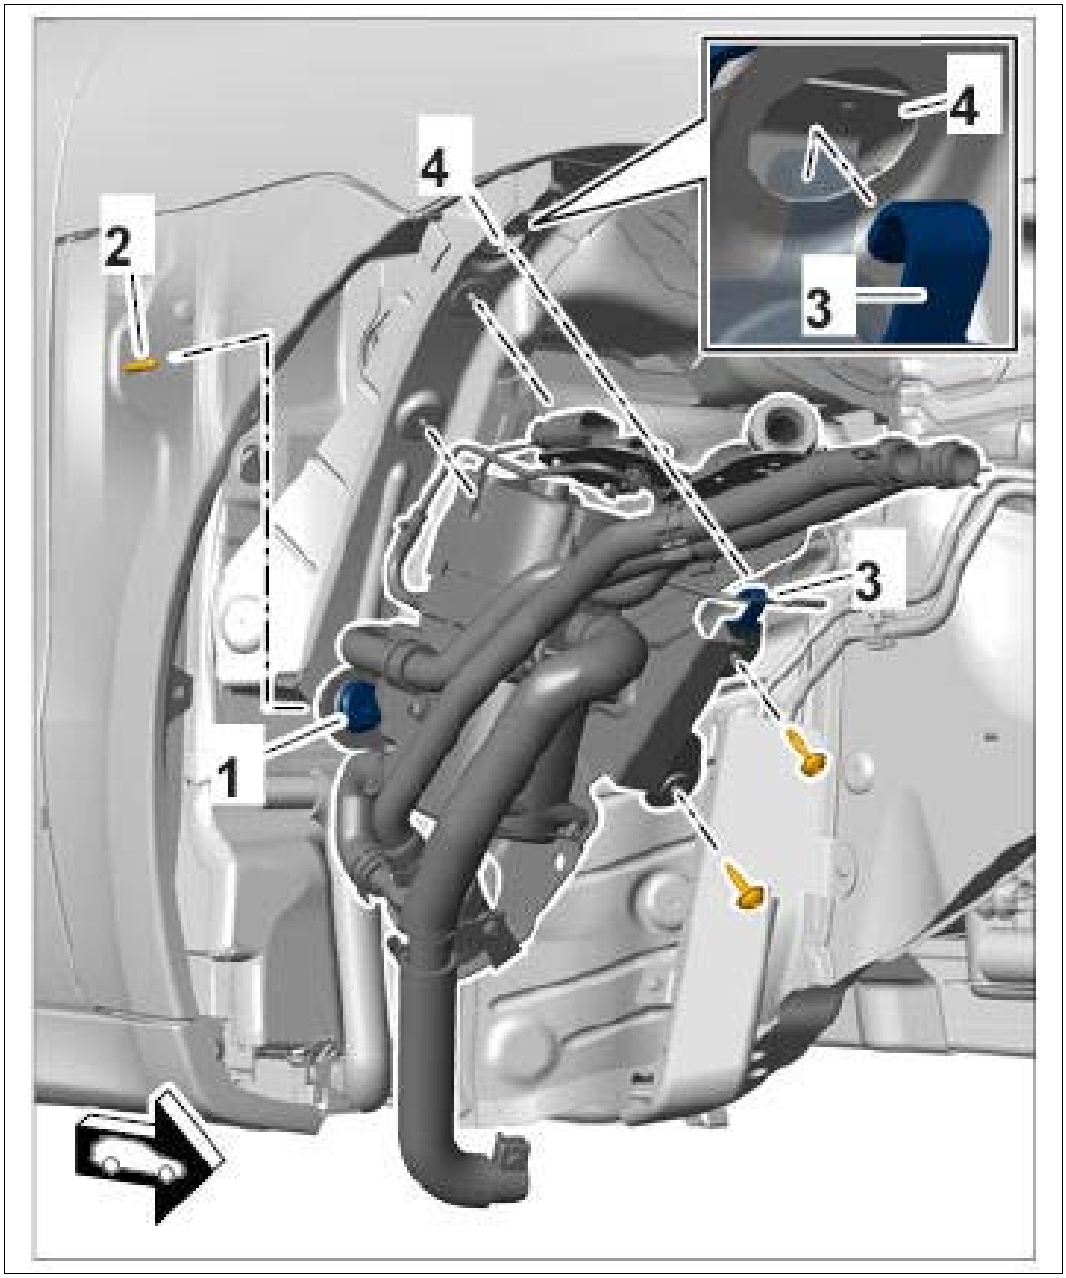


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Position the heater.

    1. 2.1. Position rubber sleeve **-1-** on the retaining pin **-2-** .
    2. 2.2. Engage clip **-3-** for the holder in the cut-out **-4-** .

Fig 2: Positioning Heater

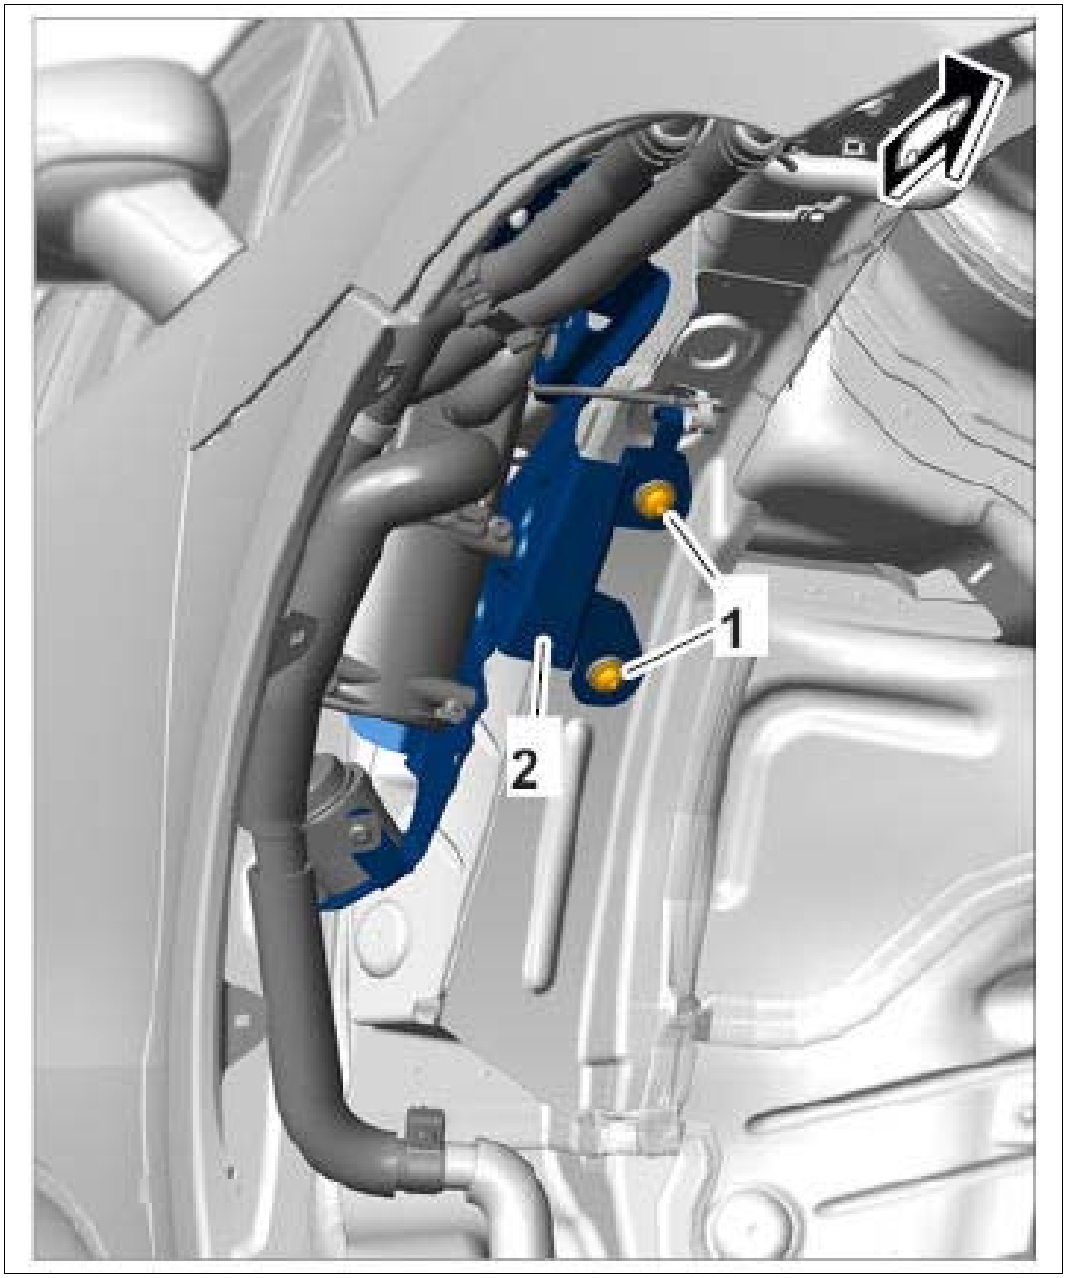


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Secure the heater.

    1. 3.1. Loosely fit fastening screws **-1-** for the holder **-2-** at the top and bottom.

Fig 3: Identifying Heater Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 3.2. Slide flexi-pipe **-2-** and screw-type clamp **-1-** onto the silencer pipe **-3-** .

Fig 4: Identifying Exhaust Pipe On Silencer

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 3.3. Tighten fastening screws **-1-** on the holder **-2-** to the prescribed tightening torque. **Tightening torque 20 Nm (15 ftlb.)**

4. 3.4. Tighten screw-type clamp **-1-** .

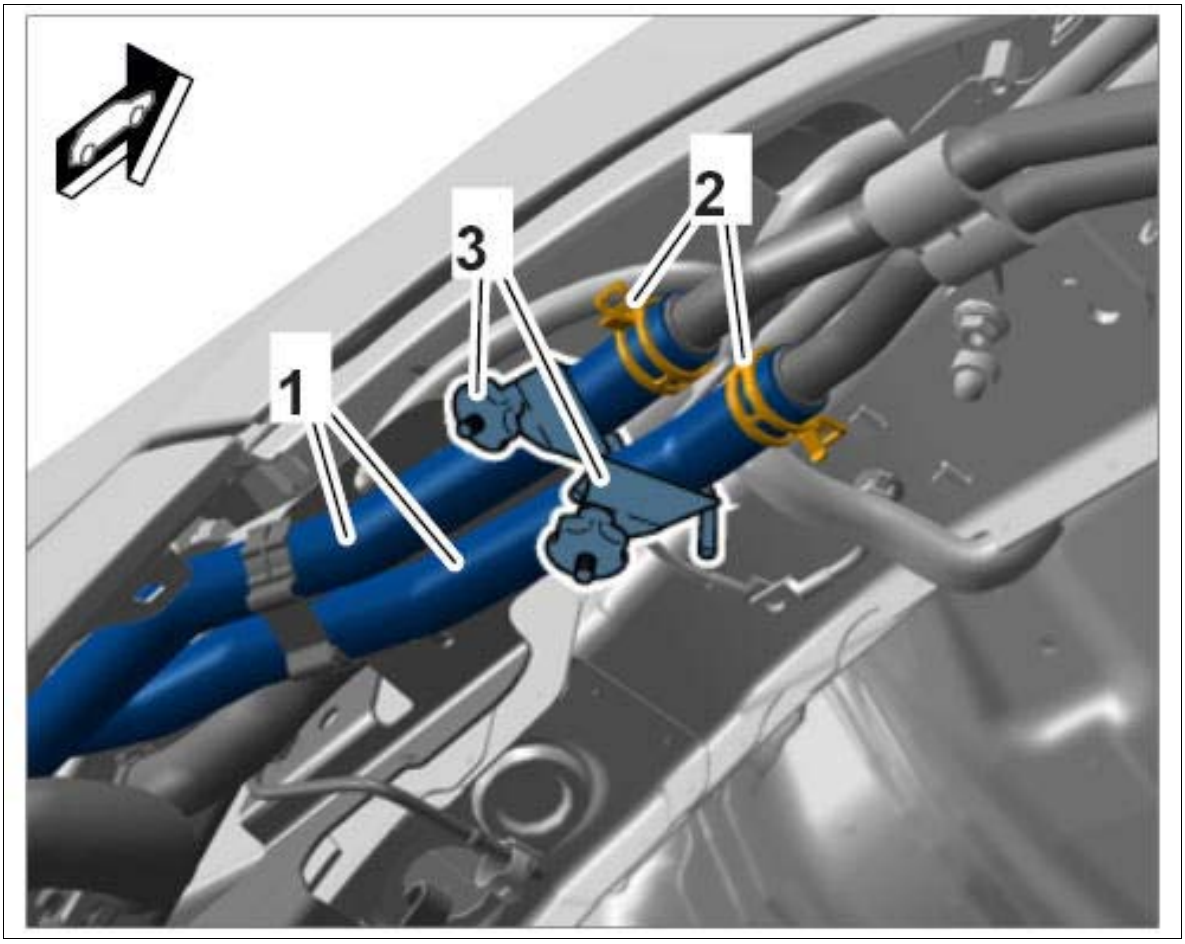
4. Secure coolant hoses.

1. 4.1. Push coolant hoses **-1-** as far as they will go over the adapters.

2. 4.2. Tighten spring band clamps **-2-** using **assembly pliers Nr.72 Pos.1.**

3. 4.3. **Hose clamp 3094 -3-** must then be removed from the coolant hoses **-1-** .

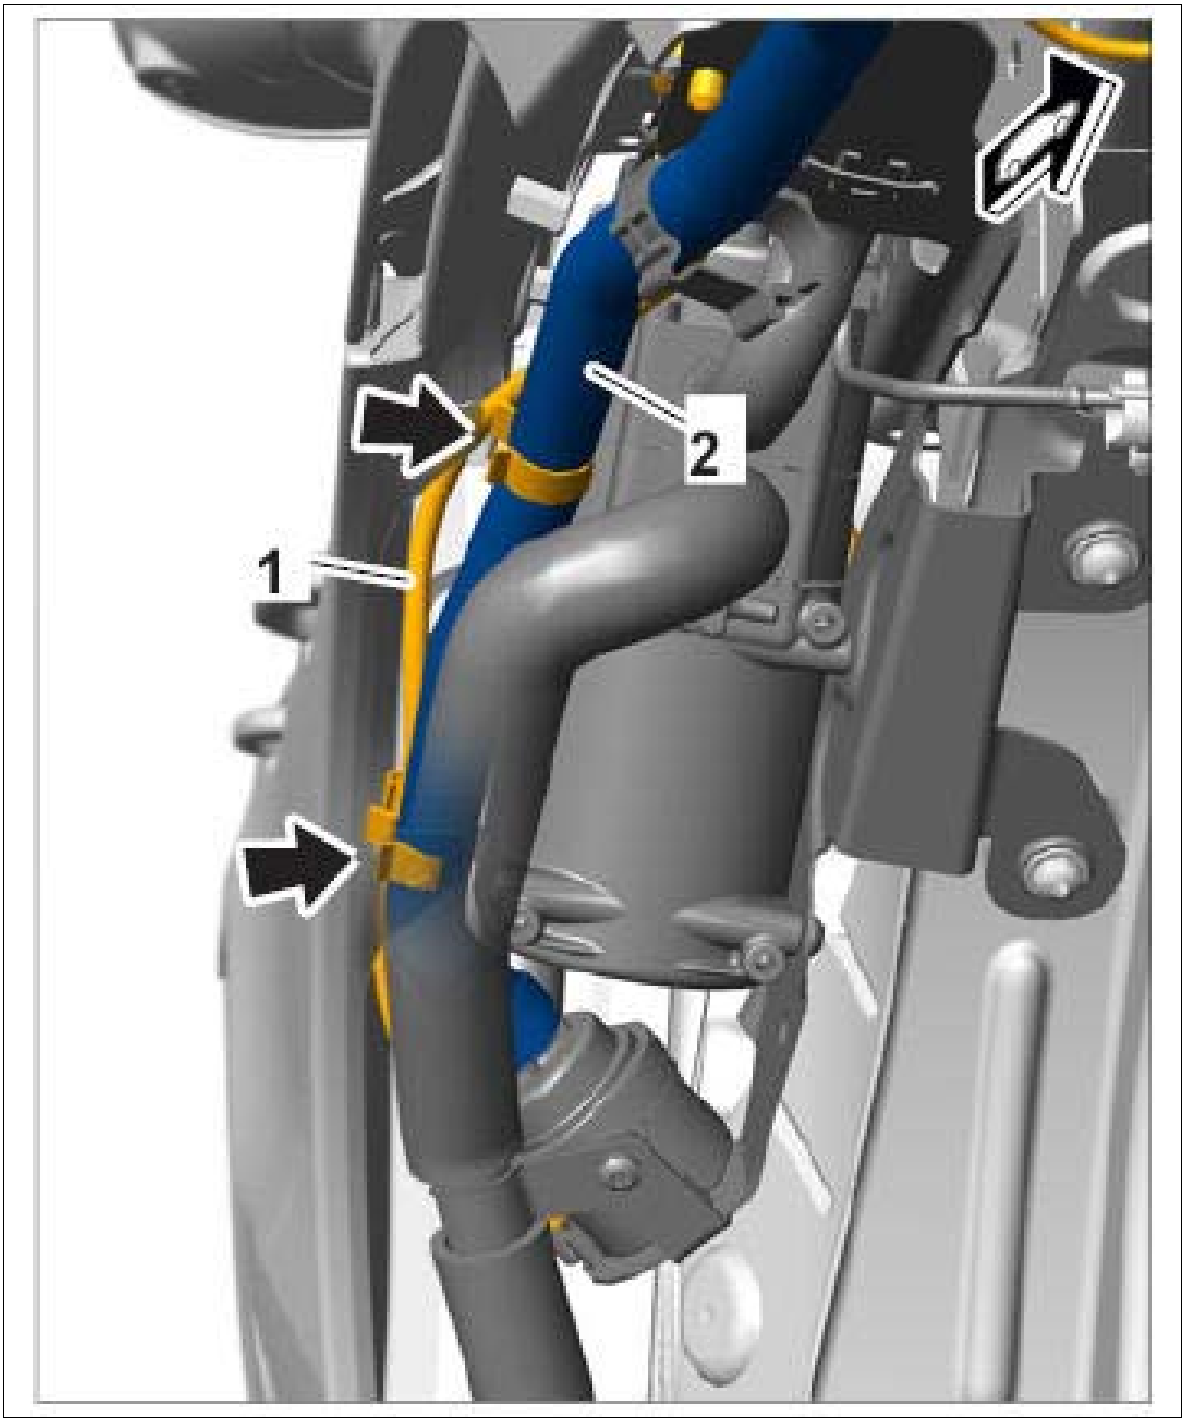
Fig 5: Identifying Coolant Hoses



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Clip wiring harness **-1-** onto the coolant hose **-2-** at the marked positions **-arrows-** .

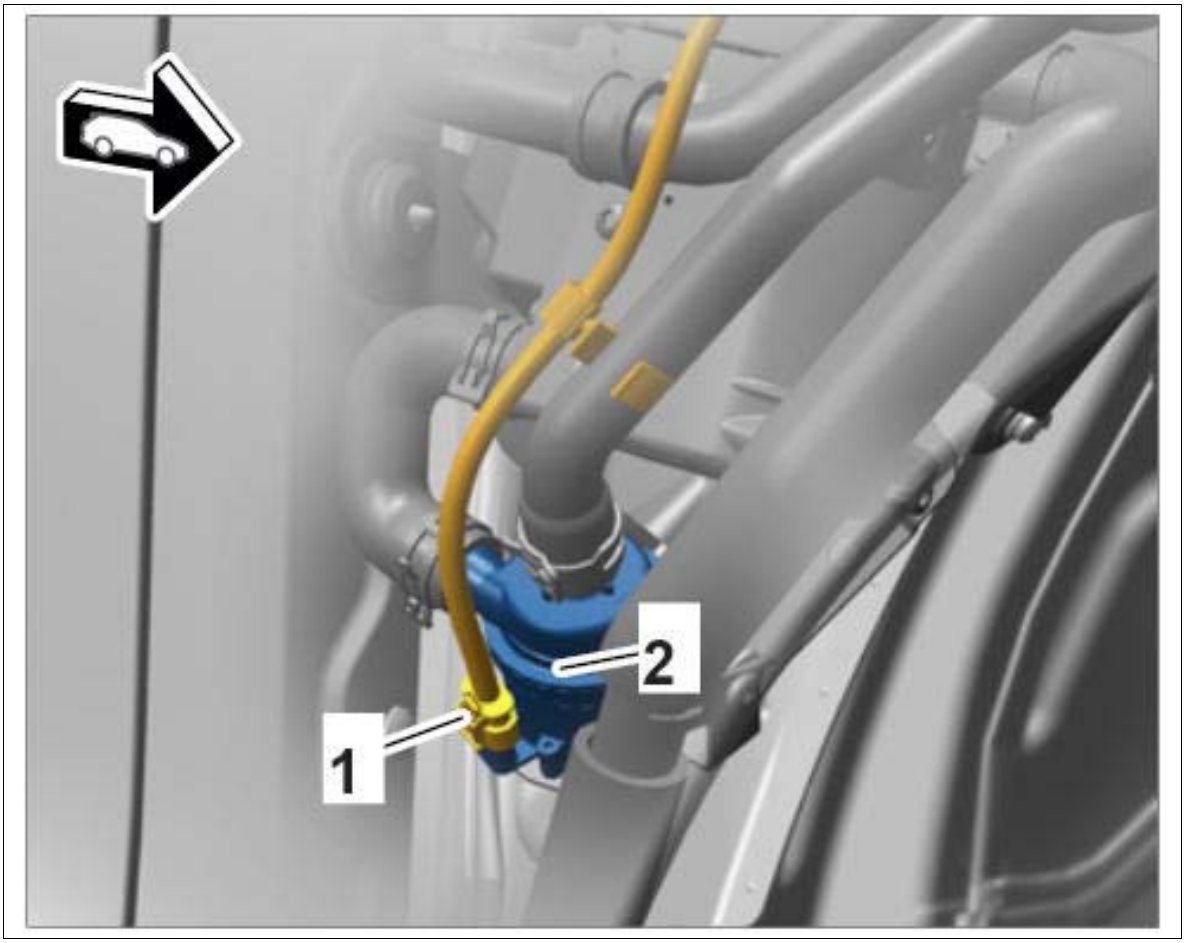
Fig 6: Locating Wiring Harness On Coolant Hose



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Connect electric plug connection **-1-** to the circulating pump **-2-** until it engages securely.

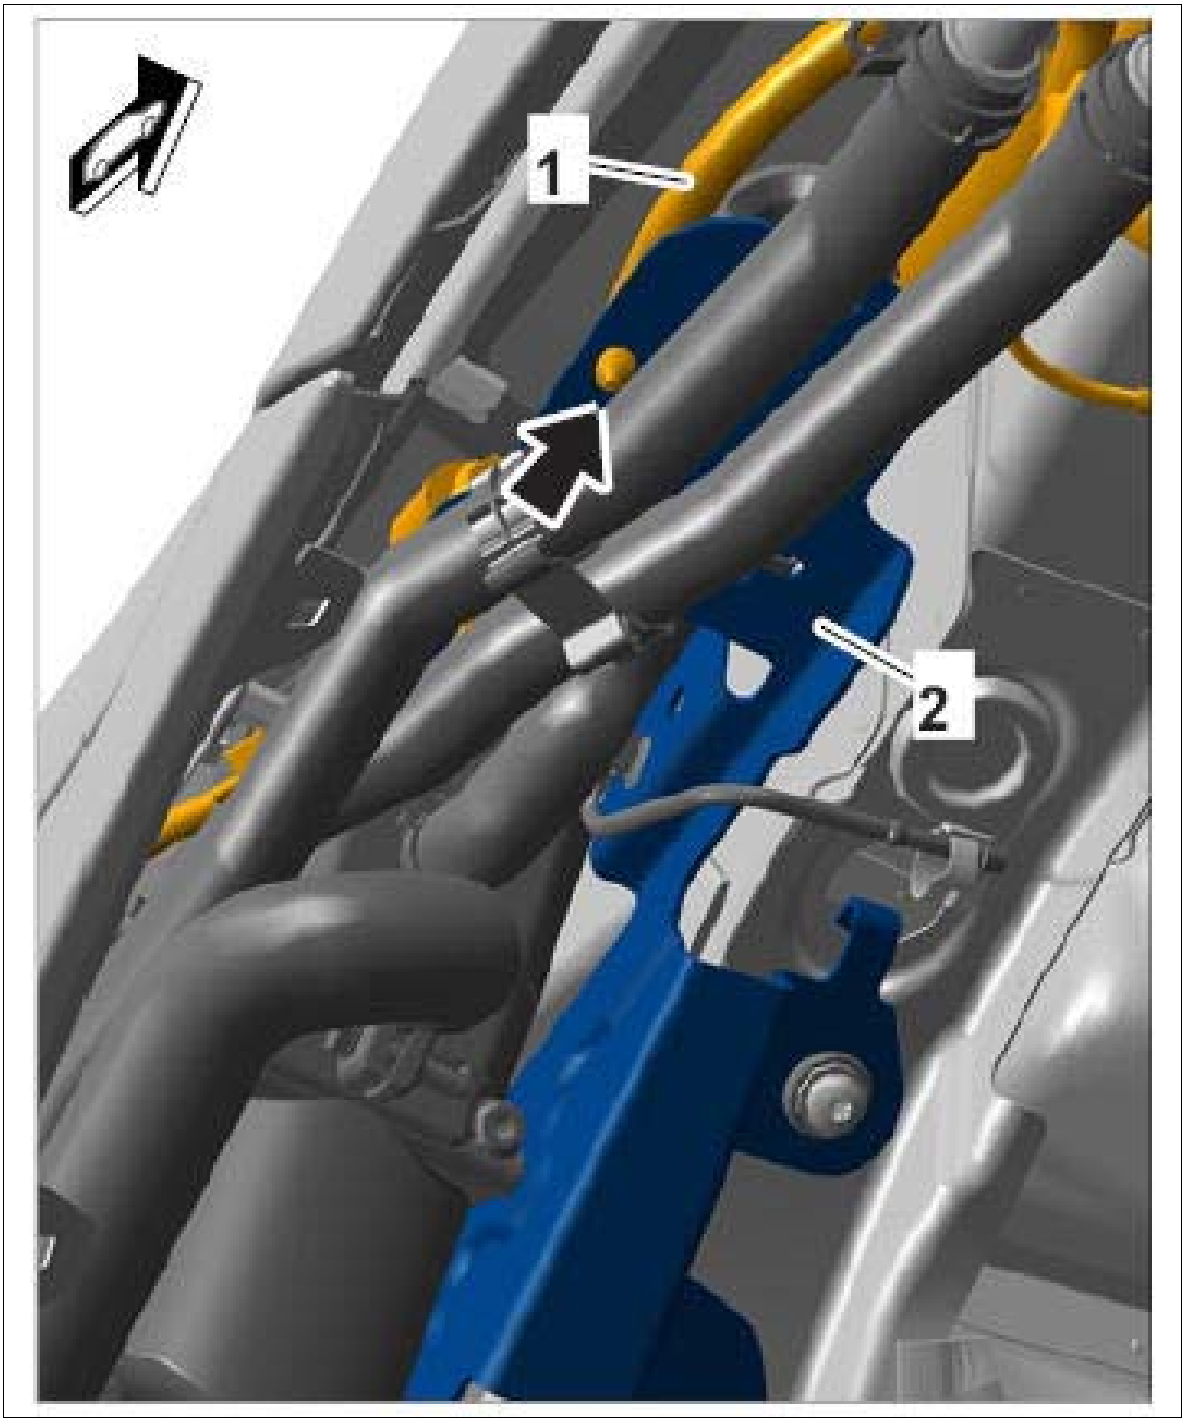
Fig 7: Identifying Circulating Pump Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Clip wiring harness **-1-** into the holder **-2-** at position **-arrow-** .

Fig 8: Locating Wiring Harness On Holder



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Secure the fuel line to the heater.

Fig 9: Locating Fuel Line In Wheel Housing

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 8.1. Push on fuel line **-2-** as far as it will go or up to the marking - minimum overlap: 25 mm.
2. 8.2. Tighten spring band clamp **-3-** using **assembly pliers Nr.72 Pos.1.**

9. The fuel system must also be pre-filled. To do this, connect **PIWIS Tester II 9818** to the vehicle.
10. Switch on ignition.
11. Select the vehicle type and start the PIDT.
12. Select the **auxiliary heater** control unit in the **overview** .
13. **Maintenance/repairs** must then be selected.
14. **Line filling** must now be selected. Then press [Next].

WM 822019 REMOVING AND INSTALLING COMPLETE HEATER (ALL MODELS) > SUBSEQUENT WORK

1. Add coolant and bleed the cooling system → 193817 DRAINING AND FILLING COOLANT .
2. Install front wheel housing liner at the right → Installing front wheel housing liner
3. Fit right front wheel → Installing Wheel .

WM 822119 REMOVING AND INSTALLING INTAKE MUFFLER (ALL MODELS) > PRELIMINARY WORK

1. Loosen heater with holder → Loosening Heater With Holder .

WM 822119 REMOVING AND INSTALLING INTAKE MUFFLER (ALL MODELS) > REMOVING AND INSTALLING INTAKE MUFFLER > REMOVING INTAKE MUFFLER

1. Cut tie-wrap **-1-** on intake muffler **-2-** .

   Fig 1: Identifying Intake Muffler Mounting On Holder

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen clamp **-1-** using a suitable tool.

Fig 2: Identifying Intake Muffler Mounting On Heater

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove intake muffler **-2-** .

WM 822119 REMOVING AND INSTALLING INTAKE MUFFLER (ALL MODELS) > REMOVING AND INSTALLING INTAKE MUFFLER > INSTALLING INTAKE MUFFLER

Information

- There is no guarantee that re-used clamps will secure the component properly.
- Removed clamps must be replaced.
- Always use new clamps during installation.

1. Position intake muffler **-2-** on the heater.
2. Tighten new clamp **-1-** using a suitable tool.

Fig 1: Identifying Intake Muffler Mounting On Heater

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Position intake muffler **-2-** in the cut-outs in the holder and secure it to the holder using new tie-wraps **-1-** .

Fig 2: Securing Intake Muffler To Holder

WM 824519 REMOVING AND INSTALLING FUEL PUMP FOR AUXILIARY HEATING (ALL MODELS) > REMOVING AND INSTALLING FUEL PUMP FOR AUXILIARY HEATING > REMOVING FUEL PUMP FOR AUXILIARY HEATING

WARNING: Emerging fuel

- *Risk of fire*

→ Disconnect the battery.

→ Avoid contact with hot parts or sources of ignition.

→ Allow engine to cool down.

→ Relieve the fuel pressure before opening the fuel lines.

→ Collect emerging fuel, absorb it if necessary with a suitable binding material and dispose of properly.

→ Use suction to remove ignitable vapors.

→ Attach warning sign to vehicle in a clearly visible position.

1. Loosen fuel pump **-1-** from the holder **-2-** .
2. Release and disconnect connector **-5-** .
3. Disconnect line **-3-** for the auxiliary heating and pull it off the fuel pump.
4. Disconnect fuel line **-4-** to the fuel tank.

5. Remove fuel pump **-1-** .

Fig 1: Identifying Auxiliary Heating Fuel Pump

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 824519 REMOVING AND INSTALLING FUEL PUMP FOR AUXILIARY HEATING (ALL MODELS) > REMOVING AND INSTALLING FUEL PUMP FOR AUXILIARY HEATING > INSTALLING FUEL PUMP FOR AUXILIARY HEATING

1. Installation is performed in reverse order.
2. The fuel system must also be pre-filled. To do this, connect **PIWIS Tester II 9818** to the vehicle.
3. Switch on ignition.
4. Select the vehicle type and start the PIDT.
5. Select the **auxiliary heater** control unit in the **overview** .
6. **Maintenance/repairs** must then be selected.
7. **Line filling** must now be selected. Then press [Next].

The circulating pump is behind the right front wheel housing liner under the heater.

WM 827219 REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER (ALL MODELS) > PRELIMINARY WORK

1. Loosen heater with holder → Loosening Heater With Holder .

WM 827219 REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER (ALL MODELS) > REMOVING AND INSTALLING CIRCULATING PUMP FOR AUXILIARY HEATER > REMOVING CIRCULATING PUMP FOR AUXILIARY HEATER

NOTE: Danger of scalding

- *Coolant can be very hot.*
- *Coolant may be pressurized.*

→ Only remove the heater when the cooling system has cooled down.

→ By carefully opening the catch on the reservoir, make sure that the cooling system is depressurized.

1. Release electric plug connection **-1-** from the circulating pump **-2-** and disconnect it.

   Fig 1: Identifying Circulating Pump Connector

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Clamp both coolant hoses **-2-** and **-4-** using **hose clamp 3094.** → Mounting for coolant hoses on circulating pump

Fig 2: Identifying Coolant Hoses On Circulating Pump

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

NOTE: Danger of slipping due to emerging coolant

1. *The emerging coolant will make the floor of the workshop slippery and may cause people to slip and fall over.*

→ Collect emerging coolant in a suitable pan.

3. Loosen spring band clamps **-1-** and **-3-** using **assembly pliers Nr.72 Pos.1** and pull off coolant hoses **-2-** and **-4-** .

4. Unscrew fastening screws **-1-** and remove circulating pump **-2-** .

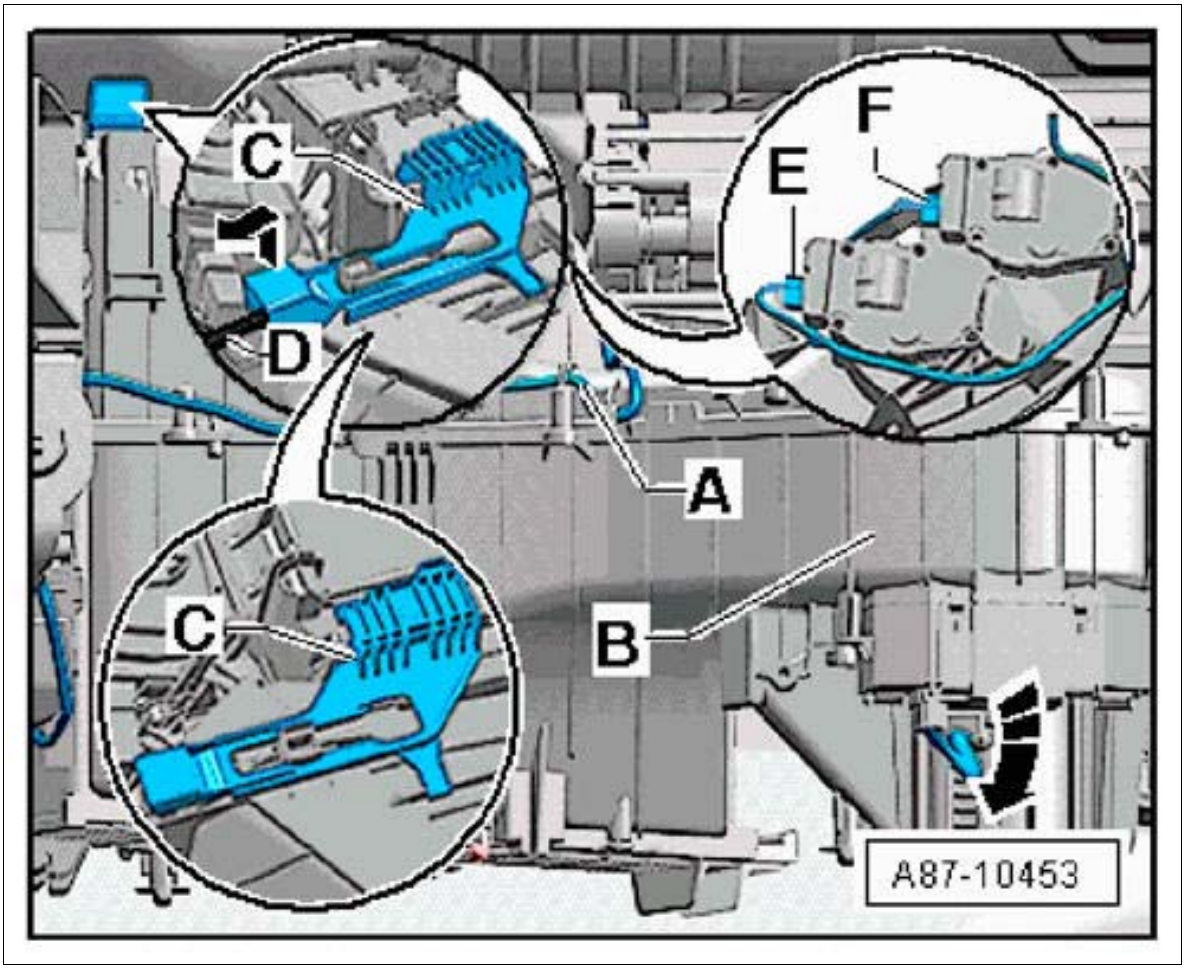
6. Disconnect wiring **-A-** .
7. Loosen locking mechanism **-C-** .
8. Pull fresh air/recirculated air/ram air housing at the right down **-arrow-** .
9. Disconnect connector for servo motors **-E and F-** .

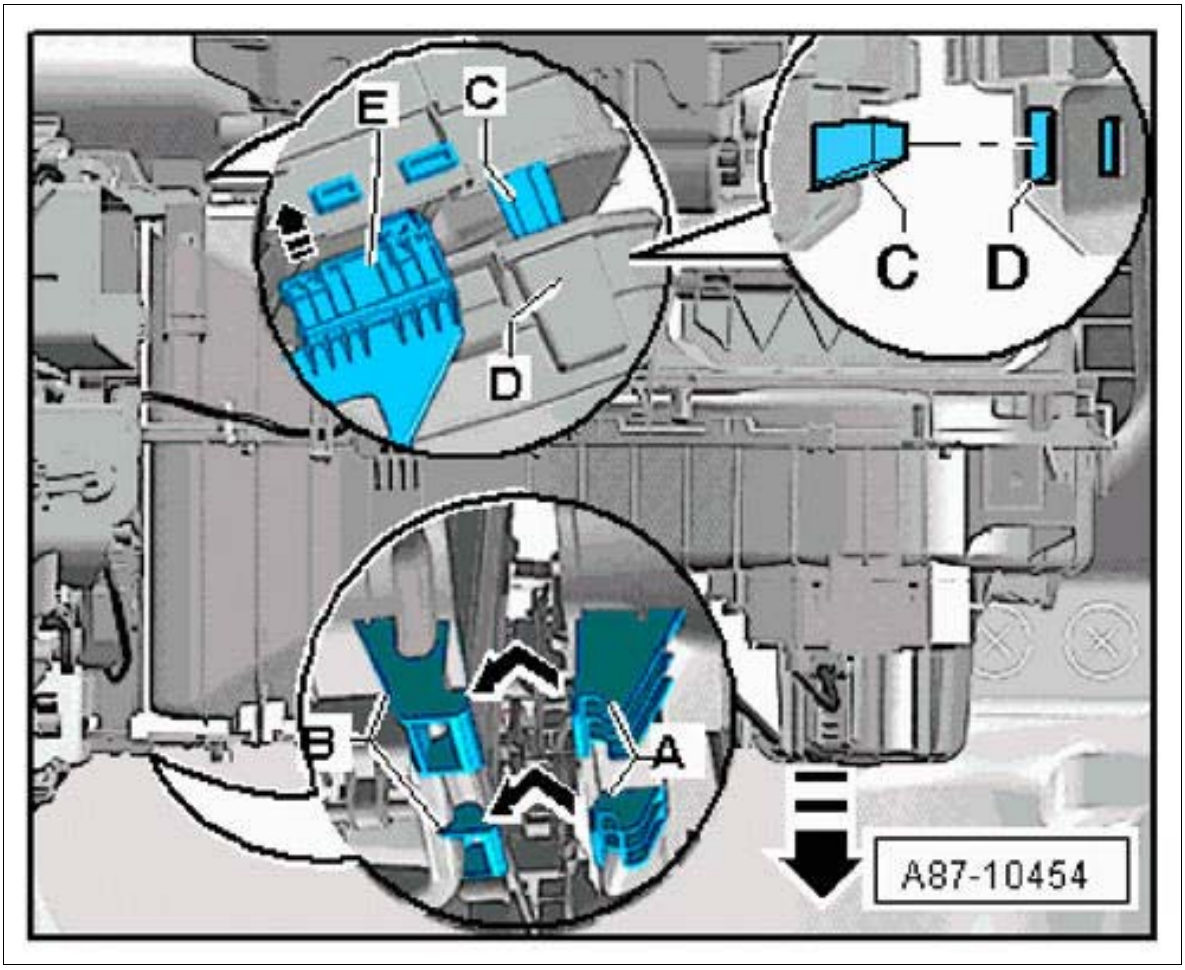
Fig 4: Pulling Fresh Air/Recirculated Air/Ram Air Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Disengage upper tab **-E-** of the heating/fresh-air unit from the mounting **-D-** for the fresh air/recirculated air/ram air housing.
11. Loosen lower mounting points **-A and B-** .

Fig 5: Removing Fresh Air/Recirculated Air/Ram Air Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Remove fresh air/recirculated air/ram air housing.
13. If the fresh air/recirculated air/ram air housing is replaced, the following work must still be carried out:
    1. 13.1. Convert heating/fresh-air blower motor → 853019 REMOVING AND INSTALLING HEATING/FRESH-AIR BLOWER MOTOR .
    2. 13.2. Convert fan control → 877819 REMOVING AND INSTALLING FAN CONTROL .

WM 851519 REMOVING AND INSTALLING HEATING/FRESH-AIR UNIT (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING HEATING/FRESH-AIR UNIT > REMOVING HEATING/FRESH-AIR UNIT

WARNING: Refrigerant

- *Danger of freezing*

→ Avoid contact with refrigerant.

→ Wear personal protective gear.

→ Observe the safety regulations for working on air-conditioned vehicles and dealing with refrigerant.

→ Observe the safety regulations for extraction and filling systems.

→ Observe the instructions for repairing air conditioning systems and storing spare parts.

Information

Before re-installing the component, check the O-rings of the refrigerant lines for damage and replace them if necessary.

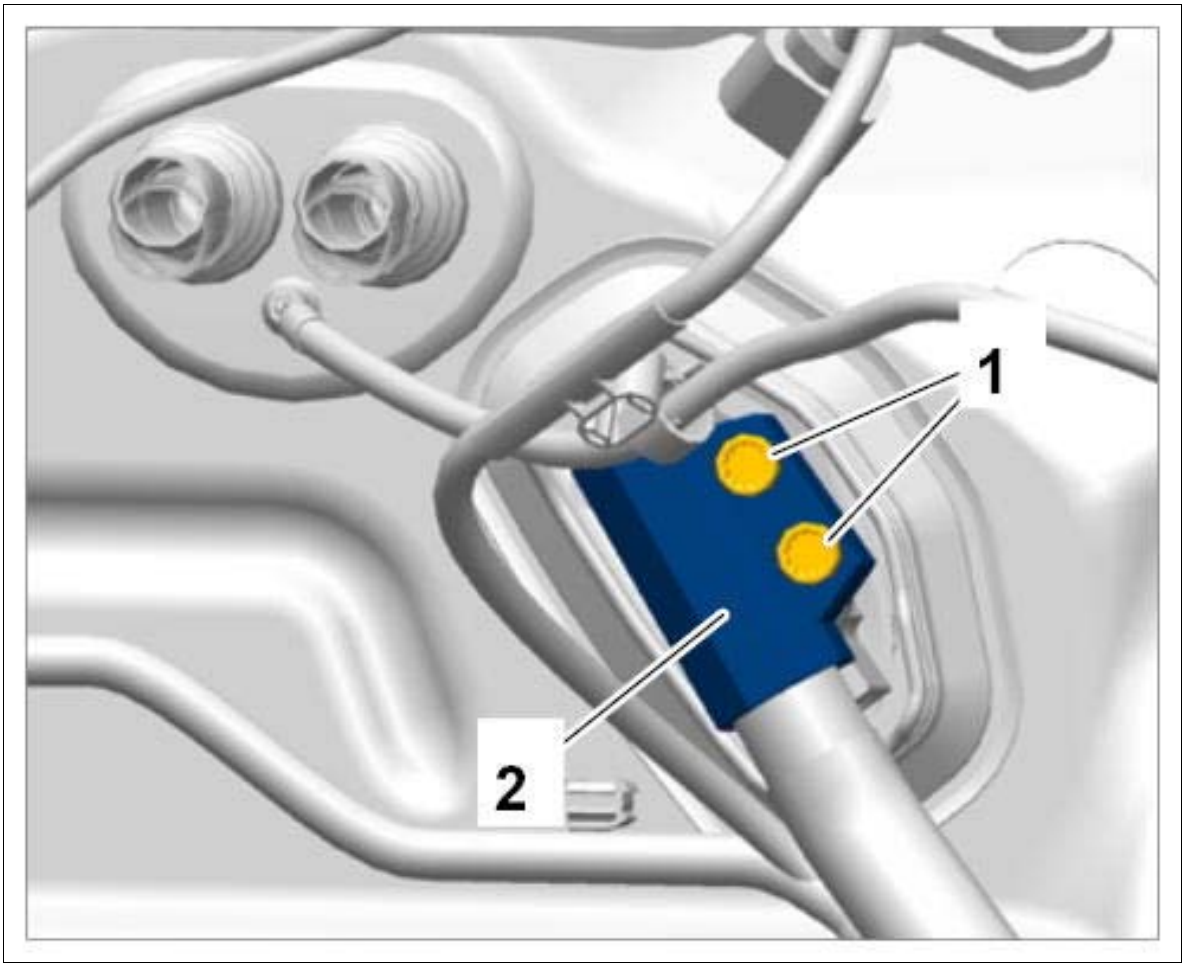
Wet the O-rings of the refrigerant lines with refrigerant oil.

Close off all lines and connections using suitable stoppers during removal.

Do not open the stoppers for the lines and connections until shortly before installation.

1. Remove fresh air/recirculated air/ram air housing.
2. Unscrew fastening screws **-1-** on the air-conditioning lines **-2-** .
3. Disconnect air-conditioning line **-2-** from the expansion valve.

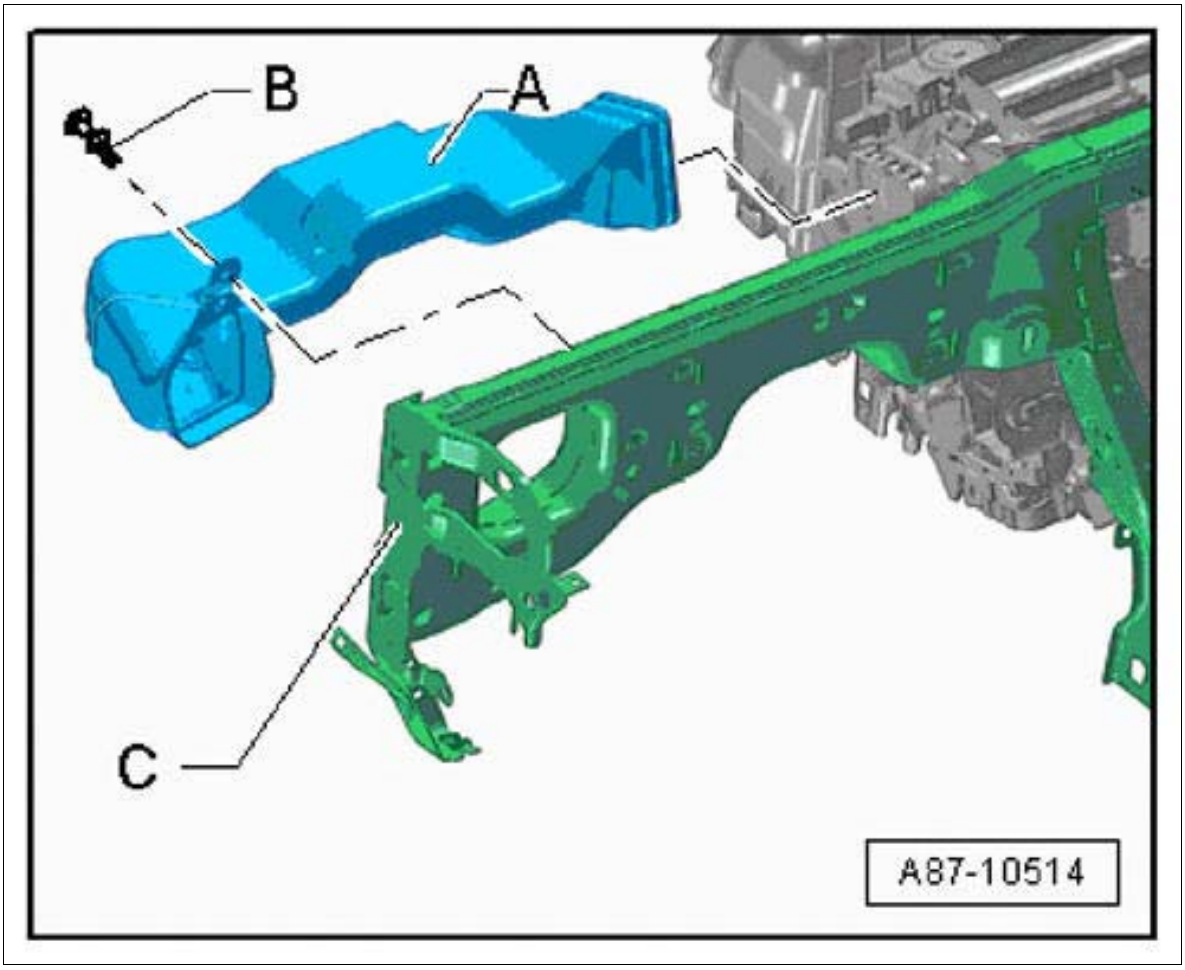
Fig 1: Identifying Air-Conditioning Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove air guides for dashboard outlet vents at the left and right

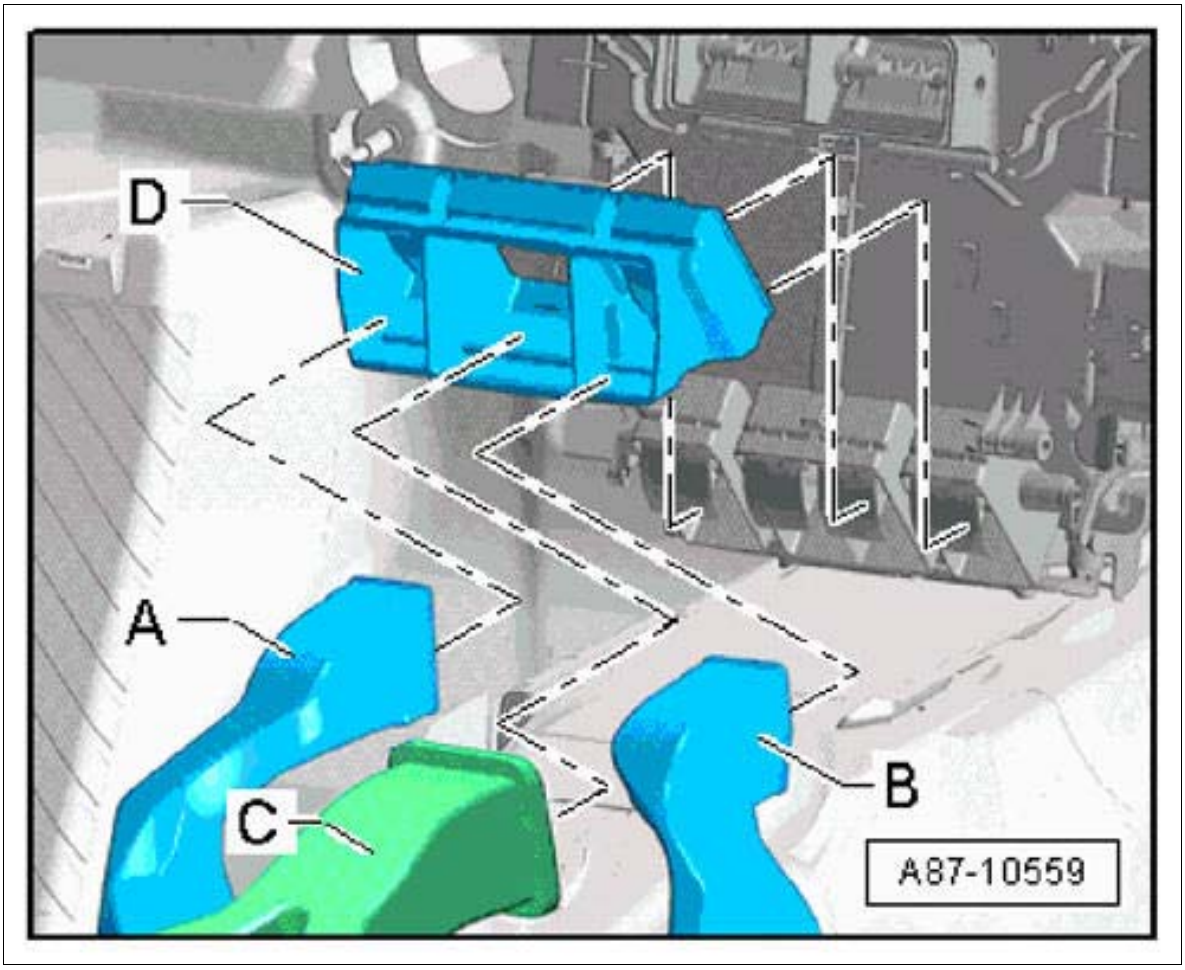
Fig 2: Removing Air Guides



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. **If installed in the vehicle:** Remove air guide for the air vent in the rear center console **-C-** .
6. Loosen air guides for rear footwell outlet vents **-A and B-** from intermediate piece **-D-** and remove intermediate piece **-D-** .

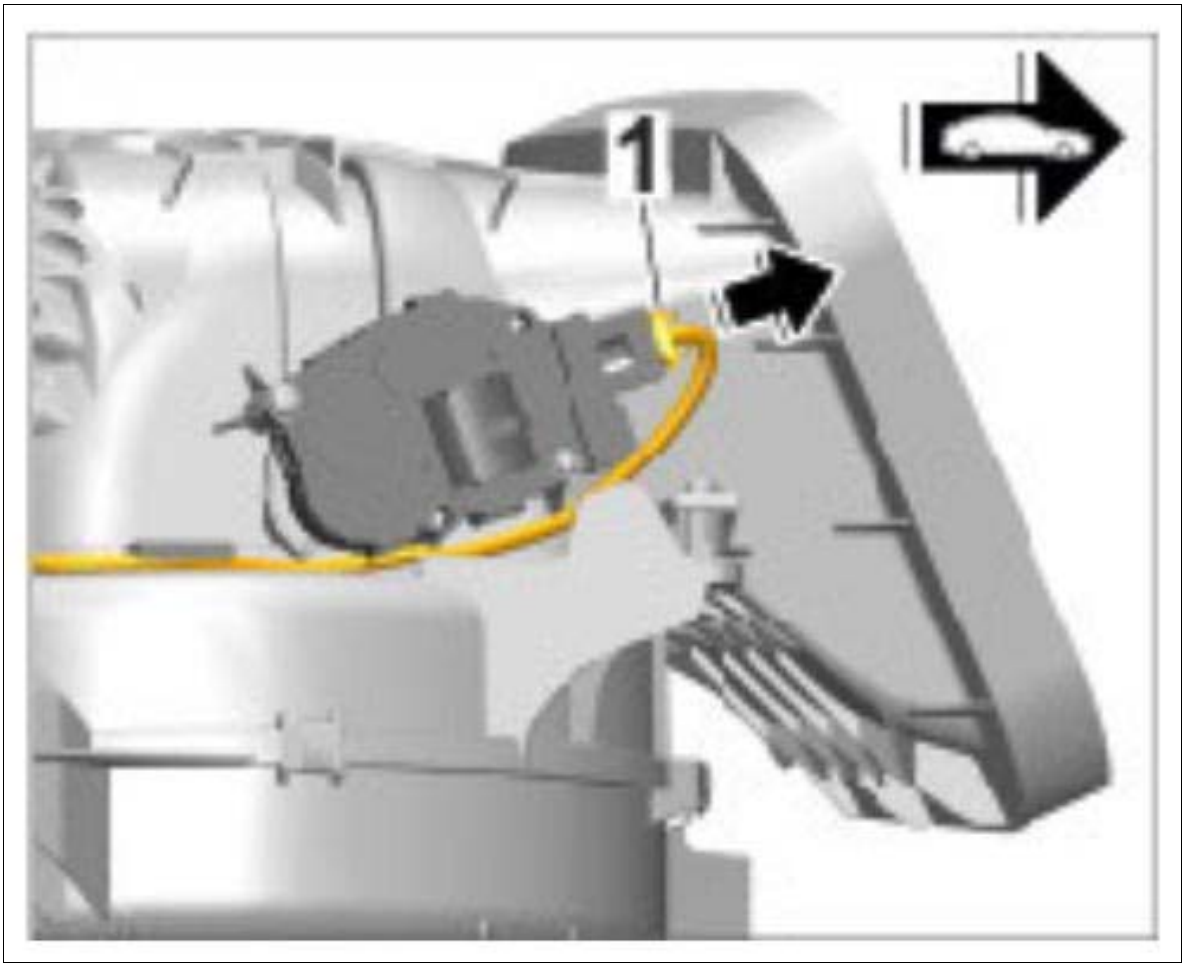
Fig 3: Identifying Rear Air Guides



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Release and disconnect electric plug connection for servo motors **-1-** .

Fig 4: Disconnecting Servo Motors Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Remove heating/fresh-air unit from the vehicle.

WM 851519 REMOVING AND INSTALLING HEATING/FRESH-AIR UNIT (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING HEATING/FRESH-AIR UNIT > INSTALLING HEATING/FRESH-AIR UNIT

1. Installation is performed in reverse order.

WM 851519 REMOVING AND INSTALLING HEATING/FRESH-AIR UNIT (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

If only the fresh air/recirculated air/ram air housing will be installed:

1. Install footwell outlet vent at the front right → INSTALLING FOOTWELL OUTLET VENT AT THE FRONT RIGHT .
2. Install glove compartment → INSTALLING GLOVE COMPARTMENT .

If the entire heating/fresh-air unit will be installed:

3. Install dashboard bracket → INSTALLING DASHBOARD SUPPORT .
4. Install front footwell outlet vent (at the left and right) → INSTALLING FRONT LEFT FOOTWELL OUTLET VENT and INSTALLING FOOTWELL OUTLET VENT AT THE FRONT RIGHT .
5. Secure heat exchanger return hose at the connection point for the passenger compartment → INSTALLING HEAT EXCHANGER RETURN HOSE .
6. Secure heat exchanger supply hose at the connection point for the passenger compartment → INSTALLING HEAT EXCHANGER SUPPLY HOSE .
7. Install center plenum panel wall → INSTALLING CROSS PANEL .
8. Install cowl panel cover → INSTALLING COWL PANEL COVER .
9. Fill in coolant → FILLING COOLANT .
10. Fill in refrigerant → DRAINING AND FILLING REFRIGERANT .
11. Connect battery ground strap → INSTALLING BATTERY .

WM 851819 REMOVING AND INSTALLING PARTICLE FILTER (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING PARTICLE FILTER > REMOVING PARTICLE FILTER

Information

1. Remove screw-type clips **-A-** and remove insulating mat **-B-** .

Fig 1: Identifying Insulating Mat

Service Manual: 87 - AIR CONDITIONING -- (95B) - MACAN

WM 870101 CHECKING AIR-CONDITIONING SYSTEM (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 870101 CHECKING AIR-CONDITIONING SYSTEM (MACAN, MACAN S, MACAN TURBO) > TROUBLESHOOTING THE AIR-CONDITIONING SYSTEM FOLLOWING COMPLAINTS ABOUT COOLING OUTPUT

Information

The troubleshooting steps shown must be used if complaints are received about the cooling output of the air-conditioning system.

→ 8X00IN INSTRUCTIONS FOR REPAIRING AIR-CONDITIONING SYSTEMS AND STORING SPARE PARTS .

Information

If it is not possible to clearly detect a leak using a leak detector, then only the leak detector additive supplied by SPEKTRONICS may be used. **Leak detector additive: Traserline TP 3860 in dissolved form.**

This leak detector additive is available from service equipment providers (e.g. Waeco). → WE1281 Air conditioning service equipment RS 2

For filling this Traser additive, special adapter kits are required, which are also available from service equipment providers (e.g. Waeco).

Information on how to use the air-conditioning system and the procedure for filling it can be found in the operating instructions for the adapter kits.

Status	Specification OK	Specification not OK
1) Check the cooling output,	Specified air flow and	Insufficient air flow from the

temperature and air flow. Check the air distribution by making adjustments to the air-conditioning control panel. Start the vehicle and check the air-conditioning system for the prescribed nominal temperature values. → WM 8X00IN TECHNICAL VALUES - AIR CONDITIONING (ALL MODELS) .	temperature is reached. Air distribution is working. Continue with **Step 2)** .	exhaust vents. Continue with **Step 3)** . Required temperature is not reached. Continue with **Step 2)** .
2) Perform on-board diagnosis on all control units. **PIWIS Tester II 9818**	No fault memory stored, air flow and temperature complies with specified nominal values. **Function OK. No further action required.** No fault memory stored and the temperature does not reach the specified nominal values. Continue with **Step 4)** .	Fault present: Work through fault memory in accordance with "Guided Fault Finding". Continue with **Step 1)** .
3) Check the following points one after the other. Replace if necessary. Remove active carbon/particle filter and check for dirt and dust particles. → 85181900 REMOVING AND INSTALLING PARTICLE FILTER . Check fan motor for correct function and adjustment. Use wiring diagram if necessary.	Fan motor and active carbon filter OK. Continue with **Step 4)** .	Replace active carbon/particle filter if necessary. Check mechanical operation (air distribution) of the servo motors/flaps and repair them if necessary. Following repairs, continue with **Step 1)** .
4) Connect air-conditioning service equipment, measure high and low pressure and compare with nominal values. → WM 8X00IN TECHNICAL VALUES - AIR CONDITIONING (ALL MODELS) .	High and low pressure OK. **Function OK. No further action required.**	High pressure too high, continue with **Step 5)** . High pressure too low, continue with **Step 6)** . Low pressure too high, continue with **Step 7)** . Low pressure too low, continue with **Step 8)** .
5) High pressure too high. Check the following points one after the other: Check condenser for dirt/dust particles and damage. Check electrical function, condenser fan activation. Drain refrigerant, measure and document the amount of refrigerant removed. >> Too much refrigerant. → 87031700 DRAINING AND FILLING		Clean the condenser. Repair condenser fan activation mechanism. Use wiring diagram. Fill the air-conditioning system with the prescribed amount of refrigerant. → WM 8X00IN TECHNICAL DATA FOR AIR-CONDITIONING SYSTEM (ALL MODELS) Continue with **Step 1)** .

REFRIGERANT		
6) High pressure too low. Check the following points one after the other: Check electrical function, air-conditioning compressor activation. Drain refrigerant, measure and document the amount of refrigerant.	>> If the amount of refrigerant is correct, remove the expansion valve and check for foreign bodies (e.g. chips, abrasion). → 87701900 REMOVING AND INSTALLING EXPANSION VALVE → 87031700 DRAINING AND FILLING REFRIGERANT Replace expansion valve if necessary. Continue with **Step 1)**	Repair air-conditioning compressor activation mechanism. Use wiring diagram. >> If there is not enough refrigerant, fill the air-conditioning system according to specifications. →WM 8X00IN TECHNICAL DATA FOR AIR-CONDITIONING SYSTEM (ALL MODELS) Check refrigerant circuit and connection points using a leak detector. >> Once you have determined the cause of refrigerant loss, replace seal or spare part. Continue with **Step 1)**
7) Low pressure too high. Check the following points one after the other: Drain refrigerant, measure and document the amount of refrigerant. >> Too much refrigerant. → 87031700 DRAINING AND FILLING REFRIGERANT	If the amount of refrigerant is correct, remove the expansion valve and check for foreign bodies (e.g. chips, abrasion). → 87701900 REMOVING AND INSTALLING EXPANSION VALVE → 87031700 DRAINING AND FILLING REFRIGERANT Replace expansion valve if necessary. Continue with **Step 1)**	>> If there is too much refrigerant, fill the air-conditioning system according to specifications. → WM 8X00IN TECHNICAL DATA FOR AIR-CONDITIONING SYSTEM (ALL MODELS) Continue with **Step 1)**
8) Low pressure too low. Check the following points one after the other: Drain refrigerant and measure the amount of refrigerant. >> Not enough refrigerant. → 87031700 DRAINING AND FILLING REFRIGERANT Loosen lines on the air-conditioning compressor and check for foreign bodies (e.g. chips, abrasion). → 873419 REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR	If the amount of refrigerant is correct, remove the expansion valve and check for foreign bodies (e.g. chips, abrasion). → 87701900 REMOVING AND INSTALLING EXPANSION VALVE → 87031700 DRAINING AND FILLING REFRIGERANT Replace expansion valve if necessary. Continue with **Step 1)**	Fill the air-conditioning system with the prescribed amount of refrigerant. → WM 8X00IN TECHNICAL DATA FOR AIR-CONDITIONING SYSTEM (ALL MODELS) Check refrigerant circuit and connection points using a leak detector. >> Once you have determined the cause of refrigerant loss, replace seal or spare part. Replace air-conditioning compressor if necessary. Continue with **Step 1)**

WM 870101 CHECKING AIR-CONDITIONING SYSTEM (MACAN, MACAN S, MACAN TURBO) > TROUBLESHOOTING THE AIR CONDITIONING SYSTEM FOLLOWING COMPLAINTS ABOUT NOISES

Information

The troubleshooting steps shown must be used if complaints are received about noises in the air-conditioning system.

→ 8X00IN INSTRUCTIONS FOR REPAIRING AIR-CONDITIONING SYSTEMS AND STORING SPARE PARTS

Information

If it is not possible to clearly detect a leak using a leak detector, then only the leak detector additive supplied by SPEKTRONICS may be used. **Leak detector additive: Traserline TP 3860 in dissolved form.**

This leak detector additive is available from service equipment providers (e.g. Waeco). → WE1281 Air conditioning service equipment RS 2

For filling this Traser additive, special adapter kits are required, which are also available from service equipment providers (e.g. Waeco).

Information on how to use the air-conditioning system and the procedure for filling it can be found in the operating instructions for the adapter kits.

Status	Specification OK	Specification not OK
1) Check for noises from around the compressor. Start the engine and switch on air conditioning.	No unusual operating noises can be heard from the air-conditioning system. Continue with **Step 2)** .	Noises coming from the air-conditioning system. >> Mechanical noises, continue with **Step 3)** If you have already carried out **Step 3)** , continue with **Step 5)** >> Squeaking noises, continue with **Step 4)**
2) Start the vehicle and check the air-conditioning system for the prescribed nominal temperature values. → WM 8X00IN TECHNICAL VALUES - AIR CONDITIONING (ALL MODELS) .	Nominal values OK and no noises from the air-conditioning system. **Function OK. No further action required.**	Nominal values not OK, proceed according to "Troubleshooting the air conditioning system following complaints about cooling output".
3) Check the following points one after the other: Remove drive belt and check condition. Check the bearing clearance of the pulley. Check refrigerant level. Drain refrigerant and measure the amount of refrigerant. >> Not enough refrigerant. → 87031700 DRAINING AND FILLING REFRIGERANT		Replace drive belt if necessary. Replace pulley if necessary. Fill the air-conditioning system with the prescribed amount of refrigerant. →WM 8X00IN TECHNICAL DATA FOR AIR-CONDITIONING SYSTEM (ALL MODELS) Check refrigerant circuit and connection points using a leak detector. >> Once you have determined the cause of refrigerant loss, replace seal or

		spare part. Continue with **Step 1)**
4) Remove drive belt and check for signs of wear or damage.	Systematically broaden the check to determine if there are noises coming from other components.	Replace drive belt if necessary. Continue with **Step 1)**
5) Replace air-conditioning compressor. → 873419 REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR	**Function OK. No further action required.**	

WM 870101 FUNCTION TEST ON AIR CONDITIONING (MACAN, MACAN S, MACAN TURBO) > FUNCTION TEST ON AIR CONDITIONING > GENERAL INFORMATION

Information

- The air outlet temperatures at the center vent on the dashboard and the high pressure in the air-conditioning system must not be higher or lower than the specified tolerance ranges after a running time of 7 minutes (high-pressure measurement).

WM 870101 FUNCTION TEST ON AIR CONDITIONING (MACAN, MACAN S, MACAN TURBO) > FUNCTION TEST ON AIR CONDITIONING > PROCEDURE AND GENERAL REQUIREMENTS FOR TESTING

Information

- The safety regulations must be observed during all work on the refrigerant system! → 8X00IN SAFETY REGULATIONS FOR WORKING ON AIR-CONDITIONED VEHICLES AND DEALING WITH REFRIGERANT R134A , → 8X00IN SAFETY REGULATIONS FOR EXTRACTION AND FILLING SYSTEMS .

Information

- If the specified nominal values are not reached, the air conditioning must be checked for leaks and repaired.

Information

- Check condensed water drain tubes: Must not be blocked by wax or underbody protection or otherwise dirty. Condensate must be able to drain away freely.
- Check fresh-air intake system: Water must not be allowed to run into the air conditioner. Must be completely dirt-free.
- Check that there is sufficient ventilation in the outside-temperature sensor area.
- Do not allow heat from the warm engine to build up near the outside-temperature sensor.

- Check particle filter: Must be dry and not excessively dirty.
- Condenser must be dirt-free.
- Make sure that all servo motors/flaps move to their end positions.
- Switch on MONO mode or SYNC mode using the button on the front air conditioning control panel.

1. Connect air conditioning service unit. → 870317 DRAINING AND FILLING REFRIGERANT .
2. Measure outside temperature using a thermometer.
3. Open all air outlet vents on the dashboard/center console (direct the blower towards the test person if necessary).
4. **Insert sensor of the temperature measuring device approx. 4 cm into the middle of the left center vent.**
5. Check stopwatch and keep an eye on the relevant temperature and high pressure on the air conditioning service unit.
6. Switch on ignition.
7. Open driver's and passenger's side windows and close sliding roof.
8. Press A/C Max button.
9. Start the engine and leave it running at idle speed (do not rev engine unnecessarily after starting!).
10. Operate air conditioning for 5 minutes at idle speed.
11. **Increase engine speed** depending on engine type and **maintain a constant engine speed for 2 minutes.** Start the time measurement immediately.
    1. 11.1. **Increase engine speed on V6 petrol vehicles to 2, 000 RPM.**
    2. 11.2. **Increase engine speed on diesel vehicles to 1, 500 RPM.**
12. Note center vent temperature and pressure values after 2 minutes.
13. Compare values (center vent temperature and pressure values) with the specified tolerances.

WM 870317 DRAINING AND FILLING REFRIGERANT (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Low-pressure gauge reading		Nominal value	3 bar		

WM 870317 DRAINING AND FILLING REFRIGERANT (MACAN, MACAN S, MACAN TURBO) > DRAINING AND FILLING REFRIGERANT > ASSEMBLY WORK INVOLVING THE REFRIGERANT SYSTEM

Information

During all work on the air-conditioning system which necessitates opening the refrigerant system, the system contents must first be disposed of in accordance with regulations!

Dirt and moisture must be kept out of the air-conditioning system's pipe system!

Thorough cleanliness must be ensured during all work!

System components must never be cleaned on the inside with hot steam!

Use only nitrogen for cleaning purposes!

When replacing a component, all openings must be closed off using suitable stoppers immediately after opening the system!

WM 870317 DRAINING AND FILLING REFRIGERANT (MACAN, MACAN S, MACAN TURBO) > DRAINING AND FILLING REFRIGERANT > GENERAL INSTALLATION SEQUENCE

The charging valves are located in the plenum panel at the rear left.

1. Screw off the protection caps on the charging valves.

   Be careful of the sealing rings when disconnecting or connecting the hose connections!

   Before connecting the high-pressure and low-pressure lines for the air conditioner to the vehicle, remove any refrigerant remaining in the lines by suction.

2. Connect the high-pressure and low-pressure lines on the air conditioner.

   Information

   In the case of servicing equipment with a transparent oil separator, read and take note of the oil level before removing the refrigerant.

   Do not carry out this step on empty air-conditioning systems (pressure gauge approx. 0 bar) because if you do, air will get into the refrigerant bottle.

   If the vehicle is cold, it may be necessary to repeat the suction procedure until all refrigerant has been removed from the air-conditioning system. This step is carried out automatically with some units.

   1. 2.1.

   2. 2.2. Leave the engine running for a short time with the air conditioning on, then connect the high-pressure and low-pressure lines of the air conditioner.

   3. 2.3. Open the valves of the high-pressure and low-pressure lines.

3. Remove refrigerant by suction.

    1. 3.1. If the vehicle is cold, it may be necessary to repeat the suction procedure until all refrigerant has been removed from the air-conditioning system. This step is carried out automatically with some units.

    2. 3.2. Wait for approx. 2 minutes after the servicing equipment has switched itself off. If the pressure gauge reading rises above 0 bar, repeat the suction process.

    3. 3.3. Drain the extracted refrigerant oil into a measuring cup on the servicing equipment and determine the volume.

       Information

       The open air-conditioning system should not be left open unnecessarily, but must be closed off using suitable stoppers immediately after being opened.

4. Carry out repairs.

   Information

   The desiccator must be replaced in the following situations:

    1. Refrigerant circuit is open for > 20 minutes.
    2. Amount of refrigerant extracted is < 30% of the required quantity.
    3. Refrigerant circuit has been open for an indefinite period of time (gradual leak, stone damage to condenser).
    4. Air-conditioning compressor has become blocked.
    5. Dryer cartridge is damaged.
    6. After opening the packaging and line connections (on a new desiccator), the desiccator must be installed within 20 minutes at the latest and the refrigerant circuit must be closed, evacuated and filled.

   The desiccator must not be replaced in the following situations:

    1. If the components are closed off using stoppers immediately after opening the refrigerant circuit and the refrigerant circuit is closed and evacuated within 20 minutes at the latest.

        1. 4.1. Before closing off the refrigerant circuit, check whether the desiccator needs to be replaced.

        2. 4.2. If necessary, reconnect high-pressure and low-pressure lines.

5. Evacuate the system and check for leaks.

    1. 5.1. If the air-conditioning system has been opened, evacuation should last at least 20 minutes so that the moisture can evaporate and be removed by suction.

    2. 5.2. If the air-conditioning system has been open for a long time, evacuation can be carried out for up to 120 minutes.

    3. 5.3. Check the pressure gauge for approx. 2 minutes. If the pressure rises, air is entering the vehicle's air-conditioning system. The leak must be located and repaired.

If the pressure remains constant, add refrigerant oil.

Information

Only ND8 refrigerant oil must be used.

6. Add refrigerant oil.
    1. 6.1. For units without an integrated oil filling system:
    2. 6.2. Start the vacuum pump. At the start of this vacuum phase, add the measured quantity of refrigerant oil using an oil injector or a hose disconnected from the servicing equipment. Reconnect the hose to the servicing equipment immediately after adding the oil.
    3. 6.3. For units with an integrated oil filling system: Add the measured quantity of refrigerant oil and wait for it to be taken in.
    4. 6.4. Do not allow any air to be taken in, otherwise Step 5 must be repeated.
7. Evacuate the system.
    1. 7.1. If the air-conditioning system has been opened, evacuation should last at least 20 minutes so that the moisture can evaporate and be removed by suction.
    2. 7.2. If the air-conditioning system has been open for a long time, evacuation can be carried out for up to 120 minutes.
    3. 7.3. For equipment with an integrated oil filling system, add refrigerant oil now.
8. Fill the air-conditioning system.
    1. 8.1. Using the servicing equipment, add the refrigerant quantity stated in the service information to the air-conditioning lines → 8X00IN TECHNICAL DATA FOR AIR-CONDITIONING SYSTEM .
    2. 8.2. As refrigerant usually flows instead of being pumped, it may not be possible - especially if the vehicle is warm and the servicing equipment is cold - to add the entire quantity. If this is the case, switch the engine and air conditioning on. Wait for the suction pressure to fall below 2 bar. Now open the low-pressure valve on the unit slowly and carefully until the remaining quantity has been added.

        NOTE: Excessively high pressure in refrigerant circuit

        1. Risk of damage to air-conditioning compressor

        → Do not allow the low-pressure gauge to exceed → **Nominal value: 3 bar** at any time.
    3. 8.3.
9. Add refrigerant from both connection hoses to the air-conditioning system in the vehicle.
    1. 9.1. The refrigerant in the high-pressure and low-pressure lines is part of the filling capacity of the refrigerant in the air-conditioning system in the vehicle.

2. 9.2. Close the valve on the high-pressure line and disconnect it from the vehicle.
3. 9.3. Start the engine and air-conditioning system. When the pressure on both pressure gauges falls below 2 bar, close the valve on the low-pressure line and disconnect it from the vehicle.

   Information

   After filling the air-conditioning system, the valve on the high-pressure and low-pressure connection must be checked using a leak detector.

   The protection caps must not be fitted.

   Position the leak detector at a specified distance (see operating instructions for each leak detector) above the valves and check the valves for signs of any leaks.

10. If there are no leaks in the high-pressure and low-pressure connection valves, fit the caps.

WM 871419 REMOVING AND INSTALLING SUN SENSOR (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove cover for center loudspeaker → 70901900 REMOVING AND INSTALLING COVER FOR CENTER LOUDSPEAKER .
2. Remove cover on defroster.

WM 873419 REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR > REMOVING AIR-CONDITIONING COMPRESSOR

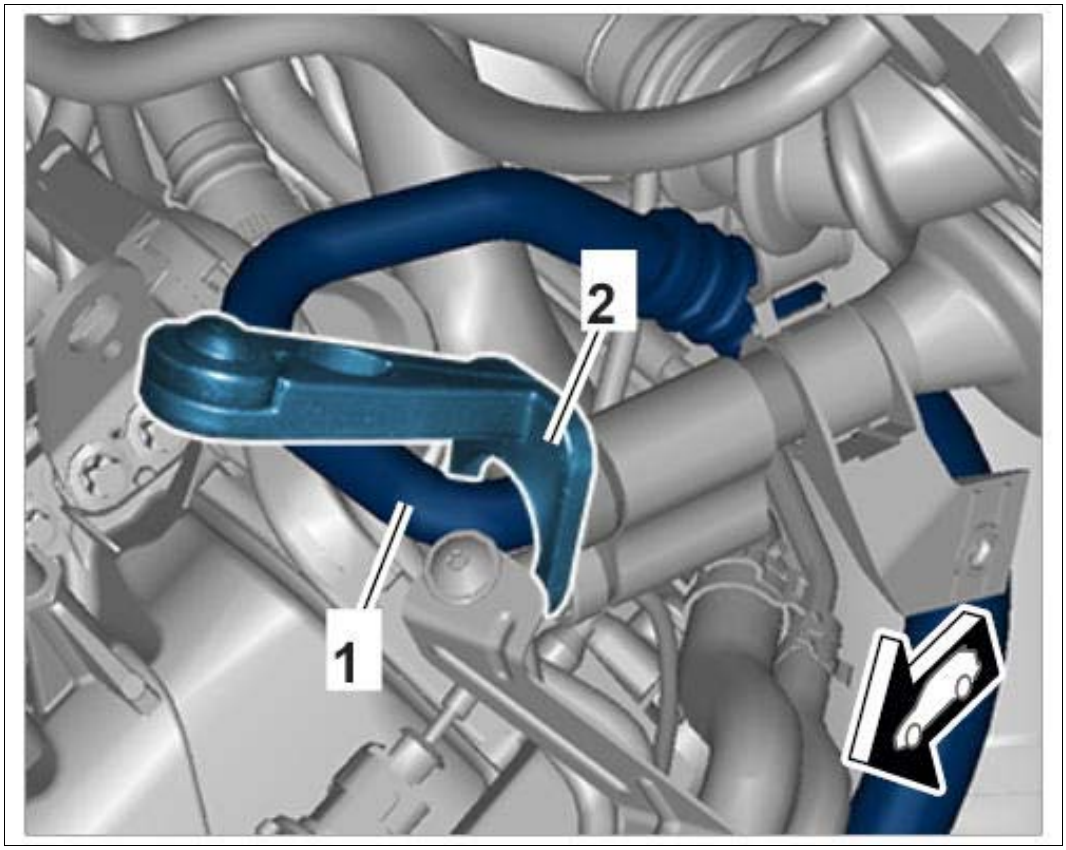
1. Release air-conditioning line from evaporator to compressor **-1-** using **release tool T40149 -2-** and pull it off.

    1. 1.1. Close off air-conditioning lines using suitable stoppers.

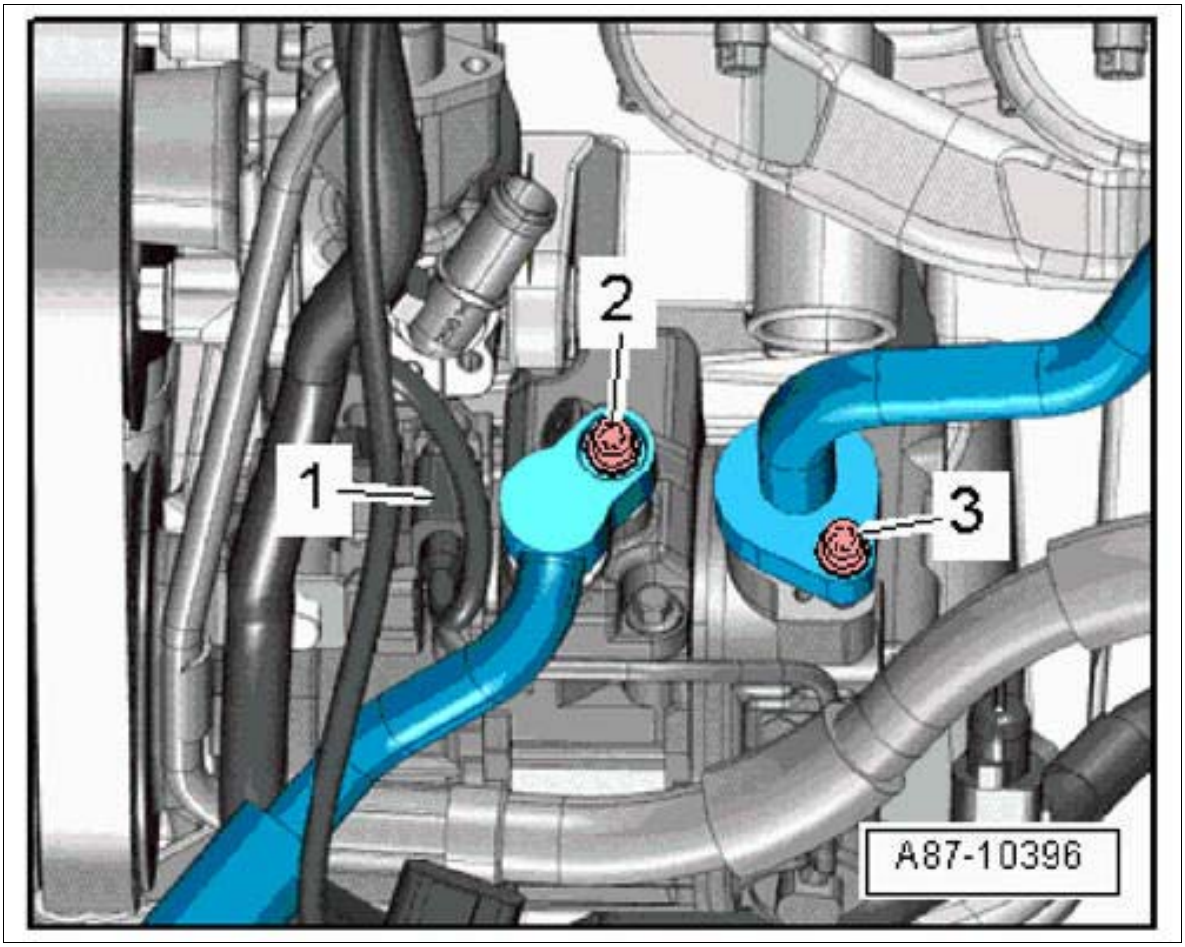
Fig 1: Identifying Release Tool (T40149)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Disconnect air-conditioning line from evaporator to the compressor at the holder for the engine.
3. Unscrew fastening screw **-2-** and pull off air-conditioning line to the condenser from the air-conditioning compressor.
4. Disconnect connector **-1-** .

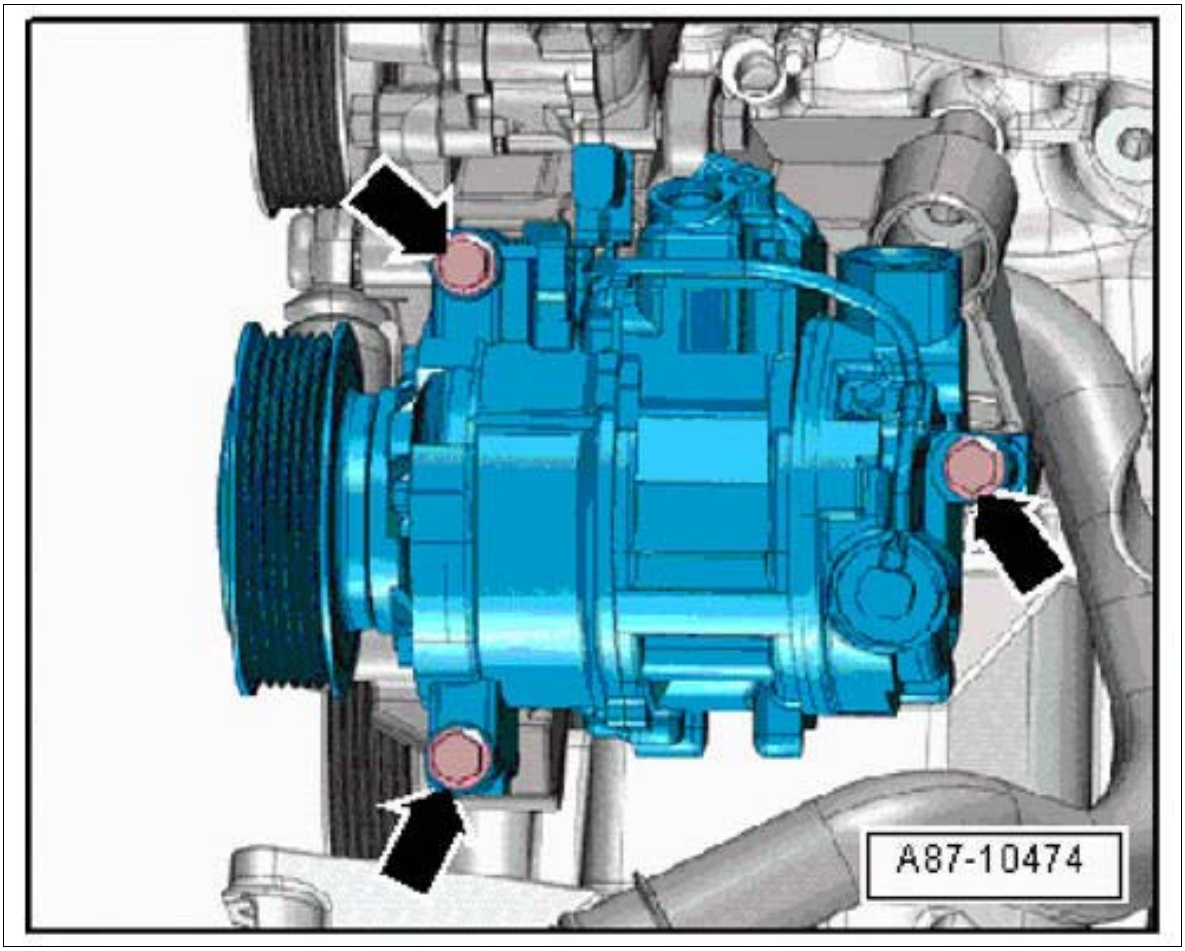
Fig 2: Identifying Lines On Air-Conditioning Compressor



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Unscrew fastening screws **-arrows-** on the air-conditioning compressor.

Fig 3: Locating Air-Conditioning Compressor Fastening Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Carefully lower the air-conditioning compressor with line to the evaporator so that the fastening screw **-3-** for the line to the evaporator can be reached.
7. Unscrew fastening screw **-3-** and pull off line to the evaporator.

WM 873419 REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR > REPLACING AIR-CONDITIONING COMPRESSOR

NOTE: Fill level too low

- *Risk of damage to components.*

→ Do not start the engine.

→ Do not tow the vehicle.

NOTE: Too much or too little refrigerant oil in air conditioning circuit

- *Reduced cooling output*
- *Lack of lubrication and failure of the air conditioning compressor*

→ If a new air conditioning compressor or a component in the circuit is replaced, the oil quantity must be checked and adjusted.

Information

All connection points must be completely dirt-free.

The air-conditioning compressor must be dry (washing the vehicle) and the air-conditioning compressor and lines must be free of moisture.

The connection points must be closed after they have been opened. Use the original transport caps.

A clean measuring cylinder with a capacity of approx. 300 ml is required.

Information

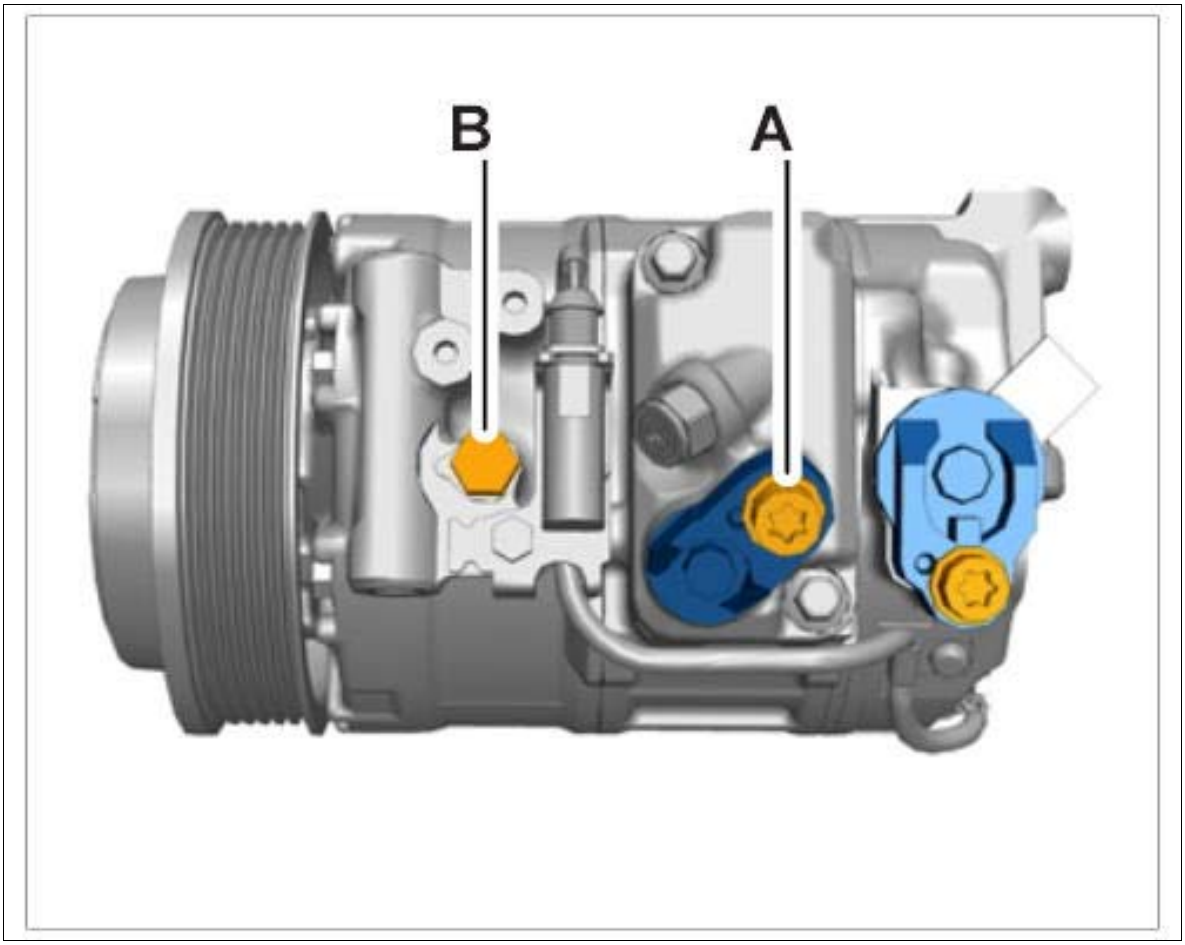
- If the air-conditioning compressor is blocked or seized up, then additional steps must be carried out to ensure that the air-conditioning system is working. See WORK STEPS FOR BLOCKED OR SEIZED UP AIR-CONDITIONING COMPRESSOR

Information

- New air-conditioning compressors are pressurized and filled with the required amount of oil for the refrigerant circuit.
- The remaining oil quantity in the individual components must therefore be taken into account!
- Refrigerant oil from the compressor or refrigerant oil removed by suction from a previously run air-conditioning system may no longer be used (special-category waste)!

1. Carefully open the cap on the high-pressure side and relieve the pressure from the air-conditioning compressor **-A-** .
2. Open the oil filler screw **-B-** on the air-conditioning compressor.

Fig 1: Identifying Cap And Oil Filler Screw (Shown Examples, Original May Differ)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Empty approx. 40 cm^3 of refrigerant oil out of the air-conditioning compressor and into a measuring glass. The remaining quantity of oil (approx. 60 cm^3) remains in the air-conditioning compressor.
4. Always replace the sealing ring for the oil filler screw.
5. Use fastening screws from the new air-conditioning compressor. Replace O-rings and coat new O-rings with refrigerant oil.

WM 873419 REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR > WORK STEPS FOR BLOCKED/SEIZED UP AIR-CONDITIONING COMPRESSOR

1. Remove desiccator from the condenser. → REMOVING AND INSTALLING DESICCATOR .
2. Check the desiccator for wear/chips.

   If there are signs of wear/chips:

3. Remove the refrigerant line between the compressor and condenser. → 874319 REMOVING AND INSTALLING COMPRESSOR/CONDENSER LINE .

4. Replace the refrigerant line between the compressor and condenser.

5. Replace the condenser with desiccator. → 875019 REMOVING AND INSTALLING CONDENSER .

6. Install the new refrigerant line between the compressor and condenser. → INSTALLING COMPRESSOR/CONDENSER LINE .

7. Install air-conditioning compressor → 873419 REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR .

   If there are no signs of wear/chips:

   1. Replace the desiccator. → REMOVING AND INSTALLING DESICCATOR .

WM 873419 REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR > INSTALLING AIR-CONDITIONING COMPRESSOR

1. Installation is performed in reverse order.

   Observe specified tightening torques:

   Air-conditioning compressor to engine: **Tightening torque 25 Nm (19 ftlb.)**

   Air-conditioning lines to air-conditioning compressor: **Tightening torque 20 Nm (15 ftlb.)**

   Air-conditioning line holder to engine: **Tightening torque 9 Nm (6.5 ftlb.)**

   Strut to lock carrier: **Tightening torque 5 Nm (3.5 ftlb.)**

   Strut to front-axle carrier: **Tightening torque 23 Nm (17 ftlb.)**

WM 873419 REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install drive belt → INSTALLING DRIVE BELT .

2. Install cover for front underbody at the left → INSTALLING COVER FOR FRONT UNDERBODY .

3. Install reservoir → INSTALLING RESERVOIR .

4. Fill in refrigerant → 870317 DRAINING AND FILLING REFRIGERANT .

WM 873419 REMOVING AND INSTALLING AIR-CONDITIONING COMPRESSOR (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK > SUBSEQUENT WORK

1. Install drive belt → INSTALLING DRIVE BELT .

WM 875819 REMOVING AND INSTALLING TEMPERATURE SENSOR (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. **Applies to left temperature sensor:**

   Install trim panel under dashboard at the left → INSTALLING TRIM PANEL UNDER DASHBOARD AT THE LEFT .

   Applies to left temperature sensor:

   Install glove compartment → INSTALLING GLOVE COMPARTMENT .

WM 877019 REMOVING AND INSTALLING EXPANSION VALVE (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2

Refrigerant line to expansion valve	M8 x 35 thread	Tightening torque	12 Nm (9 ftlb.)		
Expansion valve to air conditioner		Tightening torque	10 Nm (7.5 ftlb.)		

WM 877019 REMOVING AND INSTALLING EXPANSION VALVE (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Drain refrigerant → 870317 DRAINING AND FILLING REFRIGERANT .
2. Remove cowl panel cover → 508719 REMOVING AND INSTALLING COWL PANEL COVER .
3. Remove center plenum panel wall → 508119 REMOVING AND INSTALLING CROSS PANEL (DISASSEMBLING PLENUM PANEL) .

WM 877019 REMOVING AND INSTALLING EXPANSION VALVE (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING EXPANSION VALVE > REMOVING EXPANSION VALVE

WARNING: Refrigerant

- *Danger of freezing*

→ Avoid contact with refrigerant.

→ Wear personal protective gear.

→ Observe the safety regulations for working on air-conditioned vehicles and dealing with refrigerant.

→ Observe the safety regulations for extraction and filling systems.

→ Observe the instructions for repairing air conditioning systems and storing spare parts.

Information

Before re-installing the component, check the O-rings of the refrigerant lines for damage and replace them if necessary.

Wet the O-rings of the refrigerant lines with refrigerant oil.

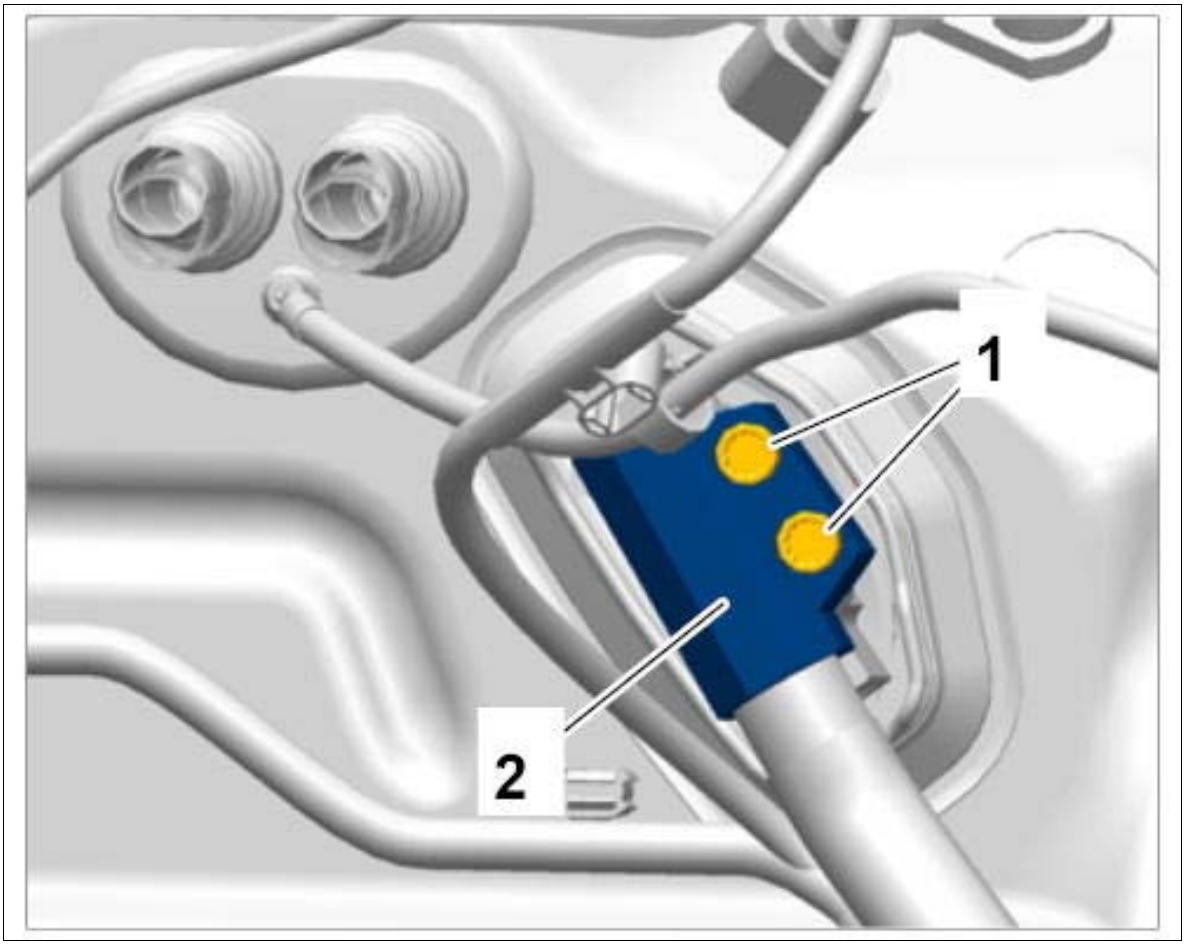
Close off all lines and connections using suitable stoppers during removal.

Do not open the stoppers for the lines and connections until shortly before installation.

1. Unscrew fastening screws **-1-** on the air-conditioning lines **-2-** .
2. Disconnect air-conditioning line **-2-** from the expansion valve and carefully press it aside (to

facilitate access).

Fig 1: Identifying Air-Conditioning Line Fastening Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew fastening screws **-1-** on the expansion valve **-2-** .
4. Disconnect expansion valve **-2-** from the connection pieces.

Fig 2: Identifying Expansion Valve Fastening Screws

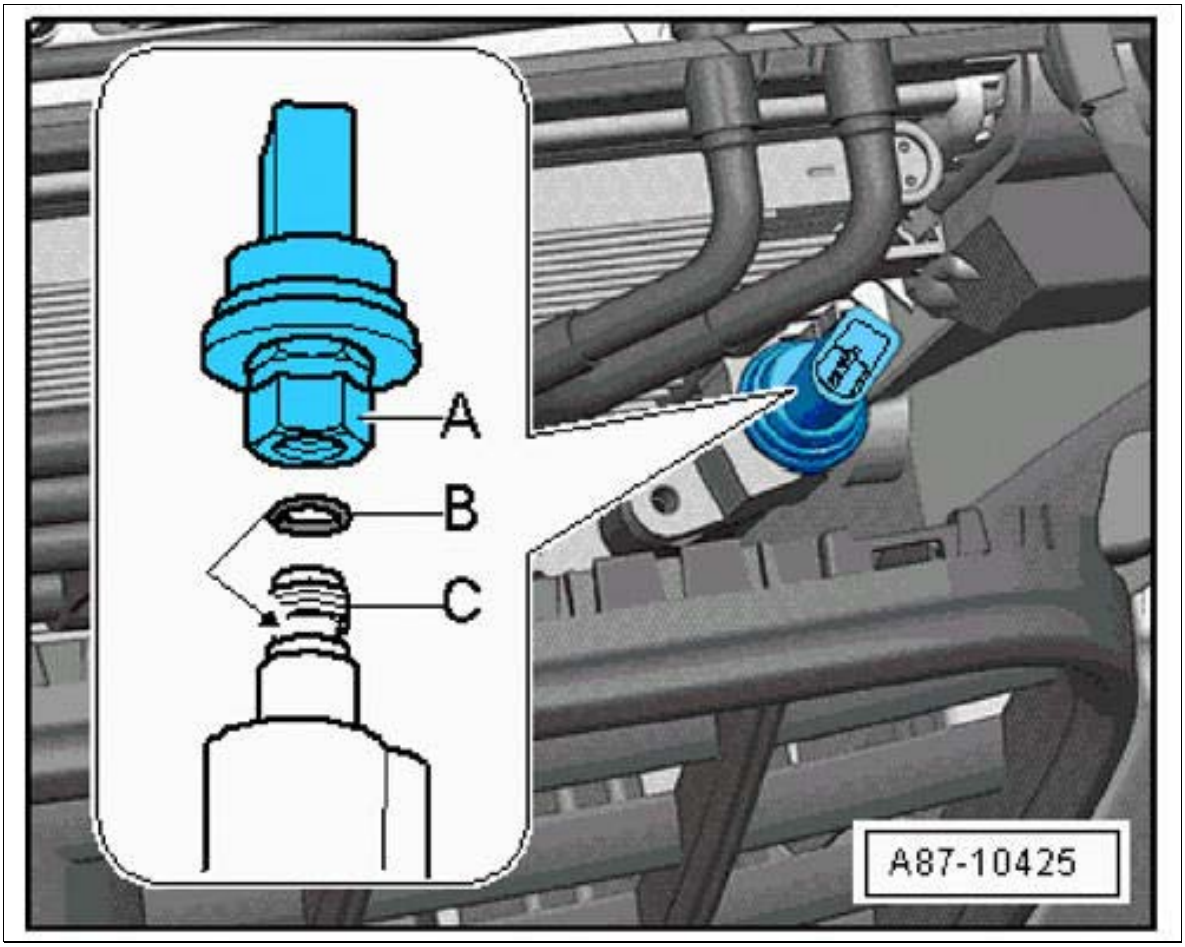
1. Replace O-ring **-B-** .
2. Installation is performed in reverse order.

Fig 1: Removing/Installing Pressure Switch



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 878319 REMOVING AND INSTALLING PRESSURE SWITCH (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install lower part of front lid lock at the left. → INSTALLING LOWER PART OF LID LOCK .

WM 8X00IN AIR CONDITIONING (ALL MODELS) > INFORMATION > DISTRIBUTION OF OIL QUANTITY IN REFRIGERANT CIRCUIT

Information

- Oil removed by suction must be returned to the system!
- Refrigerant oil removed from a previously run air-conditioning system may no longer be used (special-category waste)!
- After the refrigerant has been removed by suction and a component has been replaced, the oil quantity must be determined and topped up by the quantity remaining in the removed component!

When individual components listed in the following table are replaced, the measured oil quantity removed by suction from the refrigerant circuit and the quantity in the component must be returned to the refrigerant circuit.

In order to use a new compressor in a refrigerant circuit that is already functional, the oil quantity of the new compressor must be reduced by max. 47 cm^3. The compressor oil quantity is 110 cm^3 for a new compressor in as-delivered state.

WM 8X00IN AIR CONDITIONING (ALL MODELS) > INFORMATION > DISTRIBUTION OF OIL QUANTITY IN THE INDIVIDUAL AIR-CONDITIONING COMPONENTS

Component	Distribution of oil quantity in %	Oil quantity: low-pressure oil 8 in cm^3
Compressor	57	63
Condenser incl. desiccator	11	12
Refrigerant lines	11	12
Evaporator	21	23
Total compressor oil quantity	**for 100**	**110**

WM 8X00IN INSTRUCTIONS FOR CARRYING OUT GENERAL REPAIRS ON VEHICLES WITH AUXILIARY HEATING (ALL MODELS) > INFORMATION > INSTRUCTIONS FOR CARRYING OUT GENERAL REPAIRS ON VEHICLES WITH AUXILIARY HEATING

Information

- Perform on-board diagnosis of the auxiliary heating system using the vehicle diagnostic tester.
- If parts of the fuel system were removed or replaced, make sure that all components for extracting

fuel for the auxiliary heating system are installed properly.

- To avoid confusing the coolant hoses, mark them before removal.

Following repair work near the fuel line for the auxiliary heating system, check the following points:

- Check that the fuel lines are routed flush with the underbody and are protected from mechanical damage.
- Check that the fuel line for the auxiliary heating system is protected against high temperatures that could cause malfunctions.
- Check that the fuel line is not touching any hot components.

WM 8X00IN INSTRUCTIONS FOR REPAIRING AIR-CONDITIONING SYSTEMS AND STORING SPARE PARTS (ALL MODELS) > INSTRUCTIONS FOR REPAIRING AIR-CONDITIONING SYSTEMS AND STORING SPARE PARTS

Information

If you need to work on the refrigerant circuit, close off all openings immediately using commercially available rubber stoppers.

Store air-conditioning components in a dry and sealed-off area.

Blast air-conditioning components with nitrogen before refitting.

When fitting parts, do not remove stoppers until shortly before installation. Likewise, do not remove the protective foil from the desiccator until just before installation. The desiccator absorbs moisture from the air and is then useless.

Do not carry out repairs in the open during damp weather.

The desiccator should be replaced as soon as one component of the air conditioning system has been replaced or if the air conditioning system was open for > 20 minutes.

Moisture in the refrigerant circuit not only leads to poor cooling, but oversaturation can also cause the desiccator to disintegrate and contaminate the air-conditioning system from inside. This can result in expensive and complicated repairs.

Evacuate the refrigerant circuit according to instructions.

Use a pressure reducer when working with nitrogen.

WM 8X00IN NOMINAL VALUES FOR PRESSURES AND TEMPERATURES (ALL MODELS) > INFORMATION > GENERAL INFORMATION

Information

- The air outlet temperatures at the center vent on the dashboard and the high pressure in the air-conditioning system must not be higher or lower than the specified tolerance ranges after a

running time of 7 minutes (high-pressure measurement).

WM 8X00IN NOMINAL VALUES FOR PRESSURES AND TEMPERATURES (ALL MODELS) > INFORMATION > PROCEDURE AND GENERAL REQUIREMENTS FOR TESTING

Information

- The safety regulations must be observed during all work on the refrigerant system! → 8X00IN SAFETY REGULATIONS FOR WORKING ON AIR-CONDITIONED VEHICLES AND DEALING WITH REFRIGERANT R134A , → 8X00IN SAFETY REGULATIONS FOR EXTRACTION AND FILLING SYSTEMS .

Information

- If the specified nominal values are not reached, the air conditioning must be checked for leaks and repaired.

Information

- Check condensed water drain tubes: Must not be blocked by wax or underbody protection or otherwise dirty. Condensate must be able to drain away freely.
- Check fresh-air intake system: Water must not be allowed to run into the air conditioner. Must be completely dirt-free.
- Check that there is sufficient ventilation in the outside-temperature sensor area.
- Do not allow heat from the warm engine to build up near the outside-temperature sensor.
- Check particle filter: Must be dry and not excessively dirty.
- Condenser must be dirt-free.
- Make sure that all servo motors/flaps move to their end positions. ↓
- Switch on MONO mode or SYNC mode using the button on the front air conditioning control panel.

1. Connect air conditioning service unit. → 870317 DRAINING AND FILLING REFRIGERANT .
2. Measure outside temperature using a thermometer.
3. Open all air outlet vents on the dashboard/center console (direct the blower towards the test person if necessary).
4. **Insert sensor of the temperature measuring device approx. 4 cm into the middle of the left center vent.**
5. Check stopwatch and keep an eye on the relevant temperature and high pressure on the air conditioning service unit.
6. Switch on ignition.
7. Open driver's and passenger's side windows and close sliding roof.

8. Press A/C Max button.
9. Start the engine and leave it running at idle speed (do not rev engine unnecessarily after starting!).
10. Operate air conditioning for 5 minutes at idle speed.
11. **Increase engine speed** depending on engine type and **maintain a constant engine speed for 2 minutes.** Start the time measurement immediately.
    1. 11.1. **Increase engine speed on V6 petrol vehicles to 2, 000 RPM.**
    2. 11.2. **Increase engine speed on diesel vehicles to 1, 500 RPM.**
12. Note center vent temperature and pressure values after 2 minutes.
13. Compare values (center vent temperature and pressure values) with the specified tolerances.

WM 8X00IN NOMINAL VALUES FOR PRESSURES AND TEMPERATURES (ALL MODELS) > TECHNICAL VALUES > CENTRE VENT TEMPERATURE AS A FUNCTION OF OUTSIDE TEMPERATURE

Fig 1: Centre Vent Temperature Graph

blue - Upper limit

red - Lower limit

TA - Outside temperature (°C)

p - High pressure in refrigerant circuit (bar)

WM 8X00IN RULES RELATING TO CLEANLINESS FOR WORKING ON THE AUXILIARY HEATING SYSTEM AND FUEL SYSTEM (ALL MODELS) > INFORMATION > RULES RELATING TO CLEANLINESS FOR WORKING ON THE AUXILIARY HEATING SYSTEM AND FUEL SYSTEM

Information

- Thoroughly clean connection points and adjacent areas before loosening them.
- Place removed parts on a clean surface (use film or paper, no fibre-shedding cloths) and cover

them.

- If repair work will not be carried out immediately, the parts must be covered carefully or sealed.
- Only install clean parts.
- Do not take spare parts out of the packaging until just before installation.
- Do not use parts that have been left without packaging.

When the fuel system is open, do not:

- Use compressed air.
- Start the engine.
- Switch on auxiliary heating.

WM 8X00IN SAFETY MEASURES WHEN WORKING ON VEHICLES WITH AUXILIARY HEATING (ALL MODELS) > INFORMATION > SAFETY MEASURES WHEN WORKING ON VEHICLES WITH AUXILIARY HEATING

Information

- It is important to ensure that the auxiliary heating timer is deactivated during a workshop visit and while working on the vehicle in order to prevent the auxiliary heating system from coming on unintentionally.
- The preset timer must be activated again following repair work.
- The auxiliary heating system must not be on or switched on in areas in which there is a danger of fire and risk of explosion.
- The auxiliary heating system must not be on or switched on in enclosed spaces without an exhaust extraction system.
- Always comply with the applicable safety regulations when working on the fuel system.
- The engine must not be started if components of the fuel system (e.g. metering pump, fuel line, fuel supply indicator) are removed or open.
- Before starting repair work on the auxiliary heating system: Relieve overpressure in the cooling system by carefully opening the catch on the coolant reservoir.
- The function of the auxiliary heating system must be checked following repair work on the auxiliary heating system or fuel system.
- When repair work is complete, perform on-board diagnosis of the auxiliary heating system using the vehicle diagnostic tester.

WM 8X00IN SAFETY REGULATIONS FOR EXTRACTION AND FILLING SYSTEMS (ALL MODELS) > SAFETY REGULATIONS FOR EXTRACTION AND FILLING

SYSTEMS

> *WARNING: Improper handling of the filling system for the air conditioning.*
>
> - *Unnecessary damage to the environment due to emerging refrigerant.*

→ Before connecting the filling system to the air-conditioning, make sure that the manual shut-off valves are closed.

→ Before disconnecting the filling system from the air-conditioning, make sure that the process is complete so that no refrigerant can escape into the atmosphere.

→ After the purified refrigerant has been filled into an external compressed gas bottle from the filling system, the manual shut-off valves on the bottle and on the filling system should be closed.

→ Do not expose the filling system to moisture or use in a damp environment.

→ Shut off the power supply at the filling system before carrying out maintenance work.

→ An extension cable with cross-sectional area of at least 2.5 mm 2 should be used only when absolutely necessary.

→ In the case of fire, the external bottle should be removed.

→ Fill the oil extracted from the air-conditioning system into a suitable closable container (the refrigerant oil contains small quantities of refrigerant).

→ The filling system must be secured to prevent rolling.

WM 8X00IN SAFETY REGULATIONS FOR WORKING ON AIR-CONDITIONED VEHICLES AND HANDLING REFRIGERANT R134A (ALL MODELS) > GENERAL SAFETY REGULATIONS FOR REFRIGERANTS

> ⚠ *CAUTION: Extreme heating of air-conditioning system e.g. from sunlight shining into the vehicle or as a result of welding and soldering work.*
>
> - *Danger of fire due to excessive heating of air conditioning.*
> - *Danger of environmental pollution due to emerging refrigerant.*

→ When carrying out repairs on the air-conditioning system, the system must be emptied by suction and the refrigerant must be purified. Chlorine-free refrigerants must also not be allowed to escape into the atmosphere and must be disposed of correctly.

→ Due to their chemical composition, different refrigerants must not be mixed with each other! This also applies for smaller quantities.

→ No welding, soldering or hot-air heating may take place on parts of the filled air-conditioning system or

in its immediate vicinity.

→ While drying after painting work, the temperature burden on the vehicle must not exceed two hours at a maximum temperature of 80°C.

→ Whether or not the system is filled with refrigerant, the heating causes a very strong overpressure which can cause damage to the system or even lead to an explosion.

→ R 134a is completely non-toxic at normal temperatures, but it decomposes upon contact with a flame or at high temperatures.

→ Refrigerant bottles must not be thrown and must not be subjected to direct sunlight or other heat sources for an extended period when full.

→ The maximum permissible temperature of a filled refrigerant bottle must not exceed 45 °C.

→ Risk of injury! High temperatures from open flames or hot solids causes chemical breakdown of refrigerant gas. Inhalation of the resulting breakdown products leads to coughing and nausea.

WARNING: Caustic fluids

- *Danger of chemical burns*

→ Avoid contact with caustic fluid.

→ Wear personal protective gear.

→ Ensure that there is good ventilation.

→ If you do come into contact, wash off immediately with plenty of warm water and contact a doctor if necessary.

WARNING: Refrigerant

- *Danger of freezing*

→ Avoid contact with refrigerant.

→ Wear personal protective gear.

→ Observe the safety regulations for working on air-conditioned vehicles and dealing with refrigerant.

→ Observe the safety regulations for extraction and filling systems.

→ Observe the instructions for repairing air conditioning systems and storing spare parts.

Information

- The following safety measures should be followed for refrigerant R134a (additional regulations may apply in certain countries).

If repair work necessitates opening the refrigerant circuit, the refrigerant circuit must first be emptied.

Avoid all contact with liquid or gaseous refrigerants. If refrigerant should escape despite all safety measures having been taken, do not inhale the resulting refrigerant/air mixture. Switch on extraction systems, protect hands with rubber gloves and protect eyes with protective goggles.

If refrigerant gets onto any other body parts despite all safety measures having been taken, these should also be rinsed immediately and thoroughly with water for at least 15 minutes.

Although refrigerant R134a is non-flammable, smoking, welding, soldering and hard-soldering is prohibited in a room containing refrigerant.

WM 8X00IN SAFETY REGULATIONS FOR WORKING ON AIR-CONDITIONED VEHICLES AND HANDLING REFRIGERANT R134A (ALL MODELS) > EMPTYING THE REFRIGERANT CIRCUIT

Information

Refrigerant R134a contributes to the greenhouse effect as soon as it is released into the Earth's atmosphere.

Refrigerant should not be released into the environment but is to be extracted from the refrigerant circuit using an extraction or service station. The extracted refrigerant is then prepared again on-site or returned to the manufacturer for environmentally-friendly disposal (varying or additional regulations may apply in certain countries).

WM 8X00IN SAFETY REGULATIONS FOR WORKING ON AIR-CONDITIONED VEHICLES AND HANDLING REFRIGERANT R134A (ALL MODELS) > WORKING ON THE REFRIGERANT CIRCUIT

WARNING: Toxic substances

- *Danger of poisoning or suffocation*
- *Danger of burns to the eyes and skin*

→ Ventilate the work area well.

→ Never ingest or inhale.

→ Read specific information on the Hazard Sheet.

→ Do not smoke, eat or drink in the work area.

WM 8X00IN SAFETY REGULATIONS FOR WORKING ON AIR-CONDITIONED VEHICLES AND HANDLING REFRIGERANT R134A (ALL MODELS) > PAINTING

WORK ON VEHICLES WITH AIR CONDITIONING

WARNING: Painting work on vehicles with air-conditioning

- *Material damage due to the air-conditioning system bursting.*

→ When carrying out repairs involving painting work, object temperatures in the drying oven or its preheating zone should not exceed 80 °C.

WM 8X00IN SAFETY REGULATIONS FOR WORKING ON AIR-CONDITIONED VEHICLES AND HANDLING REFRIGERANT R134A (ALL MODELS) > NOTES ON GENERAL REPAIRS

The refrigerant circuit of the air-conditioning system may only be emptied and opened if this is necessary in order to comply with safety measures or if components of the refrigerant circuit have to be replaced.

The air-conditioning refrigerant circuit also remains closed during all other standard vehicle repair work.

Contact corrosion!

For this reason, the manufacturer only fits connecting elements with a special surface coating.

Contact corrosion can occur if unsuitable connecting elements (screws, nuts, washers, rivets, plugs, adhesives, etc.) are used.

Only use original Porsche parts!

WM 8X00IN TECHNICAL DATA FOR AIR-CONDITIONING SYSTEM (ALL MODELS) > TECHNICAL VALUES

WM 033500 FAULT MEMORY FOR ON-BOARD DIAGNOSIS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	

PIWIS Tester II	Special tool	9818		
WM 033500 FAULT MEMORY FOR ON-BOARD DIAGNOSIS (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 033500 FAULT MEMORY FOR ON-BOARD DIAGNOSIS (ALL MODELS) > READING OUT AND ERASING FAULT MEMORIES

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

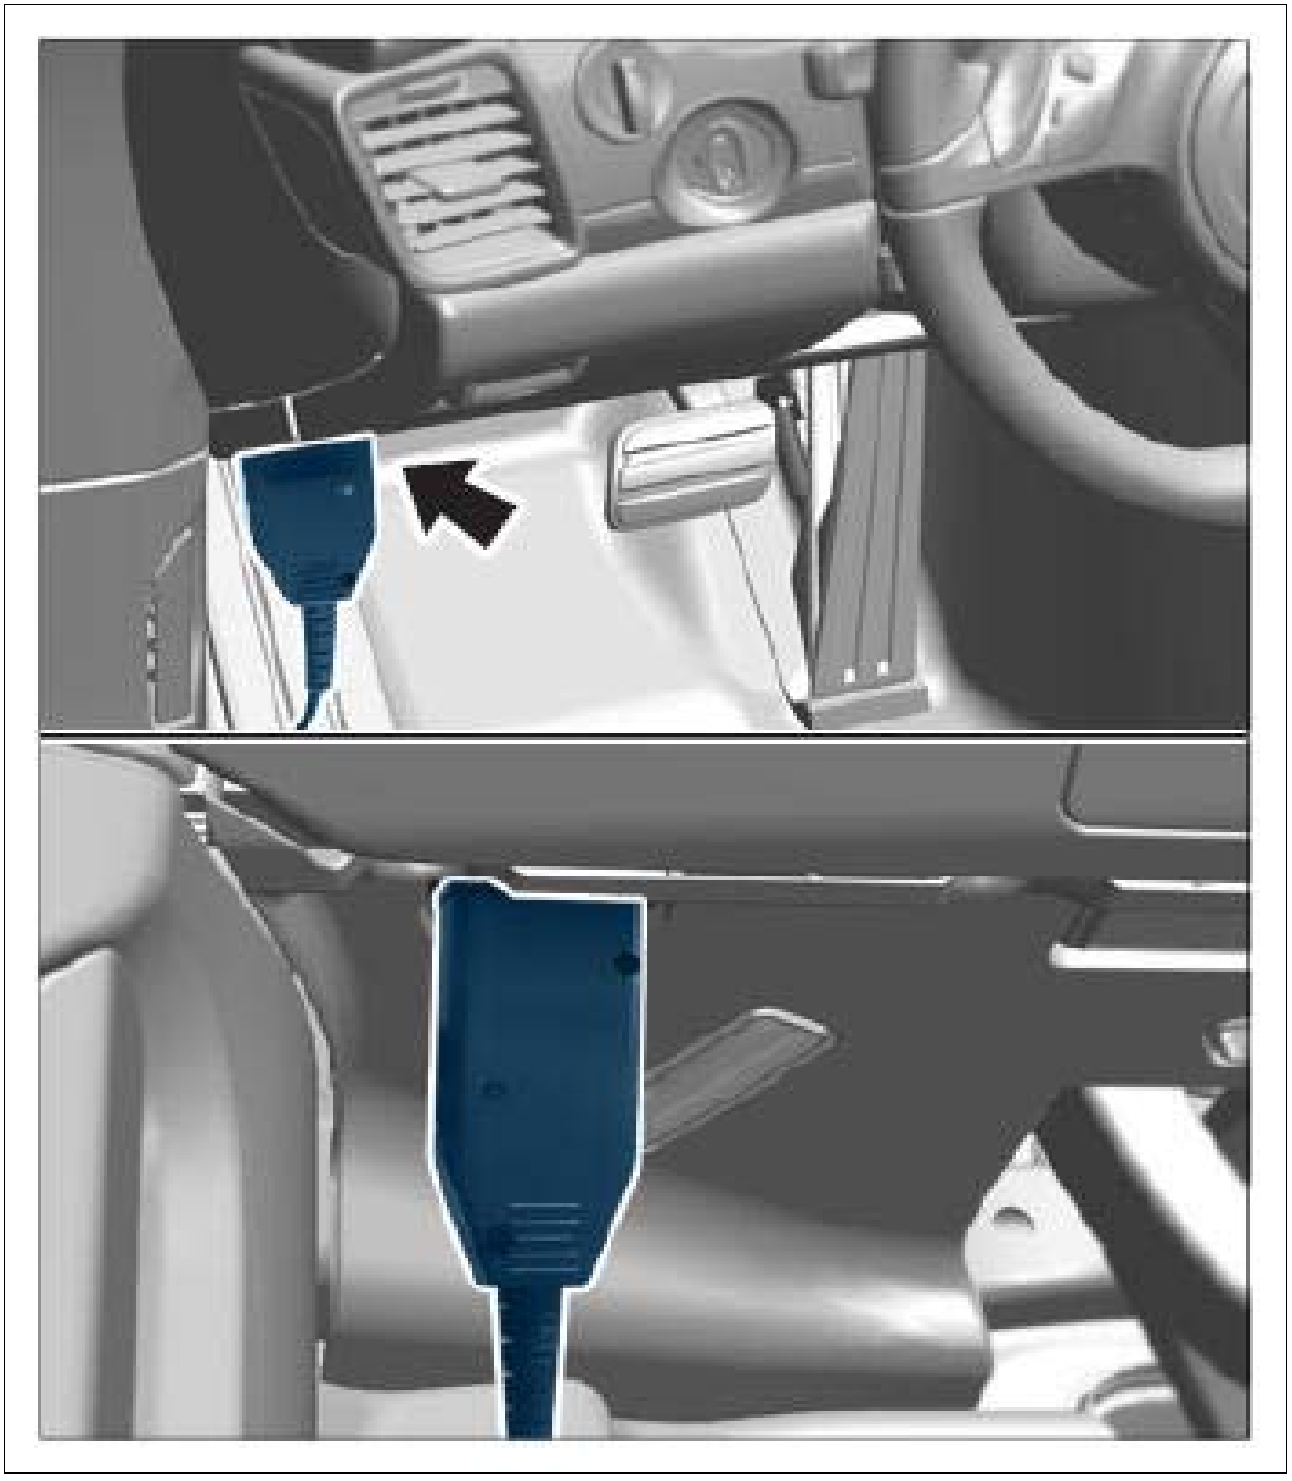
→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

The **PIWIS Tester II 9818** is connected to the vehicle via a diagnostic socket. The diagnostic socket is located inside the vehicle close to the driver's A-pillar below the instrument panel.

Fig 1: Locating Diagnostic Socket



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Start the **PIWIS Tester II 9818** and follow the instructions on the Tester.
2. Select the vehicle type. The diagnostic application starts.
3. In the **Control unit overview** , press [F7] to continue.
4. Select the menu **Read out all fault memories and erase them if necessary** and press [F12] to continue.

5. Check existing faults and press [F8] to delete faults.
6. Delete faults by pressing [F12] (Yes) or press [F11] if you decide not to delete the faults.
7. Press [F11] to return to the selection.

WM 033500 FAULT MEMORY FOR ON-BOARD DIAGNOSIS (ALL MODELS) > READING OUT AND ERASING FAULT MEMORIES > RESETTING SERVICE INTERVAL

If the engine oil is replaced during maintenance work, the service interval must be reset.

1. Start the **PIWIS Tester II 9818** and follow the instructions on the Tester.
2. Select the vehicle type. The diagnostic application starts.
3. Select the **Instrument cluster** menu and press [F12].
4. Select the **Maintenance/repairs** menu.
5. Select the **Reset service interval** menu and press [F12].
6. Select the maintenance work that was carried out (tick the relevant boxes) and press [F12].
7. Select the engine variant and start the **Reset** function by pressing [F8]. Press [F12] to continue.
8. Exit the menu, shut down the PIWIS Tester and disconnect it from the vehicle.

WM 033500 FAULT MEMORY FOR ON-BOARD DIAGNOSIS (ALL MODELS) > READING OUT AND ERASING FAULT MEMORIES > READING OUT SOOT MASS IN PARTICLE FILTER

Information

The soot mass must be checked every 30, 000 km (18, 640 miles) on diesel vehicles.

If the particle filter is replaced, the soot mass value must be reset.

1. Start **PIWIS Tester II 9818** and follow the instructions on the Tester.
2. Select the vehicle type. The diagnostic application starts.
3. Select the **DME** menu and press [F12].
4. Select the **Actual values, input signals** menu.
5. Select the **Catalytic converter diesel particle filter** menu and press [F12].
6. **Select K100 diesel particle filter, bank 1, soot mass (soot level) calculated** and press [F12].
7. The value is now displayed in grams.

- If the value is greater than **40 g** , the message "Check DPF" appears in the instrument cluster. Release the diesel particle filter by performing a regeneration drive as described in the Driver's Manual. If the regeneration drive could not be completed successfully, carry out a service regeneration. → 033500 FAULT MEMORY FOR ON-BOARD DIAGNOSIS
- If the value is **44 g** , a service regeneration must be carried out. → 033500 FAULT MEMORY FOR ON-BOARD DIAGNOSIS
- If the value is greater than **68 g** , a service regeneration is no longer possible. The particle filter must be replaced.

WM 033500 FAULT MEMORY FOR ON-BOARD DIAGNOSIS (ALL MODELS) > READING OUT AND ERASING FAULT MEMORIES > CARRYING OUT SERVICE REGENERATION

1. Select the **DME** menu and press [F12].
2. Select the **Maintenance/repairs** menu.
3. Select the **Particle filter regeneration** menu and press [F12].
4. Follow the instructions and steps on the Tester.

WM 035100 ADDITIONAL MAINTENANCE EVERY 2 YEARS (ALL MODELS) > ADDITIONAL MAINTENANCE EVERY 2 YEARS

Additional maintenance every 2 years	OK
Change brake fluid	
Prepare condition report for long-life guarantee	
Tyre sealing compound: check use-by date and replace if necessary → 442655 REPLACING TYRE SEALING COMPOUND

Rear final drive: change oil → 399055 CHANGING OIL FOR FINAL DRIVE	

WM 039500 ADDITIONAL MAINTENANCE EVERY 240, 000 KM/160, 000 MILES OR EVERY 16 YEARS (A AND B MARKETS) (ALL MODELS) > ADDITIONAL MAINTENANCE EVERY 240, 000 KM/160, 000 MILES OR EVERY 16 YEARS

Additional maintenance every 240, 000 km/160, 000 miles or every 16 years	OK
All-wheel final drive: change oil → 399055 CHANGING OIL FOR ALL-WHEEL FINAL DRIVE	
Rear final drive: change oil → 399055 CHANGING OIL FOR FINAL DRIVE	

EMISSIONS MAINTENANCE REMINDER

NOTE: To determine the appropriate reset procedure, refer to OXYGEN SENSOR WARNING LIGHT RESET INDEX . Only vehicles listed in this index have an Oxygen Sensor Warning Light reset.

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
911	
1977-83	Emissions Maintenance Reminder Reset - Procedure 1
924	
1977-82	Emissions Maintenance Reminder Reset - Procedure 1
928	
1978-83	Emissions Maintenance Reminder Reset - Procedure 1

EMISSIONS MAINTENANCE REMINDER > EMISSIONS MAINTENANCE REMINDER RESET - PROCEDURE 1

Oxygen sensor (O2S) light will come on at 30,000 mile intervals as a reminder to replace sensor. After replacing sensor, reset warning light as follows:

1. On 911 models, disconnect battery ground cable and remove speedometer. Counter will be visible through speedometer mounting hole. Using a thick piece of wire or a thin rod, press White reset button all the way in against stop. Ensure warning light is out.
2. On 924 models, after replacing oxygen sensor and with vehicle still raised, locate mileage counter on left engine mount. Using a thick wire or thin metal rod, push in reset button all the way to stop. Ensure warning light is out.
3. On 928 and 928S with CIS system, counter is located to right of passenger seat floor (near door sill). Remove counter cover retaining screw and cover. Press reset button all the way in against stop. Ensure warning light is out.

MAINTENANCE SERVICE REMINDER

NOTE: To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE

REMINDER RESET INDEX . Only vehicles listed in this index have a Service Reminder Indicator (SRI) reset.

2010-16	Maintenance Service Reminder Reset - Procedure 3

MAINTENANCE SERVICE REMINDER > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1

Tip: 2013 Boxster Oil Capacity and Reset

NOTE: A Porsche scan tool is required to perform this procedure. See appropriate tool procedure.

MAINTENANCE SERVICE REMINDER > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1 > PIWIS TESTER 9718

NOTE: If the engine oil is replaced during maintenance work, the service interval must be reset.

1. Start the PIWIS Tester 9718 and follow the instructions on the Tester
2. Select vehicle type, press >> and start the automatic control unit search.
3. Select the Instrument Cluster menu and press >>.
4. Select the Special Functions menu and press >>.
5. Select the Reset Service Interval display menu and press >>.
6. The messages Resetting Service Interval and Function completed successfully appear on the Tester.
7. Quit the menu, shut down the PIWIS Tester and disconnect it from the vehicle.

MAINTENANCE SERVICE REMINDER > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1 > PIWIS TESTER II 9818

NOTE: If the engine oil is replaced during maintenance work, the service interval must be reset.

1. Start the Tester and follow the instructions on the Tester
2. Select Vehicle Type, press F12, and start the automatic control unit search.
3. Select the menu Instrument Cluster, Maintenance/Repairs and press F12 to continue.
4. Select the Reset Service Interval menu and press F12.
5. Select the Model Year and press F12.
6. Select the Unit and press F12.
7. Select GT vehicle and press F12.
8. Check that -> 5. -> 6. and -> 7. are selected and press F12
9. The service interval is reset. Press F12 to exit.
10. Quit the menu, shut down the PIWIS Tester and disconnect it from the vehicle.

MAINTENANCE SERVICE REMINDER > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 2

If the engine oil is replaced during maintenance work, the service interval must be reset.

Standard Service Interval Reset:

1. In the PST2 (Porsche System Tester 2), select Instrument cluster, then press >>.
2. Select the Coding menu, then press >>.
3. Select Reset Service Interval Display menu, then press >>.

> *NOTE: Depending on the country, additional items are checked in the case of the V6 model. These items must be selected on a country-specific basis.*

4. Select Reset menu and confirm with F8.
5. Quit menu, shut down PST and disconnect from vehicle.

Maintenance Calculator Reset:

> *NOTE: All Cayenne V6 engines are factory filled with an engine oil of VW specification "50300". New vehicles produced have their maintenance calculator set for an oil change service interval of 10,000 miles (15,000 km) or 1 year. The maintenance calculator in the Cayenne (V6) determines the time of the engine oil change depending on the vehicle load and driving style, and requests for "Service" via the multi-function display.*

After changing the oil, the oil change service interval must be reset in the instrument cluster using the PST2 (Porsche System Tester 2). The country version for which the new vehicle was produced is stored in the control modules. The PST2 automatically detects this country version before resetting the maintenance calculator and depending on this, offers the following options for oil change service intervals:

1. The country version of the vehicle corresponds to one of the countries listed in Table 1. Depending on the engine oil used for the oil change, the following selection options for oil change service intervals are available in the selection menu of the PST2 for these vehicles, when resetting the maintenance calculator with the PST2:
    1. **1.1** If an engine oil in accordance with the VW specification "50300" was used: The oil change service interval is set in the maintenance calculator for an oil change service interval of up 30,000 km or 2 years, after selecting and confirming this oil quality in the PST2 menu => "Engine oil according to VW spec. "50300".
    2. **1.2** If an engine oil not in accordance with the VW specification "50300" was used: The oil change service interval is set in the maintenance calculator for a fixed oil change service interval of 10,000 miles (15,000 km) or 1 year, after selecting and confirming this oil quality in the PST2 menu => "Engine oil with general Porsche approval".
2. The country version of the vehicle "does not" correspond to one of the countries listed in Table 1. For vehicles having these country versions, all engine oils approved by Porsche may be used which are listed in this bulletin below and Cayenne Technical Information Bulletin, GROUP 1, NO. 4/04 . Even when an engine oil meeting the VW specification "50300" is used, the oil change service interval of 10,000 miles (15,000 km) or 1 year is to be observed.
    1. **2.1** If an engine oil approved by Porsche was used: The oil change service interval is

set for a fixed oil change service interval of 10,000 miles (15,000 km) or 1 year when resetting the maintenance calculator with the PST2.

For more information about the oil change interval for Cayenne V6 and how to reset the "Maintenance Calculator" in the instrument cluster, see CAYENNE (V6) - ENGINE OILS APPROVED BY PORSCHE - OIL CHANGE SERVICE INTERVAL technical service bulletin (GROUP 1, NO. 3/04).

MAINTENANCE SERVICE REMINDER > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 3

NOTE: If the engine oil is replaced during maintenance work, the service interval must be reset.

1. Start the PIWIS Tester II 9818 and follow the instructions on the Tester
2. Select vehicle type and start the PIDT.
3. Select the Instrument Cluster menu and press F12.
4. Select the Maintenance/Repairs menu.
5. Select the Reset Service Interval menu and press F12.
6. Select the maintenance work that was carried out (tick the relevant boxes) and press F12
7. Select the engine variant and start the Reset function by pressing F8. Press F12 to continue.
8. Quit the menu, shut down the PIWIS Tester and disconnect it from the vehicle.

TIMING BELT TENSION REMINDER

NOTE: To determine the appropriate reset procedure, refer to TIMING BELT TENSION REMINDER RESET INDEX . Only vehicles listed in this index have a Timing Belt Tension Indicator Lamp reset.

TIMING BELT TENSION REMINDER RESET INDEX

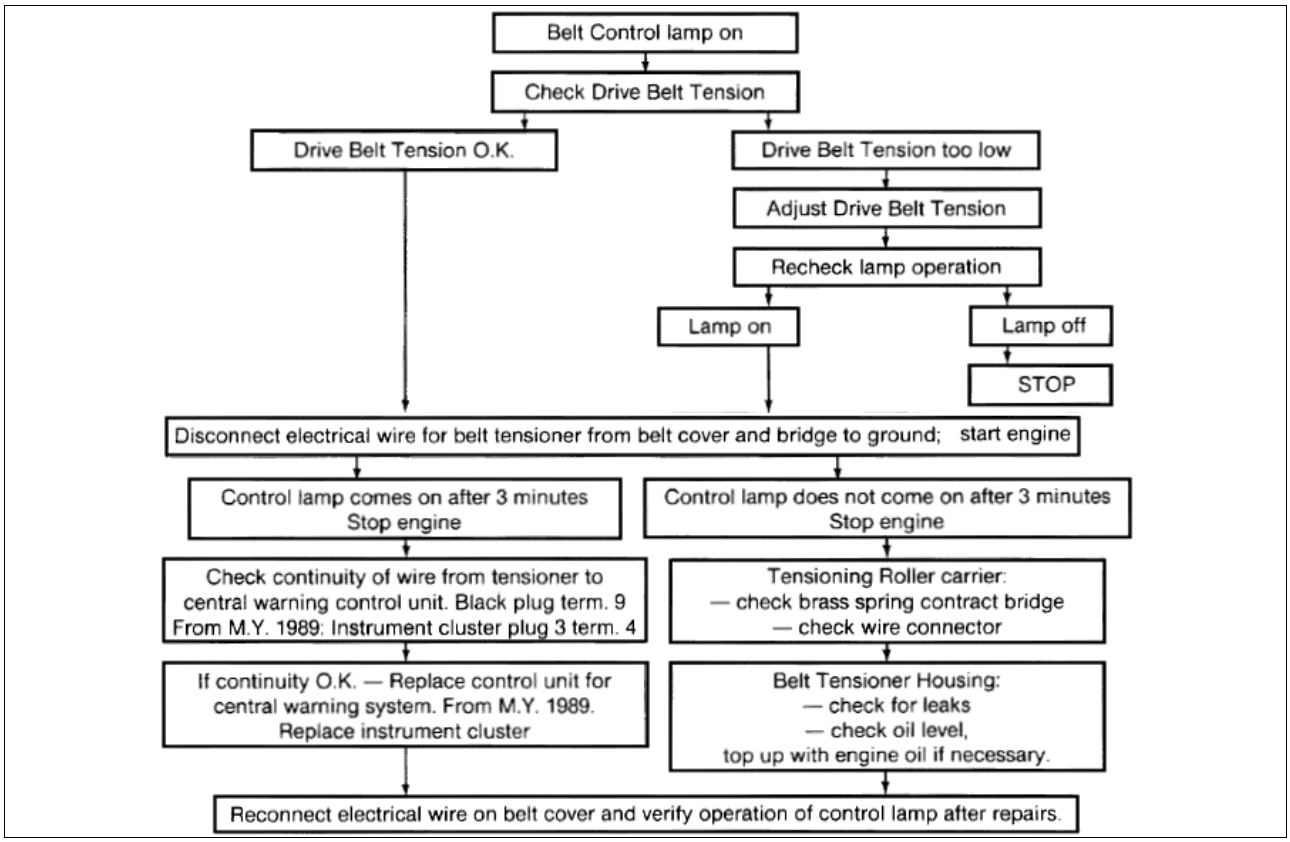
Model & Year	Reset Procedure
928	
1985-95	Timing Belt Tension Reminder Reset - Procedure 1

TIMING BELT TENSION REMINDER > TIMING BELT TENSION REMINDER RESET -

PROCEDURE 1

The engine is equipped with a timing belt tension switch. If the timing belt tension indicator lamp comes on, use Fig 1 as a guide to diagnosis. Lamp will turn off automatically when the correct timing belt tension is restored or electrical problem is corrected.

Fig 1: Diagnosing Timing Belt (Camshaft Drive Belt) Tension Indicator Lamp



Courtesy of PORSCHE OF NORTH AMERICA, INC.

> *NOTE: This information comes from Porsche technical service bulletin No. 9010, Group 1. Publication date of April 12, 1990.*

TIRE PRESSURE MONITOR SYSTEM REMINDER

> *NOTE: To determine the appropriate reset procedure, refer to TPMS REMINDER RESET INDEX . Only vehicles listed in this index have a TPMS reset.*

> *CAUTION: 1st generation TPM wheel electronics are not compatible with 2nd generation TPM wheel electronics. 1st generation is **up to** 2008, and 2nd generation is 2009 and beyond.*

If wheels with wheel electronics from the 1st TPM generation are mounted on a vehicle with a 2nd generation TPM system (or vice versa), the wheel electronics will not be recognized by the TPM system. The TPM system is not active and a corresponding warning is displayed in the multi-function display of the instrument cluster. The wheel electronics will also be stored as defective in the fault memory of the TPM control unit.

Wheel electronics unit (sensor) part numbers are:

- ***2005-07:*** *997.606.021.00 (433 MHz)*
- ***2008:*** *997.606.021.01 (433 MHz)*
- ***2009-:*** *997.606.021.20 (433 MHz)*

TPMS REMINDER RESET INDEX

2006-16	TPMS Reminder Reset - Procedure 3
Boxster	
2006-16	TPMS Reminder Reset - Procedure 3
Cayenne	
2005-10	TPMS Reminder Reset - Procedure 2
2011-16	TPMS Reminder Reset - Procedure 1
Cayman	
2007-16	TPMS Reminder Reset - Procedure 3
Panamera	
2010-16	TPMS Reminder Reset - Procedure 1

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 1

Tire Pressure Monitoring begins to "learn" the wheels after a wheel change, wheel transmitter replacement, a tire pressure adjustment (when a warning message has been displayed), once an update of the tire settings has been performed. During this process, Tire Pressure Monitoring recognizes the wheels and their locations. The message "No monitoring, system is learning" appears on the multi-purpose display. The wheel learning process takes place exclusively when the vehicle is being driven above 16 mph (25 km/h). Tire Pressure Monitoring requires a certain amount of time to learn the wheels.

NOTE: The tire type and size must be updated even if the settings for the new set of

wheels are the same as for the old wheels. If the tire settings are not updated, the message "TIRE CHANGE? UPDATE SETTINGS!" is displayed on the multi-purpose display.

Starting TPMS Learn:

1. Select menu "TIRE PRESSURE", then "ADJUST". Set tire type and tire size (both items must be set). See **Operating Multi-Purpose Display** .
2. The learning process is now started, and will be completed when vehicle is driven. The message "NO MONITORING - SYSTEM LEARNING" is displayed. The current tire pressure will be displayed once the learning phase is complete.

Operating Multi-Purpose Display:

With multi-function steering wheel:

- Selecting menu, function, setting option: Rotary knob (top right button).
- Confirming selection: Press rotary knob.
- Moving back one or several selection levels: Button below rotary knob (middle right button).

Without multi-function steering wheel: (Use the lower lever on the right of the steering column.)

- Selecting menu, function, setting option: Push the lever downwards or upwards.
- Confirming selection: Push the lever forward.
- Moving back one or several selection levels: Pull the lever back (toward rear of vehicle).

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 2

NOTE: If tires have been rotated, tire pressure changed, or a tire pressure sensor or wheel has been replaced, the TPM system must be reset. See Tire Pressure Monitor System Reset . When vehicle is stationary after a tire pressure warning, the display changes to "SELECTION AFTER WARNING" screen. See "Selection After Warning" Reset .

If tire pressures have been adjusted, without being prompted by a TPMS warning indicator, no reset procedure is required. If tire pressures have been adjusted after a TPMS warning indicator display, see "Selection After Warning" Reset .

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 2 > TIRE PRESSURE MONITOR SYSTEM RESET

1. Select menu "TYRE PRESSURE", "SETTINGS, then "TYRES". Set tire type and tire size (both items must be set).

NOTE: The tire type and size must be selected even if the settings for the new set of wheels are the same as for the old wheels.

2. The learning process is now started, and will be completed when vehicle is driven. The message "NO MONITORING - SYSTEM LEARNING" is displayed. The current tire pressure will not be displayed until the learning phase is complete.

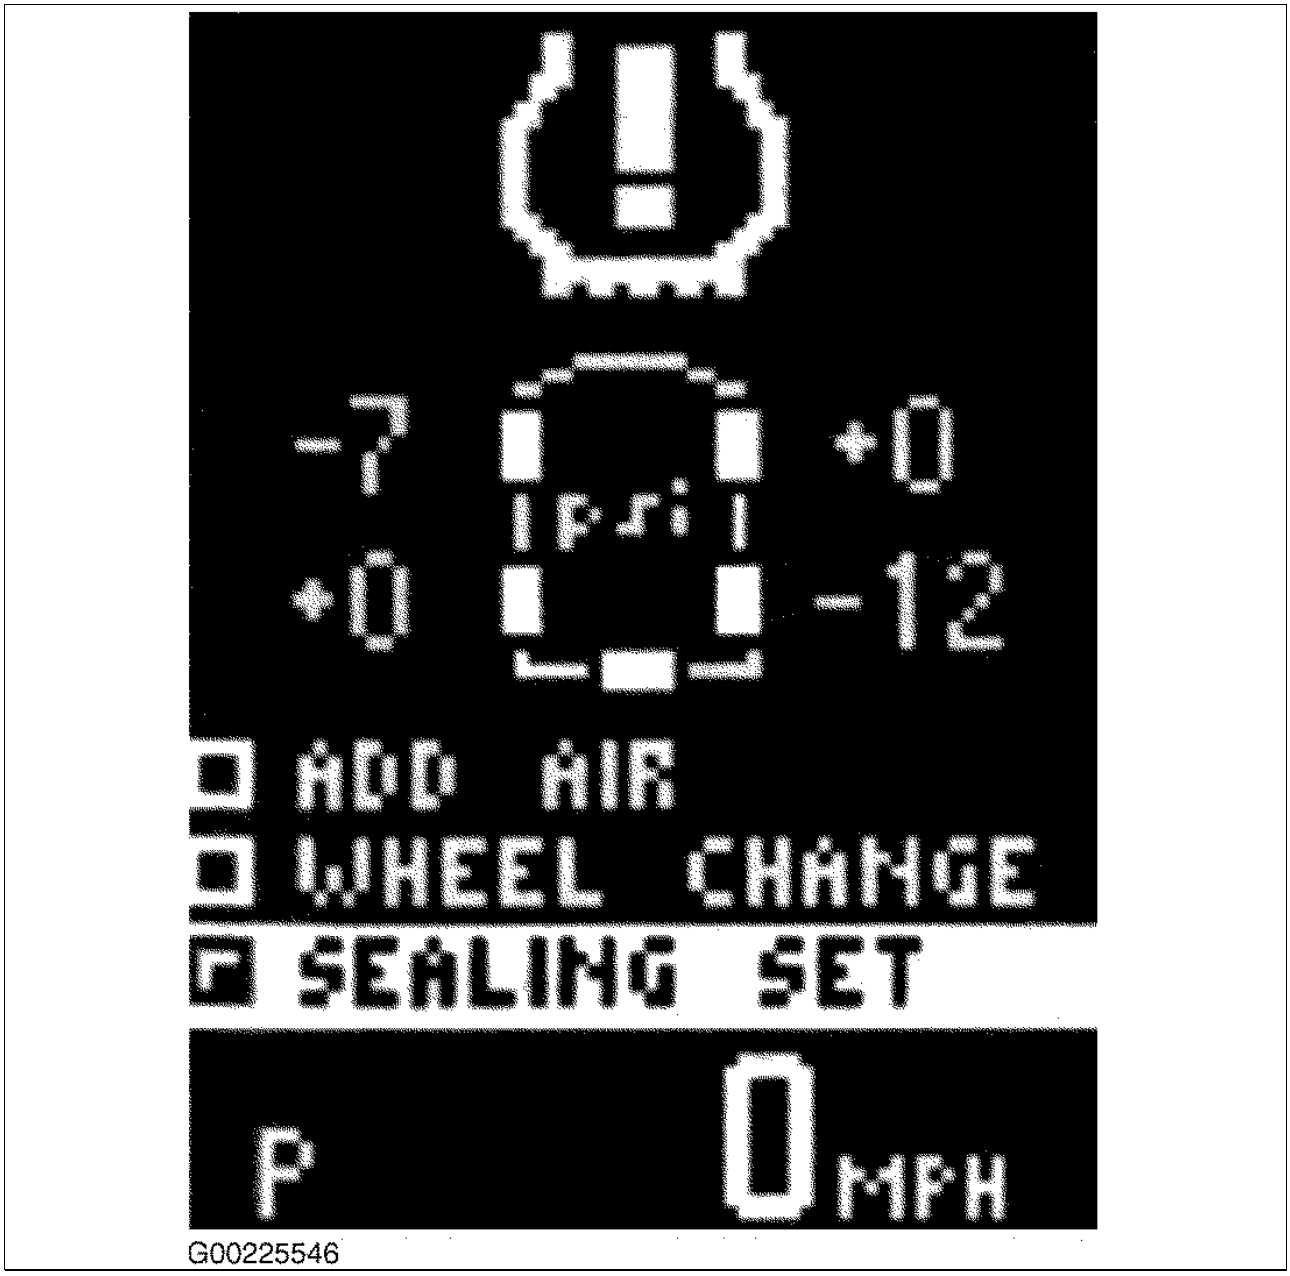
TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 2 > "SELECTION AFTER WARNING" RESET

When the vehicle is stationary after a tire pressure warning, the screen changes to "SELECTION AFTER WARNING". See Fig 1. Choose the appropriate procedure:

- If tire pressure was changed, see Adding Air .
- If a wheel was changed, see Wheel Change .
- If a flat is repaired using tire sealant, see Sealing Set .

NOTE: If a selection is made in the "SELECTION AFTER WARNING" display without performing the appropriate actions, the message "CAUTION - FLAT TYRE - CHECK TYRES" will be displayed.

Fig 1: Identifying TPM System "SELECTION AFTER WARNING" Screen



Courtesy of PORSCHE OF NORTH AMERICA, INC.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 2 > "SELECTION AFTER WARNING" RESET > ADDING AIR

1. After inflating the wheel in question, select "ADD AIR" from "SELECTION AFTER WARNING" menu. The display will return to the basic screen after acknowledgement.
2. If vehicle is driven without selecting "ADD AIR", a "WHEN VEHICLE STOPS: HIT SELECTION" message will be displayed. When vehicle is stopped, perform previous step.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 2 > "SELECTION AFTER WARNING" RESET > WHEEL CHANGE

1. Select "WHEEL CHANGE" from "SELECTION AFTER WARNING" menu. The display will return to "SPARE WHEEL" menu after acknowledgement. Select spare wheel type.
2. If the tire type and size of the new tires have not been set , a "WHEEL CHANGE? CHECK SETTINGS" message will be displayed. When vehicle is stopped, display will return to "SELECTION AFTER WARNING" menu. Perform previous step.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 2 > "SELECTION AFTER WARNING" RESET > SEALING SET

After repairing flat tire with tire sealant, select "SEALING SET". The display will return to the basic screen after acknowledgement. A warning message will display if vehicle speed exceeds 50 mph (80 km/h).

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 3

NOTE: If tire pressures have been adjusted, no reset procedure is required.

NOTE: If tires have been rotated, or a tire pressure sensor or wheel has been replaced, the TPM system must be reset. See procedure below.

Tire Pressure Monitoring begins to "learn" new tire pressure sensors after a wheel change or sensor replacement after updating the tire specification settings. During the Learn process, the TPMS recognizes the wheels and their locations. A "No Monitoring" message appears on the multi-purpose display. The wheel learning process takes place exclusively when the vehicle is being driven above 16 mph (25 km/h). Tire Pressure Monitoring requires a certain amount of time to learn the wheels.

Updating Tire Specification Settings:

NOTE: The on-board computer is operated with the lower left lever on the steering column.

1. Push operating lever forward in order to switch on the selection field.
2. Select "TPC" with the operating lever.
3. Push operating lever forward. The display changes to the Tire pressure menu.
4. Select "Set" with the operating lever.

5. Push the operating lever forward. Select desired tire type: summer or winter.
6. Push operating lever forward. A display for confirming the selected type of tire appears.
7. Select "Continue" and push the operating lever forward.
8. Select the appropriate tire size (18 or 19 inch) and push operating lever forwards. A display for confirming the selected tire size appears.
9. If "Process complete" is displayed, learning mode will be initiated.
10. Drive vehicle above 16 mph (25 km/h) until correct tire pressures are displayed.

NOTE: The message "Process aborted" appears if the setting process is interrupted. All entries made up to this point are lost, and the original settings remain in effect. Only if the message "Process complete" appears after the settings have been made will the tire pressure monitoring re-learn the wheels.

WM 691119 REMOVING AND INSTALLING FRONT THREE-POINT BELT (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

1. Move front seat forward.
2. Disconnect the battery. → 2X00IN GENERAL INFORMATION ON DISCONNECTING THE BATTERY
3. Remove B-pillar trim panel. → 706719 REMOVING AND INSTALLING B-PILLAR TRIM PANEL

WM 691119 REMOVING AND INSTALLING FRONT THREE-POINT BELT (MACAN, MACAN S, MACAN TURBO) > REMOVING FRONT THREE-POINT BELT

WARNING: Incorrect handling of seat-belt pretensioner unit

- *Triggering of seat-belt pretensioner unit*

→ Observe safety regulations for handling seat-belt pretensioner units.

→ Observe disposal regulations for seat-belt pretensioner units.

→ After disconnecting the battery, wait 1 minute before disconnecting the seat-belt pretensioner unit.

→ Remove ignition key and disconnect the battery. Route or insulate the ground strap so that all contact with a ground carrier is avoided. Read and follow work instructions after disconnecting the battery.

→ If removed for an extended period, the seat-belt pretensioner unit must be stored in a safe place.

→ Transport the seat-belt pretensioner unit in such a way that the seat belt can retract safely if it is actuated.

NOTE: Incorrect handling of spring plate on seat belt mount

- *The seat belt must be replaced.*

→ Only bend the spring plate up as far as required to allow you to push the seat belt mount off the mounting pin.

→ The spring plate must be touching the mounting pin during installation with preload.

Information

- Some of the repair illustrations show only one side of the vehicle.
- Naturally, some steps also have to be performed on the opposite side of the vehicle as well.

1. Remove seat belt mount.

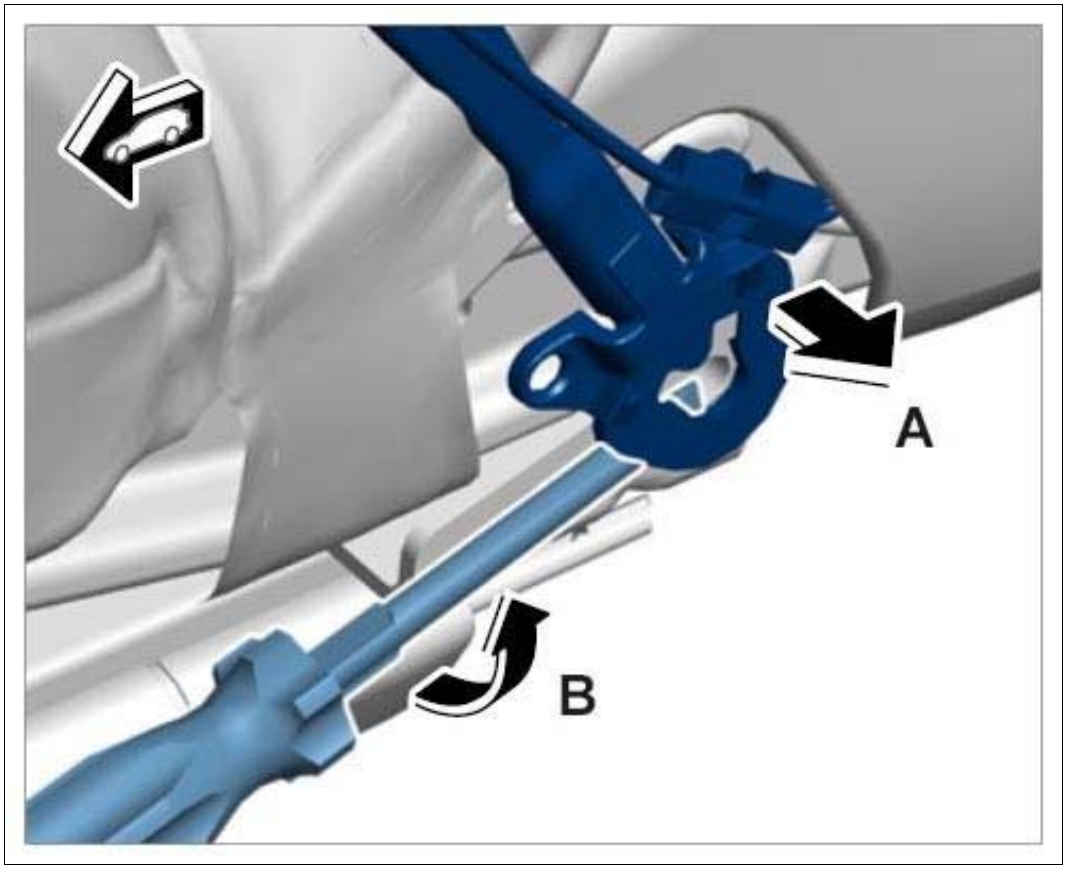
    1. 1.1. Disengage cap **-1-** and slide it over the seat belt mount **-2-** .

       Fig 1: Identifying Seat Belt Mount On Front Seat

       
       Courtesy of PORSCHE CARS NORTH AMERICA, INC.

    2. 1.2. Release retaining clip **-3-** on the seat belt mount using a suitable screwdriver **-arrow A-** .

Fig 2: Releasing Seat Belt Mount

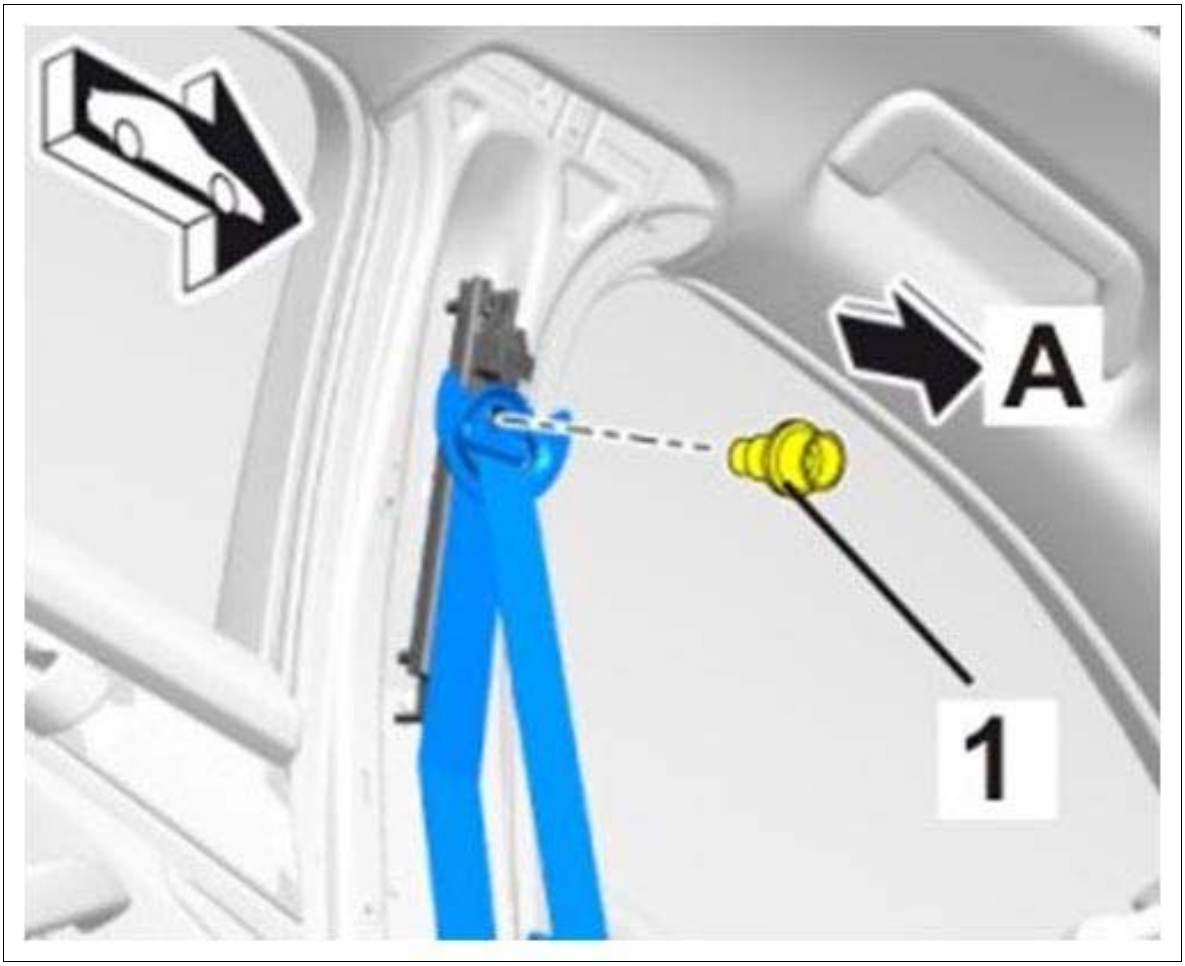


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 1.3. Push seat belt mount over the retaining pin **-arrow B-** until the lug under the retaining pin loosens the clip.
4. 1.4. Remove seat belt mount from the retaining pin.

2. Unscrew fastening screw **-1-** on the top belt fitting and remove it **-A-** .

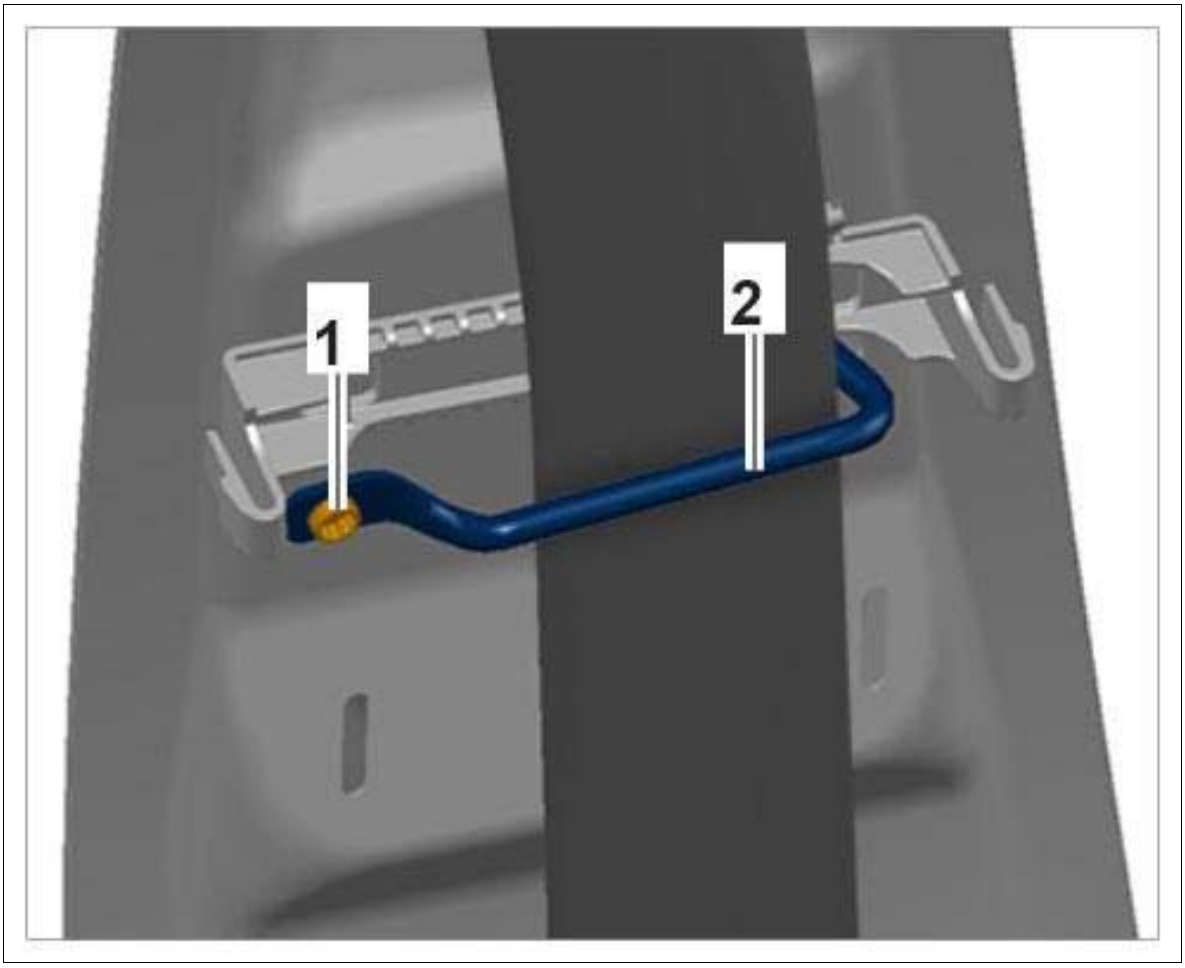
Fig 3: Loosening Belt Fitting From Adjustment Fitting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew fastening screw **-1-** for the belt guide **-2-** from the B-pillar.

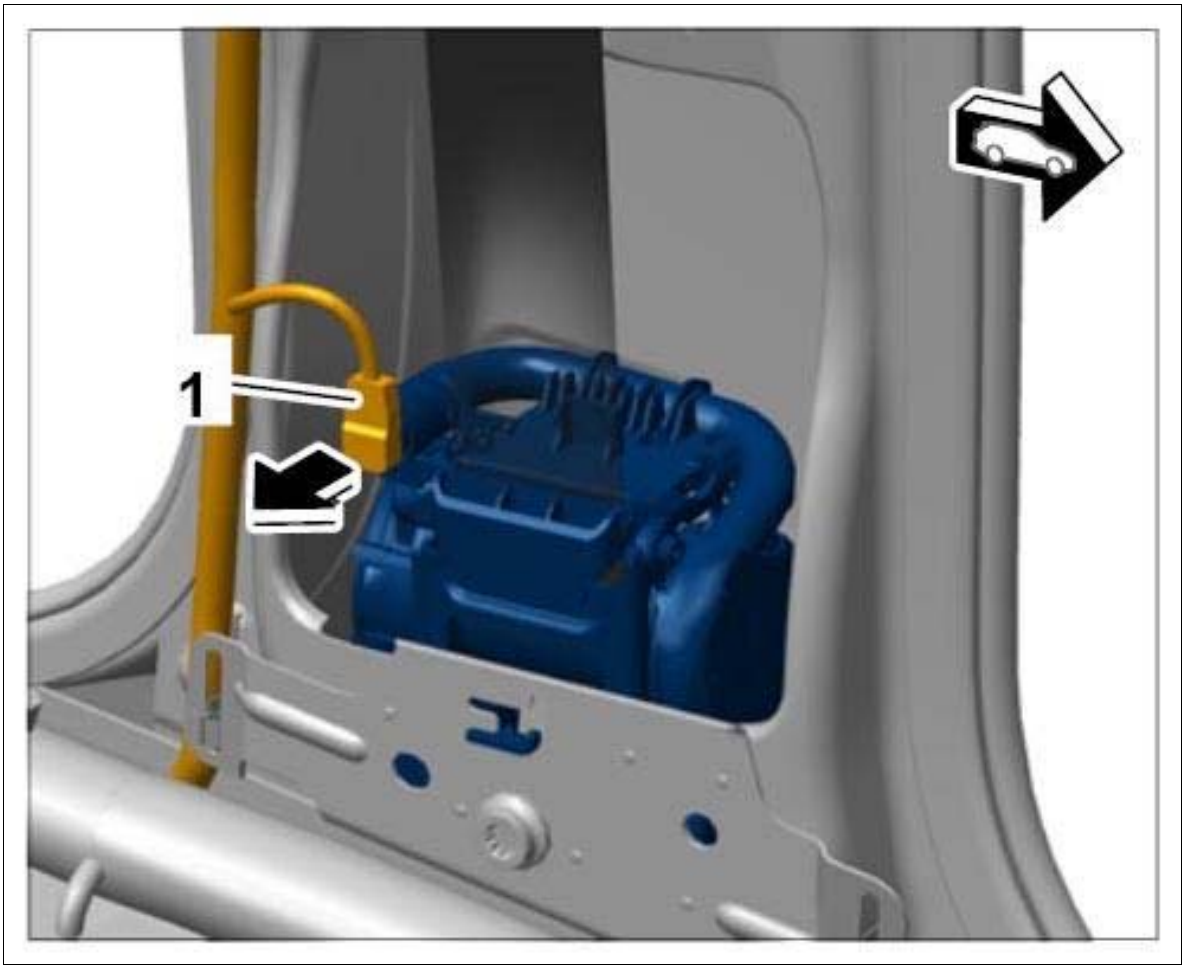
Fig 4: Removing Belt Guide



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Release and disconnect electric plug connection (RoW) **-1-** from seat-belt pretensioner **-arrow-** .

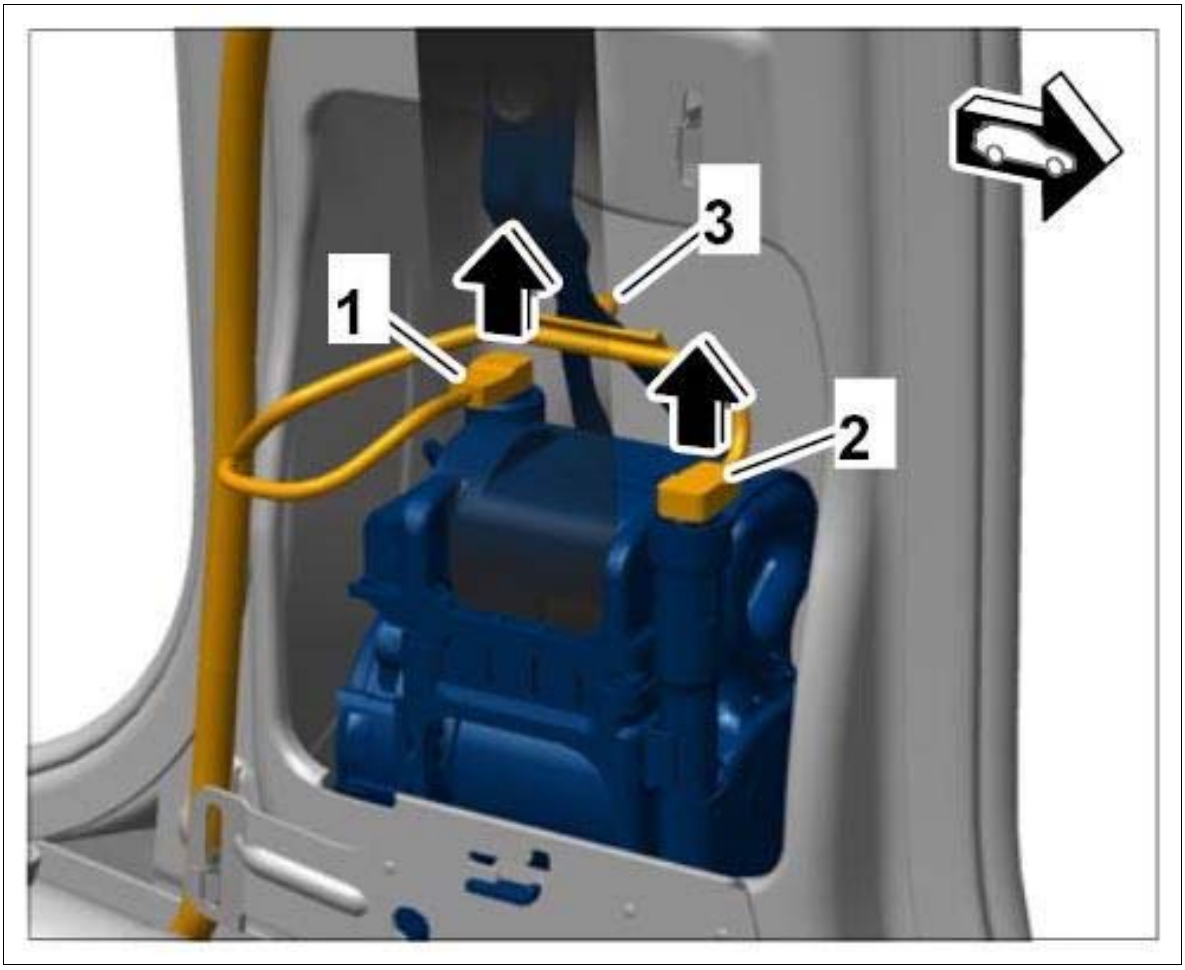
Fig 5: Disconnecting Electric Line From Seat-Belt Pretensioner



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Release and disconnect electric plug connections (USA) **-1 and 2-** from seat-belt pretensioner. Unclip line from fixing clip.

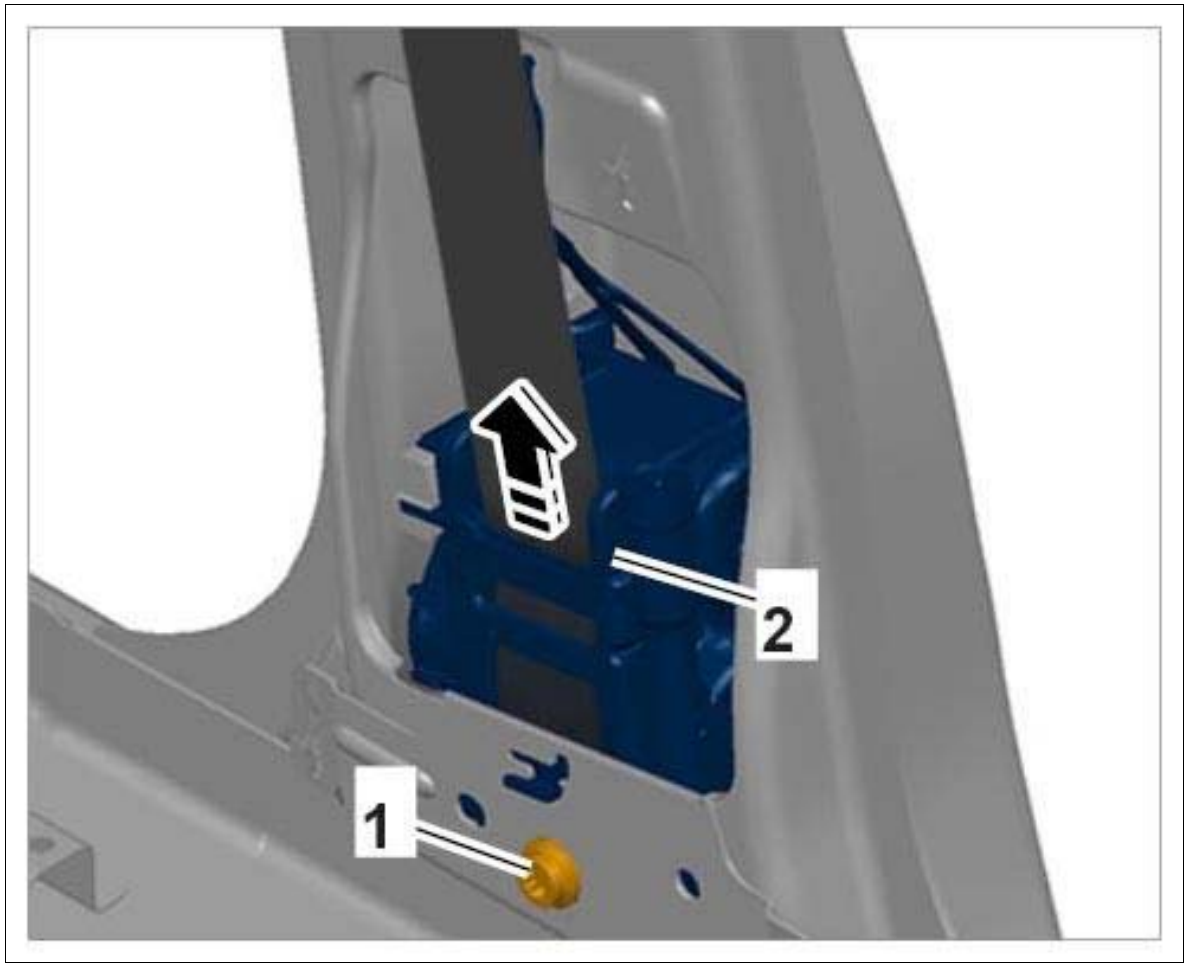
Fig 6: Disconnecting Electric Line From Seat-Belt Pretensioner (USA)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Loosen fastening screw **-1-** and remove seat-belt pretensioner **-2-** in an upward direction **-arrow-** .

Fig 7: Removing Seat-Belt Pretensioner

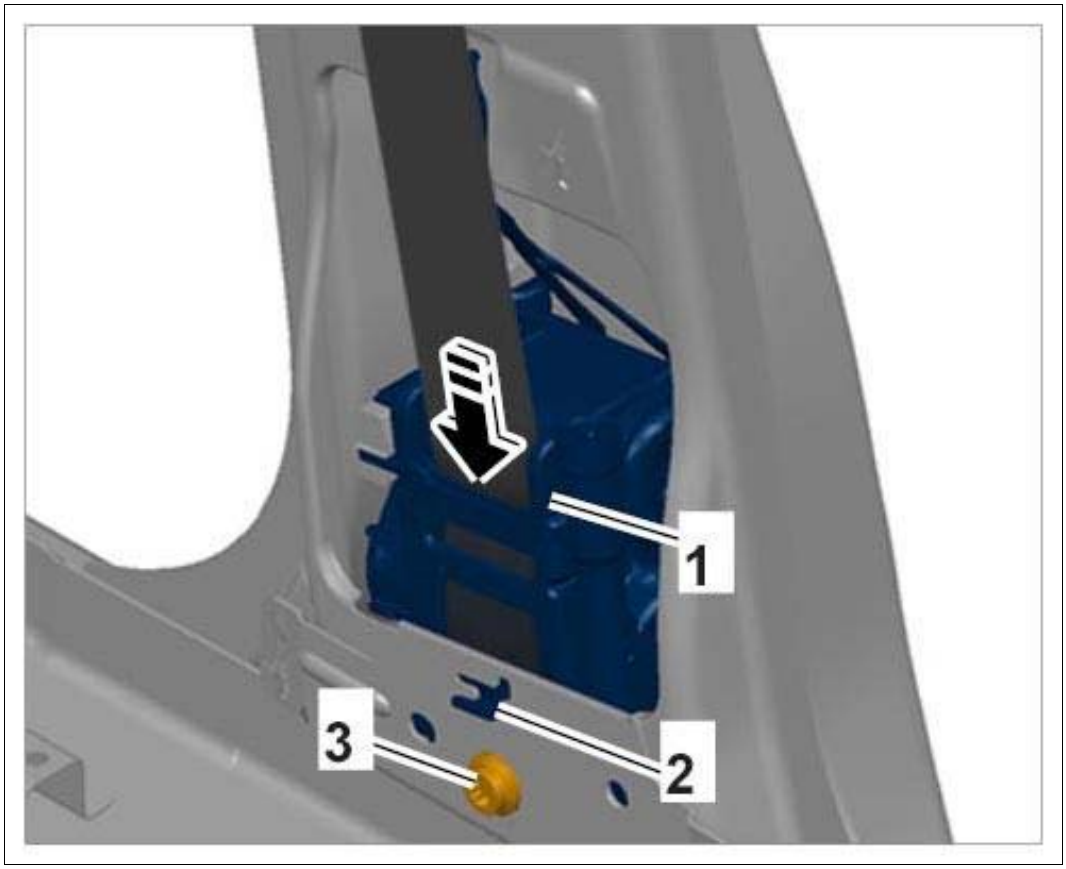


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 691119 REMOVING AND INSTALLING FRONT THREE-POINT BELT (MACAN, MACAN S, MACAN TURBO) > INSTALLING FRONT THREE-POINT BELT

1. Install seat-belt pretensioner.
    1. 1.1. Fit seat-belt pretensioner **-1- (-arrow-)** , making sure that the guide pin is fitted correctly **-2-** .

Fig 1: Installing Seat-Belt Pretensioner



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 1.2. Tighten fastening screw **-3-** until secure **Tightening torque 50 Nm (37 ftlb.)** .

   Information

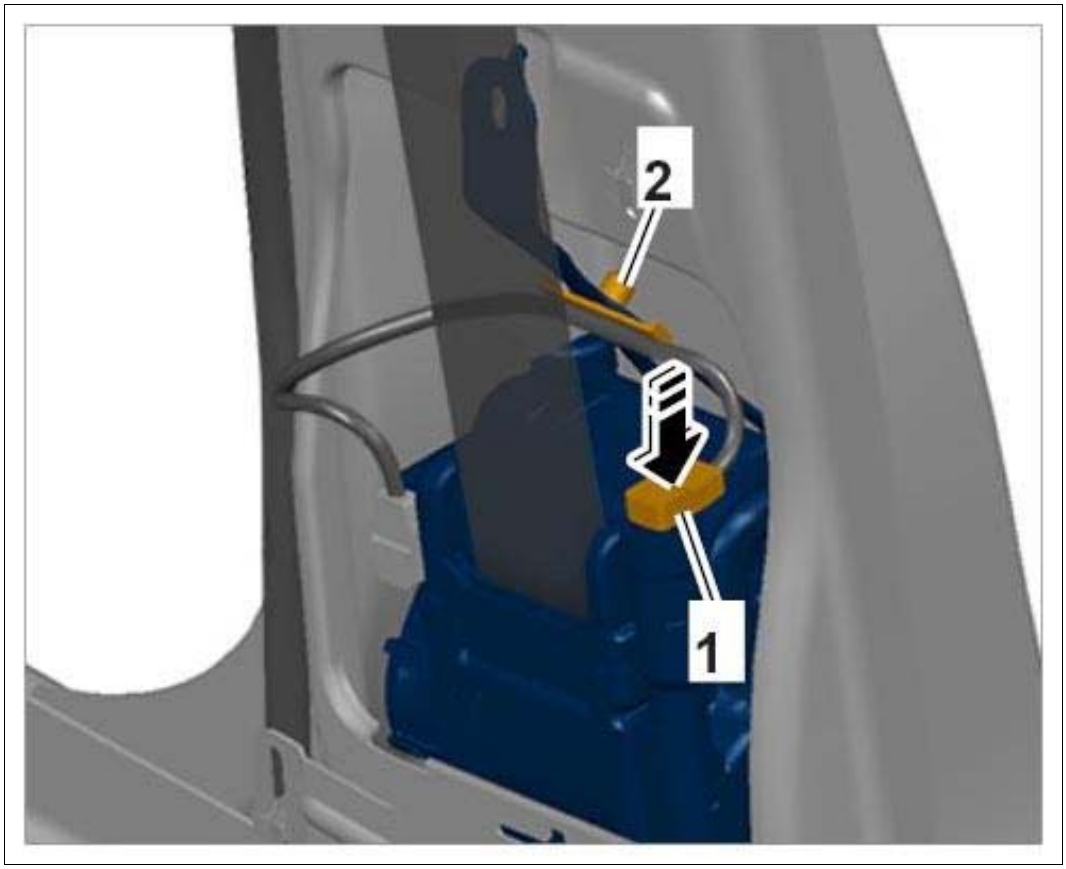
   Always replace the fastening screws on the three-point seat belt. The micro-self-locking screws must not be treated (e.g. greased) or loosened and then screwed on again.

   Information

   When routing the electric lines, make sure that they are not routed through the belt-coiling area.

3. 1.3. Plug in electric plug connection **-1- (-arrow-)** and close the locking mechanism.

Fig 2: Securing Electric Line On Seat-Belt Pretensioner



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

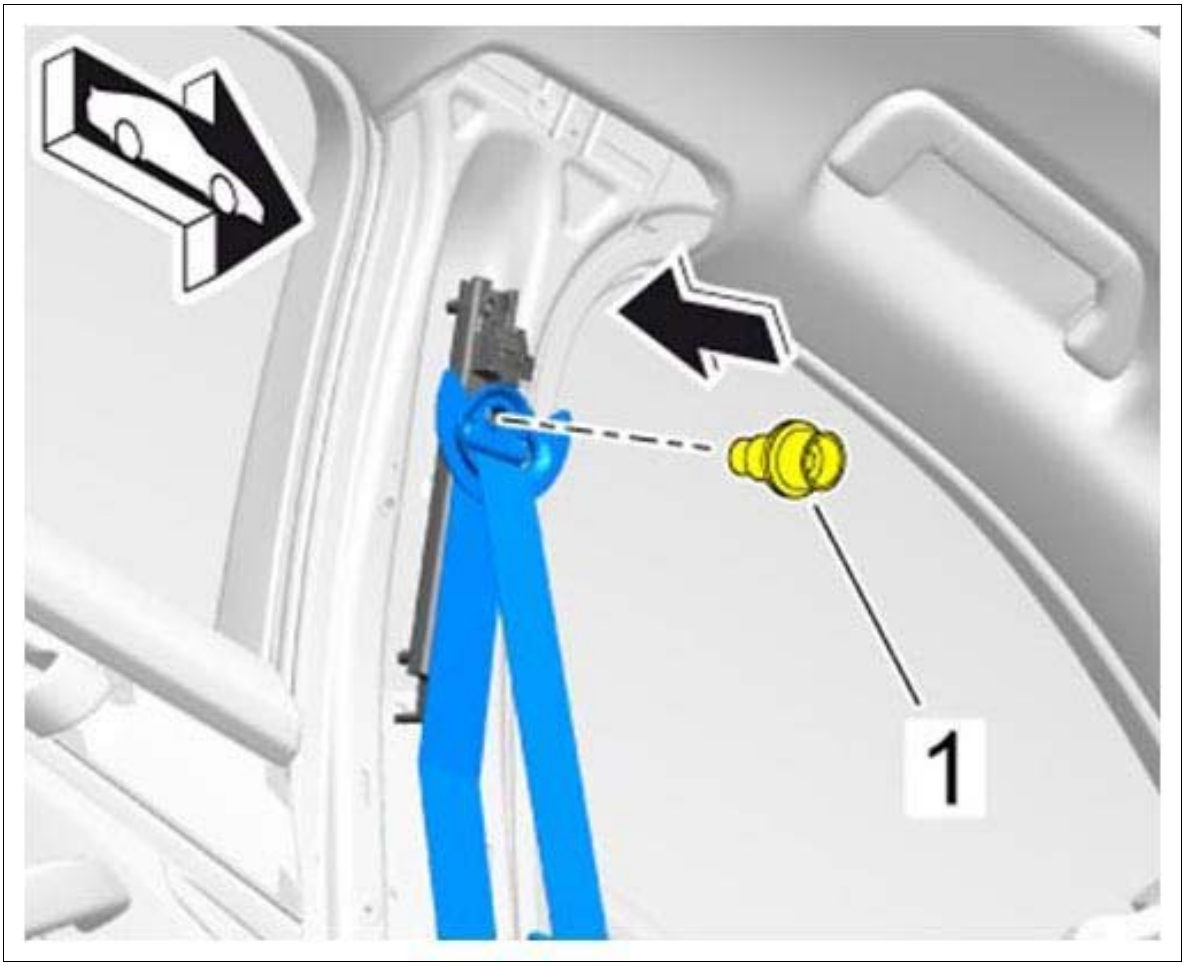
4. 1.4. Secure electric line in the fixing clip **-2-** .

   Information

   Once the fastening screw has been tightened, the belt lug must level out on its own in a vertical position or in the relevant support direction.

2. Tighten fastening screw **-1-** for belt lug on the height adjuster **Tightening torque 50 Nm (37 ftlb.)** .

Fig 3: Securing Sash Guide Cover On Height Adjuster



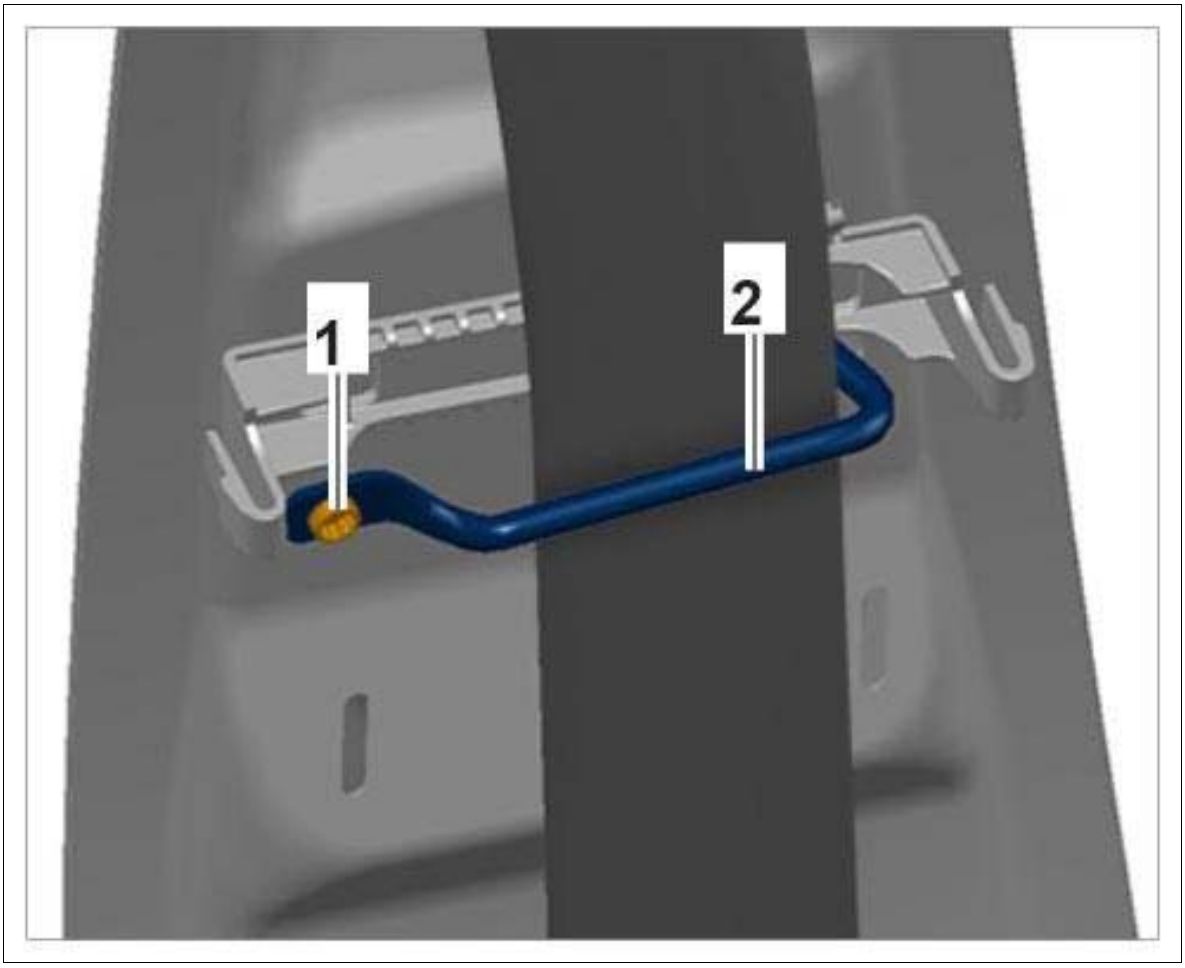
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Do not twist the three-point belt during installation!

3. Tighten fastening screw **-1-** for the belt guide **-2-** at the B-pillar **Tightening torque 4.5 Nm (3 ftlb.)** .

Fig 4: Installing Belt Guide



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Do not twist the three-point belt during installation!

4. Install seat belt mount.

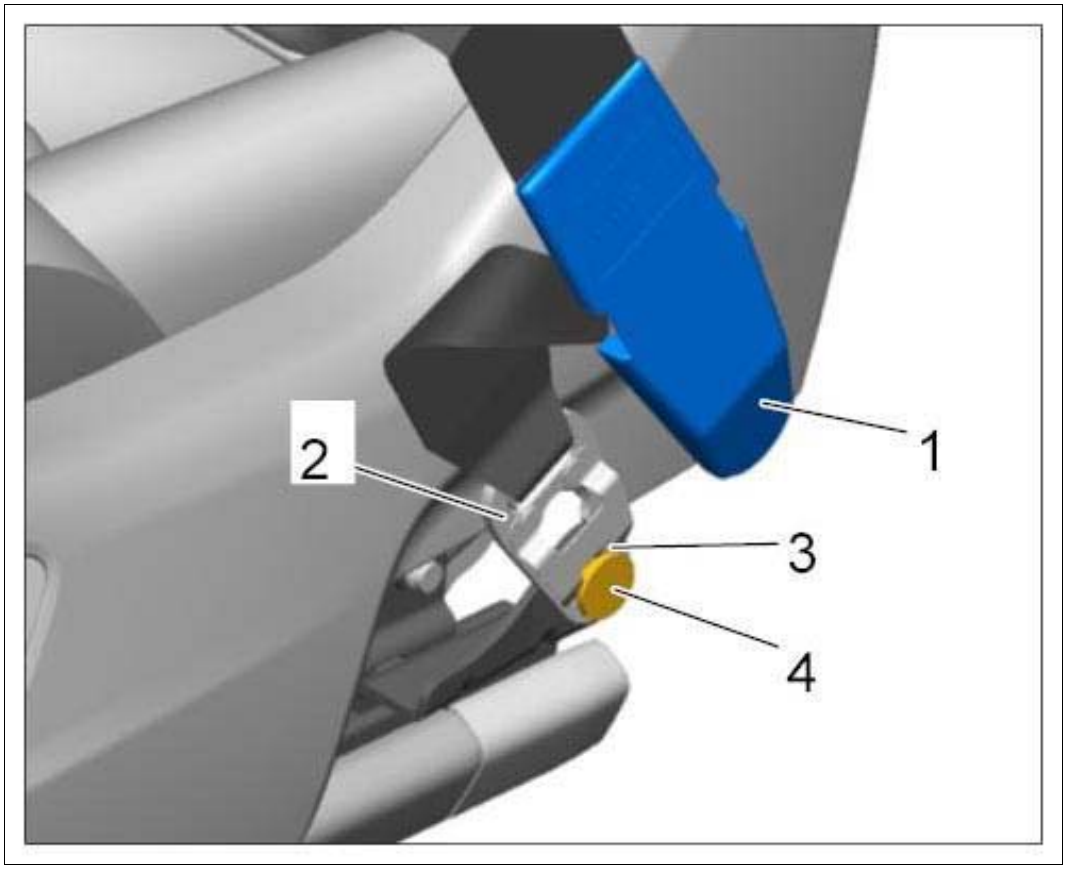
> *NOTE: Incorrect handling of spring plate on seat belt mount*
>
> *1. The seat belt must be replaced.*

→ Only bend the spring plate up as far as required to allow you to push the seat belt mount off the mounting pin.

→ The spring plate must be touching the mounting pin during installation with preload.

1. 4.1. Position seat belt mount **-2-** on the retaining pin **-4-** and pull upward until the retaining clip **-3-** locks with an audible click.

Fig 5: Identifying Seat Belt Mount On Front Seat



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 4.2. Pull on the belt strap. The retaining clip **-3-** must engage fully on the holder.
3. 4.3. Slide the cap **-1-** over the seat belt mount **-2-** and lock it. The label on the seat belt must be pushed into the cap when you slide the cover down.

WM 691119 REMOVING AND INSTALLING FRONT THREE-POINT BELT (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install B-pillar trim panel. → INSTALLING LOWER PART OF B-PILLAR TRIM PANEL .
2. Connect the battery. → 2X00IN GENERAL INFORMATION ON DISCONNECTING THE BATTERY
3. Perform a function test.
    1. The belt strap must be fully rolled up when the function test is started.
    2. Move the seat belt height adjustment to the highest position.
    3. Pull out belt strap completely as far as it will go.
    4. Roll up the belt strap again slowly. An audible clattering noise can be heard when you do this.

5. If the rolling-up process is interrupted, the belt strap cannot be pulled out again (permanent belt blockage).
6. The permanent belt blockage function must switch off at least 100 mm before the belt strap is rolled up fully, thereby ensuring that the belt strap can be pulled out again.

WM 691219 REMOVING AND INSTALLING REAR THREE-POINT BELT (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

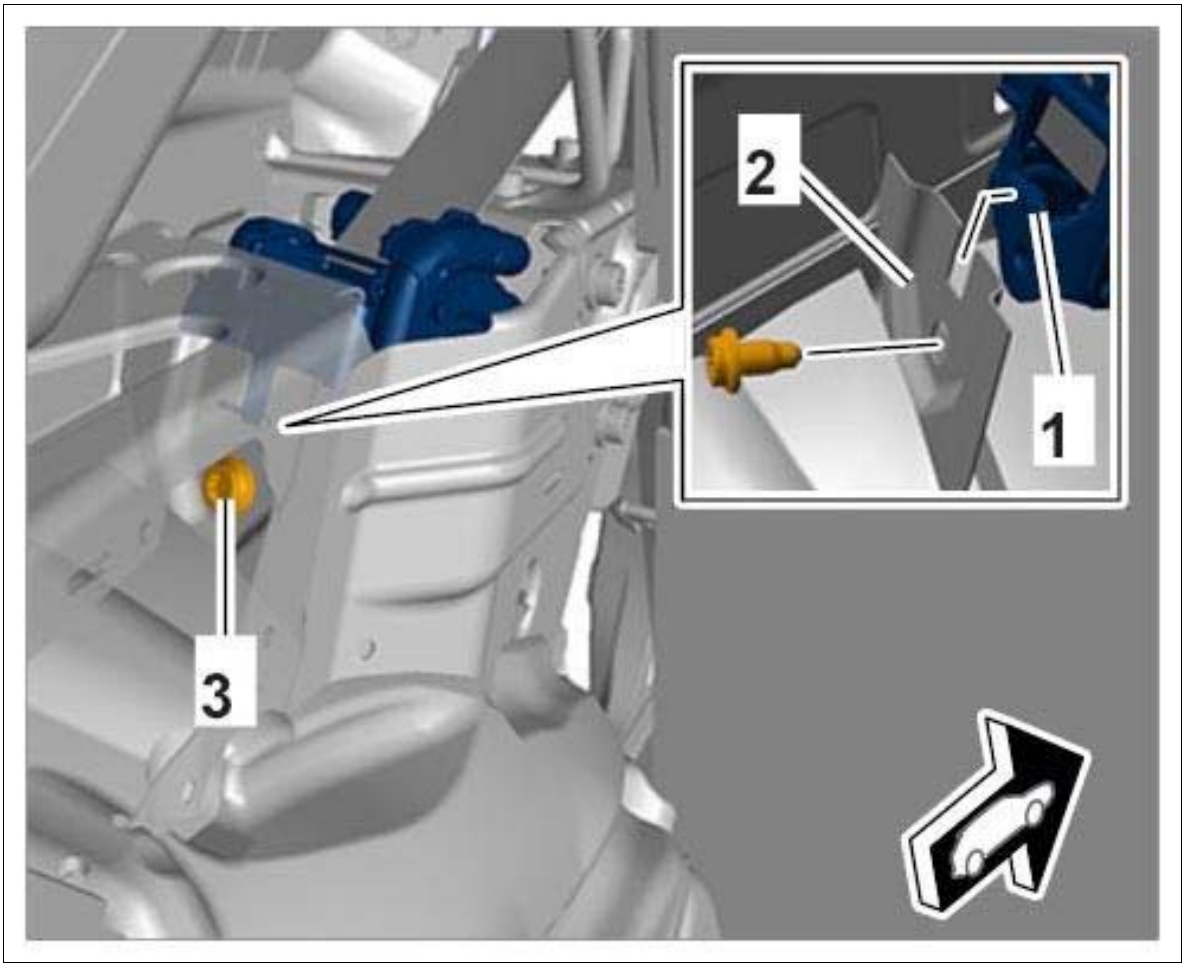
WM 691219 REMOVING AND INSTALLING REAR THREE-POINT BELT (MACAN, MACAN S, MACAN TURBO) > INSTALLING REAR THREE-POINT BELT > INSTALLING REAR THREE-POINT BELT AT THE LEFT AND RIGHT

Information

- Replace fastening screws with new fastening screws before installation.
- Self-locking nuts and screws must always be replaced before installation.

1. Hook seat-belt pretensioner **-1-** into the bodyshell **-2-** and secure with the fastening screw **-3-** (**Tightening torque 50 Nm (37 ftlb.)**).

Fig 1: Installing Seat-Belt Pretensioner



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

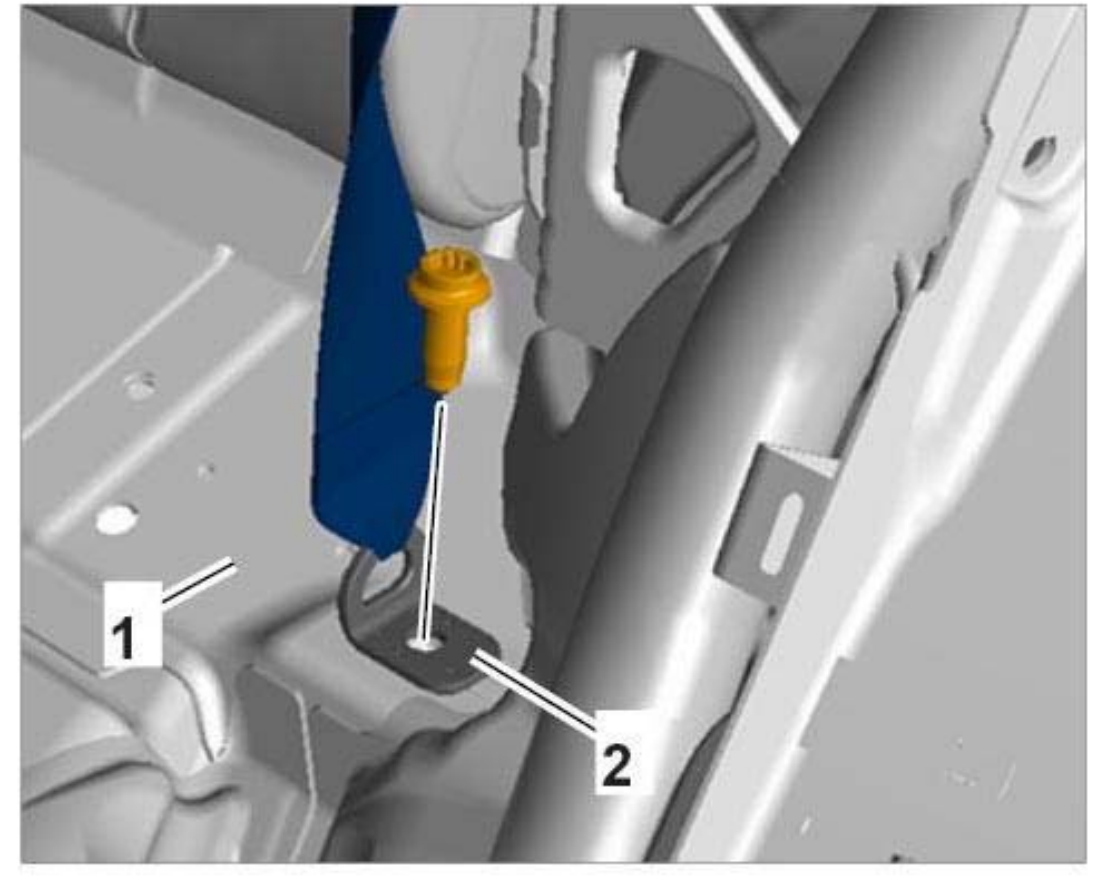
2. Guide seat belt over the belt deflector and secure seat belt mount **-1-** to the body **-2-** (**Tightening torque 50 Nm (37 ftlb.)**).

   Information

   Observe correct installation position for seat belt mount:

   1. Do not install belt twisted.
   2. Twist lock must engage fully in the recess in the bodyshell before being screwed in.
   3. Belt must be facing the center of the vehicle.

Fig 2: Securing Seat Belt Mount



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Connect electric plug connection **-1-** to the seat-belt pretensioner **-2-** .

   Information

   Electric lines must not be routed in the belt roll-up and belt strap area.

    3. Roll up the belt strap again slowly. An audible clattering noise can be heard when you do this.
    4. If the rolling-up process is interrupted, the belt strap cannot be pulled out again (permanent belt blockage).
    5. The permanent belt blockage function must switch off at least 100 mm before the belt strap is rolled up fully, thereby ensuring that the belt strap can be pulled out again.

WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) > GENERAL WARNING NOTES > WARNING NOTE FOR SEAT BELTS

WARNING: Road tests on public roads

- *Danger to other people on the roads*

→ Perform drive tests on a stretch of road with no traffic.

Information

After any accident, the seat belt system must be checked systematically for signs of damage. If damage

is found, the entire seat belt system must be replaced.

WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > PROCEDURE FOR CHECKING SEAT BELTS

Information

After any accident, the seat belt system must be checked systematically for proper function and damage. If damage is found according to the test points, the entire seat belt system must be replaced.

Information

In the case of damage which does not occur as the result of an accident, e.g. wear, only the damaged part needs to be replaced.

Information

The following requirements must be met when fitting the seat belt.

If one of the requirements listed below is not met, the seat belt or seat-belt buckle must be replaced.

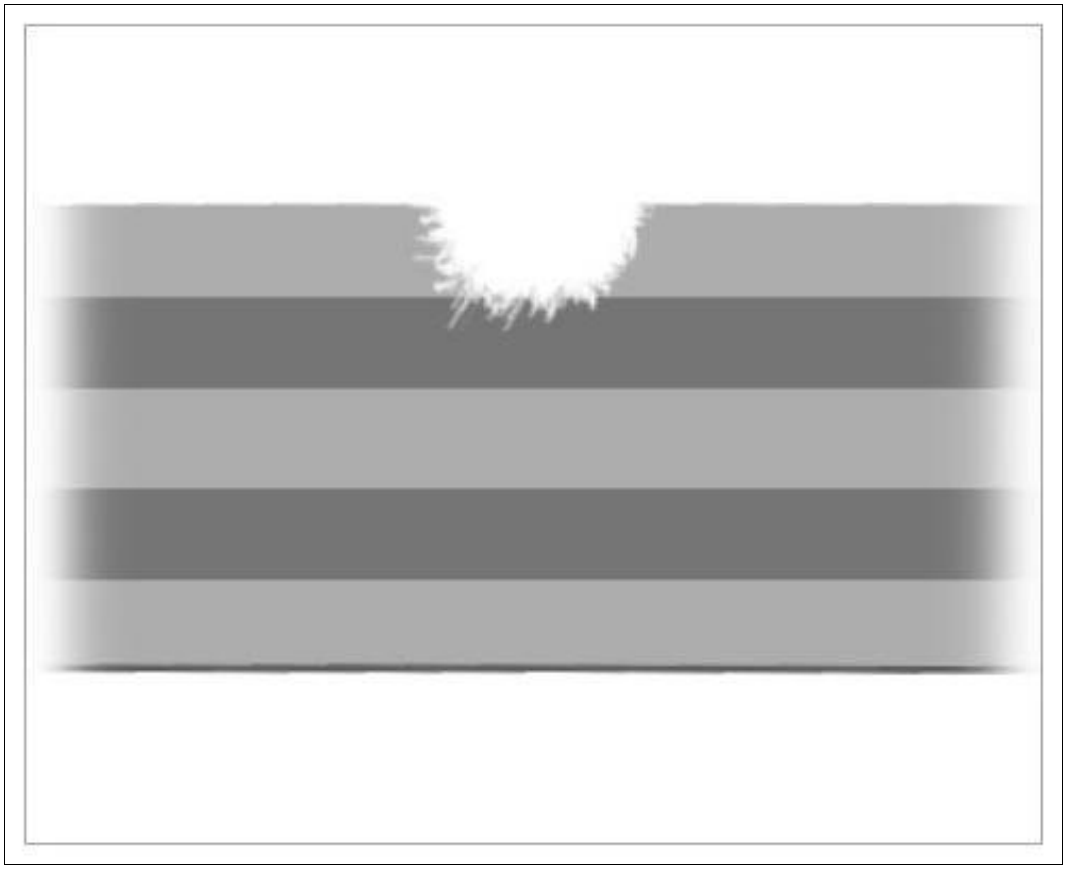
WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > CHECKING BELT STRAP

- Pull the belt strap on the automatic belt device out fully.
- Check the belt strap for soiling. Clean it, if necessary, using mild soap suds. Avoid direct sunshine when drying.

1. **Damage type 1**

    1. 1.1. If one of the damage types shown below **-Damage type 1, 2-** is found on an vehicle involved in an accident, the seat belt and seat-belt buckle must be replaced.

Fig 1: Identifying Seat-Belt Damage Area (Type 1)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. **Damage type 2**

    1. 2.1. If damage such as damage type **-Damage type 1, 2, 3-** is found on a vehicle not involved in an accident, it is sufficient to replace the damaged seat belt.

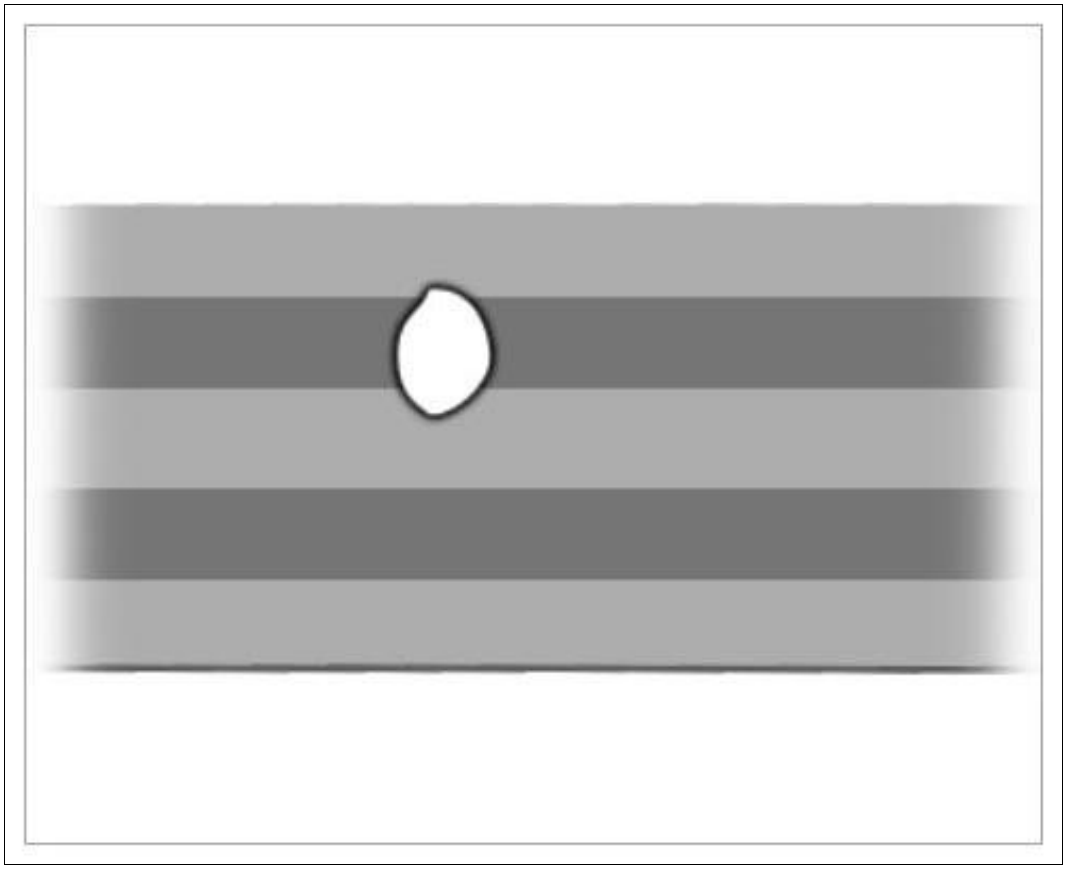
Fig 2: Identifying Seat-Belt Damage Area (Type 2)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. **Damage type 3**

    1. 3.1. Burn hole from cigarettes, for example.

Fig 3: Identifying Seat-Belt Burn Hole Area (Type 3)

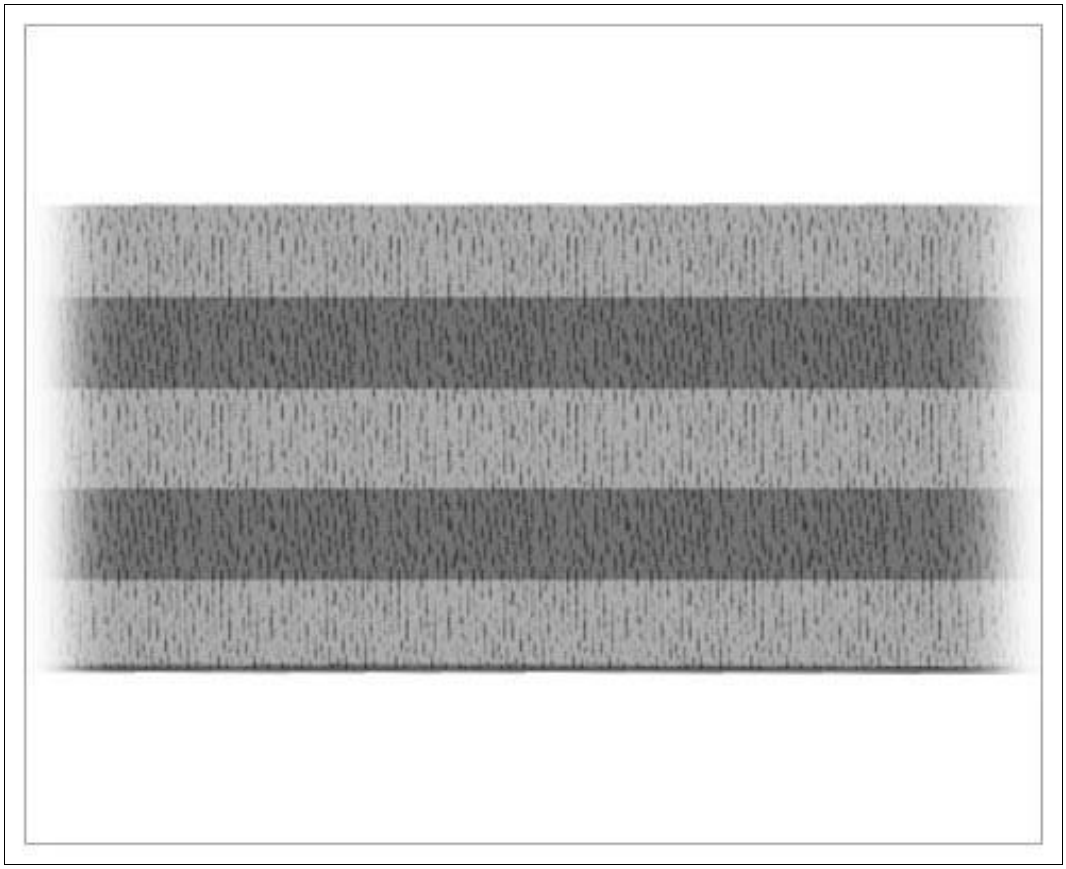


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. **Damage type 4**

    1. 4.1. The seat-belt pretensioner must always be replaced if it has been triggered. The seat belt is damaged by the deflector **-Damage type 4-** .

Fig 4: Identifying Seat-Belt Damage Area (Type 4)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > CHECKING AUTOMATIC BELT DEVICE (LOCKING EFFECT)

The automatic belt device has two locking functions

- The first locking function is triggered by pulling the seat belt out quickly (belt extension acceleration).

WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > CHECKING AUTOMATIC BELT DEVICE (LOCKING EFFECT) > CHECK

- Pull the belt strap out of the automatic belt device with a strong pull.

If no locking effect occurs, the entire seat belt and seat-belt buckle must be replaced.

In the case of faults in the extension or retraction of the seat belt, check whether the locking tab of the automatic belt device is engaged correctly in the sheetmetal bracket on the body.

- The second locking function is triggered by a change in the sequence of vehicle movement (vehicle-dependent locking function).

> *WARNING: Road tests on public roads*
>
> - *Danger to other people on the roads*

→ Perform drive tests on a stretch of road with no traffic.

- Fasten the seat belt.

> *WARNING: Road tests on public roads*
>
> - *Danger to other people on the roads*

→ Perform drive tests on a stretch of road with no traffic.

- Accelerate the vehicle to 20 km/h (12 mph) and then perform an emergency stop by pressing the footbrake.

If the belt is not locked by the blocking mechanism during the braking phase, the entire seat belt and seat-belt buckle must be replaced.

WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > CHECKING LOOK AND OPERATION OF SEAT-BELT BUCKLE

- Inspect the seat-belt buckle for crack formation and flaking.

In the case of damage, the entire seat belt and seat-belt buckle must be replaced.

WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > CHECKING LOOK AND OPERATION OF SEAT-BELT BUCKLE > CHECK SEAT-BELT BUCKLE

- Push the belt latch into the seat-belt buckle until it engages with an audible click. Check whether the lock mechanism has engaged by pulling strongly on the belt strap.

If the belt latch fails to lock in the seat-belt buckle even just once in at least 5 test procedures, the entire seat belt and seat-belt buckle must be replaced.

WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) >

CHECKING SEAT BELTS > CHECKING LOOK AND OPERATION OF SEAT-BELT BUCKLE > CHECK SEAT-BELT BUCKLE RELEASE

- Release the seat belt by pressing your finger on the button on the seat-belt buckle.

Carry out the test procedure at least 5 times. If the belt latch fails to jump out even just once, the entire seat belt and seat-belt buckle must be replaced.

Information

Lubricants must never be used to eliminate noises or stiffness of the buttons on the seat-belt buckles.

WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > CHECKING SASH GUIDE COVERS

Plastic-coated covers show fine, parallel scores after the belt system has been subjected to stress (seat belt buckled during accident). On the other hand, wear caused by frequent use is indicated by a stripe-free, smooth surface.

- Check the sash guide covers for distortion, flaking and crack formation.

In the event of scoring and/or damage, the entire seat belt and seat-belt buckle must be replaced.

WM 691301 CHECKING SEAT BELTS (MACAN, MACAN S, MACAN TURBO) > CHECKING SEAT BELTS > CHECKING MOUNTING PARTS AND FASTENING POINTS

- Check the belt buckle strap for distortion.
- Check the function of the height adjuster.
- Check fastening points (seat, B-pillar, C-pillar, vehicle floor) for distortion or thread damage.

If the parts are damaged, the entire seat belt and seat-belt buckle must be replaced.

Replace damaged or distorted fastening points.

WM 692419 REMOVING AND INSTALLING FRONT BELT LOCK (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2

WM 693619 REMOVING AND INSTALLING ADJUSTMENT FITTING (MACAN, MACAN S, MACAN TURBO) > REMOVING ADJUSTMENT FITTING

Information

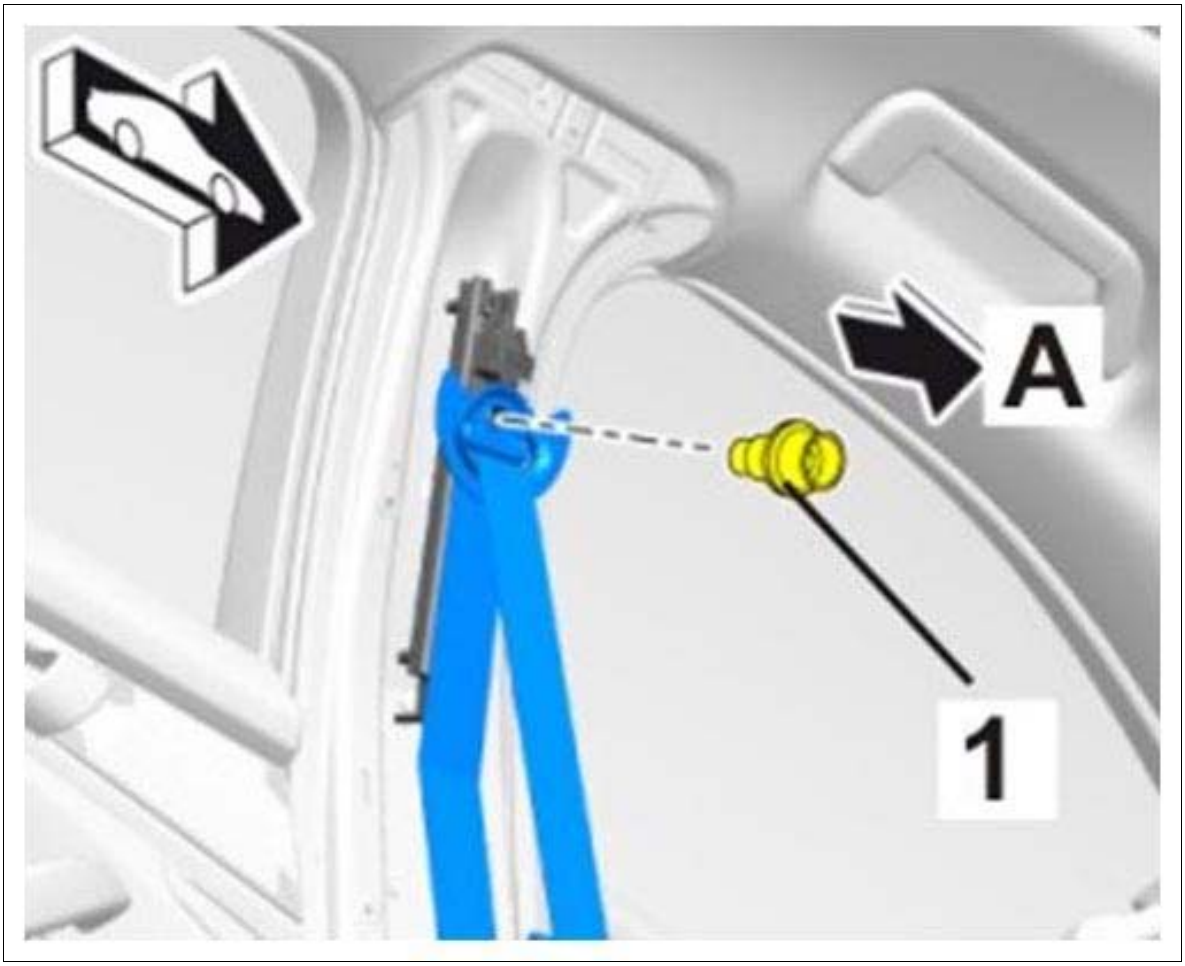
After any accident, the seat belt system must be checked systematically for signs of damage. If damage is found, the entire seat belt system must be replaced.

Information

- Some of the repair illustrations show only one side of the vehicle.
- Naturally, some steps also have to be performed on the opposite side of the vehicle as well.

1. Unscrew fastening screw **-1-** on sash guide cover and remove sash guide cover **-A-** .

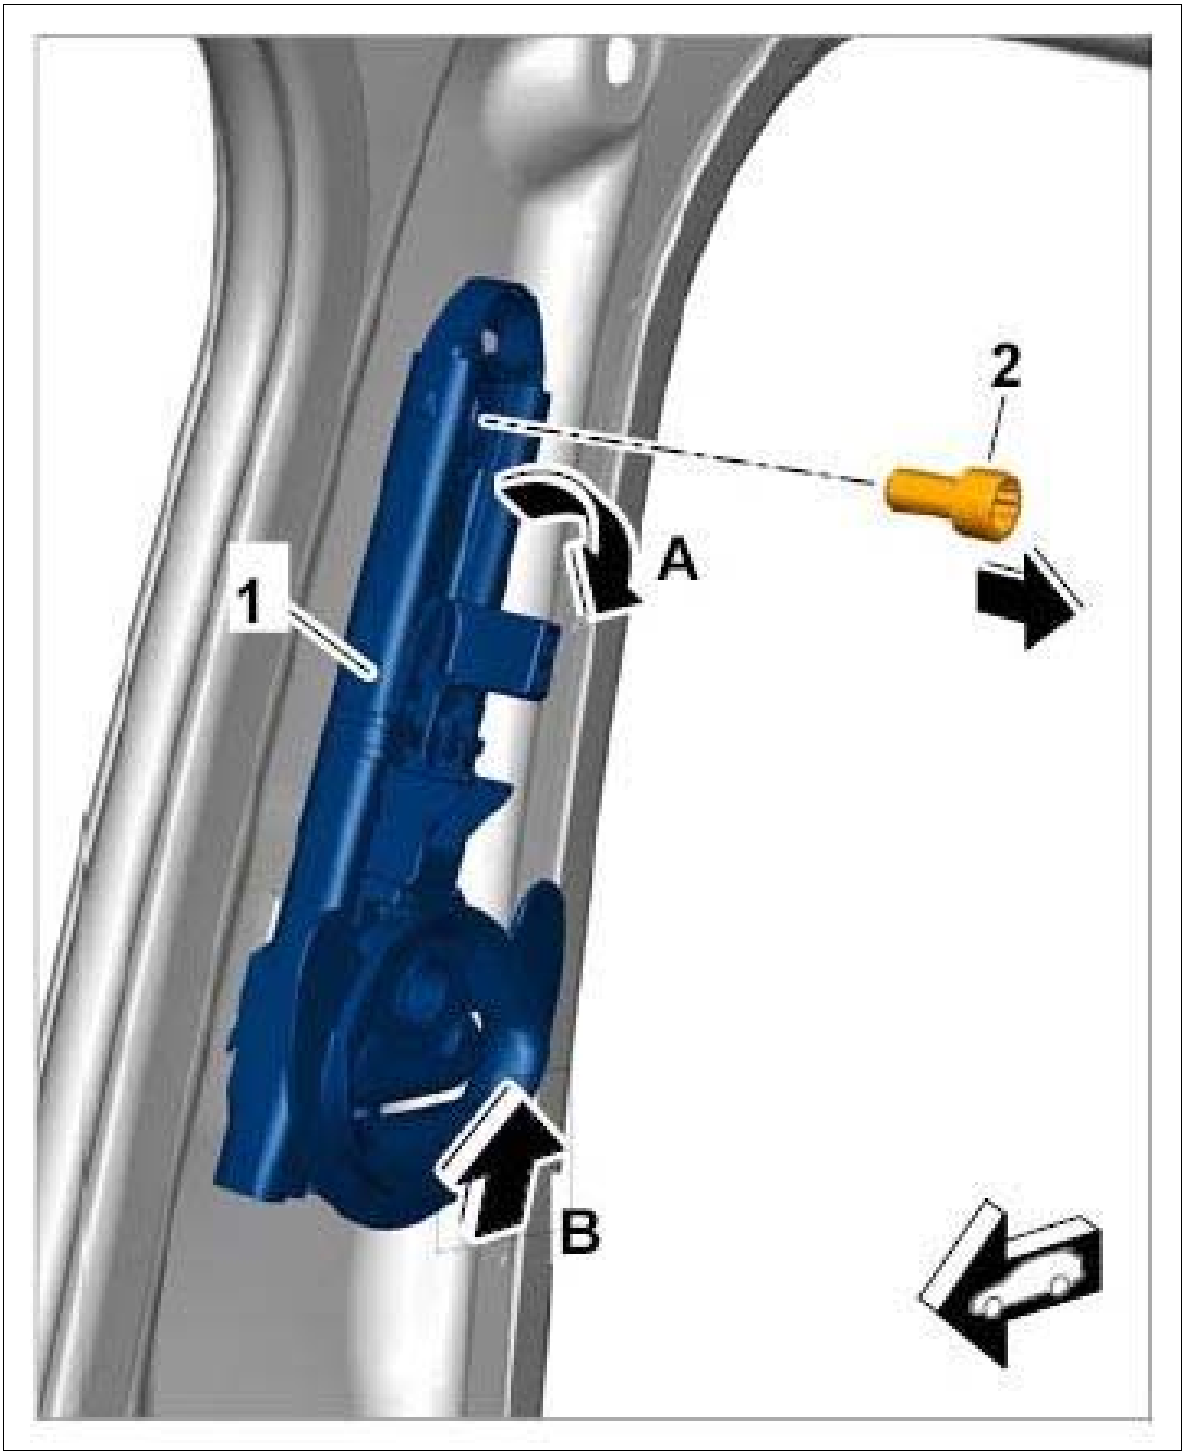
Fig 1: Removing Sash Guide Cover



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Position adjustment fitting **-1-** so that the fastening screw **-2-** is accessible.

Fig 2: Removing Adjustment Fitting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew the fastening screw **-2-** .

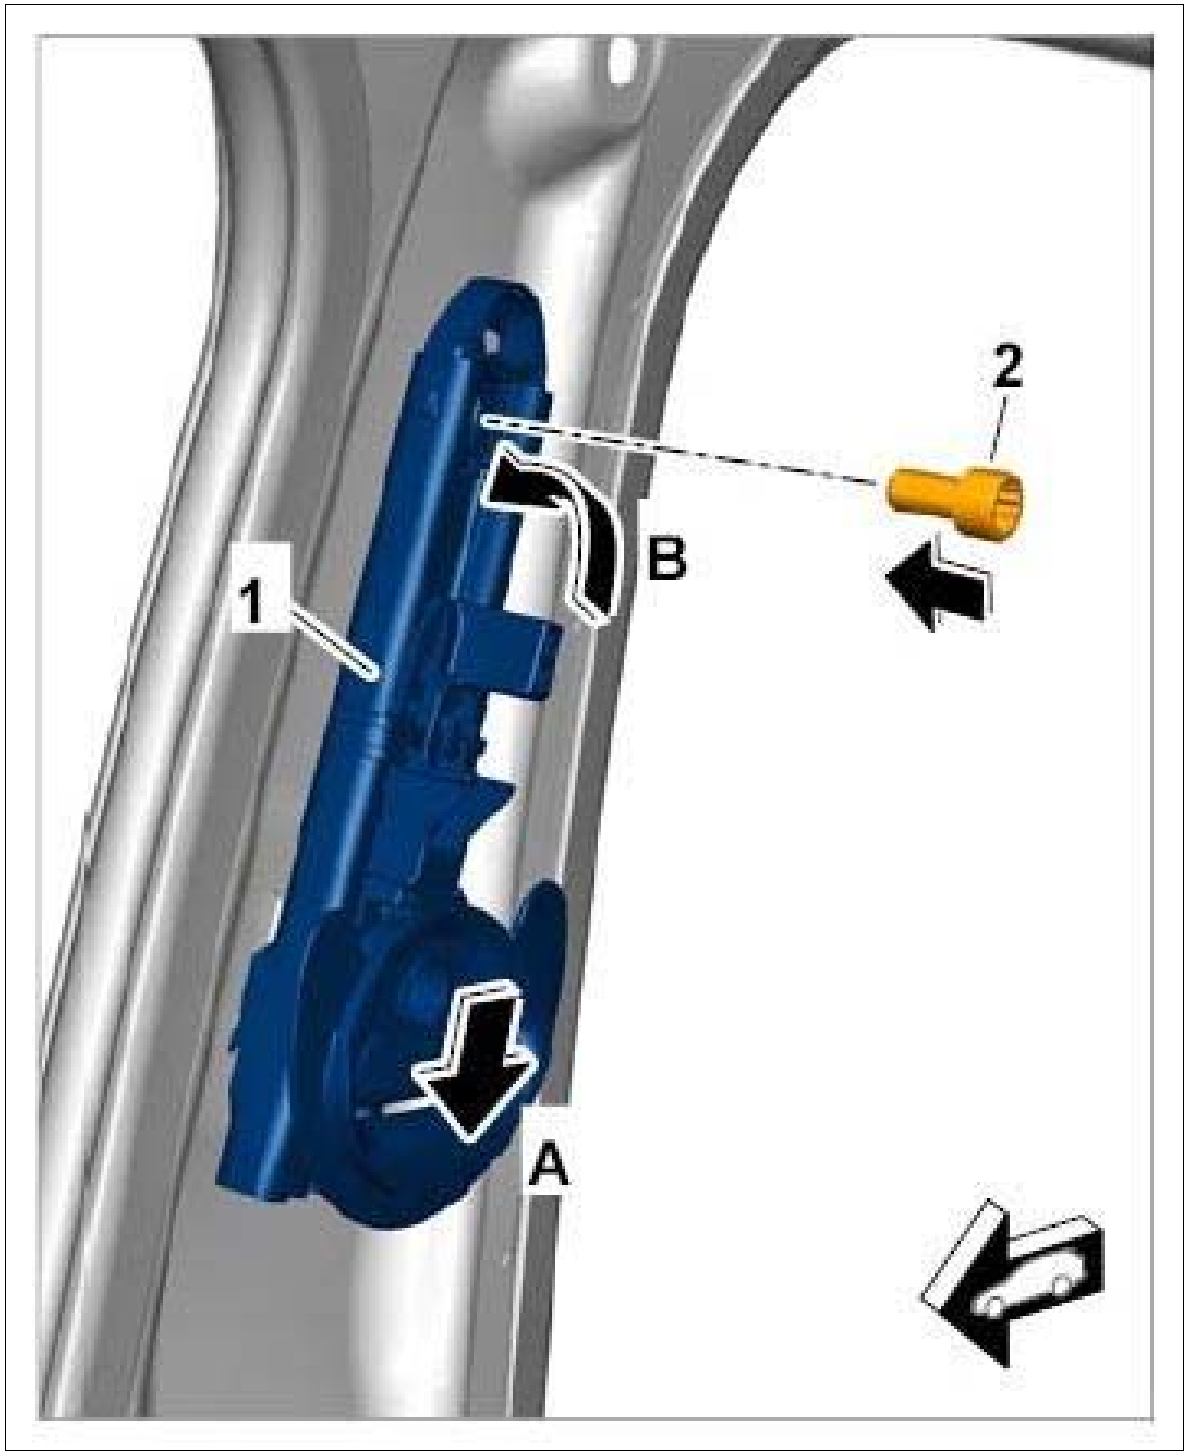
4. Fold adjustment fitting inwards **-arrow A-** and remove by pulling it upwards **-arrow B-** .

WM 693619 REMOVING AND INSTALLING ADJUSTMENT FITTING (MACAN, MACAN

S, MACAN TURBO) > INSTALLING ADJUSTMENT FITTING

1. Engage adjustment fitting **-1-** at the bottom **-arrow A-** and fold it up towards the B-pillar **-arrow B-** .

   Fig 1: Installing Adjustment Fitting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Tighten fastening screw **-2-** until secure **Tightening torque 20 Nm (15 ftlb.)** .

   Information

Always replace the fastening screws on the three-point seat belt. The micro-self-locking screws must not be treated (e.g. greased) or loosened and then screwed on again.

3. Tightening fastening screw **-1-** on sash guide cover at the adjustment fitting **Tightening torque 50 Nm (37 ftlb.)** .

   Information

   Once the fastening screw has been tightened, the belt lug must level out on its own in a vertical position or in the relevant support direction.

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

NOTE: Voltage peaks

- *Risk of damage to electrical load or to the control unit*

Information

- Some of the repair illustrations show only one side of the vehicle.
- Naturally, some steps also have to be performed on the opposite side of the vehicle as well.

1. Unscrew fastening screw **-1-** and remove sensor **-B-** .
2. Guide airbag sensor out of the lock carrier.
3. Release electric plug connection **-a-** and disconnect it **-A-** .

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

Information

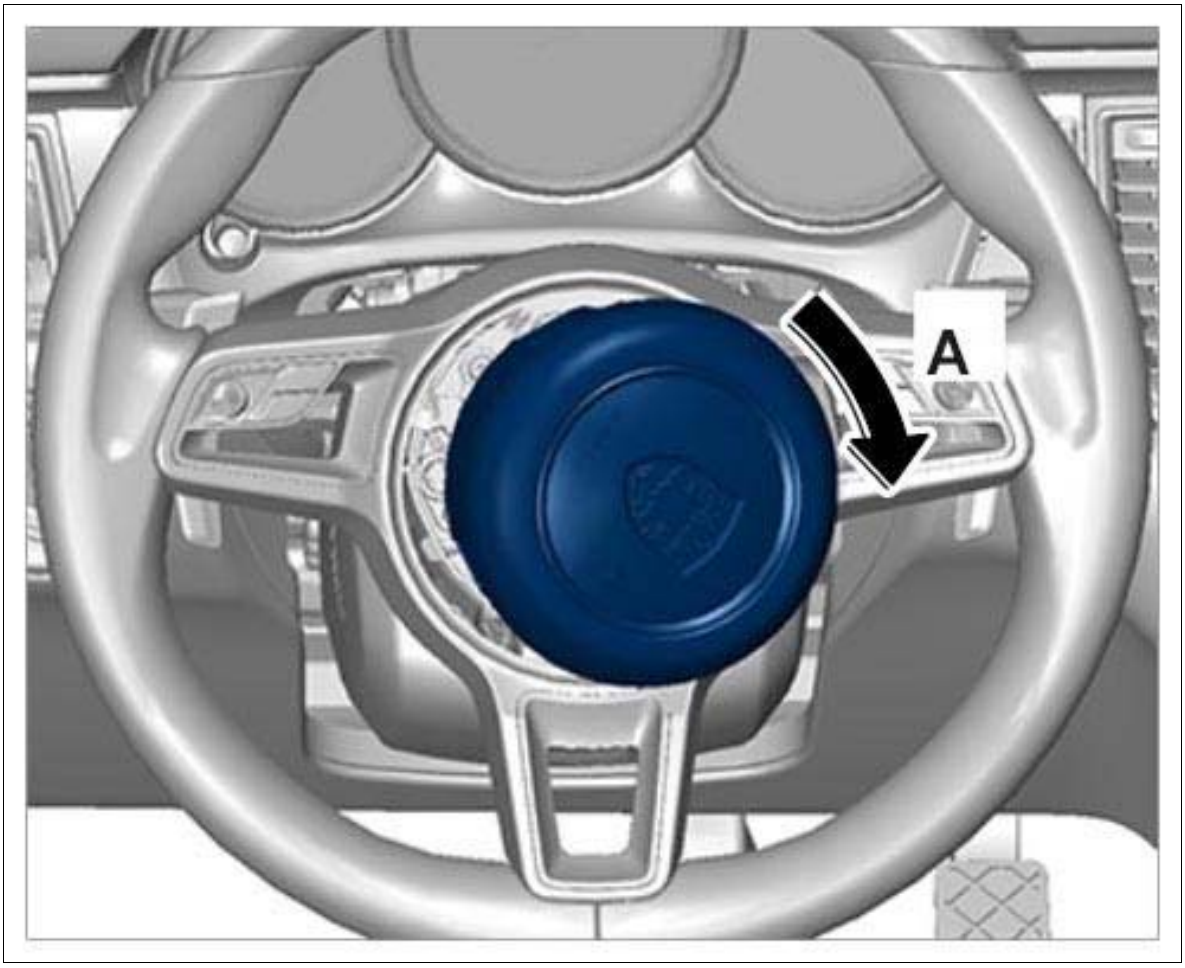
Before installing the airbag unit, check to see whether the locking clip, the airbag unit mounting and/or the metal stop on the steering wheel are bent. Replace the damaged component if it is deformed. Only fit an airbag unit that has a perfectly functioning locking clip at the correct position. The locking clip must not jam or become hooked.

1. Turn the airbag unit approx. 120-180° clockwise **-A-** to make it easier to plug the steering wheel wire harness into the airbag.

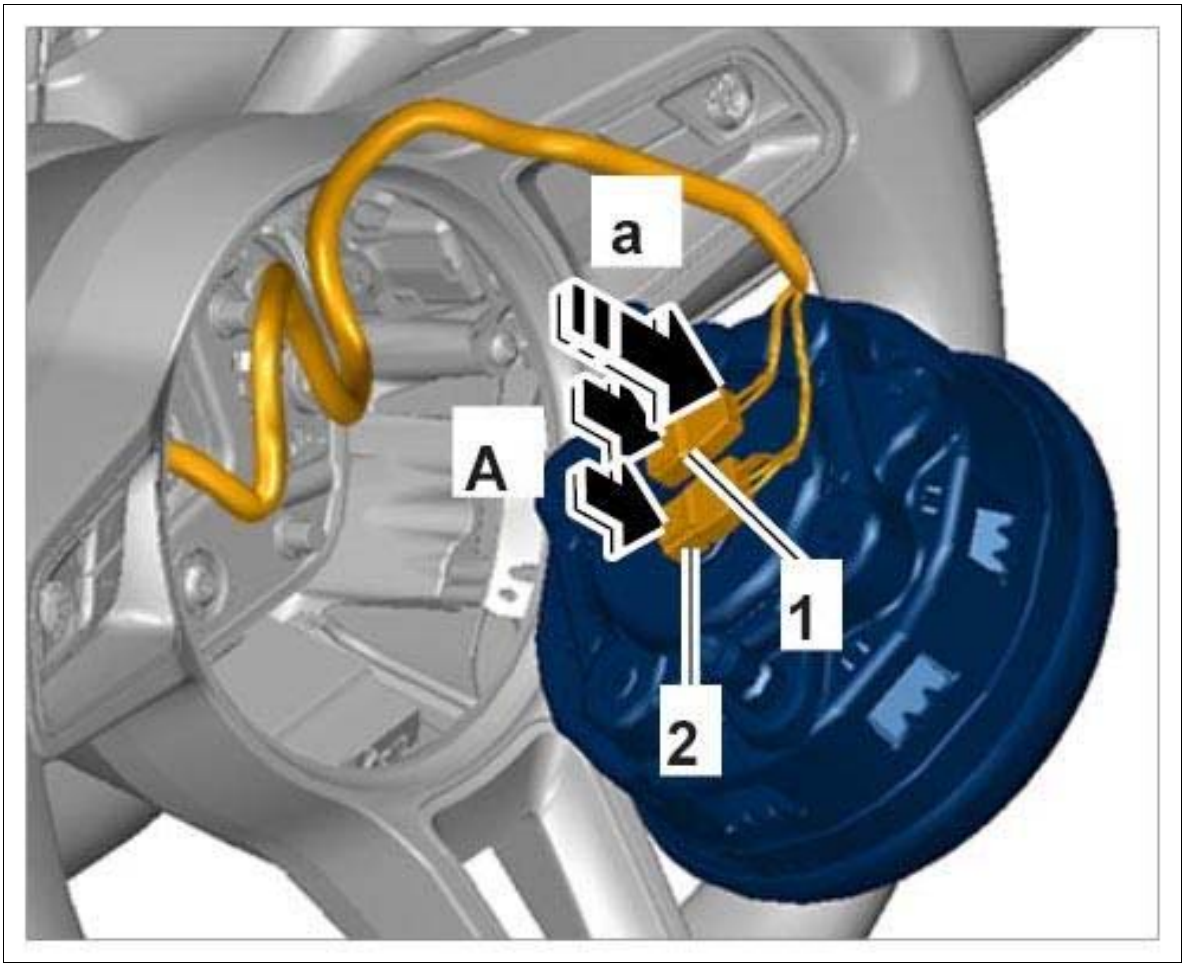
Fig 1: Turning Airbag Unit Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Plug in electric plug connections **-1, 2- (-a-)** and lock them by turning the locking mechanism in direction of arrow **-A-** . Check color coding of the plug connections.

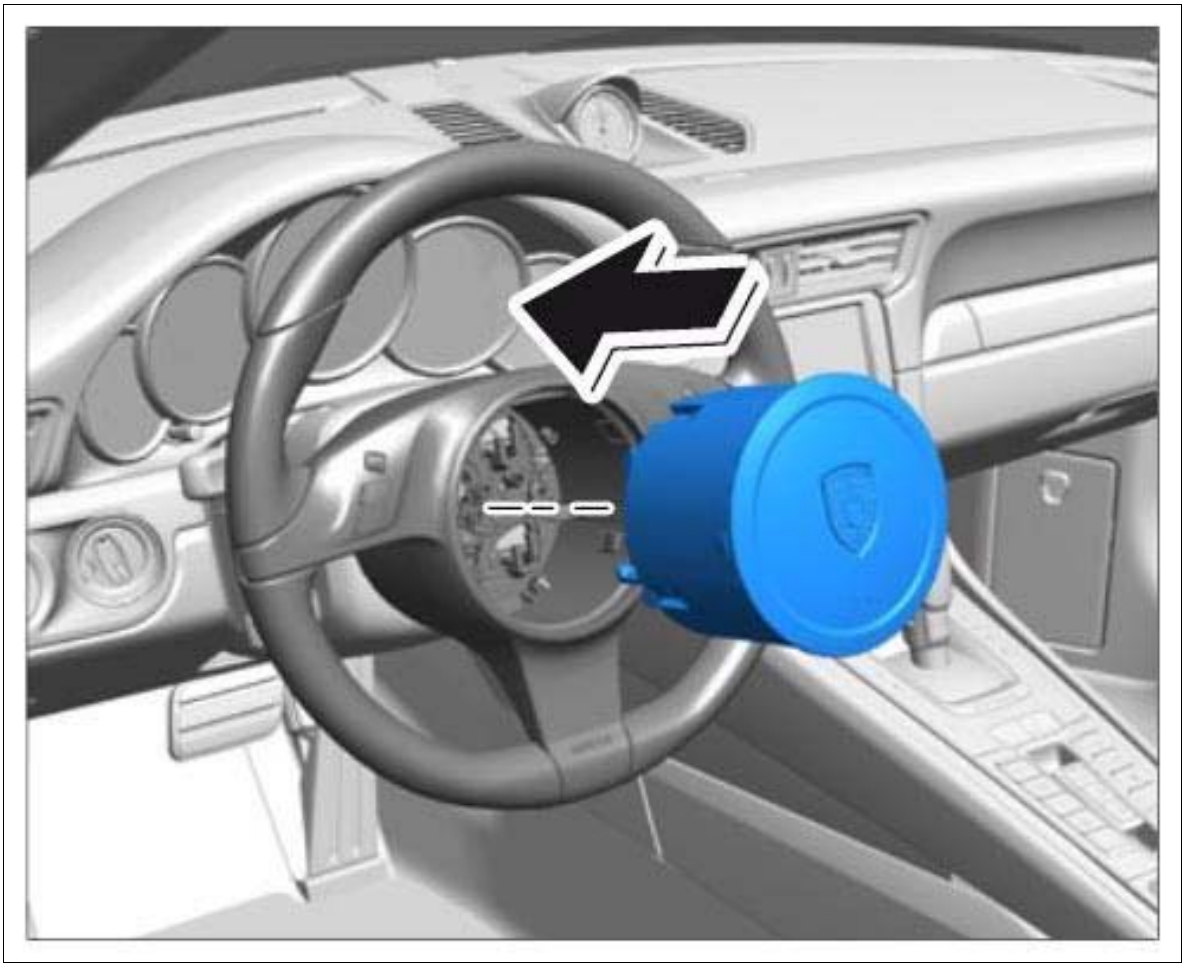
Fig 2: Installing Airbag Unit Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Position the airbag unit at the correct position and engage it in the steering wheel using both hands and intermittent pressure **-arrow-** .

Fig 3: Installing Driver Airbag Unit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Each time the airbag unit is fitted, it is important to check that it is installed correctly by tapping the steering wheel rim and performing a visual inspection (position of airbag unit on steering wheel).

WM 695819 REMOVING AND INSTALLING DRIVER'S AIRBAG UNIT (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK > SUBSEQUENT WORK FOR DRIVER'S AIRBAG UNIT

Information

After replacing airbag components, proof of replacement must be documented in the Warranty and Maintenance booklet.

1. Connect battery ground strap and carry out work instructions after connecting the battery → 270619 REMOVING AND INSTALLING BATTERY

2. If the airbag unit was replaced, proof of replacement must be entered in the Warranty and Maintenance booklet.

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

WARNING: Incorrect handling of safety bolts

- *Danger of injury*
- *Loss of torque*

→ Always use new fastening screws and nuts following removal.

→ Observe specified tightening torques.

→ Carry out a visual inspection of all re-used parts.

Information

Always replace the fastening screws on the airbag unit after customer service and reworking. The micro-self-locking screws must not be treated, greased or loosened and then screwed on again.

WM 696819 REMOVING AND INSTALLING OCCUPANT DETECTION CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

Information

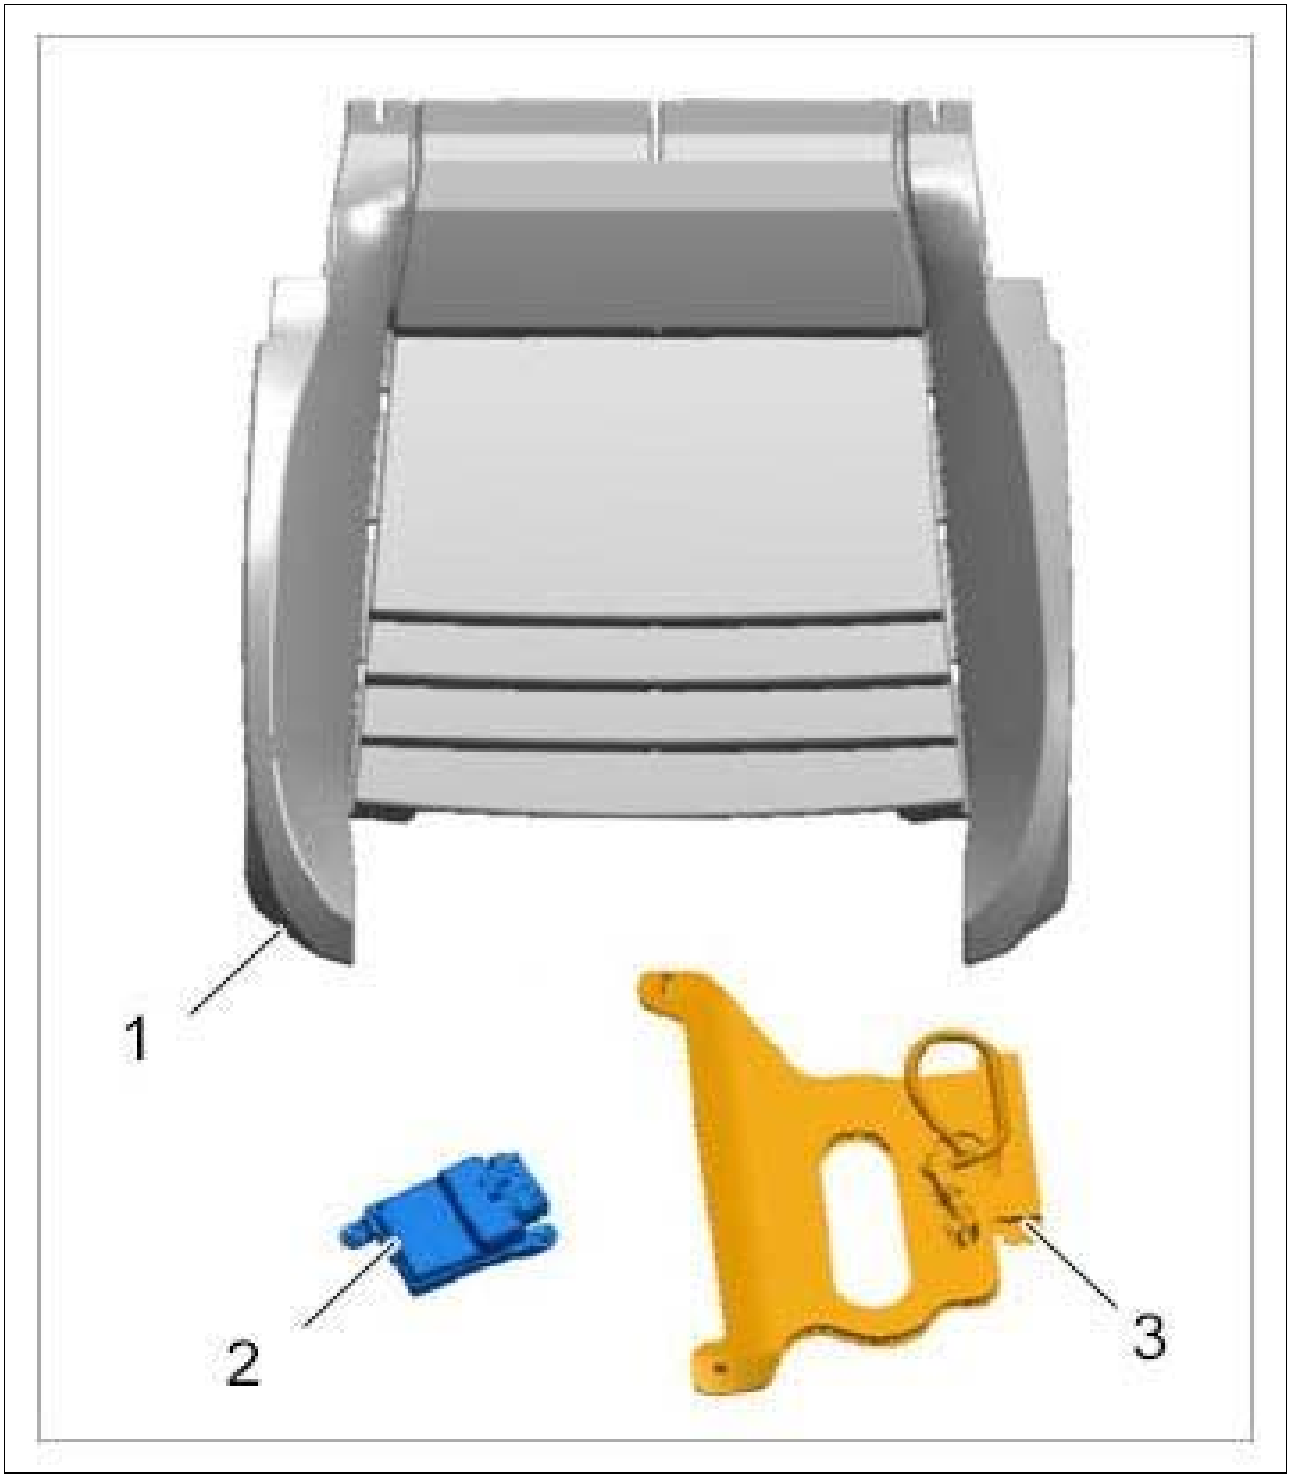
If occupant detection components (installed for country equipment USA/Canada/Mexico) must be

replaced, the repair kit comprising padding, occupant detection control unit and pressure sensor mat **must** always **be replaced as a complete unit** .

The spare parts are grouped in a repair kit (comprising padding -1-, occupant detection control unit -2- and pressure sensor mat -3-), which must always be replaced as a complete unit.

1. Padding
2. Occupant detection control unit
3. Pressure sensor mat

Fig 1: Identifying Occupant Detection Repair Kit Contents



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

A **mixed installation,** e.g. "old" pressure sensor mat and "new" control unit, is **not permitted** .

The padding, pressure sensor mat and occupant detection control unit are calibrated together by the manufacturer and must therefore only be replaced as a complete unit.

The occupant detection control unit does **not** have to be coded.

Information

The connector of the occupant detection control unit must be inserted straight as otherwise the seal will be damaged. The seating of the seal must then be checked.

1. Disconnect the battery. → 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY
2. Remove right front seat. → 720119 REMOVING AND INSTALLING FRONT SEAT .
3. Remove control unit for memory seat adjustment. → 729319 REMOVING AND INSTALLING CONTROL UNIT FOR MEMORY SEAT ADJUSTMENT .

The padding, pressure sensor mat and occupant detection control unit are calibrated together by the manufacturer and must therefore only be replaced as a complete unit.

The occupant detection control unit does **not** have to be coded.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Switch off ignition and replace control unit → 696819 REMOVING AND INSTALLING OCCUPANT DETECTION CONTROL UNIT
2. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition.
3. Select the vehicle type under **Diagnostics.**
4. Select **Airbag** control unit in the **overview** .
5. **Maintenance and repairs** must now be selected.
6. **Select Calibrate occupant detection** and press [F12] to continue.
7. Follow the instructions on the Tester and press [F12] to continue.
8. **Start the function** by pressing [F8]
9. The message **"Function has been executed"** appears. Press [F11] to go back.
10. Read out the fault memory and erase it if necessary.
11. Perform function test: Switch the ignition off and then on again. The airbag warning light in the instrument cluster comes on and must go off again after a few seconds.

WM 697019 REMOVING AND INSTALLING PEDESTRIAN PROTECTION (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Pedestrian protection to lock carrier, upper	Tapping screw	Tightening torque	4.5 Nm (3.5 ftlb.)		
Pedestrian protection to lock carrier, lower	Tapping screw	Tightening torque	3 Nm (2 ftlb.)		

WM 697019 REMOVING AND INSTALLING PEDESTRIAN PROTECTION (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove front apron. → 631519 REMOVING AND INSTALLING FRONT APRON
2. Remove ventilation guides. → 661319 REMOVING AND INSTALLING VENTILATION GUIDE

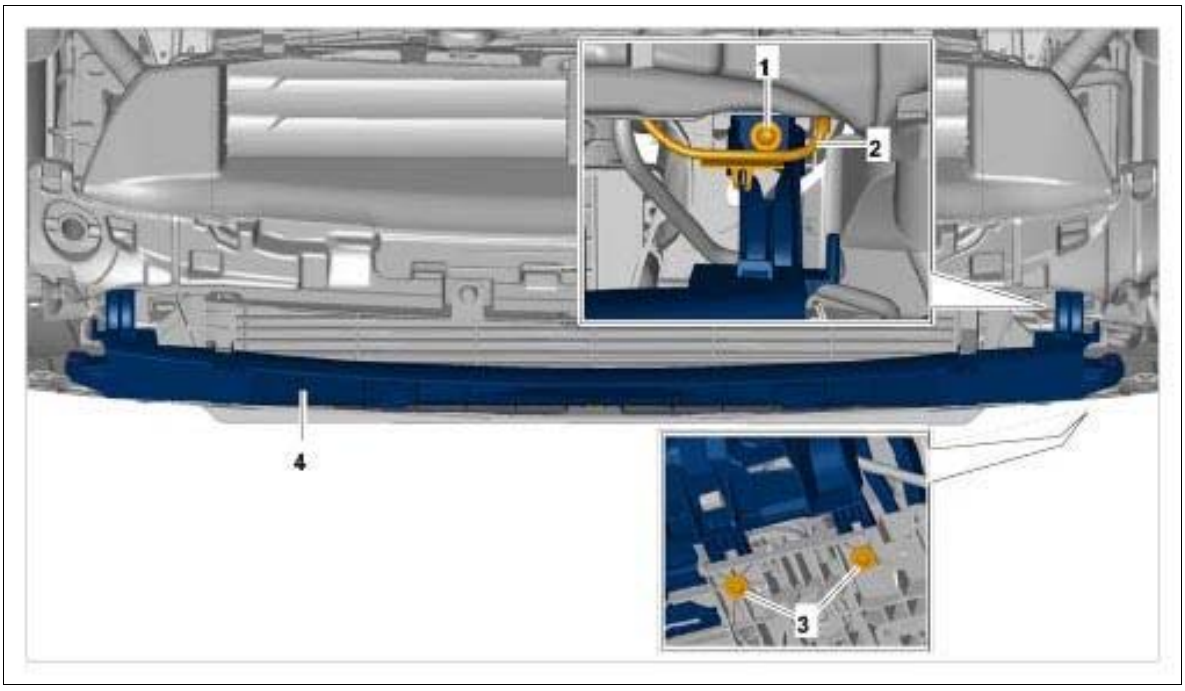
WM 697019 REMOVING AND INSTALLING PEDESTRIAN PROTECTION (MACAN, MACAN S, MACAN TURBO) > REMOVING PEDESTRIAN PROTECTION

Information

- The number of fastening screws, fixing clips, plug connections, holders and trim panels can vary depending on equipment.
- The illustrations for removing and installing the drive mechanism are shown only on one equipment variant and may differ from the actual equipment variant.
- Some steps must be carried out automatically.
- Some of the repair illustrations show only one side of the vehicle.

1. Unclip wire harness **-2-** on pedestrian protection **-4-** .
2. Unscrew top fastening screws **-1-** .
3. Unscrew bottom fastening screws **-3-** .
4. Remove pedestrian protection **-4-** by pulling it forward.

Fig 1: Identifying Pedestrian Protection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 697019 REMOVING AND INSTALLING PEDESTRIAN PROTECTION (MACAN, MACAN S, MACAN TURBO) > INSTALLING PEDESTRIAN PROTECTION

Installation is performed in reverse order. Pay particular attention to the following:

1. Tighten top fastening screws to the specified torque. **Tightening torque 4.5 Nm (3.5 ftlb.)**
2. Tighten bottom fastening screws to the specified torque. **Tightening torque 3 Nm (2 ftlb.)**

WM 697019 REMOVING AND INSTALLING PEDESTRIAN PROTECTION (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install ventilation guides. → INSTALLING VENT GUIDE .
2. Install front apron. → INSTALLING FRONT APRON .

WM 697819 REMOVING AND INSTALLING KNEE AIRBAG ON DRIVER'S SIDE (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Knee airbag to trim panel under dashboard	Screw, M5 x 16	Tightening torque	4 Nm (3 ftlb.)		
Knee airbag to strut	Screw, M6 x 30	Tightening torque	15 Nm (11 ftlb.)		
Ground cable to knee airbag holder	Nut, M6	Tightening torque	8 Nm (6 ftlb.)		

WM 697819 REMOVING AND INSTALLING KNEE AIRBAG ON DRIVER'S SIDE (MACAN, MACAN S, MACAN TURBO) > INFORMATION > INSTALLATION POSITION OF KNEE AIRBAG ON DRIVER'S SIDE

WM 697819 REMOVING AND INSTALLING KNEE AIRBAG ON DRIVER'S SIDE (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK > PRELIMINARY WORK FOR KNEE AIRBAG ON DRIVER'S SIDE

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

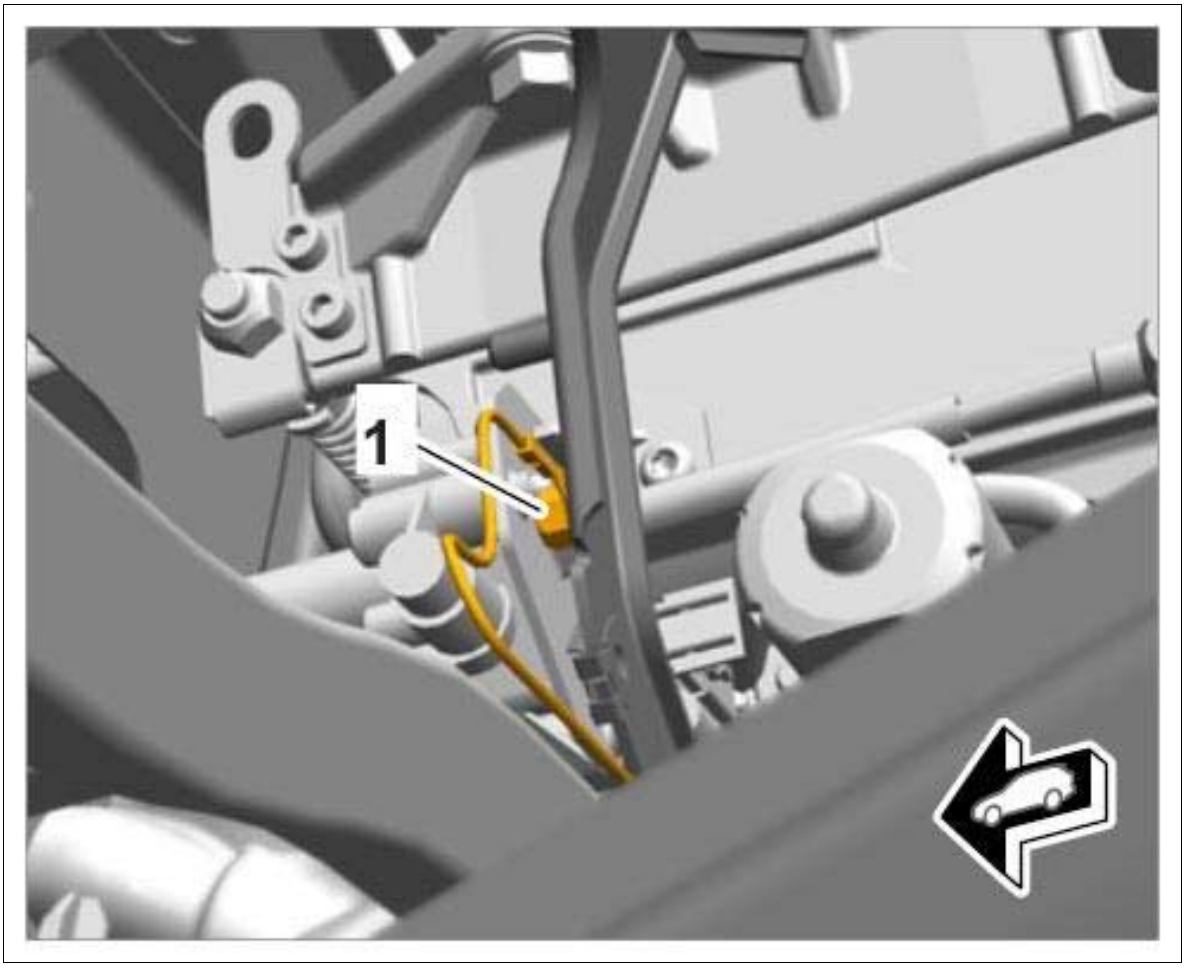
→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

1. Disconnect battery ground strap → Loosening and securing ground strap for battery. → WM 270619 REMOVING AND INSTALLING BATTERY (ALL MODELS) .
2. Remove cover under dashboard .
3. Loosen ground cable on knee airbag holder **-1-** .

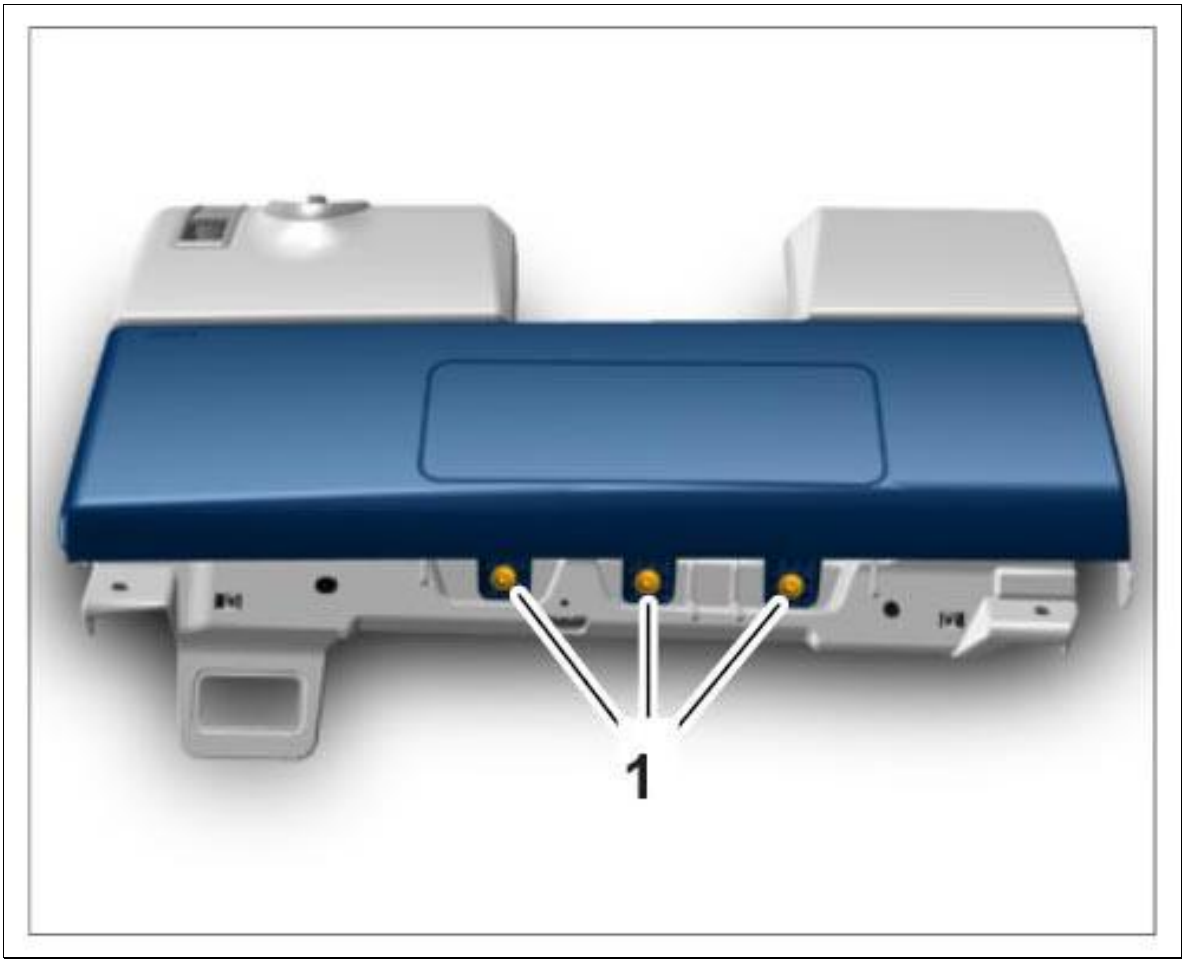
Fig 1: Identifying Ground Cable On Retaining Bracket



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Loosen fastening screws **-1-** from the knee airbag at the strut.

Fig 2: Identifying Knee Airbag To Strut Fastening Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove trim panel under dashboard → 701919 REMOVING AND INSTALLING TRIM PANEL UNDER DASHBOARD - section on "Removing and installing" and disconnect plug connection for knee airbag.

WM 697819 REMOVING AND INSTALLING KNEE AIRBAG ON DRIVER'S SIDE (MACAN, MACAN S, MACAN TURBO) > REMOVING KNEE AIRBAG ON DRIVER'S SIDE

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead

starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

WARNING: Incorrect handling of safety bolts

- *Danger of injury*
- *Loss of torque*

→ Always use new fastening screws and nuts following removal.

→ Observe specified tightening torques.

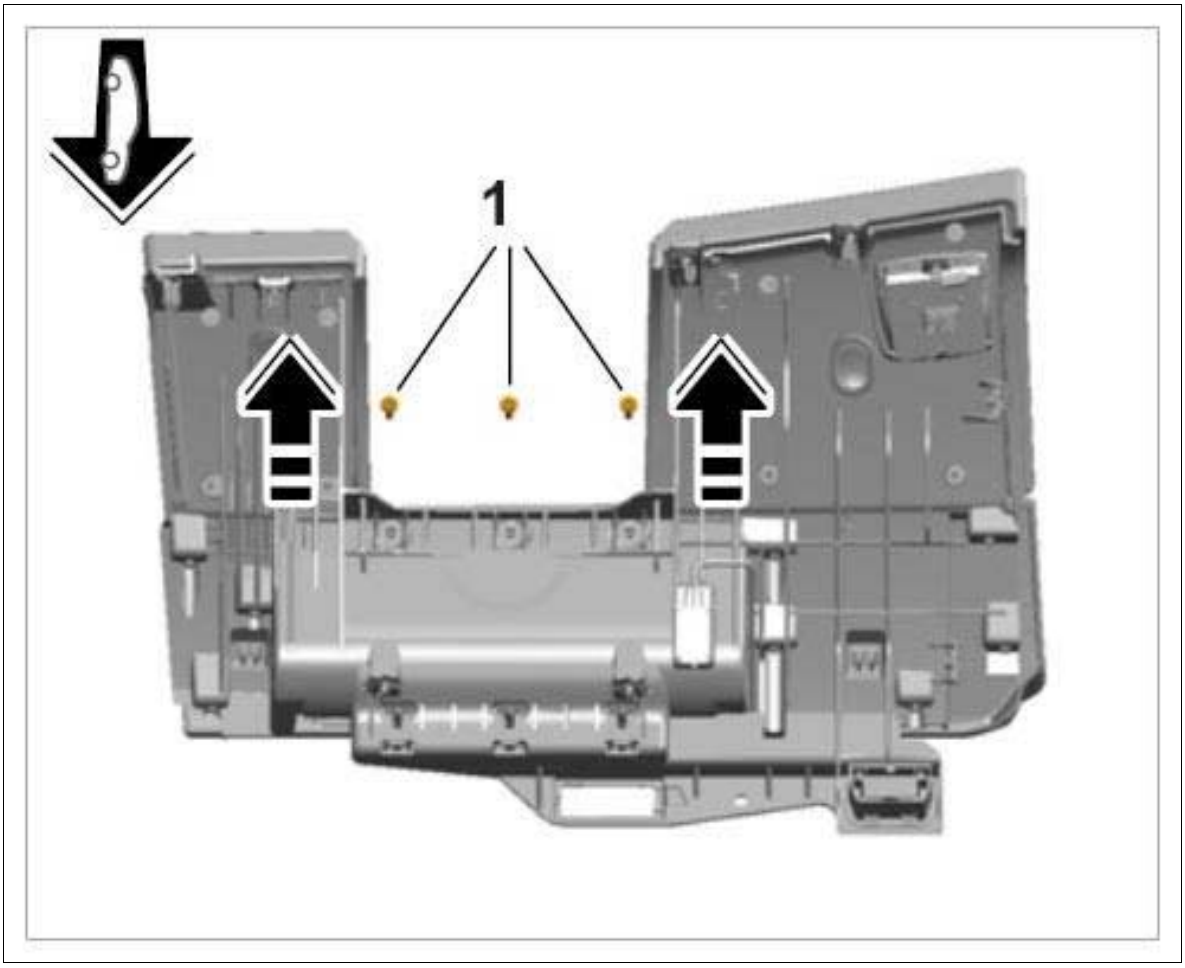
→ Carry out a visual inspection of all re-used parts.

Information

Always replace the fastening screws on the airbag unit after customer service and reworking. The micro-self-locking screws must not be treated, greased or loosened and then screwed on again.

1. Loosen fastening screws **-1-** between the knee airbag and trim panel under the dashboard.

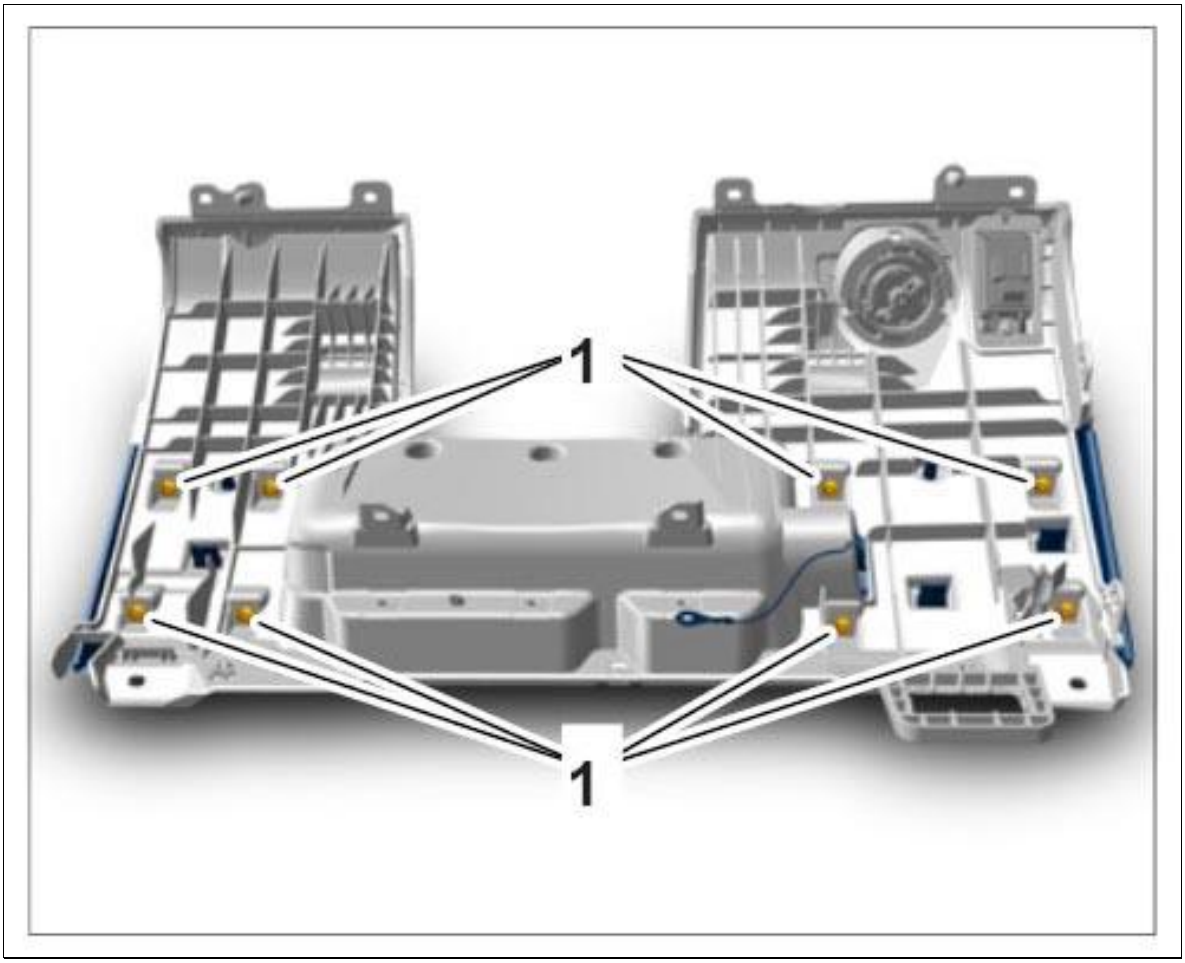
Fig 1: Loosening Upper Fastening Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen fastening screws **-1-** on trim panel for knee airbag at the trim panel under the dashboard.

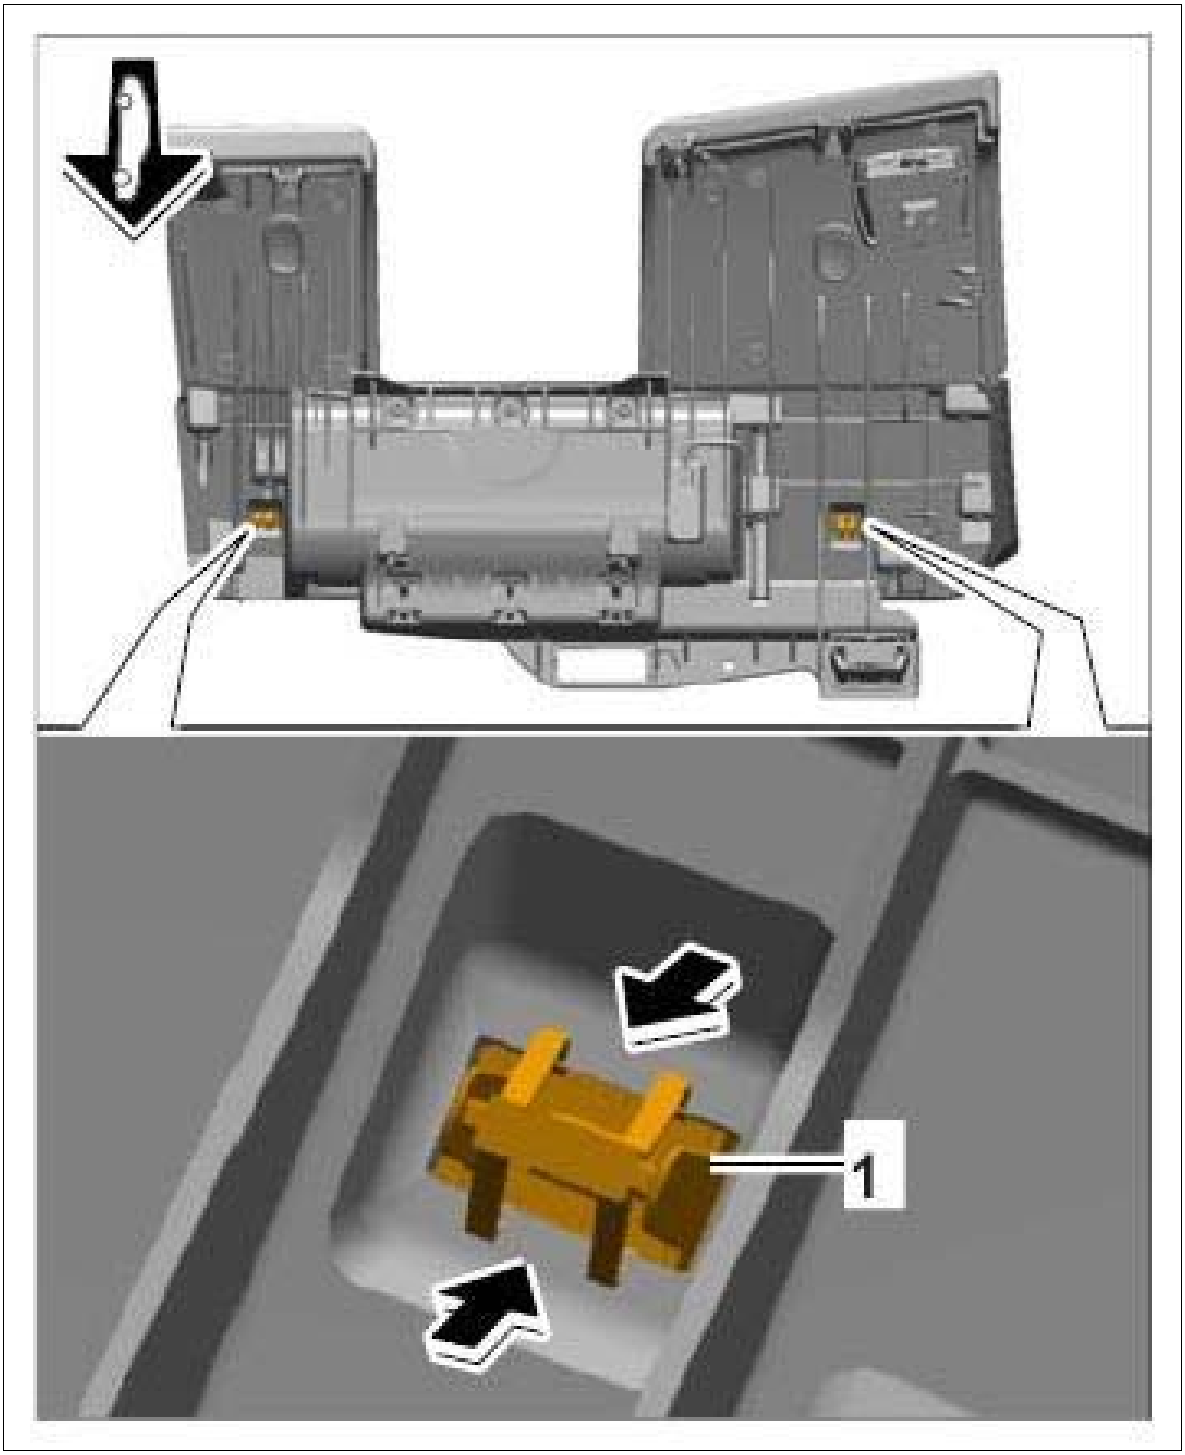
Fig 2: Identifying Knee Airbag On Trim Panel Under Dashboard



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unclip three fixing clips **-1-** securing trim panel for knee airbag to trim panel under the dashboard.

Fig 3: Removing Knee Airbag



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove knee airbag and set it down in accordance with the relevant instructions.

WM 697819 REMOVING AND INSTALLING KNEE AIRBAG ON DRIVER'S SIDE (MACAN, MACAN S, MACAN TURBO) > INSTALLING KNEE AIRBAG ON DRIVER'S SIDE

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

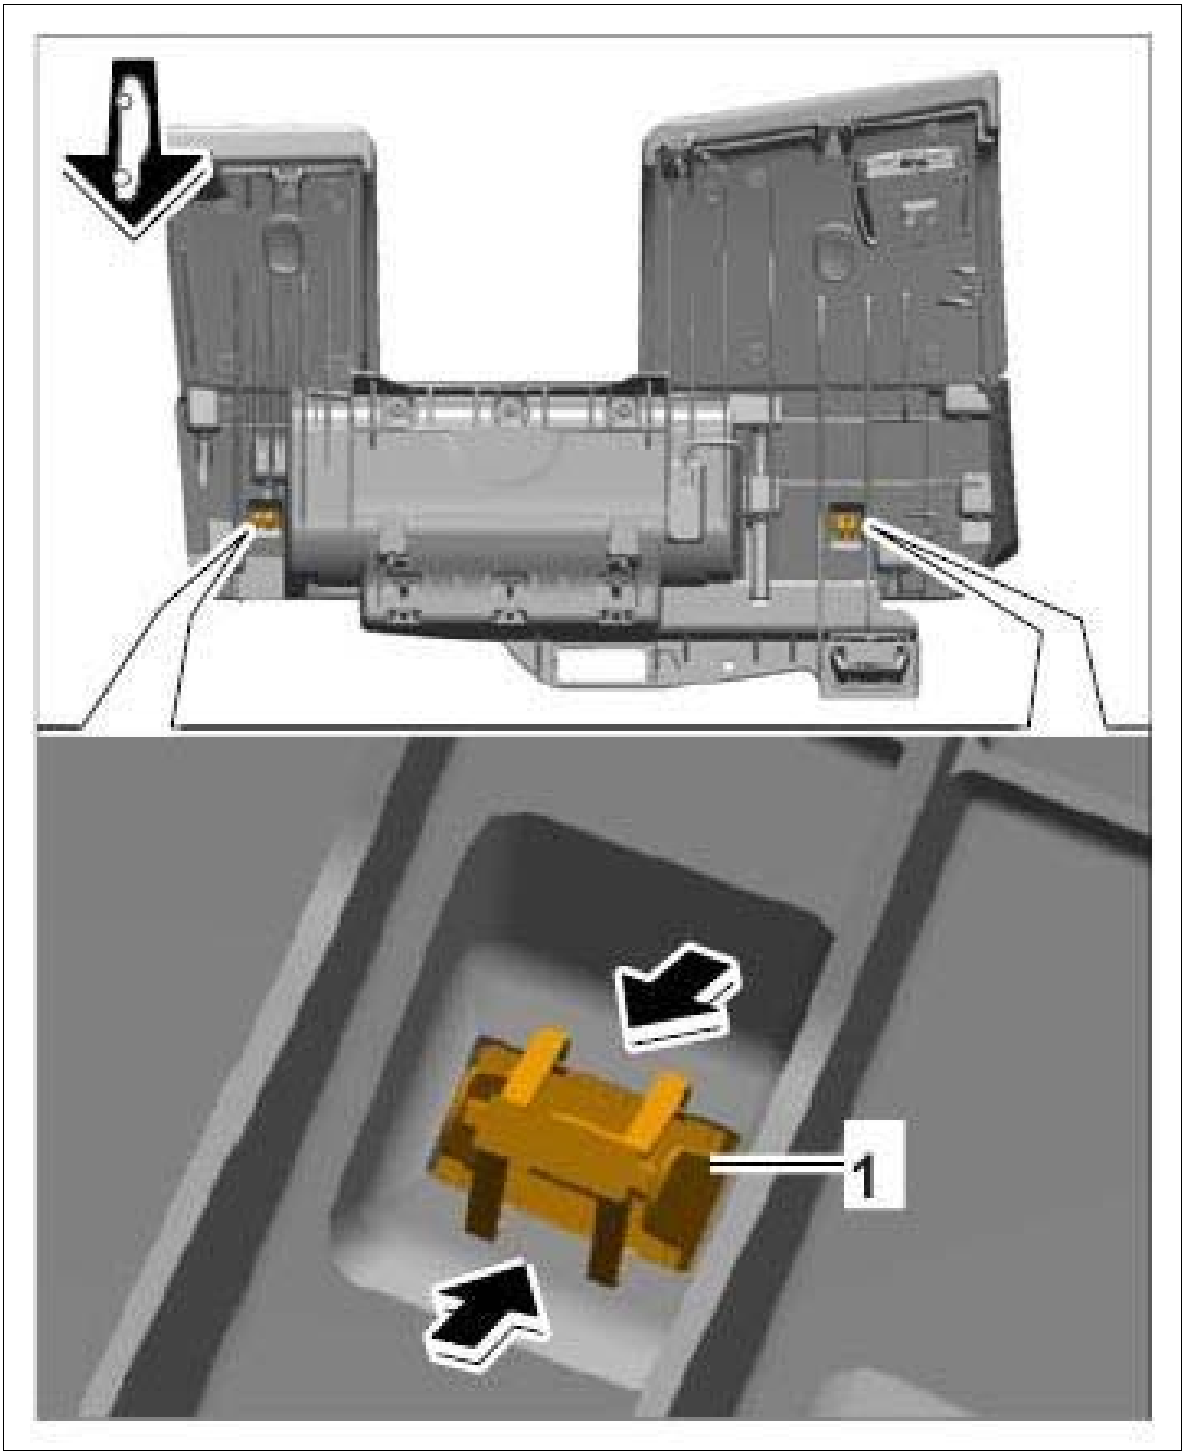
→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

1. Position knee airbag so that the three fixing clips **-1-** engage in the corresponding mounting on the trim panel.

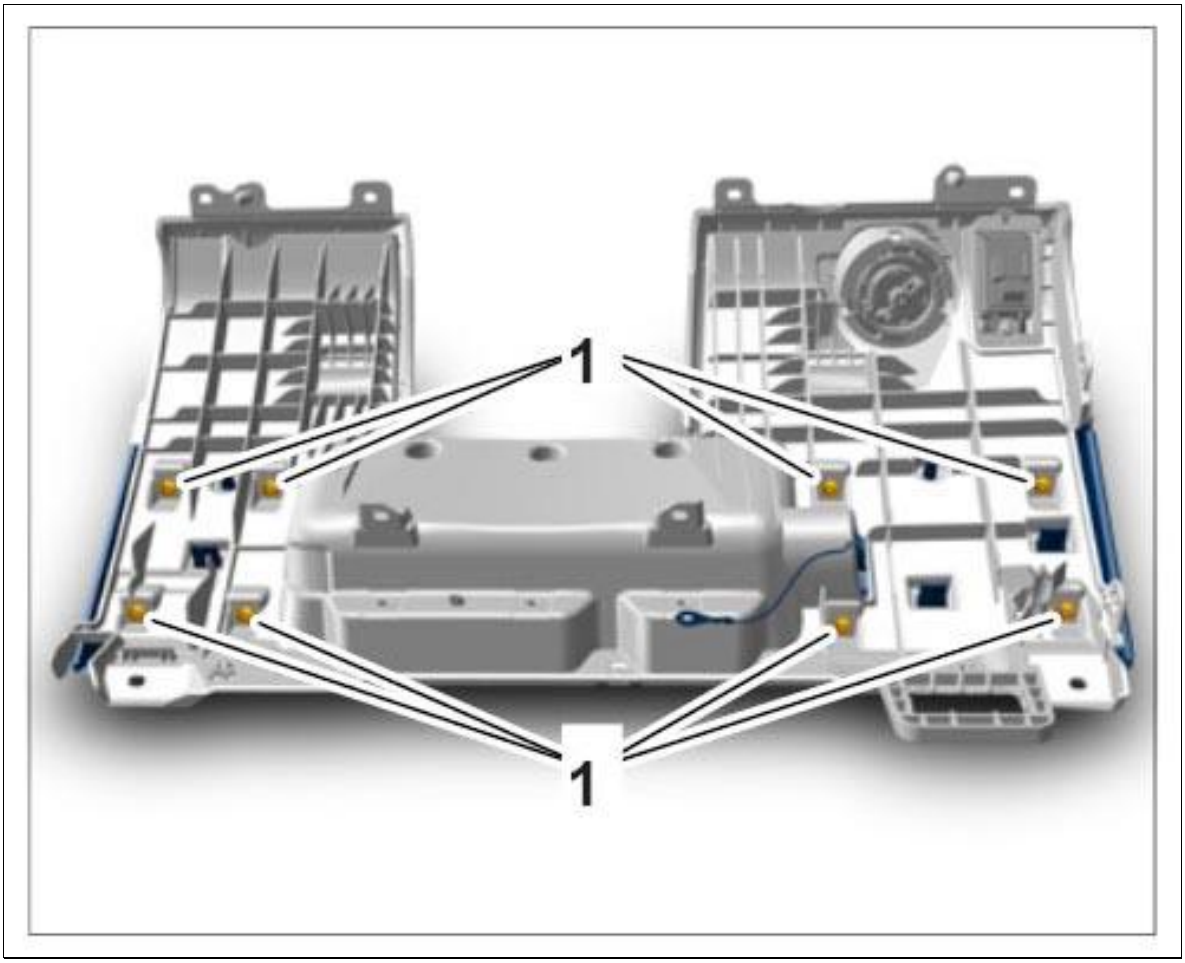
Fig 1: Installing Knee Airbag



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Clip knee airbag into the trim panel.
3. Tighten fastening screws **-1-** on trim panel for knee airbag at the trim panel under the dashboard.

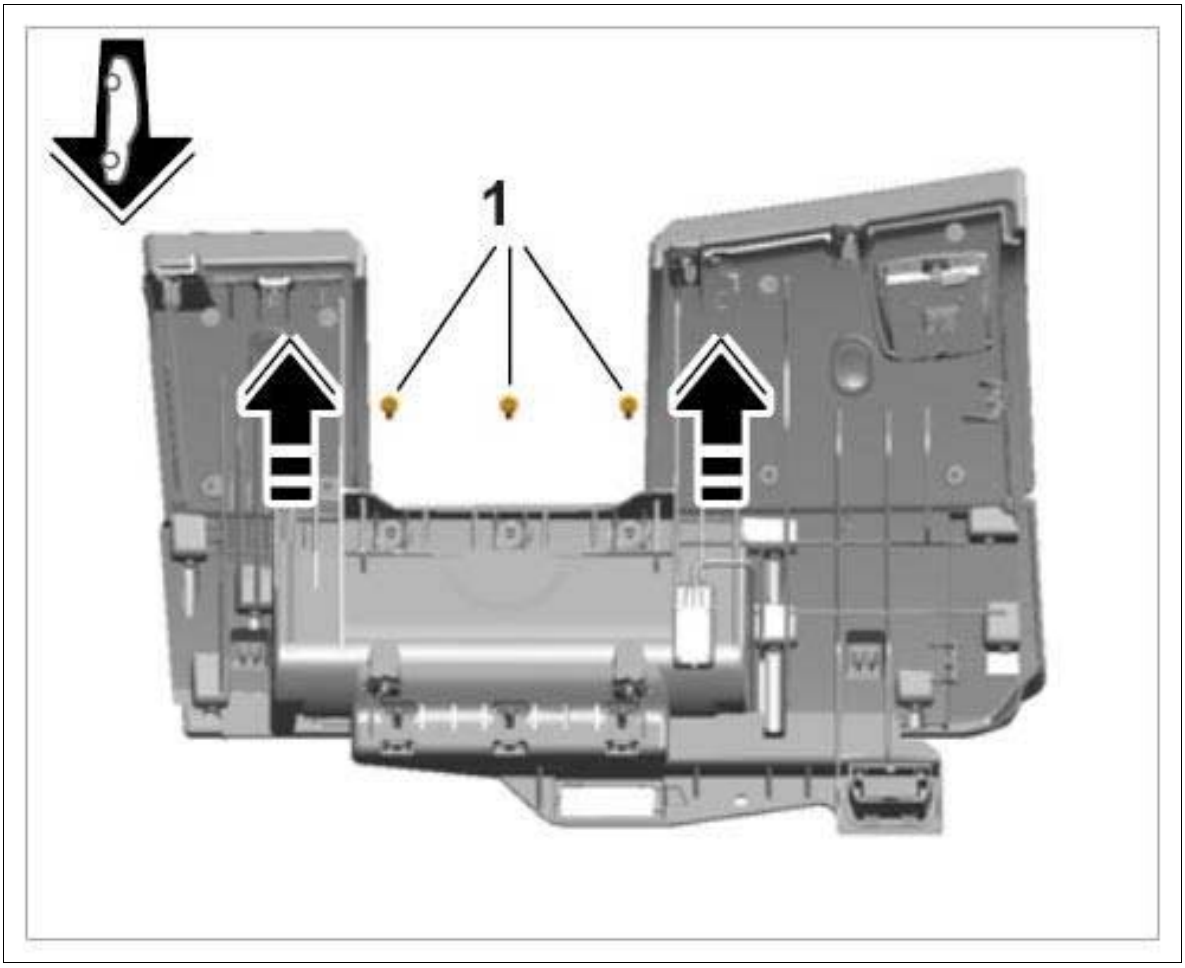
Fig 2: Identifying Knee Airbag On Trim Panel Under Dashboard



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Tighten fastening screws **-1-** between the knee airbag and trim panel under the dashboard to the prescribed tightening torque. → **Tightening torque: 4 Nm (3 ftlb.).**

Fig 3: Identifying Upper Fastening Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WARNING: Incorrect handling of safety bolts

- *Danger of injury*
- *Loss of torque*

Triggering of airbag unit.

System faults can occur.

→ Always use new fastening screws and nuts following removal.

Information

Always replace the fastening screws on the airbag unit after customer service and reworking. The micro-self-locking screws must not be treated, greased or loosened and then screwed on again.

WM 697819 REMOVING AND INSTALLING KNEE AIRBAG ON DRIVER'S SIDE

(MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK > SUBSEQUENT WORK FOR KNEE AIRBAG ON DRIVER'S SIDE

WARNING: Incorrect handling of airbag units

- → *Observe specified tightening torques.*
- → *Carry out a visual inspection of all re-used parts.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

WM 480819 REMOVING AND INSTALLING CONTROL UNIT FOR ELECTRIC STEERING COLUMN LOCK (ELV) (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 480819 REMOVING AND INSTALLING CONTROL UNIT FOR ELECTRIC STEERING COLUMN LOCK (ELV) (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove steering column. → 481519 REMOVING AND INSTALLING STEERING COLUMN .

WM 480819 REMOVING AND INSTALLING CONTROL UNIT FOR ELECTRIC STEERING COLUMN LOCK (ELV) (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING CONTROL UNIT FOR ELECTRIC STEERING COLUMN LOCK (ELV) > REMOVING CONTROL UNIT FOR ELECTRIC STEERING COLUMN LOCK (ELV)

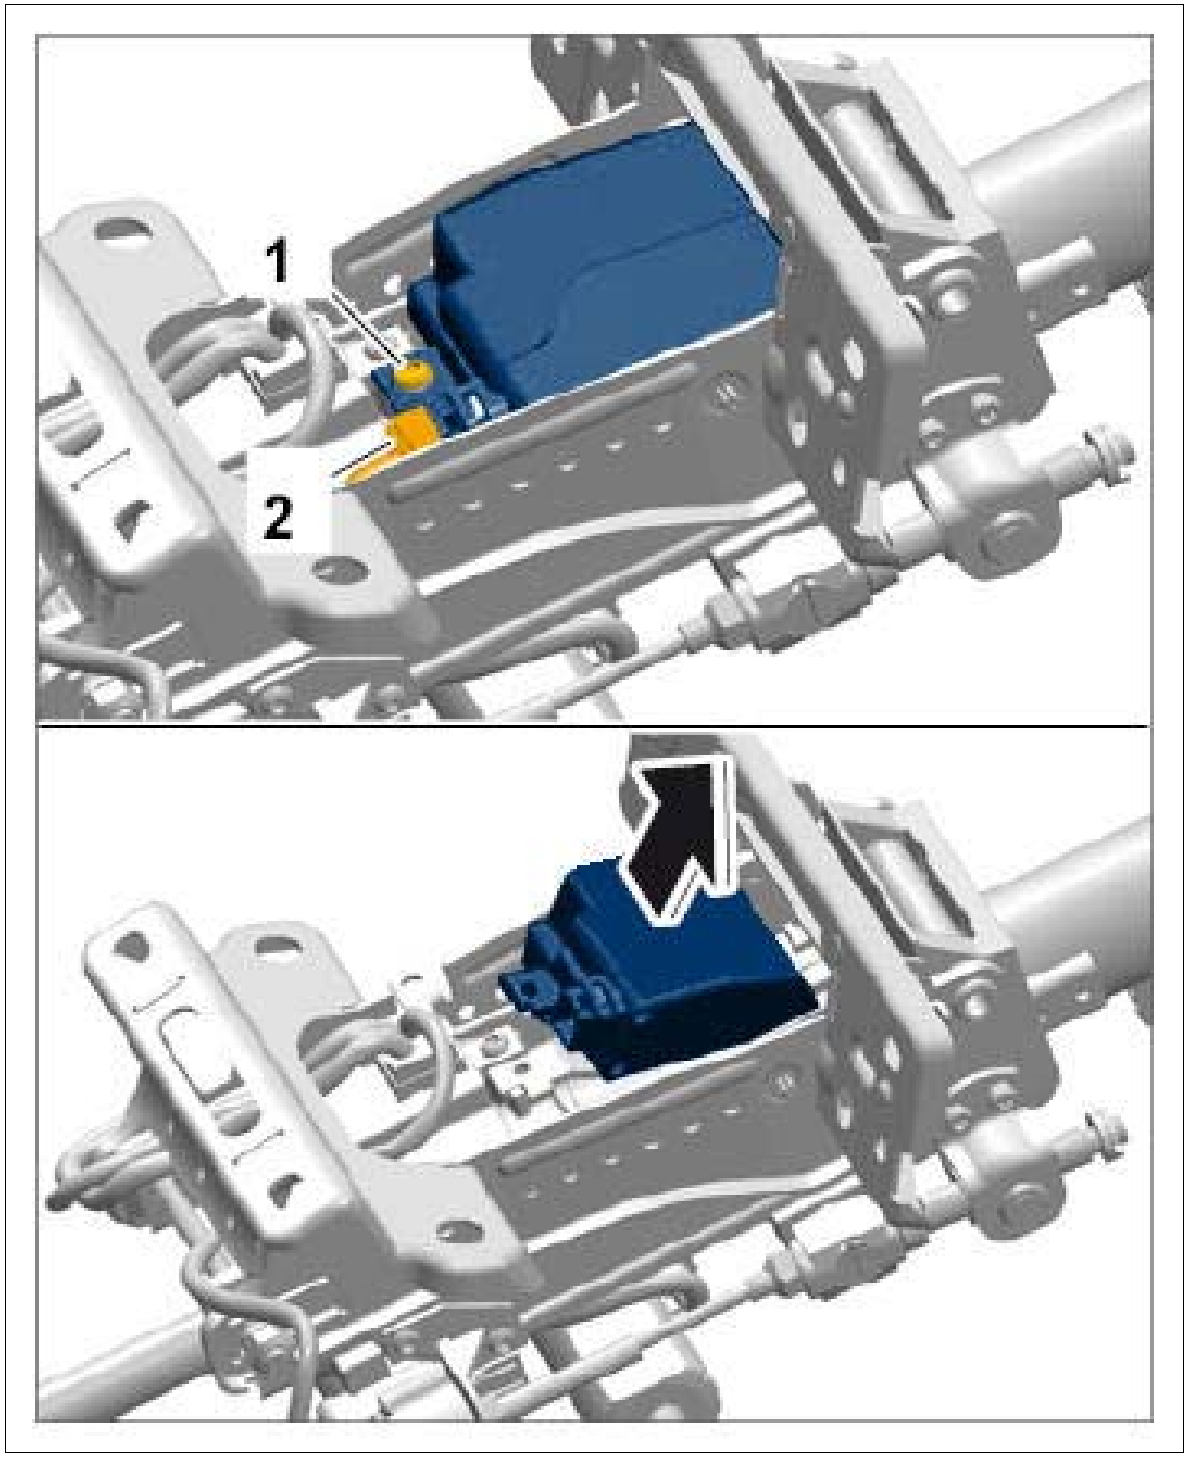
NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

→ Remove the ignition key and switch off load before disconnecting or removing load.

1. Release and disconnect connector **-2-** .
2. Unscrew and remove fastening screw **-1-** .

Fig 1: Removing ELV Control Unit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Lift the ELV control unit and pull it out of the steering column **-arrow-** .

WM 480819 REMOVING AND INSTALLING CONTROL UNIT FOR ELECTRIC STEERING COLUMN LOCK (ELV) (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING CONTROL UNIT FOR ELECTRIC STEERING COLUMN LOCK (ELV)

> INSTALLING CONTROL UNIT FOR ELECTRIC STEERING COLUMN LOCK (ELV)

1. Installation is performed in reverse order.

WM 480819 REMOVING AND INSTALLING CONTROL UNIT FOR ELECTRIC STEERING COLUMN LOCK (ELV) (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install steering column → INSTALLING STEERING COLUMN .
2. If the control unit was replaced, the "new" control unit must be adapted to suit the vehicle using **PIWIS Tester II 9818** . → 480855 REPLACING ELV CONTROL UNIT .

WM 480855 REPLACING ELV CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 480855 REPLACING ELV CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 480855 REPLACING ELV CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Switch off ignition and replace the ELV control unit. → 480819 REMOVING AND INSTALLING ELV CONTROL UNIT .

WM 480855 REPLACING ELV CONTROL UNIT (MACAN, MACAN S, MACAN TURBO) > TEACHING ELV CONTROL UNIT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms; different text or additions may appear in **PIWIS Tester II 9818** .

Information

All remote controls (keys) are required for teaching a DME, front-end electronics (front BCM), rear-end electronics (rear BCM), electronic steering lock (ELV) control unit or remote controls (keys) for example.

Remote controls (keys) that are not taught during this teaching procedure will no longer be recognized by the vehicle.

1. **PIWIS Tester II 9818** must be connected to the vehicle before starting the Tester. Switch on ignition using original remote control.
2. Select the menu **Diagnostics --> Online teaching function --> Engine immobilizer** on the Start page.
3. **Vehicle** must now be selected. Then press [F12] to continue. Vehicle data will be read out.
4. Follow the instructions on the Tester.
5. The vehicle identification number (VIN) is displayed. Change the vehicle identification number if necessary.
6. Enter the repair order number and press [F12] to continue.

7. Enter the PPN user name and password and press [F12] to continue.
8. Login is performed.
9. The Tester displays the message **Login successful** . Press [F12] to continue.
10. Follow the instructions on the Tester to select the required menu.
11. Once the teaching process is completed successfully, the Tester shows the following status, for example:

    2 keys taught

    Front BCM: taught

    ELV: taught

    Rear BCM: taught

    DME: taught

    Overall vehicle status: taught. Continue with [F12]
12. Press [ESC] to exit the **Online teaching function** and select the **vehicle type** on the Start page.
13. Read out the fault memory and delete faults if necessary.
14. Lock, open and start the vehicle using all remote controls (hand-held transmitters).
15. Read out the fault memory again.

WM 481019 REMOVING AND INSTALLING STEERING WHEEL (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
multiple-tooth socket-wrench insert	Commercially available tool	Nr.32

MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Steering wheel to steering column	Internal serration screw, M18 x 1.5 x 26. Always replace following removal! (microencapsulated thread)	Initial tightening	30 Nm (22 ftlb.)		
Steering wheel to steering column	Internal serration screw, M18 x 1.5 x 26. Always replace following removal! (microencapsulated thread)	Final tightening	+90°		

WM 481019 REMOVING AND INSTALLING STEERING WHEEL (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Disconnect the battery → WM 2X00IN WORK INSTRUCTIONS AFTER DISCONNECTING THE BATTERY .

> *WARNING: Incorrect handling of airbag units*
>
> 1. *Triggering of airbag unit.*
> 2. *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

2. Remove driver's airbag unit → 695819 REMOVING AND INSTALLING DRIVER'S AIRBAG UNIT .

WM 481019 REMOVING AND INSTALLING STEERING WHEEL (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING STEERING WHEEL > REMOVING STEERING WHEEL

1. Turn wheels to straight-ahead position.

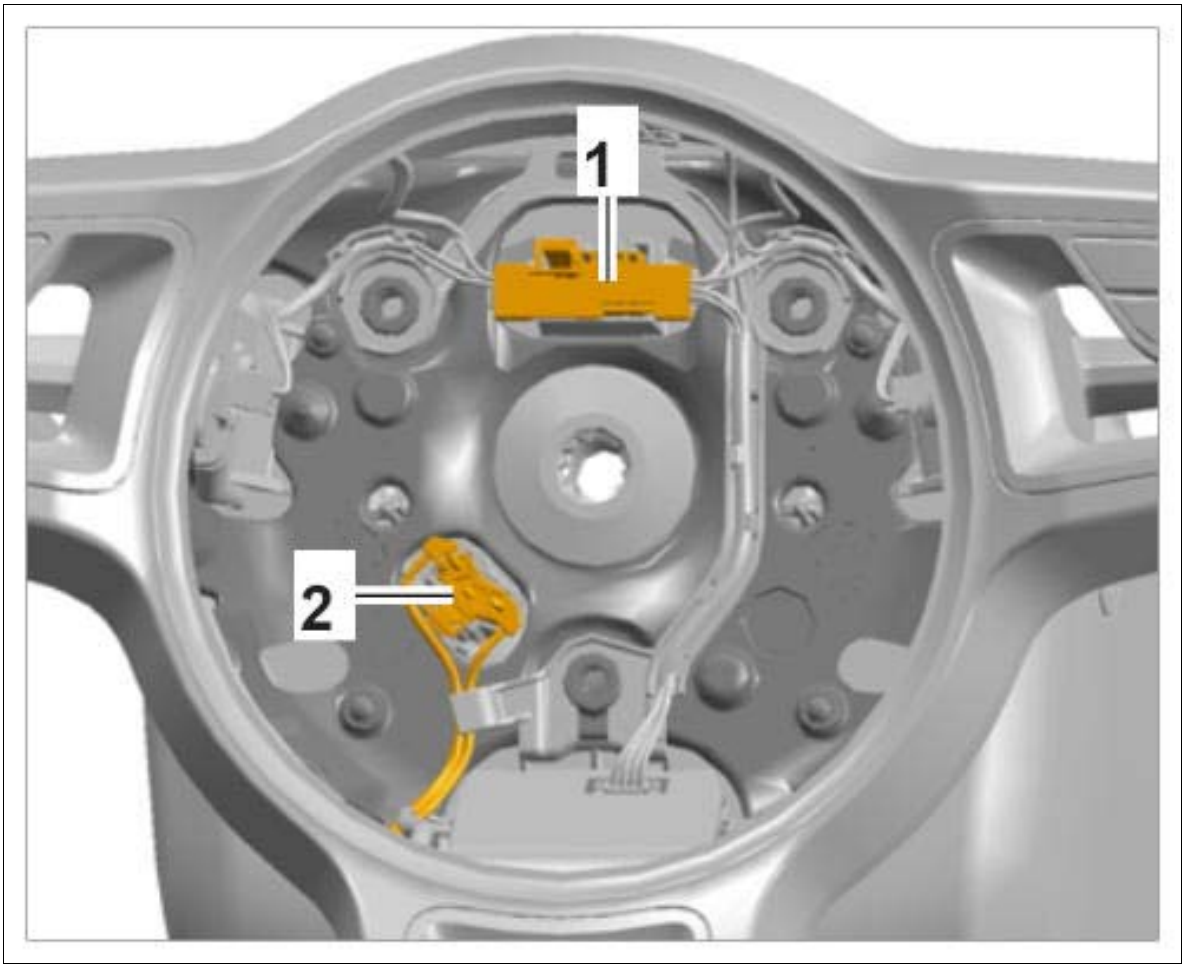
   Information

   1. Always release and disconnect the plug connections for steering wheel heater cables and airbag cables before removing the steering wheel.

2. Release plug connection for airbag wire harness **-1-** and disconnect it.

3. If the vehicle has a heated steering wheel: release and disconnect plug connection for steering wheel heating **-2-** .

Fig 1: Identifying Plug Connections

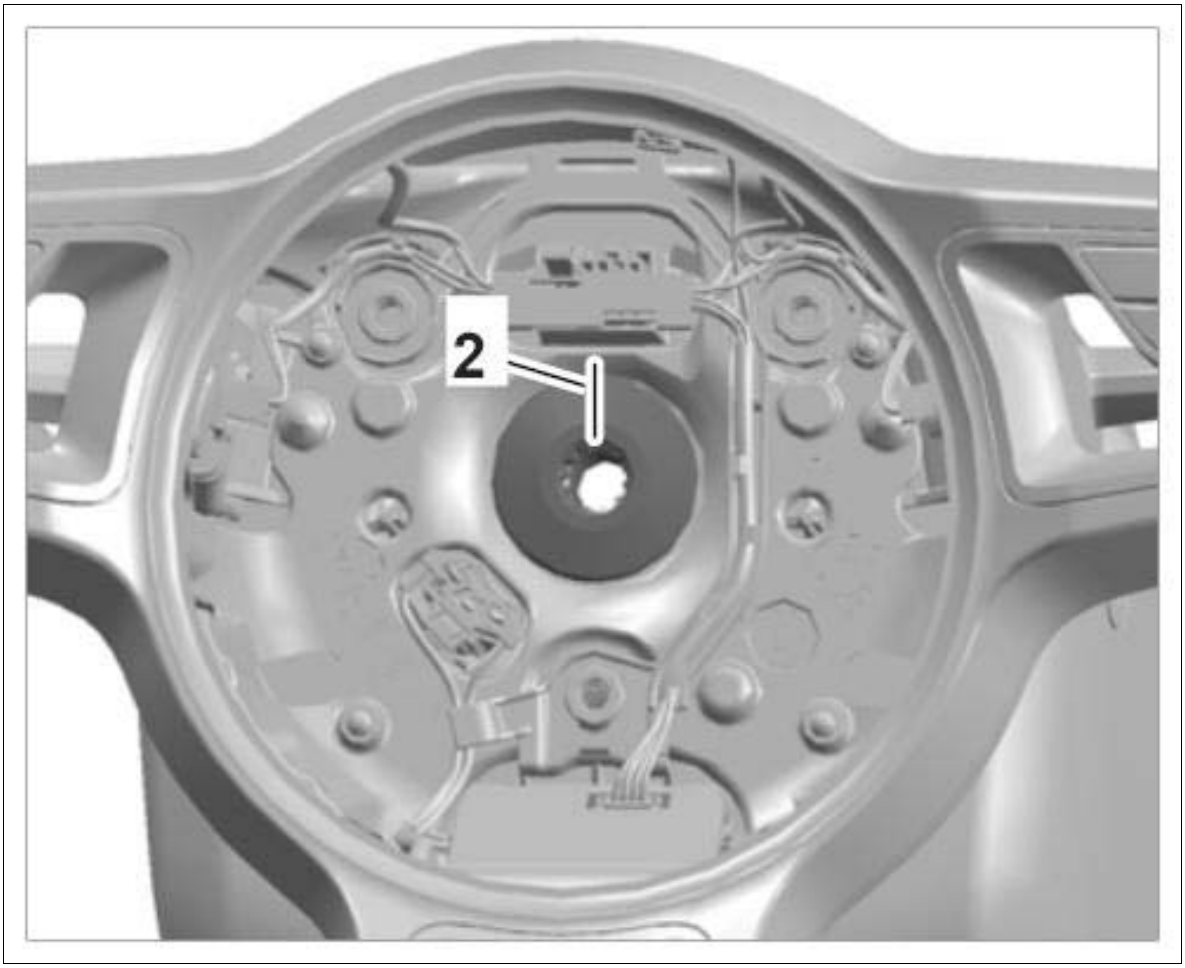


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Immediately after unscrewing the screw and **before** removing the steering wheel, always mark the position of the steering wheel between the steering wheel and steering column **-2-** .

Fig 2: Identifying Steering Column Mark

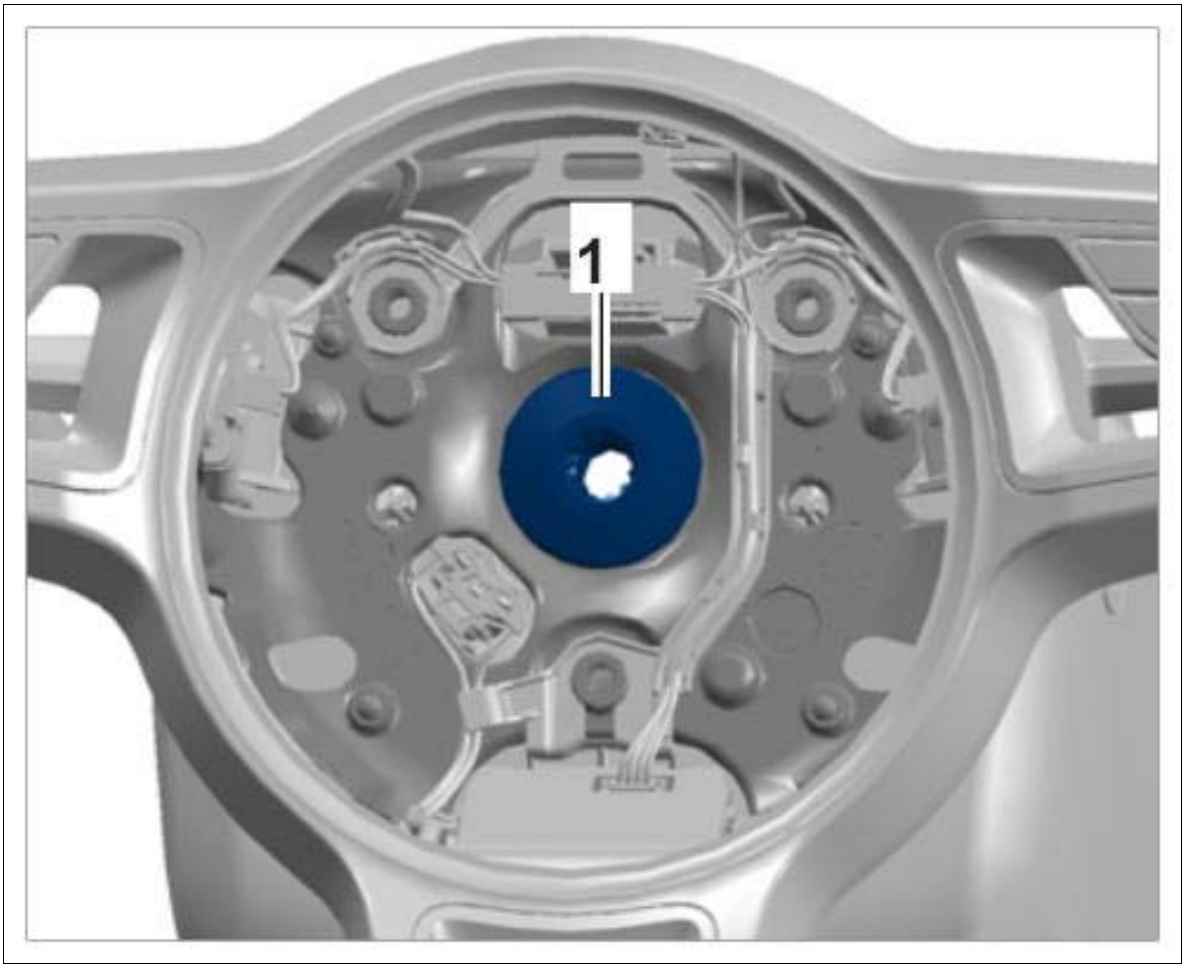


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

This ensures that the steering wheel will be fitted at the same position on the steering column again during re-installation.

4. Unscrew and remove fastening screw **-1-** using **multiple-tooth socket-wrench insert Nr.32** .

Fig 3: Identifying Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Mark the position of the steering wheel.
6. Remove steering wheel.

WM 481019 REMOVING AND INSTALLING STEERING WHEEL (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING STEERING WHEEL > INSTALLING STEERING WHEEL

Information

- Turn wheels to straight-ahead position and observe the markings you applied earlier!
- Always replace the multiple-tooth screw!

1. Installation is performed in reverse order.

   Steering wheel to steering column: **Initial tightening 30 Nm (22 ftlb.) Final tightening +90°**

2. When fitting the steering wheel, make sure that the marking **-2-** between the steering wheel and steering column is aligned.

Fig 1: Identifying Steering Column Mark

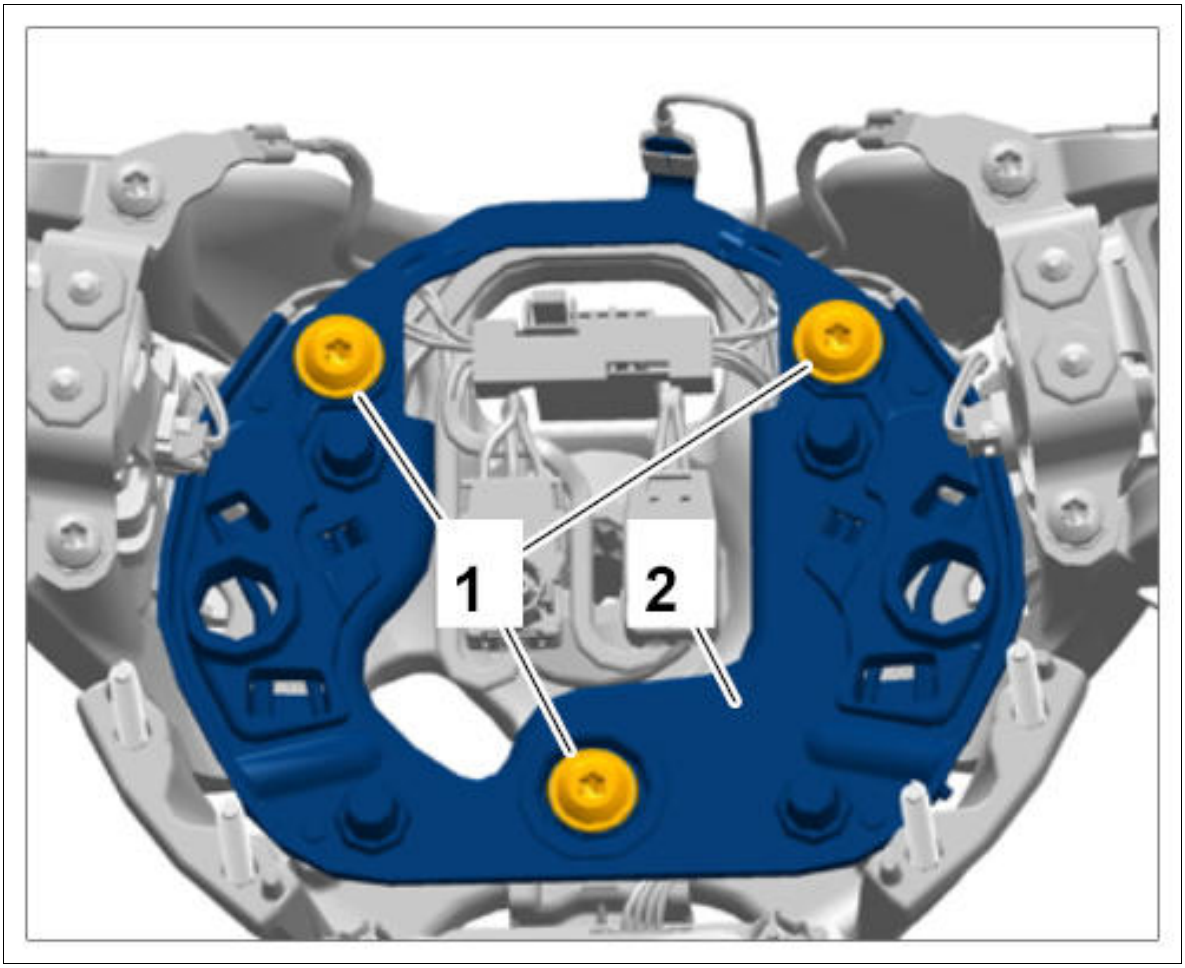
WM 481037 DISASSEMBLING AND ASSEMBLING STEERING WHEEL (MACAN, MACAN S, MACAN TURBO) > DISASSEMBLING AND ASSEMBLING STEERING WHEEL > ASSEMBLING STEERING WHEEL

The steering wheel is assembled in reverse order to disassembly. Pay particular attention to the following:

1. Tighten fastening screws **-1-** on the contact bridge **-2-** . **Tightening torque 6 Nm (4.5 ftlb.)**

   Check that the springs are fitted between the contact bridge and steering wheel skeleton and check that they are seated correctly.

Fig 1: Identifying Screws For Contact Bridge



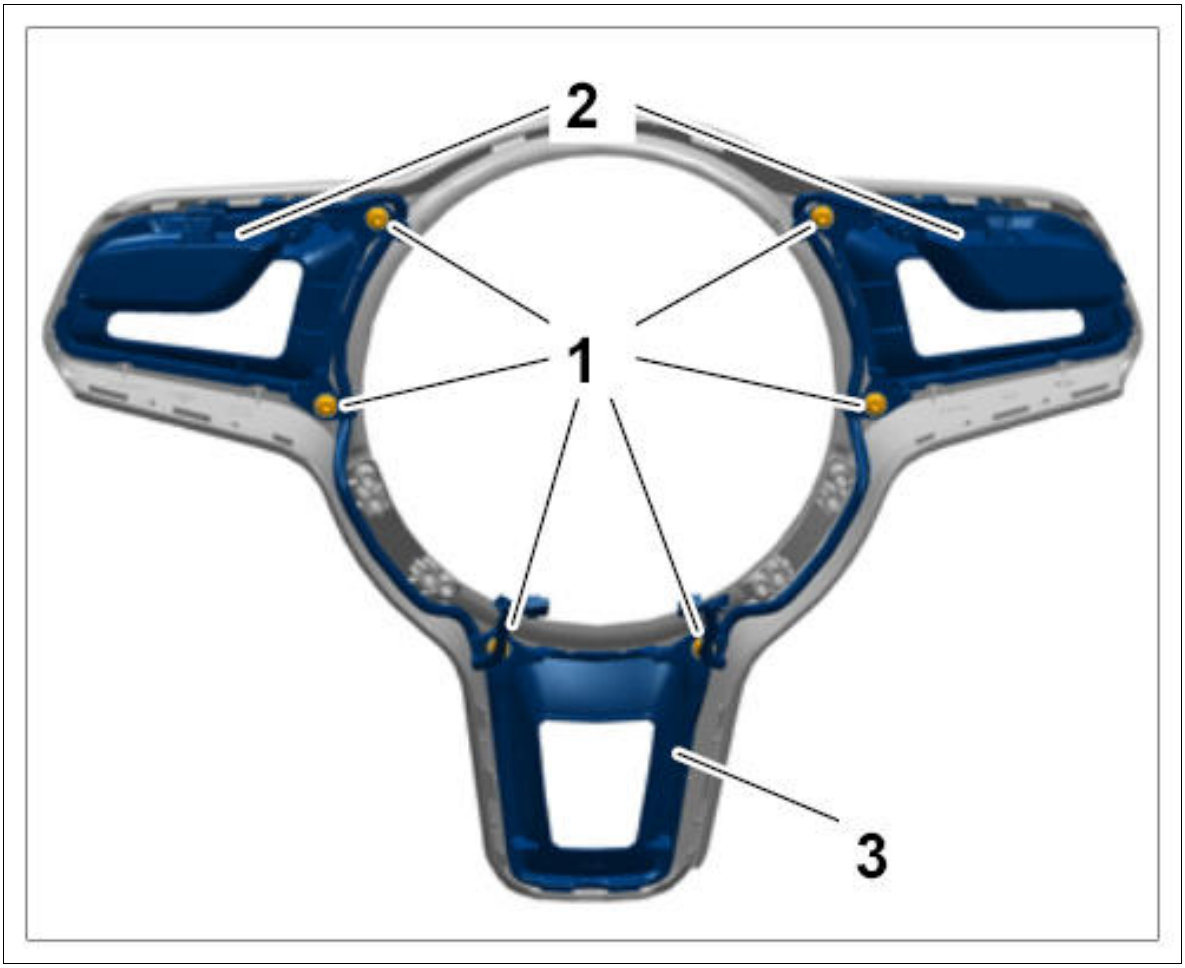
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Multi-functional switches can be used immediately after installation. They do not need to be coded.

2. Fit multi-functional switch **-2-** with cables and front trim **-3-** into the main cover.

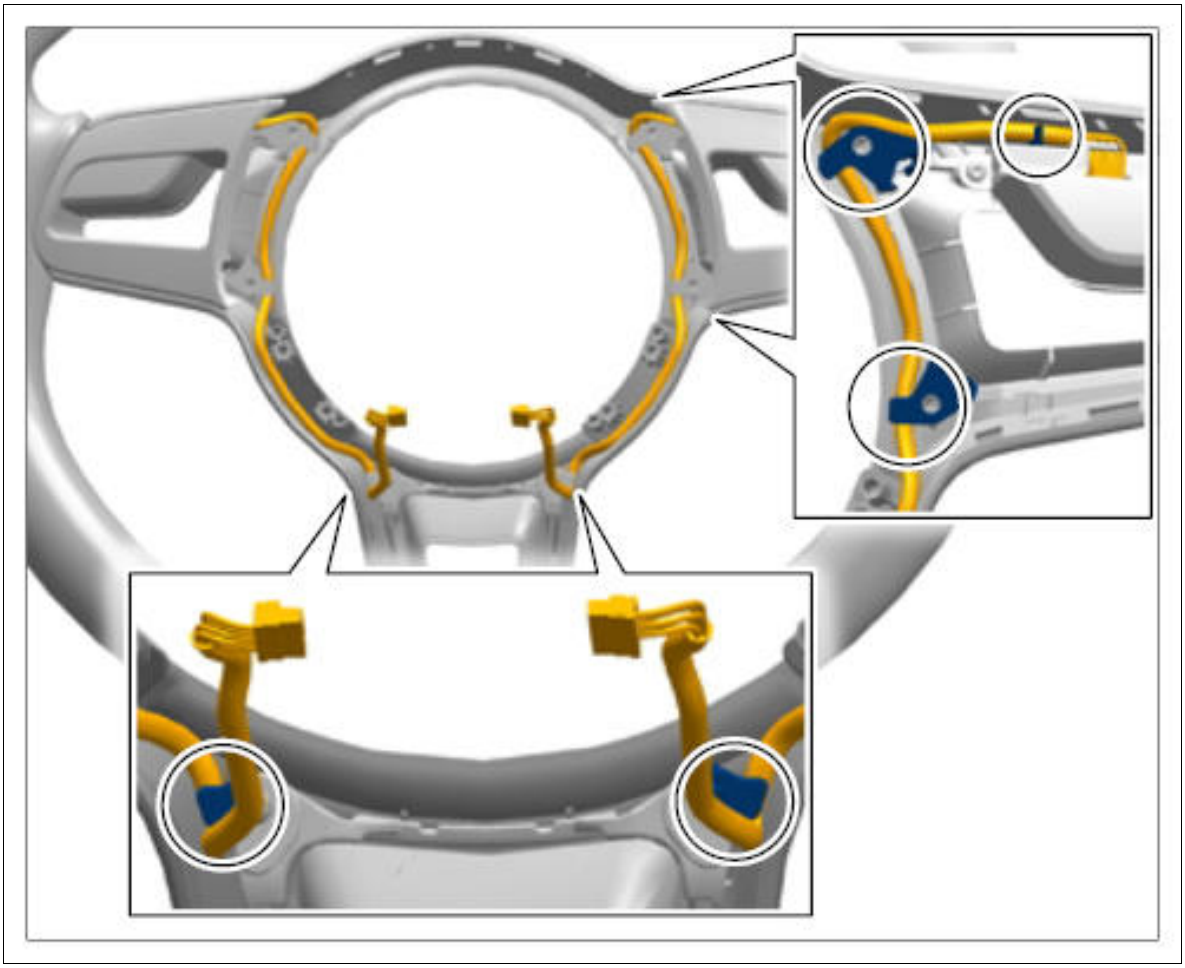
Fig 2: Identifying Multi-Functional Switch And Front Trim On Main Trim



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Check cable routing! Route cables under the plastic lugs, see marked positions. → Cable routing for multi-functional switch in main trim

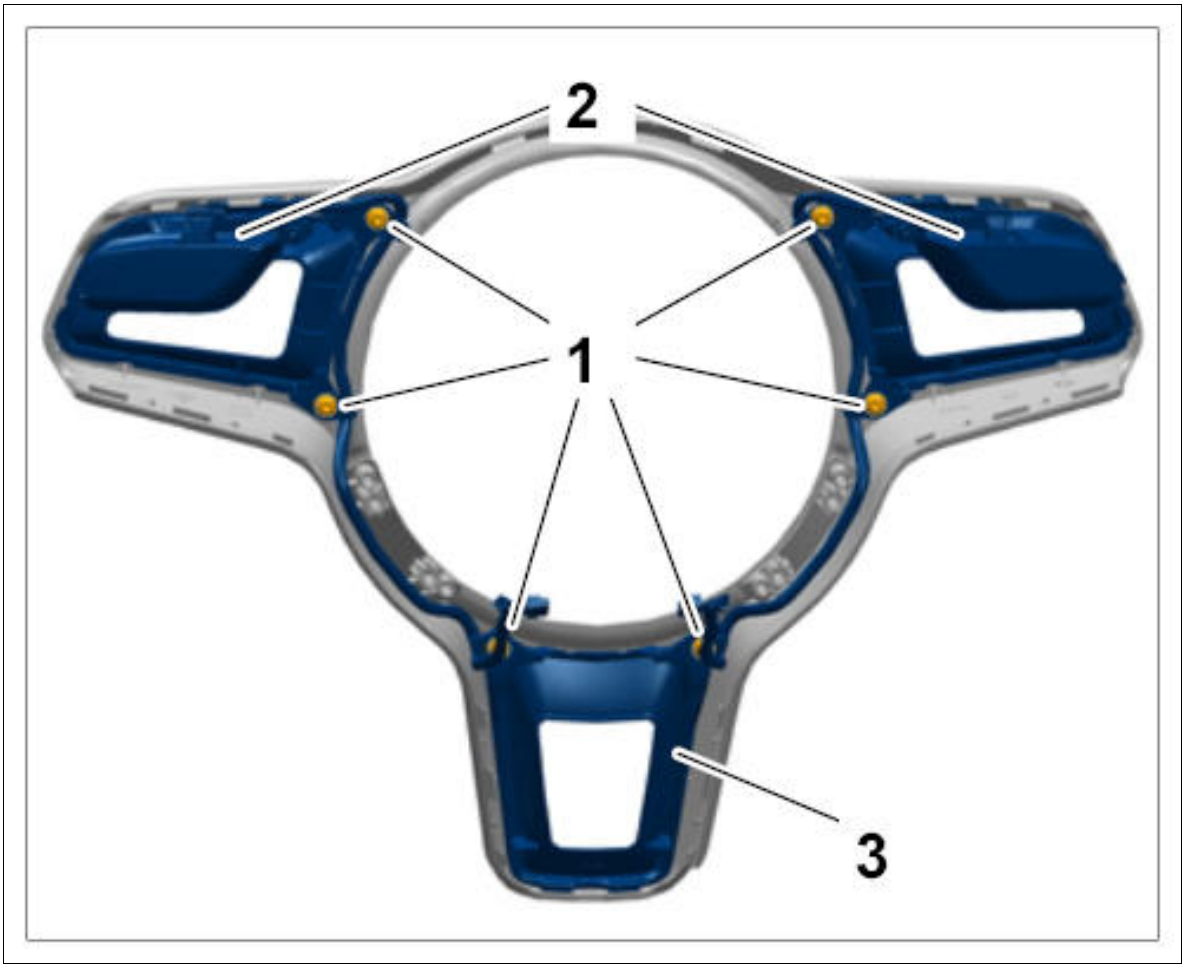
Fig 3: Identifying Cable Routing For Multi-Functional Switch In Main Trim



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Tighten fastening screws **-1-** for the multi-functional switch **-2-** and front trim **-3-** . **Tightening torque 0.45 Nm (0.25 ftlb.)**

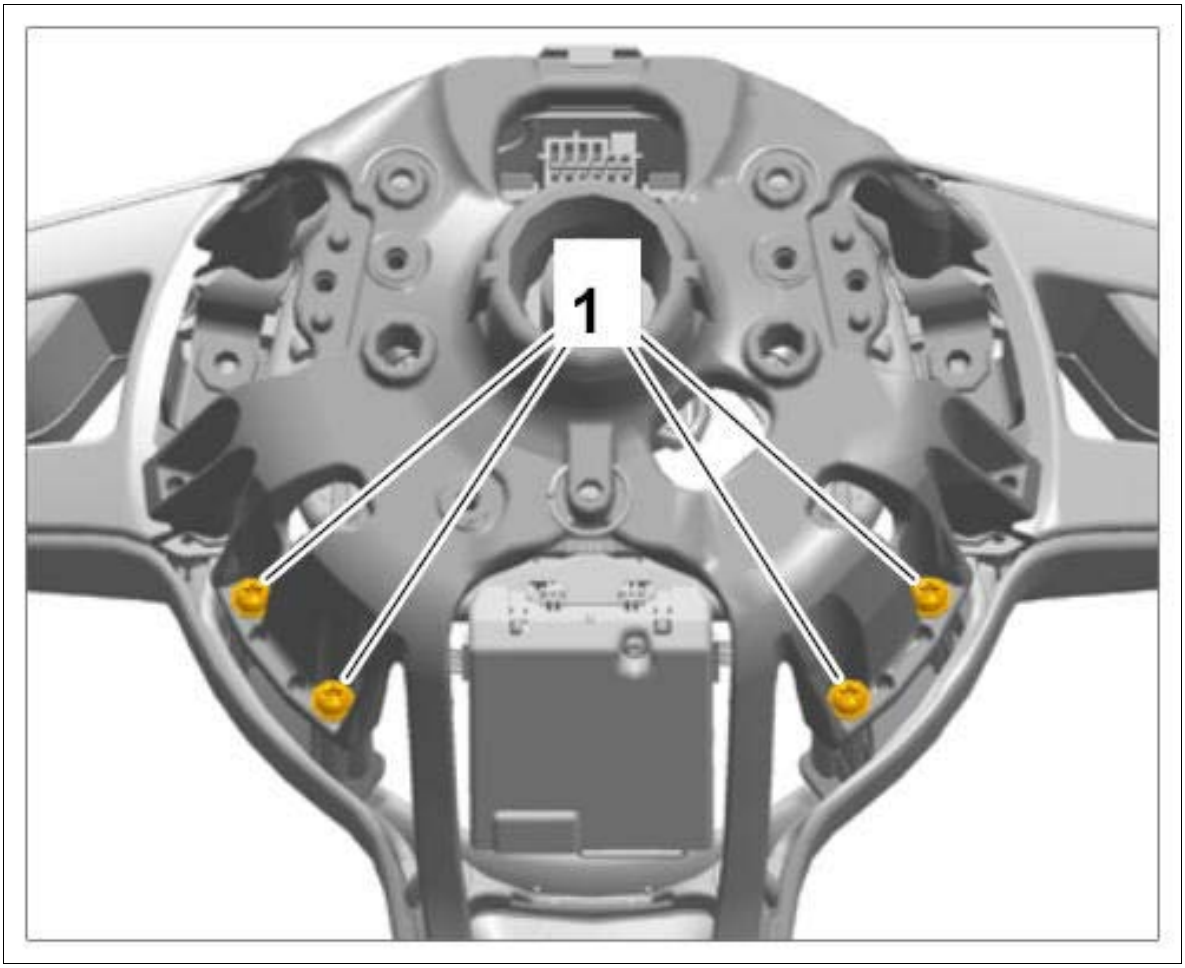
Fig 4: Identifying Multi-Functional Switch And Front Trim On Main Trim



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Tighten fastening screws **-1-** for main trim. **Tightening torque 2 Nm (1.5 ftlb.)**

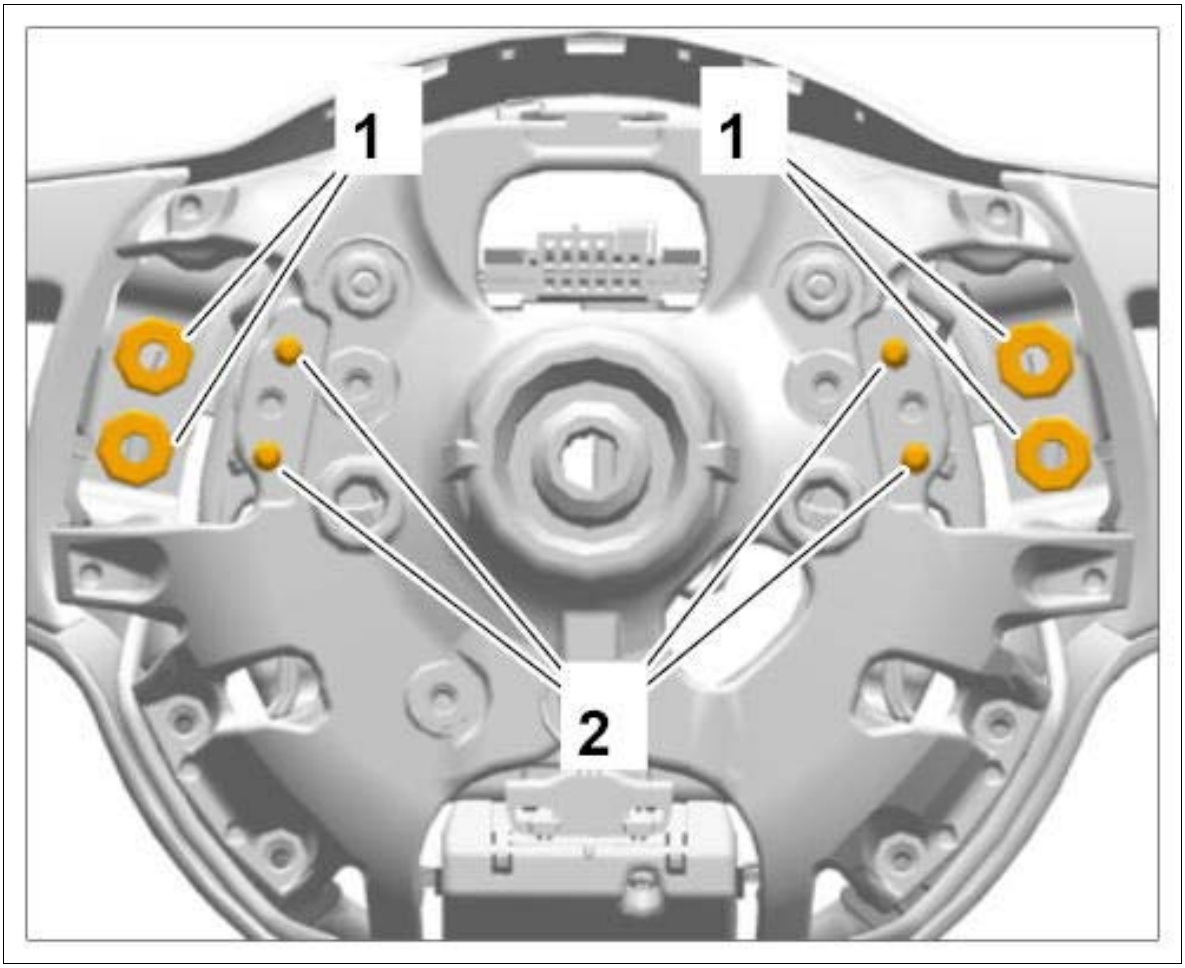
Fig 5: Identifying Main Trim



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Insert paddles into guides **-1-** and **-2-** .

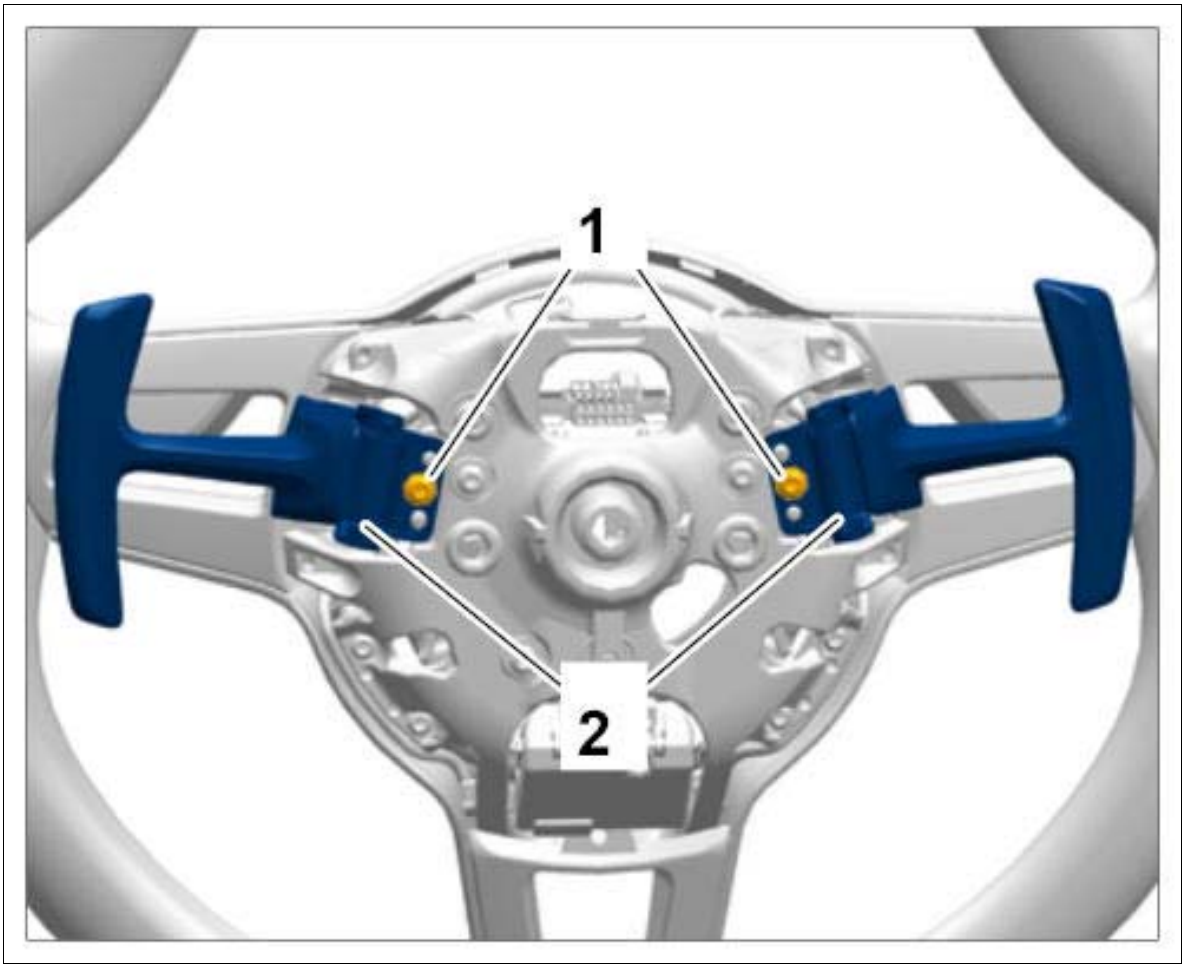
Fig 6: Identifying Guides For Paddles



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Tighten fastening screws **-1-** for the paddles **-2-** . **Tightening torque 2.5 Nm (2 ftlb.)**

Fig 7: Identifying Screws For Paddles

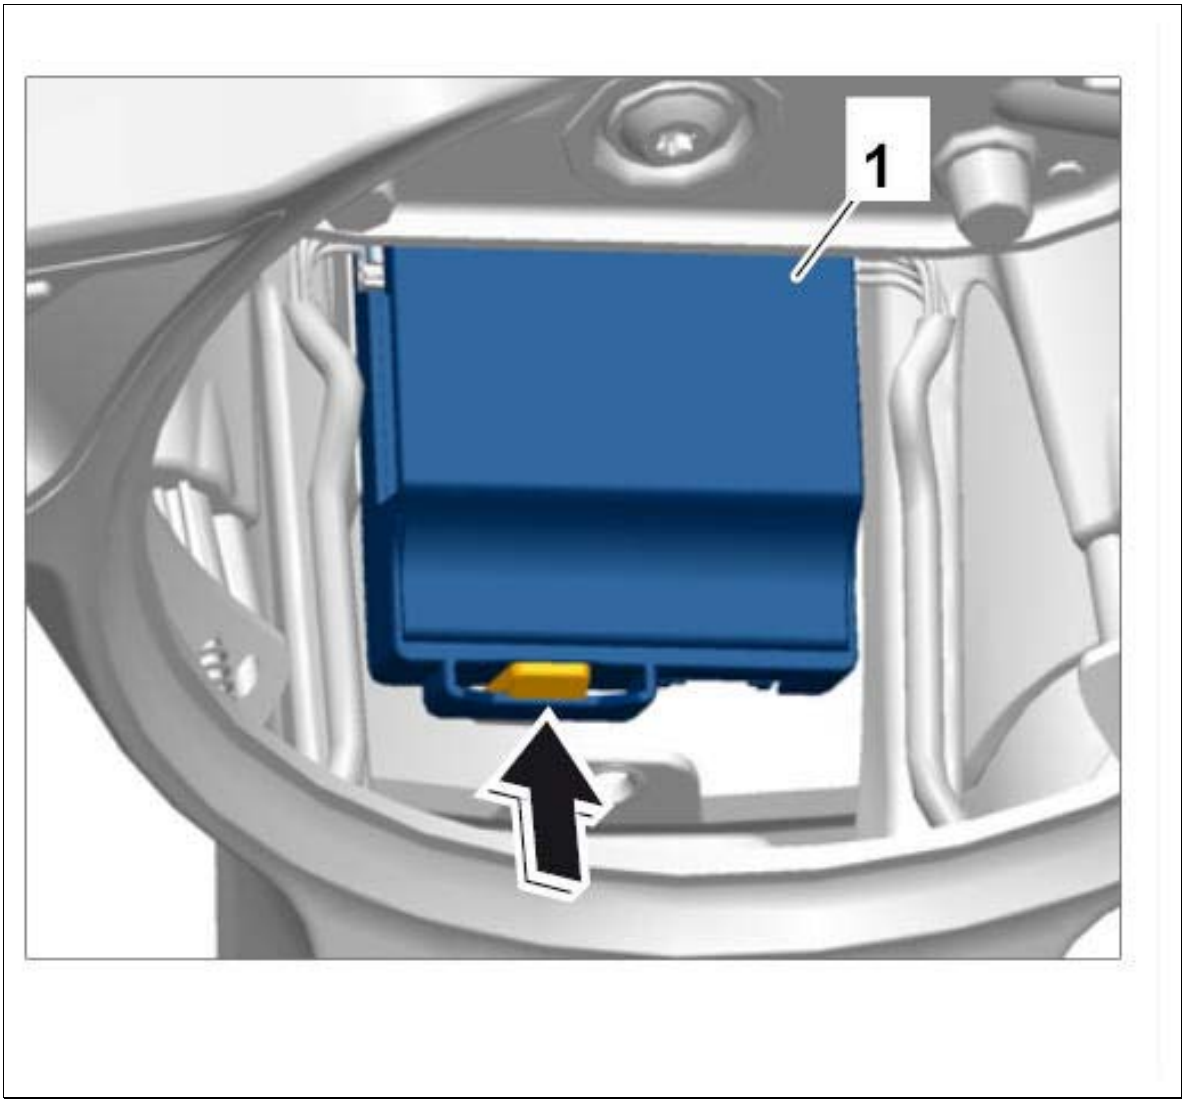


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Insert control unit **-1-** at the rear in the steering wheel and lock it.

   Then lock the control unit at the front in the steering wheel at position **-arrow-** .

Fig 8: Inserting Control Unit



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Tighten fastening screws **-1-** on rear cover **-2-** . **Tightening torque 2.7 Nm (2 ftlb.)**

Fig 9: Identifying Screws On Back Cover

WM 481037 DISASSEMBLING AND ASSEMBLING STEERING WHEEL (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install steering wheel → INSTALLING STEERING WHEEL .

WM 481319 REMOVING AND INSTALLING STEERING COLUMN CASING (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Lower part of casing to steering column		Tightening torque	1.5 Nm (1 ftlb.)		

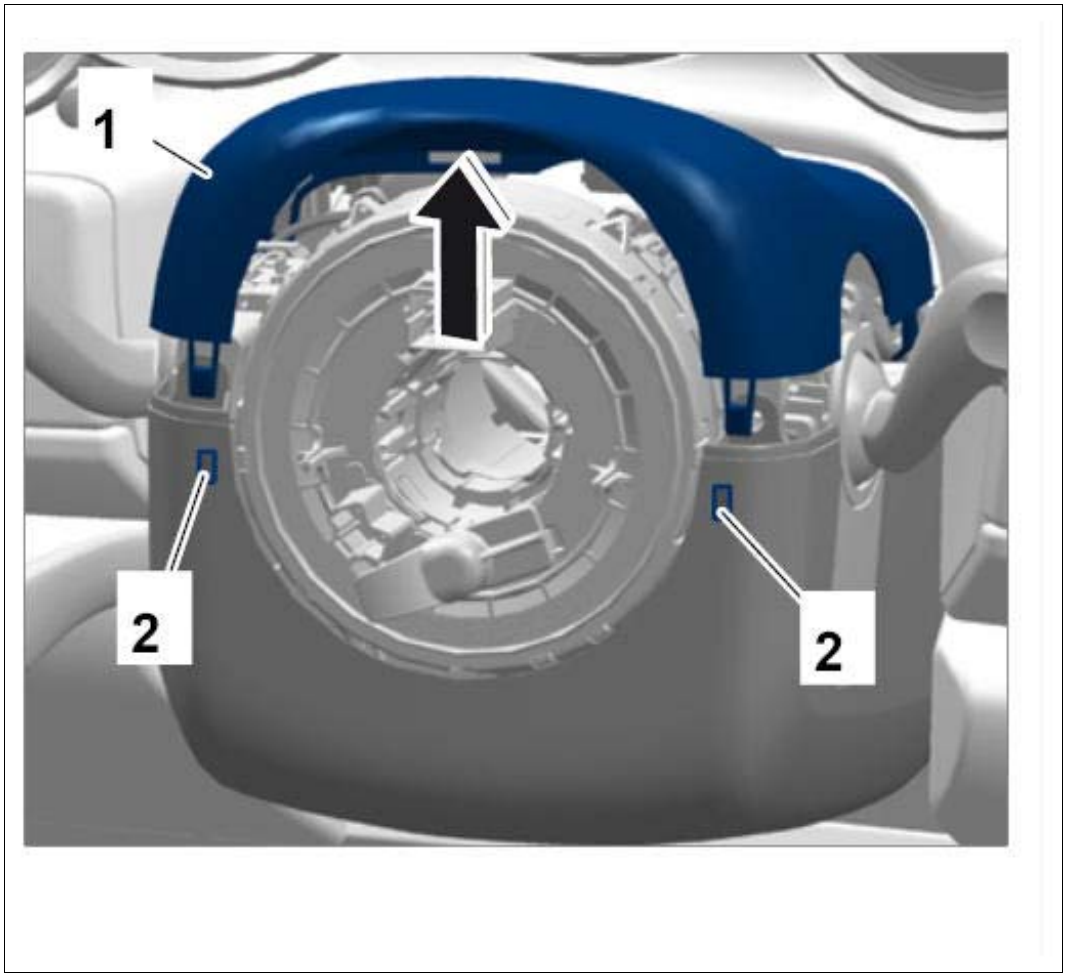
WM 481319 REMOVING AND INSTALLING STEERING COLUMN CASING (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. **Only for electric steering-wheel adjustment:** Remove switch for height and fore-and-aft adjustment → 482919 REMOVING AND INSTALLING SWITCH FOR HEIGHT AND FORE-AND-AFT ADJUSTMENT .

WM 481319 REMOVING AND INSTALLING STEERING COLUMN CASING (MACAN, MACAN S, MACAN TURBO) > REMOVING STEERING COLUMN CASING

1. Adjust steering wheel to its lower position.
2. Unclip upper part of casing.
    1. 2.1. Turn steering wheel in such a way that the openings on the front are accessible.
    2. 2.2. Unclip upper part of casing **-1-** through the openings on the front **-2-** using a suitable screwdriver.

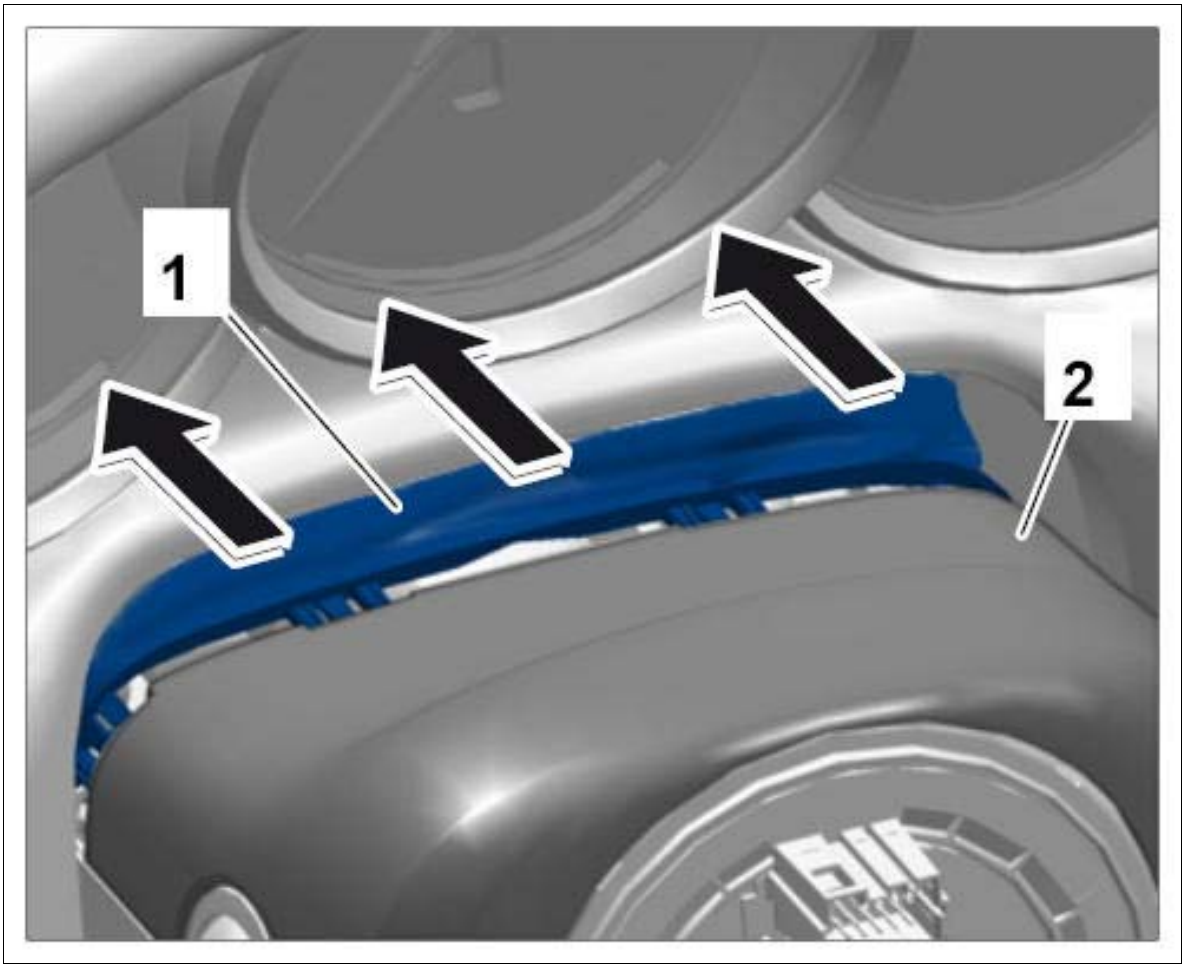
    Fig 1: Removing Upper Part Of Casing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unhook dust boot **-1-** on upper part of casing **-2-** and push it back.

Fig 2: Removing Dust Boot



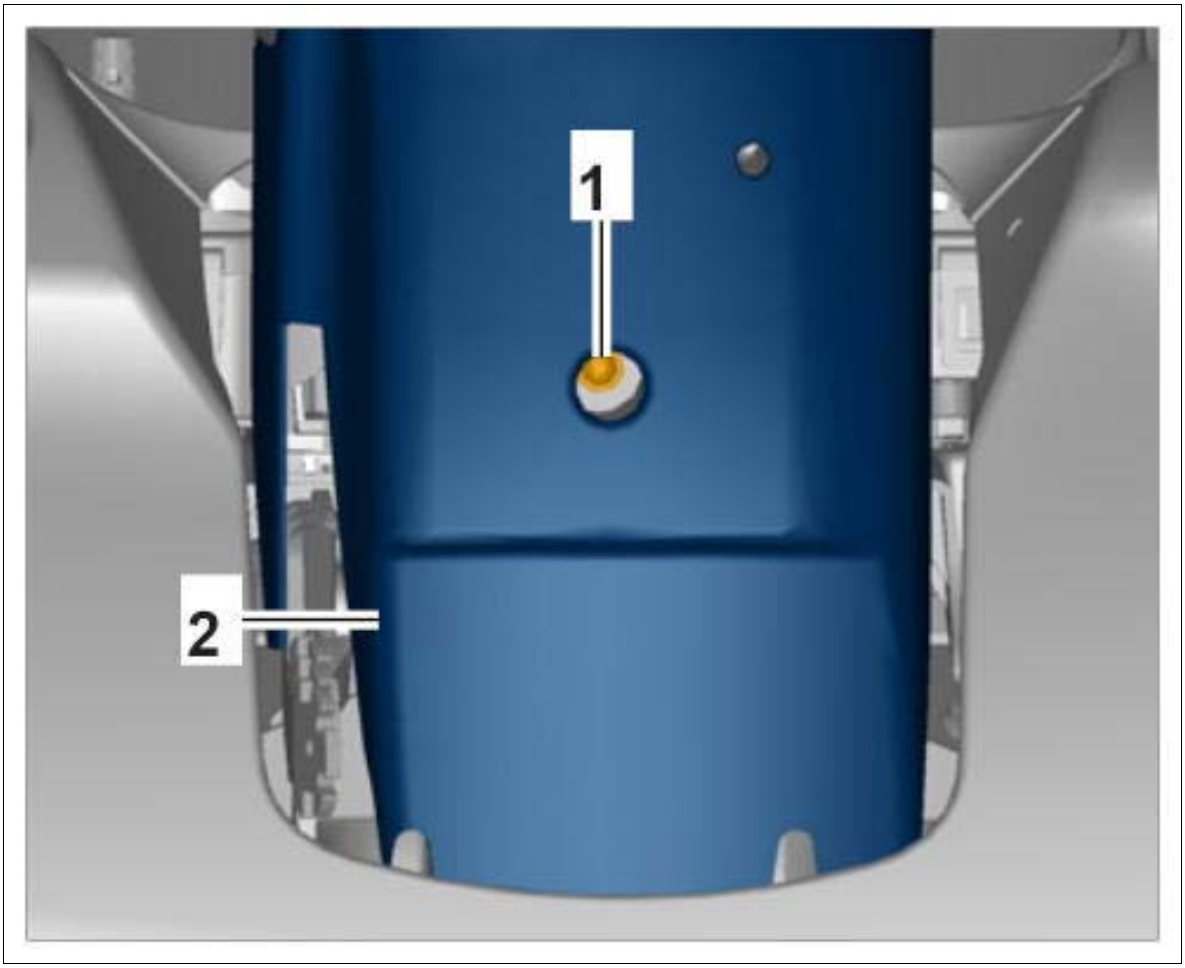
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove upper part of casing.
5. Release lower part of casing.

   Only for manual steering-wheel adjustment:

   Unscrew fastening screw **-1-** on lower part of casing **-2-** .

Fig 3: Identifying Screw On Lower Part (Manual Steering-Wheel Adjustment)

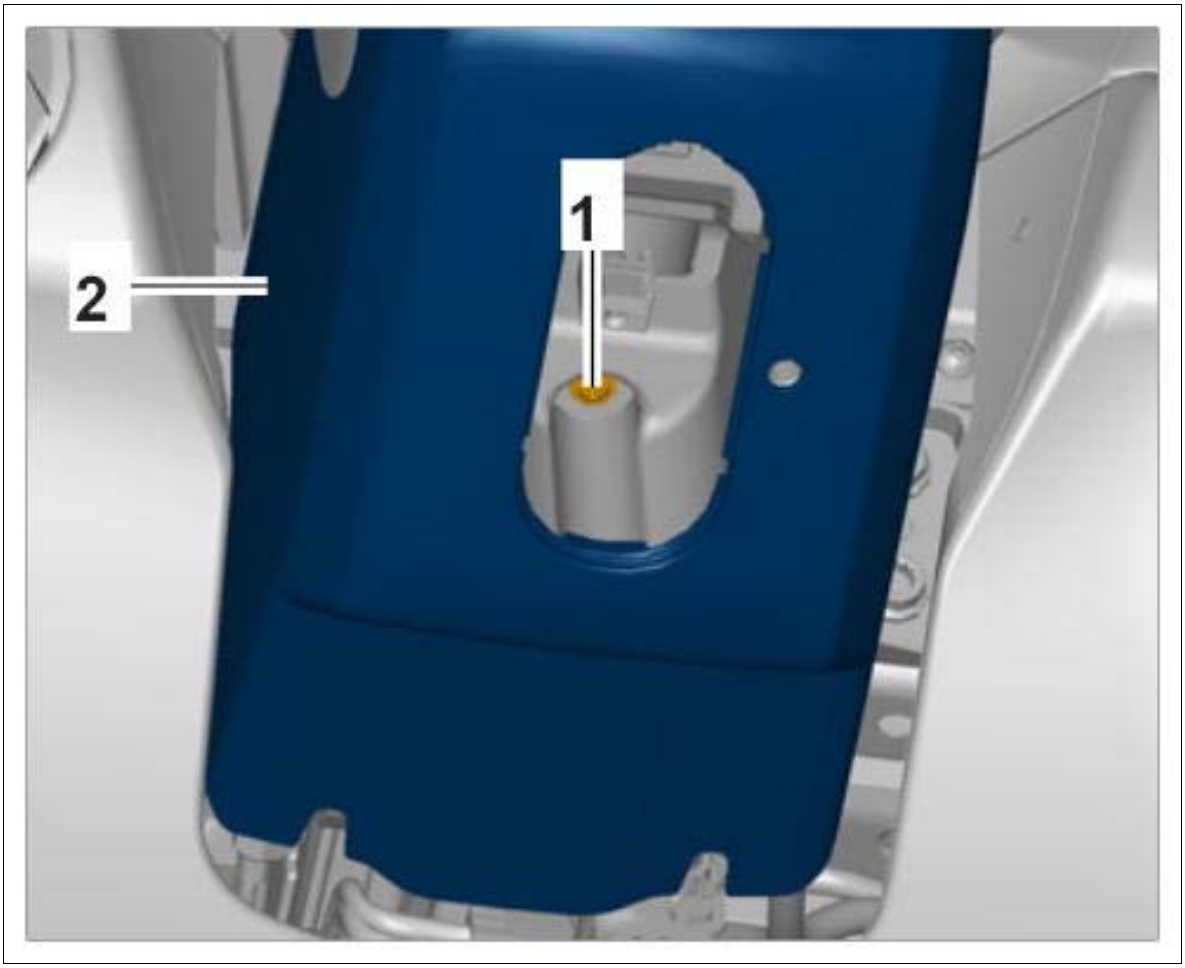


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Only for electric steering-wheel adjustment:

Unscrew fastening screw **-1-** in recess on lower part of casing **-2-** .

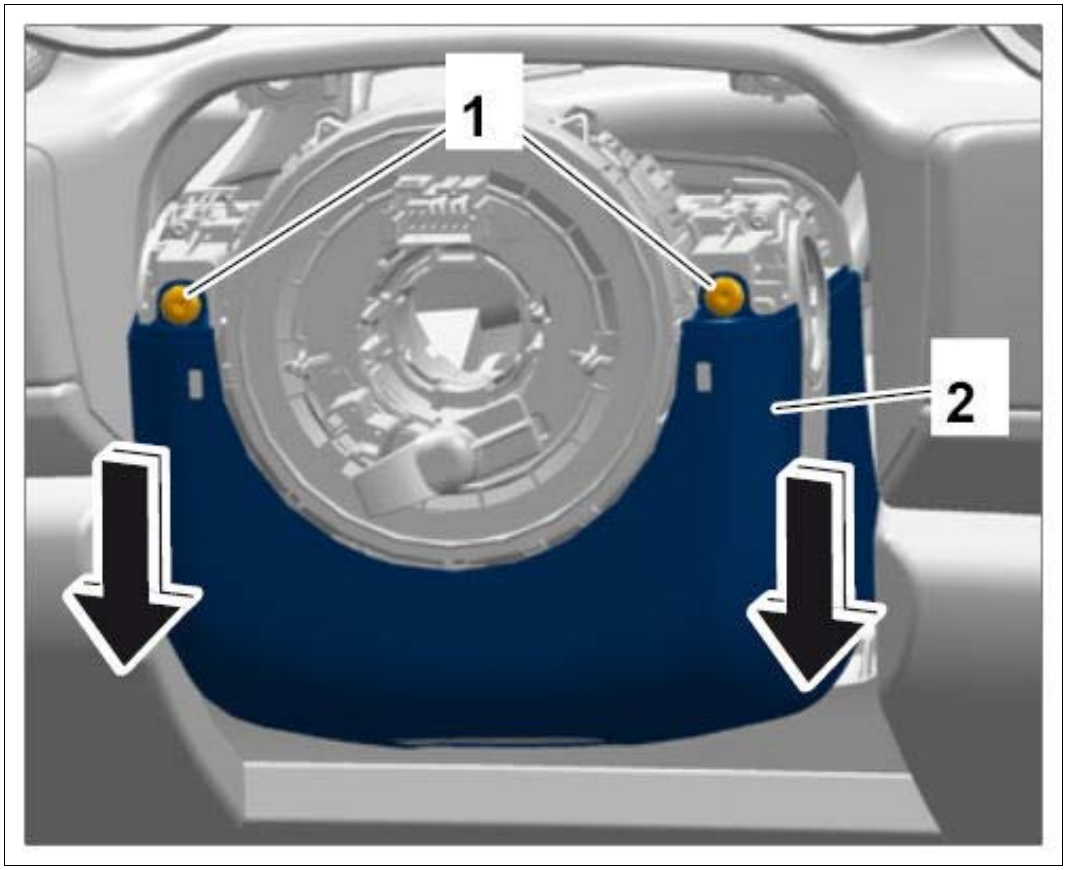
Fig 4: Identifying Screw On Lower Part (Electric Steering-Wheel Adjustment)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 5.1. Turn the steering wheel in such a way that the fastening screws **-1-** on the front are accessible.

Fig 5: Removing Screws On Lower Part (Front)



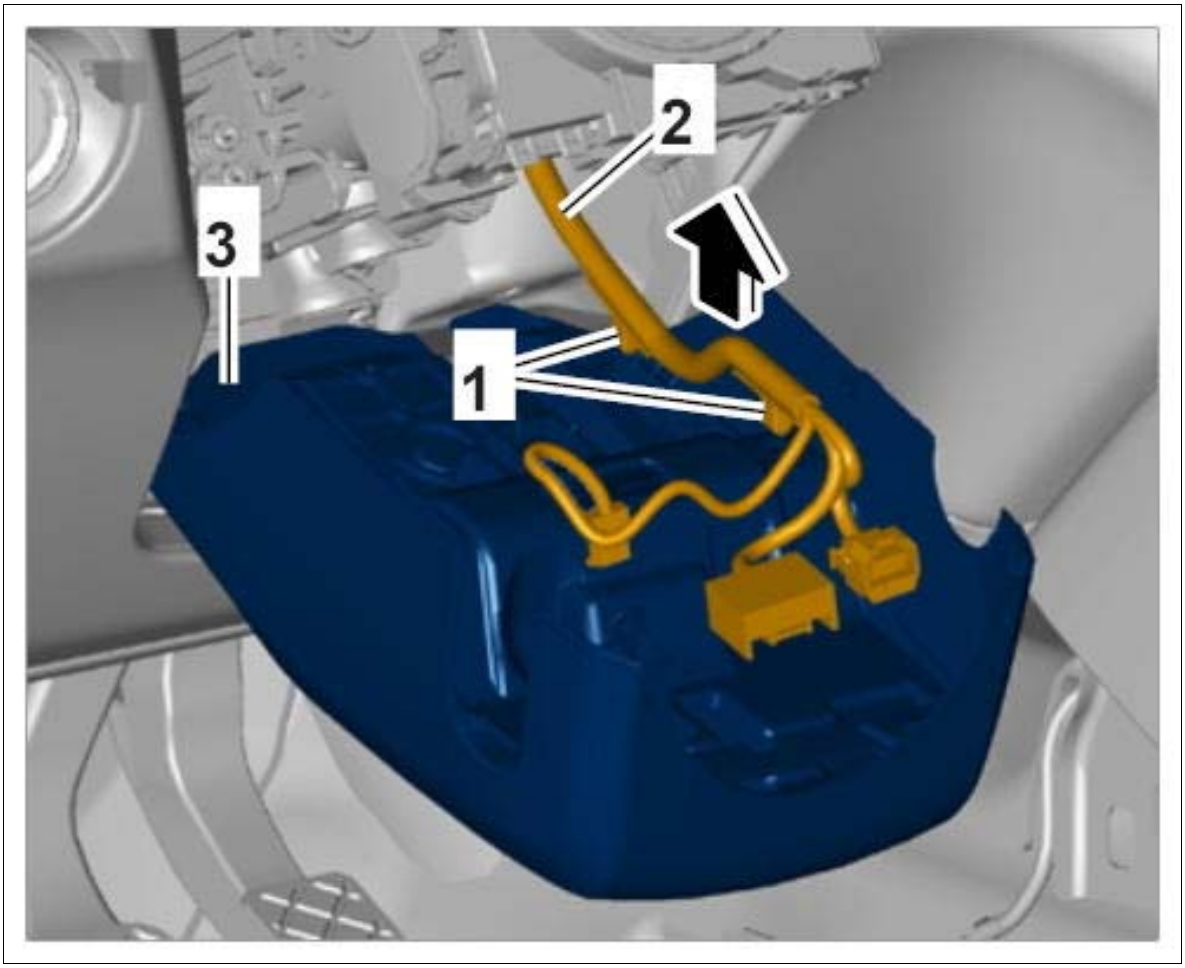
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 5.2. Unscrew fastening screws **-1-** on the front of the lower part of casing **-2-** .

3. 5.3. Fold lower part of casing **-2-** down out of the way **-arrows-** .

6. Unclip wiring harness **-2-** from lower part of casing **-3-** at the positions **-1-** .

Fig 6: Removing Lower Part



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Remove lower part of casing **-3-** .

WM 481319 REMOVING AND INSTALLING STEERING COLUMN CASING (MACAN, MACAN S, MACAN TURBO) > INSTALLING STEERING COLUMN CASING

1. Installation is performed in reverse order to removal.

   Observe the specified tightening torque when tightening fastening screws on lower part of casing. **Tightening torque 1.5 Nm (1 ftlb.)**

WM 481319 REMOVING AND INSTALLING STEERING COLUMN CASING (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. **Only for electric steering-wheel adjustment:** Install switch for height and fore-and-aft adjustment → 482919 REMOVING AND INSTALLING SWITCH FOR HEIGHT AND FORE-AND-AFT ADJUSTMENT .

WM 481519 REMOVING AND INSTALLING STEERING COLUMN (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Steering column to retaining frame/module cross member	M8 x 30 thread	Tightening torque	20 Nm (15 ftlb.)		
Steering column to mounting saddle	M8 x 22 thread	Tightening torque	20 Nm (15 ftlb.)		
Steering column to intermediate steering shaft (universal joint)	M8 x 30 thread/always use new screw or bolt following removal	Tightening torque	30 Nm (22 ftlb.)		

WM 481519 REMOVING AND INSTALLING STEERING COLUMN (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

Information

- The fore-and-aft adjustment must be brought to the fully extended position for the electrically adjustable steering column. The vertical adjustment must be moved to the center position. This will improve access to the fastening screws on the mounting bracket.

1. Remove steering-column switch → 945019 REMOVING AND INSTALLING STEERING-COLUMN SWITCH .
2. Remove trim panel under dashboard → 701919 REMOVING AND INSTALLING TRIM PANEL UNDER DASHBOARD .
3. Remove front footwell outlet vent on the driver's side → 805519 REMOVING AND INSTALLING FRONT FOOTWELL OUTLET VENT .

WM 481519 REMOVING AND INSTALLING STEERING COLUMN (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install front footwell outlet vent on the driver's side → INSTALLING FRONT LEFT FOOTWELL OUTLET VENT .
2. Install trim panel under dashboard → INSTALLING TRIM PANEL UNDER DASHBOARD AT THE RIGHT .
3. Install steering-column switch → INSTALLING STEERING-COLUMN SWITCH .
4. Calibrate steering-angle sensor → 456005 INITIALIZING AND CALIBRATING STEERING-ANGLE SENSOR .

WM 481555 REPLACING STEERING COLUMN (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove steering column → 481519 REMOVING AND INSTALLING STEERING COLUMN .

WM 481555 REPLACING STEERING COLUMN (MACAN, MACAN S, MACAN TURBO) > REPLACING STEERING COLUMN

1. Change the control units for steering column adjustment and electronic steering column lock (ELV).

   → 483019 REMOVING AND INSTALLING CONTROL UNIT FOR HEIGHT ADJUSTMENT

   → 480819 REMOVING AND INSTALLING CONTROL UNIT FOR ELV

WM 481555 REPLACING STEERING COLUMN (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install steering column → INSTALLING STEERING COLUMN .

WM 4815IN ASSESSMENT OF STEERING COLUMN AFTER ACCIDENT DAMAGE (MACAN, MACAN S, MACAN TURBO) > INFORMATION > FUNDAMENTALS

Various kinds of damage can be caused to steering columns in the event of accidents or driving conditions similar to accidents. In cases where the steering column shows no external damage it can be difficult to detect damage. This damage represents an unacceptable risk for the vehicle, since it could lead to failure of the steering system.

To decide whether the steering column of a vehicle involved in an accident must be replaced or may continue to be used, the following guidelines are helpful.

WM 4815IN ASSESSMENT OF STEERING COLUMN AFTER ACCIDENT DAMAGE (MACAN, MACAN S, MACAN TURBO) > INFORMATION > ASSESSMENT OF THE STEERING COLUMN OF A VEHICLE INVOLVED IN AN ACCIDENT

The steering column may remain in the vehicle if all the following conditions are met:

No visible damage (breakage, cracks, deformation) to such front-axle parts as steering arms, steering gear, steering column mountings, steering wheel and airbag unit, wheel rims, wheel bearing housing (wheel carriers), tie rods, steering shaft or to the points on the body where wheel suspension parts are bolted on.

No unacceptable rise in torque and no jamming or catching when the steering gear is turned from stop to stop. The front wheels must be free (front axle raised) when turning and the ignition must be switched off (no power assistance).

The steering column does not catch/jam when turned separately without steering gear.

No axial play in the steering column.

The steering column must be replaced by a new or replacement unit if one of the following points applies:

Impact is felt by occupants.

Airbag has been triggered.

Visible or perceptible damage to the steering column.

Play in steering shaft line.

Fire damage.

In addition, for vehicles with electrically adjustable steering columns, if the adjustment does not function perfectly (the axial and/or vertical adjustment time from stop to stop is too long, unusual noises are heard in this area).

The steering intermediate shaft and/or a universal joint is touching another component or has clearance of less than 5 mm.

The steering wheel is more than 10° out of line when the marking for steering center position overlaps → 449503 SUSPENSION ALIGNMENT, COMPLETE refer to "Adjusting toe".

If permanent deformation, breakage, cracks or play have been detected in:

steering gear,

steering column mountings,

tie rods,

steering arms,

spring struts,

wheel carriers,

control arms,

front-axle carrier (chassis subframe)

then the steering column must be checked according to the criteria listed above.

WM 482819 REMOVING AND INSTALLING INTERMEDIATE STEERING SHAFT (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Steering column to intermediate steering shaft (universal joint)	M8 x 30 thread/always use new screw or bolt following removal	Tightening torque	30 Nm (22 ftlb.)		

Intermediate steering shaft to steering gear (universal joint)	M8 x 30 thread/always use new screw or bolt following removal	Tightening torque	30 Nm (22 ftlb.)		

WM 482819 REMOVING AND INSTALLING INTERMEDIATE STEERING SHAFT (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Turn wheels to straight-ahead position (steering wheel in center position).
2. Move steering wheel all the way back.
3. Remove front underbody panelling → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY .
4. Remove front-axle support → 400819 REMOVING AND INSTALLING FRONT-AXLE SUPPORT .

WM 482819 REMOVING AND INSTALLING INTERMEDIATE STEERING SHAFT (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING INTERMEDIATE STEERING SHAFT > REMOVING INTERMEDIATE STEERING SHAFT

Information

- The sealing bellows and intermediate steering shaft are one unit.
- The sealing bellows cannot be removed from the intermediate steering shaft.
- Do not try to remove the sealing bellows from the intermediate steering shaft!

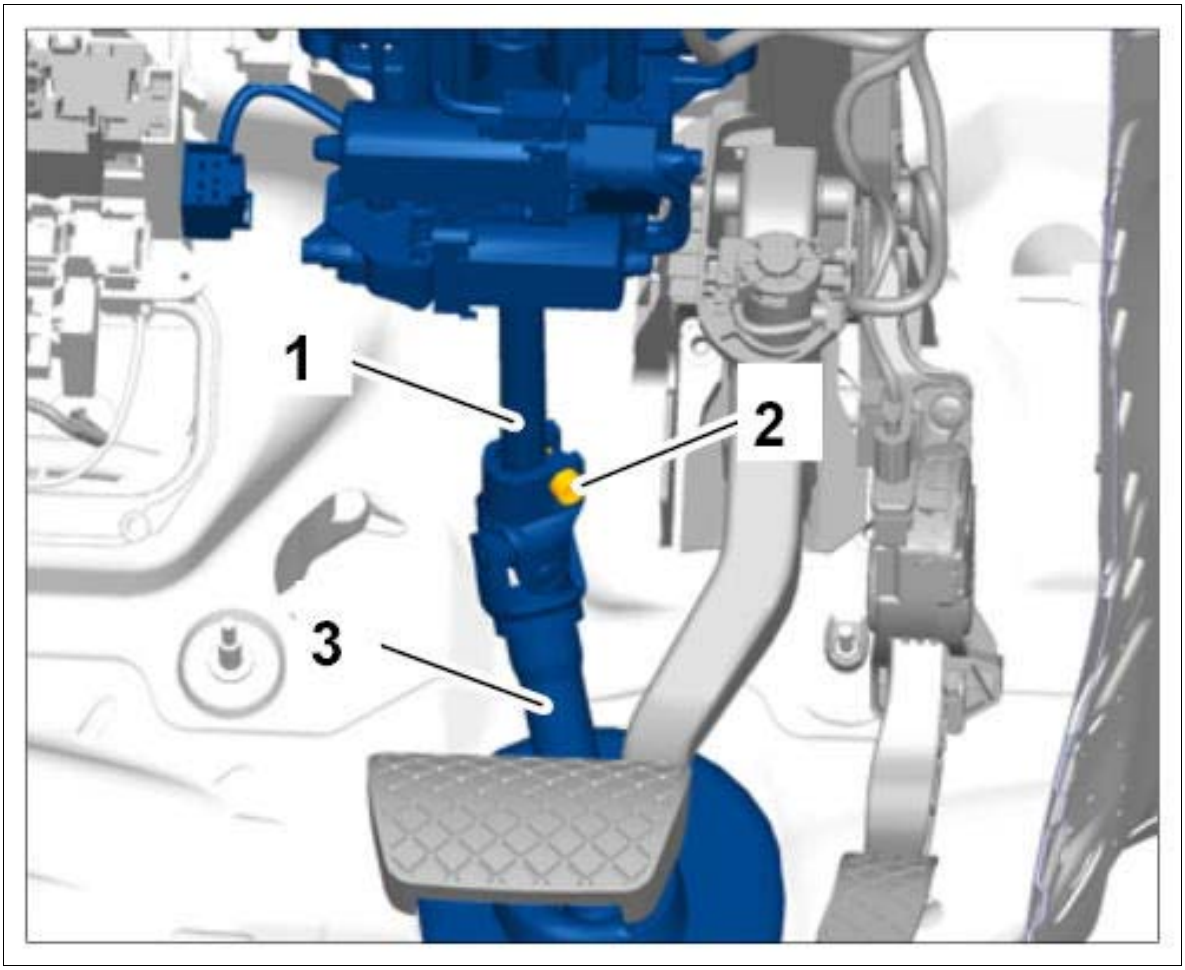
Fig 1: Locating Intermediate Steering Shaft Position

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Unscrew fastening screw **-2-** on universal joint.

   Pull intermediate steering shaft **-3-** off the steering column **-1-** .

Fig 2: Identifying Steering Column On Intermediate Steering Shaft

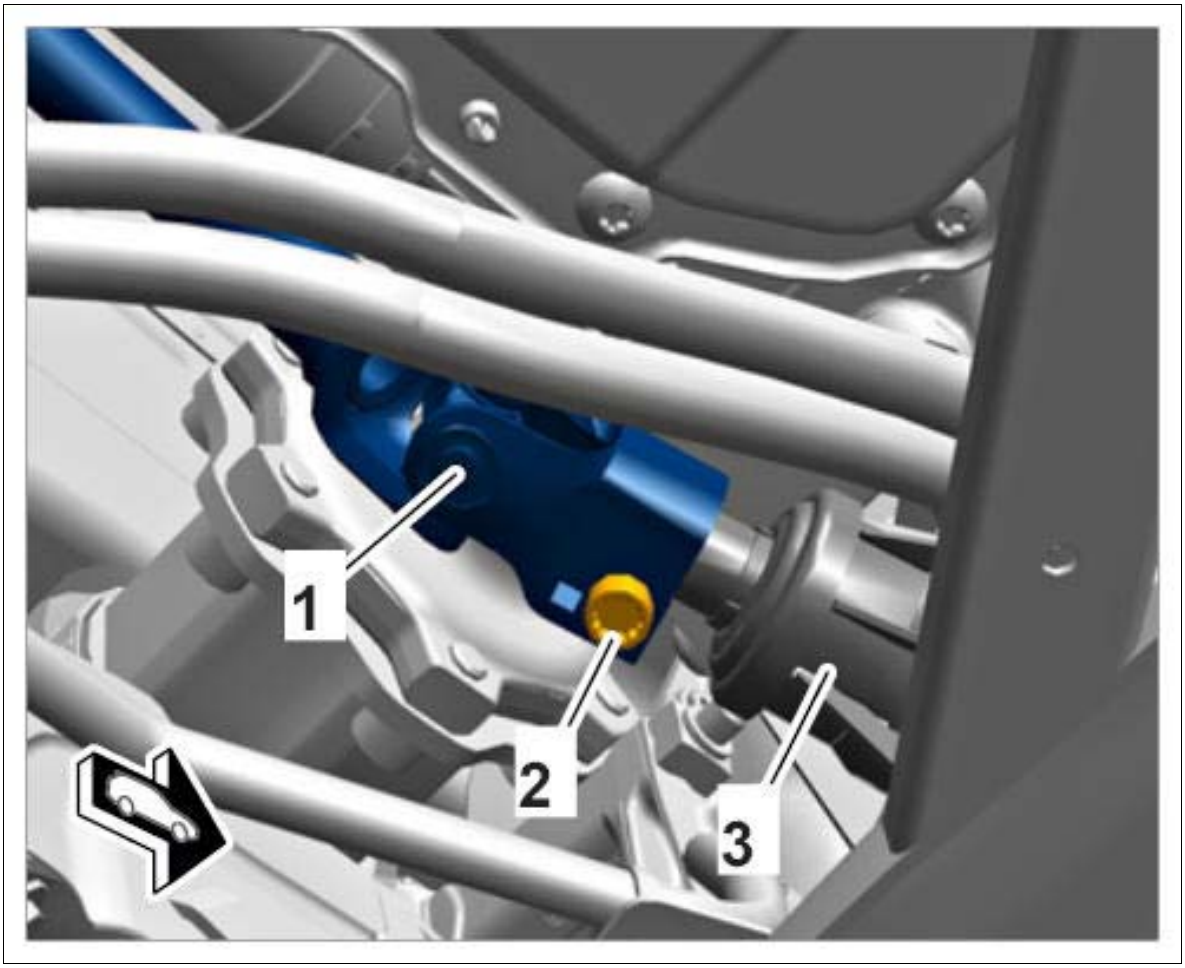


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Unscrew fastening screw **-2-** on universal joint.

   Pull intermediate steering shaft **-1-** off the steering gear **-3-** .

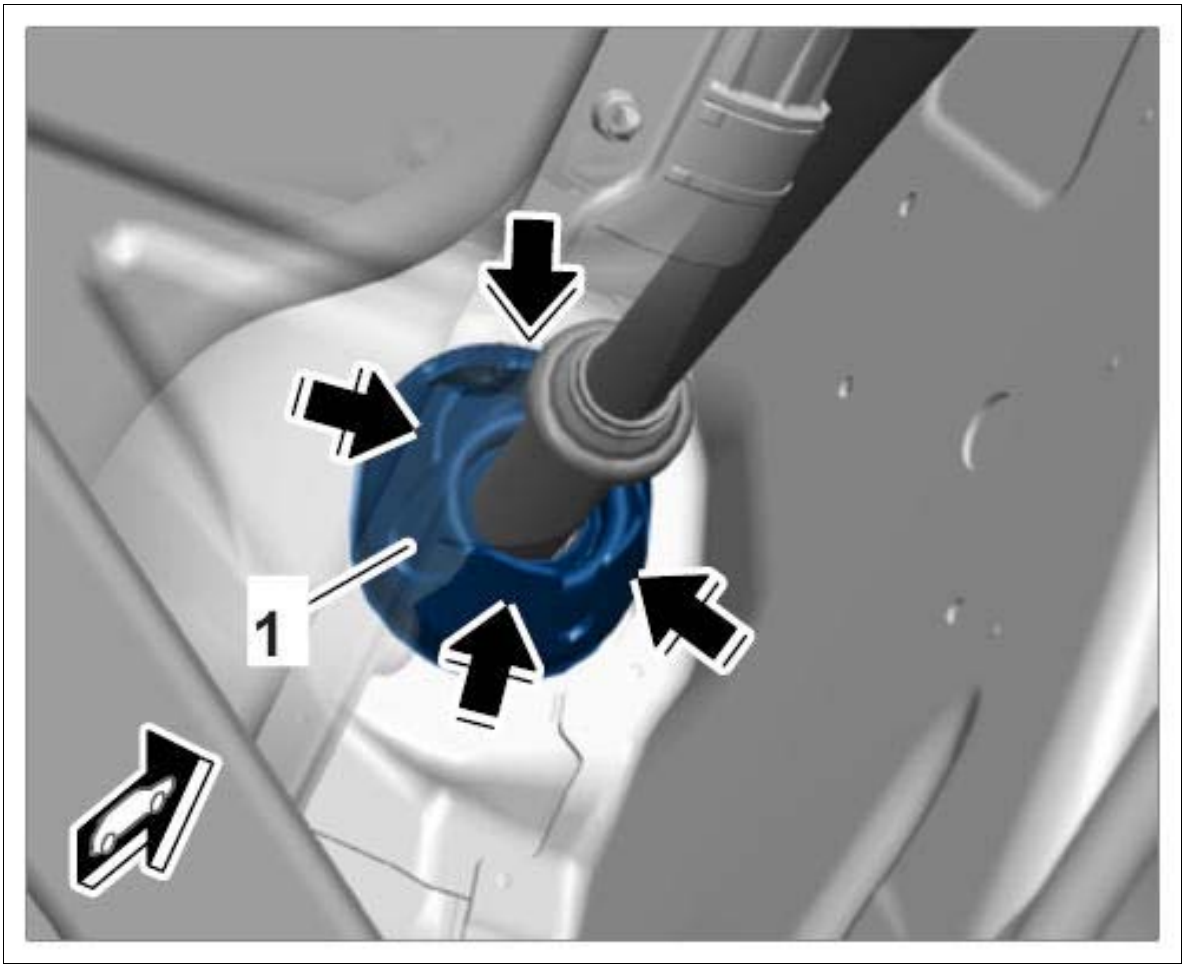
Fig 3: Removing Intermediate Steering Shaft On Steering Gear



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Press sealing bellows **-1-** together on the tabs **-arrows-** and press into the interior of the vehicle.

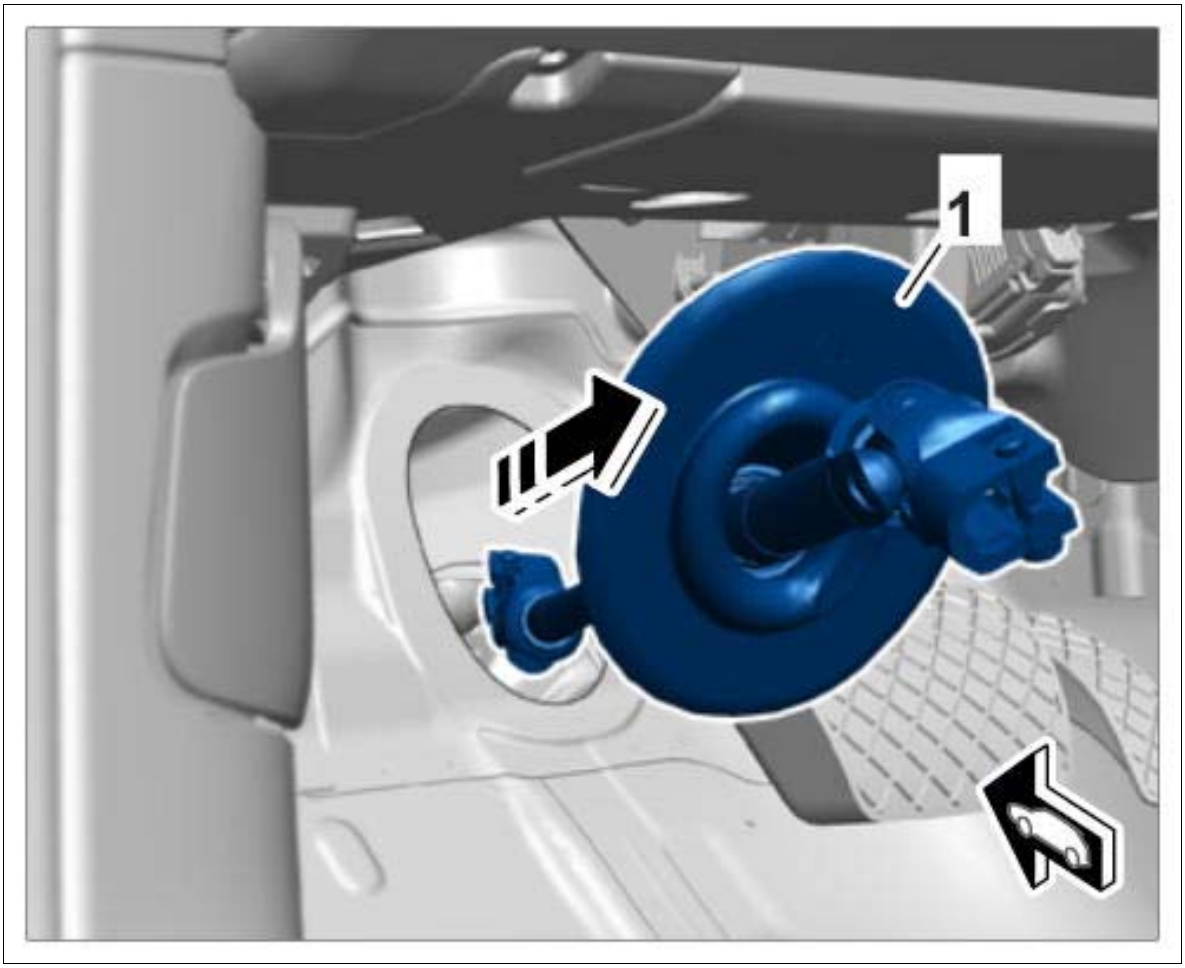
Fig 4: Pressing Sealing Bellows On Body (Underside)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove intermediate steering shaft **-1-** by pulling it towards the passenger compartment **-arrow-** .

Fig 5: Removing Intermediate Steering Shaft

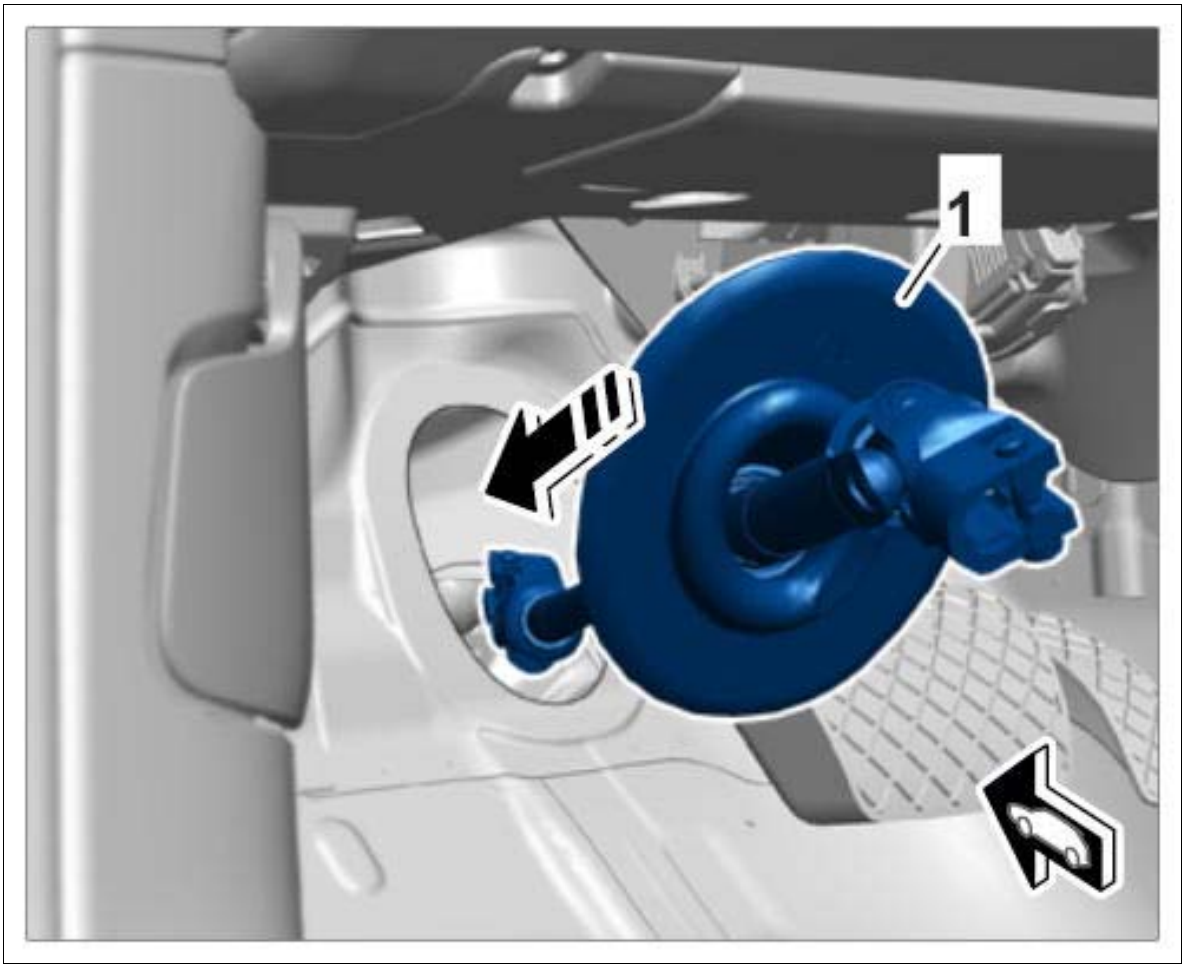


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 482819 REMOVING AND INSTALLING INTERMEDIATE STEERING SHAFT (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING INTERMEDIATE STEERING SHAFT > INSTALLING INTERMEDIATE STEERING SHAFT

1. Position intermediate steering shaft **-1-** from within the passenger compartment **-arrow-** .

Fig 1: Positioning Intermediate Steering Shaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

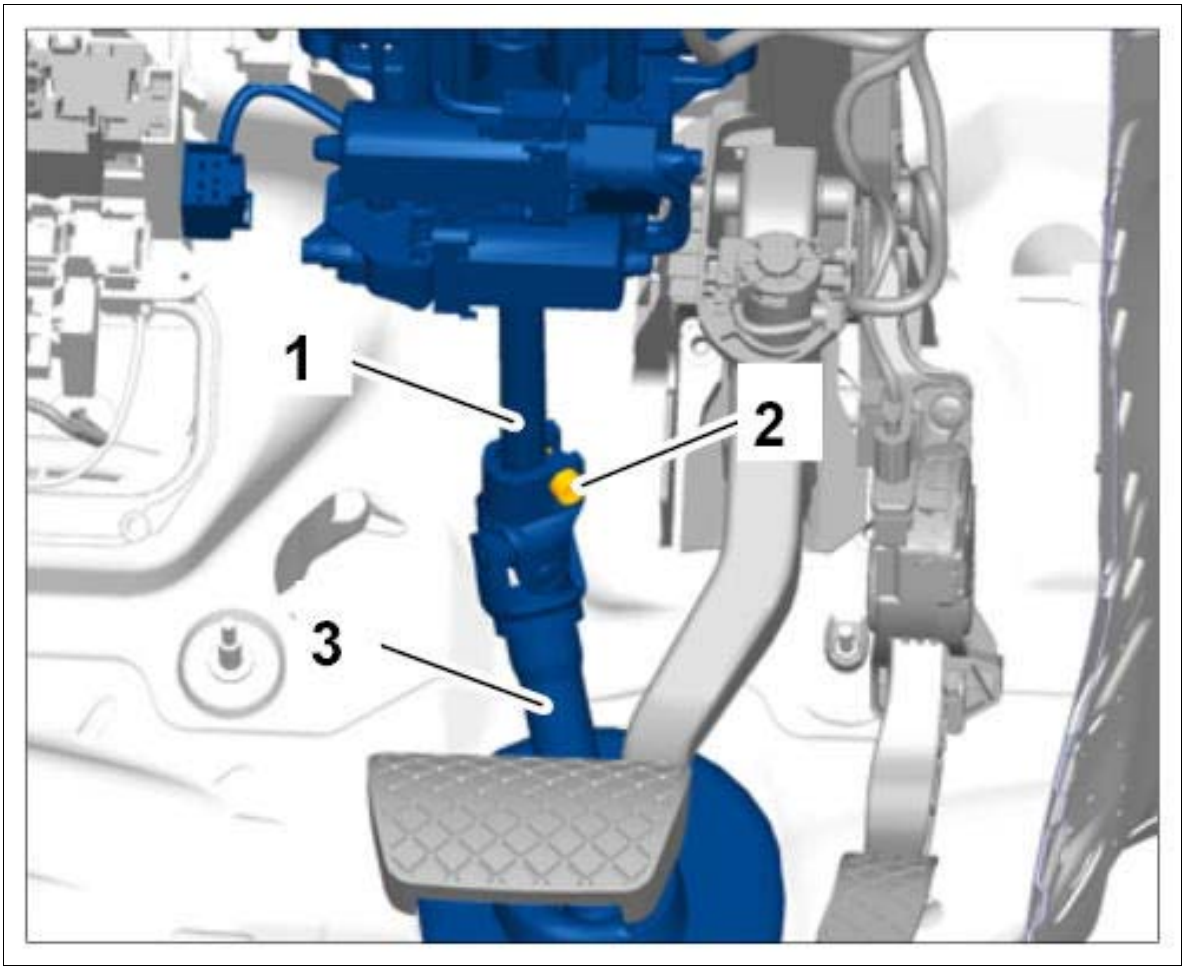
2. Fit intermediate steering shaft **-3-** as far as it will go onto the steering column **-1-** .

   Information

   Always replace the clamping screw on the universal joint.

   Tighten fastening screw **-2-** . **Tightening torque 30 Nm (22 ftlb.)**

Fig 2: Identifying Steering Column On Intermediate Steering Shaft

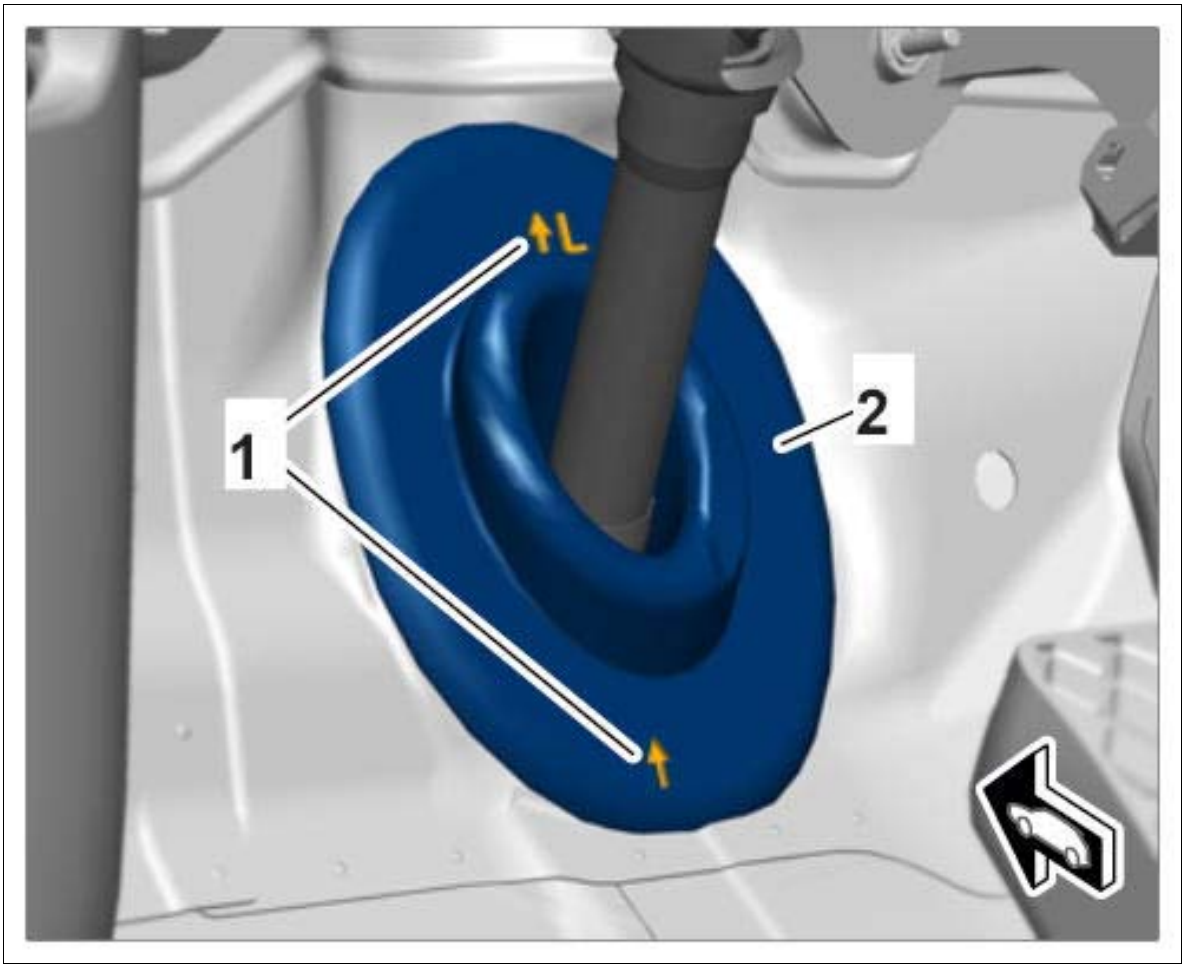


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Insert sealing bellows **-1-** as far as possible from within the passenger compartment.

   Make sure that the two arrows **-1-** are pointing upwards.

Fig 3: Positioning Sealing Bellows In Passenger Compartment



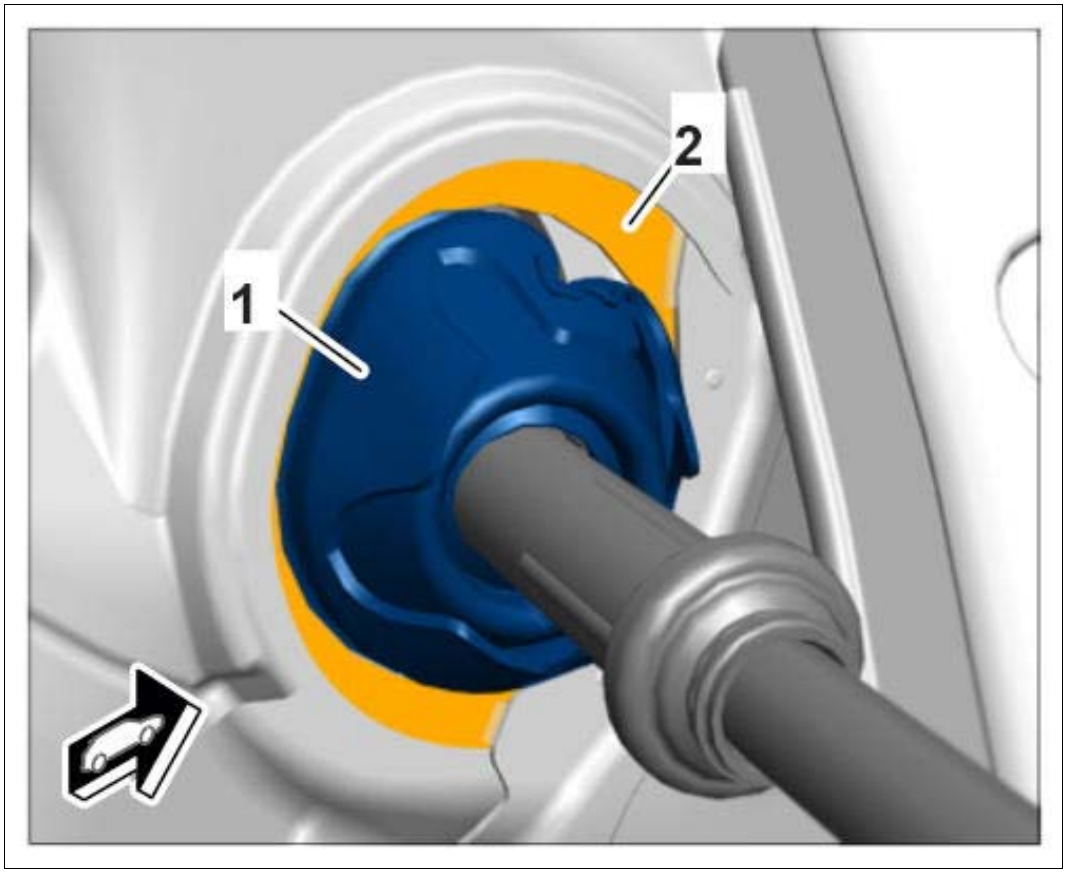
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Secure the sealing bellows on the underside of the vehicle.

    1. 4.1. Pull sealing bellows **-1-** in through the opening.
    2. 4.2. Fit the sealing bellows **-1-** onto the collar **-2-** of the body completely using the tabs without turning the sealing bellows.
    3. 4.3. Then check the installation position of the sealing bellows in the passenger compartment using the arrows. The arrows must be pointing straight up.

       Loosen the sealing bellows, turn it to the correct installation position and fit it again if necessary.

Fig 4: Fitting Sealing Bellows On Body (Underside)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Fit intermediate steering shaft **-1-** as far as it will go onto the steering gear **-3-** .

   Information

   Always replace the clamping screw on the universal joint.

   Tighten fastening screw **-2-** . **Tightening torque 30 Nm (22 ftlb.)**

WM 483055 REPLACING CONTROL UNIT FOR HEIGHT ADJUSTMENT (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 483055 REPLACING CONTROL UNIT FOR HEIGHT ADJUSTMENT (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Switch off ignition and replace control unit. → 483019 REMOVING AND INSTALLING CONTROL UNIT FOR HEIGHT ADJUSTMENT .

WM 483055 REPLACING CONTROL UNIT FOR HEIGHT ADJUSTMENT (MACAN, MACAN S, MACAN TURBO) > REPLACING CONTROL UNIT FOR HEIGHT ADJUSTMENT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition.
2. Select the vehicle type and start the diagnostic application.
3. **Extended identifications** must now be selected.
4. **Enter the vehicle identification number** and press [Enter] to confirm your entry.
5. Select the **Front-end electronics** control unit in the **overview** .
6. **Maintenance/repairs** must then be selected.
7. Select **Steering column adjustment normalizing run** and press [F12] to continue.
8. Follow the instructions on the Tester.
9. Start the **Steering column adjustment normalizing run** by pressing [F8].
10. The normalizing run ends once all end stops have been set.
11. Once the **procedure has been completed successfully** , press [F12] to continue.
12. Read out the fault memory and erase it if necessary.
13. Carry out a function test.

WM 485319 REMOVING AND INSTALLING BELLOWS FOR STEERING-GEAR HOUSING (JOINT BOOT) (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Inner clamp on bellows on passenger's side (diameter: 85 mm)	Fit using clamp tensioner V.A.G 1682 A	Tightening torque	7 Nm (5 ftlb.)		
Inner clamp on bellows on driver's side (diameter: 59 mm)	Fit using clamp tensioner V.A.G 1682 A	Tightening torque	10 Nm (7.5 ftlb.)		

WM 485319 REMOVING AND INSTALLING BELLOWS FOR STEERING-GEAR HOUSING (JOINT BOOT) (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove tie-rod ball → REMOVING AND INSTALLING TIE-ROD BALL 488119 REMOVING AND INSTALLING TIE-ROD BALL .
2. Remove front underbody panelling → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY .

WM 485319 REMOVING AND INSTALLING BELLOWS FOR STEERING-GEAR

HOUSING (JOINT BOOT) (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING BELLOWS FOR STEERING-GEAR HOUSING (JOINT BOOT) > REMOVING BELLOWS FOR STEERING-GEAR HOUSING (JOINT BOOT)

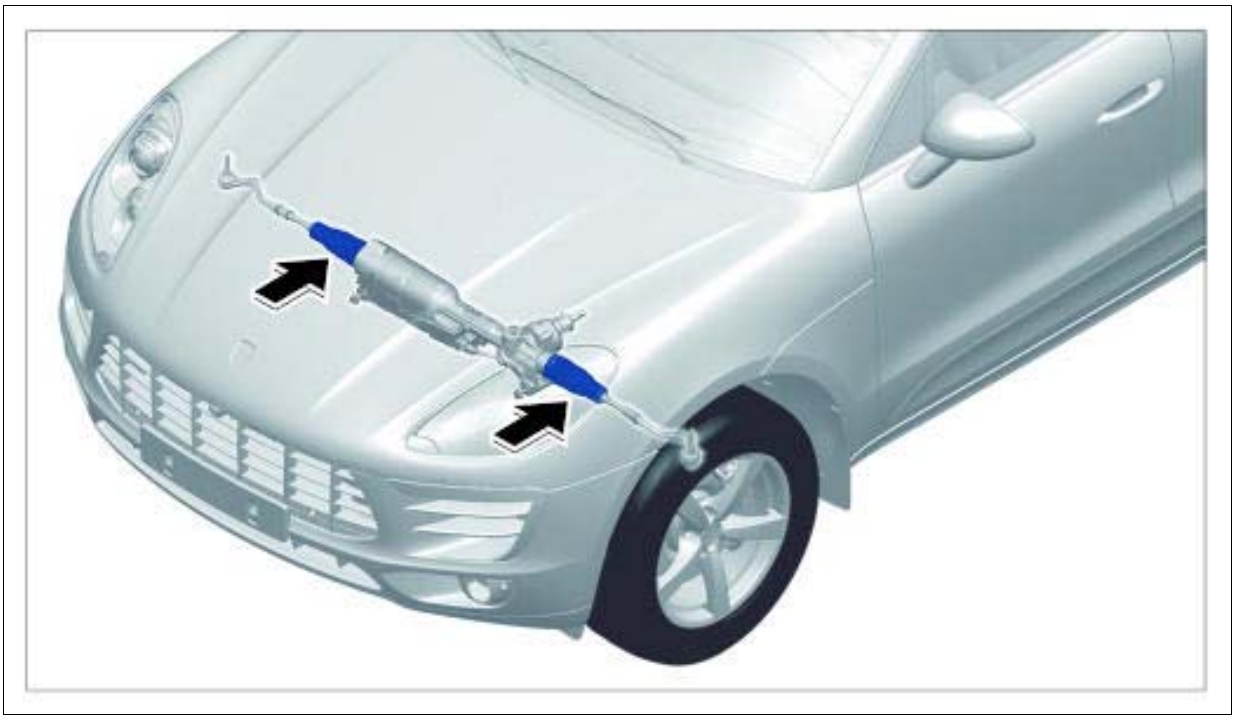
Information

- Mark the position of the tie-rod ball on the thread before unscrewing it.
- Count the number of turns when unscrewing the tie-rod ball.
- It will then be possible to install the tie-rod ball back in the same position and retain the basic setting of the steering trapeze.
- However, this does not replace the suspension alignment.

Information

- Make sure that no dirt gets into the power-steering gear and bellows when removing and installing the bellows.

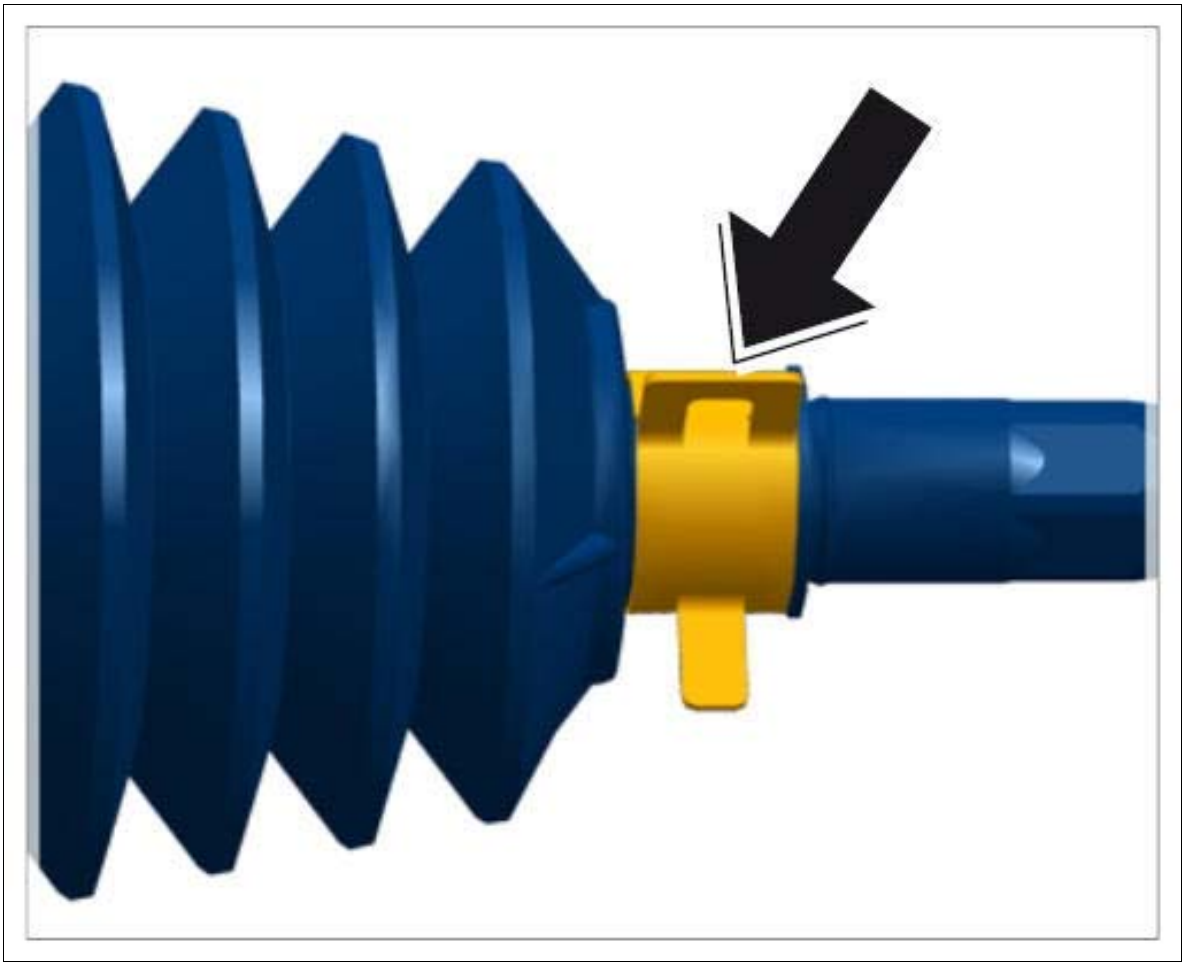
Fig 1: Loosening Outer Clamp On Bellows



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Loosen the outer clamp **-arrow-** on the bellows using **assembly tools for spring band clamps Nr.72.**

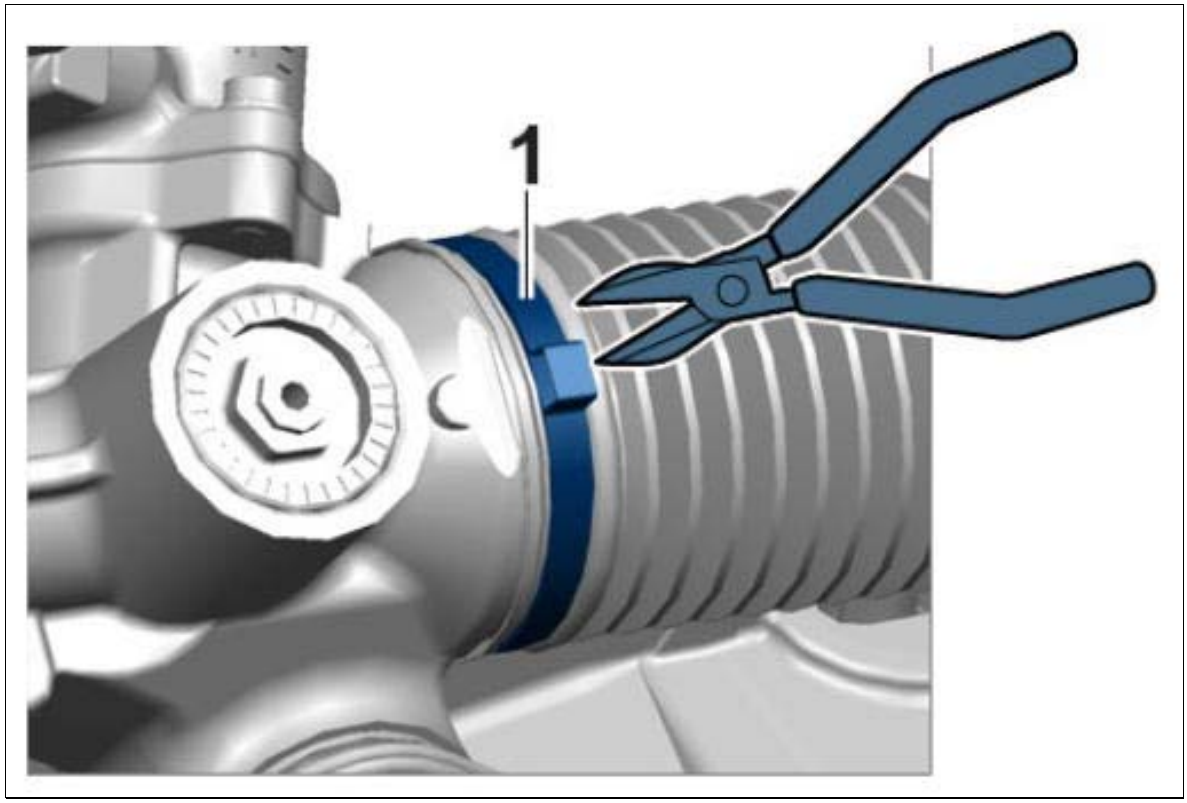
Fig 2: Locating Outer Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen the inner clamp **-1-** on the bellows using suitable pliers.

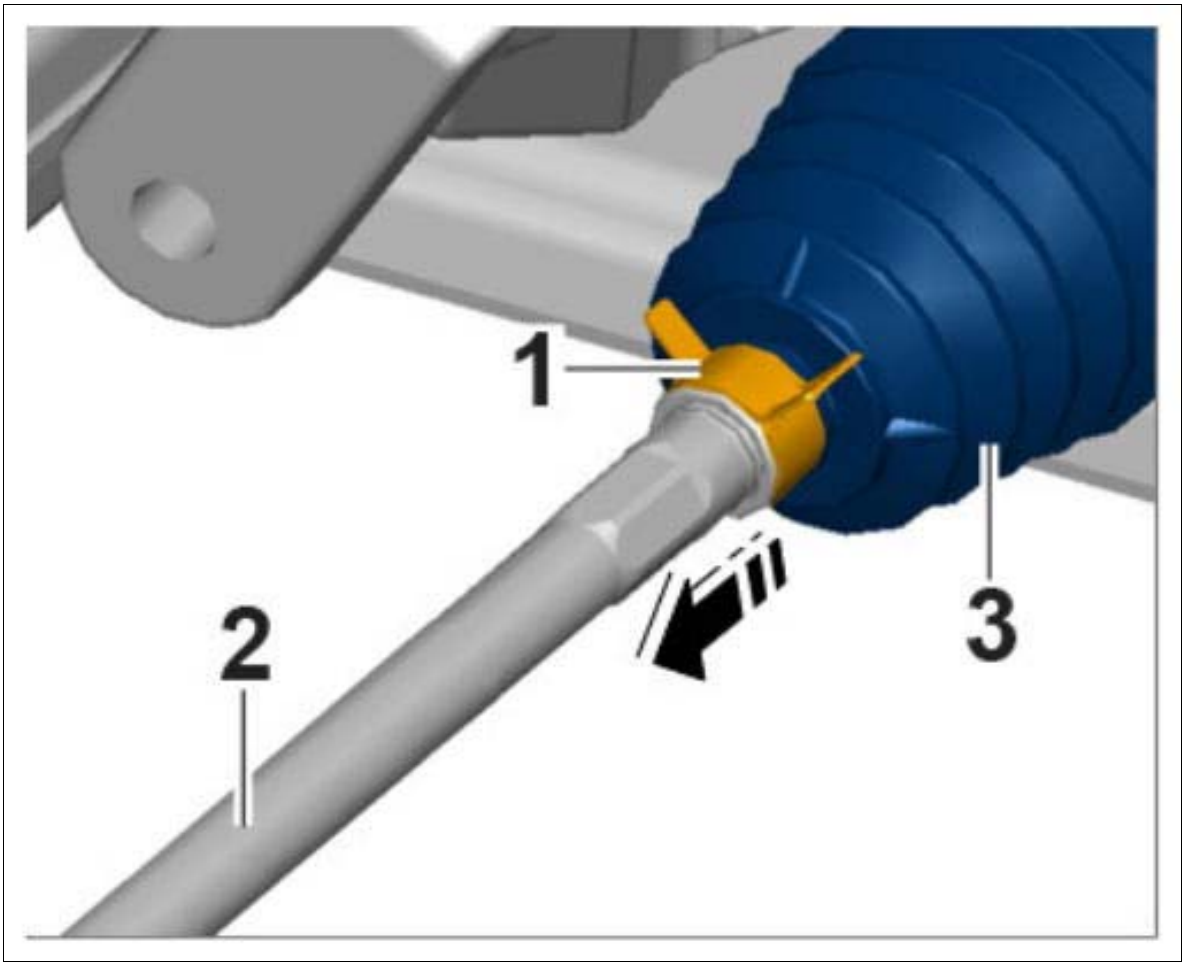
Fig 3: Loosening Inner Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew lock nut from tie rod.
4. Pull bellows **-3-** together with clamp **-1-** off the tie rod **-2-** .

Fig 4: Pulling Off Bellows



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 485319 REMOVING AND INSTALLING BELLOWS FOR STEERING-GEAR HOUSING (JOINT BOOT) (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING BELLOWS FOR STEERING-GEAR HOUSING (JOINT BOOT) > INSTALLING BELLOWS FOR STEERING-GEAR HOUSING (JOINT BOOT)

NOTE: Water can leak in if sealing elements are damaged.

- *Component can become damaged or may not function.*

→ Replace damaged sealing elements.

→ Check that sealing elements are fitted correctly.

Information

- New bellows must always be used following removal.

Information

- There is no guarantee that re-used clamps will secure the component properly.
- Removed clamps must be replaced.
- Always use new clamps during installation.

1. Fit new bellows and secure with new clamps. Make sure it fits perfectly both on the steering-gear housing and on the tie rod.

    1. 1.1. Push on bellows until you hear and feel it engaging securely on the tie rod.

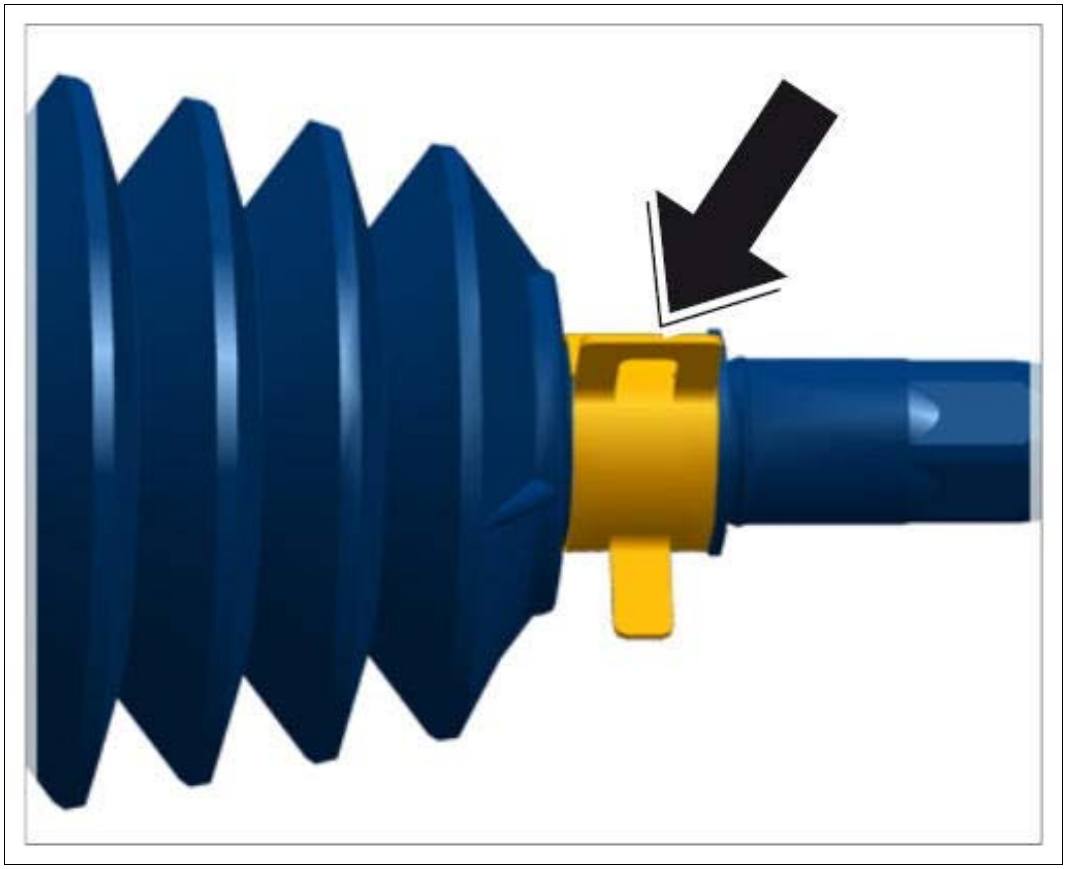
        Dimension **-a-** must be 2 mm.

        Fig 1: Fitting Bellows

        
        Courtesy of PORSCHE CARS NORTH AMERICA, INC.

    2. 1.2. Fit new outer clamp **-arrow-** using **assembly tools for spring band clamps Nr.72.**

Fig 2: Locating Outer Clamp

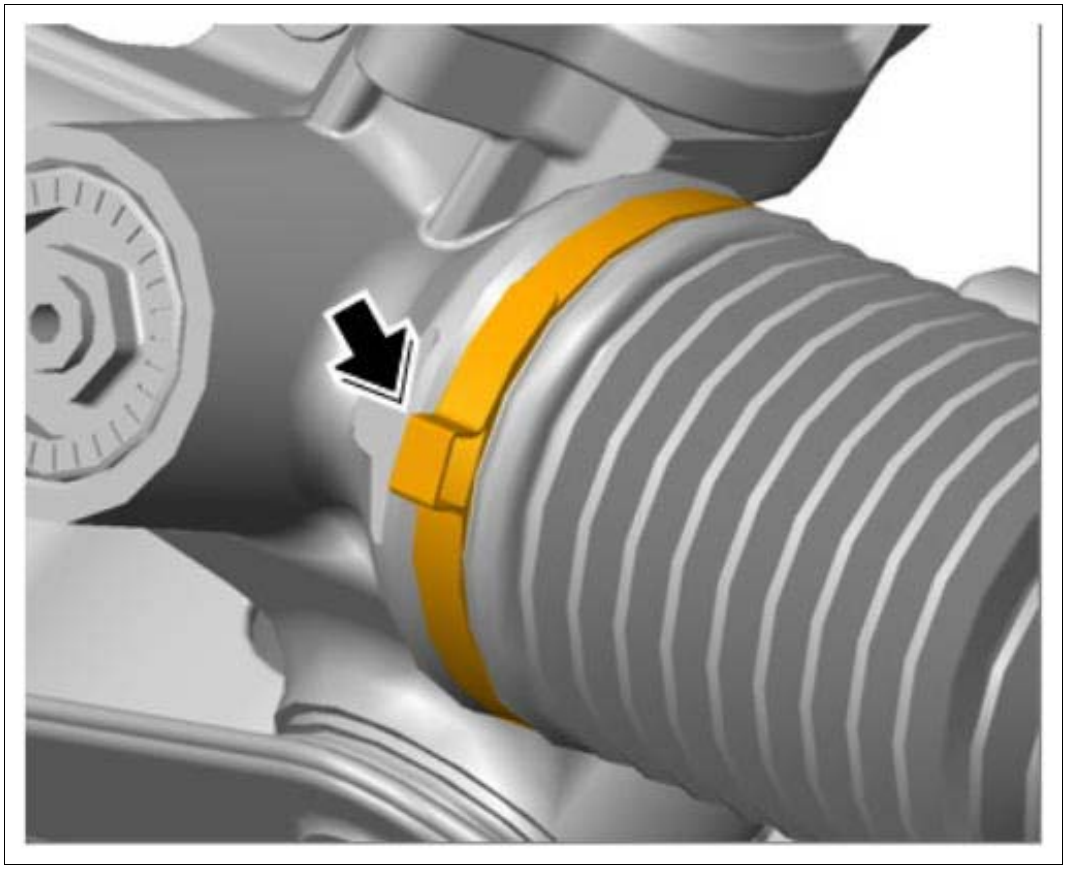


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 1.3. Fit new inner clamp using **clamp tensioner WE 1614** .

   During fitting, make sure that the bellows is not twisted and that the clamp lug **-arrow-** is easy to reach.

Fig 3: Locating Inner Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.3.1. Fit clamp tensioner **-1-** as shown. Make sure that the blades of the tensioner are positioned in the corners **-arrows-** of the clamp.

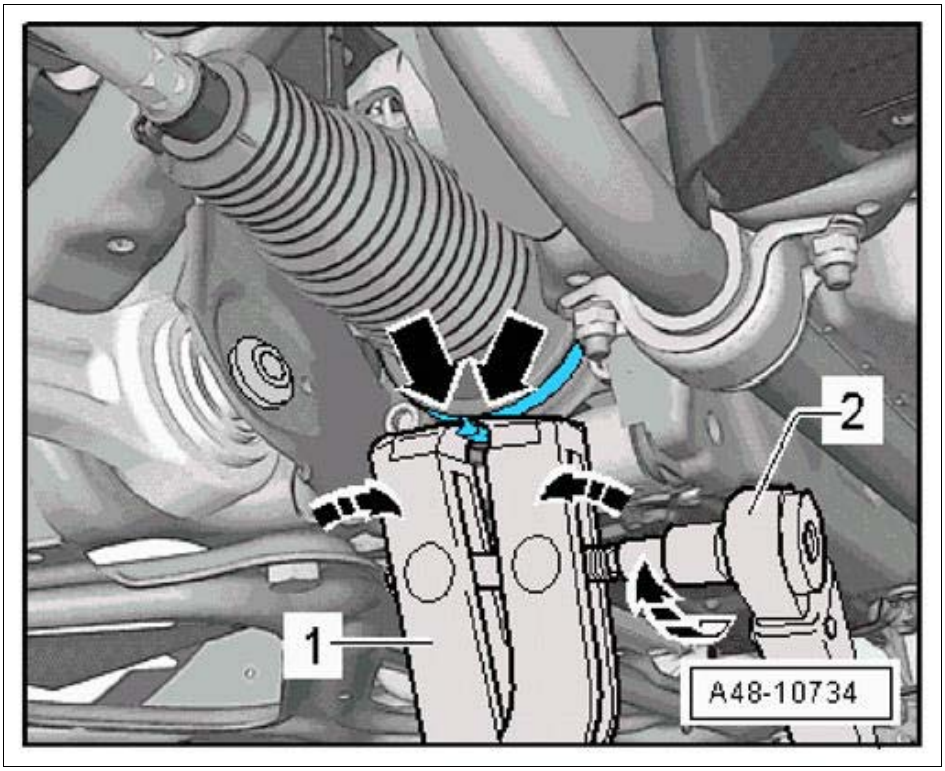
   Tighten clamp by turning the spindle using a torque wrench **-2-** . Do not tilt the tensioner while doing this.

   Make sure that the thread of the spindle on the clamp tensioner **-1-** can move freely. Lubricate with MoS2 lubricant if necessary.

   If it is stiff, e.g. due to dirt on the thread, the required clamping force of the clamp will not be achieved.

   Observe the specified tightening torque:

Fig 4: Tightening Inner Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Type of clamp	Clamp tensioner V.A.G 1682 A (Hazet) with adapter V.A.G 1682 A/1
Clamp on passenger's side (diameter: 85 mm)	**Tightening torque 7 Nm (5 ftlb.)**
Clamp on driver's side (diameter: 59 mm)	**Tightening torque 10 Nm (7.5 ftlb.)**

WM 485319 REMOVING AND INSTALLING BELLOWS FOR STEERING-GEAR HOUSING (JOINT BOOT) (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install tie-rod ball → INSTALLING TIE-ROD BALL .
2. Install front underbody panelling → INSTALLING COVER FOR FRONT UNDERBODY .
3. Perform suspension alignment and make adjustments if necessary → 449503 SUSPENSION ALIGNMENT, COMPLETE .

WM 487919 REMOVING AND INSTALLING TIE ROD (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Tie rod to rack-and-pinion (axial joint)		Tightening torque	100 Nm (74 ftlb.)		
Inner clamp on bellows on passenger's side (diameter: 85 mm)	Fit using clamp tensioner V.A.G 1682 A	Tightening torque	7 Nm (5 ftlb.)		
Inner clamp on bellows on driver's side (diameter: 59 mm)	Fit using clamp tensioner V.A.G 1682 A	Tightening torque	10 Nm (7.5 ftlb.)		

WM 487919 REMOVING AND INSTALLING TIE ROD (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

Information

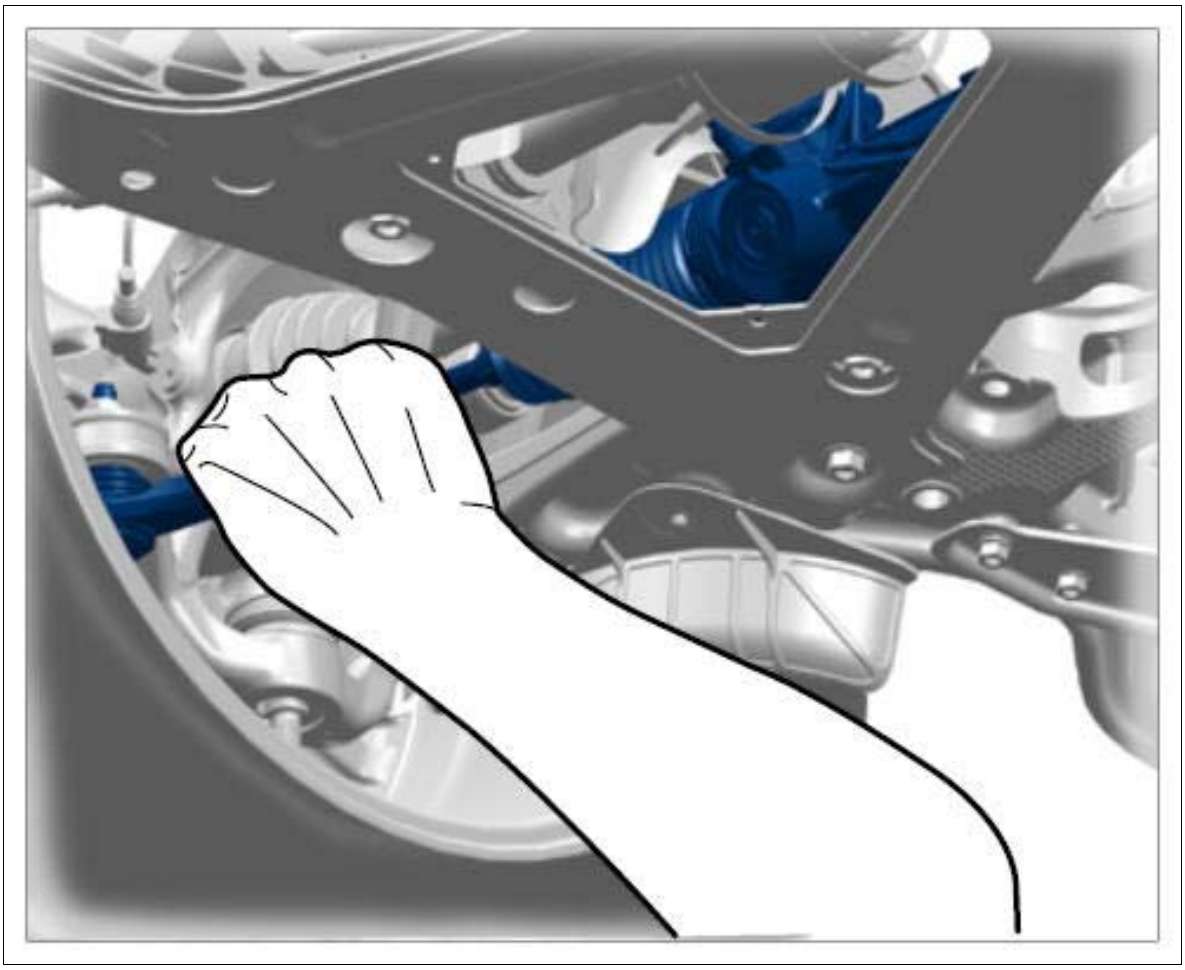
Before removing the tie rod, always check the tie rod joints on both sides. If a joint does not meet the test conditions, it must be replaced.

Only if there is no play in the steering can it be set correctly and the operating reliability of the vehicle can thus be guaranteed.

1. Check tie rod joint.

   Test conditions: The vehicle must be standing on its wheels in order to check the tie rod joints; vehicles with air suspension must be adjusted to maximum ground clearance.

   Fig 1: Checking Tie Rod Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Check that the dust boots, bellows and joints are working perfectly and have no leaks.
2. 1.2. Check the left tie rod joint.

   Turn the wheels to the right and take hold of the tie-rod ball **-1-** . Get a second mechanic to turn the steering by moving the steering wheel back and forth slightly.

   There must be no play on the joint.

   If you detect a certain amount of play that is not caused by the tie rod joint, the axial joint between the steering gear and tie rod is worn.

3. 1.3. Check the right tie rod joint.

   Turn the wheels to the left and take hold of the tie-rod ball **-1-** . Get a second mechanic to turn the steering by moving the steering wheel back and forth slightly.

   There must be no play on the joint.

   If you detect a certain amount of play that is not caused by the tie rod joint, the axial joint between the steering gear and tie rod is worn.

2. Remove tie-rod ball → REMOVING AND INSTALLING TIE-ROD BALL .
3. Remove front underbody panelling → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY .

WM 487919 REMOVING AND INSTALLING TIE ROD (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING TIE ROD > REMOVING TIE ROD

Information

Mark the position of the tie-rod ball on the thread before unscrewing it from the tie rod.

Count the number of turns when unscrewing it (turns of tie-rod ball).

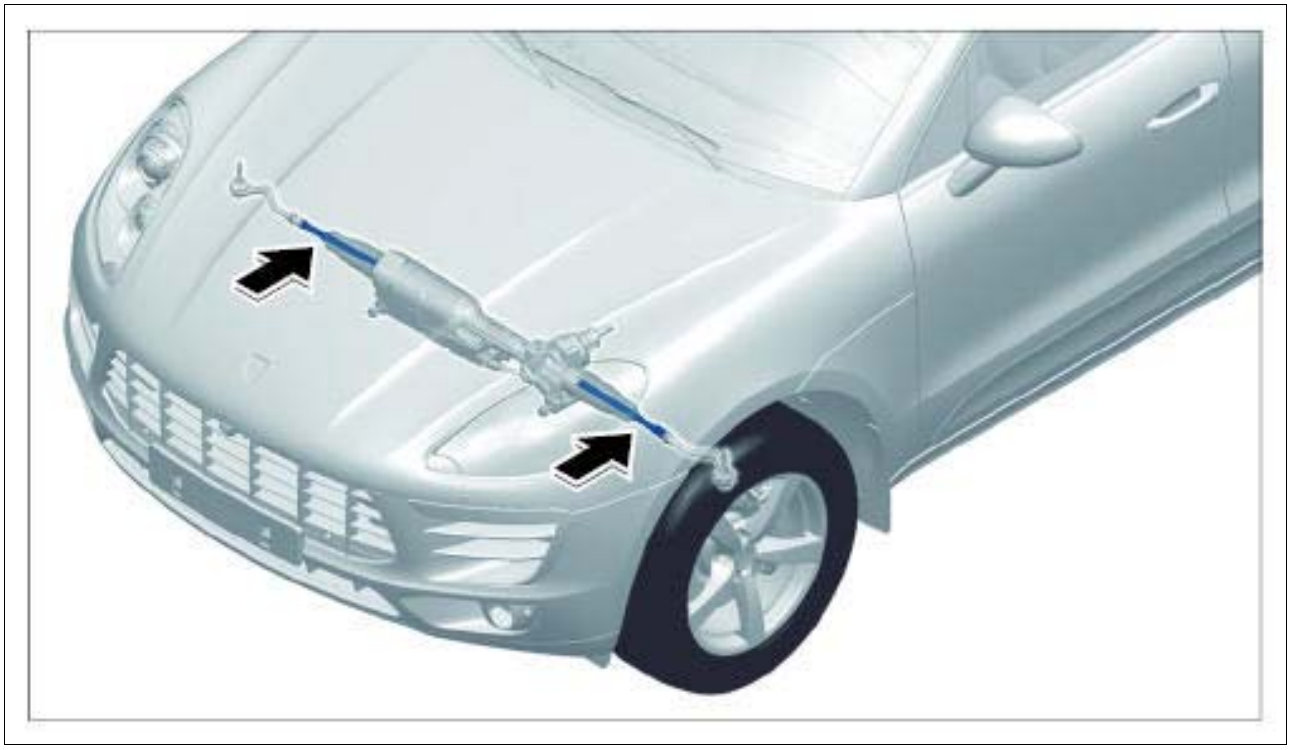
This avoids the need to perform an approximate adjustment of the steering trapeze when reassembling.

This is **not** a substitute for the suspension alignment.

Information

After removing the tie rod, the steering track must be adjusted.

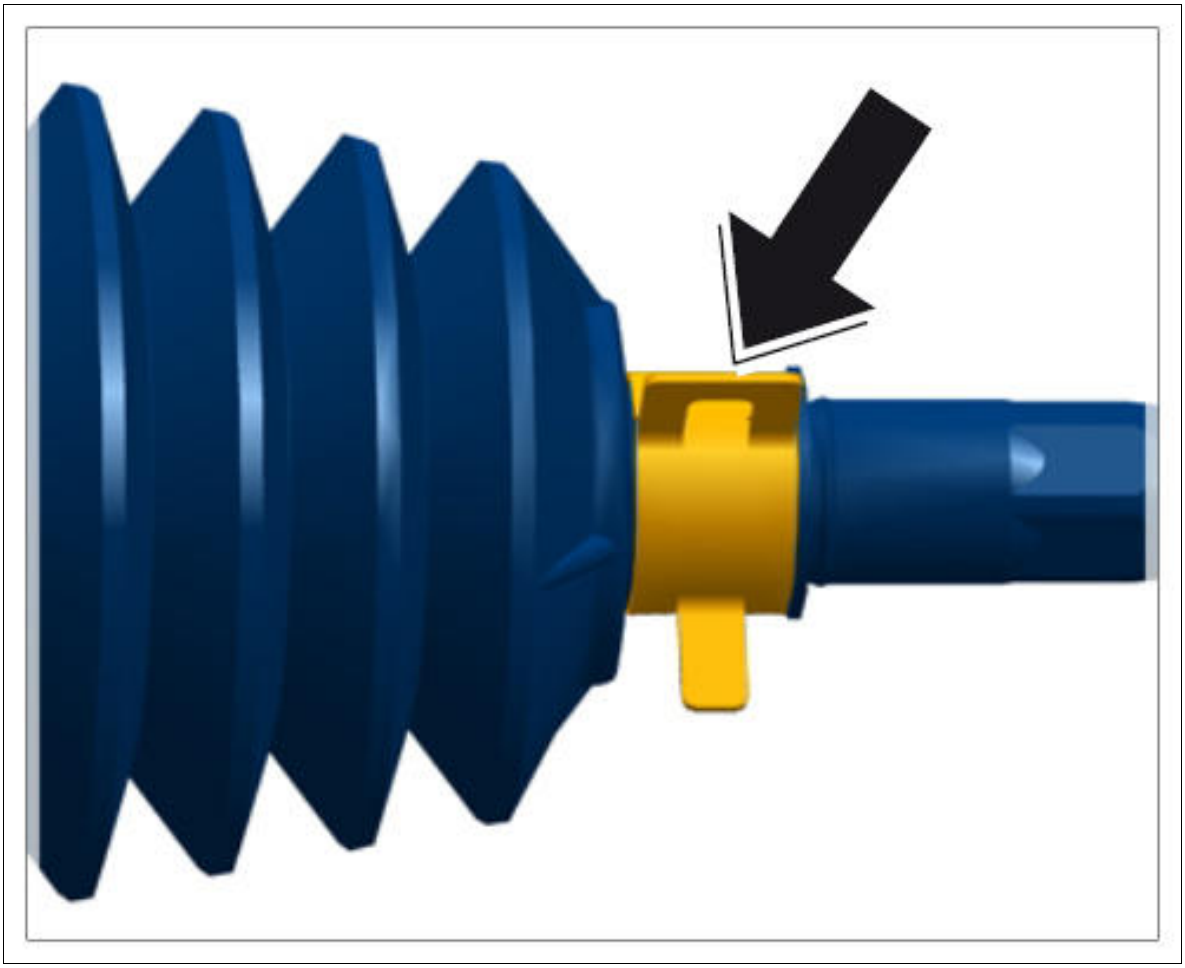
Fig 1: Locating Tie Rod Position



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Loosen the outer clamp **-arrow-** on the bellows using **assembly tools for spring band clamps Nr.72.**

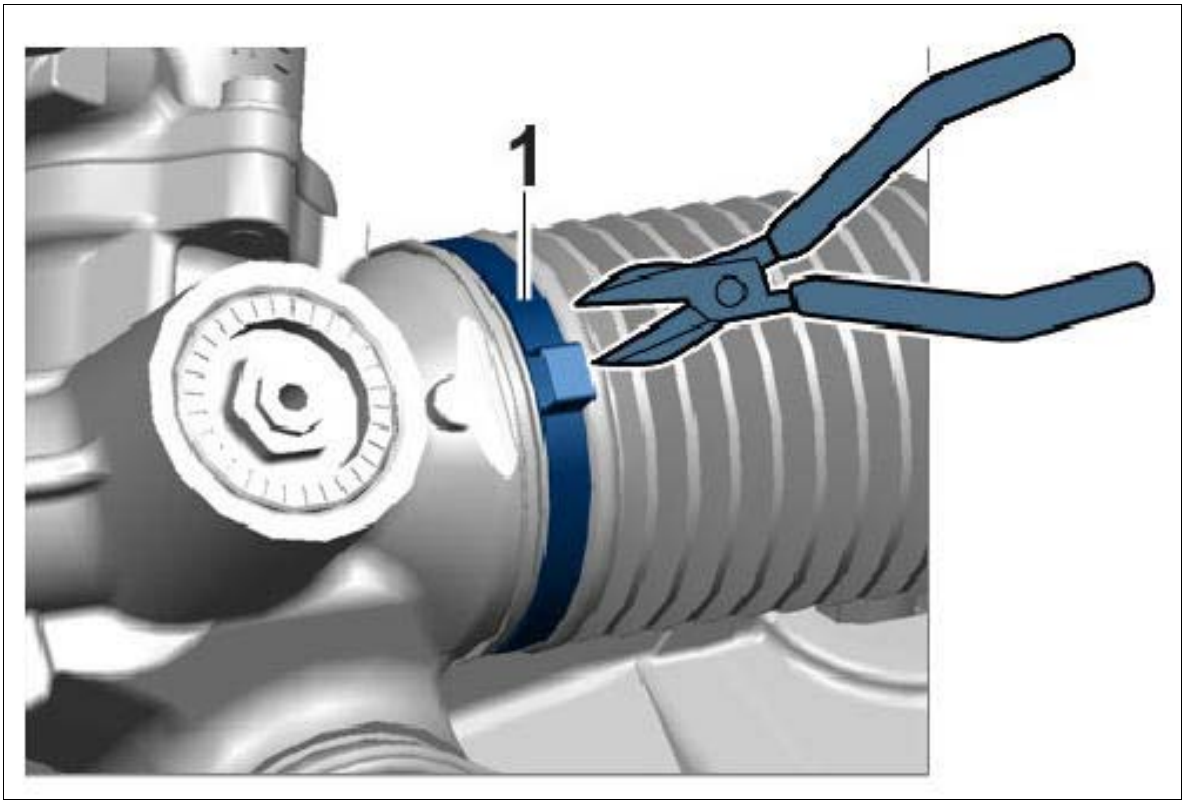
Fig 2: Locating Outer Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen the inner clamp **-1-** on the bellows using suitable pliers.

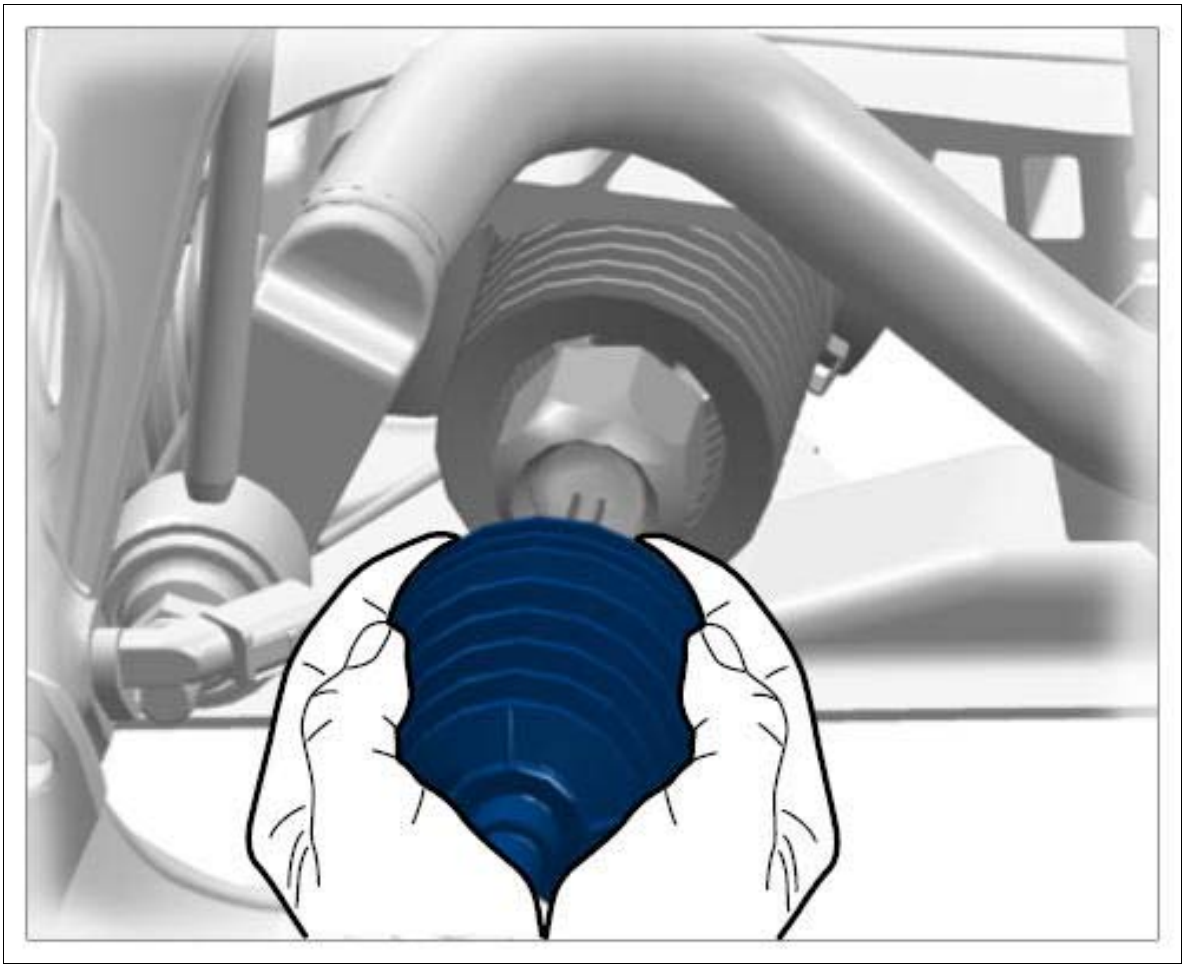
Fig 3: Loosening Inner Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Carefully pull the bellows outwards until the axial joint is accessible. → Pulling out bellows (example)

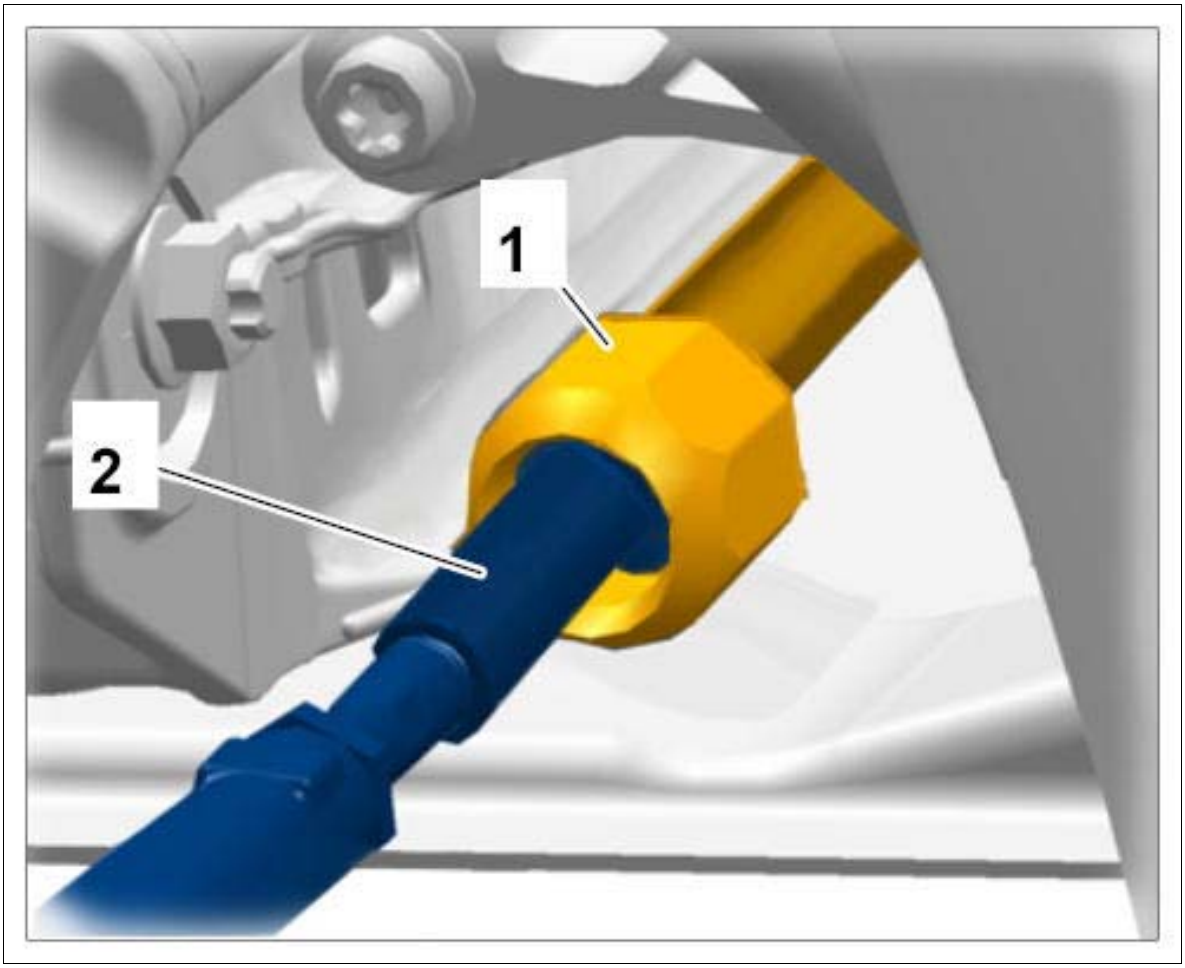
Fig 4: Pulling Out Bellows



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Unscrew octagon **-1-** on the ball joint of the tie rod **-2-** from the rack-and-pinion using **V.A.G 1923 open-jawed wrench insert Nr.95-2.**

Fig 5: Loosening Ball Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove tie rod. If the tie rod is replaced, the marking for the old tie rod on the wheel side must be copied to the new tie rod.

WM 487919 REMOVING AND INSTALLING TIE ROD (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING TIE ROD > INSTALLING TIE ROD

NOTE: Water can leak in if sealing elements are damaged.

- *Component can become damaged or may not function.*

→ Replace damaged sealing elements.

→ Check that sealing elements are fitted correctly.

Information

Carry out a close visual inspection of all parts.

The inner clamp must be replaced.

When fitting the ball joints, ensure that the bevel pinions are clean. Remove dirt or grease on bevel pinions, e.g. with a lint-free cloth. Do not use cleaning agent/solvent.

Information

- New bellows must always be used following removal.

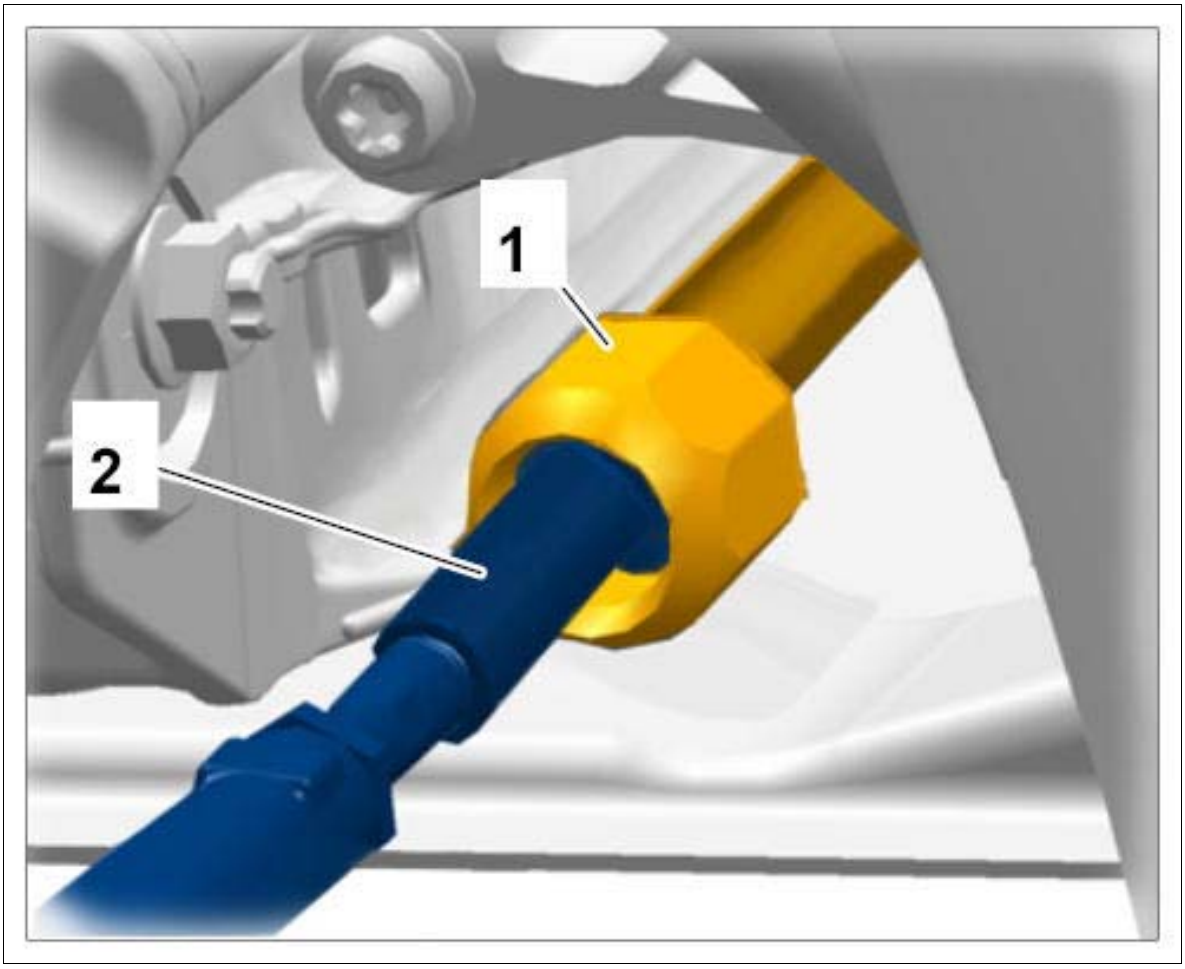
Information

- There is no guarantee that re-used clamps will secure the component properly.
- Removed clamps must be replaced.
- Always use new clamps during installation.

1. Fit tie rod **-2-** on the rack-and-pinion by tightening the octagon **-1-** . **Tightening torque 100 Nm (74 ftlb.)**

   Make sure that no damage (scoring or similar damage) is caused to the rack-and-pinion.

   Fig 1: Loosening Ball Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

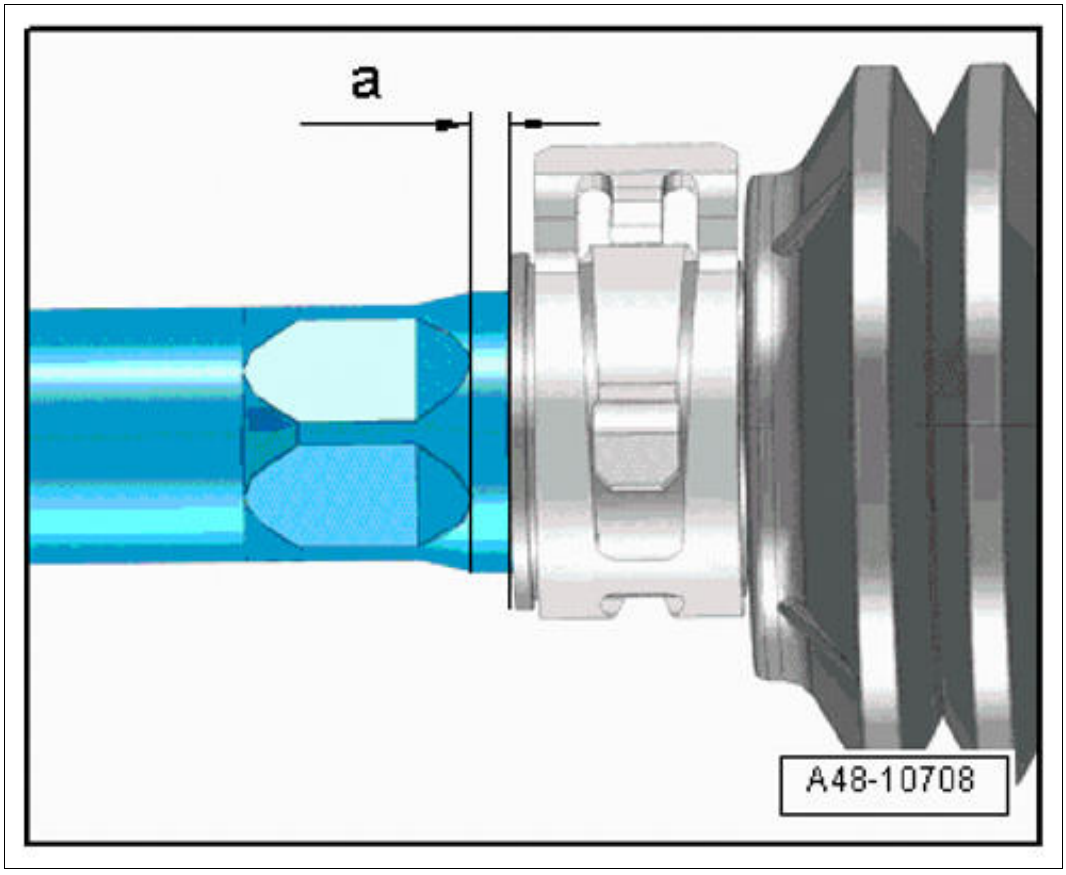
2. Fit new bellows and secure with new clamps.

Make sure it fits perfectly both on the steering-gear housing and on the tie rod.

1. 2.1. Push on bellows until you hear and feel it engaging securely on the tie rod.

   Dimension **-a-** must be 2 mm.

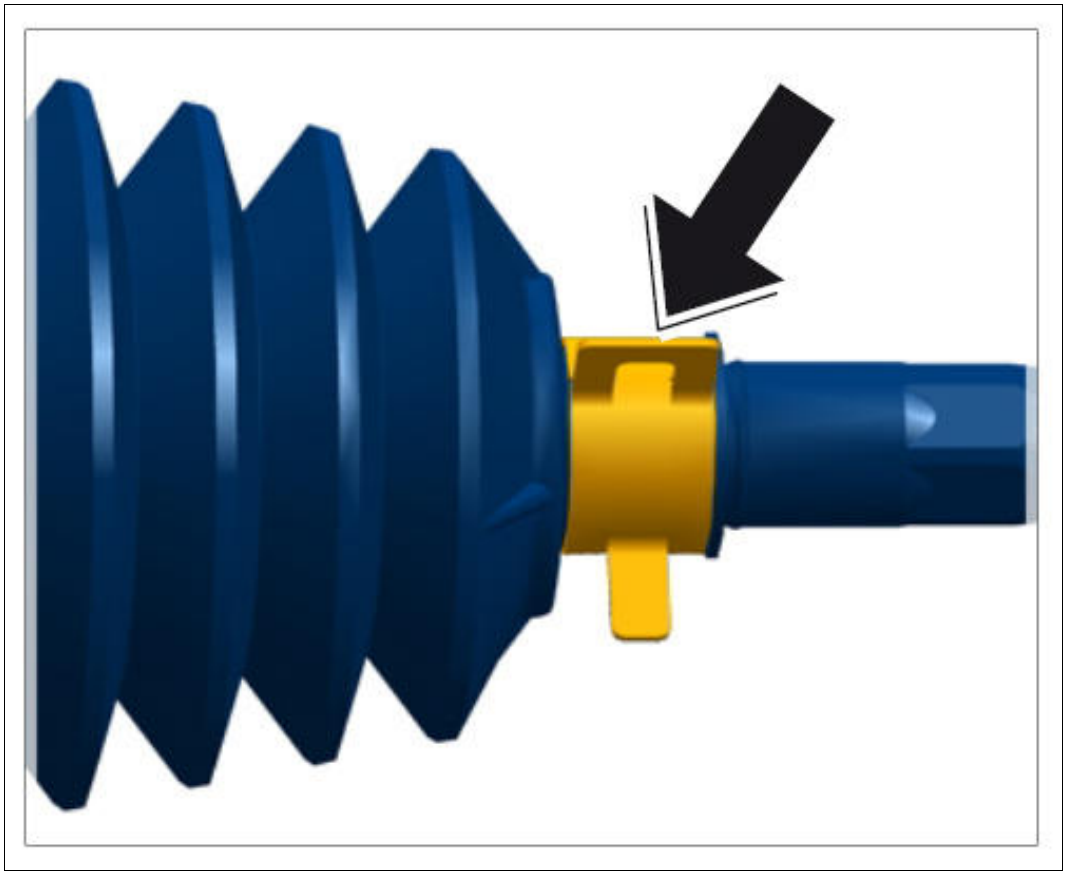
   Fig 2: Fitting Bellows



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 2.2. Fit new outer clamp **-arrow-** using **assembly tools for spring band clamps Nr.72.**

Fig 3: Locating Outer Clamp

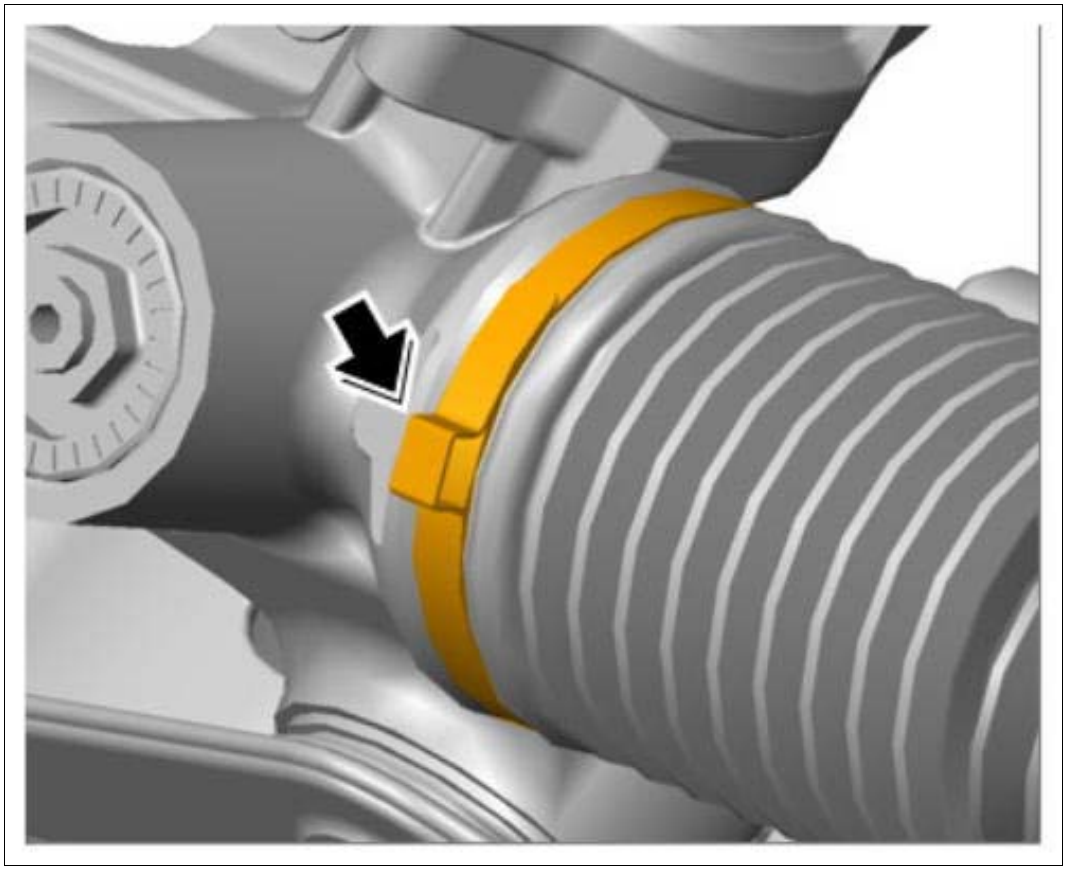


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 2.3. Fit new inner clamp using tool V.A.G 1682 A clamp tensioner. **(Tool not found!)**

   During fitting, make sure that the bellows is not twisted and that the clamp lug **-arrow-** is easy to reach.

Fig 4: Locating Inner Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 2.3.1. Fit clamp tensioner **-1-** as shown. Make sure that the blades of the tensioner are positioned in the corners **-arrows-** of the clamp.

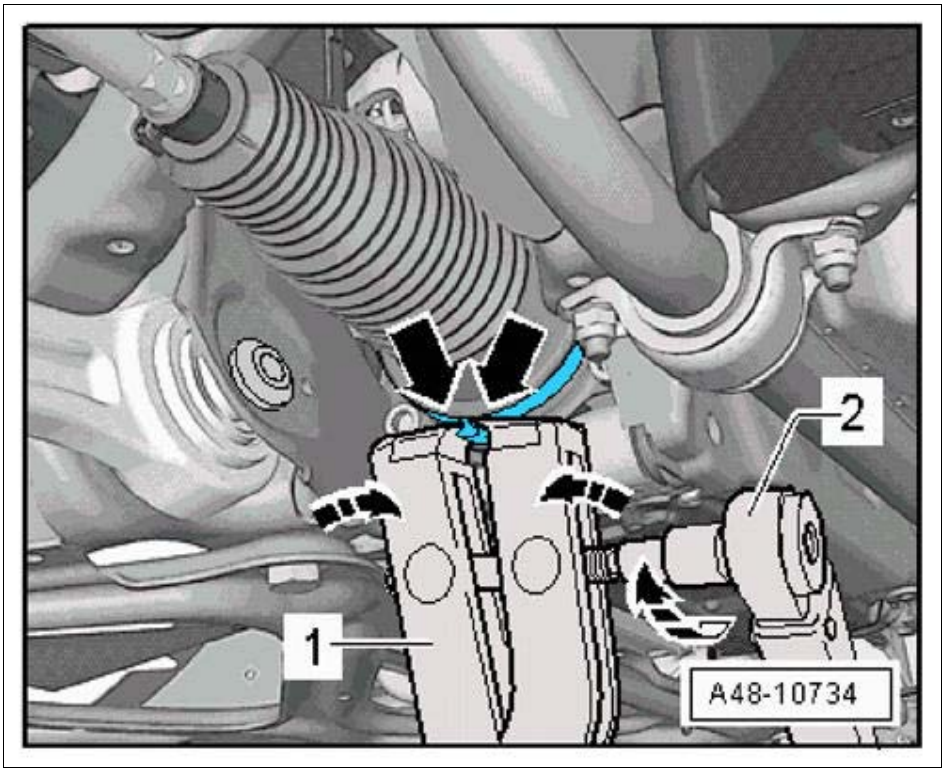
   Tighten clamp by turning the spindle using a torque wrench **-2-** . Do not tilt the tensioner while doing this.

   Make sure that the thread of the spindle on the clamp tensioner **-1-** can move freely. Lubricate with MoS2 lubricant if necessary.

   If it is stiff, e.g. due to dirt on the thread, the required clamping force of the clamp will not be achieved.

   Observe the specified tightening torque:

Fig 5: Tightening Inner Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Type of clamp	Clamp tensioner V.A.G 1682 A (Hazet) with adapter V.A.G 1682 A/1
Clamp on passenger's side (diameter: 85 mm)	**Tightening torque 7 Nm (5 ftlb.)**
Clamp on driver's side (diameter: 59 mm)	**Tightening torque 10 Nm (7.5 ftlb.)**

WM 487919 REMOVING AND INSTALLING TIE ROD (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install tie-rod ball → INSTALLING TIE-ROD BALL .
2. Install front underbody panelling → INSTALLING COVER FOR FRONT UNDERBODY .
3. Perform complete suspension alignment and make adjustments if necessary → 449503 SUSPENSION ALIGNMENT, COMPLETE .

WM 488119 REMOVING AND INSTALLING TIE-ROD BALL (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description

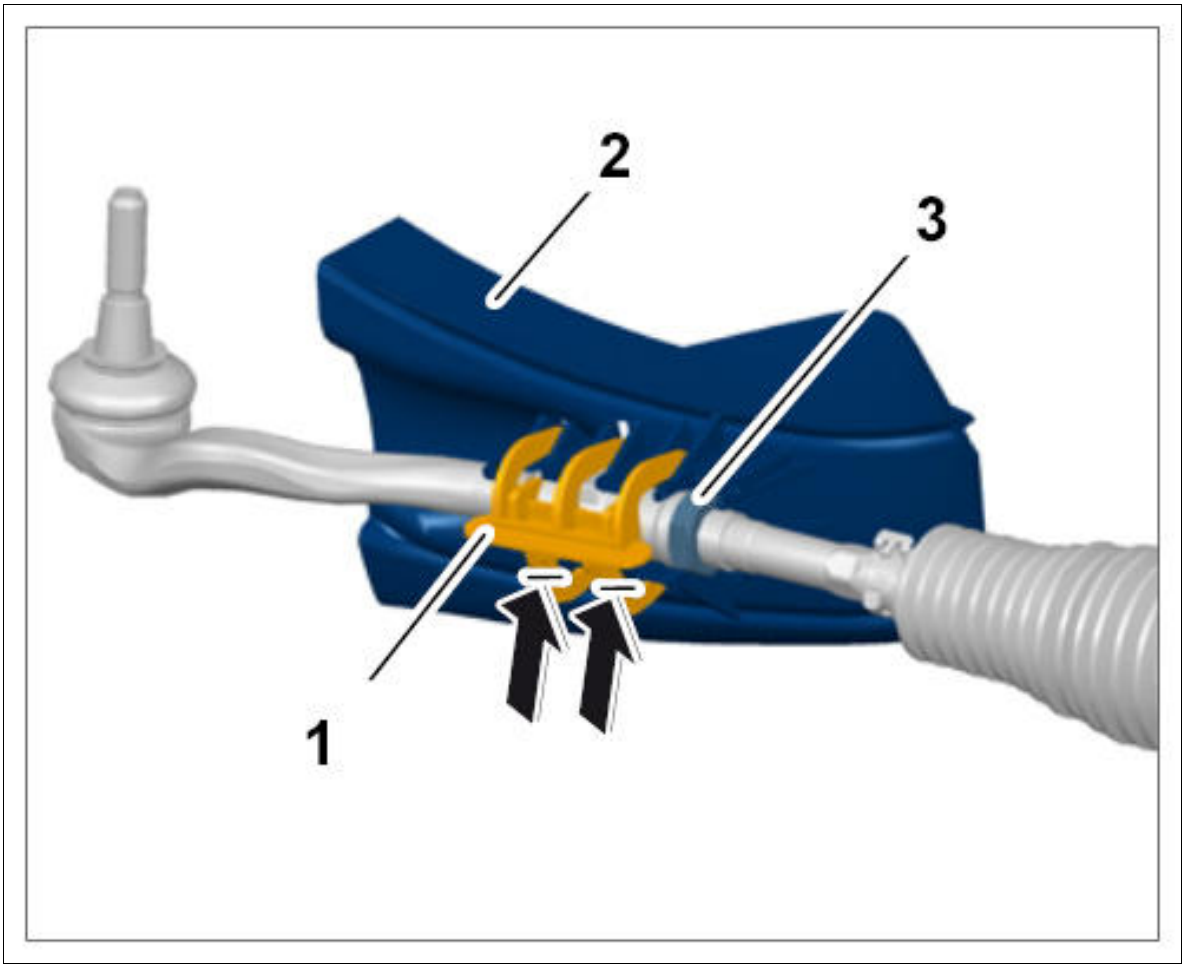
ball joint puller	VW tool	T40010		
WM 488119 REMOVING AND INSTALLING TIE-ROD BALL (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Tie-rod ball to tie rod	Counter when loosening and tightening the lock nut on the outer joint	Tightening torque	90 Nm (67 ftlb.)		
Tie-rod ball to wheel carrier cone	M12 x 1.5 thread/always use new nut following removal	Tightening torque	100 Nm (74 ftlb.)		

WM 488119 REMOVING AND INSTALLING TIE-ROD BALL (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .
2. Remove wheel → 440519 REMOVING AND INSTALLING WHEEL .
3. Remove air-guide element from tie rod, if fitted.

Fig 1: Locating Air-Guide Element On Tie Rod

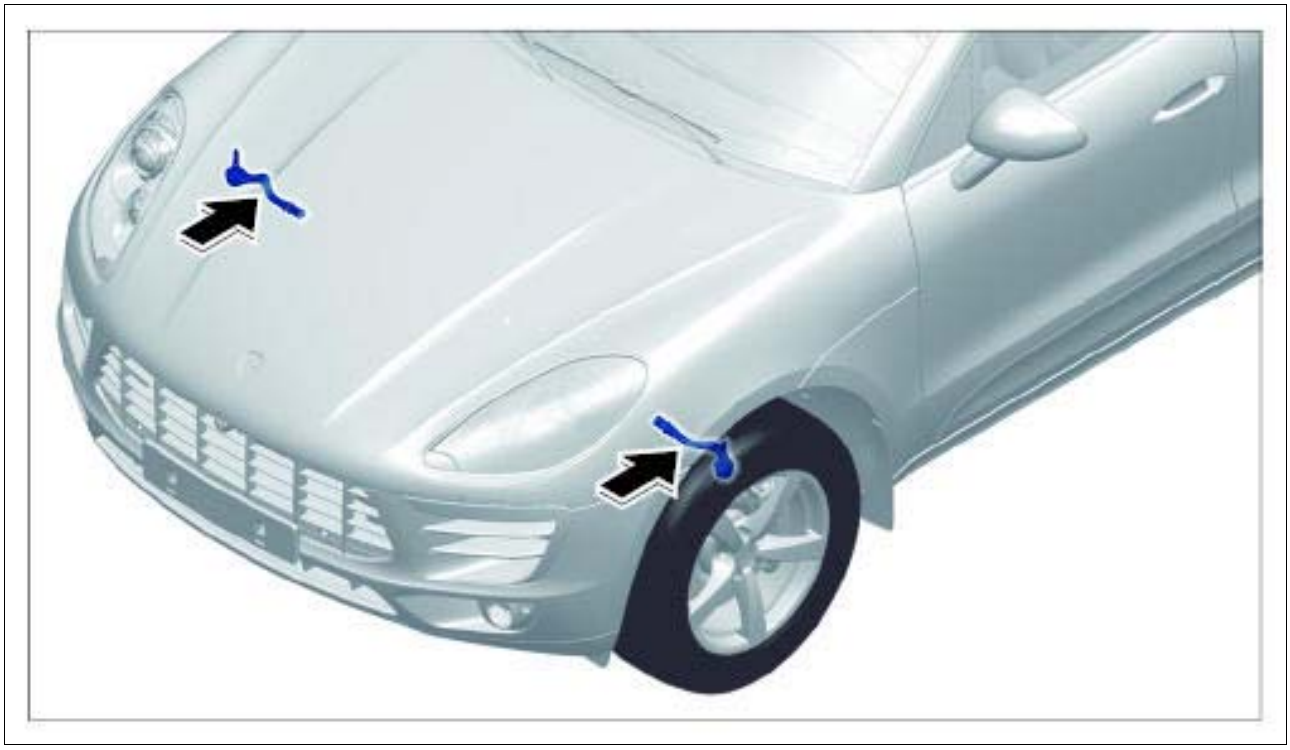


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. Cut through the lower arms of the clamp **-1-** at the marked positions **-arrows-** using a suitable tool.
2. 3.2. Remove air-guide element **-2-** .

WM 488119 REMOVING AND INSTALLING TIE-ROD BALL (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING TIE-ROD BALL > REMOVING TIE-ROD BALL

Fig 1: Locating Tie-Rod Ball Position



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. To make it easier to remove the tie-rod ball, swivel the relevant wheel bearing housing so that the tie rod is fully extended.

   Information

   Mark the position of the tie-rod ball on the thread before unscrewing it from the tie rod.

   Count the number of turns when unscrewing it (turns of tie-rod ball).

   This avoids the need to perform an approximate adjustment of the steering trapeze when reassembling.

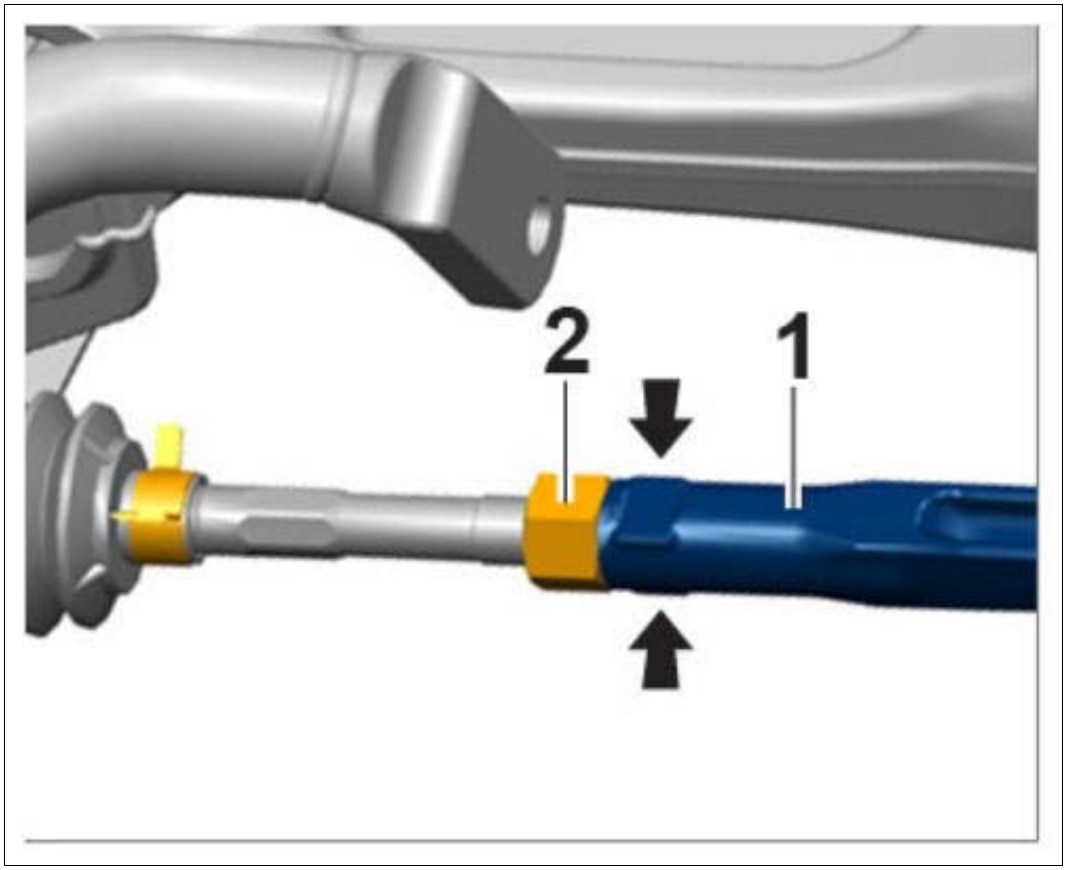
   This is **not** a substitute for the suspension alignment.

2. Detach tie-rod ball **-1-** from tie rod.

   1. 2.1. Counter the tie-rod ball **-1-** at the flattened areas **-arrows-** using a suitable open-ended wrench.

   2. 2.2. Loosen lock nut **-2-** .

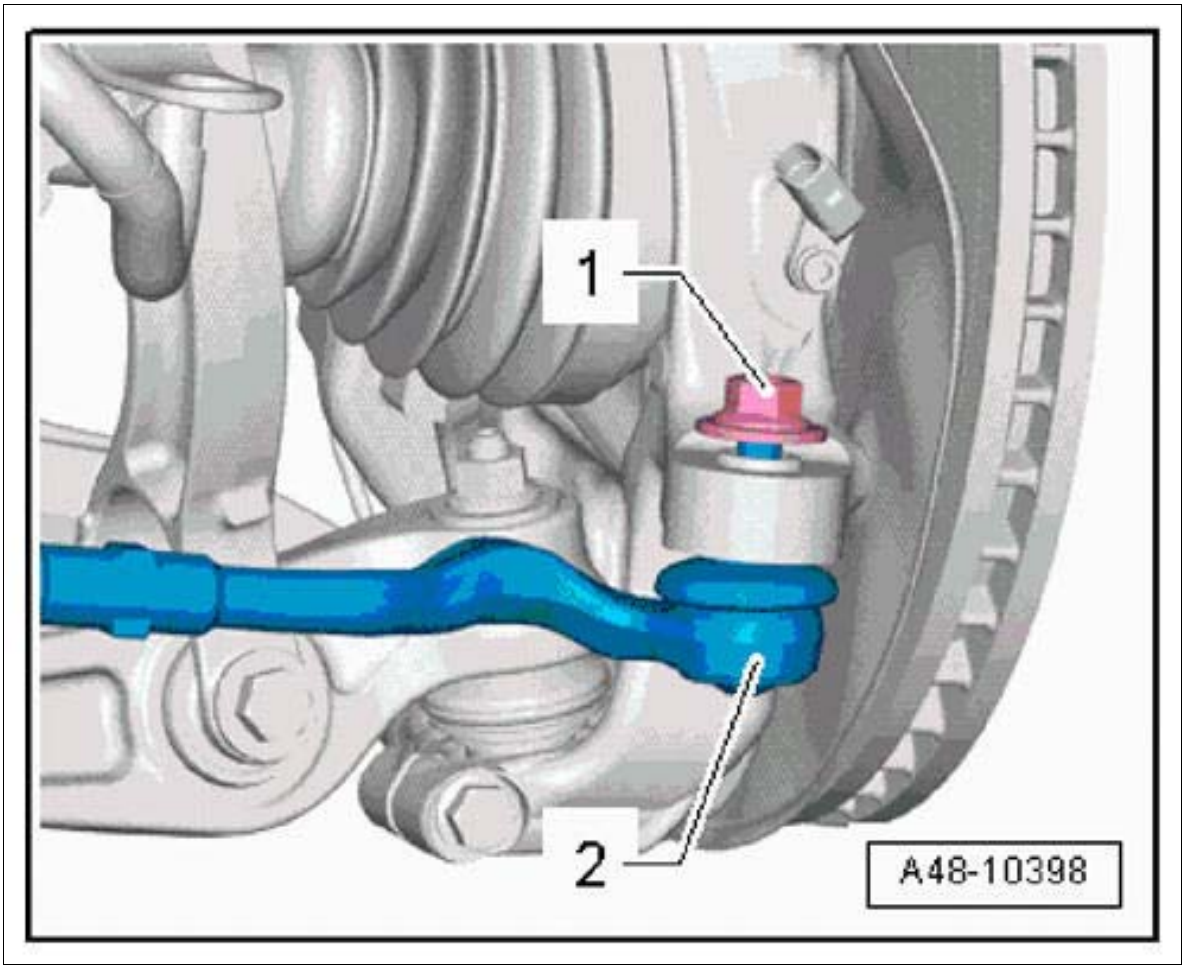
Fig 2: Detaching Tie-Rod Ball



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew fastening nut **-1-** on the joint pin for the tie-rod ball **-2-** until it is flush with the thread of the joint pin.

Fig 3: Identifying Tie-Rod Ball On Wheel Bearing Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

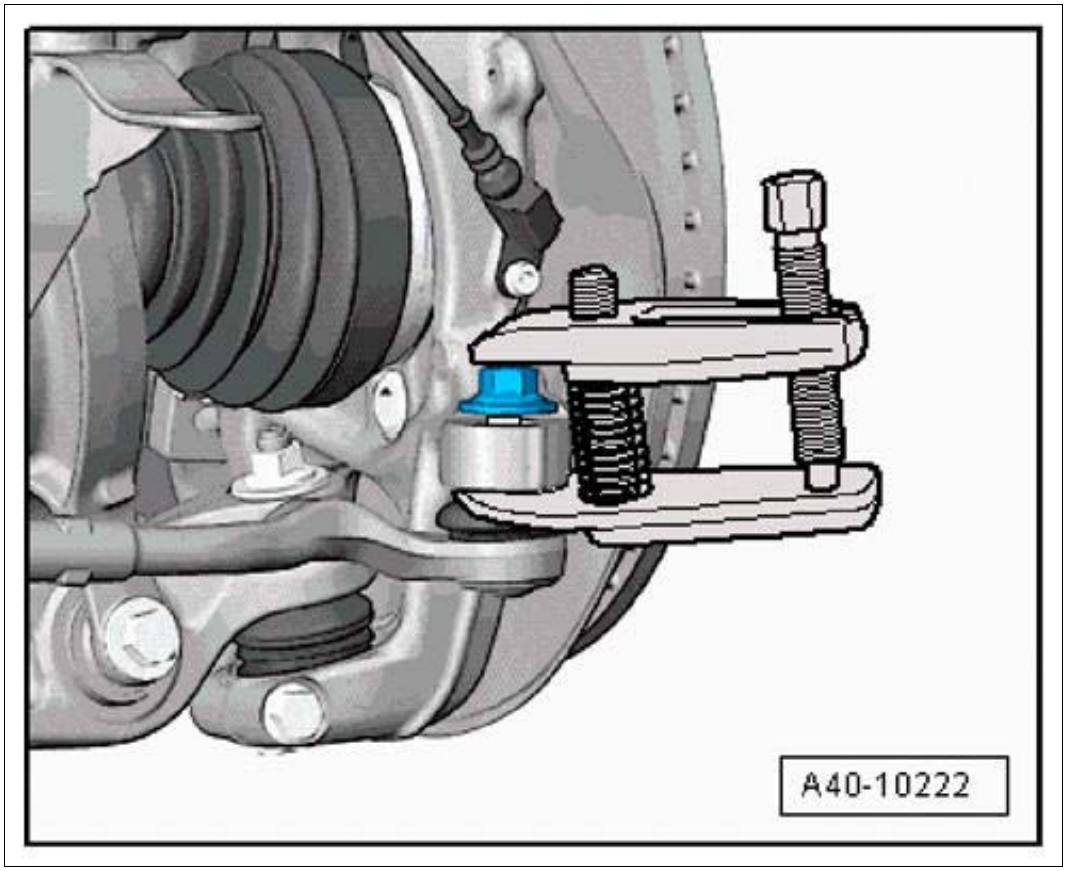
4. Loosen tie-rod ball from the wheel bearing housing. When doing so, make sure not to damage the speed sensor.

    1. 4.1. Position **ball joint puller T40010** over the joint pin and fit it on the fastening nut.
    2. 4.2. Press tie-rod ball off the tapered end of the wheel carrier using **ball joint puller T40010.**

        Screw in hexagon on the **ball joint puller T40010** until the tie-rod ball becomes detached from the tapered end of the wheel carrier.

        Make sure that the lever arms of the ball joint puller are parallel to each other when the greatest amount of force is applied. Readjust if necessary. → Pressing off tie-rod ball

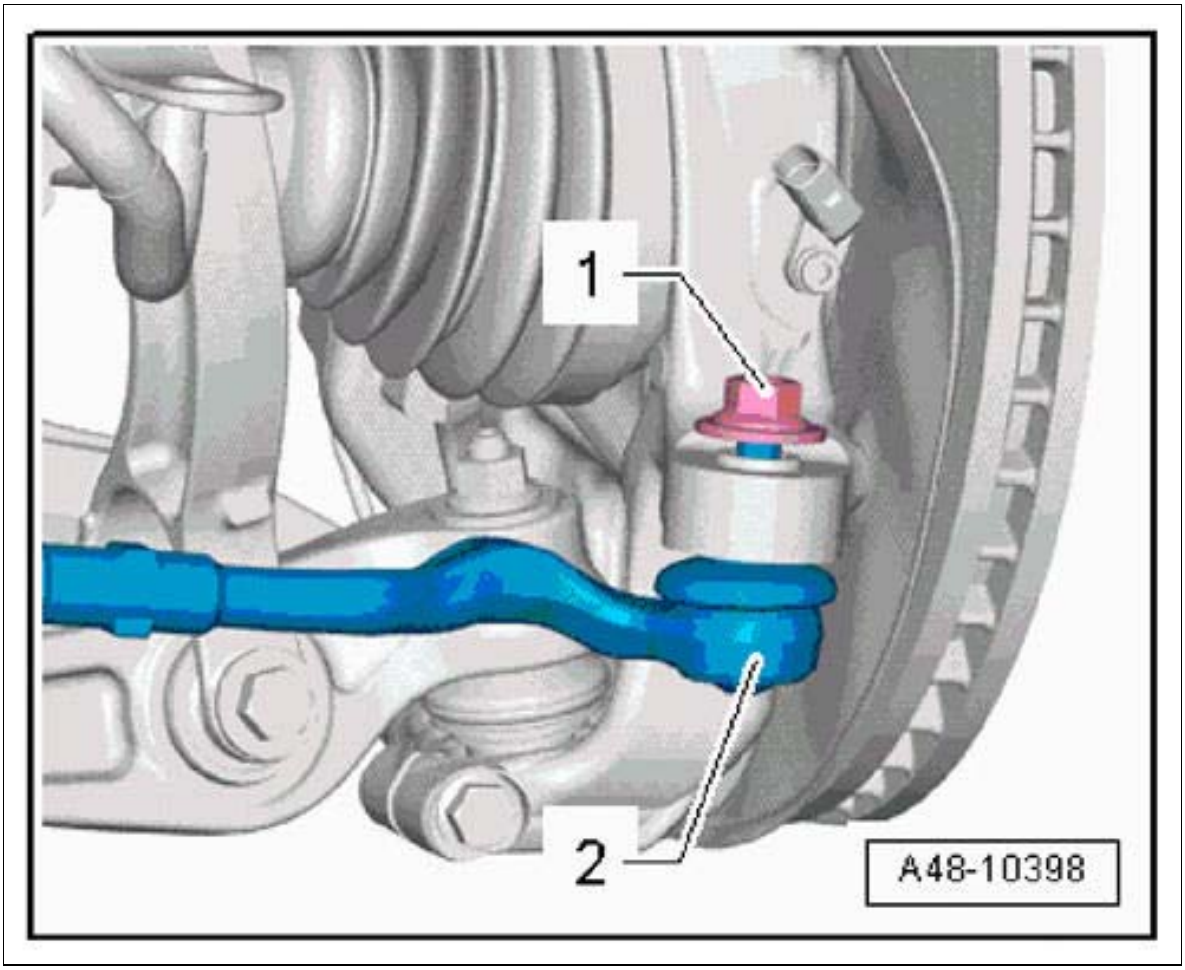
Fig 4: Pressing Off Tie-Rod Ball



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Loosen fastening nut **-1-** from the joint pin on the tie-rod ball **-2-** .

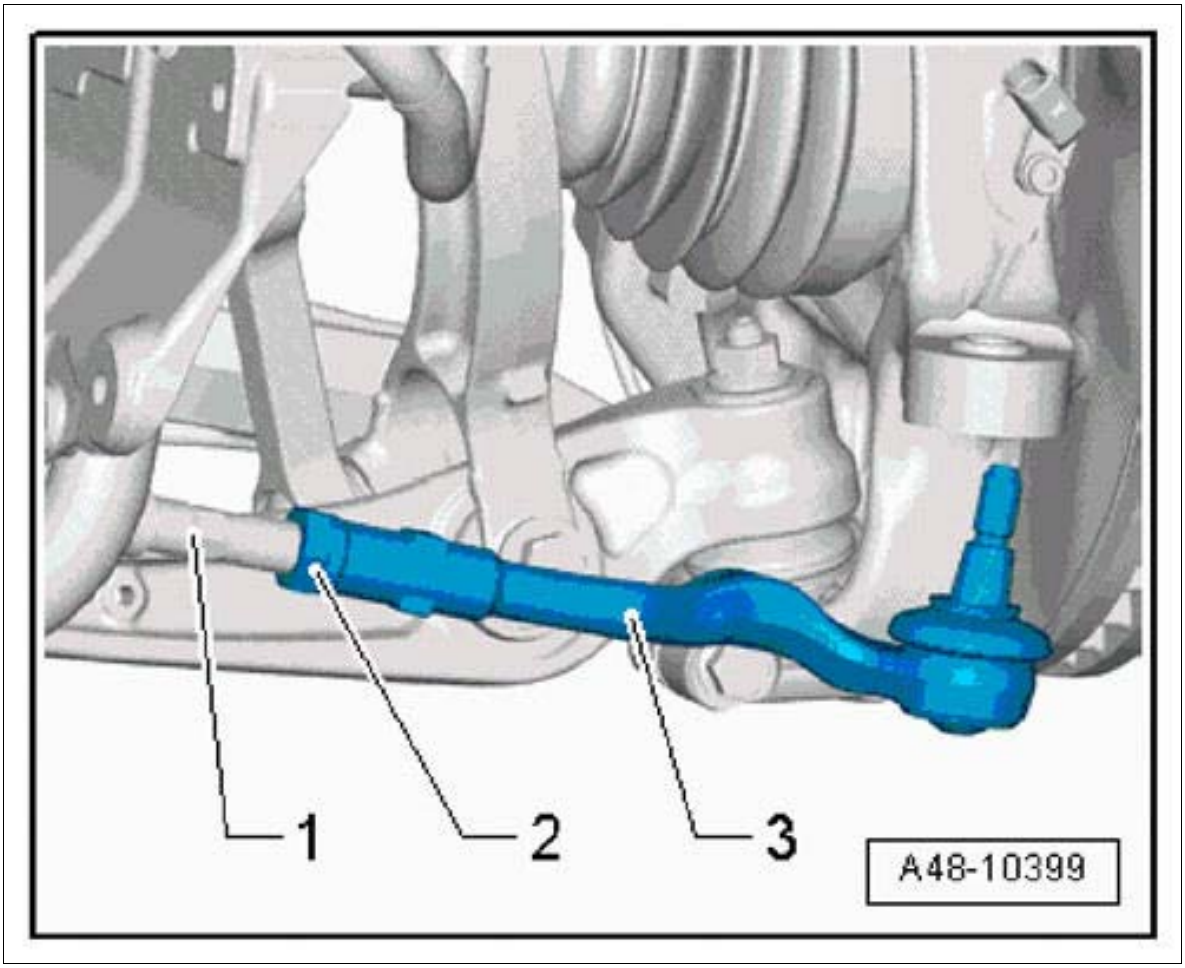
Fig 5: Identifying Tie-Rod Ball On Wheel Bearing Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Unscrew tie-rod ball **-3-** from tie rod **-1-** and remove it.

Fig 6: Identifying Tie-Rod Ball



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 488119 REMOVING AND INSTALLING TIE-ROD BALL (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING TIE-ROD BALL > INSTALLING TIE-ROD BALL

Information

Clean the thread of the tie-rod ball before screwing the tie-rod ball onto the tie rod.

To prevent any damage when screwing the tie-rod ball onto the tie rod, make sure in particular that the thread engages uniformly.

Screw on the tie-rod ball by the number of turns you wrote down during removal. Then turn it as far as the marking.

This is **not** a substitute for a later suspension alignment, but merely avoids the need for an approximate adjustment of the steering trapeze.

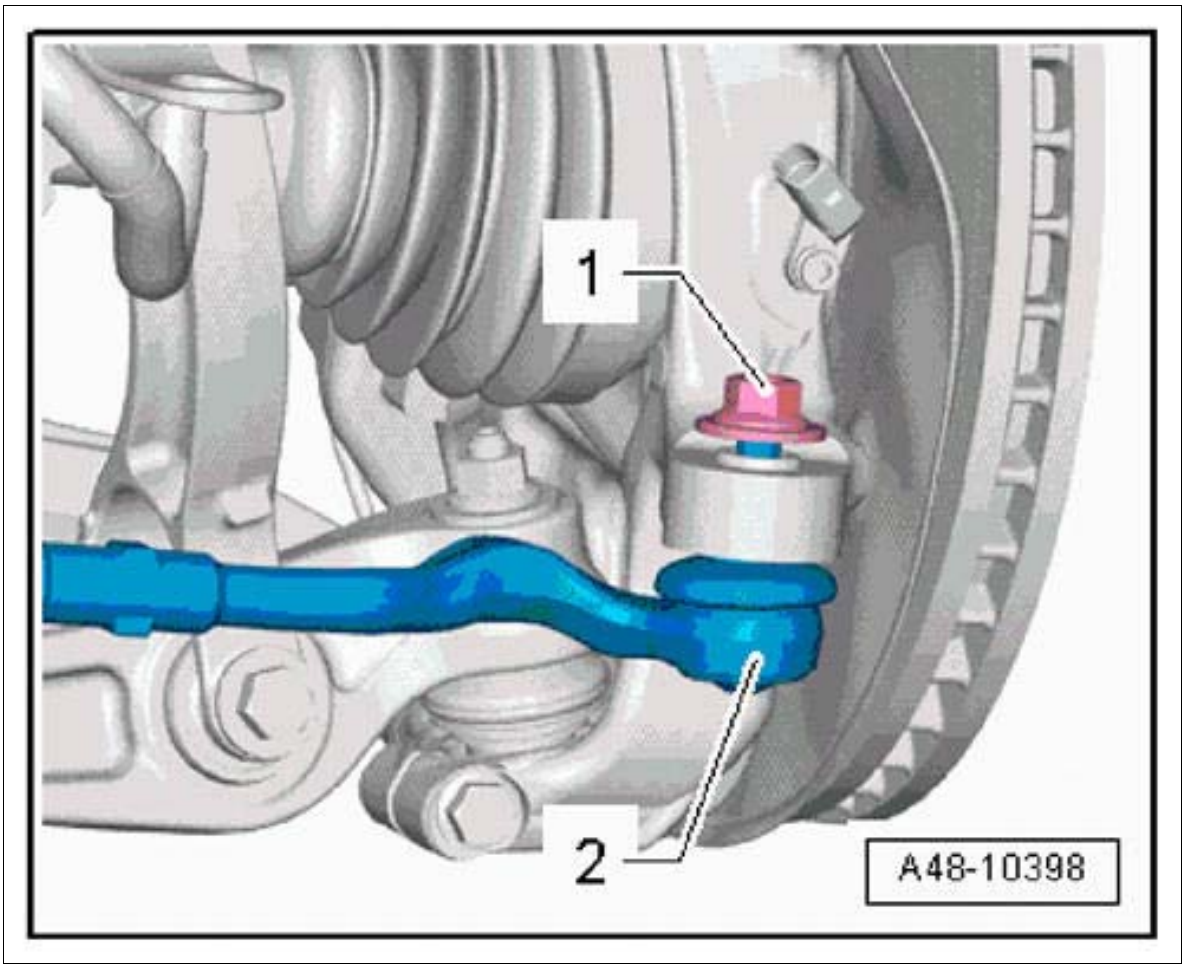
1. Installation is performed in reverse order to removal. Pay particular attention to the following:

   Fastening nut **-1-** securing tie-rod ball to tapered end of wheel carrier: **Tightening torque 100**

Nm (74 ftlb.)

Always use a new nut following removal.

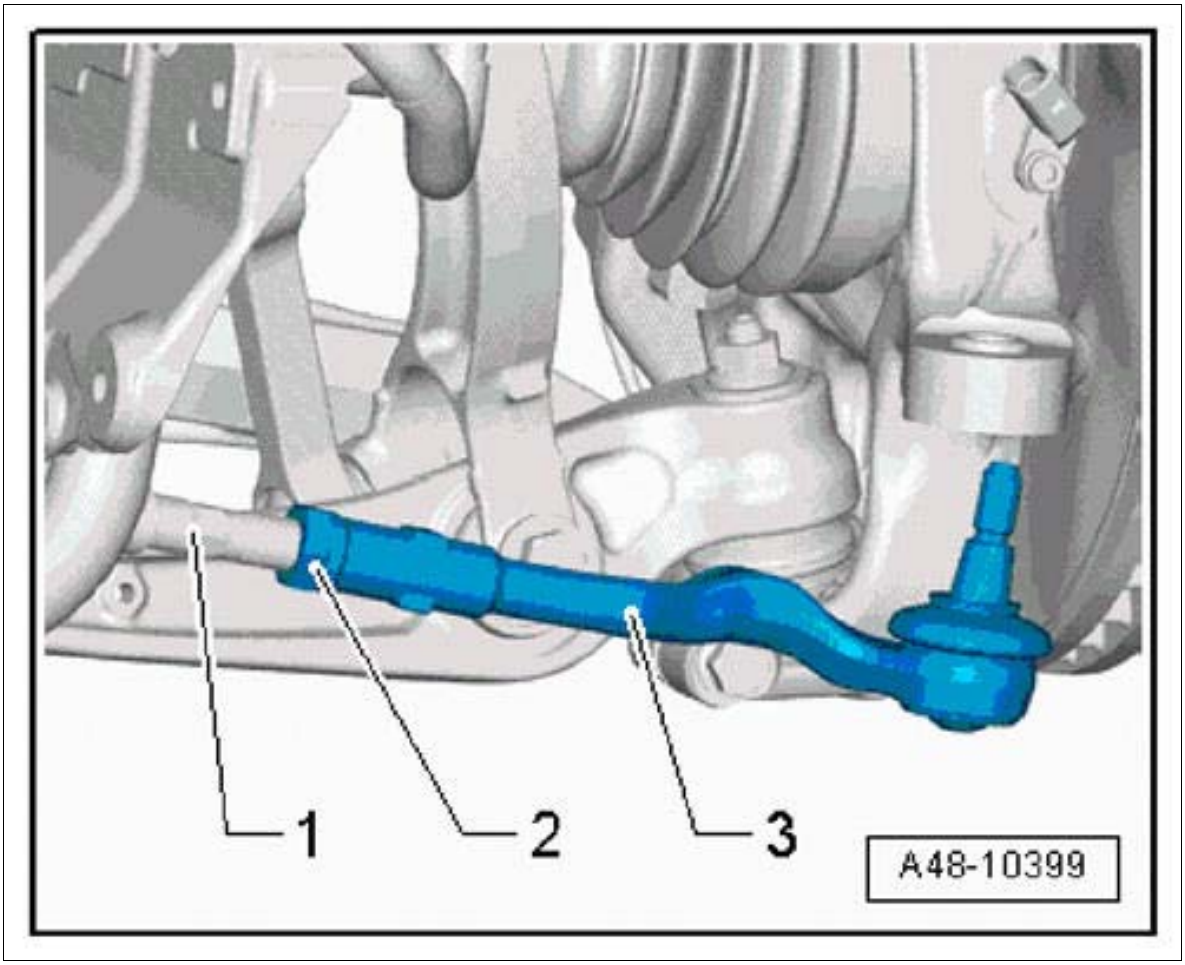
Fig 1: Identifying Tie-Rod Ball On Wheel Bearing Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Lock nut **-2-** securing tie-rod ball to tie rod: **Tightening torque 90 Nm (67 ftlb.)**

Fig 2: Identifying Tie-Rod Ball

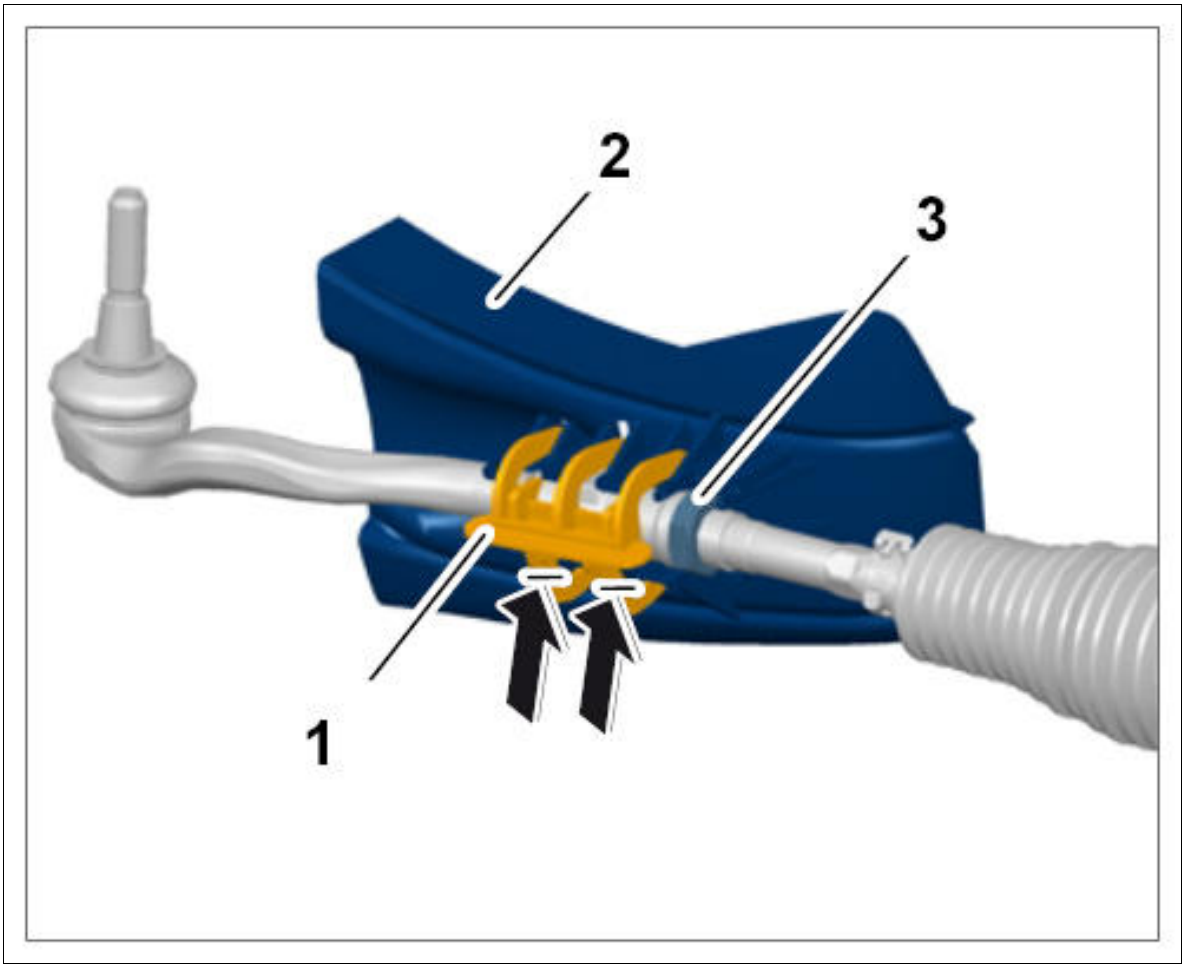


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 488119 REMOVING AND INSTALLING TIE-ROD BALL (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Fit wheel → 440519 REMOVING AND INSTALLING WHEEL .
2. Perform suspension alignment and make adjustments if necessary → 449503 SUSPENSION ALIGNMENT, COMPLETE .
3. If installed on the vehicle: Attach new air-guide element to the tie rod.

Fig 1: Locating Air-Guide Element On Tie Rod



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. Push air-guide element **-2-** onto the tie-rod ball from the front.

   Check the position of the lock nut **-3-** in the cut-out on the air-guide element **-2-** .

2. 3.2. Secure the air-guide element with a new clamp.

   Check that the clamp locks correctly.

   Check that the clamp has locked correctly through the test lugs **-1-** in the air-guide element **-2-** .

Fig 2: Identifying Test Lugs And Air-Guide Element

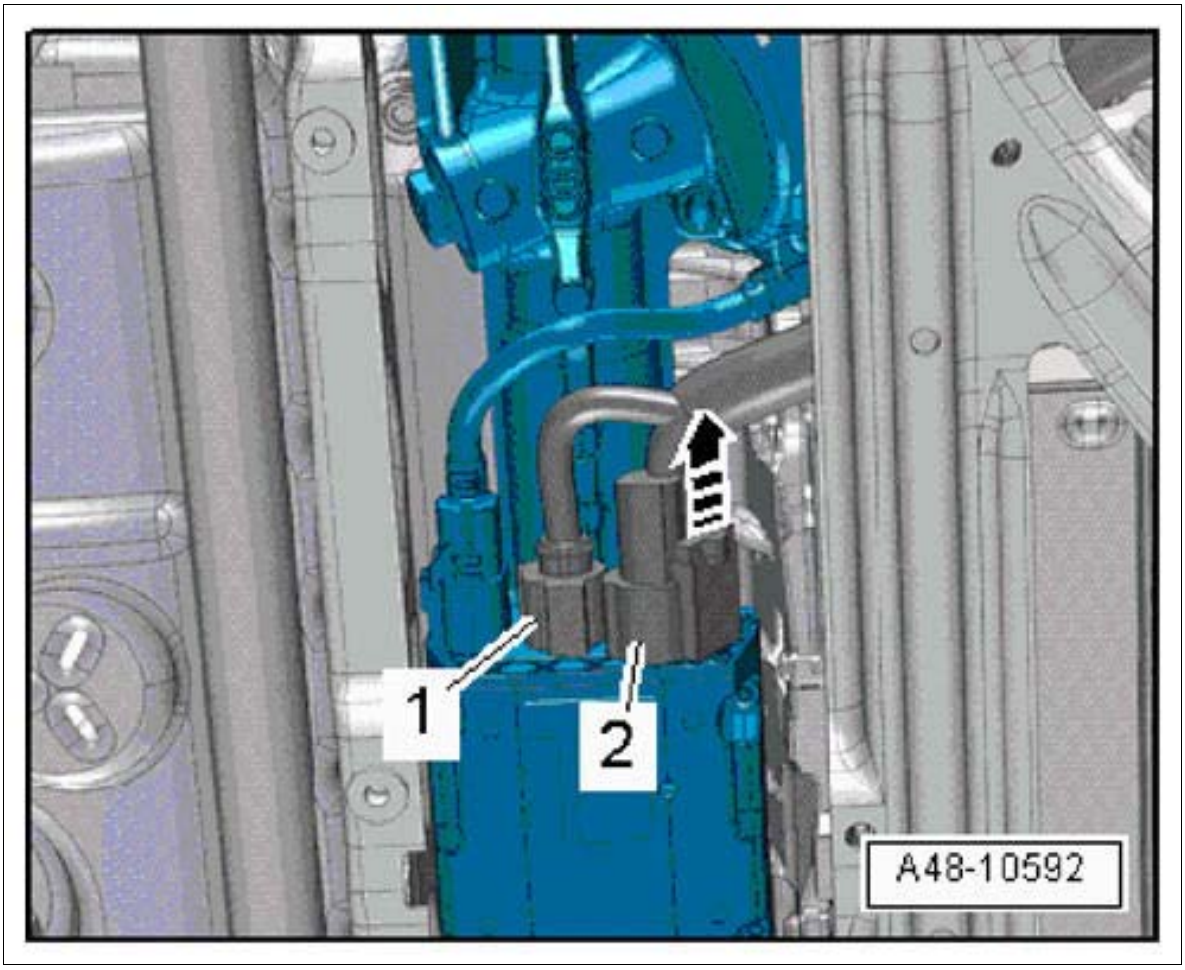
7. Release and disconnect connectors for vehicle signals **-1-** and power supply **-2-** .

Fig 7: Removing Connectors For Steering Gear



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

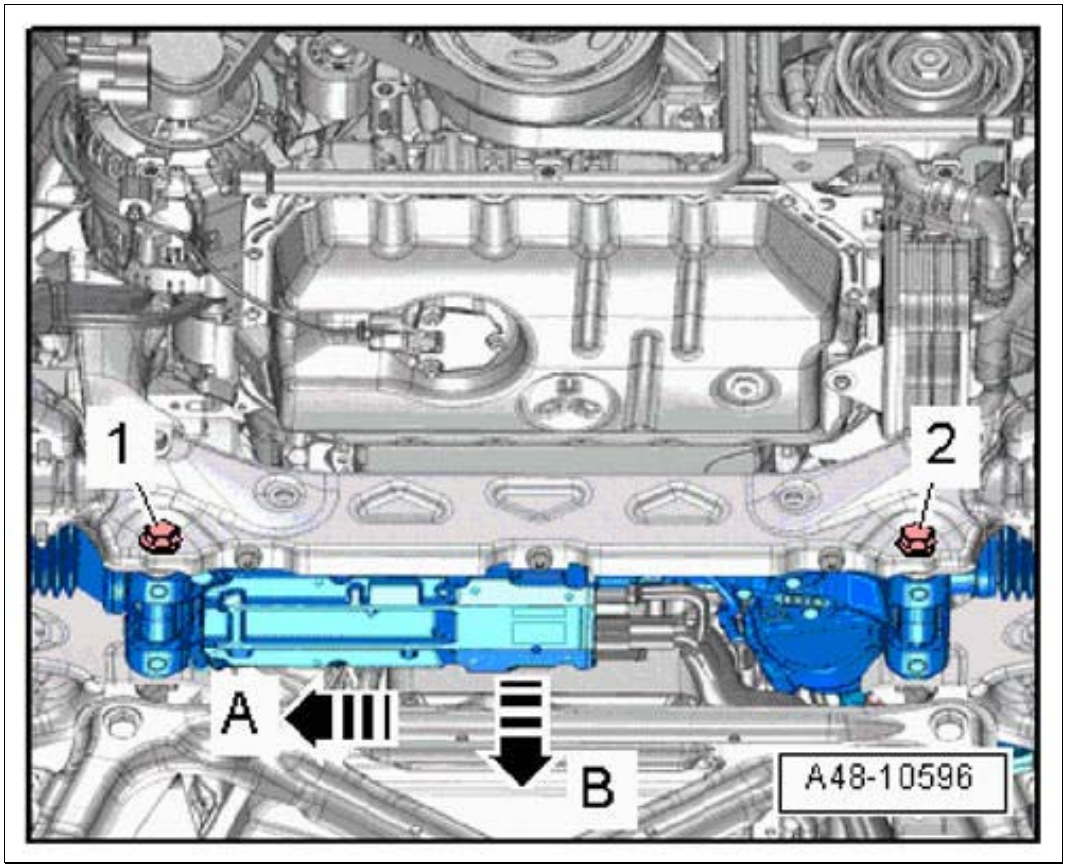
8. Remove steering gear.

> *WARNING: Danger of objects or loads falling down*
>
> *1. Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

1. 8.1. Unscrew and remove fastening screws **-1-** and **-2-** on the steering gear.
2. 8.2. Press steering gear aside slightly **-arrow A-** and remove it by pulling it downwards **-arrow B-** .

Fig 8: Pressing Steering Gear



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

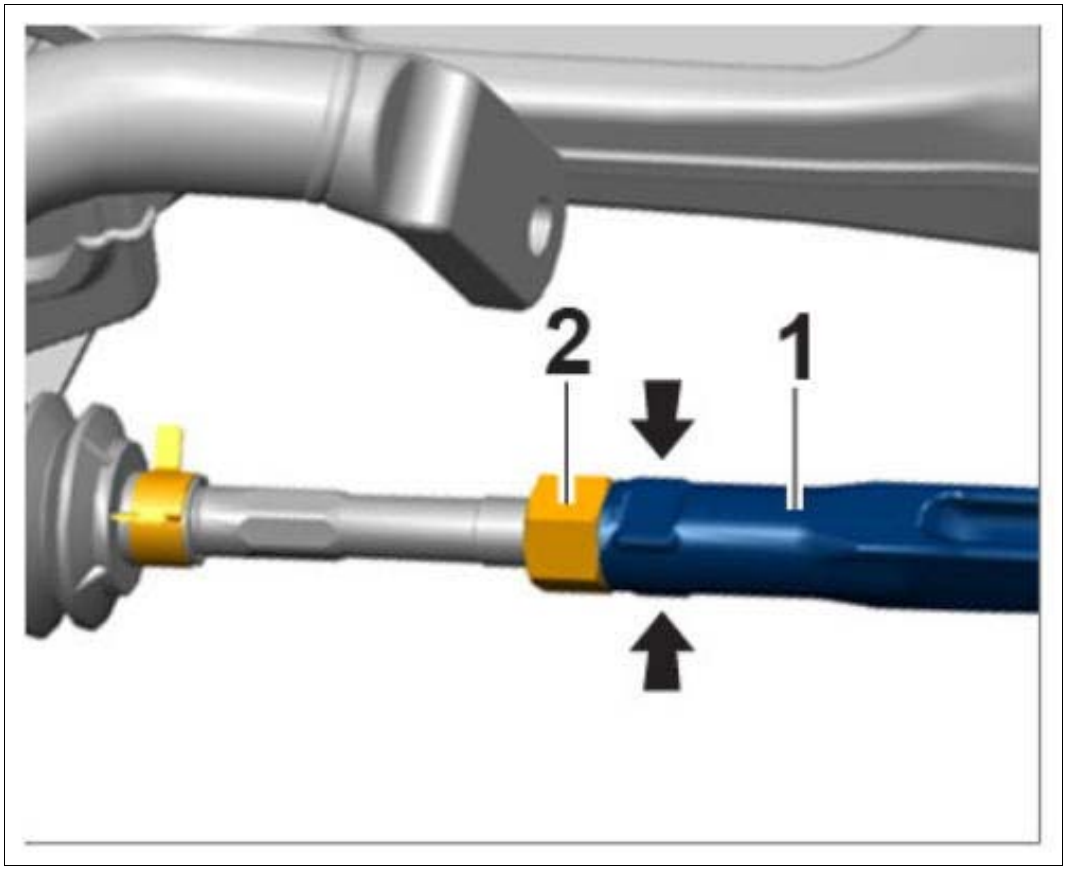
WM 489055 REPLACING POWER-STEERING GEAR (MACAN, MACAN S, MACAN TURBO) > REPLACING POWER-STEERING GEAR

Information

- The new steering gear comes as an assembly - it is simply a matter of taking the existing tie-rod balls and lock nuts from the old steering gear and fitting them on the new one.
- Check tie-rod balls for wear and replace them if necessary.
- Check that the bellows are seated correctly to prevent water from leaking in.

1. Remove steering gear → 489055 REPLACING POWER-STEERING GEAR .
2. Loosen the two tie-rod balls **-1-** from the tie rods on the removed steering gear.
    1. 2.1. Counter the tie-rod ball **-1-** at the flattened areas **-arrows-** using a suitable open-ended wrench.
    2. 2.2. Loosen lock nut **-2-** .

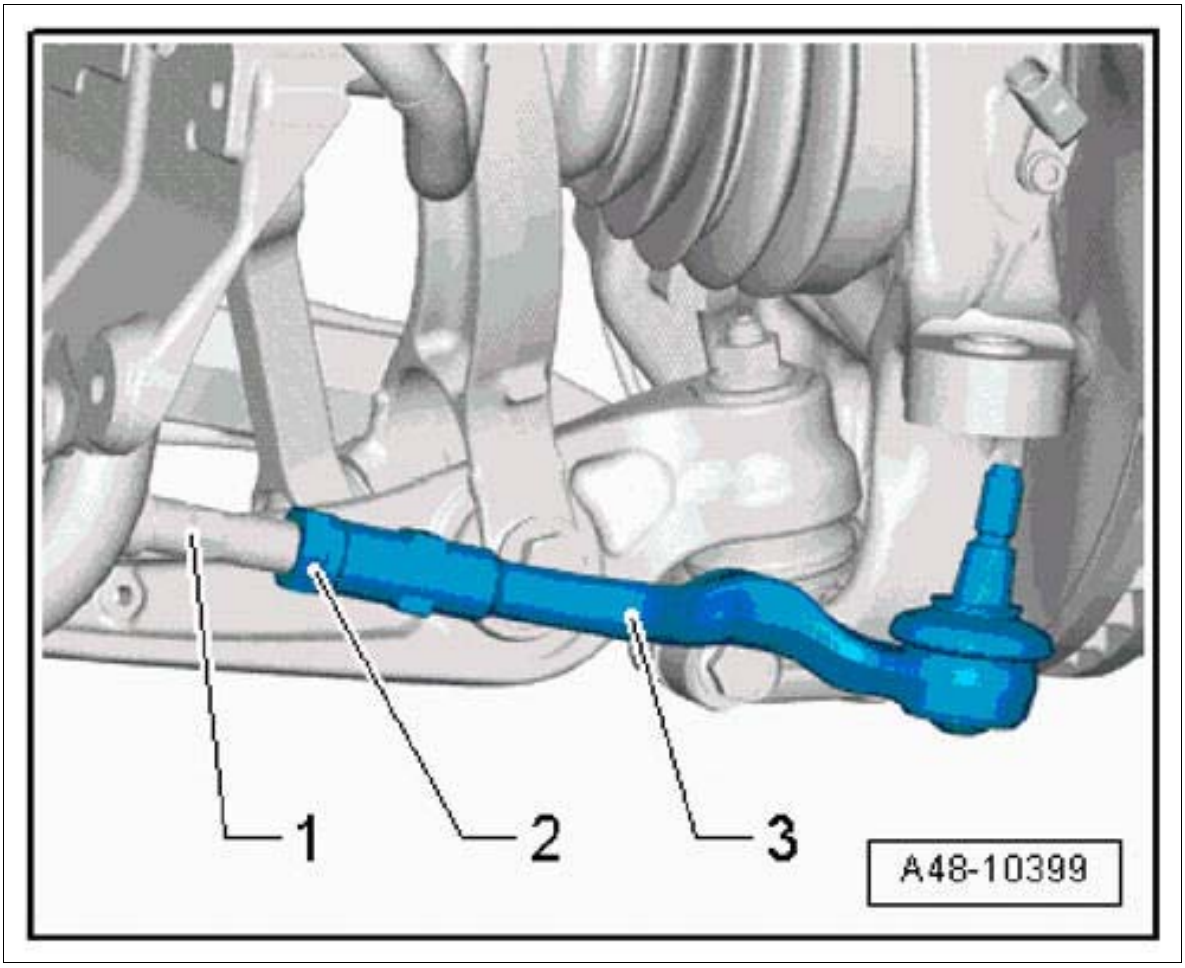
Fig 1: Detaching Tie-Rod Ball



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew and remove tie-rod ball **-3-** and lock nut **-2-** from the tie rod **-1-** .

Fig 2: Identifying Tie-Rod Ball



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Screw lock nut **-2-** and tie-rod ball **-3-** onto the new steering gear.
5. Install steering gear → REPLACING POWER-STEERING GEAR .

WM 489055 REPLACING POWER-STEERING GEAR (MACAN, MACAN S, MACAN TURBO) > INSTALLING POWER-STEERING GEAR

NOTE: Water can leak in if sealing elements are damaged.

- *Component can become damaged or may not function.*

→ Replace damaged sealing elements.

→ Check that sealing elements are fitted correctly.

Information

- Make sure that the pre-fitted intermediate wire harness and the torque sensor connector are not

damaged during installation. If one of these components is damaged, the complete steering gear must be replaced.

Installation is performed in reverse order.

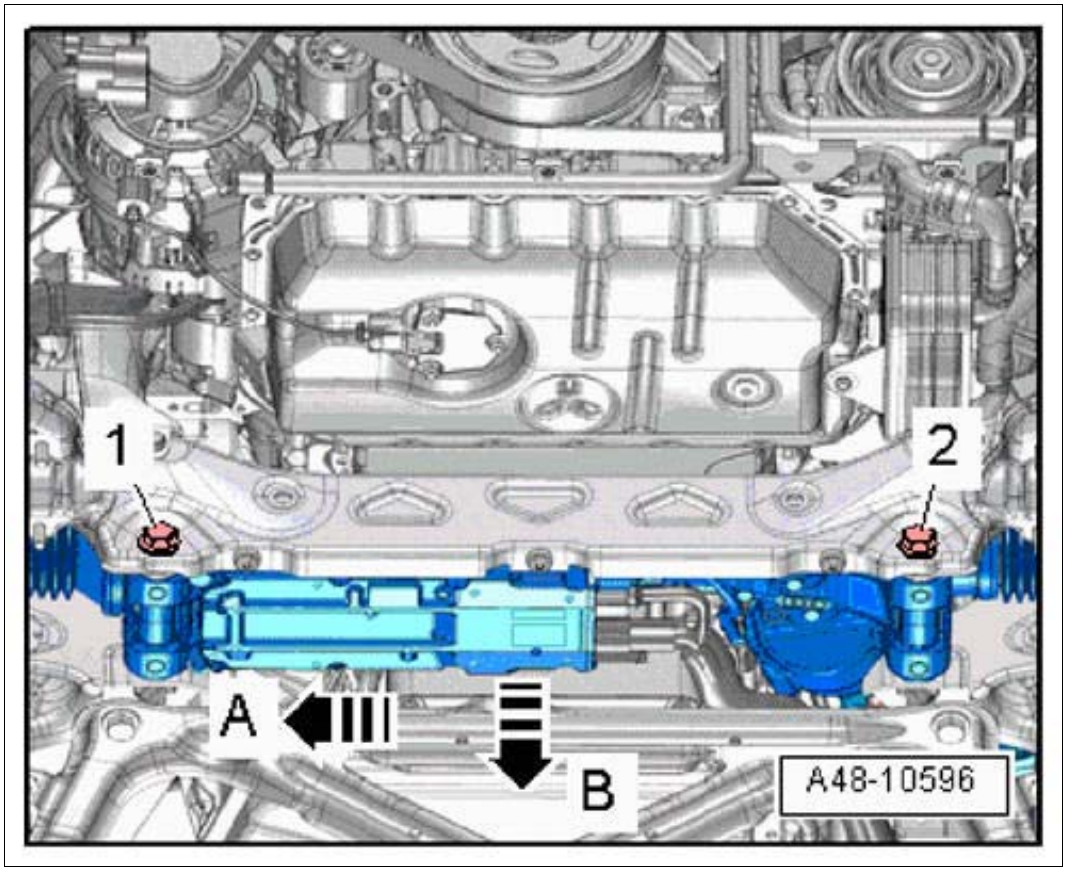
Pay particular attention to the following:

- Always use new steering gear fastening screws and a new clamping screw on the universal joint following removal. Clean screw threads and make sure that they remain clean and free of grease.
- Always check the bellows and clamps for damage and make sure they are seated securely to prevent water from leaking in.
- Connectors must lock with an audible click.
- **Replace fastening screws that are tightened to a torque angle!**
- **Replace nuts for the steering gear fastening screws!**
- Observe specified tightening torques and torque angle.

1. Move steering gear into installation position.

1. 1.1. Screw in fastening screws **-1-** and **-2-** for the steering gear, but do not tighten them!

Fig 1: Pressing Steering Gear

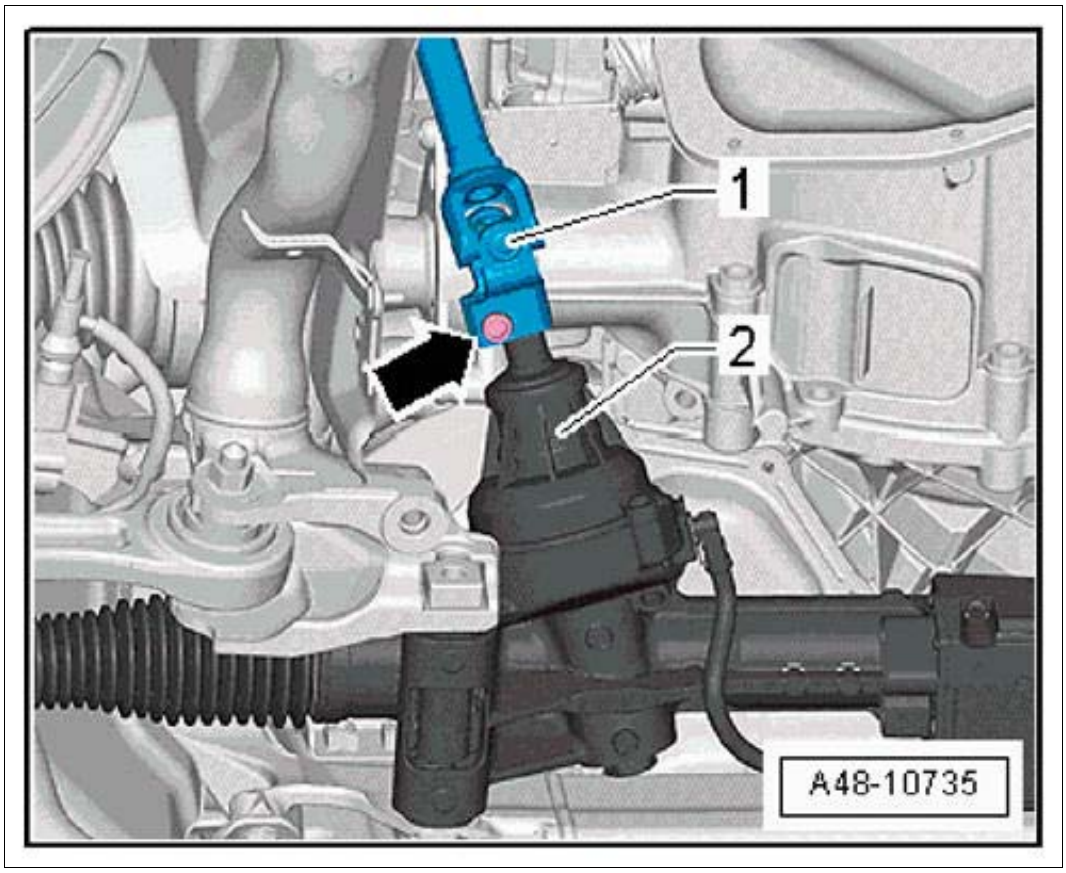


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Fit universal joint.

1. 2.1. Grease the journal of the input shaft for the steering gear using a non-water-soluble lubricant (e.g. lithium-saponified grease).
2. 2.2. Slide the universal joint **-1-** to the correct position in the center.

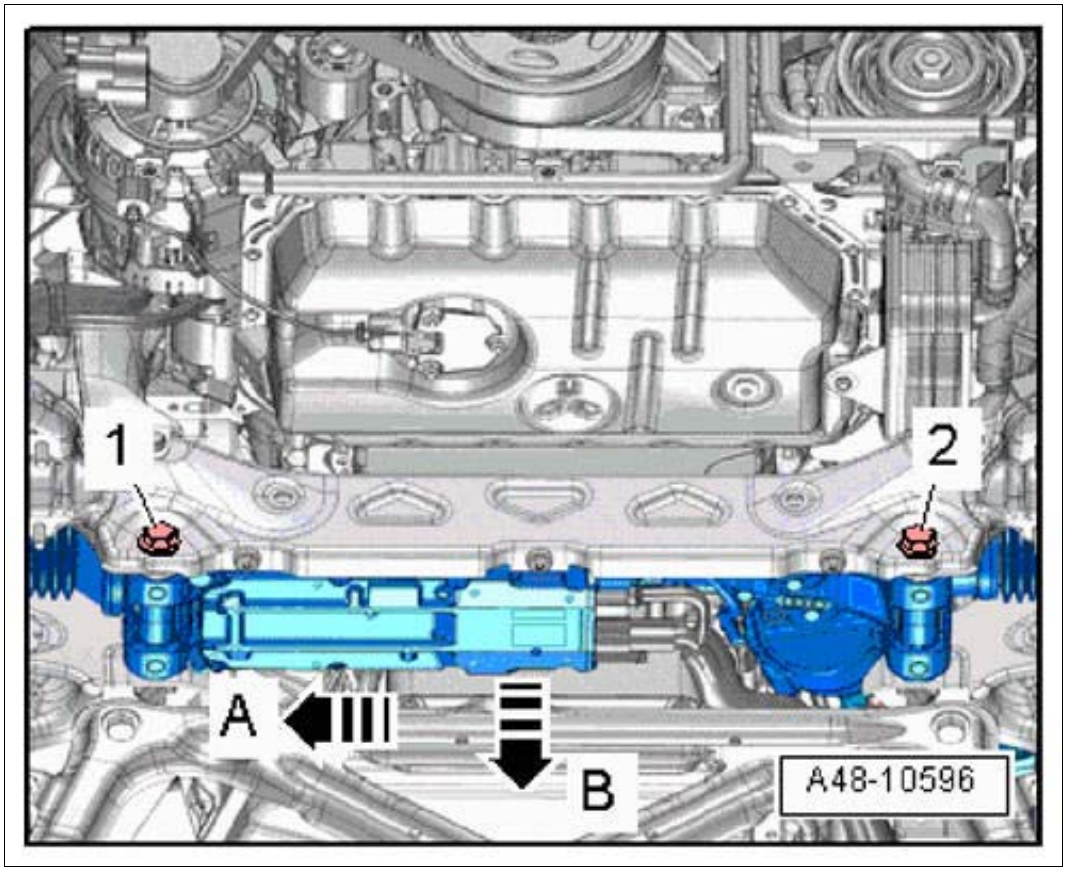
   Fig 2: Locating Universal Joint On Steering Gear



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 2.3. Tighten fastening screws **-1-** and **-2-** on the steering gear. **Initial tightening 80 Nm (59 ftlb.) Final tightening +180°**

Fig 3: Tightening Screws Of Steering Gear



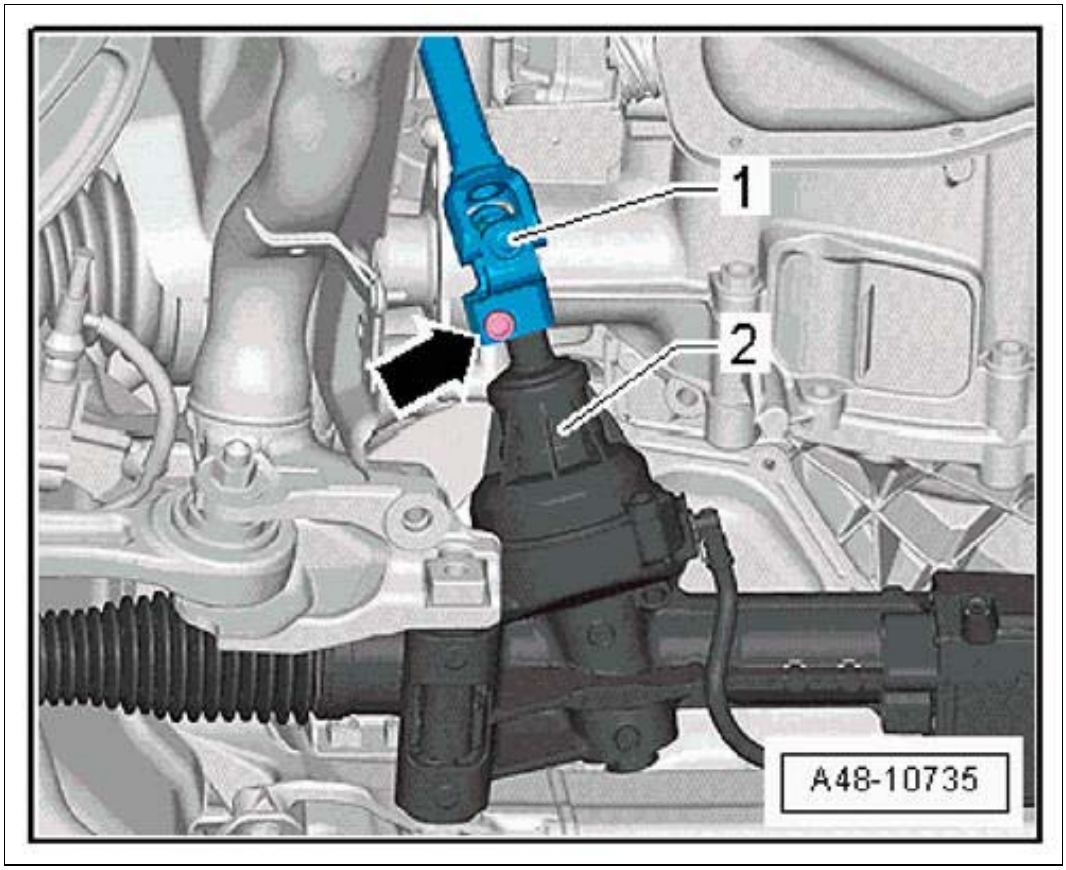
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Always replace the clamping screw on the universal joint.

4. 2.4. Tighten clamping screw **-arrow-** on the universal joint **-1-** . **Tightening torque 30 Nm (22 ftlb.)**

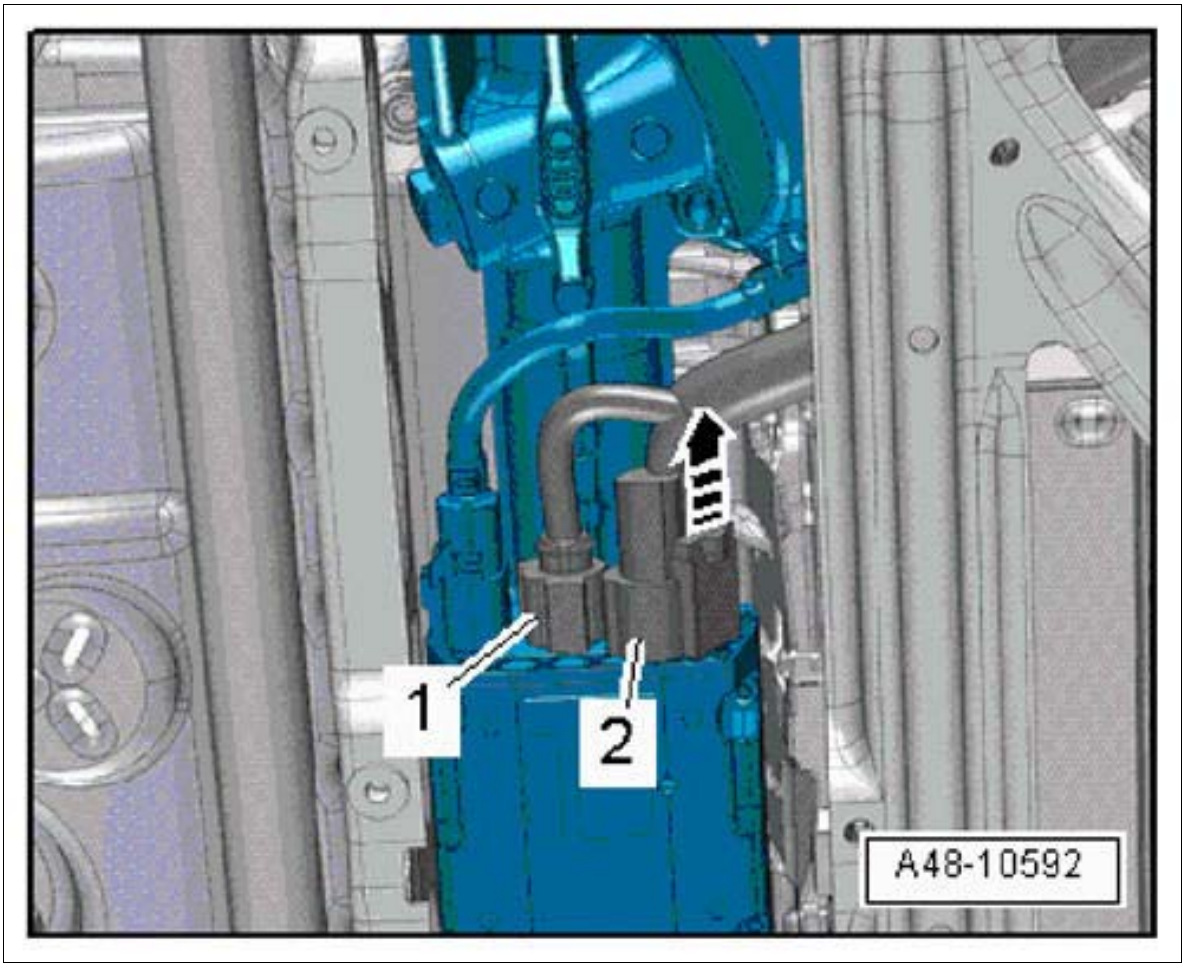
Fig 4: Locating Universal Joint On Steering Gear



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Connect connectors for vehicle signals **-1-** and power supply **-2-** . Connectors must lock with an audible click.

Fig 5: Removing Connectors For Steering Gear



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Install anti-roll bar → INSTALLING FRONT ANTI-ROLL BAR .
5. Install tie-rod ball → INSTALLING TIE-ROD BALL .

WM 489055 REPLACING POWER-STEERING GEAR (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install front-axle support → INSTALLING FRONT-AXLE SUPPORT .
2. Install front underbody panelling → INSTALLING COVER FOR FRONT UNDERBODY .
3. Install front wheels → INSTALLING WHEEL .
4. Perform suspension alignment → 449503 SUSPENSION ALIGNMENT, COMPLETE .
5. Calibrate steering-angle sensor → 456005 INITIALIZING AND CALIBRATING STEERING ANGLE SENSOR .

WM 4890IN ASSESSMENT OF STEERING GEAR AFTER ACCIDENT DAMAGE (MACAN, MACAN S, MACAN TURBO) > INFORMATION > FUNDAMENTALS

Various kinds of damage can occur to the steering gear in the event of accidents or driving conditions similar to accidents. In cases where the steering gear shows no external damage it can sometimes be difficult and costly to detect damage. Nevertheless, this damage represents an unacceptable risk for the vehicle, since it could lead to failure of the steering system.

A comprehensive check on all individual parts of the steering gear is not usually feasible due to the relatively high cost and is not possible using ordinary workshop resources. Instead, consideration must be given to the condition of other components that are easier to check.

To decide whether the steering gear of a vehicle involved in an accident must be replaced or may continue to be used, the following guidelines are helpful.

WM 4890IN ASSESSMENT OF STEERING GEAR AFTER ACCIDENT DAMAGE (MACAN, MACAN S, MACAN TURBO) > INFORMATION > ASSESSMENT OF THE STEERING OF A VEHICLE INVOLVED IN AN ACCIDENT

The steering gear may remain in the vehicle if all the following conditions are met:

No visible damage to such front-axle parts as wheel rims, spring struts, wheel carriers, control arms, steering arms, tie rods, chassis subframe, the steering shaft or to the points on the body where wheel suspension parts are bolted on.

No impermissible rise in torque and no jamming or catching when the steering gear is turned from stop to stop. The front wheels must be free (front axle raised) when turning and the ignition must be switched off (no power assistance).

The permissible tolerances for wheel alignment must not be exceeded.

The steering gear must be replaced by a new or exchange unit if one of the following points applies:

Visible or perceptible damage to the steering gear.

Fire damage (e.g. steering bellows burnt).

Permanent deformation or breakage of:

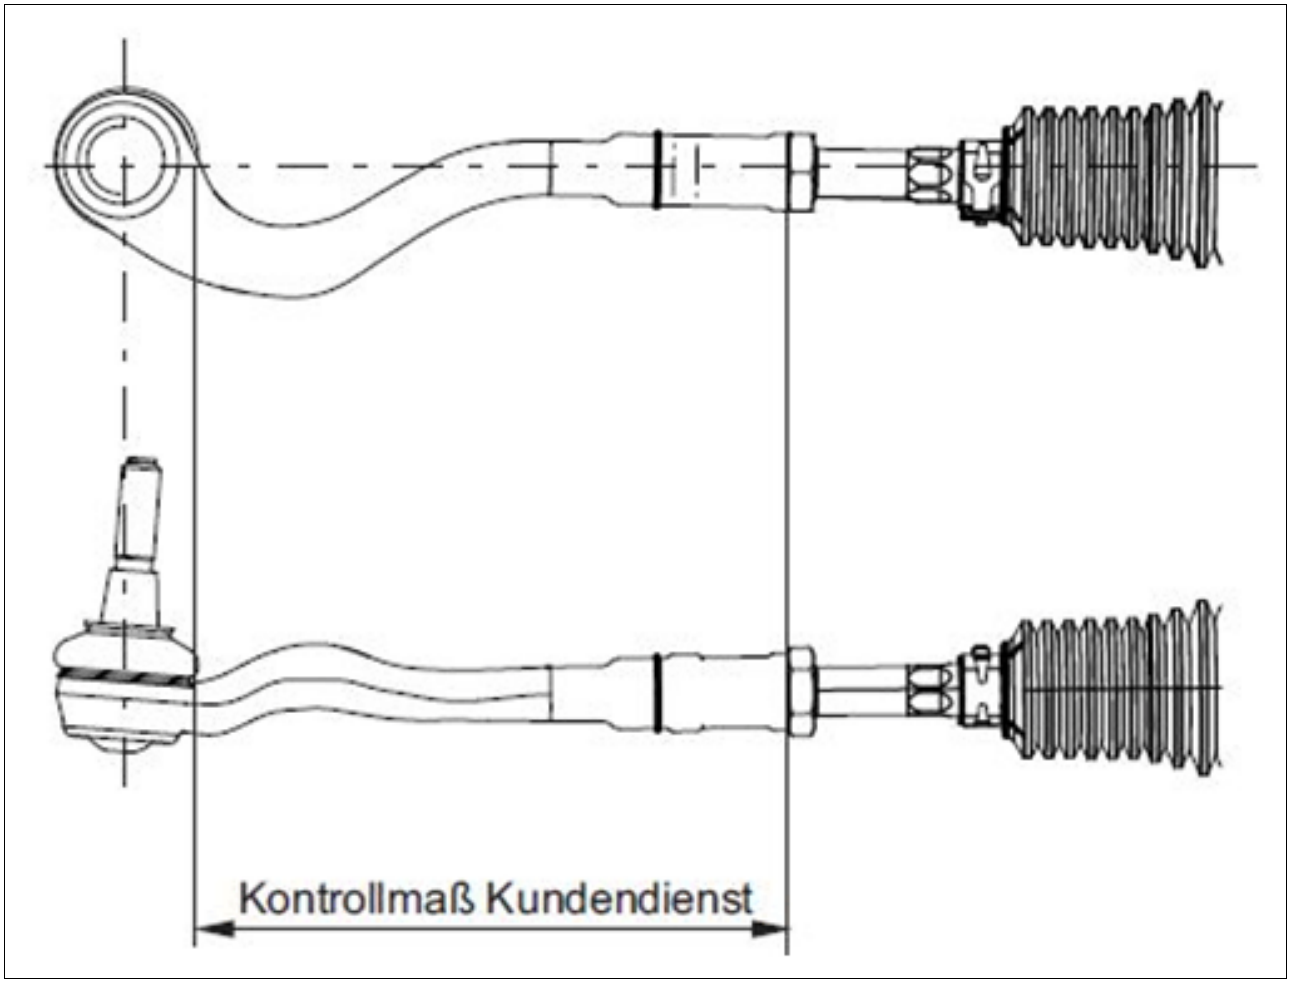
Steering-gear mountings

Tie-rod ball

Tie rods

Control dimension for tie-rod ball: If a control dimension is < 188 mm, the complete steering gear with tie rod and tie-rod ball must be replaced.

Fig 1: Identifying Tie-Rod Ball Control Dimension



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Steering arms

Spring struts

Wheel carriers

Control arms

Chassis subframe

If the listed criteria are insufficient for a decision, we recommend that the steering gear be replaced with a new or exchange unit.

WM 4890IN ASSESSMENT OF STEERING GEAR AFTER ACCIDENT DAMAGE (MACAN, MACAN S, MACAN TURBO) > INFORMATION > EXCEPTIONAL REGULATION/ORDER HANDLING

If a workshop's intended exchange of steering gear is refused by a customer or insurer for reasons of costs, an expert or - if this is impossible abroad, the importer - should be called in at the cost of the

refusing party. If the decision contradicts the guideline, we recommend that a memorandum be drawn up on the point and that it be countersigned by the expert.

Service Manual: 4X - CHASSIS - GENERAL -- (95B) - MACAN

WM 4X00IN BRAKE DISC MEASUREMENT SHEET (ALL MODELS) > INFORMATION > BRAKE DISC MEASUREMENT SHEET

Information

Notes on checking and measurement points can be found in:

- Technical data relating to the tests. → 4650TW TECHNICAL DATA/BRAKE WEAR LIMIT
- Description of Tests 1-3, front. → 465002 CHECKING FRONT BRAKE DISCS (WEAR ASSESSMENT)
- Description of Tests 1-3, rear. → 465302 CHECKING REAR BRAKE DISCS (WEAR ASSESSMENT)

A copy or print-out of the data card shown here can be used to document the measured result. The data cards cannot be ordered.

1. Make a copy or print-out of the data card shown here.

   Information

   1. Actual values that are identical in all versions are already entered!
   2. These values may change in the course of further development . Check them if necessary and add the new values as required. → 4650TW TECHNICAL DATA/BRAKE WEAR LIMIT

2. Before taking measurements (Test 1 to Test 3), enter the general data, vehicle type and the missing nominal values (new brake disc thickness/brake disc wear limit) in the data card.
3. Carry out measurements (actual status) and enter the values in the data card.
4. If brake discs are to be replaced, carry out Test 2 with the new discs again and enter the latest values in a new data card.

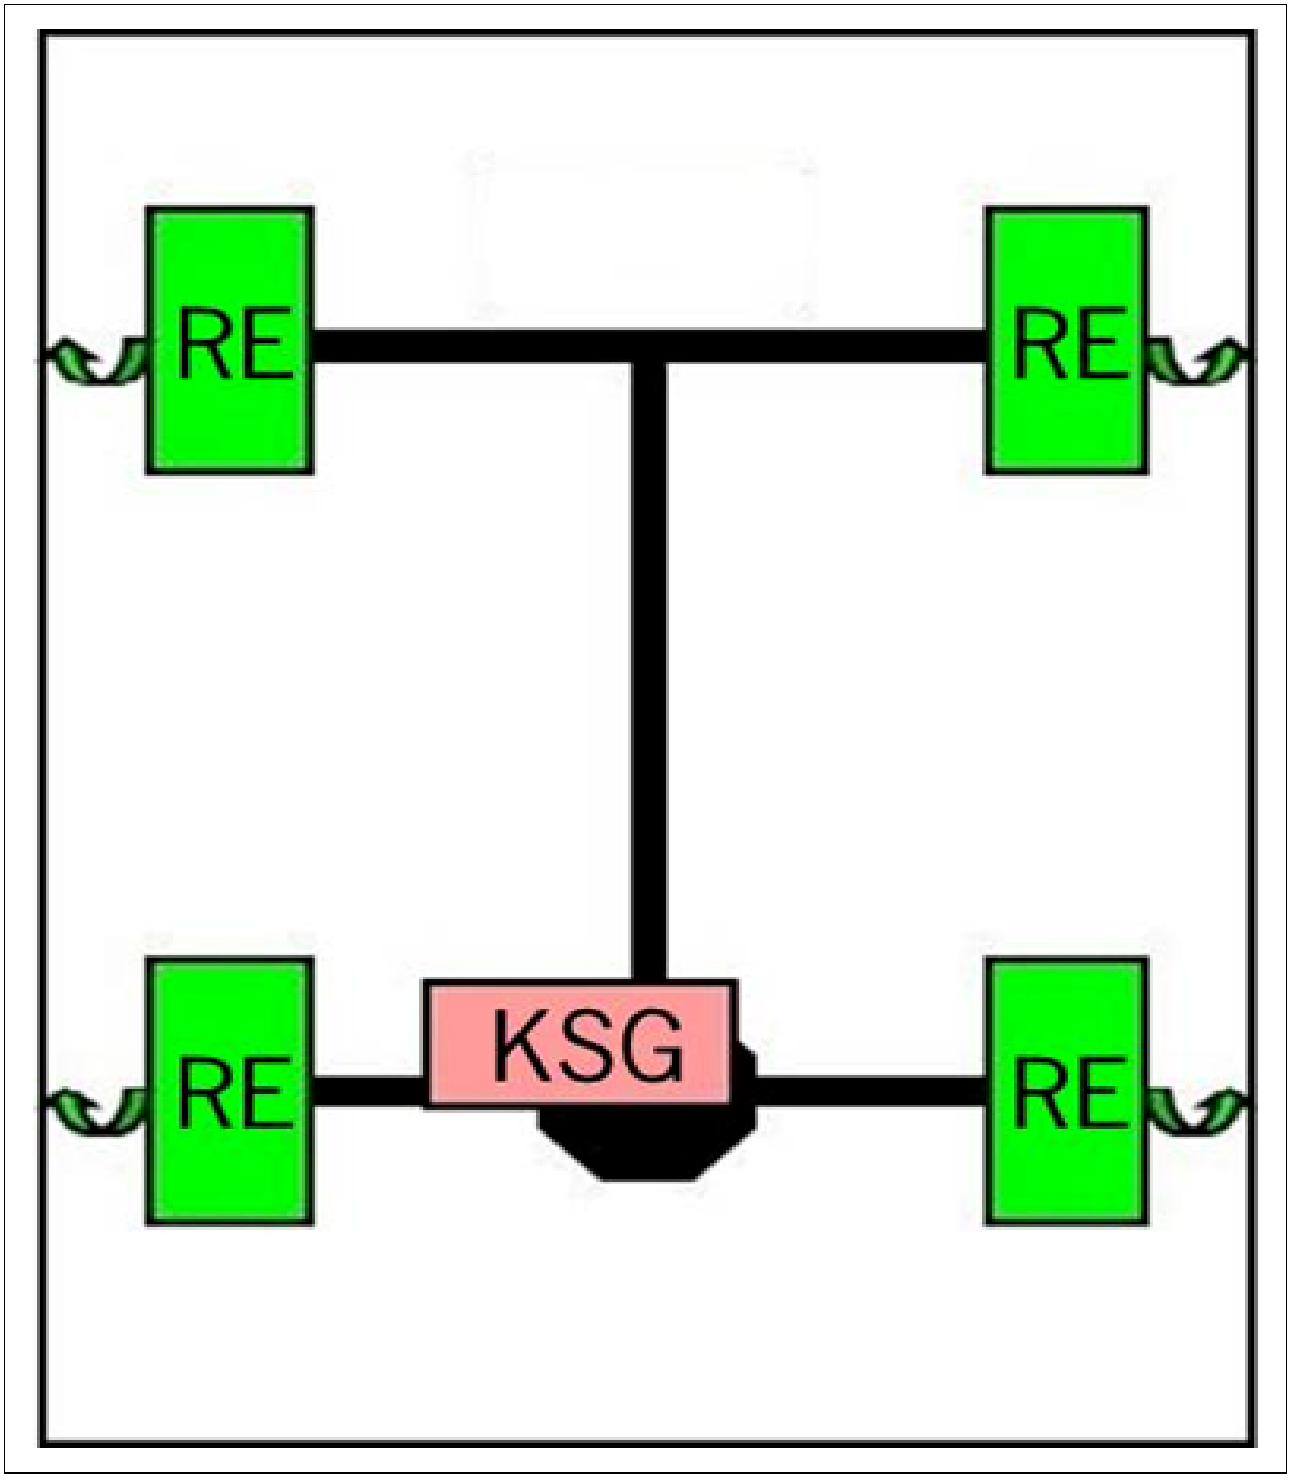
WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TOOLS

Designation	Type	Number	Description	

PIWIS Tester II	Special tool	9818		
WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) > DESIGN AND OPERATING PRINCIPLE > DESIGN

Fig 1: Identifying 3RD Generation TPM System Design



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The 3rd generation TPM system consists of:

- 4 wheel electronics units screwed onto the wheels
- 4 TPM valves and
- 1 TPM control unit (KSG) with integrated central antenna (installed on the rear axle)

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) > DESIGN AND OPERATING PRINCIPLE > OPERATING PRINCIPLE

The 3rd generation TPM system operates on the principle of unidirectional communication between the wheel electronics and control unit. This means that the wheel electronics can communicate with the control unit, but the control unit cannot communicate with the wheel electronics.

The wheel electronics units send the currently measured tire pressure, the direction of rotation, the temperature of the air in the tire and the remaining service life (of the battery) as well as a specific ID from the wheel that is currently turning at specified intervals.

The wheel position is learned automatically from the side and axle specifications. The direction of rotation of a wheel is detected by acceleration sensors in the wheel electronics (left/right detection). Axle sensing (front axle/rear axle detection) is performed based on differentiated sound levels between the front and rear axle, where the central antenna is fitted close to one axle (high level). The levels received from the other axle are correspondingly low.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) > DESIGN AND OPERATING PRINCIPLE > TRANSMISSION MODES

The wheel electronics units communicate with the control unit in various modes. Depending on the current mode of a wheel electronics unit, it sends telegrams to the control unit at defined intervals.

- **Normal mode:** Normal mode is active while the vehicle is driving (after Burst mode has ended).
- **Sleep mode:** Sleep mode is activated as soon as the vehicle remains stationary for longer than 5 minutes. The wheel electronics then send no more telegrams. If the ignition is switched on while the wheel electronics units are in Sleep mode, no tire pressures are displayed (display in instrument cluster: "-.-"). Tire pressures are only displayed again when the vehicle is driving (see Burst mode).
- **Burst mode:** If the wheel electronics units are in Sleep mode and the vehicle is accelerated to over 25 km/h (15 mph) from stationary, the wheel electronics units switch to Burst mode. The wheel electronics units send their telegrams for 60 seconds at fast intervals.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > GENERAL INFORMATION

If a new set of wheels is used or wheel electronics units were replaced, the TPM system must be taught. When teaching the TPM system, the control unit stores the wheel IDs of the wheel electronics units and assigns a position to them.

New wheel electronics units can be taught by selecting a new set of wheels in the instrument cluster.

The system is then in learning mode and re-assigns the wheel IDs that are received.

But the system also detects a wheel change if the stored information does not correspond to the information received. The control unit then displays a message on the instrument cluster prompting you to select the newly fitted set of wheels.

The wheel electronics units can be taught while the vehicle is driving and while it is stationary. Teaching while driving is recommended.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > TEACHING WHILE DRIVING

A procedure in **PIWIS Tester II 9818** can be used to teach the wheel IDs while driving: >>Tyre Pressure Monitoring (TPM) system << >>Maintenance/repairs<< >>Teach wheel IDs<< >>Teach wheel IDs while driving<<.

The wheel IDs can also be taught without using the System Tester.

The following points must always be observed:

- Allow an idle time of at least 5 minutes before teaching the wheel IDs (wheel electronics units are then in Sleep mode).
- Briefly accelerate the vehicle to over 25 km/h (15 mph) in order to teach the wheel IDs (wheel electronics units are then in Burst mode).
- Then continue driving at any speed (even < 25 km/h or 15 mph) for max. 10 minutes.
- Teaching was successful if a pressure reading is displayed in the instrument cluster for all wheel positions.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > TEACHING WHILE STATIONARY

Information

If the TPM system is to be taught while the vehicle is stationary, it is advisable to take note of the wheel IDs and the position of all wheels and store the information together with the wheels. This can significantly reduce the teaching time for the next wheel change.

The wheel IDs and position can be read out using **PIWIS Tester II 9818** if this information is already stored in the control unit. >>Tyre Pressure Monitoring (TPM) system<< >>Actual values and input signals<<

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > TEACHING

WHILE STATIONARY > IF WHEEL IDS ARE KNOWN

Allocation of wheel electronics units using the **PIWIS Tester II 9818:** >>Tyre Pressure Monitoring (TPM) system<< >>Maintenance/repairs<< >>Teach wheel IDs<< >>Teach wheel IDs while vehicle is stationary<< >>Wheel IDs known<<.

WM 4X00IN GENERAL INFORMATION ON TYRE PRESSURE MONITORING (TPM) (ALL MODELS) > TEACHING TYRE PRESSURE MONITORING (TPM) > TEACHING WHILE STATIONARY > IF WHEEL IDS ARE UNKNOWN

Allocation of wheel electronics units using the **PIWIS Tester II 9818:** >>Tyre Pressure Monitoring (TPM) system<< >>Maintenance/repairs<< >>Teach wheel IDs<< >>Teach wheel IDs while vehicle is stationary<< >>Wheel IDs unknown<<.

Always observe the following procedure (instructions on the System Tester always take precedence!):

- Allow an idle time of at least 5 minutes before teaching the wheel IDs (wheel electronics units are then in Sleep mode).
- As per instructions on the System Tester, pressure (at least 0.2 bar and approx. 5 seconds) at the wheels must be reduced.
- The wheel electronics registers the pressure difference (after 2 minutes at the latest) and switches to Burst mode.
- The control unit receives the telegrams from the activated wheel electronics unit and writes its wheel ID to the specified position.

WM 4X00IN INFORMATION ON PSM (ALL MODELS) > INFORMATION ON PSM

PSM is an active control system for stabilizing the vehicle at the limit of driving dynamics. Sensors continuously determine:

- Vehicle speed
- Direction of travel (steering angle)
- Lateral acceleration
- Longitudinal acceleration
- Rotation rate

Information

- The PSM (Porsche Stability Management) is automatically ready/switched on after each engine start.

WM 4X00IN INFORMATION ON PSM (ALL MODELS) > INFORMATION ON PSM >

INFORMATION ON PSM

The vehicles are equipped with a new PSM generation with enhanced functions, which considerably improve active safety.

- Enhanced braking readiness
- Brake assist function
- Enhanced Trailer Stability Management
- New ABS tuning for braking on loose surfaces

With enhanced braking readiness, the brake system builds up slight pressure when the accelerator is released quickly and places the brake pads lightly on the brake discs. If the driver now presses the brake, braking power can be achieved more quickly. This results in a shorter stopping distance. Enhanced braking readiness always remains active, irrespective of whether PSM is on or off.

On identifying full braking - when a defined pedal pressure is exceeded - brake assist supplies the required pressure for maximum deceleration via the PSM hydraulic unit. Brake assist can be deactivated by switching off PSM.

Enhanced Trailer Stability Management is a support function of PSM for driving with a trailer. The system detects swaying movements of the trailer and tries to minimize these through targeted braking. Trailer Stability Management can be switched off by switching off PSM. When the driver presses the brake pedal, Trailer Stability Management is activated even if PSM is switched off.

The ABS control strategy has been modified for braking on loose surfaces. A brake barrier, which helps to reduce braking distance on gravel or snow for example, is created in front of the tires by blocking the wheels short.

WM 4X00IN INFORMATION ON PSM (ALL MODELS) > INFORMATION ON PSM > SWITCHING OFF PSM

Press the PSM button. PSM switches off after a short delay.

When PSM is off, the PSM OFF warning light in the instrument panel and the indicator light in the switch light up.

- When braking, the vehicle is also stabilized when PSM is switched off!
- One-sided wheel spin is also prevented when PSM is switched off!

PSM should always be switched on for normal driving.

In the following exceptional cases, it can be advantageous to switch off the PSM temporarily:

- On a loose surface and in deep snow
- When rocking the vehicle free
- When using snow chains
- On extremely rough ground (if one or more wheels have little or no road grip - engine performance

is reduced)

WM 4X00IN INFORMATION ON PSM (ALL MODELS) > INFORMATION ON PSM > SWITCHING PSM BACK ON

Press the PSM button. PSM switches on after a short delay.

WM 4X00IN LIFTING THE VEHICLE (ALL MODELS) > TOOLS

Designation	Type	Number	Description

WM 4X00IN LIFTING THE VEHICLE (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Switching on the levelling system	Speed > 7 km/h (4 mph), the levelling system switches on automatically.	Speed greater than	+7 km/h (4 mph)		

WM 4X00IN LIFTING THE VEHICLE (ALL MODELS) > LIFTING THE VEHICLE > GENERAL INFORMATION

NOTE: Air springs can become kinked/fall out

- *Risk of damage to air springs*

→ Switch off the levelling system (press and hold the levelling system button for at least 10 seconds).

→ Check the bellows before lowering the vehicle.

Information

Always pay particular attention to the following before raising the vehicle:

- Deactivate the levelling system before raising the vehicle (press and hold the levelling system button for at least 10 seconds).
- If a transmission range is engaged while the vehicle is raised, the levelling system must first be deactivated using PIWIS Tester II 9818. To do this, select >>Levelling system/PASM<< >>Drive links/checks<< >>Activate/deactivate vehicle<< in the control unit overview. Select the value "Deactivate levelling system (permanently)" and press "Start" [F8] to execute the function. Re-activate the levelling system when the work is complete. To do this, select the value "Activate levelling system" in the same menu item and press "Start" [F8] to execute the function.

WM 4X00IN LIFTING THE VEHICLE (ALL MODELS) > LIFTING THE VEHICLE > LIFTING THE VEHICLE

1. Drive vehicle onto the lifting platform. Pay particular attention to the following:
    1. When driving onto a lifting platform, ensure that there is sufficient distance between the lifting platform and the vehicle.
    2. If work has to be done in the front footwell, the vehicle should be positioned in such a way that the doors can be opened far enough.
2. On vehicles with air suspension/levelling system: Switch off the levelling system.
    1. 2.1. Switch on ignition.
    2. 2.2. Press and hold the levelling system button until the message >>Levelling system switched off<< appears on the instrument cluster.

Fig 1: Identifying Levelling System Button

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WARNING: Vehicle can fall down

1. Risk of squashing or crushing

2. Risk of damage to the vehicle

→ Do not place any solid objects under the raised vehicle.

→ Ensure that the lifting platform is prevented from lowering.

→ Remove solid objects before lowering the vehicle.

→ Raise the vehicle only at the take-up points provided.

3. Raise the vehicle at the four jacking points **-1-** .

Fig 2: Identifying Vehicle Jacking Points

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > FITTING CHASSIS COMPONENTS

WARNING: Incorrect handling of safety bolts

- *Danger of injury*
- *Loss of torque*

→ Always use new fastening screws and nuts following removal.

→ Observe specified tightening torques.

→ Carry out a visual inspection of all re-used parts.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > SPRING STRUTS/COIL SPRINGS

WARNING: Installation of incorrect or damaged coil springs

- *Different vehicle handling*
- *Coil springs can break*

→ Examine the components carefully before installation.

→ When installing new coil springs/spring struts, make sure they are assigned correctly.

→ Only use a suitable tool for removing and installing coil springs.

→ Do not weld or grind, or use a hammer close to the spring struts.

→ Do not apply color markings to the coil springs.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > WHEELS AND TIRES

WARNING: High tire seating pressure

- *Risk of squashing or bruising*

→ Use a tire filling cage.

Information

- Newly mounted tires require a bedding-in period to remove the vulcanization layer.
- Customers must be informed that the full performance of new tires is achieved only after a distance of 100 to 200 km (60 to 120 miles) has been driven. Avoid extreme driving maneuvers (acceleration, braking) during this time.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > WORKING ON VEHICLES WITH PSM

WARNING: Steering-angle sensor not calibrated or calibrated incorrectly

- *Unexpected vehicle handling*
- *Steering-angle sensor does not function*
- *Malfunction in steering-angle sensor*

→ After working on wheel suspension parts, when replacing the steering-angle sensor and after changing the wheel alignment values, calibrate the steering-angle sensor using **PIWIS Tester II 9818** .

→ Keep the front wheels in straight-ahead position on the measuring platform during calibration.

→ On vehicles with electromechanical steering, also re-teach the electric steering lock settings.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > BRAKE SYSTEM

WARNING: Installation of brake pads with the wrong brake pad quality

- *Longer braking distance*
- *More wear on brake pads*

→ Only use the type-specific brake pads.

→ Replace the brake pads when the brake pad wear indicator light comes on, but no later than when

there is a residual pad thickness of 2 mm on each axle.

→ Replace the brake discs on each axle as soon as the brake pad wear limit is reached.

Information

- Observe brake fluid quality. Use only new DOT 4 brake fluid.
- The brake-fluid change interval using Super DOT4 brake fluid is two years.
- This brake fluid is available under the following part numbers: Container quantity: 1 liter = 000.043.203.66. 30 liters = 000.043.203.67.

WM 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR CARRYING OUT REPAIRS ON THE CHASSIS (ALL MODELS) > GENERAL WARNING NOTES > HANDLING AIRBAG SYSTEMS

WARNING: Incorrect handling of airbag units

- *Triggering of airbag unit.*
- *System faults can occur.*

→ Switch off ignition and remove ignition key or remote control (hand-held transmitter).

→ A power supply (e.g. battery charger) must not be connected to the external power supply/jump-lead starting terminals.

→ Disconnect the battery and insulate the ground strap so that all contact with a ground carrier is avoided.

→ Wait 1 minute after disconnecting the battery.

→ Only pull off connector on the triggering unit after the waiting time has elapsed.

→ Make sure that no foreign objects are located in front of the airbag unit during installation.

→ Replace damaged parts during removal.

→ Always position airbag units so that the blow-out opening is facing upwards, e.g. crest on driver's airbag.

→ Do not position anything on the airbag units.

→ If removed for an extended period, the airbag units must be stored in a safe place.

→ Airbag units must not come into contact with grease, oil, detergents, liquids, or similar substances.

→ Do not expose airbag units to temperatures above 90°.

→ Do not remove the short-circuit spring on the plug-in contacts.

→ Ignition and preparations may only be carried out by skilled staff, supervised by a second responsible person.

→ Before disposal, the airbag unit must be rendered harmless by electrical ignition performed in accordance with all precautionary measures, thereby preventing it from being used incorrectly.

Fastening screws	Heat shield over engine mount	Tightening torque	20 Nm (15 ftlb.)		
Fastening screws	Heat shield to front-axle carrier	Tightening torque	9 Nm (6.5 ftlb.)		
Fastening screw	Heat shield to front-axle carrier	Tightening torque	20 Nm (15 ftlb.)		
Fastening screws	Heat shield over engine mount	Tightening torque	20 Nm (15 ftlb.)		
Fastening screws	Retainer plate to front-axle carrier	Tightening torque	30 Nm (22 ftlb.)		
Fastening screw	Step 1, engine mount	Initial tightening	90 Nm (67 ftlb.)		

Fastening screw	Step 2, engine mount	Final tightening	+90°		
Fastening screw	Step 1, front-axle carrier to body	Initial tightening	115 Nm (85 ftlb.)		
Fastening screw	Step 2, front-axle carrier to body	Final tightening	+90°		
Fastening screw	Step 1, front-axle carrier to body	Initial tightening	115 Nm (85 ftlb.)		
Fastening screw	Step 2, front-axle carrier to body	Final tightening	+90°		
Fastening screws	Engine mount to front-axle carrier	Tightening torque	55 Nm (41 ftlb.)		
Fastening screws	Step 1, cross-strut to front-axle carrier	Initial tightening	90 Nm (67 ftlb.)		
Fastening screws	Step 2, cross-strut to front-axle carrier	Final tightening	+135°		
Front fastening screw	Step 1, cross-strut to front-axle carrier	Initial tightening	90 Nm (67 ftlb.)		
Fastening screw	Step 2, Cross-strut to front-axle carrier	Final tightening	+90°		
Fastening screw	Step 1, fastening screw for connecting link	Initial tightening	40 Nm (30 ftlb.)		
Fastening screw	Step 2, fastening screw for connecting link	Final tightening	+90°		
Fastening screw	Step 1, fastening screw for connecting link	Initial tightening	40 Nm (30 ftlb.)		
Fastening screw	Step 2, fastening screw for connecting link	Final tightening	+90°		
Fastening nut		Tightening torque	25 Nm (19 ftlb.)		
Fastening screw	Protective plate	Tightening torque	20 Nm (15 ftlb.)		
Dome strut to body		Tightening torque	20 Nm (15 ftlb.)		
Additional reinforcement to body		Tightening torque	20 Nm (15 ftlb.)		

Dome strut to cross panel		Tightening torque	2 Nm (1.5 ftlb.)		
Additional reinforcement to dome strut		Tightening torque	20 Nm (15 ftlb.)		
Clamp for axle joint (connection for lower trailing arm)	BM10 x 65 thread/always use new screws or bolts following removal	Tightening torque	40 Nm (30 ftlb.)		
Lower trailing arm to wheel bearing housing	M14 thread/always use new nuts following removal	Tightening torque	140 Nm (104 ftlb.)		
Lower control arm to wheel bearing housing	M14 thread/always use new nuts following removal	Tightening torque	140 Nm (104 ftlb.)		
Upper trailing arm to wheel bearing housing	M10 thread	Tightening torque	45 Nm (33 ftlb.)		
Wheel bearing to wheel bearing housing	M12 x 1.5 x 45 thread/observe installation sequence!/always use new screws or bolts following removal	Initial tightening	80 Nm (59 ftlb.)		
Wheel bearing to wheel bearing housing	M12 x 1.5 x 45 thread/observe installation sequence!/always use new screws or bolts following removal	Final tightening	+90°		
Brake disc to wheel hub	M6 x 16 thread	Tightening torque	10 Nm (7.5 ftlb.)		
Brake cover plate to wheel bearing housing	M6 x 14 thread	Tightening torque	10 Nm (7.5 ftlb.)		
Speed sensor to wheel bearing housing	M6 x 16 thread	Tightening torque	8 Nm (6 ftlb.)		
Holder to wheel bearing housing	M6 x 16 thread	Tightening torque	10 Nm (7.5 ftlb.)		
Lower trailing arm to wheel bearing housing	M14 thread/always use new nuts following removal	Tightening torque	140 Nm (104 ftlb.)		

Lower trailing arm to front-axle carrier	M12 thread/always use new screws or bolts and nuts following removal	Initial tightening	70 Nm (52 ftlb.)		
Lower trailing arm to front-axle carrier	M12 thread/always use new screws or bolts and nuts following removal	Final tightening	+180°		
Level sensor to lower trailing arm	M6 thread	Tightening torque	9 Nm (6.5 ftlb.)		
Spring strut to lower trailing arm	M12 thread/always use new screws or bolts and nuts following removal	Initial tightening	90 Nm (67 ftlb.)		
Spring strut to lower trailing arm	M12 thread/always use new screws or bolts and nuts following removal	Final tightening	+90°		
Upper trailing arm to wheel bearing housing	M10 thread	Tightening torque	45 Nm (33 ftlb.)		
Upper trailing arm to mounting saddle	M10 thread/always use new screws or bolts and nuts following removal	Initial tightening	50 Nm (37 ftlb.)		
Upper trailing arm to mounting saddle	M10 thread/always use new screws or bolts and nuts following removal	Final tightening	+90°		
Lower control arm to front-axle carrier	M12 thread/always use new screws or bolts and nuts following removal	Initial tightening	70 Nm (52 ftlb.)		
Lower control arm to front-axle carrier	M12 thread/always use new screws or bolts and nuts following removal	Final tightening	+180°		
Lower control arm to wheel bearing housing	M14 thread/always use new nuts following removal	Tightening torque	140 Nm (104 ftlb.)		
Connecting link to anti-roll bar	AM10 thread/always use new screws and nuts following removal	Initial tightening	40 Nm (30 ftlb.)		

Connecting link to anti-roll bar	AM10 thread/always use new screws and nuts following removal	Final tightening	+90°		
Connecting link to spring strut	M10 x 45 thread/always use new screws or bolts following removal	Initial tightening	40 Nm (30 ftlb.)		
Connecting link to spring strut	M10 x 45 thread/always use new screws or bolts following removal	Final tightening	+90°		
Anti-roll bar clamp to front-axle carrier	M8 thread/always use new nut following removal	Tightening torque	30 Nm (22 ftlb.)		
Mounting saddle to piston rod (conventional)	M10 thread	Tightening torque	50 Nm (37 ftlb.)		
Spring-strut supporting mount to piston rod (PASM)	M12 thread	Tightening torque	50 Nm (37 ftlb.)		
Mounting saddle to spring strut (PASM only)	M8 thread	Tightening torque	30 Nm (22 ftlb.)		
Mounting saddle to body	M10 x 35 thread/observe tightening sequence/always use new screws or bolts following removal	Initial tightening	40 Nm (30 ftlb.)		
Mounting saddle to body	M10 x 35 thread/observe tightening sequence/always use new screws or bolts following removal	Final tightening	+90°		
Damper fork to damper	M12 thread/always use new screws or bolts and nuts following removal	Initial tightening	40 Nm (30 ftlb.)

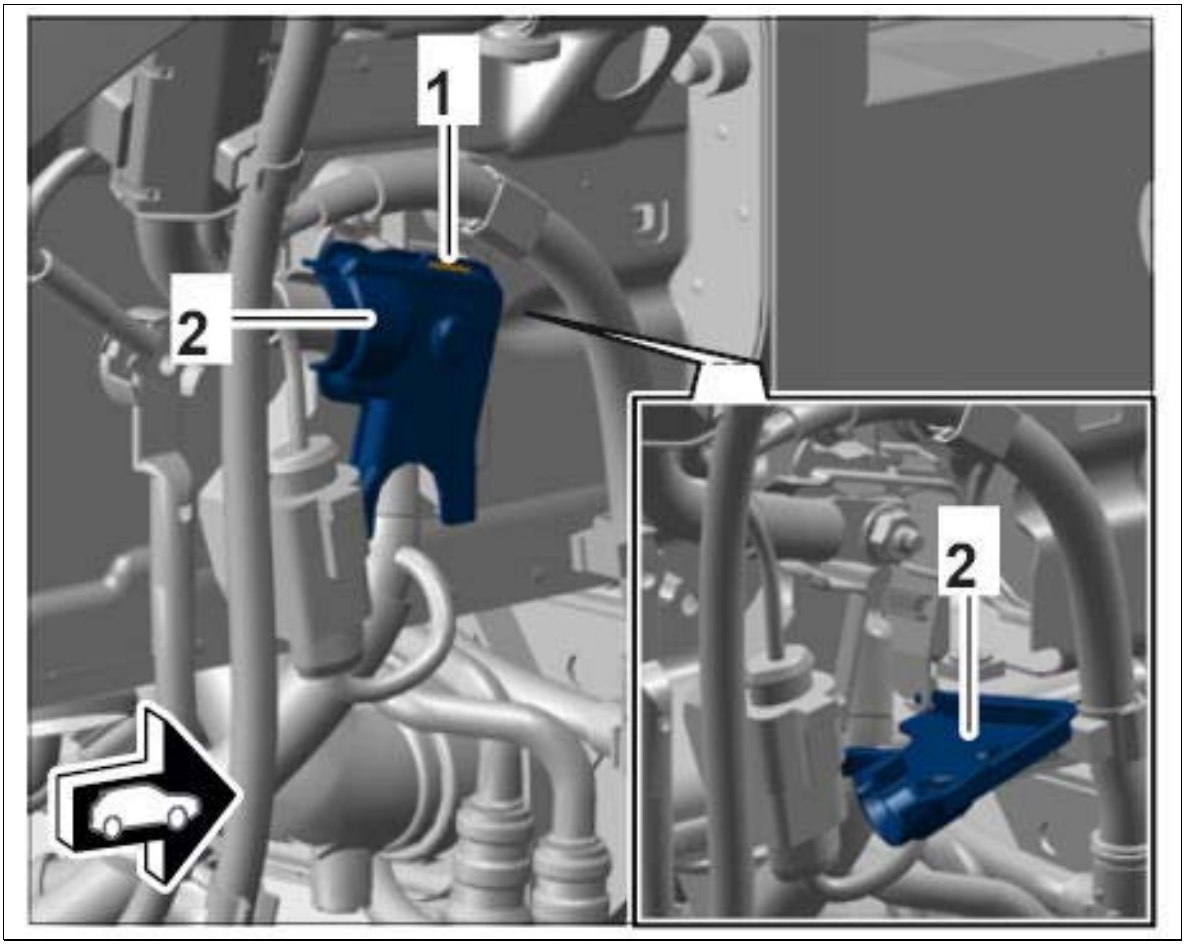
3. 3.3. Remove strut **-2-** on both sides.

4. Open locking lug **-1-** with a screwdriver, open housing cover **-2-** on the right longitudinal member and remove it.

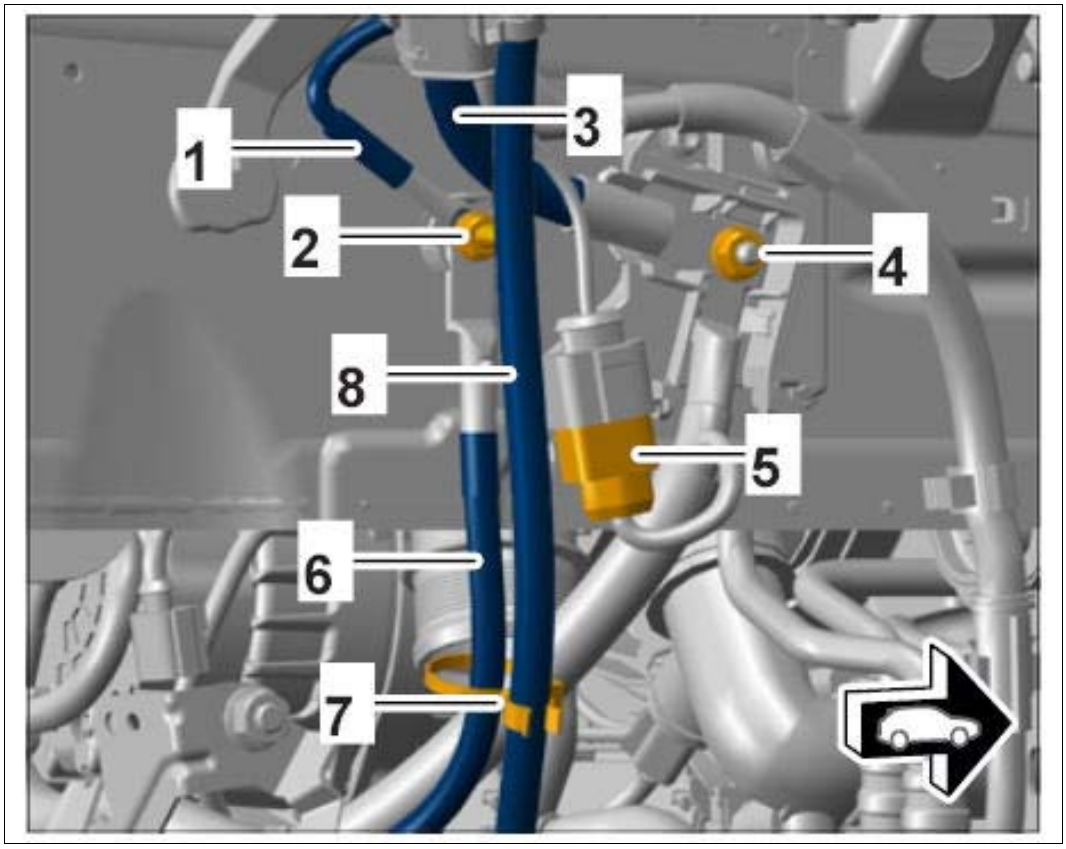
Fig 3: Identifying Housing Cover And Locking Lug



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Disconnect electric lines on the right longitudinal member.
    1. 5.1. Unclip headlight vent line **-8-** at the clip **-7-** and set it aside.
    2. 5.2. Unscrew fastening nut **-2-** and move ground lines **-1 and 6-** aside.
    3. 5.3. Disconnect electric plug connection **-5-** and pull it out of the clip.
    4. 5.4. Unscrew fastening nut **-4-** , remove ground line **-3-** and set it aside.

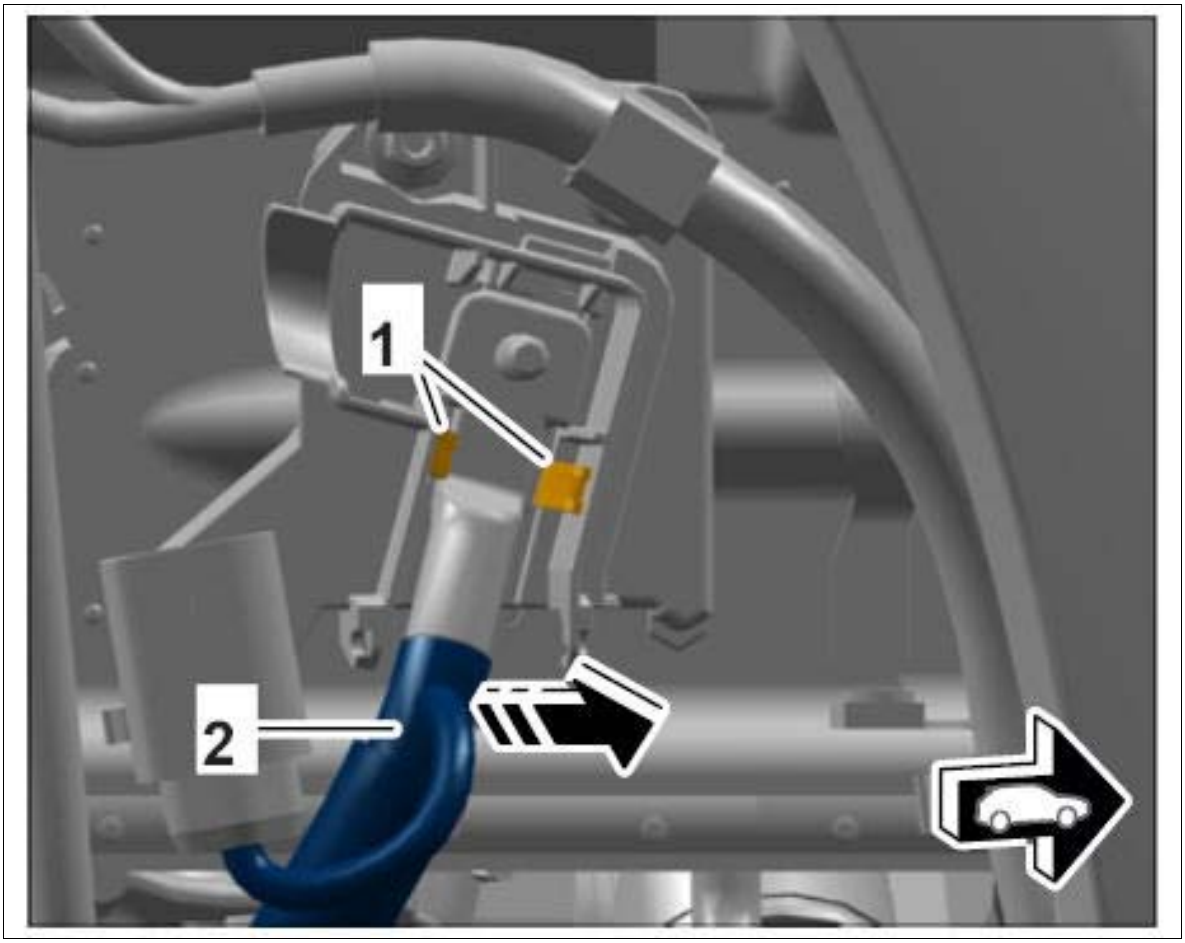
Fig 4: Identifying Longitudinal Member Electric Lines



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Press in locking lugs **-1-** , pull out ground line **-2-** in **-direction of arrow -** and set it aside.

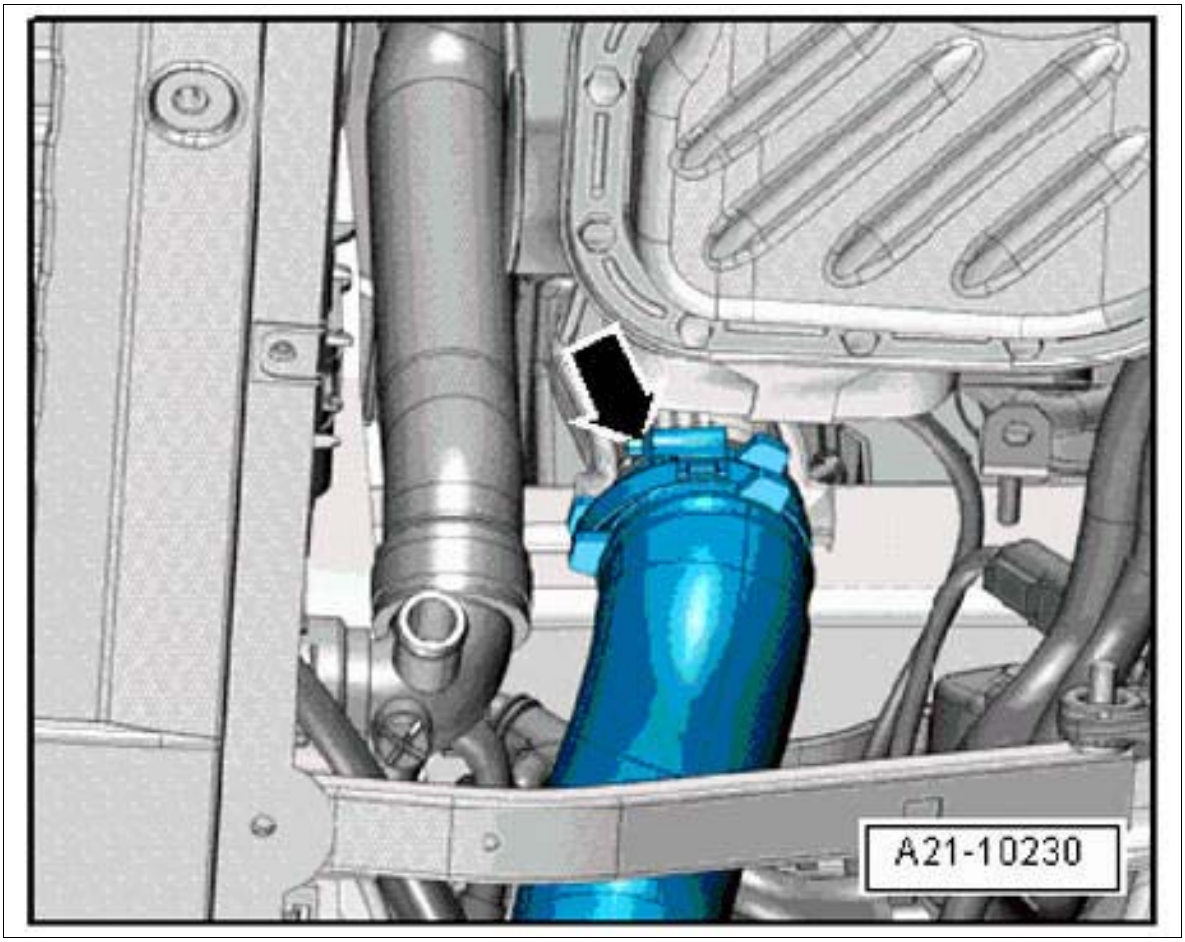
Fig 5: Identifying Ground Line



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Loosen screw-type clamp securing pressure hose -arrow - to pressure pipe and pull pressure hose off the pressure pipe.

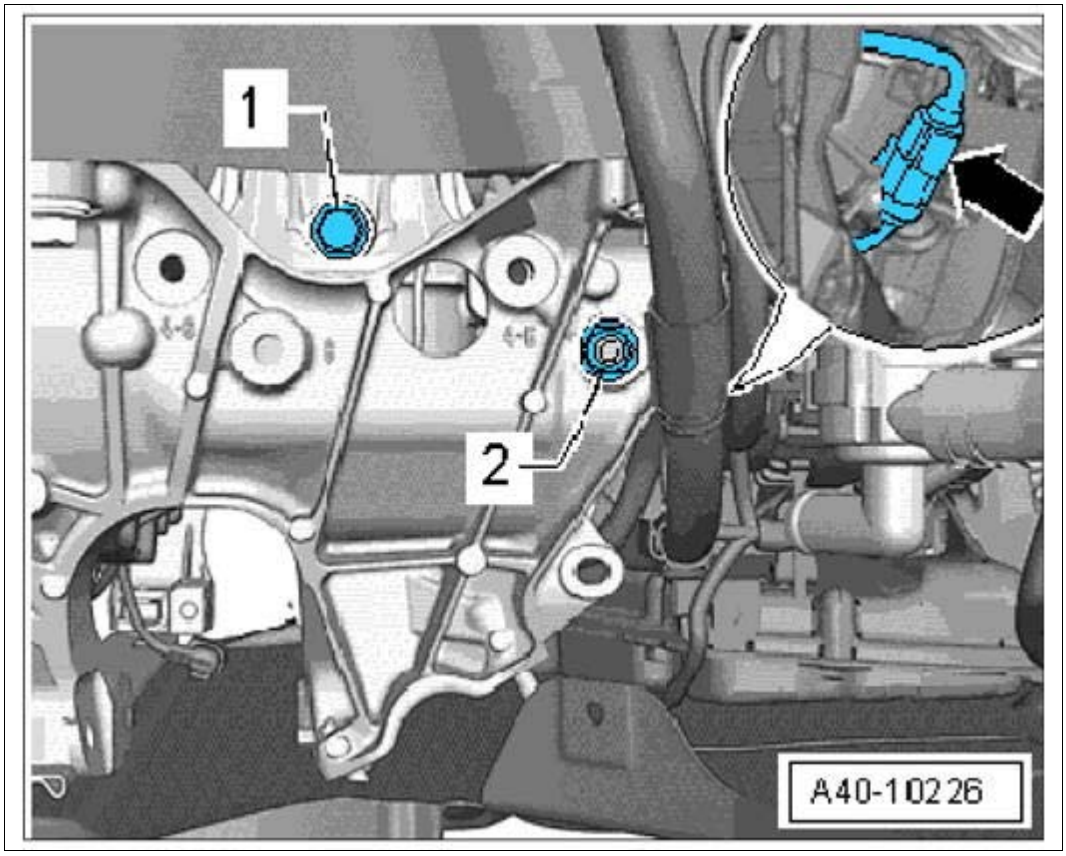
Fig 6: Locating Pressure Hose Clamp



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Expose electric wire harness on both sides of the vehicle.
    1. 8.1. Disconnect electric plug connection **-arrow-** and move it aside.
    2. 8.2. Unscrew fastening nut **-2-** and press electric wiring harness aside.

Fig 7: Identifying Electric Plug Connector & Fastening Nut

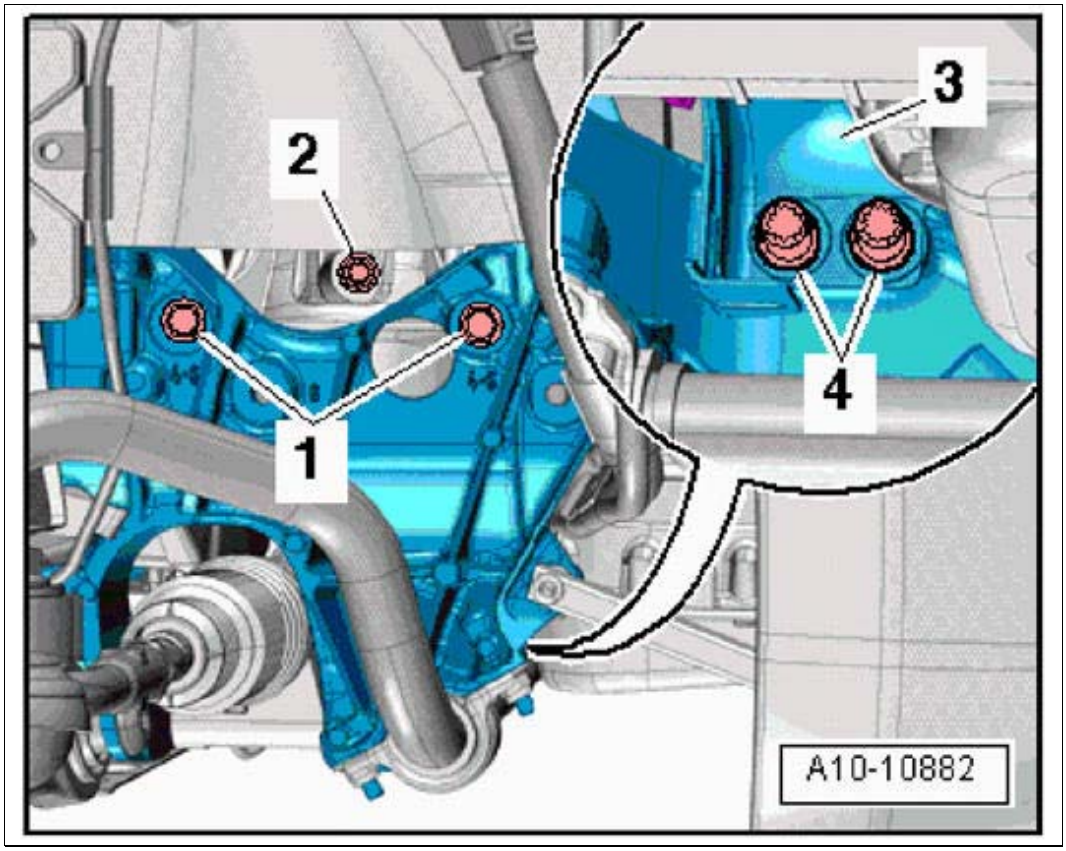


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Expose engine mount.

    1. 9.1. Unscrew fastening screws **-1-** .
    2. 9.2. **Not for V6 bi-turbo engines:** Unscrew fastening screws **-4-** .

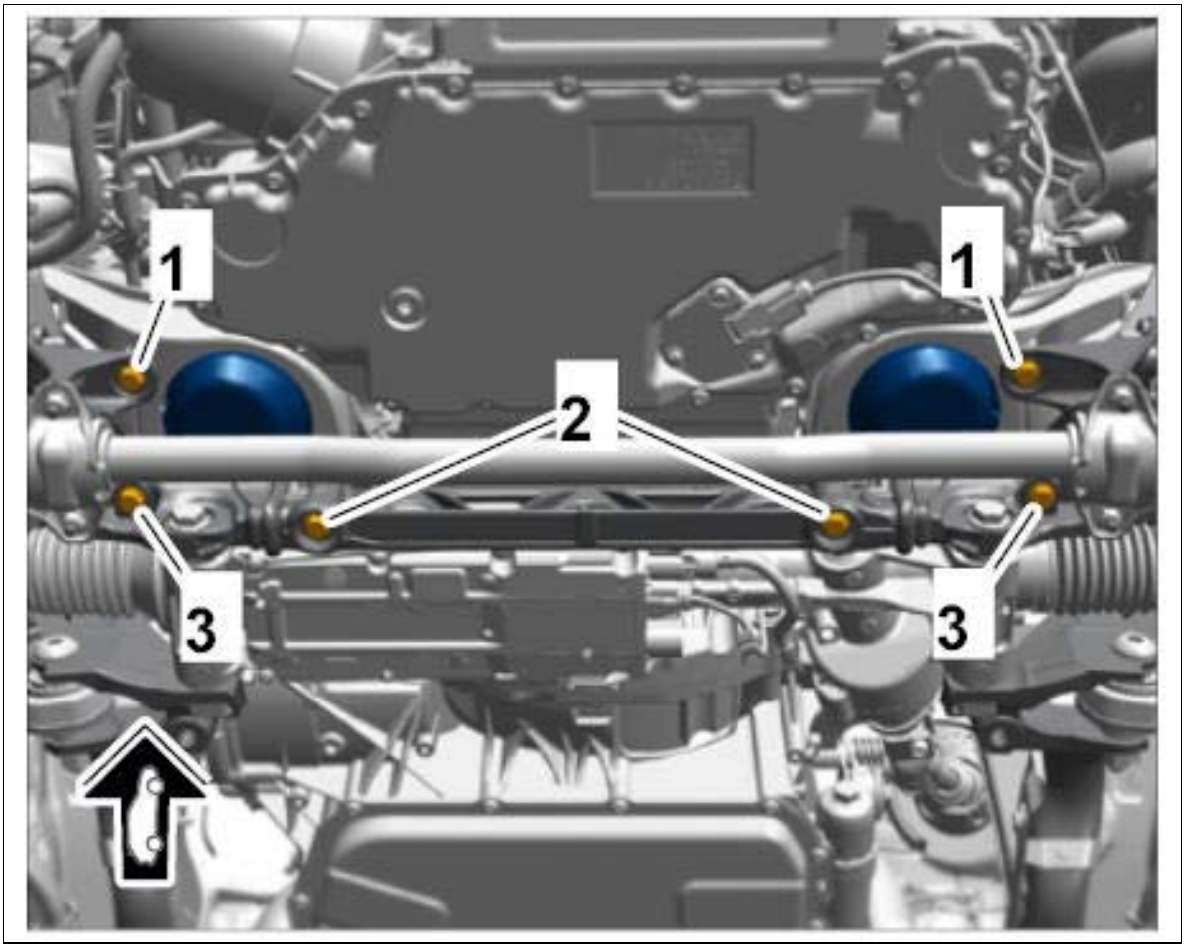
Fig 8: Identifying Engine Mount Fastening Nut



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. **Only for V6 bi-turbo engines:** Unscrew fastening screws **-1, 2 and 3-** at the engine mount.

Fig 9: Identifying Engine Mount Fastening Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

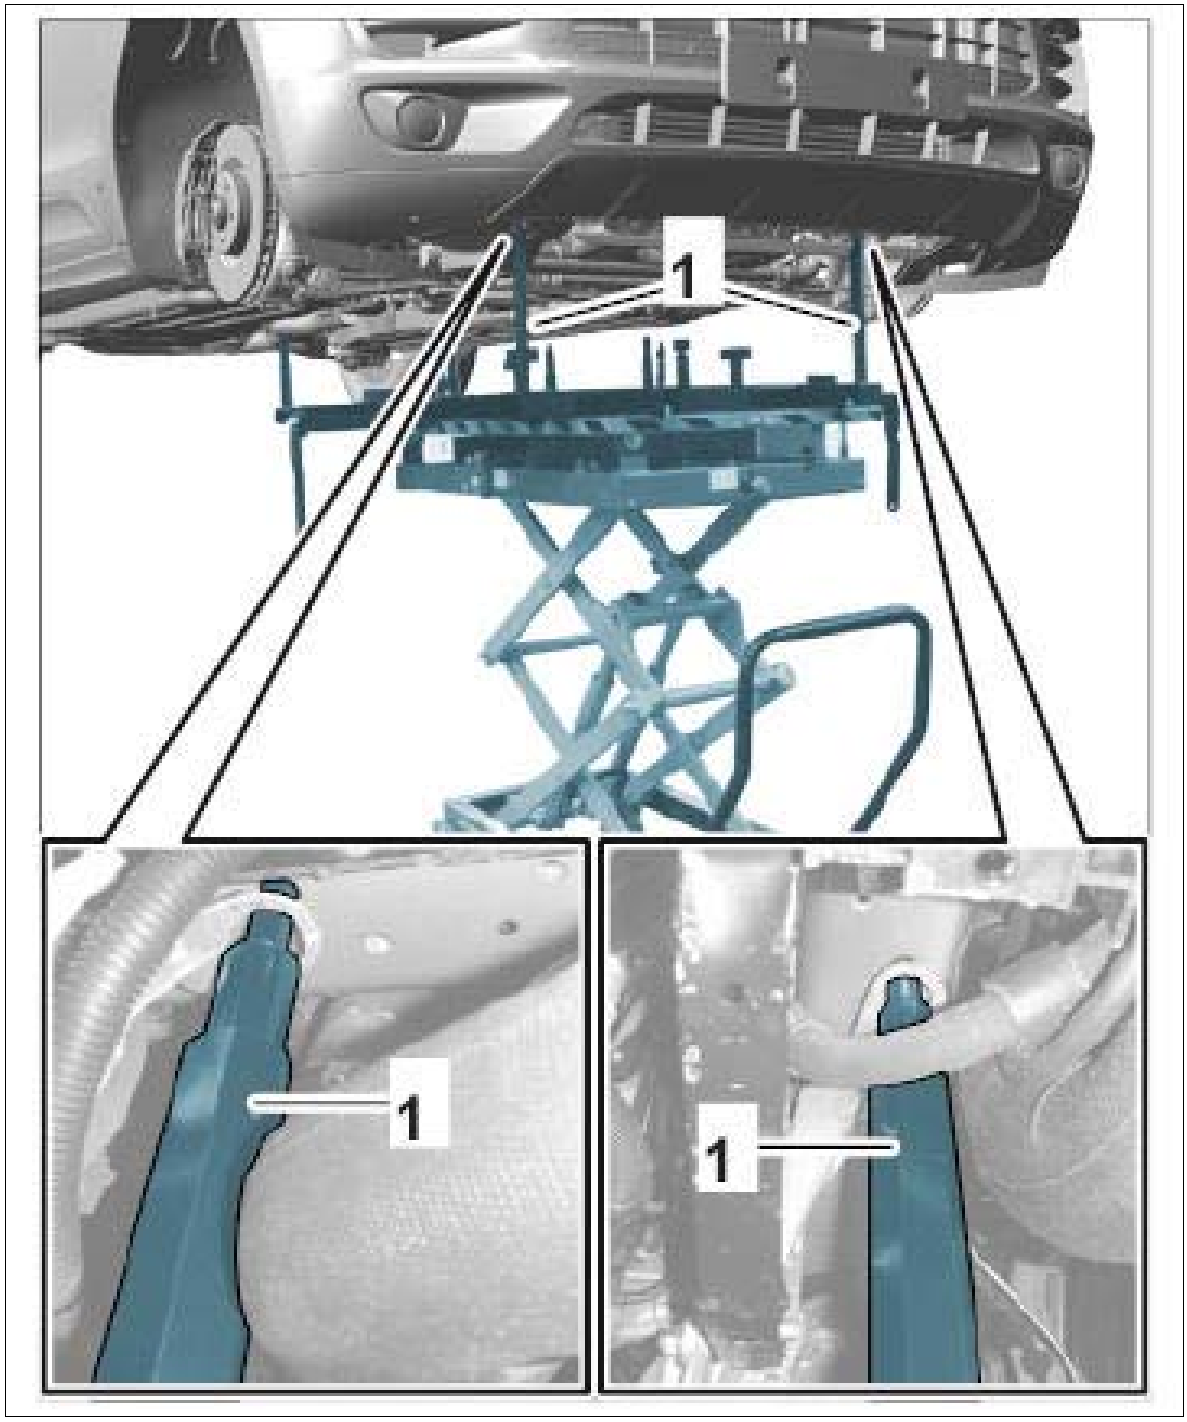
11. Prepare unit elevating platform **Master Gear unit elevating platform WE 1206** with the assembly fixture **Assembly fixture - Macan WE 1612.**

12. Raise the elevating platform and guide front locating pins **-1-** into the jacking points provided for this purpose on the body.

    Locating pins are only for guiding the assembly fixture and must not be fitted.

    Only for V6 bi-turbo engines: Do not use locating pin at the front left in direction of travel (due to accessibility of jacking point).

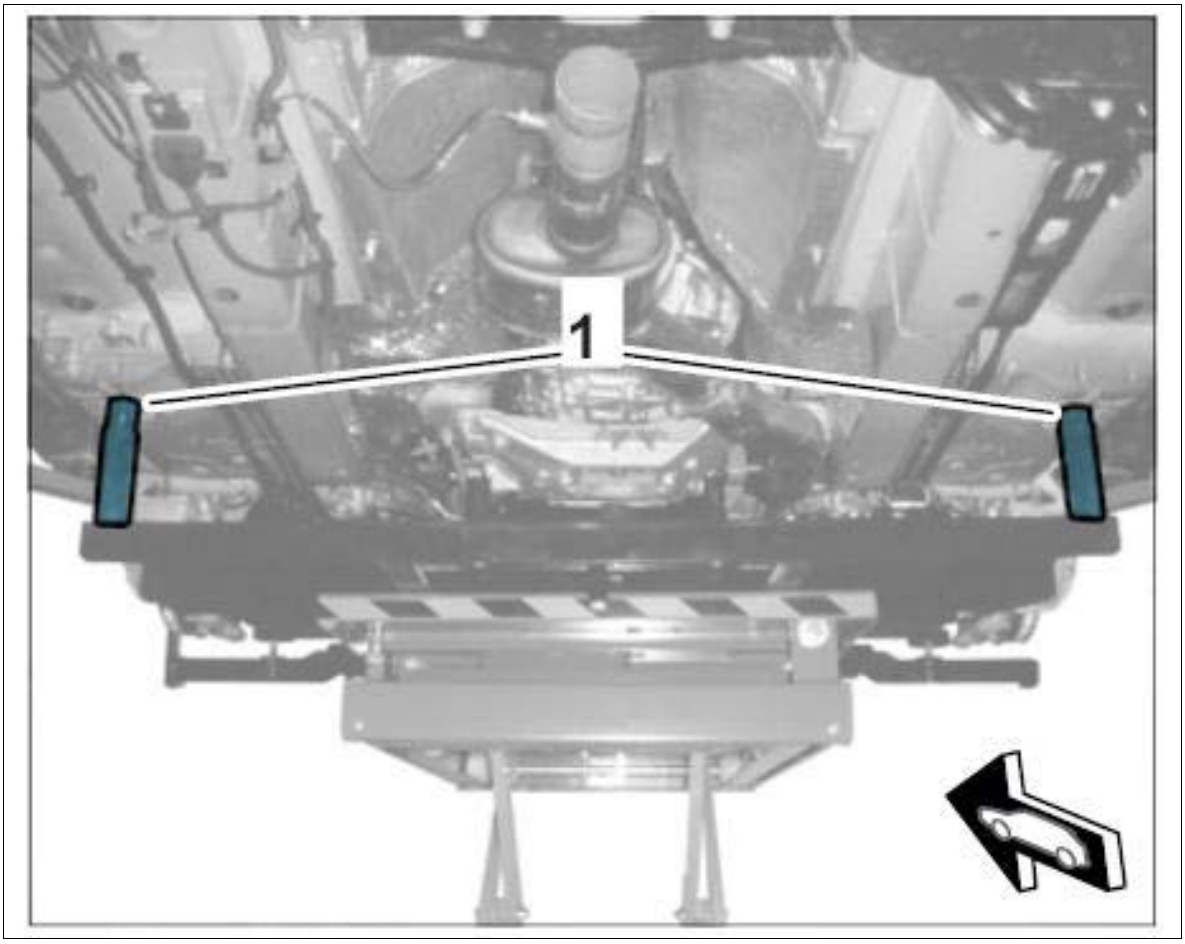
Fig 10: Identifying Elevating Platform



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

13. Guide rear assembly driver **-1-** into the jacking points provided for this purpose on the body.

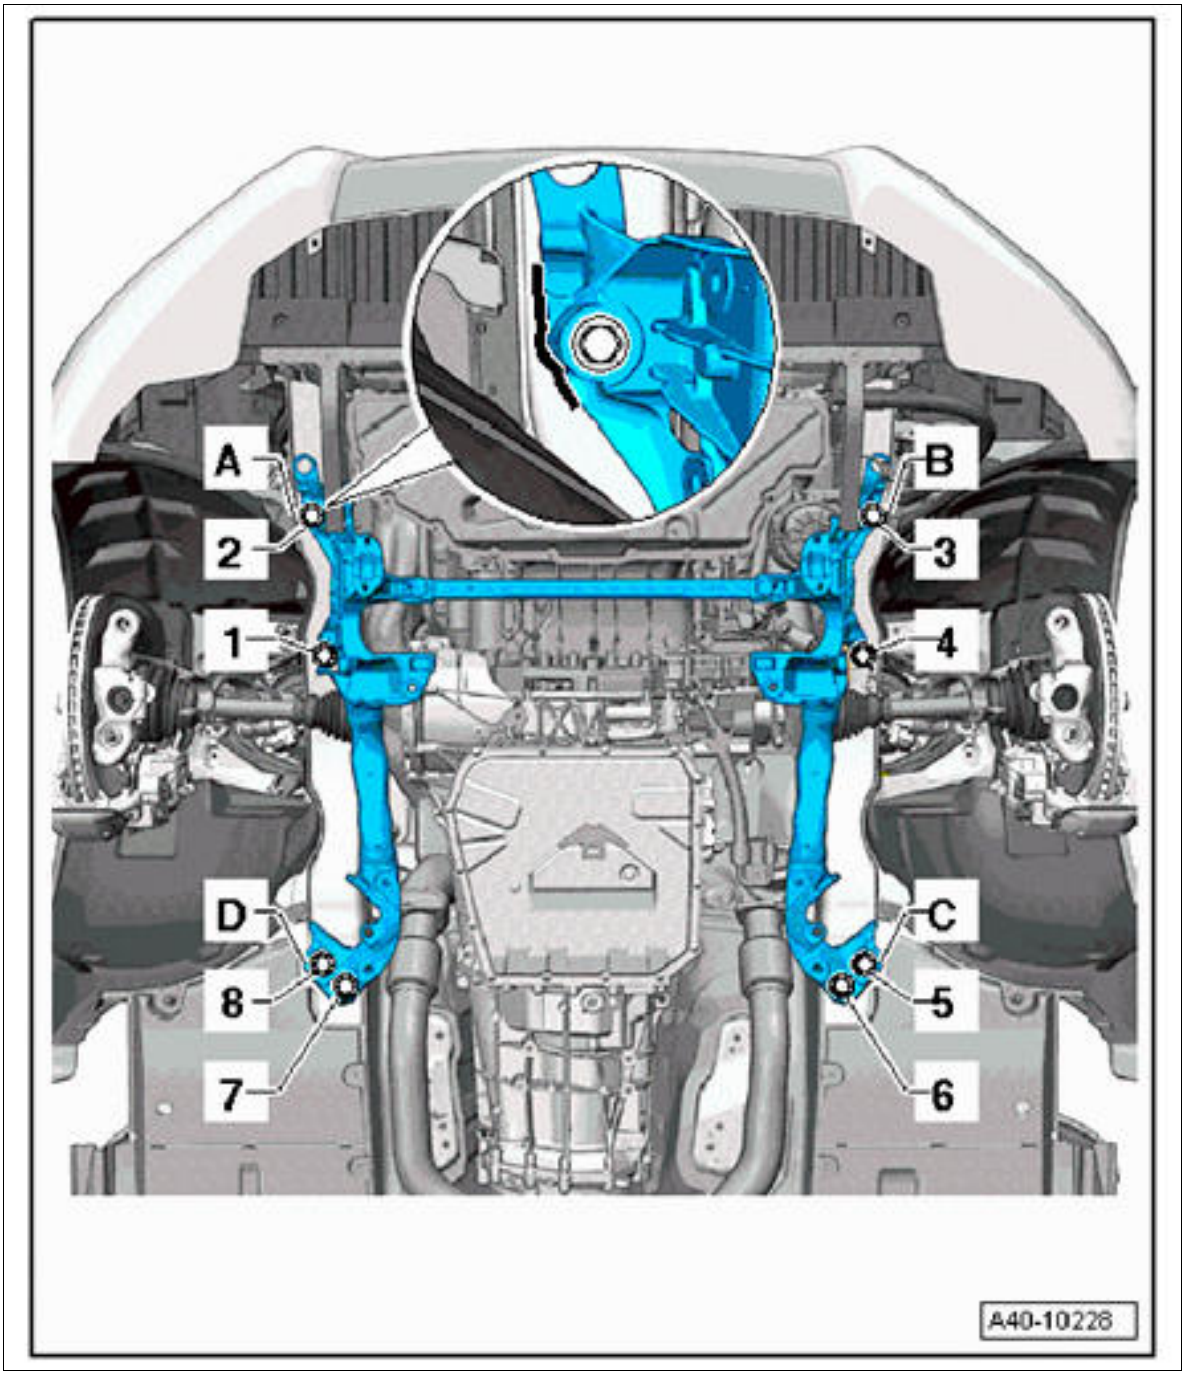
Fig 11: Identifying Rear Assembly Driver



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

14. Loosen front-axle carrier.

Fig 12: Identifying Front-Axle Carrier Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 14.1. Mark installation position of front-axle carrier **-a to d-** using a felt-tip pen.
2. 14.2. Unscrew fastening screws **-1 to 8-** on the front-axle carrier.

WM 400619 REMOVING AND INSTALLING FRONT-AXLE CARRIER (ALL MODELS) > REMOVING AND INSTALLING FRONT-AXLE CARRIER > INSTALLING FRONT-AXLE CARRIER

⚠ *CAUTION: Wheel carrier raised incorrectly*

- *Risk of squashing*
- *Risk of damage to components*

→ Wear personal protective gear.

→ Do not raise the wheel suspension higher than the normal vehicle position (vehicle resting on wheels).

Information

- All screws and threaded joints on the axle must be tightened in vehicle position. Vehicle position means: vehicle standing on its wheels, or the wheel suspension is raised with a universal vehicle lift. Dimension -1- , from lower edge of wing to center of axle corresponds to vehicle position. The current height can be found in → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT. ALWAYS OBSERVE THE FOLLOWING POINTS!

  Fig 1: Identifying Wheel To Wing Lower Edge Dimension (Rear Axle)

  
  Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- On vehicles with air springs, the respective air spring must be bled using the Porsche System

Tester . → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM

- Screws and nuts are Geomet-coated and must not be greased.

1. Installation is performed in reverse order. Check the following while doing this:
    1. Screw in and tighten new fastening screws **-1 and 4-** one after the other.

       Initial tightening 115 Nm (85 ftlb.) Final tightening +90°
    2. Screw in and tighten new fastening screws **-2 and 3-** one after the other.

       Initial tightening 115 Nm (85 ftlb.) Final tightening +90°
    3. Screw in and tighten new fastening screws **-5 and 8-** one after the other.

       Initial tightening 115 Nm (85 ftlb.) Final tightening +90°
    4. Screw in and tighten new fastening screws **-6 and 7-** one after the other.

       Initial tightening 115 Nm (85 ftlb.) Final tightening +90°

WM 400819 REMOVING AND INSTALLING FRONT-AXLE SUPPORT (ALL MODELS) > REMOVING AND INSTALLING FRONT-AXLE SUPPORT > INSTALLING FRONT-AXLE SUPPORT

Information

Risk of damage to chassis components

- If the front-axle carrier, steering gear or front-axle support is not fitted correctly, never lower the vehicle onto its wheels!
- Supporting the vehicle on the front-axle carrier or on the front-axle support (e.g. using a jack) is not permitted!
- If the vehicle needs to be moved, the front-axle support must be installed using the old bolts and square nuts and must then be tightened to the specified torque without additional torque angle.

1. Installation is performed in reverse order.

   Observe the specified **tightening torques (replace fastening screws!):**

   Front-axle support to front-axle carrier:

   Step 1 **Initial tightening 90 Nm (67 ftlb.)**

   Step 2 **Final tightening +90°**

   Front-axle support to front-axle carrier, middle and rear:

   Step 1 **Initial tightening 90 Nm (67 ftlb.)**

   Step 2 **Final tightening +135°**

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Upper trailing arm to wheel bearing housing	M10 thread	Tightening torque	45 Nm (33 ftlb.)		
Upper trailing arm to mounting saddle	M10 thread/always use new screws or bolts and nuts following removal	Initial tightening	50 Nm (37 ftlb.)		
Upper trailing arm to mounting saddle	M10 thread/always use new screws or bolts and nuts following removal	Final tightening	+90°		

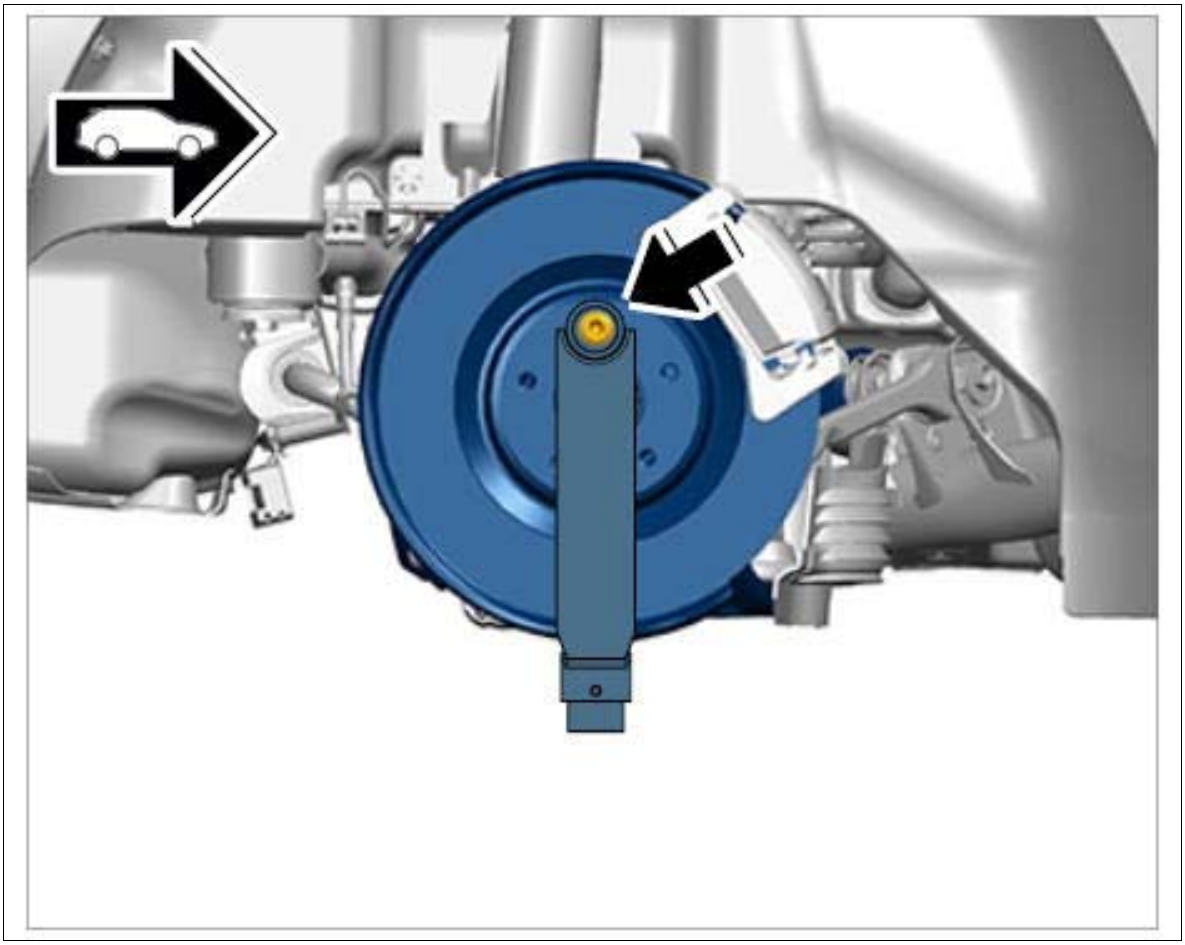
WM 401519 REMOVING AND INSTALLING UPPER TRAILING ARM (ALL MODELS) > PRELIMINARY WORK

1. Remove wheel → 440519 REMOVING AND INSTALLING WHEEL .

WM 401519 REMOVING AND INSTALLING UPPER TRAILING ARM (ALL MODELS) > REMOVING AND INSTALLING UPPER TRAILING ARM > REMOVING UPPER TRAILING ARM

1. Lift the wheel bearing housing.

Fig 1: Locating Support (T10149) Mounting Nut



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Turn the wheel hub in such a way that a bore for a wheel bolt is at the top.
2. 1.2. **Support T10149** must be secured to the wheel hub with a wheel bolt **-arrow-**
3. 1.3. **Support T10149** must now be fitted into the **transmission jack WE 1082.**
4. 1.4. Lift the wheel bearing housing.

2. Separate threaded joint **-1-** .

   Information

   The slots in the wheel bearing housing must not be widened using a chisel or similar tool!

3. Pull the two pins for the upper trailing arm **-2-** out of the wheel bearing housing.

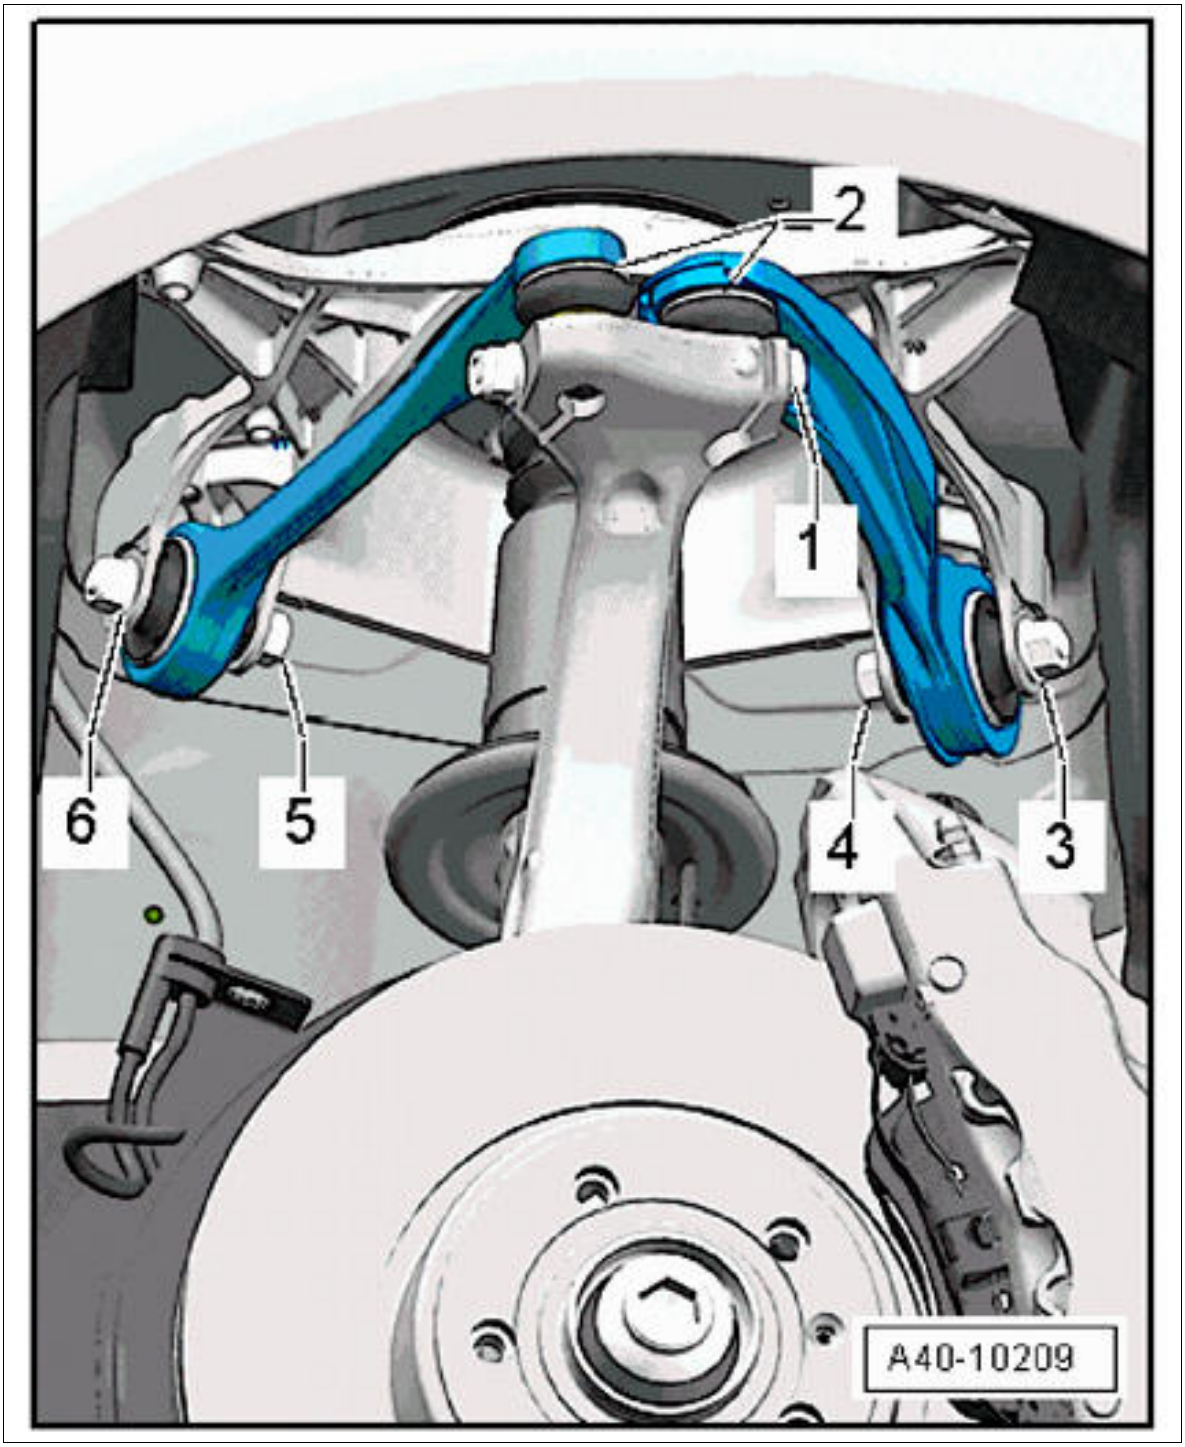
   Information

   Do not lower the wheel bearing housing any lower than required.

4. Unscrew nuts **-3 and 6-** .
5. Pull out screws **-4 and 5-** .

6. Remove upper trailing arm.

Fig 2: Identifying Upper Trailing Arm Mounting Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 401519 REMOVING AND INSTALLING UPPER TRAILING ARM (ALL MODELS) > REMOVING AND INSTALLING UPPER TRAILING ARM > INSTALLING UPPER TRAILING ARM

WARNING: Wheel bearing housing raised incorrectly

- *Risk of squashing*
- *Risk of damage to components*

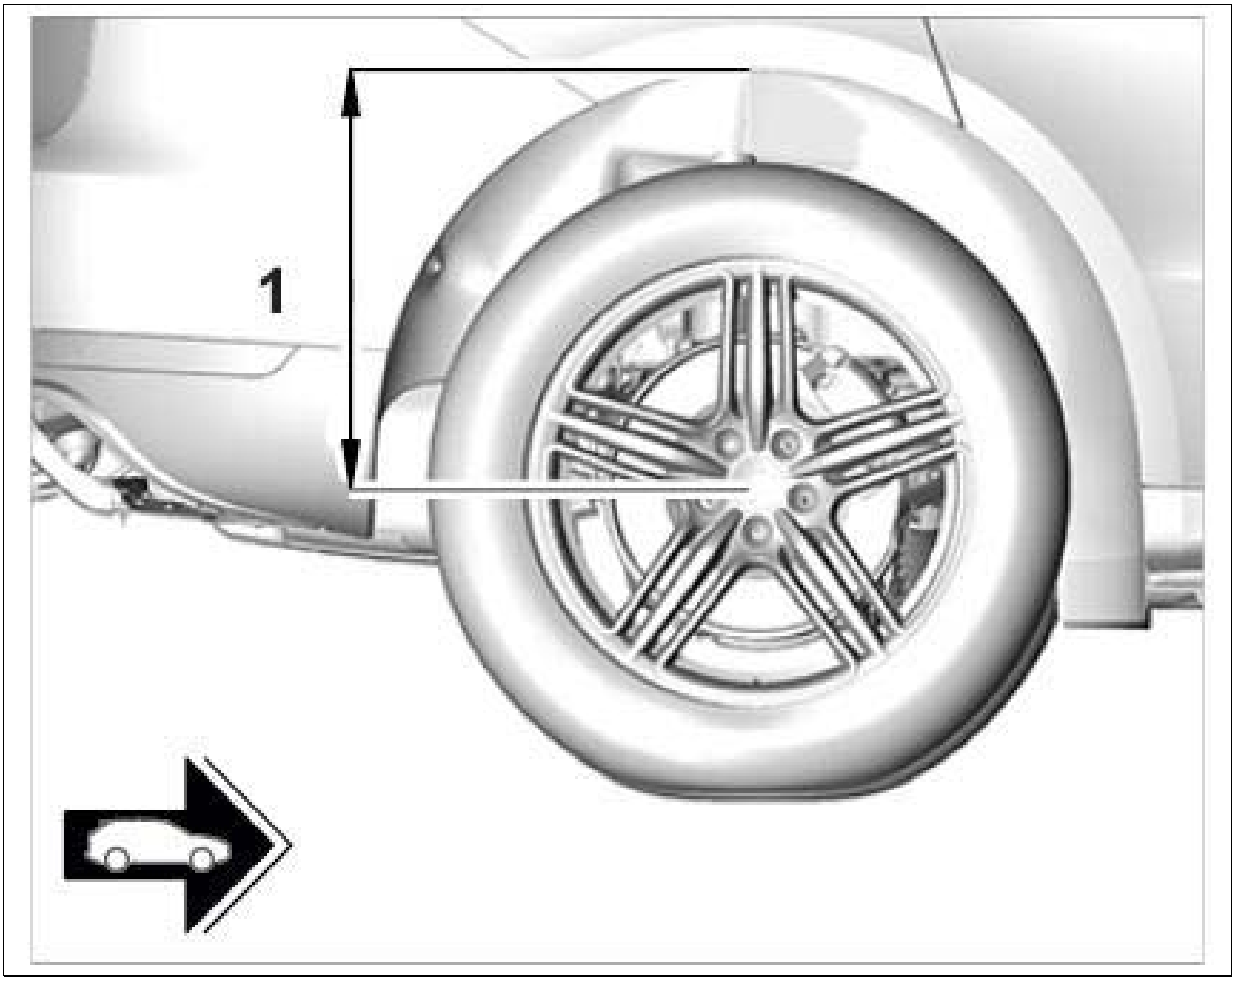
→ Wear personal protective gear.

→ Do not raise the wheel suspension higher than the normal vehicle position (vehicle resting on wheels).

Information

- All screws and threaded joints on the axle must be tightened in vehicle position. Vehicle position means: vehicle standing on its wheels, or the wheel suspension is raised with a universal vehicle lift. Dimension -1- , from lower edge of wing to center of axle corresponds to vehicle position. The current height can be found in → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT . Always observe the following points!

  Fig 1: Identifying Wheel To Wing Lower Edge Dimension (Rear Axle)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- On vehicles with air springs, the respective air spring must be bled using the Porsche System

Tester . → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM

- Screws and nuts are Geomet-coated and must not be greased.

1. Installation is performed in reverse order.

   Observe specified tightening torques:

   Upper trailing arm to wheel bearing housing: **Tightening torque 45 Nm (33 ftlb.)**

   Upper trailing arm to mounting saddle: **Initial tightening 50 Nm (37 ftlb.) Final tightening +90°**

WM 401519 REMOVING AND INSTALLING UPPER TRAILING ARM (ALL MODELS) > SUBSEQUENT WORK

1. Fit wheel → 440519 REMOVING AND INSTALLING WHEEL .
2. Perform suspension alignment → 449503 SUSPENSION ALIGNMENT, COMPLETE .

Designation	Type	Number	Description	
puller hook	Special tool	9229/		
WM 404119 REMOVING AND INSTALLING FRONT DRIVE SHAFT (ALL MODELS) > TECHNICAL VALUES

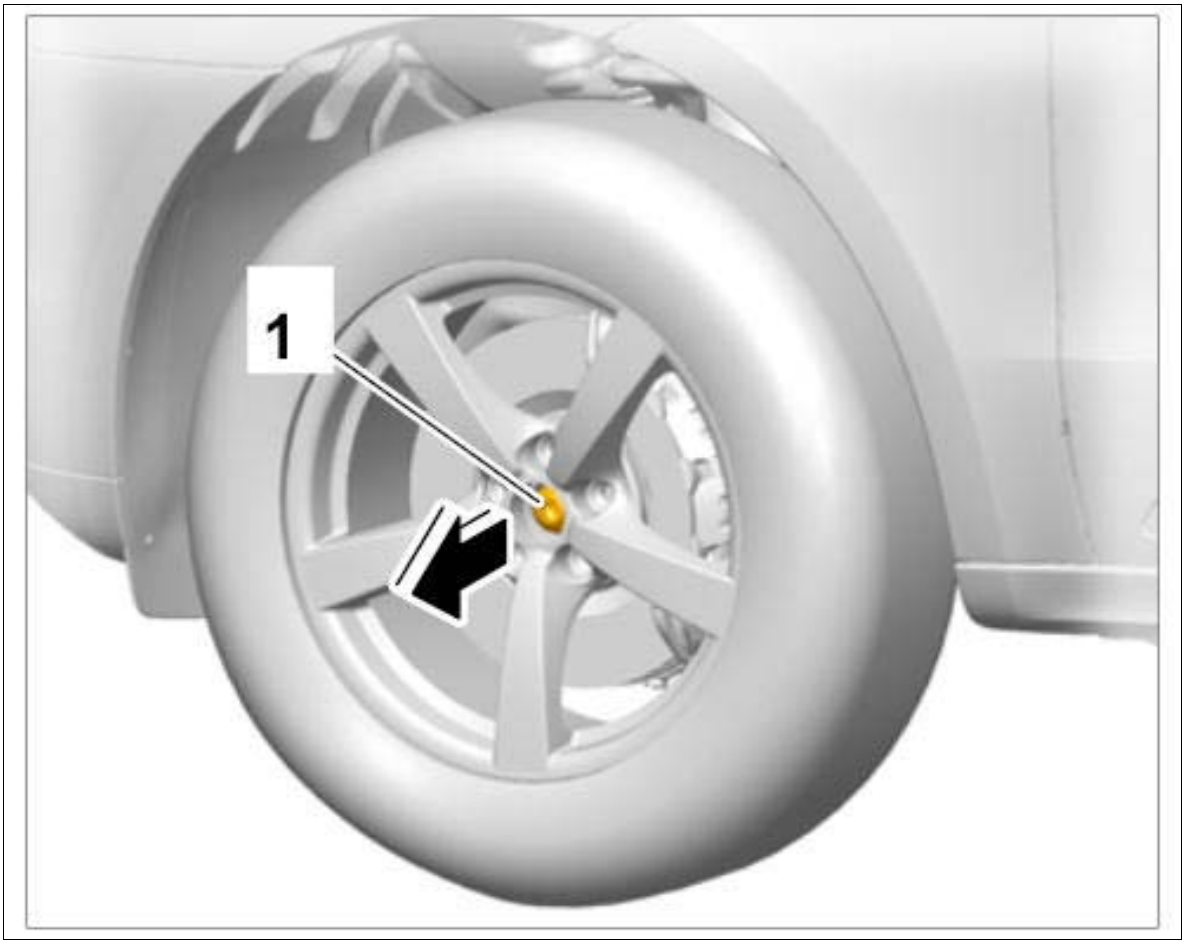
Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Drive shaft to wheel hub	Step 1 (wheels suspended in the air, press brakes while tightening)/M16 x 72 thread/always use new screws or bolts following removal	Tightening torque	200 Nm (148 ftlb.)		
Drive shaft to wheel hub	Step 2 (wheels on the ground)/M16 x 72 thread/always use new screws or bolts following removal	Torque angle	180°		

Drive shaft to transmission	M10 x 20 thread/always use new screws or bolts following removal	Initial tightening	30 Nm (22 ftlb.)		
Drive shaft to transmission	M10 x 20 thread/always use new screws or bolts following removal	Final tightening	+90°		

WM 404119 REMOVING AND INSTALLING FRONT DRIVE SHAFT (ALL MODELS) > PRELIMINARY WORK

1. Remove the relevant hub cap using **puller hook 9229/1** and loosen axle bolt **-1-** before raising the vehicle. Operate the brake while doing this (2 mechanics required).

   Fig 1: Identifying Axle Bolt



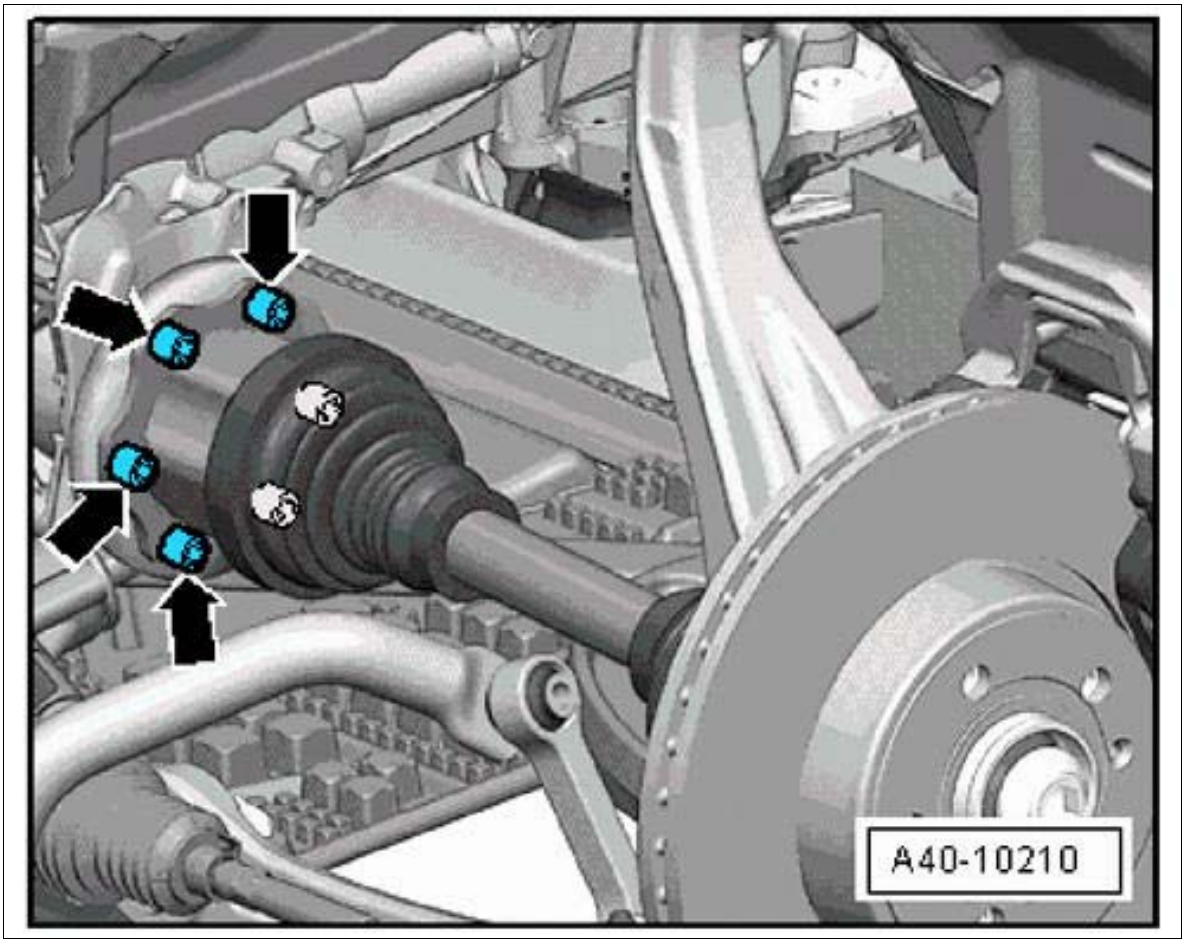
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .
3. Remove wheel → 440519 REMOVING AND INSTALLING WHEEL .

WM 404119 REMOVING AND INSTALLING FRONT DRIVE SHAFT (ALL MODELS) > REMOVING AND INSTALLING FRONT DRIVE SHAFT > REMOVING FRONT DRIVE SHAFT

1. Unscrew fastening screws for the drive shaft on the transmission.

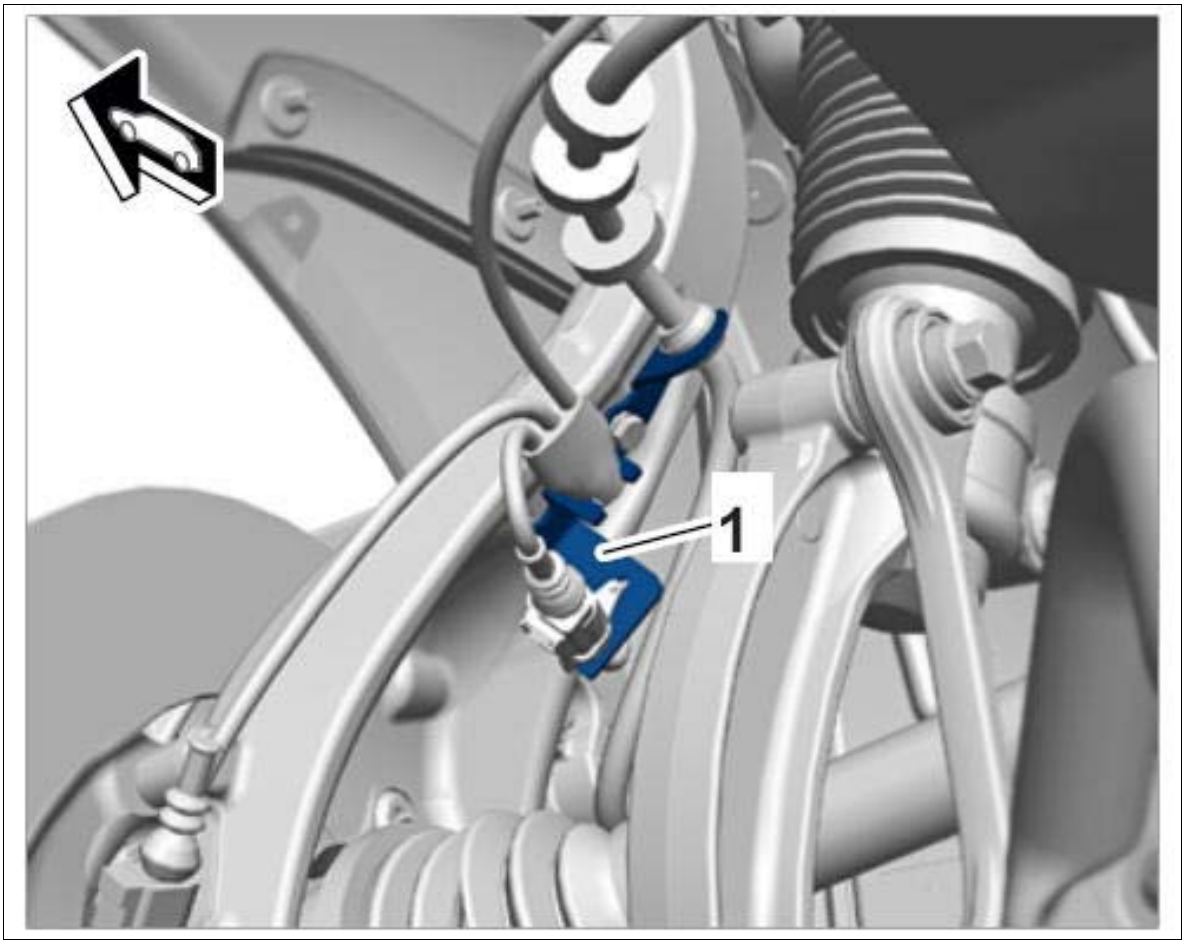
   Fig 1: Identifying Drive Shaft Mounting Bolts



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen holder **-1-** for brake line, wear indicator and speed sensor on the wheel bearing housing.

Fig 2: Identifying Brake Line Holder



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

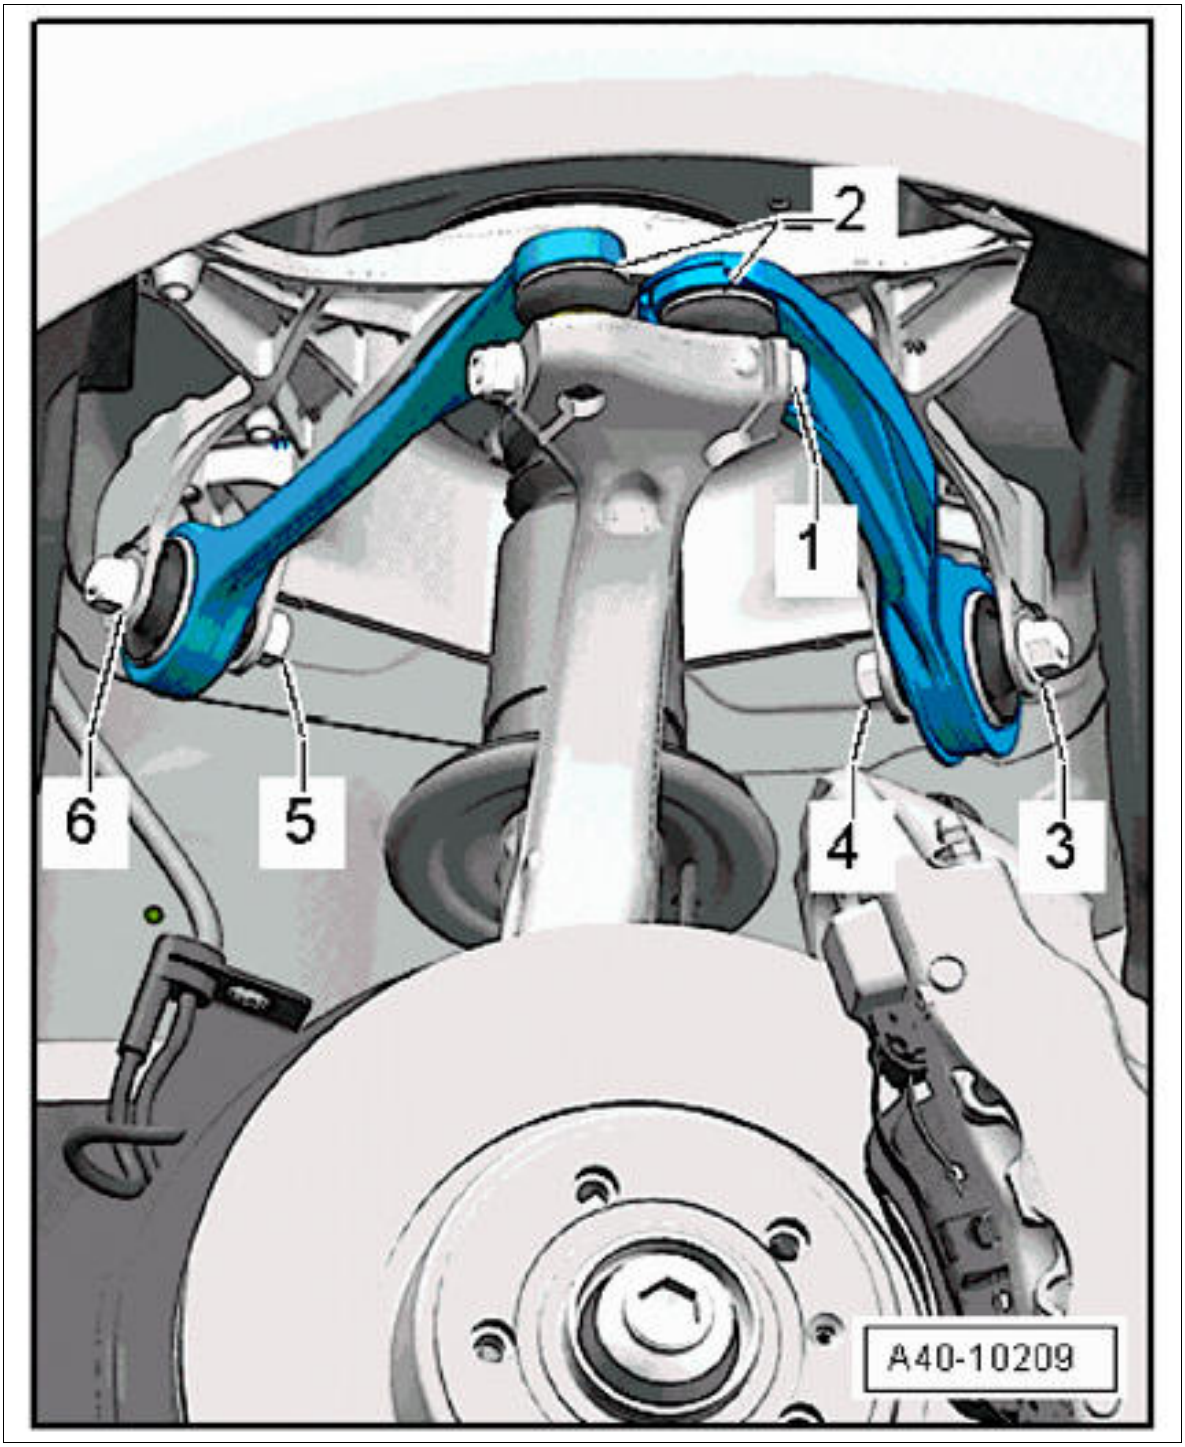
Information

When loosening the upper trailing arms, the wheel bearing housing must be held by a second mechanic in ordering to prevent the wheel bearing housing from tilting.

3. Unscrew fastening screw on the top of the wheel bearing housing **-1-** and pull both trailing arms **-2-** up and out.

   A second mechanic must hold the wheel bearing housing to prevent it from tilting out of position. The cable and brake line must not be tensioned.

Fig 3: Identifying Trailing Arms Mountings



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Swivel the wheel bearing housing out sideways and pull drive shaft journals out of the wheel hub (2nd mechanic required).
5. Remove drive shaft.

WM 404119 REMOVING AND INSTALLING FRONT DRIVE SHAFT (ALL MODELS) >

REMOVING AND INSTALLING FRONT DRIVE SHAFT > INSTALLING FRONT DRIVE SHAFT

⚠ *CAUTION: Wheel carrier raised incorrectly*

- *Risk of squashing*
- *Risk of damage to components*

→ Wear personal protective gear.

→ Do not raise the wheel suspension higher than the normal vehicle position (vehicle resting on wheels).

Information

- All screws and threaded joints on the axle must be tightened in vehicle position. Vehicle position means: vehicle standing on its wheels, or the wheel suspension is raised with a universal vehicle lift. Dimension -1- , from lower edge of wing to center of axle corresponds to vehicle position. The current height can be found in → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT . Always observe the following points!

WM 404137 DISASSEMBLING AND ASSEMBLING FRONT DRIVE SHAFT (ALL MODELS) > PRELIMINARY WORK

1. Remove front drive shaft → 404119 REMOVING AND INSTALLING FRONT DRIVE SHAFT .

WM 404137 DISASSEMBLING AND ASSEMBLING FRONT DRIVE SHAFT (ALL MODELS) > DISASSEMBLING AND ASSEMBLING FRONT DRIVE SHAFT > DISASSEMBLING FRONT DRIVE SHAFT

WARNING: Danger of objects or loads falling down

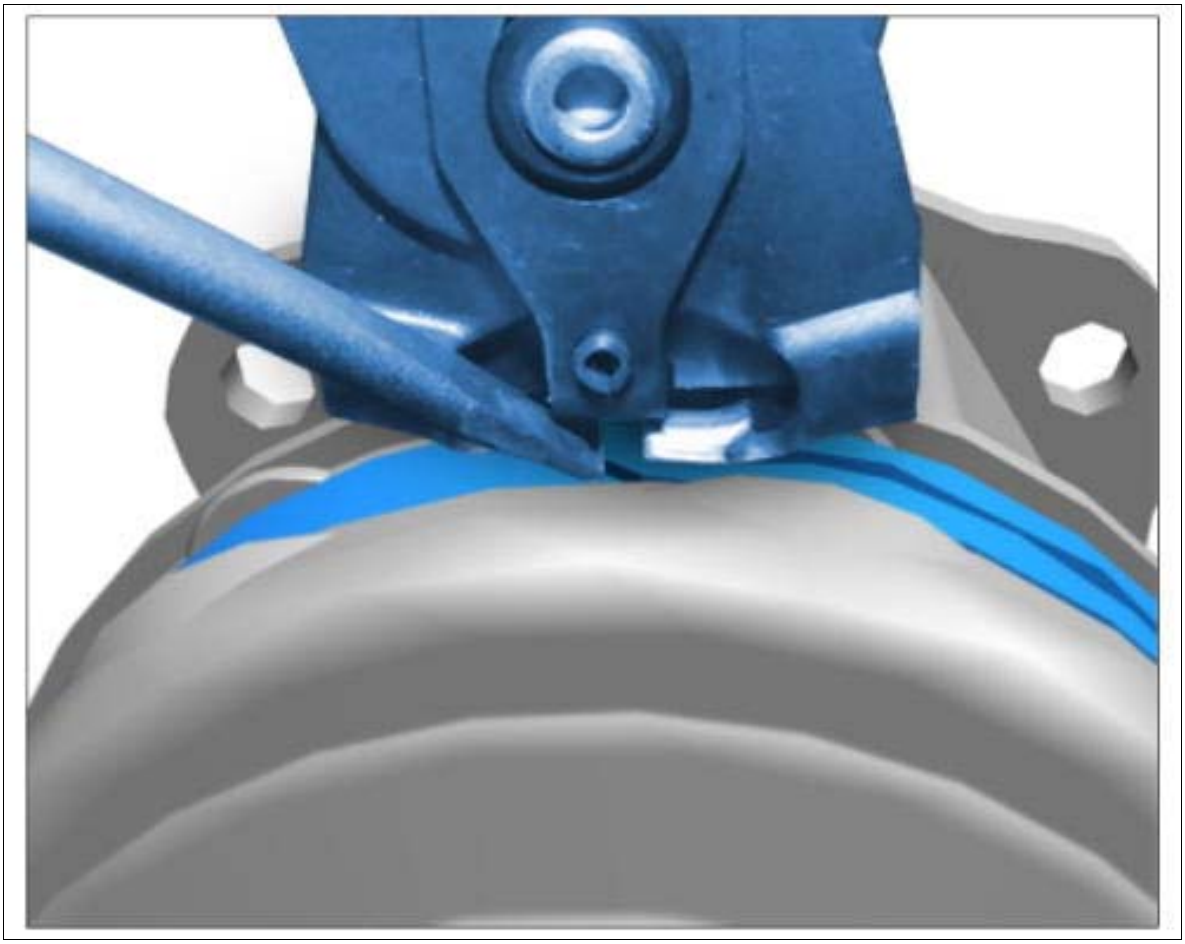
- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

The joint on the transmission side and the joint pin on the wheel side of the front axle can be replaced. The entire drive shaft must be replaced if the profile shaft of the joint pin is defective.

1. Remove the outer flat joiner on the inner drive shaft boot using **pliers Nr.74** and use a slotted screwdriver for support if necessary.

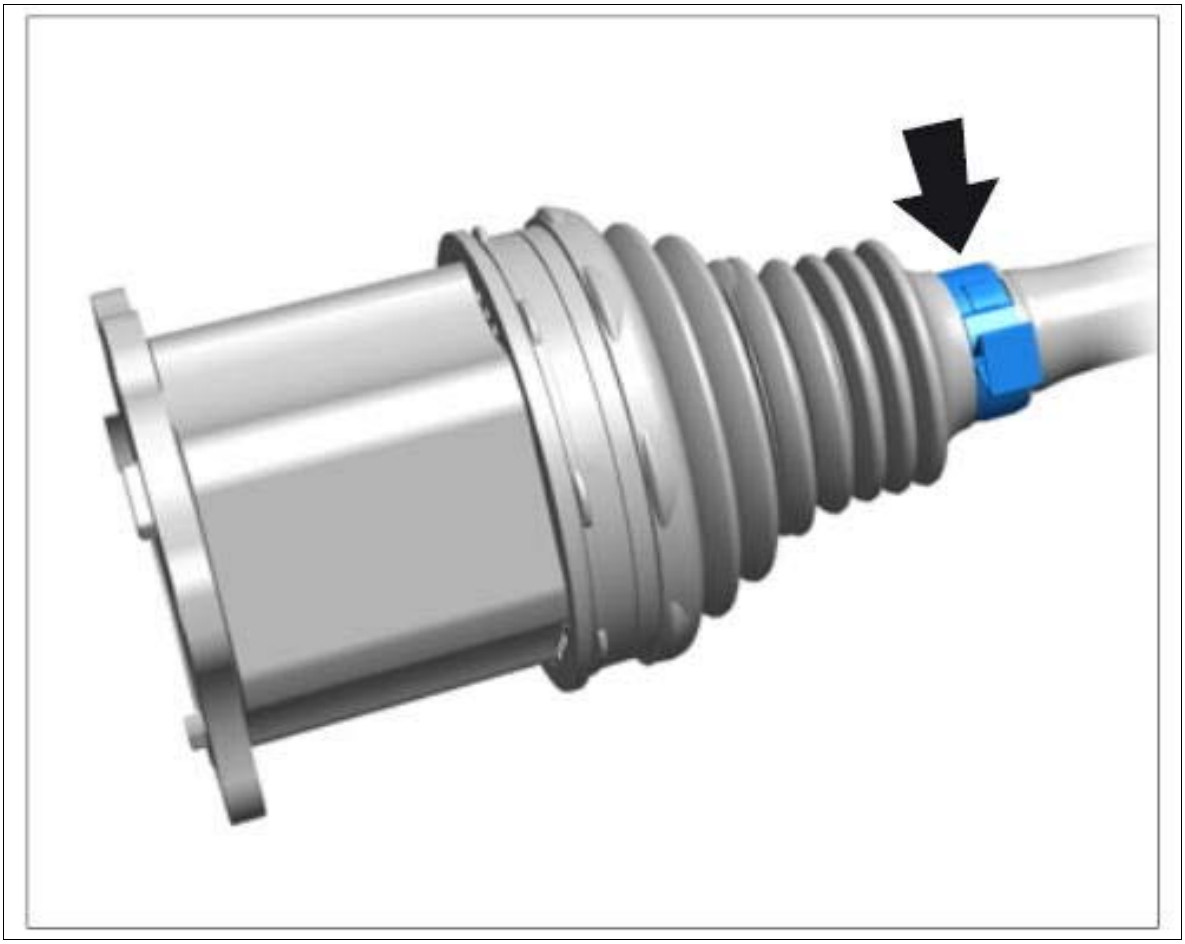
Fig 1: Removing Tripod Flat Joiner



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Remove inner flat joiner on the inner drive shaft boot.

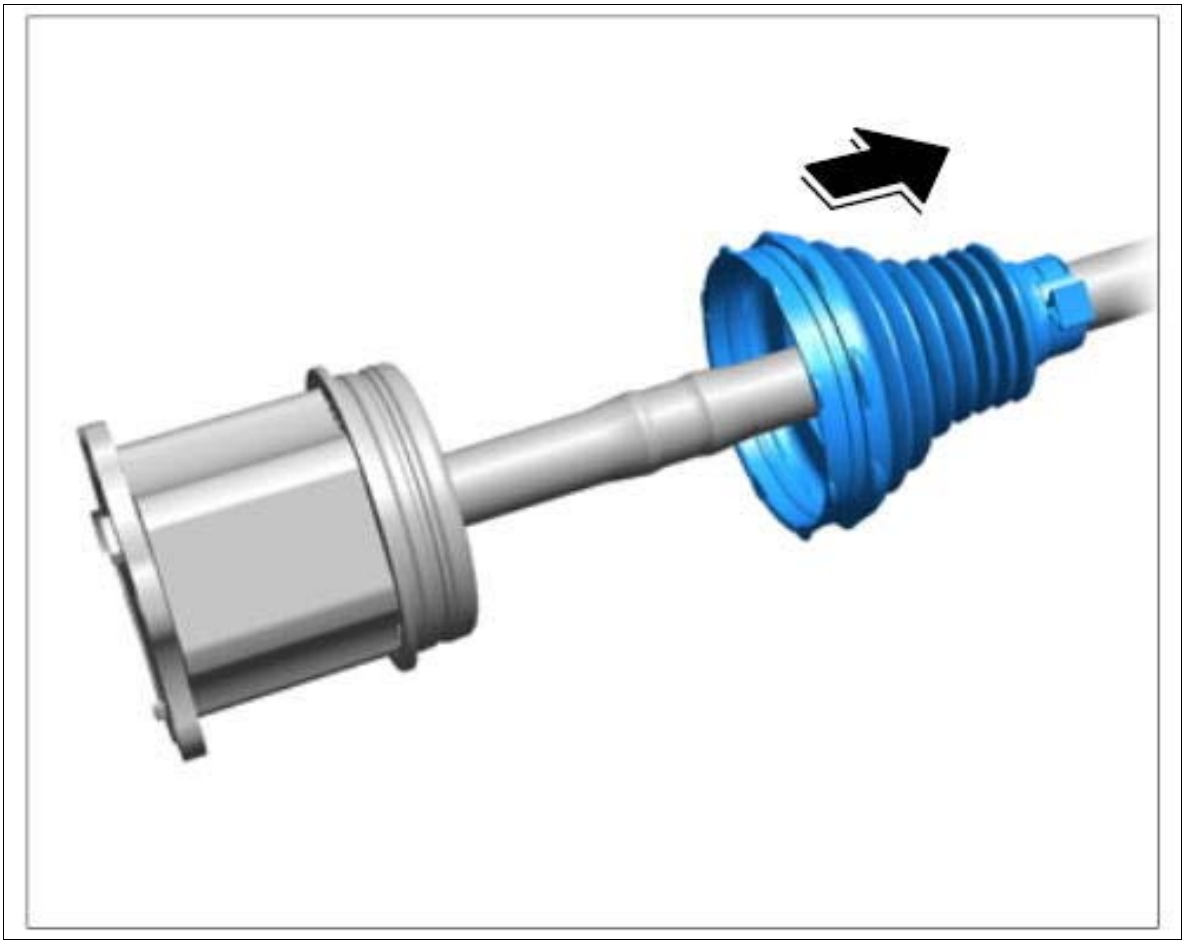
Fig 2: Locating Flat Joiner For Tripod



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Push the inner drive shaft boot back.

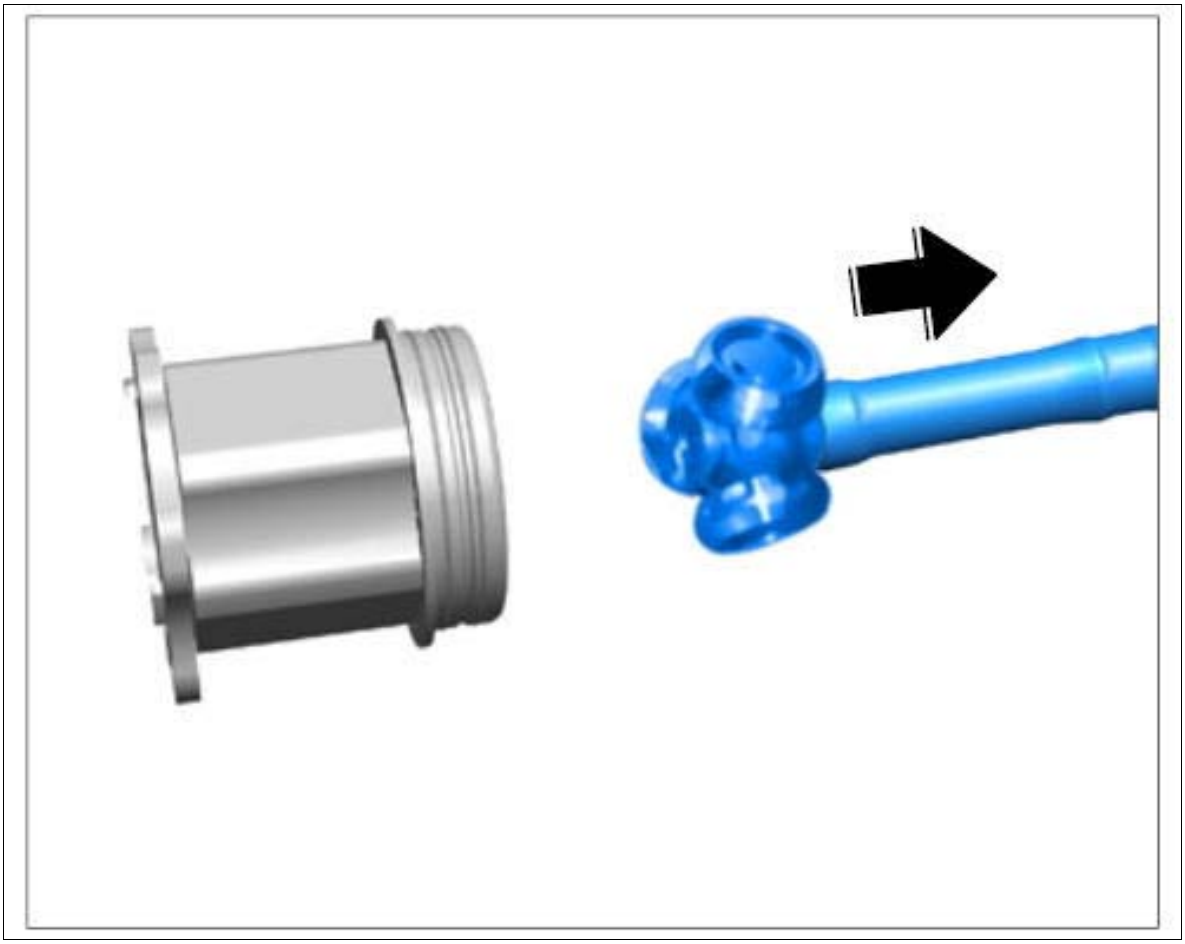
Fig 3: Pushing Inner Drive Shaft Boot



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove drive shaft from the tripod bell.

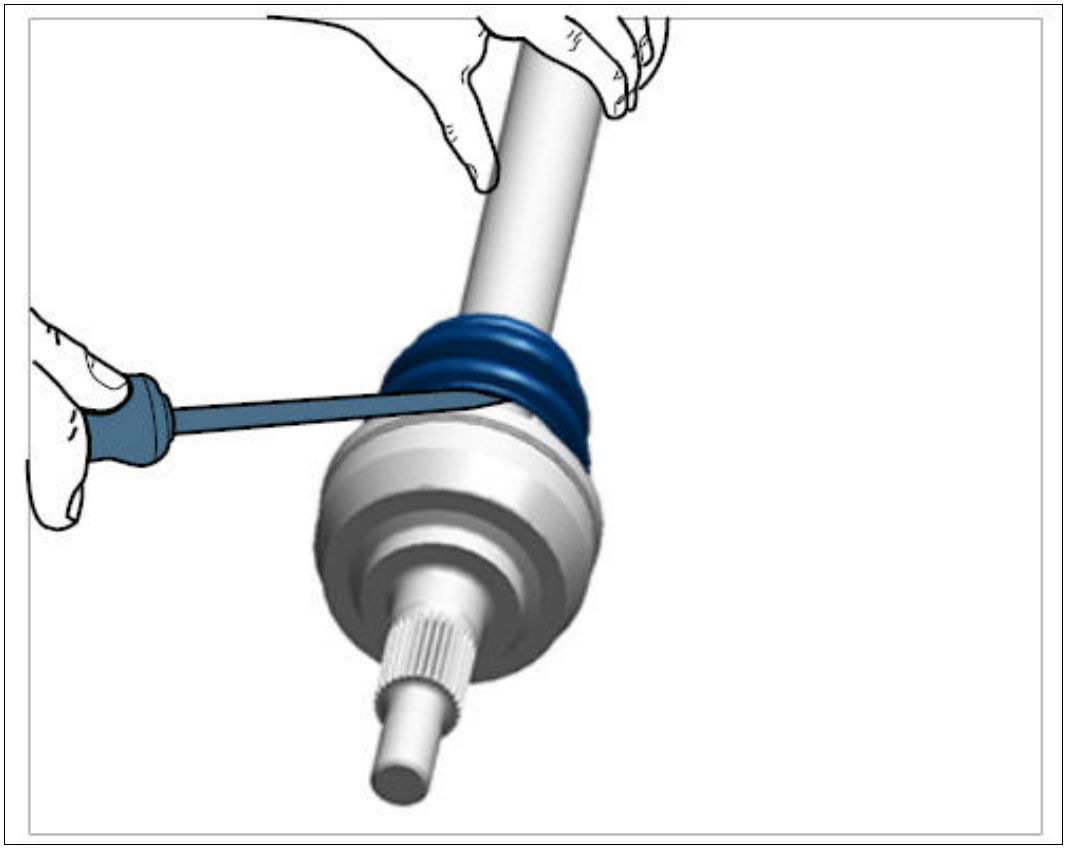
Fig 4: Removing Drive Shaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove the outer/inner flat joiners from the outer drive shaft boot.
    1. 5.1. Pull outer drive shaft boot off the joint pin.

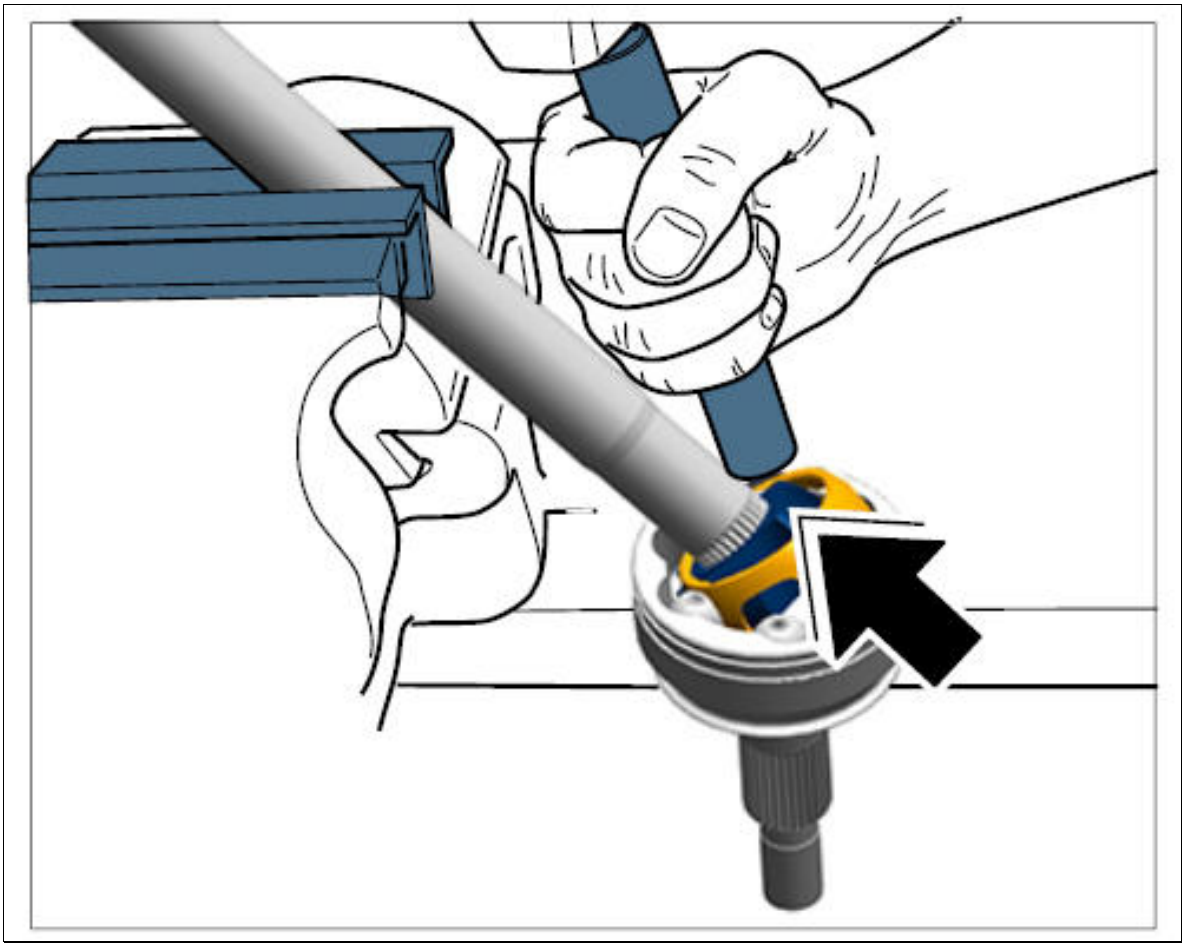
Fig 5: Removing Bellows



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Clamp the drive shaft (use aluminum protective jaws). Position an aluminum mandrel on the ball hub of the joint pin (star-shaped inner ring) **-arrow-** and remove the joint pin (outer joint) by hitting it several times with a hammer.

Fig 6: Removing Joint (Wheel Side)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 404137 DISASSEMBLING AND ASSEMBLING FRONT DRIVE SHAFT (ALL MODELS) > DISASSEMBLING AND ASSEMBLING FRONT DRIVE SHAFT > ASSEMBLING DRIVE SHAFT

WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

Visually check all parts to be re-used carefully.

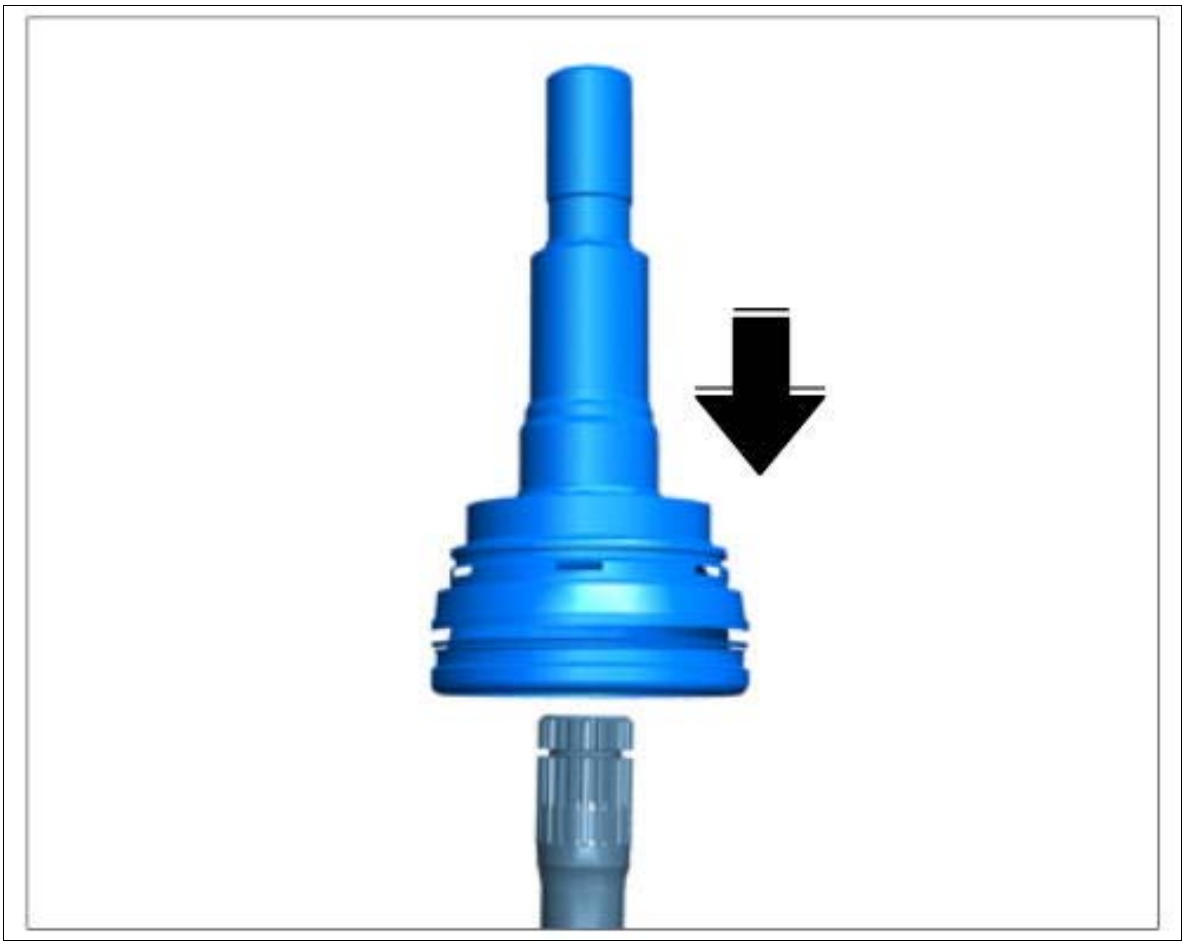
Before fitting the joint, slide all drive shaft boots and flat joiners onto the drive shaft.

Do not confuse the drive shaft boots. They are not identical parts.

Use a new circlip and check that it is seated correctly.

1. Fit both drive shaft boots onto the drive shaft.
2. Clamp the drive shaft (use aluminum protective jaws). Position the joint pin flush on the drive shaft.

   Fig 1: Positioning Joint Pin



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Fit the joint pin as far as it will go onto the drive shaft using a rubber hammer.

   Information

   1. Do not use cleaning agents on the joints (grease thinners!).
   2. Always replace the removed joint at least during assembly.
   3. Press the grease with a sufficient amount of force into the ball tracks of the joint.
   4. Make sure that only a small amount of grease gets into the drive shaft boots.

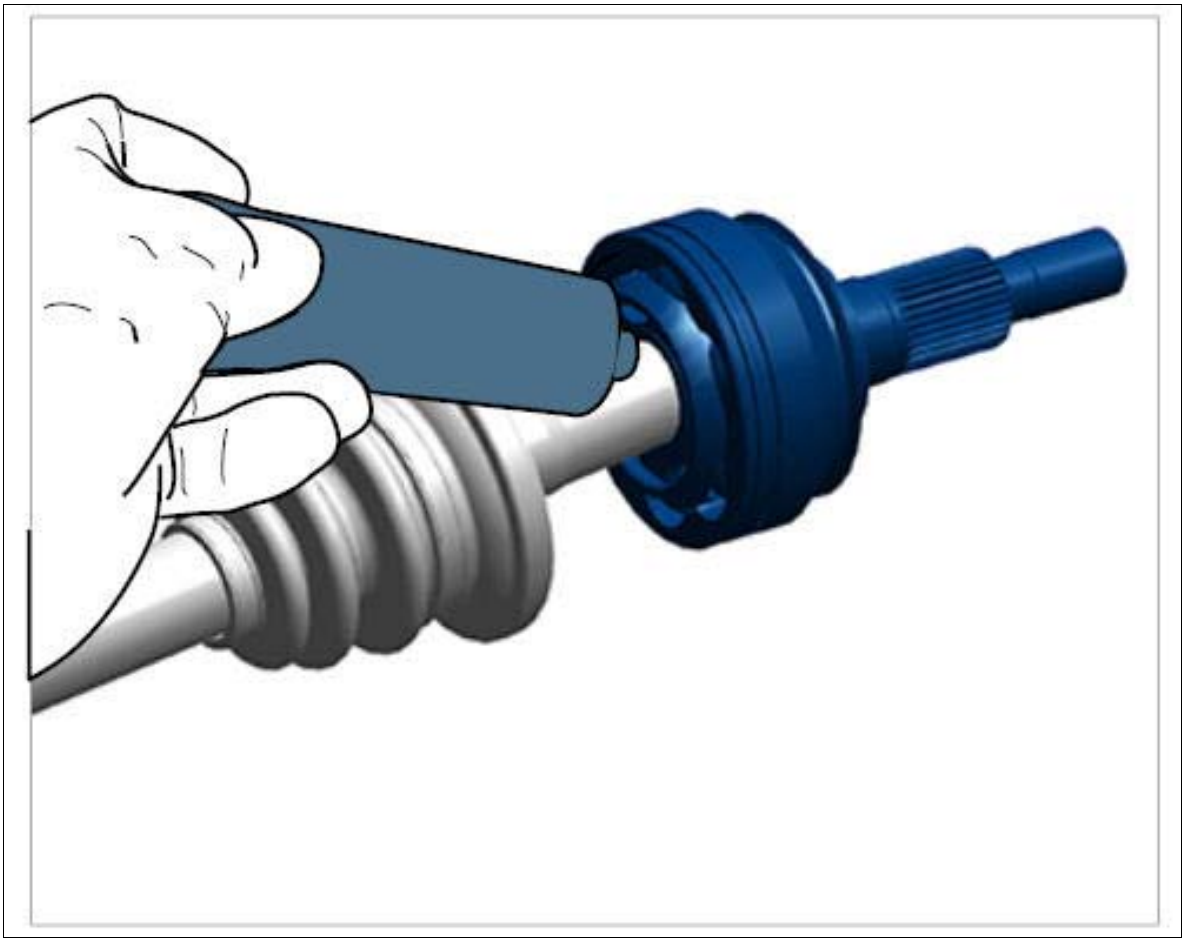
   Re-grease joints:

   Re-grease the joints using special grease .

4. Re-grease tripod joint. The joint pin is supplied ex-works with 128 grams of grease at the outside and 130 grams at the inside. Remove excess grease with a lint-free cloth. Push the required amount of grease through the joint to the outside. Then grease the inside of the joint.

5. Re-grease joint pin.

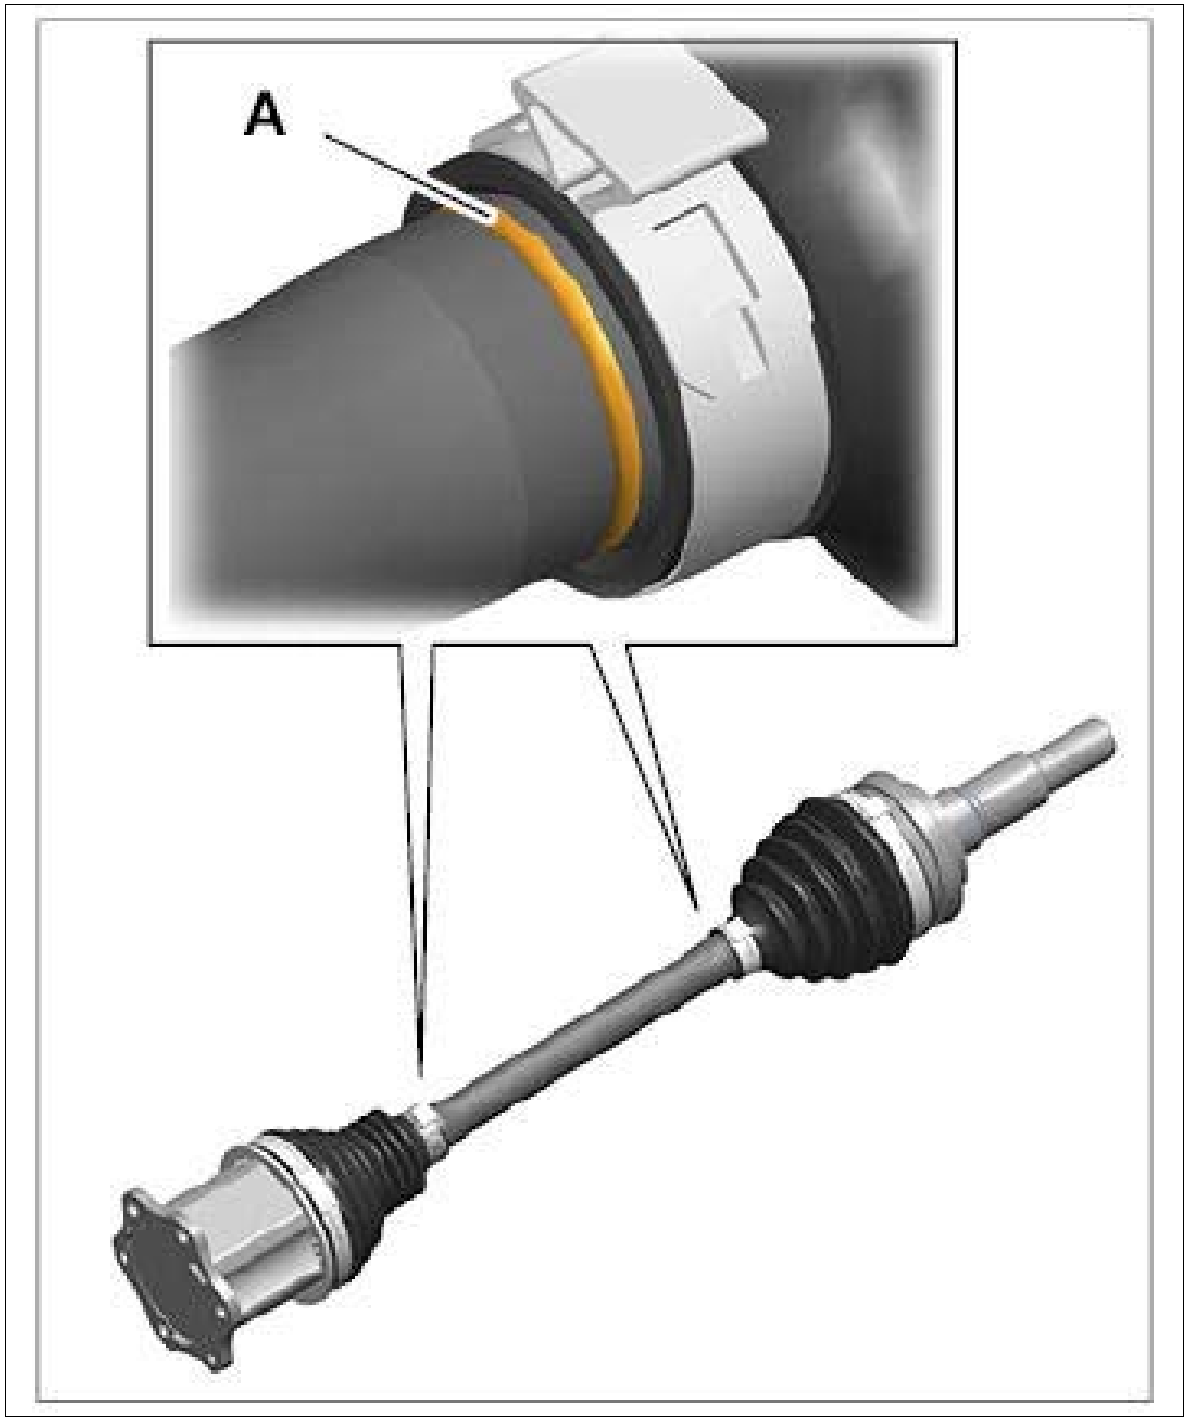
Fig 2: Applying Grease To Outer Drive Shaft



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Fit the small flat joiners for the two boots between the grooves. If the boots are fitted correctly, the groove **-1-** will be visible.

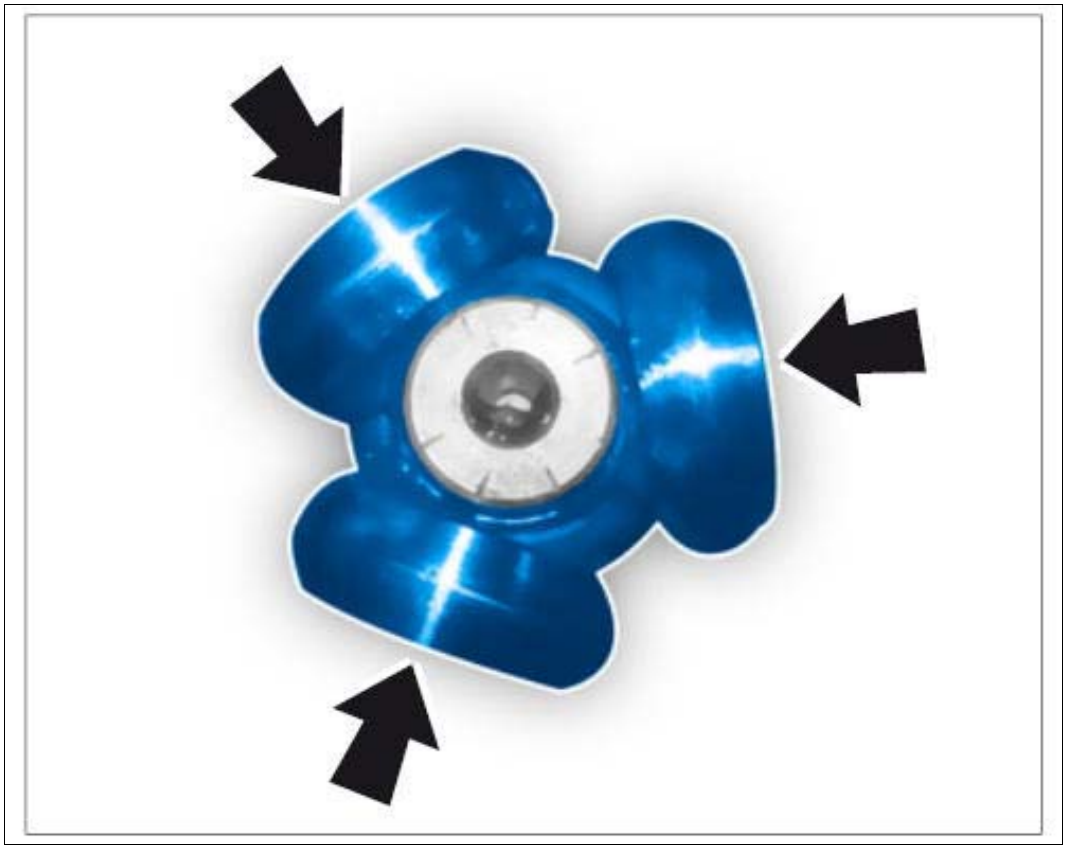
Fig 3: Identifying Drive Shaft Grooves



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Assemble tripod joint.
    1. 7.1. Clamp the drive shaft vertically in the vice. The tripod joint is facing upwards.
    2. 7.2. Position the tripod bearings flush with the pins with your hand.

Fig 4: Locating Needle-Roller Bearing Tripod Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 7.3. Fit/slide on the tripod bell.

8. Fit inner drive shaft boot.

    1. 8.1. Make sure that the inner drive shaft boot is seated correctly in the groove of the plastic ring.

    2. 8.2. Fit outer flat joiners for the two drive shaft boots using pliers Nr.74.

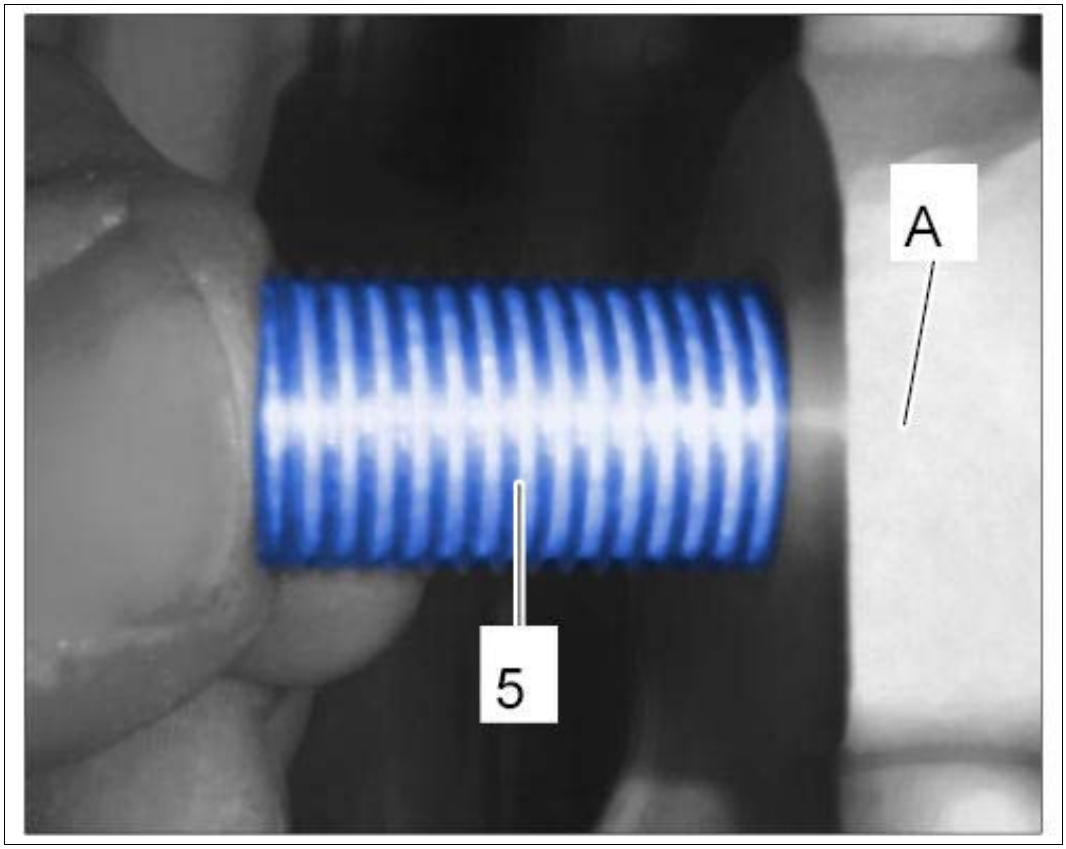
4. 3.4. The collar of the M14 threaded bush must be sitting in the recess up to the first thread. **-5-**

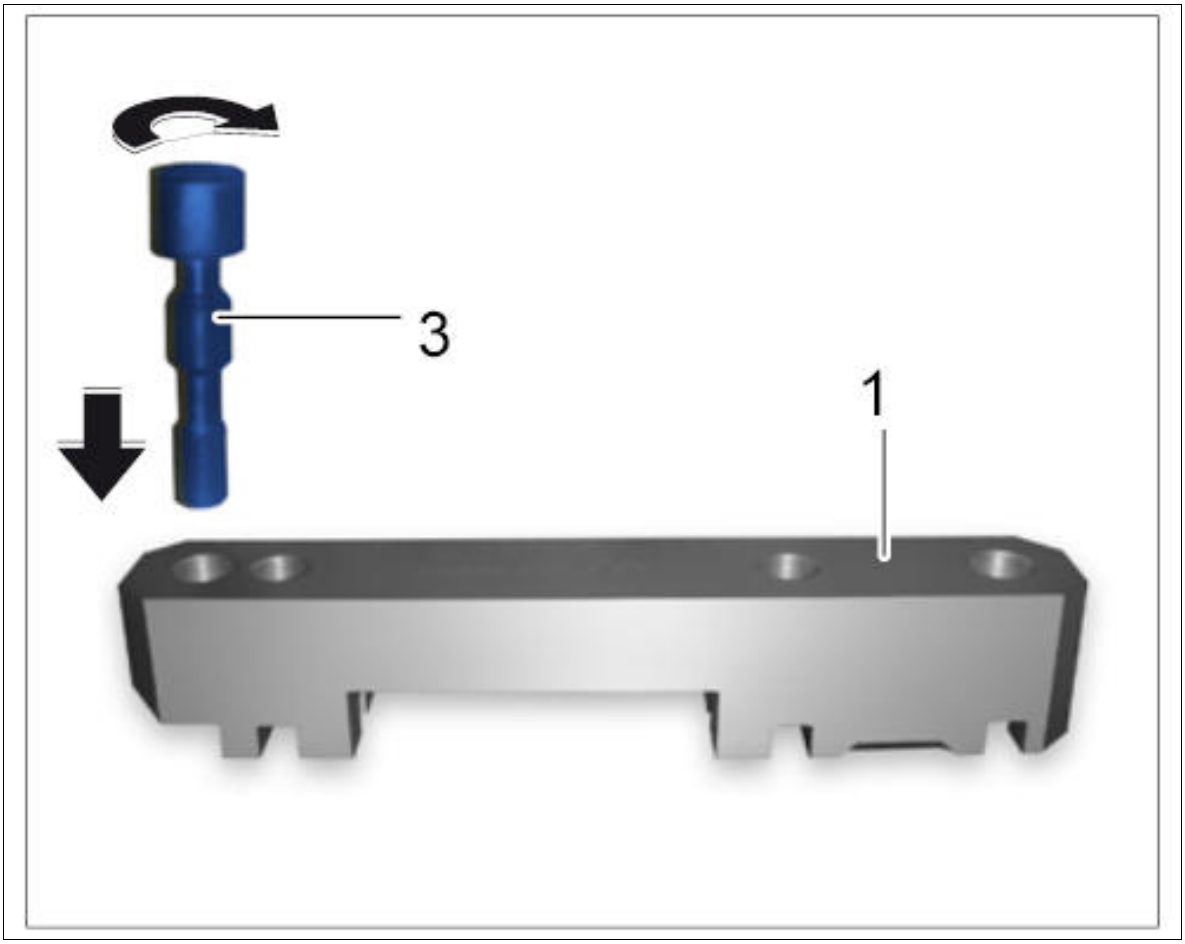
Fig 8: Checking Countersink Depth



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Fit the assembly aid with a fastening screw. **-3-** .

Fig 9: Installing Assembly Aid



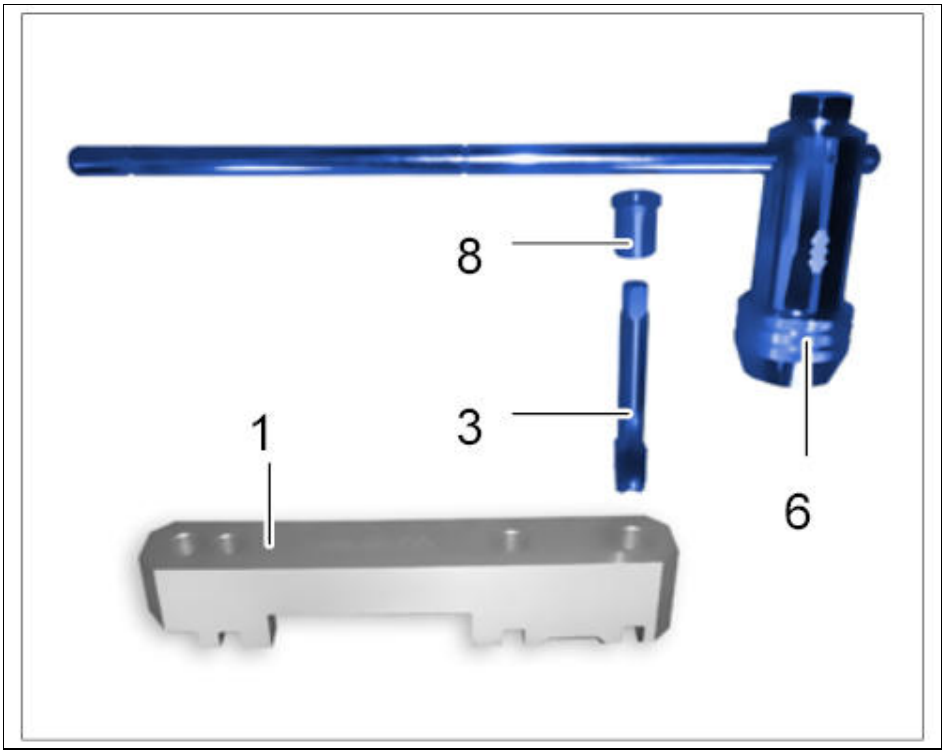
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Cut thread.

    1. 5.1. Installation sequence for cutting the thread.

        1. **1** - Assembly aid, Brake calliper repair set VAS 6627
        2. **3** - Tap, Time-Sert thread repair set No. 122-1 Item 5
        3. **8** - Guide sleeve, M14, internal diameter: 12 mm, Brake calliper repair set VAS 6627
        4. **6** - Threading die holder, Brake calliper repair set VAS 6627

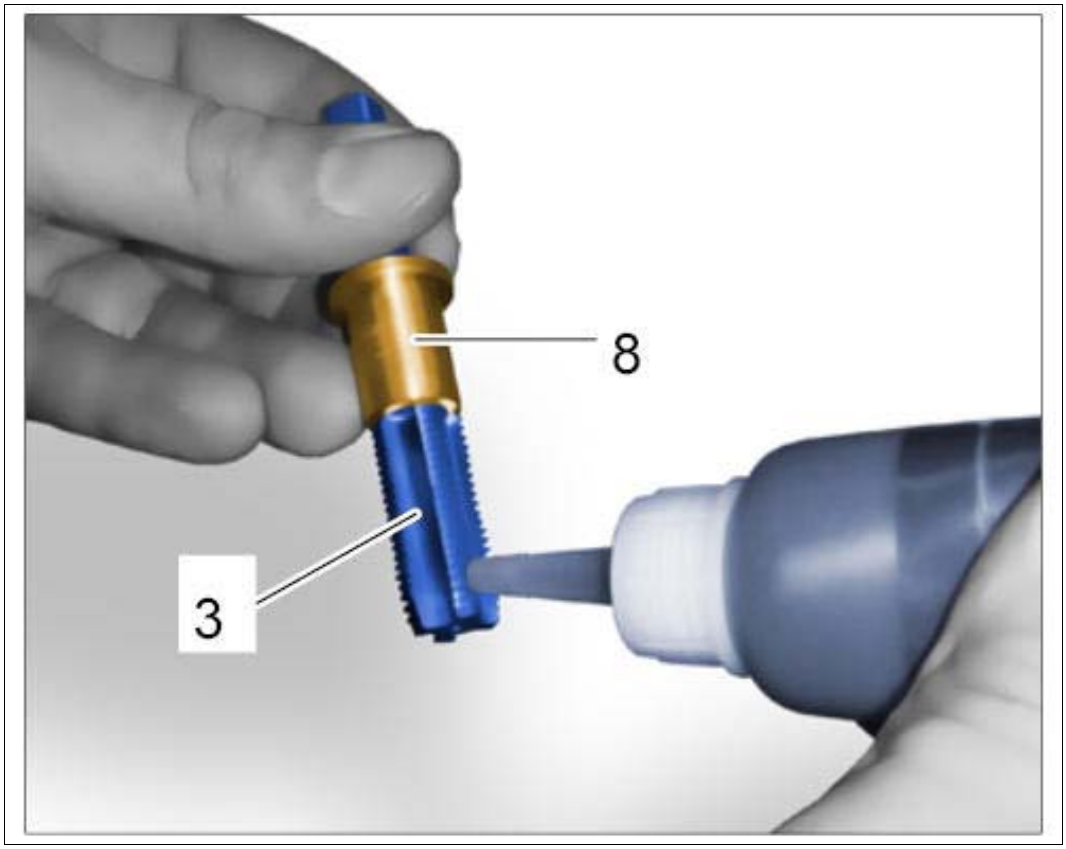
Fig 10: Identifying Thread Cutting Tools



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 5.2. Oil the tap. **-3-**

Fig 11: Applying Oiling To Tap

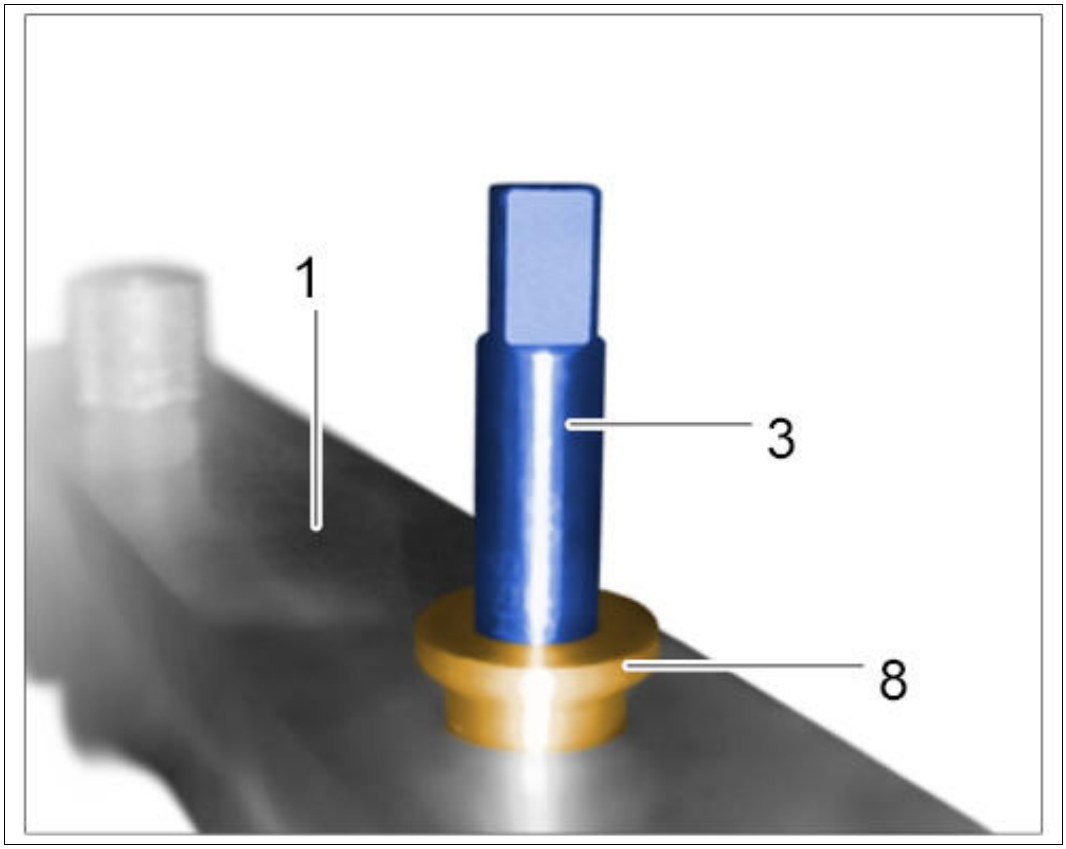


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 5.3. Insert the tap into the assembly aid. The guide sleeve is projecting slightly out of the assembly aid. But it has made contact. The guide sleeve will drop during the cutting process using the threading die holder.

    1. **1** - Assembly aid, Brake calliper repair set VAS 6627
    2. **3** - Tap, Time-Sert thread repair set No. 122-1 Item 5
    3. **8** - Guide sleeve, M14, internal diameter: 12 mm, Brake calliper repair set VAS 6627

Fig 12: Inserting Tap

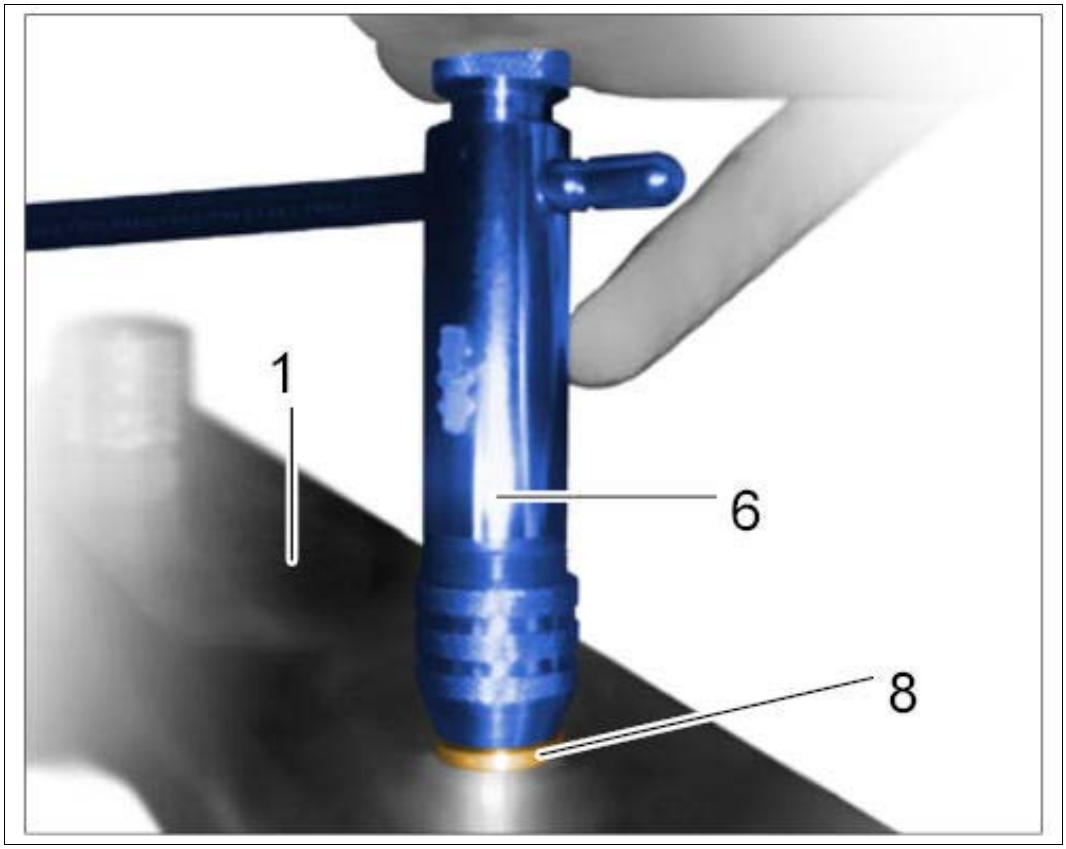


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. 5.4. Carefully cut the thread as far as the end of the bore hole (as far as the stop) using the tap.

    1. **1** - Assembly aid, Brake calliper repair set VAS 6627
    2. **8** - Guide sleeve, M14, internal diameter: 12 mm, Brake calliper repair set VAS 6627
    3. **6** - Threading die holder, Brake calliper repair set VAS 6627

Fig 13: Cutting Threads



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

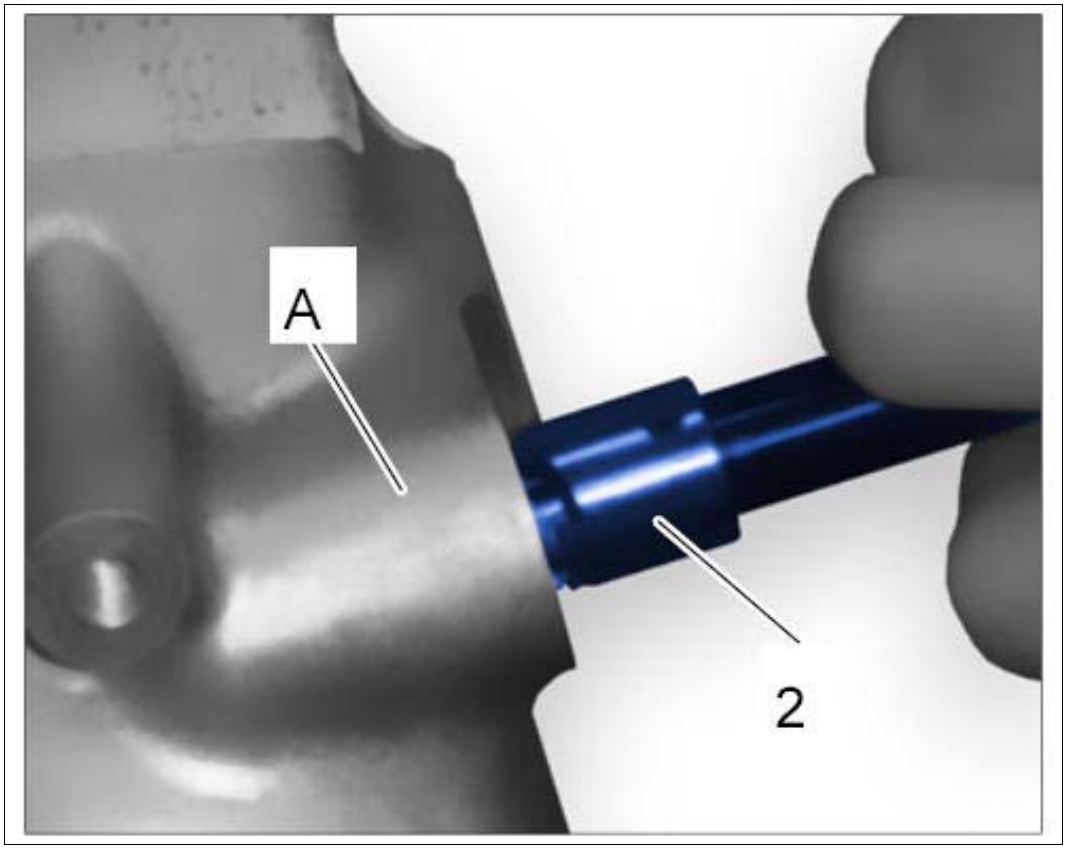
6. Re-mill the bore hole.

Information

Mill in/countersink the bore hole.

1. The collar of the threaded bush must be sitting at least → Length: 0.2 mm in the bore hole under the collar of the wheel bearing housing.
2. The collar of the threaded bush must not be projecting out.
    1. 6.1. Using the seat miller, countersink the bore again until it is sufficiently deep to allow the stop of the seat miller to sit on the wheel bearing housing (as far as the stop). **-2-**

Fig 14: Countersinking Bore Hole

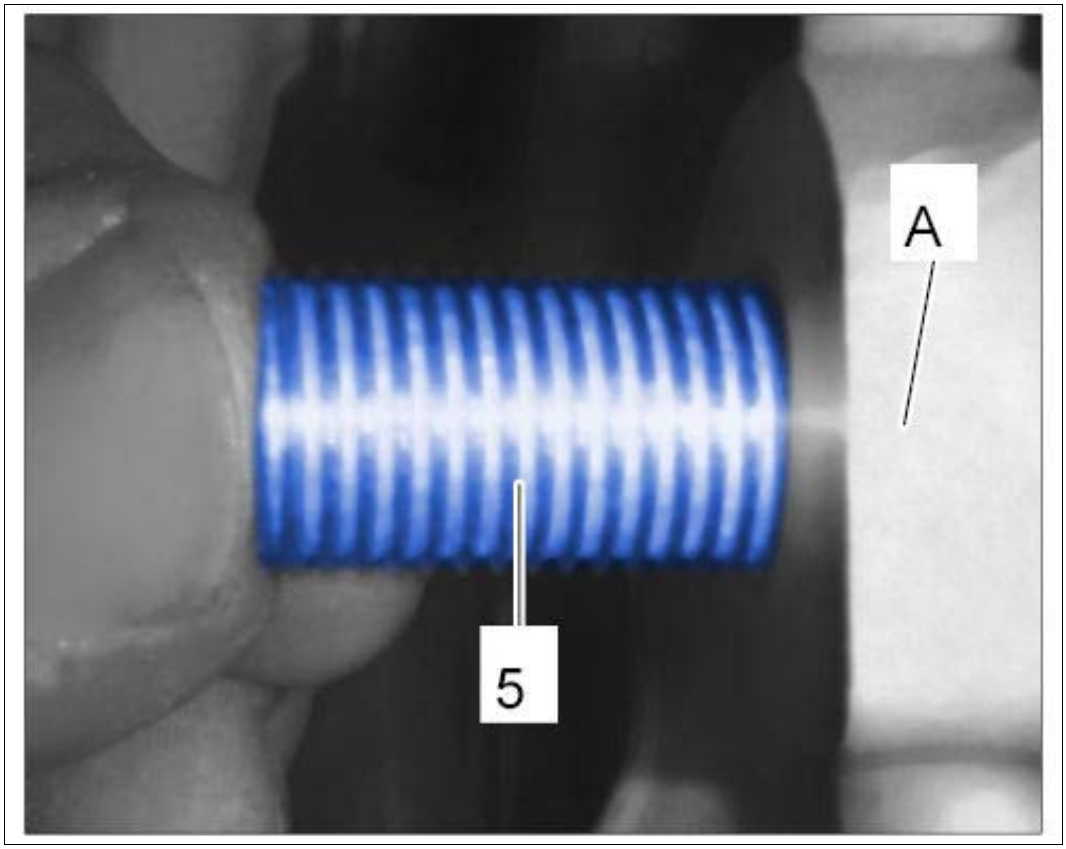


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 6.2. Carefully cut the thread again as far as the end of the bore hole (as far as the stop) using the tap. This removes the remaining milling burrs. The tap must screw out without catching!

3. 6.3. Check again to make sure that the collar of the threaded bush has disappeared in the recess. **If it has not disappeared, repeat the milling process! -5-**

Fig 15: Checking Countersink Depth



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

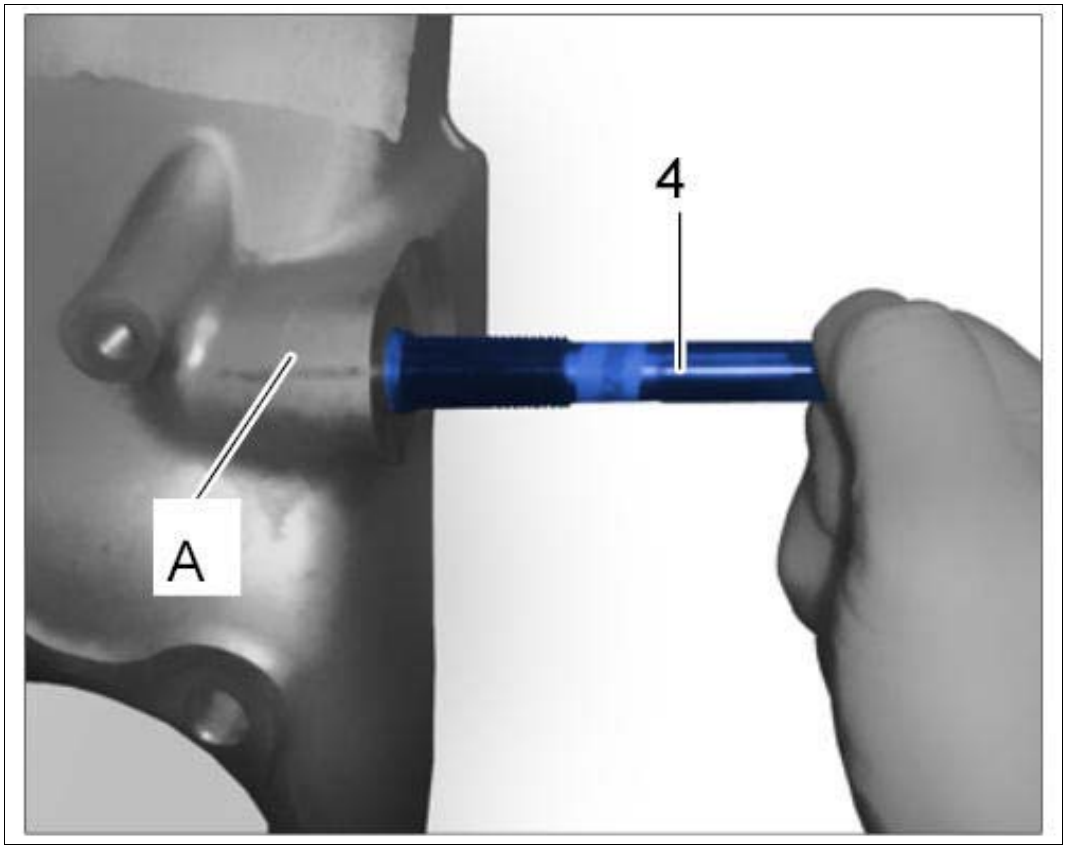
7. **Clean the thread** (using brake cleaner for example) and carefully blow the chips out of the bore hole. Wear protective goggles.

8. Insert the M14 threaded bush.

    1. 8.1. Screw in the M14 threaded bush as far as possible by hand.

    2. 8.2. Only oil the screw-in tool! Screw in the screw-in tool as far as possible by hand. Continue screwing until the threaded bush is sitting slightly deeper in the bore hole on the wheel bearing housing.

Fig 16: Inserting Threaded Bush



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 8.3. Then, screw the threaded bush in further using the threading die holder and the screw-in tool. **-4-**

   Information

   Mill in/countersink the bore hole.

   1. The collar of the threaded bush must be sitting at least → Length: 0.2 mm in the bore hole under the collar of the wheel bearing housing.
   2. The collar of the threaded bush must not be projecting out.

4. 8.4. Once the M14 threaded bush is screwed in so that it is sitting slightly deeper in the bore hole on the wheel bearing housing, you will feel the increased resistance. Continue screwing carefully until there is less resistance again.
5. 8.5. The screw-in tool must screw out without catching! **-4-**

9. Check that the M14 threaded bush is seated correctly.

> *WARNING: Threaded bush sticking out of wheel bearing housing.*
>
> *1. Brake calliper can become loose.*

→ The contact surface of the brake calliper must be flush with the contact surface of the wheel

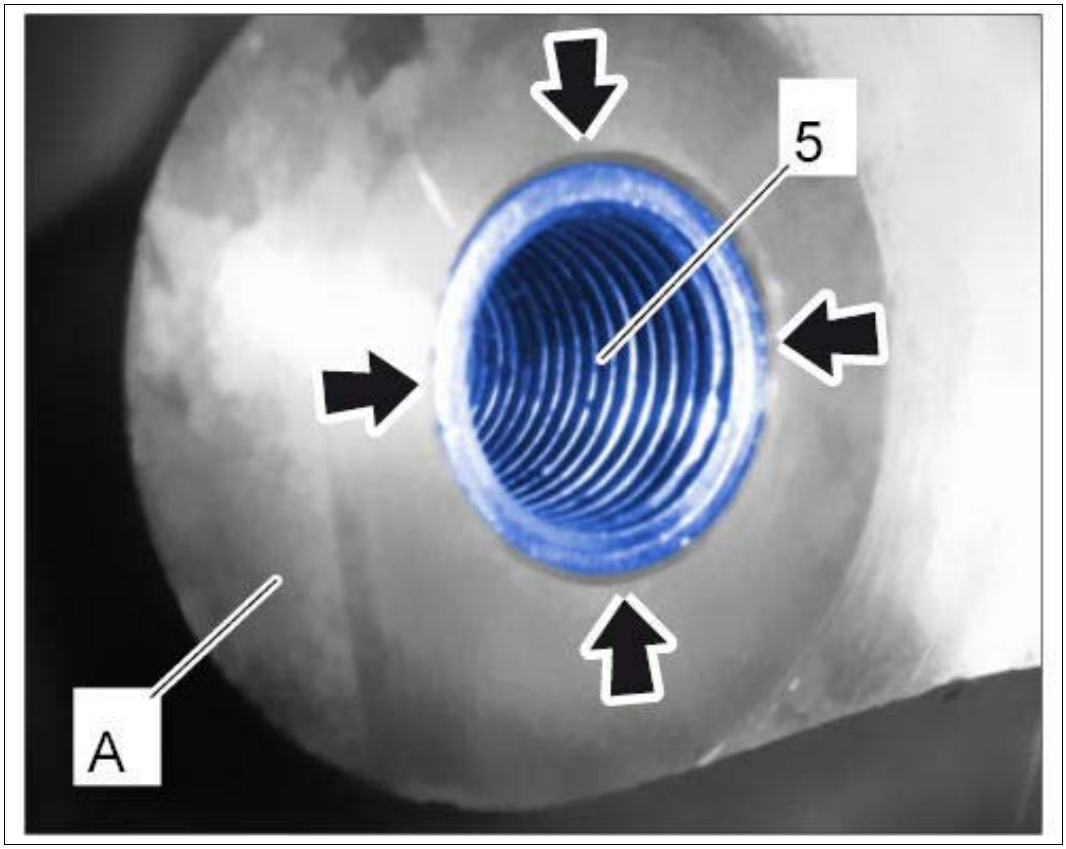
bearing housing.

→ The brake calliper must not be supported on the threaded bush.

→ There must be NO gap between the brake calliper and wheel bearing housing.

1. 9.1. The M14 threaded bush **-5-** is inserted at the correct position if the collar of the M14 threaded bush is below the contact surface of the brake calliper **-A-** ! The M14 threaded bush must not be projecting out.

   Fig 17: Locating Threaded Bush



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 9.2. The M14 threaded bush is at the correct position if it is sitting slightly deeper in the bore hole. **-arrows-**

10. Clean the thread with brake cleaner after you have completed the repair work. **The thread must be free of grease and chips.**

WM 405041 REPAIRING FRONT WHEEL BEARING HOUSING THREAD (ALL MODELS) > SUBSEQUENT WORK

1. Install front brake disc → 465019 REMOVING AND INSTALLING FRONT BRAKE DISC .

WM 405755 REPLACING FRONT WHEEL BEARING (ALL MODELS) > TOOLS

2. Unscrew fastening nuts **-1-** and remove anti-roll bar clamp **-3-** at the left and right.
3. Remove anti-roll bar **-4-** .

WM 407719 REMOVING AND INSTALLING FRONT ANTI-ROLL BAR (ALL MODELS) > REMOVING AND INSTALLING FRONT ANTI-ROLL BAR > INSTALLING FRONT ANTI-ROLL BAR

WARNING: Wheel bearing housing raised incorrectly

- *Risk of squashing*
- *Risk of damage to components*

→ Wear personal protective gear.

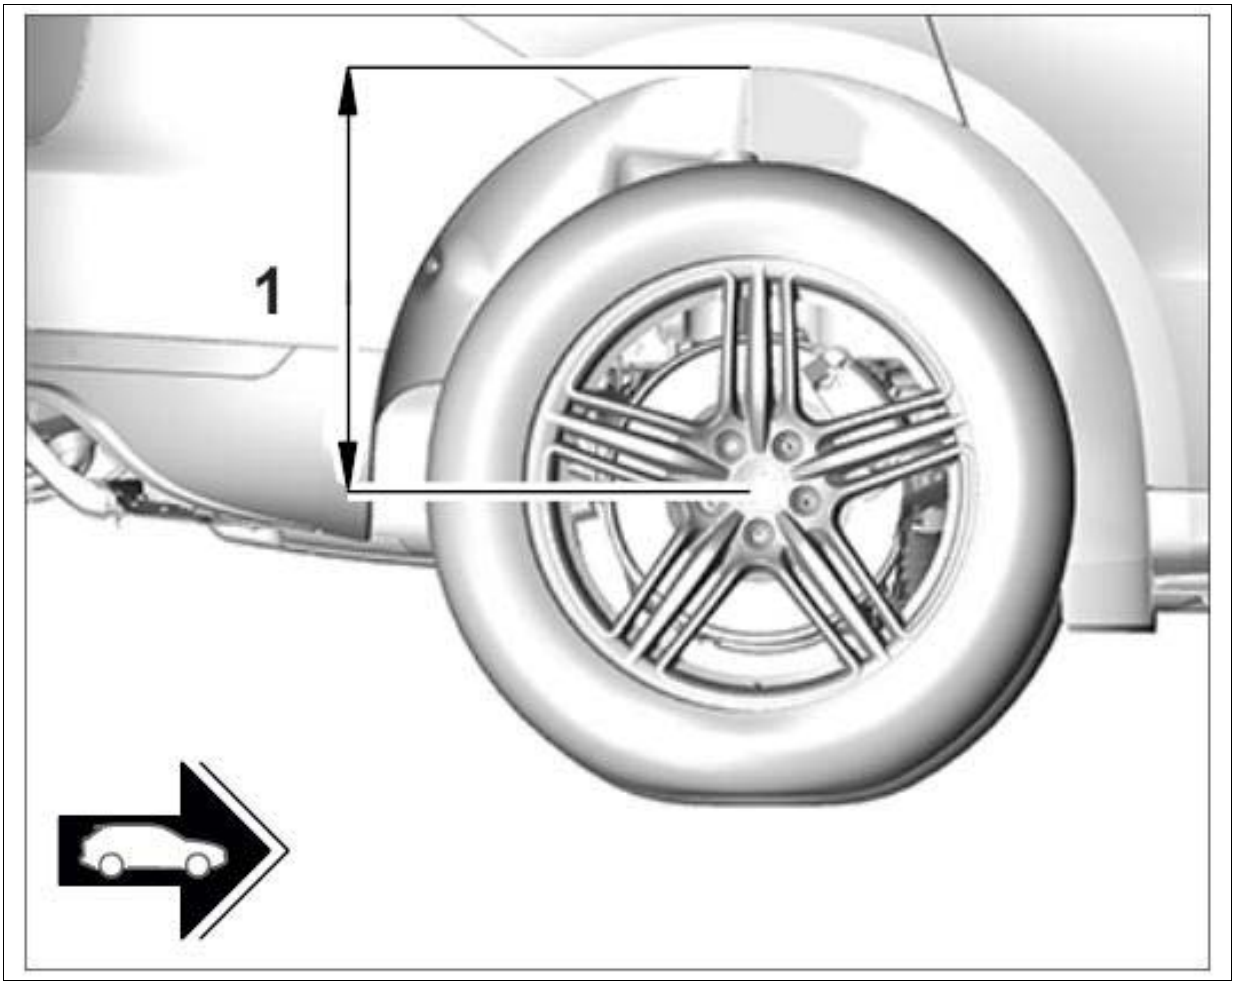
→ Do not raise the wheel suspension higher than the normal vehicle position (vehicle resting on

wheels).

Information

- All screws and threaded joints on the axle must be tightened in vehicle position. Vehicle position means: vehicle standing on its wheels, or the wheel suspension is raised with a universal vehicle lift. Dimension -1- , from lower edge of wing to center of axle corresponds to vehicle position. The current height can be found in → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT . Always observe the following points!

  Fig 1: Identifying Wheel To Wing Lower Edge Dimension (Rear Axle)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- On vehicles with air springs, the respective air spring must be bled using the Porsche System Tester . → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM
- Screws and nuts are Geomet-coated and must not be greased.

Installation is performed in reverse order to removal. Pay particular attention to the following:

1. Position anti-roll bar in installation position.

   For Macan Basis and Macan Diesel: Make sure that the gap in the rubber mounting in the right bracket is touching the contact surface of the clip.

   For Macan S and Macan Turbo: The rubber mounting is in two parts with a special precisely

fitted clip. The gap in the rubber mounting must be parallel to the contact surface of the clip.

2. Tighten fastening nuts **-1-** on the anti-roll bar clamps **-3-** on both sides of the vehicle. **Tightening torque 30 Nm (22 ftlb.)**

   Fig 2: Identifying Front Anti-Roll-Bar Mounting Nuts

Designation	Type	Number	Description	
stationary spring tensioning device	Workshop equipment	WE 1610		

socket-wrench insert	VW tool	3353		40, 42  3353

WM 408537 DISASSEMBLING AND ASSEMBLING FRONT SPRING STRUT (ALL MODELS) > PRELIMINARY WORK

1. Remove front spring strut → 408519 REMOVING AND INSTALLING FRONT SPRING STRUT .

WM 408537 DISASSEMBLING AND ASSEMBLING FRONT SPRING STRUT (ALL MODELS) > DISASSEMBLING AND ASSEMBLING FRONT SPRING STRUT > DISASSEMBLING FRONT SPRING STRUT

WARNING: Preloaded or pressurized components

- *Risk of squashing or bruising*

→ Do not reach into the danger area.

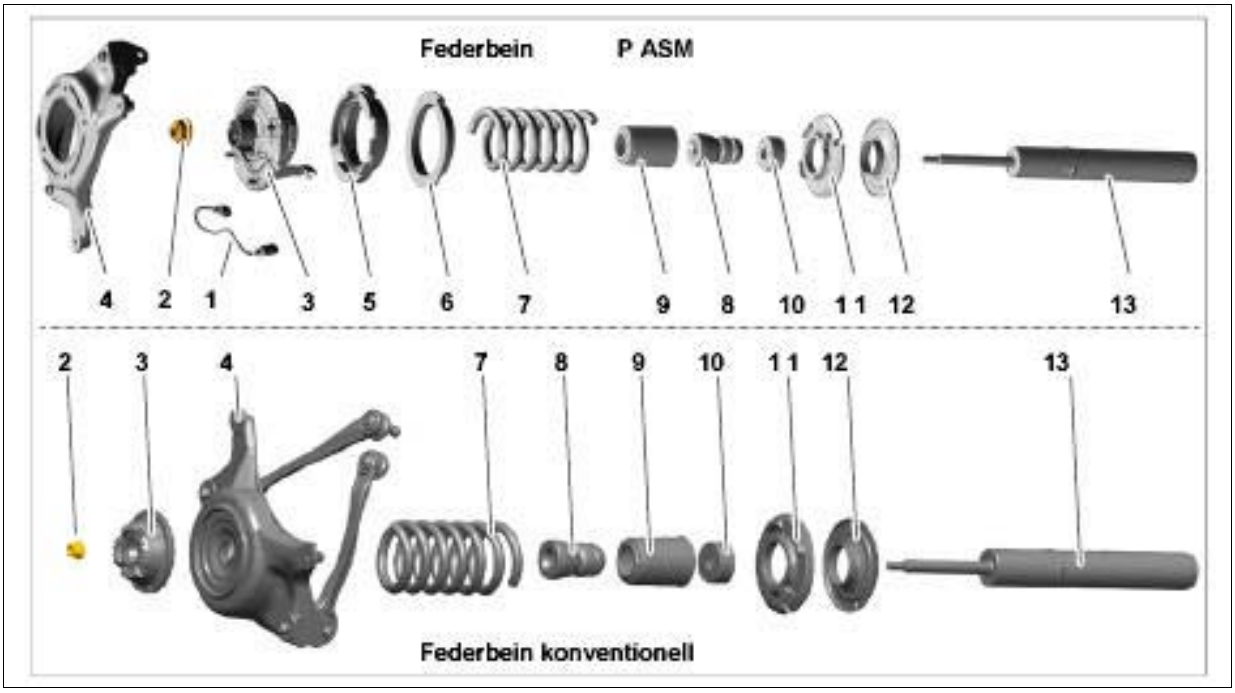
→ Relieve the tension on components before starting work.

→ Secure components to prevent them from loosening suddenly.

Information

- Observe the correct allocation (engine variant/chassis variant) when installing new coil springs and/or shock absorbers.
- Springs must only be replaced in pairs.

Fig 1: Overview Of Spring Struts



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. PASM line (PASM only)
2. Hexagon nut
3. Spring-strut mount
4. Mounting saddle (on conventional spring struts, the mounting saddle is integrated in the spring strut, while on spring struts with PASM, the mounting saddle is screwed to the bearing **(3)**
5. Insert
6. Upper concave support
7. Coil spring
8. Rubber stop
9. Boot
10. Damper cap
11. Lower concave support
12. Spring washer
13. Vibration damper

Information

The front spring strut is disassembled and assembled using the tool **stationary spring tensioning device WE 1610** .

Before inserting the spring strut, the tool **stationary spring tensioning device WE 1610** must be set up and adjusted in accordance with the operating instructions provided by the manufacturer.

1. Insert spring strut in the **stationary spring tensioning device WE 1610.** → Spring strut in spring tensioning device (conventional spring strut shown)

   Fig 2: Compressing Spring Strut In Spring Tensioning Device

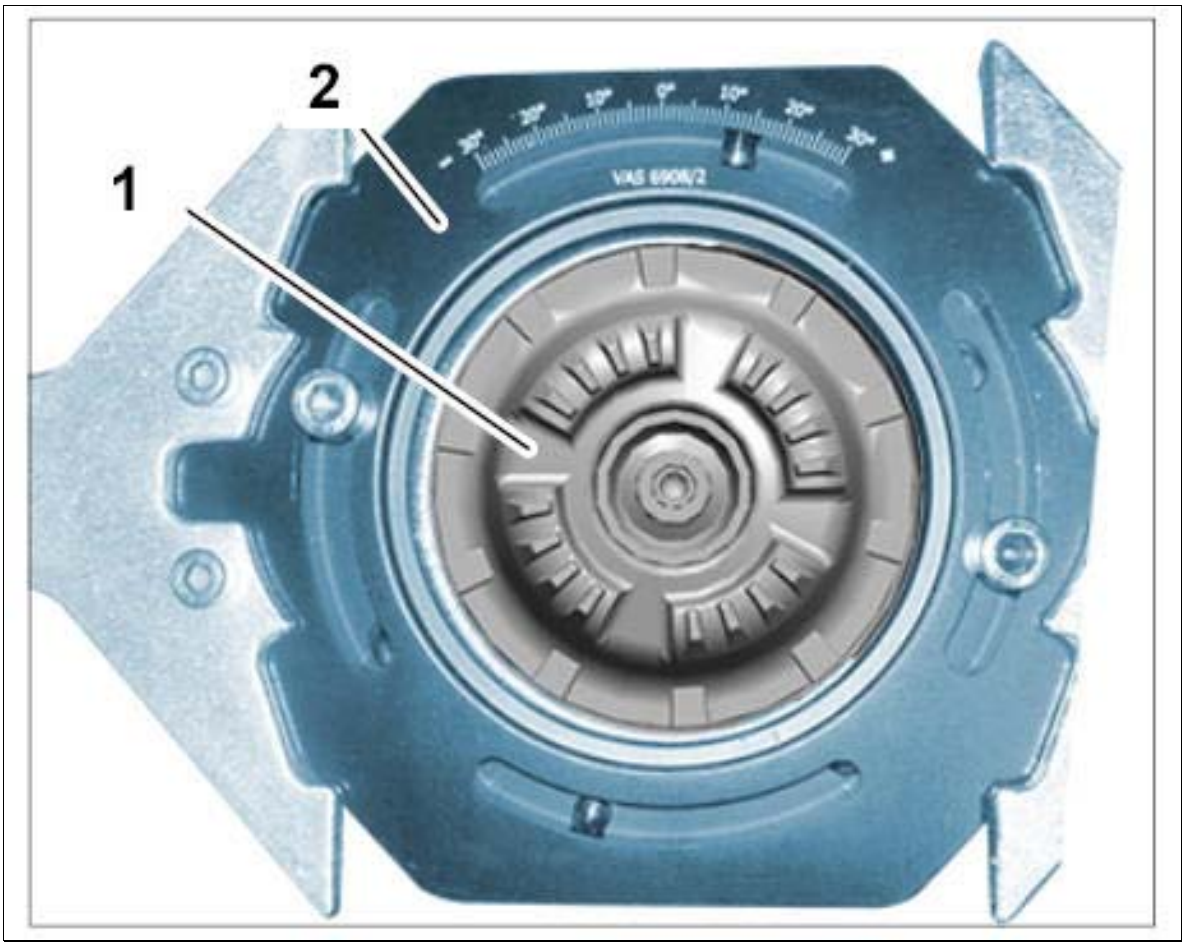
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. **Applies only to conventional spring strut:**

   Align mounting saddle chamfer concentrically with respect to the mounting plate.

Applies only to PASM spring strut:

Fig 3: Identifying Spring Strut Alignment Position (Conventional)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Insert threaded bolts **-1-** of the spring strut into the bores **-2-** on the mounting plate.

Fig 4: Identifying Spring Strut Alignment Bolts (PASM)

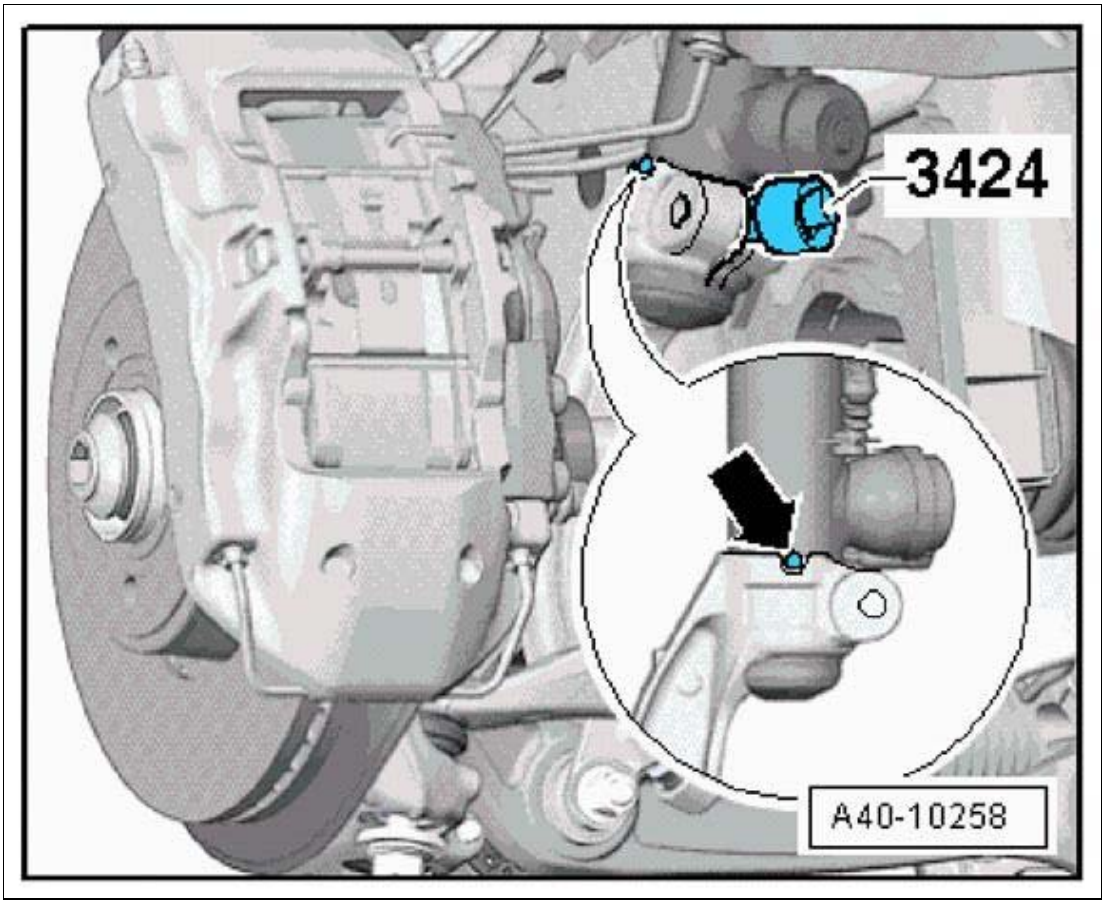
2. 5.2. Insert spreader **Spreader 3424** into the slot on the shock absorber fork.

Fig 5: Locating Spreader (3424)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 5.3. Turn the spreader 90 degrees.
4. 5.4. Pull shock absorber fork down off the spring strut.

WM 408919 REMOVING AND INSTALLING SHOCK ABSORBER FORKS (ALL MODELS) > INSTALLING SHOCK ABSORBER FORK

WARNING: Wheel bearing housing raised incorrectly

- *Risk of squashing*
- *Risk of damage to components*

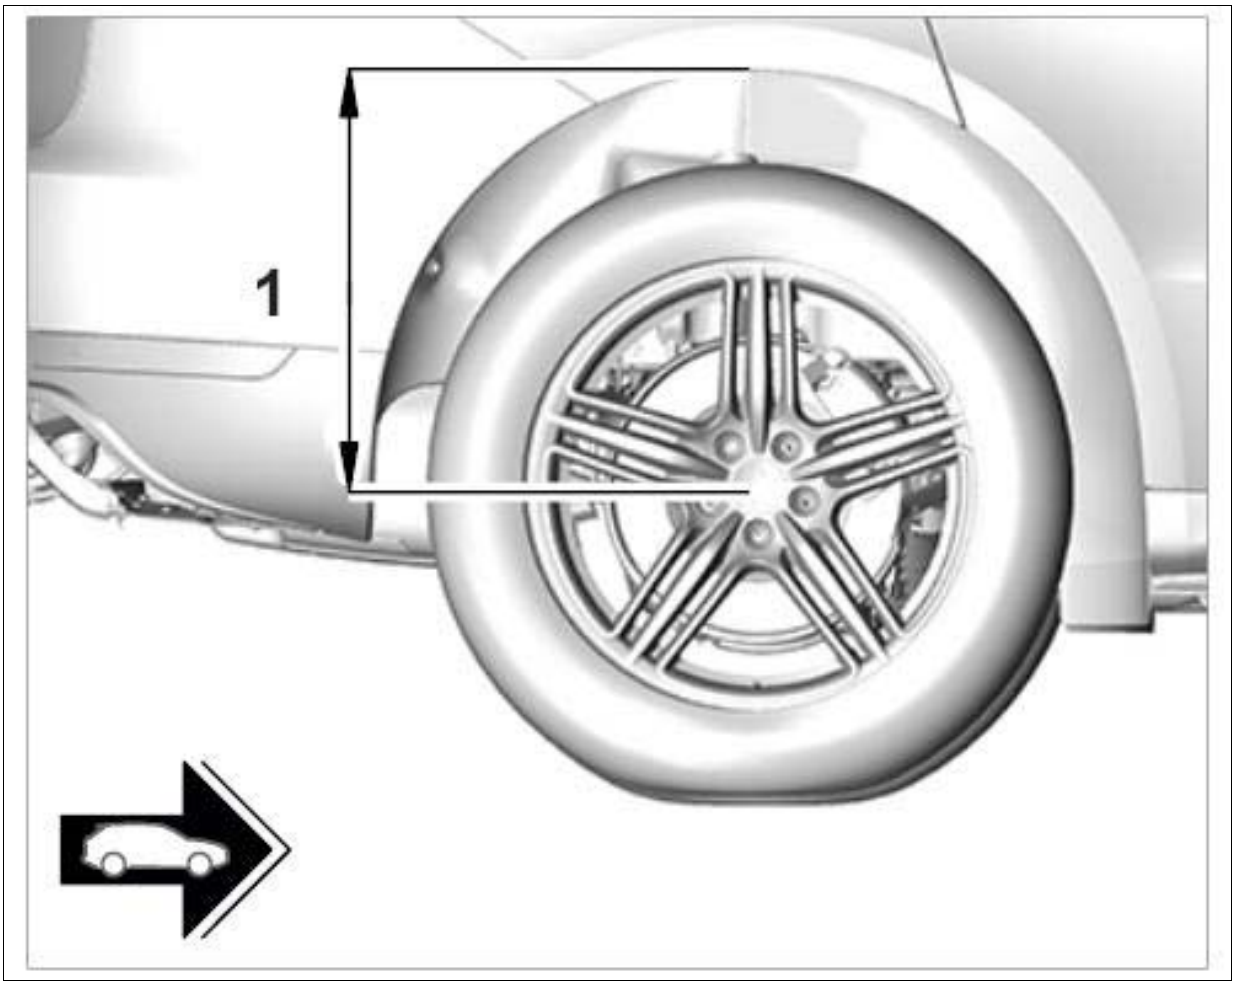
Wear personal protective gear.

→ Do not raise the wheel suspension higher than the normal vehicle position (vehicle resting on wheels).

Information

- All screws and threaded joints on the axle must be tightened in vehicle position. Vehicle position means: vehicle standing on its wheels, or the wheel suspension is raised with a universal vehicle lift. Dimension -1-, from lower edge of wing to center of axle corresponds to vehicle position. The current height can be found in → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT . Always observe the following points!

  Fig 1: Identifying Wheel To Wing Lower Edge Dimension (Rear Axle)



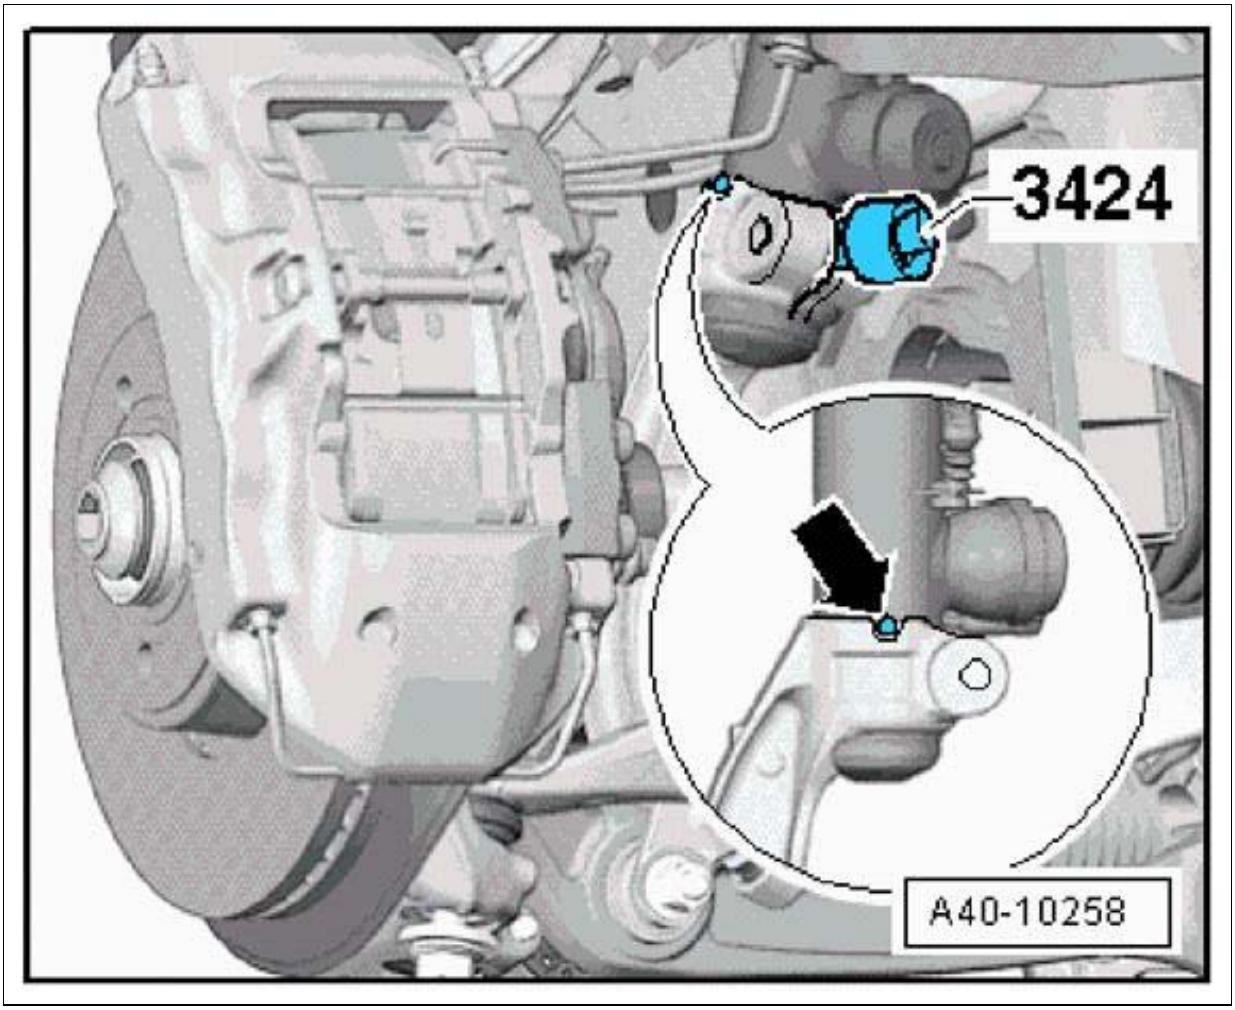
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- On vehicles with air springs, the respective air spring must be bled using the Porsche System Tester . → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM
- Screw and nuts are Geomet-coated and must not be greased

Information

- When fitting the shock absorber fork on the spring strut on vehicles with air springs, make sure that the T-bolt **-arrow-** engages in the groove on the shock absorber fork.
- Do not install spring strut too tightly!

Fig 2: Locating T-Bolt



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Installation is performed in reverse order.

   Observe specified tightening torques:

   Shock absorber fork to spring strut: **Initial tightening 40 Nm (30 ftlb.) Final tightening +180°**

   Lower trailing arm to front-axle carrier: **Initial tightening 70 Nm (52 ftlb.) Final tightening +180°**

   Spring strut to lower trailing arm: **Initial tightening 90 Nm (67 ftlb.) Final tightening +90°**

   Tie-rod ball to wheel bearing housing: **Tightening torque 100 Nm (74 ftlb.)**

   Level sensor to lower trailing arm: **Tightening torque 9 Nm (6.5 ftlb.)**

WM 420855 REPLACING REAR-AXLE BEARINGS (MACAN S, MACAN TURBO) > GENERAL INFORMATION

Information

- If a rubber/metal mount is defective, the rubber-metal mount on the opposite side must also be replaced.
- Check the other bearings before replacing a defective rubber/metal mount.
- If you see cracks, oil leaks or other damage, these rubber-metal mounts must also be replaced.

WM 420855 REPLACING REAR-AXLE BEARINGS (MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .

2. Remove wheels → 440519 REMOVING AND INSTALLING WHEEL .
3. Remove cover for underbody at the sides → 519319 REMOVING AND INSTALLING COVER FOR CENTER UNDERBODY .
4. Remove rear coil springs/air springs → 427219 REMOVING AND INSTALLING REAR COIL SPRING → 434319 REMOVING AND INSTALLING REAR AIR SPRING .

WM 420855 REPLACING REAR-AXLE BEARINGS (MACAN S, MACAN TURBO) > REPLACING REAR-AXLE BEARINGS

WARNING: Preloaded or pressurized components

- *Risk of squashing or bruising*

→ Do not reach into the danger area.

→ Relieve the tension on components before starting work.

→ Secure components to prevent them from loosening suddenly.

CAUTION: Heavy components

- *Risk of squashing*

→ Wear personal protective gear.

→ Get someone to help if necessary.

Information

- To replace the rubber-metal mounts, the rear axle housing must be lowered at the front or rear. There is no need to remove the rear axle housing.
- Lower the rear axle housing alternately at the front or rear. This can eliminate the need for wheel alignment.
- The rear axle housing must not be lowered by more than 4 cm.
- Before removing the rubber-metal mounts, mark their installation position with respect to the rear axle housing.

Replacing front bearing:

Information

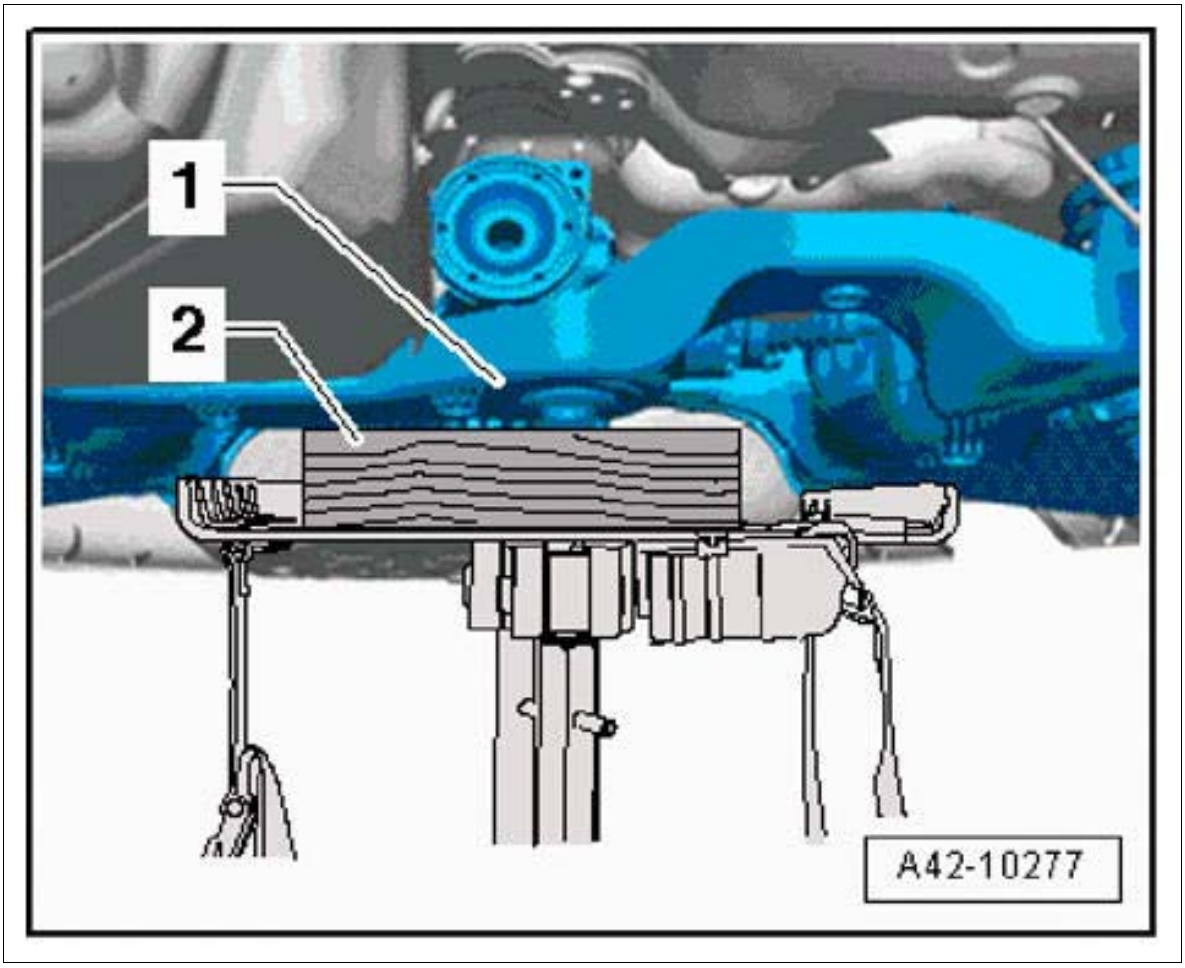
The following tools are required for replacing the front bearing:

- Assembly fixture T10263

- Assembly fixture T40185
- Assembly fixture T40033
- Hydraulic cylinder WE 1284

1. **Transmission jack WE 1082** must be positioned under the rear axle housing **-1-** with a suitable piece of wood **-2-** underneath.

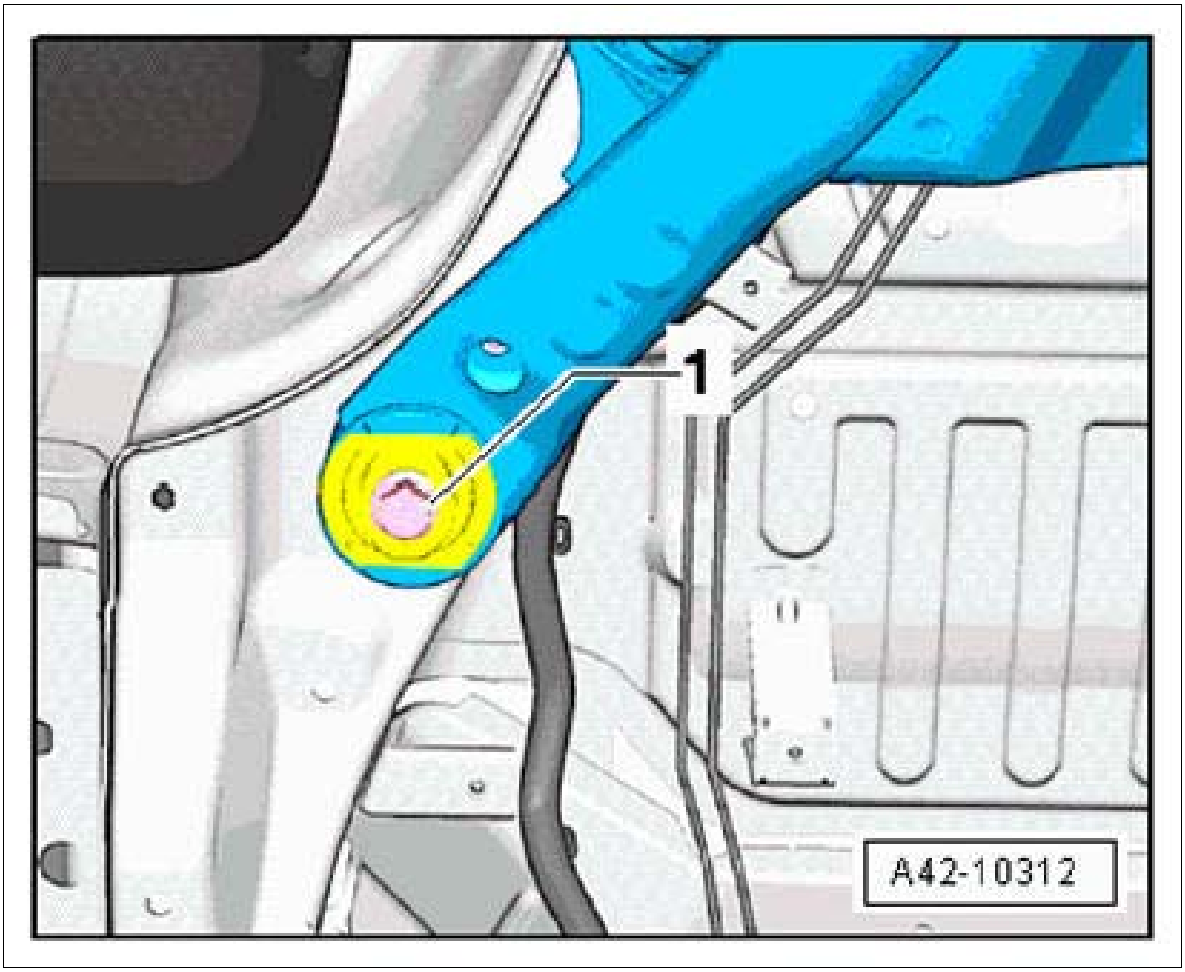
   Fig 1: Supporting Rear Axle Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Unscrew fastening screws **-1-** on both sides of the vehicle.

Fig 2: Identifying Rear Axle Housing Mounting Screws - Front



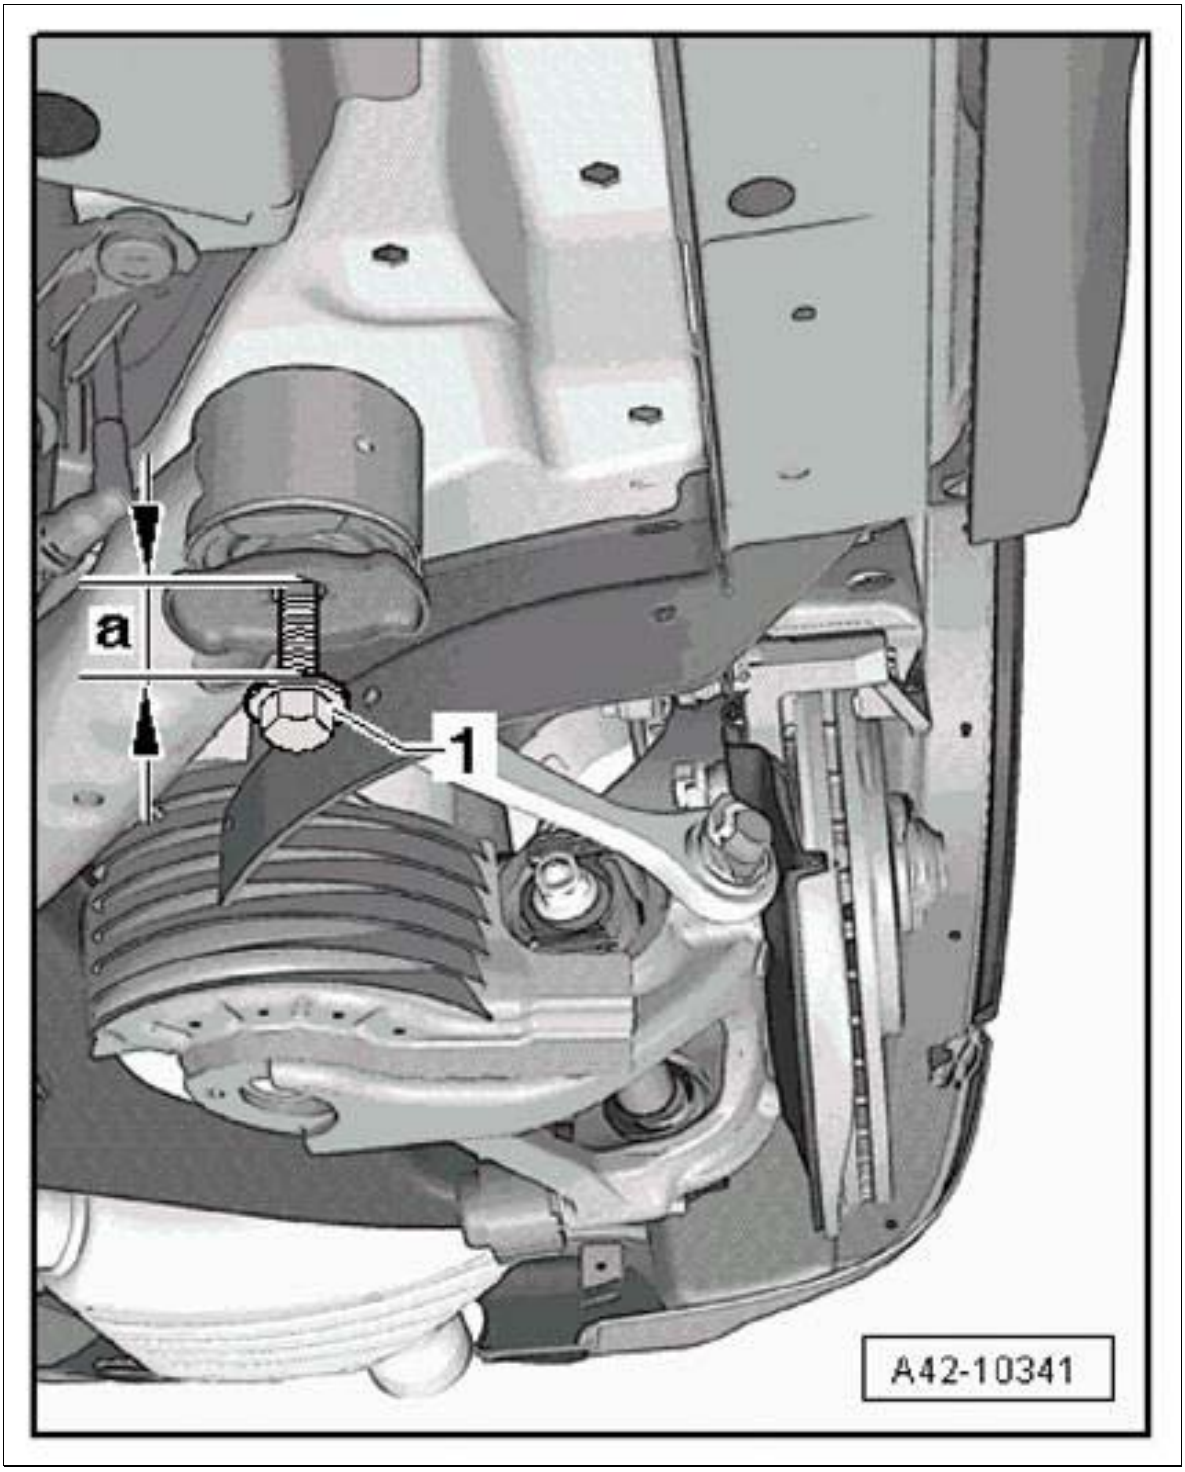
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Screw in fastening screw until dimension a = → **Control value: 4 cm** is reached.

3. Screw the fastening screw **-1-** you removed earlier into the body on the opposite side of the bearing to be replaced.

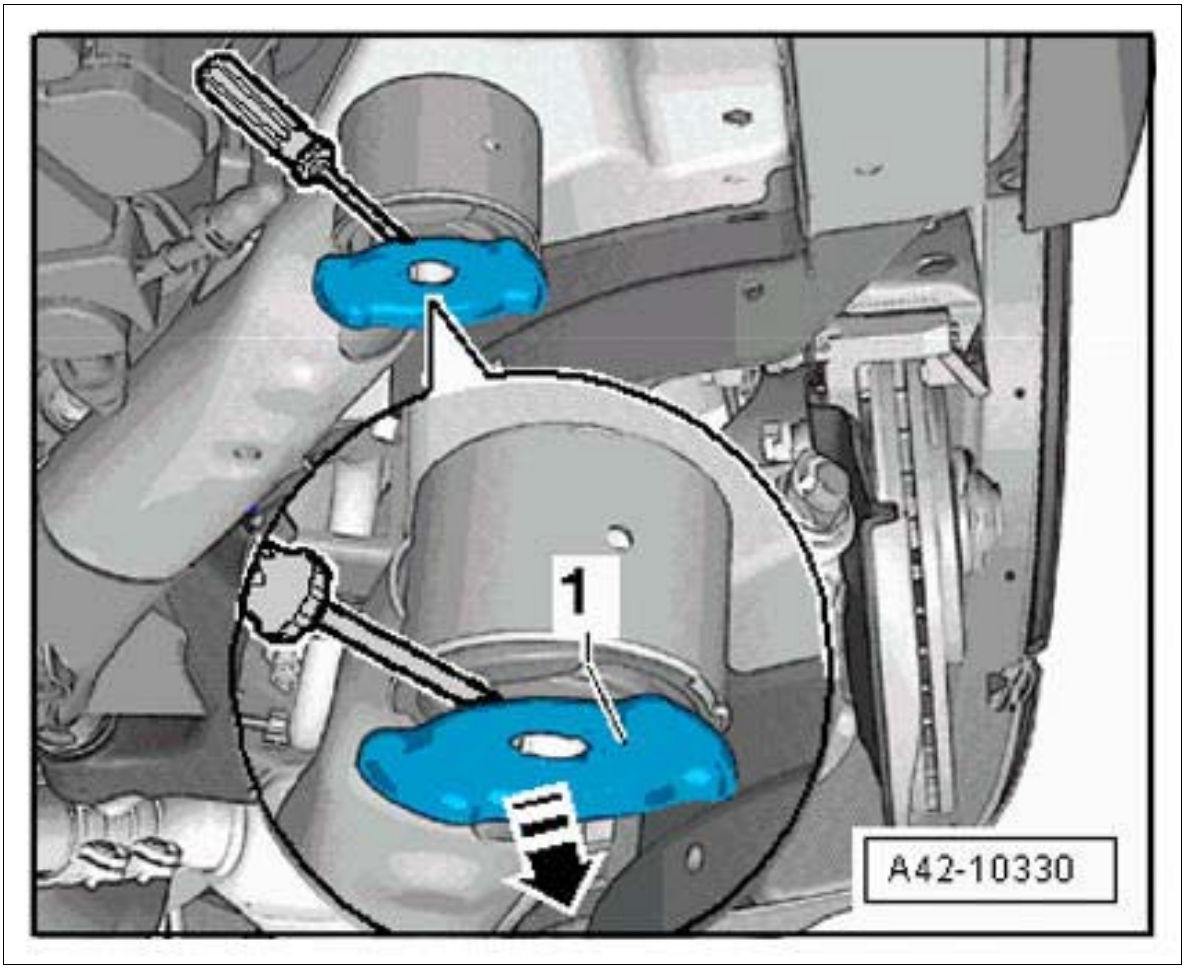
Fig 3: Identifying Rear Axle Housing Mounting Screw At Dimension -A-



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Lower the rear axle housing.
5. Lever off the twist lock **-1-** close to the retaining lugs alternately on both sides of the bearing using a screwdriver.

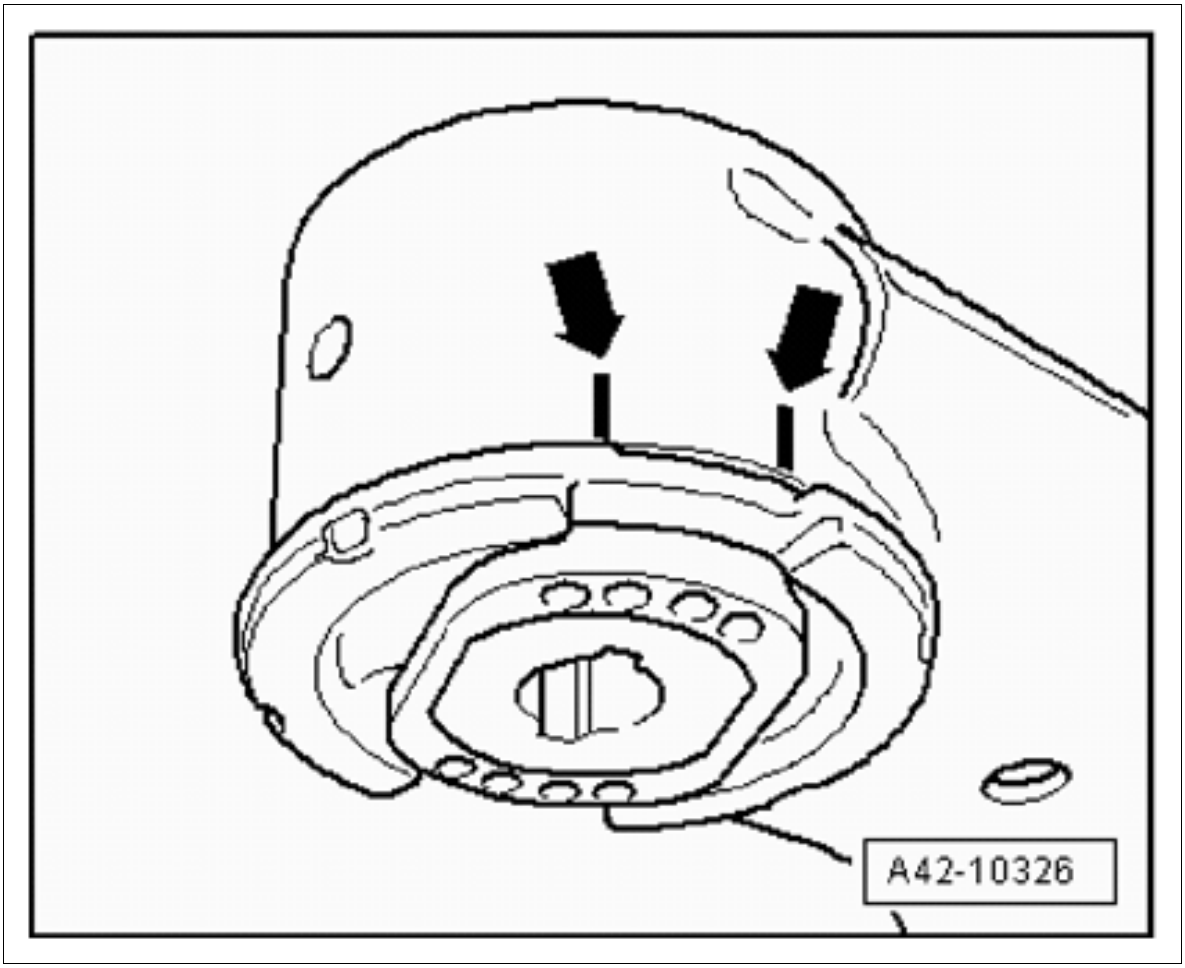
Fig 4: Removing Rear Axle Housing Twist Lock



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Mark the installation position of the bearing with respect to the rear axle housing **-arrows-** . Use the ends of the rubber bead on the bearing as a guide.

Fig 5: Locating Bearing Installation Position Mark



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

As soon as the bearing is pressed out, the device falls down.

A second person must therefore hold the device tightly while pressing out bearings on the hydraulic cylinder.

7. Press out front bearing.

   To do this, fit tools on the bearing as shown → Arrangement of tools for pressing out front bearing .

   1. Nut **T10263/5**
   2. Pressure piece **T40185/5** (cut-out is facing the bearing)
   3. Rear axle housing
   4. Support ring **T40185/6** (conical side is facing upwards, bars must engage in the cut-outs on the bearing)
   5. Pipe **T40033/3**

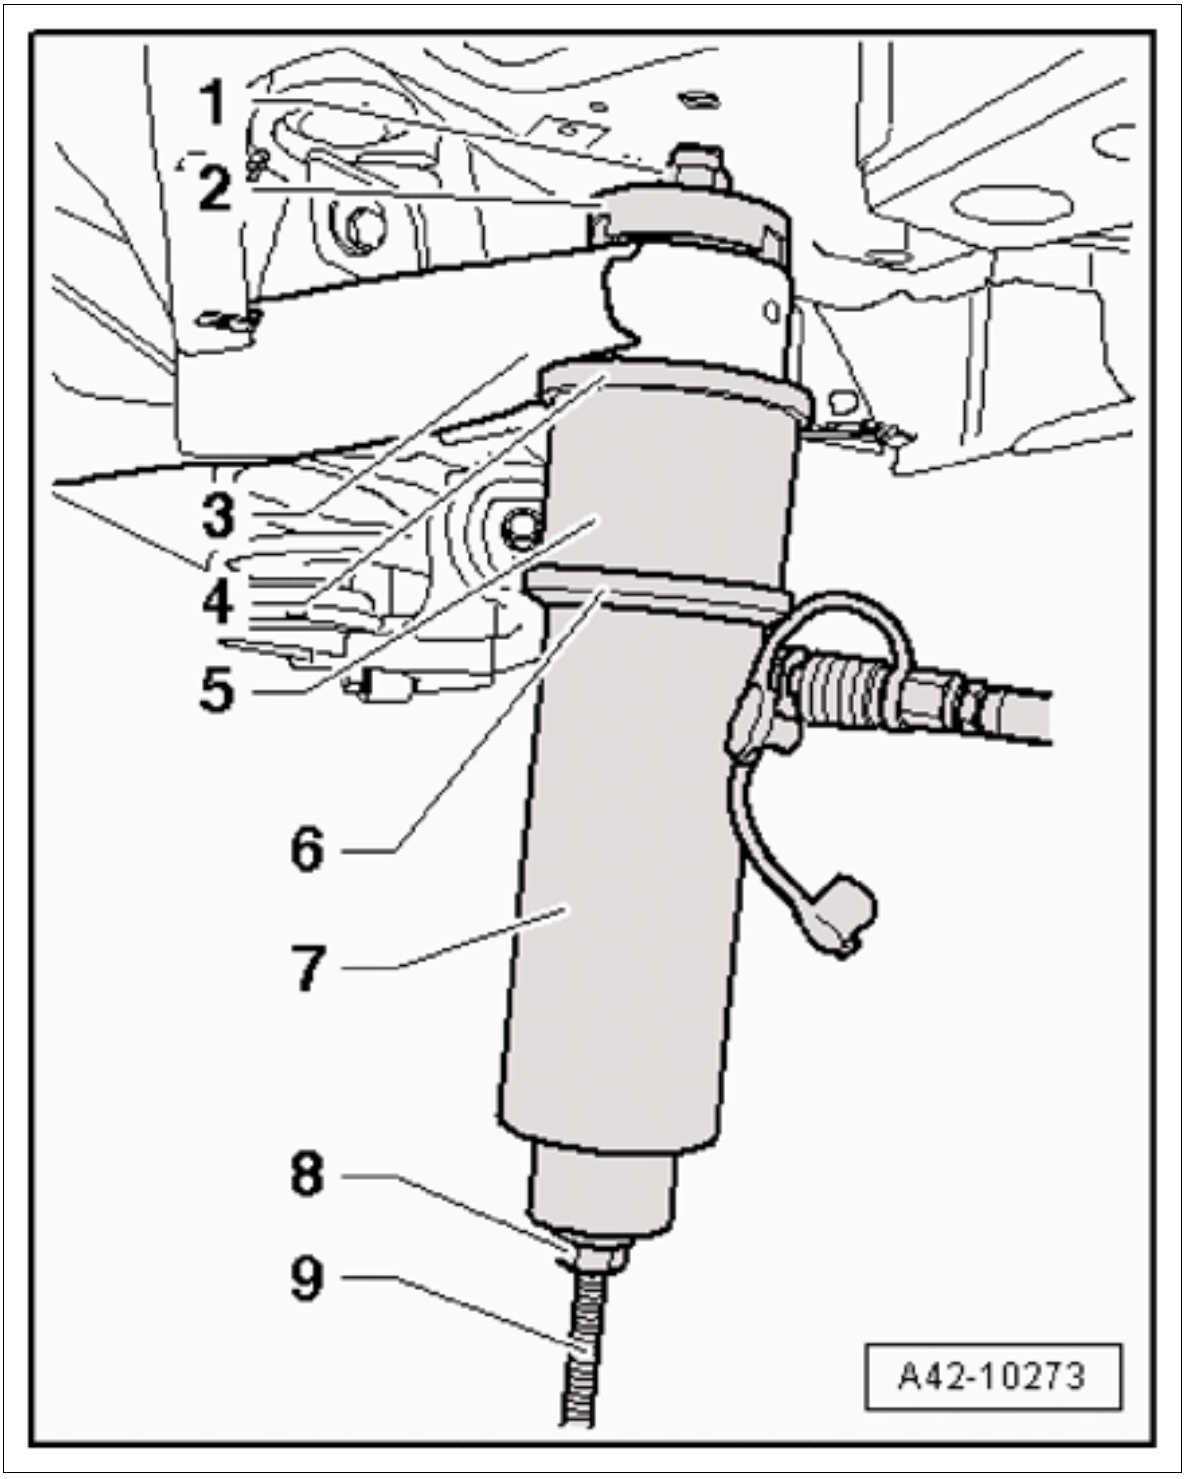
6. Pressure piece **T40033/4**

7. Hydraulic cylinder **VAS 6178**

8. Nut **T10263/5**

9. Spindle **T10263/4** (pin of the spindle pointing downwards)

Fig 6: Pressing Front Bearing

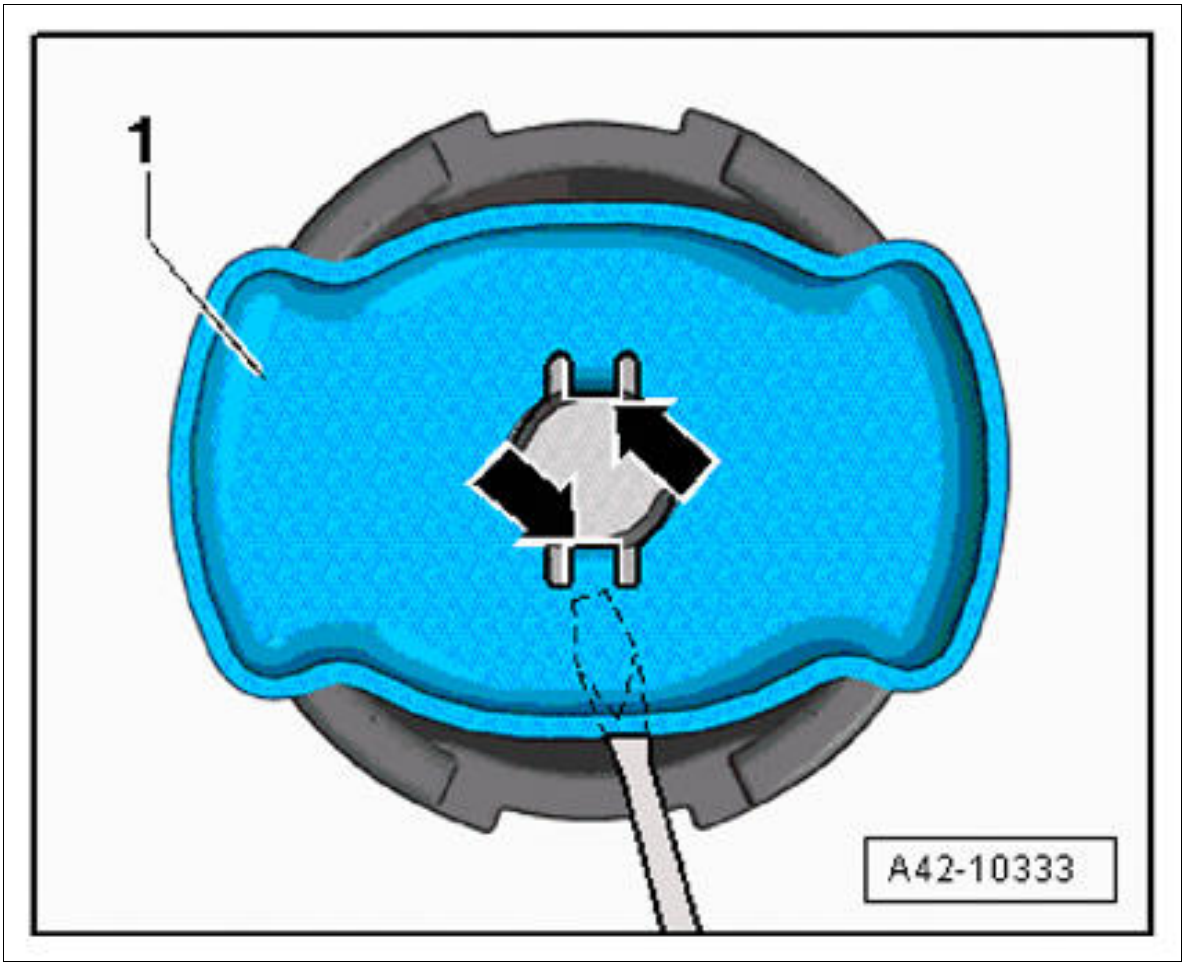


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Lever off the twist lock **-1-** close to the retaining lugs **-arrows-** alternately on both sides of the

bearing using a screwdriver.

Fig 7: Removing Twist Lock



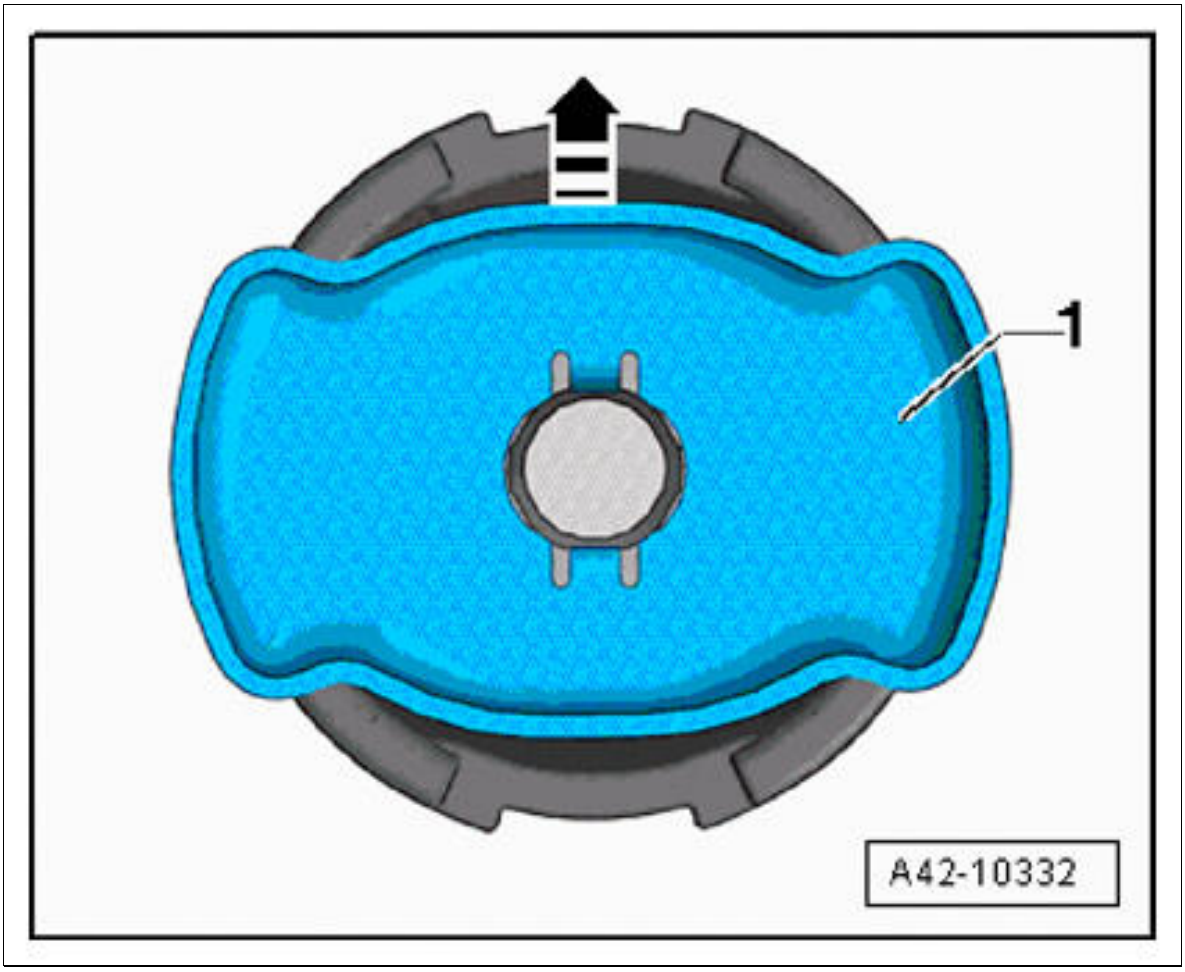
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Installation position of front bearing

Twist lock **-1-** is at an angle to the direction of travel. **-arrow-** indicates direction of travel.

Fig 8: Aligning Twist Lock



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The following must also be observed:

1. Align bearing with the applied markings before pressing it in.
2. Press bearing in until the collar is positioned loosely at the bush of the rear axle housing.
3. The ends of the rubber beads on the bearing must match the markings on the rear axle housing.

Information

Align the pressure piece **T40185/3** on the bearing as shown **-Illustration-** .

Fig 9: Identifying Pressure Piece (T40185/3)

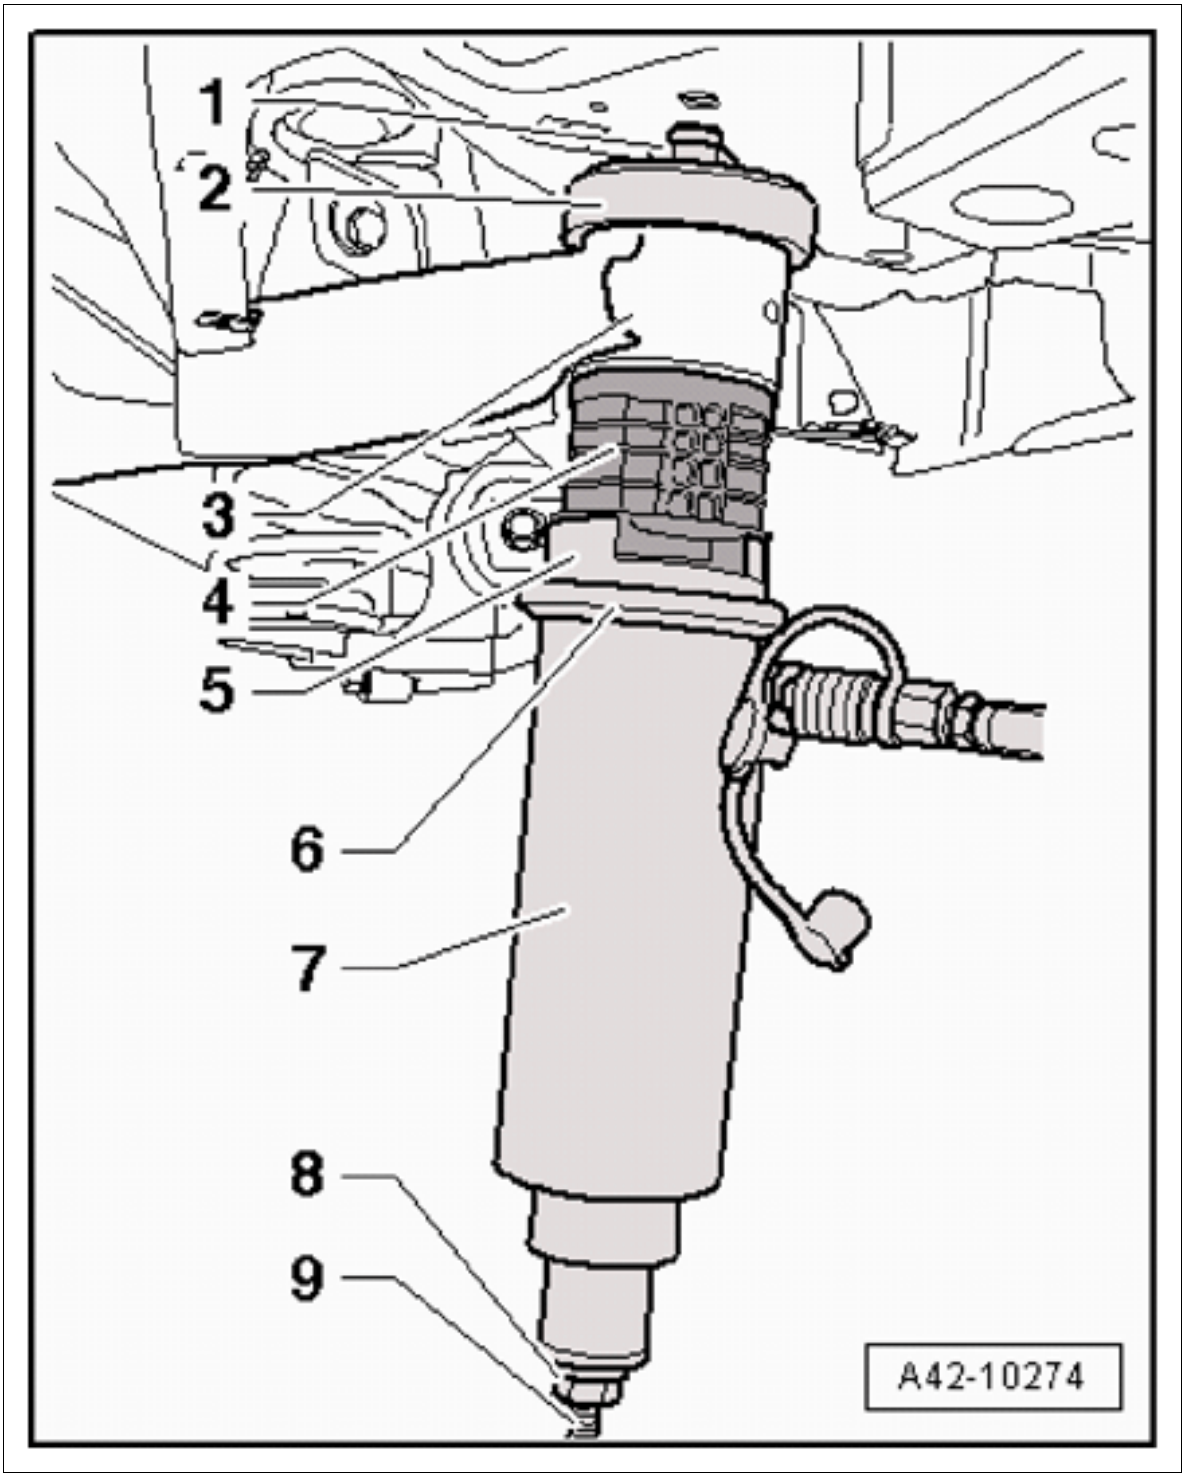
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Press in front bearing.

   To do this, fit tools on the bearing as shown → Arrangement of tools for pressing in front bearing .

   1. Nut **T10263/5**
   2. Pressure piece **T40185/4**
   3. Rear axle housing
   4. Bearing
   5. Pressure piece **T40185/3**
   6. Hydraulic cylinder **VAS 6178**
   7. Nut **T10263/5**
   8. Spindle **T10263/4** (pin of the spindle pointing downwards)

Fig 10: Pressing Front Bearing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

10. Fit twist lock on the bearing.
11. Further installation is performed in reverse order.

    Tightening torque for rear axle housing at front to body: **Initial tightening 115 Nm (85 ftlb.) Final tightening +90°**

Replacing rear bearing:

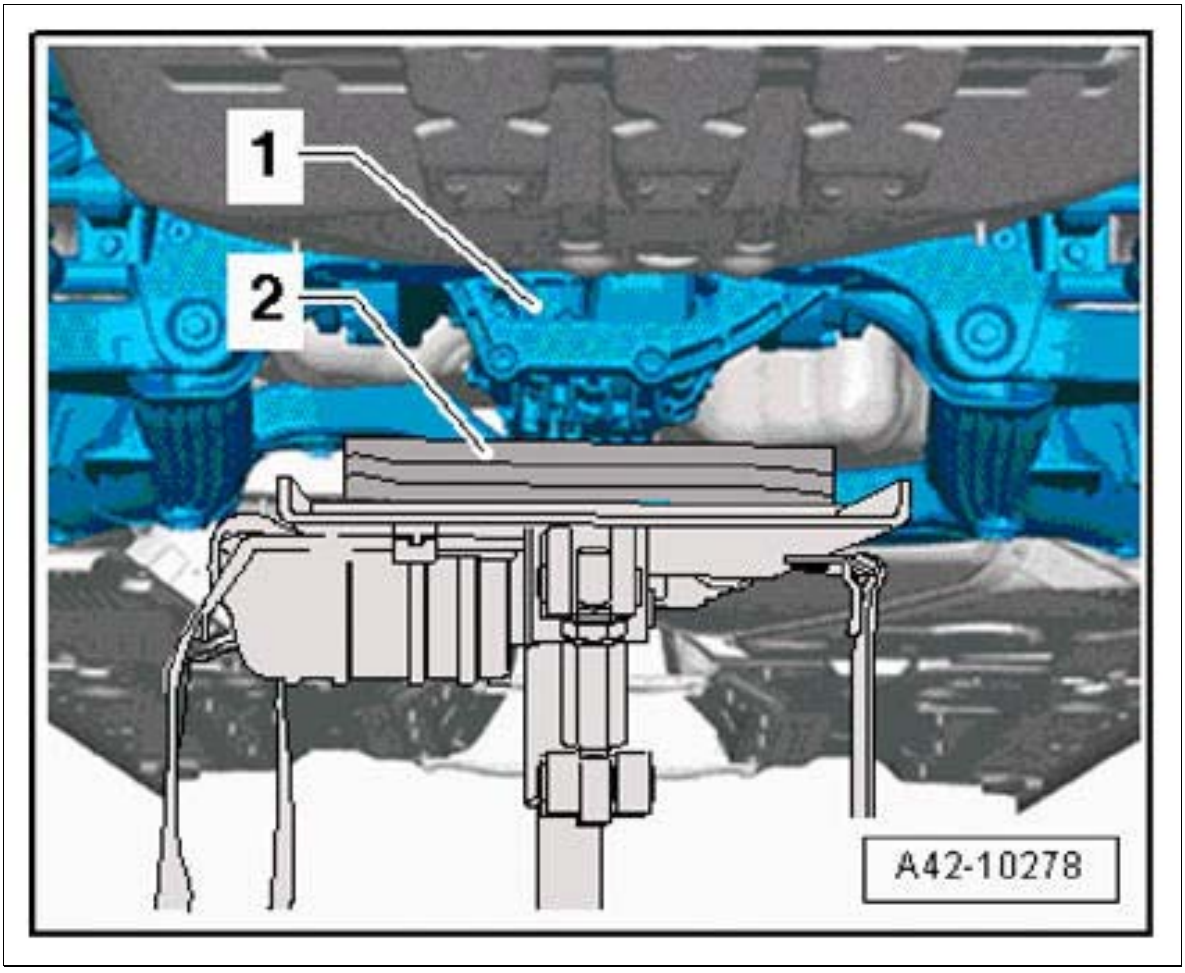
Information

The following tools are required for replacing the rear bearing:

- Assembly fixture T10263
- Assembly fixture T40185
- Assembly fixture T40033
- Hydraulic cylinder WE 1284
- Assembly fixture 3301
- Assembly fixture 3346

1. **Transmission jack WE 1082** must be positioned under the rear axle housing **-1-** with a suitable piece of wood **-2-** underneath.

   Fig 11: Supporting Rear Axle Housing

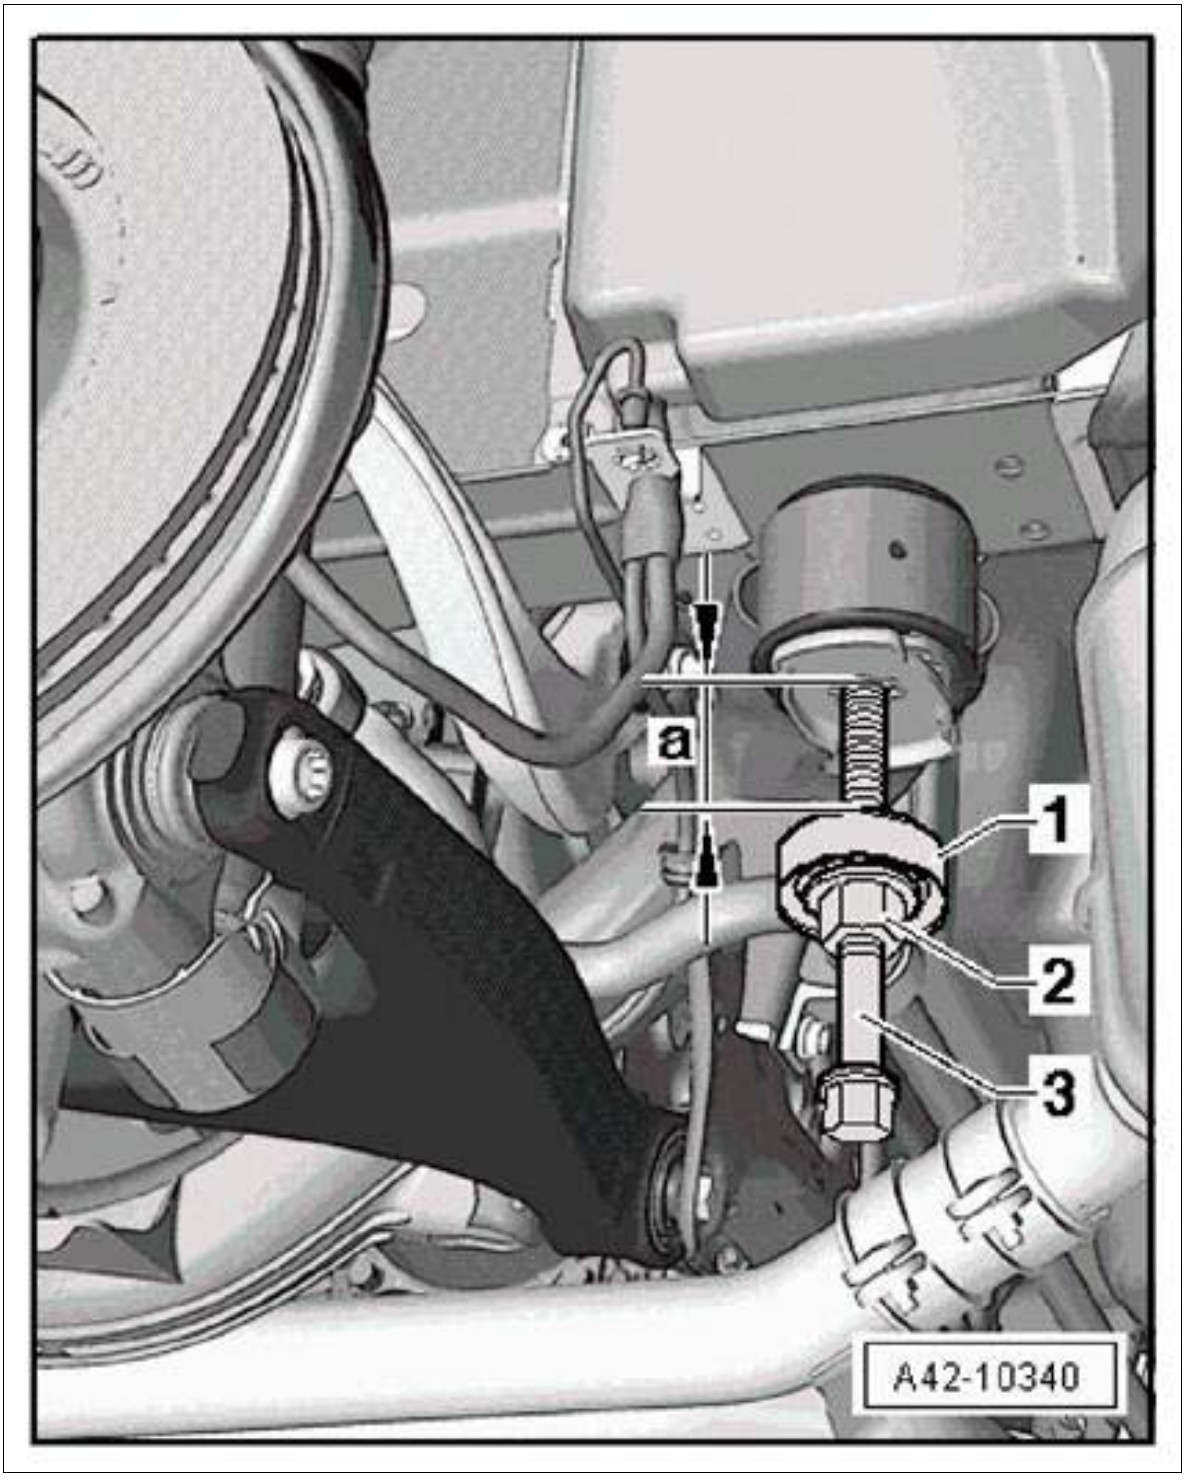


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Unscrew fastening screws at the rear of the rear axle housing.
3. Screw spindle **3346/2** with assembly tool **3301** and nut **3346/3** on the opposite side of the bearing to be replaced approx. 1.5 cm into the body.

1. Assembly tool **3301**
2. Nut **3346/3**
3. Spindle **3346/2**

Fig 12: Identifying Assembly Tool Dimension



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

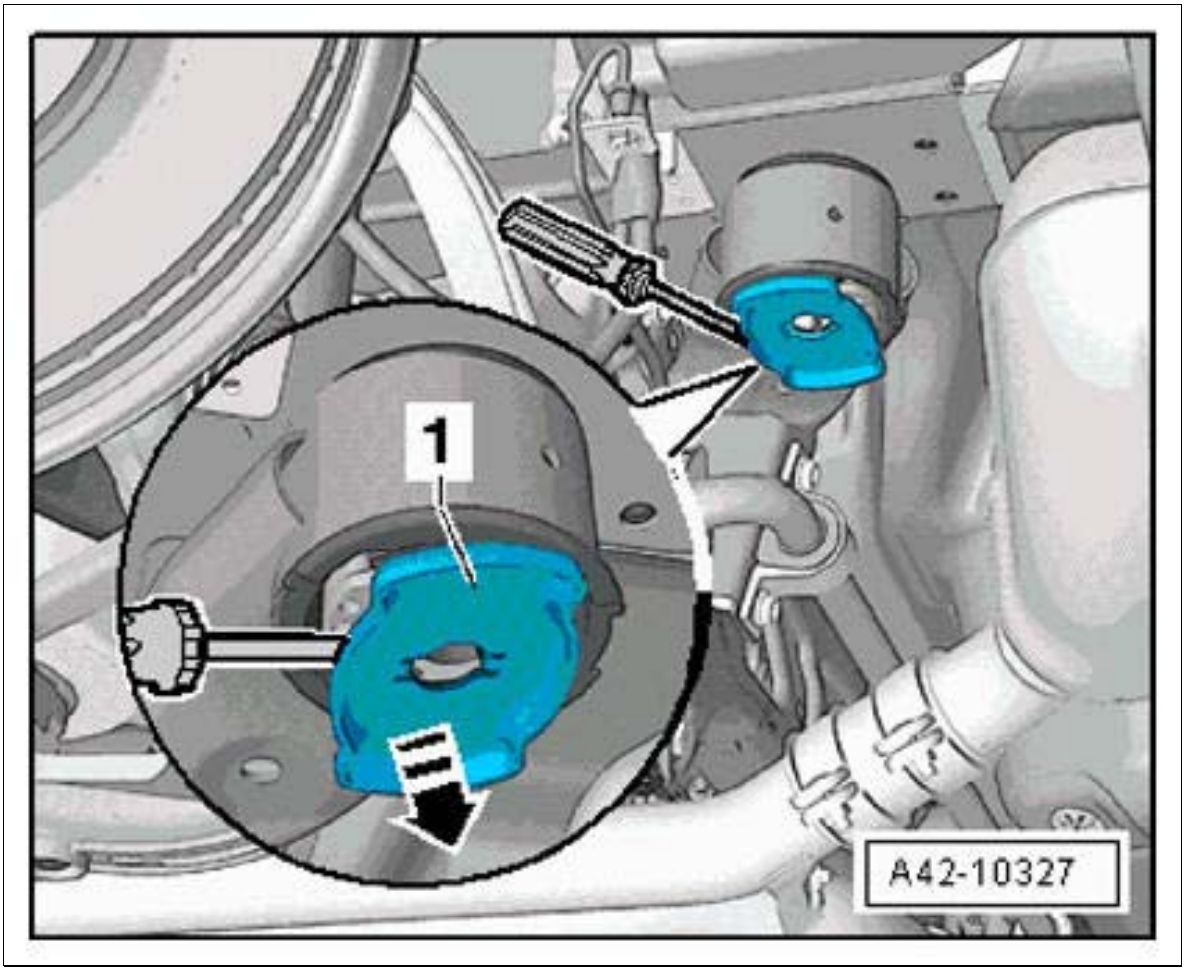
Information

Screw nut **3346/3** onto the spindle **3346/2** until dimension **a = → Control value: 4 cm** is

reached.

4. Lower the rear axle housing.
5. Lever off the twist lock **-1-** close to the retaining lugs alternately on both sides of the bearing using a screwdriver.

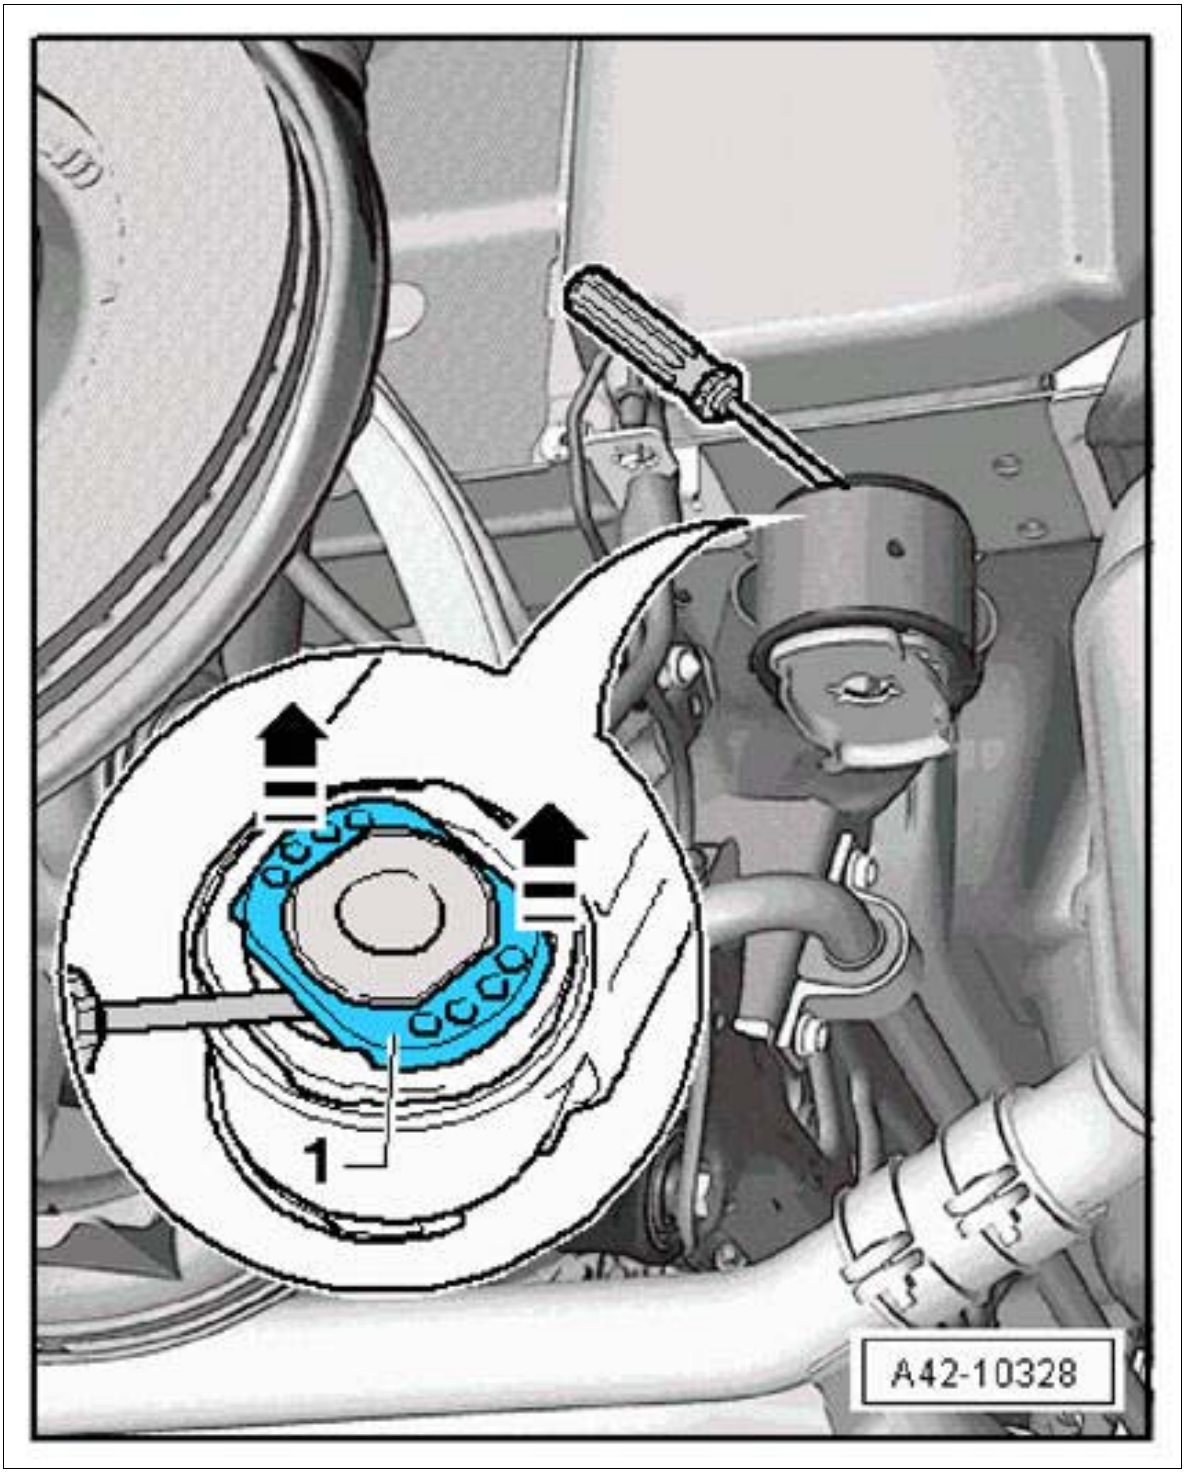
   Fig 13: Removing Rear Axle Housing Twist Lock



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Pull plastic insert **-1-** up and out.

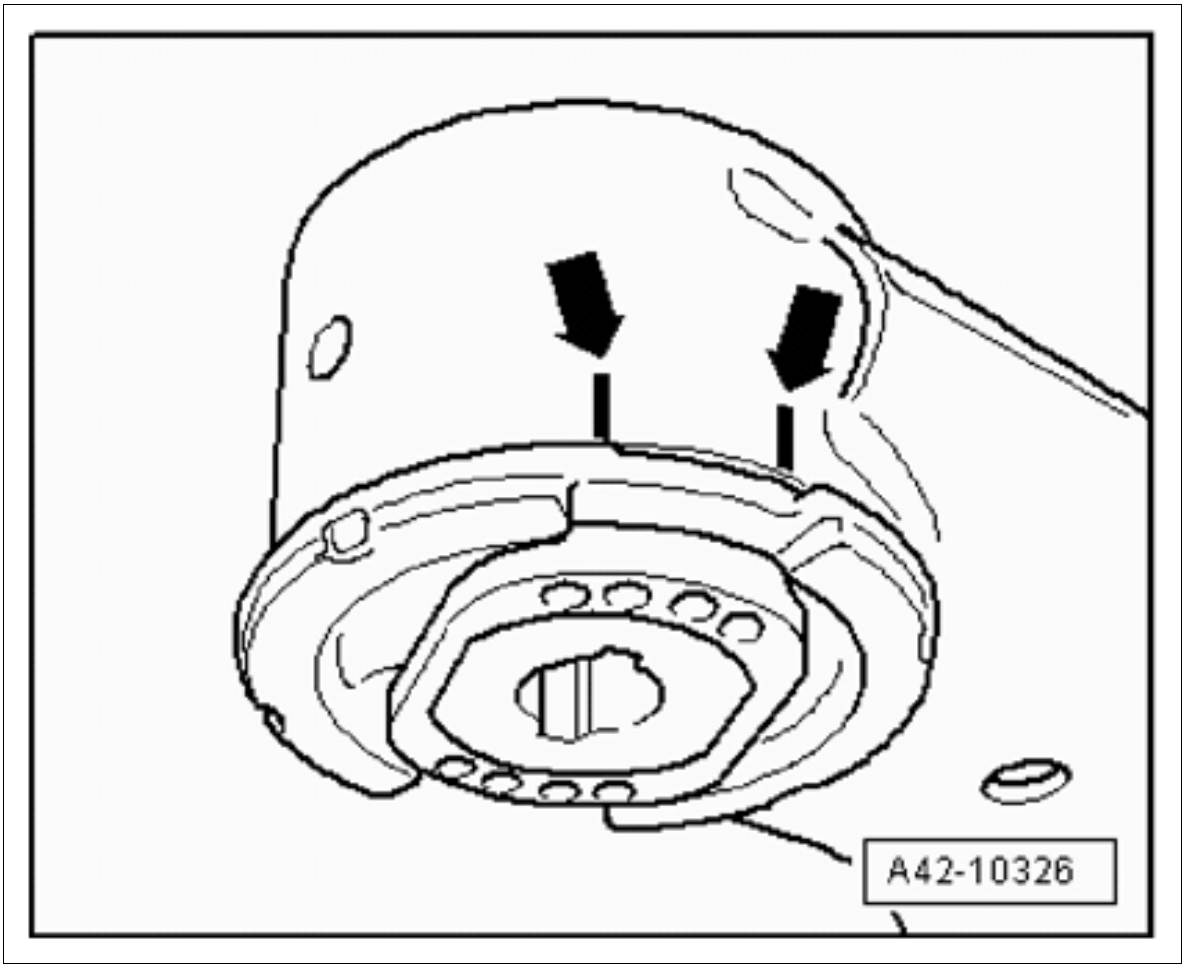
Fig 14: Pulling Plastic Insert



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Mark the installation position of the bearing with respect to the rear axle housing **-arrows-** . Use the ends of the rubber bead on the bearing as a guide.

Fig 15: Locating Rear Axle Housing Installation Position Mark



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

As soon as the bearing is pressed out, the device falls down.

A second person must therefore hold the device tightly while pressing out bearings on the hydraulic cylinder.

8. Press out rear bearing.

   To do this, fit tools on the bearing as shown → Arrangement of tools for pressing out rear bearing .

   1. Nut **T10263/5**
   2. Pressure piece **T40185/5** (cut-out is facing the bearing)
   3. Rear axle housing
   4. Support ring **T40185/6** (conical side is facing upwards, bars must engage in the cut-outs on the bearing)

WARNING: Mechanical, hydraulic or pneumatic press

- *Risk of squashing*

→ Read specific safety information for the press.

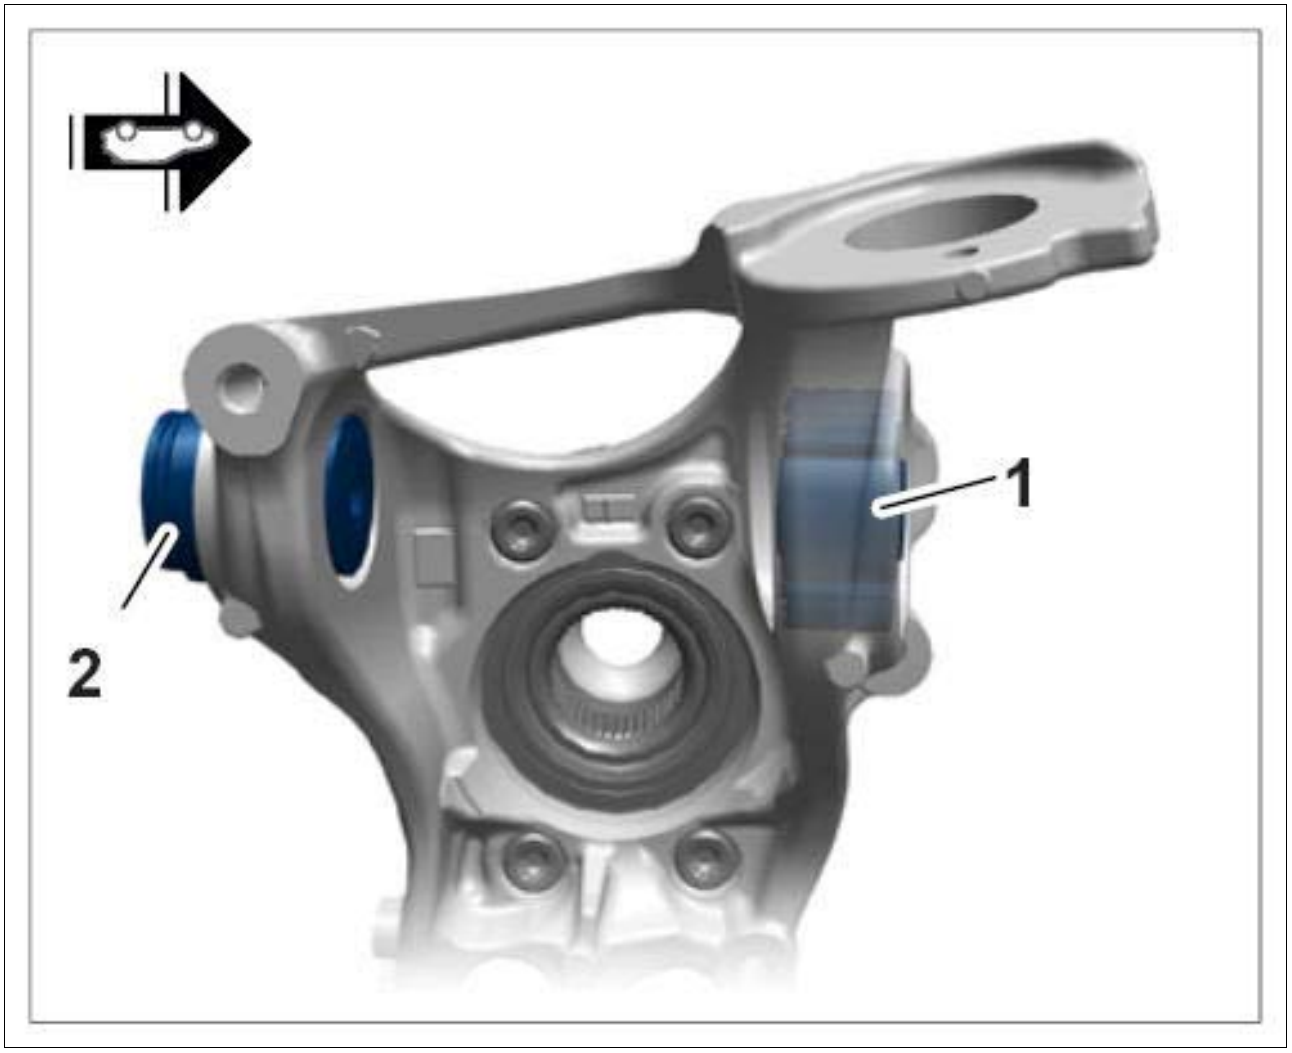
→ Check that the press is working perfectly before use, particularly the safety components.

The **assembly tool T40184** as well as the **pressure plate VW 401** and **pressure plate VW 402** are required in order to replace the bearing.

1. Bearing can be replaced.

2. Bearing cannot be replaced. Replace the wheel bearing housing if it is damaged → 425219 REMOVING AND INSTALLING REAR WHEEL BEARING HOUSING .

Fig 1: Identifying Rear Wheel Bearing Housing

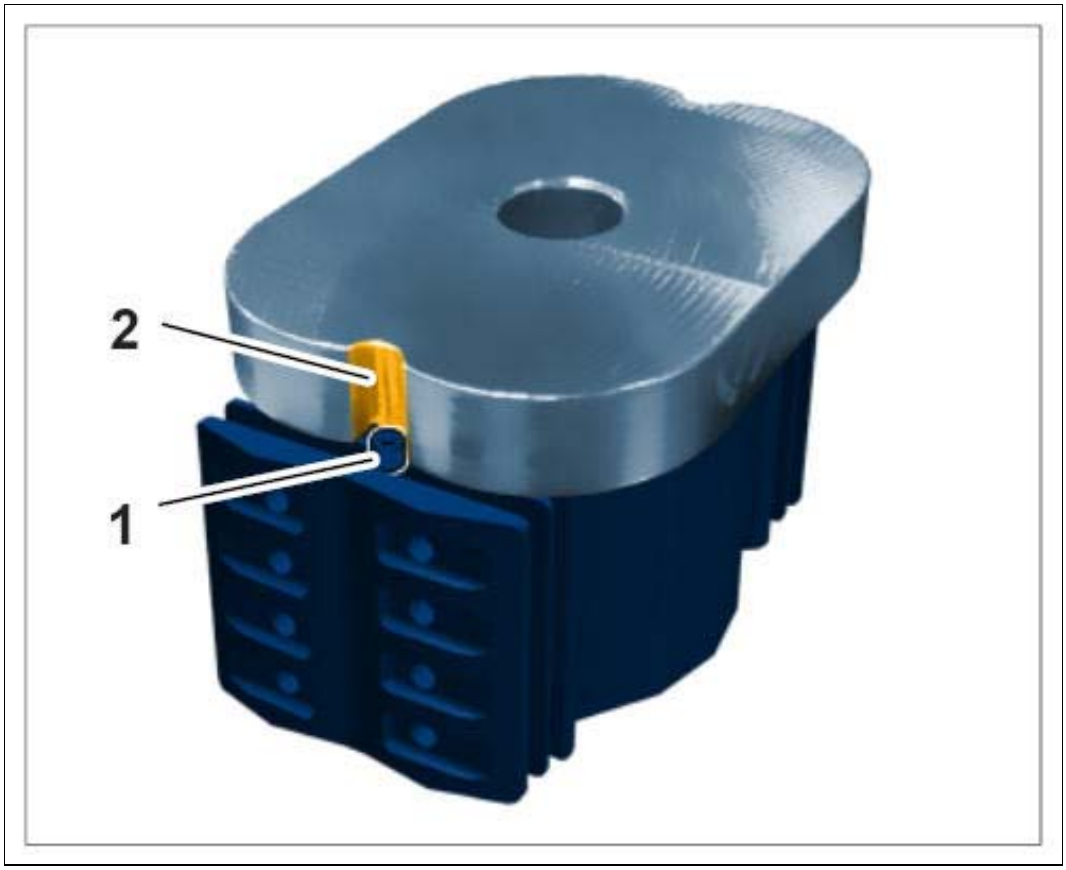


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Press out bearing **-1-** .

    1. 1.1. Fit pressure plate **T40184/2** on the bearing in such a way that the nubs **-1-** engage in the grooves **-2-** .

Fig 2: Identifying Pressure Plate And Groove

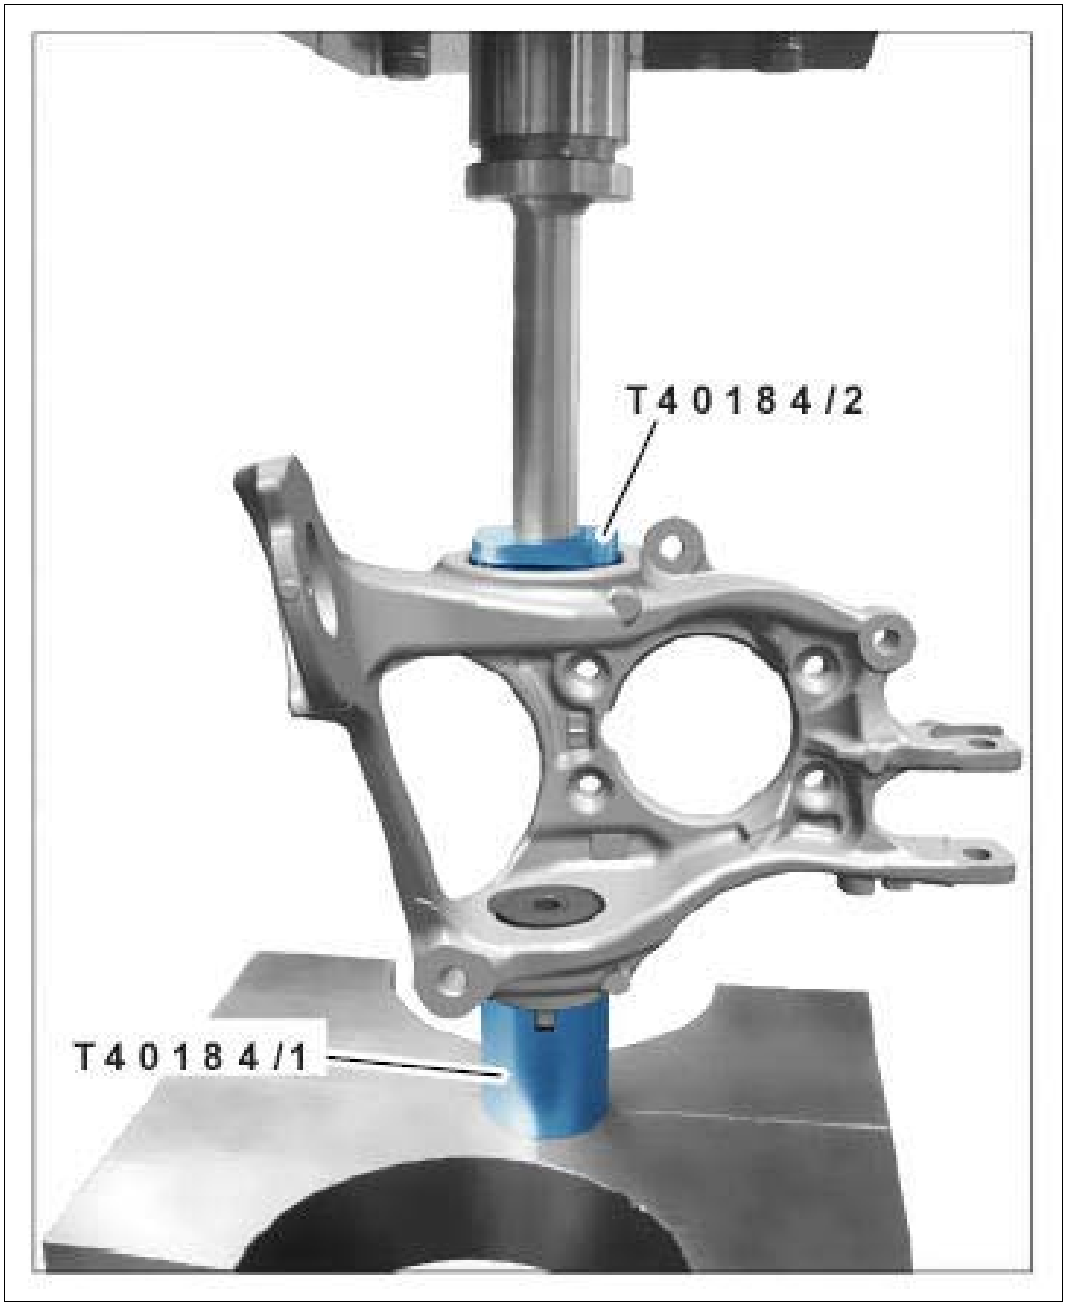


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 1.2. Use pressure pieces as follows → Arrangement of tools for pressing out bearings .

> *IMPORTANT: Bearing is tensioned when pressing it off!*

Fig 3: Pressing Bearings Into Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Press in new bearing **-1-** .

Information

The bearing is pre-tensioned by pressing in the pressure piece **T40184/3** (inner wall of the pressure piece is conical). This is necessary so that the bearing can be pressed into the bearing sleeve.

1. 2.1. Press bearing into pressure piece **T40184/3** .

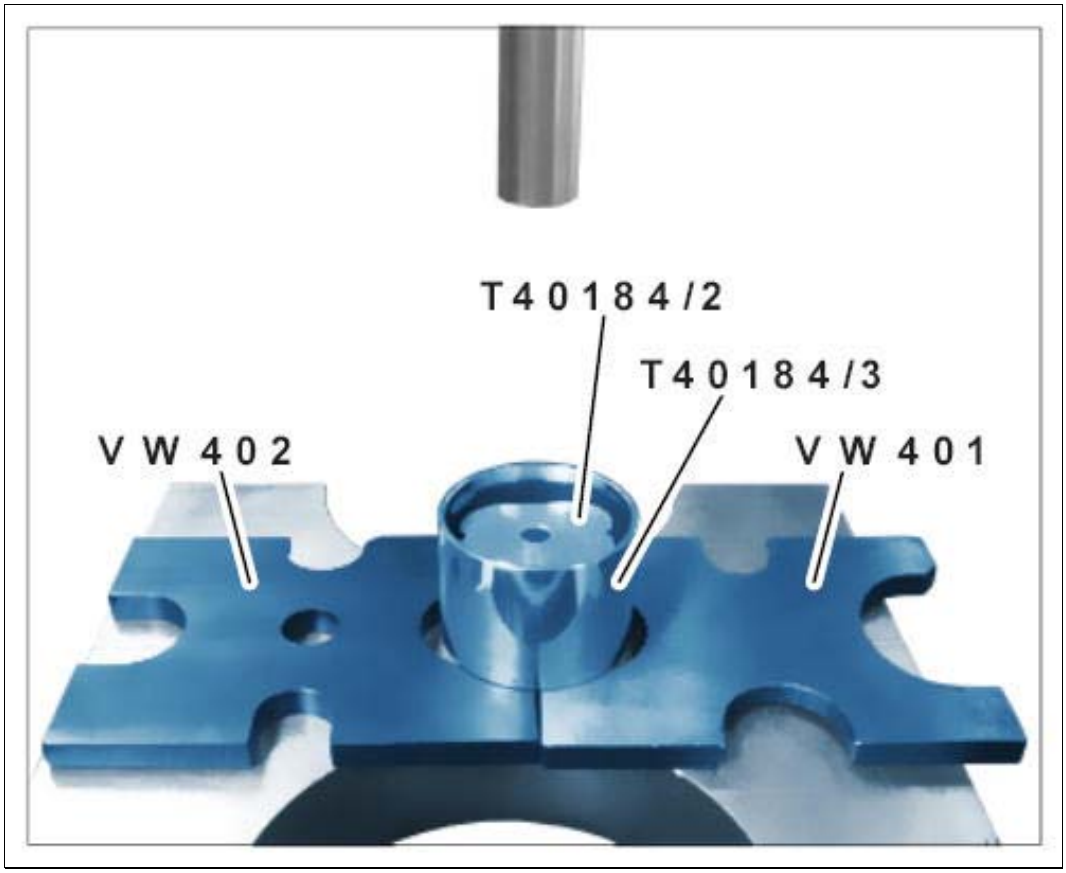
IMPORTANT: The nubs of the bearing and the thin collar of the

pressure piece must be facing upwards when pushing in the bearing!

Use pressure pieces as follows → Pressing bearing into pressure piece .

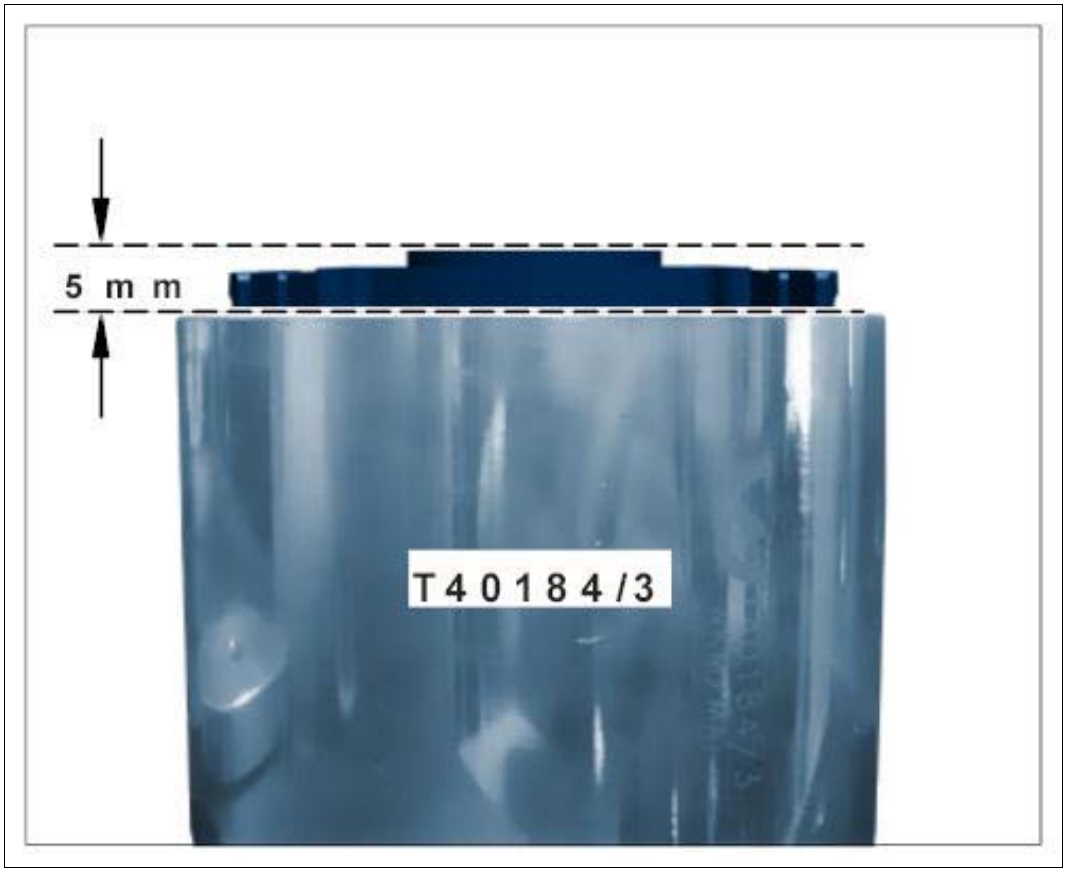
Press in the bearing until it protrudes by approx. 5 mm on the other side of the pressure piece → Dimension for pressing in bearing .

Fig 4: Pressing Bearing Into Pressure Piece



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 5: Identifying Bearing Dimension

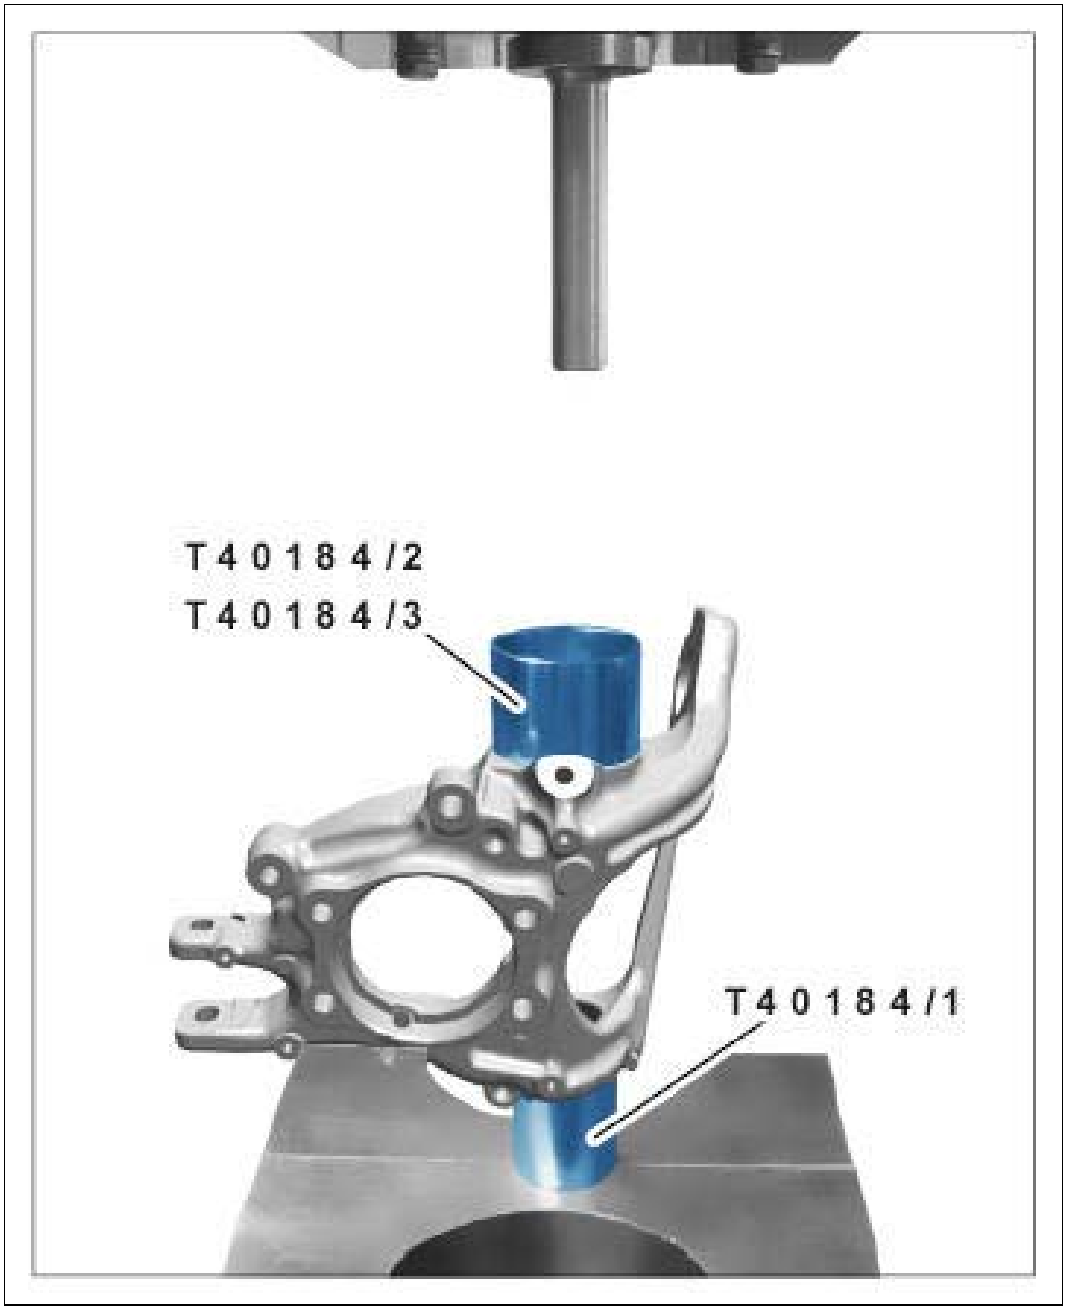


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 2.2. Fit bearing on the wheel bearing housing using pressure piece **T40184/3** (bearing is facing downwards). Check installation position of the bearing.

   Use pressure pieces as follows: (Pressure piece **T40184/2** is not visible here) → Arrangement of tools for pressing in bearings

Fig 6: Pressing Bearings



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Press in bearing until it is flush with the edge **-arrow-** .

Fig 7: Locating Bearing Installation Position

3. Install wheel bearing housing. → INSTALLING REAR WHEEL BEARING HOUSING

WM 422119 REMOVING AND INSTALLING REAR DRIVE SHAFT (MACAN, MACAN S, MACAN TURBO) > TOOLS

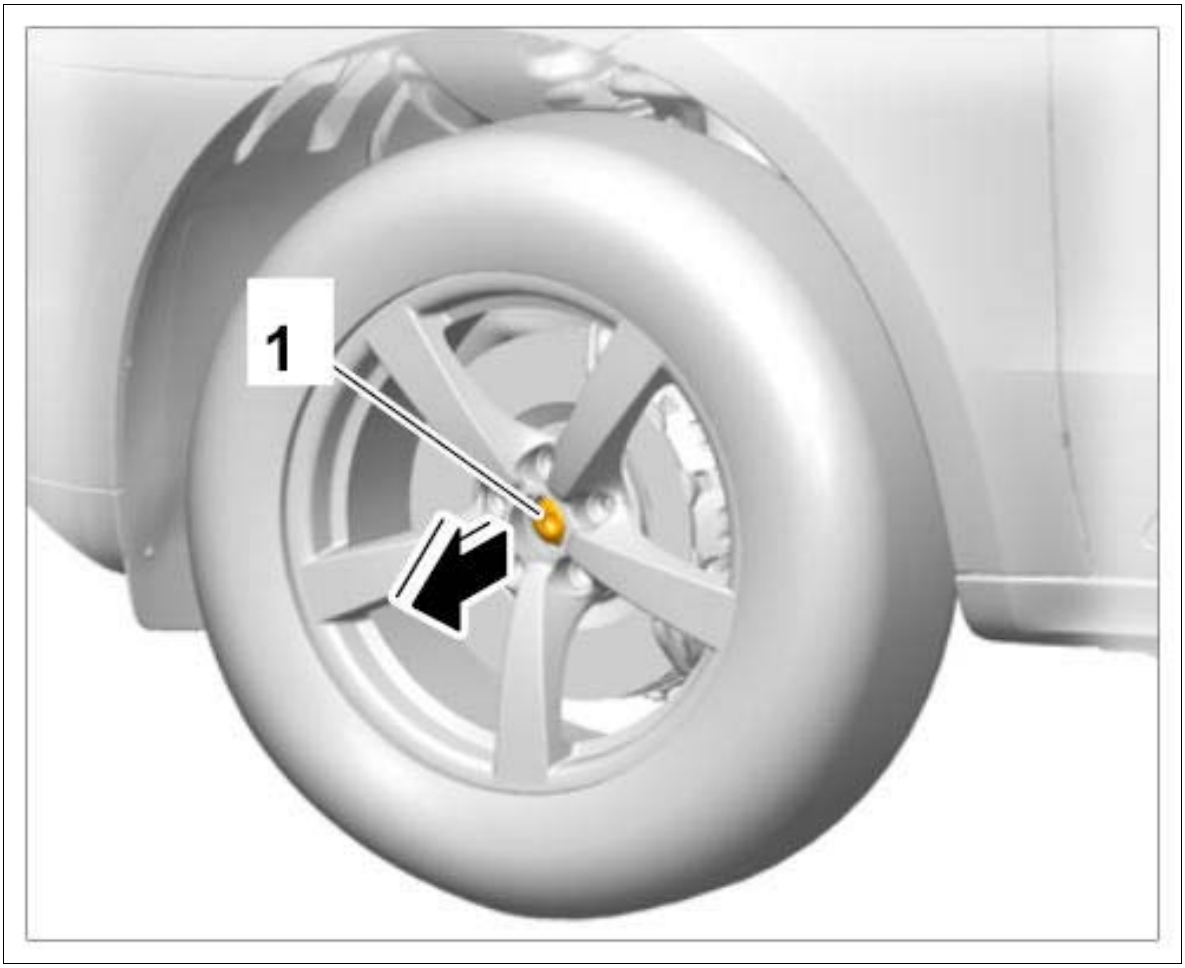
Designation	Type	Number	Description	
puller hook	Special tool	9229/1		
WM 422119 REMOVING AND INSTALLING REAR DRIVE SHAFT (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Drive shaft to wheel hub	Step 1 (wheels suspended in mid-air, operate brakes while tightening)/M16 x 72 thread/always use new screws or bolts following removal	Initial tightening	200 Nm (148 ftlb.)		
Drive shaft to wheel hub	Step 2 (wheels on the ground)/M16 x 72 thread/always use new screws or bolts following removal	Final tightening	180°		

WM 422119 REMOVING AND INSTALLING REAR DRIVE SHAFT (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove the relevant hub cap using **puller hook 9229/1** and loosen axle bolt **-1-** before raising the vehicle. Operate the brake while doing this (2 mechanics required).

Fig 1: Removing Axle Bolt

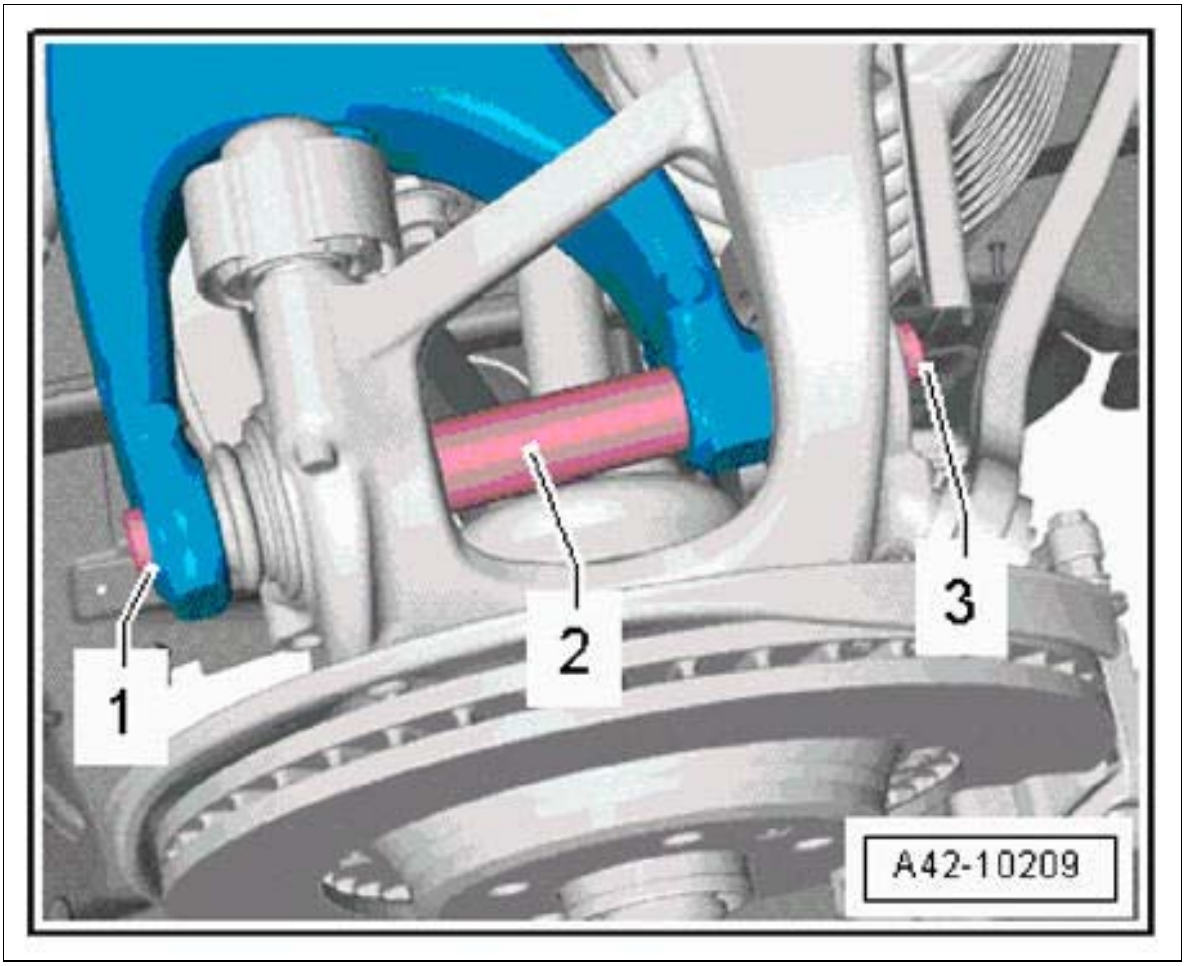


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .
3. Remove wheel → 440519 REMOVING AND INSTALLING WHEEL .
4. Disconnect all threaded connections on the wheel bearing housing as described in → 425219 REMOVING AND INSTALLING REAR WHEEL BEARING HOUSING .

   Only loosen nut **-3-** on the threaded joint from the lower trailing arm to the wheel bearing housing, do not unscrew fully.

Fig 2: Identifying Wheel Bearing Housing Trailing Arm Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

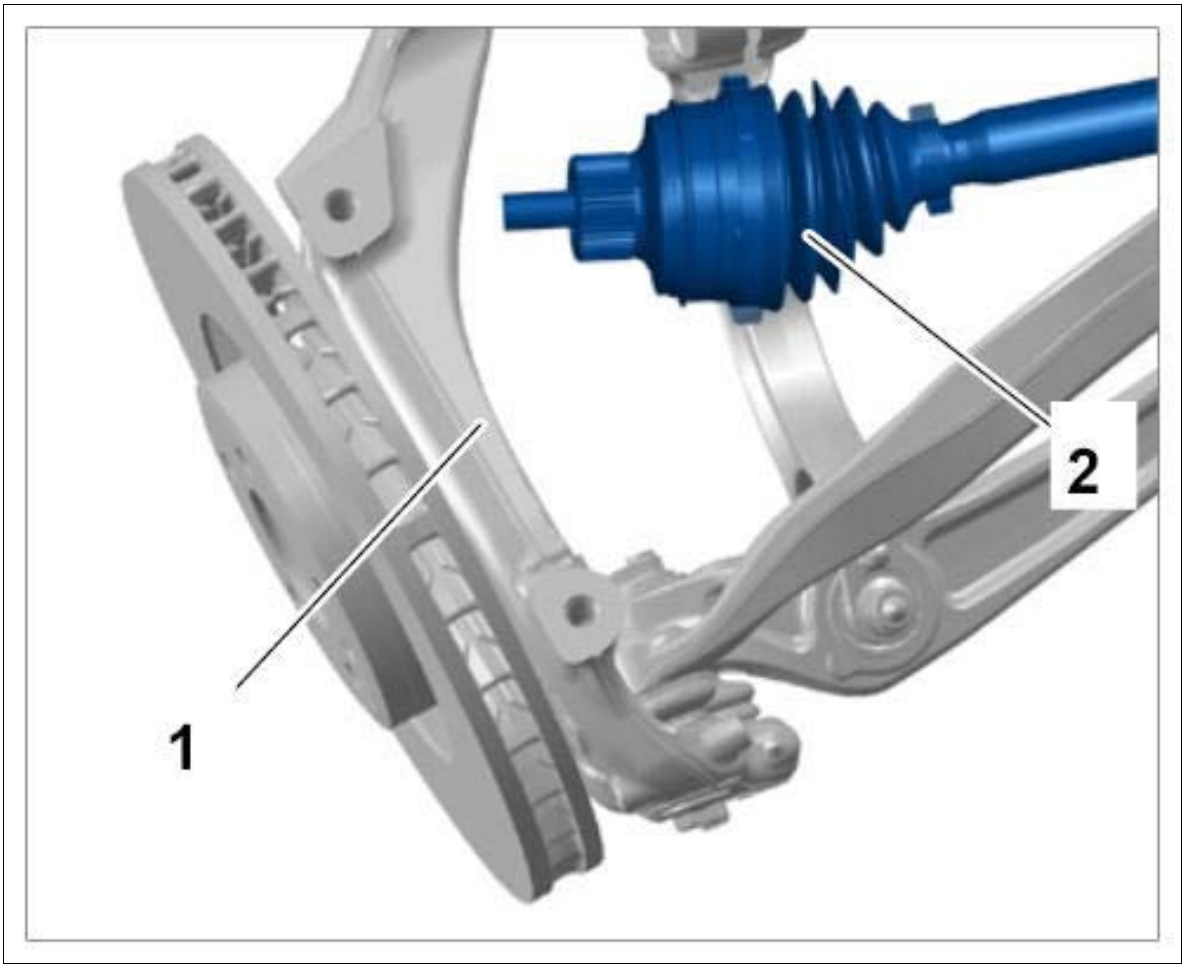
WM 422119 REMOVING AND INSTALLING REAR DRIVE SHAFT (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING REAR DRIVE SHAFT > REMOVING REAR DRIVE SHAFT

Information

Drive shafts must not be left hanging from the joint stop! Hold the drive shaft or tie it up if necessary.

1. Tilt wheel bearing housing **-1-** down slightly. A second mechanic must guide the drive shaft **-2-** carefully out of the wheel bearing housing.

Fig 1: Identifying Drive Shaft On Wheel Bearing Housing Side

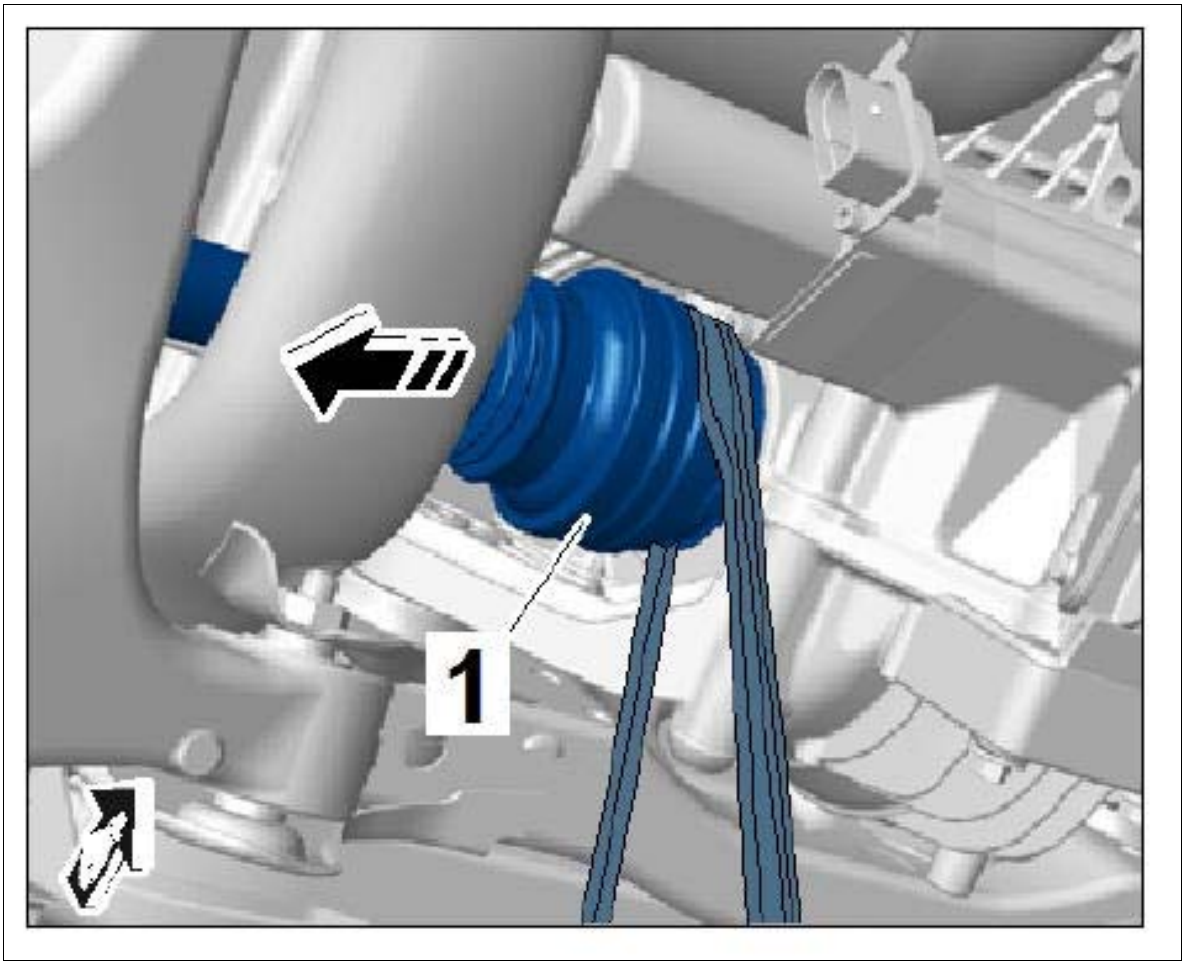


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Lever out the drive shaft **-1-** using a suitable tool (e.g using 2 mounting levers) and carefully remove it from the rear-axle transmission housing.

> *IMPORTANT:* ***Hold the drive shaft!*** *In the event of unfavorable tolerances, the drive shaft might slip out.*

Fig 2: Removing Drive Shaft On Transmission Side



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 422119 REMOVING AND INSTALLING REAR DRIVE SHAFT (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING REAR DRIVE SHAFT > INSTALLING REAR DRIVE SHAFT

⚠ *CAUTION: Wheel carrier raised incorrectly*

- *Risk of squashing*
- *Risk of damage to components*

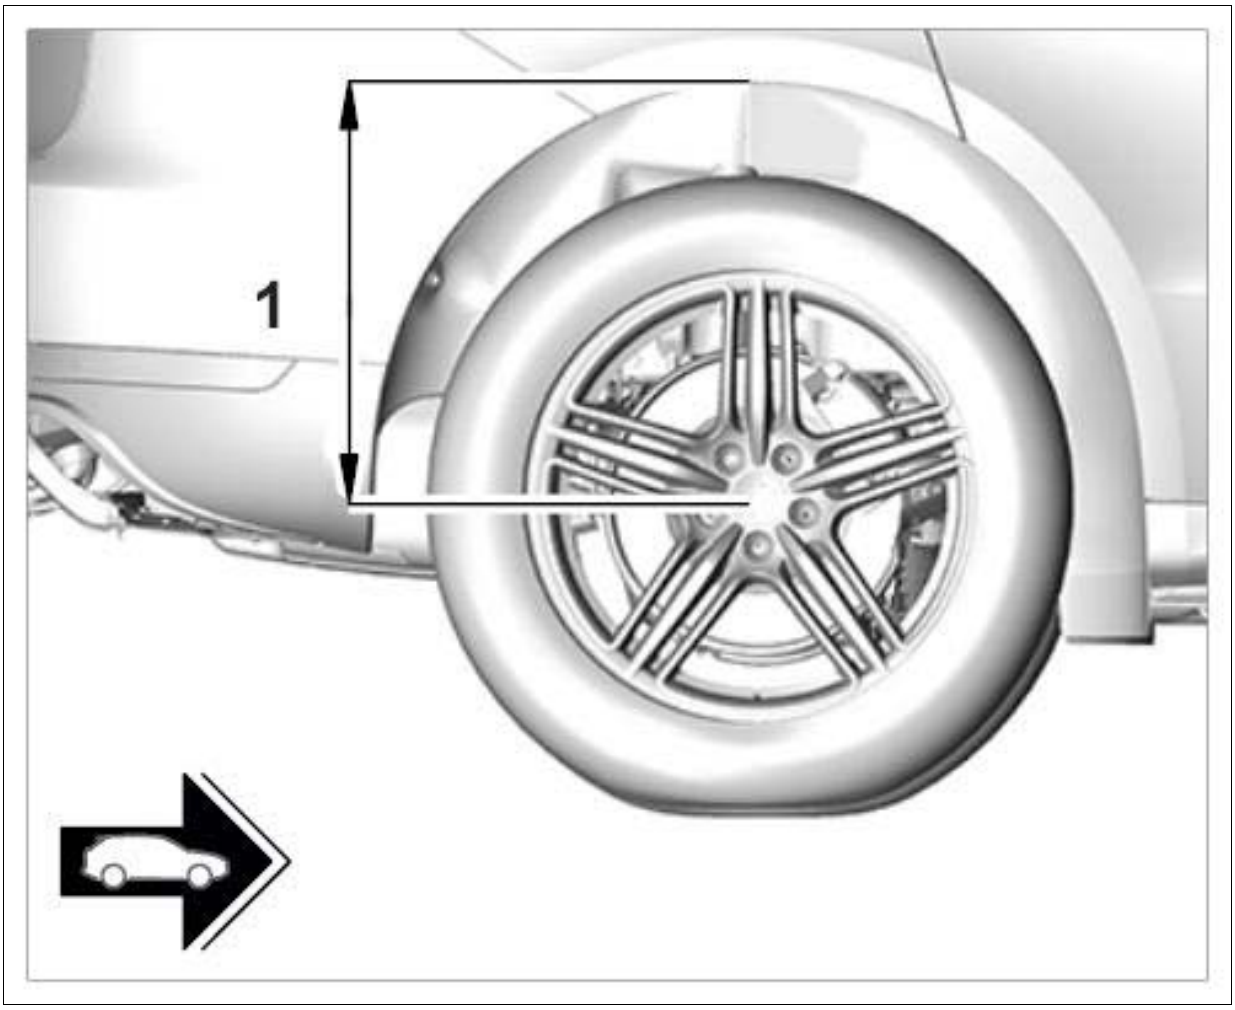
→ Wear personal protective gear.

→ Do not raise the wheel suspension higher than the normal vehicle position (vehicle resting on wheels).

Information

- All screws and threaded joints on the axle must be tightened in vehicle position. Vehicle position means: vehicle standing on its wheels, or the wheel suspension is raised with a universal vehicle lift. Dimension -1- , from lower edge of wing to center of axle corresponds to vehicle position. The current height can be found in → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT . Always observe the following points!

  Fig 1: Identifying Wheel To Wing Lower Edge Dimension (Rear Axle)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- On vehicles with air springs, the respective air spring must be bled using the Porsche System Tester . → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM
- Screws and nuts are Geomet-coated and must not be greased.

Information

Before installing the shaft, replace the lock ring (circlip) on the shaft as well as the shaft sealing ring in the final drive. Removing and installing sealing ring for output flange.

Make sure not to damage the sealing ring when guiding the shaft into the final drive.

- The inner end of the drive shaft must be held with both hands at the joint and inserted into the rear axle differential with a quick jerk. The outer joint must be held by a second mechanic in order to prevent damage.

- Check that the joint is seated correctly in the rear axle differential: Hold the joint with both hands and pull outwards.
- Visually check that the plastic protective rings are flush on the rear axle differential.

1. Grease splines with a little Optimoly TA aluminum paste and insert drive shaft. When doing this, press the inner joint together fully.
2. Installation is performed in reverse order.

   Observe specified tightening torques:

   Drive shaft to wheel hub (Step 1: Wheels suspended in mid-air, operate brake while tightening): **Initial tightening 200 Nm (148 ftlb.)**

   Drive shaft to wheel hub (Step 2: Wheels on the ground): **Final tightening 180°**

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

No.	Designation	Qty.	Removal	Installation
1	Circlip	1	Remove circlip.	Do not confuse circlip no. 1 with circlip no. 9 on the inner joint. The two parts are not identical. Carefully slide the circlip onto the joint pin from above. Check that the circlip is fitted correctly. The circlip is pre-fitted when a new joint is installed!
2	Protective ring (transmission side only)	1	Left side only: Break (carefully) during removal in order to lever the drive shaft out of the transmission.	Replace protective ring.
3	Inner joint			

4	Large clamp	1	Remove clamp.	For securing the bellows.
5	Bellows	1	Remove bellows from the profile shaft.	
6	Small clamp	1	Remove clamp.	For securing the bellows.
7	Circlip	1	Remove circlip carefully with a pliers.	Do not confuse circlip no. 9 with circlip no. 1 on the inner joint. The two parts are not identical. Carefully slide the circlip into the groove on the profile shaft from the side. Check that the circlip is fitted correctly.
8	Drive shaft	1	Remove the joint from the profile shaft using an aluminum mandrel and by hitting the ball hub (star-shaped inner ring) hard several times with a hammer.	Always use a new joint during installation! Position the joint on the profile shaft. Press circlip no. 9 together as required so that the joint slides over it easily when you tap it with a rubber hammer. Grease the new joint!
9	Circlip	1	Remove circlip carefully with a pliers.	Do not confuse circlip no. 9 with circlip no. 1 on the inner joint. The two parts are not identical. Carefully slide the circlip into the groove on the profile shaft from the side. Check that the circlip is fitted correctly.
10	Small clamp	1	Remove clamp.	For securing the bellows.
11	Bellows	1	Remove bellows from the profile shaft.	

12	Large clamp	1	Remove clamp.	For securing the bellows.
13	Outer joint			

WM 422137 DISASSEMBLING AND ASSEMBLING REAR DRIVE SHAFT (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Remove rear drive shaft → 422119 REMOVING AND INSTALLING REAR DRIVE SHAFT .

WM 422137 DISASSEMBLING AND ASSEMBLING REAR DRIVE SHAFT (MACAN, MACAN S, MACAN TURBO) > DISASSEMBLING AND ASSEMBLING REAR DRIVE SHAFT > DISASSEMBLING REAR DRIVE SHAFT

WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

The joint on the transmission side and the joint pin on the wheel side of the rear axle can be replaced. The entire drive shaft must be replaced if the profile shaft is defective.

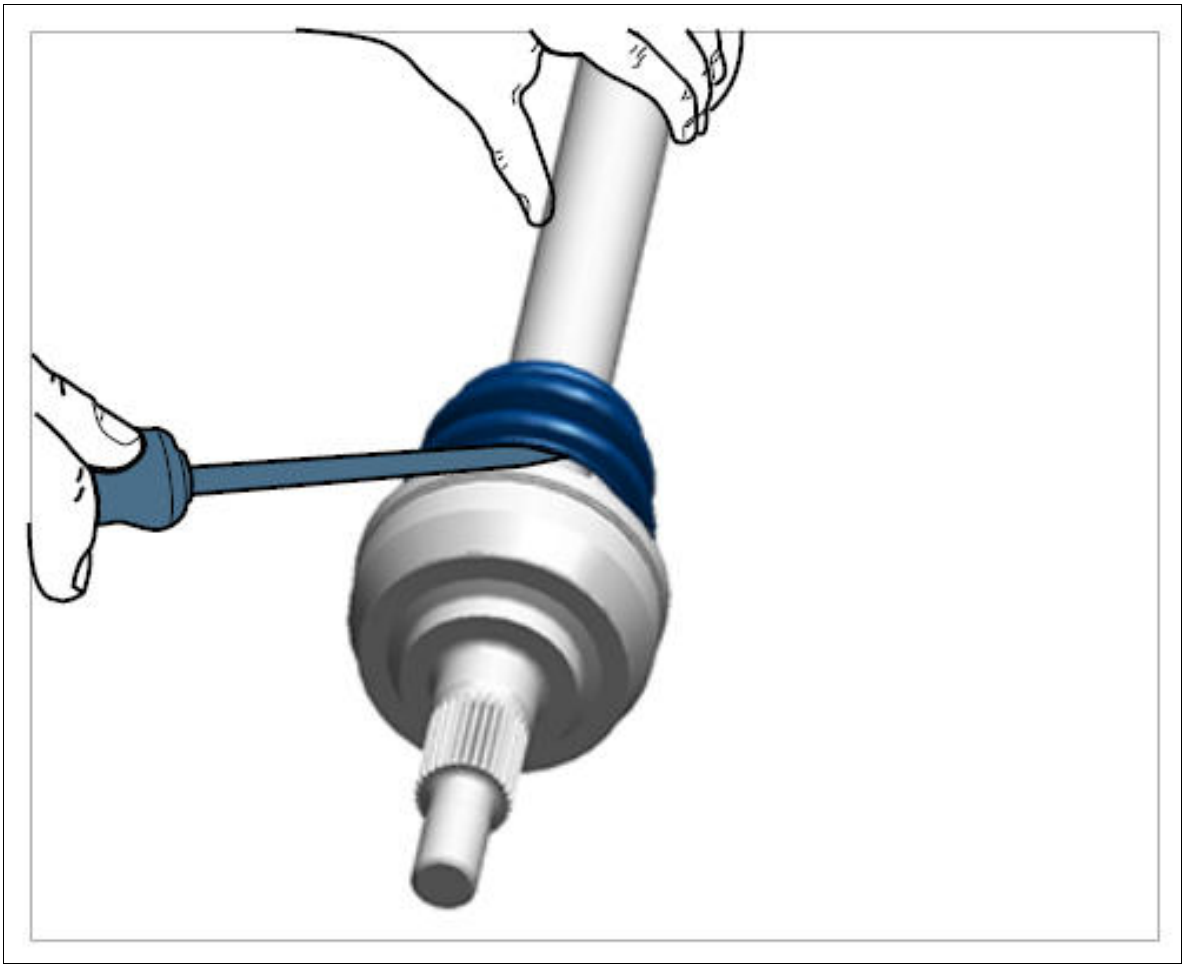
Inner joint (transmission side)

Information

Before removing the bellows, mark the position of the bellows on the drive shaft with a colored pen .

1. Remove the circlip (on transmission side) using **circlip pliers Nr.68.**
2. Remove the bellows from the inner joint and slide it back. → Removing bellows

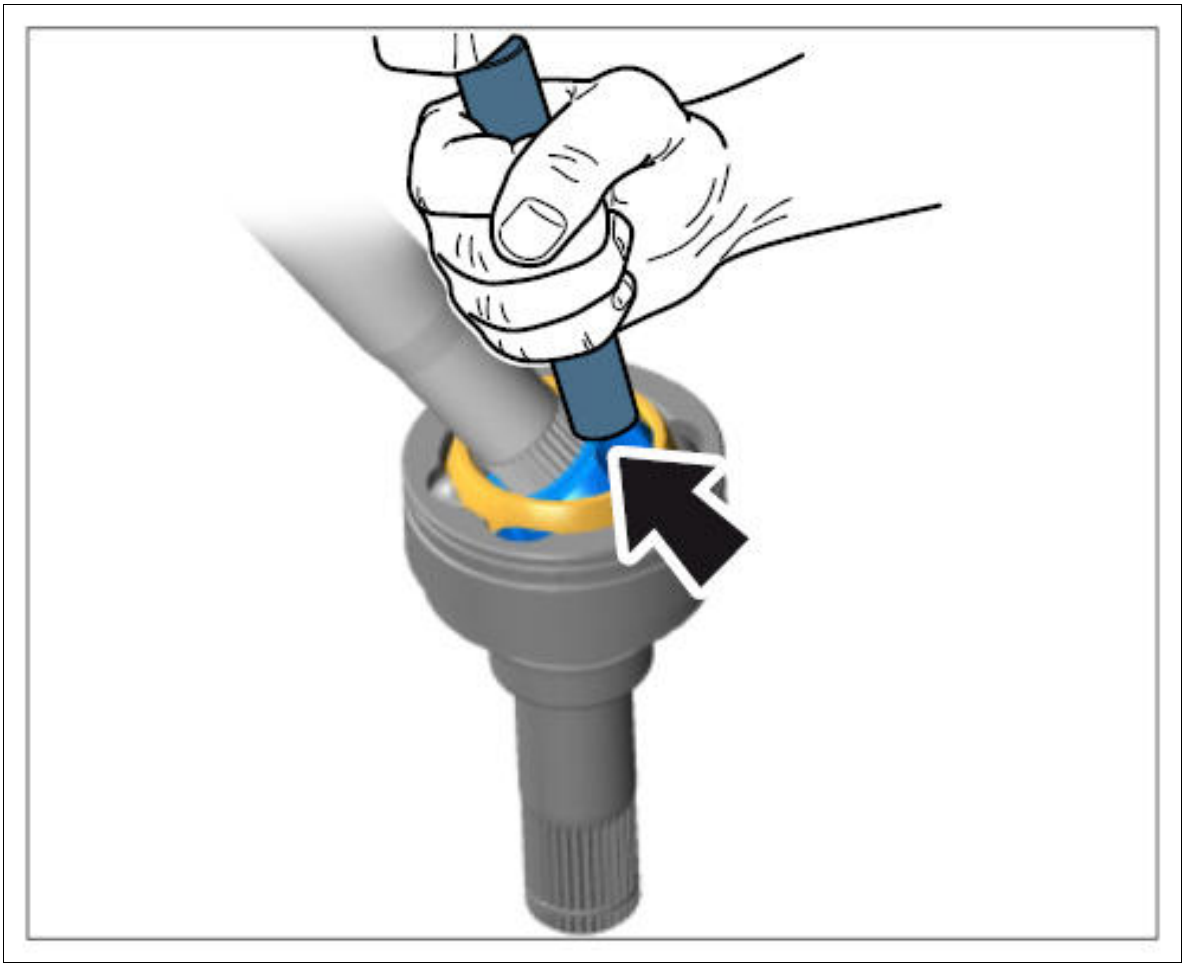
Fig 1: Removing Inner Joint Bellow



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Clamp the drive shaft (use aluminum protective jaws). Fit an aluminum mandrel on the ball hub (star-shaped inner ring) **-arrow-** and remove the joint pin (inner joint) by hitting it several times with a hammer.

Fig 2: Removing Joint (Transmission Side)



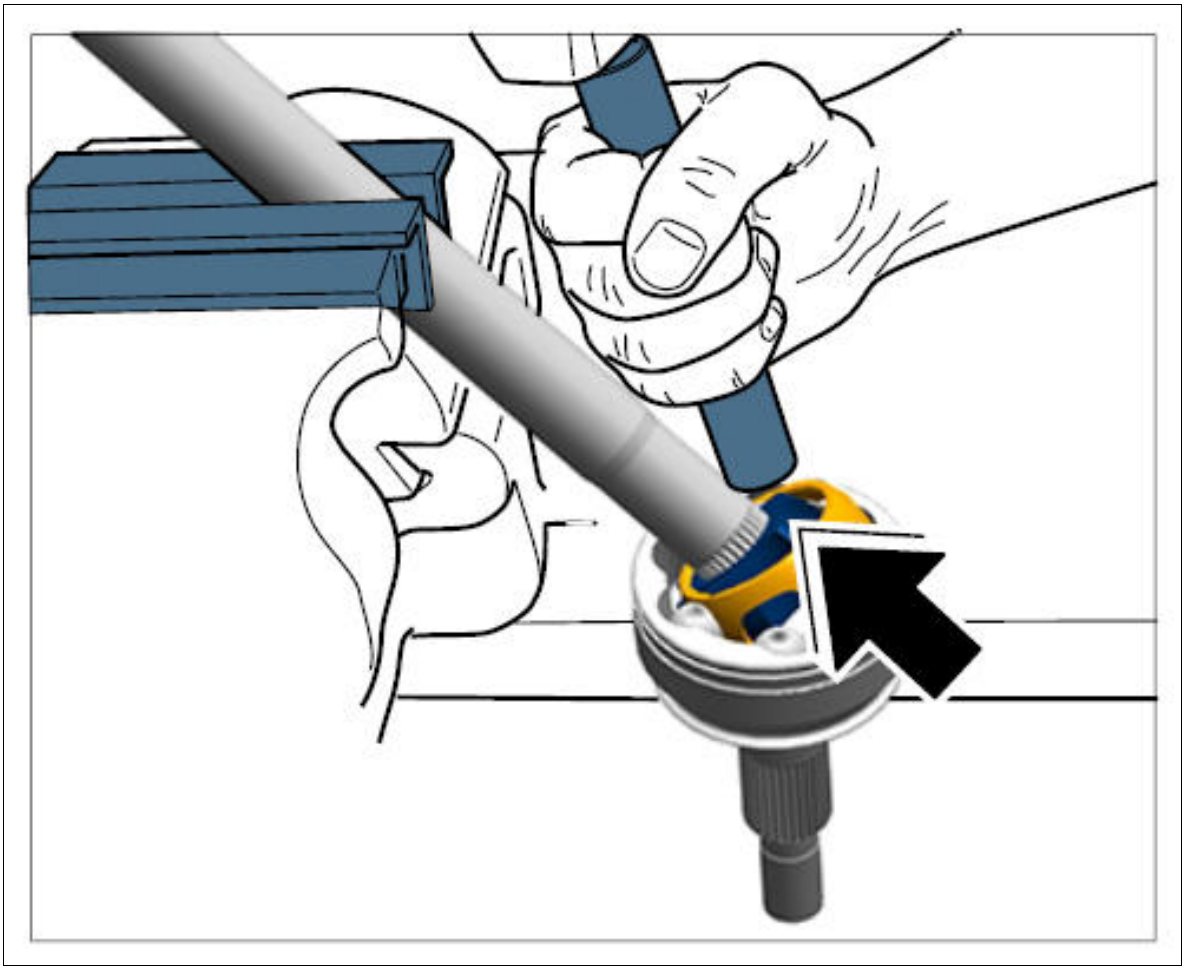
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Remove the hose clamps and bellows and take them off the profile shaft.

   Outer joint (on wheel side)

5. Clamp the drive shaft (use aluminum protective jaws). Fit an aluminum mandrel on the ball hub (star-shaped inner ring) **-arrow-** and remove the joint pin (outer joint) by hitting it several times with a hammer.

Fig 3: Removing Joint (Wheel Side)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 422137 DISASSEMBLING AND ASSEMBLING REAR DRIVE SHAFT (MACAN, MACAN S, MACAN TURBO) > DISASSEMBLING AND ASSEMBLING REAR DRIVE SHAFT > ASSEMBLING REAR DRIVE SHAFT

WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

The drive shaft is assembled in reverse order.

Check all parts to be re-used carefully.

Before fitting the joint, slide all bellows, hose clamps and other clamps onto the drive shaft.

Use new circlips and ensure that they are seated correctly.

Use a new protective ring (on transmission side). Check that it is fitted correctly.

1. Clamp the joint (use aluminum protective jaws). Carefully slide the new circlip onto the shaft from above.

2. Press the circlip together as required so that the joint slides over it easily when you tap it with a rubber hammer. Hold the drive shaft and joint pin with both hands and fit the joint pin onto the drive shaft under the workshop press until the pressure increases (this is as far as it can go). Check the pressure gauge! → **Contact force: +20 kN** Do not exceed the maximum force for pressing in joints (20 kilonewtons/2 tons)!

   The procedure for fitting both joints is identical.

   Information

   1. Do not use cleaning agents on the joints (grease thinners!).

   2. Always replace the removed joint at least during assembly.

   3. Press the grease with a sufficient amount of force into the ball tracks of the joint.

   4. Make sure that only a small amount of grease gets into the drive shaft boots.

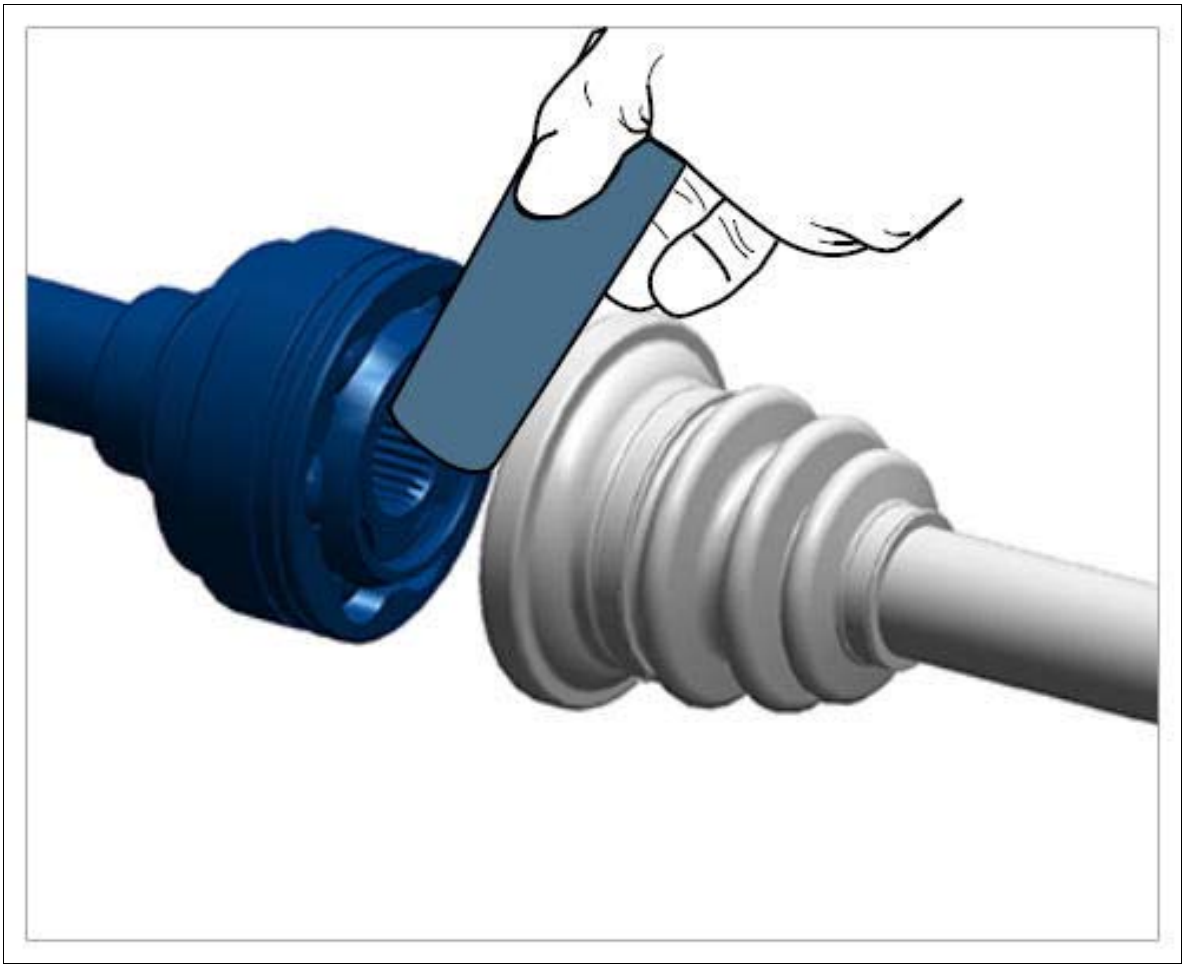
   Greasing joints:

   Grease the joints with special grease . The original grease quantities for the individual joints are specified in the following table.

Vehicle	Joint, inner (gram)	Joint pin, outer (gram)
Without rear differential lock (Macan, basic Macan S)	70	70
Without rear differential lock (Macan diesel, Macan Turbo)	80	85
With rear differential lock	80	85

   Joint on transmission side: Grease the joint using the quantities of grease specified in the table. The complete drive shaft is supplied ex-works with the quantities of grease specified in the table. Before sliding on the bellows, remove excess grease using a lint-free cloth. Push the required amount of grease through the joint to the outside. Then grease the inside of the joint.

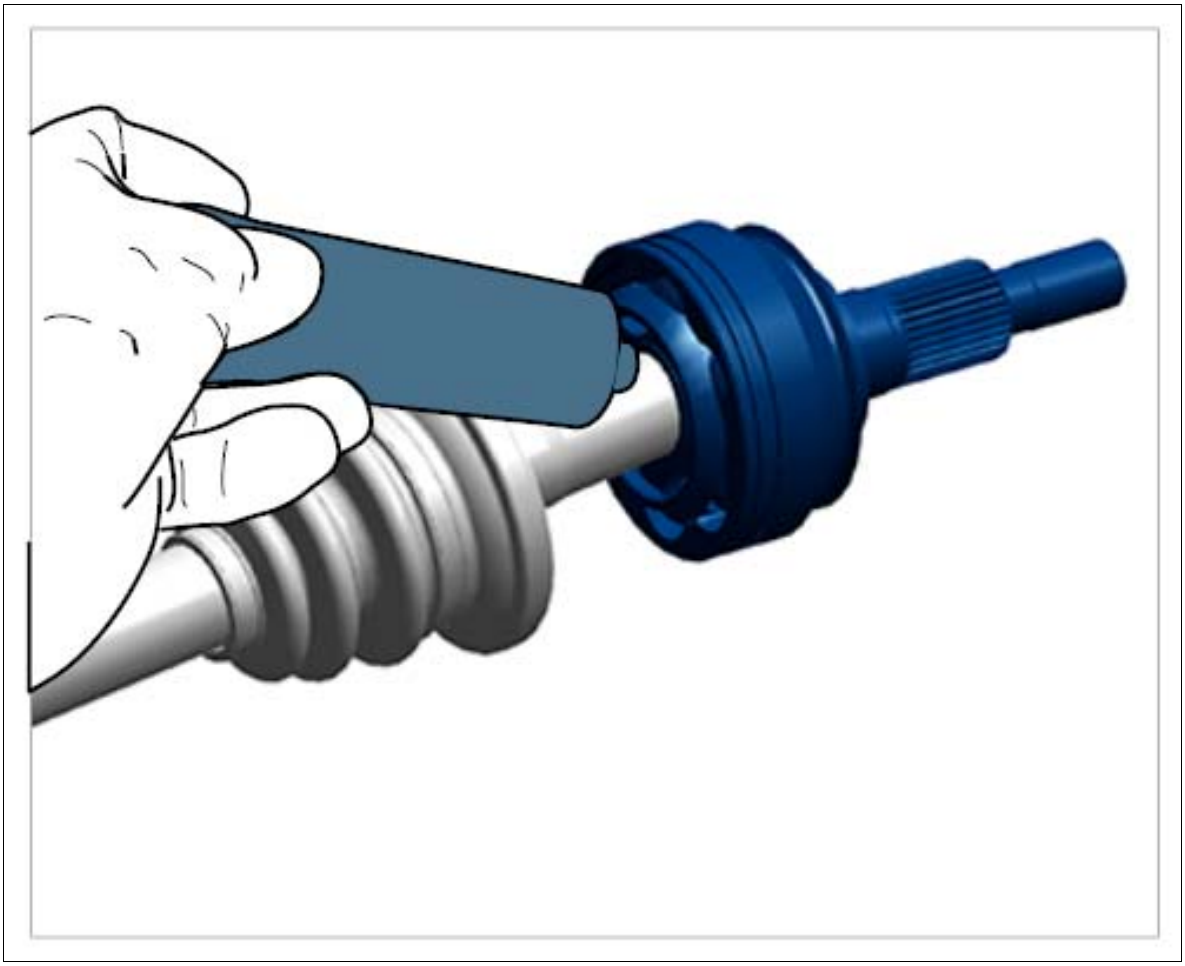
Fig 1: Applying Grease To Drive Shaft Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Joint pin on wheel side: Grease the joint using the quantities of grease specified in the table. The complete drive shaft is supplied ex-works with the quantities of grease specified in the table. Before sliding on the bellows, remove excess grease using a lint-free cloth. Push the required amount of grease through the joint to the outside. Then grease the inside of the joint.

Fig 2: Applying Grease To Inside Of Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Position the new bellows

1. At the marking you made earlier on the drive shaft .
2. Always comply with the specified dimension.

3. Fit the small clamps for the bellows.
    1. 3.1. To do this, slide the joint from stop to stop and determine → **Dimension -X-: +90 mm+3 mm**

Fig 3: Identifying Dimension -X-

1. Mark the position of the eccentric screw with respect to the wheel bearing housing for reinstallation.
2. Unscrew fastening screws for the control arm **-2-** at the chassis subframe and at the wheel bearing housing (eccentric screw) **-1-** .
3. Remove control arm.

WM 423555 REPLACING UPPER CONTROL ARM (MACAN, MACAN S, MACAN TURBO) > REPLACING UPPER CONTROL ARM > INSTALLING UPPER CONTROL ARM

WARNING: Wheel bearing housing raised incorrectly

- *Risk of squashing*
- *Risk of damage to components*

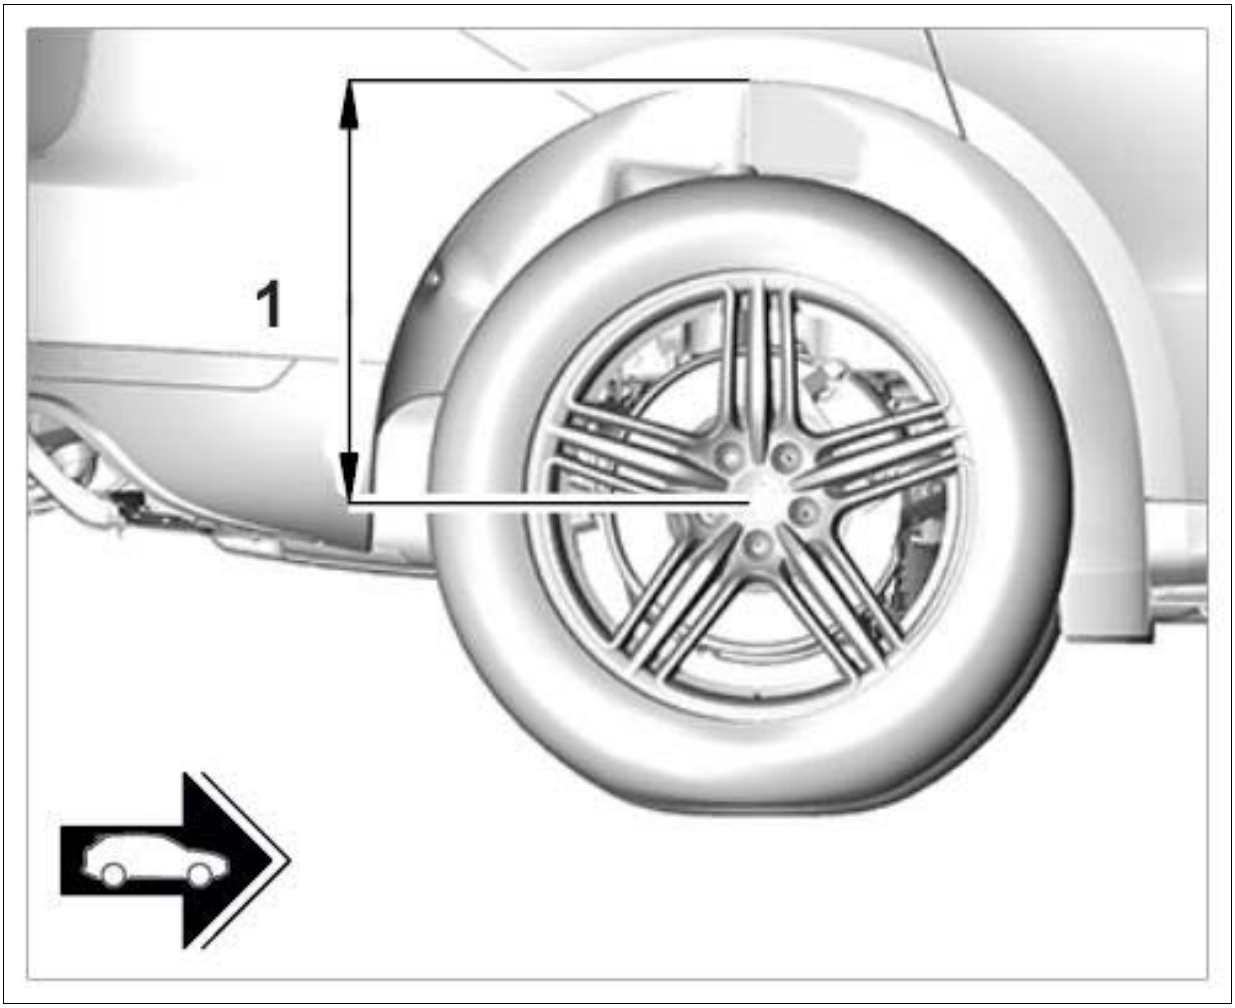
→ Wear personal protective gear.

→ Do not raise the wheel suspension higher than the normal vehicle position (vehicle resting on wheels).

Information

- All screws and threaded joints on the axle must be tightened in vehicle position. Vehicle position means: vehicle standing on its wheels, or the wheel suspension is raised with a universal vehicle lift. Dimension -1- , from lower edge of wing to center of axle corresponds to vehicle position. The current height can be found in → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT . Always observe the following points!

Fig 1: Identifying Wheel To Wing Lower Edge Dimension (Rear Axle)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- On vehicles with air springs, the respective air spring must be bled using the Porsche System Tester . → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM
- Screws and nuts are Geomet-coated and must not be greased.

1. Installation is performed in reverse order.

   Observe specified tightening torques:

   Upper control arm to rear axle housing: **Initial tightening 70 Nm (52 ftlb.) Final tightening +180°**

   Upper control arm to wheel bearing housing: **Tightening torque 95 Nm (70 ftlb.)**

WM 423555 REPLACING UPPER CONTROL ARM (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Fit wheel → INSTALLING WHEEL .

2. Perform suspension alignment → 449503 SUSPENSION ALIGNMENT, COMPLETE .

2. Remove wheel. → 440519 REMOVING AND INSTALLING WHEEL

WM 427219 REMOVING AND INSTALLING REAR COIL SPRING (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING REAR COIL SPRING > REMOVING REAR COIL SPRING

WARNING: Preloaded or pressurized components

- *Risk of squashing or bruising*

→ Do not reach into the danger area.

→ Relieve the tension on components before starting work.

→ Secure components to prevent them from loosening suddenly.

Information

Coil springs

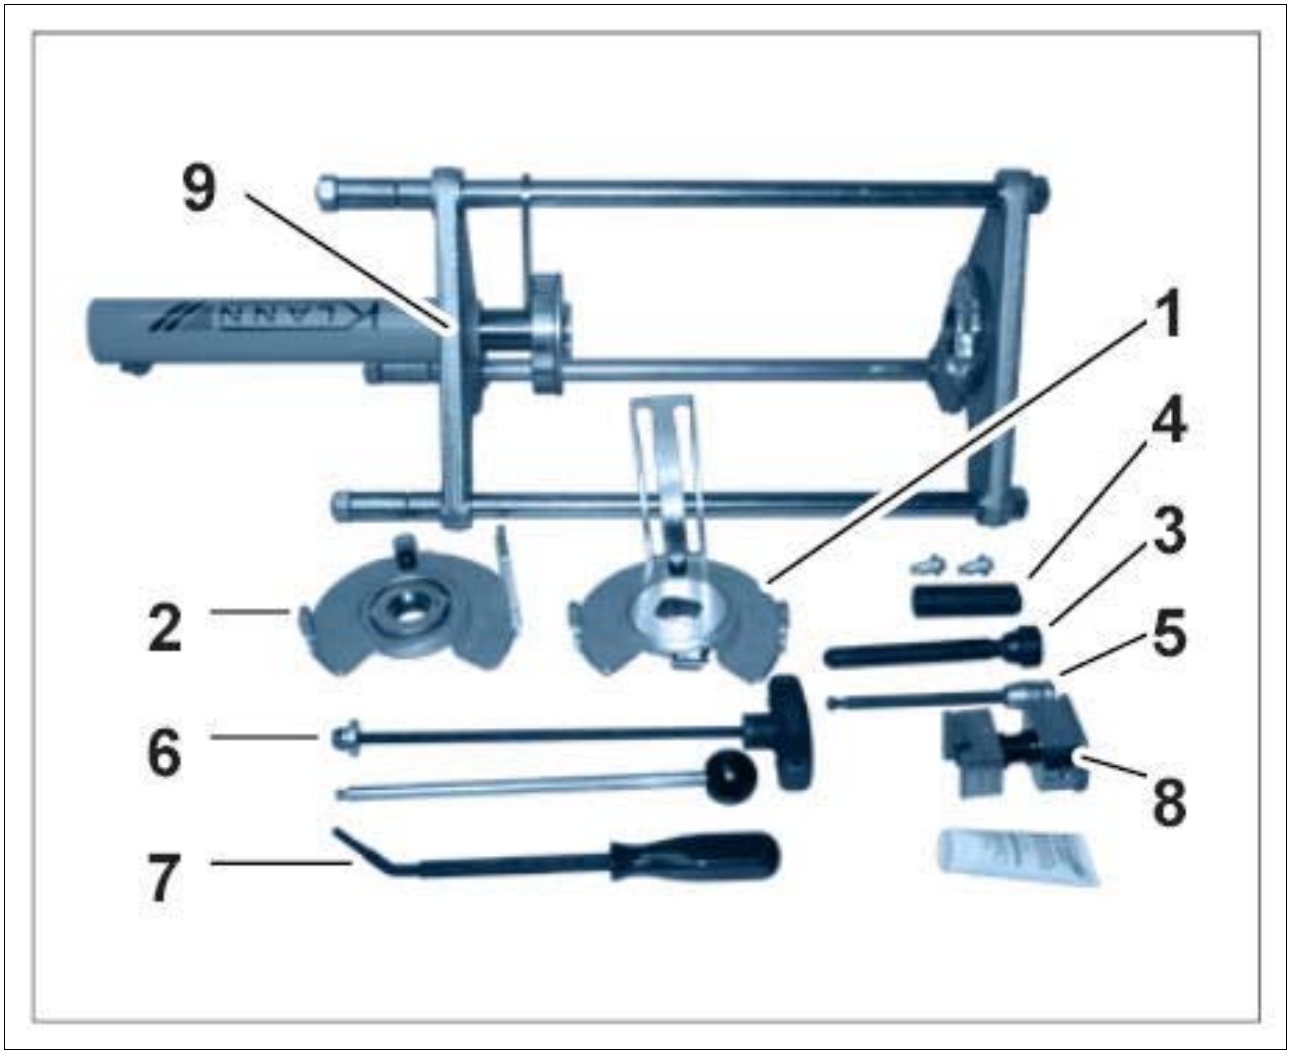
- Do not press coil springs together onto the block.
- Do not damage the surface of the coil springs (corrosion protection).
- Do not use solvents to clean the coil springs.

The **spring tensioning system WE 1609** is required for removing and installing the coil springs.

1. Pressure plate with locking mechanism
2. Pressure plate with pivot bearing
3. Spindle

4. Plunger
5. Socket wrench
6. T-bar wrench
7. Holding wrench
8. Spreader device
9. Hydraulic tensioning device

Fig 1: Identifying Spring Tensioning System VAS 6907



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

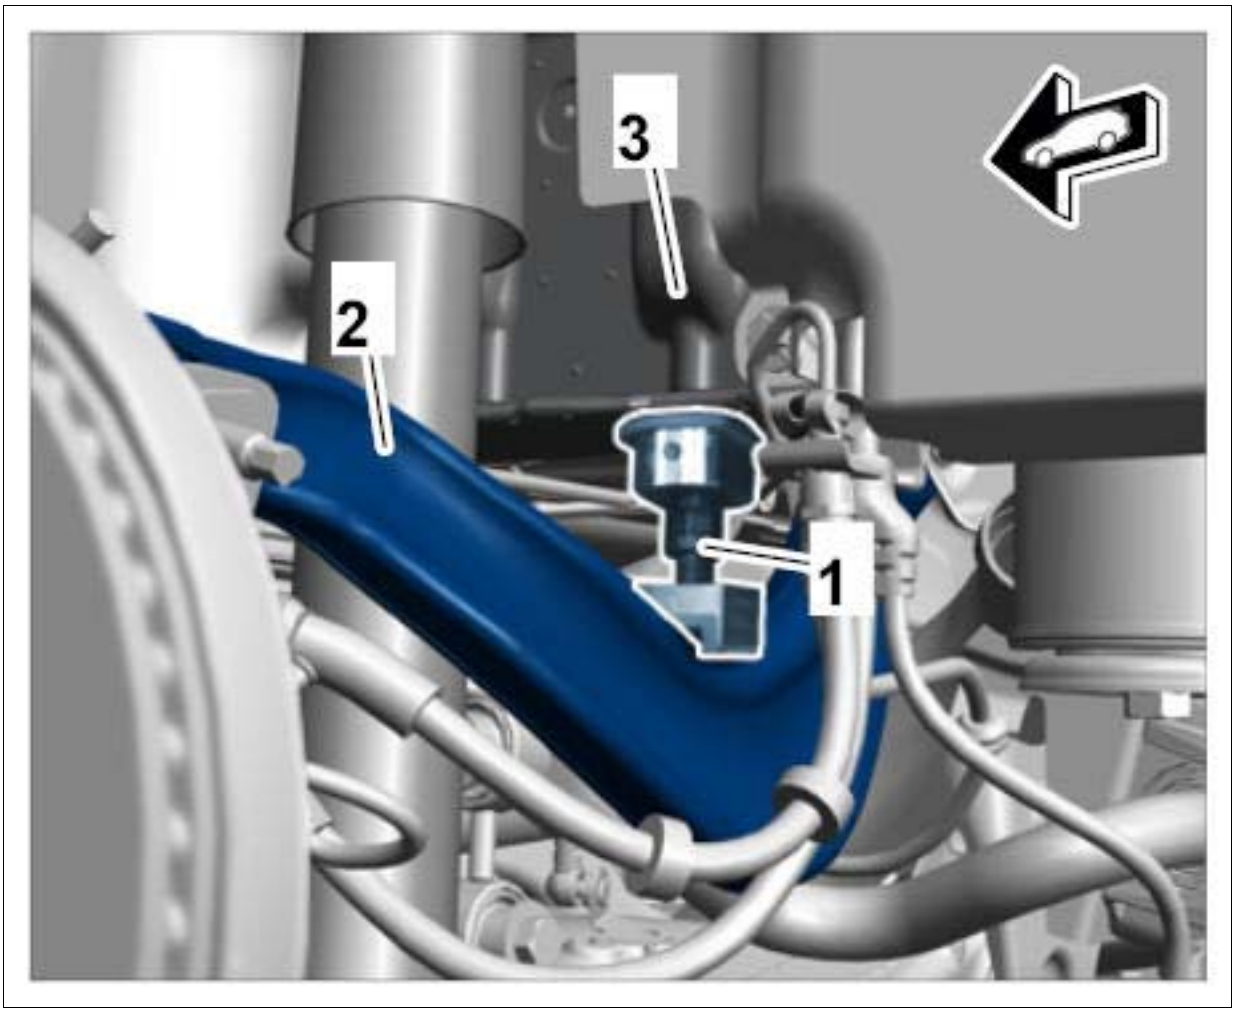
The spreader device **VAS 6907/8** makes it easier to remove and install coil springs.

When the spreader device is inserted, it prevents the axle from moving upwards when tightening the coil spring.

- With the coil spring installed, insert spreader device -1- between the upper trailing arm -2- and body -3- .

- Adjust the height of the spreader device at the hexagon until it is fitted securely.
- Always remove the spreader device from the vehicle after installing the coil spring.

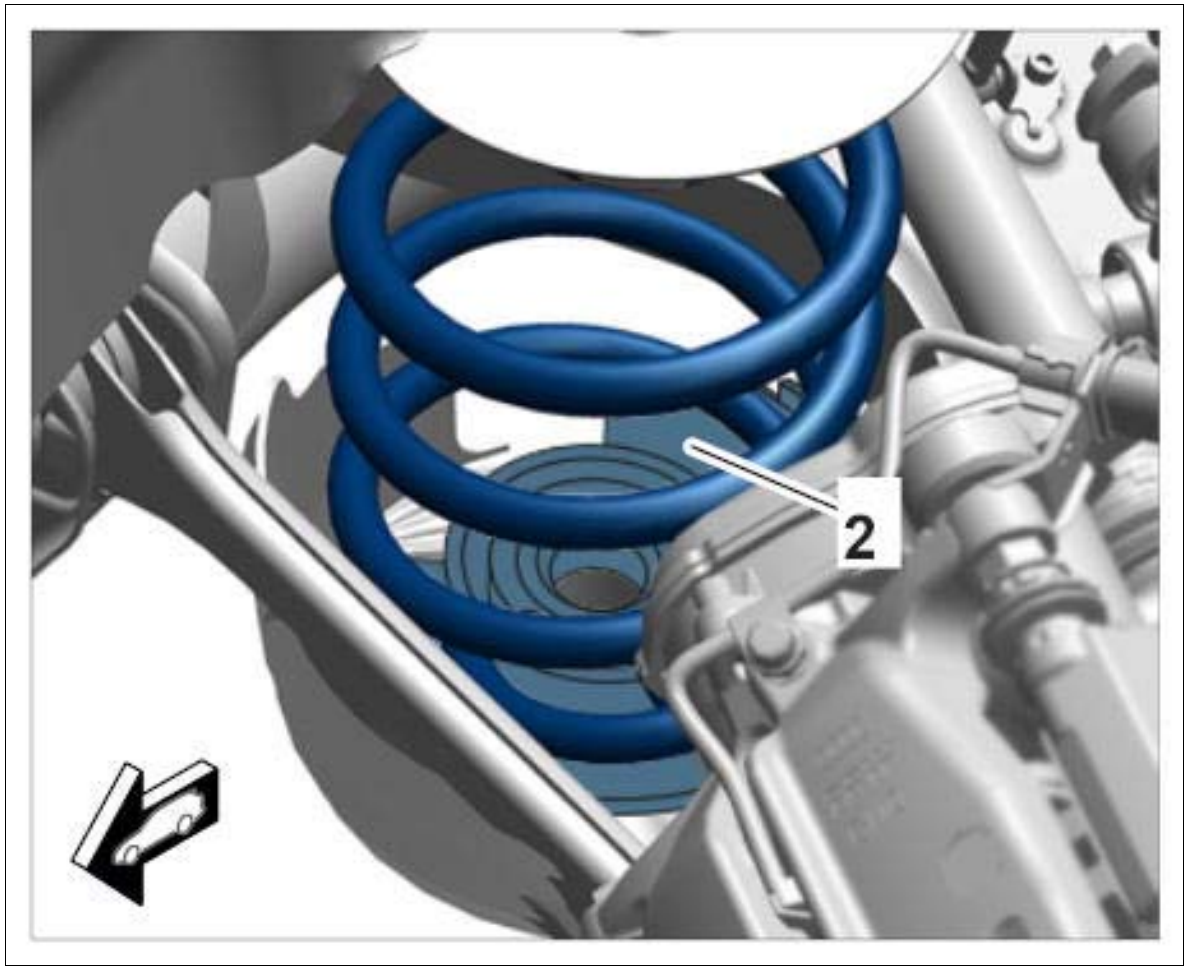
Fig 2: Installing Spreader Device VAS 6907/8



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Insert pressure plate with pivot bearing **VAS 6907/2** down as far as possible from the outside. Press the stone guard aside slightly if necessary. → Pressure plate at the bottom

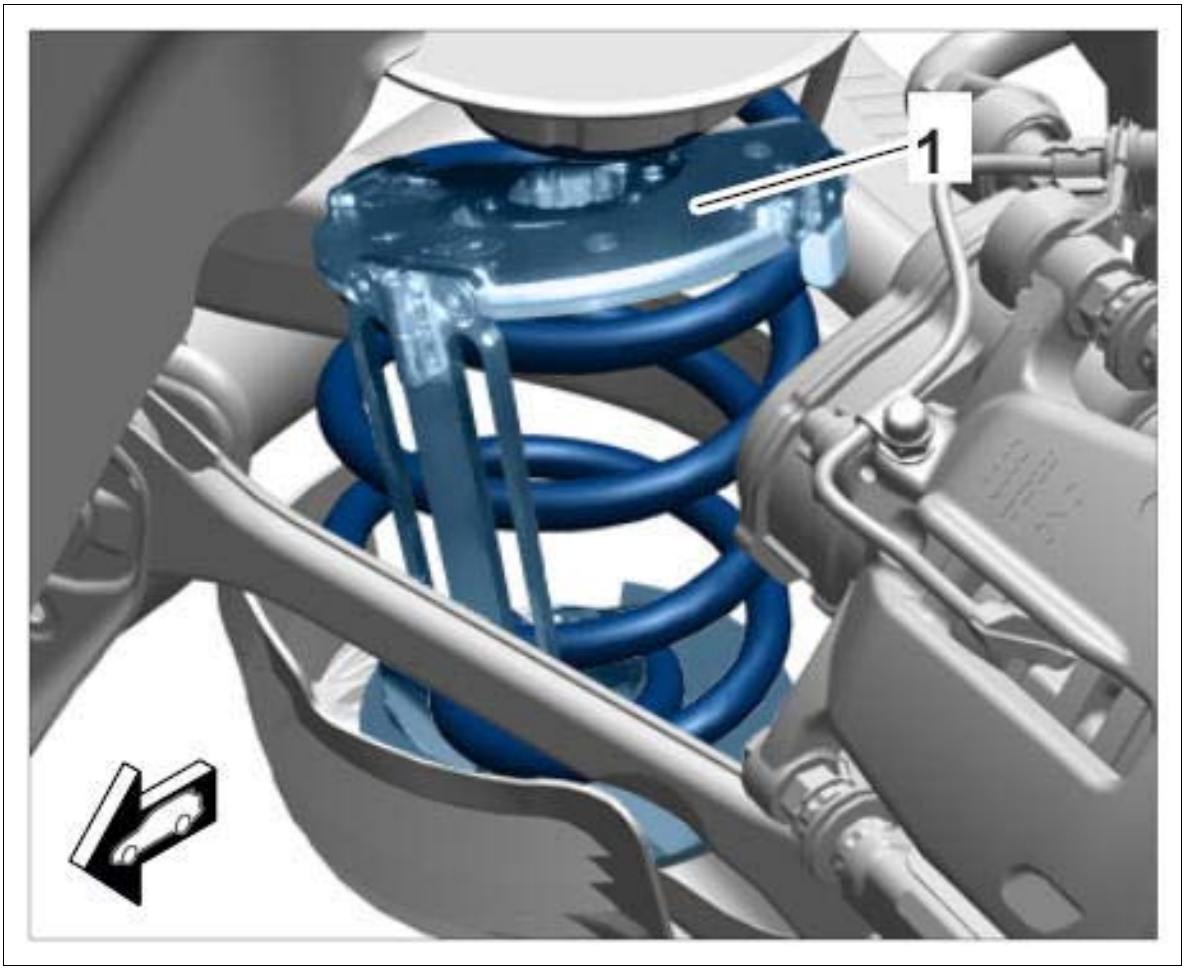
Fig 3: Identifying Pressure Plate (Bottom)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Insert pressure plate with locking mechanism **VAS 6907/1** up as far as possible from the outside. → Pressure plate at the top

Fig 4: Identifying Pressure Plate (Top)

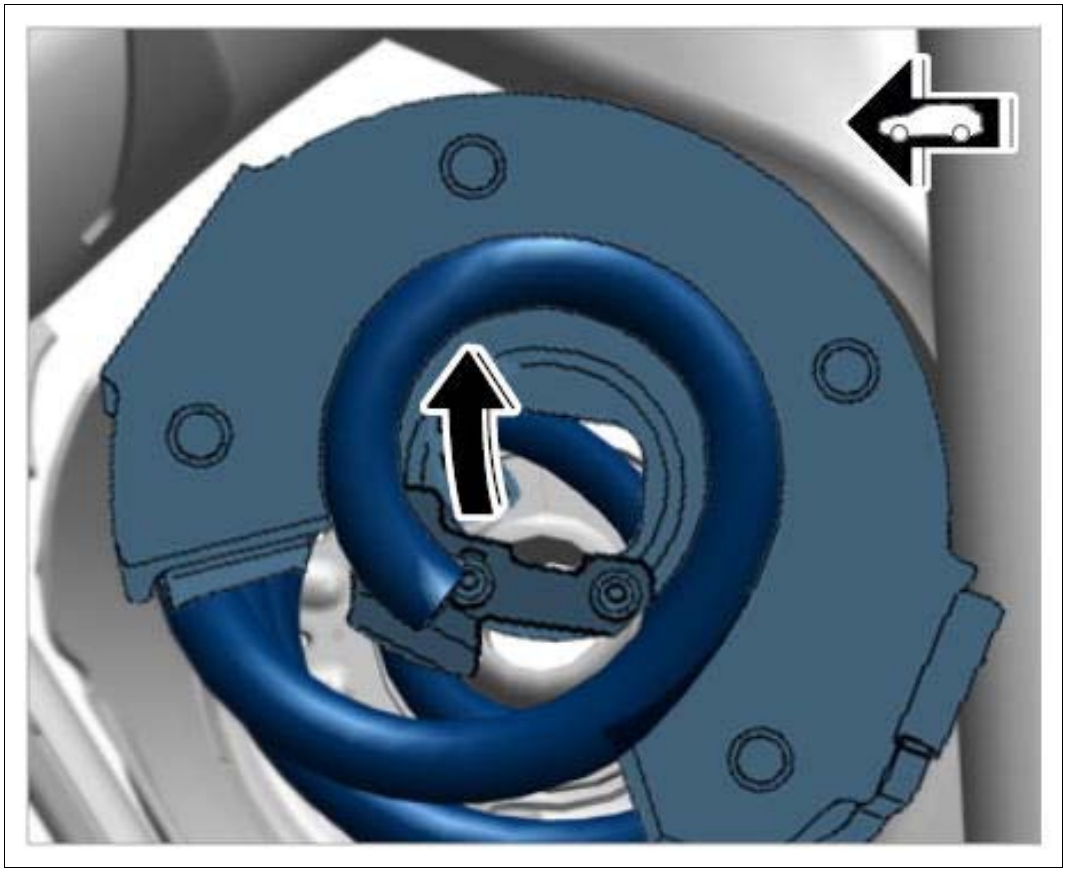


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Insert plunger **VAS 6907/4** into pressure plate with locking mechanism using T-bar wrench **VAS 4907/6** .

    1. 3.1. Press locking lever in **-direction of arrow-** to secure the plunger.

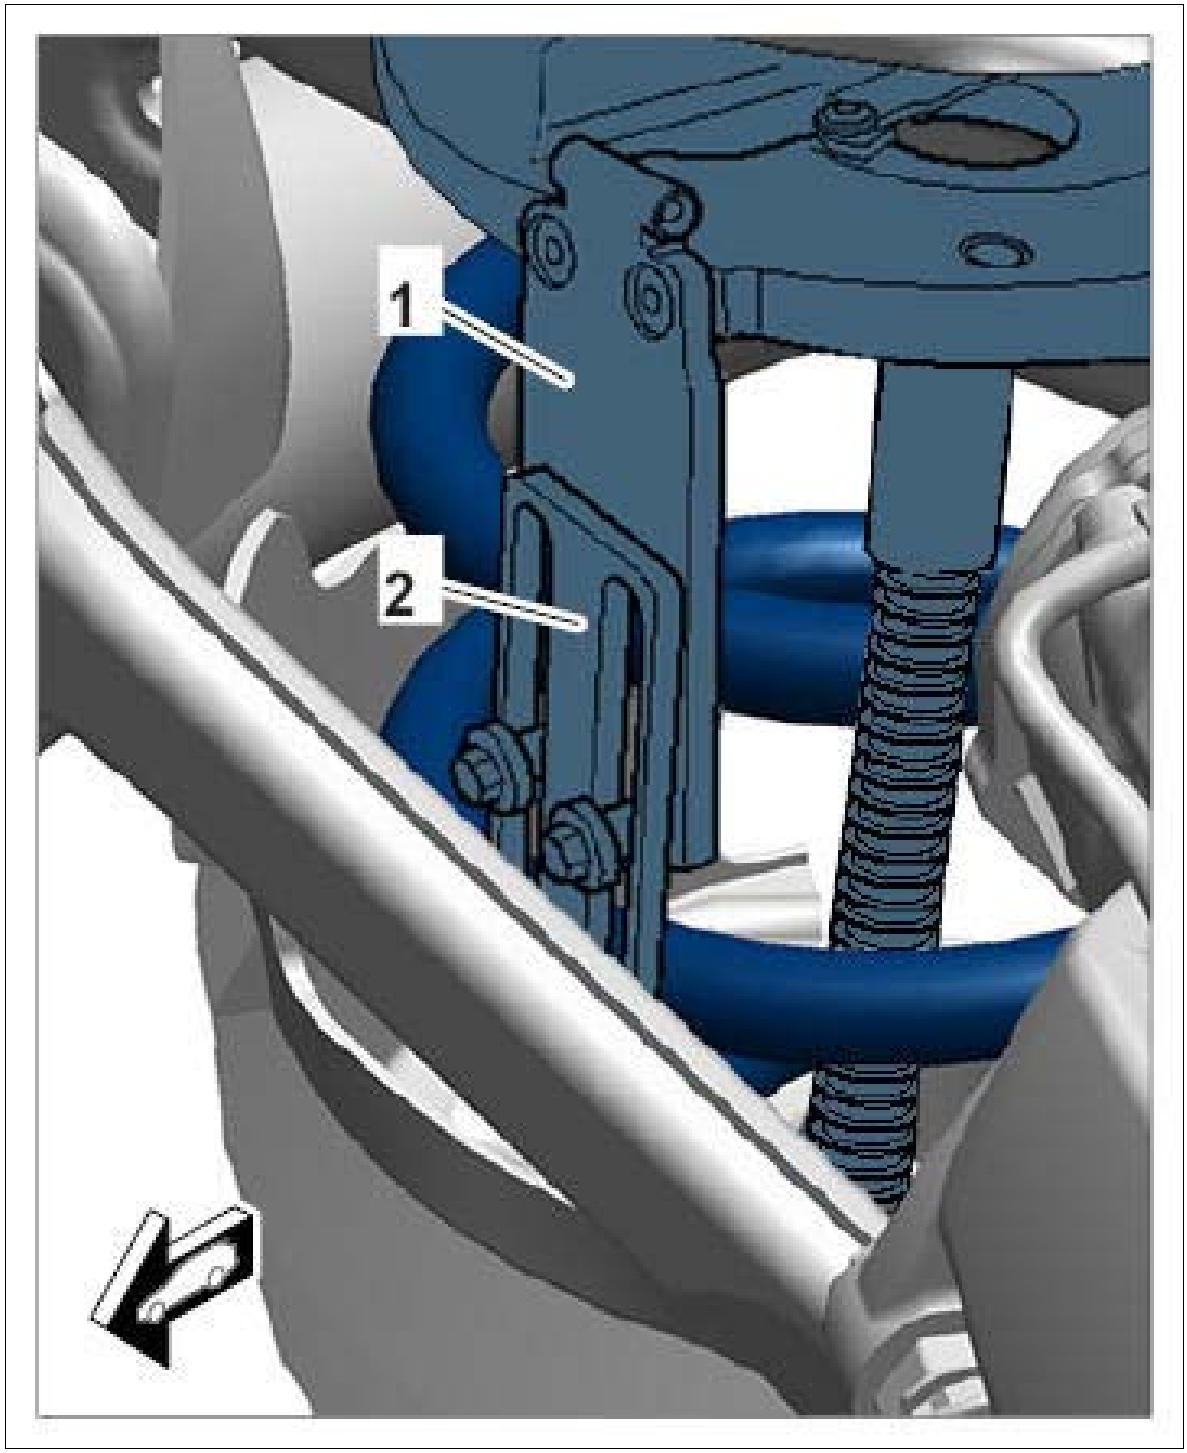
Fig 5: Locating Pressure Plate Locking Lever



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Screw both pressure plates up/down as far as required until they have three windings enclosed.
5. Screw twist lock holders **-1 and 2-** of the two pressure plates together.

Fig 6: Identifying Lock Holders

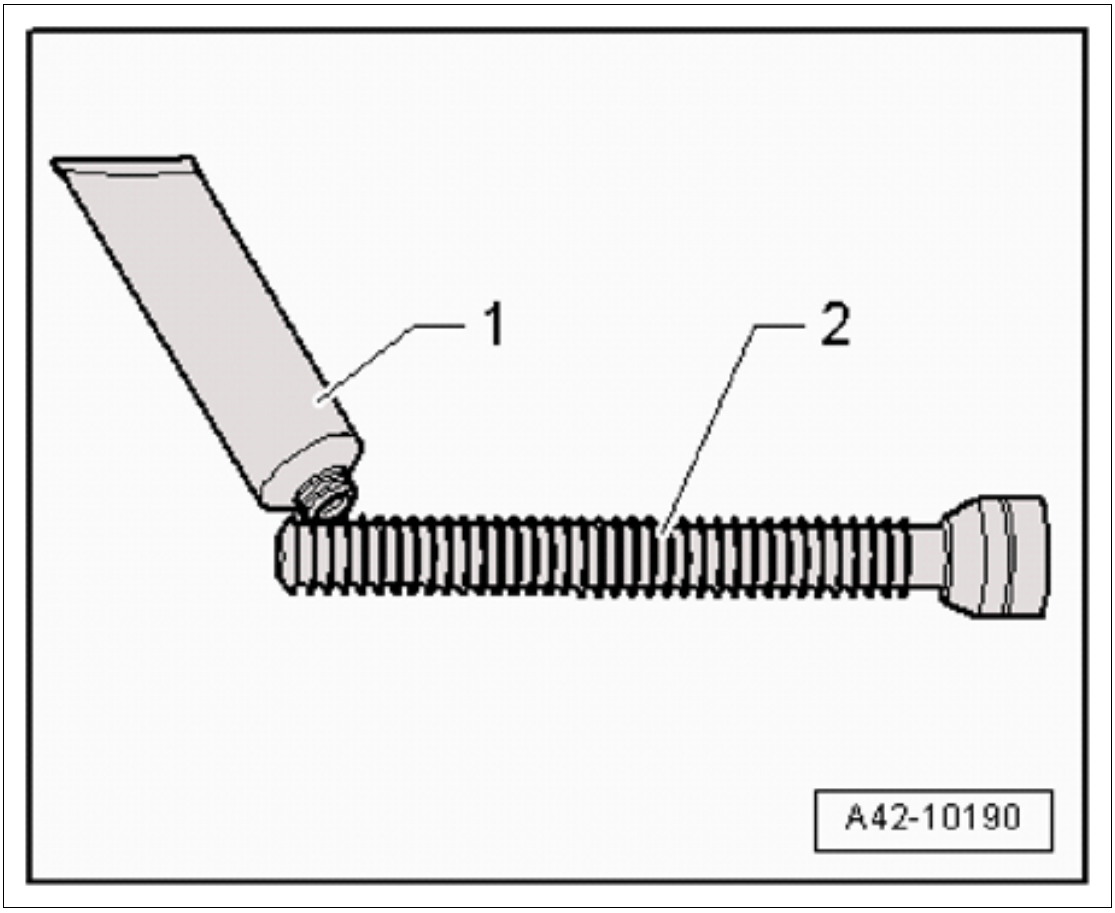


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. Before removing and installing each spring, the spindle -2- at the front must always be greased lightly using the supplied grease -1- .
2. Only use the grease provided to grease the spindle. Other types of grease will damage the spindle.

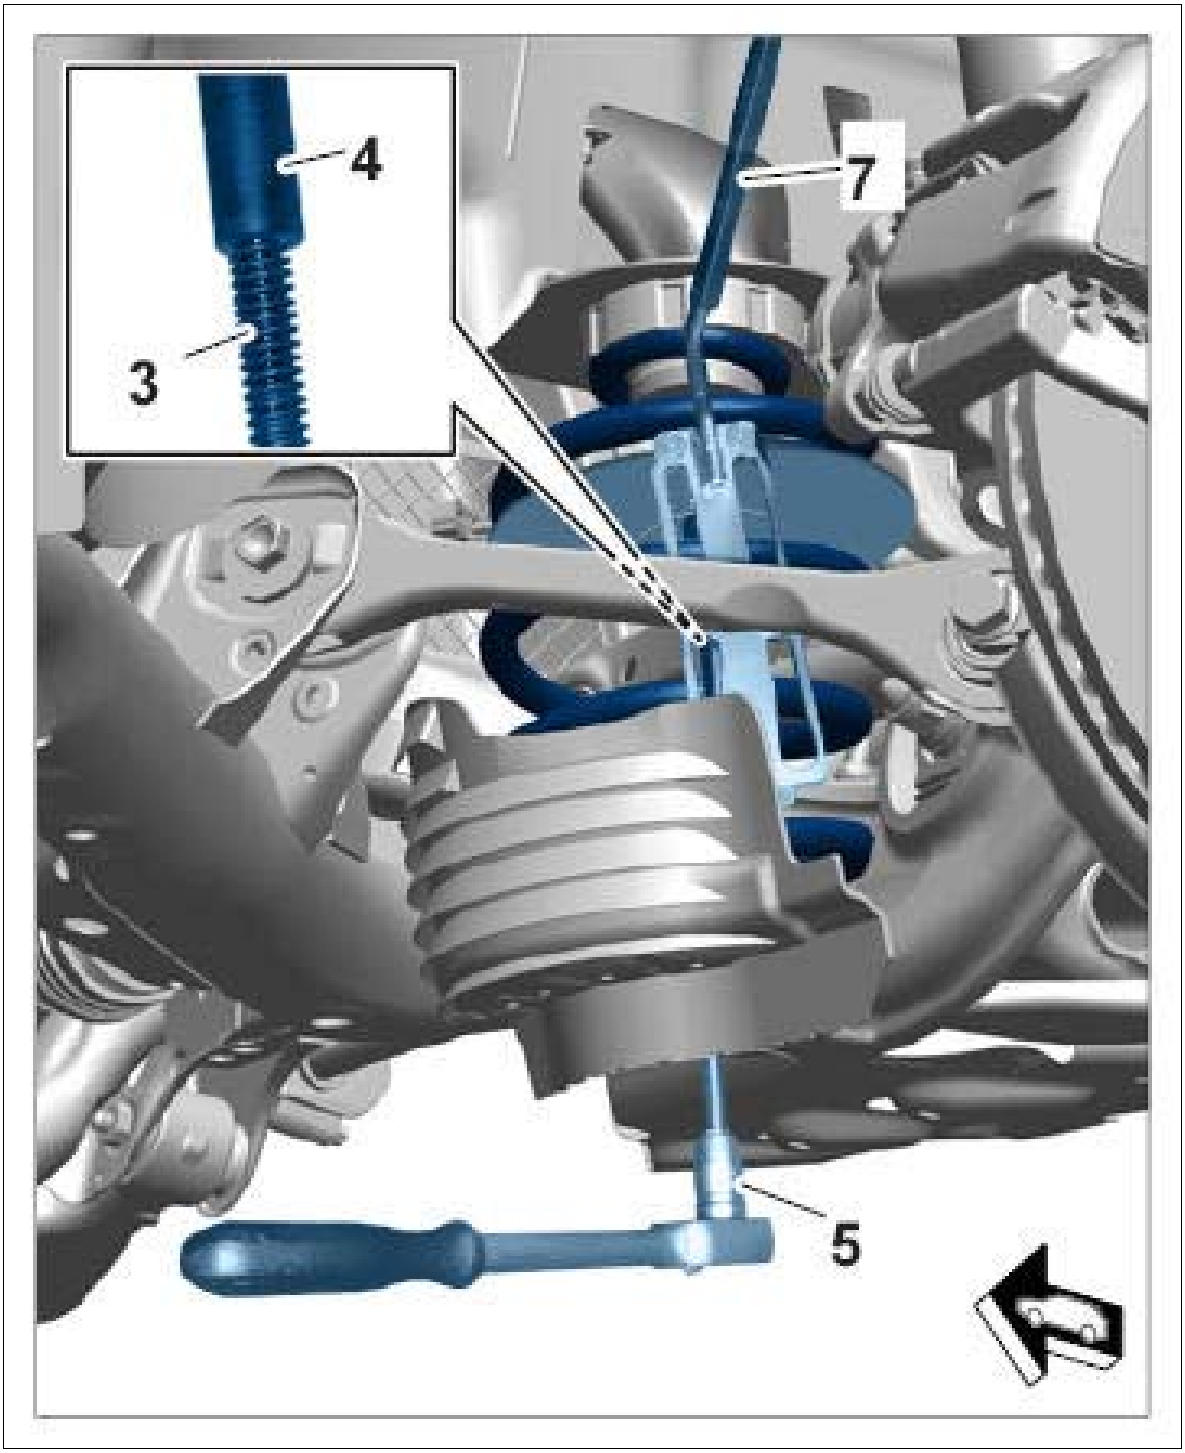
Fig 7: Identifying Spindle Grease Applying Area



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Screw the spindle **VAS 6907/3** into the plunger **VAS 6907/4** using socket wrench **VAS 6907/5**

Fig 8: Tightening Coil Springs



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

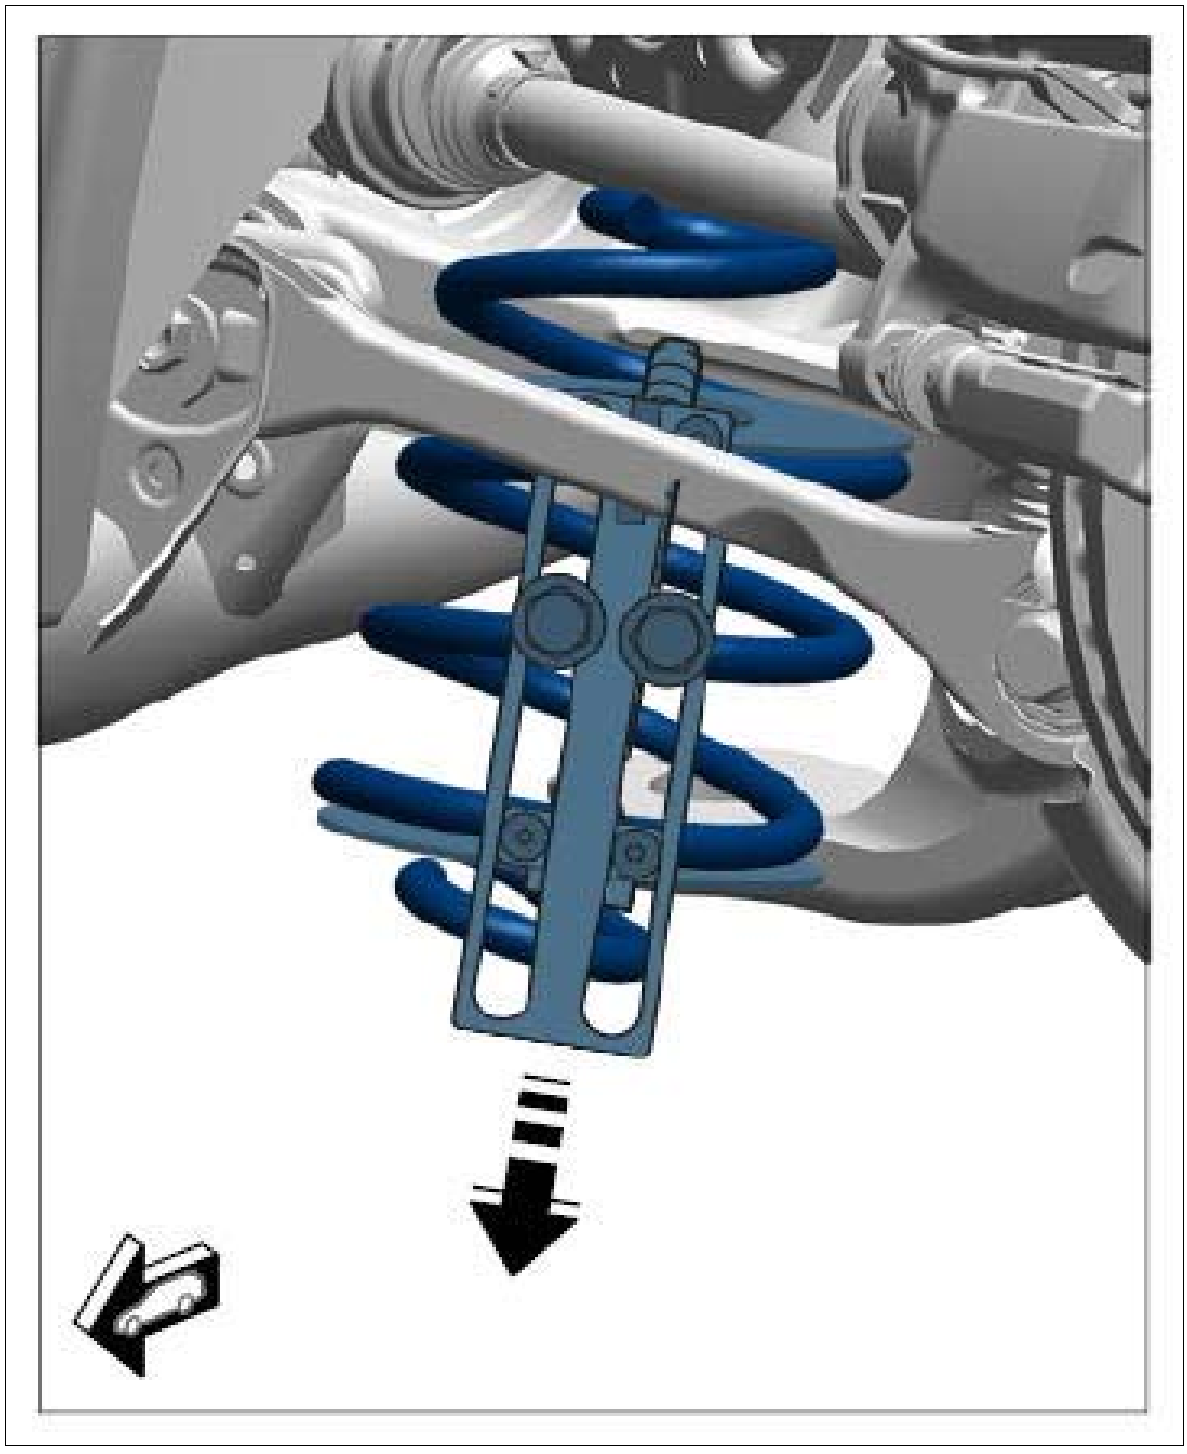
1. 6.1. Insert holding wrench **VAS 6907/7** into the bracket **-arrow-** to counter the movement.
2. 6.2. Pretension pressure plates slightly using the spindle
3. 6.3. Check that the coil spring is seated correctly in the pressure plates.

7. Tension the coil spring using a socket wrench until the stone guard and upper and lower spring

plates can be removed.

8. Remove coil spring by pulling it forward at the bottom. → Removing coil spring

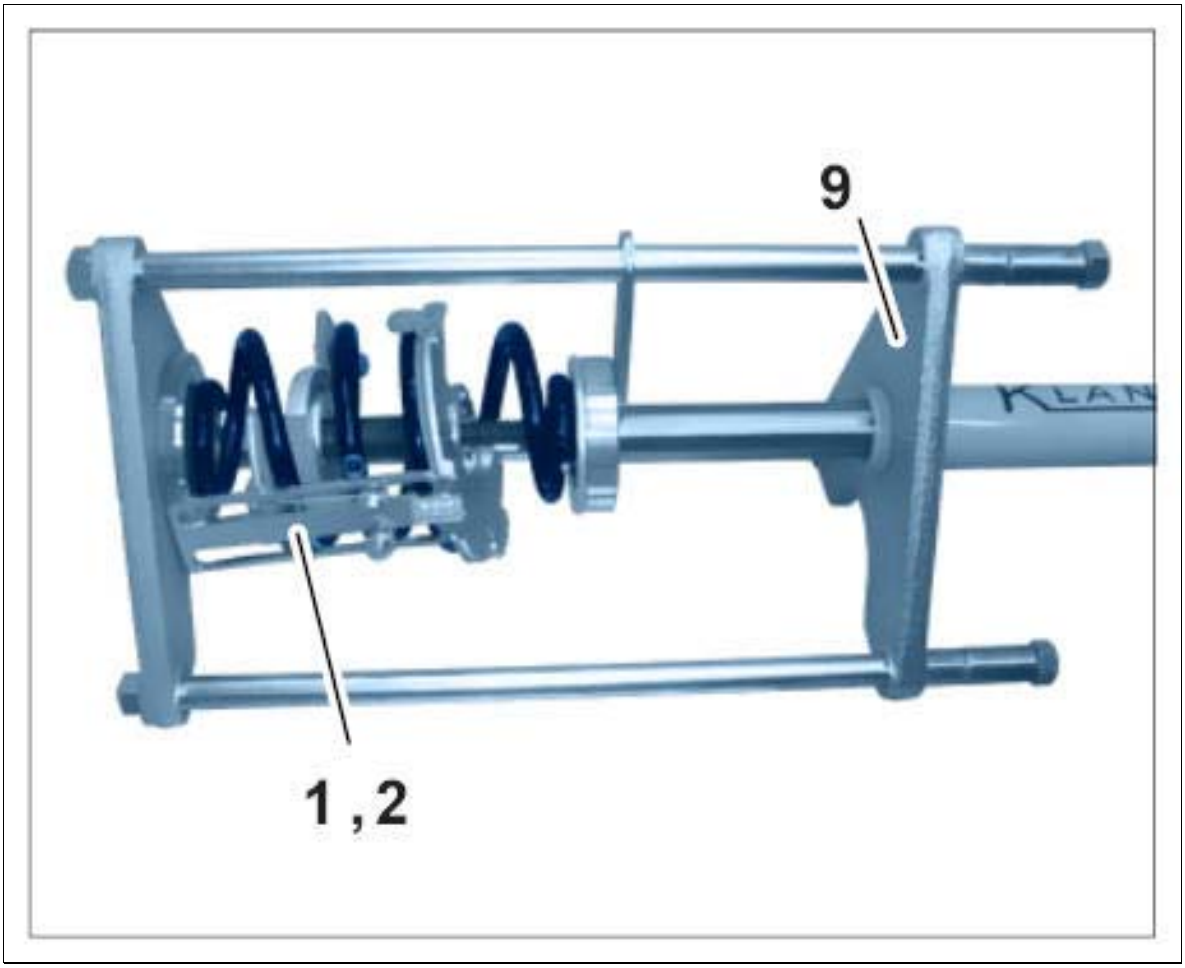
   Fig 9: Removing Coil Spring



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Screw the spindle back slightly if necessary (do not unscrew fully, risk of injury!) so that the spindle projects out over the end of the coil spring.
10. Insert pre-tensioned spring into the hydraulic tensioning device **VAS 6907/9.**

Fig 10: Identifying Hydraulic Tensioning Device



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

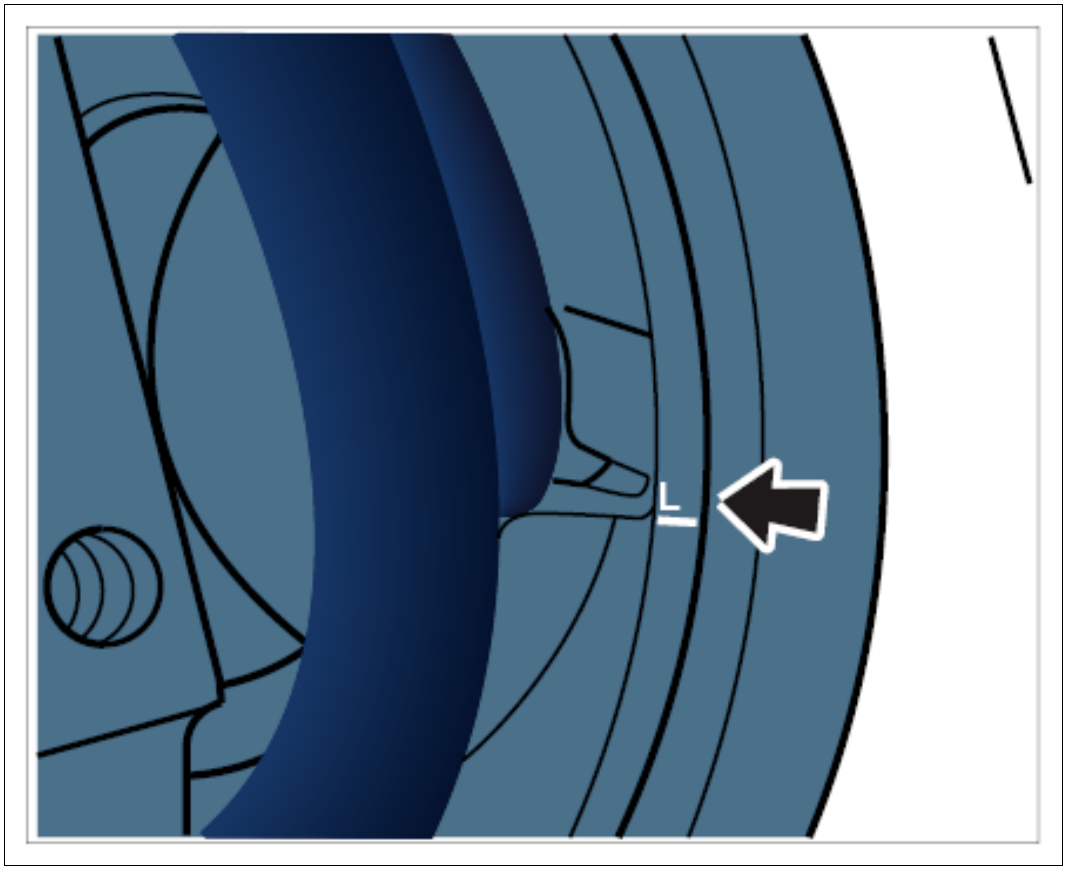
1. 10.1. **Left coil spring:**

   Fit underside of end of spring in the spring tensioning system at marking "L".

   Right coil spring:

   Fit underside of end of spring in the spring tensioning system at marking "R".

Fig 11: Locating Coil Spring Marking (Left)

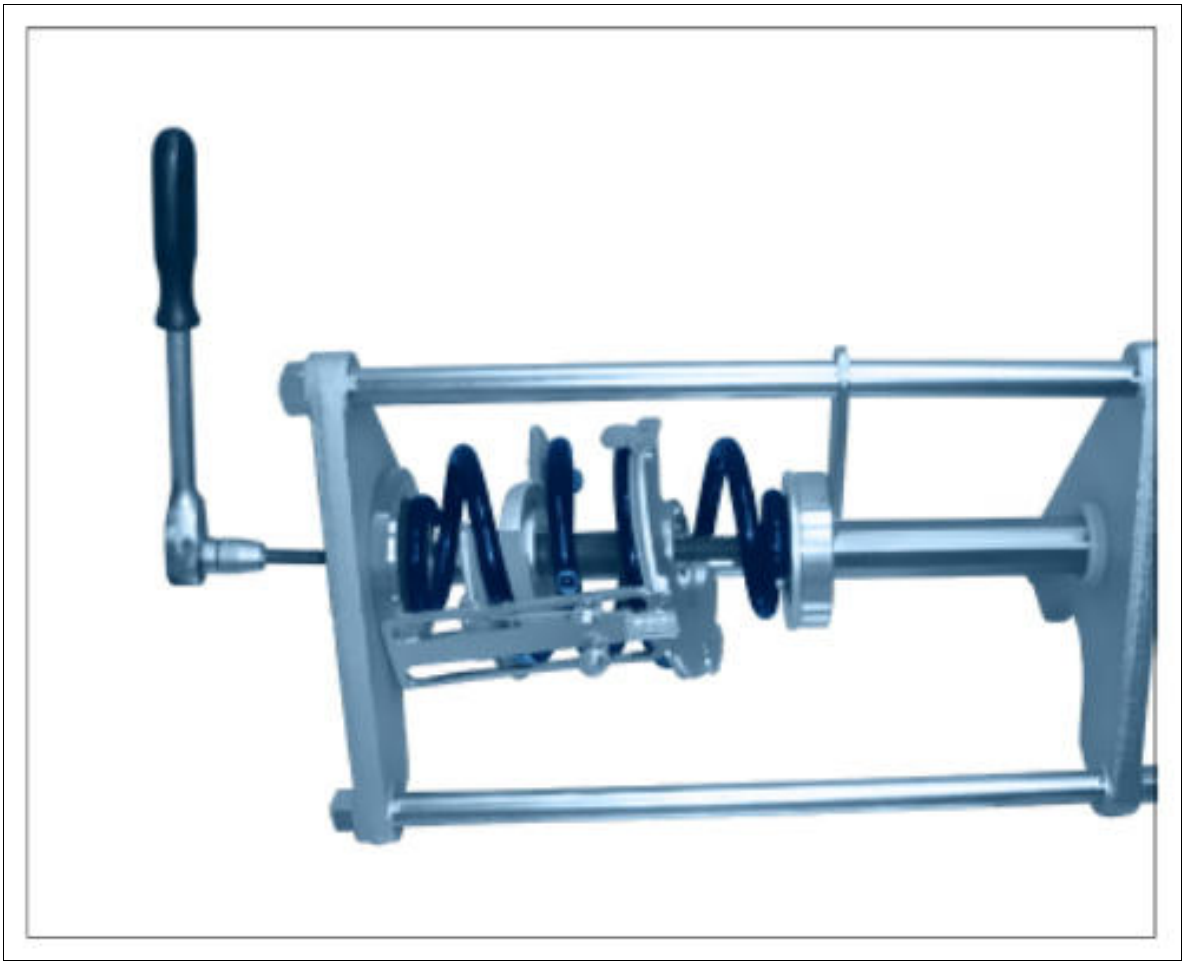


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 10.2. Use the **foot pump WE 1283** to tension the coil spring in the hydraulic tensioning device **-9-** until the tension on the pressure plates **-1, 2-** is relieved.

11. Unscrew spindle using socket wrench **VAS 6907/5** . → Unscrewing spindle

Fig 12: Tensioning Coil Spring



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Unscrew screws for the twist lock holders and remove pressure plates.
13. Relieve all tension on the coil spring.

WM 427219 REMOVING AND INSTALLING REAR COIL SPRING (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING REAR COIL SPRING > INSTALLING REAR COIL SPRING

Please note the following:

- Always replace coil springs in pairs.

1. Insert coil spring into the hydraulic tensioning device **VAS 6907/9** .

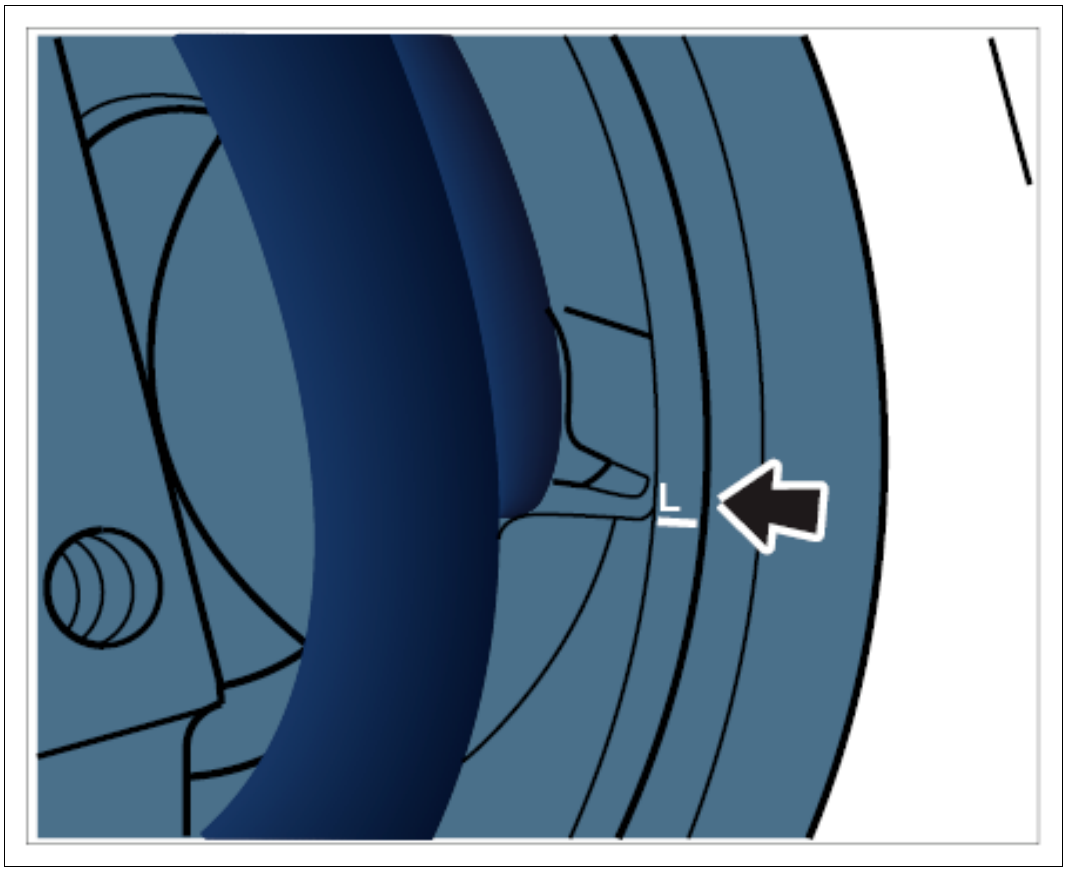
    1. 1.1. **Left coil spring:**

        Fit underside of end of spring in the spring tensioning system at marking "L".

        Right coil spring:

Fit underside of end of spring in the spring tensioning system at marking "R".

Fig 1: Locating Coil Spring Marking (Left)

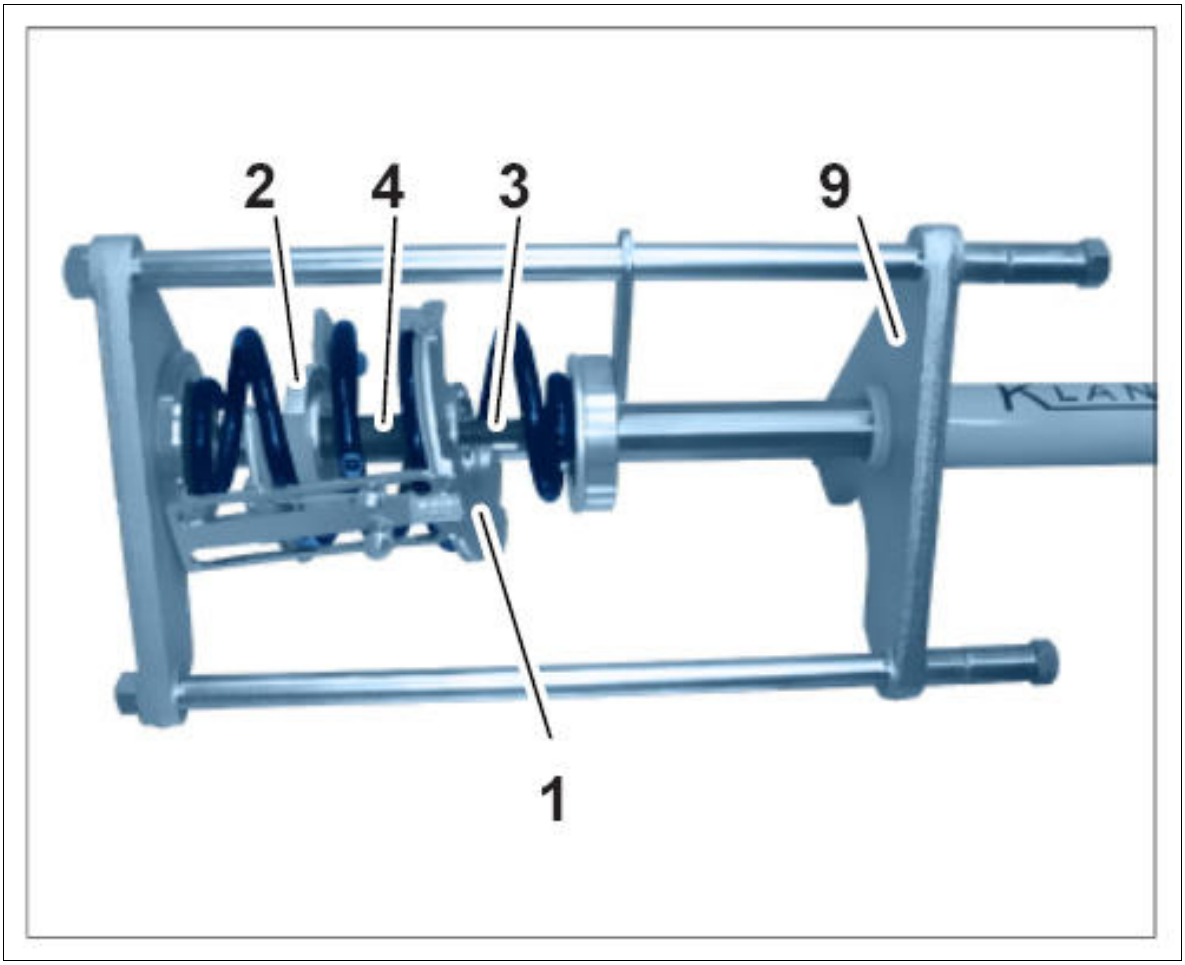


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 1.2. Use the **foot pump WE 1283** to tension the coil spring in the hydraulic tensioning device so that the pressure plates can be inserted.

2. Tension the coil spring using pressure plates.

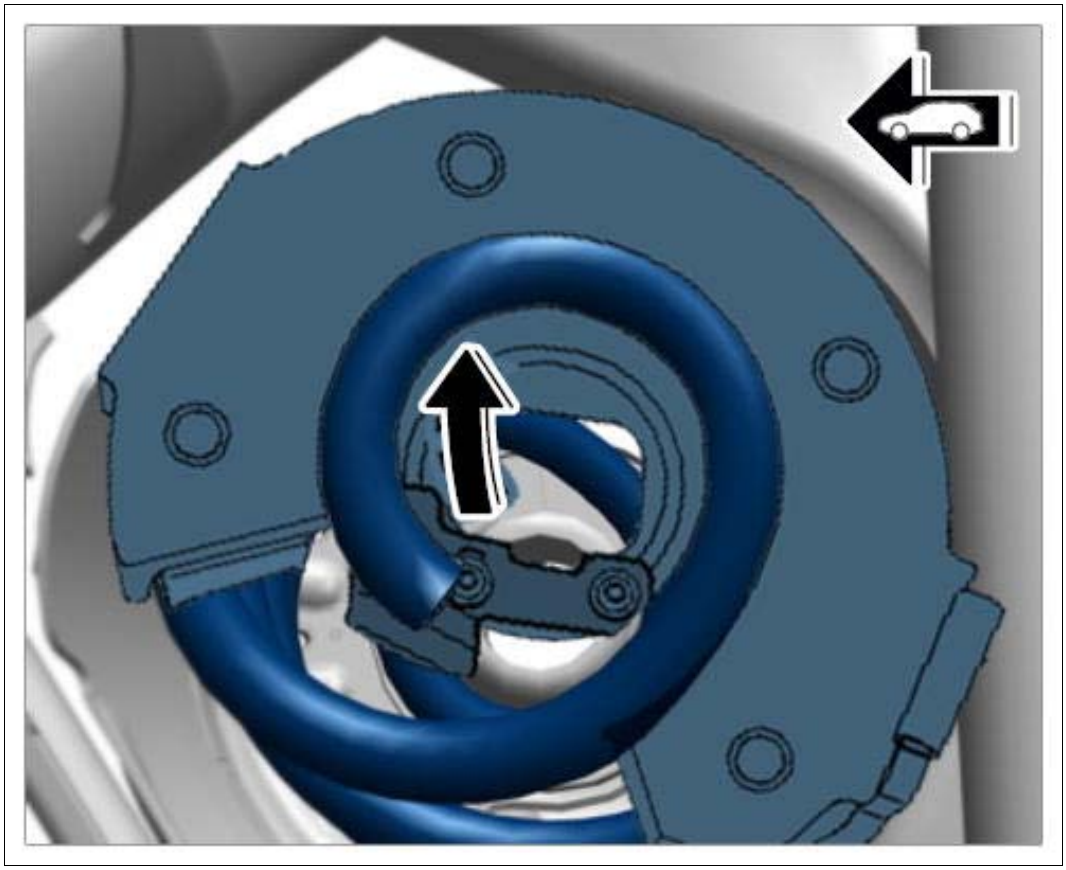
Fig 2: Compressing Coil Spring Using Pressure Plates



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 2.1. Insert pressure plate with locking mechanism **-1-** and pressure plate with pivot bearing **-2-** into the coil spring in such a way that three windings are enclosed.
2. 2.2. Insert plunger **-4-** into pressure plate with locking mechanism **-1-** . Use T-bar wrench **VAS 6907/6** as an aid if necessary.
3. 2.3. Press locking lever in **-direction of arrow-** to secure the plunger.

Fig 3: Closing Locking Lever



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. 2.4. Insert spindle **-3-** .
5. 2.5. Screw pressure plates **-1, 2-** together.
6. 2.6. Tension coil spring using socket wrench **VAS6907/5** .

3. Relieve tension on the hydraulic tensioning device **VAS6907/9** and remove coil spring with tensioning device.

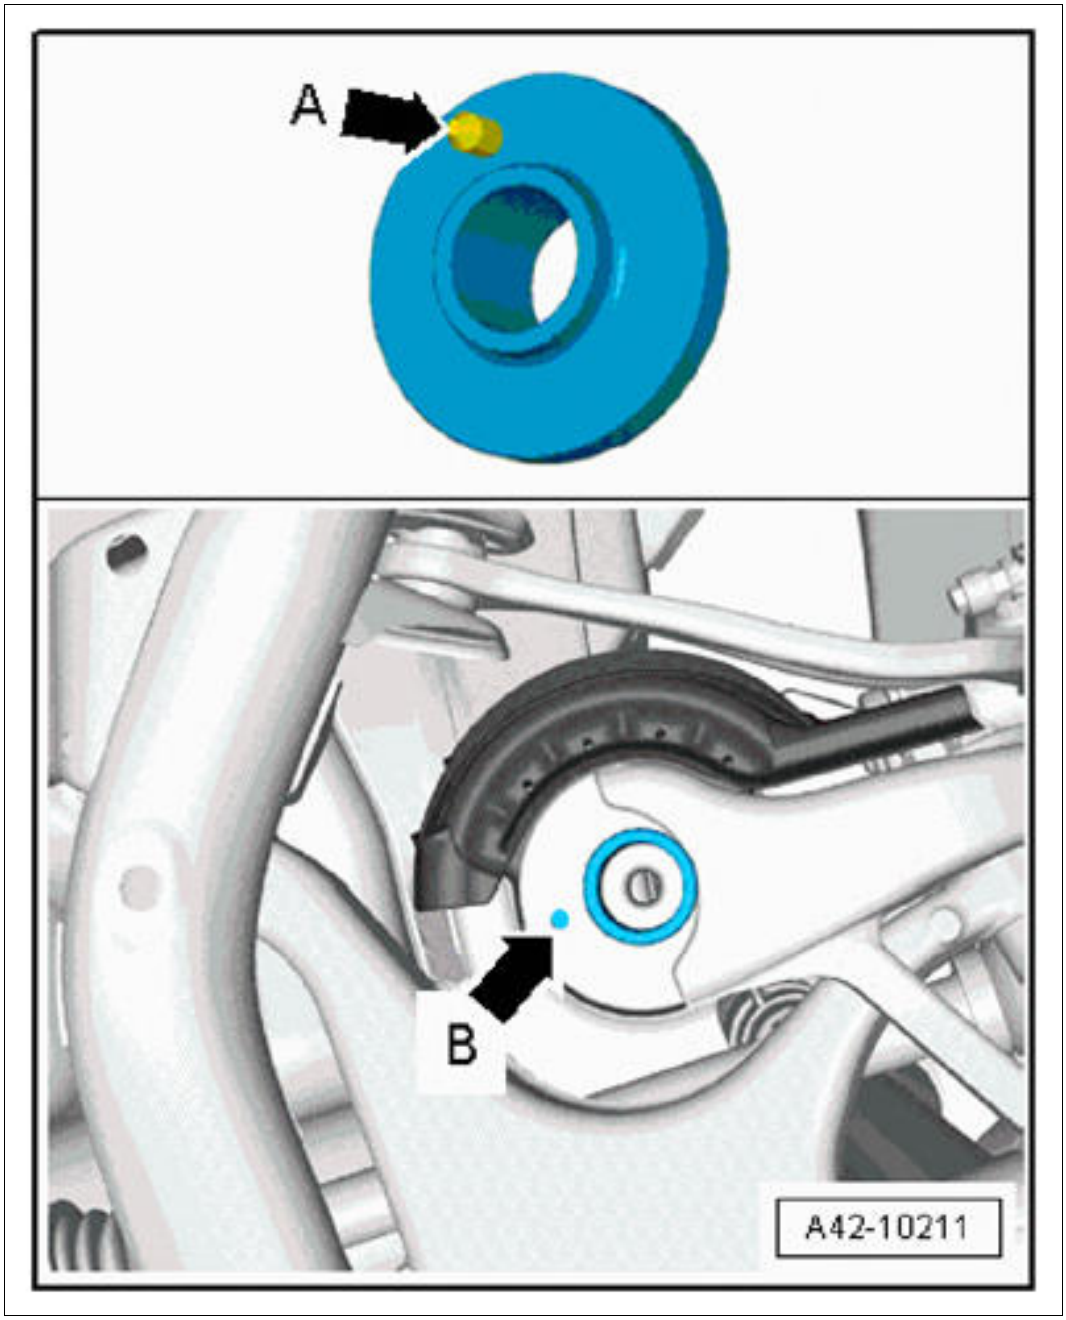
   Information

   The spindle must only protrude so far over the coil spring that the upper spring plate can still be fitted fully on the coil spring.

4. Insert coil spring with stone guard and upper and lower spring plates.

   1. 4.1. Insert lower spring plate with pin **-A-** into bore **-B-** on the wheel bearing housing.

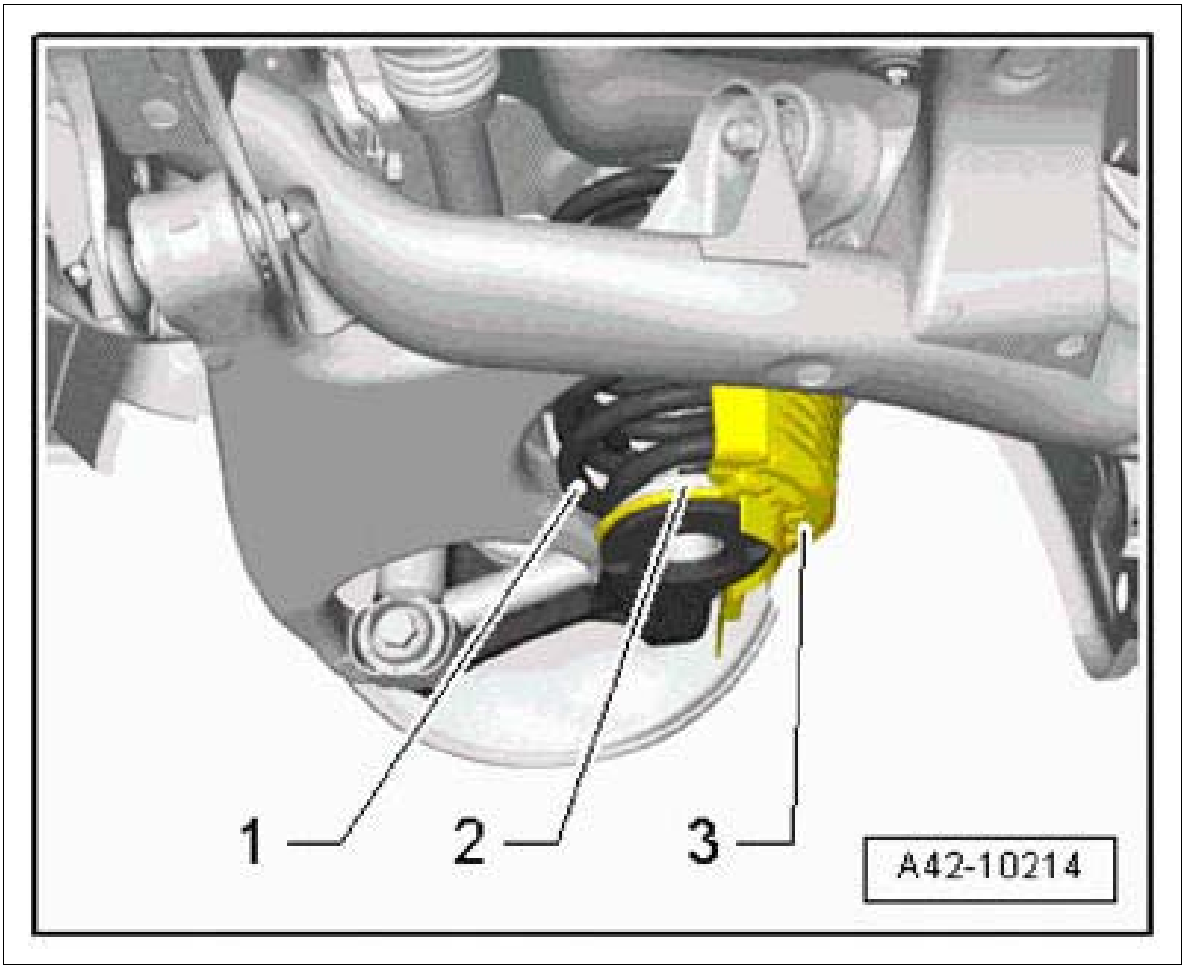
Fig 4: Locating Lower Spring Plate



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Screw coil spring **-1-** as far as it will go into the lower spring plate **-2-** .

Fig 5: Identifying Coil Springs And Spring Plate



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Relieve tension on the coil spring and remove pressure plates.

WM 427219 REMOVING AND INSTALLING REAR COIL SPRING (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Fit wheel. → INSTALLING WHEEL .
2. The vehicle will need to be aligned if new coil springs have been installed. → 449503 SUSPENSION ALIGNMENT, COMPLETE

WM 429019 REMOVING AND INSTALLING REAR ANTI-ROLL BAR (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2

WM 429019 REMOVING AND INSTALLING REAR ANTI-ROLL BAR (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING REAR ANTI-ROLL BAR > INSTALLING REAR ANTI-ROLL BAR

WARNING: Wheel bearing housing raised incorrectly

- *Risk of squashing*
- *Risk of damage to components*

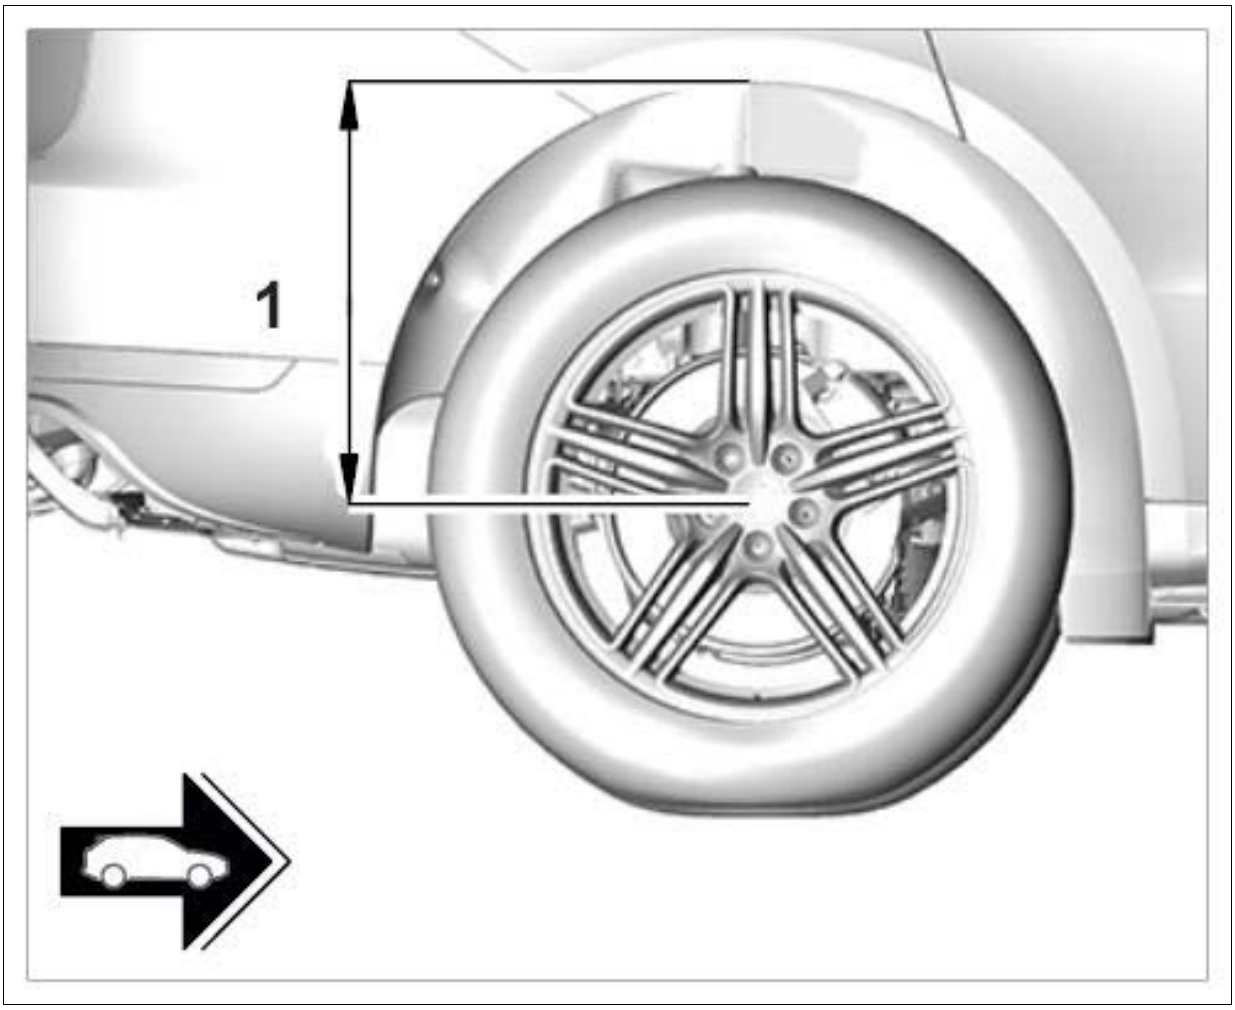
→ Wear personal protective gear.

→ Do not raise the wheel suspension higher than the normal vehicle position (vehicle resting on wheels).

Information

- All screws and threaded joints on the axle must be tightened in vehicle position. Vehicle position means: vehicle standing on its wheels, or the wheel suspension is raised with a universal vehicle lift. Dimension -1- , from lower edge of wing to center of axle corresponds to vehicle position. The current height can be found in → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT . Always observe the following points!

  Fig 1: Identifying Wheel To Wing Lower Edge Dimension (Rear Axle)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- On vehicles with air springs, the respective air spring must be bled using the Porsche System Tester . → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM
- Screws and nuts are Geomet-coated and must not be greased.

Installation is performed in reverse order to removal. Pay particular attention to the following:

1. Position connecting links **-2-** on the removed anti-roll bar **-3-** .
2. Screw fastening screws **-1-** into nuts, but do not tighten, so that the connecting links **-2-** can still move.

Fig 2: Identifying Rear Anti-Roll Bar And Connecting Links

WM 430115 CALIBRATING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
Quick clamping device	Workshop equipment	WE 1621		
PIWIS Tester II	Special tool	9818		
WM 430115 CALIBRATING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 430115 CALIBRATING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > CALIBRATING THE LEVELLING SYSTEM > CHECKING

Calibration must be performed if one or more of the following situations apply:

- Control unit was replaced.
- Level sensors were replaced.
- Vehicle lies to one side after being raised. If lifting platform mode is activated, carry out a test drive (lifting platform mode switches off and the vehicle corrects itself). If this does not work, check the system for faults → 430149 TROUBLESHOOTING THE LEVELLING SYSTEM and then calibrate the system.

Level sensors are calibrated by determining a correction value (corresponding to the actual height of the vehicle) and storing it permanently in the control unit.

WM 430115 CALIBRATING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > CALIBRATING THE LEVELLING SYSTEM > NOTES ON CALIBRATION

The nominal values for the nominal heights of the level sensors are stored in the control unit. The actual values of the respective axle heights, front left, front right, rear left, rear right, have to be measured manually and then entered using the Porsche System Tester. The actual values must be measured on the front and rear axle, both on the left and right. → Height Measurement Point On Rear Axle ; - Height Measurement Point On Front Axle .

See also: → Conditions For Carrying Out Calibration .

WM 430115 CALIBRATING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > CALIBRATING THE LEVELLING SYSTEM > HEIGHT MEASUREMENT POINT ON REAR AXLE

The distance between the lower edge of the wing and upper edge of the measured-value pickup **-X-** is measured.

Fig 1: Identifying Rear Axle Point Height

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 430115 CALIBRATING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > CALIBRATING THE LEVELLING SYSTEM > HEIGHT MEASUREMENT POINT ON FRONT AXLE

Information

Check the following at the height measuring point on the front axle:

- Lower edge of the wing is covered by the front lid.
- Only measure the height on the front axle when the front lid is open.

The distance between the lower edge of the wing and upper edge of the measured-value pickup **-X-** is measured.

Fig 1: Identifying Front Axle Point Height

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 430115 CALIBRATING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > CALIBRATING THE LEVELLING SYSTEM > CONDITIONS FOR CARRYING OUT CALIBRATION

Information

- Calibration can only be carried out while the vehicle is stationary.
- The vehicle must stand "floating" on the measuring platform to avoid straining the axles.
- Calibration is also required for the variants with "steel springs - PASM". The headlight beam adjustment (HBA) sensors are also calibrated.
- Before calibration is performed, the vehicle must be adjusted to Normal level and the Height sensor system component test must be carried out!
- Ensure that tire pressures have been adjusted to the respective tire specifications. (WM 4405IN WHEELS AND TIRES (ALL MODELS))
- The vehicle is raised and lowered during the height sensor system component test and then adjusts to the correct level!
- The measured values for the vehicle height must correspond approximately to the values specified under Adjustment values for suspension alignment . An implausible value will not be accepted. For the current comparative values for the vehicle height, please refer to the adjustment values for suspension alignment → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT
- Do not cancel calibration! If calibration is interrupted, the fault code 000286 "Customer service mode not complete" remains stored and is active! A warning appears in the instrument cluster. Select >>Drive links/checks<< in the menu. Delete the fault memory and perform calibration again!

WM 430115 CALIBRATING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > CALIBRATING THE LEVELLING SYSTEM > CALIBRATION PROCEDURE

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Adhere strictly to the information provided under "Conditions for carrying out calibration"!

Always carry out the "Calibration procedure" **step-by-step** until calibration is complete!

1. Fit measured-value pickup **Quick clamping device WE 1621** on the relevant wheel.
2. **PIWIS Tester II 9818** must be connected to the vehicle before starting the Tester. Switch on ignition using original remote control (hand-held transmitter).
3. Apply electric parking brake.
4. Close the doors and tailgate.
5. **Erase the fault memory.**

   To do this, connect the Porsche System Tester. Select >>Levelling system/PASM<< >>Fault memory<< >>Erase fault memory<< in the control unit overview.

   Follow the instructions on the Porsche System Tester.
6. **Perform Height sensor system component test.**

   Select >>Maintenance/repairs<< >>Height sensor system component test<< in the menu.

   Follow the instructions on the Porsche System Tester.
7. **Perform height sensor calibration.**

   Select >>Maintenance/repairs<< >>Height sensor calibration<< in the menu.

   Follow the instructions on the Porsche System Tester.

   Information

   Check the following at the height measuring point on the front axle:

   1. Lower edge of the wing is covered by the front lid.
   2. Only measure the height on the front axle when the front lid is open.

      1. 7.1. Determine the actual value for the height of the vehicle body at the measuring points.

         1. 7.1.1. When determining the height of the vehicle body, the height is measured from the lower edge of the wing to the upper edge of the measured-value pickup, dimension **X** .
         2. 7.1.2. Then add the **radius** of the measured-value pickup **32.5 mm** to this measured dimension X.

            Sample calculation:

            Measured dimension X = 430 mm; measured-value pickup radius = 32.5 mm

            X + measured-value pickup radius = height of vehicle body

            430 mm + 32.5 mm = 462.5 mm

      2. 7.2. Enter the determined values in the Porsche System Tester.

         If an implausible value is entered (actual value is not accepted by Porsche System

Tester), please refer to the information under: "Procedure: Measured actual value is not accepted".

8. **Complete the diagnostic session (only for steel springs)**

   Select >>Drive links/checks<< >>Completion of height sensor calibration<< in the menu.

   Follow the instructions on the Porsche System Tester.

   When calibration is completed successfully, >>**Result** << >>**Function completed** << is displayed!

When calibration is complete, the vehicle does not adjust automatically to Normal Level. The height values can only be checked after test-driving the vehicle.

WM 430115 CALIBRATING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > CALIBRATING THE LEVELLING SYSTEM > PROCEDURE: MEASURED ACTUAL VALUE IS NOT ACCEPTED

Information

During height sensor calibration, a height value that is entered may not be accepted by the Porsche System Tester.

In this case, at least one value is implausible, i.e. the value is not within the tolerance range for the vehicle height stored in the control unit.

The reason for this may be as follows:

- An incorrect calibration was carried out previously (e.g. by entering an incorrect measured value).
- A level sensor is faulty (e.g. due to a bent level sensor linkage or holder).

1. Measure the vehicle body height again.
2. If the measured values are identical to the values measured previously, check the front and rear level sensors for damage. Check, in particular, that the level sensor linkage or holders are not bent.

   If the level sensors are damaged, these must be replaced and the calibration must be repeated.

   → 431855 REPLACING FRONT LEVEL SENSOR

   → 431955 REPLACING REAR LEVEL SENSOR

3. If level sensors are intact, the specified vehicle level (required value: → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT) must be set step-by-step.

   Information

   The Porsche System Tester accepts height values with a required value tolerance of +/- 25 mm.

   If the determined mean value is not within this tolerance range during the step-by-step

procedure for setting the vehicle level, the closest tolerance range limit value must be entered as the actual value in the Porsche System Tester.

1. 3.1. Enter the mean value determined from the actual/required value at the affected vehicle position (front left, front right, rear left or rear right) instead of the unaccepted actual value.

   Example:

   The height measurement shows that front left vehicle height is 430 mm and the measured value is not accepted during height sensor calibration.

   Actual value: 430 mm; required value: 464 mm

   (Actual value + required value)/2 = mean value

   (430 mm + 464 mm)/2 = 447 mm

   Now enter the value 447 mm for the front left height in the Porsche System Tester.

2. 3.2. **Perform Height sensor system component test** (vehicle is adjusted to the required value on the affected side of the vehicle).

   Select >>Maintenance/repairs<< >>Height sensor system component test<< in the menu.

   Follow the instructions on the Porsche System Tester.

3. 3.3. **Perform height sensor calibration.**

   Select >>Maintenance/repairs<< >>Height sensor calibration<< in the menu.

   Follow the instructions on the Porsche System Tester.

   1. 3.3.1. Determine the actual value for the height of the vehicle body at the measuring points.

   2. 3.3.2. Enter the determined values in the Porsche System Tester.

4. 3.4. **Perform Height sensor system component test** again (vehicle is now at the required level).

   Select >>Maintenance/repairs<< >>Height sensor system component test<< in the menu.

   Follow the instructions on the Porsche System Tester.

WM 430149 TROUBLESHOOTING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) (MACAN, MACAN S, MACAN TURBO) > TOOLS

Safety instructions and information for repairing the chassis → 4X00IN SAFETY INSTRUCTIONS AND INFORMATION FOR REPAIRING THE CHASSIS

WM 430149 TROUBLESHOOTING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) (MACAN, MACAN S, MACAN TURBO) > INFORMATION > GUIDED FAULT FINDING

Symptom	Fault detection	Possible causes	Solution
Gradual loss of pressure ○ Vehicle lying to one side after a long time ○ Longer than average regulating times ○ No reaction to driver's request	Observe vehicle height over a long period of time and try to find the leak using commercially available leak detection spray	Leak in air-spring strut/air spring	Replace air-spring strut/air spring → 433019 REMOVING AND INSTALLING FRONT AIR-SPRING STRUT → 434319 REMOVING AND INSTALLING REAR AIR SPRING or carry out repairs
		Leak in air lines or valve unit	Check tightening torques for air line connections, check insertion depth of air lines (color marking), replace air line

Symptom	Fault detection	Possible causes	Solution
Vehicle lying to one side	1.) Check that the air	Air line on front axle not	Insert air line on front

○ No leaks in the system	line is fitted correctly on the front air springs	inserted far enough (fault code 284)	axle as far as it will go; only one marking should be visible. To check that the air line is fitted correctly, pull it briefly against the insertion direction. If it cannot be pulled out or can only be pulled out with considerable effort, the air line is fitted correctly.
	2.) Carry out Guided Fault Finding using the Porsche System Tester	Vehicle level sensor faulty	Replace vehicle level sensor → 431855 REPLACING FRONT LEVEL SENSOR → 431955 REPLACING REAR LEVEL SENSOR
		Linkage or holder for vehicle level sensor is bent	

Symptom	Fault detection	Possible causes	Solution
Vehicle is too high ○ Vehicle cannot be lowered	1.) Check that the vehicle has sufficient ground clearance	Vehicle position is raised	Look for signs of damage and check clearance around the air-spring struts/air springs and anti-roll bars
	2.) Check air line and line routing	Air line blocked, kinked or frozen Air line on front axle not inserted far enough (fault code 284)	Replace kinked air lines; carefully blow out frozen and blocked air lines using compressed air Insert air line on front axle as far as it will go; only one marking should be visible. To check that the air line is fitted correctly, pull it briefly against the insertion direction. If it cannot be pulled out or can only be pulled out with considerable effort, the air line is fitted correctly.
	3.) Levelling system: Upper/lower limit value exceeded	Compressor fuse faulty Air line on front axle not inserted far enough (fault code 284)	Replace compressor → 431519 REMOVING AND INSTALLING COMPRESSOR FOR LEVELLING SYSTEM Insert air line on front axle as far as it will go; only one marking should be visible. To check that

			the air line is fitted correctly, pull it briefly against the insertion direction. If it cannot be pulled out or can only be pulled out with considerable effort, the air line is fitted correctly.
	4.) Vehicle cannot be lowered despite having reconnected the air line on the front axle	Valve on the air-spring strut does not open.	Replace pressure retaining valve on the affected air-spring strut → 433655 REPLACING FRONT VALVE (PRESSURE RETAINING VALVE)
	5.) Carry out Guided Fault Finding using the Porsche System Tester	Check relays, plug contacts, wire harness and fuses in the vehicle electrical system Drain valve in the compressor faulty/leaking/open	Replace compressor → REMOVING AND INSTALLING COMPRESSOR FOR LEVELLING SYSTEM
		Drain valve in compressor or control valves in valve block do not work Valve unit does not work	Replace compressor → REMOVING AND INSTALLING COMPRESSOR FOR LEVELLING SYSTEM
	6.) Valve unit blocked	Dirt in valve unit	Replace valve unit → 432355 REPLACING VALVE UNIT (LEVELLING SYSTEM)
	7.) Compressor/valve block blocked	Dirt in compressor/valve block	Replace compressor → REMOVING AND INSTALLING COMPRESSOR FOR LEVELLING SYSTEM
	8.) If no faults were found after carrying out Step 6.), the compressor is faulty	Compressor faulty	Replace compressor → REMOVING AND INSTALLING COMPRESSOR FOR LEVELLING SYSTEM

Symptom	Fault detection	Possible causes	Solution
Vehicle is too low ○ Vehicle cannot be raised or can	1.) Check air line and line routing	Air line blocked, kinked or frozen	Replace kinked air lines; carefully blow out frozen and blocked air lines using compressed air

only be raised very slowly	2.) Valve unit blocked	Dirt in valve unit	Replace valve unit → 432355 REPLACING VALVE UNIT (LEVELLING SYSTEM)
	3.) Compressor/valve block blocked	Dirt in compressor/valve block	Replace compressor → REMOVING AND INSTALLING COMPRESSOR FOR LEVELLING SYSTEM
	4.) Carry out Guided Fault Finding using the Porsche System Tester	Check relays, plug contacts, wire harness and fuses in the vehicle electrical system Drain valve in the compressor faulty/leaking/open	Replace compressor → REMOVING AND INSTALLING COMPRESSOR FOR LEVELLING SYSTEM
		Drain valve in compressor or control valves in valve block do not work	Replace compressor → REMOVING AND INSTALLING COMPRESSOR FOR LEVELLING SYSTEM
	5.) If no faults were found after carrying out Step 4.), the compressor is faulty	Compressor faulty	Replace compressor → REMOVING AND INSTALLING COMPRESSOR FOR LEVELLING SYSTEM

Symptom	Fault detection	Possible causes	Solution
Rapid loss of pressure	Vehicle lying to the left or right; when you try to switch to a different level, you can hear air coming from the faulty air spring	Air-spring strut/air spring is faulty	Replace air-spring strut/air spring → 433019 REMOVING AND INSTALLING FRONT AIR-SPRING STRUT → 434319 REMOVING AND INSTALLING REAR AIR SPRING or carry out repairs → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM
		Air line torn off	Replace air line → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM

Symptom	Fault detection	Possible causes	Solution

Insufficient damping	Test drive: Adjust the damping level while the vehicle is in motion. You should feel a significant change in the damping effect when driving on uneven road surfaces. Also listen for "rumbling noises"	Damping adjustment valve faulty	Replace air-spring strut → 433019 REMOVING AND INSTALLING FRONT AIR-SPRING STRUT or replace rear shock absorber → 429319 REMOVING AND INSTALLING REAR SHOCK ABSORBER
		Vibration damper worn	Replace air-spring strut → 433019 REMOVING AND INSTALLING FRONT AIR-SPRING STRUT ; clean the air line system → **2.** Cleaning air line system or replace rear shock absorber → 429319 REMOVING AND INSTALLING REAR SHOCK ABSORBER
Error message "PASM failure" with significant inward/outward spring motion. The error message is gone after switching the ignition off and on again.	Fault code 322, 323, 324 or 325 stored in the fault memory.	Front level sensor holder bent.	Replace front level sensor → 431855 REPLACING FRONT LEVEL SENSOR .

WM 430149 TROUBLESHOOTING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) (MACAN, MACAN S, MACAN TURBO) > INFORMATION > PROCEDURE FOR CHECKING THE LEVELLING SYSTEM

1. Perform the following check under these conditions:
    1. The vehicle must be standing on a level surface.
    2. The vehicle must be cold and must not be moved during the check.
    3. The room temperature should be between 10 °C and 30 °C and must not fluctuate to any great extent.
        1. 1.1. Adjust the vehicle to Normal Level.
            1. 1.1.1. Stop the engine and move selector lever to position P.
            2. 1.1.2. **PIWIS Tester II 9818** must now be connected.

                Do not get into or out of the vehicle while adjusting the vehicle to normal level and after adjusting it to normal level. This can give false

alignment results.

3. 1.1.3. Select >>Levelling system/PASM<< >>Drive links/checks<< >>Adjust vehicle level<< in the control unit overview.

4. 1.1.4. Select the value **Low level 1** and press [F8] to start. Vehicle adjusts to Low Level.

5. 1.1.5. Once Low Level has been reached, select **Normal Level** and press [F8] to start. Vehicle now adjusts to Normal Level.

2. 1.2. Switch off the levelling system (switch it back on again when work is complete).

    1. 1.2.1. Use **PIWIS Tester II 9818** to select >>Levelling system/PASM<< >>Drive links/checks<< >>Activate/deactivate vehicle<< in the control unit overview.

    2. 1.2.2. Select the value **Deactivate levelling system (permanently)** and press [F8] to start. The levelling system is now switched off.

3. 1.3. Compress vehicle at front and rear axles by approximately 25 mm 2-3 times and allow it to spring back freely.

4. 1.4. Open the bonnet.

5. 1.5. Fit measured-value pickup **Quick clamping device WE 1621** on the relevant wheel.

    Information

    Check the following at the height measuring point on the front axle:

    1. Lower edge of the wing is covered by the front lid.

    2. Only measure the height on the front axle when the front lid is open.

6. 1.6. Determine the actual value for the height of the vehicle body at the measuring points.

Fig 1: Identifying Front Axle Height

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.6.1. When determining the height of the vehicle body, the height is measured from the lower edge of the wing to the upper edge of the measured-value pickup, dimension **X** .

2. 1.6.2. Then add the **radius** of the measured-value pickup **32.5 mm** to this measured dimension **X** .

   Sample calculation:

   Measured dimension X = 430 mm; measured-value pickup radius = 32.5 mm

   X + measured-value pickup radius = height of vehicle body

430 mm + 32.5 mm = 462.5 mm

7. 1.7. Measure the vehicle height (→ **1.6.**) again after two hours and compare it with the first measurement.

   Dimensions and tolerances can be taken from the prescribed vehicle height for vehicles with air suspension. → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT

If the vehicle is lying at an angle, there is a leak at the wheel suspension with the greatest difference between the first and second measurement.

Use commercially available leak detection spray to check the affected air-spring strut/air spring and the relevant air line one after the other.

If there is no difference after two hours, the vehicle height must be measured again after 24 hours.

The following components must also be checked:

1. Air line connections
2. Air-spring strut/air spring
3. Valve unit

If the vibration dampers are faulty, oil from the vibration damper may have entered the air supply system. To ensure that the air spring system works perfectly, it is absolutely essential that you clean the system after a fault is found and replace other components.

2. Procedure for repairing the air spring system after a fault is found on the vibration dampers:
   1. Screw off the affected line on the air-spring strut/air spring and solenoid valve block.
   2. Blow out the line several times until it is clean using compressed air by introducing the compressed air at the end of the line at the solenoid valve block.
   3. Check for traces of vibration damper oil in the solenoid valve block.
   4. If vibration damper oil has contaminated the valve unit, it must be replaced.
   5. Check the internal line from the compressor to the solenoid valve block.
   6. If there is oil in the line between the compressor and the pressure accumulator, the line and the pressure accumulator must be replaced.

      If there is oil in the internal line, the compressor must be replaced.

WM 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	

pressure reducer	Workshop equipment	WE 1409		adapter	Special tool	9825	For connecting to the air spring line	connecting line	Special tool	9825/1	For connecting to the compressed gas bottle of nitrogen	valve screwdriver	Commercially available tool	Nr.164 Pos.5		

WM 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > BLEEDING AND FILLING THE LEVELLING SYSTEM >

INSTRUCTIONS FOR WORKING ON VEHICLES WITH AN EMPTY AIR SUSPENSION SYSTEM IN THE WORKSHOP

Information

Vehicles That Have Been Raised With The Air Suspension System Empty Must Not Be Set Back Down On Their Wheels Or Driven.

- Raising A Vehicle With Empty Air-Spring Struts Creates A Vacuum In The Air Springs. The Air-Spring Strut Bellows May Develop Creases After The Vehicle Has Been Set Back Down On The Floor. This Results In The Premature Failure Of The Air-Spring Struts.
- If The Vehicle Has Been "Driven" With One Or More Empty Air Springs, These Air Springs Must Be Replaced.
- Absolute Cleanliness Is Essential When Working On Air Suspension Systems.

Maneuvering A Vehicle With An Empty Air Suspension System Is Not Permitted Because This Will Damage The Air Springs!

WM 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > BLEEDING AND FILLING THE LEVELLING SYSTEM > BLEEDING AND FILLING AN AIR SPRING > BLEEDING AN AIR SPRING WITHOUT ANY LOSS OF SYSTEM AIR

This function is used for bleeding when working on an air spring or the lines for an air spring. The air from up to two air-spring struts can be stored in the pressure accumulator.

1. Switch off the levelling system
    1. 1.1. Switch on ignition.
    2. 1.2. Press the levelling system button for at least → **Time: +10 s** .
2. Raise the vehicle (wheels must be suspended freely). → 4X00IN LIFTING THE VEHICLE
3. Select >>Levelling system/PASM<< >>Maintenance/repairs<< >>Replacement of an air spring<< in the control unit overview. Select the relevant air spring and then select >>Bleed<<. Follow the instructions on the Porsche System Tester.
4. After completing repair work, select >>Levelling system/PASM<< >>Maintenance/repairs<< >>Replacement of an air spring<< in the control unit overview and then select >>Fill<<. Follow the instructions on the Porsche System Tester.

WM 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > BLEEDING AND FILLING THE LEVELLING SYSTEM > BLEEDING AND FILLING MULTIPLE COMPONENTS AND/OR THE PRESSURE ACCUMULATOR > BLEEDING MULTIPLE COMPONENTS AND/OR THE PRESSURE ACCUMULATOR WITH PARTIAL LOSS OF SYSTEM AIR

This function is used for bleeding when working on the system and/or the pressure accumulator. Some of the system air is lost in the process.

1. Select >>Levelling system/PASM<< >>Maintenance/repairs<< >>Replacement of several components or replacement of the pressure accumulator<< in the control unit overview and then select >>Bleed<<. Follow the instructions on the Porsche System Tester.
2. After completing repair work, select >>Levelling system/PASM<< >>Maintenance/repairs<< >>Replacement of several components or replacement of the pressure accumulator<< in the control unit overview and then select >>Fill<<. Follow the instructions on the Porsche System Tester. Refer to "FILLING " .

WM 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > INFORMATION > FILLING

Information

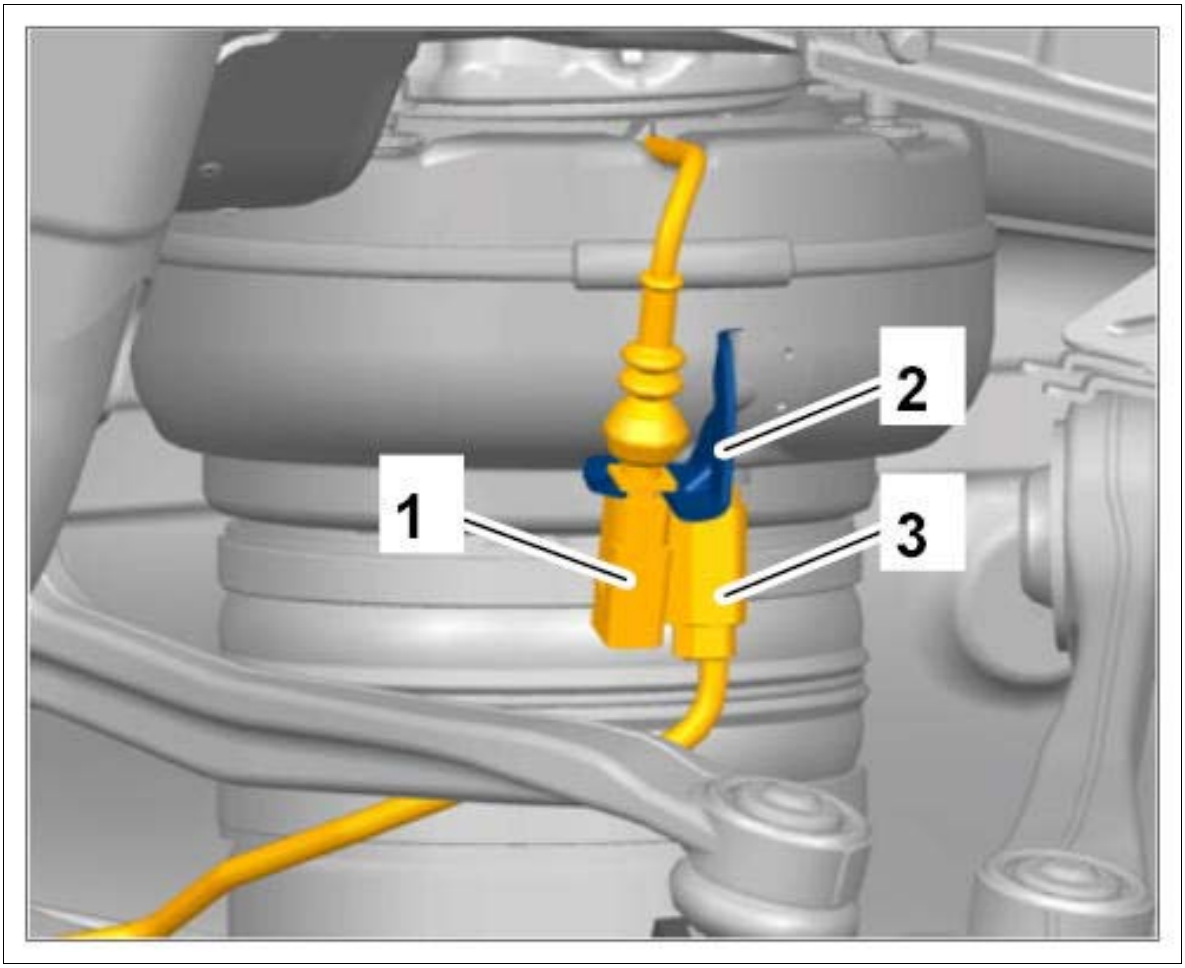
Only nitrogen 5.0 may be used for filling the air suspension system.

- Use a compressed gas bottle with a corresponding pressure reducer unit and pressure gauge.
- Fill the air suspension system to at least → Pressure: +16 bar.
- Fill the air suspension system to max. → Pressure: +17 bar
- Wheels must be suspended freely.
- Switch on ignition.

The air suspension system is filled from the front right air line. After filling the system using the compressed gas bottle of nitrogen, the front right air-spring strut is filled from the pressure accumulator.

1. Raise the vehicle. → 4X00IN LIFTING THE VEHICLE
2. Disconnect air-spring strut line **-3-** at the front right.

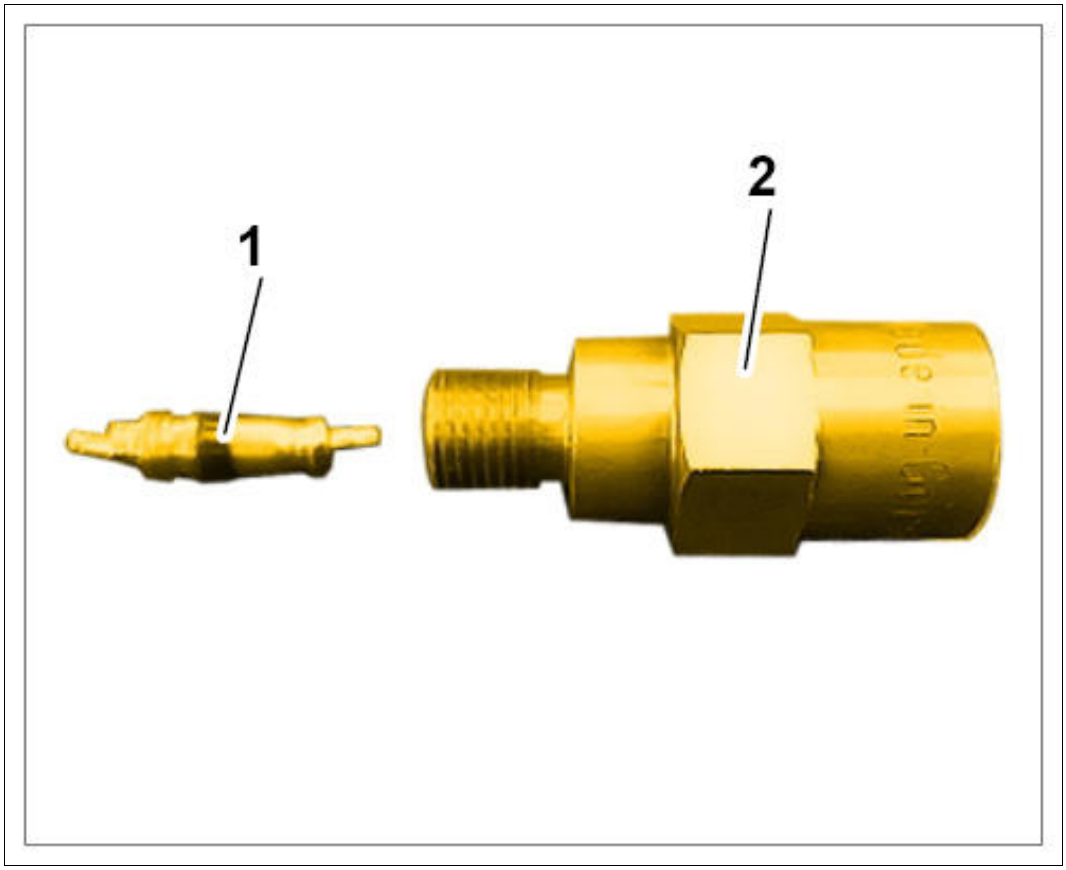
Fig 1: Identifying Line Connections For Air-Spring Strut



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 2.1. Remove valve pin **-1-** using **valve screwdriver Nr.164 Pos.5** from **adapter 9825 -2-** .

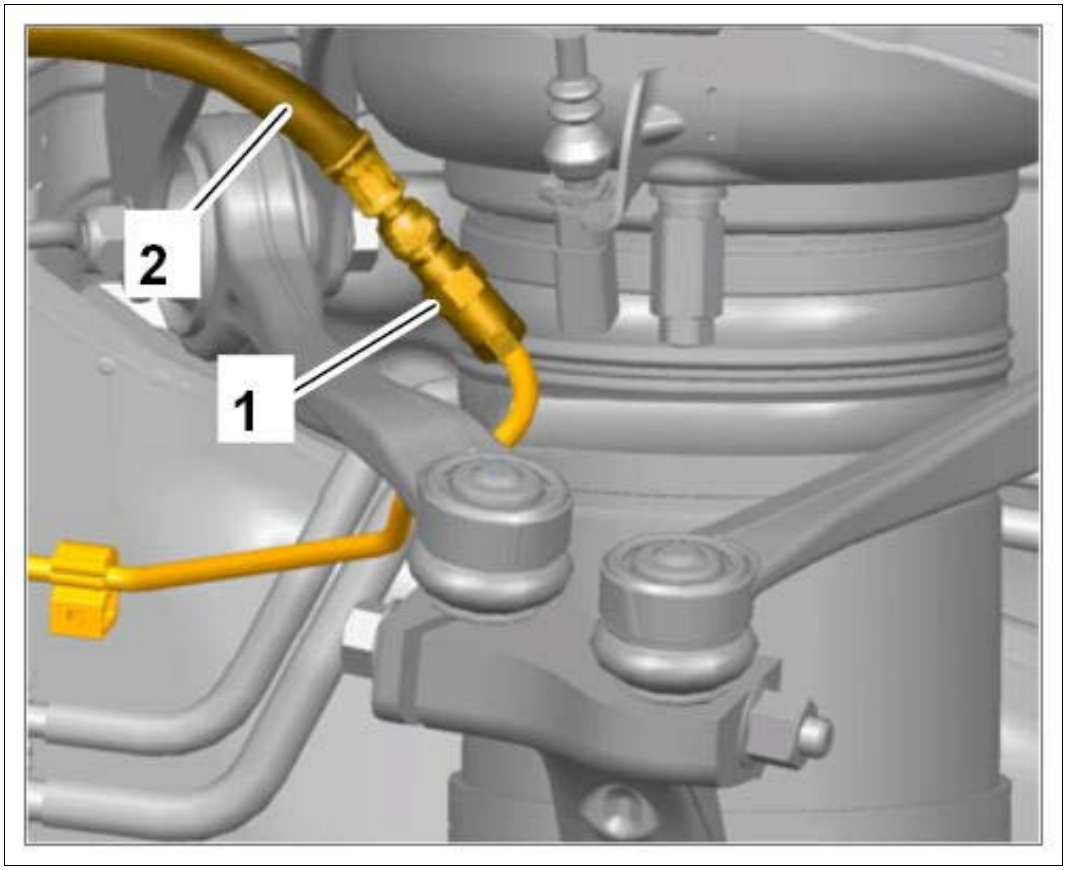
Fig 2: Removing Valve Pin



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 2.2. **Adapter 9825 -1-** and **connecting line 9825/1 -2-** must be connected to the compressed gas bottle of nitrogen and **pressure reducer WE 1409.**

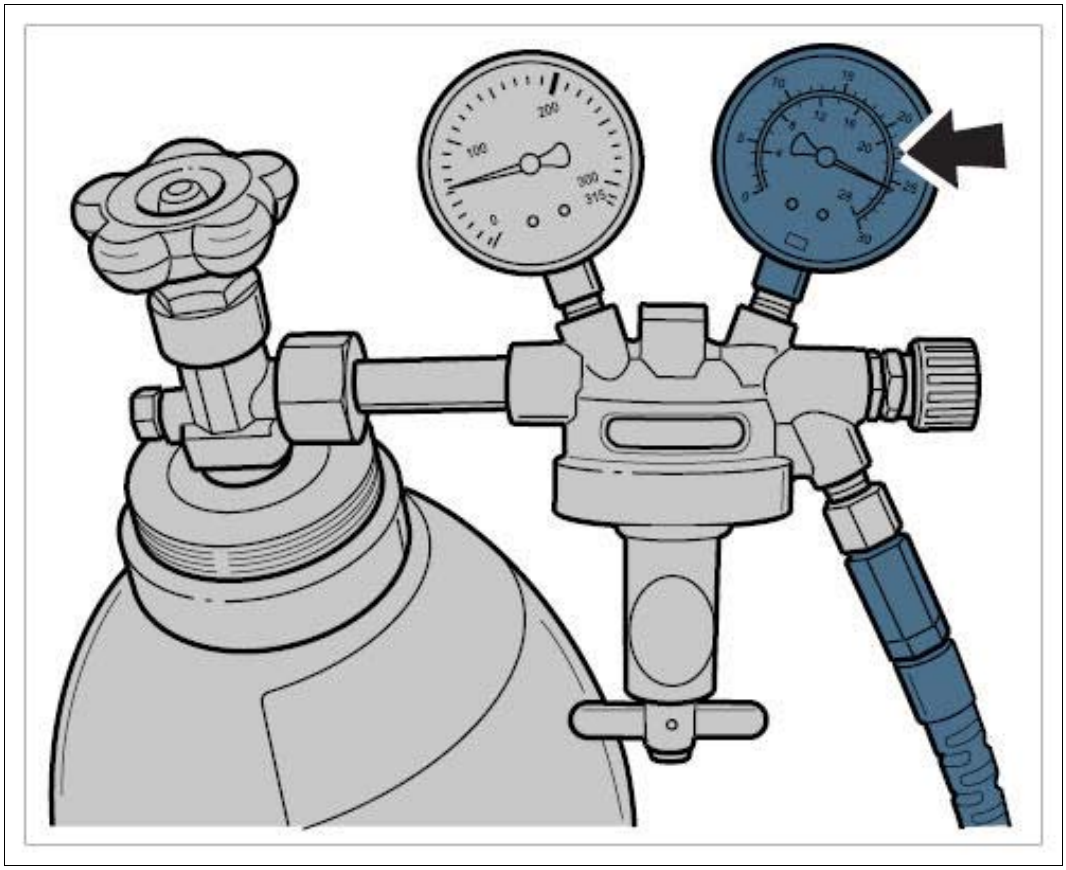
Fig 3: Connecting Adapter And Compressed Gas Bottle



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 2.3. Open the compressed gas bottle and set the → **Pressure: +17 bar** max. (shown as an example!)

Fig 4: Checking Gas Bottle Pressure



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Connect the Porsche System Tester and select >>Levelling system/PASM<< >>Maintenance/repairs<< >>Replacement of several components or replacement of the pressure accumulator<< in the control unit overview and then select >>Fill<<. Follow the instructions on the Porsche System Tester.

4. Fit air line at the front right.

5. Complete the >>Fill<< process. Follow the instructions on the Porsche System Tester.

WM 4301IN COMPONENT ARRANGEMENT - AIR SUSPENSION (MACAN, MACAN S, MACAN TURBO) > COMPONENT ARRANGEMENT - AIR SUSPENSION > COMPONENT ARRANGEMENT - AIR SUSPENSION

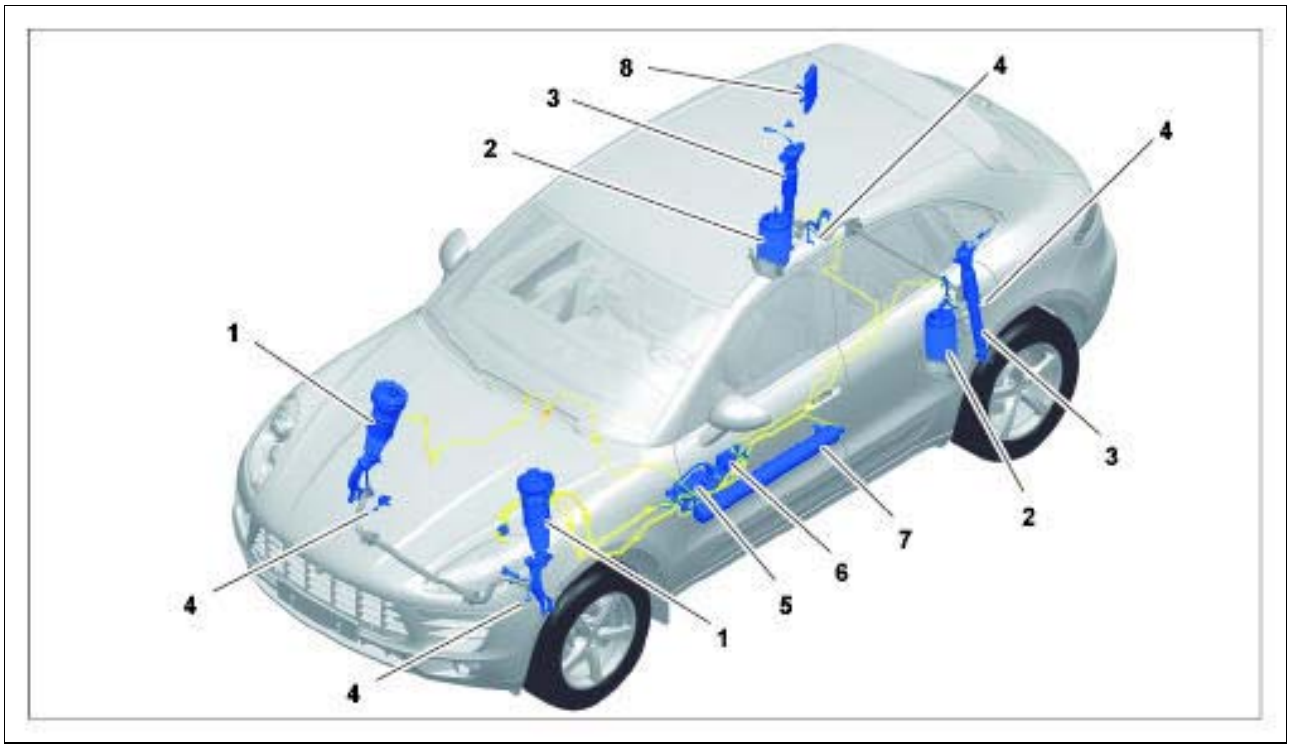
The Macan models feature an optional levelling system with fully supporting air suspension on both axles and an electronically controlled damping system Porsche Active Suspension Management (PASM).

The air suspension with level control makes it possible to actively adapt the ground clearance of the Macan to the current driving situation or to the vehicle load.

Depending on the load, various vehicle ride heights with various suspension characteristics can be achieved by increasing or decreasing the air volume. The amount of air needed for each air-spring strut is determined by means of a control unit and provided via an air supply consisting of a compressor, a

solenoid valve unit and pressure accumulator.

Fig 1: Identifying Air Suspension Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*

- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → **Nominal value: 40 A** to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition and press [F12] to continue.
2. Select the vehicle type and start the diagnostic application.
3. Select the required control unit **PASM** in the **overview** .
4. **Extended identifications** must now be selected.
5. **Enter the vehicle identification number** and press [Enter] to confirm your entry.
6. **Maintenance/repairs** must then be selected.
7. **Control unit replacement** must now be selected. Then press [F12] to continue.
8. **Select Write data,** press [F12] and then press [F8] to start. Data is installed.
9. The Tester confirms that **Coding has been written successfully.** Press [F12] to continue.
10. Read out the fault memory and erase it if necessary.
11. Check the PASM function during the test drive.

WM 431855 REPLACING FRONT LEVEL SENSOR (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Front level sensor to front-axle carrier	M8 thread	Tightening torque	20 Nm (15 ftlb.)		
Level sensor to lower trailing arm	M6 thread	Tightening torque	9 Nm (6.5 ftlb.)		

WM 431855 REPLACING FRONT LEVEL SENSOR (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Raise the vehicle. → 4X00IN LIFTING THE VEHICLE

WM 431855 REPLACING FRONT LEVEL SENSOR (MACAN, MACAN S, MACAN TURBO) > REPLACING FRONT LEVEL SENSOR

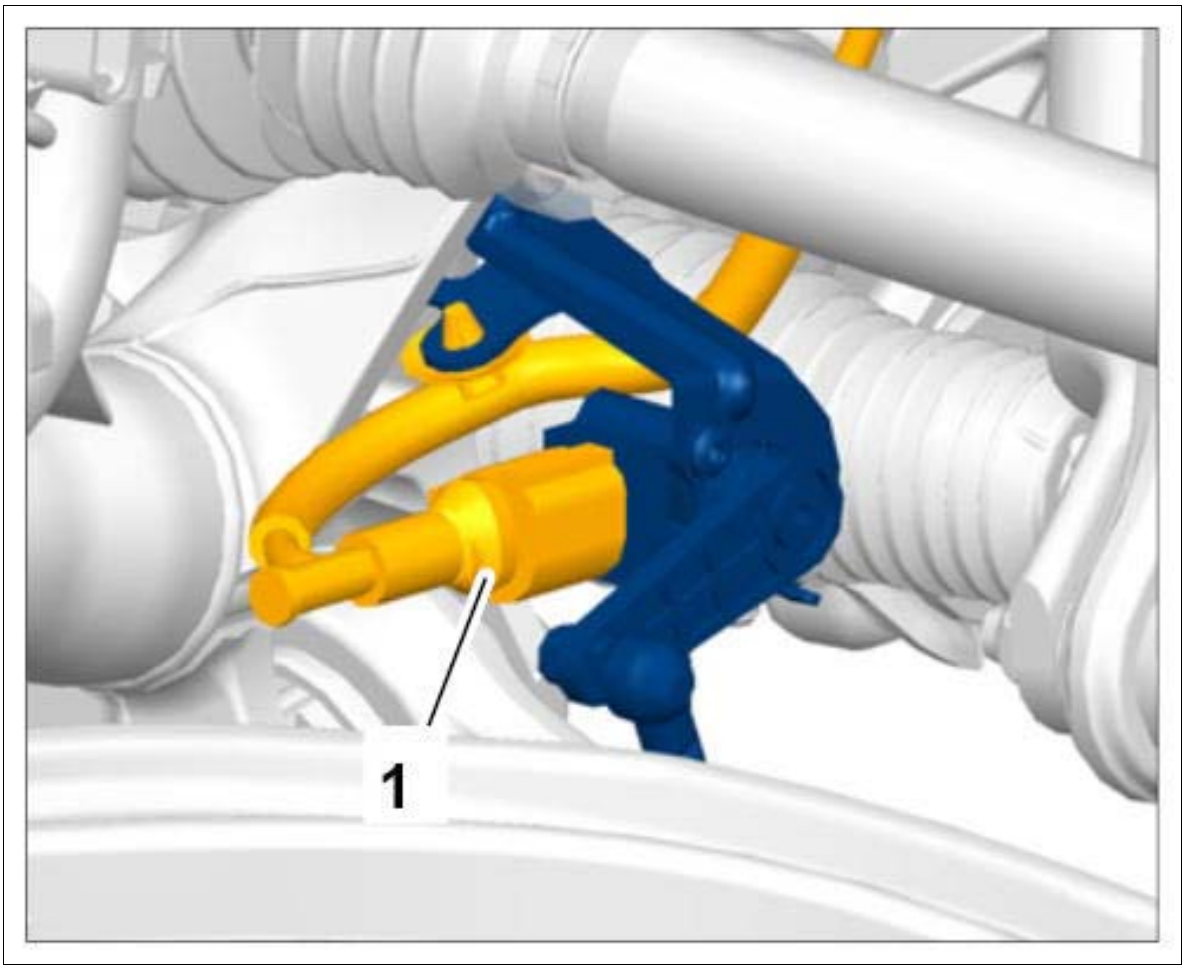
Information

Either two or four level sensors are installed on the vehicle, depending on equipment variant:

- Steel springs without PASM: only left side of the vehicle (front and rear axle)
- Air springs and steel springs with PASM: left and right side of the vehicle (front and rear axle)

1. Press electric connector **-1-** together and disconnect it.

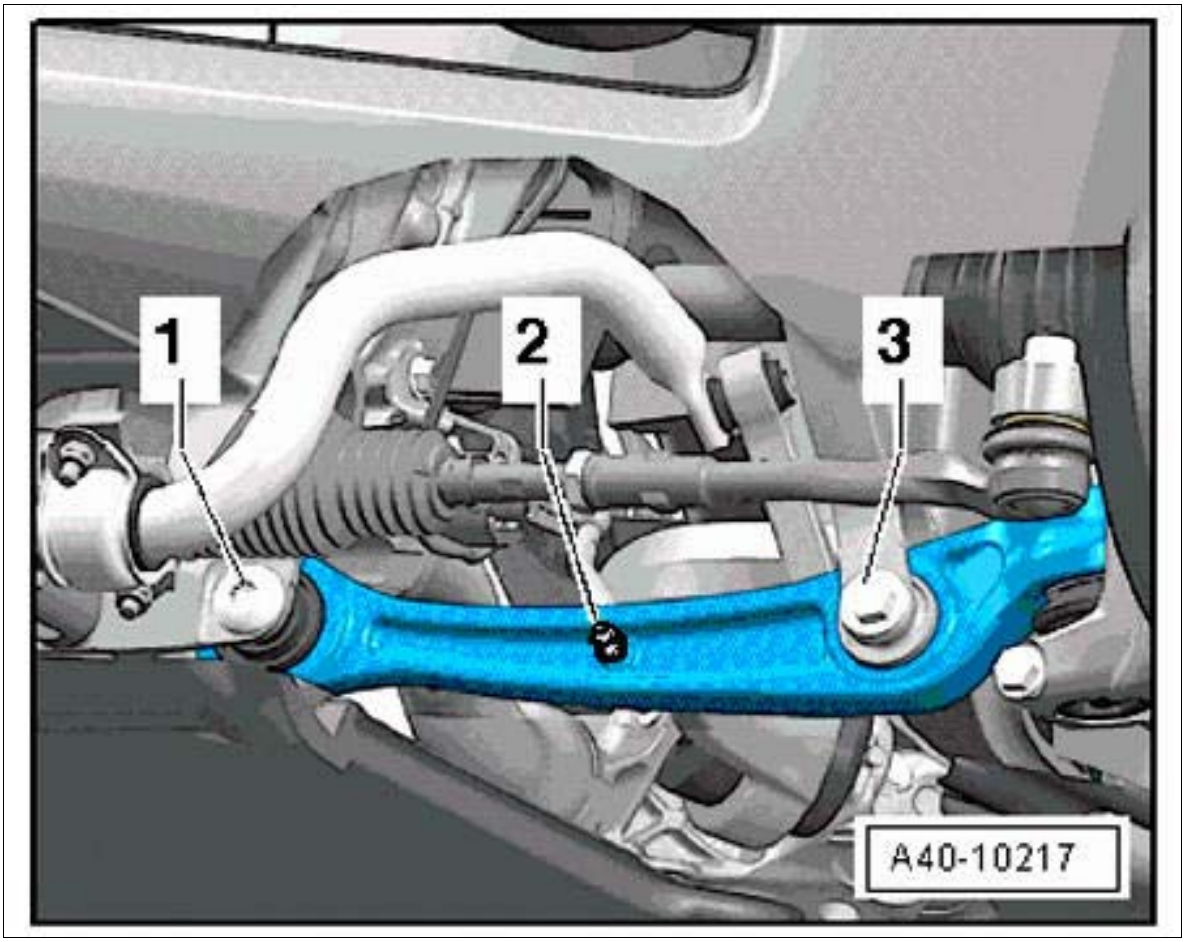
Fig 1: Identifying Level Sensor Connector



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Unscrew nut **-2-** for the level sensor on the lower trailing arm.

Fig 2: Identifying Lower Trailing Arm Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Loosen nut **-3-** and remove level sensor.

Fig 3: Identifying Level Sensor Mounting

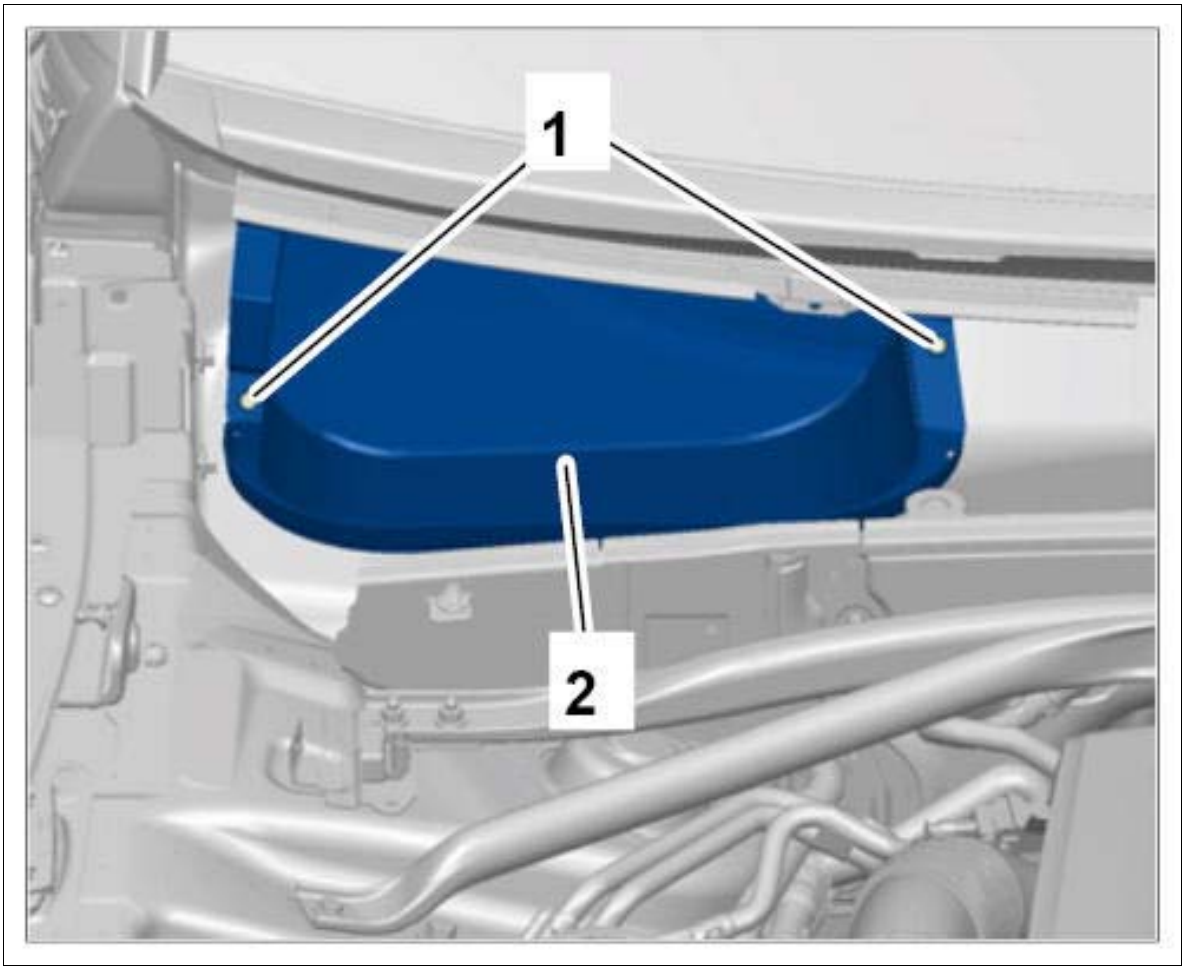
1. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .
2. Bleed the levelling system → BLEEDING AND FILLING THE LEVELLING SYSTEM .
3. Remove wheel → 440519 REMOVING AND INSTALLING WHEEL .
4. Remove cowl panel cover → 508719 REMOVING AND INSTALLING COWL PANEL COVER .
5. Unscrew fastening screws **-1-** and remove air inlet housing cover **-2-** .

Fig 1: Identifying Air Inlet Housing Cover Mounting Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Remove front trim panel → 700219 REMOVING AND INSTALLING FRONT TRIM PANEL .
7. Remove additional reinforcement on dome strut → 408619 REMOVING AND INSTALLING FRONT STRUT (DOME STRUT) .

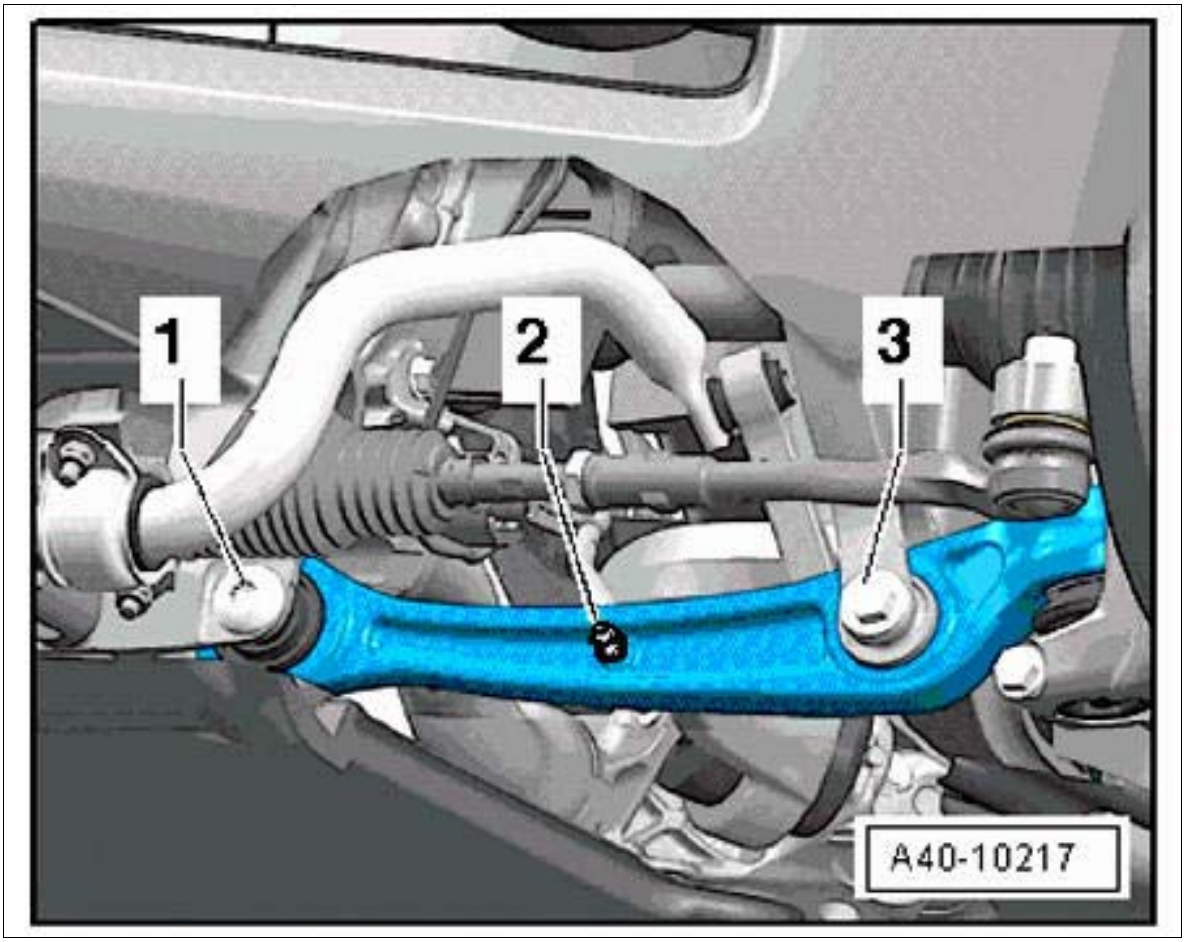
   Information

   If the level sensor remains fitted, this can bend the level sensor holder.

   This causes a malfunction in the levelling system!

8. Screw off nut **-2-** on the level sensor.

Fig 2: Identifying Lower Trailing Arm Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Remove shock absorber fork. → 408919 REMOVING AND INSTALLING SHOCK ABSORBER FORKS

WM 433019 REMOVING AND INSTALLING FRONT AIR-SPRING STRUT (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING FRONT AIR-SPRING STRUT > REMOVING FRONT AIR-SPRING STRUT

Information

To prevent damage to the air springs, pay particular attention to the following points when handling air springs:

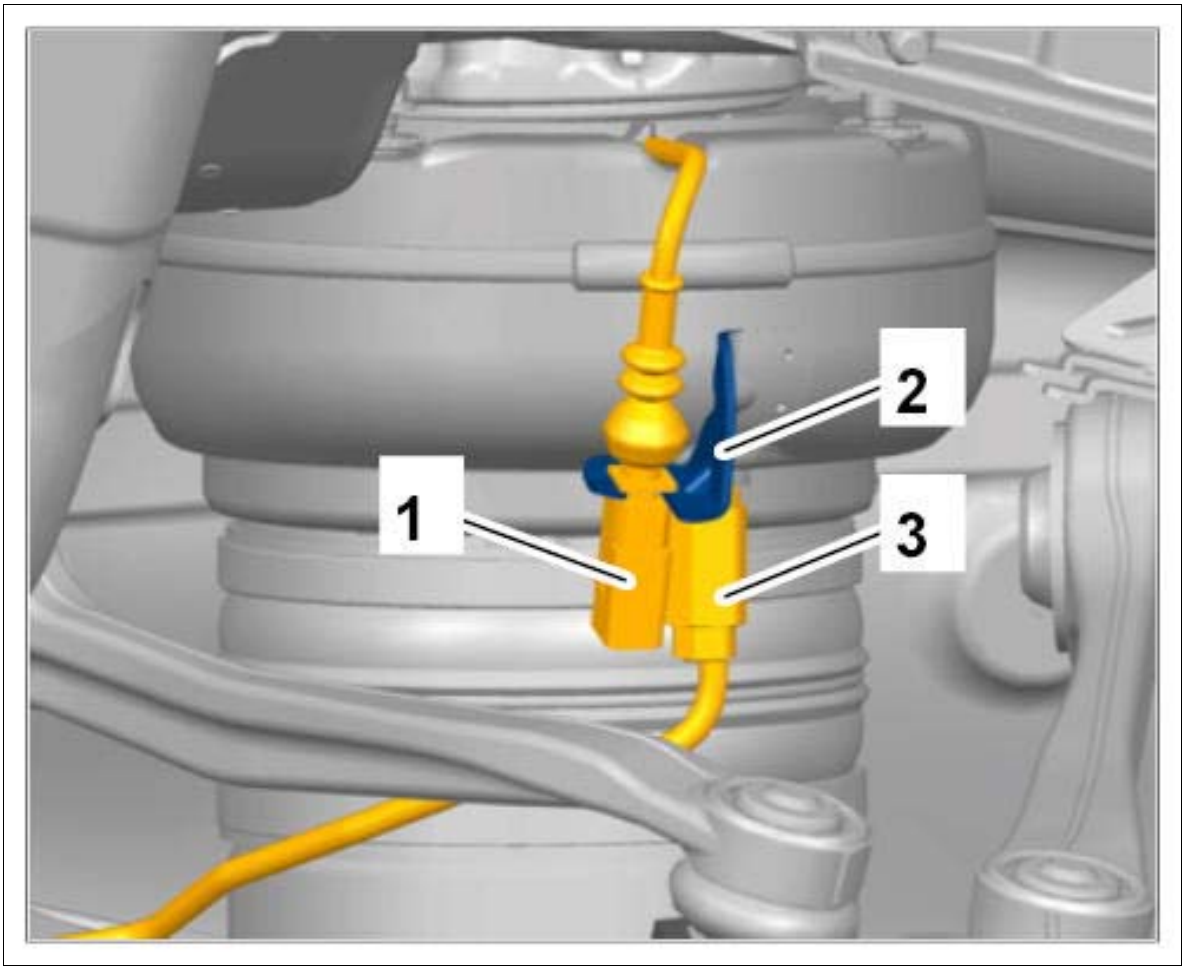
- Never empty air springs completely. This applies to both installed and removed air springs . Air springs must only be bled as described under → 4301IN DRAINING AND FILLING THE LEVELLING SYSTEM .
- Never lower a vehicle with empty air springs

1. Remove PASM connector.

1. 1.1. Loosen connector and release line from the holder **-1-** .
2. 1.2. Release connector **-2-** and disconnect it.

2. Loosen the air line **-3-** on the air-spring strut **quickly (only a small amount of air should escape)** and counter at the pressure-retaining valve while doing this (the pressure-retaining valve must not loosen!).

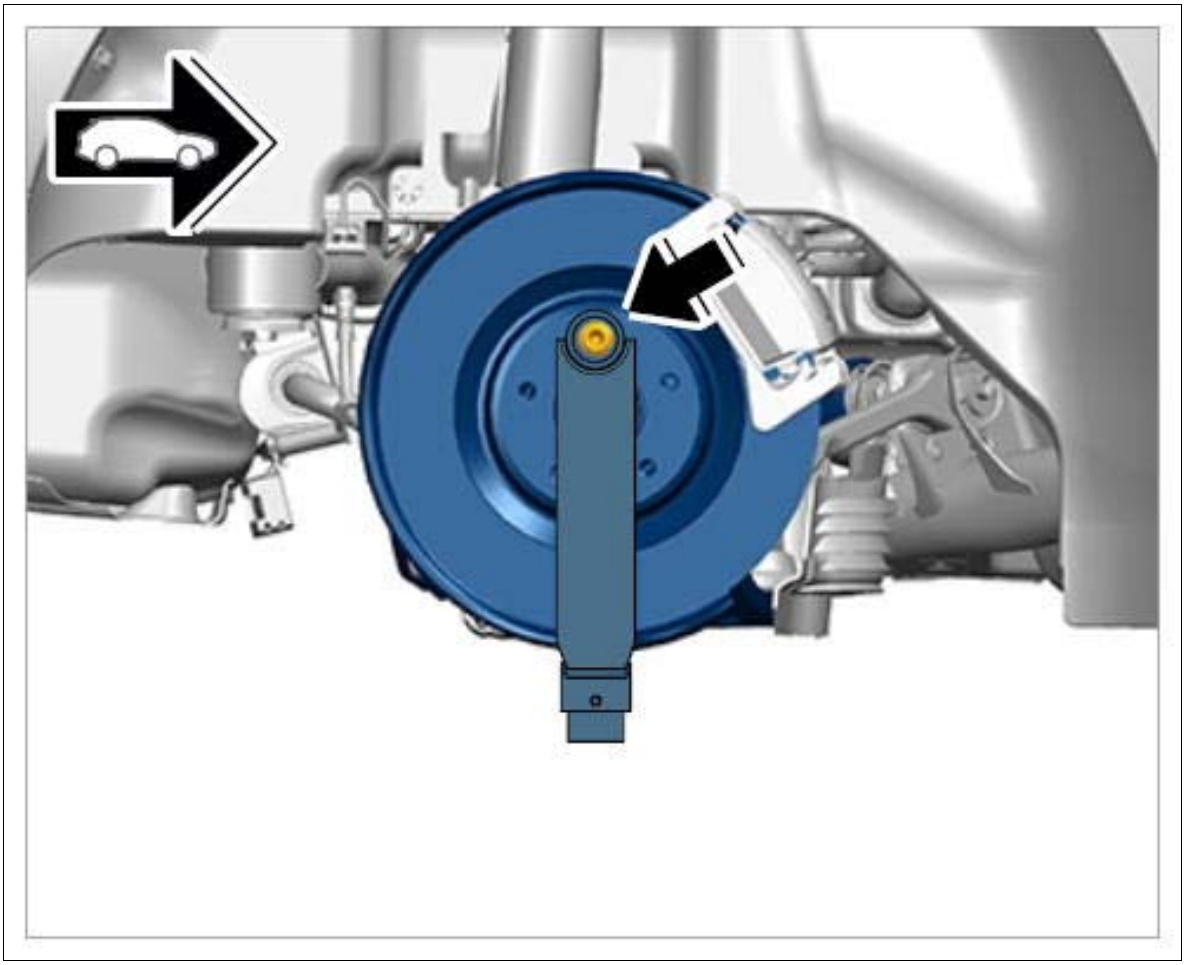
Fig 1: Identifying Line Connections For Air-Spring Strut



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Support the wheel bearing housing to prevent the wheel bearing housing from tilting.

Fig 2: Locating Support (T10149) Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. Turn the wheel hub in such a way that a bore for a wheel bolt is at the top.
2. 3.2. **Support T10149** must be secured to the wheel hub with a wheel bolt **-arrow-**
3. 3.3. **Support T10149** must now be fitted into the **transmission jack WE 1082.**

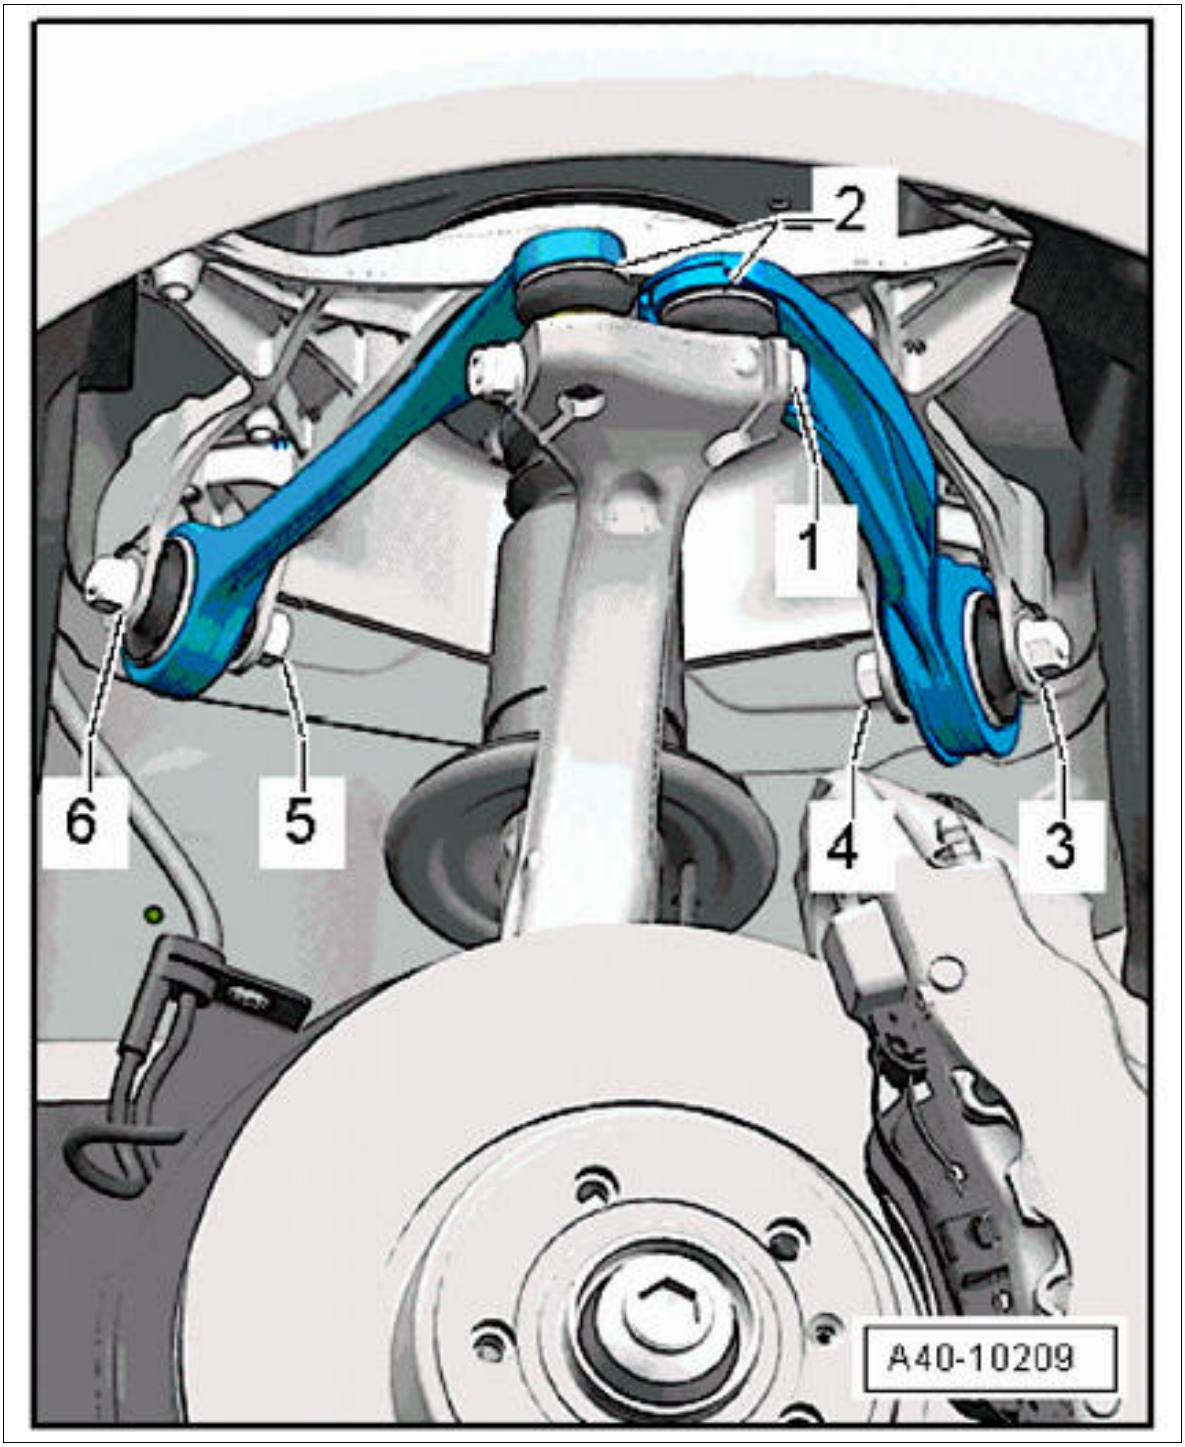
4. Separate threaded joint **-1-** on the wheel bearing housing at the top.

   Information

   The slots in the wheel bearing housing must not be widened using a chisel or similar tool!

5. Pull the two pins for the upper trailing arm **-2-** out of the wheel bearing housing. (Upper trailing arms remain fitted on the mounting saddle **-3 to 6-**)

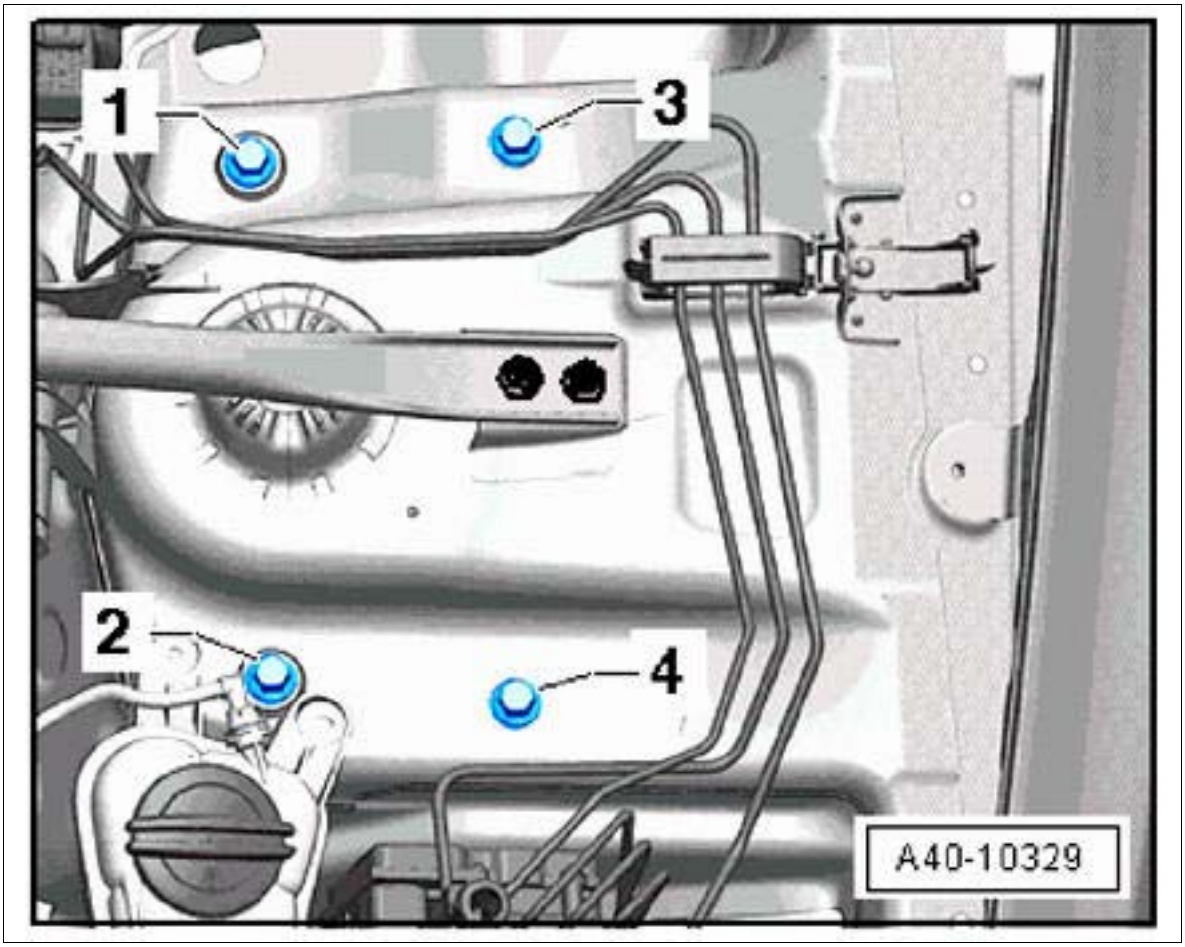
Fig 3: Identifying Upper Trailing Arm Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Unscrew fastening screws **-1 to 4-** at the top of the spring strut.

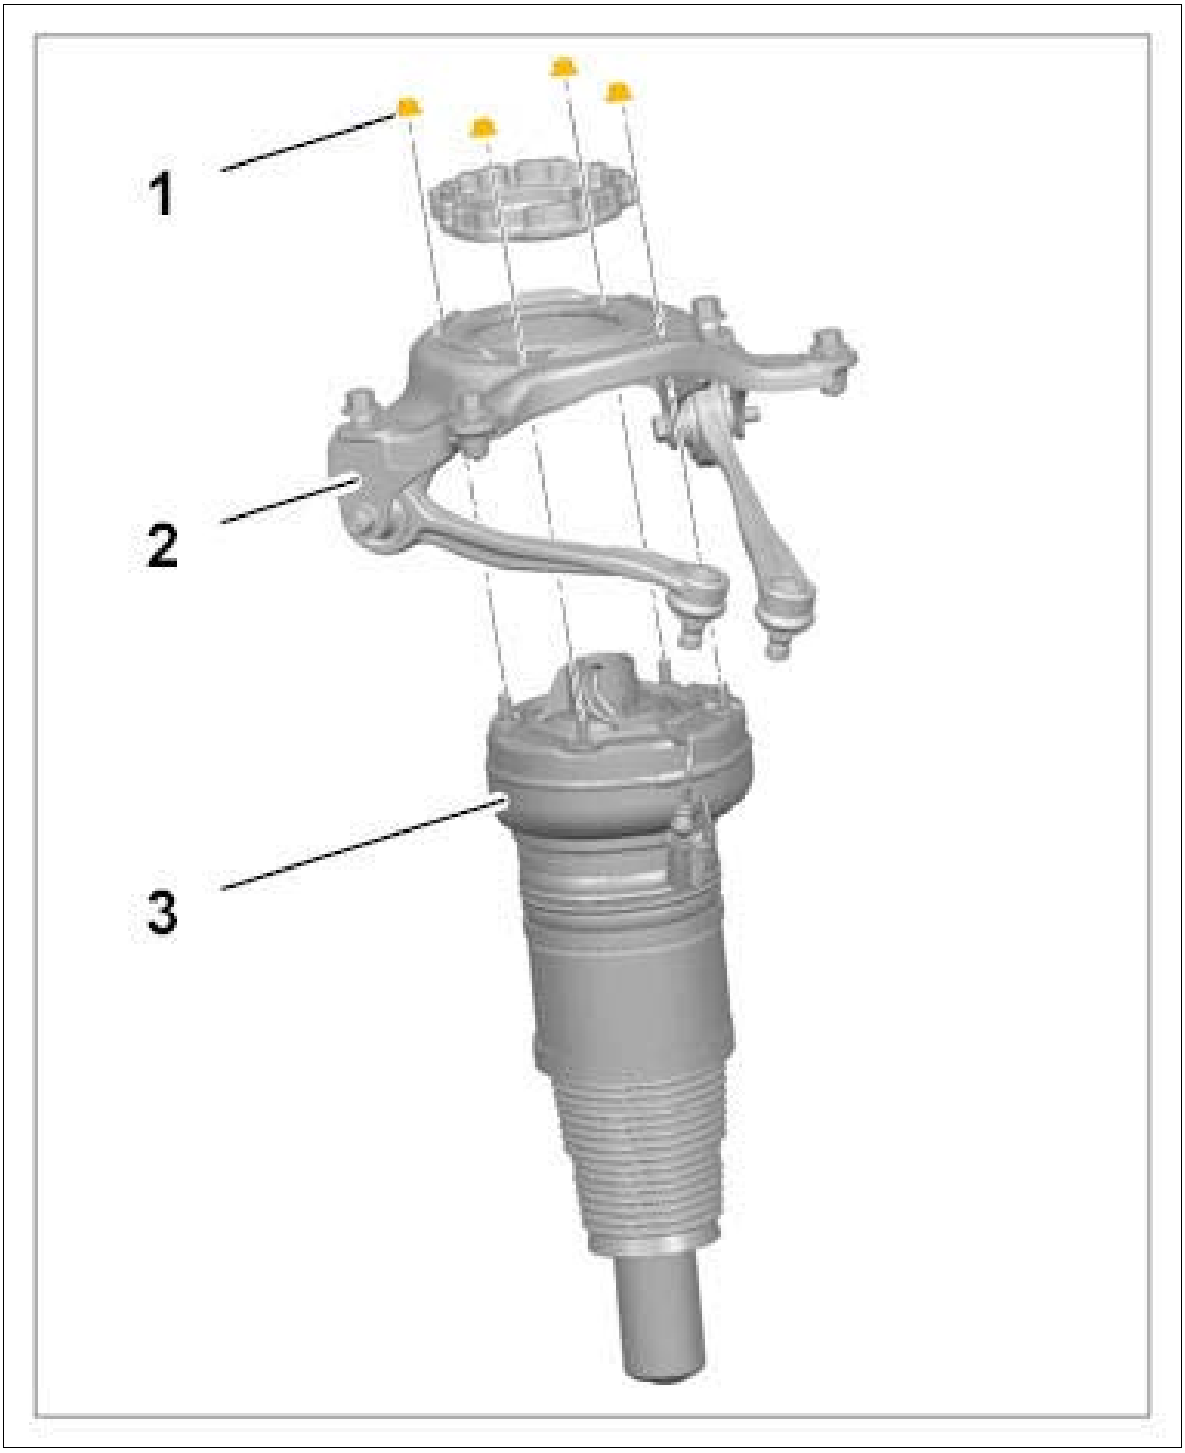
Fig 4: Identifying Upper Spring-Strut Mount



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Remove air-spring strut.
8. Unscrew fastening screws **-1-** and remove mounting saddle **-2-** from the air-spring strut **-3-** .

Fig 5: Identifying Mounting Saddle Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 433019 REMOVING AND INSTALLING FRONT AIR-SPRING STRUT (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING FRONT AIR-SPRING STRUT > INSTALLING FRONT AIR-SPRING STRUT

⚠ *CAUTION: Wheel carrier raised incorrectly*

- *Risk of squashing*
- *Risk of damage to components*

→ Wear personal protective gear.

→ Do not raise the wheel suspension higher than the normal vehicle position (vehicle resting on wheels).

Information

- All screws and threaded joints on the axle must be tightened in vehicle position. Vehicle position means: vehicle standing on its wheels or the wheel suspension is raised with a universal vehicle lift. Dimension -1- , from lower edge of wing to center of axle corresponds to vehicle position. The current height can be found in → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT . Always observe the following points!

  Fig 1: Identifying Wheel To Wing Lower Edge Dimension (Rear Axle)

  
  Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Screws and nuts are Geomet-coated and must not be greased.

1. Installation is performed in reverse order.

   Observe specified tightening torques:

   Mounting saddle to air-spring strut: **Tightening torque 30 Nm (22 ftlb.)**

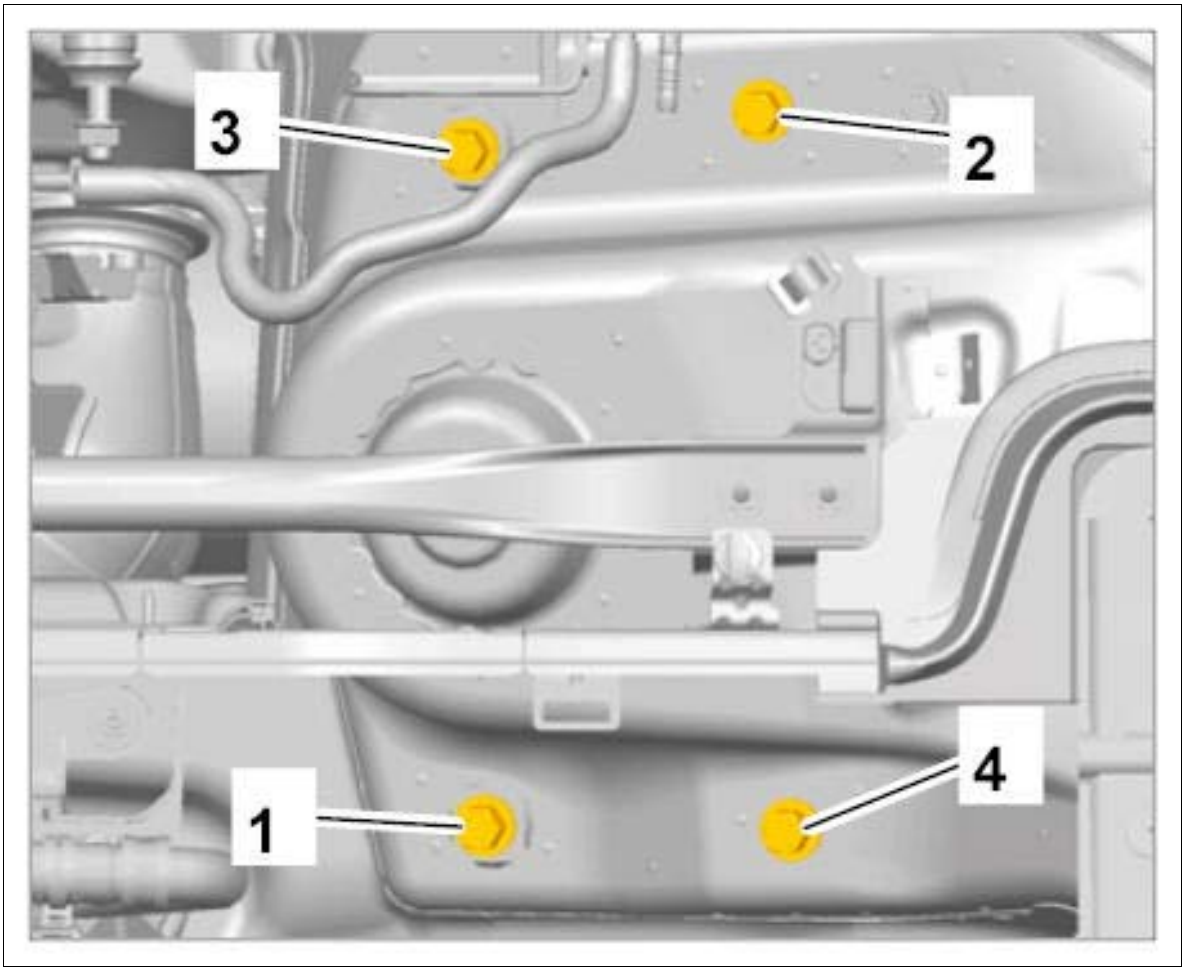
   Upper air-spring strut to body: **Initial tightening 40 Nm (30 ftlb.) Final tightening +90°**

   Observe the tightening sequence **-1 to 4-** !

   Upper trailing arm to wheel bearing housing: **Tightening torque 45 Nm (33 ftlb.)**

   Air line to air spring: **Tightening torque 3 Nm (2 ftlb.)**

   Fig 2: Saddle Body Screws Tightening Sequence

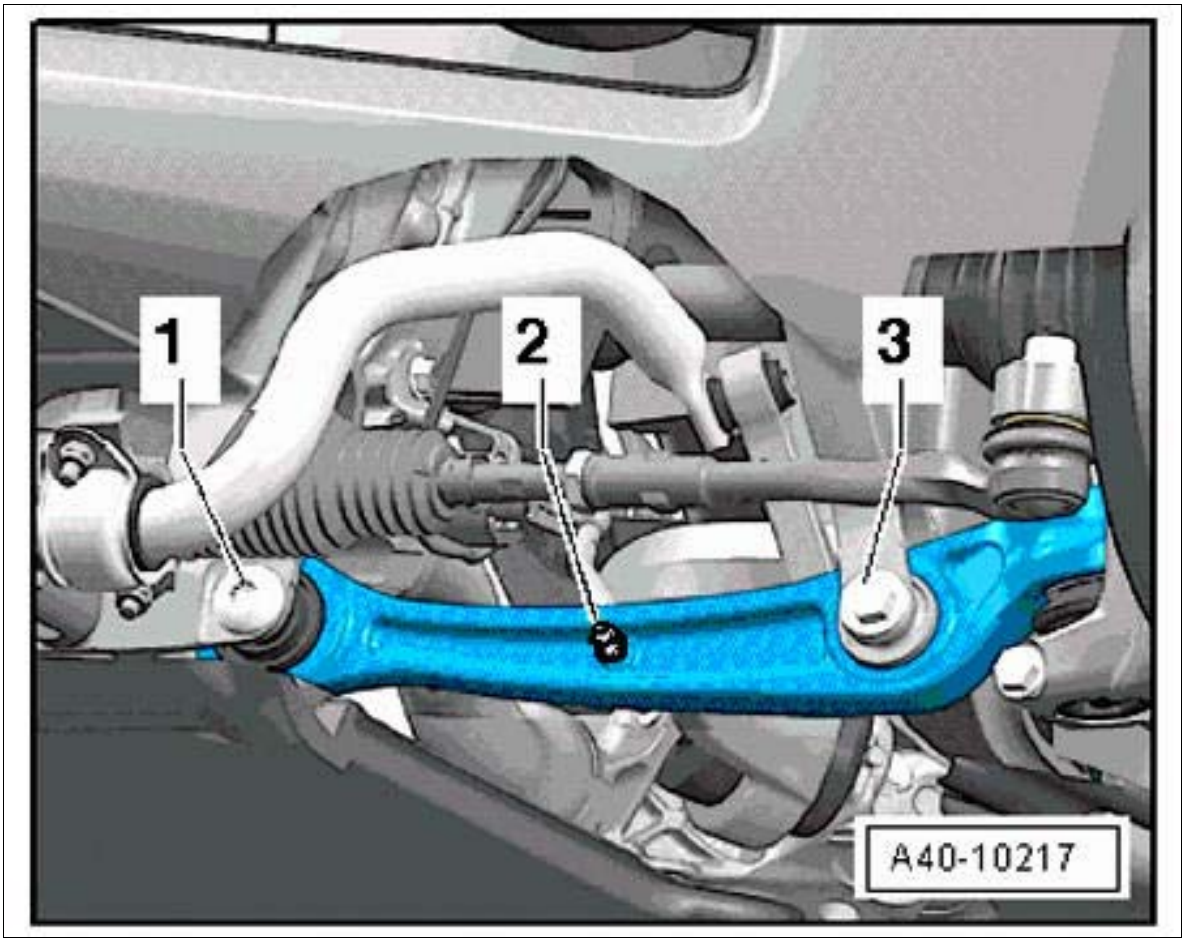


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 433019 REMOVING AND INSTALLING FRONT AIR-SPRING STRUT (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install shock absorber fork. → INSTALLING SHOCK ABSORBER FORK .
2. Tighten nut **-2-** on level sensor. **Tightening torque 9 Nm (6.5 ftlb.)**

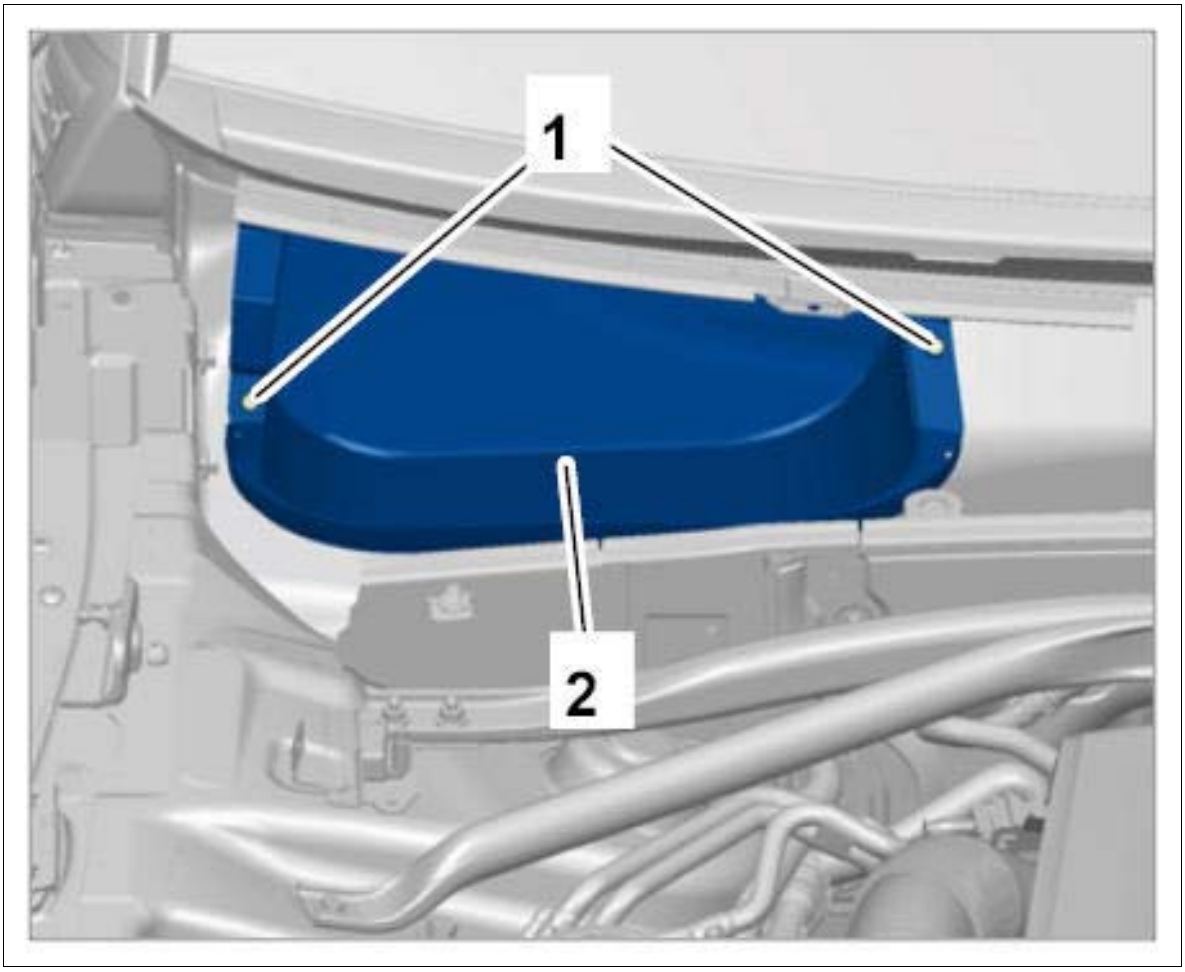
Fig 1: Identifying Lower Trailing Arm Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Install additional reinforcement on dome strut → INSTALLING FRONT STRUT .
4. Install front trim panel → INSTALLING FRONT TRIM PANEL .
5. Install air inlet housing cover **-2-** and tighten fastening screws **-1-** .

Fig 2: Identifying Air Inlet Housing Cover Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Install cowl panel cover. → INSTALLING COWL PANEL COVER
7. Fill the levelling system. → BLEEDING AND FILLING THE LEVELLING SYSTEM .
8. Fit wheel → INSTALLING WHEEL .

WM 433655 REPLACING FRONT VALVE (PRESSURE CONTROL VALVE) (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Air line to air-spring strut		Tightening torque	3 Nm (2 ftlb.)		
Pressure control valve to air-spring strut		Tightening torque	8 Nm (6 ftlb.)		

WM 433655 REPLACING FRONT VALVE (PRESSURE CONTROL VALVE) (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .
2. Remove wheel → 440519 REMOVING AND INSTALLING WHEEL .

WM 433655 REPLACING FRONT VALVE (PRESSURE CONTROL VALVE) (MACAN, MACAN S, MACAN TURBO) > REPLACING FRONT VALVE (PRESSURE CONTROL VALVE)

WARNING: Vehicle is lowered when air line is loosened

- *Risk of squashing*

→ When loosening the pressure control valve, raise the vehicle on a lifting platform.

→ Only leave the vehicle on the lifting platform until a new pressure control valve is installed and the air-spring strut is filled.

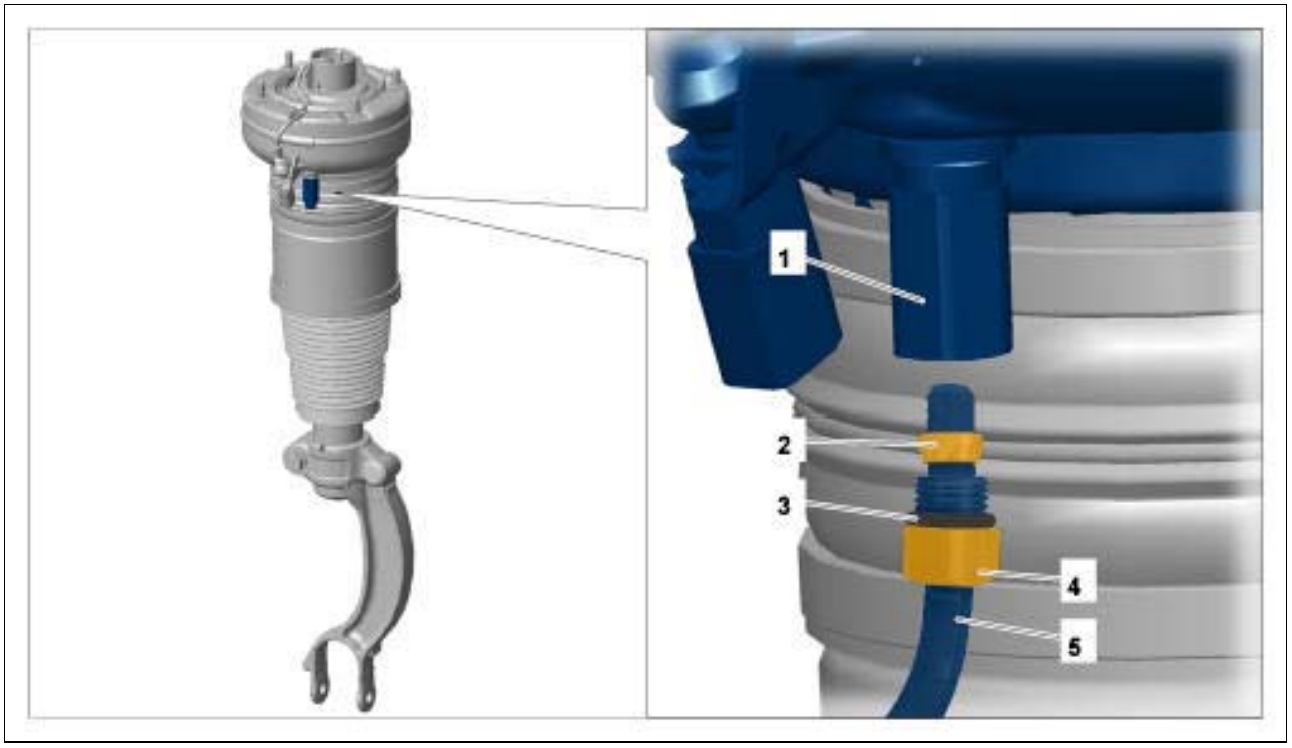
Information

The pressure control valve can only be replaced if:

- it was damaged during removal and installation ,
- the sealing ring in the pressure control valve is defective ,
- it no longer lets air out (valve jammed/vehicle cannot be lowered).

Never lower a vehicle with empty air springs.

Fig 1: Identifying Pressure Control Valve Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Pressure control valve
2. Cutting ring
3. Sealing ring (always replace sealing ring)
4. VOSS threaded joint
5. Air line

1. To prevent dirt from getting into the threaded bore on the air-spring strut, clean the pressure control valve area thoroughly with a lint-free cloth.
2. Unscrew VOSS threaded joint (with air line) from the pressure control valve. Counter at the pressure control valve at the same time.

> *NOTE: Escaping residual air*
>
> *1. Risk of eye injuries*

→ Wear protective goggles.

3. Carefully bleed the air-spring strut by hand. To do this, push the valve lifter open slightly using a 5-mm Allen key.
4. Unscrew pressure control valve at the air-spring strut.

WM 433655 REPLACING FRONT VALVE (PRESSURE CONTROL VALVE) (MACAN, MACAN S, MACAN TURBO) > REPLACING FRONT VALVE (PRESSURE CONTROL VALVE) > INSTALLING FRONT VALVE (PRESSURE CONTROL VALVE)

Depending on the condition of the VOSS threaded joint and air line fitted on the vehicle, the VOSS threaded joint and air line can either be used again or replaced.

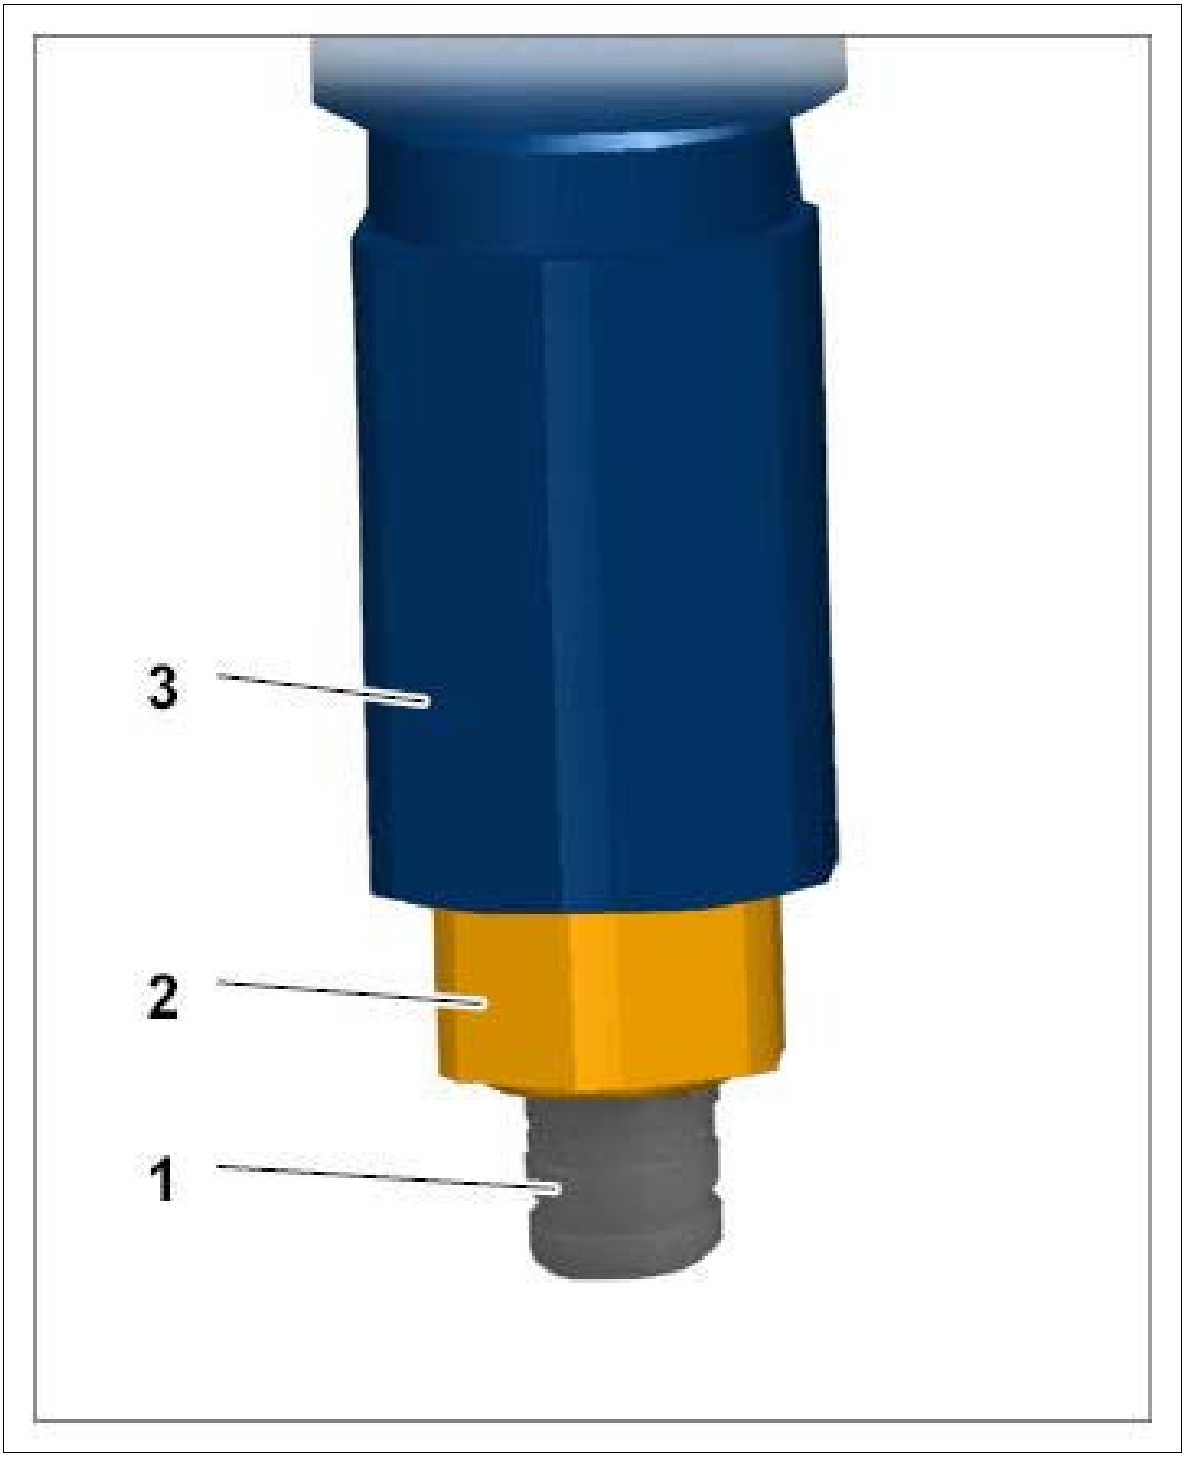
Using the same VOSS threaded joint on the vehicle:

Information

If you intend to re-use the VOSS threaded joint fitted on the vehicle, the VOSS threaded joint (including stopper and cutting ring) that comes pre-fitted on the new pressure control valve must first be removed.

1. Pull stopper **-1-** out of the new pressure control valve **-3-** .
2. Unscrew VOSS threaded joint **-2-** on the new pressure control valve **-3-** .

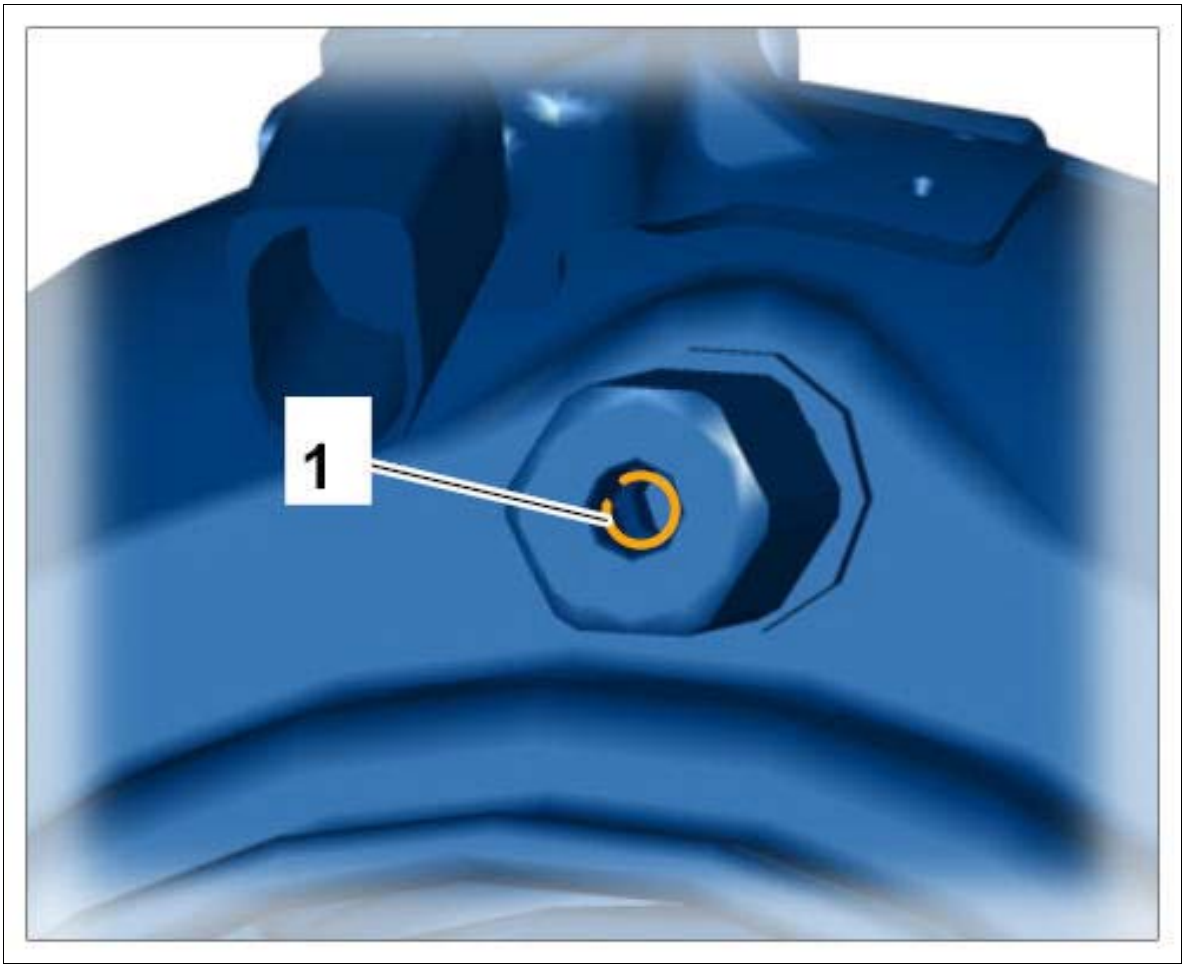
Fig 1: Identifying Pressure Control Valve And Stopper



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove cutting ring **-1-** .

Fig 2: Identifying Pressure Valve Cutting Ring



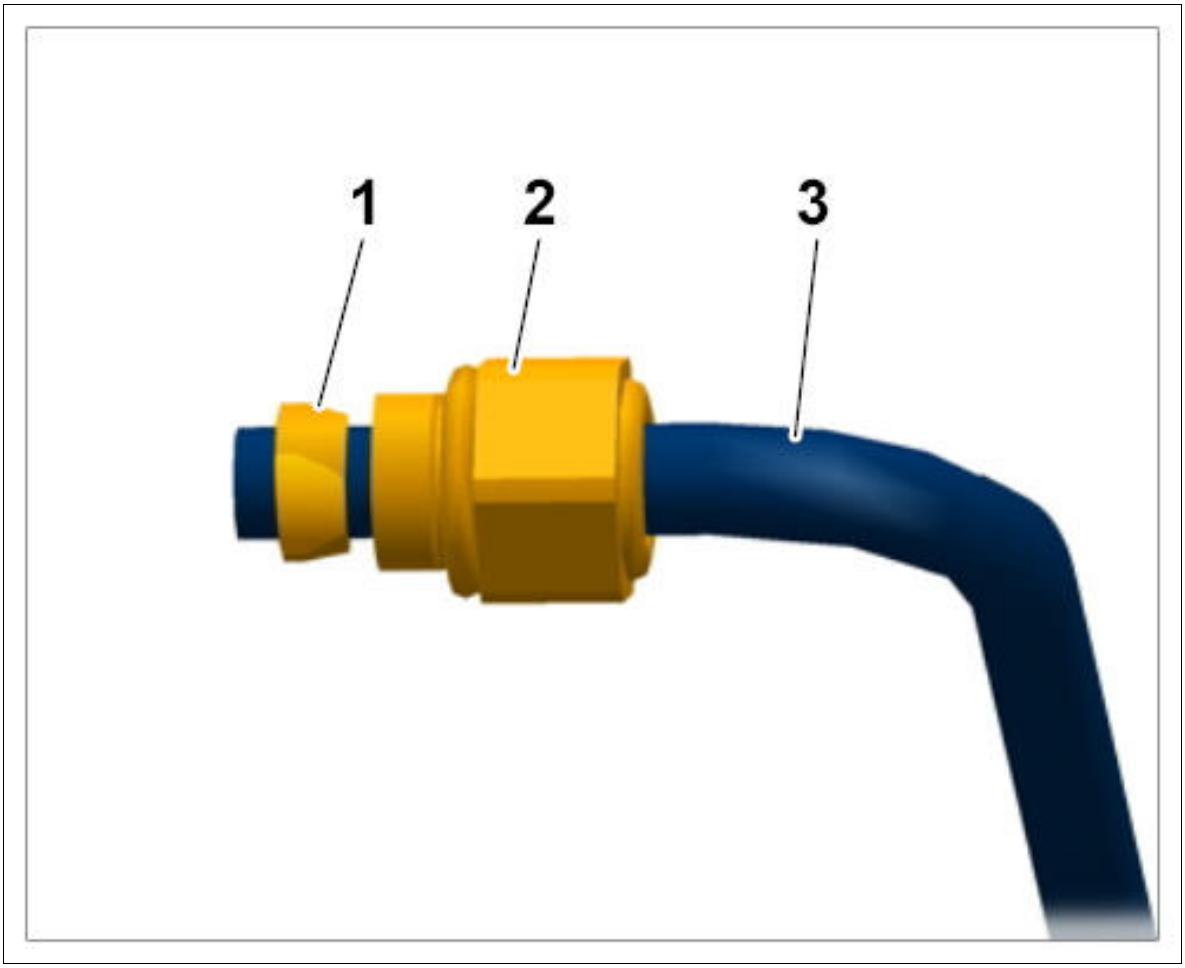
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Screw new pressure control valve into the air-spring strut. **Tightening torque 8 Nm (6 ftlb.)**
5. Fit VOSS threaded joint on pressure control valve. **Tightening torque 3 Nm (2 ftlb.)**

Replacing VOSS threaded joint on the vehicle:

1. Loosen the cutting ring **-1-** on the air line **-3-** using a suitable tool.
2. Pull VOSS threaded joint **-2-** off the air line **-3-** .

Fig 3: Identifying Valve Cutting Ring And VOSS Threaded Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Sharp edges at the end of the air line or at the point where the cutting ring is fitted can damage the newly fitted O-ring.

For this reason, always de-burr the end of the air line.

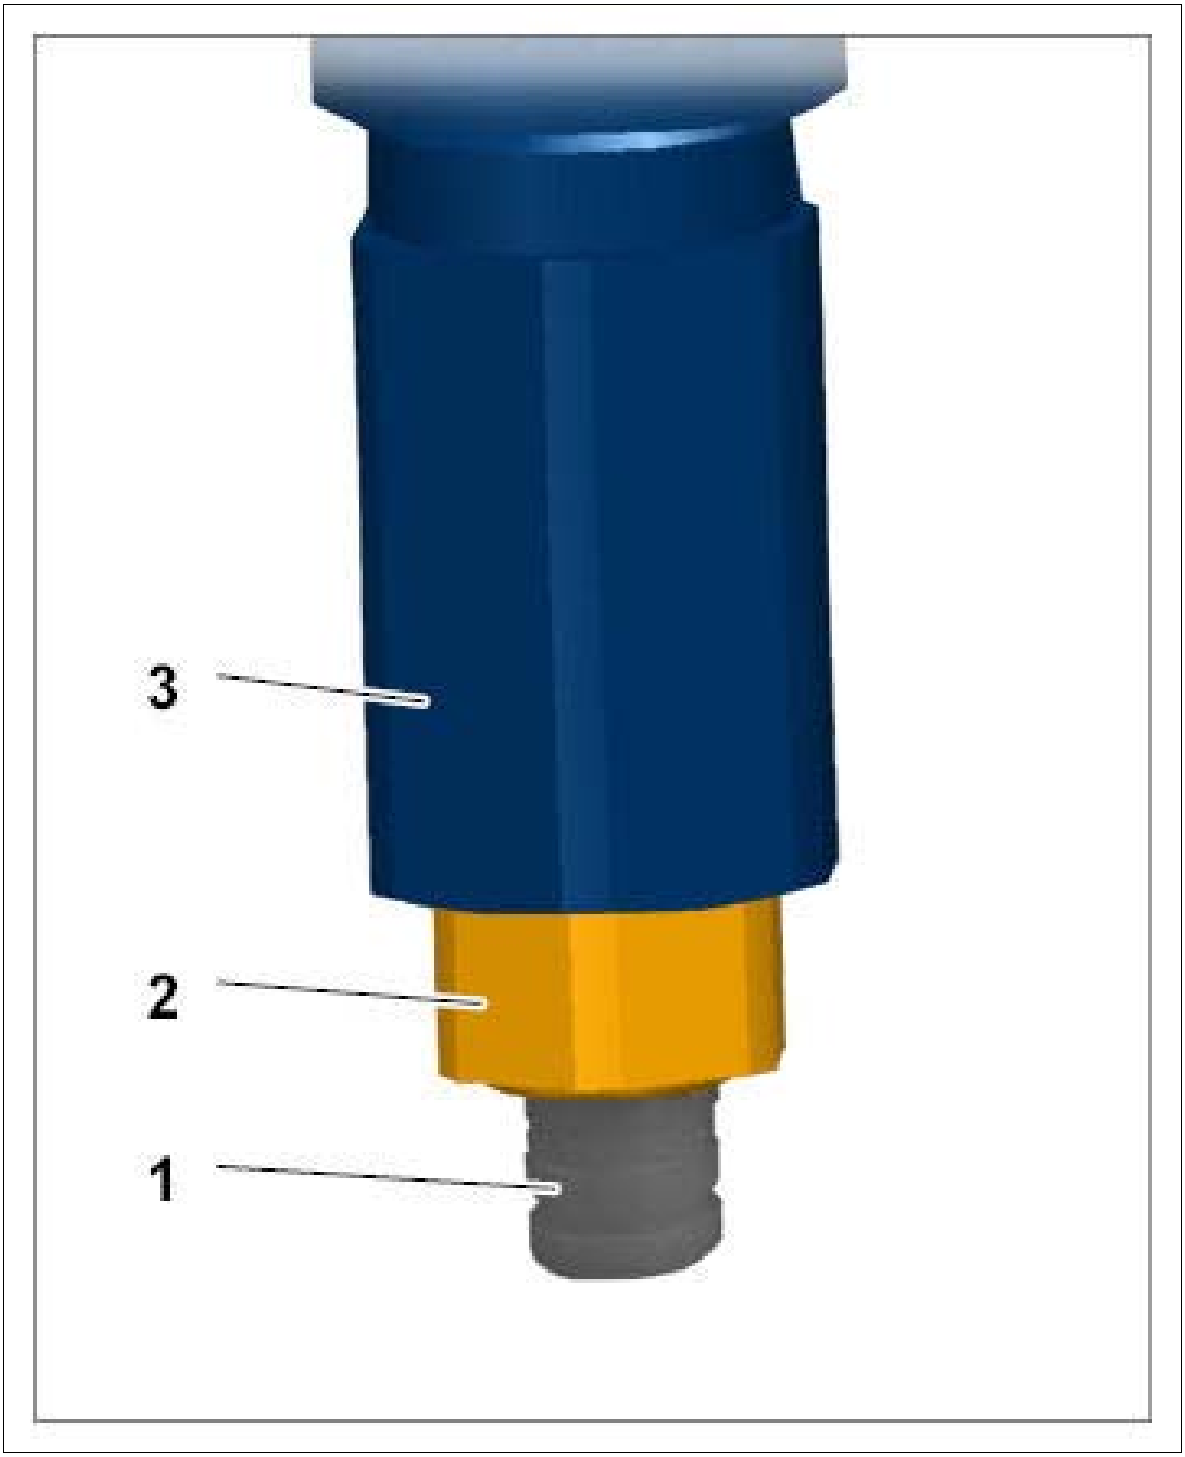
If there is also a sharp edge at the point where the cutting ring is fitted, the air line must be repaired. → 438541 REPAIRING AIR LINE

3. Check air line for damage/leaks.

   Repair the air line if it is damaged → 438541 REPAIRING AIR LINE .

4. Pull stopper **-1-** out of the new pressure control valve.

Fig 4: Identifying Pressure Control Valve And Stopper



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Screw new pressure control valve into the air-spring strut. **Tightening torque 8 Nm (6 ftlb.)**

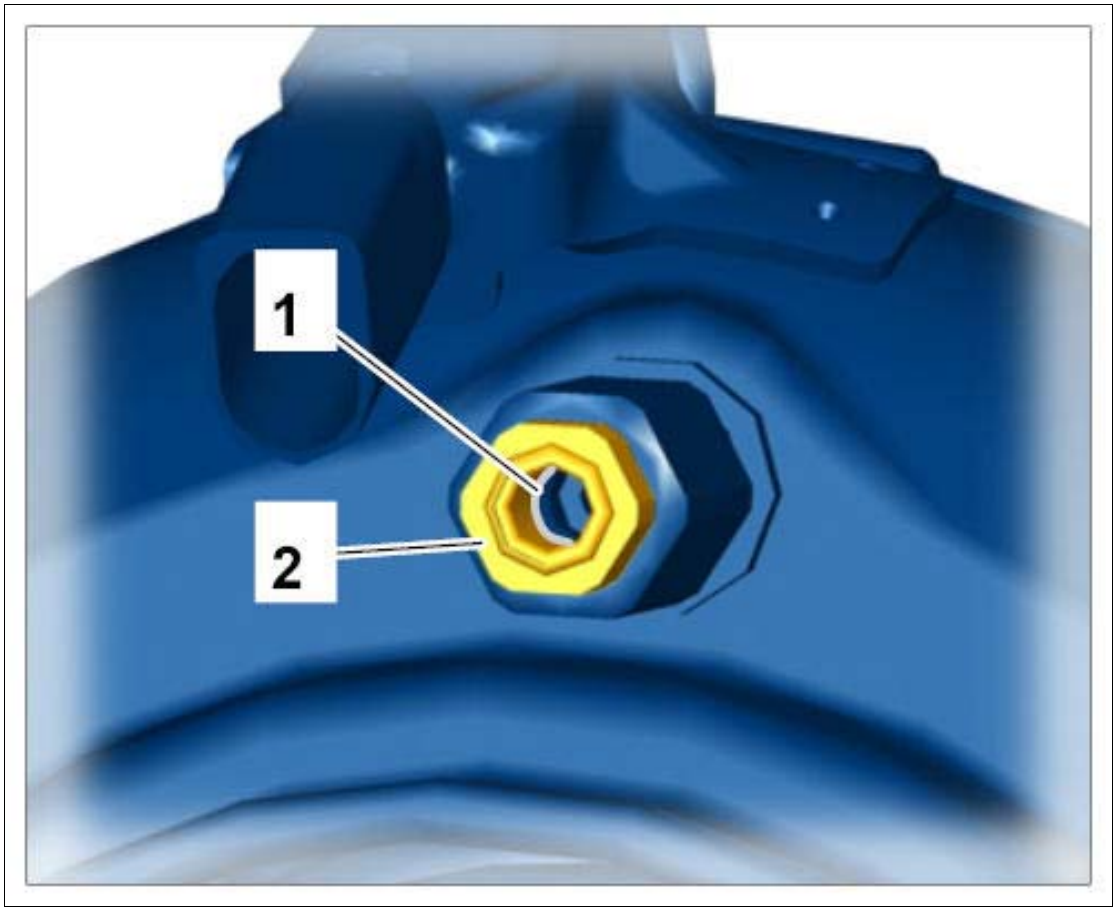
Information

Before installation, the following parts must be pre-fitted on the pressure control valve:

1. Cutting ring -1-

2. VOSS threaded joint -2-

Fig 5: Identifying Pressure Control Valve Ring And Threaded Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Insert air line as far as it will go into the VOSS threaded joint on the pressure control valve.
7. Check that the air line is fitted correctly:
    1. Only one marking on the air line should be visible.
    2. Pull the air line briefly against the insertion direction. If it cannot be pulled out, the air line is fitted correctly.

WM 433655 REPLACING FRONT VALVE (PRESSURE CONTROL VALVE) (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Fit wheel → INSTALLING WHEEL .
2. Fill the air spring → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM .

WM 434319 REMOVING AND INSTALLING REAR AIR SPRING (MACAN, MACAN S, MACAN TURBO) > TOOLS

Designation	Type	Number	Description	
transmission jack	Workshop equipment	WE 1082		
PIWIS Tester II	Special tool	9818		Support	VW tool	T10149		
WM 434319 REMOVING AND INSTALLING REAR AIR SPRING (MACAN, MACAN S, MACAN TURBO) > TECHNICAL VALUES

Air line to air spring		Tightening torque	3 Nm (2 ftlb.)		

WM 434319 REMOVING AND INSTALLING REAR AIR SPRING (MACAN, MACAN S, MACAN TURBO) > PRELIMINARY WORK

1. Raise the vehicle → 4X00IN LIFTING THE VEHICLE .
2. Bleed the relevant air spring using **PIWIS Tester II 9818.** → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM .

WM 434319 REMOVING AND INSTALLING REAR AIR SPRING (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING REAR AIR SPRING > REMOVING REAR AIR SPRING

NOTE: Air springs can become kinked/fall out

- *Risk of damage to air springs*

→ Switch off the levelling system (press and hold the levelling system button for at least 10 seconds).

→ Check the bellows before lowering the vehicle.

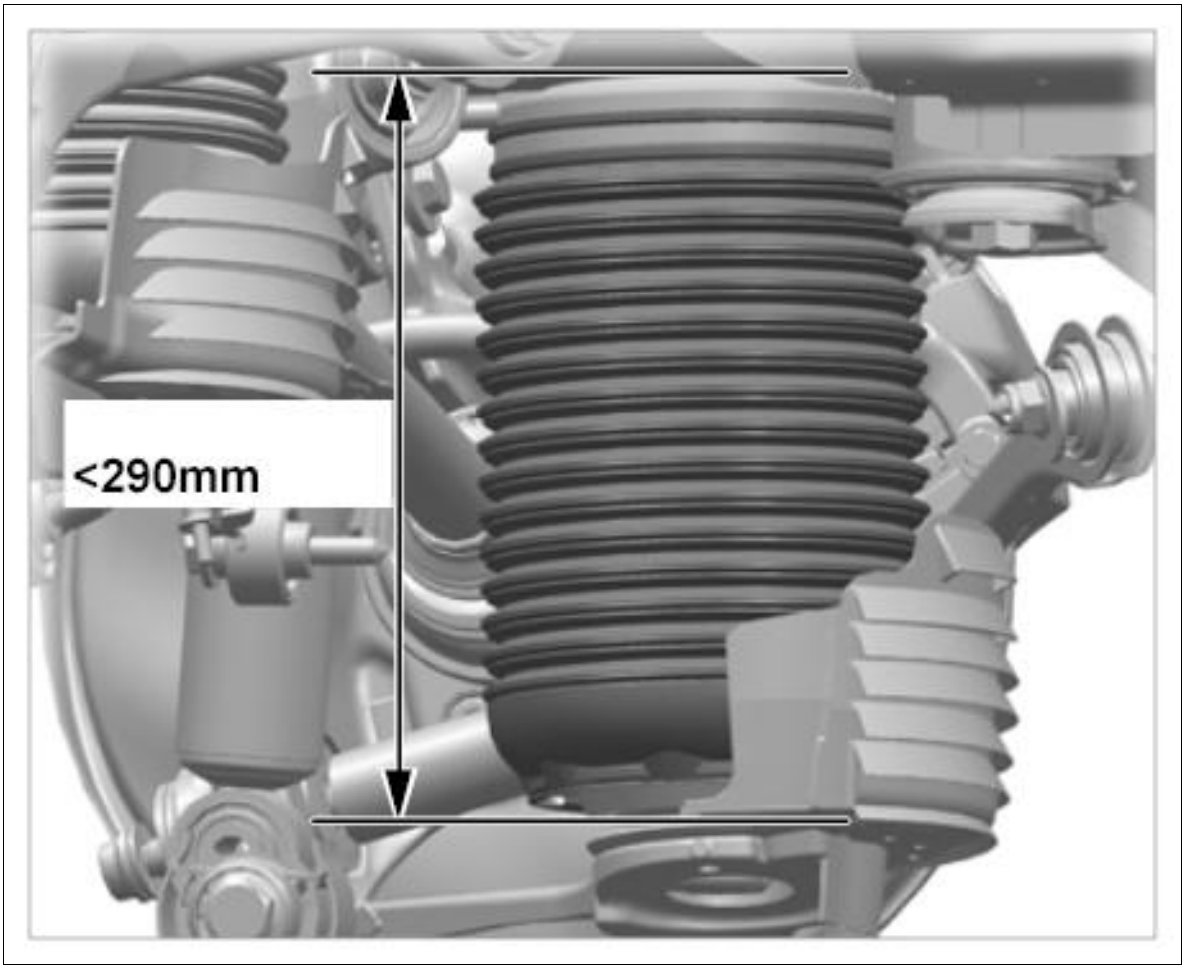
Information

To prevent damage to the air springs, pay particular attention to the following points when handling air springs:

- Do not pull the air spring apart.
- Do not bend the air spring.
- Do not carry the air spring at the insertion pin.
- The length must not be less than 220 mm.
- Never lower a vehicle with empty air springs.

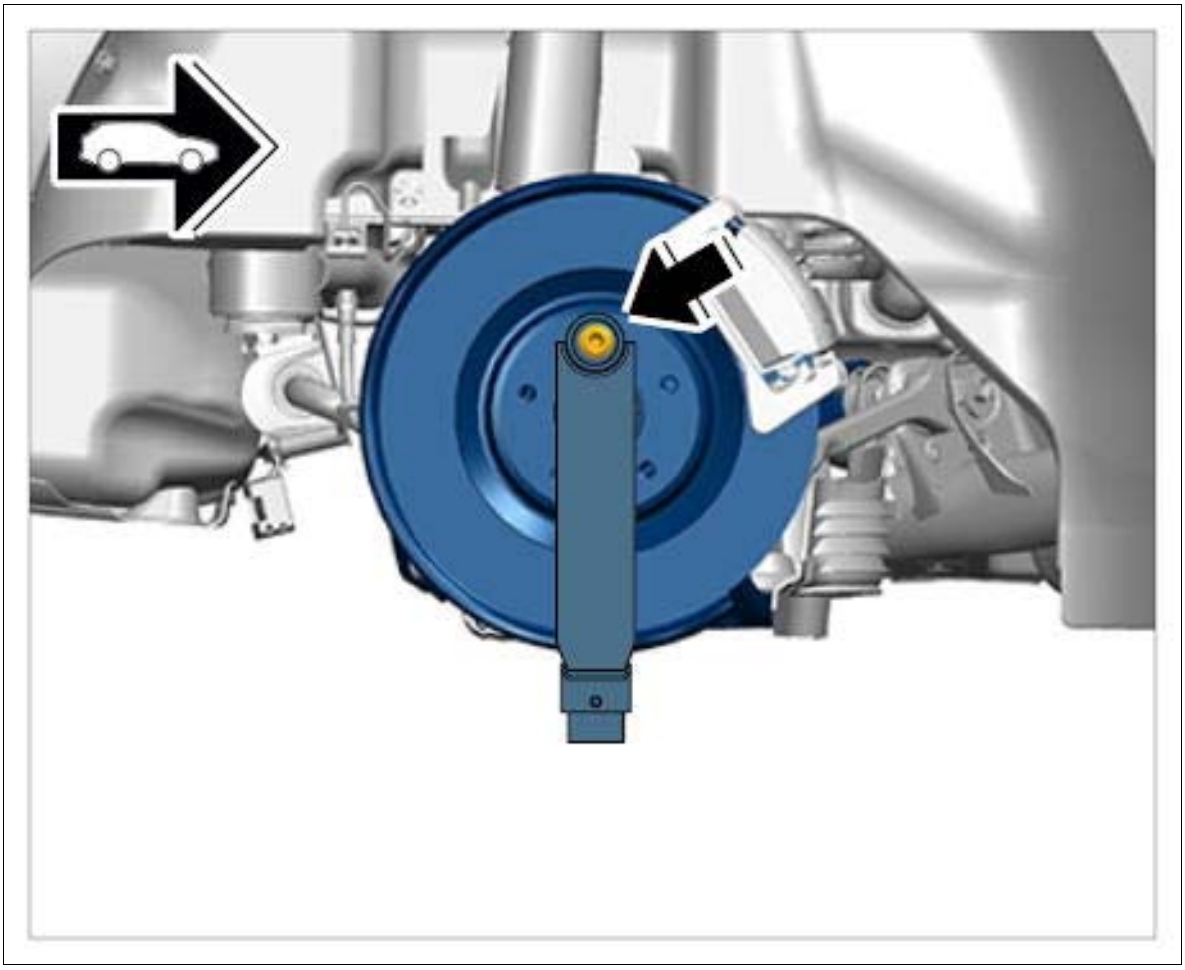
1. Raise the wheel bearing housing until an air spring length of < 290 mm is reached (the length must not be less than 220 mm!).

Fig 1: Identifying Air Spring Length



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Fig 2: Locating Support (T10149) Mounting

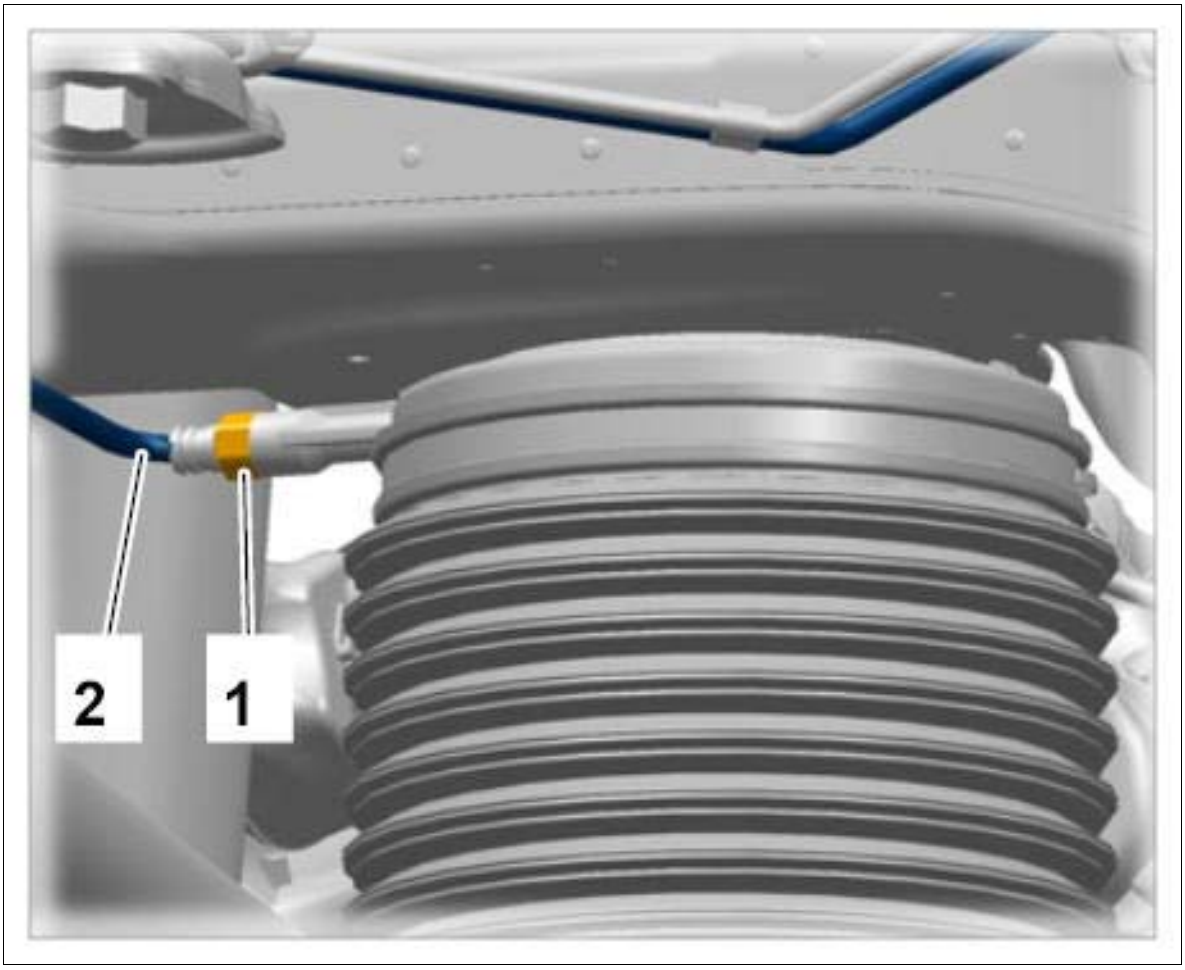


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 1.1. Turn the wheel hub in such a way that a bore for a wheel bolt is at the top.
2. 1.2. **Support T10149** must be secured to the wheel hub with a wheel bolt **-arrow-**
3. 1.3. **Support T10149** must now be fitted into the **transmission jack WE 1082** .

2. Unscrew union nut **-1-** and pull off air line **-2-** .

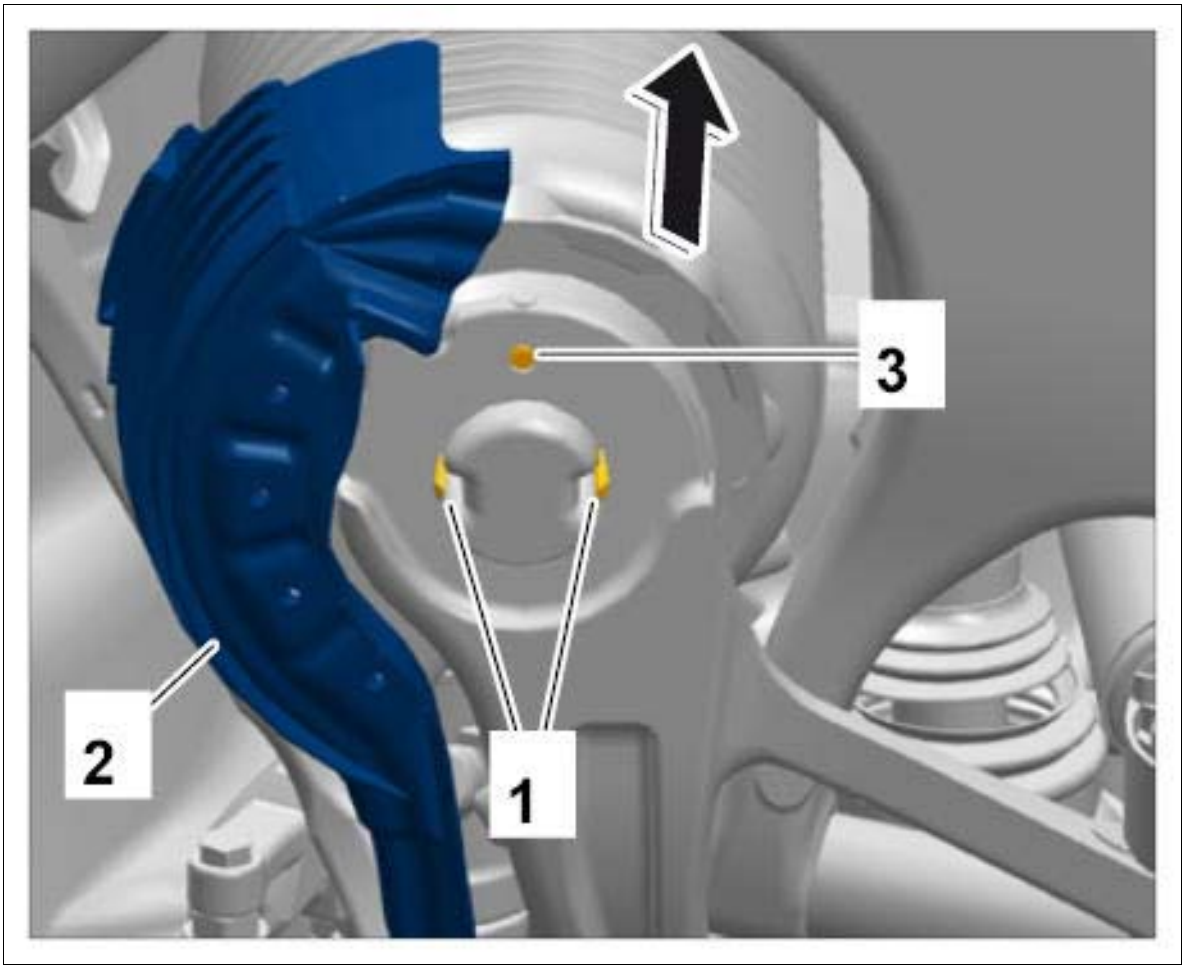
Fig 3: Identifying Air Line Connection And Union Nut



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Lower the transmission jack.
4. Press clips **-1-** on the lower air spring together and press the air spring upwards **-arrow-** .
5. Remove stone guard **-2-** .

Fig 4: Pressing Air Spring



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Carefully remove the air spring by pulling it downwards. → Removing air spring

   Do not pull air spring apart!

Fig 5: Removing Air Spring

WM 434319 REMOVING AND INSTALLING REAR AIR SPRING (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING REAR AIR SPRING > REPLACING REAR AIR SPRING

If the rear air spring is replaced, pay particular attention to the following points:

Depending on the condition of the VOSS threaded joint (air line connection to air spring) fitted on the vehicle, the VOSS threaded joint can either be used again or replaced.

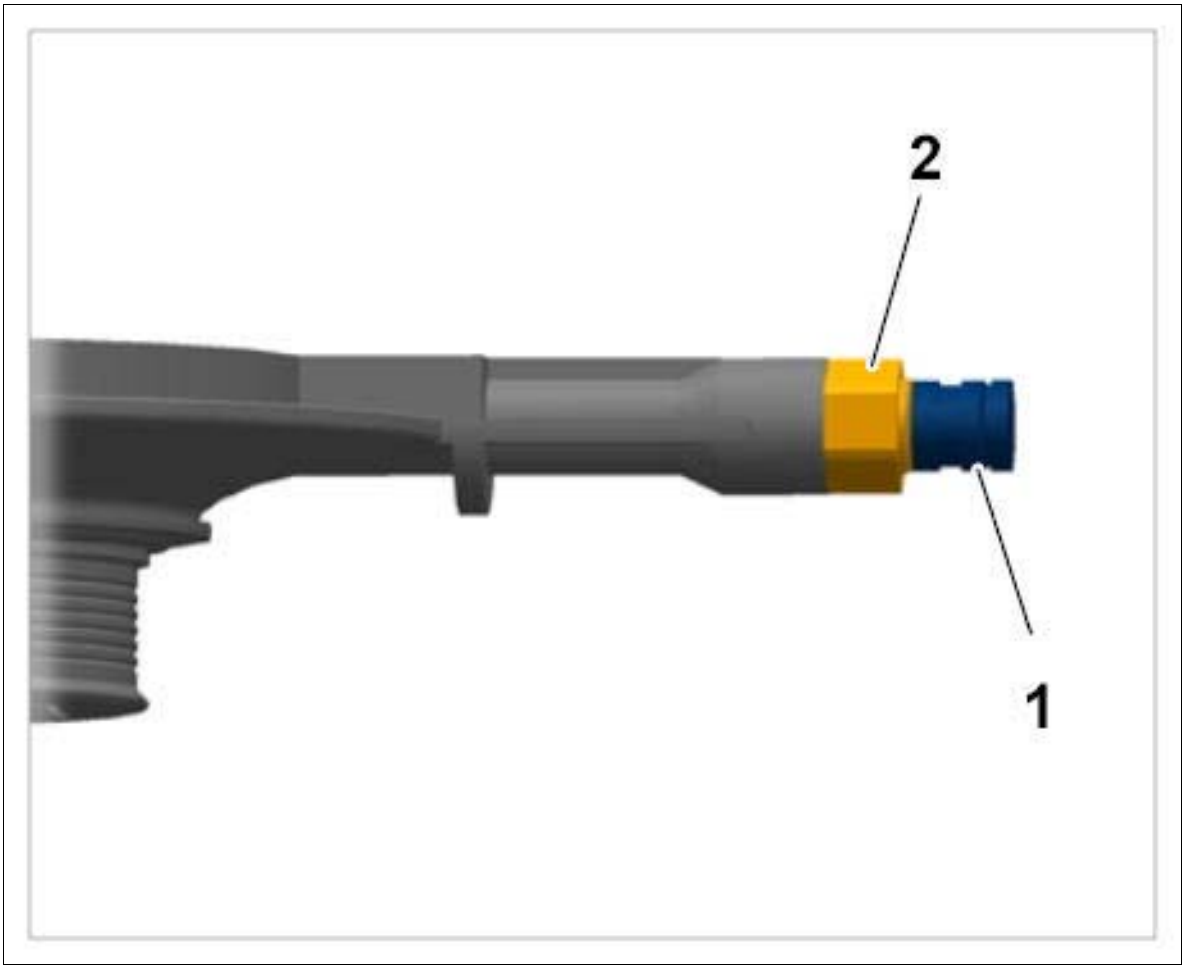
Using the same VOSS threaded joint on the vehicle:

Information

If you intend to re-use the VOSS threaded joint fitted on the vehicle, the VOSS threaded joint (including stopper and cutting ring) that comes pre-fitted on the new air spring must first be removed.

1. Pull stopper **-1-** out of the new air spring.
2. Unscrew VOSS threaded joint **-2-** on the new air spring.

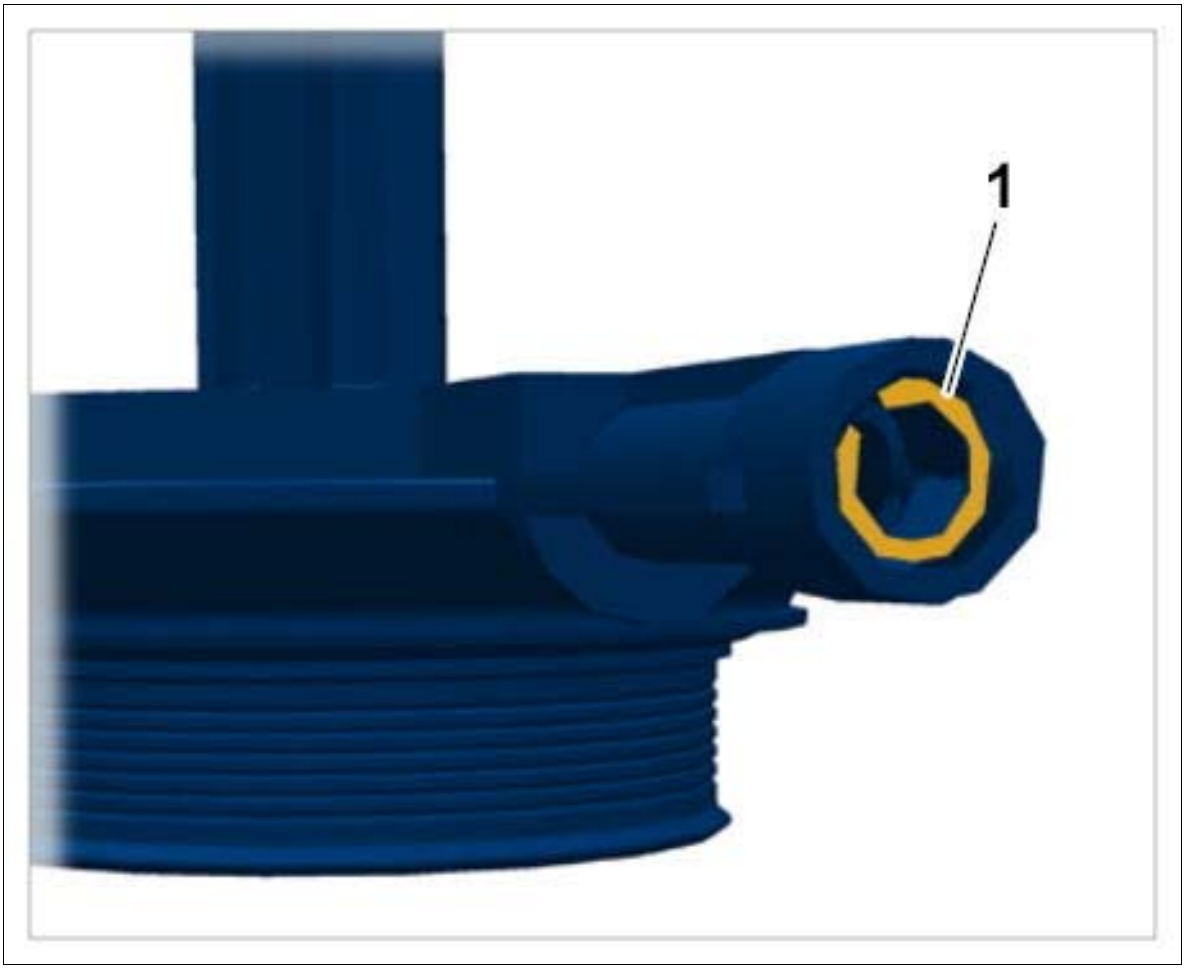
Fig 1: Identifying Air Spring And Stopper



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Remove cutting ring **-1-** .

Fig 2: Identifying Rear Air Spring Cutting Ring



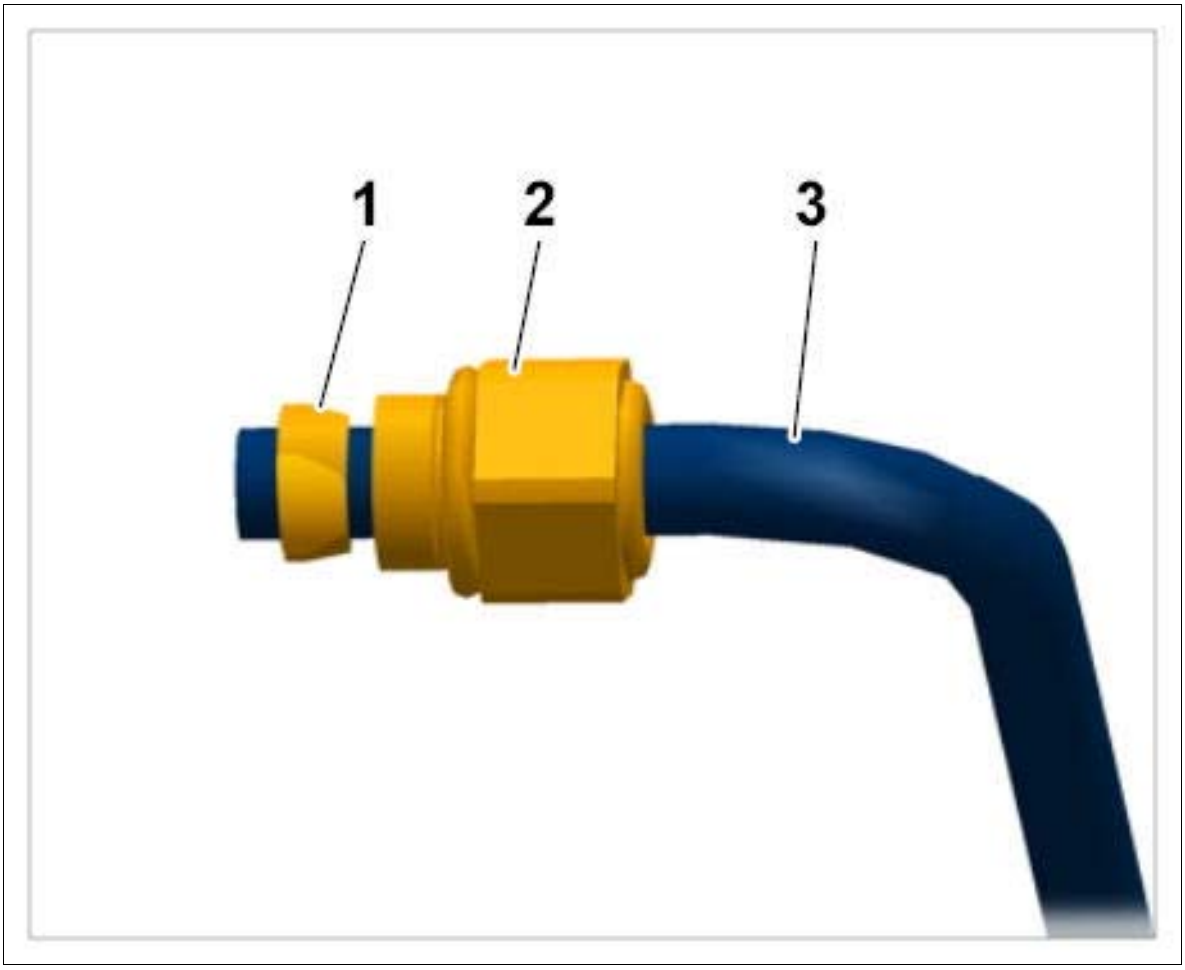
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Install new rear air spring (see "INSTALLING REAR AIR SPRING ").

Replacing VOSS threaded joint on the vehicle:

1. Loosen the cutting ring **-1-** on the air line **-3-** using a suitable tool.
2. Pull VOSS threaded joint **-2-** off the air line **-3-** .

Fig 3: Identifying Rear Air Spring Cutting Ring And VOSS Threaded Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Sharp edges at the end of the air line or at the point where the cutting ring is fitted can damage the newly fitted O-ring.

For this reason, always de-burr the end of the air line.

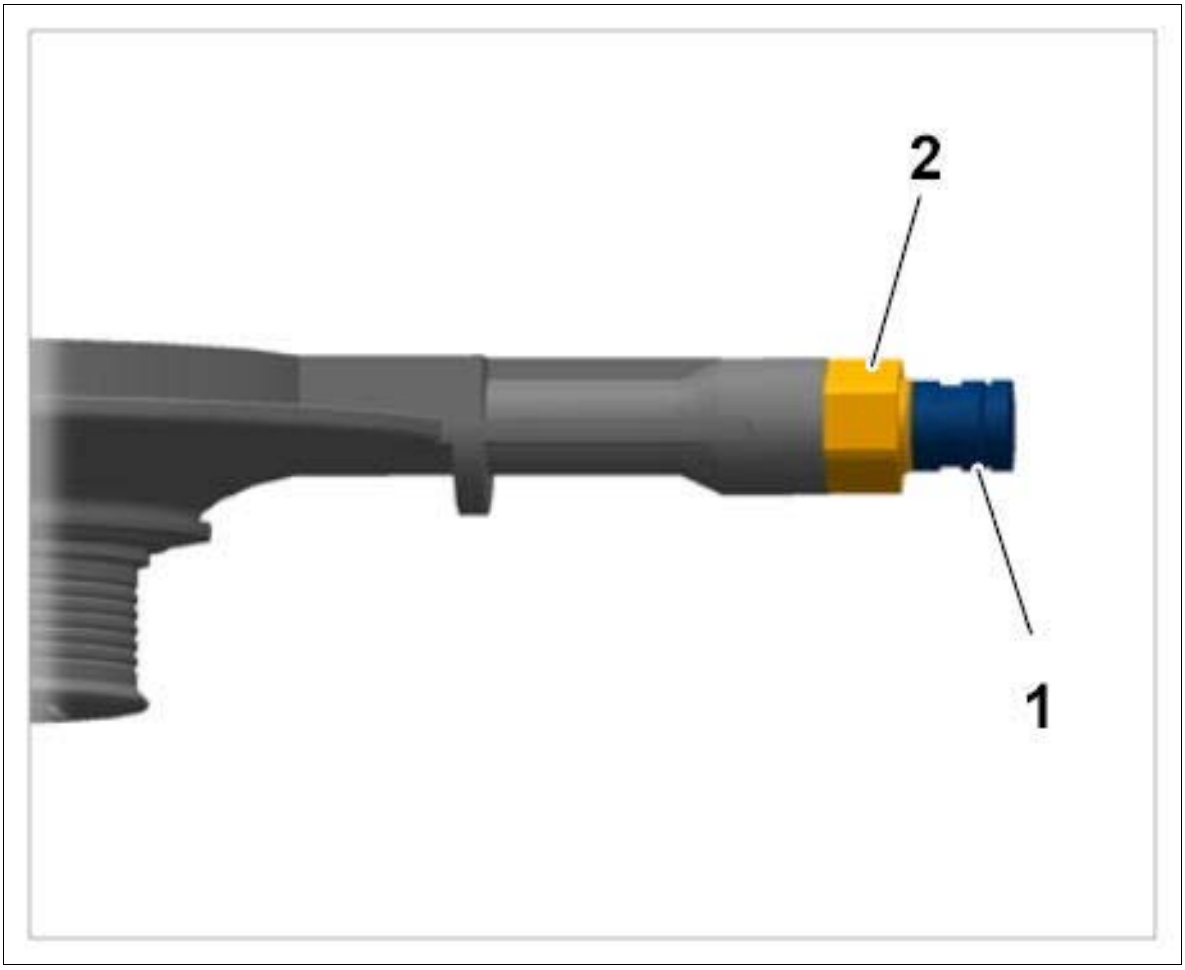
If there is also a sharp edge at the point where the cutting ring is fitted, the air line must be repaired. → 438541 REPAIRING AIR LINE

3. Check air line for damage/leaks.

   Repair the air line if it is damaged → 438541 REPAIRING AIR LINE .

4. Pull stopper **-1-** out of the new air spring.

Fig 4: Identifying Air Spring Stopper



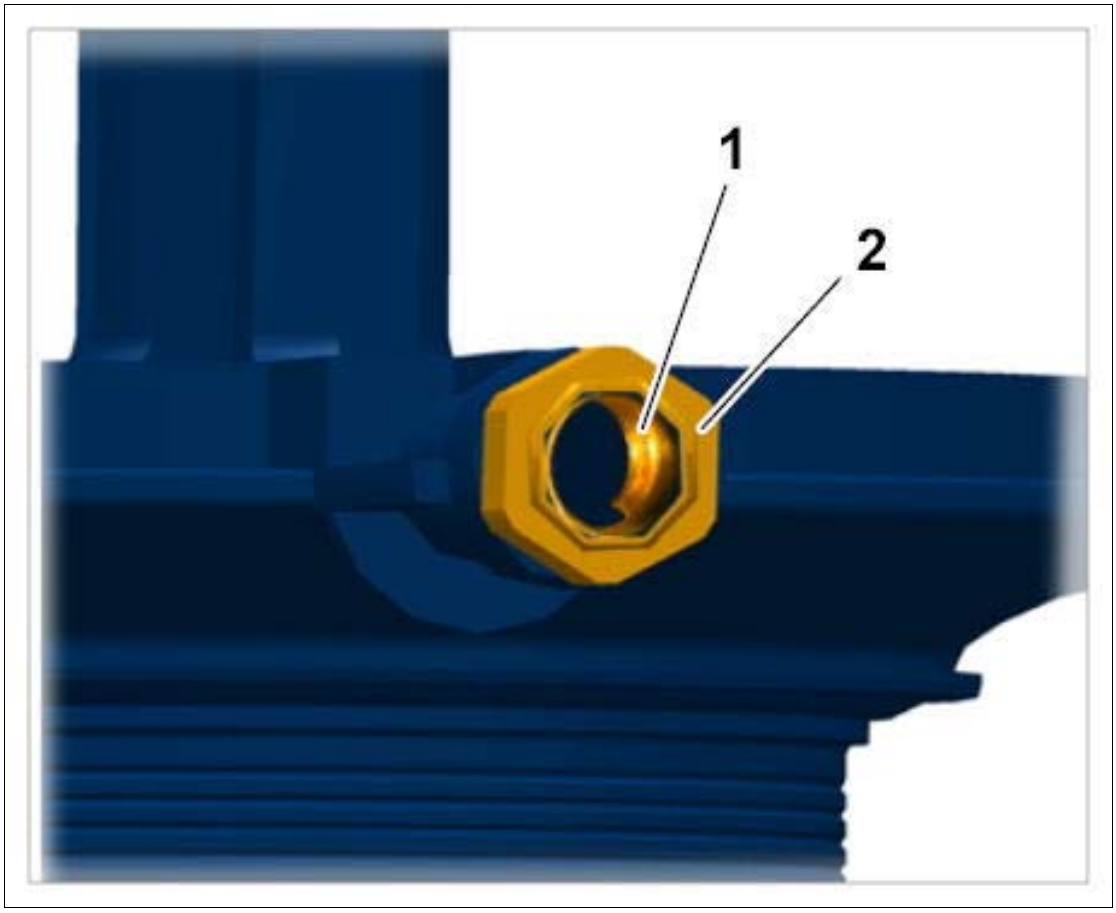
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

Before installation, the following parts must be pre-fitted on the air connection of the new air spring:

1. Cutting ring -1-
2. VOSS threaded joint -2-

Fig 5: Identifying Air Connection Cutting Ring And Threaded Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Install new rear air spring (see "INSTALLING REAR AIR SPRING ").

   Pay particular attention to the following when fitting the air line on the air spring:

   1. Insert air line as far as it will go.
   2. To check that the air line is fitted correctly, pull it briefly against the insertion direction. If it cannot be pulled out or can only be pulled out with considerable effort, the air line is fitted correctly.

WM 434319 REMOVING AND INSTALLING REAR AIR SPRING (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING REAR AIR SPRING > INSTALLING REAR AIR SPRING

1. Installation is performed in reverse order. Pay particular attention to the following:

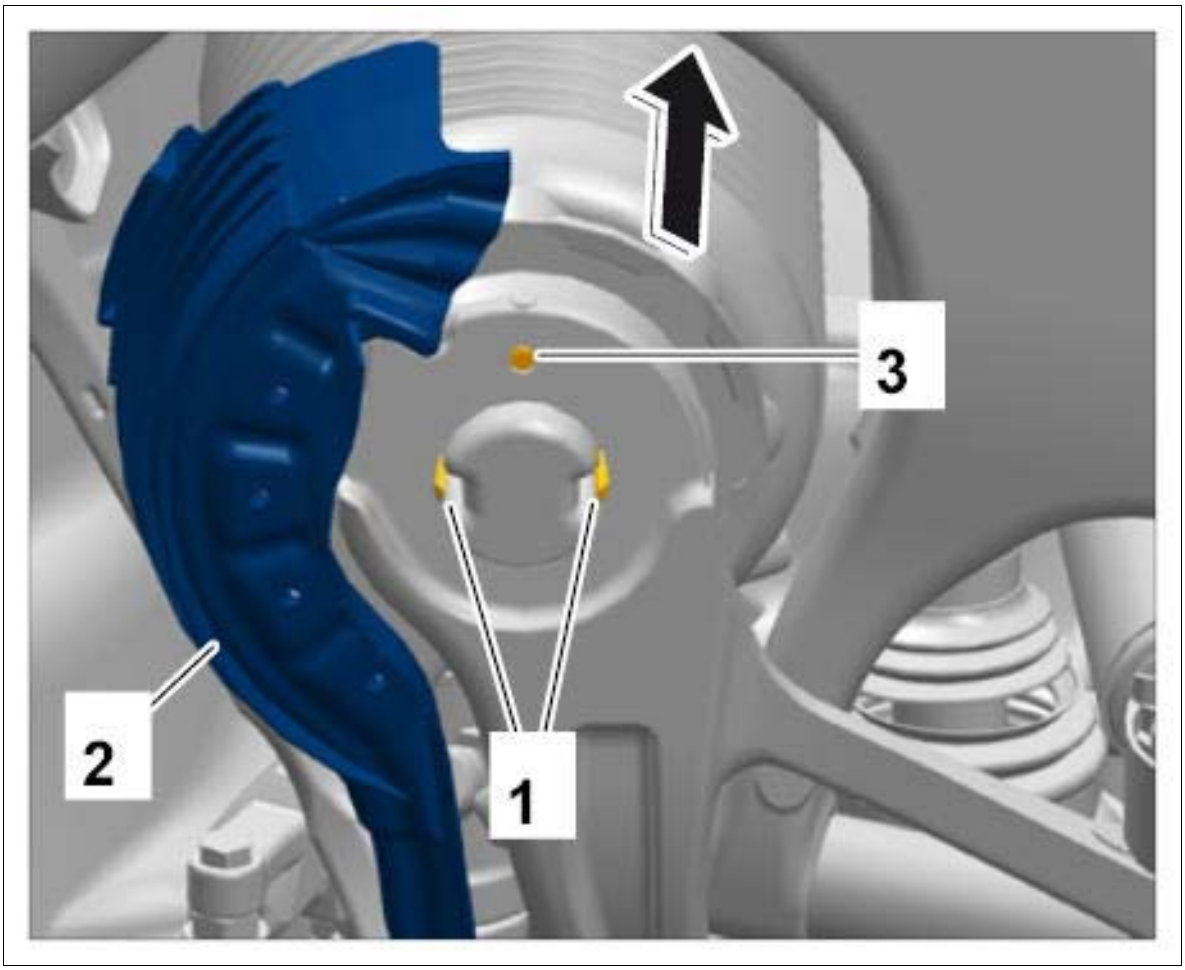
   The length of the air spring must not exceed max. 290 mm! Otherwise, there is a danger that the air spring will be damaged.

2. Align the air spring in such a way that the pin of the lower air spring is seated in the bore on the support **-3-** at the bottom.

Observe specified tightening torques:

Air line to air spring: **Tightening torque 3 Nm (2 ftlb.)**

Fig 1: Installing Air Spring



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 434319 REMOVING AND INSTALLING REAR AIR SPRING (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

WARNING: Sudden filling of the air spring

- *Risk of squashing*

→ Do not reach into the danger area.

→ Keep third parties away from the danger area.

→ Remove tools from the danger area.

1. Fill the relevant air spring using **PIWIS Tester II 9818.** → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM .

2. Perform a visual test and touch test on the rear air springs.

   Air springs must be adequately filled and rolling creases in the protective boot must be removed correctly (no kinks)! → Rolling creases on air spring

   Fig 1: Identifying Air Spring Rolling Creases

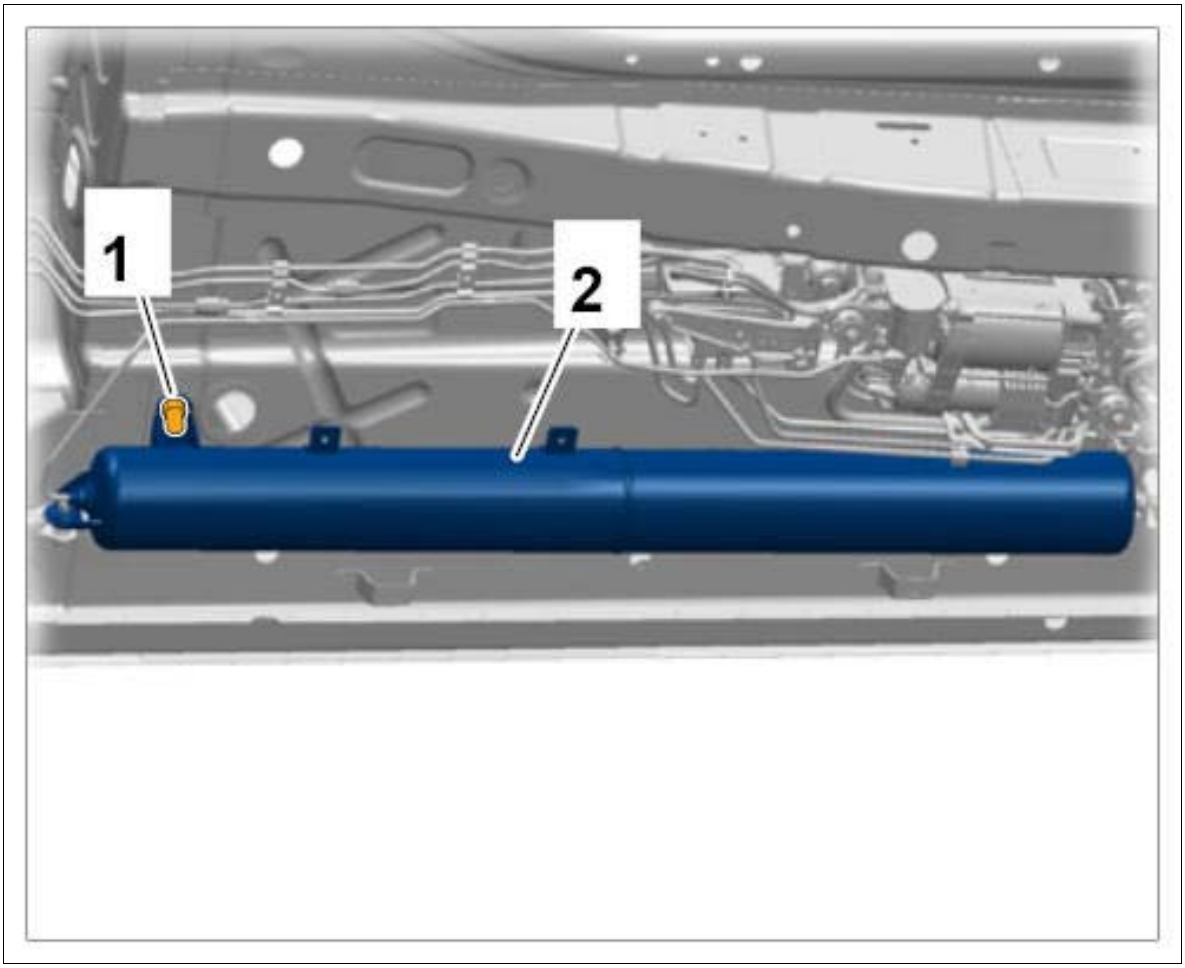
1. Disconnect air line on the pressure accumulator.
2. Unscrew fastening screw **-1-** on the pressure accumulator **-2-** .

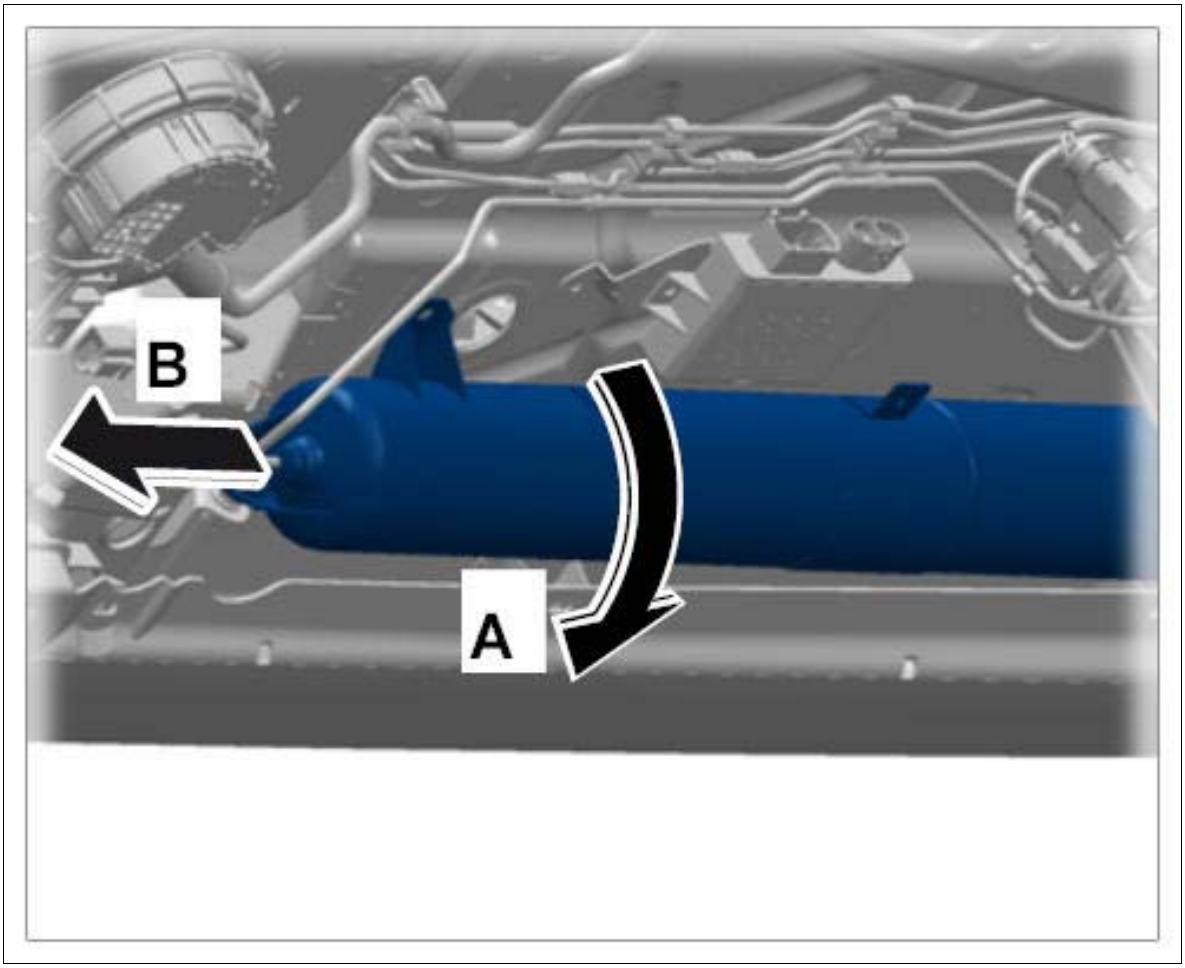
Fig 1: Identifying Pressure Accumulator Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Tilt the pressure accumulator down slightly **-direction arrow A-** and remove it by pulling it to the side **-direction arrow B-** .

Fig 2: Removing Pressure Accumulator



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 438219 REMOVING AND INSTALLING PRESSURE ACCUMULATOR FOR LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > REMOVING AND INSTALLING PRESSURE ACCUMULATOR FOR LEVELLING SYSTEM > INSTALLING PRESSURE ACCUMULATOR FOR LEVELLING SYSTEM

1. Installation is performed in reverse order.

   Observe specified tightening torques:

   Pressure accumulator to body: **Tightening torque 20 Nm (15 ftlb.)**

   Air line to pressure accumulator: **Tightening torque 3.5 Nm (2.5 ftlb.)**

WM 438219 REMOVING AND INSTALLING PRESSURE ACCUMULATOR FOR LEVELLING SYSTEM (MACAN, MACAN S, MACAN TURBO) > SUBSEQUENT WORK

1. Install center underbody (left cover). → INSTALLING COVER FOR CENTER UNDERBODY .
2. Fill the levelling system. → BLEEDING AND FILLING THE LEVELLING SYSTEM .

WM 438541 REPAIRING AIR LINE (MACAN, MACAN S, MACAN TURBO) > TOOLS

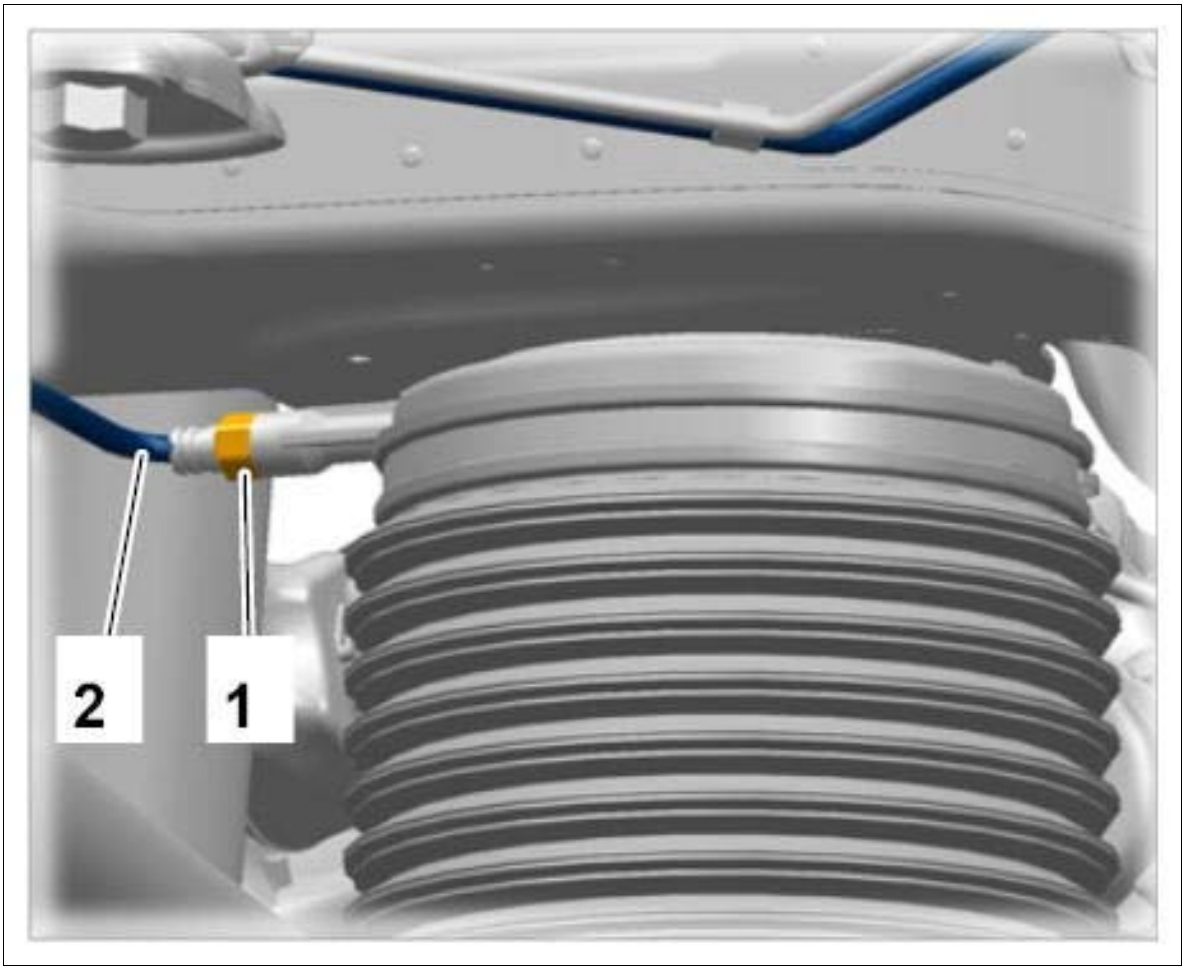
Designation	Type	Number	Description	
cutting pliers	Workshop equipment	WE 1506		
PIWIS Tester II	Special tool	9818		
WM 438541 REPAIRING AIR LINE (MACAN, MACAN S, MACAN TURBO) > REPAIRING AIR LINE

Information

If a new air spring/new pressure control valve is to be installed, the VOSS threaded joint is already pre-fitted.

1. Raise the vehicle. → 4X00IN LIFTING THE VEHICLE
2. Bleed the relevant section using **PIWIS Tester II 9818.** → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM .
3. Loosen VOSS threaded joint **-1-** on the defective air line **-2-** from the relevant component (e.g. air spring/compressor).

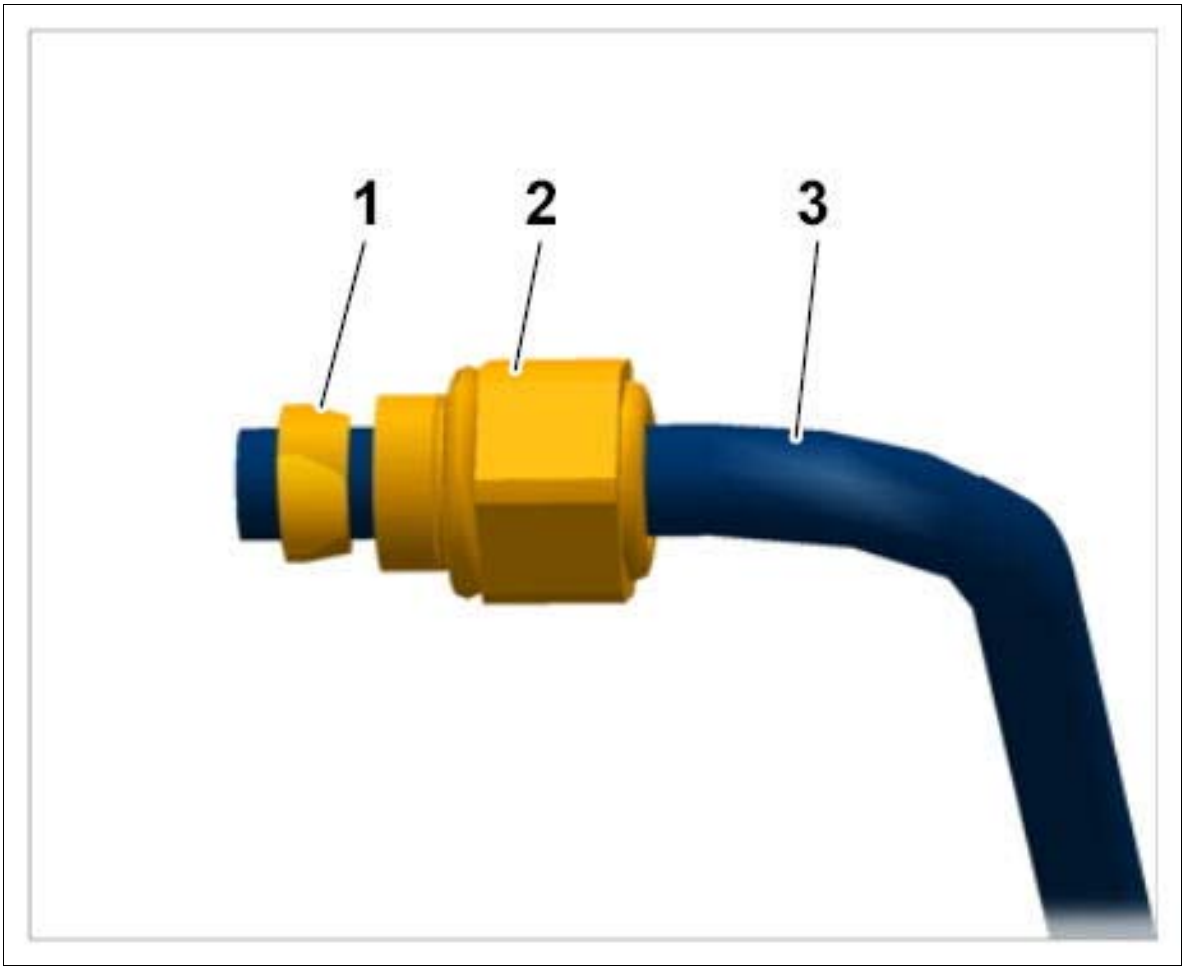
Fig 1: Identifying Air Line Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Loosen the cutting ring **-1-** on the air line **-3-** using a suitable tool.
5. Pull VOSS threaded joint **-2-** off the air line **-3-** .

Fig 2: Identifying Air Line Cutting Ring And VOSS Threaded Joint



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

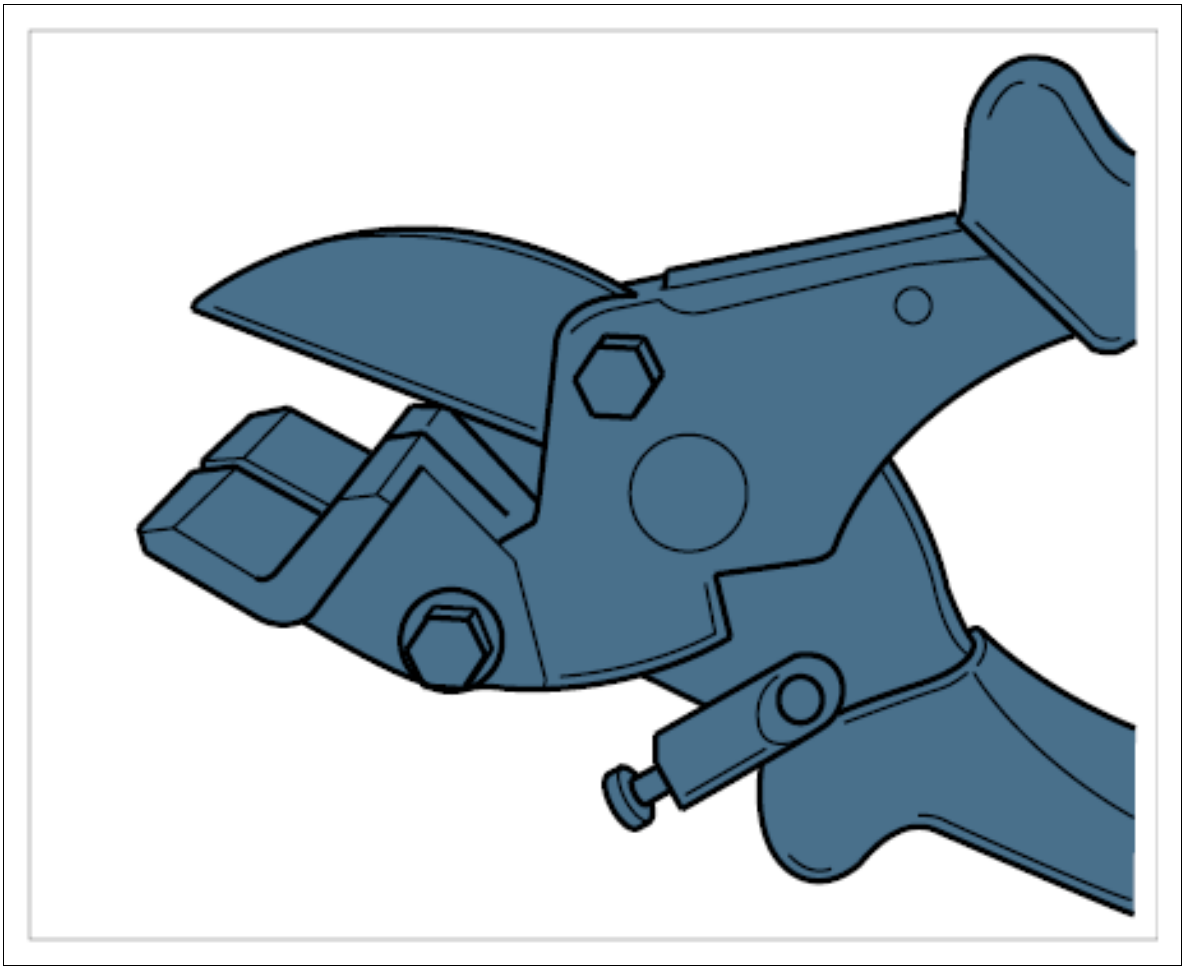
Information

Pay particular attention to the following points when choosing the repair point:

1. The repair point must be in an area protected from water spray.
2. Only straight line sections should be chosen for repairs. If a bent section of line is selected, this can result in leaks in the push-on connector.

6. Cut off defective section of the air line with a straight cut using **cutting pliers WE 1506.**

Fig 3: Identifying Pliers VAS 6228



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

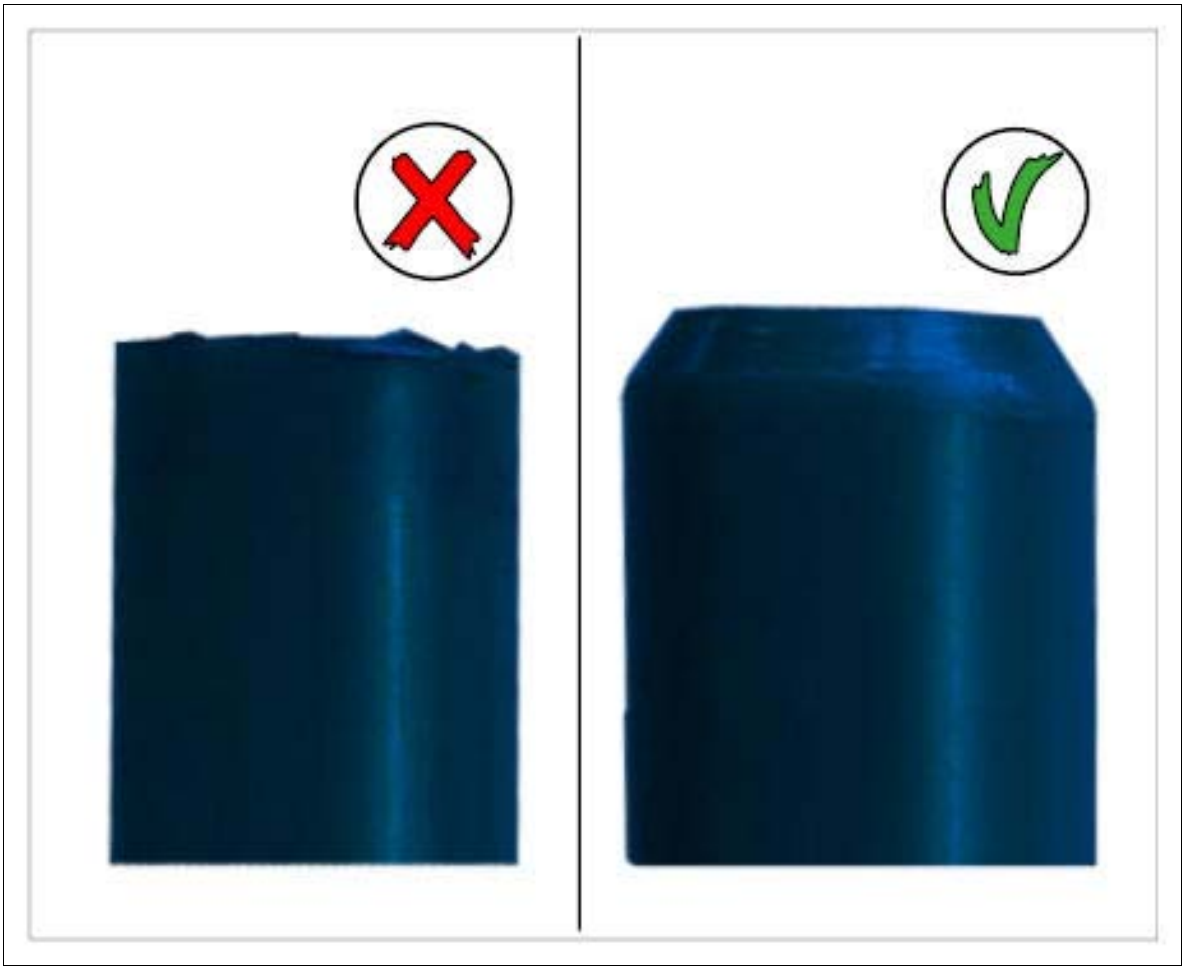
Information

Sharp edges at the end of the air line or at the point where the cutting ring is fitted can damage the newly fitted O-ring.

For this reason, always de-burr the end of the air line.

7. De-burr the end of the new air line section using a suitable tool → De-burring air line .

Fig 4: Identifying De-Burring Air Line

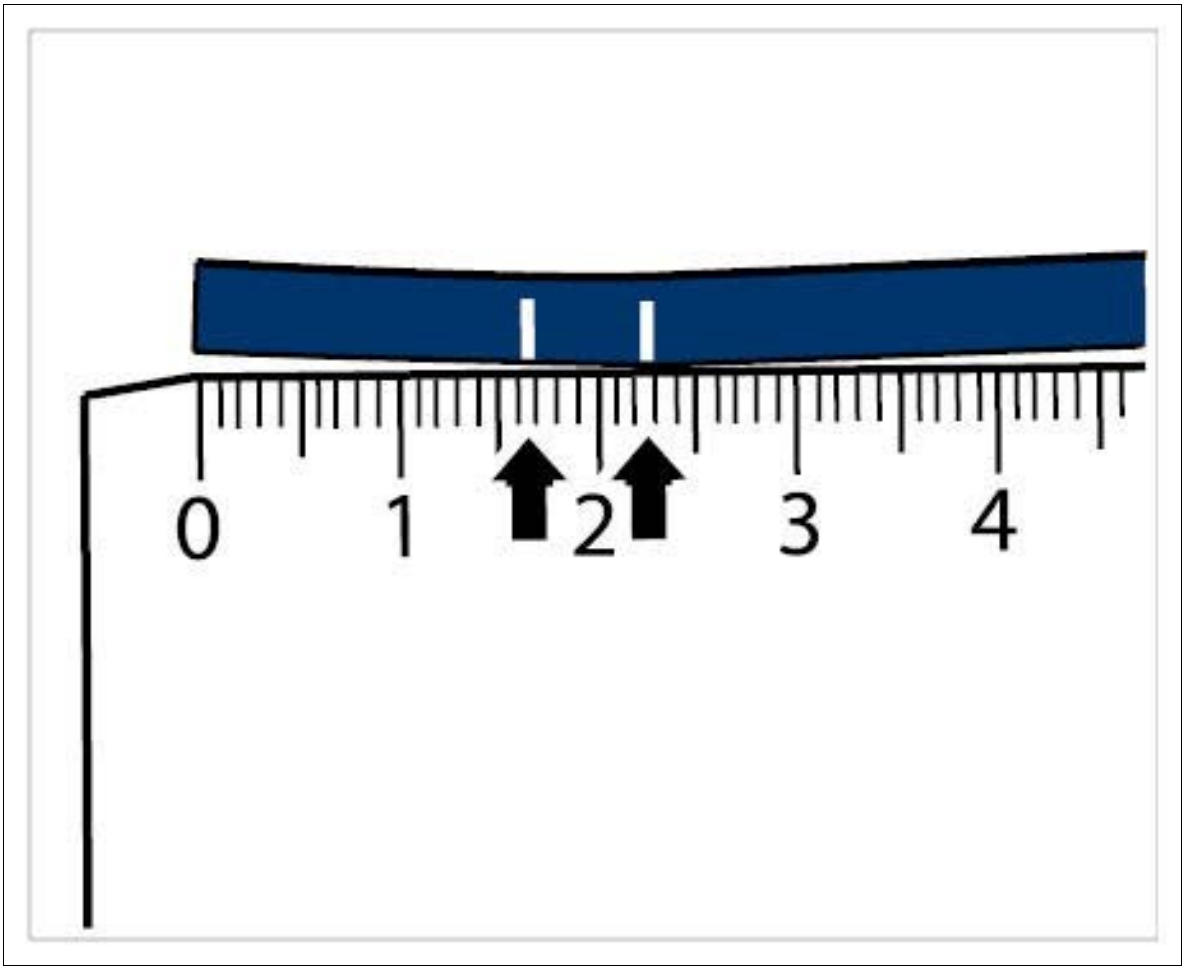


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Mark the new air line with a colored marking (e.g. using a water-resistant marker).

   Applies to end of hose on valve block: Measured from the end of the hose, make two colored markings at 17 mm and 22 mm respectively **-arrows-** .

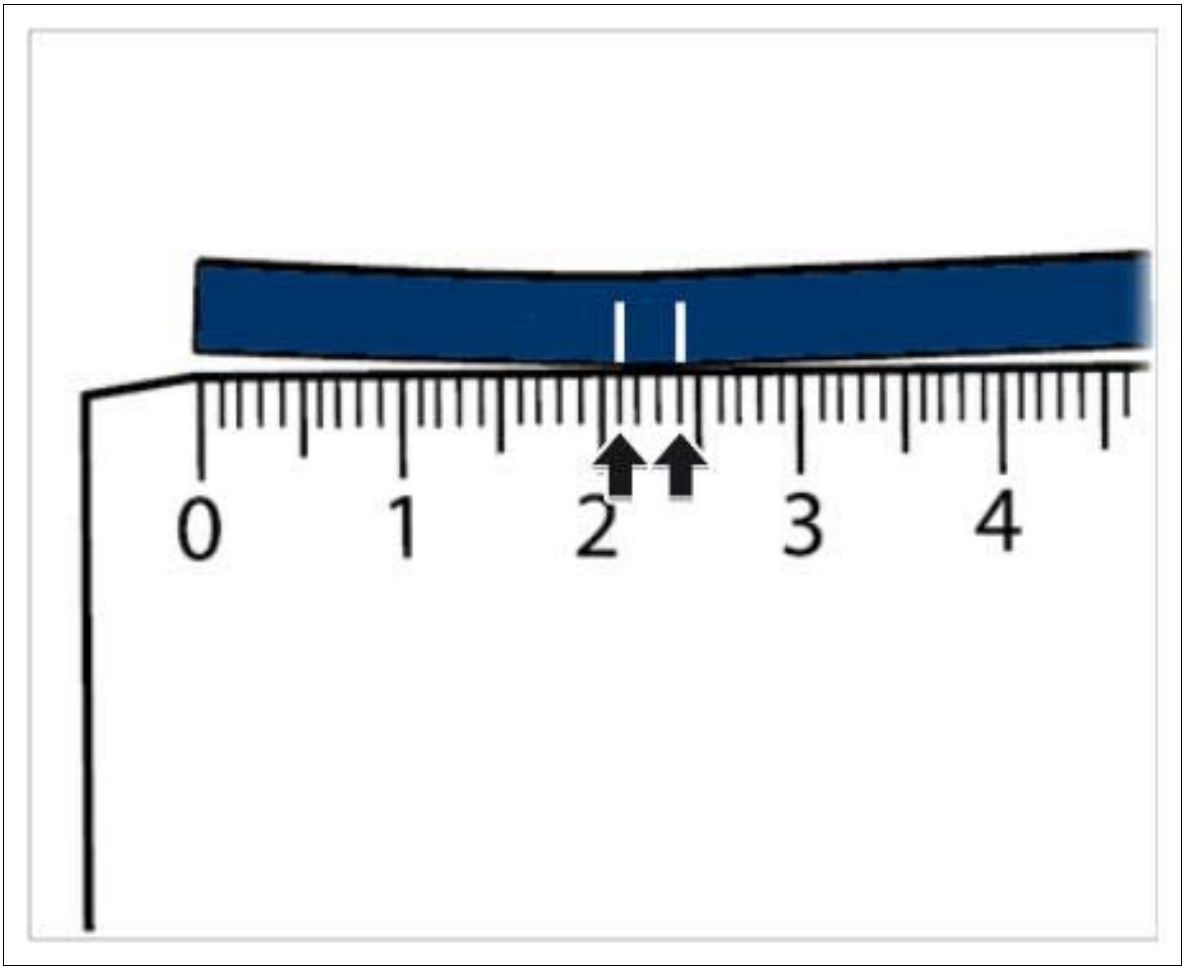
Fig 5: Locating Air Line Mark (Valve Block Side)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Applies to end of hose on air spring: Measured from the end of the hose, make two colored markings at 21 mm and 24 mm respectively **-arrows-** .

Fig 6: Locating Air Line Mark (Air Spring Side)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

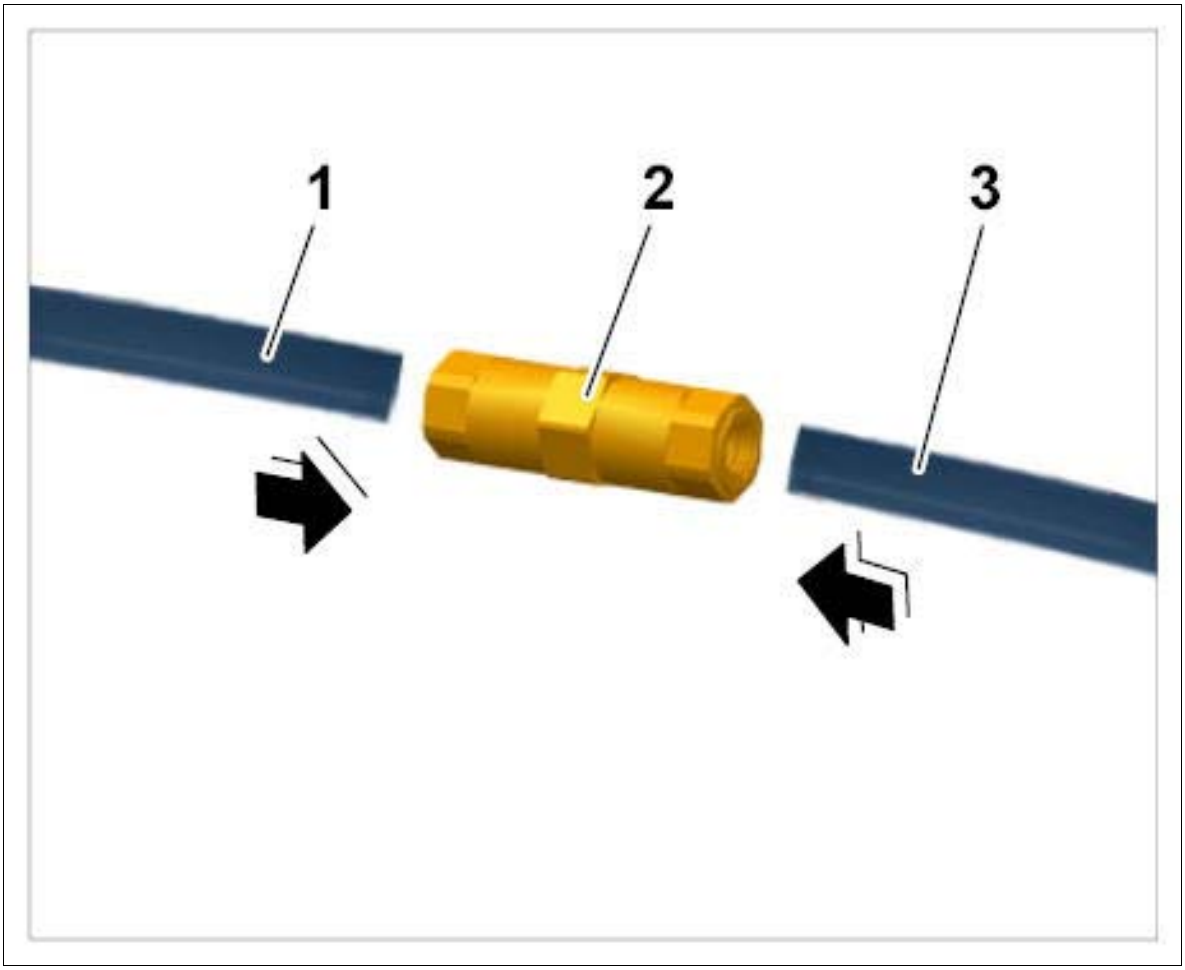
9. Check air line for soiling (e.g. dust particles) and clean it if necessary.

   Information

   Insert air lines as far as they will go into the push-on connector.

10. Connect new air line section **-1-** using the push-on connector **-2-** to the air line installed in the vehicle **-3-** .

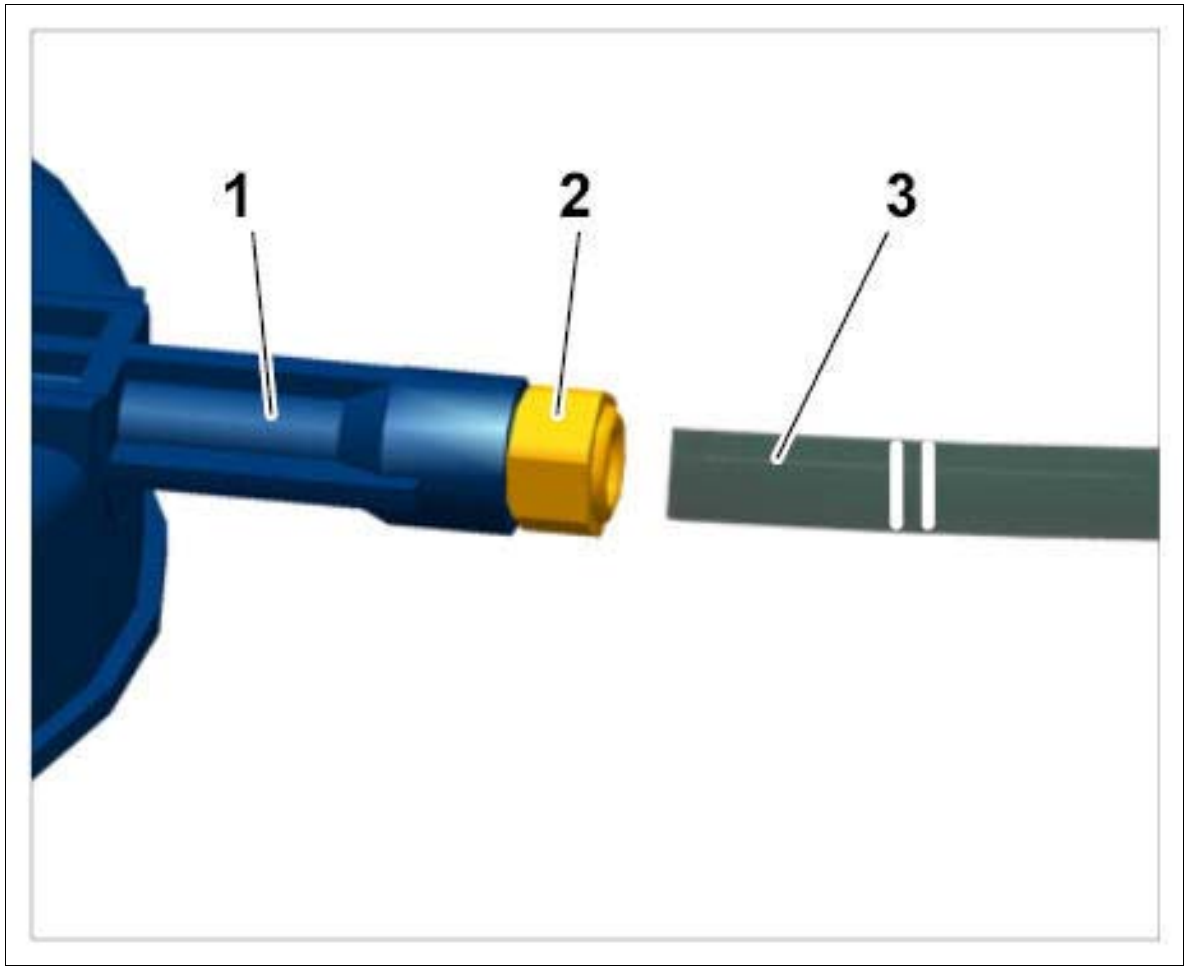
Fig 7: Connecting Air Lines



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

11. Insert air line **-3-** as far as it will go into the VOSS threaded joint **-2-** on the air spring/valve block **-1-** .

Fig 8: Identifying Air Line And VOSS Threaded Joint (Rear Air Spring)



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Check that the air line is fitted correctly:
    1. Only one marking on the air line should be visible.
    2. Pull the air line briefly against the insertion direction. If it cannot be pulled out, the air line is fitted correctly.
13. Fill the relevant section using **PIWIS Tester II 9818.** → 4301IN BLEEDING AND FILLING THE LEVELLING SYSTEM .

WM 440519 REMOVING AND INSTALLING WHEEL (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Wheel to wheel hub		Tightening torque	160 Nm (118 ftlb.)		

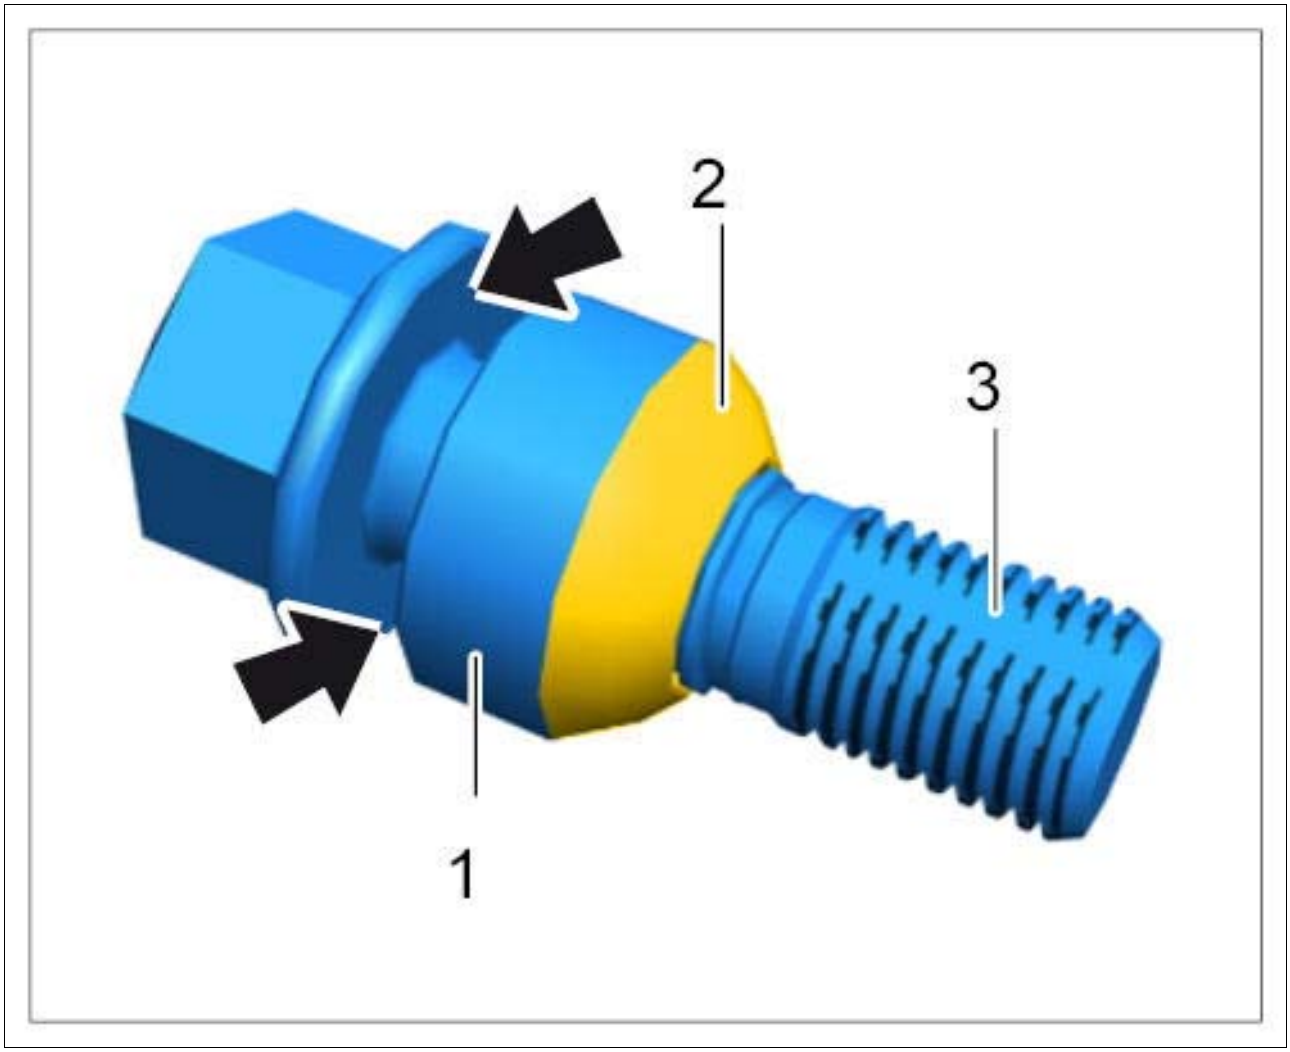
WM 440519 REMOVING AND INSTALLING WHEEL (ALL MODELS) > INFORMATION ON WHEEL BOLTS

- Use a suitable commercially available tool (a/f 19 mm). Never use an impact bolter to loosen and tighten the wheel bolts.
- Use original Macan wheel bolts only.
- Wheel bolts must never be reworked.
- Replace damaged wheel bolts. This damage includes mechanical damage to the thread, the spherical cap and damage resulting from seizure of the bolt head bearing surface and spherical cap ring. It must be possible to rotate the spherical cap ring on the bolt shank and move it in axial direction.
- Never grease the wheel bolts and security wheel bolts.

1. Spherical cap ring (permanently connected to the wheel bolt)
2. Spherical cap bearing surface facing the rim. Do not grease.
3. Thread. Do not grease.

arrows - Contact surfaces between the bolt head and spherical cap ring. Do not grease.

Fig 1: Identifying Wheel Bolt



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 440519 REMOVING AND INSTALLING WHEEL (ALL MODELS) > REMOVING AND INSTALLING WHEEL > REMOVING WHEEL

Information

- On vehicles with PCCB, use two assembly aids (threaded pins for fitting wheel) in order to rule out any possibility of heavy contact of the wheel with the brake disc!
- The assembly aids should be obtained from the Porsche Parts Service (Part No. 999.571.074.30)!
- Vehicles with Tire Pressure Monitoring system (TPM): Every new set of wheels or wheel change must be communicated to the control unit (even if the new wheels have the same specifications as the old ones). To do this, select >>Tire pressure, Settings, Tire type and Tire size<< in the main menu on the instrument cluster and confirm your selection. The control unit then stores these values while the vehicle is driving (at more than 25 km/h (16 mph)). The current tire pressure is not available during this time.

- For information on teaching the TPM system, see → 4X00IN GENERAL INFORMATION ON THE TIRE PRESSURE MONITORING SYSTEM (TPM).
- The wheel mounting trolley can be used to make mounting easier

> *NOTE: Removing/fitting wheels*
>
> - *Risk of damage to (ceramic) brake discs*

→ Use two assembly pins when removing and fitting the wheel.

→ Carefully guide the wheel towards the wheel hub, thereby preventing any heavy impact on the (ceramic) brake disc.

1. Remove wheel. **Never use an impact bolter to loosen the wheel bolts!**

   Fig 1: Identifying Assembly Aids

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

   1. 1.1. On vehicles with PCCB (ceramic brake discs), unscrew and remove two wheel bolts that are not next to each other.
   2. 1.2. Replace the two removed wheel bolts with assembly aids **-1-** .

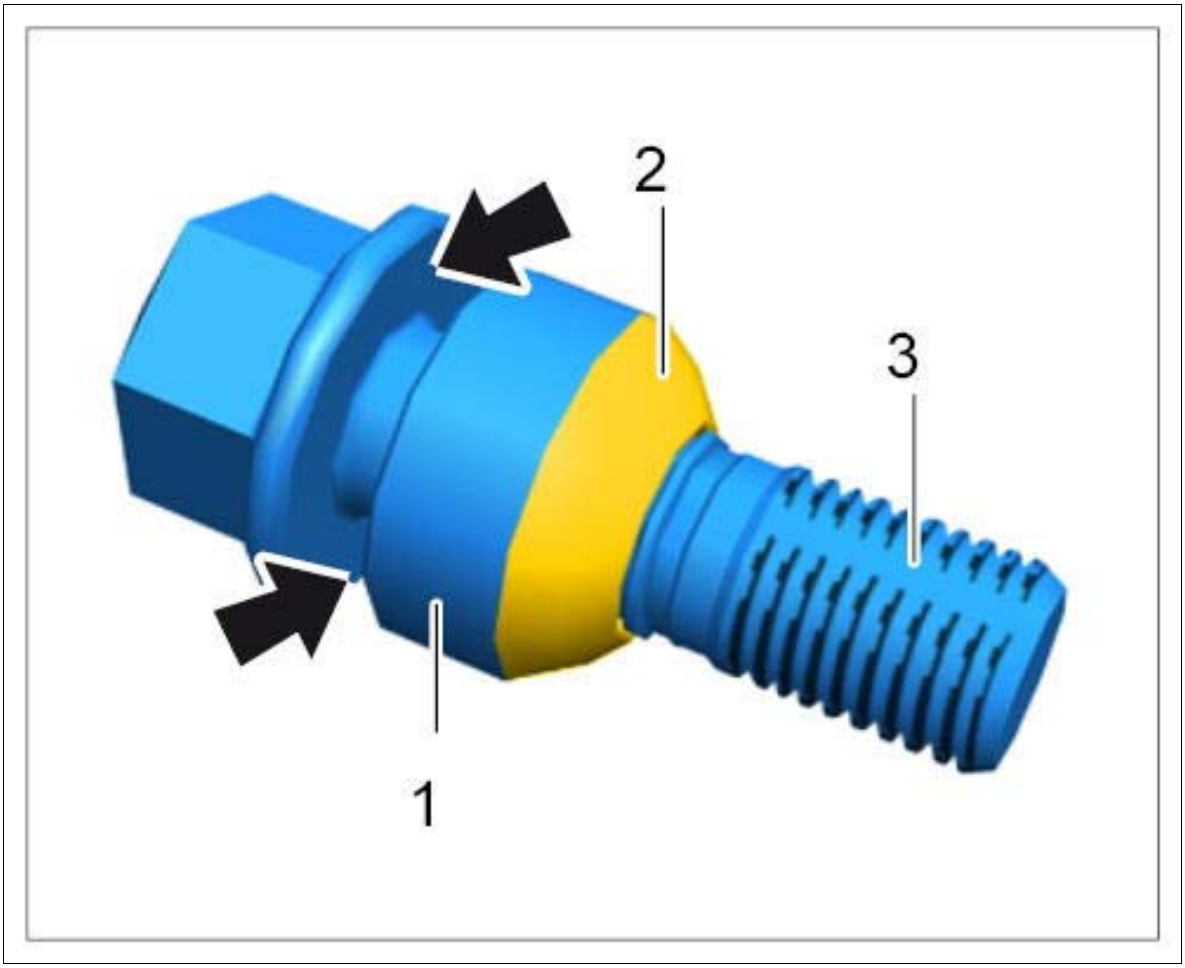
3. 1.3. Unscrew and remove the remaining wheel bolts.
4. 1.4. Carefully remove the wheel.

WM 440519 REMOVING AND INSTALLING WHEEL (ALL MODELS) > REMOVING AND INSTALLING WHEEL > INSTALLING WHEEL

1. In the event of heavy soiling, clean the wheel bolts and concavities in the rim with a lint-free cloth.

   The wheel bolts/security wheel bolts (thread and all surfaces) must not be greased.

   Fig 1: Identifying Wheel Bolt



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

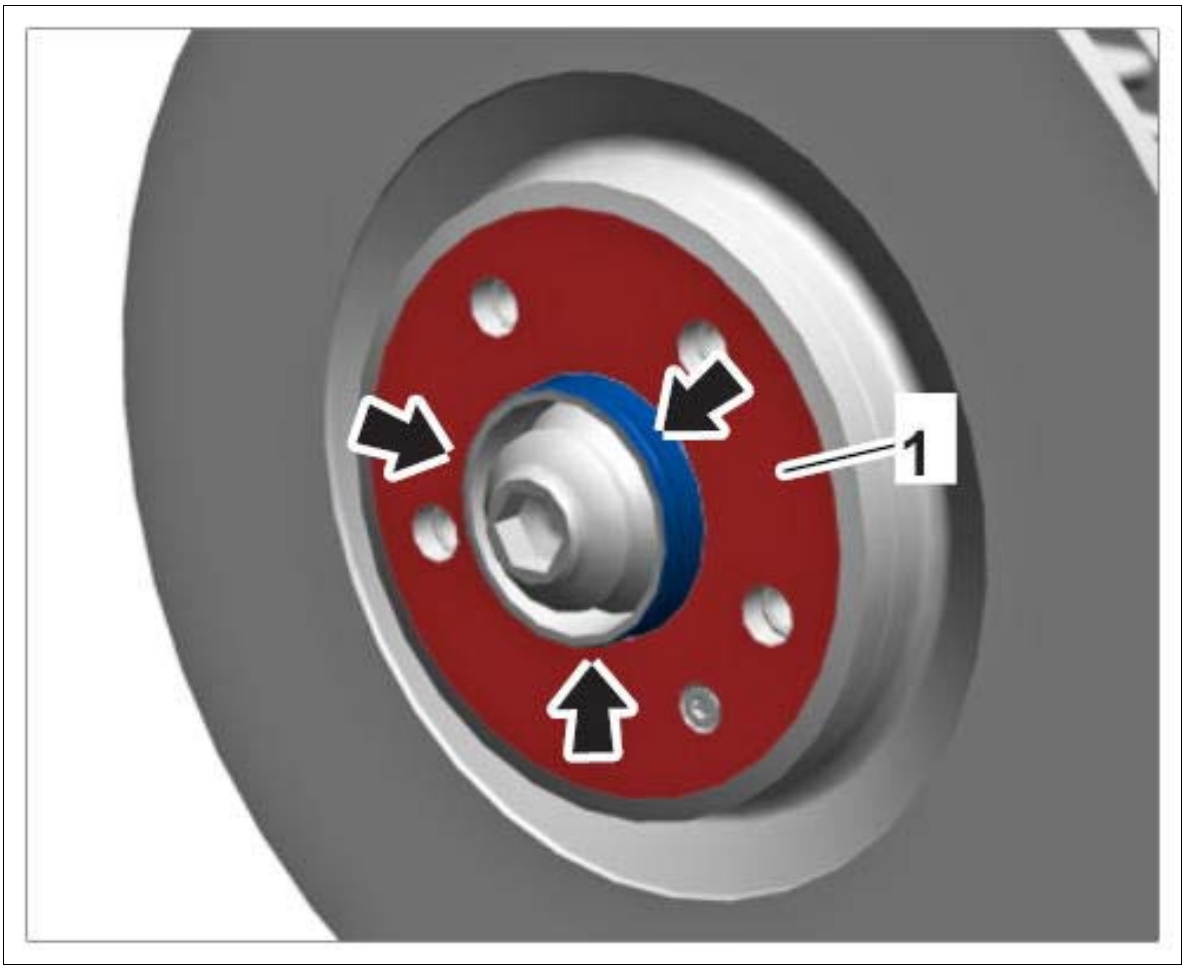
2. The contact surfaces of the wheel on the wheel hub and brake disc must be clean. Clean them if necessary.

   Re-grease or grease the wheel centering surface on the wheel hub (blue area) **-arrows-** with a very thin coat of Optimoly TA (aluminum paste).

   The wheel contact surface on the brake disc (red area) **-1-** and on the wheel itself must not be greased (greasing is not permitted).

ONLY the area marked in blue **-arrows-** may be greased.

Fig 2: Locating Wheel Centering Surface



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Fit wheel.

Never use an impact bolter to tighten the wheel bolts!

Fig 3: Identifying Assembly Aids (Wheel Threaded Bolts)

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. On vehicles with PCCB, screw the assembly aids **-1-** into two threaded holes that are not next to each other before fitting the wheel.
2. 3.2. Carefully push the wheel over the assembly aids **-1-** .
3. 3.3. Screw the other wheel fastening bolts into the remaining threaded holes.
4. 3.4. Replace the assembly aids **-1-** with wheel fastening bolts.
5. 3.5. Fit wheel fastening bolts and tighten them evenly at the same time. Start at the top when tightening.

4. Tighten the wheel fastening bolts to the specified tightening torque. **Tightening torque 160 Nm (118 ftlb.)**

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > TOOLS

Designation	Type	Number	Description	

measuring gauge	Commercially available tool	Nr.136		
WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > GENERAL INFORMATION ON BALANCING/OPTIMIZING WHEELS

Excessive rough running of the wheels, caused by wheel imbalance, flat spots and securing the wheel on the vehicle, causes vibrations and shaking in the steering wheel. This in turn leads to increased wear on various parts of the chassis.

Even if wheels are correctly balanced, rolling and steering imbalance can still occur. E.g.:

- excessive geometric errors (radial and lateral runout),
- radial force variations (softer and more rigid areas in the tire).

Information

- Achieving a good result requires utmost care, observance of the instructions and procedure, and attempting to eliminate even the very last gram of imbalance.

Recommendations/prerequisites:

Wheel suspension elements must be in good working order.

The wheels must be clean with no foreign objects in the tire.

Use a tire measuring gauge, e.g. **measuring gauge Nr.136** to check radial and lateral runout values on wheels without flat spots. Values of less than 1 mm are desirable - around 0.5 mm would be better.

To limit the number of radial runout errors and to optimize rolling smoothness, it is a good idea - and even necessary in some cases - to match the tire (i.e. to fit it at a favorable position with respect to the rim). Follow tips and fitting instructions as well as information on tire mounting paste for tires.

If the disc wheels (wheels without tires) are perfect but the complete wheels have large radial and lateral runout values (due to ply breakage or other damage), it may be necessary to replace the tire.

Balance used wheels only after they have been warmed up by driving, otherwise flat spots will simulate imbalance. Never perform matching on wheels with flat spots. In the event of flat spots, wheels must be warmed up by driving 25 - 30 km (16 - 20 miles) on a motorway. Lift up the vehicle immediately on return. This prevents new flat spots from forming.

Correct tire pressure is an important prerequisite.

Place the balancing weights at the prescribed position.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > EXPLANATION OF TERMS > GEOMETRIC ERROR (RADIAL AND LATERAL RUNOUT)

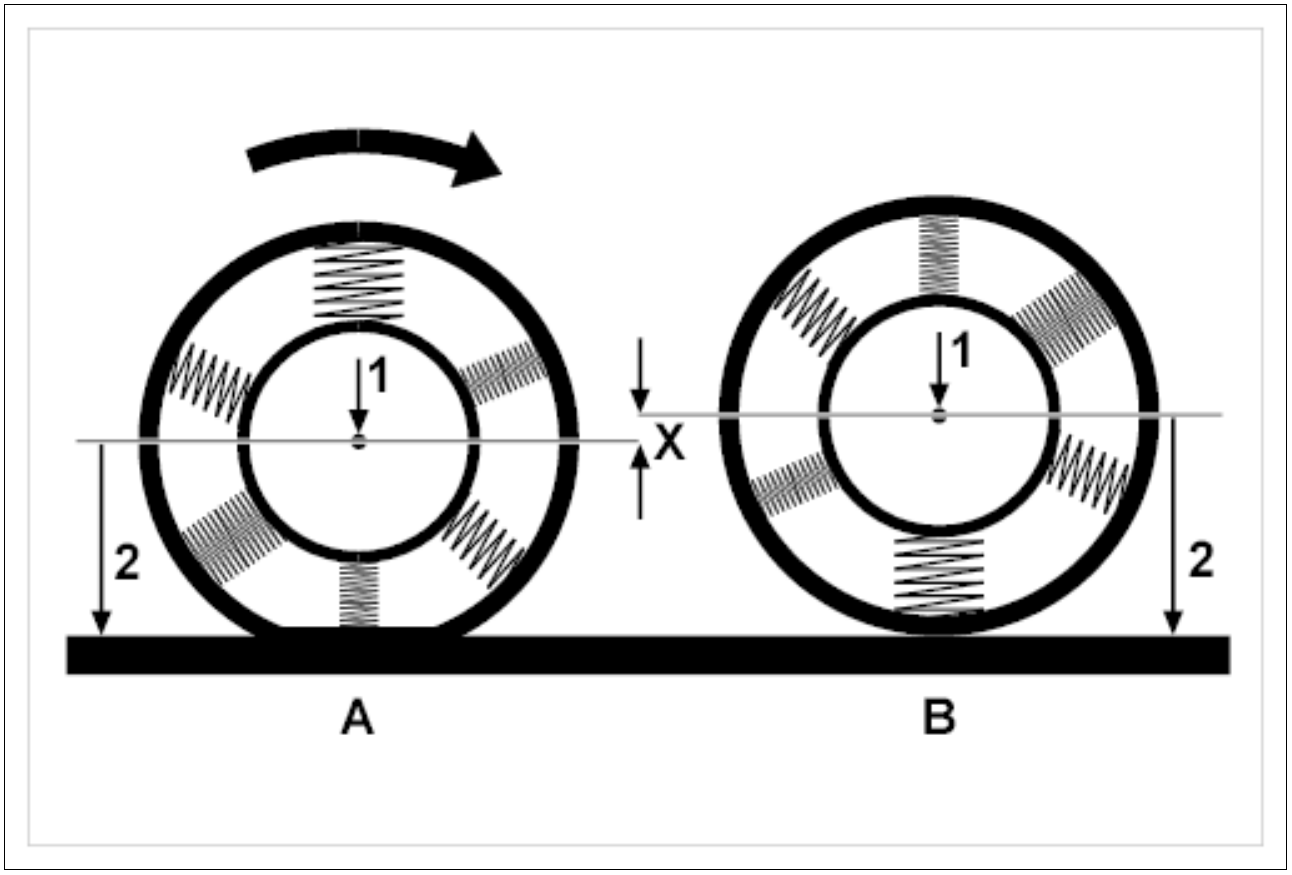
Radial and lateral runout of the rim and/or rim/tire assembly.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > EXPLANATION OF TERMS > FLAT SPOTS

Flat spots can occur on the tires if the vehicle is idle for extended periods.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > EXPLANATION OF TERMS > RADIAL FORCE VARIATIONS

Fig 1: Identifying Rim/Tire Assembly Radial And Lateral Runout



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

The radial force is a force that compresses a tire. Based on its size, a tire has softer (**-item A-**) and more rigid zones (**-item B-**) due to constructive and production-related factors. Given this, the tire compresses to various extents at a constant wheel load (**-arrow 1-**) and a constant tire pressure (**-arrows 2-**). This varying spring action (**-X-**) in the tire can cause vibrations in the chassis on even road surfaces and the driver may notice this as shaking in the steering wheel, for example. Measuring the radial force variation involves running the tire on a wheel balancer that measures radial force variation while applying a constant load to the tire. This simulates the rolling of the tire on a driving surface. Variations in radial force occur independently of the direction of rotation of the tire and are measured as the difference between the maximum and minimum radial force ("peak-to-peak" value).

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > EXPLANATION OF TERMS > 1. HARMONIC

The changes in radial force variation can be broken down mathematically into individual variations. Porsche uses the value of the 1st Harmonic Variation (basic variation) to assess the tire from the point of view of rigidity. The 1st Harmonic Variation relates to the changes in radial force that cause the strongest vibrations. Changes in radial force can also result in further harmonic variations (2nd-4th Harmonic). These relate to the changes in radial force that cause weaker vibrations.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > EXPLANATION OF TERMS > UNCONTROLLED MATCHING

Turn the tire on the wheel by 90° or 180° if necessary in order to achieve an acceptable value with regard to rolling smoothness (true running, imbalance and distribution of balance weights).

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > EXPLANATION OF TERMS > CONTROLLED MATCHING

With a balancing machine with matching program. In most cases, this produces an even better result with regard to the rolling smoothness (true running, imbalance and distribution of the balance weights) than can be achieved with uncontrolled matching.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > EXPLANATION OF TERMS > TIRE SEATING PRESSURE

This is the filling pressure after the tire has been fitted on the rim at which the tire bead, coming out of the deep bed, must pop over the hump of the rim bead. This seating pressure must not exceed 4 bar.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > BALANCING/OPTIMIZING WHEELS

In certain cases, it may be necessary to measure radial force variations. This should be done before normal balancing is performed.

The entire process is subdivided into several operations:

1. Fitting the tire on the rim.
2. 2.
    A. Measuring radial force variations and optimizing the wheels if necessary. Then balancing the wheels.
    B. As an alternative to item 2 A, if there is no device available to measure radial force variations: Stationary balancing of the wheel (eliminating static and dynamic imbalance) with optimization of rolling smoothness.
3. Fitting the wheel on the vehicle.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) >

BALANCING/OPTIMIZING WHEELS > FURTHER TO 1: FITTING THE TIRE ON THE RIM

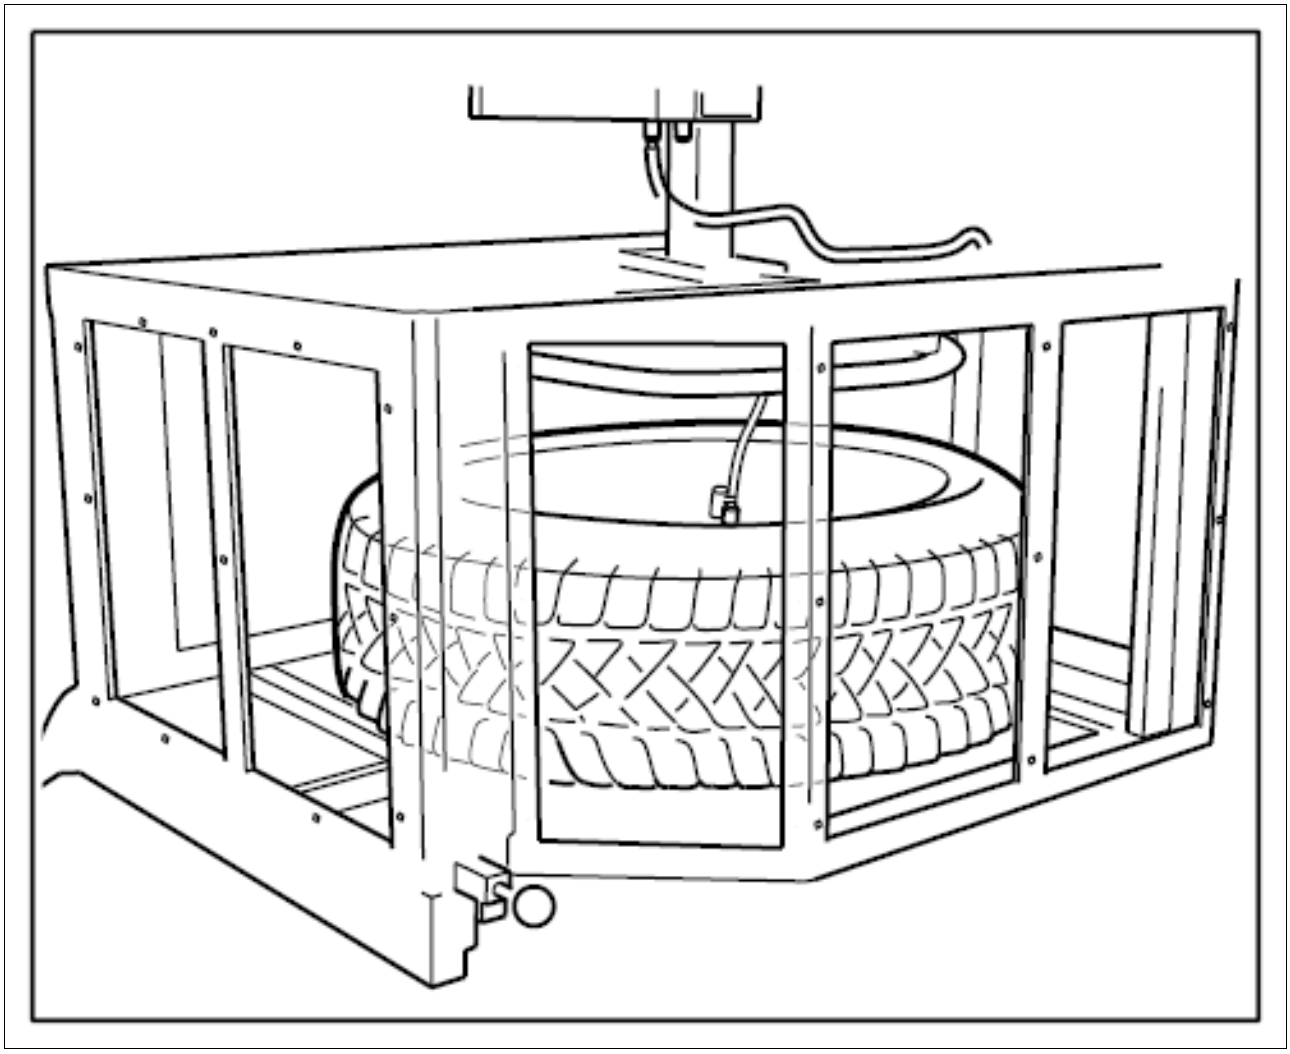
- Remove rubber residues and dried-on tire paste from the rim, especially from the rim bead and the hump.
- Check rim for damage; remove old balancing weights.
- Use the specified tire mounting pastes Remaxx Sport mounting paste (from Rema Tip Top/Item No. 593 0577) or Bead Lubricant (from Rema Tip Top/Item No. 514 4985) or Gleitmittel VA sliding compound (from Azett/Item No. 5000-021-220) so that the tire does not turn on the rim - undoing all your careful work - the first time you drive the vehicle. If the tire turns by as little as 20 mm with respect to the rim, this can worsen an optimum balancing result.
- Fit tire on the rim. When doing so, it is a good idea - and even necessary in some cases - to fit the tire at a favorable position with respect to the rim (matching). Compare Controlled and Uncontrolled matching below.

WARNING: High tire seating pressure

- *Risk of squashing or bruising*

→ Use a tire filling cage.

Fig 1: Identifying Tire Filling Cage



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- Fill the tire to a maximum pressure of 4.0 bar. By the time the pressure reaches 4.0 bar, at the latest, the tire beads must pop out of the deep bed and over the hump of the rim bead in order to avoid fractures of the bead core. If necessary, interrupt the process and generously coat all necessary surfaces with sliding compound (tire mounting paste). Then repeat the process.
- Uncontrolled matching: Turn the tire on the wheel by 90° or 180° if necessary in order to achieve an acceptable value with regard to rolling smoothness (true running, imbalance and distribution of balance weights).
- Controlled matching: With a balancing machine with matching program. In most cases, this produces an even better result with regard to the rolling smoothness (true running, imbalance and distribution of the balance weights) than can be achieved with uncontrolled matching.
- Check the fit of the tire on the rim using the bead centering line.
- Set the prescribed tire pressure.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) >

BALANCING/OPTIMIZING WHEELS > FURTHER TO 2A: MEASURING RADIAL FORCE VARIATIONS

- Tension wheel on balancing machine with radial force variation measurement (vibration monitoring system).
- Observe the operating instructions of the balancing machine (adjust the machine from time to time).
- The contact surface of the wheel on the balancing flange (flat surface) and the centering surface must be clean.
- The display disabling function must be switched off.
- Adjust tire pressure to 2.7 bar (best test pressure) when balancing and measuring radial force variations.
- Particular attention must be paid to the wheel mounting when measuring radial force variations and when balancing. Using the special pressure pieces provided by the manufacturer of the balancing machine will ensure that wheels are balanced accurately and there is the highest possible repeat accuracy. Read the operating instructions.

Maximum deviations permitted in radial force variation results:

Radial force variation (peak-to-peak vibrations)	170 N
Radial force variation 1st Harmonic (variation)	109 N

If these values are exceeded, the tire must be matched on the rim.

If these values are not reached, the wheel must be balanced.

Information

A new tire must be fitted if the radial force variation cannot be reduced to the values listed in the table.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > FURTHER TO 2B: STATIONARY BALANCING WITH OPTIMIZATION OF ROLLING SMOOTHNESS

- Clamp wheel on stationary balancing machine.
- Read the operating instructions for the balancing machine; adjust the machine from time to time, if necessary.
- The contact surface of the wheel on the balancing flange (flat surface) and the centering surface must be clean.
- Centre (clamp) the wheel from the inside using centering clamping device . This centering clamping device fits all wheel-balancing machines approved by Porsche.
- Set required tire pressure (tire-pressure plate).

- Centre (clamp) the wheel from the inside using centering clamping device . This centering clamping device fits all wheel-balancing machines approved by Porsche.

Check radial and lateral runout during the first measuring run. Values of less than 1.0 mm are desirable - around 0.5 mm would be better.

Consider the size of the measured balancing weights and their distribution on the inner and outer planes (inner and outer rim flanges) critically.

A uniform distribution with low values (e.g. 35g/40g) means that the tire was fitted correctly and the quality of the tire and rim is good.

A value of 70g/90g (70g/90g with tire Pressure Monitoring) should not be exceeded with interior balancing behind the wheel center. A considerably different distribution, e.g. 40g/90g is not good; this usually indicates incorrect fitting. Problem wheels of this kind often have pronounced radial and lateral runout values.

This can be remedied by matching (use correct mounting paste). This can be improved with uncontrolled matching (manual); significant improvement is possible in almost all cases using the rolling smoothness optimization program (controlled matching).

tire pressure during balancing at required pressure.

Permissible residual imbalance of max. 8g on the rim flange. **Panamera: Permissible residual imbalance of less than 3g, or max. 3g per plane** .

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > FURTHER TO 3: FITTING THE WHEEL ON THE VEHICLE

Information

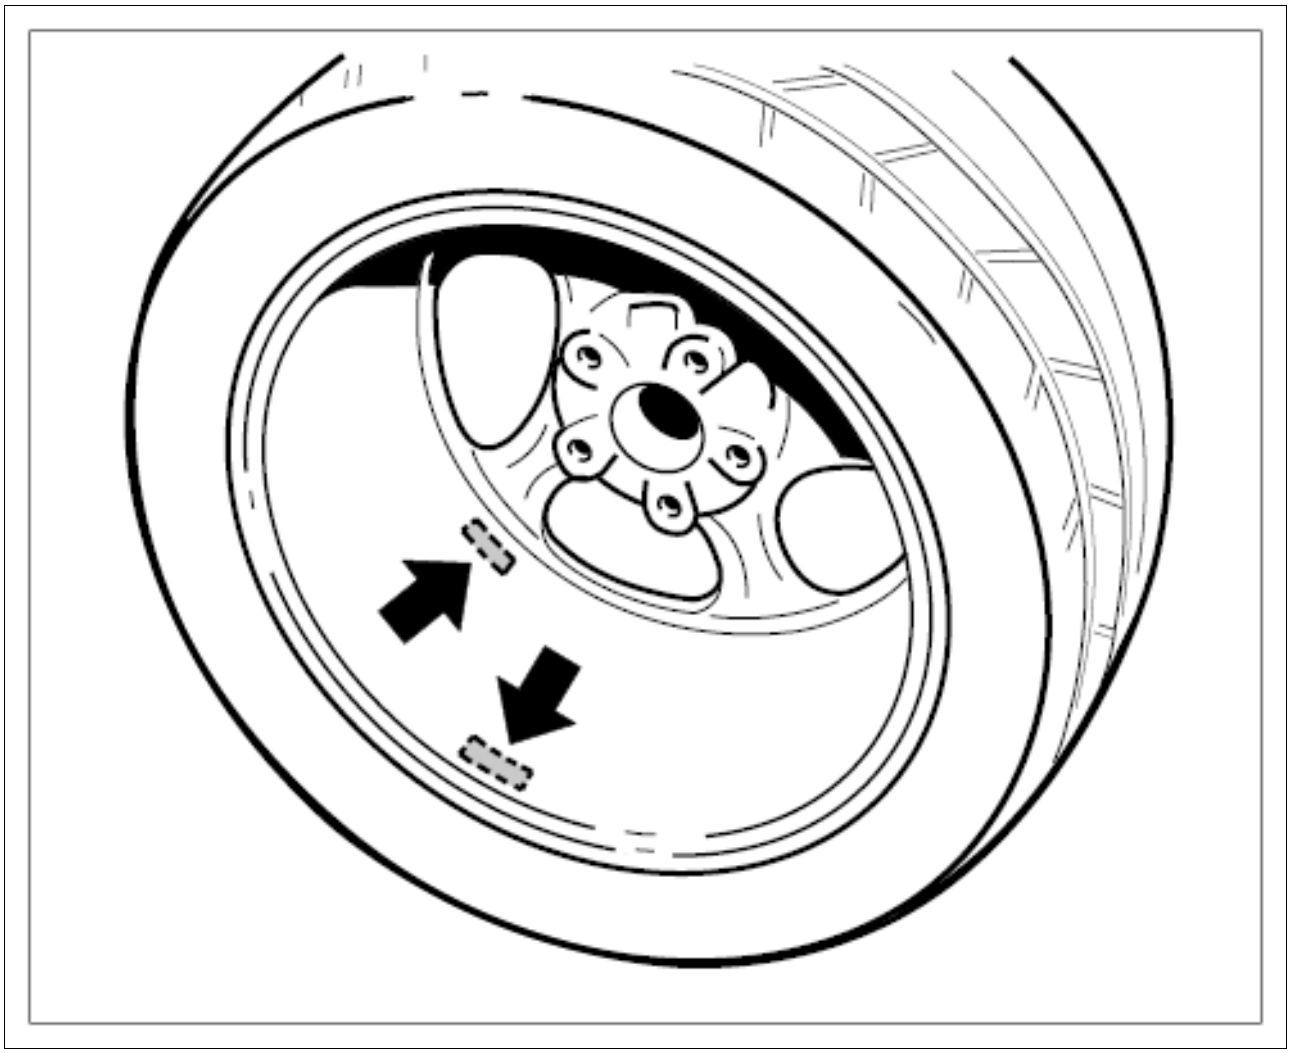
- Never use an impact bolter.
- Observe the description on wheel removal and installation (fitting wheel on vehicle) → 440519 REMOVING AND INSTALLING WHEEL .
- Fit the wheels with the lowest residual imbalance values on the front axle. Observe the rolling direction of the wheels.
  - Fit wheel using a suitable commercially available tool.
  - Screw in wheel bolts by hand and then tighten evenly. Start at the top when tightening. Always observe the specified tightening torque of 160 Nm (118 ftlb.)
  - Set required tire pressure (tire-pressure plate).

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > BALANCING WEIGHTS

Balancing weights: For balance stick-on weights .

Attach both weights to the inner side.

Fig 1: Locating Wheels Balancing Weights



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

- Observe program selection and operating instructions of the balancing machine.

WM 440593 BALANCING/OPTIMIZING WHEELS (ALL MODELS) > BALANCING/OPTIMIZING WHEELS > ATTACHING BALANCE STICK-ON WEIGHTS

Information

- Remove the protective film just before sticking on the weight, as prolonged exposure to the air will reduce the bonding strength.
- Pay attention to cleanliness.
  - Determine exact position of the balancing weights (if necessary, temporarily stick on the balancing weights with a strip of adhesive tape until the correct position is determined).

- Prepare bonding surface on the rim. The bonding surface must be perfectly clean and free of grease.
- Remove protective paper from the bonding surface of the weight and press the weight firmly into place.
- The balance stick-on weight must be in uniform contact over the entire surface.
- Check that the balancing weight is seated securely. A freshly affixed weight must not become detached from the rim when a shear load is applied at right angles to its longitudinal axis.

WM 4405IN WHEELS AND TIRES (ALL MODELS) > CHECKING > CHECKING CONDITION

Tires are a safety element that meet the demands placed on them only if they have the correct air pressure and sufficient tread depth.

Information

The >> Tire pressure << display is for information purposes only.

- tire pressure settings can only be entered according to the values in >> Filling information<<.

1. Check condition and tire pressures.

   Valve caps protect the valve from dust and dirt and therefore from damage.

2. Always screw on valve caps tightly and replace missing valve caps.

For vehicles with Tire Pressure Monitoring (TPM), which can be identified by aluminum valves, the tire pressure must be adjusted according to the >> Filling information << on the multi-function display. To do this, select >> Main menu >> TPM >> Filling information <<. Adjust the deviation values so that they range from 0.0 bar to +0.1 bar. Fill the tires according to the display using the tire-inflating device. Example: If the tire pressure display >> Filling information << shows - 0.2 bar, 0.2 bar pressure must be added.

Fig 1: Display - Filling Information Screen

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

The >> tire pressure << display is for information purposes only.

- tire pressure settings can only be entered according to the values in >> Filling information <<.

Due to the pressure and temperature relationship (approx. 0.1 bar/10° C), the actual pressure values displayed under >> tire pressure << on the multi-function display, or on the pressure gauge of the tire-inflating device, can deviate from the required pressure specified at 20° C on the tire pressure plate if the air temperature in the tire is significantly above (higher values) or significantly below 20° C (lower values). Changes in tire pressure are displayed after max. 1 minute under >> Filling information << after switching on the ignition. A series of dashes (-.-) will appear instead of the tire pressure during this time.

Fig 2: Display - tire Pressure Screen

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

For vehicles with tire Pressure Monitoring (TPM), always use plastic valve caps. Plastic valve caps protect against dust, dirt and humidity, and therefore against damage (corrosion).

Tires are a safety element that meet the demands placed on them only if they have the correct air pressure and sufficient tread depth.

> *WARNING: Risk of accidents if the air pressure in the tires falls below the minimum pressure, if the tread depth is insufficient or if there are foreign bodies, pricks, cracks and bulges in the sidewall (ply breakage).*
>
> - *Modified handling behavior can cause accidents and significant material damage.*

→ The tire pressure must never fall below the values specified (these are minimum pressures).

→ The tread depth must never fall below the minimum value.

→ A visual inspection of the tires (for cracks, pricks, bulges in the sidewall and/or foreign bodies) must

be carried out.

WM 4405IN WHEELS AND TIRES (ALL MODELS) > INSTRUCTIONS > TIRE PRESSURE FOR COLD TIRES (APPROX. 20 °C)

Information

The currently applicable air pressure values and comfort tire pressure values in the individual countries can be found in the Manufacturer Approval >>Approved wheels and tires<< in the >>Manufacturer Approvals<<, Group 4.

tire pressures apply to all-season, winter and summer tires. They also apply only to tires approved by Porsche.

Part load: Payload < 260 kg

Full load: Payload > 260 kg

The collapsible spare wheel is an optional extra (tire sealing compound comes as standard).

WM 4405IN WHEELS AND TIRES (ALL MODELS) > INSTRUCTIONS > OVERVIEW OF TIRES AND WHEELS (STANDARD)

- The chart of tires and wheels for summer and winter can be found in the Manufacturer's Certificate >>Approved wheels and tires<< in the information medium >>Manufacturer's Certificates<<, Group 4.
- When replacing summer tires, pay close attention to the tire specification number. The specification codes N1, N2, N3 and N0 distinguish the summer tires specially approved by Porsche from other versions of the same tire type and size.

Information

- Observe the mounting specifications for the wheel nuts when fitting the wheel on the vehicle.

→ 440519 REMOVING AND INSTALLING WHEEL

WM 4405IN WHEELS AND TIRES (ALL MODELS) > INSTRUCTIONS > NOTES ON MOUNTING TIRES

- When fitting tires, the direction of rotation and the inner and outer sides should be noted.

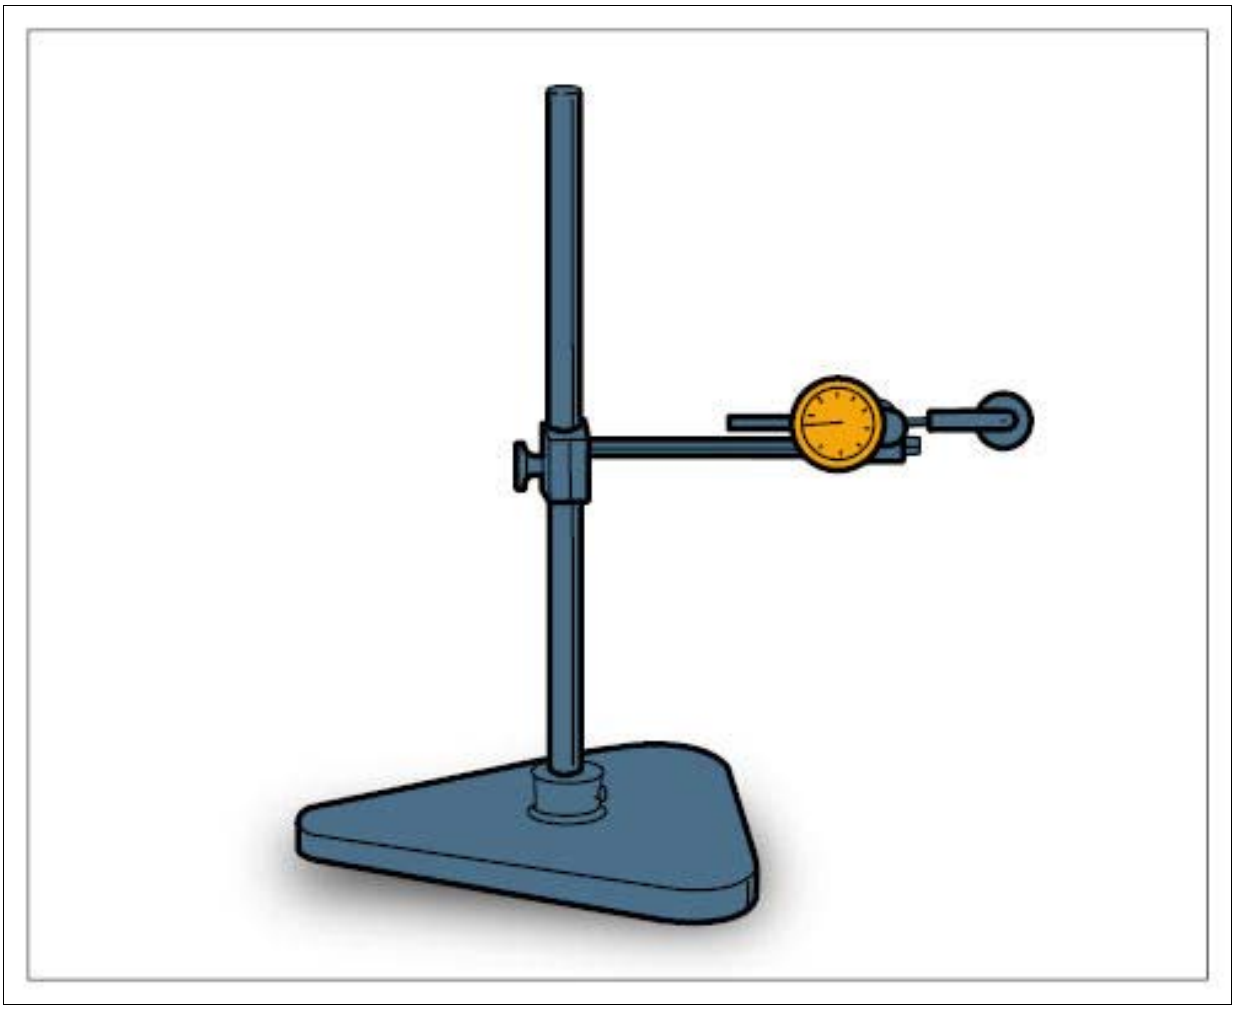
WM 441202 CHECKING DISC WHEELS (ALL MODELS) > CHECKING DISC WHEELS

Information

- Straightening and welding work cannot be performed on light alloy wheels.

- The work is carried out initially with the wheel mounted on the vehicle.
- To measure wheels with tires and wheels without tires, use a tire measuring gauge , e.g. VAG. 1435 .

  Fig 1: Identifying tire Gauge

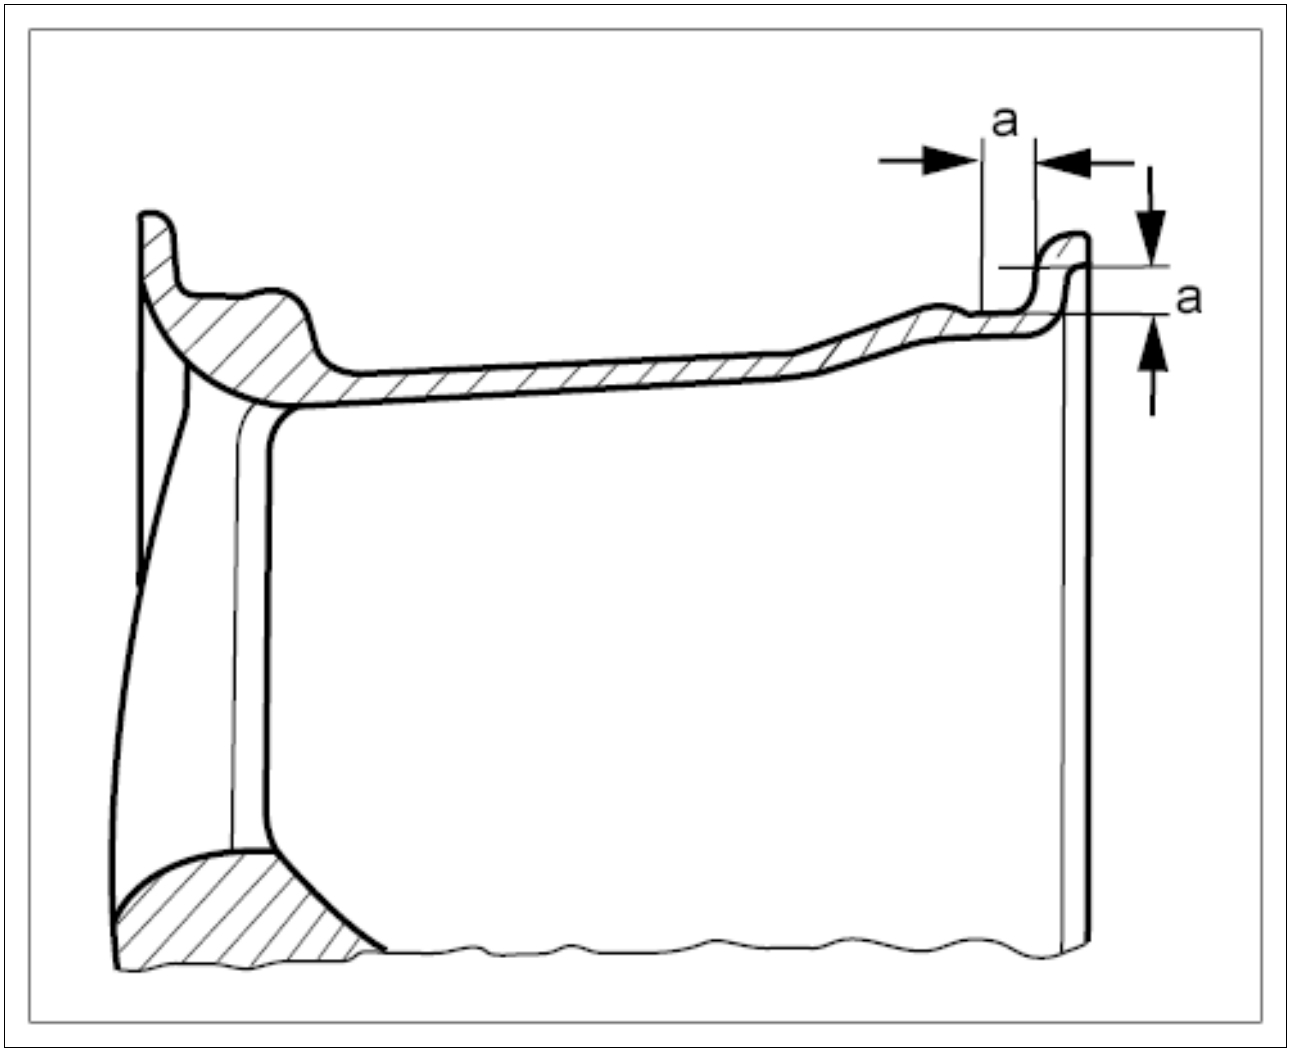


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Maximum permissible radial runout and lateral runout of the wheel with tire = 1.25 mm. Values less than 1.0 mm - around 0.5 mm would be better - are desirable. For this purpose, match the tire (turn the tire on the rim if necessary).

Maximum permissible radial runout and lateral runout **-a-** of alloy wheels = 0.7 mm.

Fig 2: Identifying Wheel Runout Dimension



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

If in isolated cases further measurements are necessary, carry out the following procedure.

1. To measure wheels without tires, remove the wheel from the vehicle. → 440519 REMOVING AND INSTALLING WHEEL
2. Remove the tire from the alloy wheel. → 444019 MOUNTING TIRES (REMOVING AND INSTALLING TIRES)
3. Clamp the wheel on the balancing machine and take measurements at the points **-a-** .

WM 442655 REPLACING TIRE SEALING COMPOUND (ALL MODELS) > INFORMATION ON TIRE SEALING COMPOUND

The intended position for the tire sealing compound should be taken from the Driver's Manual (index: tire sealing compound/sealant set for defective tires).

The use-by date of the tire sealing compound must be checked every 2 years.

If the tire sealing compound is out of date (or will be out of date by the next maintenance event), the tire sealing compound must be replaced.

The expiry date can be found on the packaging of the tire sealing compound/sealant set.

The Driver's Manual for the vehicle describes its use in detail (sealing of tire in the event of minor slashing damage). The tire sealing compound/sealant set is also supplied with instructions.

The tire sealing compound is extremely flammable and hazardous to health. Warnings to this effect are printed on the bottle and given in the Driver's Manual.

WM 442655 REPLACING TIRE SEALING COMPOUND (ALL MODELS) > REPLACING TIRE SEALING COMPOUND

1. If the expiry date of the tire sealing compound/sealant set has lapsed, get a new compressed air bottle from stock and place it in the storage space provided.

   The part number of the compressed air bottle can be found in the Porsche Electronic Parts Catalogue (PET) (Main Group 6/Sub-group Wheels).

2. The compressed air bottle that has passed its expiry date must be disposed of in accordance with country-specific regulations.

WM 443219 REMOVING AND INSTALLING WHEEL ELECTRONICS (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Wheel electronics unit to valve		Tightening torque	4 Nm (3 ftlb.)		

WM 443219 REMOVING AND INSTALLING WHEEL ELECTRONICS (ALL MODELS) > GENERAL INFORMATION ON WHEEL ELECTRONICS

The tire Pressure Monitoring (TPM) system is designed to constantly monitor the tire pressure when the vehicle is moving. One set of wheel electronics **-8-** per wheel is mounted in the rim well base. These measure tire pressure and temperature at regular intervals and transfer the values to a central control unit via a high-frequency route. The control unit evaluates the information and transfers the data to the instrument cluster if required. In this way, the driver is warned and informed if the tire pressure needs to be adjusted.

There are different types of wheel electronics **-8-** . Wheel electronics units with amplified transmitting power are used on the Macan. These transmit in the high-frequency range of:

- 433 MHz or 315 MHz.

The following points can be used as distinguishing features:

- The labelling - 433 MHz or 315 MHz.
- The color (dark grey - 433 MHz; light grey - 315 MHz).
- The part number.
- No stars on the left and right of the slot.

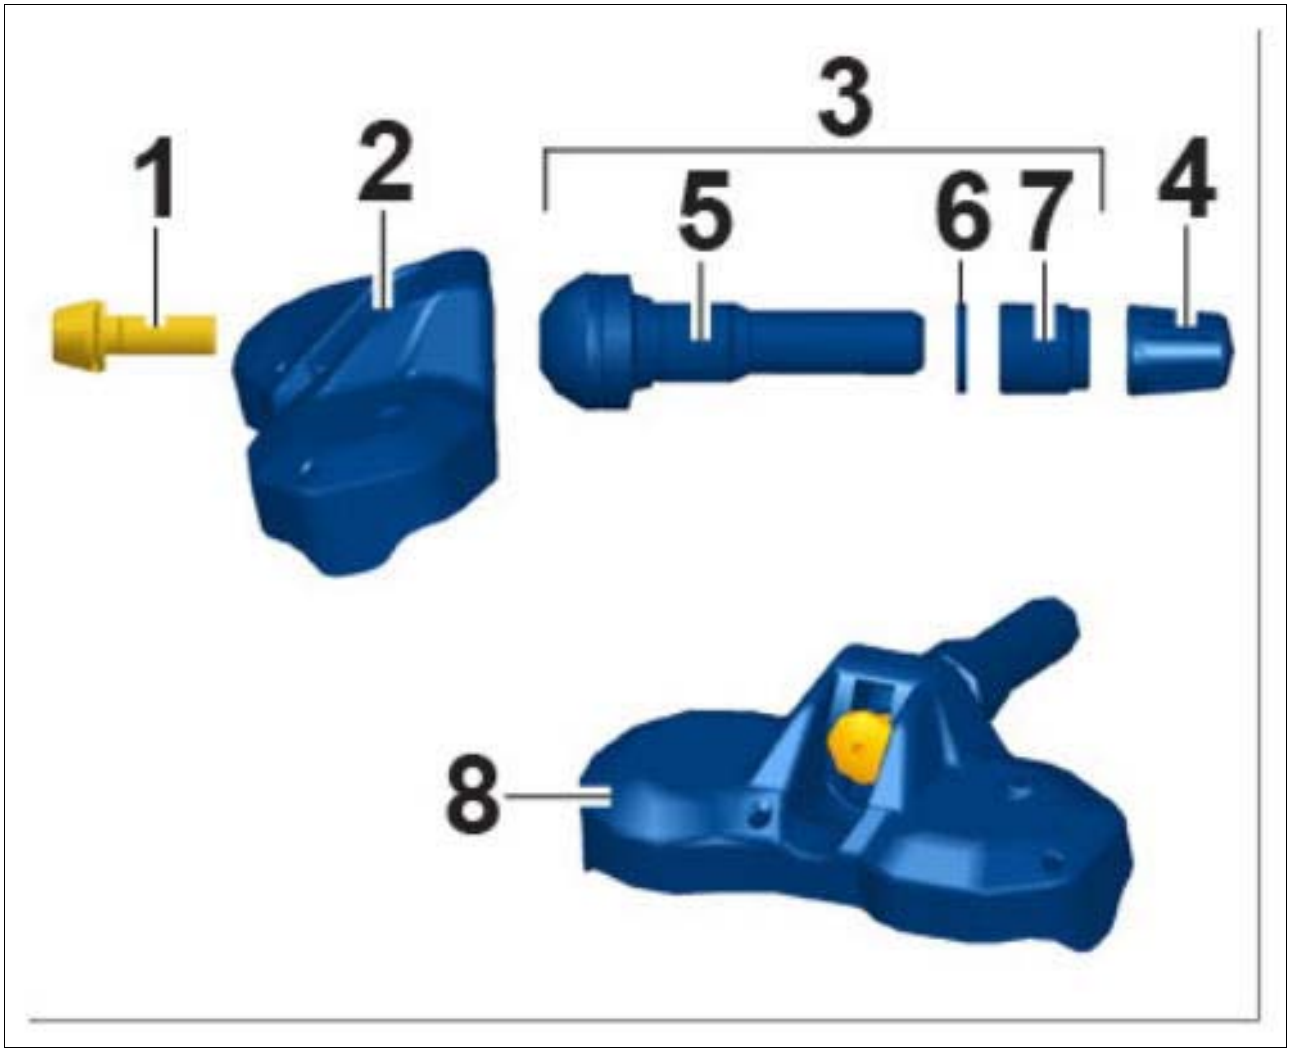
Valve must be replaced complete with screw -1, 3, 4- if:

- The wheel electronics unit is removed
- The self-locking fastening screw **-1-** is loose
- The valve body **-5-** is bent
- The union nut **-7-** is loose.

The wheel electronics unit -2- must be replaced if:

- The housing is visibly deformed
- The filter surface (round, porous section on back of wheel electronics) is so badly soiled that it can no longer be cleaned by wiping
- tire sealing compound (tire sealing liquid) has been used
- The service life of the battery is exceeded
- There is a fault inside the wheel electronics unit.

Fig 1: Identifying 3RD Generation Wheel Electronics Components



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Self-locking (Torx) fastening screw
2. Wheel electronics
3. Valve complete (No. 5 to No. 7)
4. Valve cap
5. Valve body with valve insert
6. Double chamfered washer
7. Union nut
8. Wheel electronics assembled

WM 443219 REMOVING AND INSTALLING WHEEL ELECTRONICS (ALL MODELS) > PRELIMINARY WORK

1. Remove tires → 444019 FITTING TIRES (REMOVING AND INSTALLING TIRES) .

WM 443219 REMOVING AND INSTALLING WHEEL ELECTRONICS (ALL MODELS) > REMOVING AND INSTALLING WHEEL ELECTRONICS > REMOVING WHEEL ELECTRONICS

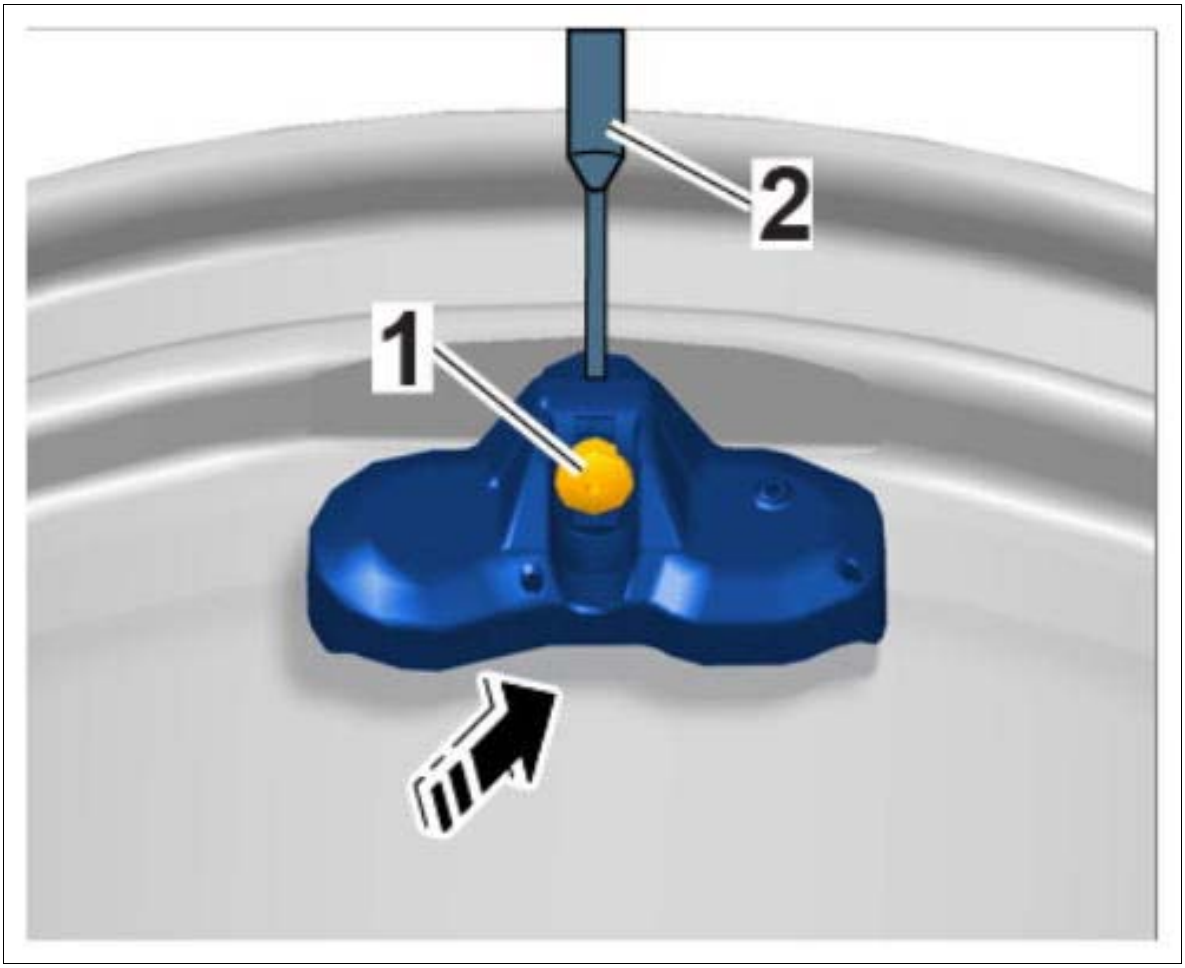
The wheel electronics unit is located on the valve in the outer rim base.

Fig 1: Removing Wheel Electronics

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. Loosen fastening screw **-1-** on the wheel electronics unit. If necessary counter in the bore at the valve foot using a suitable assembly pin, e.g. steel pin Ø approx. 1.8 mm.

Fig 2: Removing Wheel Electronics Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Loosen the union nut and remove the valve.

WM 443219 REMOVING AND INSTALLING WHEEL ELECTRONICS (ALL MODELS) > REMOVING AND INSTALLING WHEEL ELECTRONICS > INSTALLING WHEEL ELECTRONICS

Every set of wheels or wheel change must be communicated to the control unit. In particular, this is necessary when wheel positions have been interchanged. For this purpose, always select the tire type and tire size under Main menu > Tire pressure > Tire type in the instrument cluster. The control unit then learns the wheel positions again while the vehicle is driving.

1. **Clean the valve bore very carefully (visual inspection).**

   Information

   When replacing the wheel electronics -

   1. Always use a completely new valve.
   2. Always use a new fastening screw.

2. Fit the wheel electronics unit loosely at the valve (do not tighten) and position it in the valve bore together with the new valve.

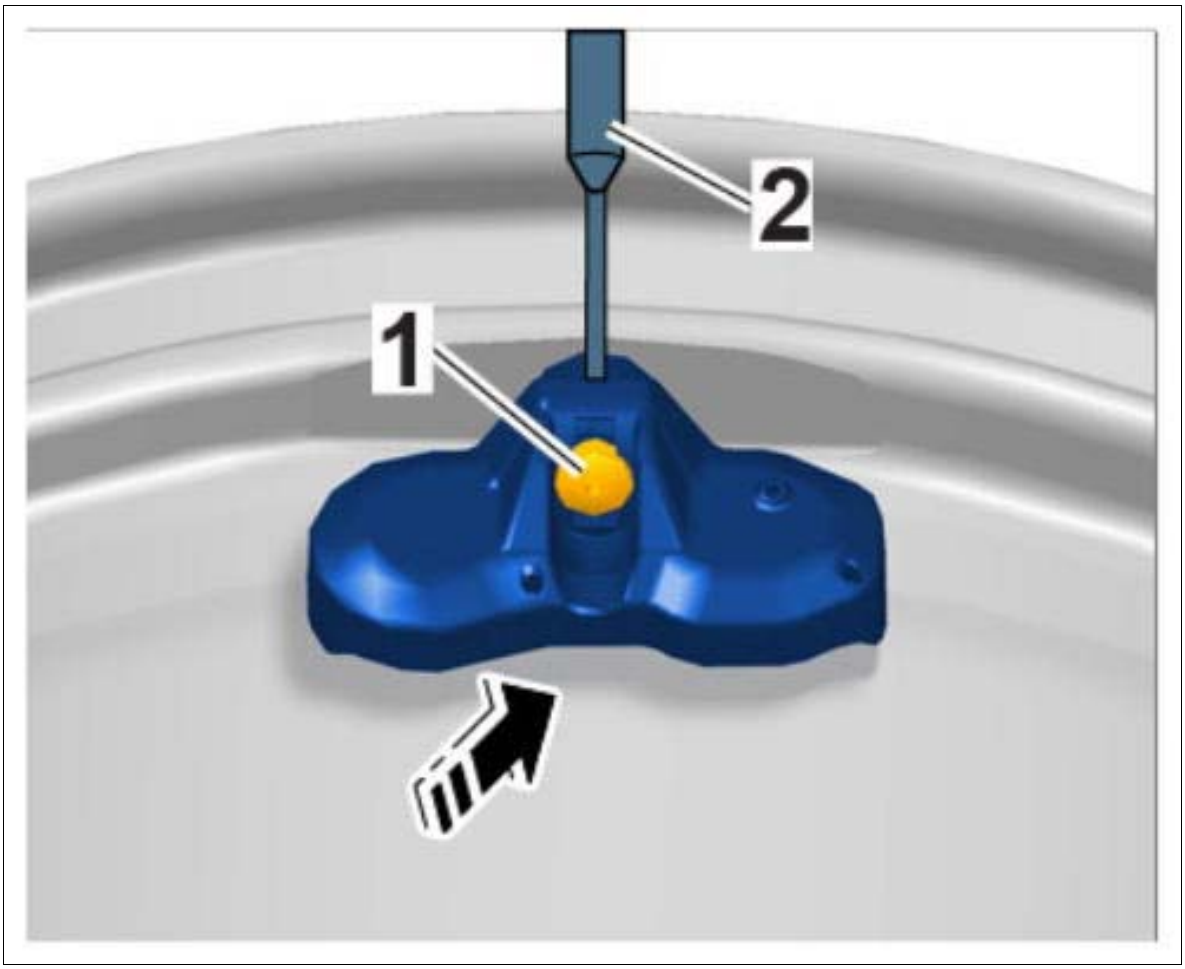
   Information

   Counter the new valve with an assembly pin (supplied with the new valve).

   1. The valve-stem seal may become twisted and can cause damage.

3. Fit the washer, chamfered on both sides, from outside and screw on the union nut until it is seated correctly. Visibly screw in the bore at the valve foot and block it using the supplied assembly pin.

   Fig 1: Installing Wheel Electronics Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Push wheel electronics **-1-** slightly into the rim base (this adjusts the angle of inclination of valve to wheel electronics).

Fig 2: Identifying Wheel Electronics

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

When tightening the wheel electronics unit/valve, tighten to the specified tightening torque evenly and in one movement. The tightening process must not be interrupted.

1. Remove the assembly pin after tightening the components.

5. Tighten self-locking (Torx) fastening screw to the specified tightening torque → **Tightening torque: 4 Nm (3 ftlb.).** The wheel electronics unit should now be lying evenly against the rim.

Information

The wheel electronics must not come into contact with the tire mounting paste or solvent.

When mounting tires, ensure absolute cleanliness around the wheel electronics unit.

WM 443219 REMOVING AND INSTALLING WHEEL ELECTRONICS (ALL MODELS) > SUBSEQUENT WORK

1. Fit tires → Mounting Tires .

WM 443419 REMOVING AND INSTALLING TPM CONTROL UNIT (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 443419 REMOVING AND INSTALLING TPM CONTROL UNIT (ALL MODELS) > REMOVING AND INSTALLING TPM CONTROL UNIT > REMOVING CONTROL UNIT FOR TIRE PRESSURE MONITORING (TPM)

NOTE: Voltage peaks

- *Risk of damage to load or to the control unit*

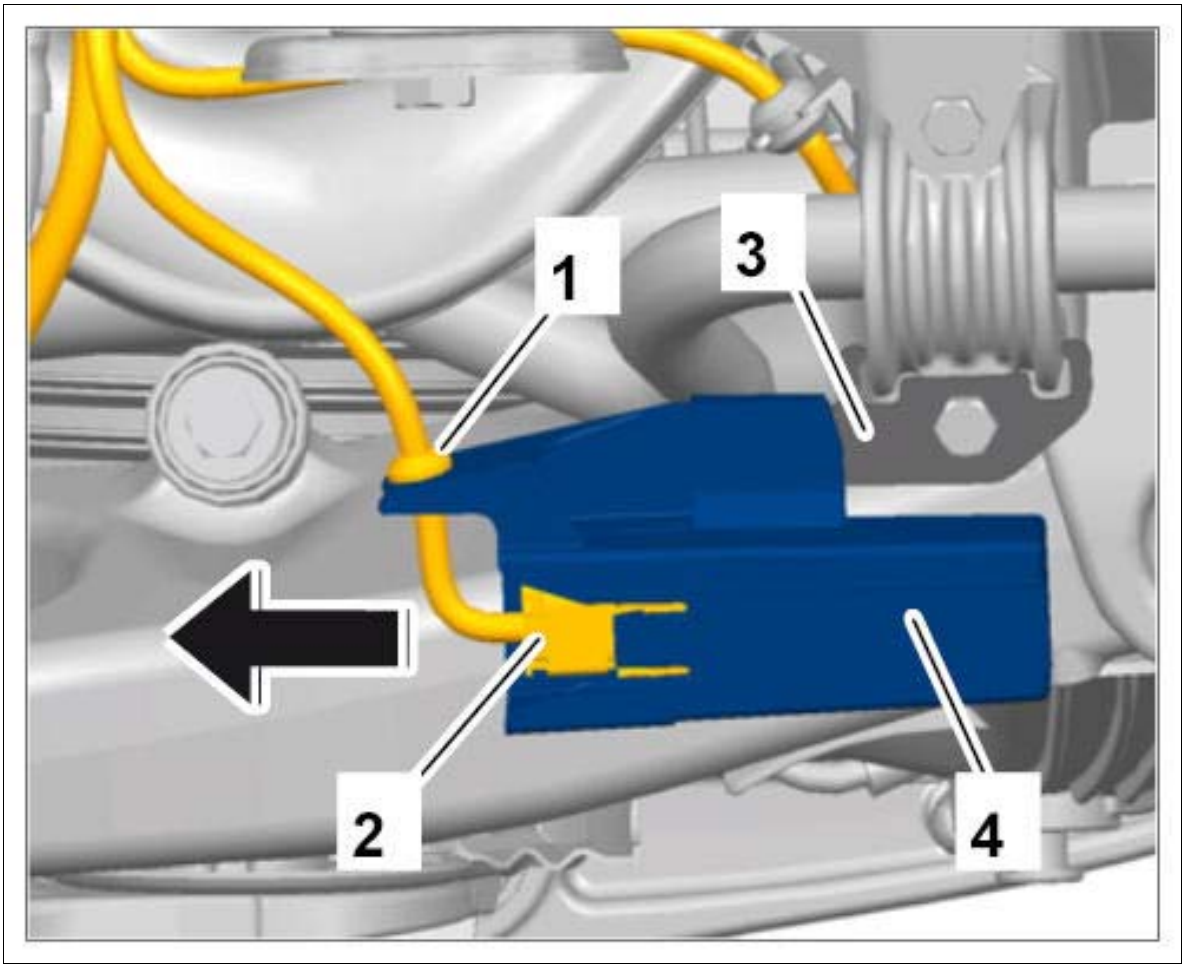
→ Remove the ignition key and switch off load before disconnecting or removing load.

The TPM control unit is located on the rear axle on the left anti-roll-bar mount.

The antenna is integrated in the TPM control unit. For more information, see → 4X00IN GENERAL INFORMATION ON THE tire PRESSURE MONITORING SYSTEM (TPM) .

1. Disconnect electric line at the holder **-1-** .
2. Release and disconnect connector **-2-** .
3. Unclip TPM control unit with holder **-4-** on the back of the holder **-3-** and disconnect it **-arrow-** .

Fig 1: Removing TPM Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Take TPM control unit **-1-** out of the holder **-2-** (**-arrow-**).

WM 443419 REMOVING AND INSTALLING TPM CONTROL UNIT (ALL MODELS) > REMOVING AND INSTALLING TPM CONTROL UNIT > INSTALLING CONTROL UNIT FOR TIRE PRESSURE MONITORING (TPM)

1. Installation is performed in reverse order.

WM 443419 REMOVING AND INSTALLING TPM CONTROL UNIT (ALL MODELS) > SUBSEQUENT WORK

1. If the control unit was replaced, the "new" control unit must be adapted to suit the vehicle using **PIWIS Tester II 9818.** → 443455 REPLACING CONTROL UNIT FOR tire PRESSURE MONITORING (TPM) .

WM 443455 REPLACING TPM CONTROL UNIT (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 443455 REPLACING TPM CONTROL UNIT (ALL MODELS) > TECHNICAL VALUES

Location	Description	Type	Basic value	Tolerance 1	Tolerance 2
Current rating		Nominal value	40 A		

WM 443455 REPLACING TPM CONTROL UNIT (ALL MODELS) > PRELIMINARY WORK

1. Switch off ignition and replace control unit. → 443419 REMOVING AND INSTALLING TPM CONTROL UNIT .

WM 443455 REPLACING TPM CONTROL UNIT (ALL MODELS) > REPLACING TPM CONTROL UNIT > CODING CONTROL UNIT

NOTE: Voltage drop

- *Risk of irreparable damage to control unit*
- *Risk of damage to control unit*
- *Fault entries in the control unit*
- *Coding in the control unit is aborted*
- *Malfunctions in control unit, even during programming*

→ Prior to disconnecting the control unit, switch off ignition and remove ignition key.

→ Ensure that the power supply is not interrupted during programming.

→ Connect a battery charger with a current rating of at least → Nominal value: 40 A to the vehicle battery.

Information

The **PIWIS Tester II 9818** instructions take precedence since the description may be different with later Tester releases.

The procedure described here has been structured in general terms. Different text or additional information may appear in **PIWIS Tester II 9818** .

1. Connect the PIWIS Tester to the vehicle and start the Tester. Switch on ignition.
2. Select the vehicle type and start the diagnostic application.
3. Select the required control unit, e.g. **tire Pressure Monitoring system in the overview.**
4. **Extended identifications** must now be selected.
5. **Enter the vehicle identification number** and press [Enter] to confirm your entry.
6. **Maintenance/repairs** must then be selected.
7. **Control unit replacement** must now be selected. Then press [F12] to continue.
8. Follow the instructions on the Tester.
9. The Tester displays the message **Coding has been completed successfully.** Press [F12] to continue.
10. **Teach wheel IDs** must now be selected. Then press [F12] to continue.
11. Select the desired teaching process, then press [F12].
12. Follow the instructions on the Tester and press [F12] to continue.
13. **Read out the fault memory** and erase it if necessary.
14. Check the TPM function during the test drive.

WM 444019 MOUNTING TIRES (REMOVING AND INSTALLING TIRES) (ALL MODELS) > INFORMATION > TOOLS > TIRE REMOVAL/MOUNTING MACHINE

Only use recommended tire removal/mounting machine and auxiliary equipment (special mounting lever, bead holding-down device).

Search criteria in PIWIS (PPN):

- Information media
- HBW .
- Main group: 4 - Running gear/Tool type: Workshop Equipment/Dealer Classification: All

Fig 1: Identifying WE 1084 tire Removal/Mounting Machine

2. Holding-down device 9539 - for holding down the tire bead.
3. Wulstboy - for holding down the tire bead (alternative to holding-down device 9539/item 2)
4. Balance stick-on weight remover - commercially available

WM 444019 MOUNTING TIRES (REMOVING AND INSTALLING TIRES) (ALL MODELS) > INFORMATION > REQUIREMENTS/INFORMATION ON REMOVING/MOUNTING TIRES

Information

- tire temperature during removal/mounting must be approx. 20 °C (at least 15 °C). Allow enough time to heat the vehicle/tires in a suitable environment if necessary (at room temperature of more than 15 °C). Example: If the room temperature of the workshop is approx. 20 °C and the tire temperature is approx. - 15 °C, approx. 3 hours are required to heat the tires to the required temperature.
- Before removal/mounting, it is important to establish whether a tire Pressure Monitoring system (TPM) is fitted! The tire valve serves as the distinguishing feature. Without TPM: rubber valve. With TPM: aluminum valve. If a TPM system is fitted, read the special information on the tire Pressure Monitoring system .
- Vehicles with TPM: Before changing a tire, read out the remaining life span of the wheel electronics

unit (battery capacity) using the PIWIS Tester. The value you read out gives an indication as to whether or not it needs to be replaced (not a 100% value). If the values are considerably lower than expected for the next tire change, talk to the customer and determine whether he/she is happy to have the wheel electronics unit(s) replaced at this time.

- Use only TIP TOP Universal, Order No. 593 0601 (3.5 kg bucket) or Contifix as the removal/mounting paste (sliding compound). Use sufficient sliding compound.
- No large point load for wheel (rim) and tire during removal/mounting. If this is not observed, damage will occur that will render a tire unusable (ready for disposal) and/or require a new rim.
- Before removal/mounting, check the mounting head (of the mounting machine) for damage (scoring, soiling). Clean or replace the mounting head if necessary to prevent paint damage and pressure marks on the rim flange.
- All parts that touch the disc wheel and tire are made of plastic to prevent damage to paintwork during removal/mounting. Protect the rim flange with adhesive tape if necessary. The mounting lever can also be covered with adhesive tape in order to avoid damaging the area around the spokes (during removal).
- If you do not have a mounting lever with plastic protection, use a rim flange protector (assembly aid) and avoid letting it slip on to the rim flange.
- Check the disc wheel for damage (sealing face between tire/rim, true running, superficial damage and deformation).
- If you intend to continue using the tire, check it for damage (sealing face between tire/rim, ply damage, tire beads, sidewalls and tread depth).
- The rubber valve must generally be replaced when a tire change is necessary. In vehicles with TPM (aluminum valve), the valve only needs to be replaced in exceptional cases. This is elaborated further in: "Special information on TPM" (module in this service information).
- When mounting tires, pay particular attention to the direction of rotation and the inside/outside.
- When replacing only one tire on an axle, make sure that the tread depth of the new tire does not differ from that of the other tire by more than 30%!

WM 444019 MOUNTING TIRES (REMOVING AND INSTALLING TIRES) (ALL MODELS) > INFORMATION > SPECIAL NOTES FOR TIRE PRESSURE MONITORING (TPM)

NOTE: Wheel electronics

- *Wheel electronics unit and valve may have been fitted incorrectly.*
- *Wheel electronics units may not have been assigned correctly.*

→ Read and follow the installation instructions for the wheel electronics units. → 443219 REMOVING AND INSTALLING WHEEL ELECTRONICS

→ Check that the wheel electronics units are assigned correctly.

Information

- If the old wheels are still in the vicinity after assembly work (for example changing winter tires and/or wheels from another vehicle with TPM), these will still be detected by the system. If one or more of these wheels has a minimum pressure of more than 0.5 bar (7 psi) below the required pressure, this can trigger a warning in the instrument cluster. In this case, remove the wheels or use the PIWIS Tester to adjust the vehicle outside the radio range of these wheels.
- Before changing a tire, read out the remaining life span of the wheel electronics unit (battery capacity) using the PIWIS Tester.
- For vehicles with tire Pressure Monitoring (TPM), the valve and wheel electronics -arrow- are only replaced in exceptional cases. The following points can make replacement necessary.

Fig 1: Identifying Wheel Electronics

1. Self-locking (Torx) fastening screw
2. Wheel electronics
3. Valve complete (No. 5 to No. 7)
4. Valve cap
5. Valve body with valve insert
6. Double chamfered washer
7. Union nut
8. Wheel electronics assembled

Valve must be replaced complete with screw -1, 2, 3- if:

- The wheel electronics unit is removed
- The self-locking fastening screw **-1-** is loose

- The valve body **-5-** is bent
- The union nut **-7-** is loose.

The wheel electronics unit -2- must be replaced if:

- The housing is visibly deformed
- The filter surface (round, porous section on back of wheel electronics) is so badly soiled that it can no longer be cleaned by wiping
- tire sealing compound (tire sealing liquid) has been used
- The service life of the battery is exceeded
- There is a fault inside the wheel electronics unit.

WM 444019 MOUNTING TIRES (REMOVING AND INSTALLING TIRES) (ALL MODELS) > REMOVING/MOUNTING TIRES (REMOVING AND INSTALLING TIRES) > REMOVING TIRES

For correct tire removal/mounting, follow the instructions provided for the tire removal/mounting machine.

See REQUIREMENTS/INFORMATION ON REMOVING/MOUNTING TIRES !

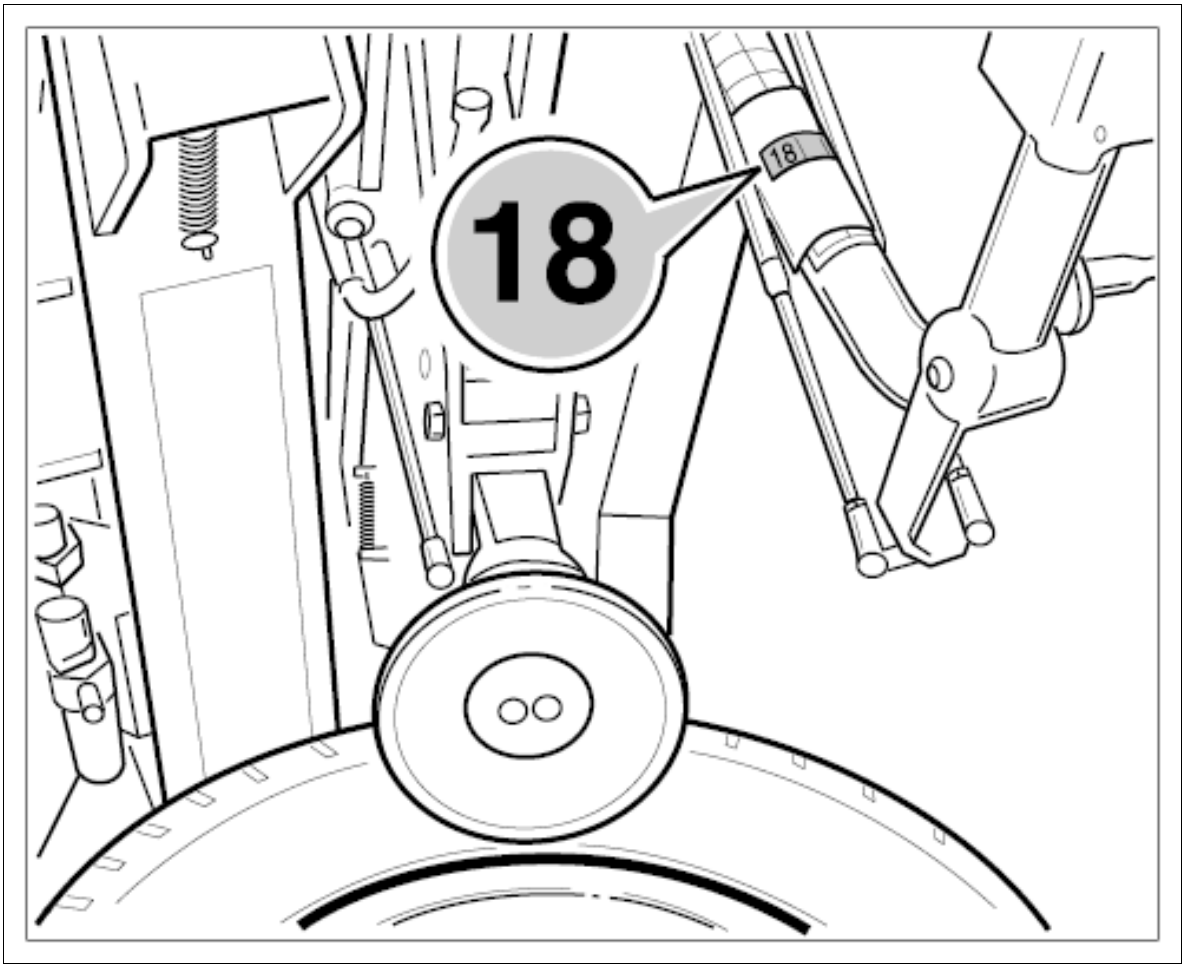
1. Fit and clamp a clean disc wheel on the tire removal/mounting machine.

   Check that the tire is seated securely and without damage (as described in the instructions provided for the tire removal/mounting machine).

2. Unscrew the valve insert and release the air so that the tire is depressurized.

3. Set the tire bead press-off tool (in accordance with the tire size).

Fig 1: Identifying Tire Press-Off Tool



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

1. 3.1. Set the tire bead press-off tool to the inch graduation (rough setting in accordance with the tire size).
2. 3.2. Then adjust the setting precisely (the press-off roller must not touch the rim when positioned on the tire). If this is not the case, the rim flange may be damaged by the press-off rollers.

4. Loosen the lower and upper tire bead (press the tire off the rim).

    1. 4.1. The wheel must be turned anti-clockwise (anti-clockwise rotation of the mounting table) when pressing the tire off the rim (loosening the tire bead). Otherwise, excessive forces occur on the fastening bolts of the machine which can break the bolts.

        First press off the lower tire bead and then the upper tire bead (to ensure that the wheel remains seated securely on the machine).

        Coat the tire beads with mounting paste even at this stage of the procedure to make it easier to press the tire bead off.
    2. 4.2. Loosen the two bead press-off tools again (by moving them back to their original position).

5. Before removing the tire, coat the tire beads with mounting paste again if necessary to facilitate removal.

   Information

   1. Always use a bead holding-down device for removing the upper tire bead (second tire bead).

   2. Use the Wulstboy bead holding-down device (type 2 in section 6.2) for tire/wheel combinations that are difficult to remove.

6. **Removal**

   1. 6.1. **Removing upper tire bead - type 1**

      Valve/wheel electronics unit at 12 o'clock position.

      Fit the mounting head on the rim flange.

      The mounting lever (with plastic protection) is pushed into the deep bed underneath the upper tire bead, and then guided over the mounting shoe and pushed down.

      Lift the tire bead out of the rim bed by turning the wheel clockwise. Check the following while doing this:

      1. Check that the bead lip is facing outwards and is fully visible. Otherwise, the tire bead can become jammed and be damaged irreparably.

      2. The mounting lever must be the same distance from the inside of the tire and the valve during the entire removal procedure.

      3. Constantly check that the plastic protection (on the mounting lever) is positioned correctly in order to protect the rim.

      4. The lower (second) tire bead must be in the deep bed during removal.

      5. The tire bead must not be pressing against the wheel electronics unit.

   2. 6.2. **Removing upper tire bead using bead holding-down device type 2 = Wulstboy**

      Valve/wheel electronics unit at approx. 12 o'clock position.

      Use the upper plastic press-off roller on the mounting machine to press the upper tire bead approx. 4 to 5 cm below the rim flange (max. 5 cm/the belt edge of the tire must not be deformed by the plastic press-off roller). This makes space for the bead holding-down device blocks.

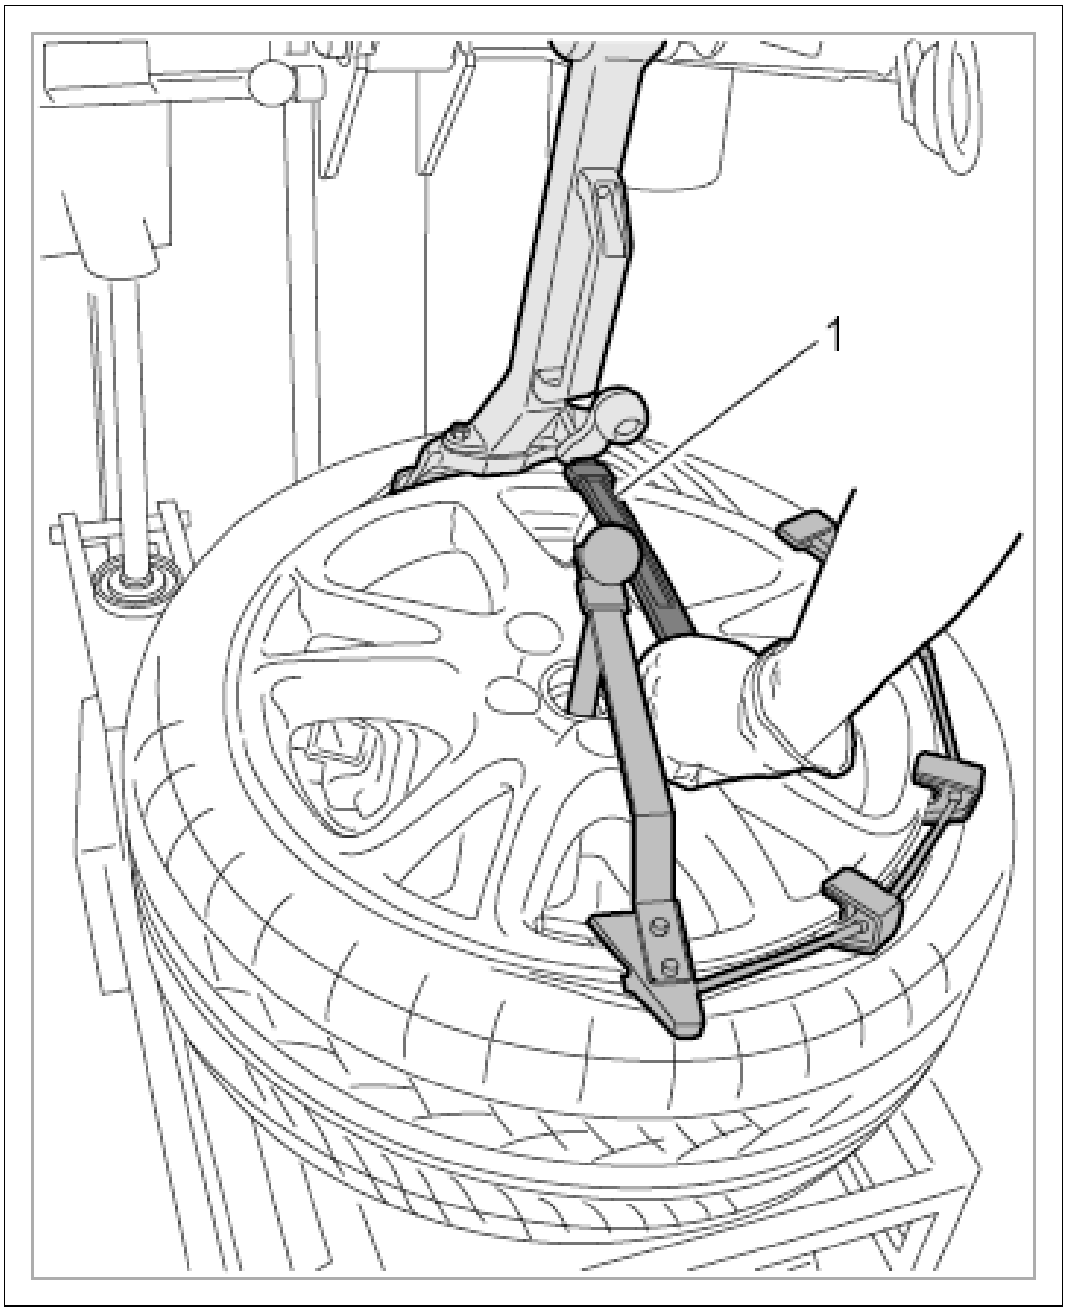
      Fit the bead holding-down device (Wulstboy) into the middle of the "wheel/rotary plate". Move the arm of the bead holding-down device to the 1 o'clock position.

      Turn the wheel slowly in a clockwise direction (clockwise rotation) and insert the blocks of the bead holding-down device.

      Remove the upper press-off roller on the mounting machine from the tire and fit the mounting head on the rim flange. Insert the mounting lever (with plastic protection) **-1-** and lever the upper tire bead over the mounting head.

Continue turning the disc wheel slowly (clockwise rotation) until the bead holding-down device (Wulstboy) is just in front of the mounting head. Remove the Wulstboy using holding-down device 9539. Continue turning the disc wheel slowly (clockwise rotation) until the upper bead is completely removed.

Fig 2: Removing tire Using Wulstboy



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. **Removing lower tire bead:**

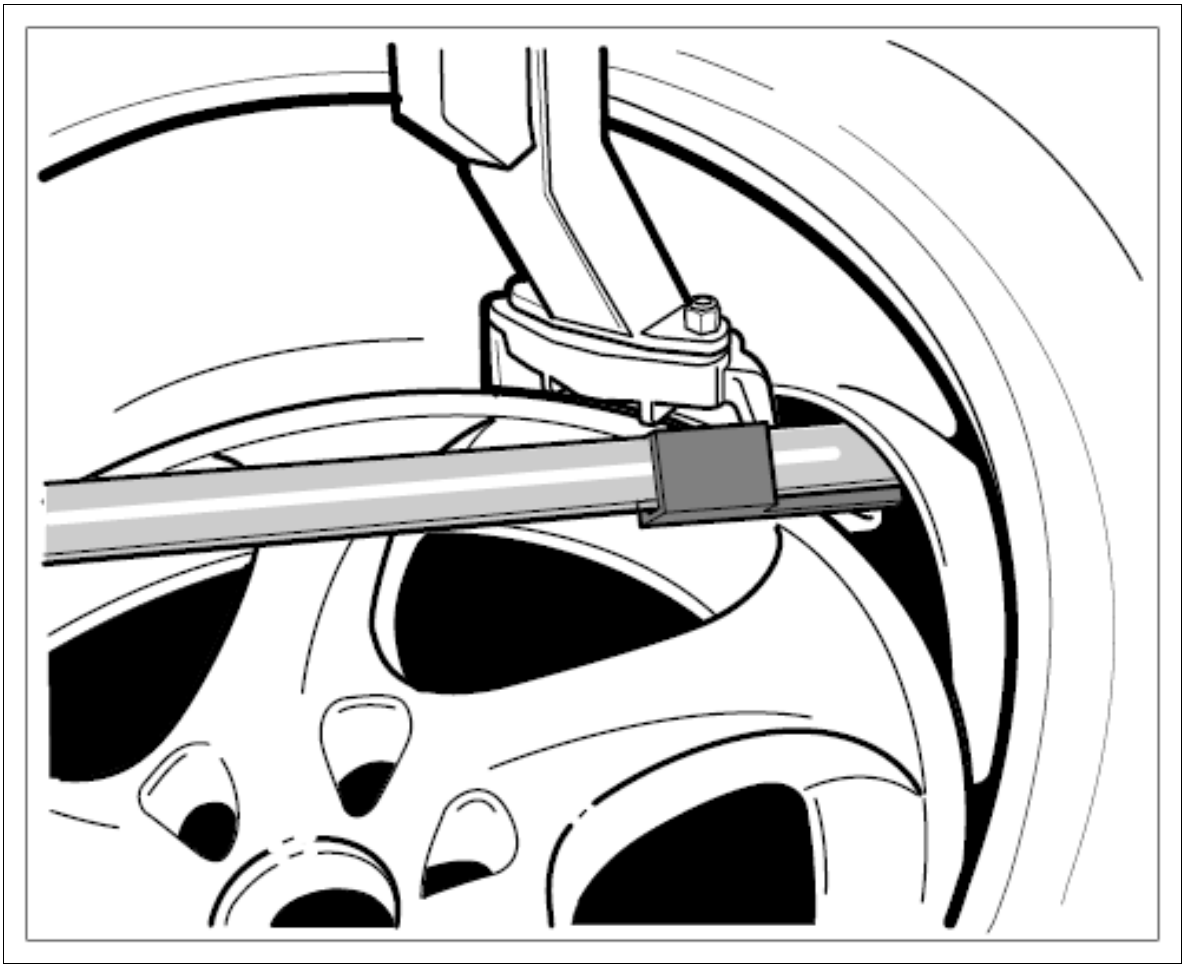
Valve/wheel electronics unit at 12 o'clock position.

Pull the tire upwards and push it into the rim bed underneath the second tire bead using the mounting lever (plastic protection). Make sure that the valve/wheel electronics unit is not damaged.

Check the position of the mounting lever. The mounting lever must be the same distance from the inside of the tire and the valve during the entire removal procedure. Constantly check that the plastic protection (on the mounting lever) is positioned correctly in order to protect the rim.

Turn the wheel slowly clockwise until the tire is removed.

Fig 3: Removing tire



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Set the mounting lever and tire aside (in a safe/clean place).

   Detach the disc wheel from the machine, remove it and lay it carefully aside (store in a safe place).

WM 444019 MOUNTING TIRES (REMOVING AND INSTALLING TIRES) (ALL MODELS) > REMOVING/MOUNTING TIRES (REMOVING AND INSTALLING TIRES) > MOUNTING TIRES

NOTE: Wheel electronics

- *Wheel electronics unit and valve may have been fitted incorrectly.*

- *Wheel electronics units may not have been assigned correctly.*

→ Read and follow the installation instructions for the wheel electronics units. → 443219 REMOVING AND INSTALLING WHEEL ELECTRONICS

→ Check that the wheel electronics units are assigned correctly.

Information

- For correct tire mounting, follow the instructions provided for the tire removal/mounting machine.
- Always use approved tires and tire sizes (specification code/speed index/load capacity). This data can be found in the applicable/current Technical Information.
- tire temperature during removal/mounting must be approx. 20 °C (at least 15 °C). Allow enough time to heat the vehicle/tires in a suitable environment if necessary (at room temperature of more than 15 °C). Example: If the room temperature of the workshop is approx. 20 °C and the tire temperature is approx. - 15 °C, approx. 3 hours are required to heat the tires to the required temperature.
- The wheel electronics must not be treated with compressed air, tire mounting paste, cleaning agents or any other solvents.
- Disc wheels with wheel electronics must not be cleaned with a high-pressure power cleaner before tires have been fitted.
- Do not expose filter surface of wheel electronics. Remove soiling with a lint-free cloth. Do not apply tire mounting paste to the wheel electronics unit. All traces of tire mounting paste must be removed from the wheel electronics unit.
- During fitting, ensure that the tire bead is not pressed against the wheel electronics unit.
- Huge tension can be transferred to the tire bead when the mounting paste dries quickly. It is therefore absolutely essential to mount the upper and lower tire bead quickly and without delay.

1. **Complete preparatory steps for mounting tires:**
    1. Remove abraded rubber particles from the disc wheel and check for damage. → 441202 CHECKING DISC WHEELS .
    2. Fit and clamp the clean wheel as described in the instructions provided for the tire removal/mounting machine.
    3. On vehicles with TPM, check the valve and wheel electronics unit for damage. Replace these components if they are damaged or if they do not comply with specifications (special information on TPM).
    4. Always replace the rubber valve (on vehicles without TPM). Use a commercially available insertion tool and tire mounting paste.
    5. If you intend to continue using the tire, check it for damage (sealing face between tire/rim, ply damage, tire beads, sidewalls and tread depth).
    6. As a general rule, check the bead area (mounting and sealing face) for damage before mounting tires (even new tires). Ensure that this area is perfectly clean to prevent any

slow air leaks (loss of tire pressure) in this area (after mounting the tire). A loss of tire pressure often goes unnoticed on vehicles without TPM. **Serious consequence: Reduced driving dynamics and the tire can be damaged irreparably as a result of increased kneading action (overheating).**

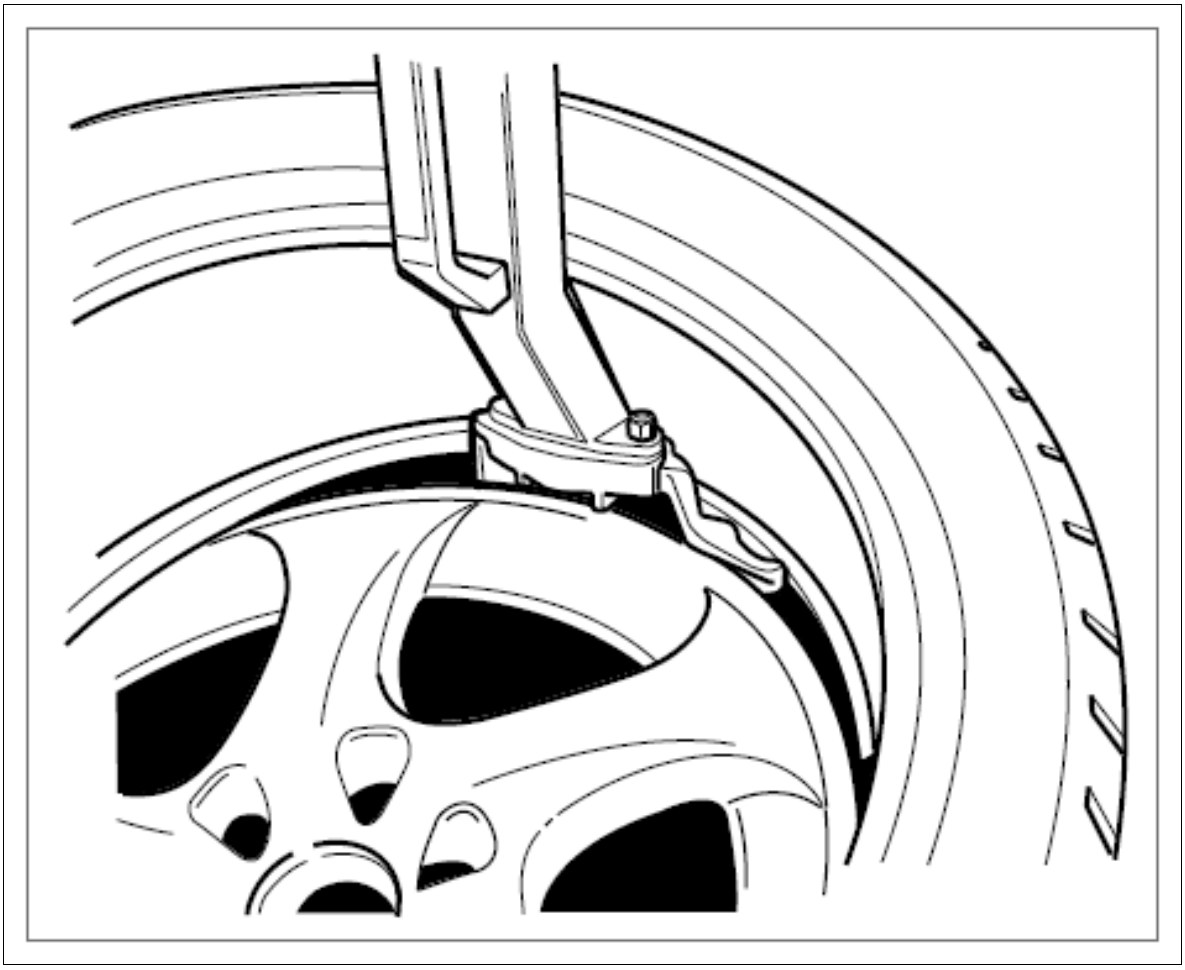
2. **Coat the rim and tire (both bead areas) with a sufficient amount of tire mounting paste TIP TOP Universal, Order No. 593 0601 or Contifix.** Absolute cleanliness is essential (clean brush/clean tire mounting paste). Make sure that there are no traces of tire mounting paste on the wheel electronics unit.

3. **Fitting lower tire bead (first tire bead).**

   Place the tire at the correct position on the disc wheel (check direction of rotation and inside/outside position).

   Push in mounting arm and position on top of the rim flange. The mounting head must be offset by 180° with respect to the valve.

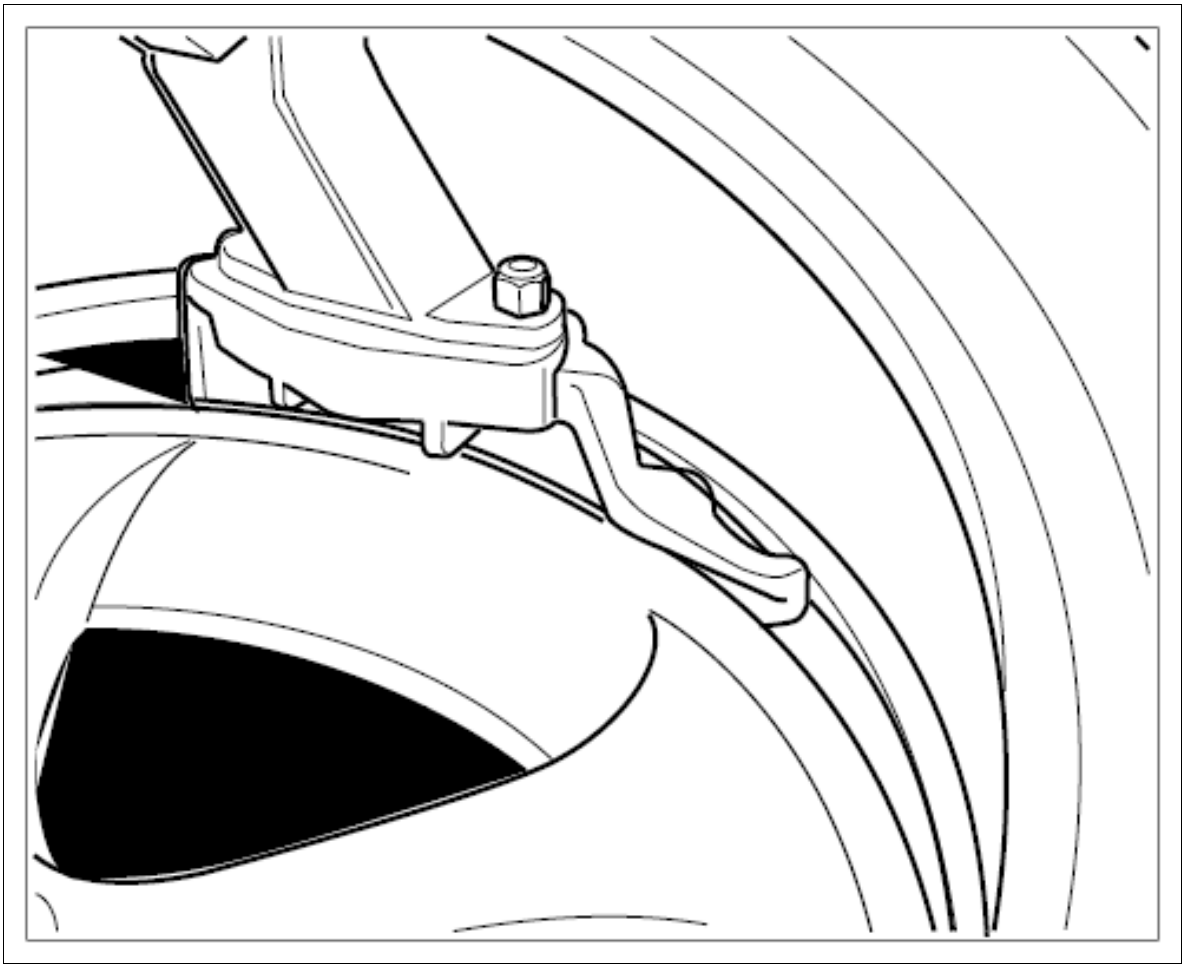
   Fig 1: Installing tire



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Push the lower tire bead (first tire bead) partly over the rim flange and guide it through the mounting head → Mounting tire, lower tire bead, Figure 2Fig 2. Turn the disc wheel slowly in a clockwise direction (clockwise rotation of mounting table) until the lower tire bead is completely fitted.

Fig 2: Installing tire



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Fitting upper tire bead (second tire bead) using bead holding-down device. This presses the tire bead into the deep bed.

   Information

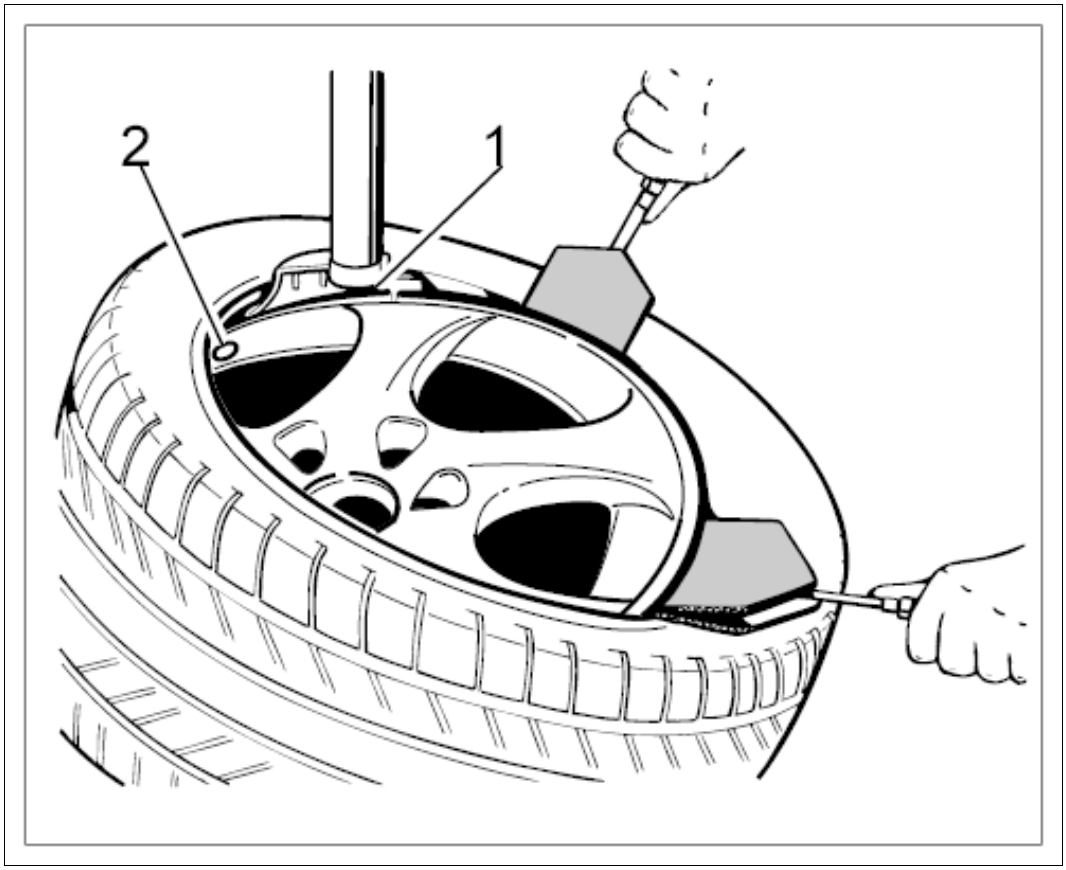
   1. Always use a bead holding-down device for mounting the upper tire bead (second tire bead).
   2. There are two types of bead holding-down devices. These are described in sections 4.1 and 4.2 below.
   3. Use the Wulstboy bead holding-down device (type 2 in section 4.2) for tire/wheel combinations that are difficult to mount.

      1. 4.1. **Fitting upper tire bead (second tire bead) using bead holding-down device type 1 = special tool 9539**

         Position the mounting head **-1-** approx. 15 cm to the right of the valve **-2-** .

         Hold the upper tire bead (second tire bead) in the deep bed using the bead holding-down device 9539 and turn the disc wheel slowly at the same time (clockwise rotation of mounting table) until the upper tire bead is completely fitted.

Fig 3: Installing tire Using Holding-Down Device 9539



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. 4.2. **Fitting upper tire bead (second tire bead) using bead holding-down device type 2 = Wulstboy**

   Position the mounting head approx. 15 cm to the right of the valve.

   Use the upper plastic press-off roller (on the mounting machine) to press the upper tire bead approx. 4 to 5 cm below the rim flange (max. 5 cm/the belt edge of the tire must not be deformed by the plastic press-off roller). This makes space for the bead holding-down device blocks.

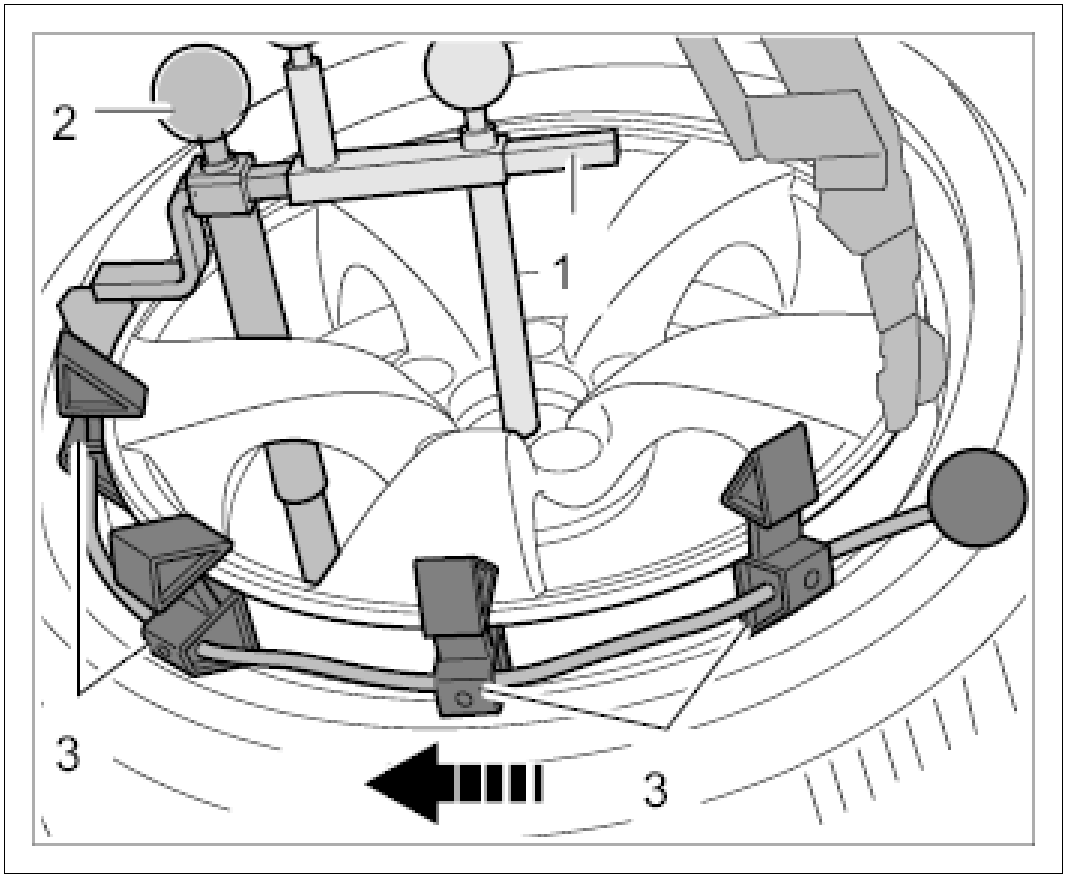
   Fit the bead holding-down device (Wulstboy) into the middle of the "wheel/rotary plate" **-1-** . Move the arm **-2-** of the bead holding-down device to the 1 o'clock position.

   Turn the wheel slowly in a clockwise direction (clockwise rotation) and insert the blocks **-3-** of the bead holding-down device.

   Continue turning the disc wheel slowly (clockwise rotation) until the upper bead is completely fitted.

   After fitting the upper tire bead, loosen the bead holding-down device by turning the disc wheel anti-clockwise (anti-clockwise rotation) and remove the blocks using the upper press-off roller.

Fig 4: Identifying Wulstboy Blocks



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. **Filling/setting tires.**

    1. 5.1. Remove entire wheel from tire fitting unit.

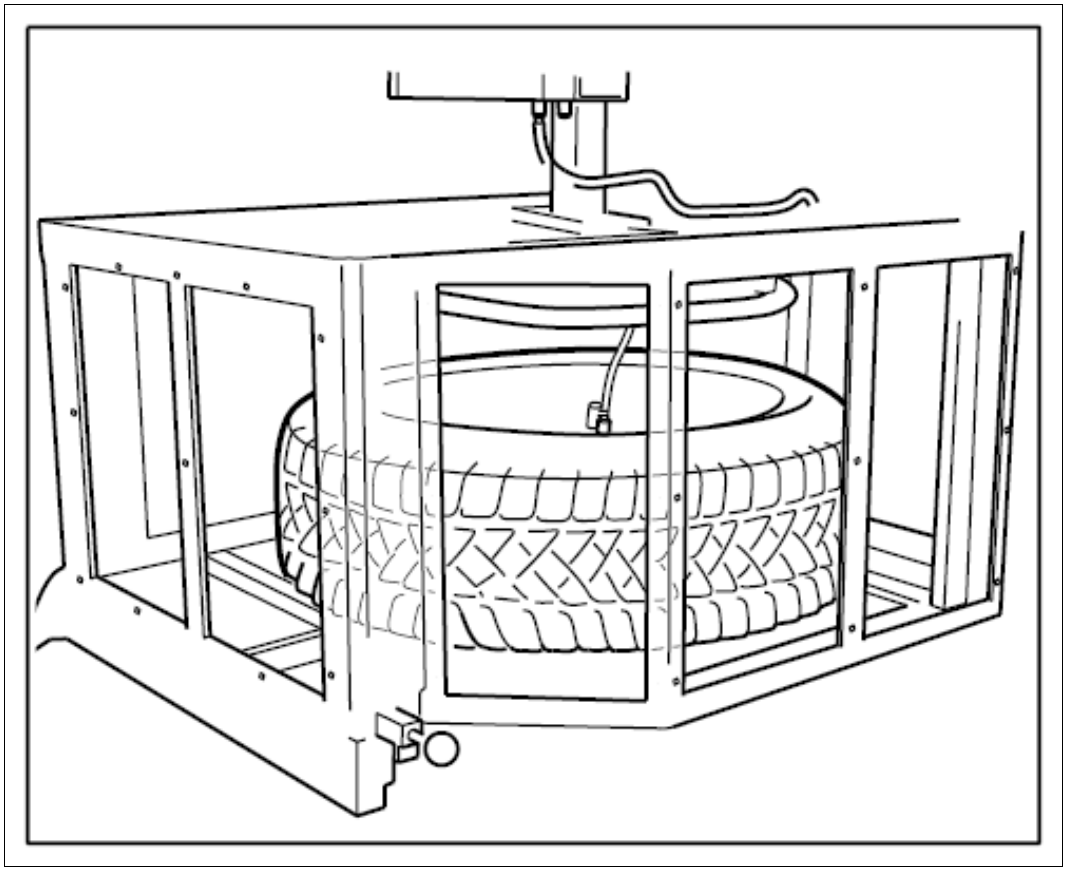
    > *WARNING: High tire seating pressure*
    >
    > *1. Risk of squashing or bruising*

    → Use a tire filling cage.

    2. 5.2. Fill the tire (without the valve insert) with air immediately **in the tire filling cage** (while the tire mounting paste is still fully effective). Continue filling the tire until the tire beads slide/jump over the humps (max. 3.3 bar/48 psi).

    If the tire is not seated correctly when the maximum permitted tire seating pressure (max. 3.3 bar/48 psi) is applied, coat the wheel and tire again with tire mounting paste TIP TOP Universal or Contifix and repeat the procedure.

Fig 5: Identifying tire Filling Cage



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. 5.3. Screw in new valve insert. Counter at the valve body when tightening. Required tightening torque is 0.2 Nm/0.1 ftlb to 0.35 Nm/0.2 ftlb. (20 to 35 Ncm/1.6 to 3 inlb.). A safety valve screw-on tool with tightening control (e.g. from Butler) is ideal for this.

   Fill tire to the setting pressure of 4.0 bar (58 psi). Check that the tire bead is seated correctly. The tire must be lying evenly against the rim all the way around.

   Set the prescribed tire pressure. → 4405IN WHEELS AND TIRES/tire PRESSURE . Screw on valve cap.

6. **Balance the wheel** → 440593 BALANCING/OPTIMIZING WHEELS

7. **Perform a test drive.** Avoid extreme driving maneuvers (acceleration, braking) during the test drive to prevent the tire from turning on the rim.

   This can happen if the tire mounting paste is not completely dry. Optimum balancing will be impaired as a result.

   Observe the following criteria during the test drive:

   1. 7.1. TPM function (tire Pressure Monitoring system).

      Before starting the test drive (with "ignition on"), select the mounted set of wheels under Main menu > tire pressure > Settings in the instrument cluster. The control unit then learns the wheel positions again while the vehicle is driving.

The system starts learning as soon as you accelerate above 25 km/h (16 mph). The learning time is normally about 30 seconds, but can take several minutes when the vehicle is driven in a metallic environment (e.g. multi-storey car park, bridge and other concrete, highly metallic surfaces).

2. 7.2. Rough running performance and vibrations
3. 7.3. Vehicle handling.

WM 4440IN INFORMATION ON TIRES/MOUNTING TIRES (ALL MODELS) > INFORMATION > TIRES > TIRE DAMAGE - CAUSED WHILE DRIVING

If a tire is damaged and it cannot be determined with absolute certainty that there is no ply damage - with all of its consequences - or if the tire was thermally or mechanically overloaded due to a loss of pressure or other prior damage, we recommend replacement of the tire in question for safety reasons.

WM 4440IN INFORMATION ON TIRES/MOUNTING TIRES (ALL MODELS) > INFORMATION > TIRES > TIRE DAMAGE - CAUSED WHILE REMOVING/MOUNTING TIRES

When mounting tubeless tires, check the sealing face of the tire and the disc wheel for cleanliness and any signs of damage. Bear in mind here that the bead base performs the sealing function on tubeless tires. When mounting the tire beads, use only the specified tire mounting pastes. The following can occur if an unsuitable mounting paste is used:

- Twisting of the tire on the rim.
- Fracture of the bead bundle during mounting and if the seating pressure is too high.
- Damage to the tire bead.
- Damage to the rim surface by aggressive substances.

WM 4440IN INFORMATION ON TIRES/MOUNTING TIRES (ALL MODELS) > INFORMATION > TIRES > REPLACING TIRES

Tires should not be more than 6 years old!

Repairs to the tires are not permitted nor is the use of inner tubes in tubeless tires.

When replacing a tire on an axle, make sure that the tread depth of the new tire does not differ from that of the other tire by more than 30%.

If new tires are mounted or the tires of one axle are replaced, tires of the same make and with the same specification code must always be used on each of the two axles.

If tires are replaced on one axle only, the different tread depth in relation to the other axle can cause a noticeable change in the handling the driver has become accustomed to. This is especially true if new

tires are mounted on the rear axle. This effect decreases with increasing tire mileage.

The overview of summer and winter tires is included in Technical Information (TI), Group 4. When replacing summer tires, pay close attention to the tire specification number for the same make of tire. The specification code (for example N0) distinguishes the summer tires specially authorized by Porsche from other models of the same tire type and size.

Customers should be informed that the full performance of new or newly mounted tires is achieved only after driving the vehicle for a distance of 100 to 200 km (60 to 120 miles). Extreme driving maneuvers (acceleration, braking) should be avoided.

WM 4440IN INFORMATION ON TIRES/MOUNTING TIRES (ALL MODELS) > INFORMATION > TIRES > TIRE STORAGE

Tires must be stored in a cool, dry and dark room with adequate ventilation. They must never come into contact with fuel, oil, grease or chemicals. Complete wheels can be stacked for storage. It is advisable to increase the tire pressure by 0.4 bar (6 psi).

If the tires are not mounted on wheels, store them in the vertical position. Tires stored in vertical position should be turned every two weeks in order to prevent excessive flat spots. If the tires are stacked in horizontal position, they will become severely deformed and cannot be seated in the rim flange easily when mounted.

Tires age due to physical and chemical processes, which can impair their function. If they are stored for an extended period, they will harden and become brittle faster than tires that are in continual use. Hairline ageing cracks can occur on older tires. If tires are in use, the kneading action activates the plasticizer in the rubber and thereby prevents hardening and cracking.

WM 4440IN INFORMATION ON TIRES/MOUNTING TIRES (ALL MODELS) > INFORMATION > TIRES > TIRE IDENTIFICATION (SPEED CLASSES/TIRE AGE)

Tires should not be more than 6 years old!

The age of the tire can be determined from the manufacturer's code, which is shown behind the DOT code on the tire sidewall! The date of manufacture (the last four digits) is shown at the end of the code!

Example

DOT DM CP 05 Y 2200	22 = production week
	00 = production year 2000

WM 4440IN TIRES (ALL MODELS) > GENERAL MOUNTING INSTRUCTIONS > GENERAL

Information

- Always use new rubber valves when changing tires.

- The metal valve only needs to be replaced in certain cases. → 443219 REMOVING AND INSTALLING WHEEL ELECTRONICS
- When fitting tires, the direction of rotation and the inner and outer sides should be noted.
- Only use TIP TOP Universal or Contifix tire fitting paste.

Before mounting the tires on the wheels, check for damage (cracks, dents, etc.) as well as radial and lateral runout. Maximum permissible radial runout and lateral runout of alloy wheels = 0.7 mm. Maximum permissible radial runout and lateral runout of the wheel with tire = 1.25 mm. Try to keep the values at less than 1.0 mm - around 0.5 mm is better.

When mounting tubeless tires, check the sealing face of the tire and the disc wheel for cleanliness and any signs of damage. Bear in mind here that the bead base performs the sealing function on tubeless tires. When mounting the tire beads, use only the specified tire mounting pastes. The following can occur if an unsuitable mounting paste is used:

- Twisting of the tire on the rim
- Fracture of the bead core during mounting if the seating pressure is too high
- Damage to the tire bead
- Damage to the rim surface by aggressive substances.

If Contifix is used, apply sparingly to the tire beads (due to risk of the tire turning on the rim). If possible, the vehicle should not be driven for 24 hours after tire mounting or matching.

Information

- Customers should be informed that the full performance of new or newly mounted tires is achieved only after a distance of 100 to 200 km (60 to 120 miles) has been driven. Extreme driving maneuvers (acceleration, braking) should be avoided.
- The absolute limit on how far the tire can turn on the wheel must be regarded as 20 mm. Furthermore, this will worsen the result of optimum balancing.
- Mark the relative positions of the tire and wheel for reference.

In order to optimize rolling smoothness, it is important - and necessary in some cases - to mount the tire at a good position with respect to the rim (matching).

WM 4440IN TIRES (ALL MODELS) > GENERAL MOUNTING INSTRUCTIONS > UNCONTROLLED MATCHING

Turn the tire on the wheel by 90° or 180° if necessary in order to achieve an acceptable value with regard to rolling smoothness (true running, imbalance and distribution of balance weights).

WM 4440IN TIRES (ALL MODELS) > GENERAL MOUNTING INSTRUCTIONS > CONTROLLED MATCHING

With a balancing machine with matching program. In most cases, this produces an even better result

with regard to the rolling smoothness (true running, imbalance and distribution of the balance weights) than can be achieved with uncontrolled matching.

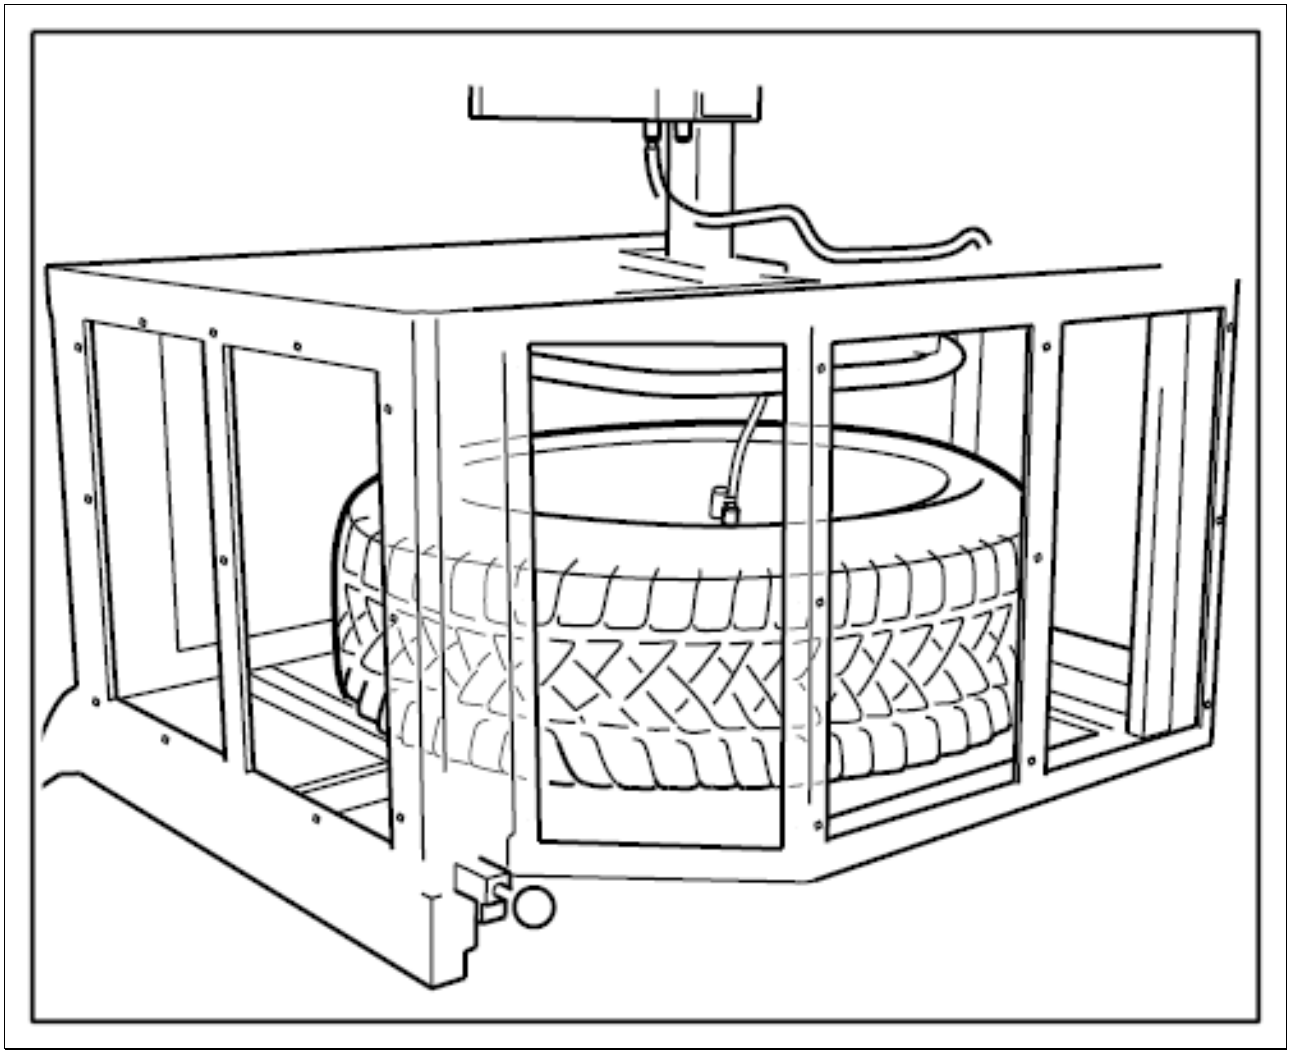
WM 4440IN TIRES (ALL MODELS) > GENERAL MOUNTING INSTRUCTIONS > MOUNTING TIRES

WARNING: High tire seating pressure

- *Risk of squashing or bruising*

→ Use a tire filling cage.

Fig 1: Identifying Tire Filling Cage



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

- After mounting the tubeless tires, inflate them without valve insert to max. 4.0 bar (58 psi) gauge pressure to ensure they are seated properly on the rim. By the time the pressure reaches 4.0 bar

(58 psi), at the latest, the tire beads must pop out of the deep bed and over the hump of the rim bead in order to avoid fractures of the bead core. Interrupt the process if necessary and generously coat all necessary surfaces with sliding compound (tire mounting paste) again. Then repeat the process. Screw in the valve insert and set the specified tire pressure.

If new tires are to be mounted or the tires of one axle are to be replaced, tires of the same make and with the same specification code must always be used on each of the two axles. If tires are replaced on one axle only, the different tread depth in relation to the other axle can cause a noticeable change in the handling the driver has become accustomed to. This is especially true if new tires are mounted on the rear axle. This effect decreases with increasing tire mileage.

Information

- If a tire is damaged and it cannot be determined with absolute certainty that there is no ply damage - with all of its consequences - or if the tire was thermally or mechanically overloaded due to a loss of pressure or other prior damage, we recommend replacement of the tire in question for safety reasons.
- When replacing a tire on an axle, make sure that the tread depth of the new tire does not differ from that of the other tire by more than 30 %.
- Repairs to the tires are not permitted nor is the use of inner tubes in tubeless tires.
- When replacing summer tires, pay close attention to the tire specification number.

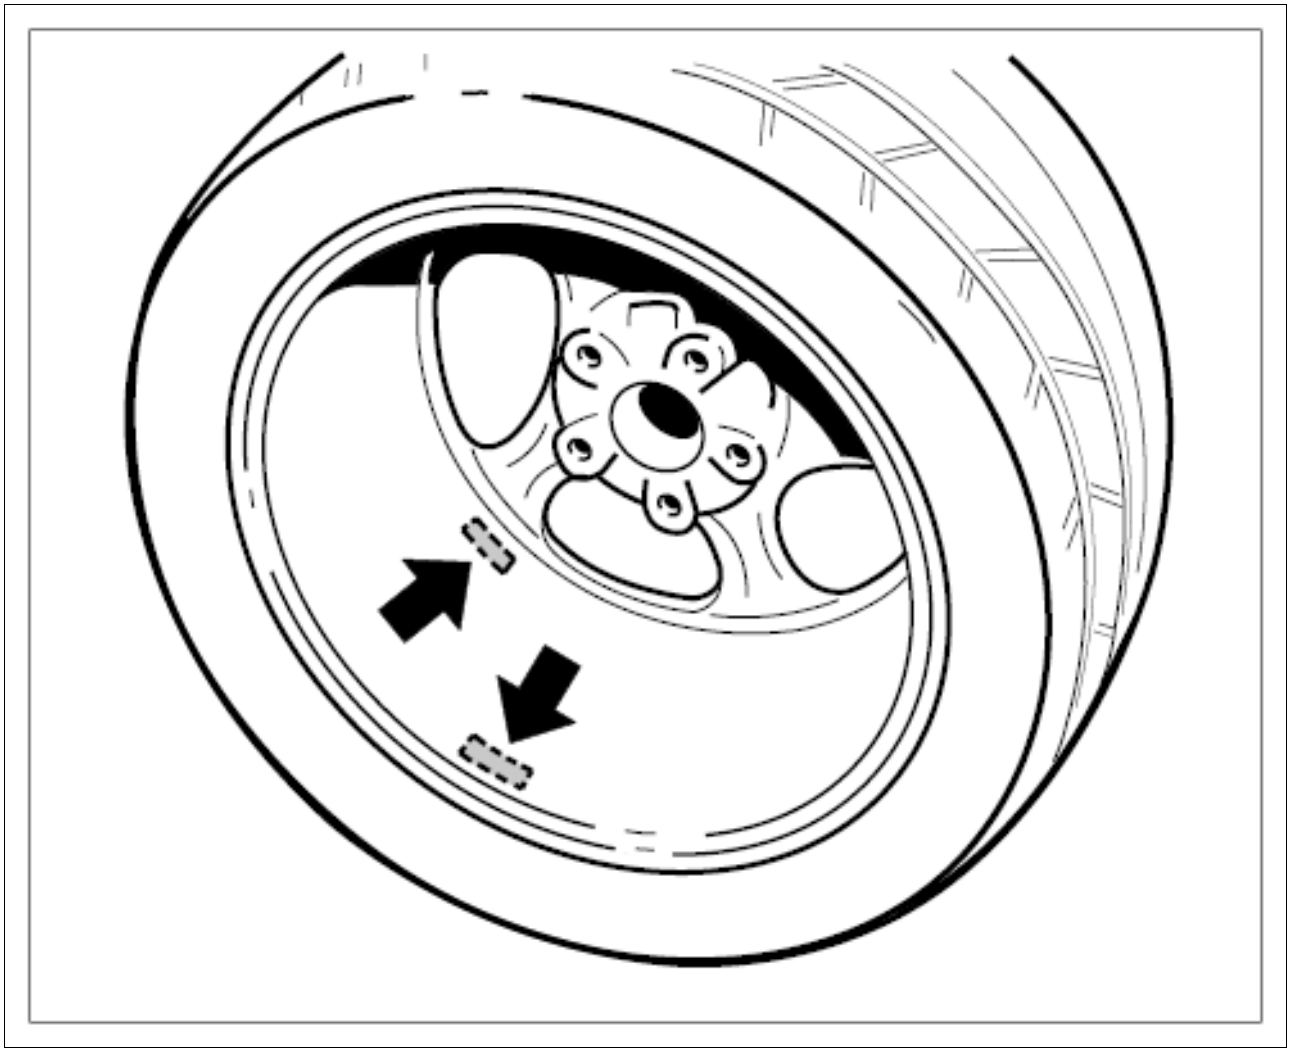
The overview of summer and winter tires is included in Technical Information (TI), Group 4. When replacing summer tires, pay close attention to the tire specification number for the same make of tire. The specification characters (for example N0) distinguish the summer tires specially authorized by Porsche from other models of the same tire type and size.

WM 4440IN TIRES (ALL MODELS) > GENERAL MOUNTING INSTRUCTIONS > BALANCING WEIGHTS

Type of balancing weights: Adhesive weights as used previously (no special version necessary).

Attach both weights to the inner side **-arrows-** .

Fig 1: Locating Balancing Weights



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

- Observe program selection and operating instructions of the balancing machine.

WM 4440IN TIRES (ALL MODELS) > GENERAL MOUNTING INSTRUCTIONS > TIRE STORAGE

Tires must be stored in a cool, dry and dark room with adequate ventilation. They must never come into contact with fuel, oil, grease or chemicals. Complete wheels can be stacked for storage. It is advisable to increase the tire pressure by 0.4 bar (6 psi).

If the tires are not mounted on wheels, store them in the vertical position. Tires stored in vertical position should be turned every two weeks in order to prevent excessive flat spots. If the tires are stacked in horizontal position, they will become severely deformed and cannot be seated in the rim flange easily when mounted.

Tires age due to physical and chemical processes, which can impair their function. If they are stored for

an extended period, they will harden and become brittle faster than tires that are in continual use. Hairline ageing cracks can occur on older tires. If tires are in use, the kneading action activates the plasticizer in the rubber and thereby prevents hardening and cracking.

WM 4440IN TIRES (ALL MODELS) > GENERAL MOUNTING INSTRUCTIONS > TIRE AGE

Information

- Tires should not be older than 6 years! Not even the emergency spare wheel!

The age of the tire can be determined from the manufacturer's code, which is shown behind the DOT code on the tire sidewall! The date of manufacture (the last four digits) can be found at the end of the code!

WM 449503 SUSPENSION ALIGNMENT, COMPLETE (ALL MODELS) > INFORMATION > GENERAL PROCEDURE FOR SUSPENSION ALIGNMENT

Perform suspension alignment using an electronic wheel-alignment analyzer. Measurement procedures are described in the operating instructions for the wheel-alignment analyzer used.

For nominal value for front and rear axles, refer to the Technical data. → 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT .

In order to exclude erroneous measurements, the following preconditions must be met before alignment and the following points should be given special attention:

Empty weight of vehicle according to DIN 70020, i.e. vehicle in ready-to-drive condition with full tank and including tools but without driver or additional weights.

Joint and wheel-bearing play OK (wheel-bearing play cannot be adjusted).

tire pressure in accordance with regulations, fairly uniform tire tread.

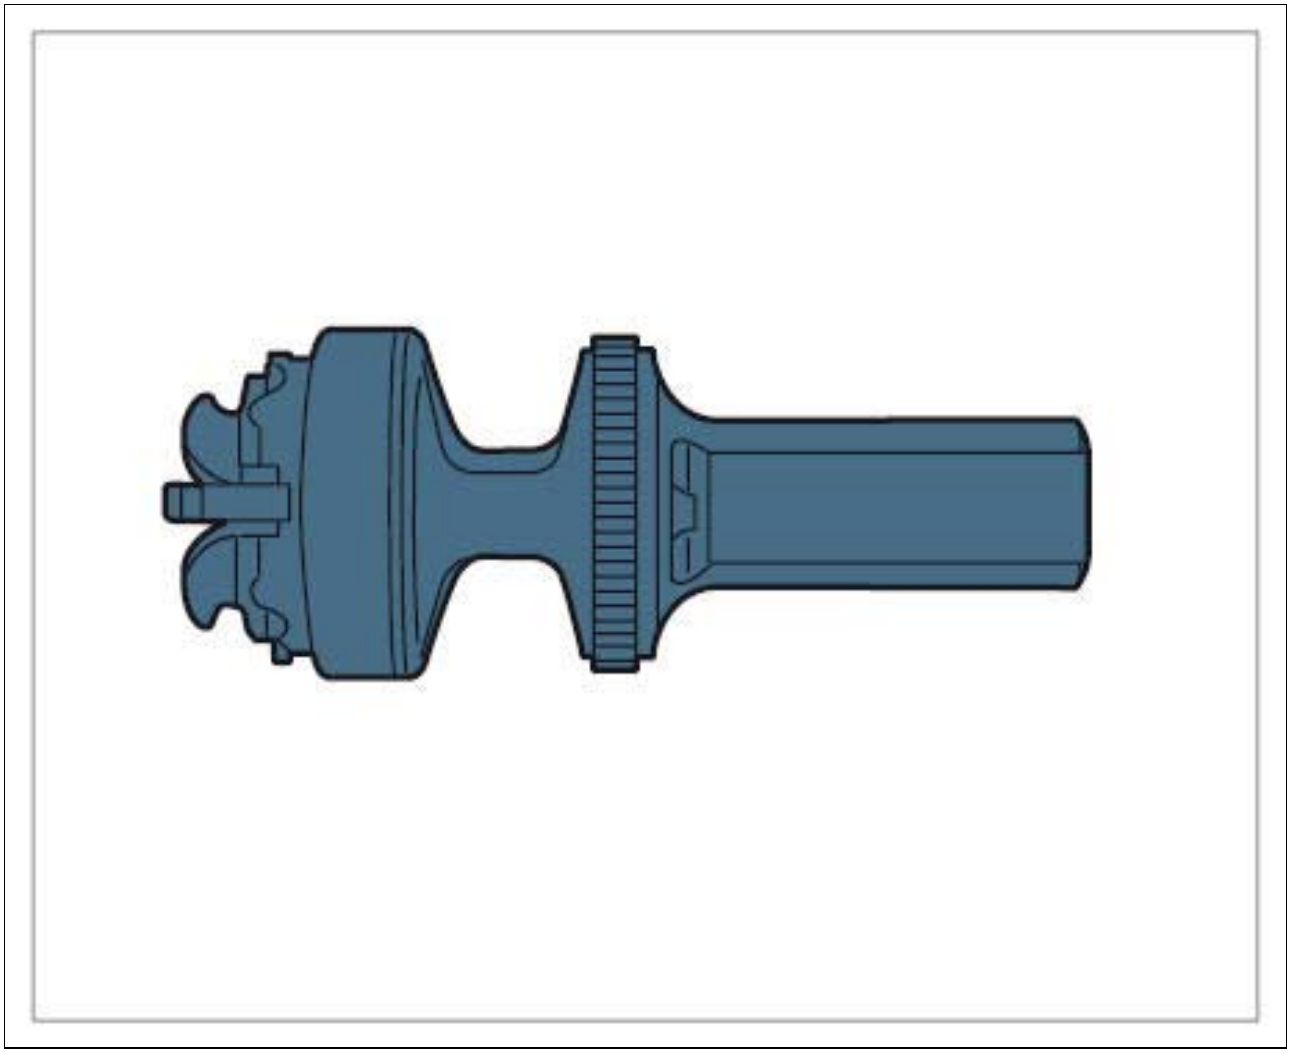
Use **puller hook 9229/1** to pull off the hub caps (in order to fit the quick-clamping holders).

Quick-clamping holder with adapter (for the measured-value pickups/measuring reflectors) correctly secured to the wheels.

Use **quick-clamping unit WE 1621** → Self-centering quick-clamping holder (example) to secure the measured-value pickups/measuring reflectors to the wheels.

The self-centering quick-clamping holders are positioned centrally (with the claws first) in the center of the rim and are tautened in the rim by turning the straining ring (clockwise).

Fig 1: Identifying Self-Centering Quick-Clamping Holder



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Receiving surfaces for the quick-clamping holders on the wheels and the adapter surfaces must be clean and flat. Always check the levelling surface on the wheels precisely in particular before fitting the quick-clamping holders.

Strictly comply with maintenance intervals for measuring equipment and measuring platform. If the levelling of the measuring platform or measuring station is done in-house, levelling equipment is required. A spirit level is not adequate.

Skilled handling of measuring equipment and measuring platform.

Sliding plates with transverse motion (rotary motion) at the rear axle are advisable.

Refer to the Technical Literature provided the manufacturer of the measuring equipment and the manufacturer of the measuring platform.

Do not treat measured values as a whole, but very critically with regard to driving dynamics, high-speed strength of the tires, tire wear and cost/benefit effects (time required for correction of insubstantial deviations). The toe values are of decisive significance for driving dynamics and tire wear.

Perform suspension alignment only in the sequence specified in the service information. The camber

values at the front axle are valid if the wheels are in the straight-ahead position. Steering wheel and steering gear in center position when toe is being adjusted.

Before wheel alignment values are adjusted at front and rear axles, it is recommended that the vehicle height be checked at the DIN empty weight. Conclusions can then be drawn about wheel alignment values in the event of any suspension alignment that becomes necessary later.

WM 449503 SUSPENSION ALIGNMENT, COMPLETE (ALL MODELS) > HEIGHT CHECK > SPECIAL NOTES FOR VEHICLES WITH AIR SUSPENSION

On vehicles with air suspension, the vehicle must be set to normal level. The vehicle may be aligned and adjusted in this position only.

If the control unit or one of the level sensors was replaced, calibration must be carried out using the Porsche System Tester. → 430115 CALIBRATING THE LEVELLING SYSTEM

Adjust vehicle to normal level:

1. Drive vehicle onto the wheel-alignment platform, switch off engine and move selector lever to position P.
2. **PIWIS Tester II 9818** must now be connected.

   Do not get into or out of the vehicle while adjusting the vehicle to normal level and after adjusting it to normal level for suspension alignment. This can give false alignment results.
3. Select >>Levelling system/PASM<< >>Drive links/checks<< >>Adjust vehicle level<< in the control unit overview.
4. Select the value **Low level 1** and press [F8] to start. The vehicle adjusts to Low Level.
5. Once Low Level has been reached, select **Normal Level** and press [F8] to start. The vehicle now adjusts to Normal Level.

WM 449503 SUSPENSION ALIGNMENT, COMPLETE (ALL MODELS) > HEIGHT CHECK > CHECKING VEHICLE HEIGHT

1. To check the height, position ready-to-drive vehicle (fully tanked with tire repair kit or spare wheel and tools) on a flat surface or on the measuring station. The normal vehicle level must be set for vehicles with air suspension. Please read the section: **Special notes for vehicles with air suspension**
2. On vehicles with air suspension/levelling system, switch off the levelling system (and switch it back on again when work is complete).
    1. 2.1. Use **PIWIS Tester II 9818** to select >>Levelling system/PASM<< >>Drive links/checks<< >>Activate/deactivate vehicle<< in the control unit overview.
    2. 2.2. Select the value **Deactivate levelling system (permanently)** and press [F8] to start. The levelling system is now switched off.

3. Compress vehicle at front and rear axles by approximately 25 mm 2-3 times and allow it to spring back freely.
4. Open the bonnet.
5. Measure the vehicle height **-dimension 1-** at all four wheels on the vehicle.

Fig 1: Identifying Wheel To Wing Lower Edge Dimension (Rear Axle)

WM 449503 SUSPENSION ALIGNMENT, COMPLETE (ALL MODELS) > REAR-AXLE AND FRONT-AXLE WHEEL ALIGNMENT > CHECKING/ADJUSTING WHEEL ALIGNMENT

Information

Special points relating to vehicle adjustment:

- Toe difference angle and caster cannot be adjusted.
- Camber at the front axle cannot be adjusted. But camber can be centered evenly within the tolerance range by moving the front-axle carrier.

1. Prepare vehicle for checking and/or adjusting wheel alignment values. Place front wheels on

turntable and rear wheels on rotary/sliding plates.

2. Compress vehicle as far as possible (by a few mm) at front and rear axles twice or three times and allow it to spring back freely.

WM 449503 SUSPENSION ALIGNMENT, COMPLETE (ALL MODELS) > REAR-AXLE AND FRONT-AXLE WHEEL ALIGNMENT > CENTERING CAMBER ON THE FRONT AXLE

Information

Camber at the front axle cannot be adjusted. But camber can be centered evenly within the tolerance range by moving the front-axle carrier.

All axle adjustment values must be checked whenever the camber is adjusted!

1. Remove front underbody panelling → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY .

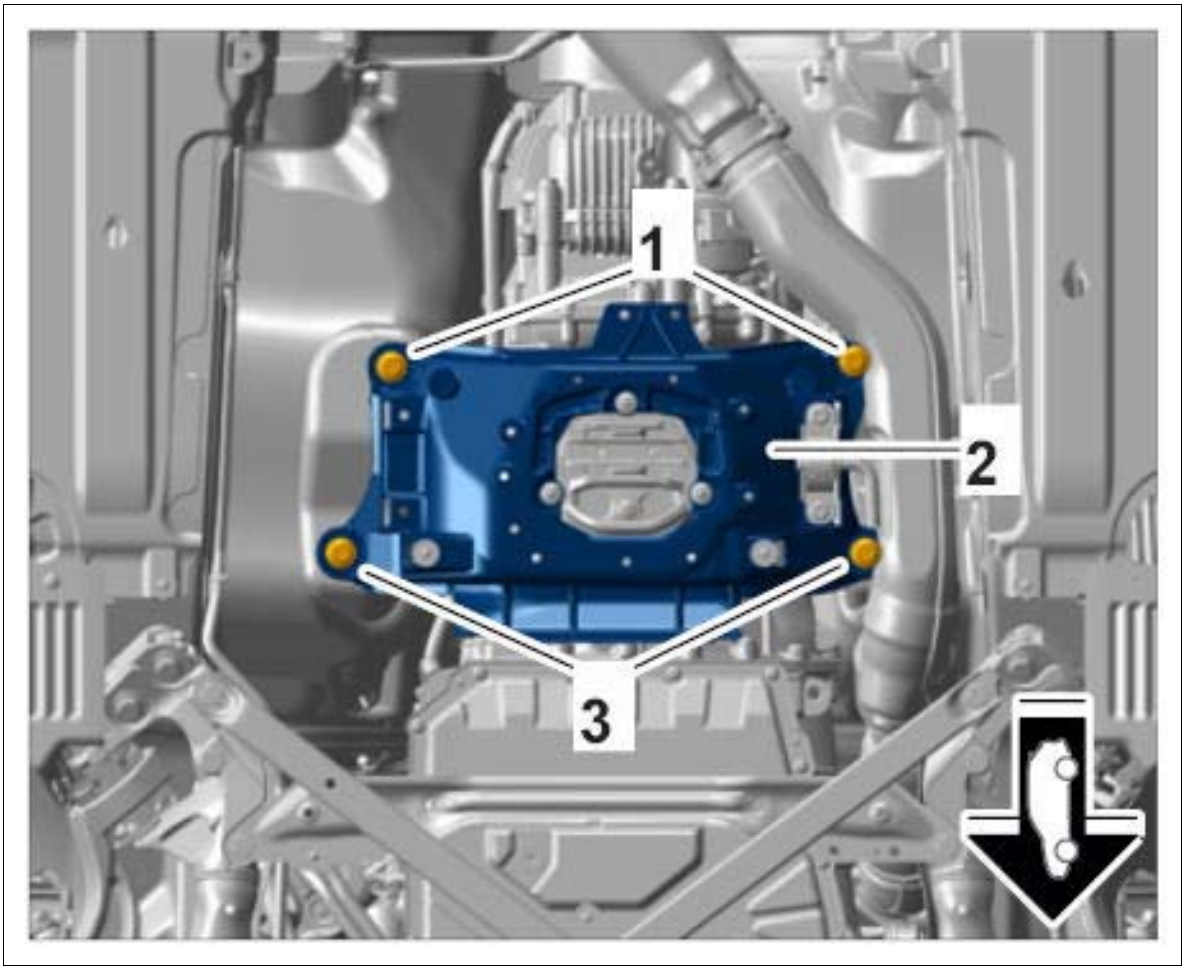
2. Unscrew fastening screws **-1 and 2-** and remove heat shields at the left and right.

Fig 1: Identifying Front-Axle Carrier Heat Shield

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Loosen fastening screws **-1 and 3-** on the transmission support **-2-** . This ensures that the transmission mount is not strained.

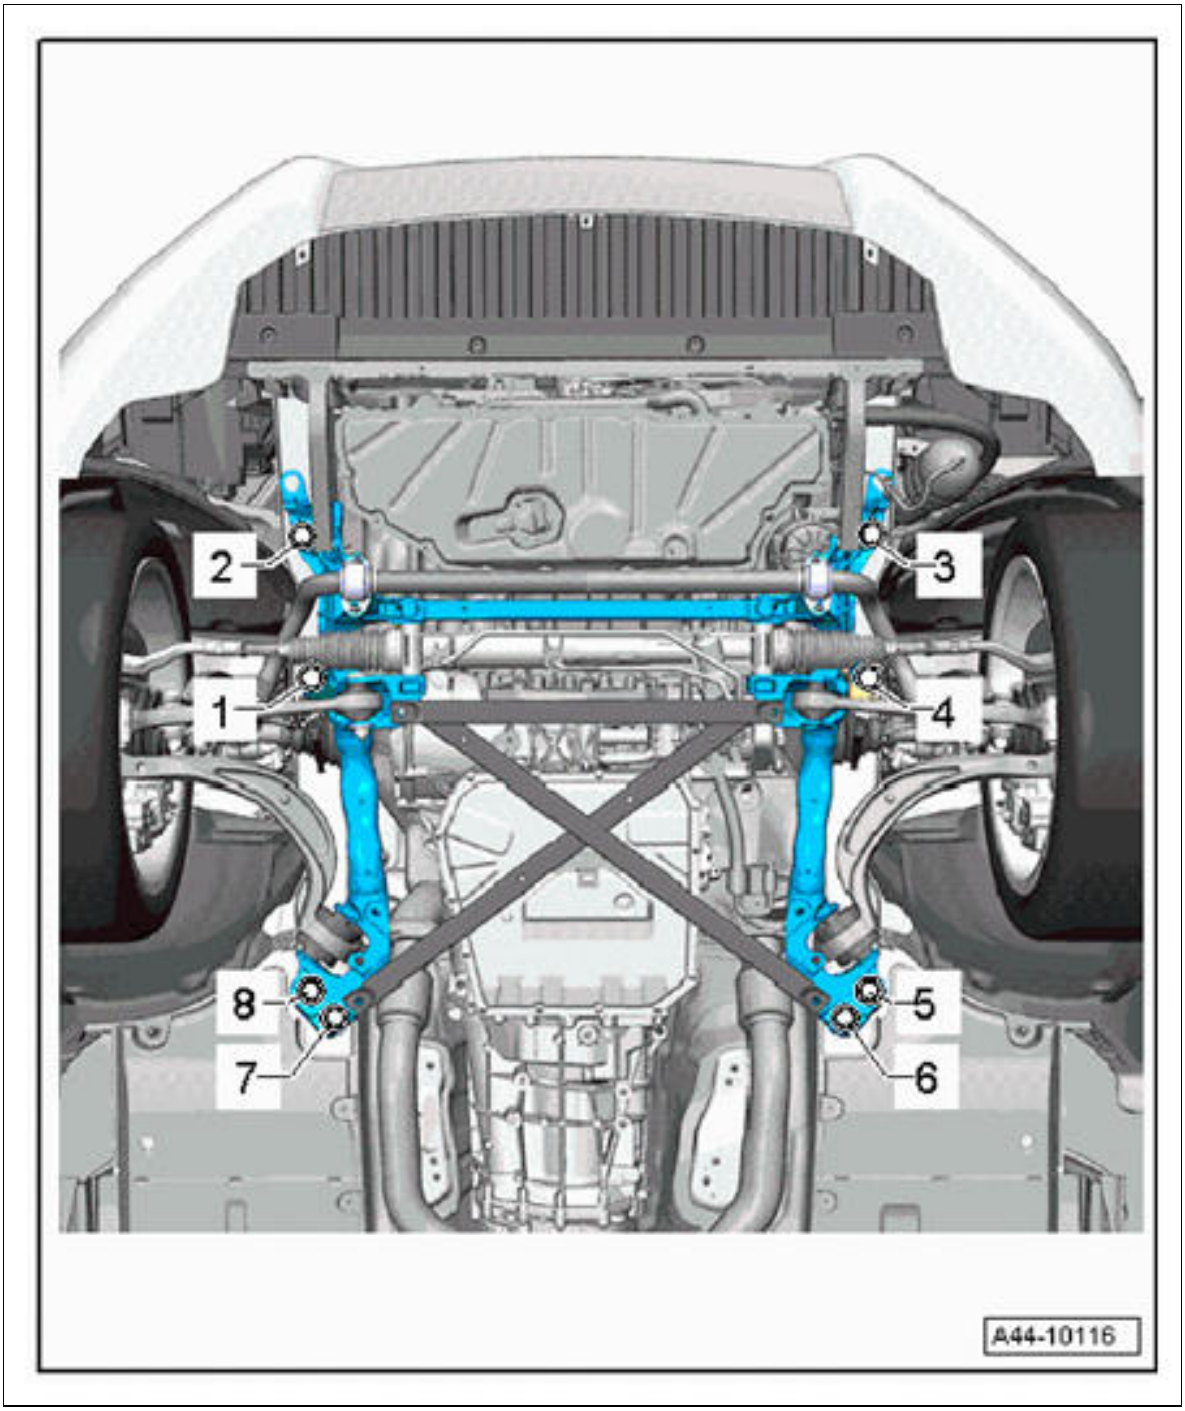
Fig 2: Identifying Transmission Support Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Loosen fastening screws **-1 to 8-** on the front-axle carrier.

Fig 3: Identifying Front-Axle Carrier Mounting

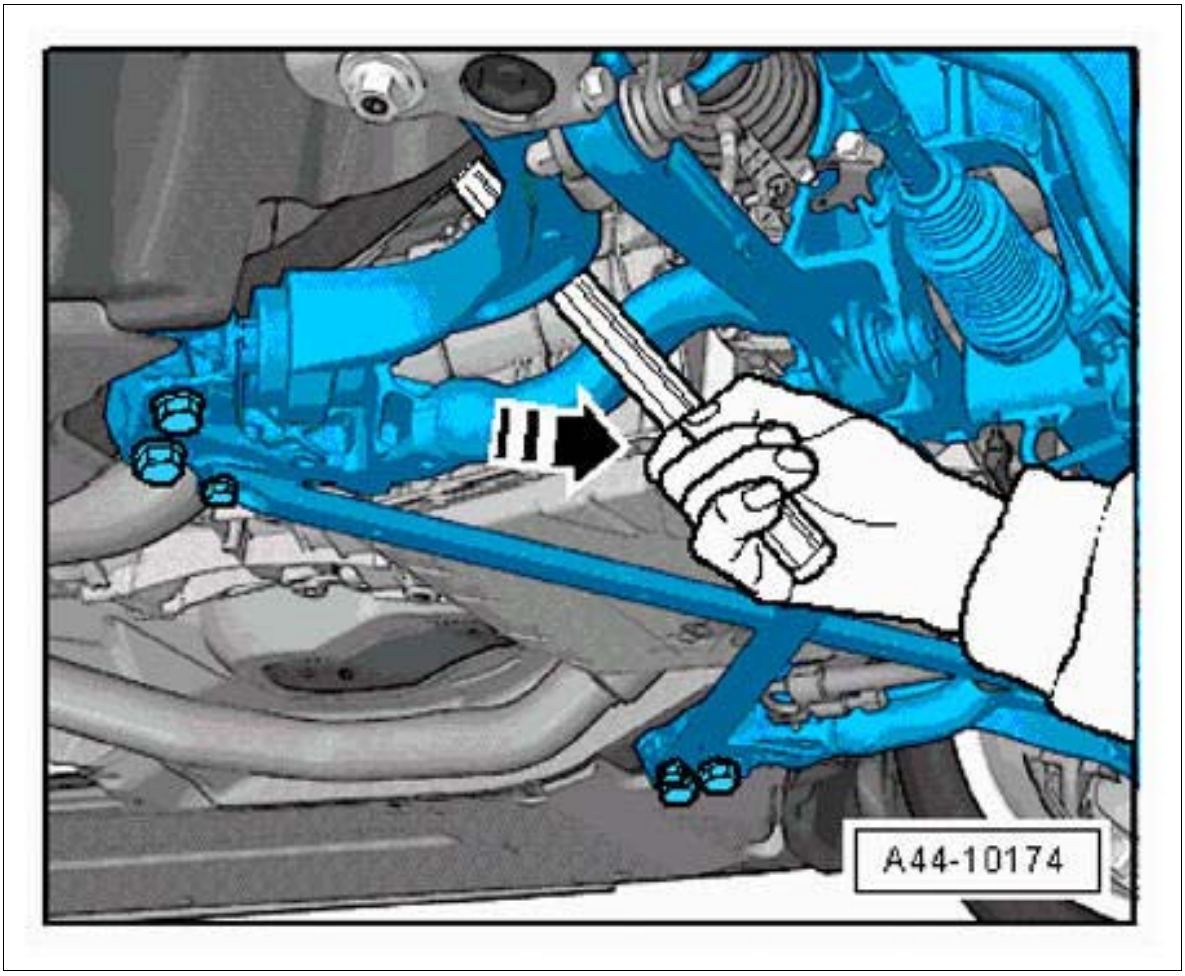


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Raise the front of the vehicle at the lifting platform jacking points using an axle lift.
6. Move the front-axle carrier with engine mount and anti-roll bar to the required position using a plastic-coated tire iron → Moving front-axle carrier .

   Before checking the camber values, compress the vehicle at the front axle several times.

Fig 4: Moving Front-Axle Carrier



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Screw in and tighten new fastening screws **-1 and 4-** one after the other.

   Step 1: **Initial tightening 115 Nm (85 ftlb.)**

   Step 2: **Final tightening +90°**

8. Screw in and tighten new fastening screws **-2 and 3-** one after the other.

   Step 1: **Initial tightening 115 Nm (85 ftlb.)**

   Step 2: **Final tightening +90°**

9. Screw in and tighten new fastening screws **-5 and 8-** one after the other.

   Step 1: **Initial tightening 115 Nm (85 ftlb.)**

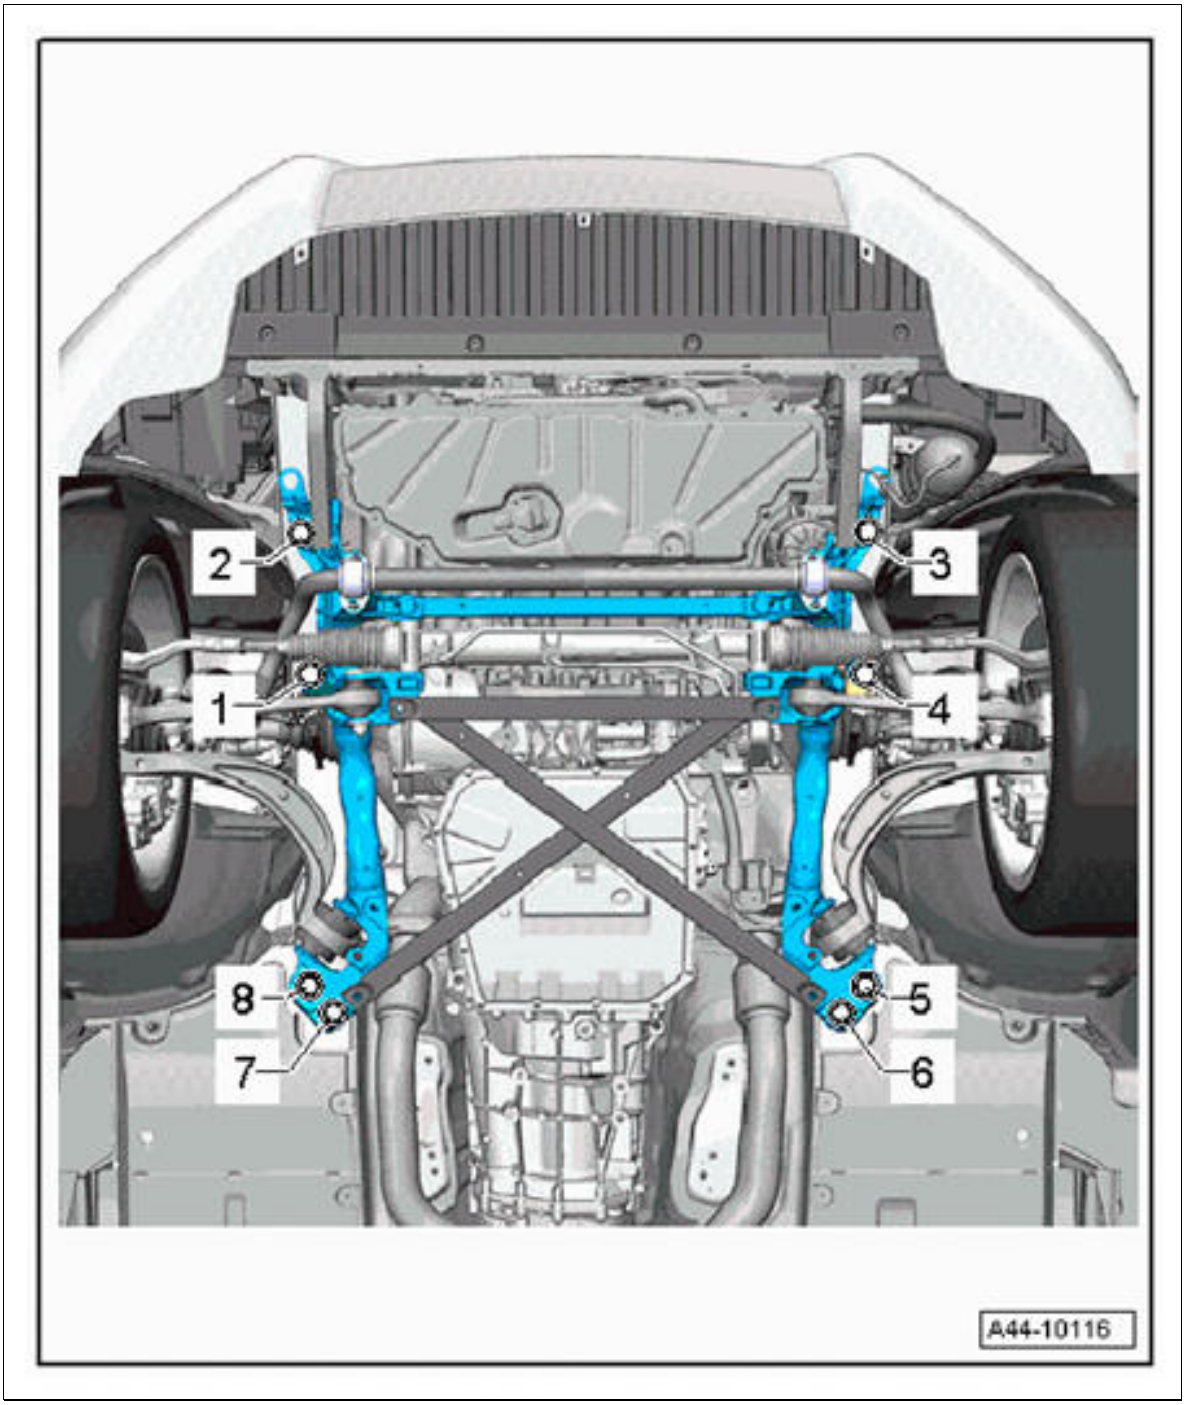
   Step 2: **Final tightening +90°**

10. Screw in and tighten new fastening screws **-6 and 7-** one after the other.

    Step 1: **Initial tightening 115 Nm (85 ftlb.)**

    Step 2: **Final tightening +90°**

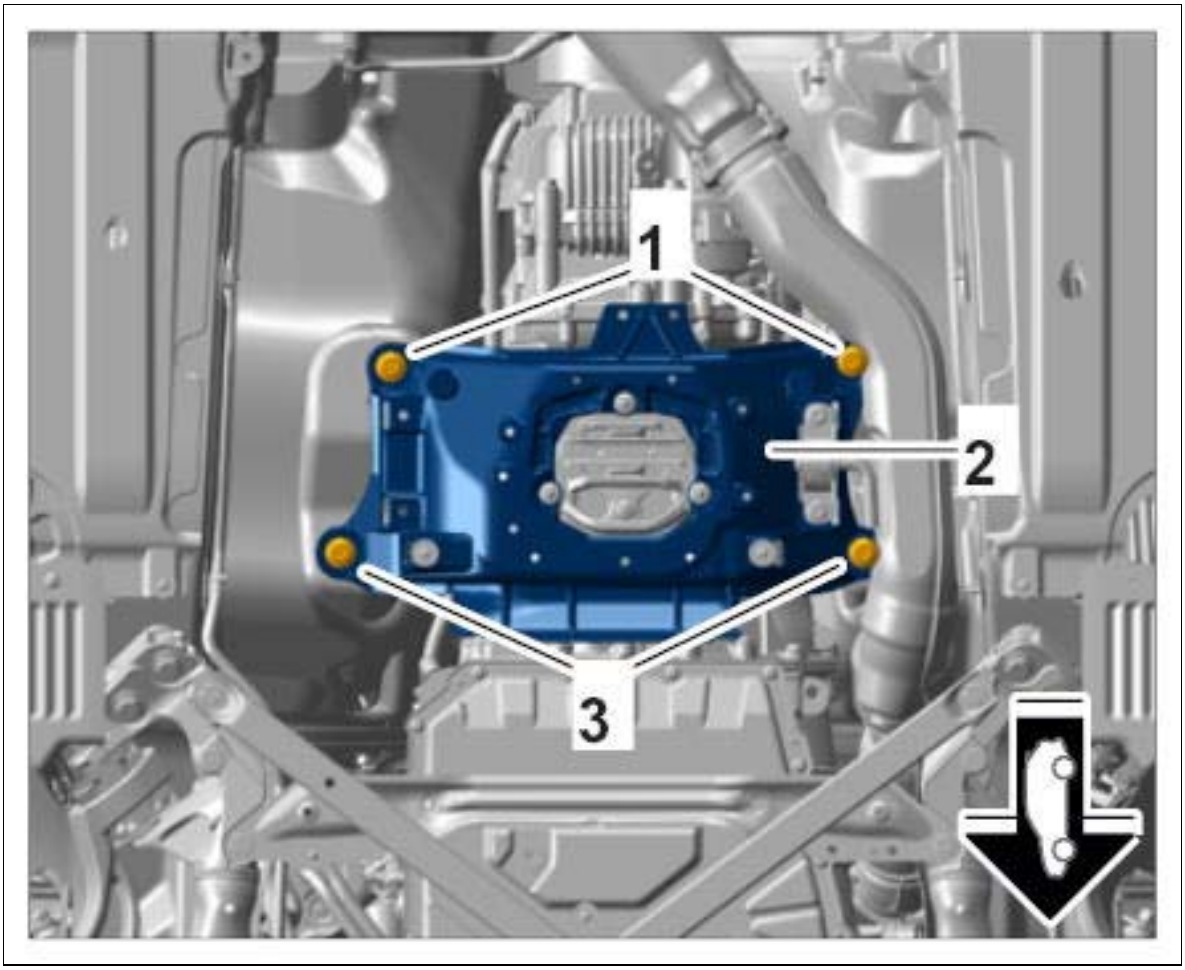
Fig 5: Identifying Front-Axle Carrier Mounting



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

11. Tighten fastening screws **-1 and 3-** on the transmission support **-2-** . **Tightening torque 70 Nm (52 ftlb.)**

Fig 6: Identifying Transmission Support Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

12. Check the camber value again.
13. Install heat shields at the left and right and tighten fastening screws **-1 and 2-** .

    Fastening screws **-1-** : **Tightening torque 9 Nm (6.5 ftlb.)**

    Fastening screw **-2-** : **Tightening torque 20 Nm (15 ftlb.)**

Fig 7: Identifying Front-Axle Carrier Heat Shield

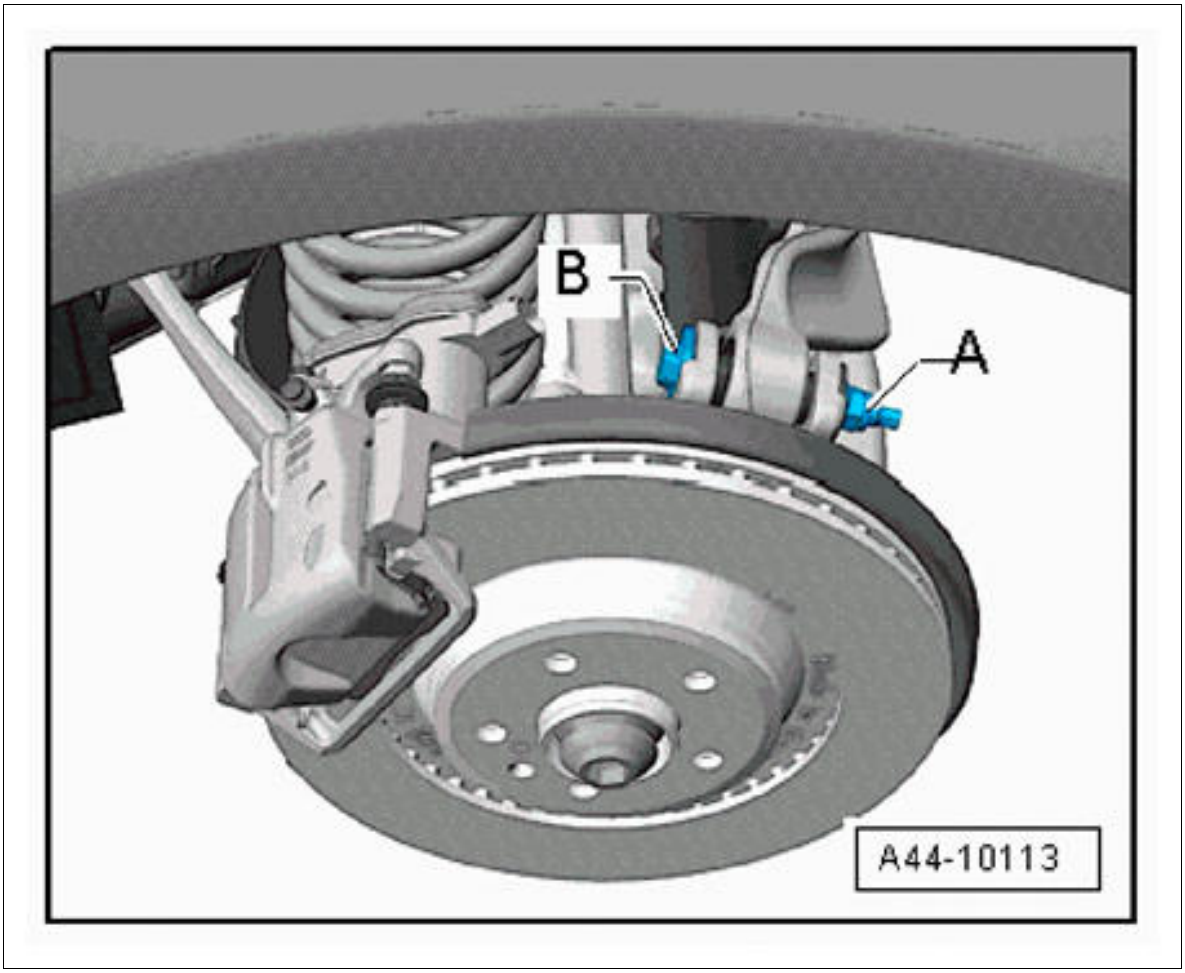
14. Install front underbody panelling → 519219 REMOVING AND INSTALLING COVER FOR FRONT UNDERBODY .

WM 449503 SUSPENSION ALIGNMENT, COMPLETE (ALL MODELS) > REAR-AXLE AND FRONT-AXLE WHEEL ALIGNMENT > ADJUSTING REAR-AXLE CAMBER

1. Turn the camber eccentric **-B-** as required after loosening the lock nut **-A-** .

   Then tighten the lock nut **-A-** on the camber eccentric **-B-** . **Tightening torque 95 Nm (70 ftlb.)**

Fig 1: Identifying Rear-Axle Camber



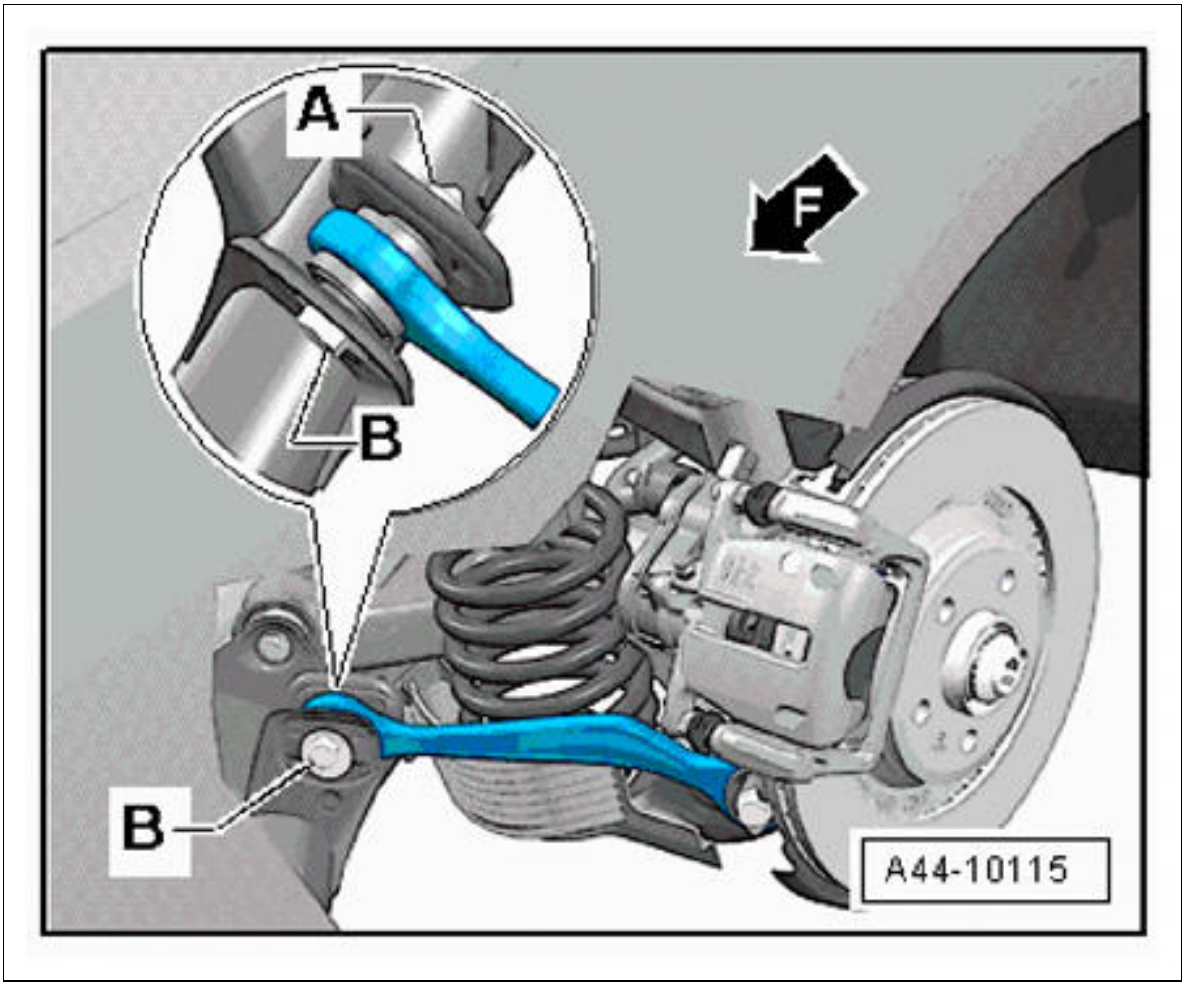
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 449503 SUSPENSION ALIGNMENT, COMPLETE (ALL MODELS) > REAR-AXLE AND FRONT-AXLE WHEEL ALIGNMENT > ADJUSTING REAR-AXLE TOE

1. Turn the toe eccentric adjuster **-B-** as required after loosening the lock nut **-A-** .

   Then tighten lock nut **-A-** using **interchangeable head T40183** on the toe eccentric adjuster **-B-** . **Tightening torque 95 Nm (70 ftlb.)**

Fig 1: Identifying Rear-Axle Toe Eccentric Adjuster



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 449503 SUSPENSION ALIGNMENT, COMPLETE (ALL MODELS) > REAR-AXLE AND FRONT-AXLE WHEEL ALIGNMENT > ADJUSTING FRONT-AXLE TOE

1. Clamp steering wheel in center position using steering-wheel holder **-A-** . Use only steering-wheel holders that do not project into the area of the airbag unit **-B-** . If necessary, shorten the guide rod on the steering-wheel holder at the top **-arrow-** .

Fig 1: Locating Steering-Wheel Holder

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

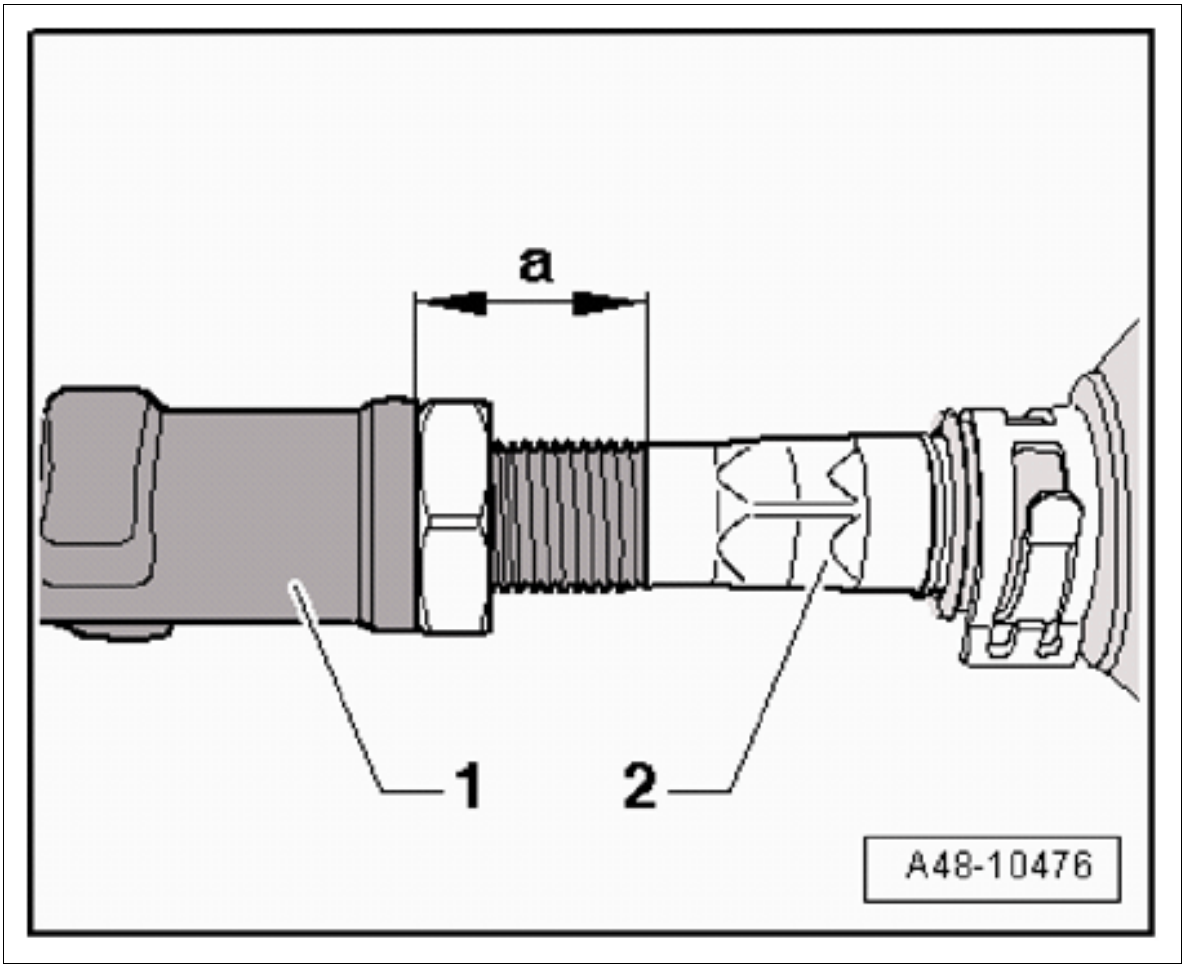
For fast and reliable steering wheel alignment in center position, use a **steering wheel alignment gauge WE 1343** (with integrated angle measurement box).

Fig 2: Identifying Steering Wheel Alignment Gauge

Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Measure dimension **-a-** between the tie-rod ball **-1-** and tie rod **-2-** at the left and right and take note of the value. Dimension **-a-** should be the same before and after alignment at the left and right (maximum difference between left and right < 2.5 mm).

Fig 3: Identifying Tie Rod Dimension



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

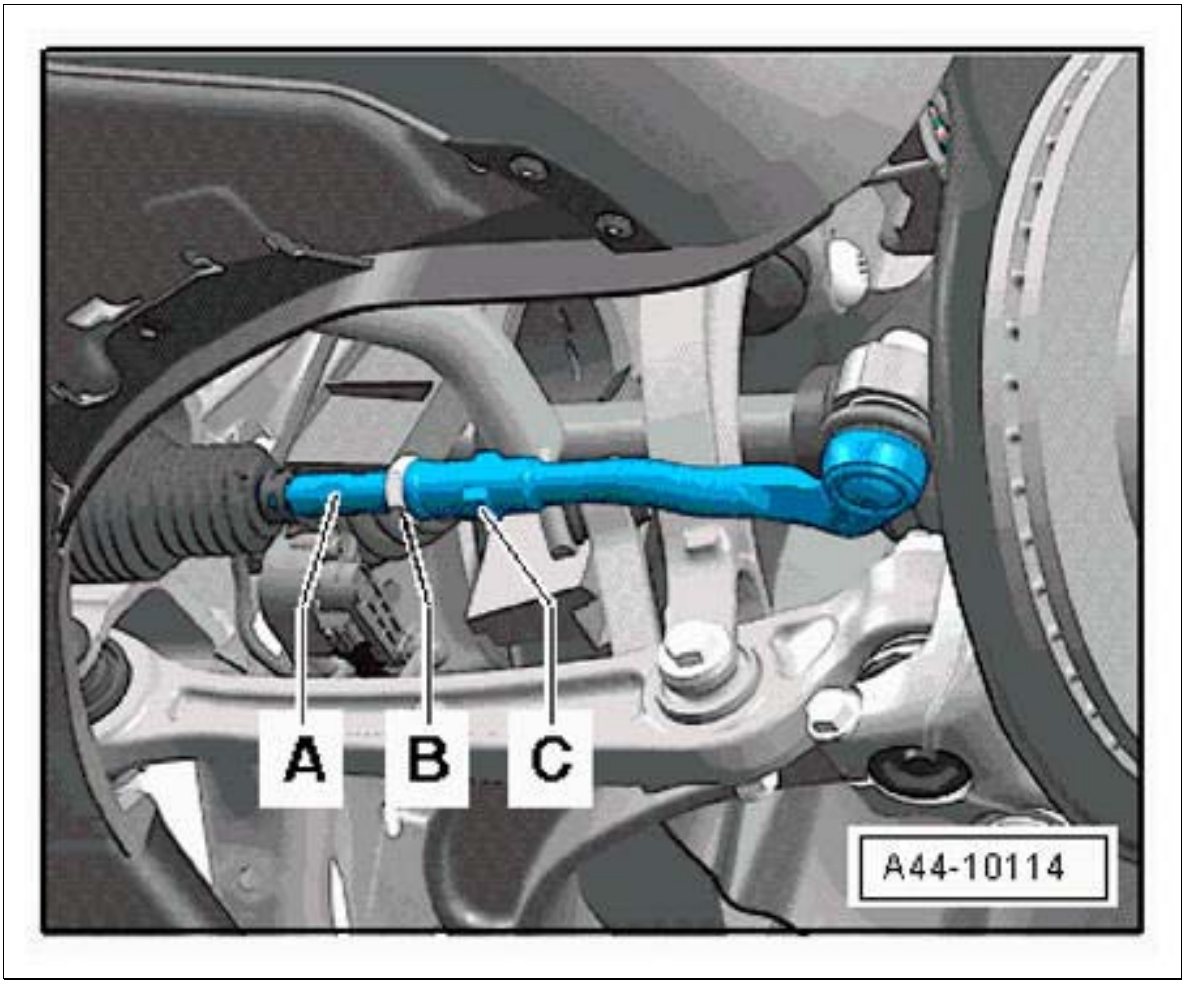
3. Loosen lock nut **-B-** . Counter at the tie-rod ball **-c-** while doing this.

   Information

   Make sure that the bellows are not twisted after turning the tie rods!

4. Adjust the toe at the left and right wheel using hexagon **-A-** .

Fig 4: Identifying Front-Axle Toe Lock Nut And Tie Rod Ball



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Tighten lock nut **-B-** and check the toe value again. **Tightening torque 90 Nm (67 ftlb.)**

WM 449503 SUSPENSION ALIGNMENT, COMPLETE (ALL MODELS) > REAR-AXLE AND FRONT-AXLE WHEEL ALIGNMENT > SUBSEQUENT WORK

WARNING: Steering-angle sensor not calibrated or calibrated incorrectly

- *Unexpected vehicle handling*
- *Steering-angle sensor does not function*
- *Malfunction in steering-angle sensor*

→ After working on wheel suspension parts, when replacing the steering-angle sensor and after changing the wheel alignment values, calibrate the steering-angle sensor using **PIWIS Tester II 9818** .

→ Keep the front wheels in straight-ahead position on the measuring platform during calibration.

→ On vehicles with electromechanical steering, also re-teach the electric steering lock settings.

1. The steering-angle sensor must be calibrated if the previous wheel alignment values (on rear and/or front axle) have been changed.

   → 456005 INITIALIZING AND CALIBRATING STEERING-ANGLE SENSOR .

   In addition, calibrate the distance measuring sensor (ACC sensor) control unit and front camera (if fitted).

   → 278515 ADJUSTING CONTROL UNIT FOR DISTANCE MEASURING SENSOR

   → 9638K2 CALIBRATING FRONT CAMERA .

2. Once you have calibrated the steering-angle sensor, re-teach the electric steering lock settings with the engine running.

   In each phase, turn the steering wheel fully to the right and then to the left and hold it at full lock for a short time (follow instructions on the Tester).

WM 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT (ALL MODELS) > TOOLS

Designation	Type	Number	Description	
PIWIS Tester II	Special tool	9818		
WM 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT (ALL MODELS) > VEHICLE HEIGHT > VEHICLE HEIGHT WITH STEEL SPRINGS

Information

- The following values relate to the empty weight, i.e. full fuel tank, vehicle with tire repair kit (or spare wheel, collapsible wheel) and tools, but without driver and without additional weights.

- tire pressure in accordance with specifications.
- If the control unit or one of the self-levelling sensors has been replaced, calibration must be carried out using the Porsche System Tester.

Vehicle height	Steel springs
Front-axle height	
with 18, 19, 20, 21-inch wheels [mm]	479, 2 ±10
From outer wheel center to bottom edge of wing	
Rear-axle height	
with 18, 19, 20, 21-inch wheels [mm]	472, 6 ±10
From outer wheel center to bottom edge of wing	
Max. difference in height between left and right: 10 mm	

WM 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT (ALL MODELS) > VEHICLE HEIGHT > VEHICLE HEIGHT WITH AIR SPRINGS

Information

- The following values relate to the empty weight, i.e. full fuel tank, vehicle with tire repair kit (or spare wheel, collapsible wheel) and tools, but without driver and without additional weights.
- tire pressure in accordance with specifications.
- Adjust the vehicle to normal level beforehand. The vehicle may be aligned and adjusted in this position only. → 4X00IN LIFTING THE VEHICLE
- If the control unit or one of the self-levelling sensors has been replaced, calibration must be carried out using the Porsche System Tester.

Vehicle height	Air spring
Front-axle height	
with 18, 19, 20, 21-inch wheels [mm]	464 ±10
From outer wheel center to bottom edge of wing	
Rear-axle height	
with 18, 19, 20, 21-inch wheels [mm]	457 ±10
From outer wheel center to bottom edge of wing	
Max. difference in height between left and right: 10 mm	

WM 4495TW ADJUSTMENT VALUES FOR SUSPENSION ALIGNMENT (ALL MODELS)

> VEHICLE HEIGHT > WHEEL ALIGNMENT VALUES, STEEL SPRINGS

Information

Adjusting the front axle

The front axle of the Macan can be adjusted as follows:

- Toe : Adjustment using the tie rod
- Camber : Adjustment by moving the front-axle carrier (necessary if max. difference from left to right is exceeded)
- Caster: Cannot be adjusted!

For a detailed description, see → 449503 SUSPENSION ALIGNMENT, COMPLETE .

WARNING: Steering-angle sensor not calibrated or calibrated incorrectly

- *Unexpected vehicle handling*
- *Steering-angle sensor does not function*
- *Malfunction in steering-angle sensor*

→ After working on wheel suspension parts, when replacing the steering-angle sensor and after changing the wheel alignment values, calibrate the steering-angle sensor using **PIWIS Tester II 9818** .

→ Keep the front wheels in straight-ahead position on the measuring platform during calibration.

→ On vehicles with electromechanical steering, also re-teach the electric steering lock settings.

Information

- The following values relate to the empty weight, i.e. full fuel tank, vehicle with spare wheel (collapsible wheel) and tools, but without driver and without additional weights.
- tire pressure in accordance with specifications.
- The toe-difference angle value is also influenced by the vehicle height. For this reason the measured result must be evaluated accordingly. No action is necessary in the case of small deviations from the toe-difference angle's required value as long as the value to the right and left is almost the same.

Wheel alignment values	Steel springs
Front axle	
Toe unpressed (per wheel)	+ 0°05' ±5'
Toe unpressed (total)	+ 0°10' ±10'
Max. difference, left to right	0°05'

Camber (with wheels in straight-ahead position) Can be adjusted by moving the front-axle carrier	- 0°30' ±20'
Max. difference, left to right	0°20'
Toe difference angle at 20° steering angle	1°48' ±30'
Caster (cannot be adjusted!)	+ 3°48' ±30'
Max. difference, left to right	0°20'
Rear axle	
Toe unpressed (per wheel) Adjustment value	+ 0°10' ±5'
Toe unpressed (total) Adjustment value	+ 0°20' ±10'
Max. difference, left to right	0°07'
Camber	- 1°25' ±20'
Max. difference, left to right	0°20'

WM 4495TW CONVERSION TABLE FOR WHEEL ALIGNMENT VALUES (ALL MODELS) > MINUTES TO DECIMAL DEGREES

Information

- The wheel alignment values are specified in degrees and minutes in the Technical Manual (division in 60 units).
- In countries in which the decimal degree is widely used, the electronic wheel alignment testers can be converted from degrees/minutes (division in 60 units) to decimal degrees (division in 100 units) by pressing a key (special function). This function is standard for the electronic wheel alignment testers approved by Porsche.
- Minutes (') can be converted into decimal degrees and decimal degrees into minutes (') using the conversion table. To do this, read out the required values from the table using the co-ordinates.

min (')	0	1	2	3	4	5	6	7	8	9
degrees (°)										
0	--	0.017	0.033	0.050	0.067	0.083	0.100	0.117	0.133	0.150
10	0.167	0.183	0.200	0.217	0.233	0.250	0.267	0.283	0.300	0.317
20	0.333	0.350	0.367	0.383	0.400	0.417	0.433	0.450	0.467	0.483
30	0.500	0.517	0.533	0.550	0.567	0.583	0.600	0.617	0.633	0.650
40	0.667	0.683	0.700	0.717	0.733	0.750	0.767	0.783	0.800	0.817
50	0.833	0.850	0.867	0.883	0.900	0.917	0.933	0.950	0.967	0.983
60	1.000									

WM 4495TW CONVERSION TABLE FOR WHEEL ALIGNMENT VALUES (ALL MODELS) > MINUTES TO DECIMAL DEGREES > CONVERSION FROM MINUTES TO DECIMAL DEGREES (EXAMPLES)

- Example 1: toe 17 min (17') = 0.283 decimal degrees according to table. Procedure for this: The imaginary line starting at the top of the 7-min column moving downwards and the line starting on the left in the 10-min row moving right meet at point/column 0.283.
- Example 2: camber 1° 25' (1 degree and 25 min) = 1.417 decimal degrees. This is the result from the table (1 degree or 60 min) = 1.000 + 0.417 (25 min).

WM 4495TW CONVERSION TABLE FOR WHEEL ALIGNMENT VALUES (ALL MODELS) > MINUTES TO DECIMAL DEGREES > CONVERSION FROM DECIMAL DEGREES TO MINUTES (EXAMPLES)

- Example 1: toe 0.350 decimal degree = 21 min (21'). A search is performed for the decimal value (0.350) in the table. The co-ordinates are then formed from this point/value. Line to the left = 20' and line upwards = 1' (which equals 20' + 1').
- Example 2: camber 1.683 decimal degrees = 1° 41' (1 degree and 41 min). This result is obtained as follows: Split the value into 1.000 = 1 degree (1°) and search for the remainder 0.683 in the table. Then form the co-ordinates again. Line to the left = 40' and line upwards = 1' (which equals

40' + 1').

WM 370235 CHECKING AND TOPPING UP ATF (ALL MODELS) > INFORMATION > TEST CONDITIONS

Information

Always pay particular attention to the following before raising the vehicle:

- Deactivate the levelling system before raising the vehicle (press and hold the levelling system button for at least 10 seconds).
- If a transmission range is engaged while the vehicle is raised, the levelling system must first be deactivated using PIWIS Tester II 9818 . To do this, select >>Levelling system/PASM<< >>Drive links/checks<< >>Activate/deactivate vehicle<< in the control unit overview. Select the value "Deactivate levelling system (permanently)" and press "Start" [F8] to execute the function.
  Re-activate the levelling system when the work is complete. To do this, select the value "Activate levelling system" in the same menu item and press "Start" [F8] to execute the function.
- Transmission must not be in limp-home mode.
- Warm up transmission in lower load range. Switch all transmission ranges several times while doing so.
- Read out the ATF temperature using **PIWIS Tester II 9818.**
- ATF temperature: 30 - 50 °C.

- Selector lever is in position P.
- Parking brake actuated.
- Test and filling process at idle speed.
- Air conditioning and heating switched off.
- The ATF temperature must not be higher than 30 °C at the beginning of the test.
- If the ATF temperature is higher than 30 °C, let the transmission cool down.

WM 370235 CHECKING AND TOPPING UP ATF (ALL MODELS) > PRELIMINARY WORK

Information

To ensure that the transmission is filled correctly, the vehicle must be horizontal on the lifting platform.

1. Remove cover for front underbody. → Removing cover for front underbody
2. Place oil collection pan under the transmission.

WM 370235 CHECKING AND TOPPING UP ATF (ALL MODELS) > CHECKING AND TOPPING UP ATF

WARNING: Hot fluid

- *Danger of scalding*

→ Let the fluid cool down.

→ Wear personal protective gear.

NOTE: Dirt and contamination

- *Risk of damage to units or components*

→ Protect components from dirt and contamination.

→ Clean or replace dirty components.

NOTE: Fill level too low

- *Risk of damage to components.*

→ Do not start the engine.

→ Do not tow the vehicle.

Information

Only use oil approved by Porsche in the Porsche Doppelkupplung (PDK) .

Information

- Read out the ATF temperature using PIWIS Tester II 9818.
- The ATF temperature must not be higher than 30 °C at the beginning of the ATF test.
- The ATF level changes as the ATF temperature changes.
- Perform ATF test when the engine running and selector lever in position P.
- An ATF test performed when the ATF temperature is too low will result in overfilling.
- An ATF test performed when the temperature is too high will result in insufficient filling.
- An ATF level that is too high or too low will impair the function of the transmission.

Information

- The ATF level is checked at the ATF inspection plug.
- The ATF level is correct if a small amount of fluid still emerges at the ATF inspection plug at an ATF temperature of between 30° and 50 °C.

Information

Always pay particular attention to the following before raising the vehicle:

- Deactivate the levelling system before raising the vehicle (press and hold the levelling system button for at least 10 seconds).
- If a transmission range is engaged while the vehicle is raised, the levelling system must first be deactivated using PIWIS Tester II 9818. To do this, select >>Levelling system/PASM<< >>Drive links/checks<< >>Activate/deactivate vehicle<< in the control unit overview. Select the value "Deactivate levelling system (permanently)" and press "Start" [F8] to execute the function. Re-activate the levelling system when the work is complete. To do this, select the value "Activate levelling system" in the same menu item and press "Start" [F8] to execute the function.

1. Read off the ATF temperature on **PIWIS Tester II 9818** while the engine is running.
2. Leave engine running at idle speed.
3. Place oil collection pan underneath.

4. Fill manual metering pump **Manual metering pumps HDP 500 Porsche WE 1372** with ATF for the Porsche Doppelkupplung (PDK).

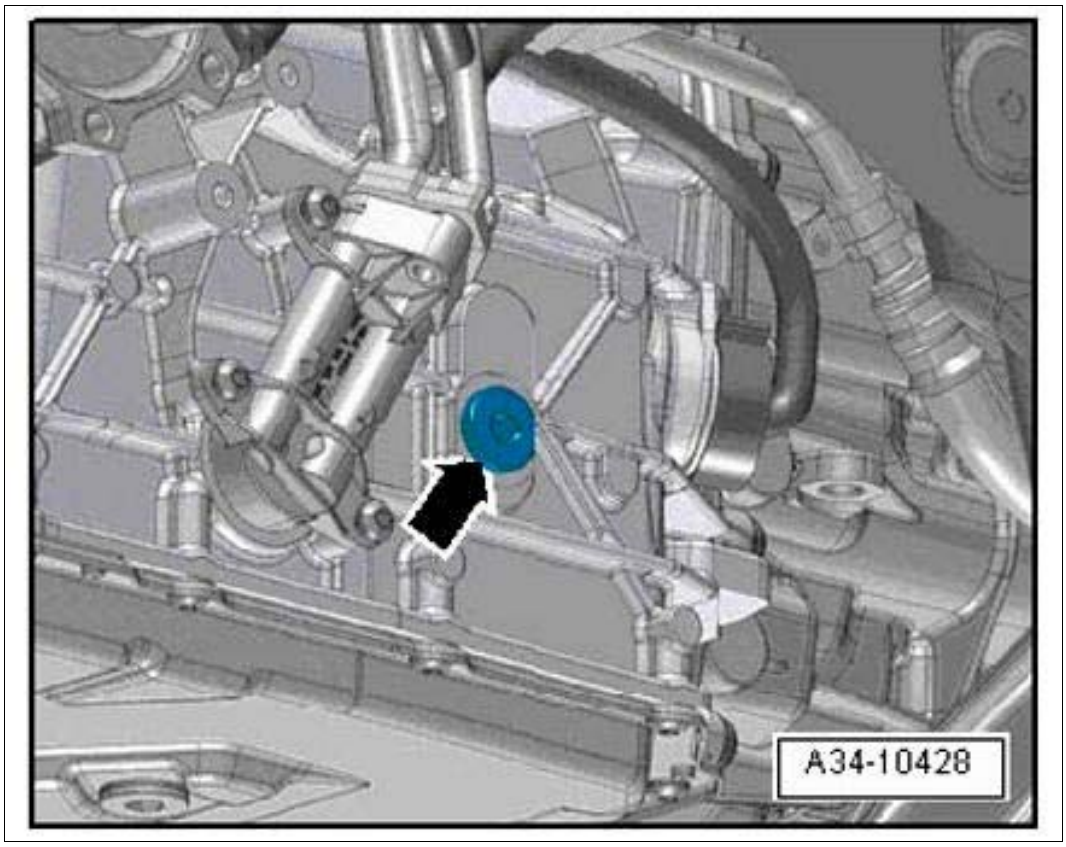
5. Check and top up ATF.

    1. 5.1. When an ATF temperature of 30 °C is reached, unscrew the ATF inspection plug **-arrow-** .

    2. 5.2. If ATF emerges from the ATF control opening before the ATF temperature has reached 40 °C, the ATF level is OK.

    3. 5.3. If no ATF emerges at a temperature of up to 40 °C, add ATF using **manual metering pump HDP 500 Porsche WE 1372** until ATF emerges.

    Fig 1: Locating ATF Inspection Plug



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. The ATF inspection plug must be closed again at 50 °C at the latest.

2. Switch off the engine if necessary, let the transmission cool down and repeat the test.

6. **Screw in and tighten new** ATF inspection plug with a **new** sealing ring. **Tightening torque 45 Nm (33 ftlb.)**

WM 370235 CHECKING AND TOPPING UP ATF (ALL MODELS) > SUBSEQUENT

WORK

1. Install cover for front underbody. → Installing cover for front underbody
2. Move oil collection pan away.

WM 3704K2 CALIBRATING SELECTOR KNOB (ALL MODELS) > PRELIMINARY WORK

1. Selector lever control unit replaced.
    1. 1.1. Selector knob connector is not connected.

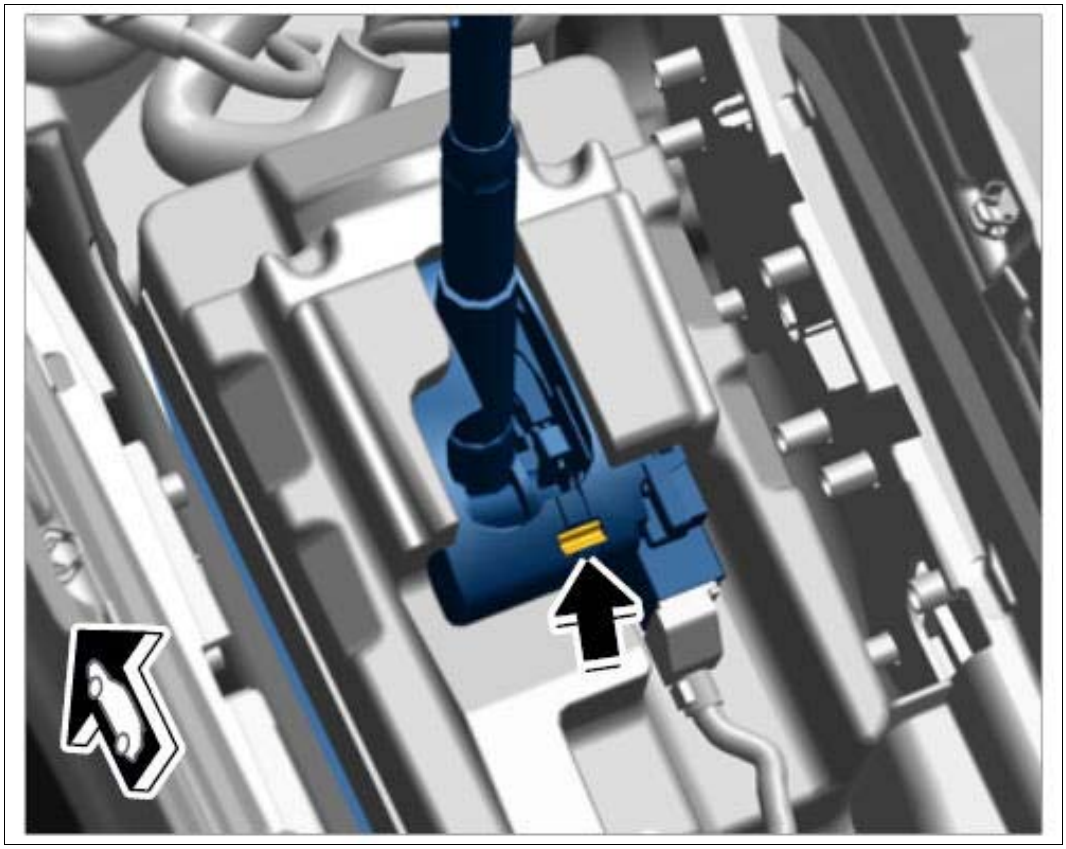
WM 3704K2 CALIBRATING SELECTOR KNOB (ALL MODELS) > CALIBRATING SELECTOR KNOB

Information

Do not operate the brakes during the entire procedure.

1. Switch off ignition.
2. Move selector knob to position **P** .
3. Open the driver's door.
4. Switch ignition on and then off again.
5. The four position displays **(P; R; N; D)** must flash in the instrument cluster.
6. Plug in selector lever connector.
    1. 6.1. Position display in the instrument cluster changes to **P** .
7. **Wait 2 seconds.**
8. **Press** the emergency release button **-arrow- five times within 3 seconds.**
    1. 8.1. The four position displays **(P; R; N; D)** must now flash again in the instrument cluster.
    2. 8.2. If this does not happen, repeat the procedure starting from Step 4.

Fig 1: Locating Emergency Release Button



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Press the emergency release button once (i.e. 6 times in total),↓ shift from **P** to **D** and wait **1 second** .
    1. 9.1. The emergency release button must be released again immediately after shifting out of **P** .
10. Move selector knob to position **M** .
    1. 10.1. Do not shift into position **M+** or **M-** while doing this.
11. Leave the selector knob in position **M** until the position displays stop flashing in the instrument cluster and position **D** is indicated.
    1. 11.1. This can take up to 7 seconds.
12. The calibration process is now complete. If the flashing display stopped even before this, calibration must be repeated.
13. Checking calibration.
    1. 13.1. Start the engine.
    2. 13.2. Shift through all positions using the selector knob - all positions must now be displayed correctly in the position display in the instrument cluster.
    3. 13.3. If this is not the case, calibration must be repeated.

14. Delete the fault memory in the transmission and instrument cluster control unit using the PIWIS Tester.

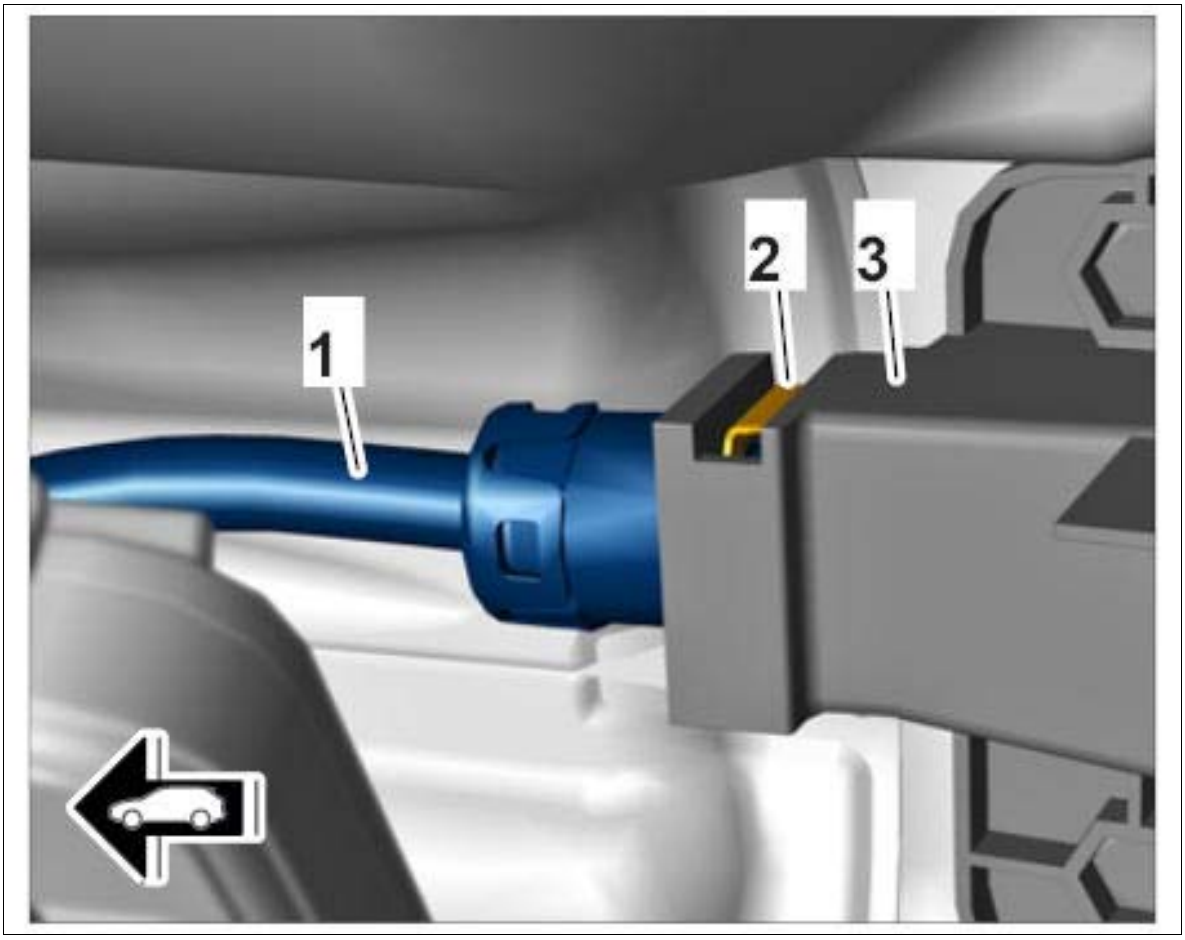
2. Guide locking cable **-1-** into the selector support **-3-** and fit safety clip **-2-** .

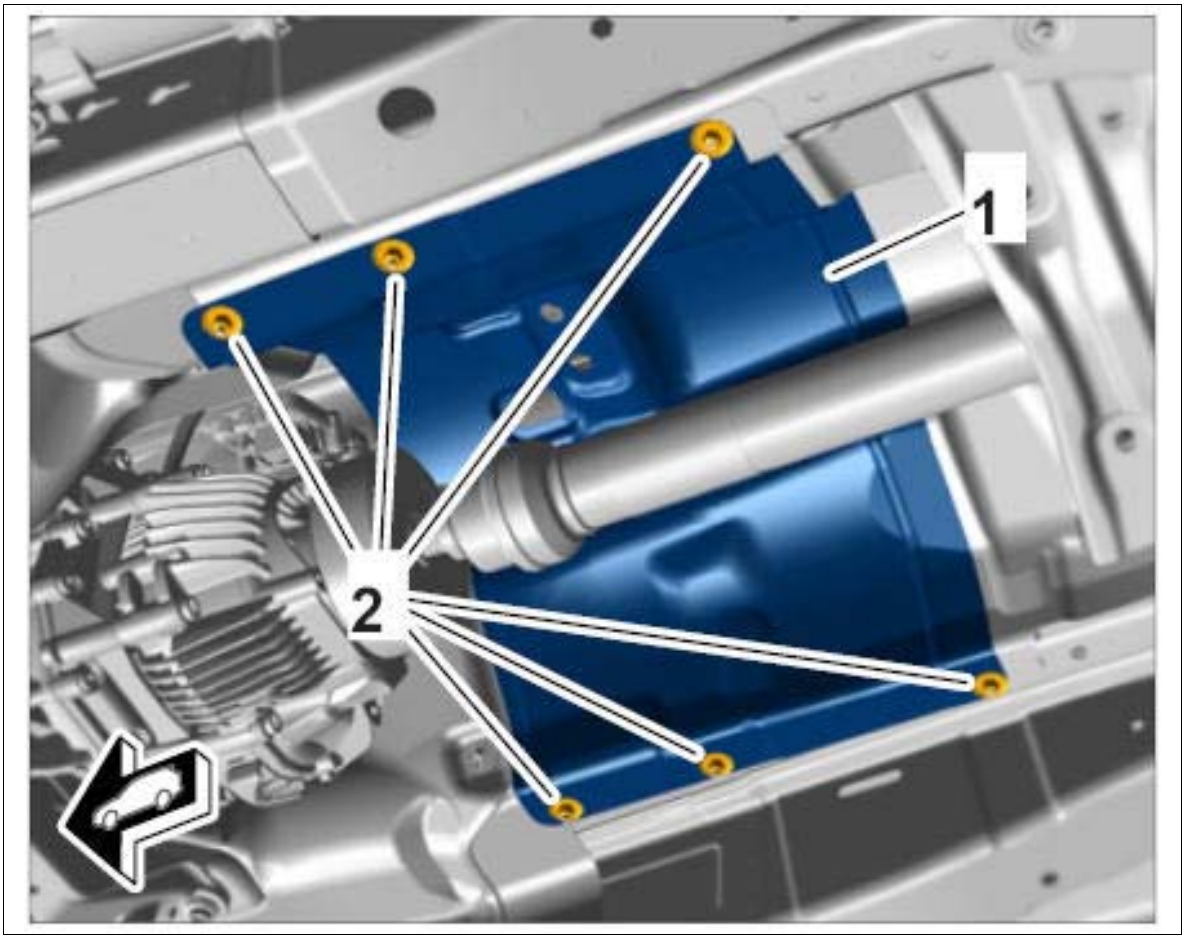
Fig 3: Identifying Locking Cable Safety Clip



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Position heat shield and fit and tighten fastening nuts **-2-** .

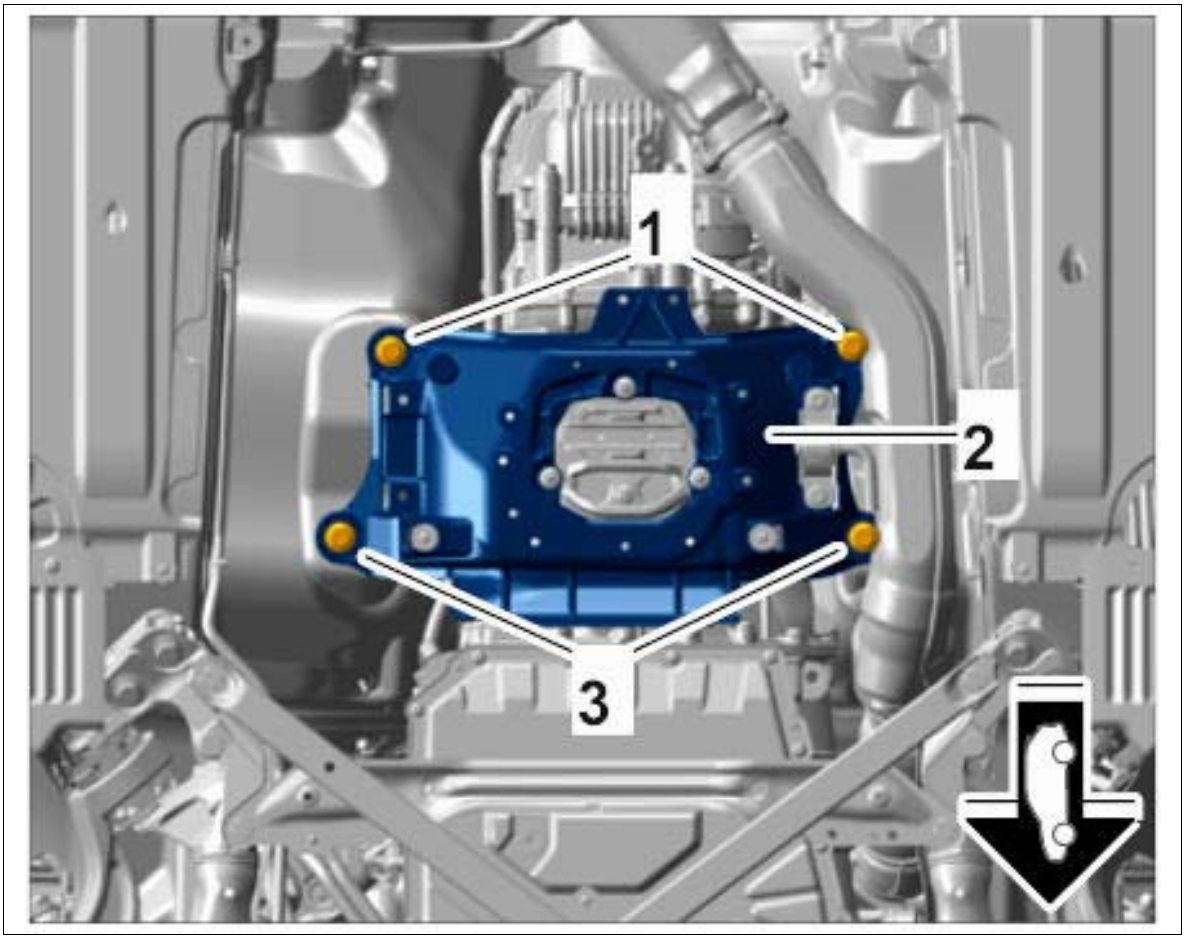
Fig 4: Identifying Heat Shield Fastening Nuts



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Lift the transmission and fit and tighten fastening screws **-1-** and **-3-** . **Tightening torque 70 Nm (52 ftlb.)**

Fig 5: Identifying Gear Support Fastening Screws



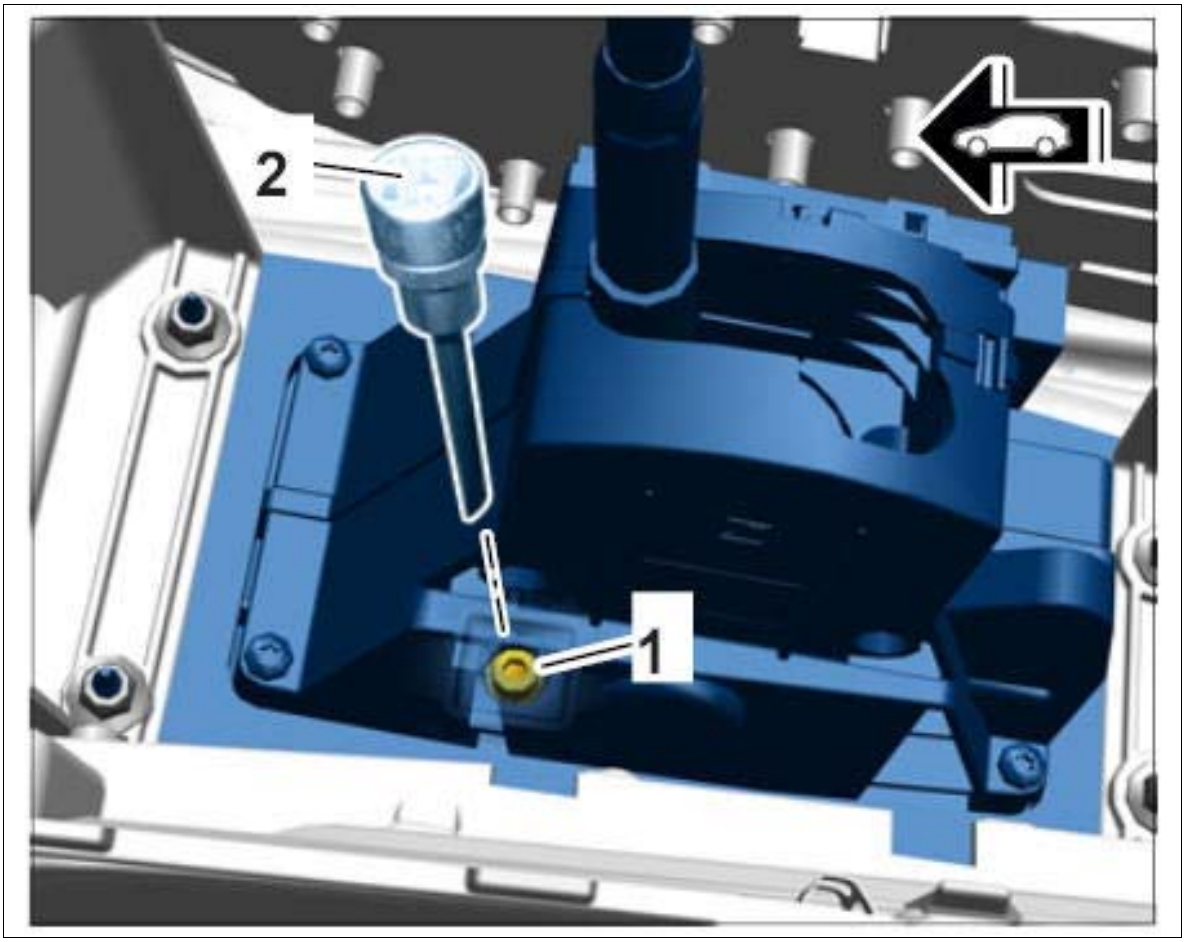
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Information

1. Loosen clamping screw for locking cable by only about 1 turn.
2. The clamping screw is only accessible in selector-lever position "P".
3. When the clamping screw is loosened, the selector lever must remain in position "P".

5. Tighten fastening screw **-1-** for the locking cable using **socket insert a/f 5 T40031. Tightening torque 13 Nm (9.5 ftlb.)**

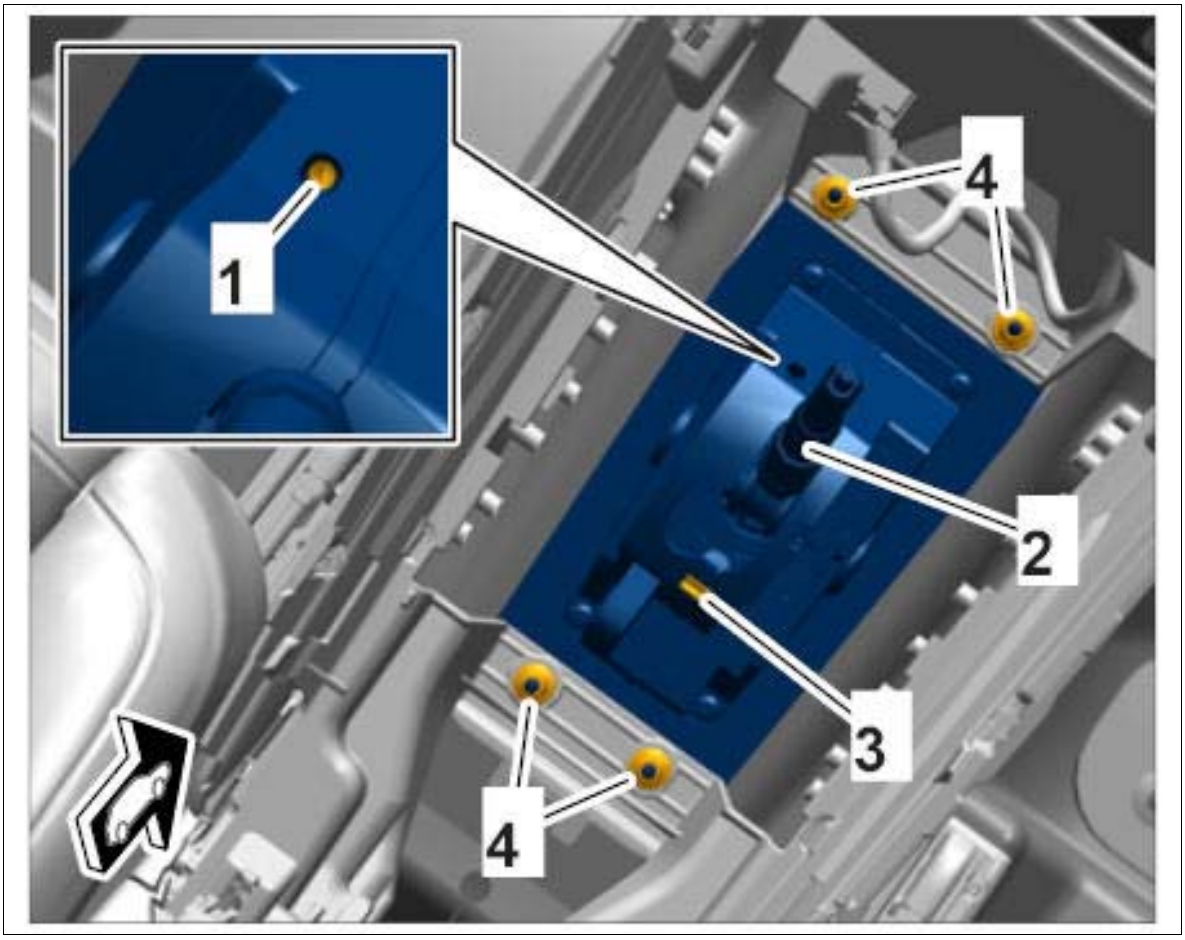
Fig 6: Identifying Locking Cable Fastening Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Press release **-3-** , actuate selector knob **-2-** and move selector lever from position "P" to "D" and from position "D" to "M" and back again several times.

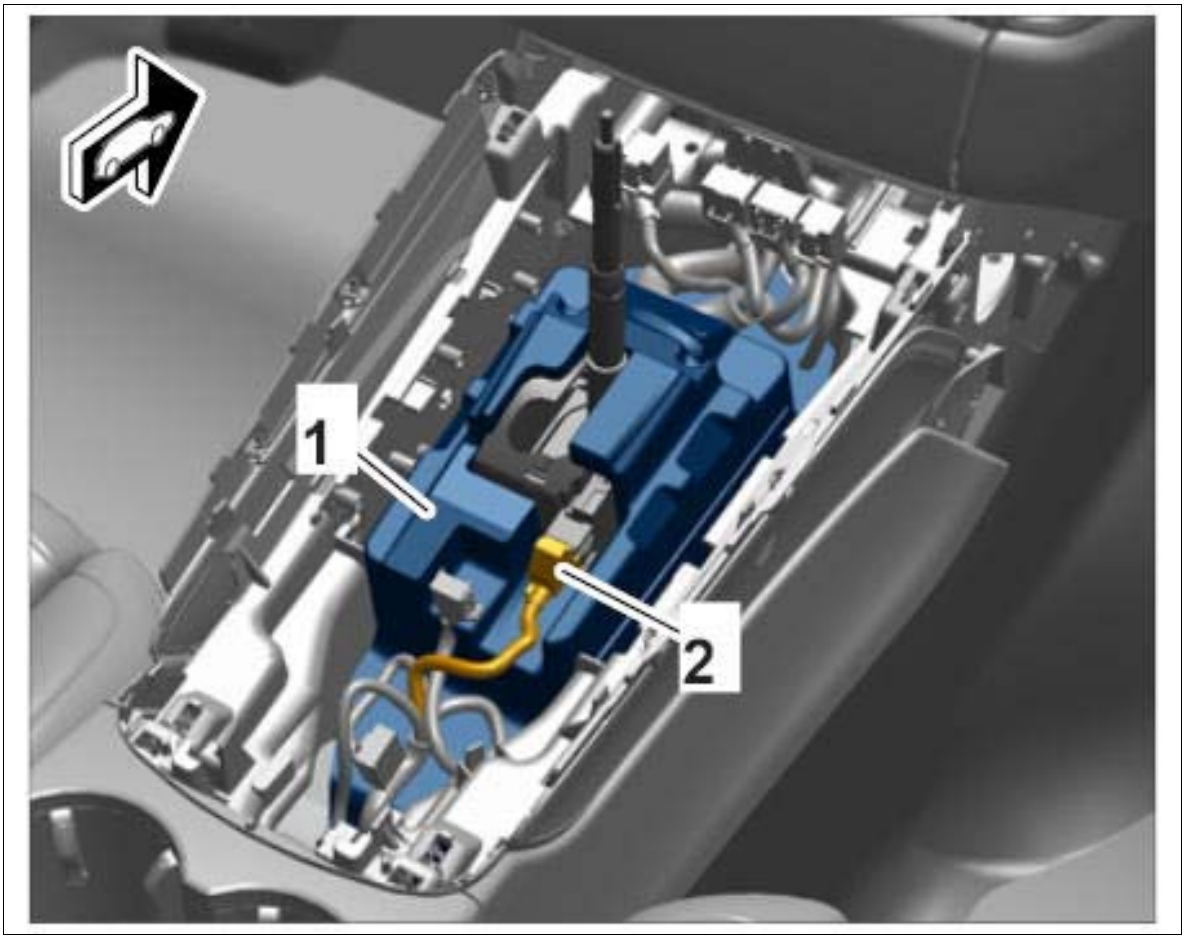
Fig 7: Identifying Selector Support And Knob



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Position insulating mat **-1-** and connect electric plug connection **-2-** .

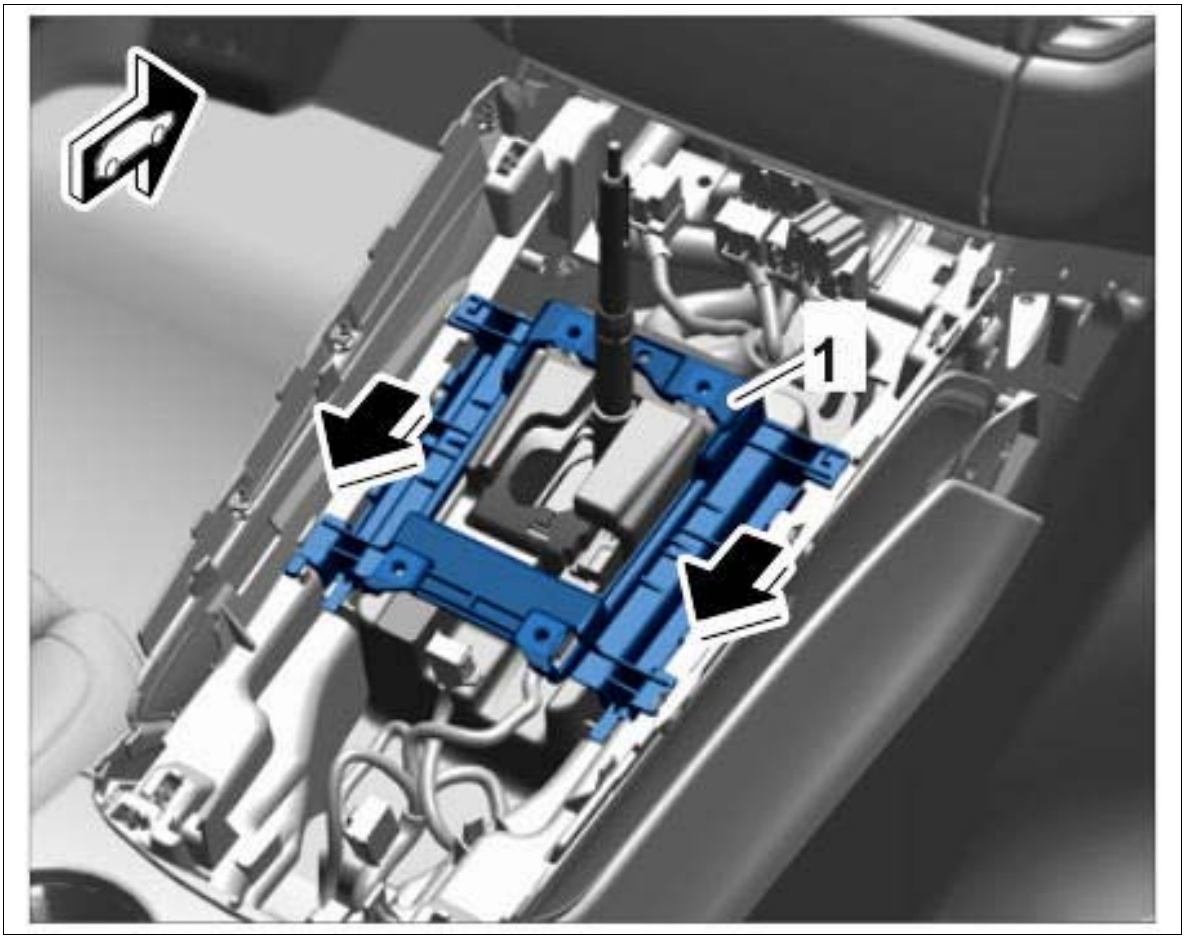
Fig 8: Identifying Insulating Mat Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Position holder for switch console **-1-** and engage in **-direction of arrow-** .

Fig 9: Positioning Switch Console Holder



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

WM 371319 REMOVING AND INSTALLING LOCKING CABLE (ALL MODELS) > SUBSEQUENT WORK

1. Install switch console. → Installing Switch Console
2. Install upper part of center console cover. → Installing Upper Part Of Center Console Cover
3. Install center console trim. → Installing Center Console Trim

WM 371319 REMOVING AND INSTALLING LOCKING CABLE (ALL MODELS) > SUBSEQUENT WORK > FUNCTION TEST

1. Move selector lever from position "P" to "D" and from position "D" to "M" and back again several times.
2. Check that the parking lock is disengaged.
    1. 2.1. Insert ignition key into the ignition lock.

2. 2.2. Move selector lever to position "P". "P" appears in the instrument cluster.
3. 2.3. Actuate the operating brake.
4. 2.4. Start the engine.
5. 2.5. Move selector lever to position "D". "D" appears in the instrument cluster.
6. 2.6. Release the operating brake. If the vehicle moves forward, the test is complete. Otherwise, all connecting pieces must be checked again.

3. Check that the parking lock is engaged (engine running).
    1. 3.1. Insert ignition key into the ignition lock.
    2. 3.2. Move selector lever to position "P". "P" appears in the instrument cluster.
    3. 3.3. Actuate the operating brake.
    4. 3.4. Start the engine.
    5. 3.5. Release the operating brake. The vehicle must not move. Otherwise, the entire system must be checked.
    6. 3.6. Switch off engine.
4. Check that the parking lock is engaged (blocking effect).
    1. 4.1. Insert ignition key into the ignition lock.
    2. 4.2. Move selector lever to position "P". "P" appears in the instrument cluster.
    3. 4.3. Move selector lever to position "N". "N" appears in the instrument cluster.
    4. 4.4. Get another person to help you to push the vehicle for a distance of at least one metre. It must be possible to move the vehicle. Otherwise, the entire system must be checked.
    5. 4.5. Actuate the operating brake.
    6. 4.6. Move selector lever to position "P". "P" appears in the instrument cluster.
    7. 4.7. Get another person to help you to push the vehicle. The vehicle must not move (a max. movement of 150 mm is acceptable). Otherwise, the entire system must be checked.

WM 375519 REMOVING AND INSTALLING ATF PAN (ALL MODELS) > PRELIMINARY

WORK

1. Move selector lever to position **"P"** .
2. Remove cover for center underbody. →Removing cover for center underbody

WM 375519 REMOVING AND INSTALLING ATF PAN (ALL MODELS) > REMOVING ATF PAN

WARNING: ATF!

- *Possible danger of injury or damage (swollen hoses, skin irritation, danger of slipping, etc.)*

→ Before lines are opened, place a cloth underneath them!

→ Components that come into contact with ATF must be cleaned IMMEDIATELY with water!

→ Take appropriate protective measures (e.g. use gloves, safety goggles, oil binding material)

→ Collect emerging ATF!

WARNING: Danger of objects or loads falling down

- *Risk of squashing or crushing*

→ Secure components to prevent them from falling down.

WARNING: Hot fluid

- *Danger of scalding*

→ Let the fluid cool down.

→ Wear personal protective gear.

NOTE: Dirt and contamination

- *Risk of damage to units or components*

→ Protect components from dirt and contamination.

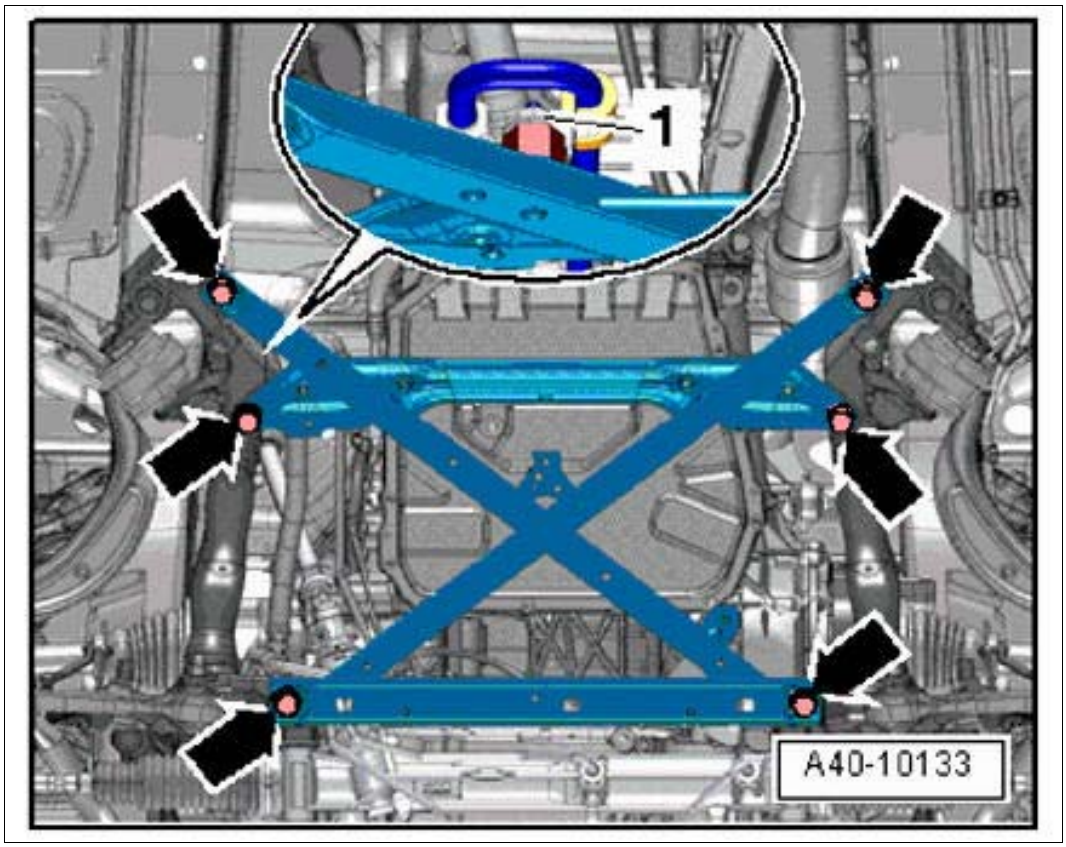
→ Clean or replace dirty components.

Information

- The engine must not be started if there is no ATF in the transmission.
- Risk of damage to the transmission.

1. Remove cross-strut for front-axle carrier.
    1. 1.1. Unscrew fastening screws **-arrows -** .
    2. 1.2. When removing the cross-strut, unclip line **-1-** .

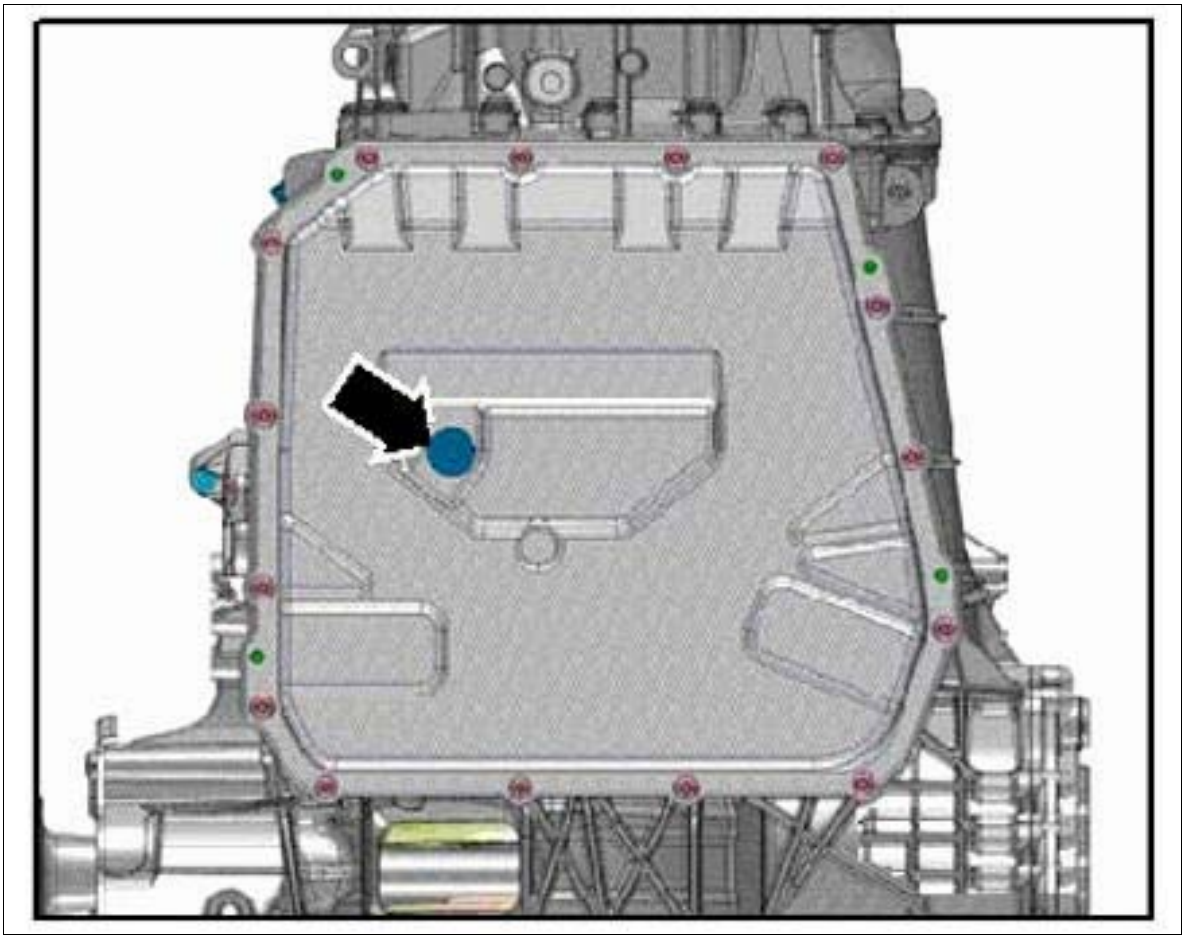
    Fig 1: Locating Cross-Strut Screws



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Place a drip pan underneath.
3. Unscrew ATF oil drain plug **-arrow-** on the ATF oil pan and drain ATF.

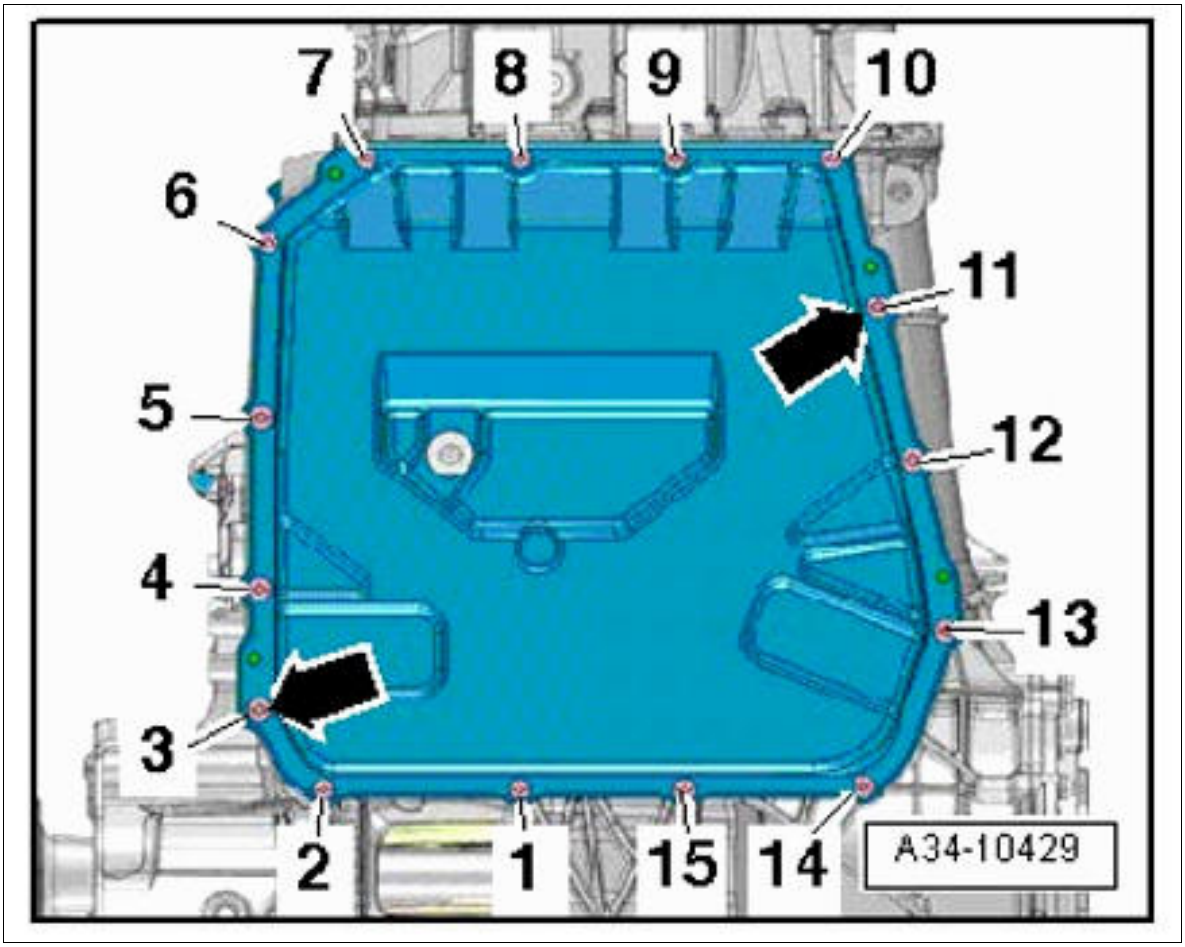
Fig 2: Locating ATF Drain Plug Screw



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Unscrew fastening screws **-1... 15-** in diagonally opposite sequence and remove ATF pan.

Fig 3: ATF Oil Pan Screws Loosening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Remove old seal on the ATF pan.
6. Place ATF pan on a clean surface.

WM 375519 REMOVING AND INSTALLING ATF PAN (ALL MODELS) > INSTALLING ATF PAN

NOTE: Dirt and contamination

- *Risk of damage to units or components*

→ Protect components from dirt and contamination.

→ Clean or replace dirty components.

Information

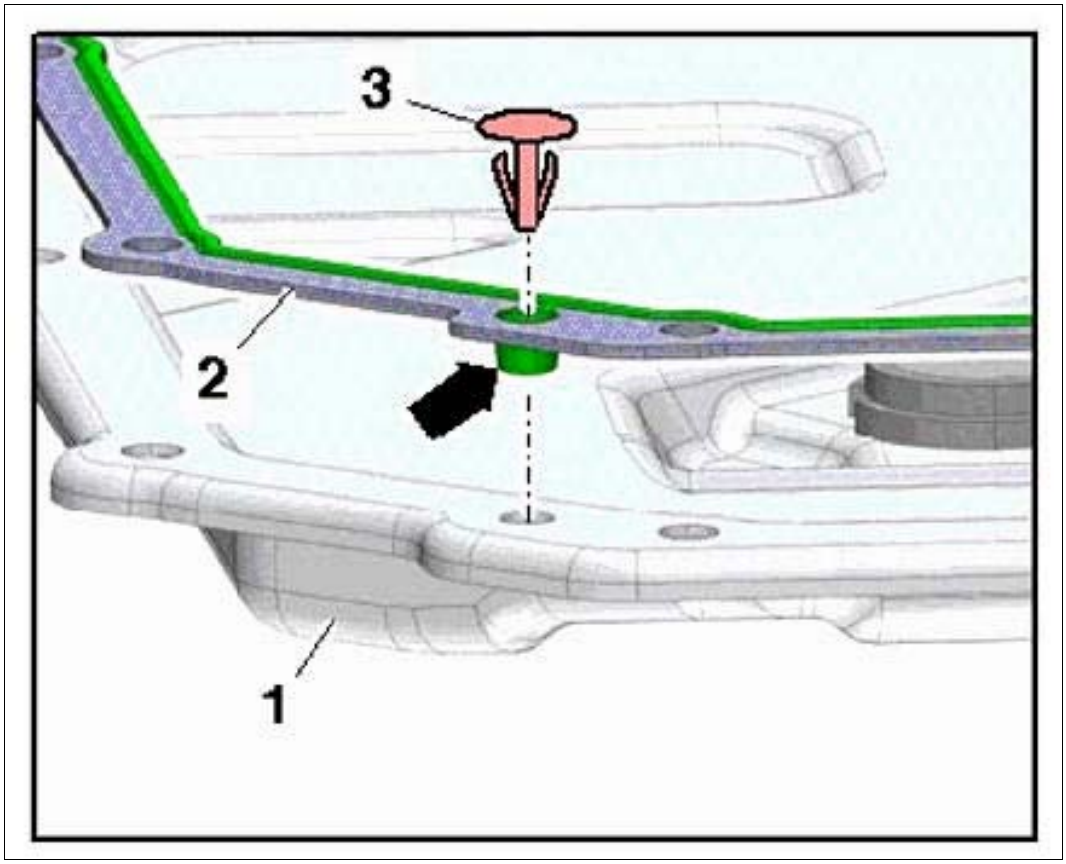
- The engine must not be started if there is no ATF in the transmission.

- Risk of damage to the transmission.

1. **Fit a new** seal.

    1. 1.1. Clean sealing face on the ATF pan.
    2. 1.2. Insert nubs **-arrow-** of the **new** seal **-2-** into the ATF pan **-1-** .

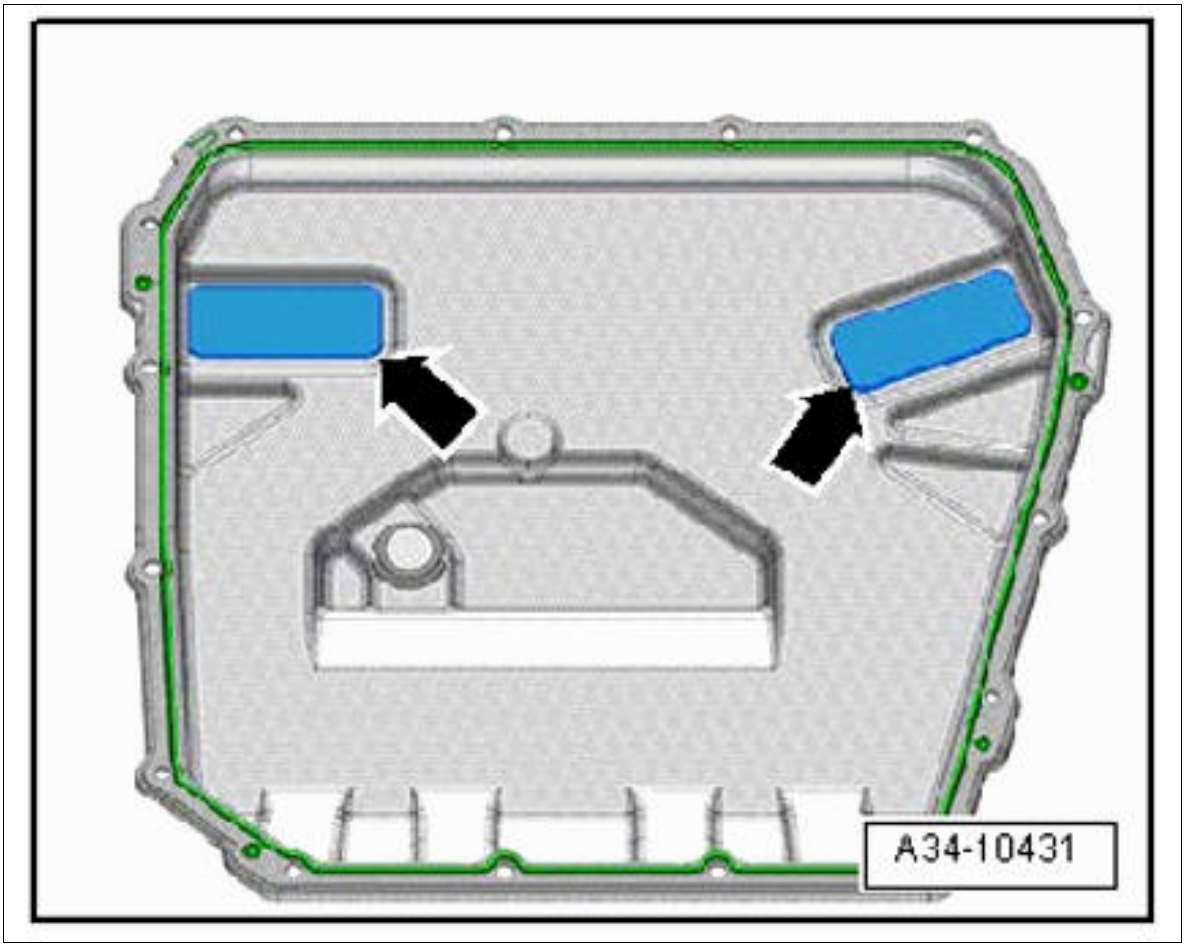
    Fig 1: Locating ATF Pan Seal



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Clean the magnetic strips **-arrows-** and check that they are fitted over the entire surface in the ATF pan.

Fig 2: Locating ATF Oil Pan Magnetic Strips



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Install ATF pan.
    1. 3.1. Position ATF pan.
    2. 3.2. Fit fastening screws **-1... 15-** by hand and screw in as far as they will go.
    3. 3.3. Tighten fastening screws. **Tightening torque 10 Nm (7.5 ftlb.)**

Fig 3: ATF Oil Pan Screws Tightening Sequence

1. Remove underbody cover. → Removing cover for front underbody

WM 386219 REMOVING AND INSTALLING LINE FOR ATF COOLING (ALL MODELS) > REMOVING LINE FOR ATF COOLING

WARNING: ATF!

- *Possible danger of injury or damage (swollen hoses, skin irritation, danger of slipping, etc.)*

→ Before lines are opened, place a cloth underneath them!

→ Components that come into contact with ATF must be cleaned IMMEDIATELY with water!

→ Take appropriate protective measures (e.g. use gloves, safety goggles, oil binding material)

→ Collect emerging ATF!

CAUTION: Hot components

- *Risk of burns*

→ Let hot components cool down.

→ Wear personal protective gear.

Information

Before re-installing the ATF lines, check the O-rings on the lines for damage and replace them if necessary.

Coat O-rings on ATF lines with ATF.

Close off all lines and connections using suitable stoppers during removal.

Do not open the stoppers for the lines and connections until shortly before installation.

1. Disconnect ATF line at the union nuts **-1 and 2-** , disconnect it at the connection point and close it off using a stopper.

1. Disconnect the battery. → Removing battery
2. Remove ATF pan. → Removing ATF pan

WM 387719 REMOVING AND INSTALLING CONTROL MECHANISM FOR TRANSMISSION (ALL MODELS) > REMOVING CONTROL MECHANISM FOR TRANSMISSION

WARNING: Hot fluid

- *Danger of scalding*

→ Let the fluid cool down.

→ Wear personal protective gear.

CAUTION: Pointed or sharp objects

- *Risk of cracks, pricks or cuts*

→ Wear personal protective gear.

NOTE: Voltage peaks

- *Risk of damage to loads or to the control unit*

→ Disconnect the battery before removing the component or control unit.

Information

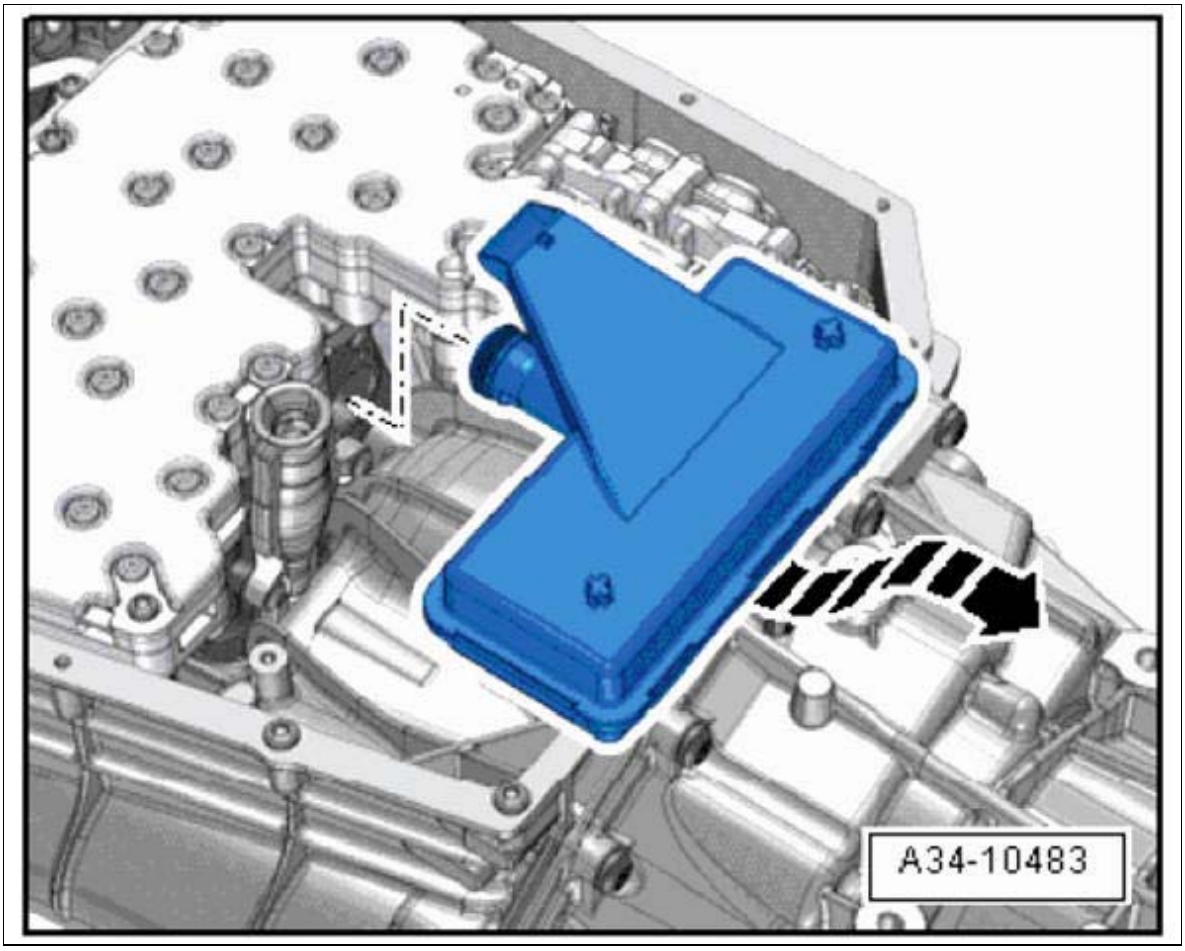
- Discharge the transmission electrostatically before removing control mechanism for transmission.
- The sealing face of the control mechanism for transmission must not be damaged.
- Only loosen the fastening screws with brightly colored screw heads, otherwise damage can occur.
- Control mechanism for transmission is partly secured in the transmission.
- If the control mechanism for transmission has to be pried off, get another mechanic to secure the control mechanism for transmission to prevent it from falling out.
- To pry off the control mechanism, two fastening screws can be screwed in slightly to prevent the control unit from falling down.
- Only set the control mechanism for transmission down with the screw head side facing downwards.

Information

- Do not touch plug contacts in the connector for the transmission with your hands.
- When prying out the tappets, do not use the sensors for support.

1. Carefully pull ATF suction filter to the rear in **-direction of arrow-** and remove it from the control mechanism for transmission.

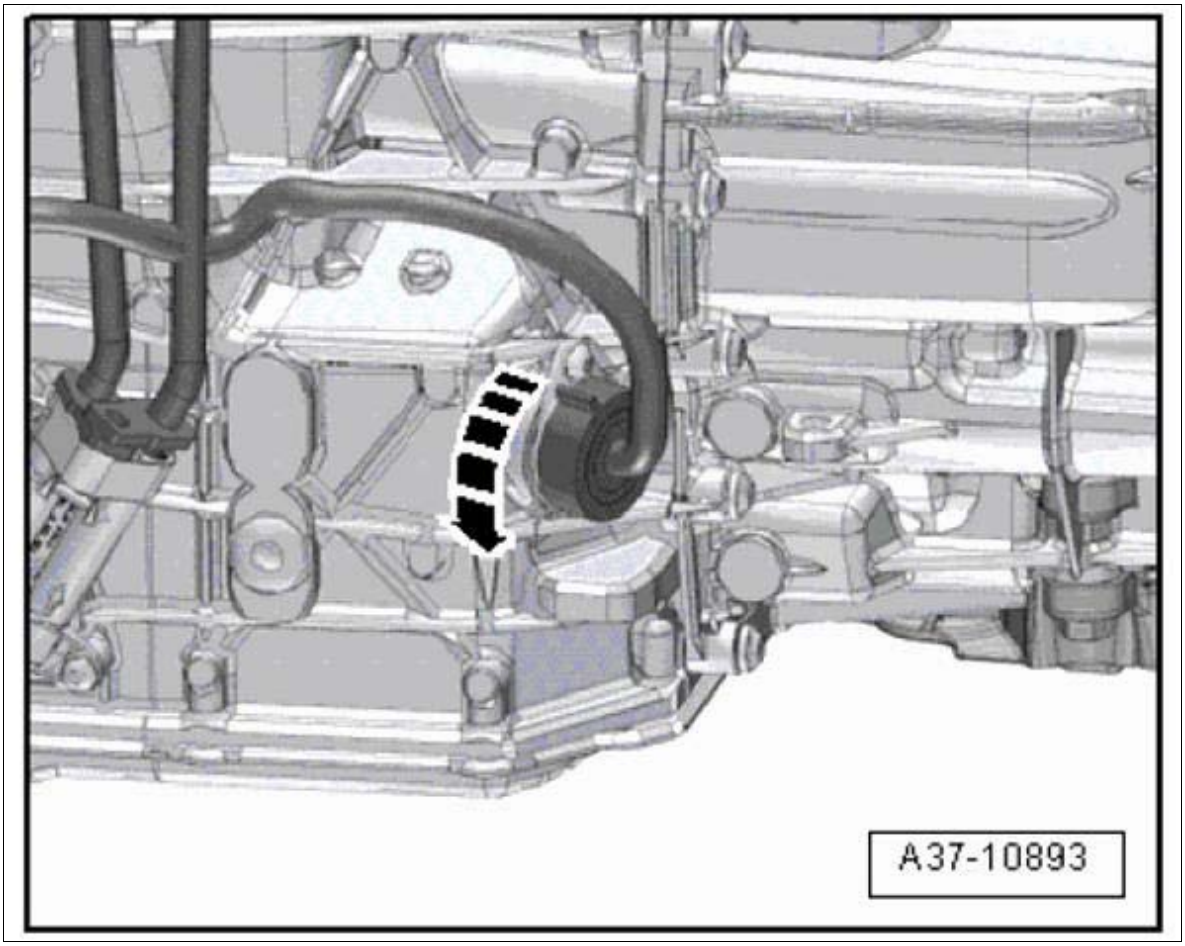
Fig 1: Pulling ATF Suction Filter



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Turn electric plug connection in **-direction of arrow-** and disconnect plug connection.

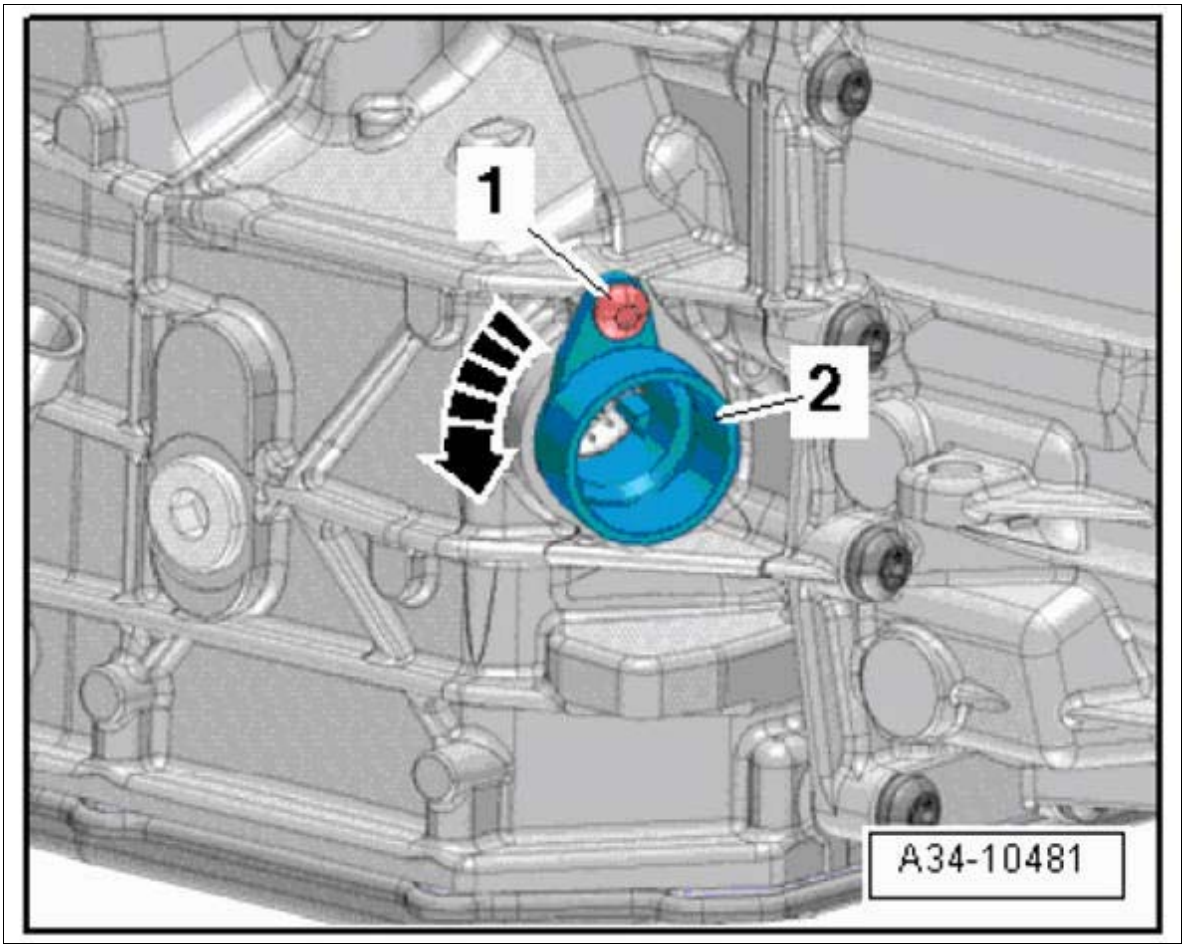
Fig 2: Turning Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Unscrew fastening screw **-1-** , turn connector housing in **-direction of arrow-** and pull it off.

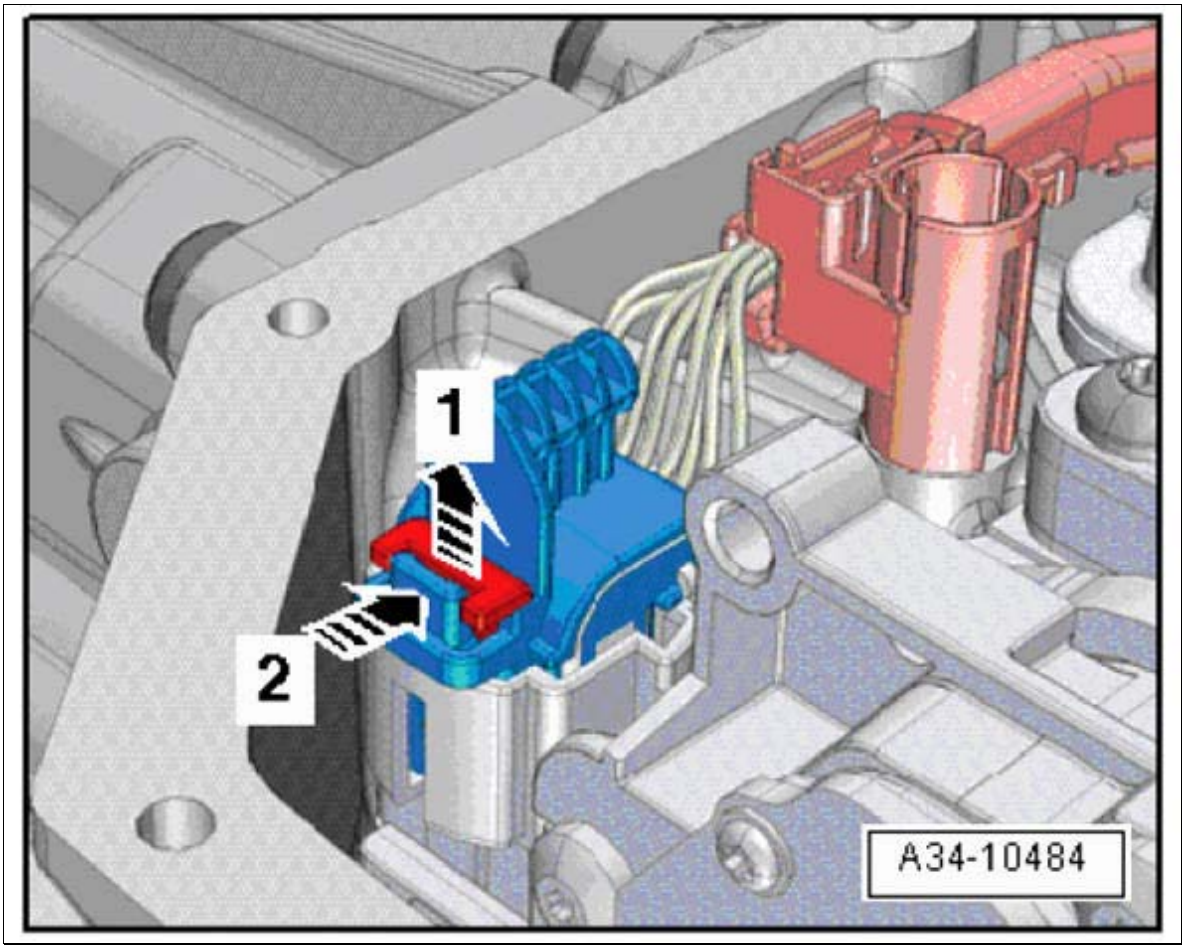
Fig 3: Removing Connector Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Release fuse **-1-** in **-direction of arrow-** , press in release **-2-** and disconnect electric plug connection.

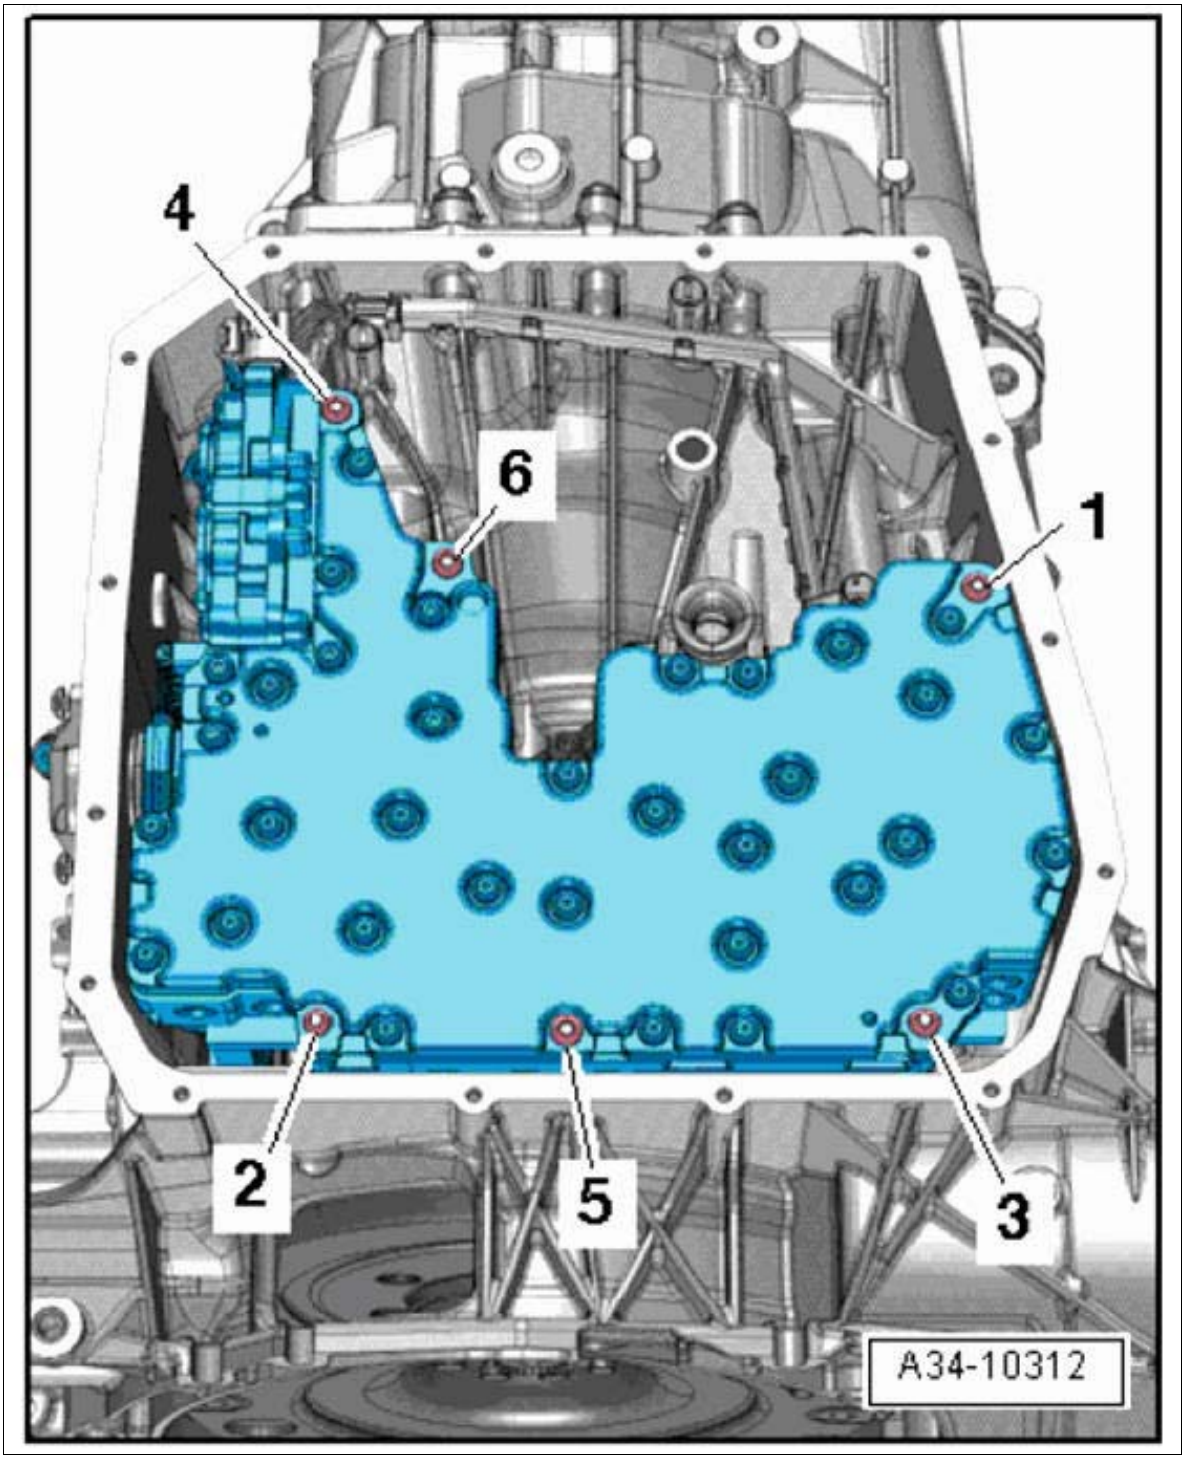
Fig 4: Disconnecting RPM Sensors Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Unscrew fastening screws **-1... 6-** .

Fig 5: Transmission Control Mechanism Screws Loosening Sequence



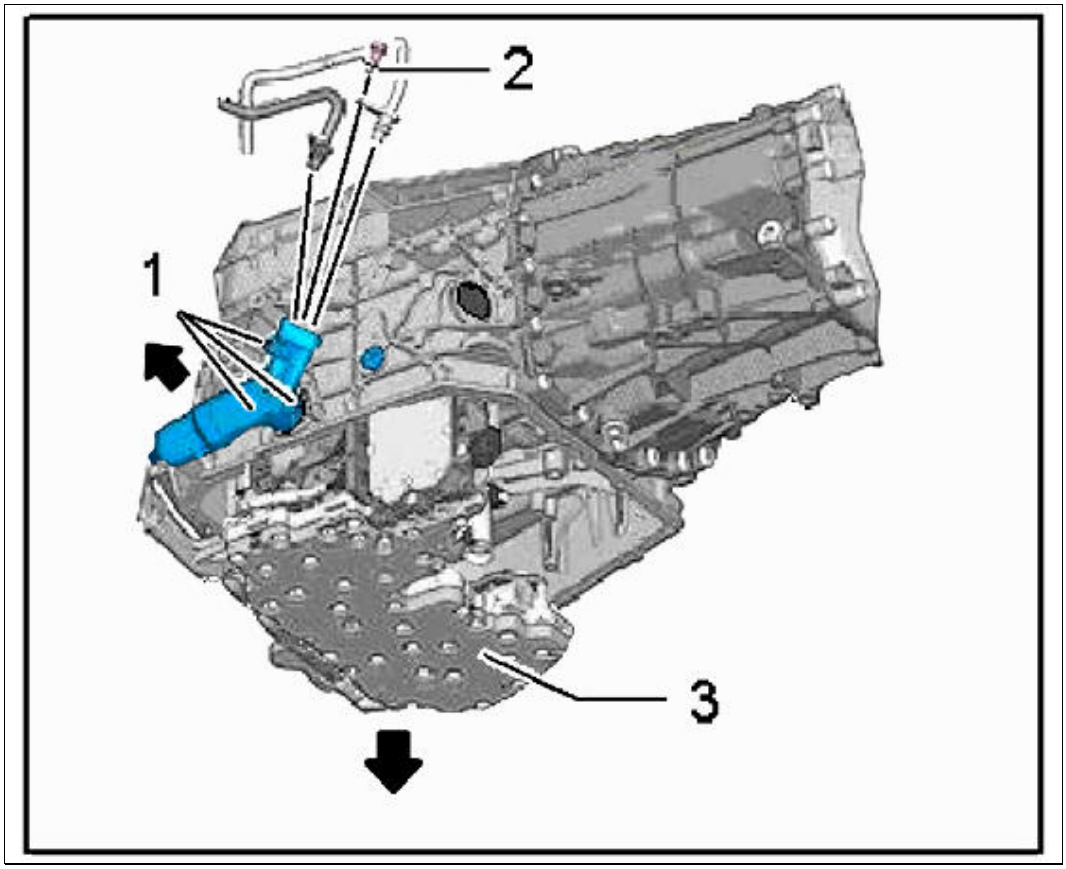
Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Remove control mechanism for transmission **-3-** .

    1. 6.1. Unscrew fastening screws **-1-** .
    2. 6.2. Carefully detach ATF filter housing in **-direction of arrow -** and remove it from the control mechanism for transmission.
    3. 6.3. Carefully remove control mechanism for transmission **-3-** in **-direction of**

arrow- .

Fig 6: Removing Transmission Control Mechanism



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Remove ATF oil pipes.
    1. 7.1. Disconnect ATF oil pipes **-1 and 2-** .
    2. 7.2. Disconnect ATF oil pipes **-3... 5-** .
    3. 7.3. Replace O-rings, coat with ATF and re-insert ATF oil pipes.
    4. 7.4. Check that the ATF oil pipes are fitted correctly.

Fig 7: Locating ATF Oil Pipes

WM 387719 REMOVING AND INSTALLING CONTROL MECHANISM FOR TRANSMISSION (ALL MODELS) > REMOVING CONTROL MECHANISM FOR TRANSMISSION > ADJUSTING SHIFT FORKS AND GEAR ACTUATORS

Information

- Before installing the control mechanism for transmission, move shift forks and gear actuators into center position.

Information

- Do not touch plug contacts in the connector for the transmission with your hands.
- When prying out the tappets, do not use the sensors for support.

Adjusting shift forks:

Every shift fork has 3 positions:

- Gear engaged **-G-**
- Idle speed **-N-** (center position)
- Gear engaged **-G-**

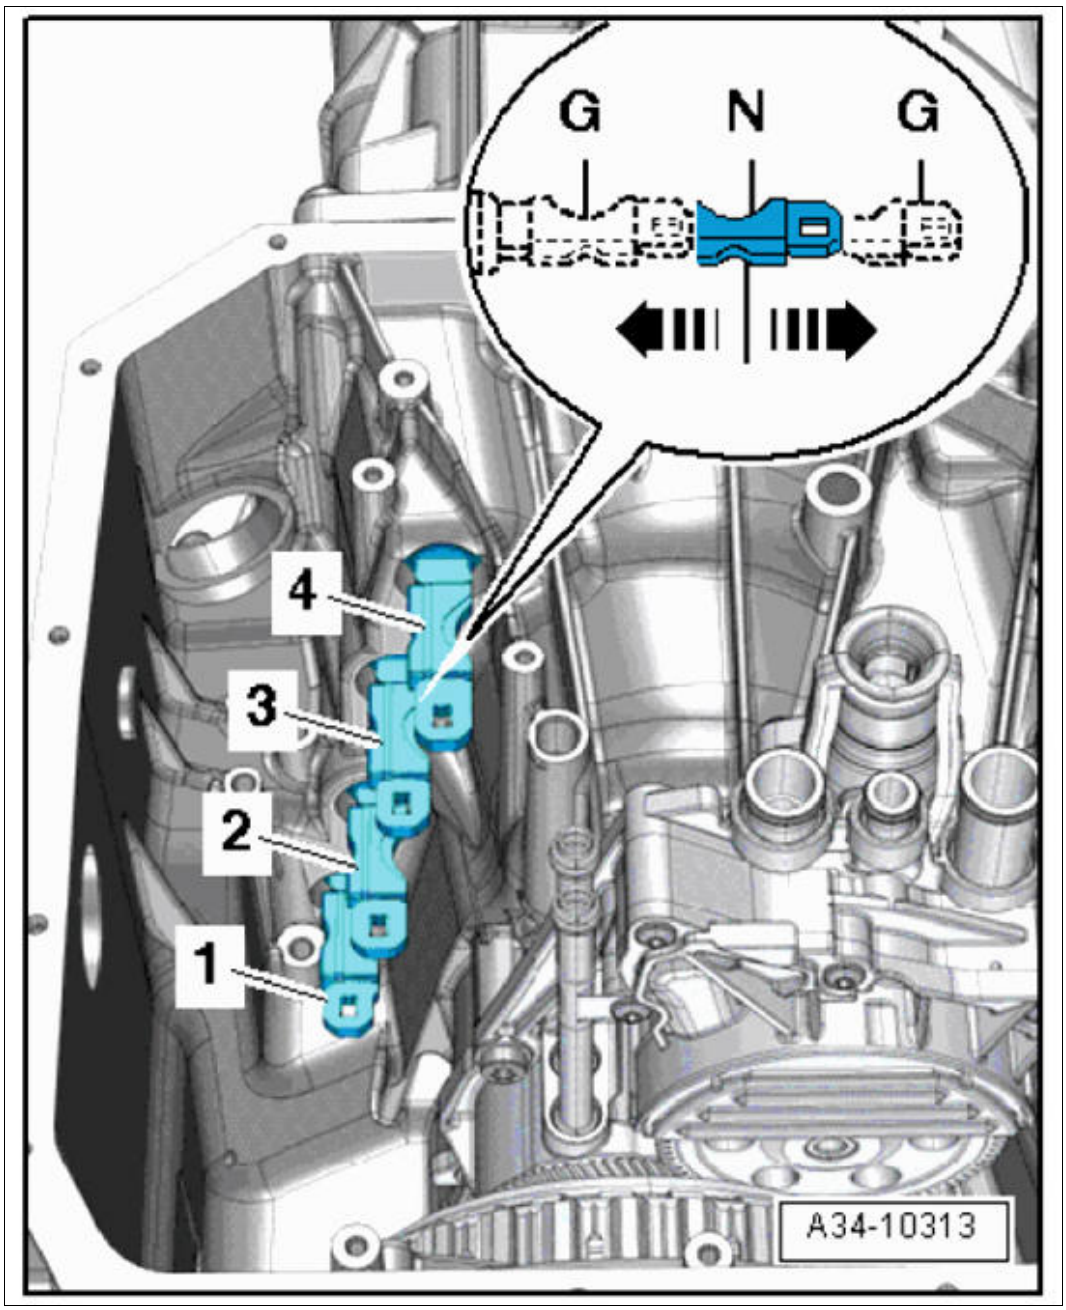
Information

- Before installing the control mechanism for transmission, move shift forks and gear actuators into center position.

1. Adjust shift forks.

1. 1.1. Check shift positions of shift forks **-1... 4-** manually.
2. 1.2. Shift each of the four shift forks to each position once one after the other. **-arrows-** .
3. 1.3. Move all shift forks back to center position.

Fig 1: Checking Shift Forks



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

Adjusting gear actuators:

1. Dimension **-a-** = 33.5 mm

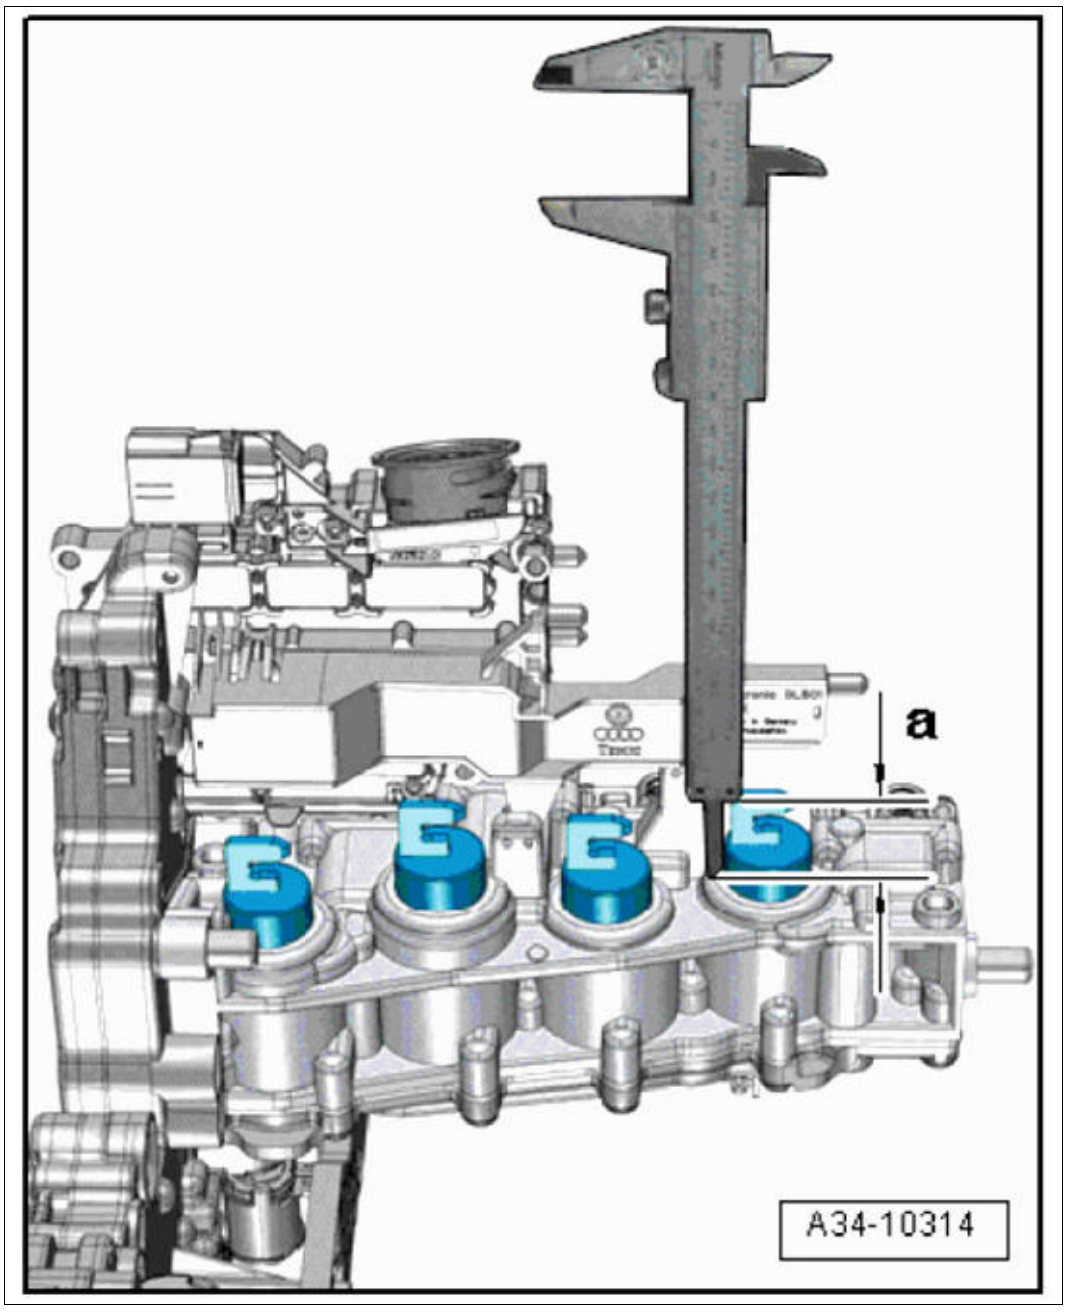
Information

1. Before installing the control mechanism for transmission, move shift forks and gear actuators into center position.

2. Adjust gear actuators.

1. 2.1. Adjust the four gear actuators on the back of the control mechanism for transmission to center position with the dimension **-a-** .

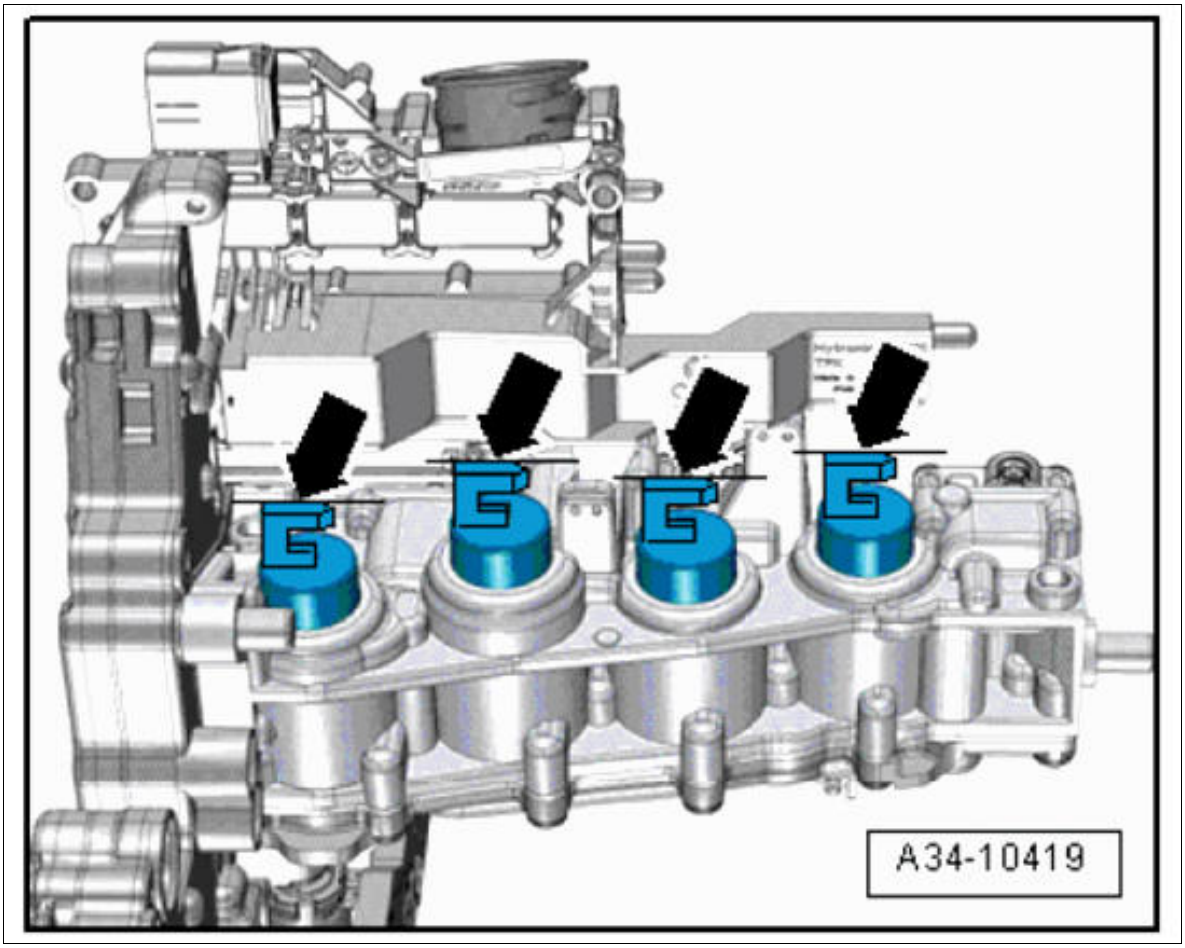
Fig 2: Measuring Shift Forks



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Align drivers **-arrows-** for the gear actuators so that they engage in the eyelets on the shift forks during installation.

Fig 3: Locating Shift Fork



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

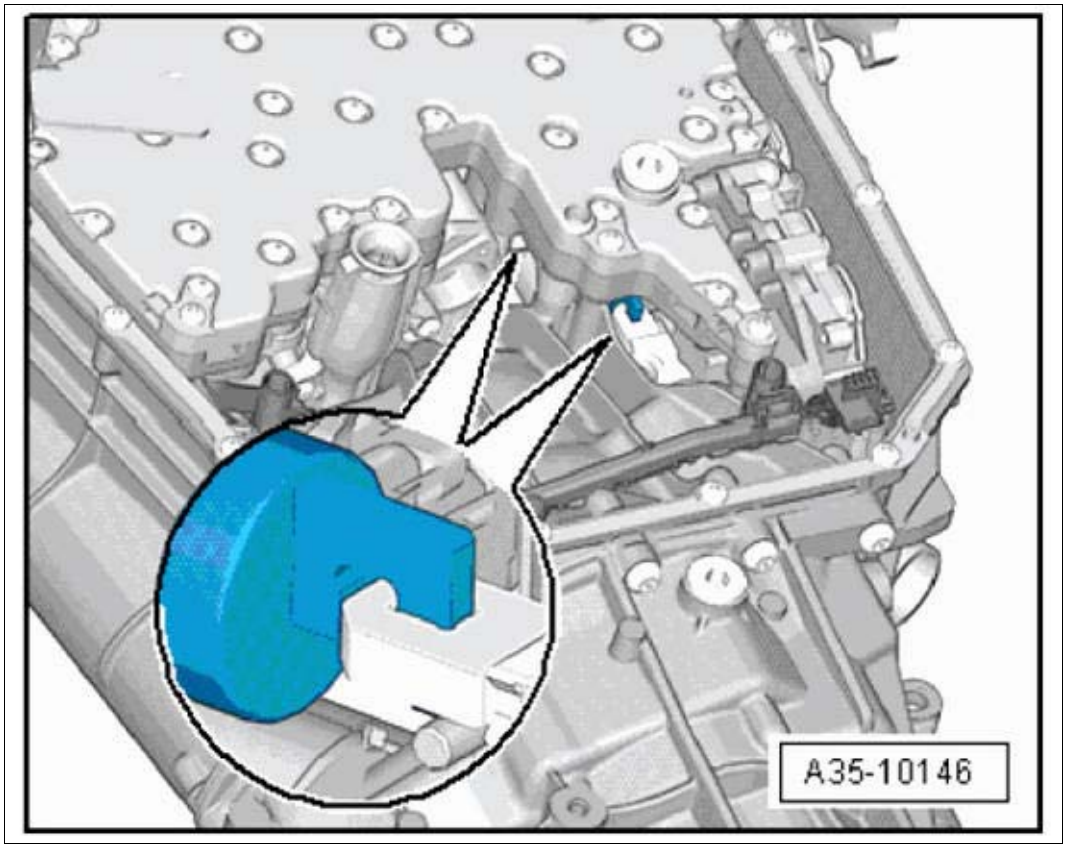
WM 387719 REMOVING AND INSTALLING CONTROL MECHANISM FOR TRANSMISSION (ALL MODELS) > INSTALLING CONTROL MECHANISM FOR TRANSMISSION

Information

After installing the control mechanism for transmission, code and calibrate it using **PIWIS Tester II 9818** .

1. Check shift forks.
    1. 1.1. Check all gear actuators by directing a torch through the opening between the control mechanism for transmission and transmission housing.
    2. 1.2. All four drivers for the gear actuators must engage in the related eyelets on the shift forks. → Shift fork

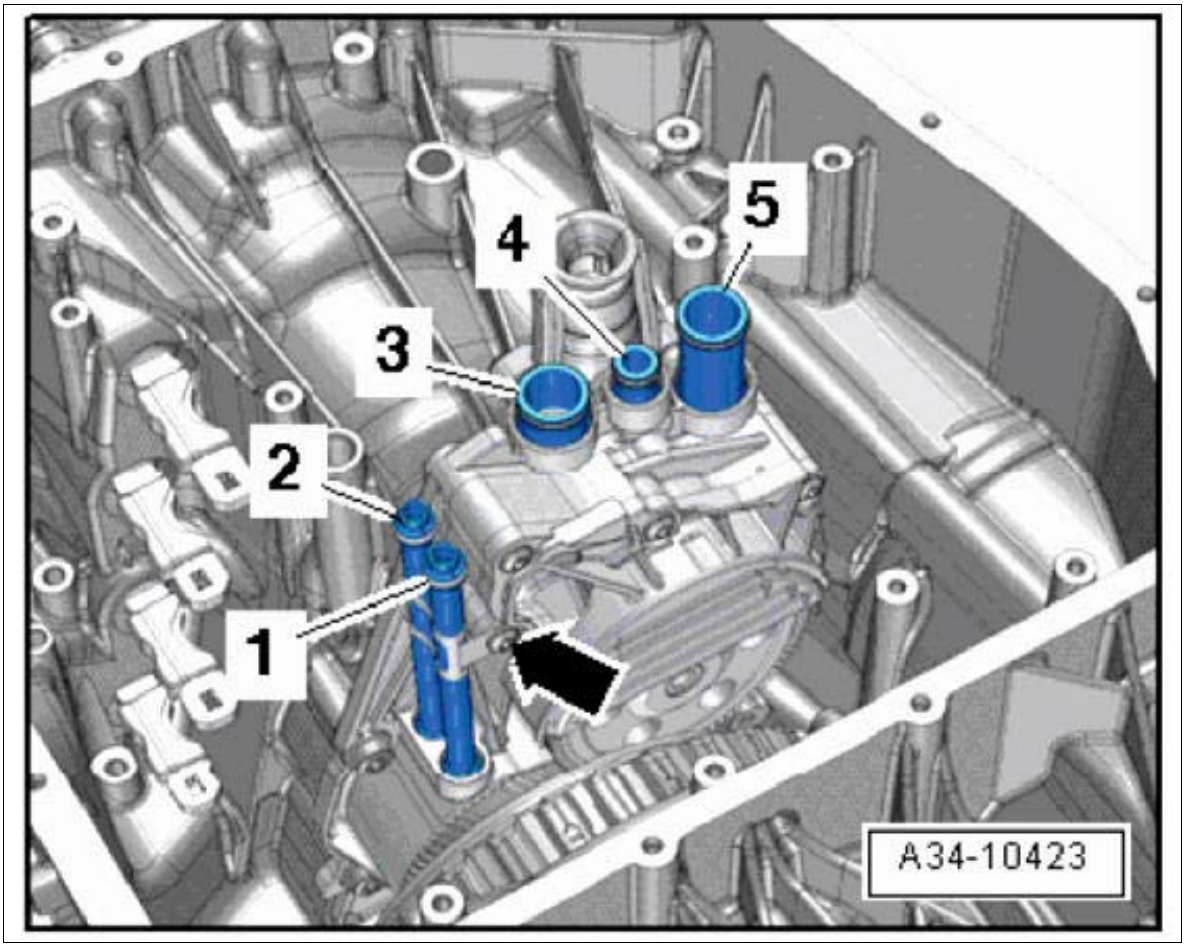
Fig 1: Identifying Shift Fork



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

2. Check that the ATF oil pipes **-1... 5-** are fitted securely.

Fig 2: Locating ATF Oil Pipes

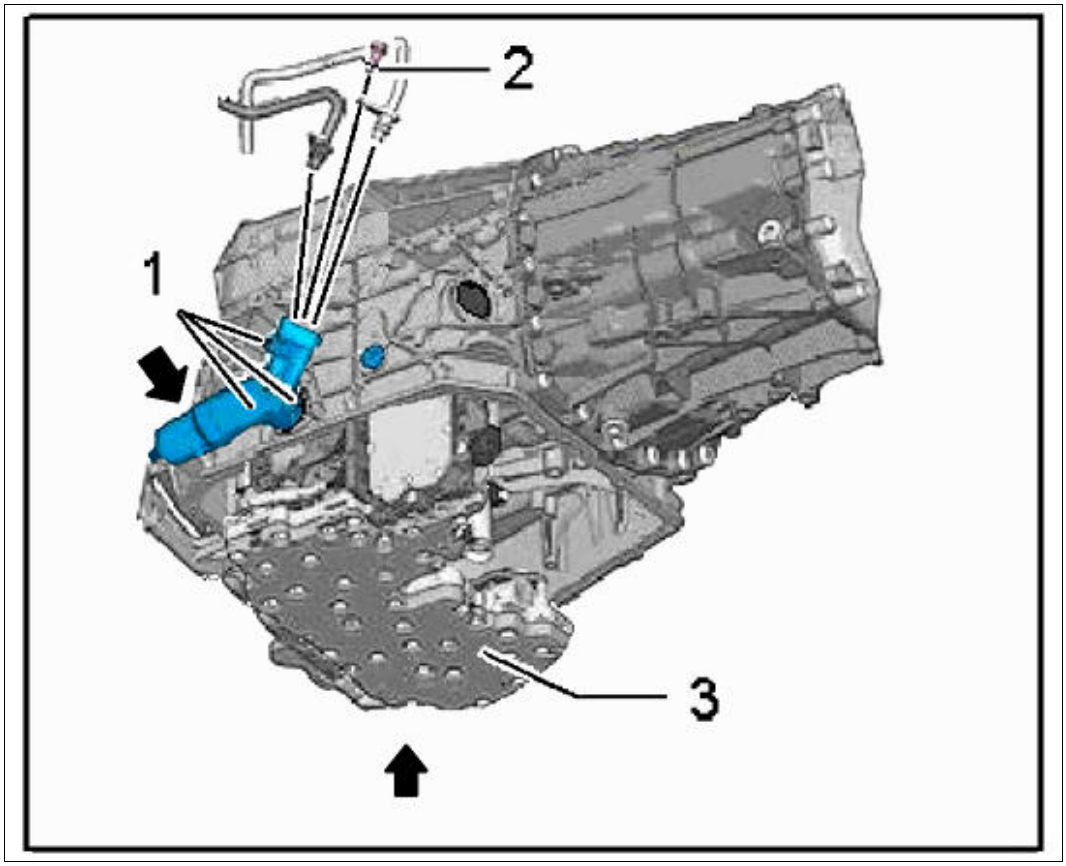


Courtesy of PORSCHE CARS NORTH AMERICA, INC.

3. Install control mechanism for transmission **-3-** .

    1. 3.1. Pull ATF filter housing out slightly.
    2. 3.2. Guide control mechanism for transmission **-3-** in **-direction of arrow-** until it is fitted in the transmission.
    3. 3.3. Check that the control mechanism for transmission is fitted correctly.
    4. 3.4. Fit ATF filter housing on the control mechanism for transmission and check that the oil pipes are fitted correctly.
    5. 3.5. Fit and tighten fastening screws **-1-** . Tightening torque 10 Nm (7.5 ftlb.)

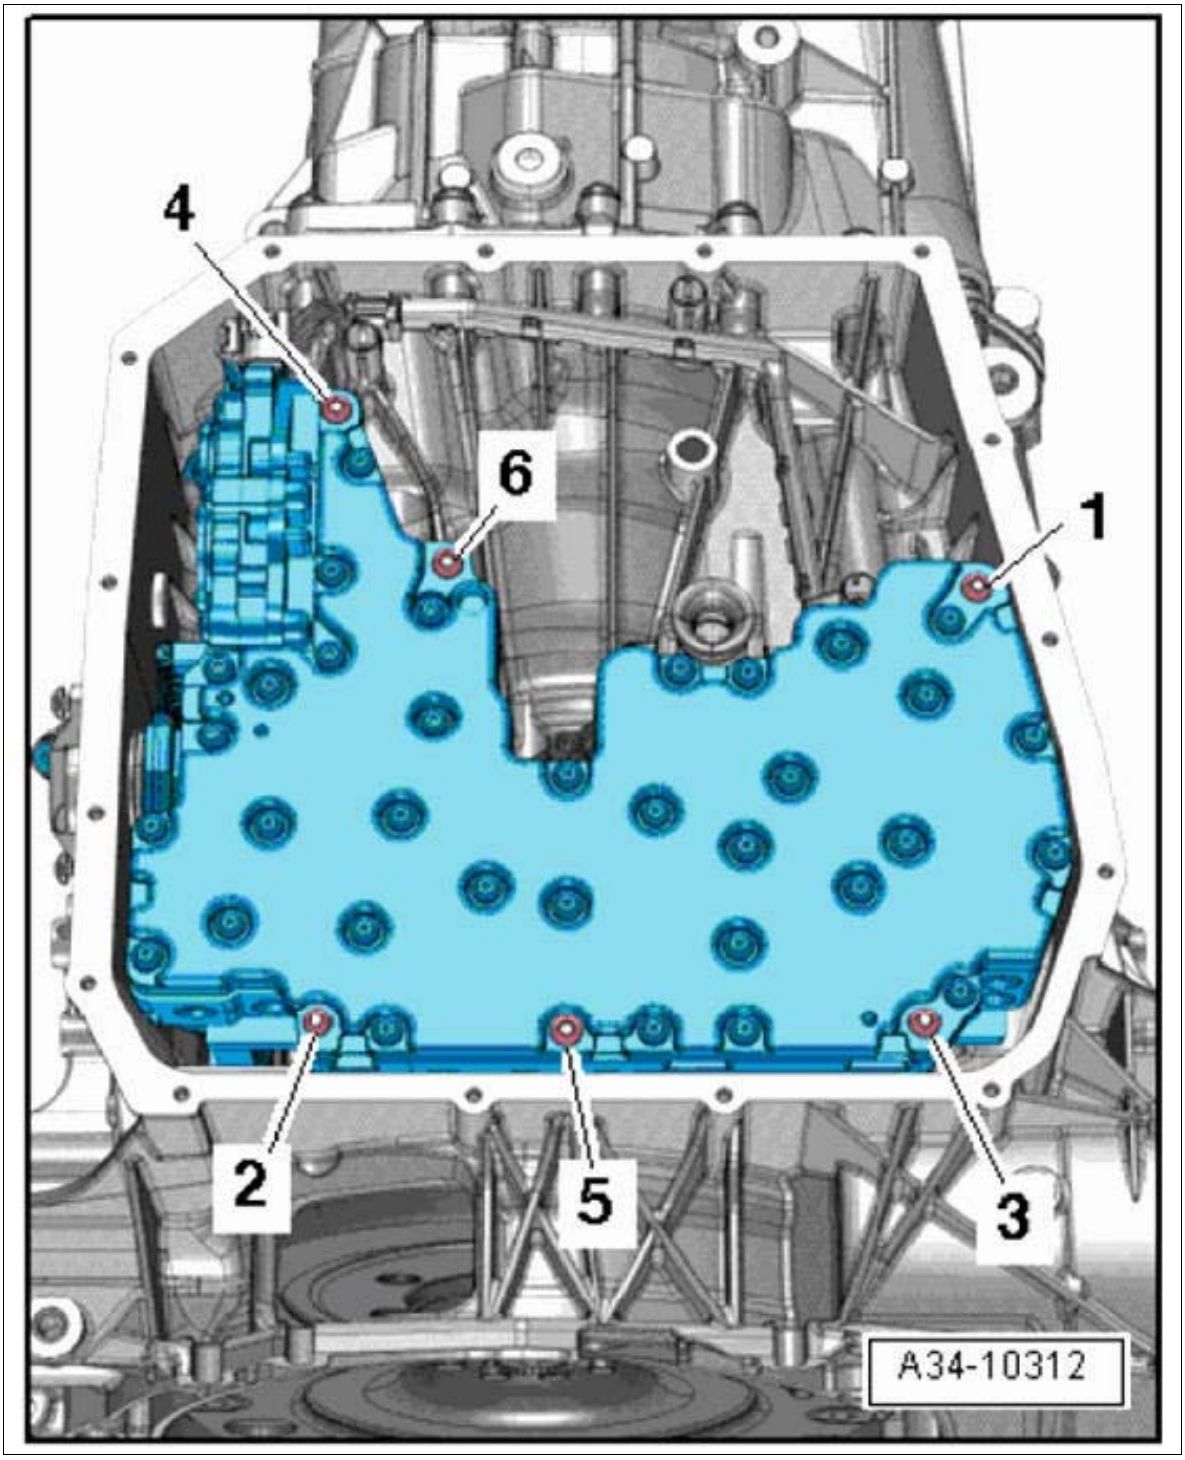
Fig 3: Installing Transmission Control Mechanism



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

4. Fit and tighten fastening screws **-1... 6-** . **Tightening torque 10 Nm (7.5 ftlb.)**

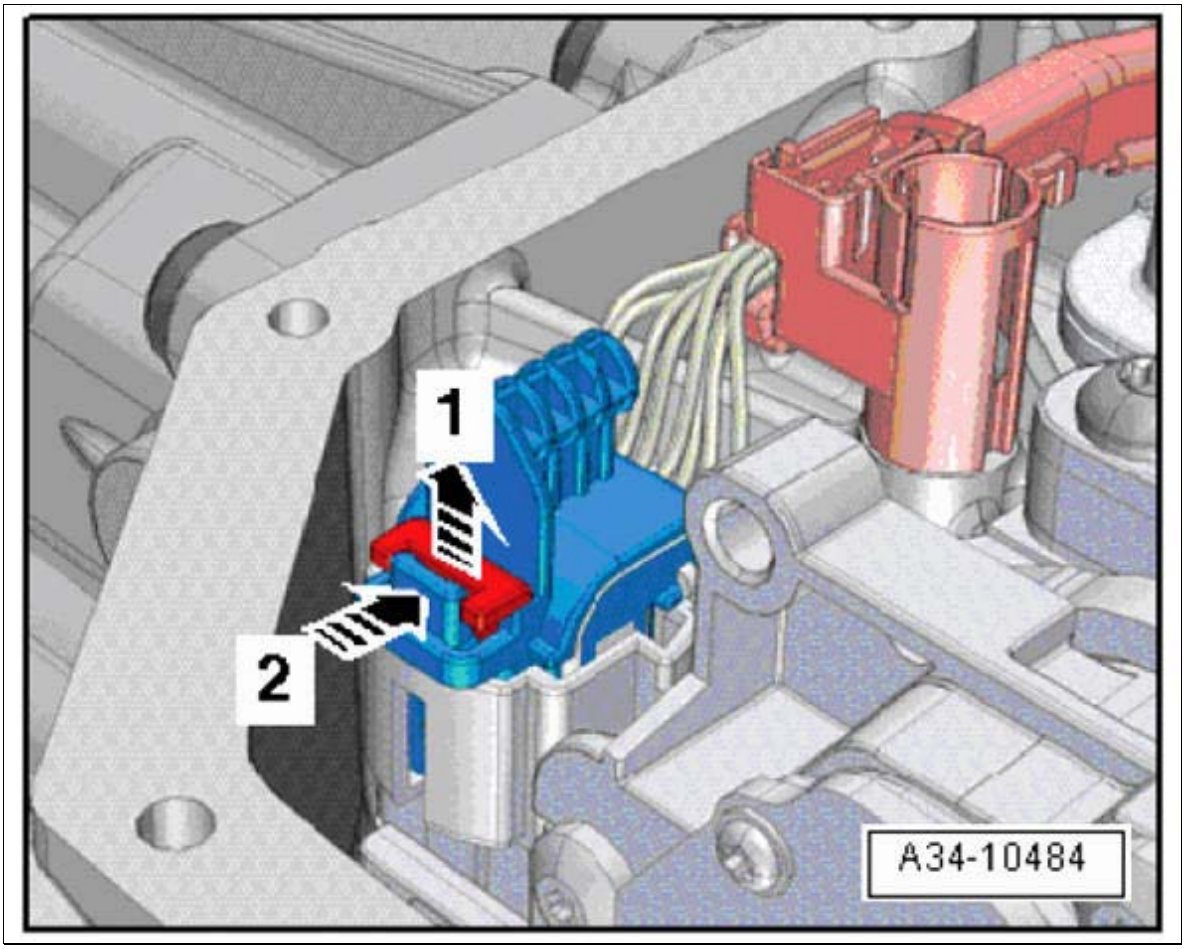
Fig 4: Transmission Control Mechanism Screws Tightening Sequence



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

5. Connect electric plug connection and engage the lock **-1-** .

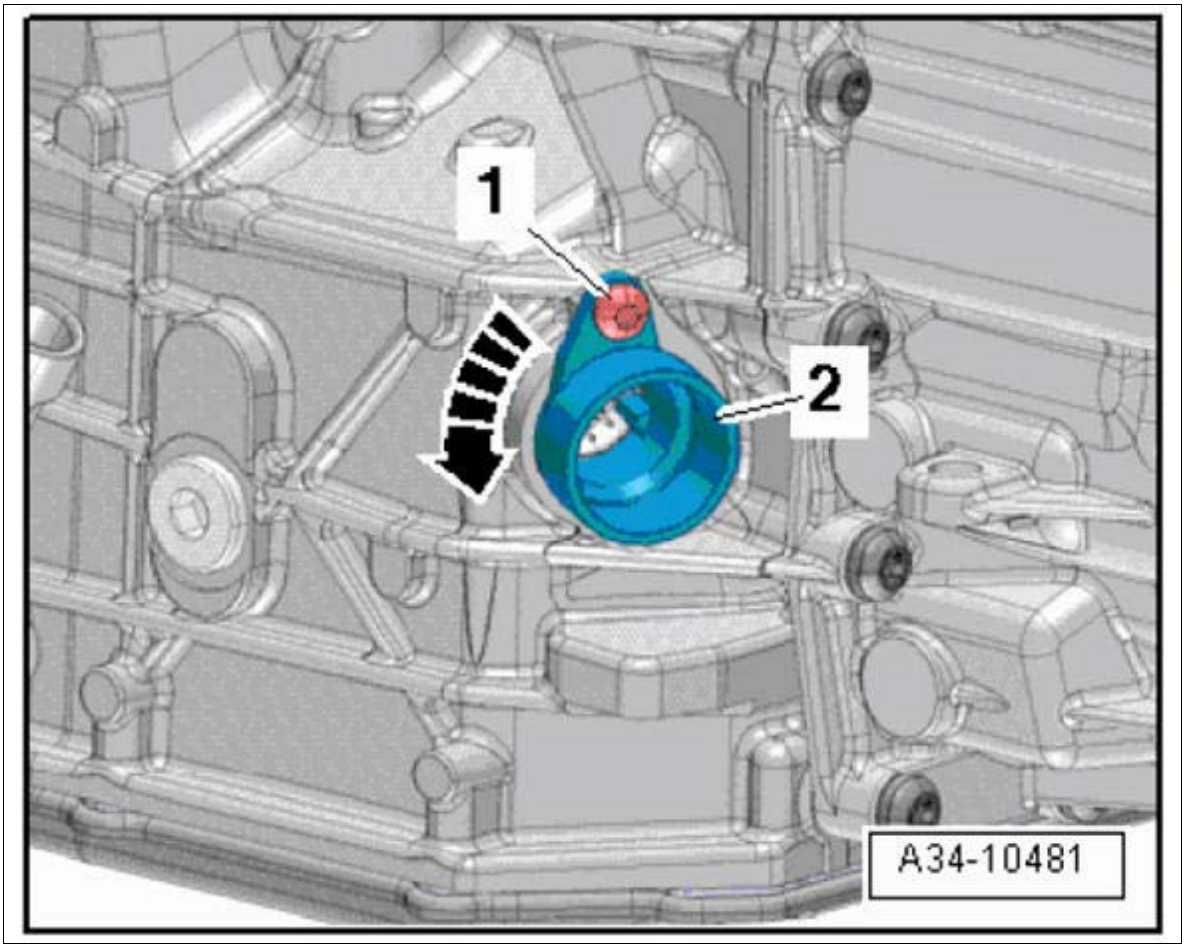
Fig 5: Connecting RPM Sensors Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

6. Guide in connector housing **-2-** and turn it in **-direction of arrow-** until you reach the bore for the fastening screw. Then fit and tighten fastening screw **-1-** . **Tightening torque 8 Nm (6 ftlb.)**

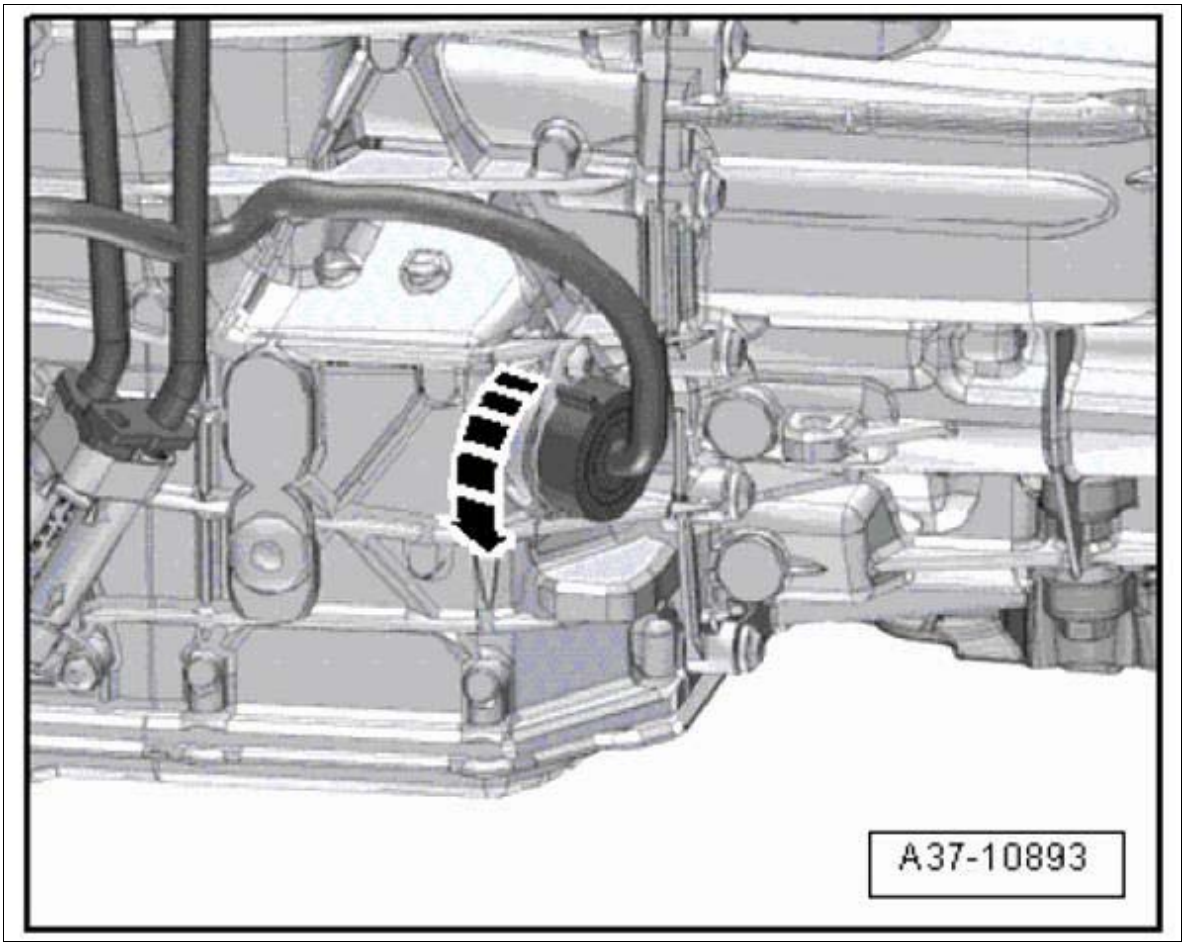
Fig 6: Turning Connector Housing



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

7. Connect electric plug connection on connector housing and lock it by turning the lock in **-direction of arrow-** .

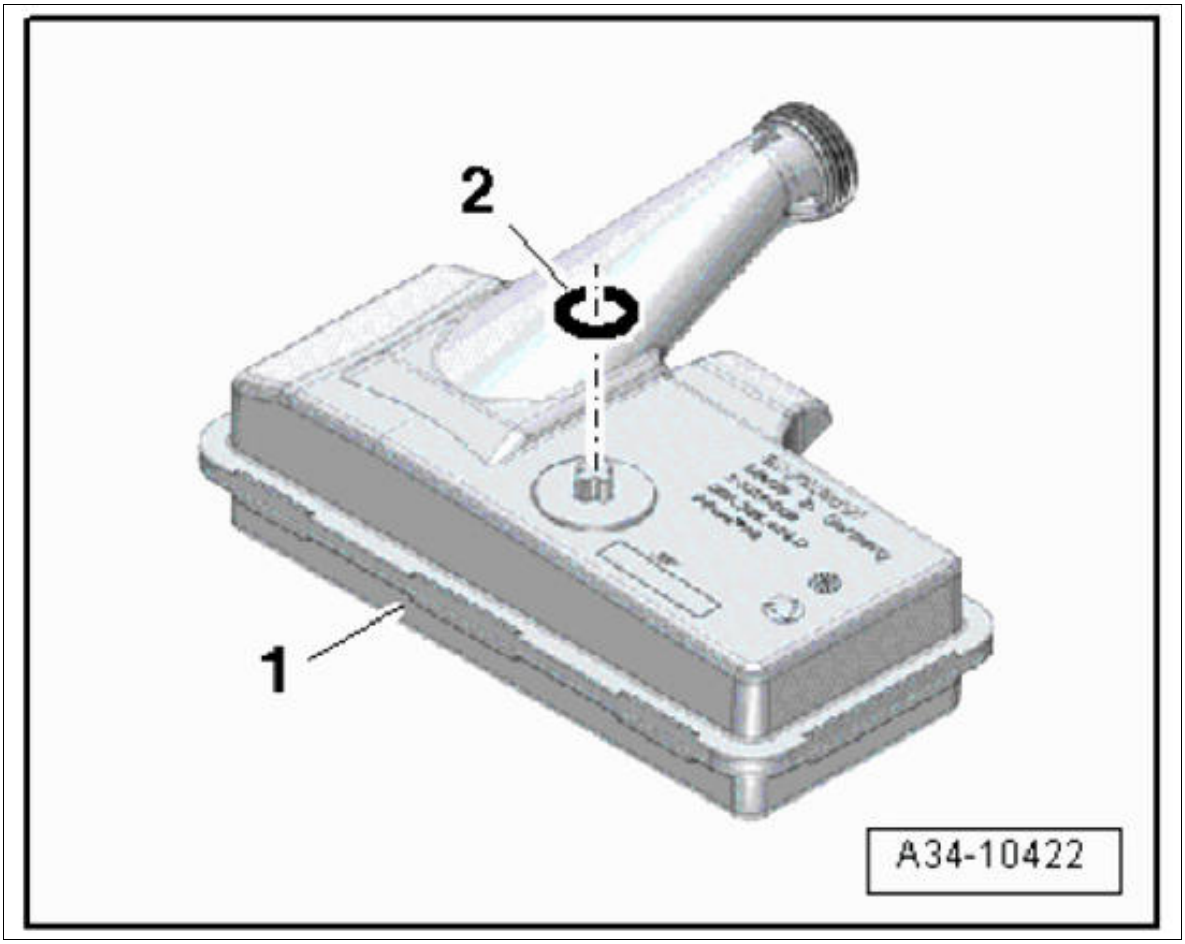
Fig 7: Connecting Electric Plug Connection



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

8. Replace seal **-2-** .

Fig 8: Identifying ATF Suction Filter Seal



Courtesy of PORSCHE CARS NORTH AMERICA, INC.

9. Guide ATF suction filter into the control mechanism for transmission in **-direction of arrow-** .

Fig 9: Installing ATF Suction Filter

Fastening screw securing bending vibration balancer to cover	M8 (3 ea.)/replace	Initial tightening	20 Nm (15 ftlb.)		
Fastening screw securing bending vibration balancer to cover		Final tightening	+90°	+/-20°	
Fastening nut	Fastening screw on transmission mount	Tightening torque	20 Nm (15 ftlb.)		
Fastening screw	Fastening screw on transmission support	Tightening torque	70 Nm (52 ftlb.)		
Fastening screw	Fastening screw on transmission bracket	Tightening torque	40 Nm (30 ftlb.)		
Fastening nut	Fastening nut on transmission bracket	Tightening torque	20 Nm (15 ftlb.)		

Fastening screws	Step 1	Tightening torque	20 Nm (15 ftlb.)		
Fastening screw	Step 2	Torque angle	+90°		
Fastening screws		Tightening torque	23 Nm (17 ftlb.)		
ATF drain plug on oil pan		Tightening torque	45 Nm (33 ftlb.)		
Fastening screw	ATF oil pan to transmission	Tightening torque	10 Nm (7.5 ftlb.)		
Fastening screw	Mechatronics to transmission	Tightening torque	10 Nm (7.5 ftlb.)		
Fastening screw	Retaining bracket to transmission	Tightening torque	10 Nm (7.5 ftlb.)		
Fastening screw	ATF filter housing to transmission	Tightening torque	10 Nm (7.5 ftlb.)		
Fastening screw	ATF lines to ATF filter housing	Tightening torque	20 Nm (15 ftlb.)		
ATF inspection plug		Tightening torque	45 Nm (33 ftlb.)		
Fastening screw	ATF connector housing	Tightening torque	8 Nm (6 ftlb.)		
Fastening screw	Cable guide for rpm sensor to transmission	Tightening torque	8 Nm (6 ftlb.)		
Fastening screws	ATF oil pan	Tightening torque	10 Nm (7.5 ftlb.)		
ATF filter housing cover		Tightening torque	8 Nm (6 ftlb.)		
Fastening screw	ATF lines to ATF filter housing	Tightening torque	20 Nm (15 ftlb.)		
Fastening screw	ATF filter housing to transmission	Tightening torque	10 Nm (7.5 ftlb.)		
Fastening nuts	Selector support	Tightening torque	8 Nm (6 ftlb.)		
Clamping screw	Clamping screw for adjusting locking cable	Tightening torque	13 Nm (9.5 ftlb.)		
Fastening screws	Locking cable holder to transmission	Tightening torque	8 Nm (6 ftlb.)		

Fastening screw securing connection piece for ATF lines to transmission	M8 x 25	Tightening torque	20 Nm (15 ftlb.)		
Fastening screws	ATF lines to radiator	Tightening torque	5 Nm (3.5 ftlb.)		
Union nuts	ATF line connection point	Tightening torque	29 Nm (21 ftlb.)		
Fastening screw	ATF line to oil pan	Tightening torque	8 Nm (6 ftlb.)		
Fastening screw	ATF line to oil pan	Tightening torque	8 Nm (6 ftlb.)		
Fastening screws securing transfer gear to Porsche Doppelkupplung (PDK)	M10 x 70/replace	Initial tightening	50 Nm (37 ftlb.)		
Fastening screws securing transfer gear to Porsche Doppelkupplung (PDK)		Final tightening	+90°		
Fastening screws	Step 1: Cardan shaft to rear axle differential	Tightening torque	21 Nm (16 ftlb.)		
Fastening screws	Step 2: Cardan shaft to rear axle differential	Torque angle	+90°		
Fastening screws	Heat shield to holder	Tightening torque	55 Nm (41 ftlb.)		
Fastening nut	Heat shield to body	Tightening torque	2.1 Nm (1.5 ftlb.)		
Fastening screws	Heat shield to tank holder	Tightening torque	15 Nm (11 ftlb.)		
Fastening screws	Tunnel support	Tightening torque	55 Nm (41 ftlb.)		
Rear fastening screw securing rear final drive to rear axle carrier	M12 x 80	Tightening torque	95 Nm (70 ftlb.)		
Bottom fastening screw securing rear final drive to	M10 x 92/replace	Initial tightening	40 Nm (30 ftlb.)		

rear axle carrier					
Bottom fastening screw securing rear final drive to rear axle carrier		Final tightening	+90°		
Fastening screw on servo motor for rear-differential lock		Tightening torque	13 Nm (9.5 ftlb.)		
Inspection and filler plug for all-wheel final drive		Tightening torque	45 Nm (33 ftlb.)		
ATF inspection and filler plug		Tightening torque	0 Nm (0 ftlb.)		
Transmission oil drain plug		Tightening torque	45 Nm (33 ftlb.)		
Oil drain plug on rear final drive		Tightening torque	35 Nm (26 ftlb.)	+/-5 Nm (+/- 3.5 ftlb.)	
Inspection and filler plug on rear final drive		Tightening torque	35 Nm (26 ftlb.)	+/-5 Nm (+/- 3.5 ftlb.)	

WM 3X00IN TECHNICAL VALUES - TRANSMISSION (ALL MODELS) > INFORMATION > FILLING CAPACITIES

Porsche Doppelkupplung (PDK)	
Specification: Castrol BOT342A	
ATF transmission oil (clutches, mechatronics) New filling including volume of 0.5 liters for filling the ATF lines	→ **Filling capacity: 7 Liter**
ATF transmission oil change quantity	→ **Filling capacity: 6.5 Liter**
Front-axle final drive	
Specification: Castrol BOT233FEQ with additive	
MTF transmission oil (gear wheels, front-axle final drive)	→ **Filling capacity: 4.1 Liter**
MTF transmission oil change quantity	→ **Filling capacity: 4.1 Liter**
Hang-on transmission	
Specification: Shell TF0870 Qatar	
Transmission oil for hang-on transmission	→ **Filling capacity: 0.58 Liter**
Rear axle differential without lock	

Specification: Castrol SAF-PD	
Transmission oil for rear axle differential	→ **Filling capacity: 1.2 Liter**
Rear axle differential with lock	
Specification: Castrol SAF Carbon mod.	
Transmission oil for rear axle differential	→ **Filling capacity: 1.45 Liter**
