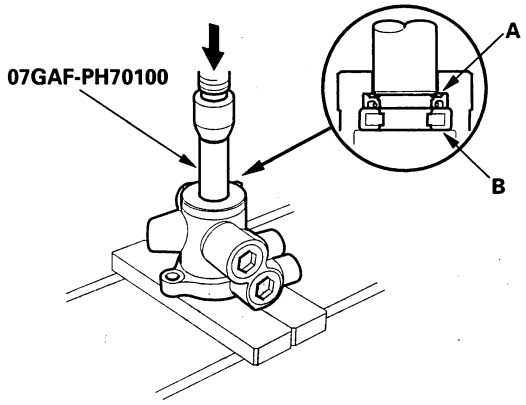
27. Press the valve oil seal (A) and roller bearing (B) out of the valve housing using a hydraulic press and special tool.



28. Clean the disassembled parts with solvent, and dry them with compressed air. Do not dip rubber parts in the solvent.

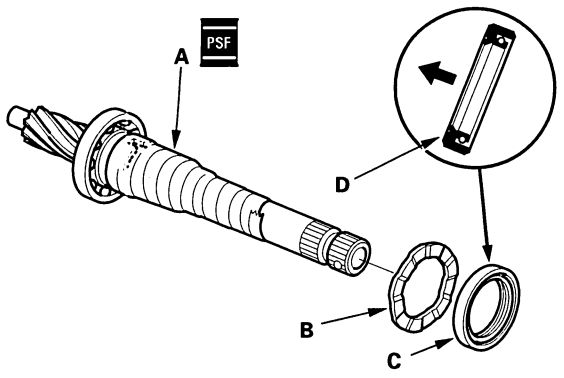
(cont'd)

Protected by AR

Steering Gearbox Overhaul (cont'd)

Reassembly

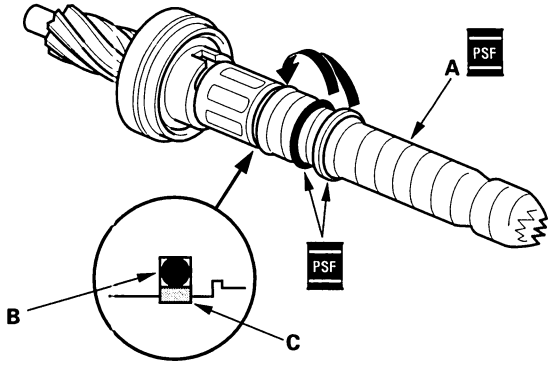
29. Apply vinyl tape (A) to the stepped portion of the pinion shaft, and coat the surface of the vinyl tape with power steering fluid.



30. Install the wave washer (B).

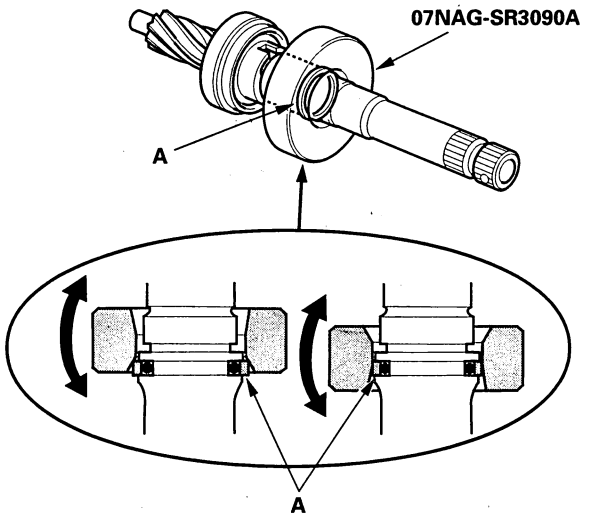
31. Coat the inside surface of the new valve oil seal (C) with power steering fluid, and install the seal with its grooved side facing opposite the bearing, then slide it over the pinion shaft, being careful not to damage its sealing lip (D).

32. Apply vinyl tape (A) to the splines and stepped portion of the shaft, and coat the surface of the vinyl tape with power steering fluid.



33. Fit the new O-ring (B) in the groove of the pinion shaft. Then slide the new valve seal ring (C) over the shaft and in the groove on the pinion shaft.

34. Remove the tape, and apply power steering fluid to the surface of the valve seal ring (A).



35. Apply power steering fluid to the inside of the special tool. Set the larger diameter end of the special tool over the valve seal ring, and move the special tool up and down several times to make the valve seal ring fit in the pinion shaft groove.

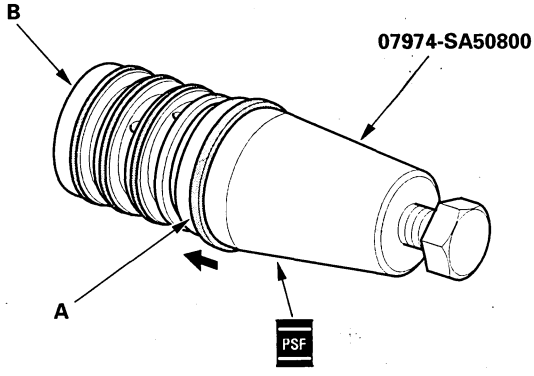
36. Remove the special tool, turn it over, slide the smaller diameter end over the valve seal ring. Move it up and down several times to make the valve seal ring fits snugly in the pinion shaft groove.

BACK

Protected by AR

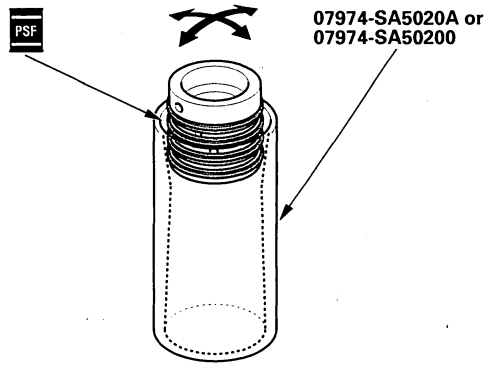
37. Apply power steering fluid to the surface of the special tool. Slip two new seal rings (A) over the special tool from the smaller diameter end, and expand them. Install only two rings at a time from each end of the pinion shaft sleeve (B).

    Note these items when installing the seal ring:
    - Do not over-expand the seal ring. Install the resin seal rings with care so as not to damage them. After installation, make sure you contract the seal rings using the special tool (sizing tool).
    - There are two types of sleeve seal rings: black and brown. Do not mix the different types of rings as they are not compatible.



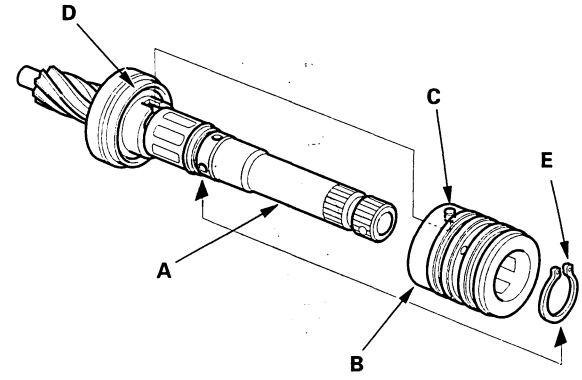
38. Align the special tool with each groove in the sleeve, and slide a sleeve seal ring into each groove. After installation, compress the seal rings with your fingers temporarily.

39. Apply power steering fluid to the seal rings on the sleeve, and to the entire inside surface of the special tool, then slowly insert the sleeve into the special tool.

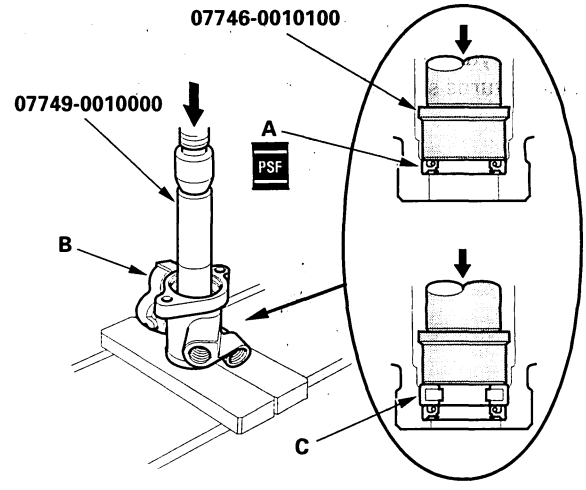


40. Move the sleeve back and forth several times to make the seal rings snugly fit in the sleeve. Make sure the seal rings are not twisted.

41. Apply power steering fluid to the surface of the pinion shaft (A). Slide the sleeve (B) onto the pinion shaft by aligning the locating pin (C) on the inside of the sleeve with the cutout (D) in the shaft. Then install the new snap ring (E) securely in the pinion shaft groove. Be careful not to damage the valve seal ring when inserting the sleeve.



42. Apply power steering fluid to the seal ring lip of the new valve oil seal (A), then install the seal in the valve housing (B) using a hydraulic press and special tools. Install the seal with its grooved side facing the tool.



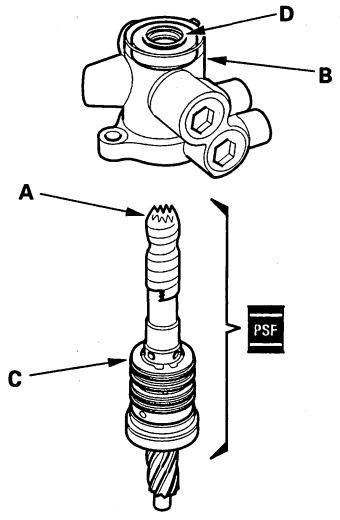
43. Press the roller bearing (C) into the valve housing with a hydraulic press and special tool.

(cont'd)

Protected by AR

Steering Gearbox Overhaul (cont'd)

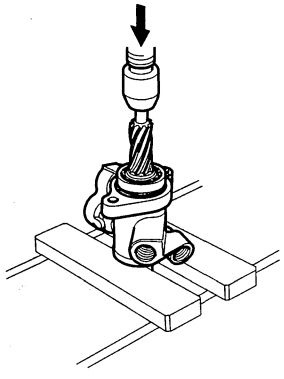
44. Apply vinyl tape (A) to the pinion shaft, then coat the vinyl tape with power steering fluid.



45. Insert the pinion shaft into the valve housing (B). Be careful not to damage the valve seal rings (C) and valve oil seal sealing lip (D).

46. Remove the vinyl tape from the pinion shaft, then remove any residue from the tape adhesive.

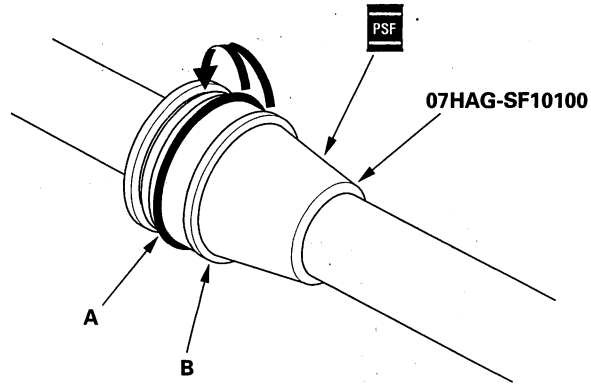
47. Press the pinion shaft/sleeve into the valve housing with a hydraulic press. Check that the pinion shaft/sleeve turns smoothly by hand after installing it.



48. Coat the special tool with power steering fluid, then slide it onto the rack, big end first.

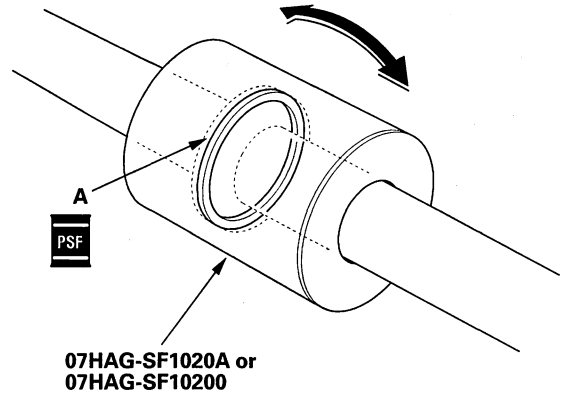
49. Position the new O-ring (A) and new piston seal ring (B) on the special tool, then slide them down toward the big end of the tool.

Note these items during reassembly:
- Do not over expand the resin seal rings. Install the resin seal rings with care so as not to damage them. After installation, make sure you contract the seal ring using the special tool (sizing tool).
- Replace the piston's O-ring and seal ring as a set.



50. Pull the O-ring off into the piston groove, then pull the piston seal ring off into the piston groove on top of the O-ring.

51. Coat the piston seal ring (A) and the inside of the special tool with power steering fluid, then carefully slide the tool onto the rack and over the piston seal ring.

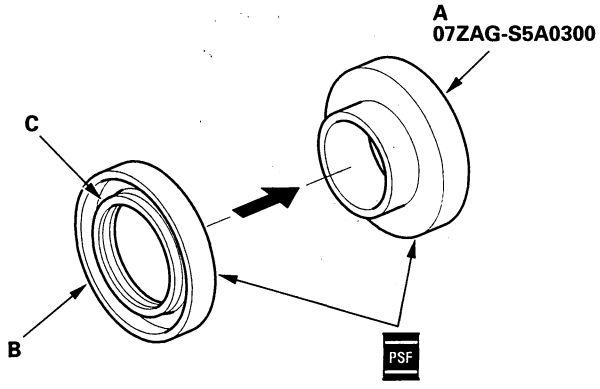


52. Move the special tool back and forth several times to make sure the piston seal ring fits snugly in the piston.

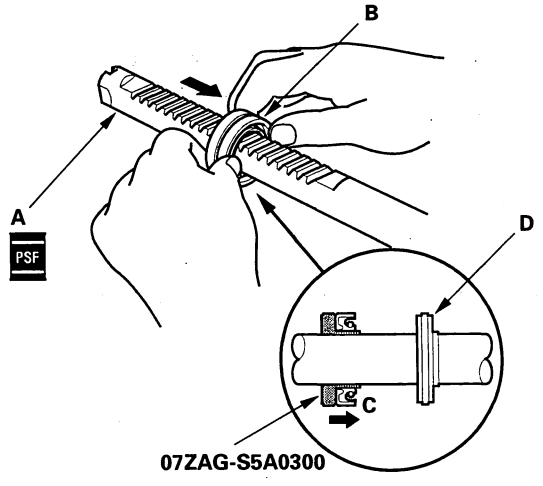
BACK

Protected by AR

53. Coat the sliding surface of the special tool (A) and new cylinder end seal (B) with power steering fluid. Place the seal on the special tool with its grooved side (C) facing opposite the special tool.



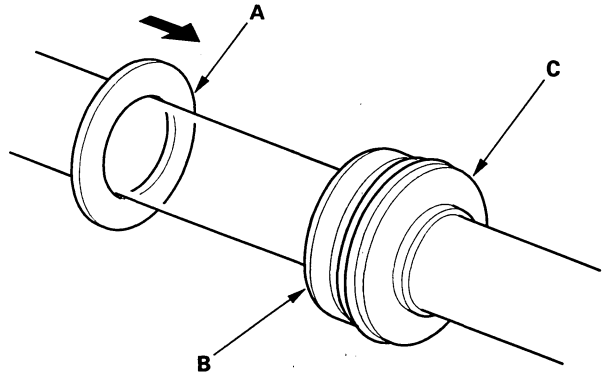
54. Coat the surface of the steering rack (A) with power steering fluid.



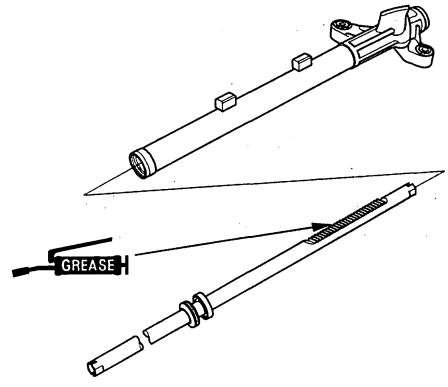
55. Install the cylinder end seal (B) onto the steering rack with its grooved side (C) toward the piston (D).

56. Separate the cylinder end seal from the special tool, then remove the special tool.

57. Install the new backup ring (A) on the steering rack, then place the backup ring and cylinder end seal (B) against the piston (C).



58. Apply multipurpose grease to the steering rack teeth, then insert the steering rack into the gearbox housing. Be careful not to damage the inner surface of the cylinder wall with the rack edges.

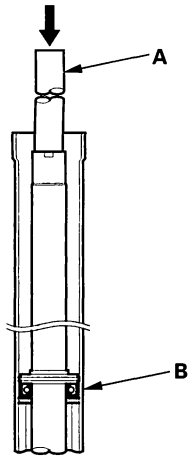


(cont'd)

Protected by AR

Steering Gearbox Overhaul (cont'd)

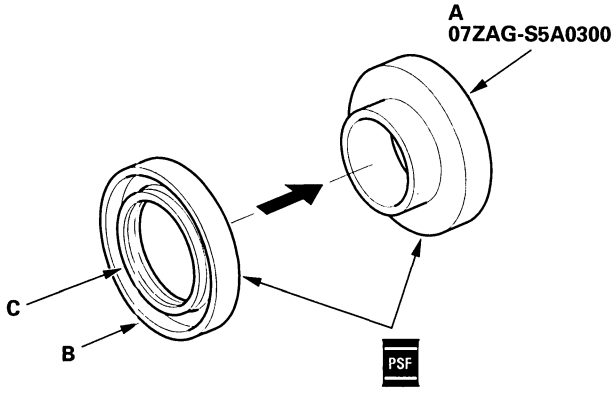
59. Insert an appropriate size deep socket wrench (A) onto the steering rack as shown.



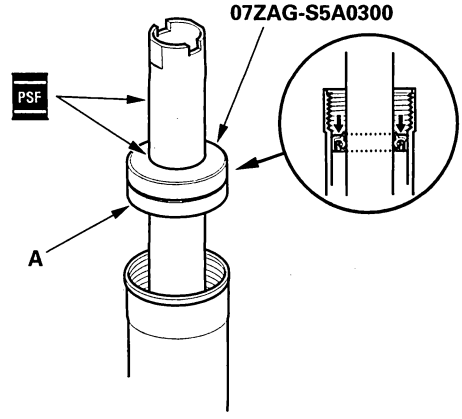
60. Install the cylinder end seal (B) into the bottom of the cylinder by pressing on the tool with a press. Do not push on the tool with excessive force as it may damage the cylinder end seal.

61. Remove the tool, and center the steering rack.

62. Coat the sliding surface of the special tool (A) and new cylinder end seal (B) with power steering fluid. Place the seal on the special tool with its grooved side (C) facing opposite the special tool.



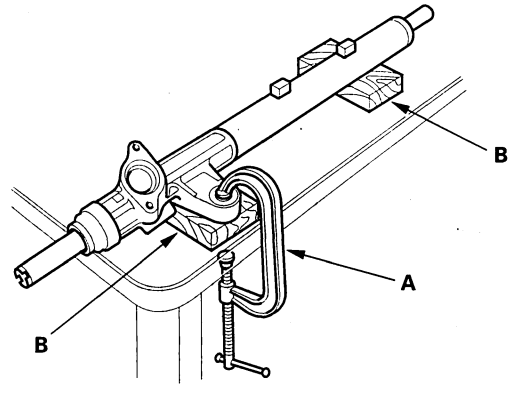
63. Coat the inside surface of the special tool and steering rack with power steering fluid, then install the cylinder end seal (A) onto the steering rack with its grooved side toward the cylinder.



64. Separate the cylinder end seal from the special tool, then remove the special tool.

65. Push in the cylinder end seal with your finger. Be careful not to damage the face of the seal with the threads and burrs at the staked position of the cylinder housing.

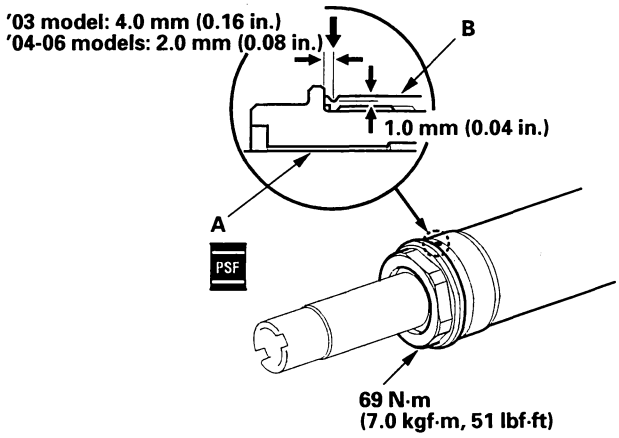
66. Hold the gearbox housing using a C-clamp (commercially available) (A) and the wooden blocks (B). Do not clamp the cylinder part of the housing and gearbox housing in the vise.



BACK

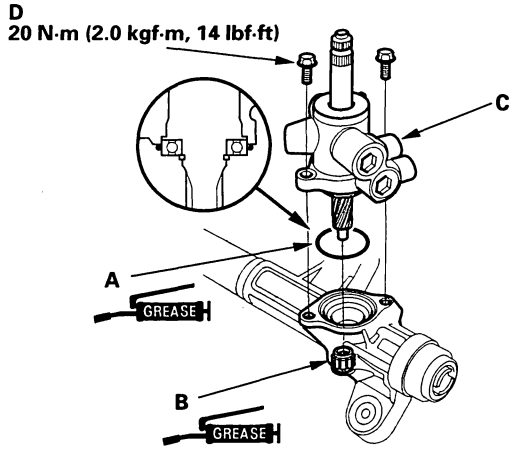
Protected by AR

67. Coat the inside surface of the cylinder end (A) with power steering fluid, then install the cylinder end by screwing it into the cylinder (B). Tighten the cylinder end to the specified torque.



68. Stake the point of the cylinder show (opposite from where the stake was removed during disassembly).

69. Coat the new O-ring (A) with multipurpose grease, and carefully fit it on the valve housing.

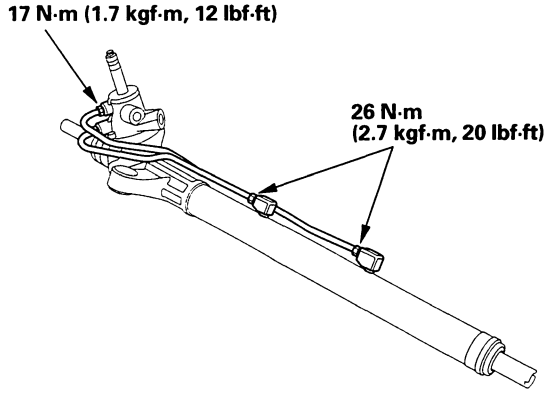


70. Apply multipurpose grease to the needle bearing (B) in the gearbox housing, then install the valve body unit (C) by engaging the gears. Note the valve body unit installation position (direction of the line connections).

71. Tighten the flange bolts (D) to the specified torque.

72. Install the cylinder lines.

    Note these items during reassembly:
    - Thoroughly clean the joints of the cylinder lines. The joints must be free of foreign material.
    - Install the cylinder lines by tightening the flare nuts by hand first, then tighten the flare nuts to the specified torque.

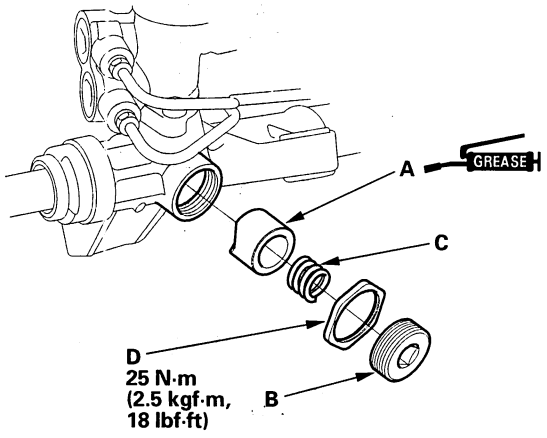


(cont'd)

Protected by AR

Steering Gearbox Overhaul (cont'd)

73. Apply multipurpose grease to the sliding surface and circumference of the rack guide (A), and install it onto the gearbox housing.

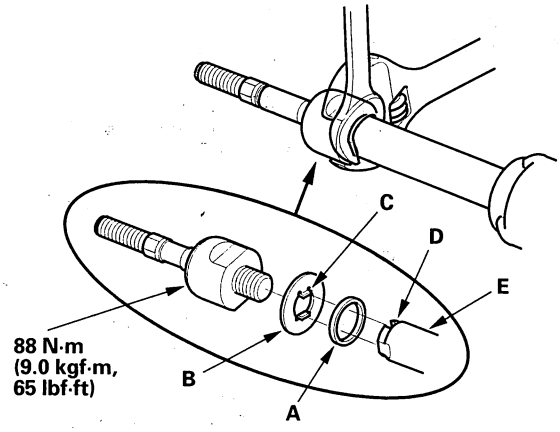


74. Apply new sealant (Three Bond 1215 or Loctite 5699) to the middle of the threads on the rack guide screw (B), then install the spring (C) and rack guide screw.

75. Tighten the rack guide screw, and loosely install the locknut (D).

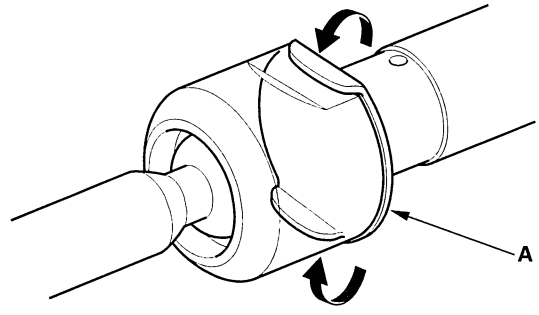
76. Adjust the rack guide screw (see page 17-29). After adjusting, check that the rack moves smoothly by sliding it right and left.

77. Install a new stop rubber (A) and a new lock washer (B). Align the lock washer tabs (C) with the slots (D) on the rack end (E) while holding the lock washer in place. Repeat this step for the other side of the rack.



78. Hold the flat surface sections of the steering rack with a wrench, and tighten both rack ends. Be careful not to damage the rack surface with the wrench.

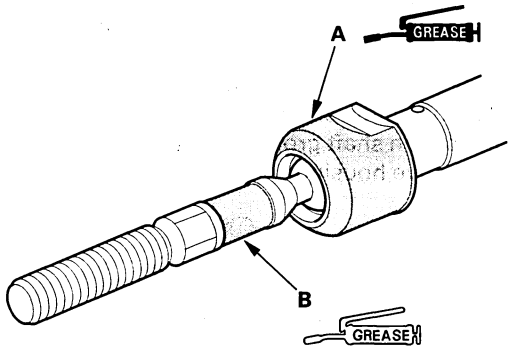
79. Bend the lock washer (A) back against the flat spots on the rack end joint housing.



BACK

Protected by AR

80. Apply multipurpose grease to the circumference of the rack end joint housing (A).

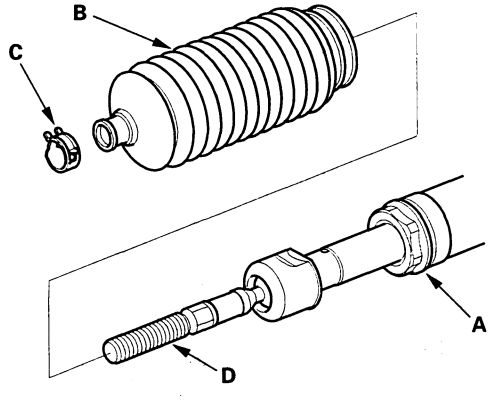


(P/N 08798-9013)

81. Apply a light coat of silicone grease to the boot grooves (B) on the rack ends.

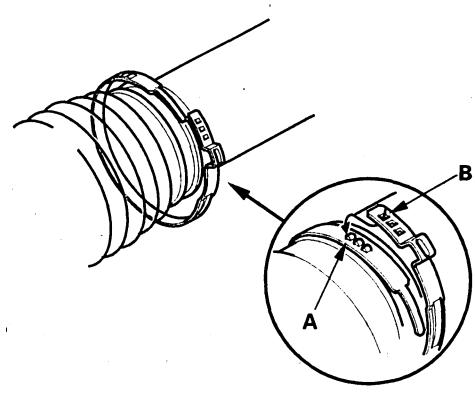
82. Center the steering rack within its stroke.

83. Clean off any grease or contamination from the boot installation grooves (A) around the gearbox housing. Install the boots (B) on the rack ends with the tie-rod clips (C), and fit the boot end in the installation grooves in the housing properly.

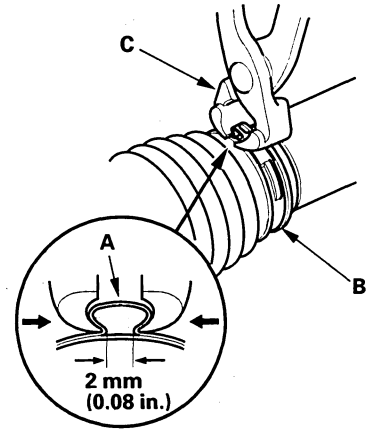


84. After installing the boots, wipe any grease off the threaded section (D) of the rack end.

85. Install the new boot bands by aligning the tabs (A) with the holes (B) of the band.



86. Close the ear portion (A) of the band (B) with commercially available pincers, Oetiker 1098 or equivalent (C).



87. Slide the rack right and left to be certain that the boots are not deformed or twisted.

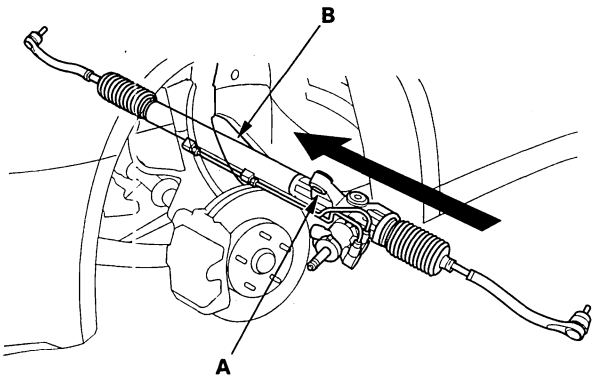
Protected by AR

Steering Gearbox Installation

Special Tools Required
Subframe adaptor EQS02C000016
(Available through the Honda Tool and Equipment program 888-424-6857)

1. Before installing the steering gearbox, make sure that no power steering fluid is on the mating surface of the gearbox and a front suspension subframe. To prevent the gearbox mounting bolts from loosening after the installation, remove any power steering fluid from the mount cushions and bolt holes.

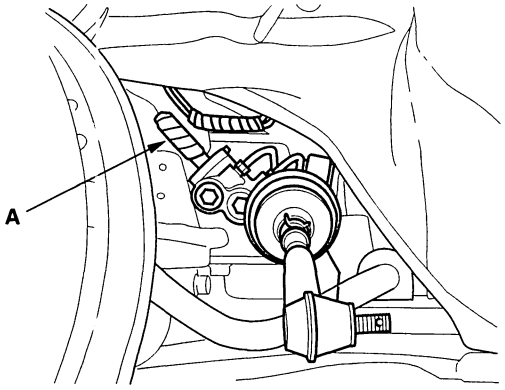
2. Apply a mild soap and water solution to both sides of the mount cushion mating surfaces (A).



3. Pass the cylinder of the steering gearbox (B) through the wheelwell opening on the driver's side.

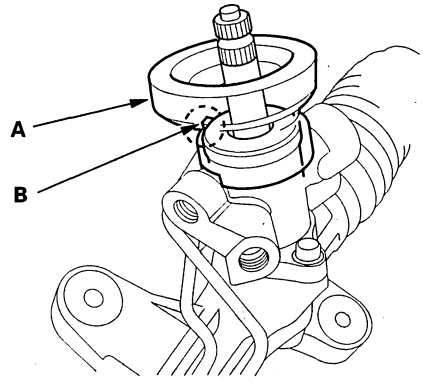
4. Carefully move the steering gearbox toward the passenger's side until the pinion shaft clears the wheelwell opening on the body.

5. Rotate the steering gearbox so the pinion shaft (A) points upward.

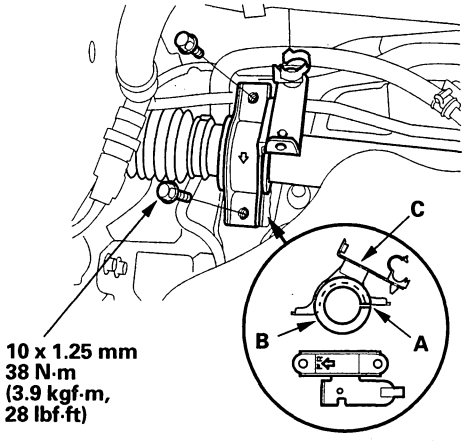


6. Continue moving the gearbox toward the passenger's side until the steering gearbox is in position. Make sure the power steering return line and feed line are routed above the gearbox.

7. Remove the vinyl tape from the pinion shaft, and install the pinion shaft grommet (A). Align the slot in the pinion shaft grommet with the lug portion (B) on the valve housing.



8. Position the cutout (A) on the mounting cushion (B) as shown, and install it on the cylinder of the gearbox securely.

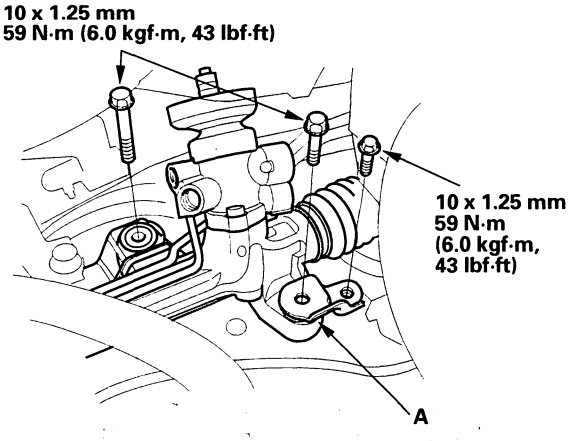


9. Install the gearbox mounting bracket (C) over the mounting cushion, and loosely install the two flange bolts.

BACK

Protected by AR

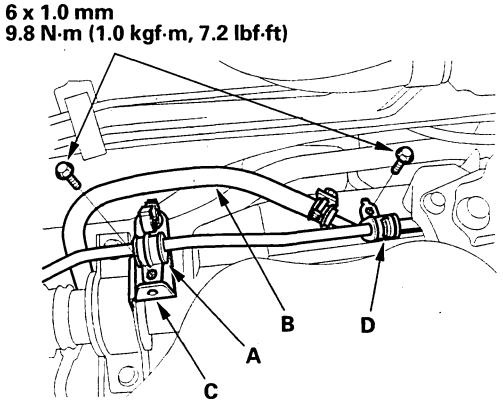
10. Install the steering stiffener plate (A) and gearbox mounting bolts on the left side of the gearbox, then tighten them to the specified torque.



11. Tighten the flange bolts on the right side of the gearbox to specified torque alternately in two or more steps.

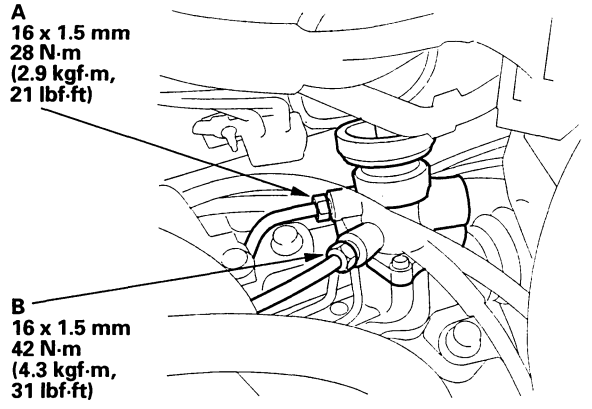
12. Loosely connect the return line and feed line by hand.

13. Install the feed line holder (A) and return hose (B) on the gearbox mounting bracket (C)



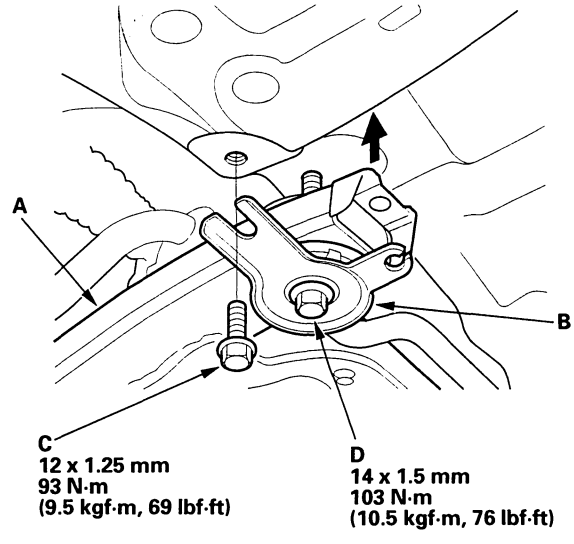
14. Install the feed line holder (D) on the front suspension subframe. Make sure that there is no interference between the feed and return lines and any other parts.

15. Tighten the return line flare nut (A) to the specified torque.



16. Tighten the feed line flare nut (B) to the specified torque.

17. Raise the jack supporting front suspension subframe (A) with special tool until the subframe is in position (see page 20-229).



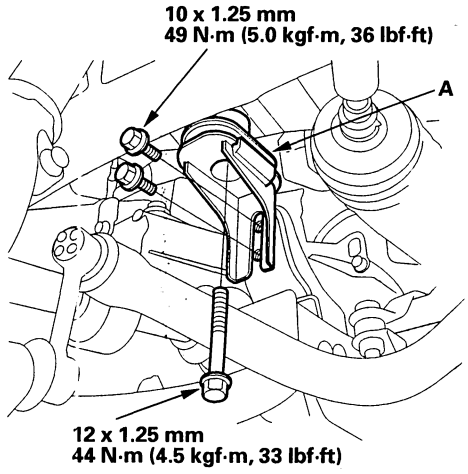
18. Install the front suspension subframe rear bracket (B) mounting bolt (C), then tighten new subframe mounting bolt (D) to the specified torque.

(cont'd)

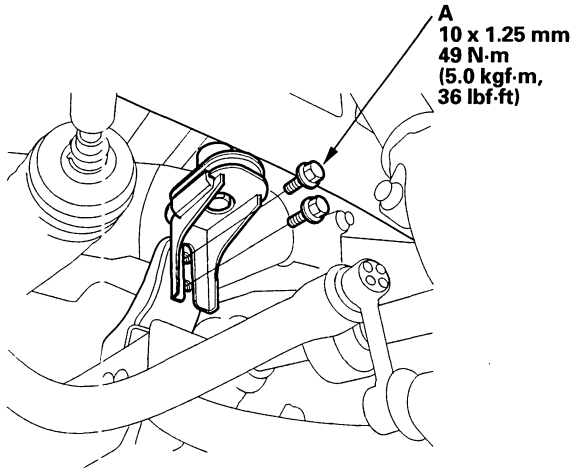
Protected by AR

Steering Gearbox Installation (cont'd)

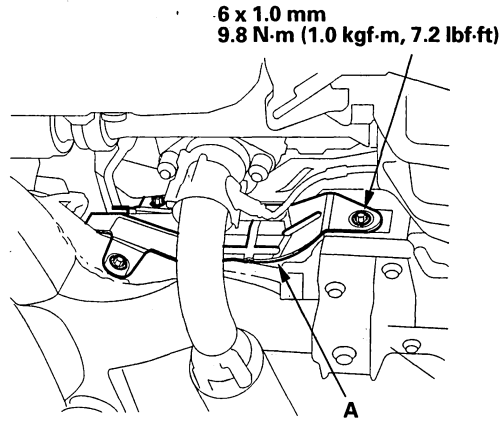
19. Install the front suspension subframe left middle mount (A).



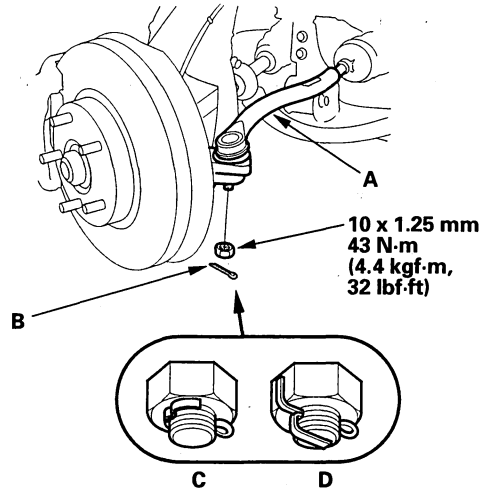
20. Install the front suspension subframe right middle mount bolts (A).



21. Install the P/S heat baffle plate (A).



22. Wipe off any grease from the ball joint tapered section and threads. Then reconnect the tie-rod end (A) to the knuckle arms.

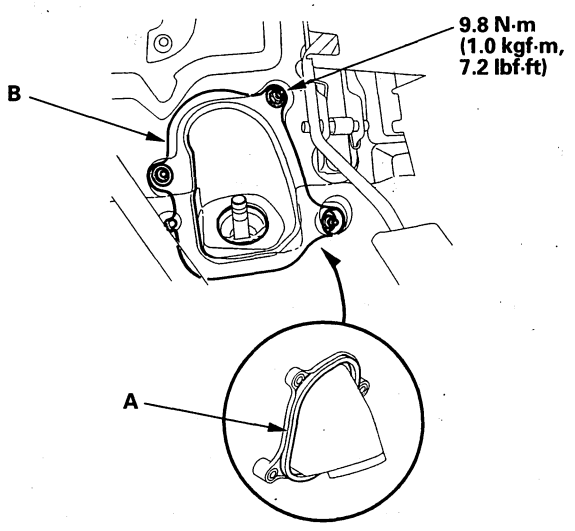


23. Install the tie-rod end ball joint nut, and tighten it to the specified torque. Then install the new cotter pin (B), and bend it as shown (C) or (D).

BACK

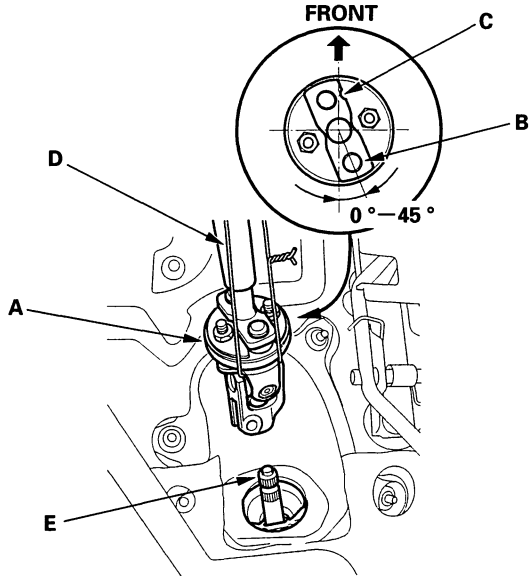
Protected by AR

24. Install the new cover seal (A) all the way around in the steering joint cover B. Make sure there are no wrinkles in the seal, then install the steering joint cover B.



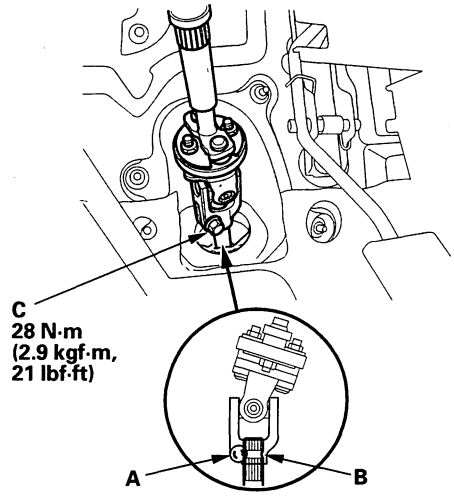
25. Center the steering rack within its stroke.

26. Position the steering column joint (A) so the bolt (B) opposite to the notch (C) is within the range shown.



27. With the rack in the straight ahead driving position, cut the wire (D) and slip the lower end of the steering joint on to pinion shaft (E).

28. Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft, and loosely install the joint bolt (C). Make sure the joint bolt is securely in the groove in the pinion shaft. Pull on the steering joint to make sure the steering joint is fully seated.



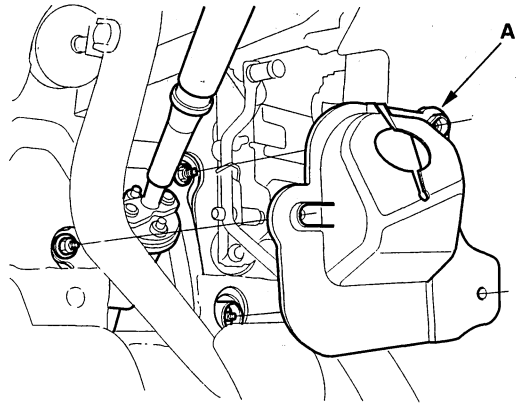
29. Tighten the steering joint bolt to the specified torque.

(cont'd)

Protected by AR

Steering Gearbox Installation (cont'd)

30. Install the steering joint cover A.



31. Install the front wheels, then set the wheels in the straight ahead position.

32. Center the cable reel by first rotating it clockwise until it stops. Then rotate it counterclockwise (about three full turns) until the arrow mark on the label points straight up. Reinstall the steering wheel (see page 17-24).

33. Fill the system with power steering fluid, and bleed air from the system (see page 17-12).

34. After installation, do the following checks.

- Start the engine, allow it to idle, and turn the steering wheel from lock-to-lock several times to warm up to the fluid. Check the gearbox for leaks (see page 17-11).
- Do the front toe inspection (see page 18-6).
- Check the steering wheel spoke angle. If steering spoke angles to the right and left are not equal (steering wheel and rack are not centered), correct the engagement of the joint/pinion shaft serrations, and repeat step 31. Then adjust the front toe by turning the tie-rod ends, if necessary.

BACK

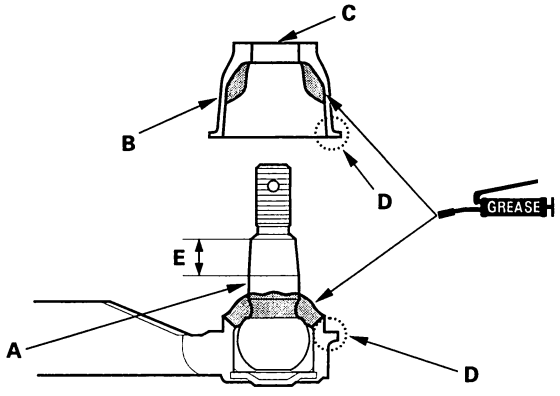
Protected by AR

Tie-rod Ball Joint Boot Replacement

Special Tools Required
Front hub dis/assembly tool 07965-SA50500

1. Remove the boot from the tie-rod end, and wipe the old grease off the ball pin.

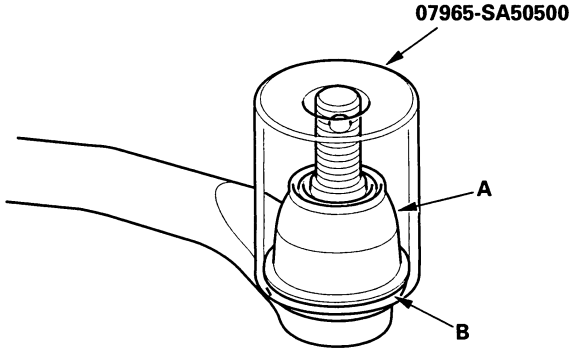
2. Pack the lower area of the ball pin (A) with fresh multipurpose grease.



3. Pack the interior of the new boot (B) and lip (C) with fresh multipurpose grease.

   Note these items when installing new grease:
   - Keep grease off the boot mounting area (D) and the tapered section (E) of the ball pin.
   - Do not allow dust, dirt, or other foreign materials to enter the boot.

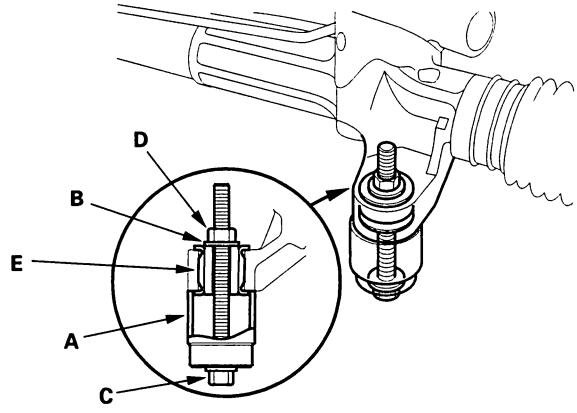
4. Install the new boot (A) using the special tool. The boot must not have a gap at the boot installation sections (B). After installing the boot, check the ball pin tapered section for grease contamination, and wipe it if necessary.



Gearbox Mount Cushion Replacement

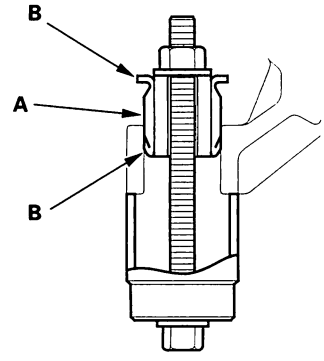
1. Remove the steering gearbox (see page 17-30).

2. Position the 34 mm socket wrench (A) on the flange part of the gearbox housing with a washer (B), 10 x 105 mm flange bolt (C) and the 10 mm nut (D) as shown.



3. Hold the flange bolt with a wrench, and tighten the nut with a wrench. Remove the gearbox mount cushion (E).

4. Apply a mild soap and water solution to the new gearbox mount cushion surface (A), then place it on the gearbox mounting cushion hole.



5. Position the 34 mm socket wrench on the flange part of the gearbox housing with a washer, flange bolt, and the nut as shown.

6. Install the gearbox mount cushion by tightening the nut until the mount cushion edges (B) properly fit on the gearbox flange surface.

Wheel Alignment

The suspension can be adjusted for front camber, front toe, and rear toe. However, each of these adjustments are related to each other. Forexample, when you adjust camber, the toe will change. Therefore you must adjust the front wheel alignment whenever you adjust camber or toe.

Pre-Alignment Checks

For proper inspection and adjustment of the wheel alignment, do these checks:

1. Release the parking brake to avoid an incorrect measurement.
2. Make sure the suspension is not modified.
3. Check the tire size and tire pressure.

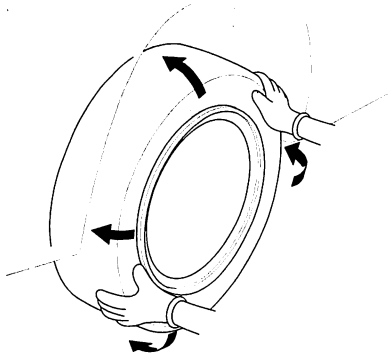
Tire size

DX ('03-05), and VP models:	**P195/65R15 89H**
LX ('03-05), LX ('06 4-door) and LX-P models:	**P205/65R15 92H**
DX ('06), LX ('06 2-door), SE, EX, EXL models:	**P205/60R16 91V**

Tire pressure

DX ('03-06), VP, LX ('06 2-door), SE, EX, EXL models:
Front: 220 kpa (2.2 kgf/cm², 32 psi)
Rear: 210 kpa (2.1 kgf/cm², 30 psi)
LX ('03-05), LX ('06 4-door) and LX-P models:
Front: 210 kpa (2.1 kgf/cm², 30 psi)
Rear: 200 kpa (2.0 kgf/cm², 29 psi)

4. Check the runout of the wheels and tires (see page 18-10).
5. Check the suspension ball joints. (Hold a wheel with your hands, and move it up and down and right and left to check for wobbling.)



6. Bounce the vehicle up and down several times to stabilize the suspension.

Caster Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Check the caster angle.

Caster angle:
DX ('03-05) and VP models: 3°10'±45'
DX ('06), LX, LX-P, SE, EX, EXL models: 3°15'±45'

2. If out of specification, check for bent or damaged suspension components.

BACK

Protected by AR

Camber Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Check the camber angle.

   Camber angle:
   Front:
   DX ('03-05) and VP models: 0 ° 03 '±45 '
   DX ('06), LX, LX-P, SE, EX, EXL models:
   0 ° 00 '±45 '
   Maximum difference between the right and left side: 0 ° 45 '
   Rear:
   DX ('03-05) and VP models: −0 ° 50 '±30 '
   DX ('06), LX, LX-P, SE, EX, EXL models:
   −1 ° 00 '±30 '

2. If out of specification, check for bent or damaged suspension components.

Front Toe Inspection/Adjustment

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

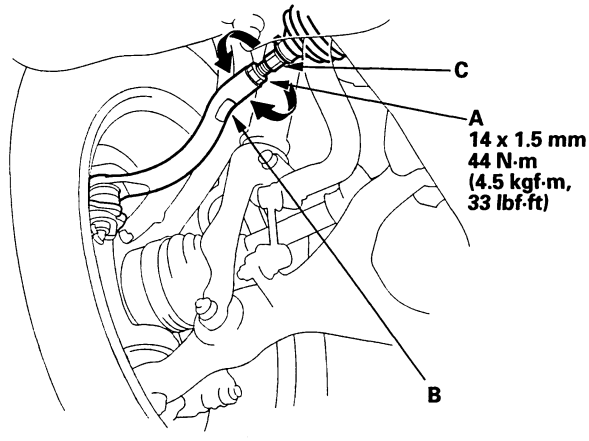
1. Center the steering wheel spokes, and install a commercially available steering wheel holder tool.

2. Check the toe with the wheels pointed straight ahead.

   Front toe-in: 0±2 mm (0±1/16 in.)

   - If no adjustment is required, remove the alignment equipment.
   - If adjustment is required, go to step 3.

3. Loosen the tie-rod locknuts (A) while holding the flat surface sections (B) of the tie-rod end with a wrench, and turn both rack ends (C) until the front toe is within specifications.



4. After adjusting, tighten the tie-rod locknuts. Reposition the rack-rod boot if it is twisted or displaced.

(cont'd)

Protected by AR

Wheel Alignment (cont'd)

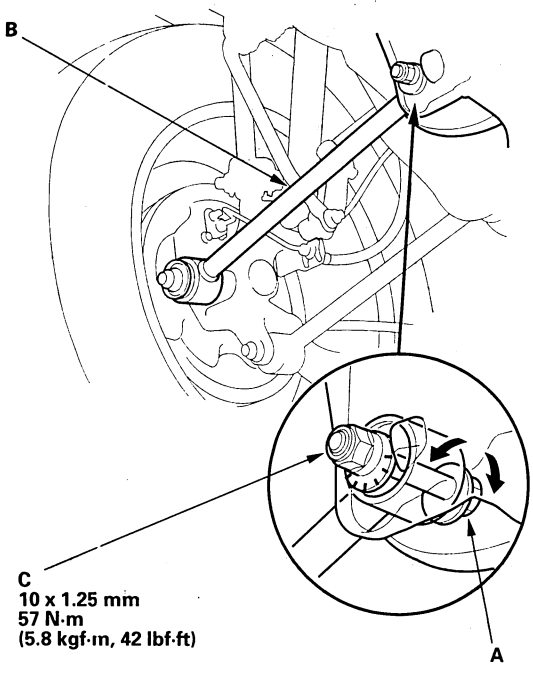
Rear Toe Inspection/Adjustment

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Release the parking brake to avoid an incorrect measurement.
2. Check the toe.

   Rear toe-in: 2±2 mm (1/16±1/16 in.)

   - If no adjustment is required, remove the alignment equipment.
   - If adjustment is required, go to step 3.
3. Hold the adjusting bolt (A) on the rear control arm (B), and loosen the self-locking nut (C).



4. Replace the self-locking nut with a new one, and lightly tighten it.

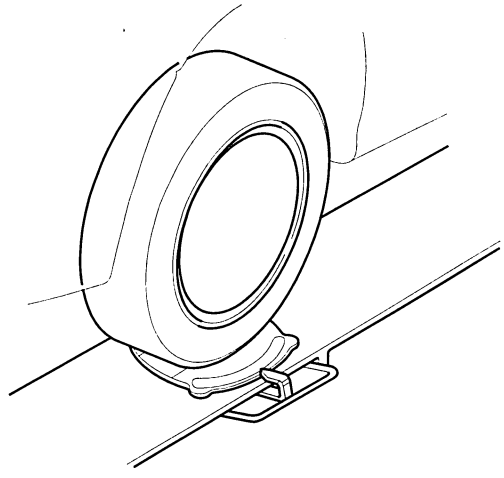
   NOTE: Always use a new self-locking nut whenever it has been loosened.
5. Adjust the rear toe by turning the adjusting bolt until the toe is correct.
6. Tighten the self-locking nut while holding the adjusting bolt.

Turning Angle Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels.

   Turning angle:
   Inward:
   DX ('03-05) and VP models: 39 ° 00 '±2 °
   DX ('06), LX, LX-P, SE, EX, EXL models: 38 ° 50 '±2 °
   Outward:
   DX ('03-05) and VP models: 31 ° 50 ' (reference)
   DX ('06), LX, LX-P, SE, EX, EXL models: 31 ° 40 ' (reference)



2. If the turning angle is not within the specifications, check for bent or damaged suspension components.

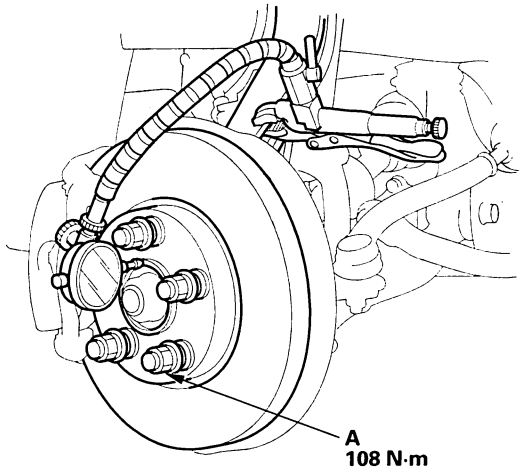
Protected by AR

Wheel Bearing End Play Inspection

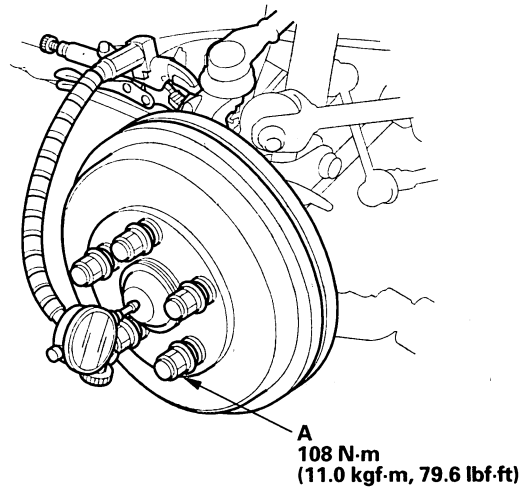
1. Raise the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the wheels, then reinstall the wheel nuts (A), and torque to the specified torque.
3. Attach the dial gauge. Place the dial gauge against the hub flange or hub cap.

Front/Rear:
Standard: 0—0.05 mm (0—0.002 in.)

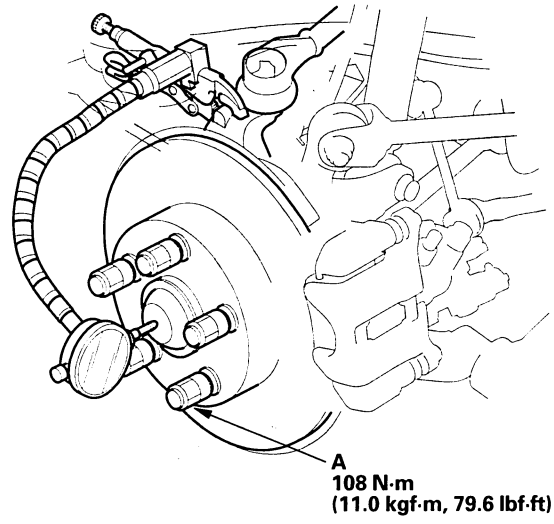
Front:



Rear-Drum Brake:



Rear-Disc Brake:



4. Measure the bearing end play by moving the brake drum or brake disc inward and outward.
5. If the bearing end play measurement is more than the standard, replace the wheel bearing or hub bearing unit.

Protected by AR

Wheel Runout Inspection

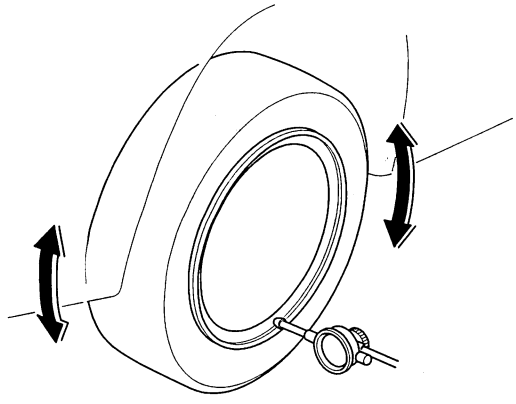
NOTE: When measuring the front wheel runout, turn the other side of the wheel slowly by hand.

1. Raise the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Check for a bent or deformed wheel.
3. Set up the dial gauge as shown, and measure the axial runout by turning the wheel.

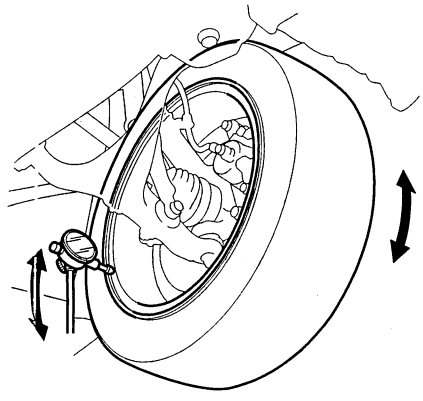
Front and rear wheel axial runout:

Standard:	
Steel wheel:	**0—1.0 mm (0—0.04 in.)**
Aluminum wheel:	**0—0.7 mm (0—0.03 in.)**
Service limit:	**2.0 mm (0.08 in.)**

Steel wheel:



Aluminum wheel:

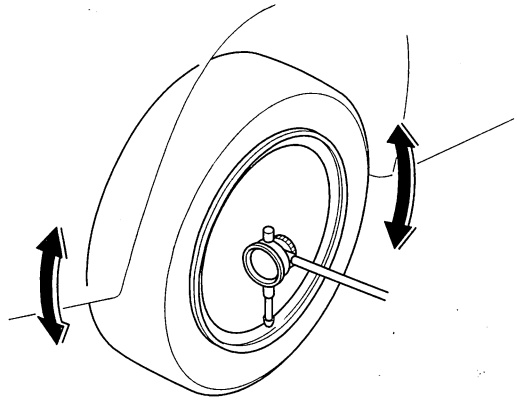


4. Reset the dial gauge to the position shown, and measure the radial runout.

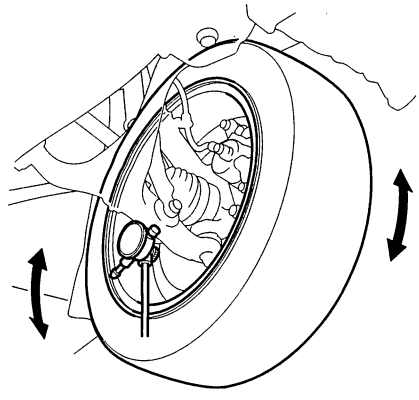
Front and rear wheel radial runout:

Standard:	
Steel wheel:	**0—1.0 mm (0—0.04 in.)**
Aluminum wheel:	**0—0.7 mm (0—0.03 in.)**
Service limit:	**1.5 mm (0.06 in.)**

Steel wheel:



Aluminum wheel:



5. If the wheel runout is not within the specification, check the wheel bearing end play (see page 18-9), and make sure the mating surfaces on the brake disc or brake drum, and the inside of the wheel are clean.
6. If the bearing end play is within the specification but the wheel runout is more than the service limit, replace the wheel.

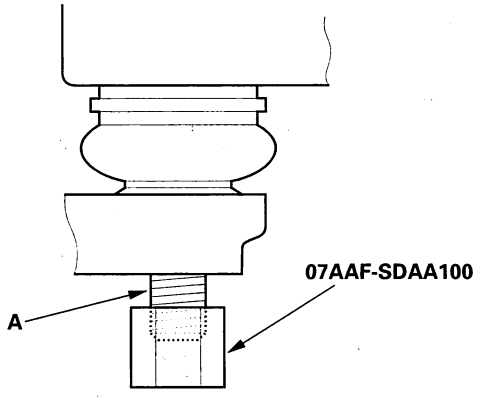
Ball Joint Removal

Special Tools Required
- Ball joint thread protector, 12 mm 07AAF-SDAA100
- Ball joint remover, 28 mm 07MAC-SL0A202

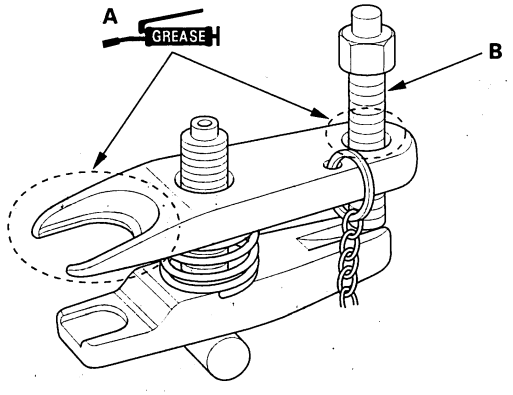
NOTICE

Always use a ball joint remover to disconnect a ball joint. Do not strike the housing or any other part of the ball joint connection to disconnect it.

1. Install the special tool onto the threads of the ball joint (A) by hand until it stops. To prevent damage to the threaded end of the ball joint pin.

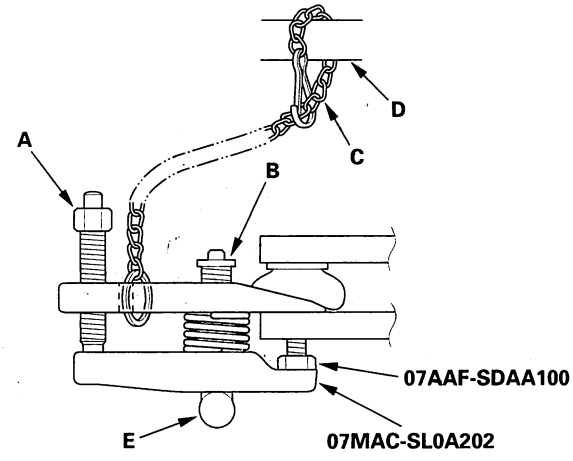


2. Apply grease to the special tool on the areas shown (A). This will ease installation of the tool and prevent damage to the pressure bolt (B) threads.



3. Loosen the pressure bolt (A), and install the special tools as shown. Insert the jaws carefully, making sure not to damage the ball joint boot. Adjust the jaw spacing by turning the adjusting bolt (B).

   NOTE: Fasten the safety chain (C) securely to a suspension arm or the subframe (D). Do not fasten it to a brake line or wire harness.



4. After adjusting the adjusting bolt, make sure the head (C) of the adjusting bolt is in the position shown to allow the jaw to pivot.

5. With a wrench, tighten the pressure bolt until the ball joint pin pops loose from the ball joint pin hole. If necessary, apply penetrating type lubricant to loosen the ball joint pin.

   NOTE: Do not use pneumatic or electric tools on the pressure bolt.

6. Remove the tool, then remove the nut from the end of the ball joint pin, and pull the ball joint out of the ball joint pin hole. Inspect the ball joint boot, and replace it if damaged.

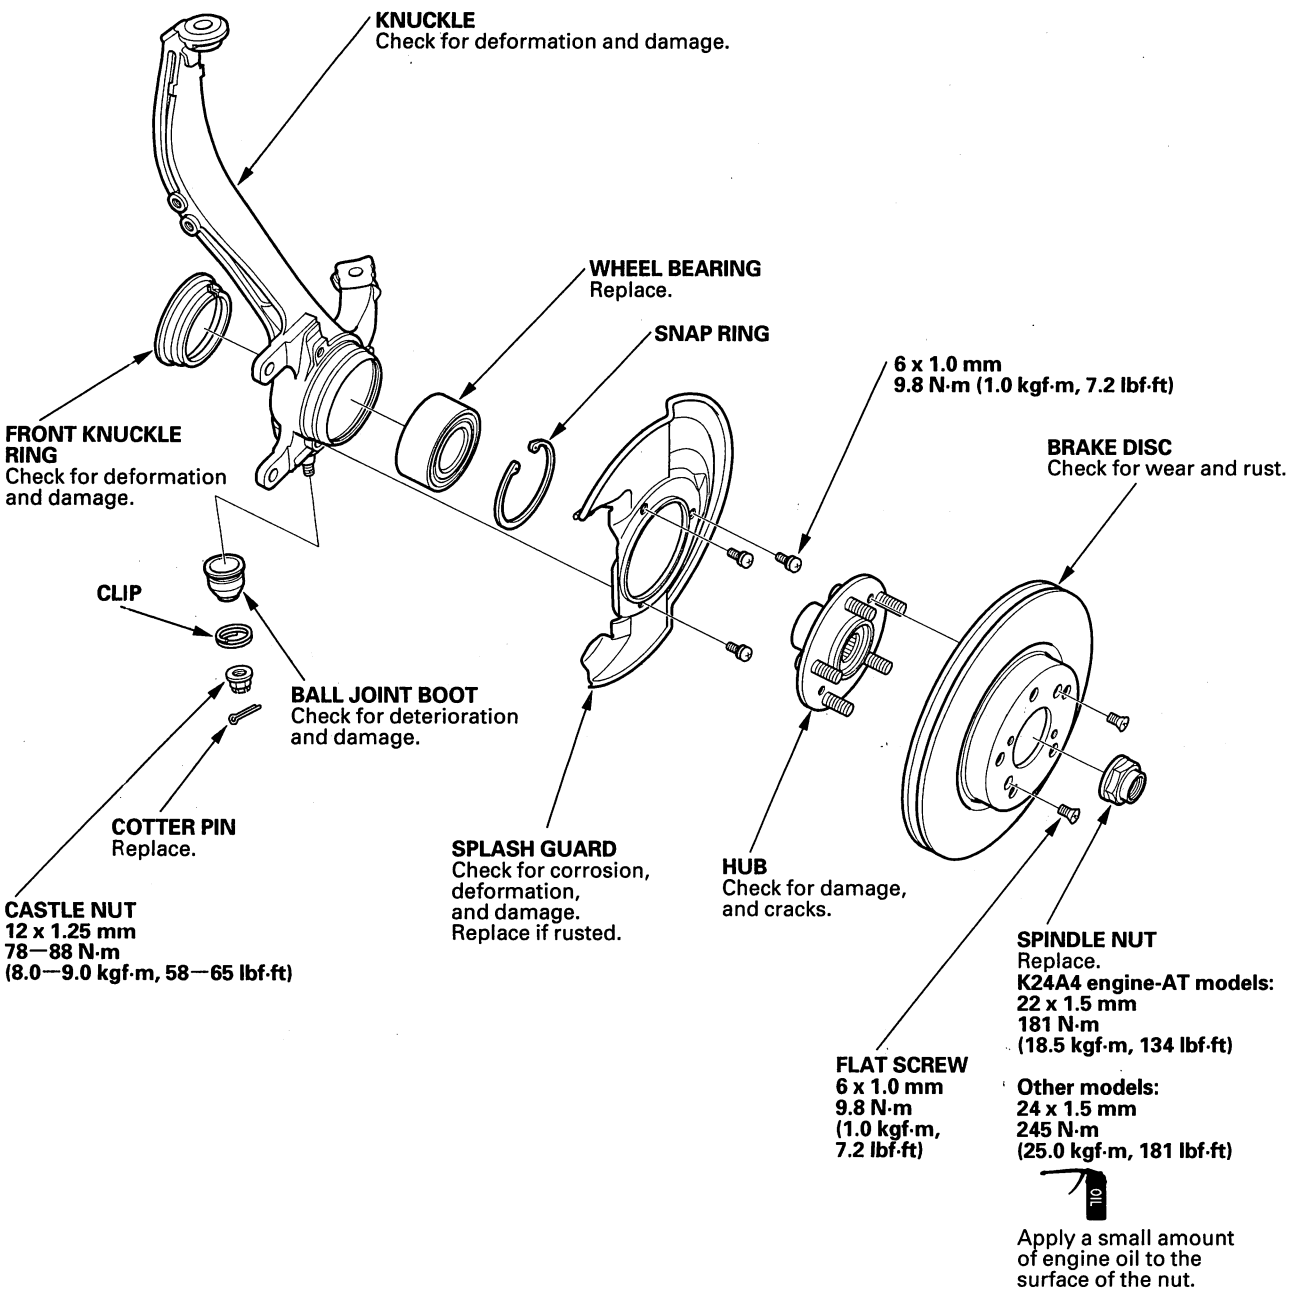
Knuckle/Hub/Wheel Bearing Replacement

Exploded View



BACK

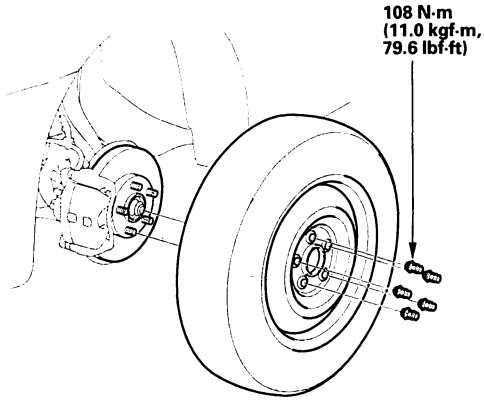
Protected by AR

Special Tools Required
- Hub dis/assembly tool, 42 mm 07GAF-SD40100
- Ball joint remover, 28 mm 07MAC-SL0A202
- Attachment, 72 x 75 mm 07746-0010600
- Attachment, 78 x 90 mm 07GAD-SD40101
- Driver 07749-0010000
- Support base 07965-SD90100
- Ball joint thread protector, 12 mm 07AAF-SDAA100

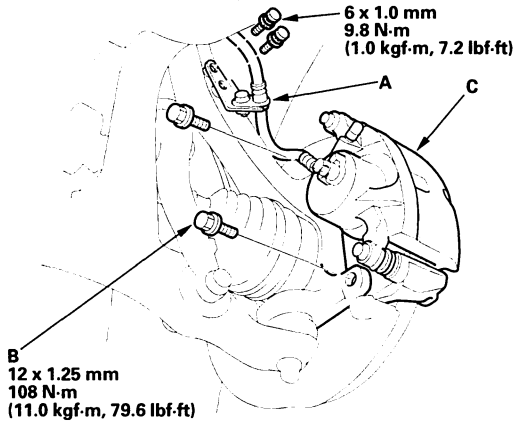
Knuckle/Hub Replacement

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see page 1-14).

2. Remove the wheel nuts and front wheel.

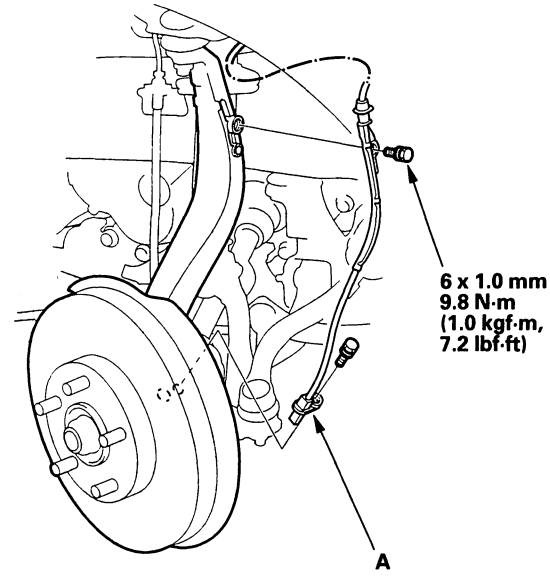


3. Remove the brake hose mounting bracket (A).

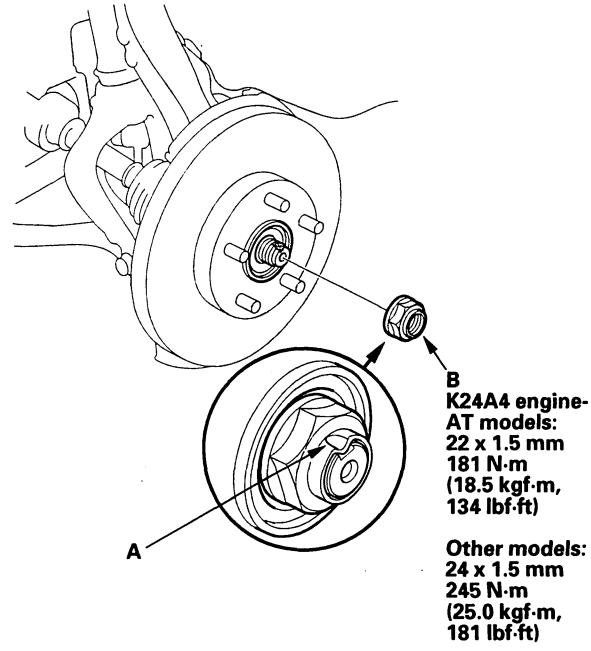


4. Remove the brake caliper bracket mounting bolts (B), and remove the caliper assembly (C) from the knuckle. To prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage. Do not twist the brake hose with force.

5. Remove the wheel sensor (A) from the knuckle. Do not disconnect the wheel sensor connector.



6. Raise the stake (A), and remove the spindle nut (B).

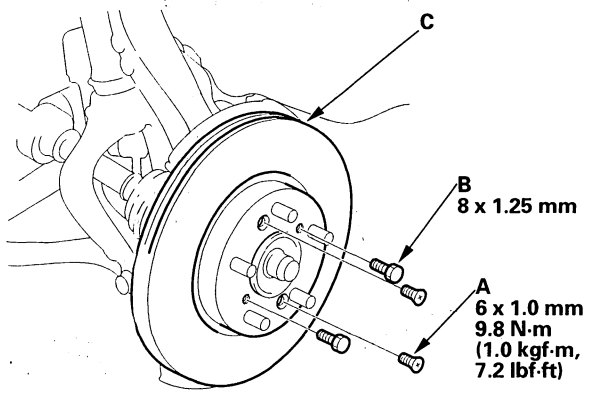


(cont'd)

Protected by AR

Knuckle/Hub/Wheel Bearing Replacement (cont'd)

7. Remove the 6 mm brake disc retaining screws (A).

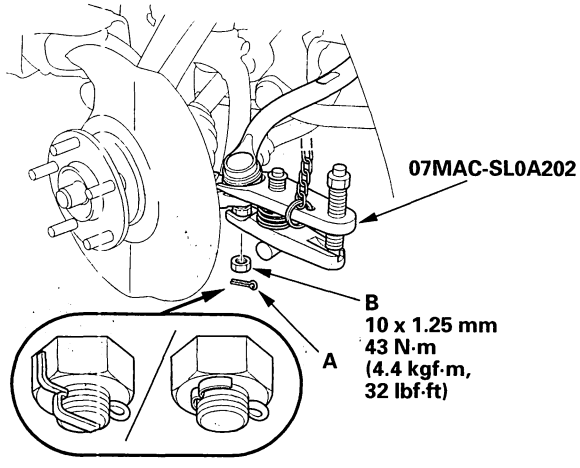


8. Screw two 8 x 1.25 mm bolts (B) into the disc to push it away from the hub. Turn each bolt two turns at a time to prevent cocking the disc excessively.

9. Remove the brake disc (C) from the hub.

10. Remove the cotter pin (A) from the tie-rod end ball joint, and loosen the nut (B).

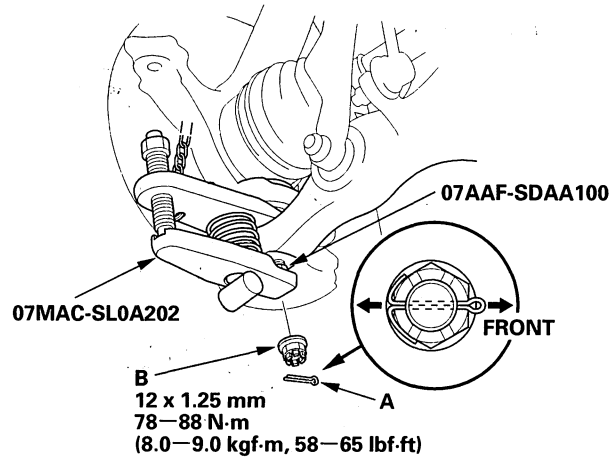
    NOTE: During installation, install the new cotter pin after tightening the nut, and bend its end as shown.



11. Disconnect the tie-rod end ball joint from the knuckle using the special tool (see page 18-11).

12. Remove the cotter pin (A) from the lower arm ball joint, and loosen the nut (B).

    NOTE:
    - To avoid damaging the ball joint, install the special tool on the threads of the ball joint.
    - Be carefull not to damage the ball joint boot when installing the remover.
    - Do not force or hammer on the lower arm, or pry between the lower arm and the knuckle. You could damage the ball joint.
    - Insert the new cotter pin in to the ball joint pin hole from the front to the rear of the vehicle, and bend its end as shown.



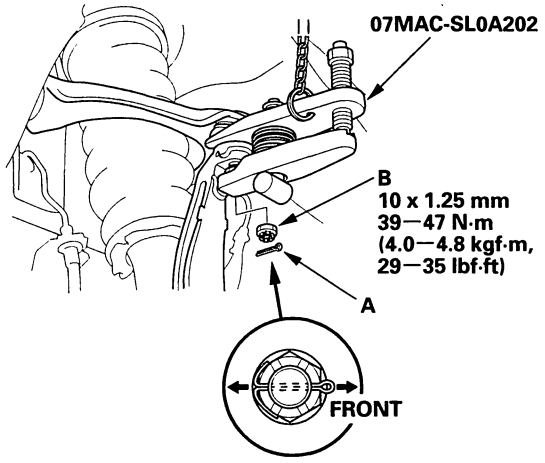
13. Disconnect the lower arm ball joint from the lower arm using the special tools (see page 18-11).

BACK

Protected by AR

14. Remove the cotter pin (A) from the upper arm ball joint, and loosen the nut (B).

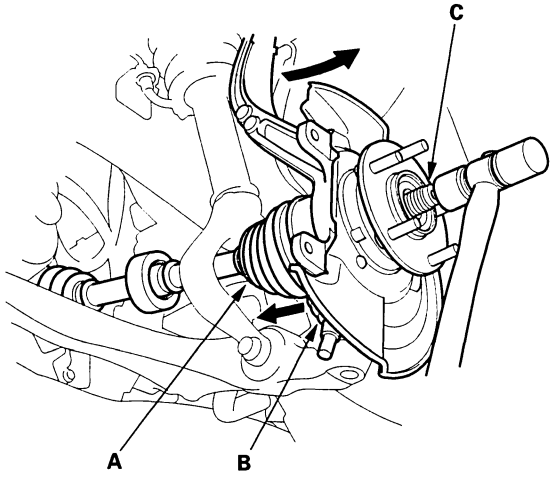
    NOTE: During installation, insert the new cotter pin into the ball joint pin from the front to the rear of the vehicle, and bend its end as shown.



15. Disconnect the upper arm ball joint from the knuckle using the special tool (see page 18-11).

16. Remove the driveshaft outboard joint (A) from the knuckle (B) by tapping the driveshaft end (C) with a plastic hammer while drawing the hub outward, then remove the knuckle.

    NOTE: Do not pull the driveshaft end outward. The inner driveshaft joint may come apart.



17. Install the knuckle/hub in the reverse order of removal, and note these items:

    - Be careful not to damage the ball joint boot when installing the knuckle.
    - Tighten all mounting hardware to the specified torque values.
    - Before connecting the lower arm ball joint to the lower arm, degrease the threaded section and tapered portion of the ball joint pin, the lower arm connecting hole, and the threaded section and mating surface of the castle nut.
    - First install all the components and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values. Do not place the jack against the ball joint pin of the knuckle.
    - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
    - Install a new cotter pin on the castle nut after torquing.
    - Use a new spindle nut on reassembly.
    - Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the driveshaft.
    - Before installing the brake disc, clean the mating surface of the front hub and the inside of the brake disc.
    - Before installing the wheel, clean the mating surface of the brake disc and the inside of the wheel.
    - Check the front wheel alignment, and adjust it if necessary (see page 18-6).

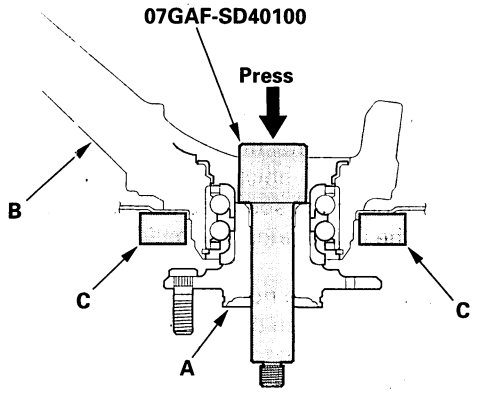
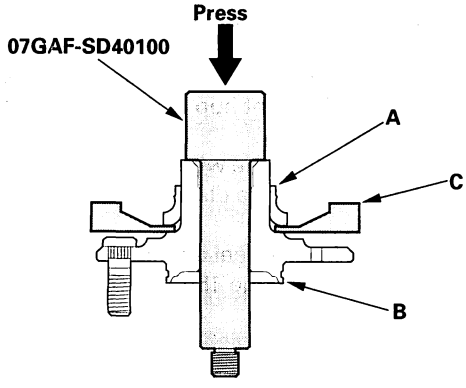
Knuckle/Hub/Wheel Bearing Replacement (cont'd)

Wheel Bearing Replacement

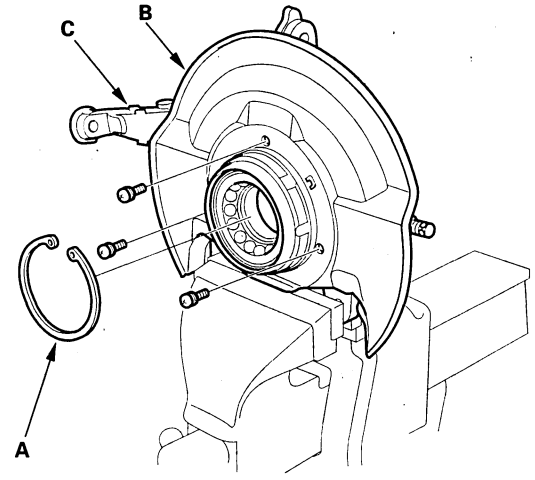
1. Separate the hub (A) from the knuckle (B) using the special tool and a hydraulic press. Hold the knuckle with the attachment (C) of the hydraulic press or equivalent tool. Be careful not to deform the splash guard. Hold onto the hub to keep it from falling when pressed clear.



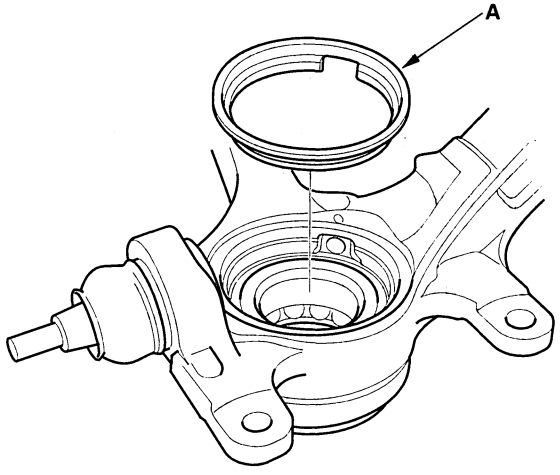
2. Press the wheel bearing inner race (A) off of the hub (B) using the special tool, commercially available bearing separator (C), and a press.



3. Remove the snap ring (A) and the splash guard (B) from the knuckle (C).



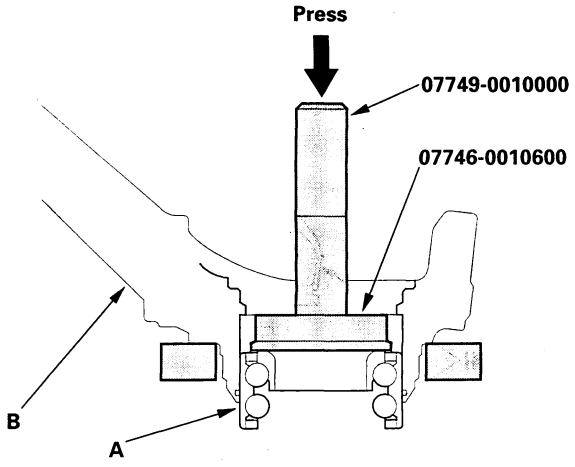
4. Check the front knuckle ring (A) for damage or deformation, and replace it if necessary.



BACK

Protected by AR

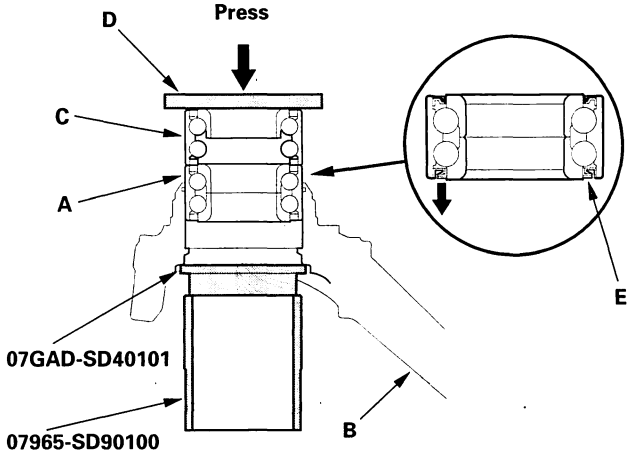
5. Press the wheel bearing (A) out of the knuckle (B) using the special tools and a press.



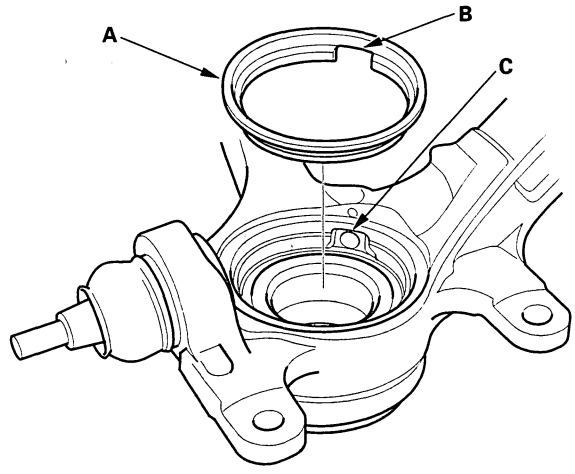
6. Wash the knuckle and hub thoroughly in high flash point solvent before reassembly.

7. Press a new wheel bearing (A) into the knuckle (B) using the old bearing (C), a steel plate (D), the special tools, and a press.

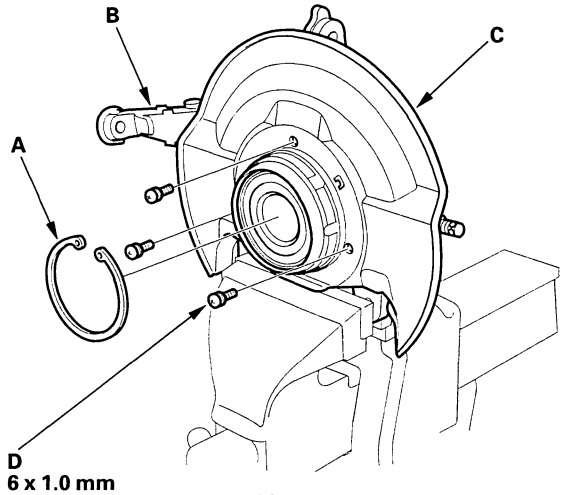
NOTE:
- Install the wheel bearing with the wheel sensor magnetic encoder (E) (brown color), toward the inside of the knuckle.
- Remove any oil, grease, dust, metal debris, and other foreign material from the encoder surface.
- Keep any magnetic tools away from the encoder surface.
- Be careful not to damage the encoder surface when you insert the wheel bearing.



8. Install the new front knuckle ring (A) on the inside of the knuckle by aligning the cutout portion (B) on the ring with the wheel sensor hole (C) in the knuckle. Be careful not to damage or deform the ring when installing it.



9. Install the snap ring (A) securely in the knuckle (B).



6 x 1.0 mm
9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)

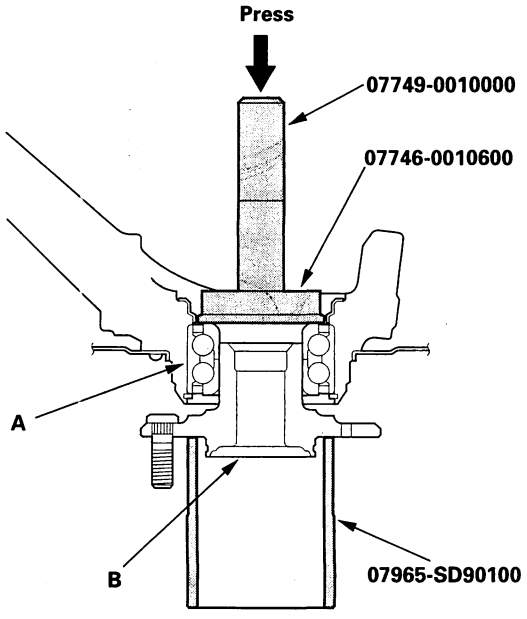
10. Install the splash guard (C), and tighten the screws (D) to the specified torque value.

(cont'd)

Protected by AR

Knuckle/Hub/Wheel Bearing Replacement (cont'd)

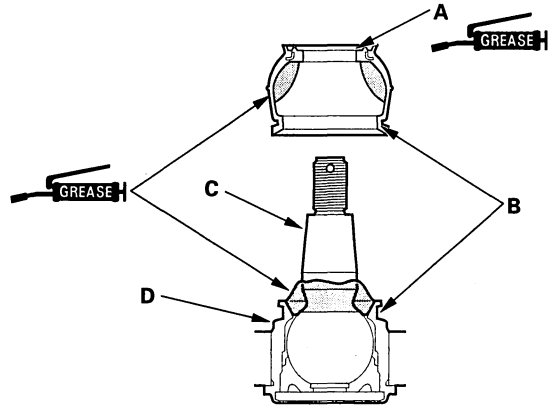
11. Press a wheel bearing (A) onto the hub (B) using the special tools and a press.



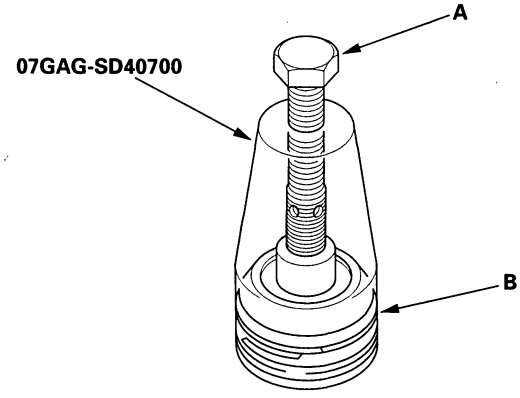
Ball Joint Boot Replacement

Special Tools Required
Ball joint boot clip guide 07GAG-SD40700

1. Remove the boot clip and the boot.
2. Pack the interior and lip (A) of a new boot with grease. Keep the grease off of the boot-to-knuckle mating surface (B).



3. Wipe the grease off the tapered portion of the pin (C), and pack fresh grease into the base (D). Do not let dirt, or other foreign materials get into the boot.
4. Install the boot on the ball joint, then squeeze it gently to force out any air.
5. Adjust the special tool with the adjusting bolt (A) until its base is just above the groove around the bottom of the boot. Then slide the clip (B) over the tool and into position on the boot.



6. After installing a boot, wipe any grease off the exposed portion of the ball joint pin.

BACK

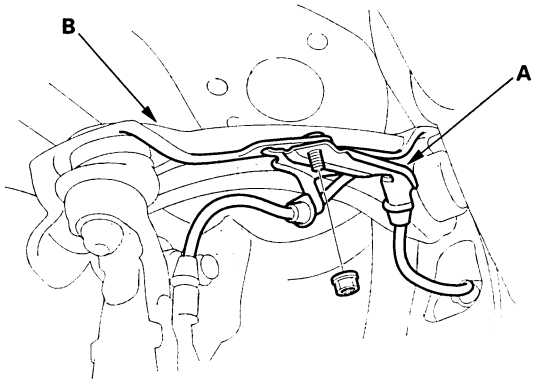
Protected by AR

Upper Arm Replacement

Special Tools Required
Ball joint remover, 28 mm 07MAC-SL0A202

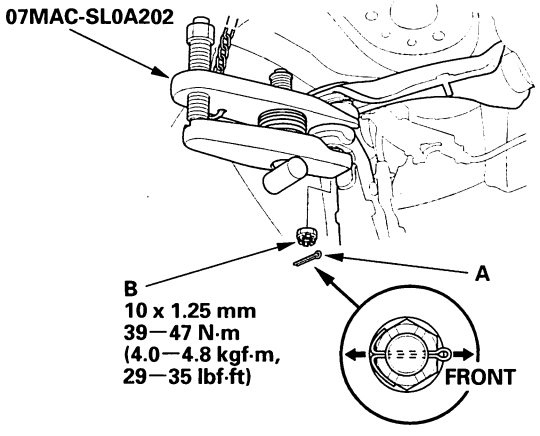
1. Remove the front damper (see page 18-25).

2. Remove the wheel sensor bracket (A) from the upper arm (B).



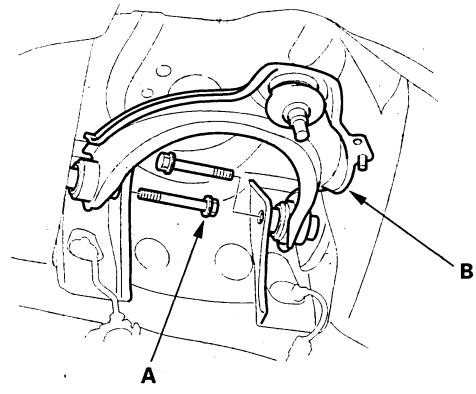
3. Remove the cotter pin (A) from the upper arm ball joint, and loosen the nut (B).

   NOTE: During installation, insert the new cotter pin into the ball joint pin hole from the front to the rear of vehicle, and bend its end as shown.

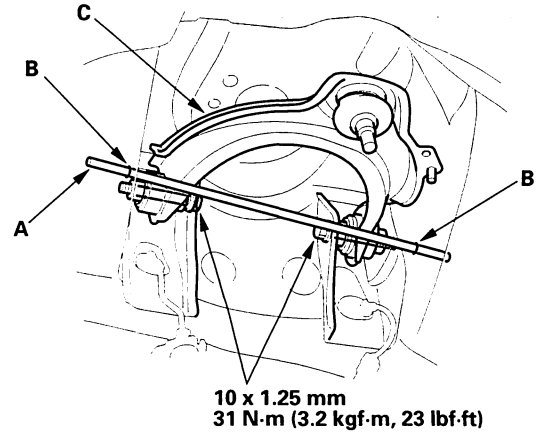


4. Disconnect the upper arm ball joint from the knuckle using the special tool (see page 18-11).

5. Remove the upper arm mounting bolts (A), and remove the upper arm (B).



6. Install the upper arm by inserting a rod (A) of appropriate size (O.D. 6 mm/L: 300 mm) into the positioning holes (B), and place the upper arm (C) on the rod to position it before tightening the upper arm mounting bolts.



(cont'd)

Protected by AR

Upper Arm Replacement (cont'd)

7. Install the remaining parts in the reverse order of removal, and note these items:

   - Be careful not to damage the ball joint boot when installing the knuckle.
   - Tighten all mounting hardware to specified torque values.
   - First install all the components and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values. Do not place the jack against the ball joint pin of the knuckle.
   - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
   - Install a new cotter pin on the castle nut after torquing.
   - Before installing the wheel, clean the mating surface on the brake disc and the inside of the wheel.
   - Check the front wheel alignment, and adjust it if necessary (see page 18-6).

Lower Arm Removal/Installation

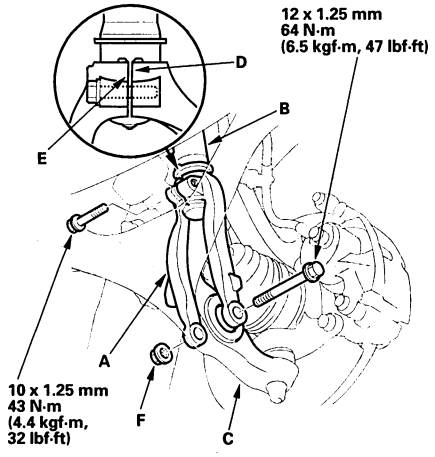
Special Tools Required
- Ball joint remover, 28 mm 07MAC-SL0A202
- Ball joint thread protector, 12 mm 07AAF-SDAA100

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see page 1-14).

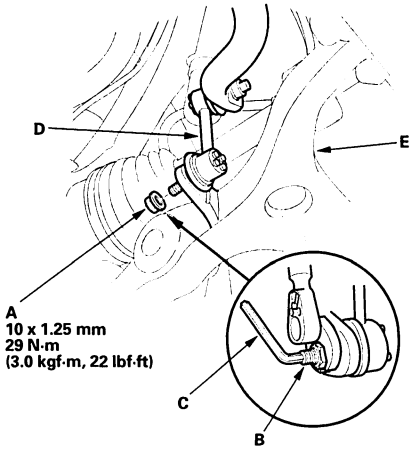
2. Remove the front wheel.

3. Remove the damper fork (A) from the damper (B) and lower arm (C).

   NOTE: During installation, insert the damper fork into the damper lower end so the aligning tab (D) is aligned with the slot (E) in the damper fork. Replace the damper fork mounting nut (F) with a new one.



4. Remove the flange nut (A) while holding the joint pin (B) with a hex wrench (C), and disconnect the stabilizer link (D) from the lower arm (E).

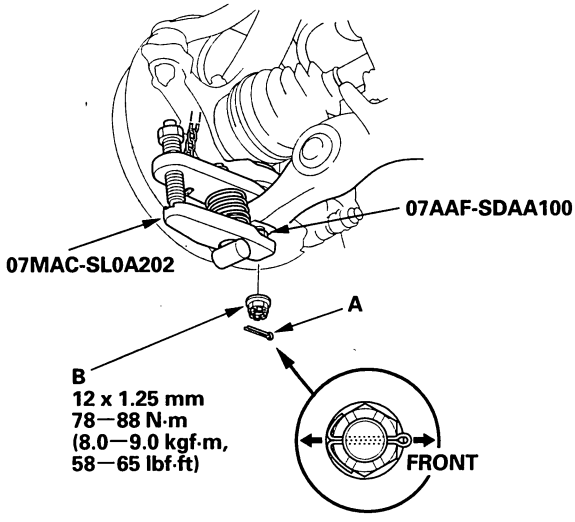


BACK

Protected by AR

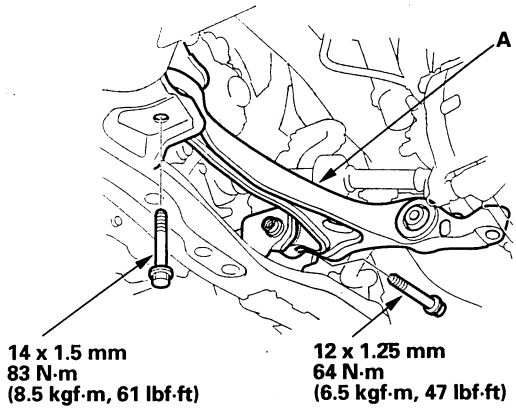
5. Remove the cotter pin (A) from the lower arm ball joint castle nut (B), and remove the nut.

NOTE:
- To avoid damaging the ball joint, install the special tool on the threads of the ball joint.
- Be careful not to damage the ball joint boot when installing the remover.
- Do not force or hammer on the lower arm, or pry between the lower arm and knuckle. You could damage the ball joint.
- Insert the new cotter pin into the ball joint pin hole from the front to the rear of vehicle, and bend its end as shown.



6. Disconnect the lower arm ball joint from the knuckle using the special tools (see page 18-11).

7. Remove the flange bolts, and remove the lower arm (A).



8. Install the lower arm in the reverse order of removal, and note these items:

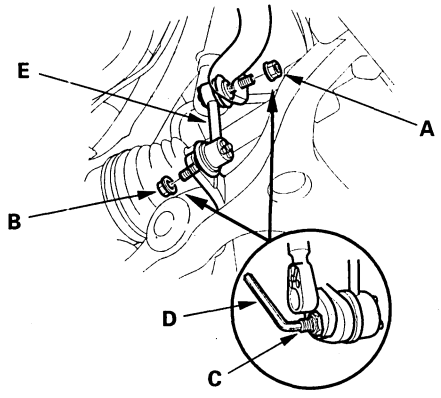
- Be careful not to damage the ball joint boot when installing the knuckle.
- Tighten all mounting hardware to the specified torque values.
- Before connecting the lower arm ball joint to the lower arm, degrease the threaded section and tapered portion of the ball joint pin, the lower arm connecting hole, and the threaded section and mating surface of the castle nut.
- First install all the components and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values. Do not place the jack against the ball joint pin of the knuckle.
- Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
- Install a new cotter pin on the castle nut after torquing.
- Before installing the wheel, clean the mating surface of the brake disc and the inside of the wheel.
- Check the wheel alignment, and adjust it if necessary (see page 18-6).

Protected by AR

Stabilizer Link Replacement

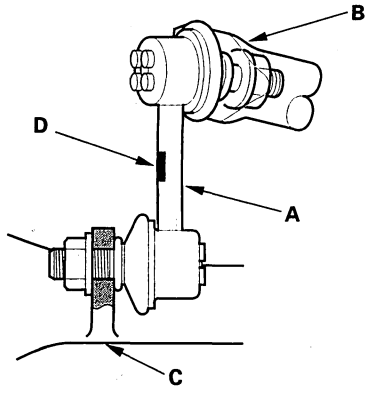
1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see page 1-14). Remove the front wheels.

2. Remove the self-locking nut (A) and flange nut (B) while holding the respective joint pin (C) with a hex wrench (D), and remove the stabilizer link (E).



3. Install the stabilizer link (A) on the stabilizer bar (B) and lower arm (C) with the joint pins set at the center of their range of the movement.

   NOTE: The left stabilizer link has a yellow paint mark (D), while the right stabilizer link has a white paint mark.



4. Install a new self-locking nut and flange nut, and lightly tighten them.

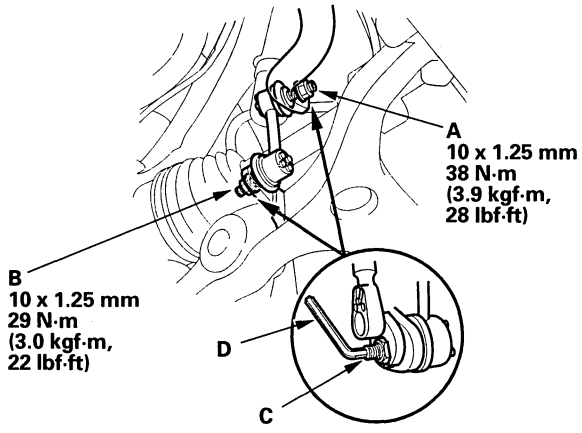
   NOTE: Use a new self-locking nut on reassembly.

5. Place the floor jack under the lower arm, and raise the suspension to load it with the vehicle's weight.

   NOTICE

   Do not place the jack against the ball joint pin of the knuckle.

6. Tighten the new self-locking nut (A) and flange nut (B) to the specified torque values while holding the respective joint pins (C) with a hex wrench (D).



7. After 5 minutes of driving, tighten the self-locking nut again to the specified torque value.

BACK

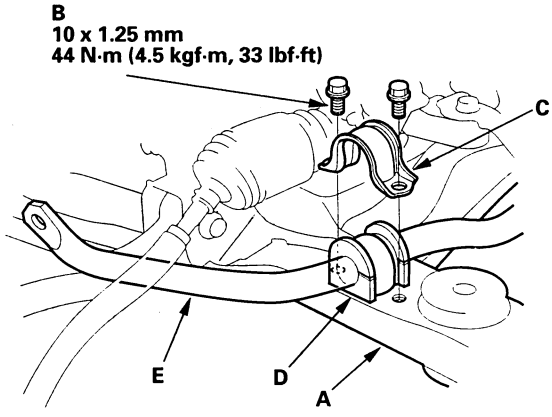
Protected by AR

Stabilizer Bar Replacement

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see page 1-14). Remove the front wheels.

2. Disconnect the stabilizer links from the stabilizer bar on the right and left (see page 18-22).

3. Remove the front suspension subframe (A) from the body (see page 20-228).



4. Remove the flange bolts (B) and bushing holders (C), then remove the bushings (D) and the stabilizer bar (E).

5. Install the stabilizer bar in the reverse order of removal, and note these items:

   - Note the right and left direction of the stabilizer bar.
   - Align the ends of the paint marks (A) on the stabilizer bar with each end of the bushings (B).
   - Note the fore/aft direction of the bushing holders.
   - Refer to Stabilizer Link Replacement to connect the stabilizer bar to the links (see page 18-22).

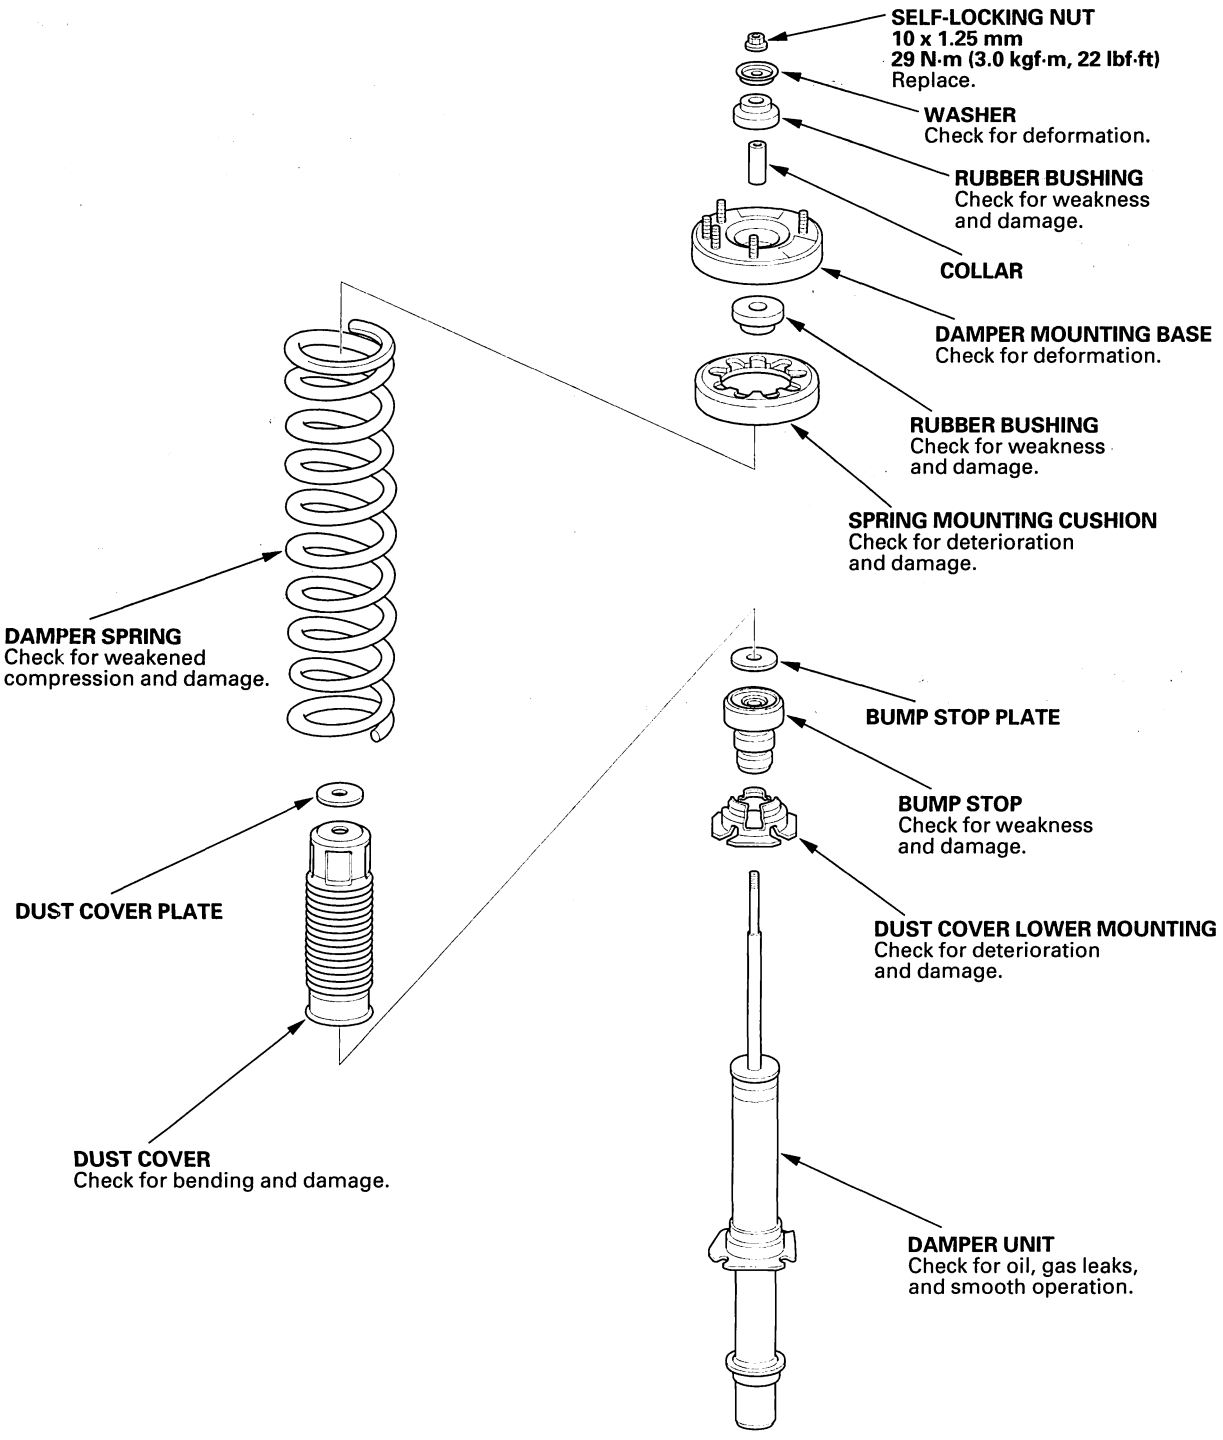
Damper/Spring Replacement

Exploded View



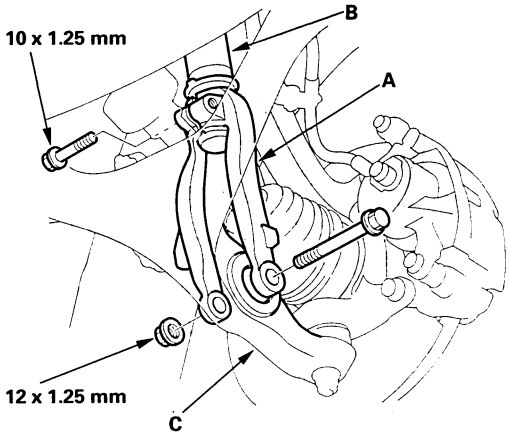
BACK

Protected by AR

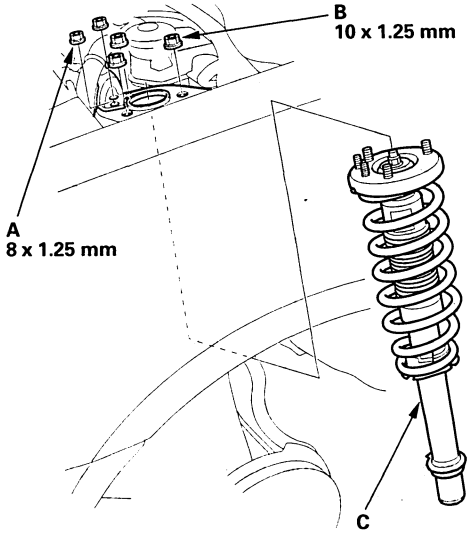
NOTE: When compressing the damper spring, use a commercially available strut spring compressor (Branick MST-580A or Model 7200, or equivalent). According to the manufacturer's instructions.

Removal

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the front wheel.
3. Remove the damper fork (A) from the damper (B) and lower arm (C).

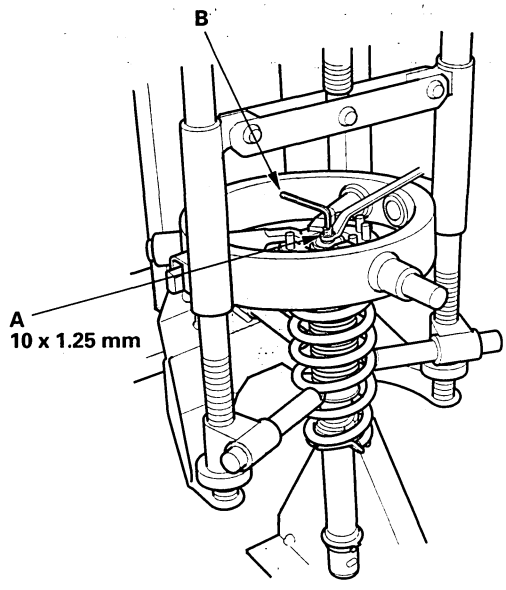


4. Remove the two 8 mm flange nuts (A) and three 10 mm flange nuts (B) from the top of the damper, and remove the damper assembly (C) .



Disassembly/Inspection

1. Compress the damper spring, then remove the self-locking nut (A) while holding the damper shaft with a hex wrench (B). Do not compress the spring more than necessary to remove the nut.



2. Release the pressure from the strut spring compressor, then disassemble the damper as shown in the Exploded View.

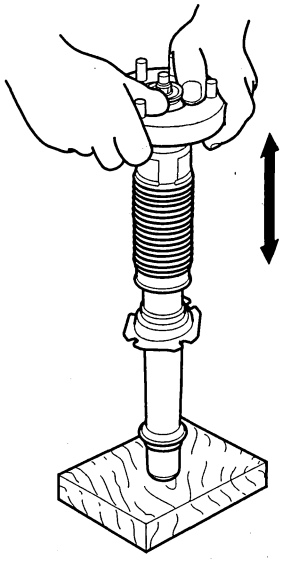
(cont'd)

Protected by AR

Damper/Spring Replacement (cont'd)

3. Reassemble all the parts, except for the spring mounting cushion and spring.

4. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced.



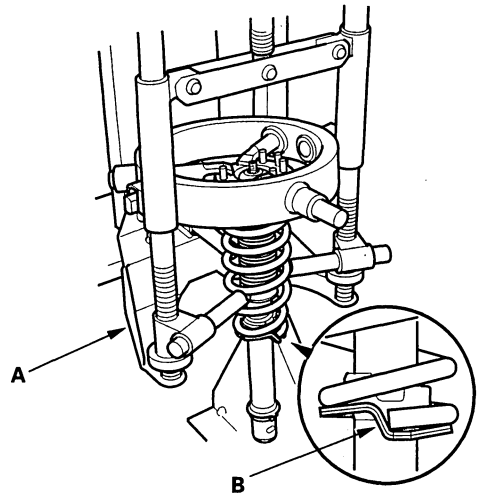
5. Check for oil leaks, abnormal noises, and binding during these tests.

Reassembly

NOTE: Refer to the Exploded View as needed.

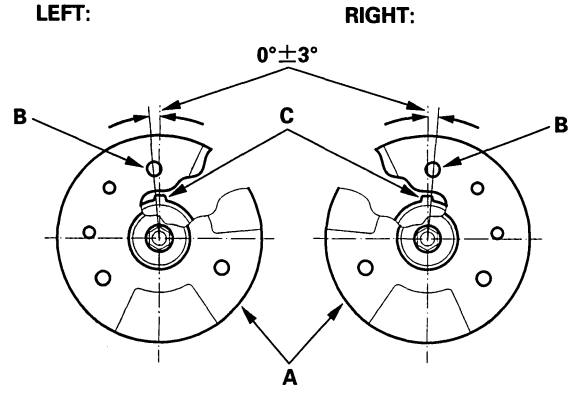
1. Assemble the damper disassembled parts except for the washer and self-locking nut.

2. Install the damper assembly on commercially available strut spring compressor (A), and compress the spring lightly.



3. Align the bottom of the spring and the stepped part (B) of the lower spring seat.

4. Position the damper mounting base (A) so the stud bolt (B) in it is aligned with the aligning tab (C) in the damper unit.

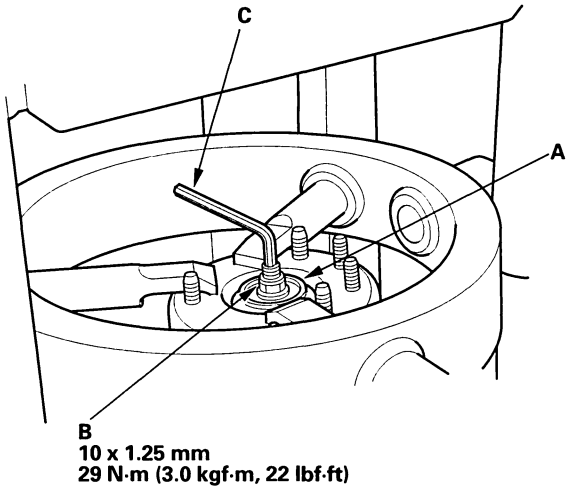


5. Compress the damper spring. Do not compress the spring excessively.

BACK

Protected by AR

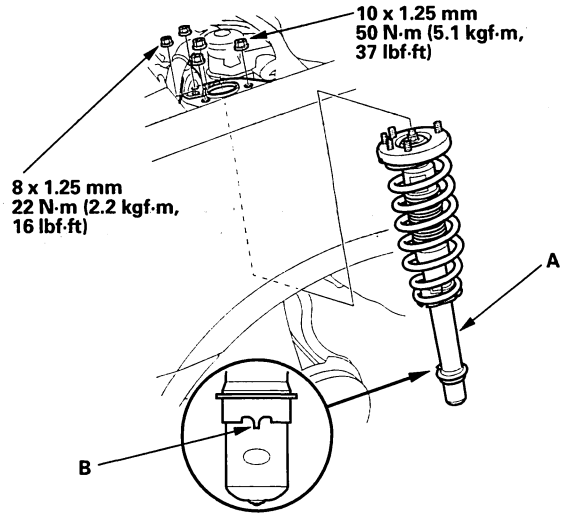
6. Install the washer (A) and a new 10 mm self-locking nut (B). Hold the damper shaft with a hex wench (C), and tighten the 10 mm self-locking nut to the specified torque value.



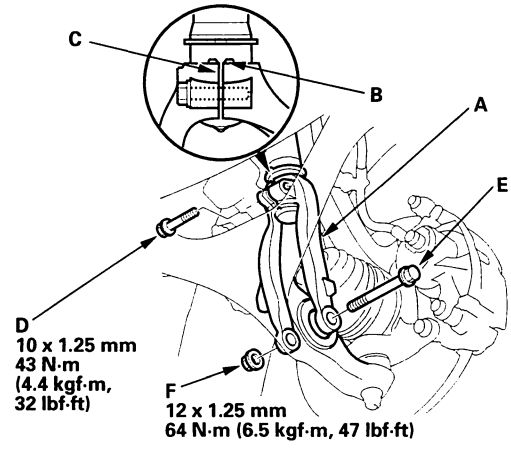
7. Remove the damper assembly from the strut spring compressor.

Installation

1. Position the damper assembly (A) in the body with the aligning tab (B) facing inside, then loosely install the flange nuts.



2. Install the damper fork (A) over the driveshaft and onto the lower arm. Install the front damper in the damper fork so the aligning tab (B) is aligned with the slot (C) in the damper fork.



3. Loosely install the damper pinch bolt (D) into the damper fork.

4. Install the flange bolt (E) to the damper fork and lower arm, and lightly tighten the new damper fork mounting nut (F).

   NOTE: Use a new damper fork mounting nut on reassembly.

(cont'd)

Protected by AR

Damper/Spring Replacement (cont'd)

5. Place the floor jack under the lower arm, and raise the suspension to load it with the vehicle's weight.
6. Tighten the flange nuts on the top of the damper to the specified torque values.
7. Tighten the damper pinch bolts to the specified torque value.
8. Tighten the flange nut on the damper fork to the specified torque value.
9. Clean the mating surface of the brake disc and the inside of the wheel, then install the front wheel.

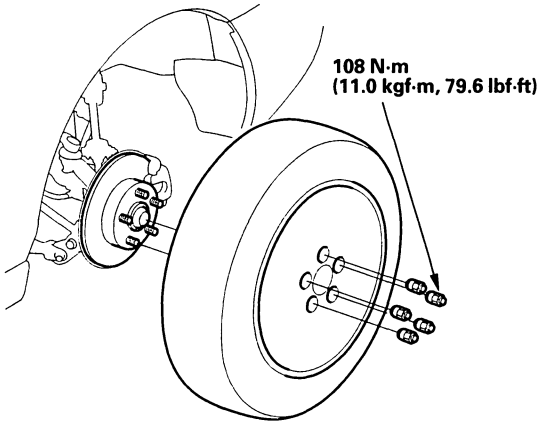
Ball joint remover, 28 mm 07MAC-SL0A202

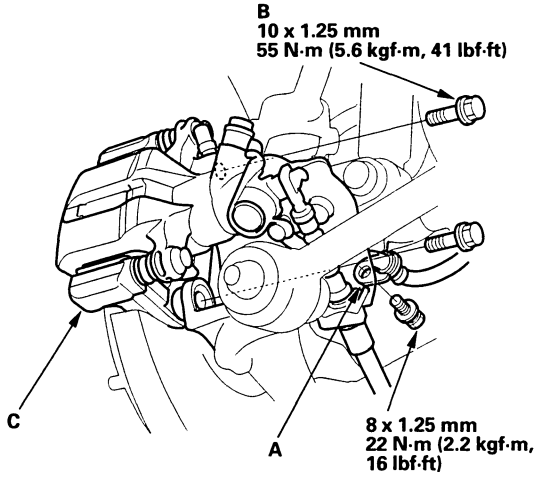
Hub Replacement-Disc Brake

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).

2. Remove the wheel nuts and rear wheel.

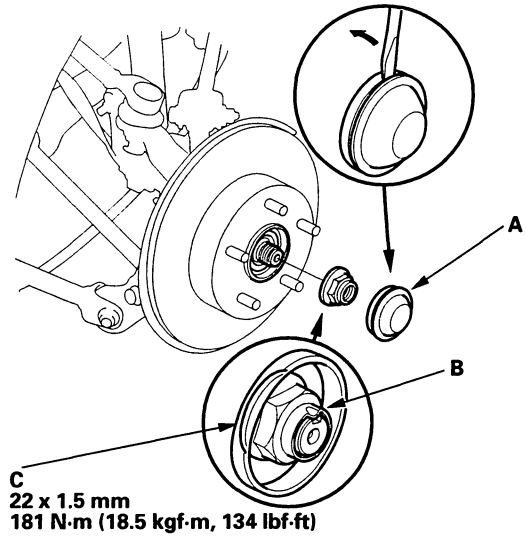


3. Remove the brake hose mounting bracket (A).



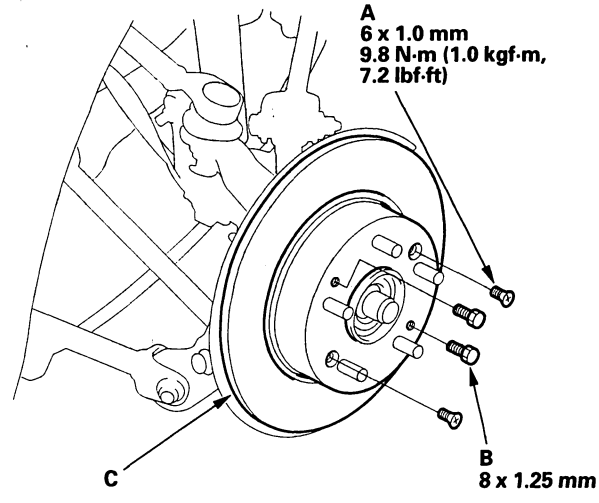
4. Remove the brake caliper bracket mounting bolts (B), and remove the caliper assembly (C) from the knuckle. To prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage. Do not twist the brake hose with force.

5. Remove the hub cap (A).



6. Raise the stake (B), and remove the spindle nut (C).

7. Remove the 6 mm brake disc retaining screws (A).



8. Screw two 8 x 1.25 mm bolts (B) into the disc to push it away from the hub. Turn each bolt two turns at a time to prevent cocking the disc excessively.

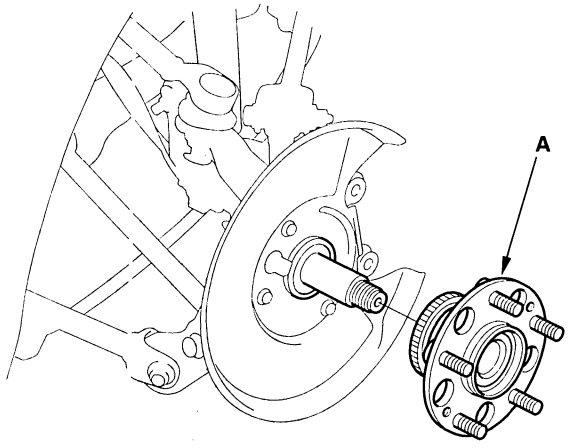
9. Remove the brake disc (C).

(cont'd)

Protected by AR

Knuckle/Hub Replacement (cont'd)

10. Remove the hub bearing unit (A).



11. Install the hub bearing unit in the reverse order of removal, and note these items:

- Tighten all mounting hardware to the specified torque values.
- Use a new spindle nut on reassembly.
- Wash the spindle thoroughly in high flash point solvent before reassembly.
- Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the driveshaft.
- Before installing the brake disc, clean the matching surfaces of the hub bearing unit and brake disc.
- Before installing the wheel, clean the mating surfaces of the brake disc and the inside of the wheel.
- Check the wheel alignment, and adjust it if necessary (see page 18-6).

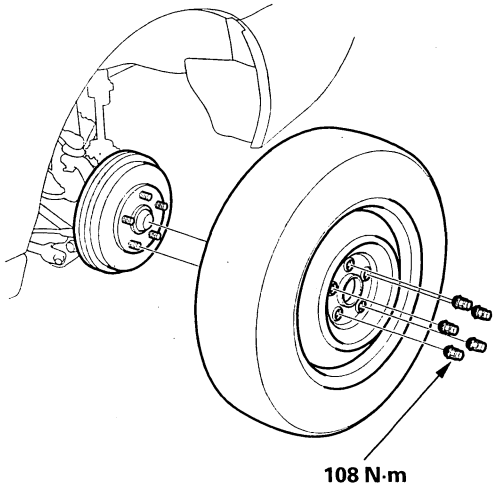
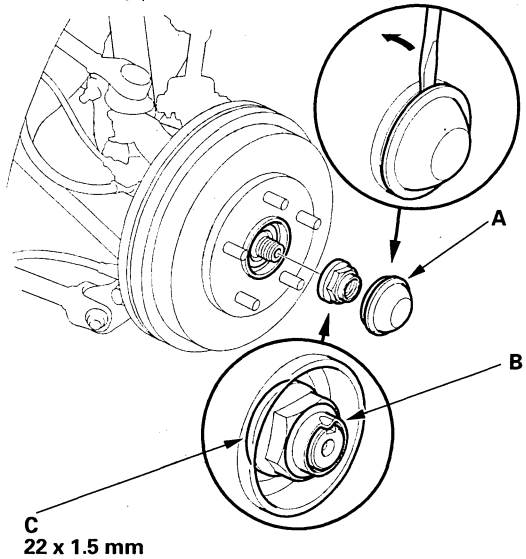
Hub Replacement-Drum Brake

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).

2. Remove the wheel nuts and rear wheel.

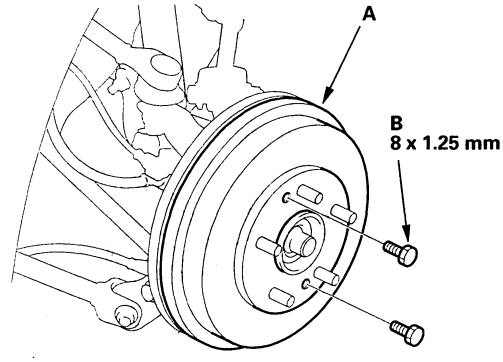


3. Remove the hub cap (A).

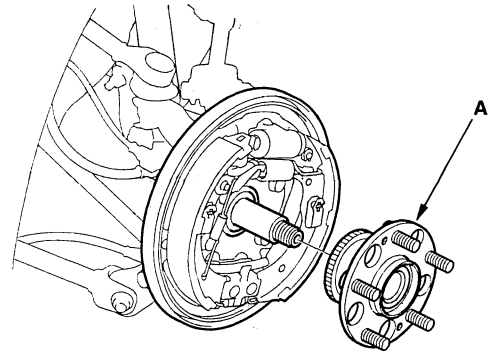


4. Raise the stake (B), and remove the spindle nut (C).

5. Release the parking brake lever, and remove the brake drum (A). Screw two 8 x 1.25 mm bolts (B) into the drum to push it away from the hub. Turn each bolt two turns at a time to prevent cocking the drum excessively.



6. Remove the hub bearing unit (A).



7. Install the hub bearing unit in the reverse order of removal, and note these items:

- Tighten all mounting hardware to the specified torque values.
- Wash the spindle thoroughly in high flash point solvent before reassembly.
- Use a new spindle nut reassembly.
- Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the driveshaft.
- Before installing the brake drum, clean the matching surfaces of the hub bearing unit and brake drum.
- Before installing the wheel, clean the mating surfaces of the brake drum and the inside of the wheel.
- Check the wheel alignment, and adjust it if necessary (see page 18-6).

Knuckle/Hub Replacement (cont'd)

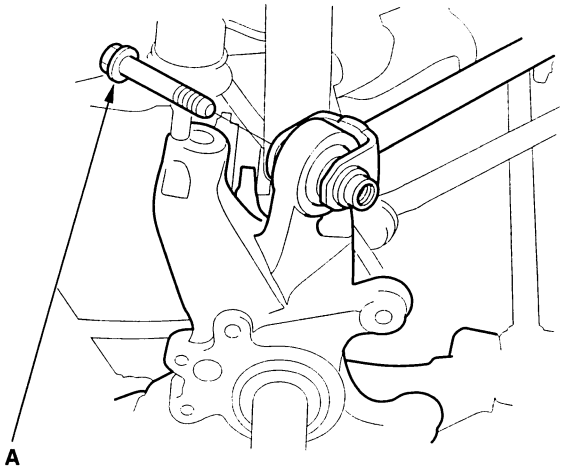
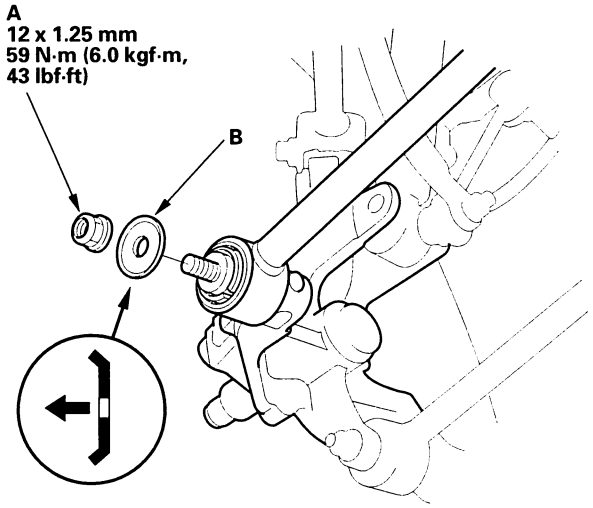
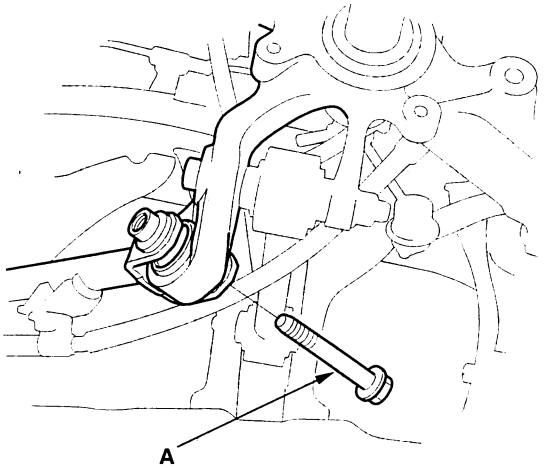
9. Remove the leading arm mounting bolt (A) from the knuckle.



10. Remove the control arm mounting nut (A) and washer (B) from the knuckle.



11. Remove the trailing arm mounting bolt (A) from the knuckle.



12. Remove the lower arm mounting bolt (A), then remove the knuckle (B).

BACK

Protected by AR

13. Install the knuckle in the reverse order of removal, and note these items:

- Be careful not to damage the ball joint boot when installing the knuckle.
- Tighten all mounting hardware to the specified torque values.
- First install all the components and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values.
- Use a new lower arm mounting nut and control arm mounting nut on reassembly.
- Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
- Install a new lock pin on the castle nut after torquing.
- Before installing the wheel, clean the mating surface on the brake drum and the inside of the wheel.
- Fill the master cylinder reservoir to the MAX (upper) level line, and bleed the brake system (see page 19-9). Check for a leak at the brake line to wheel cylinder, and retighten if necessary.
- Check the wheel alignment, and adjust it if necessary (see page 18-6).

Upper Arm Removal/Installation

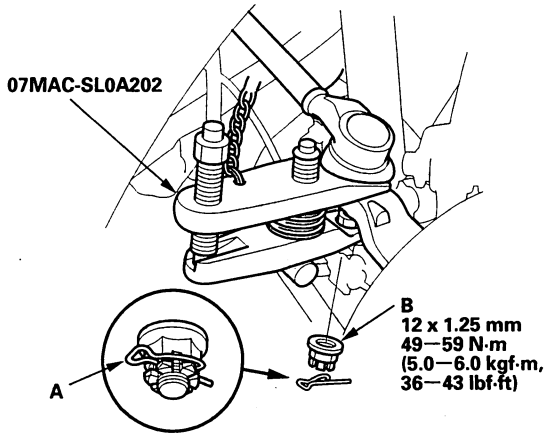
Special Tools Required
Ball joint remover, 28 mm 07MAC-SL0A202

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).

2. Remove the rear wheel.

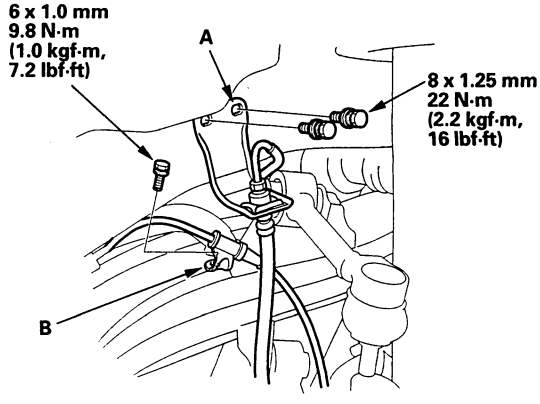
3. Remove the lock pin (A) from the upper arm ball joint, and loosen the nut (B).

   NOTE: During installation, install the new lock pin as shown after tightening the nut.



4. Disconnect the upper arm ball joint from the knuckle using the special tool (see page 18-11).

5. Remove the brake hose mounting bracket (A). Do not disconnect the brake line.



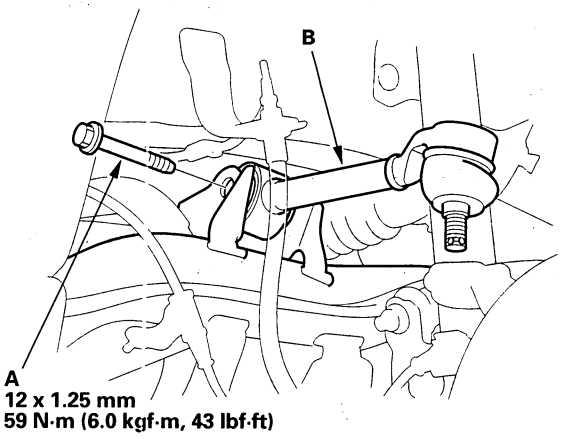
6. Remove the wheel sensor harness mounting bracket (B).

(cont'd)

Protected by AR

Upper Arm Removal/Installation (cont'd)

7. Remove the flange bolt (A), and remove the upper arm (B).



8. Install the upper arm in the reverse order of removal, and note these items:

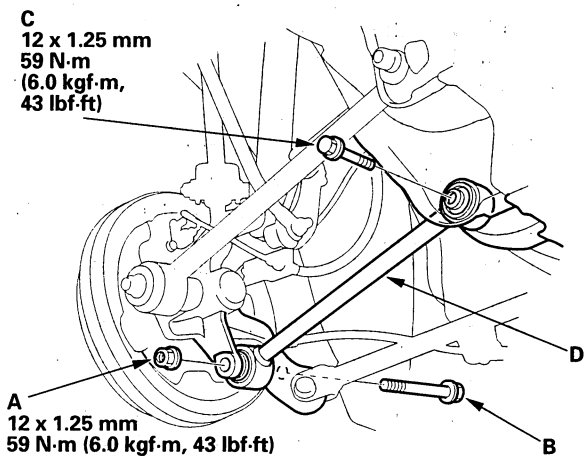
- Be careful not to damage the ball joint boot when installing the knuckle.
- Tighten all mounting hardware to the specified torque values.
- First install all the components and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values.
- Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
- Install a new lock pin on the castle nut after torquing.
- Before installing the wheel, clean the mating surface on the brake disc or drum and inside of the wheel.
- Check the wheel alignment, and adjust it if necessary (see page 18-6).

Lower Arm Replacement

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).

2. Remove the rear wheel.

3. Remove the lower arm mounting nut (A) and mounting bolt (B) from the knuckle side.



4. Remove the flange bolt (C), and remove the lower arm (D).

5. Install the lower arm in the reverse order of removal, and note these items:

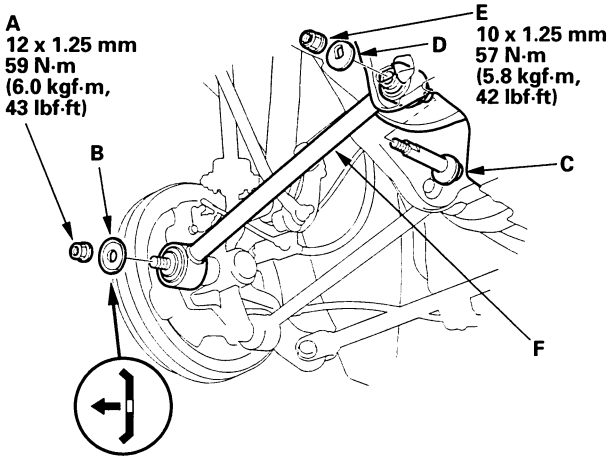
- Tighten all mounting hardware to the specified torque values.
- Use a new lower arm mounting nut on reassembly.
- First install all the components and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values.
- Before installing the wheel, clean the mating surface on the brake disc or drum and inside of the wheel.
- Check the wheel alignment, and adjust it if necessary (see page 18-6).

BACK

Protected by AR

Control Arm Replacement

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the rear wheel.
3. Remove the control arm mounting nut (A) and washer (B) from the knuckle side.

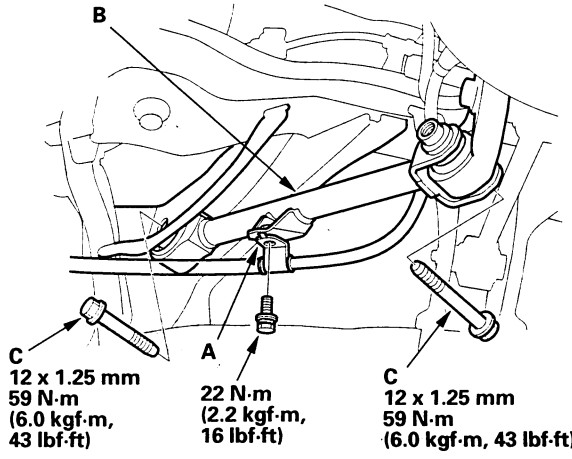


4. Mark the cam positions of the adjusting bolt (C) and adjusting cam (D), then remove the self-locking nut (E), and adjusting cam, and adjusting bolt. Discard the self-locking nut and control arm mounting nut.
5. Remove the control arm (F).
6. Install the control arm in the reverse order of removal, and note these items:

- Align the cam positions of the adjusting bolt and adjusting cam with the marked positions when tightening.
- Use a new self-locking nut and control arm mounting nut on reassembly.
- Tighten all mounting hardware to the specified torque values.
- First install all the components and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values.
- Before installing the wheel, clean the mating surface on the brake disc or drum and inside of the wheel.
- Check the wheel alignment, and adjust it if necessary (see page 18-6).

Trailing Arm Removal/Installation

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the rear wheel.
3. Remove the parking brake cable bracket (A) from the trailing arm (B).



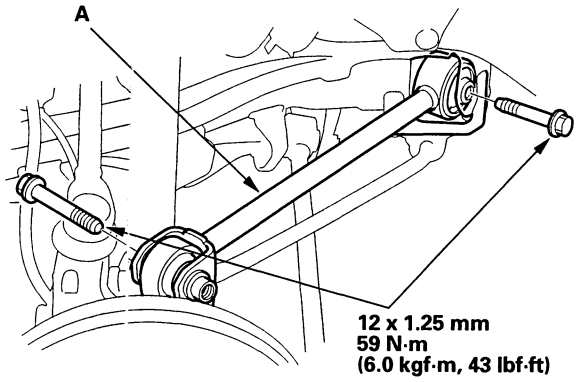
4. Remove the mounting bolts (C), and remove the trailing arm.
5. Install the trailing arm in the reverse order of removal, and note these items:

- Tighten all mounting hardware to the specified torque values.
- First install all the components and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values.
- Before installing the wheel, clean the mating surface on the brake disc or drum and inside of the wheel.
- Check the wheel alignment, and adjust it if necessary (see page 18-6).

Protected by AR

Leading Arm Replacement

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the rear wheel.
3. Remove the mounting bolts, and remove the leading arm (A).



4. Install the leading arm in the reverse order of removal, and note these items:
   - Tighten all mounting hardware to the specified torque values.
   - First install all the components and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values.
   - Before installing the wheel, clean the mating surface on the brake disc or drum and inside of the wheel.
   - Check the wheel alignment, and adjust it if necessary (see page 18-6).

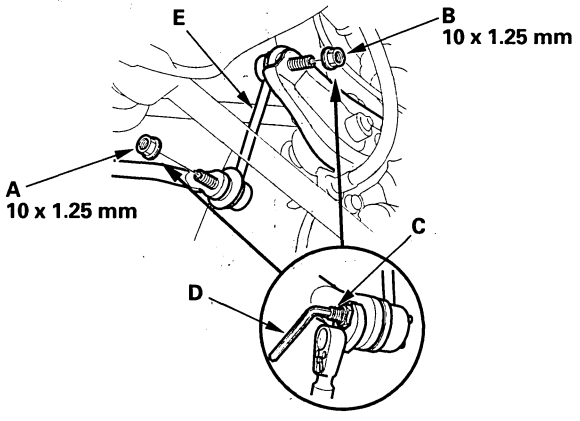
Stabilizer Link Removal/Installation

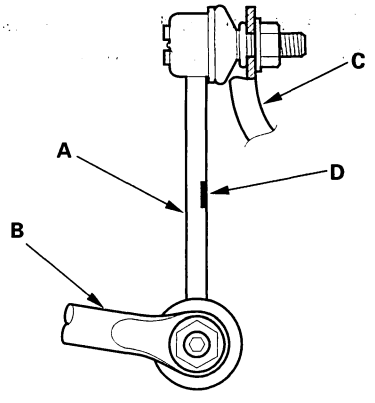
1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14). Remove the rear wheels.

2. Remove the self-locking nut (A) and flange nut (B) while holding the respective joint pin (C) with a hex wrench (D), and remove the stabilizer link (E).



3. Install the stabilizer link (A) on the stabilizer bar (B) and stabilizer link bracket (C) with the joint pins set at the center of their range of the movement.

   NOTE: The left stabilizer link has a white paint mark (D), while the right stabilizer link has a yellow paint mark.

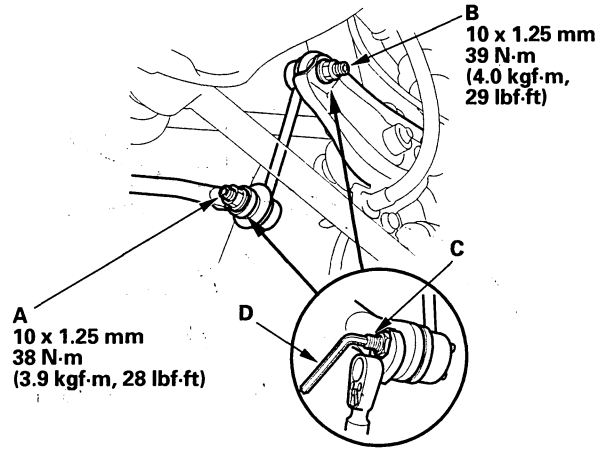


4. Install the new self-locking nut and flange nut, and lightly tighten them.

   NOTE: Use a new self-locking nut on reassembly.

5. Place the floor jack under the knuckle, and raise the suspension to load it with the vehicle's weight.

6. Tighten the self-locking nut (A) and flange nut (B) to the specified torque values while holding the respective joint pins (C) with a hex wrench (D).

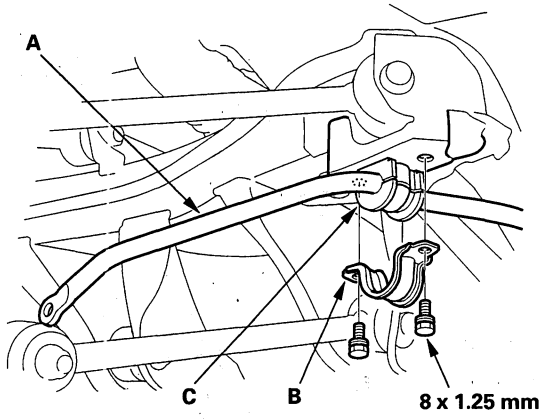


7. After 5 minutes of driving, tighten the self-locking nut again to the specified torque value.

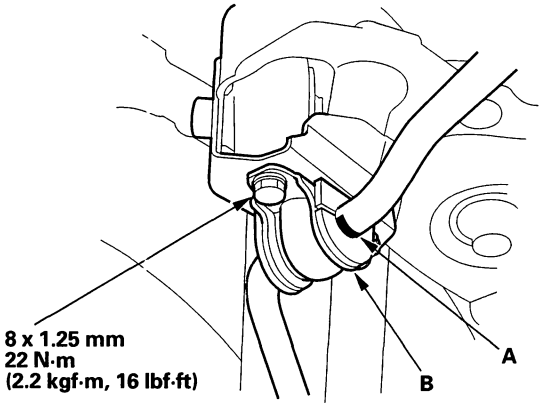
Protected by AR

Stabilizer Bar Replacement

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14). Remove the rear wheels.
2. Disconnect the stabilizer links from the stabilizer bar (A) on the right and left (see page 18-43).



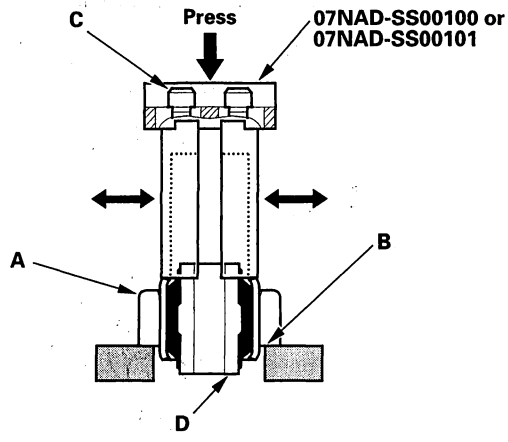
3. Remove the flange bolts and bushing holders (B), then remove the bushing (C) and the stabilizer bar.
4. Install the stabilizer bar in the reverse order of removal, and note these items:
   - Note the right and left direction of the stabilizer bar.
   - Align the ends of the paint marks (A) on the stabilizer bar with the bushing (B).
   - Refer to Stabilizer Link Replacement to connect the stabilizer to the links (see page 18-43).



Knuckle Bushing Replacement

Special Tools Required
Bushing driver 30—40 07NAD-SS00100
or 07NAD-SS00101

1. Position the knuckle (A) on the press with the machined surface (B) facing down.



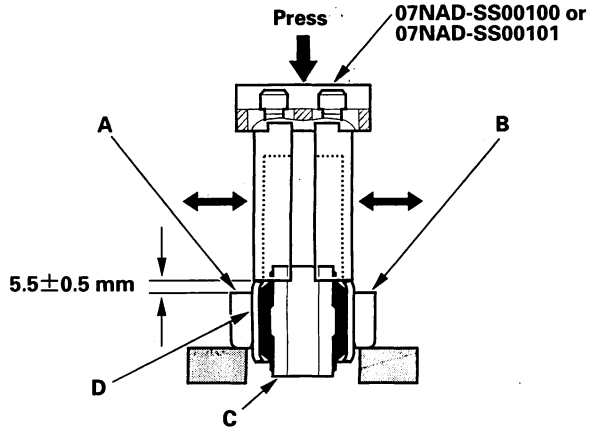
2. Adjust the special tool so it matches the inner diameter of the bushing hole, then tighten the socket bolts (C) securely.
3. Position the special tool on the bushing (D).
4. Remove the bushing by pressing on the special tool with a press as shown.

   NOTE: Be careful not to damage the inside of the bushing hole while pressing on the bushing.

BACK

Protected by AR

5. Position the knuckle (A) on the press with the machined surface (B) facing up.



6. Adjust the special tool so it matches with the outer diameter of the bushing (C).

7. Position the special tool on the outer sleeve (D) of the bushing.

8. Press the bushing into the knuckle using the special tool as shown.

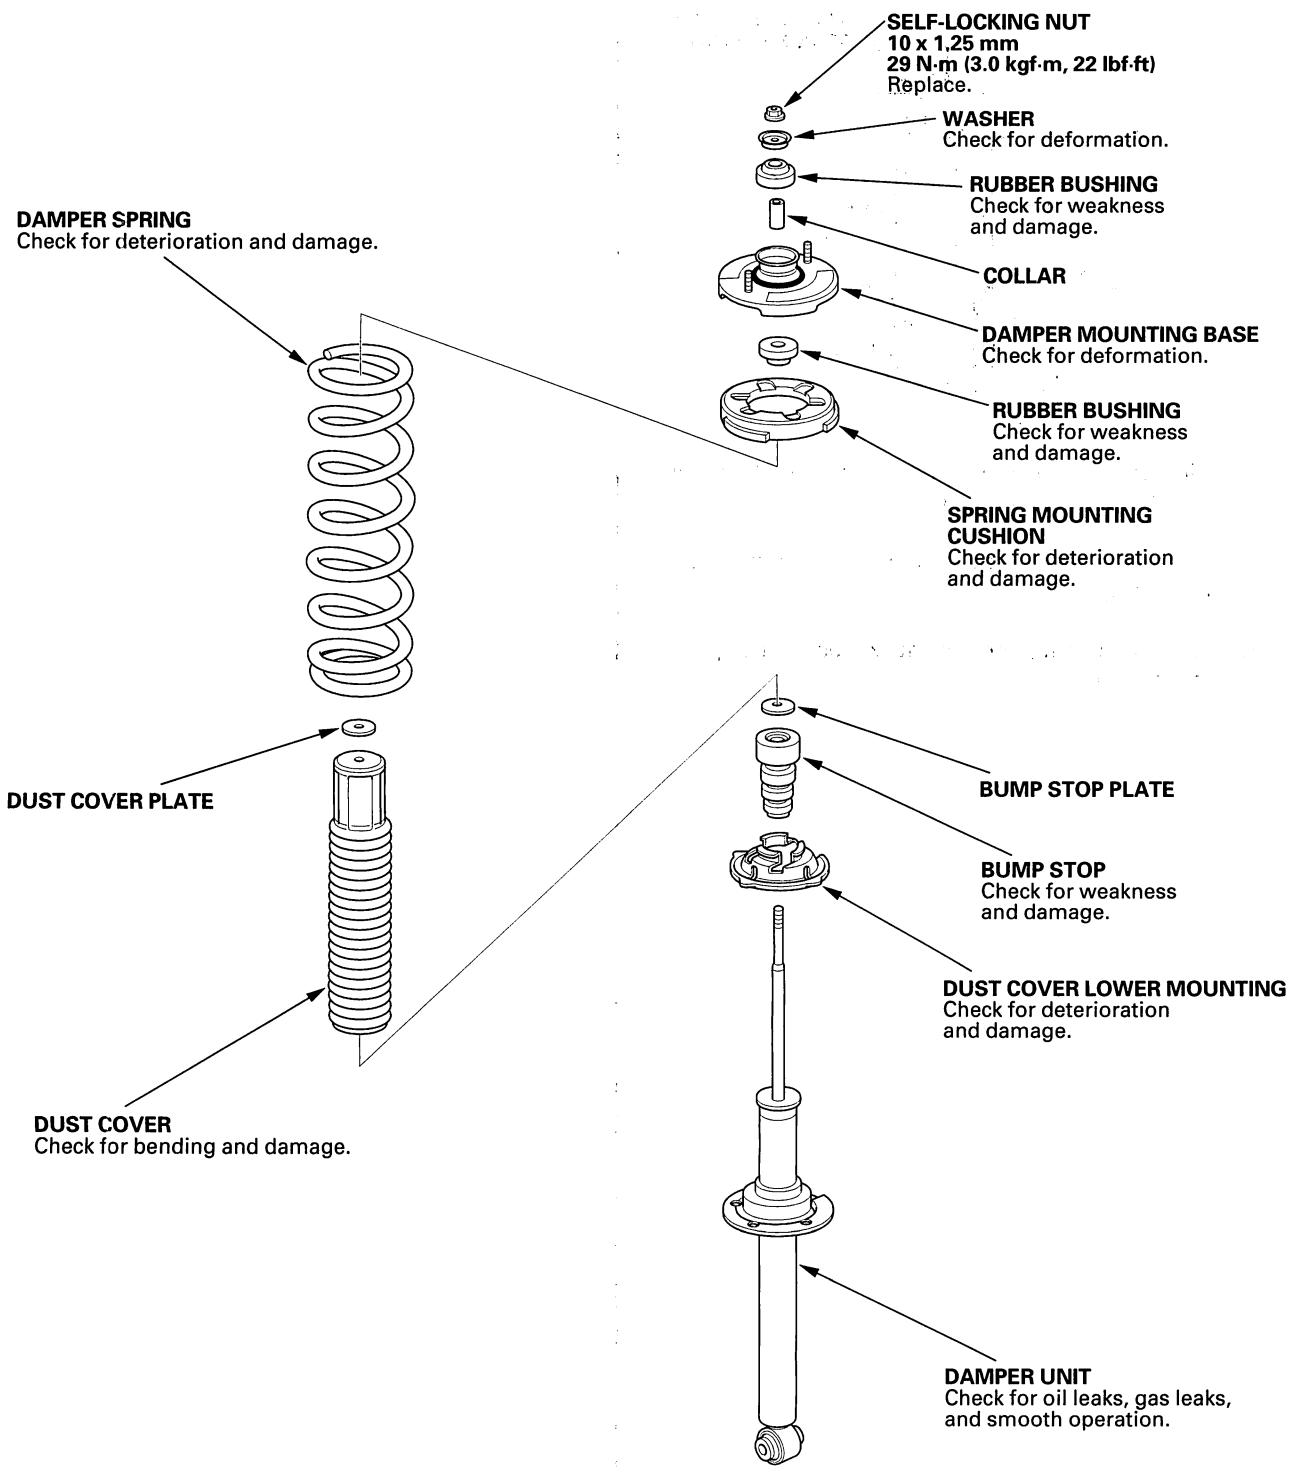
Damper/Spring Replacement

Exploded View



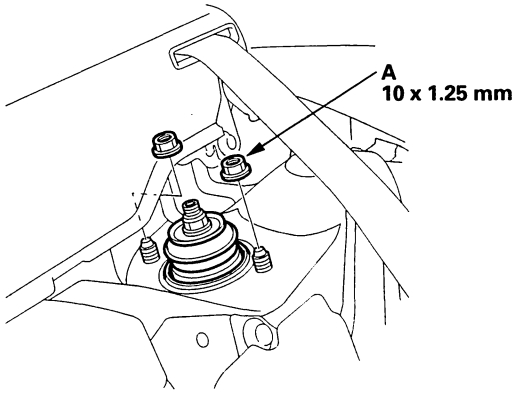
BACK

Protected by AR

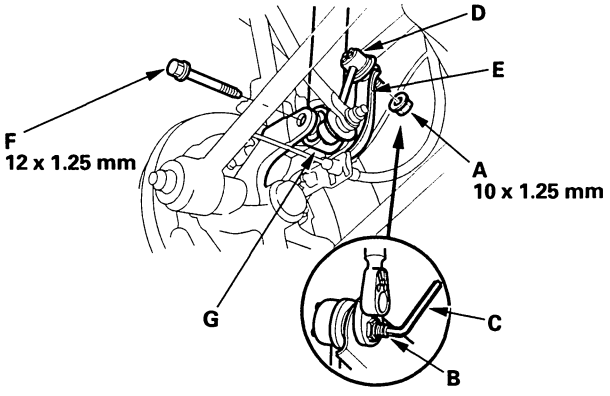
NOTE: When compressing the damper spring, use a commercially available strut spring compressor (Branick MST-580A or Model 7200, or equivalent). According to the manufacturer's instructions.

Removal

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14). Remove the rear wheel.
2. Remove the rear bulkhead cover (see page 20-108).
3. Remove the seat side bolster (see page 20-174).
4. Remove the two flange nuts (A).



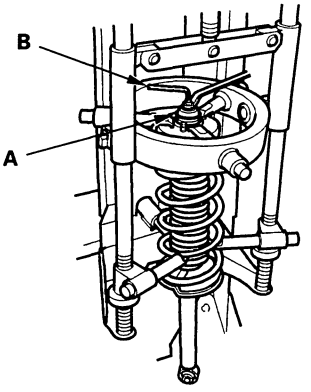
5. Remove the flange nut (A) while holding the joint pin (B) with a hex wrench (C), and disconnect the stabilizer link (D) from the stabilizer link bracket (E).



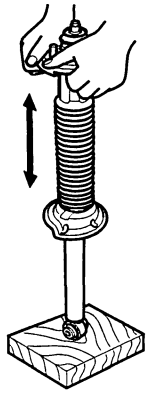
6. Remove the flange bolt (F) from the knuckle.
7. Lower the rear suspension, and remove the damper (G) from the vehicle. Damper springs are different, left and right. Mark the springs L and R before you continue.

Disassembly/Inspection

1. Compress the damper spring, then remove the self-locking nut (A) while holding the damper shaft with a hex wrench (B). Do not compress the spring more than necessary to remove the self-locking nut.



2. Release the pressure from the strut spring compressor, then disassemble the damper as shown in the Exploded View.
3. Reassemble all parts, except the spring.
4. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced.



5. Check for oil leaks, abnormal noises, and binding during these tests.

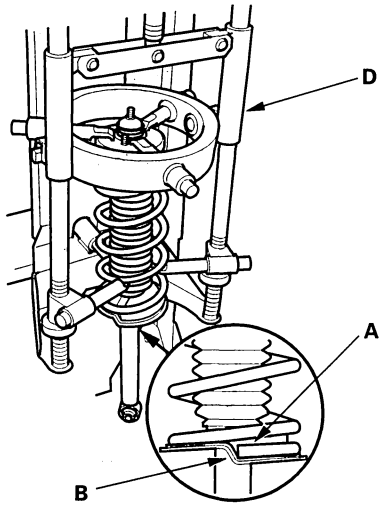
(cont'd)

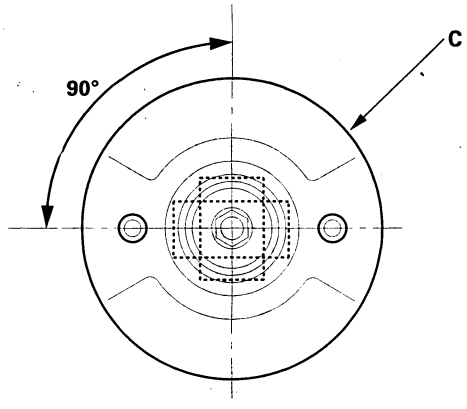
Protected by AR

Damper/Spring Replacement (cont'd)

Reassembly

1. Install all parts except the self-locking nut and washer onto the damper unit by referring to the Exploded View. Align the bottom of the spring (A) and the stepped part of the lower spring seat (B), and align the damper mounting base (C) as shown.

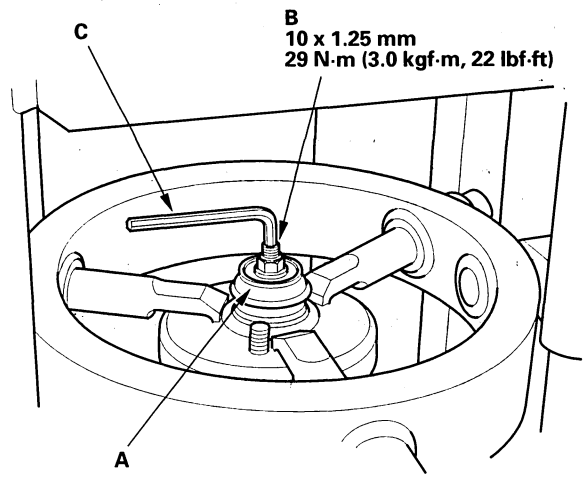




2. Install the damper assembly on commercially available strut spring compressor (D).

3. Compress the damper spring with the spring compressor.

4. Install the washer (A), and loosely install a new self-locking nut (B).



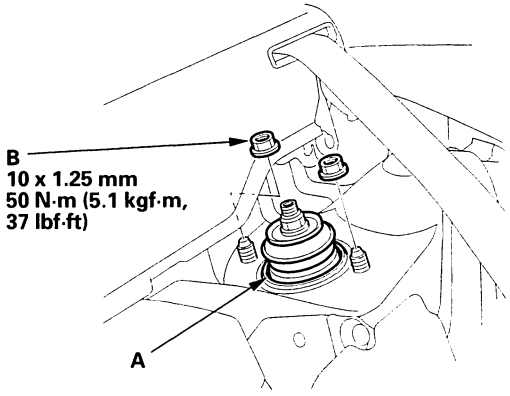
5. Hold the damper shaft with a hex wrench (C), and tighten the self-locking nut to the specified torque value.

BACK

Protected by AR

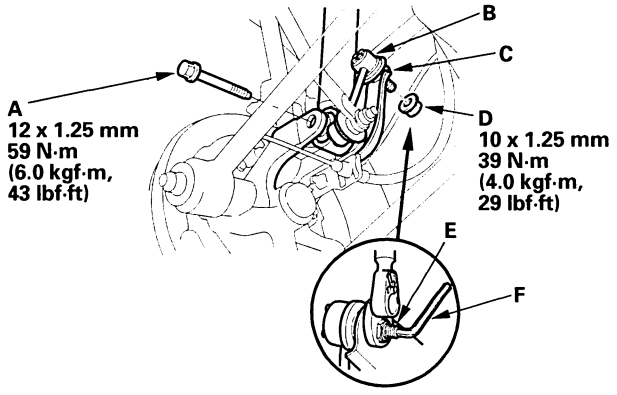
Installation

1. Lower the rear suspension, and position the damper (A), in the body.



2. Loosely install the flange nuts (B) onto the top of the damper.

3. Loosely install the flange bolt (A) on the bottom of the damper. Connect the stabilizer link (B) on the bracket (C), and loosely install the flange nut (D).



4. Raise the rear suspension with a floor jack load the vehicle weight, and tighten the flange bolt to the specified torque value.

5. Tighten the flange nut while holding the joint pin (E) with a hex wrench (F).

6. Tighten the two flange nuts on top of the damper to the specified torque value.

7. Install the seat side bolster (see page 20-174).

8. Install the rear bulkhead cover (see page 20-108).

9. Clean the mating surface of the brake disc or drum and the inside of the wheel, then install the rear wheel.

10. Check the wheel alignment, and adjust it if necessary (see page 18-6).

Conventional Brake Components

Brake System Inspection and Test

Inspect the brake system components listed. Repair or replace any parts that are leaking or damaged.

Component Inspections:

Component	Procedure	Also check for:
Master Cylinder	Look for damage or signs of fluid leakage at: • Reservoir or reservoir grommets • Line joints • Between master cylinder and booster	Bulging seal at reservoir cap. This is a sign of fluid contamination.
Brake Hoses	Look for damage or signs of fluid leakage at: • Line joints and banjo bolt connections • Hoses and lines, also inspect for twisting or damage	Bulging, twisted, or bent lines.
Caliper	Look for damage or signs of fluid leakage at: • Piston seal • Banjo bolt connections • Bleed screw	Seized or sticking caliper pins.
ABS Modulator-Control Unit	Look for damage or signs of fluid leakage at: • Line joints • Modulator-control unit	

Brake System Test

Brake pedal sinks/fades when braking

1. Start the engine, and let it warm up to operating temperature.
2. Attach a 50 mm (2 in.) piece of masking tape along the bottom of the steering wheel, and draw a horizontal reference mark across it.
3. With the transmission in Neutral, press and hold the brake pedal lightly (about the same pressure needed to keep an A/T-equipped vehicle from creeping), then release the parking brake.
4. While still holding the brake pedal, hook the end of the tape measure behind it. Then pull the tape up to the steering wheel, noting where the tape measure lines up with the reference mark you made on the masking tape.
5. Apply steady pressure to the brake pedal for 3 minutes.
6. Watch the tape measure.

   • If it moves less than 10 mm (3/8 in.), the master cylinder is OK.
   • If it moves more than 10 mm (3/8 in.), replace the master cylinder.

   NOTE: If the brake pedal sinks more than 10 mm (3/8 in.) in 3 minutes, the master cylinder is faulty. A sight change in pedal height when the A/C compressor cycles on and off is normal. (The A/C compressor load changes the vacuum available to the brake booster.)

BACK

Protected by AR

Rapid brake pad wear, vehicle vibration (after a long drive), or high, hard brake pedal

NOTE: Make sure that the caliper pins are installed correctly.
The upper and lower caliper pins are different. If the top and bottom caliper pins are installed in the wrong location, it will cause uneven tire wear, vibration, and or uneven or rapid pad wear for proper caliper pin location (see page 19-15).

1. Drive the vehicle until the brakes drag or until the pedal is high and hard. This can take 20 or more brake pedal applications during an extended test-drive.

2. With the engine running, raise the vehicle on a lift, and spin all four wheels by hand.

   Is there brake drag at any of the wheels?

   YES—Go to step 3.

   NO—Look for other causes of the pad wear, high pedal, or vehicle vibration. ■

3. Turn the engine off, pump the brake pedal to deplete the vacuum in the brake booster, and then spin the wheels again to check for brake drag.

   Is there brake drag at any of the wheels?

   YES—Go to step 4.

   NO—Replace the brake booster (see page 19-19). ■

4. Without removing the brake lines, unbolt and separate the master cylinder from the booster, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?

   YES—Go to step 5.

   NO—Check the brake pedal position switch adjustment and pedal free play (see page 19-6). ■

5. Loosen the hydraulic lines at the master cylinder, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?

   YES—Go to step 6.

   NO—Replace the master cylinder (see page 19-16). ■

6. Loosen the bleed screws at each caliper, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?

   YES—Disassemble and repair the caliper on the wheel(s) with brake drag. ■

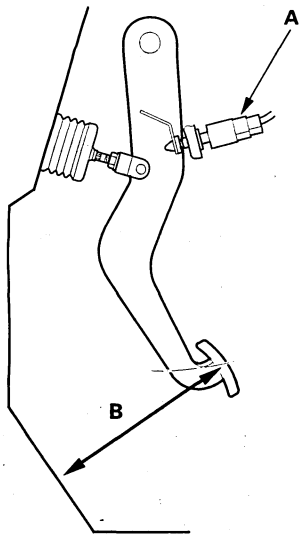
   NO—Look for a bulging master cylinder cap seal, discolored or contaminated brake fluid in the master cylinder, or damaged brake lines. If any of these items are damaged, replace them. If all of these items are OK, replace the ABS modulator-control unit (see page 19-65). ■

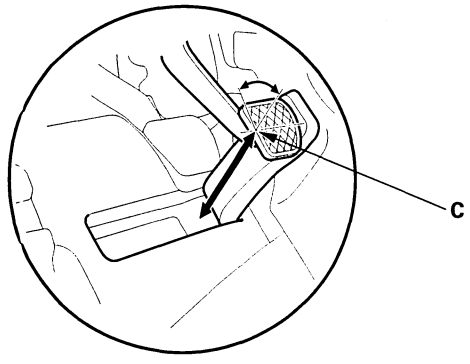
Protected by AR

Brake Pedal and Brake Pedal Position Switch Adjustment

Pedal Height

1. Turn the brake pedal position switch (A) counterclockwise, and pull it back until it is no longer touching the brake pedal.

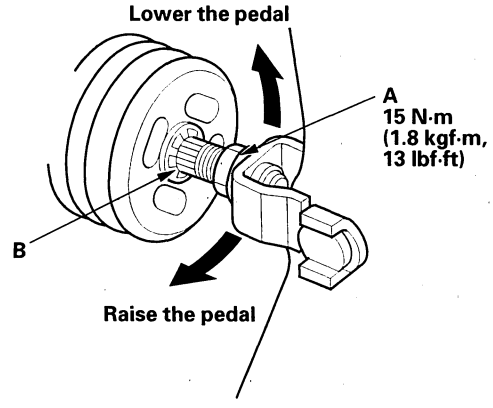




2. Lift up the carpet. At the insulator cutout, measure the pedal height (B) from the left side of the pedal pad (C).

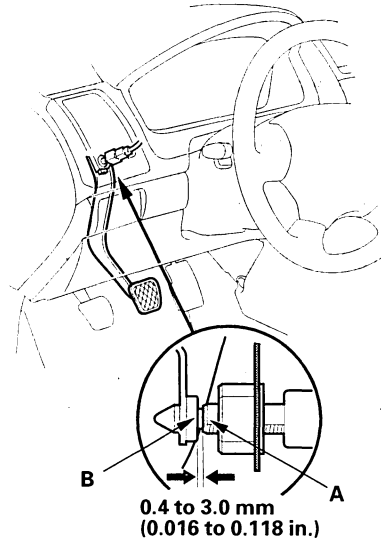
Standard pedal height (with carpet removed):
M/T: 167 mm (6 9/16 in.)
A/T: 172 mm (6 13/16 in.)

3. Loosen the pushrod locknut (A), and screw the pushrod in or out with pliers on the knurled part of the push rod (B) until the standard pedal height from the floor is reached. After adjustment, tighten the locknut firmly. Do not adjust the pedal height with the pushrod pressed.



Brake Pedal Position Switch Clearance

4. Push in the brake pedal position switch until its plunger is fully pressed (threaded end (A) touching the pad (B) on the pedal arm). Then, turn the brake pedal position switch 45 ° clockwise to lock it. The gap between the brake pedal position switch and the pad is automatically adjusted to 0.4 to 3.0 mm (0.016 to 0.118 in.) by locking the switch. Make sure the brake lights go off when the pedal is released.



5. Check the brake pedal free play.

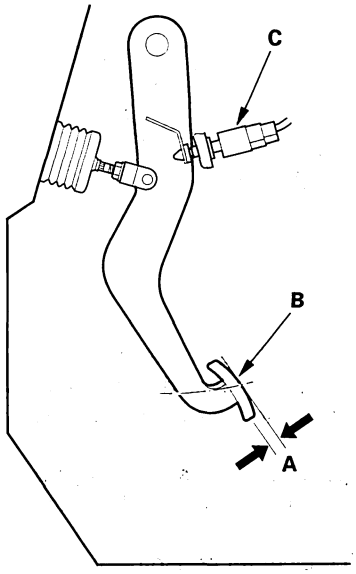
BACK

Protected by AR

Pedal Free Play

1. With the engine off, inspect the pedal free play (A) on the pedal pad (B) by pushing the brake pedal by hand.

   Free play: 1—5 mm (1/16—3/16 in.)



2. If the pedal free play is out of specification, adjust the brake pedal position switch (C). If the brake pedal free play is insufficient, it may result in excessive brake drag.

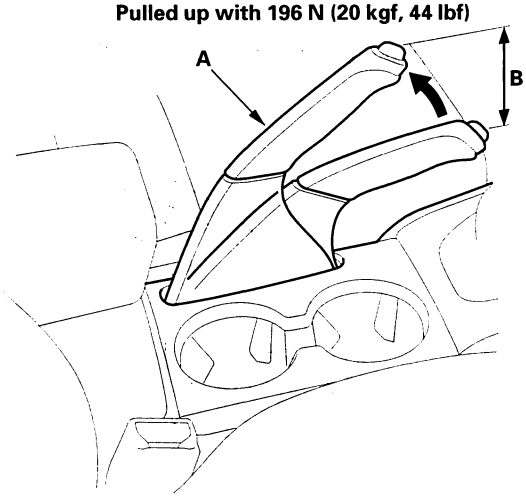
Parking Brake Check and Adjustment

Check

1. Pull the parking brake lever (A) with 196 N (20 kgf, 44 lbf) of force to fully apply the parking brake. The parking brake lever should be locked within the specified number of clicks (B).

   Lever locked clicks:
   With rear disc: 6 to 9
   With rear drum: 4 to 7

Pulled up with 196 N (20 kgf, 44 lbf)



2. Adjust the parking brake if the lever clicks are not within the specification.

(cont'd)

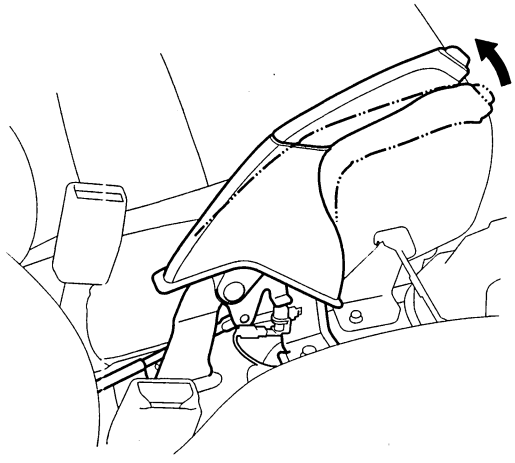
Protected by AR

Parking Brake Check and Adjustment (cont'd)

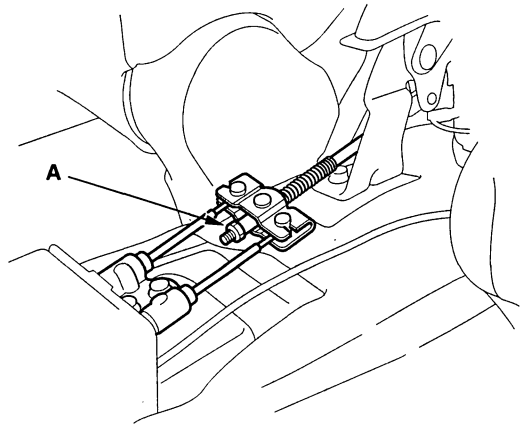
Adjustment

NOTE: After servicing the rear brake shoes, loosen the parking brake adjusting nut, start the engine, and press the brake pedal several times to set the self-adjusting brake before adjusting the parking brake (with rear drum brake).

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the center console (see page 20-125).
3. Pull the parking brake lever up one click.



4. Tighten the adjusting nut (A) until the parking brakes drag slightly when the rear wheels are turned.



5. Release the parking brake lever fully, and check that the parking brakes do not drag when the rear wheels are turned. Readjust if necessary.
6. Pull the parking brake all the way up, and make sure the parking brakes are fully applied.
7. Reinstall the center console (see page 20-125).

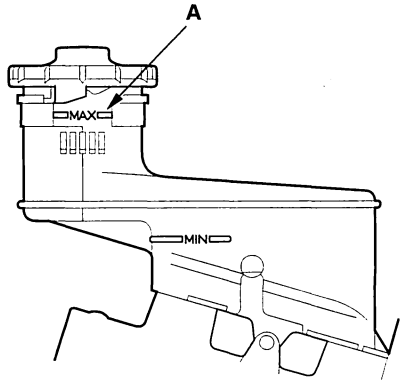
BACK

Protected by AR

Brake System Bleeding

NOTE:
- Do not reuse the drained fluid. Use only clean Honda DOT 3 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Do not mix different brands of brake fluid; they may not be compatible.
- Make sure no dirt or other foreign matter is allowed to contaminate the brake fluid.
- Do not spill brake fluid on the vehicle, it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.
- The reservoir on the master cylinder must be at the MAX (upper) level mark at the start of the bleeding procedure and checked after bleeding each brake caliper. Add fluid as required.

1. Make sure the brake fluid level in the reservoir is at the MAX (upper) level line (A).



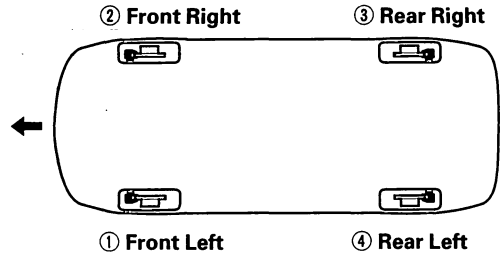
2. Attach a length of clear drain tube to the bleed screw.

3. Have someone slowly pump the brake pedal several times, then apply steady pressure.

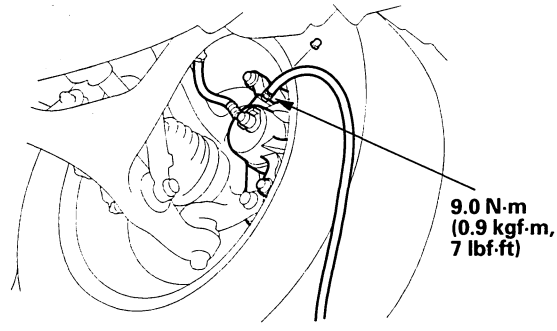
4. Starting at the left-front, loosen the brake bleed screw to allow air to escape from the system. Then tighten the bleed screw securely.

5. Repeat the procedure for each wheel in the sequence shown following until air bubbles no longer appear in the fluid.

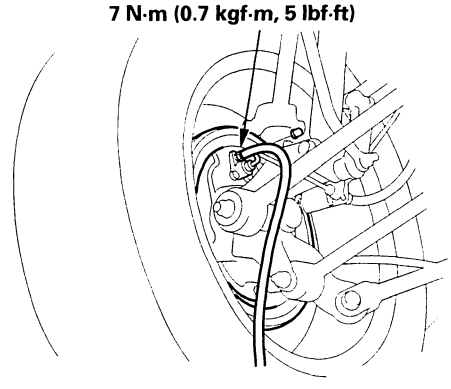
BLEEDING SEQUENCE:



Front



Rear

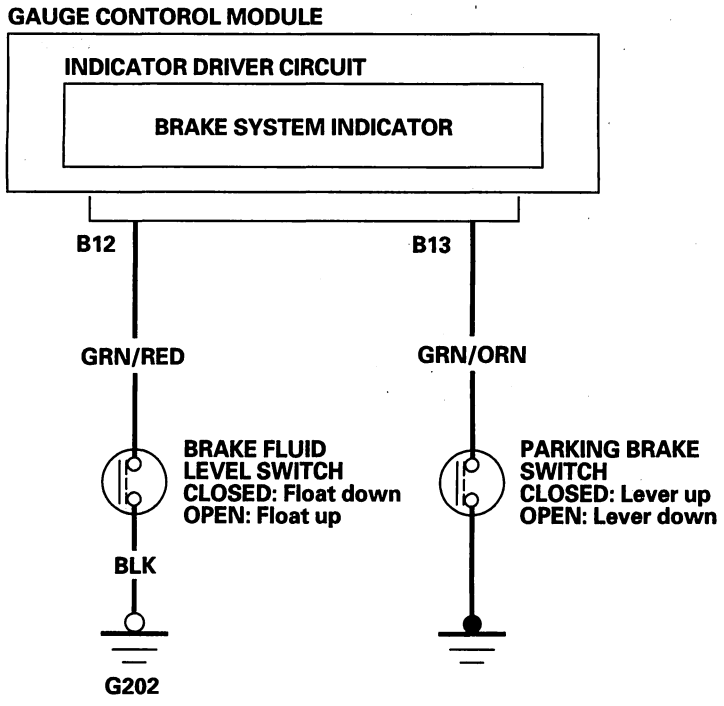


6. Refill the master cylinder reservoir to the MAX (upper) level line.

Protected by AR

Conventional Brake Components

Brake System Indicator Circuit Diagram

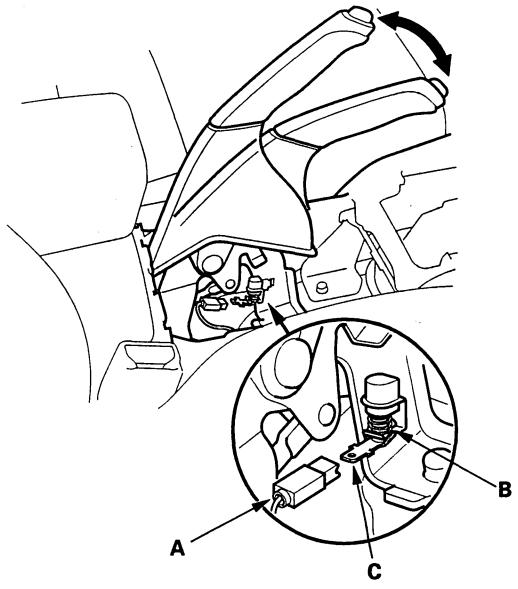


BACK

Protected by AR

Parking Brake Switch Test

1. Remove the center console, and disconnect the connector (A) from the parking brake switch (B).



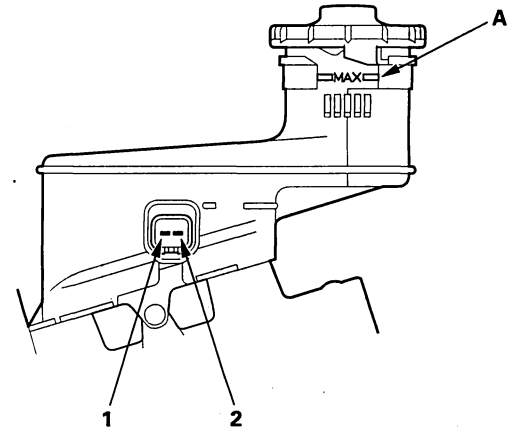
2. Check for continuity between the positive terminal (C) and body ground.

   - With the brake lever up, there should be continuity.
   - With the brake lever down, there should be no continuity.

Brake Fluid Level Switch Test

Check for continuity between the terminals (1 and 2) with the float in the down position and in the up position.

- Remove the brake fluid completely from the reservoir. With the float down, there should be continuity.
- Fill the reservoir with brake fluid to the MAX (upper) level (A). With the float up, there should be no continuity.



Protected by AR

Front Brake Pad Inspection and Replacement

⚠CAUTION

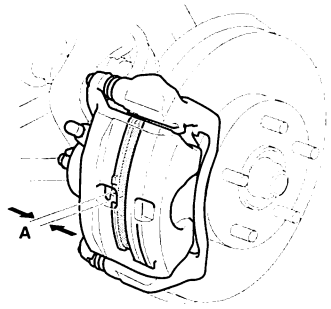
Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

Inspection

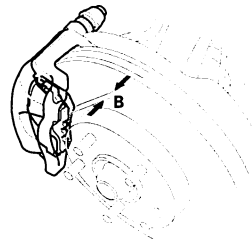
1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the front wheels.
3. Check the thickness of the inner pad (A) and outer pad (B). Do not include the thickness of the backing plate.

Brake pad thickness:
Standard: 10.5—11.5 mm (0.41—0.45 in.)
Service limit: 1.6 mm (0.06 in.)

Inner pad



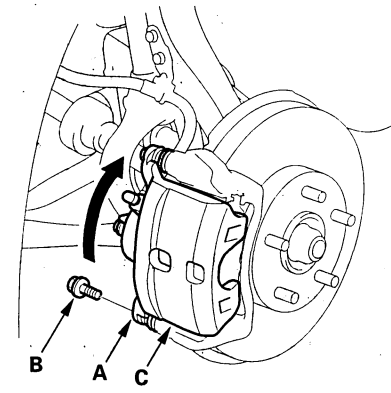
Outer pad



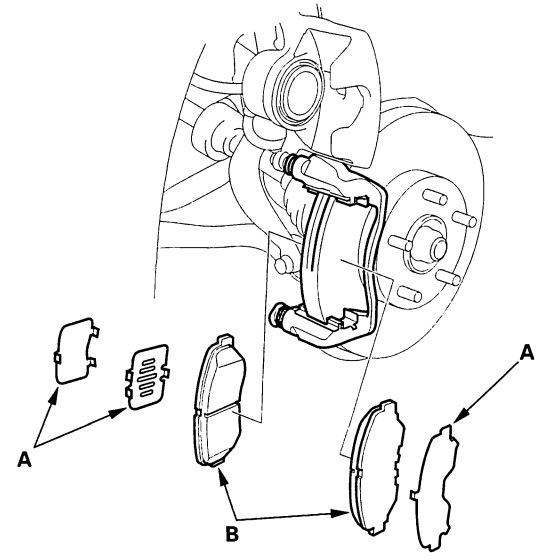
4. If the brake pad thickness is less than the service limit, replace all the front brake pads as a set.

Replacement

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the front wheels.
3. Remove the brake hose mounting bolt.
4. Remove the flange bolt (B) while holding the pin A with a wrench being careful not to damage the pin boot, and pivot the caliper (C) up out of the way. Check the brake hose and pin boots for damage and deterioration.



5. Remove the pad shims (A) and brake pads (B).

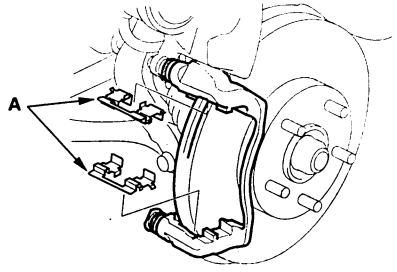


6. Check the hose and pin boots for damage and deterioration.

BACK

Protected by AR

7. Remove the pad retainers (A), and check the caliper pin for free movement.

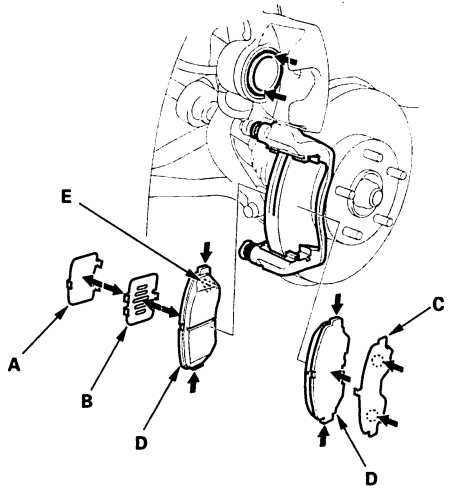


8. Clean the caliper thoroughly; remove any rust, and check for grooves and cracks.

9. Check the brake disc for damage and cracks.

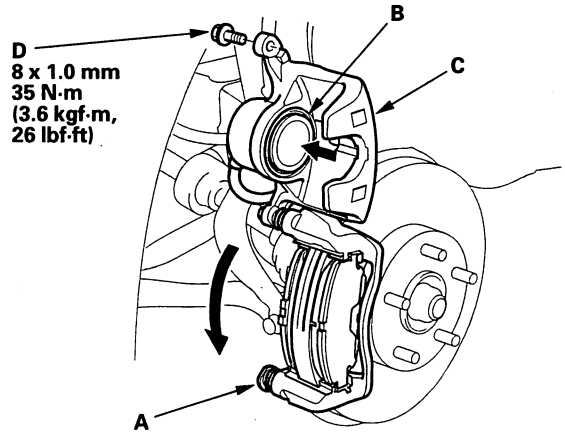
10. Clean and install the pad retainers.

11. Apply a thin coat of M-77 assembly paste (P/N 08798-9010) to the pad side of shim outer pad shim C, inner pad shim B, both sides of inner pad shim A, the back of brake pads (D), and to the other areas indicated by the arrows. Wipe excess assembly paste off the pad shims and brake pads. Contaminated brake discs and pads reduce stopping ability. Keep assembly paste off the brake discs and brake pad material.



12. Install the brake pads and pad shims correctly. Install the brake pads with the wear indicator (E) on top.
If you are reusing the brake pads, always reinstall the brake pads in their original positions to prevent a momentary loss of braking efficiency.

13. Push in the piston (B) so the caliper will fit over the brake pads. Check the brake fluid level. The brake fluid may overflow if the reservoir is too full. Make sure the piston boot is in position to prevent damaging it when pivoting the caliper down.



14. Pivot the caliper (C) down into position. Install the flange bolt (D), and tighten it to the specified torque while holding the pin A with a wrench being careful not to damage the pin boot.

15. Install the brake hose mounting bolt, and tighten it to the specified torque.

16. Press the brake pedal several times to make sure the brakes work.

    NOTE: Engagement of the brake may require a greater pedal stroke immediately after the brake pads have been replaced as a set. Several applications of the brake pedal will restore the normal pedal stroke.

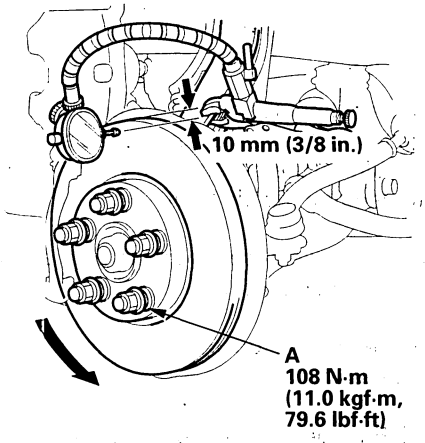
17. After installation, check for leaks at hose and line joints or connections, and retighten if necessary. Then test-drive the vehicle.

Protected by AR

Front Brake Disc Inspection

Runout

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the front wheels.
3. Remove the brake pads (see page 19-12).
4. Inspect the brake disc surface for damage and cracks. Clean the brake disc thoroughly, and remove all rust.
5. Install suitable flat washers (A) and wheel nuts, and tighten the nuts to the specified torque to hold the brake disc securely against the hub.



6. Set up the dial gauge against the brake disc as shown, and measure the runout at 10 mm (3/8 in.) from the outer edge of the brake disc.

   Brake disc runout:
   Service limit: 0.10 mm (0.004 in.)

7. If the brake disc is beyond the service limit, refinish the brake disc with an on-car brake lathe. The Kwik-Lathe produced by Kwik-way Manufacturing Co. and the "Front Brake Disc Lathe" offered by Snap-on Tools Co. are approved for this operation.

   Max. refinish limit: 21.0 mm (0.83 in.)

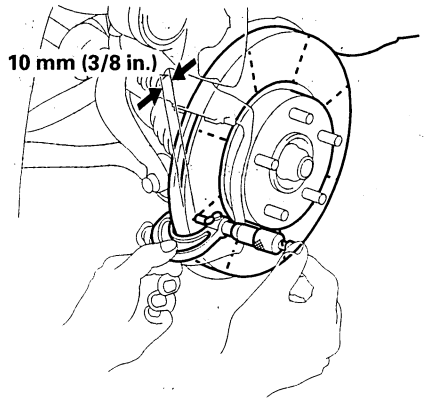
   NOTE:
   - If the brake disc is beyond the service limit for refinishing, replace it (see step 3 on page 18-13).
   - A new disc should be refinished if its runout is greater than 0.10 mm (0.004 in.).

Thickness and Parallelism

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the front wheels.
3. Remove the brake pads (see page 19-12).
4. Using a micrometer, measure brake disc thickness at eight points, approximately 45 ° apart and 10 mm (3/8 in.) in from the outer edge of the brake disc. Replace the brake disc if the smallest measurement is less than the max. refinishing limit.

   Brake disc thickness:
   Standard: 22.9—23.1 mm (0.90—0.91 in.)
   Max. refinishing limit: 21.0 mm (0.83 in.)
   Brake disc parallelism: 0.015 mm (0.0006 in.) max.

   NOTE: This is the maximum allowable difference between the thickness measurements.



5. If the smallest measurement is less than the max. refinishing limit, replace the brake disc (see step 3 on page 18-13).
6. If the brake disc is beyond the service limit for parallelism, refinish the brake disc with an on-car brake lathe. The Kwik-Lathe produced by Kwik-way Manufacturing Co. and the "Front Brake Disc Lathe" offered by Snap-on Tools Co. are approved for this operation.

BACK

Protected by AR

Front Brake Caliper Overhaul

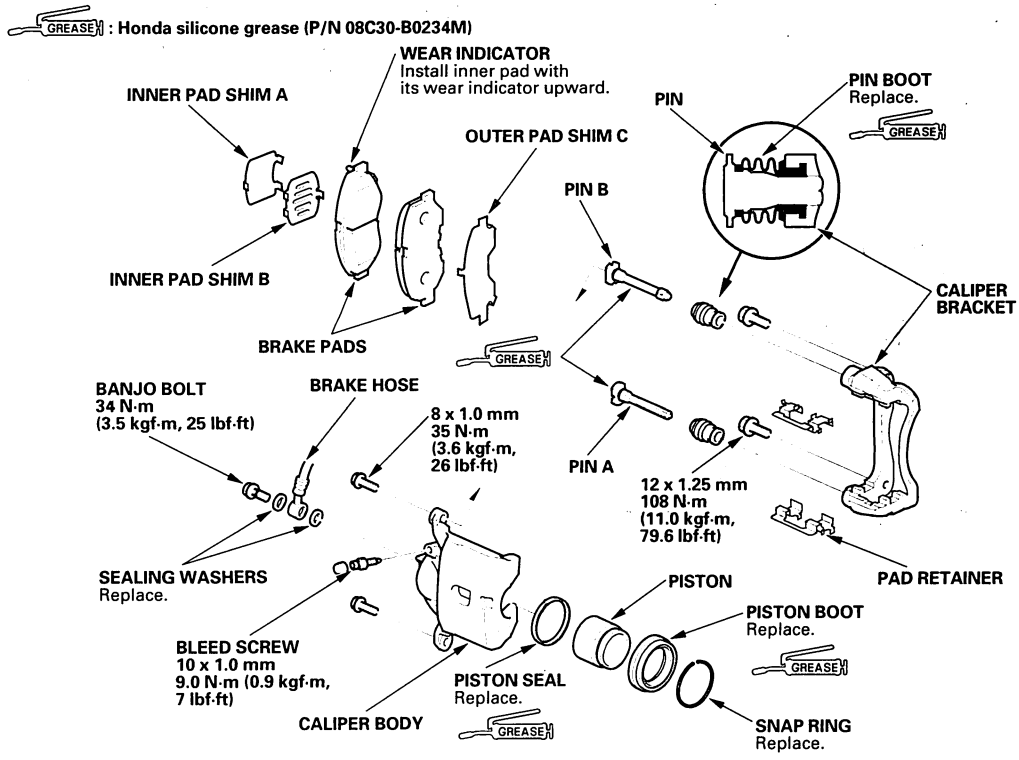
⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

Remove, disassemble, inspect, reassemble, and install the caliper, and note these items:

NOTE: Make sure that the caliper pins are installed correctly.
The upper and lower caliper pins are different. If the caliper pins are installed in the wrong location, it will cause uneven tire wear, vibration, and or uneven or rapid pad wear.

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- To prevent dripping brake fluid, cover disconnected hose joints with rags or shop towels.
- Clean all parts in brake fluid and air dry; blow out all passages with compressed air.
- Before reassembling, check that all parts are free of dust and other foreign particles.
- Replace parts with new ones as specified in the illustration.
- Make sure no dirt or other foreign matter gets in the brake fluid.
- Make sure no grease or oil gets on the brake discs or pads.
- When reusing brake pads, always reinstall them in their original positions to prevent loss of braking efficiency.
- Do not reuse drained brake fluid. Use only clean Honda DOT 3 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Do not mix different brands of brake fluid as they may not be compatible.
- Coat the pistons, piston seals grooves, and caliper bore with clean brake fluid.
- Replace all rubber parts with new ones whenever disassembled.
- After installing the caliper, check the brake hose and line for leaks, interference, and twisting.

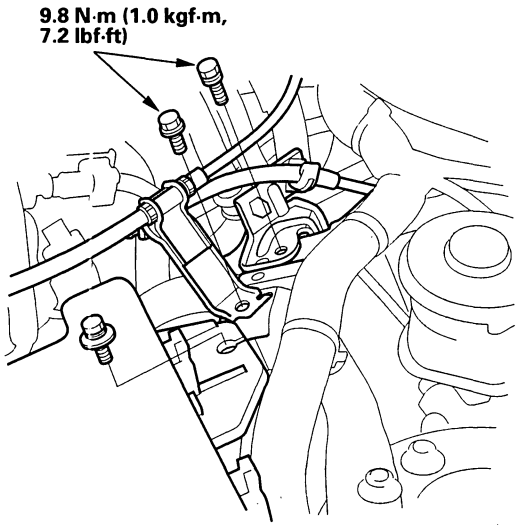


Protected by AR

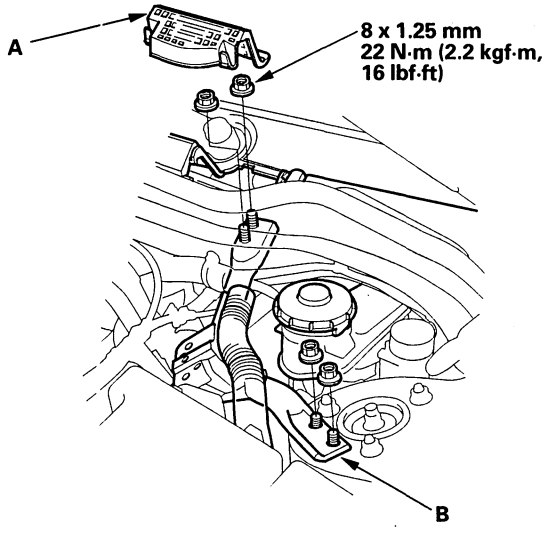
Master Cylinder Replacement

NOTE: Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.

1. Remove the cable clamps from the body.

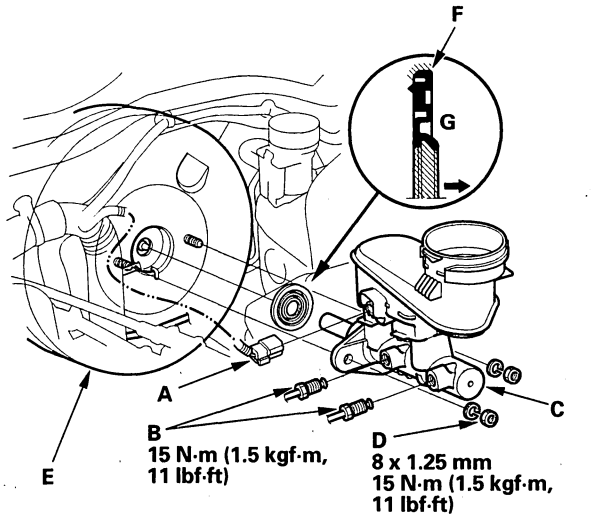


2. Remove the access panel (A), then remove the right strut brace (B).



3. Remove the reservoir cap and brake fluid from the master cylinder reservoir.

4. Disconnect the brake fluid level switch connector (A).



5. Disconnect the brake lines (B) from the master cylinder (C). To prevent spills, cover the hose joints with rags or shop towels.

6. Remove the master cylinder mounting nuts (D) and washers.

7. Remove the master cylinder from the brake booster (E). Be careful not to bend or damage the brake lines when removing the master cylinder.

8. Remove the rod seal (F) from the master cylinder.

BACK

Protected by AR

9. Install the master cylinder in the reverse order of removal, and note these items:

   - Replace all the rubber parts with new ones whenever the master cylinder is removed.
   - Use a new rod seal on reassembly.
   - Coat the inner bore lip and outer circumference of the new rod seal with the recommended seal grease in the master cylinder set.
   - Install the rod seal onto the master cylinder with its grooved side (G) toward the master cylinder.
   - Check the brake pedal height and free play after installing the master cylinder, and adjust it if necessary (see page 19-6).

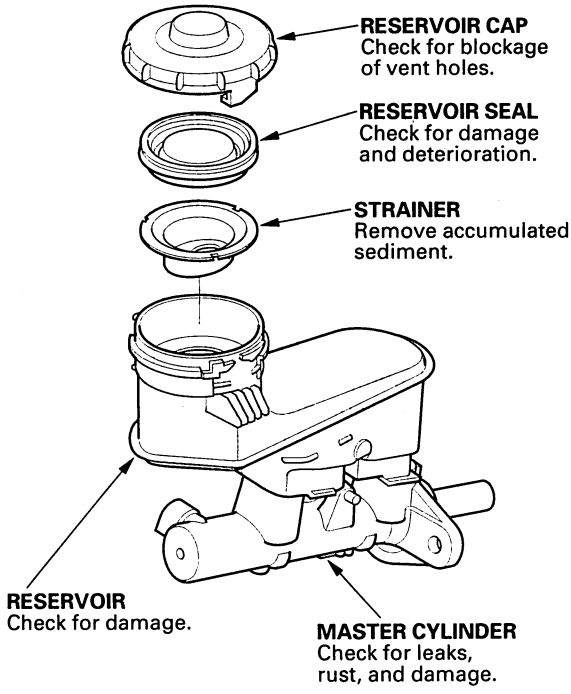
10. Bleed system (see page 19-9).

11. Spin the wheels to check for brake drag.

Master Cylinder Inspection

NOTE:

- Before reassembling, check that all parts are free of dirt and other foreign particles.
- Do not try to disassemble the master cylinder assembly. Replace the master cylinder assembly with a new part if necessary.
- Do not allow dirt or foreign matter to contaminate the brake fluid.



Protected by AR

Brake Booster Test

Functional Test

1. With the engine stopped, press the brake pedal several times to deplete the vacuum reservoir, then press the brake pedal hard, and hold it for 15 seconds. If the brake pedal sinks, either the master cylinder is bypassing internally, or the brake system (master cylinder, lines, modulator, or caliper) is leaking.

2. Start the engine with the brake pedal pressed. If the pedal sinks slightly, the vacuum booster is operating normally. If the brake pedal height does not vary, the booster or check valve is faulty.

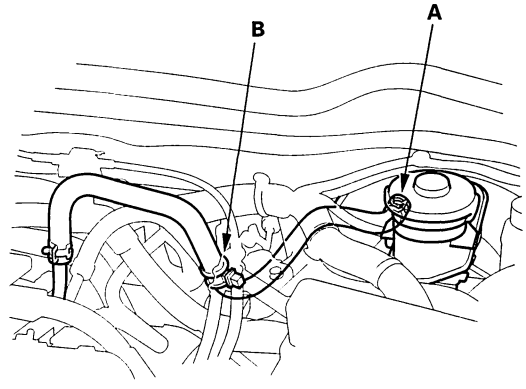
3. With the engine running, press the brake pedal lightly, and shift the transmission to the D position. Apply just enough pressure to hold back automatic transmission creep. If the brake pedal sinks more than 10 mm (3/8 in.) in 3 minutes, the master cylinder is faulty. A slight change in pedal height when the A/C compressor cycles on and off is normal. (The A/C compressor load changes the vacuum available to the booster.)

Leak Test

1. Press the brake pedal with the engine running, then stop the engine. If the brake pedal height does not vary while pressed for 30 seconds, the vacuum booster is OK. If the pedal rises, the booster is faulty.

2. Turn the engine off, and wait 30 seconds. Press the brake pedal several times using normal pressure. When the brake pedal is first pressed, it should be low. On consecutive applications, the pedal height should gradually rise. If the brake pedal position does not vary, check the booster check valve.

3. Disconnect the brake booster vacuum hose at the booster (A). The check valve (B) is built into the hose.



4. Start the engine, and let it idle. There should be vacuum available. If no vacuum is available, the check valve is not working properly. Replace the brake booster vacuum hose and check valve, and retest.

5. Start the engine, and then pinch the brake booster vacuum hose between the check valve and the booster.

6. Turn the engine off and wait 30 seconds. Press the brake pedal several times using normal pressure. When the brake pedal is first pressed, it should be low. On consecutive applications, the brake pedal height should gradually rise.

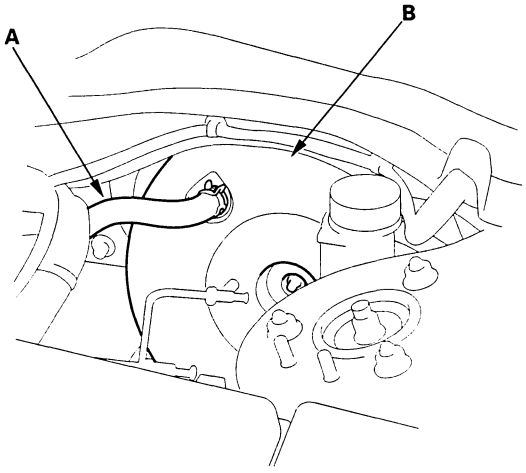
   - If the brake pedal position does not vary, replace the brake booster.
   - If the brake pedal position varies, replace the brake booster vacuum hose/check valve assembly.

BACK

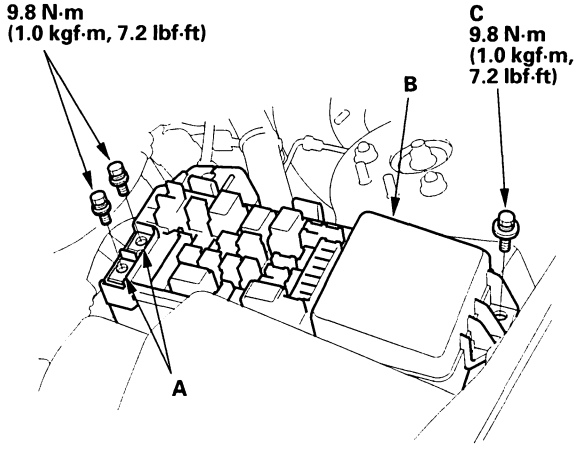
Protected by AR

Brake Booster Replacement

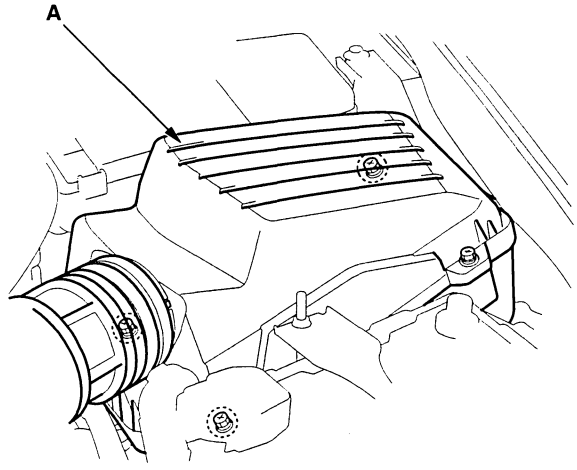
1. Make sure you have the anti-theft codes for the radio and navigation system, then write down the frequencies for the radio's preset buttons.
2. Disconnect the negative cable from the battery.
3. Remove the master cylinder (see page 19-16).
4. Disconnect the vacuum hose (A) from the brake booster (B).



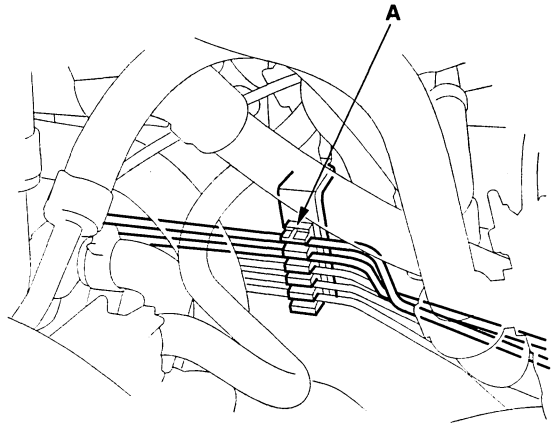
5. Remove the under-hood fuse/relay box cover.
6. Disconnect (+) and (−) terminals (A) of the under-hood fuse/relay box (B).



7. Remove the under-hood fuse/relay box mounting bolt (C), then remove the under-hood fuse/relay box from the body.
8. Remove the air cleaner assembly (A).



9. Remove the primary and secondary brake lines from the hose clamp (A).

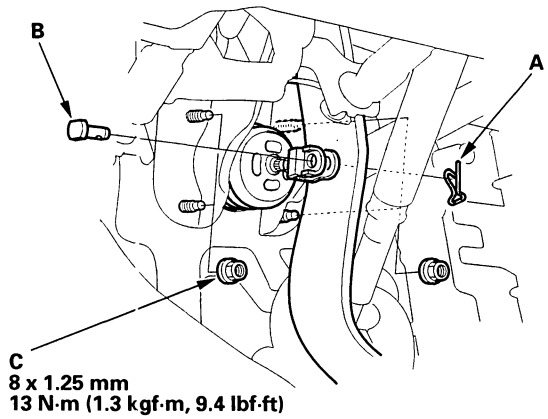


(cont'd)

Protected by AR

Brake Booster Replacement (cont'd)

10. Remove the lock pin (A) and the joint pin (B), then disconnect the yoke from the brake pedal.

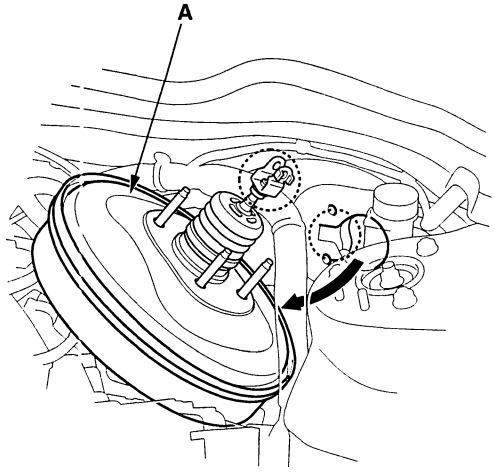


11. Remove the brake booster mounting nuts (C).

12. Remove the brake booster (A) from the engine compartment.

NOTICE

- Be careful not to damage the booster surfaces and threads of the booster stud bolts.
- Be careful not to bend or damage the brake lines.



13. Install the brake booster in the reverse order of removal, and note these items:

- Use a new lock pin whenever installing.
- After installing the brake booster and master cylinder, fill the reservoir with new brake fluid, bleed the brake system (see page 19-9), and adjust the brake pedal height and free play (see page 19-6).

BACK

Protected by AR

Rear Brake Pad Inspection and Replacement

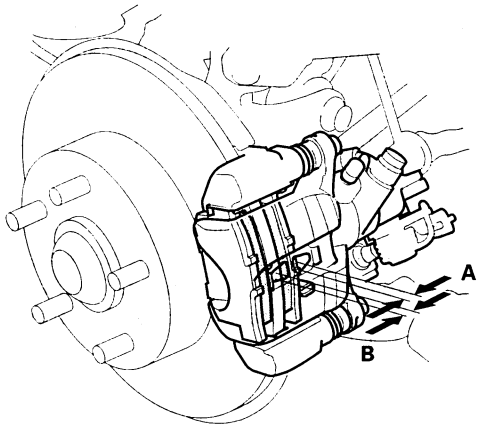
⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

Inspection

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the rear wheels.
3. Check the thickness of the inner pad (A) and outer pad (B). Do not include the thickness of the backing plate.

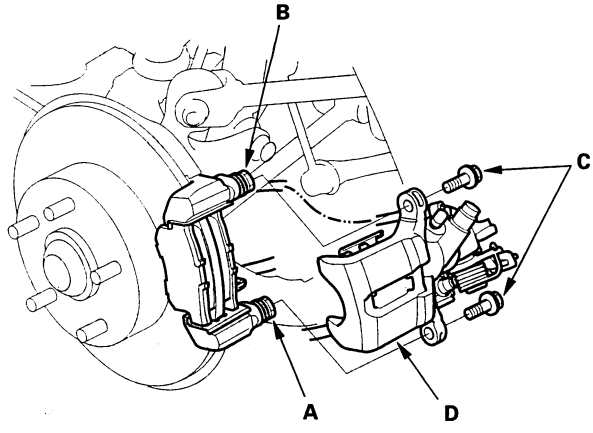
Brake pad thickness:
Standard: 8.9—9.1 mm (0.350—0.358 in.)
Service limit: 1.6 mm (0.06 in.)



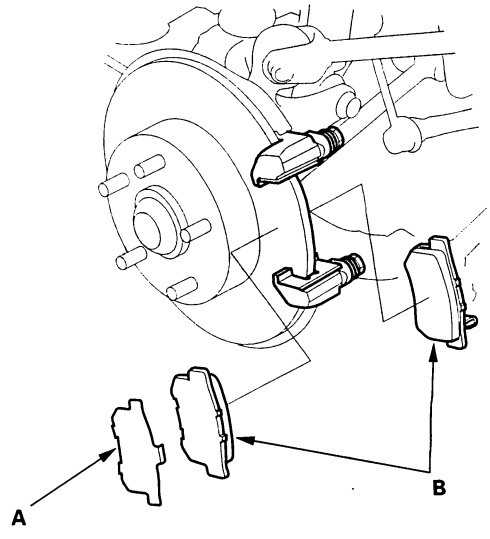
4. If the brake pad thickness is less than the service limit, replace all the rear brake pads as a set.

Replacement

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the rear wheels.
3. Remove the flange bolts (C) while holding the pin A and pin B with a wrench being careful not to damage the pin boots, and remove the caliper (D). Check the hose and pin boots for damage and deterioration.



4. Remove the pad shim (A) and brake pads (B).

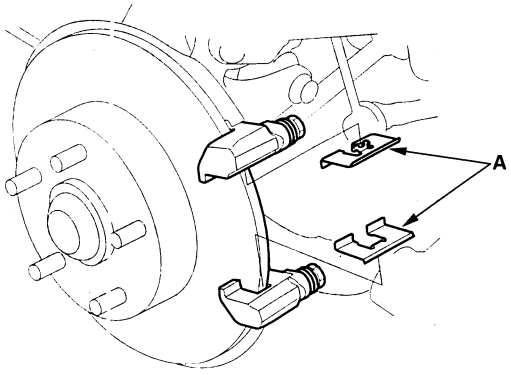


(cont'd)

Protected by AR

Rear Brake Pad Inspection and Replacement (cont'd)

5. Remove the pad retainers (A).

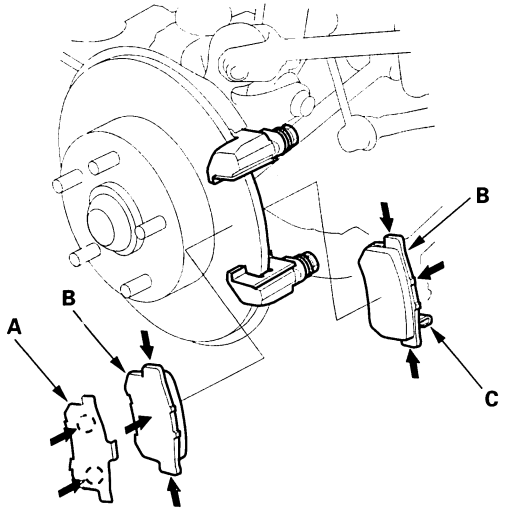


6. Clean the caliper thoroughly; remove any rust and check for grooves and cracks.

7. Check the brake disc for damage and cracks.

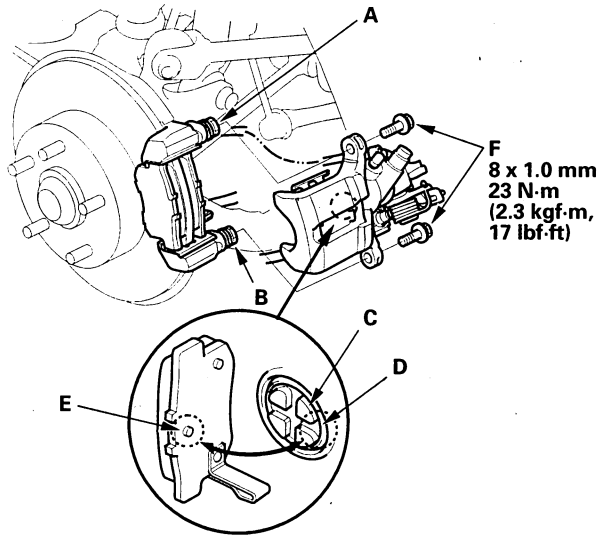
8. Install the pad retainers.

9. Apply a thin coat of M-77 assembly paste (P/N 08798-9010) to both sides of the pad shim (A), the back of brake pads (B), and the other areas indicated by the arrows. Wipe excess assembly paste off the pad shims and brake pads. Contaminated brake discs or pads reduce stopping ability. Keep assembly paste off the brake discs and pad material.



10. Install the brake pads and pad shims correctly. Install the brake pad with the wear indicator (C) on the inside bottom.
If you are reusing the brake pads, always reinstall the brake pads in their original positions to prevent a momentary loss of braking efficiency.

11. Rotate the caliper piston (C) clockwise into the cylinder, then align the cutout (D) in the piston with the tab (E) on the inner pad by turning the piston back. Lubricate the boot with rubber grease to avoid twisting the piston boot. If the piston boot is twisted, back it out so it is positioned properly.



12. Install the caliper. Install the flange bolts (F), and tighten it to the specified torque while holding the pin A and pin B with a wrench. Be careful not to damage the pin boots.

13. Press the brake pedal several times to make sure the brakes work.

    NOTE: Engagement of the brake may require a greater pedal stroke immediately after the brake pads have been replaced as a set. Several applications of the brake pedal will restore the normal pedal stroke.

14. After installation, check for leaks at hose and line joints or connections, and retighten if necessary. Then test-drive the vehicle.

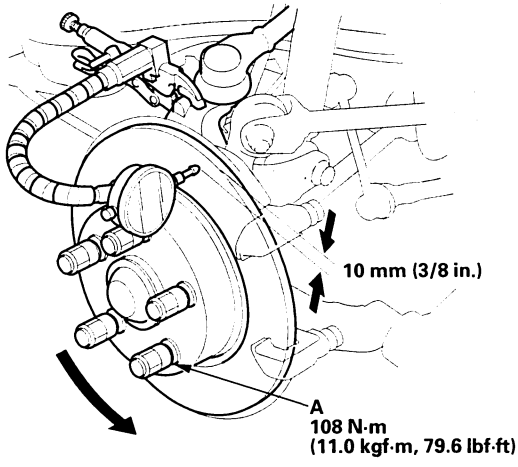
Rear Brake Disc Inspection

Runout

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the rear wheels.
3. Remove the brake pads (see page 19-21).
4. Inspect the brake disc surface for damage and cracks. Clean the brake disc thoroughly, and remove all rust.
5. Install suitable flat washers (A) and wheel nuts, and tighten the wheel nuts to the specified torque to hold the brake disc securely against the hub.



6. Set up the dial gauge against the brake disc as shown, and measure the runout at 10 mm (3/8 in.) from the outer edge of the brake disc.

   Brake disc runout:
   Service limit: 0.10 mm (0.004 in.)

7. If the brake disc is beyond the service limit, refinish the brake disc with an on-car brake lathe. The Kwik-Lathe produced by Kwik-way Manufacturing Co. and the "Front Brake Disc Lathe" offered by Snap-on Tools Co. are approved for this operation.

   Max. refinish limit: 8.0 mm (0.31 in.)

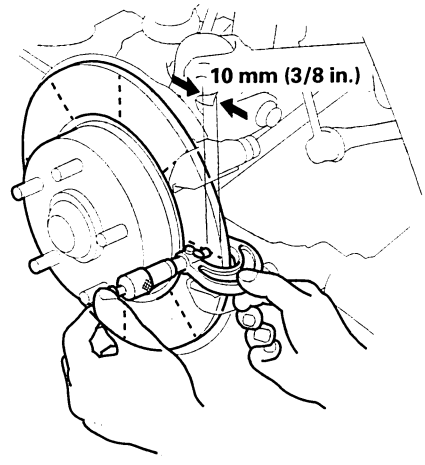
   NOTE:
   - If the brake disc is beyond the service limit for refinishing, replace it (see step 3 on page 18-31).
   - A new disc should be refinished if its runout is greater than 0.10 mm (0.004 in.).

Thickness and Parallelism

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the rear wheels.
3. Remove the brake pads (see page 19-21).
4. Using a micrometer, measure disc thickness at eight points, about 45 ° apart and 10 mm (3/8 in.) in from the outer edge of the brake disc. Replace the brake disc if the smallest measurement is less than the max. refinishing limit.

   Brake disc thickness:
   Standard: 8.9—9.1 mm (0.35—0.36 in.)
   Max. refinishing limit: 8.0 mm (0.31 in.)
   Brake disc parallelism: 0.015 mm (0.0006 in.) max.

   NOTE: This is the maximum allowable difference between the thickness measurements.



5. If the brake disc is beyond the service limit for parallelism, refinish the brake disc with an on-car brake lathe. The Kwik-Lathe produced by Kwik-way Manufacturing Co. and the "Front Brake Disc Lathe" offered by Snap-on Tools Co. are approved for this operation.

   NOTE: If the brake disc is beyond the service limit for refinishing, replace it (see step 3 on page 18-31).

Rear Brake Caliper Overhaul

⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

Remove, disassemble, inspect, reassemble, and install the caliper, and note these items:

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- To prevent dripping brake fluid, cover disconnected hose joints with rags or shop towels.
- Clean all parts in brake fluid and air dry; blow out all passages with compressed air.
- Before reassembling, check that all parts are free of dirt and other foreign particles.
- Replace parts with new ones as specified in the illustration.
- Make sure no dirt or other foreign matter gets into the brake fluid.
- Make sure no grease or oil gets on the brake discs or pads.
- When reusing brake pads, always reinstall them in their original positions to prevent loss of braking efficiency.
- Do not reuse drained brake fluid. Use only clean Honda DOT 3 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Do not mix different brands of brake fluid as they may not be compatible.
- Coat the piston, piston seal groove, and caliper bore with clean brake fluid.
- Replace all rubber parts with new ones whenever disassembled.
- After installing the caliper, check the brake hose and line for leaks, interference, and twisting.

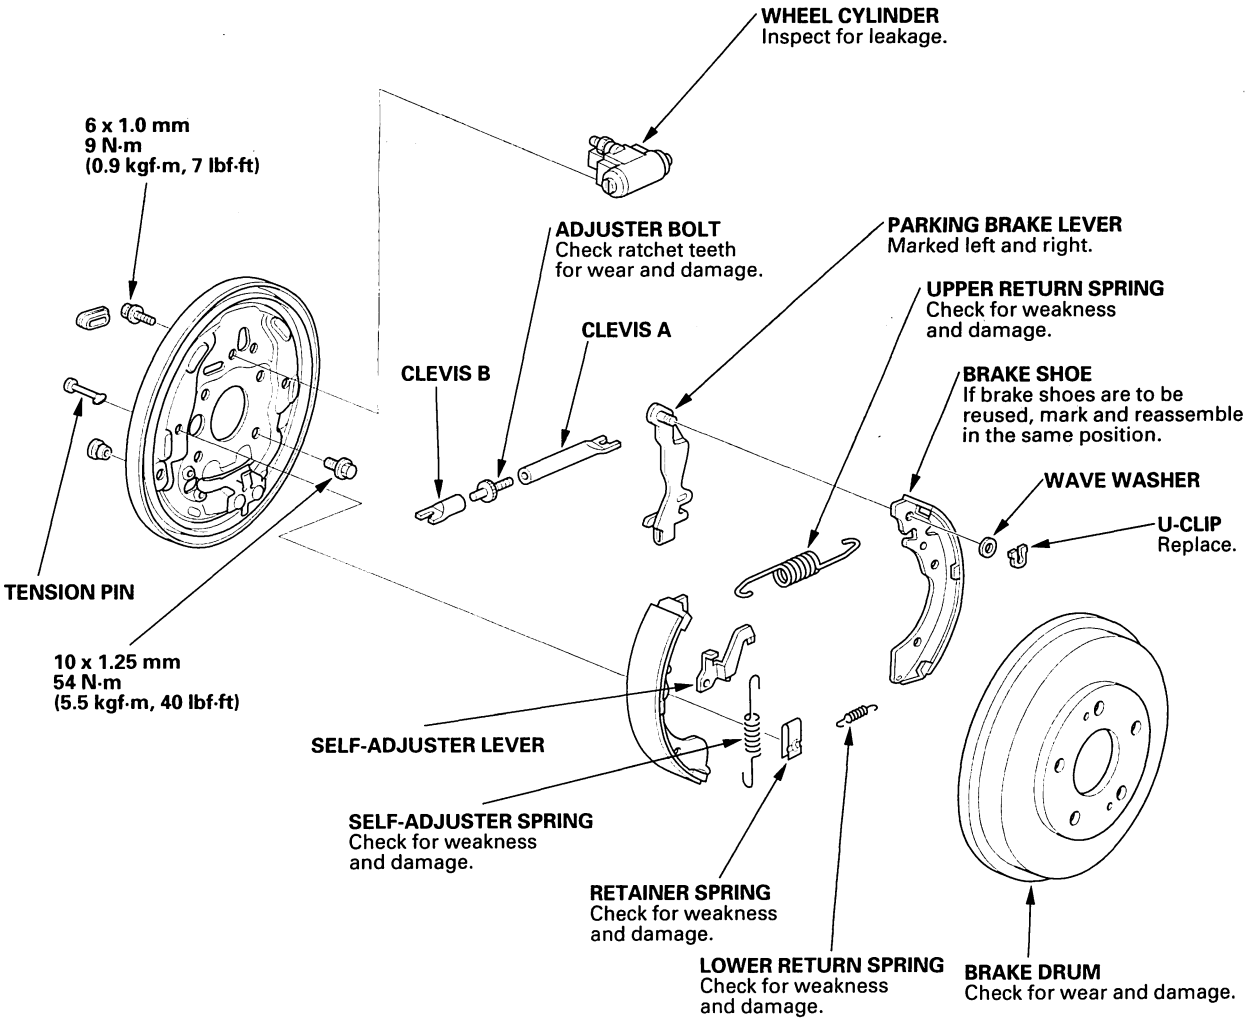
Rear Drum Brake Inspection

⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

NOTE:
- Contaminated brake linings or drums reduce stopping ability.
- Block the front wheels before jacking up the rear of the vehicle.

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see page 1-14).
2. Remove the rear wheels.
3. Release the parking brake, and remove the rear brake drum (see step 5 on page 18-33).

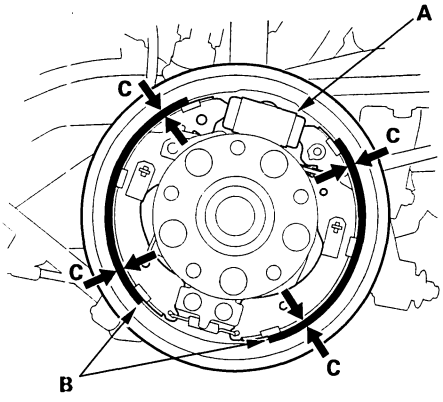


(cont'd)

Protected by AR

Rear Drum Brake Inspection (cont'd)

4. Check the wheel cylinder (A) for leakage.



5. Check the brake linings (B) for cracking, glazing, wear, and contamination.

6. Measure the brake lining thickness (C). Measurement does not include brake shoe thickness.

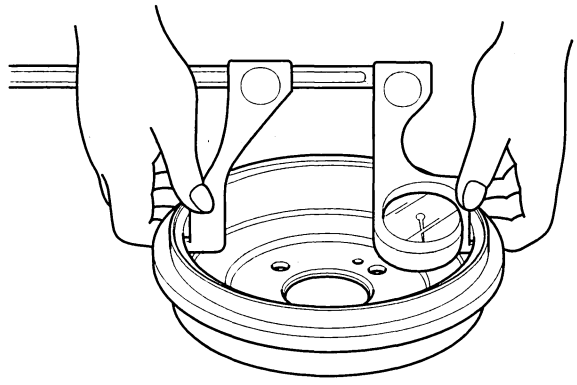
   Brake lining thickness:
   Standard: 4.5 mm (0.18 in.)
   Service limit: 2.0 mm (0.08 in.)

7. If the brake lining thickness is less than the service limit, replace the brake shoes as a set.

8. Check the hub bearing for smooth operation. If it requires servicing, replace it (see page 18-33).

9. Measure the inside diameter of the brake drum with inside vernier calipers.

   Drum inside diameter:
   Standard: 219.9—220 mm (8.657—8.661 in.)
   Service limit: 221 mm (8.701 in.)



10. If the inside diameter of the brake drum is more than the service limit, replace the brake drum.

11. Check the brake drum for scoring, grooves, corrosion, and cracks.

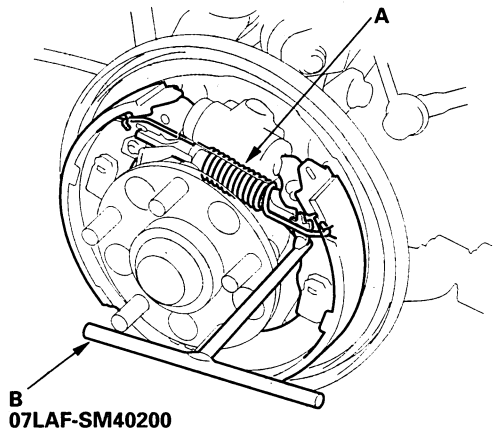
Rear Brake Shoe Replacement

Special Tools Required
Brake spring installer 07LAF-SM40200

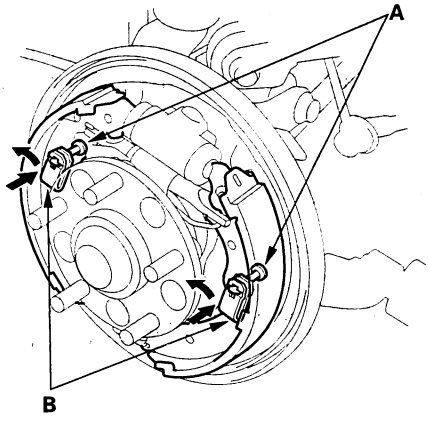
Removal/Disassembly

1. Remove the brake drum (see step 1 on page 18-33).

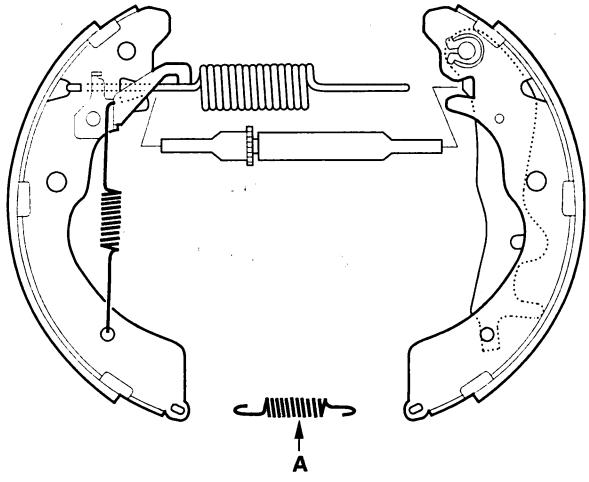
2. Unhook the upper return spring (A) from the rearward shoe using the special tool (B).



3. Remove the tension pins (A) by pushing each retainer spring (B) and turning the pins.



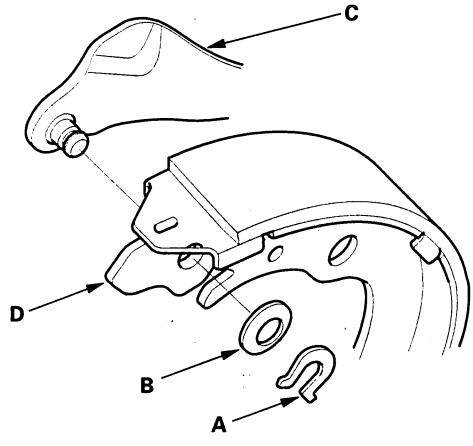
4. Lower the brake shoe assembly, and remove the lower return spring (A). Be careful not to damage the wheel cylinder dust cover.



5. Remove the brake shoe assembly from the backing plate, and disassemble the brake shoe assembly.

6. Disconnect the parking brake cable from the parking brake lever, and remove the brake shoe.

7. Remove the U-clip (A), and wave washer (B), and separate the parking brake lever (C) from the brake shoe (D).



(cont'd)

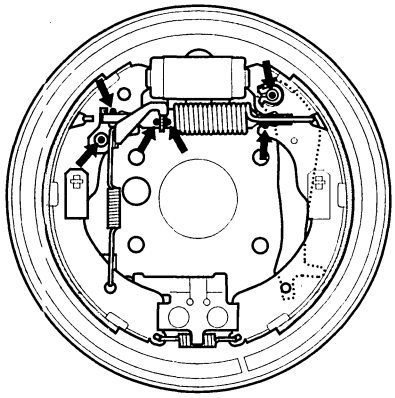
Protected by AR

Rear Brake Shoe Replacement (cont'd)

Reassembly

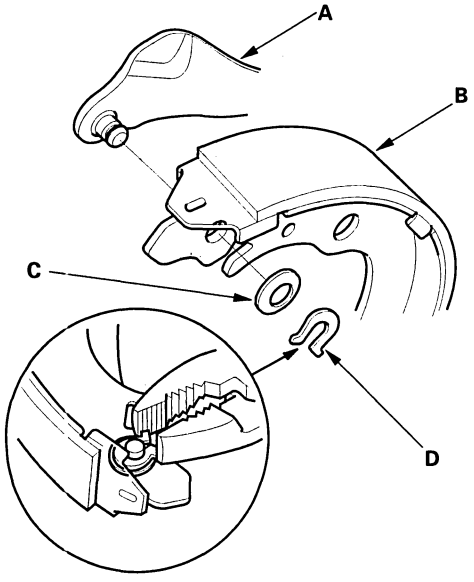
1. Apply a thin coat of 44 MA assembly paste onto the sliding surfaces as illustrated. Wipe off any excess assembly paste. Do not get assembly paste on the brake lining material.

→• Sliding surfaces



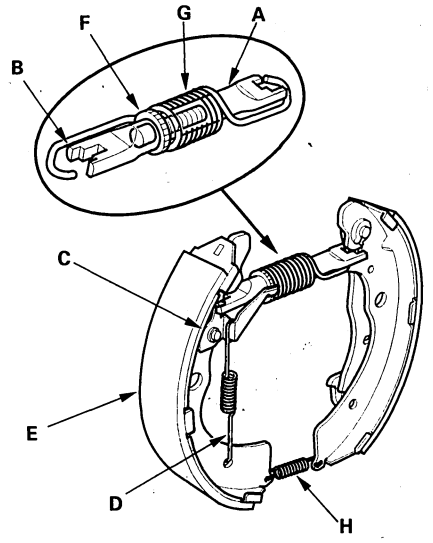
2. Install the parking brake lever (A) to the rearward brake shoe (B), and secure it with the wave washer (C), and a new U-clip (D). Pinch the U-clip securely to prevent it from coming off.

NOTE: Install the wave washer with its convex side facing outside.



3. Connect the parking brake cable to the rearward brake shoe.

4. Install the self-adjuster lever (C) and self-adjuster spring (D) on the front side brake shoe (E).



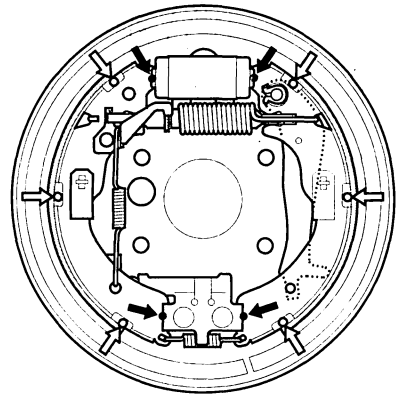
5. Assemble the brake shoes with the clevis A, adjuster bolt (F), clevis B, upper return spring (G), and lower return spring (H).

NOTE: Fully turn the adjuster bolt into the clevis A.

6. Apply a thin coat of 44 MA assembly paste onto the sliding surfaces as illustrated. Wipe off any excess assembly paste. Do not get assembly paste on the brake lining material.

→• Sliding surfaces

⇨○ Backside edge of the brake shoe

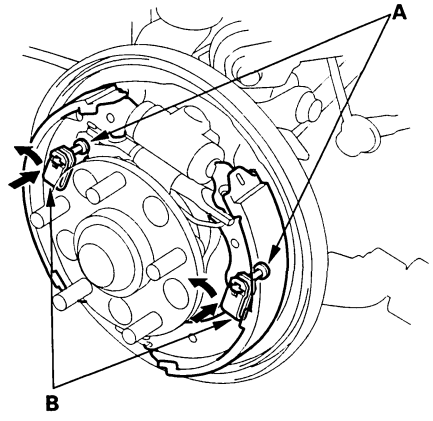


7. Install the brake shoe assembly on the backing plate fitting the top of the brake shoes onto the wheel cylinder pistons and the bottom of the brake shoes onto the locating plate.

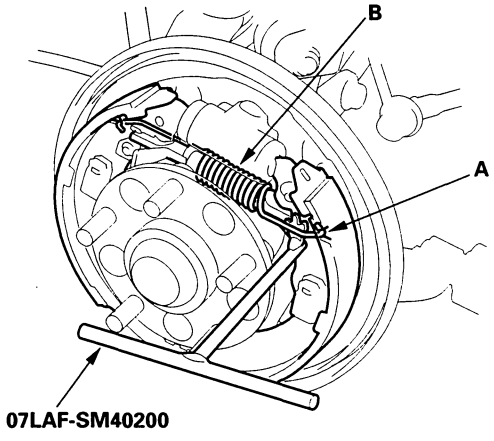
BACK

Protected by AR

8. Install the tension pins (A), and secure with the retainer springs (B) by pushing it and turning each pin.



9. Hook the end (A) of the upper return spring (B) with the special tool.



10. Install the brake drum and rear wheel.

11. If the wheel cylinder has been removed, bleed the brake system (see page 19-9).

12. Press the brake pedal several times to set the self-adjusting brake.

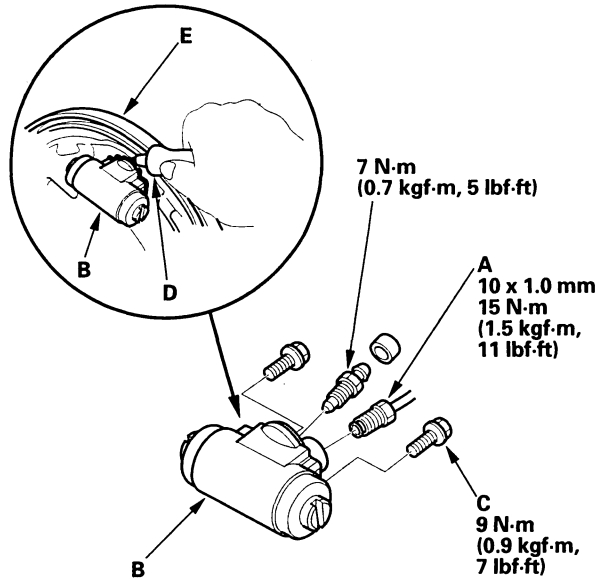
13. Adjust the parking brake (see page 19-7).

Rear Wheel Cylinder Replacement

NOTE:
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.
- To prevent spills, cover the hose joints with rags or shop towels.
- Use only a Honda wheel cylinder special bolt.

1. Remove the brake shoes (see page 19-27).

2. Disconnect the brake line (A) from the wheel cylinder (B).



3. Remove the bolt (C) and the wheel cylinder from the backing plate.

4. Apply Three Bond 1109G sealant or equivalent (D) between the wheel cylinder and backing plate (E), and install the wheel cylinder.

5. Install the removed parts in the reverse order of removal.

6. Bleed the brake system (see page 19-9).

7. Check for leaks at the line joint and bleed screw, and retighten if necessary.

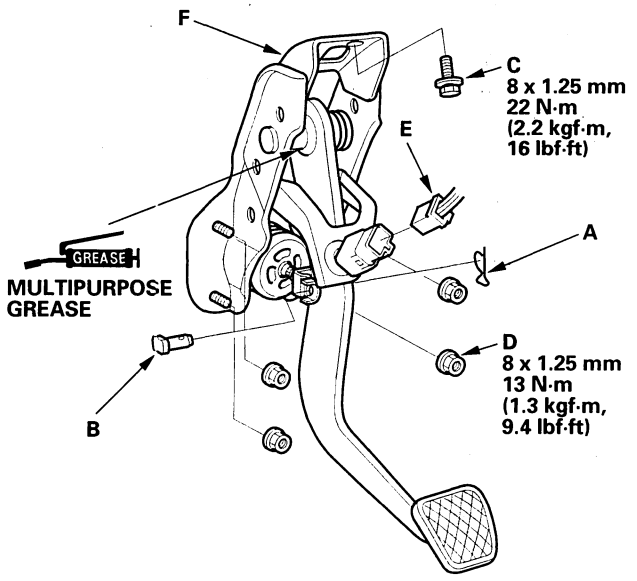
BACK

Protected by AR

Conventional Brake Components

Brake Pedal Replacement

1. Remove the lock pin (A) and pin (B).



2. Remove the brake pedal bracket mounting bolt (C) and nuts (D).
3. Disconnect the brake pedal position switch connector (E).
4. Remove the brake pedal with bracket (F).
5. Install in the reverse order of removal.
6. Do the brake pedal and brake pedal position switch adjustment (see page 19-6).

   NOTE: Replace the lock pin whenever the brake pedal is replaced.

BACK

Protected by AR

Brake Hose and Line Inspection

1. Inspect the brake hoses for damage, deterioration, leaks, interference, and twisting.
2. Check the brake lines for damage, rusting, and leaks. Also check for bent brake lines.
3. Check for leaks at hose and line joints and connections, and retighten if necessary.
4. Check the master cylinder and ABS modulator-control unit for damage and leakage.

NOTE: Replace the brake hose clip whenever the brake hose is serviced.

Connection Point	Component	Connected to	Specified Torque Value	Note
A	Front brake caliper	Brake hose	34 N·m (3.5 kgf·m, 25 lbf·ft)	Banjo bolt
		Breed screw	9.0 N·m (0.9 kgf·m, 7.0 lbf·ft)	
B	Rear brake caliper	Brake hose	34 N·m (3.5 kgf·m, 25 lbf·ft)	Banjo bolt
		Breed screw	9.0 N·m (0.9 kgf·m, 7.0 lbf·ft)	
C	Rear wheel cylinder	Brake line	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut
		Breed screw	7.0 N·m (0.7 kgf·m, 5.0 lbf·ft)	
D	Brake hose	Brake line	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut
E	Master cylinder	Brake line	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut
F	ABS modulator-control unit	Brake line (12 mm nut)	22 N·m (2.2 kgf·m, 16 lbf·ft)	Flare nut
		Brake line (10 mm nut)	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut

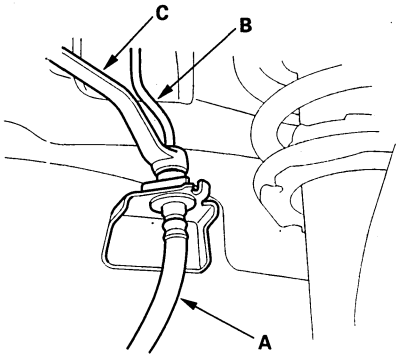
Brake Hose Replacement

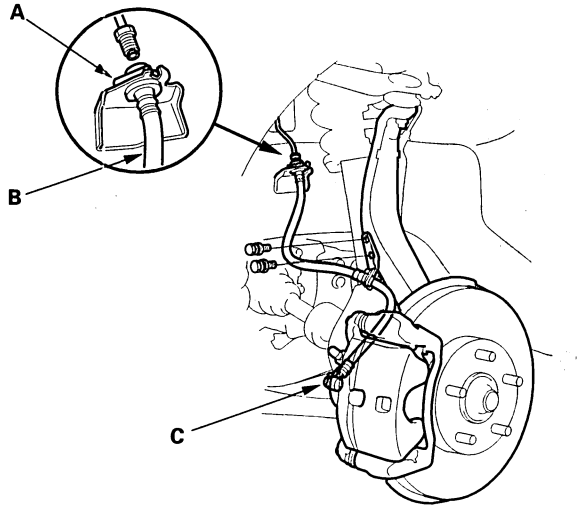
NOTE:
- Before reassembling, check that all parts are free of dirt and other foreign particles.
- Replace parts with new ones whenever specified to do so.
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- To prevent dripping, cover disconnecting line joints with rags or shop towels.

1. Replace the brake hose (A) if the hose is twisted, cracked, or if it leaks.



2. Disconnect the brake hose from the brake line (B) using a 10 mm flare-nut wrench (C).

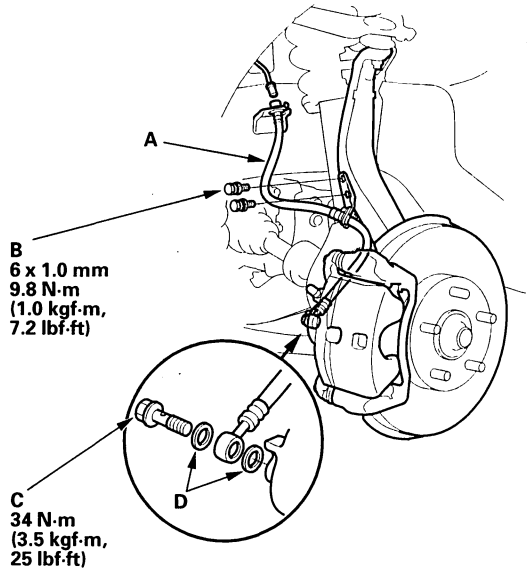
3. Remove and discard the brake hose clip (A) from the brake hose (B).



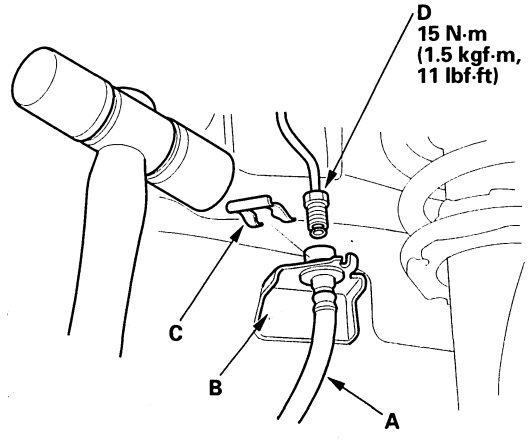
4. Remove the banjo bolt (C), and disconnect the brake hose from the caliper.

5. Remove the brake hose from the knuckle.

6. Install the brake hose (A) on the damper with flange bolts (B) first, then connect the brake hose to the caliper with the banjo bolt (C) and new sealing washers (D).



7. Install the brake hose (A) on the upper brake hose bracket (B) with a new brake hose clip (C).



8. Connect the brake line (D) to the brake hose.

9. After installing the brake hose, bleed the brake system (see page 19-9).

10. Do the following checks:
    - Check the brake hose and line joint for leaks, and tighten if necessary.
    - Check the brake hoses for interference and twisting.

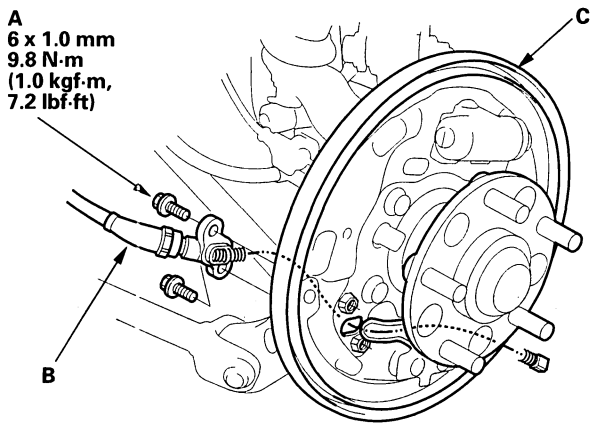
Parking Brake Cable Replacement (cont'd)

NOTE: The parking brake cable must not be bent or distorted. This will lead to stiff operation and premature cable failure. Refer to the Exploded View as needed during this procedure.

1. Remove the brake drum and shoes, and disconnect the parking brake cable from the brake shoe (see page 19-27).

2. Remove the flange bolts (A) and parking brake cable (B) from the backing plate (C).



3. Reinstall the parking brake cable in the reverse order of removal, and note these items:

   - Before installing the brake drum, clean the mating surface of the rear hub and the inside of the brake drum.
   - Before installing the wheel, clean the mating surfaces on the brake drum and inside of the wheel.
   - Adjust the parking brake (see page 19-7). Apply the parking brake firmly 10 times then adjust it again.

General Troubleshooting Information

ABS Indicator

- If the system is OK, the ABS indicator goes off 2 seconds after turning the ignition switch ON (II).
- The ABS indicator comes on when the ABS modulator-control unit detects a problem in the system. However, even though the system is operating properly, the indicator will come on under these conditions:
  - Only the drive wheels rotate
  - One drive wheel is stuck
  - The vehicle goes into a spin
  - The ABS continues to operate for a long time
  - The vehicle is subjected to an electrical signal disturbance

To determine the actual cause of the problem, question the customer about the problem, taking the conditions into consideration.

- When a problem is detected and the ABS indicator comes on, there are cases when the indicator stays on until the ignition switch is turned OFF, and cases when the indicator goes off automatically when the system returns to normal.
  - DTC 61 or 62: The ABS indicator goes off automatically when the system returns to normal.
  - DTC 11, 13, 15, 17, 31, 32, 33, 34, 35, 36, 37, 38, 54, 71, or 81: The ABS indicator stays on until the ignition switch is turned OFF whether or not the system returns to normal.
  - DTC 12, 14, 16, 18, 21, 22, 23, 24, 41, 42, 43, 44, 51, 52, or 53: The ABS indicator goes off after the ignition switch is turned OFF and then back ON (II), the vehicle is driven, and the system is OK.

Brake System Indicator

The brake system indicator in the gauge control module will come on under these conditions:

- Parking brake lever pulled up
- Low brake fluid in the brake master cylinder reservoir
- ABS modulator-control unit detects a problem that affects the EBD

Diagnostic Trouble Code (DTC)

- The memory can hold any number of DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are indicated in the order they occurred, beginning with the most recent.
- The DTCs are memorized in the EEPROM (non-volatile memory). Therefore, the memorized DTCs are not cleared when the battery is disconnected, the ignition switch is turned off, or the system returns to normal. Do the specified procedures to clear the DTCs.

Self-diagnosis

- Self-diagnosis can be classified into two categories:
  - Initial diagnosis:
    Done right after the ignition switch is turned ON (II) and until the ABS indicator goes off
  - Regular diagnosis:
    Done right after the initial diagnosis until the ignition switch is turned OFF
- When a problem is detected by self-diagnosis, the system does the following:
  - Turns the ABS indicator and possibly the brake system indicator on
  - Memorizes the DTC
  - Stops ABS operation

Kickback

The pump motor operates when the ABS modulator-control unit is functioning, and the fluid in the reservoir is forced back to the master cylinder, causing kickback at the brake pedal.

Pump Motor

- The pump motor operates when the ABS modulator-control unit is functioning.
- The ABS modulator-control unit checks the pump motor operation when the vehicle is driven the first time after the ignition switch is turned ON (II). You may hear the motor operate at this time, but it is normal.

(cont'd)

Protected by AR

General Troubleshooting Information (cont'd)

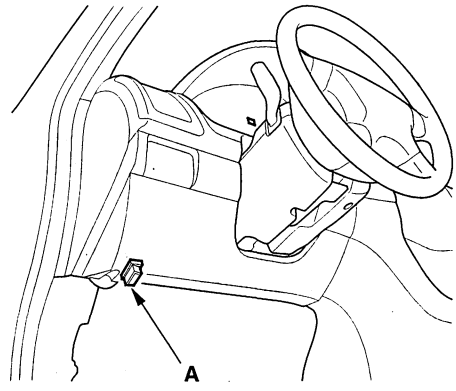
How to Troubleshoot DTCs

The troubleshooting flowchart procedures assume that the cause of the problem is still present, and the ABS indicator and possibly the brake system indicator are still on. Following the flowchart when the ABS indicator does not come on can result in incorrect diagnosis. The connector illustrations show the female terminal connectors with a single outline and the male terminal connectors with a double outline.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the ABS indicator and possibly the brake system indicator came on, such as during ABS control, after ABS control, when the vehicle was at a certain speed, etc.
2. Clear the code and, test-drive the vehicle. If the code resets immediately, refer to the code troubleshooting chart.
3. When the ABS indicator and possibly the brake system indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor terminal contact, etc., before you start troubleshooting.
4. After troubleshooting, clear the DTC, and test-drive the vehicle. Make sure the ABS indicator and possibly the brake system indicator does not come on.

How to Retrieve DTCs

1. With the ignition switch OFF, connect the Honda Diagnostic System (HDS) to the 16P data link connector (DLC) (A) under the left side of the dashboard.

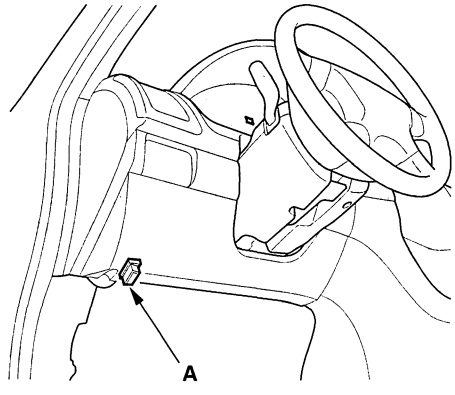


2. Turn the ignition switch ON (II), and follow the prompts on the HDS to display the ABS DTC(s) on the screen. After determining the DTC, refer to the ABS DTC Troubleshooting.

   NOTE: See the HDS Help menu for specific instructions.

How to Clear DTCs

1. With the ignition switch OFF, connect the HDS to the 16P data link connector (DLC) (A) under the left side of the dashboard.



2. Turn the ignition switch ON (II), and clear the DTC(s) by following the screen prompts on the HDS.

   NOTE: See the HDS Help menu for specific instructions.

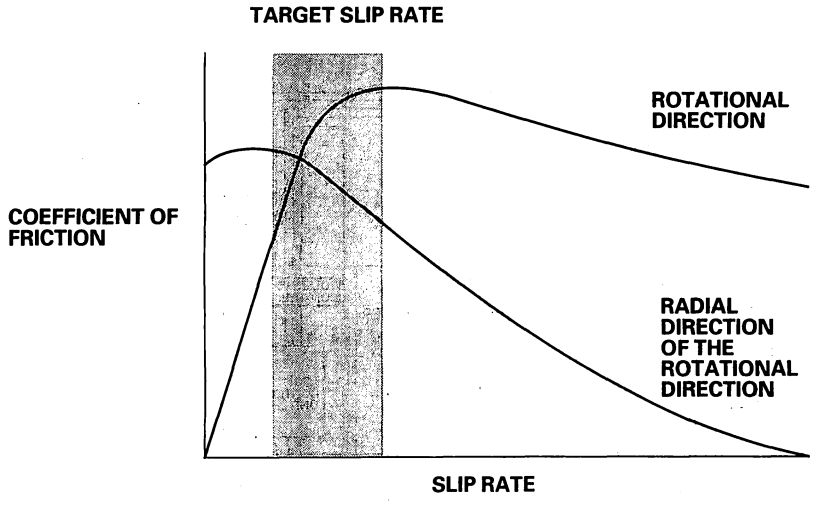
Features

When the brake pedal is pressed during driving, the wheels can lock before the vehicle comes to a stop. In such an event, the maneuverability of the vehicle is reduced if the front wheels are locked, and the stability of the vehicle is reduced if the rear wheels are locked, creating an extremely unstable condition. The ABS precisely controls the slip rate of the wheels to ensure maximum grip force from the tires, thereby ensuring the maneuverability and stability of the vehicle.
The ABS calculates the slip rate of the wheels based on the vehicle speed and the wheel speed, then it controls the brake fluid pressure to reach the target slip rate.

Grip Force of Tire and Road Surface



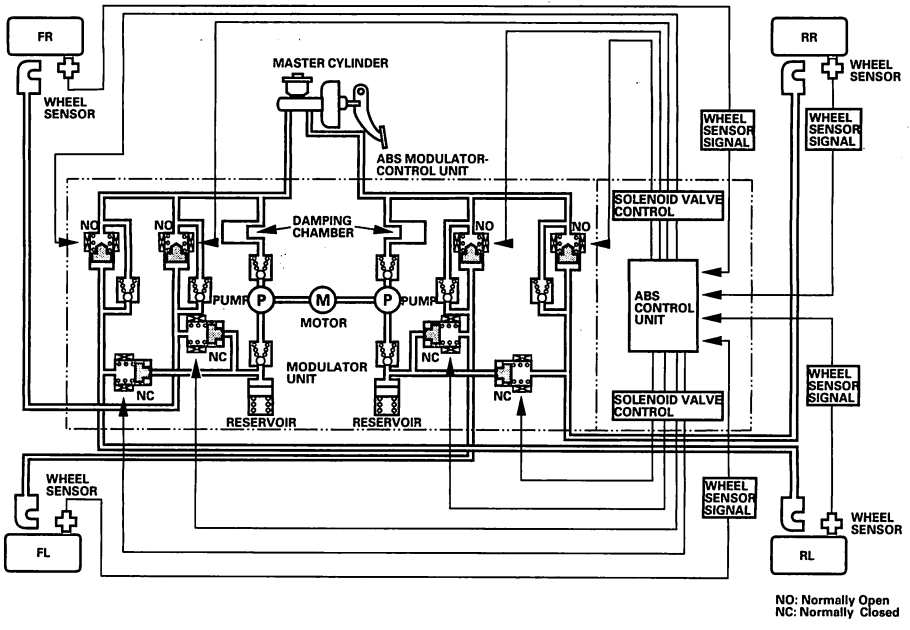
(cont'd)

Protected by AR

ABS Components

System Description (cont'd)

COMPONENTS		MAIN FUNCTION
Wheel sensor		The wheel sensor outputs the speed signal to the ABS control unit according to the pulser's rotation speed.
ABS modulator-control unit	ABS control unit	The ABS control unit processes the signal from the wheel sensors, then outputs the ABS control signal to the modulator unit.
	Modulator unit	The modulator unit receives the control signal, then controls brake fluid pressure for each wheel.
Motor relay (inside of the ABS control unit)		The motor relay drives the ABS pump motor.
ABS fail-safe relay (inside of the ABS control unit)		The ABS fail-safe relay cuts the power to the solenoid valves when a problem is detected.



BACK

Protected by AR

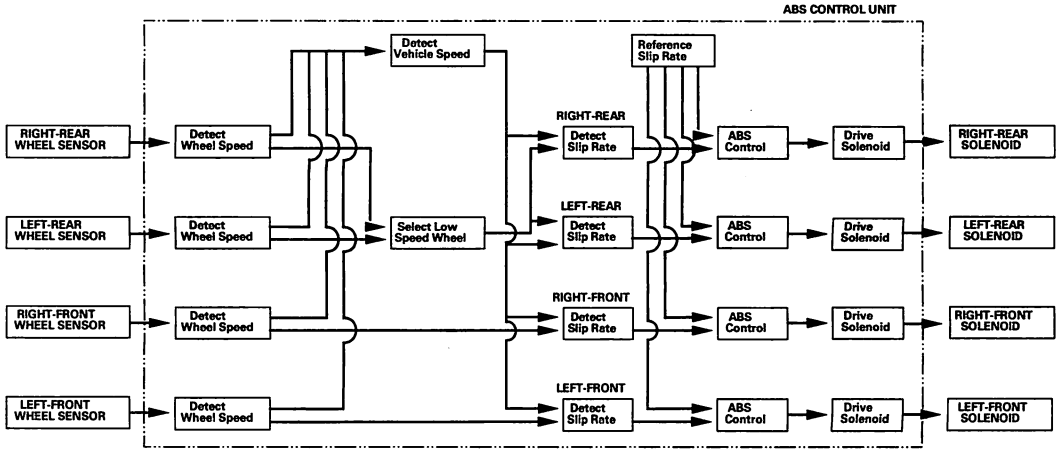
ABS Control Unit

Main Control

The ABS control unit detects the wheel speed based on the wheel sensor signal it received, then it calculates the vehicle speed based on the detected wheel speed. The control unit detects the vehicle speed during deceleration based on the rate of deceleration.

The ABS control unit calculates the slip rate of each wheel, and transmits the control signal to the modulator unit solenoid valve when the slip rate is high.

The hydraulic control has three modes: Pressure reducing, pressure retaining, and pressure intensifying.



Electronic Brake Distribution (EBD) Control

The electronic brake distribution (EBD) function helps control vehicle braking by adjusting the rear brake force before the ABS operates. Based on wheel sensor signals, the ABS control unit uses the modulator to control the rear brakes individually. When the rear wheel speed is less than the front wheel speed, the ABS control unit retains the current rear brake fluid pressure by closing the inlet valve in the modulator. As the rear wheel speed increases and approaches the front wheel speed, the control unit increases the rear brake fluid pressure by momentarily opening the inlet valve. This whole process is repeated very rapidly. While this is happening, there is kickback at the brake pedal.

During self-diagnosis, if the ABS control unit detects a problem that affects the EBD, it turns on the brake system indicator and the ABS indicator.

Self-diagnosis Function

1. The ABS control unit is equipped with a CPU and a monitor IC. They check each other for problems.
2. The CPU check the system circuits.
3. The ABS control unit turns on the ABS and possibly the brake system indicator when the unit detects a problem, and the unit stops ABS operation.
4. The self-diagnosis can be classified into these two categories:
   - Initial diagnosis
   - Regular diagnosis

On-board Diagnosis Function

The ABS can be diagnosed with the HDS.
The ALB Checker cannot be used with this system. For air bleeding, and checking wheel sensor signals, use the HDS. See the HDS Help menu for specific operating instructions.

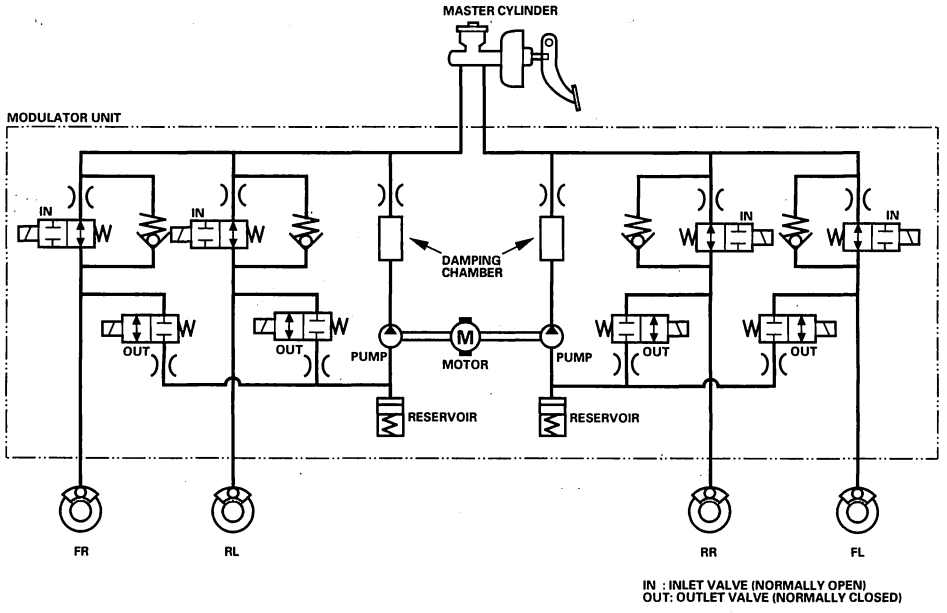
ABS Components

System Description (cont'd)

ABS Modulator

The ABS modulator consists of the inlet solenoid valve, outlet solenoid valve, reservoir, pump, and the pump motor. The modulator reduces the caliper fluid pressure directly. It is a circulating-type modulator because the brake fluid circulates through the caliper, reservoir, and the master cylinder. The hydraulic control has three modes; normal braking, pressure retaining, and pressure reducing. The hydraulic circuit is an independent four channel type, one channel for each wheel.

Shown in normal braking mode



Normal braking mode: Inlet valve open, outlet valve closed:
Master cylinder fluid is pumped out to the caliper.

Pressure retaining mode: Inlet valve closed, outlet valve closed:
Caliper fluid is retained by the inlet valve and outlet valve.

Pressure reducing mode: Inlet valve closed, outlet valve open:
Caliper fluid flows through the outlet valve to the reservoir.
When in pressure reducing mode, the pump motor is ON.
The reservoir fluid is pumped out by the pump, through the damping chamber, to the master cylinder.
When stopping ABS operation, the pump motor is OFF.

BACK

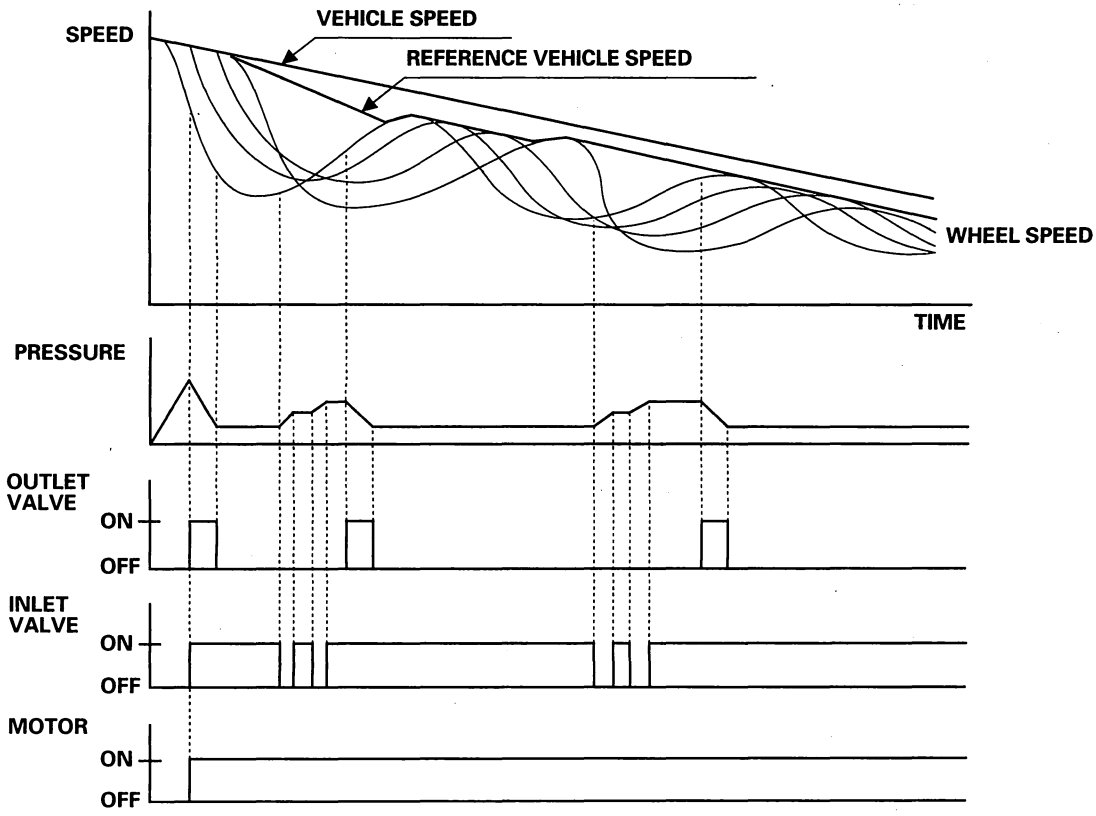
Protected by AR

Wheel Sensors

The wheel sensors are the magnetic contactless type. The wheel sensors detect changing of magnetic polarity on the magnetic encoder contained inside the front wheel bearings. The ABS modulator-control unit calculates the wheel speed based on signals sent from the wheel sensor.

NOTE: The front wheel bearings are directional.

Wheel Speed and Modulator Control



When the wheel speed drops sharply below the vehicle speed, the outlet valve opens momentarily to reduce the caliper fluid pressure. The pump motor starts at this time. As the wheel speed is restored, the inlet valve opens momentarily to increase the caliper fluid pressure.

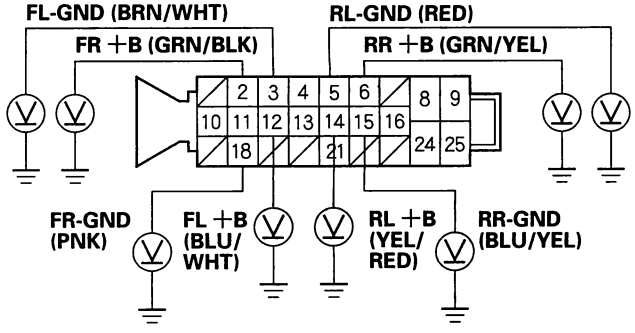
DTC Troubleshooting

DTC 11, 13, 15, 17: Wheel Sensor (Open/Short to Body Ground/Short to Power)

1. Disconnect the ABS modulator-control unit 25P connector.
2. Start the engine.
3. Measure the voltage between body ground and the appropriate wheel sensor +B and GND terminals of the ABS modulator-control unit 25P connector individually (see table).

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 2	FR-GND: No. 18
13 (Left-front)	FL +B: No. 12	FL-GND: No. 3
15 (Right-rear)	RR +B: No. 6	RR-GND: No. 15
17 (Left-rear)	RL +B: No. 14	RL-GND: No. 5

ABS MODULATOR-CONTROL UNIT 25P CONNECTOR



Wire side of female terminals

Is there battery voltage?

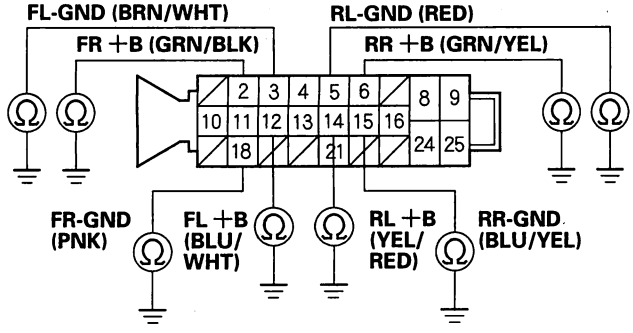
YES—Repair short to power in the wire between the ABS modulator-control unit and the appropriate wheel sensor. ■

NO—Go to step 4.

4. Turn the ignition switch OFF.
5. Check for continuity between body ground and the appropriate wheel sensor +B and GND terminals of the ABS modulator-control unit 25P connector individually (see table).

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 2	FR-GND: No. 18
13 (Left-front)	FL +B: No. 12	FL-GND: No. 3
15 (Right-rear)	RR +B: No. 6	RR-GND: No. 15
17 (Left-rear)	RL +B: No. 14	RL-GND: No. 5

ABS MODULATOR-CONTROL UNIT 25P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 6.

NO—Go to step 8.

6. Disconnect the appropriate wheel sensor 2P connector.

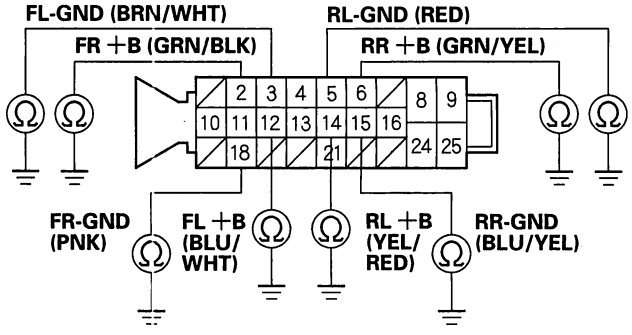
DTC Troubleshooting (cont'd)

7. Check for continuity between body ground and the appropriate wheel sensor +B and GND terminals of the ABS modulator-control unit 25P connector individually (see table).

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 2	FR-GND: No. 18
13 (Left-front)	FL +B: No. 12	FL-GND: No. 3
15 (Right-rear)	RR +B: No. 6	RR-GND: No. 15
17 (Left-rear)	RL +B: No. 14	RL-GND: No. 5

ABS MODULATOR-CONTROL UNIT 25P CONNECTOR



Wire side of female terminals

Is there continuity?

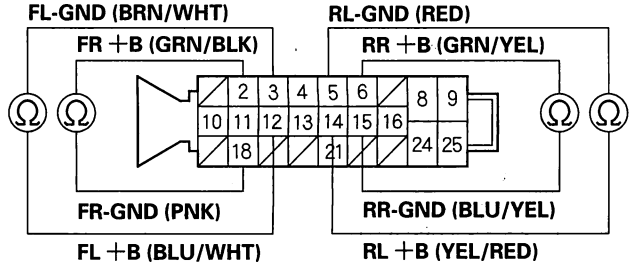
YES—Repair short to body ground in the wire between the ABS modulator-control unit and the wheel sensor.■

NO—Replace the wheel sensor (see page 19-68).■

8. Measure the resistance between the appropriate wheel sensor +B and GND terminals of the ABS modulator-control unit 25P connector (see table), then measure the resistance between the same terminals and reverse the positive and negative tester probes.

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 2	FR-GND: No. 18
13 (Left-front)	FL +B: No. 12	FL-GND: No. 3
15 (Right-rear)	RR +B: No. 6	RR-GND: No. 15
17 (Left-rear)	RL +B: No. 14	RL-GND: No. 5

ABS MODULATOR-CONTROL UNIT 25P CONNECTOR



Wire side of female terminals

Is the resistance infinity (open circuit) in both directions?

YES—Go to step 9.

NO—Go to step 11.

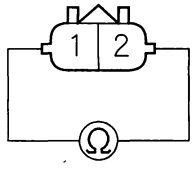
9. Disconnect the appropriate wheel sensor 2P connector.

BACK

Protected by AR

10. Measure the resistance between the appropriate wheel sensor 2P connector terminals, then measure the resistance between the same terminals and reverse the positive and negative tester probes.

WHEEL SENSOR 2P CONNECTOR



Terminal side of female terminals

Is the resistance infinity (open circuit) in both directions?

YES—Replace the wheel sensor (see page 19-68). ■

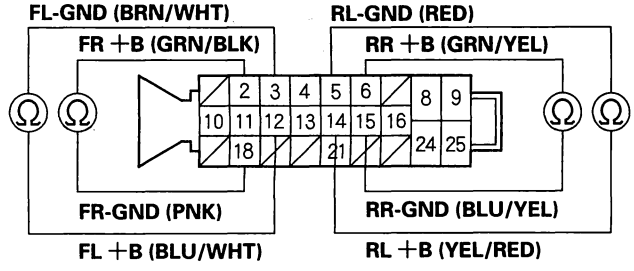
NO—Repair open in the wire between the ABS modulator-control unit and the wheel sensor. ■

11. Disconnect the appropriate wheel sensor 2P connector.

12. Check for continuity between the appropriate wheel sensor +B and GND terminals of the ABS modulator-control unit 25P connector (see table), then check for continuity between the same terminals and reverse the positive and negative tester probes.

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 2	FR-GND: No. 18
13 (Left-front)	FL +B: No. 12	FL-GND: No. 3
15 (Right-rear)	RR +B: No. 6	RR-GND: No. 15
17 (Left-rear)	RL +B: No. 14	RL-GND: No. 5

ABS MODULATOR-CONTROL UNIT 25P CONNECTOR



Wire side of female terminals

Is there continuity in both directions?

YES—Repair the wires between the ABS modulator-control unit and the wheel sensor that are shorted to each other. ■

NO—Check for loose or poor connections at the ABS modulator-control unit 25P connector and the appropriate wheel sensor 2P connector. If the connections are good, replace the appropriate wheel sensor and recheck for DTCs. If the DTC returns, replace the ABS modular-control unit (see page 19-65). ■

DTC Troubleshooting (cont'd)

DTC 12, 14, 16, 18: Wheel Sensor (Electrical Noise/Intermittent Interruption)

NOTE: If the ABS indicator comes on because of electrical noise, the indicator will go off when you drive the vehicle over 19 mph (30 km/h) and the noise is gone.

1. Inspect the appropriate wheel sensor and magnetic encoder (front) and pulser (rear) (see page 19-67).

DTC	Appropriate Wheel Sensor
12	Right-front
14	Left-front
16	Right-rear
18	Left-rear

Are they OK?

YES—Go to step 2.

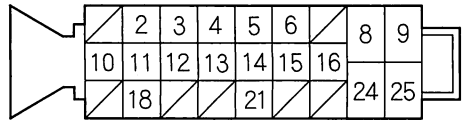
NO—Reinstall or replace the appropriate wheel sensor or magnetic encoder (front) and pulser (rear) (see page 19-68).■

2. Disconnect the ABS modulator-control unit 25P connector.

3. Check for continuity between the appropriate wheel sensor GND terminal and other wheel sensor GND terminals (see table).

DTC	Appropriate Terminal	Other Terminals		
12	FR-GND: No. 18	No. 3	No. 15	No. 5
14	FL-GND: No. 3	No. 18	No. 15	No. 5
16	RR-GND: No. 15	No. 18	No. 3	No. 5
18	RL-GND: No. 5	No. 18	No. 3	No. 15

ABS MODULATOR-CONTROL UNIT 25P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wires between the appropriate wheel sensor and the other wheel sensor.■

NO—Clear the DTC, and test-drive the vehicle. If the ABS indicator comes on and the same DTC is indicated, replace the ABS modulator-control unit (see page 19-65).■

BACK

Protected by AR

DTC 21, 22: Magnetic Encoder (Front)

DTC 23, 24: Pulser (Rear)

1. Clear the DTC (see page 19-38).
2. Test-drive the vehicle at 19 mph (30 km/h) or more.

   Does the ABS indicator come on, and are DTCs 21, 22, 23, 24 indicated?

   YES—Go to step 3.

   NO—The system is OK at this time. ■
3. Inspect the appropriate encoder or pulser (see table) (see page 19-67).

DTC	Appropriate Encoder or Pulser
21	Right-front
22	Left-front
23	Right-rear
24	Left-rear

   Is the sensor OK?

   YES—Go to step 4.

   NO—Replace the magnetic encoder or pulser. ■
4. Check that the front encoder is installed correctly (see step 7 on page 18-17), or rear pulser for damage.

   Are they installed correctly?

   YES—Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and recheck. ■

   NO—Reinstall or replace the appropriate encoder or pulser. ■

DTC 31, 32, 33, 34, 35, 36, 37, 38: Solenoid

1. Clear the DTC (see page 19-38).
2. Turn the ignition switch ON (II).
3. Verify the DTC.

   Does the ABS indicator come on, and are DTCs 31, 32, 33, 34, 35, 36, 37, 38 indicated?

   YES—Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit. ■

   NO—The system is OK at this time. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 41, 42, 43, 44: Wheel Lock

1. Check for brake drag when the brakes are hot.

   Do the brakes drag?

   YES—Repair the brake drag. ■

   NO—Go to step 2.

2. Check the installation of the appropriate wheel sensor (see table).

DTC	Appropriate Wheel Sensor
41	Right-front
42	Left-front
43	Right-rear
44	Left-rear

   Is it correct?

   YES—The probable cause was the vehicle spun during cornering. If the code reoccurs during normal driving, replace the ABS modulator-control unit (see page 19-65). ■

   NO—Reinstall the wheel sensor correctly. ■

DTC 51: Motor Lock

DTC 52: Motor Stuck OFF

1. Check the No. 17 (30 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

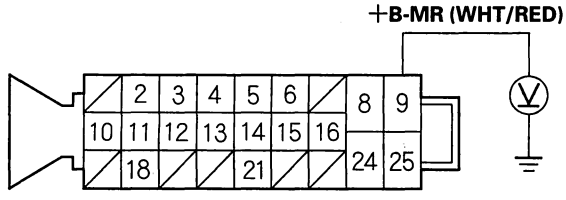
   YES—Reinstall the fuse, and go to step 2.

   NO—Replace the fuse, and recheck. If the fuse is blown, check for a short to body ground in this fuse circuit. If the circuit is OK, replace the ABS modulator-control unit (see page 19-65). ■

2. Disconnect the ABS modulator-control unit 25P connector.

3. Measure the voltage between the ABS modulator-control unit 25P connector terminal No. 9 and body ground.

ABS MODULATOR-CONTROL UNIT 25P CONNECTOR



Wire side of female terminals

   Is there battery voltage?

   YES—Reconnect the ABS modulator-control unit 25P connector, then go to step 4.

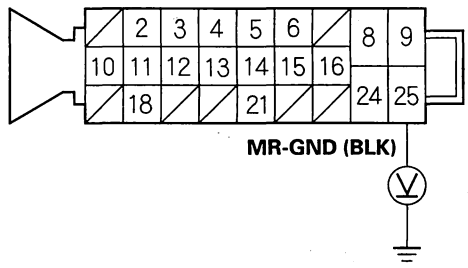
   NO—Repair open in the wire between the No. 17 (30 A) fuse and the ABS modulator-control unit. ■

BACK

Protected by AR

4. Measure the voltage between the ABS modulator-control unit 25P connector terminal No. 25 and body ground.

ABS MODULATOR-CONTROL UNIT 25P CONNECTOR



Wire side of female terminals

Is there less than 0.1 voltage?

YES—Go to step 5.

NO—Repair open in the wire between the ABS control unit and body ground (G203).■

5. Clear the DTC (see page 19-38).

6. Test-drive the vehicle at 6 mph (10 km/h) or more.

Does the ABS indicator come on, and are DTC 51 or DTC 52 indicated?

YES—Check for loose terminals in the ABS modulator-control unit 25P connector. If connections are OK, replace the ABS modulator-control unit (see page 19-65).■

NO—The system is OK at this time.■

DTC 53: Motor Stuck ON

1. Clear the DTC (see page 19-38).

2. Test-drive the vehicle.

Does the ABS indicator come on, and is DTC 53 indicated?

YES—Replace the ABS modulator-control unit (see page 19-65).■

NO—The system is OK at this time.■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 54: ABS Fail-safe Relay

DTC 61: Low +B-FSR Voltage

1. Check the No. 18 (20 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES—Reinstall the fuse, and go to step 2.

   NO—Replace the fuse, and recheck.

2. Clear the DTC (see page 19-38).

3. Test-drive the vehicle.

   Does the ABS indicator come on, and are DTC 54 or DTC 61 indicated?

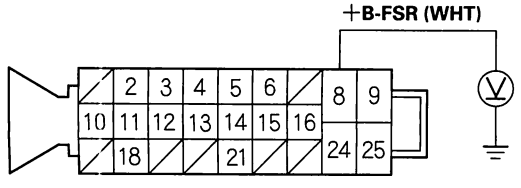
   YES—Go to step 4.

   NO—Intermittent failure; the vehicle is OK at this time.■

4. Disconnect the ABS modulator-control unit 25P connector.

5. Measure the voltage between the ABS modulator-control unit 25P connector terminal No. 8 and body ground.

ABS MODULATOR-CONTROL UNIT 25P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Check for loose terminals in the ABS modulator-control unit 25P connector. If connections are OK, replace the ABS modulator-control unit (see page 19-65).■

NO—Repair open in the wire between the No. 18 (20 A) fuse in the under-hood fuse/relay box and the ABS modulator-control unit.■

DTC 62: High +B-FSR Voltage

1. Clear the DTC (see page 19-38).

2. Test-drive the vehicle at 6 mph (10 km/h) or more.

   Does the ABS indicator come on?

   YES—Go to step 3.

   NO—The system is OK at this time.■

3. Verify the DTC.

   Is DTC 62 indicated?

   YES—Go to step 4.

   NO—Do the appropriate troubleshooting for the DTC.■

4. Check the charging system.

   Is the charging system OK?

   YES—Replace the ABS modulator-control unit (see page 19-65).■

   NO—Repair the charging system, and retest.■

BACK

DTC 71: Different Diameter Tire

1. Clear the DTC (see page 19-38).
2. Test-drive the vehicle.

   Does the ABS indicator come on, and is DTC 71 indicated?

   YES—Go to step 3.

   NO—Intermittent failure; confirm that tire inflation is set to spec. The vehicle is OK at this time. ■
3. Check that all four tires are the specified size and are inflated to the proper specification.

   Are all four tires the correct size and properly inflated?

   YES—Go to step 4.

   NO—Install the correct tires or set the tires to the correct inflation, and retest. ■
4. With the vehicle on level ground, mark each tire with a small spot of grease. Roll the vehicle until each of the tires makes two grease spots on the floor.
5. Measure and record the distance between the two grease spots.

   Is the difference between the shortest and the longest measurement more than 10 %?

   YES—Replace the tire/tires that is smaller or larger than the others. ■

   NO—Replace the ABS modulator-control unit (see page 19-65). ■

DTC 81: Central Processing Unit (CPU) Diagnosis, and ROM/RAM Diagnosis

1. Check for other DTCs.

   Is another DTC present?

   YES—Do the appropriate troubleshooting for the other DTC. ■

   NO—Go to step 2.
2. Clear the DTC (see page 19-38).
3. Test-drive the vehicle.

   Does the ABS indicator come on, and is DTC 81 indicated?

   YES—Replace the ABS modulator-control unit (see page 19-65). ■

   NO—Intermittent failure; the vehicle is OK at this time. ■

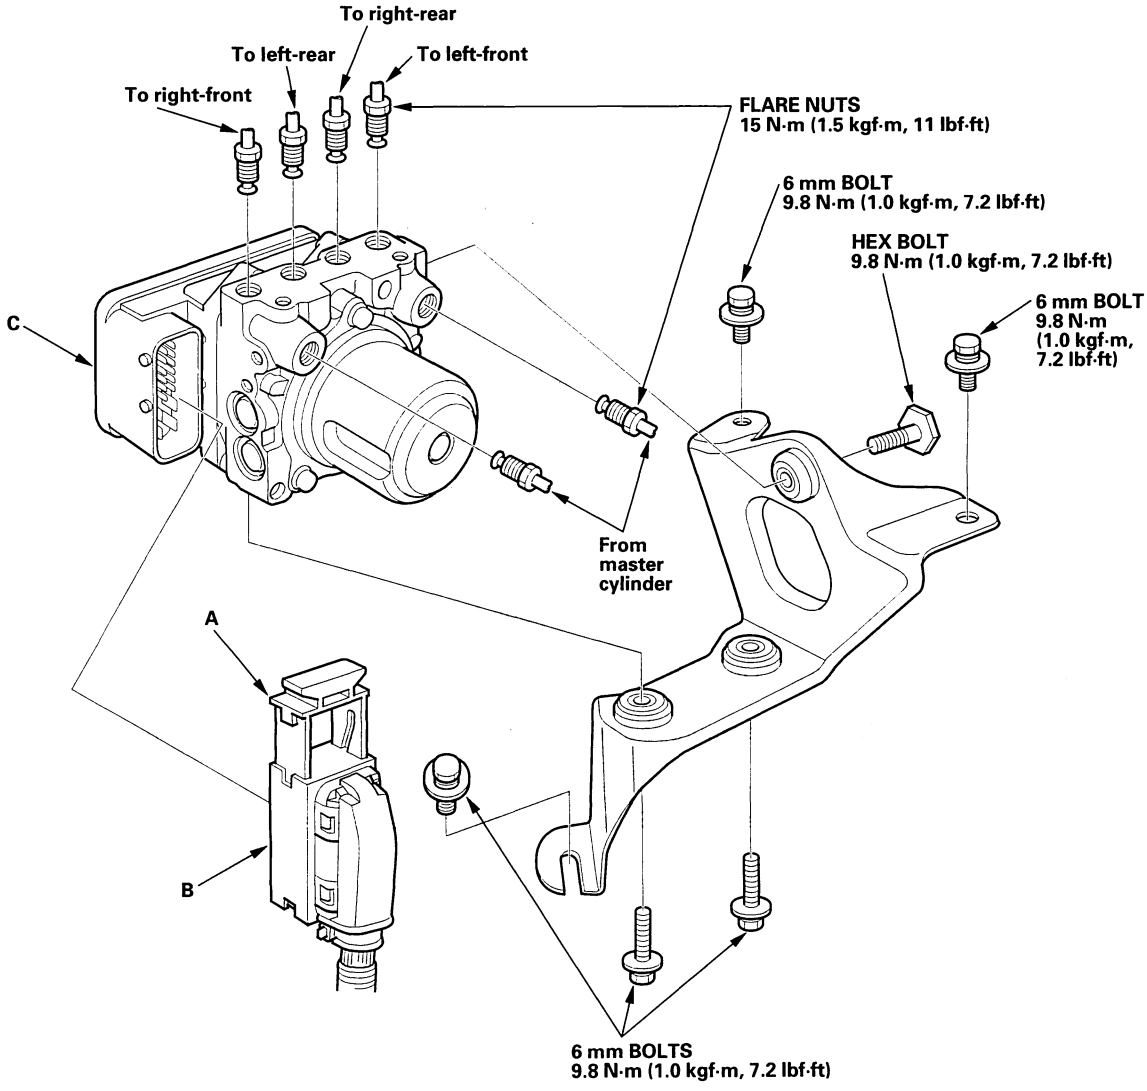
ABS Modulator-Control Unit Removal and Installation

NOTE:
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- Be careful not to damage or deform the brake lines during removal and installation.
- To prevent the brake fluid from flowing, plug and cover the hose ends and joints with a shop towel or equivalent material.

Removal

1. Pull up the lock (A) of the ABS modulator-control unit 25P connector (B), and the connector disconnects itself.



2. Disconnect the six brake lines from the ABS modulator-control unit (C).
3. Remove the five 6 mm bolts and the one hex bolt.
4. Remove the ABS modulator-control unit.

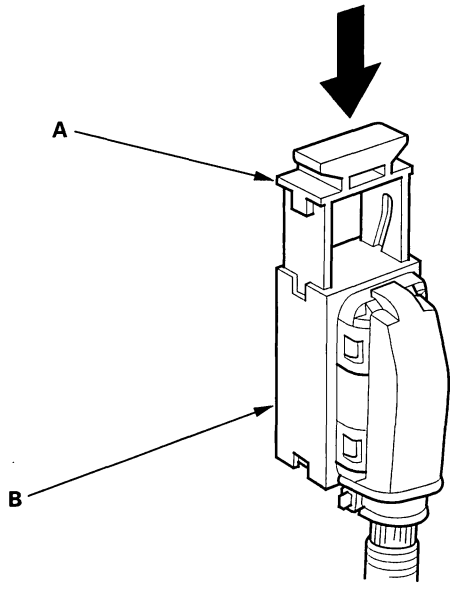
(cont'd)

Protected by AR

ABS Modulator-Control Unit Removal and Installation (cont'd)

Installation

1. Install the ABS modulator-control unit, then tighten the five 6 mm bolts and the one hex bolt.
2. Reconnect the six brake lines, then tighten the flare nuts to the specified torque.
3. Align the connecting surface of the ABS modulator-control unit 25P connector to the ABS modulator-control unit.
4. Push in the lock (A) of the ABS modulator-control unit 25P connector (B) until you hear it click into place.



5. Bleed the brake system, starting with the front wheels (see page 19-9).
6. Start the engine, and check that the ABS indicator goes off.
7. Test-drive the vehicle, check the ABS operation, and check that the ABS indicator does not come on.
8. If the brake pedal is now spongy, there may be air trapped in the modulator and then induced into the normal brake system during modulation. Exercise the ABS then bleed the brake system again, starting with the front wheels (see page 19-9).

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If body maintenance is required)

The Accord SRS includes a driver's airbag in the steering wheel hub, a passenger's airbag in the dashboard above the glove box, seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in this Service Manual. Items marked with an asterisk (*) on the contents page include or are located near SRS components. Servicing, disassembling, or replacing these items require special precautions and tools, and should be done only by an authorized Honda dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work must be performed by an authorized Honda dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the airbags and/or side airbags.
- Do not bump or impact the SRS unit, front impact sensors, or side impact sensors when the ignition switch is ON (II), or for at least 3 minutes after the ignition switch is turned OFF; otherwise, the system may fail in a collision, or the airbags may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, front console, dashboard, dashboard lower panel, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

Door Panel Removal/Installation

Special Tools Required
- KTC trim tool set SOJATP2014
- Trim pad remover, Snap-on A 177A or equivalent, commercially available

2-door

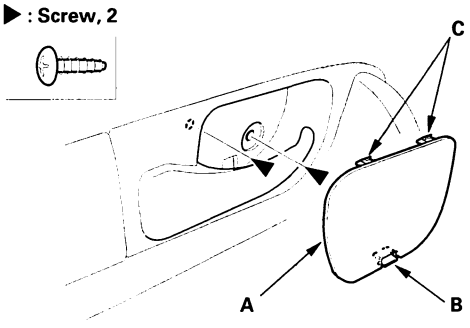
NOTE: Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

1. Lower the glass fully.

2. Using a trim tool, pry out on the lower portion of the cover (A) to release the hooks (B, C), then remove the cover and the screws.

Fastener Locations

▶: Screw, 2

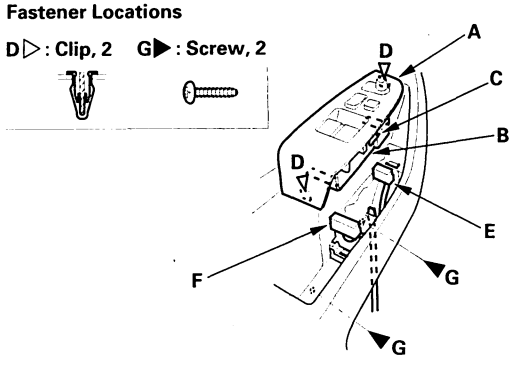


3. Remove the power window switch panel (A).

   –1 Insert a flat-tip screwdriver wrapped with protective tape through the hole under the armrest, and push up the bottom of the power window switch (B) to release the panel.
   –2 Pull out along the edge of the panel to release the hook (C) and clips (D).
   –3 Disconnect the power mirror switch connector (E) (driver's) and the power window switch connector (F).

Fastener Locations

D▷: Clip, 2 G▶: Screw, 2



4. Remove the screws (G) from under the armrest.

5. Remove the mirror mount cover (see step 2 on page 20-41).

6. Remove the door panel (A) with as little bending as possible to avoid creasing or breaking it.

   –1 Start at the bottom edge of the door panel, release the clips that are just above the marks (B) on the edge of the panel with a commercially available trim pad remover.
   –2 Detach the upper clips.
   –3 Starting at the rear, pull the door panel upward and over the lock knob (C).

   NOTE: The inner handle cable (D) and the courtesy light bulb socket (E) are connected to the door panel. Do not pull the door panel up too far, or the inner handle cable will be damaged.

Fastener Locations

▷: Clip, 8

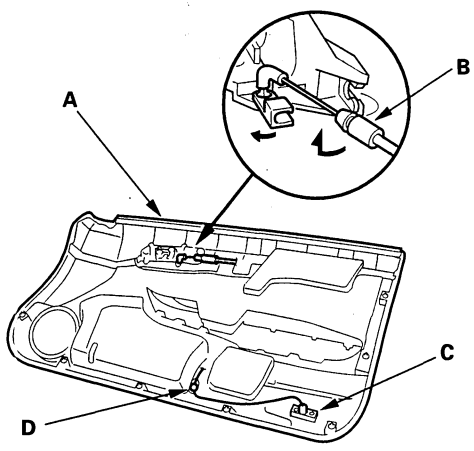
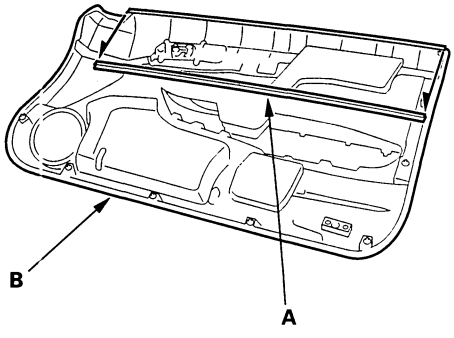
Door Panel Removal/Installation (cont'd)

7. While holding the door panel (A) away from the door, disconnect the inner handle cable (B) and courtesy light bulb socket (C), and detach the harness clip (D) from the panel, then remove the panel.

Back view



8. If necessary, remove the door glass inner weatherstrip (A) from the door panel (B) by pulling it down.



9. Install the panel in the reverse order of removal, and note these items:

- Check the clips for damage or stress-whitening, and replace them with new ones.
- Make sure the connectors are plugged in properly, and the cable and the bulb socket are connected properly.
- Make sure the window and power door lock operate properly.
- Driver's: Perform the power window control unit reset procedure (see page 22-232).

Front Door Panel Removal/ Installation

Special Tools Required
- KTC trim tool set SOJATP2014
- Trim pad remover, Snap-on A 177A or equivalent, commercially available

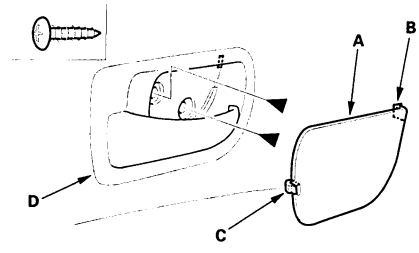
4-door

NOTE: Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

1. Lower the glass fully.

2. Using a trim tool, pry out on the rear portion of the cover (A) to release the hooks (B, C), then remove the cover and the screws securing the inner handle (D).

Fastener Locations
▶ : Screw, 2



3. Remove the power window switch panel (A).

–1 Pry up on the rear edge of the switch panel with a trim tool to release the rear clip.
–2 Pull out along the edge of the panel to release the hooks (B) and front clip.
–3 Disconnect the power mirror switch connector (C) (driver's) and the power window switch connector (D).

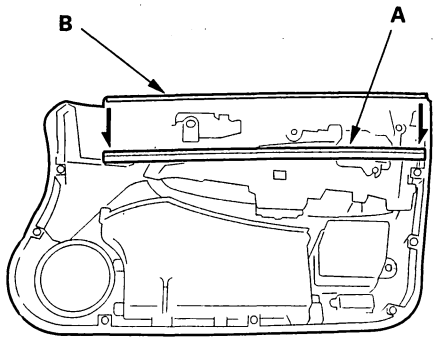
Front Door Panel Removal/ Installation (cont'd)

8. If necessary, remove the door glass inner weatherstrip (A) from the door panel (B) by pulling it down.



9. Install the door panel in the reverse order of removal, and note these items:

- Check the clips for damage or stress-whitening, and replace them with new ones.
- Make sure the connectors are plugged in properly, and the cable and the bulb socket are connected properly.
- If equipped, make sure the window and power door lock operate properly.
- Driver's: Perform the power window control unit reset procedure (see page 22-232).

Door Outer Handle Replacement

2-door

NOTE: Put on gloves to protect your hands.

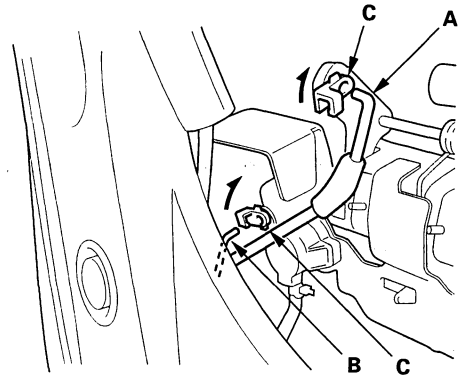
1. Remove these items:

   - Door panel (see page 20-9)
   - Plastic cover, as necessary (see page 20-3)

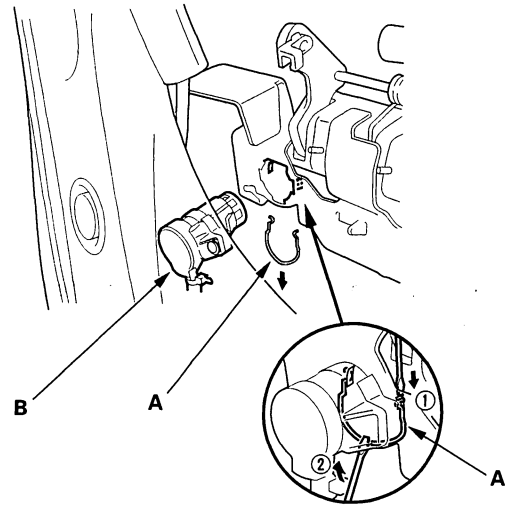
2. Raise the glass fully.

3. Disconnect the outer handle rod (A) and cylinder rod (B) from the joint bushings (C).

   NOTE: Check the joint bushing for damage and replace if necessary.



4. Release the retainer clip (A), then remove the lock cylinder (B).



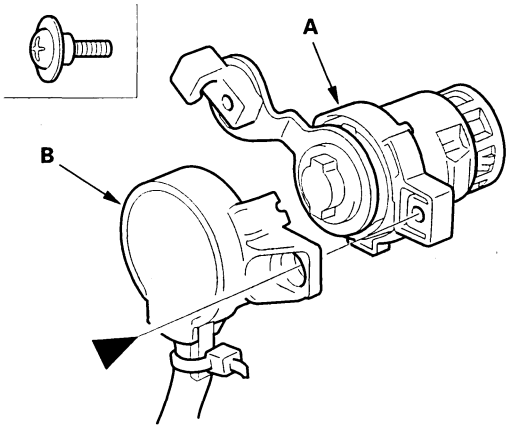
BACK

Protected by AR

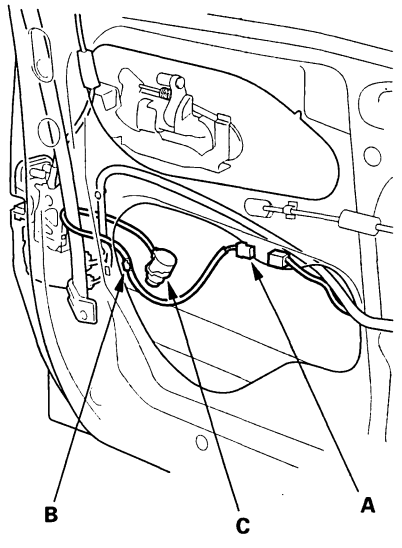
5. Remove the screw, then separate the lock cylinder (A) and lock cylinder switch (B).

Fastener Location

▶ : Screw, 1



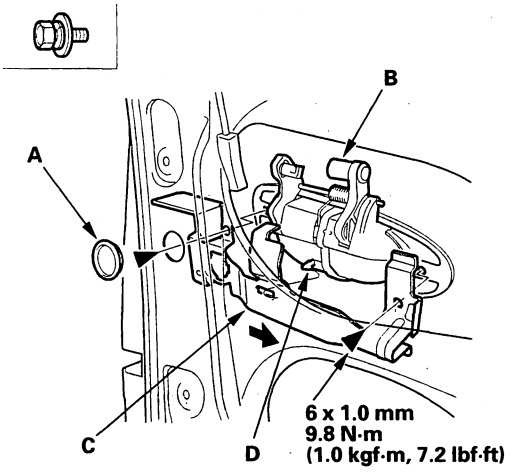
6. Disconnect the lock cylinder switch connector (A), and detach the harness clip (B), then remove the lock cylinder switch (C).



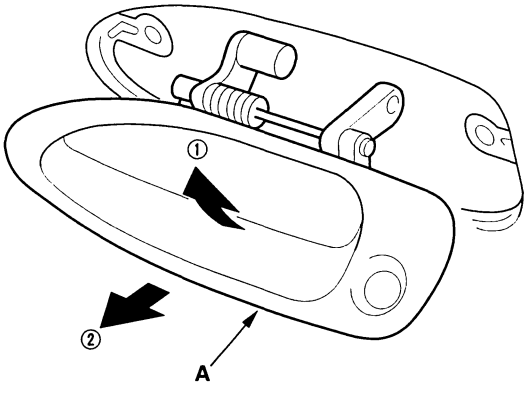
7. Remove the maintenance cap (A). While holding the outer handle (B) from the outside of the door, remove the bolts, then remove the outer handle protector (C) by sliding it forward to release the hook (D).

Fastener Locations

▶ : Bolt, 2



8. Pull out the outer handle (A) in the numbered sequence, and remove it.



(cont'd)

Protected by AR

Door Outer Handle Replacement (cont'd)

9. Install the handle in the reverse order of removal, and note these items:

   - Make sure the lock cylinder switch harness is routed properly.
   - Make sure the lock cylinder switch connector is plugged in properly, and each rod is connected securely.
   - Be sure that the end of the lock cylinder is engaged with the lock cylinder switch correctly.
   - Make sure the door locks and opens properly.
   - When installing the lock cylinder, leave the outer door handle bolts loose so the inner protector does not interfere with the lock cylinder, then tighten the handle bolts.
   - Install the lock cylinder retaining clip on the handle, then install the lock cylinder. Be sure the clip is fully seated in the slot on the lock cylinder.
   - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
   - Driver's: Perform the power window control unit reset procedure (see page 22-232).

Front Door Outer Handle Replacement

4-door

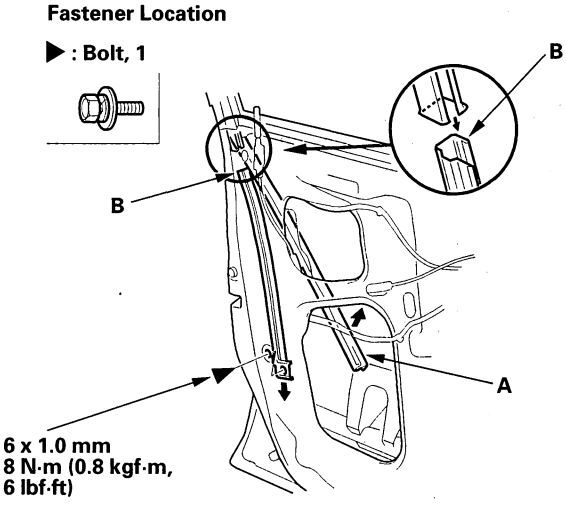
NOTE: Put on gloves to protect your hands.

1. Remove these items:

   - Door panel (see page 20-10)
   - Plastic cover, as necessary (see page 20-5)

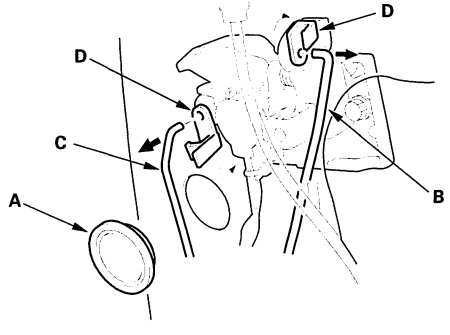
2. Raise the glass fully.

3. Pull the glass run channel (A) away as necessary, and remove the bolt, then remove the center lower channel (B) by pulling it downward.



4. Remove the maintenance cap (A), then disconnect the outer handle rod (B), and cylinder rod (C) from the joint bushings (D).

   NOTE: Check the joint bushing for damage and replace if necessary.



BACK

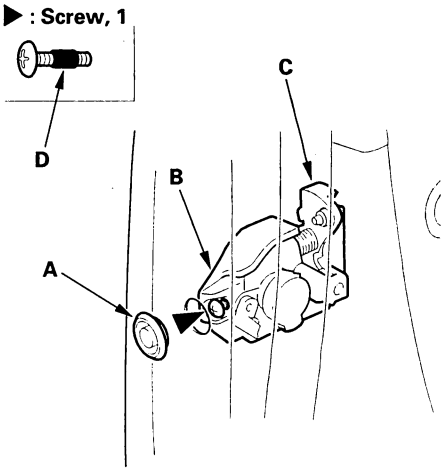
Protected by AR

5. Driver's and some passenger's: Remove the maintenance cap (A) from the rear of the door, then loosen the screw securing the lock cylinder protector (B) and the outer handle (C).

   NOTE: Because of the tape (D) on the middle of threads, the screw will stay on the protector after it is loosened.

Fastener Location

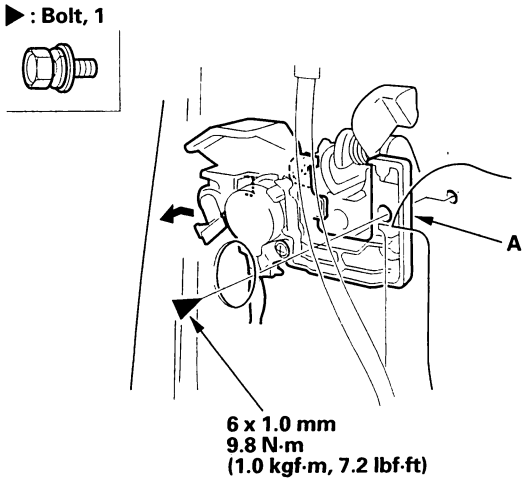
▶ : Screw, 1



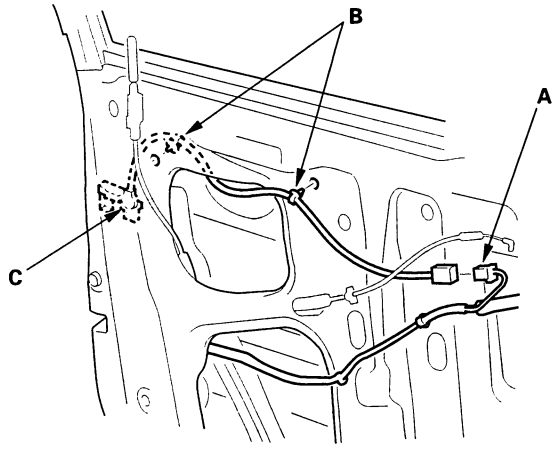
6. Remove the bolt, slide the lock cylinder protector (A) rearward, then remove the lock cylinder switch (for some models), lock cylinder, and lock cylinder protector as an assembly.

Fastener Location

▶ : Bolt, 1



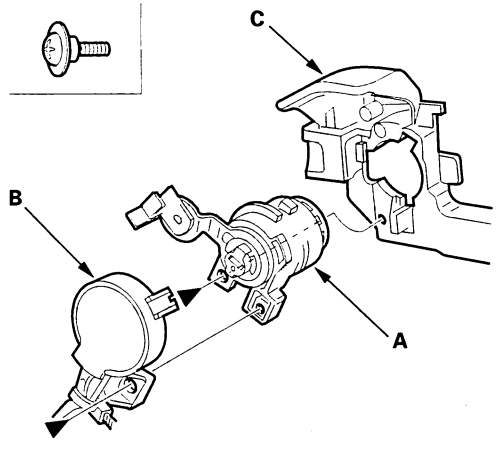
7. With lock cylinder switch: Disconnect the lock cylinder switch connector (A), and detach the harness clips (B), then remove the lock cylinder switch (C).



8. Remove the screws, then separate the lock cylinder (A), lock cylinder switch (B) (for some models), and lock cylinder protector (C).

Fastener Locations

▶ : Screw, 2

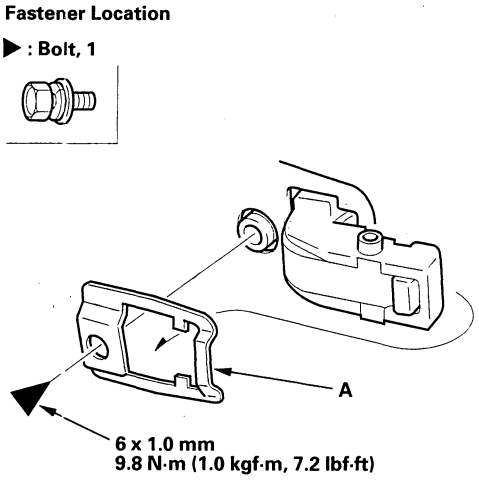


(cont'd)

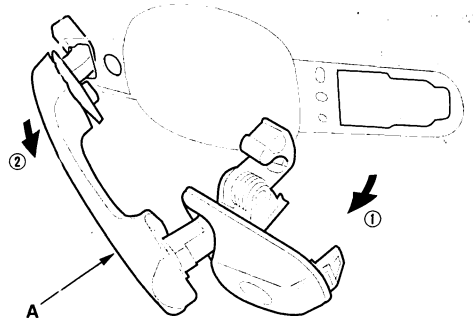
Protected by AR

Front Door Outer Handle Replacement (cont'd)

9. Remove the bolt, then remove the spacer (A).



10. While pulling the outer handle (A), remove the handle from the holes in the door panel. Take care not to scratch the door.



11. Install the handle in the reverse order of removal, and note these items:

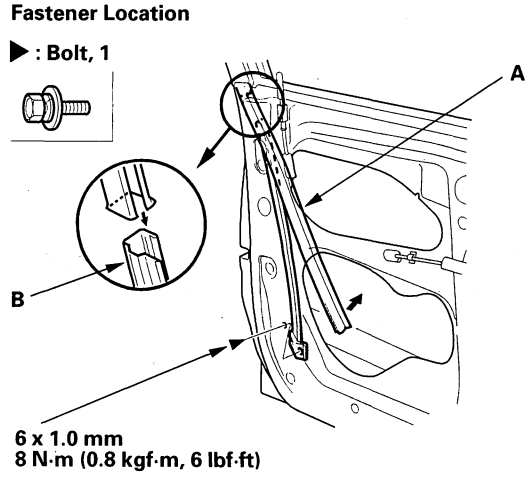
- Make sure the lock cylinder switch harness is routed properly (for some models).
- Make sure the lock cylinder switch connector is plugged in properly (for some models), and each rod is connected securely.
- Be sure that the end of the lock cylinder is engaged with the lock cylinder switch correctly.
- Make sure the door lock cylinder/door locks operate properly.
- Make sure the door handle works properly.
- When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
- Driver's: Perform the power window control unit reset procedure (see page 22-232).

Door Latch Replacement

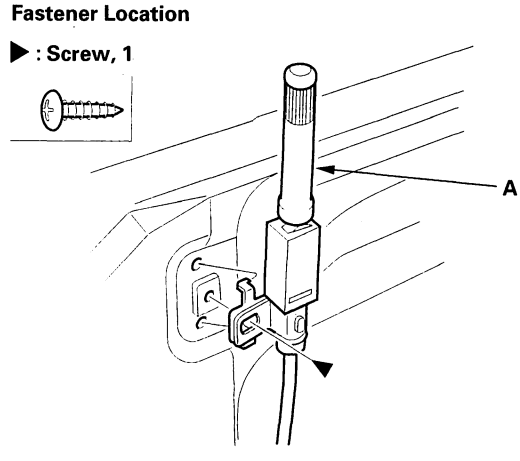
2-door

NOTE: Put on gloves to protect your hands.

1. Raise the glass fully.
2. Remove these items:
   - Door panel (see page 20-9)
   - Plastic cover, as necessary (see page 20-3)
3. Disconnect the cylinder rod from the lock cylinder, then disconnect the outer handle rod from the outer handle (see step 3 on page 20-12).
4. Pull the glass run channel (A) away as necessary, and remove the bolt, then remove the center lower channel (B) by pulling it downward.



5. Remove the screw securing the lock knob (A).



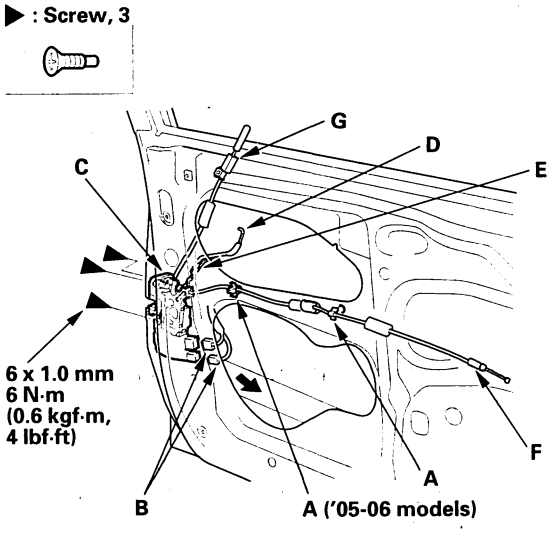
BACK

Protected by AR

6. Detach the inner handle cable clip (A), and disconnect the actuator connectors (B). Remove the screws, then remove the latch (C) through the hole in the door. Take care not to bend the outer handle rod (D), cylinder rod (E), inner handle cable (F), and lock cable (G).

Fastener Locations

▶ : Screw, 3



7. Install the latch in the reverse order of removal, and note these items:

- Make sure the actuator connectors are plugged in property, and each rod is connected securely.
- Make sure the door locks and opens properly.
- When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
- Driver's: Perform the power window control unit reset procedure (see page 22-232).

4-door

NOTE: Put on gloves to protect your hands.

1. Raise the glass fully.

2. Remove these items:

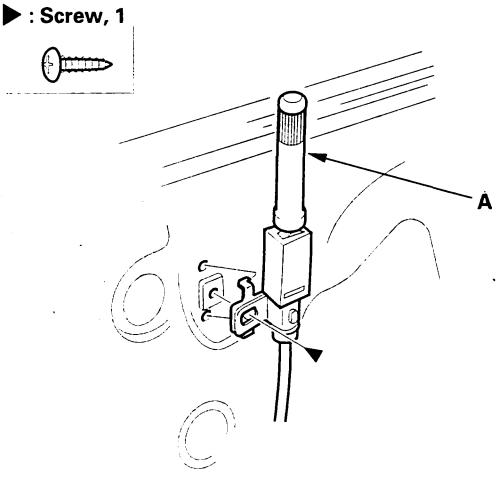
- Door panel (see page 20-10)
- Plastic cover, as necessary (see page 20-5)
- Center lower channel (see step 3 on page 20-14)

3. Disconnect the cylinder rod from the lock cylinder, and disconnect the outer handle rod from the outer handle (see step 4 on page 20-14).

4. Remove the screw securing the lock knob (A).

Fastener Location

▶ : Screw, 1



(cont'd)

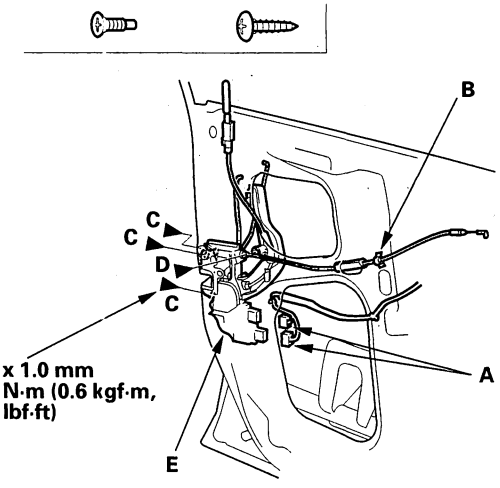
Protected by AR

Front Door Latch Replacement (cont'd)

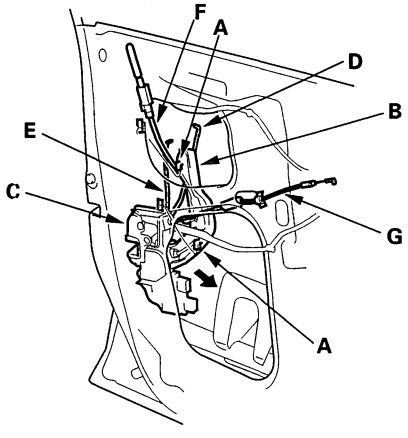
5. Disconnect the actuator connectors (A) (for some models), and detach the inner handle cable clip (B). Remove the screws (C, D) securing the latch (E) and the lock cable protector.

Fastener Locations

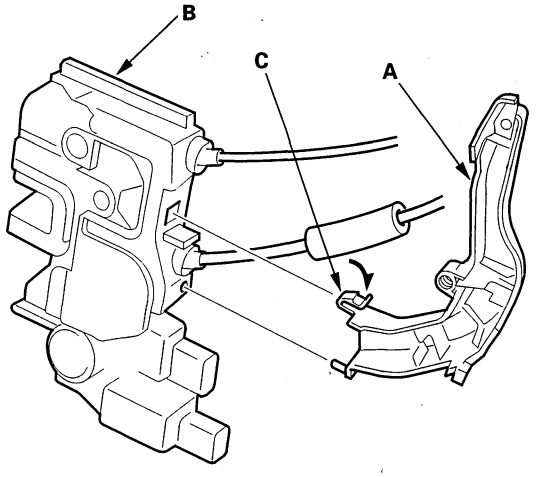
C▶: Screw, 3 D▶: Screw, 1



6. Release the hooks (A) of the lock cable protector (B) from the door, then remove the latch (C) with the protector through the hole in the door. Take care not to bend the outer handle rod (D), cylinder rod (E), lock cable (F), and inner handle cable (G).



7. Remove the lock cable protector (A) from the latch protector (B) by releasing the hook (C).



8. Install the latch in the reverse order of removal, and note these items:

- If equipped, make sure the actuator connectors are plugged in properly and each rod is connected securely.
- Make sure the door locks and opens properly.
- When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
- Driver's: Perform the power window control unit reset procedure (see page 22-232).

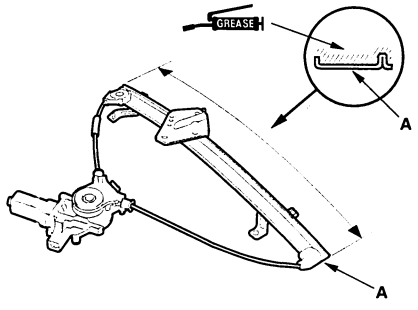
6. Remove the bolts (C), and loosen the bolts (D), then remove the regulator through the hole in the door.

7. Apply multipurpose grease to all the sliding surfaces of the regulator (A) where shown.



8. Install the glass and regulator in the reverse order of removal, and note these items:

- Roll the glass up and down to see if it moves freely without binding.
- Make sure that there is no clearance between the glass and glass run channel when the glass is closed.
- Adjust the position of the glass as necessary (see page 20-35).
- Check for water leaks (see step 7 on page 20-36).
- Test-drive and check for wind noise and rattles.
- When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
- Make sure the power door locks, windows, and power mirror operate properly.
- Driver's: Perform the power window control unit reset procedure (see page 22-232).

Door Sash Trim Replacement

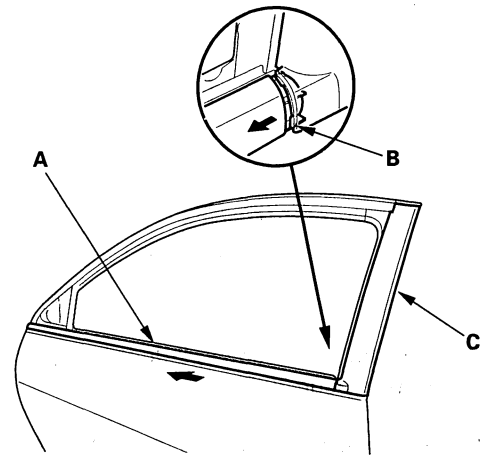
2-door

NOTE: Take care not to scratch the door.

1. Lower the glass fully.

2. Remove the mirror (see page 20-41).

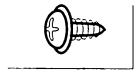
3. Slide the door glass outer weatherstrip (A) forward to release the hook (B) on bottom of the door sash trim (C) from under the rear end of the weatherstrip.

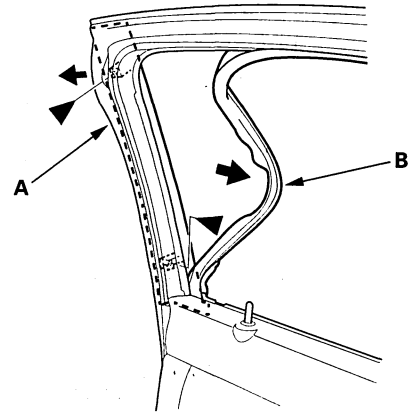


4. Pull back the door weatherstrip (A) at the rear upper corner, and pull the glass run channel (B) away as needed, then remove the screws.

Fastener Locations

▶: Screw, 2

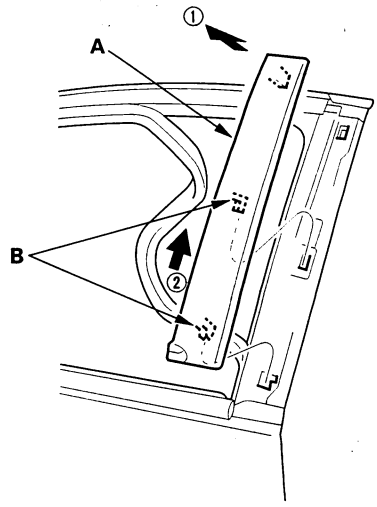




BACK

Protected by AR

5. Pull up the door sash trim (A) to release the hooks (B) from the holes in the sash, then remove the trim.



6. Install the trim in the reverse order of removal.

Front Door Glass Outer Weatherstrip Replacement

Special Tools Required
KTC trim tool set SOJATP2014

NOTE:
- If you remove the door glass outer weatherstrip, replace it with a new one because it will bend.
- Put on gloves to protect your hands.
- Take care not to scratch the door.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

1. Remove these items:
   - Door panel, 2-door (see page 20-9), 4-door (see page 20-10)
   - Mirror (see page 20-41)
   - Door sash trim, 2-door (see page 20-20)

2. 4-door: Remove the screw from the rear edge of the door.

Fastener Location

▶ : Screw, 1

Front Door Outer Molding Replacement

Special Tools Required
KTC trim tool set SOJATP2014

NOTE:
- If you remove the door outer molding, replace it with a new one because it will bend during removal.
- Put on gloves to protect your hands.
- Take care not to scratch the door.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

1. Remove these items:
   - Mirror (see page 20-41)
   - Door sash trim, 2-door (see page 20-20)

2. Remove the door outer molding (A).
   –1 4-door: Pry the rear clip with a trim tool.
   –2 While removing the upper edge of the door outer molding from the edge of the sash, cut the double-sided adhesive tapes (B) with a utility knife, then remove the molding.

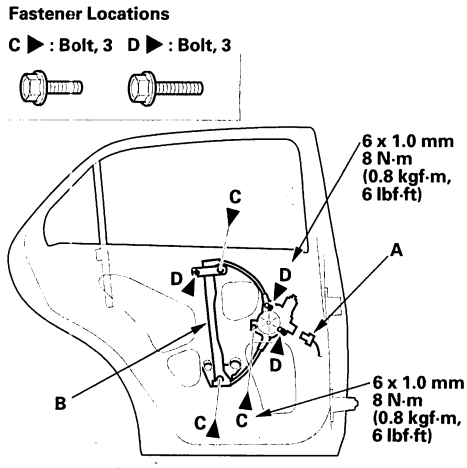
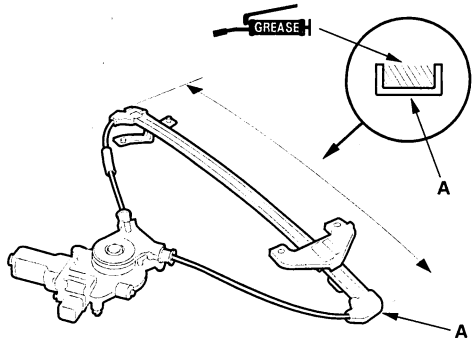
Rear Door Glass and Regulator Replacement (cont'd)

7. Disconnect the connector (A) from the regulator (B).



8. Remove the bolts (C), and loosen the bolts (D), then remove the regulator through the hole in the door.

9. Apply multipurpose grease to all the sliding surfaces of the regulator (A) where shown.



10. Install the glass and regulator in the reverse order of removal, and note these items:

- Roll the glass up and down to see if it moves freely without binding.
- Make sure that there is no clearance between the glass and glass run channel when the glass is closed.
- Adjust the position of the glass as necessary (see page 20-35).
- Check for water leaks (see step 7 on page 20-36).
- Test-drive and check for wind noise and rattles.
- When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its perimeter.

Rear Door Glass Outer Weatherstrip Replacement

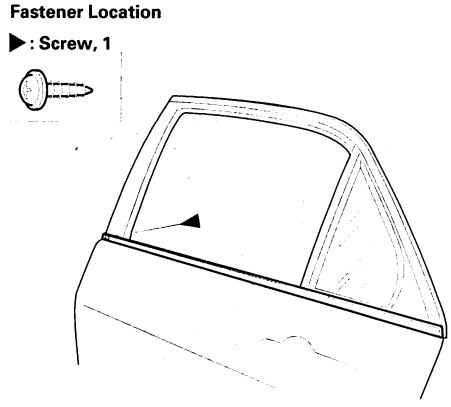
Special Tools Required
KTC trim tool set SOJATP2014

4-door

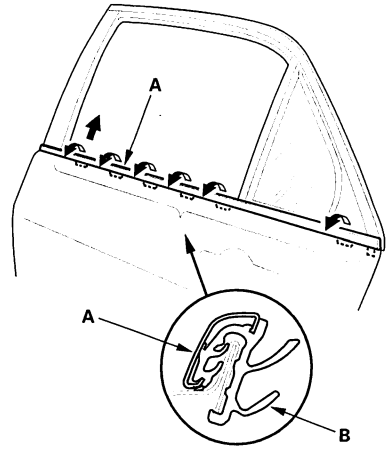
NOTE:
- Once you remove the door glass outer weatherstrip, replace it with a new one because it will bend.
- Put on gloves to protect your hands.
- Take care not to scratch the door.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

1. Remove the door panel (see page 20-25).

2. Remove the screw from the front edge of the door.



3. Starting at the front, pull the door glass outer weatherstrip (A) up at each portion where the inner molding (B) catches the inside edge of the window slot.

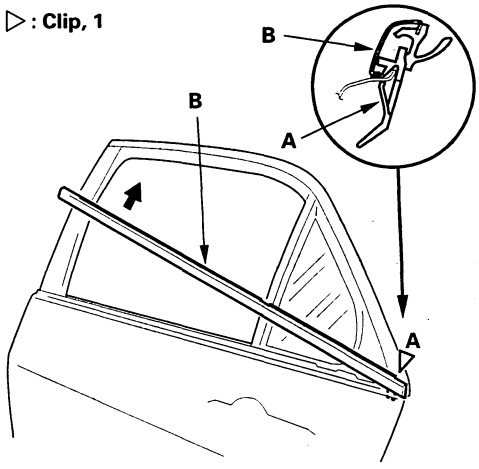


BACK

Protected by AR

4. Detach the rear clip (A), then remove the door glass outer weatherstrip (B).

Fastener Location
A ▷: Clip, 1



5. Install a new weatherstrip in the reverse order of removal.

Rear Door Outer Molding Replacement

Special Tools Required
KTC trim tool set SOJATP2014

Rear Door Outer Molding Replacement (cont'd)

2. While removing the upper edge of the door outer molding (B) from the edge of the sash, cut the double-sided adhesive tapes (C) with a utility knife, then remove the molding.

3. Scrape off the remaining double-sided adhesive tape from the sash, then clean the sash surface with a sponge dampened in alcohol.

4. Install new door outer molding in the reverse order of removal, and note these items.

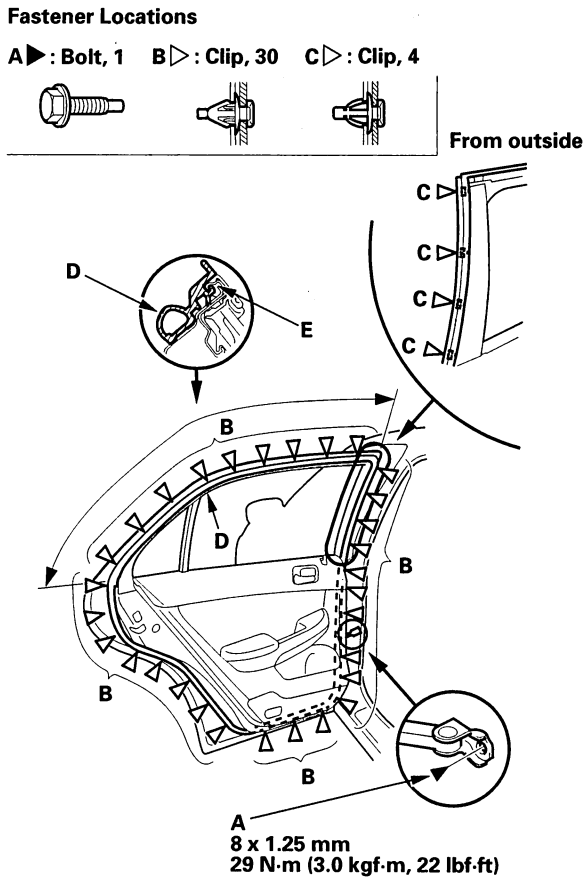
   - Push the clip and the adhesive portions into place securely.
   - Make sure the upper and lower sides of the molding are catching the edges of the sash properly.

Rear Door Weatherstrip Replacement

4-door

NOTE:
- Take care not to scratch the door.
- Use a clip remover to remove the clips.

1. At the B-pillar, remove the detent rod mounting bolt (A).



2. Detach the clips (B, C), then remove the door weatherstrip (D).

3. Install the weatherstrip in the reverse order of removal, and note these items:

   - Check the clips for damage or stress-whitening, and replace them with new ones.
   - Make sure the weatherstrip is installed in the holder (E) securely.
   - Apply medium strength liquid thread lock to the detent rod mounting bolt before installation.
   - Test-drive and check for wind noise.

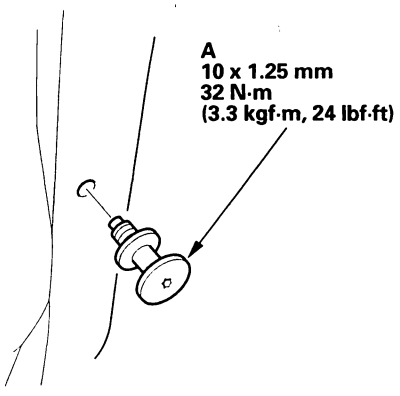
Rear Door Hook Pin and Catch Replacement

4-door

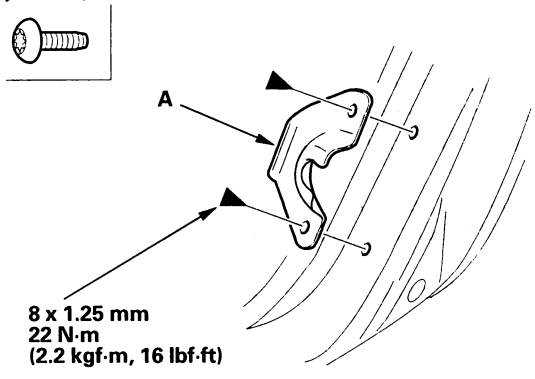
1. With a T40 Torx bit, remove the door hook pin (A) from the door.



2. With a T40 Torx bit, remove the bolts, then remove the door catch (A) from the body.

Fastener Locations

▶: Bolt, 2



3. Install the hook pin and catch in the reverse order of removal, and apply medium strength liquid thread lock to the threads of the door hook pin.

Front and Rear Door Glass Adjustment

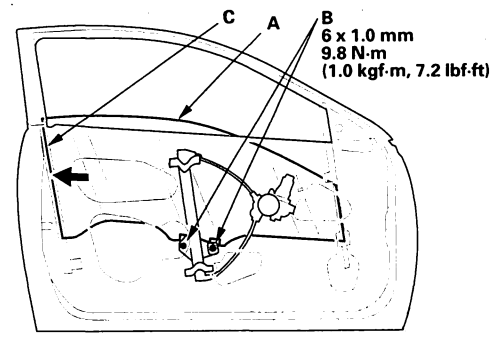
NOTE:
- Check the weatherstrips and glass run channel for damage or deterioration, and replace them if necessary.
- Wipe the run channel clean with a shop towel.
- Lubricate the run channel with Shin-Etsu silicone grease P/N 08798-9013.

1. Place the vehicle on a firm, level surface.

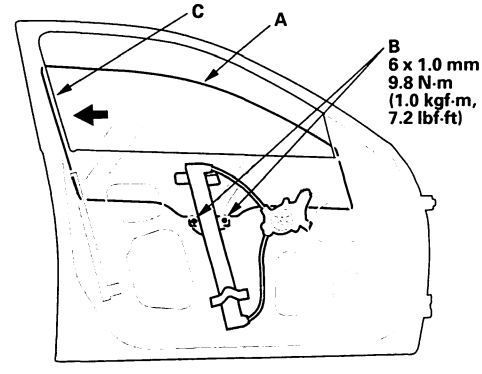
2. Remove these items:
   - Door panel, 2-door (see page 20-9), 4-door front door (see page 20-10), 4-door rear door (see page 20-25)
   - Plastic cover, 2-door (see page 20-3), 4-door front door (see page 20-5), 4-door rear door (see page 20-7)

3. Carefully move the glass (A) until you can see the glass mounting bolts (B), then loosen them.

2-door



4-door front door

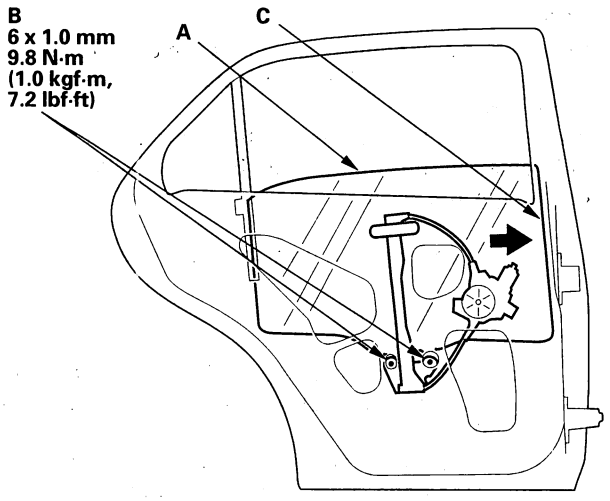


(cont'd)

Protected by AR

Front and Rear Door Glass Adjustment (cont'd)

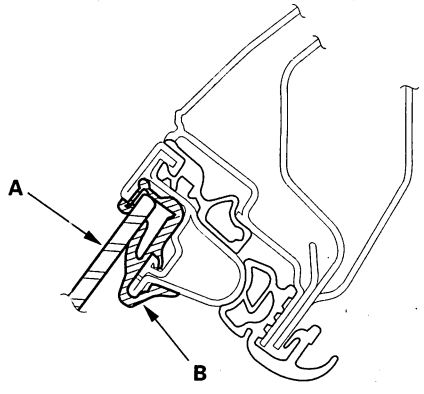
4-door rear door



4. Push the glass against the channel (C), then tighten the glass mounting bolts.

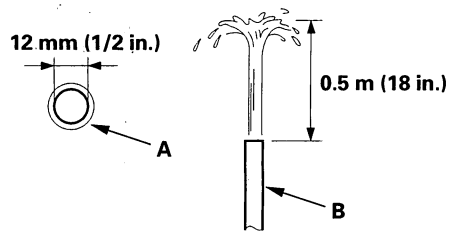
5. Check that the glass moves smoothly.

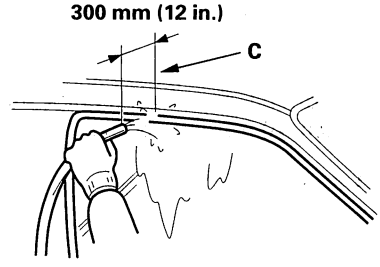
6. Raise the glass fully, and check for gaps. Also check that the glass (A) contacts the glass run channel (B) evenly.



7. Check for water leaks. Run water over the roof and on the sealing area as shown, and note these items:

   - Use a 12 mm (1/2 in.) diameter hose (A).
   - Adjust the rate of water flow as shown (B).
   - Do not use a nozzle.
   - Hold the hose about 300 mm (12 in.) away from the door (C).





8. Attach the plastic cover, and install the door panel, 2-door (see page 20-9), 4-door front door (see page 20-10), 4-door rear door (see page 20-25).

9. Driver's: Perform the power window control unit reset procedure (see page 22-232).

10. Test-drive and check for wind noise.

BACK

Protected by AR

Front and Rear Door Position Adjustment

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

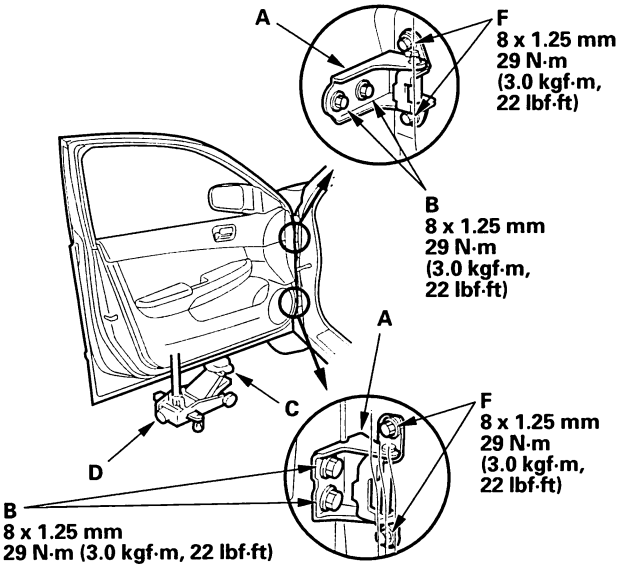
NOTE: Check for a flush fit with the body, then check for equal gaps between the front, rear, and bottom door edges and the body. Check that the door and body edges are parallel.

1. Place the vehicle on a firm, level surface when adjusting the doors.

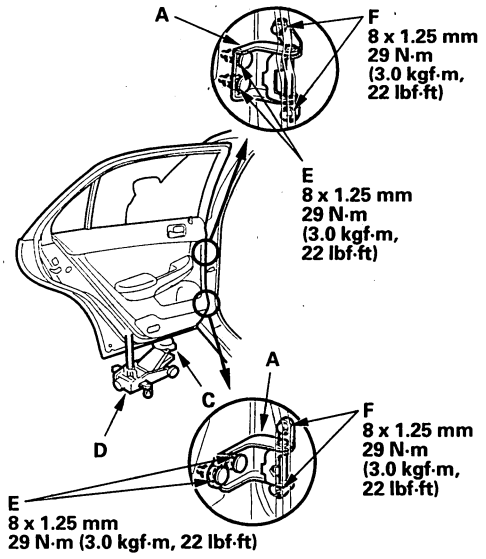
2. Adjust at the hinges (A):

   - On the front door: Remove the front inner fender (see page 20-211) and front fender fairing (see page 20-213). Loosen the hinge mounting bolts (B) slightly, and move the door backward or forward, up or down as necessary to equalize the gaps. Place a shop towel (C) on the jack (D) to prevent damage when adjusting the door.
   - On the rear door: Remove the B-pillar lower trim, without side curtain airbags (see page 20-96), with side curtain airbags (see page 20-102) and remove the front seat belt and retractor (see page 23-5), and the plug seal from the body. Loosen the hinge mounting nuts (E) slightly, and move the door backward or forward, up or down as necessary to equalize the gaps. Place a shop towel on the jack to prevent damage when adjusting the door.

2-door and 4-door front door

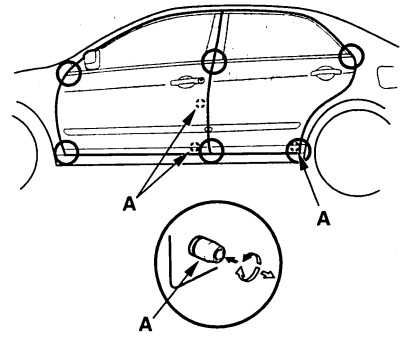


4-door rear door



3. If necessary, replace the door mounting bolts (F) with the adjusting bolts (P/N 90102-SFA-305) made specifically for door adjustment, then adjust at the door: Loosen the adjusting bolts slightly, move the door in or out until it's flush with the body, and up or down as necessary to equalize the gaps.

4. Check that the door and body edges are parallel. If necessary, adjust the door cushions (A) to make the rear of the doors flush with the body.



5. Apply touch-up paint to the hinge mounting bolts, and around the hinges.

6. Check for water leaks (see step 7 on page 20-36).

7. Test-drive and check for wind noise.

8. Reinstall all remaining removed parts.

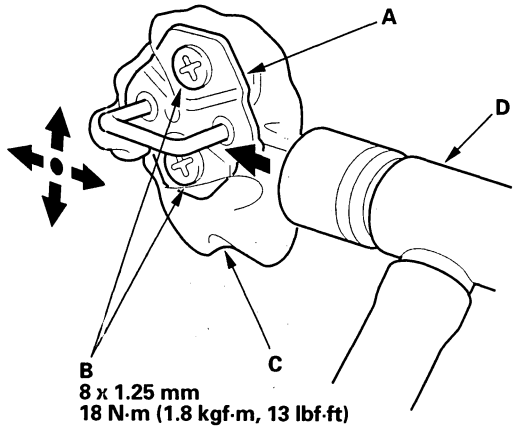
BACK

Protected by AR

Front and Rear Door Striker Adjustment

Make sure the door latches securely without slamming it. If necessary, adjust the striker (A): The striker can be adjusted slightly up or down, and in or out.

1. Loosen the screws (B), then insert a shop towel (C) between the body and striker.



2. Lightly tighten the screws.
3. Wrap the striker with a shop towel, then adjust the striker by tapping it with a plastic hammer (D). Do not tap the striker too hard.
4. Loosen the screws, and remove the shop towel.
5. Lightly tighten the screws.
6. Hold the outer handle out, and push the door against the body to be sure the striker allows a flush fit. If the door latches properly, tighten the screws and recheck.

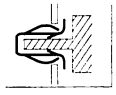
Power Mirror/Manual Mirror Replacement

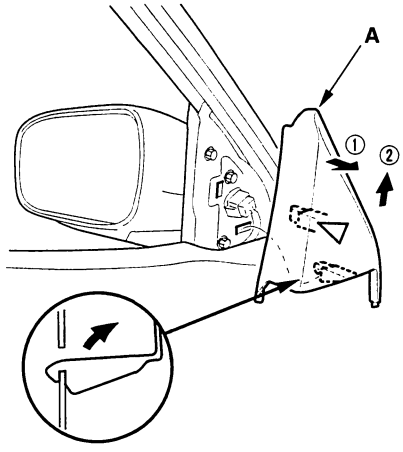
NOTE: The 4-door model is shown, the 2-door model is similar.

1. Lower the door glass fully.
2. Carefully pry out the mirror mount cover (A) by hand in the sequence shown.

Fastener Location

▷: Clip, 1

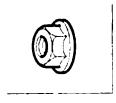


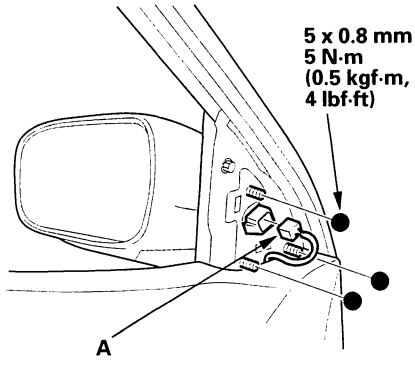


3. On power mirror models: Disconnect the connector (A).

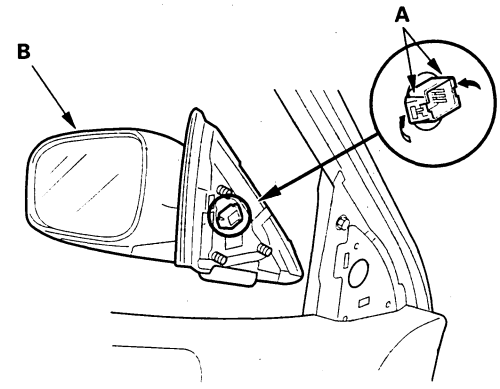
Fastener Locations

●: Nut, 3





4. While holding the mirror, remove the nuts securing the mirror, and remove the mirror (manual mirror models).
5. On power mirror models: While holding the mirror, push in on the connector clip tabs (A), then push out to remove the mirror (B). Take care not to scratch the door.



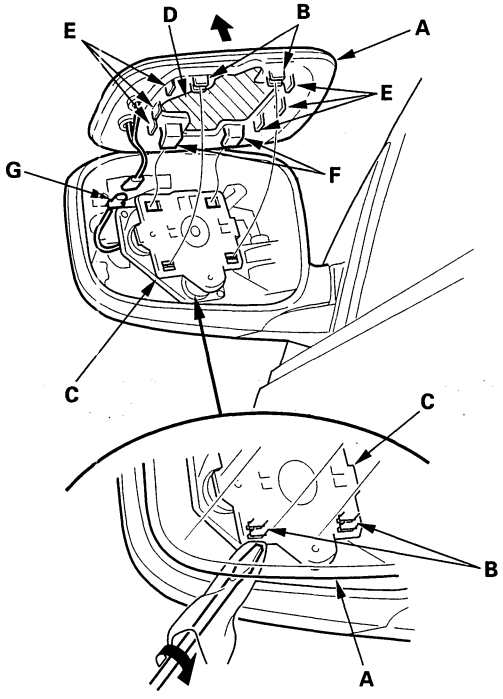
6. Install the mirror in the reverse order of removal, and make sure the connector is plugged in properly (power mirror models).

Protected by AR

Mirror Holder Replacement

2-door and Japan-Produced 4-door

1. Carefully insert a flat-tip screwdriver wrapped with a shop towel under the mirror holder (A) next to the lower clips (B), then pry out on the clip portions. Take care not to scratch the mirror.



2. Separate the mirror holder from the actuator (C) by slowly pulling them apart while separating the adhesive portion (D) and releasing the hooks (E, F). If equipped, disconnect the mirror defogger connector (G).

3. If equipped, reconnect the mirror defogger connector.

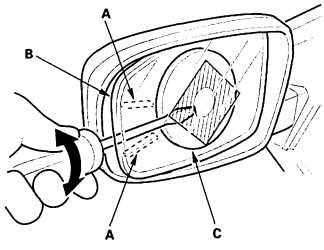
4. Reattach the hooks of the mirror holder to the actuator, then position the mirror holder on the actuator. Carefully push on the clip portions of the mirror holder until the mirror holder locks into place.

5. Check the operation of the actuator.

U.S.A-Produced 4-door

1. Adjust the mirror fully to the inward position.

2. Insert a long, thin flat-tipped screwdriver along the ribs (A) on the mirror holder (B). Slide the tip of the screwdriver between the mirror holder and the actuator (C).

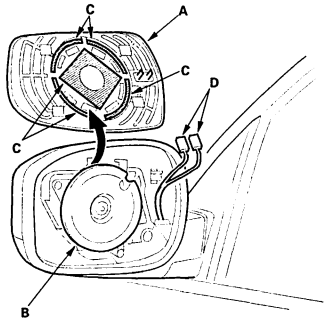


3. Quickly twist the screwdriver to separate the mirror holder from the mirror actuator.

4. Insert the screwdriver further under the mirror holder and twist it again.

   NOTE: Do not pry up on the mirror holder to separate the two parts, as this can cause either the mirror glass or actuator to break.

5. Separate the mirror holder (A) from the actuator (B) by slowly pulling them apart while separating the adhesive (C). If equipped, disconnect the mirror defogger connectors (D) from the heater pad terminals.



6. Remove any remaining adhesive from the actuator.

7. If equipped, reconnect the mirror defogger connectors.

8. Reattach the mirror holder to the actuator, then position the mirror holder on the actuator. Carefully push on the mirror holder until the mirror holder snaps into place.

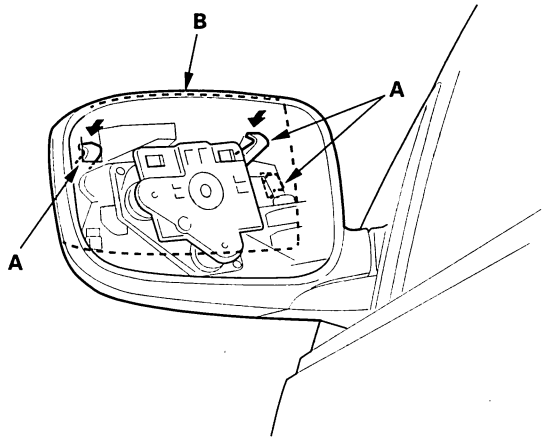
9. Check the operation of the actuator.

BACK

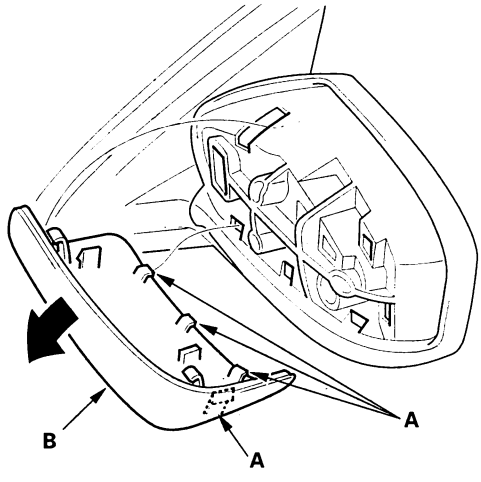
Protected by AR

Mirror Housing Cover Replacement

1. Remove the mirror holder (see page 20-42).
2. From the mirror holder opening, release the hooks (A) of the mirror housing cover (B).



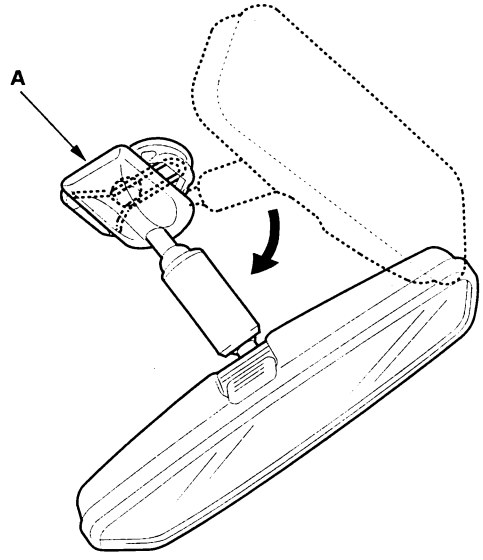
3. Release the hooks (A), then remove the mirror housing cover (B).



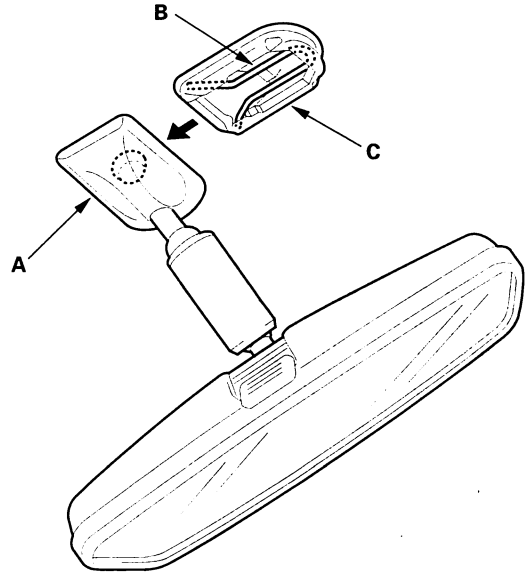
4. Install the mirror housing cover in the reverse order of removal.

Rearview Mirror Replacement

1. Turn the rearview mirror base (A) 90 °.



2. Slide the rearview mirror (A) down toward the bottom of the windshield to detach it from the spring (B) in the mount (C).



3. If necessary, remove the spring from the mount.
4. Install the rearview mirror in the reverse order of removal.

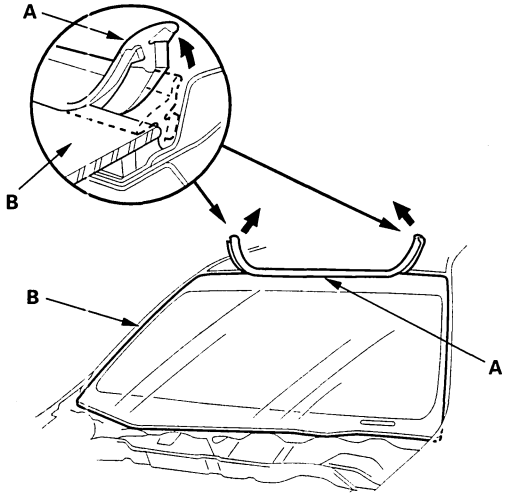
Windshield Replacement

NOTE:
- Put on gloves to protect your hands.
- Wear eye protection while cutting the glass adhesive with piano wire.
- Use seat covers to avoid damaging the seat.

1. Remove these items:
   - Windshield wiper arms (see page 22-253)
   - Cowl covers (see page 20-199)
   - Rearview mirror (see page 20-43)
   - A-pillar trim, both sides, 2-door without side curtain airbags (see page 20-94), 2-door with side curtain airbags (see page 20-99), 4-door without side curtain airbags (see page 20-94), 4-door with side curtain airbags (see page 20-99)
   - Roof moldings (see page 20-200)

2. Remove the molding (A) from the upper edge of the windshield (B). If necessary, cut the molding with a utility knife.

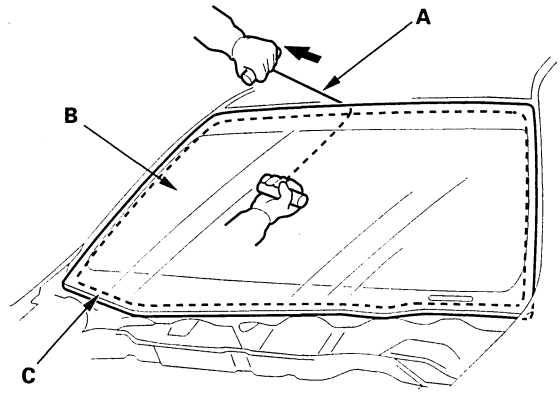


3. If the old windshield is to be reinstalled, make alignment marks across the glass and body with a grease pencil.

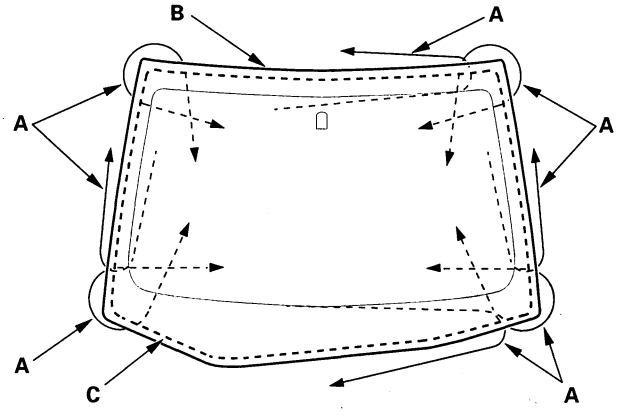
4. Pull down the front portion of the headliner (see page 20-117). Take care not to bend the headliner excessively, as you may crease or break it.

5. Apply protective tape along the edge of the dashboard and body. Using an awl, make a hole through the rubber dam and adhesive from inside the vehicle at the corner portion of the windshield. Push a piece of piano wire through the hole, and wrap each end around a piece of wood.

6. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the windshield (B) as possible to prevent damage to the body and dashboard. Carefully cut through the rubber dam and adhesive (C) around the entire windshield.



Cutting positions



7. Carefully remove the windshield.

BACK

Protected by AR

8. With a knife, scrape the old adhesive smooth to a thickness of about 2 mm (0.08 in.) on the bonding surface around the entire windshield opening flange:

   - Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.
   - Remove the rubber dam and fasteners from the body.
   - Replace the dashboard seal with a new one.

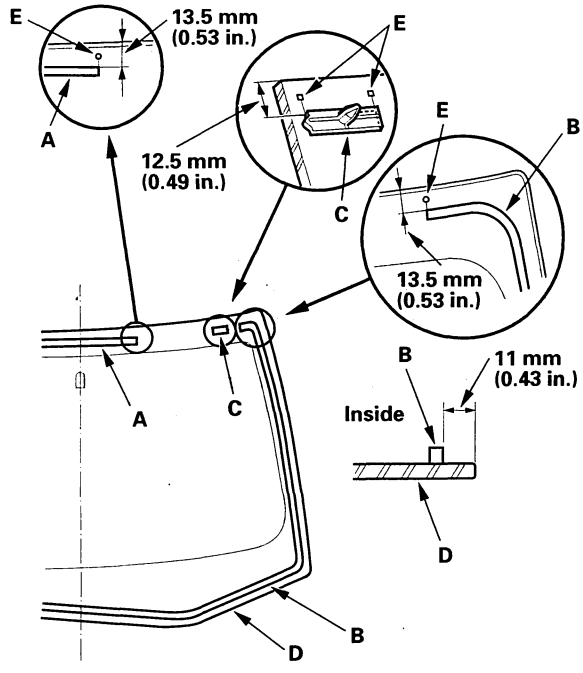
9. Clean the body bonding surface with a sponge dampened in alcohol. After cleaning, keep oil, grease and water from getting on the clean surface.

10. If the old windshield is to be reinstalled, use a putty knife to scrape off all of the old adhesive, the fasteners and the rubber dam from the windshield. Clean the inside face and the edge of the windshield with alcohol where new adhesive is to be applied. Make sure the bonding surface is kept free of water, oil and grease.

11. Attach the upper rubber dam (A), lower rubber dam (B), and clips (C) with adhesive tape to the inside face of the windshield (D) as shown:

    - Be sure the rubber dam and clips line up with the alignment marks (E).
    - Be careful not to touch the windshield where adhesive will be applied.

    Rubber dams adhesive tape:
    Thickness 0.16 mm (0.0063 in.)
    Width 3.5 mm (0.14 in.)
    Clips adhesive tape:
    Thickness 0.4 mm (0.016 in.)
    Width 10 mm (0.39 in.)



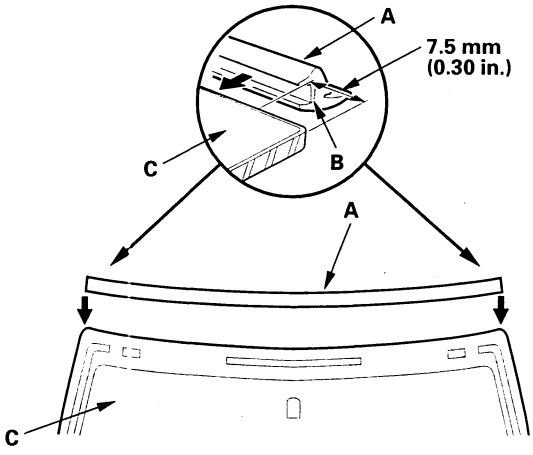
(cont'd)

Protected by AR

Windshield Replacement (cont'd)

12. Attach the molding (A) with adhesive tape (B) to the upper edge of the windshield (C). Be careful not to touch the windshield where adhesive will be applied.

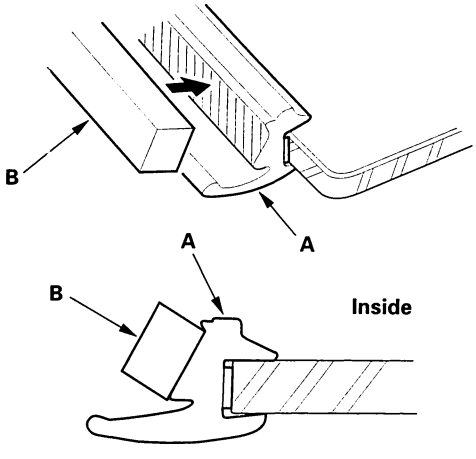
Molding adhesive tape: Thickness 0.8 mm (0.03 in.)
Width 4 mm (0.16 in.)



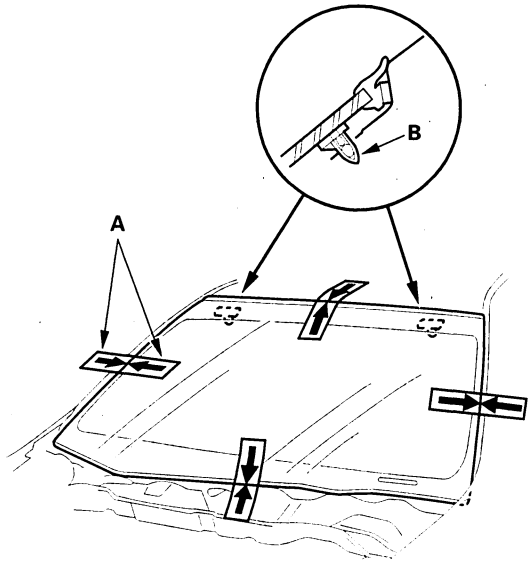
13. Apply primer to the molding (A), then attach the molding upper seal (B) with adhesive tape to the inside surface of the molding as shown.

Seals adhesive tape: Thickness 0.16 mm (0.0063 in.)
Width 7 mm (0.28 in.)

: **Apply primer here.**



14. Set the windshield in the opening, and center it. Make alignment marks (A) across the windshield and body with a grease pencil at the four points shown. Make sure both clips (B) contact with the edge of the body holes. Be careful not to touch the windshield where adhesive will be applied.



15. Remove the windshield.

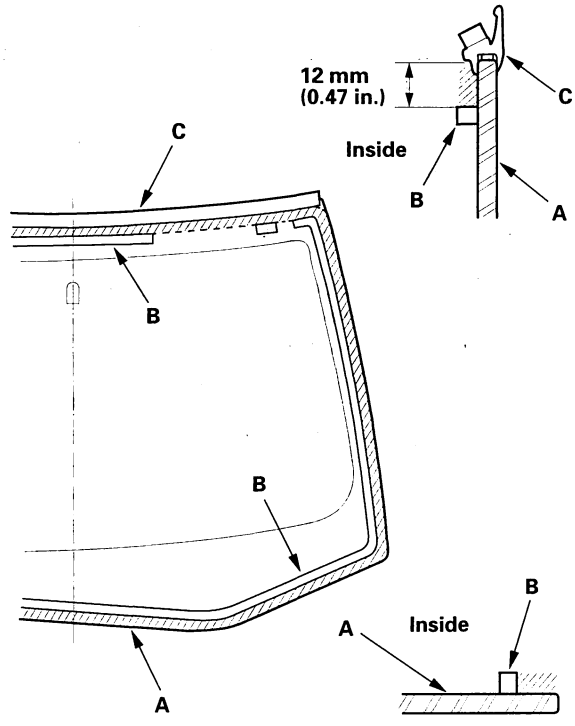
BACK

Protected by AR

16. With a sponge, apply a light coat of glass primer around the edge of the windshield (A) between the dams (B) and molding (C) as shown, then lightly wipe it off with gauze or cheesecloth:

    - Apply glass primer to the molding.
    - Do not apply body primer to the windshield, and do not get body and glass primer sponges mixed up.
    - Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the windshield properly, causing a leak after the windshield is installed.
    - Keep water, dust, and abrasive materials away from the primed surfaces.

    : **Apply glass primer here.**



17. With a sponge, carefully apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the primer dry for at least 10 minutes:

    - Do NOT apply body primer to any remaining original adhesive on the flange.
    - Be careful not to mix up the body and glass primer sponges.
    - Never touch the primed surfaces with your hands.

    : **Apply body primer to exposed paint as shown.**

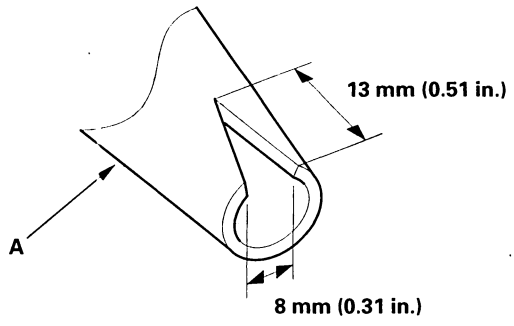
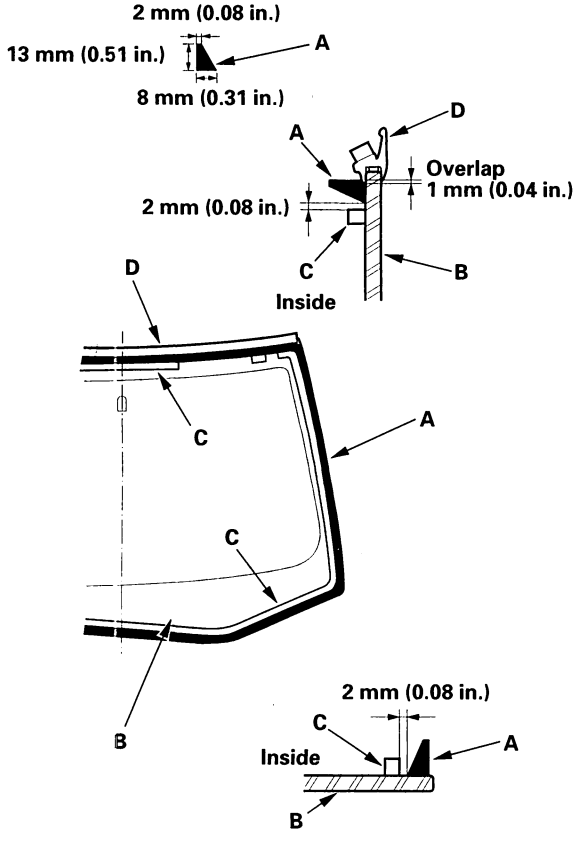
Protected by AR

Windshield Replacement (cont'd)

18. Cut a "V" in the end of the nozzle (A) on the adhesive cartridge as shown.



19. Pack adhesive into the cartridge without air pockets to ensure continuous delivery. Put the cartridge in a caulking gun, and run a bead of adhesive (A) around the edge of the windshield (B) between the dams (C) and molding (D) as shown. Apply the adhesive within 30 minutes after applying the glass primer. Make a slightly thicker bead at each corner.



20. Use suction cups to hold the windshield over the opening, align it with the alignment marks made in step 14, and set it down on the adhesive. Lightly push on the windshield until its edges are fully seated on the adhesive all the way around. Do not open or close the doors until the adhesive is dry.

21. Scrape or wipe the excess adhesive off with a putty knife or towel. To remove adhesive from a painted surface or the windshield, wipe with a soft shop towel dampened with alcohol.

22. Let the adhesive dry for at least 1 hour, then spray water over the windshield and check for leaks. Mark leaking areas, and let the windshield dry, then seal with sealant:

    - Let the vehicle stand for at least 4 hours after windshield installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.
    - Keep the windshield dry for the first hour after installation.

23. Reinstall all remaining removed parts.

    NOTE: Advise the customer not to do the following things for 2 to 3 days:
    - Slam the doors with all the windows rolled up.
    - Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

BACK

Protected by AR

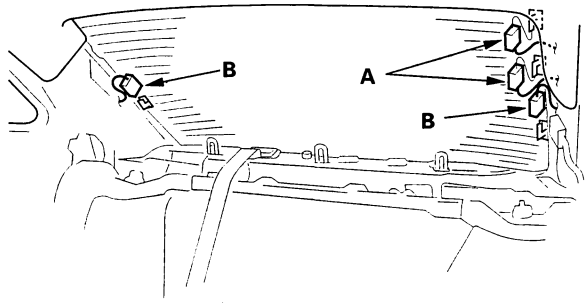
Rear Window Replacement

NOTE:
- Put on gloves to protect your hands.
- Wear eye protection while cutting the glass adhesive with piano wire.
- Use seat covers to avoid damaging any surfaces.
- Do not damage the rear window defogger grid lines, window antenna grid lines, and terminals.

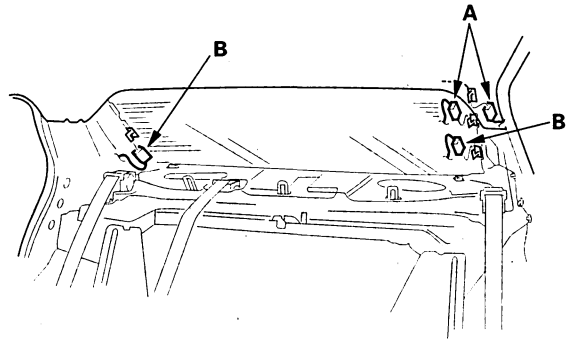
1. Remove these items:
   - Trunk lid
   - Rear shelf, 2-door (see page 20-108), 4-door (see page 20-110)

2. Disconnect the window antenna connectors (A) and rear window defogger connectors (B).

2-door



4-door



3. If the old rear window is to be reinstalled, make alignment marks across the glass and body with a grease pencil.

4. Pull down the rear portion of the headliner (A) by detaching the clips (B). Take care not to bend the headliner excessively, as you may crease or break it.

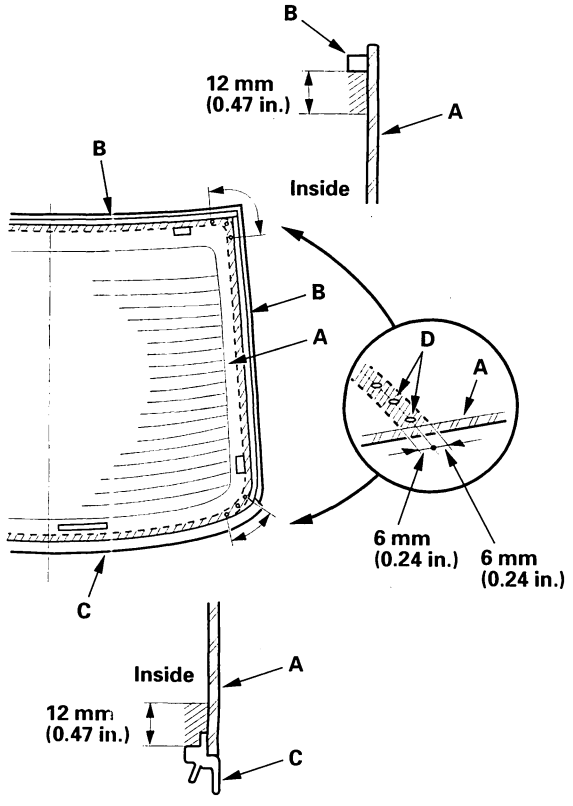
19. With a sponge, apply a light coat of glass primer along the edge of the rear window (A) between the dams (B) and molding (C) as shown, then lightly wipe it off with gauze or cheesecloth:

    - 2-door: With the printed dots (D) on the rear window as a guide, apply the glass primer to both lower corner portions of the rear window.
    - Do not apply body primer to the rear window, and do not get body and glass primer sponges mixed up.
    - Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the rear window properly, causing a leak after the rear window is installed.
    - Keep water, dust, and abrasive materials away from the primed surfaces.

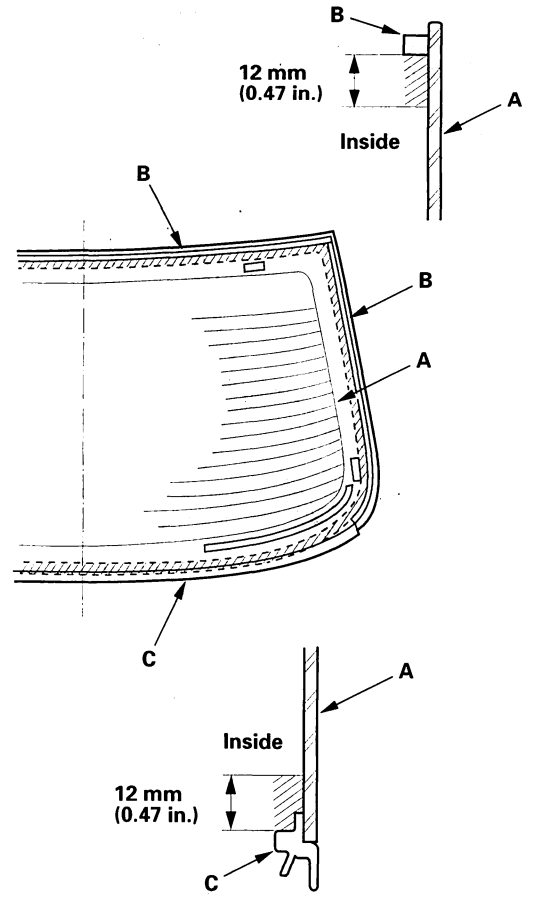
2-door

: Apply glass primer here.



4-door

: Apply glass primer here.



BACK

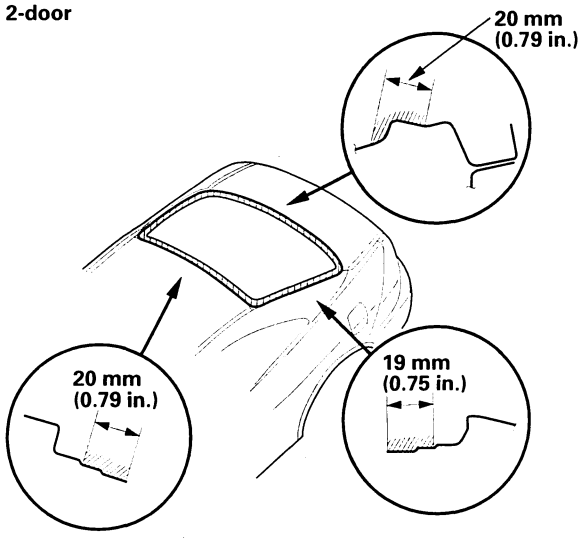
Protected by AR

20. With a sponge, carefully apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the primer dry for at least 10 minutes:

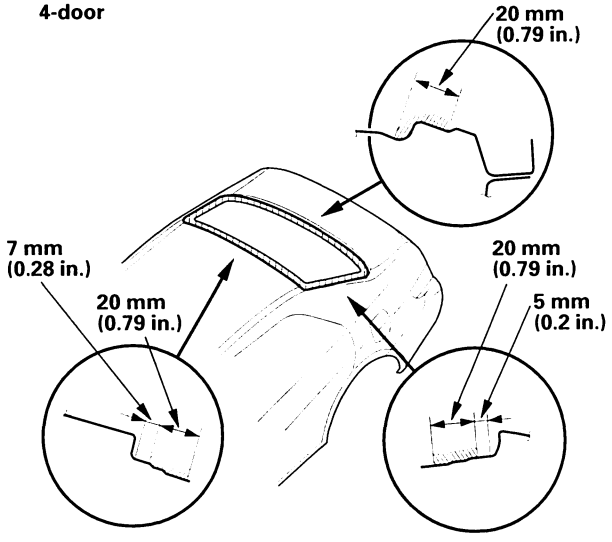
    - Do NOT apply body primer to any remaining original adhesive on the flange.
    - Be careful not to mix up the body and glass primer sponges.
    - Never touch the primed surfaces with your hands.

    : **Apply body primer to exposed paint as shown.**

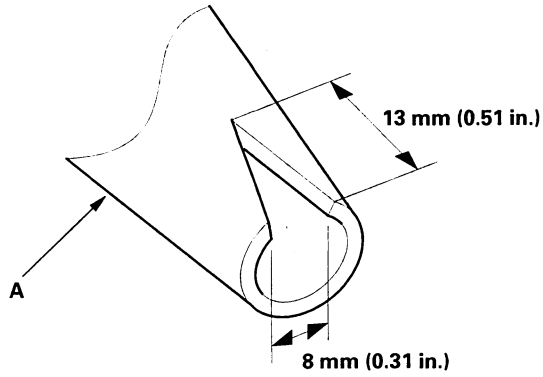
2-door



4-door



21. Cut a "V" in the end of the nozzle (A) on the adhesive cartridge as shown.



(cont'd)

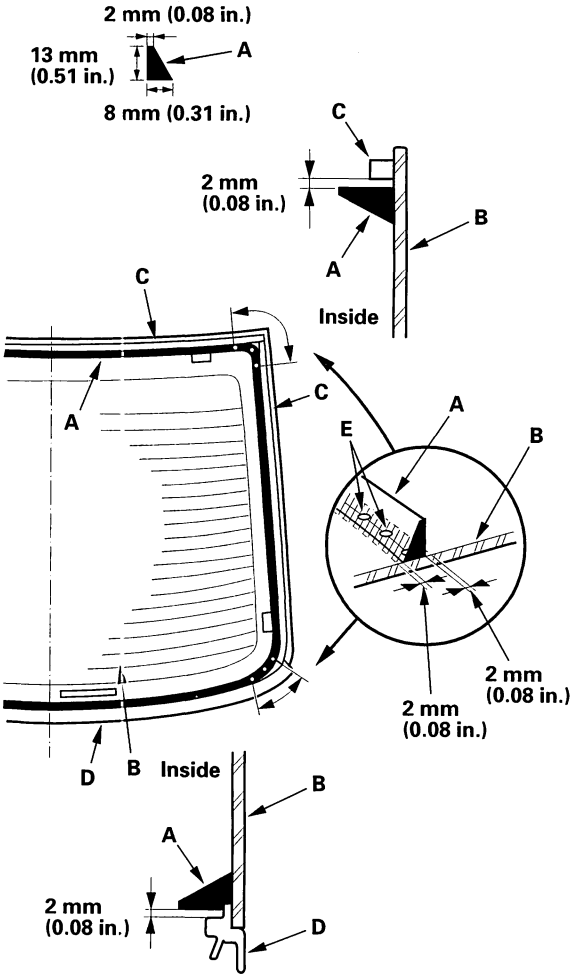
Rear Window Replacement (cont'd)

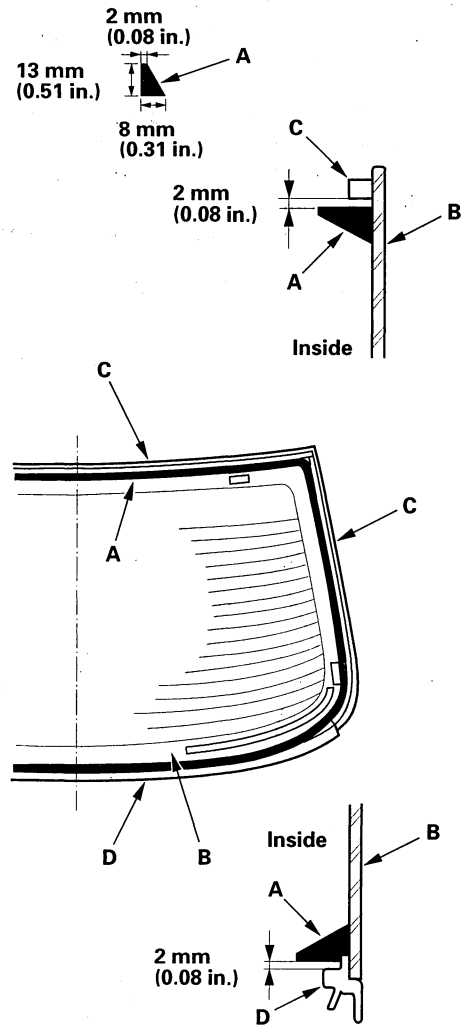
22. Pack adhesive into the cartridge without air pockets to ensure continuous delivery. Put the cartridge in a caulking gun, and run a bead of adhesive (A) around the edge of the rear window (B) between the dams (C) and molding (D) as shown:

    - 2-door: With the printed dots (E) on the rear window as a guide, apply the adhesive to both side portions of the rear window.
    - Apply the adhesive within 30 minutes after applying the glass primer. Make a slightly thicker bead at each corner.

2-door



4-door



BACK

Protected by AR

23. Use suction cups to hold the rear window over the opening, align it with the alignment marks you made in step 15, and set it down on the adhesive. Lightly push on the rear window until its edges are fully seated on the adhesive all the way around. Do not open or close the doors until the adhesive is dry.

24. Scrape or wipe the excess adhesive off with a putty knife or towel. To remove adhesive from a painted surface or the rear window, use a soft shop towel dampened with alcohol.

25. Let the adhesive dry for at least 1 hour, then spray water over the rear window and check for leaks. Mark the leaking areas, let the rear window dry, then seal with sealant. Let the vehicle stand for at least 4 hours after rear window installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.

26. Reinstall all remaining removed parts.

    NOTE: Advise the customer not to do the following things for 2 to 3 days:
    - Slam the doors with all the windows rolled up.
    - Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

Quarter Glass Replacement

2-door

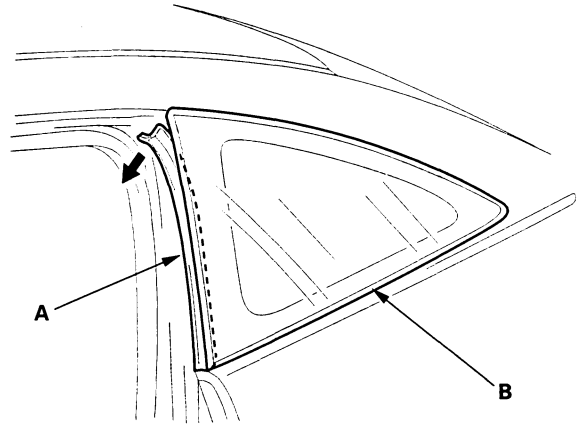
NOTE:
- Put on gloves to protect your hands.
- Use seat covers to avoid damaging any surface.

1. Remove these items:

    - C-pillar trim, without side curtain airbags (see page 20-97), with side curtain airbags (see page 20-104)
    - Side trim panel, as necessary (see page 20-106)
    - Front seat belt upper anchor (see step 6 on page 23-6)
    - B-pillar upper trim, without side curtain airbags (see page 20-95), with side curtain airbags (see page 20-100)

2. Apply protective tape along the inside and outside edges of the body, and along the edge of the headliner. Using an awl, make a hole through the adhesive from inside the vehicle. Push a piece of piano wire through the hole, and wrap each end around a piece of wood.

3. Remove the front seal (A) from the front edge of the quarter glass (B). If necessary, cut the front seal with a utility knife.



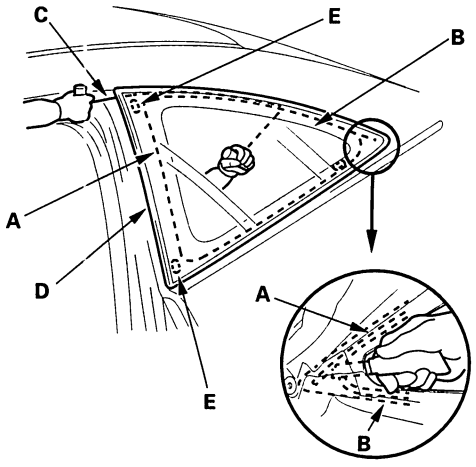
(cont'd)

Protected by AR

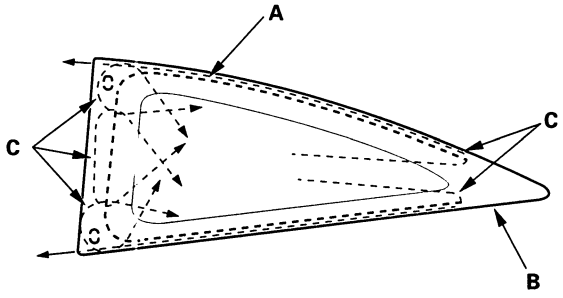
Quarter Glass Replacement (cont'd)

4. Carefully cut through the adhesive (A) at the rear corner portion of the quarter glass (B) with a utility knife. With a helper on the outside, pull the piano wire (C) back and forth in a sawing motion. Hold the piano wire as close to the quarter glass as possible to prevent damage to the body, and carefully cut through the adhesive around the entire quarter glass:

   - If the quarter glass is to be reinstalled, take care not to damage the molding (D).
   - If the molding is damaged, replace the quarter glass, molding, and clips (E) as an assembly.
   - If any of the clips are broken, the quarter glass can be reinstalled using butyl tape (refer to step 9).



Cutting positions



5. Carefully remove the quarter glass.

6. With a putty knife, scrape the old adhesive smooth to a thickness of about 2 mm (0.08 in.) on the bonding surface around the entire quarter glass opening flange:

   - Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.
   - Remove the clips and fastener from the body.

7. Clean the body bonding surface with a sponge dampened in alcohol. After cleaning, keep oil, grease, and water from getting on the surface.

8. If the old quarter glass is to be reinstalled, use a putty knife to scrape off all of the old adhesive, any broken clips, and the fastener from the glass. Clean the inside face and the edge of the glass with alcohol where new adhesive is to be applied. Make sure the bonding surface is kept free of water, oil, and grease.

BACK

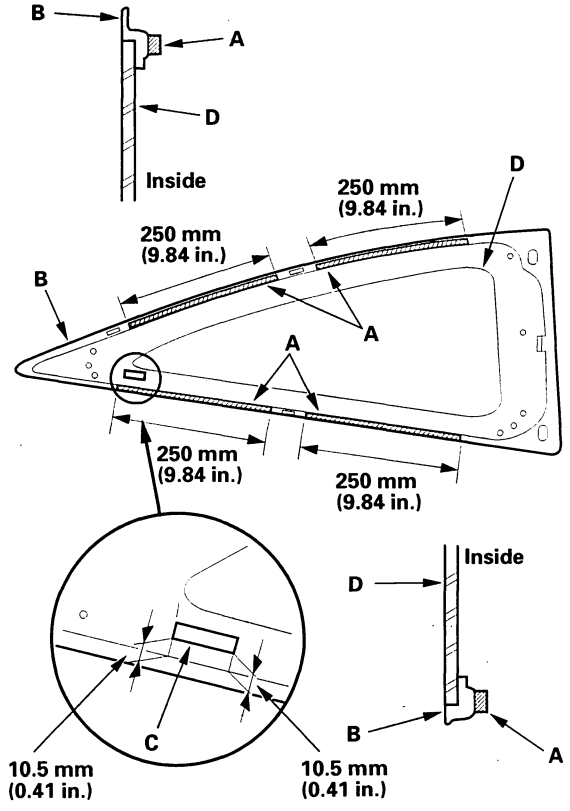
Protected by AR

9. If the old quarter glass is to be reinstalled (and either clip is broken off the molding), apply a light coat of primer, then apply butyl tape (A) to the molding (B) as shown. Attach the fastener (C) with adhesive tape to the inside face of the quarter glass (D):

   - Be careful not to touch the quarter glass where adhesive will be applied.
   - Do not peel the separator off the butyl tape.

   Fastener adhesive tape:
   Thickness 0.8 mm (0.031 in.)

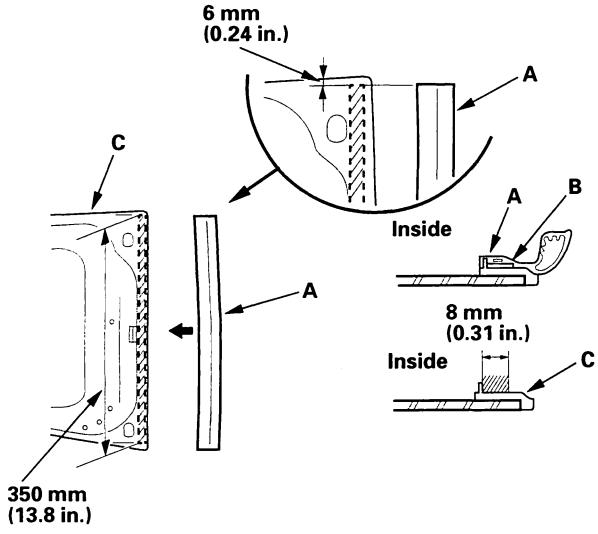
   : **Apply glass primer here.**



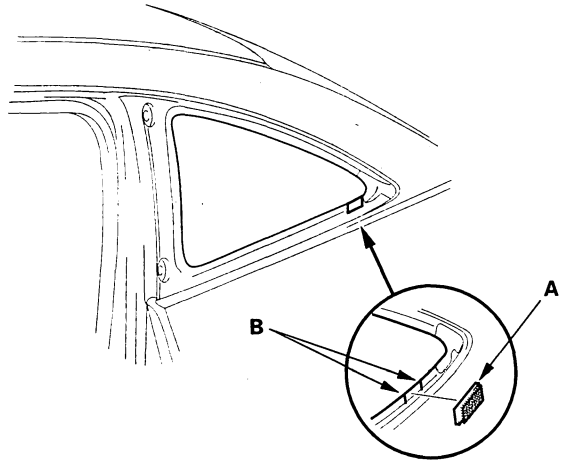
10. Attach the front seal (A) with adhesive tape (B) onto the molding (C).

    Seal adhesive tape: **Thickness 0.8 mm (0.031 in.)**
    Width 7 mm (0.28 in.)

    : **Apply primer here.**



11. Attach the fastener (A) to the body. Be sure the fastener lines up with the alignment marks (B).

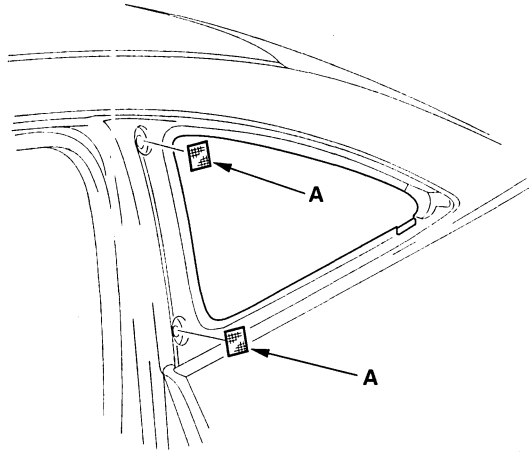


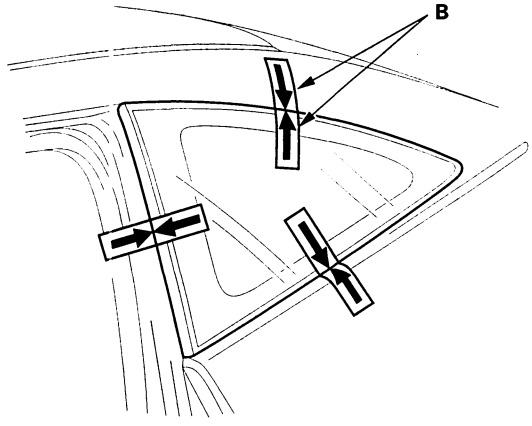
(cont'd)

Protected by AR

Quarter Glass Replacement (cont'd)

12. If the old quarter glass is to be reinstalled (and either clip is broken off the molding), seal the body holes with pieces of urethane tape (A). Then set the quarter glass upright in the opening, and make alignment marks (B) across the quarter glass and body with a grease pencil at the three points shown. Be careful not to touch the quarter glass where adhesive will be applied.



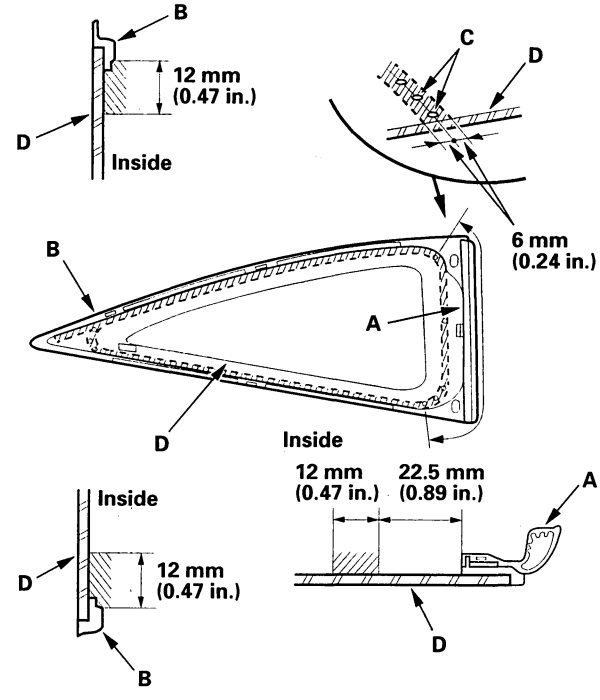


13. Remove the quarter glass.

14. With a sponge, apply a light coat of glass primer along the edge of the front seal (A) and molding (B) as shown, then lightly wipe it off with gauze or cheesecloth:

- With the printed dots (C) on the quarter glass (D) as a guide, apply the glass primer to the front portion of the quarter glass.
- Do not apply body primer to the quarter glass, and do not get body and glass primer sponges mixed up.
- Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the quarter glass properly, causing a leak after the quarter glass is installed.
- Keep water, dust, and abrasive materials away from the primed surfaces.

: **Apply glass primer here.**



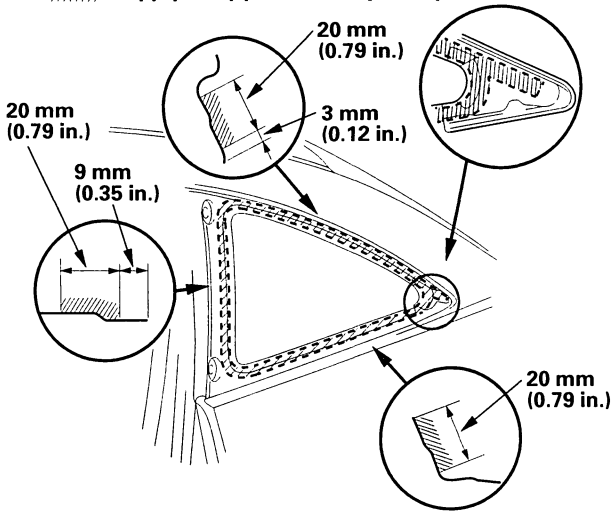
BACK

Protected by AR

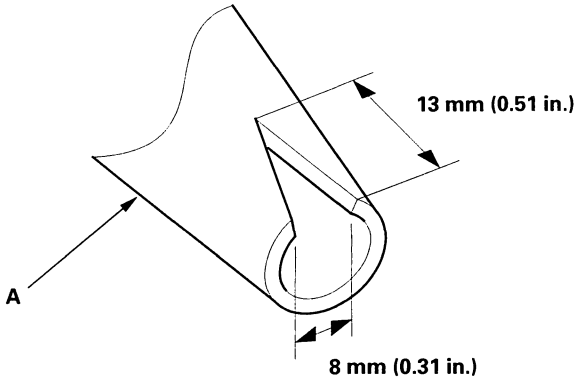
15. With a sponge, carefully apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the primer dry for at least 10 minutes:

    - Do NOT apply body primer to any remaining original adhesive on the flange.
    - Be careful not to mix up the body and glass primer sponges.
    - Never touch the primed surfaces with your hands.

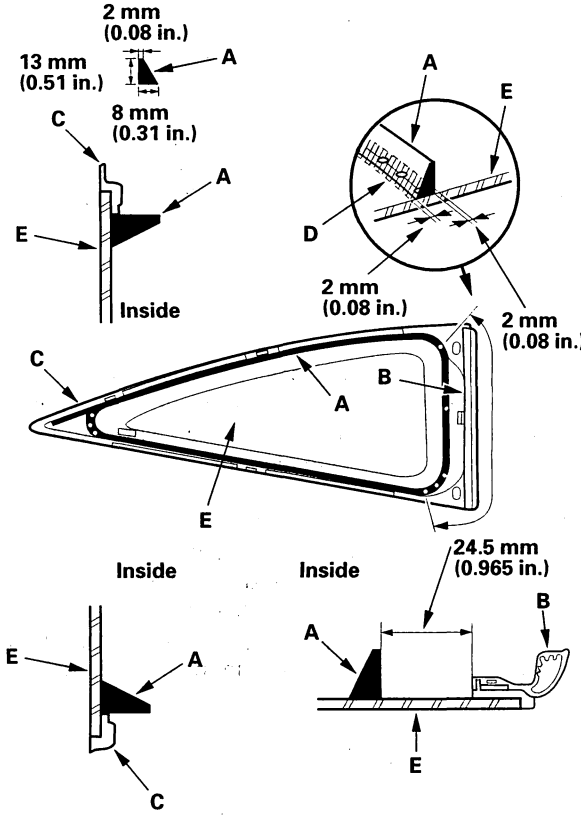
    : **Apply body primer to exposed paint as shown.**



16. Cut a "V" in the end of the nozzle (A) on the adhesive cartridge as shown.



17. Pack adhesive into the cartridge without air pockets to ensure continuous delivery. Put the cartridge in a caulking gun, and run a bead of adhesive (A) around the edge of the front seal (B) and molding (C) as shown. With the glass primer (D) you applied in step 14 on the quarter glass (E) as a guide, apply the adhesive to the upper and lower corner portions of the quarter glass. Apply the adhesive within 30 minutes after applying the glass primer. Make a slightly thicker bead at each corner.

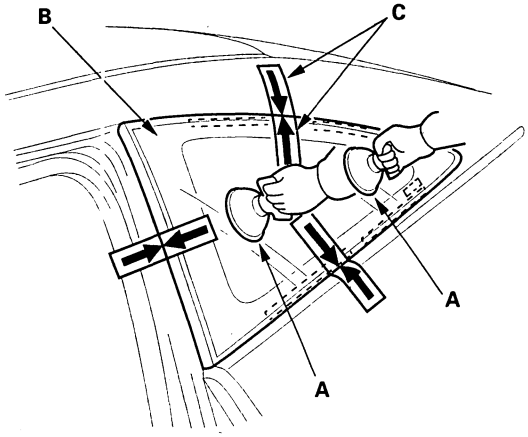


(cont'd)

Protected by AR

Quarter Glass Replacement (cont'd)

18. Use suction cups (A) to hold the quarter glass (B) over the opening, align the clips or the alignment marks (C) made in step 12, and set it down on the adhesive. Lightly push on the quarter glass until its edges are fully seated on the adhesive all the way around. Do not open or close the doors until the adhesive is dry.



19. Scrape or wipe the excess adhesive off with a putty knife or towel. To remove adhesive from a painted surface or the quarter glass, wipe with a soft shop towel dampened with alcohol.

20. Let the adhesive dry for at least 1 hour, then spray water over the quarter glass and check for leaks. Mark the leaking areas and let the quarter glass dry, then seal with sealant. Let the vehicle stand for at least 4 hours after quarter glass installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.

21. Reinstall all remaining removed parts.

    NOTE: Advise the customer not to do the following things for 2 to 3 days:
    - Slam the doors with all the windows rolled up.
    - Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

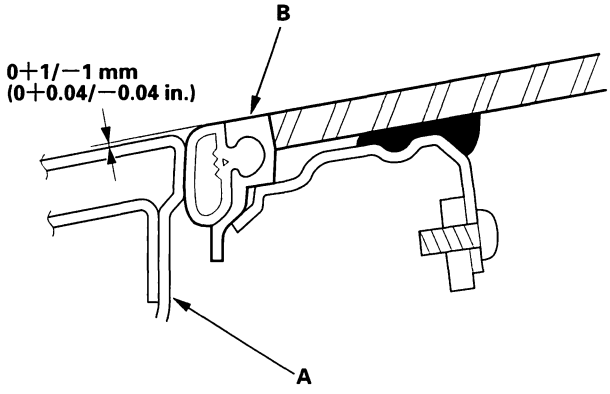
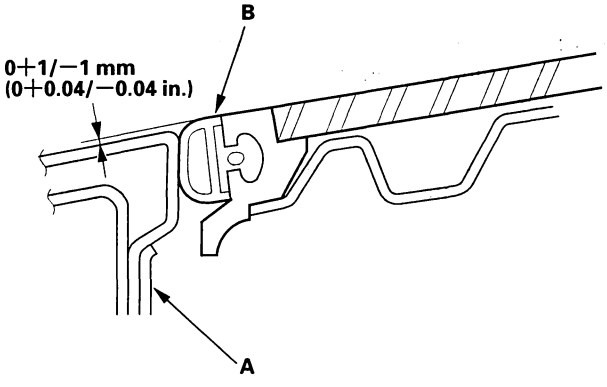
Glass Height Adjustment

The roof panel (A) should be even with the glass weatherstrip (B), to within 0+1/−1 mm (0+0.04/−0.04 in.) all the way around. If not, make the following adjustment:

2-door

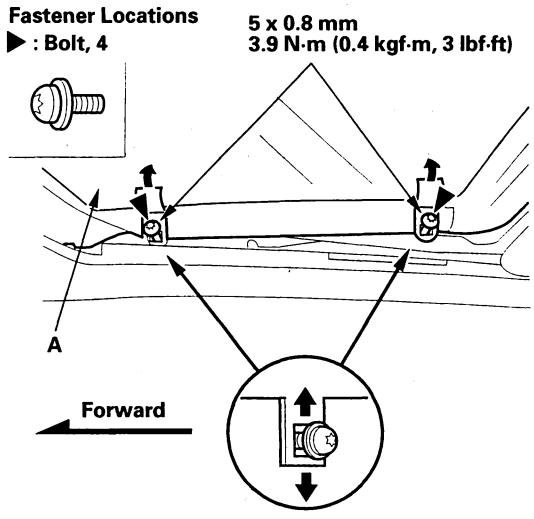


4-door

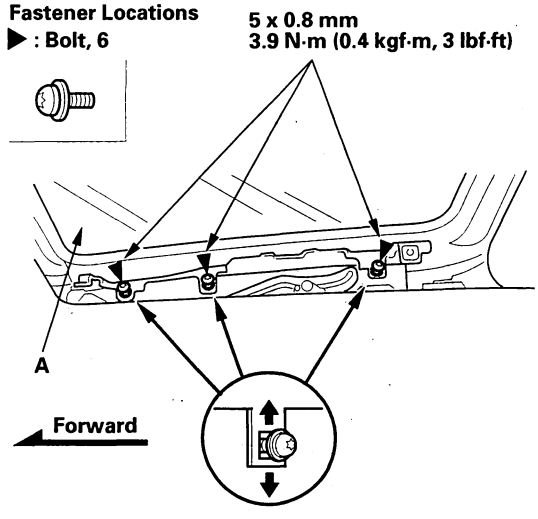


1. 4-door: Remove the bracket cover from each side (see step 3 on page 20-70).
2. Using a T25 Torx bit, loosen the bolts on each side, and adjust the glass (A).

2-door



4-door



3. If necessary, repeat on the opposite side.

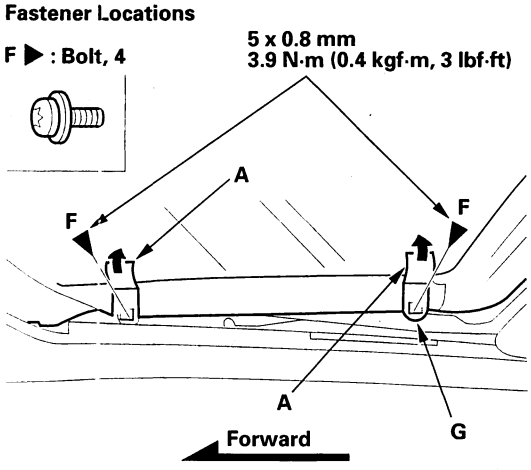
BACK

Protected by AR

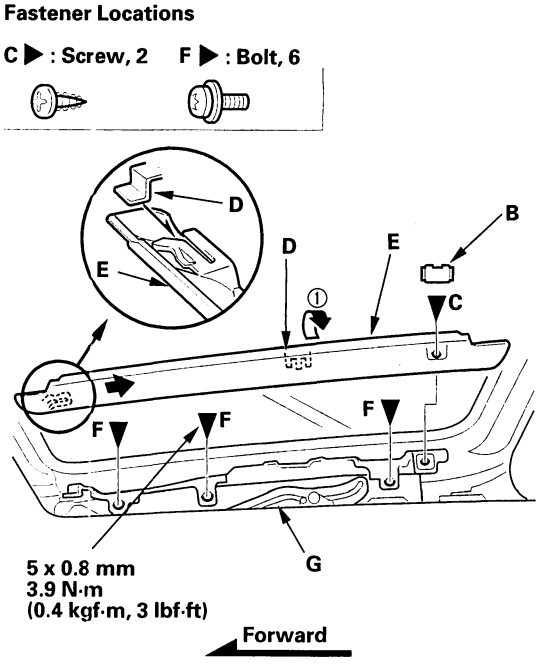
Glass Replacement

1. Close the glass fully.
2. Slide the sunshade all the way back.
3. 2-door: Turn the slit portions of the molding (A) up.
   4-door: Pry out the lid (B), remove the screws (C), and release the hooks (D), then remove both bracket covers (E).

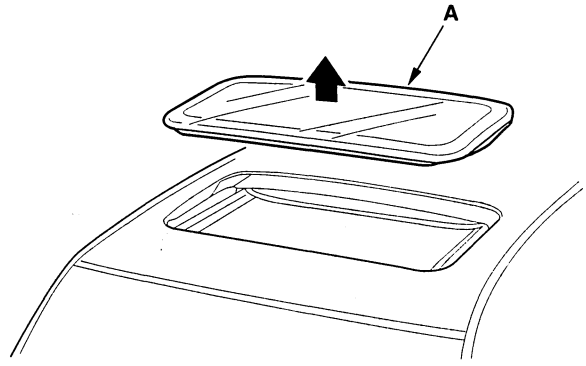
2-door



4-door



4. Using a T25 Torx bit, remove the bolts (F) from both glass brackets (G).
5. Remove the glass (A) by lifting it up. Do not damage the roof panel.



6. Install the glass in the reverse order of the removal, and note these items:
   - 2-door: Apply medium strength liquid thread lock to the glass mounting bolts before reinstallation.
   - Adjust the glass height alignment.
7. Check for water leaks. Use free-flowing water from a hose without a nozzle. Do not use high-pressure water.

   NOTE: It is normal for some water to seep past the moonroof into the moonroof frame, and exit out through the drains.

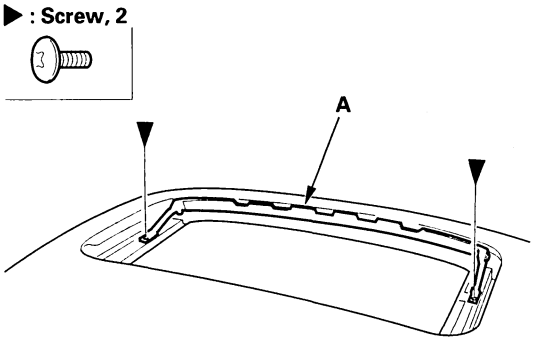
Wind Deflector Replacement

2-door

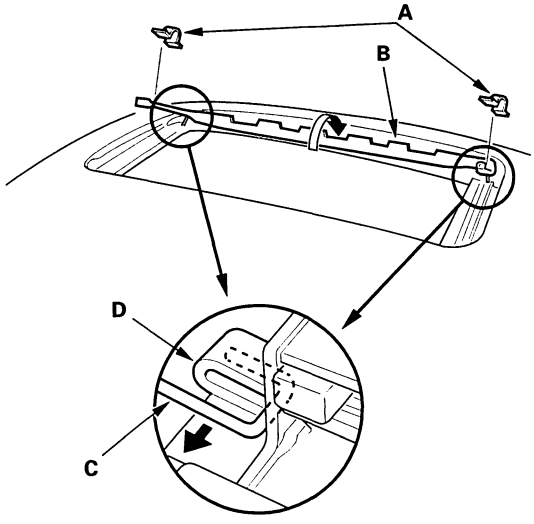
1. Open the glass fully.
2. Remove the screws securing the wind deflector (A).

Fastener Locations

▶ : Screw, 2



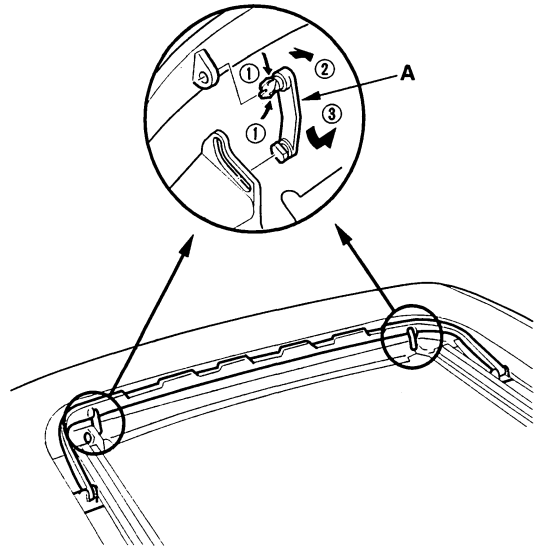
3. Remove the deflector link bases (A) from each side. Twist the wind deflector (B) forward and push it down, and pass the deflector spring (C) out through the slot of the slide stop (D) on each side, then remove the wind deflector.



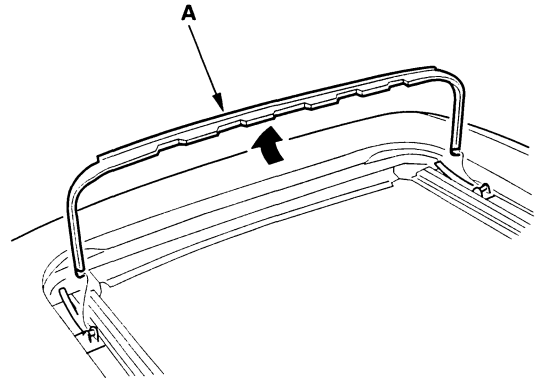
4. Install the deflector in the reverse order of removal, and apply multipurpose grease to both slots where the deflector springs are installed.

4-door

1. Open the glass fully.
2. Remove the links (A) from both sides.



3. Remove the wind deflector (A).

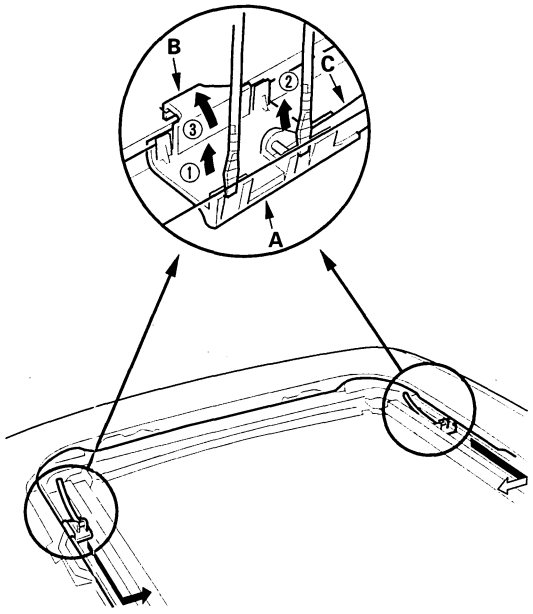


(cont'd)

Protected by AR

Wind Deflector Replacement (cont'd)

4. Pry up on the deflector bases (A) and release the hooks (B), then remove the bases with springs (C) from both sides.



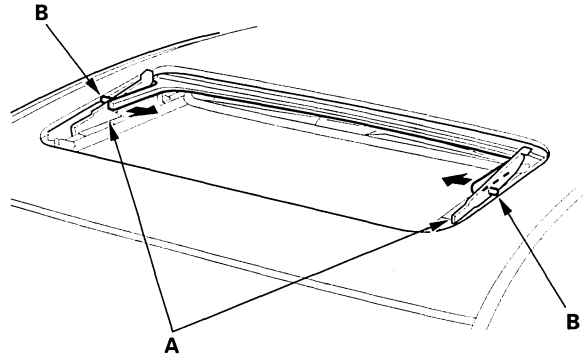
5. Install the deflector in the reverse order of removal.

Drain Channel Replacement

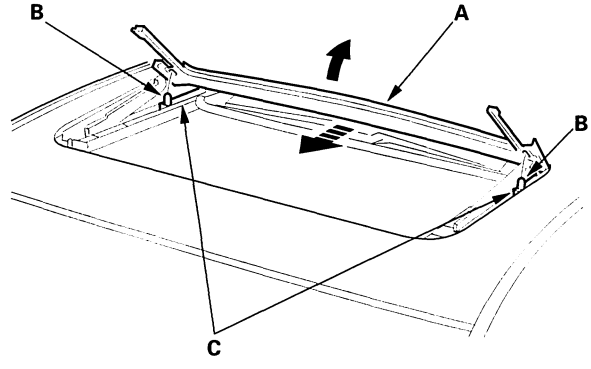
2-door

1. Remove the glass (see page 20-70).

2. Move both glass brackets (A) to detach the pins (B) inside from both glass brackets.



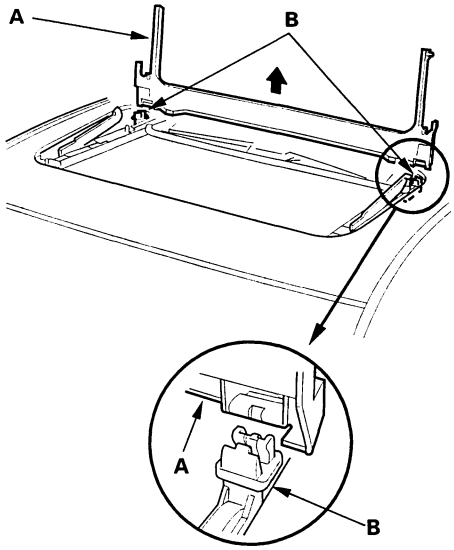
3. Turn the drain channel (A) up while sliding it forward to release it from the pins (B) on both drain channel sliders (C).



BACK

Protected by AR

4. Stand the drain channel (A) upright, and pull up the channel to remove it from both drain channel sliders (B).



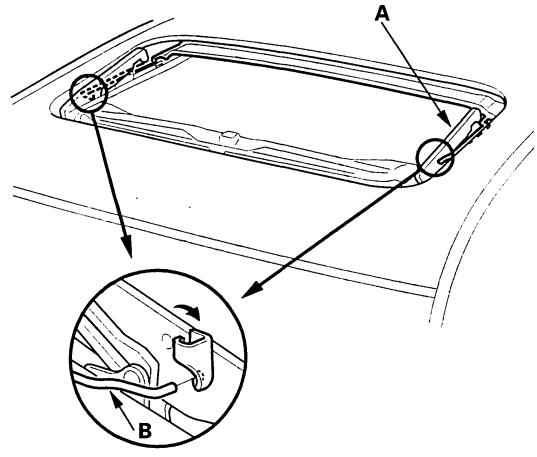
5. Install the channel in the reverse order of removal, and check the glass height adjustment (see page 20-69).

6. Check for water leaks. Let the water run freely from a hose without a nozzle. Do not use a high-pressure spray.

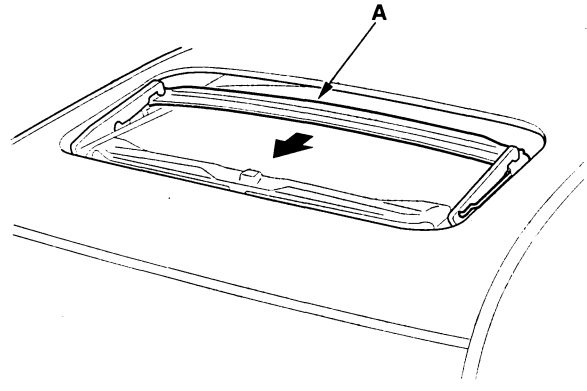
4-door

1. Remove the glass (see page 20-70).

2. With the moonroof wrench, move both glass brackets (A) to the position where the moonroof normally tilts up and disconnect the drain channel rods (B) on both sides.



3. Slide the drain channel (A) forward.

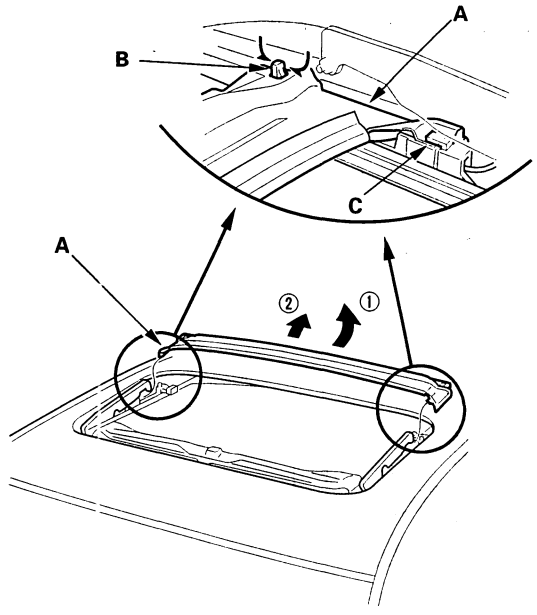


(cont'd)

Protected by AR

Drain Channel Replacement (cont'd)

4. Pull the rear edge of the drain channel (A) up while pushing both clips (B), and release the channel from both hooks (C) of the drain channel slider by pulling it rearward.



5. Remove the drain channel.

6. Install the channel in the reverse order of removal, and note these items:

   - Push the clip portions into place securely.
   - Check the glass height adjustment (see page 20-69).

7. Check for water leaks. Let the water run freely from a hose without a nozzle. Do not use a high-pressure spray.

Sunshade Replacement

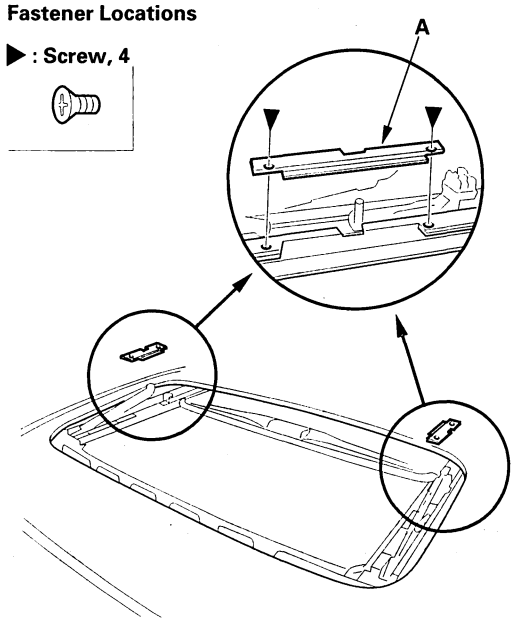
2-door

1. Remove the drain channel (see page 20-72).

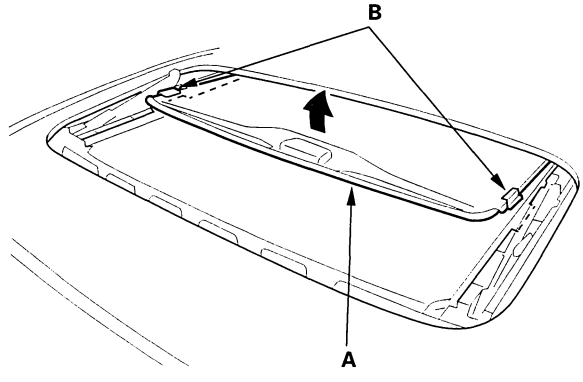
2. Remove the screws, then remove the set plate (A) from each side.

Fastener Locations

▶ : Screw, 4



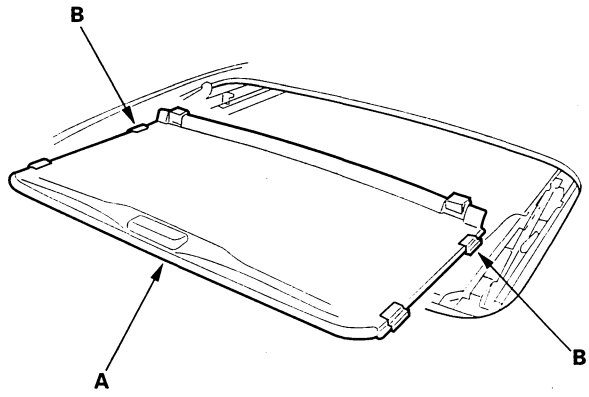
3. Slide the sunshade (A) until you can see both front sunshade base sliders (B).



BACK

Protected by AR

4. While lifting the front portion of the sunshade (A), move the sunshade forward until you can see both rear sunshade base sliders (B). Do not damage the sunshade.



5. Release both rear sunshade base sliders from the guide rail portions of the frame, then remove the sunshade.

6. Install the sunshade in the reverse order of removal, and note these items:

   - Apply medium strength liquid thread lock to the set plate mounting screws before reinstallation.
   - Check the glass height adjustment (see page 20-69).

7. Check for water leaks. Let the water run freely from a hose without a nozzle. Do not use a high-pressure spray.

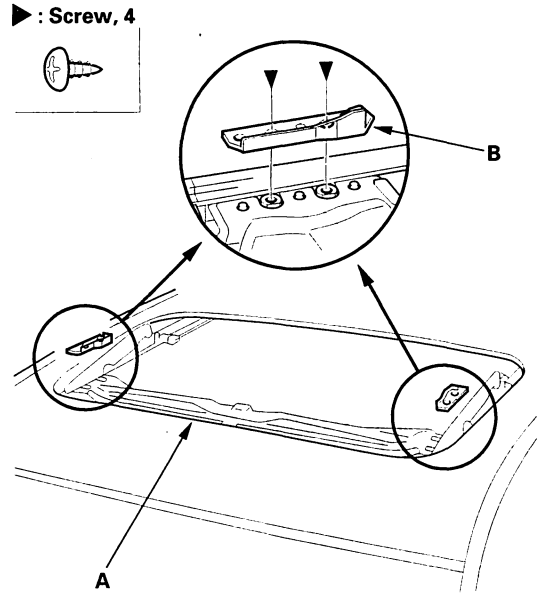
4-door

1. Remove the drain channel (see page 20-73).

2. Slide the sunshade (A) until you can see both sunshade slider spacers (B).

Fastener Locations

▶ : Screw, 4



3. Remove the screws, then remove both spacers.

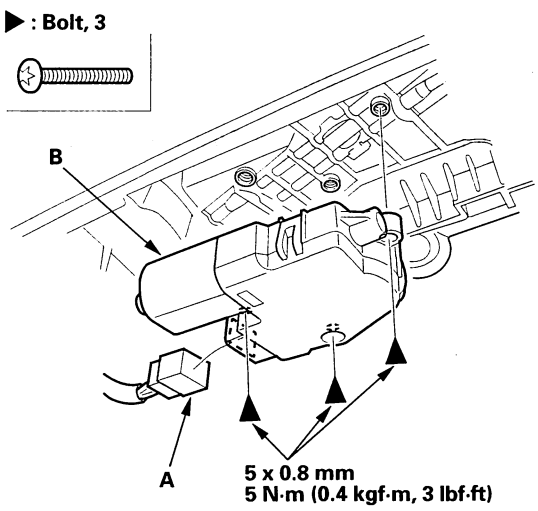
Motor Replacement

2-door

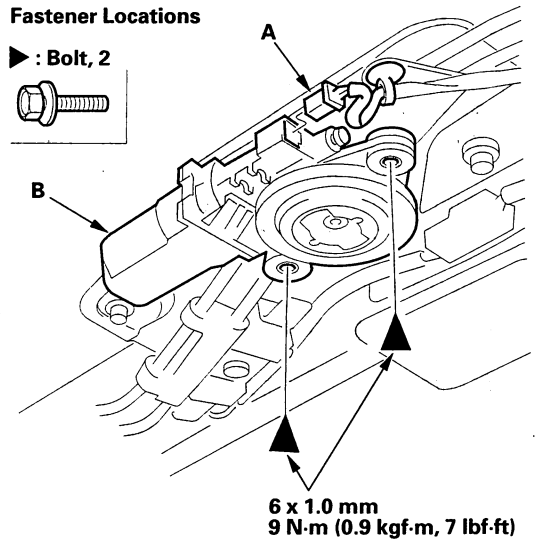
1. Remove the headliner (see page 20-117).
2. Put on gloves to protect your hands. Disconnect the connector (A), and using a T25 Torx bit, remove the bolts, then remove the motor (B). Do not operate the motor before reinstallation.



3. Install the motor in the reverse order of removal, and note these items:
   - Apply medium strength liquid thread lock to the motor mounting bolts before reinstallation.
   - Make sure the connector is plugged in properly.
   - Do the moonroof motor reprogram procedure (see page 22-307).
   - Check the motor operation.

4-door

1. Remove the headliner (see page 20-117).
2. Put on gloves to protect your hands. Disconnect the connector (A), and remove the bolts, then remove the motor (B).



3. Install the motor in the reverse order of removal, and note these items:
   - Make sure the connector is plugged in properly.
   - Check the motor operation.

Frame and Drain Tube Replacement

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

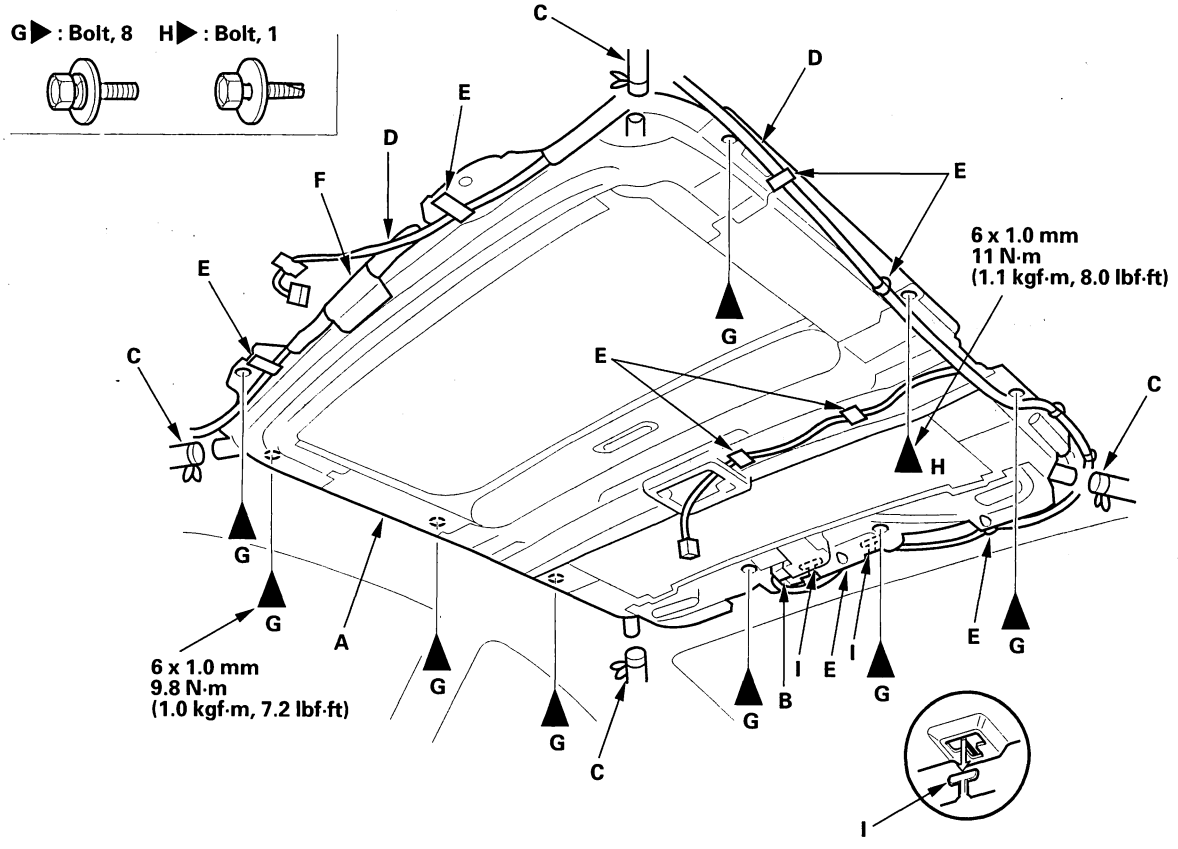
1. Remove these items:

   - Headliner (see page 20-117)
   - Moonroof glass (see page 20-70)

2. 2-door: Remove the moonroof frame (A). Put on gloves to protect your hands.

   –1 Disconnect the motor connector (B), and the drain tubes (C).
   –2 Remove the interior harness (D) by detaching the harness clips (E) and removing the cushion tape (F).
   –3 With an assistant holding the frame, remove the bolts (G, H) starting at the rear, and release the rear hooks (I) by moving the frame forward, then remove the frame.
   –4 With the help of an assistant, carefully remove the frame through the door opening. Take care not to damage the interior trim, body, or seat covers.

Fastener Locations



BACK

Protected by AR

3. 4-door: Remove the moonroof frame (A). Put on gloves to protect your hands.

–1 Disconnect the motor connector (B), open/close-tilt/close switch connector (C), and the drain tubes (D), and remove the moonroof relays (E).
–2 Remove the interior harness (F) by detaching the harness clips (G) and removing the tapes (H).
–3 With an assistant holding the frame, remove the bolts starting at the rear, and release the rear hooks (I) by moving the frame forward, then remove the frame.
–4 With the help of an assistant, carefully remove the frame through the front door opening. Take care not to damage the interior trim, body, or seat covers.

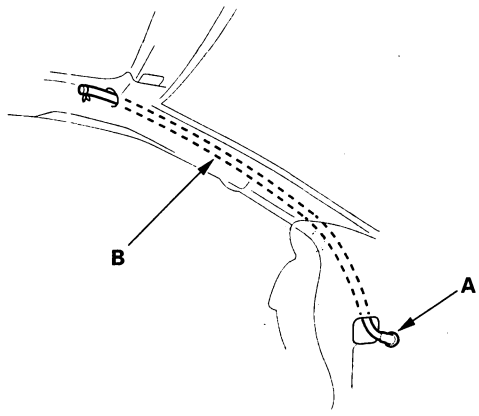
Protected by AR

Frame and Drain Tube Replacement (cont'd)

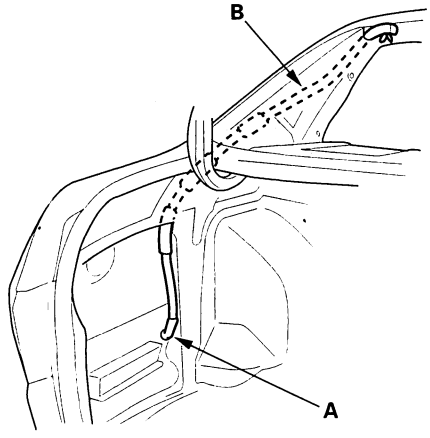
4. To remove a front drain valve (A) from the body, remove the kick panel, left or right, 2-door (see page 20-90), 4-door (see page 20-91). Tie a string to the top end of the drain tube, then pull the front drain tube (B) down out of the front pillar.



5. To remove a rear drain valve (A) from the body, remove these parts, 2-door (see page 20-112), 4-door (see page 20-113):

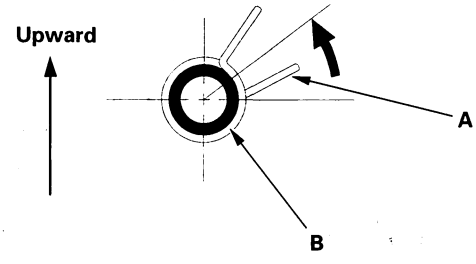
   - Spare tire lid
   - Trunk rear trim panel
   - Jack lid

   Tie a string to the top end of the rear drain tube (B), then pull back the trunk side trim panel and pull the drain tube down out of the pillar.



6. Install the frame and drain tube in the reverse order of removal, and note these items:

   - Before installing the frame, clear the drain tubes and drain valves using compressed air.
   - Check the frame seal.
   - Clean the surface of the frame.
   - To install a drain tube, tie the top of the tube to the string that was pulled through when the tube was removed. Use the string to pull the tube up into the roof.
   - When installing the frame, first attach the rear hooks into the body holes.
   - Make sure the connectors are plugged in properly.
   - When installing the rear drain tube at the rear pillar, make sure the cushion on the tube aligns with the hole in the body, and that the alignment mark on the tube aligns with the upper clip.
   - When connecting the drain tube, slide it over the frame nozzle at least 10 mm (0.39 in.).
   - Install the tube clip (A) on the drain tube (B) as shown.



7. Check for water leaks. Let the water run freely from a hose without a nozzle. Do not use a high-pressure spray.

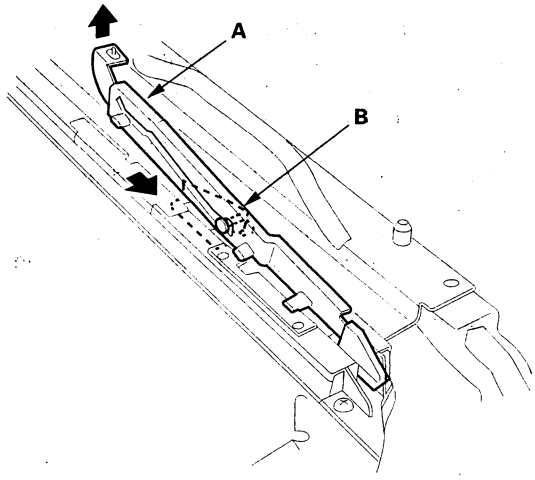
Inner Cable Replacement

2-door

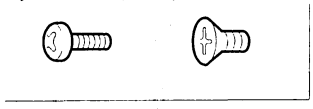
1. Remove the frame (see page 20-78).
2. Remove these items:
   - Wind deflector (see page 20-71)
   - Moonroof motor (see page 20-77)
3. Tilt the glass bracket (A) up by sliding the link lifter (B) forward fully.

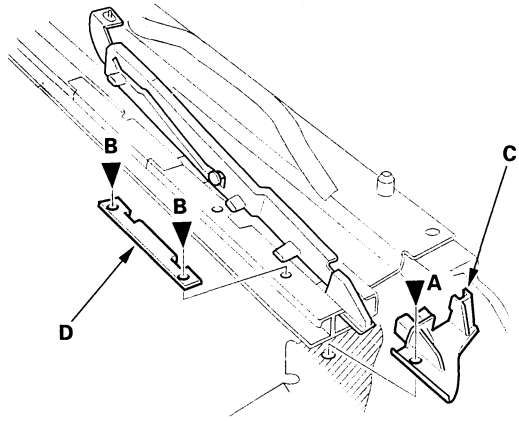


4. Remove the screws (A, B), then remove the slide stop (C) and the plate (D).

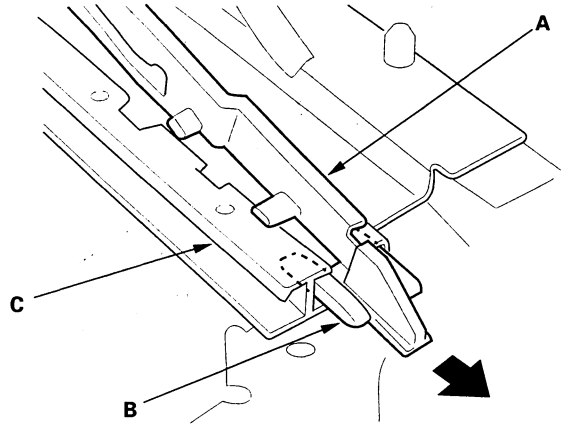
Fastener Locations

A▶ : Screw, 1 B▶ : Screw, 2

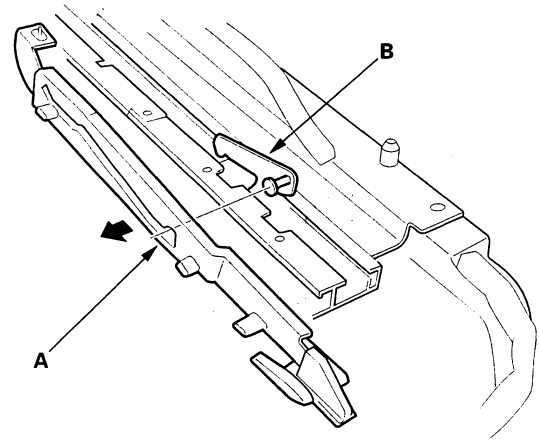




5. Slide the glass bracket (A) forward to remove the front slider portion (B) of the bracket out of the guide rail (C).



6. Remove the glass bracket (A) from the link lifter (B).

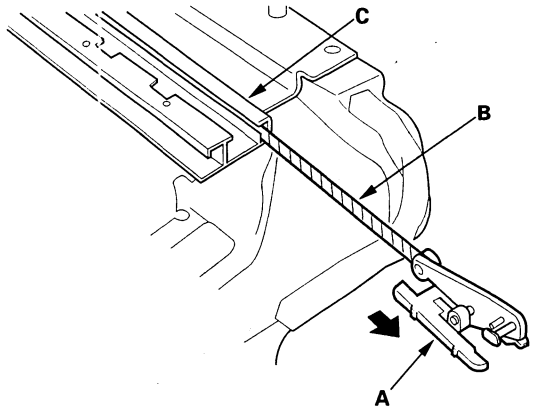


(cont'd)

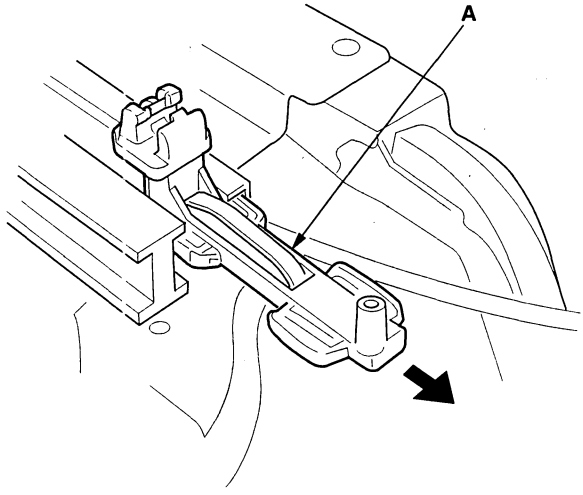
Protected by AR

Inner Cable Replacement (cont'd)

7. Pull the slider portion (A) of the inner cable (B) out of the slide rail (C), then remove the inner cable.



8. If necessary, remove the drain channel slider (A) by sliding it forward.



9. Install the slider and cable in the reverse order of removal, and note these items:

- Damaged parts should be replaced.
- Apply multipurpose grease to the glass bracket (A) and guide rail portion of the frame (B) indicated by the arrows.
- Apply butyl sealant (C) to the frame (D) where the slide stops (E) will be reinstalled with screws (F).
- Apply medium strength liquid thread lock to the set plate (G) mounting screws (H) before reinstallation.
- Before reinstalling the motor, slide both glass brackets rearward fully until the slider portions (I) of the inner cable contact with the screws (J) on the guide rail to align both glass brackets.
- Before reinstalling the motor, install the frame and glass, then check the opening drag (see page 20-87).
- After reinstalling the motor, do the moonroof motor reprogram procedure (see page 22-307).

Drain Channel Slider and Cable Assembly Replacement

4-door

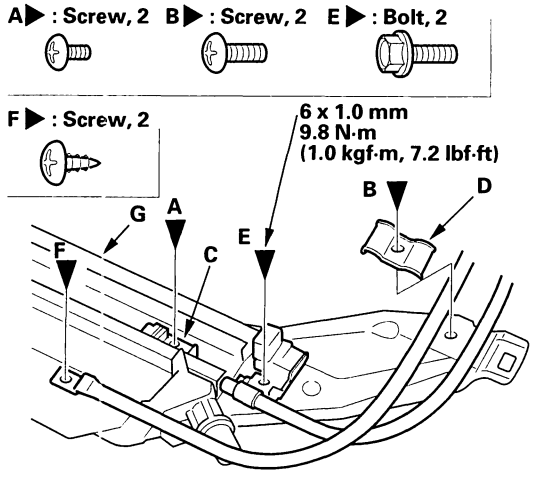
1. Remove the frame (see page 20-78).

2. Remove these parts from the frame:

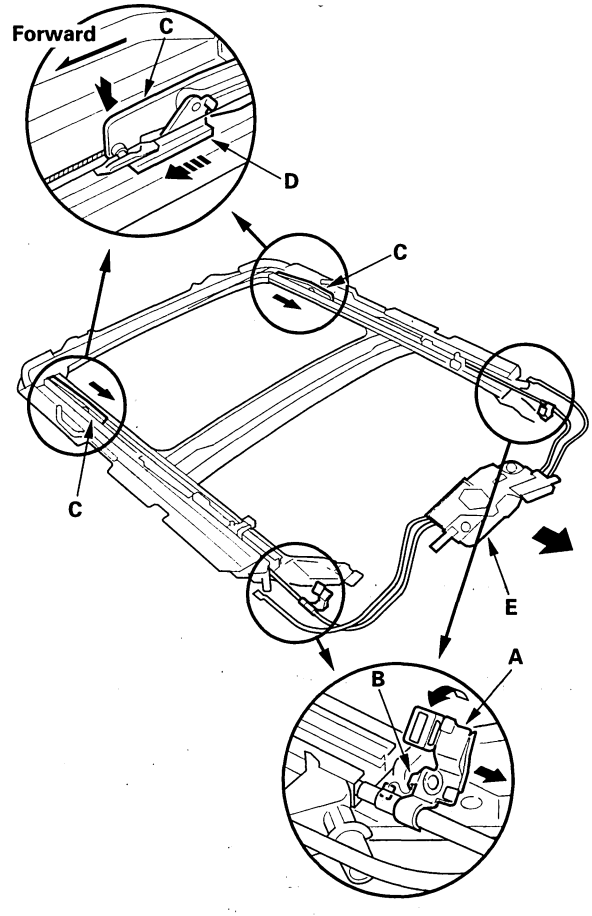
   - Sunshade (see page 20-75)
   - Moonroof motor (see page 20-77)

3. Put on gloves to protect your hands. Remove the screws (A, B) securing the slide stops (C), and cable tube rear brackets (D), cable tube side bracket mounting bolts (E) and the cable tube mounting screws (F) from both sides of the frame (G).

Fastener Locations



4. Turn both cable tube side brackets (A) up to release the hooks (B) from the holes in both sides of the frame.



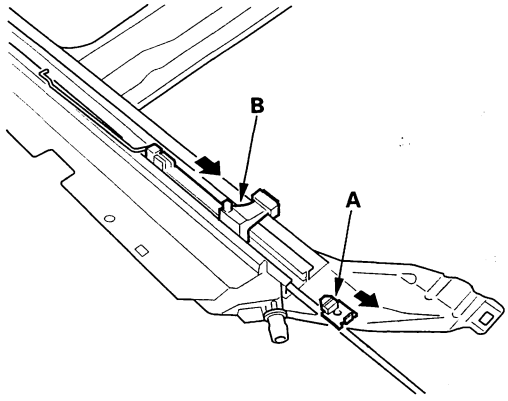
5. Pivot the glass brackets (C) down by sliding the lift up sliders (D) back, then slide both glass brackets back with the lift up sliders.

6. Slide the cable assembly (E) half-way.

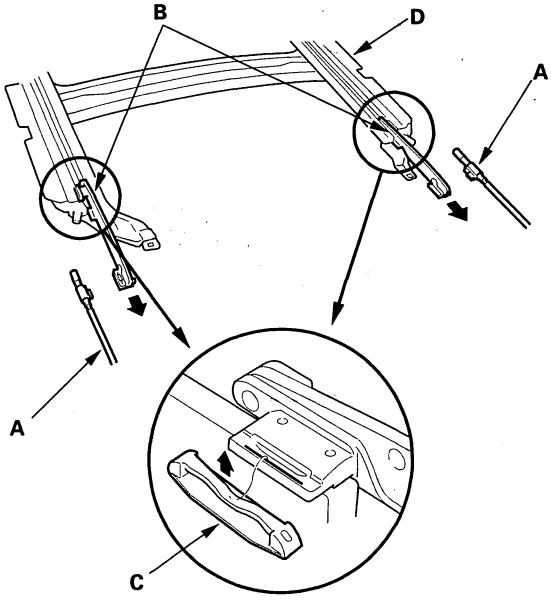
BACK

Protected by AR

7. Remove the slide stops (A) and the drain channel sliders (B) from both sides.

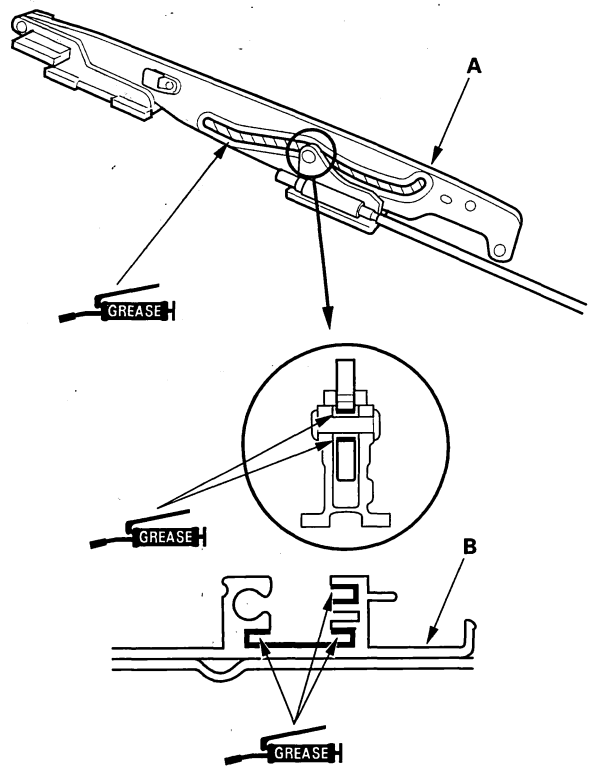


8. Slide the cable assembly (A) and both glass brackets (B) back, remove the deflector sliders (C) from both glass brackets, then remove them from the frame (D).



9. Install the slider and cable assembly in the reverse order of removal, and note these items:

- Damaged parts should be replaced.
- Apply multipurpose grease to the glass bracket (A) and guide rail portion of the frame (B) indicated by the arrows.
- Before reinstalling the motor, make sure both link lifters are parallel, and in the fully closed position.
- Before reinstalling the motor, install the frame and glass, then check the opening drag (see page 20-87).



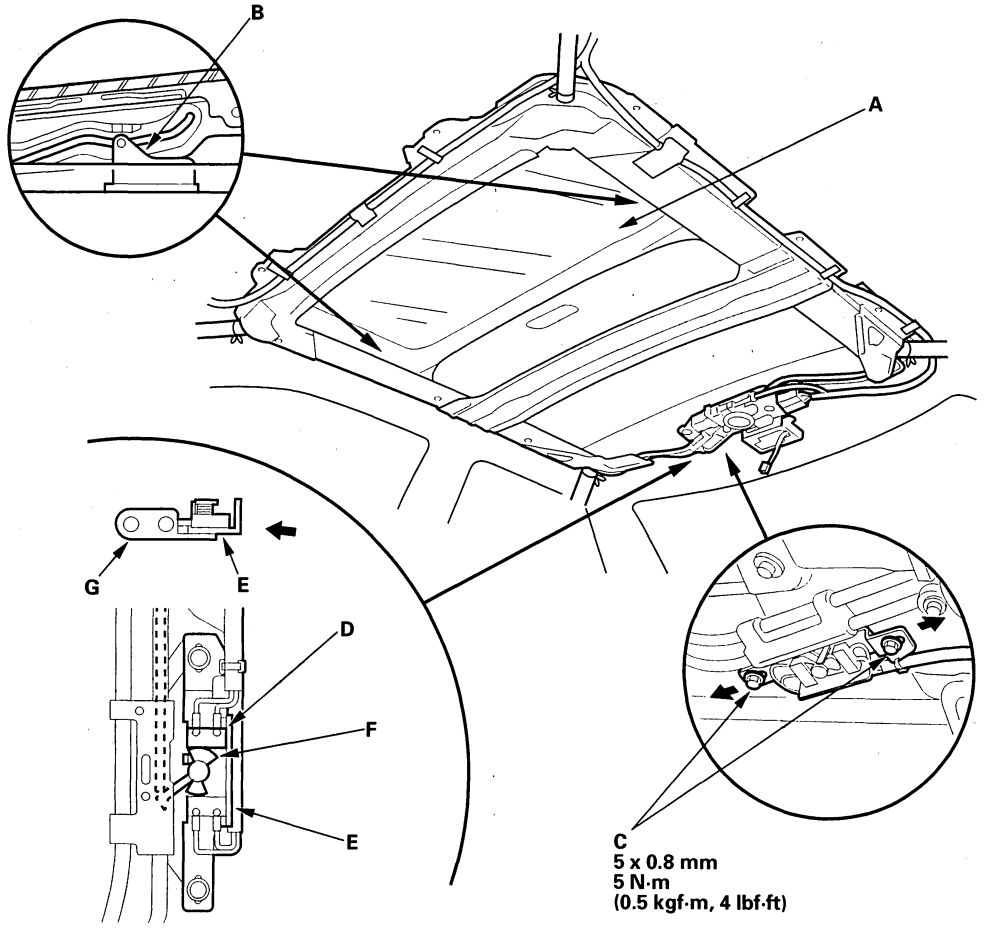
Protected by AR

Moonroof

Limit Switch Adjustment

4-door

1. Remove the headliner (see page 20-117).
2. With the moonroof wrench, close the glass (A) fully:
   - Make sure both link lifters (B) are parallel, and in the position shown.
   - Check the glass fit to the roof panel and the glass height (see page 20-69).



3. With an open-end wrench, loosen the limit switch mounting bolts (C).
4. Adjust the limit switch (D):
   - Move the switch plate (E) a little at a time, then secure it at the position where you hear a faint click when the switch cam (F) pushes the limit switch (open/close).
   - Check that the switch plate contacts the switch bracket (G).
5. Check the operation of the glass (from the tilt-up position to fully closed position, from the fully open position to the fully closed position) by operating the moonroof switch: Adjust the switch plate until the glass opens and closes correctly.
6. Reinstall all remaining parts in the reverse order of removal.

BACK

Protected by AR

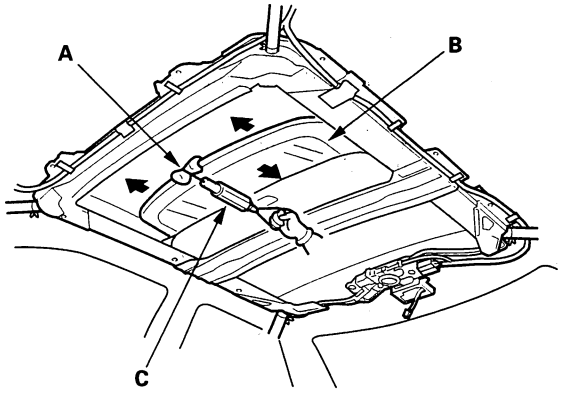
Closing Force and Opening Drag Check

1. Remove the headliner (see page 20-117).

2. Closing force check:

   - With a shop towel (A) on the leading edge of the glass (B), attach a spring scale (C) as shown.
   - Have an assistant hold the switch to close the glass while you measure the force required to stop it.
   - Read the force as soon as the glass stops moving, then immediately release the switch and spring scale.

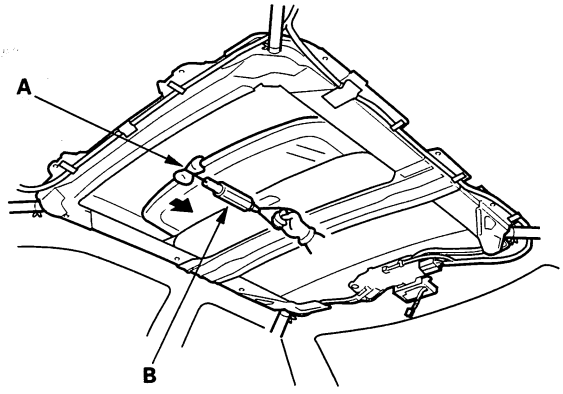
   Closing force: 200—290 N (20—30 kgf, 44—66 lbf)



3. If the force in not within specification, remove the moonroof motor, 2-door (see page 20-77), 4-door (see page 20-77), then check:

   - The gear portion and the inner cable for breakage and damage. If the gear portion is broken, replace the motor. If the inner cable is damaged, remove the frame (see page 20-78), and replace the cable, 2-door (see page 20-81), 4-door (see page 20-84).
   - The moonroof motor, 2-door (see page 22-308), 4-door (see page 22-306). If the motor fails to run or doesn't turn smoothly, replace it.
   - The opening drag. Go to step 4.

4. Opening drag check: Protect the leading edge of the glass with a shop towel (A). Measure the effort required to open the glass using a spring scale (B) as shown.



5. If the load is over 40 N (4 kgf, 9 lbf), check:

   - The side clearance and glass height adjustment (see page 20-69).
   - For broken or damaged sliding parts. If any sliding parts are damaged, replace them.

6. 2-door: Do the moonroof motor reprogram procedure (see page 22-307) after reinstalling the moonroof motor.

Trim Removal/Installation - Door Areas

Special Tools Required
KTC trim tool set SOJATP2014

2-door - Door Sill Area

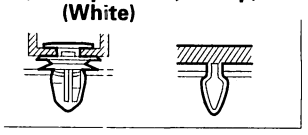
NOTE:
- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

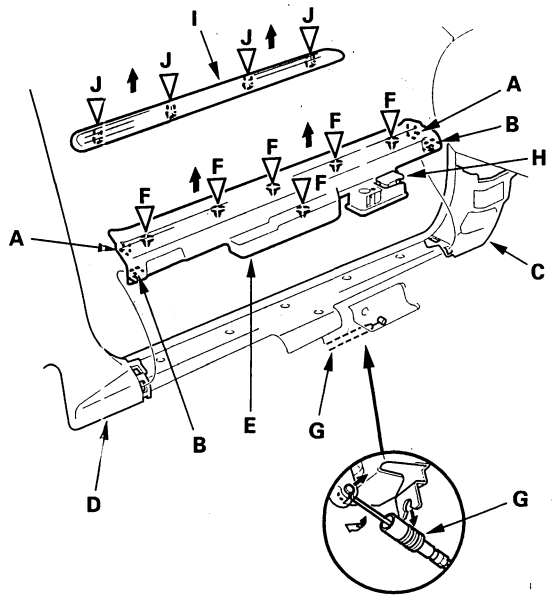
1. Left side: Remove the footrest (see step 5 on page 20-123).

2. Left side: Remove the front side cap from the door sill trim, and remove the opener lock cylinder and bolt (see page 20-223).

3. Detach the hooks (A) and tabs (B) from the kick panel (C) and side trim panel (D), and pull the door sill trim (E) up by hand to detach the clips (F), then remove it.

Fastener Locations
F ▷: Clip, 6 (White) J ▷: Clip, 4





4. Disconnect the trunk lid opener/fuel fill door opener cable (G) from the opener (H).

5. If necessary, pull the side outer trim (I) up to detach the clips (J), then remove the trim.

6. Remove the left kick panel (A) or the right kick panel (B).

–1 Pull out the door opening trim (C) as needed from the kick panel hooks (D) and the door opening flange.
–2 Left side: Pull the hood release handle, and hold it.
–3 Pull the kick panel back by hand to detach the clips (E, F, G), then remove it.

Fastener Locations
E ▷: Clip, 1 (Black) F ▷: Clip, 2 (Light Blue) G ▷: Clip, 1 (White)

Headliner Removal/Installation

Special Tools Required
KTC trim tool set SOJATP2014

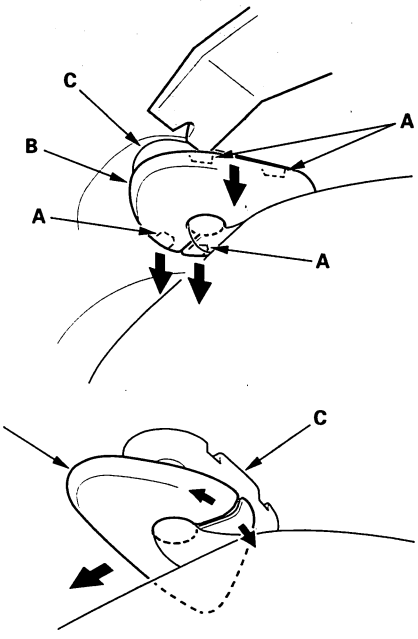
SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE:
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
- Take care not to bend or scratch the headliner.
- Be careful not to damage the dashboard and other interior trim.

1. Remove these items:

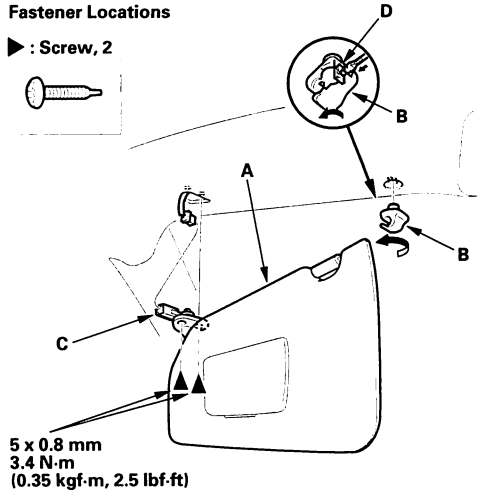
   - A-pillar trim, both sides, 2-door without side curtain airbag (see page 20-94), 2-door with side curtain airbag (see page 20-99), 4-door without side curtain airbag (see page 20-94), 4-door with side curtain airbag (see page 20-99)
   - Ceiling light (see page 22-221)
   - Front seat belt upper anchor, both sides, 2-door (see step 7 on page 23-6), 4-door (see step 7 on page 23-8)
   - B-pillar lower trim, 4-door without side curtain airbags (see page 20-96), 4-door with side curtain airbags (see page 20-102)
   - B-pillar upper trim, both sides, 2-door without side curtain airbags (see page 20-95), 2-door with side curtain airbags (see page 20-100), 4-door without side curtain airbags (see page 20-96), 4-door with side curtain airbags (see page 20-102)
   - C-pillar trim, both sides, 2-door without side curtain airbags (see page 20-97), 2-door with side curtain airbags (see page 20-104), 4-door without side curtain airbags (see page 20-98), 4-door with side curtain airbags (see page 20-105)

2. From both sides, using a trim tool, release the tabs (A), then turn the sunvisor cap (B), and remove it from the bracket (C).



3. From both sides, remove the sunvisor (A) and holder (B).

   –1 Remove the self-tapping ET screws.
   –2 Remove the sunvisor from the body and holder.
   –3 If equipped, disconnect the vanity mirror light connector (C).
   –4 Using a flat-tip screwdriver, push the hook (D), turn the holder 90 °, and then pull it out.



(cont'd)

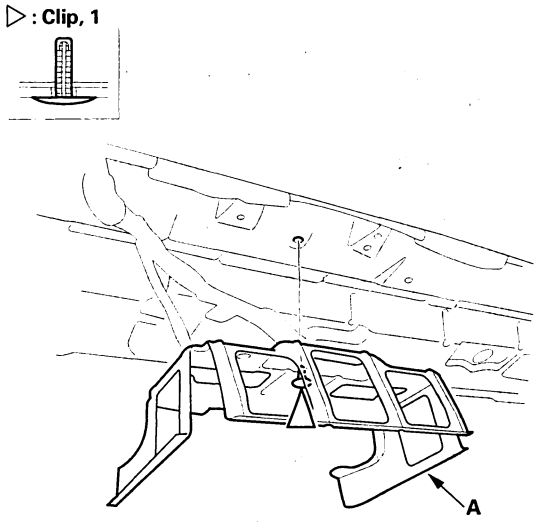
10. 4-door with moonroof: If necessary, pull down the roof console bracket (A) to release the clip.

Fastener Location

▷: Clip, 1



11. Install the headliner in the reverse order of removal, and note these items:

- If the side curtain airbag has been deployed, replace the headliner and front grab handle (4-door) on deployed side with new ones.
- To prevent the side curtain airbag from accidentally deploying, being damaged when deploying, and injuring persons when deploying, removed trim pieces should be checked for these kinds of damage:
  - Any creases or tears in the headliner (A)
  - Any fasteners (B) or clip bases (C) which have come off the headliner
  - Any damage around the grab handle holes (D) (4-door) or sunvisor holes (E) in the headliner
  - Any deformations in the grab handle (F) (4-door)
  - Any cracks in the sunvisor stay base (G)
  - Any bends or cracks in the sunvisor stay shaft (H)
  - Any cracks in the sunvisor base (I)
  - Any cracks in the vanity mirror base (J)
  - Any deformations in the grab handle bracket (4-door)
- Replace any damaged parts with new ones.
- Make sure the top of the headliner overlaps with the trim pieces correctly (see page 23-196).
- When passing the headliner through the door opening, be careful not to fold or bend it. Also, be careful not to scratch the body.
- 4-door: If the threads on a visor or grab handle screw are worn out, use an oversized self-tapping ET screw made specifically for this application:

  Visor: P/N 90137-S30-003
  Grab handle: P/N 90137-S0A-003

- Check that both sides of the headliner are securely attached to the trim.

Carpet Replacement

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE:
- Put on gloves to protect your hands.
- Take care not to damage, wrinkle or twist the carpet.
- Be careful not to damage the dashboard or other interior trim pieces.

1. With side curtain airbag: Make sure you have the anti-theft codes for the radio and the navigation system, then write down the frequencies for the preset buttons.

2. With side curtain airbag: Disconnect the negative cable from the battery, and wait at least 3 minutes before beginning work.

3. Remove these items:

   - Front seats, both sides (see page 20-144)
   - Rear seat cushion, 2-door (see page 20-173), 4-door (see page 20-174)
   - Rear seat side bolsters, both sides, 4-door (see page 20-174)
   - Front door sill trim, both sides, 2-door (see page 20-90), 4-door (see page 20-91)
   - Kick panels, both sides, 2-door (see page 20-90), 4-door (see page 20-91)
   - Rear door sill trim, both sides, 4-door (see page 20-93)
   - B-pillar lower trim, 4-door without side curtain airbags (see page 20-96), 4-door with side curtain airbags (see page 20-102)
   - Center console (see page 20-125)
   - Driver's dashboard center lower cover (see page 20-136)
   - Passenger's dashboard center lower cover (see step 4 on page 20-136)
   - '04-06 models: Driver's dashboard under cover (see page 20-130)
   - '04-06 models: Passenger's dashboard lower cover (see page 20-134)
   - Parking brake lever (see page 19-33)

4. Remove the front seat belt lower anchor bolt, both sides ('03 model) or passenger's side ('04-06 models), 2-door (see step 4 on page 23-5), 4-door (see step 4 on page 23-7).

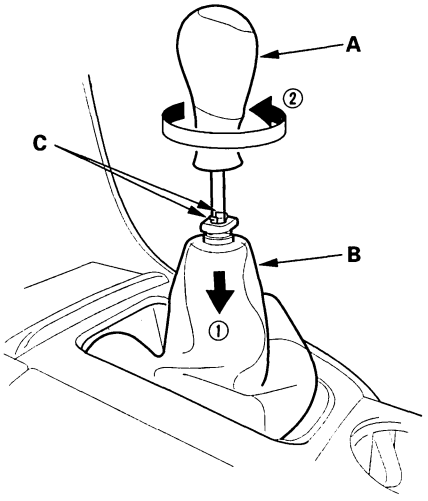
Center Console Removal/Installation

Special Tools Required
KTC trim tool set SOJATP2014

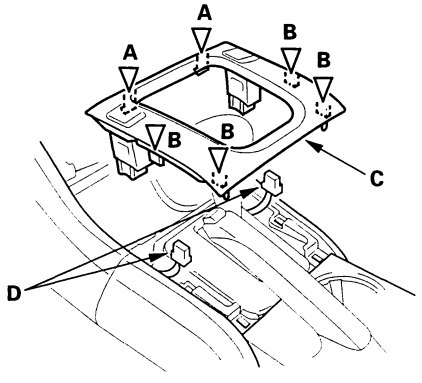
NOTE:
- Take care not to scratch the front seat, dashboard, and related parts.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

1. M/T model: Remove the shift knob (A).
   - –1 Lower the shift lever boot (B) to release the hooks (C) from the knob.
   - –2 Remove the shift knob.



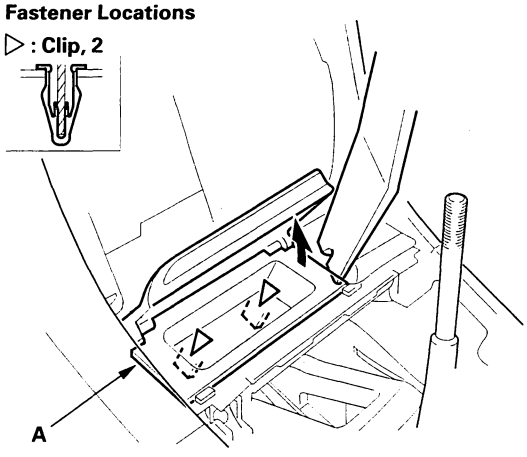
2. Detach the clips (A, B) by pulling the center console front panel (C) up. If equipped, disconnect the seat heater switch connectors (D).

Fastener Locations
A▷: Clip, 2 B▷: Clip, 4



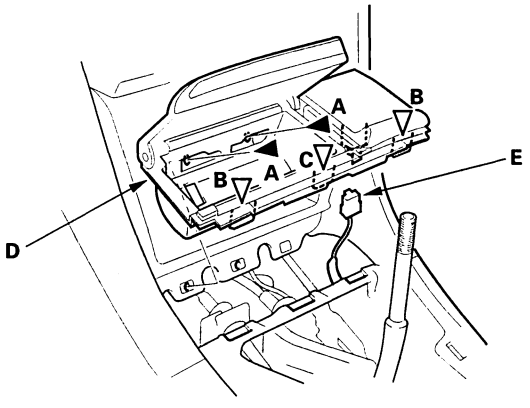
3. Pry up on the right of the console pocket (A) with a trim tool, and detach the clips, then remove the pocket.

Fastener Locations
▷: Clip, 2



4. Remove the screws (A), detach the clips (B) and hook (C) by pulling the center holder (D) up, and disconnect the front accessory power socket connector (E).

Fastener Locations
A▶: Screw, 2 B▷: Clip, 2 C▷: Hook, 1



(cont'd)

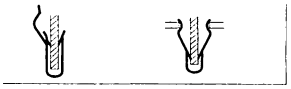
Protected by AR

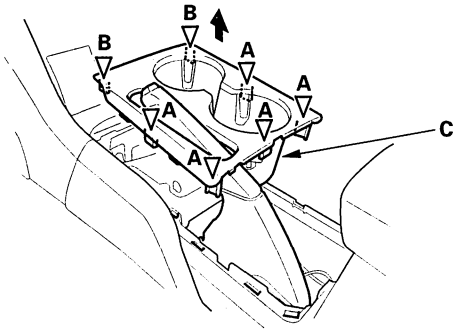
Center Console Removal/ Installation (cont'd)

5. Detach the clips (A, B) by pulling the center console rear panel (C) up.

Fastener Locations

A ▷: Clip, 5 B ▷: Clip, 2



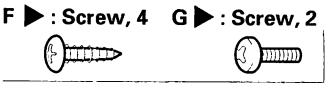


6. Remove the center console (A).

–1 Open the console box lid (B) then remove the console mat (C).
–2 If equipped, disconnect the rear accessory power socket connector (D), and detach the clip (E).
–3 Remove the screws (F, G), then pull the rear portion of the console up to release the hooks (H), then remove it.

Fastener Locations

F ▶: Screw, 4 G ▶: Screw, 2



7. Install the console in the reverse order of removal, and check the clips for damage or stress-whitening, and replace them with new ones.

Center Console Armrest Disassembly/Reassembly

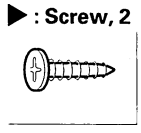
NOTE:
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
- Take care not to scratch armrest.

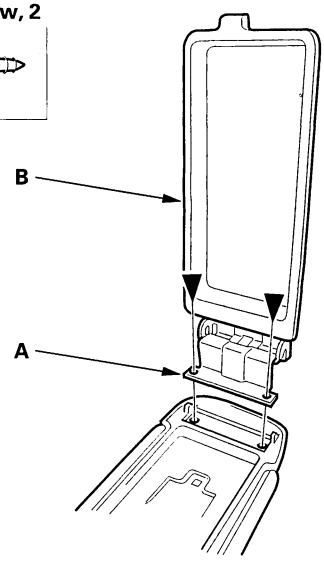
1. Remove the center console armrest (see step 2 on page 20-128).

2. Remove the screws, then remove the armrest hinge (A) and the console tray (B) as an assembly.

Fastener Locations

▶: Screw, 2





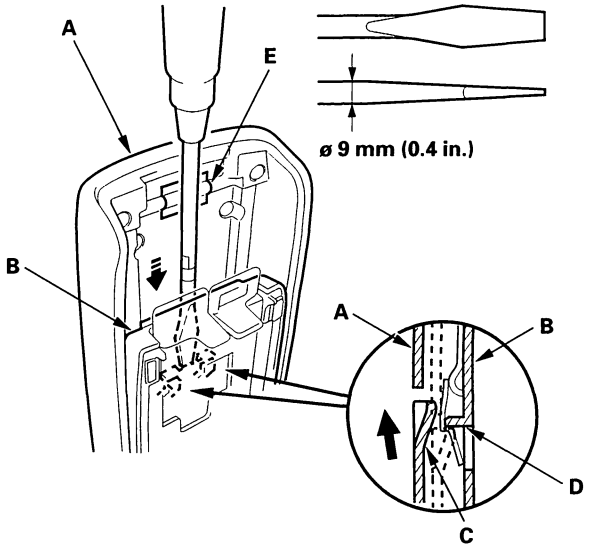
3. Slide the console armrest forward fully.

BACK

Protected by AR

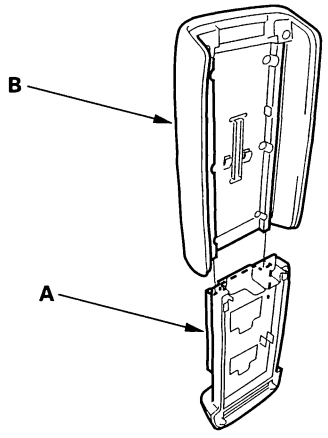
4. Insert a large flat-tip screwdriver wrapped with protective tape into the center of the gap between the console armrest (A) and the console armrest base (B), and gently push it straight down until both inside hooks (C) of the console armrest come off the stop portions (D) of the console base.

   NOTE: Apply protective tape (E) to the projection in the back surface of the console armrest to prevent damage.



5. Slightly slide the console armrest forward to get the inside hooks over the stop portions, then remove the flat-tip screwdriver from the gap.

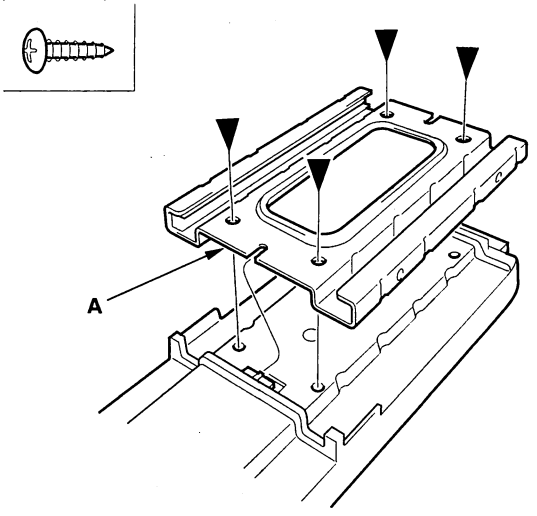
6. Remove the console armrest (A) from the guide rails of the console armrest base (B).



7. Remove the screws, then remove the slide bracket (A).

Fastener Locations

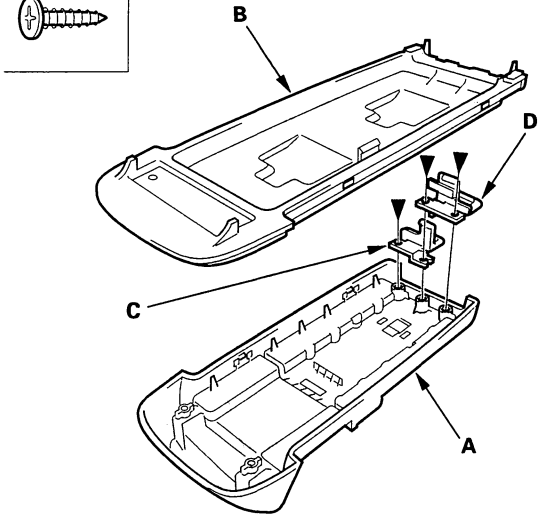
▶ : Screw, 4



8. Separate the console armrest upper base (A) from the lower base (B). Remove the screws, then remove the armrest lock (C) and the tray lock (D) from the upper base.

Fastener Locations

▶ : Screw, 3



9. Reassemble the console armrest in the reverse order of disassembly.

BACK

Center Pocket Removal/Installation

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE:
- Put on gloves to protect your hands.
- Take care not to scratch the dashboard and related parts.

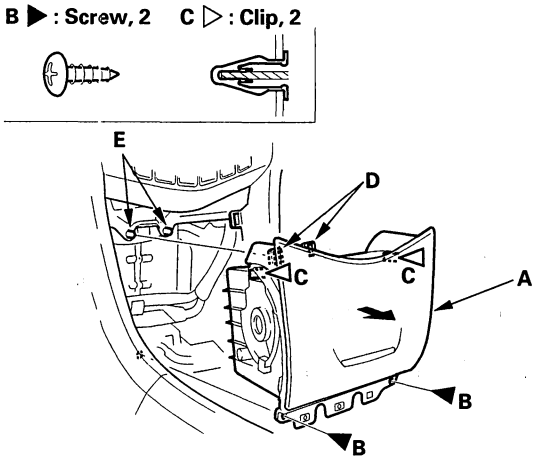
1. Remove the center holder (see page 20-125).

2. Remove the center pocket (A).

   –1 Remove the screws (B).
   –2 Open the lid, then pull the pocket back by hand to detach the clips (C).
   –3 Close the lid, then remove the pocket.

Fastener Locations

B ▶ : Screw, 2 C ▷ : Clip, 2



3. Install the pocket in the reverse order of removal, and note these items:

   - Make sure the holders (D) are installed onto the pins (E) properly.
   - Push the clipped portions into place securely.
   - Make sure the center pocket lid opens smoothly.

Glove Box Removal/Installation

Special Tools Required
KTC trim tool set SOJATP2014

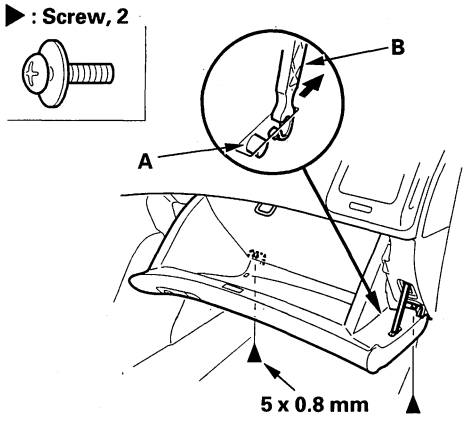
SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE:
- Take care not to scratch the dashboard and related parts.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

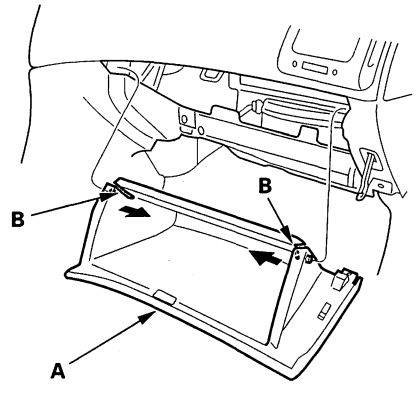
1. Detach the hook (A) of the glove box damper (B), and remove the screws.

Fastener Locations

▶ : Screw, 2



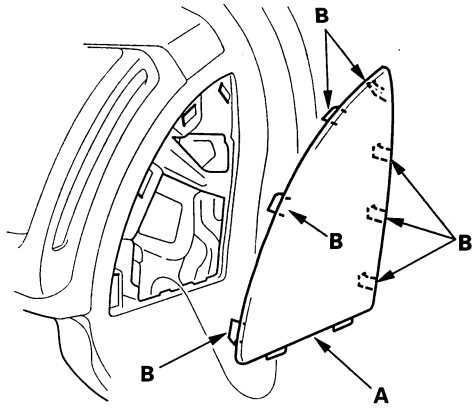
2. While holding the glove box (A), release the glove box stop (B) on each side from the dashboard by pushing them in, then remove the glove box.



BACK

Protected by AR

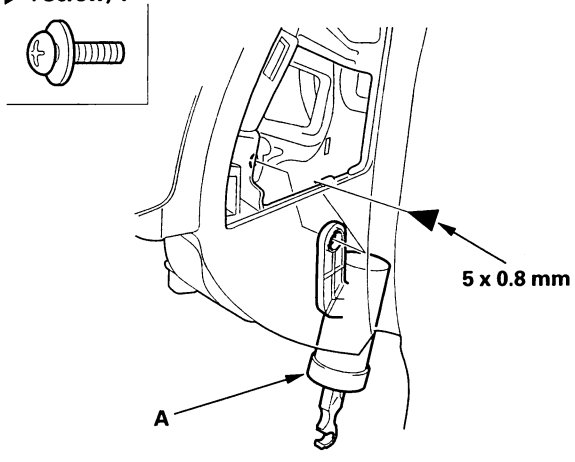
3. Open the passenger's door, and gently pull out on the front of the dashboard side cover (A) to release the hooks (B), and remove the cover.



4. Remove the screw, then remove the glove box damper (A).

Fastener Location

▶ : Screw, 1



5. Install the glove box in the reverse order of removal.

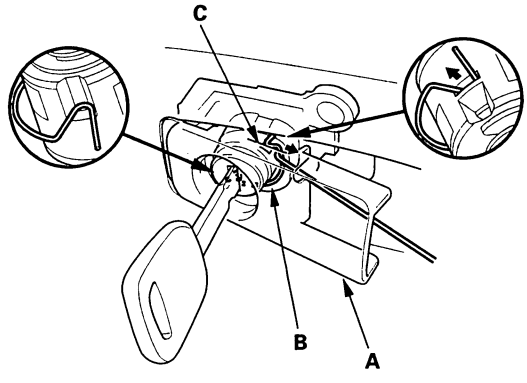
Glove Box Lock Cylinder Replacement

NOTE: Take care not to scratch the glove box.

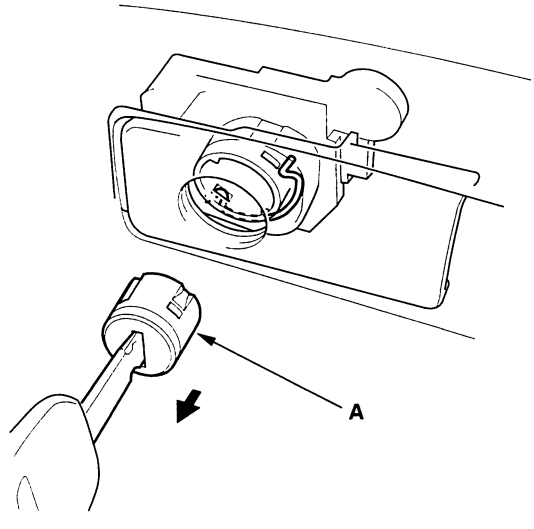
1. Remove the glove box (see page 20-132).

2. Pull out the glove box knob (A) and use a hooked-shaped tool to pull the top end of the retainer (B) out of its slot (C).

   NOTE: Do not remove the retainer entirely. Leave the other side of it in the original position when removing and installing the lock cylinder.



3. Remove the glove box lock cylinder (A).

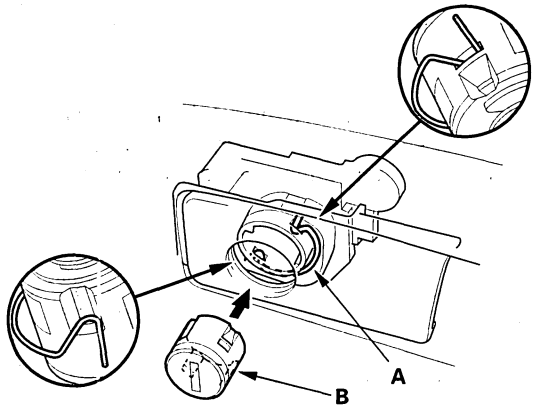


(cont'd)

Protected by AR

Glove Box Lock Cylinder Replacement (cont'd)

4. Reinstall the top of the retainer (A) in its original position, then reinstall the lock cylinder (B). Push the cylinder into place securely until the retainer snaps into place.



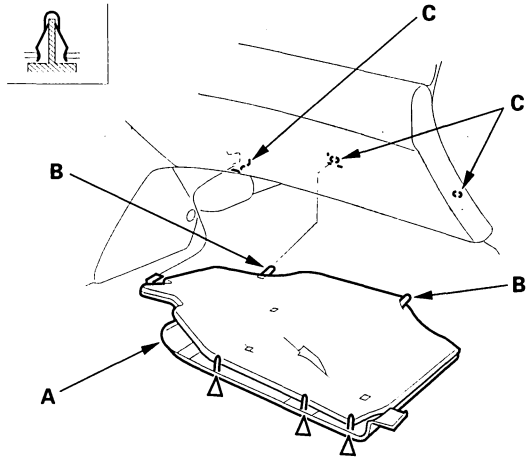
Passenger's Dashboard Lower Cover Removal/Installation

NOTE: Take care not to scratch the dashboard and related parts.

1. Remove the passenger's dashboard lower cover (A).
   - –1 Gently pull down the edge nearest the glove box to detach the clips.
   - –2 Pull the cover away to release the pins (B) from the holders (C).

Fastener Locations

▷: **Clip, 3**



2. Install the cover in the reverse order of removal.

Dashboard Side Vent Removal/Installation

Special Tools Required
KTC trim tool set SOJATP2014

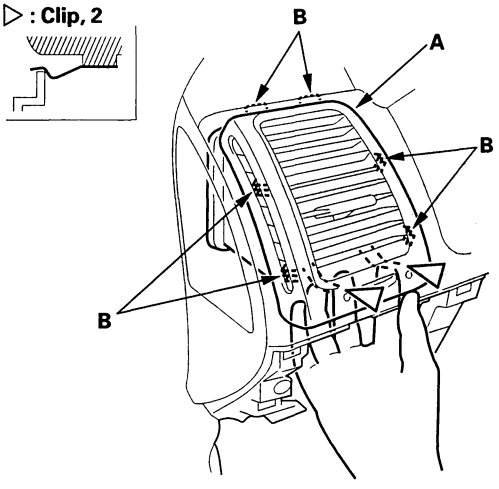
Driver's

NOTE:
- Take care not to scratch the dashboard and related parts.
- Put on gloves to protect your hands.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

1. Remove the driver's dashboard lower cover (see page 20-130).

2. Push up the lower clips by hand, then push out the driver's side vent (A) by releasing the upper and side tabs (B).

Fastener Locations



3. Reinstall the tab portions of the vent first, then push the clip portions into place securely.

Passenger's

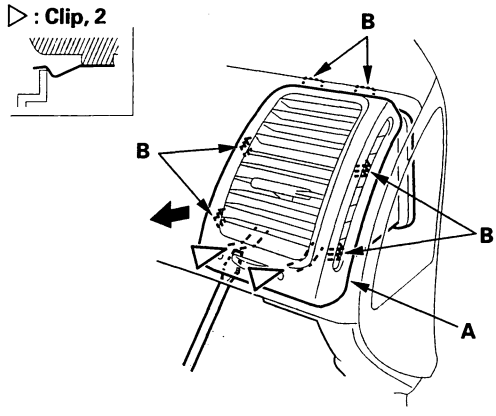
NOTE:
- Take care not to scratch the dashboard and related parts.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

1. Detach the hook of the glove box damper, then lower the glove box (see page 20-132).

2. Carefully insert a flat-tip screwdriver under the clip, and push it up.

3. Pull out along the edge of the passenger's side vent (A) by hand to release the lower clips and the upper and side tabs (B). Then remove the vent.

Fastener Locations



4. Reinstall the tab portions of the vent first, then push the clip portions into place securely.

Dashboard/Steering Hanger Beam Removal/Installation

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE:
- When prying with a flat-tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts to prevent damage.
- Have an assistant help you when removing and installing the dashboard/steering hanger beam.
- Take care not to scratch the dashboard, body and other related parts.
- Put on gloves to protect your hands.

1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the frequencies for the preset buttons.

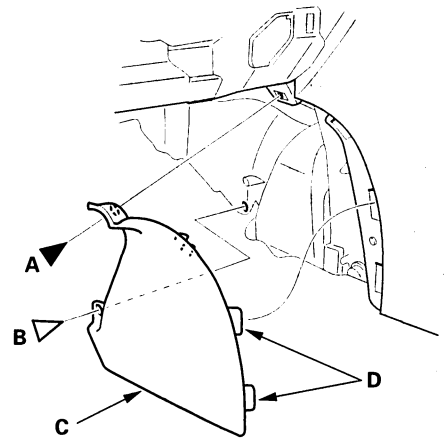
2. Disconnect the negative cable from the battery, and wait at least 3 minutes before beginning work.

3. Remove these items:
   - Center console (see page 20-125)
   - Driver's dashboard lower cover (see page 20-130)
   - Passenger's dashboard lower cover (see page 20-134)
   - Center pocket (see page 20-132)
   - Glove box (see page 20-132)
   - Driver's dashboard under cover (see page 20-130)
   - Kick panels, both sides, 2-door (see page 20-90), 4-door (see page 20-91)
   - A-pillar trim, both sides, 2-door without side curtain airbags (see page 20-94), 2-door with side curtain airbags (see page 20-99), 4-door without side curtain airbags (see page 20-94), 4-door with side curtain airbags (see page 20-99)
   - Steering column (see page 17-25)

4. Remove the screw (A) and release the clip (B), then remove the driver's center lower cover (C) by releasing the hooks (D).

Fastener Locations

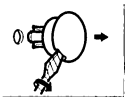
A▶: Screw, 1 B▷: Clip, 1

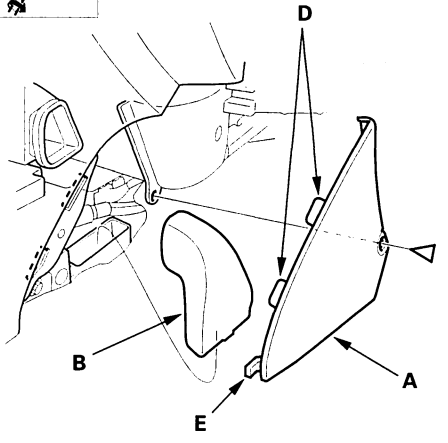


5. Release the clip, then remove the passenger's center lower cover (A) and the rear vent duct (B) by releasing the hooks (D) and the hook (E) ('04-06 models).

Fastener Location

▷: Clip, 1





6. Remove the SRS control unit (see page 23-213).

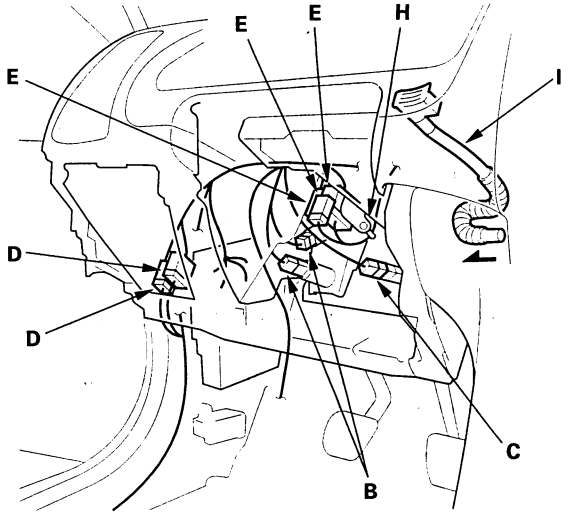
BACK

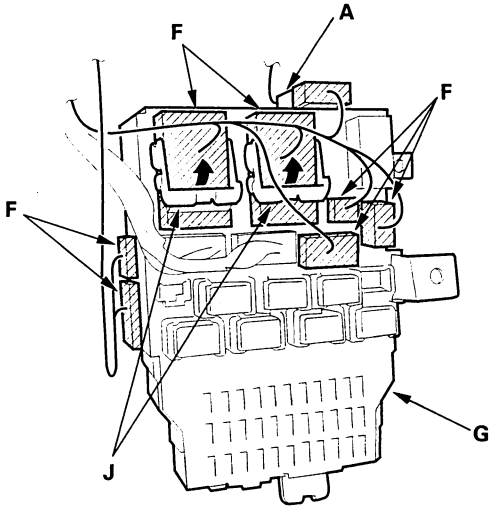
Protected by AR

Driver's side

7. From under the dash, disconnect the interior wire harness connector (A) (with moonroof), clutch switch connectors (B) (on M/T model), and brake switch connector (C), floor wire harness connectors (D), engine compartment wire harness connectors (E), and disconnect the dashboard wire harness connectors (F) from the under-dash fuse/relay box (G), then release the wire harness clip (H). On auto A/C model, disconnect the air hose (I).

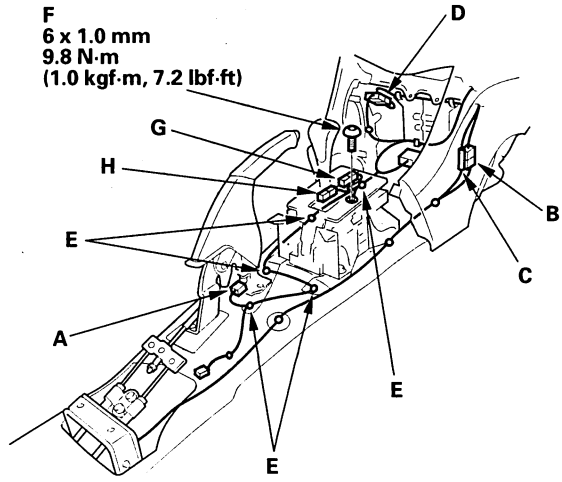
   NOTE: Lift the white wire harness connector locks (J) before trying to remove the connectors from the fuse box.





Middle portion (shift lever portion)

8. Disconnect the parking brake switch connector (A), radio antenna connector (B), antenna lead (C), and A/C subharness connector (D), then release the wire harness clips (E).
   Using a T30 Torx bit, remove the ground bolt (F).
   On A/T model, disconnect the parking pin switch connector (G) and shift lock solenoid connector (H).



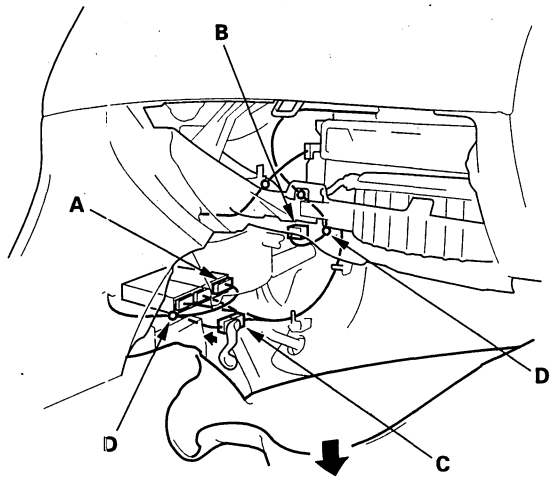
(cont'd)

Protected by AR

Dashboard/Steering Hanger Beam Removal/Installation (cont'd)

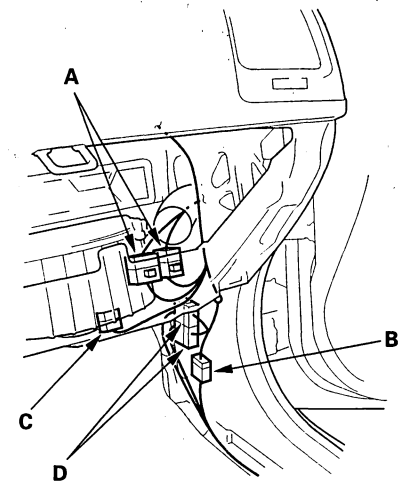
Middle portion (passenger's side)

9. From under the dash, disconnect the ECM/PCM connector (A), power transistor connector (B), and engine wire harness connector (C), then release the wire harness clips (D).



Passenger's side

10. From under the dash, disconnect the passenger's door wire harness connectors (A), floor wire harness connector (B), and blower motor connector (C). On vehicles with navigation system, disconnect connectors (D).

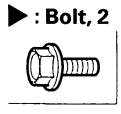


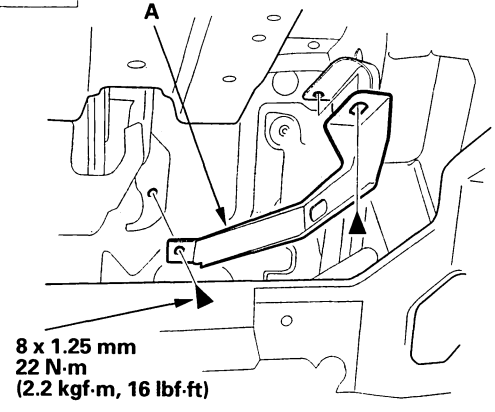
11. Detach all of the harness and connector clips.

12. Remove bolts, then remove the brake pedal support member (A).

Fastener Locations

▶ : Bolt, 2





13. Cover the parking brake handle to protect it.

BACK

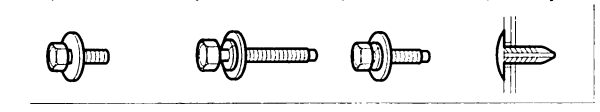
Protected by AR

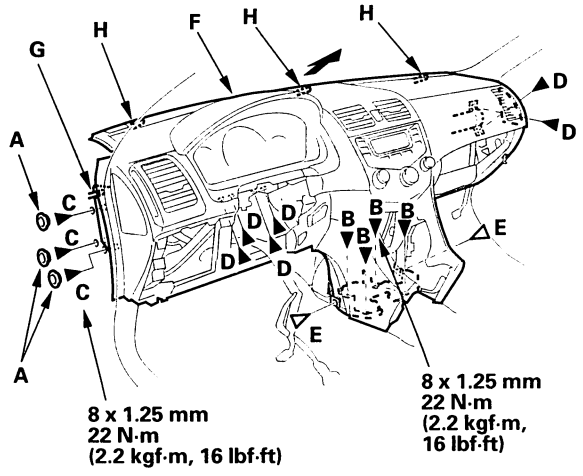
14. Open the driver's door, and remove the caps (A), then remove the bolts (B, C, D), and clips (E) and lift up on the dashboard (F)/steering hanger beam to release it from the guide pins (G, H).

    NOTE: Before removing the dashboard/steering hanger beam, make sure all the harnesses have been disconnected.

Fastener Locations

B ▶ : Bolt, 4 C ▶ : Bolt, 3 D ▶ : Bolt, 6 E ▷ : Clip, 2





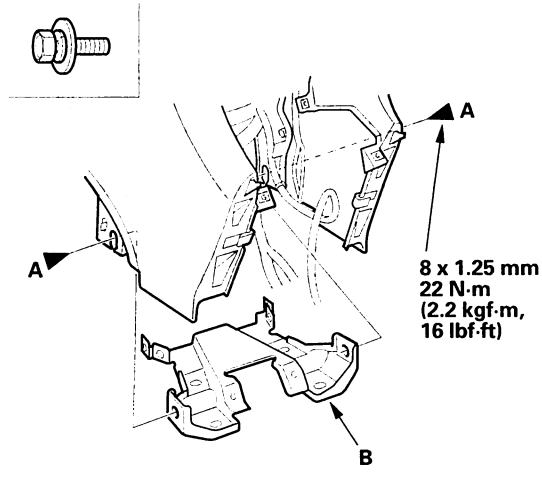
15. Carefully remove the dashboard/steering hanger beam through the front door opening.

    NOTE: Lay the dashboard/steering hanger beam on its front or back. Do not stand it on the lower console opening or you may damage it.

16. Remove the bolts (A), then remove the center bracket (B).

Fastener Locations

A ▶ : Bolt, 2



17. Install the dashboard/steering hanger beam in the reverse order of removal, and note these items:

- Apply medium strength liquid thread lock to the bolts securing the center bracket and the dashboard center frame before reinstallation.
- Reinstall the center bracket on the center frame, and slightly tighten the mounting bolts. Reinstall the dashboard/steering hanger beam on the body. After tightening both dashboard/steering hanger beam mounting bolts, tighten the center bracket mounting bolts and center frame mounting bolts.
- Make sure the dashboard/steering hanger beam fits onto the guide pins correctly.
- Before tightening the bolts, make sure none of the wire harnesses are pinched.
- Make sure the connectors are plugged in properly, and the antenna lead and air hose are connected properly.
- Reconnect the negative cable to the battery.
- Enter the anti-theft codes for the radio and the navigation system, then enter the customer's radio station presets.
- Reset the clock.

Protected by AR

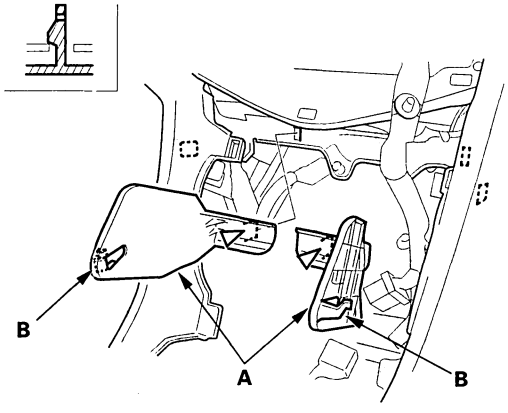
Dashboard Replacement

NOTE: Put on gloves to protect your hands.

1. Remove the dashboard (see page 20-136).
2. Remove these items from the dashboard:
   - Upper panel (see page 20-131)
   - Instrument panel (see page 20-129)
   - Gauge control module (see page 22-276)
   - Audio-HVAC-Display module (see page 22-371)
   - Passenger's airbag (see page 23-198)
   - Glove box damper (see step 4 on page 20-133)
3. Detach the hooks by pulling both blind covers (A) back, release the hooks (B), then remove the covers.

Fastener Locations

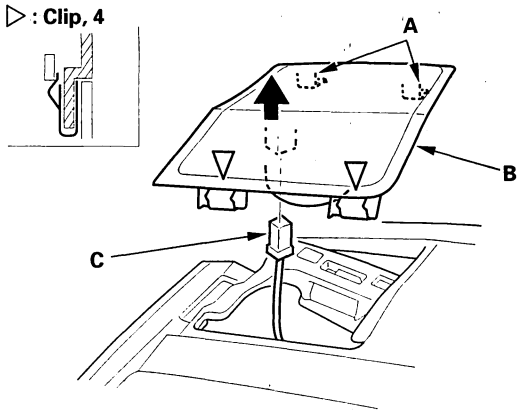
▷ : **Hook, 2**



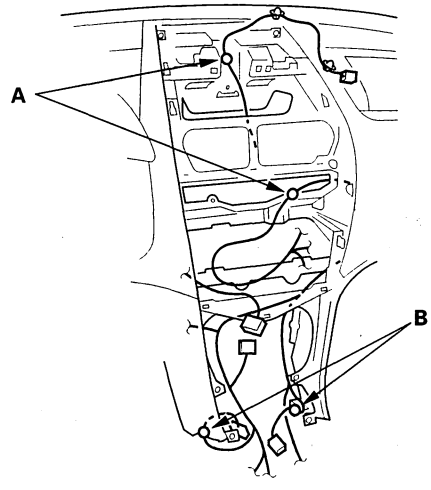
4. On both sides, detach the clips and release the hooks (A), then remove the tweeters (B) or tweeter grille. Disconnect the tweeter connectors (C).

Fastener Locations

▷ : **Clip, 4**



5. From the front of the dashboard, detach the harness clips (A, B).

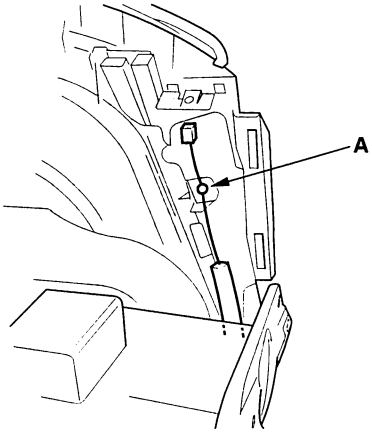


BACK

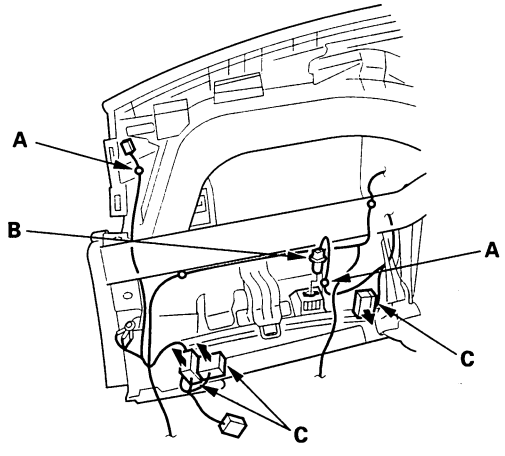
Protected by AR

6. From the back of the dashboard, Detach the harness clips (A) from both sides.

Driver's side



Passenger's side



7. On passenger's side disconnect the glove box light bulb socket (B), and detach the connectors (C).

8. Remove the screws (A, B) securing the dashboard (C) and steering hanger beam (D), and detach the clips (E), then separate the dashboard and steering hanger beam.

Fastener Locations

Front Seat Removal/Installation

Special Tools Required
KTC trim tool set SOJATP2014

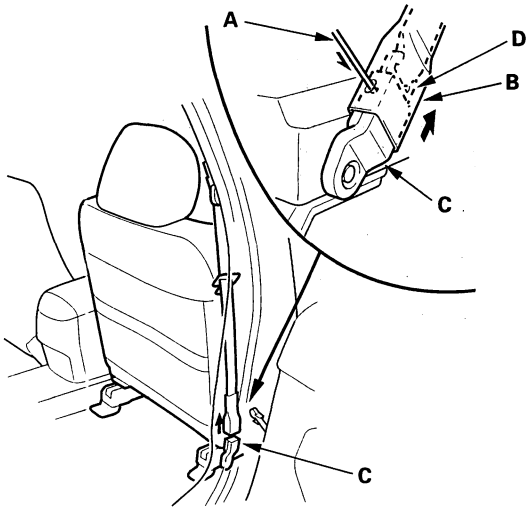
SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE
- Put on gloves to protect your hands.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
- Take care not to scratch the body or tear the seat covers.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.

1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the frequencies for the preset buttons.

2. Tilt the steering wheel all the way up and telescope it all the way in.

3. '04-06 models passenger's seat: Carefully insert the tip of a small screwdriver (A) through the hole in the back of the front seat belt lower anchor cover (B) and into the hole in the front seat belt lower anchor (C). Unlock the lower anchor by pushing in on the screwdriver. Remove the screwdriver, and then detach the front seat belt anchor plate (D) and anchor cover from the lower anchor.



4. Slide the seat all the way forward, then remove the seat track end covers (A) from the back of both seat tracks.

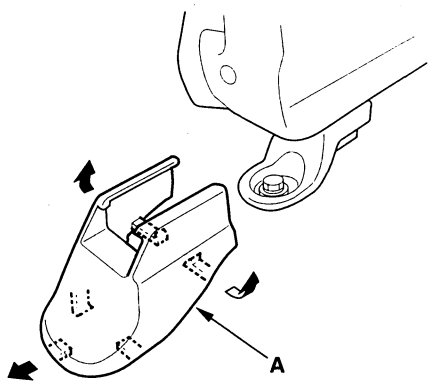
BACK

Protected by AR

8-way power

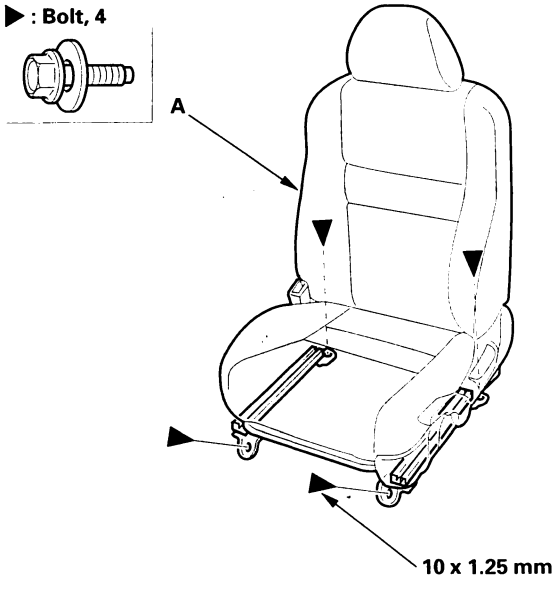


5. Slide the seat about half way to the rear so you can access the seat mounting bolts. If equipped with the 8-way power seat, fully raise the seat.

6. If equipped with a side airbag, disconnect the negative cable from the battery, and wait at least 3 minutes before removing the seat.

7. Remove the bolts securing the front seat (A).

Fastener Locations



8. Lift up the front seat, then detach the harness clip (A), and disconnect the connector.

   - Seat belt switch connector (B) except on the 8-way power seat.
   - Power seat harness connector (C) on the driver's and passenger's power seats.
   - If equipped, the seat heater connector (D) on the 2-way power seat and passenger's manual seat.
   - Side airbag connector (E) on the driver's and passenger's seat.
   - OPDS/ODS unit connector (F) on the passenger's seat.
   - '04-06 models, disconnect the seat position sensor subharness connector (G) on the driver's manual height adjustable seat and the 8-way power seat.
   - Weight sensor unit connector (H) ('04-05 models), weight sensor connector (I) ('06 model) on the passenger's seat.

9. With the help of an assistant, carefully remove the front seat through the front door opening.

10. Install the seat in the reverse order of removal, and note these items:

- Apply medium strength liquid thread lock to the front seat mounting bolts before reinstallation.
- Make sure each connector is plugged in properly.
- Tighten the seat mounting bolts to the specified torque in the sequence shown. Slide the seat all the way back and tighten ① and ②, then slide it forward and tighten ③ and ④.
- Before attaching the lower anchor bolts, make sure there are no twists or kinks in the seat belts.
- '04-06 models passenger's seat: The triangle marks (A) on the anchor plate (B) and the lower anchor (C) must face the same side. Insert the anchor plate into the lower anchor, and make sure that it is locked securely.
- If equipped with a side airbag, reconnect the negative cable to the battery.
- Enter the anti-theft codes for the radio and navigation system, then enter the customer's radio station presets.
- Reset the clock.

Front Seat Lumbar Support Replacement

Special Tools Required
KTC trim tool set SOJATP2014

For Some Models (Driver's seat)

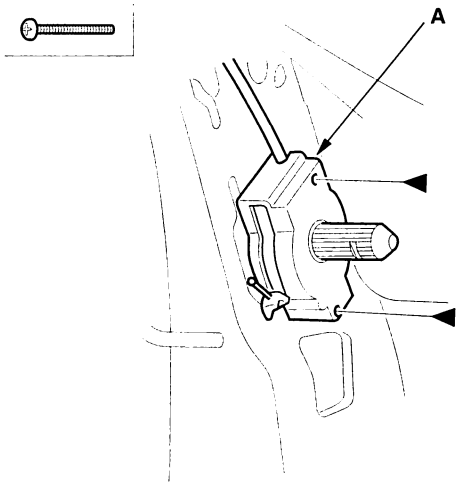
SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE:
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.
- Take care not to bend the cable.
- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.

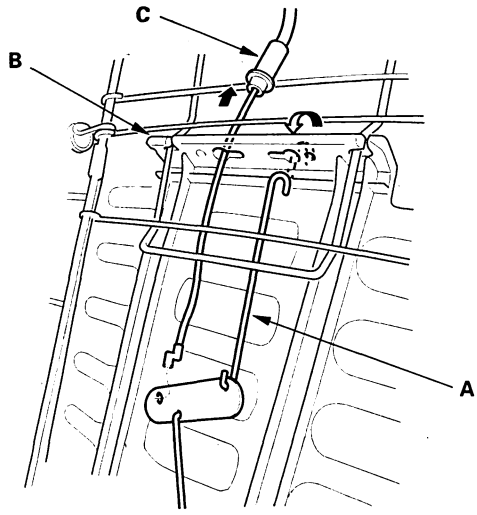
1. Remove these items:
   - Lumbar support knob (see step 6 on page 20-167)
   - Back panel (see step 8 on page 20-168)
2. Release the hook strips on the inside of the seat-back (see step 9 on page 20-168).
3. Remove the screws securing the lumbar support actuator (A).

Fastener Locations

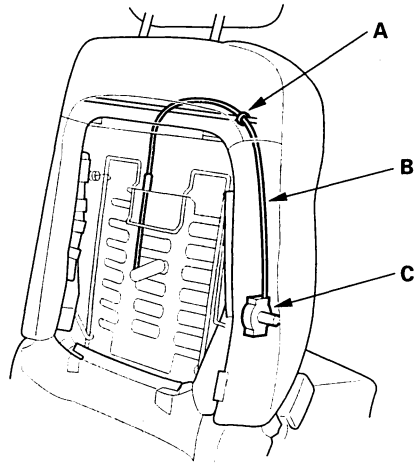
▶ : Screw, 2



4. Release the hook of the yoke wire (A) from top of the basket (B) to loosen the lumbar support cable (C), then disconnect it.



5. Release the wire tie (A), then remove the lumbar support cable (B) and actuator (C) as an assembly.

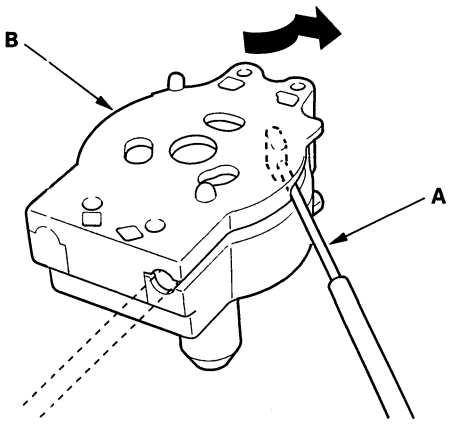


(cont'd)

Protected by AR

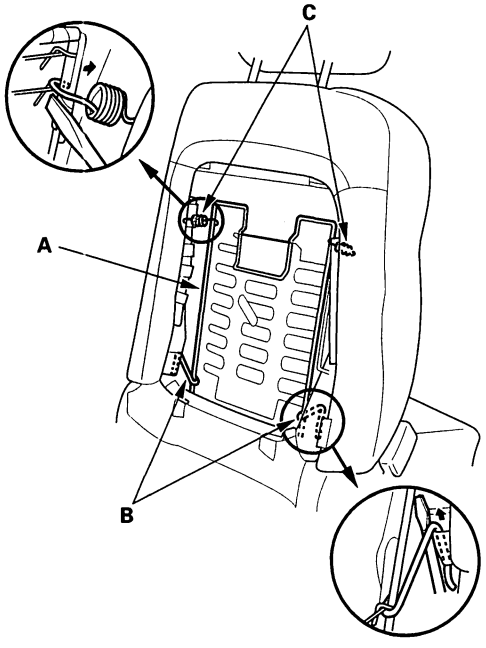
Front Seat Lumbar Support Replacement (cont'd)

6. Disconnect the lumbar support cable (A) from the lumbar support actuator (B).



7. Remove the lumbar support (A).

   –1 Release both lower springs (B) from inside the seat-back.
   –2 Release the lumbar support from both upper springs (C).



8. Install the lumbar support in the reverse order of removal, and note these items:

   - Make sure the cable is connected securely.
   - To prevent wrinkles when installing a seat-back cover, make sure the material is stretched evenly over the pad before securing the hook strips.
   - Replace the back panel clips with new ones.

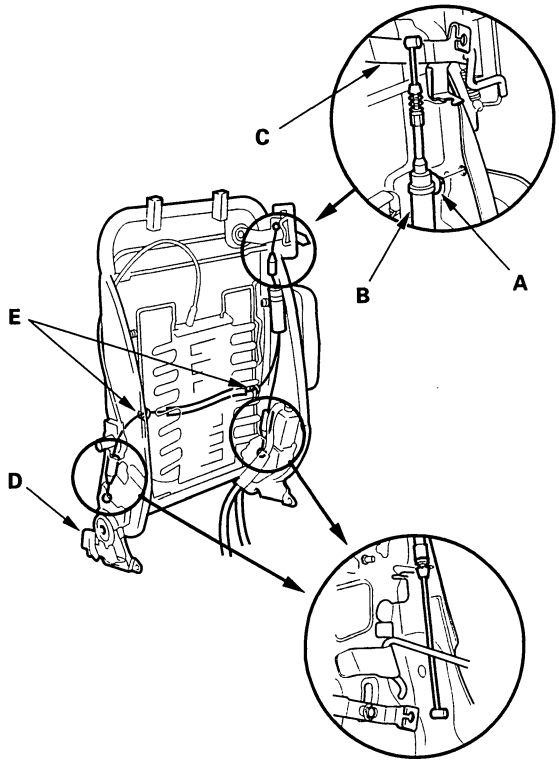
Rear Seat Access Cable Replacement

2-door Driver's Seat

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE:
- Take care not to tear the seams or damage the seat covers.
- Take care not to bend the cable.
- Put on glove protect your hands.

1. Remove the front driver's seat (see page 20-144).
2. Remove the seat-back (see page 20-155).
3. Remove the seat-back cover/pad as an assembly from the seat-back frame (see page 20-166).
4. Detach the cable clip (A), and disconnect the rear seat access cable (B) from the rear seat access lever (C) and both recline adjusters (D). Release the wire ties (E), then remove the cable.



5. Install the cable in the reverse order of removal, and note these items:
   - Replace any wire ties you removed with new ones.
   - To prevent wrinkles when installing a seat-back cover, make sure the material is stretched evenly over the pad before securing the hooks.

Protected by AR

Front Seat Cover Replacement

- SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.
- '04-06 models: The operation of the driver's seat position sensor must be checked after any of these actions (see page 23-37):
  - Driver's seat position sensor replacement
  - Cover plate (front side of driver's seat slide rail) replacement
- '04-05 models: The front passenger's weight sensor (SWS) unit must be calibrated after any of the these actions (see page 23-33):
  - Front passenger's seat replacement (including any seat components)
  - Replacement of the seat weight sensors
  - Replacement of the seat weight sensor unit
- '06 model: The front passenger's weight sensor must be calibrated after any for this action (see page 23-33):
  - Replacement of the seat weight sensors

NOTE:
- With side airbag: Seats with a side airbag have a "SIDE AIRBAG" label on the seat-back. Because the component parts (seat-back cover, cushion, etc.) of seats with and without airbags are different, make sure you install only the correct replacement parts.
- With side airbag: Do not repair any tears or frayed spots of the seat-back cover. If necessary, replace the seat-back cover.
- Take care not to tear the seams or damage the seat covers.
- On the passenger's seat with side airbag, do not touch the OPDS sensor in the seat-back pad, and keep it away from oil. Oil can corrode the sensor causing it to fail.
- Put on gloves to protect your hands.

Seat-back Cover

1. Remove the front seat (see page 20-144).
2. Remove the headrest.
3. With recline motor and/or side airbag: From under the seat cushion, disconnect the recline motor connector (A), and if equipped, the seat-back heater connector (B) on the driver's 8-way power seat. Detach the side airbag connector clip (C), the OPDS/ODS unit connector clip (D) on the passenger's seat, and harness clips (E). Release the hook springs (F) (on some driver's seat) and seat cushion cover (G) from the seat cushion frame spring (H), release the hook strips (I) on 2-door passenger's seat, then pull the cover back, and remove the wire ties (J).
   The manual height adjustable seat is similar to the 2-way power seat.

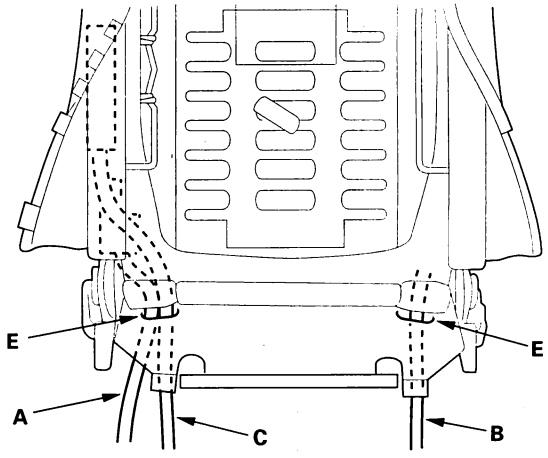
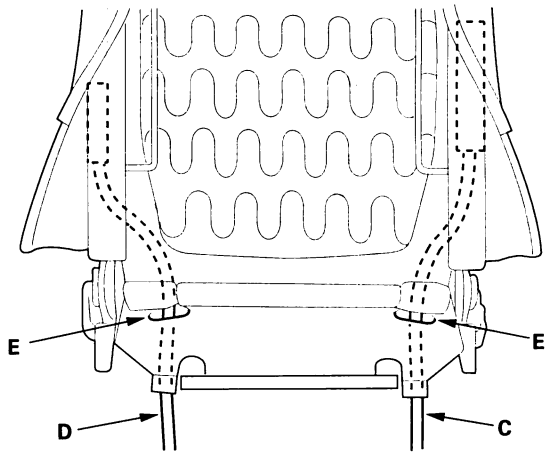
10. With recline motor and/or side airbag: Pull the recline motor harness (A), seat-back heater harness (B) (some driver's seat), side airbag harness (C) and the OPDS/ODS harness (D) (passenger's seat) out through the holes (E) in the seat-back cover.

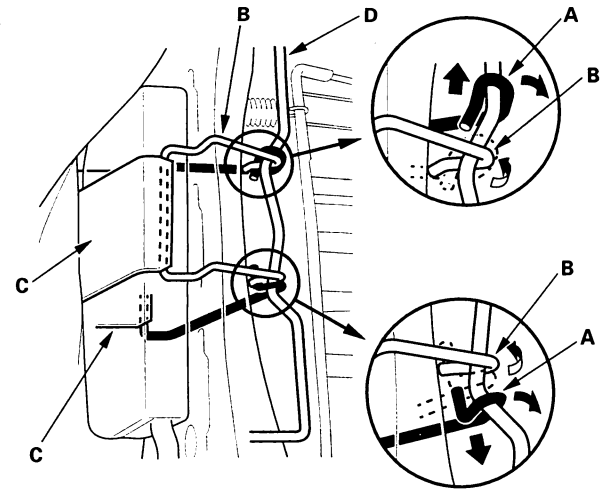
Driver's seat-back



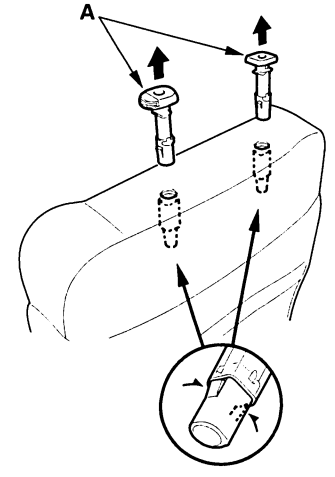
Passenger's seat-back



11. With side airbag: Release the front hook (A) and rear hook (B) of the reinforcing cloth (C) from seat-back frame (D).



12. Pull out the headrest guides (A) while pinching the tabs on the ends of the guides, and remove them.

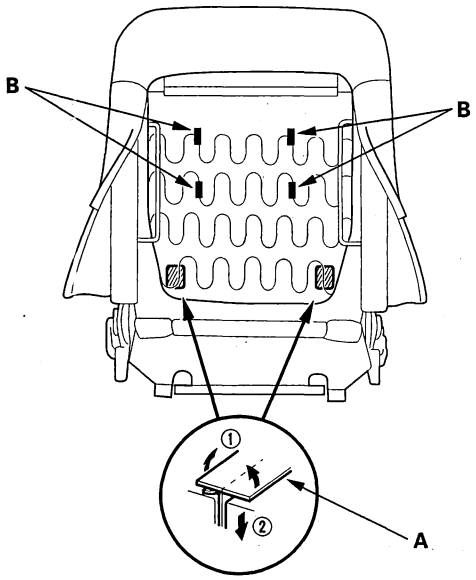


(cont'd)

Protected by AR

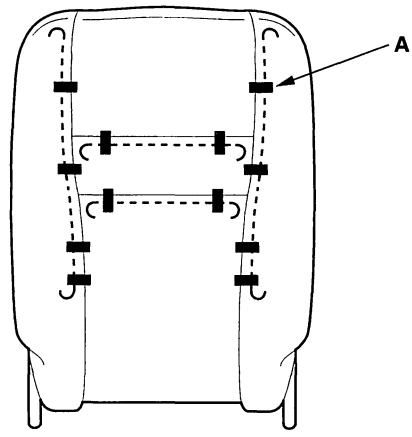
Front Seat Cover Replacement (cont'd)

13. From the back of the seat-back, pass both lower retainers (A) through the slots in the seat-back pad, and on passenger's seat with side airbag release all of the clips (B).

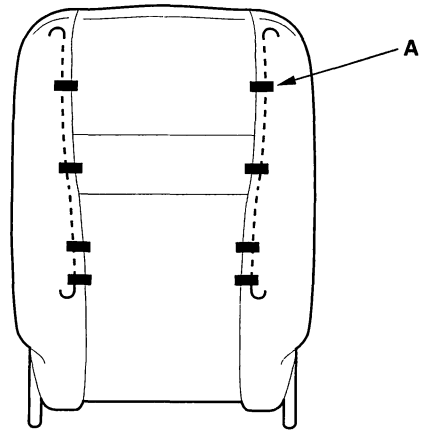


14. Pull back the edge of the seat-back cover all the way around, and release the clips (A), then remove the seat-back cover.

Driver's and passenger's without side airbag



Passenger's with side airbag

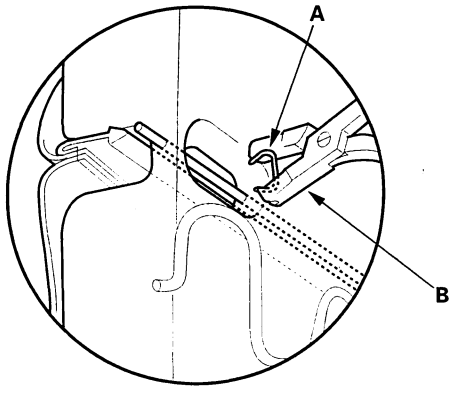


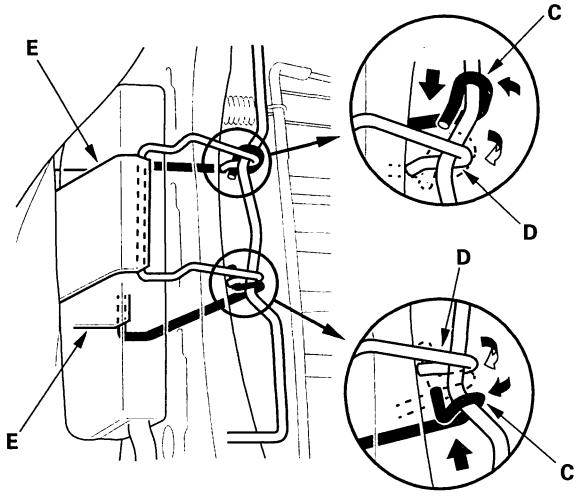
BACK

Protected by AR

15. Install the cover in the reverse order of removal, and note these items:

    - Reinitialize the OPDS/ODS control unit (see page 23-32).
    - To prevent wrinkles when installing a seat-back cover, make sure the material is stretched evenly over the pad before securing the clips, hooks, and hook strips.
    - Replace any clips you removed with new ones (A). Install them with commercially available upholstery ring pliers (B).
    - Reinstall the front hook (C) and rear hook (D) of the reinforcing cloth (E) securely.
    - Use only original Honda replacement seat-back covers.
    - If equipped, make sure the recline motor harness, side airbag harness, and OPDS/ODS harness (passenger's seat) are routed properly.





Seat Cushion Cover

1. Remove the front seat (see page 20-144).

2. With recline motor and/or side airbag: From under the seat cushion, detach the recline motor connector clip, the side airbag connector clip, and on the passenger's seat, the OPDS/ODS unit connector clip. Release the hook springs (on some driver's seats) and the seat cushion cover from the seat cushion frame spring, then pull the cover back, and remove the wire ties.

3. Remove these items from the front seat, then remove the seat-back, '03 model 2-door manual seat (see page 20-149), '04-06 models 2-door manual seat (see page 20-150), '03 model 4-door manual seat (see page 20-151), '04-06 models 4-door manual seat (see page 20-152), manual height adjustable seat (see page 20-153), 2-way power seat (see page 20-154), 8-way power seat (see page 20-155):

    - Recline cover
    - Center cover

4. Release the hook strips (A) and retainers (B) (manual height adjustable seat) from both sides the seat cushion.

    NOTE : Manual height adjustable seat is shown; other seats are similar, except for the height ratchet unit portion.

Roof Molding Replacement

Special Tools Required
KTC trim tool set SOJATP2014

NOTE:
- Put on gloves to protect your hands.
- Take care not to damage the windshield.
- Do not use any of metallic tools to remove the roof molding, or you may chip the edge of the windshield and cracks in the windshield will occur.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.
- Take care not to bend the roof molding.

Molding Replacement

1. Remove the cowl cover (see page 20-199).
2. Remove the windshield portion of the roof molding (A).
   - –1 Carefully insert a plastic trim tool (B) under the molding next to the clip (C).
   - –2 While pulling the clip portion of the molding up by hand, push each of the eight small hooks (D) in the numbered sequence shown to release the clip from the retainer (E).
     Do not try to pry up the clip even if it is hard to release from the retainer.
   - –3 Gradually work your way up to release each of the upper clips (F, G, H).
   - –4 Slide the molding off the lower clip (I).
   - –5 Rotate the lower clip to remove it.

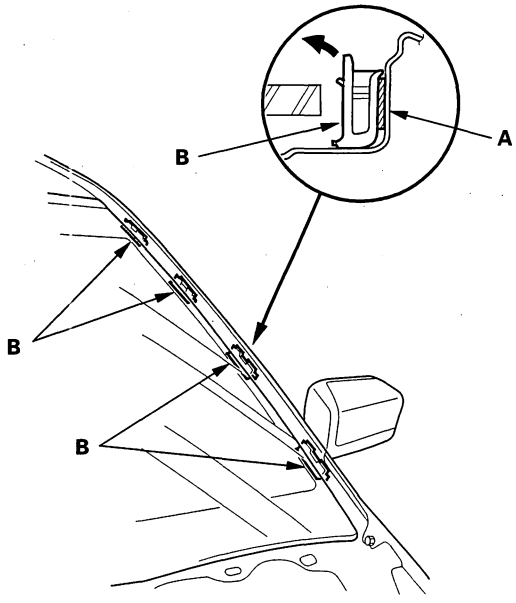
Roof Molding Replacement (cont'd)

Retainer Replacement (4-door Adhesive type)

1. Gradually scrape off the adhesive tape (A) under the retainers (B) while heating it with a heat gun.

   NOTE:
   - Do not heat the painted body surface around the retainers too much.
   - To keep the exterior resin parts near the A-pillar from being overheated by the heat gun, wrap them with aluminum foil.



2. Clean the body bonding surface with a sponge dampened in alcohol. After cleaning, keep oil, grease, and water from getting on the surface.

3. Install the upper retainers (A) and the lower retainers (B).

   –1 Peel the adhesive backing away from the upper and lower retainers.
   –2 Line up the retainers with the alignment marks (C) on the body, and attach the retainers with adhesive tape (D) (3M 9259, or equivalent).
   –3 Apply epoxy two-part mixing adhesive (E) around the edge of the retainers as shown.

Door Molding Replacement

Special Tools Required
KTC trim tool set SOJATP2014

4-door

NOTE:
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.
- Be careful not to pry too far or you may bend the molding.
- Put on gloves to protect your hands.

1. Prepare to release the molding clips from inside the vehicle.

   - To remove the front door molding, remove the front door panel (see page 20-10) and plastic cover.
   - To remove the rear door molding, remove the rear door panel (see page 20-25) and plastic cover.

2. Release the clips (A) and gently pry the front door molding (B) or rear door molding (C) away from the door while separating the adhesive tape (D, E, F).

   Adhesive tape (D): Thickness 1.2 mm (0.047 in.), Width 18 mm (0.71 in.)
   Adhesive tape (E): Thickness 1.2 mm (0.047 in.), Width 5 mm (0.2 in.)
   Adhesive tape (F): Thickness 0.4 mm (0.016 in.), Width 5 mm (0.2 in.)

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If HVAC maintenance is required)

The Accord SRS includes a driver's airbag in the steering wheel hub, a passenger's airbag in the dashboard above the glove box, seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in this Service Manual. Items marked with an asterisk (*) on the contents page include or are located near SRS components. Servicing, disassembling, or replacing these items require special precautions and tools, and should be done only by an authorized Honda dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work must be performed by an authorized Honda dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the airbags and/or side airbags.
- Do not bump or impact the SRS unit, front impact sensors, or side impact sensors when the ignition switch is ON (II), or for at least 3 minutes after the ignition switch is turned OFF; otherwise, the system may fail in a collision, or the airbags may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, front console, dashboard, dashboard lower panel, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

A/C Service Tips and Precautions

⚠ WARNING

- Compressed air mixed with R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.

⚠ CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

The air conditioning system uses HFC-134a (R-134a) refrigerant and polyalkyleneglycol (PAG) refrigerant oil, which are not compatible with CFC-12 (R-12) refrigerant and mineral oil. Do not use R-12 refrigerant or mineral oil in this system, and do not attempt to use R-12 servicing equipment; damage to the air conditioning system or your servicing equipment will result.
Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2210 to remove R-134a from the air conditioning system.

If accidental system discharge occurs, ventilate work area before resuming service.

R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

- *Always* disconnect the negative cable from the battery whenever replacing air conditioning parts.
- Keep moisture and dirt out of the system. When disconnecting any lines, plug or cap the fittings immediately; don't remove the caps or plugs until just before you reconnect each line.
- Before connecting any hose or line, apply a few drops of refrigerant oil to the O-ring.
- When tightening or loosening a fitting, use a second wrench to support the matching fitting.
- When discharging the system, use a R-134a refrigerant recovery/recycling/charging station; don't release refrigerant into the atmosphere.

A/C Refrigerant Oil Replacement

Recommended PAG oil: DENSO ND-OIL 8

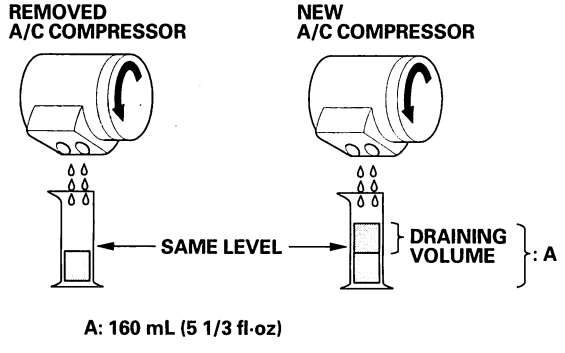
- P/N 38897-PR7-A01AH: 120 mL (4 fl·oz)
- P/N 38899-PR7-A01: 40 mL (1 1/3 fl·oz)

Add the recommended refrigerant oil in the amount listed if you replace any of the following parts.

- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if it gets on the paint, wash it off immediately.

A/C condenser .....25 mL (5/6 fl·oz)
Evaporator .....45 mL (1 1/2 fl·oz)
Line or hose .....10 mL (1/3 fl·oz)
Receiver/Dryer .....10 mL (1/3 fl·oz)
Leakage repair .....25 mL (5/6 fl·oz)
A/C compressor .....For A/C compressor replacement, subtract the volume of oil drained from the removed A/C compressor from 160 mL (5 1/3 fl·oz), and drain the calculated volume of oil from the new A/C compressor: 160 mL (5 1/3 fl·oz) — Volume of removed A/C compressor = Volume to drain from new A/C compressor.

NOTE: Even if no oil is drained from the removed A/C compressor, don't drain more than 50 mL (1 2/3 fl·oz) from the new A/C compressor.



A: 160 mL (5 1/3 fl·oz)

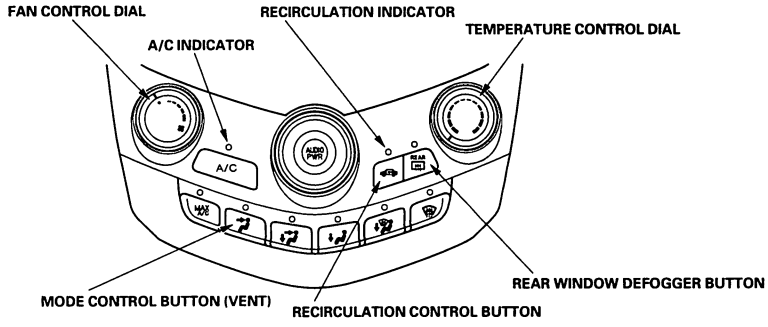
General Troubleshooting Information

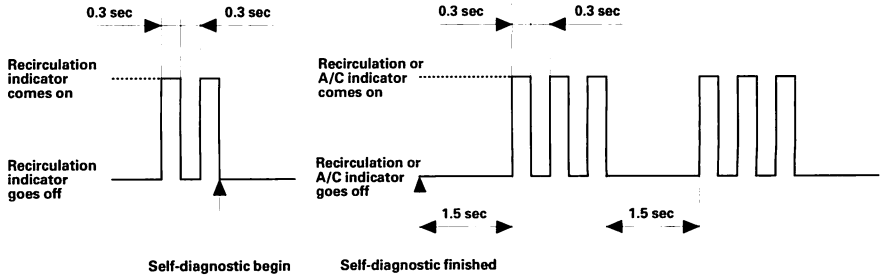
How to Retrieve a DTC

The audio-HVAC display panel has a self-diagnostic function for heating, ventilation, and air conditioning system. To run the self-diagnostic function, do the following:

1. Turn the ignition switch OFF.
2. Turn the fan switch OFF.
3. Set the temperature control dial on Max Cool, then push the mode control button to select Vent.
4. Turn the ignition switch ON (II).
5. Press and hold the recirculation control button.
6. While holding the button down, press the rear window defogger button five times within 10 seconds. The recirculation indicator blinks two times, then the self-diagnostic will begin.
   - If there is any problem in the system after self-diagnostic is finished, the recirculation indicator will blink Diagnostic Trouble Code (DTC) 1 through 6. If there are any problems in the evaporator temperature sensor circuit, the A/C indicator will blink DTC 7 or 8.
   - If no DTC's are found, the indicator will not blink.



Example of DTC indication Pattern (DTC 3)



Cancelling the Self-diagnostic Function

7. Turn the ignition switch OFF to cancel the self-diagnostic function. After completing repair work, run the self-diagnostic function again to make sure that there are no other malfunctions.

Max Cool Position Function

When the mode control button is in the MAX COOL position, the audio-HVAC display panel will automatically select the recirculation mode and turn the A/C on. The recirculation switch and A/C switch are disabled and cannot be turned off in this mode. If the audio-HVAC display panel fails to function as described, replace it.

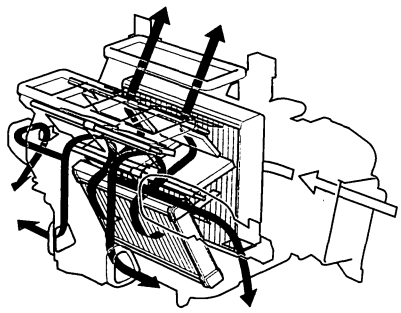
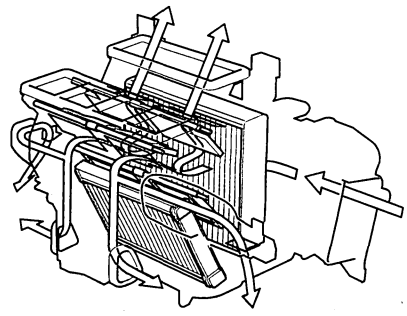
(HEAT/DEF)

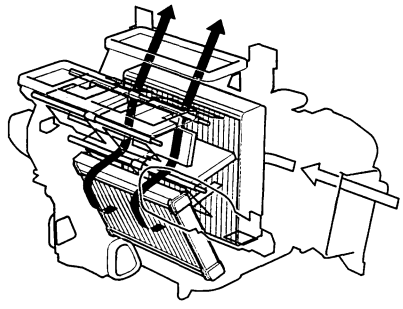
HOT

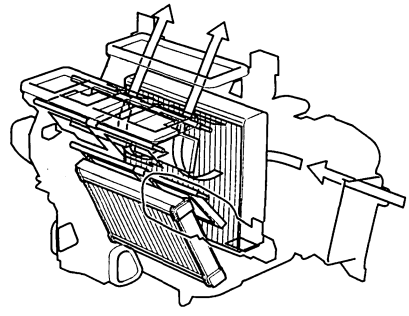
COOL





(DEF)



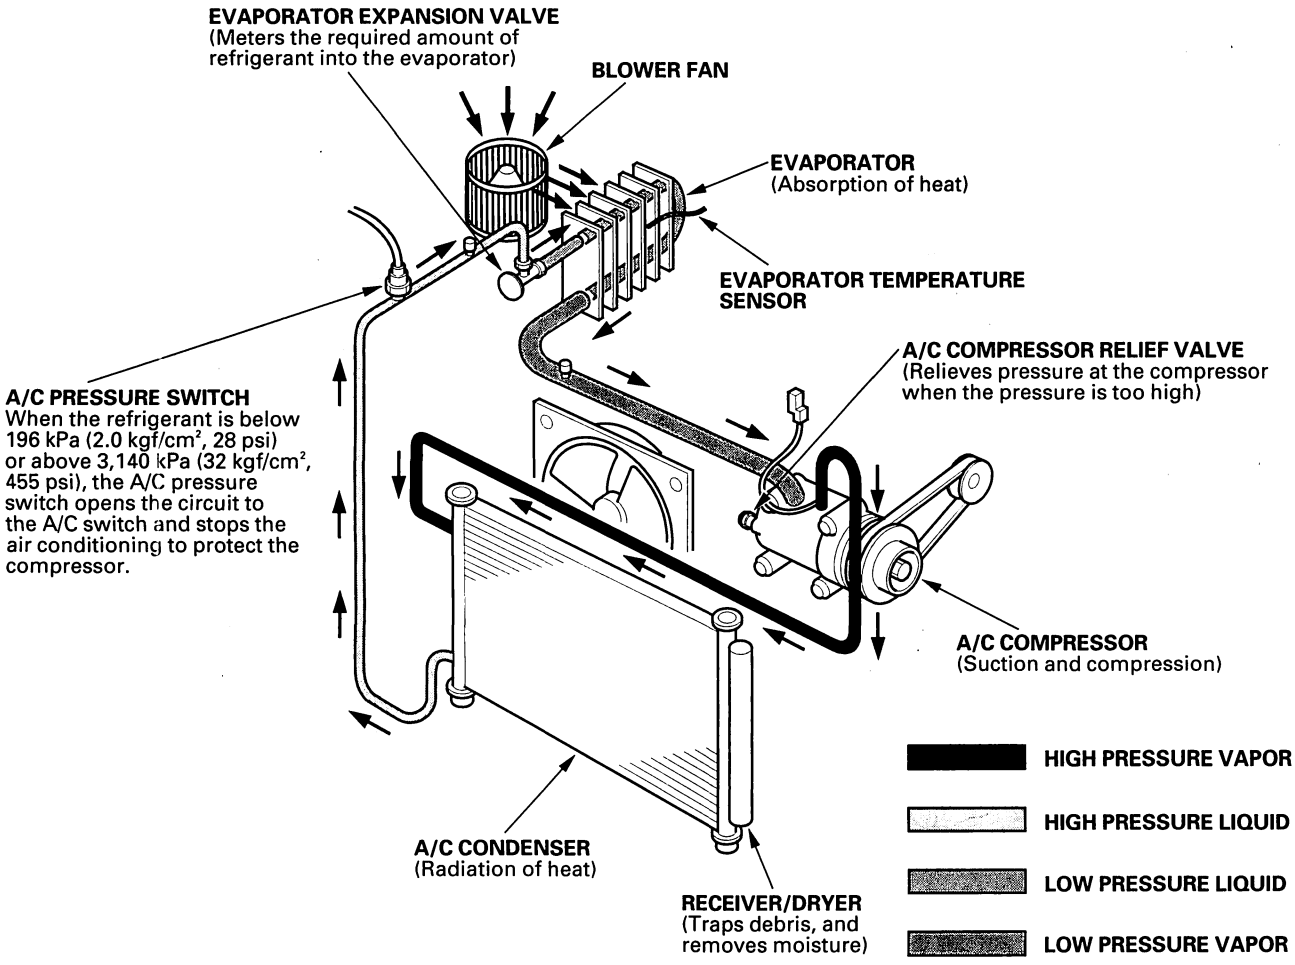


(cont'd)

Protected by AR

System Description (cont'd)

The air conditioning system removes heat from the passenger compartment by circulating refrigerant through the system.



This vehicle uses HFC-134a (R-134a) refrigerant which does not contain chlorofluorocarbons. Pay attention to the following service items:

- Do not mix refrigerants CFC-12 (R-12) and HFC-134a (R-134a). They are not compatible.
- Use only the recommended polyalkyleneglycol (PAG) refrigerant oil (DENSO ND-OIL 8) designed for the R-134a compressor. Intermixing the recommended (PAG) refrigerant oil with any other refrigerant oil will result in compressor failure.
- All A/C system parts (compressor, discharge line, suction line, evaporator, condenser, receiver/dryer, expansion valve, O-rings for joints) are designed for refrigerant R-134a. Do not exchange with R-12 parts.
- Use a halogen gas leak detector designed for refrigerant R-134a.
- R-12 and R-134a refrigerant servicing equipment are not interchangeable. Use only a recovery/recycling/charging station that is U.L.-listed and is certified to meet the requirements of SAE J2210 to service the R-134a air conditioning systems.
- Always recover the refrigerant R-134a with an approved recovery/recycling/charging station before disconnecting any A/C fitting.

DTC Troubleshooting

DTC 1: An Open in the Air Mix Control Motor Circuit

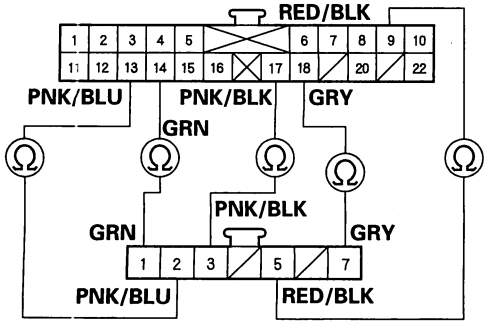
1. Disconnect the air mix control motor 7P (4-door) or 5P (2-door) connector.
2. Disconnect audio-HVAC display panel 22P connector.
3. Check for continuity between the following terminals of audio-HVAC display panel 22P connector and the air mix control motor 7P (4-door) or 5P (2-door) connector.

4-door:

22P:	7P:
No. 9	No. 5
No. 13	No. 2
No. 14	No. 1
No. 17	No. 3
No. 18	No. 7

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR

Wire side of female terminals



AIR MIX CONTROL MOTOR 7P CONNECTOR

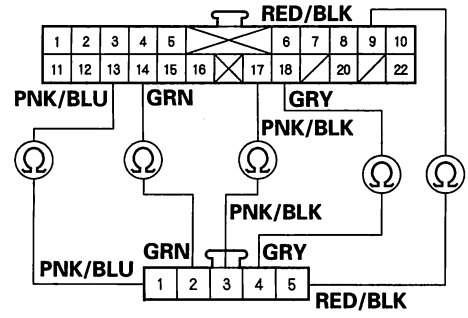
Wire side of female terminals

2-door:

22P:	5P:
No. 9	No. 5
No. 13	No. 1
No. 14	No. 2
No. 17	No. 3
No. 18	No. 4

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR

Wire side of female terminals



AIR MIX CONTROL MOTOR 5P CONNECTOR

Wire side of female terminals

Is there continuity?

YES—Check for loose wires or poor connections at audio-HVAC display panel 22P connector and at the air mix control motor 7P (4-door) or 5P (2-door) connector. If the connections are good, test the air mix control motor, 4-door (see page 21-43), 2-door (see page 21-43). If the air mix control motor is OK, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair any open in the wire(s) between the audio-HVAC display panel and the air mix control motor. ■

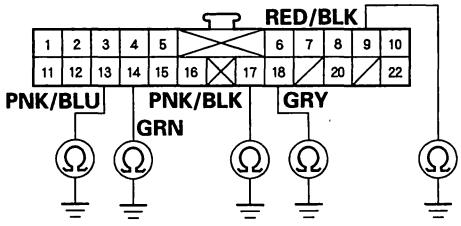
BACK

Protected by AR

DTC 2: A Short in the Air Mix Control Motor Circuit

1. Disconnect the air mix control motor 7P (4-door) or 5P (2-door) connector.
2. Disconnect audio-HVAC display panel 22P connector.
3. Check for continuity between body ground and audio-HVAC display panel 22P connector terminals No. 9, 13, 14, 17, and 18 individually.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR



Wire side of female terminals

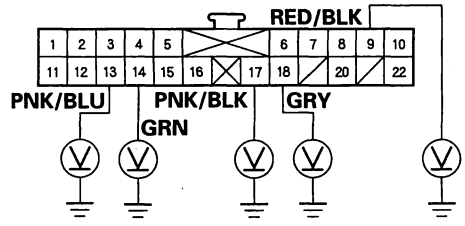
Is there continuity?

YES—Repair any short to body ground in the wire(s) between the audio-HVAC display panel and the air mix control motor. ■

NO—Go to step 4.

4. Turn the ignition switch ON (II), and check the same terminals for voltage.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR



Wire side of female terminals

Is there any voltage?

YES—Repair any short to power in the wire(s) between the audio-HVAC display panel and the air mix control motor. This short may also damage the audio-HVAC display panel. Repair the short to power before replacing the audio-HVAC display panel. ■

NO—Test the air mix control motor, 4-door (see page 21-43), 2-door (see page 21-43). If the air mix control motor is OK, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 3: A Problem in the Air Mix Control Linkage, Door, or Motor

1. Test the air mix control motor.

   - 4-door (see page 21-43)
   - 2-door (see page 21-43)

   Is the air mix control motor OK?

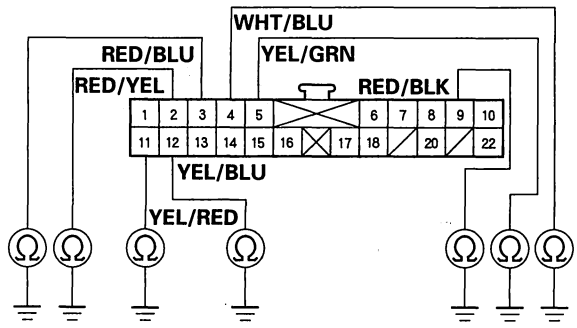
   YES—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

   NO—Replace the air mix control motor, or repair the linkage and doors. ■

DTC 4: An Open or Short in the Mode Control Motor Circuit

1. Disconnect the mode control motor 7P (4-door) or 10P (2-door) connector.
2. Disconnect audio-HVAC display panel 22P connector.
3. Check for continuity between body ground and audio-HVAC display panel 22P connector terminals No. 2, 3, 4, 5, 9, 11, and 12 individually.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair any short to body ground in the wire(s) between the audio-HVAC display panel and the mode control motor. ■

NO—Go to step 4.

MODE CONTROL MOTOR 10P CONNECTOR

Wire side of female terminals

Is there continuity?

YES—Check for loose wires or poor connections at audio-HVAC display panel 22P connector and at the mode control motor 7P (4-door) or 10P (2-door) connector. If the connections are good, test the mode control motor, 4-door (see page 21-45), 2-door (see page 21-45). If the mode control motor is OK, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/ indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair any open in the wire(s) between the audio-HVAC display panel and the mode control motor. ■

DTC 5: A Problem in the Mode Control Linkage, Doors, or Motor

1. Test the mode control motor, 4-door (see page 21-45), 2-door (see page 21-45).

Is the mode control motor OK?

YES—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/ indication goes away, replace the original audio-HVAC display panel. ■

NO—Replace the mode control motor, or repair the linkage and doors. ■

BACK

Protected by AR

DTC 6: A Problem in the Blower Motor Circuit

1. Check the No. 21 (40A) fuse in the under-hood fuse/relay box, and the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES—Go to step 2.

   NO—Replace the fuse(s), and recheck.■

2. Connect the No. 2 (4-door) or No. 1 (2-door) terminal of the blower motor 2P connector to body ground with a jumper wire.

   4-door:

   BLOWER MOTOR 2P CONNECTOR

   Wire side of female terminals

   2-door:

   BLOWER MOTOR 2P CONNECTOR

   Wire side of female terminals

3. Turn the ignition switch ON (II).

   Does the blower motor run?

   YES—Go to step 4.

   NO—Go to step 17.

4. Turn the ignition switch OFF.

5. Disconnect the jumper wire.

6. Disconnect the power transistor 4P connector.

7. Check for continuity between the No. 2 (4-door) or No. 3 (2-door) terminal of the power transistor 4P connector and body ground.

   4-door:

   POWER TRANSISTOR 4P CONNECTOR

   Wire side of female terminals

   2-door:

   POWER TRANSISTOR 4P CONNECTOR

   Wire side of female terminals

   Is there continuity?

   YES—Go to step 8.

   NO—Check for an open in the wire between the power transistor and body ground. If the wire is OK, check for poor ground at G503.■

(cont'd)

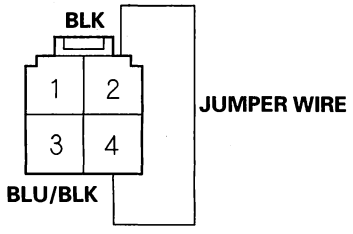
Protected by AR

DTC Troubleshooting (cont'd)

8. Connect the No. 2 and No. 4 (4-door) or No. 1 and No. 3 (2-door) terminals of the power transistor 4P connector with a jumper wire.

4-door:

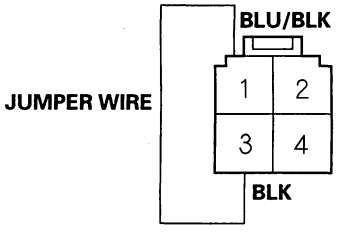
POWER TRANSISTOR 4P CONNECTOR



Wire side of female terminals

2-door:

POWER TRANSISTOR 4P CONNECTOR



Wire side of female terminals

9. Turn the ignition switch ON (II).

Does the blower motor run at high speed?

YES—Go to step 10.

NO—Repair open in the BLU/BLK wire between the power transistor and the blower motor.■

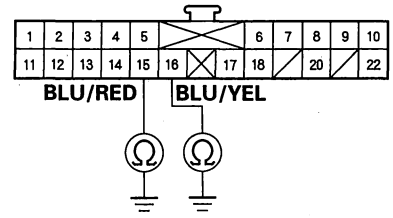
10. Turn the ignition switch OFF.

11. Disconnect the jumper wire.

12. Disconnect audio-HVAC display panel 22P connector.

13. Check for continuity between the No. 15 and No. 16 terminals of audio-HVAC display panel 22P connector and body ground individually.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair any short to body ground in the wire(s) between the audio-HVAC display panel and the power transistor.■

NO—Go to step 14.

BACK

Protected by AR

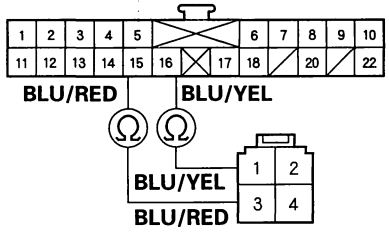
14. Check the continuity between the following terminals of audio-HVAC display panel 22P connector and the power transistor 4P connector.

4-door:

22P:	4P:
No. 15	No. 3
No. 16	No. 1

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR

Wire side of female terminals



POWER TRANSISTOR 4P CONNECTOR

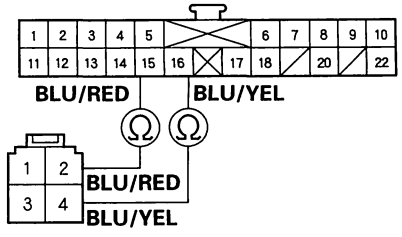
Wire side of female terminals

2-door:

22P:	4P:
No. 15	No. 2
No. 16	No. 4

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR

Wire side of female terminals



POWER TRANSISTOR 4P CONNECTOR

Wire side of female terminals

Is there continuity?

YES—Go to step 15.

NO—Repair any open in the wire(s) between the audio-HVAC display panel and the power transistor. ■

15. Reconnect audio-HVAC display panel 22P connector.

16. Test the power transistor (see page 21-50).

Is the power transistor OK?

YES—Check for loose wires or poor connections at audio-HVAC display panel 22P connector and at the power transistor 4P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/ indication goes away, replace the original audio-HVAC display panel. ■

NO—Replace the power transistor. ■

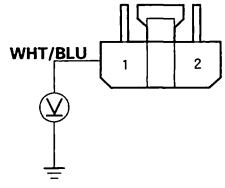
17. Disconnect the jumper wire.

18. Disconnect the blower motor 2P connector.

19. Measure the voltage between the No. 1 (4-door) or No. 2 (2-door) terminal of the blower motor 2P connector and body ground.

4-door:

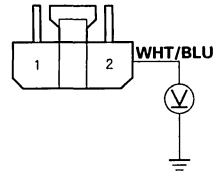
BLOWER MOTOR 2P CONNECTOR



Wire side of female terminals

2-door:

BLOWER MOTOR 2P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Replace the blower motor. ■

NO—Go to step 20.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

20. Turn the ignition switch OFF.

21. Remove the blower motor relay from the under-hood fuse/relay box, and test it (see page 22-79).

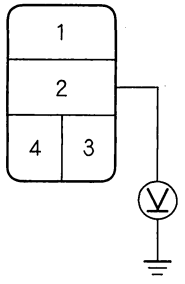
    Is the relay OK?

    YES—Go to step 22.

    NO—Replace the blower motor relay.■

22. Measure the voltage between the No. 2 terminal of the blower motor relay 4P socket and body ground.

BLOWER MOTOR RELAY 4P SOCKET



Is there battery voltage?

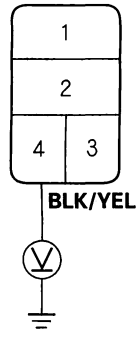
YES—Go to step 23.

NO—Replace the under-hood fuse/relay box.■

23. Turn the ignition switch ON (II).

24. Measure the voltage between the No. 4 terminal of the blower motor relay 4P socket and body ground.

BLOWER MOTOR RELAY 4P SOCKET



Is there battery voltage?

YES—Go to step 25.

NO—Repair open in the wire between the No. 30 fuse in the under-dash fuse/relay box and the blower motor relay.■

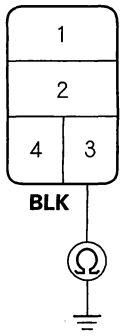
BACK

Protected by AR

25. Turn the ignition switch OFF.

26. Check for continuity between the No. 3 terminal of the blower motor relay 4P socket and body ground.

BLOWER MOTOR RELAY 4P SOCKET



Is there continuity?

YES—Repair open in the WHT/BLU wire between the blower motor relay and the blower motor. ■

NO—Check for an open in the wire between the blower motor relay and body ground. If the wire is OK, check for poor ground at G302. ■

DTC 7: An Open in the Evaporator Temperature Sensor Circuit

1. Remove the evaporator temperature sensor (see page 21-49) and test it (see page 21-49).

   Does the evaporator temperature sensor test OK?

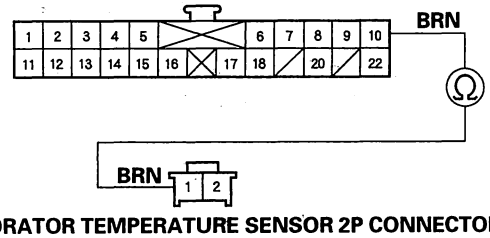
   YES—Go to step 2.

   NO—Replace the evaporator temperature sensor. ■

2. Disconnect the audio-HVAC display panel 22P connector.

3. Check for continuity between the No. 10 terminal of audio-HVAC display panel 22P connector and the No. 1 terminal of the evaporator temperature sensor 2P connector.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR
Wire side of female terminals



EVAPORATOR TEMPERATURE SENSOR 2P CONNECTOR

Is there continuity?

YES—Go to step 4.

NO—Repair open in the wire between the audio-HVAC display panel and the evaporator temperature sensor. ■

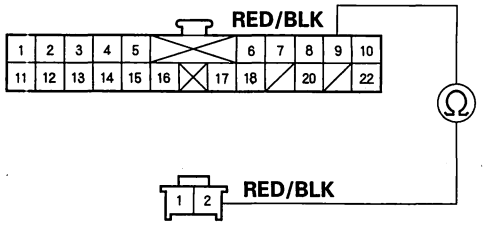
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

4. Check for continuity between the No. 9 terminal of audio-HVAC display panel 22P connector and the No. 2 terminal of the evaporator temperature sensor 2P connector.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR
Wire side of female terminals



EVAPORATOR TEMPERATURE SENSOR 2P CONNECTOR
Wire side of female terminals

Is there continuity?

YES—Check for loose wires or poor connections at audio-HVAC display panel 22P connectors and at the evaporator temperature sensor 2P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair open in the wire between the audio-HVAC display panel and the evaporator temperature sensor. ■

DTC 8: A Short in the Evaporator Temperature Sensor Circuit

1. Remove the evaporator temperature sensor (see page 21-49) and test it (see page 21-49).

Is the resistance within the specifications shown on the graph?

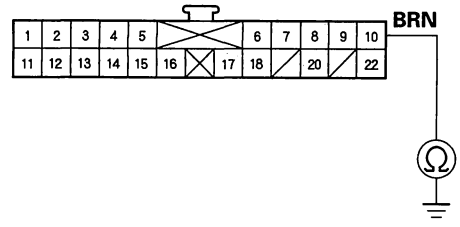
YES—Go to step 2.

NO—Replace the evaporator temperature sensor. ■

2. Disconnect the audio-HVAC display panel 22P connector.

3. Check for continuity between the No. 10 terminal of audio-HVAC display panel 22P connector and body ground.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short to body ground in the wire between the audio-HVAC display panel and the evaporator temperature sensor. ■

NO—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

Protected by AR

Recirculation Control Motor Circuit Troubleshooting

1. Check the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 2.

   NO—Replace the fuse, and recheck. ■

2. Disconnect the recirculation control motor 7P (4-door) or 5P (2-door) connector.

3. Turn the ignition switch ON (II).

4. Measure the voltage between the No. 1 (4-door) or No. 5 (2-door) terminal of the recirculation control motor 7P (4-door) or 5P (2-door) connector and body ground.

   4-door:

   RECIRCULATION CONTROL MOTOR 7P CONNECTOR

   Wire side of female terminals

   2-door:

   RECIRCULATION CONTROL MOTOR 5P CONNECTOR

   Wire side of female terminals

   Is there battery voltage?

   YES—Go to step 5.

   NO—Repair open in the wire between the No. 30 fuse in the under-dash fuse/relay box and the recirculation control motor. ■

5. Turn the ignition switch OFF.

6. Test the recirculation control motor.

   - 4-door (see page 21-47)
   - 2-door (see page 21-47)

   Is the recirculation control motor OK?

   YES—Go to step 7.

   NO—Replace the recirculation control motor. ■

7. Disconnect the audio-HVAC display panel 22P connector.

8. Check for continuity between the No. 7 and No. 8 terminals of audio-HVAC display panel 22P connector and body ground individually.

   AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR

   Wire side of female terminals

   Is there continuity?

   YES—Repair any short to body ground in the wire(s) between the audio-HVAC display panel and the recirculation control motor. ■

   NO—Go to step 9.

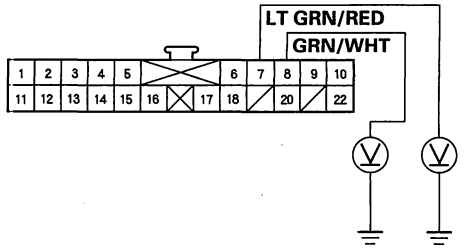
(cont'd)

Protected by AR

Recirculation Control Motor Circuit Troubleshooting (cont'd)

9. Turn the ignition switch ON (II), and check the same wires for voltage.

AUDIO-HVAC DISPLAY PANEL
22P CONNECTOR



Wire side of female terminals

Is there any voltage?

YES—Repair any short to power in the wire(s) between the audio-HVAC display panel and the recirculation control motor. This short may also damage the audio-HVAC display panel. Repair the short to power before replacing the audio-HVAC display panel. ■

NO—Go to step 10.

10. Turn the ignition switch OFF.

11. Check for continuity between the following terminals of audio-HVAC display panel 22P connector and the recirculation control motor 7P (4-door) or 5P (2-door) connector.

4-door:

22P:	7P:
No. 7	No. 7
No. 8	No. 5

AUDIO-HVAC DISPLAY PANEL
22P CONNECTOR

Wire side of female terminals

A/C Condenser Fan Circuit Troubleshooting

NOTE: Do not use this troubleshooting procedure if the radiator fan and/or the A/C compressor is inoperative. Refer to the symptom troubleshooting index.

1. Check the No. 9 (20A) fuse in the under-hood fuse/relay box, and the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES—Go to step 2.

   NO—Replace the fuse(s), and recheck. ■

2. Remove the A/C condenser fan relay from the under-hood fuse/relay box, and test it (see page 22-79).

   Is the relay OK?

   YES—Go to step 3.

   NO—Replace the A/C condenser fan relay. ■

3. Measure the voltage between the No. 1 terminal of the A/C condenser fan relay 4P socket and body ground.

   A/C CONDENSER FAN RELAY 4P SOCKET

   Is there battery voltage?

   YES—Go to step 4.

   NO—Replace the under-hood fuse/relay box. ■

4. Connect the No. 1 and No. 2 terminals of the A/C condenser fan relay 4P socket with a jumper wire.

   A/C CONDENSER FAN RELAY 4P SOCKET

   Does the A/C condenser fan run?

   YES—Go to step 5.

   NO—Go to step 8.

5. Disconnect the jumper wire.

6. Turn the ignition switch ON (II).

7. Measure the voltage between the No. 3 terminal of the A/C condenser fan relay 4P socket and body ground.

   A/C CONDENSER FAN RELAY 4P SOCKET

   Is there battery voltage?

   YES—Replace the under-hood fuse/relay box. ■

   NO—Repair open in the wire between the No. 30 fuse in the under-dash fuse/relay box and the A/C condenser fan relay. ■

8. Disconnect the jumper wire.

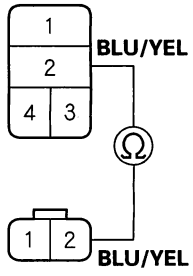
BACK

Protected by AR

9. Disconnect the A/C condenser fan 2P connector.

10. Check for continuity between the No. 2 terminal of the A/C condenser fan relay 4P socket and the No. 2 terminal of the A/C condenser fan 2P connector.

A/C CONDENSER FAN RELAY 4P SOCKET



A/C CONDENSER FAN 2P CONNECTOR
Wire side of female terminals

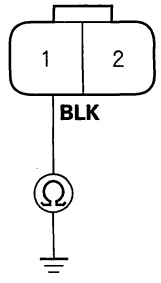
Is there continuity?

YES—Go to step 11.

NO—Repair open in the wire between the A/C condenser fan relay and the A/C condenser fan.■

11. Check for continuity between the No. 1 terminal of the A/C condenser fan 2P connector and body ground.

A/C CONDENSER FAN 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Replace the A/C condenser fan motor.■

NO—Check for an open in the wire between the A/C condenser fan and body ground. If the wire is OK, check for poor ground at G201.■

Radiator and A/C Condenser Fan Common Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if only one fan is inoperative, or if the A/C compressor is inoperative. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Check the No. 9 (20A) and No. 11 (20A) fuses in the under-hood fuse/relay box, and the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

Are the fuses OK?

YES—Go to step 2.

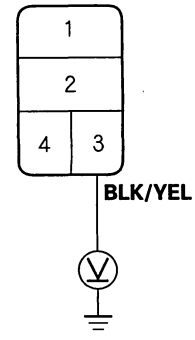
NO—Replace the fuse(s), and recheck.■

2. Remove the A/C condenser fan relay from the under-hood fuse/relay box.

3. Turn the ignition switch ON (II).

4. Measure the voltage between the No. 3 terminal of the A/C condenser fan relay 4P socket and body ground.

A/C CONDENSER FAN RELAY 4P SOCKET



Is there battery voltage?

YES—Go to step 5.

NO—Repair open in the wire between the No. 30 fuse in the under-dash fuse/relay box and the A/C condenser fan relay.■

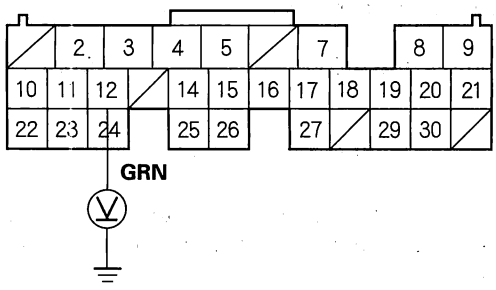
(cont'd)

Protected by AR

Radiator and A/C Condenser Fan Common Circuit Troubleshooting (cont'd)

5. Turn the ignition switch OFF.
6. Reinstall the A/C condenser fan relay.
7. Make sure the A/C switch is OFF, and the engine coolant temperature is below 199°F (93°C).
8. Turn the ignition switch ON (II).
9. Using a backprobe set, measure the voltage between the No. 12 terminal of ECM/PCM connector E (31P) and body ground with the ECM/PCM connectors connected.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there battery voltage?

YES—Check for loose wires or poor connections at terminal E12 of the ECM/PCM connector E (31P). If the connections are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM/PCM.■

NO—Repair open in the wire between the radiator fan relay, the A/C condenser fan relay, and the ECM/PCM.■

NOTE: After replacing the ECM/PCM, do the following items:
- ECM/PCM idle learn procedure (see page 11-316).
- Reset the power window control unit (see page 22-232).
- Enter the anti-theft codes for the radio and navigation system, then enter the customer's radio station presets.

A/C Compressor Clutch Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if the fans are also inoperative. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Check the No. 12 (7.5A) fuse in the under-hood fuse/relay box, and the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES—Go to step 2.

   NO—Replace the fuse(s), and recheck.■

2. Check the engine coolant temperature, throttle position, and idle speed (use the HDS PGM-FI data list if possible).

ECT Sensor	169—194°F (76—90°C)
TPS	About 0.5 V
RPM	MT: More than 700 AT: More than 800

   Is the coolant temperature, throttle position, and idle speed OK?

   YES—Go to step 3.

   NO—Troubleshoot and repair the cause of the high engine coolant temperature, low idle, or excessively high throttle position sensor reading.■

3. Remove the A/C compressor clutch relay from the under-hood fuse/relay box, and test it (see page 22-79).

   Is the relay OK?

   YES—Go to step 4.

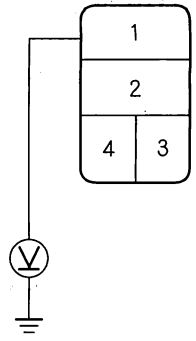
   NO—Replace the A/C compressor clutch relay.■

BACK

Protected by AR

4. Measure the voltage between the No. 1 terminal of the A/C compressor clutch relay 4P socket and body ground.

A/C COMPRESSOR CLUTCH RELAY 4P SOCKET



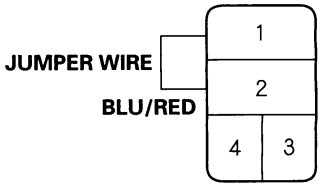
Is there battery voltage?

YES—Go to step 5.

NO—Replace the under-hood fuse/relay box.■

5. Connect the No. 1 and No. 2 terminals of the A/C compressor clutch relay 4P socket with a jumper wire.

A/C COMPRESSOR CLUTCH RELAY 4P SOCKET



Does the A/C compressor clutch click ?

YES—Go to step 6.

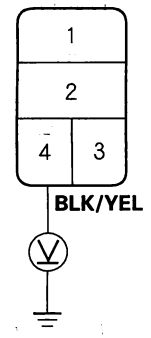
NO—Go to step 14.

6. Disconnect the jumper wire.

7. Turn the ignition switch ON (II).

8. Measure the voltage between the No. 4 terminal of the A/C compressor clutch relay 4P socket and body ground.

A/C COMPRESSOR CLUTCH RELAY 4P SOCKET



Is there battery voltage?

YES—Go to step 9.

NO—Repair open in the wire between the No. 30 fuse in the under-dash fuse/relay box and the A/C compressor clutch relay.■

9. Turn the ignition switch OFF.

10. Reinstall the A/C compressor clutch relay.

11. Make sure the A/C switch is OFF.

12. Turn the ignition switch ON (II).

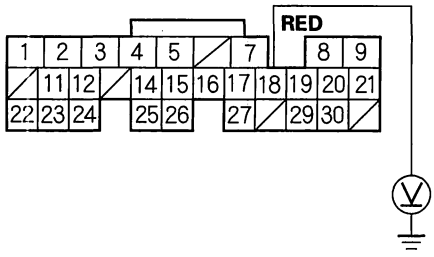
(cont'd)

Protected by AR

A/C Compressor Clutch Circuit Troubleshooting (cont'd)

13. Using a backprobe set, measure the voltage between the No. 18 terminal of ECM/PCM connector E (31P) and body ground with the ECM/PCM connectors connected.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there battery voltage?

YES—Check for loose wires or poor connections at terminal E18 of the ECM/PCM connector E (31P). If the connections are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM/PCM.■

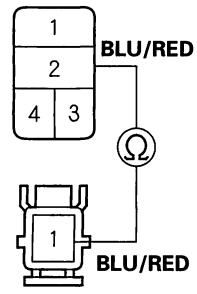
NO—Repair open in the wire between the A/C compressor clutch relay and the ECM/PCM.■

14. Disconnect the jumper wire.

15. Disconnect the A/C compressor clutch 1P connector.

16. Check for continuity between the No. 2 terminal of the A/C compressor clutch relay 4P socket and the No. 1 terminal of the A/C compressor clutch 1P connector.

A/C COMPRESSOR CLUTCH RELAY 4P SOCKET



A/C COMPRESSOR CLUTCH 1P CONNECTOR
Terminal side of male terminals

Is there continuity?

YES—Check the A/C compressor clutch clearance, and the A/C compressor clutch field coil (see page 21-60). Repair as needed.■

NO—Repair open in the wire between the A/C compressor clutch relay and the A/C compressor clutch.■

BACK

A/C Pressure Switch Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if the following items are operative; A/C condenser fan, radiator fan, A/C compressor, or if the heater is inoperative. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Check for body DTCs in test mode A of the MICS (see page 22-91).

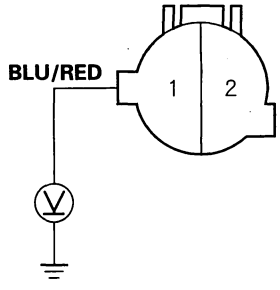
   Are the any DTCs indicated?

   YES—Do the appropriate troubleshooting for the DTC indicated. ■

   NO—Go to step 2.

2. Disconnect the A/C pressure switch 2P connector.
3. Turn the ignition switch ON (II).
4. Measure the voltage between the No. 1 terminal of the A/C pressure switch 2P connector and body ground.

A/C PRESSURE SWITCH 2P CONNECTOR



Wire side of female terminals

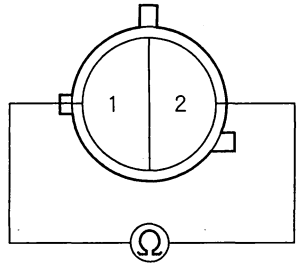
Is there 5 V or more?

YES—Go to step 5.

NO—Go to step 13.

5. Turn the ignition switch OFF.
6. Check for continuity between the No. 1 and No. 2 terminals of the A/C pressure switch.

A/C PRESSURE SWITCH



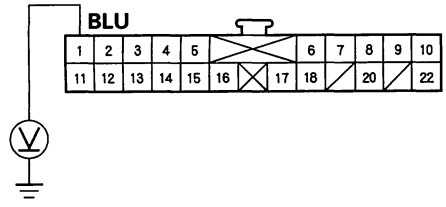
Is there continuity?

YES—Go to step 7.

NO—Go to step 14.

7. Reconnect the A/C pressure switch 2P connector.
8. Disconnect audio-HVAC display panel 22P connector.
9. Turn the ignition switch ON (II).
10. Measure the voltage between the No. 1 terminal of audio-HVAC display panel 22P connector and body ground.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR



Wire side of female terminals

Is there 5 V or more?

YES—Go to step 11.

NO—Repair open in the wire between the audio-HVAC display panel and the A/C pressure switch. ■

(cont'd)

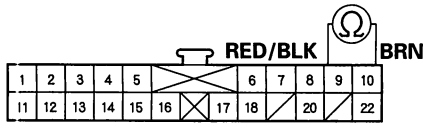
Protected by AR

A/C Pressure Switch Circuit Troubleshooting (cont'd)

11. Turn the ignition switch OFF.

12. Measure the resistance between the No. 9 and No. 10 terminals of the audio-HVAC display panel 22P connector.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR



Wire side of female terminals

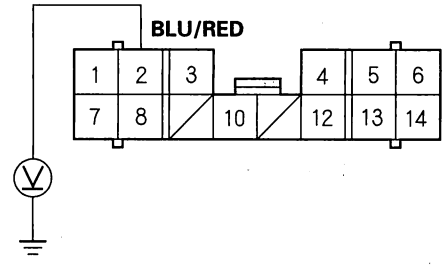
Is the resistance less than 24 k ohms?

YES—Check for loose wires or poor connections at audio-HVAC display panel 22P connector and at the A/C pressure switch 2P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair cause of high resistance in the evaporator temperature circuit. ■

13. Measure the voltage between the No. 2 terminal of under-hood fuse/relay box connector H (14P) and body ground with the under-hood fuse/relay box connectors connected.

UNDER-HOOD FUSE/RELAY BOX CONNECTOR H (14P)



Wire side of female terminals

Is there 5 V or more?

YES—Repair open in the wire between the under-hood fuse/relay box and the A/C pressure switch. ■

NO—Check for loose or poor connections at the No. 2 terminal of the under-hood fuse/relay box. If the connections are OK, replace the under-hood fuse/relay box. ■

14. Check for proper A/C system pressure.

Is the pressure within specifications?

YES—Replace the A/C pressure switch. ■

NO—Repair the A/C pressure problem. ■

Air Mix Control Motor Test

4-door

1. Disconnect the 7P connector from the air mix control motor.

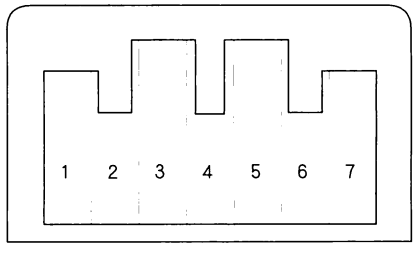
   NOTICE
   Incorrectly applying power and ground to the air mix control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 1 terminal of the air mix control motor, and ground the No. 2 terminal; the air mix control motor should run, and stop at Max Cool. If it doesn't, reverse the connections; the air mix control motor should run, and stop at Max Hot.

3. If the air mix control motor did not run in step 2, remove it, then check the air mix control linkage and door for smooth movement.

   - If the linkage and door move smoothly, replace the air mix control motor.
   - If the linkage or door sticks or binds, repair them as needed.
   - If the air mix control motor runs smoothly, go to step 4.

AIR MIX CONTROL MOTOR



4. Measure the resistance between the No. 5 and No. 7 terminals. It should be between 4.2 to 7.8 kΩ.

5. Reconnect the air mix control motor 7P connector, then turn the ignition switch ON (II).

6. Using the backprobe set, measure the voltage between the No. 3 and No. 5 terminals.

   Max Cool—about 0.5 V
   Max Hot—about 4.5 V

7. If either the resistance or voltage readings are not as specified, replace the air mix control motor.

2-door

1. Disconnect the 5P connector from the air mix control motor.

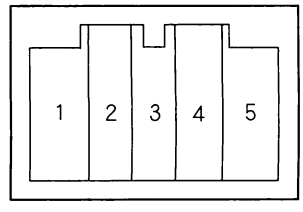
   NOTICE
   Incorrectly applying power and ground to the air mix control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 1 terminal of the air mix control motor, and ground the No. 2 terminal; the air mix control motor should run, and stop at Max Hot. If it doesn't, reverse the connections; the air mix control motor should run, and stop at Max Cool.

3. If the air mix control motor did not run in step 2, remove it, then check the air mix control linkage and door for smooth movement.

   - If the linkage and door move smoothly, replace the air mix control motor.
   - If the linkage or door sticks or binds, repair them as needed.
   - If the air mix control motor runs smoothly, go to step 4.

AIR MIX CONTROL MOTOR



4. Measure the resistance between the No. 4 and No. 5 terminals. It should be between 4.2 to 7.8 kΩ.

5. Reconnect the air mix control motor 5P connector, then turn the ignition switch ON (II).

6. Using the backprobe set, measure the voltage between the No. 3 and No. 5 terminals.

   Max Cool—about 1.0 V
   Max Hot—about 4.0 V

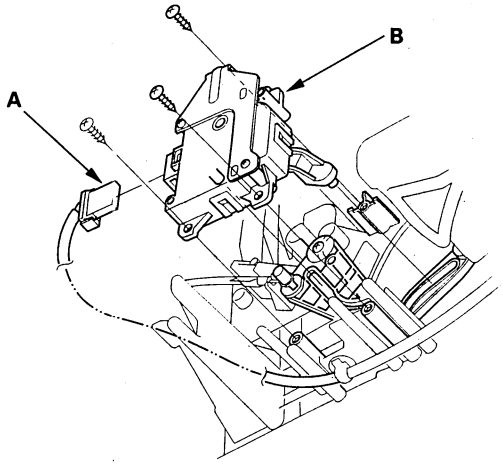
7. If either the resistance or voltage readings are not as specified, replace the air mix control motor.

Protected by AR

Air Mix Control Motor Replacement

4-door

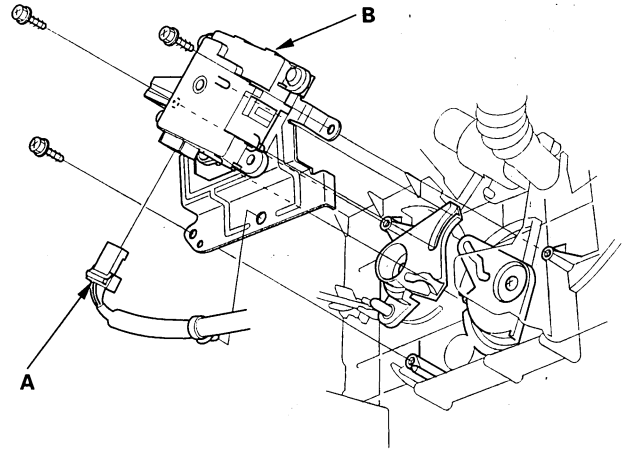
1. Disconnect the 7P connector (A) from the air mix control motor (B). Remove the self-tapping screws and the air mix control motor from the heater unit.



2. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

2-door

1. Disconnect the 5P connector (A) from the air mix control motor (B). Remove the self-tapping screws and the air mix control motor from the heater unit.



2. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

BACK

Protected by AR

Mode Control Motor Test

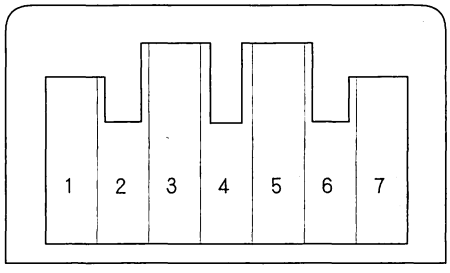
4-door

1. Disconnect the 7P connector from the mode control motor.

   NOTICE
   Incorrectly applying power and ground to the mode control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 2 terminal of the mode control motor, and ground the No. 1 terminal; the mode control motor should run smoothly, and stop at Vent. If it doesn't, reverse the connections; the mode control motor should run smoothly, and stop at Defrost. When the mode control motor stops running, disconnect battery power immediately.

MODE CONTROL MOTOR



3. If the mode control motor did not run in step 2, remove it, then check the mode control linkage and doors for smooth movement.

   - If the linkage and doors move smoothly, replace the mode control motor.
   - If the linkage or doors stick or bind, repair them as needed.
   - If the mode control motor runs smoothly, go to step 4.

4. Use a digital multimeter with an output of 1 mA or less at the 20 kΩ range. With the mode control motor running as in step 2, check for continuity between the No. 3, 4, 5 and 6 terminals and the No. 7 terminal individually. There should be continuity for a moment at each terminal as the motor moves past the switch's terminal.

5. If there is no continuity for a moment at each terminal, replace the mode control motor.

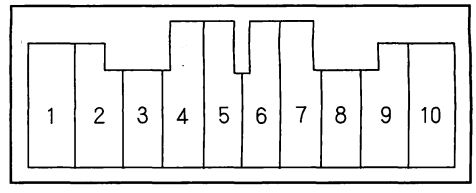
2-door

1. Disconnect the 10P connector from the mode control motor.

   NOTICE
   Incorrectly applying power and ground to the mode control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 2 terminal of the mode control motor, and ground the No. 1 terminal; the mode control motor should run smoothly, and stop at Vent. If it doesn't, reverse the connections; the mode control motor should run smoothly, and stop at Defrost. When the mode control motor stops running, disconnect battery power immediately.

MODE CONTROL MOTOR



3. If the mode control motor did not run in step 2, remove it, then check the mode control linkage and doors for smooth movement.

   - If the linkage and doors move smoothly, replace the mode control motor.
   - If the linkage or doors stick or bind, repair them as needed.
   - If the mode control motor runs smoothly, go to step 4.

4. Use a digital multimeter with an output of 1 mA or less at the 20 kΩ range. With the mode control motor running as in step 2, check for continuity between the No. 6, 7, 8 and 9 terminals and the No. 10 terminal individually. There should be continuity for a moment at each terminal as the motor moves past the switch's terminal.

5. If there is no continuity for a moment at each terminal, replace the mode control motor.

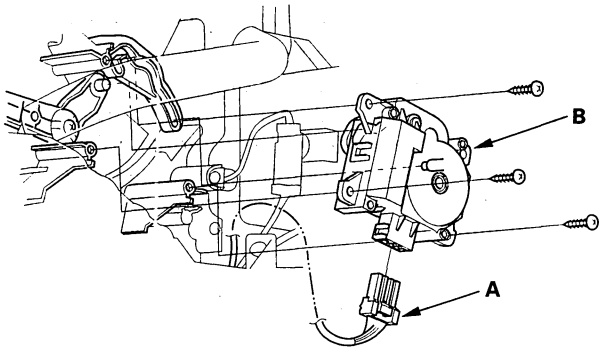
Mode Control Motor Replacement

4-door

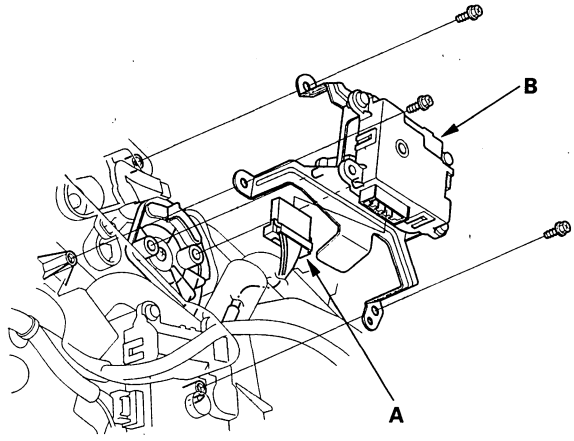
1. Open the glove box. Remove the damper from the glove box, then let the glove box hang down (see page 20-132).
2. Disconnect the 7P connector (A) from the mode control motor (B). Remove the self-tapping screws and the mode control motor from the heater unit.



3. Install the motor in the reverse order of removal. After installation, make sure the motor runs smoothly.

2-door

1. Open the glove box. Remove the damper from the glove box, then let the glove box hang down (see page 20-132).
2. Disconnect the 10P connector (A) from the mode control motor (B). Remove the self-tapping screws and the mode control motor from the heater unit.



3. Install the motor in the reverse order of removal. After installation, make sure the motor runs smoothly.

BACK

Protected by AR

Recirculation Control Motor Test

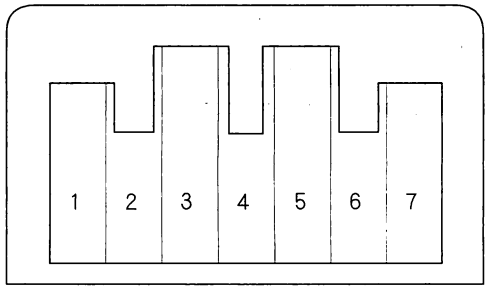
4-door

1. Disconnect the 7P connector from the recirculation control motor.

   NOTICE
   Incorrectly applying power and ground to the recirculation control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 1 terminal of the recirculation control motor, and ground the No. 5 or No. 7 terminals; the recirculation control motor should run smoothly. To avoid damaging the recirculation control motor, do not reverse power and ground. Disconnect the No. 5 or No. 7 terminals from ground; the recirculation control motor should stop at Fresh (when the No. 7 terminal is disconnected) or Recirculate (when the No. 5 terminal is disconnected). Don't cycle the recirculation control motor for a long time.

RECIRCULATION CONTROL MOTOR



3. If the recirculation control motor did not run in step 2, remove it, then check the recirculation control linkage and doors for smooth movement.

   - If the linkage and doors move smoothly, replace the recirculation control motor.
   - If the linkage or doors stick or bind, repair them as needed.

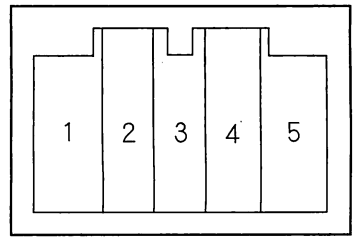
2-door

1. Disconnect the 5P connector from the recirculation control motor.

   NOTICE
   Incorrectly applying power and ground to the recirculation control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 5 terminal of the recirculation control motor, and ground the No. 1 or No. 2 terminals; the recirculation control motor should run smoothly. To avoid damaging the recirculation control motor, do not reverse power and ground. Disconnect the No. 1 or No. 2 terminals from ground; the recirculation control motor should stop at Fresh (when the No. 1 terminal is disconnected) or Recirculate (when the No. 2 terminal is disconnected). Don't cycle the recirculation control motor for a long time.

RECIRCULATION CONTROL MOTOR



3. If the recirculation control motor did not run in step 2, remove it, then check the recirculation control linkage and doors for smooth movement.

   - If the linkage and doors move smoothly, replace the recirculation control motor.
   - If the linkage or doors stick or bind, repair them as needed.

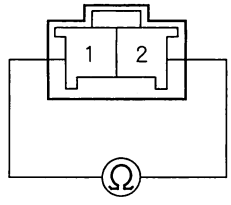
Evaporator Temperature Sensor Test

1. First, dip the sensor in ice water (32°F) (0°C) and measure the resistance between its terminals.

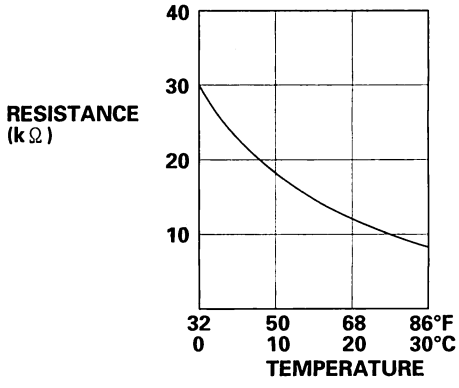
EVAPORATOR TEMPERATURE SENSOR



Terminal side of male terminals

2. Next, pour warm water on the sensor and check for a change in resistance.

3. Compare the resistance readings with the specifications shown in the graph; the resistance should be within the specifications.

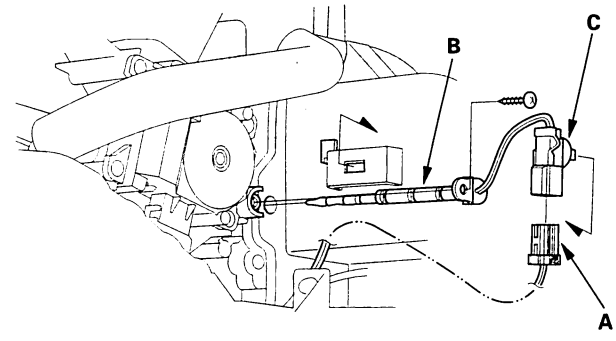


Evaporator Temperature Sensor Replacement

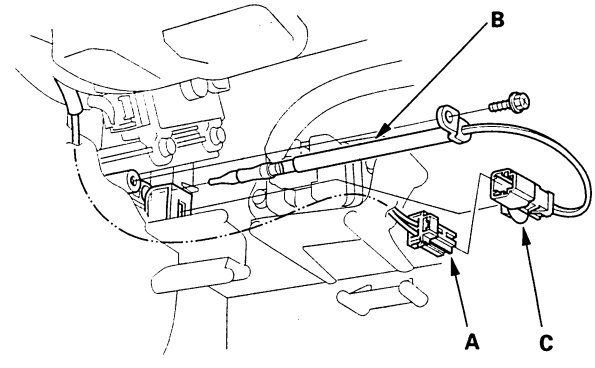
1. Open the glove box. Remove the damper from the glove box, then let the glove box hang down (see page 20-132).

2. Disconnect the 2P connector (A) from the evaporator temperature sensor (B), then remove the connector clip (C). Remove the self-tapping screw, and carefully pull out the evaporator temperature sensor.

4-door:



2-door:



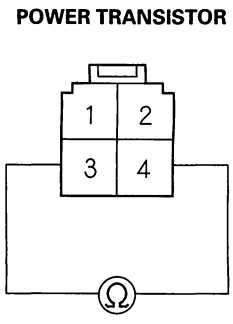
3. Install the sensor in the reverse order of removal.

Protected by AR

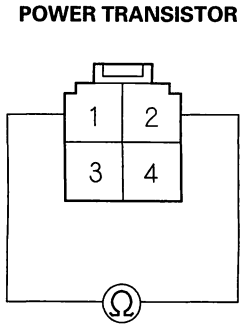
Power Transistor Test

1. Disconnect the 4P connector from the power transistor.
2. Measure the resistance between the No. 3 and No. 4 (4-door) or No. 1 and No. 2 (2-door) terminals of the power transistor. It should be about 1.4—1.5 kΩ.
   - If the resistance is within the specifications, go to step 3.
   - If the resistance is not within the specifications, replace the power transistor.

4-door:

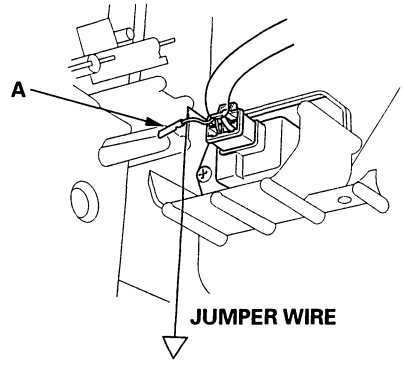


2-door:

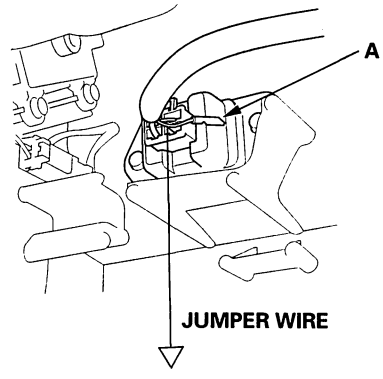


3. Carefully release the lock tab on the No. 1 (4-door) or No. 4 (2-door) terminal (BLU/YEL) (A) in the 4P connector, then remove the terminal and insulate it from body ground.

4-door:



2-door:



4. Reconnect the 4P connector to the power transistor.
5. Supply 12 volts to the No. 1 (4-door) or No. 4 (2-door) cavity of the power transistor connector with a jumper wire.
6. Turn the ignition switch ON (II), and check that the blower motor runs.
   - If the blower motor does not run, replace the power transistor.
   - If the blower motor runs, the power transistor is OK.

BACK

Protected by AR

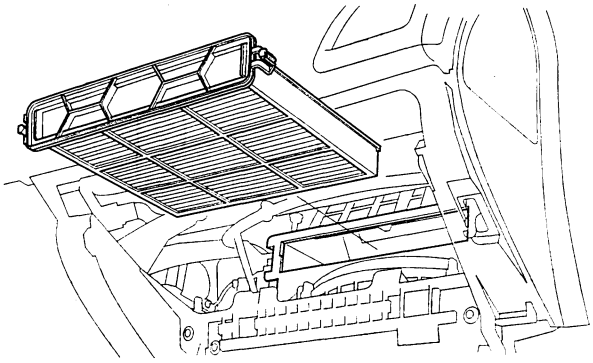
Dust and Pollen Filter Replacement

The dust and pollen filter should be replaced every 30,000 miles (48,000 km) or 24 months, whichever comes first. Replace the filter more often if the airflow is less than usual, or if the vehicle is driven in areas that have high concentrations of soot from industry or diesel powered vehicles.

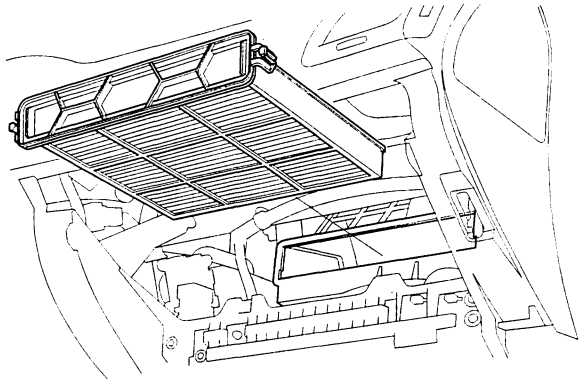
1. Open the glove box. Remove the damper from the glove box then let the glove box hang down (see page 20-132).

2. Remove the dust and pollen filter assembly from the evaporator case.

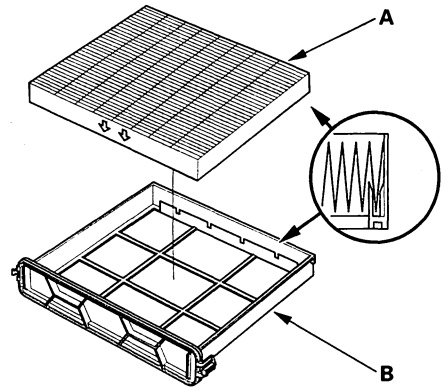
4-door:



2-door:



3. Remove the filter (A) from the housing (B), and replace the filter.



4. Install the filter in the reverse order of removal. Make sure that there is no air leaking out of the evaporator.

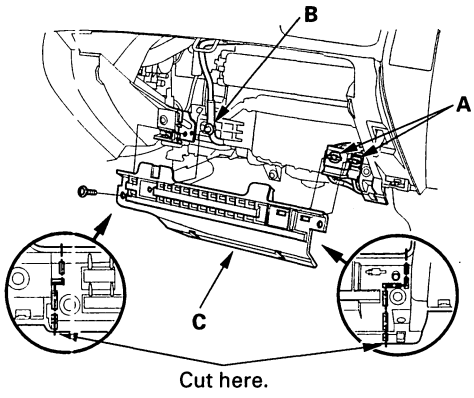
Protected by AR

Blower Unit Removal and Installation

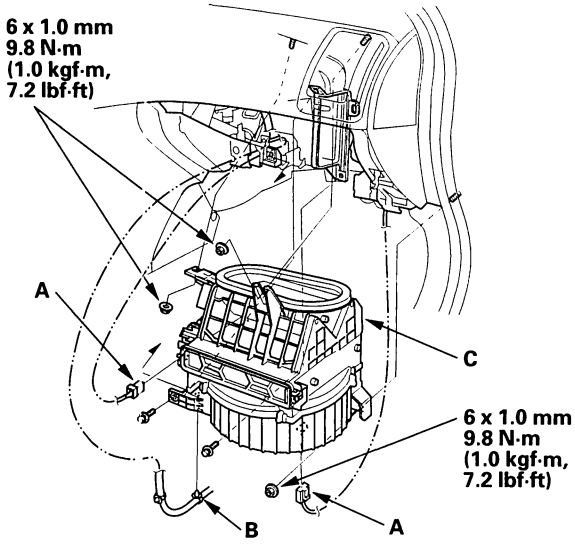
4-door

1. Remove the glove box (see page 20-132), and the passenger's kick panel (see page 20-91).

2. Remove the connector clips (A), the wire harness clip (B), and bolt. Cut the plastic cross brace (C) in the glove box opening with diagonal cutters in the area shown. Retain these parts to be reinstalled later.



3. Disconnect the connectors (A) from the blower motor, and the recirculation control motor, then remove the wire harness clip (B). Remove the mounting nuts, the mounting bolts and the blower unit (C).

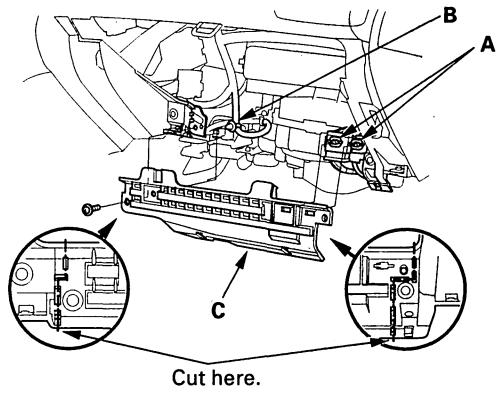


4. Install the unit in the reverse order of removal. Make sure that there is no air leakage.

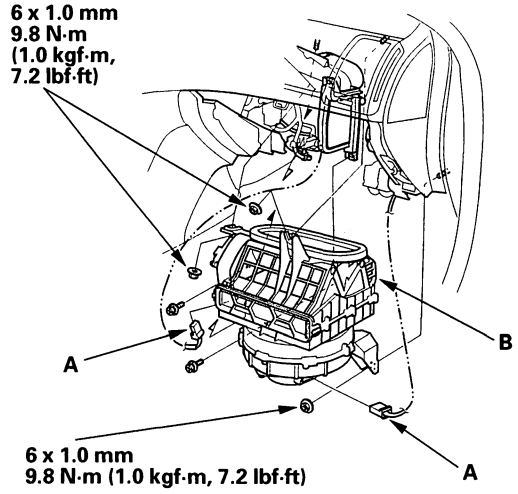
2-door

1. Remove the glove box (see page 20-132), and the passenger's kick panel (see page 20-90).

2. Remove the connector clips (A), the wire harness clip (B), and bolt. Cut the plastic cross brace (C) in the glove box opening with diagonal cutters in the area shown. Retain these parts to be reinstalled later.



3. Disconnect the connectors (A) from the blower motor, and the recirculation control motor. Remove the mounting nuts, the mounting bolts and the blower unit (B).



4. Install the unit in the reverse order of removal. Make sure that there is no air leakage.

BACK

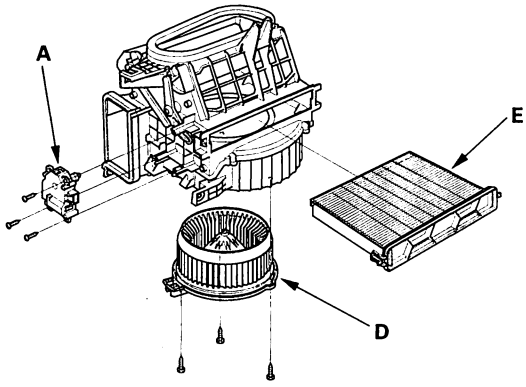
Protected by AR

Blower Unit Component Replacement

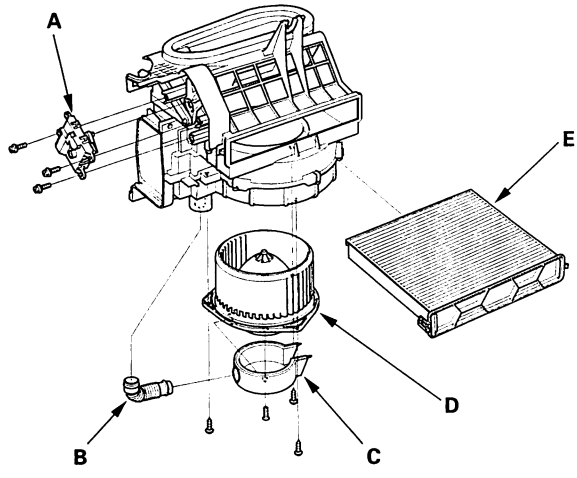
Note these items when overhauling the blower unit:

- The recirculation control motor (A), blower motor cooling hose (B) (2-door), blower motor cover (C) (2-door), the blower motor (D) and the dust and pollen filter (E) can be replaced without removing the blower unit.
- Before reassembly, make sure the recirculation control linkage and doors move smoothly without binding.
- After reassembly, make sure the recirculation control motor runs smoothly, 4-door (see page 21-47), 2-door (see page 21-47).

4-door:



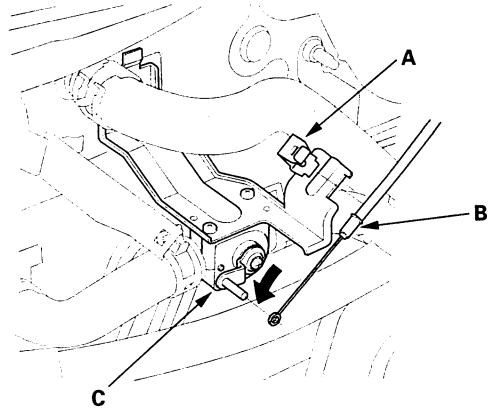
2-door:



Heater Unit/Core Replacement

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs of service.

1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the frequencies for the radio's preset buttons.
2. Disconnect the negative cable from the battery.
3. With air conditioning; disconnect the suction and receiver lines from the evaporator core, 4-door (see page 21-57), 2-door (see page 21-58).
4. From under the hood, open the cable clamp (A), then disconnect the heater valve cable (B) from the heater valve arm (C). Turn the heater valve arm to the fully opened position as shown.



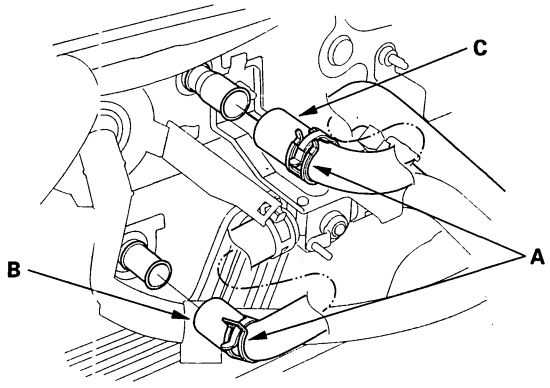
5. When the engine is cool, drain the engine coolant from the radiator (see page 10-6).

(cont'd)

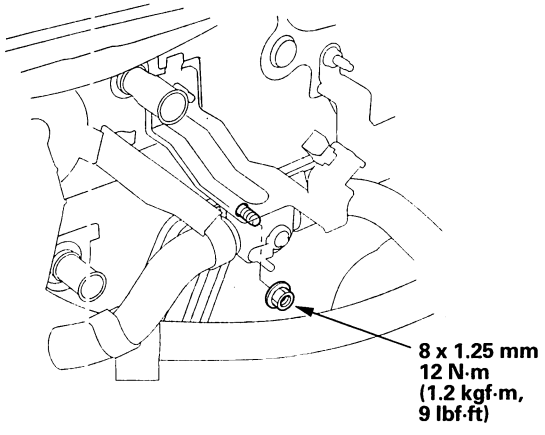
Protected by AR

Heater Unit/Core Replacement (cont'd)

6. Slide the hose clamps (A) back, then disconnect the inlet heater hose (B) and the outlet heater hose (C) from the heater unit. Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.



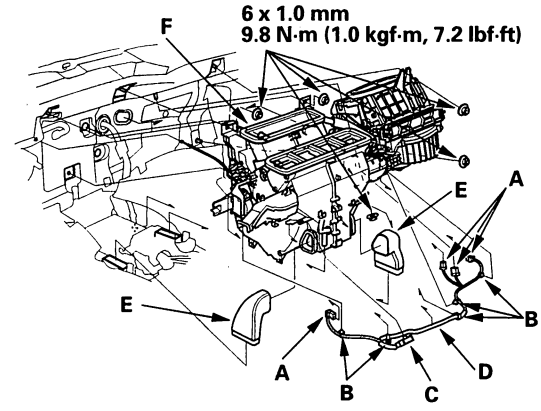
7. Remove the mounting nut from the heater unit. *Take care not to damage or bend the fuel lines and the brake lines, etc.*



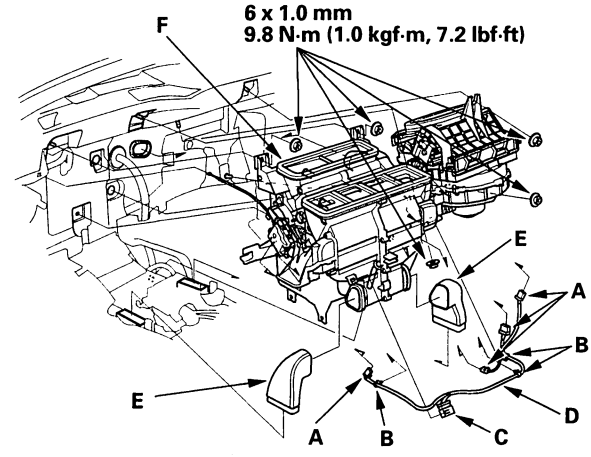
8. Remove the dashboard (see page 20-136).

9. Disconnect the connectors (A) from the air mix control motor, the evaporator temperature sensor, the power transistor, and the recirculation control motor, then remove the wire harness clips (B), the connector clip (C) and the wire harness (D). Remove the heater ducts (E), then remove the mounting nuts and the blower-heater unit (F).

4-door:



2-door:

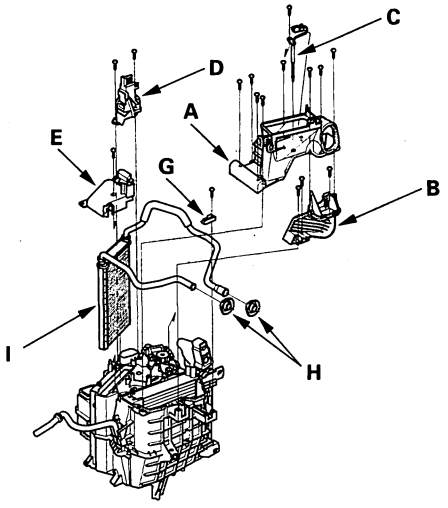


BACK

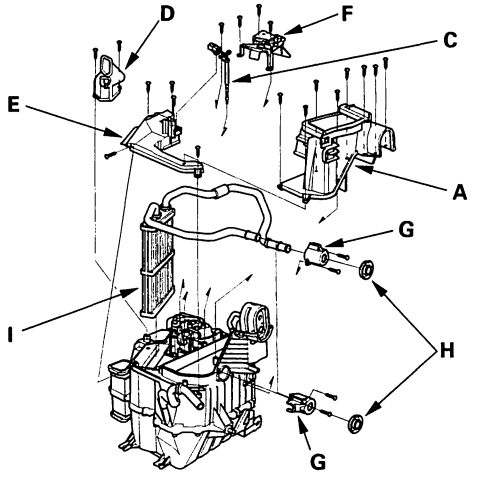
Protected by AR

10. Remove the self-tapping screws, the evaporator temperature sensor (C) and the joint duct A, then remove the self-tapping screws and the joint duct B (4-door). Remove the self-tapping screws, then remove the passenger's heater outlet (D), and the heater core cover (E). Remove the self-tapping screws and the mode control motor (F) (2-door). Remove the self-tapping screws, the heater pipe brackets (G), the grommets (H) and carefully pull out the heater core (I) so you don't bend the inlet and outlet pipes.

4-door:



2-door:



11. Install the heater core and the evaporator core (with A/C) in the reverse order of removal.

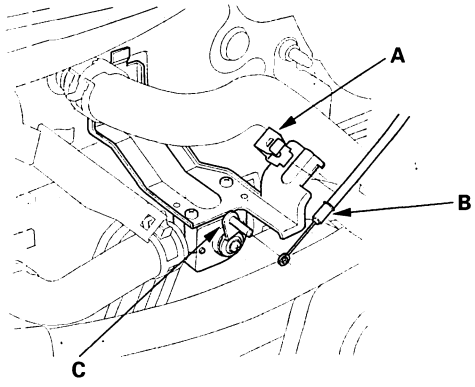
12. Install the heater unit in the reverse order of removal, and note these items:

- Do not interchange the inlet and outlet heater hoses, and install the hose clamps securely.
- Refill the cooling system with engine coolant (see page 10-6).
- Adjust the heater valve cable (see page 21-56).
- Make sure that there is no coolant leakage.
- Make sure that there is no air leakage.
- With air conditioning: refer to evaporator core replacement (see page 21-57).
- Reset the power window control unit (see page 22-232).
- Enter the anti-theft codes for the radio and the navigation system, then enter the customer's radio station presets.

Protected by AR

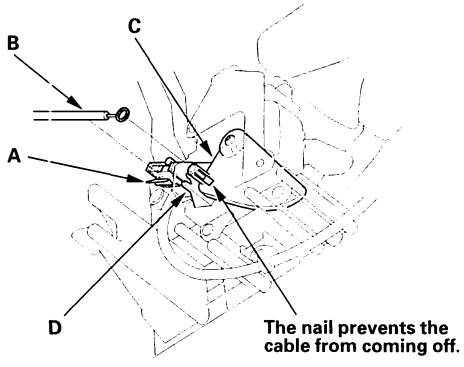
Heater Valve Cable Adjustment

1. From under the hood, open the cable clamp (A), then disconnect the heater valve cable (B) from the heater valve arm (C).

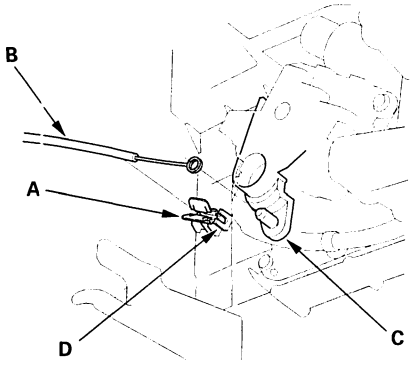


2. From under the dash, disconnect the heater valve cable housing from the cable clamp (A), and disconnect the heater valve cable (B) from the air mix control linkage (C).

4-door:



2-door:

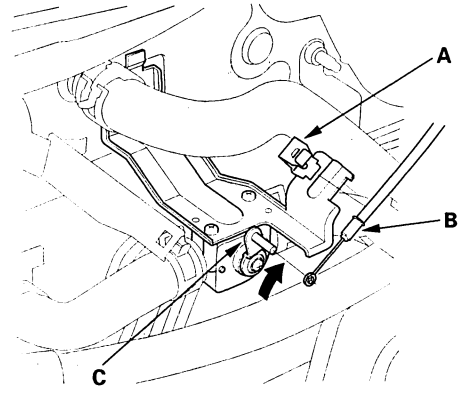


3. Set the temperature control dial to Max Cool (LO) with the ignition switch ON (II).

4. Attach the heater valve cable (B) to the air mix control linkage (C) as shown step 2. Hold the end of the heater valve cable housing against the stop (D), then snap the heater valve cable housing into the cable clamp (A).

   NOTE:
   - Insert the ring from the end of the cable securely to the linkage pin.
   - 4-door: Insert the ring over the nail, making sure it is correctly attached.
   - 2-door: Insert the ring all the way to the base of the pin.

5. From under the hood, turn the heater valve arm (C) to the fully closed position as shown, and hold it. Attach the heater valve cable (B) to the heater valve arm, and gently pull on the heater valve cable housing to take up any slack, then install the heater valve cable housing into the cable clamp (A).



BACK

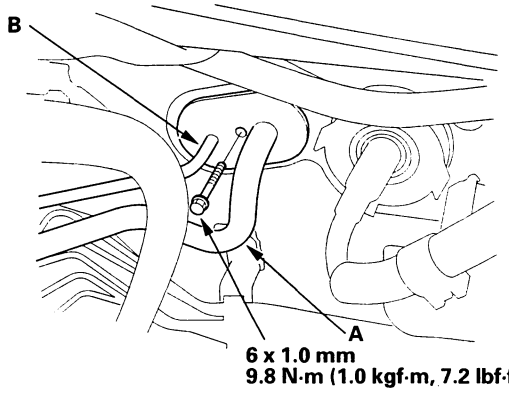
Protected by AR

Evaporator Core Replacement

4-door

1. Recover the refrigerant with a recovery/recycling/charging station (see page 21-65).

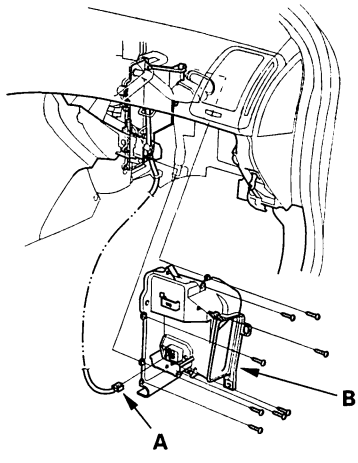
2. Remove the bolt, then disconnect the suction line (A) and the receiver line (B) from the evaporator core.



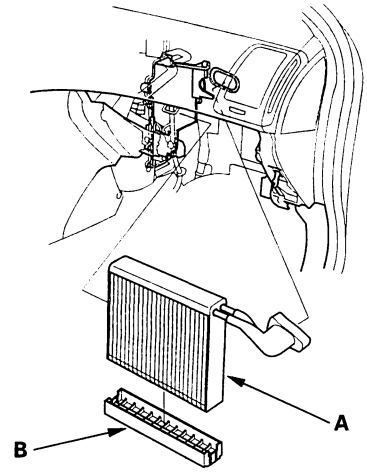
3. Remove the blower unit, 4-door (see page 21-52), 2-door (see page 21-52).

4. Remove the evaporator temperature sensor (see page 21-49).

5. Disconnect the connector (A) from the power transistor, then remove the self-tapping screws, and the expansion valve cover (B).



6. Carefully pull out the evaporator core (A) and the plate (B) without bending the pipes.



7. Install the core in the reverse order of removal, and note these items:

- If you're installing a new evaporator core, add refrigerant oil (DENSO ND-OIL 8) (see page 21-8).
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
- Make sure that there is no air leakage.
- Charge the system (see page 21-67).

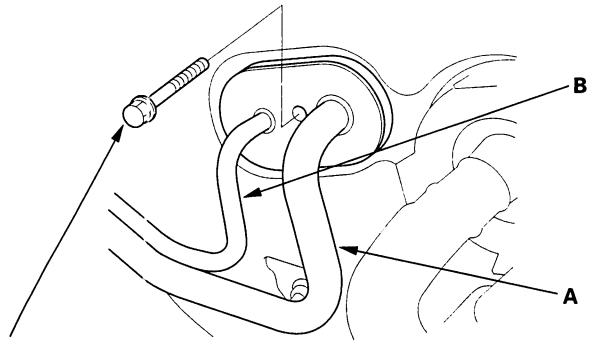
Protected by AR

Evaporator Core Replacement (cont'd)

2-door

1. Recover the refrigerant with a recovery/recycling/charging station (see page 21-65).

2. Remove the bolt, then disconnect the suction line (A) and the receiver line (B) from the evaporator core.

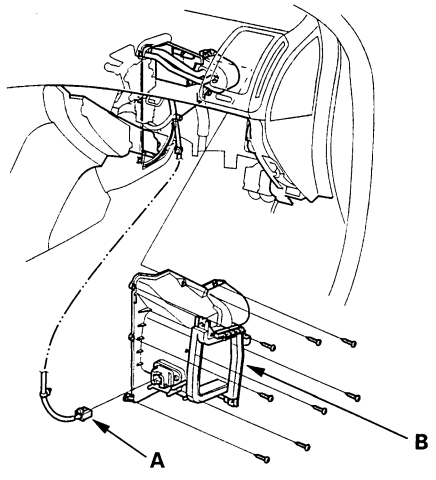


6 x 1.0 mm
9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)

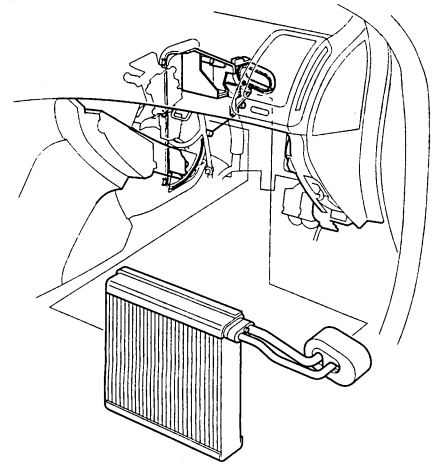
3. Remove the blower unit, 4-door (see page 21-52), 2-door (see page 21-52).

4. Remove the evaporator temperature sensor (see page 21-49).

5. Disconnect the connector (A) from the power transistor, then remove the self-tapping screws, and the expansion valve cover (B).



6. Carefully pull out the evaporator core without bending the pipes.



7. Install the core in the reverse order of removal, and note these items:

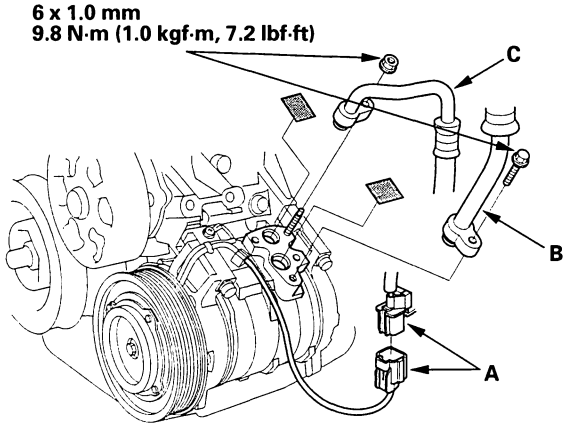
- If you're installing a new evaporator core, add refrigerant oil (DENSO ND-OIL 8) (see page 21-8).
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
- Make sure that there is no air leakage.
- Charge the system (see page 21-67).

BACK

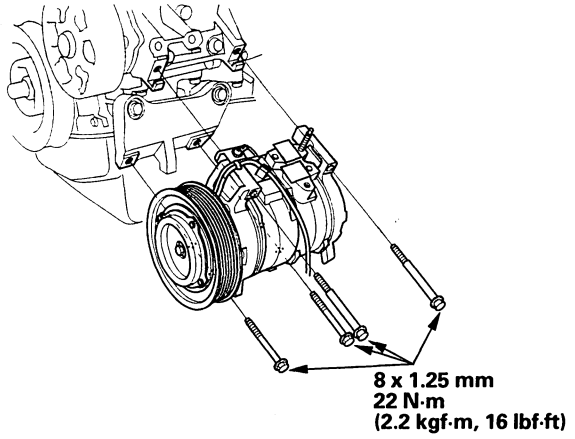
Protected by AR

A/C Compressor Replacement

1. If the A/C compressor is marginally operable, run the engine at idle speed, and let the air conditioning work for a few minutes, then shut the engine off.
2. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the frequencies for the radio's preset buttons.
3. Disconnect the negative cable from the battery.
4. Recover the refrigerant with a recovery/recycling/charging station (see page 21-65).
5. Remove the alternator (see page 4-40).
6. Remove the A/C compressor clutch connector (A) from the A/C condenser fan shroud, then disconnect the connector. Remove the bolt and the nut, then disconnect the suction line (B) and discharge line (C) from the A/C compressor. Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.



7. Remove the mounting bolts and the A/C compressor. Be careful not to damage the radiator fins when removing the A/C compressor.



8. Install the A/C compressor in the reverse order of removal, and note these items:

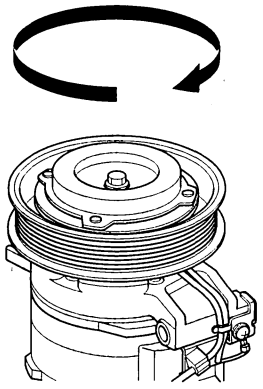
- If you're installing a new A/C compressor, you must calculate the amount of refrigerant oil to be removed from it (see page 21-8).
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
- Use refrigerant oil (DENSO ND-OIL 8) for HFC-134a DENSO piston type A/C compressor only.
- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
- Be careful not to damage the radiator fins when installing the A/C compressor and the A/C condenser fan shroud.
- Charge the system (see page 21-67).
- Reset the power window control unit (see page 22-232).
- Enter the anti-theft codes for the radio, and the navigation system, then enter the customer's radio station presets.

Protected by AR

A/C Compressor Clutch Check

1. Check the pressure plate for discoloration, peeling, or other damage. If there is damage, replace the clutch set (see page 21-61).

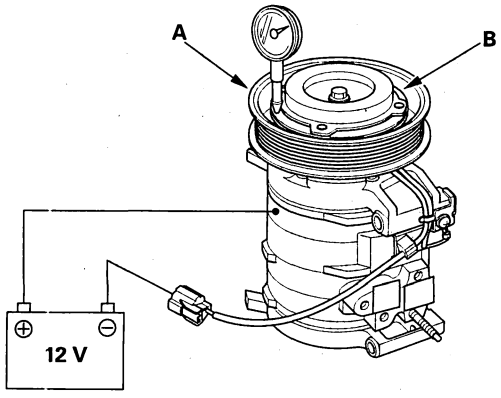
2. Check the pulley bearing play and drag by rotating the pulley by hand. Replace the clutch set with a new one if it is noisy or has excessive play/drag (see page 21-61).



3. Measure the clearance between the pulley (A) and the pressure plate (B) with a dial indicator. Zero out the indicator, then apply battery voltage to the A/C compressor clutch. Measure the movement of the pressure plate when the voltage is applied. If the clearance is not within the specified limits, the pressure plate must be reshimmed (see page 21-61).

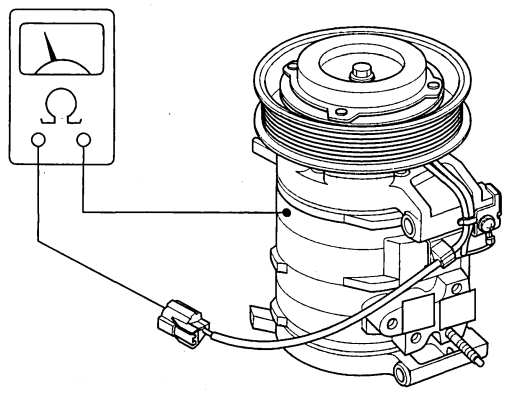
Clearance: 0.35—0.6 mm (0.014—0.024 in.)

NOTE: The shims are available in three thicknesses: 0.1 mm, 0.3 mm and 0.5 mm.



4. Check resistance of the field coil. If resistance is not within specifications, replace the field coil (see page 21-61).

Field Coil Resistance: 3.9—4.3 ohms at 68°F (20°C)



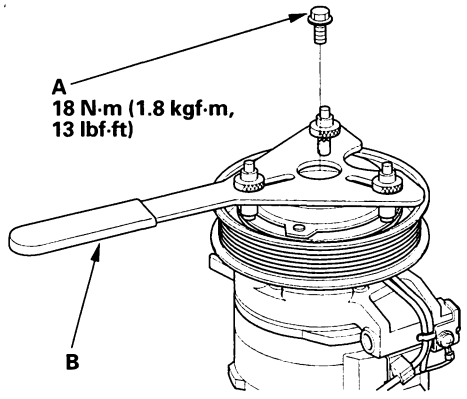
BACK

Protected by AR

A/C Compressor Clutch Overhaul

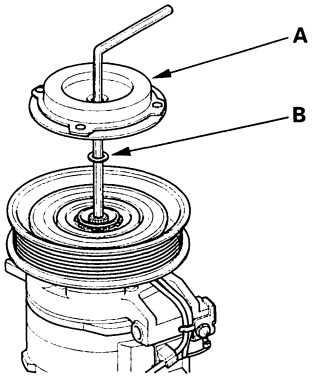
Special Tools Required
A/C clutch holder, Robinair 10204 or Kent-Moore J37872, or Honda Tool and Equipment KMT-J33939, commercially available

1. Remove the center bolt (A) while holding the pressure plate with a commercially available A/C clutch holder (B).

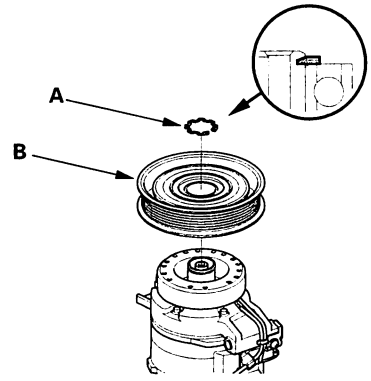


2. Remove the pressure plate (A) and shim(s) (B), taking care not to lose the shim(s). If the clutch needs adjustment, increase or decrease the number and thickness of shims as necessary, then reinstall the pressure plate, and recheck its clearance (see page 21-60).

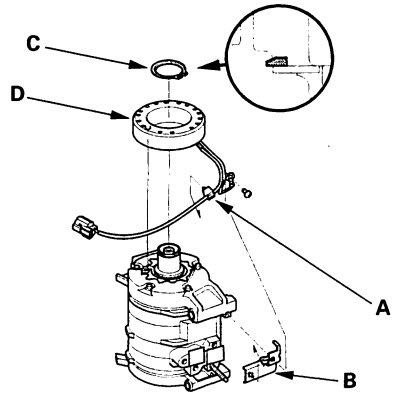
   NOTE: The shims are available in three thicknesses: 0.1 mm, 0.3 mm and 0.5 mm.



3. If you are replacing the field coil, remove the snap ring (A) with snap ring pliers, then remove the pulley (B). Be careful not to damage the pulley or the A/C compressor.



4. Remove the screw, the wire harness clip (A), and the holder (B). Remove the snap ring (C) with snap ring pliers, then remove the field coil (D). Be careful not to damage the field coil or the A/C compressor.



5. Reassemble the clutch in the reverse order of disassembly, and note these items:

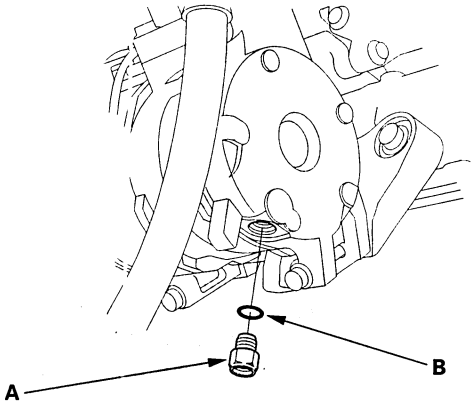
   - Install the field coil with the wire side facing down, and align the boss on the field coil with the hole in the A/C compressor.
   - Clean the pulley and A/C compressor sliding surfaces with contact cleaner or other non-petroleum solvent.
   - Install new snap rings, note the installation direction, and make sure they are fully seated in the groove.
   - Make sure that the pulley turns smoothly after it's reassembled.
   - Route and clamp the wires properly or they can be damaged by the pulley.

BACK

Protected by AR

A/C Compressor Relief Valve Replacement

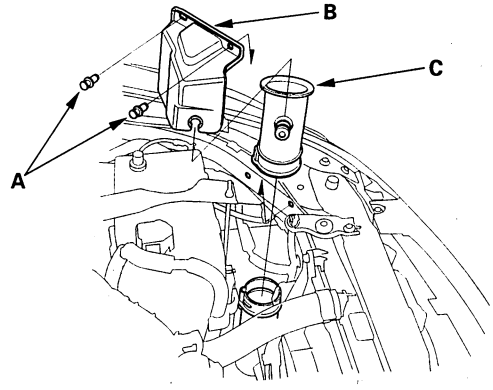
1. Recover the refrigerant with a recovery/recycling/charging station (see page 21-65).
2. Remove the relief valve (A) and the O-ring (B). Plug the opening to keep foreign matter from entering the system and the A/C compressor oil from running out.



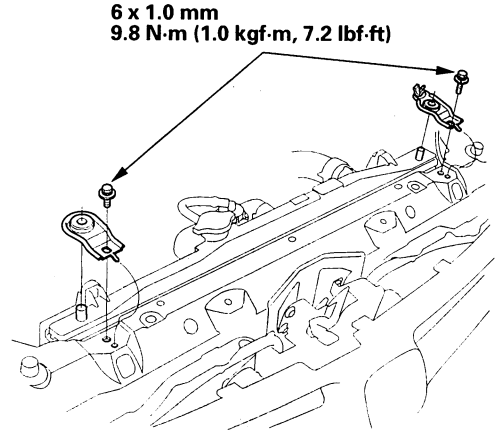
3. Clean the mating surfaces.
4. Replace the O-ring with a new one at the relief valve, and apply a thin coat of refrigerant oil before installing it.
5. Remove the plug, and install and tighten the relief valve.
6. Charge the system (see page 21-67).

A/C Condenser Replacement

1. Recover the refrigerant with a recovery/recycling/charging station (see page 21-65).
2. Remove the front bulkhead cover.
   - 4-door (see page 20-185)
   - 2-door (see page 20-184)
3. Remove the clips (A), then remove the air intake cover (B) and the air intake tube or duct (C).



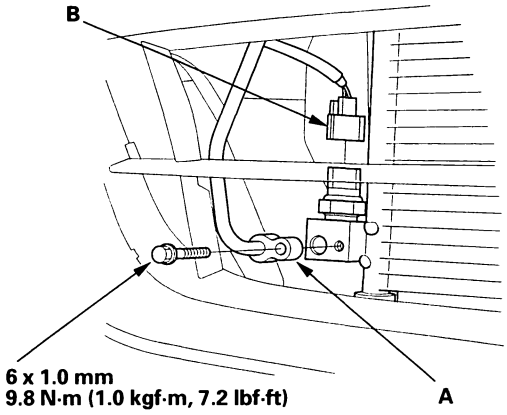
4. Remove the bolts and radiator upper mount brackets.



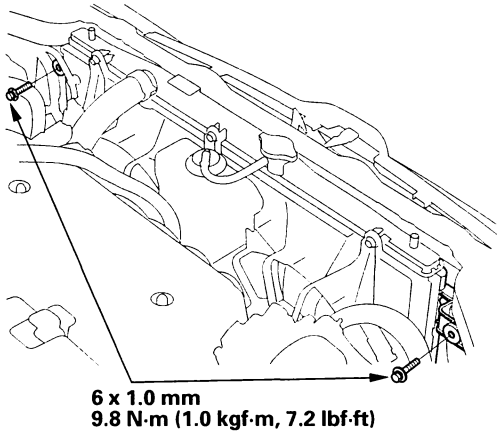
BACK

Protected by AR

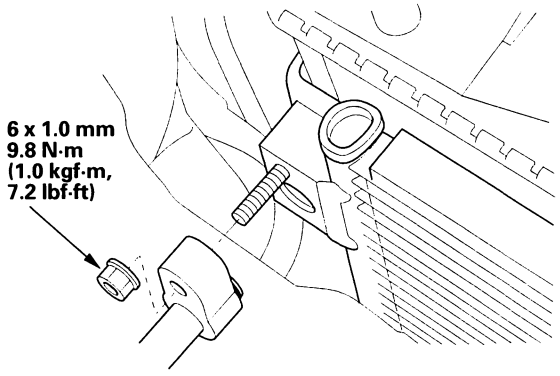
5. Remove the bolt, then disconnect the receiver line (A) from the A/C condenser. Disconnect the A/C pressure switch connector (B).



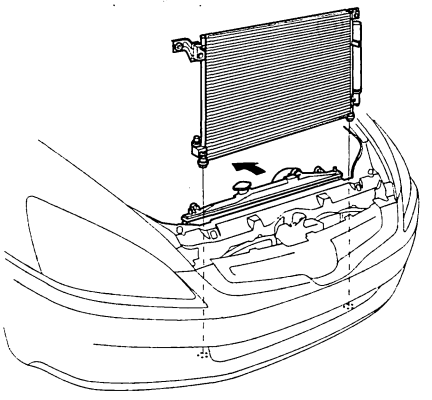
6. Remove the bolts from the A/C condenser.



7. Remove the nut, then disconnect the discharge line from the A/C condenser.



8. Remove the A/C condenser by lifting it up. Be careful not to damage the radiator and A/C condenser fins when removing the A/C condenser.



9. Install the A/C condenser in the reverse order of removal, and note these items:

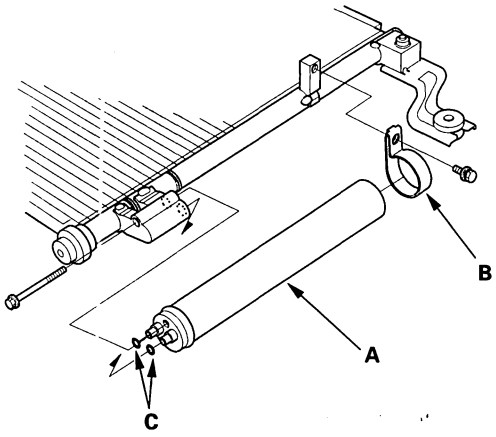
- If you're installing a new A/C condenser, add refrigerant oil (DENSO ND-OIL 8) (see page 21-8).
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
- Be careful not to damage the radiator or the A/C condenser fins when installing the A/C condenser.
- Charge the system (see page 21-67).

Protected by AR

Receiver/Dryer Desiccant Replacement

1. Remove the A/C condenser (see page 21-62).

2. Remove the bolts from the A/C condenser, then remove the receiver/dryer (A), the bracket (B) and the O-rings (C).



3. Install the receiver/dryer in the reverse order of removal, and note these items:

   Replace the O-rings with new ones, and apply a thin coat of refrigerant oil (DENSO ND-OIL 8) before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.

BACK

Protected by AR

Refrigerant Recovery

⚠CAUTION

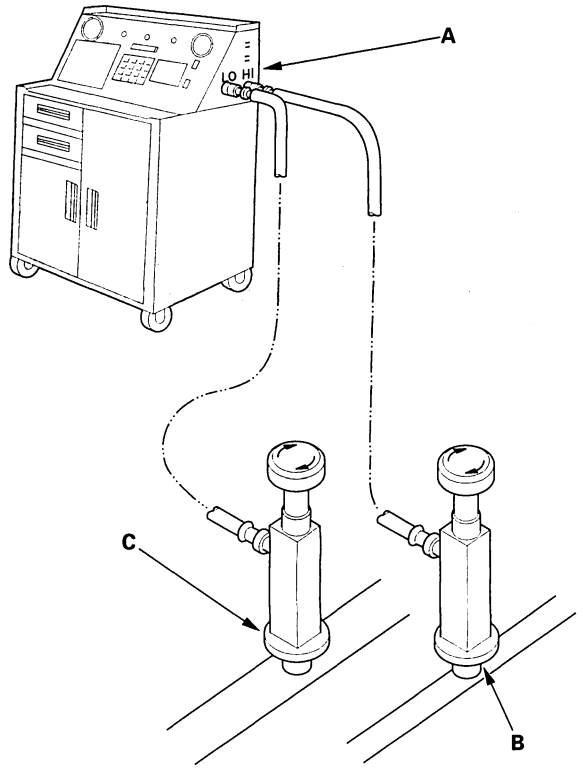
- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2210 to remove HFC-134a (R-134a) from the air conditioning system.

If accidental system discharge occurs, ventilate work area before resuming service.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect a R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.



2. Measure the amount of refrigerant oil removed from the A/C system after the recovery process is completed. Be sure to put the same amount of new refrigerant oil back into the A/C system before charging.

Protected by AR

System Evacuation

⚠CAUTION

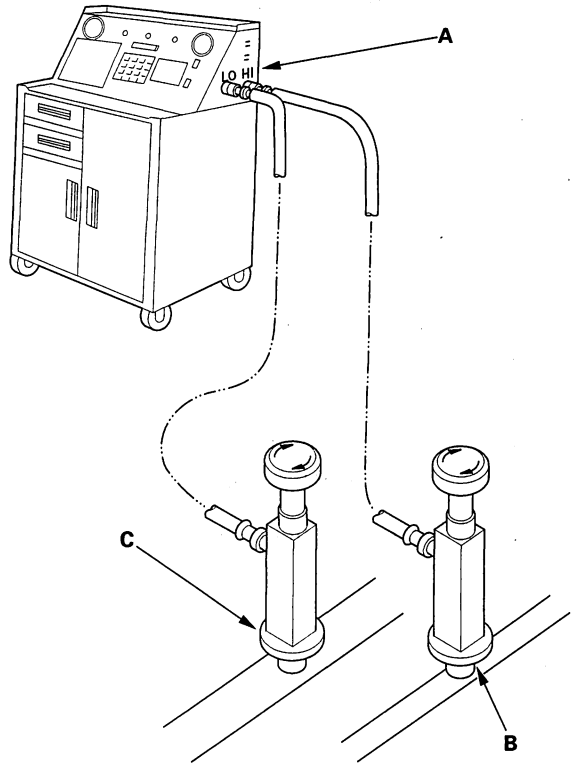
- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2210 to remove HFC-134a (R-134a) from the air conditioning system.

If accidental system discharge occurs, ventilate work area before resuming service.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. When an A/C System has been opened to the atmosphere, such as during installation or repair, it must be evacuated using a R-134a refrigerant recovery/recycling/charging station. (If the system has been open for several days, the receiver/dryer should be replaced, and the system should be evacuated for several hours.)
2. Connect a R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions. Evacuate the system.



3. If the low-pressure does not reach more than 93.3 kPa (700 mmHg, 27.6 in.Hg) in 15 minutes, there is probably a leak in the system. Partially charge the system, and check for leaks (see step 3 on page 21-68).

BACK

Protected by AR

System Charging

⚠CAUTION

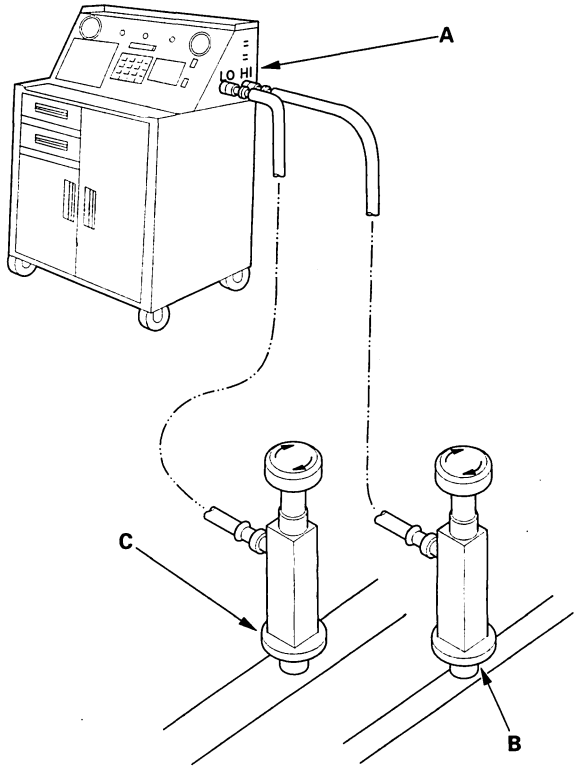
- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2210 to remove HFC-134a (R-134a) from the air conditioning system.

If accidental system discharge occurs, ventilate work area before resuming service.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect a R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.



2. Evacuate the system (see page 21-66).
3. Add the same amount of new refrigerant oil to the system that was removed during recovery. Use only DENSO ND-OIL 8 refrigerant oil.
4. Charge the system with the specified amount of R-134a refrigerant. Do not overcharge the system; the compressor will be damaged.

   Select the appropriate units of measure for your refrigerant charging station.

   Refrigerant Capacity:
   500 to 550 g
   0.50 to 0.55 kg
   1.1 to 1.2 lbs
   17.6 to 19.4 oz
5. Check for refrigerant leaks (see page 21-68).
6. Check for system performance (see page 21-69).

Protected by AR

Refrigerant Leak Test

Special Tools Required
Leak detector, Honda Tool and Equipment YGK-H-10PM commercially available

⚠WARNING

- Compressed air mixed with R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning system.

⚠CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

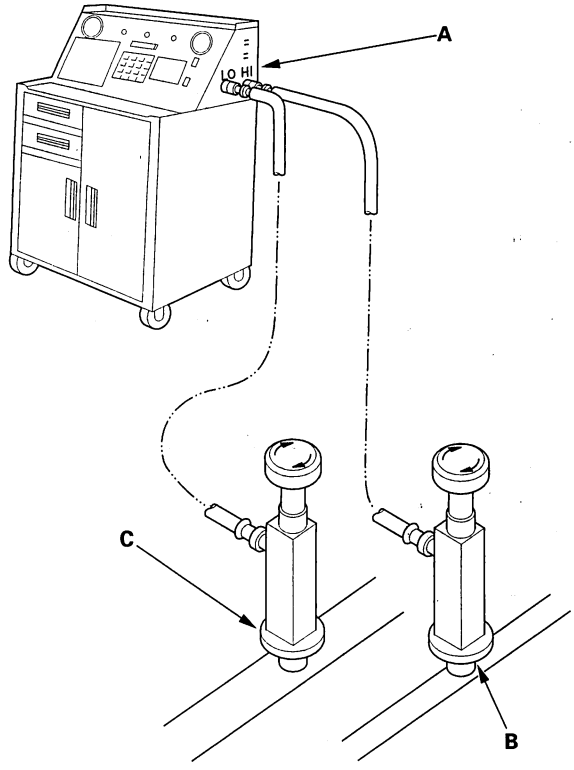
Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2210 to remove HFC-134a (R-134a) from the air conditioning system.

If accidental system discharge occurs, ventilate work area before resuming service.

R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect a R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.



2. Open high pressure valve to charge the system to the specified capacity, then close the supply valve, and disconnect the charging station fittings.

   Select the appropriate units of measure for your refrigerant charging station.

   Refrigerant Capacity:
   500 to 550 g
   0.50 to 0.55 kg
   1.1 to 1.2 lbs
   17.6 to 19.4 oz

3. Check the system for leaks using a R-134a refrigerant leak detector with an accuracy of 14 g (0.5 oz) per year or better.

4. If you find leaks that require the system to be opened (to repair or replace hoses, fittings, etc.), recover the system.

5. After checking and repairing leaks, the system must be evacuated.

A/C System Test

Performance Test

⚠ WARNING

- Compressed air mixed with R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.

⚠ CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

The performance test will help determine if the air conditioner system is operating within specifications.

Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2210 to remove HFC-134a (R-134a) from the air conditioning system.

If accidental system discharge occurs, ventilate work area before resuming service.

R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.

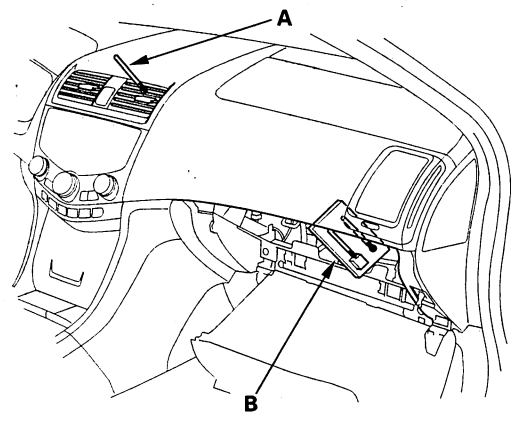
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect a R-134a refrigerant recovery/recycling/charging station to the high-pressure service port and the low-pressure service port, following the equipment manufacturer's instructions.

2. Determine the relative humidity and air temperature.

3. Open the glove box. Remove the damper from the glove box, then let the glove box hang down (see page 20-132).

4. Insert a thermometer (A) in the center vent.



5. Place a thermometer (B) near the blower unit.

6. Test conditions:

   - Avoid direct sunlight.
   - Open hood.
   - Open front doors.
   - Set the temperature control dial to Max Cool, the mode control switch to Vent and the recirculation control switch to Recirculate.
   - Turn the A/C switch on and the fan switch to Max.
   - Run the engine at 1,500 rpm.
   - No driver or passengers in vehicle.

7. After running the air conditioning for 10 minutes under the above test conditions, read the delivery temperature from the thermometer in the center vent, the intake temperature near the blower unit, and the high and low system pressure from the A/C gauges.

(cont'd)

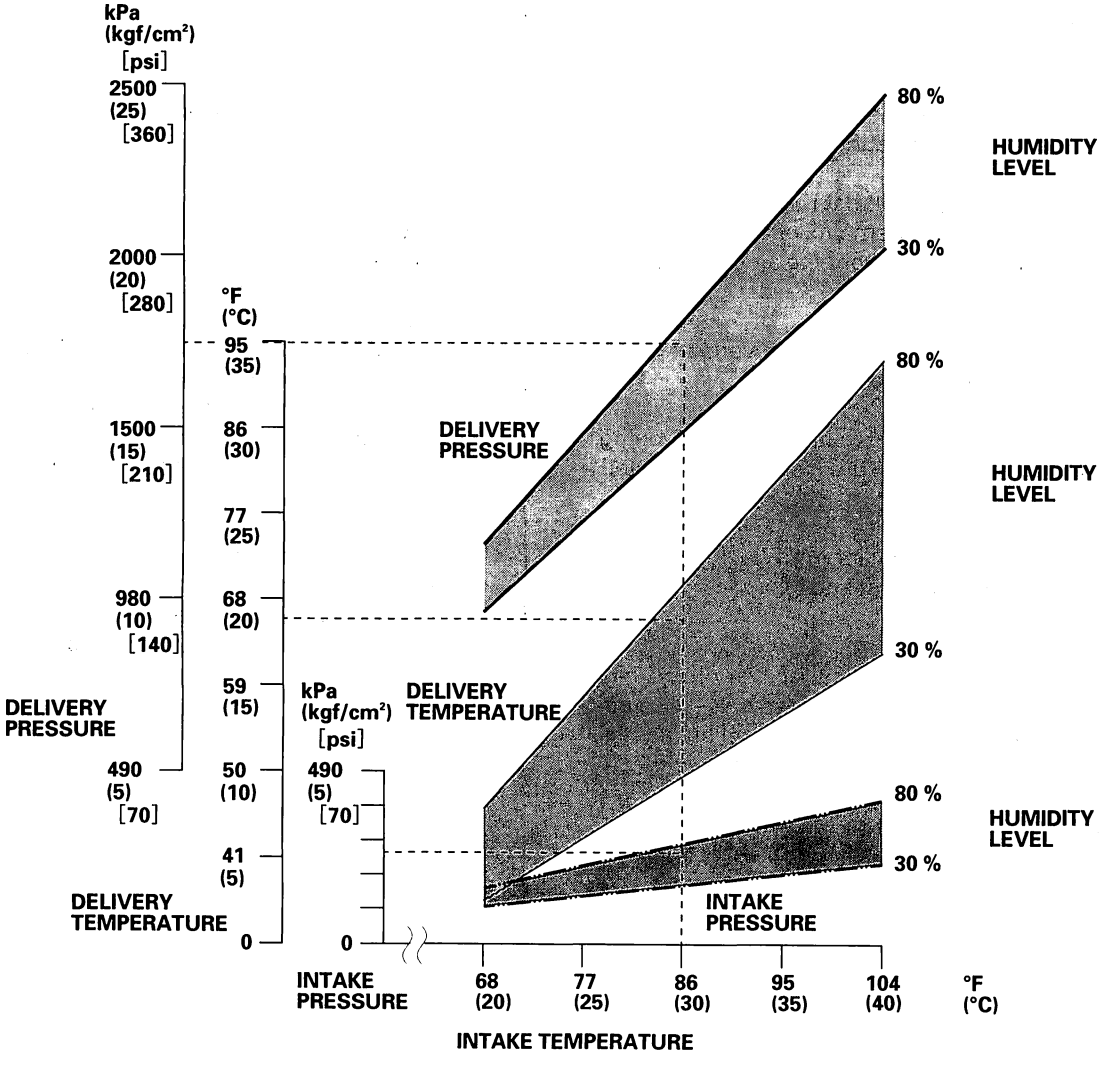
Protected by AR

A/C System Test (cont'd)

8. To complete the charts:

- Mark the delivery temperature along the vertical line.
- Mark the intake temperature (ambient air temperature) along the bottom line.
- Draw a line straight up from the air temperature to the humidity.
- Mark a point 10 % above and 10 % below the humidity level.
- From each point, draw a horizontal line across the delivery temperature.
- The delivery temperature should fall between the two lines.
- Complete the low-side pressure test and high-side pressure test in the same way.
- Any measurements outside the line may indicate the need for further inspection.

Example	Intake temperature (dry):	86°F (30°C) Humidity level 70 %
	Intake temperature (wet):	77.9°F (25.5°C)
	Intake pressure:	255 kPa (2.6 kgf/cm²) (37.0 psi)
	Delivery temperature:	65.5°F (18.6°C)
	Delivery pressure:	1716 kPa (17.5 kgf/cm²) (248.9 psi)
Results:	Within normal range	



BACK

Protected by AR

Pressure Test

Test results	Related symptoms	Probable cause	Remedy
Discharge (high) pressure abnormally high	After stopping A/C compressor, pressure drops about 196 kPa (2.0 kgf/cm², 28 psi) quickly, and then falls gradually.	Air in system	Recover, evacuate (see page 21-66), and recharge with specified amount (see page 21-67).
	Reduced or no air flow through A/C condenser.	• Clogged A/C condenser or radiator fins • A/C condenser or radiator fan not working properly	• Clean • Check voltage and fan rpm. • Check fan direction.
	Line to A/C condenser is excessively hot.	Restricted flow of refrigerant in system	Restricted lines
Discharge pressure abnormally low	High and low-pressures are balanced soon after stopping A/C compressor. Low side is higher than normal.	• Faulty A/C compressor discharge valve • Faulty A/C compressor seal	Replace the A/C compressor.
	Outlet of expansion valve is not frosted, low-pressure gauge indicates vacuum.	• Faulty expansion valve • Moisture in system	• Replace • Recover, evacuate, and recharge with specified amount.
Suction (low) pressure abnormally low	Expansion valve is not frosted, and low-pressure line is not cold. Low-pressure gauge indicates vacuum.	• Frozen expansion valve (Moisture in system) • Faulty expansion valve	• Recover, evacuate, and recharge with specified amount. • Replace the expansion valve.
	Discharge temperature is low, and the air flow from vents is restricted.	Frozen evaporator	Run the fan with A/C compressor off, then check evaporator temperature sensor.
	Expansion valve is frosted.	Clogged expansion valve	Clean or replace.
Suction pressure abnormally high	Low-pressure hose and check joint are cooler than the temperature around evaporator.	Expansion valve open too long	Repair or replace.
	Suction pressure is lowered when A/C condenser is cooled by water.	Excessive refrigerant in system	Recover, evacuate, and recharge with specified amount.
	High and low-pressures are equalized as soon as the A/C compressor is stopped, and both gauges fluctuate while running.	• Faulty gasket • Faulty high-pressure valve • Foreign particle stuck in high-pressure valve	Replace the A/C compressor.
Suction and discharge pressures abnormally high	Reduced air flow through A/C condenser.	• Clogged A/C condenser or radiator fins • A/C condenser or radiator fan not working properly	• Clean • Check voltage and fan rpm. • Check fan direction.
Suction and discharge pressures abnormally low	Low-pressure hose and metal end areas are cooler than evaporator.	Clogged or kinked low-pressure hose parts	Repair or replace.
	Temperature around expansion valve is too low compared with that around receiver/dryer.	Clogged high-pressure line	Repair or replace.
Refrigerant leaks	A/C compressor clutch is dirty.	A/C compressor shaft seal leaking	Replace the A/C compressor.
	A/C compressor bolt(s) are dirty.	Leaking around bolt(s)	Tighten bolt(s) or replace the A/C compressor.
	A/C compressor gasket is wet with oil.	Gasket leaking	Replace the A/C compressor.
	A/C fitting is dirty.	Leaking O-ring.	Clean A/C fitting and replace O-ring.

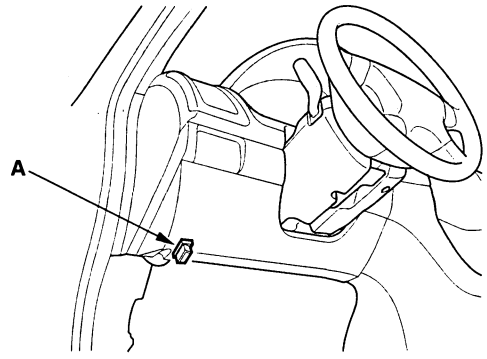
General Troubleshooting Information

How to Check for DTCs with the HDS

NOTE: Before troubleshooting the climate control system, refer to the multiplex integrated control system test mode A (see page 22-91).

1. Make sure the ignition switch is OFF.
2. Connect the HDS to the Data Link Connector (DLC) (A) located under the driver's side of the dashboard.



3. Turn the ignition switch ON (II).
4. Select DTCs in the body electrical climate control mode MENU of the HDS.
5. Check for DTCs. If a DTC is indicated, go to the next step. If no DTC(s) is indicated, refer to symptom troubleshooting.
6. Turn the ignition switch OFF.
7. Disconnect the HDS from the DLC.
8. Do the troubleshooting procedure for the DTC indicated.

(cont'd)

Protected by AR

General Troubleshooting Information (cont'd)

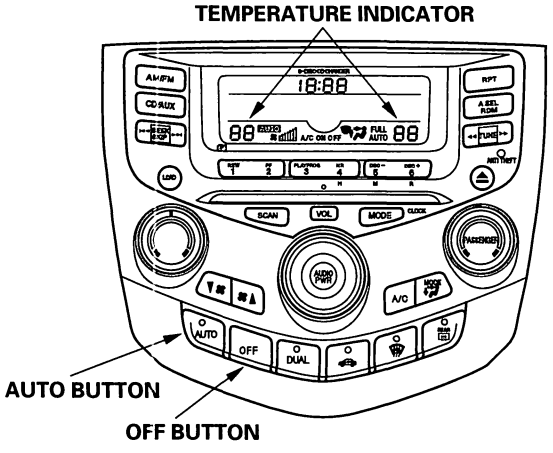
How to Retrieve a DTC (Without HDS)

The audio-HVAC display panel has a self-diagnosis function for climate control. To run the self-diagnosis function, do the following:

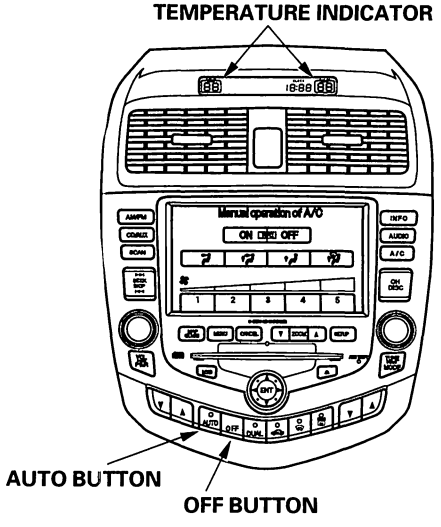
NOTE: Before troubleshooting the climate control system, refer to the multiplex integrated control system test mode A (see page 22-91).

1. Turn the ignition switch ON (II).
2. Press the AUTO button and then the OFF button. Continue to hold both buttons down for 1 minute.

Without Navigation System:



With Navigation System:

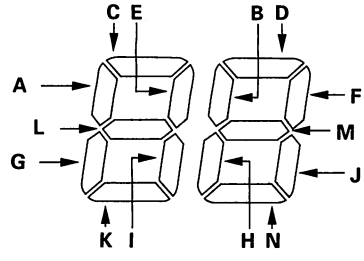


If there are any problems in the system, the temperature indicator will light up the segment (A through Q) corresponding to the error. The temperature indicator will then alternate every second between displaying "88" (all segments lit) and the error code segment (A through Q).

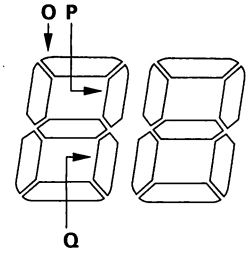
NOTE: The system will only display the DTC when the AUTO and OFF buttons are pressed. If you release the buttons, the display will go blank. To return the display, simply press the AUTO then the OFF buttons again.

To determine the meaning of the DTC, refer to the DTC Troubleshooting Index. If no segments light up, the system is still not operating properly, check the sensor inputs to the climate control unit, or refer to symptom troubleshooting.

DRIVER'S TEMPERATURE INDICATOR



PASSENGER'S TEMPERATURE INDICATOR



Cancelling the Self-diagnostic Function

3. Turn the ignition switch OFF to cancel the self-diagnostic function. After completing repair work, run the self-diagnostic function again to make sure that there are no other malfunctions.

BACK

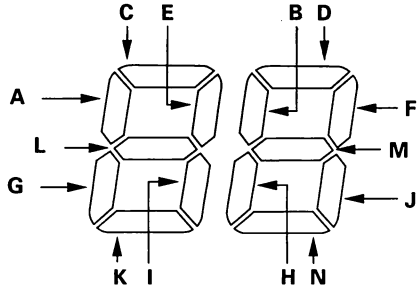
Protected by AR

Checking the DTCs by DTC Indicator

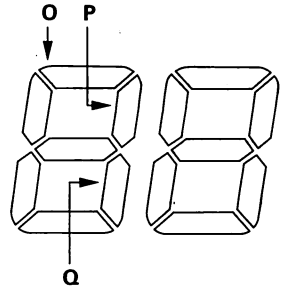
NOTE: Before troubleshooting the climate control system, refer to the multiplex integrated control system test mode A (see page 22-91).

To retrieve the DTC, you must run the self-diagnostic function. In the case of multiple problems, the respective indicator segments will come on. If indicator segments A, C, E, G, I, L, and O come on at the same time, there may be an open in the common ground wire of the sensors.

DRIVER'S TEMPERATURE INDICATOR



PASSENGER'S TEMPERATURE INDICATOR



DTC (Temperature Indicator segment)	Detection Item	Page
A	An open in the in-car temperature sensor circuit	(see page 21-94)
B	A short in the in-car temperature sensor circuit	(see page 21-95)
C	An open in the outside air temperature sensor circuit	(see page 21-96)
D	A short in the outside air temperature sensor circuit	(see page 21-97)
E	An open in the sunlight sensor circuit	(see page 21-98)
F	A short in the sunlight sensor circuit	(see page 21-99)
G	An open in the evaporator temperature sensor circuit	(see page 21-100)
H	A short in the evaporator temperature sensor circuit	(see page 21-101)
I	An open in the driver's air mix control motor circuit	(see page 21-102)
J	A short in the driver's air mix control motor circuit	(see page 21-103)
K	A problem in the driver's air mix control linkage, door, or motor	(see page 21-104)
L	An open or short in the mode control motor circuit	(see page 21-105)
M	A problem in the mode control linkage, doors, or motor	(see page 21-107)
N	A problem in the blower motor circuit	(see page 21-107)
O	An open in the passenger's air mix control motor circuit	(see page 21-112)
P	A short in the passenger's air mix control motor circuit	(see page 21-114)
Q	A problem in the passenger's air mix control linkage, door, or motor	(see page 21-105)

General Troubleshooting Information (cont'd)

Displaying Sensor Inputs at the Climate Control Unit

The climate control unit has a mode that displays sensor inputs it receives. This mode shows you what the climate control unit is receiving from each of the sensors, one at a time, and it can help you determine if a sensor is faulty.

Check these items before using the sensor input display mode

1. Turn the ignition switch ON (II), and check the recirculation door function; press the recirculation button to switch from FRESH to RECIRC. The air volume and sound should change slightly.

2. Set the temperature control knob to the desired test temperature. When selecting the test temperature, note these items:

   - "LO" temperature setting will default to MAX COOL, VENT, and RECIRC.
   - "HI" temperature setting will default to MAX HOT, FLOOR, and FRESH.
   - 61 through 89°F settings will use the automatic climate control logic.

3. Turn the ignition switch OFF.

To run the sensor input display mode, follow these steps

1. Turn the ignition switch OFF.

2. Press and hold both the AUTO and DUAL buttons, then start the engine.

3. After the engine starts, release the buttons. The audio-HVAC display panel will flash the sensor number and then the value for that sensor. Record the value displayed.

4. To advance to the next sensor, press the rear window defogger button.

Sensor	Item	Displayed Value
1	In-car Temperature Sensor	°C
2	Ambient Temperature	°C
3	Solar Radiation Sensor Value: Dark = 00, Flashlight = 04, Cloudy =10, Sunny =65	Kcal/m²·h
4	Engine Coolant Temperature	°C
5	Evaporator Outlet Air Temperature	°C
6	Driver's Air Mix Opening (Low value indicates cooler air distribution, higher value indicates warmer air distribution)	% of opening
7	Passenger's Air Mix Opening (Low value indicates cooler air distribution, higher value indicates warmer air distribution)	% of opening
8	Vehicle Speed (Vehicle must be driven to display speed)	Km/h
9	Vent Temperature Air Out (TAO)	°C

NOTE:
- The sensor values will be displayed in degrees Celsius (°C) or an alphanumeric code. Use the chart to convert the value to degrees Fahrenheit (°F).
- If the sensor value displays "Er", this indicates there is an open or short in the circuit or sensor. Check for DTCs using the HDS, or refer to checking DTCs by DTC indication to check for DTCs.
- If necessary, compare the sensor input display to an alike, known-good vehicle under the same test conditions.
- If the sensor is out of the normal range, refer to the sensor test, or substitute with a known-good sensor, and recheck.

5. To cancel the sensor input display mode, press the AUTO button, or turn the ignition off.

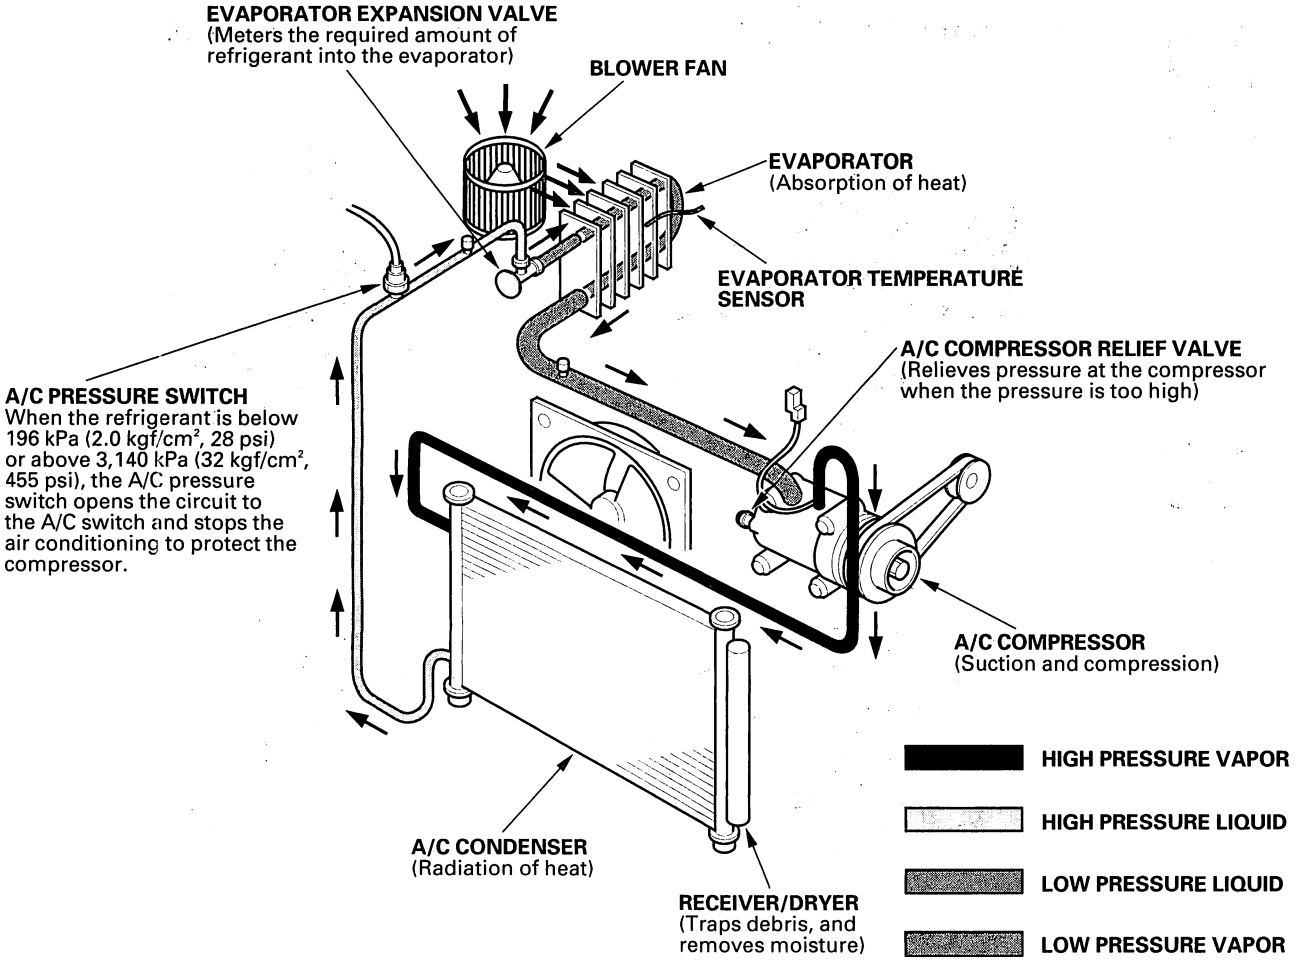
System Description (cont'd)

The air conditioning system removes heat from the passenger compartment by circulating refrigerant through the system.



This vehicle uses HFC-134a (R-134a) refrigerant which does not contain chlorofluorocarbons. Pay attention to the following service items:

- Do not mix refrigerants CFC-12 (R-12) and HFC-134a (R-134a). They are not compatible.
- Use only the recommended polyalkyleneglycol (PAG) refrigerant oil (DENSO ND-OIL 8) designed for the R-134a compressor. Intermixing the recommended (PAG) refrigerant oil with any other refrigerant oil will result in compressor failure.
- All A/C system parts (compressor, discharge line, suction line, evaporator, condenser, receiver/dryer, expansion valve, O-rings for joints) are designed for refrigerant R-134a. Do not exchange with R-12 parts.
- Use a halogen gas leak detector designed for refrigerant R-134a.
- R-12 and R-134a refrigerant servicing equipment are not interchangeable. Use only a recovery/recycling/charging station that is U.L.-listed and is certified to meet the requirements of SAE J2210 to service the R-134a air conditioning systems.
- Always recover the refrigerant R-134a with an approved recovery/recycling/charging station before disconnecting any A/C fitting.

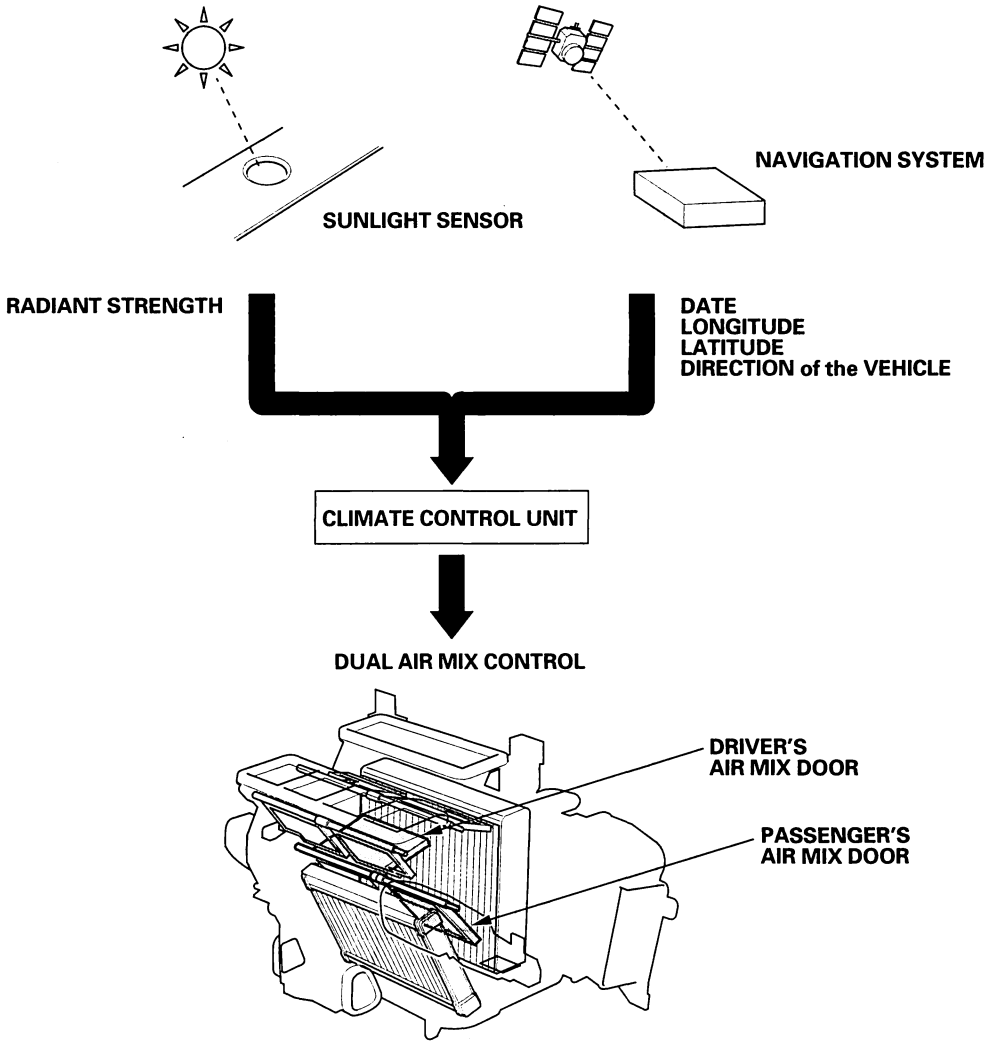
i-Dual Climate Control System (With navigation system) 2004-2005 Models

This system automatically controls the temperature and the vent mode of the air direction to the driver and passenger's side, depending on the angle of the sun, and the direction of the vehicle. It calculates information such as date, time, longitude, and latitude from the navigation system, as well as the radiant strength of the sun from the sunlight sensor, to determine the appropriate mode position and temperature to be directed to each side.



In the event that the navigation system malfunctions, or when driving in areas where the navigation cannot determine the vehicle position (non-coverage areas, tunnels, etc.), the climate control system will operate the same as a vehicle without navigation.

DTC Troubleshooting

DTC B1225 or DTC indicator A: An Open in the In-car Temperature Sensor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1225 or A indicated?

   YES—Go to step 5.

   NO—Intermittent failure, check for loose wires or poor connections in the in-car temperature sensor circuit. ■
5. Remove the in-car temperature sensor (see page 21-122) and test it (see page 21-122).

   Does the in-car temperature sensor test OK?

   YES—Go to step 6.

   NO—Replace the in-car temperature sensor. ■
6. Disconnect audio-HVAC display panel connector A (22P).
7. Check for continuity between the No. 11 terminal of audio-HVAC display panel connector A (22P) and the No. 1 terminal of the in-car temperature sensor 2P connector.

   Is there continuity?

   YES—Go to step 8.

   NO—Repair open in the wire between the climate control unit and the in-car temperature sensor. ■
8. Check for continuity between the No. 15 terminal of audio-HVAC display panel connector A (22P) and the No. 2 terminal of the in-car temperature sensor 2P connector.

   Is there continuity?

   YES—Check for loose wires or poor connections at audio-HVAC display panel connector A (22P) and at the in-car temperature sensor 2P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

   NO—Repair open in the wire between the climate control unit and the in-car temperature sensor. ■

BACK

DTC B1226 or DTC indicator B: A Short in the In-car Temperature Sensor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1226 or B indicated?

   YES—Go to step 5.

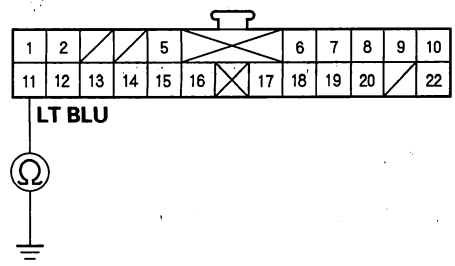
   NO—Intermittent failure. ■
5. Remove the in-car temperature sensor (see page 21-122).
6. Test the in-car temperature sensor (see page 21-122).

   Is the resistance within the specifications shown on the graph?

   YES—Go to step 7.

   NO—Replace the in-car temperature sensor. ■
7. Disconnect audio-HVAC display panel connector A (22P).
8. Check for continuity between the No. 11 terminal of audio-HVAC display panel connector A (22P) and body ground.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Wire side of female terminals

Is there continuity?

YES—Repair short to body ground in the wire between the climate control unit and the in-car temperature sensor. ■

NO—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

DTC Troubleshooting (cont'd)

DTC B1227 or DTC indicator C: An Open in the Outside Air Temperature Sensor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1227 or C indicated?

   YES—Go to step 5.

   NO—Intermittent failure, check for loose wires or poor connections on the outside air temperature sensor circuit. ■

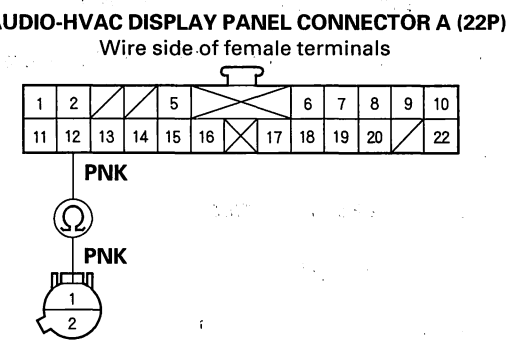
5. Remove the outside air temperature sensor (see page 21-123) and test it (see page 21-123).

   Does the outside air temperature sensor test OK?

   YES—Go to step 6.

   NO—Replace the outside air temperature sensor. ■

6. Disconnect audio-HVAC display panel connector A (22P).
7. Check for continuity between the No. 12 terminal of audio-HVAC display panel connector A (22P) and the No. 1 terminal of the outside air temperature sensor 2P connector.



Is there continuity?

YES—Go to step 8.

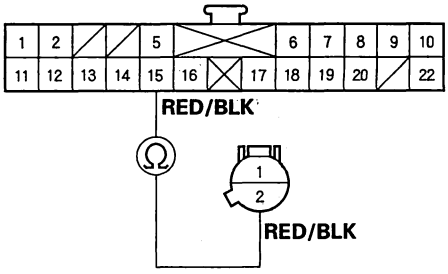
NO—Repair open in the wire between the climate control unit and the outside air temperature sensor. ■

BACK

Protected by AR

8. Check for continuity between the No. 15 terminal of audio-HVAC display panel connector A (22P) and the No. 2 terminal of the outside air temperature sensor 2P connector.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)
Wire side of female terminals



OUTSIDE AIR TEMPERATURE SENSOR 2P CONNECTOR
Wire side of female terminals

Is there continuity?

YES—Check for loose wires or poor connections at audio-HVAC display panel connector A (22P) and at the outside air temperature sensor 2P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair open in the wire between the climate control unit and the outside air temperature sensor. ■

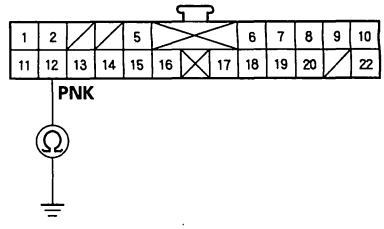
DTC B1228 or DTC indicator D: A Short in the Outside Air Temperature Sensor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1228 or D indicated?
   YES—Go to step 5.
   NO—Intermittent failure. ■
5. Remove the outside air temperature sensor (see page 21-123).
6. Test the outside air temperature sensor (see page 21-123).

   Is the resistance within the specifications shown on the graph?
   YES—Go to step 7.
   NO—Replace the outside air temperature sensor. ■
7. Disconnect audio-HVAC display panel connector A (22P).
8. Check for continuity between the No. 12 terminal of audio-HVAC display panel connector A (22P) and body ground.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Wire side of female terminals

Is there continuity?
YES—Repair short to body ground in the wire between the climate control unit and the outside air temperature sensor. ■
NO—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

DTC Troubleshooting (cont'd)

DTC B1229 or DTC indicator E: An Open in the Sunlight Sensor Circuit

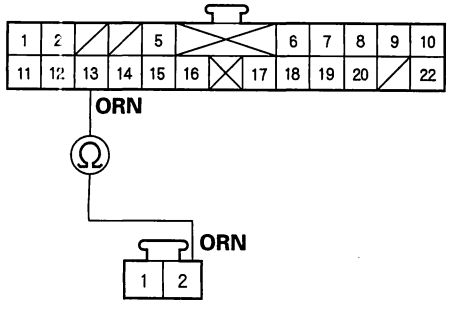
1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1229 or E indicated?

   YES—Go to step 5.

   NO—Intermittent failure, check for loose wires or poor connections on the sunlight sensor circuit. ■
5. Disconnect the sunlight sensor 2P connector.
6. Disconnect audio-HVAC display panel connector A (22P).
7. Check for continuity between the No. 13 terminal of audio-HVAC display panel connector A (22P) and the No. 2 terminal of the sunlight sensor 2P connector.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)
Wire side of female terminals



SUNLIGHT SENSOR 2P CONNECTOR
Wire side of female terminals

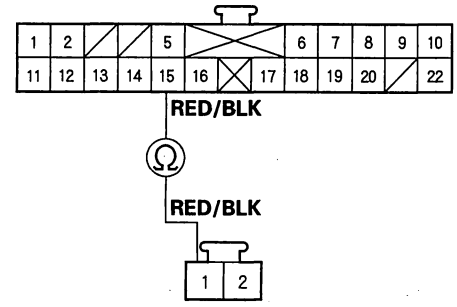
Is there continuity?

YES—Go to step 8.

NO—Repair open in the wire between the climate control unit and the sunlight sensor. ■

8. Check for continuity between the No. 15 terminal of audio-HVAC display panel connector A (22P) and the No. 1 terminal of the sunlight sensor 2P connector.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)
Wire side of female terminals



SUNLIGHT SENSOR 2P CONNECTOR
Wire side of female terminals

Is there continuity?

YES—Go to step 9.

NO—Repair open in the wire between the climate control unit and the sunlight sensor. ■

9. Reconnect the sunlight sensor 2P connector.
10. Reconnect audio-HVAC display panel connector A (22P).
11. Test the sunlight sensor (see page 21-124).

    Is the sunlight sensor OK?

    YES—Check for loose wires or poor connections at audio-HVAC display panel connector A (22P) and at the sunlight sensor 2P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

    NO—Replace the sunlight sensor. ■

DTC B1230 or DTC indicator F: A Short in the Sunlight Sensor Circuit

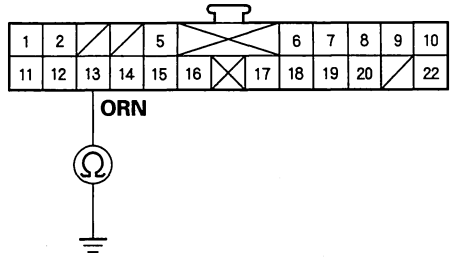
1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1230 or F indicated?

   YES—Go to step 5.

   NO—Intermittent failure. ■
5. Disconnect the sunlight sensor 2P connector.
6. Disconnect audio-HVAC display panel connector A (22P).
7. Check for continuity between the No. 13 terminal of audio-HVAC display panel connector A (22P) and body ground.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Wire side of female terminals

Is there continuity?

YES—Repair short to body ground in the wire between the climate control unit and the sunlight sensor. ■

NO—Go to step 8.

8. Reconnect the sunlight sensor 2P connector.
9. Reconnect audio-HVAC display panel connector A (22P).
10. Test the sunlight sensor (see page 21-124).

    Is the sunlight sensor OK?

    YES—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/ indication goes away, replace the original audio-HVAC display panel. ■

    NO—Replace the sunlight sensor. ■

DTC Troubleshooting (cont'd)

DTC B1231 or DTC indicator G: An Open in the Evaporator Temperature Sensor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1231 or G indicated?

   YES—Go to step 5.

   NO—Intermittent failure, check for loose wires or poor connections on the evaporator temperature sensor circuit. ■
5. Remove the evaporator temperature sensor (see page 21-49) and test it (see page 21-49).

   Does the evaporator temperature sensor test OK?

   YES—Go to step 6.

   NO—Replace the evaporator temperature sensor. ■
6. Disconnect audio-HVAC display panel connector A (22P).
7. Check for continuity between the No. 14 terminal of audio-HVAC display panel connector A (22P) and the No. 1 terminal of the evaporator temperature sensor 2P connector.

   Is there continuity?

   YES—Go to step 8.

   NO—Repair open in the wire between the climate control unit and the evaporator temperature sensor. ■
8. Check for continuity between the No. 15 terminal of audio-HVAC display panel connector A (22P) and the No. 2 terminal of the evaporator temperature sensor 2P connector.

   Is there continuity?

   YES—Check for loose wires or poor connections at audio-HVAC display panel connector A (22P) and at the evaporator temperature sensor 2P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

   NO—Repair open in the wire between the climate control unit and the evaporator temperature sensor. ■

DTC Troubleshooting (cont'd)

DTC B1233 or DTC indicator I: An Open in the Driver's Air Mix Control Motor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1233 or I indicated?

   YES—Go to step 5.

   NO—Intermittent failure, check for loose wires or poor connections on the driver's air mix control motor circuit. ■
5. Test the driver's air mix control motor.

   - 4-door (see page 21-43)
   - 2-door (see page 21-43)

   Is the driver's air mix control motor OK?

   YES—Go to step 6.

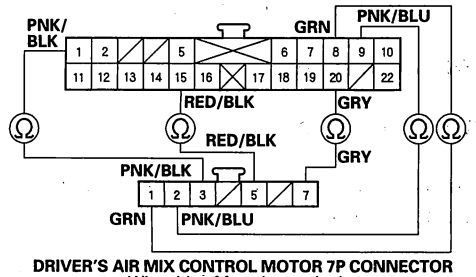
   NO—Replace the driver's air mix control motor. ■

   - 4-door (see page 21-44)
   - 2-door (see page 21-44)
6. Disconnect the driver's air mix control motor 7P (4-door) or 5P (2-door) connector.
7. Disconnect audio-HVAC display panel connector A (22P).
8. Check for continuity between the following terminals of audio-HVAC display panel connector A (22P) and the driver's air mix control motor 7P (4-door) or 5P (2-door) connector.

4-door:

22P:	7P:
No. 1	No. 3
No. 8	No. 1
No. 9	No. 2
No. 15	No. 5
No. 20	No. 7

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)
Wire side of female terminals

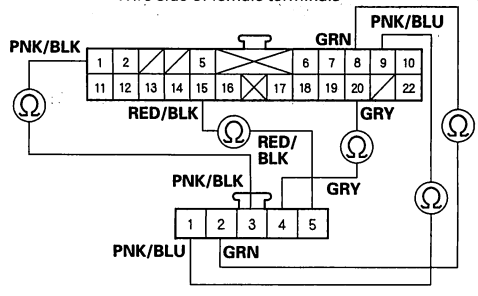


DRIVER'S AIR MIX CONTROL MOTOR 7P CONNECTOR
Wire side of female terminals

2-door:

22P:	5P:
No. 1	No. 3
No. 8	No. 2
No. 9	No. 1
No. 15	No. 5
No. 20	No. 4

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)
Wire side of female terminals



DRIVER'S AIR MIX CONTROL MOTOR 5P CONNECTOR
Wire side of female terminals

Is there continuity?

YES—Check for loose wires or poor connections at audio-HVAC display panel connector A (22P) and at the driver's air mix control motor 7P (4-door) or 5P (2-door) connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair any open in the wire(s) between the climate control unit and the driver's air mix control motor. ■

BACK

Protected by AR

DTC B1234 or DTC indicator J: A Short in the Driver's Air Mix Control Motor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1234 or J indicated?

   YES—Go to step 5.

   NO—Intermittent failure. ■
5. Test the driver's air mix control motor.

   - 4-door (see page 21-43)
   - 2-door (see page 21-43)

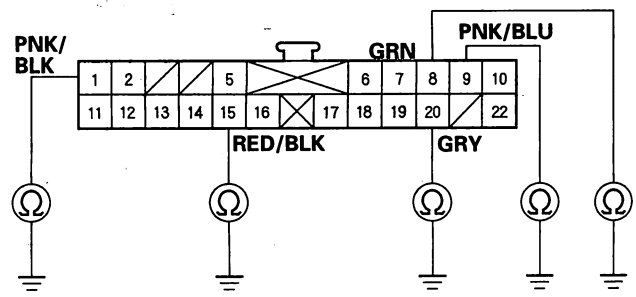
   Is the driver's air mix control motor OK?

   YES—Go to step 6.

   NO—Replace the driver's air mix control motor. ■

   - 4-door (see page 21-44)
   - 2-door (see page 21-44)
6. Disconnect the driver's air mix control motor 7P (4-door) or 5P (2-door) connector.
7. Disconnect audio-HVAC display panel connector A (22P).
8. Check for continuity between body ground and audio-HVAC display panel connector A (22P) terminals No. 1, 8, 9, 15 and 20 individually.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Wire side of female terminals

Is there continuity?

YES—Repair any short to body ground in the wire(s) between the climate control unit and the driver's air mix control motor. ■

NO—Go to step 9.

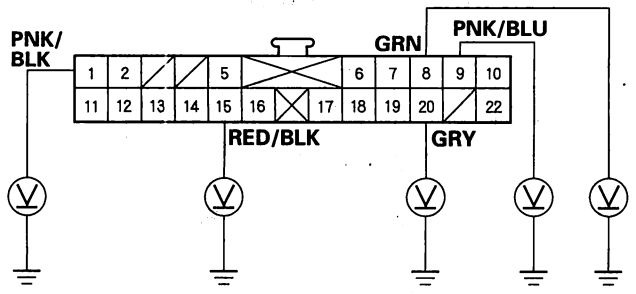
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

9. Turn the ignition switch ON (II), and check the same terminals for voltage.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Wire side of female terminals

Is there any voltage?

YES—Repair any short to power in the wire(s) between the climate control unit and the driver's air mix control motor. This short may also damage the climate control unit. Repair the short to power before replacing the audio-HVAC display panel. ■

NO—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

DTC B1235 or DTC indicator K: A Problem in the Driver's Air Mix Control Linkage, Door, or Motor

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

Is DTC B1235 or K indicated?

YES—Go to step 5.

NO—Intermittent failure. ■

5. Test the driver's air mix control motor.

- 4-door (see page 21-43)
- 2-door (see page 21-43)

Are the driver's air mix control motor and linkage OK?

YES—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Replace the driver's air mix control motor, 4-door (see page 21-44), 2-door (see page 21-44), or repair the driver's air mix control linkage or door. ■

BACK

Protected by AR

DTC B1239 or DTC indicator L: An Open or Short in the Mode Control Motor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1239 or L indicated?

   YES—Go to step 5.

   NO—Intermittent failure, check for loose wires or poor connections on the mode control motor circuit. ■
5. Test the mode control motor.

   - 4-door (see page 21-45)
   - 2-door (see page 21-45)

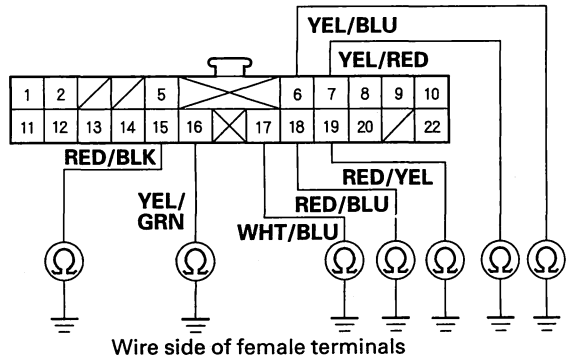
   Is the mode control motor OK?

   YES—Go to step 6.

   NO—Replace the mode control motor. ■

   - 4-door (see page 21-46)
   - 2-door (see page 21-46)
6. Disconnect the mode control motor 7P (4-door) or 10P (2-door) connector.
7. Disconnect audio-HVAC display panel connector A (22P).
8. Check for continuity between body ground and audio-HVAC display panel connector A (22P) terminals No. 6, 7, 15, 16, 17, 18, and 19 individually.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



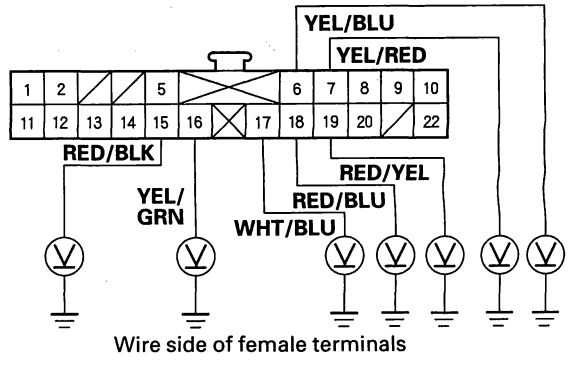
Is there continuity?

YES—Repair any short to body ground in the wire(s) between the climate control unit and the mode control motor. ■

NO—Go to step 9.

9. Turn the ignition switch ON (II), and check the same terminals for voltage.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Is there any voltage?

YES—Repair any short to power in the wire(s) between the climate control unit and the mode control motor. This short may also damage the climate control unit. Repair the short to power before replacing the audio-HVAC display panel. ■

NO—Go to step 10.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

10. Turn the ignition switch OFF, and check for continuity between the following terminals of audio-HVAC display panel connector A (22P) and the mode control motor 7P (4-door) or 10P (2-door) connector.

4-door:

22P:	7P:
No. 6	No. 1
No. 7	No. 2
No. 15	No. 7
No. 16	No. 3
No. 17	No. 4
No. 18	No. 5
No. 19	No. 6

Wire side of female terminals

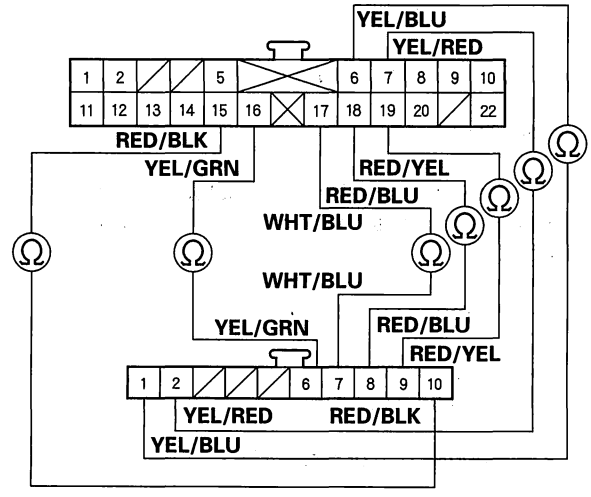
2-door:

22P:	10P:
No. 6	No. 1
No. 7	No. 2
No. 15	No. 10
No. 16	No. 6
No. 17	No. 7
No. 18	No. 8
No. 19	No. 9

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)
Wire side of female terminals



MODE CONTROL MOTOR 10P CONNECTOR
Wire side of female terminals

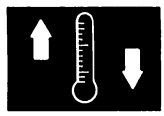
Is there continuity?

YES—Check for loose wires or poor connections at audio-HVAC display panel connector A (22P) and at the mode control motor 7P (4-door) or 10P (2-door) connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair any open in the wire(s) between the climate control unit and the mode control motor. ■

BACK

Protected by AR



DTC B1240 or DTC indicator M: A Problem in the Mode Control Linkage, Doors, or Motor

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1240 or M indicated?

   YES—Go to step 5.

   NO—Intermittent failure. ■
5. Test the mode control motor.

   - 4-door (see page 21-45)
   - 2-door (see page 21-45)

   Are the mode control motor and linkage OK?

   YES—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

   NO—Replace the mode control motor, 4-door (see page 21-46), 2-door (see page 21-46), or repair the mode control linkage or doors. ■

DTC B1241 or DTC indicator N: A Problem in the Blower Motor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1241 or N indicated?

   YES—Go to step 5.

   NO—Intermittent failure, check for loose wires or poor connections on the blower motor circuit. ■
5. Check the No. 21 (40A) fuse in the under-hood fuse/relay box, and the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES—Go to step 6.

   NO—Replace the fuse(s), and recheck. ■

(cont'd)

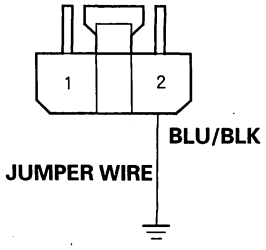
Protected by AR

DTC Troubleshooting (cont'd)

6. Connect the No. 2 (4-door) or No. 1 (2-door) terminal of the blower motor 2P connector to body ground with a jumper wire.

4-door:

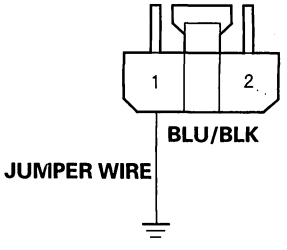
BLOWER MOTOR 2P CONNECTOR



Wire side of female terminals

2-door:

BLOWER MOTOR 2P CONNECTOR



Wire side of female terminals

7. Turn the ignition switch ON (II).

Does the blower motor run?

YES—Go to step 8.

NO—Go to step 21.

8. Turn the ignition switch OFF.

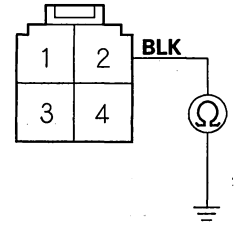
9. Disconnect the jumper wire.

10. Disconnect the power transistor 4P connector.

11. Check for continuity between the No. 2 (4-door) or No. 3 (2-door) terminal of the power transistor 4P connector and body ground.

4-door:

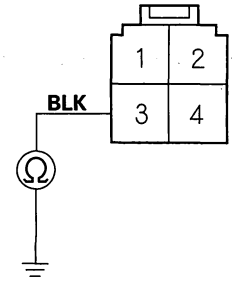
POWER TRANSISTOR 4P CONNECTOR



Wire side of female terminals

2-door:

POWER TRANSISTOR 4P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 12.

NO—Check for an open in the wire between the power transistor and body ground. If the wire is OK, check for poor ground at G503. ■

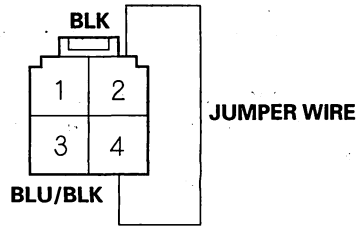
BACK

Protected by AR

12. Connect the No. 2 and No. 4 (4-door) or No. 1 and No. 3 (2-door) terminals of the power transistor 4P connector with a jumper wire.

4-door:

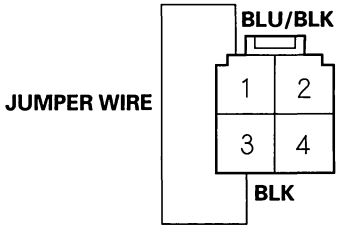
POWER TRANSISTOR 4P CONNECTOR



Wire side of female terminals

2-door:

POWER TRANSISTOR 4P CONNECTOR



Wire side of female terminals

13. Turn the ignition switch ON (II).

Does the blower motor run at high speed?

YES—Go to step 14.

NO—Repair open in the BLU/BLK wire between the power transistor and the blower motor. ■

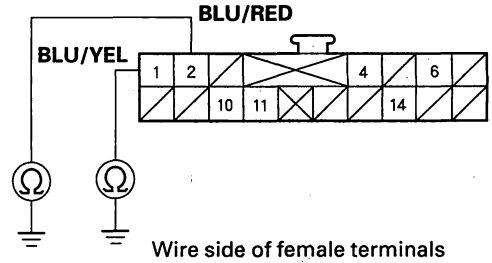
14. Turn the ignition switch OFF.

15. Disconnect the jumper wire.

16. Disconnect the audio-HVAC display panel connector B (16P).

17. Check for continuity between the No. 1 and No. 2 terminals of audio-HVAC display panel connector B (16P) and body ground individually.

AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)



Wire side of female terminals

Is there continuity?

YES—Repair any short to body ground in the wire(s) between the climate control unit and the power transistor. ■

NO—Go to step 18.

(cont'd)

Protected by AR

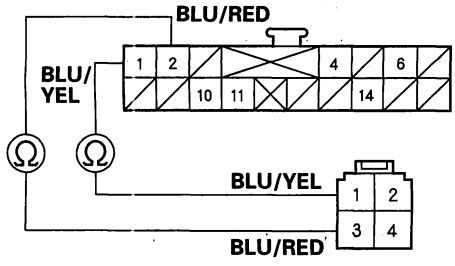
DTC Troubleshooting (cont'd)

18. Check the continuity between the following terminals of audio-HVAC display panel connector B (16P) and the power transistor 4P connector.

4-door:

16P:	4P:
No. 1	No. 1
No. 2	No. 3

AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)
Wire side of female terminals

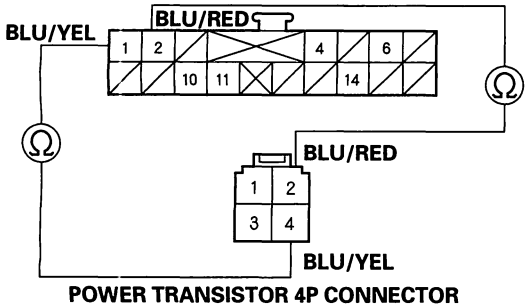


POWER TRANSISTOR 4P CONNECTOR
Wire side of female terminals

2-door:

16P:	4P:
No. 1	No. 4
No. 2	No. 2

AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)
Wire side of female terminals



POWER TRANSISTOR 4P CONNECTOR
Wire side of female terminals

Is there continuity?

YES—Go to step 19.

NO—Repair any open in the wire(s) between the climate control unit and the power transistor. ■

19. Reconnect audio-HVAC display panel connector B (16P).

20. Test the power transistor (see page 21-50).

Is the power transistor OK?

YES—Check for loose wires or poor connections at audio-HVAC display panel connector B (16P) and at the power transistor 4P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Replace the power transistor. ■

BACK

Protected by AR

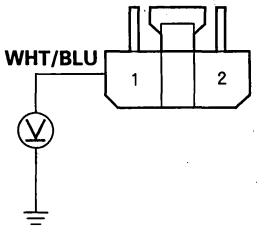
21. Disconnect the jumper wire.

22. Disconnect the blower motor 2P connector.

23. Measure the voltage between the No. 1 (4-door) or No. 2 (2-door) terminal of the blower motor 2P connector and body ground.

4-door:

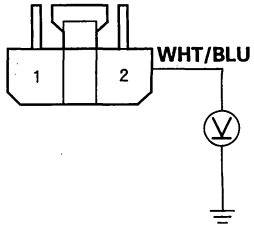
BLOWER MOTOR 2P CONNECTOR



Wire side of female terminals

2-door:

BLOWER MOTOR 2P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Replace the blower motor.■

NO—Go to step 24.

24. Turn the ignition switch OFF.

25. Remove the blower motor relay from the under-hood fuse/relay box, and test it (see page 22-79).

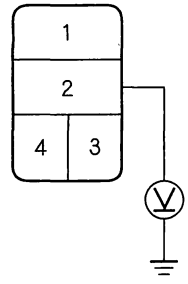
Is the relay OK?

YES—Go to step 26.

NO—Replace the blower motor relay.■

26. Measure the voltage between the No. 2 terminal of the blower motor relay 4P socket and body ground.

BLOWER MOTOR RELAY 4P SOCKET



Is there battery voltage?

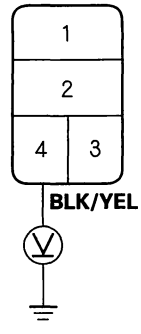
YES—Go to step 27.

NO—Replace the under-hood fuse/relay box.■

27. Turn the ignition switch ON (II).

28. Measure the voltage between the No. 4 terminal of the blower motor relay 4P socket and body ground.

BLOWER MOTOR RELAY 4P SOCKET



Is there battery voltage?

YES—Go to step 29.

NO—Repair open in the wire between the No. 30 fuse in the under-dash fuse/relay box and the blower motor relay.■

(cont'd)

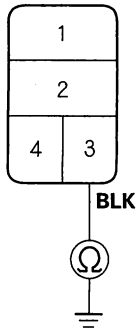
Protected by AR

DTC Troubleshooting (cont'd)

29. Turn the ignition switch OFF.

30. Check for continuity between the No. 3 terminal of the blower motor relay 4P socket and body ground.

BLOWER MOTOR RELAY 4P SOCKET



Is there continuity?

YES—Repair open in the WHT/BLU wire between the blower motor relay and the blower motor. ■

NO—Check for an open in the wire between the blower motor relay and body ground. If the wire is OK, check for poor ground at G302. ■

DTC B1236 or DTC indicator O: An Open in the Passenger's Air Mix Control Motor Circuit

1. Clear the DTC.

2. Turn the ignition switch OFF, and then ON.

3. Operate the climate control system in several modes.

4. Check the DTCs.

   Is DTC B1236 or O indicated?

   YES—Go to step 5.

   NO—Intermittent failure, check for loose wires or poor connections on the passenger's air mix control motor circuit. ■

5. Test the passenger's air mix control motor.

   - 4-door (see page 21-125)
   - 2-door (see page 21-125)

   Is the passenger's air mix control motor OK?

   YES—Go to step 6.

   NO—Replace the passenger's air mix control motor. ■

   - 4-door (see page 21-126)
   - 2-door (see page 21-126)

6. Disconnect the passenger's air mix control motor 7P (4-door) or 5P (2-door) connector.

7. Disconnect audio-HVAC display panel connector A (22P).

BACK

Protected by AR

8. Check for continuity between the following terminals of audio-HVAC display panel connector A (22P) and the passenger's air mix control motor 7P (4-door) or 5P (2-door) connector.

4-door:

22P:	7P:
No. 2	No. 3
No. 10	No. 1
No. 15	No. 5
No. 20	No. 7
No. 22	No. 2

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)

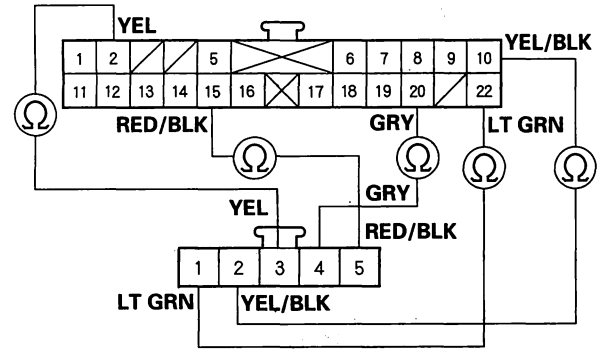
PASSENGER'S AIR MIX CONTROL MOTOR 7P CONNECTOR
Wire side of female terminals

2-door:

22P:	5P:
No. 2	No. 3
No. 10	No. 2
No. 15	No. 5
No. 20	No. 4
No. 22	No. 1

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)
Wire side of female terminals



PASSENGER'S AIR MIX CONTROL MOTOR 5P CONNECTOR
Wire side of female terminals

Is there continuity?

YES—Check for loose wires or poor connections at audio-HVAC display panel connector A (22P) and at the passenger's air mix control motor 7P (4-door) or 5P (2-door) connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair any open in the wire(s) between the climate control unit and the passenger's air mix control motor. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC B1237 or DTC indicator P: A Short in the Passenger's Air Mix Control Motor Circuit

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1237 or P indicated?

   YES—Go to step 5.

   NO—Intermittent failure. ■
5. Test the passenger's air mix control motor.

   - 4-door (see page 21-125)
   - 2-door (see page 21-125)

   Is the passenger's air mix control motor OK?

   YES—Go to step 6.

   NO—Replace the passenger's air mix control motor. ■

   - 4-door (see page 21-126)
   - 2-door (see page 21-126)
6. Disconnect the passenger's air mix control motor 7P (4-door) or 5P (2-door) connector.
7. Disconnect audio-HVAC display panel connector A (22P).
8. Check for continuity between body ground and audio-HVAC display panel connector A (22P) terminals No. 2, 10, 15, 20 and 22 individually.

   AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)

   Wire side of female terminals

   Is there continuity?

   YES—Repair any short to body ground in the wire(s) between the climate control unit and the passenger's air mix control motor. ■

   NO—Go to step 9.
9. Turn the ignition switch ON (II), and check the same terminals for voltage.

   AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)

   Wire side of female terminals

   Is there any voltage?

   YES—Repair any short to power in the wire(s) between the climate control unit and the passenger's air mix control motor. This short may also damage the climate control unit. Repair the short to power before replacing the audio-HVAC display panel. ■

   NO—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

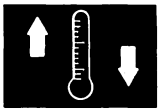
Protected by AR



DTC B1238 or DTC indicator Q: A Problem in the Passenger's Air Mix Control Linkage, Door, or Motor

1. Clear the DTC.
2. Turn the ignition switch OFF, and then ON.
3. Operate the climate control system in several modes.
4. Check the DTCs.

   Is DTC B1238 or Q indicated?

   YES—Go to step 5.

   NO—Intermittent failure. ■
5. Test the passenger's air mix control motor.

   - 4-door (see page 21-125)
   - 2-door (see page 21-125)

   Is the passenger's air mix control motor and linkage OK?

   YES—Substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

   NO—Replace the passenger's air mix control motor, 4-door (see page 21-126), 2-door (see page 21-126), or repair the passenger's air mix control linkage or door. ■

DTC B1202: Climate Control Unit Internal Error

1. Clear the DTCs using the HDS.
2. Turn the ignition switch OFF, and then ON.
3. Turn the climate control system on and operate several functions. (A/C on/off, air mix and blend door operations, temperature settings etc..)
4. Check for DTCs by selecting the DTC MENU (DTCs) from the HDS.

   Is DTC B1202 indicated?

   YES—The climate control unit is faulty; replace the audio-HVAC display panel. ■

   NO—Intermittent failure, the climate control unit is OK at this time. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC B1205: Climate Control Unit Lost Communication with the Gauge Control Module (VSP/NE message)

DTC B1206: Climate Control Unit Lost Communication with the Gauge Control Module (ECT message)

DTC B1207: Climate Control Unit Lost Communication with the Gauge Control Module (ILLUMI message)

1. Turn the ignition switch ON (II).
2. Push the AUTO button.

   Does the climate control turn on?

   YES—Go to step 3.

   NO—Go to climate control power and ground circuit troubleshooting (see page 21-119).
3. Clear the DTCs using the HDS.
4. Turn the ignition switch OFF, and then ON.
5. Turn the climate control system on and operate several functions. (A/C on/off, air mix and blend door operations, temperature settings etc..)
6. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC B1205, B1206 and/or B1207 indicated?

   YES—Go to step 7.

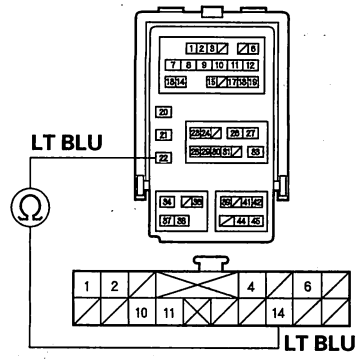
   NO—Intermittent failure, the gauge control module and climate control unit are OK at this time. ■
7. Check the DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC B1008, B1060 and/or B1061 indicated?

   YES—Perform the gauge control module input test (see page 22-259). ■

   NO—Go to step 8.
8. Disconnect audio-HVAC display panel connector B (16P).
9. Disconnect the under-dash fuse/relay box connector N (45P) from the fuse/relay box.
10. Check for continuity between the No. 22 terminal of under-dash fuse/relay box connector N (45P) and the No. 14 terminal of the audio-HVAC display panel connector B (16P).

UNDER-DASH FUSE/RELAY BOX CONNECTOR N (45P)
Wire side of female terminals



AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)
Wire side of female terminals

Is there continuity?

YES—The gauge control module and/or climate control unit faulty. Substitute one component at a time and recheck. Replace the component that eliminates the DTC/symptom. ■

NO—Repair open in the wire between the gauge control module and the climate control unit. ■

BACK

Protected by AR

Recirculation Control Motor Circuit Troubleshooting

1. Check the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 2.

   NO—Replace the fuse, and recheck. ■

2. Disconnect the recirculation control motor 7P (4-door) or 5P (2-door) connector.

3. Turn the ignition switch ON (II).

4. Measure the voltage between the No. 1 terminal of the recirculation control motor 7P (4-door) or No. 5 terminal of the 5P (2-door) connector and body ground.

   4-door:

   RECIRCULATION CONTROL MOTOR 7P CONNECTOR

   Wire side of female terminals

   2-door:

   RECIRCULATION CONTROL MOTOR 5P CONNECTOR

   Wire side of female terminals

   Is there battery voltage?

   YES—Go to step 5.

   NO—Repair open in the wire between the No. 30 fuse in the under-dash fuse/relay box and the recirculation control motor. ■

5. Turn the ignition switch OFF.

6. Test the recirculation control motor.

   - 4-door (see page 21-47)
   - 2-door (see page 21-47)

   Is the recirculation control motor OK?

   YES—Go to step 7.

   NO—Replace the recirculation control motor, 4-door (see page 21-48), 2-door (see page 21-48), or repair the recirculation control linkage or doors. ■

7. Disconnect audio-HVAC display panel connector B (16P).

8. Check for continuity between the No. 10 and No. 11 terminals audio-HVAC display panel connector B (16P) and body ground individually.

   AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)

   Wire side of female terminals

   Is there continuity?

   YES—Repair any short to body ground in the wire(s) between the climate control unit and the recirculation control motor. ■

   NO—Go to step 9.

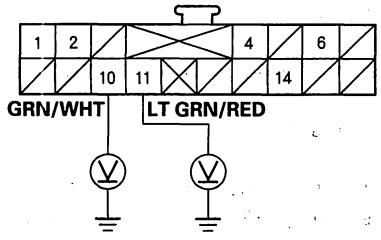
(cont'd)

Protected by AR

Recirculation Control Motor Circuit Troubleshooting (cont'd)

9. Turn the ignition switch ON (II), and check the same wires for voltage.

AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)



Wire side of female terminals

Is there any voltage?

YES—Repair any short to power in the wire(s) between the climate control unit and the recirculation control motor. This short may also damage the climate control unit. Repair the short to power before replacing the audio-HVAC display panel. ■

NO—Go to step 10.

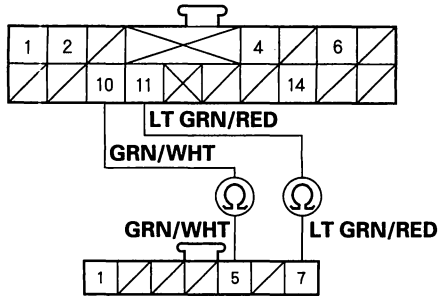
10. Turn the ignition switch OFF.

11. Check for continuity between the following terminals of audio-HVAC display panel connector B (16P) and the recirculation control motor 7P (4-door) or 5P (2-door) connector.

4-door:

16P:	7P:
No. 10	No. 5
No. 11	No. 7

AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)
Wire side of female terminals

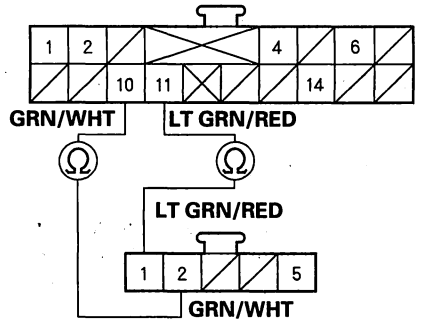


RECIRCULATION CONTROL MOTOR 7P CONNECTOR
Wire side of female terminals

2-door:

16P:	5P:
No. 10	No. 2
No. 11	No. 1

AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)
Wire side of female terminals



RECIRCULATION CONTROL MOTOR 5P CONNECTOR
Wire side of female terminals

Is there continuity?

YES—Check for loose wires or poor connections at audio-HVAC display panel connector B (16P) and at the recirculation control motor 7P (4-door) or 5P (2-door) connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair any open in the wire(s) between the climate control unit and the recirculation control motor. ■

Climate Control Power and Ground Circuit Troubleshooting

1. Check the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 2.

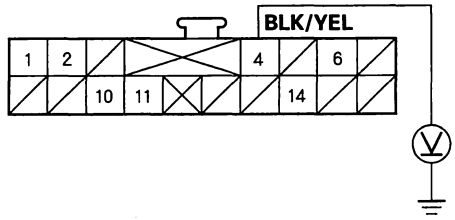
   NO—Replace the fuse, and recheck.■

2. Disconnect audio-HVAC display panel connector B (16P).

3. Turn the ignition switch ON (II).

4. Measure the voltage between the No. 4 terminal of audio-HVAC display panel connector B (16P) and body ground.

AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)



Wire side of female terminals

Is there battery voltage?

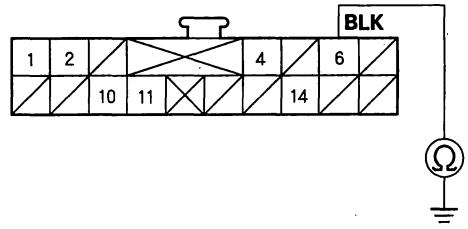
YES—Go to step 5.

NO—Repair open in the wire between the No. 30 fuse in the driver's under-dash fuse/relay box and the climate control unit.■

5. Turn the ignition switch OFF.

6. Check for continuity between the No. 6 terminal of audio-HVAC display panel connector B (16P) and body ground.

AUDIO-HVAC DISPLAY PANEL CONNECTOR B (16P)



Wire side of female terminals

Is there continuity?

YES—Check for loose wires or poor connections at audio-HVAC display panel connector B (16P). If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel.■

NO—Check for an open in the wire between the climate control unit and body ground. If the wire is OK, check for poor ground at G503.■

Protected by AR

A/C Pressure Switch Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if the following items are operative; condenser fan, A/C compressor, or if the heater is inoperative. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Check for body DTCs in test mode A of the multiplex integrated control system (see page 22-91).

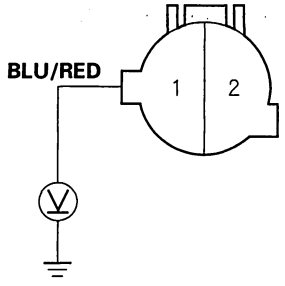
   Are there any DTC indicated?

   YES—Do the appropriate troubleshooting for the DTC indicated.■

   NO—Go to step 2.

2. Disconnect the A/C pressure switch 2P connector.
3. Turn the ignition switch ON (II).
4. Measure the voltage between the No. 1 terminal of the A/C pressure switch 2P connector and body ground.

A/C PRESSURE SWITCH 2P CONNECTOR



Wire side of female terminals

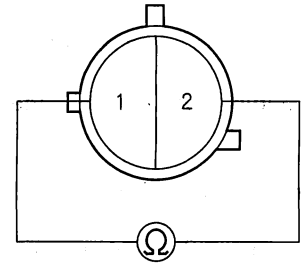
Is there 5 V or more?

YES—Go to step 5.

NO—Go to step 13.

5. Turn the ignition switch OFF.
6. Check for continuity between the No. 1 and No. 2 terminals of the A/C pressure switch.

A/C PRESSURE SWITCH



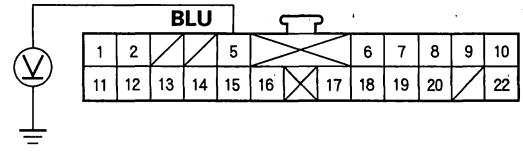
Is there continuity?

YES—Go to step 7.

NO—Go to step 14.

7. Reconnect the A/C pressure switch 2P connector.
8. Disconnect audio-HVAC display panel connector A (22P).
9. Turn the ignition switch ON (II).
10. Measure the voltage between the No. 5 terminal of the audio-HVAC display panel connector A (22P) and body ground.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Wire side of female terminals

Is there 5 V or more?

YES—Go to step 11.

NO—Repair open in the wire between the climate control unit and the A/C pressure switch.■

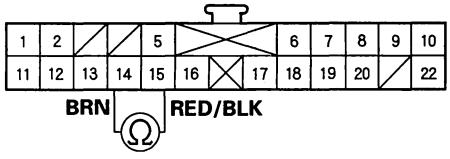
BACK

Protected by AR

11. Turn the ignition switch OFF.

12. Measure the resistance between the No. 14 and No. 15 terminals of the audio-HVAC display panel connector A (22P).

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Wire side of female terminals

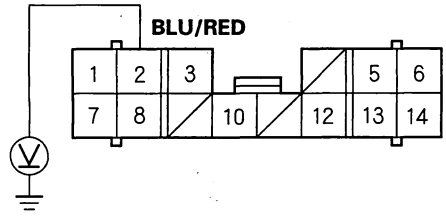
Is the resistance less than 24 k ohms?

YES—Check for loose wires or poor connections at audio-HVAC display panel connector A (22P) and at the A/C pressure switch 2P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair cause of high resistance in the evaporator temperature circuit. ■

13. Measure the voltage between the No. 2 terminal of under-hood fuse/relay box connector H (14P) and body ground with the under-hood fuse/relay box connectors connected.

UNDER-HOOD FUSE/RELAY BOX CONNECTOR H (14P)



Wire side of female terminals

Is there 5 V or more?

YES—Repair open in the wire between the under-hood fuse/relay box and the A/C pressure switch. ■

NO—Check for loose or poor connections at the No. 2 terminal of the under-hood fuse/relay box. If the connections are OK, replace the under-hood fuse/relay box. ■

14. Check for proper A/C system pressure.

Is the pressure within specifications?

YES—Replace the A/C pressure switch. ■

NO—Repair the A/C pressure problem. ■

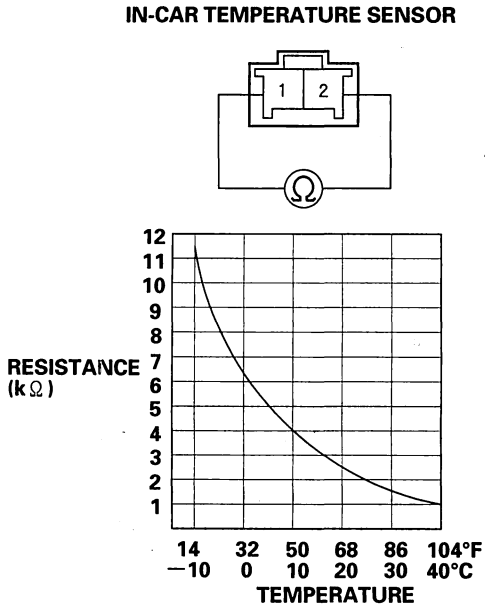
BACK

Protected by AR

In-car Temperature Sensor Test

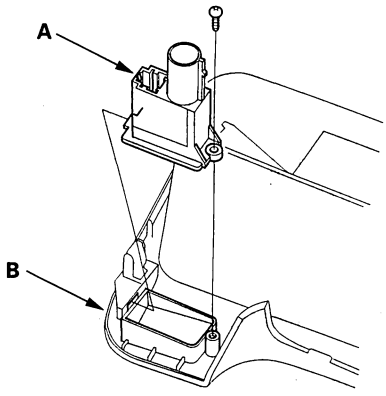
Check for a change in resistance by heating or cooling the sensor with a hair drier.

Compare the resistance reading between the No. 1 and No. 2 terminals of the in-car temperature sensor with the specifications shown in the graph; the resistance should be within the specifications.



In-car Temperature Sensor Replacement

1. Remove the instrument panel (see page 20-129).
2. Remove the self-tapping screw and the in-car temperature sensor (A) from the instrument panel (B).



3. Install the sensor in the reverse order of removal. Be sure to connect the air hose securely.

BACK

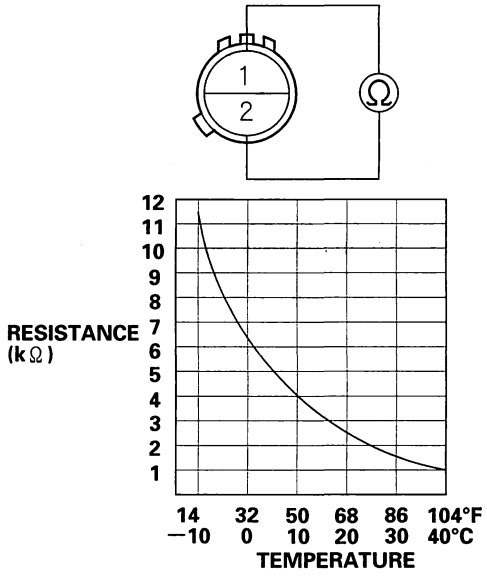
Protected by AR

Outside Air Temperature Sensor Test

Dip the sensor in ice water, and measure the resistance. Then pour warm water on the sensor, and check for a change in resistance.

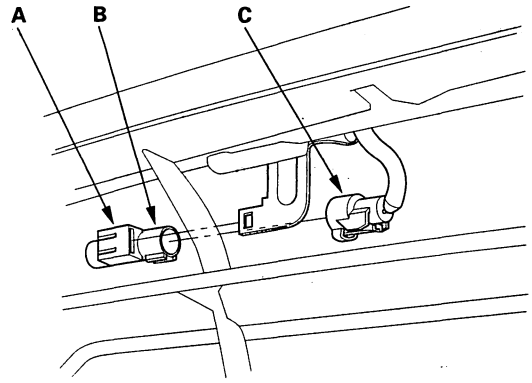
Compare the resistance reading between the No. 1 and No. 2 terminals of the outside air temperature sensor with the specifications shown in the graph; the resistance should be within the specifications.

OUTSIDE AIR TEMPERATURE SENSOR



Outside Air Temperature Sensor Replacement

1. Lift the tab (A) to release the lock, and remove the outside air temperature sensor (B) from the back of the front bumper beam. Disconnect the 2P connector (C) from the outside air temperature sensor.

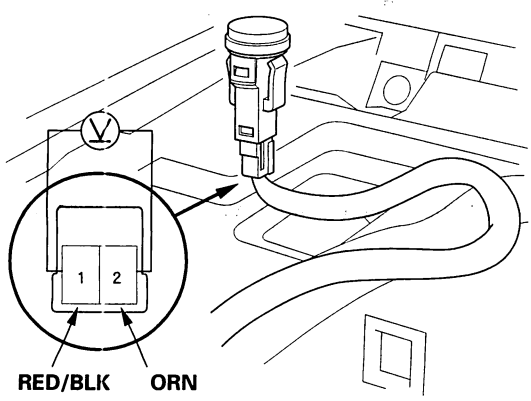


2. Install the sensor in the reverse order of removal.

Protected by AR

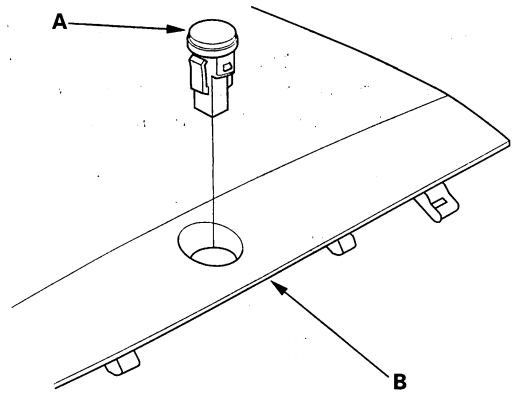
Sunlight Sensor Test

1. Remove the sunlight sensor, and reconnect the connector.
2. Turn the ignition switch ON (II). Measure the voltage between the terminals with the (+) probe on the No. 1 terminal and the (−) probe on the No. 2 terminal with the 2P connector connected. The voltage readings will not change under the light of a flashlight or a fluorescent lamp. Voltage should be:
   - 3.6—3.7 V or more with the sensor out of direct sunlight.
   - 3.3—3.5 V or less with the sensor in direct sunlight.



Sunlight Sensor Replacement

1. Remove the upper panel from the dashboard (see page 20-131).
2. Remove the sunlight sensor (A) from the upper panel (B). Be careful not to damage the sensor.



3. Install the sensor in the reverse order of removal.

BACK

Protected by AR

Passenger's Air Mix Control Motor Test

4-door

1. Disconnect the 7P connector from the passenger's air mix control motor.

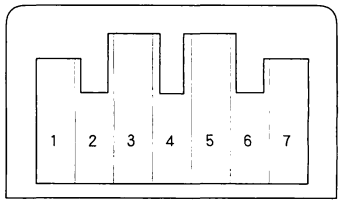
   NOTICE
   Incorrectly applying power and ground to the passenger's air mix control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 1 terminal of the passenger's air mix control motor, and ground the No. 2 terminal; the passenger's air mix control motor should run, and stop at Max Cool. If it doesn't, reverse the connections; the passenger's air mix control motor should run, and stop at Max Hot.

3. If the passenger's air mix control motor did not run in step 2, remove it, then check the passenger's air mix control linkage and door for smooth movement.

   - If the linkage and door move smoothly, replace the passenger's air mix control motor.
   - If the linkage or door sticks or binds, repair them as needed.
   - If the passenger's air mix control motor runs smoothly, go to step 4.

PASSENGER'S AIR MIX CONTROL MOTOR



4. Measure the resistance between the No. 5 and No. 7 terminals. It should be between 4.2 to 7.8 kΩ.

5. Reconnect the passenger's air mix control motor 7P connector, then turn the ignition switch ON (II).

6. Using the backprobe set, measure the voltage between the No. 3 and No. 5 terminals.

   Max Cool—about 1.5 V
   Max Hot—about 4.5 V

7. If either the resistance or voltage readings are not as specified, replace the passenger's air mix control motor (see page 21-126).

2-door

1. Disconnect the 5P connector from the passenger's air mix control motor.

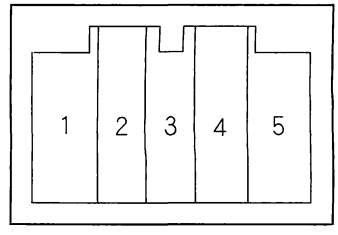
   NOTICE
   Incorrectly applying power and ground to the passenger's air mix control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 1 terminal of the passenger's air mix control motor, and ground the No. 2 terminal; the passenger's air mix control motor should run, and stop at Max Hot. If it doesn't, reverse the connections; the passenger's air mix control motor should run, and stop at Max Cool.

3. If the passenger's air mix control motor did not run in step 2, remove it, then check the passenger's air mix control linkage and door for smooth movement.

   - If the linkage and door move smoothly, replace the passenger's air mix control motor.
   - If the linkage or door sticks or binds, repair them as needed.
   - If the passenger's air mix control motor runs smoothly, go to step 4.

PASSENGER'S AIR MIX CONTROL MOTOR



4. Measure the resistance between the No. 4 and No. 5 terminals. It should be between 4.2 to 7.8 kΩ.

5. Reconnect the passenger's air mix control motor 5P connector, then turn the ignition switch ON (II).

6. Using the backprobe set, measure the voltage between the No. 3 and No. 5 terminals.

   Max Cool—about 1.0 V
   Max Hot—about 4.0 V

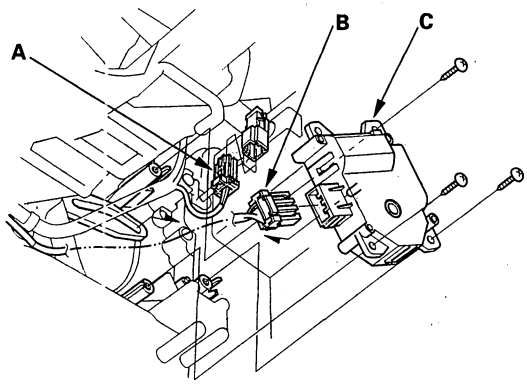
7. If either the resistance or voltage readings are not as specified, replace the passenger's air mix control motor (see page 21-126).

Protected by AR

Passenger's Air Mix Control Motor Replacement

4-door

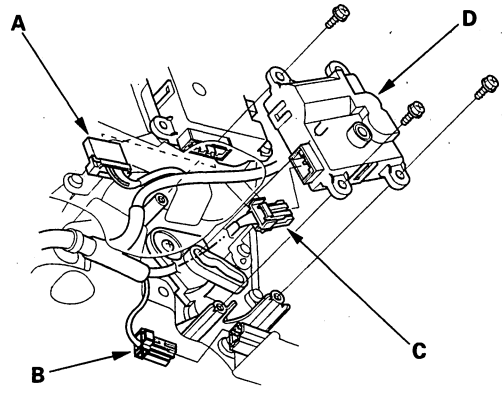
1. Disconnect the 2P connector (A) from the evaporator temperature sensor. Disconnect the 7P connector (B) from the passenger's air mix control motor (C). Remove the self-tapping screws and the passenger's air mix control motor from the heater unit.



2. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

2-door

1. Disconnect the 10P connector (A) from the mode control motor. Disconnect the 2P connector (B) from the evaporator temperature sensor. Disconnect the 5P connector (C) from the passenger's air mix control motor (D). Remove the self-tapping screws and the passenger's air mix control motor from the heater unit.



2. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If electrical maintenance required)

The Accord SRS includes a driver's airbag in the steering wheel hub, a passenger's airbag in the dashboard above the glove box, seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in this Service Manual. Items marked with an asterisk (*) on the contents page include or are located near SRS components. Servicing, disassembling, or replacing these items require special precautions and tools, and should be done only by an authorized Honda dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work must be performed by an authorized Honda dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the airbags and/or side airbags.
- Do not bump or impact the SRS unit, front impact sensors, or side impact sensors when the ignition switch is ON (II), or for at least 3 minutes after the ignition switch is turned OFF; otherwise, the system may fail in a collision, or the airbags may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, front console, dashboard, dashboard lower panel, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

General Troubleshooting Information

Tips and Precautions

Before Troubleshooting

1. Check applicable fuses in the appropriate fuse/relay box.

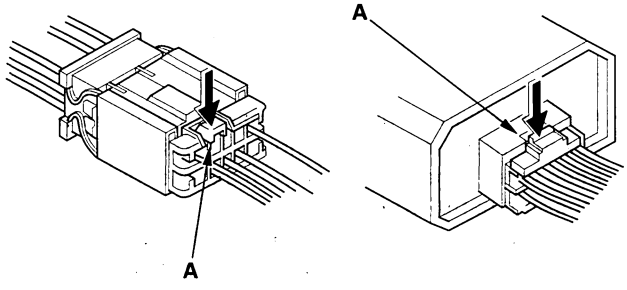
2. Check the battery for damage, state of charge, and clean and tight connections.

NOTICE

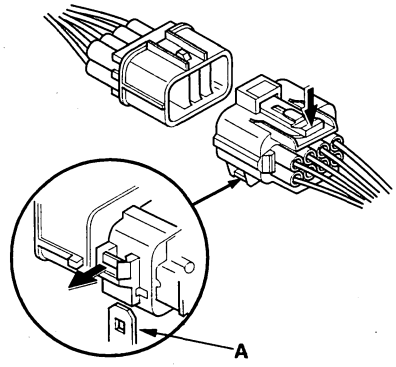
- Do not quick-charge a battery unless the battery ground cable has been disconnected, otherwise you will damage the alternator diodes.
- Do not attempt to crank the engine with the battery ground cable loosely connected or you will severely damage the wiring.

Handling Connectors

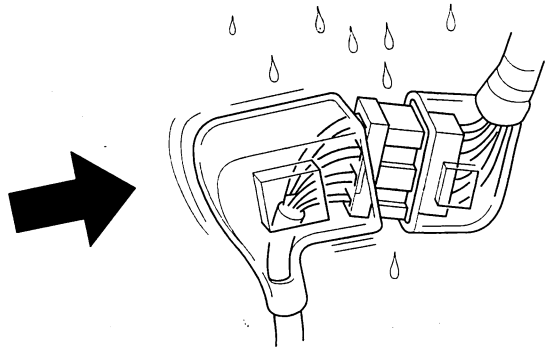
- Make sure the connectors are clean and have no loose wire terminals.
- Make sure multiple cavity connectors are packed with dielectric grease (except watertight connectors).
- All connectors have push-down release type locks (A).



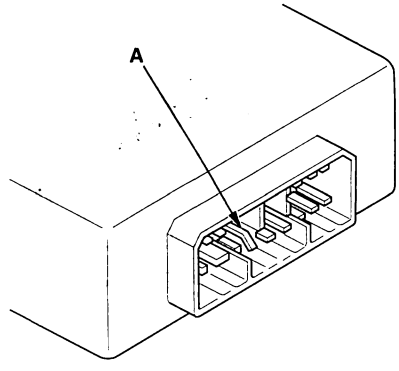
- Some connectors have a clip on their side used to attach them to a mount bracket on the body or on another component. This clip has a pull type lock.
- Some mounted connectors cannot be disconnected unless you first release the lock and remove the connector from its mount bracket (A).



- Never try to disconnect connectors by pulling on their wires; pull on the connector halves instead.
- Always reinstall plastic covers.



- Before connecting connectors, make sure the terminals (A) are in place and not bent.

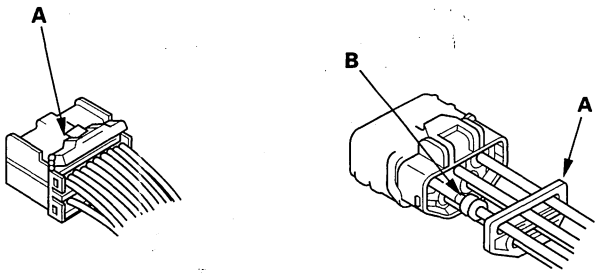


(cont'd)

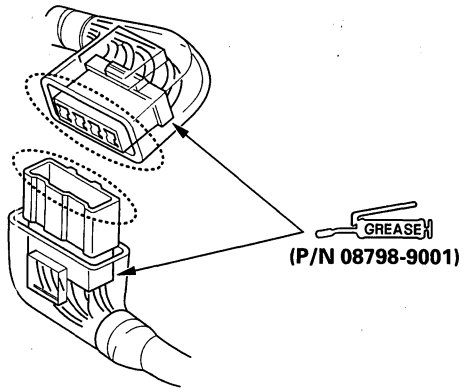
Protected by AR

General Troubleshooting Information (cont'd)

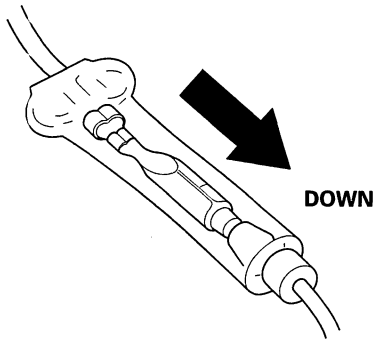
- Check for loose retainer (A) and rubber seals (B).



- The backs of some connectors are packed with dielectric grease. Add grease if necessary. If the grease is contaminated, replace it.

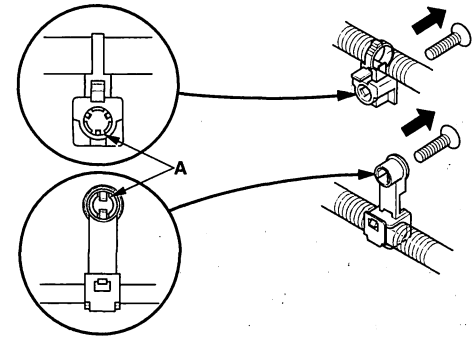


- Insert the connector all the way and make sure it is securely locked.
- Position wires so that the open end of the cover faces down.

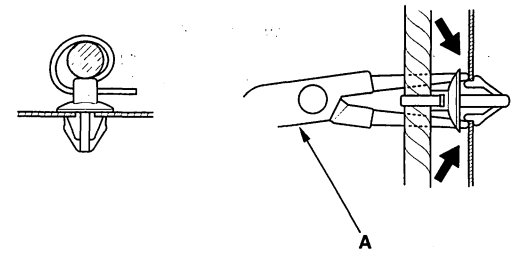


Handling Wires and Harnesses

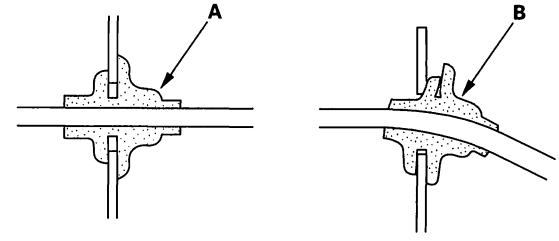
- Secure wires and wire harnesses to the frame with their respective wire ties at the designated locations.
- Remove clips carefully; don't damage their locks (A).



- Slip pliers (A) under the clip base and through the hole at an angle, then squeeze the expansion tabs to release the clip.



- After installing harness clips, make sure the harness doesn't interfere with any moving parts.
- Keep wire harnesses away from exhaust pipes and other hot parts, from sharp edges of brackets and holes, and from exposed screws and bolts.
- Seat grommets in their grooves properly (A). Do not leave grommets distorted (B).

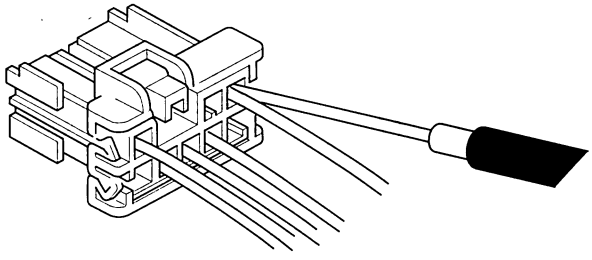


BACK

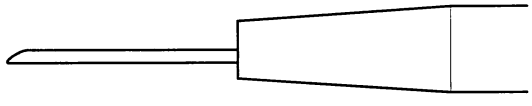
Protected by AR

Testing and Repairs

- Do not use wires or harnesses with broken insulation. Replace them or repair them by wrapping the break with electrical tape.
- Never attempt to modify, splice, or repair SRS wiring. If there is an open or damage is SRS wiring or terminals, replace the harness.
- After installing parts, make sure that no wires are pinched under them.
- When using electrical test equipment, follow the manufacturer's instructions and those described in this manual.
- If possible, insert the probe of the tester from the wire side (except waterproof connector).



- Use back probe adaptor 07TAZ-001020A.



- Refer to the instructions in the Honda Terminal Kit for identification and replacement of connector terminals.

Five-step Troubleshooting

1. Verify The Complaint:
   Turn on all the components in the problem circuit to verify the customer complaint. Note the symptoms. Do not begin disassembly or testing until you have narrowed down the problem area.

2. Analyze The Schematic:
   Look up the schematic for the problem circuit. Determine how the circuit is supposed to work by tracing the current paths from the power feed through the circuit components to ground. If several circuits fail at the same time, the fuse or a ground is a likely cause.

   Based on the symptoms and your understanding of the circuit operation, identify one or more possible causes of the problem.

3. Isolate The Problem By Testing The Circuit:
   Make circuit tests to check the diagnosis you made in step 2. Keep in mind that a logical, simple procedure is the key to efficient troubleshooting. Test for the most likely cause of failure first. Try to make tests at points that are easily accessible.

4. Fix The Problem:
   Once the specific problem is identified, make the repair. Be sure to use proper tools and safe procedures.

5. Make Sure The Circuit Works:
   Turn on all components in the repaired circuit in all modes to make sure you've fixed the entire problem. If the problem was a blown fuse, be sure to test all of the circuits on the fuse. Make sure no new problems turn up and the original problem does not recur.

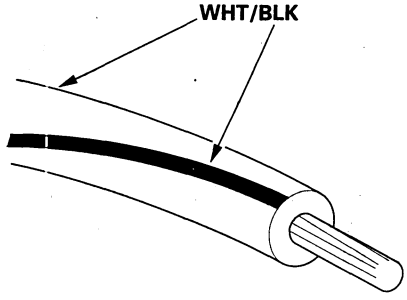
General Troubleshooting Information (cont'd)

Wire Color Codes

The following abbreviations are used to identify wire colors in the circuit schematics:

WHT	White
YEL	Yellow
BLK	Black
BLU	Blue
GRN	Green
RED	Red
ORN	Orange
PNK	Pink
BRN	Brown
GRY	Gray
PUR	Purple
LT BLU	Light Blue
LT GRN	Light Green

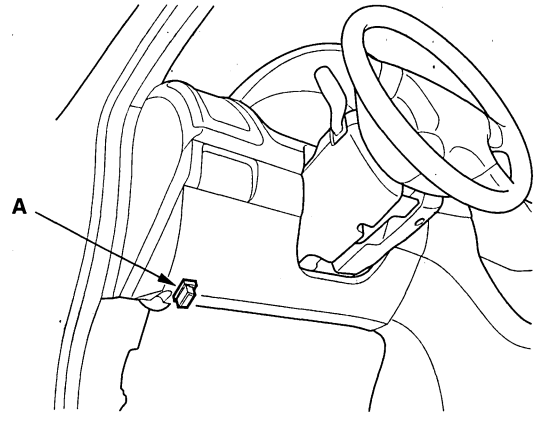
The wire insulation has one color or one color with another color stripe. The second color is the stripe.



How to Check for DTCs with the Honda Diagnostic System (HDS)

1. Connect the Honda Diagnostic System (HDS) to the Data Link Connector (DLC) (A) located under the driver's side of the dashboard.

   NOTE: For specific operations, refer to the user's manual that came with the Honda Diagnostic System (HDS).



2. Select the TEST MODE MENU and check for Diagnostic Trouble Code (DTCs), and note them. Refer to the Troubleshooting Index and begin the appropriate troubleshooting procedure.

Connector Index

Identification numbers have been assigned to in-line connectors, junction connectors, and terminals. The number is preceded by the letter "C" for connectors, "G" for ground terminals or "T" for non-ground terminals.

Harness	Location			
	Engine Compartment	Dashboard	Others (Floor, Door, Trunk, and Roof)	Notes
Battery ground cable	(−) G1			(see page 22-14)
Engine ground cable A	T1 G2			(see page 22-14)
Engine ground cable B	T2 G3			(see page 22-14)
Starter subharness	C101, C153 (+) T101 through T104			(see page 22-15)
Engine wire harness	C101 through C103, C108 C152, C201 through C203 T10 through T13 G101			(see page 22-16)
Front engine compartment wire harness (left branch)	C301 G301			(see page 22-22)

Ground Distribution

Ground to Components Index

Ground	Component or circuit grounded
G1	Battery-terminal
G2	Engine mount bracket
G3	Transmission housing
G101	ECM/PCM (PG1 and PG2 are BLK; LG1 and LG2 are BRN/YEL), CMP sensor A, CKP sensor, Countershaft speed sensor (A/T), CMP sensor B, EGR valve, IAC valve, Ignition coils, Mainshaft speed sensor (A/T), Thermal joints, A/T clutch pressure control solenoid valve A (A/T), A/T clutch pressure control solenoid valve B (A/T), A/T clutch pressure control solenoid valve C (A/T), Transmission range switch (A/T), Rocker arm oil pressure switch (VTEC oil pressure switch), Rocker arm oil control solenoid (VTEC solenoid valve)
	Shielding between the ECM/PCM and knock sensor has BRN/YEL wire
G201	A/C condenser fan motor, Hood switch (with security), Right headlights, Right front turn signal/side marker lights
G202	Brake fluid level switch, Cruise control actuator, Power steering pressure (PSP) switch, Washer fluid level switch (Canada)
G203	ABS modulator-control unit
G301	Daytime running lights relay (Canada), Left headlights, Left front turn signal/side marker lights, Radiator fan motor, Radiator fan switch ('03-04 models)
G302	Blower motor relay, ELD unit, Relay control module, Windshield wiper motor
G401	Daytime running lights control unit (2 wires)
G501	Accessory power socket relay, Ambient light (with moonroof), Clutch interlock switch (M/T), Clutch pedal position switch (M/T with cruise control), Combination switch control unit, Cruise control unit, Data link connector (DLC), Driver's door lock knob switch, Driver's door key cylinder switch, Gauge control module, Ignition key switch, Key interlock solenoid, Moonroof switch, Moonroof control unit (2-door), Moonroof open and close relays (4-door), Power window master switch, Relay control module, Vanity mirror lights (G501 connects to G601 via under-dash fuse/relay box)
G502	Multiplex integrated control unit (MICU)
G503	Audio-HVAC subdisplay (with navigation), Audio-HVAC display module, Data link connector (DLC), Front accessory power socket, Front passenger's door lock knob switch, Front passenger's power window switch, Gauge control module, Glove box light, Memory erase signal (MES) connector, Navigation display unit, Power transistor, Rear accessory power socket, Right power mirror defogger (Canada), Park pin switch
	Shielding between the ECM/PCM, Gauge control module, and Navigation unit have BRN wire.
G504	Audio unit
G505	SRS unit
G506	Driver's seat heater switch, Front passenger's seat heater switch, Seat heater relay
G601	Driver's power seat switch (2 wires for 8-way adjustable, 1 wire for 2-way adjustable), Driver's seat belt switch, Driver's seat heater, Door multiplex control unit, Left power mirror defogger (Canada), Left rear door lock knob switch (with security) (4-door), Left rear power window switch (4-door), Multiplex integrated control unit (MICU), MICU service check connector, Power mirror switch, Turn signal/hazard relay (G601 connects to G501 via under-dash fuse/relay box.)
G602	Front passenger's seat belt switch, Front passenger's seat heater, Front passenger's weight sensor unit ('04-05 models), Navigation unit, OPDS/ODS unit, Right rear door lock knob switch (with security) (4-door), Right rear power window switch (4-door)
G603	Fuel pump
G701 (4-door)	Back-up lights, Brake lights, High mount brake light, License plate light, Taillights, Turn signal lights, Trunk latch switch, Trunk key cylinder switch
G701 (2-door)	High mount brake light, Left back-up light, Left brake light, Left taillight, Left turn signal light, License plate light, Trunk latch switch
G702 (2-door)	Right back-up light, Right brake light, Right taillight, Right turn signal light

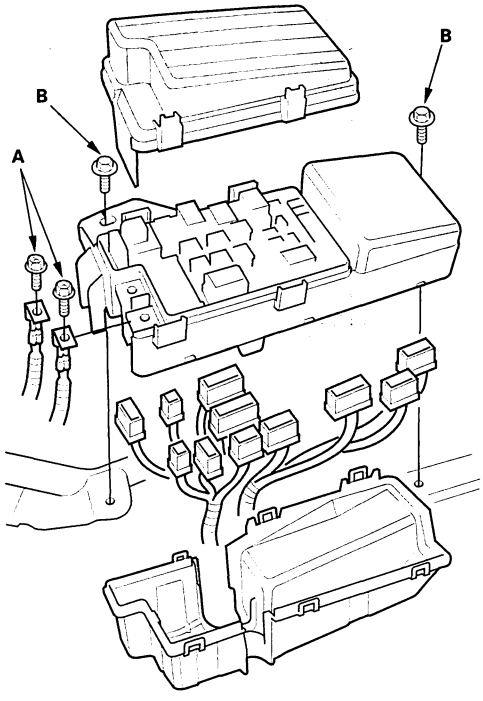
Under-hood Fuse/Relay Box

Removal and Installation

Removal

1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the customer's audio station presets and XM radio channel presets. Make sure the ignition switch is OFF.
2. Connect the HDS to the data link connector (DLC), and ground the SCS.
3. Disconnect the battery negative cable, then disconnect the positive cable, and wait at least 3 minutes.
4. Remove the under-hood multi-relay box (Canada) from the under-hood fuse/relay box.
5. Remove the screws (A) from the alternator and battery cable terminals.
6. Remove the two mounting bolts (B) from the under-hood fuse/relay box.
7. Remove the under cover from the under-hood fuse/relay box.
8. Disconnect the connectors from the under-hood fuse/relay box.



Installation

1. Connect the connectors to the under-hood fuse/relay box, then install the under-hood fuse/relay box in the reverse order of removal.
2. Install the removed parts in the reverse order of removal.
3. Connect the both positive cable and negative cable to the battery.
4. Do the ECM/PCM idle learn procedure (see page 11-316).
5. Reset the power window control unit (see page 22-232).
6. Enter the anti-theft codes for the radio and navigation system, then enter the customer's audio station presets and XM radio channel presets.
7. Confirm that all systems work properly.

DTC Troubleshooting

B1055: Relay Control Module lost communication with MICU

B1056: Relay Control Module lost communication with MICU

B1057: Relay Control Module lost communication with MICU (door switch message)

B1058: Relay Control Module lost communication with Door Multiplex Control Unit (door lock switch message)

B1059: Relay Control Module lost communication with Door Multiplex Control Unit (panic message)

B1060: Relay Control Module lost communication with Gauge Control Module (VSP/NE message)

B1061: Relay Control Module lost communication with Gauge Control Module (A/T message)

B1062: Relay Control Module lost communication with Combination Switch Control Unit (headlight switch message)

B1063: Relay Control Module lost communication with Combination Switch Control Unit (wiper switch message)

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch OFF then ON.
3. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC B1055, B1056, B1057, B1058, B1059, B1060, B1061, B1062 and/or B1063 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the B-CAN communication line is OK at this time.■
4. Check for DTCs other than those listed above.

   Are any other DTCs present?

   YES—Go to step 5.

   NO—Perform Relay Control Module Input Test (see page 22-132).
5. Find the chart that contains at least one retrieved DTC in column A and one retrieved DTC in column B. Perform the input test for the ECU listed in that chart.
   If no DTC from column B is found, then continue to Relay Control Module input test.■

Chart 1

A	B	ECU
B1055 B1056 B1057	B1157 B1159 B1255	MICU (see page 22-124)

Chart 2

A	B	ECU
B1058 B1059	B1006 B1010 B1160	Door Multiplex Control Unit (see page 22-129)

Chart 3

A	B	ECU
B1060 B1061	B1008 B1205 B1206 B1207	Gauge Control Module • '03-05 models, see page 22-127 • '06 model, see page 22-128

Chart 4

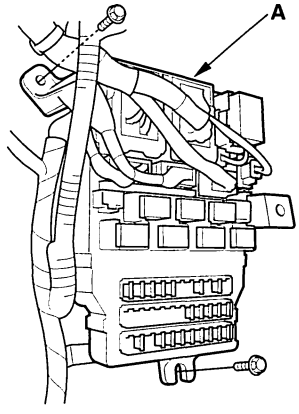
Under-dash Fuse/Relay Box

Removal and Installation

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

Removal

1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the customer's audio station presets and XM radio channel presets. Make sure the ignition switch is OFF.
2. Connect the HDS to the data link connector (DLC), and ground the SCS.
3. Disconnect the battery negative cable, then disconnect the positive cable, and wait at least 3 minutes.
4. Remove the left front door sill trim and left kick panel (see page 20-90).
5. Disconnect the connectors from the fuse side of the under-dash fuse/relay box (A).



6. Remove the two mounting bolts and pull the fuse/relay box away from the body.
7. Disconnect the connectors and remove the under-dash fuse/relay box.

   NOTE: Some SRS harness connectors are spring-loaded lock type (see page 23-24).

8. Carefully remove the relays. Do not use pliers.

Installation

1. Install the removed relays.
2. Connect the connectors to the under-dash fuse/relay box, then install the under-dash fuse/relay box in the reverse order of removal.
3. Install the removed parts in the reverse order of removal.
4. Connect both the positive cable and negative cable to the battery.
5. Reset the power window control unit (see page 22-232).
6. Enter the anti-theft codes for the radio and navigation system, then enter the customer's audio station presents and XM radio channel presets.
7. Confirm that all systems work properly.

Protected by AR

Battery Test

⚠ WARNING

A battery can explode if you do not follow the proper procedure, causing serious injury to anyone nearby. Follow all procedures carefully and keep sparks and open flames away from the battery.

Use either a JCI or Bear ARBST tester, and follow the manufacturer's procedures. If you don't have one of these computerized testers, follow this conventional test procedure:

1. Be sure the temperature of the electrolyte is between 70 °F (21 °C) and 100 °F (38 °C).
2. Inspect the battery case for cracks or leaks.
   - If the case is damaged, replace the battery. ■
   - If the case looks OK, go to step 3.
3. Check the indicator EYE.
   - If the EYE indicates the battery is charged, go to step 4.
   - If the EYE indicates a low charge, go to step 7.
4. Apply a 300 amp load for 15 seconds to remove the surface charge.
5. Wait 15 seconds, then apply a test load of 280 amps for 15 seconds.
6. Record battery voltage.
   - If voltage is above 9.6 volts, the battery is OK. ■
   - If voltage is below 9.6 volts, go to step 7.
7. Charge the battery on High (40 amps) until the EYE shows the battery is charged, plus an additional 30 minutes. If the battery charge is very low, it may be necessary to bypass the charger's polarity protection circuitry.
   - If the EYE indicates the battery is charged within three hours, the battery is OK. ■
   - If the EYE indicates the battery is not charged within three hours, replace the battery. ■

Power Relay Test

Use this chart to identify the type of relay, then do the test listed for it.

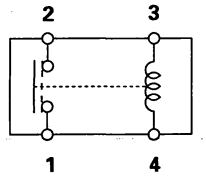
NOTE: For the turn signal/hazard relay input test (see page 22-214).

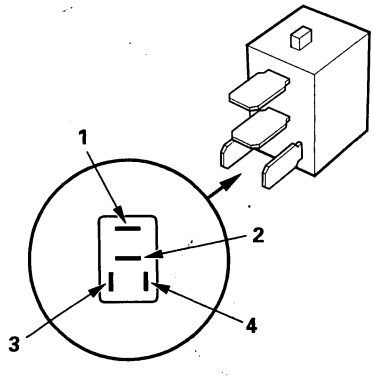
Relay	Test
A/C compressor clutch relay	Normally-open type
Accessory power socket relay	
Blower motor relay	
A/C condenser fan relay	
Ignition coil relay	
Air fuel ratio sensor relay	
PGM-FI main relay 1, 2	
Power window relay	
Radiator fan relay	
Rear window defogger relay	
Starter cut relay	
Throttle actuator control module relay	
Daytime running lights relay (Canada)	Five-terminal type
Moonroof close relay	
Moonroof open relay	
Seat heater relay	

Normally-open type

Check for continuity between the terminals.

- There should be continuity between the No. 1 and No. 2 terminals when power and ground are connected to the No. 3 and No. 4 terminals.
- There should be no continuity between the No. 1 and No. 2 terminals when power is disconnected.





(cont'd)

Protected by AR

Power Relay Test (cont'd)

Five-terminal type B

Check for continuity between the terminals.

- There should be continuity between the No. 1 and No. 2 terminals when power and ground are connected to the No. 3 and No. 5 terminals.
- There should be continuity between the No. 1 and No. 4 terminals when power is disconnected.

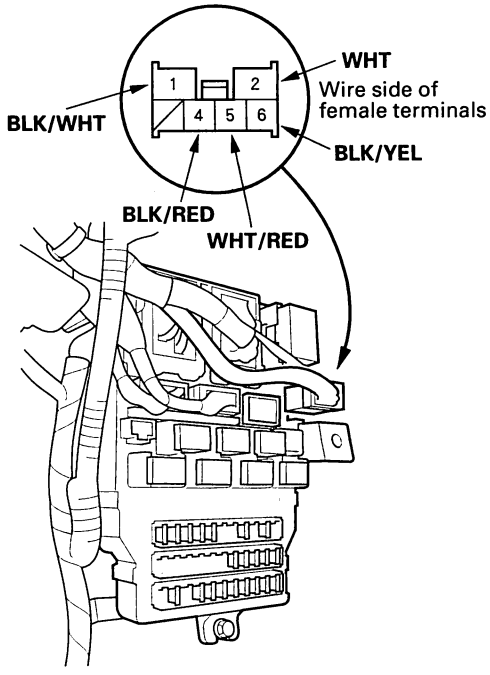
Ignition Switch

Test

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

1. Make sure you have the anti-theft code for the radio and the navigation system, then write down the customer's audio station presets and XM radio channel presets. Make sure the ignition switch is OFF.
2. Connect the HDS to the date link connector (DLC), and ground the SCS.
3. Disconnect the battery negative cable.
4. Remove the left front door sill trim and left kick panel (see page 20-90).
5. Disconnect the 6P connector from the driver's under-dash fuse/relay box.



6. Check for continuity between the terminals in each switch position according to the table.

Terminal / Position	WHT/ RED (ACC)	WHT (BAT)	BLK/ YEL (IG1)	BLK/ RED (IG2)	BLK/ WHT (ST)
O (LOCK)					
I (ACC)	○——	——○			
II (ON)	○——	——○——	——○——	——○	
III (START)		○——	——○——	————	——○

7. If the continuity checks do not agree with the table, replace the steering lock.
8. After reconnecting the battery, enter the anti-theft code for the radio and the navigation system, then enter the customer's audio station presets and XM radio channel presets.
9. Do the power window control unit reset procedure (see page 22-232).

Multiplex Integrated Control System (MICS)

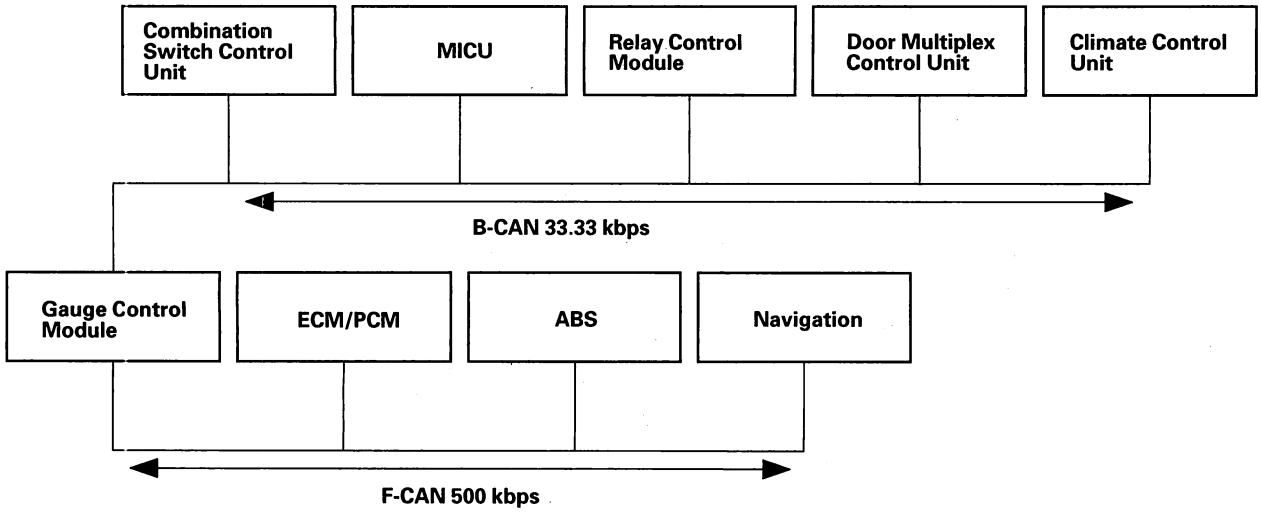
System Description

Body Controller Area Network (B-CAN) and Fast Controller Area Network (F-CAN)

Fast controller Area Network (F-CAN) and Body Controller Area Network (B-CAN) share information between multiple Electronic Control Units (ECUs). B-CAN communication moves at a slower speed for convenience related items, and for other functions. F-CAN information moves at a faster speed for "real time" functions such as fuel and emissions data. To allow both systems to share information, the Gauge Control Module translates information from B-CAN to F-CAN and from F-CAN to B-CAN.

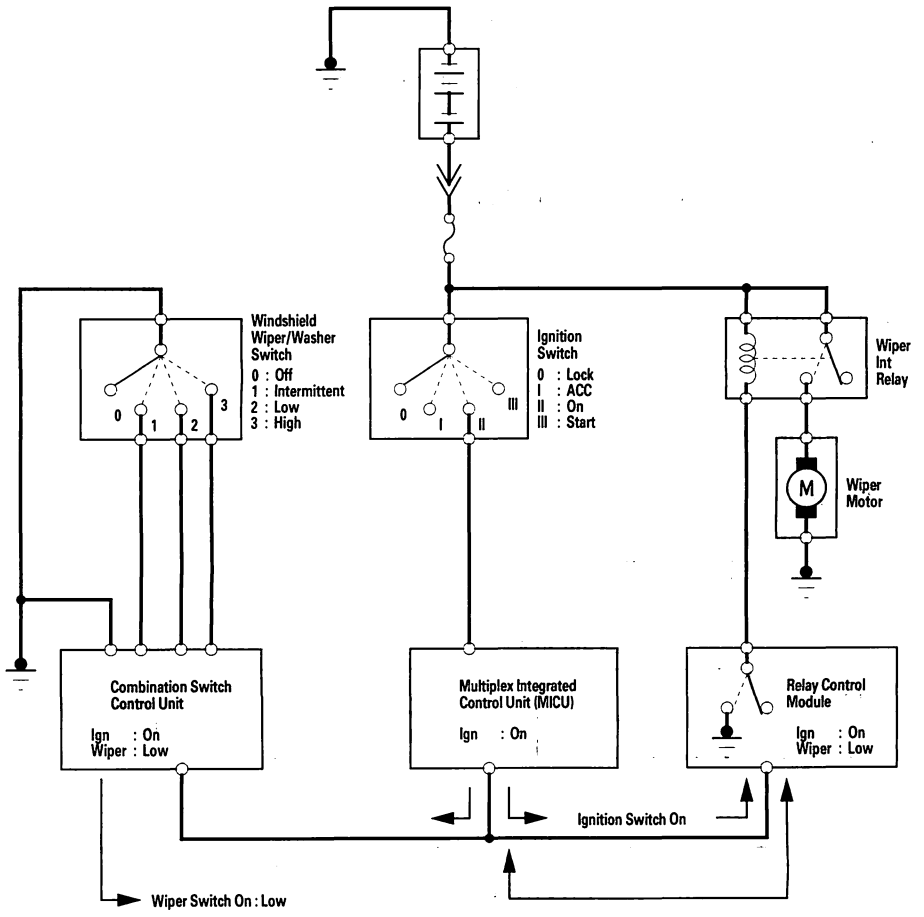
The ECUs on the B-CAN and F-CAN transmit and receive information in the form of structured messages that may be received by several different ECUs on the network at one time. These message are transmitted and received across a communication circuit that consists of a single wire that is shared by all the ECUs on the circuit. Since messages on the F-CAN network are typically of higher importance, a second wire is used for communication circuit integrity monitoring. A backup circuit is also added to the headlight and wiper circuits on the B-CAN network in the event of a network wire or ECU failure that would effect the operation of the system.



BACK

Protected by AR

Messages are transmitted by an ECU (that monitors an input) over the communication circuit. ECUs that use the message (information related to that input) are the receivers. For example, the Combination Switch Control Unit monitors the wiper switch. When the wiper switch is placed in the low speed position, the Combination Switch Control Unit transmits that message on the communication circuit. The Relay Control Module receives the message and turns on the wipers by providing a ground for the relay.



(cont'd)

Protected by AR

System Description (cont'd)

"Connected" ECUs

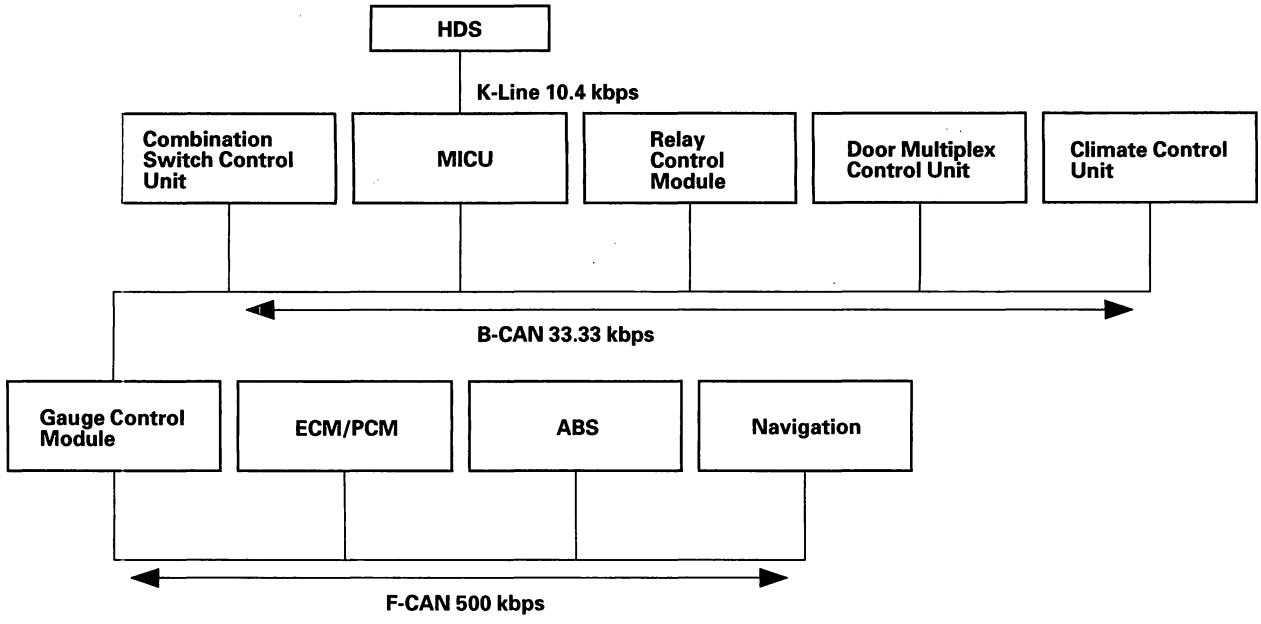
Several ECUs are connected to each of the two networks. The Gauge Control Module is part of both networks since it is the "Gateway" between them. Below is a list of ECUs and the network they are connected to.

B-CAN ECUs

- Gauge Control Module
- Relay Control Module
- Multiplex Integrated Control Unit (MICU)
- Door Multiplex Control Unit
- Combination Switch Control Unit
- Climate Control Unit
- Optional Security (LX model option)
- Optional Unit (B-CAN option)

F-CAN ECUs

- Gauge Control Module
- ECM/PCM
- Navigation Control Unit
- ABS



BACK

Protected by AR

Network "Loss of Communication" Error Checking

The B-CAN and F-CAN systems send messages to each other to check the integrity of the network communication circuit. They do this by sending a specific digital message out after an event. For example, turning the ignition switch to ON. After the switch to ON, all the ECUs on the communication circuit expect to receive a message from other specific units within a specified amount of time. If the message is not received, the ECU will transmit a DTC reporting that the control units did not communicate.

Example of communication circuit test

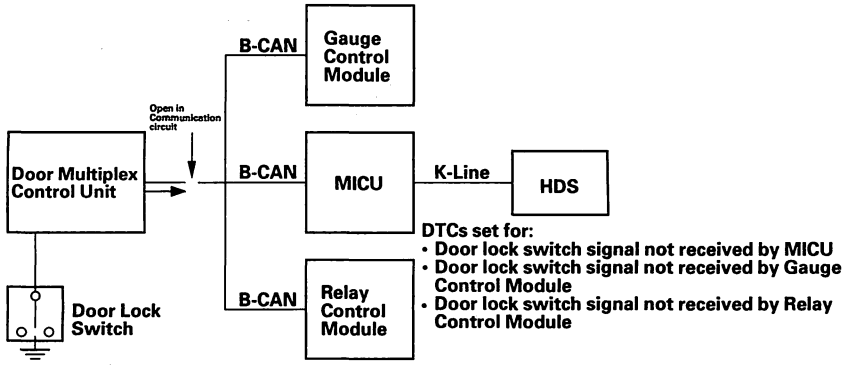
Normal circuit

1. Ignition switch turned ON.
2. The door multiplex control unit transmits a door switch signal.
3. The multiplex integrated control unit (MICU), relay control module and gauge control module receive the door lock switch signal.
4. Communication circuit test is passed.

Since the door lock switch message was received by all the ECUs expecting to receive a signal, the communication circuit between those units is OK. There are multiple signal sent and received by each ECU during this time to insure that the communication circuit is intact.

Failed circuit

5. Ignition switch is turned ON.
6. The door multiplex control unit transmits a door switch signal.
7. The multiplex integrated control unit (MICU), relay control module and gauge control module expect to receive the door lock switch signal, but since there is a break in the communication circuits, it is not received.
8. Each ECU that expects to receive the door lock switch signal from the door multiplex control unit will transmit DTCs for the signal that it did not receive.



Since there is a break in the communication circuit, the door lock switch signal could not be received by the gauge control module, multiplex integrated control unit (MICU) or the relay control module. Each of these units will set "loss of communication" error codes for the signal(s) they did not receive. There may be multiple communication DTCs if the unit that has become disconnected from the network would normally transmit multiple messages during the communication line test. For example, the door multiplex control unit sends keyless panic signal and door lock switch signal during the communication circuit test.

Diagnostic Trouble Codes

There are three DTC types used by the CAN networks.

Internal error DTCs	The ECUs run internal checks. If one finds that there is an internal ECU problem, it will set an internal error DTC. Confirm that the battery and charging system are OK. If so, this indicates that the ECU needs to be replaced.
Loss of communication DTCs	Loss of communication DTCs (and Bus-off DTCs) are set when there is a problem with the communication between ECUs. This could be in the connections, the wiring, or the ECU (as called out in the DTC Troubleshooting index).
Signal error DTCs	The ECUs can run diagnostics on some input circuits to determine if that circuits is functioning properly (no opens or shorts). If a circuit falls the diagnostic test, a DTC will set (NOTE: Not all input circuits are tested for errors).

(cont'd)

Protected by AR

System Description (cont'd)

Troubleshooting the CAN circuit related problems

Using the HDS (Preferred method)

1. Go to B-CAN System Diagnosis Test Mode A to check for "Connected units" and DTCs (see page 22-91).
2. If no DTCs are retrieved, go to B-CAN System Diagnosis Test Mode C or D.

Without the HDS (Should be used only if HDS is unavailable)

3. Check for communication circuit problems using B-CAN System Diagnosis Test Mode 1 (see page 22-96).
4. Check for DTCs while in Mode 1 (see page 22-96).
5. Sort, and then troubleshoot the DTCs in the order below. Refer to the DTC troubleshooting Index for DTC descriptions.

   1st. Internal error and voltage failure DTCs

   2nd. Loss of communication DTCs

   3rd. Signal error DTCs

6. If no DTCs are retrieved, use B-CAN System Diagnosis Test Mode 2 to check all inputs related to failure (see page 22-96).

Loss of Communication DTC cross-reference chart

When an ECU is unable to communicate with the other ECUs on the circuit, the other units will set loss of communication DTCs. Use this chart to find the control unit that is not communicating.

7. Find the Transmitting Unit that is in the same row as all of the loss of communication DTCs retrieved.
8. Perform the input test for the transmitting unit.

Transmitting Unit	Message	Receiving Unit/Loss of Communication DTC					
		MICU	Relay Control Module	Door Multiplex Control unit	Gauge Control Module	Combination Switch Control Unit	Climate Control Unit
MICU	Alarm		B1056				
	MICU		B1055	RX	B1157	B1255	
	Door Switch		B1057	RX	B1159		
Relay Control Module	Relay Control Module	B1005			B1158		
Door Multiplex Control unit	Panic	B1010	B1059				
	Door Lock Switch	B1006	B1058		B1160		
Gauge Control Module	VSP/NE		B1060				B1205
	A/T	B1008	B1061				
	ENGTEMP						B1206
	ILLUMI						B1207
Combination Switch Control Unit	Headlight Switch	B1007	B1062		B1155		
	Wiper Switch	B1009	B1063		B1156		
PCM	Engine				B1168		
	A/T				B1169		

RX: Receiving unit does not set a loss of communication DTC.

Troubleshooting - B-CAN System Diagnosis Test Mode A

NOTE:
- Check for engine DTCs (U-codes) with the HDS. If any U-codes are detected, find and repair the cause of code(s) before continuing with the diagnosis test.
- Perform this diagnosis first if the symptom is related to the B-CAN system.
- Always cycle the ignition switch within 3 seconds when prompted in the DTC troubleshooting procedures.

1. Make sure the system is related to B-CAN.

   - Gauge control module
   - Exterior lights
   - Turn signals
   - Entry light control
   - Interior lights
   - Safety indicators
   - Rear window defogger
   - Horns (security and panic)
   - Chimes (key, seatbelt and lights ON)
   - Power windows (key-off timer)
   - Moonroof timer (EX, EXL)
   - Wiper/washer
   - Security*1
   - Keyless entry
   - Power door locks
   - Climate control (EX, EXL)
   - Key interlock
   - Dash light brightness

   * 1: EX, EXL, LX-V6, Canada LX '06 model
   Canada SE

   Is the symptom related to the B-CAN system?

   YES—Go to step 2.

   NO—Go to the system troubleshooting for the system with the symptom. ■

2. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC) 16P connector.

3. From BODY ELECTRICAL MENU, select connected units UNIT INFORMATION, and then select CONNECTED UNIT.

   - MICU
   - Door multiplex control unit
   - Gauge control module
   - Combination switch control unit
   - Relay control module
   - Climate control unit (EXL, EX-V6)

   NOTE:
   - If the unit is communicating with the scan tool, DETECT will be displayed.
   - If the unit is not communicating, "NOT AVAILABLE" will be displayed.

   Are all control units communicating with the HDS?

   YES—Go to step 4.

   NO—If any of them are not communicating, go to B-CAN System Diagnosis Test Mode B. If all units are not communicating, or only the MICU is communicating, go to DTC B1000troubleshooting (see page 22-116). ■

(cont'd)

Protected by AR

Troubleshooting - B-CAN System Diagnosis Test Mode A (cont'd)

4. Select the system that has the problem from the BODY ELECTRICAL DTCs MENU, then select DTCs.

   Are any DTCs indicated?

   YES—Go to step 5.

   NO—If the problem is related to one the following items, go to B-CAN System Diagnosis Test Mode C.

   - Exterior lights
   - Turn signals
   - Entry light control
   - Interior lights
   - Rear window defogger (climate control)
   - Horns (security and panic)
   - Power windows (key-off timer)
   - Moonroof timer (EX, EXL)
   - Wiper/washer
   - Power door locks

   NOTE: If the problem is related to one of the following items, go to the troubleshooting for that individual system.

   - Gauge control module
   - Safety indicators
   - Chimes (key, seat belt and lights ON)
   - Security (EX, EXL)
   - Keyless entry
   - Climate control (EX, EXL)
   - Key interlock
   - Dash light brightness
   - Audio System
   - Navigation

5. Record all DTCs and sort them by DTC type using the DTC troubleshooting Index.

6. Troubleshoot the DTC(s) in the following order:

   - Battery voltage DTCs.
   - Internal error DTCs.
   - Loss of communicator DTCs. Begin troubleshooting with the lowest number first (Example: if DTC B1006 and B1058 are retrieved, begin by troubleshooting B1006).
   - Signal error DTCs.

BACK

Protected by AR

Troubleshooting - B-CAN System Diagnosis Test Mode B

NOTE:
- Perform this diagnosis if any of the control units are not communicating (Not Available displayed in the HDS.) as found by the B-CAN system Diagnosis Test Mode A.
- Always cycle the ignition switch within 3 seconds when prompted in the DTC troubleshooting procedures.

1. Using the Honda Diagnostic System (HDS), select the system that has the symptom from the BODY ELECTRICAL MENU.

2. Select DTCs, and then check for loss of communication DTCs (use the DTC Troubleshooting Index to find the DTC type).

   Are loss of communication DTCs indicated?

   YES—Go to step 3.

   NO—Replace the MICU.■

3. Perform the input test for the unit not communicating with the HDS.

Unit not communicating
MICU (see page 22-124)
Door multiplex control unit (see page 22-129)
Gauge control module (see page 22-127 ('03-05 models) or page 22-128 ('06 models))
Relay control module (see page 22-132)
Climate control unit (see page 21-90)
Combination switch control unit (see page 22-131)

Protected by AR

Troubleshooting - B-CAN System Diagnosis Test Mode C

NOTE:
- Perform this diagnosis if a component that is controlled by the B-CAN system does not stop or does not turn off.
- If the component does not turn ON, go to B-CAN System Diagnosis Test Mode D.
- See the B-CAN system unit input/output index for a list of input and output devices and the control units that monitor the input and controls the output devices (see page 22-89).
- Always cycle the ignition switch within 3 seconds when prompted in the DTC troubleshooting procedures.

1. Check for DTCs by selecting the TEST MODE MENU from the Honda Diagnostic System (HDS).

   Are any DTCs indicated?

   YES—Go to B-CAN System Diagnosis Test Mode A. ■

   NO—Go to step 2.

2. Turn OFF the switch that controls the malfunctioning component.

3. Select DATA LIST from the TEST MODE MENU, and check the input of the switch that controls the component.

   Does the tester indicate the switch is OFF?

   YES—Go to step 4.

   NO—Go to step 6.

4. In the DATA LIST of, check the output signal of the malfunctioning component.

   Is the output signal OFF?

   YES—Go to step 5.

   NO—Replace the control unit that controls the device that will not turn OFF (see page 22-89). ■

5. Check the relay if applicable, then check for a short in the wire between the relay and the component, relay and control unit or the component and control unit.

   Are the relay and the wire harness OK?

   YES—Replace the control unit that controls the component that will not turn OFF. ■

   NO—Replace the relay or repair the wire harness. ■

6. Check the switch, then check for a short in the wire between the switch and the control unit that monitors the switch.

   Is the switch and wire harness OK?

   YES—Replace the control unit that monitors the switch. ■

   NO—Replace the switch or repair the wire harness. ■

BACK

Protected by AR

Troubleshooting - B-CAN System Diagnosis Test Mode D

NOTE:
- Perform this diagnosis a component that is controlled by the B-CAN system does not run or does not come on.
- If the component does not turn off or does not stop, go to B-CAN System Diagnosis Test Mode C.
- See the B-CAN system unit input/output index for a list of input and output devices and the control units that monitor the input and controls the output devices (see page 22-89).
- Always cycle the ignition switch within 3 seconds when prompted in the DTC troubleshooting procedures.

1. Check the fuse of the malfunctioning output device.

   Is the fuse OK?

   YES—Go to step 2.

   NO—Replace the fuse and recheck.■

2. Check for DTCs by selecting the TEST MODE MENU from the Honda Diagnostic System (HDS).

   Are any DTCs indicated ?

   YES—Go to B-CAN System Diagnosis Test Mode A.■

   NO—Go to step 3.

3. Turn ON the switch that controls the malfunctioning component.

4. Select DATA LIST from the TEST MODE MENU, and check output signal for the malfunctioning component.

   Is there an output signal?

   YES—Go to step 5.

   NO—Go to step 9.

5. Check the relay and ground, then check for an open or a short in the circuit for the malfunctioning component.

   Are the relay and circuit OK?

   YES—Go to step 6.

   NO—Replace the relay or repair the wire circuit.■

6. Perform the function test for the malfunctioning component.

   Does the output device pass the function test?

   YES—Go to step 7.

   NO—Replace the component.■

7. With the malfunctioning output device connected, connect a voltmeter between the malfunctioning output device and body ground on the wire that the control unit uses to control the output device circuit.

8. Select MISC. TEST from the TEST MODE MENU, and do the forced operation test of the malfunctioning component.

   Is there a change in voltage (12 V to 0 V or 0 V to 12 V)?

   YES—Replace the component.■

   NO—Replace the control unit that controls the malfunctioning component.■

9. Select DATA LIST from the TEST MODE MENU, and make sure the switch signal input for the malfunctioning system indicates a change when operated.

   Does the switch input indicated ON when the switch is ON?

   YES—Replace the control unit that controls the malfunctioning component.■

   NO—Go to step 10.

10. Check the switch and its ground (if applicable), then check for an open or a short in the wire between the switch and the control unit that monitors it.

    Is the switch and the wire harness OK?

    YES—Replace the control unit that monitors the switch.■

    NO—Replace the switch or repair the wire harness.■

Protected by AR

Troubleshooting - B-CAN System Diagnosis Test Mode 1 and Test Mode 2 (without the HDS)

1. Check the No. 7 (10 A) fuse and No. 21 (7.5 A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

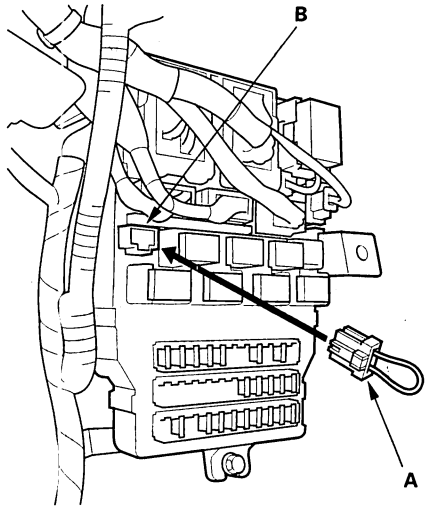
   YES—Go to step 2.

   NO—Find and repair the cause of the blown fuse. ■

2. Remove the left kick panel (see page 20-90).

3. Turn the ignition switch ON (II).

4. Connect the MPCS Service connector (A) to the MCIC socket (B) in the under-dash fuse/relay box.



5. Wait 5 seconds, then watch the ceiling light.

6. If there is a DTC, the ceiling light and ignition switch light will blink, pause, then repeat the DTC as long as the ignition switch ON (II).

   Is there a repeating DTC?

   YES—Count the blinks, then go to step 7.

   NO—Go to step 8.

7. About 1 second after you go into self-diagnosis Mode 1, the ceiling light will indicate the DTC, and repeat it every 3 seconds. If there is more than one DTC, the system will indicate them in ascending order, beginning from the DTC with the lowest numerical value. Troubleshoot the DTCs as indicated below:

   - DTC 2, 3, 4 and 5 simultaneously: Check for an open in the BLU wire between multiplex integrated control unit D11 and relay module I7, BRN/RED wire between multiplex integrated control unit J4 and door multiplex control unit No. 16, LT GRN wire between multiplex integrated control unit X27 and combination switch control unit No. 4, BRN/YEL wire between multiplex integrated control unit N28 and gauge control module terminal No. 25. If the wire is OK, substitute a known-good under-dash fuse/relay box (multiplex integrated control unit), under-hood fuse/relay box, power window master switch, wiper/washer switch and gauge one at a time, in that order, and recheck for the DTCs after each substitution.
   - DTC 1 only: Go to MICU input test (see page 22-124).
   - DTC 2 only (no other DTCs present): Go to the relay module input test. If all inputs are OK, substitute a known-good relay module and then a MICU, one at a time, and then check for DTCs. If a DTC recurs after a substitution, replace that unit.
   - DTC 3 only (no other DTCs present): Go to the door multiplex control unit input test. If all inputs are OK, substitute a known-good door multiplex control unit and then a MICU, one at a time, and then check for DTCs. If a DTC recurs after a substitution, replace that unit.
   - DTC 4 only (no other DTCs present): Go to the combination switch control unit input test. If all inputs are OK, substitute a known-good wiper/washer switch and then a MICU, one at a time, and then check for DTCs. If a DTC recurs after a substitution, replace that unit.
   - DTC 5 only (no other DTCs present): Go to the gauge control module input test. If all inputs are OK, substitute a known-good gauge control module and then a MICU, one at a time, and then check for DTCs. If a DTC recurs after a substitution, replace that unit.

BACK

Protected by AR

DTC	Cause
1	The MICU cannot receive signals from the bus communication line.
2	The MICU cannot receive signals from the relay module communication line.
3	The MICU cannot receive signals from the power window communication line.
4	The MICU cannot receive signal from the combination switch communication line.
5	The MICU cannot receive signals from the gauge control module.

8. Check for B-CAN DTCs indicated by the gauge control module while still in Test Mode 1 (see page 22-96).

   Are any DTCs indicated?

   YES—Go to step 9.

   NO—Go to step 11.

9. Record all DTCs and sort them by type using the DTC Troubleshooting Index.

10. Troubleshoot the DTCs in the following order:

    - Battery voltage DTCs
    - Internal error DTCs
    - Loss of communication DTCs (begin with the lowest number first; for example, if B1006 and B1059 are retrieved, troubleshoot B1006 first)
    - Signal error DTCs

11. Remove the MPCS service connector from the under-dash fuse/relay box socket for 5—10 seconds, then re-insert it.

    NOTE: If the MPCS connector is disconnected for too short or too long of a time, or the ignition switch is turned OFF, the system will return to Test Mode 2.

12. In the list of circuits that can be checked in Test Mode 2. Operate the switch that is most closely related to the problem. If the circuit is OK, the ceiling light will blink once. If the circuit is faulty, there will be no indication.

MICU

Item
Driver's door switch (OPEN)
Front passenger's door switch (OPEN)
Left rear door switch (OPEN)
Right rear door switch (OPEN)
Trunk latch switch (OPEN)
Front passenger's door lock knob switch (UNLOCK)*
Left rear door lock knob switch (UNLOCK)
Right rear door lock knob switch (UNLOCK)*
Audio-HVAC display module security ground (disconnected)
Driver's seat belt switch (unbuckled)
Brake pedal position switch (ON; brake pedal pressed)
Passenger's door lock switch (LOCK/UNLOCK)

* The front passenger's and right rear door lock knob switches must be in the locked position when beginning the test.

RELAY CONTROL MODULE

Item
Windshield wiper switch (AUTO STOP/PARK)
Hood switch (open)
A/C pressure switch/thermal protector (A/C ON)

COMBINATION SWITCH CONTROL UNIT

Item
Turn signal switch (LEFT)
Turn signal switch (RIGHT)
Combination light switch (ON; each position)
Dimmer switch (ON)
Passing switch (ON)
Windshield wiper switch (ON)
Intermittent wiper dwell timer
Windshield washer switch (ON)

Protected by AR

Troubleshooting - B-CAN System Diagnosis Test Mode 1 and Test Mode 2 (without the HDS) (cont'd)

POWER WINDOW MASTER SWITCH (DOOR MULTIPLEX CONTROL UNIT)

Item
Power window master switch (Driver's Window UP)
Power window master switch (Driver's Window DOWN)
Power window master switch (Driver's Window AUTO UP)
Power window master switch (Driver's Window AUTO DOWN)
Power window master switch (Front Passenger's Window UP)
Power window master switch (Front Passenger's Window DOWN)
Power window master switch (Left Rear Window UP)
Power window master switch (Left Rear Window DOWN)
Power window master switch (Right Rear Window UP)
Power window master switch (Right Rear Window DOWN)
Driver's door key cylinder switch* (LOCK)
Driver's door key cylinder switch* (UNLOCK)
Driver's door lock switch (LOCK)
Driver's door lock switch (UNLOCK)
Driver's door lock knob switch (LOCK)
Driver's door lock knob switch (UNLOCK)

* A second key is necessary to check the key cylinder inputs.
Be sure to rotate the key cylinder switch two times to each position (lock and lock, unlock and unlock) to ensure the door lock knob switch is in the appropriate position.

GAUGE CONTROL MODULE

Item
Parking brake switch (ON; parking brake applied)
Cruise control SET/RESUME/CANCEL switch (ON; switch pressed)
Transmission range switch (P, R, N, D)
Washer fluid level switch (Canada)
Brake fluid level switch (fluid removed)

Does the ceiling light indicate proper switch operation?

YES—Go to function and input test for the system related to the failure. ■

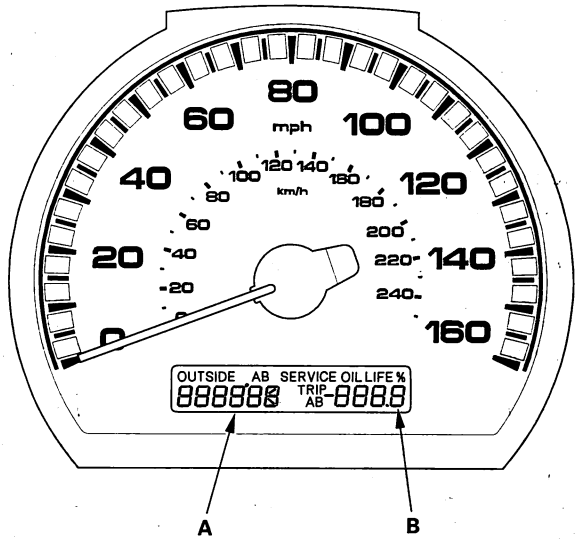
NO—Repair the open, short, or replace the faulty switch. ■

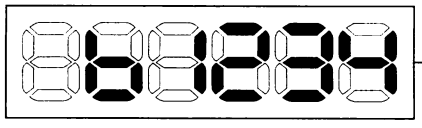
BACK

Protected by AR

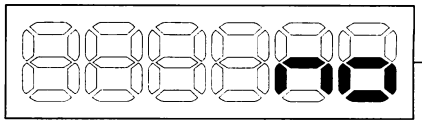
Gauge Control Module DTC Display

While in Test Mode 1, the DTCs which have been detected and stored individually by various B-CAN (Body-controller Area Network) units, will be shown one by one on the odometer display (A) when the communication between the Multiplex Integrated Control Unit (MICU) and the gauge control module is normal. To scroll through the DTCs, press the RESET knob on the gauge control module.

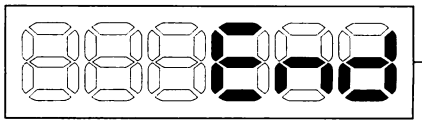




Displaying the DTC. The last four digits represent the DTC.



No DTCs detected.



All the DTCs have been displayed.

The unit that has stored the code can be identified by the number shown on the trip meter display (B).

MICU	10
Relay Control Module	11
Door Multiplex Control Unit	30
Gauge Control Module	50
Climate Control Module	51
Combination Switch Control Unit	70

How to clear the DTC

While in Test Mode 1, press and hold down the RESET knob for more than 10 seconds.

Protected by AR

DTC Troubleshooting

DTC B1000: Communication Bus Line Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1000 indicated?

   YES—Go to step 4.

   NO—Intermittent failure. The communication bus line is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34).■
4. Check for DTCs using the HDS.

   Are DTC B1005, B1006, B1007, B1008, B1009 and B1010 indicated?

   YES—Go to step 5.

   NO—Replace the MICU.■
5. Disconnect each control unit one at a time. Clear the DTC, then recheck for DTCs after each unit is disconnected.

   - Gauge control module
   - Relay control module
   - Driver's multiplex control unit
   - Climate control unit
   - Combination switch control unit

   Is DTC B1000 indicated with each unit disconnected?

   YES—Check for a short to power or ground in the communication circuit by disconnecting the harness at each control unit and testing for continuity to ground or short to power. Repair or replace the harness as necessary.■

   NO—Substitute a known-good control unit with the one that was disconnected, and did not set DTC B1000.■

DTC B1050, B1100, B1150, B1200, B1250: Communication Bus Line Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Are DTC(s) B1050, B1100, B1150, B1200 or B1250 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the system is OK at this time.■

B1050	Relay Control Module
B1100	Door Multiplex Control Unit
B1150	Gauge Control Module
B1200	Audio-HVAC Display Module
B1250	Combination Switch Control Unit

4. Check for DTCs using the HDS.

   Is DTC(s) B1000 indicated?

   YES—Troubleshoot DTC B1000.■

   NO—If DTC B1050 is indicated, replace the relay control module. If DTC B1100 is indicated, replace the door multiplex control unit. If DTC B1150 is indicated, replace the gauge control module (see page 22-276). If DTC B1200 is indicated, replace the climate control unit. If DTC B1250 is indicated, replace the combination switch control unit.■

BACK

Protected by AR

DTC B1001, B1002: Multiplex Integrated Control Unit (MICU) Internal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Operate the door lock (LOCK/UNLOCK).
4. Check for DTCs using the HDS.

   Is DTC B1001 or B1002 indicated?

   YES—Faulty MICU; replace the under-dash fuse/relay box. ■

   NO—Intermittent failure, the MICU is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34). ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC B1005: MICU Lost Communication with Relay Control Module

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1005 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the relay module is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34). ■
4. Check for DTCs in the gauge control module using the HDS.

   Is DTC B1158 indicated?

   YES—Go to Relay Control Module Input Test (see page 22-132). ■

   NO—Check for an open in the communication circuit between the MICU and the relay control module. If the circuit is OK, replace the MICU. If the circuit is bad, repair the open. ■

DTC B1006: MICU Lost Communication with Door Multiplex Control Unit (Door Lock Switch Message)

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1006 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the door multiplex control unit is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34). ■
4. Check for DTCs in the gauge control module and relay module using the HDS.

   Is DTC B1160 and B1058 indicated?

   YES—Go to Door Multiplex Control Unit Input Test (see page 22-129). ■

   NO—Check for an open in the communication circuit between the MICU and the door multiplex control unit. If the circuit is OK, replace the MICU. If the circuit is bad, repair the open. ■

BACK

Protected by AR

DTC B1007: MICU Lost Communication with the Combination Switch Control Unit (Headlight Switch Message)

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1007 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the MICU is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34).■
4. Check for DTCs of the gauge control module and relay control module using the HDS.

   Is DTC B1155 and B1062 indicated?

   YES—Go to the Combination Switch Control Unit Input Test (see page 22-131).■

   NO—Check for an open in the communication circuit between the MICU and the combination switch control unit. If the circuit is OK, replace the MICU. If the circuit is bad, repair the open.■

DTC B1008: MICU Lost Communication (A/T Message) with the Gauge Control Module

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1008 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the gauge control module is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34).■
4. Check for DTCs in the relay control module using the HDS.

   Is DTC B1161 indicated?

   YES—Go to the Gauge Control Module Input Test.■

   - '03-05 models (see page 22-127)
   - '06 model (see page 22-128)

   NO—Check for an open in the communication circuit between the MICU and the gauge control module. If the circuit is OK, replace the MICU. If the circuit is bad, repair the open.■

Protected by AR

DTC Troubleshooting (cont'd)

DTC B1009: MICU Lost Communication with the Combination Switch Control Unit (Wiper/ Washer Switch Message)

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1009 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the combination switch control unit is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34).■
4. Check for DTCs of the gauge control module and relay control module using the HDS.

   Is DTC B1156 and B1063 indicated?

   YES—Go to the Combination Switch Control Unit Input Test (see page 22-131).■

   NO—Check for an open in the communication circuit between the MICU and the combination switch control unit. If the circuit is OK, replace the MICU. If the circuit is bad, repair the open.■

DTC B1010: MICU Lost Communication (Panic Message) with the Door Multiplex Control Unit

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1010 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the door multiplex control unit is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34).■
4. Check for DTCs of the relay control module using the HDS.

   Is DTC B1059 indicated?

   YES—Go to the Door Multiplex Control Unit Input Test (see page 22-129).■

   NO—Check for an open in the communication circuit between the MICU and the door multiplex control unit. If the circuit is OK, replace the MICU. If the circuit is bad, repair the open.■

BACK

Protected by AR

DTC B1102: Door Multiplex Control Unit Internal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Operate the power window (UP/DOWN).
4. Check for DTCs using the HDS.

   Is DTC B1102 indicated?

   YES—Faulty door multiplex control unit; replace the power window master switch. ■

   NO—Intermittent failure, the door multiplex control unit is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34). ■

DTC B1178: F-CAN Communication Line Error

DTC B1168: Gauge Control Module Lost Communication with ECM/PCM (Engine Messages)

DTC B1169: Gauge Control Module Lost Communication with the PCM (A/T Messages)

1. Clear the DTCs using the HDS.
2. Turn the ignition switch OFF then back to the ON (II).
3. Start and run the engine for at least 5 seconds then turn the engine off.
4. Check for DTCs using the HDS.

   Is DTC B1178, B1168 and/or B1169 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, the F-CAN communication line is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34). ■

5. Check for DTCs in the ECM/PCM, ABS/TCS or Navigation.

   Are any DTCs indicated?

   YES—Troubleshoot the ECM/PCM, ABS/TCS or Navigation DTCs. ■

   NO—Go to step 6.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

6. Perform the Gauge Control Module Input Test.

   - '03-05 models (see page 22-127)
   - '06 model (see page 22-128)

   Are all inputs OK?

   YES—Go to step 7.

   NO—Repair the faulty input then recheck for DTCs. ■

7. Substitute a known-good gauge control module.
8. Clear the DTCs using the HDS.
9. Turn the ignition switch OFF then back to the ON (II).
10. Start and run the engine for at least 5 seconds then turn the engine off.
11. Check for DTCs using the HDS.

    Is DTC B1178, B1168 and/or B1169 indicated?

    YES—Substitute a known-good ECM/PCM and retest. If the system/indication goes away, replace the original ECM/PCM. ■

    NO—The original gauge control module is faulty; replace the gauge control module (see page 22-276). ■

DTC B1080: Power Supply Circuit (IG1 line) Input Error for Relay Control Module and MICU

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Turn the ignition switch ON (II) and wait for 2 seconds or more.

   Is DTC B1080 indicated again?

   YES—Go to step 4.

   NO—Intermittent failure, the relay control module is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34). ■

4. Check the MICU IG1 power supply No. 21 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to MICU Input Test (see page 22-124). ■

   NO—Replace the fuse and recheck for DTCs. ■

BACK

Protected by AR

DTC B1251: Combination Switch Control Unit Internal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1251 indicated?

   YES—Faulty combination switch control unit; replace the wiper/washer switch. ■

   NO—Intermittent failure, the CPU in the combination switch control unit is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34). ■

DTC B1255: Combination Switch Control Unit Lost Communication With MICU

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1255 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, MICU is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see page 22-78) and the charging system (see page 4-34). ■

4. Check for DTCs in the combination switch control using the HDS.

   Is DTC B1055 and B1157 indicated?

   YES—Go to MICU input test (see page 22-124). ■

   NO—Replace the combination switch control unit. ■

3. Inspect the connector and socket terminals to be sure they are all making good contact.

   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 4.

4. Reconnect the connectors to the under-dash fuse/relay box, and make sure these input tests at the appropriate connectors on the under-dash fuse/relay box.

   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
P7	WHT/BLK	Under all conditions	Attach to ground: The ignition key light should come on.	• Blown No. 13 (20 A) fuse in the under-hood fuse/relay box • Blown LED • An open in the wire
I4	GRN/RED	Ceiling light switch in the middle position, all doors closed	Attach to ground: The ceiling light should come on.	• Blown No. 6 (7.5 A) fuse in the under-dash fuse/relay box • Faulty ceiling light • An open in the wire
D6 . J9 . X34	YEL	Ignition switch ON (II)	Check for voltage to ground: There should be battery voltage.	• Blown No. 21 (7.5 A) fuse in the under-dash fuse/relay box • An open in the wire
K4	GRN/WHT	Under all conditions	Check for voltage to ground: There should be battery voltage.	• Blown No. 27 (20 A) fuse in the under-dash fuse/relay box • An open in the wire
X35	WHT/RED	Under all conditions	Check for voltage to ground: There should be battery voltage.	• Blown No. 7 (10 A) fuse in the under-dash fuse/relay box • An open in the wire
H9	BLK	Under all conditions	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G601) • An open in the wire
P1	BRN/BLK	Under all conditions	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G502) • An open in the wire
E9	BLK	Under all conditions	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G601) • An open in the wire

System Description

Security Alarm System

The security alarm system is armed automatically after the doors, hood, and trunk are closed and locked. For the system to arm, the ignition switch must be off, the key must be removed, and the MICU must receive signals that the doors, hood, trunk are closed and locked. The alarm can be disarmed at any time by unlocking the driver's door with the key or pressing the UNLOCK button on the remote transmitter.

When everything is closed and locked, the only inputs that are grounded, and have 0 volts, are the driver's door lock knob switch (LOCK position), and the integrated audio-HVAC display module. In other words, all of the other switches are open, and have about 5 volts with system awake and 1 volts in sleep mode, including the key cylinder switches. The security indicator in the gauge control module begins to flash immediately after the vehicle is completely closed and locked, and 15 seconds later, the security system arms and the security indicator flashes on for a shorter amount of time than before. If the security indicator does not flash, the system is not arming. A beep sounds and parking lights flash to confirm the security alarm system is armed if the LOCK button is pressed a second time within 5 seconds.

If one of the switches is misadjusted or shorted internally, or there is a short in the circuit, the security system will not arm. As long as the control unit continues to receive a ground signal (0 volts), it senses that the vehicle is not closed and locked, and the system will not arm. A switch that is slightly misadjusted can cause the alarm to sound for no apparent reason. In this case, a significant change in outside air temperature, the vibration of a passing truck, or someone bumping into the vehicle could cause the alarm to sound. There is no glass breakage or motion detector feature.

If anything is opened or improperly unlocked after the system is armed, the control unit receives a ground signal from that switch, and the 1—5 volts reference drops to 0 volts. If the integrated audio-HVAC display module is disconnected, the input loses its ground, and the input voltage goes to 1—5 volts. The system sounds the alarm when any of these occur:

- A door or the trunk is forced open
- A door is unlocked without using the key or the remote transmitter
- The hood is opened (EX, EXL, LX-V6, Canada LX, '06 model Canada SE)
- The audio-HVAC display module is disconnected (EX, EXL, LX-V6, '06 model USA SE, Canada SE-V6)
- The remote panic is operated

When the system sounds the alarm, the horns sound and the exterior lights flash for 2 minutes. The alarm can be stopped at any time by unlocking the driver's door with the key or by pressing any button on the remote transmitter.

Panic Mode

The panic mode sounds the alarm in order to attract attention. When the PANIC button on the remote transmitter is pressed and held for 2 seconds, the alarm sounds and the exterior lights flash for about 20 seconds.

The panic mode can be cancelled at anytime by pressing any button on the remote transmitter or by turning the ignition switch ON (II). The panic mode will not function if the ignition switch is ON (II).

(cont'd)

Protected by AR

System Description (cont'd)

Keyless Entry System

The keyless entry system is integrated with the MICS. The multiplex integrated control unit (MICU) receives LOCK, UNLOCK and PANIC signals from the door multiplex control unit (keyless receiver).

The keyless entry system allows you to lock and unlock the vehicle with the remote transmitter. When you press the LOCK button, all doors lock. When you press the UNLOCK button once, only the driver's door unlocks. The other doors will unlock when you press the button a second time. The doors will not lock with the remote transmitter if a door is not fully closed, or if the key is in the ignition switch.

If the UNLOCK button is pressed, released, then pressed and held, the windows will begin to open. The windows stop if the button is released. See power windows for more information and troubleshooting.

When the switch for the ceiling light is in the center position, it will come on when the UNLOCK button is pressed. If a door is not opened, the light will go off in about 30 seconds, and the doors will relock. If the doors are locked with the remote transmitter within 30 seconds, the light will go off immediately.

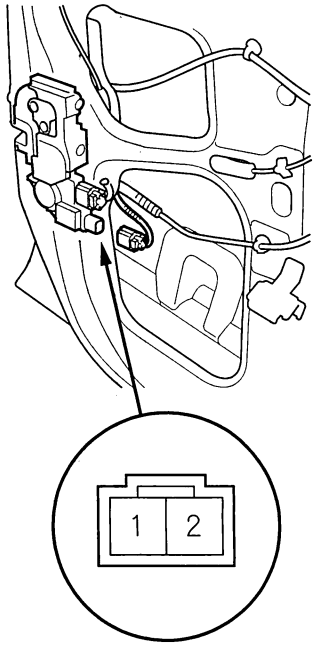
Door Lock Actuator Test

Driver's door

1. Remove the driver's door panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 2P connector from the actuator.



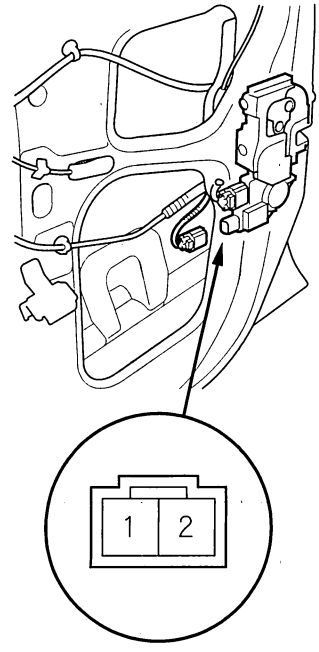
3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Terminal / Position	1	2
LOCK	⊕	⊖
UNLOCK	⊖	⊕

4. If the actuator does not operate as specified, replace it.

Passenger's door

1. Remove the passenger's door panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 2P connector from the actuator.



3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Terminal / Position	1	2
LOCK	⊕	⊖
UNLOCK	⊖	⊕

4. If the actuator does not operate as specified, replace it.

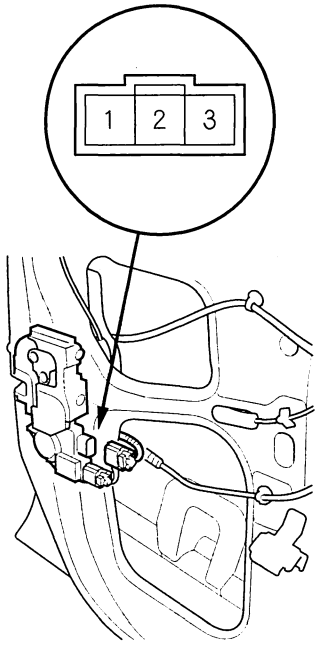
Door Lock Knob Switch Test

Driver's Door

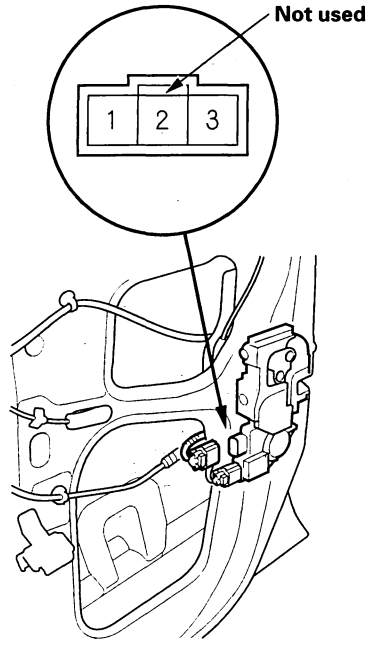
1. Remove the driver's door panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 3P connector from the actuator.



3. Check for continuity between the terminals.
   - There should be continuity between the No. 2 and No. 3 terminals when the door lock knob switch is in the LOCK position and no continuity when the switch is in the UNLOCK position.
   - There should be continuity between the No. 1 and No. 3 terminals when the door lock knob switch is in the UNLOCK position and no continuity when the switch is in the LOCK position.
4. If the continuity is not as specified, replace the door lock actuator.

Front Passenger's Door (EX, EXL, '06 model Canada SE)

1. Remove the front passenger's door panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 3P connector from the actuator.



3. Check for continuity between the terminals. There should be continuity between the No. 1 and No. 3 terminals when the door lock knob switch in the UNLOCK position and no continuity when the switch is in the LOCK position.
4. If the continuity is not as specified, replace the door lock actuator.

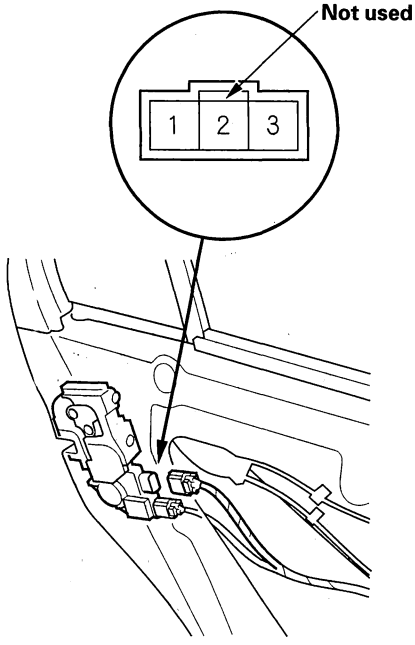
Door Lock Knob Switch Test (cont'd)

Rear Door (EX, EXL, '06 model Canada SE)

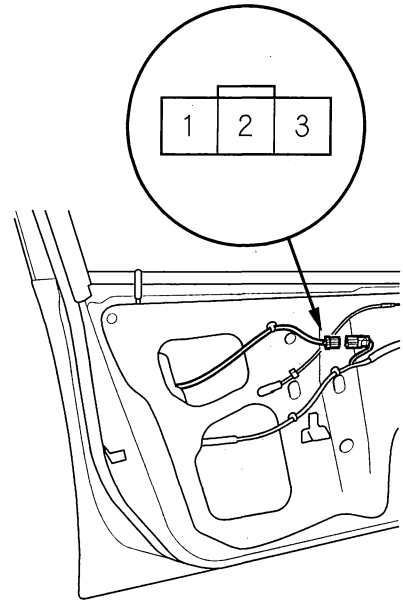
1. Remove the left or right rear door panel (see page 20-25).
2. Disconnect the 3P connector from the actuator.



3. Check for continuity between the terminals. There should be continuity between the No. 1 and No. 3 terminals when the door lock knob switch is UNLOCK position and no continuity when the switch is in the LOCK position.
4. If the continuity is not as specified, replace the door lock actuator.

Door Key Cylinder Switch Test

1. Remove the driver's door panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 3P connector from the key cylinder switch.



3. Check for continuity between the terminals.
   - There should be continuity between the No. 2 and No. 3 terminals when the door key cylinder switch is in LOCK position.
   - There should be no continuity between the No. 2 and No. 3 terminals when the door key cylinder switch is in the neutral or UNLOCK position.
   - There should be continuity between the No. 1 and No. 2 terminals when the door key cylinder switch is in UNLOCK position.
   - There should be no continuity between the No. 1 and No. 2 terminals when the door key cylinder switch is in the neutral or LOCK position.
4. If the continuity is not as specified, replace the door key cylinder assembly.
   - 2-door (see page 20-12)
   - 4-door (see page 20-14)

Control Unit Input Test

1. Before testing the keyless entry/security control functions, troubleshoot the multiplex integrated control system. (see page 22-91).

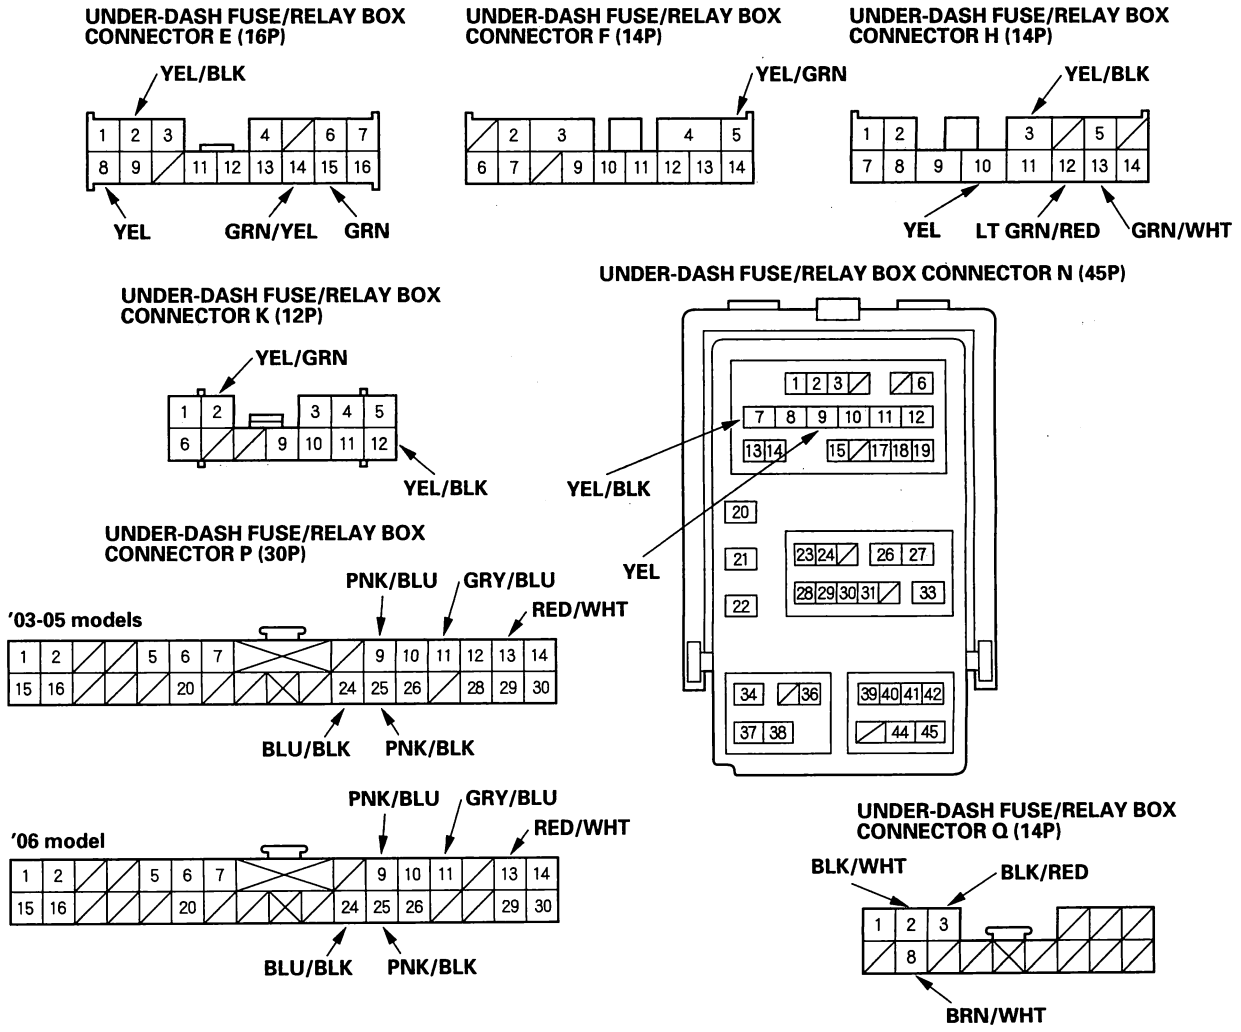
Multiplex Integrated Control Unit

2. Remove the left kick panel.

   - 2-door (see page 20-90)
   - 4-door (see page 20-91)

3. Disconnect the under-dash fuse/relay box connectors.

   NOTE: All connectors are wire side of female terminals.



4. Inspect the connector and socket terminals to be sure they are all making good contact.

   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.

(cont'd)

Protected by AR

Control Unit Input Test (cont'd)

5. With the connectors still disconnected, make these input tests at the connectors.

   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
H9	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501, G601) • An open in the wire
F5	YEL/GRN	Connect the F5 terminal to the battery positive terminal momentarily.	Check trunk opener operation: Trunk lid should open.	• Poor ground (G701) • Faulty trunk opener solenoid • An open in the wire
K2 K12	YEL/GRN YEL/BLK	Connect the battery positive terminal to K12 (K2) terminal, and K2 (K12) terminal to H9 terminal.	Check actuator operation: The driver's door lock actuator should lock (unlock).	• Faulty driver's door lock actuator • An open in the wire
N7 N9	YEL/BLK YEL	Connect the battery positive terminal to N7 (N9) terminal, and N9 (N7) terminal to H9 terminal.	Check actuator operation: The front passenger's door lock actuator should lock (unlock).	• Faulty front passenger's door lock actuator • An open in the wire
E2 E8	YEL/BLK YEL	Connect the battery positive terminal to E2 (E8) terminal, and E8 (E2) terminal to H9 terminal.	Check actuator operation: The left rear door lock actuator should lock (unlock).	• Faulty left rear door lock actuator • An open in the wire
H3 H10	YEL/BLK YEL	Connect the battery positive terminal to H3 (H10) terminal, and H10 (H3) terminal to H9 terminal.	Check actuator operation: The right rear door lock actuator should lock (unlock).	• Faulty right rear door lock actuator • An open in the wire

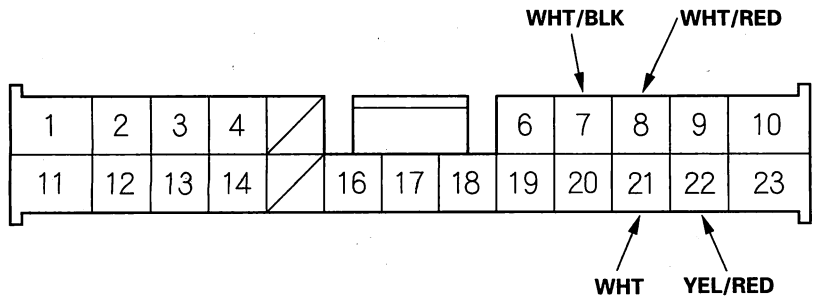
Door Multiplex Control Unit

8. Remove the driver's power window switch panel (see page 20-9).

9. Disconnect the 23P connector from the power window master switch.



Wire side of female terminals

10. Inspect the connector and socket terminals to be sure they are all making good contact.

- If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
- If the terminals look OK, go to step 11.

(cont'd)

Protected by AR

Control Unit Input Test (cont'd)

11. Reconnect the connector to the door multiplex control unit, and make these input tests at the connectors.

    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 12.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
7	WHT/BLK	Driver's door lock knob switch unlocked	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G501) • Faulty driver's door lock knob switch • An open in the wire
		Driver's door lock knob switch locked	Check for voltage to ground: There should be 5 V or more.	• Faulty driver's door lock knob switch • Short to ground
22	YEL/RED	Driver's door lock knob switch locked	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G501) • Faulty driver's door lock knob switch • An open in the wire
		Driver's door lock knob switch unlocked	Check for voltage to ground: There should be 5 V or more.	• Faulty driver's door lock knob switch • Short to ground
21	WHT	Driver's door key cylinder switch in UNLOCK	Check for voltage to ground: There should be less than 1 V.	• Faulty driver's door key cylinder switch • Poor ground (G501) • An open in the wire • Short to ground
		Driver's door key cylinder switch in neutral	Check for voltage to ground: There should be 5 V or more.	
		Driver's door key cylinder switch in LOCK	Check for voltage to ground: There should be 5 V or more.	
8	WHT/RED	Driver's door key cylinder switch in LOCK	Check for voltage to ground: There should be less than 1 V.	• Faulty driver's door key cylinder switch • Poor ground (G501) • An open in the wire • Short to ground
		Driver's door key cylinder switch in neutral	Check for voltage to ground: There should be 5 V or more.	
		Driver's door key cylinder switch in UNLOCK	Check for voltage to ground: There should be 5 V or more.	

12. If all the input tests prove OK, and no DTCs were found during MICU troubleshooting (B-CAN system diagnosis test mode A), go to the B-CAN system input and output index. If multiple failures are found on more than one control unit, replace the under-dash fuse/relay box (includes the MICU). If input failures are related to a particular control unit, replace that control unit.

DTC Troubleshooting

DTC B1026: Passenger's Door Lock Switch Signal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Operate the passenger's door lock switch in the LOCK and UNLOCK positions for 2 seconds.
4. Check for DTCs using the HDS.

   Is DTC B1026 indicated?

   YES—Go to step 5.

   NO—Intermittent failure. The passenger's door lock system is OK at this time. Check pinfits and connections. ■
5. With the door lock in UNLOCK position, select SECURITY from the HDS and enter the DATA LIST.
6. Check the ON/OFF information of the Front Psnger's Door Lock Sw. (LOCK) and Front Psnger's Door Lock Sw. (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?

   YES—Go to step 7.

   NO—Go to step 9.
7. Make sure the ON/OFF information of the Front Psnger's Door Lock Sw. (LOCK) and Front Psnger's Door Lock Sw. (UNLOCK) are changed when the passenger's door lock switch is in the LOCK and UNLOCK positions.

   Does the information show the correct ON and OFF indications when the door lock switch in the LOCK and UNLOCK positions?

   YES—Faulty MICU; replace it. ■

   NO—Go to step 8.
8. Check for a short between the door lock switch LOCK and UNLOCK wires.

   Are the wire harnesses OK?

   YES—Faulty passenger's door lock switch; replace it. ■

   NO—A short in the wire, repair and recheck. ■
9. Remove the passenger's inner handle (see page 20-9).
10. Disconnect the 3P connector from the passenger's door lock switch.
11. Check the ON/OFF information of the Front Psnger's Door Lock Sw. (LOCK) and Front Psnger's Door Lock Sw. (UNLOCK) in the DATA LIST.

    Are both information indicators OFF?

    YES—Faulty passenger's door lock switch; replace it. ■

    NO—Go to step 12.
12. Check for a short in the wire between the MICU and passenger's door lock switch at the security alarm/ keyless door lock system control unit input test (see page 22-143).

    Are the wire harnesses OK?

    YES—Faulty MICU; replace it. ■

    NO—A short in the wire, repair and recheck. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC B1027: Trunk Key Cylinder Switch Signal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Operate the trunk key cylinder switch for 2 seconds.
4. Check the DTCs using the HDS.

   Is DTC B1027 indicated?

   YES—Go to step 5.

   NO—Intermittent failure. The trunk key cylinder system is OK at this time.■
5. With the trunk key cylinder switch in the off (neutral) position, select the TEST MODE MENU from the HDS and enter the DATA LIST.
6. Check the ON/OFF information of the Trunk Key Cylinder Switch (UNLOCK) in the DATA LIST.

   Is the information indicator OFF?

   YES—Go to step 7.

   NO—Go to step 9.
7. Make sure the ON/OFF information of the Trunk Key Cylinder Switch (UNLOCK) are changed when the trunk key cylinder switch is turned to UNLOCK position with the key.

   Does the information show ON when the trunk key cylinder switch is turned to UNLOCK position, and show OFF when the trunk key cylinder switch is returned to the off (neutral) position?

   YES—Faulty MICU; replace it.■

   NO—Go to step 8.
8. Check for an open in the wire between the MICU and trunk key cylinder switch.

   Are the wire harnesses OK?

   YES—Faulty trunk key cylinder switch; replace it.■

   NO—An open in the wire, repair and recheck.■
9. Disconnect the 3P connector from the trunk key cylinder switch.
10. Check the ON/OFF information of the Trunk Key Cylinder Switch (UNLOCK) in the DATA LIST.

    Is the information indicator OFF?

    YES—Faulty trunk key cylinder switch; replace it.■

    NO—Go to step 11.
11. Check for a short in the wire between the MICU and trunk key cylinder switch.

    Are the wire harnesses OK?

    YES—Faulty MICU; replace it.■

    NO—A short in the wire, repair and recheck.■

DTC B1127: Driver's Door Key Cylinder Switch Signal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Operate the driver's door key cylinder in the LOCK and UNLOCK positions for 2 seconds.
4. Check for DTCs using the HDS.

   Is DTC B1127 indicated?

   YES—Go to step 5.

   NO—Intermittent failure. The driver's door key cylinder system is OK at this time. Check pinfits and connections. ■
5. With no driver's door key cylinder operation, select SECURITY from the HDS, and enter the DATA LIST.
6. Check the ON/OFF information of the Driver's Door Key Cylinder Switch (LOCK) and Driver's Door Key Cylinder Switch (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?

   YES—Go to step 7.

   NO—Go to step 10.
7. Turn the driver's door key cylinder to the LOCK and UNLOCK positions with the ignition key and check the ON/OFF information of the Driver's Door Key Cylinder Switch (LOCK) and Driver's Door Key Cylinder Switch (UNLOCK) in the DATA LIST.

   Is the Driver's Door Key Cylinder Switch (LOCK) (Driver's Door Key Cylinder Switch (UNLOCK)) information indicator ON when the key cylinder is in the LOCK (UNLOCK) position, and OFF when the key is returned to the neutral position?

   YES—Faulty door multiplex control unit; replace the power window master switch. ■

   NO—Go to step 8.
8. Disconnect the driver's door key cylinder switch 3P connector.
9. Check for continuity between the No. 3 (LOCK) and No. 1 (UNLOCK) terminals of the driver's door key cylinder switch 3P connector and the No. 8 (LOCK) and No. 21 (UNLOCK) terminals of the power window master switch 23P connector.

   Is there continuity?

   YES—Faulty driver's door key cylinder switch. ■

   NO—Repair an open in the WHT/RED (LOCK) or WHT (UNLOCK) wire. ■
10. Disconnect the driver's door key cylinder switch 3P connector.
11. Check the ON/OFF information of the Driver's Door Key Cylinder Switch (LOCK) and Driver's Door Key Cylinder Switch (UNLOCK) in the DATA LIST.

    Are both information indicators OFF?

    YES—Faulty driver's door key cylinder switch. ■

    NO—Go to step 12.

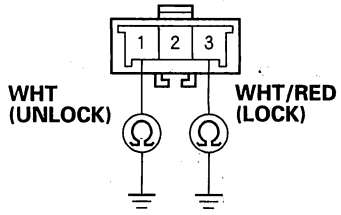
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

12. Check for continuity between the No. 3 (LOCK) and No. 1 (UNLOCK) terminals of the driver's door key cylinder switch 3P connector and body ground.

DRIVER'S DOOR KEY CYLINDER SWITCH 3P CONNECTOR



Terminal side of male terminals

Is there continuity?

YES—Repair a short in the WHT/RED (LOCK) or WHT (UNLOCK) wire. ■

NO—Faulty door multiplex control unit; replace the power window master switch. ■

DTC B1128: Driver's Door Lock Switch Signal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Operate the driver's door lock switch in the LOCK and UNLOCK positions for 2 seconds.
4. Check for DTCs using the HDS.

   Is DTC B1128 indicated?

   YES—Go to step 5.

   NO—Intermittent failure. The driver's door lock switch system is OK at this time. Check pinfits and connections. ■
5. With no driver's door lock switch operation, select SECURITY from the HDS, and enter the DATA LIST.
6. Check the ON/OFF information of the Driver's Door Lock Switch (LOCK) and Driver's Door Lock Switch (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?

   YES—Go to step 7.

   NO—Check the door lock switch. If the driver's door lock switch is OK, faulty door multiplex control unit; replace the power window master switch. ■
7. Push the driver's door lock switch in LOCK and UNLOCK positions, and check the ON/OFF information of the Driver's Door Lock Switch (LOCK) and Driver's Door Lock Switch (UNLOCK) in the DATA LIST.

   Is the Driver's Door Lock Switch (LOCK) (Driver's Door Lock Switch (UNLOCK)) information indicator ON when the door lock switch is pushed in each switch position, and OFF when the door lock switch is released?

   YES—Substitute a known-good power window master switch. If the code is still present, replace the MICU. ■

   NO—Faulty door multiplex control unit; replace the power window master switch. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC B1129: Driver's Door Lock Knob Switch Signal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Operate the driver's door lock knob switch in the LOCK and UNLOCK positions for 2 seconds.
4. Check for DTCs using the HDS.

   Is DTC B1129 indicated?

   YES—Go to step 5.

   NO—Intermittent failure. The driver's door lock knob switch system is OK at this time. Check pinfits and connections.■

5. Select SECURITY from the HDS, and enter the DATA LIST.

   Check the ON/OFF information of the Driver's Door Lock knob Switch (LOCK) and Driver's Door Lock knob Switch (UNLOCK) in the DATA LIST.

   Is the Driver's Door Lock knob Switch (LOCK) information indicator ON and Driver's Door Lock knob Switch (UNLOCK) information indicator OFF with the door lock knob switch in LOCK position, and is the Driver's Door Lock knob Switch (LOCK) information indicator OFF and Driver's Door Lock knob Switch (UNLOCK) information indicator ON with the door lock knob switch in UNLOCK position?

   YES—Substitute a known-good power window master switch. If the code is still present, replace the MICU.■

   NO—Go to step 6.

6. Disconnect the driver's door lock knob switch 3P connector.
7. Check the ON/OFF information of the Driver's Door Lock knob Switch (LOCK) and Driver's Door Lock knob Switch (UNLOCK) in the DATA LIST.

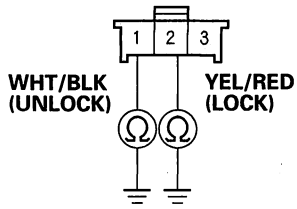
   Are both information indicators OFF?

   YES—Faulty driver's door lock knob switch.■

   NO—Go to step 8.

8. Check for continuity between the No. 2 (LOCK) and No. 1 (UNLOCK) terminals of the driver's door lock knob switch 3P connector and body ground.

DRIVER'S DOOR LOCK KNOB SWITCH 3P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair a short in the YEL/RED (LOCK) or WHT/BLK (UNLOCK) wire.■

NO—Go to driver's door lock knob switch test (see page 22-141). If the driver's door lock knob switch is OK, the door multiplex control unit is faulty; replace the power window master switch.■

Tripped Sensor History

The security system stores information on the last tripped sensor if the security system has been violated. The information can be retrieved using the HDS.

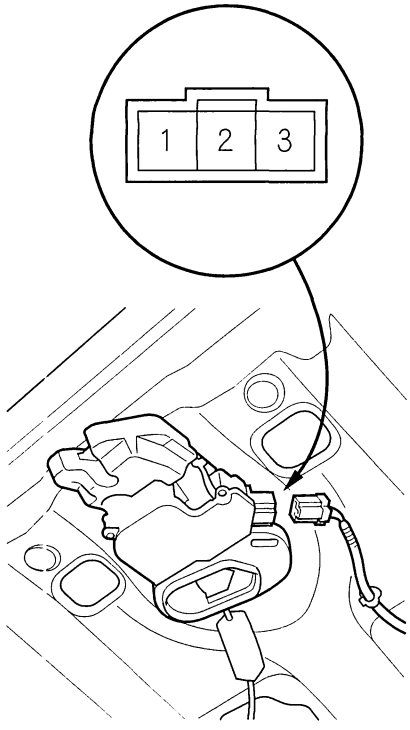
To retrieve the last tripped sensor data:

1. Select HISTORY DATA from the security system test mode menu.
2. Select CURRENT DATA.
3. Confirm that the VIN matches the Vehicle then press the enter button.
4. Scroll through the data list.
   - Sensors that were violated will indicate DETECT.
   - Sensors that were not violated will indicate NONE.
5. Inspect the DETECT circuit for:
   - Misadjusted or damaged switch.
   - Loose or corroded connections.
   - Intermittent short to ground.

Protected by AR

Trunk Lid Opener Solenoid Test

1. Disconnect the 3P connector from the trunk latch switch/trunk lid opener solenoid.



2. Check trunk lid opener solenoid operation by connecting power and ground according to the table. To prevent damage to the trunk lid opener solenoid, apply battery voltage only momentarily.

Terminal / Position	1	2
UNLOCK	⊕	⊖

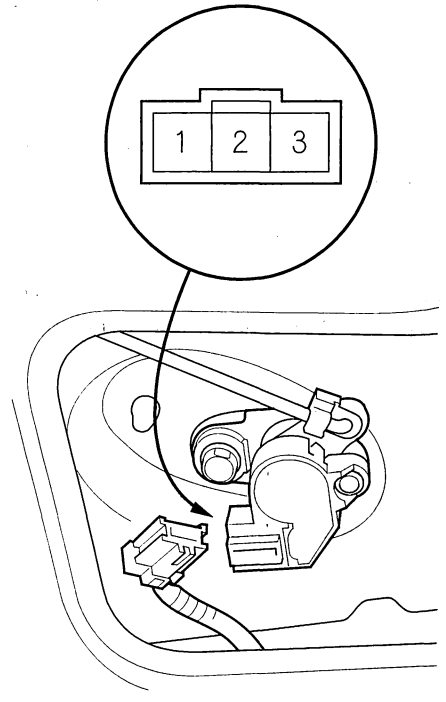
3. If the trunk lid opener solenoid does not work as specified, replace it.

Trunk Key Cylinder Switch Test

4-door EX, EXL, LX-V6, '06 model Canada SE

1. Remove the trunk lid trim (see page 20-116).

2. Disconnect the 3P connector from the key cylinder switch.



3. Check for continuity between the terminals. There should be continuity between the No. 2 and No. 3 terminals when the trunk key cylinder switch is in UNLOCK position. There should be no continuity between the No. 2 and No. 3 terminals when the trunk key cylinder switch is in the released (neutral) position.

4. If the continuity is not as specified, replace the trunk key cylinder switch.

BACK

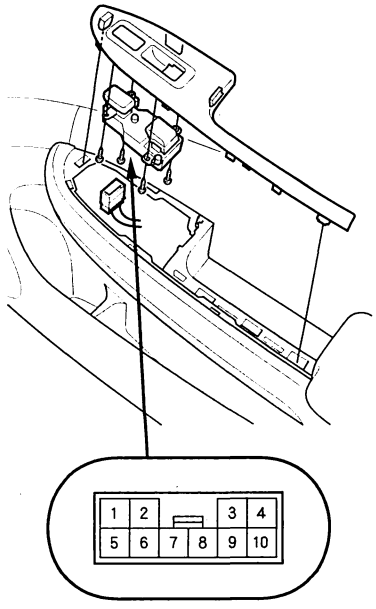
Door Lock Switch Test

Passenger's Door Lock Switch

1. Remove the front passenger's switch panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 10P connector from the front passenger's power window switch.

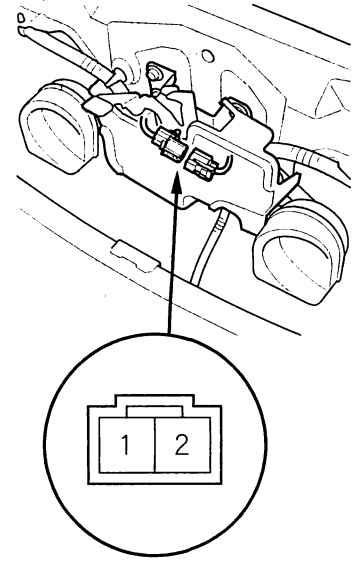


3. Check for continuity between the terminals.
   - There should be continuity between the No. 2 and No. 9 terminals when the door lock switch is in LOCK position. There should be no continuity between the No. 2 and No. 9 terminals when the door lock switch is in the neutral position.
   - There should be continuity between the No. 1 and No. 9 terminals when the door lock switch is in UNLOCK position. There should be no continuity between the No. 1 and No. 9 terminals when the door lock switch is in the neutral position.
4. If the continuity is not as specified, replace the door lock switch.

Hood Switch Test

EX, EXL, LX-V6, Canada LX, '06 model Canada SE

1. Open the hood.
2. Disconnect the 2P connector from the hood switch.



3. Check for continuity between the terminals. There should be continuity between the No. 1 and No. 2 terminals when the hood is opened (lever released). There should be no continuity between the No. 1 and No. 2 terminals when the hood is closed (lever pushed down).
4. If the continuity is not as specified, replace the hood switch.

Protected by AR

Transmitter Test

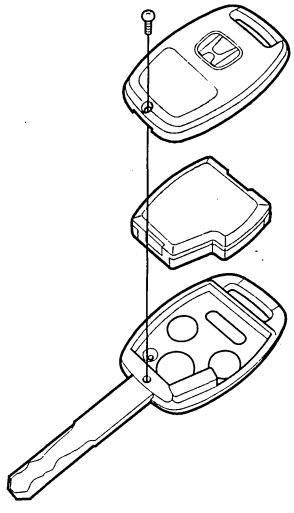
NOTE:
- If the doors unlock or lock with the transmitter, but the LED on the transmitter does not come on, the LED is faulty; replace the transmitter.
- If any door is open, you cannot lock the doors with the transmitter.
- If you unlocked the doors with the transmitter, but do not open any of the doors within 30 seconds, the doors relock automatically.
- The doors do not lock or unlock with the transmitter if the ignition key is inserted in the ignition switch.

1. Press the lock or unlock button five or six times to reset the transmitter.

   - If the locks work, the transmitter is OK.■
   - If the locks don't work, go to step 2.

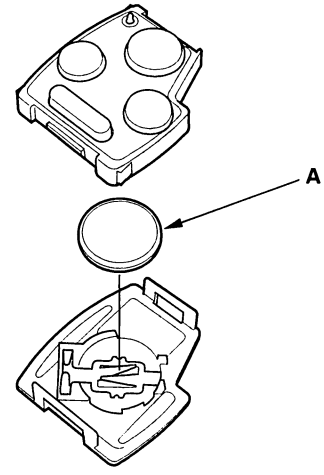
2. Open the transmitter and check for water damage.

   - If you find any water damage, replace the transmitter.■
   - If there is no water damage, go to step 3.



3. Replace the transmitter battery (A) with a new one, and try to lock and unlock the doors with the transmitter by pressing the lock or unlock button five or six times.

   - If the doors lock and unlock, the transmitter is OK.■
   - If the doors don't lock and unlock, go to step 4.



4. Reprogram and register the transmitter, then try to lock and unlock the doors.

   - If the doors lock and unlock, the transmitter is OK.■
   - If the doors don't lock and unlock, try and program to another vehicle. If still not operating, replace the transmitter.■

BACK

Protected by AR

Transmitter Programming

Storing transmitter codes:
The codes of up to three transmitters can be stored into the keyless receiver unit memory. (If a fourth code is stored, the code which was input first will be erased.)

NOTE: It is important to maintain the time limits between the steps. Make sure the doors, the hood and the tailgate are closed.

1. Turn the ignition switch ON (II).
2. Within 1 to 4 sec, press the transmitter lock or unlock button with the transmitter aimed at the keyless receiver in the power window master switch.
3. Within 1 to 4 sec, turn the ignition switch OFF.
4. Within 1 to 4 sec, turn the ignition switch ON (II).
5. Within 1 to 4 sec, press the transmitter lock or unlock button with the transmitter aimed at the keyless receiver in the power window master switch.
6. Within 1 to 4 sec, turn the ignition switch OFF.
7. Within 1 to 4 sec, turn the ignition switch ON (II).
8. Within 1 to 4 sec, press the transmitter lock or unlock button with the transmitter aimed at the keyless receiver in the power window master switch.
9. Within 1 to 4 sec, turn the ignition switch OFF.
10. Within 4 sec, turn the ignition switch ON (II).
11. Within 1 to 4 sec, press the transmitter lock or unlock button with the transmitter aimed at the keyless receiver in the power window master switch.
12. Confirm you can hear the sound of the door lock actuators within 1 to 4 sec, then push the transmitter lock or unlock button again, or the code will not be stored.
13. Within 10 sec, aim the transmitters (up to two additional ones) whose codes you want to store at the keyless receiver, and press the transmitter lock or unlock buttons.
    Confirm that you can hear the sound of the door lock actuators after each transmitter code is stored.
14. Turn the ignition switch OFF, and pull out the key.
15. Confirm proper operation with the transmitters.

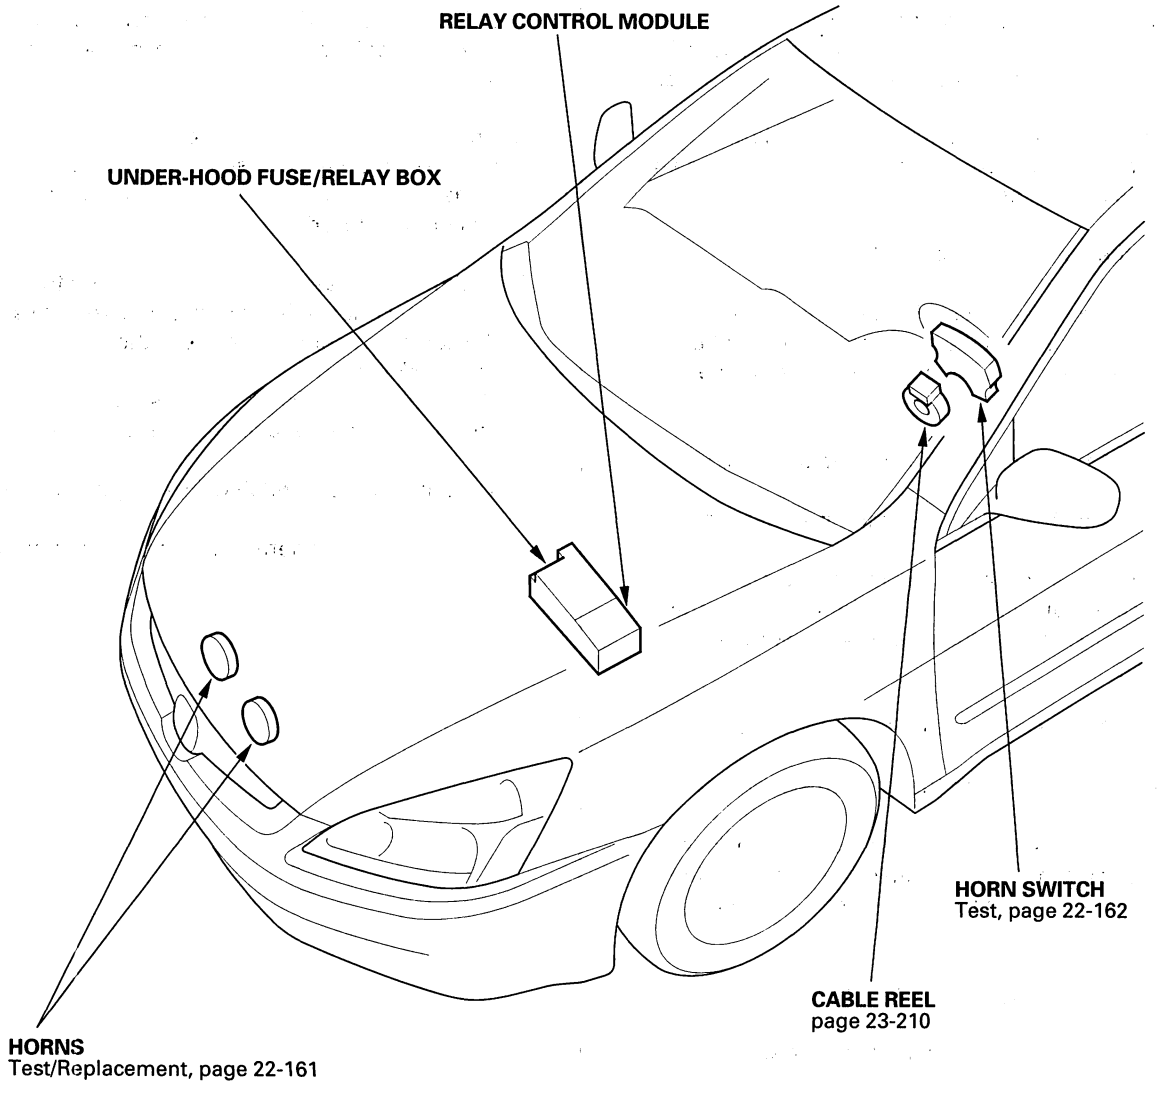
Horns

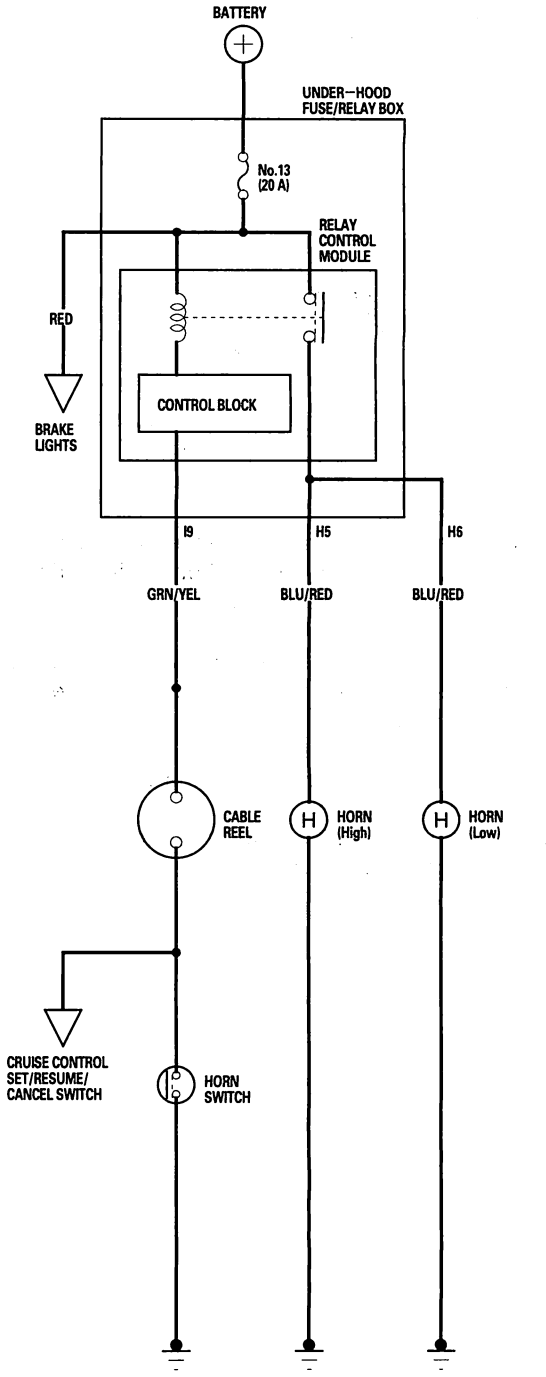
Component Location Index



BACK

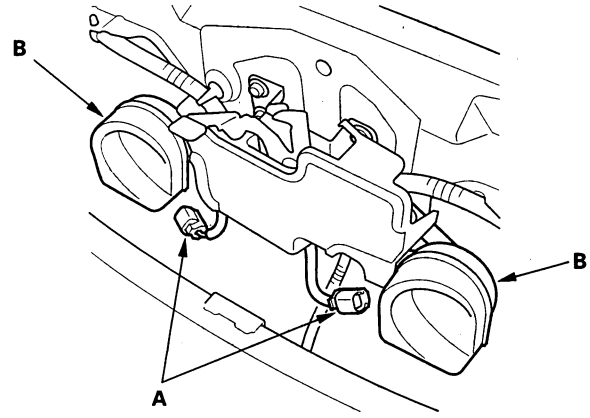
Protected by AR

Circuit Diagram

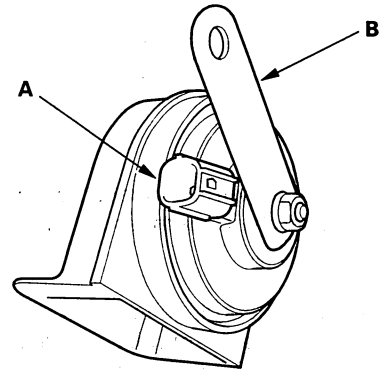


Horn Test/Replacement

1. Remove the front bulkhead cover (see page 20-197).
2. Disconnect the 1P connector (A) from each horn (B).



3. Test the horn by connecting battery power to the terminal (A) and grounding the bracket (B). The horn should sound.



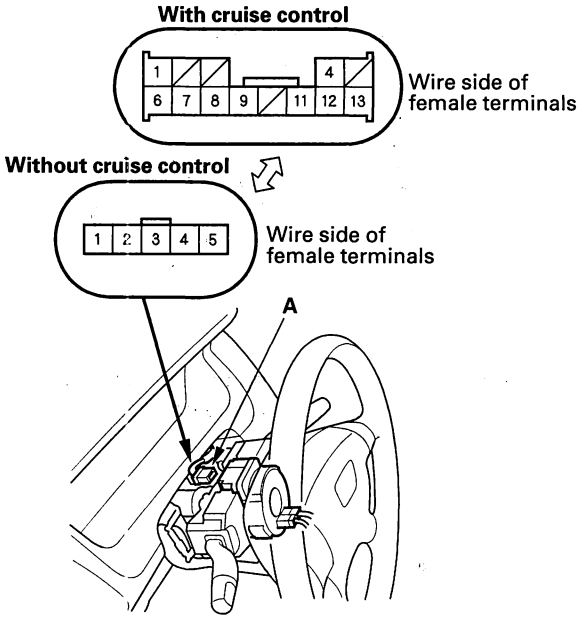
4. If it fails to sound, replace it.

Protected by AR

Horn Switch Test

1. Remove the steering column covers (see page 17-25).

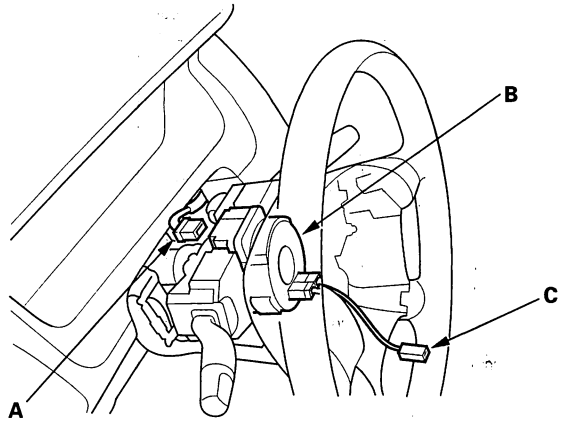
2. Disconnect the cable reel 5P (13P) connector (A) from the dashboard wire harness.
( ): With cruise control



3. Using a jumper wire, connect the No. 1 terminal of the dashboard wire harness 5P (or 13P) connector to body ground.

   - If the horns sound, go to step 4.
   - If the horns don't sound, check these items:
     - No. 13 (20 A) fuse in the under-hood fuse/relay box.
     - Relay control module in the under-hood fuse/relay box.
     - Horns (see page 22-161).
     - An open in the wire.

4. Reconnect the cable reel 5P (13P) connector (A) to the dashboard wire harness.
( ): With cruise control



5. Remove the driver's airbag assembly (see page 23-197), and disconnect the horn switch 1P positive terminal from the cable reel (B).

6. Using a jumper wire, connect the cable reel side 1P connector (C) to body ground, and turn the wheel side to side.

   - If the horns sound, replace the driver's airbag assembly.
   - If the horns don't sound or sounds intermittently, replace the cable reel.

DTC Troubleshooting

DTC B1075: Headlight Signal Error

1. Clear the DTCs using the HDS.
2. Turn the headlights switch from the OFF position to the ON position.
3. Check for DTCs using the HDS.

   Is DTC B1075 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the headlight circuit is OK at this time. Check pinfits and connections. ■
4. With the headlight switch OFF, select LIGHTING SYSTEM from the HDS, and enter the DATA LIST.
5. Check the ON/OFF information of the Headlight Switch (BACK-UP) in the DATA LIST.

   Is the information indicator OFF?

   YES—Go to step 6.

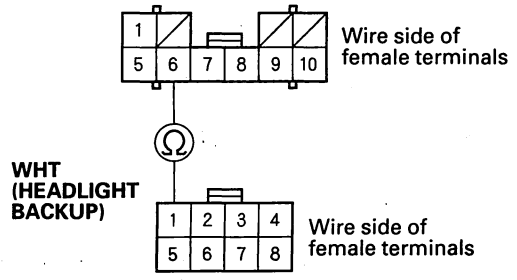
   NO—Go to step 10.
6. Turn the headlight switch ON.
7. Check the ON/OFF information of the Headlight Switch (BACK-UP) in the DATA LIST.

   Is the information indicator ON?

   YES—Troubleshoot DTC B1278. ■

   NO—Go to step 8.
8. Disconnect the relay control module 10P connector (under-hood fuse/relay box connector I) and the wiper/washer switch 8P connector.
9. Check for continuity between the No. 6 terminal of the relay control module 10P connector and the No. 1 terminal of the wiper/washer switch (combination switch control unit) 8P connector.

RELAY CONTROL MODULE 10P CONNECTOR (UNDER-HOOD FUSE/RELAY BOX CONNECTOR I)



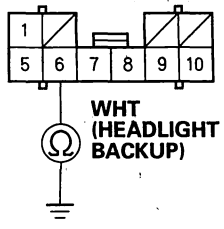
WIPER/WASHER SWITCH 8P CONNECTOR

Is there continuity?

YES—Faulty combination switch control unit; replace the wiper/washer switch. ■

NO—Repair an open in the WHT wire. ■
10. Disconnect the relay control module 10P connector.
11. Check for continuity between the No. 6 terminal of the relay control module 10P connector and body ground.

RELAY CONTROL MODULE 10P CONNECTOR (UNDER-HOOD FUSE/RELAY BOX CONNECTOR I)



Wire side of female terminals

Is there continuity?

YES—Repair a short in the WHT wire. ■

NO—Faulty combination switch control unit; replace the wiper/washer switch. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC B1078: Daytime Running Lights Signal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Operate the parking brake lever.
4. Check for DTCs using the HDS.

   Is DTC B1078 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, the daytime running lights system is OK at this time. Check pinfits and connections. ■
5. Turn the headlight switch ON, then push the combination light switch forward for high beams.

   Do both headlights come on?

   YES—Go to step 6.

   NO—Go to step 9.
6. Turn the headlight switch OFF.
7. Select LIGHTING SYSTEM from the HDS, and enter the DATA LIST.
8. Check the ON/OFF information of the DRL Relay Command (Canada) in the DATA LIST.

   Is the information indicator ON?

   YES—Replace the daytime running lights relay. ■

   NO—Go to the relay control module input test (see page 22-132). ■
9. Check the No. 3 (10 A) or No. 5 (10 A) fuses in the under-hood fuse/relay box.

   Are both fuses OK?

   YES—Go to step 10.

   NO—Replace the blown fuse and recheck the system. ■
10. Check headlight bulbs.

    Are both bulbs OK?

    YES—Go to step 11.

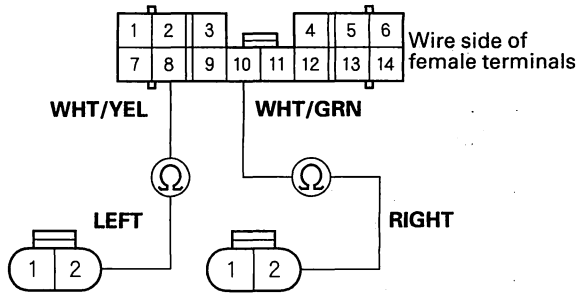
    NO—Replace the blown bulb and recheck the system. ■

BACK

Protected by AR

11. Check for continuity between the No. 2 terminal of the headlight (high beam) 2P connectors and the No. 8 (left headlight) or No. 10 (right headlight) terminals of the under-hood fuse/relay box 14P connector H.

UNDER-HOOD FUSE/RELAY BOX 14P CONNECTOR H



HEADLIGHT 2P CONNECTORS (HIGH BEAM)
Wire side of female terminals

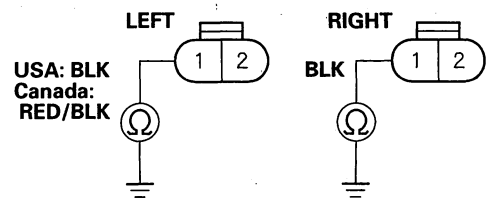
Is there continuity?

YES—Go to step 12.

NO—Repair an open in the WHT/YEL (left headlight) or WHT/GRN (right headlight) wire.■

12. Check for continuity between the No. 1 terminal of the headlight (high beam) 2P connectors and body ground.

HEADLIGHT 2P CONNECTORS (HIGH BEAM)



Wire side of female terminals

Is there continuity?

YES—Faulty relay control module; replace the under-hood fuse/relay box.■

NO—Check the daytime running lights relay (left headlight). If OK, repair an open in the BLK wire or poor ground (G201, G301).■

Protected by AR

DTC Troubleshooting (cont'd)

DTC B1079: Daytime Running Lights Malfunction (USA) ('06 model)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch OFF.
3. Make sure the brake pedal position switch is OFF.
4. Make sure the headlight switch is OFF.
5. Turn the ignition switch ON (II).
6. Check for DTCs with the HDS.

   Is DTC B1079 indicated?

   YES—Go to step 7.

   NO—Intermittent failure. The daytime running light system is OK at this time. Check for loose or poor connections. ■

7. Turn the headlight switch ON, then push the combination light switch forward for high beams.

   Do both headlights come on?

   YES—Go to step 8.

   NO—If one of the headlights doesn't come on, check the fuse and bulb, and for a poor ground (G201, G301) or an open in the wire. If both headlights don't come on, go to step 11.

8. Turn the headlight switch OFF.
9. Select LIGHTING SYSTEM from the HDS, and enter the DATA LIST.
10. Check the ON/OFF information of the DRL Command in the DATA LIST.

    Is the information indicator ON?

    YES—Go to relay control module input test (see page 22-132). ■

    NO—Substitute a known-good daytime running light control unit and recheck the system. ■

11. Check the No. 3 (10 A) and No. 5 (10 A) fuses in the under-hood fuse/relay box.

    Are both fuses OK?

    YES—Go to step 12.

    NO—Replace the blown fuse, and recheck the system. ■

12. Check the headlight bulbs.

    Are both bulbs OK?

    YES—Go to step 13.

    NO—Replace the blown bulb, and recheck the system. ■

BACK

Protected by AR

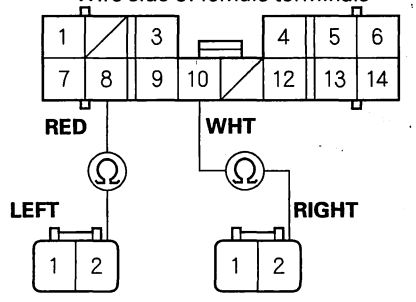
13. Disconnect the 2P connector from each headlight high beam.

14. Disconnect under-hood fuse/relay box connector H (14P).

15. Check for continuity between left headlight high beam 2P connector terminal No. 2 and under-hood fuse/relay box connector H (14P) terminal No. 8, and between right headlight high beam 2P connector terminal No. 2 and under-hood fuse/relay box connector H (14P) terminal No. 10.

UNDER-HOOD FUSE/RELAY BOX CONNECTOR H (14P)

Wire side of female terminals



HEADLIGHT HIGH BEAM CONNECTORS (2P)

Wire side of female terminals

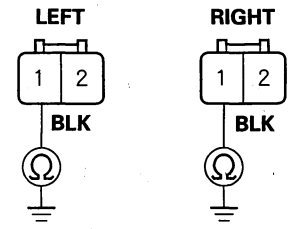
Is there continuity?

YES—Go to step 16.

NO—Repair an open in the wire.■

16. Check for continuity between each headlight high beam 2P connector terminal No. 1 and body ground.

HEADLIGHT HIGH BEAM CONNECTORS (2P)



Wire side of female terminals

Is there continuity?

YES—Faulty relay control module; replace the under-hood fuse/relay box.■

NO—Repair an open in the wire or a poor ground (G201, G301).■

DTC Troubleshooting (cont'd)

DTC B1275: Headlight Switch OFF Position Circuit Malfunction

DTC B1276: Headlight Switch Parking (SMALL) Position Circuit Malfunction

DTC B1277: Headlight Switch AUTO Position Circuit Malfunction

DTC B1278: Headlight Switch ON Position Circuit Malfunction

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1275, B1276, B1277 or B1278 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, the headlight system is OK at this time. Check pinfits and connections. ■
4. Reset the DTCs using the HDS.
5. Turn the ignition switch ON (II) and wait for 2 seconds.
6. Turn the parking (small) light switch ON and wait for 2 seconds.
7. Turn the headlight light switch (LOW) ON and wait for 2 seconds.
8. Change the dimmer switch position from low beam to high beam and wait for 2 seconds.
9. Check the DTCs using the HDS.

   Is DTC B1275, B1276, B1277, B1278 indicated?

   YES—Go to step 10.

   NO—Intermittent failure, the combination switch and the control unit are OK at this time. Check pinfits and connections. ■
10. Disconnect the combination light switch 12P connector from the wiper/washer switch.
11. Perform the combination light switch test (see page 22-206).

    Is the combination light switch check OK?

    YES—Faulty combination switch control unit, replace the wiper/washer switch. ■

    NO—Replace the combination light switch. ■

BACK

Protected by AR

DTC B1279: Headlight Switch DIMMER Position Circuit Malfunction

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1279 indicated?

   YES—Go to step 4.

   NO—Intermittent failure. The turn signal switch circuit is OK at this time. Check pinfits and connections. ■
4. Reset the DTCs by CLEAR MENU (DTC CLEAR) of the HDS.
5. Turn the ignition switch ON (II), then turn the headlight switch ON.
6. Change the combination light switch from low beam to high beam and wait for 2 seconds.
7. Pull and hold the combination light switch lever and keep the passing switch position for more than 2 seconds.
8. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC B1279 indicated?

   YES—Go to step 9.

   NO—Intermittent failure, the combination switch and the combination switch control unit are OK at this time. Check pinfits and connections. ■
9. Disconnect the combination light switch 12P connector from the wiper/washer switch.
10. Perform the combination light switch test (see page 22-206).

    Is the combination light switch OK?

    YES—Faulty combination switch control unit, replace the wiper/washer switch. ■

    NO—Replace the combination light switch. ■

DTC B1280: Turn Signal Switch Circuit Malfunction

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs using the HDS.

   Is DTC B1280 indicated?

   YES—Go to step 4.

   NO—Intermittent failure. The turn signal switch circuit is OK at this time. Check pinfits and connections. ■
4. Reset the DTCs by CLEAR MENU (DTC CLEAR) of the HDS.
5. Turn the ignition switch ON (II).
6. Turn the turn signal switch to the left position and wait for 2 seconds.
7. Turn the turn signal switch to the right position and wait for 2 seconds.
8. Check for DTCs using the HDS.

   Is DTC B1280 indicated?

   YES—Go to step 9.

   NO—Intermittent failure, the turn signal light switch and the combination switch control unit are OK at this time. Check pinfits and connections. ■
9. Disconnect the combination light switch 12P connector from the wiper/washer switch.
10. Check for short in the turn signal light switch terminals in each switch position (see page 22-206).

    Is there a short?

    YES—Faulty, turn signal light switch, replace the combination light switch. ■

    NO—Faulty combination switch control unit, replace the wiper/washer switch. ■

Protected by AR

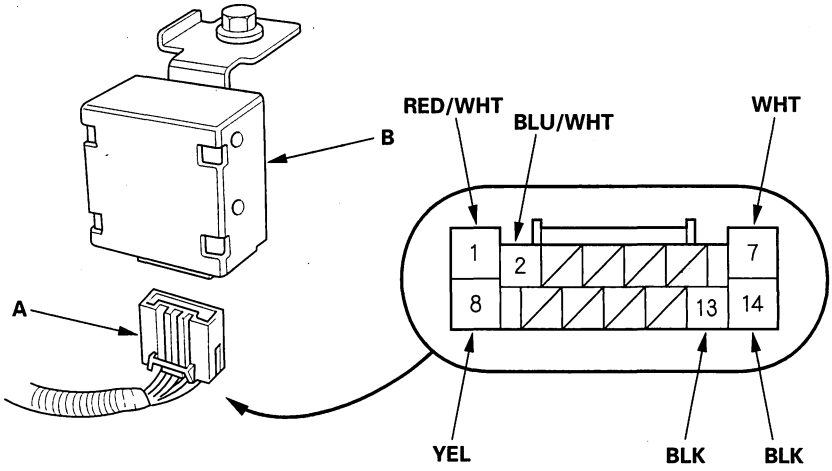
Daytime Running Lights Control Unit Input Test

USA ('06 model)

NOTE:
- Before troubleshooting the daytime running lights control system, troubleshoot the multiplex integrated control system first using B-CAN System Diagnosis Test Mode A (see page 22-91).
- Make sure the headlights high beam come on normally with the combination light switch ON.

1. Remove the driver's dashboard lower cover (see page 20-130).

2. Disconnect the 14P connector (A) from the daytime running lights control unit (B).



Wire side of female terminals

3. Inspect the connector and socket terminals to be sure they are all making good contact.

   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to step 4.

4. Reconnect the connector to the daytime running lights control unit, and make these input tests at the connector.

   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
13 14	BLK	Under all conditions	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G401) • An open in the wire
8	YEL	Ignition switch ON (II)	Check for voltage to ground: There should be battery voltage.	• Blown No. 21 (7.5 A) fuse in the driver's under-dash fuse/relay box • An open in the wire
1	RED/WHT	Under all conditions	Check for voltage to ground: There should be battery voltage.	• Blown No. 19 (40 A) fuse in the under-hood fuse/relay box • Blown No. 3 (10 A) fuse in the driver's under-dash fuse/relay box • An open in the wire

5. Disconnect the 14P connector from the daytime running lights control unit, and make these input tests at the connector.

   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all input tests prove OK, the control unit must be faulty: replace it.

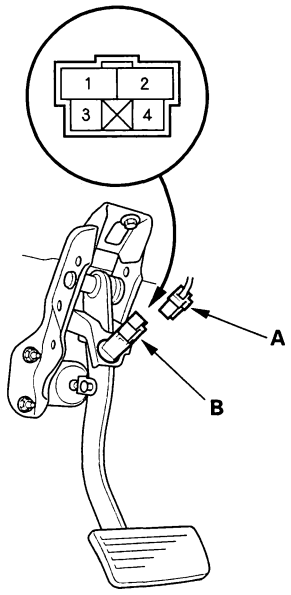
Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
2	BLU/WHT	Under all conditions	Check for continuity between the No. 2 terminal and under-hood fuse/relay box connector H (14P) No. 3 terminal: There should be continuity.	An open in the wire
7	WHT	Under all conditions	Check for continuity to ground: There should be continuity.	• Faulty under-hood fuse/relay box • A open in thr wire

BACK

Protected by AR

Brake Pedal Position Switch Test

1. Disconnect the 4P connector (A) from the brake pedal position switch (B).



2. Check for continuity between the No. 1 and No. 2 terminals.

   - There should be continuity when the brake pedal is pressed.
   - There should be no continuity when the brake pedal is released.

3. Check for continuity between the No. 3 and No. 4 terminals (with cruise control).

   - There should be no continuity when the brake pedal is pressed.
   - There should be continuity when the brake pedal is released.

4. If necessary, adjust or replace the switch, or adjust the pedal height (see page 19-6).

Protected by AR

Headlight Adjustment

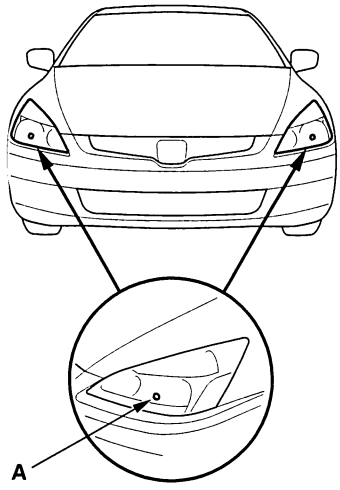
⚠CAUTION

Headlights become very hot during use; do not touch them or any attaching hardware immediately after they have been turned off.

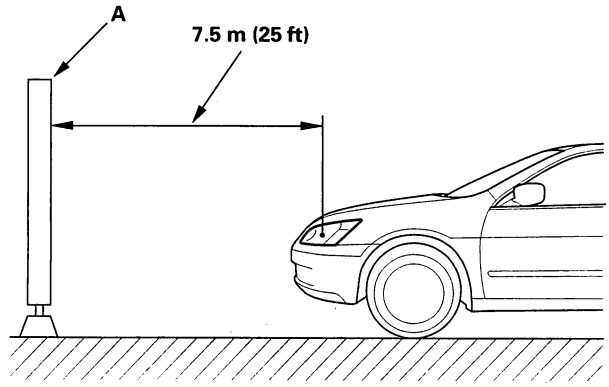
Before adjusting the headlights:

- Park the vehicle on a level surface.
- Make sure the tire pressures are correct.
- The driver or someone who weighs the same should sit in the driver's seat.

1. Clean the outer lens so that you can see the center (A) of the headlights.



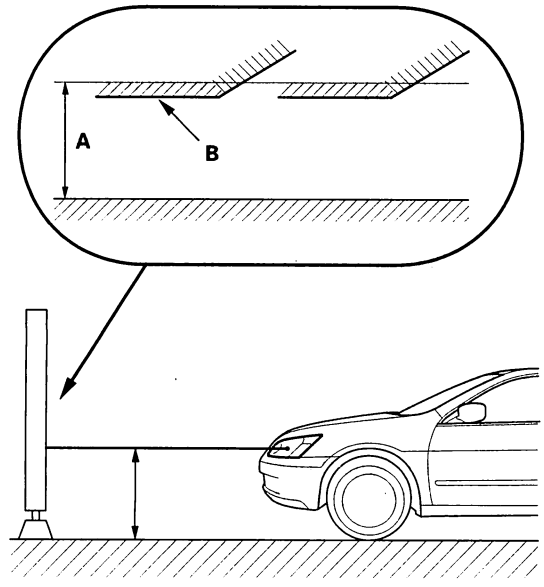
2. Park the vehicle in front of a wall or a screen (A).



3. Turn the low beams on.

4. Determine if the headlights are aimed properly.

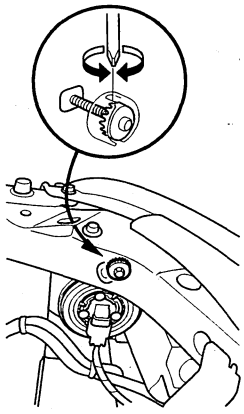
Vertical adjustment:
Measure the height of the headlights (A). The lights should reflect 52 mm (2.1 in.) below headlight height (B).



BACK

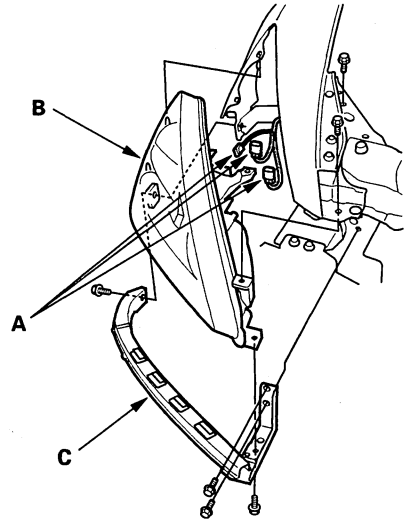
Protected by AR

5. If necessary, open the hood and adjust the headlights to local requirements by turning the vertical adjuster.



Headlight Replacement

1. Remove the front bumper.
   - 2-door (see page 20-184)
   - 4-door (see page 20-185)
2. Remove the connectors (A) from the headlight assembly (B).



3. Remove the five mounting bolts and the harness clip, then remove the headlight.
4. Remove the bolt and the corner upper beam (C) from the headlight.
5. Install the headlight in the reverse order of removal.
6. After replacement, adjust the headlight to local requirement.

Protected by AR

Exterior Lights

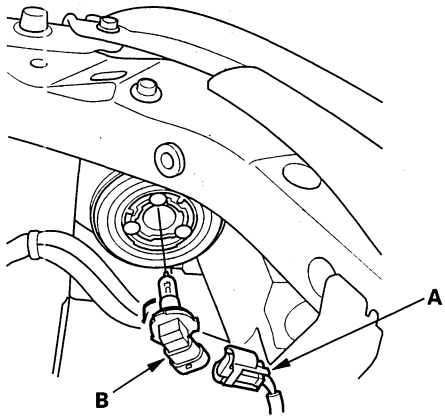
Bulb Replacement

Headlight

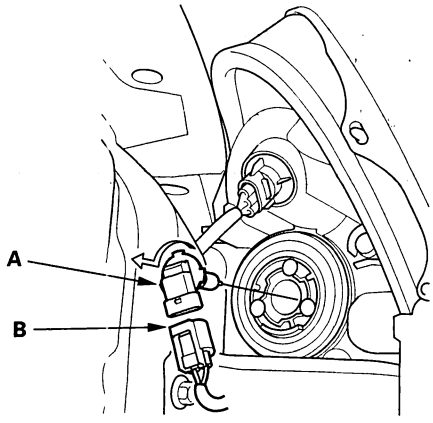
1. For low beam headlight bulb, remove the inner fender (see page 20-211).
2. Disconnect the 2P connectors (A) from the headlight.

Headlight (high beam): 60 W
Headlight (low beam): 51 W

High beam:



Low beam:

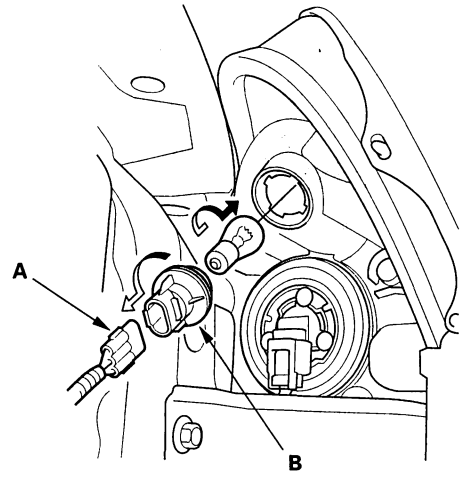


3. Turn the bulb socket (B) 45 ° counterclockwise to remove the bulb.
4. Install a new bulb in the reverse order of removal.

Front Turn Signal/Side Marker Lights

1. Remove the inner fender (see page 20-211).
2. Disconnect the 3P connector (A) from the front turn signal/side marker light.

Front Turn Signal/Side Marker Lights: 21/5 W



3. Turn the bulb socket (B) 45 ° counterclockwise to remove the bulb.
4. Install a new bulb in the reverse order of removal.

BACK

Entry Lights Control System

Control Unit Input Test

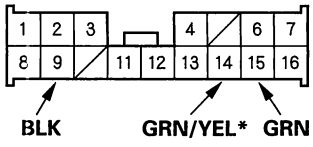
1. Before testing the entry light control functions, troubleshoot the multiplex integrated control system using B-CAN System Diagnosis Test Mode A (see page 22-91).

Multiplex Integrated Control Unit

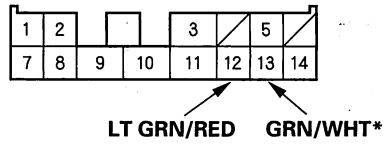
2. Remove the left kick panel.
   - 2-door (see page 20-90)
   - 4-door (see page 20-91)
3. Disconnect the under-dash fuse/relay box connectors.

   NOTE: All connectors are wire side of female terminals.

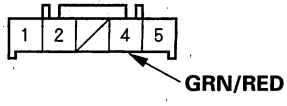
UNDER-DASH FUSE/RELAY BOX CONNECTOR E (16P)



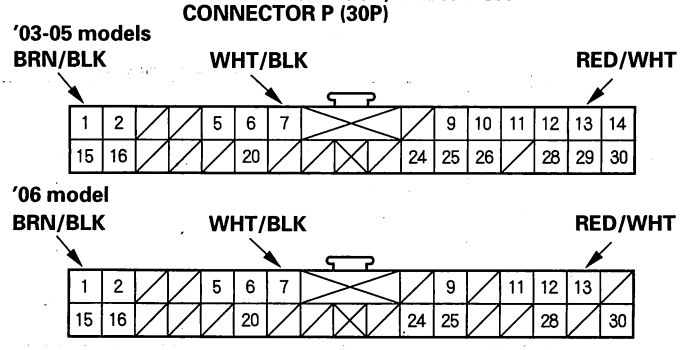
UNDER-DASH FUSE/RELAY BOX CONNECTOR H (14P)



UNDER-DASH FUSE/RELAY BOX CONNECTOR I (5P)



UNDER-DASH FUSE/RELAY BOX CONNECTOR P (30P)



*: 4-door

4. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.

BACK

Protected by AR

5. With the connectors still disconnected, make these input tests at the connector.

   • If any test indicates a problem, find and correct the cause, the recheck the system.
   • If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
P1	BRN/BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
E9	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G601) • An open in the wire
P7	WHT/BLK	Under all conditions	Attach to ground: Ignition key light should come on.	• Blown No. 13 (20 A) fuse in the under-hood fuse/relay box • Faulty ignition keylight (LED) • An open in the wire
I4	GRN/RED	Ceiling light switch in middle position	Attach to ground: Ceiling light(s) should come on.	• Blown No. 6 (7.5 A) fuse in the under-dash fuse/relay box • Blown bulb • Faulty ceiling light • An open in the wire

6. Reconnect the connectors to the under-dash fuse/relay box.

7. Turn the ignition switch to ON (II) to keep the system awake and make these input tests at the appropriate connectors on the under-dash fuse/relay box.

   • If any test indicates a problem, find and correct the cause, then recheck the system.
   • If all the input tests prove OK, go to step 8.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
E15	GRN	Driver's door open	Check for voltage to ground: There should be less than 1 V.	• Faulty driver's door switch • An open in the wire
		Driver's door closed	Check for voltage to ground: There should be 5 V or more.	• Faulty driver's door switch • Short to ground
H12	LT GRN/RED	Front passenger's door open	Check for voltage to ground: There should be less than 1 V.	• Faulty front passenger's door switch • An open in the wire
		Front passenger's door closed	Check for voltage to ground: There should be 5 V or more.	• Faulty front passenger's door switch • Short to ground
E14*	GRN/YEL	Left rear door open	Check for voltage to ground: There should be less than 1 V.	• Faulty left rear door switch • An open in the wire
		Left rear door closed	Check for voltage to ground: There should be 5 V or more.	• Faulty left rear door switch • Short to ground
H13*	GRN/WHT	Right rear door open	Check for voltage to ground: There should be less than 1 V.	• Faulty right rear door switch • An open in the wire
		Right rear door closed	Check for voltage to ground: There should be 5 V or more.	• Faulty right rear door switch • Short to ground
P13	RED/WHT	Ignition key inserted into the ignition switch	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G501) • Faulty ignition key switch • An open in the wire
		Ignition key removed from the ignition switch	Check for voltage to ground: There should be 5 V or more.	• Faulty ignition key switch • Short to ground

*: 4-door

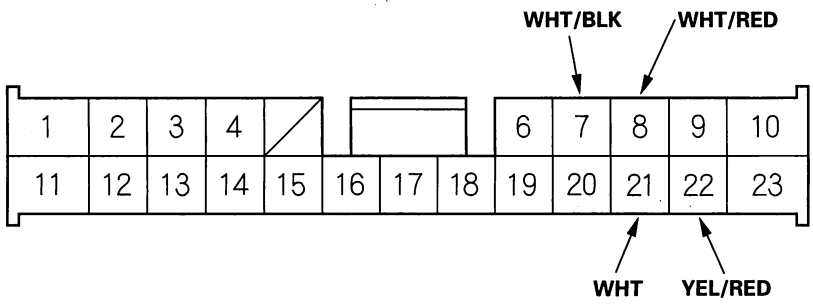
Entry Lights Control System

Control Unit Input Test (cont'd)

Door Multiplex Control Unit

8. Remove the driver's door panel (see page 20-9).
9. Disconnect the 23P connector from the door multiplex control unit.
10. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals look OK, go to step 11.



Wire side of female terminals

11. Reconnect the connector to the door multiplex control unit, and make these input tests at the appropriate connector.
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, the control unit must be faulty; replace the power window master switch.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
22	YEL/RED	Driver's door lock knob locked	Check for voltage to ground: There should be less than 1 V.	• Faulty driver's door lock actuator • Poor ground (G501)
		Drive's door lock knob unlocked	Check for voltage to ground: There should be 5 V or more.	• Faulty driver's door lock actuator • Short to ground
7	WHT/BLK	Driver's door lock knob unlocked	Check for voltage to ground: There should be less than 1 V.	• Faulty driver's door lock actuator • Poor ground (G501) • An open in the wire
		Driver's door lock knob locked	Check for voltage to ground: There should be 5 V or more.	• Faulty driver's door lock actuator • Short to ground
8	WHT/RED	Driver's door key cylinder switch in LOCK	Check for voltage to ground: There should be less than 1 V.	• Faulty driver's door key cylinder switch • Poor ground (G501) • An open in the wire • Short to ground
		Driver's door key cylinder switch in the neutral position	Check for voltage to ground: There should be 5 V or more.	
		Driver's door key cylinder switch in UNLOCK	Check for voltage to ground: There should be 5 V or more.	
21	WHT	Driver's door key cylinder switch in UNLOCK	Check for voltage to ground: There should be less than 1 V.	• Faulty driver's door key cylinder switch • Poor ground (G501) • An open in the wire • Short to ground
		Driver's door key cylinder switch in the neutral position	Check for voltage to ground: There should be 5 V or more.	
		Driver's door key cylinder switch in LOCK	Check for voltage to ground: There should be 5 V or more.

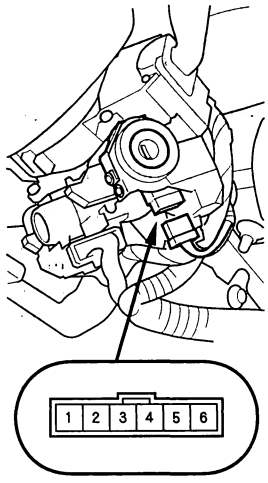
Ignition Key Switch Test

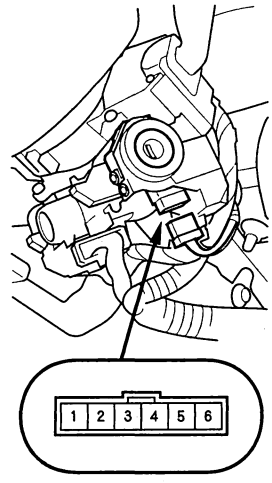
1. Remove the steering column upper and lower covers (see page 17-25).
2. Disconnect the 6P connector.



3. Check for continuity between the No. 1 and No. 2 terminals.
   - There should be continuity with the key in the ignition switch.
   - There should be no continuity with the key removed.
4. If the continuity is not as specified, replace the ignition switch.

Ignition Key Light Test

1. Remove the steering column upper and lower covers (see page 17-25).
2. Disconnect the 6P connector.



3. The LED should come on when power is connected to the No. 6 terminal and ground is connected to No. 5 terminal.
4. If the LED does not come on, replace the ignition switch.

System Description

Key Cylinder Operation

With the key inserted in the driver's door key cylinder, turn the key a second time and hold within 10 seconds to operate the windows (clockwise to open, counterclockwise to close). The windows stop moving when the key is released.

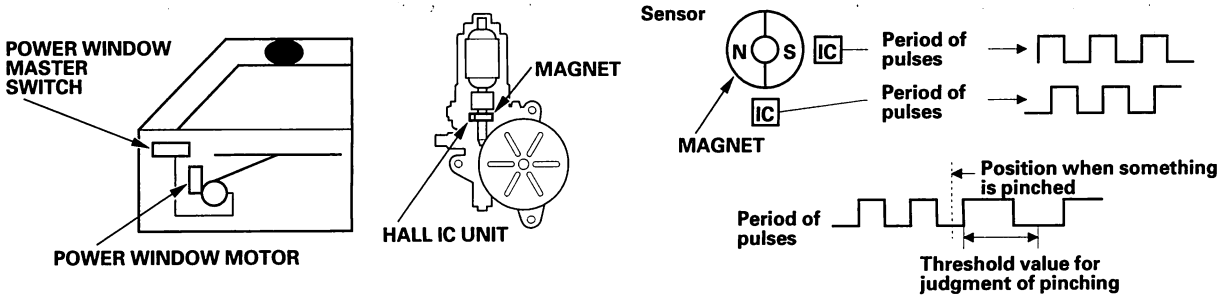
NOTE: Anti-trap will not work when door key cylinder switch is used to close the windows.

Keyless Operation

By pressing the UNLOCK button of the keyless transmitter a second time and holding , the windows open. The windows stop moving when the UNLOCK button is released. The windows do not close with the LOCK button.

Anti-trap Power Window Operation

The system is composed of the power window master switch, the power window master switch and the driver's window motor. The power window motor incorporates a pulser which generates pulses during the motor's operation and sends the pulses to the power window control unit. As soon as the power window master switch detects no pulses from the pulser, the control unit makes the power window motor stop and reverse. This is to prevent pinching your hand or fingers during auto-up operation.



Protected by AR

Resetting the Power Window Control Unit

Resetting the power window is required when any of the following have been removed or repaired

- Power window regulator
- Power window motor
- Window run channel
- Door glass

Using the HDS

1. Connect the Honda Diagnostic System (HDS) to the vehicle's DLC.
2. Turn the ignition switch ON (II), then enter the vehicle's VIN and mileage at the prompts.
3. Select Body Electrical from the System Selection menu.
4. From the Body Electrical System Select menu, select Power Windows.
5. From the Mode menu, select Adjustments.
6. From the Adjustment menu, select Window P Reset.
7. Follow the prompts on the screen.
8. Confirm that the power window master switch is reset by using the driver's window AUTO UP and DOWN function.

BACK

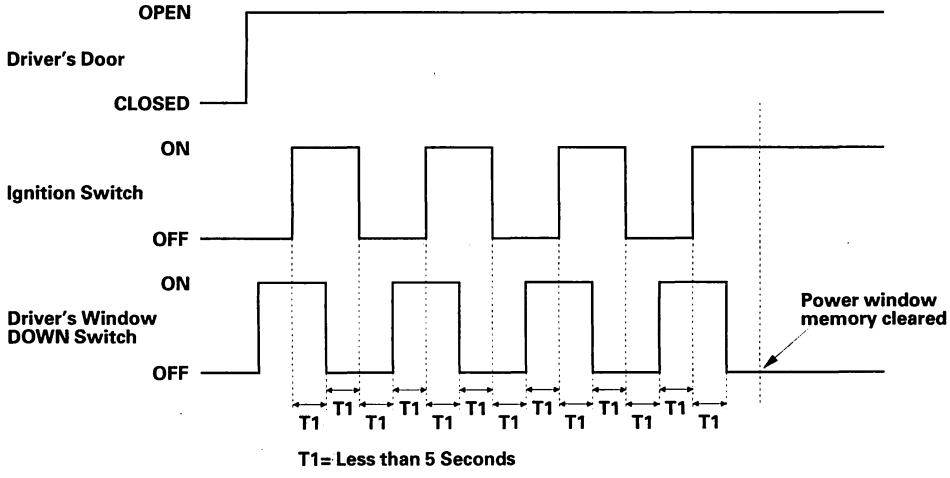
Protected by AR

Resetting the power window

Without the HDS

1. Turn the ignition switch ON (II).
2. Move the driver's window all the way down by using the driver's window DOWN switch.
3. Open the driver's door.

   NOTE: steps 4-7 must be done within 5 seconds of each other.



4. Turn the ignition switch OFF.
5. Push and hold the driver's window DOWN switch.
6. Turn the ignition switch ON (II).
7. Release the driver's window DOWN switch.
8. Repeat steps 4-7 three more times.
9. Wait 1 second.
10. Confirm that AUTO UP and AUTO DOWN do not work. If AUTO UP and DOWN work, go back to step 1.
11. Move the driver's window all the way down by holding the driver's window DOWN switch to the AUTO DOWN position.
12. Pull up and hold the driver's window UP switch to the AUTO UP position until the window reaches the fully closed position, then continue to hold the switch for 1 second.
13. Confirm that the power window master switch is reset by using the driver's window AUTO UP and DOWN function.

    If the window still does not work in AUTO, repeat the procedure several times, paying close attention to the 5 second time limit between steps. If it still does not work, go to B-CAN System Diagnosis Test Mode A (see page 22-91).

Power Windows

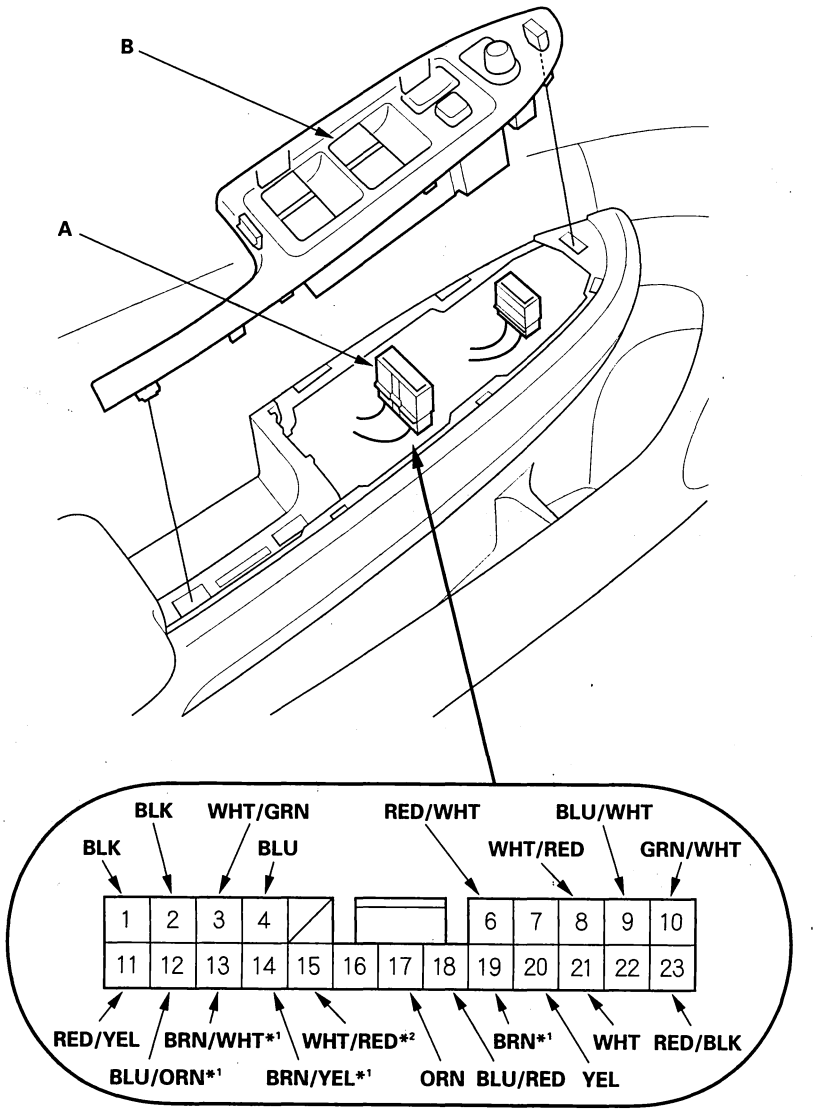
Master Switch Input Test

1. Before testing the power windows, troubleshoot the multiplex integrated control system using B-CAN System Diagnosis Test Mode A (see page 22-91).

2. Remove the driver's door switch trim.

   - 2-door (see page 20-9)
   - 4-door (see page 20-10)

3. Disconnect the 23P connector (A) from the power window switch (B).



Wire side of female terminals

*1: 4-door
*2: '05-06 models

4. Inspect the connector and socket terminals to be sure they are all making good contact.

   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.

BACK

Protected by AR

5. Reconnect the 23P connector to the switch.

6. Turn the ignition switch to ON (II) to keep the system awake and perform the following input tests.

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 7.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
6	RED/WHT	Ignition switch ON (II)	Check for voltage to ground: There should be battery voltage.	• Faulty power window master switch • Short to ground in the wire
2	BLK	Under all conditions	Check for voltage to ground: There should be 1 V or less.	• Faulty power window master switch • Poor ground (G601)
10	GRN/WHT	Under all conditions	Check for voltage to ground: There should be battery voltage.	• Blown No. 23 (P/W) (50 A) fuse in the under-hood fuse/relay box • Blown No. 27 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
20	YEL	Ignition switch ON (II)	Check for voltage to ground: There should be battery voltage.	• Blown No. 21 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
15*1	WHT/RED	Under all conditions	Check for voltage to ground: There should be battery voltage.	• Blown No. 7 (10 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
1	BLK	Under all conditions	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G601) • An open in the wire
4	BLU	Ignition switch ON (II), and the driver's window switch AUTO DOWN	Check for voltage between the No. 4 and No. 2 terminals: There should be 0 V—about 5 V—0 V—about 5 V repeatedly (a digital voltmeter reads about 2.5 V while the window moves).	• Blown No. 21 (7.5 A) fuse in the under-dash fuse/relay box • Blown No. 27 (20 A) fuse in the under-dash fuse/relay box • Faulty power window master switch • Short to ground in the wire • Faulty driver's window motor
17	ORN	Ignition switch ON (II), and the driver's window switch AUTO DOWN	Check for voltage between the No. 17 and No. 2 terminals: There should be 0 V—about 5 V—0 V—about 5 V repeatedly (a digital voltmeter reads about 2.5 V while the window moves).	
21	WHT	Driver's door key cylinder switch in UNLOCK	Check for voltage to ground: There should be 1 V or less.	• Faulty driver's door key cylinder switch • Poor ground (G501) • An open in the wire
		Driver's door key cylinder switch in neutral	Check for voltage to ground: There should be about 5 V.	• Short to ground • Faulty driver's door key cylinder switch
		Driver's door key cylinder switch in LOCK	Check for voltage to ground: There should be about 5 V.	
8	WHT/RED	Driver's door key cylinder switch in LOCK	Check for voltage to ground: There should be 1 V or less.	• Faulty driver's door key cylinder switch • Poor ground (G501) • An open in the wire
		Driver's door key cylinder switch in neutral	Check for voltage to ground: There should be about 5 V.	• Short to ground • Faulty driver's door key cylinder switch
		Driver's door key cylinder switch in UNLOCK	Check for voltage to ground: There should be about 5 V.	

* 1: '05-06 models

NOTE: Reference voltage is approximately 5 V when system is awake. The voltage drops to 0.8 V when the system goes into sleep mode.

Protected by AR

Master Switch Input Test (cont'd)

7. Disconnect the 22P connector from the power window master switch, and make these input tests at the connector.

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, the control unit must be faulty; replace the power window master switch.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
3	WHT/GRN	Under all conditions	Connect terminal No. 3 to ground. Check for voltage at under-dash fuse/relay box No. 26 (20 A) fuse: There should be battery voltage.	• Blown No. 23 (P/W) (50 A) fuse in the under-hood fuse/relay box. • Faulty power window relay • Faulty under-dash fuse/relay box • An open in the wire
11	RED/YEL	Connect the No. 10 and No. 11 terminals with a jumper wire, and No. 23 terminal to body ground.	Check the driver's window motor operation: The window should go down.	• Blown No. 27 (20 A) fuse in the under-dash fuse/relay box • Faulty driver's power window motor • An open in the wire
23	RED/BLK	Connect the No. 10 and No. 23 terminals with a jumper wire, and No. 11 terminal to body ground.	Check for driver's window motor operation: The window should go up.	
9	BLU/WHT	Connect the No. 10 and No. 9 terminals with a jumper wire, and the No. 3 terminal to body ground.	Check the front passenger's window motor operation: The window should go down.	• Poor ground (G503) • Blown No. 26 (20 A) fuse in the under-dash fuse/relay box • Faulty front passenger's power window switch • Faulty front passenger's power window motor • An open in the wire
18	BLU/RED	Connect the No. 10 and No. 18 terminals with a jumper wire, and the No. 3 terminal to body ground.	Check the front passenger's window motor operation: The window should go up.	
13*1	BRN/WHT	Connect the No. 10 and No. 13 terminals with a jumper wire, and the No. 3 terminal to body ground.	Check the left rear window motor operation: The window should go up.	• Poor ground (G601) • Blown No. 24 (20 A) fuse in the under-dash fuse/relay box • Faulty left rear power window switch • Faulty left rear power window motor • An open in the wire
19*1	BRN	Connect the No. 10 and No. 19 terminals with a jumper wire, and the No. 3 terminal to body ground.	Check the left rear window motor operation: The window should go down.	
12*1	BLU/ORN	Connect the No. 10 and No. 12 terminals with a jumper wire, and the No. 3 terminal to body ground.	Check the right rear window motor operation: The window should go up.	• Poor ground (G602) • Blown No. 25 (20 A) fuse in the under-dash fuse/relay box • Faulty right rear power window switch • Faulty right rear power window motor • An open in the wire
14*1	BRN/YEL	Connect the No. 10 and No. 14 terminals with a jumper wire, and the No. 3 terminal to body ground.	Check the right rear window motor operation: The window should go down.

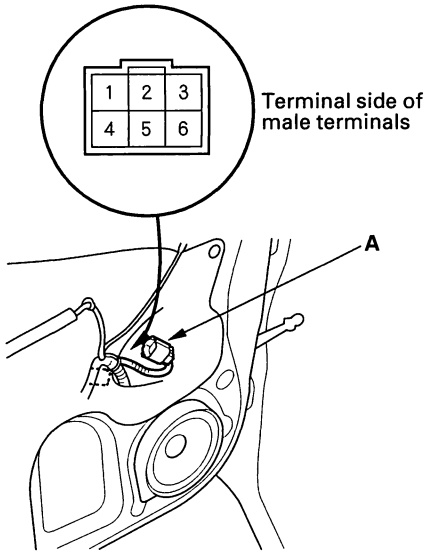
Driver's Window Motor Test

Motor Test

1. Remove the driver's door panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 6P connector (A) from the window motor.



3. Test the motor in each direction by connecting battery power and ground according to the table. When the motor stops running, disconnect one lead immediately.

Terminal / Direction	1	4
UP	⊖	⊕
DOWN	⊕	⊖

4. If the motor does not run or fails to run smoothly, replace it.

Pulser Test

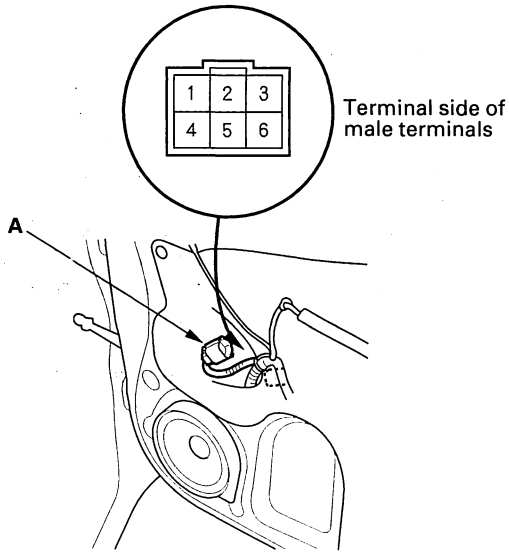
5. Reconnect the 6P connector to the window motor.
6. Check for voltage between the terminals.
   - There should be battery voltage between the No. 6 (+) and No. 5 (−) terminals when the ignition switch is ON (II).
   - Connect an analog voltmeter between the No. 2 (+) and No. 5 (−) terminals, and run the window motor down or up. The voltmeter needle should move back and forth alternately (a digital voltmeter should show the average voltage between 0—5 V).
   - Connect an analog voltmeter between the No. 3 (+) and No. 5 (−) terminals, and run the window motor at down or up. The voltmeter needle should move back and forth alternately.

   If the voltage is not as specified, replace the driver's window motor.

Protected by AR

Passenger's Window Motor Test

1. Remove the passenger's door panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 6P connector (A) from the window motor.



3. Test the motor by connecting battery power and ground according to the table. When the motor stops running, disconnect one lead immediately.

Terminal / Direction	3(4)	6(1)
UP	⊕	⊖
DOWN	⊖	⊕

( ): Left rear window motor

4. If the motor does not run or fails to run smoothly, replace it.

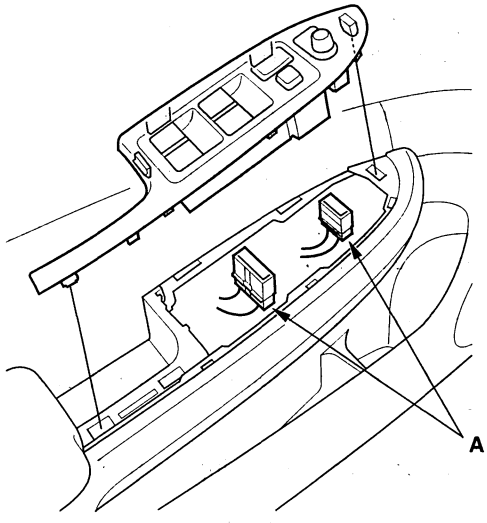
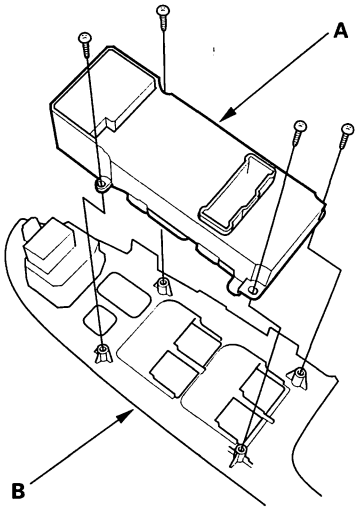
Master Switch Replacement

1. Carefully pry off the driver's door switch trim.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the power mirror and power window switch connectors (A).



3. Remove the four mounting screws, then remove the master switch (A) from the panel (B).

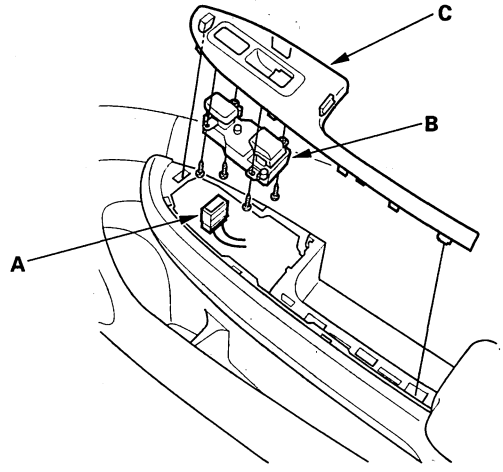


4. Reinstall the switch in reverse order of removal.
5. Reset the power window control unit (see page 22-232).
6. For some models; reprogram the keyless remotes (see page 22-159).

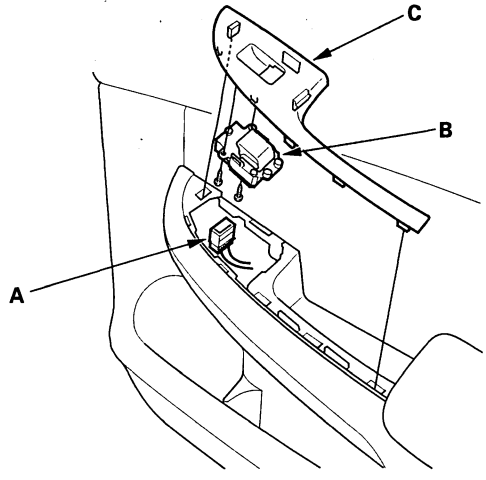
Passenger's Window Switch Test/ Replacement

1. Carefully pry off the door switch trim.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the power window switch connector (A), then remove the three mounting screws and the power window switch (B) from the switch trim (C).

Front Passenger's:



Rear:



3. Swap the window switch with another known-good switch and test.
   If the original window switch is faulty, replace it.

DTC Troubleshooting

DTC B1125: Driver's Power Window Motor A Pulse Error

DTC B1126: Driver's Power Window Motor B Pulse Error

1. Open and close the driver's power window by using the driver's switch manually.
2. While the power window moving, select POWER WINDOWS from the HDS and enter the DATA LIST.
3. Check the EXIST/NONE information of the P/W PLSA (B1125) or P/W PLSB (B1126) in the DATA LIST.

   Do the information indicators display EXIST?

   YES—Replace the power window master switch. ■

   NO—Go to step 4.
4. Refer to the power window master switch input test, check for continuity between the driver's power window motor 6P connector and the power window master switch 23P connector (see page 22-236).

   Are all the wire harnesses OK?

   YES—Substitute a known-good power window master switch, and recheck. If DTC is gone, the original master switch is faulty; replace it. If the DTC is still indicated, replace the driver's power window motor. ■

   NO—Repair a short or an open in the wire. ■

DTC B1140: Driver's Power Window Position Detect Circuit Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON (II).
3. Open and close the driver's power window by using the driver's switch manually.
4. Check for DTCs using the HDS.

   Is DTC B1125 or B1126 indicated?

   YES—Troubleshoot the DTC B1125 or B1126 (see page 22-242). ■

   NO—Go to step 5.
5. Reset the power window control unit (see page 22-232).
6. Check for DTCs again using the HDS.

   Is DTC B1140 indicated?

   YES—Faulty door multiplex control unit; replace the power window master switch. ■

   NO—The system is recovered at this time. ■

DTC Troubleshooting

DTC B1076: Windshield Wiper Signal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON (II).
3. Turn the wiper switch to INT, LOW, then HIGH for at least 2 seconds each.
4. Check for DTCs using the HDS.

   Is DTC B1076 indicated?

   YES—Go to step 5.

   NO—Intermittent failure. The windshield wiper system is OK at this time. Check pinfits and connections. ■
5. With the wiper/washer switch OFF, select WINDSHIELD WIPERS from the HDS, and enter the DATA LIST.
6. Check the ON/OFF information of the Windshield Wiper Switch (BACK-UP) in the DATA LIST.

   Is the information indicator OFF?

   YES—Go to step 7.

   NO—Go to step 11.
7. Turn the wiper switch ON (low or high).
8. Check the ON/OFF information of the Windshield Wiper Switch (BACK-UP) in the DATA LIST.

   Is the information indicator ON?

   YES—Faulty relay control module; replace the under-hood fuse/relay box. ■

   NO—Go to step 9.
9. Disconnect the relay control module 10P connector and the wiper/washer switch 8P connector.
10. Check for continuity between the No. 5 terminal of the relay control module 10P connector and the No. 5 terminal of the wiper/washer switch (combination switch control unit) 8P connector.

   Is there continuity?

   YES—Faulty combination switch control unit; replace the wiper/washer switch. ■

   NO—Repair an open in the GRN/WHT wire. ■
11. Disconnect the relay control module 10P connector and the wiper/washer switch 8P connector.
12. Check for continuity between the No. 5 terminal of the relay control module 10P connector and body ground.

   Is there continuity?

   YES—Repair a short in the GRN/WHT wire. ■

   NO—Faulty relay control module; replace the under-hood fuse/relay box. ■

BACK

Protected by AR

DTC B1077: Windshield Wiper (As) Signal Error

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON (II).
3. Turn the wiper switch to INT, LOW, then HIGH for at least 2 seconds each.
4. Check for DTCs using the HDS.

   Is DTC B1077 indicated?

   YES—Go to step 5.

   NO—Intermittent failure. The windshield wiper system is OK at this time. Check pinfits and connections. ■
5. Turn the ignition switch ON (II).
6. Select WINDSHIELD WIPERS from the HDS and enter the DATA LIST.
7. Turn the windshield wiper switch ON.
8. Check the ON/OFF information of the Windshield Wiper Switch (INTERMITTENT), Windshield Wiper Switch (LOW), and Windshield Wiper Switch (HIGH) in the DATA LIST at each wiper switch position.

   Is the information indicator ON at each switch position?

   YES—Go to step 9.

   NO—Go to step 17.
9. Select FUNCTIONAL. TEST from the TEST MODE MENU, and operate the windshield wiper motor with FR WIPER (LOW) and FR WIPER (HIGH).

   Does the windshield wiper motor run?

   YES—Go to step 10.

   NO—Go to step 18.
10. Turn the windshield wiper switch OFF, and stop the wiper arms at the park position. (If the wiper arms do not stop at the park position, turn the ignition switch OFF and stop them at the park position correctly.)
11. Turn the ignition switch ON (II).

    Do the wipers begin to run as soon as the ignition switch is cycled ON?

    YES—Go to step 16.

    NO—Go to step 12.
12. Check the ON/OFF information of the Windshield Wiper Motor PARK Switch in the DATA LIST.

    Is the information indicator OFF?

    YES—Go to step 13.

    NO—Faulty relay control module; replace the under-hood fuse/relay box. ■
13. Turn the ignition switch ON (II), and turn the windshield wiper switch ON at low speed.
14. Check the ON/OFF information of the Windshield Wiper Motor PARK Switch in the DATA LIST.

    Does the DATA LIST information indicate ON and OFF alternately as the wipers pass the PARK position?

    YES—Intermittent failure, the windshield wiper system is OK at this time. Check pinfits and connections. ■

    NO—Go to step 15.

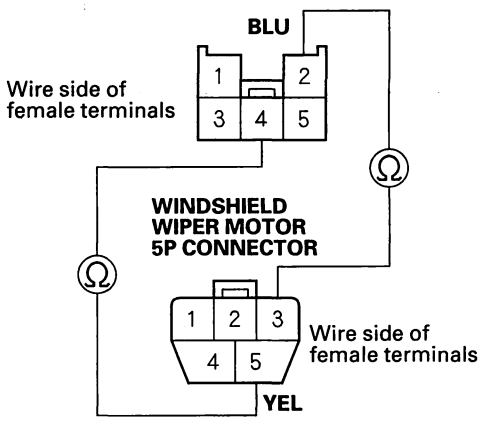
21. Check for continuity between the No. 3 [No. 1] and No. 5 [No. 4] terminals of the windshield wiper motor 5P connector and the No. 2 and No. 4 terminal of the under-hood fuse/relay box 5P connector J.
[ ] : 2-door

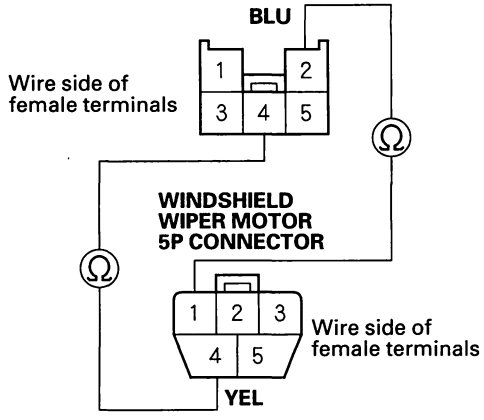
4-door:

UNDER-HOOD FUSE/RELAY BOX 5P CONNECTOR J



2-door:

UNDER-HOOD FUSE/RELAY BOX 5P CONNECTOR J



Is there continuity?

YES—Repair an open in the BLU or YEL wire. ■

NO—Go to step 22.

22. Perform the wiper motor test (see page 22-252).

Does the wiper motor operate correctly?

YES—Faulty relay module; Replace the under-hood fuse/relay box. ■

NO—Replace the windshield wiper motor. ■

DTC Troubleshooting (cont'd)

DTC B1281: Windshield Wiper Switch MIST Position Circuit Malfunction

DTC B1282: Windshield Wiper Switch INT (AUTO) Position Circuit Malfunction

DTC B1283: Windshield Wiper Switch LOW Position Circuit Malfunction

DTC B1284: Windshield Wiper Switch HIGH Position Circuit Malfunction

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON (II).
3. Turn the windshield wiper switch in MIST and wait for 2 seconds.
4. Turn the windshield wiper switch OFF and wait for 2 seconds.
5. Turn the windshield wiper switch in INT (AUTO) and wait for 2 seconds.
6. Turn the windshield wiper switch in LOW and wait for 2 seconds.
7. Turn the windshield wiper switch in HIGH and wait for 2 seconds.
8. Check for DTCs using the HDS.

Is DTC B1281, B1282, B1283, or B1284 indicated?

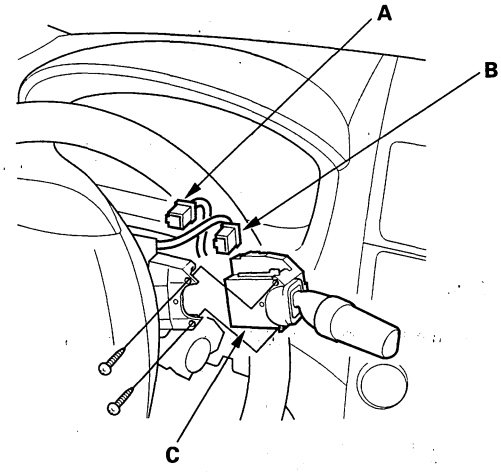
YES—Replace the windshield wiper/washer switch. ■

NO—Intermittent failure, the windshield wiper/washer switch and the combination switch control unit are OK at this time. Check pinfits and connections. ■

Wiper/Washer Switch Test/ Replacement

NOTE: The wiper/washer switch is built into the combination switch control unit. For the wiper/washer test, refer to the wiper/washer switch input test (see page 22-251).

1. Remove the dashboard lower cover (see page 20-130).
2. Remove the steering column covers (see page 17-25).
3. Disconnect the combination light switch 12P connector (A) and dashboard wire harness 8P connector (B) from the wiper/washer switch (C).



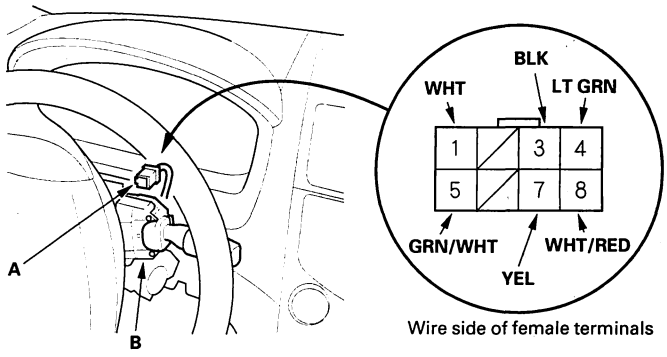
4. Remove the two screws, then slide out the wiper/washer switch.

BACK

Protected by AR

Wiper/Washer Switch Input Test

1. Before troubleshooting the wiper/washer system, troubleshoot the B-CAN System Diagnosis Test Mode A (see page 22-91).
2. Remove the dashboard lower cover (see page 20-130).
3. Remove the steering column covers (see page 17-25).
4. Disconnect the 8P connector (A) from the wiper/washer switch (B).



Wire side of female terminals

5. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 6.
6. Reconnect the connect, and make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 7.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
3	BLK	Under all conditions	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G501, G601) • An open in the wire
8	WHT/RED	Under all conditions	Check for voltage to ground: There should be battery voltage.	• Blown No. 15 (40 A) fuse in the under-dash fuse/relay box • Blown No. 7 (10 A) fuse in the under-dash fuse/relay box • An open in the wire
7	YEL	Ignition switch ON (II)	Check for voltage to ground: There should be battery voltage.	• Blown No. 21 (7.5 A) fuse in the under-dash fuse/relay box • An open in the wire

7. Disconnect the connector from the wiper/washer switch, and make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the combination switch control unit must be faulty, replace the wiper/washer switch.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
5	GRN/WHT	Under all conditions	Check for continuity between the No. 5 terminal and under-hood fuse/relay box 10P connector No. 5 terminal: There should be continuity.	An open in the wire
4	LT GRN	Under all conditions	Check for continuity between the No. 4 terminal and under-dash fuse/relay box X connector No. 27 terminal: There should be continuity.	An open in the wire
1	WHT	Under all conditions	Check for continuity between the No. 1 terminal and under-hood fuse/relay box 10P connector No. 6 terminal: There should be continuity.	An open in the wire

Protected by AR

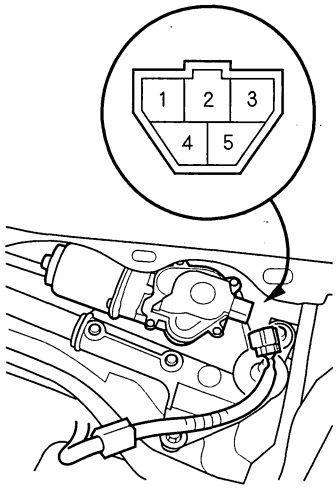
Wiper Motor Test

1. Open the hood, and remove the wiper arms.

   NOTE: Carefully remove the wiper arms, so that they do not touch the hood.

2. Remove the hood seal and cowl cover.

3. Disconnect the connector from the wiper motor.



4. Test the motor by connecting battery power to the No. 2 terminal and ground the No. 3 [1] terminal of the wiper motor 5P connector. The motor should run at low speed. If the motor does not run or fails to run smoothly, replace the motor.

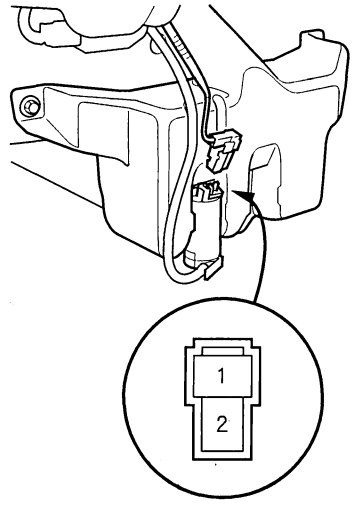
5. Test the motor by connecting battery power to the No. 2 terminal and ground the No. 5 [4] terminal of the wiper motor 5P connector. The motor should run at high speed. If the motor does not run or fails to run smoothly, replace the motor.

6. Connect an analog voltmeter between the No. 4 [5] (+) and No. 1 [3] (−) terminals, and run the motor at low or high speed. The voltmeter should indicate 12 V and 4 V or less alternately. If it does not, replace the wiper motor.
   [ ] : 2-door

Washer Motor Test

1. Remove the right inner fender (see page 20-211).

2. Disconnect the 2P connector from the washer motor.



3. Test the motor by connecting battery power to the No. 1 terminal and ground the No. 2 terminal of the washer motor. The motor should run.

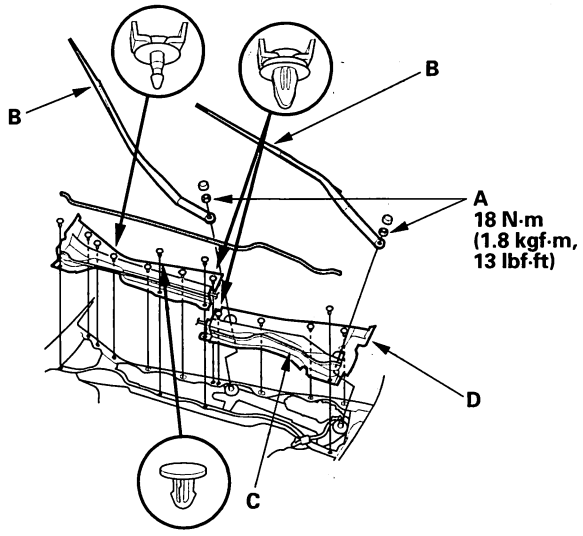
   - If the motor does not run or fails to run smoothly, replace it.
   - If the motor runs smoothly, but little or no washer fluid is pumped, check for a disconnected or blocked washer hose, or a clogged washer motor outlet.

BACK

Protected by AR

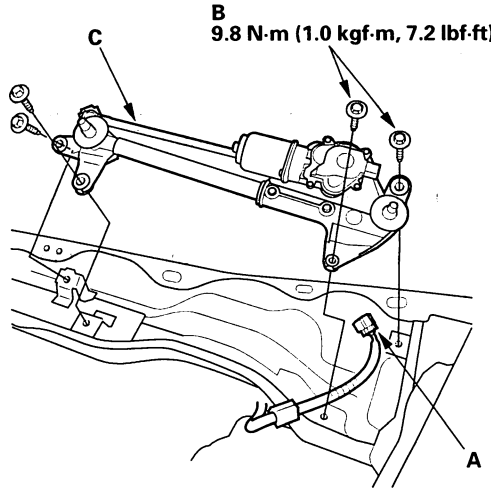
Wiper Motor Replacement

1. Open the hood. Remove the caps, nuts (A), and the windshield wiper arms (B).



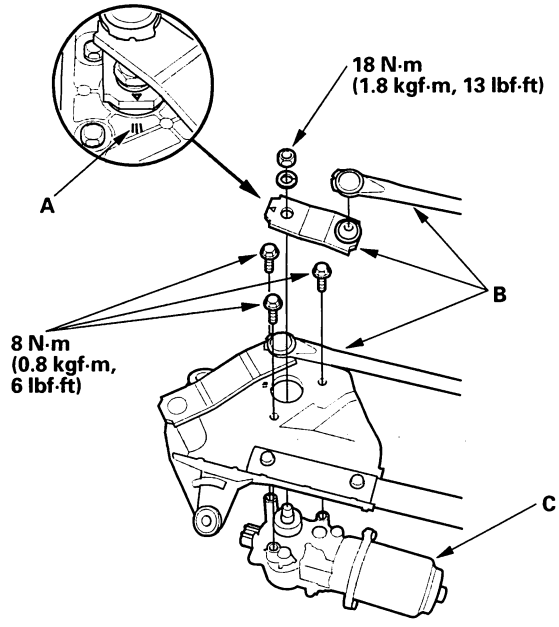
2. Remove the hood seals (C) and cowl covers (D).

3. Disconnect the 5P connector (A) from the wiper motor.



4. Remove the four bolts (B) and wiper linkage assembly (C).

5. Scribe a line (A) across the link and windshield wiper linkage to show the original adjustment. Separate the windshield wiper linkage (B) from the wiper motor (C).



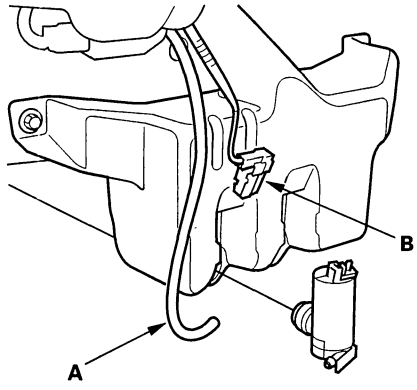
6. Install in the reverse order to removal, and note these items:

- Apply multipurpose grease to the moving parts.
- Before reinstalling the wiper arms, turn the wiper switch ON, then OFF to return the wiper shafts to the park position.
- If necessary, replace any damaged clips.
- Check the wiper motor operation.

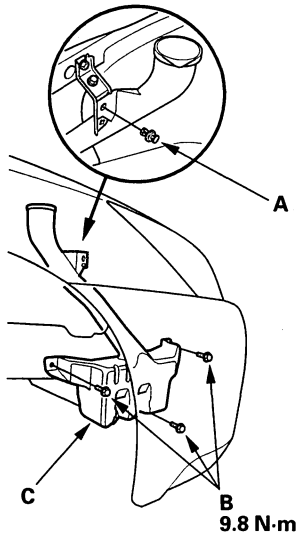
Protected by AR

Washer Reservoir Replacement

1. Remove the right inner fender (see page 20-211).
2. Disconnect the washer tube (A) and washer motor 2P connector (B).



3. Remove the clip (A) and three bolts (B), then remove the washer reservoir (C).

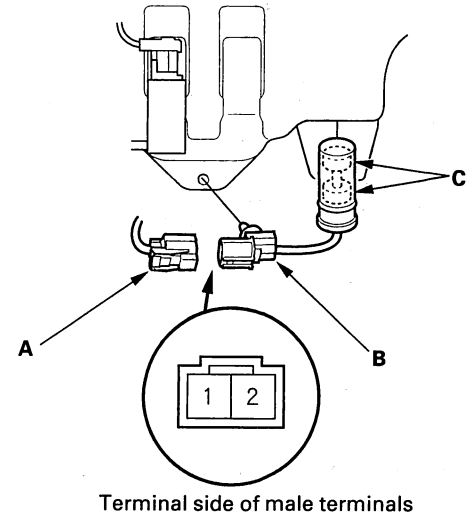


4. Install the reservoir in the reverse order of removal.

Washer Fluid Level Switch Test

Canada

1. Remove the right inner fender (see page 20-211).
2. Disconnect the 2P connector (A) from the washer fluid level switch (B).



Terminal side of male terminals

3. Remove the washer fluid level switch from the reservoir.

   NOTE: Fluid may flow out of the opening.

4. Check for continuity between the No. 1 and No. 2 terminals in each float position (C).

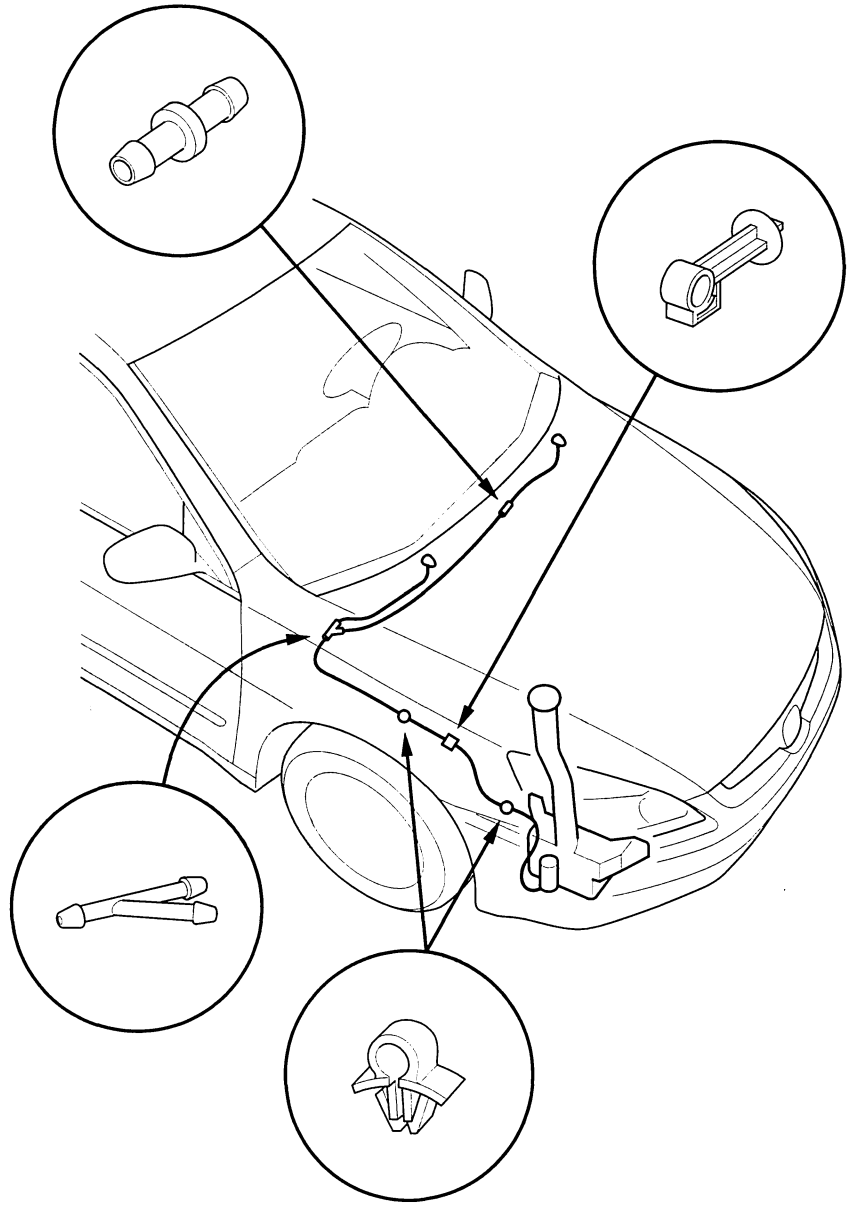
   - There should be continuity when the float is down.
   - There should be no continuity when the float is up.

BACK

Protected by AR

Washer Tube Replacement

1. Remove the right inner fender (see page 20-211).
2. Remove the windshield washer nozzles and clips, then remove the tube.



3. Install in the reverse order of removal. Take care not to pinch the washer tube. Check the windshield washer operation.

Self-diagnostic Function

Before troubleshooting the gauge system, refer to multiplex integrated control system B-CAN System Diagnosis Test Mode A (see page 22-91).

The gauge control module has a self-diagnostic function.
- The beeper drive circuit check
- The indicator drive circuit check
- The switch input test
- The LCD segments check
- The gauges drive circuit check (Speedometer, Tachometer, Fuel gauge, Coolant temperature gauge)
- The communication line check (of the body-controller area network (B-CAN) communication line and the frame-controller area network (F-CAN) communication line between the gauges).

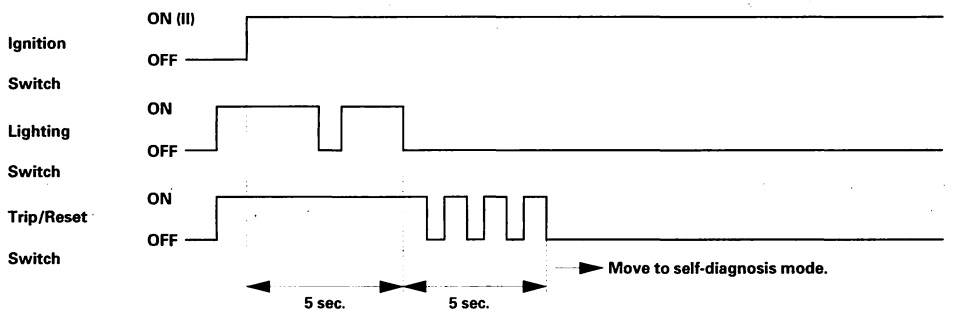
NOTE: Indicators are also controlled via the communication line.

Entering the self-diagnostic function

Before running the self-diagnostic function, check the No. 7 (10 A) fuse and the No. 21 (7.5 A) fuse in the under-dash fuse/relay box.

1. Push and hold the trip/reset button.
2. Turn the headlights ON.
3. Turn the ignition switch ON (II).
4. Within 5 sec., turn the headlights OFF, then ON and OFF again.
5. Within 5 sec., release the trip/reset button, and then push and release the button three times repeatedly.

NOTE:
- While in the self-diagnostic mode, the dash lights brightness controller operates normally.
- While in the self-diagnostic mode, the trip/reset button is used to start the Beeper Drive Circuit Test and the Gauge Drive Circuit Check.
- If the vehicle speed exceeds 1.2 mph (2 km/h) or the ignition switch is turned OFF, the self-diagnostic mode ends.



The Beeper Drive Circuit Check

When entering the self-diagnostic mode, the beeper sounds five times.

The Indicator Drive Circuit Check

When entering the self-diagnostic mode, the following indicator lights blink:
Seat belt indicator, charging system indicator, low fuel indicator, maintenance required indicator, security indicator, high beam indicator, lights on indicator, malfunction indicator lamp (MIL), A/T gear position indicator, ABS indicator, cruise main indicator and safety indicators (doors and trunk).

Switch Input Check

After the intermittent beeper sounds at the initial stage of the self-diagnostic function, a beeper sounds continuously while any of the following switch inputs are switched from OFF to ON:
Cruise control main cruise set, cruise cancel, cruise resume, and parking brake switches.

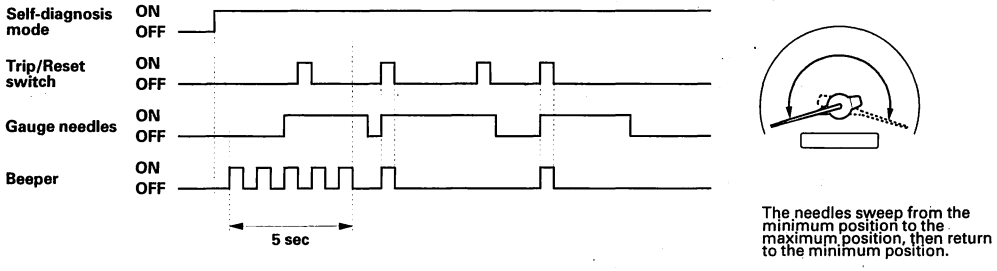
(cont'd)

Protected by AR

Self-diagnostic Function (cont'd)

The LCD Segment Check
When entering the self-diagnostic mode, the odo/trip segments and outside air temperature segment blink five times.

The Gauge Drive Circuit Check
When entering the self-diagnostic mode, the speedometer, the tachometer, the fuel gauge, and the coolant temperature gauge needles sweep from the minimum position to maximum position, then return to the minimum position.
NOTE:
After the beeper stops sounding and the gauge needles return to the minimum position, pushing the trip/reset button starts the Beeper Drive Circuit Check (one beep) and the Gauge Drive Circuit Check again.
The check cannot be started again until the gauge needles return to the minimum position.



If a needle fails to sweep or the beeper does not sound, replace the gauge control module.

The Communication Line Check
While in the self-diagnostic mode, the Communication Line Check starts after the odo/trip LCD Segments Check.
If all segments comes on, the communication line is OK.

- If the word "Error 1" is indicated, there is a malfunction in the communication line between the gauge control module and the frame-controller area network (F-CAN). Check for DTCs in the ECM/PCM. If no DTCs are found, go to B-CAN System Diagnosis Test Mode A (see page 22-91).
- If the word "Error 2" is indicated, there is a malfunction in the communication line between the gauge control module and the body-controller area network (B-CAN). Go to B-CAN System Diagnosis Test Mode A (see page 22-91).
- If the word "Error 3" is indicated, there is a malfunction in the communication line between the gauge control module and the body-controller area network (B-CAN) and the frame-controller area network (F-CAN). Check for DTCs in the ECM/PCM. If no DTCs are found, go to B-CAN System Diagnosis Test Mode A (see page 22-91).

Normal:

Faulty (example Error 1):

If any communicaition line errors are found, go to B-CAN System Diagnosis Test Mode A (see page 22-91).

Ending the self-diagnostic function
Turn the ignition switch OFF.
Note: If the vehicle speed exceeds 1.2 mph (2 km/h), the self-diagnostic function ends.

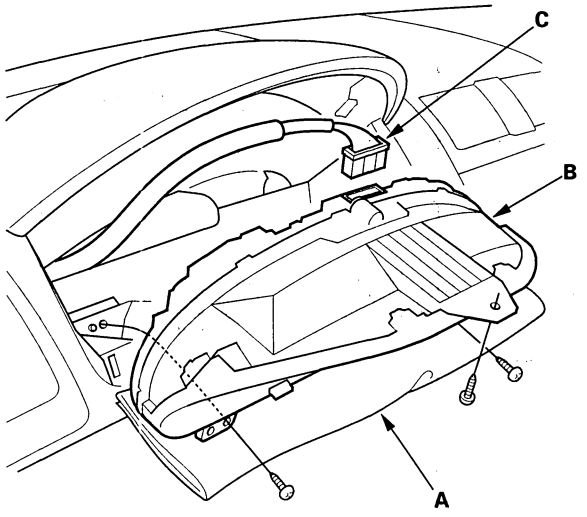
Gauge Control Module Replacement

1. Remove the instrument panel (see page 20-129), then remove the upper column cover (see page 17-25).

2. Place a clean shop towel (A) under the gauge control module to prevent scratching the steering column or dash panel.



3. Remove the screws from the gauge control module (B).

4. Disconnect the 30P ('03-05 models) or 36P ('06 model) connector (C), and remove the gauge control module.

5. Install the gauge control module in the reverse order of removal.

Rewriting the ODO Data on a New Gauge Control Module

NOTE:
- If the HDS retrieves the ODO data from the gauge control module, the ODO value on the ODO/TRIP display will appear as "— — —", making the ODO function unusable, and the HDS will be unable to retrieve additional ODO values.
- Rewriting is not possible on a gauge control module that does not communicate.
- Obtain a new gauge control module before starting the rewriting process.

1. Before replacing the gauge control module, connect the HDS to the data link connector.

2. Select GAUGES AND INDICATORS from the HDS menu display.

3. Select "ODO REWRITE" from the ADJUSTMENTS menu display, and follow the instructions on the menu display to retrieve the ODO value.

4. Replace the gauge control module.

5. Follow the instructions on the menu display to write the new ODO value to the new gauge control module.

Outside Air Temperature Indicator Test

NOTE: To test the outside air temperature sensor (see page 21-123).

The outside air temperature sensor for the indicator is mounted behind the front bumper. Because of this, the temperature reading can be affected by heat reflection from the road, engine heat, and even exhaust from the surrounding traffic. To prevent bogus readings, the display uses a specific logic as shown.

The outside air is warmer than when the ignition switch was turned OFF (ACC or LOCK) position:

- If the ignition switch was turned OFF for less than 2 hours, the displayed temperature when you turn the ignition switch to ON (II) stays at the ignition switch-off temperature until the vehicle has gone faster than 18 mph (11 km/h) for 30 seconds, then rises 1 degree every minute until the outside air temperature is reached.
- If the ignition switch was turned OFF for 2 hours or more, the displayed temperature when you turn the ignition switch to ON (II) the display immediately updates to the measured outside air temperature.

The outside air is cooler than when the ignition switch was turned OFF (ACC or LOCK) position:

- If the ignition switch was turned OFF for less than 2 hours, the displayed temperature when you turn the ignition switch to ON (II) is the ignition switch-off temperature.
  The displayed temperature then drops 1 degree every 2 seconds until the reading matches the outside air temperature.
- If the ignition switch was turned OFF for 2 hours or more, the displayed temperature is the measured outside air temperature.

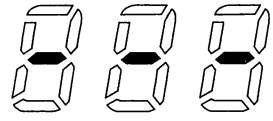
Forced Display

You can also force the indicator to display the measured temperature.

1. Turn the ignition switch OFF.
2. Remove the No. 7 (10 A) fuse from the under-dash fuse/relay box for 60 seconds, then reinstall it.
3. Turn the ignition switch ON (II).

Troubleshooting

If the indicator displays "— — —" for more than 2 seconds after selecting the outside air temperature display mode, check the climate control system for DTCs, or an open in the LT BLU wire between the under-dash fuse/relay box and the climate control unit.



(cont'd)

Protected by AR

Outside Air Temperature Indicator Test (cont'd)

Calibration

NOTE: This procedure must be done after the temperature sensor stabilizes.

The outside air temperature indicator's displayed temperature can be recalibrated ±3 ° to meet the customer's expectations.

1. Turn the ignition switch ON (II).
2. Press and hold the reset select button for 10 seconds. While you continue to hold the button, the display will scroll through temperature settings from +3 ° to −3 ° as shown.

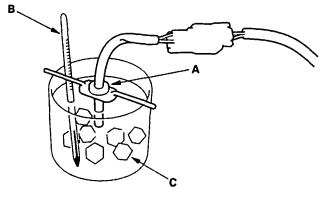
3. When the desired correction value appears on the display, release the button, and the recalibrated outside air temperature will be displayed. Each time a desired correction valve is entered, it replaces the previous valve.

Example:
Incorrect value = 68 °F (20 °C)

Desired correction valve = +2 °F (+1 °C)
Correct valve = 70 °F (21 °C)

Desired correction valve = −2 °F (−1 °C)
Correct valve = 66 °F (19 °C)

NOTE: To recalibrate the display to the true temperature, remove the outside air temperature sensor (A), but leave it connected. Submerge the sensor and a thermometer (B) in a container of ice water (C). Select the calibration mode as described above, then recalibrate the display to the true temperature.



Resetting the Maintenance Required Indicator

Blinking Pattern:

Miles (km)	Maintenance Reminder Light
At 7,900 (12,640) to 8,100 (12,960)	Blinks for 10 seconds when the ignition switch is turned ON (II).
At 9,900 (15,840) to 11,000 (16,160)	Comes on and stays on while the ignition switch is ON (II).

How to Reset

Push and hold the trip/reset button, turn the ignition switch ON (II), and continue to hold the button for more than 10 seconds.

DTC Troubleshooting

DTC B1152: Gauge Control Module EEPROM Error

1. Clear the DTCs using the HDS.
2. Start the engine.
3. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC B1152 indicated?

   YES—Faulty gauge control module; replace the gauge control module (see page 22-276).■

   NO—Intermittent failure, the gauge control module is OK at this time. Check pinfits and connections. If the connections are good, check the battery condition (see page 22-78), and the charging system (see page 4-34).■

DTC B1155: Gauge Control Module Lost Communication (Headlight Switch Message) with the Combination Switch Control Unit

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC B1155 indicated?

   YES—Go to step 4.

   NO—Intermittent failure. The gauge control system is OK at this time. Check pinfits and connections.■
4. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC B1007 or B1062 also indicated?

   YES—Go to Combination Switch Control Unit Input Test (see page 22-131).■

   NO—Go to Gauge Control Module Input Test.■
   - '03-05 models: see page 22-127
   - '06 model: see page 22-128

DTC B1157: Gauge Control Module Lost Communication with Multiplex Integrated Control Unit (MICU)

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC B1157 indicated?

   YES—Go to step 4.

   NO—Intermittent failure. The gauge control system is OK at this time. Check pinfits and connections.■
4. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Are DTCs B1055 and B1255 also indicated?

   YES—Go to Multiplex Integrated Control Unit Input Test (see page 22-124).■

   NO—Go to Gauge Control Module Input Test.■
   - '03-05 models: see page 22-127
   - '06 model: see page 22-128

DTC B1158: Gauge Control Module Lost Communication with Relay Module

1. Clear the DTCs using the HDS.
2. Cycle the ignition switch to OFF and then back ON.
3. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC B1158 indicated?

   YES—Go to step 4.

   NO—Intermittent failure. The gauge control system is OK at this time. Check pinfits and connections.■
4. Check for DTCs by the DTCs MENU (DTCs) of the HDS.

   Is DTC B1005 also indicated?

   YES—Go to Relay Control Module Input Test (see page 22-132).■

   NO—Go to Gauge Control Module Input Test.■

DTC B1175: Fuel Gauge Sending Unit Signals Input Error

1. Do the fuel gauge sending unit test (see page 11-351).

   Is the fuel gauge sending unit OK?

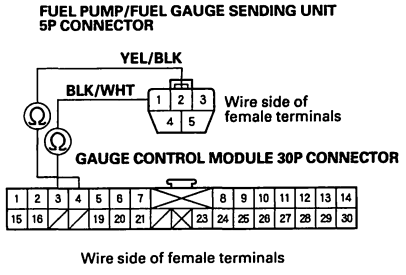
   YES—Go to step 2.

   NO—Replace the fuel gauge sending unit. ■

2. Disconnect the 30P ('03-05 models) or 36P ('06 model) from the gauge control module and the 5P connector from the fuel pump/fuel gauge sending unit.

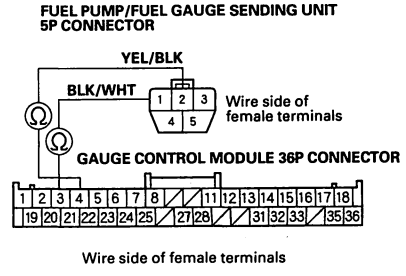
3. Check for continuity between the No. 3 and No. 4 terminals of the gauge control module 30P ('03-05 models) or 36P ('06 model) connector and No. 1 and No. 2 terminals of the fuel pump/fuel gauge sending unit 5P connector.

   '03-05 models



Wire side of female terminals

   '06 model



Wire side of female terminals

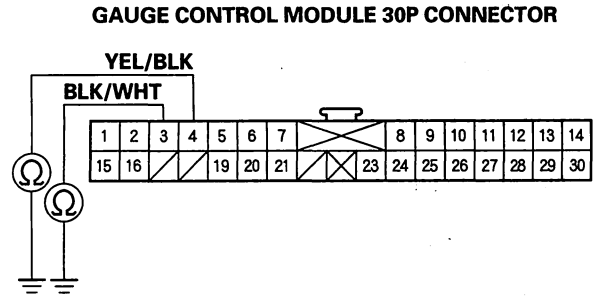
   Is there continuity?

   YES—Go to step 4.

   NO—Repair an open in the BLK/WHT or YEL/BLK wire between the gauge control module and fuel gauge sending unit. ■

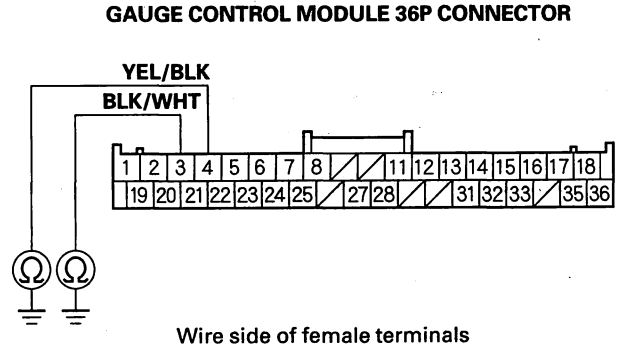
4. Check for continuity between the No. 3 and No. 4 terminals of the gauge control module 30P ('03-05 models) or 36P ('06 model) connector and body ground.

   '03-05 models



Wire side of female terminals

   '06 model



Wire side of female terminals

   Is there continuity?

   YES—Repair a short in the BLK/WHT or YEL/BLK wire. ■

   NO—Inspect all pinfits between the gauge control module and the sending unit. If circuit integrity is good, and the problem still exist, swap gauge control module with a known-good one. If the problem is gone, replace the gauge control module (see page 22-276). ■

Safety Indicator Input Test

1. Before testing the safety indicator functions, troubleshoot the multiplex integrated control system using the B-CAN System Diagnosis Test Mode A (see page 22-91).

Multiplex Integrated Control Unit

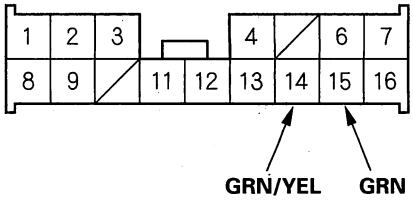
2. Remove the left kick panel.

   - 2-door (see page 20-90)
   - 4-door (see page 20-91)

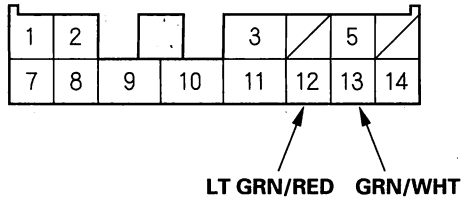
3. Disconnect the under-dash fuse/relay box connectors E, H and P.

   NOTE: All connectors are wire side of female terminals.

UNDER-DASH FUSE/RELAY BOX CONNECTOR E (16P)

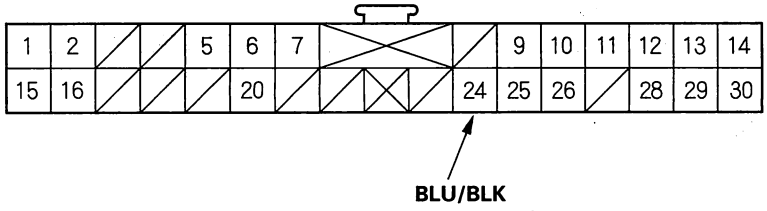


UNDER-DASH FUSE/RELAY BOX CONNECTOR H (14P)



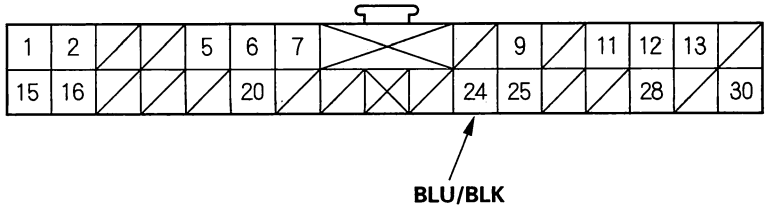
'03-05 models

UNDER-DASH FUSE/RELAY BOX CONNECTOR P (30P)



'06 model

UNDER-DASH FUSE/RELAY BOX CONNECTOR P (30P)



4. Inspect the connector and socket terminals to be sure they are all making good contact.

   - If the terminals are bent, loose or corroded, repair them as necessary, are recheck the system.
   - If the terminals look OK, go to step 5.

(cont'd)

Protected by AR

Safety Indicator Input Test (cont'd)

5. Reconnect the connectors to the under-dash fuse/relay box.

6. Turn the ignition switch to ON (II) to keep the system awake and make sure these input tests at the appropriate connectors on the under-dash fuse/relay box.

   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 7.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
E15	GRN	Driver's door open	Check for voltage to ground: There should be less than 1 V.	• Faulty driver's door switch • An open in the wire
		Driver's door closed	Check for voltage to ground: There should be about 5 V.	• Faulty driver's door switch • Short to ground
H12	LT GRN/ RED	Front passenger's door open	Check for voltage to ground: There should be less than 1 V.	• Faulty front passenger's door switch • An open in the wire
		Front passenger's door closed	Check for voltage to ground: There should be about 5 V.	• Faulty front passenger's door switch • Short to ground
E14*	GRN/YEL	Left rear door open	Check for voltage to ground: There should be less than 1 V.	• Faulty left rear door switch • An open in the wire
		Left rear door closed	Check for voltage to ground: There should be about 5 V.	• Faulty left rear door switch • Short to ground
H13*	GRN/WHT	Right rear door open	Check for voltage to ground: There should be less than 1 V.	• Faulty right rear door switch • An open in the wire
		Right rear door closed	Check for voltage to ground: There should be about 5 V.	• Faulty right rear door switch • Short to ground
P24*	BLU/BLK	Trunk lid open	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G701) • Faulty trunk latch switch • An open in the wire
		Trunk lid closed	Check for voltage to ground: There should be about 5 V.	• Faulty trunk latch switch • Short to ground

*: 4-door

7. Run the gauge control module Self-diagnostic Function (see page 22-259).

   - If the indicators flash, go to step 8.
   - If the indicators do not flash, replace the gauge control module.

8. Substitute a known-good under-dash fuse/relay box and recheck the system.

   - If the symptom is gone, the multiplex integrated control unit (MICU) is faulty; replace the under-dash fuse/relay box.
   - If the symptom is still present, the gauge control module must be faulty; replace the gauge control module.

Control Unit Input Test

1. Before testing, troubleshoot the multiplex integrated control system using B-CAN System Diagnosis Test Mode A (see page 22-91).

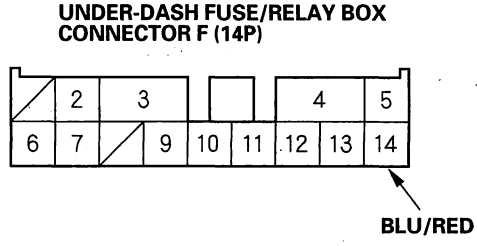
Multiplex Integrated Control Unit

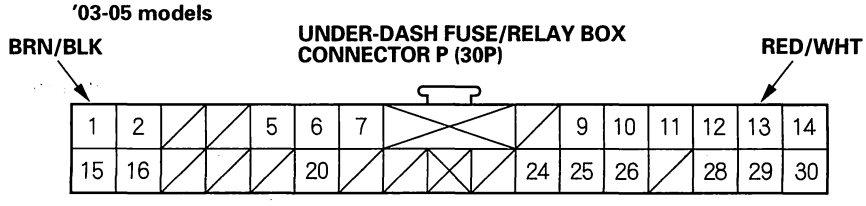
2. Remove the left kick panel.

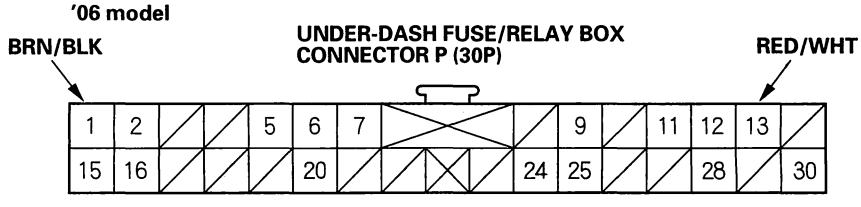
   - 2-door (see page 20-90)
   - 4-door (see page 20-91)

3. Disconnect the under-dash fuse/relay box connectors F and P.

   NOTE: All connectors are wire side of female terminals.







4. Inspect the connector and socket terminals to be sure they are all making good contact.

   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals are OK, go to step 5.

(cont'd)

Protected by AR

Control Unit Input Test (cont'd)

5. Reconnect the connectors, and make these input tests at the connector.

   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

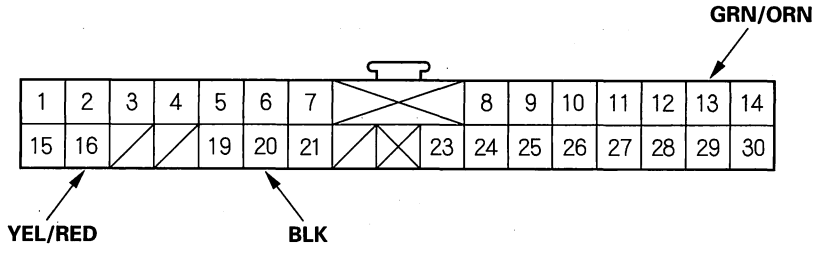
Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
F14 . H14	BLU/RED	Ignition switch ON (II), driver's seat belt is buckled.	Check for voltage to ground: There should be 1 V or less.	• Faulty driver's seat belt switch • Poor ground (G601) • An open in the wire
		Ignition switch ON (II), driver's seat belt is unbuckled.	Check for voltage to ground: There should be about 5 V.	• Faulty driver's seat belt switch • Short to ground
P13	RED/WHT	Ignition key in the ignition switch.	Check for voltage to ground: There should be 1 V or less.	• Faulty ignition switch • Poor ground (G501) • An open in the wire
		Ignition key out of the ignition switch.	Check for voltage to ground: There should be about 5 V*.	• Faulty ignition switch • Short to ground

* Within 5 seconds of pulling the key out of the ignition switch, the system will go into sleep mode and the reference voltage drops from about 5 V to about 1 V.

6. Remove the gauge control module (see page 22-276).

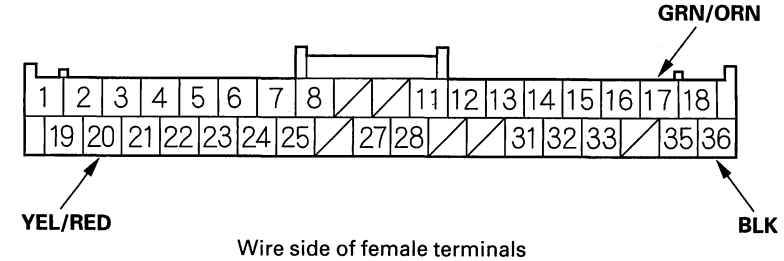
7. Disconnect the gauge control module 30P ('03-05 models) or 36P ('06 model) connector.

GAUGE CONTROL MODULE 30P CONNECTOR



Wire side of female terminals

GAUGE CONTROL MODULE 36P CONNECTOR



Wire side of female terminals

8. Inspect the connector and socket terminals to be sure they are all making good contact.

   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals are OK, go to step 9.

BACK

Protected by AR

9. With the connectors still disconnected, make these input tests at the connector.

   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If the input tests prove OK, go to step 10.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
16 20*3	YEL/RED	Engine OFF	Check for continuity to ground: There should be continuity.	• Faulty engine oil pressure switch • An open in the wire
		Engine running	Check for continuity to ground: There should be no continuity.	• Mechanical problem in the engine • Faulty engine oil pressure switch • An short to ground in the wire

* 3: '06 model

10. Reconnect the connector, and make these input tests at the connector.

    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If the input tests prove OK, go to step 11.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
13*1 17*2	GRN/ORN	Parking brake lever pulled	Check for voltage to ground: There should be less than 1 V.	• Faulty parking brake switch • An open in the wire
		Parking brake lever released	Check for voltage to ground: There should be about 5 V or more.	• Faulty parking brake switch • Short to ground
20 36*3	BLK	Under all conditions	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G501) • An open in the wire

* 1: '04-05 models parking brake reminder
* 2: '06 model parking brake reminder
* 3: '06 model

11. Run the gauge control module Self-diagnostic Function (see page 22-259).

    - If the beeper sounds and the seatbelt light flashes, go to step 12.
    - If the beeper does not sounds, or the seatbelt light does not flash, replace the gauge control module (see page 22-276).

12. Substitute a known-good under-dash fuse/relay box and recheck the system.

    - It the symptom is gone, the MICU is faulty; replace the under-dash fuse/relay box.
    - It the symptom is still present, the gauge control module is faulty; replace the gauge control module (see page 22-276).

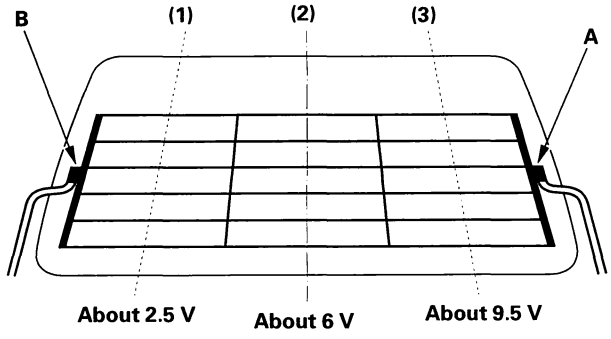
Function Test

Before troubleshooting the rear window circuit, perform multiplex integrated control system troubleshooting using B-CAN System Diagnosis Test Mode A (see page 22-91).

NOTE:
- Be careful not to scratch or damage the defogger wires with the tester probe.
- Before testing, check the No. 14 (40 A) fuse in the under-hood fuse/relay box and No. 30 (7.5 A) fuse in the under-dash fuse/relay box.

1. Check for voltage between the positive terminal (A) and body ground with the ignition switch and defogger switch ON.
   There should be battery voltage.

   - If there is no voltage, check for:
     - Faulty defogger relay.
     - Faulty window antenna coil.
     - Faulty climate control unit (audio-HVAC display module)
     - An open in the BLK/YEL wire to the positive terminal.
   - If there is voltage, go to step 2.



2. Disconnect the negative terminal (B) from the rear window defogger.

3. Check for continuity between the negative terminal and body ground.

   - If there is no continuity, check for an open in the BLK/YEL wire and ground.
   - If there is continuity, go to step 4.

4. Reconnect the negative terminal to the rear window defogger.

5. Turn the ignition switch ON (II) and the rear window defogger switch ON.

6. Touch the voltmeter positive probe to the points (1), (2), (3) on each defogger wire, and the negative probe to the negative terminal.

   - If the voltage is as specified, the defogger wire up to that point is OK.
   - If the voltage is not as specified, repair the defogger wire.
     - If it is more than specified at one of the points, there is a break in the negative half of the wire.
     - If it is less than specified at one of the points, there is a break in the negative half of the wire.

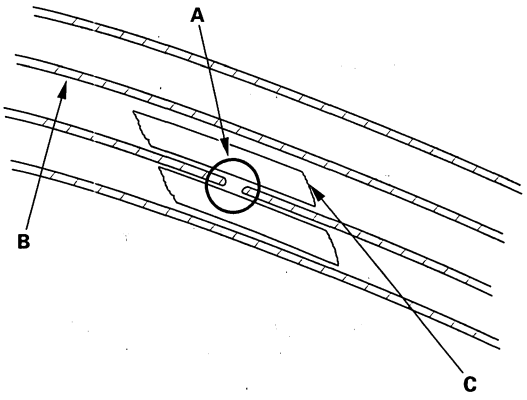
Protected by AR

Rear Window Defogger

Defogger Wire Repair

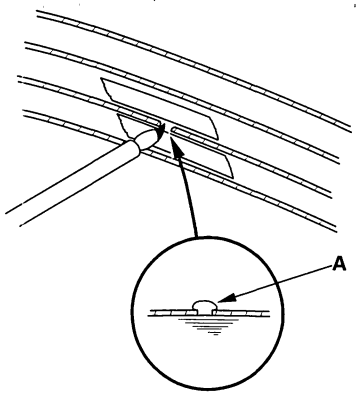
NOTE: To make an effective repair, the broken section must be no longer than one inch.

1. Lightly rub the area around the broken section (A) with fine steel wool, then clean it with alcohol.



2. Carefully mask above and below the broken portion of the defogger wire (B) with cellophane tape (C).

3. Using a small brush, apply a heavy coat of silver conductive paint (commercially available) extending about 1/8 " on both sides of the break. Allow 25 minutes to dry.



4. Perform the function test to confirm that the wire is repaired.

5. Apply a second coat of paint in the same way. Let it dry 3 hours before removing the tape.

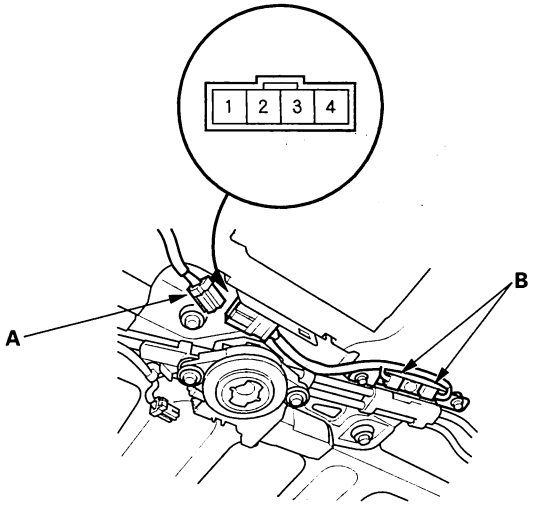
Limit Switch Test

4-door

1. Remove the headliner (see page 20-117).
2. Disconnect the 4P connector (A) from the moonroof limit switch (B).



3. Check for continuity between the terminals in each switch position according to the table.

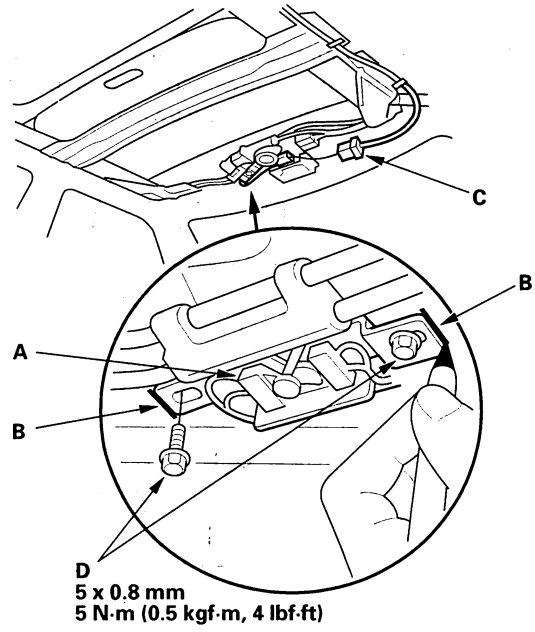
Position \ Terminal	1	2	3	4
TILT	○—○		○—○	
OPEN	○—		—○	
CLOSE	○—○			

4. If the continuity is not as specified, adjust the moonroof limit switch (see page 20-86).
   If the continuity is still not as specified, replace the moonroof limit switch.

Limit Switch Replacement

4-door

1. Remove the headliner (see page 20-117).
2. Mark the position of the moonroof limit switch (A) on the moonroof fame (B).



3. Disconnect the 4P connector (C) from the moonroof limit switch.
4. Remove the two mounting bolts (D).
5. Install the switch in the reverse order of removal.
6. Adjust the moonroof limit switch as needed (see page 20-86).

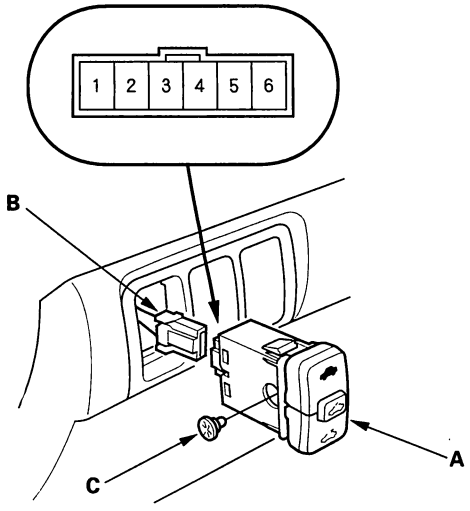
Protected by AR

Moonroof

Switch Test

NOTE: The moonroof can still be operated for about 10 minutes after the ignition switch is turned from the "II" to the "I" or "O" positions, as long as none of the doors are opened. This provides a convenience to parked occupants while offering a degree of security against unwanted or accidental moonroof operation.

1. Carefully push out the moonroof switch (A) from behind the dashboard lower cover, then disconnect the 6P connector (B) from the switch.



2. Check for continuity between the terminals in each switch position according to the table.

Terminal / Position	2		5	1	3	4	6
CLOSE		○		○	○		
TILT	○		○		○	○	
OPEN		○			○		○

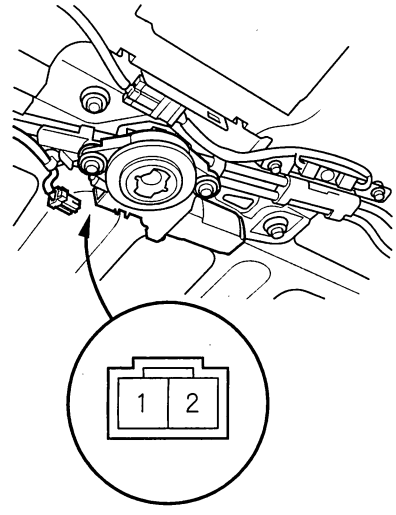
3. If the continuity is not as specified, replace the bulb (C) or the switch.

Motor Test

4-door

1. Remove the headliner (see page 20-117).

2. Disconnect the 2P connector from the moonroof motor.



3. Check the motor by connecting power and ground according to the table.

Terminal / Position	1	2
OPEN	⊕	⊖
CLOSE	⊖	⊕

4. If the motor does not run, replace it.

   NOTE: See closing force check (see page 20-87) for motor clutch test.

BACK

Protected by AR

Moonroof Calibration

2-door

NOTE: Moonroof calibration is required if any of the conditions listed below occur:

- The ignition switch is turned OFF while operating the moonroof (pressing the open/close switch). As a countermeasure, if the ignition switch is returned to the ON (II) position within 10 minutes, and moonroof operation is continued, calibration will not necessary.
  NOTE: If a door is opened during the 10 minutes period, the calibration will be required.
- The moonroof is manually operated using the moonroof wrench with the battery dead or disconnected.
- The moonroof motor is replaced with a new one.
- The moonroof motor is removed from the moonroof assembly and operated before it is reinstalled.

Moonroof glass is positioned in the OPEN position (or partially open)

1. Press the moonroof OPEN switch until the moonroof stops in its fully open position.
2. Release the moonroof OPEN switch.
3. Press the moonroof OPEN switch again for about 13 seconds.
   NOTE: Keep pressing the switch even through the moonroof motor continues to function.
4. Calibration is complete. The moonroof will automatically move to the regular preset fully open position and come to stop.

Moonroof glass is positioned in the TILT position

1. Press the moonroof OPEN switch until the moonroof glass stops in its fully open position.
2. Release the moonroof OPEN switch.
3. Press the moonroof OPEN switch for about 13 seconds.
   NOTE: Keep pressing the switch even through the moonroof glass will repeat an inching behavior (moving 40 mm, then stopping for 0.4 seconds)
4. Calibration is complete. The moonroof will automatically move to the regular preset fully open position and come to stop.

Moonroof motor is replaced

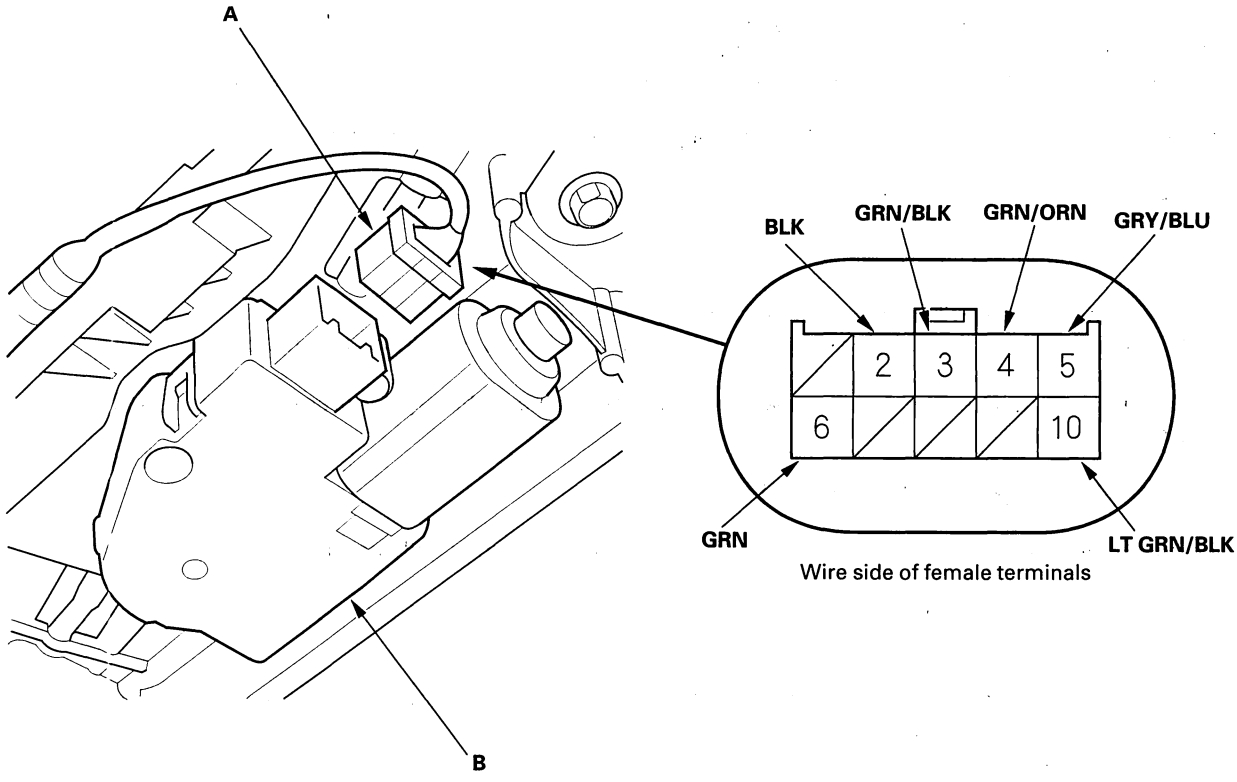
1. Open the moonroof to its fully open position manually with the moonroof wrench.
2. Remove the moonroof motor (see page 20-77).
   NOTE: If you have accidentally moved the moonroof glass after the removal of the moonroof motor, return the moonroof to its fully open position.
3. Install the new moonroof motor (see page 20-77).
4. Perform the moonroof OPEN position calibration procedure.
5. Within 5 seconds after completion of the moonroof calibration, press the moonroof OPEN switch again. After 3 seconds the moonroof glass will move toward the fully closed position.
6. Release the moonroof OPEN switch.
   NOTE: The moonroof glass will move toward the fully closed position even though the open switch is being pressed. Allow it to move until it reaches the fully closed position.
   NOTE: Step 5 is only applicable if a new motor is installed, and must not be applied to the original motor. The original motor memorized the initial position data and does not require recalibration.

Protected by AR

Moonroof Control Unit Input Test

2-door

1. Remove the headliner (see page 20-117).
2. Disconnect the 10P connector (A) from the moonroof control unit (B).



3. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 4.

BACK

Protected by AR

4. Reconnect the connector, and make these input tests at the connector.

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
6	GRN	Under all conditions	Check for voltage to ground: There should be battery voltage.	• Blown No. 28 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
2	BLK	Under all conditions	Check for voltage to ground: There should be less than 1 V.	• Poor ground (G501, G601) • An open in the wire

5. Disconnect the connector from the moonroof control unit, and make these input tests at the connector

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the inputs prove OK, the control unit must be faulty; replace it.

3	GRN/BLK	Under all conditions	Check for continuity between the No. 3 terminal and the multiplex integrated control unit P12 terminal: There should be continuity.	An open in the wire
4	GRN/ORN	Moonroof switch in TILT position	Check for continuity between the No. 3 and No. 4 terminals: There should be continuity.	• Faulty moonroof switch • An open in the wire
5	GRY/BLU	Moonroof switch in OPEN position	Check for continuity between the No. 3 and No. 5 terminals: There should be continuity.	• Faulty moonroof switch • An open in the wire
10	LT GRN/BLK	Moonroof switch in CLOSE position	Check for continuity between the No. 3 and No. 10 terminals: There should be continuity.	• Faulty moonroof switch • An open in the wire

Audio System

System Description

Overview

The audio unit acts as the "processor" for all audio functions. Selection of the audio functions can be done from the front panel, the audio remote (on steering wheel), or by using the navigation voice control system. The audio display provides the current front and rear audio status. For vehicles with the navigation option, additional audio information is available by touching the audio button. (See the owner's manual for more details.)

Each audio component passes its audio signal to the audio unit. In addition it communicates with the audio unit via the GA-Net bus. Any open connection in this circuit will cause audio and navigation functions to appear inoperative.

The 6CD changer output can be directed to the audio unit.

The XM can be output to the audio unit.

Self-diagnostic Function

Starting the self-diagnostic function (with Navigation)

1. Turn the ignition switch to ACC (I) or ON (II).
2. Turn the audio unit off.
3. While holding down the upper part of both the "CH/DISK" and "SEEK/SKIP" bars at the same time, press the VOL/PWR knob.
4. "DIAG" will appear on the audio-HVAC subdisplay/clock to indicate you have entered the self-diagnostic mode.

5. By pressing a button while "DIAG" is displayed, the input will trigger a mode that is assigned to that switch.

   AM/FM button
   Entire LCD lighting mode: Turns on the entire LCD to show the presence or absence of an LCD failure.
   CD/AUX or CD/SAT button
   Entire LCD light-out mode: Turns off the entire LCD to show the presence or absence of an LCD failure.
   SEEK SKIP bar (▶▶I)
   Display IS-BUS communication verification status: Displays the verification of the communication between the climate control unit and Navigation-display (toggles between "nVd" and "AC" every 5 seconds).
   SEEK SKIP bar (I◀◀)
   Display 12C-BUS communication verification status: Displays the verification of the communication among the display, the EEPROM, and the tuner (toggles between "DSP", "EEP" and "TnR" every 5 seconds).

6. The self-diagnostic function will end when the audio unit is turned off, or the ignition switch is turned off.

Error Codes

The audio system displays error codes when a problem is detected with the disc changer, the disc, the XM radio, or the anti-theft code.

Error Code Displayed	Possible Cause	Solution
DISC	Cannot read disc.	Eject the disc and try another one.
DISC ERROR	There is a porblem with the disc player. A common problem is disc labels coming off the disc in the player.	Try to eject the disc and try another one. If there is still a problem, replace the audio unit.
DISC FORMAT	A disc was inserted that has a format that is not recognized.	Eject the disc and try another one.
DISC-H	Disc player is hot. This can happen if the vehicle is parked out in the hot sun all day.	Park the vehicle in a cooler place for awhile and try the disc player again. If the error code is still present, try another disc. If the error code is still present, replace the audio unit.
LOADING	XM radio is acquiring audio or program information.	Wait until the radio has received the information.
XM OFF AIR	XM channel not in service.	Try another XM channel.
XM NO SIGNAL	Loss of signal.	Both terrestrial and satellite antennas have lost signal. Park the vehicle outside with a clear view of the southern horizon.
XM UPDATING	XM radio is receiving information update from the network.	This message will disappear once the update is done.
XM ANTENNA	XM antenna error.	Repair the open or short in the terrestrial or satellite antenna. Substitute the XM antenna and recheck. If the error is gone, replace the original XM antenna. If the error is still present, replace the antenna lead.
————	No signal from XM.	Check known-good vehicle with XM radio. If the known-good vehicle has the same symptoms, contact XM at (800) 852-9090.
ERR 1	Anti-theft code mismatch (1st try).	Enter the correct anti-theft code.
ERRE	Anti-theft code mismatch (10th try).	Remove fuse No. 5 (20 A) in the under-dash fuse/relay box, then reinsert it. You will have 10 more tries to enter the correct anti-theft code.

Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Poor radio reception or interference	Symptom Troubleshooting (see page 22-334)	• Antenna lead short or open in the wire • Window antenna open
Disc changer does not move between discs (with navigation)	Symptom Troubleshooting (see page 22-336)	
Radio preset memory is lost	Symptom Troubleshooting (see page 22-337)	• Battery condition • Battery cable condition
XM radio preset memory is lost ('04-06 models)	Symptom Troubleshooting (see page 22-338)	
Power will not turn OFF	Symptom Troubleshooting (see page 22-339)	
No sound is heard from speakers (display is normal)	Symptom Troubleshooting (see page 22-339)	
Poor or no sound with XM radio ('04-06 models)	Symptom Troubleshooting (see page 22-341)	
XM radio display is blank and no station information is displayed ('04-06 models)	Symptom Troubleshooting (see page 22-342)	
Audio disc does not play	Symptom Troubleshooting (see page 22-344)	
Audio disc skips	Symptom Troubleshooting (see page 22-344)	Tire pressure (over inflated)
Radio remote switch does not work properly	Symptom Troubleshooting (see page 22-345)	
Volume does not change (with navigation or single CD type)	Symptom Troubleshooting (see page 22-347)	
Volume does not change (6 CD type)	Symptom Troubleshooting (see page 22-348)	
Audio disc does not load	Symptom Troubleshooting (see page 22-349)	
Audio disc does not eject (with navigation or single CD type)	Symptom Troubleshooting (see page 22-350)	
Audio disc does not eject (6 CD type)	Symptom Troubleshooting (see page 22-351)	
Disc changer does not load all six discs	Symptom Troubleshooting (see page 22-352)	
Audio-HVAC display module switches do not work	Symptom Troubleshooting (see page 22-352)	
Disc LED does not turn ON or OFF	Symptom Troubleshooting (see page 22-353)	
Power switch will not turn ON (with navigation or single CD type)	Symptom Troubleshooting (see page 22-354)	
Power switch will not turn ON (6 CD type)	Symptom Troubleshooting (see page 22-356)	
Display is missing information (6 CD type)	Symptom Troubleshooting (see page 22-358)	
Audio-HVAC subdisplay/clock does not display (with navigation)	Symptom Troubleshooting (see page 22-359)	
Audio display and controls are dim, no back lighting (LCD segments can be read)	Symptom Troubleshooting (see page 22-360)	
No display appears on the screen (LCD segments cannot be read)	Symptom Troubleshooting (see page 22-360)	
Security indicator does not work properly	Symptom Troubleshooting (see page 22-361)

Symptom Troubleshooting

Poor radio reception or interference

NOTE: Check the radio reception in an open area. Poor reception/interference can be caused by the following:
- The radio station is far away.
- A tall building, a mountain, or high-voltage power line is nearby.

1. Check if each radio station can be received normally. Compare the radio reception/interference to another vehicle of the same model and trim level in the exact same conditions.

   Are they the same?

   YES—Operation is normal. ■

   NO—Go to step 2.

2. Check if the radio reception/interference is the same in several locations.

   Is the reception/interference the same?

   YES—Go to step 3.

   NO—Multipath interference or weak station. Operation is normal. ■

3. Check the reception/interference when the rear window defogger is on.

   Is the reception poor with the rear window defogger on?

   YES—Check for a break in the rear window defogger grid (see page 22-381), a poor connection, or a faulty antenna coil (see page 22-380). ■

   NO—Go to step 4.

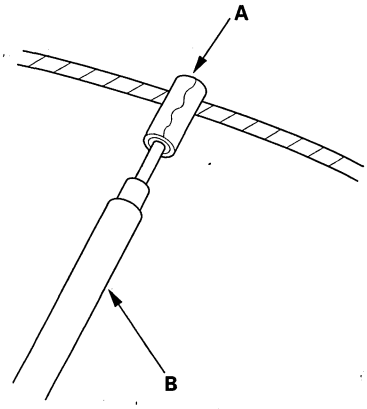
4. Check to see if the problem is interference while the engine is running.

   Is there noise (static or while) with the engine running?

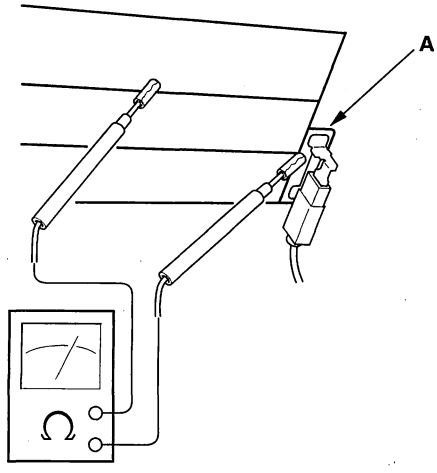
   YES—Check the antenna and radio grounds. If OK, check the charging system and the ignition system. ■

   NO—Go to step 5.

5. Wrap aluminum foil (A) around the tip of a tester probe (B) as shown.



6. Check for continuity by touching one tester probe to the window antenna terminal (A), and move the other tester probe along the antenna wires.



Is there continuity in all sections of the antenna?

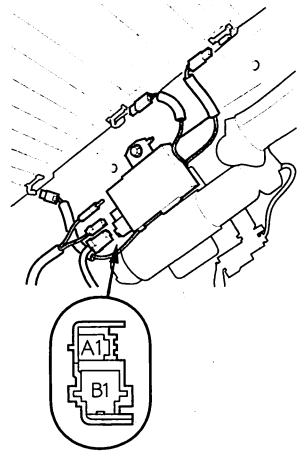
YES—Go to step 7.

NO—Repair the antenna wires (see page 22-381). ■

BACK

Protected by AR

7. Turn the radio ON, and measure the voltage between antenna amplifier connector A terminal 1 and body ground.



Is there 12 V?

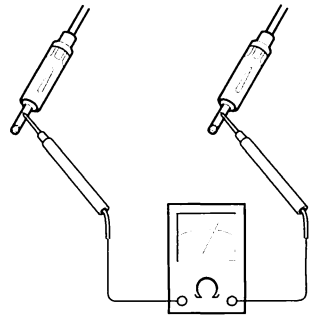
YES—Go to step 8.

NO—Go to step 13.

8. Remove the audio-HVAC display module, and disconnect the antenna lead.

9. Disconnect the antenna lead from the antenna amplifier.

10. Check for continuity between the antenna cable center pin at the audio unit lead and the antenna cable center pin at the antenna amplifier lead.

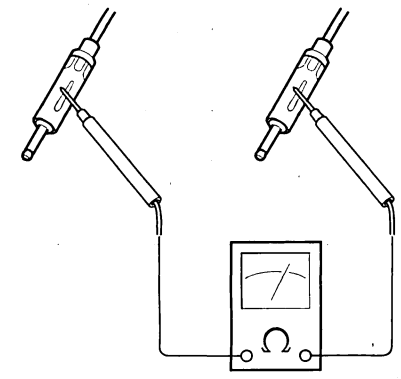


Is there continuity?

YES—Go to step 11.

NO—Replace the antenna cable. ■

11. Check for continuity between the shield surface of the audio unit lead and the antenna cable shield surface of the antenna amplifier lead.

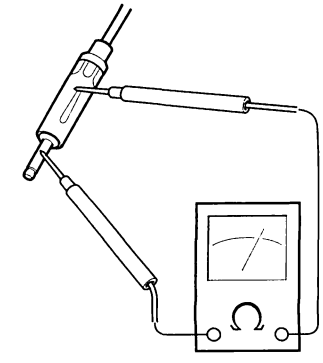


Is there continuity?

YES—Go to step 12.

NO—Replace the antenna cable. ■

12. Check for continuity between the antenna cable center pin and the surface of the antenna lead.



Is there continuity?

YES—Replace the antenna cable. ■

NO—Replace the antenna amplifier and recheck. If the reception is still poor, replace the audio unit. ■

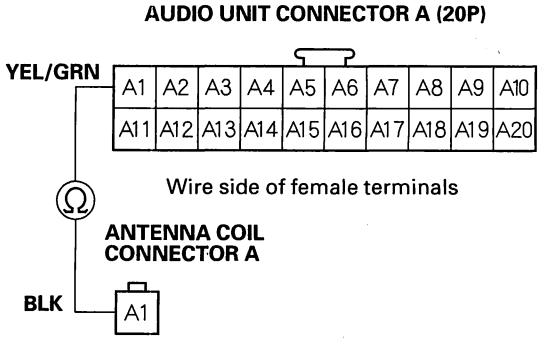
(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

13. Remove the audio-HVAC display module and disconnect the radio unit connector A (20P).

14. Check for continuity between audio unit connector A (20P) terminal No. 1 and antenna coil connector A terminal No. 1.



Is there continuity?

YES—Substitute a known-good audio-HVAC display module and retest. ■

NO—Repair the open in the wire between the audio unit and the antenna coil. ■

Disc changer does not move between discs (with navigation)

1. Insert the six CDs into the audio unit and see if the changer moves between CDs.

   Does the changer operate normally?

   YES—Intermittent failure, the CD changer is OK at this time. ■

   NO—Go to step 2.

2. Insert six different CDs into the audio unit.

   Does the changer operate normally?

   YES—At least one of the original CDs is faulty. ■

   NO—Replace the audio unit. ■

BACK

Protected by AR

Radio preset memory is lost

1. Set each of the radio station preset buttons.

   Do each of the preset buttons set properly?

   YES—Go to step 2.

   NO—Replace the audio-HVAC display module. ■

2. Turn the ignition switch OFF for 1 minute, then turn it back to ON (II).

3. Test all the preset buttons for proper recall operation.

   Do the preset buttons recall the set radio stations?

   YES—System is normal at this time. Check connections at the audio unit. ■

   NO—Go to step 4.

4. Inspect the under-dash fuse/relay box No. 5 (10 A) fuse.

   Is it OK?

   YES—Go to step 5.

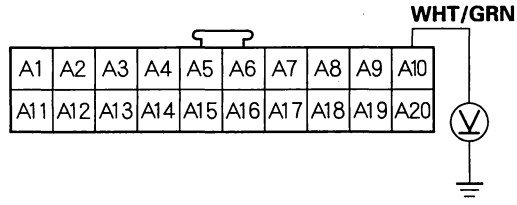
   NO—Replace the fuse and reset. If it fails again, repair the short to ground in the harness. ■

5. Remove the audio-HVAC display module (see page 22-371).

6. Turn the ignition switch ON (II).

7. Measure voltage between the audio unit connector A10 terminal and body ground.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

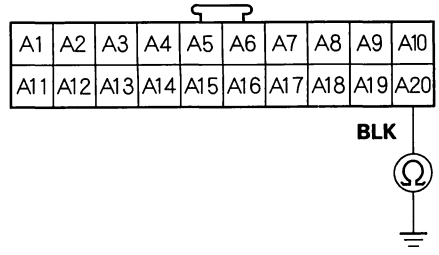
Is there battery voltage?

YES—Go to step 8.

NO—An open wire between the under-dash fuse/relay box and audio unit A10 terminal. ■

8. Check for continuity between the audio unit A20 terminal and body ground.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

Is there continuity?

YES—Replace the audio-HVAC display module. ■

NO—An open wire between the audio unit A20 terminal and body ground (G504). ■

Protected by AR

Symptom Troubleshooting (cont'd)

XM radio preset memory is lost ('04-06 models)

1. Set each of the XM radio channel preset buttons.

   Do each of the XM radio channel preset buttons set properly?

   YES—Go to step 2.

   NO—Replace the audio-HVAC display module (see page 22-371).■

2. Turn OFF the ignition switch for 1 minute, then turn it back to ON (II).

3. Test all of the XM radio channel preset buttons for proper recall operation.

   Do the preset buttons recall the set radio stations?

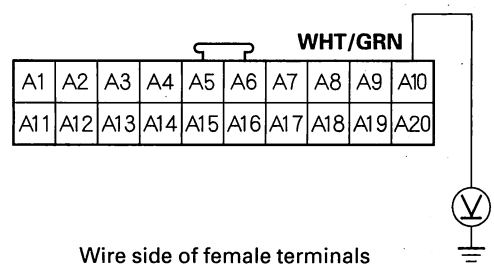
   YES—System is normal at this time. Check connections at the audio unit.■

   NO—Go to step 4.

4. Turn the ignition switch to LOCK (0).

5. Measure voltage between audio unit connector A (20P) No. 10 terminal and body ground.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

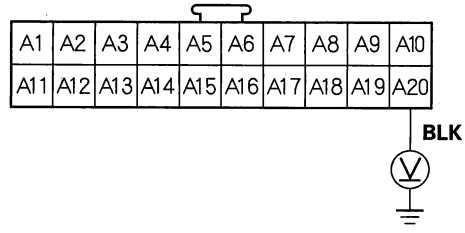
Is there battery voltage?

YES—Go to step 6.

NO—Repair an open in the wire between the driver's under-dash fuse/relay box and audio unit connector A (20P) No. 10 terminal.■

6. Check for voltage between audio unit connector A (20P) No. 20 terminal and body ground.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

Is there less than 0.1 V?

YES—Replace the audio unit.■

NO—Repair an open in the wire between audio unit connector A (20P) No. 20 terminal and body ground (G504).■

BACK

Protected by AR

Power will not turn OFF

1. With the ignition switch ON (II), push the power switch OFF, or turn the ignition switch OFF to see if the audio unit turns OFF.

   Is the audio unit OFF?

   YES—Operation is normal. ■

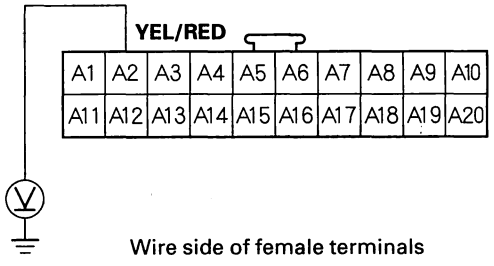
   NO—Go to step 2.

2. Turn the ignition switch OFF.

3. Remove the audio unit (see page 22-372). Disconnect the audio unit connector A (20P).

4. Measure the voltage between the No. 2 terminal of the audio unit connector A (20P) and body ground.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

Is there voltage?

YES—Check for short to power on YEL wire. ■

NO—Replace the audio unit. ■

No sound is heard from speakers (display is normal)

NOTE:
- Set the fader and balance positions to the center.
- Before performing symptom troubleshooting, check for power switch will not turn ON troubleshooting (see page 22-354).

1. Check that the volume button is not set to min level.

   Is it at MIN level?

   YES—Raise the volume level, and recheck the function. ■

   NO—
   - With navigation: Go to step 2.
   - Without navigation: Go to step 3.

2. Check the NAVIGATION MUTE MODE.

   Is the NAVIGATION MUTE MODE set?

   YES—Cancel the NAVIGATION MUTE MODE by pressing the voice command button, and recheck the function. ■

   NO—Go to step 3.

3. Check to see if there is a specific speaker that has no sound.

   Is there a specific one?

   YES—Go to step 4.

   NO—Go to step 9.

4. Turn the ignition switch OFF.

(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

5. Remove the speaker(s) with no sound (see page 22-378), and disconnect its connector.

6. Check the speaker with no sound for damage.

   Is there any damage?

   YES—Substitute the speaker and recheck. ■

   NO—Go to step 7.

7. Check the speaker 2P connector for a loose or poor connection.

   Reconnect the speaker 2P connector and recheck the symptom; does it still fail?

   YES—Go to step 8.

   NO—Operation is normal. ■

8. Measure the resistance between the No. 1 and No. 2 terminals of the speaker connector.

   Is there about 4 Ω ?

   YES—Go to step 9.

   NO—Faulty speaker(s). ■

9. Remove the audio unit (see page 22-372).

10. Disconnect the audio unit connector A (20P).

11. Check the resistance between the following terminals of audio unit connector A (20P).

Speaker	Terminal	Wire color
Driver's door speaker, Left tweeter	A8 (+)	GRN/BLK
	A18 (−)	LT GRN
Front passenger's door speaker, Right tweeter	A7 (+)	GRN/YEL
	A17 (−)	GRY
Left rear speaker	A6 (+)	BLU/WHT
	A16 (−)	BLU/BLK
Right rear speaker	A5 (+)	PNK
	A15 (−)	BLU/YEL

   Is there more than 4 Ω ?

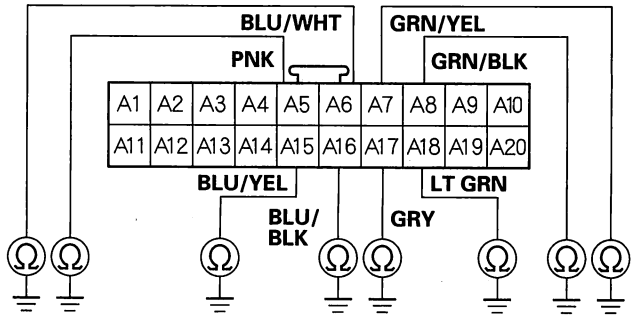
   YES—Go to step 12.

   NO—Repair an open in the wire between the audio unit and speaker. ■

12. Disconnect the speaker 2P connector.

13. Check for continuity between body ground and audio unit connector A (20P) terminals No. 5, 6, 7, 8, 15, 16, 17, and 18 individually.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

   Is there continuity?

   YES—Repair short to ground in the wire between the audio unit and speaker. ■

   NO—Substitute a known-good audio unit and recheck. If the symptom/indication goes away, replace the original audio unit. ■

BACK

Poor or no sound with XM radio ('04-06 models)

NOTE: Check the radio reception in an open area. Poor reception/interference can be caused by tall buildings, mountains, or high-voltage power lines are nearby.

1. Turn the ignition switch to ACC (I).
2. Turn on the audio unit and select XM radio.
3. Check for an error message on the display.

   Is there any message displayed?

   YES—Go to error code list (see page 22-332). ■

   NO—Go to step 4.

4. Disconnect audio unit connector B (14P).
5. Check for continuity between XM receiver connector A (14P) and body ground according to the table.

XM receiver connector	Wire color
A6	BLU
A14	WHT
A5	GRN
A13	RED
A9	BLU
A10	RED
A2	LT BLU

   Is there continuity?

   YES—Repair a short to ground in the wire between the audio unit and the XM receiver. ■

   NO—Go to step 6.

6. Check for continuity between XM receiver connector A (14P) and audio unit connector B (14P) according to the table.

XM receiver connector	Audio unit connector	Wire color
A6	B6	BLK, GRY
A14	B14	WHT, BRN/WHT
A5	B5	GRN, LT GRN
A13	B13	RED, BRN/YEL
A9	B9	BLU
A10	B10	RED, GRN
A11	B11	BLK
A2	B2	LT BLU

   Is there continuity?

   YES—Substitute a known-good XM receiver, then reconnect all connectors and recheck. If the symptom/indication goes away, replace the original XM receiver. If symptom/indication is still present, replace the audio unit. ■

   NO—Repair open in the wire between audio unit and XM receiver. ■

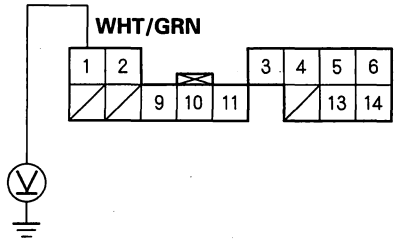
Protected by AR

Symptom Troubleshooting (cont'd)

XM radio display is blank and no station information is displayed ('04-06 models)

1. Turn the ignition switch to LOCK (0).
2. Disconnect XM receiver connector A (14P).
3. Turn the ignition switch to ACC (I).
4. Check the voltage between XM receiver connector A (14P) No. 1 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)



Wire side of female terminals

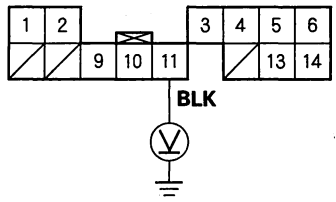
Is there battery voltage?

YES—Go to step 5.

NO—Repair an open in the wire between fuse No. 5 (10 A) under-dash fuse/relay box and XM receiver connector A (14P) No. 1 terminal.■

5. Check for voltage between XM receiver connector A (14P) No. 11 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)



Wire side of female terminals

Is there less than 0.1 V?

YES—Go to step 6.

NO—Repair an open in the wire between XM receiver connector A (14P) No. 11 terminal and audio unit connector B (14P) No. 11 terminal.■

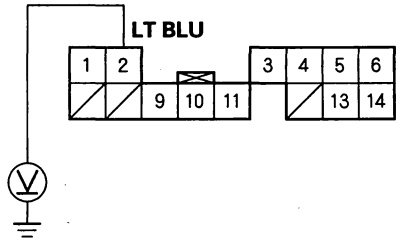
6. Turn the ignition switch to LOCK (0).

BACK

Protected by AR

7. Check the voltage between XM receiver connector A (14P) No. 2 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)



Wire side of female terminals

Is there 10 V or more present?

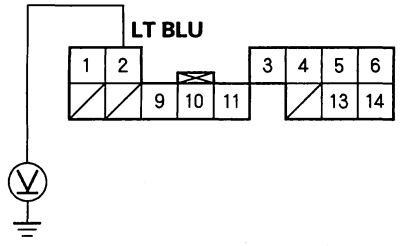
YES—Go to step 8.

NO—Substitute a known-good XM receiver and recheck. If 10 V or more are present, replace the original XM receiver. ■

8. Turn the ignition switch ON (II).

9. Check the voltage between XM receiver connector A (14P) No. 2 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)



Wire side of female terminals

Is there less than 0.1 V?

YES—Substitute a known-good XM receiver, then reconnect all connectors and recheck. If the symptom/indication goes away, replace the original XM receiver. If symptom/indication is still present, replace the audio unit. ■

NO—Substitute a known-good audio unit and recheck. If 0.5 V or less are present, replace the original audio unit. ■

Protected by AR

Symptom Troubleshooting (cont'd)

Special Tools Required
Diagnostics CD 07AAZ-SDBA100

Audio disc does not play

1. Try loading a disc.

   Does the disc load?

   YES—Go to step 2.

   NO—Go to disc does not load (see page 22-349). ■

2. Insert another disc to see if the symptom can be duplicated.

   Does the disc play?

   YES—Operation is normal. ■

   NO—Go to step 3.

3. Insert audio diagnostic CD (T/N 07AAZ-SDBA100) in the audio unit.

   Does the disc play?

   YES—The original disc is faulty or has an unreadable format. ■

   NO—Replace the audio unit (see page 22-372). ■

Special Tools Required
Diagnostics CD 07AAZ-SDBA100

Audio disc skips

1. Confirm the vehicles tires are properly inflated.

2. Check customer's CD for scratches, fingerprints, and marks.

   NOTE: The following test should be performed with the audio unit bass and treble set to customer's listening preference. When comparing to known-good vehicles, comparison should be performed on same model and trim level.

3. Test-drive to identify when customer's CD skipping occurs. The audio diagnostic CD (T/N: 07AAZ-SDBA100) can be used if customer's CD is not available. Use tracks 10—12.

   Does the skipping occur?

   YES—Go to step 4.

   NO—Operation is normal. ■

4. Compare the customer's CD that is skipping to a known-good vehicle under the same conditions.

   Does the CD skip in the known-good vehicle under the same conditions?

   YES—Operation is normal. ■

   NO—Go to step 5.

BACK

Protected by AR

5. With the vehicle parked and the engine running, insert the diagnostic skip test CD (07AAZ-SDBA300). Play tracks 2—11 and note the track number(s) the CD starts skipping. Do the same test on a known-good vehicle.

   Does the CD skip on same track(s) number as the known-good vehicle?

   YES—Operation is normal. ■

   NO—Go to step 6.

6. Insert the diagnostic skip test CD (07AAZ-SDBA200) play tracks 7—11 and tracks 13—15 and note the track number(s) the CD starts skipping. Perform the same test on a known-good vehicle.

   Does the CD skip on same track(s) number as known-good vehicle?

   YES—Operation is normal. ■

   NO—Replace the audio unit (see page 22-372). ■

Radio remote switch does not work properly

1. Test the radio remote switch (see page 22-379).

   Is the radio remote switch OK?

   YES—Intermittent failure, the radio remote switch and audio unit is OK at this time. ■

   NO—Go to step 2.

2. Check the audio unit operation (volume up, volume down, CH (—), CH (+), MODE).

   Is the audio unit operation OK?

   YES—Go to step 3.

   NO—Replace the audio unit (see page 22-372), and recheck. ■

3. Remove the audio-HVAC display module (see page 22-371).

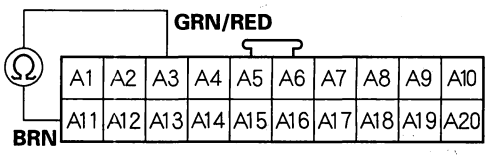
(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

4. Measure resistance between the No. 3 and No. 11 terminals of the audio unit connector (20P). The resistance shoald be as shown in the table.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

RADIO REMOTE SWITCH TABLE

Button held down	VOL DOWN	VOL UP	CH (−)	CH (+)	MODE	(NONE)
Resistance	about 100 Ω	about 370 Ω	about 840 Ω	about 2 kΩ	about 4 kΩ	10 kΩ

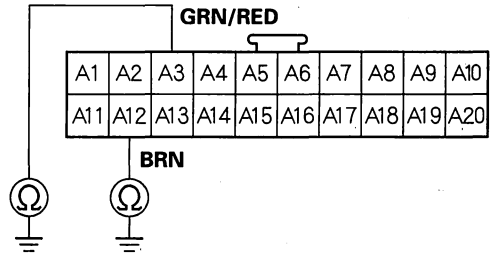
Is resistance OK?

YES—Go to step 5.

NO—Repair open or high resistance in the circuit between the audio unit and the radio remote switch. If the wires are OK, replace the cable reel (see page 23-210).■

5. Check for continuity between the No. 3 terminal of the audio unit connector A (20P) and body ground, and between the No. 11 terminal and body ground. There should be no continuity.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

Is there continuity?

YES—Repair the short to body ground in the circuit between the audio unit and the radio remote switch. If the wires are OK, replace the cable reel (see page 23-210).■

NO—Replace the audio unit (see page 22-372).■

BACK

Protected by AR

Special Tools Required
- Radio test harness breakout box 07AAZ-SDAA100
- Test harness A&B (Alpine) 070AZ-SDAA100

Volume does not change (with navigation or single CD type)

1. Set the fader and balance position to the center.
2. Operate the volume knob to see if the volume changes accordingly.

   Does it change?

   YES—Operation is normal.■

   NO—Go to step 3.
3. Operate the volume knob to see if the LCD display changes accordingly.

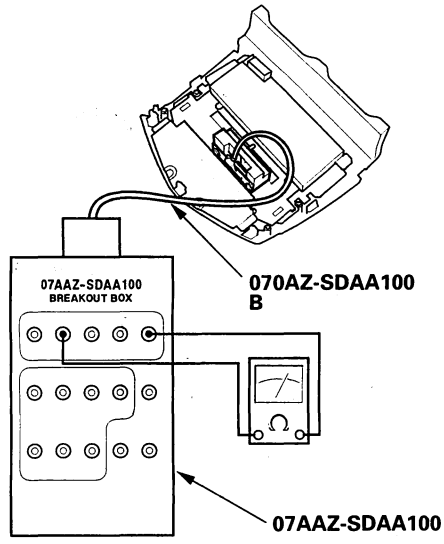
   Does it change?

   YES—Replace the audio unit.■

   NO—Go to step 4.
4. Remove the audio unit (see page 22-372).
5. Connect test harness (070AZ-SDAA100) test harness A (with navigation), or test harness B (with single CD player) to radio test harness breakout box (07AAZ-SDAA100).
6. Connect the special tool (070AZ-SDAA100) PTN-1 (A) (with navigation) or PTN-4 (B) (with single CD type) connector to the printed circuit board connector.

   With navigation:

   With single CD type:



7. Connect the ohm meter to the special tool (070AZ-SDAA100) GND terminal and VOL+ terminal.
8. Turn the volume knob clockwise one click at a time. The resistance should change as follows with each turn of the knob:
   1.0 Ω → infinity → 1.0 Ω → infinity → 1.0 Ω

   Does the resistance change as indicated?

   YES—Go to step 9.

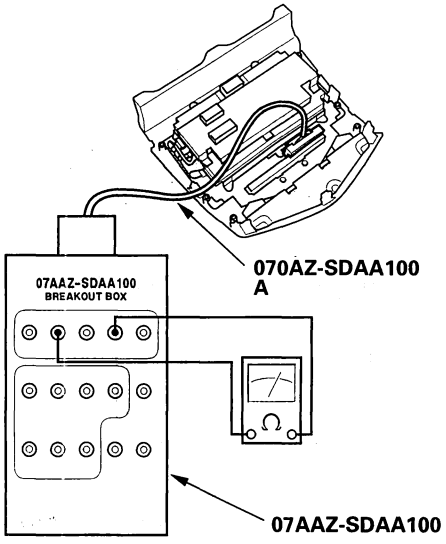
   NO—Replace the audio-HVAC display panel.■
9. Connect the ohm meter to the special tool (070AZ-SDAA100 adapter) GND terminal and VOL— terminal.

(cont'd)

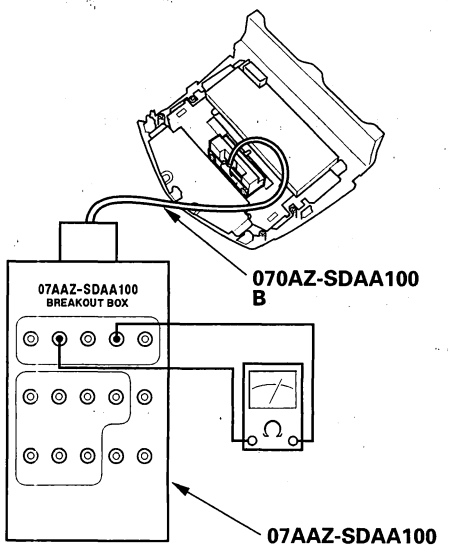
Protected by AR

Symptom Troubleshooting (cont'd)

With navigation:



With single CD type:



10. Turn the volume knob clockwise one click at a time. The resistance should change as follows with each turn of the knob:
1.0 kΩ → infinity → 1.0 kΩ → infinity → 1.0 kΩ

Does the resistance change as indicated?

YES—Replace the audio unit.■

NO—Replace the audio-HVAC display panel.■

Special Tools Required
- Radio test harness breakout box 07AAZ-SDAA100
- Test harness (Stanley) 070AZ-SDAA200

Volume does not change (6 CD type)

1. Set the fader and balance position to the center.
2. Operate the volume knob to see if the volume changes accordingly.

   Does it change?

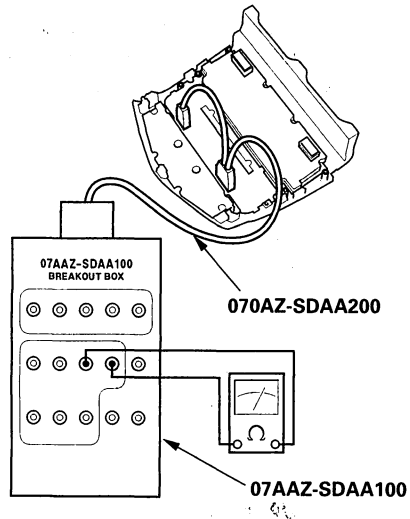
   YES—Operation is normal.■

   NO—Go to step 3.
3. Operate the volume knob to see if the LCD display changes accordingly.

   Does it change?

   YES—Replace the audio unit.■

   NO—Go to step 4.
4. Remove the audio unit (see page 22-372).
5. Connect test harness (070AZ-SDAA200) to the radio test harness breakout box (07AAZ-SDAA100).
6. Connect the special tool (070AZ-SDAA200) connectors to the printed circuit board connector.



7. Connect the ohm meter to the special tool (070AZ-SDAA200 adapter) GND terminal and VOL-A terminal.

BACK

Protected by AR

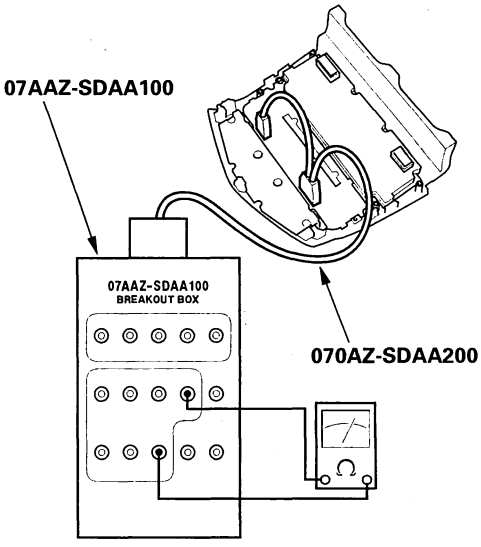
8. Turn the volume knob clockwise one click at a time. The resistance should change as follows with each turn of the knob:
0 kΩ → infinity → 0 kΩ → infinity → 0 kΩ

Does the resistance change as indicated?

YES—Go to step 9.

NO—Replace the audio-HVAC display panel. ■

9. Connect the ohm meter to the special tool (070AZ-SDAA200 adapter) GND terminal and VOL-B terminal.



10. Turn the volume knob clockwise one click at a time. The resistance should change as follows with each turn of the knob:
0 kΩ → infinity → 0 kΩ → infinity → 0 kΩ

Does the resistance change as indicated?

YES—Replace the audio unit. ■

NO—Replace the audio-HVAC display panel. ■

Audio disc does not load

1. Insert a CD to see if the symptom can be duplicated.

Does the CD load?

YES—Operation is normal. If the audio disc loads normally, but will not play, go to audio disc does not play (see page 22-344). ■

NO—Go to step 2.

2. Insert another CD.

Does the CD load?

YES—The original CD is faulty. ■

NO—Replace audio unit. ■

Protected by AR

Symptom Troubleshooting (cont'd)

Special Tools Required
- Radio test harness breakout box 07AAZ-SDAA100
- Test harness A&B (Alpine) 070AZ-SDAA100

Audio disc does not eject (with navigation or single CD type)

NOTE: Inspect the quality of the CDs, and make sure there are no adhesive labels applied to them.

1. Check to see if the CD disc is ejected correctly by pushing the EJECT button.

   Is it normal?

   YES—Operation is normal. ■

   NO—Go to step 2.

2. Check to see if it is ejected with some binding or not ejected at all.

   Is it ejected with some binding?

   YES—Go to step 3.

   NO—Go to step 4.

3. Replace the disc and recheck.

   Does the problem continue?

   YES—Faulty audio unit. ■

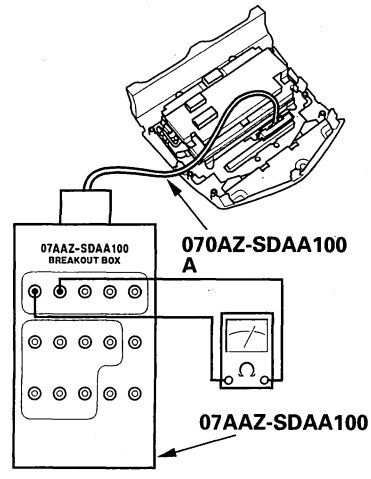
   NO—Faulty disc. ■

4. Remove the audio unit (see page 22-372).

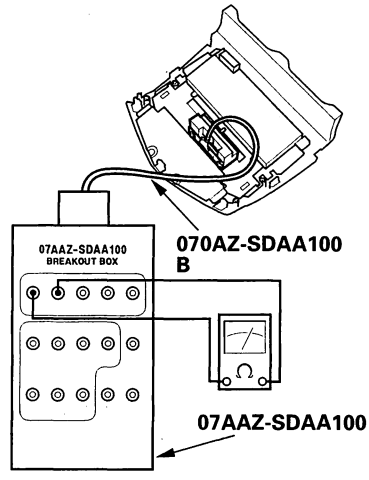
5. Connect test harness (070AZ-SDAA100) test harness A (with navigation), or test harness B (single CD type) to the radio test harness breakout box (07AAZ-SDAA100).

6. Connect the special tool connector to the printed circuit board connector.

With navigation:



With single CD type:



7. Connect the ohm meter to the special tool (070AZ-SDAA100 adapter) EJECT and GND terminals.

8. Press the EJECT button and check for continuity between the EJECT and GND terminals.

   Is there continuity?

   YES—Replace the audio unit. ■

   NO—Replace the audio-HVAC display panel. ■

BACK

Protected by AR

Special Tools Required
- Radio test harness breakout box 07AAZ-SDAA100
- Test harness (Stanley) 070AZ-SDAA200

Audio disc does not eject (6 CD type)

NOTE: Inspect the quality of the CDs, and make sure there are no adhesive labels applied to them.

1. Check to see if the CD disc is ejected correctly by pushing the EJECT button.

   Is it normal?

   YES—Operation is normal. ■

   NO—Go to step 2.

2. Check to see if it is ejected with some binding or not ejected at all.

   Is it ejected with some binding?

   YES—Go to step 3.

   NO—Go to step 4.

3. Replace the disc and recheck.

   Does the problem continue?

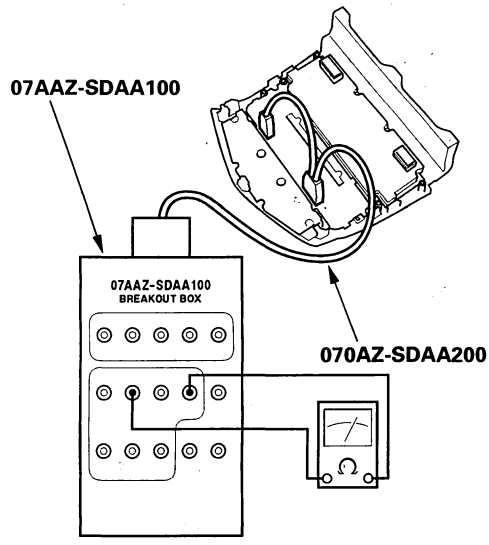
   YES—Replace audio unit. ■

   NO—Faulty CD disc. ■

4. Remove the audio unit (see page 22-372).

5. Connect test harness (070AZ-SDAA200) to the radio test harness breakout box (07AAZ-SDAA100).

6. Connect the special tool connectors to the printed circuit board connector.



7. Connect the ohm meter to the special tool (070AZ-SDAA200 adapter) EJECT and GND terminals.

8. Push the EJECT button and check for continuity between the EJECT and GND terminals.

   Is there continuity?

   YES—Go to step 9.

   NO—Replace the audio-HVAC display panel. ■

9. Check the audio-HVAC display panel and audio unit for assembling integrity.

   Are they assembled correctly?

   YES—Replace the audio unit. ■

   NO—Reinstall the audio-HVAC display panel onto the audio unit, and check the problem. ■

Protected by AR

Symptom Troubleshooting (cont'd)

Disc changer does not load all six discs

NOTE: Inspect the quality of the discs, and make sure there are no adhesive labels applied to them.

1. Load six discs into the audio unit.

   Does the audio unit accept all six discs?

   YES—Intermittent failure, the audio unit is OK at this time. ■

   NO—Go to step 2.

2. Try to load the discs again.

   Does the audio unit accept all six discs?

   YES—At least one of the original CDs is faulty. ■

   NO—Replace the audio unit. ■

Audio-HVAC display module switches do not work

NOTE: In order to troubleshoot the main power switch, go to "Power switch will not turn on" (see page 22-354).

1. Refer to the following switch list, and find the appropriate switch for each button. Then perform the following exercise to identify the switch that does not work by operating various buttons which only belong to that switch.

   Switch List:
   Switch A: AM/FM, CD/AUX, SCAN, SEEK/SKIP, UP/DOWN, CH/DISC UP DOWN, LOAD, EJECT
   Switch B: INFO, MAP, MENU, JOY, CANCEL, SET UP, ZOOM UP/DOWN
   Switch C: TUNE Push MODE
   Switch D: TEMPERATURE CONTROL, AUTO, OFF, DEF, RECIRCULATION, REAR DEF, DUAL
   Switch E: AUDIO
   Switch F: A/C

2. Check to see if the buttons that do not function all belong to switch A.

   Are they all switch A's?

   YES—Faulty audio-HVAC display panel and audio unit. Replace the audio-HVAC display module. ■

   NO—Go to step 3.

3. Check to see if the buttons that do not function all belong to switch B.

   Are they all switch B's?

   YES—Faulty audio-HVAC display panel and audio unit. Replace the audio-HVAC display module. ■

   NO—Go to step 4.

BACK

Protected by AR

4. Check to see if the buttons that do not function all belong to switch C.

   Are they all switch C's?

   YES—Faulty audio-HVAC display panel and audio unit. Replace the audio-HVAC display module. ■

   NO—Go to step 5.

5. Check to see if the buttons that do not function all belong to switch D.

   Are they all switch D's?

   YES—Replace the audio-HVAC display panel. ■

   NO—Go to step 6.

6. Check to see if the buttons that do not function all belong to switch E.

   Are they all switch E's?

   YES—Faulty audio-HVAC display panel, audio unit and navigation display. Replace the audio-HVAC display module. ■

   NO—Go to step 7.

7. Check to see if the button that do not function all belong to switch F.

   Are they all switch F's?

   YES—Faulty audio-HVAC display panel, climate control unit and navigation display. Replace the audio-HVAC display module. ■

   NO—Replace the audio-HVAC display panel. ■

Disc LED does not turn ON or OFF

1. Identify whether the LED that does not turn on or off is the green or red one; they indicated the status.

   - Green indicator: Loading on ready.
   - Red indicator: Loading on wait.

   Is LED indicated?

   YES—Operation is normal. ■

   NO—Replace the audio unit. ■

Protected by AR

Special Tools Required
- Radio test harness breakout box 07AAZ-SDAA100
- Test harness A&B (Alpine) 070AZ-SDAA100

Power switch will not turn ON (with navigation or single CD type)

1. With the ignition switch ON (II), push the power switch ON to see if the audio unit turns ON.

   Does the power turn on?

   YES—Operation is normal. ■

   NO—Go to step 2.

2. Turn the ignition switch OFF, then check the No. 5 (10 A) and No. 32 (7.5 A) fuses in the under-dash fuse/relay box.

   Are the fuses OK?

   YES—Go to step 3.

   NO—Replace the fuse(s) and recheck. ■

3. Remove the audio-HVAC display module (see page 22-371). Check that audio unit connector A (20P) is properly connected.

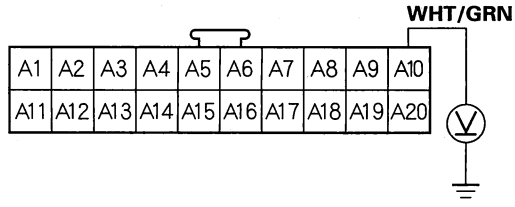
   Is it connected properly?

   YES—Go to step 4.

   NO—Reconnect the connector, and recheck the function. ■

4. Measure voltage between audio unit connector A10 terminal and body ground.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

Is there battery voltage?

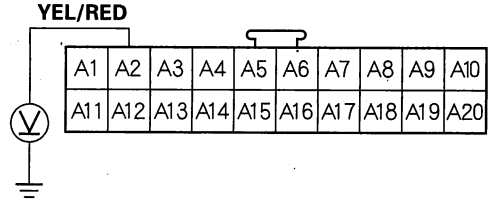
YES—Go to step 5.

NO—Repair the open circuit or poor connection in wire between the under-dash fuse/relay box No. 5 (10 A) fuse and audio unit connector A terminal No. 10. ■

5. Turn the ignition switch ON (II).

6. Measure the voltage between the audio unit connector A terminal No. 2 and body ground.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

Is there battery voltage?

YES—Go to step 7.

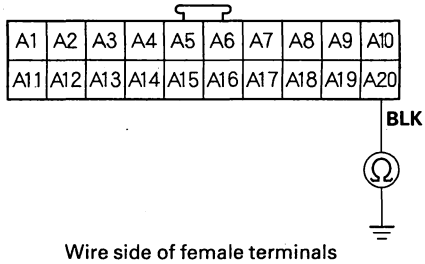
NO—Repair the open circuit or poor connection in the wire between the under-dash fuse/relay box No. 32 (7.5 A) fuse and audio unit connector A terminal No. 2. ■

BACK

Protected by AR

7. Turn the ignition switch OFF, then check for continuity between audio unit connector A terminal No. 20 and body ground.

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

Is there continuity?

YES—Go to step 8.

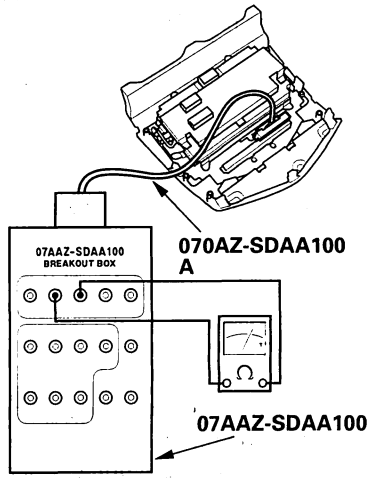
NO—Repair the open wire between audio unit connector A20 and body ground (G504). ■

8. Remove the audio unit (see page 22-372).

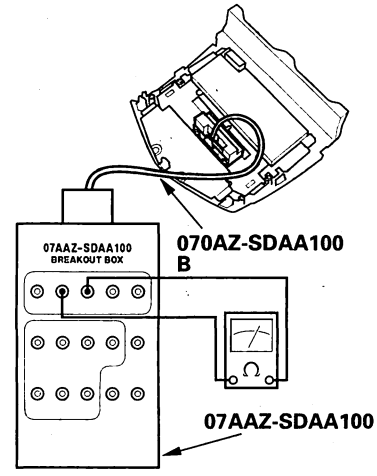
9. Connect test harness (070AZ-SDAA100) test harness A (with navigation), or test harness B (single CD type) to the radio test harness breakout box (07AAZ-SDAA100).

10. Connect the special tool connector to the printed circuit board connector.

With navigation:



With single CD player:



11. Connect the ohm meter to the special tool (070AZ-SDAA100 adapter) POWER and GND terminals.

12. Push the POWER button and check for continuity between the POWER and GND terminals.

Is there continuity?

YES—Replace the audio unit. ■

NO—Replace the audio-HVAC display panel. ■

Protected by AR

Symptom Troubleshooting (cont'd)

- Radio test harness breakout box 07AAZ-SDAA100
- Test harness (Stanley) 070AZ-SDAA200

Display is missing information (6 CD type)

NOTE:
- A part of the A/C does not display.
- There is display of A/C information.
- Wrong indication in LCD.

1. Repeat turning the ignition switch ON (II) and OFF to see if the problem appears.

   Does the problem appear?

   YES—Go to step 2.

   NO—Operation is normal. ■

2. Remove the audio-HVAC display module (see page 22-371), and check for the proper connection of the connectors.

   Is it connected properly?

   YES—Go to step 3.

   NO—Reconnect the connectors, and recheck the problem. ■

3. Check all A/C information of LCD display.

   Do all the indicators work?

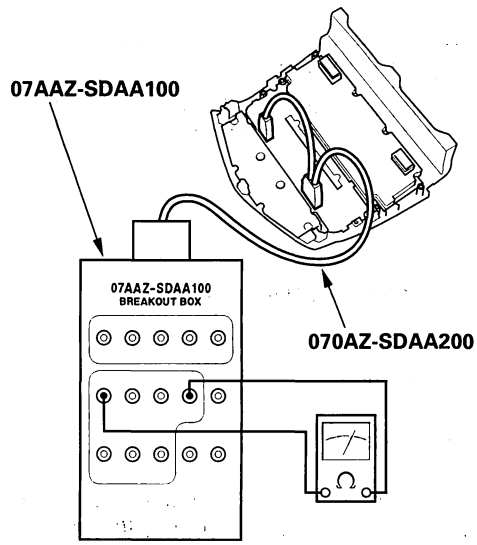
   YES—Go to step 4.

   NO—Replace the audio-HVAC display module. ■

4. Remove the audio unit (see page 22-372).

5. Connect test harness (070AZ-SDAA200) to the radio test harness breakout box (07AAZ-SDAA100).

6. Connect the special tool connectors to the printed circuit board connector.



7. Connect the ohm meter to the special tool (070AZ-SDAA200 adapter) AUTO/MANU and GND terminals.

   Is there continuity?

   YES—Faulty audio-HVAC display panel. ■

   NO—Operation is normal. ■

Audio-HVAC subdisplay/clock does not display (with navigation)

1. Check the connections at the audio-HVAC subdisplay/clock 10P connector and the audio unit connector C (10P).

   Are the connectors and terminals connected properly?

   YES—Go to step 2.

   NO—Repair the connection and recheck. ■

2. Check for continuity between the audio-HVAC subdisplay/clock 10P connector and the audio unit connector C (10P) terminals for each wire listed in the chart.

Wire	Audio-HVAC subdisplay/ clock 10P connector terminal	Audio unit connector C (10P) terminal
BLU/ORN	2	2
YEL/RED	4	4
YEL	5	5
BLU/RED	6	6
BLU	7	7
GRY	8	8
BLK	1	1
RED	9	9
GRN	10	10
BLK	3	(body ground)

   Is there continuity?

   YES—Go to step 3.

   NO—Repair the open in the wire between the audio unit and the audio-HVAC subdisplay/clock. ■

3. Check for continuity between each audio-HVAC subdisplay/clock 10P connector terminal and body ground.

Wire	Clock 10P connector terminal
BLU/ORN	2
YEL/RED	4
YEL	5
BLU/RED	6
BLU	7
GRY	8
BLK	1
RED	9
GRN	10

   Is there continuity?

   YES—Repair the short to ground in the wire between the audio unit and the audio-HVAC subdisplay/clock. ■

   NO—Go to step 4.

4. Substitute a known-good audio-HVAC subdisplay/ clock and recheck.

   Does the subdisplay work properly?

   YES—Replace the original audio-HVAC subdisplay/ clock. ■

   NO—Substitute a known-good audio-HVAC display panel and retest. If the problem is gone, replace the original audio unit. ■

Protected by AR

Symptom Troubleshooting (cont'd)

Audio display and controls are dim, no back lighting (LCD segments can be read)

1. Repeat turning the ignition switch ON (II) and OFF to see if the back lighting returns.

   Does the back lighting return?

   YES—Operation is normal at this time. ■

   NO—Go to step 2.

2. Shine a flashlight against the audio unit display.

   Can the audio unit display information be seen?

   YES—Replace the audio unit (see page 22-372).

   NO—Go to no display appears on the screen (LCD segments can not be read) (see page 22-360).

No display appears on the screen (LCD segments cannot be read)

1. Repeat turning the ignition switch ON (II) and OFF to see if the problem appears.

   Does the problem appear?

   YES—Go to step 2.

   NO—Operation is normal. ■

2. Remove the audio-HVAC display module (see page 22-371), and check for the proper connection of the audio unit connector A (20P).

   Is it connected properly?

   YES—Go to step 3.

   NO—Reconnect the connector, and recheck the problem. ■

3. Check that the audio unit switches correctly respond to your operation.

   Do they function correctly?

   YES—Faulty audio unit. ■

   NO—Faulty front printed circuit board and audio printed circuit board. ■

BACK

Protected by AR

Security indicator does not work properly

1. Check if the operation of the security indicator when turning the ignition switch OFF.

   Does the security indicator flash?

   YES—Operation is normal. ■

   NO—Go to step 2.

2. Check the operation of the radio station preset buttons.

   Do the preset buttons set and keep their memory?

   YES—Replace the audio unit. ■

   NO—Go to radio preset memory is lost (see page 22-337). ■

Sound Quality Diagnosis

Special Tools Required
Diagnostics CD 07AAZ-SDBA100

Use the following tests to check sound quality.

NOTE: Before beginning the following tests, write down the client's bass, treble, fader and balance settings, then set them to their center positions for the testing.

Left/Right Channel ID

Do this test to confirm proper channel routing.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA 100) into the audio unit.
2. Play track No. 1 (left, both, right channel ID) at a normal, or slightly higher than normal, volume level.
3. The voice should be audible only from the channel or channels when indicated.
   - If the channel ID is correct for each side, go to phase test (see page 22-362).
   - If the channel ID is not correct, check for
     - Shorted speaker wire
     - Faulty audio unit

Special Tools Required
Diagnostics CD 07AAZ-SDBA100

Phase Test

Do this test to confirm proper speaker phasing.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA 100) into the audio unit.
2. Play track No. 2 (phase) at a normal, or slightly higher than normal, volume level.
3. The voice should sound centered and focused when it is in-phase.
4. The voice should sound diffused, and have "less bass" when it is out of phase.
   - If the voice changes from in-phase to out of phase as indicated by the prompt, the phasing is correct. Go to electrical noise test (see page 22-363).
   - If the voice always sounds out of phase, phasing is not correct. Check for
     - Crossed speaker wires
     - Faulty audio unit

BACK

Protected by AR

Special Tools Required
Diagnostics CD 07AAZ-SDBA100

Electrical Noise Test

Do this test to check for electrical noise being induced into the audio system.

NOTE: Electrical noise may be caused by outside sources that cannot be filtered by the audio system. Make sure you remove cell phones and/or turn off any aftermarket devices before beginning this test.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA 100) into the audio unit.
2. Play track No. 4 (digital zero) at a normal, or slightly higher than normal, volume level.
3. Operate any electrical device that may causes noise from the audio system, including starting the engine.
4. Play track No. 5 (near digital zero) at a normal, or slightly higher than normal, volume level.
5. Operate any electrical device that may causes noise from the audio system, including starting the engine.
6. Play track No. 6 (SNR) at a normal, or slightly higher than normal, volume level.
7. Operate any electrical device that causes noise from the audio system, including starting the engine.

   - If no abnormal noise is heard, go to the individual speaker test (see page 22-364).
   - If the noise is present only during the SNR track, replace the audio unit.
   - If the noise is heard during the digital zero or near digital zero track, check for
     - Poor ground at the audio unit, engine, or battery cable
     - Pinched or shorted speaker wire
     - Faulty audio unit
     - Other faulty components causing excessive electrical noise (ignition coils, alternator, door lock actuators, etc.). Disconnect any suspect components, and then replay the tracks that were originally noisy. If the noise is gone, check the component's circuit and the component.

Protected by AR

Sound Quality Diagnosis (cont'd)

Special Tools Required
Diagnostics CD 07AAZ-SDBA100

Individual Speaker Test

Do this test to identify a faulty speaker.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA 100) into the audio unit.
2. Play track No. 30 (steady 300 Hz tone) at a normal, or slightly higher than normal, volume level.
3. Listen to each speaker for poor sound, and compare it to the other speakers. Use the audio unit's fader and balance settings to help isolate the channel with the problem.
   - If the sound quality produced by a specific speaker is poor, substitute it with a known-good speaker. If the poor sound quality continues, go to the sound balance test (see page 22-364).
   - If the sound quality is OK, go to the sound balance test (see page 22-364).

Special Tools Required
Diagnostics CD 07AAZ-SDBA100

Sound Balance Test

Perform this test to identify a faulty channel or speaker.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA 100) into the audio unit.
2. Confirm the bass and treble are set to the center positions.
3. Play track No. 3 (pink noise) at a normal, or slightly higher than normal, volume level.
4. A "static" type sound should be heard through all speakers.
5. Insert the audio diagnostic CD (T/N 07AAZ-SDBA 100) into the audio unit of a known-good vehicle.
6. Set the bass and treble to the center positions.
7. Play track No. 3 (pink noise) all the same level as was played in step 3.
8. Compare the sounds made by the two vehicles.
   - If the sounds made by the two vehicles are very similar, go to the Frequency Sweep Test (see page 22-365).
   - If the sound does not have as much bass, go to the phase test (see page 22-362).
   - If the sound does not have enough "hiss," check the tweeters and their circuits.

BACK

Protected by AR

Special Tools Required
Diagnostics CD 07AAZ-SDBA100

Frequency sweep

Do this test to find rattles or reverberation that may cause a perception of poor sound quality.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA 100) into the audio unit.
2. Play track No. 13 (sweep from 500 Hz to 35 Hz) at a normal, or slightly higher than normal, volume level.
3. Listen to each speaker for poor sound quality or reverberations caused by specific frequencies. Use the voice-over to estimate the frequency that causes the vibration. Use the audio unit's fader and balance settings to help isolate the channel with the problem.
   - If vibrations or poor sound quality is heard, go to step 4.
   - If no vibrations or poor sound quality is heard, go to sound judging (see page 22-365).
4. Choose the appropriate track from No. 14 to 25 (small range frequency sweep) or 26 to 53 (single frequencies) to recreate the frequency that caused the poor sound quality or vibration located in step 3; this aids in diagnosis of the cause.

   NOTE: When you get to the track that recreates the problem, select the repeat function on the audio unit, this will help you isolate the cause.
5. Replace or insulate the source of the vibration or, if the speaker is the source of the poor sound quality, replace it.

Special Tools Required
Diagnostics CD 07AAZ-SDBA100

Sound judging

Do this test to compare overall sound quality, imaging, and dynamics between the customer's vehicle and a known-good vehicle. Only use a vehicle of the same model and trim level for this test.

1. In the customer's vehicle, set the bass, treble, fader, and balance settings to the customer's normal settings that were written down before beginning the test.
2. Insert the audio diagnostic CD (T/N 07AAZ-SDBA 100) into the audio unit.
3. Play tracks No. 7 to 12 (sound quality, midland, dynamics, and imaging demonstration tracks) at a normal, or slightly higher than normal, volume level. Write down the volume setting being used.
4. Listen to areas of the track that stand out as being either real clear or poorer than other areas of the track.
5. In a known-good vehicle, insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
6. Play the tracks at the same volume level and the same bass, treble, balance, and fader settings as used in step 3 in the customer's vehicle.
7. Listen to the same area of the track that stood out as being either real clear or poorer than other areas of the track.

(cont'd)

Protected by AR

Sound Quality Diagnosis (cont'd)

8. Compare the customer's vehicle's sound quality results the known-good vehicle's results.

   - If the sound quality in the customer's vehicle is comparable to the sound quality in the known-good vehicle, then the customer's vehicle is operating as designed.
   - If the sound quality is not comparable, check these items in order.
     - Loose or improperly installed speakers or other hardware that may become excited by the vibrations generated by the speakers
     - Damaged speaker(s)
     - Faulty audio unit

Seek Stop Test

Do this test to check the performance of the audio unit's AM and FM reception. Refer to symptom troubleshooting: no sound is heard from speakers (display is normal) (see page 22-339) before continuing with this test.

NOTE:
- Aftermarket theft-recovery devices and other aftermarket accessories may reduce radio reception.
- Changes in cloud cover and other atmospheric conditions will affect the ability of the audio unit to receive radio signals.

1. Park the client's vehicle in an open area away from buildings or other obstacles.
2. Park a known-good vehicle (same year, model, and trim level) next to the customer's vehicle, facing the same direction.
3. Start the engine in the customer's vehicle, and turn on the radio.
4. Set the FM receiver to 87.7 MHz.
5. Press the "Seek +" button, and record the first station that the audio unit locks onto.
6. Press the "Seek +" button repeatedly, and write down each station that the audio unit locks onto until the station recorded in step 5 is reached again.
7. Set the AM receiver to 530 kHz.
8. Press the "Seek +" button, and record the first station that the audio unit locks onto.
9. Press the "Seek +" button repeatedly, and write down each station that the audio unit locks onto until the station recorded in step 8 is reached again.

BACK

Protected by AR

10. Turn the ignition switch to LOCK (0).

11. Start the engine in the known-good vehicle, and then perform steps 4 thru 10 on the known-good vehicle.

12. Compare the number of stations received in steps 6 and 9 in the customer's vehicle with the number of stations received in the known-good vehicle.

    - If the number of stations received is the same, or within 10 %, the audio unit's tuner performance is OK. The problem may be atmospheric conditions, multi-path interference, or other obstructions to the radio signal.
    - If the customer's vehicle receives fewer stations by at least 10 %, go to step 2 of poor radio reception of interference (see page 22-334).

Audio-HVAC Display Module Illumination Troubleshooting

NOTE: If the display is blank when the headlights are off, the problem is not in the illumination circuit (see page 22-360).

1. Turn the ignition switch to the ON (II) position.
2. Turn the combination light switch ON.
3. Turn the illumination control dial on the gauge control module back and forth between full dim and full bright.

   Does the problem with the illumination affect only the audio-HVAC display panel?

   YES—Go to step 4.

   NO—Go to B-CAN Diagnosis Test Mode A (see page 22-91).
4. Turn the illumination control dial on the gauge control module back and forth between full dim and full bright while watching the audio-HVAC display panel buttons, button LEDs, LCD displays.
5. Proceed with the diagnostic procedure for the appropriate symptom(s).

Symptom	Diagnostic Procedure
• Buttons stay bright and do not adjust with dimmer • LEDs do not dim with dimmer off of full bright position • LCD display or subdisplay is full bright and does not adjust with dimmer • Lower panel ambient light may or may not dim with dimmer	Go to step 6.
• Buttons do not light up • LEDs do not dim • LCD display or subdisplay is full bright and does not adjust with dimmer, or does not fully dim • Lower panel ambient light may or may not dim with dimmer	Go to step 9.
• Lower panel ambient light does not light up • Buttons dim with dimmer • LEDs dim with dimmer off of full bright position • LCD display dims with dimmer	Go to step 12.
Symptom other than those listed above	Replace the audio-HVAC display module.■

6. Remove the audio-HVAC display module (see page 22-371) and check for loose wires terminals or poor connections at audio unit connector A (20P).

   Are all the wire terminals tight, and is audio unit connector A (20P) connected properly?

   YES—Go to step 7.

   NO—Repair the loose wire terminal, or properly connect audio unit connector A (20P) and recheck the symptom.■
7. Turn the illumination control dial on the gauge control module to the full bright position.

BACK

Protected by AR

8. Measure the voltage between the No. 19 and No. 20 terminals of audio unit connector A (20P).

   Is there 1 V or less?

   YES—Check connections at audio unit connector A (20P). If connections are OK substitute a known-good audio-HVAC display module and recheck the symptom. If the symptom is gone, replace the original audio-HVAC display module. ■

   NO—Repair open in the RED wire between the MICU and the audio-HVAC display module. ■

9. Remove the audio-HVAC display module (see page 22-371) and check for loose wire terminals or poor connections at audio unit connector A (20P).

   Are all the wire terminals tight, and is audio unit connector A (20P) connected properly?

   YES—Go to step 10.

   NO—Repair the loose wire terminal, or properly connect audio unit connector A (20P) and recheck the symptom. ■

10. With the combination light switch still ON, turn the illumination control dial on the gauge control module to the full bright position.

11. Measure the voltage between the No. 9 and No. 20 terminals of the audio unit connector A (20P).

    Is there battery voltage?

    YES—Check connections at the audio unit connector A (20P). If connections are OK substitute a known-good audio-HVAC display module and recheck the symptom. If the symptom is gone, replace the original audio-HVAC display module. ■

    NO—Repair open in the RED/BLK wire between the under-hood fuse/relay box and the audio-HVAC display panel. ■

12. Remove the audio-HVAC display module (see page 22-371) and check for loose wire terminals or poor connections at climate control unit connector B (16P).

    Are all the wire terminals tight, and is climate control unit connector B (16P) connector connected properly?

    YES—Go to step 13.

    NO—Repair the loose wire terminal, or properly connect climate control unit connector B (16P) and recheck the symptom. ■

13. Turn the illumination control dial on the gauge control module to the full bright position.

14. Measure the voltage between the No. 12 and No. 6 terminals of climate control unit connector B (16P).

    Is there 1 V or less?

    YES—Go to step 15.

    NO—Repair open in the RED wire between the MICU and the climate control unit. ■

15. Measure the voltage between the No. 8 and No. 6 terminals of the climate control unit connector B (16P).

    Is there battery voltage?

    YES—Check connections at climate control unit connector B (16P). If connections are OK substitute a known-good audio-HVAC display module and recheck the symptom. If the symptom is gone, replace the original audio-HVAC display module. ■

    NO—Repair open in the RED/BLK wire between the under-hood fuse/relay box and the climate control unit. ■

XM Antenna Troubleshooting

Radio displays error code: XM NO SIGNAL or XM ANTENNA ('04-06 models)

NOTE: Check XM radio reception in an open area. Poor reception/interference can be caused by tall buildings, mountains, or high-voltage power lines.

1. Park vehicle outside with a clear view of the southern horizon.

   Does XM radio receive a signal?

   YES—Reception interference operation is normal. ■

   NO—Go to step 2.

2. Check XM antenna connector B (2P) at XM receiver.

   Is XM antenna connector B connected?

   YES—Go to step 3.

   NO—Reconnect XM connector B, recheck XM radio operation. If the signal restored, operation is normal. If signal not restored go to step 3.

3. Substitute known-good XM antenna.

   Does the XM radio receive a signal?

   YES—Replace XM antenna. ■

   NO—Substitute known-good XM antenna subharness. If XM radio receives signal, replace original XM antenna subharness. ■

Audio-HVAC Display Module Removal/Installation

SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE:
- Put on gloves to protect your hands.
- Take care not to scratch the dashboard and related parts.
- Lay a workshop towel under the parts when working on them to protect the face panel from scratches or other damage.
- Do not work in a dusty or dirty place.
- Discharge static electricity from your body before and during the work.
- Do not touch the circuit board with your bare hands.
- Do not work with dirty hands.
- Be careful not to fold the flat plate cable.
- Do not touch the terminal connector of the flat plate cable with your bare hands. (If you have touched it, wipe it off thoroughly.)

1. Make sure you have the anti-theft codes for the radio and navigation system, then write down the frequencies for the radio's preset buttons.

2. Remove the upper panel (see page 20-131).

3. Remove the center pocket (see page 20-132).

4. Remove the screws and bolts, disconnect the audio-HVAC display module connectors (A) and the antenna lead (B), then remove the audio-HVAC display module (C).

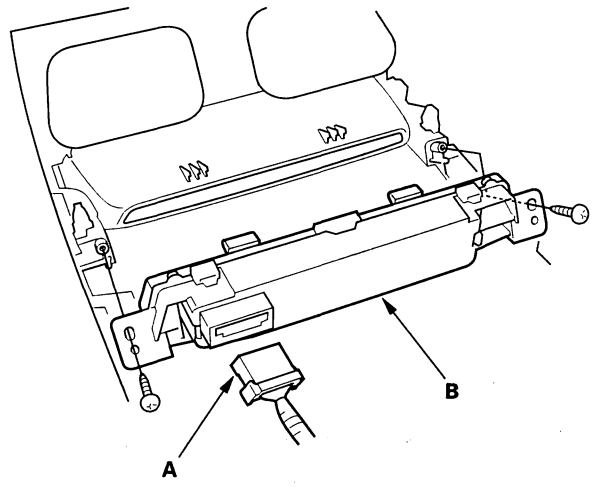
Audio-HVAC Subdisplay/Clock Replacement

With Navigation

1. Remove the upper panel (see page 20-131).
2. Remove the two mounting screws.
3. Disconnect the 10P connector (A) from the audio-HVAC subdisplay/clock (B).



4. Install in the reverse order of removal.

BACK

Protected by AR

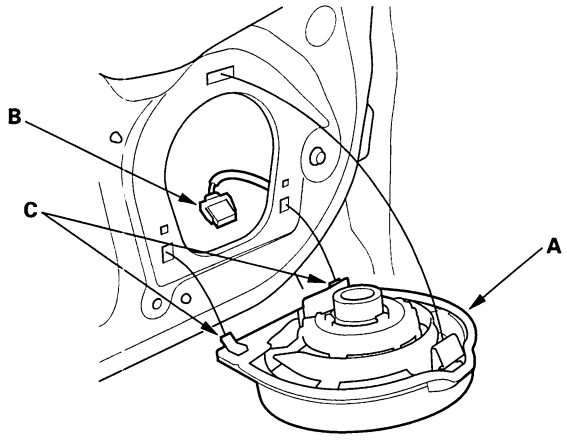
Speaker Replacement

Front Speaker

1. Remove the door panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)

NOTICE
If you pull the speaker out too far from the door, you will damage the lower clips (C).

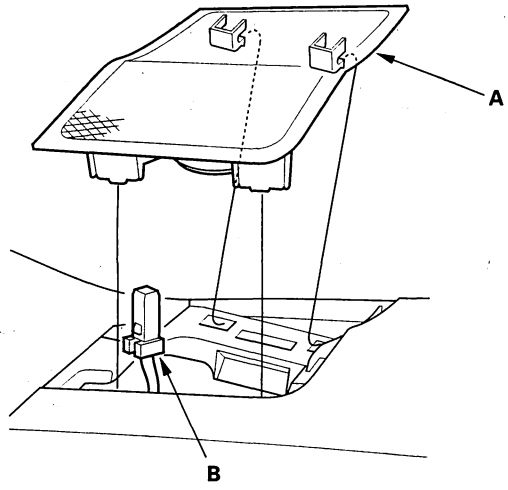
2. Pull the speaker (A) straight out, just enough to release the upper clips. Then lift the speaker straight up to release the lower clips (C).



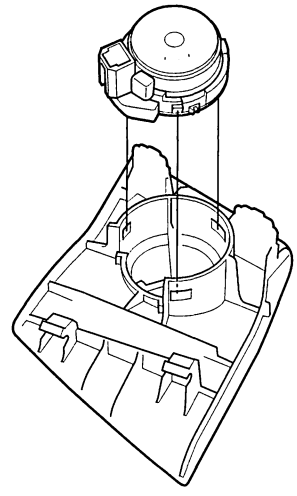
3. Disconnect the 2P connector (B), and remove the speaker.
4. Install in the reverse order of removal.

Tweeter

1. Remove the tweeter speaker grille (A).



2. Disconnect the 2P connector (B) from the tweeter.
3. Remove the tweeter speaker grille from the tweeter.



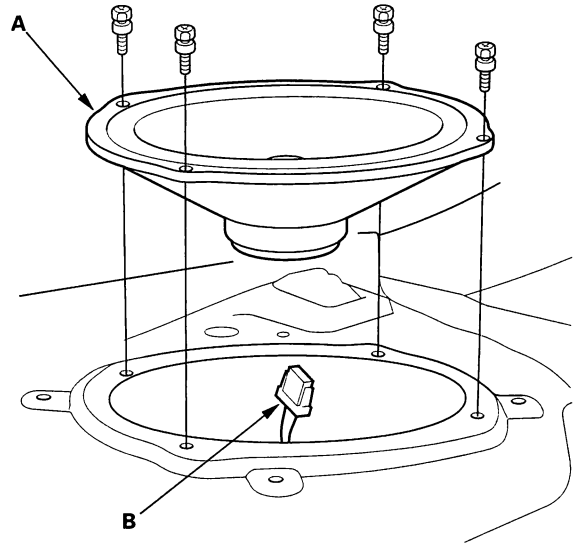
4. Install in the reverse order of removal.

BACK

Protected by AR

Rear Speaker

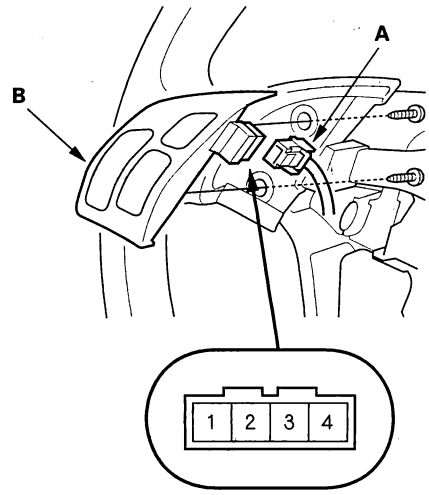
1. Remove the rear speaker cover by prying straight up to release the clips.
2. Remove the four mounting bolts from the rear speaker (A).



3. Disconnect the 2P connector (B), and remove the speaker.
4. Install in the reverse order of removal.

Radio Remote Switch Test

1. Remove the driver's airbag assembly (see page 23-197).
2. Remove the 4P connector (A) from the radio remote switch (B).



3. Remove the two mounting screws and the switch.
4. Measure resistance between the No. 3 and No. 4 terminals in each switch position according to the table.

Position	Resistance
OFF	About 10 kΩ
MODE	About 4 kΩ
CH (+)	About 2 kΩ
CH (−)	About 840 Ω
▲ (VOL. UP)	About 370 Ω
▼ (VOL. DOWN)	About 100 Ω

5. If the resistance is not as specified, replace the remote switch.

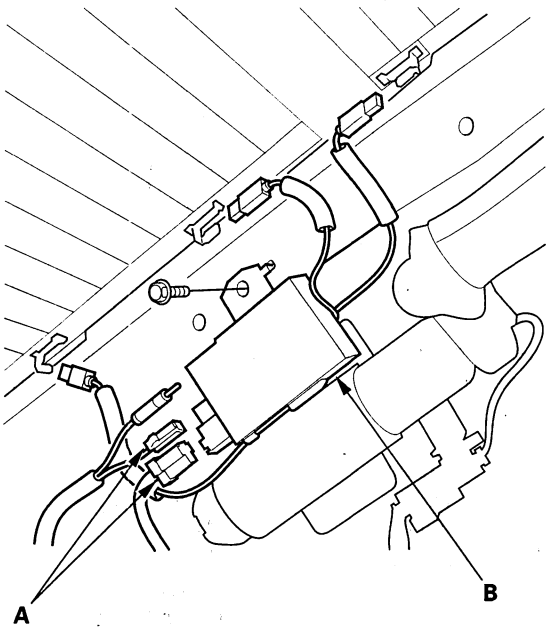
Protected by AR

Window Antenna Coil Replacement

1. Remove the left rear pillar trim.

   - 2 door without side Curtain Airbags (see page 20-97)
   - 4 door without side Curtain Airbags (see page 20-98)
   - 2 door with side Curtain Airbags (see page 20-104)
   - 4 door with side Curtain Airbags (see page 20-105)

2. Disconnect the 1P connectors (A) from the window antenna coil (B).



3. Disconnect all connectors, then remove the bolt and window antenna coil.

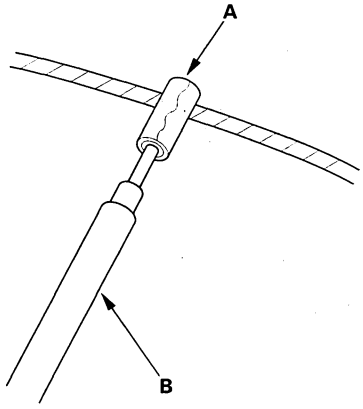
4. Install in the reverse order of removal.

BACK

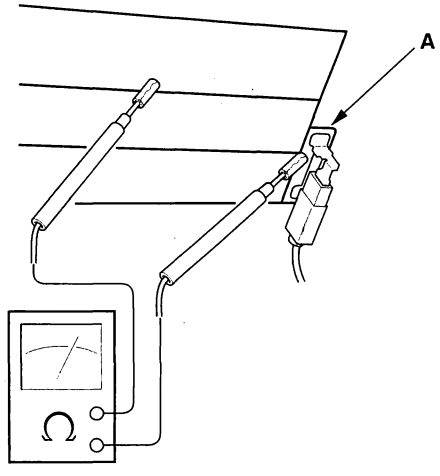
Protected by AR

Window Antenna Test

1. Wrap aluminum foil (A) around the tip of the tester probe (B) as shown.



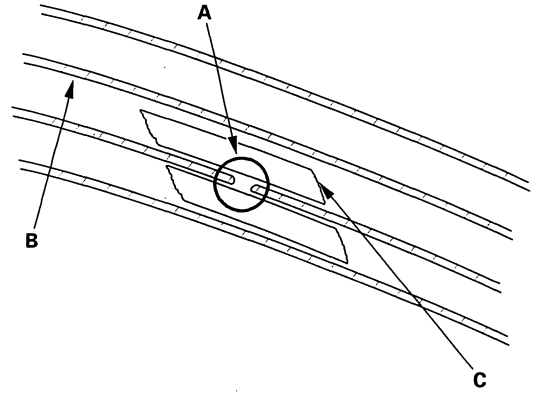
2. Touch one tester probe to the near of the window antenna terminal (A) here, and move the other tester probe along the antenna wires to check that continuity exists. Repair if continuity does not exist.



Window Antenna Repair

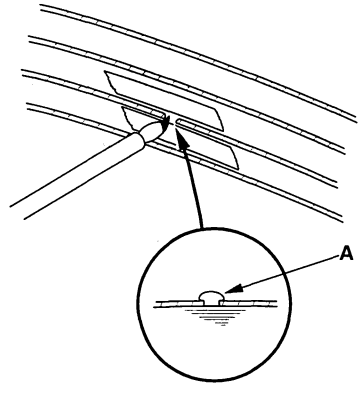
NOTE: To make an effective repair, the broken section must be no longer than one inch.

1. Lightly rub the area around the broken section (A) with fine steel wool, then clean it with alcohol.



2. Carefully mask above and below the broken portion of the window antenna wire (B) with cellophane tape (C).

3. Mix the silver conductive paint thoroughly. Using a small brush, apply a heavy coat of paint (A) extending about 1/8 " on both sides of the break. Allow 30 minutes to dry.



4. Check for continuity in the repaired wire.

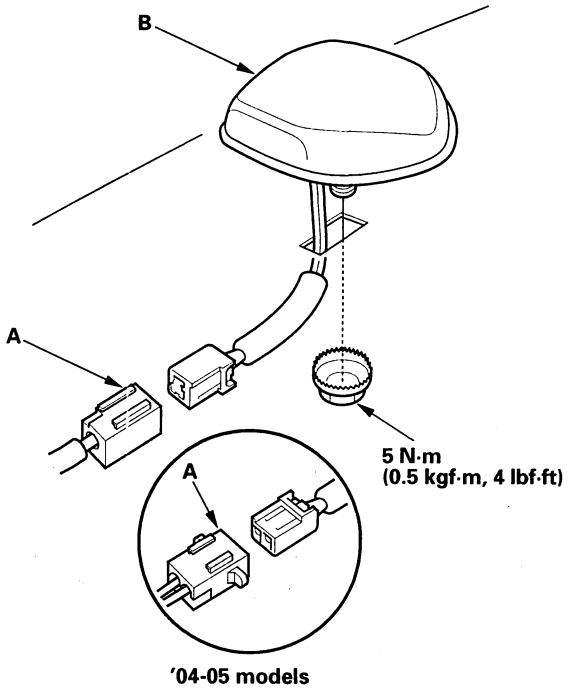
5. Apply a second coat of paint in the same way. Let it dry three hours before removing the tape.

Protected by AR

XM Antenna Replacement

'04-06 models

1. Remove the headliner (see page 20-117).
2. Disconnect the 2P ('04-05 models) or 1P ('06 model) connector (A) from the XM antenna (B).



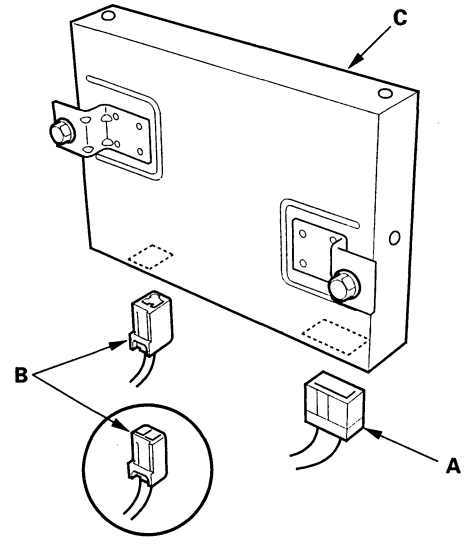
'04-05 models

3. Remove the nut from the XM antenna.
4. Install in the reverse order of removal.

XM Receiver Replacement

'04-06 models

1. Open the trunk lid.
2. Remove the right trunk side trim panel.
   - 2-door (see page 20-112)
   - 4-door (see page 20-113)
3. Loosen the two nuts from the XM receiver.
4. Disconnect the 14P connector (A) and 2P ('04-05 models) or 1P ('06 model) connector (B) from the XM receiver (C).



'04-05 models

5. Install in the reverse order of removal.

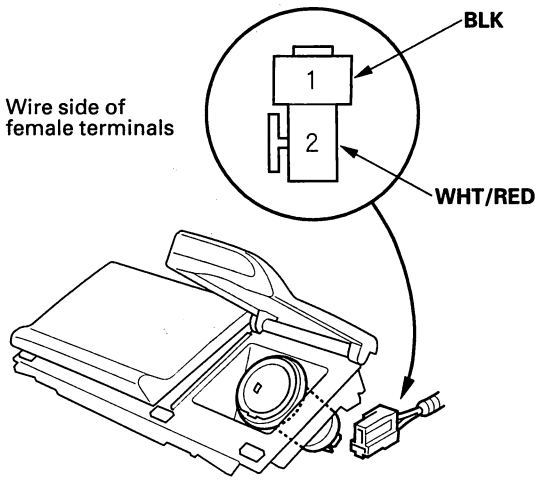
Front Accessory Power Socket Test/Replacement

1. Remove the center console holder (see page 20-125).

2. Disconnect the 2P connector from the front accessory power socket.



3. Inspect the connector terminals to be sure they are all making good contact.

   - If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 4.

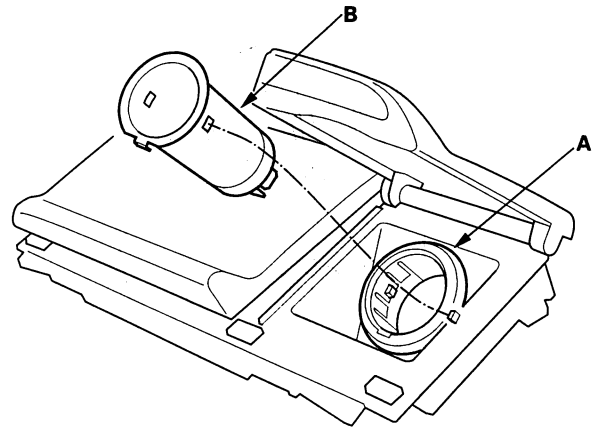
4. Turn the ignition switch to ACC (I), and check for voltage between the No. 2 terminal and body ground. There should be battery voltage.

   - If there is battery voltage, go to step 5.
   - If there is no battery voltage, check for:
     - Blown No. 9 (15 A) or No. 32 (7.5 A) fuse in the under-dash fuse/relay box.
     - Faulty accessory power socket relay.
     - Poor ground (G501, G601).
     - An open in the wire.

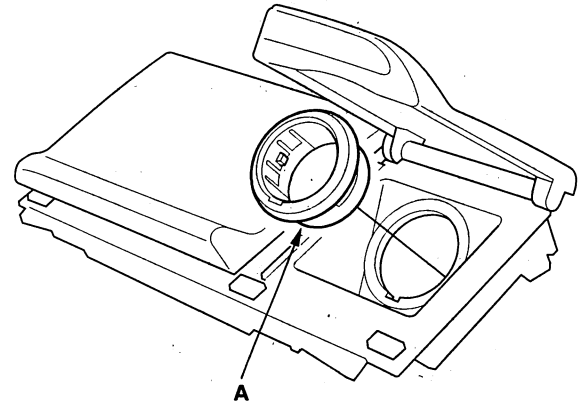
5. Check for continuity between the No. 1 terminal and body ground. There should be continuity.

   - If there is continuity, go to step 6.
   - If there is no continuity, check for:
     - Poor ground (G503).
     - An open in the wire.

6. Remove the housing (A) and socket (B).



7. Remove the ring (A).



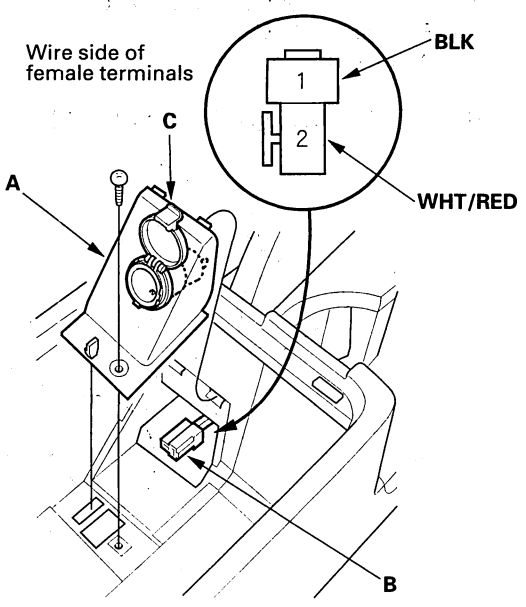
8. Install the power socket in the reverse order of removal.

Protected by AR

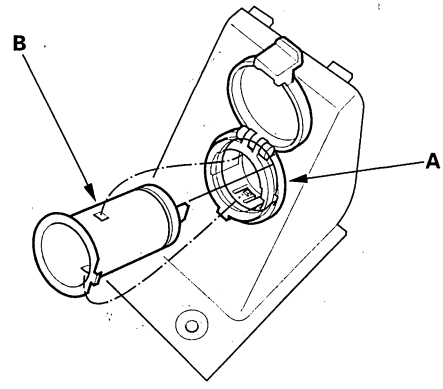
Accessory Power Sockets

Rear Accessory Power Socket Test/Replacement

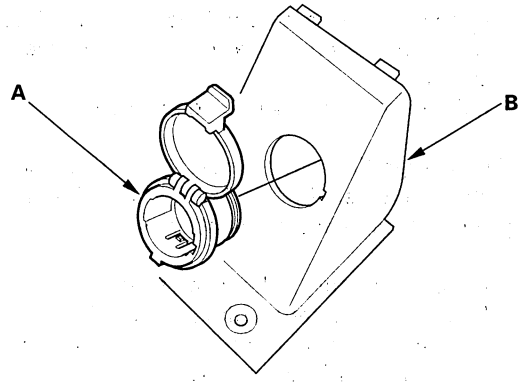
1. Open the center console.
2. Remove the screw and accessory power socket panel (A).



3. Disconnect the 2P connector (B) from the rear accessory power socket (C).
4. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. Turn the ignition switch to ACC (I), and check for voltage between the No. 2 terminal and body ground. There should be battery voltage.
   - If there is battery voltage, go to step 6.
   - If there is no battery voltage, check for:
     - Blown No. 9 (15 A) or No. 32 (7.5 A) fuse in the under-dash fuse/relay box.
     - Faulty accessory power socket relay.
     - Poor ground (G501, G601).
     - An open in the wire.
6. Check for continuity between the No. 1 terminal and body ground. There should be continuity.
   - If there is continuity, go to step 7.
   - If there is no continuity, check for:
     - Poor ground (G503).
     - An open in the wire.
7. Remove the housing (A) and socket (B).



8. Remove the housing (A) from the panel (B).



9. Install the power socket in the reverse order of removal.

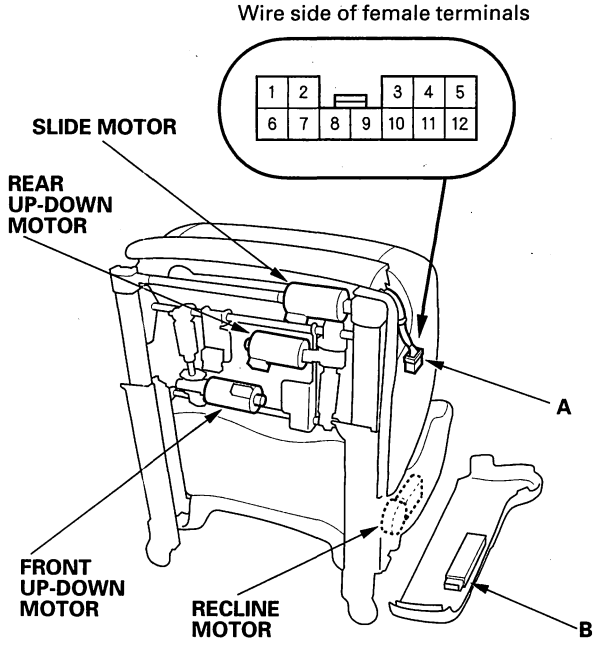
Motor Test

Driver's 8-way Adjustable Power Seat

1. Remove the driver's seat (see page 20-144).
2. Disconnect the 12P connector (A) from the power seat adjustment switch (B).



3. Test each motor by applying battery voltage and body ground to the terminals.

Slide motor

Terminal / Position	7	11
Forward	⊖	⊕
Backward	⊕	⊖

Recline motor

Terminal / Position	6	12
Forward	⊖	⊕
Backward	⊕	⊖

Front up-down motor

Terminal / Position	3	9
UP	⊕	⊖
DOWN	⊖	⊕

Rear up-down motor

Terminal / Position	1	5
UP	⊕	⊖
DOWN	⊖	⊕

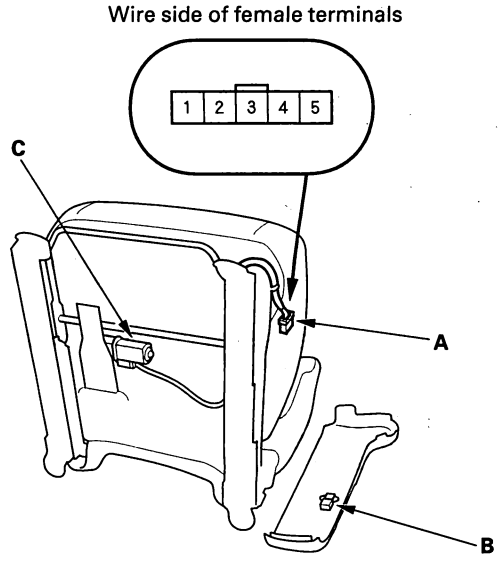
4. If the motor does not run or fails to run smoothly, check for an open in the driver's seat wire harness between the 12P connector and each motor connector. If the harness is OK, replace the motor (see page 20-162).

BACK

Protected by AR

Driver's 2-way Adjustable Power Seat

1. Remove the driver's seat (see page 20-144).
2. Disconnect the 5P connector (A) from the power seat adjustment switch (B).



3. Test the motor (C) by applying battery voltage to the 5P connector No. 2 (or No. 4) and ground to the No. 4 (or No. 2) terminals. The motor should run.
4. If the motor does not run or fails to run smoothly, check for an open in the wire between the 5P connector and the motor 2P connector. If the harness is OK, replace the motor (see page 20-162).

Seat Heaters

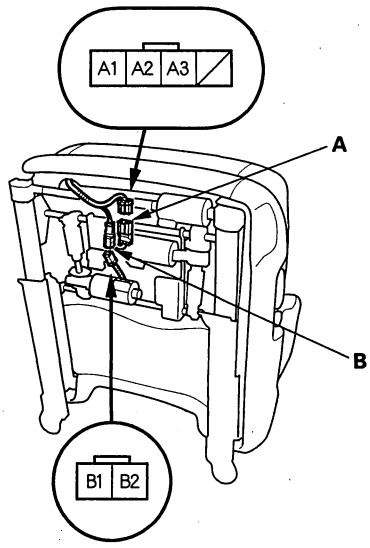
Seat Heater Test

Driver's Seat

1. Remove the driver's seat (see page 20-144).
2. Disconnect the 4P connector (A) and 2P connector (B) from the seat heater.

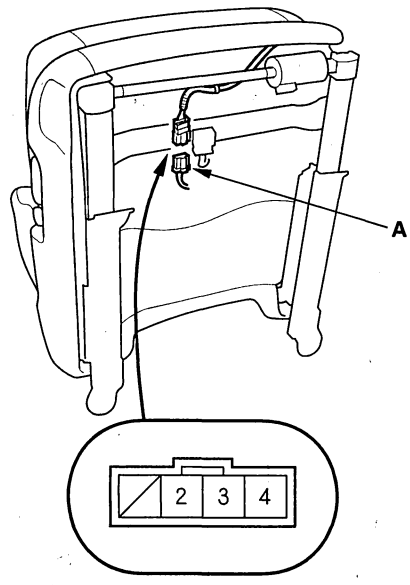


Wire side of female terminals

3. Check for continuity between the B1 and B2 terminals of the seat-back heater 2P connector. There should be continuity.
4. Check for continuity between the A1 and A2 terminals, and the A1 and B2 terminals. There should be continuity.
5. If the continuity check is not as specified, replace the seat heater.

Front Passenger's Seat

1. Remove the passenger's seat (see page 20-144).
2. Disconnect the 4P connector (A) from the seat heater.



Terminal side of male terminals

3. Check for continuity between the No. 2 and No. 3 terminals, and No. 3 and No. 4 terminals of the 4P connector. There should be continuity.
4. If the continuity is not as specified, replace the seat heater.

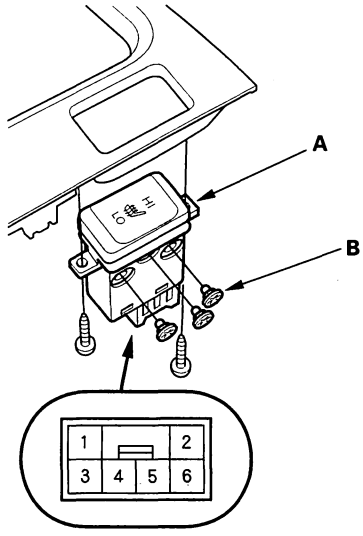
BACK

Protected by AR

Switch Test

1. Remove the center console front panel (see page 20-125).

2. Disconnect the 6P connector from the seat heater switch (A), then remove the switch.



3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal		1		2	3	4		5	6
ON	HIGH	○	○	○	○	○	○	○	○
	LOW	○	○	○		○	○	○	
					○			○	
OFF		○	○	○					

4. If the continuity check is not as specified, replace the illumination bulbs (B) or the switch.

Power Mirrors

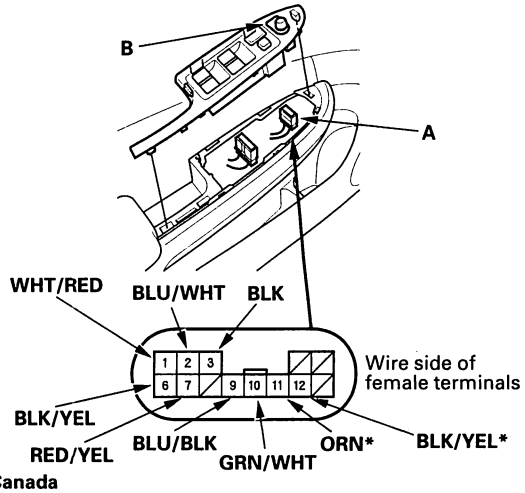
Function Test

1. Remove the driver's door switch trim.

   - 2-door (see page 20-9)
   - 4-door (see page 20-10)

   NOTE: The illustration shows 4-door.



*: Canada

2. Disconnect the 13P connector (A) from the power mirror switch (B), and inspect the terminals. If OK, go to step 3.

3. Choose the appropriate test based on the symptom:
   - Both mirrors don't work, go to step 4.
   - Left mirror doesn't work, go to step 6.
   - Right mirror doesn't work, go to step 7.
   - Defogger doesn't work (Canada), go to step 8.

Both mirrors

4. Check for voltage between the No. 6 terminal and body ground with the ignition switch ON (II). There should be battery voltage.
   - If there is no battery voltage, check for:
     - Blown No. 30 (7.5 A) fuse in the under-dash fuse/relay box.
     - An open in the BLK/YEL wire.
   - If there is battery voltage, go to step 5.

5. Check for continuity between the No. 3 terminal and body ground.
   There should be continuity.
   - If there is no continuity, check for:
     - An open in the BLK wire.
     - Poor ground (G501, G601).
   - If there is continuity, check both mirrors individually as described in the next column.

Left mirror

6. Connect the No. 6 terminal to the No. 9 terminal, and the No. 2 (or No. 10) terminal to the No. 3 terminal with jumper wires. The left mirror should tilt down (or swing left) with the ignition switch ON (II).
   - If the mirror does not tilt down (or does not swing left), check for an open in the BLU/WHT (or GRN/WHT) wire between the left mirror and the 13P connector. If the wire is OK, check the left mirror actuator.
   - If the mirror neither tilts down nor swings left, repair the BLU/BLK wire.
   - If the mirror works properly, check the mirror switch.

Right mirror

7. Connect the No. 6 terminal to the No. 7 terminal, and the No. 1 (or No. 10) terminal to the No. 3 terminal with jumper wires. The right mirror should tilt down (or swing left) with the ignition switch ON (II).
   - If the mirror does not tilt down (or does not swing left), check for an open in the WHT/RED (or GRN/WHT) wire between the right mirror and the 13P connector.
     If the wire is OK, check the right mirror actuator.
   - If the mirror neither tilts down nor swings left, repair the RED/YEL wire.
   - If the mirror works properly, check the mirror switch.

Defogger (Canada)

8. Connect the No. 12 and No. 11 terminals with a jumper wire, and check for voltage between the No. 4 terminal of the mirror connectors and body ground. There should be battery voltage and both mirrors should warm up with the ignition switch ON (II).
   - If there is no voltage or neither warms up, check for:
     - An open in the BLK/YEL or ORN wire.
     - Blown No. 30 (7.5 A) fuse in the under-dash fuse/relay box.
   - If only one fails to warm up, check:
     - Its defogger.
     - Poor ground (G501, G601).
   - If both warm up, check the defogger switch.

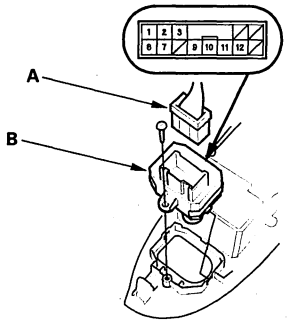
BACK

Protected by AR

Power Mirror Switch Test/ Replacement

1. Remove the driver's door switch trim.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 13P connector (A) from the power mirror switch (B).

   NOTE: The illustration shows 4-door.



3. Check for continuity between the terminals in each switch position according to the table.

Mirror Switch:

	Terminal / Position	1	2	3	6	7	9	10
L	UP		○	○			○	
L	DOWN		○	○	○		○	
L	LEFT				○		○	○
L	RIGHT				○		○	○
R	UP	○		○				
R	DOWN	○		○	○			
R	LEFT				○	○		○
R	RIGHT				○	○		○

Defogger Switch (Canada):

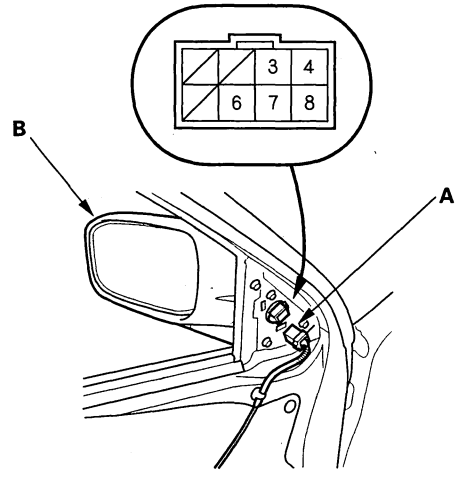
Terminal / Position	11	12
ON	○	○
OFF		

4. If the continuity is not as specified, replace the power mirror switch.

Power Mirror Actuator Test

1. Remove the door panel.
   - 2-door (see page 20-9)
   - 4-door (see page 20-10)
2. Disconnect the 8P connector (A) from the power mirror actuator (B).

   NOTE: The illustration shows 4-door.



3. Check actuator operation by connecting power and ground according to the table.

Terminal / Position	6	7	8
TILT UP		⊖	⊕
TILT DOWN		⊕	⊖
SWING LEFT	⊖	⊕	
SWING RIGHT	⊕	⊖	

4. If the mirror fails to work properly, replace the mirror actuator.

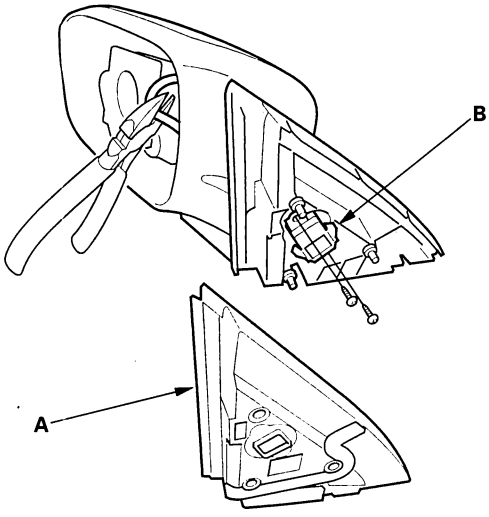
Defogger Test (Canada)

5. Check for continuity between the No. 3 and No. 4 terminals of the 8P connector. There should be continuity with the defogger switch ON. If there is no continuity, check for an open circuit.

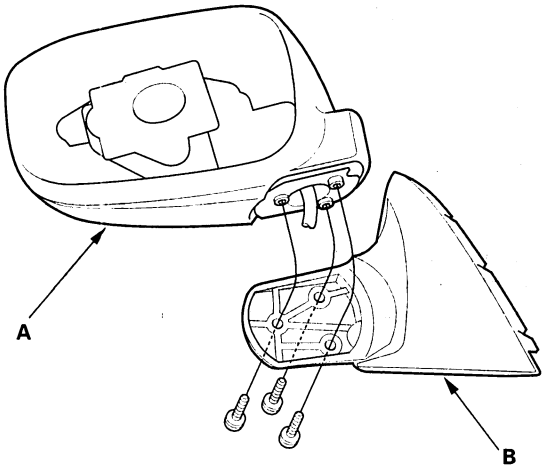
Protected by AR

Power Mirror Actuator Replacement

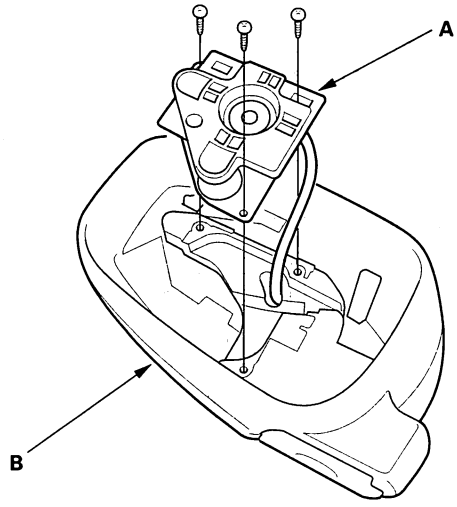
1. Remove the power mirror (see page 20-41).
2. Disconnect the 8P connector.
3. Carefully remove the mirror holder from the mirror housing. Gently pull it out by hand (see page 20-43).
4. Remove the cover (A), then remove the two screws from the mirror connector (B).



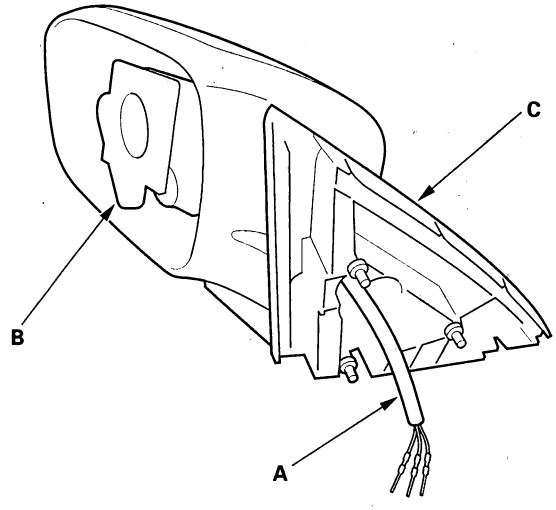
5. Record the terminal locations and wire colors.
6. Cut the wire harness with the wire cutter.
7. Remove the three screws, and separate the mirror housing (A) from the bracket (B).



8. Remove the three screws and separate the actuator (A) from the housing (B).



9. Route the wire harness (A) of the new actuator (B) through the hole in the bracket (C).



10. Install the new actuator in the reverse order of removal.

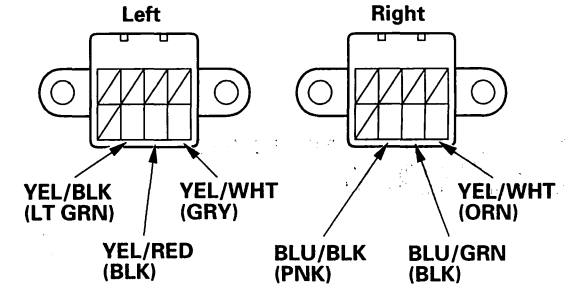
BACK

Protected by AR

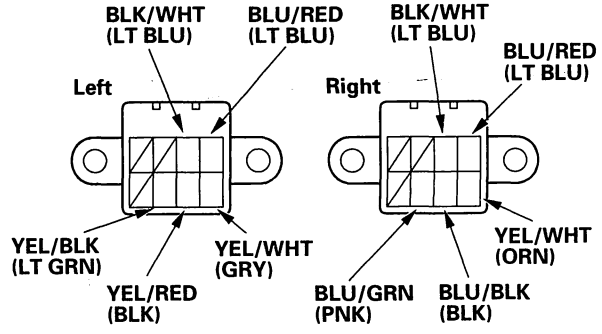
11. Insert the terminals into the connector in the original arrangement as shown below.

Terminal View:

USA



Canada



( ): Donelly made

12. Reassemble in the reverse order of disassembly. Be careful not to break the mirror holder when reinstalling it to the actuator.

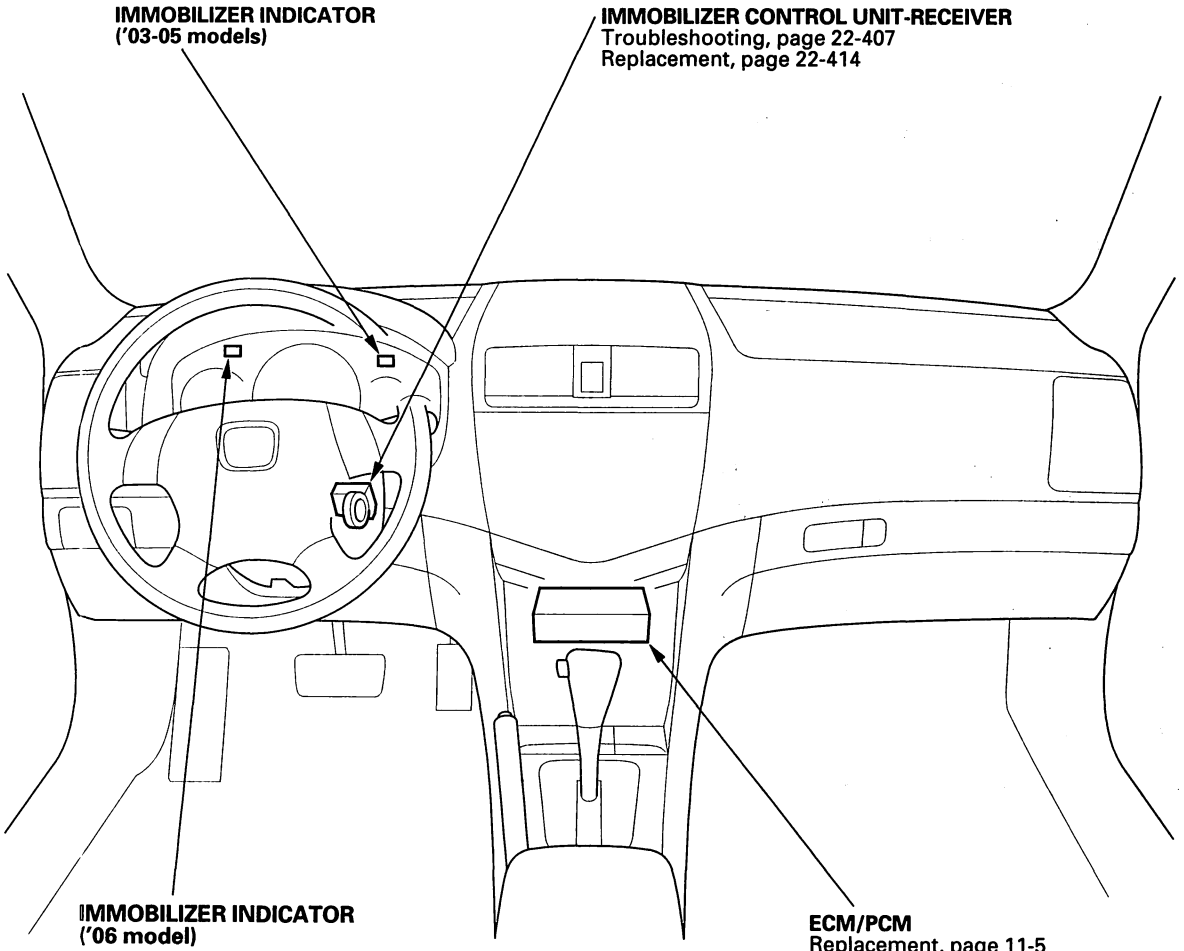
13. Reinstall the mirror assembly to the door.

14. Operate the power mirror to ensure smooth operation.

Protected by AR

Immobilizer System

Component Location Index



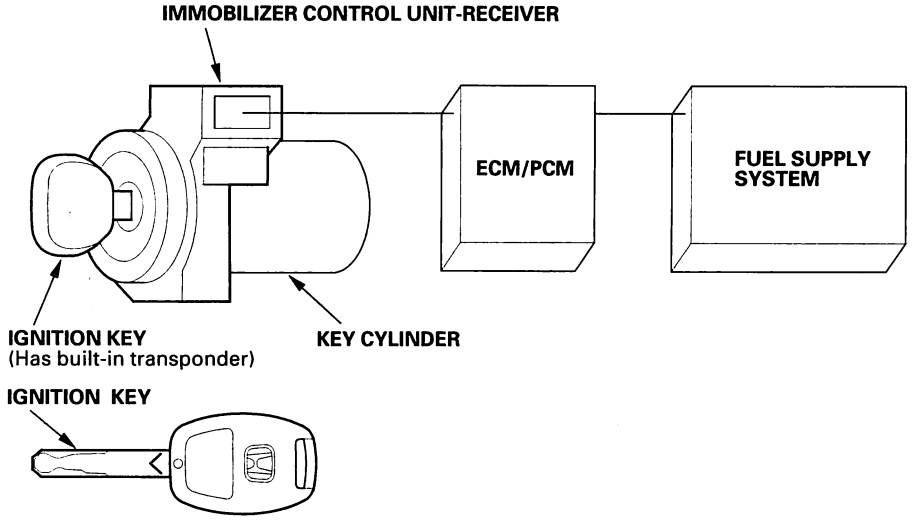
BACK

Protected by AR

System Description

The vehicle is equipped with a type IV immobilizer system that will disable the vehicle unless the proper ignition key is used. This system consists of a transponder located in the ignition key, an immobilizer control unit-receiver, an indicator light, and the ECM/PCM.

When the key is inserted in the ignition switch and turned to the ON (II) position, the immobilizer control unit-receiver sends power to the transponder in the ignition key. The transponder then sends a coded signal back to the immobilizer control unit-receiver which then sends a coded signal to the ECM/PCM. The code is a rolling type embedded in the immobilizer control unit-receiver instead the PCM.



NOTE: This key is slimilar in appearance to other models, but it is a rolling code type. Only key with a V on the shank can be used.

- If the proper key has been used, the immobilizer indicator light will come on for about 2 seconds, then go off.
- If the wrong key has been used or the code was not received or recognized by the unit, the indicator light will come on for about 2 seconds, then it will blink until the ignition switch is turned OFF.
- If the ignition switch is turned OFF, the indicator will blink for about 5 seconds to signal that the unit has reset correctly, then the indicator will go off.
- If the customer has lost their key, and cannot start the engine, contact Honda Customer Relations.

IMMOBILIZER INDICATOR LIGHT BLINKING PATTERN:

Troubleshooting

1. Turn the ignition switch ON (II) with a programmed key.
2. Check to see if the immobilizer indicator comes on.

   Does the indicator come on?

   YES—Go to step 3.

   No—Go to step 12.
3. Check the immobilizer indicator operation.

   Does the indicator come on for 2 seconds, then go off?

   YES—Go to step 4.

   No—Go to step 6.
4. Try to crank the engine.

   Does the starter motor operate?

   YES—Go to step 5.

   No—Check the starter motor. ■
5. Try to start the engine.

   Does the engine start?

   YES—If available, check the Status Log in the Immobilizer Info with the HDS (see page 22-413). If the Status Log is not available, the immobilizer system is OK at this time. ■

   No—Go to step 25. ■
6. Check to see if the immobilizer indicator comes on and blinks.

   Does the indicator blink?

   YES—Go to step 25.

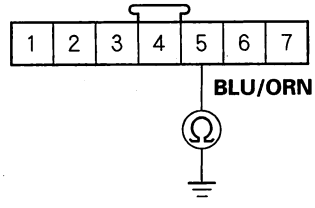
   No—Go to step 7.
7. Disconnect the 7P connector from the immobilizer control unit-receiver.
8. Check to see if the immobilizer indicator goes off.

   Does the indicator go off?

   YES—Check the immobilizer control unit-receiver. ■

   No—Go to step 9.
9. Turn the ignition switch OFF.
10. Remove the gauge control module and disconnect its 30P ('03-05 models) or 36P ('06 model) connector (see page 22-276).
11. Check for continuity between the immobilizer control unit-receiver 7P connector No. 5 (IMOARM) terminal and body ground.

IMMOBILIZER CONTROL-UNIT RECEIVER 7P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair a short in the wire. ■

No—Faulty immobilizer indicator, replace the gauge control module. ■

Troubleshooting (cont'd)

12. Try to start the engine.

    Does the engine start?

    YES—Go to step 13.

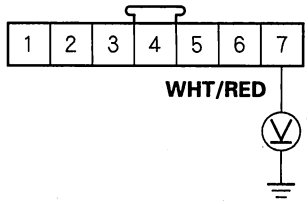
    No—Go to step 18.

13. Turn the ignition switch OFF.

14. Disconnect the 7P connector from the immobilizer control unit-receiver.

15. Check for voltage between the immobilizer control unit-receiver 7P connector No. 7 (+B) terminal and body ground.

IMMOBILIZER CONTROL-UNIT RECEIVER 7P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Go to step 16.

No—Faulty No. 7 (10 A) fuse in the under-dash fuse/relay box. If the fuse is OK, check for an open in the wire between the immobilizer control unit-receiver and under-dash fuse/relay box.■

16. Remove the gauge control module and disconnect its 30P ('03-05 models) or 36P ('06 model) connector (see page 22-276).

17. Check for continuity between the immobilizer control unit-receiver 7P connector No. 5 (IMOARM) terminal and gauge control module 30P ('03-05 models) or 36P ('06 model) connector No. 28 ('03-05 models) or No. 21 ('06 model) terminal.

Troubleshooting (cont'd)

25. Turn the ignition switch OFF.
26. Connect the HDS to the data link connector.
27. Turn the ignition switch ON (II).
28. Look at the System Check in the Immobilizer Info with the HDS (see page 22-412).

    Is the immobilizer system normal?

    YES—Go back to step 1.

    NO—Go to step 29.
29. Verify the System Check display on the HDS for the following information:

    - Harness short from the ECM/PCM to the immobilizer unit. (S-net line short)
    - The communication was not good between the ECM/PCM and the immobilizer unit by the battery voltage low.
    - The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise.
    - Immobilizer unit failure
    - ECM/PCM failure

    Does the HDS display any of the above information?

    YES—Go to step 30.

    NO—Go to step 34.
30. Turn the ignition switch OFF.
31. Disconnect the 7P connector from the immobilizer control unit-receiver.
32. Disconnect the ECM/PCM connector E (31P).
33. Check for continuity between the immobilizer control unit-receiver 7P connector No. 2 (IMOCD) terminal and body ground.

    IMMOBILIZER CONTROL UNIT-RECEIVER 7P CONNECTOR

    
    Wire side of female terminals

    Is there continuity?

    YES—Repair a short in the wire. ■

    NO—Substitute a known-good immobilizer control unit-receiver and/or ECM/PCM. ■
34. Verify the System Check display on the HDS for the following information:

    - Blown fuse
    - Harness open from the ECM/PCM and the immobilizer unit.
    - The communication was not good between the ECM/PCM and the immobilizer unit by battery voltage low.
    - The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise.
    - Immobilizer unit failure
    - ECM/PCM failure

    Does the HDS display any of the above information?

    YES—Go to step 35.

    NO—Check the Possible Failures shown on the System Check display (see page 22-412). ■
35. Turn the ignition switch OFF.
36. Disconnect the 7P connector from the immobilizer control unit-receiver.
37. Disconnect the ECM/PCM connector from the E (31P).

BACK

Immobilizer System

System Check

1. Connect the HDS to the data link connector.
2. Turn the ignition switch ON (II).
3. Monitor the System Check in the Immobilizer Info with the HDS.
4. If the HDS displays the "Immobilizer system is normal", the immobilizer system is OK. If the HDS displays any other messages, check as follows:

Status Log No.	System Check	Possible Failures
A-1	Immobilizer system is not normal	• This key is not registered in the immobilizer unit. Try to register keys by using "KEYS". • The communication was not good between the antenna and the immobilizer key by influence of metal such as key chains. • The communication was not good between the antenna and the immobilizer key by battery voltage low.
A-2	Immobilizer system is not normal	• Intermittent interruption between transponder and immobilizer unit. • The immobilizer key type is different. It is not for this vehicle but for another one or for other company's one. • Key failure (transponder failure) • The communication was not good between the antenna and the immobilizer key by influence of metal such as key chains. • The communication was not good between the antenna and the immobilizer key by battery voltage low.
A-3	Immobilizer system is not normal	• The ignition switch was turned on with a non-immobilizer key. • The immobilizer key type is different. It is not for this vehicle but for another one or for other company's one. • Key failure (transponder failure) • The communication was not good between the antenna and the immobilizer key by influence of metal such as key chains. • The communication was not good between the antenna and the immobilizer key by battery voltage low. • Immobilizer unit failure
B-1	Immobilizer system is not normal	• The ECM/PCM was not registered. Try to register the ECM/PCM by using "REPLACE ECM/PCM". • The communication was not good between the ECM/PCM and the immobilizer unit by battery voltage low. • The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise.
B-2	Immobilizer system is not normal	• The ECM/PCM was not registered. Try to register the ECM/PCM by using "REPLACE ECM/PCM". • The communication was not good between the ECM/PCM and the immobilizer unit by battery voltage low. • The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise.
D-1	Immobilizer system is not normal	• Harness short from the ECM/PCM to the immobilizer unit. (S-net line short) • The communication was not good between the ECM/PCM and the immobilizer unit by battery voltage low. • The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise. • Immobilizer unit failure • ECM/PCM failure
D-3	Immobilizer system is not normal	• Blown fuse • Harness open from the ECM/PCM to the immobilizer unit. • The communication was not good between the ECM/PCM and the immobilizer unit by battery voltage low. • The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise. • Immobilizer unit failure • ECM/PCM failure

BACK

Protected by AR

Status Log

If you suspect there is a immobilizer system problem, check the status log.

NOTE: Status log may not be available for all models. If you have an updated immobilizer control unit-receiver ('03-05 models) or a '06 model, status log should be available.

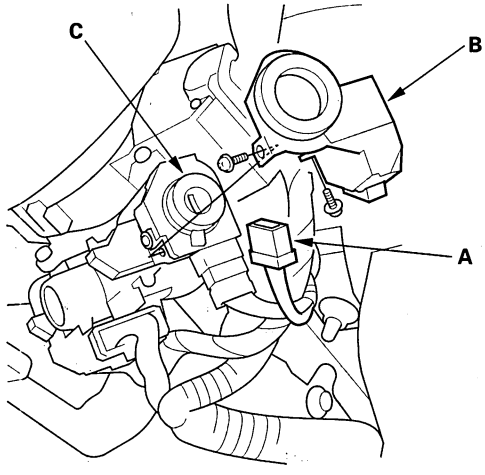
1. Connect the HDS to the data link connector.
2. Turn the ignition switch ON (II).
3. On the HDS screen, select Honda systems, select immobilizer set-up, select immobilizer information, then select status log.
4. Check the Status log count. Troubleshoot the status with the highest count first. If no counts are listed, the immobilizer system is OK. Continue with normal symptom troubleshooting.

Status Log No.	Detected Item	Probable Cause
A-1	KEY CODE MISMATCH (Code format normal, but code data is mismatch)	1. The key was not registered 2. Interference from metal such as key chains 3. Low battery voltage
A-2	KEY CODE MISMATCH (Code format failure)	1. Ignition switch was turned on with another type of immobilizer key or aftermarket key 2. Interference from metal such as key chains 3. Low battery voltage
A-3	KEY CODE MISMATCH (No key code or non-immobilizer key)	1. Ignition switch was turned on with another type of immobilizer key or aftermarket key 2. Interference from metal such as key chains 3. Low battery voltage 4. Key failure 5. Immobilizer control unit-receiver failure
B-1	ECM/PCM CODE MISMATCH (Code format normal, but code data is mismatch)	1. ECM/PCM was not registered correctly 2. Low battery voltage 3. Poor or loose terminal connections at the immobilizer control unit-receiver 4. Communication line electrical noise
B-2	ECM/PCM MISMATCH (Code format failure)	1. ECM/PCM was not registered correctly 2. Low battery voltage 3. Poor or loose terminal connections at the immobilizer control unit-receiver 4. Communication line electrical noise
D-1	SECURITY-NET LINE PROBLEM (Short to ground)	1. Low battery voltage 2. Poor or loose terminal connections at the immobilizer control unit-receiver and the ECM/PCM 3. Communication line electrical noise
D-3	SECURITY-NET LINE PROBLEM (Open line or ECM/PCM failure)	1. Open or short in the harness from the ECM/PCM to the immobilizer control unit-receiver 2 Low battery voltage 3 Poor or loose terminal connections at the immobilizer control unit-receiver and the ECM/PCM 4 Communication line electrical noise

Protected by AR

Immobilizer Control Unit-Receiver Replacement

1. Remove the dashboard lower cover (see page 20-130).
2. Remove the steering column covers (see page 17-25).
3. Disconnect the 7P connector (A) from the immobilizer control unit-receiver (B).



4. Remove the two screws and the immobilizer control unit-receiver from the ignition key cylinder (C).
5. Install the immobilizer control unit-receiver in the reverse order of removal.
6. After replacement, check the immobilizer system.

Navigation System ('03-05 models)

General Troubleshooting Information

General Operation

Refer to the Navigation System Manual for the navigation system operating procedures.

Anti-theft Feature

The navigation system and audio unit have a coded theft protection circuit. Be sure to get the customer's anti-theft security codes number before;

- disconnecting the battery.
- disconnecting the navigation unit 8P connector.
- removing the No. 7 (10 A) fuse from the under-dash fuse/relay box.

After service, reconnect power to the navigation unit, and turn the ignition switch ON (II). Enter the 4-digit anti-theft security code, then select "Done".

If the code cannot be found, use the interactive Network (*i*N) to look it up. You will need the serial number from the navigation unit in the trunk. It is on a label on the underside of the unit. Alternatively, you can view the serial number in the "Navi ECU" diagnostic screen (see page 22-469).

When replacing the navigation unit, be sure to give the customer the new anti-theft security code.

Symptom Diagnosis

Certain circumstances and system limitations will result in occasional vehicle positioning errors. Some customers may think this indicates a problem with the navigation system when, in fact, the system is normal. Keep the following items in mind when interviewing customers about symptoms of the navigation system.

Self-Inertial Navigation Limitations

The limitations of the self-inertial portion of the navigation system (the yaw rate sensor and the vehicle speed signal) can cause some discrepancies between the vehicle's actual position and the indicated vehicle position (GPS vehicle position).

The following circumstances may cause vehicle positioning errors:

- Moving the vehicle with the engine stopped and the vehicle stopped, such as by ferry or tow truck, or if the vehicle is spun on a turn table.
- Tire slippage, changes in tire rolling diameters, and some driving situations may cause discrepancies in travel distances. Examples of this include:
  - Continuous tire slippage on a slippery surface
  - Driving with snow chains mounted
  - Abnormal tire pressure
  - Incorrect tire size
  - Frequent lane changes across a wide highway
  - Continuous driving on a straight or gently curving highway
  - Very bumpy roads
- Tolerances in the system and map inaccuracies sometimes limit how precisely the vehicle position is indicated. Examples of this include:
  - Driving on roads not shown on the map (map matching is not possible)
  - Driving on a road that winds in one direction, such as a loop bridge, an interchange, or a spiral parking garage
  - Driving on a road with a series of sharp hair-pin turns
  - Driving near a gradual highway exit or transition
  - Driving on one of two close parallel roads
  - Making many 90 degree turns

Global Positioning System (GPS) Limitations

The GPS cannot detect the vehicle's position during the following instances:

- For the first 5 to 10 minutes after reconnecting the battery (This can take as long as 45 minutes).
- When the satellite signals are blocked by tall buildings, mountains, tunnels, large trees, inside parking structures or large trucks.
- When the GPS antenna is blocked by metallic window tinting or by an object placed above it in the vehicle. The GPS antenna requires a clear unobstructed view of the sky.
- When there is no satellite signal output (Signal output is sometimes stopped for satellite servicing).
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (radio, CD players/changers, radar detectors and theft recovery systems), and cellphones placed near the navigation system.

BACK

Protected by AR

The accuracy of GPS is reduced during these instances:

- Metallic window tinting above the GPS antenna.
- When only two satellite signals can be received (Three satellite signals are required for accurate positioning).
- When the satellite control centers are experiencing problems.
- When driving near high tension power lines.
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (radio, CD players/changers, radar detectors and theft recovery systems), and cellphones placed near the navigation system.

Muting Logic

Whenever the navigation system is giving guidance all the front speakers are muted. When the voice control system is being used, all of the speakers are muted.

LCD Display Unit Limitations

- In cold temperatures, the display may stay dark for the first 2 or 3 minutes until it warms up.
- When the display is too hot because of direct summer sunlight, it will remain dark until the temperature drops (You may see an error message displayed stating this fact).
- When the humidity is high and the interior temperature is low, the display may appear cloudy. The display will clear up after some use.
- Fingerprints on the touch panel may sometimes be noticeable because of the panel's low-reflection coating. Clean the screen with a soft, damp cloth. You may use a mild cleaner intended for eye glasses or computer screens. To avoid scratching the panel, do not rub too hard, or use abrasive cleaners or shop towels.
- The touch panel is an infrared system, so there is no need to press hard. If a touch switch does not function immediately, shift your finger slightly, and touch again.

NOTE: Input may be affected by direct sunlight.

Symptom Duplication

- When the symptom can be duplicated, verify that it is not a characteristic of the system. Review the navigation manual and compare it to a known-good vehicle (with the same software and database), under the same conditions. If not the same, follow the self-diagnostic procedures and the appropriate troubleshooting procedures.
- When the symptom does not reappear or only reappears intermittently, ask the customer about the conditions when the symptom occurred.
  - Ask the customer to demonstrate the problem.
  - Try to establish possible user error or misunderstanding of the system.
  - Try to establish if outside interference may have been the cause.
  - Try to duplication the symptom under the same conditions the customer was experiencing.
  - Vibration, temperature extremes, and moisture (dew, humidity) are factors that are difficult to duplicate.
  - Inspect the vehicle for after-market electronic devices (vehicle locators, amps, radar detectors, etc) that may be hidden.

Service Precautions

- If the navigation unit needs to be replaced, inform the customer that personal information in the navigation system will be lost. If possible, have the customer record their personal information before the unit is replaced.
- Before disconnecting the battery, make sure you have the anti-theft codes for the radio and the navigation system, and write down the XM radio channel presets. Also obtain any PGM-FI or transmission DTCs and freeze frame date (which will be lost when the PCM loses power).
- When the battery is disconnected, the internal GPS clock is reset to "0:00". The clock will reset to the correct time after the system finishes GPS initialization.
- After reconnecting the battery, you have to wait to get the initial signal from the satellite. It will take from 10 to 45 minutes.
- Before returning the vehicle to the customer, enter the radio and navigation anti-theft security code, then enter the customer's XM radio channel presets, and set the clock.

(cont'd)

Protected by AR

General Troubleshooting Information (cont'd)

System Initialization

If for any reason, you lose power to the navigation system (like the battery was disconnected). The navigation system will require initialization. Once completed, your system will be ready to use.

This initialization requires the following:

- Entry of the 4-digit anti-theft security code to "unlock" the system
- GPS initialization (may not be needed depending of the length of time the system was without power)
- Map matching to align the GPS to a location on the map

Entering Security Code

The navigation system and audio unit have a coded theft protection circuit. Be sure to get the customer's anti-theft security codes number before;

- disconnecting the battery
- disconnecting the navigation unit 8P connector
- removing the No. 7 (10 A) fuse from the under-dash fuse/relay box

After service, reconnect power to the navigation unit, and turn the ignition switch ON (II). Enter the 4-digit anti-theft security code, then select "Done".

When replacing the navigation unit or audio unit, be sure to give the customer the new anti-theft security code.

GPS initialization

Depending on the length of time the battery was disconnected, your system may require GPS initialization. If it does, the following screen appears:

*****Wait*****
The system is acquiring its GPS signal. This could take up to 10 minutes.
• Engine must be running
• Vehicle must be parked outside, away from buildings
• Do not move the vehicle at this time

If this procedure is not necessary the system proceeds directly to the Disclaimer screen. During initialization, the system searches for all available GPS satellites, and obtains their orbital information. During this procedure the vehicle should be out in the open with a clear view of the sky.

If the navigation system finds the satellites properly, this box clears, and changes to the Disclaimer screen. If within 10 minutes the system fails to locate a sufficient number of satellites to locate your position, the following screen appears.

Navigation system is unable acquire a proper GPS signal.
• Move vehicle to another location
• Turn the ignition switch off
• Disconnect the battery for 30 minutes to clear the GPS receiver's memory
• Reconnect the battery and follow the screen prompts

If this is displayed, turn off the engine, then restart the vehicle. If you now see the Disclaimer screen, the GPS initialization is complete.

NOTE:
- The average acquiring time is less than 10 minutes, but it can take as long as 45 minutes.
- If the system is still unable to acquire a signal, follow the instructions on the screen. If this screen appears again, go to troubleshooting for the GPS icon is white (see page 22-453).

BACK

Protected by AR

Map Matching

This part of the initialization matches the GPS coordinates with a road on the map screen. To perform this part of the procedure, ensure that the navigation system is displaying a map, and drive the vehicle on a mapped road shown on the map screen. Do not enter a destination at this time. When the name of the current road you are driving on, appears at the bottom of the screen, the entire procedure is complete. Your system is now ready to use.

Obtaining A Navigation DVD

If the Navigation DVD is lost or damaged, or you need a yearly updated DVD, you have 2 ways to purchase one. You can either call (888) 291-4675, or order on-line at www.honda.com.

Both methods require a credit card. The DVD for this model has an orange label, and cannot be ordered through the parts system. The following DVDs will not work in this navigation system:

- Earlier or later model navigation DVDs (colored labels; white, black, or turquoise)
- Map software programs manufactured by other companies
- DVD movies, or DVDs containing audio recordings

Update DVDs are available for purchase usually in the fall of each year. They may contain the following:

- Enhanced maps and points of interest (POI) coverage
- Fixes for minor software bugs
- Additional features

NOTE: Updating is optional, and there is no program to provide free DVDs containing yearly mapping updates.

Audio-HVAC subdisplay does not work properly	Troubleshooting (see page 22-463)	• Navigation unit • Subdisplay unit • Harness/fuses/switches
Audio-HVAC subdisplay does not match time in set-up	Make sure H/U Time Send is ON. Go to H/U Time Send under functional set up (see page 22-474)	
Time is not correct	Reset Time Adjustment in set-up	
Navigation frequently asks for code and needs GPS initialization	Troubleshooting (see page 22-463)	• Navigation unit • Harness/fuses/switches
Some set-up and information functions of the navigation system are "grayed-out" do not work	Customer did not select "OK" from Disclaimer screen. Refer to System Function Diagram (see page 22-434)	
Previous Destinations button is dim and not selectable in the Enter destination by screen	The vehicle may be new, or the customer deleted the destination. Enter a destination, and allow the system to route to it. After the trip, the Previous Destinations button will be selectable.	
Today's Destinations button is dim and not selectable in the Enter destination by screen	The customer has not entered a group of locations for Today's Destinations. This is normal. The button is only selectable if the customer is using this function.	
Navigation system displays Extension when XM is selected in the audio screen	Wrong colored disc installed in the navigation unit. The DVD should have a white label. Install the correct color labeled disc.	

Protected by AR

Navigation System ('03-05 models)

System Description

Overview

The navigation system is a highly-sophisticated, hybrid locating system that uses satellites and a map database to show you where you are and to help guide you to a desired destination.

The navigation system receives signals from the global positioning system (GPS), a network of 24 satellites in orbit around the earth. By receiving signals from several of these satellites, the navigation system can determine the latitude, longitude elevation of the vehicle. In addition, signals from the system's yaw rate sensor and the ECM/PCM (vehicle speed pulse) enable the system to keep track of the vehicle's direction and speed of travel.

This hybrid system has advantages over a system that is either entirely self-contained or one that relies totally on the GPS. For example, the self-contained portion of the system can keep track of vehicle position even when satellite signals cannot be received. When the navigation system is on, the GPS can keep track of the vehicle position even when the vehicle is transported by ferry.

The navigation system applies all location, direction, and speed information to maps and calculates a route to the destination entered. As you drive to that destination, the system provides both visual and audio guidance.

This navigation system also has voice recognition that allows voice control of most of the navigation functions. The Talk and BACK buttons on the steering wheel activate the voice control. The voice control also allows control of the audio and climate control.

The navigation system provides a trip computer function. The fuel economy display is calculated by data provided by the ECM/PCM. The ECM/PCM provides fuel pulses via the F-CAN bus, and a dedicated speed signal. Trip computer screen data is approximate and will not agree with odometer or the customer's actual fuel consumed.

The illumination signal is used by the navigation unit to automatically switch the display between Night and Day brightness modes when Display is set to Auto. When the instrument panel brightness control is set to full brightness, the navigation system stays in the Day mode, even with the headlights on. Display unit button illumination is supplied through the audio unit. The illumination cancel signal (dash brightness full) is passed by the CAN bus to the navigation control unit.

The GA-NET bus provides communication between the navigation unit and the display unit. This bus also links the components in the audio-HVAC display module. The bus is used to pass button and touch-screen commands to the navigation unit. In addition, muting and voice control commands are sent to the display unit and the audio and climate control systems for processing. The audio unit uses the bus to control the XM-receiver or other accessories.

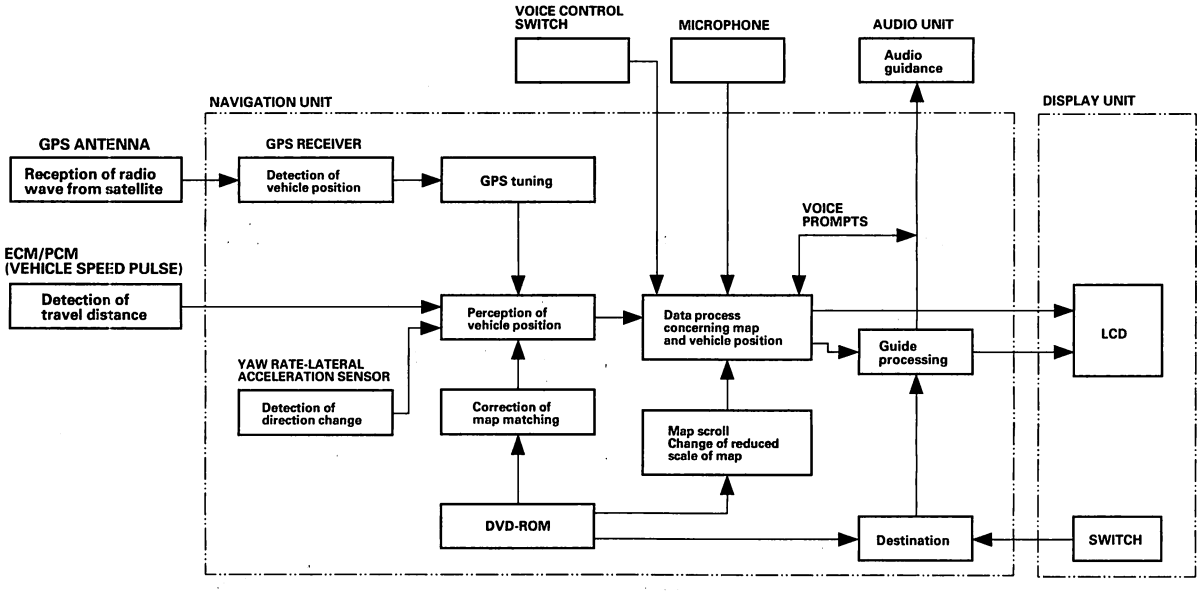
Navigation System ('03-05 models)

System Description (cont'd)

Navigation Function

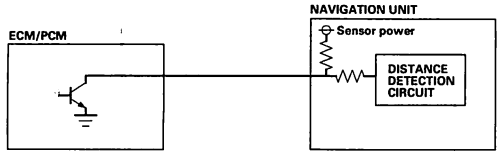
The navigation system is composed of the navigation unit, the ECM/PCM (vehicle speed signal), the GPS antenna, microphone, voice control switch, audio unit, climate control unit, and the display unit.

Function Diagram



Vehicle Speed Pulse

The vehicle speed pulse is sent by the ECM/PCM. The ECM/PCM receives a signal from the countershaft speed sensor, then it processes the signal and transmits it to the speedometer and other systems.

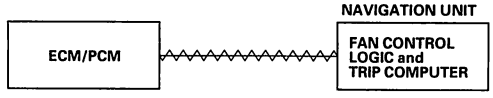


Charge Signal

The PCM sends a charge signal to the navigation unit via F-CAN. A thermister inside the navigation unit monitors the units internal temperature. This information combined with charge signal determines the control units internal cooling fan operation.

Fuel Use and Level Data

The navigation unit monitors the ECM/PCM fuel usage and tank level data via the F-CAN bus. The navigation system combines this information, the vehicle speed signal, GPS, and the map data for trip computer calculations.



BACK

Protected by AR

Yaw Rate Sensor

The yaw rate sensor (located in the navigation unit) detects the direction change (angular speed) of the vehicle. The sensor is an oscillation gyro built into the navigation unit.

Sensor Element Structure

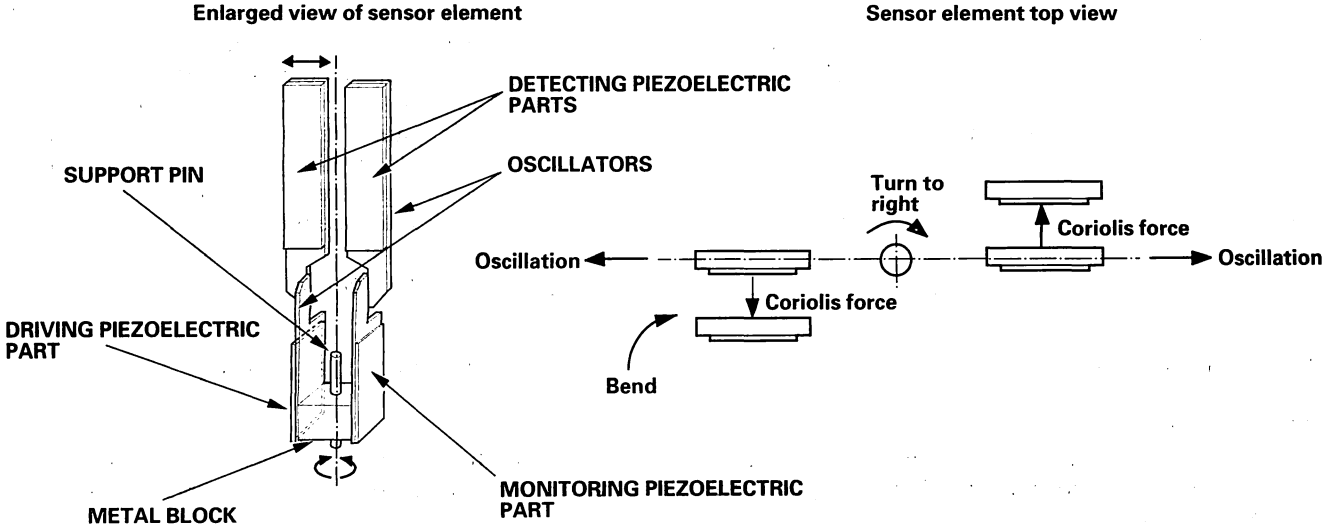
The sensor element is shaped like a tuning fork, and it consists of the piezoelectric parts, the metal block, and the support pin. There are four piezoelectric parts: one to drive the oscillators, one to monitor and maintain the oscillation at a regular frequency, and two to detect angular velocity. The two oscillators, which have a 90-degree twist in the center, are connected at the bottom by the metal block and supported by the support pin. A detection piezoelectric part is attached to the top of each oscillator. The driving piezoelectric part is attached to the bottom of one oscillator, and the monitoring piezoelectric part is attached to the bottom of the other oscillator.

Oscillation Gyro Principles

The piezoelectric parts have "electric/mechanical transfer characteristics." They bend vertically when voltage is applied to both sides of the parts, and voltage is generated between both sides of the piezoelectoric parts when they are bent by an external force. The oscillation gyro functions by utilizing this characteristic of the piezoelectric parts and "Coriolis force." (Coriolis force deflects moving objects as a result of the earth's rotation.) In the oscillation gyro, this force moves the sensor element when angular velocity is applied.

Operation

1. The driving piezoelectric part oscillates the oscillator by repeatedly bending and returning when an AC voltage of 6 kHz is applied to the part, The monitoring-side oscillator resonates because it is connected to the driving-side oscillator by the metal block.
2. The monitoring piezoelectric part bends in proportion to the oscillation and outputs voltage (the monitor signal). The navigation unit control circuit controls the drive signal to stabilize the monitor signal.
3. When the vehicle is stopped, the detecting piezoelectric parts oscillate right and left with the oscillators, but no signal is output because the parts are not bent (no angular force).
4. When the vehicle turns to the right, the sensor element moves in a circular motion with the right oscillator bending forward and the left oscillator bending rearward. The amount of forward/rearward bend varies according to the angular velocity of the vehicle.
5. The detecting piezoelectric parts output voltage (the yaw rate signal) according to the amount of bend. The amount of vehicle direction change is determined by measuring this voltage.



(cont'd)

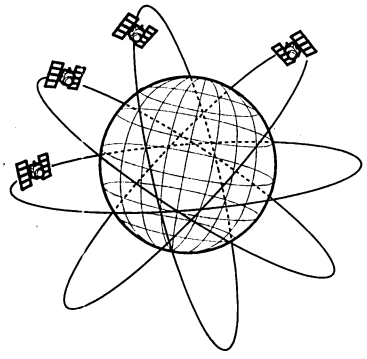
Protected by AR

Navigation System ('03-05 models)

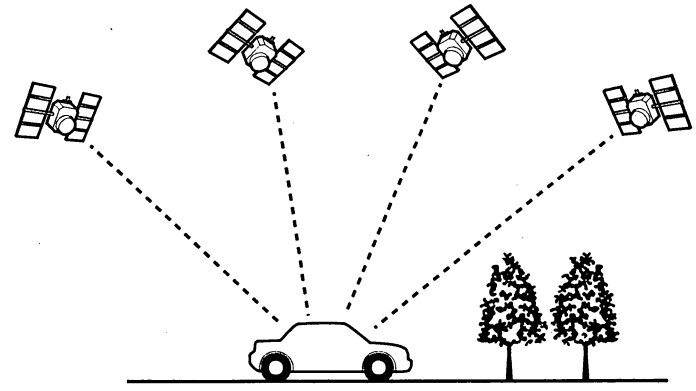
System Description (cont'd)

Global Positioning System (GPS)
The global positioning system (GPS) enables the navigation system to determine the current position of the vehicle by utilizing the signals transmitted from the satellites in orbit around the earth. The satellites transmit the satellite identification signal, orbit information, transmission time signal, and other information. When the GPS receiver receives a signal from three or more satellites simultaneously, it calculates the current position of the vehicle based on the distance to each satellite and the satellite is position in its respective orbit.

Position detection Image with GPS satellite



NOTE: Four satellites on each of 6 orbits.



Precision of GPS
The precision of the GPS varies according to the number of satellites from which signals are received and the view of the sky. The precision is indicated by the color of the GPS icon shown on the display.

GPS ICON	NUMBER OF SATELLITES	CONDITION	DESCRIPTION
White GPS icon	2 or less	Impossible to detect vehicle position	GPS function is normal. The satellite signals received by the GPS are too few to detect the vehicle position.
Green GPS icon	3	Vehicle position detectable in 2 dimensions	The longitude and latitude of the vehicle position can be detected. (Less precise than detection in three dimensions)
	4 or more	Vehicle position detectable in 3 dimensions	The longitude, latitude and the altitude of the vehicle position can be detected. (More precise than detection in two dimensions)
Not indicated	———	Faulty	The GPS can't be utilized due to a faulty GPS receiver, open in the wire, or other fault or interference.

GPS Antenna
The GPS antenna amplifies and transmits the signals received from the satellites to the GPS receiver.

GPS Receiver
The GPS receiver is built in the navigation unit. It calculates the vehicle position by receiving the signal from the GPS antenna. The vehicle position and signal reception condition is transmitted from the GPS receiver to the navigation control unit to adjust vehicle position.

BACK

Protected by AR

Navigation Unit
The navigation unit calculates the vehicle position and guides you to the destination. The unit performs map matching correction, GPS correction, and distance tuning. It also controls the menu functions and the DVD-ROM drive, and interprets voice commands. With control of all these items, the navigation unit makes the navigation picture signal, then it transmits the signal to the display unit and audio driving instructions to the audio unit.

Calculation of Vehicle Position
The navigation unit calculates the vehicle position (the driving direction and the current position) by receiving the directional change signals from the yaw rate sensor and the travel distance signals from the PCMs vehicle speed pulse (VSP) signal.

Map Matching Tuning
The map matching tuning is accomplished by indicating the vehicle position on the roads on the map. The map data transmitted from the DVD-ROM is checked against the vehicle position data, and the vehicle position is indicated on the nearest road. Map matching tuning does not occur when the vehicle travels on a road not shown on the map, or when the vehicle position is far away from a road on the map.

GPS Tuning
The GPS tuning is accomplished by indicating the vehicle position as the GPS's vehicle position. The navigation unit compares its calculated vehicle position data with the GPS vehicle position data. If there is large difference between the two, the indicated vehicle position is adjusted to the GPS vehicle position.

Distance Tuning
The distance tuning reduces the difference between the travel distance signal from the VSP and the distance data on the map. The navigation unit compares its calculated vehicle position data with the GPS vehicle position data. The navigation unit then decreases the tuning value when the vehicle position is always ahead of the GPS vehicle position, and it increases the tuning value when the vehicle position is always behind the GPS vehicle position.

Route Guidance
The navigation unit can calculate different routes to a selected destination. You have five options:

- Direct Route — Calculate a route that is the most direct.
- Easy Route — Calcute a route that minimizes the number of turns needed.
- Minimize Freeways — Calculate a route that avoids freeway travel. If that is not possible, keep the amount of freeway travel to a minimum.
- Minimize Toll Roads — Calculate a route that avoids, or minimizes travel on toll roads.
- Maximize Freeways — Calculate a route that uses freeways as much as possible.

Audio Guidance
The navigation unit transmits audio driving instructions before entering an intersection or passing a junction. The audio instructions come through the audio unit to the front speakers.

NOTE: The front speakers are muted whenever the navigation system is giving guidance commands, and all of the speakers when the voice control system is being used.

DVD-ROM
The DVD-ROM contains the following:

- MAP data
- POI database: Restaurants, and other points of interest
- NAVI Program: The DVD contains the software for each model that uses this DVD

Protected by AR

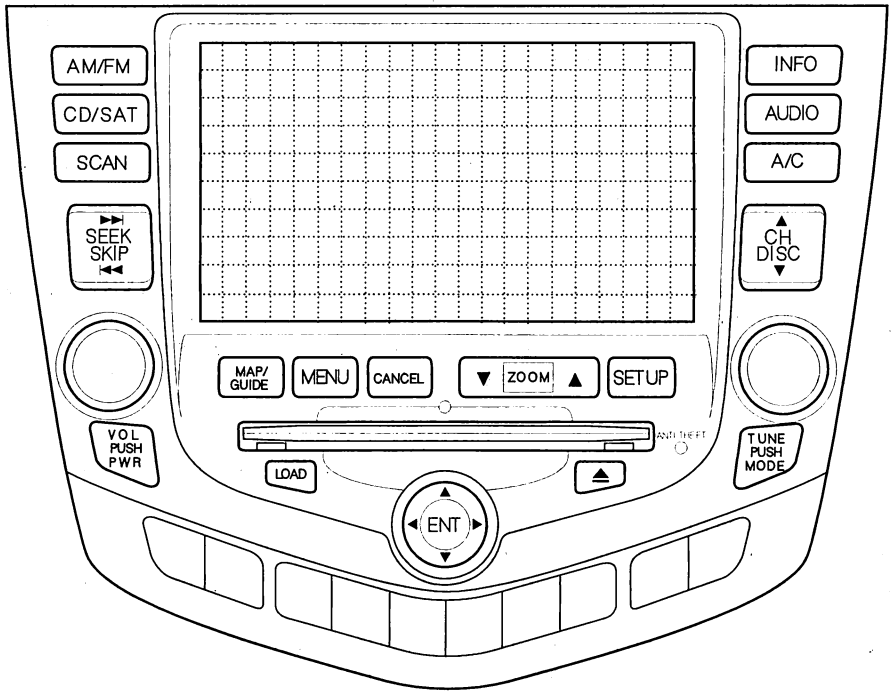
Navigation System ('03-05 models)

System Description (cont'd)

Audio Unit
The audio unit receives the audio driving instructions from the navigation unit and transmits the instructions through the front speakers even when the audio system is in use. The audio unit is also a termination point in the GA-Net bus.

Display Unit
The display unit uses liquid crystal display (LCD). The LCD is a 7-inch-diagonal, thin film transistor (TFT), stripe type with 280,800 picture elements, The color film and fluorescent light are laid out on the back of the liquid crystal film. The touch sensor on the front of the LCD is an infrared type with 20 vertical and 9 horizontal infrared rays to produce 180 sensing points. The display unit transmits the signal from each button and the touch screen command to the navigation unit using the GA-NET bus.

Infrared rays
('04-05 models shown)



- - - - - - - - - : **Infrared for touch screen commands**

Microphone
The microphone (on the ceiling, near the front map light) receives voice commands and transmits them to the navigation unit for interpretation.

Talk Button
Activates the voice control system in the navigation unit to accept voice commands.

Back Button
Returns the display to the previous screen (similar function as the CANCEL button).

Glossary

The following is a glossary of terms pertaining to the Voice Recognition Navigation System.

Item	Definition
Audio-HVAC subdisplay	The upper display that shows the time and current status of the audio and climate control systems.
Breadcrumbs	Off road tracking dots that can be followed on the map to retrace your route back to a mapped (digitized) road. This function can be turned on/off in Setup screen 1.
CAN	Controller Area Network. This communication network allows processors in the vehicle to send/receive information. The fuel pulses used by the trip computer are received from the PCM using the F-CAN (Fast Controller Area Network) bus.
B-CAN	Body CAN Bus (see CAN)
CPU	Central Processing Unit. The main device within the navigation unit that coordinates the rest of the electronic functions.
Database	This consists of the Map data, and the POI (Points Of Interest) data stored on the DVD
DBW	Drive By Wire. Allows electrical control of the throttle without the need of a mechanical linkage.
DCA	Detailed Coverage Area. Main metropolitan areas in the Lower 48 states, and Canada are mapped to this level. See the Navigation Owner's manual for a list of these areas.
DTC	Diagnostic Trouble Codes. Use the Honda PGM Tester, or HDS tablet to obtain, and troubleshoot the cause of these codes.
Dead Reckoning	The use of the speed signal, and yaw rate sensor to position the vehicle on the map even when the GPS signal is obscured by tall buildings, or while driving in a tunnel.
Digitized Road	A road that appears on the navigation screen. The road name will appear at the bottom of the navigation screen. If the user drives "off road", the navigation system will display "Not on a digitized road", and if 1/2 mile, then "breadcrumbs" will appear.
Disclaimer Screen	Screen containing cautionary information. It is meant to be read carefully and acknowledged by the customer when using the navigation system.
DVD or DVD-ROM	Digital Versatile Disk. The navigation program and database resides on this disk. See the Navigation Owner's Manual for information on how to order a replacement or update DVD.
ECM	Engine Control Module. Typically referred to as the PCM.
E/T	Elapsed Time for the current trip as displayed by the trip computer screen.
Extension	A term displayed by the navigation system when an "unknown" input has been selected (for example "XM" was selected). This is only displayed when the wrong version software is installed in the navigation unit.
FAQ	Frequently Asked Question. See the Navigation Owner's Manual for a list of the customer FAQs, and troubleshooting information.
F-CAN	Fast CAN Bus (see CAN)
FE	Fuel Economy value as displayed on the trip computer screen.
Fuel Pulses	This signal is transmitted on the CAN bus, and is used by the Trip Computer to calculate the fuel economy.
GPS	Global Positioning System. A network of 24 satellites in orbit around the earth. The navigation system can simultaneously receive signals from up to 12 satellites to accurately position the vehicle on the map.
HDS	Honda Diagnostic System. A hand held tablet PC for use in diagnosing vehicle problems. This device can be used to obtain DTC codes for diagnosis of navigation system CAN related problems.
H/U	Head Unit. The navigation system display unit assembly in the dash.
Initialization	This refers to the period needed to re-acquire the GPS satellite orbital information whenever the navigation system power has been disconnected. This can take from 10 to 45 minutes.
LCD	Liquid Crystal Display (the navigation screen)

Navigation System ('03-05 models)

System Description (cont'd)

Item	Definition
Map Matching	The received GPS information allows the navigation system to position the vehicle on the map. Map matching has occurred if the map screen is displaying the current street name in the bottom-shaded area.
Mic	Abbreviation for the microphone used for receiving voice commands. It is located near the map light in the ceiling.
Model (in the diagnosis Version screen)	A "model code" stored on an internal "chip" in the navigation unit. The model code tells the navigation unit what software to load. Every navigation unit "model" has a unique part number for the navigation unit.
MW	Maneuver Window. While on-route to a destination, this window displays information about the next maneuver.
Navi	Abbreviation for the Navigation System
Off Route	This occurs when the user leaves mapped roads. Off road tracking dots ("breadcrumbs") are displayed if the option is enabled in Setup. The user can use them to return to a mapped road. The bottom of the navigation screen will say "Not on a digitized road".
Outlying Areas	These are rural areas that typically have only their main roads mapped. All other roads are shown in light brown for reference only, since they have not been verified.
PC Card Slot	The PC Card (PCMCIA, type II) slot is for factory use only. Make sure that the sliding door is closed at all items. If opened, an error message is displayed on the screen.
PCM	Powertrain Control Module. This unit supplies the navigation system speed signal, and sends fuel pulses for the trip computer function via the F-CAN network.
PCMCIA	A computer industry defined term referring to the PC Card slot standard.
PGM Tester	A Honda diagnostic tool for use in diagnosing vehicle problems.
PIN	Personal Identification Number. A random 4 digit number created by the customer to protect personal information.
POI	Point Of Interest. These are the businesses, schools etc. found under the "places" option on the main menu.
Polygon	Colored areas on the map screen denoting parks, schools etc. See the Navigation Owner's Manual "Traveling to Your Destination" for a list of the assigned colors.
QWERTY	Keyboard layout resembling the typewriter keys. The keyboard layout can be changed to an alphabetical layout in the Setup mode.
SCS connector	The 2-pin connector used to put the navigation system into the diagnostic mode.
Security Code	Code needed to activate the navigation system. The security code can be obtained from the "iN" by entering the navigation system control serial number. The serial number can be found from the diagnostic screens (Unit Check, Navi ECU), or from the under side of the control unit.
Touch Switches or Touch Sensor	The sides of the navigation screen have 9 vertical and 20 horizontal infrared beams that are interrupted by the user's finger to select the desired function.
Tuning	A continual update of internal navigation system scaling factors. See the individual sensor tuning discussions under either "System Description", or "System Diagnosis Mode" (see page 22-464) in this manual.
Unverified Streets	These streets have not been verified for turn restrictions, one-way, etc. They are shown in light brown on the map. You can enter address destinations in these areas, but voice guidance ends at the last verified street closest to your destination.

BACK

Protected by AR

Item	Definition
Verified Streets	These streets consist of the detailed metropolitan coverage areas, and all other inter-town connection roads. These roads are shown in black on the map.
VP	Vehicle Position. When in map mode, this circular icon shows the vehicle position on the map. Touch this icon to show the latitude, longitude, and elevation of your current position.
VR	Voice Recognition. This allows voice control of many of the navigation functions. The hardware consists of the microphone, steering wheel (Talk/Back) buttons, and the front speakers. See the overview for more information.
VSP	Vehicle Speed Pulse. This pulse signal coming from the PCM is used to update the Vehicle position on the map, and to calculate the trip computer fuel economy. These pulses do not indicate direction (forward or backward). When in reverse, the navigation receives a signal from the MICU and directs the VP to move backwards on the map.
VSS	Vehicle Speed Sensor. This sensor reads the output shaft speed at the transmission and, provides a speed pulse to the PCM. The PCM sends this pulse to the navigation system and speedometer.
XM Satellite Radio	A satellite band radio system where signals are received from either a satellite or land based transmitters.
Yaw Sensor	This device is located in the navigation system control unit and senses the side-to-side twisting force generated when the vehicle turns.

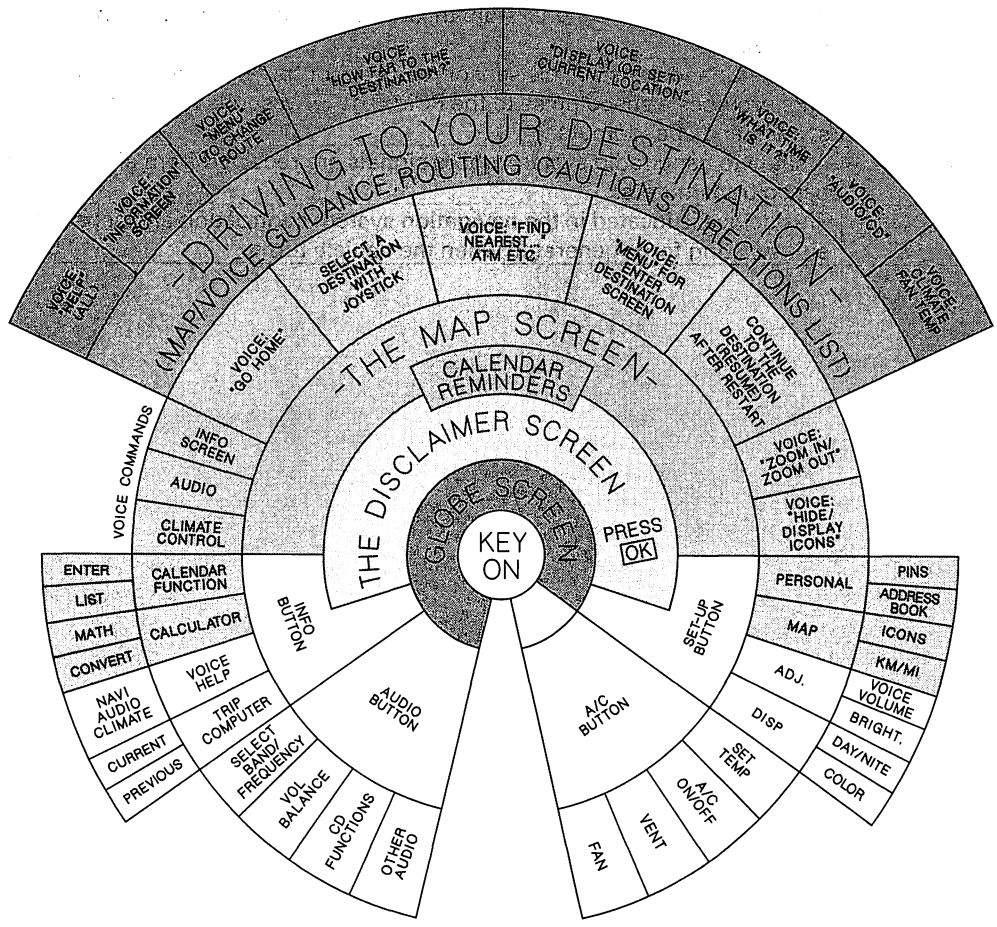
Navigation System ('03-05 models)

System Description (cont'd)

System Function Diagram
This diagram shows the features of the navigation system starting at the center and working outward in layers. The navigation program starts at "Key ON", and then displays the globe screen. Once the disclaimer screen is acknowledged, the next shaded portions of the diagram become active. However, some functions of the INFO and SET UP buttons, and all functions of the AUDIO and A/C buttons can be accessed immediately after the globe screen (white).

These items above the map screen show various methods to begin a destination, such as "Go Home". Once you begin driving to your destination, you are provided with map/voice guidance, routing cautions (in unverified areas), and a directions list. While driving to your destination, use the voice control system as much as possible to interact with the navigation, audio, and climate control systems.



- Functions accessible at any time
- Disclaimer screen
- Map screen/voice commands to enter a destination
- Driving to your destination
- Voice commands while driving to your destination
- Globe screen

Diagnostic Function Diagram

This diagram shows the diagnostic slice of the System Function Diagram. It has the diagnostic features of the navigation system starting at the center and working outward in layers. The diagnostic starts at "Key ON," and then displays the Diagnostic Main Menu (Select Diagnosis items) after:

- Starting the vehicle with the SCS connector plugged in to the navigation service check connector (see page 22-480) to get to the System Links screen, then selecting Return.
- Simultaneously pressing and holding the MENU, MAP/GUIDE, and CANCEL buttons.

The diagram shows the available menu choices starting at the buttom left and moving clockwise.
You will find a detailed explanation of each feature on the given page numbers.
In most cases, do not clear or change settings in any diagnostic screen unless instructed to do so in the explanation or by the factory. If the factory supplies you with a PCMCIA card to place in the PC slot, then the features specified in the diagram with "Card" are available.

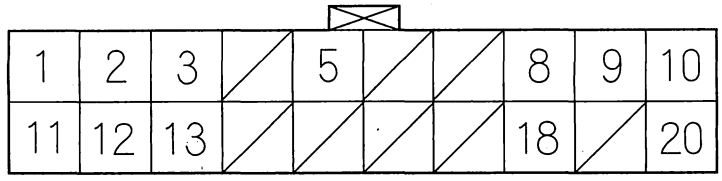
Navigation System ('03-05 models)

System Description (cont'd)

Navigation Unit Inputs and Outputs for Connector A (20P)



Wire side of female terminals

Terminal Number	Wire Color	Terminal Name	Description	Voltage (about)	Symptom
1	WHT	R SIG (Red signal)	Red color signal	0—1 V AC	If open: Red color missing (see "RGB Color" diagnostic). If short to ground: Red color missing (see "RGB Color" diagnostic).
2	RED	G SIG (Green signal)	Green color signal	0—1 V AC	If open: Green color missing (see "RGB Color" diagnostic). If short to ground: Green color missing (see "RGB Color" diagnostic).
3	GRY	SH SIG (Shield signal)	Shield for terminal No. 1, 2, 11, 12, 13	0 V	If open: No change to display. If short to ground: No change to display.
5	RED/BLK	ILL (+) (Illumination positive)	Parking light on signal from dash and console lights, under-hood "Relay fuse box"	Lights on= battery voltage, Lights off=0 V	If open: When brightness="Auto", night mode for the display is inoperative when lights on. If short to ground: Blows fuse 4 in under-hood fuse/relay box.
8	WHT	CAN-H (CAN high)	F-CAN bus communication with the "gauge control module"	Pulses 2.5—6 V average 3 V	If open: 1) System Links FI-ECU, and Meter both show "NG". 2) F-CAN diagnostic="NG". 3) B-CAN diagnostic="NG". 4) Car status CHG (CAN)=0. 5) Functional Setup, Trip into, FUP & Sampled FL=0. If short to ground: Same diagnostic conditions as when open, and also sets the following DTCs. • B1168 Gauge Control Module loss of Comm. (Engine) • B1169 Gauge Control Module loss of Comm. (A/T) • B1178 F-CAN communication Circuit error. • U0073 (F-CAN Bus off) • U0155 (F-CAN Gauge control) • U0121 (F-CAN TCS control)
9	GRN/BLK	SH DISP BUS (Shield display bus)	Shield for display bus terminal No. 10, 20	0 V	If open: No change to display. If short to ground: No change to display.
10	RED/WHT	DISP BUS (+) (Display bus positive)	Date bus (+) GA-Net	0 V—5 V pulses average 2.5 V depends on bus traffic	If open: Navigation buttons and touch screen do not work. If short to ground: Navigation buttons and touch screen do not work.

Symptom Troubleshooting

No picture is displayed

NOTE
- Always check the connectors for poor connections or loose terminals.
- Diagnostic Test: Navi System Link

1. Check the No. 7 (10 A) fuse and No. 32 (7.5 A) fuse in the under-dash fuse/relay box, and reinstall the fuse if it is OK.

   Is the fuse OK?

   YES—Go to step 2.

   NO—Replace the fuse and recheck. ■

2. Turn the ignition switch to ACC (I).

3. Operate the radio and listen to the audio.

   Can audio be heard?

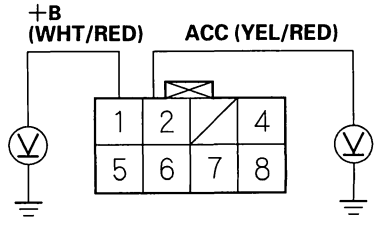
   YES—Go to step 4.

   NO—Check the ACC circuit. ■

4. Turn the ignition switch ON (II).

5. Measure the voltage between body ground and navigation unit connector C (8P) terminals No. 1 and No. 2 individually.

NAVIGATION UNIT CONNECTOR C (8P)



Wire side of female terminals

Is there battery voltage?

YES—Go to step 6.

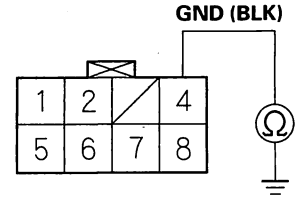
NO—If the +B wire does not have voltage, repair open in the wire between the under-dash fuse/relay box and the navigation unit.
If the ACC wire does not have voltage, repair open in the wire between the under-dash fuse/relay box and the navigation unit. ■

6. Turn the ignition switch OFF.

7. Disconnect the navigation unit connector C (8P).

8. Check for continuity between navigation unit connector C (8P) terminal No. 4 and body ground.

NAVIGATION UNIT CONNECTOR C (8P)



Wire side of female terminals

Is there continuity?

YES—Go to step 9.

NO—Repair open in the wire between the navigation unit and body ground (G603). ■

9. Reconnect the navigation unit connector C (8P).

10. Perform the forced starting of the display (see page 22-480).

    Is the diagnosis menu of the picture diagnosis displayed?

    YES—Go into the Diagnostic mode and use the "Navi System Link" diagnostic (see page 22-465) to check the links. ■

    NO—Go to step 11.

(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

11. Shield the display unit from the sun with your hand, and check that the display is back lit (only back light is ON.)

    Can you see the back light?

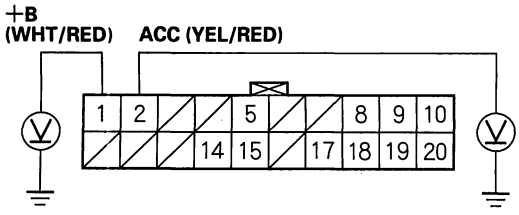
    YES—Replace the navigation unit (see page 22-481).■

    NO—Go to step 12.

12. Turn the ignition switch ON (II).

13. Measure the voltage between body ground and display unit connector B (20P) terminal No. 1 and No. 2 individually.

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there battery voltage?

YES—Replace the display unit.■

NO—If the +B wire does not have voltage, repair open in the wire between the under-dash fuse/relay box and the navigation unit.
If the ACC wire does not have voltage, repair open in the wire between the under-dash fuse/relay box and the navigation unit.■

Picture is missing a color or tone

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.

1. Go into the Diagnostic Menu and use "RGB Color" test under Monitor Check (see page 22-467).

   Are the red, green, and blue colored circles shown?

   YES—The system is OK at this time.■

   NO—Go to step 2.

2. Turn the ignition switch to OFF.

3. Disconnect the navigation unit connector A (20P) and display unit 20P connector.

4. Check for loose terminals at navigation unit connector A (20P) and display unit 20P connector.

   Are there loose terminals?

   YES—Repair the terminal.■

   NO—Go to step 5.

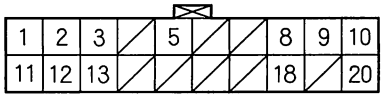
BACK

Protected by AR

5. Check for continuity between the appropriate terminals of navigation unit connector A (20P) to display unit connector B (20P) based on the missing color(s).

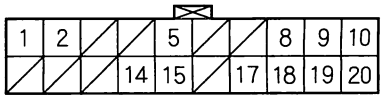
Missing color	Navigation unit connector A (20P)	Display unit connector B (20P)	Wire color
Blue	A11	B18	YEL
Green	A2	B9	RED
Red	A1	B8	WHT

NAVIGATION UNIT CONNECTOR A (20P)



Wire side of female terminals

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there continuity?

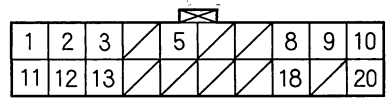
YES—Go to step 6.

NO—There is an open in the circuit between the display unit and the navigation unit. Check for poor connections or loose terminals at the display and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness.■

6. Check for continuity between the appropriate terminals of navigation unit connector A (20P) and display unit connector B (20P) based on the missing color(s).

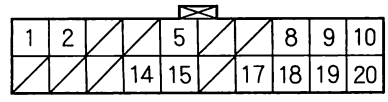
Missing color	Navigation unit connector A (12P)	Display unit connector B (20P)
Blue	A11	B10, B20
Green	A2	B10, B20
Red	A1	B10, B20

NAVIGATION UNIT CONNECTOR A (20P)



Wire side of female terminals

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there continuity?

YES—There is a short to body ground in the circuit between the display unit and the navigation unit. Replace the affected shielded harness.■

NO—Replace the navigation unit. If the problem is still unresolved, replace the display unit.■

BACK

Protected by AR

Symptom Troubleshooting (cont'd)

Picture has lines/rolls/other issues

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.

1. Check for electronic aftermarket accessories (possibly hidden) mounted near the display unit or the navigation unit.

   Are there any electronic accessories?

   YES—Disable the accessories, and recheck. ■

   NO—Go to step 2.

2. Start up the navigation picture.

   Is the picture scrolling horizontally (left to right or right to left)?

   YES—Check for an open or short to ground in the C SIG wire from navigation unit connector A (20P) terminal No. 12 to display unit connector B (20P) terminal No. 19. Also check for a short to ground between display unit connector B terminal No. 19 and terminal No. 20. ■

   NO—Go to step 3.

3. Go into the Diagnostic mode and use "RGB Color" test under Monitor Check (see page 22-467).

   Is the picture missing a red, green or blue color?

   YES—Do the troubleshooting for the picture is missing a color or tone (see page 22-448). ■

   NO—Go to step 4.

4. Turn the ignition switch OFF.

5. Substitute a known-good display unit, and recheck.

   Is the picture OK?

   YES—Replace the original display unit. ■

   NO—Replace the navigation unit (see page 22-481). ■

BACK

Protected by AR

Display unit buttons or touch screen buttons do not work or respond properly

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.

1. Turn the ignition switch to ACC (I).

2. Go into the Diagnostic mode and use the "Touch Panel" test under Monitor Check (see page 22-467) and, if necessary, the "Display" test under Unit Check (see page 22-469).

   Do the buttons work properly?

   YES—System is OK.■

   NO—Go to step 3.

3. Try all the buttons on the navigation system.

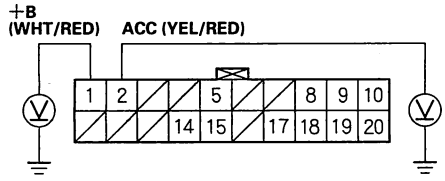
   Is there a specific row or columns of buttons, set of button, or a certain button that does not respond properly (i.e. pressing a button in the lower left corner causes a button in the right lower corner to respond.)?

   YES—Replace the display unit.■

   NO—Go to step 4.

4. Measure the voltage between body ground and display unit connector B (20P) terminal No. 1 and No. 2 individually.

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there battery voltage?

YES—Go to step 5.

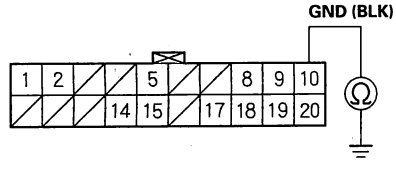
NO—If the +B wire does not have voltage, repair the open in the wire between the under-dash fuse/relay box and the display unit. If the ACC wire does not have voltage, repair the open in the wire between the under-dash fuse/relay box and the display unit.■

5. Turn the ignition switch OFF.

6. Disconnect the display unit connector B (20P).

7. Check for continuity between display unit connector B (20P) terminal No. 10 and body ground.

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there continuity?

YES—Go to step 8.

NO—Repair the open in the wire between the display unit and body ground (G503).■

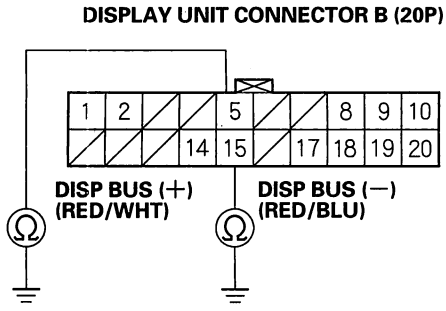
8. Disconnect the navigation unit connector A (20P).

(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

9. Check for continuity between body ground and display unit connector B (20P) terminal No. 5 and No. 15 individually.



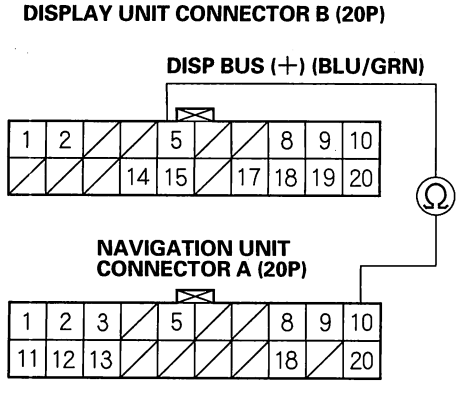
Wire side of female terminals

Is there continuity?

YES—There is a short to body ground in the circuit between the display unit and the navigation unit. Replace the affected shielded harness.■

NO—Go to step 10.

10. Check for continuity between display unit connector B (20P) terminal No. 5 and navigation unit connector A (20P) terminal No. 10.



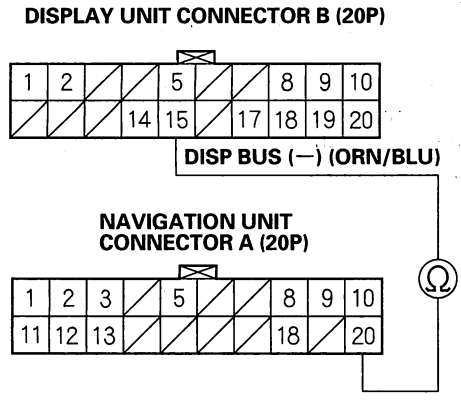
Wire side of female terminals

Is there continuity?

YES—Go to step 11.

NO—There is an open in the circuit between the display unit and the navigation unit. Check for poor connections or loose terminals at the display and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness.■

11. Check for continuity between display unit connector B (20P) terminal No. 15 and navigation unit connector A (20P) terminal No. 20.



Wire side of female terminals

Is there continuity?

YES—Replace the display unit.■

NO—There is an open in the circuit between the display unit and the navigation unit. Check for poor connections or loose terminals at the display and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness.■

GPS icon is white, or not shown

NOTE:
- Make sure the vehicle is parked outside and away from buildings.
- Refer to GPS Information (see page 22-472) for realtime satellite reception display.

1. Check for metallic window tint on the windshield and electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the navigation unit.

   Is there metallic window tint or electronic accessories?

   YES—Remove tint or the accessories and recheck. ■

   NO—Go to step 2.

2. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-465) to check the GPS antenna.

   Is "GPS Ant" icon red?

   YES—Use the "Navi ECU" test under Unit Check (see page 22-469) to check for a kinked, crushed, or disconnected GPS antenna wire. If necessary, try a known-good GPS antenna. If icon is still red, replace the navigation unit. ■

   NO—Check that nothing is blocking the GPS antenna located under the rear shelf and recheck. Sudstitute a known-good navigation unit, and recheck. ■

Voice guidance cannot be heard

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, write down the customer's radio station presets, and get the radio and navigation system anti-theft codes.
- After troubleshooting, enter the radio and navigation system anti-theft codes, and the radio station presets.

1. Press the display unit SET-UP button.

2. Check the volume setting for the navigation system.

   Is it set to OFF?

   YES—Set the volume to an audible level. ■

   NO—Go to step 3.

3. Check the radio operation.

   Can you hear the radio?

   YES—Go to step 4.

   NO—Troubleshoot the audio system. ■

4. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-465) to check the radio.

   Is "Radio" icon red?

   YES—Troubleshoot the audio system. ■

   NO—Go to step 5.

5. Turn the ignition switch OFF.

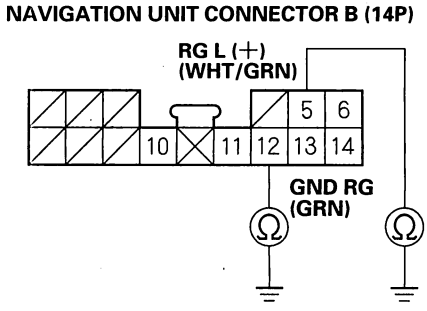
6. Disconnect the navigation unit connector B (14P) and the audio unit connector A (20P).

(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

7. Check for continuity between body ground and navigation unit connector B (14P) terminals No. 5, No. 12 individually.



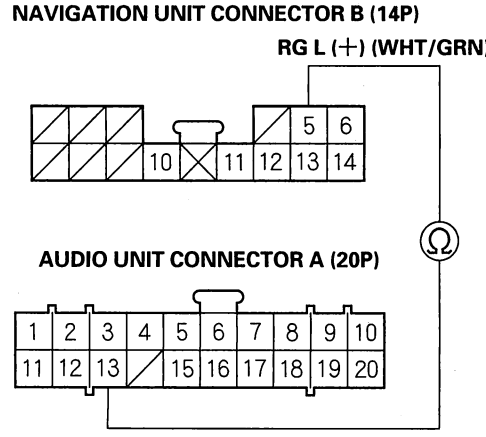
Wire side of female terminals

Is there continuity?

YES—Replace the affected shielded harness. ■

NO—Go to step 8.

8. Check for continuity between navigation unit connector B (14P) terminal No. 5 and the audio unit connector A (20P) terminal No. 13.



Wire side of female terminals

Is there continuity?

YES—Go to step 9.

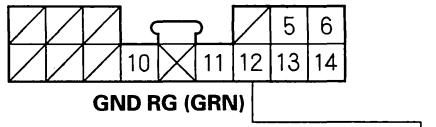
NO—There is an open in the circuit between the navigation unit and audio unit. Check for poor connections or loose terminals at the audio and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness. ■

BACK

Protected by AR

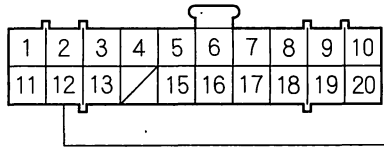
9. Check for continuity between navigation unit connector B (14P) terminal No. 12 and the audio unit connector A (20P) terminal No. 12.

NAVIGATION UNIT CONNECTOR B (14P)



GND RG (GRN)

AUDIO UNIT CONNECTOR A (20P)



Wire side of female terminals

Is there continuity?

YES—Go to step 10.

NO—There is an open in the circuit between the navigation unit and audio unit. Check for poor connections or loose terminals at the audio and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness. ■

10. Substitute a known-good audio unit, and recheck.

Is the system OK?

YES—Replace the original audio unit. ■

NO—Replace the navigation unit (see page 22-481). ■

Voice control does not work/respond

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, write down the customer's radio station presets, and get the radio and navigation system anti-theft codes.
- After troubleshooting, enter the radio and navigation system anti-theft codes, and the radio station presets.

Before assuming that a voice complaint is hardware related, ensure that the voice control system is being operated correctly.

- Make sure you are on the correct screen when trying to issue a voice command. For instance, the command "Find the nearest Italian Restaurant" only works on a Map screen.
  (See the Navigation System Manual for a complete list of allowed voice commands for the information being displayed.)
- Close the windows and moonroof.
- Set the fan speed to low (1 or 2).
- Adjust the air flow from the air conditioning vents so that they do not blow against the microphone on the ceiling.
- Pause after pressing the TALK button, then give a voice command clearly in a natural speaking voice. If the system cannot recognize your command, speak louder.
- If the microphone picks up voices other than yours, the system may not interpret your voice commands correctly.
- If you speak a command with something in your mouth, or your voice is too husky, the system may misunderstand your command.

(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

1. Go into the Diagnostic Menu and use the "Mic Level" test the under Functional Setup (see page 22-474) to check the operation of the TALK and BACK buttons.

   Are the TALK and BACK buttons operational?

   YES—Go to step 2.

   NO—Check for an open or short to ground on navigation unit connector B (14P) terminal No. 10. ■

2. Use the "Mic Level" diagnostic under Functional Setup (see page 22-474) to check the operation of the microphone.

   Is the microphone operational?

   YES—Check the operation of the voice control system (see the Navigation System Manual). ■

   NO—Check for a loose front map light (microphone) assembly. If OK, check for an open or short to ground on navigation unit connector B (14P) terminals No. 6 and No. 14. ■

Vehicle position icon constantly leaves road or is very far from actual position

1. Check the GPS icon on the navigation picture.

   Is the GPS icon white?

   YES—Do the troubleshooting for GPS icon is white, or not shown (see page 22-453). ■

   NO—Go to step 2.

2. Go into the Diagnostic Menu and use the "Yaw Rate" test (see page 22-473) to check the yaw rate sensor.

3. Go into the Diagnostic Menu and use the "Car Status" test (see page 22-471) to check the vehicle speed pulse.

   Are the yaw rate sensor and vehicle speed pulse OK?

   YES—The problem may be normal. Check to see if the problem occurs in the same place. If it does, the problem could be in the database. Go to step 4.

   NO—If the problem is the yaw rate sensor, replace the navigation unit (see page 22-481). If the problem is the vehicle speed pulse, troubleshoot the vehicle speed signal circuit. ■

4. Substitute a known-good navigation unit and check to see if the problem occurs in the same place.

   Does the problem occur in the same place?

   YES—The problem is in the database. Report the problem according to the Navigation System Manual under "Reporting Errors". ■

   NO—Replace the original navigation unit (see page 22-481). ■

BACK

Protected by AR

DVD screen error messages

NOTE:
- Check the Navigation System Manual for a list of common DVD screen error messages and the probable cause.
- Go into the Diagnostic Menu and use the "Car Status" test (see page 22-471) to check the status of the DVD lid.

1. Check the DVD-ROM reading surface for scratches.

   Are there scratches?

   YES—Replace the DVD-ROM (see page 22-480). ■

   NO—If the problem occurs occasionally when the system is cold, this is normal. If the problem occurs frequently when driving, replace the navigation unit (see page 22-481). ■

Trip computer-no distance

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- If the Previous button on the Trip Computer screen is not active, make sure to answer OK to the Disclaimer screen.
- Verify that the correct navigation unit is installed for this model. Go into the Diagnostic Menu and use "Version" (see page 22-478).

1. Go into the Diagnostic Menu and use the "Car Status" test (see page 22-471) to check for a vehicle speed pulse (VSP).

   Is there a VSP when the vehicle is moving?

   YES—Check the CAN system for DTCs. If OK, replace the navigation unit. ■

   NO—Check the VSP wire for an open or short to power or ground. ■

Protected by AR

Symptom Troubleshooting (cont'd)

Trip computer-no fuel information

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- If the Previous button on the Trip Computer screen is not active, make sure to answer OK to the Disclaimer screen.
- Verify that the correct navigation unit is installed for this model. Go into the Diagnostic Menu and use "Version" (see page 22-478).

Do the "Navi System Link" test (see page 22-465) to check the communication line between the ECM/PCM (FI-ECU) and the navigation unit.

1. Go into the Diagnostic Menu and use "Trip Information" test under Functional Setup (see page 22-474) with the engine running.

   Are the values greater than zero?

   YES—The system is OK.■

   NO—Check the CAN system for DTCs. If OK, replace the navigation unit.■

Navigation cannot control A/C

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- Verify that the correct navigation unit is installed for this model. Go into the Diagnostic Menu and use "Version" (see page 22-478).

1. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-465).

   Is "Air-con" icon red?

   YES—Do the climate control system troubleshooting.■

   NO—Check for an open or short to ground between display unit connector A (5P) terminals No. 2, No. 3 No. 4 and climate control unit connector A (16P) terminals No. 16, No. 15, No. 8. If OK, check the climate control system for normal operation. If the climate control system works properly, substitute a known-good display unit and recheck.■

BACK

Display day/night mode does not work

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- Full brightness on the instrument panel brightness control causes the system to stay in the day mode, even when the lights are on.

1. Make sure the instrument panel brightness control is not on full brightness.

2. Change the day/night mode to AUTO under Set-up and recheck.

   Does the display change to day and night modes using the headlights?

   YES—The system is OK at this time. ■

   NO—Go to step 3.

3. Go into the Diagnostic Menu and use the "Car Status" test to check for an ILL signal (see page 22-471).

   Is "ILL" signal OK?

   YES—The system is OK. ■

   NO—Check the ILL+ circuit between the navigation unit and relay module. ■

System locks up constantly

1. Start the engine and turn the ignition switch OFF, then turn the ignition switch ON (II).

   Does the system reboot?

   YES—The system is OK at this time. ■

   NO—Check the DVD for scratches or damage and the navigation unit for water damage. If OK, go into the Diagnostic Menu and do all of the "Unit Check" tests (see page 22-469). ■

Protected by AR

Symptom Troubleshooting (cont'd)

Vehicle icon wanders across the map when driving (does not follow a displayed road) or spins when driving

NOTE: This symptom is caused by a defective yaw rate sensor. Perform this diagnostic when the vehicle is cold and warm.

1. Go into the Diagnostic Menu and use the "Yaw Rate" test (see page 22-473).

   Are the values correct?

   YES—The system is OK. ■

   NO—Replace the navigation unit (see page 22-481). ■

Navigation drives by itself when parked

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft code.
- After troubleshooting, re-enter the anti-theft code, and re-initialize the navigation system.

1. Start the engine.
2. From the main menu, select places, then select any destination, and begin the trip.
3. With the vehicle parked, watch the vehicle icon on the display.

   Does the vehicle position icon move by itself?

   YES—Go to step 4.

   NO—The system is OK at this time. ■
4. Go into the Diagnostic Menu and select "Demonstration" test (see page 22-474) under Functional Setup.

   Is "Demonstration Mode" set to "YES"?

   YES—Set the Demonstration mode to "NO". ■

   NO—Replace the navigation unit (see page 22-481). ■

BACK

Protected by AR

Navigation stays on with ignition switch off

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft code.
- After troubleshooting, re-enter the anti-theft code, and re-initialize the navigation system.

1. With the key out of the ignition.

   Does the navigation screen stay on?

   YES—Go to step 2.

   NO—The system is OK at this time. ■

2. The vehicle may have been used as a demonstration vehicle at an event like an auto show. In these events, power is often jumpered to the navigation system so that the ignition key is not needed in the vehicle. At the end of the show, the jumper wire may not have been removed. Check the navigation unit "C" connector (8P) for a "non-factory" jumper wire in series with the factory cable.

   Is there a jumper wire?

   YES—Remove the jumper wire, and re-test. ■

   NO—Go to step 3.

3. The display or audio unit may have been jumpered behind the dash to allow the navigation system to run without the ignition key.

   Does the radio function with the ignition switch off?

   YES—Go to step 4.

   NO—Go to step 5.

4. Remove the display unit and check to see if the audio 20P connector has a non-factory jumper wire in series with the factory connector.

   Is there a jumper wire?

   YES—Remove the jumper wire, and re-test. ■

   NO—Go to step 5.

5. Check the interior lights with the ignition switch off.

   Can you turn on the interior lights with the ignition switch off?

   YES—Troubleshooting the ACC circuit. ■

   NO—Replace the navigation unit (see page 22-481). ■

Protected by AR

Symptom Troubleshooting (cont'd)

Navigation cannot control audio/CD

1. Make sure the anti-theft code for the audio system is entered.
2. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-465).

   Is for "Radio" icon red?

   YES—Do the troubleshooting for the voice guidance cannot be heard (see page 22-453). ■

   NO—Go to step 3.
3. Substitute a known-good navigation unit (see page 22-481), and recheck.

   Can the navigation control audio/CD?

   YES—Replace the original navigation unit (see page 22-481). ■

   NO—Do the audio system troubleshooting. ■

Navigation cannot control XM radio

1. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-465).

   Is the "XM" icon red?

   YES—Check the connector at the XM receiver. ■

   NO—Go to step 2.
2. Substitute a known-good navigation unit (see page 22-481), and recheck.

   Can the navigation control the XM radio?

   YES—Replace the original navigation unit (see page 22-481). ■

   NO—Do the audio system troubleshooting. ■

BACK

Protected by AR

Audio-HVAC subdisplay does not work properly

1. Check the clock. Reset if necessary.

   Does the clock reset?

   YES—The system is OK at this time. ■

   NO—Go to step 2.

2. Check for an open or short to body ground between subdisplay unit 10P connector terminal No. 4, No. 5, No. 6, No. 7 and navigation unit connector A (10P) terminal No. 4, No. 5, No. 6, No. 7.

   Are the circuits OK?

   YES—Replace the navigation unit. ■

   NO—Repair the circuits. ■

Navigation frequently asks for code and needs GPS initialization

1. Check for an open on navigation unit connector C (8P) terminals No. 1 and No. 2.

   Are the circuits OK?

   YES—Replace the navigation unit. ■

   NO—Repair the circuits. ■

Protected by AR

System Diagnosis Mode

Start-up procedure and Diagnosis Menu

There are two ways to enter the diagnostic mode:

1. Connect the SCS connector (see page 22-480) to the navigation service connector located in the trunk. Turn the ignition switch to the ON (II) position. The display will go directly to the diagnostic menu screen shown below.

   NOTE: When finished troubleshooting, make sure to remove the SCS connector.

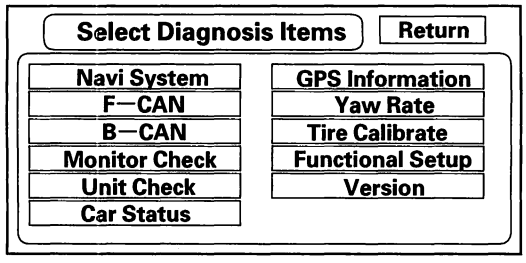
2. Turn the ignition switch ON (II). Use the navigation display hard buttons as described below:

   A. If the battery has not been disconnected, then press and hold the 3 buttons (Menu, Map/ Guide, and Cancel), and keep them pressed for about 5 seconds. The display screen will go directly to the "Select Diagnosis Items" menu shown below.

   B. If the battery was disconnected and reconnected prior to this test, hold down the Menu and Zoom Out buttons at the "Code" or "GPS Acquire" screen. The display will go to the "Navi System Link" screen. Push the joystick to go to the "Functional Setup menu," then touch the Return icon to get to the "Select Diagnosis Items" menu.

   NOTE: This only allows access to the diagnostic screens. All other navigation functions are disabled.

DIAGNOSTIC MENU SCREEN



3. After the display changes to the Select Diagnosis Items menu, select the item you want to check and the diagnostic will start. To return to the previous screen, select "RETURN".

   - Navi System (Link)
   - F-CAN (System link)
   - B-CAN (System link)
   - Monitor Check
   - Unit Check
   - Car Status
   - GPS Information
   - Yaw Rate
   - Tire Calibrate
   - Functional Setup
   - Version

BACK

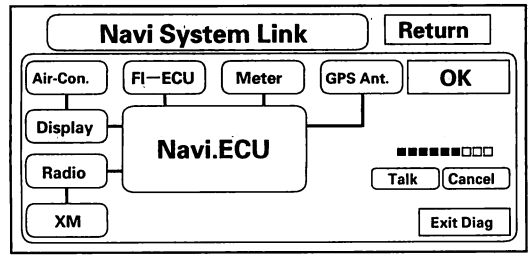
Protected by AR

Navi System Link

- This diagnostic tests the cables connecting the navigation components. Ensure that the ignition switch is in the ON (II) position. When the diagnostic begins, a "bong" sound is heard. The system is in a "Detecting" mode, and is waiting for all items in white to be tested. This includes the navigation voice control (TALK/BACK) buttons, and microphone. Press the navigation TALK button on the steering wheel, and in a normal voice, say "testing". The Talk indicator on the screen should become green, and the voice level indicator should move to at least the 6th bar to pass. Next, press the navigation BACK button. This should cause the "Cancel" indicator to go green.
- If all of the communication lines connecting the system components, and the navigation TALK/BACK buttons/microphone check out OK (all block diagram items green), then the "OK" indicator will become green.
- If there is a problem with the system, the faulty system component item will change to red, and the screen will show "NG" in red. Use the troubleshooting index, and other diagnostic screens to help locate the problem.
- The indication on the screen will not change until the ignition switch is cycled. After repairing the affected cable or system, repeat this diagnostic.

  NOTE: Green boxes and green "OK" indicate that the communications lines (cables) are intact. This diagnostic does not necessarily imply that the individual components are functioning properly. For instance, the GPS antenna wire may be crushed, but still show as "green" . A road test, or other diagnostic may be necessary to find the problem.

- This navigation system is designed for use in the US or Canada market.
  - US Market: English is the only language choice.
  - Canada Market: On the disclaimer screen, English or French can be selected.
  - Touch the "Chg Canada" or "Chg US" button to select the desired choice.
- Select "Return" to return to the Diagnosis Menu.



NOTE:
- The mic level indicator must reach the 6th bar or greater to pass the test.
- For '04-05 models; If the XM link is red or flashing red, go to audio system symptom troubleshooting (see page 22-462).

(cont'd)

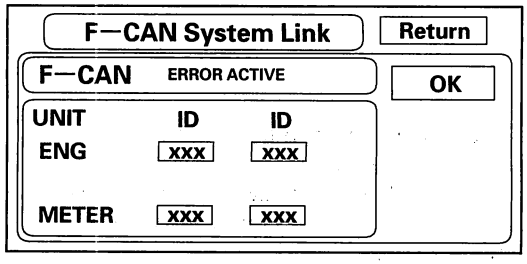
Protected by AR

System Diagnosis Mode (cont'd)

F-CAN System Link

F-CAN (Fast Controller Area Network) passes information between processors on the network. For example, the F-CAN network is used to pass fuel pulses between the ECM/PCM and the navigation unit for the trip computer function. The F-CAN network uses a communication protocol that transmits data at 500 Kbps.

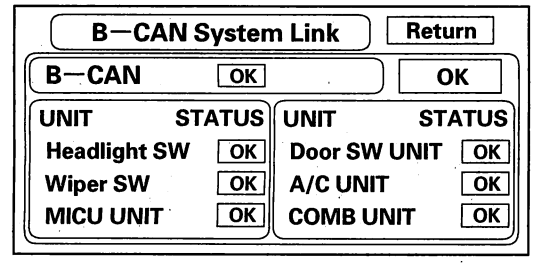
- If the diagnostic screen below reads NG with the ignition switch ON (II), then diagnostic trouble codes (DTCs) for the F-CAN can be retrieved with the HDS (Honda Diagnostic System). The data displayed in the ID boxes is irrelevant.
- For more details on troubleshooting the F-CAN, refer to the multiplex system.



B-CAN System Link

B-CAN (Body Controller Area Network) communication moves at a slower speed for convenience related items, and for other functions.

- If the diagnostic screen below reads NG with the ignition switch ON (II), then diagnostic trouble codes (DTCs) for the B-CAN can be retrieved with the HDS (Honda Diagnostic System). The data displayed in the ID boxes is irrelevant.
- For more details on troubleshooting the B-CAN, refer to the multiplex system.



BACK

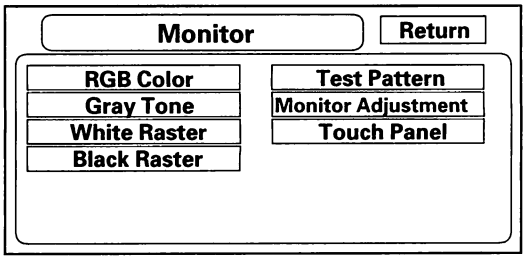
Protected by AR

Monitor Check

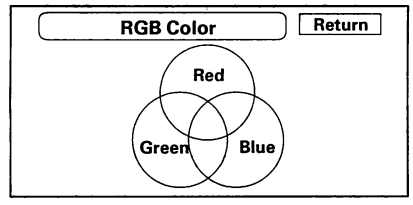
Overview of display unit

- The display unit communicates with the navigation unit over its own GA-Net bus. Information is sent to the navigation unit whenever the user activates the touch screen, or buttons. Information sent by the navigation unit to the display unit includes commands to control the LCD back light.
- The display unit is protected by the security system by daisy-chaining the security signal through it, and then passing the signal to the audio unit.
- The illumination input from the gauge brightness control provides back lighting for the buttons surrounding the screen.
- The display unit also communicates with the climate control unit to set the A/C, mode, and fan speed, and to receive the outside temperature that is displayed on the A/C-INFO screen.

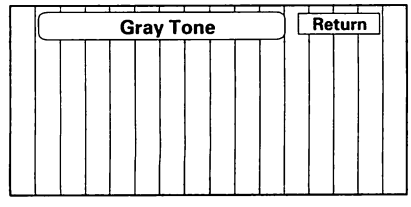
These screens allow troubleshooting of the display unit. Select the item you want to troubleshoot, and follow the diagnostic instructions.



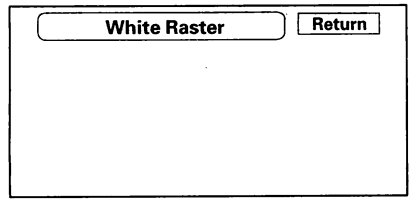
RGB Color
This screen verifies that the display unit is receiving the video (R, G, B and Composite sync) signals properly. The three primary colors should all be shown without distortion. The combination of all three should produce a central white section. If any of the colors are missing, troubleshoot for the color signal (see page 22-448). If the picture has lines in it, or scrolls horizontally or vertically, troubleshoot for a Composite sync problem (see page 22-450).



Gray Tone
This screen looks for problems with contrast. You should be able to see the changes from bar to bar across the scale. It is normal for the 2 bars on either side to appear the same.



White Raster
The entire display must be shown in white.

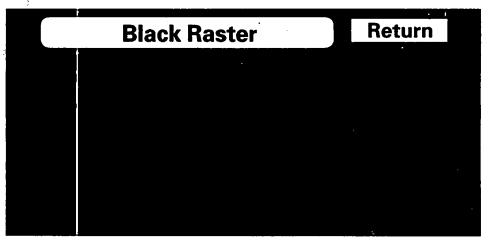


(cont'd)

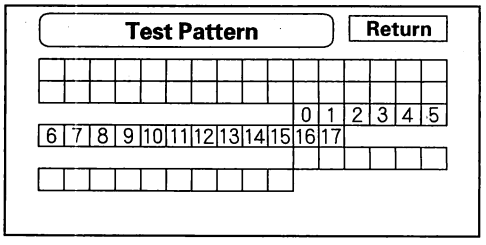
Protected by AR

System Diagnosis Mode (cont'd)

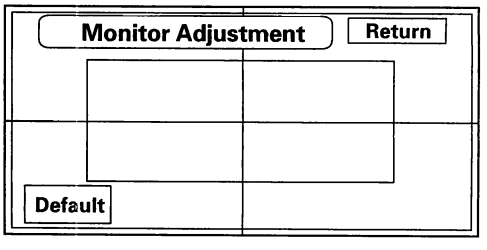
Black Raster
The entire display must be shown in black.



Test Pattern
The chart below shows the colors being used for the Map and Menu screens. This is for factory use only. To check the color signal use the "RGB Color" test.

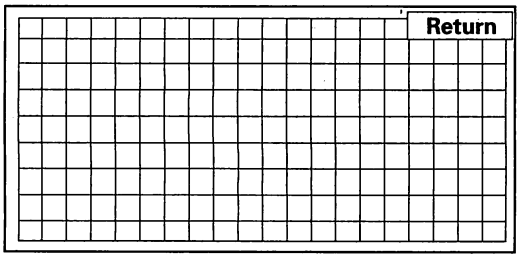


Monitor Adjustment
This allows the navigation display to be centered. Use the joystick to move the picture up/down or left/right. It is unlikely that you will ever need to adjust the monitor position. The "Default" button will reset the display position to factory specifications.



Touch Panel
The panel touch sensing system consists of 9 horizontal and 20 vertical infrared beams. Touching the screen blocks both a horizontal and a vertical beam. Every possible touch position is shown on this diagnostic screen. Touching one of these areas should cause its color to reverse, and sound a "beep". If any areas of the screen either don't respond, or respond at some other location when touched, then replace the display unit. The "Display" test under Unit Check provides an additional method to determine if one of the infrared sources or detectors is bad.

NOTE: Direct sunlight can affect this test by falsely triggering the infrared detectors, so perform this diagnostic inside or in a shaded area.

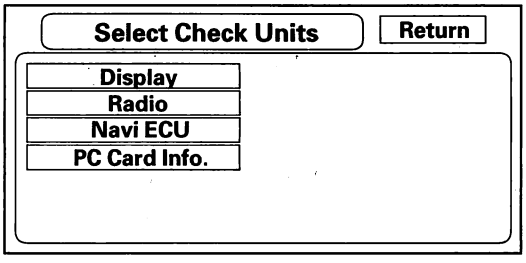


BACK

Protected by AR

Unit Check

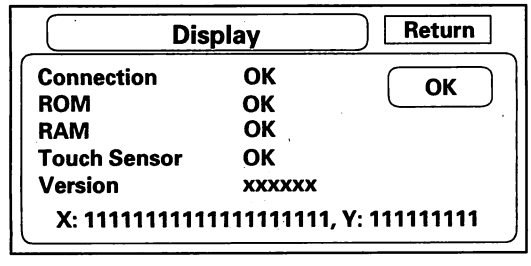
Select the item you want to check, and the test starts.



Display

This diagnostic performs additional checks on the communication bus between the control unit and the display. In addition, the internal electronics and touch screen functionality are confirmed.

- When the connection is NG, first check for loose terminals at the navigation unit and the display unit connections. Next check for an open or short in the communication line between the navigation unit and the display unit. If the line is found to have an open or short, replace the affected shielded harness.
- If the ROM or RAM is NG, replace the display unit.
- If the touch sensor is NG, then check for zeros in the "X", or "Y" values below.
- The version represents the software version in the display.
- The "1" following the X, indicate the 20 working vertical infrared beams/receptors (from left to right). The "1s" following the Y, indicate the 9 working horizontal beams (from top to bottom). If any one of the "1s" is a zero, this indicates that there is a problem with one of the beams or receptors. Check all around the inside rim of the navigation screen for dirt or anything that may be blocking a beam. If nothing is found, replace the display unit. See the display unit diagram in the "System Description" (see page 22-430) showing the infrared beam layout. Individual touch positions can be verified by running the "Touch Panel" test under the Monitor Check.

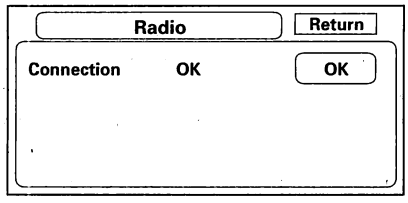


(cont'd)

Protected by AR

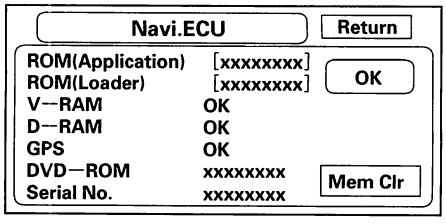
System Diagnosis Mode (cont'd)

Radio
If the NG is indicated, check for loose audio unit connector.

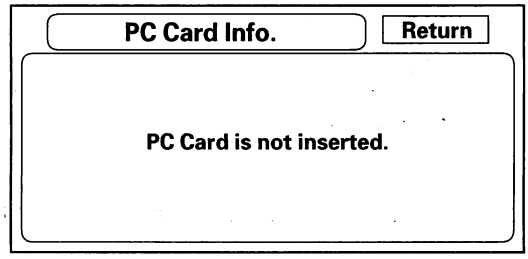


Navi ECU
This screen looks for problem with the navigation unit. When this diagnostic is initiated, there is a delay of up to a minute while it runs.

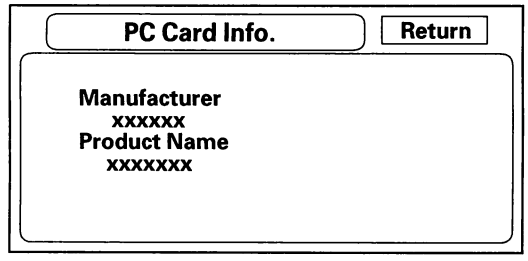
- "ROM (Application)", and "ROM (Loader)" are for factory use.
- If "V-RAM" or "D-RAM" is NG, then replace the navigation unit.
- If "GPS" indicates "NG (ANT)", then check the entire GPS antenna wire from the navigation unit to the antenna. If the wire is crushed or damaged, try a known good antenna. If this diagnostic reads OK, then order a new GPS antenna. If the diagnostic still reads NG (ANT), then replace the navigation unit.
- "DVD ROM" represents the database version on the DVD. This information can also be found in Setup Screen 4 by selecting System Information.
- "Serial No." should be the same as the serial number found on the underside of the navigation unit. This number is needed to obtain the security code from the Interactive Network (IN) system.
- Mem Clr is for factory use and should not be used unless instructed by the factory.
  Selecting this will erase the customer's settings, personal information, GPS orbital data, and anything else stored in memory.



PC Card info
There is no PC Card in the PC slot, and the screen should say, "PC Card is not inserted". Do not insert any card or object into the slot.



If the factory provides a PC card and instructs you to insert a card, then the screen displays the Manufacturer, and Product Name as shown in the following screen.



BACK

Protected by AR

Car Status

This screen is used to confirm that navigation unit is properly receiving input signals. Signals equal to (0) are OFF, and signals equal to (1) are ON. If the value on the display does not match the actual vehicle status, then check the wire carrying the signal.

- CHG-(OBSELETE-NOT USED) Charge indicator (Pin 3 of C-Connector)
  a) OFF (0) when engine is off, or alternator is not charging
  b) ON (1) when engine is running

This signal was used by the previous DVD navigation system. If CHG was off, then the screen was shut off after 10 minutes of inactivity to minimize battery consumption.

- VSP-Vehicle Speed Pulse from ECM/PCM (Pin 6 of C-connector)
  a) OFF (0) when vehicle is not moving
  b) ON (1) when vehicle is moving

The VSP comes from the ECM/PCM as a dedicated signal. Internally, the navigation unit compares the actual VP on the map against street data to adjust the pulse to speed scaling factor. As this scaling factor becomes more accurate, the "Level" gradually increases from 0 to 10.

- BACK-Reverse indication from taillight relay (Pin 5 of C-connector)
  a) OFF (0) when shift lever is in any position other than reverse
  b) ON (1) when shift lever is in reverse

The Back signal is used by the navigation unit to allow the map screen to show the VP moving backwards when in reverse. This signal is needed because the Speed Pulse has no direction indication.

- CHG (CAN)-Charge indicator from ECM/PCM using F-CAN bus (Pin 8, 18 of navigation unit A-connector)
  a) OFF (0) when engine is off
  b) ON (1) when engine is running

This signal is obtained off of the F-CAN bus. See the Multiplex control system for troubleshooting F-CAN. Diagnostic trouble codes (DTCs) for the F-CAN can be retrieved with the HDS (Honda Diagnostic System).

- ILL-Illumination Indication (Pin 5 of navigation unit A-connector)
  a) OFF (0) when parking lights, or headlights are off
  b) ON (1) when parking lights, or headlights are off

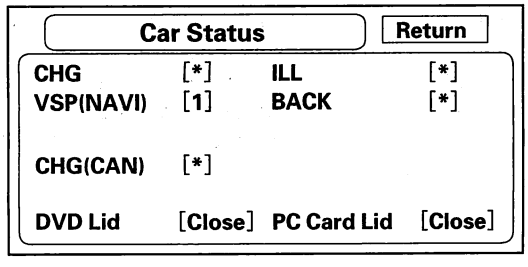
This signal is used by the navigation unit to determine whether to put the navigation screen into the Day or Night brightness mode. (Setup screen 1)

- DVD Lid-senses if DVD door is open
  a) (Close) when door is closed
  b) (Open) when door is open

The navigation unit has a micro switch to detect this. If open is indicated when the door is closed, replace the navigation unit.

- PC Card Lid-Senses if PC Card door is open
  a) (Close) when door is closed
  b) (Open) when door is open

The navigation unit has a micro switch to detect this. If open is indicated when the door is slid shut, then replace the navigation unit. This slot is for insertion of PC Flash memory cards for gathering diagnostic information. This is for factory use only.



(cont'd)

Protected by AR

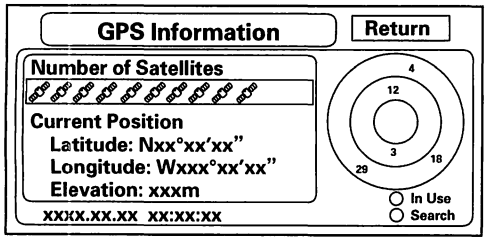
System Diagnosis Mode (cont'd)

GPS Information

This screen shows the current status of GPS reception. The circular diagram shows the current location of the GPS satellites (yellow numbers) as they would appear in the sky. The outer circle represents the horizon (0 degrees elevation). The middle and inner circles represents 30 and 60 degrees respectively. The very center of the diagram (90 degrees elevation) is directly overhead. Naturally, nearby obstructions, like tall buildings will block satellites in that direction. That is why it is necessary to be in an open area to effectively troubleshoot GPS reception issues. The satellite numbers shown on the diagram correspond to the "PRN" number in the "GPS Details" screen. There are always 24 "active" GPS satellites in orbit. Because satellites fail, and have to be removed from service, spares always parked in orbit, ready to be activated. This is why the PRN (satellite ID number) can be greater than 24.

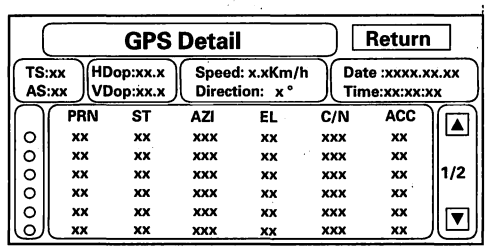
NOTE:

- To use this screen for troubleshooting, the vehicle should be out side away from buildings, tall trees, and high-tension wires for at least 10 minutes with the engine running.
- Metallic window tinting on the rear window or after-market electronic accessories mounted near the navigation or display units can interfere with GPS acquisition.
- The "Number of Satellites" box shows the number of acquired satellites (maximum of 12). It should contain 3 or more icons. If not troubleshoot for "GPS icon is white, or not shown" (see page 22-453).
- The "Current Position" shows latitude, longitude, and elevation(in meters). If there are less than 3 satellites, the elevation can be grossly inaccurate.
- The Date/Time field shows the current date, and also a time that includes daylight savings and other offsets entered by the customer in Setup screen 2 "Adjust Time Zone/Clock".



GPS Detail

By pressing and holding the MENU button for 10 seconds, a GPS Detail screen is displayed. This screen displays real time incoming satellite positional data. Most of the information shown on this screen is for factory use, however some of the data can indicate partial GPS signal interference.



- The box TS/AS and HDop/VDop is for factory use.
- The Speed and Direction information is updated in real time when driving, and can be used to detect intermittent speed sensor problems.
- The Date/Time Information is the same as in Setup screen 2 "Adjust Time Zone/Clock".
- If the "3D" icon is shown above the yellow dots, this implies that at least 4 satellites are available for map positioning, and the "GPS" indicator on the map screen will be green. See the Global Positioning System detailed explanation in the "System Description" (see page 22-428).
- If the row of data in the table below begins with a "yellow dot", the AZI and EL fields can be used to locate each satellite on the circular GPS diagram (see prior screen).

BACK

Protected by AR

NOTE: The data shown in the GPS Detail screen is an example only.

The table of values shown on the screen below has the following columns:

Column	Description	Problem indication
Active	Active satellites (Yellow Dot)	If "3D" is missing, follow GPS icon is white, or not shown troubleshooting (see page 22-453).
PRN	The satellite ID number	
ST	The status: 0 = cannot view or searching, 2 = acquiring	If all 0, then, follow GPS icon is white, or not shown troubleshooting (see page 22-453).
AZI	Azimuth, the angle (0—360) clockwise from north	
EL	Elevation from the horizon (90 deg is overhead)	
C/N	N/A	Healthy signal is 49—52, no signal: 27—33
ACC	N/A	

Yaw Rate

This diagnostic checks the yaw rate sensor in the control unit. This device detects when the vehicle turns, and repositions the vehicle position icon on the map screen. For more detailed information, see the yaw rate sensor theory of operation under "System Description" (see page 22-427).

- "Sensor" indicates the voltage output from the yaw rate sensor. It should indicate about 2.500 bolts when stopped.
- "Offset" is the reference voltage or standard within the yaw rate sensor. It also should indicate about 2.500 volts when stopped.
- A "sensor" output voltage HIGHER than the "Offset" voltage indicates that the vehicle is turning to the right.
  A "sensor" output voltage LOWER than the "Offset" voltage indicates that the vehicle is turning to the left.
- The yaw rate offset, and sensor should both indicate about 2.500 volts when stopped. If either reads zero, or 5.000 volts replace the navigation unit.
- The yaw rate offset and sensor should be within +/— 0.01 V of each other when stopped. The sensor value should change relative to the offset as the car is turned while driving. If not, replace the navigation unit.

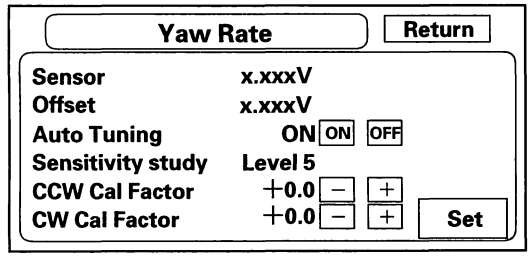
Example: Car stopped

Normal		**Abnormal**	
Offset	2.526 V	Offset	2.526 V
Sensor	2.516—2.536 V	Sensor	2.623 V

Example: Car turning

Normal		**Abnormal**	
Offset	2.526 V	Offset	2.526 V
Sensor	2.678 V (right turn) 2.478 V (left turn)	Sensor	2.623 V (no change on turns)

- Auto tuning should always be on. If it is off, turn it on.
- "Sensitivity study" represents the status of the internal tuning function. At initialization, this value starts at 6 and increases to # 10 as the internal correction values become more accurate.
- The settings "CCW Cal Factor", "CW Cal Factor", and "Set" are for factory use only. THIS SHOULD NEVER BE USED.



(cont'd)

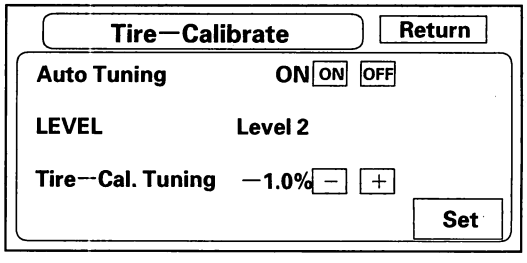
Protected by AR

System Diagnosis Mode (cont'd)

Tire Calibrate

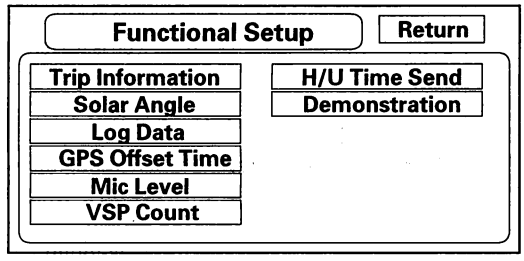
As the vehicle moves, the navigation system receives speed pulses from the ECM/PCM. These pulses are converted using a conversion factor to a mph speed that moves the vehicle position (VP) on the map. The navigation system has an internal tuning function that generates and refines this factor based on actual driving. The "Level" indicates the status of the tuning. At navigation initialization, it begins at 0, and increases to 10 as the navigation system is used.

- The "Auto Tuning" is factory set to "ON", and should remain on.
- The "LEVEL" indicates the tuning status. If it is less than 10, the unit is still calibrating.
- The "Tire-Cal. Tuning" and "Set" should not be used. It is for factory use only.



Functional Setup

Select the item you want to check.

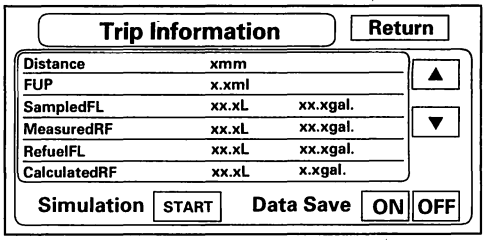


BACK

Protected by AR

Trip Information
This screen shows current internal values used for trip computer calculations. They are for factory use only.

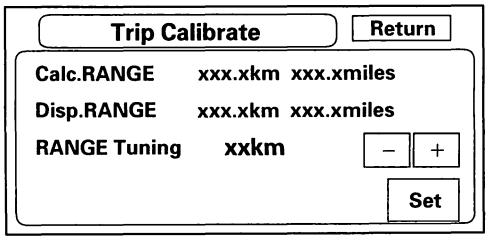
- Simulation "Start" is for factory use.
- "Data Save" should always be on. It is for factory use only.



Trip Calibrate
By holding down the MENU button while on the "Trip Information" screen, you will see the screen below. This screen allows you to adjust the vehicle range (distance to empty).

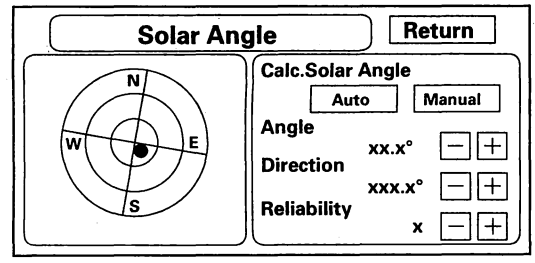
- "Calc. RANGE" is the calculated value.
- "Disp. RANGE" is the distance displayed on the trip computer "Range" field. If it reads "0", the vehicle will have enough fuel to travel about 20 miles.
- Range Tuning can be adjusted "+" or "—" to adjust the range to empty. It is recommended that this value not be changed.

NOTE: Setting the range offset too low (+10) could result in the vehicle running out of gas before the display reads "0". Make changes slowly when changing this value.



Solar Angle
This screen is used to graphically display the sun's position as determined by GPS. The navigation system uses the sun's angle, along with the sunlight sensor to control the driver/passenger A/C air flow. The heat that must be removed by the A/C unit varies, depending on the angle of the sun entering the vehicle. This screen is for factory use only, and should not be adjusted.

- The screen shows a circular diagram of the sky oriented in the direction that the vehicle is pointing. During daylight hours a red dot is shown, representing the direction and elevation of the sun. The outer circle represents the horizon (0 degrees elevation). The middle circle is 30 degrees, the center circle is 60 degrees, and the very center is directly overhead (90 degrees).
- "Auto" should always be on (yellow).
- The "Angle", "Dir", and "Reliability" settings are used by the factory to simulate the sun's position for debugging this function.



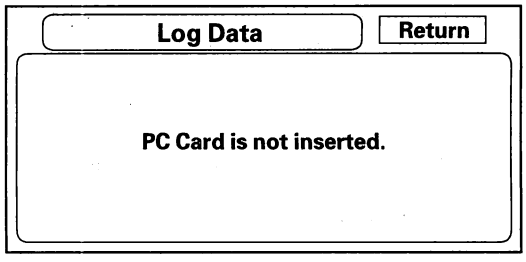
(cont'd)

Protected by AR

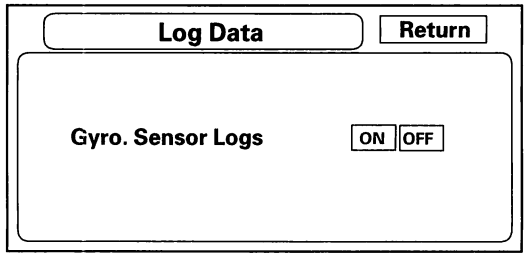
System Diagnosis Mode (cont'd)

Log Data
This screen allows the factory to collect log data to troubleshoot navigation system issues.

- Normally there is no card in the "PC Card Slot", and the PC slot door should always be closed. The screen should look like below.

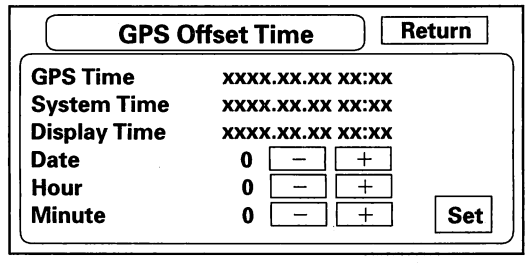


- However, if the factory provides a PC card and instructs you to insert it into the card slot (label side up), and then slide the PC Card door shut. If instructed by the factory, select "Gyro. Sensor Logs ON". Follow the factory procedure for gathering test data, and properly ending the test.



GPS Offset Time
This screen is for factory use only. It allows adjustment of the GPS time. This display updates in real time.

- "GPS Time" is the time as received from the GPS satellites. It is in Greenwich Mean Time (GMT).
- "System Time" is the internal time used by the navigation unit to calculate your position on the map. It is also in Greenwich Mean Time (GMT).
- "Display Time" is the time shown on Setup screen 2 "Adjust Time Zone/Clock", and reflects any changes due to daylight savings time or time adjustments entered by the customer.
- Date, Hour, Minute, and "Set" should not be used.



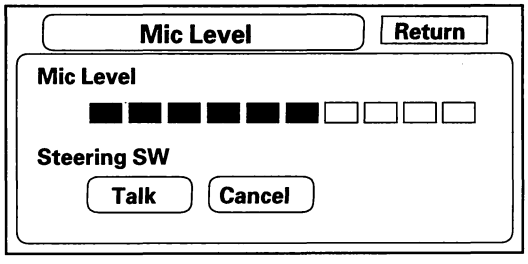
BACK

Protected by AR

Mic Level
This diagnostic allows you to independently test the microphone and the TALK and BACK buttons. They are used to activate the voice control system. The microphone is located near the map light in the ceiling. It is directional, and works best if the voice is coming from the drivers seat.

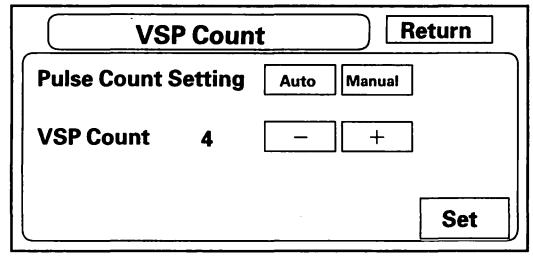
- Press the TALK button on the steering wheel, and in a normal voice say "testing". The TALK indicator on the screen should momentarily become green, and the text "Now Recording..." should appear in yellow. In addition, the Mic Level indicator should on the screen does not briefly become green, then check the wiring from the TALK button to the navigation unit. If there is no "Mic Level" movement when you speak, then you should check the wire running from the microphone to the control unit.
- Press the BACK button on the steering wheel. This should cause the Cancel indicator on the screen to momentarily become green. If it does not briefly change to green, then check the wiring from the steering wheel BACK button to the navigation unit.

NOTE: The Mic Level indicator must reach the 6th bar or greater to pass the test.



VSP Count
This screen displays the number of pulses per revolution of the tire. This is for factory use only, and should not be changed.

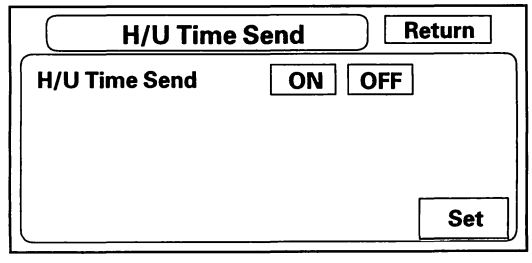
- "Pulse Count Setting" should always be set to "Auto".
- "VSP Count" should always be "4", and should never be adjusted or set to any other value.



H/U Time Send
This screen determines whether to automatically send the navigation time to the upper display. The display unit connector A (10P) passes this information to the subdisplay unit. The navigation time can be found in the Setup screen 2 "Adjust Time Zone/Clock" setting.

- "H/U Time Send" should always be set to "ON".

NOTE: Selecting "Reset" on the Adjust Time Zone/ Clock screen automatically resets this diagnostic function to "ON".

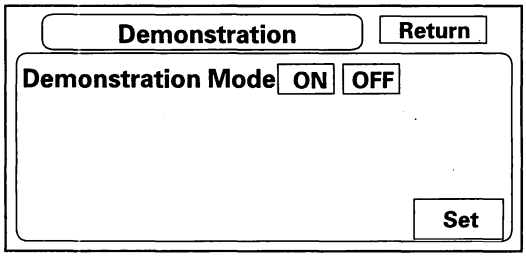


(cont'd)

Protected by AR

System Diagnosis Mode (cont'd)

Demonstration
This screen is for factory use only, and should always be set to "OFF". Occasionally this setting is turned "ON" when vehicles are being used at Auto Shows or similar events. Turning this feature on, allows the navigation system to automatically follow a route to a destination when the vehicle is stationary.



Version

This screen displays the current version of the program, and allows the loading of a new version of the program either from a CD/DVD or from a PC card.

The D-Ram Program version should always be greater than or equal to the Disc Program version. The mapped database version is the date of the database on the DVD.

The Model code is 20H, and is for factory use only. This code is stored on a chip in the navigation unit. Therefore, every model has a unique part number for the navigation unit.

NOTE: If any model number other than 20H is displayed, replace the navigation unit with the correct part. The model code tells the navigation unit what software to load off the DVD.

Do not use DISC LOAD or Card LOAD, unless instructed to do so by the factory.

Protected by AR

Error Message Table

Screen Error Message	Solution
Navigation system is unable to acquire a proper GPS signal.	Make sure there is nothing on the rear package tray blocking the GOS antenna. If not, move the vehicle to an open space away from tall buildings, trees, etc. Rear window tinting and after-market devices can affect the GPS reception.
Navigation unit door is open or No DVD disc installed. Please check system.	Make sure the navigation DVD is installed with the label side up and the navigation unit door is fully snapped closed.
PC card slot door is open. Please check system.	Make sure that the sliding door for the PC card is fully closed.
No DVD disc, please check system.	Check that the navigation DVD is installed with the label side up.
Display temp is too high. System will shut down until display cools down.	This message will appear briefly when the display temperature is too high, and then the display will turn off until the temperature cools down. The system will turn back on when the display cools down.
Outside temperature is low, system will take a while to start up.	The temperature is below —30°C and the navigation ECU has difficulties reading the DVD. The system will start up when the temperate warms up.
DVD disc reading error (unformatted), please consult your dealer.	Check the DVD source for deep scratches or other damage. Make sure you are using an official Honda navigation DVD (orange in color). The system cannot read other mapping databases or video DVDs. If the problem persists, see your dealer.
Route has not been completed. Please try again from a different location.	Routing to or from a place (new area) that is not in the database. Try planning a different route to or from a different location.
No alternate route found. Original route will be guided.	No alternate route method was found. The original route will be used.
This destination cannot be found in database.	The destination was not found in the database. Try another destination nearby, or select the destination with the joystick.

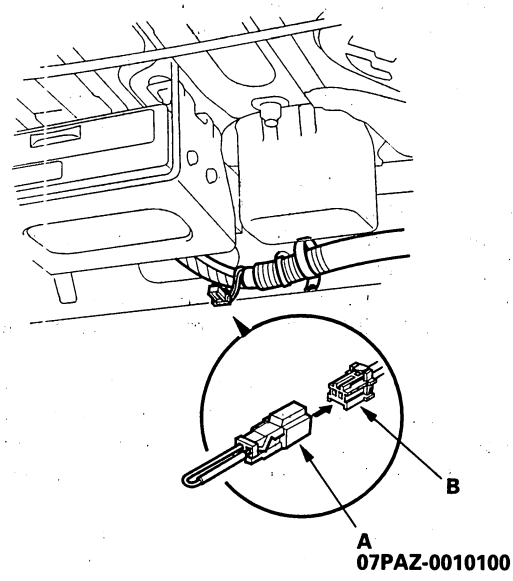
Navigation System ('03-05 models)

Forced Starting of Display

Special Tools Required
SCS service connector 07PAZ-0010100

1. Connect the SCS service connector (A) to the navigation service check connector (B) located behind the navigation unit.



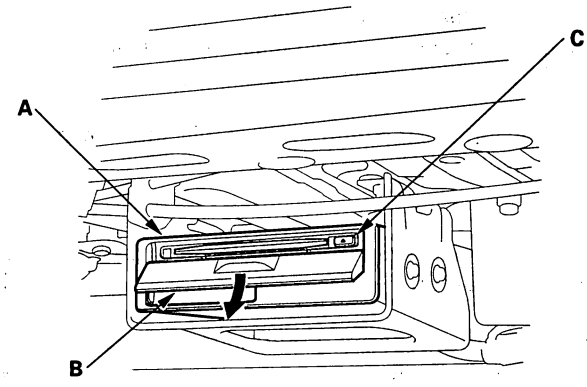
2. Turn the ignition switch ON (II).
3. Check that the system starts up and then changes to the "Navi System Link" screen.

   NOTE: If the system fails to display the "Navi System Link" screen, refer to no picture is displayed (see page 22-447).

DVD-ROM Replacement

NOTE: When the DVD-ROM is re-inserted or replaced, a map match must be done (see page 22-421).

1. Turn the ignition switch ON (II).
2. Open the front cover (A) of the navigation unit (B) located trunk room.



3. Press the EJECT button (C).
4. Remove the DVD-ROM.
5. Insert the new DVD-ROM.
6. Close the front cover. Do not turn the ignition switch OFF, until data is down loaded to navigation unit.

   NOTE: After servicing, the front cover must be closed. If you start up the navigation system with the front cover open, the display will indicate. "Navigation unit door is open or No DVD Disk installed. Please check system".

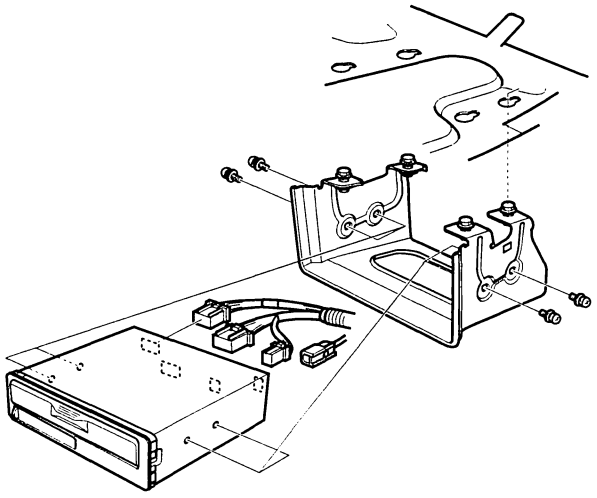
BACK

Protected by AR

Navigation Unit Removal/ Installation

NOTE: If the navigation unit is replaced or disconnected, a map match must be done (see page 22-421).

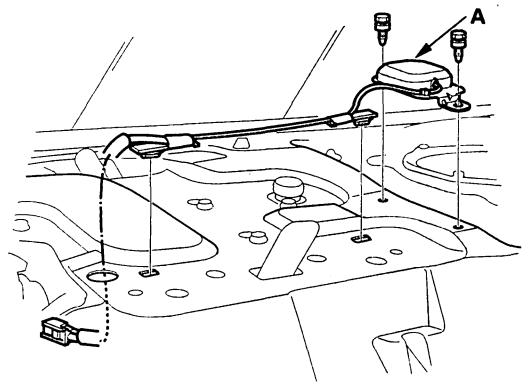
1. Remove the navigation unit from the trunk room.



2. Remove the navigation unit bracket (B) from the passenger's seat.
3. Remove the bracket from the navigation unit (C).
4. Install in the reverse order of removal.

GPS Antenna Removal/Installation

1. Remove the rear shelf (see page 20-108).
2. Remove the GPS antenna (A).



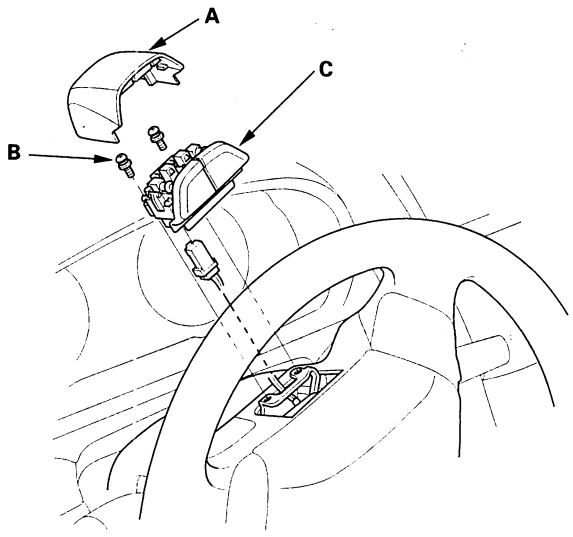
3. Install in the reverse order of removal.

Protected by AR

Voice Control Switch Removal/Installation

1. For 4 door, remove the driver's airbag (see page 23-197), then remove the voice control switch (see page 17-23).
   For 2 door, remove the voice control switch cover (A) from left side of the steering wheel.

   Illustration shows 2 door models



2. Remove the two screws (B) from the voice control switch (C), then remove the voice control switch.
3. Disconnect the voice control switch connector.
4. Install in the reverse order of removal.

Navigation System ('06 model)

General Troubleshooting Information

General Operation

Refer to the Navigation System Manual for the navigation system operating procedures.

Anti-theft Feature

The navigation system and audio unit have a coded theft protection circuit. Be sure to get the customer's anti-theft security codes number before;

- disconnecting the battery.
- disconnecting the navigation unit 8P connector.
- removing the No. 7 (10 A) fuse from the under-dash fuse/relay box.

After service, reconnect power to the navigation unit, and turn the ignition switch ON (II). Enter the 4-digit anti-theft security code, then select "Done".

If the code cannot be found, use the interactive Network (*i*N) to look it up. You will need the serial number from the navigation unit in the trunk. It is on a label on the underside of the unit. Alternatively, you can view the serial number in the Navi ECU diagnostic screen (see page 22-536).

When replacing the navigation unit, be sure to give the customer the new anti-theft security code.

Symptom Diagnosis

Certain circumstances and system limitations will result in occasional vehicle positioning errors. Some customers may think this indicates a problem with the navigation system when, in fact, the system is normal. Keep the following items in mind when interviewing customers about symptoms of the navigation system.

Self-Inertial Navigation Limitations

The limitations of the self-inertial portion of the navigation system (the yaw rate sensor and the vehicle speed signal) can cause some discrepancies between the vehicle's actual position and the indicated vehicle position (GPS vehicle position).

The following circumstances may cause vehicle positioning errors:

- Moving the vehicle with the engine stopped and the vehicle stopped, such as by ferry or tow truck, or if the vehicle is spun on a turn table.
- Tire slippage, changes in tire rolling diameters, and some driving situations may cause discrepancies in travel distances. Examples of this include:
  - Continuous tire slippage on a slippery surface
  - Driving with snow chains mounted
  - Abnormal tire pressure
  - Incorrect tire size
  - Frequent lane changes across a wide highway
  - Continuous driving on a straight or gently curving highway
  - Very bumpy roads
- Tolerances in the system and map inaccuracies sometimes limit how precisely the vehicle position is indicated. Examples of this include:
  - Driving on roads not shown on the map (map matching is not possible)
  - Driving on a road that winds in one direction, such as a loop bridge, an interchange, or a spiral parking garage
  - Driving on a road with a series of sharp hair-pin turns
  - Driving near a gradual highway exit or transition
  - Driving on one of two close parallel roads
  - Making many 90 degree turns

Global Positioning System (GPS) Limitations

The GPS cannot detect the vehicle's position during the following instances:

- For the first 5 to 10 minutes after reconnecting the battery (This can take as long as 45 minutes).
- When the satellite signals are blocked by tall buildings, mountains, tunnels, large trees, inside parking structures or large trucks.
- When the GPS antenna is blocked by metallic window tinting or by an object placed above it in the vehicle. The GPS antenna requires a clear unobstructed view of the sky.
- When there is no satellite signal output (Signal output is sometimes stopped for satellite servicing).
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (radio, CD players/changers, radar detectors and theft recovery systems), and cellphones placed near the navigation system.

BACK

Protected by AR

The accuracy of GPS is reduced during these instances:

- Metallic window tinting above the GPS antenna.
- When only two satellite signals can be received (Three satellite signals are required for accurate positioning).
- When the satellite control centers are experiencing problems.
- When driving near high tension power lines.
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (radio, CD players/changers, radar detectors and theft recovery systems), and cellphones placed near the navigation system.

Muting Logic

Whenever the navigation system is giving guidance all the front speakers are muted. When the voice control system is being used, all of the speakers are muted.

LCD Display Unit Limitations

- In cold temperatures, the display may stay dark for the first 2 or 3 minutes until it warms up.
- When the display is too hot because of direct summer sunlight, it will remain dark until the temperature drops (You may see an error message displayed stating this fact).
- When the humidity is high and the interior temperature is low, the display may appear cloudy. The display will clear up after some use.
- Fingerprints on the touch panel may sometimes be noticeable because of the panel's low-reflection coating. Clean the screen with a soft, damp cloth. You may use a mild cleaner intended for eye glasses or computer screens. To avoid scratching the panel, do not rub too hard, or use abrasive cleaners or shop towels.
- The touch panel consists of a touch sensitive resistive memberance covering the display. Unlike previous systems, you must actually "touch" the display to activate it. Never use hard or sharp implements to operate the screen because you risk damaging the sensing membrane. If a touch "switch" does not function immediately, shift your finger slightly, and touch it again.

Note: The display is unaffected by sunlight, as in previous displays.

Symptom Duplication

- When the symptom can be duplicated, verify that it is not a characteristic of the system. Review the navigation manual and compare it to a known-good vehicle (with the same software and database), under the same conditions. If not the same, follow the self-diagnostic procedures and the appropriate troubleshooting procedures.
- When the symptom does not reappear or only reappears intermittently, ask the customer about the conditions when the symptom occurred.
  - Ask the customer to demonstrate the problem.
  - Try to establish possible user error or misunderstanding of the system.
  - Try to establish if outside interference may have been the cause.
  - Try to duplication the symptom under the same conditions the customer was experiencing.
  - Vibration, temperature extremes, and moisture (dew, humidity) are factors that are difficult to duplicate.
  - Inspect the vehicle for after-market electronic devices (vehicle locators, amps, radar detectors, etc) that may be hidden.

Service Precautions

- If the navigation unit needs to be replaced, inform the customer that personal information in the navigation system will be lost. If possible, have the customer record their personal information before the unit is replaced.
- Before disconnecting the battery, make sure you have the anti-theft codes for the radio and the navigation system, and write down the XM radio channel presets. Also obtain any PGM-FI or transmission DTCs and freeze frame date (which will be lost when the PCM loses power).
- When the battery is disconnected, the internal GPS clock is reset to "0:00". The clock will reset to the correct time after the system finishes GPS initialization.
- After reconnecting the battery, you have to wait to get the initial signal from the satellite. It will take from 10 to 45 minutes.
- Verify map matching
- Before returning the vehicle to the customer, enter the radio and navigation anti-theft security code, then enter the customer's XM radio channel presets, adjust the setup clock settings in the navigation system.

(cont'd)

Protected by AR

General Troubleshooting Information (cont'd)

System Initialization

If for any reason, you lose power to the navigation system (like the battery was disconnected). The navigation system will require initialization. Once completed, the system will be ready to use.

This initialization requires the following:

- Entry of the 4-digit anti-theft security code to "unlock" the system
- GPS initialization (may not be needed depending of the length of time the system was without power)
- Map matching to align the GPS to a location on the map

Entering Security Code

The navigation system and audio unit have a coded theft protection circuit. Be sure to get the customer's anti-theft security codes number before;

- disconnecting the battery
- disconnecting the navigation unit 8P connector
- removing the No. 7 (10 A) fuse from the under-dash fuse/relay box

After service, reconnect power to the navigation unit, and turn the ignition switch ON (II). Enter the 4-digit anti-theft security code, then select "Done".

When replacing the navigation unit or audio unit, be sure to give the customer the new anti-theft security code.

GPS initialization

Depending on the length of time the battery was disconnected, your system may require GPS initialization. If it does, the following screen appears:

*****Wait*****
The system is acquiring its GPS signal.
This could take up to 10 minutes.
• Engine must be running
• Vehicle must be parked outside, away from buildings
• Do not move the vehicle at this time

If this procedure is not necessary the system proceeds directly to the Disclaimer screen. During initialization, the system searches for all available GPS satellites, and obtains their orbital information. During this procedure the vehicle should be out in the open with a clear view of the sky.

If the navigation system finds the satellites properly, this box clears, and changes to the Disclaimer screen. If within 10 minutes the system fails to locate a sufficient number of satellites to locate your position, the following screen appears.

Navigation system is unable acquire a proper GPS signal.
• Move vehicle to another location
• Turn the ignition switch off
• Disconnect the battery for 30 minutes to clear the GPS receiver's memory
• Reconnect the battery and follow the screen prompts

If this is displayed, turn off the engine, then restart the vehicle. If you now see the Disclaimer screen, the GPS initialization is complete.

NOTE:
- The average acquiring time is less than 10 minutes, but it can take as long as 45 minutes.
- If the system is still unable to acquire a signal, follow the instructions on the screen. If this screen appears again, go to troubleshooting for the No GPS icon is shown (see page 22-521).

BACK

Protected by AR

Map Matching

This part of the initialization matches the GPS coordinates with a road on the map screen. To perform this part of the procedure, ensure that the navigation system is displaying a map. Check the "GPS" icon in the upper left corner of the screen, it should be "Green" when the vehicle is parked outside, with the correct color labeled DVD installed in the navigation unit. Drive the vehicle on a mapped road shown on the map screen. Do not enter a destination at this time. When the name of the current road you are driving on, appears at the bottom of the screen, the entire procedure is complete. Your system is now ready to use.

Obtaining A Navigation DVD

If the Navigation DVD is lost or damaged, or you need a yearly updated DVD, you have 2 ways to purchase one. You can either call (888) 291-4675, or order on-line at www.honda.com.

Both methods require a credit card. The DVD for this model has a white label, and cannot be ordered through the parts system. The following DVDs will not work in this navigation system:

- Navigation DVDs with labels other than white
- Map software programs manufactured by other companies
- DVD movies, or DVDs containing audio recordings

Update DVDs are available for purchase usually in the fall of each year. They may contain the following:

- Enhanced maps and points of interest (POI) coverage
- Fixes for minor software bugs
- Additional features

NOTE: Updating is optional, and there is no program to provide free DVDs containing yearly mapping updates.

Navigation System ('06 model)

System Description

Overview

The navigation system is a highly-sophisticated, hybrid locating system that uses satellites and a map database to show you where you are and to help guide you to a desired destination.

The navigation system receives signals from the global positioning system (GPS), a network of 24 satellites in orbit around the earth. By receiving signals from several of these satellites, the navigation system can determine the latitude, longitude elevation of the vehicle. In addition, signals from the system's yaw rate sensor and the ECM/PCM (vehicle speed pulse) enable the system to keep track of the vehicle's direction and speed of travel.

This hybrid system has advantages over a system that is either entirely self-contained or one that relies totally on the GPS. For example, the self-contained portion of the system can keep track of vehicle position even when satellite signals cannot be received. When the navigation system is on, the GPS can keep track of the vehicle position even when the vehicle is transported by ferry.

The navigation system applies all location, direction, and speed information to maps and calculates a route to the destination entered. As you drive to that destination, the system provides both visual and audio guidance.

This navigation system also has voice recognition that allows voice control of most of the navigation functions. The Talk and BACK buttons on the steering wheel activate the voice control. The voice control also allows control of the audio and climate control.

The navigation system provides a trip computer function. The fuel economy display is calculated by data provided by the ECM/PCM. The ECM/PCM provides fuel use and level data via the F-CAN bus, and a dedicated speed signal.

The illumination signal is used by the navigation unit to automatically switch the display between Night and Day brightness modes when Display is set to Auto. When the instrument panel brightness control is set to full brightness, the navigation system stays in the Day mode, even with the headlights on. Display unit button illumination is supplied through the audio unit.

The GA-NET bus provides communication between the navigation unit and the display unit. This bus also links the components in the audio-HVAC display module. The bus is used to pass button and touch-screen commands to the navigation unit. In addition, muting and voice control commands are sent to the display unit and the audio and climate control systems for processing. The audio unit uses the bus to control the XM-receiver or other accessories.

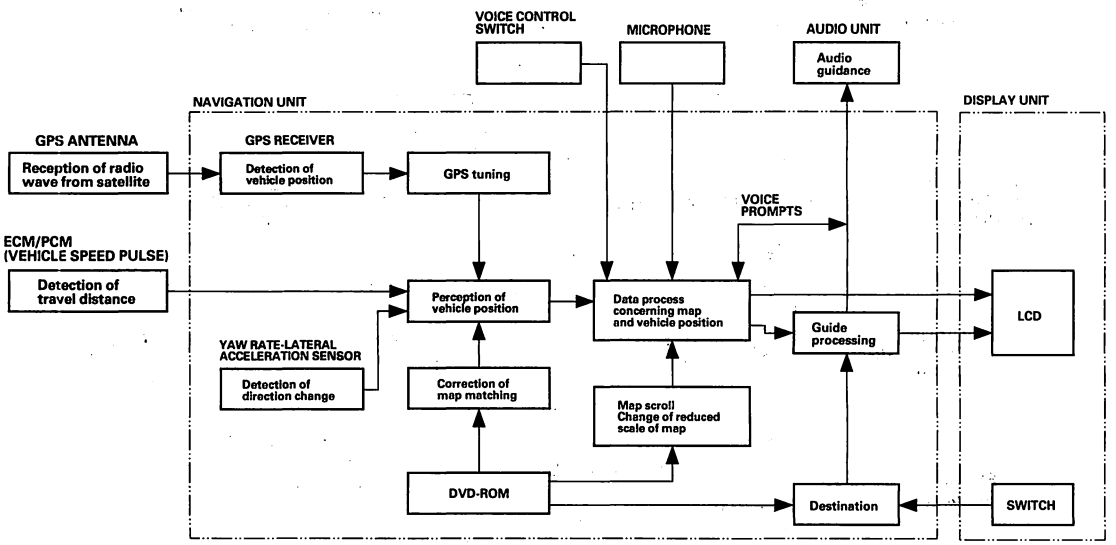
Navigation System ('06 model)

System Description (cont'd)

Navigation Function

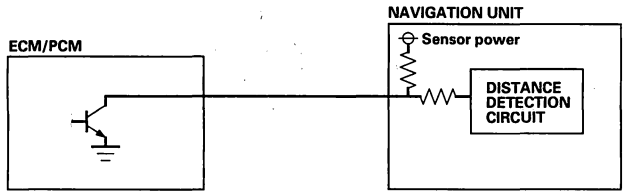
The navigation system is composed of the navigation unit, the ECM/PCM (vehicle speed signal), the GPS antenna, microphone, voice control switch, audio unit, climate control unit, and the display unit.

Function Diagram



Vehicle Speed Pulse

The vehicle speed pulse is sent by the ECM/PCM. The ECM/PCM receives a signal from the countershaft speed sensor, then it processes the signal and transmits it to the speedometer and other systems.

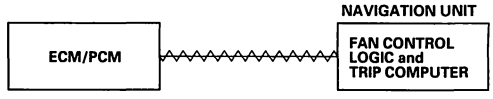


Charge Signal

The PCM sends a charge signal to the navigation unit via F-CAN. A thermister inside the navigation unit monitors the units internal temperature. This information combined with charge signal determines the control units internal cooling fan operation.

Fuel Use Level Data

The navigation unit monitors the ECM/PCM fuel usage and tank level data via the F-CAN bus. The navigation system combines this information, the vehicle speed signal, GPS, and the map data for trip computer calculations.



BACK

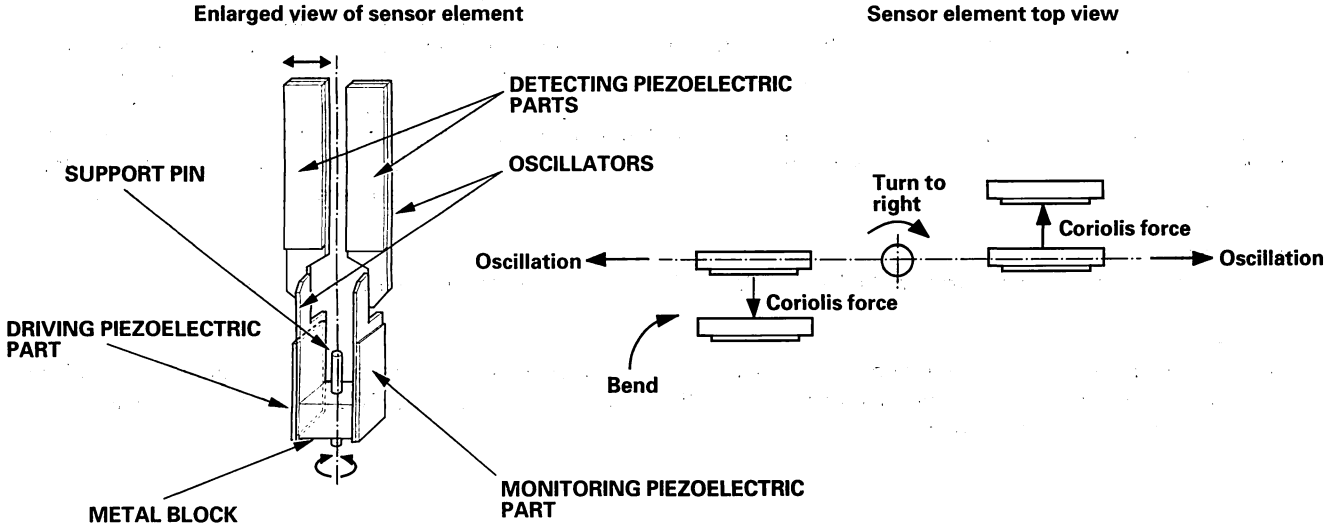
Protected by AR

Yaw Rate Sensor
The yaw rate sensor (located in the navigation unit) detects the direction change (angular speed) of the vehicle. The sensor is an oscillation gyro built into the navigation unit.

Sensor Element Structure
The sensor element is shaped like a tuning fork, and it consists of the piezoelectric parts, the metal block, and the support pin. There are four piezoelectric parts: one to drive the oscillators, one to monitor and maintain the oscillation at a regular frequency, and two to detect angular velocity. The two oscillators, which have a 90-degree twist in the center, are connected at the bottom by the metal block and supported by the support pin. A detection piezoelectric part is attached to the top of each oscillator. The driving piezoelectric part is attached to the bottom of one oscillator, and the monitoring piezoelectric part is attached to the bottom of the other oscillator.

Oscillation Gyro Principles
The piezoelectric parts have "electric/mechanical transfer characteristics." They bend vertically when voltage is applied to both sides of the parts, and voltage is generated between both sides of the piezoelectoric parts when they are bent by an external force. The oscillation gyro functions by utilizing this characteristic of the piezoelectric parts and "Coriolis force." (Coriolis force deflects moving objects as a result of the earth's rotation.) In the oscillation gyro, this force moves the sensor element when angular velocity is applied.

Operation
1. The driving piezoelectric part oscillates the oscillator by repeatedly bending and returning when an AC voltage of 6 kHz is applied to the part, The monitoring-side oscillator resonates because it is connected to the driving-side oscillator by the metal block.
2. The monitoring piezoelectric part bends in proportion to the oscillation and outputs voltage (the monitor signal). The navigation unit control circuit controls the drive signal to stabilize the monitor signal.
3. When the vehicle is stopped, the detecting piezoelectric parts oscillate right and left with the oscillators, but no signal is output because the parts are not bent (no angular force).
4. When the vehicle turns to the right, the sensor element moves in a circular motion with the right oscillator bending forward and the left oscillator bending rearward. The amount of forward/rearward bend varies according to the angular velocity of the vehicle.
5. The detecting piezoelectric parts output voltage (the yaw rate signal) according to the amount of bend. The amount of vehicle direction change is determined by measuring this voltage.



(cont'd)

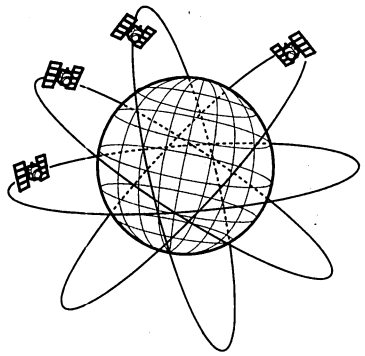
Protected by AR

Navigation System ('06 model)

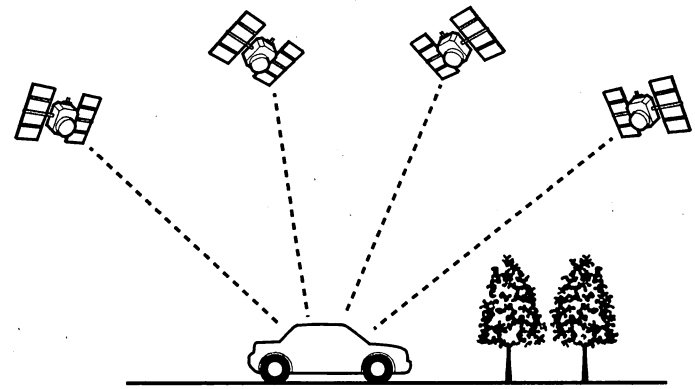
System Description (cont'd)

Global Positioning System (GPS)
The global positioning system (GPS) enables the navigation system to determine the current position of the vehicle by utilizing the signals transmitted from the satellites in orbit around the earth. The satellites transmit the satellite identification signal, orbit information, transmission time signal, and other information. When the GPS receiver receives a signal from three or more satellites simultaneously, it calculates the current position of the vehicle based on the distance to each satellite and the satellite is position in its respective orbit.

Position detection Image with GPS satellite



NOTE: Four satellites on each of 6 orbits.



Precision of GPS
The precision of the GPS varies according to the number of satellites from which signals are received and the view of the sky. The precision is indicated by the color of the GPS icon shown on the display.

GPS ICON	NUMBER OF SATELLITES	CONDITION	DESCRIPTION
No GPS icon shown	2 or less	Impossible to detect vehicle position	GPS function is normal. The satellite signals received by the GPS are too few to detect the vehicle position.
Sqare GPS icon shown with white "GPS"	3	Vehicle position detectable in 2 dimensions	The longitude and latitude of the vehicle position can be detected. (Less precise than detection in three dimensions)
Cube GPS icon shown with green "GPS"	4 or more	Vehicle position detectable in 3 dimensions	The longitude, latitude and the altitude of the vehicle position can be detected. (More precise than detection in two dimensions)

GPS Antenna
The GPS antenna amplifies and transmits the signals received from the satellites to the GPS receiver.

GPS Receiver
The GPS receiver is built in the navigation unit. It calculates the vehicle position by receiving the signal from the GPS antenna. The vehicle position and signal reception condition is transmitted from the GPS receiver to the navigation control unit to adjust vehicle position.

BACK

Protected by AR

Navigation Unit
The navigation unit calculates the vehicle position and guides you to the destination. The unit performs map matching correction, GPS correction, and distance tuning. It also controls the menu functions and the DVD-ROM drive, and interprets voice commands. With control of all these items, the navigation unit makes the navigation picture signal, then it transmits the signal to the display unit and audio driving instructions to the audio unit.

Calculation of Vehicle Position
The navigation unit calculates the vehicle position (the driving direction and the current position) by receiving the directional change signals from the yaw rate sensor and the travel distance signals from the PCMs vehicle speed pulse (VSP) signal.

Map Matching Tuning
The map matching tuning is accomplished by indicating the vehicle position on the roads on the map. The map data transmitted from the DVD-ROM is checked against the vehicle position data, and the vehicle position is indicated on the nearest road. Map matching tuning does not occur when the vehicle travels on a road not shown on the map, or when the vehicle position is far away from a road on the map.

GPS Tuning
The GPS tuning is accomplished by indicating the vehicle position as the GPS's vehicle position. The navigation unit compares its calculated vehicle position data with the GPS vehicle position data. If there is large difference between the two, the indicated vehicle position is adjusted to the GPS vehicle position.

Distance Tuning
The distance tuning reduces the difference between the travel distance signal from the VSP and the distance data on the map. The navigation unit compares its calculated vehicle position data with the GPS vehicle position data. The navigation unit then decreases the tuning value when the vehicle position is always ahead of the GPS vehicle position, and it increases the tuning value when the vehicle position is always behind the GPS vehicle position.

Route Guidance
The navigation unit can calculate different routes to a selected destination. You have five options:

- Direct Route — Calculate a route that is the most direct.
- Easy Route — Calculate a route that minimizes the number of turns needed.
- Minimize Freeways — Calculate a route that avoids freeway travel. If that is not possible, keep the amount of freeway travel to a minimum.
- Minimize Toll Roads — Calculate a route that avoids, or minimizes travel on toll roads.
- Maximize Freeways — Calculate a route that uses freeways as much as possible.

Audio Guidance
The navigation unit transmits audio driving instructions before entering an intersection or passing a junction. The audio instructions come through the audio unit to the front speakers.

NOTE: The front speakers are muted whenever the navigation system is giving guidance commands, and all of the speakers when the voice control system is being used.

DVD-ROM
The map data (including all scale rates) is stored in the DVD-ROM. The map data includes:

- Road distances, road widths, speed limits, traffic regulations, passing time at junction, distances to junctions, and the driving instructions for audio guidance.
- Latitude and longitude GPS.

(cont'd)

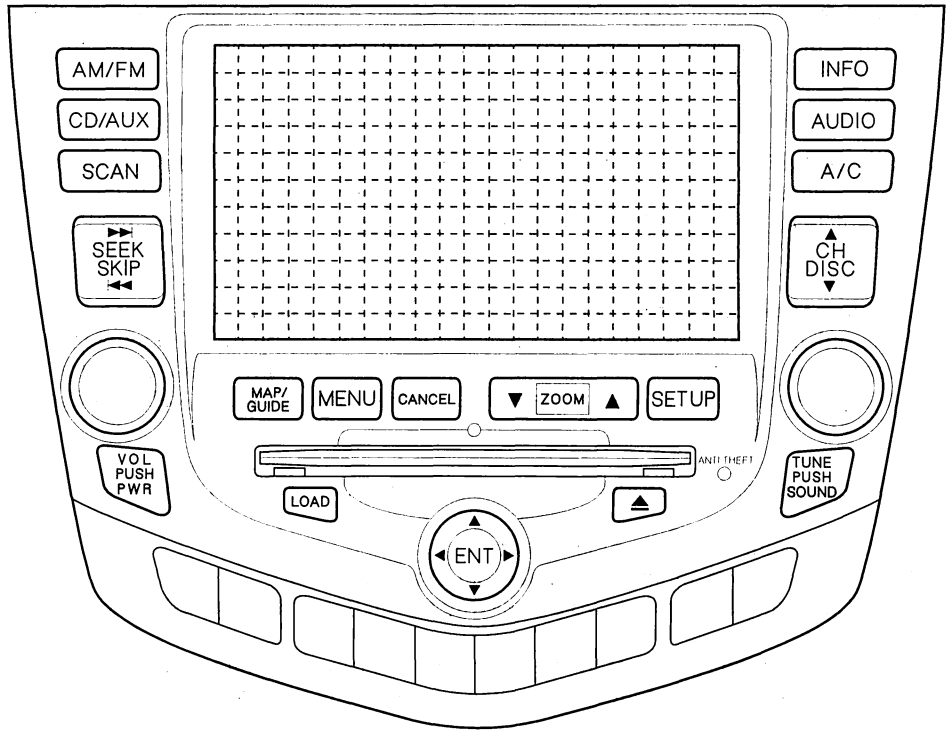
Protected by AR

Navigation System ('06 model)

System Description (cont'd)

Audio Unit
The audio unit receives the audio driving instructions from the navigation unit and transmits the instructions through the front speakers even when the audio system is in use. The audio unit is also a termination point in the GA-Net bus.

Display Unit
The display unit uses liquid crystal display (LCD). The LCD is a 7-inch-diagonal, thin film transistor (TFT), stripe type with 330,960 picture elements, The color film and fluorescent light are laid out on the back of the liquid crystal film. The touch sensor on the front of the LCD consists of a touch sensitive resistive membrane with an infinite number of possible touch locations. To maintain compatibility with earlier display units the sensing locations are confined to a grid of 20 vertical and 10 horizontal touch locations. This produces 200 total sensing zones. The display unit transmits the signal from each operation key and the touch switches to the navigation unit over the GA-Net bus.



Microphone
The microphone (on the ceiling, near the front map light) receives voice commands and transmits them to the navigation unit for interpretation.

Talk Button
Activates the voice control system in the navigation unit to accept voice commands.

Back Button
Returns the display to the previous screen (similar function as the CANCEL button).

Glossary

The following is a glossary of terms pertaining to the Voice Recognition Navigation System.

Item	Definition
Audio-HVAC subdisplay	The upper display that shows the time and current status of the audio and climate control systems.
Breadcrumbs	Off road tracking dots that can be followed on the map to retrace your route back to a mapped (digitized) road. This function can be turned on/off in Setup screen 1.
CAN	Controller Area Network. This communication network allows processors in the vehicle to send/receive information. The fuel pulses used by the trip computer are received from the PCM using the F-CAN (Fast Controller Area Network) bus.
B-CAN	Body CAN Bus (see CAN)
CPU	Central Processing Unit. The main device within the navigation unit that coordinates the rest of the electronic functions.
Database	This consists of the Map data, and the POI (Points Of Interest) data stored on the DVD
DBW	Drive By Wire. Allows electrical control of the throttle without the need of a mechanical linkage.
DCA	Detailed Coverage Area. Main metropolitan areas in the Lower 48 states, and Southern Canada are mapped to this level. See the Navigation Owner's manual for a list of these areas.
DTC	Diagnostic Trouble Codes. Use the Honda PGM Tester, or HDS tablet to obtain, and troubleshoot the cause of these codes.
Dead Reckoning	The use of the speed signal, and yaw rate sensor to position the vehicle on the map even when the GPS signal is obscured by tall buildings, or while driving in a tunnel.
Digitized Road	A road that appears on the navigation screen. The road name will appear at the bottom of the navigation screen. If the user drives "off road", the navigation system will display "Not on a digitized road", and if 1/2 mile, then "breadcrumbs" will appear.
Disclaimer Screen	Screen containing cautionary information. It is meant to be read carefully and acknowledged by the customer when using the navigation system.
DVD or DVD-ROM	Digital Versatile Disk. The navigation program and database resides on this disk. See the Navigation Owner's Manual for information on how to order a replacement or update DVD.
ECM	Engine Control Module. Typically referred to as the PCM.
E/T	Elapsed Time for the current trip as displayed by the trip computer screen.
FAQ	Frequently Asked Question. See the Navigation Owner's Manual for a list of the customer FAQs, and troubleshooting information.
F-CAN	Fast CAN Bus (see CAN)
FE	Fuel Economy value as displayed on the trip computer screen.
Fuel Pulses	This signal is transmitted on the CAN bus, and is used by the Trip Computer to calculate the fuel economy.
GA-Net bus	Units communication line.
GPS	Global Positioning System. A network of 24 satellites in orbit around the earth. The navigation system can simultaneously receive signals from up to 12 satellites to accurately position the vehicle on the map.
HDS	Honda Diagnostic System. A hand held tablet PC for use in diagnosing vehicle problems. This device can be used to obtain DTC codes for diagnosis of navigation system CAN related problems.
H/U	Head Unit. The navigation system display unit assembly in the dash.
Initialization	This refers to the period needed to re-acquire the GPS satellite orbital information whenever the navigation system power has been disconnected. This can take from 10 to 45 minutes.
LCD	Liquid Crystal Display (the navigation screen)

(cont'd)

Protected by AR

Navigation System ('06 model)

System Description (cont'd)

Item	Definition
Map Matching	The received GPS information allows the navigation system to position the vehicle on the map. Map matching has occurred if the map screen is displaying the current street name in the bottom-shaded area.
Mic	Abbreviation for the microphone used for receiving voice commands. It is located near the map light in the ceiling.
Model (in the diagnosis Version screen)	A "model code" stored on an internal "chip" in the navigation unit. The model code tells the navigation unit what software to load. Every navigation unit "model" has a unique part number for the navigation unit.
MW	Maneuver Window. While on-route to a destination, this window displays information about the next maneuver.
Navi	Abbreviation for the Navigation System
Off Route	This occurs when the user leaves mapped roads. Off road tracking dots ("breadcrumbs") are displayed if the option is enabled in Setup. The user can use them to return to a mapped road. The bottom of the navigation screen will say "Not on a digitized road".
Outlying Areas	These are rural areas that typically have only their main roads mapped. All other roads are shown in light brown for reference only, since they have not been verified.
PC Card Slot	The PC Card (PCMCIA, type II) slot is for factory use only.
PCM	Powertrain Control Module. This unit supplies the navigation system speed signal, and sends fuel pulses for the trip computer function via the F-CAN network.
PCMCIA	A computer industry defined term referring to the PC Card slot standard.
PIN	Personal Identification Number. A random 4 digit number created by the customer to protect personal information.
POI	Point Of Interest. These are the businesses, schools etc. found under the "places" option on the main menu.
Polygon	Colored areas on the map screen denoting parks, schools etc. See the Navigation Owner's Manual "Traveling to Your Destination" for a list of the assigned colors.
QWERTY	Keyboard layout resembling the typewriter keys. The keyboard layout can be changed to an alphabetical layout in the Setup mode.
SCS connector	The 2-pin connector used to put the navigation system into the diagnostic mode.
Security Code	Code needed to activate the navigation system. The security code can be obtained from the "iN" by entering the navigation system control serial number. The serial number can be found from the diagnostic screens (Unit Check, Navi ECU), or from the under side of the control unit.
Touch Switches or Touch Sensor	The navigation screen has 2 clear films on the screen panel. When you touch the screen panel, the films engaged and the display unit detects the touch point.
Tuning	A continual update of internal navigation system scaling factors. See the individual sensor tuning discussions under either "System Description", or "System Diagnosis Mode" (see page 22-532) in this manual.
Unverified Streets	These streets have not been verified for turn restrictions, one-way, etc. They are shown in light brown on the map. You can enter address destinations in these areas, but voice guidance ends at the last verified street closest to your destination.

BACK

Protected by AR

Item	Definition
Verified Streets	These streets consist of the detailed metropolitan coverage areas, and all other inter-town connection roads. These roads are shown in black on the map.
VP	Vehicle Position. When in map mode, this circular icon shows the vehicle position on the map. Touch this icon to show the latitude, longitude, and elevation of your current position.
VR	Voice Recognition. This allows voice control of many of the navigation functions. The hardware consists of the microphone, steering wheel (Talk/Back) buttons, and the front speakers. See the overview for more information.
VSP	Vehicle Speed Pulse. This pulse signal coming from the PCM is used to update the Vehicle position on the map, and to calculate the trip computer fuel economy. These pulses do not indicate direction (forward or backward). When in reverse, the navigation receives a signal from the MICU and directs the VP to move backwards on the map.
VSS	Vehicle Speed Sensor. This sensor reads the output shaft speed at the transmission and, provides a speed pulse to the PCM. The PCM sends this pulse to the navigation system and speedometer.
XM Satellite Radio	A satellite band radio system where signals are received from either a satellite or land based transmitters.
Yaw Sensor	This device is located in the navigation system control unit and senses the side-to-side twisting force generated when the vehicle turns.

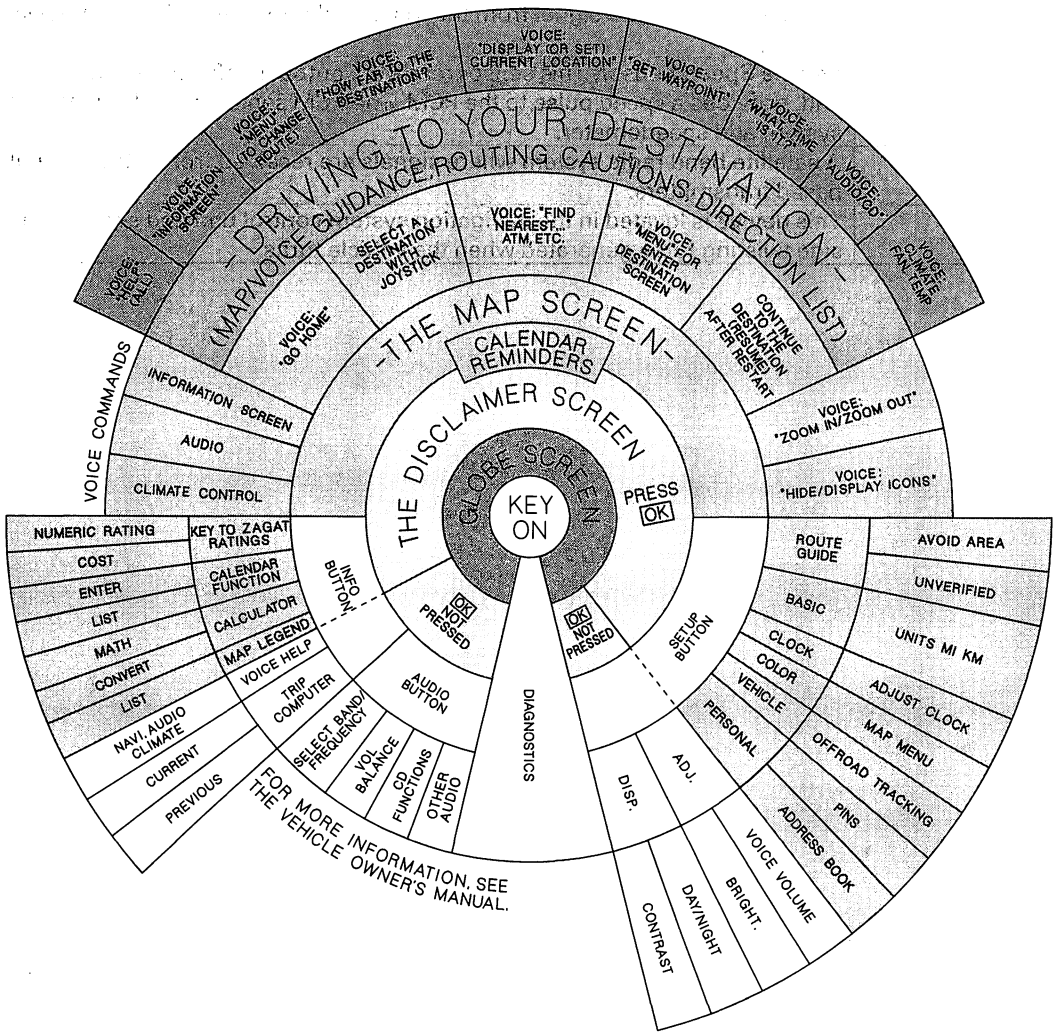
Navigation System ('06 model)

System Description (cont'd)

System Function Diagram

This diagram shows the features of the navigation system starting at the center and working outward in layers. The navigation program starts at "Key ON", and then displays the globe screen. Once the disclaimer screen is acknowledged, the next shaded portions of the diagram become active. However, some functions of the INFO and SET UP buttons, and all functions of the AUDIO and A/C buttons can be accessed immediately after the globe screen (white).

These items above the map screen show various methods to begin a destination, such as "Go Home". Once you begin driving to your destination, you are provided with map/voice guidance, routing cautions (in unverified areas), and a directions list. While driving to your destination, use the voice control system as much as possible to interact with the navigation, audio, and climate control systems.



- Functions accessible at any time
- Disclaimer screen
- Map screen/voice commands to enter a destination
- Driving to your destination
- Voice commands while driving to your destination
- Globe screen

Diagnostic Function Diagram

This diagram shows the diagnostic slice of the System Function Diagram. It has the diagnostic features of the navigation system starting at the center and working outward in layers. The diagnostic starts at "Key ON," and then displays the Diagnostic Main Menu (Select Diagnosis items) after:

The diagram shows the available menu choices starting at the buttom left and moving clockwise.

You will find a detailed explanation of each feature on the given page numbers.

In most cases, do not clear or change settings in any diagnostic screen unless instructed to do so in the explanation or by the factory. If the factory supplies you with a PCMCIA card to place in the PC slot, then the features specified in the diagram with "Card" are available.

- Starting the vehicle with the SCS connector plugged in to the navigation service check connector (see page 22-549) to get to the System Links screen, then selecting Return.
- Simultaneously pressing and holding the MENU, MAP/GUIDE, and CANCEL buttons.

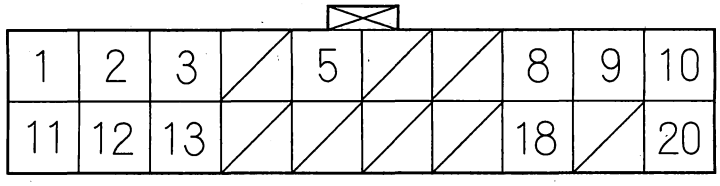
Navigation System ('06 model)

System Description (cont'd)

Navigation Unit Inputs and Outputs for Connector A (20P)



Wire side of female terminals

Terminal Number	Wire Color	Terminal Name	Description	Voltage (about)	Symptom
1	WHT	R SIG (Red signal)	Red color signal	0—1 V AC	If open: Red color missing (see "RGB Color" diagnostic). If short to ground: Red color missing (see "RGB Color" diagnostic).
2	RED	G SIG (Green signal)	Green color signal	0—1 V AC	If open: Green color missing (see "RGB Color" diagnostic). If short to ground: Green color missing (see "RGB Color" diagnostic).
3	GRY	SH SIG (Shield signal)	Shield for terminal No. 1, 2, 11, 12, 13	0 V	If open: No change to display. If short to ground: No change to display.
5	RED/BLK	ILL (+) (Illumination positive)	Parking light on signal from dash and console lights, under-hood "Relay fuse box"	Lights on= battery voltage, Lights off=0 V	If open: When brightness="Auto", night mode for the display is inoperative when lights on. If short to ground: Blows fuse 4 in under-hood fuse/relay box.
8	WHT	CAN-H (CAN high)	F-CAN bus communication with the "gauge control module"	Pulses 2.5—6 V average 3 V	If open: 1) System Links FI-ECU, and Meter both show "NG". 2) F-CAN diagnostic="NG". 3) B-CAN diagnostic="NG". 4) Car status CHG (CAN)=0. 5) Functional Setup, Trip into, FUP & Sampled FL=0. If short to ground: Same diagnostic conditions as when open, and also sets the following DTCs. • B1168 Gauge Control Module loss of Comm. (Engine) • B1169 Gauge Control Module loss of Comm. (A/T) • B1178 F-CAN communication Circuit error. • U0073 (F-CAN Bus off) • U0155 (F-CAN Gauge control) • U0121 (F-CAN TCS control)
9	GRY	SH DISP BUS (Shield display bus)	Shield for display bus terminal No. 10, 20	0 V	If open: No change to display. If short to ground: No change to display.
10	RED/WHT	DISP BUS (+) (Display bus positive)	Date bus (+) GA-Net	0 V—5 V pulses average 2.5 V depends on bus traffic	If open: Navigation buttons and touch screen do not work. If short to ground: Navigation buttons and touch screen do not work.

Terminal Number	Wire Color	Terminal Name	Description	Voltage (about)	Symptom
11	YEL	B SIG (Blue signal)	Blue color signal	0—1 V AC	If open: Blue color missing (see "RGB Color" diagnostic). If short to ground: Blue color missing (see "RGB Color" diagnostic).
12	BRN	C SIG (Composite signal)	Composite video (vertical/horizontal) Synchronizing signal	0.3 V AC	If open: Picture rolls horizontally, colors still visible. If short to ground: Picture rolls horizontally, colors still visible.
13	BLU	GND SIG (Ground signal)	Ground for color signal	0 V	If open: No change to display. If short to ground: No change to display.
18	RED	CAN-L (CAN low)	F-CAN bus communication with the "gauge control module"	Pulses 2.5—6 V average 3 V	If open: 1) System Links FI-ECU, and Meter both show "NG". 2) F-CAN diagnostic="NG". 3) B-CAN diagnostic="NG". 4) Car status CHG (CAN)=0. 5) Functional Setup, Trip into, FUP & Sampled FL=0. If short to ground: Same diagnostic conditions as when open, and also sets the following DTCs. • B1168 Gauge Control Module loss of Comm. (Engine) • B1169 Gauge Control Module loss of Comm. (A/T) • B1178 F-CAN communication Circuit error. • U0073 (F-CAN Bus off) • U0155 (F-CAN Gauge control) • U0121 (F-CAN TCS control)
20	RED/BLU	DISP BUS (—) (Display bus negative)	Date bus (—) GA-Net	0 V—5 V pulses nominally 2.5 V	If open: Navigation buttons and touch screen do not work. If short to ground: Hard and touch buttons work OK.

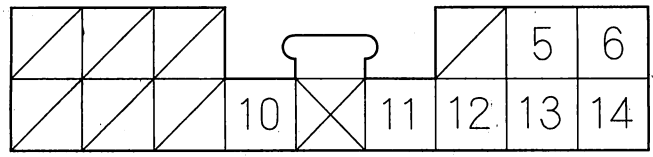
Navigation System ('06 model)

System Description (cont'd)

Navigation Unit Inputs and Outputs for Connector B (14P)



Wire side of female terminals

Terminal Number	Wire Color	Terminal Name	Description	Voltage (about)	Symptom
5	WHT/GRN	RG L (+) (Route guidance voice left positive)	Left audio signal of voice guidance, and Voice Recognition (VR) prompts	Audio signal 0.004—0.04 V	If open: If voice activated, radio speakers buzz; if voice off, no effect. If short to ground: If voice activated, radio speakers buzz; if voice off, no effect.
6	BLU	MIC SIG (+) (Mic signal positive)	Microphone output signal positive	4—5 V (with Talk button pressed)	If open: No microphone signal shown in diagnostic screens: "Navi System Link" and Functional Setup "Mic Level". If short to ground: No microphone signal shown in diagnostic screens: "Navi System Link" and Functional Setup "Mic Level".
10	GRY	STRG SW (Steering switches)	Steering switch output	4—5 V (Talk button depressed) 2.5—3 V (Back button depressed)	If open: Steering wheel "Talk", and "Back" switch/buttons do not work. If short to ground: Steering wheel "Talk", and "Back" switch/buttons do not work.
11	LT GRN	SH RG (Shield route guidance)	Shield for terminal No. 5, 12	0 V	If open: No effect on voice output. If short to ground: No effect on voice output.
12	GRN	GND RG (Ground routs guidance)	Ground for voice guidance, and Voice Recognition (VR) prompts	0 V	If open: No effect on voice output. If short to ground: No effect on voice output.
13	LT BLU	SH MIC (Shield mic)	Shield for terminal No. 6, 14	0 V	If open: No effect on voice recognition. If short to ground: No effect on voice recognition.
14	PNK	GND MIC (Ground mic)	Ground for microphone signal	0 V	If open: No microphone signal shown in diagnostics: "Navi System Link" and Functional Setup "Mic Level". If short to ground: No effect on voice recognition.

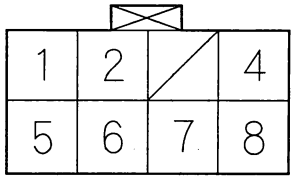
Navigation Unit Inputs and Outputs for Connector C (8P)



Wire side of female terminals

Terminal Number	Wire Color	Terminal Name	Description	Voltage (about)	Symptom
1	WHT/RED	+B (+B Power source)	Continuous power source	Battery voltage	If open: Display picture goes out (display back light still on). NOTE: System will reboot to "enter code" screen. If short to ground: Blows fuse No. 7 (10 A) in the under-dash fuse/relay box.
2	YEL/RED	ACC (Accessory)	Power source for accessories	Battery voltage at ACC (I)	If open: Display picture goes out (display back light still on). NOTE: When re-connected the system will reboot to "enter code" screen. If short to ground: Blows fuse No. 32 (7.5 A) in the under-dash fuse/relay box.
4	BLK	GND (Ground)	Ground for navigation unit	0 V	If open: No effect on system. If short to ground: No effect on system.
5	GRN	BACK LT (Back light)	Reverse signal of select laver from "Multiplex Integrated Control Unit" (A/T) or backup light switch (M/T)	In reverse, battery voltage: Otherwise 0 V	If open: Navigation never sees reverse. Diagnostic screen "Car Status", "Back"=0. If short to ground: Blows fuse No. 21 (7.5 A) in the under-dash fuse/relay box.
6	BLU/WHT	VSP (Vehicle speed pulse)	Vehicle speed pulse signal from PCM	Pulses 0—5 V: Average 2.5 V, when moving	If open: No vehicle speed pulses. Diagnostic screen "Car Status", VSP Navi=0. If short to ground: No vehicle speed pulses. Diagnostic screen "Car Status", VSP Navi=0.
7	GRN/RED	DIAG P (Diagnostic positive)	Service check signal for navigation system	5—6 V	If open: No effect on system. If short to ground: System goes into diagnostic mode.
8	GRN/YEL	DIAG N (Diagnostic negative)	Ground for service check signal	0 V	If open: No effect on system. If short to ground: No effect on system.

Symptom Troubleshooting

No picture is displayed

NOTE
- Always check the connectors for poor connections or loose terminals.
- Diagnostic Test: Navi System Link
- Confirm the correct DVD disc is installed in the navigation unit (see page 22-489)

1. Check the No. 7 (10 A) fuse and No. 32 (7.5 A) fuse in the under-dash fuse/relay box, and reinstall the fuse if it is OK.

   Is the fuse OK?

   YES—Go to step 2.

   NO—Replace the fuse and recheck.■

2. Turn the ignition switch to ACC (I).

3. Operate the radio and listen to the audio.

   Can audio be heard?

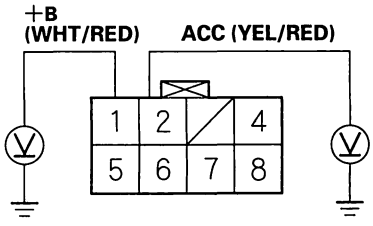
   YES—Go to step 4.

   NO—Check the ACC circuit.■

4. Turn the ignition switch ON (II).

5. Measure the voltage between body ground and navigation unit connector C (8P) terminals No. 1 and No. 2 individually.

NAVIGATION UNIT CONNECTOR C (8P)



Wire side of female terminals

Is there battery voltage?

YES—Go to step 6.

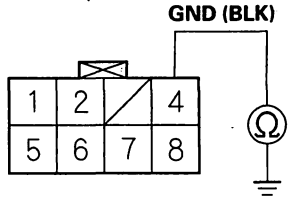
NO—If the +B wire does not have voltage, repair open in the wire between the under-dash fuse/relay box and the navigation unit.
If the ACC wire does not have voltage, repair open in the wire between the under-dash fuse/relay box and the navigation unit.■

6. Turn the ignition switch OFF.

7. Disconnect the navigation unit connector C (8P).

8. Check for continuity between navigation unit connector C (8P) terminal No. 4 and body ground.

NAVIGATION UNIT CONNECTOR C (8P)



Wire side of female terminals

Is there continuity?

YES—Go to step 9.

NO—Repair open in the wire between the navigation unit and body ground (G603).■

9. Reconnect the navigation unit connector C (8P).

10. Perform the forced starting of the display (see page 22-549).

    Is the diagnosis menu of the picture diagnosis displayed?

    YES—Go into the Diagnostic mode and use the "Navi System Link" diagnostic (see page 22-533) to check the links.■

    NO—Go to step 11.

(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

11. Shield the display unit from the sun with your hand, and check that the display is back lit (only back light is ON.)

    Can you see the back light?

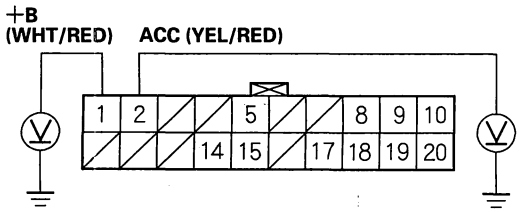
    YES—Replace the navigation unit (see page 22-550). ■

    NO—Go to step 12.

12. Turn the ignition switch ON (II).

13. Measure the voltage between body ground and display unit connector B (20P) terminal No. 1 and No. 2 individually.

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there battery voltage?

YES—Replace the display unit. ■

NO—If the +B wire does not have voltage, repair open in the wire between the under-dash fuse/relay box and the navigation unit.
If the ACC wire does not have voltage, repair open in the wire between the under-dash fuse/relay box and the navigation unit. ■

Picture is missing a color or tone

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- Confirm the correct DVD disc is installed in the navigation unit (see page 22-489)

1. Go into the Diagnostic Menu and use "RGB Color" test under Monitor Check (see page 22-534).

   Are the red, green, and blue colored circles shown?

   YES—The system is OK at this time. ■

   NO—Go to step 2.

2. Turn the ignition switch to OFF.

3. Disconnect the navigation unit connector A (20P) and display unit 20P connector.

4. Check for loose terminals at navigation unit connector A (20P) and display unit 20P connector.

   Are there loose terminals?

   YES—Repair the terminal. ■

   NO—Go to step 5.

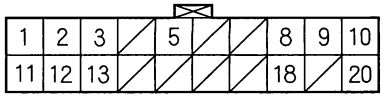
BACK

Protected by AR

5. Check for continuity between the appropriate terminals of navigation unit connector A (20P) to display unit connector B (20P) based on the missing color(s).

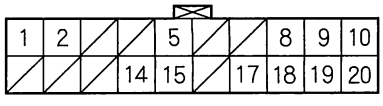
Missing color	Navigation unit connector A (20P)	Display unit connector B (20P)	Wire color
Blue	A11	B18	YEL
Green	A2	B9	RED
Red	A1	B8	WHT

NAVIGATION UNIT CONNECTOR A (20P)



Wire side of female terminals

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there continuity?

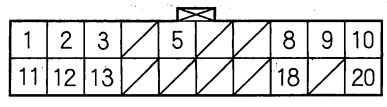
YES—Go to step 6.

NO—There is an open in the circuit between the display unit and the navigation unit. Check for poor connections or loose terminals at the display and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness.■

6. Check for continuity between the appropriate terminals of navigation unit connector A (20P) and display unit connector B (20P) based on the missing color(s).

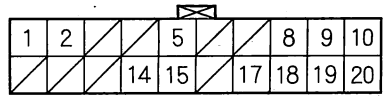
Missing color	Navigation unit connector A (12P)	Display unit connector B (20P)
Blue	A11	B10, B20
Green	A2	B10, B20
Red	A1	B10, B20

NAVIGATION UNIT CONNECTOR A (20P)



Wire side of female terminals

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there continuity?

YES—There is a short to body ground in the circuit between the display unit and the navigation unit. Replace the affected shielded harness.■

NO—Replace the navigation unit. If the problem is still unresolved, replace the display unit.■

Protected by AR

Symptom Troubleshooting (cont'd)

Picture has lines/rolls/other issues

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- Confirm the correct DVD disc is installed in the navigation unit (see page 22-489)

1. Check for electronic aftermarket accessories (possibly hidden) mounted near the display unit or the navigation unit.

   Are there any electronic accessories?

   YES—Disable the accessories, and recheck. ■

   NO—Go to step 2.

2. Start up the navigation picture.

   Is the picture scrolling horizontally (left to right or right to left)?

   YES—Check for an open or short to ground in the C SIG wire from navigation unit connector A (20P) terminal No. 12 to display unit connector B (20P) terminal No. 19. Also check for a short to ground between display unit connector B terminal No. 19 and terminal No. 20. ■

   NO—Go to step 3.

3. Go into the Diagnostic mode and use "RGB Color" test under Monitor Check (see page 22-534).

   Is the picture missing a red, green or blue color?

   YES—Do the troubleshooting for the picture is missing a color or tone (see page 22-516). ■

   NO—Go to step 4.

4. Turn the ignition switch OFF.

5. Substitute a known-good display unit, and recheck.

   Is the picture OK?

   YES—Replace the original display unit. ■

   NO—Replace the navigation unit (see page 22-550). ■

BACK

Protected by AR

Display unit buttons or touch screen buttons do not work or respond properly

NOTE:
- If the audio system is malfunctioning, repair the audio system first. Refer to the appropriate audio system troubleshooting.
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.

1. Turn the ignition switch to ACC (I).

2. Go into the Diagnostic mode and use the "Touch Panel" test under Monitor Check (see page 22-534) and, if necessary, the "Display" test under Unit Check (see page 22-536).

   Do the buttons work properly?

   YES—System is OK.■

   NO—Go to step 3.

3. Try all the buttons on the navigation system.

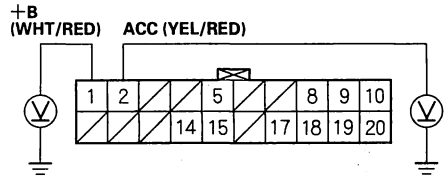
   Is there a specific row or columns of buttons, set of button, or a certain button that does not respond properly (i.e. pressing a button in the lower left corner causes a button in the right lower corner to respond.)?

   YES—Replace the display unit.■

   NO—Go to step 4.

4. Measure the voltage between body ground and display unit connector B (20P) terminal No. 1 and No. 2 individually.

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there battery voltage?

YES—Go to step 5.

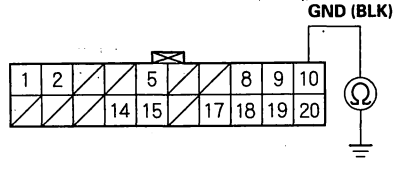
NO—If the +B wire does not have voltage, repair the open in the wire between the under-dash fuse/relay box and the display unit. If the ACC wire does not have voltage, repair the open in the wire between the under-dash fuse/relay box and the display unit.■

5. Turn the ignition switch OFF.

6. Disconnect the display unit connector B (20P).

7. Check for continuity between display unit connector B (20P) terminal No. 10 and body ground.

DISPLAY UNIT CONNECTOR B (20P)



Wire side of female terminals

Is there continuity?

YES—Go to step 8.

NO—Repair the open in the wire between the display unit and body ground (G503).■

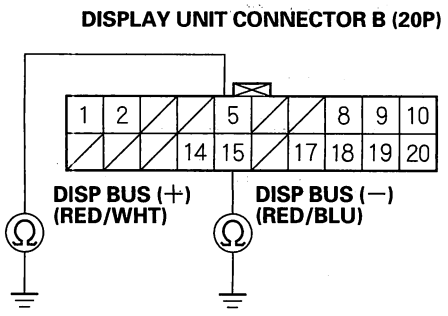
8. Disconnect the navigation unit connector A (20P).

(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

9. Check for continuity between body ground and display unit connector B (20P) terminal No. 5 and No. 15 individually.



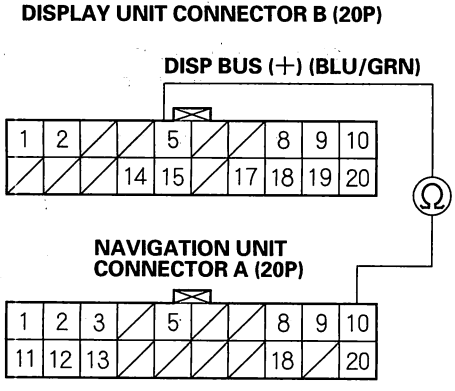
Wire side of female terminals

Is there continuity?

YES—There is a short to body ground in the circuit between the display unit and the navigation unit. Replace the affected shielded harness.■

NO—Go to step 10.

10. Check for continuity between display unit connector B (20P) terminal No. 5 and navigation unit connector A (20P) terminal No. 10.



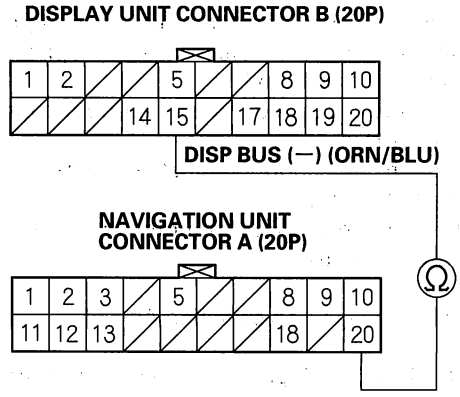
Wire side of female terminals

Is there continuity?

YES—Go to step 11.

NO—There is an open in the circuit between the display unit and the navigation unit. Check for poor connections or loose terminals at the display and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness.■

11. Check for continuity between display unit connector B (20P) terminal No. 15 and navigation unit connector A (20P) terminal No. 20.



Wire side of female terminals

Is there continuity?

YES—Replace the display unit.■

NO—There is an open in the circuit between the display unit and the navigation unit. Check for poor connections or loose terminals at the display and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness.■

BACK

GPS icon is white, or not shown

NOTE:
- Make sure the vehicle is parked outside and away from buildings.
- Refer to GPS Information (see page 22-541) for realtime satellite reception display.

1. Check for metallic window tint on the windshield and electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the navigation unit.

   Is there metallic window tint or electronic accessories?

   YES—Remove tint or the accessories and recheck. ■

   NO—Go to step 2.

2. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-533) to check the GPS antenna.

   Is "GPS Ant" icon red?

   YES—Use the "Navi ECU" test under Unit Check (see page 22-536) to check for a kinked, crushed, or disconnected GPS antenna wire. If necessary, try a known-good GPS antenna. If icon is still red, replace the navigation unit. ■

   NO—Check that nothing is blocking the GPS antenna located under the rear shelf and recheck. Sudstitute a known-good navigation unit, and recheck. ■

Voice guidance cannot be heard

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, write down the customer's radio station presets, and get the radio and navigation system anti-theft codes.
- After troubleshooting, enter the radio and navigation system anti-theft codes, and the radio station presets.

1. Press the display unit SET-UP button.

2. Check the volume setting for the navigation system.

   Is it set to OFF?

   YES—Set the volume to an audible level. ■

   NO—Go to step 3.

3. Check the radio operation.

   Can you hear the radio?

   YES—Go to step 4.

   NO—Troubleshoot the audio system. ■

4. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-533) to check the radio.

   Is "Radio" icon red?

   YES—Troubleshoot the audio system. ■

   NO—Go to step 5.

5. Turn the ignition switch OFF.

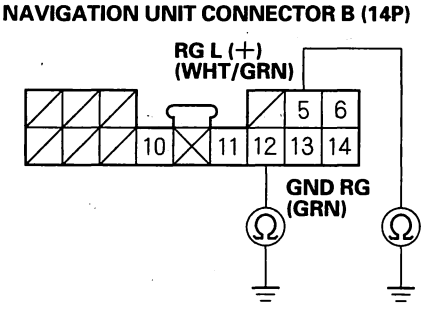
6. Disconnect the navigation unit connector B (14P) and the audio unit connector A (20P).

(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

7. Check for continuity between body ground and navigation unit connector B (14P) terminals No. 5, No. 12 individually.



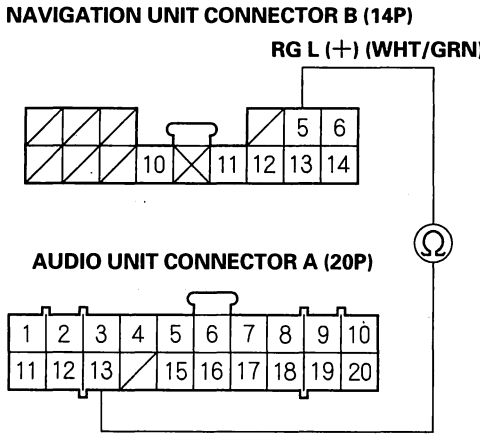
Wire side of female terminals

Is there continuity?

YES—Replace the affected shielded harness. ■

NO—Go to step 8.

8. Check for continuity between navigation unit connector B (14P) terminal No. 5 and the audio unit connector A (20P) terminal No. 13.



Wire side of female terminals

Is there continuity?

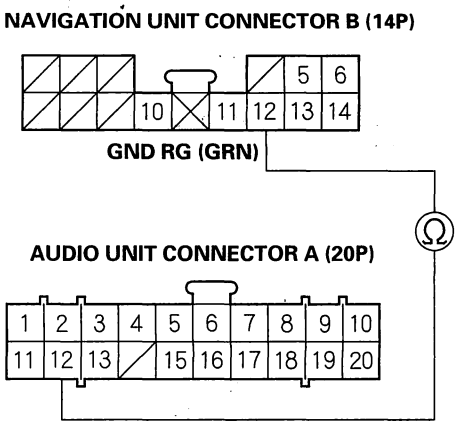
YES—Go to step 9.

NO—There is an open in the circuit between the navigation unit and audio unit. Check for poor connections or loose terminals at the audio and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness. ■

BACK

Protected by AR

9. Check for continuity between navigation unit connector B (14P) terminal No. 12 and the audio unit connector A (20P) terminal No. 12.



Is there continuity?

YES—Go to step 10.

NO—There is an open in the circuit between the navigation unit and audio unit. Check for poor connections or loose terminals at the audio and navigation units. If a poor connection or loose terminal is found, replace the affected shielded harness. ■

10. Substitute a known-good audio unit, and recheck.

Is the system OK?

YES—Replace the original audio unit. ■

NO—Replace the navigation unit (see page 22-550). ■

Voice control does not work/respond

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, write down the customer's radio station presets, and get the radio and navigation system anti-theft codes.
- After troubleshooting, enter the radio and navigation system anti-theft codes, and the radio station presets.

Before assuming that a voice complaint is hardware related, ensure that the voice control system is being operated correctly.

- Make sure you are on the correct screen when trying to issue a voice command. For instance, the command "Find the nearest Italian Restaurant" only works on a Map screen.
  (See the Navigation System Manual for a complete list of allowed voice commands for the information being displayed.)
- Close the windows and moonroof.
- Set the fan speed to low (1 or 2).
- Adjust the air flow from the air conditioning vents so that they do not blow against the microphone on the ceiling.
- Pause after pressing the TALK button, then give a voice command clearly in a natural speaking voice. If the system cannot recognize your command, speak louder.
- If the microphone picks up voices other than yours, the system may not interpret your voice commands correctly.
- If you speak a command with something in your mouth, or your voice is too husky, the system may misunderstand your command.

(cont'd)

Protected by AR

Symptom Troubleshooting (cont'd)

1. Go into the Diagnostic Menu and use the "Mic Level" test the under Functional Setup (see page 22-544) to check the operation of the TALK and BACK buttons.

   Are the TALK and BACK buttons operational?

   YES—Go to step 2.

   NO—Check for an open or short to ground on navigation unit connector B (14P) terminal No. 10. ■

2. Use the "Mic Level" diagnostic under Functional Setup (see page 22-544) to check the operation of the microphone.

   Is the microphone operational?

   YES—Check the operation of the voice control system (see the Navigation System Manual). ■

   NO—Check for a loose front map light (microphone) assembly. If OK, check for an open or short to ground on navigation unit connector B (14P) terminals No. 6 and No. 14. ■

Vehicle position icon constantly leaves road or is very far from actual position

1. Check the GPS icon on the navigation picture.

   Is No GPS icon shown?

   YES—Do the troubleshooting for GPS icon is white, or not shown (see page 22-521). ■

   NO—Go to step 2.

2. Go into the Diagnostic Menu and use the "Yaw Rate" test (see page 22-542) to check the yaw rate sensor.

3. Go into the Diagnostic Menu and use the "Car Status" test (see page 22-539) to check the vehicle speed pulse.

   Are the yaw rate sensor and vehicle speed pulse OK?

   YES—The problem may be normal. Check to see if the problem occurs in the same place. If it does, the problem could be in the database. Go to step 4.

   NO—If the problem is the yaw rate sensor, replace the navigation unit (see page 22-550). If the problem is the vehicle speed pulse, troubleshoot the vehicle speed signal circuit. ■

4. Substitute a known-good navigation unit and check to see if the problem occurs in the same place.

   Does the problem occur in the same place?

   YES—The problem is in the database. Report the problem according to the Navigation System Manual under "Reporting Errors". ■

   NO—Replace the original navigation unit (see page 22-550). ■

BACK

Protected by AR

DVD screen error messages

NOTE:
- Check the Navigation System Manual for a list of common DVD screen error messages and the probable cause.
- Go into the Diagnostic Menu and use the "Car Status" test (see page 22-539) to check the status of the DVD lid.

1. Check the DVD-ROM reading surface for scratches.

   Are there scratches?

   YES—Replace the DVD-ROM (see page 22-549). ■

   NO—If the problem occurs occasionally when the system is cold, this is normal. If the problem occurs frequently when driving, replace the navigation unit (see page 22-550). ■

Trip computer-no distance

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- If the Previous button on the Trip Computer screen is not active, make sure to answer OK to the Disclaimer screen.
- Verify that the correct navigation unit is installed for this model. Go into the Diagnostic Menu and use "Version" (see page 22-547).

1. Go into the Diagnostic Menu and use the "Car Status" test (see page 22-539) to check for a vehicle speed pulse (VSP).

   Is there a VSP when the vehicle is moving?

   YES—Check the CAN system for DTCs. If OK, replace the navigation unit. ■

   NO—Check the VSP wire for an open or short to power or ground. ■

Protected by AR

Symptom Troubleshooting (cont'd)

Trip computer-no fuel information

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- If the Previous button on the Trip Computer screen is not active, make sure to answer OK to the Disclaimer screen.
- Verify that the correct navigation unit is installed for this model. Go into the Diagnostic Menu and use "Version" (see page 22-547).

Do the "Navi System Link" test (see page 22-533) to check the communication line between the ECM/PCM (FI-ECU) and the navigation unit.

1. Go into the Diagnostic Menu and use "Trip Computer" test under Unit Check (see page 22-536) with the engine running.

   Are the values greater than zero?

   YES—The system is OK.■

   NO—Check the CAN system for DTCs. If OK, replace the navigation unit.■

Navigation cannot control A/C

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- Verify that the correct navigation unit is installed for this model. Go into the Diagnostic Menu and use "Version" (see page 22-547).

1. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-533).

   Is "Air-con" icon red?

   YES—Do the climate control system troubleshooting.■

   NO—Check for an open or short to ground between display unit connector A (5P) terminals No. 2, No. 3 No. 4 and climate control unit connector A (16P) terminals No. 16, No. 15, No. 8. If OK, check the climate control system for normal operation. If the climate control system works properly, substitute a known-good display unit and recheck.■

BACK

Protected by AR

Display day/night mode does not work

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting get the navigation system anti-theft codes.
- After troubleshooting, enter the navigation system anti-theft codes.
- Full brightness on the instrument panel brightness control causes the system to stay in the day mode, even when the lights are on.

1. Make sure the instrument panel brightness control is not on full brightness.

2. Change the day/night mode to AUTO under Set-up and recheck.

   Does the display change to day and night modes using the headlights?

   YES—The system is OK at this time. ■

   NO—Go to step 3.

3. Go into the Diagnostic Menu and use the "Car Status" test to check for an ILL signal (see page 22-539).

   Is "ILL" signal OK?

   YES—The system is OK. ■

   NO—Check the ILL+ circuit between the navigation unit and relay module. ■

System locks up constantly

1. Start the engine and turn the ignition switch OFF, then turn the ignition switch ON (II).

   Does the system reboot?

   YES—The system is OK at this time. ■

   NO—Check the DVD for scratches or damage and the navigation unit for water damage. If OK, go into the Diagnostic Menu and do all of the "Unit Check" tests (see page 22-536). ■

Protected by AR

Symptom Troubleshooting (cont'd)

Vehicle icon wanders across the map when driving (does not follow a displayed road) or spins when driving

NOTE: This symptom is caused by a defective yaw rate sensor. Perform this diagnostic when the vehicle is cold and warm.

1. Go into the Diagnostic Menu and use the "Yaw Rate" test (see page 22-542).

   Are the values correct?

   YES—The system is OK. ■

   NO—Replace the navigation unit (see page 22-550). ■

Navigation drives by itself when parked

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft code.
- After troubleshooting, re-enter the anti-theft code, and re-initialize the navigation system.

1. Start the engine.
2. From the main menu, select places, then select any destination, and begin the trip.
3. With the vehicle parked, watch the vehicle icon on the display.

   Does the vehicle position icon move by itself?

   YES—Go to step 4.

   NO—The system is OK at this time. ■
4. Go into the Diagnostic Menu and select "DEMO MODE" test (see page 22-544) under Functional Setup.

   Is "DEMO MODE" set to "YES"?

   YES—Set the Demonstration mode to "NO". ■

   NO—Replace the navigation unit (see page 22-550). ■

BACK

Protected by AR

Navigation stays on with ignition switch off

NOTE:
- Always check the connectors for poor connections or loose terminals.
- Before troubleshooting, get the navigation system anti-theft code.
- After troubleshooting, re-enter the anti-theft code, and re-initialize the navigation system.

1. With the key out of the ignition.

   Does the navigation screen stay on?

   YES—Go to step 2.

   NO—The system is OK at this time. ■

2. The vehicle may have been used as a demonstration vehicle at an event like an auto show. In these events, power is often jumpered to the navigation system so that the ignition key is not needed in the vehicle. At the end of the show, the jumper wire may not have been removed. Check the navigation unit "C" connector (8P) for a "non-factory" jumper wire in series with the factory cable.

   Is there a jumper wire?

   YES—Remove the jumper wire, and re-test. ■

   NO—Go to step 3.

3. The display or audio unit may have been jumpered behind the dash to allow the navigation system to run without the ignition key.

   Does the radio function with the ignition switch off?

   YES—Go to step 4.

   NO—Go to step 5.

4. Remove the display unit and check to see if the audio 20P connector has a non-factory jumper wire in series with the factory connector.

   Is there a jumper wire?

   YES—Remove the jumper wire, and re-test. ■

   NO—Go to step 5.

5. Check the interior lights with the ignition switch off.

   Can you turn on the interior lights with the ignition switch off?

   YES—Troubleshooting the ACC circuit. ■

   NO—Replace the navigation unit (see page 22-550). ■

Protected by AR

Symptom Troubleshooting (cont'd)

Navigation cannot control audio/CD

1. Make sure the anti-theft code for the audio system is entered.
2. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-533).

   Is for "Radio" icon red?

   YES—Do the troubleshooting for the voice guidance cannot be heard (see page 22-521). ■

   NO—Go to step 3.
3. Substitute a known-good navigation unit (see page 22-550), and recheck.

   Can the navigation control audio/CD?

   YES—Replace the original navigation unit (see page 22-550). ■

   NO—Do the audio system troubleshooting. ■

Navigation cannot control XM radio

1. Go into the Diagnostic Menu and use the "Navi System Link" test (see page 22-533).

   Is the "XM" icon red?

   YES—Check the connector at the XM receiver. ■

   NO—Go to step 2.
2. Substitute a known-good navigation unit (see page 22-550), and recheck.

   Can the navigation control the XM radio?

   YES—Replace the original navigation unit (see page 22-550). ■

   NO—Do the audio system troubleshooting. ■

BACK

Protected by AR

Audio-HVAC subdisplay does not work properly

1. Check the clock. Reset if necessary.

   Does the clock reset?

   YES—The system is OK at this time. ■

   NO—Go to step 2.

2. Check for an open or short to body ground between subdisplay unit 10P connector terminal No. 4, No. 5, No. 6, No. 7 and navigation unit connector A (10P) terminal No. 4, No. 5, No. 6, No. 7.

   Are the circuits OK?

   YES—Replace the navigation unit. ■

   NO—Repair the circuits. ■

Navigation frequently asks for code and needs GPS initialization

1. Check for an open on navigation unit connector C (8P) terminals No. 1 and No. 2.

   Are the circuits OK?

   YES—Replace the navigation unit. ■

   NO—Repair the circuits. ■

Protected by AR

System Diagnosis Mode

Start-up procedure and Diagnosis Menu

There are two ways to enter the diagnostic mode:

1. Connect the SCS connector (see page 22-549) to the navigation service connector located in the trunk. Turn the ignition switch to the ON (II) position. The display will go directly to the diagnostic menu screen shown below.

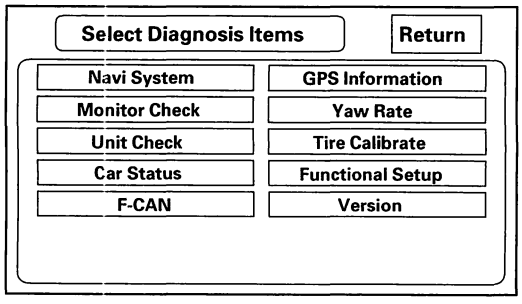
   NOTE: When finished troubleshooting, make sure to remove the SCS connector.

2. Turn the ignition switch ON (II). Use the navigation display hard buttons as described below:

   Press and hold the 3 buttons (Menu, Map/Guide, and Cancel), and keep them pressed for about 5 seconds. The display screen will go directly to the "Select Diagnosis Items" menu shown below.

   NOTE: This only allows access to the diagnostic screens. All other navigation functions are disabled.

DIAGNOSTIC MENU SCREEN



3. After the display changes to the Select Diagnosis Items menu, select the item you want to check and the diagnostic will start. To return to the previous screen, select "RETURN".

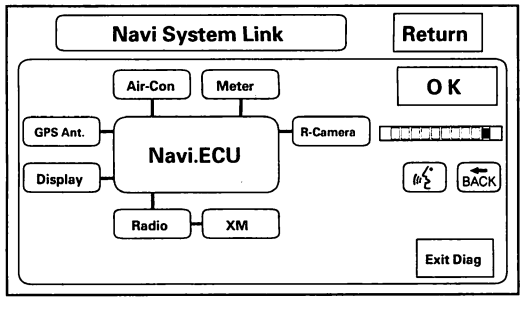
   - Navi System (Link)
   - Monitor Check
   - Unit Check
   - Car Status
   - F-CAN
   - GPS Information
   - Yaw Rate
   - Tire Calibrate
   - Functional Setup
   - Version

BACK

Protected by AR

Navi System Link

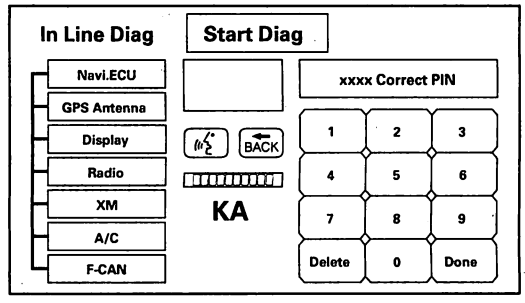
- This diagnostic tests the cables connecting the navigation components. Ensure that the ignition switch is in the ON (II) position. When the diagnostic begins, a "bong" sound is heard. The system is in a "Detecting" mode, and is waiting for all items in white to be tested. This includes the voice control (Talk/Back) buttons, and microphone. Press the TALK button on the steering wheel, and in a normal voice, say "testing". The Talk indicator on the screen should become green, and the voice level indicator should move to at least the 6th bar to pass. Next, press the Back button. This should cause the "Cancel" indicator to go green.
- If all of the communication lines connecting the system components, and the Talk/Back switch buttons/microphone check out OK (all block diagram items green), then the "OK" indicator will become green.
- If there is a problem with the system, the faulty system component item will change to red, and the screen will show "NG" in red. Use the troubleshooting index, and other diagnostic screens to help locate the problem.
- The indication on the screen may not change until the ignition switch is cycled. After repairing the affected cable or system, repeat this diagnostic.
  NOTE: Green boxes and green "OK" indicate that the communications lines (cables) are intact. This diagnostic does not necessarily imply that the individual components are functioning properly. For instance, the GPS antenna wire may be crushed, but still show as "green" . A road test, or other diagnostic may be necessary to fully test each component.



NOTE: The mic level indicator must reach the 6th bar or greater to pass the test.

Factory diagnostic screen "In Line Diag"

When a navigation control unit is powered up for the first time at the factory, the "factory diagnosis" screen (In Line Diag) shows up. Normally the factory performs the steps necessary to verify proper operation and terminate the "factory diagnostic". Until the proper confirmation sequence is performed, the screen will show up every time the vehicle is started.



Follow the steps below to prevent the screen from showing up in the future:

- Hold down the buttons (Menu + Map/Guide + Cancel) for about 5 seconds (the "Select Diagnosis Items" screen will appear)
- Hold down the Map/ Guide button for 5—10 seconds (A screen with a "Complete" button, will appear)
- Touch "Complete", and then the "Return" button (the system may re-boot)
- Restart the vehicle, and confirm normal operation by completing the "PDI of the navigation system" Service Bulletin.

(cont'd)

Protected by AR

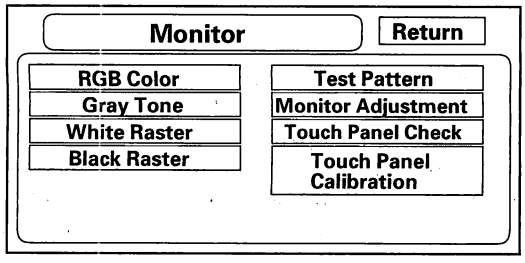
System Diagnosis Mode (cont'd)

Monitor Check

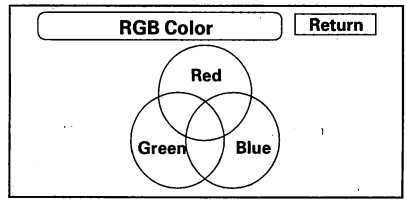
Overview of display unit

- The display unit communicates with the navigation unit over its own GA-Net bus. Information is sent to the navigation unit whenever the user activates the touch screen, or buttons. Information sent by the navigation unit to the display unit includes commands to control the LCD back light.
- The navigation unit also sends navigation and rear camera video information to the screen using the Red, Green, Blue, and Composite Video signals.
- The display unit is protected by the security system by daisy-chaining the security signal through it, and then passing the signal to the audio unit.
- The illumination input from the gauge brightness control provides back lighting for the buttons surrounding the screen.

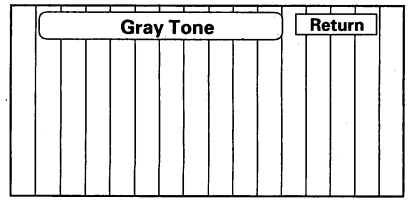
These screens allow troubleshooting of the display unit. Select the item you want to troubleshoot, and follow the diagnostic instructions.



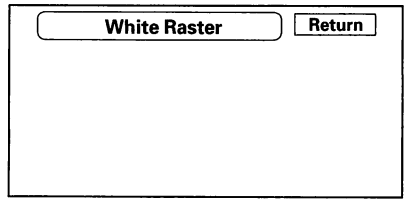
RGB Color
This screen verifies that the display unit is receiving the video (R, G, B and Composite sync) signals properly. The three primary colors should all be shown without distortion. The combination of all three should produce a central white section. If any of the colors are missing, troubleshoot for the color signal (see page 22-516). If the picture has lines in it or scrolls horizontally, or vertically, troubleshoot for a Composite sync problem (see page 22-518).



Gray Tone
This screen looks for problems with contrast. You should be able to see the changes from bar to bar across the scale. It is normal for the 2 bars on either side to appear the same.



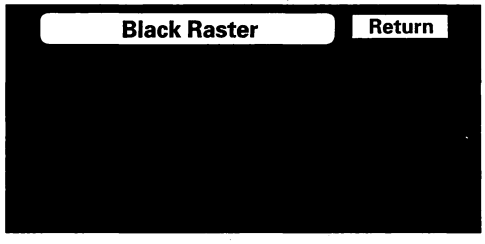
White Raster
The entire display must be shown in white.



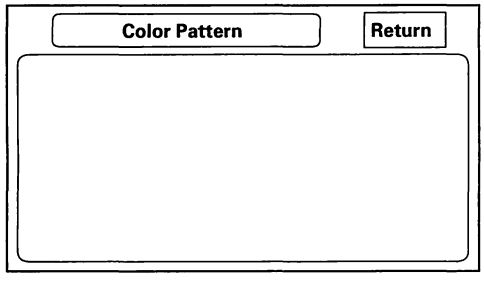
BACK

Protected by AR

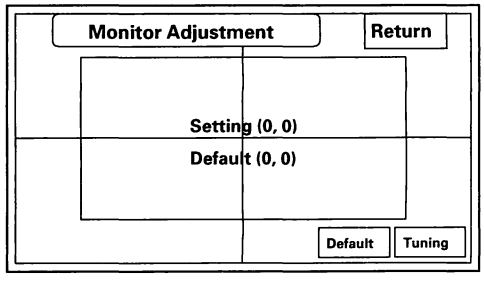
Black Raster
The entire display must be shown in black.



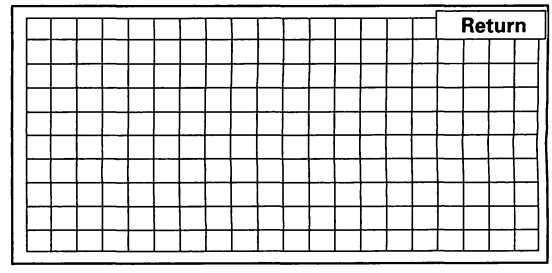
Color Pattern
The chart below shows the colors being used for the map and menu screens. This is for factory use only. To check the color signal use the "RGB Color" diagnostic found under the Monitor Check.



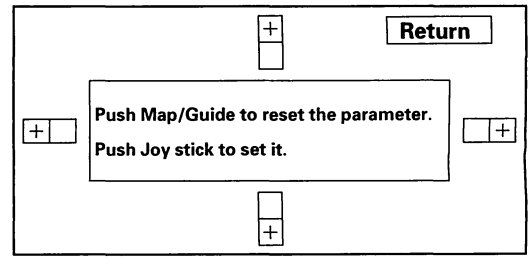
Monitor Adjustment
This allows the navigation display to be centered. Use the joystick to move the picture up/down or left/right. It is unlikely that you will ever need to adjust the monitor position. The "Default" button will reset the display position to factory specifications.



Touch Panel
The panel touch sensing system consists of a touch sensitive resistive membrane covering the display. Contrarily to other systems using infrared beams, the screen has to be physically "touched" to make it work. The display has capability of an almost infinite number of touch locations. However, to be compatible with earlier systems, the software only senses the locations shown on the diagram screen below. Every possible touch button position is shown on this diagram screen. Touching one of these should cause its color to reverse, and sound a "beep." If the touch locations are off slightly (by less than one touch location), use the "Touch Panel Calibration" diagnostic to re-align the touch "zones" with the screen image. If any areas of the screen either don't respond, or respond at some other location when touched, the replace the display unit.



Touch Panel Calibration
Touch the "+" item on the screen. If the screen respond at some other location when touched, adjust responded point to touched point using the joy stick.



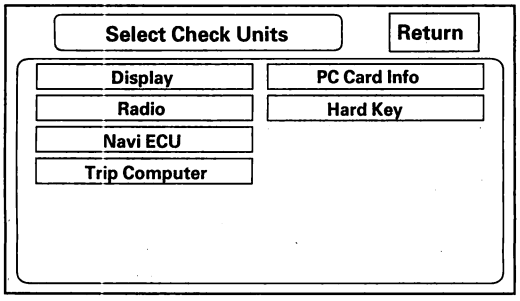
(cont'd)

Protected by AR

System Diagnosis Mode (cont'd)

Unit Check

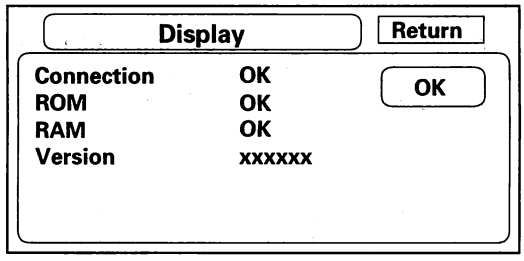
Select the item you want to check and the diagnostic starts.



Display

This diagnostic performs additional checks on the communication bus between the control unit and the display. In addition, the internal electronics and touch screen functionality are confirmed.

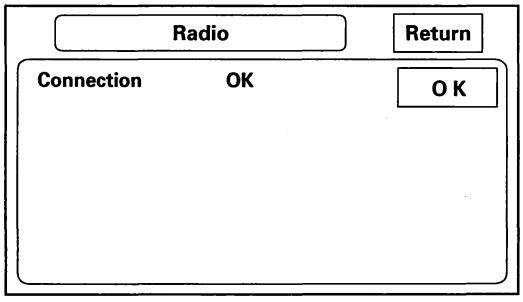
- When the connection is NG, first check for loose terminals at the navigation unit and the display unit connections. Next check for an open or short in the communication line between the navigation unit and the display unit. If the line is found to have an open or short, replace the affected shielded harness.
- If the ROM or RAM is NG, replace the display unit.
- The version represents the software version in the display.



BACK

Protected by AR

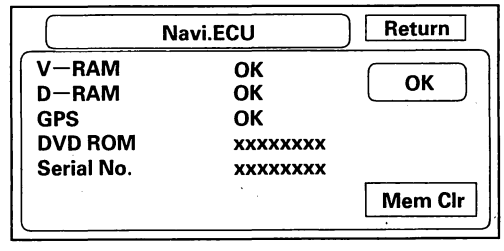
Radio
This diagnostic checks the audio connections. If not OK, do the troubleshooting for audio system.



Navi ECU
This screen looks for problems the navigation unit. When this diagnostic is initiated, there is a delay of up to a minute while it runs.

NOTE: This diagnostic cannot be canceled when running.

- If "V-RAM" or "D-RAM" is NG, then replace the navigation unit.
- If "GPS" indicates "NG (ANT)", then check the entire GPS antenna wire from the navigation unit to the antenna. If the wire is crushed or damaged, try a known good antenna. If this diagnostic reads OK, then order a new GPS antenna. If the diagnostic still reads NG (ANT), then replace the navigation unit.
- "DVD ROM" represents the database version on the DVD. This information can also be found in Setup Screen 4 by selecting System Information.
- "Serial No." should be the same as the serial number found on the underside of the navigation unit. This number is needed to obtain the security code from the Interactive Network (IN) system.
- The Mem Clr is for factory use and should not be used unless instructed by the factory.
  Selecting this will erase the customer's settings, personal information, and anything else stored in memory.



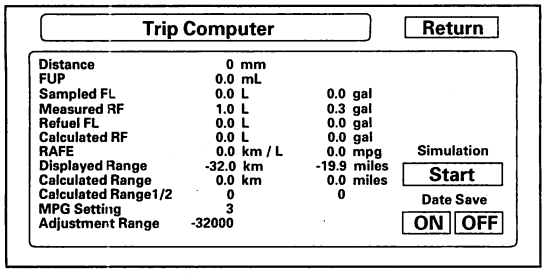
(cont'd)

Protected by AR

System Diagnosis Mode (cont'd)

Trip Computer
This screen shows current internal values used for trip computer calculations. They are for factory use only.

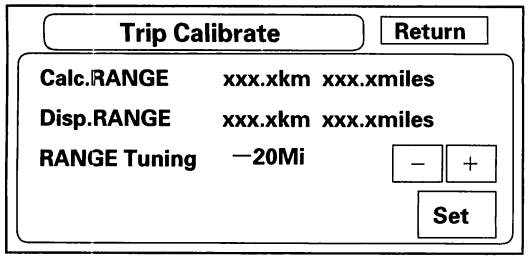
- Simulation "Start" is for factory use.
- "Data Save" should always be OFF. It is for factory use only.



Trip Calibrate
By holding down the MENU button while on the "Trip Information" screen, you will see the screen below. This screen allows you to adjust the vehicle range (distance to empty).

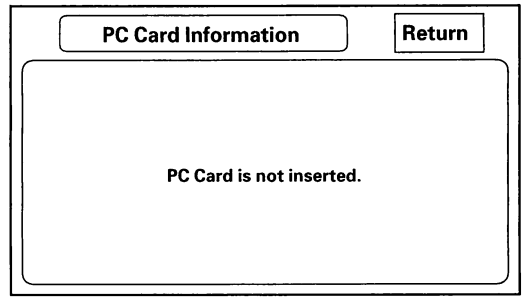
- "Calc. RANGE" is the calculated value.
- "Disp. RANGE" is the distance displayed on the trip computer "Range" field. If it reads "0", the vehicle will have enough fuel to travel apporoximately 20 miles.
- Range Tuning can be adjusted "+" or "—" to adjust the range to empty. It is recommended that this value not be changed.

NOTE: Setting the range offset too low (+10) could result in the vehicle running out of gas before the display reads "0". Make changes slowly when changing this value.

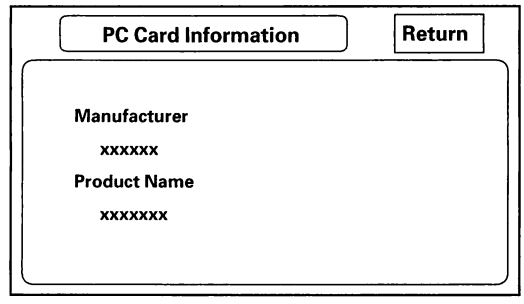


PC Card info.
There is no PC Card in the PC slot, and the screen should say, "PC Card is not inserted."

NOTE: Do not insert any card or object into the slot.



If the factory provides a PC card and instructs you to insert a card, then the screen displays the Manufacturer, and Product Name as shown in the following screen.

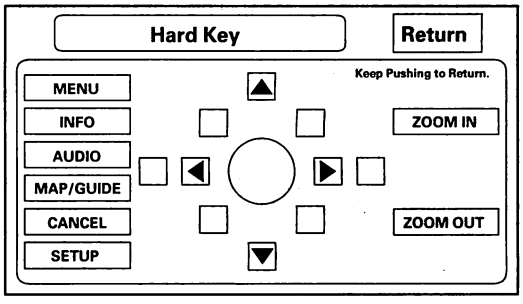


BACK

Protected by AR

Hard Key
This diagnostic tests the joystick, and the buttons that surround it. For this model, the joystick and buttons utilize the GA-Net bus for communication to the navigation control unit.

To complete the test, touch each button, and move the joystick to each indicated position. As each function is tested, the corresponding button on the display should highlight. To exit, push in and hold the joystick.



Car Status

This screen is used to confirm that navigation unit is properly receiving input signals. Signals equal to (0) are OFF, and signals equal to (1) are ON. If the value on the display does not match the actual vehicle status, then check the wire carrying the signal.

- VSP-Vehicle Speed Pulse from PCM
  (Pin 6 of C-connector)
  a) OFF (0) when vehicle is not moving
  b) ON (1) when vehicle is moving

The VSP comes from the PCM as a dedicated signal. Internally, the navigation unit compares the actual VP on the map against street data to adjust the pulse to speed scaling factor. As this scaling factor becomes more accurate, the "Level" gradually increases from 0 to 10 (see the Tire Calibrate diagnostic screen).

- BACK-Reverse indication from taillight relay
  (Pin 5 of C-connector)
  a) OFF (0) when shift lever is in any position other than reverse
  b) ON (1) when shift lever is in reverse

The Back signal is used by the navigation unit to allow the map screen to show the VP moving backwards when in reverse and to activate the rearview camera. This signal is needed because the Speed Pulse has no direction indication.

(cont'd)

Protected by AR

System Diagnosis Mode (cont'd)

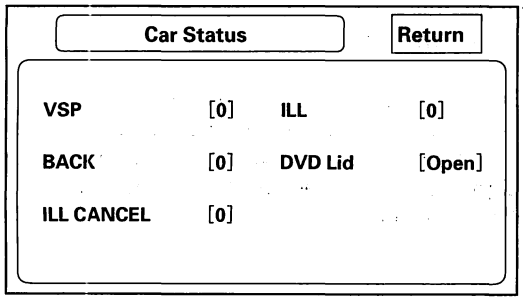
This signal is obtained off of the F-CAN bus. For problems, perform F-CAN troubleshooting. Diagnostic trouble codes (DTCs) for the F-CAN can be retrieved with the HDS (Honda Diagnostic System).

- ILL-Illumination Indication
  (Pin 5 of navigation unit A-connector)
  a) OFF (0) when parking lights, or headlights are off
  b) ON (1) when parking lights, or headlights are off

This signal is used by the navigation unit to determine whether to put the navigation screen into the Day or Night brightness mode. (Setup screen 1)

- DVD Lid-senses if DVD door is open
  a) (Close) when door is closed
  b) (Open) when door is open

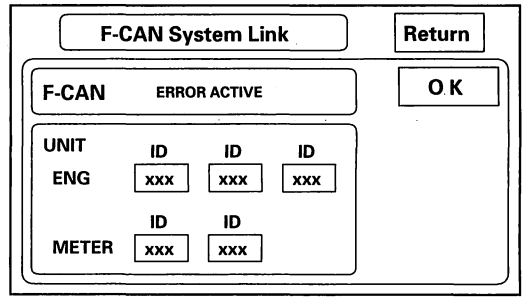
The navigation unit has a micro switch to detect this. If open is indicated when the door is closed, replace the navigation unit.



F-CAN System Link

F-CAN (Fast Controller Area Network) passes information between processors on the network. For example, the F-CAN network is used to pass fuel pulses between the PCM and the navigation unit for the trip computer function. The F-CAN network uses a communication protocol that transmits data at 500 Kbps.

- If the diagnostic screen below reads NG with the ignition switch ON (II), then diagnostic trouble codes (DTCs) for the F-CAN can be retrieved with the HDS (Honda Diagnostic System). The data displayed in the ID boxes is irrelevant.
- For more details on troubleshooting the F-CAN, refer to the multiplex system.



BACK

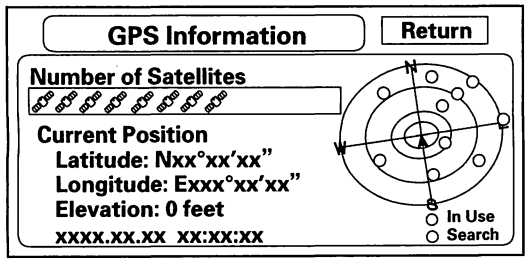
Protected by AR

GPS Information

This screen shows the current status of GPS reception. The circular diagram shows the current location of the GPS satellites (yellow dots) as they would appear in the sky. The outer circle represents the horizon (0 degrees elevation). The middle and inner circles represents 30 and 60 degrees respectively. The very center of the diagram (90 degrees elevation) is directly overhead. Naturally, nearby obstructions, like tall buildings will block satellites in that direction. That is why it is necessary to be in an open area to effectively troubleshoot GPS reception issues. There are always 24 "active" GPS satellites in orbit. Because satellites fail, and have to be removed from service, spares always parked in orbit, ready to be activated. This is why the PRN (satellite ID number) can be greater than 24.

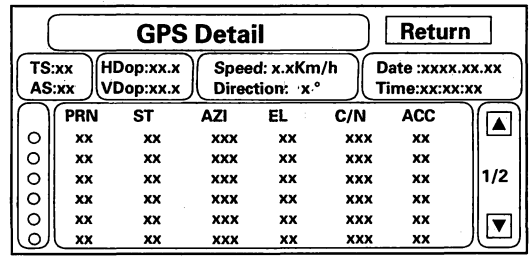
NOTE: To use this screen for troubleshooting, the vehicle should be out side away from buildings, tall trees, and high-tension wires for at least 10 minutes with the engine running.

- The "Number of Satellites" box shows the number of acquired satellites (maximum of 12). It should contain 3 or more icons. If not troubleshoot for "GPS icon is white, or not shown" (see page 22-521).
- The "Current Position" shows latitude, longitude, and elevation (in meters). If there are less than 3 satellites, the elevation can be grossly inaccurate.
- The Date/Time field shows the current date, and also a time that includes daylight savings and other offsets entered by the customer in Setup screen 2 "Adjust Time Zone/Clock".



GPS Detail

By pressing and holding the MENU button for 10 seconds, a GPS Detail screen is displayed. This screen displays real time incoming satellite positional data. Most of the information shown on this screen is for factory use, however some of the data can indicate partial GPS signal interference.



(cont'd)

Protected by AR

System Diagnosis Mode (cont'd)

- The box TS/AS and HDop/VDop is for factory use.
- The Speed and Direction information is updated in real time when driving, and can be used to detect intermittent speed sensor problems.
- The Date/Time Information is the same as in Setup screen "Adjust Time Zone/Clock".
- If the "3D" icon is shown above the yellow dots, this implies that at least 4 satellites are available for map positioning, and the "GPS" indicator on the map screen will be green. See the "Global Positioning System" detailed explanation in the "System Description".
- If the row of data in the table below begins with a "yellow dot", the AZI and EL fields can be used to locate each satellite on the circular GPS diagram (see prior screen).

NOTE: The data shown in the GPS Detail screen is an example only.

The table of values shown on the screen below has the following columns:

Column	Description	Problem indication
Active	Active satellites (Yellow Dot)	If "3D" is missing, follow GPS icon is white, or not shown troubleshooting (see page 22-521).
PRN	The satellite ID number	
ST	The status: 0= cannot view or searching, 2= acquiring	If all 0, then, follow GPS icon is white, or not shown troubleshooting (see page 22-521).
AZI	Azimuth, the angle (0—360) clockwise from north	
EL	Elevation from the horizon (90 deg is overhead)	
C/N	N/A	Healthy signal is 49-52, no signal: 27-33
ACC	N/A	

Yaw Rate

This diagnostic checks the yaw rate sensor in the control unit. This device detects when the vehicle turns, and repositions the vehicle position icon on the map screen. For more detailed information, see the yaw rate sensor theory of operation under "System Description"

- "Sensor" indicates the voltage output from the yaw rate sensor. It should indicate about 2.500 volts when stopped.
- "Offset" is the reference voltage or standard within the yaw rate sensor. It also should indicate about 2.500 volts when stopped.
- A "sensor" output voltage HIGHER than the "Offset" voltage indicates that the vehicle is turning to the right.
  A "sensor" output voltage LOWER than the "Offset" voltage indicates that the vehicle is turning to the left.
- The yaw rate offset, and sensor should both indicate about 2.500 volts when stopped. If either reads zero, or 5.000 volts, replace the navigation unit.

BACK

Protected by AR

- The yaw rate offset and sensor should be within +/—0.01 V of each other when stopped. The sensor value should change relative to the offset as the car is turned while driving. If not, replace the navigation unit.

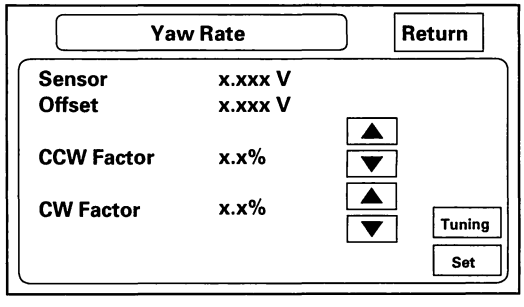
Example: Car stopped

Normal		**Abnormal**	
Offset	2.526 V	Offset	2.526 V
Sensor	2.516—2.536 V	Sensor	2.623 V

Example: Car turning

Normal		**Abnormal**	
Offset	2.526 V	Offset	2.526 V
Sensor	2.678 V (right turn) 2.478 V (left turn)	Sensor	2.623 V (no change on turns)

- The settings "CCW Cal Factor", "CW Cal Factor", and "Set" are for factory use only. THIS SHOULD NEVER BE USED.
- Touch "Tuning" to view small but gradual yaw rate problems.



Yaw Rate Tuning
This diagnostic allows you to graphically display problems with the yaw rate sensor.

- The "ANG-Disp" value accumulates any differences between the "offset", and "sensor" voltages (see Yaw Rate diagnostic). When the sensor is healthy, the random changes in these two voltages generally cancels out, so the value is 0. However if one voltage is consistently higher than the other, then the "ANG-Disp" value accumulates the constant change.
- The "Reset" button temporarily clears the angular accumulation (ANG-Disp), and clears the display dots.
- Do not touch the "CCW" or "CW", or "Set" buttons. These are used for factory setup only.

Two tests are explained below. For gross problems with the sensor, the stationary test usually confirms whether the sensor is defective. For yaw rate issues related to driving, perform the road test described below.

1. Stationary test: If the "VP" icon spins in place and the "ANG-Disp" value slowly increases or decreases in value, the yaw rate sensor is defective. Replace the Navigation control unit.
2. Road test: Drive the vehicle on a very straight road. Enter the diagnostic mode, select "Yaw rate", and touch the "Tuning" button. While driving down a straight road, the white "dots" should trace a straight line across the screen. However, if you are driving on a straight road, and you notice the dots constantly dropping down or heading up as you drive, the navigation control unit's yaw sensor is defective. You can touch "Reset" to clear "ANG-Disp", and dotted line.

3. If either test above fails, please enter "Yaw rate sensor defective" for the problem description, on the "Navigation core return form".

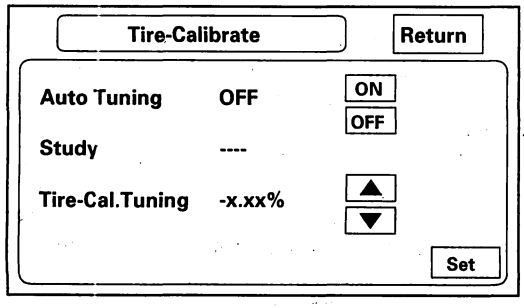
Protected by AR

System Diagnosis Mode (cont'd)

Tire Calibrate

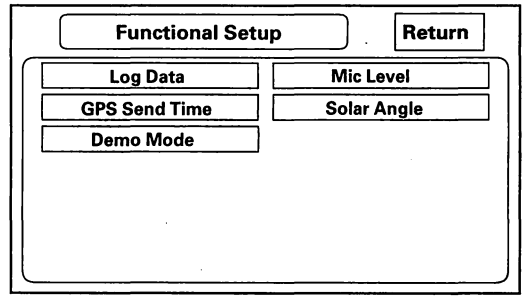
As the vehicle moves, the navigation system receives speed pulses from the PCM. These pulses are converted using a conversion factor to a mph speed that moves the vehicle position (VP) on the map. The navigation system has an internal tuning function that generates and refines this factor based on actual driving. The "Level" indicates the status of the tuning. At initialization, it begins at 0, and increases to 10 as the navigation system is used.

- The "Auto Tuning" is factory set to "ON", and should remain on.
- The "LEVEL" indicates the tuning status. If it is less than 10, the unit is still calibrating.
- The "Tire-Cal. Tuning" and Set should not be used. It is for factory use only.



Functional Setup

Select the item you want to check.

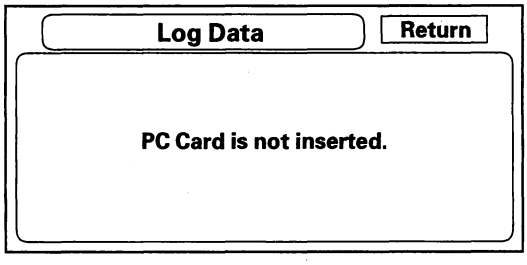


BACK

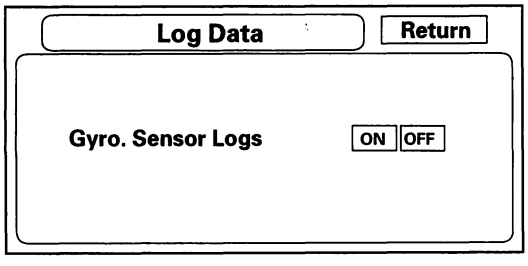
Protected by AR

Log Data
This screen allows the factory to collect log data to troubleshoot navigation system issues.

- Normally there is no card in the "PC Card slot", and the PC slot door should always be closed.

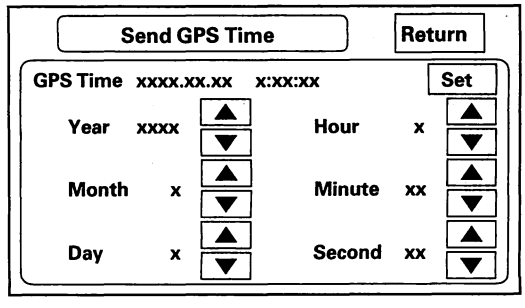


- However, if the factory provides a PC card and instructs you to insert it into the card slot (label side up), and then slide the PC Card door shut. If instructed by the factory, select "Gyro. Sensor Logs ON". Follow the factory procedure for gathering test data, and properly ending the test.



GPS Send Time
This screen is for factory use only, do not adjust. It allows adjustment of the GPS time. This display updates in real time.

- "GPS Time" is the time as received from the GPS satellites. It is in Greenwich Mean Time (GMT).
- "System Time" is the internal time used by the navigation unit to calculate your position on the map. It is also in Greenwich Mean Time (GMT).
- "Display Time" is the time shown on Setup screen 2 "Adjust Time Zone/Clock", and reflects any changes due to daylight savings time or time adjustments entered by the customer.
- Date, Hour, Minute, and "Set" should not be used.



Demo Mode
This screen is for factory use only, and should always be set to "OFF". Occasionally this setting is turned "ON" when vehicles are being used at Auto Shows or similar events. Turning this feature on, allows the navigation system to automatically follow a route to a destination when the vehicle is stationary.

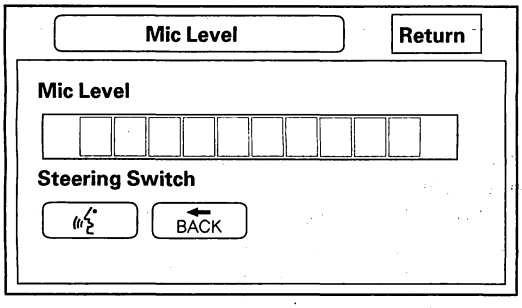
Protected by AR

System Diagnosis Mode (cont'd)

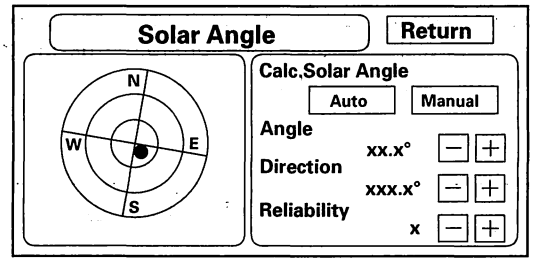
Mic Level
This diagnostic allows you to independently test the microphone and the Talk/Back buttons. They are used to activate the voice control system. The microphone is located near the map light in the ceiling. It is directional, and works best if the voice is coming from the drivers seat.

- Press the Talk button on the steering wheel, and in a normal voice say "testing". The TALK indicator on the screen should momentarily become green, and the text "Now Recording..." should appear in yellow. In addition, the Mic Level indicator should move at least to the 6th bar. If the Talk indicator on the screen does not briefly become green, then check the wiring from the Talk button to the navigation unit. If there is no "Mic Level" movement when you speak, then you should check the wire running from the microphone to the control unit.
- Press the Back button on the steering wheel. This should cause the Cancel indicator on the screen to momentarily become green. If it does not briefly change to green, then check the wiring from the steering wheel Back button to the navigation unit.



Solar Angle
This screen is used to graphically display the sun's position as determined by GPS. The navigation system uses the sun's angle, along with the sunlight sensor to control the driver/passenger A/C air flow. The heat that must be removed by the A/C unit varies, depending on the angle of the sun entering the vehicle. This screen is for factory use only, and should not be adjusted.

- The screen shows a circular diagram of the sky oriented in the direction that the vehicle is pointing. During daylight hours a red dot is shown, representing the direction and elevation of the sun. The outer circle represents the horizon (0 degrees elevation). The middle circle is 30 degrees, the center circle is 60 degrees, and the very center is directly overhead (90 degrees).
- "Auto" should always be on (yellow).
- The "Angle", "Dir", and "Reliability" settings are used by the factory to simulate the sun's position for debugging this function.



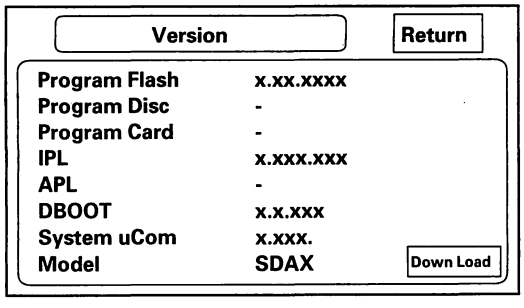
BACK

Protected by AR

Version

This screen displays the current version of the program, and allows the loading of a new version of the program either from a CD/DVD or from a PC card.

- Program Flash is the version of the navigation program in memory.
- Program Disc is the version of the program on the DVD.
- The Values "IPL", "APL", "DBOOT", and "System uCom" are for factory use.
- The value for "Models" should begin with the letters "SDA"; and indicates that the navigation unit is for an ACCORD. If any other letters appear after "Models", then verify the part number on the underside of the navigation unit, and replace the navigation unit if necessary.
- "Download" should never be touched unless instructed by the factory. Touching download overwrites the navigation software version in memory, with the software version on the DVD.



NOTE: If any model number other than SDAX is displayed, replace the navigation unit with the correct part. The model code tells the navigation unit what software to load off the DVD.

System Diagnosis Mode (cont'd)

Error Message Table

Screen Error Message	Solution
Navigation system is unable to acquire a proper GPS signal.	Make sure there is nothing on the rear package tray blocking the GOS antenna. If not, move the vehicle to an open space away from tall buildings, trees, etc. Rear window tinting and after-market devices can affect the GPS reception.
Navigation unit door is open or No DVD disc installed. Please check system.	Make sure the navigation DVD is installed with the label side up and the navigation unit door is fully snapped closed.
PC card slot door is open. Please check system.	Make sure that the sliding door for the PC card is fully closed.
No DVD disc, please check system.	Check that the navigation DVD is installed with the label side up.
Display temp is too high. System will shut down until display cools down.	This message will appear briefly when the display temperature is too high, and then the display will turn off until the temperature cools down. The system will turn back on when the display cools down.
Outside temperature is low, system will take a while to start up.	The temperature is below −30°C and the navigation ECU has difficulties reading the DVD. The system will start up when the temperate warms up.
DVD disc reading error (unformatted), please consult your dealer.	Check the DVD source for deep scratches or other damage. Make sure you are using an official Honda navigation DVD (white in color). The system cannot read other mapping databases or video DVDs. If the problem persists, see your dealer.
Route has not been completed. Please try again from a different location.	Routing to or from a place (new area) that is not in the database. Try planning a different route to or from a different location.
No alternate route found. Original route will be guided.	No alternate route method was found. The original route will be used.
This destination cannot be found in database.	The destination was not found in the database. Try another destination nearby, or select the destination with the joystick.

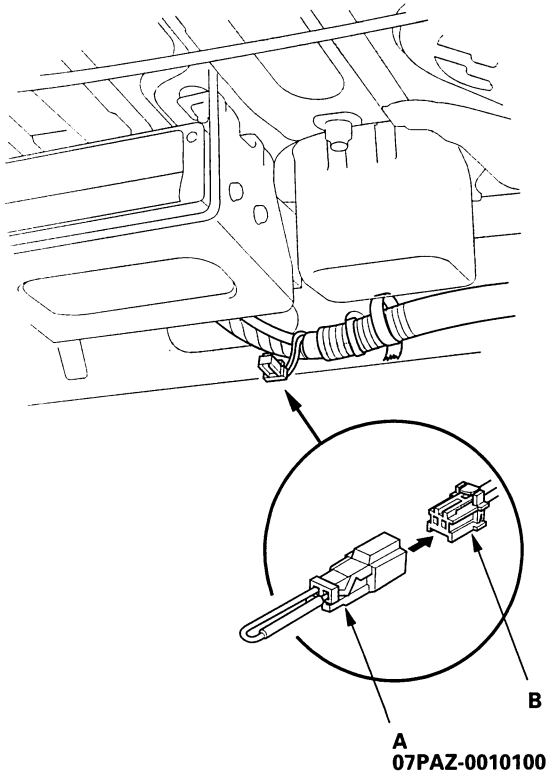
Forced Starting of Display

Special Tools Required
SCS service connector 07PAZ-0010100

1. Connect the SCS service connector (A) to the navigation service check connector (B) located behind the navigation unit.



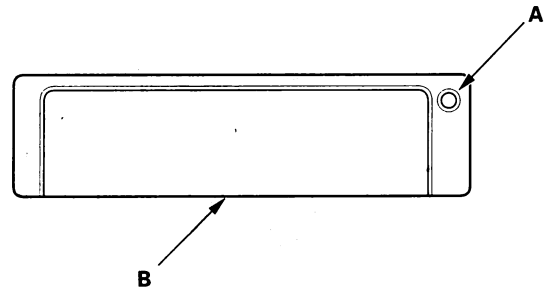
2. Turn the ignition switch ON (II).
3. Check that the system starts up and then changes to the "Navi System Link" screen.
4. Remove the SCS connector.

   NOTE: If the system fails to display the "Navi System Link" screen, refer to no picture is displayed (see page 22-515).

DVD-ROM Replacement

NOTE: When the DVD-ROM is re-inserted or replaced, a map match must be done (see page 22-489).

1. Turn the ignition switch ON (II).
2. Push the open button (A) of the navigation unit (B) located in the trunk area.



3. Press the EJECT button.
4. Remove the DVD-ROM.
5. Insert the new DVD-ROM.
6. Push the open button. Do not turn the ignition switch OFF, until data is down loaded to navigation unit.

   NOTE: After servicing, the front cover must be closed. If you start up the navigation system with the front cover open, the display will indicate. "Navigation unit door is open or No DVD Disk installed. Please check system".

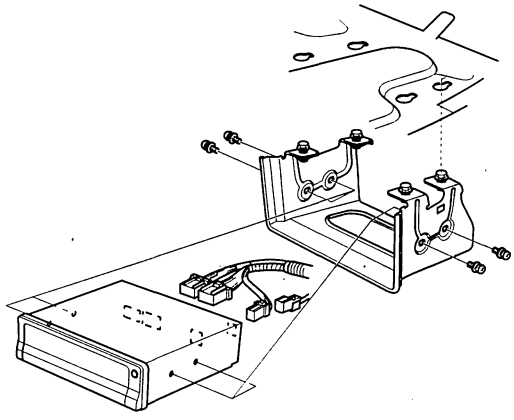
Navigation System ('06 model)

Navigation Unit Removal/ Installation

NOTE: If the navigation unit is replaced or disconnected, a map match must be done (see page 22-489).

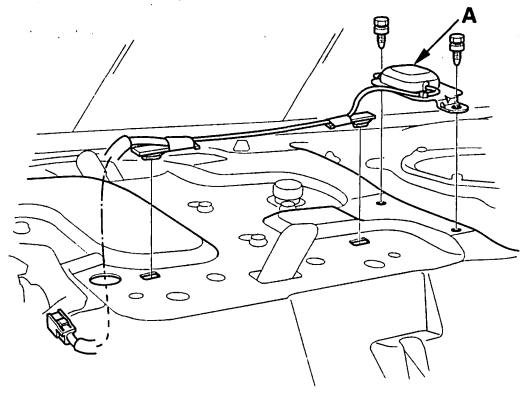
1. Remove the navigation unit from the trunk area.



2. Remove the navigation unit bracket (B) from the passenger's seat.
3. Remove the bracket from the navigation unit (C).
4. Install in the reverse order of removal.

GPS Antenna Removal/Installation

1. Remove the rear shelf (see page 20-108).
2. Remove the GPS antenna (A).



3. Install in the reverse order of removal.

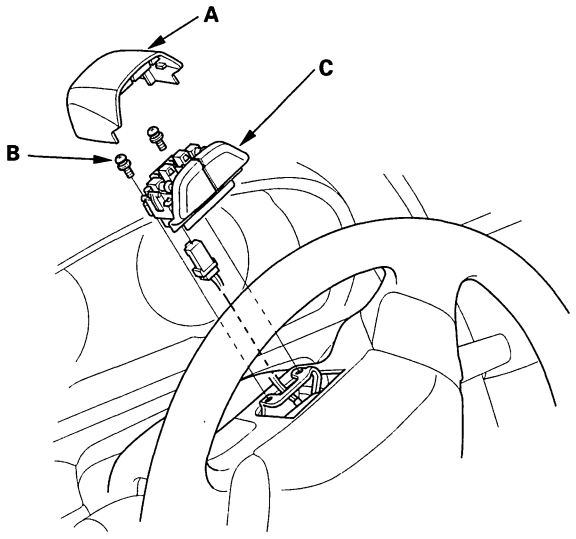
BACK

Protected by AR

Voice Control Switch Removal/Installation

1. For 4 door, remove the driver's airbag (see page 23-197), then remove the voice control switch (see page 17-23).
   For 2 door, remove the voice control switch cover (A) from left side of the steering wheel.

   Illustration shows 2 door models



2. Remove the two screws (B) from the voice control switch (C), then remove the voice control switch.
3. Disconnect the voice control switch connector.
4. Install in the reverse order of removal.

Front Seat Belt Replacement

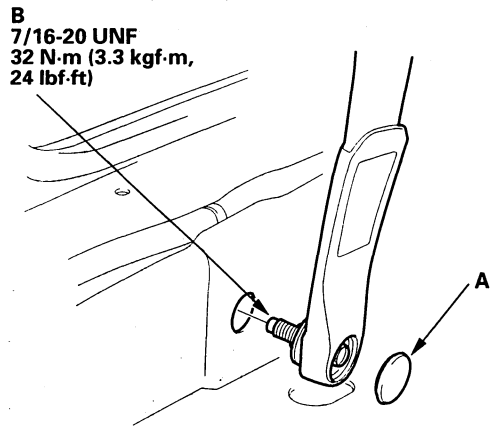
SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

NOTE: Check the front seat belts for damage, and replace them if necessary. Be careful not to damage them during removal and installation.

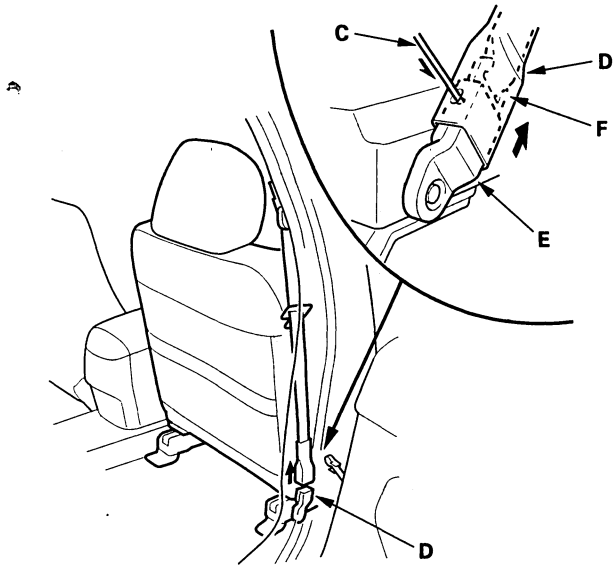
Front Seat Belt - 2-door

1. Make sure you have the anti-theft codes for the audio and the navigation system, then write down the frequencies for the audio preset buttons.
2. Slide the front seat forward fully.
3. Disconnect the negative cable from the battery, and wait at least 3 minutes before beginning work.
4. Remove the seat belts.
   - '03 model driver's and passenger's seat belts and '04-06 models driver's seat belt: Remove the lower anchor cap (A), and remove the lower anchor bolt (B).
   - '04-06 models passenger's seat belt: Carefully insert the tip of a small screwdriver (C) through the hole in the back of the front seat belt lower anchor cover (D) and into the hole in the front seat belt lower anchor (E).
     Unlock the lower anchor by pushing in on the screwdriver. Remove the screwdriver, and then detach the front seat belt anchor plate (F) and anchor cover from the lower anchor.

'03 model



'04-06 models



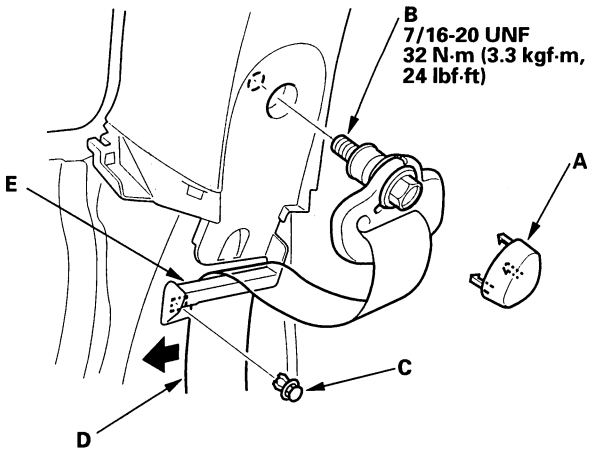
5. Remove these items:
   - Side trim panel (see page 20-106).
   - Middle cross-member gusset (see page 20-226).

(cont'd)

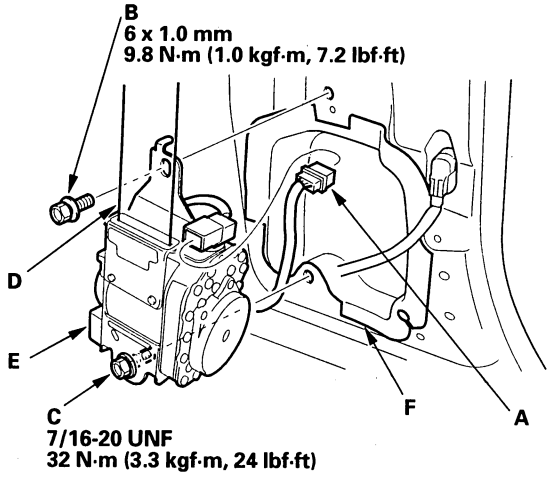
Protected by AR

Front Seat Belt Replacement (cont'd)

6. Remove the upper anchor cap (A), and remove the upper anchor bolt (B). Release the clip (C), then release the front seat belt (D) from the seat belt guide (E).



7. Disconnect the seat belt tensioner connector (A). Remove the retractor mounting bolt (B) and the retractor bolt (C), then remove the front seat belt (D) and retractor (E).



8. If necessary, remove the front seat belt protector (F).

9. Install the belt in the reverse order of removal, and note these items:

- Check that the retractor locking mechanism functions (see page 23-15).
- Assemble the washers, collars, and bushings on the upper and lower anchor bolts as shown.
- If the seat belt tensioner has been deployed, replace the front seat belt protector with a new one.
- Apply medium strength liquid thread lock to the anchor bolts before reinstallation.
- Before installing the anchor bolts, make sure there are no twists or kinks in the front seat belt.
- Make sure the seat belt tensioner connector is plugged in properly.
- '04-06 models passenger's seat belt: Before attaching the front seat belt lower anchor, make sure there are no twists or kinks in the belts. Triangle marks (A) on the anchor plate (B) and on the lower anchor (C) must face the same side. Insert the hook on the anchor plate into the lower anchor, and be sure that the lower anchor is locked securely.
- Reconnect the negative cable to the battery.
- Enter the anti-theft codes for the audio and the navigation system, then enter the customer's audio station presets.
- Reset the clock.

Upper anchor bolt installation

Protected by AR

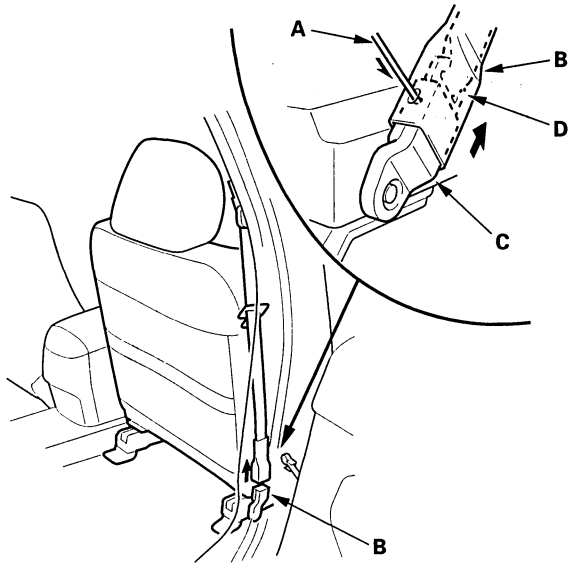
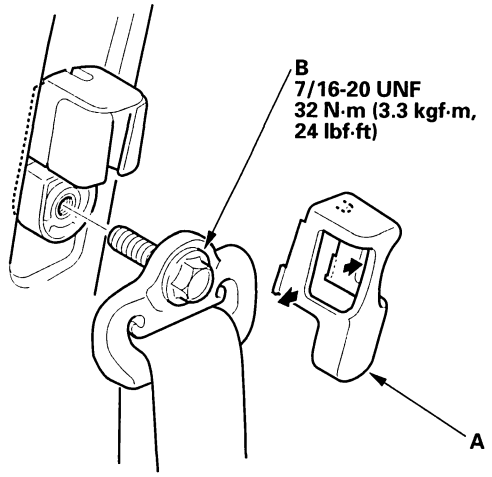
Front Seat Belt Replacement (cont'd)

5. '04-06 models passenger's seat belt: Carefully insert the tip of a small screwdriver (A) through the hole in the back of the front seat belt lower anchor cover (B) and into the hole in the front seat belt lower anchor (C).
   Unlock the lower anchor by pushing in on the screwdriver. Remove the screwdriver, and then detach the front seat belt anchor plate (D) and anchor cover from the lower anchor.

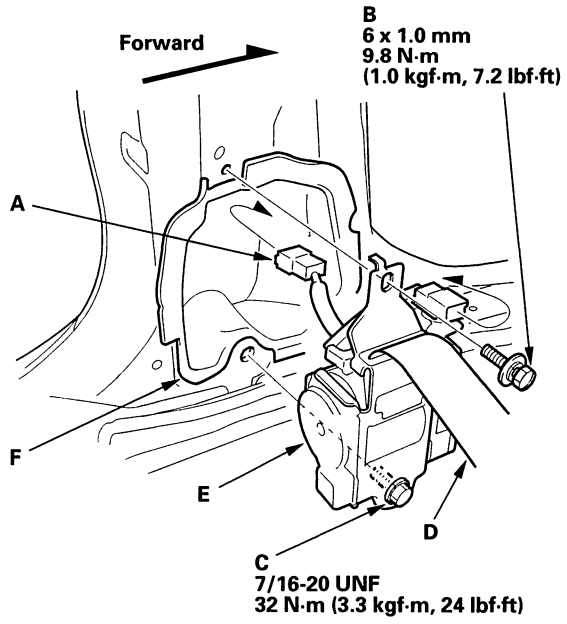


6. Remove the B-pillar lower trim, without side curtain airbags (see page 20-96), with side curtain airbags (see page 20-102).

7. Remove the upper anchor cover (A), and remove the upper anchor bolt (B).



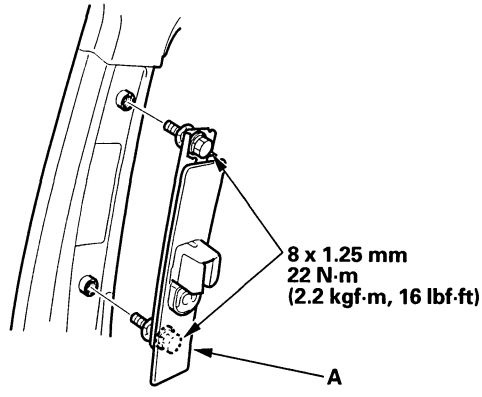
8. Disconnect the seat belt tensioner connector (A). Remove the upper retractor mounting bolt (B) and the lower retractor bolt (C), then remove the front seat belt (D) and retractor (E).



9. If necessary, remove the front seat belt protector (F).

10. Remove the B-pillar upper trim, without side curtain airbags (see page 20-96), with side curtain airbags (see page 20-102).

11. Remove the shoulder anchor adjuster (A).



BACK

Protected by AR

12. Install the seat belt in the reverse order of removal, and note these items:

- Apply medium strength liquid thread lock to the anchor bolts before reinstallation.
- Check that the retractor locking mechanism functions (see page 23-15).
- Assemble the washers, collars, and bushings on the upper and lower anchor bolts as shown.
- If the seat belt tensioner has been deployed, replace the front seat belt protector with a new one.
- Before installing the anchor bolts, make sure there are no twists or kinks in the front seat belt.
- Make sure the seat belt tensioner connector is plugged in properly.
- '04-06 models passenger's seat belt: Before attaching the front seat belt lower anchor, make sure there are no twists or kinks in the belts. Triangle marks (A) on the anchor plate (B) and on the lower anchor (C) must face the same side. Insert the hook on the anchor plate into the lower anchor, and be sure that the lower anchor is locked securely.
- Reconnect the negative cable to the battery.
- Enter the anti-theft code for the audio and the navigation system, then enter the customer's audio station presets.
- Reset the clock.

Front Seat Belt Replacement (cont'd)

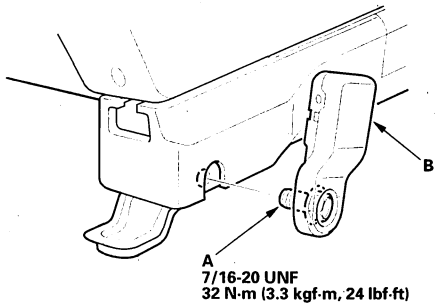
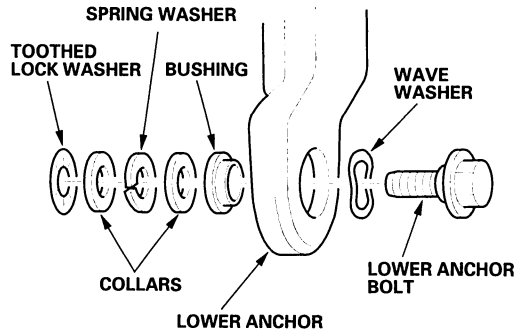
Passenger's Seat Belt Lower Anchor '04-06 Models

1. Make sure you have the anti-theft codes for the audio and the navigation system, then write down the frequencies for the audio preset buttons.
2. Disconnect the negative cable from the battery, and wait at least 3 minutes before beginning work.
3. Remove the front seat (see page 20-144).
4. Remove the lower anchor bolt (A), then remove the lower anchor (B).



5. Install the buckle in the reverse order of removal, and note these items:
   - Apply medium strength liquid thread lock to the lower anchor bolt before reinstallation.
   - Assemble the washers, collars, and bushing on the lower anchor bolt as shown.
   - Reconnect the negative cable to the battery.
   - Enter the anti-theft codes for the audio and the navigation system, then enter the customer's audio station presets.
   - Reset the clock.

Lower anchor bolt installation

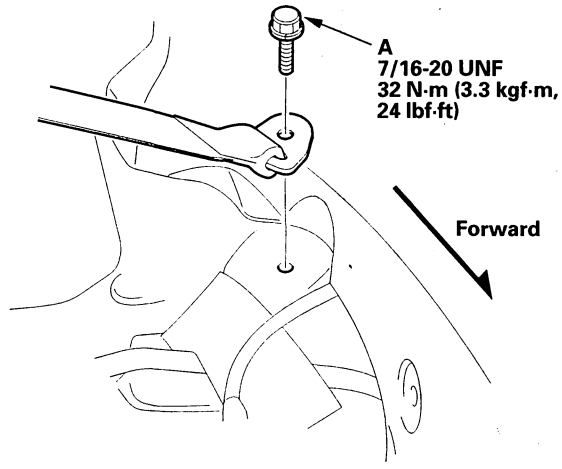


Rear Seat Belt Replacement

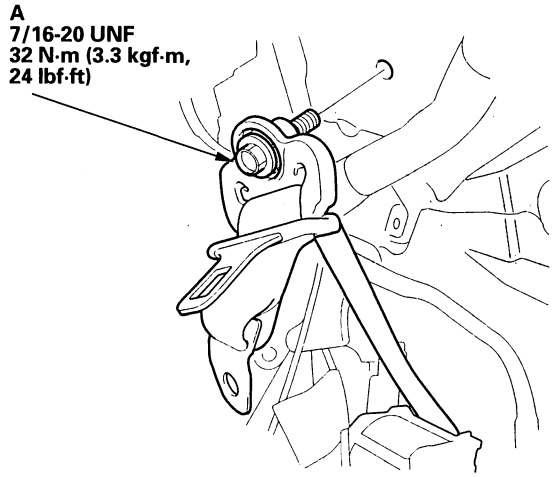
NOTE: Check the rear seat belts for damage, and replace them if necessary. Be careful not to damage them during removal and installation.

Rear Seat Belt - 2-door

1. Remove the rear seat cushion (see page 20-173).
2. Remove the lower anchor bolt (A).



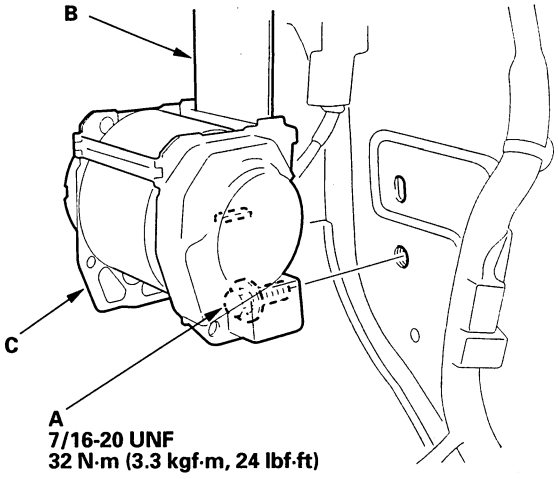
3. Remove the side trim panel (see page 20-106).
4. Remove the upper anchor bolt (A).



BACK

Protected by AR

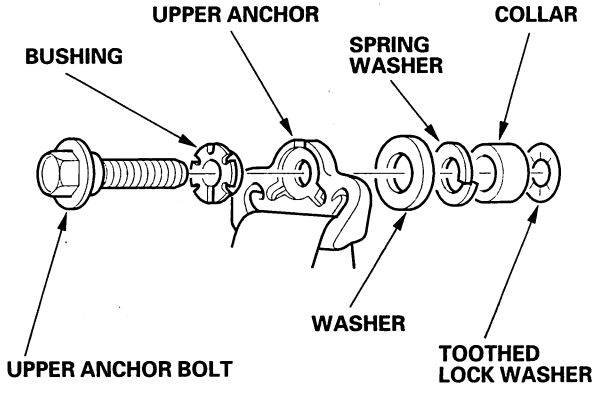
5. Remove the retractor bolt (A), then remove the rear seat belt (B) and retractor (C).



6. Install the seat belt in the reverse order of removal, and note these items:

- Apply medium strength liquid thread lock to the anchor bolts before reinstallation.
- Check that the retractor locking mechanism functions (see page 23-15).
- Assemble the washers, collar, and bushing on the upper anchor bolt as shown.
- Before installing the anchor bolts, make sure there are no twists or kinks in the rear seat belt.

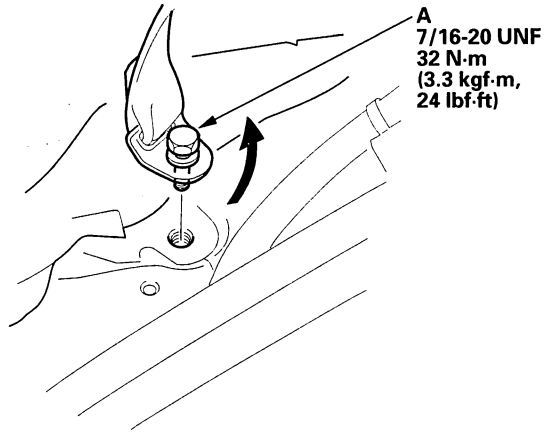
Upper anchor bolt installation



Rear Seat Belt - 4-door

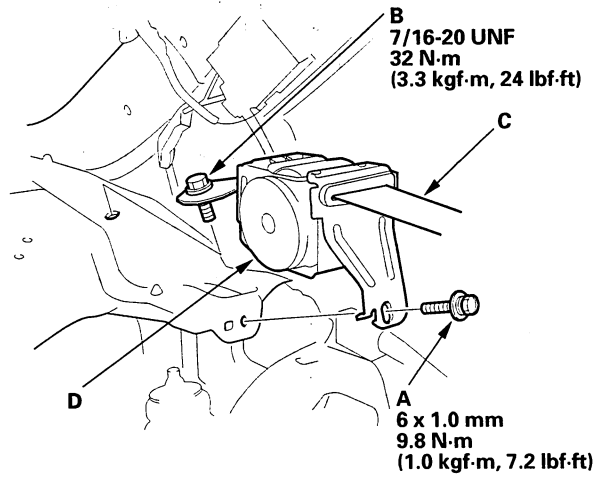
1. Remove the rear seat side bolster (see page 20-174).

2. Remove the center anchor bolt (A).



3. Remove the rear shelf (see page 20-110).

4. Remove the retractor mounting bolt (A) and the retractor bolt (B), then remove the rear seat belt (C) and retractor (D).



5. Install the seat belt in the reverse order of removal, and note these items:

- Apply medium strength liquid thread lock to the anchor bolt before reinstallation.
- Check that the retractor locking mechanism functions as described (see page 23-15).
- Before installing the anchor bolt, make sure there are no twists or kinks in the rear seat belt.

Inspection

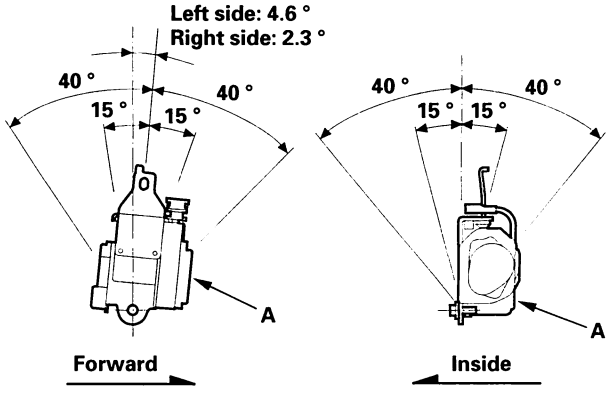
SRS components are located in this area. Review the SRS component locations (see page 23-17) and the precautions and procedures (see page 23-19) before performing repairs or service.

Retractor

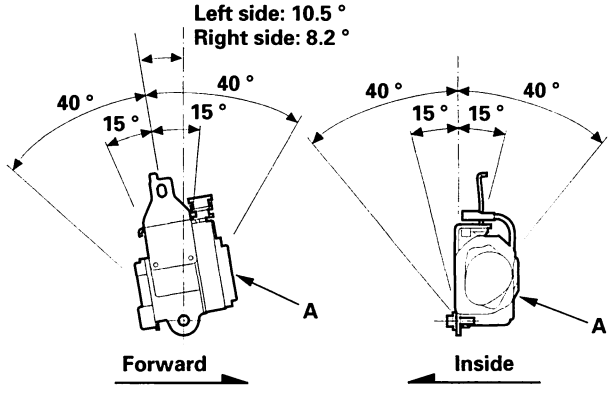
1. Before installing the retractor, check that the seat belt can be pulled out freely.

2. Make sure that the seat belt does not lock when the retractor (A) is leaned slowly up to 15 ° from the mounted position. The seat belt should lock when the retractor is leaned over 40 °. Do not attempt to disassemble the retractor. The front seat belt retractor with seat belt tensioner is shown, the front seat belt retractor without seat belt tensioner is similar.

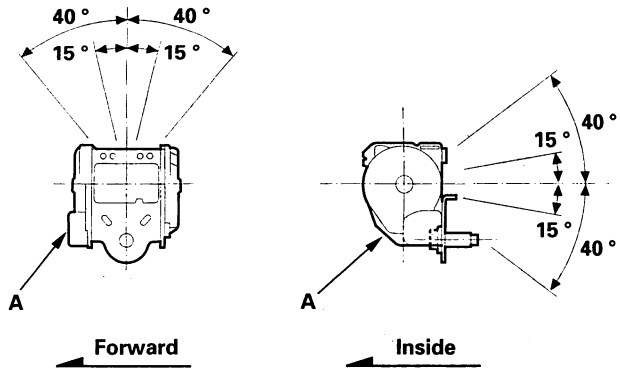
Front - 2-door



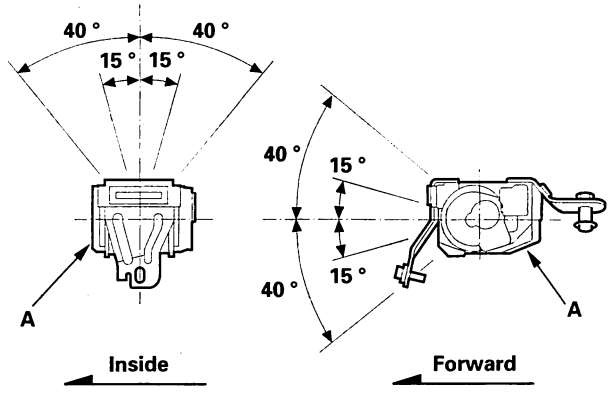
Front - 4-door



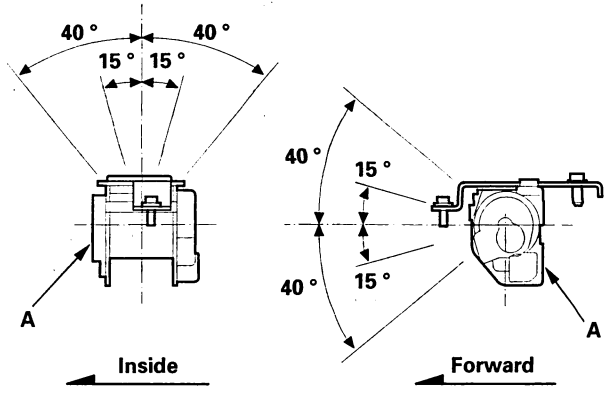
Rear - 2-door



Rear - 4-door



Rear center



3. Replace the seat belt with a new assembly if there is any abnormality. Do not disassemble any part of the seat belt for any reason.

(cont'd)

Protected by AR

Inspection (cont'd)

In-vehicle

1. Check that the seat belt is not twisted or caught on anything.

2. After installing the anchors, check for free movement on the anchor bolts. If necessary, remove the anchor bolts and check that the washers and other parts are not damaged or improperly installed.

3. Check the seat belts for damage or discoloration. Clean with a shop towel if necessary. Use only soap and water to clean.

   NOTE: Dirt build-up in the loops of the upper anchors can cause the seat belts to retract slowly. Wipe the inside of the loops with a clean cloth dampened in isopropyl alcohol.

4. Check that the seat belt does not lock when pulled out slowly. The seat belt is designed to lock only during a sudden stop or impact.

5. Make sure that the seat belt will retract automatically when released.

6. For each passenger's seat belt, check the seat belt retractor locking mechanism ALR (automatic locking retractor). This function is for securing child seats.

   –1 Pull the seat belt all the way out to engage the ALR. The seat belt should retract with a ratcheting sound, but not extend. This is normal.
   –2 To disengage the ALR, release the seat belt and allow it to fully retract, then pull the seat belt out part-way. The seat belt should retract and extend normally.

7. Replace the seat belt with a new assembly if there is any abnormality. Do not disassemble any part of the seat belt for any reason.

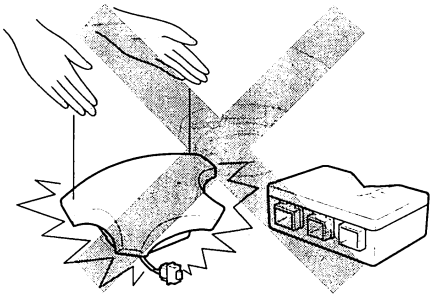
Precautions and Procedures

General Precautions

Please read the following precautions carefully before performing the airbag system service. Observe the instructions described in this manual, or the airbags could accidentally deploy and cause damage or injuries.

- Except when performing electrical inspections, always turn the ignition switch OFF, disconnect the negative cable from the battery, and wait at least 3 minutes before beginning work.
  NOTE: The SRS memory is not erased even if the ignition switch is turned OFF or the battery cables are disconnected from the battery.
- Use replacement parts which are manufactured to the same standards and quality as the original parts. Do not install used SRS parts. Use only new parts when making SRS repairs.
- Carefully inspect any SRS part before you install it. Do not install any part that shows signs of being dropped or improperly handled, such as dents, cracks or deformation.



- Before removing any of the SRS parts (including the disconnection of the connectors), always disconnect the SRS connector.
- Use only a digital multimeter to check the system. If it is not a Honda multimeter, make sure its output is 10 mA (0.01A) or less when switched to the lowest value in the ohmmeter range. A tester with a higher output could cause accidental deployment and possible injury.
- Do not put objects on the front passenger's airbag.
- The original radio and navigation system have a coded theft protection circuit. Be sure to get the customer's anti-theft codes and write down the frequencies for the radio's preset stations before disconnecting the battery negative cable.
- Before returning the vehicle to the customer, enter the radio code, the navigation code, then enter the customer's audio presets, and set the clock.

Steering-related Precautions

Cable Reel Alignment

- Misalignment of the cable reel could cause an open in the wiring, make the SRS system remote steering wheel controls and the horn inoperative. Center the cable reel whenever the following is performed (see step 6 on page 23-212).
  - Installation of the steering wheel
  - Installation of the cable reel
  - Installation of the steering column
  - Other steering-related adjustment or installation
- Do not disassemble the cable reel.
- Do not apply grease to the cable reel.
- If the cable reel shows any signs of damage, replace it with a new one. For example, if it does not rotate smoothly, replace the cable reel.

(cont'd)

Protected by AR

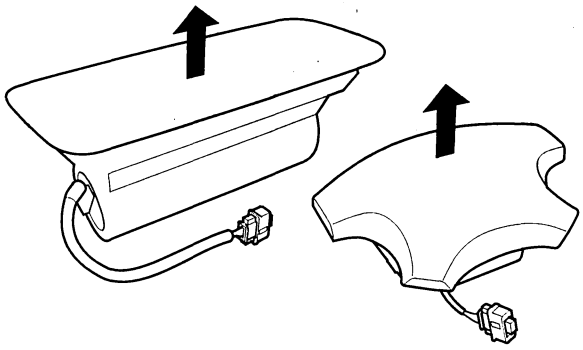
Precautions and Procedures (cont'd)

Airbag Handling and Storage

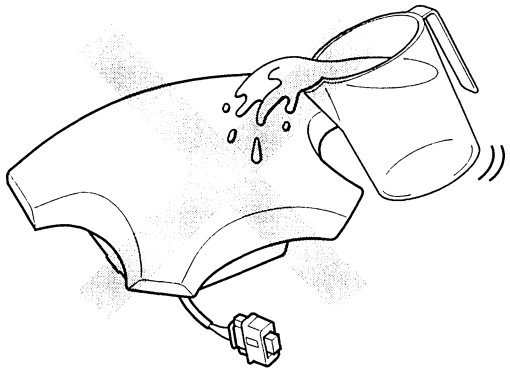
Do not disassemble an airbag. It has no serviceable parts. Once an airbag has been deployed, it cannot be repaired or reused.

For temporary storage of an airbag during service, observe the following precautions.

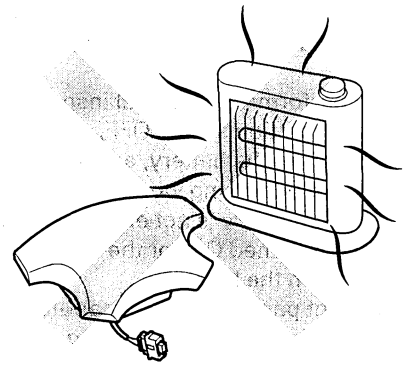
- Store the removed airbag with the pad surface up. Never put anything on the airbag.



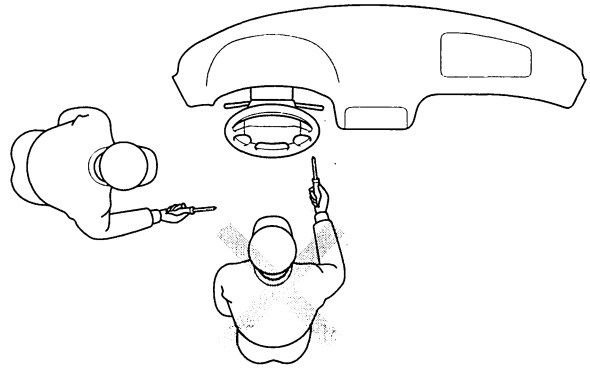
- To prevent damage to the airbag, keep it away from any oil, grease, detergent, or water.



- Store the removed airbag on a secure, flat surface away from any high heat source (exceeding 200 °F/ 93 °C).



- Never perform electrical inspections to the airbags, such as measuring resistance.
- Do not position yourself in front of the airbag during removal, inspection, or replacement.

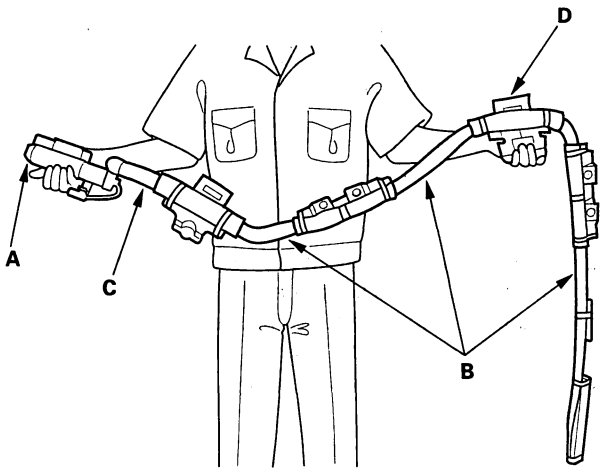


- Refer to the scrapping procedures for disposal of a damaged airbag.

BACK

Protected by AR

- The side curtain airbag inflator assembly is a long, jointed part containing an inflator (A), a flexible bag (B), an adapter pipe (C), and a center bracket (D).



- When removing or installing the side curtain airbag inflator assembly, never handle the flexible bag (B) or the adapter pipe (C).

(cont'd)

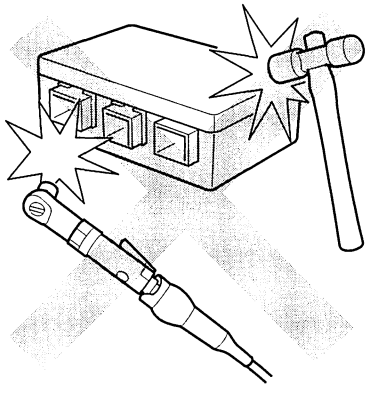
BACK

Protected by AR

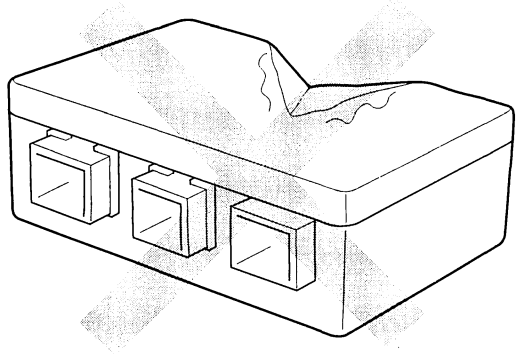
Precautions and Procedures (cont'd)

SRS Unit, Front Impact Sensors, Side Impact Sensors, Front Passenger's Weight Sensor Unit ('04-05 Models), and Front Passenger's Weight Sensors ('04-06 Models)

- Be careful not to bump or impact the SRS unit, front impact sensors, or side impact sensors when the ignition switch is ON (II), or for at least 3 minutes after the ignition switch is turned OFF.
- During installation or replacement, be careful not to bump (by impact wrench, hammer, etc.) the area around the SRS unit, front impact sensors, or side impact sensors. The airbags could accidentally deploy and cause damage or injury.



- After a collision in which the front airbags or seat belt tensioners were deployed, replace the SRS unit, front sensors, and other related components (see page 23-194). After a collision in which a side airbag was deployed, replace the side impact sensor on the deployed side, and the SRS unit. After a collision in which the airbags or the side airbags did not deploy, inspect for any damage or any deformation on the SRS unit, front impact sensors, and side impact sensors. Replace all damaged parts.



- Do not disassemble the SRS unit, front impact sensors, side impact sensors, driver's seat position sensor, front passenger's weight sensor unit ('03-05 models), and front passenger's weight sensors.
- Turn the ignition switch OFF, disconnect the battery negative cable, and wait at least 3 minutes before beginning installation or replacement of the SRS unit or disconnecting the connectors from the SRS unit.
- Be sure the SRS unit, front impact sensors, and side impact sensors are installed securely with the mounting bolts torqued to 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
- Do not spill water or oil on the SRS unit or the side impact sensors, and keep them away from dust.
- Store the SRS unit, front impact sensors, and side impact sensors in a cool (less than 104 °F/40 °C) and dry (less than 80 % relative humidity, no moisture) area.

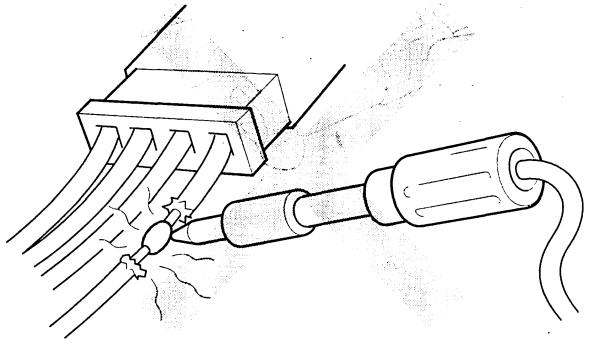
BACK

Protected by AR

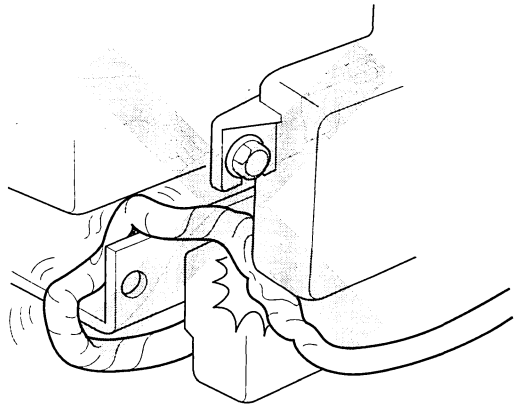
Wiring Precautions

Some of the SRS wiring can be identified by special yellow outer covering, and the SRS connectors can be identified by their yellow color.
Observe the instructions.

- Never attempt to modify, splice, or repair SRS wiring. If there is an open or damage in SRS wiring or terminals, replace the harness.



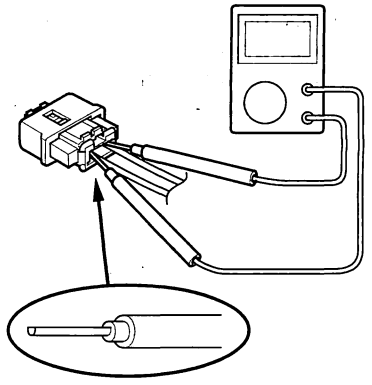
- Be sure to install the harness wires so they do not get pinched or interfere with other parts.



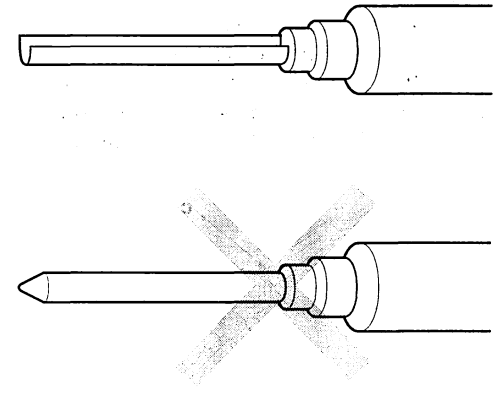
- Make sure all SRS ground locations are clean and securely fastened for optimum metal-to-metal contact. Poor grounding can cause intermittent problems that are difficult to diagnose.

Precautions for Electrical Inspections

- When using electrical test equipment, insert the probe of the tester into the wire side of the connector. Do not insert the probe of the tester into the terminal side of the connector, and do not tamper with the connector.



- Use a U-shaped probe. Do not insert the probe forcibly.



- Use specified service connectors in troubleshooting. Using improper tools could cause an error in inspection due to poor metal-to-metal contact.

(cont'd)

BACK

Protected by AR

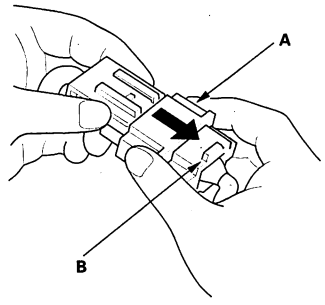
Precautions and Procedures (cont'd)

Spring-loaded Lock Connector

Some SRS system connectors have a spring-loaded lock.

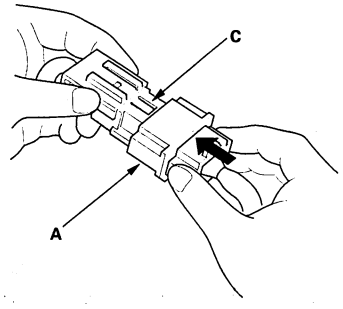
Front Airbag Connectors

Disconnecting
To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector. Then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector.

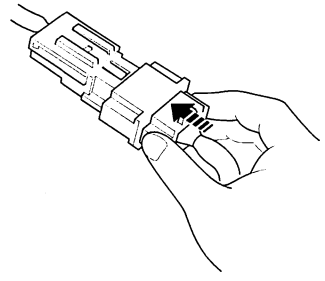


Connecting

1. To reconnect, hold the pawl-side connector, and press on the back of the sleeve-side connector in the direction shown. As the two connector halves are pressed together, the sleeve (A) is pushed back by the pawl (C). Do not touch the sleeve.

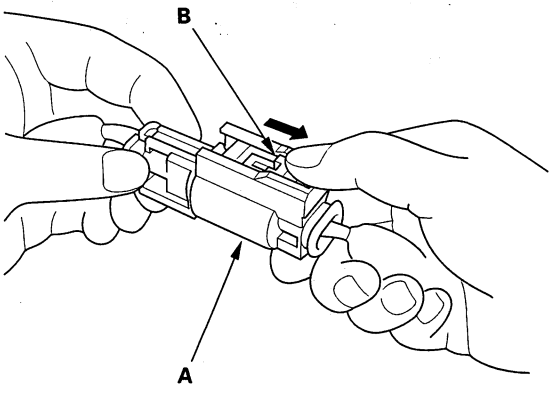


2. When the connector halves are completely connected, the pawl is released, and the spring-loaded sleeve locks the connector.



Side Airbag Connector

Disconnecting
To release the lock, pull the spring-loaded sleeve (A) and the slider (B) while holding the opposite half of the connector. Then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector half.



Connecting
Hold both connector halves, and press them firmly together until the projection (C) of the sleeve-side connector clicks.

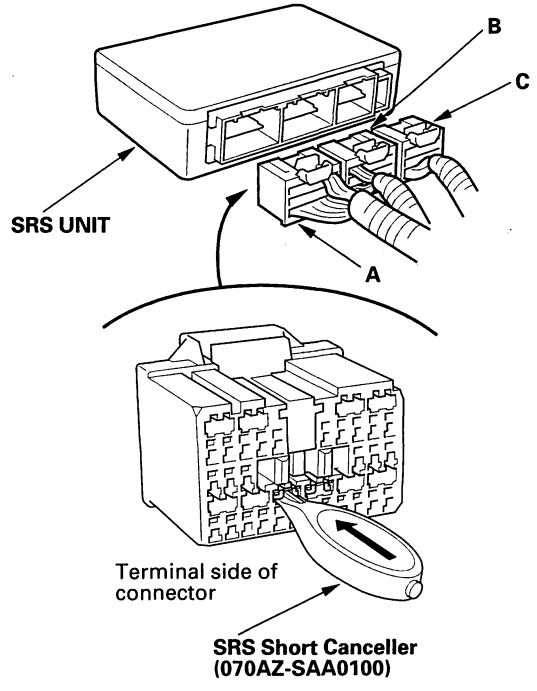
Protected by AR

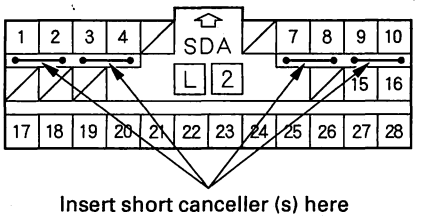
Reopening the SRS Unit Circuit For Diagnosis

NOTE:
- To prevent damage of the connector cavity, insert the SRS short canceller straight into the cavity from the terminal side.
- Do not use the special tool if it is damaged.
- Make sure to remove the special tool before re-connecting.

When SRS unit connectors A, B, or C are disconnected, a short circuit is created in the connector by its own function to prevent airbag deployment. The circuit may need to be opened when diagnosis is performed on the circuit.
Insert the SRS short canceller (No. 070AZ-SAA0100, short canceller) in the specified cavities when it is necessary to keep the circuit open for diagnosis.



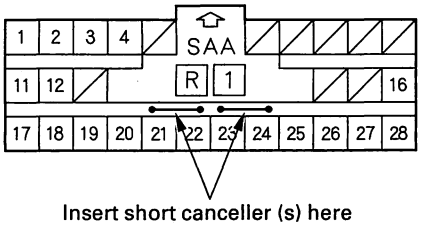
SRS UNIT CONNECTOR A (28P)



Insert short canceller (s) here

Wire side of female terminals

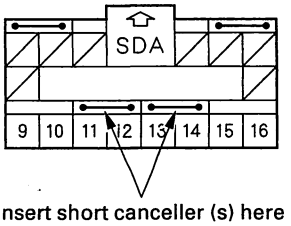
SRS UNIT CONNECTOR B (28P)



Insert short canceller (s) here

Wire side of female terminals

SRS UNIT CONNECTOR C (16P)



Insert short canceller (s) here

Wire side of female terminals

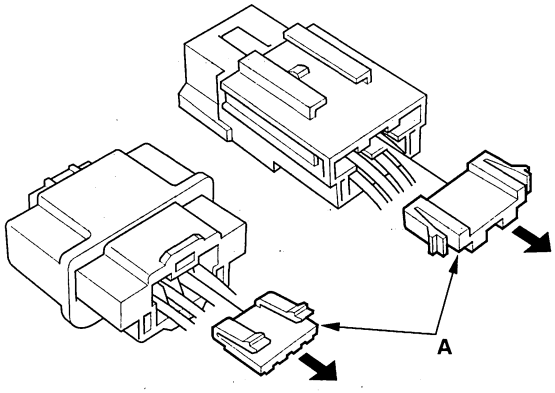
Precautions and Procedures (cont'd)

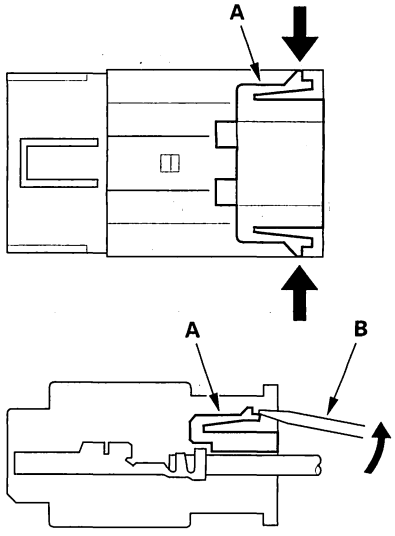
Backprobing Spring-loaded Lock Connectors

When checking voltage or resistance on this type of connector the first time, you must remove the retainer to insert the tester probe from the wire side.

NOTE: It is not necessary to reinstall the removed retainer; the terminals will stay locked in the connector housing.

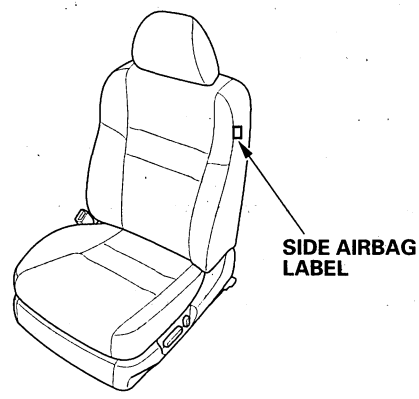
To remove the retainer (A), insert a flat-tip screwdriver (B) between the connector body and the retainer, then carefully pry out the retainer. Take care not to break the connector.





Seats with Side Airbags

Seats with side airbags have a "SIDE AIRBAG" label on the seat-back. Because the component parts (seat-back cover, cushion, etc.) of seats with and without airbags are different, make sure you install only the correct replacement parts.



- When cleaning, do not saturate the seat with liquid, and do not spray steam on the seat.
- Do not repair a torn or frayed seat-back cover. Replace the seat-back cover.
- After a collision in which the side airbag was deployed, replace the side airbag with new parts. If the seat-back cushion is split, it must be replaced. If the seat-back frame is deformed, it must be replaced.
- Never put aftermarket accessories on the seat (covers, pads, seat heaters, lights, etc.).

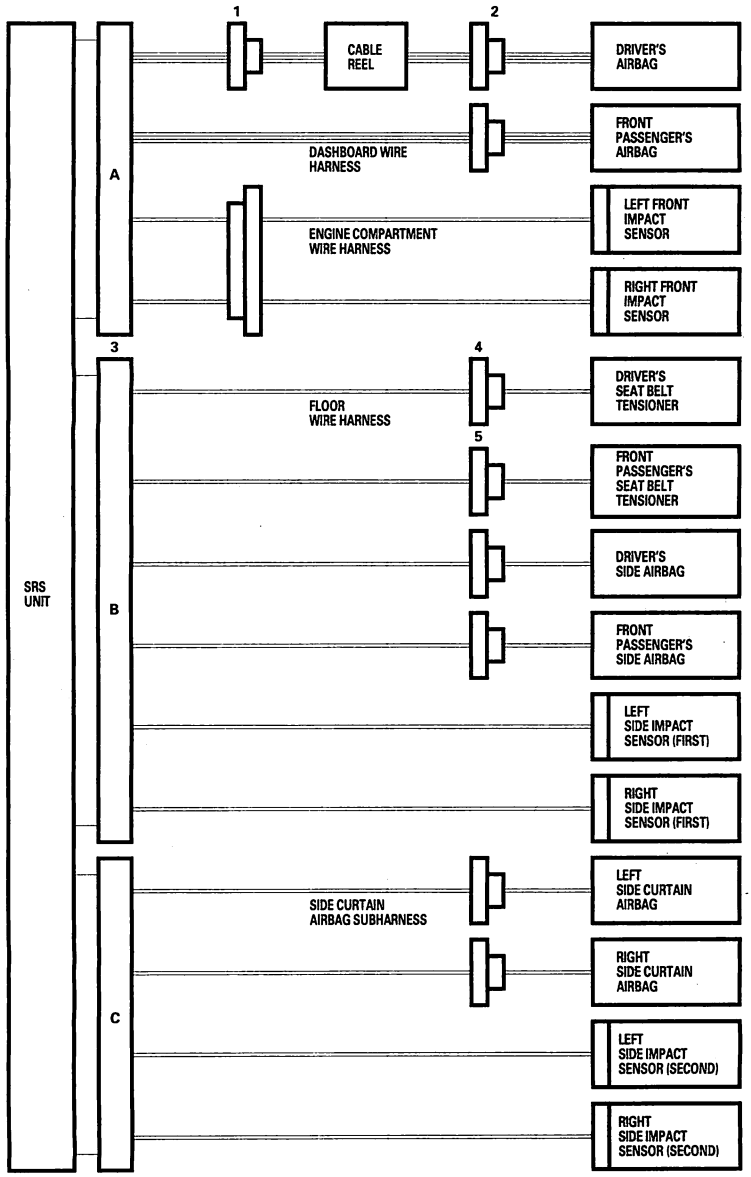
BACK

Protected by AR

Disconnecting System Connectors

Turn the ignition switch OFF and disconnect the negative cable from the battery, and wait at least 3 minutes before beginning the following procedures.

- Before disconnecting SRS unit connector B (3) from SRS unit, disconnect both seat belt tensioner 4P connectors (4, 5).
- Before disconnecting the cable reel 4P connector (1), disconnect the driver's airbag 4P connector (2).



(cont'd)

BACK

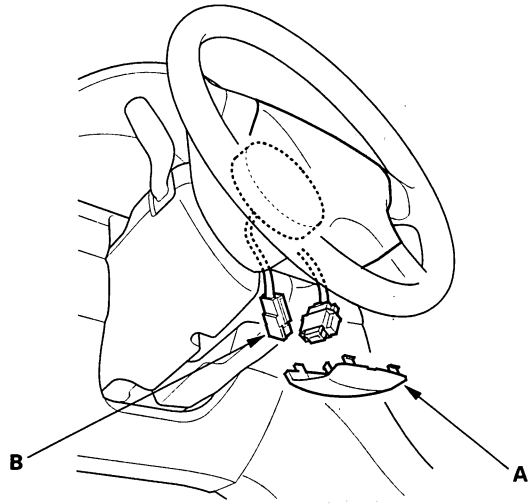
Protected by AR

Precautions and Procedures (cont'd)

1. Disconnect the battery negative cable, and wait at least 3 minutes.

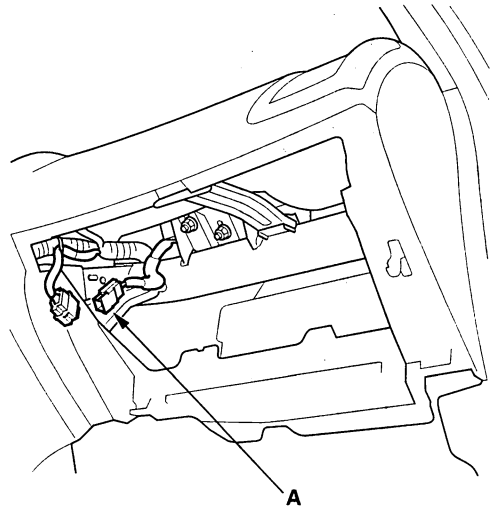
Driver's Airbag

2. Remove the access panel (A) from the steering wheel, then disconnect the driver's airbag 4P connector (B) from the cable reel.



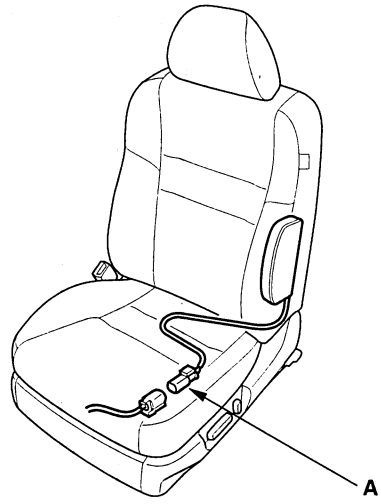
Front Passenger's Airbag

3. Remove the glove box, then disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.



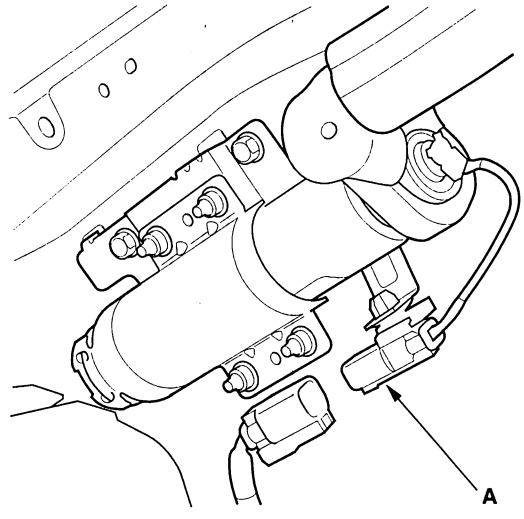
Side Airbag

4. Disconnect both side airbag 2P connectors (A) from the floor wire harness.



Side Curtain Airbag

5. Disconnect both side curtain airbag subharness 2P connectors from the side curtain airbags.

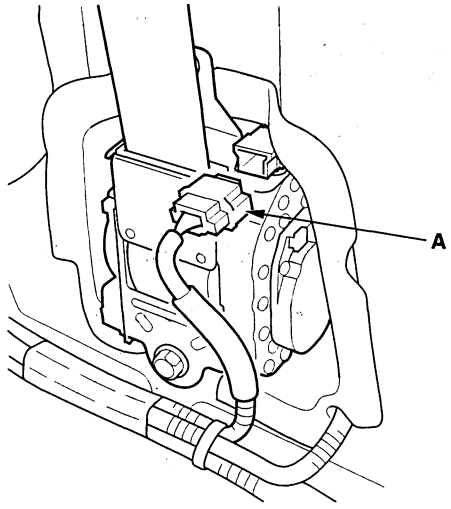


BACK

Protected by AR

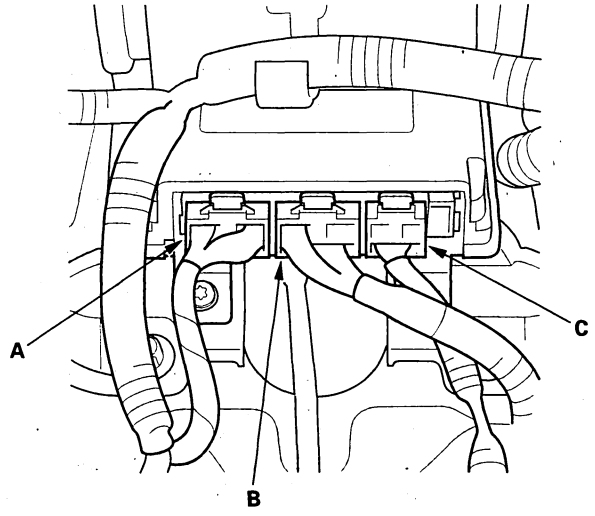
Seat Belt Tensioner

6. Disconnect both floor wire harness 4P connectors (A) from the seat belt tensioners.



SRS Unit

7. Disconnect SRS unit connector A, and/or SRS unit connector B, and/or SRS unit connector C from the SRS unit.



BACK

Protected by AR

General Troubleshooting Information

DTC (Diagnostic Trouble Codes)

The self-diagnostic function of the SRS system allows it to locate the causes of system problems and then store this information in memory. For easier troubleshooting, this data can be retrieved via a data link circuit.

- When you turn the ignition switch ON (II), the SRS indicator comes on. If it goes off after 6 seconds, the system is normal, and is not currently detecting any abnormality.
- If there is an abnormality, the system locates and defines the problem, stores this information in memory, and turns the SRS indicator on. The data will remain in the memory even when the ignition switch is turned off or if the battery is disconnected.
- The data is stored in memory as a diagnostic trouble code (DTC).
- DTCs are either latching or resetting depending on the malfunction. With resetting DTCs, the SRS indicator will go off the next time the ignition switch is turned ON and the system is normal, but the DTC is still stored. With latching DTCs the SRS indicator will not turn OFF until the malfunction is repaired and the DTC is cleared.
- When you connect the HDS to the 16P data link connector (DLC), you can retrieve a more detailed DTC in the Honda Systems "SRS" menu.
- After reading and recording the DTC, proceed with the troubleshooting procedure for that code.

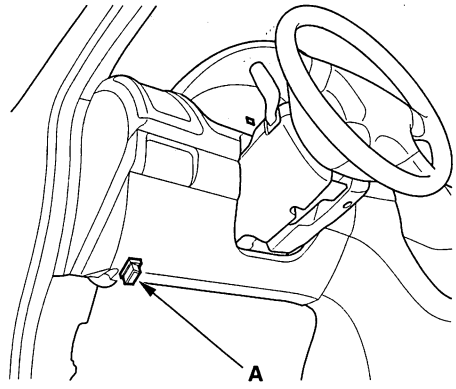
Precautions

- Use only a digital multimeter to check the system. If it's not a Honda multimeter, make sure its output is 10 mA (0.01 A) or less when switched to the smallest value in the ohmmeter range. A tester with a higher output could damage the airbag circuit or cause accidental airbag deployment and possible injury.
- Whenever the ignition switch is ON (II), or has been turned OFF for less than 3 minutes, be careful not to bump the SRS unit; the airbags could accidentally deploy and cause damage or injuries.
- Before you remove the SRS harness, disconnect the driver's airbag connector, the front passenger's airbag connector, both side airbag connectors, both side curtain airbag connectors, and both seat belt tensioner connectors.
- Make sure the battery is sufficiently charged. If the battery is dead or low, measuring values won't be correct.
- Do not touch a tester probe to the terminals in the SRS unit or harness connectors, and do not connect the terminals with a jumper wire. Use only the backprobe set and the HDS. Backprobe spring-loaded lock type connectors correctly.

Reading the DTC

HDS

1. Make sure the ignition switch is OFF.
2. Connect the HDS to the DLC (A).



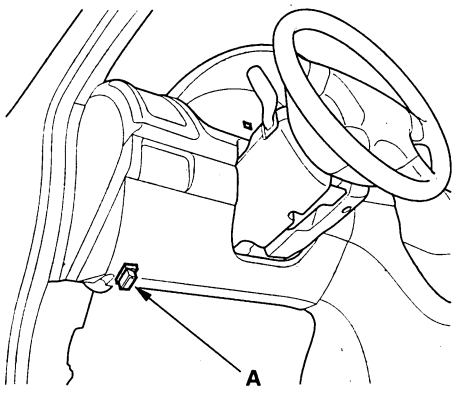
3. Turn the ignition switch ON (II).
4. Use the HDS to check for DTCs.
5. Read and record the DTC.
6. Turn the ignition switch OFF, and wait for 10 seconds.
7. Disconnect the HDS from the DLC.
8. Do the troubleshooting procedure for the DTC.

BACK

Protected by AR

Erasing the DTC Memory with HDS

1. Make sure the ignition switch is OFF.
2. Connect the HDS to the DLC (A).



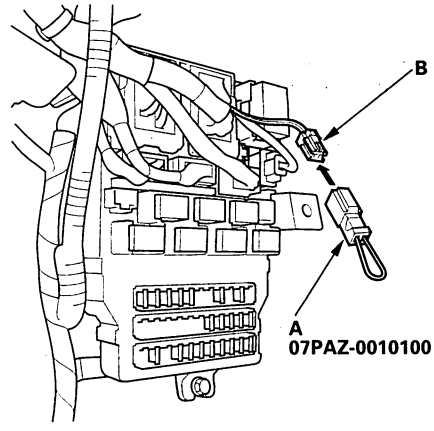
3. Turn the ignition switch ON (II).
4. In the TEST MODE MENU of the HDS, select DTC CLEAR. This erases the DTC(s).
5. Turn the ignition switch OFF, and wait for 10 seconds.
6. Disconnect the HDS from the DLC.

Erasing the DTC Memory with Manual Mode

Special Tools Required
SCS Service Connector 07PAZ-0010100

To erase the DTC(s) from the SRS unit, use the HDS, or the following procedure.

1. Make sure the ignition switch is OFF.
2. Connect the SCS service connector (A) to the yellow MES 2P connector (B). Do not use a jumper wire.



3. Turn the ignition switch ON (II).
4. The SRS indicator comes on for about 6 seconds, and then goes off. Remove the SCS service connector from the MES connector (2P) within 4 seconds after the indicator goes off.
5. The SRS indicator comes on again. Reconnect the SCS service connector to the MES connector (2P) within 4 seconds after the indicator comes on.
6. When the SRS indicator goes off, remove the SCS service connector from the MES connector (2P) within 4 seconds.
7. The SRS indicator blinks two times indicating that the memory has been erased.
8. Turn the ignition switch OFF, and wait for 10 seconds.
9. Turn the ignition switch ON (II) again. If the SRS indicator comes on for 6 seconds, and then goes off, the system is OK.

(cont'd)

Protected by AR

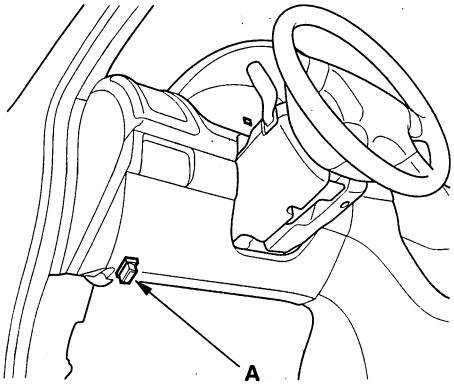
General Troubleshooting Information (cont'd)

Initializing the OPDS/ODS Unit

When a seat-back cover, seat-back cushion, and/or OPDS/ODS unit is replaced, initialize the OPDS/ODS by following the procedure.

NOTE: A new (uninitialized) OPDS/ODS unit installed with a faulty OPDS sensor can cause DTC 85-71.

1. Erase the DTC memory (see "Erasing the DTC Memory").
2. Make sure the front passenger's seat is dry. Set the seat-back in a normal position, and make sure there is nothing on the seat.
3. Make sure the ignition switch is OFF and the MES connector is not shorted.
4. Connect the HDS to the DLC (A).



5. Turn the ignition switch ON (II).
6. From the HDS Main Menu, select SRS, then Misc Test, then Adjustments. In the Adjustment Menu, select OPDS/ODS INIT. Follow the screen prompts to initialize the OPDS/ODS.
7. Turn the ignition switch OFF.
8. Disconnect the HDS from the DLC.

   NOTE: If the OPDS/ODS system fails to initialize after several attempts, replace the OPDS sensor and retry. If the OPDS/ODS system continues to fail to initialize, replace the OPDS/ODS unit.

Troubleshooting Intermittent Failures

If there was a malfunction, but it doesn't recur, it will be stored in the memory as an intermittent failure, and the SRS indicator may come on depending on the malfunction detected.

After checking the DTC, troubleshoot as follows:

1. Read the DTC (see "Reading the DTC").
2. Erase the DTC memory (see "Erasing the DTC Memory").
3. Set the parking brake, then start the engine, and let it idle.
4. The SRS indicator comes on for about 6 seconds and then go off.
5. Shake the wire harness and the connectors, take a test drive (quick acceleration, quick braking, cornering), turn the steering wheel fully left and right, and hold it there for 5 to 10 seconds. If the problem recurs, the SRS indicator will come on.
6. If you can't duplicate the intermittent failure, the system is OK at this time.

BACK

Protected by AR

Calibrating the Front Passenger's Weight Sensor Unit ('04-05 models) or calibrate the ODS unit ('06 model)

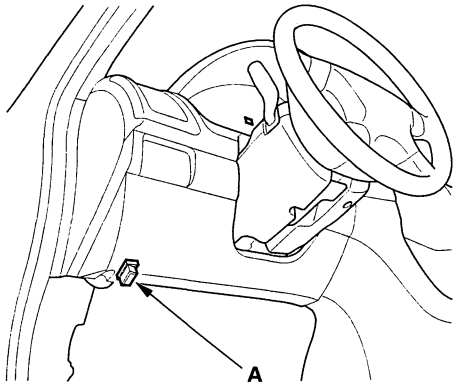
When the front passenger's weight sensors and/or weight sensor unit ('04-05 models) or calibrate the ODS unit ('06 model) is replaced, calibrate the weight sensor unit ('04-05 models) or calibrate the ODS unit ('06 model) by following the procedure.

While calibrating the front passenger's weight sensor unit ('04-05 models) or calibrate the ODS unit ('06 model), observe these precautions:

- Make sure all components of the front passenger's seat are correctly installed.
- Make sure all optional parts such as seat covers are removed.
- Make sure nothing is on or under the front passenger's seat.
- Make sure there is nothing in the front passenger's seat-back pocket.
- Keep the windows closed.
- Perform all calibration procedures except test driving in the service bay.
- Make sure the vehicle is on level ground.
- Keep the A/C and the heater off.
- Do not touch the front passenger's seat until you drive the vehicle.
- Do not expose the front passenger's seat to sudden temperature changes.

1. Position the front passenger's seat to the rear most position, and adjust the recliner to the most forward position. Do not move from these positions.

2. Connect the HDS to the data link connector (DLC) (A).



3. Drive the vehicle, and accelerate to 20 mph (36 km/h), then stop on level ground.

4. From the Main Menu, select SRS, then Seat Weight Sensor, then Misc Test, then Adjustments. Select "SWS INIT" in the Adjustment Menu and follow the prompts until the initialization operation has been completed.

5. Prepare a weight between 55 to 77 lbs (25 to 35 kg) then measure and note its actual weight (M) with a scale.

   NOTE: The accuracy of the scale must be within ±2.2 lbs (1 kg).

6. Place the weight on the front passenger's seat.

   NOTE: Leave the HDS connected in the Misc Menu.

7. Drive the vehicle, and accelerate to 20 mph (36 km/h), then stop on level ground.

8. From the HDS's Main Menu, select SRS, then Seat Weight Sensor, then Misc Test, then Inspection. Select "SEAT OUTPUT CHK." in the HDS's Inspection Menu. The weight (T) of the front passenger's seat is recorded by the HDS.

9. Calculate the variance between the weight measured on the scale (M) and the HDS (T) with the formula shown.

   Variance = (T)−(M)＜±8.6 lbs (3.9 kg)

   M: Weight measured on the scale
   T: Weight measured by the HDS with the weight on the seat

   - If the variance is ±8.6 lbs (±3.9 kg) or less, calibration is complete. Go to step 18.
   - If the variance is more than ±8.6 lbs (±3.9 kg), remove the seat weight sensors (see page 23-218), and reinstall them, then go to step 10.

(cont'd)

Protected by AR

General Troubleshooting Information (cont'd)

10. Remove weight from the front passenger's seat.

11. Drive the vehicle, accelerate to 20 mph (36 km/h), then stop on level ground.

12. From the HDS inspection menu, select Seat Weight Sensor, then "SEAT OUTPUT CHK." The weight (T0) of the front passenger's seat is recorded by the HDS.

    - If the reading on the HDS (T0) is ±6.6 lbs (±3.0 kg) or less, go to step 13.
    - If the reading on the tester (T0) is more than ±6.6 lbs (±3.0 kg), repeat this procedure from the beginning.

13. Measure and note the prepared weight (M1) again with a scale.

14. Place the weight on the front passenger's seat.

15. Drive the vehicle, accelerate to 20 mph (36 km/h), then stop on level ground.

16. From the HDS Main Menu, select SRS, then Seat Weight Sensor, then Misc Test, then Inspection. Select "SEAT OUTPUT CHK." in the HDS Inspection Menu. The weight (T1) of the front passenger's seat is recorded by the HDS.

17. Calculate the variance between the weight measured on the scale and the HDS with the formula shown.

    Variance = (T1)−(M1)＜±8.6 lbs (3.9 kg)

    T1: Weight measured by the HDS with the weight on the seat
    M1: Weight measured on the scale

    - If the variance is ±8.6 lbs (±3.9 kg) or less, calibration is complete. Go to step 18.
    - If the variance is more than ±8.6 lbs (±3.9 kg), replace the front passenger's weight sensors (if they were not replaced before this procedure), and repeat this procedure from the beginning.

18. Turn the ignition switch OFF, and disconnect the HDS from the DLC.

BACK

Operation Check of the Front Passenger's Weight Sensor Unit ('04-05 models) or operate the ODS unit ('06 model)

The operation of the front passenger's weight sensor unit ('04-05 models) or operate the ODS unit ('06 model) must be checked after any of these actions.

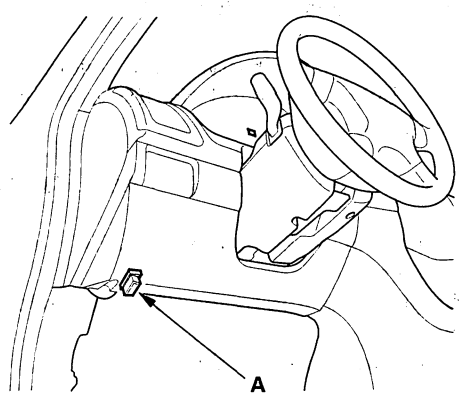
- Replacement of front passenger's seat component(s) (except weight sensor unit and/or weight sensors)
- After a vehicle collision

Pre-Operation Check Set-up

- Make sure all the components of the front passenger's seat are correctly installed.
- Position the front passenger's seat to the rear most position.
- Adjust the seat recline to the forward most position.
- Do not move the seat from this position.
- Make sure nothing is on or under the front passenger's seat.
- Make sure there is nothing in the front passenger's seat-back pocket.
- Keep the windows closed.
- Perform all calibration procedures except test-driving in the service bay.
- Make sure the vehicle is on level ground.
- Turn the heater and the A/C off.
- Do not touch the passenger's seat during the calibration.
- Do not expose the front passenger's seat to sudden temperature changes.

After Replacing Front Passenger's Seat Component(s)

1. Connect the HDS to the data link connector (DLC) (A).



2. Drive the vehicle, accelerate to 20 mph (36 km/h), then stop on level ground.

3. From the HDS Main Menu, select SRS, then Seat Weight Sensor, then Misc Test, then Inspection. Select "SEAT OUTPUT CHK." in the HDS Inspection Menu. The weight (T0) of the front passenger's seat is recorded by the HDS.

   - If the reading on the HDS (T0) is ±6.6 lbs (±3.0 kg), or less, go to step 4.
   - If the reading on the HDS (T0) is more than ±6.6 lbs (±3.0 kg), turn the ignition switch OFF, and go to step 1 of "Calibrating the Front Passenger's Weight Sensor Unit ('04-05 models) or operate the ODS unit ('06 model)."

4. Prepare a weight between 55 to 77 lbs (25 to 35 kg), then measure and note its actual weight (M) with a scale.

   NOTE: The accuracy of the scale must be within ±2.2 lbs (1 kg).

5. Place the prepared weight on the front passenger's seat.

6. Drive the vehicle, and accelerate to 20 mph (36 km/h), then stop on level ground.

(cont'd)

Protected by AR

General Troubleshooting Information (cont'd)

7. From the HDS Main Menu, select SRS, then Seat Weight Sensor, then Misc Test, then Inspection. Select "SEAT OUTPUT CHK." in the HDS Inspection Menu. The weight (T1) of the front passenger's seat is recorded by the HDS.

8. Calculate the variance between the weight measured by the scale and the HDS with the formula shown.

   Variance = ((T1)−(T0)−(M1))＜±8.6 lbs (3.9 kg)

   T1: Weight measured by the HDS with the weight on the seat
   T0: Weight measured by the HDS with no load on the seat
   M1: Weight measured on the scale

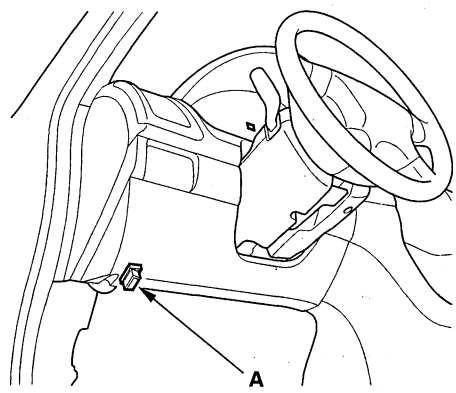
   - If the variance is ±8.6 lbs (±3.9 kg) or less, the check is complete. Go to step 9.
   - If the variance is more than ±8.6 lbs (±3.9 kg), remove the seat weight sensors, reinstall them, then repeat this procedure from the beginning.
   - If after reinstalling the front passenger's seat weight sensors, the variance is still more than ±8.6 lbs (±3.9 kg), replace the front passenger's weight sensors (if they were not replaced).

9. Turn the ignition switch OFF, and disconnect the HDS from the DLC.

After a vehicle collision

10. Position the front passenger's seat to the rear most position, adjust the recliner to the most forward position. Do not move it from these positions.

11. Connect the HDS to the data link connector (DLC) (A).



12. Drive the vehicle, accelerate to 20 mph (36 km/h), then stop on level ground.

13. From the HDS inspection menu, select Seat Weight Sensor, then "SEAT OUTPUT CHK." The weight (T0) of the front passenger's seat is recorded by the HDS.

    - If the reading on the HDS (T0) is ±6.6 lbs (±3.0 kg) or less, go to step 14.
    - If the reading on the HDS (T0) is more than ±6.6 lbs (±3.0 kg), remove the seat weight sensors, reinstall them, then repeat steps 1−3.
    - If after reinstalling the front passenger's seat weight sensors, the reading on the HDS (T0) is still more than ±6.6 lbs (±3.0 kg), go to step 1 of "Calibrating the Front Passenger's Weight Sensor Unit ('04-05 models) or calibrate the ODS unit ('06 model)."

14. Prepare a weight between 55 to 77 lbs (25 to 35 kg), then measure and note its actual weight (M) with a scale.

    NOTE: The accuracy of scale must be within ±2.2 lbs (1 kg).

15. Place the prepared weight on the front passenger's seat.

BACK

Protected by AR

16. Drive the vehicle, and accelerate to 20 mph (36 km/h), then stop on level ground.

17. From the HDS Inspection Menu, select Seat Weight Sensor, then "SEAT OUTPUT CHK." The weight (T1) of the front passenger's seat is recorded by the HDS.

18. Calculate the variance between the weight measured on the scale and the HDS with the formula shown.

    Variance = ((T1)−(T0)−(M1))＜±8.6 lbs (3.9 kg)

    T1: Weight measured by the HDS with the weight on the seat
    T0: Weight measured by the HDS with no load on the seat
    M1: Weight measured on the scale

    - If the variance is ±8.6 lbs (±3.9 kg) or less, the check is complete. Go to step 19.
    - If the variance is more than ±8.6 lbs (±3.9 kg), remove the seat weight sensors, and reinstall them, then repeat this procedure from the beginning.
    - If after reinstalling the front passenger's seat weight sensors, the variance still more than ±8.6 lbs (±3.9 kg), replace the front passenger's weight sensors and the seat riser, then go to step 1 of "Calibrating the Front Passenger's Weight Sensor Unit ('04-05 models) or calibrate the ODS unit ('06 model)."

19. Turn the ignition switch OFF, and disconnect the HDS from the DLC.

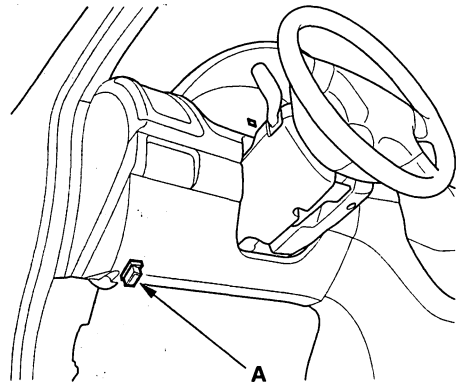
Operation Check of the Driver's Seat Position Sensor

The driver's seat position sensor must be checked after any of these actions.
- Driver's seat position sensor replacement
- Cover plate (front side of driver's seat slide rail) replacement

1. Make sure the driver's seat is at its full forward position.

2. Make sure the ignition switch is OFF (0).

3. Connect the HDS to the DLC (A).



4. Turn the ignition switch ON (II).

5. From the HDS Main Menu, select SRS, then Data List, then All Data List, then SPS.

6. Move the seat all the way forward. Using a piece of tape, mark a line on the seat's outer cover where the front riser cover meets the seat riser. The SPS should read "NEAR."

   NOTE: It takes a few seconds for the HDS to display changes, so wait about 5 seconds between each move.

   Move the seat back in small increments (about 5 mm) until the SPS reads "NOT NEAR." The seat should be approximately 25 mm from the front.

   If the SPS data does not work as described above, check the driver's seat position sensor or the cover plate for damage, and replace parts as needed.

7. Turn the ignition switch OFF, and disconnect the HDS from the DLC.

Protected by AR

DTC Troubleshooting Index

NOTE: Before looking up DTCs in the DTC troubleshooting index, verify the manufacturer of the SRS unit. The DTCs are different from manufacturer to manufacturer.

TRW SRS Unit ('03-05 models)

DTC	Latch *1	Reset *2	Detection Item	Notes
11-1x		X	Open or increased resistance in driver's airbag first inflator	(see page 23-58)
11-3x		X	Short to another wire or decreased resistance in driver's airbag first inflator	(see page 23-59)
11-4x		X	Open or increased resistance in driver's airbag second inflator	(see page 23-58)
11-6x		X	Short to another wire or decreased resistance in driver's airbag second inflator	(see page 23-59)
11-8x	X		Short to power in driver's airbag first inflator	(see page 23-61)
11-9x	X		Short to ground in driver's airbag first inflator	(see page 23-62)
11-Ax	X		Short to power in driver's airbag second inflator	(see page 23-61)
11-Bx	X		Short to ground in driver's airbag second inflator	(see page 23-62)
12-1x		X	Open or increased resistance in front passenger's airbag first inflator	(see page 23-64)
12-3x		X	Short to another wire or decreased resistance in front passenger's airbag first inflator	(see page 23-65)
12-4x		X	Open or increased resistance in front passenger's airbag second inflator	(see page 23-64)
12-6x		X	Short to another wire or decreased resistance in front passenger's airbag second inflator	(see page 23-65)
12-8x	X		Short to power in front passenger's airbag first inflator	(see page 23-66)
12-9x	X		Short to ground in front passenger's airbag first inflator	(see page 23-67)
12-Ax	X		Short to power in front passenger's airbag second inflator	(see page 23-66)
12-Bx	X		Short to ground in front passenger's airbag second inflator	(see page 23-67)
21-1x		X	Open or increased resistance in driver's seat belt tensioner	(see page 23-68)
21-3x		X	Short to another wire or decreased resistance in driver's seat belt tensioner	(see page 23-69)
21-8x	X		Short to power in driver's seat belt tensioner	(see page 23-70)
21-9x	X		Short to ground in driver's seat belt tensioner	(see page 23-71)
22-1x		X	Open or increased resistance in front passenger's seat belt tensioner	(see page 23-72)
22-3x		X	Short to another wire or decreased resistance in front passenger's seat belt tensioner	(see page 23-73)
22-8x	X		Short to power in front passenger's seat belt tensioner	(see page 23-74)
22-9x	X		Short to ground in front passenger's seat belt tensioner	(see page 23-75)
31-1x		X	Open or increased resistance in driver's side airbag inflator	(see page 23-76)
31-3x		X	Short to another wire or decreased resistance in driver's side airbag inflator	(see page 23-77)
31-8x	X		Short to power in driver's side airbag inflator	(see page 23-78)
31-9x	X		Short to ground in driver's side airbag inflator	(see page 23-79)
32-1x		X	Open or increased resistance in front passenger's side airbag inflator	(see page 23-80)
32-3x		X	Short to another wire or decreased resistance in front passenger's side airbag inflator	(see page 23-81)
32-8x	X		Short to power in front passenger's side airbag inflator	(see page 23-82)
32-9x	X		Short to ground in front passenger's side airbag inflator	(see page 23-83)
33-1x		X	Open or increased resistance in left side curtain airbag inflator	(see page 23-84)
33-3x		X	Short to another wire or decreased resistance in left side curtain airbag inflator	(see page 23-85)
33-8x	X		Short to power in left side curtain airbag inflator	(see page 23-86)
33-9x	X		Short to ground in left side curtain airbag inflator	(see page 23-87)
34-1x		X	Open or increased resistance in right side curtain airbag inflator	(see page 23-88)
34-3x		X	Short to another wire or decreased resistance in right side curtain airbag inflator	(see page 23-89)
34-8x	X		Short to power in right side curtain airbag inflator	(see page 23-90)
34-9x	X		Short to ground in right side curtain airbag inflator	(see page 23-91)

NOTE: The "x" at the end of each DTC denotes a numeric character (0 thru 9) or an alpha character (A thru F) that you will see on the HDS display. The character is unrelated to your troubleshooting; it designates the SRS unit manufacturer and other detail used for product analysis.

* 1: The SRS indicator turns on and stays on whenever the ignition switch is in the ON (II) position, or until the code is cleared.

* 2: The SRS indicator turns on when the DTC is set. The SRS indicator will not turn on after the ignition switch is cycled from ON (II) to OFF (0), but the DTC will be stored in the SRS unit.

System Description

SRS Components

Airbags
The SRS is a safety device which, when used with the seat belt, is designed to help protect the driver and front passenger in a frontal impact exceeding a certain set limit. The system consists of the SRS unit, including safing sensor and impact sensor (A), the cable reel (B), the driver's airbag (C), the front passenger's airbag (D), side airbags (E), side curtain airbags (L), seat belt tensioners (I), front impact sensors (J), side impact sensors (first) (F) and side impact sensors (second) (K).
Since the driver's and front passenger's airbags use the same sensors, both normally inflate at the same time. However, it is possible for only one airbag to inflate. This can occur when the severity of a collision is at the margin, or threshold, that the SRS unit determines whether or not the airbags will deploy. In such cases, the seat belt will provide sufficient protection, and the supplemental protection offered by the airbag would be minimal.

Front Passenger's Weight Sensors ('04-06 models)
The front passenger's weight sensor unit ('04-05 models) (M) is under the front passenger's seat along with the weight sensors (N). The weight sensors detect the weight on the seat, and send the information to the front passenger's weight sensor unit ('04-05 models) or the ODS unit ('06 model). If the total weight is about 65 lbs (30 kg) or less, the front passenger's weight sensor unit or OPDS/ODS unit sends a signal to the SRS unit to prevent the passenger's airbag from deploying. When the passenger's airbag is disabled, the passenger airbag cutoff indicator on the center panel comes on to alert the driver that the front passenger's airbag will not deploy in a front-end collision.

Driver's Seat Position Sensor ('04-06 models)
The driver's seat position sensor (O) is under the driver's seat on the left side. When the driver's seat is moved to its full forward position, the deployment of the driver's airbag is moderated to decrease its force of impact during a front-end collision.

OPDS/ODS
The side airbag system also includes an occupant position detection system (OPDS). This system consists of sensors (G) and a OPDS/ODS unit (H) in the front passenger's seat-back. The OPDS/ODS unit sends occupant height and position data to the SRS unit. If the OPDS/ODS unit determines that the front passenger is of small stature (for example, a child) or the front passenger is leaning into the side airbag deployment path, the SRS unit will automatically disable the passenger's side airbag. The SRS unit will also disable the airbag when the OPDS detects certain objects on the seat. When the side airbag is disabled, the side airbag cutoff indicator on the instrument panel alerts the driver that the passenger's side airbag will not deploy in a side impact. When the object is removed, or the passenger sits upright, the side airbag cutoff indicator will go off after a few seconds, alerting the driver that the passenger's side airbag will deploy in a side impact.

System Description (cont'd)

Side Airbag Cutoff Indicator/OPDS/ODS Operation

The indicator comes on if the front passenger's seat is occupied by a small adult or child who is leaning into the deployment path, or an object (grocery bag, briefcase, purse, etc.) is in the seat. This indicates the passenger's side airbag is off and will not deploy; there is no problem with the side airbag. If the passenger sits upright or moves to another seat, or you remove the object from the seat, the light should go off. There will be some delay between the occupant's repositioning, and when the indicator will turn on or off.

Passenger Airbag Cutoff Indicator

The indicator comes on if the weight of the front passenger is 65 lbs (30 kg) or less. This indicates the passenger's front airbag is off and will not deploy. The front airbag is shut off to reduce the chance of airbag-caused injuries.

SRS Operation

The main circuit in the SRS unit senses and judges the force of impact and, if necessary, ignites the inflator charges. If battery voltage is too low or power is disconnected due to the impact, the voltage regulator and the back-up power circuit, respectively, will keep voltage at a constant level.

For the SRS to operate

Seat Belt Tensioners

(1) A front impact sensor must activate and send electric signals to the microprocessor.
(2) The microprocessor must compute the signals and send them to the tensioners.
(3) The charges must ignite and deploy the tensioners.

Driver's and Front Passenger's Airbag(s)

(1) A front impact sensor must activate, and send electric signals to the microprocessor.
(2) The microprocessor must compute the signals, and send them to the airbag inflator(s).
(3) The inflators that received signals must ignite and deploy the airbags.

Side Airbag(s)

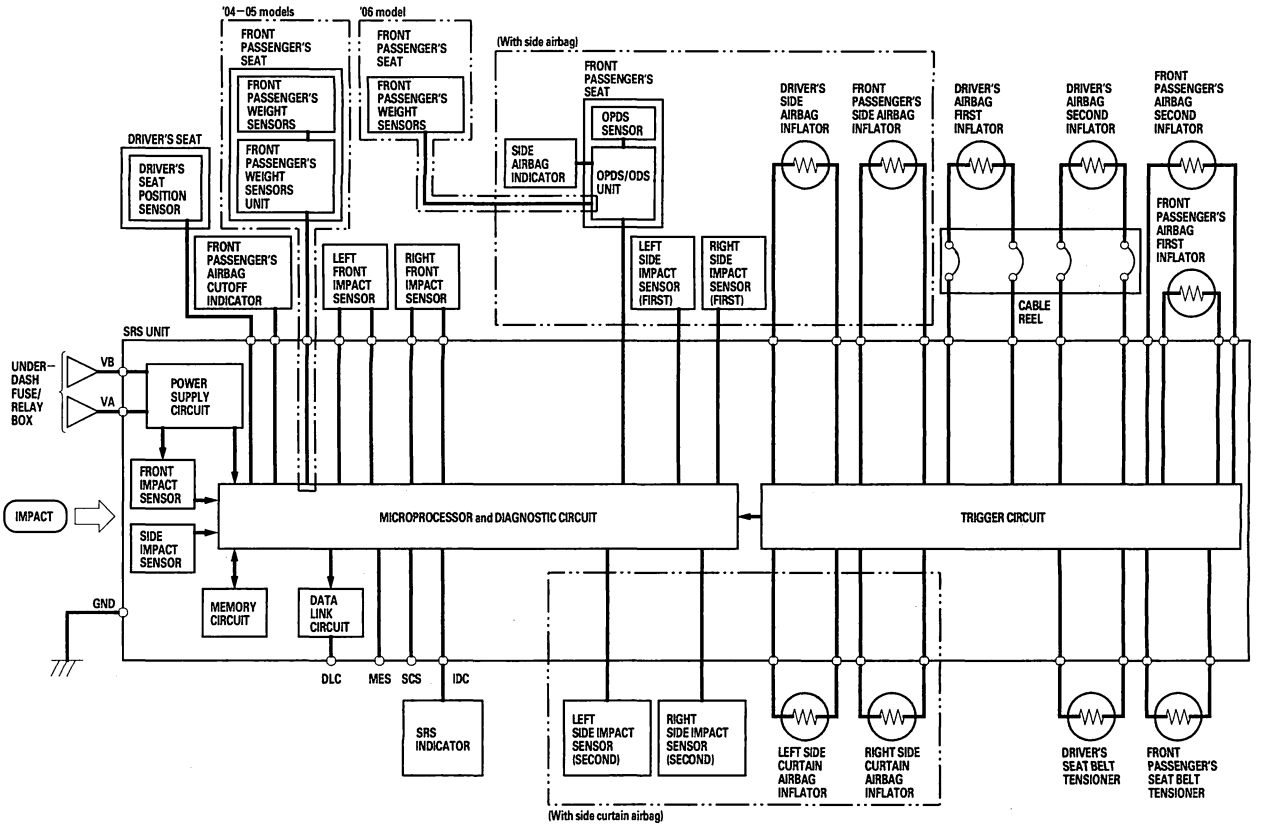
(1) A side impact sensor must activate, and send electric signals to the microprocessor.
(2) The microprocessor must compute the signals and send them to the side airbag inflator(s). However, the microprocessor cuts off the signals to the front passenger's side airbag if the SRS unit determines that the front passenger's head is in the deployment path of the side airbag.
(3) The inflator that received the signal must ignite and deploy the side airbag.

Side Curtain Airbag(s)

(1) Side impact sensors must activate, and send electrical signals to the microprocessor.
(2) The microprocessor must compute the signals and send them to the side curtain airbag and side airbag inflator(s).
(3) The inflator that received the signals must ignite and deploy the side curtain airbag and side airbag at the same time.

BACK

Protected by AR



Self-diagnosis System

A self-diagnosis circuit is built into the SRS unit; when the ignition switch is turned ON (II), the SRS indicator comes on and goes off after about 6 seconds if the system is operating normally.

If the indicator does not come on, or does not go off after 6 seconds, or if it comes on while driving, it indicates an abnormality in the system. The system must be inspected and repaired as soon as possible.

For better serviceability, the SRS unit memory stores a DTC that relates to the cause of the malfunction, and the unit is connected to the data link connector (DLC). This information can be read with the HDS when it is connected to the DLC (16P) (see page 23-30).

NOTE: Before you disconnect the battery negative cable for troubleshooting, make sure you have the anti-theft code for the audio and the navigation system. Write down the audio presets.

DTC Troubleshooting

DTC 11-1x (11-10 to 11-19, 11-1A to 11-1F):
Open in Driver's Airbag First Inflator

DTC 11-2x (11-20 to 11-29, 11-2A to 11-2F):
Increased Resistance in Driver's First Airbag Inflator

DTC 11-4x (11-40 to 11-49, 11-4A to 11-4F):
Open in Driver's Airbag Second Inflator

DTC 11-5x (11-50 to 11-59, 11-5A to 11-5F):
Increased Resistance in Driver's Airbag Second Inflator

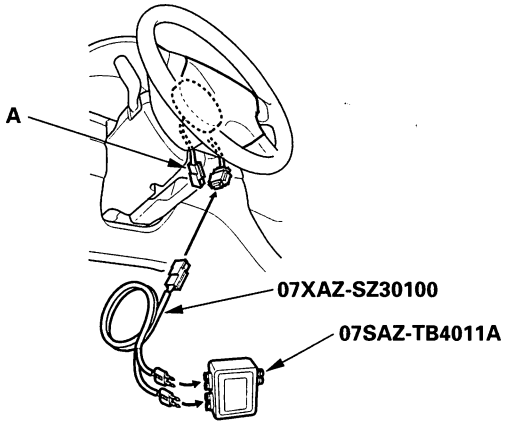
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 11-1x, 11-2x, 11-4x, or 11-5x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the driver's airbag 4P connector (A) from the cable reel.

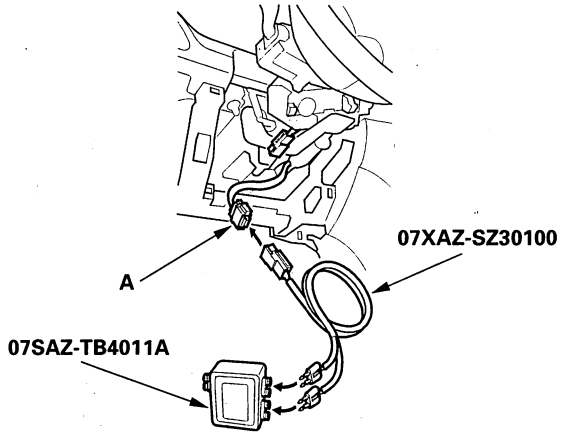


5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the cable reel.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 11-1x, 11-2x, 11-4x, or 11-5x indicated?

   YES—Go to step 9.

   NO—Open or increased resistance in the driver's airbag first or second inflator; replace the driver's airbag (see page 23-197).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the dashboard wire harness 4P connector (A) from the cable reel.



11. Connect the SRS inflator simulator (2 Ω connectors) and the simulator lead to the dashboard wire harness.
12. Reconnect the battery negative cable.
13. Erase the DTC memory.

BACK

Protected by AR

14. Read the DTC.

    Is DTC 11-1x, 11-2x, 11-4x, or 11-5x indicated?

    YES—Go to step 15.

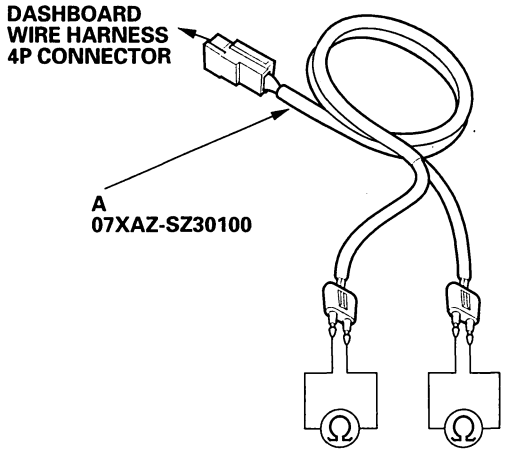
    NO—Open or increased resistance in the cable reel; replace the cable reel (see page 23-210). ■

15. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

16. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29). Do not disconnect the simulator lead from dashboard wire harness 4P connector.

17. Disconnect the SRS inflator simulator from SRS simulator lead F.

18. Check the resistance between the terminals of both SRS simulator leads. There should be 1 Ω or less.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness. ■

DTC 11-3x (11-30 to 11-39, 11-3A to 11-3F): Short to Another Wire or Decreased Resistance in Driver's Airbag First Inflator

DTC 11-6x (11-60 to 11-69, 11-6A to 11-6F): Short to Another Wire or Decreased Resistance in Driver's Airbag Second Inflator

Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100
- SRS short canceller 070AZ-SAA0100

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

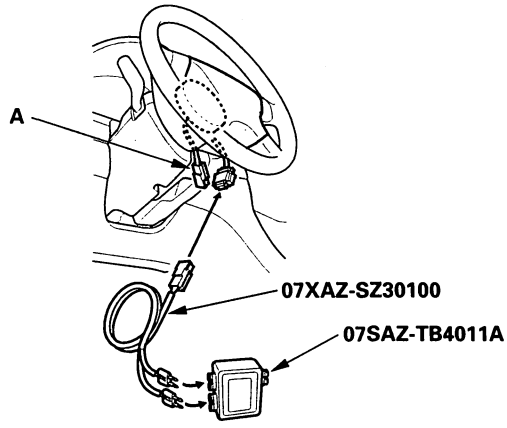
   Does the SRS indicator stay on, and is DTC 11-3x or 11-6x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

4. Disconnect the driver's airbag 4P connector (A) from the cable reel.



5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the cable reel.

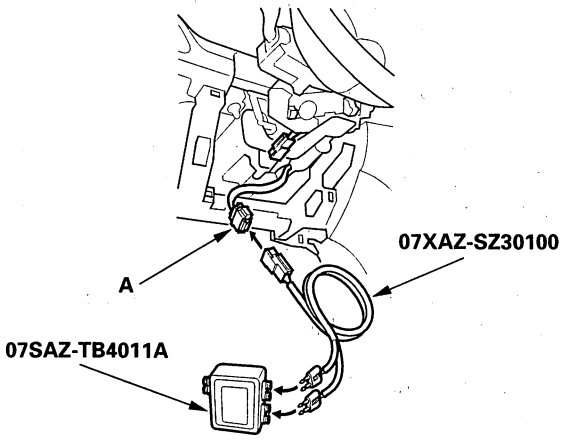
DTC Troubleshooting (cont'd)

6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 11-3x or 11-6x indicated?

   YES—Go to step 9.

   NO—Short in the driver's airbag first or second inflator; replace the driver's airbag (see page 23-197).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the dashboard wire harness 4P connector (A) from the cable reel.

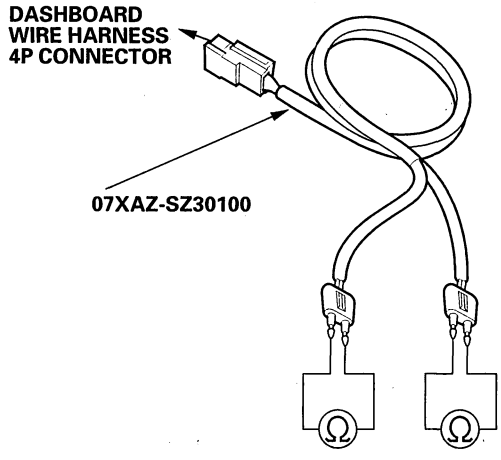


11. Connect the SRS inflator simulator (2 Ω connectors) and the simulator lead to the dashboard wire harness.
12. Reconnect the battery negative cable.
13. Erase the DTC memory.
14. Read the DTC.

    Is DTC 11-3x or 11-6x indicated?

    YES—Go to step 15.

    NO—Short in the cable reel; replace the cable reel (see page 23-210).■
15. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
16. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).
17. Disconnect the SRS inflator simulator from the SRS simulator lead.
18. Connect SRS short cancellers (070AZ-SAA0100) to the No. 7 and No. 8 terminals and No. 1 and No.2 terminals of the SRS unit connector A (28P) (see page 23-25).
19. Check resistance between the terminals of both SRS simulator leads. There should be an open circuit or at least 1 MΩ.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short in the dashboard wire harness; replace the dashboard wire harness.■

DTC 11-Ax (11-A0 to 11-A9, 11-AA to 11-AF): Short to Power in Driver's Airbag Second Inflator

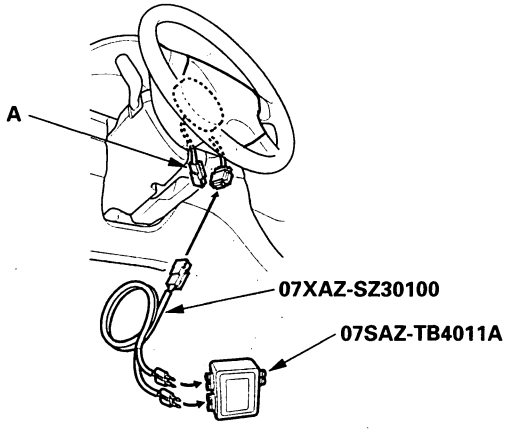
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 11-8x or 11-Ax indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the driver's airbag 4P connector (A) from the cable reel.

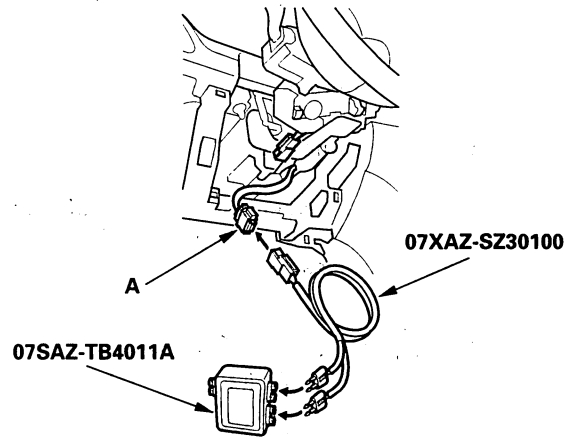


5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the cable reel.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 11-8x or 11-Ax indicated?

   YES—Go to step 9.

   NO—Short to power in the driver's airbag first or second inflator; replace the driver's airbag (see page 23-197).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the dashboard wire harness 4P connector (A) from the cable reel.



11. Connect the SRS inflator simulator (2 Ω connectors) and the simulator lead to the dashboard wire harness.
12. Reconnect the battery negative cable.
13. Erase the DTC memory.

DTC Troubleshooting (cont'd)

14. Read the DTC.

    Is DTC 11-8x or 11-Ax indicated?

    YES—Go to step 15.

    NO—Short to power in the cable reel; replace the cable reel (see page 23-210). ■

15. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

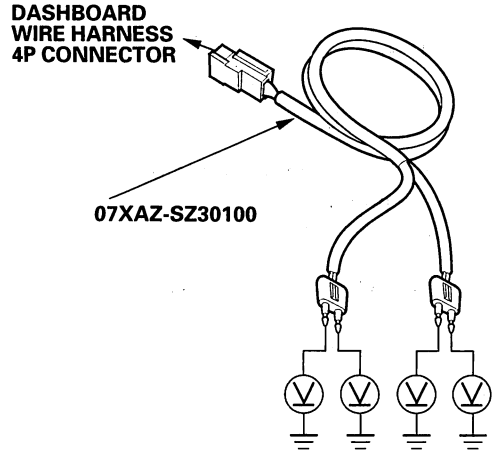
16. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

17. Disconnect the SRS inflator simulator from the SRS simulator lead.

18. Reconnect the battery negative cable.

19. Turn the ignition switch ON (II).

20. Check for voltage between each terminal of both SRS simulator leads and body ground. There should be 0.5 V or less.



Is the voltage as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Short to power in the dashboard wire harness; replace the dashboard wire harness. ■

DTC 11-9x (11-90 to 11-99, 11-9A to 11-9F): Short to Ground in Driver's Airbag First Inflator

DTC 11-Bx (11-B0 to 11-B9, 11-BA to 11-BF): Short to Ground in Driver's Airbag Second Inflator

Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

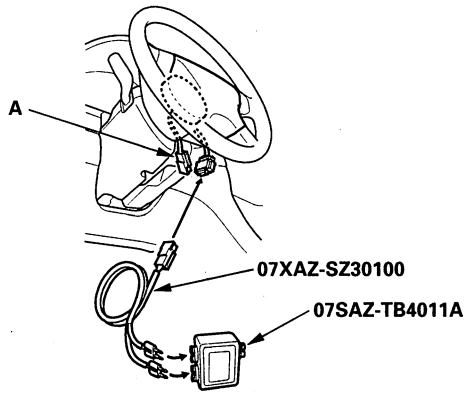
   Does the SRS indicator stay on, and is DTC 11-9x or 11-Bx indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

4. Disconnect the driver's airbag 4P connector (A) from the cable reel.



5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the cable reel.

6. Reconnect the battery negative cable.

7. Erase the DTC memory.

BACK

Protected by AR

8. Read the DTC (see page 23-30).

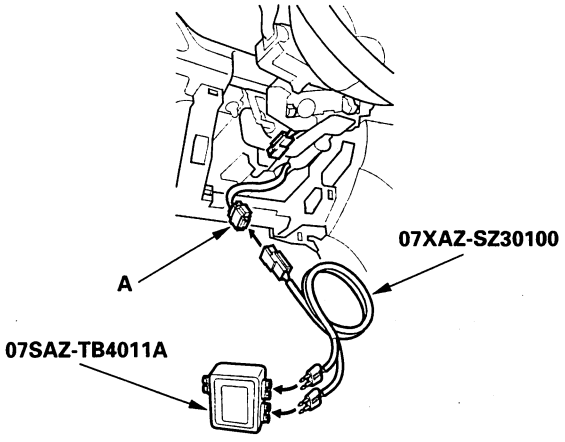
   Is DTC 11-9x or 11-Bx indicated?

   YES—Go to step 9.

   NO—Short to ground in the driver's airbag first or second inflator; replace the driver's airbag (see page 23-197).■

9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

10. Disconnect the dashboard wire harness 4P connector (A) from the cable reel.



11. Connect the SRS inflator simulator (2 Ω connectors) and the simulator lead to the dashboard wire harness.

12. Reconnect the battery negative cable.

13. Erase the DTC memory.

14. Read the DTC.

    Is DTC 11-9x or 11-Bx indicated?

    YES—Go to step 15.

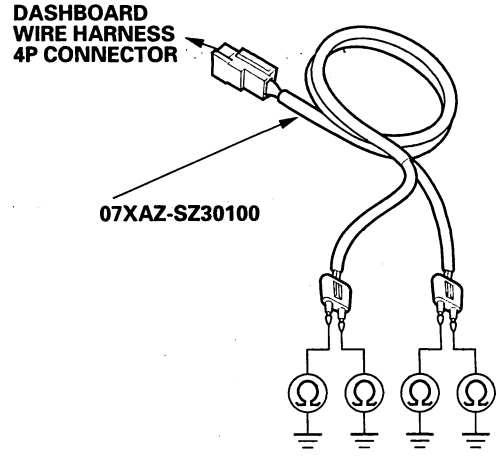
    NO—Short to ground in the cable reel; replace the cable reel (see page 23-210).■

15. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

16. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

17. Disconnect the SRS inflator simulator from the SRS simulator lead.

18. Check resistance between each terminal of both SRS simulator leads and body ground. There should be an open circuit or at least 1 MΩ.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short to ground in the dashboard wire harness; replace the dashboard wire harness.■

DTC Troubleshooting (cont'd)

DTC 12-1x (12-10 to 12-19, 12-1A to 12-1F): Open in Front Passenger's Airbag First Inflator
DTC 12-2x (12-20 to 12-29, 12-2A to 12-2F): Increased Resistance in Front Passenger's Airbag First Inflator
DTC 12-4x (12-40 to 12-49, 12-4A to 12-4F): Open in Front Passenger's Airbag Second Inflator
DTC 12-5x (12-50 to 12-59, 12-5A to 12-5F): Increased Resistance in Front Passenger's Airbag Second Inflator

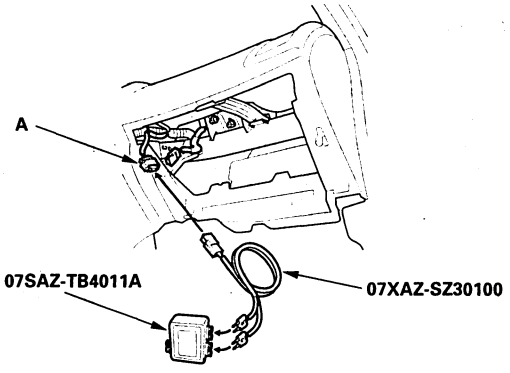
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 12-1x, 12-2x, 12-4x, or 12-5x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.



5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the dashboard wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 12-1x, 12-2x, 12-4x, or 12-5x indicated?

   YES—Go to step 9.

   NO—Open or increased resistance in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see page 23-198).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29). Do not disconnect the simulator lead from the dashboard wire harness 4P connector.
11. Disconnect the SRS inflator simulator from the SRS simulator lead.
12. Check resistance between the terminals of both SRS simulator leads. There should be 1 Ω or less.

   Is the resistance as specified?

   YES—Faulty SRS unit or poor contact at SRS unit connector A (28P). Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

   NO—Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness.■

DTC 12-3x (12-30 to 12-39, 12-3A to 12-3F): Short to Another Wire or Decreased Resistance in Front Passenger's Airbag First Inflator
DTC 12-6x (12-60 to 12-69, 12-6A to 12-6F): Short to Another Wire or Decreased Resistance in Front Passenger's Airbag Second Inflator

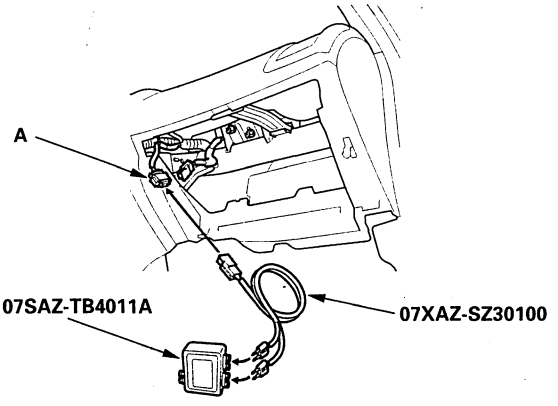
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100
- SRS short canceller 070AZ-SAA0100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 12-3x or 12-6x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.

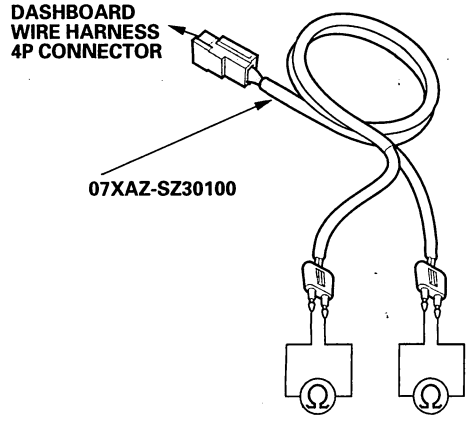


5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the dashboard wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 12-3x or 12-6x indicated?

   YES—Go to step 9.

   NO—Short in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see page 23-198).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).
11. Disconnect the SRS inflator simulator from the SRS simulator lead.
12. Connect SRS short cancellers (070AZ-SAA0100) to the No. 9 and No. 10 terminals and the No. 3 and No.4 terminal of the SRS unit connector A (28P) (see page 23-25).
13. Check resistance between the terminals of both SRS simulator leads. There should be an open circuit or at least 1 MΩ.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short in the dashboard wire harness; replace the dashboard wire harness.■

DTC Troubleshooting (cont'd)

DTC 12-8x (12-80 to 12-89, 12-8A to 12-8F): Short to Power in Front Passenger's Airbag First Inflator

DTC 12-Ax (12-A0 to 12-A9, 12-AA to 12-AF): Short to Power in Front Passenger's Airbag Second Inflator

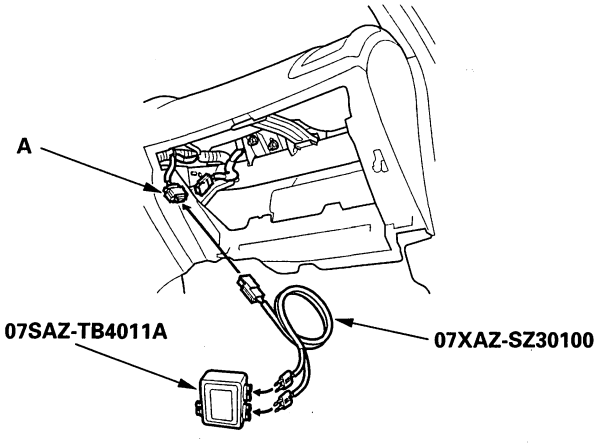
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 12-8x or 12-Ax indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.

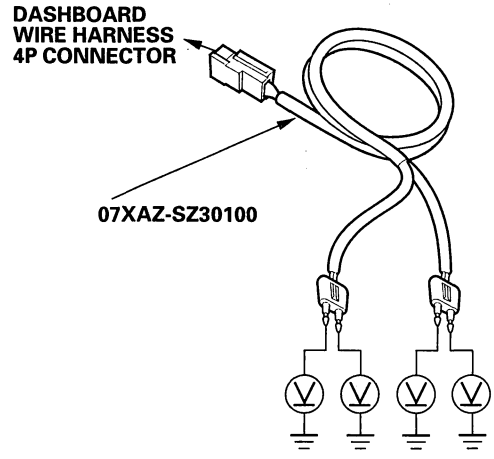


5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the dashboard wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 12-8x or 12-Ax indicated?

   YES—Go to step 9.

   NO—Short to power in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see page 23-198).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).
11. Disconnect the SRS inflator simulator from the SRS simulator lead.
12. Reconnect the battery negative cable.
13. Turn the ignition switch ON (II).
14. Check for voltage between each terminal of both SRS simulator leads and body ground. There should be 0.5 V or less.



Is the voltage as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short to power in the dashboard wire harness; replace the dashboard wire harness.■

DTC Troubleshooting (cont'd)

DTC 21-1x (21-10 to 21-19, 21-1A to 21-1F): Open in Driver's Seat Belt Tensioner

DTC 21-2x (21-20 to 21-29, 21-2A to 21-2F): Increased Resistance in Driver's Seat Belt Tensioner

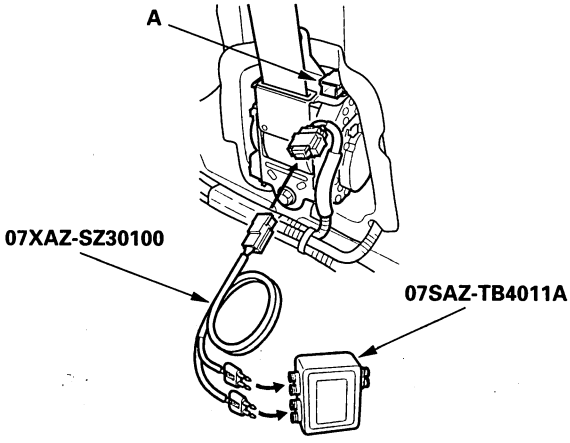
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 21-1x or 21-2x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the driver's seat belt tensioner 4P connector (A) from the floor wire harness.



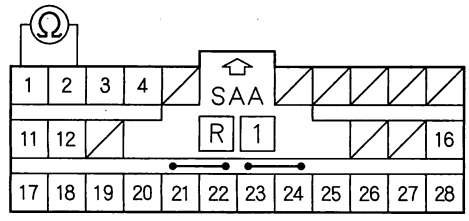
5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 21-1x or 21-2x indicated?

   YES—Go to step 9.

   NO—Open or increased resistance in the driver's seat belt tensioner; replace the driver's seat belt (see page 23-5). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the front passenger's seat belt tensioner connector (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Check resistance between the No. 1 and the No. 2 terminals of SRS unit connector B (28P). There should be 2.0—3.0 Ω.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Open or increased resistance in the floor wire harness; replace the floor wire harness. ■

DTC 21-3x (21-30 to 21-39, 21-3A to 21-3F): Short to Another Wire or Decreased Resistance in Driver's Seat Belt Tensioner

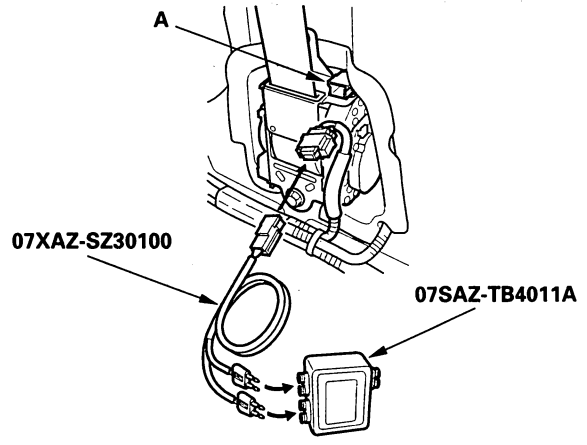
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 21-3x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the driver's seat belt tensioner 4P connector (A) from the floor wire harness.



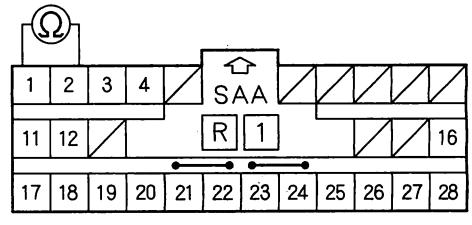
5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 21-3x indicated?

   YES—Go to step 9.

   NO—Short in the driver's seat belt tensioner; replace the driver's seat belt (see page 23-5).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the front passenger's seat belt tensioner connector (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the simulator lead from the floor wire harness.
13. Check resistance between the No. 1 and the No. 2 terminals of SRS unit connector B (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

DTC Troubleshooting (cont'd)

DTC 21-8x (21-80 to 21-89, 21-8A to 21-8F): Short to Power in Driver's Seat Belt Tensioner

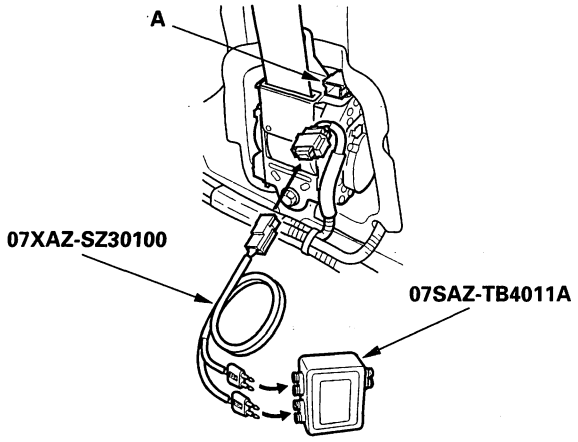
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 21-8x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the driver's seat belt tensioner 4P connector (A) from the floor wire harness.



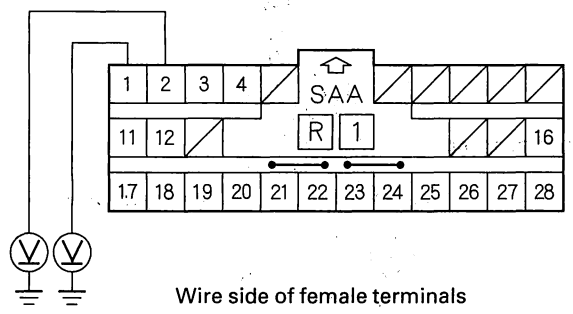
5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 21-8x indicated?

   YES—Go to step 9.

   NO—Short to power in the driver's seat belt tensioner; replace the driver's seat belt (see page 23-5). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the front passenger's seat belt tensioner connector (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the simulator lead from the floor wire harness.
13. Reconnect the battery negative cable.
14. Turn the ignition switch ON (II).
15. Check for voltage between the No. 1 terminal of SRS unit connector B (28P) and body ground, and between the No. 2 terminal and body ground. There should be 0.5 V or less.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the voltage as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Short to power in the floor wire harness; replace the floor wire harness. ■

DTC 21-9x (21-90 to 21-99, 21-9A to 21-9F): Short to Ground in Driver's Seat Belt Tensioner

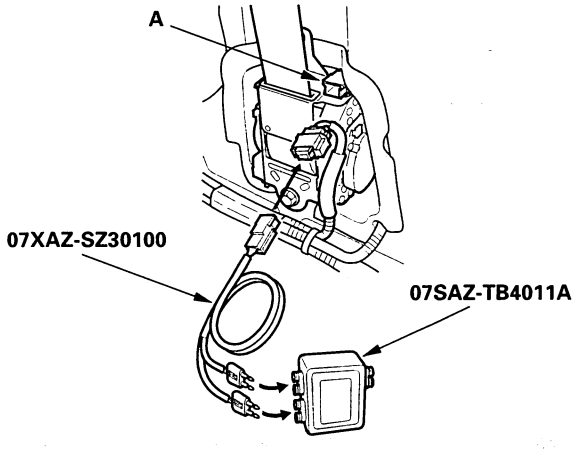
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 21-9x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the driver's seat belt tensioner 4P connector (A) from the floor wire harness.



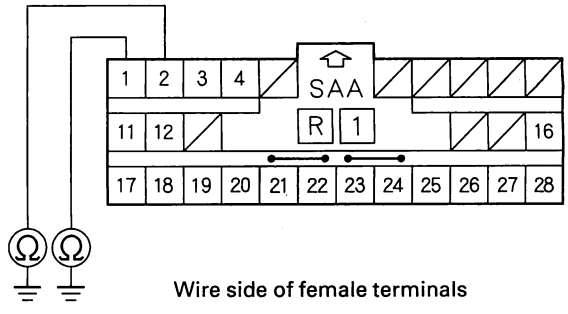
5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 21-9x indicated?

   YES—Go to step 9.

   NO—Short to ground in the driver's seat belt tensioner; replace the driver's seat belt (see page 23-5). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the front passenger's seat belt tensioner connector (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the simulator lead from the floor wire harness.
13. Check resistance between the No. 1 terminals of SRS unit connector B (28P) and body ground, and between the No. 2 terminal and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Short to ground in the floor wire harness; replace the floor wire harness. ■

DTC Troubleshooting (cont'd)

DTC 22-1x (22-10 to 22-19, 22-1A to 22-1F): Open in Front Passenger's Seat Belt Tensioner

DTC 22-2x (22-20 to 22-29, 22-2A to 22-2F): Increased Resistance in Front Passenger's Seat Belt Tensioner

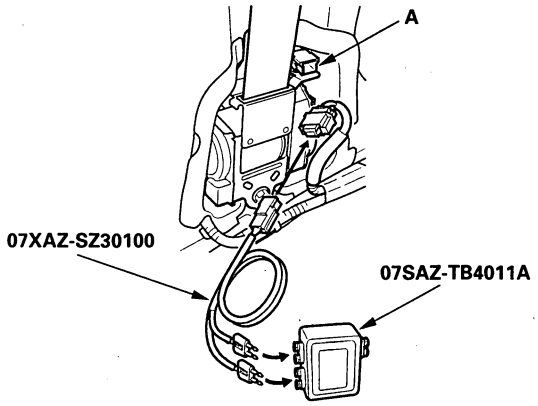
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 22-1x or 22-2x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the front passenger's seat belt tensioner 4P connector (A) from the floor wire harness.



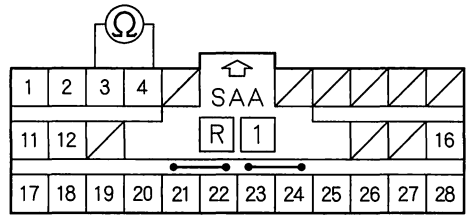
5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 22-1x or 22-2x indicated?

   YES—Go to step 9.

   NO—Open or increased resistance in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see page 23-5). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the driver's seat belt tensioner connector (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Check resistance between the No. 3 and the No. 4 terminal of SRS unit connector B (28P). There should be 2.0—3.0 Ω.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Open or increased resistance in the floor wire harness; replace the floor wire harness. ■

DTC 22-3x (22-30 to 22-39, 22-3A to 22-3F): Short to Another Wire or Decreased Resistance in Front Passenger's Seat Belt Tensioner

Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

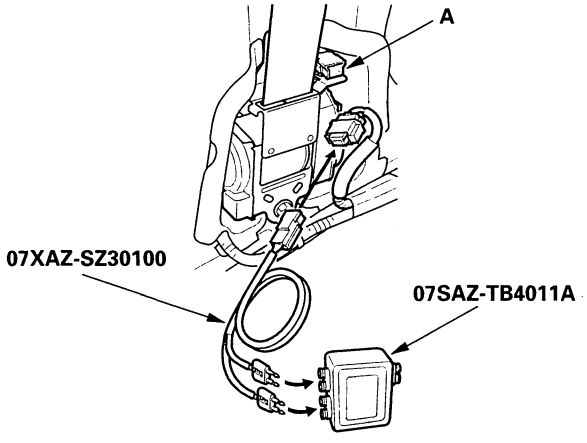
   Does the SRS indicator stay on, and is DTC 22-3x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

4. Disconnect the front passenger's seat belt tensioner 4P connector (A) from the floor wire harness.



5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the floor wire harness.

6. Reconnect the battery negative cable.

7. Erase the DTC memory.

8. Read the DTC (see page 23-30).

   Is DTC 22-3x indicated?

   YES—Go to step 9.

   NO—Short in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see page 23-5). ■

9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

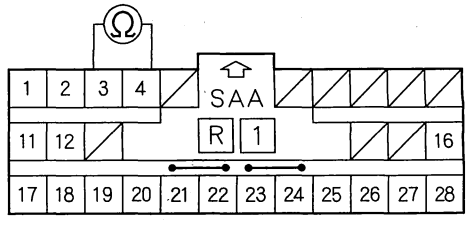
10. Disconnect the driver's seat belt tensioner connector (see step 6 on page 23-29).

11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).

12. Disconnect the simulator lead from the floor wire harness.

13. Check resistance between the No. 3 and the No. 4 terminals of SRS unit connector B (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Short in the floor wire harness; replace the floor wire harness. ■

DTC Troubleshooting (cont'd)

DTC 22-8x (22-80 to 22-89, 22-8A to 22-8F): Short to Power in Front Passenger's Seat Belt Tensioner

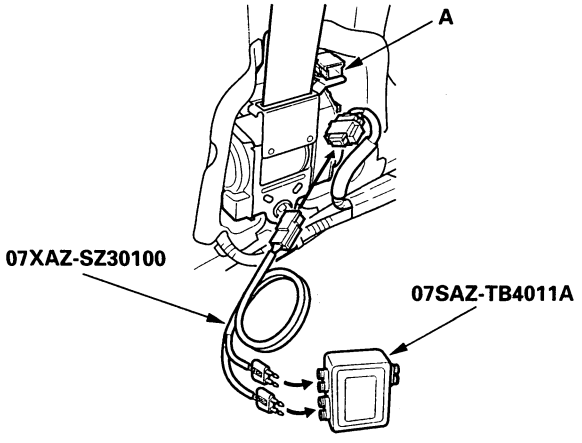
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 22-8x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the front passenger's seat belt tensioner 4P connector (A) from the floor wire harness.



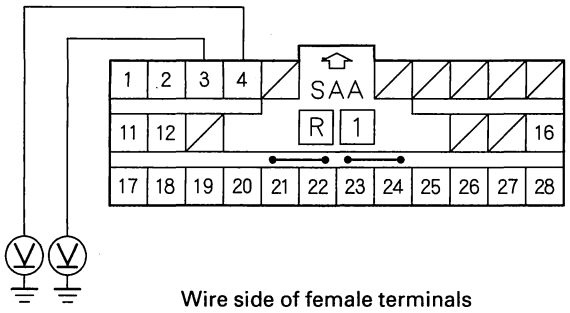
5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 22-8x indicated?

   YES—Go to step 9.

   NO—Short to power in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see page 23-5). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the driver's seat belt tensioner connector (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the simulator lead from the floor wire harness.
13. Reconnect the battery negative cable.
14. Turn the ignition switch ON (II).
15. Check for voltage between the No. 3 terminal of SRS unit connector B (28P) and body ground, and between the No. 4 terminal and body ground. There should be 0.5 V or less.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the voltage as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Short to power in the floor wire harness; replace the floor wire harness. ■

DTC 22-9x (22-90 to 22-99, 22-9A to 22-9F): Short to Ground in Front Passenger's Seat Belt Tensioner

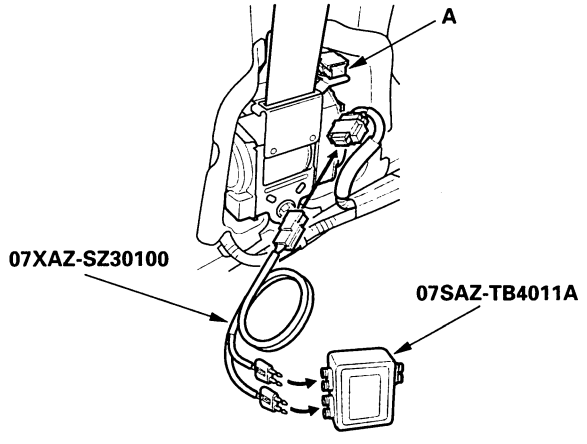
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead F 07XAZ-SZ30100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 22-9x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the front passenger's seat belt tensioner 4P connector (A) from the floor wire harness.



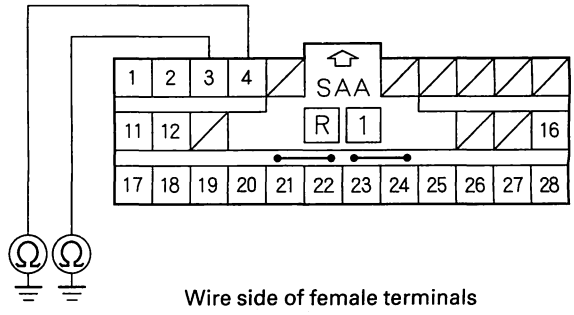
5. Connect the SRS inflator simulator (2 Ω connectors) and simulator lead F to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 22-9x indicated?

   YES—Go to step 9.

   NO—Short to ground in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see page 23-5). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the driver's seat belt tensioner connector (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the simulator lead from the floor wire harness.
13. Check resistance between the No. 3 terminal of SRS unit connector B (28P) and body ground, and between the No. 4 terminal and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Short to ground in the floor wire harness; replace the floor wire harness. ■

DTC Troubleshooting (cont'd)

DTC 31-1x (31-10 to 31-19, 31-1A to 31-1F): Open in Driver's Side Airbag Inflator

DTC 31-2x (31-20 to 31-29, 31-2A to 31-2F): Increased Resistance in Driver's Side Airbag Inflator

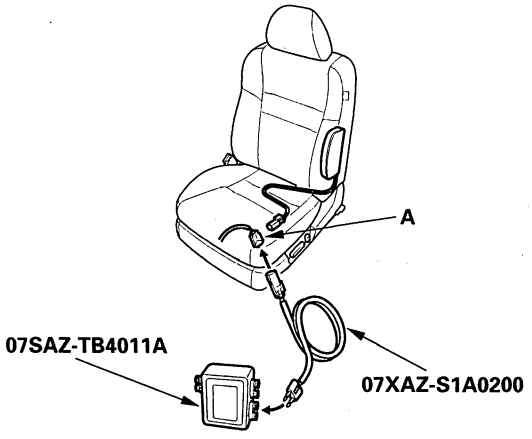
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 31-1x or 31-2x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the driver's side airbag.

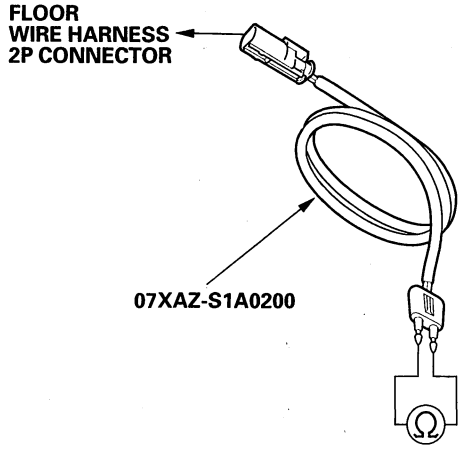


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 31-1x or 31-2x indicated?

   YES—Go to step 9.

   NO—Open or increased resistance in the driver's side airbag inflator; replace the driver's side airbag (see page 23-199). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the SRS inflator simulator from the SRS simulator lead.
13. Check resistance between the terminals of the SRS simulator lead. There should be 1.0 Ω or less.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Open or increased resistance in the floor wire harness; replace the floor wire harness. ■

DTC 31-3x (31-30 to 31-39, 31-3A to 31-3F): Short to Another Wire or Decreased Resistance in Driver's Side Airbag Inflator

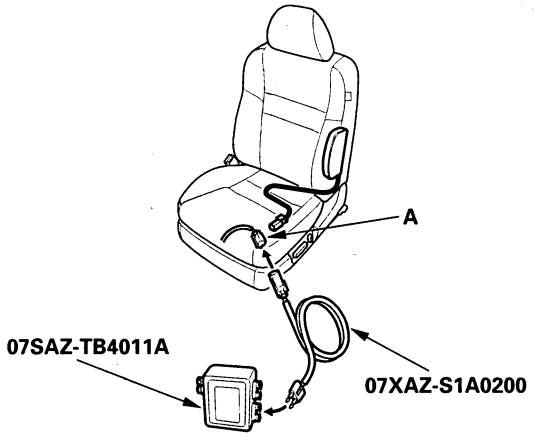
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200
- SRS short canceller 070AZ-SAA0100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 31-3x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the driver's side airbag.



5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 31-3x indicated?

   YES—Go to step 9.

   NO—Short to another wire in the driver's side airbag inflator; replace the driver's side airbag (see page 23-199). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the SRS inflator simulator from the SRS simulator lead.
13. Connect the SRS short canceller (070AZ-SAA0100) to the No. 21 and No. 22 terminals of SRS unit connector B (28P) (see page 23-25).
14. Check resistance between the terminals of SRS simulator lead E. There should be an open circuit or at least 1 MΩ.

   Is the resistance as specified?

   YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

   NO—Short in the floor wire harness; replace the floor wire harness. ■

DTC Troubleshooting (cont'd)

DTC 31-8x (31-80 to 31-89, 31-8A to 31-8F): Short to Power in Driver's Side Airbag Inflator

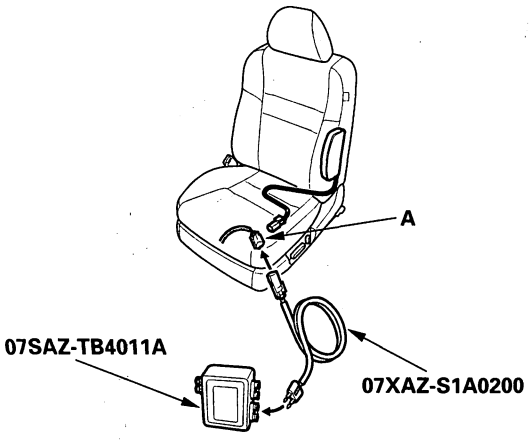
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 31-8x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the driver's side airbag.

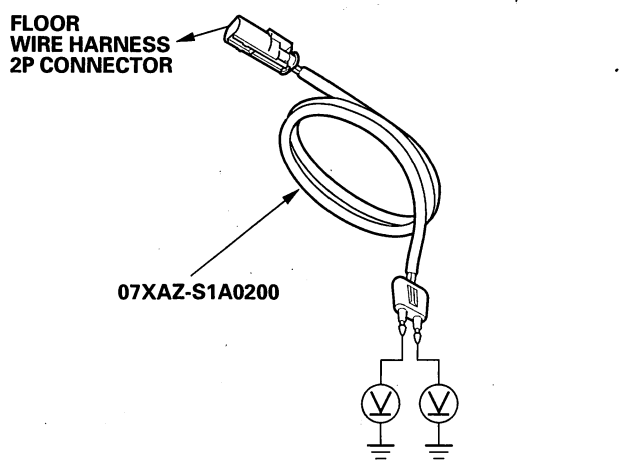


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 31-8x indicated?

   YES—Go to step 9.

   NO—Short to power in the driver's side airbag inflator; replace the driver's side airbag (see page 23-199).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the SRS inflator simulator from the SRS simulator lead.
13. Reconnect the battery negative cable.
14. Turn the ignition switch ON (II).
15. Check for voltage between each terminal of SRS simulator lead E and body ground. There should be 0.5 V or less.



Is the voltage as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short to power in the floor wire harness; replace the floor wire harness.■

DTC 31-9x (31-90 to 31-99, 31-9A to 31-9F): Short to Ground in Driver's Side Airbag Inflator

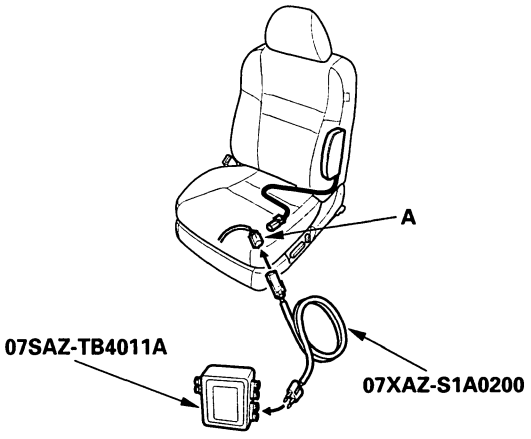
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 31-9x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the driver's side airbag.

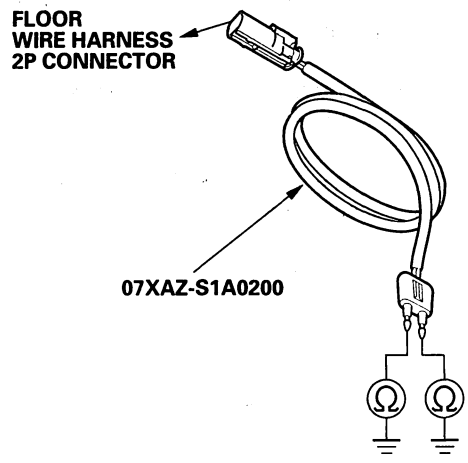


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 31-9x indicated?

   YES—Go to step 9.

   NO—Short to ground in the driver's side airbag inflator; replace the driver's side airbag (see page 23-199).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the SRS inflator simulator from the SRS simulator lead.
13. Check resistance between each terminal of SRS simulator lead E and body ground. There should be an open circuit or at least 1 MΩ.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

DTC Troubleshooting (cont'd)

DTC 32-1x (32-10 to 32-19, 32-1A to 32-1F): Open in Front Passenger's Side Airbag Inflator

DTC 32-2x (32-20 to 32-29, 32-2A to 32-2F): Increased Resistance in Front Passenger's Side Airbag Inflator

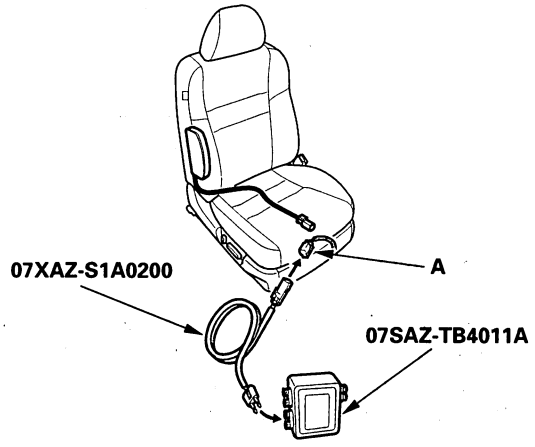
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 32-1x or 32-x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the front passenger's side airbag.

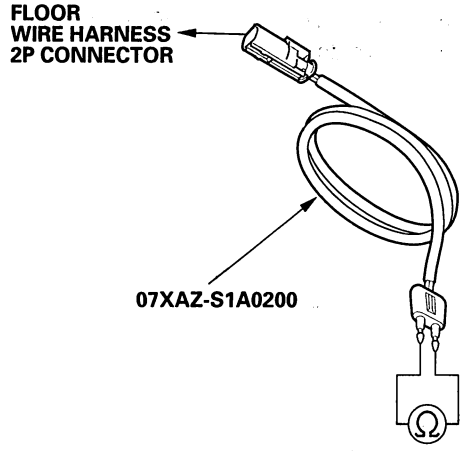


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 32-1x or 32-2x indicated?

   YES—Go to step 9.

   NO—Open or increased resistance in the front passenger's side airbag inflator; replace the front passenger's side airbag (see page 23-199).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the SRS inflator simulator from the SRS simulator lead.
13. Check resistance between the terminals of the SRS simulator lead. There should be 1.0 Ω or less.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

NO—Open or increased resistance in the floor wire harness; replace the floor wire harness.■

DTC 32-3x (32-30 to 32-39, 32-3A to 32-3F): Short to Another Wire or Decreased Resistance in Front Passenger's Side Airbag Inflator

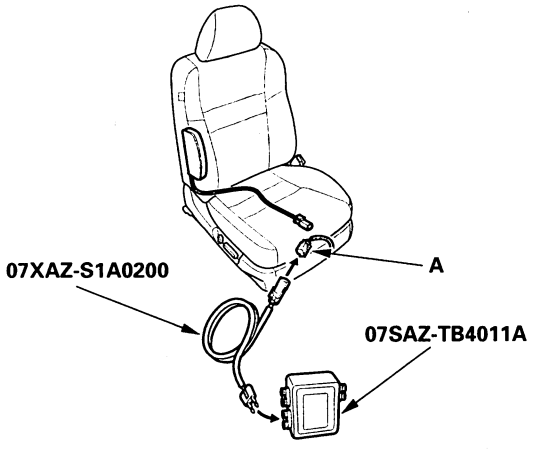
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200
- SRS short canceller 070AZ-SAA0100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 32-3x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the front passenger's side airbag.



5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 32-3x indicated?

   YES—Go to step 9.

   NO—Short to another wire in the front passenger's side airbag inflator; replace the front passenger's side airbag (see page 23-199).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the SRS inflator simulator from the SRS simulator lead.
13. Connect the SRS short canceller (070AZ-SAA0100) to the No. 23 and No. 24 terminals of SRS unit connector B (28P) (see page 23-25).
14. Check resistance between the terminals of the SRS simulator lead. There should be an open circuit or at least 1 MΩ.

   Is the resistance as specified?

   YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

DTC Troubleshooting (cont'd)

DTC 32-8x (32-80 to 32-89, 32-8A to 32-8F): Short to Power in Front Passenger's Side Airbag Inflator

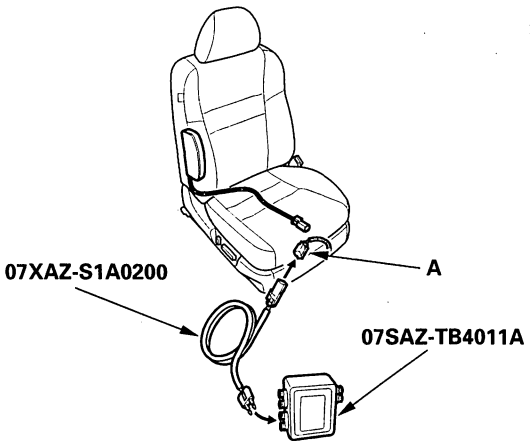
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 32-8x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the front passenger's side airbag.

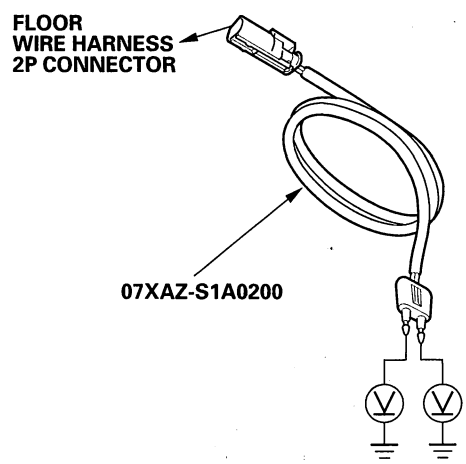


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 32-8x indicated?

   YES—Go to step 9.

   NO—Short to power in the front passenger's side airbag inflator; replace the front passenger's side airbag (see page 23-199).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the SRS inflator simulator from the SRS simulator lead.
13. Reconnect the battery negative cable.
14. Turn the ignition switch ON (II).
15. Check for voltage between each terminal of the SRS simulator lead and body ground. There should be 0.5 V or less.



Is the voltage as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short to power in the floor wire harness; replace the floor wire harness.■

DTC 32-9x (32-90 to 32-99, 32-9A to 32-9F): Short to Ground in Front Passenger's Side Airbag Inflator

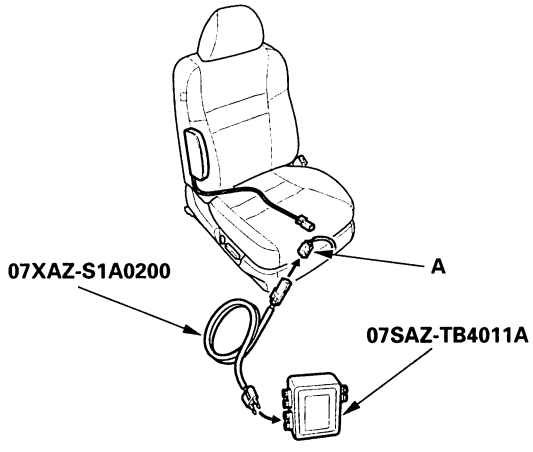
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 32-9x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the front passenger's side airbag.

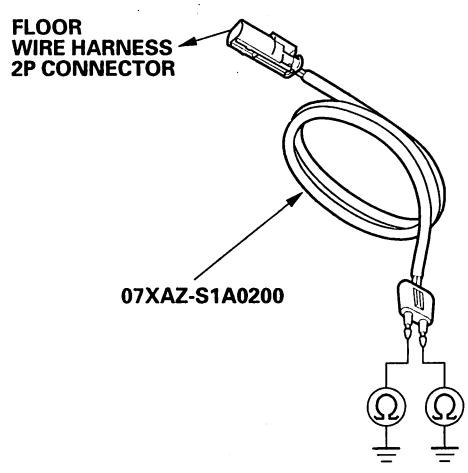


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the floor wire harness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 32-9x indicated?

   YES—Go to step 9.

   NO—Short to ground in the front passenger's side airbag inflator; replace the front passenger's side airbag (see page 23-199).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
12. Disconnect the SRS inflator simulator from the SRS simulator lead.
13. Check resistance between each terminal of the SRS simulator lead and body ground. There should be an open circuit or at least 1 MΩ.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short to ground in the floor wire harness; replace the floor wire harness.■

DTC Troubleshooting (cont'd)

DTC 33-1x (33-10 to 33-19, 33-1A to 33-1F): Open or Increased Resistance in Left Side Curtain Airbag Inflator

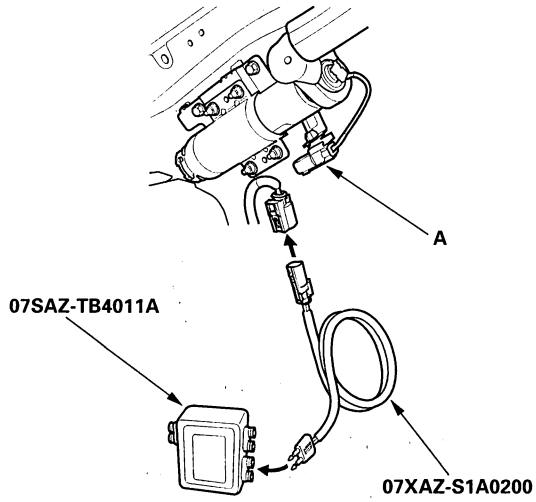
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 33-1x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the left side curtain airbag 2P connector from the side curtain airbag subharness (A).

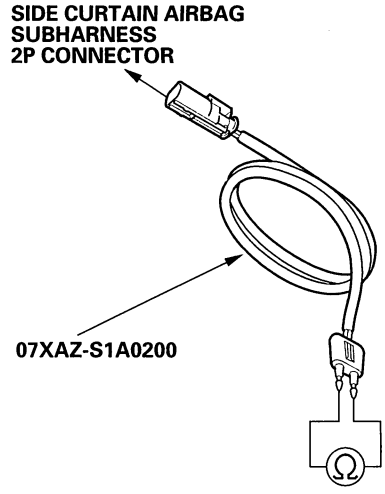


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the side curtain airbag subharness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 33-1x indicated?

   YES—Go to step 9.

   NO—Open or increased resistance in the left side curtain airbag; replace the left side curtain airbag (see page 23-200).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect SRS unit connector C (16P) from the SRS unit (see step 7 on page 23-29). Do not disconnect the simulator lead from the side curtain airbag subharness.
11. Disconnect the SRS inflator simulator from the SRS simulator lead.
12. Check resistance between the terminals of the SRS simulator lead. There should be 1.0 Ω or less.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at the SRS unit connector C (16P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

NO—Open or increased resistance in the side curtain airbag subharness; replace the side curtain airbag subharness.■

DTC 33-3x (33-30 to 33-39, 33-3A to 33-3F): Short to Another Wire or Decreased Resistance in Left Side Curtain Airbag Inflator

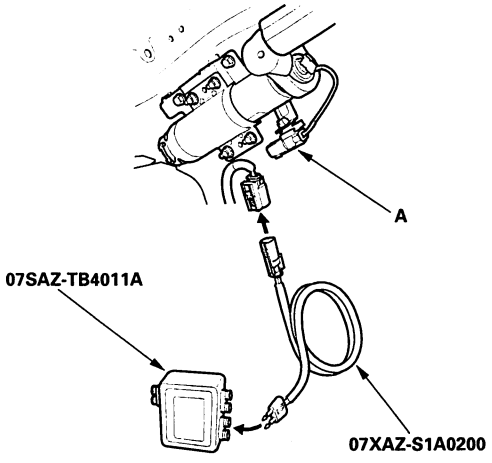
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200
- SRS short canceller 070AZ-SAA0100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 33-3x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the left side curtain airbag 2P connector from the side curtain airbag subharness (A).

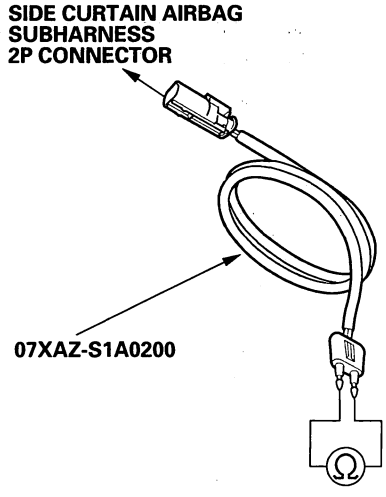


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the side curtain airbag subharness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 33-3x indicated?

   YES—Go to step 9.

   NO—Short to another wire in the left side curtain airbag inflator; replace the left side curtain airbag (see page 23-200).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect SRS unit connector C (16P) from the SRS unit (see step 7 on page 23-29).
11. Disconnect the SRS inflator simulator from the SRS simulator lead.
12. Connect the SRS short canceller (070AZ-SAA0100) to the No. 11 and No. 12 terminals of SRS unit connector C (16P) (see page 23-25).
13. Check resistance between the terminals of the SRS simulator lead. There should be an open circuit or at least 1 MΩ.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector C (16P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short to another wire in the side curtain airbag subharness; replace the side curtain airbag subharness.■

DTC Troubleshooting (cont'd)

DTC 33-8x (33-80 to 33-89, 33-8A to 33-8F): Short to Power in Left Side Curtain Airbag Inflator

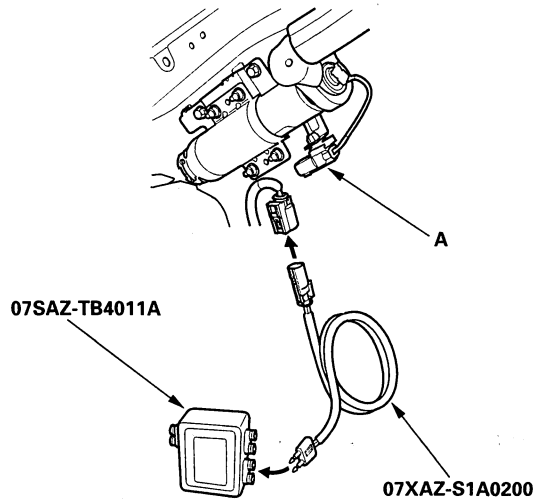
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 33-8x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the left side curtain airbag 2P connector from the side curtain airbag subharness (A).

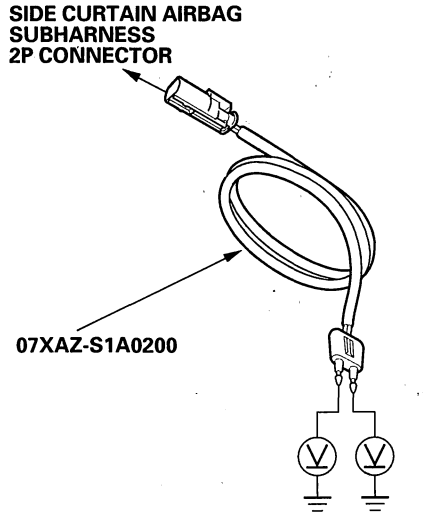


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to side curtain airbag subharness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 33-8x indicated?

   YES—Go to step 9.

   NO—Short to power in the left side curtain airbag inflator; replace the left side curtain airbag (see page 23-200).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect the SRS unit connector C (16P) from the SRS unit (see step 7 on page 23-29).
11. Reconnect the battery negative cable.
12. Turn the ignition switch ON (II).
13. Disconnect the SRS inflator simulator from the SRS simulator lead.
14. Check for voltage between each terminal of the SRS simulator lead and body ground. There should be 0.5 V or less.



Is the voltage as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector C (16P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short to power in the side curtain airbag subharness; replace the side curtain airbag subharness.■

BACK

DTC 33-9x (33-90 to 33-99, 33-9A to 33-9F): Short to Ground in Left Side Curtain Airbag Inflator

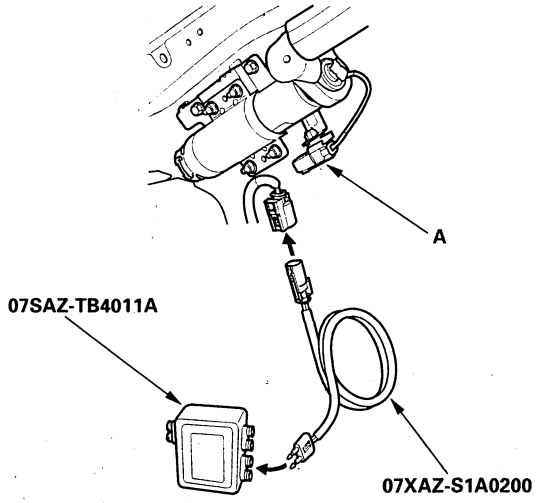
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 33-9x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the left side curtain airbag 2P connector from the side curtain airbag subharness (A).

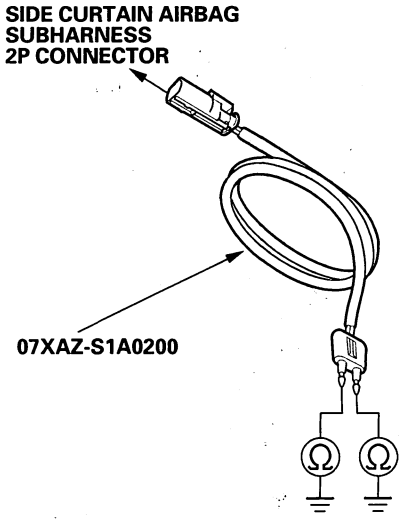


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the side curtain airbag subharness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 33-9x indicated?

   YES—Go to step 9.

   NO—Short to ground in the left side curtain airbag inflator; replace the left side curtain airbag (see page 23-200).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect SRS unit connector C (16P) from the SRS unit (see step 7 on page 23-29).
11. Disconnect the SRS inflator simulator from the SRS simulator lead.
12. Check resistance between each terminal of the SRS simulator lead and body ground. There should be an open circuit or at least 1 MΩ.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector C (16P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

NO—Short to ground in the side curtain airbag subharness; replace the side curtain airbag subharness.■

DTC Troubleshooting (cont'd)

DTC 34-1x (34-10 to 34-19, 34-1A to 34-1F): Open or Increased Resistance in Right Side Curtain Airbag Inflator

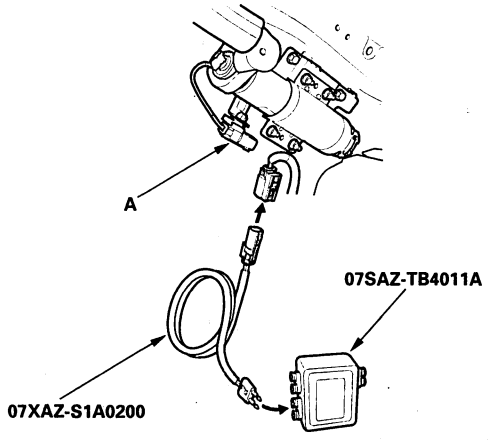
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 34-1x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the right side curtain airbag 2P connector from the side curtain airbag subharness (A).



5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the side curtain airbag subharness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 34-1x indicated?

   YES—Go to step 9.

   NO—Open or increased resistance in the right side curtain airbag inflator, replace the right side curtain airbag (see page 23-200).■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect SRS unit connector C (16P) from the SRS unit (see step 7 on page 23-29). Do not disconnect the simulator lead from the side curtain airbag subharness.
11. Disconnect the SRS inflator simulator from the SRS simulator lead.
12. Check resistance between the terminals of the SRS simulator lead. There should be 1.0 Ω or less.

   Is the resistance as specified?

   YES—Faulty SRS unit or poor contact at SRS unit connector C (16P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213).■

   NO—Open or increased resistance in the side curtain airbag subharness; replace the side curtain airbag subharness.■

DTC 34-3x (34-30 to 34-39, 34-3A to 34-3F): Short to Another Wire or Decreased Resistance in Right Side Curtain Airbag Inflator

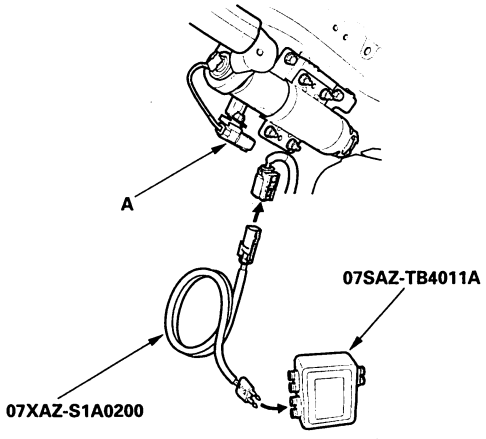
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200
- SRS short canceller 070AZ-SAA0100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 34-3x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the right side curtain airbag 2P connector from the side curtain airbag subharness (A).

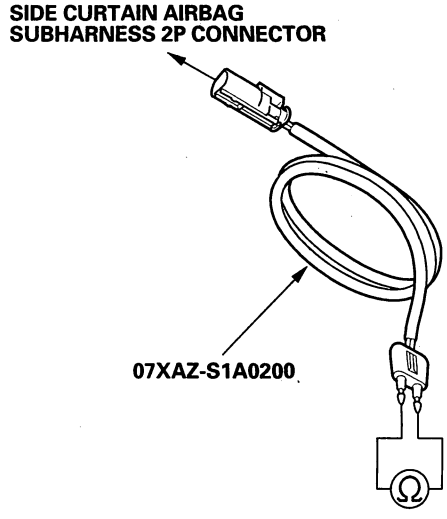


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the side curtain airbag subharness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 34-3x indicated?

   YES—Go to step 9.

   NO—Short to another wire in the right side curtain airbag inflator; replace the right side curtain airbag (see page 23-200). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect SRS unit connector C (16P) from the SRS unit (see step 7 on page 23-29).
11. Disconnect the SRS inflator simulator from the SRS simulator lead.
12. Connect the SRS short canceller (070AZ-SAA0100) to the No. 13 and No. 14 terminals of SRS unit connector C (16P) (see page 23-25).
13. Check resistance between the terminals of the SRS simulator lead. There should be an open circuit or at least 1 MΩ.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector C (16P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Short in the side curtain airbag subharness; replace the side curtain airbag subharness. ■

DTC 34-9x (34-90 to 34-99, 34-9A to 34-9F): Short to Ground in Right Side Curtain Airbag Inflator

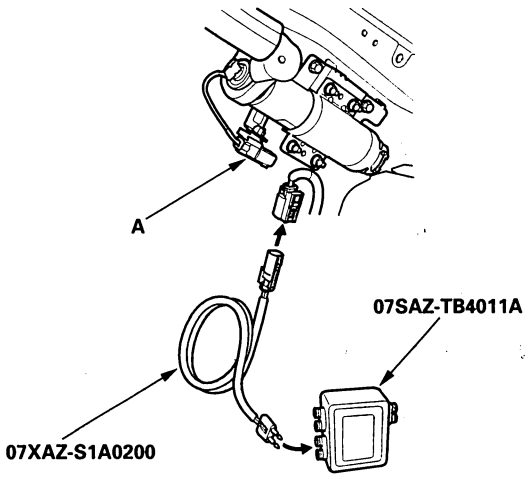
Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead E 07XAZ-S1A0200

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 34-9x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the right side curtain airbag 2P connector from the side curtain airbag subharness (A).

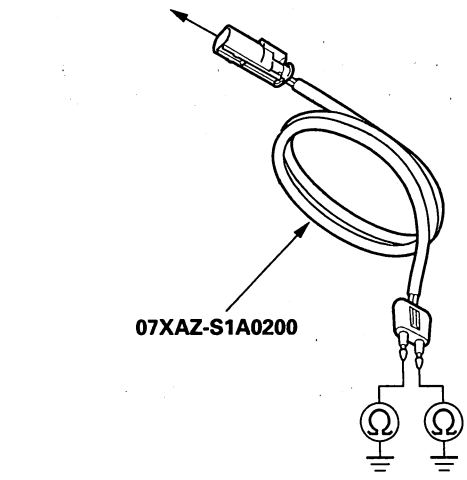


5. Connect the SRS inflator simulator (2 Ω connector) and simulator lead E to the side curtain airbag subharness.
6. Reconnect the battery negative cable.
7. Erase the DTC memory.
8. Read the DTC (see page 23-30).

   Is DTC 34-9x indicated?

   YES—Go to step 9.

   NO—Short to ground in the right side curtain airbag inflator; replace the right side curtain airbag (see page 23-200). ■
9. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
10. Disconnect SRS unit connector C (16P) from the SRS unit (see step 7 on page 23-29).
11. Disconnect the SRS inflator simulator from the SRS simulator lead.
12. Check resistance between each terminal of the SRS simulator lead and body ground. There should be an open circuit or at least 1 MΩ.



Is the resistance as specified?

YES—Faulty SRS unit or poor contact at SRS unit connector C (16P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see page 23-213). ■

DTC Troubleshooting (cont'd)

DTC 41-1x (41-10 to 41-19, 41-1A to 41-1F): No signal from the Left Front Impact Sensor

Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead H 07YAZ-S3AA100

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 41-1x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Check the connections between SRS unit connector A (28P) and the SRS unit, between the engine compartment wire harness 2P connector and the left front impact sensor (see page 23-217), and at connector C403 (see page 22-26).

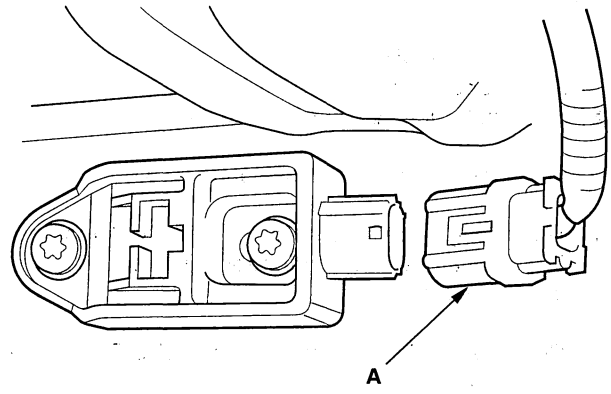
   Are the connections OK?

   YES—Go to step 4.

   NO—Repair the poor connections and retest. If DTC 41-1x is still present, go to step 4.

4. Disconnect the battery negative cable, and wait for 3 minutes.

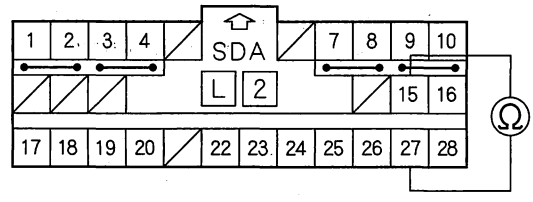
5. Disconnect the engine compartment wire harness 2P connector (A) from the left front impact sensor.



6. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

7. Check resistance between the No. 15 and No. 27 terminals of SRS unit connector A (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Go to step 8.

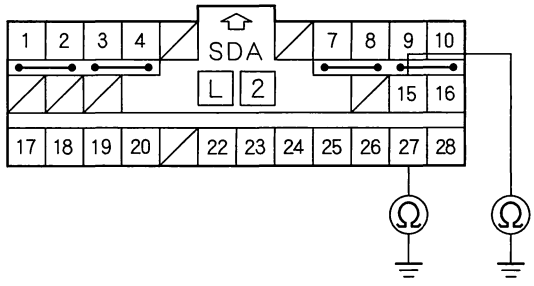
NO—Short in the engine compartment wire harness or dashboard wire harness; replace the faulty harness.■

BACK

Protected by AR

8. Check resistance between the No. 15 terminal of SRS unit connector A (28P) and body ground, and between the No. 27 terminal and body ground. There should be an open circuit or at lest 1 MΩ.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Go to step 9.

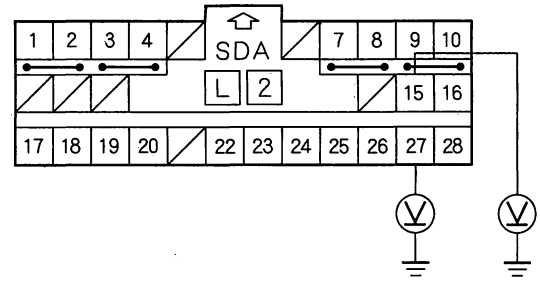
NO—Short to ground in the dashboard wire harness or engine compartment wire harness; replace the faulty harness. ■

9. Reconnect the battery negative cable.

10. Turn the ignition switch ON (II).

11. Check for voltage between the No. 15 terminal of SRS unit connector A (28P) and body ground, and between the No. 27 terminal and body ground. There should be 1 V or less.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

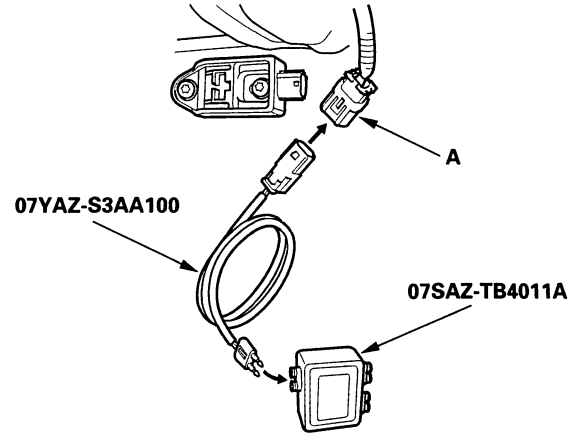
Is the voltage as specified?

YES—Go to step 12.

NO—Short to power in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness. ■

12. Turn the ignition switch OFF.

13. Connect the SRS inflator simulator (jumper connector) and simulator lead H to the engine compartment wire harness 2P connector (A).



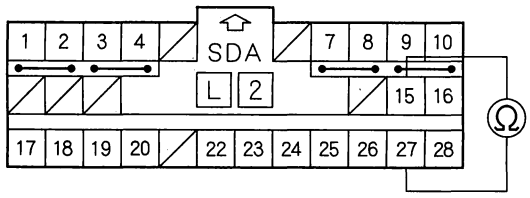
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

14. Check resistance between the No. 15 and No. 27 terminals of SRS unit connector A (28P). There should be 0—1.0 Ω.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty left front impact sensor or SRS unit; replace the left front impact sensor (see page 23-217). If the problem is still present, replace the SRS unit (see page 23-213). ■

NO—Poor connection at C403, faulty engine compartment wire harness, or faulty dashboard wire harness. Inspect C403. If it is OK, replace the faulty harness. ■

DTC 41-Cx (41-C0 to 41-C9, 41-CA to 41-CF): Faulty Power Supply to the Left Front Impact Sensor

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

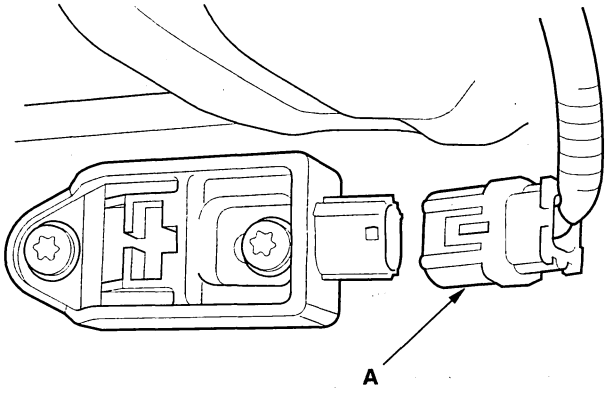
   Does the SRS indicator stay on, and is DTC 41-Cx indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

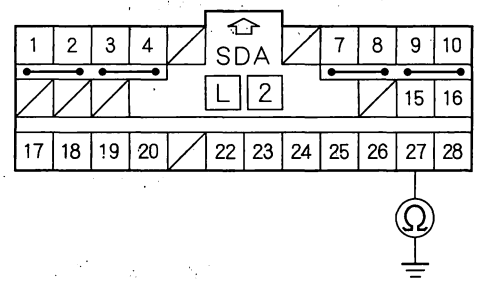
4. Disconnect the engine compartment wire harness 2P connector (A) from the left front impact sensor.



5. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

6. Check resistance between the No. 27 terminal of SRS unit connector A (28P) and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

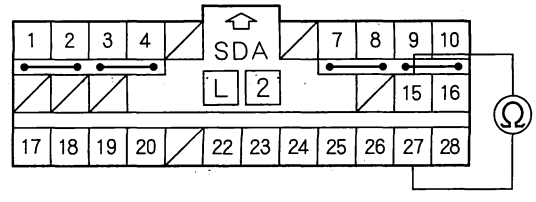
Is the resistance as specified?

YES—Go to step 7.

NO—Short to ground in the dashboard wire harness or engine compartment wire harness; replace the faulty harness. ■

7. Check resistance between the No. 15 and No. 27 terminals of SRS unit connector A (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty left front impact sensor or SRS unit; replace the left front impact sensor (see page 23-217). If the problem is still present, replace the SRS unit (see page 23-213). ■

NO—Short in the dashboard wire harness or engine compartment wire harness; replace the faulty harness. ■

DTC Troubleshooting (cont'd)

DTC 42-1x (42-10 to 42-19, 42-1A to 42-1F): No Signal from the Right Front Impact Sensor

Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead H 07YAZ-S3AA100

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 42-1x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Check the connections between SRS unit connector A (28P) and the SRS unit, between the engine compartment wire harness 2P connector and the right front impact sensor (see page 23-217), and at connector C403 (see page 22-26).

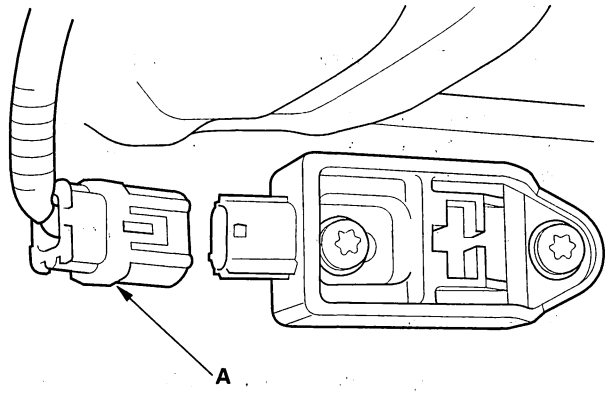
   Are the connections OK?

   YES—Go to step 4.

   NO—Repair the poor connections and retest. If DTC 42-1x is still present, go to step 4.

4. Disconnect the battery negative cable, and wait for 3 minutes.

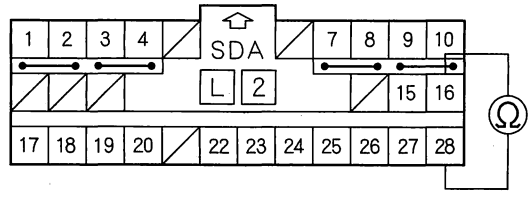
5. Disconnect the engine compartment wire harness 2P connector (A) from the right front impact sensor.



6. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

7. Check resistance between the No. 16 and No. 28 terminals of SRS unit connector A (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Go to step 8.

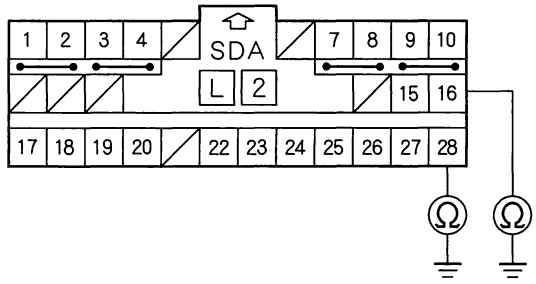
NO—Short in the engine compartment wire harness or dashboard wire harness; replace the faulty harness. ■

BACK

Protected by AR

8. Check resistance between the No. 16 terminal of SRS unit connector A (28P) and body ground, and between the No. 28 terminal and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Go to step 9.

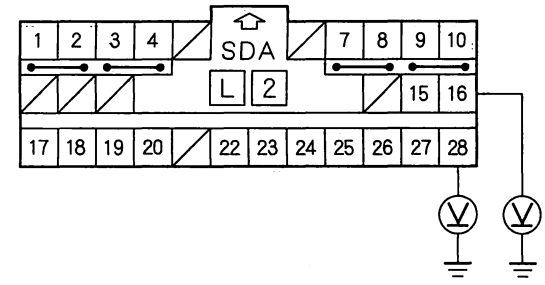
NO—Short to ground in the dashboard wire harness or engine compartment wire harness; replace the faulty harness. ■

9. Reconnect the battery negative cable.

10. Turn the ignition switch ON (II).

11. Check for voltage between the No. 16 terminal of SRS unit connector A (28P) and body ground, and between the No. 28 terminal and body ground. There should be 1 V or less.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

Is the voltage as specified?

YES—Go to step 12.

NO—Short to power in the engine compartment wire harness or dashboard wire harness; replace the faulty harness. ■

12. Turn the ignition switch OFF.

13. Connect the SRS inflator simulator (jumper connector) and the simulator lead to the engine compartment wire harness 2P connector (A).

DTC 42-Cx (42-C0 to 42-C9, 42-CA to 42-CF): Faulty Power Supply to the Right Front Impact Sensor

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

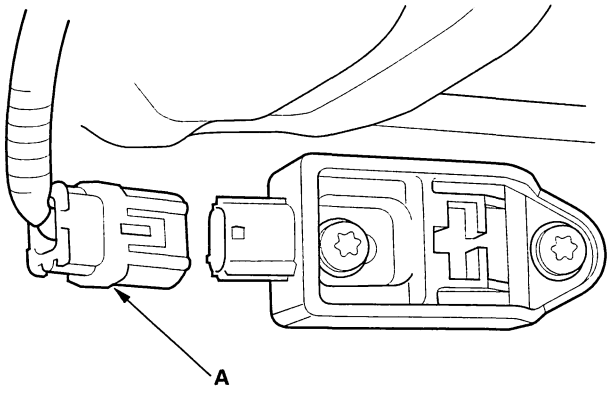
   Does the SRS indicator stay on, and is DTC 42-Cx indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

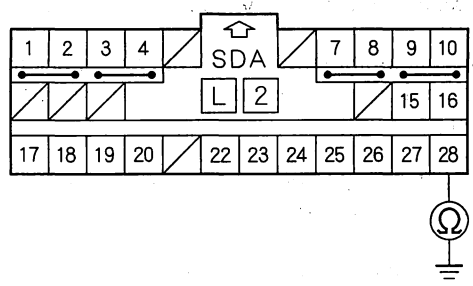
4. Disconnect the engine compartment wire harness 2P connector (A) from the right front impact sensor.



5. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

6. Check resistance between the No. 28 terminal of SRS unit connector A (28P) and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

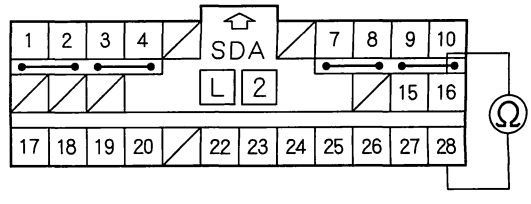
Is the resistance as specified?

YES—Go to step 7.

NO—Short to ground in the dashboard wire harness or engine compartment wire harness; replace the faulty harness.■

7. Check resistance between the No. 16 and No. 28 terminals of SRS unit connector A (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty right front impact sensor or SRS unit; replace the right front impact sensor (see page 23-217). If the problem is still present, replace the SRS unit (see page 23-213).■

NO—Short in the dashboard wire harness or engine compartment wire harness; replace the faulty harness.■

DTC Troubleshooting (cont'd)

DTC 41-2x (41-20 to 41-29, 41-2A to 41-2F), 41-3x (41-30 to 41-39, 41-3A to 41-3F): Internal Failure of the Left Front Impact Sensor

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 41-2x or 41-3x indicated?

   YES—Replace the left front impact sensor (see page 23-217). If DTC returns, replace the SRS unit (see page 23-213).■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 41-9x (41-90 to 41-99, 41-9A to 41-9F), 41-Bx (41-B0 to 41-B9, 41-BA to 41-BF): Internal Failure of the Left Front Impact Sensor

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 41-9x or 41-Bx indicated?

   YES—Replace the left front impact sensor (see page 23-217). If the DTC returns, replace the SRS unit (see page 23-213).■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

BACK

Protected by AR

DTC 42-2x (42-20 to 42-29, 42-2A to 42-2F), 42-3x (42-30 to 42-39, 42-3A to 42-3F): Internal Failure of the Right Front Impact Sensor

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 42-2x or 42-3x indicated?

   YES—Replace the right front impact sensor (see page 23-217). If DTC returns, replace the SRS unit (see page 23-213).■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 42-9x (42-90 to 42-99, 42-9A to 42-9F), 42-Bx (42-B0 to 42-B9, 42-BA to 42-BF): Internal Failure of the Right Front Impact Sensor

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 42-9x or 42-Bx indicated?

   YES—Replace the right front impact sensor (see page 23-217). If the DTC returns, replace the SRS unit (see page 23-213).■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC Troubleshooting (cont'd)

DTC 43-1x (43-10 to 43-19, 43-1A to 43-1F): No Signal from the Left Side Impact Sensor (first)

Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead H 07YAZ-S3AA100

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 43-1x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

4. Check the connection between the floor wire harness 2P connector and the left side impact sensor (first).

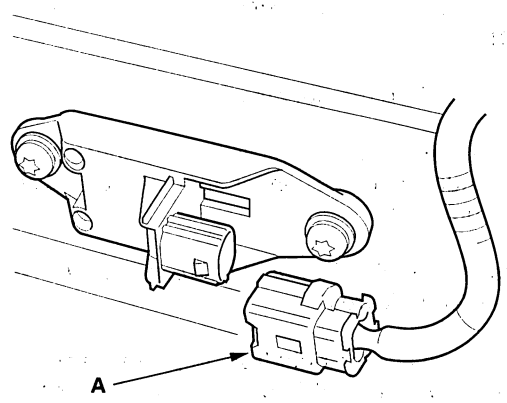
   Is the connection OK?

   YES—Go to step 5.

   NO—Repair the poor connections and retest. If the DTC 43-1x is still present, go to step 5.

5. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).

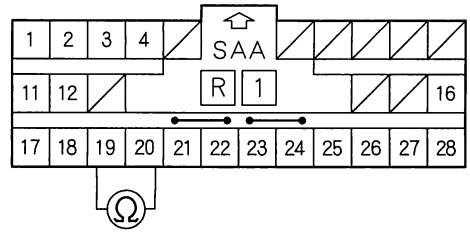
6. Disconnect the floor wire harness 2P connector (A) from the left side impact sensor (first).



7. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).

8. Check resistance between the No. 19 and No. 20 terminals of SRS unit connector B (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Go to step 9.

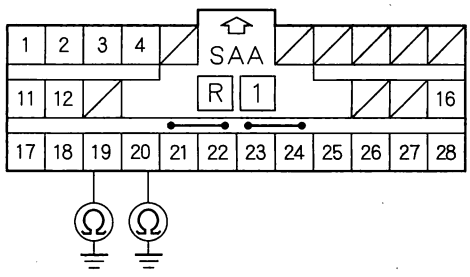
NO—Short in the floor wire harness; replace the floor wire harness. ■

BACK

Protected by AR

9. Check resistance between the No. 19 terminal of SRS unit connector B (28P) and body ground, and between the No. 20 terminal and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Go to step 10.

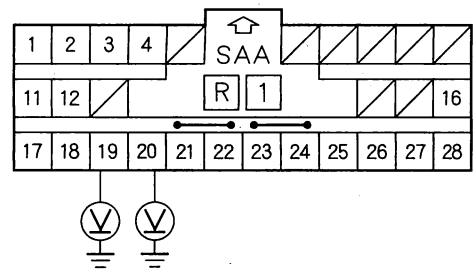
NO—Short to ground in the floor wire harness; replace the floor wire harness.■

10. Reconnect the battery negative cable.

11. Turn the ignition switch ON (II).

12. Check for voltage between the No. 19 terminal of SRS unit connector B (28P) and body ground, and between the No. 20 terminal and body ground. There should be 1 V or less.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

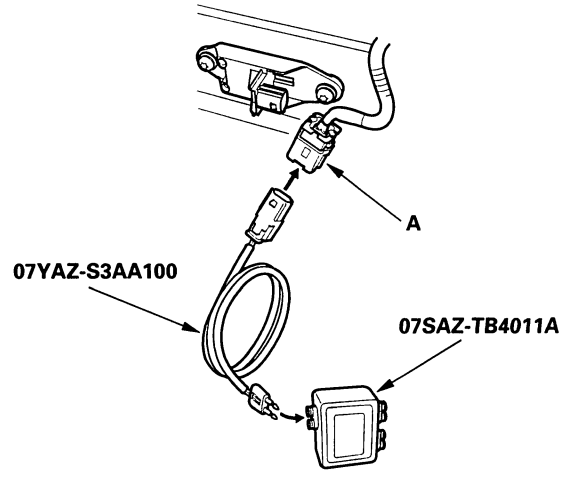
Is the voltage as specified?

YES—Go to step 13.

NO—Short to power in the floor wire harness; replace the floor wire harness.■

13. Turn the ignition switch OFF.

14. Connect the SRS inflator simulator (jumper connector) and simulator lead H to the floor wire harness 2P connector (A).



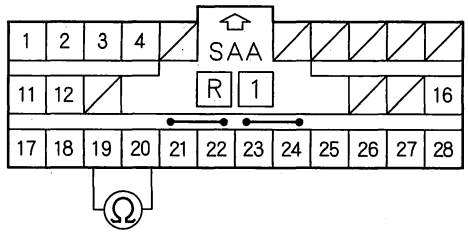
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

15. Check resistance between the No. 19 and No. 20 terminals of SRS unit connector B (28P). There should be 1.0 Ω or less.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty left side impact sensor (first) or SRS unit; replace the left side impact sensor (first) (see page 23-214). If the problem is still present, replace the SRS unit (see page 23-213). ■

NO—Open in the floor wire harness; replace the floor wire harness. ■

DTC 43-Cx (43-C0 to 43-C9, 43-CA to 43-CF): Faulty Power Supply to the Left Side Impact Sensor (first)

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 43-Cx indicated?

   YES—Go to step 3.

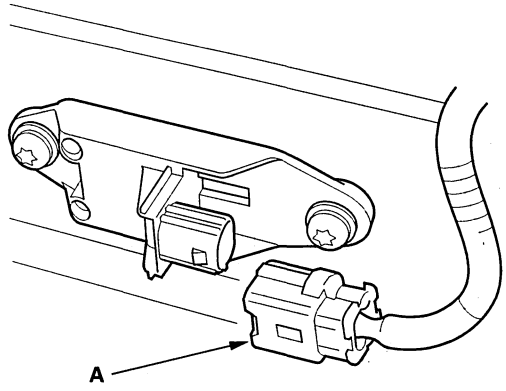
   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).

BACK

Protected by AR

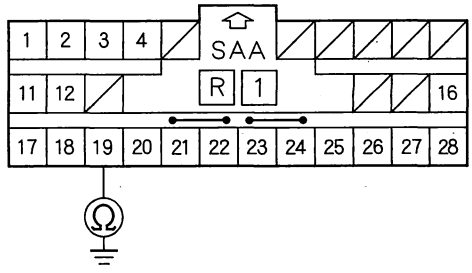
5. Disconnect the floor wire harness 2P connector (A) from the driver's side impact sensor (first).



6. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).

7. Check resistance between the No. 19 terminal of SRS unit connector B (28P) and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

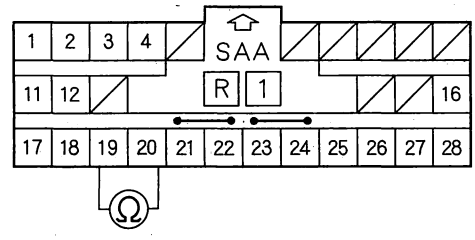
Is the resistance as specified?

YES—Go to step 8.

NO—Short to ground in the floor wire harness, replace the floor wire harness.■

8. Check resistance between the No. 19 and No. 20 terminals of SRS unit connector B (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty driver's side impact sensor (first) or SRS unit; replace the sensor (first) (see page 23-214). If the problem is still present, replace the SRS unit (see page 23-213).■

NO—Short in the floor wire harness; replace the floor wire harness.■

DTC Troubleshooting (cont'd)

DTC 44-1x (44-10 to 44-19, 44-1A to 44-1F): No Signal from the Right Side Impact Sensor (first)

Special Tools Required
- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead H 07YAZ-S3AA100

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 44-1x indicated?

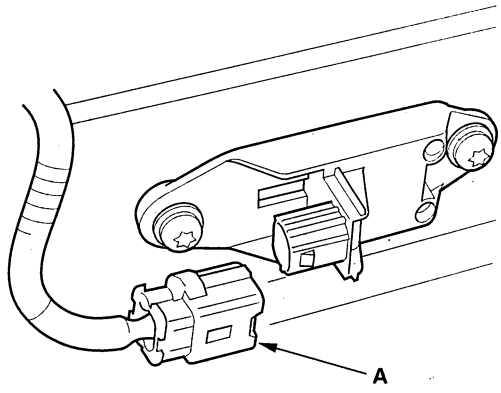
   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Check the connection between the floor wire harness 2P connector and the right side impact sensor (first).

   Is the connection OK?

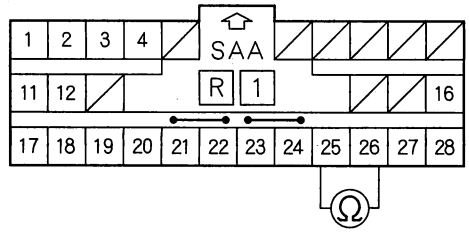
   YES—Go to step 5.

   NO—Repair the poor connections and retest. If the DTC 44-1x is still present, go to step 5.
5. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
6. Disconnect the floor wire harness 2P connector (A) from the right side impact sensor (first).



7. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
8. Check resistance between the No. 25 and No. 26 terminals of SRS unit connector B (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Go to step 9.

NO—Short in the floor wire harness; replace the floor wire harness. ■

DTC 53-2x (53-20 to 53-29, 53-2A to 53-2F), 53-3x (53-30 to 53-39, 53-3A to 53-3F), 53-4x (53-40 to 53-49, 53-4A to 53-4F): Internal Failure of the SRS Unit

NOTE: Before troubleshooting any of these DTCs, check the battery/system voltage. If the voltage is low, repair the charging system or replace the battery before troubleshooting the SRS. If the battery/system voltage is now OK, ask the customer if the battery ever went dead. A dead battery may trigger one of these DTCs.

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 53-2x, 53-3x, or 53-4x indicated?

   YES—Replace the SRS unit (see page 23-213).■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 54-1x (54-10 to 54-19, 54-1A to 54-1F), 54-2x (54-20 to 54-29, 54-2A to 54-2F), 54-3x (54-30 to 54-39, 54-3A to 54-3F): Internal Failure of the SRS Unit

NOTE: Before troubleshooting any of these DTCs, check the battery/system voltage. If the voltage is low, repair the charging system or replace the battery before troubleshooting the SRS. If the battery/system voltage is now OK, ask the customer if the battery ever went dead. A dead battery may trigger one of these DTCs.

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 54-1x, 54-2x, or 54-3x indicated?

   YES—Replace the SRS unit (see page 23-213).■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 54-4x (54-40 to 54-49, 54-4A to 54-4F), 54-5x (54-50 to 54-59, 54-5A to 54-5F), 54-6x (54-60 to 54-69, 54-6A to 54-6F):
Internal Failure of the SRS Unit

NOTE: Before troubleshooting any of these DTCs, check the battery/system voltage. If the voltage is low, repair the charging system or replace the battery before troubleshooting the SRS. If the battery/system voltage is now OK, ask the customer if the battery ever went dead. A dead battery may trigger one of these DTCs.

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 54-4x, 54-5x, or 54-6x indicated?

   YES—Replace the SRS unit (see page 23-213).■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 54-7x (54-70 to 54-79, 54-7A to 54-7F), 55-1x (55-10 to 55-19, 55-1A to 55-1F), 55-2x (55-20 to 55-29, 55-2A to 55-2F):
Internal Failure of the SRS Unit

NOTE: Before troubleshooting any of these DTCs, check the battery/system voltage. If the voltage is low, repair the charging system or replace the battery before troubleshooting the SRS. If the battery/system voltage is now OK, ask the customer if the battery ever went dead. A dead battery may trigger one of these DTCs.

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 54-7x, 55-1x, or 55-2x indicated?

   YES—Replace the SRS unit (see page 23-213).■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 61-1x (61-10 to 61-19, 61-1A to 61-1F):
Open in Driver's Seat Belt Buckle Switch (with power seat)

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), then buckle and unbuckle the driver's seat belt several times.

3. Read the DTC (see page 23-30).

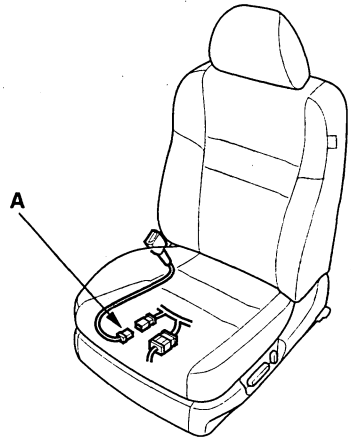
   Is DTC 61-1x indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32).

4. Turn the ignition switch OFF.

5. Disconnect the driver's seat wire harness 3P connector from the driver's seat belt buckle switch 3P connector (A).

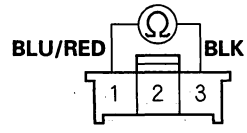


6. Buckle the driver's seat belt.

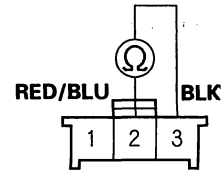
   Check resistance between the No. 1 and No. 3 terminals of the driver's seat belt buckle switch 3P connector. There should be 0—1 Ω.

   Check resistance between the No. 2 and No. 3 terminals of the same connector. There should be an open circuit or at least 1 MΩ.

DRIVER'S SEAT BELT BUCKLE SWITCH 3P CONNECTOR



Wire side of female terminals



Wire side of female terminals

Are the resistance as specified?

YES—Go to step 7.

NO—Replace the driver's seat belt buckle assembly (see page 23-5), then clear the DTC. ■

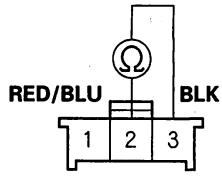
DTC Troubleshooting (cont'd)

7. Unbuckle the driver's seat belt.

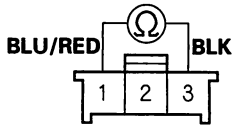
   Check resistance between the No. 2 and No. 3 terminals of the driver's seat belt buckle switch 3P connector. There should be 0—1 Ω.

   Check resistance between the No. 1 and No. 3 terminals of the same connector. There should be an open circuit or at least 1 MΩ.

DRIVER'S SEAT BELT BUCKLE SWITCH 3P CONNECTOR



Wire side of female terminals



Wire side of female terminals

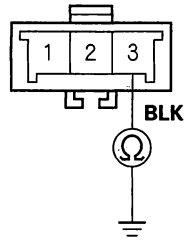
Are the resistance as specified?

YES—Go to step 8.

NO—Replace the driver's seat belt buckle assembly, then clear the DTC. ■

8. Check resistance between the No. 3 terminal of the driver's seat wire harness 3P connector and body ground. There should be 0—1 Ω.

DRIVER'S SEAT WIRE HARNESS 3P CONNECTOR



Terminal side of male terminals

Is the resistance as specified?

YES—Go to step 9.

NO—Open in the driver's seat wire harness or floor wire harness, or poor ground connection at G601 (see page 22-36). If G601 is OK, replace the faulty harness. ■

9. Disconnect the negative cable from the battery.

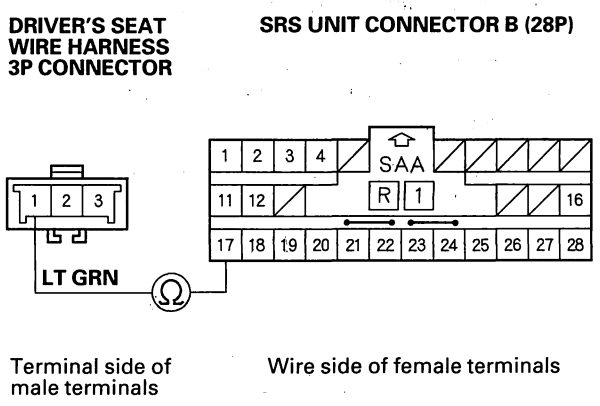
10. Disconnect both seat belt tensioner 4P connectors from the floor wire harness (see step 6 on page 23-29).

11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).

BACK

Protected by AR

12. Check resistance between the No. 17 terminal of SRS unit connector B (28P) and the No. 1 terminal of the driver's seat wire harness 3P connector. There should be 0—1 Ω.

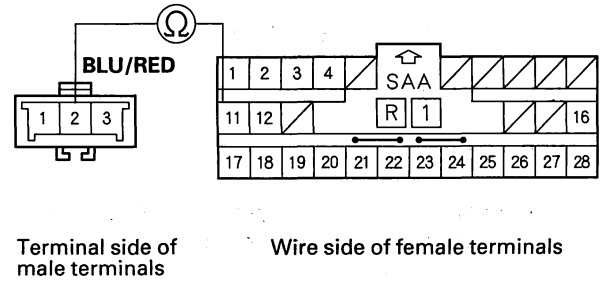


Is the resistance as specified?

YES—Go to step 13.

NO—Open in the driver's seat wire harness or floor wire harness; replace the faulty harness. ■

13. Check resistance between the No. 11 terminal of SRS unit connector B (28P) and the No. 2 terminal of the driver's seat wire harness 3P connector. There should be 0—1 Ω.



Is the resistance as specified?

YES—Replace the SRS unit (see page 23-213). ■

NO—Open in the driver's seat wire harness or floor wire harness, or poor connection at the floor wire harness. Check the connections at the floor wire harness, connector F (14P), and connector H (14P) at the under-dash fuse/relay box. If the connections are OK, replace the faulty harness or part. ■

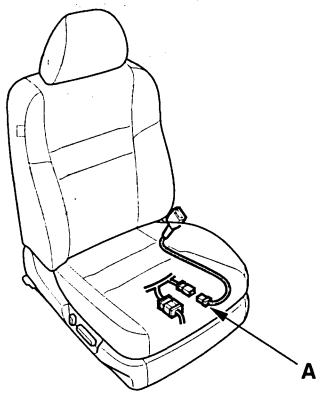
DTC 62-2x (62-20 to 62-29, 62-2A to 62-2F): Short in Front Passenger's Seat Belt Buckle Switch (with power seat)

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), then buckle and unbuckle the front passenger's seat belt several times.
3. Read the DTC (see page 23-30).

   Is DTC 62-2x indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32).
4. Turn the ignition switch OFF.
5. Disconnect the front passenger's seat belt buckle switch 3P connector (A) from the passenger's seat wire harness.

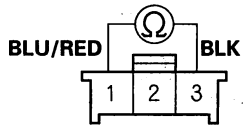


6. Buckle the front passenger's seat belt.

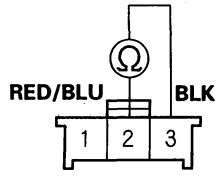
   Check resistance between the No. 1 and No. 3 terminals of the front passenger's seat belt buckle switch 3P connector. There should be 0—1 Ω.

   Check resistance between the No. 2 and No. 3 terminals of the same connector. There should be an open circuit or at least 1 MΩ.

FRONT PASSENGER'S SEAT BELT BUCKLE SWITCH 3P CONNECTOR



Wire side of female terminals



Wire side of female terminals

Are the resistance as specified?

YES—Go to step 7.

NO—Replace the front passenger's seat belt buckle assembly, then clear the DTC. ■

DTC 71-1x (71-10 to 71-19, 71-1A to 71-1F): Open in Driver's Seat Position Sensor

Special Tools Required
SRS inflator simulator 07SAZ-TB4011A

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 71-1x indicated?

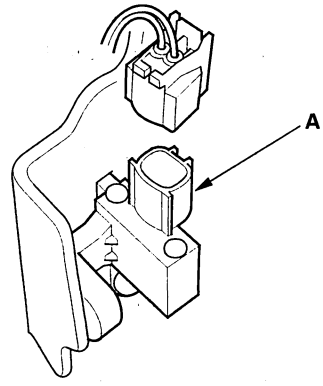
   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Check the connection between the seat position sensor harness 2P connector and the driver's seat position sensor.
4. Erase the DTC memory.
5. Read the DTC (see page 23-30).

   Is DTC 71-1x indicated?

   YES—Go to step 6.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
6. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
7. Disconnect the driver's seat wire harness 2P connector from the driver's seat position sensor (A).



8. Connect the No. 1 and No. 2 terminals of the driver's seat wire harness 2P connector with a jumper wire.
9. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).

(cont'd)

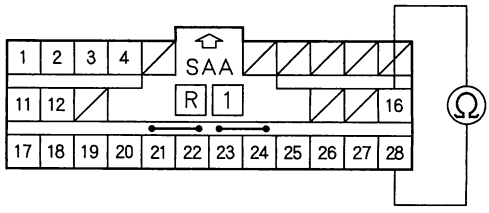
Protected by AR

DTC Troubleshooting (cont'd)

10. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).

11. Check resistance between the No. 16 and No. 28 terminals of SRS unit connector B (28P). There should be 0—1.0 Ω.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty driver's seat position sensor or SRS unit; replace the driver's seat position sensor (see page 23-220). If the problem is still present, replace the SRS unit (see page 23-213). ■

NO—Open in the floor wire harness or seat position sensor harness; replace the faulty harness. ■

DTC 71-2x (71-20 to 71-29, 71-2A to 71-2F): Short in Driver's Seat Position Sensor

1. Erase the DTC memory (see page 23-31).

2. Turn the ignition switch ON (II), and check the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 71-2x indicated?

   YES—Go to step 3.

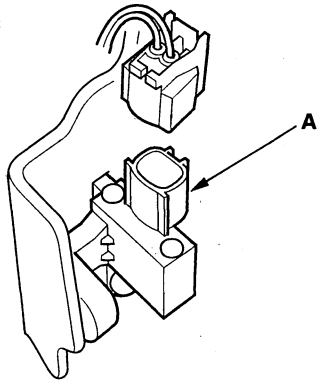
   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

BACK

Protected by AR

4. Disconnect the driver's seat wire harness 2P connector from the driver's seat position sensor (A).



5. Reconnect the battery negative cable.
6. Erase the DTC memory.
7. Read the DTC (see page 23-30).

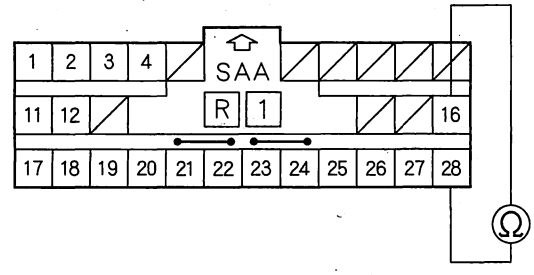
   Is DTC 71-2x indicated?

   YES—Go to step 8.

   NO—Faulty driver's seat position sensor; replace the driver's seat position sensor.■

8. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
9. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
10. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).
11. Check resistance between the No. 16 and No. 28 terminals of SRS unit connector B (28P). There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

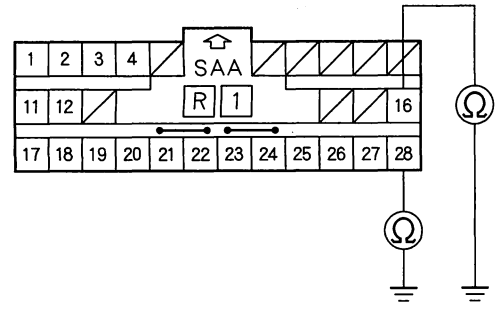
Is the resistance as specified?

YES—Go to step 12.

NO—Short in the floor wire harness or seat position sensor harness; replace the faulty harness.■

12. Check resistance between the No. 16 terminal of SRS unit connector B (28P) and body ground, and between the No. 28 terminal and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Faulty driver's seat position sensor or SRS unit; replace the driver's seat position sensor (see page 23-220). If the problem is still present, replace the SRS unit (see page 23-213).■

NO—Short in the floor wire harness or seat position sensor harness; replace the faulty harness.■

DTC Troubleshooting (cont'd)

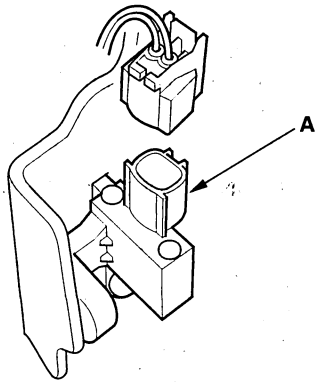
DTC 71-22: Short to Power in Driver's Seat Position Sensor

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 71-22 indicated?

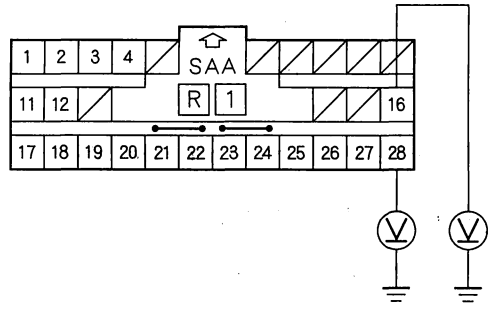
   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector from the driver's seat position sensor (A).



5. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).
6. Disconnect SRS unit connector B from the SRS unit (see step 7 on page 23-29).
7. Check the voltage between the No. 16 terminal of SRS unit connector B (28P) and body ground, and between the No. 28 terminal and body ground. There should be 1 V or less.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

Is the voltage as specified?

YES—Faulty driver's seat position sensor or SRS unit; replace the driver's seat position sensor (see page 23-220). If the problem is still present, replace the SRS unit (see page 23-213).■

NO—Short to power in the floor wire harness or seat position sensor harness; replace the faulty harness.■

DTC 81-61: No Signal from Front Passenger's Weight Sensor Unit (with side airbag) ('04-05 models)

DTC 81-62: Non-stipulated Response Data (with side airbag) ('04-05 models)

1. Erase the DTC memory (see page 23-31).
2. Read the DTC (see page 23-30).

   Is DTC 81-61 or 81-62 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Check the connection between the floor wire harness 6P connector and the front passenger's weight sensor unit.

   Is the connection OK?

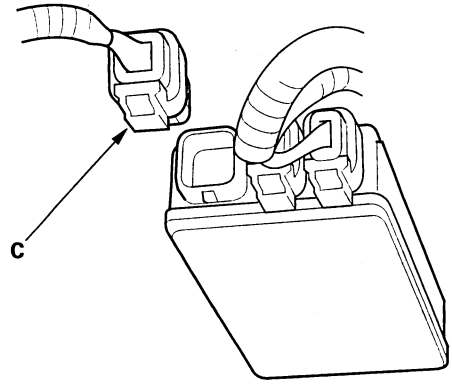
   YES—Go to step 4.

   NO—Repair the poor connection and retest. If DTC 81-61 or 81-62 or still present, go to step 6.
4. Turn the ignition switch OFF.
5. Check the No. 10 (7.5A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 6.

   NO—Replace the fuse, then turn the ignition switch ON (II). If the fuse blows again, check for a short in the No. 10 (7.5 A) fuse circuit (dashboard wire harness or floor wire harness). ■
6. Disconnect the floor wire harness 6P connector C from the front passenger's weight sensor unit.



7. Turn the ignition switch ON (II).

DTC Troubleshooting (cont'd)

DTC 81-4x (81-40 to 81-49, 81-4A to 81-4F), 81-5x (81-50 to 81-59, 81-5A to 81-5F), 81-63, 81-64: Internal Failure of the Front Passenger's Weight Sensor Unit ('04-05 models)

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 81-4x, 81-5x, 81-63, or 81-64 indicated?

   YES—Replace the front passenger's weight sensor unit (see page 23-219). If the DTC returns, replace the SRS unit (see page 23-213). ■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 81-79: Front Passenger's Weight Sensors Drift Check Failure ('04-05 models)

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 81-79 indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Turn the ignition switch OFF.
4. Make sure nothing is on the front passenger's seat.
5. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator go off?

   YES—The system is OK. ■

   NO—Remove the seat assembly (see page 20-144) and front passenger's weight sensors, then reinstall them. Calibrate the front passenger's weight sensor unit (see page 23-33). Retry the troubleshooting. If DTC 81-79 is indicated repeatedly, replace the front passenger's weight sensors. ■

BACK

Protected by AR

DTC 81-71, 81-78: Front passenger's weight sensor unit does not calibrate ('04-05 models)

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 81-71, or 81-78 indicated?

   YES—Calibrate the front passenger's weight sensor unit. If the DTC returns, replace the front passenger's weight sensor unit (see page 23-219). ■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 81-71, 81-78: ODS unit does not calibrate ('06 model)

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 81-71, or 81-78 indicated?

   YES—Calibrate the ODS unit. If the DTC returns, replace the ODS unit (see page 23-216). ■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 85-4x (85-40 to 85-49, 85-4A to 85-4F), 85-5x (85-50 to 85-59, 85-5A to 85-5F), 85-63, 85-64: Internal Failure of the OPDS/ODS Unit

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC85-4x, 85-5x, 85-63, or 85-64 indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Initialize the OPDS/ODS unit (see page 23-32).
4. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator go off?

   YES—The system is OK.■

   NO—Replace the OPDS/ODS unit (see page 23-216), and retest. If the problem is still present, replace the OPDS sensor/seat-back (see page 20-166).■

DTC 85-79: OPDS Sensor Drift Check Failure

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 85-79 indicated?

   YES—Turn the ignition switch OFF, and go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.
3. Make sure nothing is on the front passenger's seat.
4. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator go off?

   YES—The system is OK.■

   NO—Go to step 5.
5. Initialize the OPDS/ODS unit (see page 23-32).
6. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator go off?

   YES—The system is OK.■

   NO—Replace the OPDS/ODS unit (see page 23-216), and retest. If the problem is still present, replace the OPDS sensor/seat-back (see page 20-166).■

DTC Troubleshooting (cont'd)

DTC 85-61: No Signal from the OPDS Unit ('04-05 models)

DTC 85-62: Non-stipulated Response Data ('04-05 models)

NOTE:
- An incorrect OPDS unit can cause DTC 85-63.
- A new (uninitialized) OPDS unit installed with a faulty sensor can also cause DTC 85-71.

1. Make sure nothing is on the front passenger's seat.
2. Erase the DTC memory (see page 23-31).
3. Read the DTC (see page 23-30).

   Is DTC 85-61 or 85-62 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC Troubleshooting Index.

4. Check the connection between the OPDS unit harness 8P connector D and the OPDS unit.

   Is the connection OK?

   YES—Go to step 5.

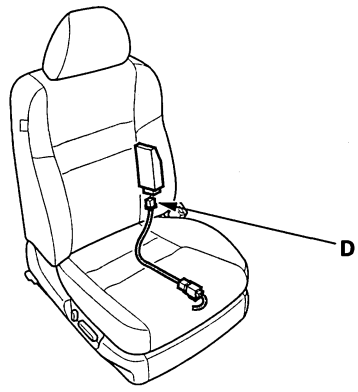
   NO—Repair the poor connection and retest. If DTC 85-61 or 85-62 is still present, go to step 5.

5. Turn the ignition switch OFF.
6. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

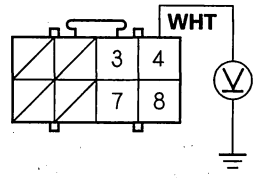
   YES—Go to step 7.

   NO—Replace the fuse, then turn the ignition switch ON (II). If the fuse blows again, check for a short in the No. 10 (7.5 A) fuse circuit (dashboard wire harness, floor wire harness, or OPDS unit harness). ■
7. Disconnect the OPDS unit 8P connector D from the OPDS unit.



8. Turn the ignition switch ON (II).
9. Check for voltage between the No. 4 terminal of the OPDS unit 8P connector D and body ground. There should battery voltage.

OPDS UNIT 8P CONNECTOR D



Wire side of female terminals

Is there battery voltage?

YES—Go to step 14.

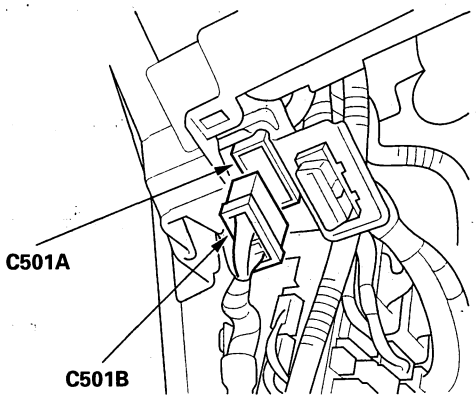
NO—Go to step 10.

10. Turn the ignition switch OFF.

BACK

Protected by AR

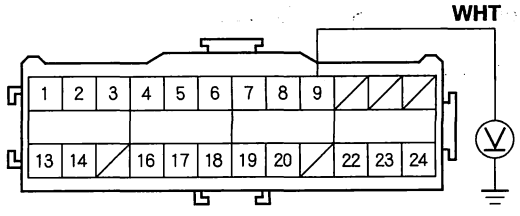
11. Disconnect dashboard wire harness 24P connector C501A from the floor wire harness (C501B).



12. Turn the ignition switch ON (II).

13. Check for voltage between the No. 9 terminal of dashboard wire harness 24P connector and body ground. There should be battery voltage.

DASHBOARD WIRE HARNESS 24P CONNECTOR



Terminal side of male terminals

Is there battery voltage?

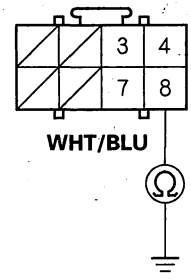
YES—Open in the WHT wire of the floor wire harness or OPDS unit harness; replace the faulty harness. ■

NO—Open in the WHT wire of the dashboard wire harness; replace the dashboard wire harness. ■

14. Turn the ignition switch OFF.

15. Check resistance between the No. 8 terminal of the OPDS unit 8P connector D and body ground. There should be 0—1.0 Ω.

OPDS UNIT 8P CONNECTOR D



Wire side of female terminals

Is the resistance as specified?

YES—Go to step 16.

NO—Open in the OPDS unit harness or floor wire harness; check the connection at G602 (see page 22-38). If the connection is OK, replace the faulty harness. ■

16. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

17. Disconnect both seat belt tensioner 4P connectors (see step 6 on page 23-29).

(cont'd)

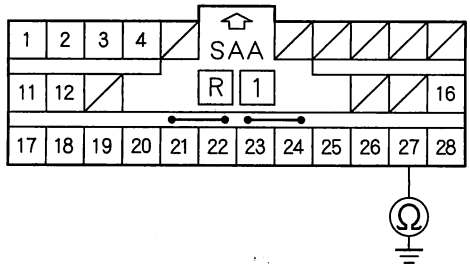
Protected by AR

DTC Troubleshooting (cont'd)

18. Disconnect SRS unit connector B (28P) from the SRS unit (see step 7 on page 23-29).

19. Check resistance between the No. 27 terminal of SRS unit connector B (28P) and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR B (28P)



Wire side of female terminals

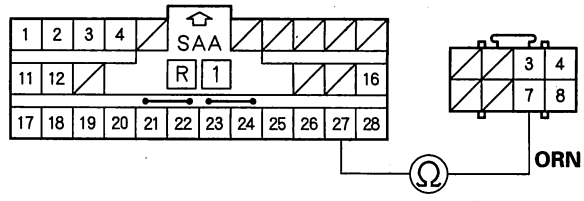
Is the resistance as specified?

YES—Go to step 20.

NO—Go to step 23.

20. Check resistance between the No. 27 terminal of SRS unit connector B (28P) and the No. 7 terminal of the OPDS unit 8P connector D. There should be 0—1.0 Ω.

SRS UNIT CONNECTOR B (28P) **OPDS UNIT 8P CONNECTOR D**



Wire side of female terminals

Is the resistance as specified?

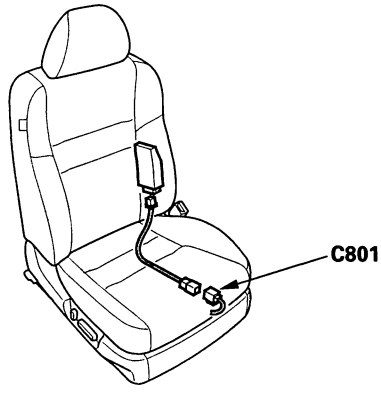
YES—Faulty OPDS unit or SRS unit; replace the OPDS unit (see page 23-216). If the problem is still present, replace the OPDS sensor/seat-back (see page 20-166). If problem is still present, replace the SRS unit (see page 23-213).■

NO—Go to step 21.

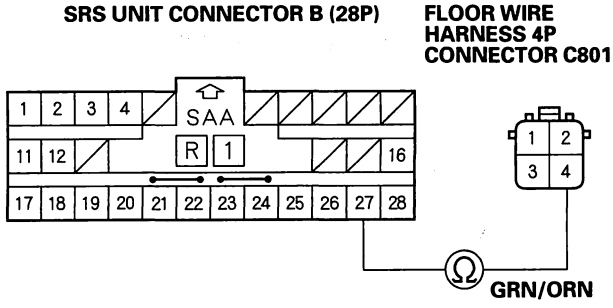
BACK

Protected by AR

21. Disconnect the floor wire harness 4P connector C801 from the OPDS unit harness.



22. Check resistance between the No. 27 terminal of SRS unit connector B (28P) and the No. 4 terminal of floor wire harness 4P connector C801. There should be 0—1.0 Ω.



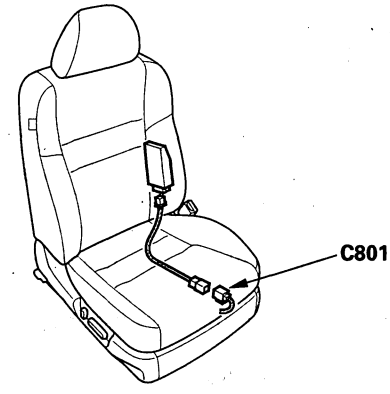
Wire side of female terminals

Is the resistance as specified?

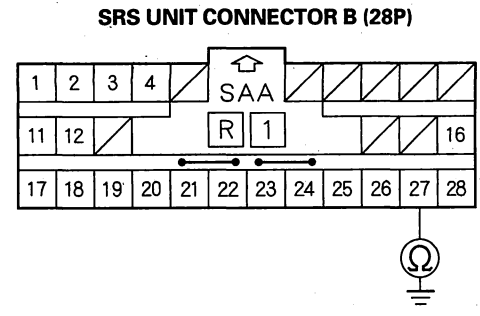
YES—Open in the OPDS unit harness; replace the OPDS unit harness. ■

NO—Open in the GRN/ORN wire of the dashboard wire harness or floor wire harness; replace the faulty harness. ■

23. Disconnect floor wire harness 4P connector C801 from the OPDS unit harness.



24. Check resistance between the No. 27 terminal of SRS unit connector B (28P) and body ground. There should be an open circuit or at least 1 MΩ.



Wire side of female terminals

Is the resistance as specified?

YES—Short to ground in the OPDS unit harness; replace the OPDS unit harness. ■

NO—Short to ground in the dashboard wire harness or floor wire harness; replace the faulty harness. ■

DTC Troubleshooting (cont'd)

DTC 81-61, 85-61: No Signal from the ODS Unit ('06 model)

DTC 81-62, 85-62: Non-stipulated Response Data ('06 model)

NOTE:
- An incorrect ODS unit can cause DTC 85-63.
- A new (uninitialized) ODS unit installed with a faulty sensor can also cause DTC 85-71.

1. Make sure nothing is on the front passenger's seat.
2. Erase the DTC memory (see page 23-31).
3. Read the DTC (see page 23-30).

   Is DTC 81-61, 85-61, 81-62, or 85-62 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC Troubleshooting Index.

4. Check the connection between the ODS unit harness 18P connector D and the ODS unit.

   Is the connection OK?

   YES—Go to step 5.

   NO—Repair the poor connection and retest. If DTC 81-61, 85-61, 81-62, or 85-62 is still present, go to step 5.

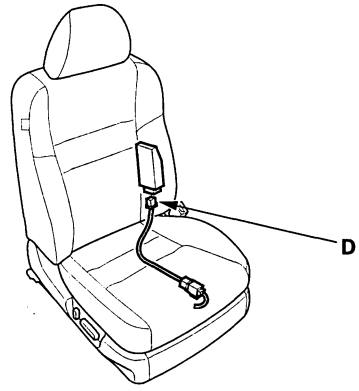
5. Turn the ignition switch OFF.
6. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 7.

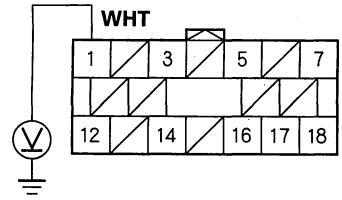
   NO—Replace the fuse, then turn the ignition switch ON (II). If the fuse blows again, check for a short in the No. 10 (7.5 A) fuse circuit (dashboard wire harness, floor wire harness, or ODS unit harness).■

7. Disconnect the ODS unit 18P connector D from the ODS unit.



8. Turn the ignition switch ON (II).
9. Check for voltage between the No. 1 terminal of the ODS unit 18P connector D and body ground. There should battery voltage.

ODS UNIT 18P CONNECTOR D



Wire side of female terminals

Is there battery voltage?

YES—Go to step 14.

NO—Go to step 10.

DTC Troubleshooting (cont'd)

DTC 85-71, 85-78: OPDS/ODS unit not initialized

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 85-71, or 85-78 indicated?

   YES—Initialized OPDS/ODS unit (see page 23-32). ■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 86-1x (86-10 to 86-19, 86-1A to 86-1F): Faulty OPDS Seat-back Sensor

DTC 86-2x (86-20 to 86-29, 86-2A to 86-2F): Faulty OPDS Seat Support Sensor

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32).

   NOTE: Aftermarket devices (fluorescent lights, laptop computers, etc.) used near the front passenger's seat-back can interfere with the seat-back sensors and cause a false DTC 86-1x or 86-2x. If one of these devices was used, erase the DTC, operate the device near the seat-back, and recheck for DTCs. If DTC 86-1x or 86-2x is reset, erase it, and do not use the device near the seat-back.

3. Check the connection at the OPDS sensor harness connector and the OPDS/ODS unit connector.

   Are the connections OK?

   YES—Go to step 4.

   NO—Reconnect the OPDS sensor harness connector, and clear the DTC. ■

4. Replace the OPDS sensor/seat-back foam (see page 20-162), and initialize the OPDS/ODS unit (see page 23-32).
5. Erase the DTC memory, then check for DTC 86-1x or 86-2x.

   Is DTC 86-1x or 86-2x indicated?

   YES—Replace the OPDS/ODS unit (see page 23-216). ■

   NO—The system is OK. ■

BACK

DTC 87-31: Internal Failure of the OPDS/ODS Unit

NOTE: Make sure the battery is sufficiently charged and in good condition.

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 87-31 indicated?

   YES—Replace the SRS unit (see page 23-213).

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index for troubleshooting details.

DTC 87-32: Side Airbag Cutoff Indicator Stays ON ('03-05 models)

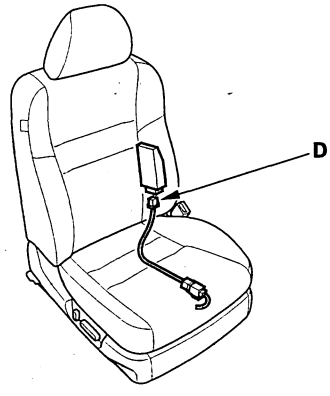
1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failure (see page 23-32).

3. Turn the ignition switch OFF. Make sure nothing is on the front passenger's seat.
4. Disconnect the OPDS unit 8P connector D from the OPDS unit.



5. Turn the ignition switch ON (II).

DTC 91-1x (91-10 to 91-19, 91-1A to 91-1F): Internal Failure of the SRS Unit

NOTE: Before troubleshooting any of these DTCs, check the battery/system voltage. If the voltage is low, repair the charging system or replace the battery before troubleshooting the SRS. If the battery/system voltage is now OK, ask the customer if the battery ever went dead. A dead battery may trigger a DTC.

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 91-1x indicated?

   YES—Replace the SRS Unit (see page 23-213). ■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 91-2x (91-20 to 91-29, 91-2A to 91-2F): Short in SRS Indicator

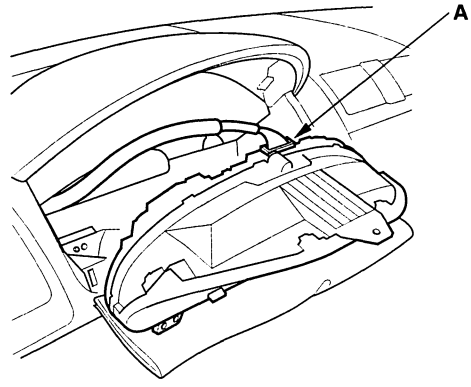
1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 91-2x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.
4. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).
5. Remove the gauge control module (see page 22-276). Disconnect the gauge control module connector 30P ('03-05 models) or 36P ('06 model) (A) from the gauge control module.



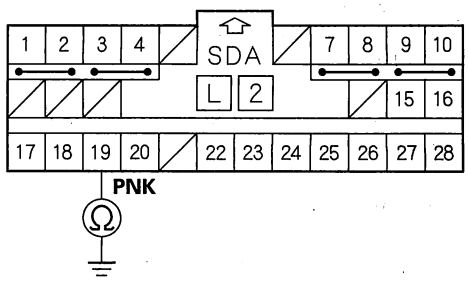
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

6. Check resistance between the No. 19 terminal of SRS unit connector A (28P) and body ground. There should be an open circuit or at least 1 MΩ.

SRS UNIT CONNECTOR A (28P)



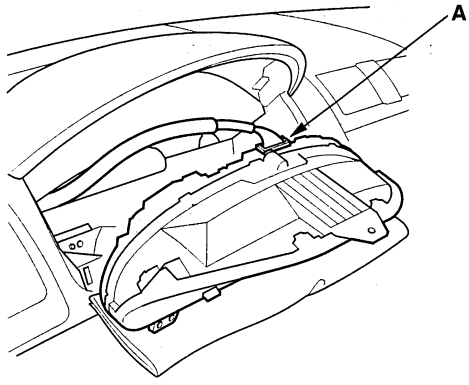
Wire side of female terminals

Is the resistance as specified?

YES—Go to step 7.

NO—Short to ground in the dashboard wire harness; replace the dashboard wire harness.■

7. Reconnect the gauge control module connector (A).

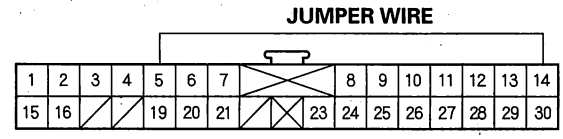


8. Turn the ignition switch ON (II).

9. Install a jumper wire between the No. 5 terminal and the No. 14 ('03-05 models), or the No. 18 ('06 model) terminal of the gauge control module connector 30P ('03-05 models), 36P ('06 model). The SRS indicator should go off.

'03-05 models

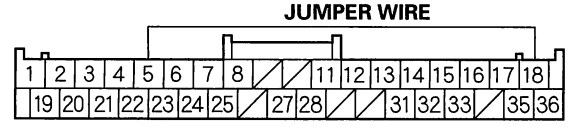
GAUGE CONTROL MODULE CONNECTOR (30P)



Wire side of female terminals

'06 model

GAUGE CONTROL MODULE CONNECTOR (36P)



Wire side of female terminals

Does the SRS indicator go off?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit (see page 23-213).■

NO—Faulty SRS indicator circuit in the gauge control module or poor contact at gauge control module connector 30P ('03-05 models), 36P ('06 model); check the connection. If the connection is OK, replace the gauge control module.■

DTC 92-1x (92-10 to 92-19, 92-1A to 92-1F): Passenger's Airbag Cutoff Indicator Malfunction ('04-06 models)

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 92-1x indicated?

   YES—Internal failure of SRS unit. Replace the SRS unit (see page 23-213).■

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

DTC 92-2x (92-20 to 92-29, 92-2A to 92-2F): Open or Short to Ground in Passenger's Airbag Cutoff Indicator ('04-06 models)

NOTE: This DTC can be set if the key is turned on when the passenger's airbag cutoff indicator is unplugged.

1. Erase the DTC memory (see page 23-31).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator stay on, and is DTC 92-2x indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Go to Troubleshooting Intermittent Failures (see page 23-32). If another DTC is indicated, go to the DTC troubleshooting index.

3. Check the connection between the dashboard wire harness 6P connector and the passenger's airbag cutoff indicator.
4. Erase the DTC memory.
5. Check for a DTC.

   Is DTC 92-2x indicated?

   YES—Go to step 6.

   NO—Repair the poor connections and retest. If DTC 92-2x is still present, go to step 6.

6. Check the No. 21 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 7.

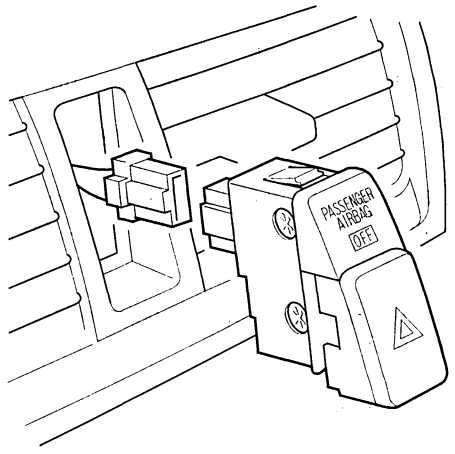
   NO—Replace the fuse, then turn the ignition switch ON (II). If the fuse blows again, check for a short in the No. 21 (7.5 A) fuse circuit (dashboard wire harness A).■

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

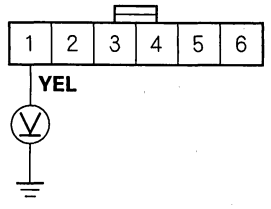
7. Disconnect the passenger's airbag cutoff indicator 6P connector.



8. Turn the ignition switch ON (II).

9. Check for voltage between the No. 1 terminal of the passenger's airbag cutoff indicator 6P connector and body ground. There should be battery voltage.

PASSENGER'S AIRBAG CUTOFF INDICATOR 6P CONNECTOR



Wire side of female terminals

Is there battery voltage?

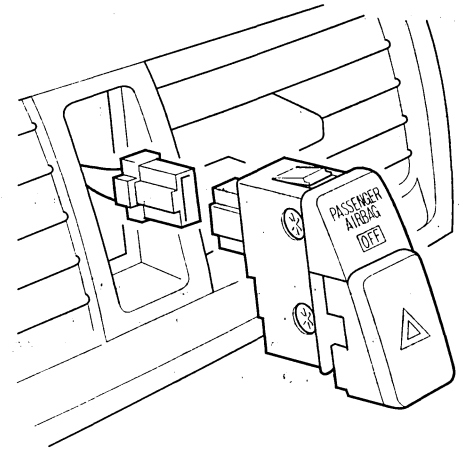
YES—Go to step 10.

NO—Open in the dashboard wire harness; replace the dashboard wire harness. ■

10. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

11. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

12. Reconnect the dashboard wire harness 6P connector to the passenger's airbag cutoff indicator.



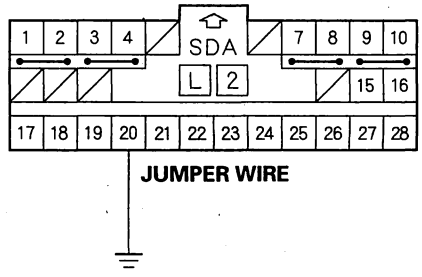
13. Reconnect the battery negative cable.

BACK

Protected by AR

14. Connect the No. 20 terminal of SRS unit connector A (28P) to body ground with a jumper wire.

SRS UNIT CONNECTOR A (28P)



- Wire side of female terminals

15. Turn the ignition switch ON (II).

16. Check the passenger's airbag cutoff indicator.

Does the passenger's airbag cutoff indicator come on?

YES—Faulty SRS unit; replace the SRS unit (see page 23-213). ■

NO—Go to step 17.

17. Turn the ignition switch OFF.

18. Disconnect the jumper wire.

19. Disconnect the passenger's airbag cutoff indicator 6P connector (A) again.

DTC Troubleshooting (cont'd)

DTC A1-1x (A1-10 to A1-19, A1-1A to A1-1F): Faulty Power Supply (VA Line)

1. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 2.

   NO—Replace the fuse, then turn the ignition switch ON (II). If the fuse blows again, check for a short in the No. 10 (7.5 A) fuse circuit (dashboard wire harness, floor wire harness, or OPDS/ODS unit harness).■

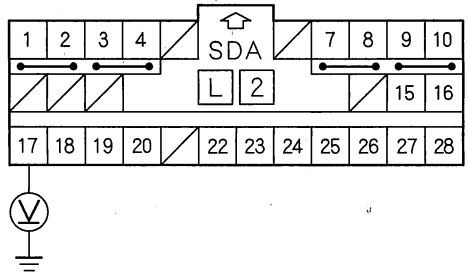
2. Disconnect the battery negative cable, and wait for 3 minutes.

3. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

4. Reconnect the battery negative cable.

5. Connect a voltmeter between the No. 17 terminal of SRS unit connector A (28P) and body ground. Turn the ignition switch ON (II), and measure voltage. There should be battery voltage.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

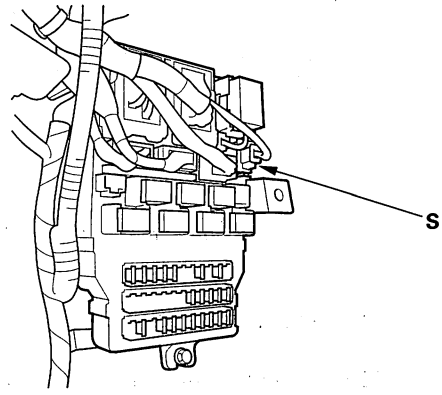
Is there battery voltage?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit (see page 23-213).■

NO—Go to step 6.

6. Turn the ignition switch OFF.

7. Disconnect under-dash fuse/relay box connector S (2P).

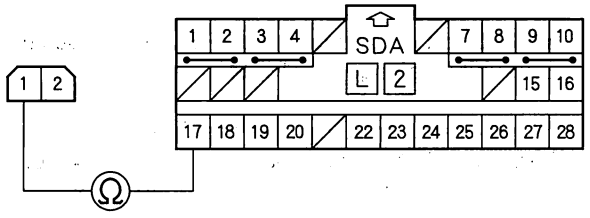


BACK

Protected by AR

8. Check resistance between the No. 1 terminal of under-dash fuse/relay box connector S (2P) and the No. 17 terminal of SRS unit connector A (28P). There should be 0—1.0 Ω.

UNDER-DASH FUSE/RELAY BOX CONNECTOR S (2P) **SRS UNIT CONNECTOR A (28P)**



Wire side of female terminals

Is the resistance as specified?

YES—Open in the under-dash fuse/relay box or poor contact between connector S (2P) and the under-dash fuse/relay box; check the connection. If the connection is OK, replace the under-dash fuse/relay box (see page 22-77). ■

NO—Open in the dashboard wire harness; replace the dashboard wire harness. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC A2-1x (A2-10 to A2-19, A2-1A to A2-1F): Faulty Power Supply (VB Line)

1. Check the No. 22 (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 11.

   NO—Go to step 2.

2. Replace the No. 22 (10 A) fuse.

3. Turn the ignition switch ON (II) and wait for 30 seconds. Then turn the ignition switch OFF.

4. Check the No. 22 (10 A) fuse,

   Is the fuse OK?

   YES—The system is OK at this time.■

   NO—Go to step 5.

5. Replace the No. 22 (10 A) fuse.

6. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

7. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

8. Reconnect the battery negative cable.

9. Turn the ignition switch ON (II), and wait for 30 seconds. Then turn the ignition switch OFF.

10. Check the No. 22 (10 A) fuse.

    Is the fuse OK?

    YES—Short to ground in the SRS unit; replace the SRS unit (see page 23-213).■

    NO—Short to ground in the dashboard wire harness or in the under-dash fuse/relay box No. 22 (10 A) fuse line; replace the dashboard wire harness. If the problem is still there, replace the under-dash fuse/relay box.■

11. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

12. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

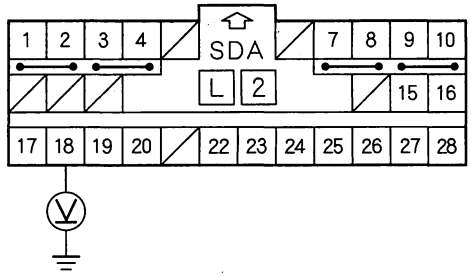
BACK

Protected by AR

13. Reconnect the battery negative cable.

14. Connect a voltmeter between the No. 18 terminal of SRS unit connector A (28P) and body ground. Turn the ignition switch ON (II), and measure voltage. There should be battery voltage.

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

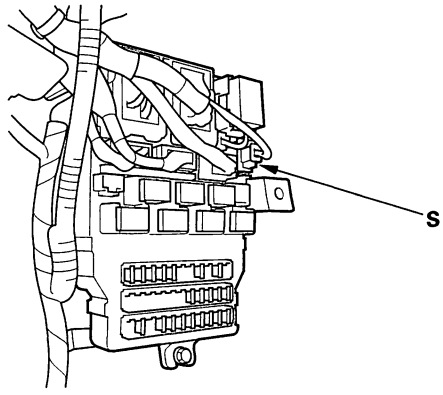
Is there battery voltage?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit (see page 23-213).■

NO—Go to step 15.

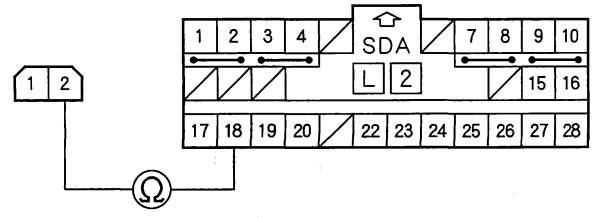
15. Turn the ignition switch OFF.

16. Disconnect under-dash fuse/relay box connector S (2P).



17. Check resistance between the No. 2 terminal of the under-dash fuse/relay box connector S (2P) and the No. 18 terminal of SRS unit connector A (28P). There should be 0—1.0 Ω.

UNDER-DASH FUSE/RELAY BOX CONNECTOR S (2P) **SRS UNIT CONNECTOR A (28P)**



Wire side of female terminals

Is the resistance as specified?

YES—Open in the under-dash fuse/relay box or poor contact between connector S (2P) and the under-dash fuse/relay box; check the connection. If the connection is OK, replace the under-dash fuse/relay box (see page 22-77).■

NO—Open in the dashboard wire harness; replace the dashboard wire harness.■

Protected by AR

Symptom Troubleshooting

SRS indicator does not come on ('03-05 models)

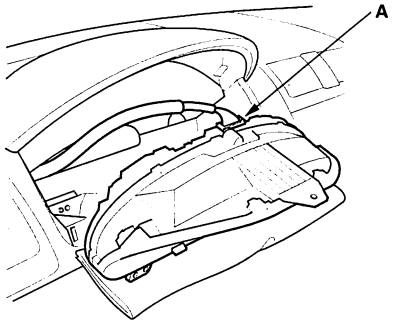
1. Turn the ignition switch ON (II), and see if the other indicators come on (brake system, etc).

   Do the other indicators come on?

   YES—Go to step 2.

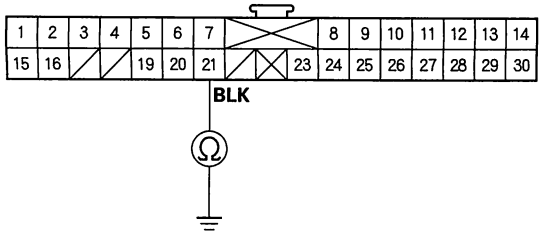
   NO—Go to step 9.

2. Turn the ignition switch OFF, then remove the gauge control module (see page 22-276). Disconnect the gauge control module connector (30P) (A) from the gauge control module.



3. Check resistance between the No. 21 terminal of gauge control module connector (30P) and body ground. There should be 0—1.0 Ω.

GAUGE CONTROL MODULE CONNECTOR (30P)



Wire side of female terminals

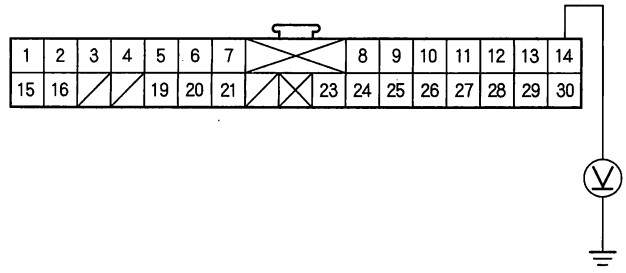
Is the resistance as specified?

YES—Go to step 4.

NO—Open in the BLK wire of the dashboard wire harness, junction connector or faulty body ground terminal (G503) (see page 22-34). If the body ground terminal is OK, replace the dashboard wire harness.■

4. Check for voltage between the No. 14 terminal of the gauge control module connector (30P) and body ground within the first 6 seconds after turning the ignition switch ON (II). There should be about 1.0 V for 6 seconds and then about 11 V.

GAUGE CONTROL MODULE CONNECTOR (30P)



Wire side of female terminals

Is the voltage as specified?

YES—Faulty SRS indicator circuit in the gauge control module; replace the gauge control module.■

NO—Go to step 5.

5. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

BACK

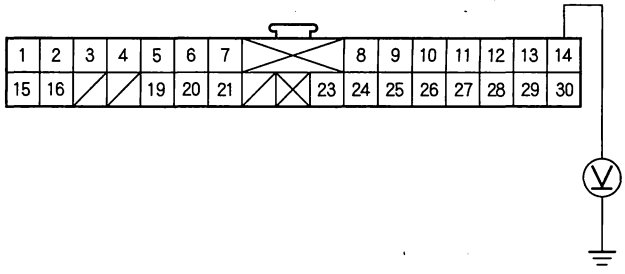
Protected by AR

6. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

7. Reconnect the battery negative cable.

8. Connect a voltmeter between the No. 14 terminal of gauge control module connector (30P) and body ground. Turn the ignition switch ON (II), and measure voltage. There should be 0.5 V or less.

GAUGE CONTROL MODULE CONNECTOR (30P)



Wire side of female terminals

Is the voltage as specified?

YES—Faulty SRS unit; replace the SRS unit (see page 23-213). ■

NO—Short to power in the PNK wire of the dashboard wire harness or junction connector; replace the dashboard wire harness. ■

9. Turn the ignition switch OFF. Check the No. 21 (7.5 A) fuse in the under-dash fuse/relay box.

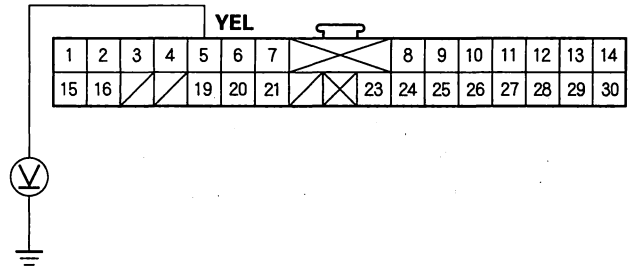
Is the fuse blown?

YES—Go to step 11.

NO—Go to step 10.

10. Connect a voltmeter between the No. 5 terminal of the gauge control module connector (30P) and body ground. Turn the ignition switch ON (II), and measure the voltage. There should be battery voltage.

GAUGE CONTROL MODULE CONNECTOR (30P)



Wire side of female terminals

Is there battery voltage?

YES—Faulty SRS indicator circuit in the gauge control module or poor contact at the gauge control module connector (30P) and the gauge control module; if the connection is OK, replace the gauge control module. ■

NO—Open in the under-dash fuse/relay box No. 21 (7.5 A) fuse circuit, or open in the YEL wire of the dashboard wire harness A or junction connector. If the under-dash fuse/relay box is OK, replace the dashboard wire harness. ■

11. Replace the No. 21 (7.5 A) fuse, then check to see if the indicators comes on.

Do the indicators come on?

YES—The system is OK at this time. ■

NO—Repair the short to ground in the under-dash fuse/relay box No. 21 (7.5 A) fuse circuit. ■

Protected by AR

Symptom Troubleshooting (cont'd)

SRS indicator does not come on ('06 model)

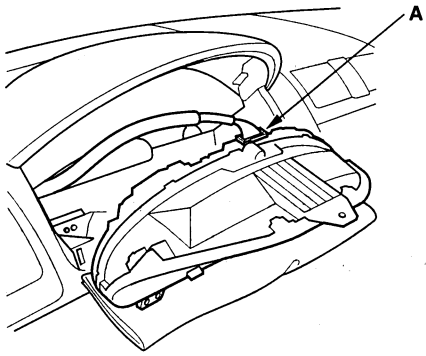
1. Turn the ignition switch ON (II), and see if the other indicators come on (brake system, etc).

   Do the other indicators come on?

   YES—Go to step 2.

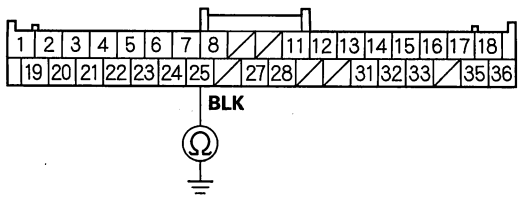
   NO—Go to step 9.

2. Turn the ignition switch OFF, then remove the gauge control module (see page 22-276). Disconnect the gauge control module connector (36P) (A) from the gauge control module.



3. Check resistance between the No. 25 terminal of gauge control module connector (36P) and body ground. There should be 0—1.0 Ω.

GAUGE CONTROL MODULE CONNECTOR (36P)



Wire side of female terminals

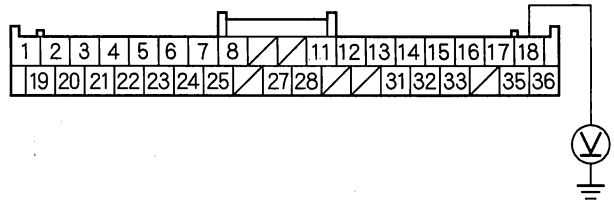
Is the resistance as specified?

YES—Go to step 4.

NO—Open in the BLK wire of the dashboard wire harness, junction connector or faulty body ground terminal (G503) (see page 22-34). If the body ground terminal is OK, replace the dashboard wire harness.■

4. Check for voltage between the No. 18 terminal of the gauge control module connector (36P) and body ground within the first 6 seconds after turning the ignition switch ON (II). There should be about 1.0 V for 6 seconds and then about 11 V.

GAUGE CONTROL MODULE CONNECTOR (36P)



Wire side of female terminals

Is the voltage as specified?

YES—Faulty SRS indicator circuit in the gauge control module; replace the gauge control module.■

NO—Go to step 5.

5. Turn the ignition switch OFF. Disconnect the battery negative cable, and wait for 3 minutes.

BACK

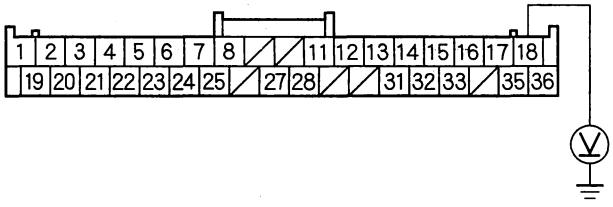
Protected by AR

6. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

7. Reconnect the battery negative cable.

8. Connect a voltmeter between the No. 18 terminal of gauge control module connector (36P) and body ground. Turn the ignition switch ON (II), and measure voltage. There should be 0.5 V or less.

GAUGE CONTROL MODULE CONNECTOR (36P)



Wire side of female terminals

Is the voltage as specified?

YES—Faulty SRS unit; replace the SRS unit (see page 23-213). ■

NO—Short to power in the PNK wire of the dashboard wire harness or junction connector; replace the dashboard wire harness. ■

9. Turn the ignition switch OFF. Check the No. 21 (7.5 A) fuse in the under-dash fuse/relay box.

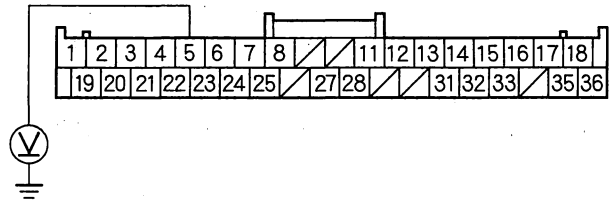
Is the fuse blown?

YES—Go to step 11.

NO—Go to step 10.

10. Connect a voltmeter between the No. 5 terminal of the gauge control module connector (36P) and body ground. Turn the ignition switch ON (II), and measure the voltage. There should be battery voltage.

GAUGE CONTROL MODULE CONNECTOR (36P)



Wire side of female terminals

Is there battery voltage?

YES—Faulty SRS indicator circuit in the gauge control module or poor contact at the gauge control module connector (36P) and the gauge control module; if the connection is OK, replace the gauge control module. ■

NO—Open in the under-dash fuse/relay box No. 21 (7.5 A) fuse circuit, or open in the YEL wire of the dashboard wire harness A or junction connector. If the under-dash fuse/relay box is OK, replace the dashboard wire harness. ■

11. Replace the No. 21 (7.5 A) fuse, then check to see if the indicators comes on.

Do the indicators come on?

YES—The system is OK at this time. ■

NO—Repair the short to ground in the under-dash fuse/relay box No. 21 (7.5 A) fuse circuit. ■

Symptom Troubleshooting (cont'd)

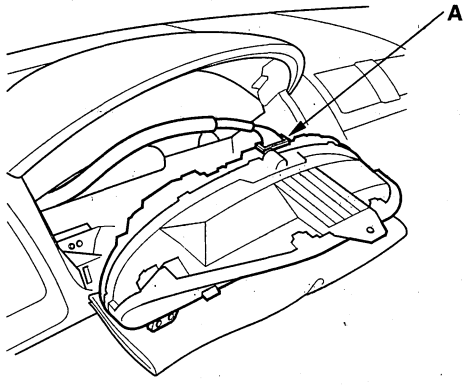
SRS indicator stays on, but no DTCs are stored ('03-05 models)

NOTE:
- If you cannot retrieve DTCs with the HDS using the SRS menu method, retrieve flash codes with the HDS in SCS mode.
- A new SRS unit must sense the entire system is OK before completing its initial self-test. The most common cause of an incomplete self-test is the failure to replace all deployed parts after a collision, in particular seat belt tensioners (see page 23-194).
- A battery/system voltage above 15.2 V can cause the SRS indicator to come on without storing any DTCs.

1. Disconnect the battery negative cable, and wait for 3 minutes.

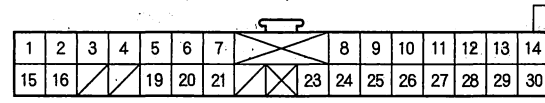
2. Disconnect SRS unit connector A (28P) from the SRS unit (see step 7 on page 23-29).

3. Remove the gauge control module (see page 22-276). Disconnect gauge control module connector (30P) (A) from the gauge control module.



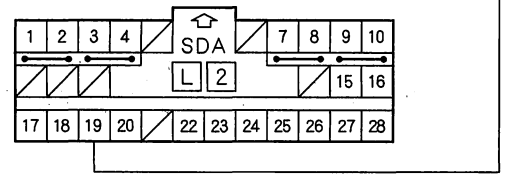
4. Check resistance between the No. 14 terminal of gauge control module connector (30P) and the No. 19 terminal of SRS unit connector A (28P). There should be 1 Ω or less.

GAUGE CONTROL MODULE CONNECTOR (30P)



Wire side of female terminals

SRS UNIT CONNECTOR A (28P)



Wire side of female terminals

Is the resistance as specified?

YES—Go to step 5.

NO—Open in the dashboard wire harness; replace the dashboard wire harness.■

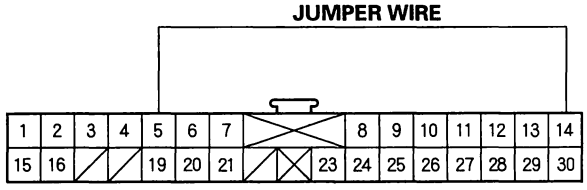
5. Reconnect the battery negative cable.

BACK

Protected by AR

6. Reconnect gauge control module connector (30P) to the gauge control module.
7. Turn the ignition switch ON (II).
8. Install a jumper wire between the No. 5 terminal and the No. 14 terminal of the gauge control module connector (30P). The SRS indicator should go off.

GAUGE CONTROL MODULE CONNECTOR (30P)



Wire side of female terminals

Does the SRS indicator go off?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Faulty SRS indicator circuit in the gauge control module or poor contact at gauge control module connector (30P); check the connection. If the connection is OK, replace the gauge control module. ■
