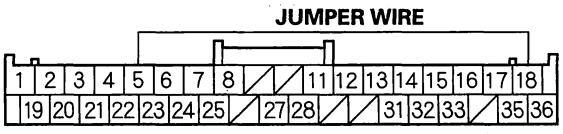
8. Install a jumper wire between the No. 5 terminal and the No. 18 terminal of the gauge control module connector (36P). The SRS indicator should go off.

GAUGE CONTROL MODULE CONNECTOR (36P)



Wire side of female terminals

Does the SRS indicator go off?

YES—Faulty SRS unit or poor contact at SRS unit connector A (28P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit (see page 23-213). ■

NO—Faulty SRS indicator circuit in the gauge control module or poor contact at gauge control module connector (36P); check the connection. If the connection is OK, replace the gauge control module. ■

Protected by AR

Component Replacement/Inspection After Deployment

NOTE:
- Before doing any SRS repairs, use the HDS SRS menu method to check for DTCs; read the DTC for the less obvious deployed parts (seat belt tensioners, front impact sensors, side airbag sensors, etc.)
- Do not mix TRW and Denso impact sensors. Impact sensors and the SRS unit must be of the same manufacturer.

After a collision where the seat belt tensioners deployed, replace these items:
- SRS unit
- Seat belt tensioners
- Front impact sensors

After a collision where the front airbag(s) deployed, replace these items:
- SRS unit
- Deployed airbag(s)
- Seat belt tensioners
- Front impact sensors

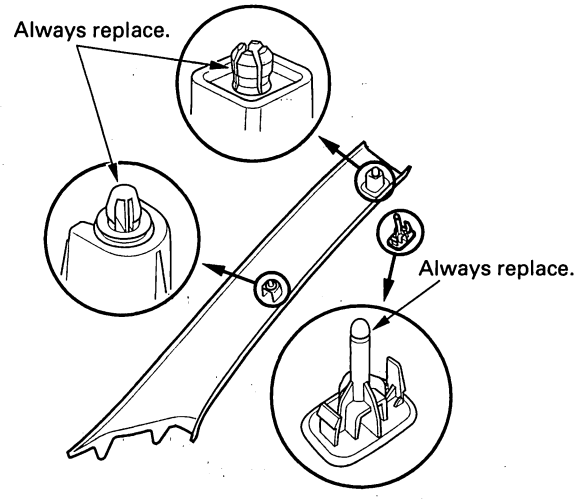
After a collision where the side airbag(s) deployed, replace these items:
- SRS unit
- Deployed side airbag(s)
- Seat belt tensioner(s) for the side(s) that deployed.
- Side impact sensor(s) (first) for the side(s) that deployed
- Side impact sensor(s) (second) for the side(s) that deployed (4-door)

After a collision where the side curtain airbag(s) deployed, replace these items:
- SRS unit
- Deployed side curtain airbag(s)
- Seat belt tensioner(s) for the side(s) that deployed
- Side impact sensor(s) (first) for the side(s) that deployed
- Side impact sensor(s) (second) for the side(s) that deployed (4-door)
- Roof trim
- A-pillar trim
- B-pillar trim
- C-pillar trim
- Front grab handle
- Sunvisor
- All related trim clips

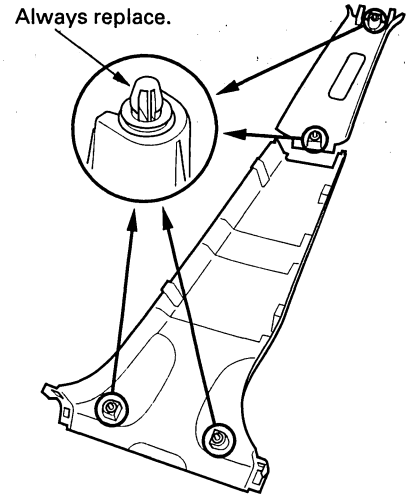
After a moderate to severe side or rear collision, inspect for damage on the side curtain airbag or other related components. According to the degree of damage, replace components as needed.

After a collision, where a side curtain airbag has deployed, replace all trim clips on that side, even if they appear to be undamaged. Replace the clips on these parts:
- A-pillar trim
- B-pillar trim
- C-pillar trim
- Front grab handle
- Sunvisor

A-Pillar



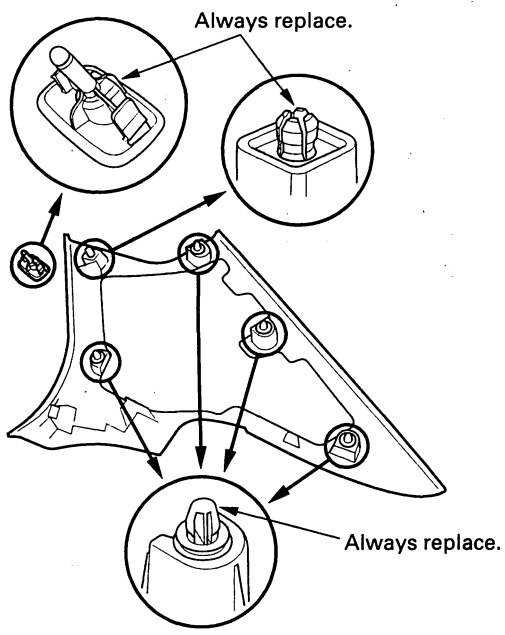
B-Pillar (4-door)



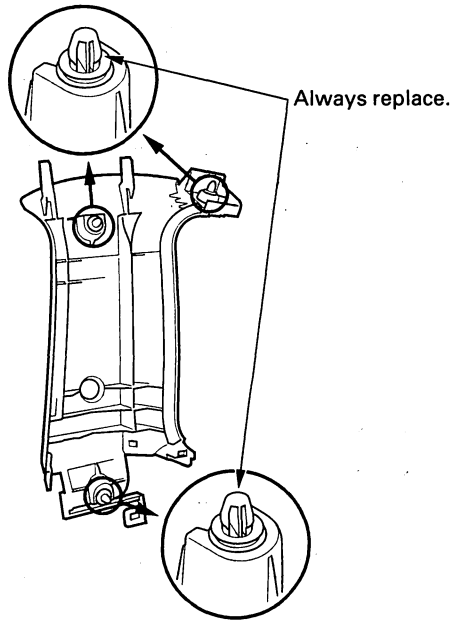
BACK

Protected by AR

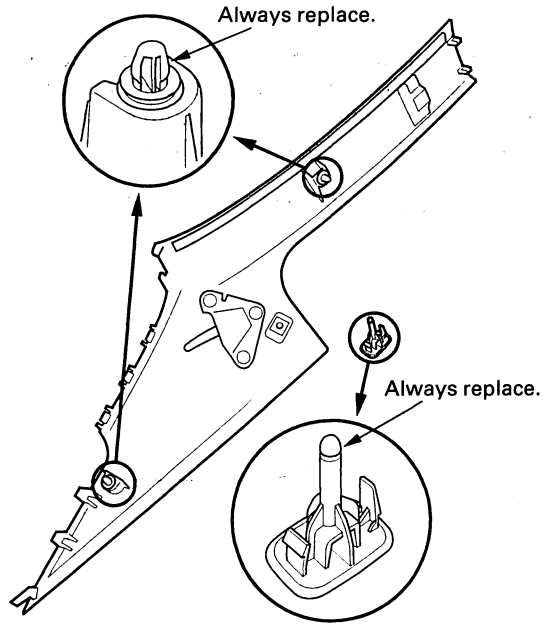
C-Pillar (4-door)



B-Pillar (2-door)



C-Pillar (2-door)



During the repair process, inspect these areas:

- Inspect all the SRS wire harnesses. Replace, don't repair, any damaged harnesses.
- Inspect the cable reel for heat damage. If there is any damage, replace the cable reel.

After the vehicle is completely repaired, turn the ignition switch ON (II). If the SRS indicator comes on for about 6 seconds and then goes off, the SRS is OK. If the indicator does not function properly, use the HDS SRS Menu Method to read the DTC. If you cannot retrieve a code, go to SRS Symptom Troubleshooting.

(cont'd)

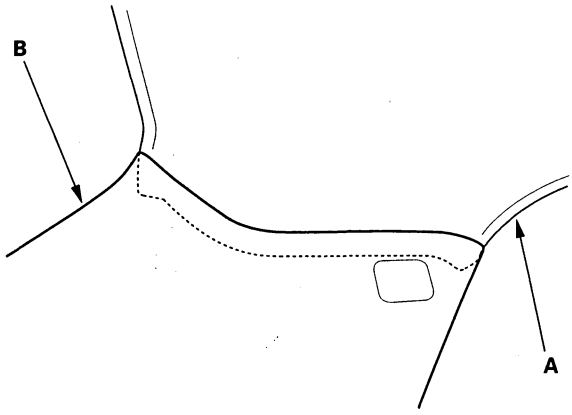
Protected by AR

Component Replacement/Inspection After Deployment (cont'd)

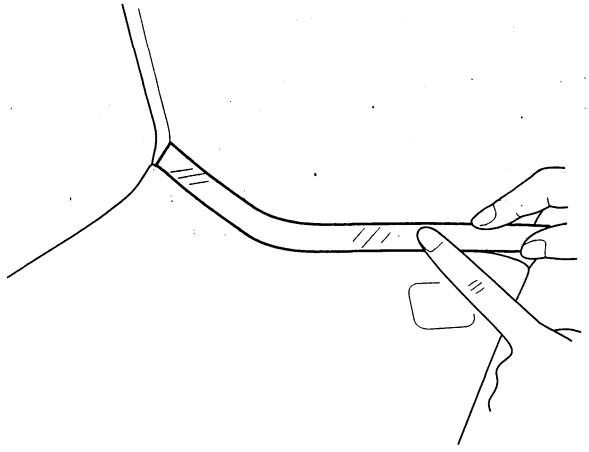
Checking and Adjusting the Headliner/Pillar Trim Overlap

To prevent the side curtain airbag from accidentally deploying and damaged the pillar trim, the overlap between the headliner and pillar trim must be less then 15 mm. To check the overlap, do this:

1. Install the headliner (A) and the pillar trim (B).

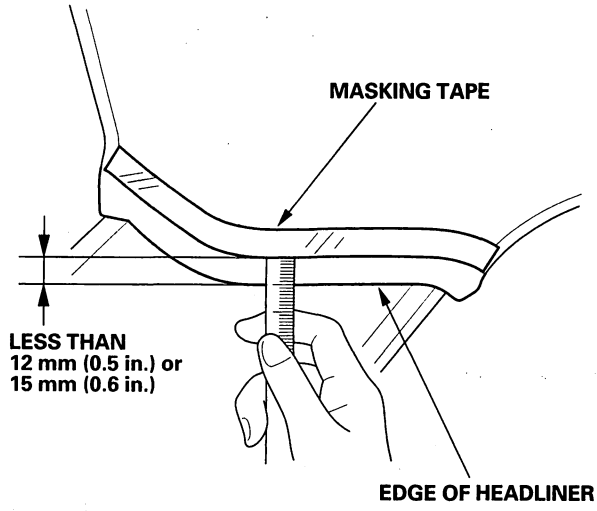


2. Using masking tape on the headliner, mark the upper edge of each pillar trim.

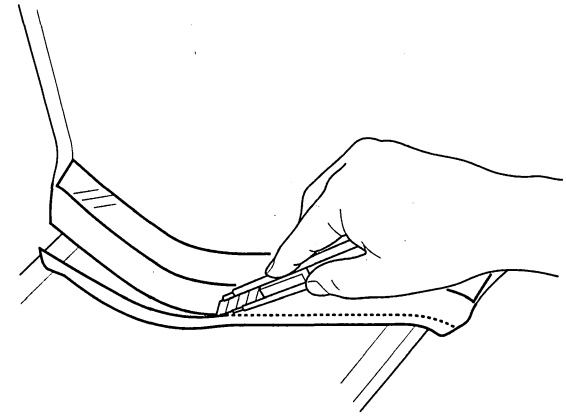


3. Remove the pillar trims, and measure the headliner overlap.

- '04-06 2-Door Models: If the overlap is less than 12 mm, remove the tape, and install the pillar trims.
- '04-06 2-Door Models: If the overlap is more than 12 mm, go to step 4.
- If the overlap is less than 15 mm, remove the tape, and install the pillar trims.
- If the overlap is more than 15 mm, go to step 4.



4. Carefully trim the headliner with a utility knife, reducing the overlap to less than 12 mm ('04-06 Models, 2-door) or 15 mm.



5. Remove the tape, and install the pillar trim.

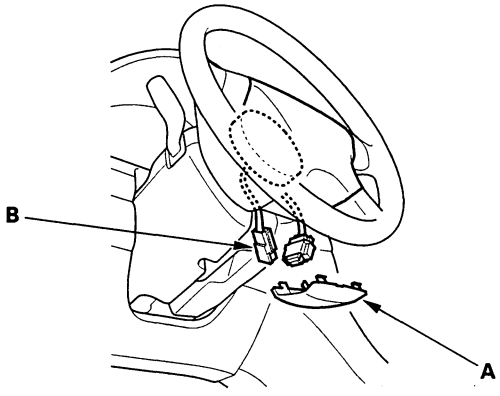
BACK

Protected by AR

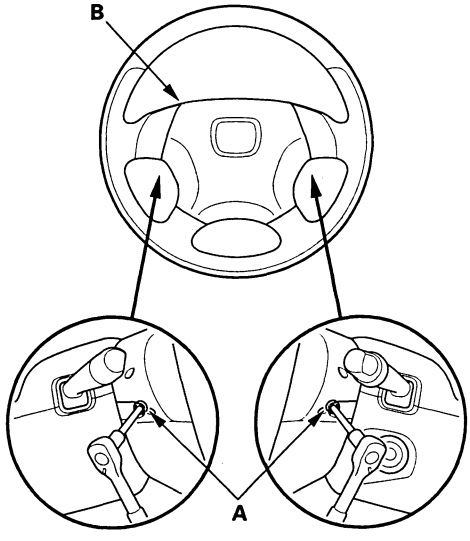
Driver's Airbag Replacement

Removal

1. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
2. Remove the access panel (A) from the steering wheel, then disconnect the driver's airbag 4P connector (B) from the cable reel.



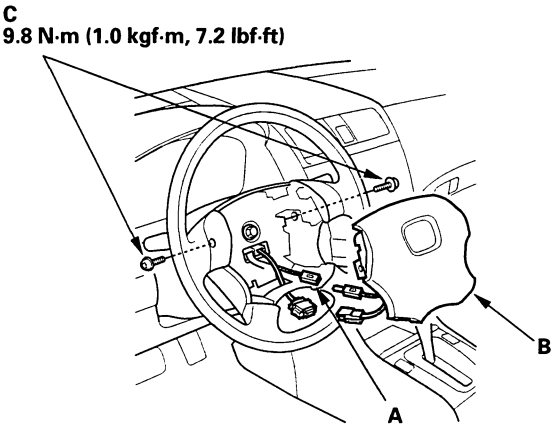
3. Remove the two Torx bolts (A) using a Torx T30 bit.



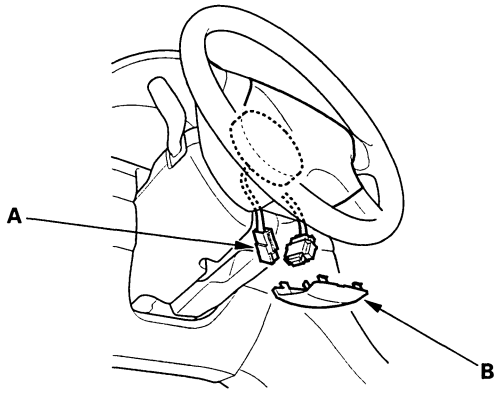
4. Disconnect the horn switch connector (1P), then remove the driver's airbag (B).

Installation

1. Connect the horn switch connector (1P) (A) to the driver's airbag.



2. Place the new driver's airbag (B) in the steering wheel, and secure it with new Torx bolts (C).
3. Connect the cable reel to the driver's airbag 4P connector (A), then install the access panel (B) on the steering wheel.



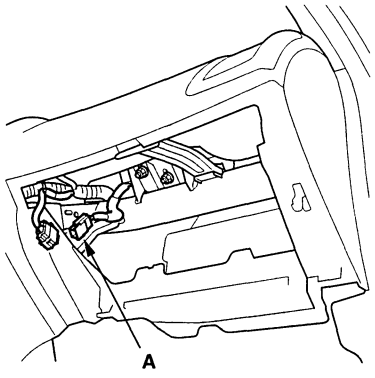
4. Connect the battery negative cable.
5. After installing the airbag, confirm proper system operation:
   - Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
   - Make sure the horn button works.

Protected by AR

Front Passenger's Airbag Replacement

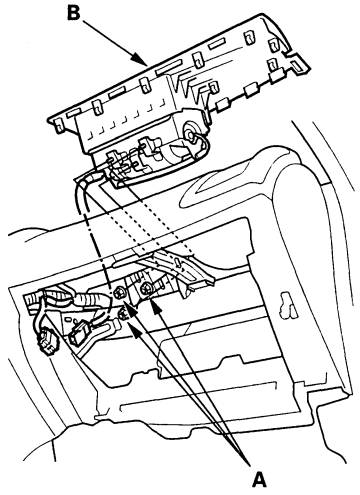
Removal

1. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
2. Remove the glove box (see page 20-132).
3. Disconnect the front passenger's airbag 4P connector (A) from dashboard wire harness.



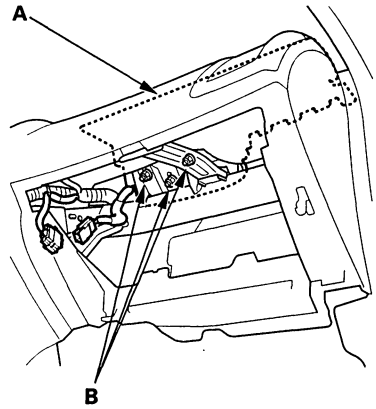
4. Disconnect the passenger's A-pillar trim.
   - Without side curtain airbag (see page 20-94).
   - With side curtain airbag (see page 20-99).
5. Remove the three mounting nuts (A) from the bracket. Cover the lid and dashboard with a cloth, and pry carefully with a flat-tip screwdriver to lift the front passenger's airbag (B) out of the dashboard.

   NOTE: The airbag lid has pawls on each side which attach it to the dashboard.



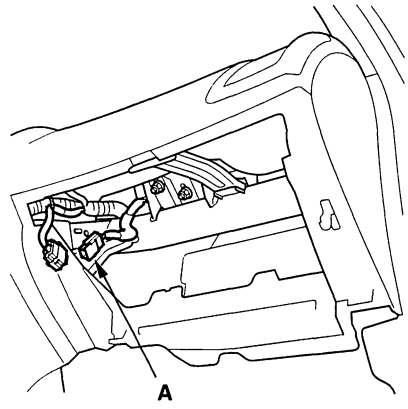
Installation

1. Place the new front passenger's airbag (A) into the dashboard. Tighten the front passenger's airbag mounting nuts (B).



9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)

2. Connect the front passenger's airbag 4P connector (A) to dashboard wire harness, then reinstall the glove box and passenger's front pillar trim.



3. Reconnect the battery negative cable.
4. After installing the airbag, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.

BACK

Protected by AR

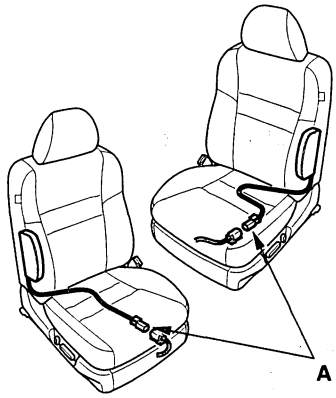
Side Airbag Replacement

NOTE: Review the seat replacement procedure before performing repairs or service.

Removal

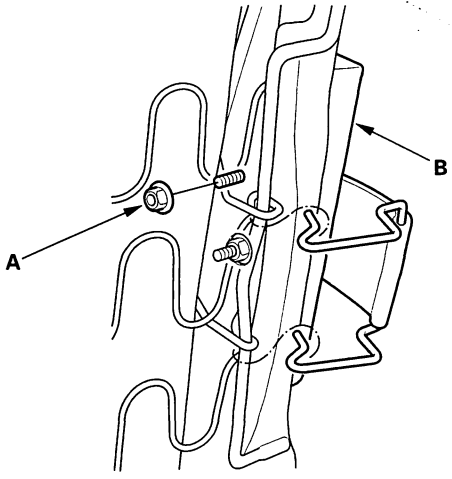
1. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.

2. Disconnect the side airbag harness 2P connectors (A).



3. Remove the seat assembly (see page 20-144) and seat-back cover (see page 20-166).

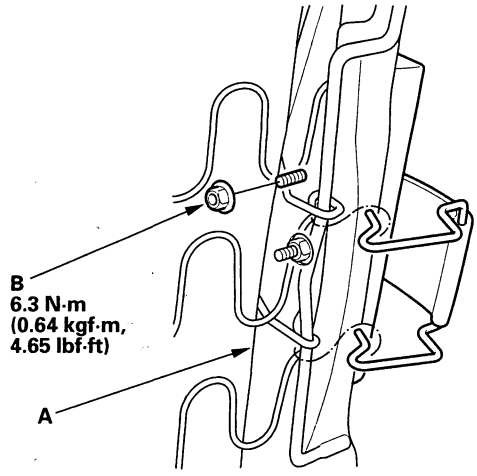
4. Remove the mounting nut (A) and the side airbag (B).



Installation

NOTE:
- If the side airbag lid is secured by a tape, remove the tape.
- Do not open the lid of the side airbag cover.
- Use new mounting nuts tightened to the specified torque.
- Make sure that the seat-back cover is installed properly. Improper installation may prevent proper deployment.
- Be sure to install the harness wires so that they are not pinched or interfering with other parts.

1. Place the new side airbag on the seat-back frame (A). Tighten the side airbag mounting nuts (B).



2. Install the seat-back cover in the reverse order of removal (see page 20-166).

3. Install the seat assembly (see page 20-144), then connect the side airbag harness 2P connector.

4. Move the front seat and the seat-back through their full ranges of movement, making sure the harness wires are not pinched or interfering with other parts.

5. Reconnect the battery negative cable.

6. Connect the HDS and clear the DTCs (see page 23-31).

7. After installing the side airbag, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.

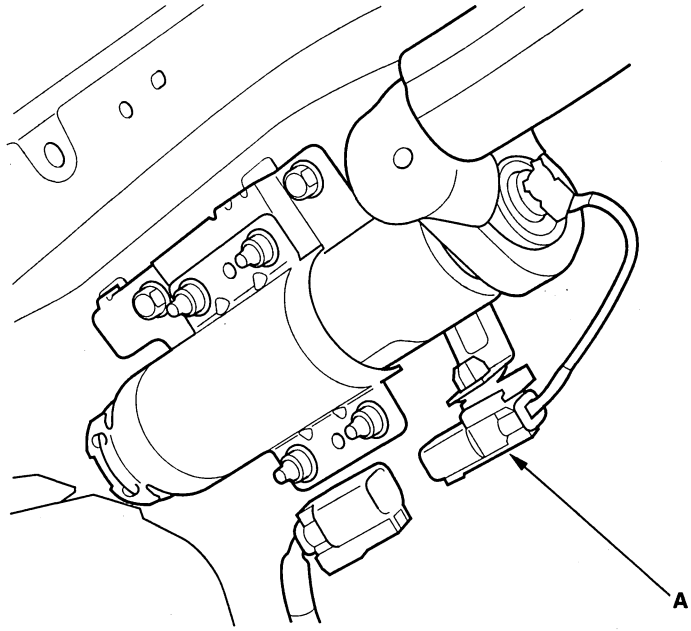
Side Curtain Airbag Replacement

Removal

NOTE:
- Review the interior trim replacement procedure before performing repair or service.
- Removal of the side curtain airbag must be performed according to the precautions/procedures described at the beginning of the SRS.
- The side curtain airbag system consists of the side curtain airbag module, including the roof trim and front grab handle. When the side curtain airbag has been deployed, these parts should be replaced.

1. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
2. Remove the headliner (see page 20-117).
3. Remove the antenna coil (see page 22-380).
4. Disconnect the side curtain airbag subharness from the side curtain airbag 2P connector (A).



BACK

Protected by AR

5. Remove the mounting bolts (A) from the bracket.

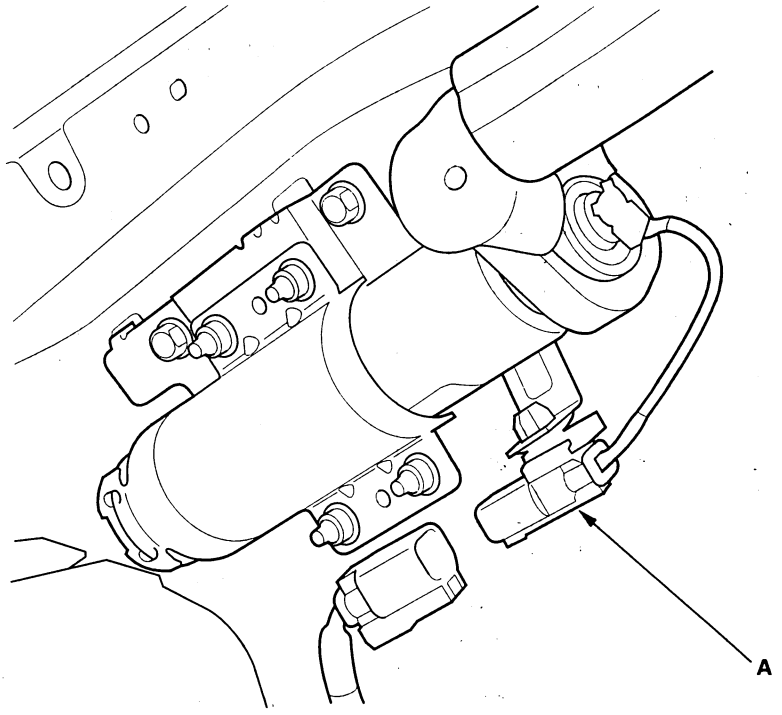
2. Connect the side curtain airbag subharness to the side curtain airbag 2P connector (A).



3. Reconnect the battery negative cable.
4. Connect the HDS and clear the DTCs (see page 23-31).
5. After installing the side curtain airbag, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
6. Install all removed parts.
7. Confirm proper headliner/pillar trim overlap (see page 23-194).

Protected by AR

Airbag Disposal

Special Tools Required
Deployment tool 07HAZ-SG00500

Before scrapping any airbags, side airbags, side curtain airbags, or seat belt tensioners (including those in a whole vehicle to be scrapped), the part(s) must be deployed. If the vehicle is still within the warranty period, the Honda District Manager must give approval and/or special instruction before deploying the part(s). Only after the part(s) have been deployed (as the result of vehicle collision, for example), can they be scrapped. If the parts appear intact (not deployed), treat them with extreme caution. Follow this procedure.

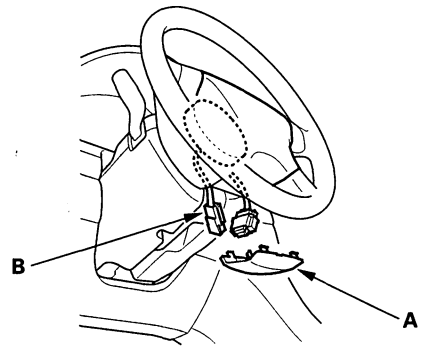
Deploying Airbags in the Vehicle

If an SRS equipped vehicle is to be entirely scrapped, its airbags, side airbags, side curtain airbags, and seat belt tensioners should be deployed while still in the vehicle. These parts should not be considered as salvageable parts and should never be installed in another vehicle.

1. Turn the ignition switch OFF, then disconnect the battery negative cable, and wait at least 3 minutes.
2. Confirm that each airbag, side airbag, side curtain airbag, or seat belt tensioner is securely mounted.
3. Confirm that the deployment tool is functioning properly by following the check procedure on the tool label.

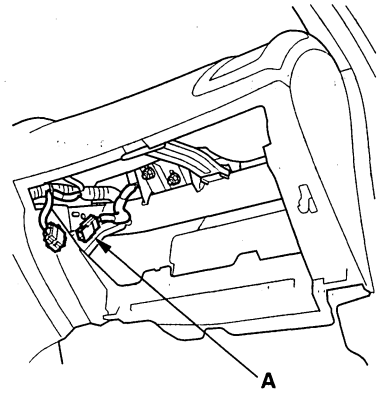
Driver's Airbag

4. Remove the access panel (A) from the steering wheel, then disconnect the driver's airbag 4P connector (B) from the cable reel.



Front Passenger's Airbag

5. Remove the glove box, then disconnect the front passenger's airbag 4P connector (A) from dashboard wire harness.

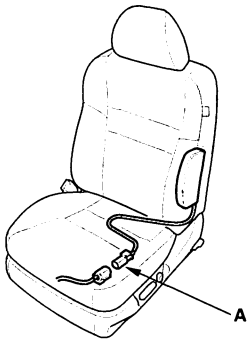


BACK

Protected by AR

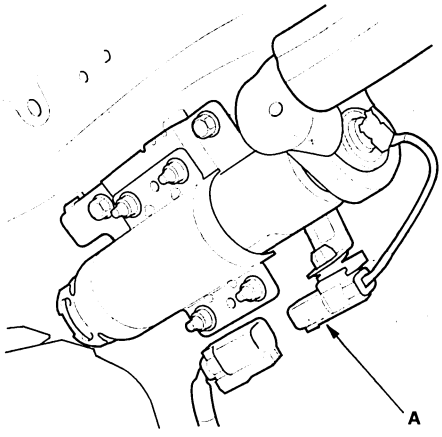
Side Airbag

6. Disconnect the side airbag 2P connector (A) from the floor wire harness.



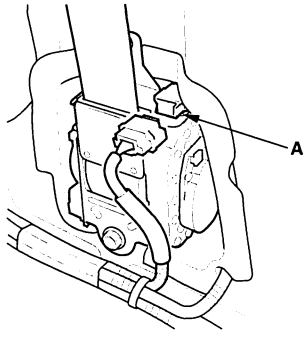
Side curtain airbag

7. Disconnect the side curtain airbag 2P connector (A) from the side curtain airbag subharness.



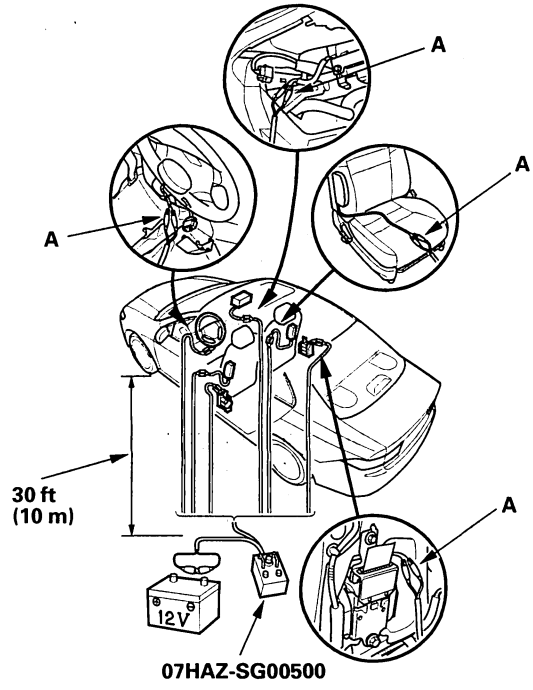
Seat belt tensioner

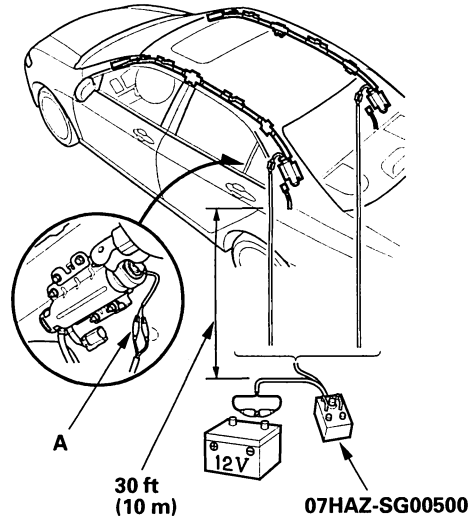
8. Disconnect the seat belt tensioner 4P connector (A) from the floor wire harness. Pull the seat belt out all the way and cut it.



9. Cut off each connector, strip the ends of the wires, and connect the deployment tool alligator clips (A) to the wires. Place the deployment tool at least 30 feet (10 meters) away from the vehicle.

NOTE: The driver's and front passenger's airbags have dual inflators. The like color wires go to the individual inflators.





(cont'd)

Protected by AR

Airbag Disposal (cont'd)

10. Connect a 12 volt battery to the tool.

    - If the green light on the tool comes on, the igniter circuit is defective and cannot deploy the component. Go to Disposal of Damaged Components.
    - If the red light on the tool comes on, the component is ready to be deployed.

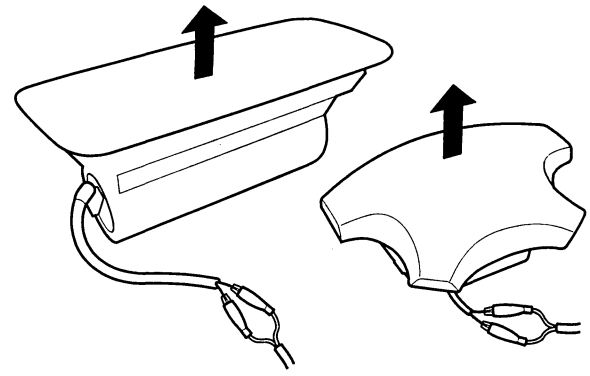
11. Push the tool's deployment switch. The airbags and tensioners should deploy (deployment is both highly audible and visible: a loud noise and rapid inflation of the bag, followed by slow deflation).

    - If the components deploy and the green light on the tool comes on, continue with this procedure.
    - If a component does not deploy, yet the green light comes ON, its igniter is defective. Go to Disposal of Damaged Components.
    - During deployment, the airbags can become hot enough to burn you. Wait 30 minutes after deployment before touching the airbags.

12. Dispose of the complete airbag. No part of it can be reused. Place it in a sturdy plastic bag (A), and seal it securely. Dispose of the deployed airbag according to your local regulations.

Deploying Components Out of the Vehicle

If an intact airbag or tensioner has been removed from a scrapped vehicle, or has been found defective or damaged during transit, storage, or service, it should be deployed as follows:



1. Confirm that the deployment tool is functioning properly by following the check procedure on the tool label.

2. Position the airbag face up, outdoors, on flat ground, at least 30 feet (10 meters) from any obstacles or people.

3. Follow steps 9 of the through 12 Deploying Airbags in the Vehicle.

   NOTE: The driver's and front passenger's airbags have dual inflators. The like color wires go to the individual inflators.

BACK

Protected by AR

Disposal of Damaged Components

1. If installed in a vehicle, follow the removal procedure for the driver's airbag (see page 23-197), front passenger's airbag (see page 23-198), side airbag (see page 23-199), side curtain airbag (see page 23-200), and seat belt tensioner (see page 23-5).

2. In all cases, make a short circuit by cutting, stripping, and twisting together the two inflator wires.

   NOTE: The driver's and front passenger's airbags have dual inflators. The like color wires go to the individual inflators.

3. Package the component in exactly the same packaging that the new replacement part came in.

4. Mark the outside of the box "DAMAGED AIRBAG NOT DEPLOYED", "DAMAGED SIDE AIRBAG NOT DEPLOYED", "DAMAGED SIDE CURTAIN AIRBAG NOT DEPLOYED", "DAMAGED SEAT BELT TENSIONER NOT DEPLOYED" so it does not get confused with your parts stock.

5. Contact your Honda District Parts & Service Manager for how and where to return it for disposal.

Deployment Tool Check

1. Connect the yellow clips to both switch protector handles on the tool; connect the tool to a battery.

2. Push the operation switch: green means the tool is OK; red means the tool is faulty.

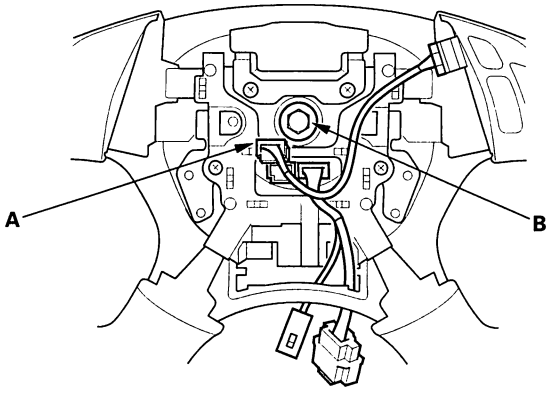
3. Disconnect the yellow clips from the battery.

Protected by AR

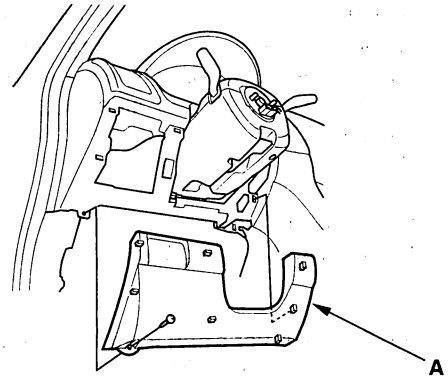
Cable Reel Replacement

Removal

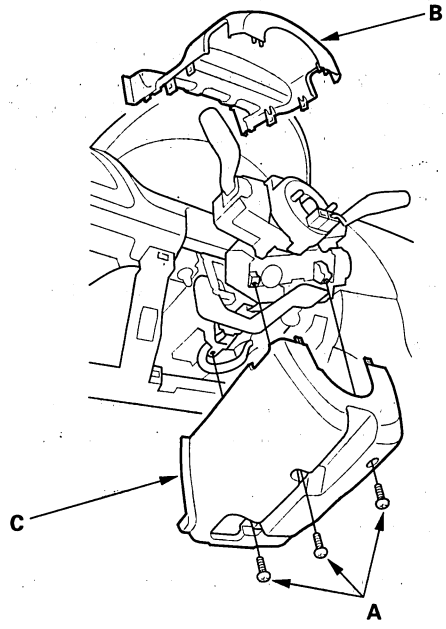
1. Make sure the wheels are aligned straight ahead.
2. Disconnect the battery negative cable, and wait at least 3 minutes.
3. Remove the driver's airbag (see page 23-197).
4. Disconnect the connector (A) from the cable reel, then remove the steering wheel bolt (B).



5. Align the front wheels straight ahead, then remove the steering wheel with a steering wheel puller (see step 5 on page 17-22). Do not tap on the steering wheel or steering column shaft when removing the steering wheel.
6. Remove the dashboard lower cover (A).



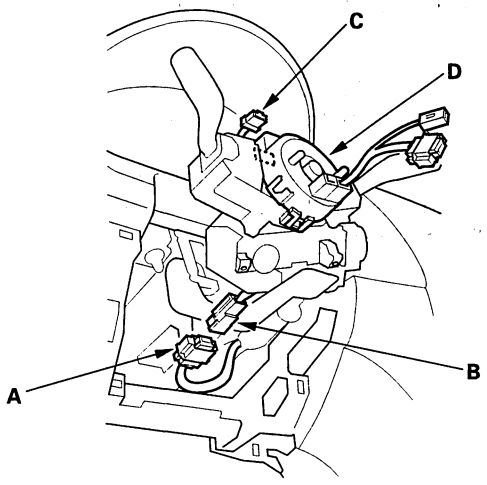
7. Remove the column cover screws (A), then remove the column covers (B, C).



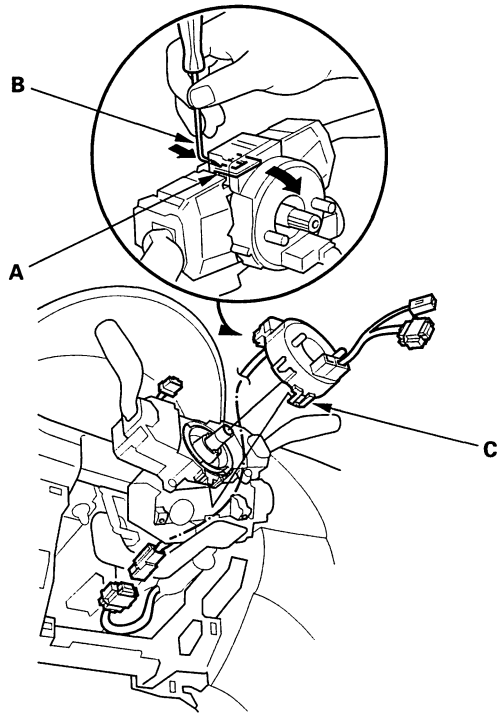
BACK

Protected by AR

8. Disconnect the dashboard wire harness 4P connector (A) from the cable reel 4P connector (B), then disconnect the dashboard wire harness 5P or 13P connector (C) from the cable reel (D).

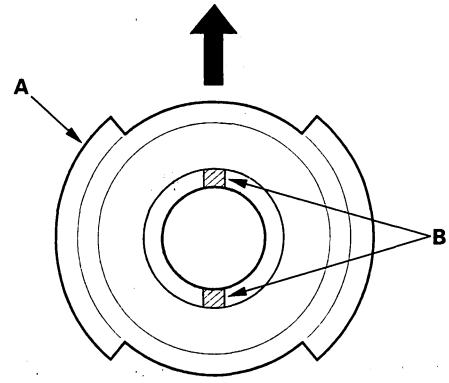


9. Release the lock tab (A) under the cable reel connector with a 90 ° hook shaped tool (B). Slide the tool below the cable reel connector just above the lock tab. Release the lower lock tab (C), and slide the cable reel off the column.

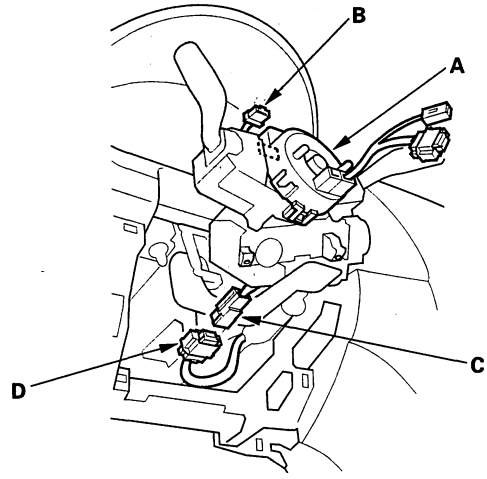


Installation

1. Before installing the steering wheel, align the front wheels straight ahead.
2. Disconnect the battery negative cable, and wait at least 3 minutes.
3. Set the turn signal cancelling sleeve (A) so that the projections (B) are aligned vertically.



4. Carefully install the cable reel (A) on the steering column shaft. Then connect the 5P or 13P connector (B) to the cable reel, and connect the 4P connector (C) to the dashboard wire harness 4P connector (D).



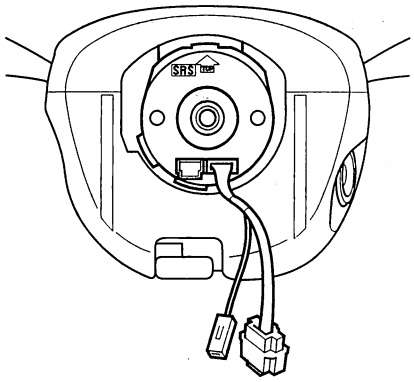
(cont'd)

Protected by AR

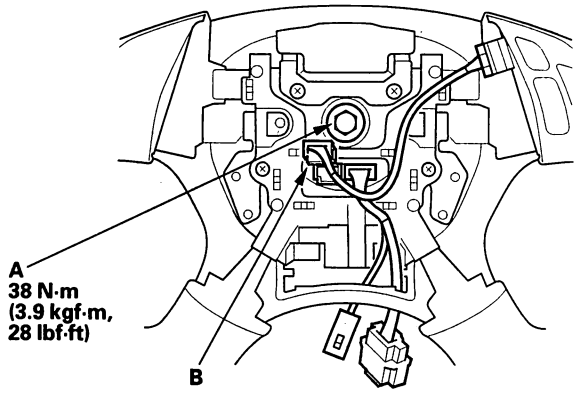
Cable Reel Replacement (cont'd)

5. Install the steering column covers.

6. If necessary, center the cable reel. (New replacement cable reels come centered.) Do this by first rotating the cable reel clockwise until it stops. Then rotate it counterclockwise (about 3 turns) until the arrow mark on the cable reel label points straight up.



7. Align the projections on the cable reel with the holes on the steering wheel (see step 2 on page 17-24). Install the steering wheel with a new steering wheel bolt (A), then reconnect the connector (B).



8. Install the driver's airbag (see page 23-197).

9. Reconnect the battery negative cable.

10. After installing the cable reel, confirm proper system operation:

    - Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
    - After the SRS indicator has turned off, turn the steering wheel fully left and right to confirm the indicator does not come on.
    - Make sure the horn works.

BACK

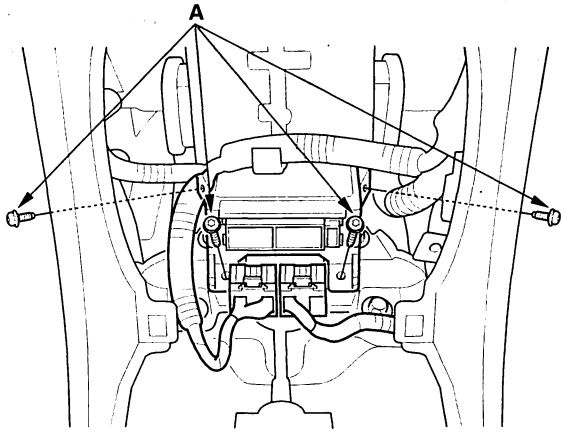
Protected by AR

SRS Unit Replacement

NOTE: Make sure the SRS unit and the impact sensors are of the same manufacturer.

Removal

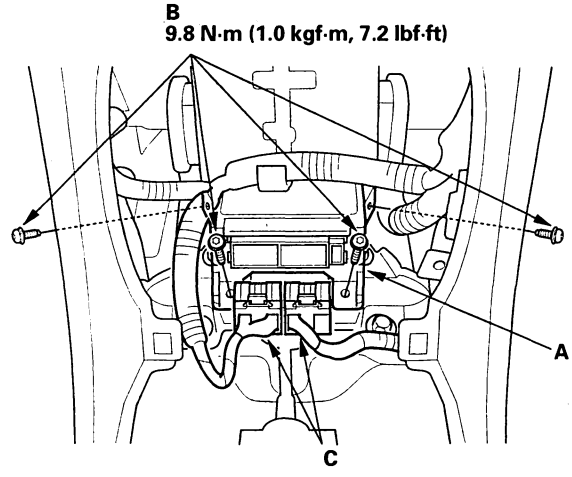
1. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
2. Disconnect both seat belt tensioner connectors (see step 6 on page 23-29).
3. Remove the center console and front panel (see page 20-125).
4. Remove the center pocket (see page 20-132).
5. Remove the center holder (see page 20-125).
6. Remove the driver's and passenger's center lower cover (see page 20-136).
7. Remove the heater vent ducts (see page 20-136).
8. Disconnect the connectors and remove the Torx bolts (A), then pull out the SRS unit.



Installation

1. Install the new SRS unit (A) with Torx bolts (B), then connect the connectors (C) to the SRS unit; push them into position until they click.

   NOTE: Be sure the SRS unit is sitting squarely against its bracket before torquing the Torx bolts.



2. Reconnect both seat belt tensioner connectors (see step 6 on page 23-29).
3. Reconnect the battery negative cable.
4. After installing the SRS unit, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
5. Install all removed parts.

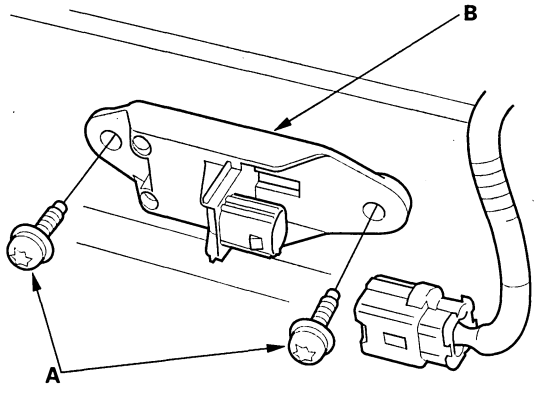
Protected by AR

Side Impact Sensor (First) Replacement

NOTE:
- Review the seat replacement procedure before doing repairs or service.
- Make sure the SRS unit and the impact sensors are of the same manufacturer.

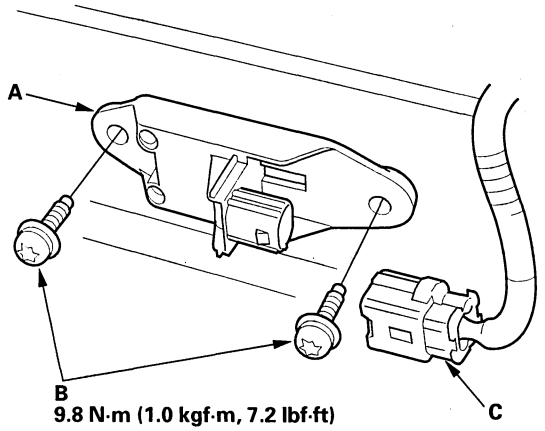
Removal

1. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
2. Disconnect the appropriate side airbag 2P connector (see step 4 on page 23-28).
3. Remove the seat assembly (see page 20-144).
4. Remove the front door sill trim and the center pillar lower trim panel.
   - 2-door (see page 20-90)
   - 4-door (see page 20-91)
5. Disconnect the floor wire harness 2P connector from the side impact sensor (first).
6. Remove the Torx bolts (A) using a Torx T30 bit, then remove the side impact sensor (first) (B).



Installation

1. Install the new side impact sensor (first) (A) with the Torx bolts (B), then connect the floor wire harness 2P connector (C) to the side impact sensor.



2. Reconnect the battery negative cable.
3. Install all removed parts.
4. After installing the side impact sensor (first), confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.

BACK

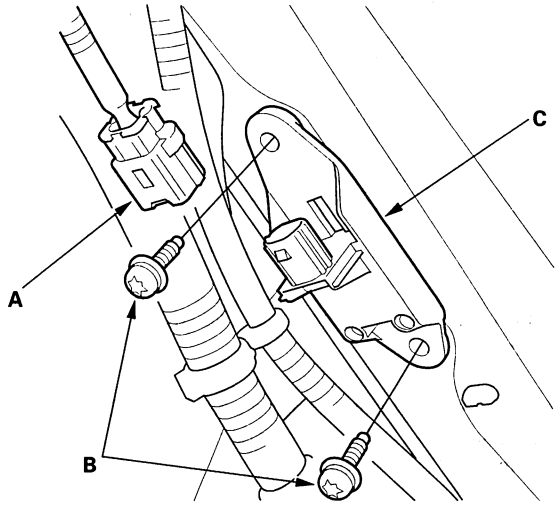
Protected by AR

Side Impact Sensor (Second) Replacement

NOTE: Make sure the SRS unit and the impact sensors are of the same manufacturer.

Removal

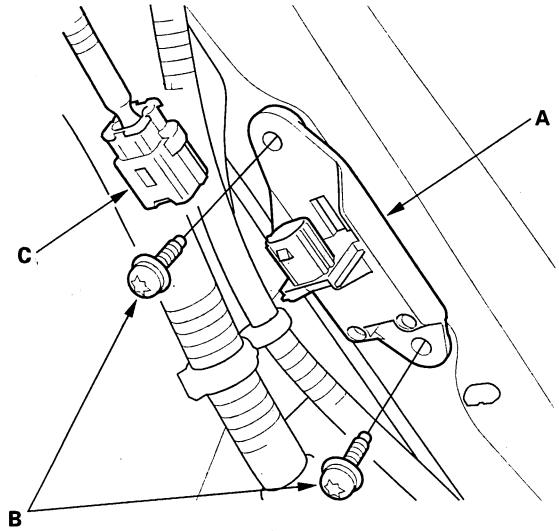
1. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
2. Disconnect the appropriate side curtain airbag 2P connector (see step 5 on page 23-28).
3. Disconnect the side impact sensor (second) 2P connector (A) from the side curtain airbag subharness.



4. Remove the Torx bolts (B) using a Torx T30 bit, then remove the side impact sensor (second) (C).

Installation

1. Install the new side impact sensor (second) (A) with the Torx bolts (B), then connect the side curtain airbag subharness 2P connector (C) to the side impact sensor (second).



9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)

2. Reconnect the battery negative cable.
3. Install all removed parts.
4. After installing the side impact sensor (second), confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.

BACK

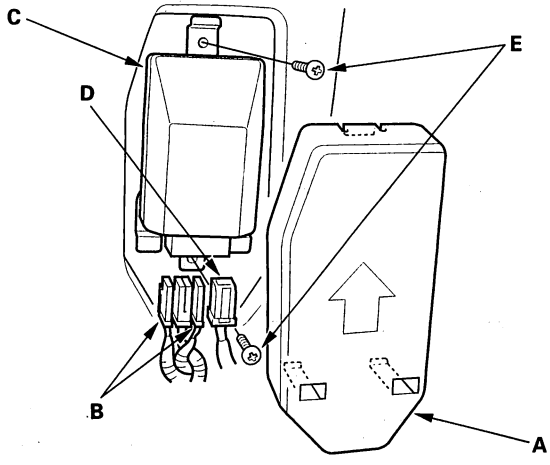
Protected by AR

OPDS/ODS Unit Replacement

NOTE: Review the seat replacement procedure (see page 20-144) before doing repairs or service.

Removal

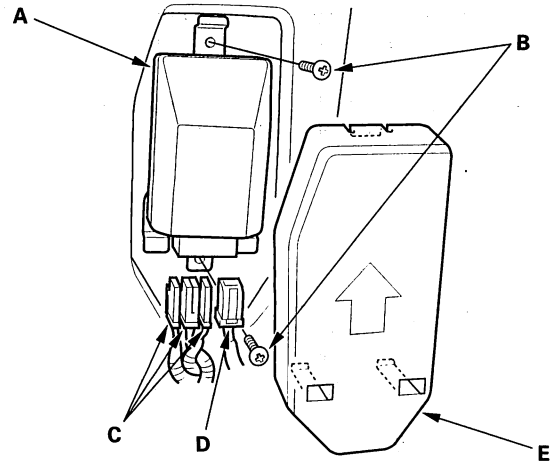
1. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
2. Disconnect the front passenger's side airbag harness 2P connector (see step 4 on page 23-28).
3. Remove the front passenger's seat assembly (see page 20-144) and seat-back cover (see page 20-166).
4. Remove the cover (A), then disconnect the OPDS unit 8P/ODS unit 18P connector D and sensor connectors (B) from the OPDS/ODS unit (C).



5. Remove the two screws (E) and the OPDS/ODS unit.

Installation

1. Place the new OPDS/ODS unit (A) on the seat-back frame. Tighten the two screws (B), and connect the OPDS unit harness 8P/ODS unit harness 18P connector D and sensor connectors (C) to the OPDS/ODS unit. Reinstall the cover (E).



2. Install the seat-back cover in the reverse order of removal.
3. Install the front passenger's seat assembly (see page 20-144), then connect the side airbag harness 2P connector.
4. Reconnect the battery negative cable.
5. Set the seat-back in the normal position, and make sure there is nothing on the front passenger's seat.
6. Initialize the OPDS/ODS unit (see page 23-32).
7. Calibrate the OPDS/ODS unit ('06 model) (see page 23-33).
8. After installing the OPDS/ODS unit, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.

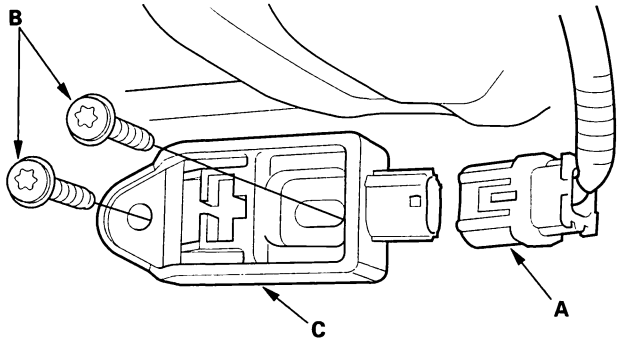
Front Impact Sensor Replacement

NOTE: Make sure the SRS unit and the impact sensors are of the same manufacturer.

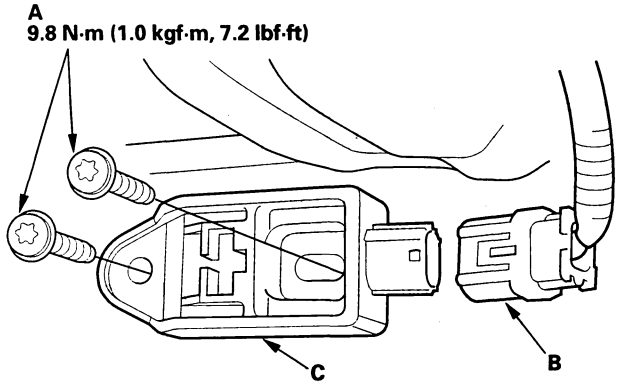
Removal

1. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
2. Disconnect the driver's airbag 4P connector (see step 2 on page 23-28), the front passenger's airbag 4P connector (see step 3 on page 23-28), and both seat belt tensioner 2P connectors (see step 6 on page 23-29).
3. Remove the front bumper.
   - 2-door (see page 20-184)
   - 4-door (see page 20-185)
4. Remove the washer reservoir for the right side sensor or the intake air resonator for the left side sensor (see page 22-254).
5. Disconnect the engine compartment wire harness 2P connector (A), and remove the two Torx bolts (B) using a Torx T30 bit, then remove the front impact sensor (C).



Installation

1. Install the new front impact sensor with new Torx bolts (A), then connect the engine compartment wire harness 2P connector (B) to the front impact sensor (C).



2. Reconnect the driver's airbag 4P connector (see page 23-28), the front passenger's airbag 4P connector (see page 23-28), and both seat belt tensioner 4P connectors (see page 23-29).
3. Reconnect the battery negative cable.
4. After installing the front impact sensor, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
5. Install all removed parts.

Front Passenger's Weight Sensor Replacement

Removal ('04-06 models)

NOTE: Removal of the front passenger's weight sensors must be performed according to the precautions/ procedures described at the beginning of SRS (see page 23-19).

1. Remove the front passenger's seat assembly (see page 20-144).
2. Remove the tamper-resistant Torx bolts attaching the seat to the weight sensors.
   - 2-door (see page 20-157)
   - 4-door (see page 20-158)
3. Remove the front passenger's weight sensors from the seat riser.
   - 2-door (see page 20-157)
   - 4-door (see page 20-158)

Installation ('04-06 models)

NOTE: Be sure to install the harness wires so they are not pinched or interfering with other parts.

1. Place the new front passenger's weight sensors on the front passenger's seat riser.
   - 2-door (see page 20-157)
   - 4-door (see page 20-158)
2. Install the seat onto the weight sensors.
3. Reinstall the front passenger's seat assembly (see page 20-144).
4. Reconnect the battery negative cable.
5. Calibrate the front passenger's weight sensor unit (see page 23-33) ('03-05 models) ODS unit ('06 model) (see page 23-33).
6. After installing the front passenger's weight sensors, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.

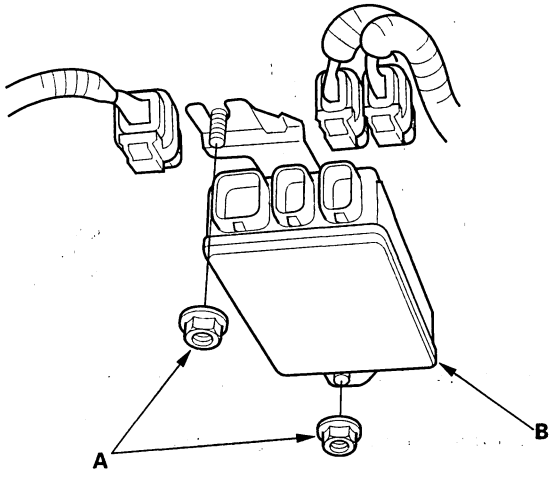
Front Passenger's Weight Sensor Unit Replacement

NOTE: Review the seat replacement procedure (see page 20-144) before performing repair or service.

Removal ('04-05 models)

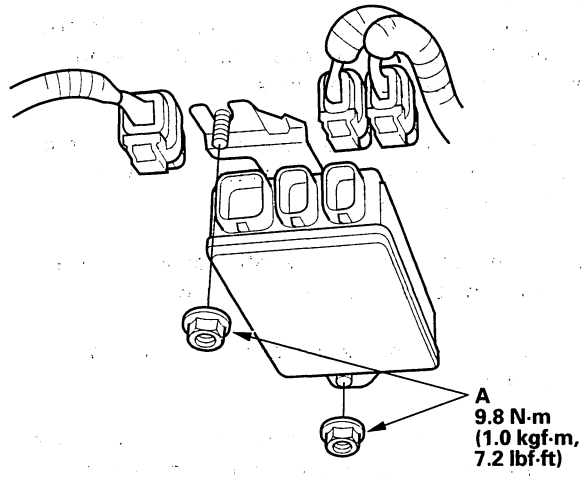
1. Make sure you have the anti-theft codes for the audio and the navigation system, then write down the audio presets.
2. Slide the seat all the way to the rear.
3. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
4. Disconnect the front passenger's airbag 4P connector (see step 3 on page 23-28).
5. Disconnect the connectors. Remove the mounting nuts (A) and the front passenger's weight sensor unit (B) from the seat riser.



Installation ('04-05 models)

NOTE: Be sure to install the harness wires so they are not pinched or interfering with other parts.

1. Place the new front passenger's weight sensor unit on the seat riser. Tighten the two mounting nuts (A) and connect the connectors.



2. Reconnect the front passenger's airbag 4P connector (see page 23-28).
3. Reconnect the battery negative cable.
4. Calibrate the front passenger's weight sensor unit (see page 23-33).
5. After installing the front passenger's weight sensor unit, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
6. Enter the anti-theft codes for the audio and the navigation system, then enter the customer's audio presets, and set the clock.

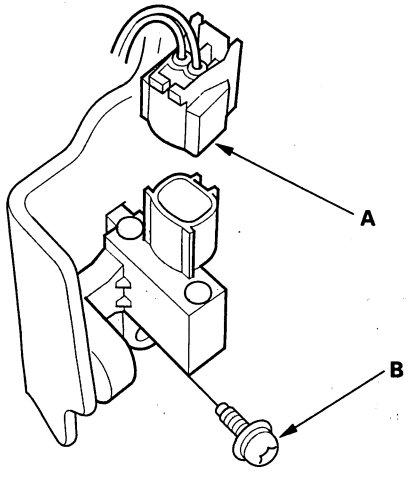
Driver's Seat Position Sensor Replacement

Removal ('04-06 models)

NOTE:
- Removal of the driver's seat position sensor must be performed according to the precautions/procedures described at the beginning of SRS (see page 23-19).
- Before disconnecting the driver's seat position sensor 2P connector, disconnect the driver's airbag 4P connector.
- Do not turn the ignition switch ON (II), and do not connect the battery negative cable while removing the driver's seat position sensor.

1. Make sure you have the anti-theft codes for the audio and the navigation system, then write down the audio presets.
2. Disconnect the battery negative cable, and wait at least 3 minutes before beginning work.
3. Remove the driver's seat assembly (see page 20-144).
4. Disconnect the floor wire harness or seat position sensor harness 2P connector (A) from the driver's seat position sensor.

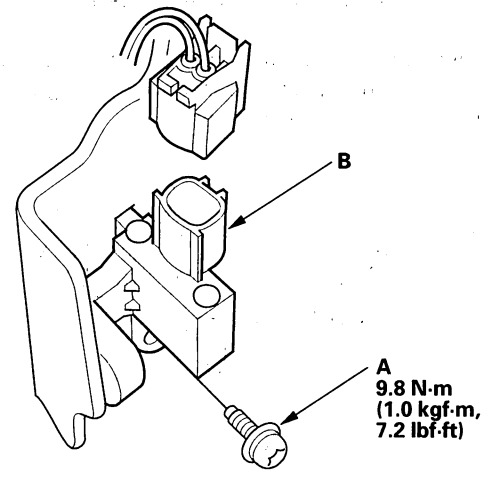


5. Using a Torx T30 bit, remove the Torx bolt (B), then remove the driver's seat position sensor.

Installation ('04-06 models)

NOTE:
- Be sure to install the harness wires so they are not pinched or interfering with other parts.
- Do not turn the ignition switch ON (II), and do not connect the battery negative cable while installing the driver's seat position sensor.
- After installing the driver's seat position sensor, make sure it is clean. Keep it away from dust.

1. Install the new driver's seat position sensor with a Torx bolt (A), then connect the floor wire harness or seat position sensor harness 2P connector to the driver's seat position sensor (B).



2. Install the driver's seat assembly (see page 20-144).
3. Reconnect the battery negative cable.
4. Check the operation of the driver's seat position sensor with the HDS (see page 23-37).
5. Enter the anti-theft codes for the audio and navigation system, then enter the customer's audio presets, and set the clock.

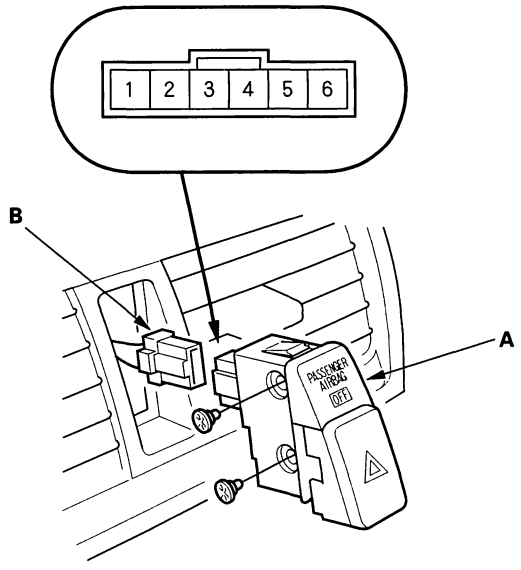
Passenger's Airbag Cutoff Indicator Illumination Bulb Test

'04-06 models

1. Remove the upper panel (see page 20-131).
2. Push out the passenger's airbag cutoff indicator (A) from behind the upper panel.



3. Disconnect the 6P connector (B) from the passenger's airbag cutoff indicator.
4. Check for continuity between the No. 3 and No. 4 terminals of the indicator. If there is no continuity, replace the bulb.
5. Install the parts in the reverse order of removal.

Cooling

Item	Measurement	Qualification	Standard or New
Radiator	Coolant capacity (includes engine, heater, hoses, and reservoir) Use Honda Long Life Antifreeze/ Coolant Type 2	M/T: engine overhaul	8.2 L (2.17 US gal)
		M/T: coolant change	6.6 L (1.74 US gal)
		A/T: engine overhaul	8.4 L (2.22 US gal)
		A/T: coolant change	6.7 L (1.77 US gal)
Reservoir	Coolant capacity		0.6 L (0.16 US gal)
Radiator cap	Opening pressure		93—123 kPa (0.95—1.25 kgf/cm², 14—18 psi)
Thermostat	Opening temperature	Begins to open	169—176 °F (76—80 °C)
		Fully open	194 °F (90 °C)
	Valve lift at fully open		10.0 mm (0.39 in.) min.

Fuel and Emissions

Item	Measurement	Qualification	Standard or New
Fuel pressure regulator	Pressure with fuel pressure gauge connected	2003-2004 models	330—380 kPa (3.4—3.9 kgf/cm², 48—55 psi)
		2005-2006 models	380—430 kPa (3.9—4.4 kgf/cm², 55—63 psi)
Fuel tank	Capacity		64.7 L (17.09 US gal)
Engine idle	Idle speed without load	A/T in N or P position	790±50 rpm
		M/T in neutral	750±50 rpm
	Idle speed with high electric load (A/C switch ON, temperature set to Max Cool, blower fan on High, rear window defogger ON, and headlights on high beams)	A/T in N or P position	790±50 rpm
		M/T in neutral	750±50 rpm

Clutch

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch pedal	Height from the floor		191 mm (7.52 in.)	———
	Stroke		130—140 mm (5.12—5.51 in.)	———
	Play		10—18 mm (0.39—0.71 in.)	———
	Disengagement height from the floor		90.5 mm (3.56 in.) min.	———
Clutch disc	Rivet head depth		1.0 mm (0.039 in.) min.	0.2 mm (0.008 in.)
	Thickness		8.68—9.53 mm (0.342—0.375 in.)	7.2 mm (0.28 in.)
Pressure plate	Warpage		0.03 mm (0.001 in.) max.	0.15 mm (0.006 in.)
	Height of diaphragm spring fingers	Measured with special tool and feeler gauge	0.6 mm (0.02 in.) max.	0.8 mm (0.03 in.)

Lubricants and Fluids

For details of lubrication points and type of lubricants to be applied, refer to the illustrated index and various work procedures (such as Assembly/Reassembly, Replacement, Overhaul, Installation, etc.) contained in each section.

Lubrication Points		Lubricant
A	Engine	Honda Motor Oil: P/N 08798-9023 (5W-20) Look for the API Certification seal on the oil container as shown below. Make sure it says "For Gasoline Engines." SAE viscosity: see chart below.
B	Manual Transmission	Honda Manual Transmission Fluid (MTF): P/N 08798-9016 Always use Honda MTF. Using motor oil can cause stiffer shifting because it does not contain the proper additives.
	Automatic Transmission	Honda Automatic Transmission Fluid (ATF)-Z1: P/N 08200-9001 Always use Honda ATF-Z1. Using a non-Honda ATF can Affect shift quality.
C	Brake system (includes ABS line)*1, (includes VSA line)*2	Honda DOT 3 Brake Fluid : P/N 08798-9008
D	Clutch line	Honda DOT 3 Brake Fluid : P/N 08798-9008 Always use Honda DOT 3 Brake Fluid. Using a non-Honda brake fluid can cause corrosion and decrease the life of the system.
E F G H	Shift lever (manual transmission) Release fork (manual transmission) Shift and select cable ends Throttle cable end (throttle link)*1	Super High Temp Grease: P/N 08798-9002
I J	Throttle cable end (below dashboard) Caliper piston boot, calipper pins, and boots	Honda Silicone Grease: P/N 08C30-B0234M
K L M N O P Q R S	Brake booster clevis Clutch master cylinder clevis Battery terminals Pedal linkage Fuel fill door Hood hinges and hood latch Door hinges: upper and lower Trunk hinges Power steering gearbox	Multipurpose grease
T	Power steering system	Honda Power Steering Fluid Always use Honda Power Steering Fluid. Using any other type of power steering fluid or automatic transmission fluid can cause increased wear and poor steering in cold weather.
U	Air conditioning compressor	Compressor oil: DENSO ND-OIL 8 (P/N 38897-PR7-A01AH or 38899-PR7-A01) for refrigerant HFC-134a (R-134a)

Maintenance Schedule

Listed by Distance/Time for Normal Conditions

2003-2005 Models

Follow the Normal Schedule if the severe driving conditions specified in the Maintenance Schedule for Severe Conditions do not apply, and if only OCCASIONALLY driven in severe driving conditions. Follow the Severe Conditions schedule if the vehicle is driven MAINLY in Canada.

Distance		Time	Maintenance Items
7,500 miles	12,000 km	———	Do items in A.
15,000 miles	24,000 km	1 year	Do items in A and B.
22,500 miles	36,000 km	———	Do items in A.
30,000 miles	48,000 km	2 years	Do items in A, B, and C.
37,500 miles	60,000 km	———	Do items in A.
45,000 miles	72,000 km	3 years	Do items in A and B.
———	———	3 years	Replace brake fluid (see page 19-9)*1. Use Honda DOT 3 Brake Fluid.
52,500 miles	84,000 km	———	Do items in A.
60,000 miles	96,000 km	4 years	Do items in A, B, and C.
67,500 miles	108,000 km	———	Do items in A.
75,000 miles	120,000 km	5 years	Do items in A and B.
82,500 miles	132,000 km	———	Do items in A.
90,000 miles	144,000 km	6 years	Do items in A, B, and C.
———	———	6 years	Replace brake fluid (see page 19-9)*1. Use Honda DOT 3 Brake Fluid.
97,500 miles	156,000 km	———	Do items in A.
105,000 miles	168,000 km	7 years	Do items in A, B, and D.
112,500 miles	180,000 km	———	Do items in A.
120,000 miles	192,000 km	8 years	Do items in A, B, C, E, F, and G.
127,500 miles	204,000 km	———	Do items in A.
135,000 miles	216,000 km	9 years	Do items in A and B.
———	———	9 years	Replace brake fluid (see page 19-9)*1. Use Honda DOT 3 Brake Fluid.
142,500 miles	228,000 km	———	Do items in A.
150,000 miles	240,000 km	10 years	Do items in A, B, and C.
157,500 miles	252,000 km	———	Do items in A.
165,000 miles	264,000 km	———	Inspect idle speed (see page 11-301). Idle speed: M/T 750±50 rpm, A/T 790±50 rpm in N or P position.
165,000 miles	264,000 km	11 years	Do items in A and B.

* 1: Refer to the 2003-2006 ACCORD Service Manual (P/N 61SDA08).

BACK

Protected by AR

2003-2005 Models

Do the items in parts A, B, C, D, E, F, and G as required for the mileage/time interval listed.

Part	Maintenance Items
A	Replace engine oil (see page 8-6) every 7,500 miles (12,000 km) or 1 year. Engine oil capacity without oil filter: 4.0 L (4.2 US qt).
	Rotate tires, and check tire inflation and condition every 7,500 miles (12,000 km). Follow the pattern shown in the Owner's Manual.
B	Replace engine oil filter (see page 8-7) every 15,000 miles (24,000 km) or 1 year. Engine oil capacity with oil filter: 4.3 L (4.5 US qt).
	Check front brake (see page 19-2) and rear brake (see page 19-21)*1 every 15,000 miles (24,000 km) or 1 year. • Check pads and discs for wear (thickness), damage, and cracks. • Check calipers for damage, leaks, and tightness of mount bolts.
	Check parking brake adjustment (see page 19-7)*1 every 15,000 miles (24,000 km) or 1 year. Check the number of clicks (6 to 9) when parking brake lever pulled with 196 N (20 kgf, 44 lbf) of force.
	Inspect tie-rod ends, steering gearbox, and gearbox boot (see page 17-3)*1 every 15,000 miles (24,000 km) or 1 year. • Check rack grease and steering linkage. • Check boots for damage and leaking grease. • Check fluid lines for damage or leaks.
	Inspect suspension components (see page 18-3)*1 every 15,000 miles (24,000 km) or 1 year. • Check bolts for tightness. • Check condition of ball joint boots for deterioration and damage.
	Inspect driveshaft boots (see page 16-4)*1 every 15,000 miles (24,000 km) or 1 year. Check boots for cracks and boot bands for tightness.
	Inspect brake hoses and lines including ABS (see page 19-31)*1 every 15,000 miles (24,000 km) or 1 year. Check the master cylinder and ABS modulator control-unit for damage or leakage.
	Inspect all fluid levels and condition of fluids every 15,000 miles (24,000 km) or 1 year. • Manual transmission fluid (MTF) (2-door model only) (see page 13-10). • Automatic transmission fluid (ATF-Z1) (see page 14-185). • Power steering fluid (see page 17-10). • Brake fluid (see page 19-9)*1. • Windshield washer fluid. • Engine coolant (see page 10-6).
	Inspect exhaust system, 2003-2005 models (see page 9-15)*1, 2006 model (see page 9-6) every 15,000 miles (24,000 km) or 1 year. Check catalytic converter heat shield, exhaust pipe, and muffler for damage, leaks, and tightness.
	Inspect fuel lines and connections (see page 11-319)* every 15,000 miles (24,000 km) or 1 year. Check for loose connections, cracks, and deterioration; retighten loose connections, and replace damage parts.

* 1: Refer to the 2003-2006 ACCORD Service Manual (P/N 61SDA08).

NOTE: According to state and federal regulations, failure to do the maintenance items marked with an asterisk (*) will not void the customer's emissions warranties. However, Honda recommends that all maintenance services be done at the recommended intervals to ensure long-term reliability.

(cont'd)

Protected by AR

Maintenance Schedule

Listed by Distance/Time for Normal Conditions (cont'd)

Do the items in parts A, B, C, D, E, F, and G as required for the mileage/time interval listed.

Part	Maintenance Items
C	Inspect drive belt (see page 4-35) every 30,000 miles (48,000 km) or 2 years. Inspect auto tensioner indicator; no adjustment needed.
	Replace dust and pollen filter (see page 21-51)*1 every 30,000 miles (48,000 km) or 2 years. • Replace the filter as often (at 15,000 miles/24,000 km intervals) if the vehicle is driven mostly in urban area that have high concentrations of soot in the air from industry and diesel-powered vehicles. • Replace the filter whenever airflow from the heating and cooling system is less than normal.
	Replace air cleaner element (see page 11-344) every 30,000 miles (48,000 km), (independent of time).
D	Inspect the valve clearance (see page 6-8) every 105,000 miles (168,000 km), otherwise adjust only if noisy. Intake: 0.20—0.24 mm (0.008—0.009 in.), Exhaust: 0.28—0.32 mm (0.011—0.013 in.).
	Replace spark plugs (see page 4-23) every 105,000 miles (168,000 km). Use IZFR6K11 (NGK) or SKJ20DR-M11 (DENSO).
	Replace timing belt (see page 6-14), and inspect water pump (see page 10-5) every 105,000 miles (168,000 km) or 7 years.
E	Replace automatic transmission fluid (see page 14-186) at 120,000 miles (192,000 km) or 6 years, then replace every 90,000 miles (144,000 km) or 5 years. Capacitiy: 3.0 L (3.2 US qt); use Honda ATF-Z1.
F	Replace manual transmission fluid (2-door model only) (see page 13-10) every 120,000 miles (192,000 km) or 8 years. Capacitiy: 2.2 L (2.3 US qt); use Honda MTF.
G	Replace engine coolant (see page 10-6) at 120,000 miles (192,000 km) or 10 years, then every 60,000 miles (96,000 km) or 5 years. Capacitiy: M/T 6.6 L (1.74 US gal), A/T 6.7 L (1.77 US gal); use Honda Long Life Antifreeze/coolant Type 2.

* 1: Refer to the 2003-2006 ACCORD Service Manual (P/N 61SDA08).

Listed by Distance/Time for Severe Conditions

2003-2005 Models

Use the Severe Conditions schedule if the vehicle is driven MAINLY in Canada or in any of the following conditions; if only OCCASIONALLY driven in these conditions, use the Normal Conditions schedule.

Severe Driving Conditions

- Driving less than 5 miles (8 km) per trip or, in freezing temperatures, driving less than 10 miles (16 km) per trip.
- Driving in extremely hot over 90°F (32°C) conditions.
- Extensive idling, or long periods of stop-and-go driving, such as a taxi or a commercial delivery vehicle.
- Trailer towing, driving with a loaded roof rack, or driving in mountainous conditions.
- Driving on muddy, dusty, or de-iced roads.

Distance		Time	Maintenance Items

Maintenance Schedule

Listed by Distance/Time for Severe Conditions (cont'd)

Do the items in parts A, B, C, D, E, F, G, H, and I as required for the mileage/time interval listed.

Part	Maintenance Items
D	Inspect drive belt (see page 4-35) every 30,000 miles (48,000 km) or 2 years. Inspect auto tensioner indicator; no adjustment needed.
	Replace dust and pollen filter (see page 21-51)*1 every 30,000 miles (48,000 km) or 2 years. • Replace the filter as often (at 15,000 miles/24,000 km intervals) if the vehicle is driven mostly in urban area that have high concentrations of soot in the air from industry and diesel-powered vehicles. • Replace the filter whenever airflow from the heating and cooling/climate control system is less than normal.
E	Replace automatic transmission fluid (see page 14-186) at 60,000 miles (96,000 km) or 3 years, then replace every 30,000 miles (48,000 km) or 2 years. Capacitiy: 3.0 L (3.2 US qt); use Honda ATF-Z1.
F	Replace manual transmission fluid (2-door model only) (see page 13-10) every 60,000 miles (96,000 km) or 4 years. Capacitiy: 2.2 L (2.3 US qt); use Honda MTF.
G	Inspect the valve clearance (see page 6-8) every 105,000 miles (168,000 km), otherwise adjust only if noisy. Intake: 0.20—0.24 mm (0.008—0.009 in.), Exhaust: 0.28—0.32 mm (0.011—0.013 in.).
	Replace spark plugs (see page 4-23) every 105,000 miles (168,000 km). Use IZFR6K11 (NGK) or SKJ20DR-M11 (DENSO).
H	Replace timing belt (see page 6-14) and inspect water pump (see page 10-5) every 60,000 miles (100,000 km) or 7 years.
I	Replace engine coolant (see page 10-6) at 120,000 miles (192,000 km) or 10 years, then every 60,000 miles (96,000 km) or 5 years. Capacitiy: M/T 6.6 L (1.74 US gal), A/T 6.7 L (1.77 US gal); use Honda Long Life Antifreeze/coolant Type 2.

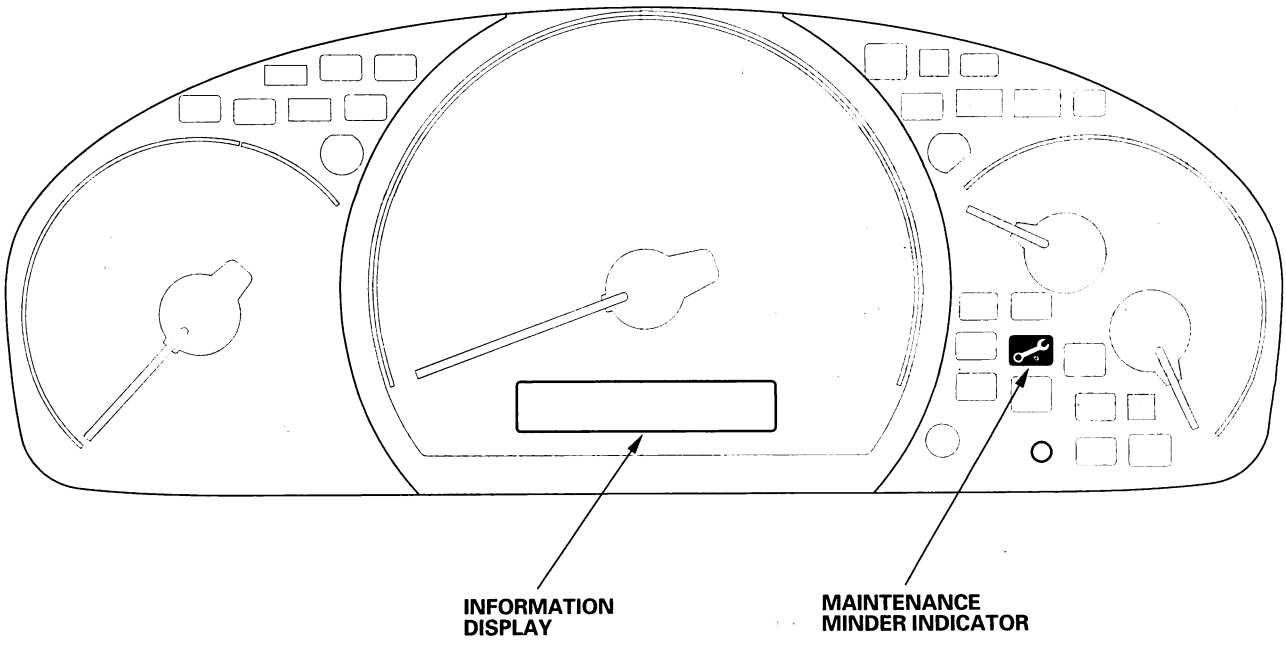
Maintenance Minder

Maintenance Display

2006 Model

The Maintenance Minder is an important feature of the information display. Based on engine operating conditions and accumulated engine revolutions, the Accord's onboard computer (ECM/PCM) calculates the remaining engine oil life. The system also displays the code for other scheduled maintenance items needing service.



Protected by AR

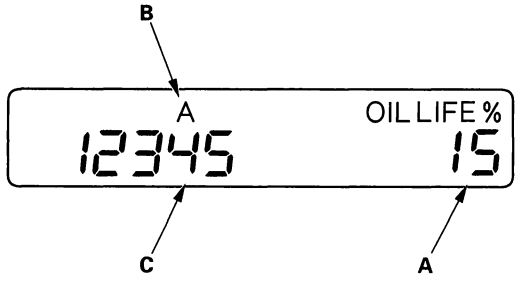
Engine Oil Life Indicator

2006 Model

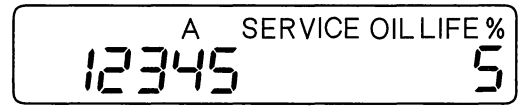
1. To see the current engine oil life, turn the ignition switch to ON (II), and push and release the trip meter select/reset knob instrument panel repeatedly until the engine oil life indicator is displayed.

2. If the oil life is 15 percent or less, you will see the oil life indicator (A) for several seconds every time you turn the ignition switch to ON (II). The maintenance minder indicator also comes on, and the maintenance item code(s) for other maintenance items needing service are displayed next to the engine oil life indicator.

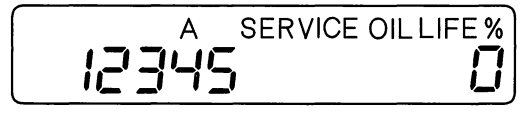
   - Complete list of maintenance main items "A" (B) (see page 3-14).
   - Complete list of maintenance sub items "B" (C) (see page 3-15).



3. When the remaining engine oil life is less then 5 percent, you will see "SERVICE OIL LIFE" message in the smart maintenance display along with the same maintenance item code(s) every time you turn the ignition switch to ON (II).



4. When the oil life is 0 percent, the remaining oil life indicator blinks when the ignition switch is in the ON (II) position.



BACK

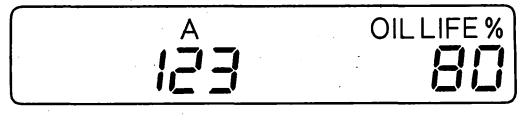
Protected by AR

5. If you still do not perform the indicated maintenance, you will see a negative mileage, for example "—10," blinking in the display. This negative mileage means that you should have performed the indicated maintenance 10 miles ago.

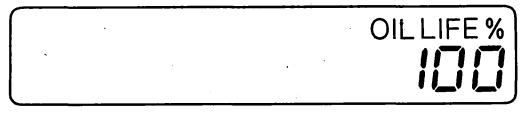
Resetting the Engine Oil Life Indicator

2006 Model

1. Turn the ignition switch to ON (II).
2. Press the trip meter select/reset knob on the instrument panel repeatedly until the engine oil life indicator is displayed.
3. Press and hold the trip meter select/reset knob for about 10 seconds until the engine oil life and maintenance item code(s) blink, then release the knob.



4. Press and hold the trip meter select/reset knob again for about 5 seconds. The maintenance item code(s) disappear and the engine oil life resets to "100," then release the knob.



Protected by AR

Maintenance Minder

Maintenance Main Items

2006 Model

If you do not see the maintenance minder indicator or the maintenance schedule display more than 12 months after the display is reset, change the engine oil every year.

NOTE:
- Independent of the maintenance messages in the smart maintenance display, replace the brake fluid every 3 years.
- Inspect idle speed every 160,000 miles (256,000 km).
- Adjust the valves during services A, B, 1, 2 or 3 if they are noisy.

Symbol	Maintenance Main Items
A	Replace engine oil (see page 8-6). Engine oil capacity without oil filter: 4.0 L (4.2 US qt).
B	Replace engine oil and oil filter (see page 8-7). Engine oil capacity with oil filter: 4.2 L (4.4 US qt).
	Rotate tires, and check tire inflation and condition. Follow the pattern shown in the Owner's Manual.
	Check front brake (see page 19-2) and rear brakes (see page 19-21)*1. • Check pads and discs for wear (thickness), damage, and cracks. • Check calipers for damage, leaks, and tightness of mounting bolts. • Check brake linings for cracking, glazing, wear, or contamination.
	Check parking brake adjustment (see page 19-7)*1. Check the number of clicks (4 to 5) when the parking brake pedal is pressed with 294 N (30 kgf, 66 lbf) of force.
	Inspect tie-rod ends, steering gearbox, and gearbox boots (see page 17-8)*1. • Check rack grease and steering linkage. • Check boots for damage and leaking grease. • Check fluid lines for damage and leaks.
	Inspect suspension components (see page 18-3)*1. • Check bolts for tightness. • Check condition of ball joint boots for deterioration and damage.
	Inspect driveshaft boots (see page 16-4). Check boots for cracks and boot bands for tightness.
	Inspect brake hoses and lines including VSA (see page 19-31)*1. Check the master cylinder and VSA modulator for damage and leakage.
	Inspect all fluid levels and condition of fluids. • Automatic transmission fluid (ATF-Z1) (see page 14-185). • Power steering fluid (see page 17-10)*1. • Brake fluid (see page 19-9)*1. • Windshield washer fluid. • Engine coolant (see page 10-6).
	Inspect exhaust system (see page 9-6)*. Check catalytic converter heat shields, exhaust pipes, and muffler for damage, leaks, and tightness.
	Inspect fuel lines and connections (see page 11-319)*. Check for loose connections, cracks, and deterioration; retighten loose connections and replace damaged parts.

* 1: Refer to the 2003-2006 ACCORD Service Manual (P/N 61SDA08).

NOTE: According to state and federal regulations, failure to do the maintenance items marked with an asterisk (*) will not void the customer's emissions warranties. However, Honda recommends that all maintenance services be done at the recommended interval, to ensure long-term reliability.

Maintenance Sub Items

2006 Model

Number	Maintenance Sub Items
1	Rotate tires, and check tire inflation and condition. Follow the pattern shown in the Owner's Manual.
2	Replace air cleaner element (see page 11-344). Replace every 15,000 miles (24,000 km), If the vehicle is driven primarily in dusty conditions.
	Replace dust and pollen filter (see page 21-51)*1. • If you drive primarily in urban areas that have high concentrations of soot in the air from industry and from diesel-powered vehicles, replace every 15,000 miles (24,000 km). • Replace the filter whenever airflow from the heating and cooling/climate control system is less than normal.
	Inspect drive belt (see page 4-35). Look for cracks and damage, then check the position of the drive belt auto-tensioner indicator.
3	Replace automatic transmission fluid (see page 14-186). • Driving in mountainous areas at very low vehicle speed or trailer towing results in higher transmission temperatures. This requires transmission fluid changes more frequently than recommended by the Maintenance Minder. If you regularly drive your vehicle under these conditions, have the transmission fluid changed at 60,000 miles (10,000 km), then every 30,000 miles (48,000 km). • Capacity: 3.1 L (3.3 US qt); use Honda ATF-Z1.
4	Replace spark plugs (see page 4-20). Use SKJ20DR-M11 (DENSO).
	Replace timing belt (see page 6-20), if the vehicle is regularly driven in very high temperatures (over 110°F, 43°C), or in very low temperatures (under −20°F, −29°C), replace every 60,000 miles (U.S.)/ 100,000 km (Canada) and inspect water pump (see page 10-5).
	Inspect the valve clearance (cold) (see page 6-8). • Otherwise, adjust only if noisy. • Intake: 0.20—0.24 mm (0.008—0.009 in.), Exhaust: 0.28—0.32 mm (0.011—0.013 in.).
5	Replace engine coolant (see page 10-6). Capacity (including the reserve tank): M/T 6.6 L (1.74 US gal), A/T 6.7 L (1.77 US gal); use Honda Long Life Antifreeze/Coolant Type 2.

* 1: Refer to the 2003-2006 ACCORD Service Manual (P/N 61SDA08).

Protected by AR

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If engine electrical maintenance is required)

The Accord SRS includes a driver's airbag in the steering wheel hub, a passenger's airbag in the dashboard above the glove box, seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in the 2003-2006 Accord Service Manual, P/N 61SDA08. Items marked with an asterisk (*) on the contents page include or are located near SRS components. Servicing, disassembling, or replacing these items require special precautions and tools, and should be done only by an authorized Honda dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work must be performed by an authorized Honda dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the airbags and/or side airbags.
- Do not bump or impact the SRS unit, front impact sensors, or side impact sensors when the ignition switch is ON (II), or for at least 3 minutes after the ignition switch is turned OFF; otherwise, the system may fail in a collision, or the airbags may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, front console, dashboard, dashboard lower panel, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Engine does not start (does not crank)	1. Check for PGM-FI DTCs. 2. Check for loose battery terminals or connections. 3. Test the battery for a low charge, refer to the 2003-2006 Accord Service Manual (see page 22-78). 4. Check the starter (see page 4-6). 5. Check the starter cut relay (see page 22-51). 6. Check the transmission range switch (A/T) (see page 14-215). 7. Check the clutch interlock switch (M/T) (see page 4-8). 8. Check the ignition switch or wire, refer to the 2003-2006 Accord Service Manual (see page 22-81).	Poor ground at G101, G102 (A/T) or G501 (M/T)
Engine cranks, but does not start	1. Check for PGM-FI DTCs. 2. Check the fuel pressure (see page 11-315). 3. Check for a plugged or damaged fuel line (see page 11-319). 4. Check for a plugged fuel filter (see page 11-326). 5. Check the throttle body (see page 11-343). 6. Check for low engine compression (see page 6-6). 7. Check for a damaged or broken timing belt.	
Engine is hard to start	1. Check for PGM-FI DTCs. 2. Check the fuel pressure (see page 11-315). 3. Check for a plugged or damaged fuel line (see page 11-319). 4. Check for a plugged fuel filter (see page 11-326). 5. Check for a restricted three way catalytic converter (TWC) or exhaust system.	
Engine cranks slowly	1. Check for loose battery terminals or connections. 2. Test the battery for a low charge, refer to the 2003-2006 Accord Service Manual (see page 22-78). 3. Check the starter for binding (see page 4-9). 4. Check for excessive drag in the engine.

Starter Circuit Troubleshooting

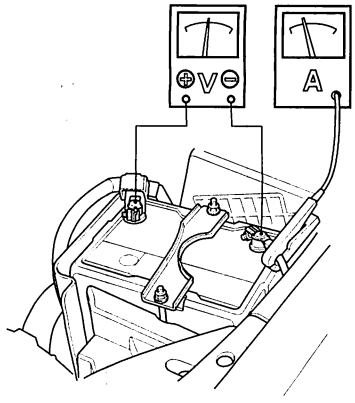
NOTE:
- Air temperature must be between 59 and 100°F (15 and 38°C) during this procedure.
- After this inspection, you must select engine control module (ECM)/powertrain control module (PCM) reset using the Honda Diagnostic System (HDS) (see page 11-4), otherwise the ECM/PCM will continues to stop the fuel injectors from operating.
- The battery must be in good condition and fully charged.

Recommended Procedure:
- Use a starter system tester.
- Connect and operate the equipment in accordance with the manufacturer's instructions.

Alternate Procedure

1. Hook up the following equipment:

   - Ammeter, 0—400A
   - Voltmeter, 0—20 V (accurate within 0.1 volt)



2. Connect the HDS to the data link connector (DLC) (see step 2 on page 11-3).

3. Turn the ignition switch ON (II), and select PGM-FI, INSPECTION, then ALL INJECTORS OFF on the HDS.

4. With the shift lever in N or P (A/T) or the clutch pedal pressed (M/T), turn the ignition switch to START (III).

   Does the starter crank the engine normally?

   YES—The starting system is OK. Go to step 10.

   NO—Go to step 5.

5. Check the battery condition. Check electrical connections at the battery, the negative battery cable to body, the engine ground cables and the starter for looseness and corrosion. Then try cranking the engine again.

   Does the starter crank the engine?

   YES—Repairing the loose connection corrected the problem. The starting system is OK. Go to step 10.

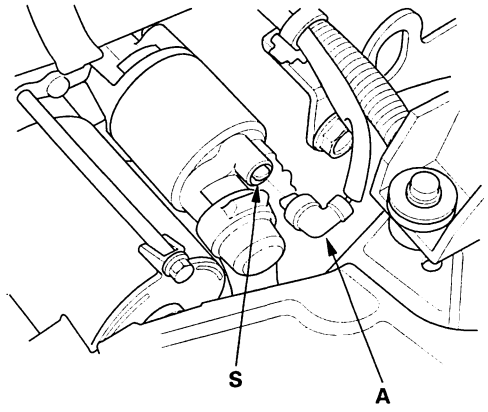
   NO—Check the following:

   - If the starter will not crank the engine at all, go to step 6.
   - If it cranks the engine erratically or too slowly, go to step 8.
   - If it does not disengage from the flywheel or torque converter ring gear when you release the key, check the following:
     - Solenoid plunger and switch malfunction
     - Dirty drive gear or damaged overrunning clutch

BACK

Protected by AR

6. Make sure the transmission is in Neutral, then disconnect the BLK/WHT wire (A) from the starter solenoid S terminal. Connect a jumper wire from the battery positive terminal to the solenoid terminal.



Does the starter crank the engine?

YES—Check the following items in the order listed until you find the open circuit: ■

- The BLK/WHT wire and connectors between the under-dash fuse/relay box and the ignition switch, and between the under-dash fuse/relay box and the starter.
- The ignition switch, refer to the 2003-2006 Accord Service Manual (see page 22-81).
- The transmission range switch and connector (A/T) or the clutch interlock switch and connector (M/T).
- The starter cut relay.

NO—Remove the starter, and repair or replace as necessary. ■

7. While cranking the engine, check the cranking voltage and current draw.

Is the cranking voltage greater than or equal to 8.5 V and is the current draw less than or equal to 380 A?

YES—Go to step 8.

NO—Replace the starter, or remove and disassemble it, and check for the following: ■

- Drag in the starter armature
- Shorted armature winding
- Excessive drag in the engine

8. Check the engine speed while cranking the engine.

Is the engine speed above 100 rpm?

YES—Go to step 9.

NO—Replace the starter, or remove and disassemble it, and check for the following: ■

- Open circuit in starter armature commutator segments
- Excessively worn starter brushes
- Open circuit in commutator brushes
- Dirty or damaged helical splines or drive gear
- Faulty drive gear clutch

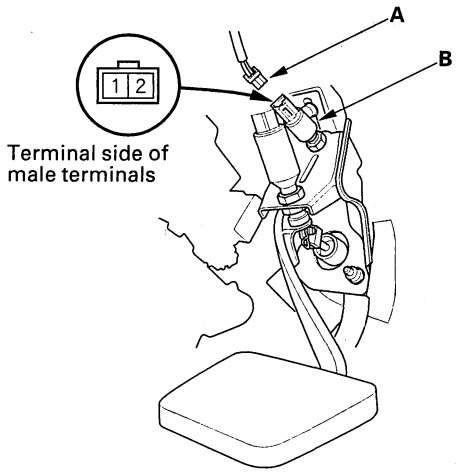
9. Remove the starter, and inspect its drive gear and the flywheel or torque converter ring gear for damage. Replace any damaged parts.

10. Select ECM/PCM reset (see page 11-4) to cancel ALL INJECTORS OFF on the HDS.

Protected by AR

Clutch Interlock Switch Test

1. Disconnect the clutch interlock switch 2P connector (A).

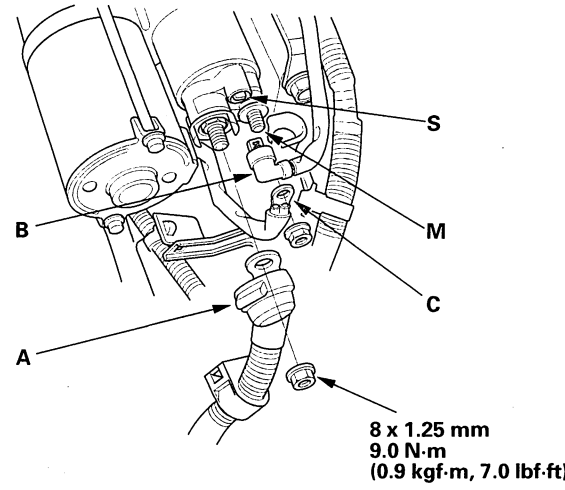


2. Remove the clutch interlock switch (B).
3. Check for continuity between the terminals according to the table.
   - If the continuity is not as specified, replace the clutch interlock switch.
   - If OK, install the clutch interlock switch, and adjust the pedal height (see page 12-6).

Terminal / Clutch Interlock Switch	1	2
PRESSED	○	○
RELEASED		

Starter Solenoid Test

1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the customer's audio presets. Make sure the ignition switch is OFF.
2. Disconnect the negative cable from the battery first, then disconnect the positive cable.
3. Remove the starter cable (A), BLK/WHT wire (B), and motor cable (C).



4. Check the hold-in coil for continuity between the S terminal and the armature housing (ground). There should be continuity.
   - If there is continuity, go to step 5.
   - If there is no continuity, replace the solenoid.
5. Check the pull-in coil for continuity between the S terminal and the M terminal. There should be continuity.
   - If there is continuity, the solenoid is OK.
   - If there is no continuity, replace the solenoid.

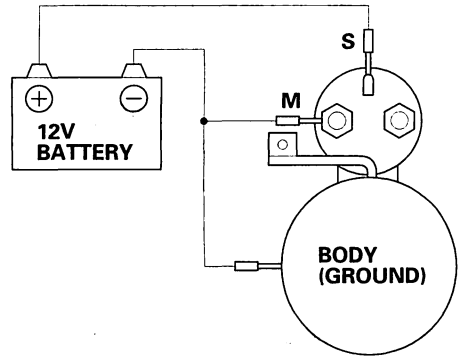
BACK

Protected by AR

6. Install in the reverse order of removal.
7. Connect the positive cable to the battery first, then connect the negative cable.
8. Enter the anti-theft codes for the radio and the navigation system, then enter the customer's audio presets.
9. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).
10. Set the clock.

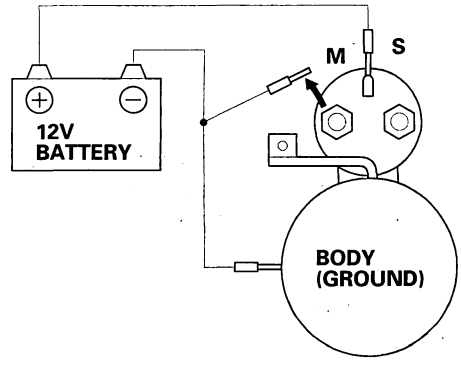
Starter Performance Test

1. Disconnect the wire from the M terminal.
2. Make a connection as shown using as heavy a wire as possible (preferably equivalent to the wire used for the vehicle). To avoid damaging the starter, never leave the battery connected for more than 10 seconds.



3. Connect the battery as shown. Make sure you disconnect the starter motor wire from the solenoid. If the starter pinion moves out, it is working properly.
4. Disconnect the battery from the M terminal. If the pinion does not retract, the hold-in coil of the solenoid is working properly.

Specifications
Electric Current: 80A or less
Motor Speed: 2,600 rpm or more

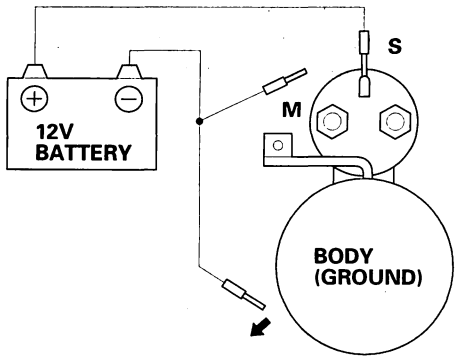


(cont'd)

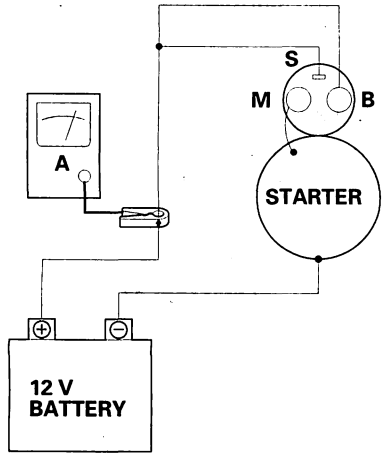
Protected by AR

Starter Performance Test (cont'd)

5. Disconnect the battery from the starter body. If the pinion retracts immediately, it is working properly.



6. Firmly the starter in a vise
7. Reconnect the wire to the M terminal.
8. Connect the starter to the battery as shown, and check that the motor turns and keeps rotating.



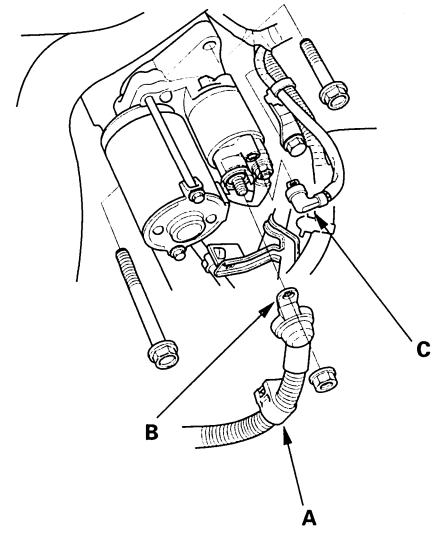
9. If the electric current and motor speed meet the specifications when the battery voltage is at 11.5 V, the starter is working properly.

Specifications
Electric Current: 80A or less
Motor Speed: 2,600 rpm or more

Starter Removal and Installation

Removal

1. Make sure you have the anti-theft codes for the radio, and the navigation system, then write down the customer's audio presets. Make sure the ignition switch is OFF.
2. Disconnect the negative cable from the battery first, then disconnect the positive cable.
3. Remove the battery.
4. Remove the harness clamp (A).



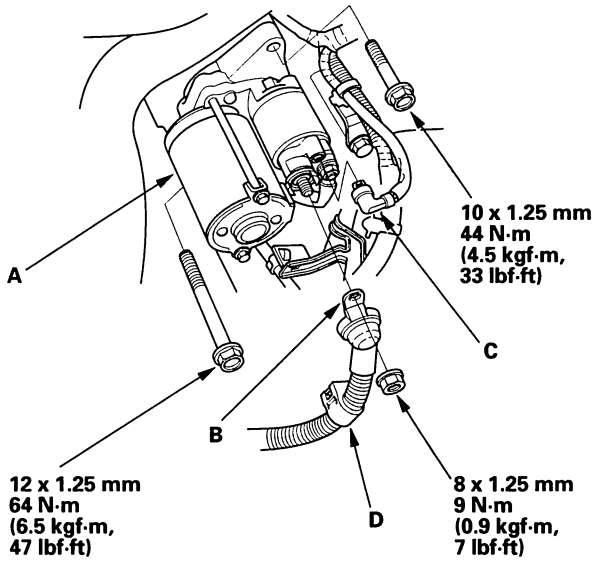
5. Disconnect the starter cable (B) from the B terminal, then disconnect the BLK/WHT wire (C) from the S terminal.
6. Remove the two bolts holding the starter, then remove the starter.

BACK

Protected by AR

Installation

1. Install the starter (A). Make sure the crimped side of the ring terminal is facing out.

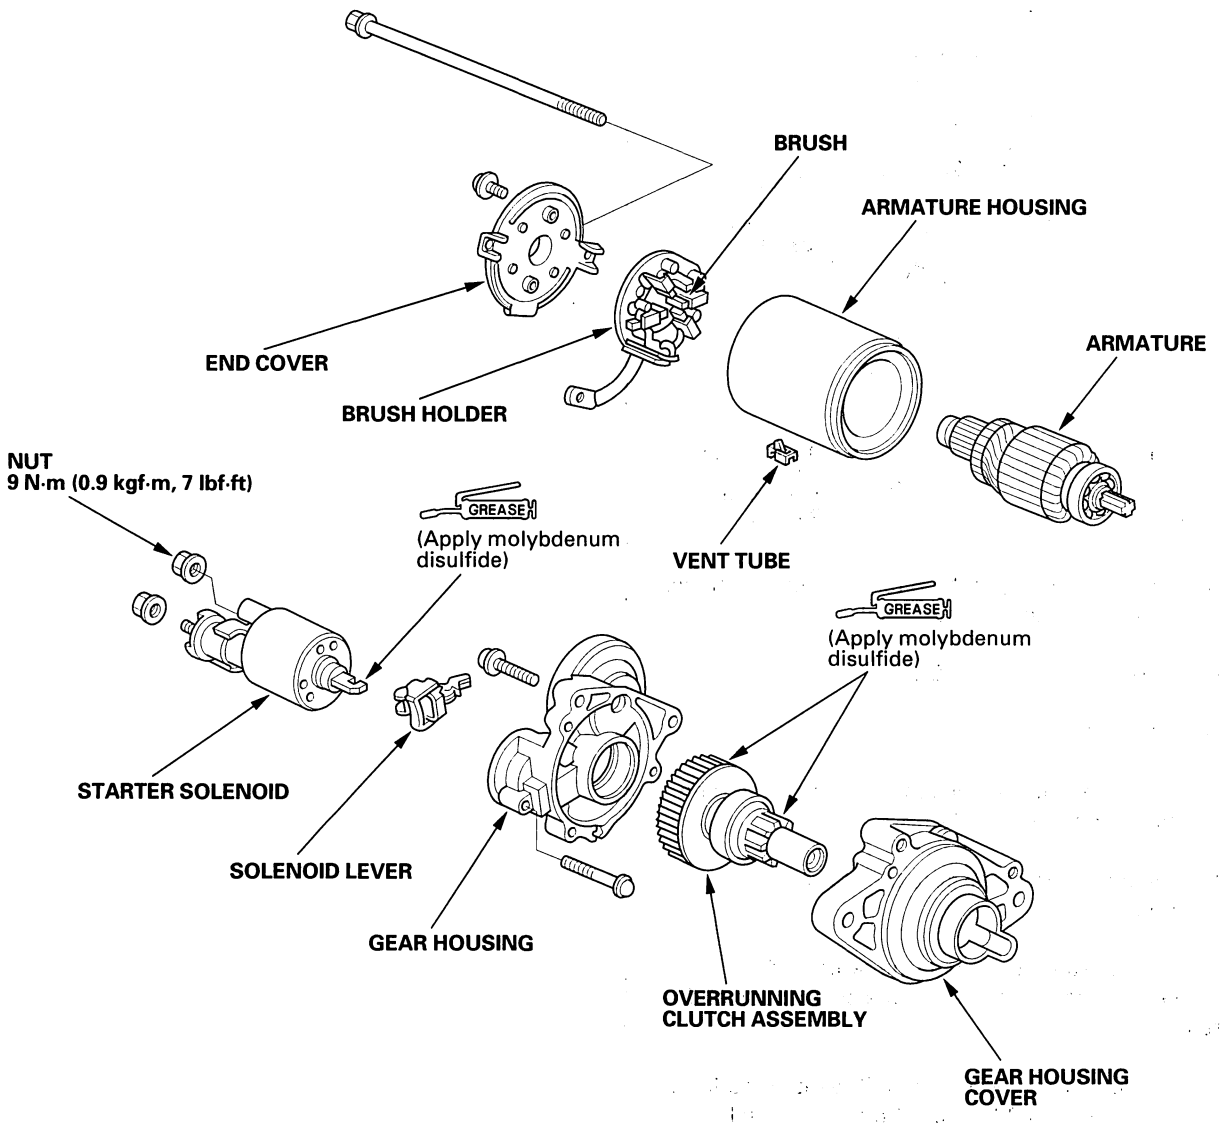


2. Connect the cable (B) to the B teminal, then connect the BLK/WHT (C) to the S terminal.
3. Install the hamess cramp (D).
4. Instal the battery.
5. Connect the positive cable to the battery first, then connect the negative cable.
6. Start the engine to make sure the starter works properly.
7. Enter the anti-theft codes for the radio and the navigation system, then enter the customer's audio presets.
8. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).
9. Set the clock.

Protected by AR

Starter Overhaul

Disassembly/Reassembly

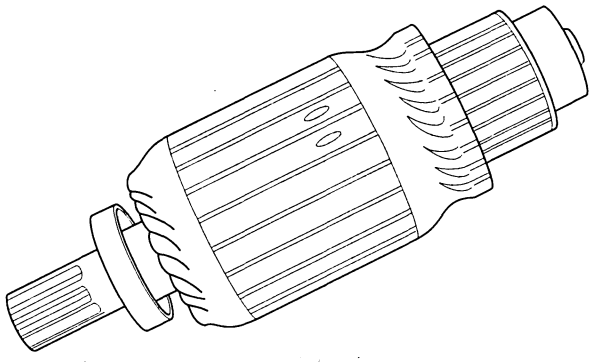


BACK

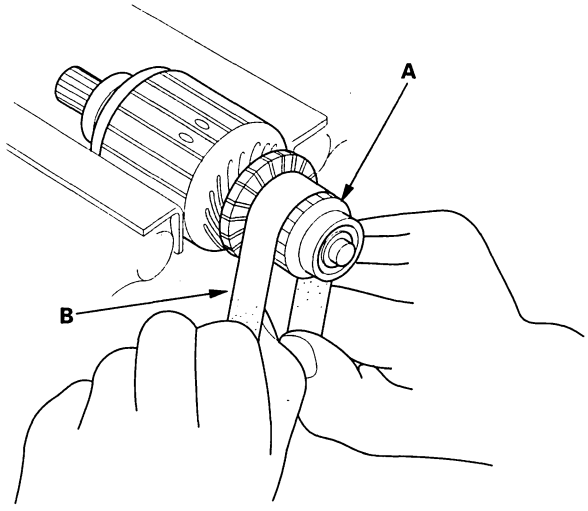
Protected by AR

Armature Inspection and Test

1. Remove the starter (see page 4-10).
2. Disassemble the starter as shown at the beginning of this procedure.
3. Inspect the armature for wear or damage from contact with the permanent magnet. If there is wear or damage, replace the armature.

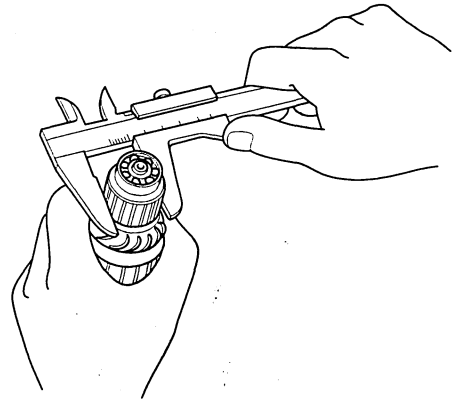


4. Check the commutator (A) surface. If the surface is dirty or burnt, resurface with emery cloth or a lathe within the following specifications, or recondition with #500 or #600 sandpaper (B).



5. Check the commutator diameter. If the diameter is below the service limit, replace the armature.

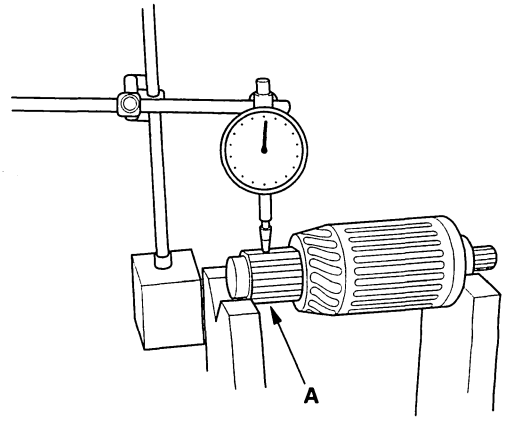
Commutator Diameter
Standard (New): 28.0—28.1 mm (1.102—1.106 in.)
Service Limit: 27.5 mm (1.083 in.)



6. Measure the commutator (A) runout.

- If the commutator runout is within the service limit, check the commutator for carbon dust or brass chips between the segments.
- If the commutator runout is not within the service limit, replace the armature.

Commutator Runout
Standard (New): 0.02 mm (0.001 in.) max.
Service Limit: 0.05 mm (0.002 in.)



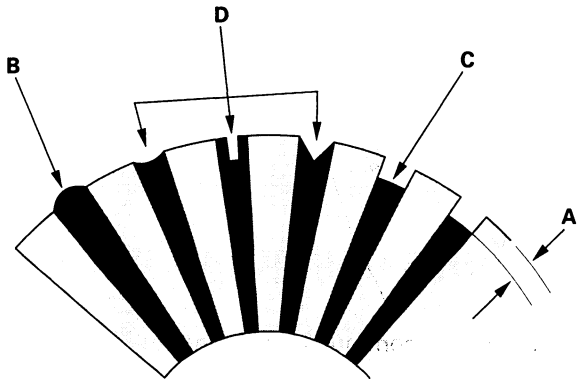
(cont'd)

Protected by AR

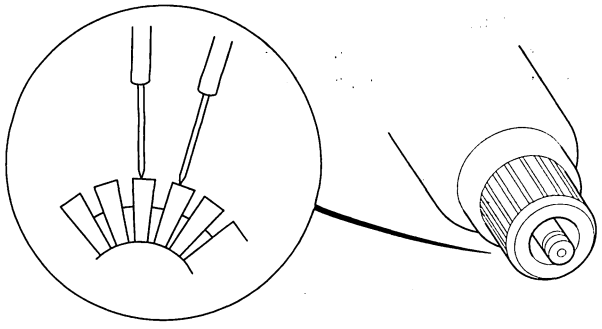
Starter Overhaul (cont'd)

7. Check the mica depth (A). If the mica is too high (B), undercut the mica with a hacksaw blade to the proper depth. Cut away all the mica (C) between the commutator segments. The undercut should not be too shallow, too narrow, or V-shaped (D).

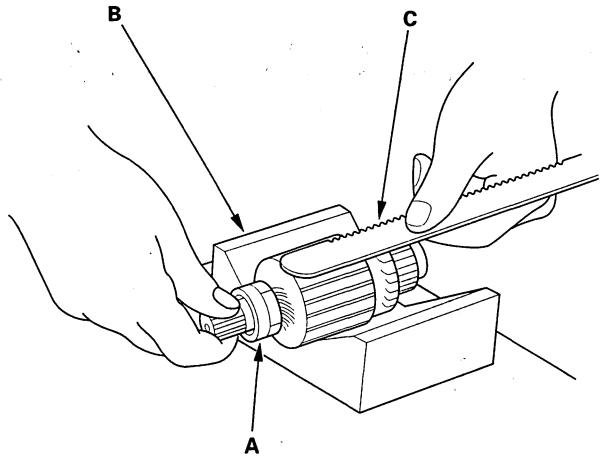
Commutator Mica Depth
Standard (New): 0.4—0.5 mm (0.016—0.020 in.)
Service Limit: 0.15 mm (0.006 in.)



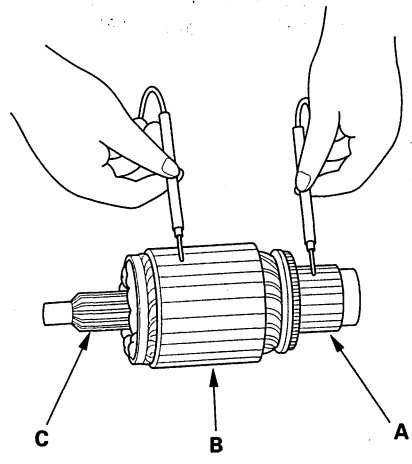
8. Check for continuity between the segments of the commutator. If there is an open circuit between any segments, replace the armature.



9. Place the armature (A) on an armature tester (B). Hold a hacksaw blade (C) on the armature core. If the blade is attracted to the core or vibrates while the core is turned, the armature is shorted. Replace the armature.



10. Check with an ohmmeter for continuity between the commutator (A) and armature coil core (B), and between the commutator and armature shaft (C). If there is continuity, replace the armature.



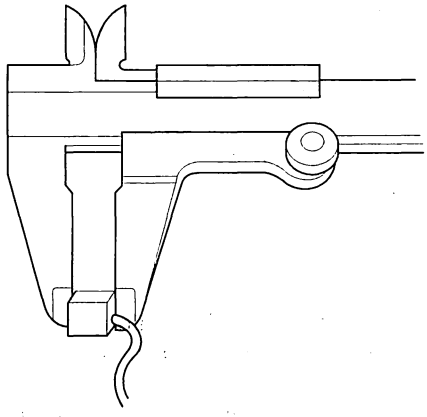
BACK

Protected by AR

Starter Brush Inspection

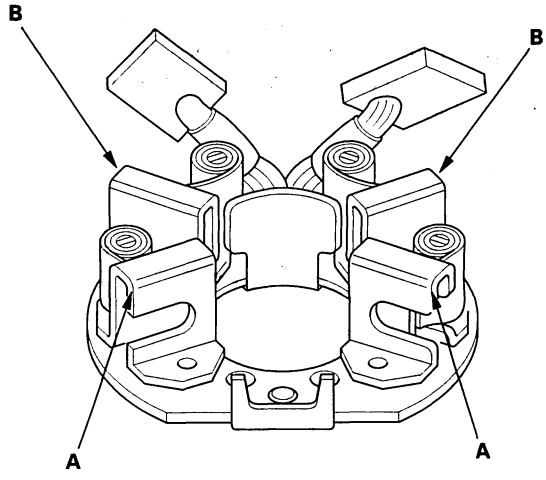
11. Measure the brush length. If it is not within the service limit, replace the brush holder assembly.

Brush Length
Standard (New): 15.8—16.2 mm (0.62—0.64 in.)
Service Limit: 11.0 mm (0.43 in.)



Starter Brush Holder Test

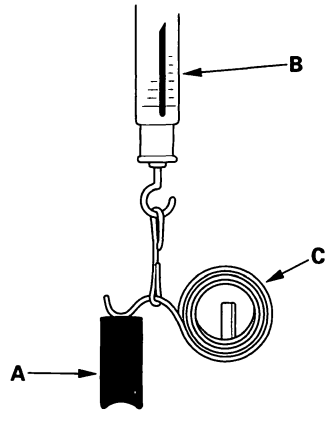
12. Check for continuity between the (+) brush holder (A) and (—) brush holder (B). If there is continuity, replace the brush holder assembly.



Brush Spring Inspection

13. Insert the brush (A) into the brush holder, and bring the brush into contact with the commutator, then attach a spring scale (B) to the spring (C). Measure the spring tension at the moment the spring lifts off the brush. If the spring tension is not within specification, replace the spring.

Spring Tension:
15.7—17.7 N (1.60—1.80 kgf, 3.53—3.97 lbf)



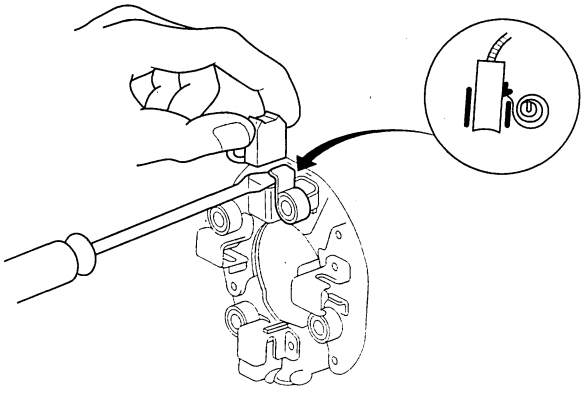
(cont'd)

Protected by AR

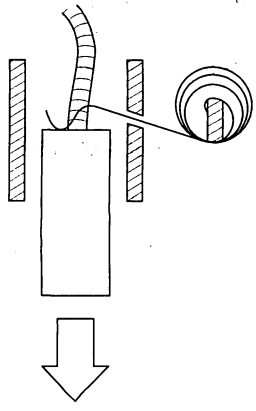
Starter Overhaul (cont'd)

14. Pry back each brush spring with a screwdriver, then position the brush about halfway out of its holder, and release the spring to hold it there.

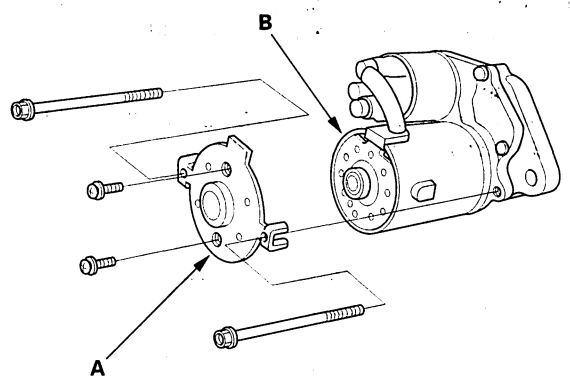
    NOTE: To seat new brushes, slip a strip of #500 or #600 sandpaper, with the grit side up, between the commutator and each brush, and smoothly rotate the armature. The contact surface of the brushes will be sanded to the same contour as the commutator.



15. Install the armature in the housing. Next, pry back each brush spring again, and push the brush down until it seats against the commutator, then release the spring against the end of the brush.



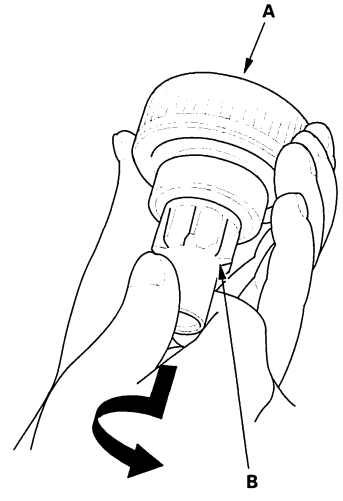
16. Install the starter end cover (A) to retain the brush holder (B).



Overrunning Clutch Inspection

17. Slide the overrunning clutch along the shaft. Replace it if it does not slide smoothly.

18. Rotate the overrunning clutch (A) in both directions. It should lock and move upward in one direction and rotate smoothly in the other direction. If it does not lock in either direction or if it locks both directions, then replace it.



19. If the starter drive gear (B) is worn or damaged, replace the overrunning clutch assembly; the gear is not available separately. Check the condition of the torque converter ring gear to see if the starter drive gear teeth are damaged.

20. Reassemble the starter in the reverse order of disassembly.

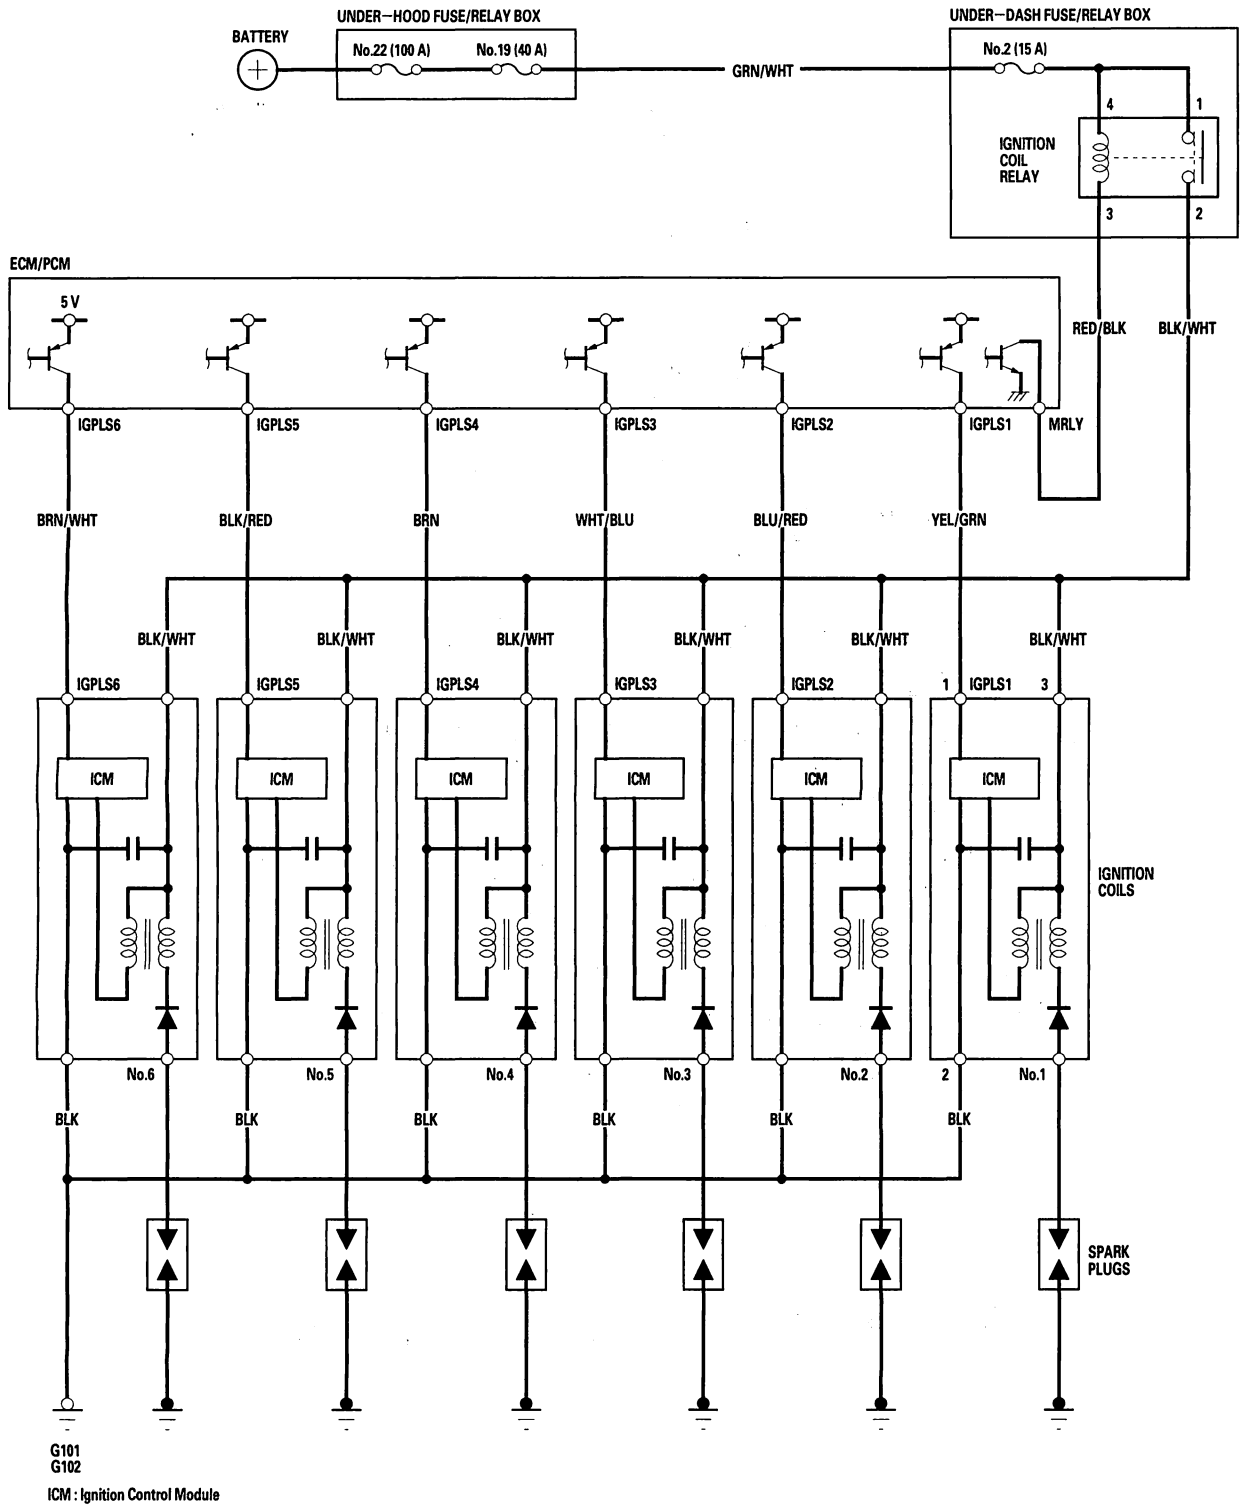
Ignition System

Circuit Diagram



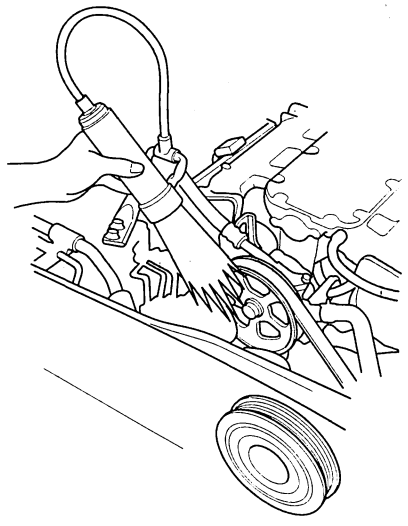
ICM : Ignition Control Module

BACK

Protected by AR

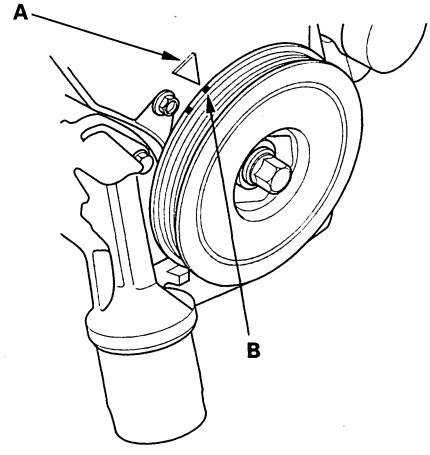
Ignition Timing Inspection

1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC) (see step 2 on page 11-3), and check for DTCs. If a DTC is present, diagnose and repair the cause before inspecting the ignition timing.
2. Start the engine. Hold the engine speed at 3,000 rpm with no load (in Neutral) until the radiator fan comes on, then let it idle.
3. Check the idle speed (see page 11-301).
4. Select "SCS" mode using the HDS.
5. Connect the timing light to the service loop.



6. Aim the light toward the pointer (A) on the timing belt cover. Check the ignition timing under a no load condition (headlights, blower fan, rear window defogger, and air conditioner are turned off).

Ignition Timing
M/T: 10°±2° BTDC (RED mark (B)) at idle in Neutral
A/T: 10°±2° BTDC (RED mark (B)) at idle in Park or Neutral

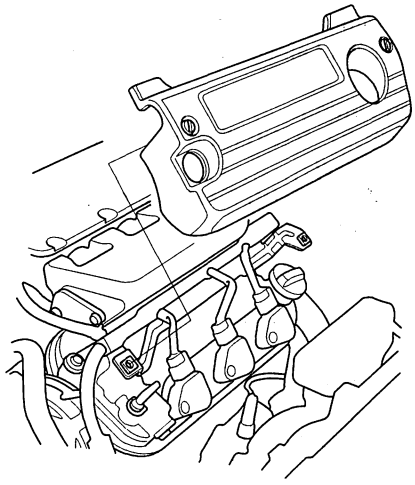


7. If the ignition timing differs from the specification, check the cam timing. If the cam timing is OK, update the engine control module (ECM)/ powertrain control module (PCM) if it does not have the latest software (see page 11-6), or substitute a known-good ECM/PCM (see page 11-7), then recheck. If the system works properly, and the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).
8. Disconnect the HDS and the timing light.

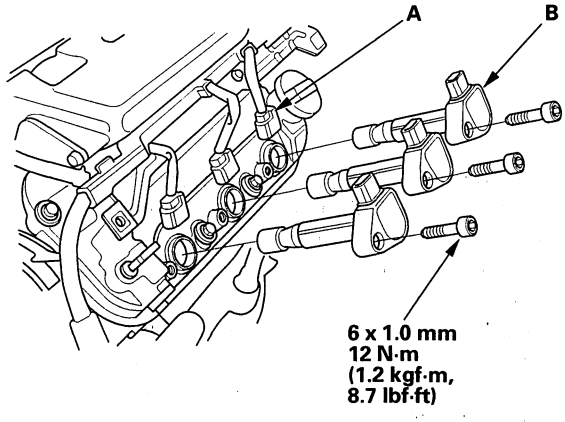
Protected by AR

Ignition Coil Removal/Installation

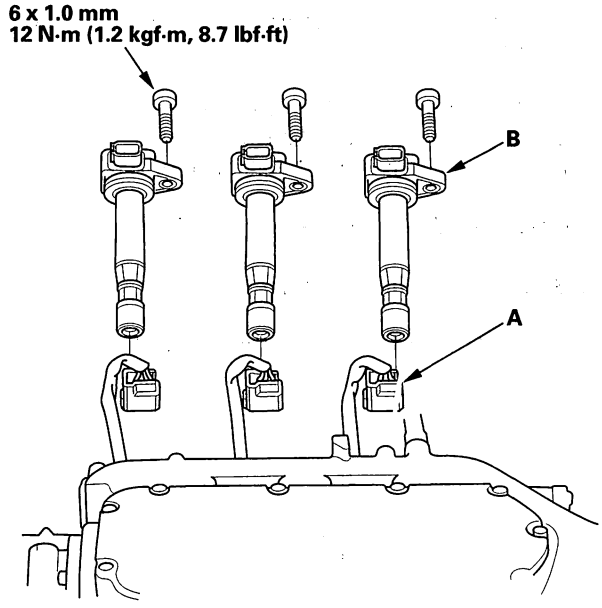
1. Remove the ignition coil cover.



2. Disconnect the ignition coil connectors (A), then remove the front bank ignition coils (B).



3. Disconnect the ignition coil connectors (A), then remove the rear bank ignition coils (B).



4. Install the ignition coils in the reverse order of removal.

BACK

Protected by AR

Ignition Coil Relay Circuit Troubleshooting

1. Check the No. 2 (15 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 2.

   NO—Replace the fuse. ■

2. Remove the ignition coil relay from the under-dash fuse/relay box, and test it (see page 22-51).

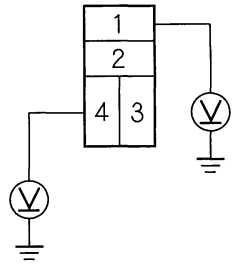
   Is the relay OK?

   YES—Go to step 3.

   NO—Replace the ignition coil relay. ■

3. Measure the voltage between ignition coil relay 4P socket terminal No. 1 and body ground, then terminal No. 4 and body ground.

IGNITION COIL RELAY 4P SOCKET



Terminal side of female terminals

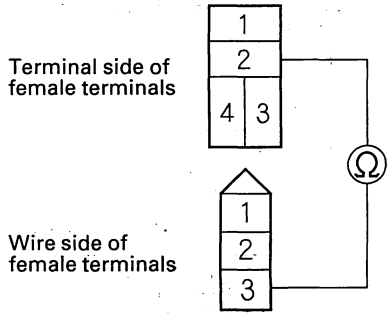
Is there battery voltage?

YES—Go to step 4.

NO—Replace the under-dash fuse/relay box. ■

4. Check for continuity between ignition coil relay 4P socket terminal No. 2 and the No. 1 ignition coil 3P connector terminal No. 3.

IGNITION COIL RELAY 4P SOCKET



No.1 IGNITION COIL 3P CONNECTOR

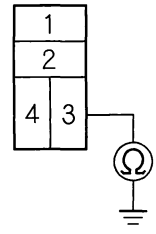
Is there continuity?

YES—Go to step 5.

NO—Repair an open in the wire between ignition coil relay 4P socket terminal No. 2 and No. 1 ignition coil 3P connector terminal No. 3. ■

5. Check for continuity between ignition coil relay 4P socket terminal No. 3 and body ground.

IGNITION COIL RELAY 4P SOCKET



Terminal side of female terminals

Is there continuity?

YES—Repair a short in the wire between ignition coil relay 4P socket terminal No. 3 and the PCM (E5). ■

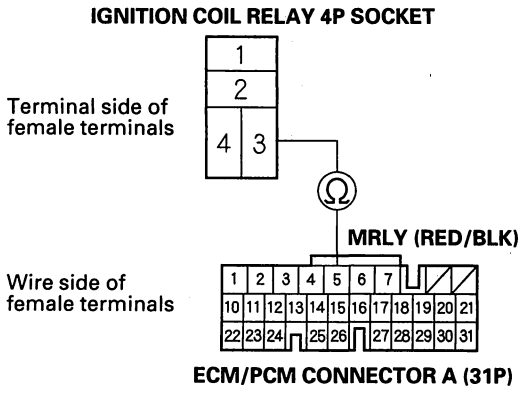
NO—Go to step 6.

(cont'd)

Protected by AR

Ignition Coil Relay Circuit Troubleshooting (cont'd)

6. Check for continuity between ignition coil relay 4P socket terminal No. 3 and engine control module (ECM)/ powertrain control module (PCM) connector terminal A5.



Is there continuity?

YES—The system is OK at this time. Check for loose or poor connections at the ignition coil relay and the ECM/PCM (A5).■

NO—Repair an open in the wire between ignition coil relay 4P socket terminal No. 3 and the ECM/PCM (A5).■

BACK

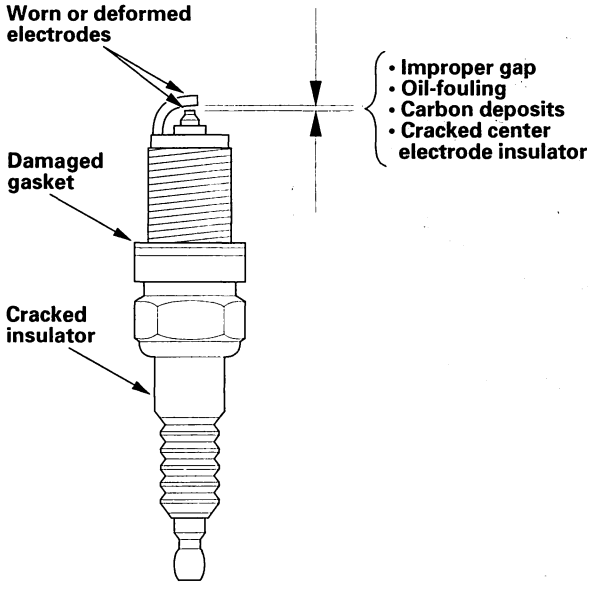
Protected by AR

Spark Plug Inspection

1. Inspect the electrodes and ceramic insulator.

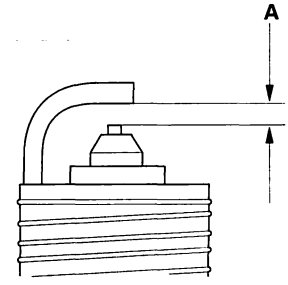
   - Burned or worn electrodes may be caused by:
     - Advanced ignition timing
     - Loose spark plug
     - Plug heat range too hot
     - Insufficient cooling

   - Fouled plug may be caused by:
     - Retarded ignition timing
     - Oil in combustion chamber
     - Incorrect spark plug gap
     - Plug heat range too cold
     - Excessive idling/low speed running
     - Clogged air cleaner element
     - Deteriorated ignition coils



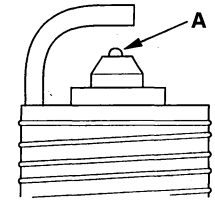
2. Do not adjust the gap (A) of iridium tip plugs ; replace the spark plug if the gap is out of specification.

   Electrode Gap
   Standard (New): 1.0—1.1 mm (0.039—0.043 in.)



3. Replace the plug at the specified interval or if the center electrode is rounded (A). Use only the spark plugs listed.

   Spark Plugs
   NGK: IZFR6K11
   DENSO: SKJ20DR-M11



4. Apply a small amount of anti-seize compound to the plug threads, and screw the plugs into the cylinder head, finger-tight. Then torque them to 18 N·m (1.8 kgf·m, 13 lbf·ft).

Symptom Troubleshooting Index

2003-2004 Models

Symptom	Diagnostic procedure	Also check for
Charging system indicator does not come on with the ignition switch ON (II)	Troubleshoot the charging system indicator circuit (see page 4-28).	
Charging system indicator stays on	1. Troubleshoot the charging system indicator circuit (see page 4-28). 2. Check for a broken drive belt (see page 4-35). 3. Check the drive belt auto-tensioner (see page 4-36).	
Battery discharged	1. Check for a poor connection and for open or shorted wire(s) in charging system. 2. Check for parasitic electrical current draw. 3. Check for a broken drive belt (see page 4-35). 4. Check the drive belt auto-tensioner (see page 4-36). 5. Troubleshoot the alternator and regulator circuit (see page 4-31). 6. Check for a poor connection at the battery terminal. 7. Test the battery, refer to the 2003-2006 Accord Service Manual (see page 22-78).	
Battery overcharged	1. Troubleshoot the alternator and regulator circuit (see page 4-31). 2. Test the battery, refer to the 2003-2006 Accord Service Manual (see page 22-78).	

2005-2006 Models

Symptom	Diagnostic procedure	Also check for
Charging system indicator does not come on with the ignition switch ON (II)	Troubleshoot the charging system indicator circuit (see page 4-29).	
Charging system indicator stays on	1. Check for PGM-FI DTCs (see page 11-3). 2. Troubleshoot the charging system indicator circuit (see page 4-29). 3. Check for a broken drive belt (see page 4-35). 4. Check the drive belt auto-tensioner (see page 4-36).	
Battery discharged	1. Check for parasitic electrical current draw. 2. Check for a broken drive belt (see page 4-35). 3. Check the drive belt auto-tensioner (see page 4-36). 4. Troubleshoot the alternator and regulator circuit (see page 4-31). 5. Check for a poor connection at the battery terminal. 6. Test the battery, refer to the 2003-2006 Accord Service Manual (see page 22-78).	
Battery overcharged	1. Troubleshoot the alternator and regulator circuit (see page 4-31). 2. Test the battery, refer to the 2003-2006 Accord Service Manual (see page 22-78).

Charging System Indicator Circuit Troubleshooting

2003-2004 Models

1. Turn the ignition switch ON (II).

   Does the charging system indicator come on?

   YES—Go to step 2.

   NO—Go to step 3.

2. Start the engine.

   Does the charging system indicator go off?

   YES—Charging system indicator circuit is OK. Go to the alternator and regulator circuit troubleshooting (see page 4-31).■

   NO—Go to step 3.

3. Do the gauge control module self-test procedure, refer to the 2003-2006 Accord Service Manual (see page 22-259).

   Does the charging system indicator flash?

   YES—Go to step 4.

   NO—Replace the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276).■

4. Turn the ignition switch OFF.

5. Disconnect the alternator 4P connector.

6. Turn the ignition switch ON (II).

7. Measure the voltage between alternator 4P connector terminal No. 1 and body ground.

   ALTERNATOR 4P CONNECTOR

   Is there battery voltage?

   YES—Go to step 8.

   NO—Check for a blown No. 18 (15A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between the alternator and under-dash fuse/relay box.■

8. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC) (see step 2 on page 11-3). Turn the ignition switch ON (II), and jump the SCS line with the HDS, then turn the ignition switch OFF.

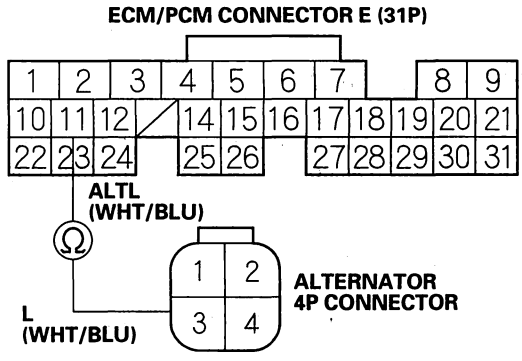
   NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.

9. Disconnect ECM/PCM connector E (31P).

BACK

Protected by AR

10. Check for continuity between ECM/PCM connector terminal E11 and alternator 4P connector terminal No. 3.



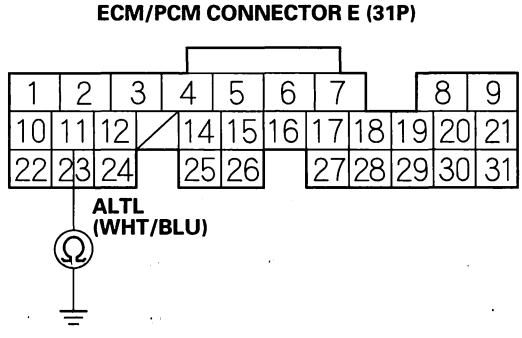
Wire side of female terminals

Is there continuity?

YES—Go to step 11.

NO—Repair an open in the wire between the alternator and the ECM/PCM. ■

11. Check for continuity between ECM/PCM connector terminal E11 and body ground.



Wire side of female terminals

Is there continuity?

YES—Repair a short in the wire between the alternator and the ECM/PCM. ■

NO—Go to the alternator and regulator circuit troubleshooting (see page 4-31). ■

2005-2006 Models

1. Turn the ignition switch ON (II).

   Does the charging system indicator come on?

   YES—Go to step 2.

   NO—Go to step 11.

2. Shift to Park or Neutral, and start the engine. Hold the engine speed at 2,000 rpm for 1 minute.

   Does the charging system indicator go off?

   YES—Charging system indicator circuit is OK. Go to the alternator and regulator circuit troubleshooting (see step 1 on page 4-32). ■

   NO—Go to step 3.

3. Do the gauge control module self-test procedure, refer to the 2003-2006 Accord Service Manual (see page 22-259).

   Does the charging system indicator flash?

   YES—Go to step 4.

   NO—Replace the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276). ■

4. Turn the ignition switch OFF.

5. Disconnect the alternator 4P connector.

6. Turn the ignition switch ON (II).

   Does the charging system indicator go off?

   YES—Replace the alternator (see page 4-38) or repair the alternator (see page 4-41). ■

   NO—Go to step 7.

(cont'd)

Protected by AR

Charging System Indicator Circuit Troubleshooting (cont'd)

7. Turn the ignition switch OFF.

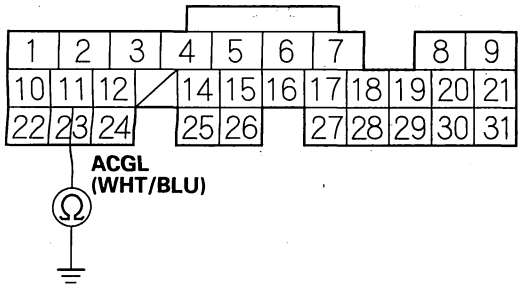
8. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC) (see step 2 on page 11-3). Turn the ignition switch ON (II), and jump the SCS line with the HDS, then turn the ignition switch OFF.

   NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.

9. Disconnect ECM/PCM connector E (31P).

10. Check for continuity between ECM/PCM connector terminal E11 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there continuity?

YES—Repair a short in the wire between the alternator and the ECM/PCM. ■

NO—Update the ECM/PCM if it does not have the latest software (see page 11-6), or substitute a known-good ECM/PCM (see page 11-7), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■

11. Do the gauge control module self-test procedure, refer to the 2003-2006 Accord Service Manual (see page 22-259).

    Does the charging system indicator flash?

    YES—Go to step 12.

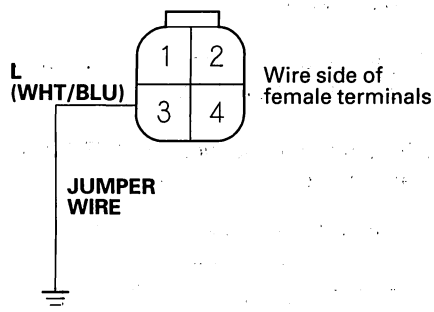
    NO—Replace the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276). ■

12. Turn the ignition switch OFF.

13. Disconnect the alternator 4P connector.

14. Connect alternator 4P connector terminal No.3 and body ground with a jumper wire.

ALTERNATOR 4P CONNECTOR



15. Turn the ignition switch ON (II).

    Does the charging system indicator come on?

    YES—Replace the alternator (see page 4-38) or repair the alternator (see page 4-41). ■

    NO—Go to step 16.

BACK

Protected by AR

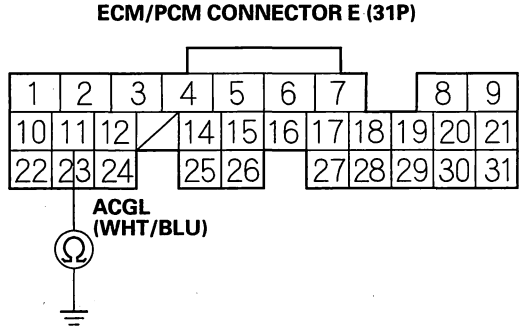
16. Turn the ignition switch OFF.

17. Connect the HDS to the DLC (see step 2 on page 11-3). Turn the ignition switch ON (II), and jump the SCS line with the HDS, then turn the ignition switch OFF.

    NOTE: This step must be done to protect the ECM/PCM from damage.

18. Disconnect ECM/PCM connector E (31P).

19. Check for continuity between ECM/PCM connector terminal E11 and body ground.



Wire side of female terminals

Is there continuity?

YES—Update the ECM/PCM if it does not have the latest software (see page 11-6), or substitute a known-good ECM/PCM (see page 11-7), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224).■

NO—Repair an open in the wire between the alternator and the ECM/PCM.■

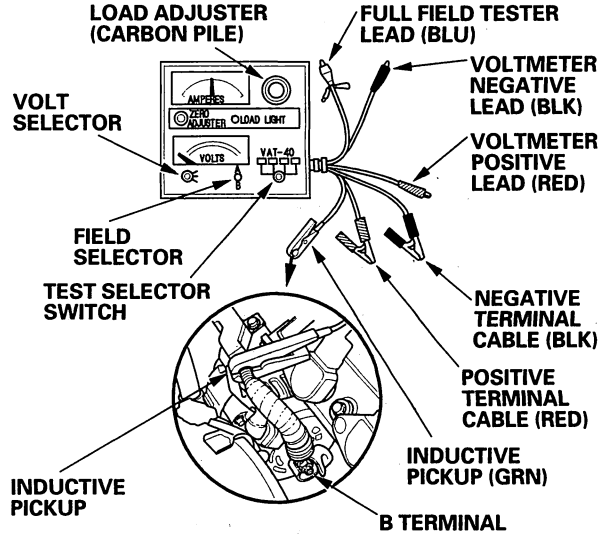
Alternator and Regulator Circuit Troubleshooting

DELPHI (2003-2005 Models)

1. Make sure the battery connections are good, and the battery is sufficiently charged, refer to the 2003-2006 Accord Service Manual (see page 22-78).

2. Remove the ignition cover (see page 4-19).

3. Connect a VAT-40 (or equivalent tester), and turn the selector switch to position 1 (starting).



4. Start the engine. Hold the engine at 3,000 rpm, with no load until the radiator fan comes on, then let it idle.

5. Raise the engine speed to 2,000 rpm, and hold it there.

   Is the voltage over 15.1 V?

   YES—Replace the alternator (see page 4-38).■

   NO—Go to step 5.

(cont'd)

Protected by AR

Alternator and Regulator Circuit Troubleshooting (cont'd)

6. Release the accelerator pedal, and let the engine idle.
7. Make sure all accessories are turned off. Turn the selector switch to position 2 (charging).
8. Remove the inductive pickup, and zero the ammeter.
9. Place the inductive pickup over the B terminal wire of the alternator so the arrow points away from the alternator.
10. Raise the engine speed to 2,000 rpm, and hold it there.

    Is the voltage less than 13.5 V?

    YES—Go to alternator control circuit troubleshooting (see page 4-33).. ■

    NO—Go to step 10.

11. Apply a load with the VAT-40 until the battery voltage drops within 12—13.5 V.

    Is the amperage 60A or more?

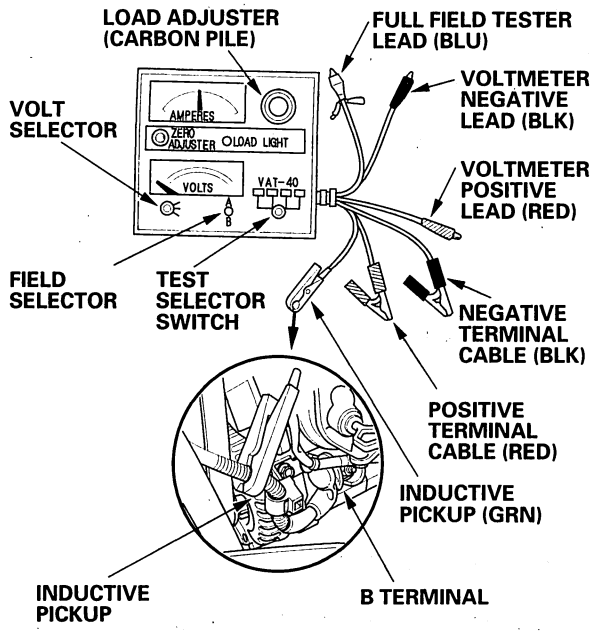
    YES—The charging system is OK. ■

    NOTE: If the charge system indicator is still on, replace the alternator.

    NO—Replace the alternator (see page 4-38) or repair the alternator (see page 4-41). ■

DENSO (2005-2006 Models)

1. Make sure the battery connections are good, and the battery is sufficiently charged, refer to the 2003-2006 Accord Service Manual (see page 22-78).
2. Remove the ignition cover (see page 4-19).
3. Connect a VAT-40 (or equivalent tester), and turn the selector switch to position 1 (starting).



4. Shift to Park or Neutral, and start the engine. Hold the engine at 3,000 rpm, with no load until the radiator fan comes on, then let it idle.
5. Raise the engine speed to 2,000 rpm, and hold it there.

   Is the voltage over 15.1 V?

   YES—Replace the alternator (see page 4-38) or rear housing assembly (see page 4-41). ■

   NO—Go to step 5.

BACK

Protected by AR

6. Release the accelerator pedal, and let the engine idle.

7. Make sure all accessories are turned off. Turn the selector switch to position 2 (charging).

8. Remove the inductive pickup, and zero the ammeter.

9. Place the inductive pickup over the B terminal wire of the alternator so that the arrow points away from the alternator.

10. Raise the engine speed to 2,000 rpm, and hold it there.

    Is the voltage less than 13.5 V?

    YES—Go to alternator control circuit troubleshooting (see page 4-33). ■

    NO—Go to step 10.

11. Apply a load with the VAT-40 until the battery voltage drops to between 12—13.5 V.

    Is the amperage 87.5A or more?

    YES—The charging system is OK. ■

    NOTE: If the charge system indicator is still on, replace the alternator (see page 4-38).

    NO—Replace or replace the alternator (see page 4-38) or repair the alternator (see page 4-41). ■

Alternator Control Circuit Troubleshooting

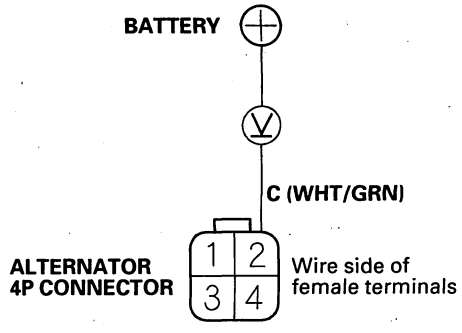
1. Check for proper operation of the electrical load detector (ELD) with the HDS.

2. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC) (see step 2 on page 11-3), and check for DTCs. If a DTC is present, diagnose and repair the cause before continuing with this test.

3. Disconnect the alternator 4P connector from the alternator.

4. Start the engine, and turn on the headlights to high beam.

5. Measure the voltage between alternator 4P connector terminal No. 2 and the positive terminal of the battery.



Is there 1 V or less?

YES—Go to step 6.

NO—Go to step 9.

6. Jump the SCS line with the HDS, then turn the ignition switch OFF.

   NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.

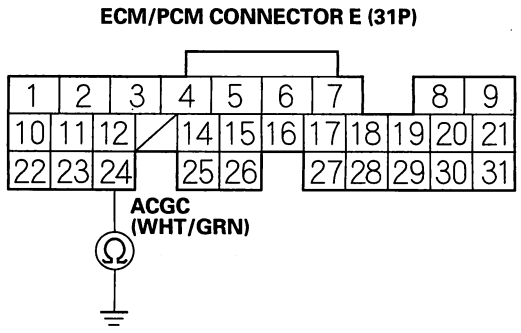
7. Disconnect engine control module ECM/PCM connector E (31P).

(cont'd)

Protected by AR

Alternator Control Circuit Troubleshooting (cont'd)

8. Check for continuity between ECM/PCM connector terminal E24 and body ground.



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the alternator and the ECM/PCM. ■

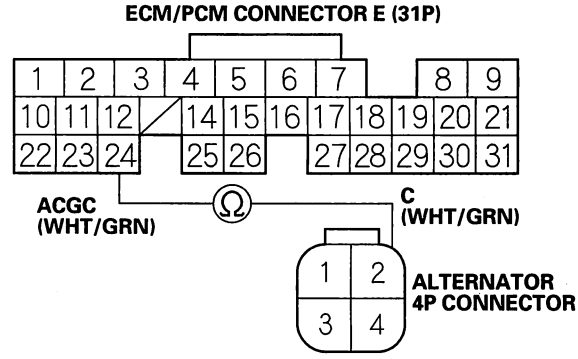
NO—Update the ECM/PCM if it does not have the latest software (see page 11-6), or substitute a known-good ECM/PCM (see page 11-7), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■

9. Jump the SCS line with the HDS, then turn the ignition switch OFF.

   NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) for damage.

10. Disconnect ECM/PCM connector E (31P).

11. Check for continuity between ECM/PCM connector terminal E24 and alternator 4P connector terminal No. 2.



Wire side of female terminals

Is there continuity?

YES—Replace the alternator (see page 4-38) or repair the alternator (see page 4-41). ■

NO—Repair an open in the wire between the alternator and the ECM/PCM. ■

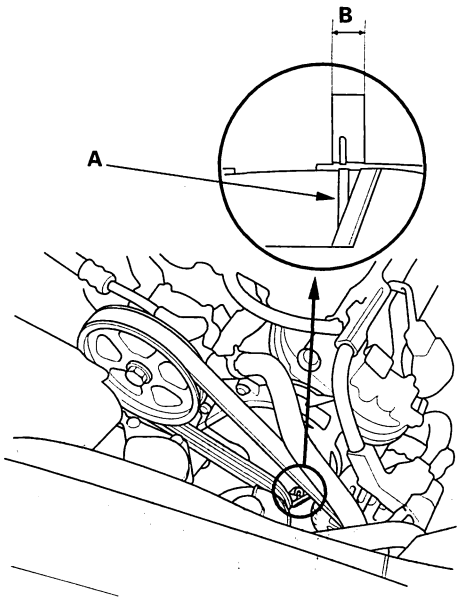
BACK

Protected by AR

Drive Belt Inspection

1. Inspect the belt for cracks and damage. If the belt is cracked or damaged, replace it.

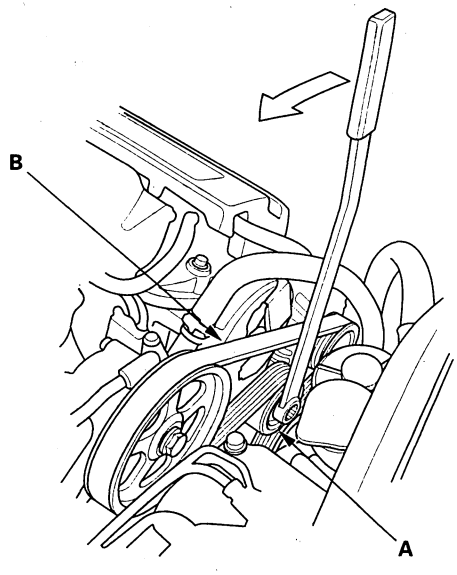
2. Check that the auto-tensioner indicator (A) is within the standard range (B) as shown. If it is out of the standard range, replace the drive belt (see page 4-35).



Drive Belt Replacement

Special Tools Required
Belt tension release tool Snap-on YA9317 or equivalent, commercially available

1. Move the auto-tensioner (A) with the belt tension release tool to relieve tension from the drive belt (B), then remove the drive belt.



2. Install the new belt in the reverse order of removal.

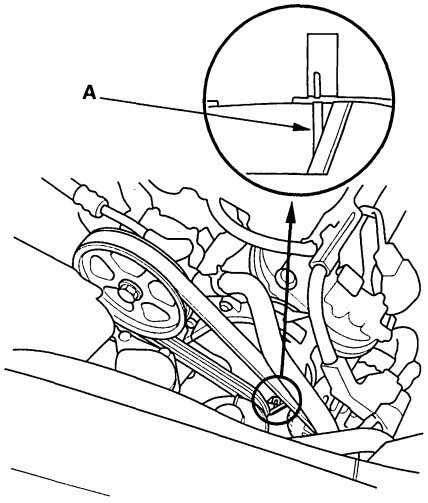
Protected by AR

Drive Belt Auto-tensioner Inspection

Special Tools Required
Belt tension release tool Snap-on YA9317 or equivalent, commercially available

1. Turn the ignition switch ON(II), then make sure to turn the A/C switch OFF.

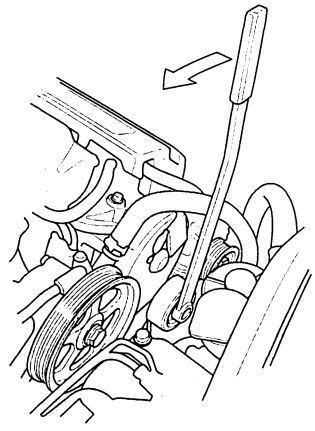
2. With the engine OFF, check the position of the auto-tensioner indicator's point (A). Start the engine, then check the position again with the engine idling. If the position of the indicator moves or fluctuates very much, replace the auto-tensioner (see page 4-37).



3. Check for abnormal noise from the tensioner pulley. If you hear abnormal noise, replace the auto-tensioner pulley (see page 4-38).

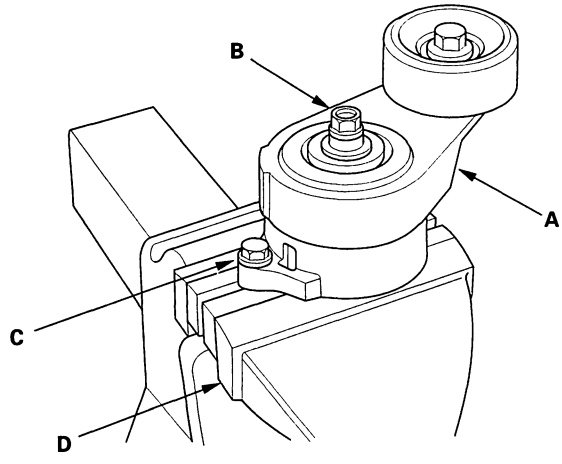
4. Remove the drive belt (see page 4-35).

5. Move the auto-tensioner within its limit with the belt tension release tool in the direction shown. Check that the tensioner moves smoothly and without any abnormal noise. If the tensioner does not move smoothly or you hear abnormal noises, replace the auto-tensioner (see page 4-37).



6. Remove the auto-tensioner (see page 4-37).

7. Clamp the auto-tensioner (A) by using a 10 mm bolt (B), 8 mm bolt (C), and a vise (D) as shown. Do not clamp the auto-tensioner itself.

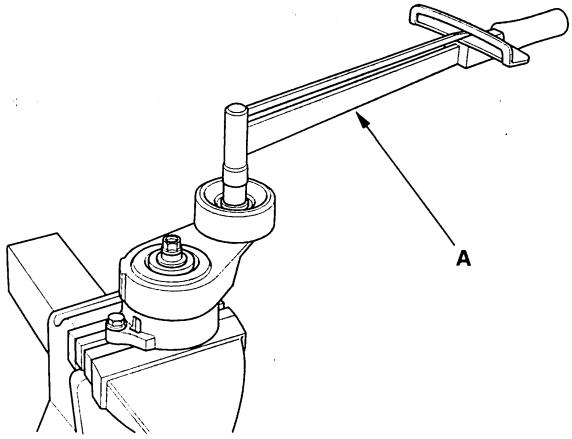


BACK

Protected by AR

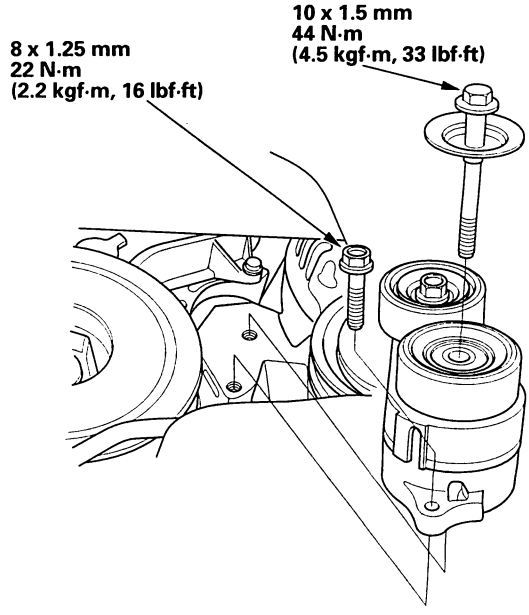
8. Attach a torque wrench (A) to the pulley bolt. measure the torque when the tensioner is turned counterclockwise. If the torque is less than the specified value, replace the auto-tensioner.

Aut-tensioner Spring Torque:
50.5 N·m (5.15 kgf·m, 37.2 lbf·ft)



Drive Belt Auto-tensioner Replacement

1. Remove the drive belt (see page 4-35).
2. Remove the splash shield (see step 31 on page 5-5).
3. Remove the auto-tensioner.

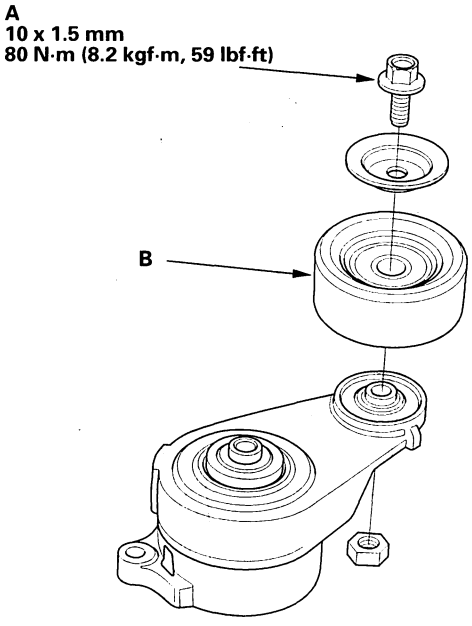


4. Install the auto-tensioner in the reverse order of removal.

Protected by AR

Tensioner Pulley Replacement

1. Remove the auto-tensioner (see page 4-37).
2. Remove the pulley bolt (A) (left-hand threads), and remove the tensioner pulley (B).

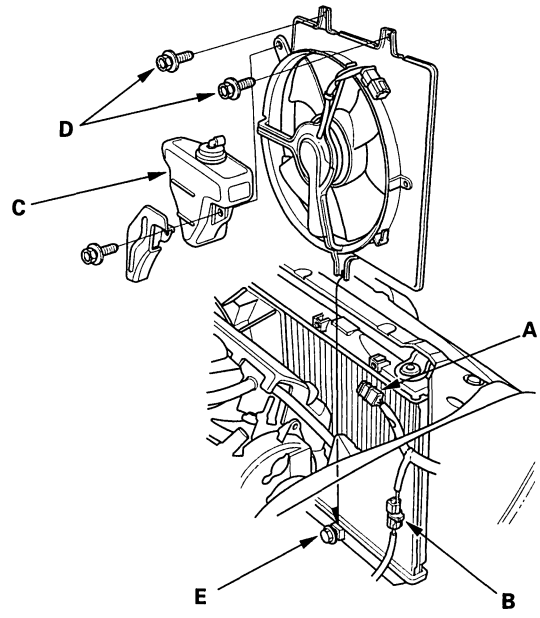


3. Install the tensioner pulley in the reverse order of removal.

Alternator Removal and Installation

Removal

1. Make sure you have the anti-theft codes for the radio, and the navigation system, then write down the customer's audio presets. Make sure the ignition switch is OFF.
2. Disconnect the negative cable from the battery first, then disconnect the positive cable.
3. Disconnect the fan motor connector (A) and compressor clutch connector (B), then remove the reserve tank (C).



4. Remove the two bolts (D), and loosen a bolt (E), then remove the condenser fan shroud.

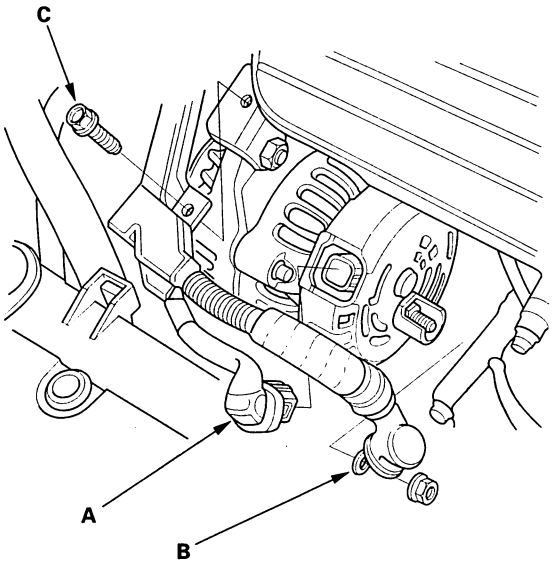
BACK

Protected by AR

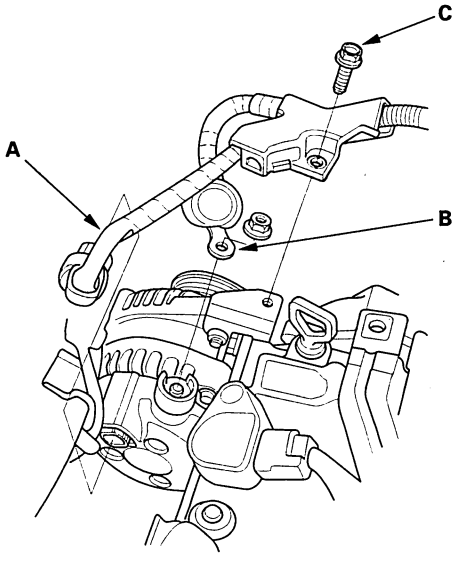
5. Remove the drive belt (see page 4-35).

6. Disconnect the alternator connector (A) and BLK wire (B) from the alternator.

DELPHI (2003-2005 Models)

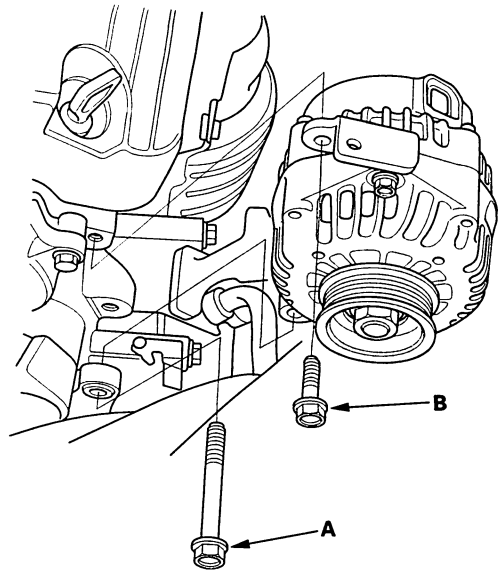


DENSO (2005-2006 Models)



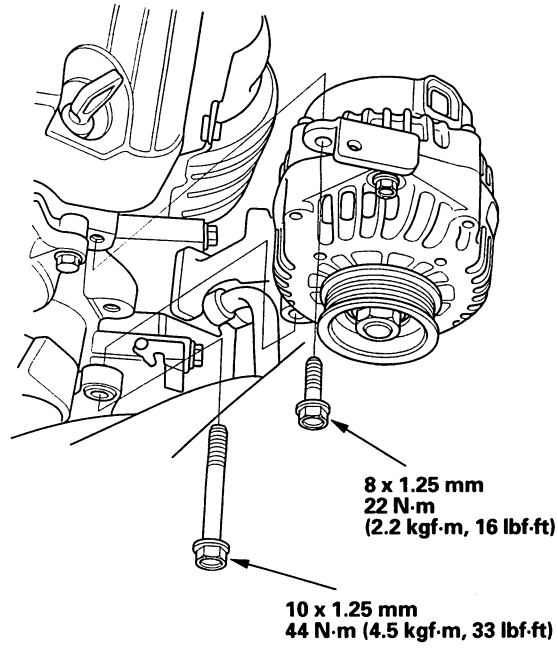
7. Remove the bolt (C) securing the harness holder.

8. Remove the mounting bolt (A) and alternator bracket mounting bolt (B), then remove the alternator.



Installation

1. Install the alternator.



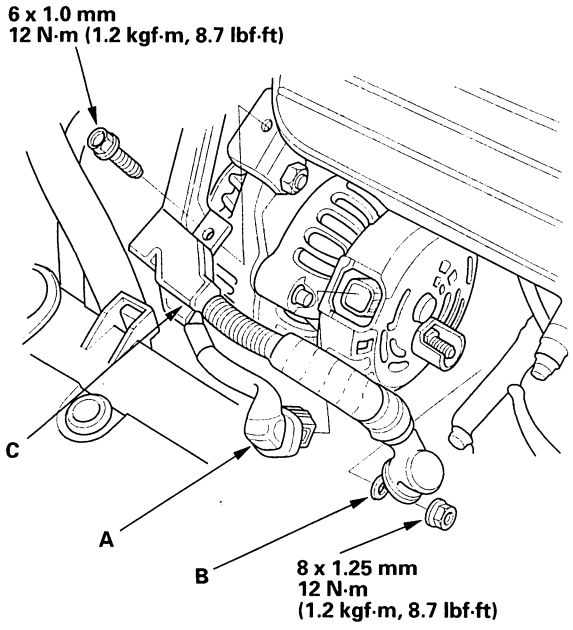
(cont'd)

Protected by AR

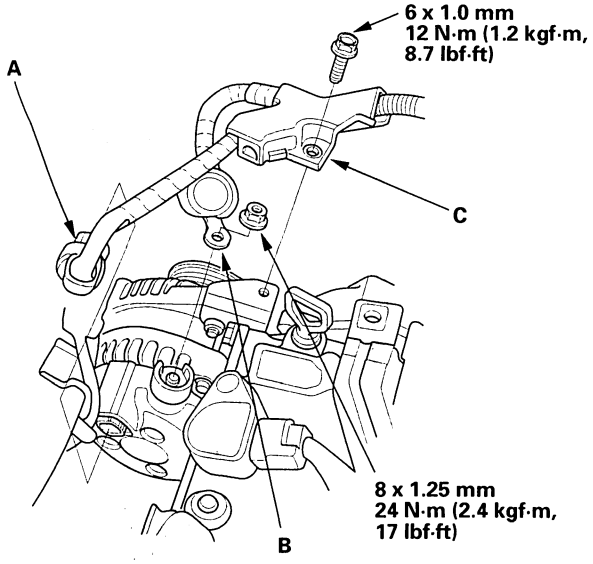
Alternator Removal and Installation (cont'd)

2. Connect the alternator connector (A) and the BLK wire (B) to the alternator.

DELPHI (2003-2005 Models)



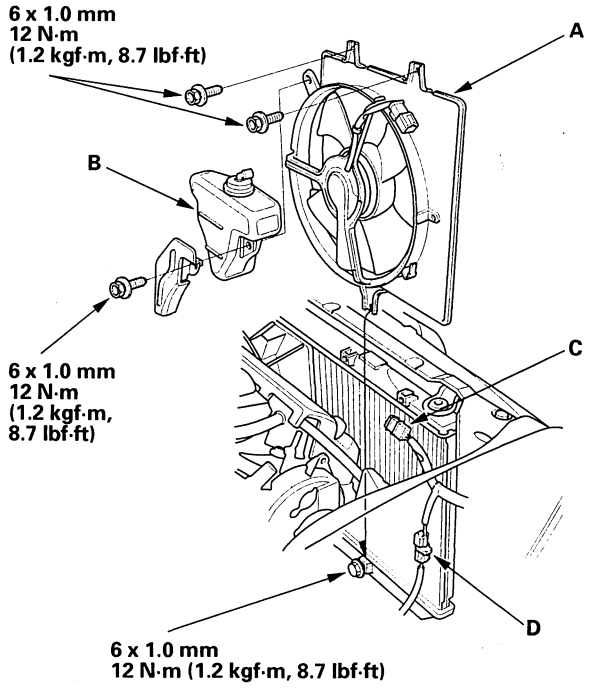
DENSO (2005-2006 Models)



3. Install the harness holder (C).

4. Install the drive belt (see page 4-35).

5. Install the condenser fan shroud (A), and reserve tank(B), then connect the fan motor connector (C) and compressor clutch connector (D).



6. Connect the positive cable to the battery first, then connect the negative cable.

7. Enter the anti-theft codes for the radio and the navigation system, then enter the customer's audio presets.

8. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

9. Set the clock.

Alternator Overhaul (cont'd)

Special Tools Required
- Driver 07749-0010000
- Attachment, 42 x 47 mm 07746-0010300

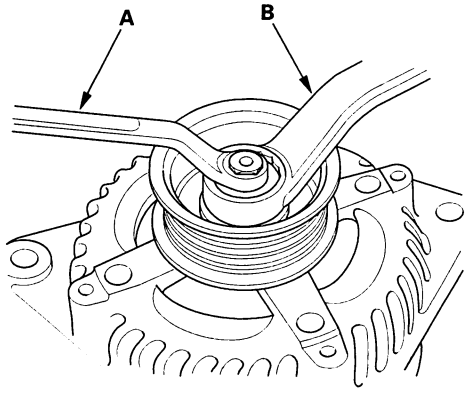
NOTE: Refer to the Exploded View as needed during this procedure.

Alternator Disassembly

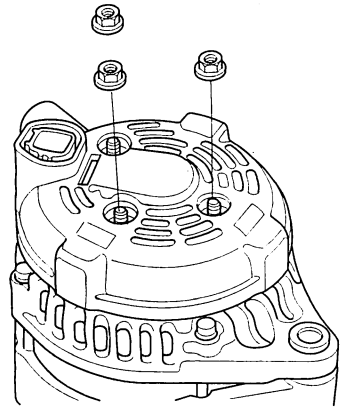
1. Test the alternator and regulator before you remove them (see page 4-31).

2. Remove the alternator (see page 4-38).

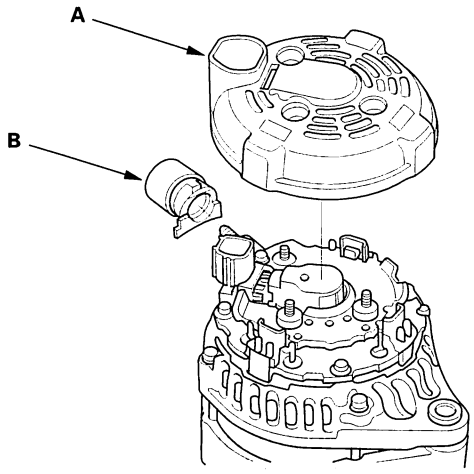
3. If the front bearing needs replacing, remove the pulley locknut with a 10 mm wrench (A) and a 22 mm wrench (B). If necessary, use an impact wrench.



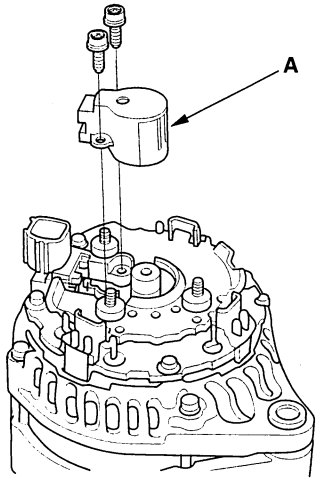
4. Remove the three flange nuts.



5. Remove the end cover (A) and the insulator (B).



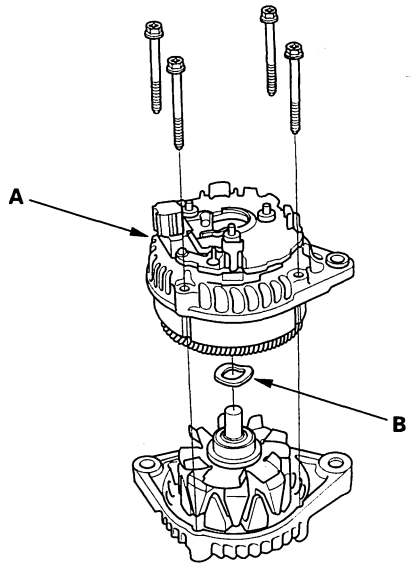
6. Remove the brush holder (A).



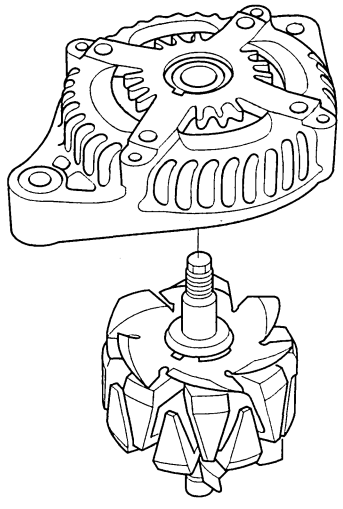
BACK

Protected by AR

7. Remove the four bolts, then remove the rear housing assembly (A) and washer (B).

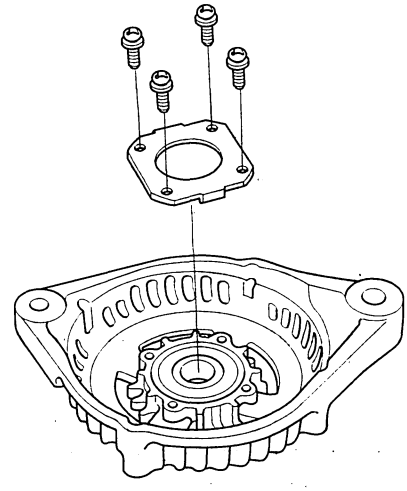


8. If you are not replacing the front bearing, go to step 13. Remove the rotor from the drive end housing.

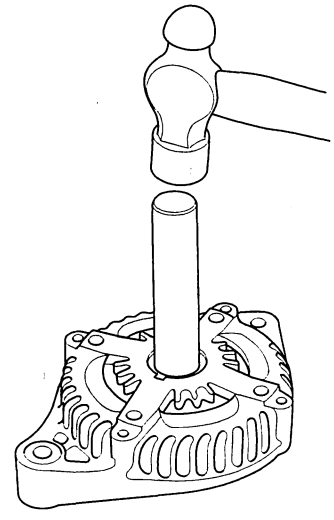


9. Inspect the rotor shaft for scoring, and inspect the bearing journal surface in the drive end housing for seizure marks.
   - If the rotor is damaged, replace the rotor assembly.
   - If the rotor is OK, go to step 10.

10. Remove the front bearing retainer plate.



11. Drive out the front bearing with a brass drift and hammer.

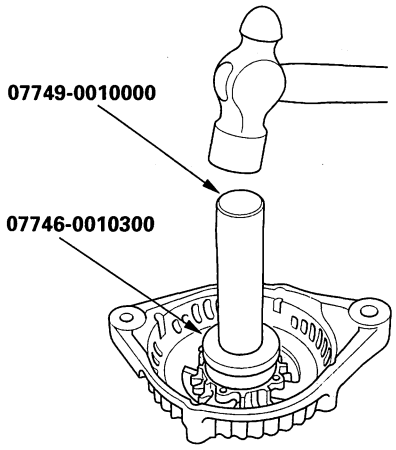


(cont'd)

Protected by AR

Alternator Overhaul (cont'd)

12. With a hammer, driver, and attachment, install a new front bearing in the drive end housing.

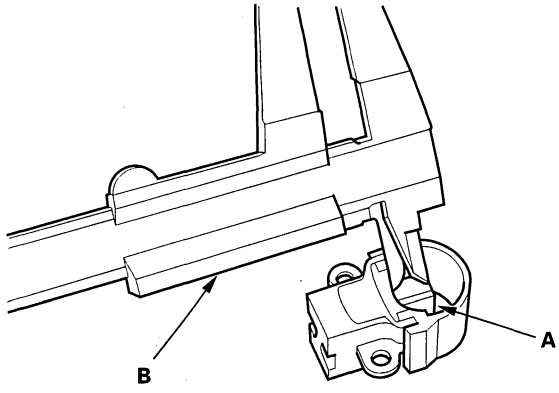


Alternator Brush Inspection

13. Measure the length of both brushes (A) with vernier calipers (B).

- If either brush is shorter than the service limit, replace the brush holder assembly.
- If the brush length is OK, go to step 14.

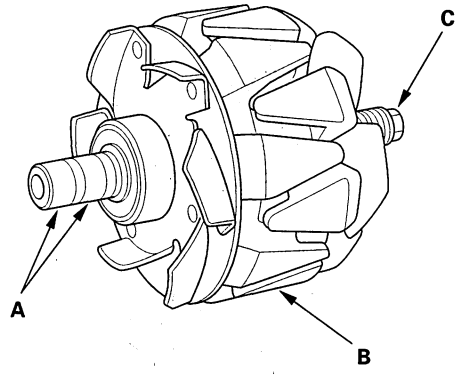
Alternator Brush Length
Standard (New): 10.5 mm (0.41 in.)
Service Limit: 1.5 mm (0.06 in.)



Rotor Slip Ring Test

14. Check for continuity between the slip rings (A).

- If there is continuity, go to step 15.
- If there is no continuity, replace the rotor assembly.



15. Check for continuity between each slip ring and the rotor (B) and the rotor shaft (C).

- If there is no continuity, replace the rear housing assembly, and go to step 16.
- If there is continuity, replace the rotor assembly.

16. Assemble the alternator in the reverse order of disassembly, and note these items:

- Be careful not to get any grease or oil on the slip rings.
- If you removed the pulley, tighten its locknut to 110 N·m (11.2 kgf·m, 81.0 lbf·ft) when you reinstall it.

Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Cruise control cannot be set	1. Check for PGM-FI and body DTCs. 2. Check the No. 13 (20 A) fuse in the under-hood fuse/relay box, and the No. 18 (15 A) fuse in the under-dash fuse/relay box. 3. Do the cruise control input test (see page 4-49). 4. Do the cruise control combination switch test (see page 4-51).	Poor ground G501
Cruise control can be set, but the CRUISE MAIN indicator does not come on	1. Check for PGM-FI and body DTCs. 2. Do the gauge control module self-diagnostic function procedure, refer to the 2003-2006 Accord Service Manual (see page 22-259). 3. Do the cruise control input test (see page 4-49). Test the cruise control master button signal input.	Faulty gauge control module
Cruise control can be set, but the CRUISE CONTROL indicator does not come on	1. Check for PGM-FI and body DTCs. 2. Do the gauge control module self-diagnostic function, procedure, refer to the 2003-2006 Accord Service 3. Manual (see page 22-259). Do the cruise control input test (see page 4-49). Test the cruise control indicator signal input.	Faulty gauge control module
Vehicle does not decelerate or accelerate accordingly when the set/decel or resume/accel switch is pressed	1. Check for PGM-FI and body DTCs. 2. Do the cruise control input test (see page 4-49). Test the cruise control Set/decel and Resume/accel switch signal inputs. 3. Do the cruise control combination switch test (see page 4-51).	Open circuit, loose or disconnected terminals: YEL/RED or GRY/RED wire
Set speed does not cancel when the brake pedal is pressed	1. Check for PGM-FI and body DTCs. 2. Check the No. 13 (20 A) fuse in the under-hood fuse/relay box, and No. 18 (15 A) fuse in the under-dash fuse/relay box. 3. Do the cruise control input test (see page 4-49). Test the brake pedal position switch signal input. 4. Do the brake pedal position switch test, refer to the 2003-2006 Accord Service Manual (see page 22-195).	• Short in the BRN/BLK wire • Faulty brake pedal position switch
Set speed does not cancel (engine rpm stays high) when the clutch pedal is pressed (M/T)	1. Check for PGM-FI and body DTCs. 2. Do the cruise control input test (see page 4-49). Test the clutch pedal position switch signal input. 3. Do the clutch pedal position switch test (see page 4-51).	• Short in the LT BLU wire • Faulty clutch pedal position switch
Set speed does not cancel when the cruise control main switch is turned off	1. Check for PGM-FI and body DTCs. 2. Do the cruise control input test (see page 4-49). Test the cruise control main switch signal input. 3. Do the cruise control combination switch test (see page 4-51).	Short to ground in the LT GRN wire
Set speed does not cancel when the cancel switch is pressed	1. Check for PGM-FI and body DTCs. 2. Check the No. 13 (20 A) fuse in the under-hood fuse/relay box. 3. Do the cruise control input test (see page 4-49). Test the cruise control Cancel switch signal input. 4. Do the cruise control combination switch test (see page 4-51).	Open circuit, loose or disconnected terminals: YEL/RED or GRY/RED wire

(cont'd)

Symptom Troubleshooting Index (cont'd)

Symptom	Diagnostic procedure	Also check for
Set speed will not resume when the resume/accel switch is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the brake pedal)	1. Check for PGM-FI and body DTCs. 2. Check the brake pedal position switch adjustment, refer to the 2003-2006 Accord Service Manual (see page 19-6). 3. Check the No. 13 (20 A) fuse in the under-hood fuse/relay box, and No. 18 (15 A) fuse in the under-dash fuse/relay box. 4. Do the cruise control input test (see page 4-46). Test the cruise control Resume/accel switch signal input. Test the brake pedal position switch signal input. 5. Do the cruise control combination switch test (see page 4-51).	• Open circuit, loose or disconnected terminals: LT GRN/BLK, GRY/RED wire • Faulty brake pedal position switch
Set speed will not resume when the resume/accel switch is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the clutch pedal) (M/T)	1. Check for PGM-FI and body DTCs. 2. Check the clutch pedal position switch adjustment (see page 12-4). 3. Do the cruise control input test (see page 4-46). Test the cruise control Resume/accel switch signal input. Test the clutch pedal position switch signal input. 4. Do the cruise control combination switch test (see page 4-51).	• Open circuit, loose or disconnected terminals: LT GRN/BLK wire • Faulty clutch pedal position switch

BACK

Protected by AR

Cruise Control Input Test

1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC) (see step 2 on page 11-3).
2. Go to B-CAN System Diagnosis Test Mode A, and check for DTCs.
3. Go to PGM-FI, and check for DTCs.
4. Turn the ignition switch ON (II).
5. Do the following tests while monitoring parameters in the PGM-FI DATA LIST with the HDS.

   NOTE: Intermittent failures are often caused by loose circuit connections. While monitoring cruise control inputs, flex their circuits, and note if any of the test result change.

Signal to be tested	Test condition	Parameter: Desired result	Possible cause if result is not obtained
Brake switch signal	Brake pedal pressed, then released	CRUISE BRAKE SW should indicate OFF when the brake pedal is pressed and ON when the brake pedal is released.	• Faulty brake pedal position switch • Blown No. 18 (15A) fuse in the under-dash fuse/relay box • An open in the wire between the ECM/PCM and the brake pedal position switch • A wire shorted to ground between the ECM/PCM and the brake pedal position switch
Clutch pedal position switch signal (M/T)	Clutch pedal pressed, then released	SHIFT/CLUTCH SW should indicate OFF when the clutch pedal is pressed and ON when the clutch pedal is released.	• Faulty clutch pedal position switch • An open in the wire between the ECM and the clutch pedal position switch • A wire shorted to ground between the ECM and the clutch pedal position switch • Poor ground G501
Transmission range switch signal (A/T)	Shift in lever D, D3, or 2 position	SHIFT/CLUTCH SW should indicate OFF in P, R, and N position and ON in D, D3, and 2 position.	• Faulty transmission range switch • An open in the wire between the PCM and the transmission range switch • A wire shorted to ground between the PCM and the transmission range switch • Poor ground G101
Cruise control main switch signal	Cruise control main switch ON and OFF	CRUISE CONTROL MAIN SW should indicate ON when the cruise control main switch is turned ON and OFF when the cruise control main switch is turned OFF.	• Faulty cruise control main switch • An open in the wire between the gauge control module and the cruise control main switch • A wire shorted to ground between the gauge assembly and the cruise control main switch • An open in the wire between the cruise control main switch and ground
Set switch signal	Set/decel switch pressed and released	CRUISE CONTROL SET SW should indicate ON when the Set/decel switch is pressed and OFF when the Set/decel switch is released.	• Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch

Cruise Control Input Test (cont'd)

Signal to be tested	Test condition	Parameter: Desired result	Possible cause if result is not obtained
Resume switch signal	Resume/accel switch pressed and released	CRUISE CONTROL RESUME SW should indicate ON when the resume/accel switch is pressed and OFF when the resume/accel switch is released.	• Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch
Cancel switch signal	Cancel switch pressed and released	CRUISE CONTROL CANCEL SW should indicate ON when the cancel switch is pressed and OFF when the cancel switch is released.	Faulty cruise control combination switch
Cruise control indicator signal	Start the engine, turn the cruise control main switch on, and drive the vehicle to speeds over 25 mph (40 km/h). Set and cancel the cruise control	CRUISE INDICATOR should indicate ON when the cruise control is set and OFF when the cruise control is canceled.	• Faulty gauge control module • A burnt cruise control indicator bulb (2003-2005 models).

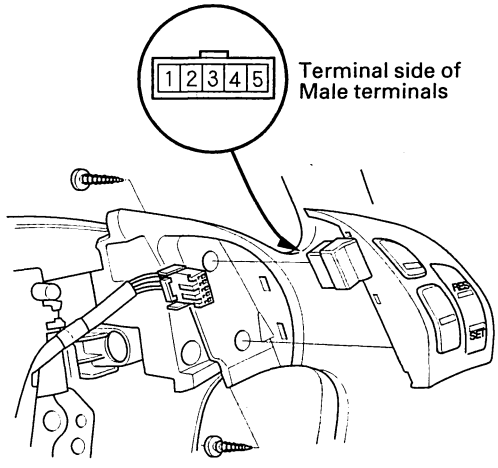
Cruise Control Combination Switch Test/Replacement

SRS components are located in this area. Review the SRS component locations, refer to the 2003-2006 Accord Service Manual (see page 23-17), and the precautions and procedures, refer to the 2003-2006 Accord Service Manual (see page 23-19), before performing repairs or service.

1. Remove the driver's airbag, refer to the 2003-2006 Accord Service Manual (see page 23-197).
2. Remove the two screws, then disconnect the connector, and remove the switch.

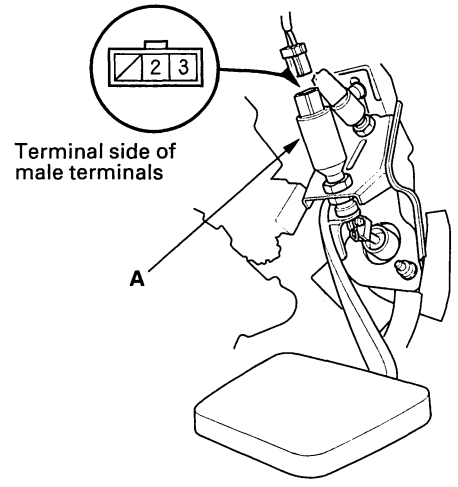


3. Check for continuity between the terminals in each switch position according to the table.
   - If there is continuity, and it matches the table, but switch failure occurred on the cruise control unit input test, check and repair the wire harness on the switch circuit.
   - If there is no continuity in one or both positions, replace the switch.

Terminal / Position	1	2	3		4	5
Cruise control main switch (ON)	○	○				
Cruise control main switch (OFF)						
Set/decel (PRESSED)			○			○
Resume/accel (PRESSED)			○		○	
Cancel (PRESSED)			○	▶		○
				▶	○	

Clutch Pedal Position Switch Test

1. Disconnect the 3P connector from the clutch pedal position switch (A).



2. Remove the clutch pedal position switch.
3. Check for continuity between the terminals according to the table.
   - If the continuity is not as specified, replace the clutch pedal position switch.
   - If OK, install the clutch pedal position switch, and adjust the pedal height (see page 12-6).

Engine Mount Control System

Troubleshooting

Special Tools Required
Vacuum pump/gauge, 0—30 in.Hg
Snap-on YA4000A or equivalent, commercially available

NOTE: Check the vacuum hoses and lines for damage and proper connections before troubleshooting.

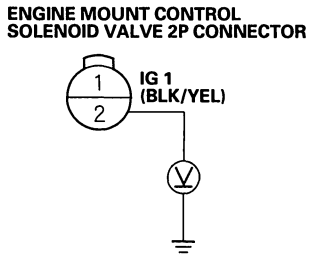
Follow this procedure if the engine vibrates excessively when idling.

1. Start the engine, and let it idle (see page 11-301).
2. Raise the engine speed from idling to 2,000 rpm.
3. Check the MOUNT CTRL SOL in the PGM-FI DATA LIST with the Honda Diagnostic System (HDS).

   Is ON indicated at idling and OFF indicated at 2,000 rpm?

   YES—Go to step 4.

   NO—Update the engine control module (ECM) / powertrain control module (PCM) if it does not have the latest software (see page 11-6), or substitute a known-good ECM/PCM (see page 11-7), then recheck. If the engine mount control system works properly, and the ECM/PCM was updated, the troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■
4. Turn the igniton switch OFF.
5. Disconnect the engine mount control solenoid valve 2P connector from the engine mount control solenoid valve.
6. Turn the ignition switch ON (II).
7. Measure the voltage between engine mount control solenoid valve 2P connector terminal No. 2 and body ground.



Is there battery voltage?

YES—Go to step 8.

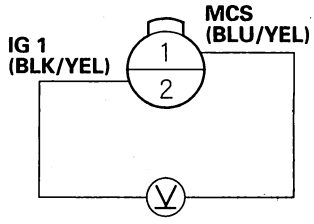
NO—Repair an open in the wire between the engine mount control solenoid valve 2P connecter terminal No.2 and No. 18 (15 A) fuse in the under-dash fuse/relay box. ■

BACK

Protected by AR

8. Measure the voltage between engine mount control solenoid valve 2P connector terminals No. 1 and No. 2, with the engine at idle.

ENGINE MOUNT CONTROL SOLENOID VALVE 2P CONNECTOR



Wire side of female terminals

Is there battery voltage?

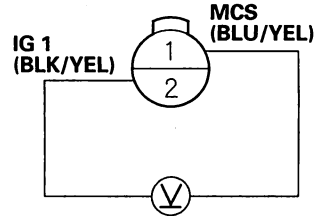
YES—Go to step 9.

NO—Repair an open in the wire between ECM/PCM (B7) and the engine mount control solenoid valve 2P connector. If the wire is OK, update the ECM/PCM if it does not have the latest software (see page 11-6), or substitute a known-good ECM/PCM (see page 11-7), and recheck. If the engine mount control system works properly, and the ECM/PCM was updated, the troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

9. Raise the engine speed above 1,000 rpm.

10. Measure the voltage between engine mount control solenoid valve 2P connector terminals No. 1 and No. 2.

ENGINE MOUNT CONTROL SOLENOID VALVE 2P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Repair a short to body ground in the wire between ECM/PCM (B7) and the engine mount control solenoid valve. If the wire is OK, update the ECM/PCM if it does not have the latest software (see page 11-6), or substitute a known-good ECM/PCM (see page 11-7), and recheck. If the engine mount control system works properly, and the ECM/PCM was updated, the troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

NO—Go to step 11.

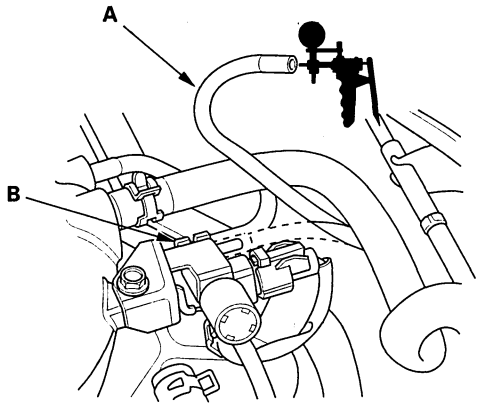
(cont'd)

Protected by AR

Engine Mount Control System

Troubleshooting (cont'd)

11. Disconnect the vacuum hose (A) that is closest to the solenoid connector from the engine mount control solenoid valve (B), and connect a commercially available vacuum pump/gauge, 0—30 in.Hg, to the hose. Apply about 20 in.Hg of vacuum, and wait for 20 seconds.



Does the engine mounts hold vacuum?

YES—Go to step 12.

NO—Either the vacuum hose or one of the engine mounts has a vacuum leak. Repair as needed. ■

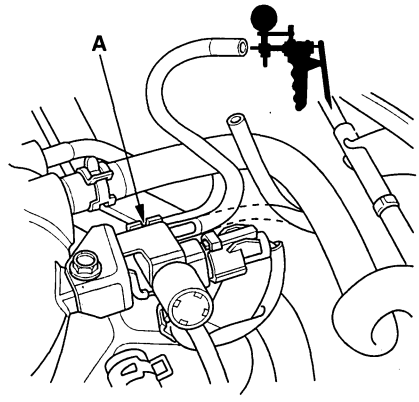
12. Release the vacuum, then apply vacuum again.

Is there a noticeable change in idle smoothness with and without vacuum applied?

YES—Go to step 13.

NO—Replace the front engine mount and/or rear engine mount. ■

13. Connect a commercially available vacuum pump/gauge, 0—30 in.Hg, to the engine mount control solenoid valve port (A) that is closest to the solenoid connector.



Is there manifold vacuum at idle, and a decrease in manifold vacuum when you raise the engine speed above 1,000 rpm?

YES—The system is OK. ■

NO—Replace the engine mount control solenoid valve. ■

Engine Assembly

Engine Removal

Special Tools Required
- Front subframe adapter VSB02C000016
- Engine support hanger, A and Reds AAR-T-12566 (available through Honda Tool and Equipment program, 888-424-6857)
- Engine hanger balance bar VSB02000019

NOTE:
- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring, hoses, or interfere with other parts.

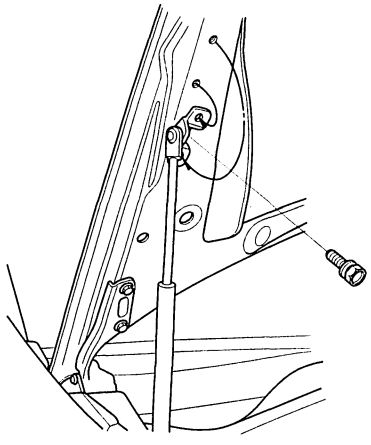
1. Make sure you have the anti-theft codes for the radio and navigation system, then write down the customer's audio presets. Make sure the ignition switch is OFF.

2. Remove the windshield wiper arms, then remove the cowl cover, refer to the 2003-2006 Accord Service Manual (see page 20-199).

3. Remove the bulkhead cover:
   - 2-door, refer to the 2003-2006 Accord Service Manual (see page 20-197)
   - 4-door, refer to the 2003-2006 Accord Service Manual (see page 20-197)

4. Remove the support struts from the engine hood. Move the engine hood to a vertical position, then reinstall the right side support strut as shown.

   NOTE: Do not attempt to close the hood with the support strut in the vertical position, as it will damage the support strut and hood.



5. Relieve the fuel pressure (see page 11-315).

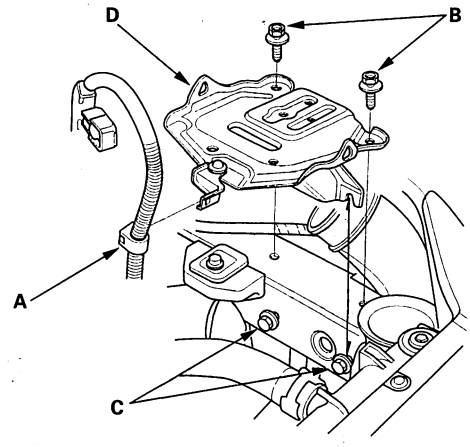
6. Drain the power steering system fluid, then plug the fluid reservoir and return hose (see page 17-10).

7. Disconnect the negative cable from the battery first, then disconnect the positive cable.

8. Remove the battery.

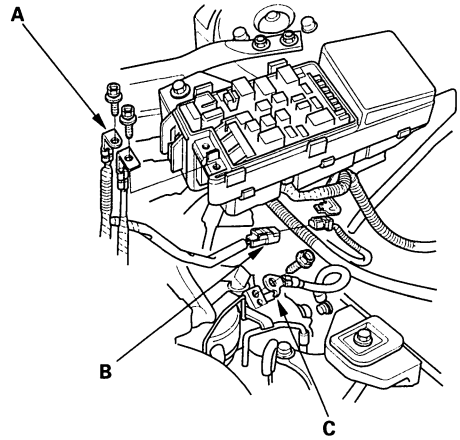
9. Remove the air cleaner housing (see page 11-344).

10. Remove the harness clamp (A).



11. Remove the two bolts (B), and loosen the two bolts (C) securing the battery base, then remove the battery base (D).

12. Remove the battery cables (A) from the under-hood fuse/relay box, then disconnect the harness connector (B).

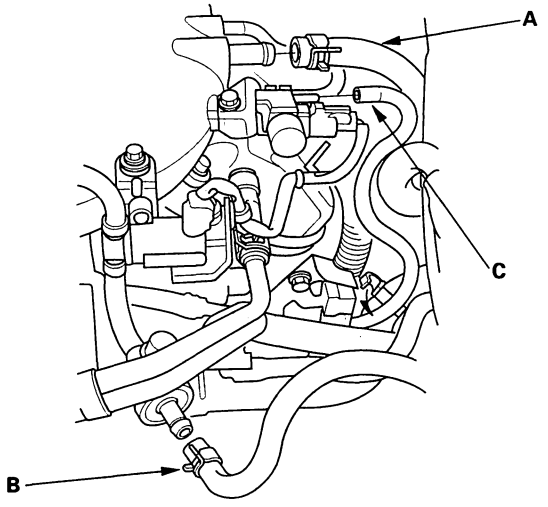


13. Remove the ground cable (C).

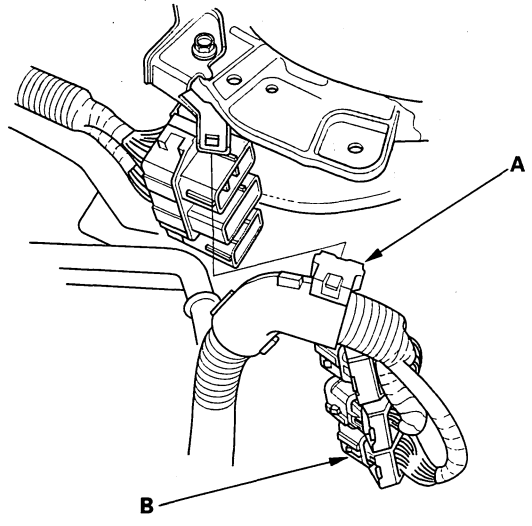
BACK

Protected by AR

14. Remove the brake booster vacuum hose (A), evaporative emission (EVAP) canister hose (B) and vacuum hose (C).

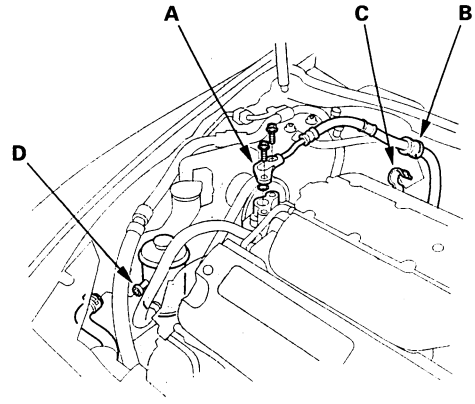


15. Remove the harness clamp (A), and disconnect the engine wire harness connectors (B) on the left side of the engine compartment.



16. Remove the drive belt (see page 4-35).

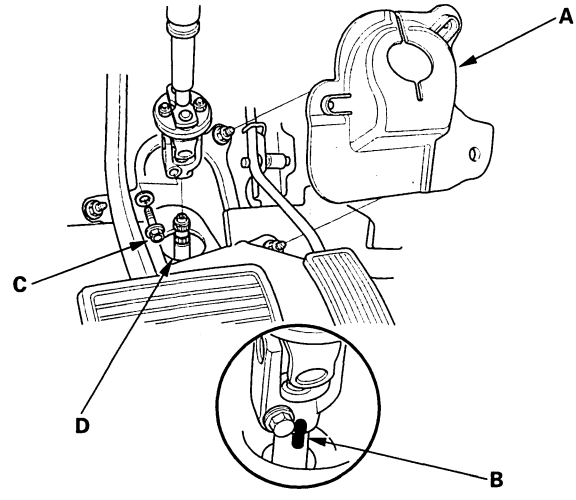
17. Remove the power steering (P/S) pump outlet line (A) from the P/S pump, then plug the outlet line and the P/S pump.



18. Remove the P/S hose (B) from the clamp (C).

19. Remove the power steering system fluid reservoir (D) from the clamp.

20. Remove the steering joint cover (A).



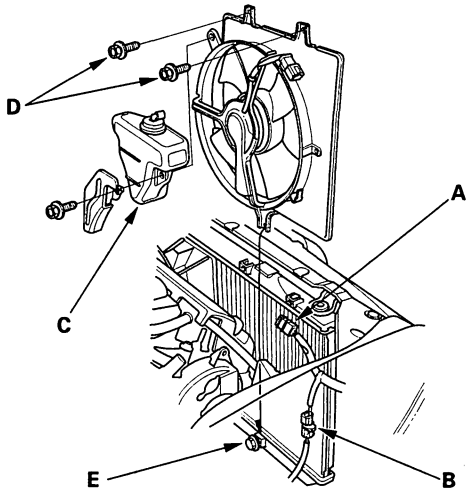
21. Looking the steering wheel. Make a reference mark (B) across the steering joint and steering gearbox pinion shaft. Remove the steering joint bolt (C), and disconnect the steering joint from the steering gearbox pinion shaft (D). To prevent damage to the cable reel, do not turn the steering wheel once the steering joint has been removed.

(cont'd)

Protected by AR

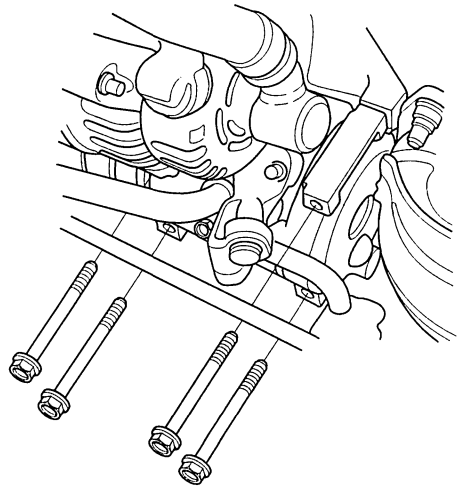
Engine Removal (cont'd)

22. Disconnect the fan motor connector (A) and compressor clutch connector (B), then remove the reserve tank (C).

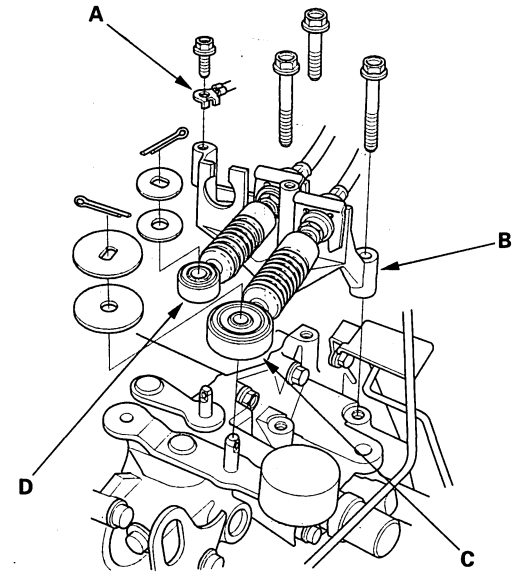


23. Remove the two bolts (D), and loosen the bolt (E), then remove the condenser fan shroud.

24. Remove the four bolts securing the A/C compressor.

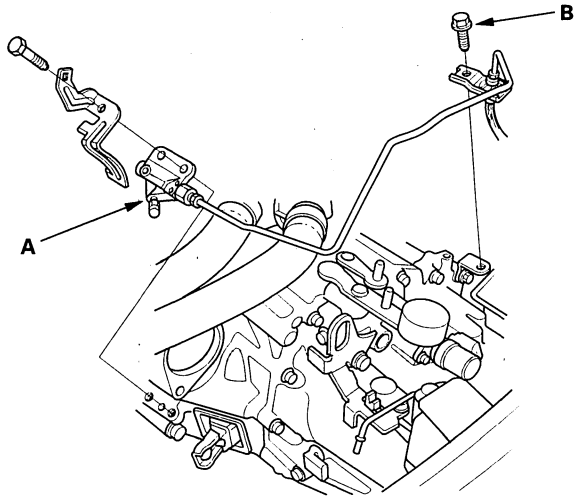


25. M/T model: Remove the ground cable (A) from the shift cable holder, then remove the three bolts securing the shift cable holder (B).



26. M/T model: Remove the shift cable (C) and select cable (D). Do not bend the cables excessively.

27. M/T model: Remove the clutch slave cylinder (A), and clutch line bracket mounting bolt (B). Do not operate the clutch pedal once the slave cylinder has been removed.



BACK

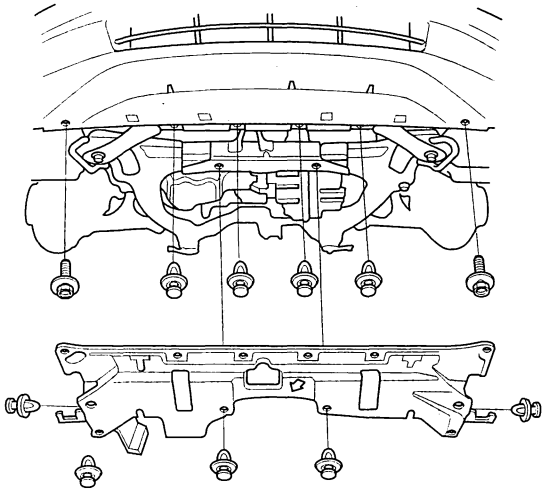
Protected by AR

28. Remove the radiator cap.

29. Raise the vehicle on the hoist to full height.

30. Remove the front wheels.

31. Remove the splash shield.



32. Loosen the drain plug in the radiator, and drain the engine coolant (see page 10-6).

33. Drain the transmission fluid:

    - Manual transmission (see page 13-10)
    - Automatic transmission (see page 14-186)

34. Drain the engine oil (see page 8-6).

35. Disconnect the stabilizer links, refer to the 2003-2006 Accord Service Manual (see page 18-22).

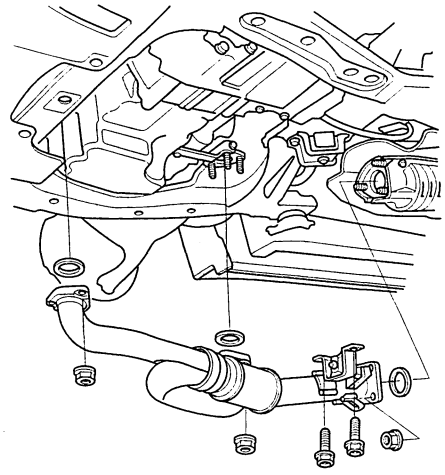
36. Remove the damper fork, refer to the 2003-2006 Accord Service Manual (see page 18-25).

37. Separate the tie-rod end ball joints from the knuckles (see step 8 on page 17-21).

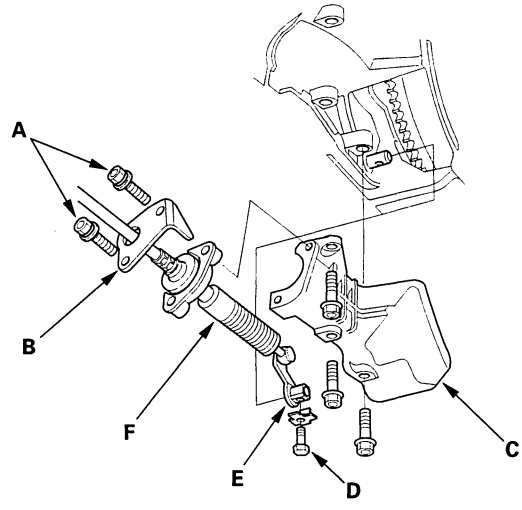
38. Separate the knuckles from the lower arms, refer to the 2003-2006 Accord Service Manual (see page 18-20).

39. Remove the driveshafts (see step 10 on page 16-5). Coat all precision-finished surfaces with clean engine oil. Tie plastic bags over the driveshaft ends.

40. Remove exhaust pipe A.



41. A/T model: Remove the bolts (A) securing the shift cable holder (B), then remove the shift cable cover (C). To prevent damage to the control lever joint, be sure to remove the bolts securing the shift cable holder before removing the bolts securing the shift cable cover.



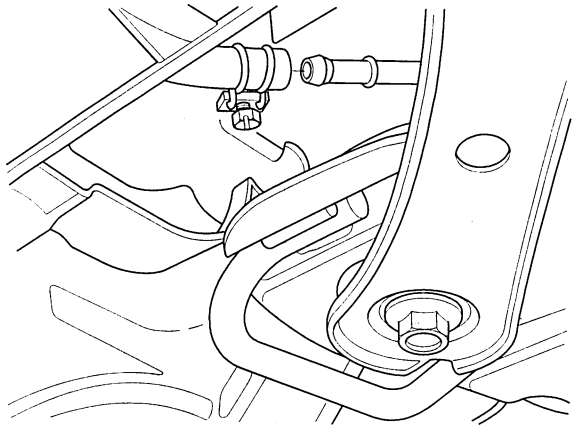
42. A/T model: Remove the lock bolt (D) securing the control lever (E), then remove the shift cable (F) with the control lever. Do not bend the shift cable excessively.

(cont'd)

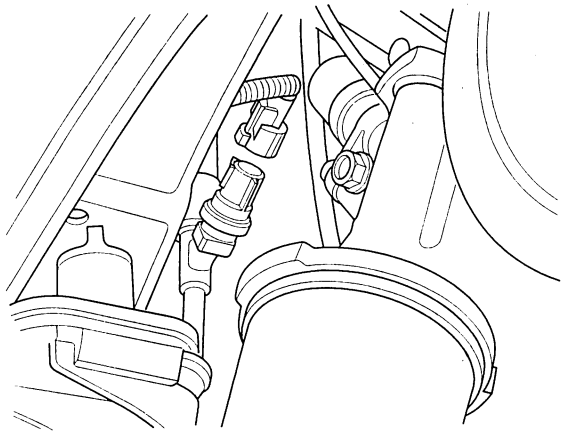
Protected by AR

Engine Removal (cont'd)

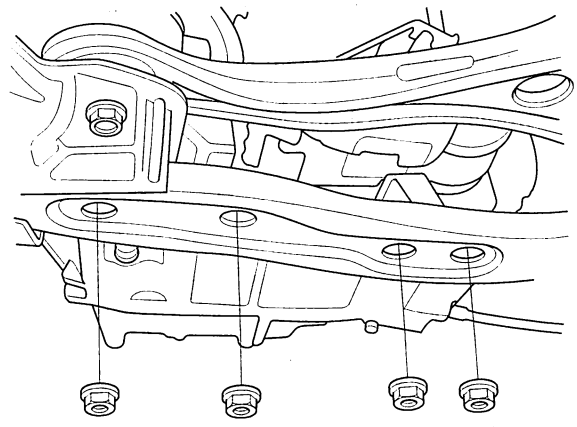
43. Remove the P/S hose, then plug the line and the hose.



44. Disconnect the power steering pressure switch connector.

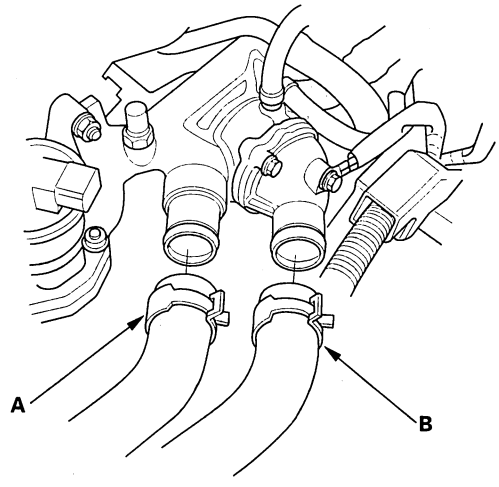


45. Remove the nuts securing the transmission lower front mount and transmission lower rear mount.



46. Lower the vehicle on the hoist.

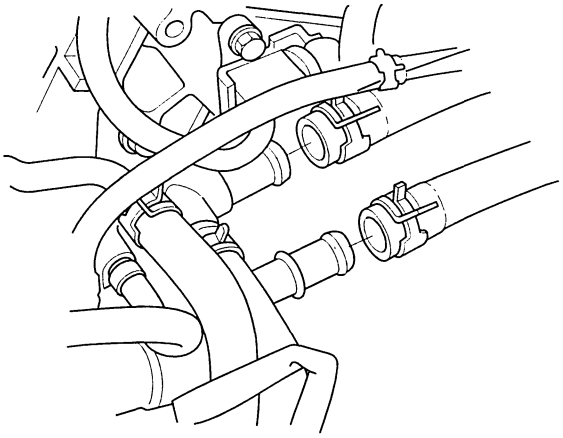
47. Remove the upper radiator hose (A) and lower radiator hose (B).



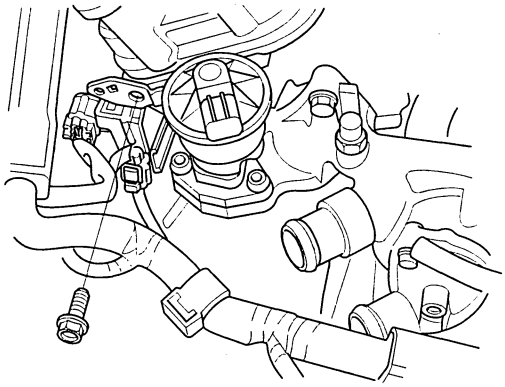
BACK

Protected by AR

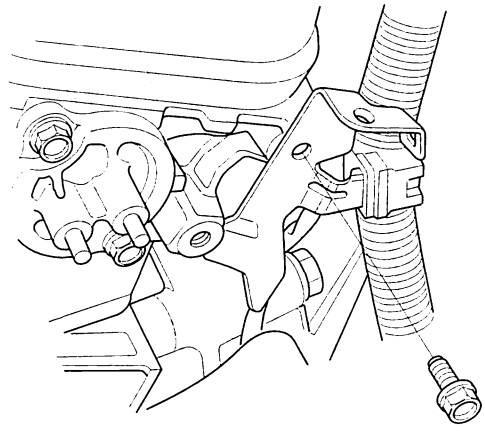
48. Remove the heater hoses.



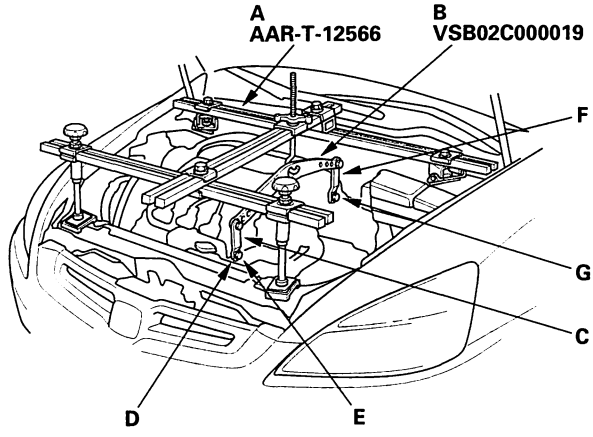
49. Remove the connector bracket from the front cylinder head; use the bracket bolt to attach engine balancer bar front arm.



50. Remove the harness clamp bracket from the rear cylinder head; use the bracket bolt to attach engine balancer bar rear arm.



51. Lift and support the engine with engine hanger (A) and engine balancer bar (B).
Attach the front arm (C) to the front cylinder head with a spacer (D) and the connector bracket bolt (10 x 1.25 mm) (E). Attach the rear arm (F) to the rear cylinder head with the harness clamp bracket bolt (8 x 1.25 mm) (G).



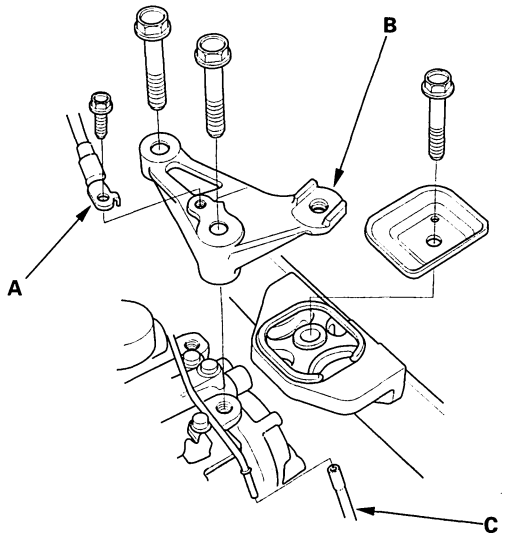
(cont'd)

Protected by AR

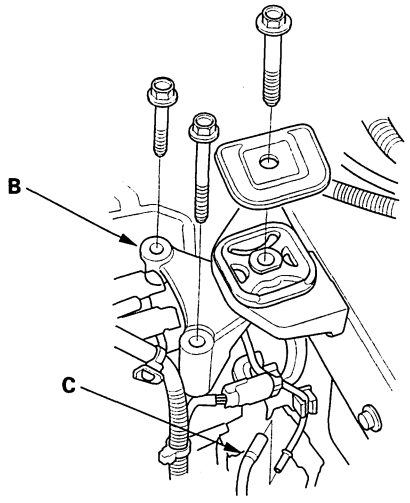
Engine Removal (cont'd)

52. M/T model: Remove the ground cable (A).

M/T:

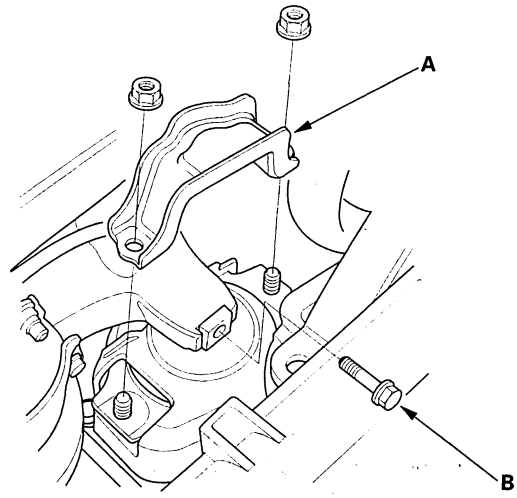


A/T:

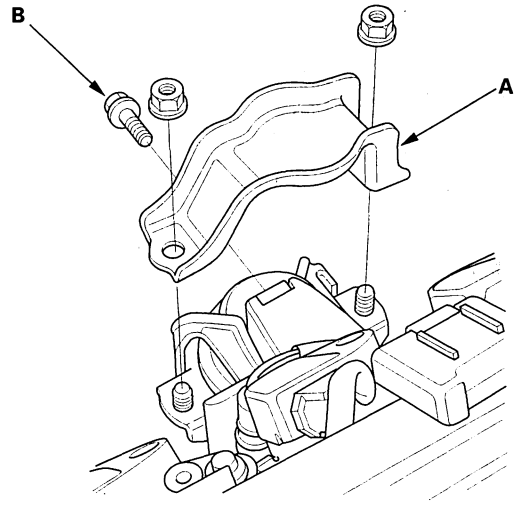


53. Remove the transmission upper mount bracket (B), and remove the vacuum hose (C).

54. Remove the front mount stop (A), then remove the front mount bolt (B).



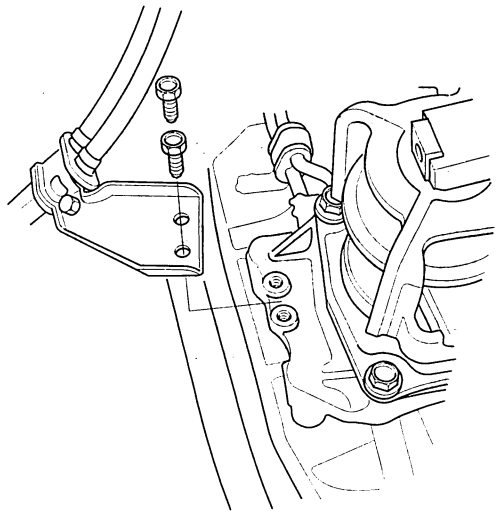
55. Remove the rear mount stop (A), then remove the rear mount bolt (B).



BACK

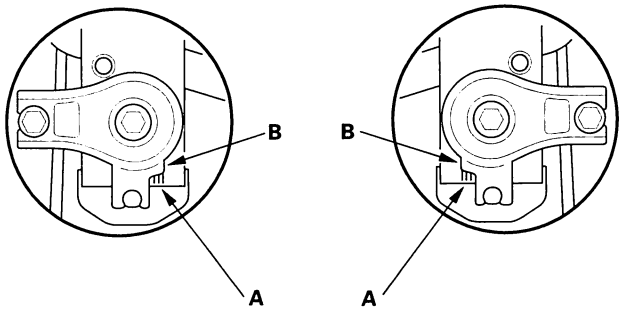
Protected by AR

56. M/T model: Remove the two bolts securing the shift cable bracket.

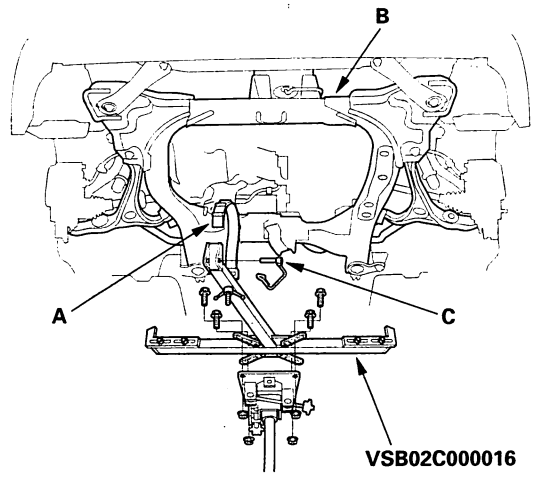


57. Raise the vehicle on the hoist to full height.

58. Make the appropriate lines (A) at the subframe that line up with the edge of the subframe stiffer (B).

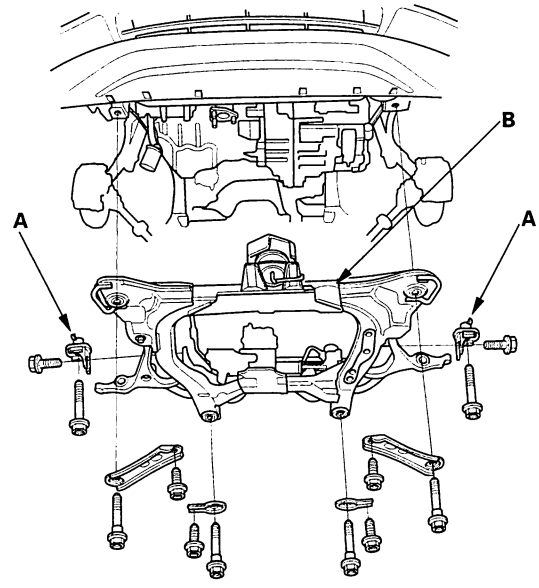


59. Attach the special tool to the subframe by hanging the belt (A) over the front of the subframe (B), then secure the belt with its stop (C).



60. Raise the jack, then line up the slots in the special tool arms with the bolt holes on the corner of the jack base, then securely attach them with four bolts.

61. Remove the subframe mid mounts (A), then remove the subframe (B).

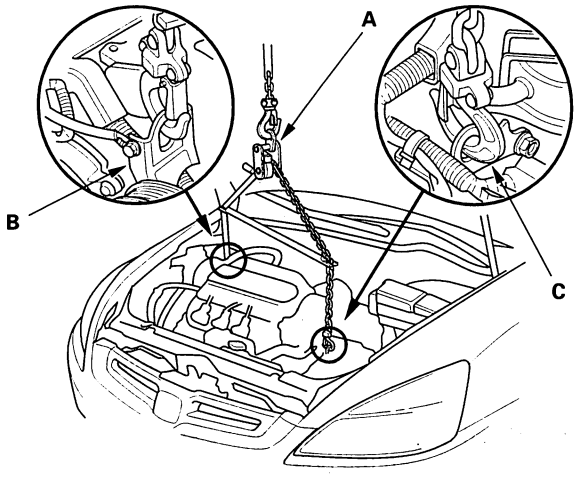


(cont'd)

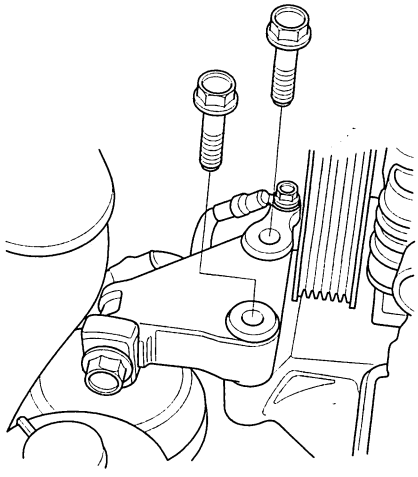
Protected by AR

Engine Removal (cont'd)

62. Lower the vehicle and attach a chain hoist (A) to the engine hook (B) and transmission hook (C). Lift up on the engine/transmission assembly until it's securely supported by the chain hoist, and remove the engine support hanger from the engine and vehicle.



63. Remove the two bolts securing the side engine mount bracket.



64. Check that the engine/transmission is completely free of vacuum hoses, fuel and coolant hoses, and electrical wiring.

65. Slowly lower the engine/transmission assembly about 150 mm (6 in.). Check once again that all hoses and electrical wiring are disconnected and free from the engine/transmission, then lower it all the way.

66. Disconnect the chain hoist from the engine/transmission assembly.

67. Raise the vehicle all the way, and remove the engine/transmission assembly from under the vehicle.

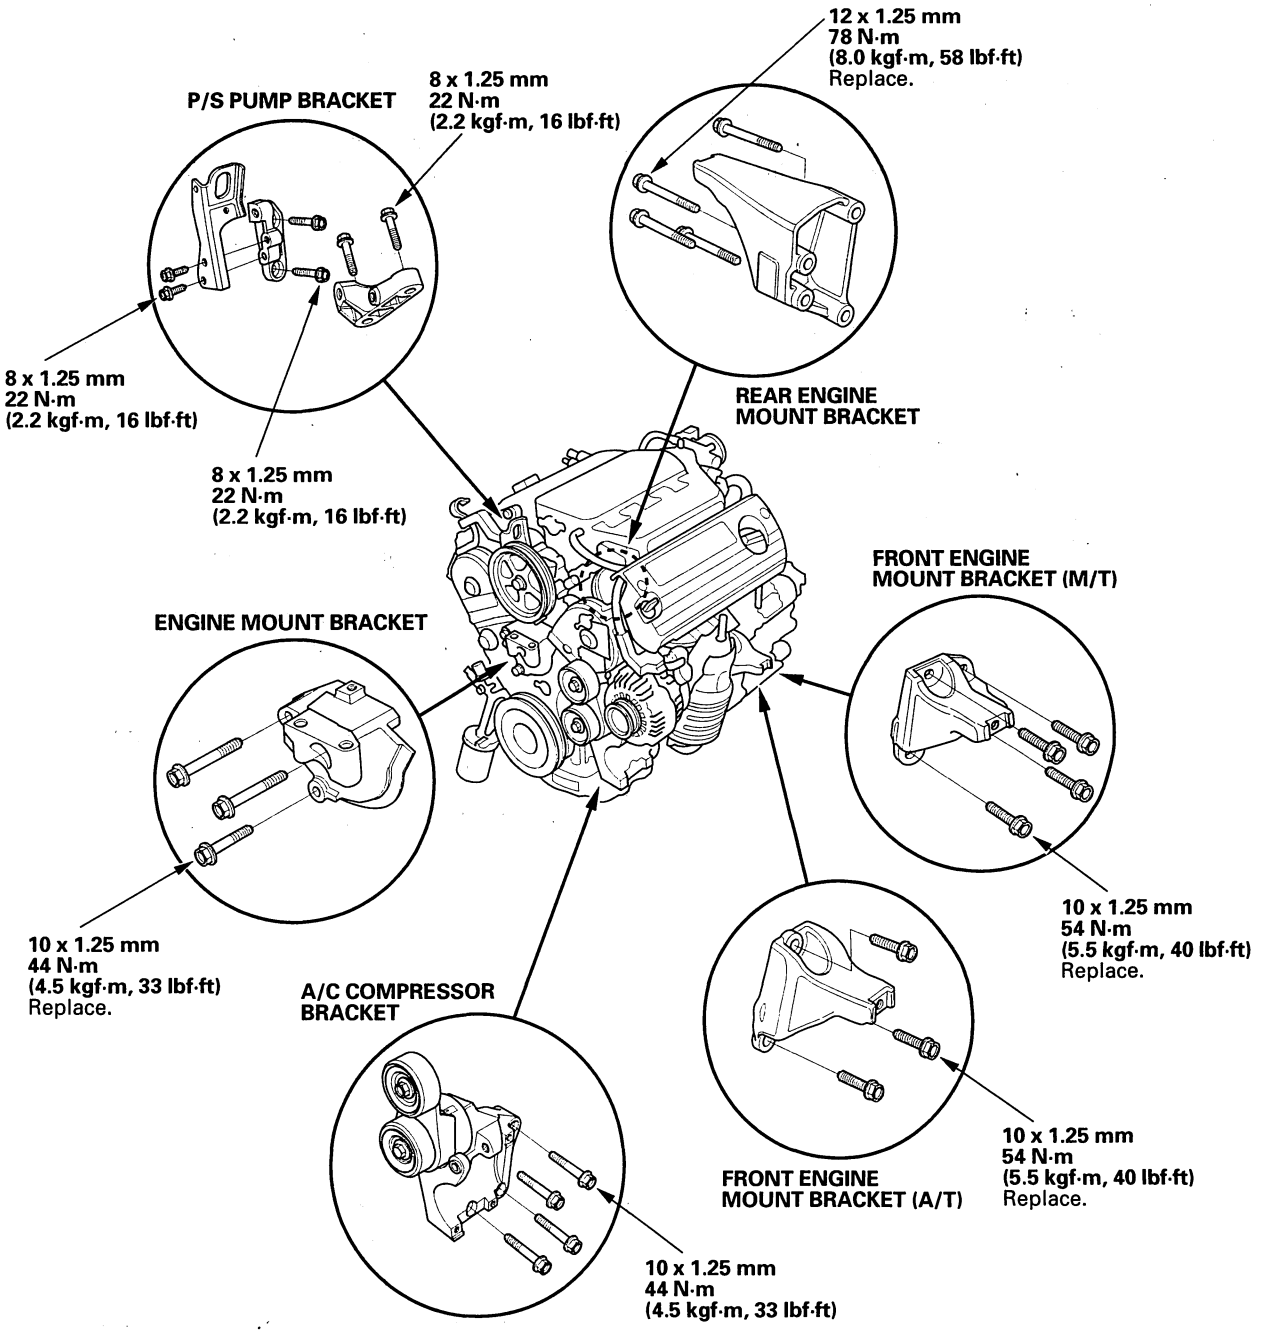
BACK

Protected by AR

Engine Installation

Special Tools Required
- Front subframe adapter VSB02C000016
- Engine support hanger, A and Reds AAR-T-12566
  (available through Honda Tool and Equipment program, 888-424-6857)
- Engine hanger balance bar VSB02000019

1. Install the accessory brackets and tighten their bolts and nuts to the specified torques.



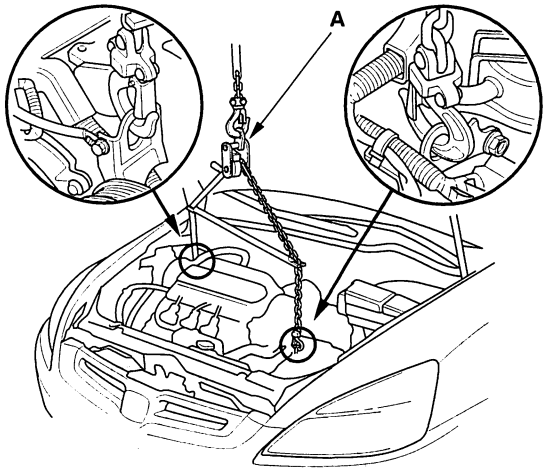
(cont'd)

Protected by AR

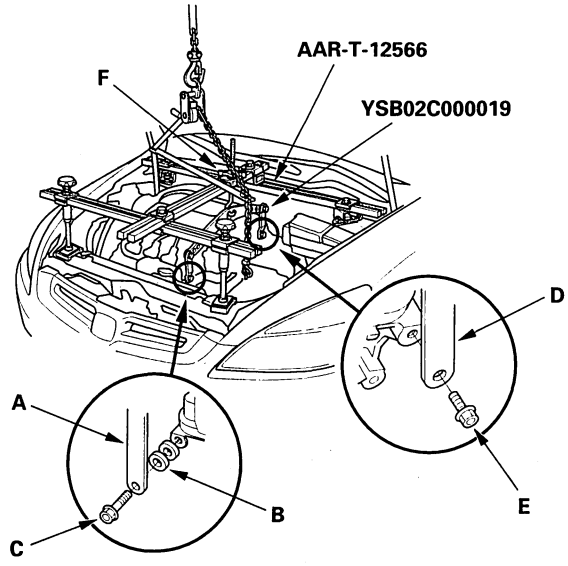
Engine Installation (cont'd)

2. Position the engine/transmission assembly under the vehicle. Be sure that they are properly aligned. Carefully lower the vehicle until the engine and transmission are properly positioned in the engine compertment. Make sure the vehicle is not resting on any part of the engine or transmission. Lift and support the engine with a chain hoist (A) and carefully raise the engine/transmission assembly into place.

   NOTE: Reinstall the mounting bolts/support nuts in the sequence given in following steps. Failure to follow this sequence may cause excessive noise and vibration, and reduce engine mount life.

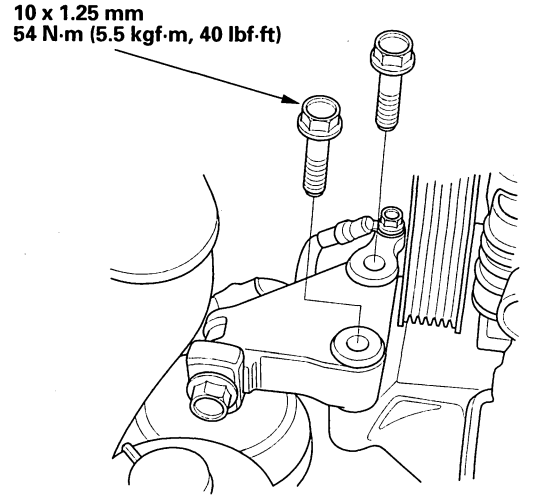


3. Inatall the engine balancer bar (VSB02C000019); attach the front arm (A) to the front cylinder head with a spacer (B) and 10 x 1.25 mm bolt (C), attach the rear arm (D) to the rear cylinder head with 8 x 1.25 mm bolt (E).



4. Install the engine support hanger (AAR-T-12566) to the vehicle, and attach the hook to the slotted hole in the engine balancer bar. Tighten the wing nut (F) by hand to lift and support the engine/transmission assembly.

5. Install and tighten the two bolts securing the upper bracket.



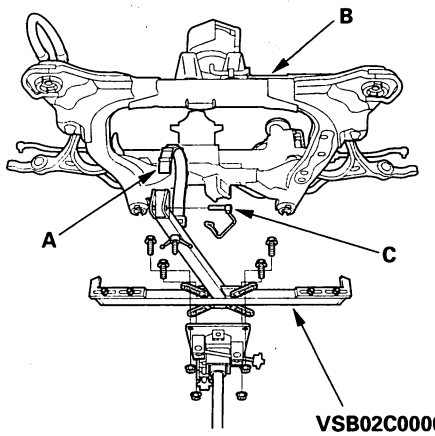
6. Remove the chain hoist, then raise the vehicle on the hoist to full height.

BACK

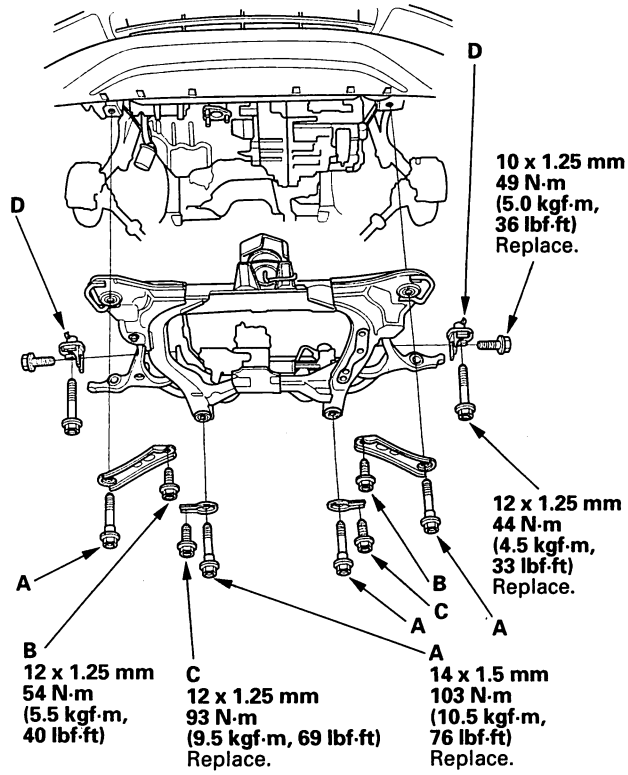
Protected by AR

7. Raise the vehicle on the hoist to full height.

8. Attach the front subframe adapter to the subframe by hanging the belt (A) over the front of the subframe (B), then secure the belt with its stop (C). Raise the subframe up to the body with a jack.



9. Loosely install the four front subframe mounting bolts (A) and the four 12 x 1.25 mm bolts (B), (C) with the stiffeners.



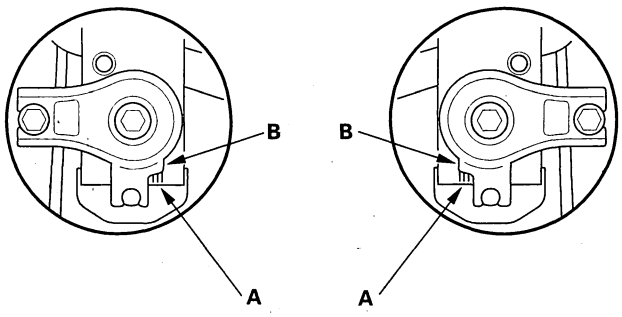
10. Loosely install the subframe mid mounts (D).

(cont'd)

Protected by AR

Engine Installation (cont'd)

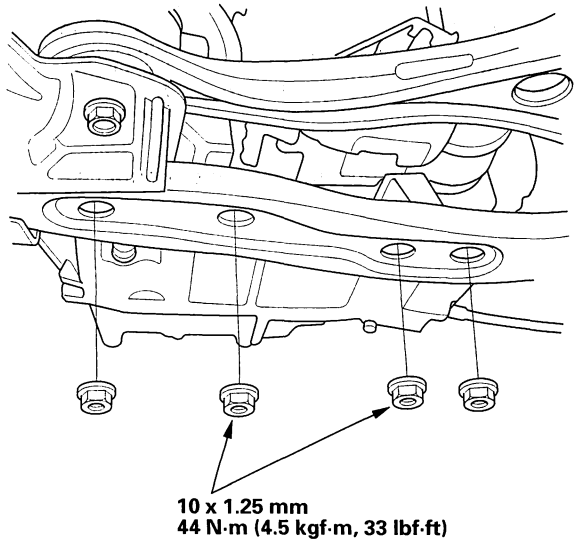
11. Align the reference marks (A) with the edge of the subframe stiffener (B), then tighten the subframe mounting bolts, and 12 x 1.25 mm bolts.



12. Remove the jack and front subframe adapter.

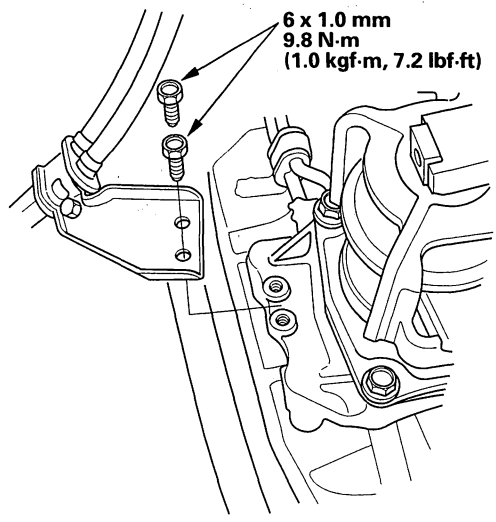
13. Tighten the bolts securing the subframe mid mounts.

14. Tighten the nuts securing the transmission lower rear mount.

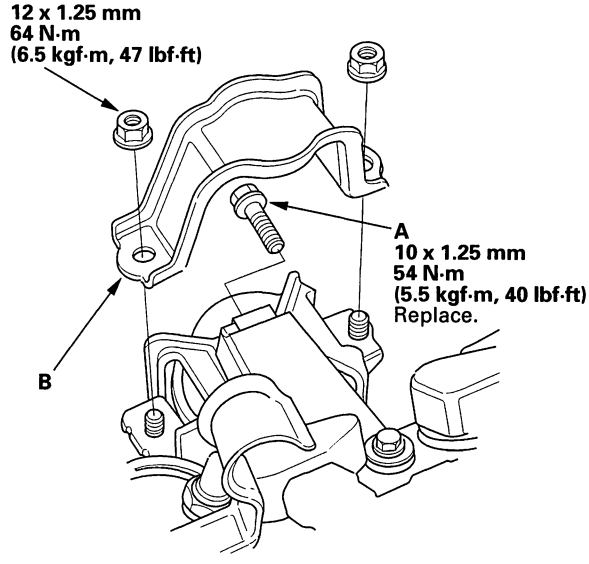


15. Lower the vehicle on the hoist, then remove the engine hanger and balancer bar.

16. M/T model: Tighten the two bolts securing the shift cable bracket.



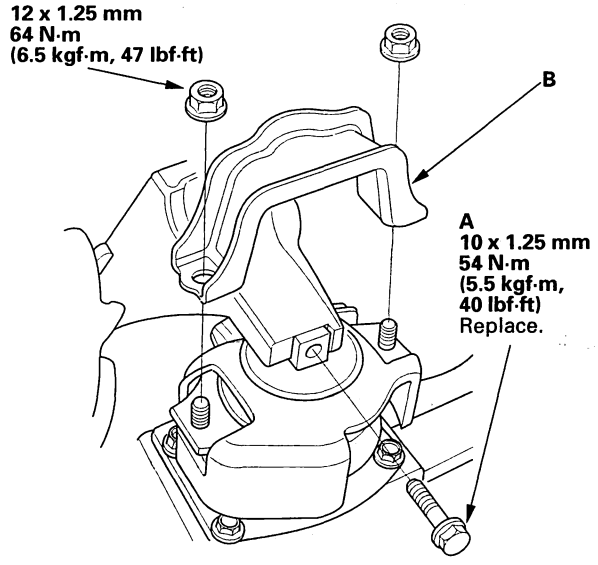
17. Tighten the rear mount bolt (A), then install the rear mount stop (B).



BACK

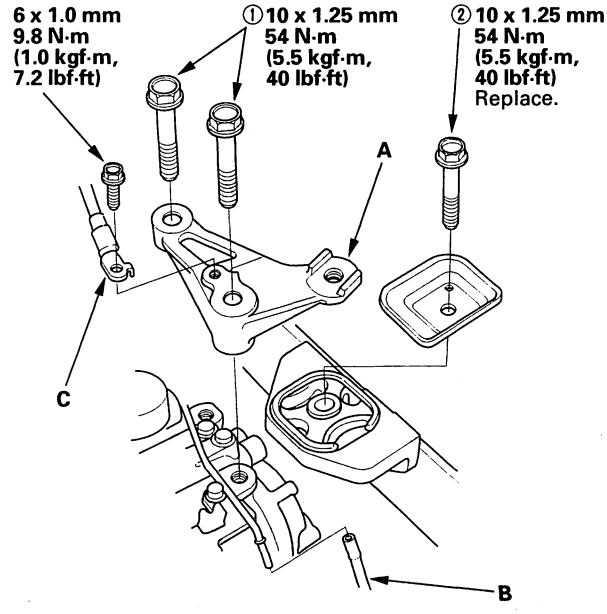
Protected by AR

18. Tighten the front mount bolt (A), then install the front mount stop (B).

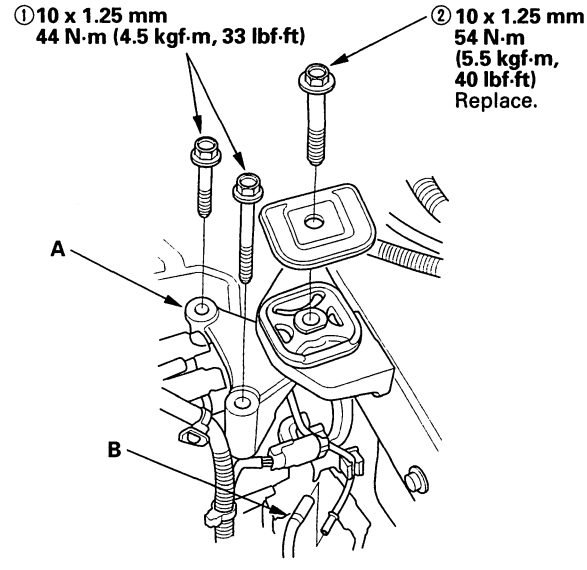


19. Install the transmission upper mount bracket (A), then tighten the bolts in the numbered sequence shown.

M/T:



A/T:



20. Install the vacuum hose (B).

21. M/T model: Install the ground cable (C).

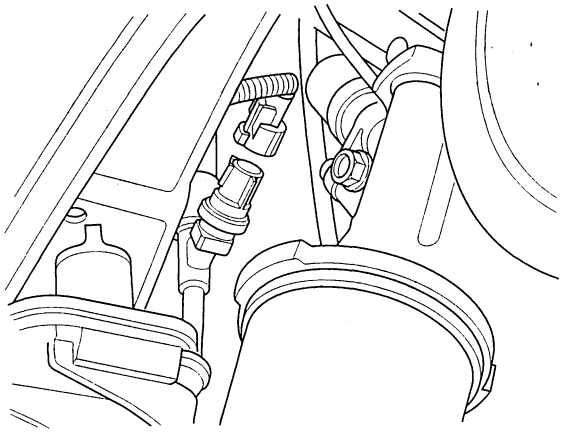
(cont'd)

Protected by AR

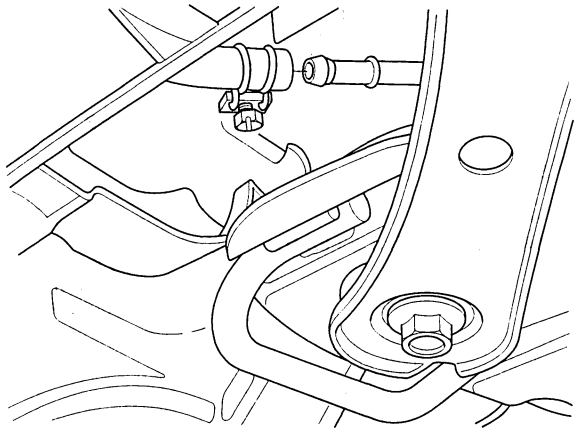
Engine Installation (cont'd)

22. Raise the vehicle on the hoist to full height.

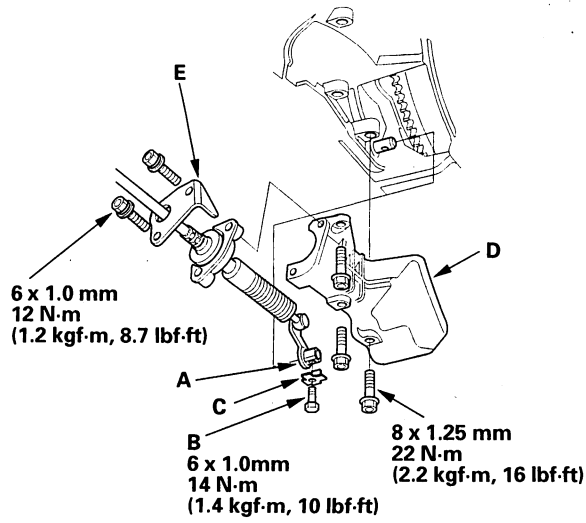
23. Connect the power steering pressure switch connector.



24. Install the power steering (P/S) hose.



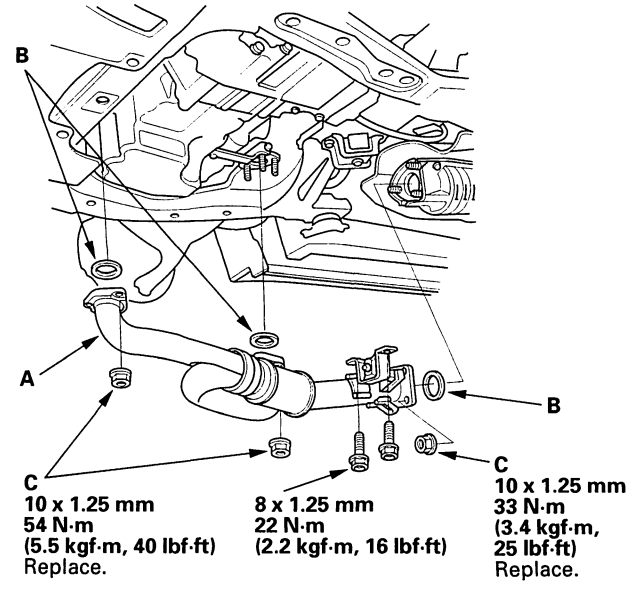
25. A/T model: Install the control lever (A) with the shift cable on the control shaft. Do not bend the shift cable excessively.



26. A/T model: Install the lock bolt (B) with a new lock washer (C), then bend the lock washer tab against the bolt.

27. A/T model: Install the shift cable cover (D), then install the shift cable holder (E) on the shift cable cover.

28. Install exhaust pipe A using new gaskets (B) and new self-locking nuts (C).



BACK

Protected by AR

29. Install a new set ring on the end of each driveshaft, then install the driveshafts. Make sure each ring "clicks" into place in the differential and intermediate shaft.

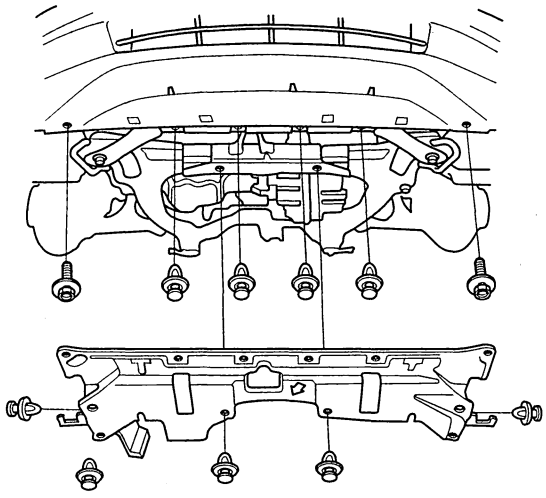
30. Connect the suspension lower arm to the knuckles, refer to the 2003-2006 Accord Service Manual (see step 8 on page 18-21).

31. Connect the tie-rod end ball joints to the knuckles (see step 21 on page 17-40).

32. Install the damper fork, refer to the 2003-2006 Accord Service Manual (see step 2 on page 18-27).

33. Connect the stabilizer links, refer to the 2003-2006 Accord Service Manual (see page 18-22).

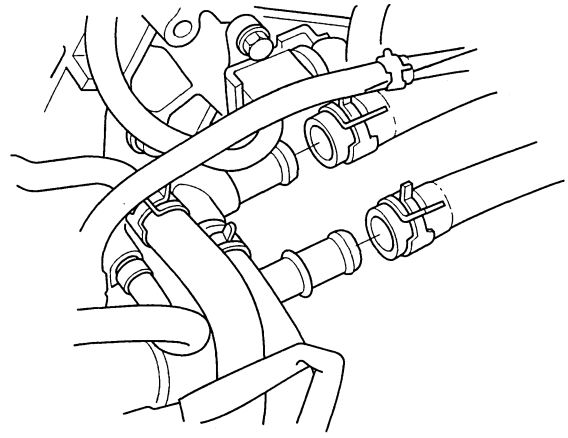
34. Install the splash shield.



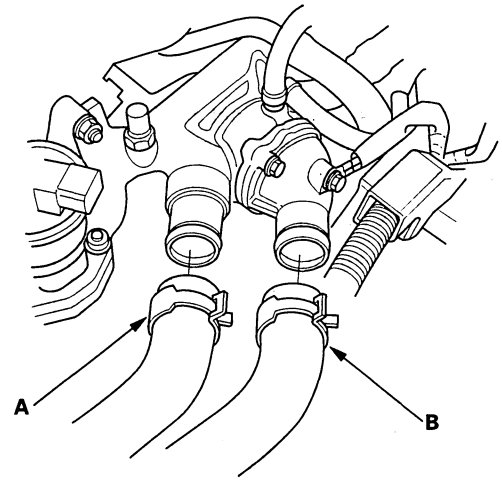
35. Install the front wheels.

36. Lower the vehicle on the hoist.

37. Install the heater hoses.



38. Install the upper radiator hose (A) and lower radiator hose (B).

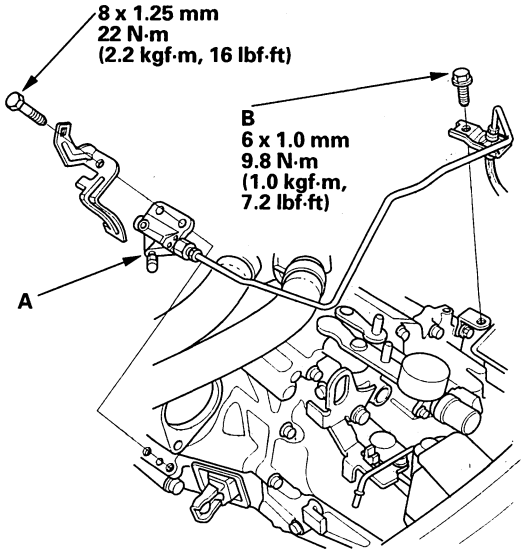


(cont'd)

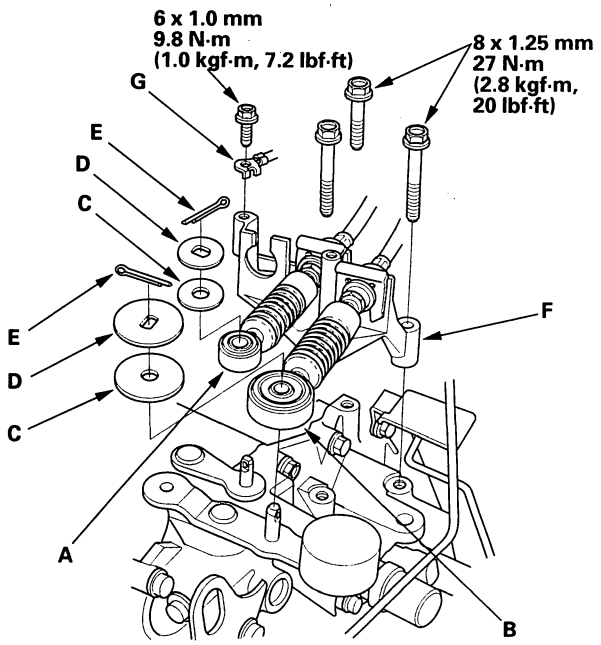
Protected by AR

Engine Installation (cont'd)

39. M/T model: Install the clutch slave cylinder (A) and clutch line bracket mounting bolt (B).

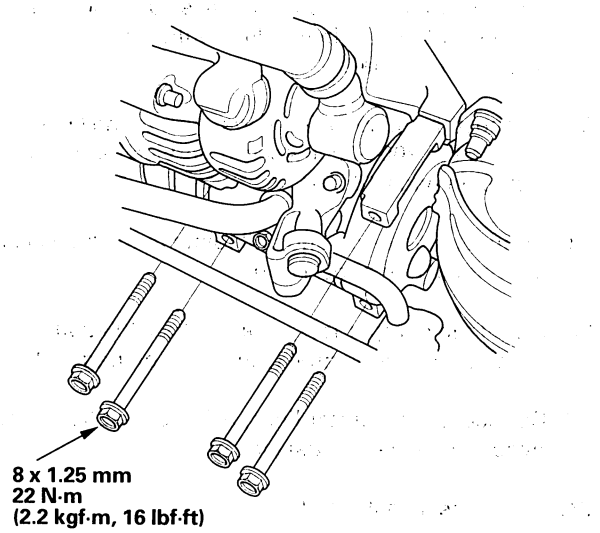


40. M/T model: Install the select cable (A) and shift cable (B) with the plastic washers (C), washers (D), and new cotter pins (E).

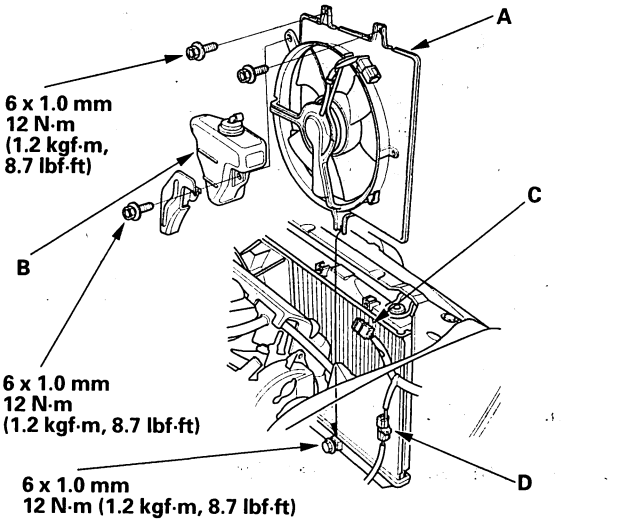


41. M/T model: Install the shift cable holder (F) and ground cable (G).

42. Install the A/C compressor.



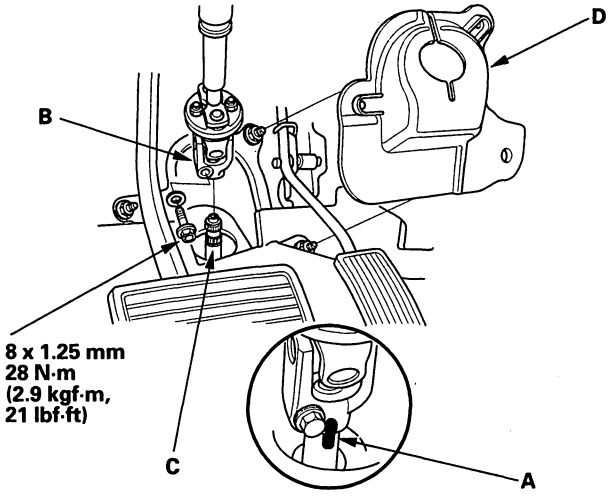
43. Install the condenser fan shroud (A), and reserve tank (B), then connect the fan motor connector (C) and compressor clutch connector (D).



BACK

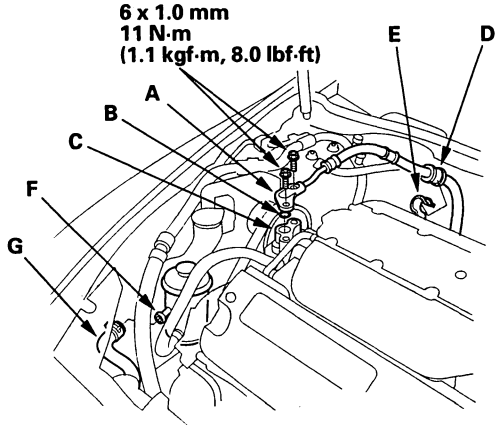
Protected by AR

44. Align the reference mark (A) on the steering joint and steering gearbox pinion shaft. Connect the steering joint (B) to the steering gearbox pinion shaft (C). Tighten the steering joint bolt.



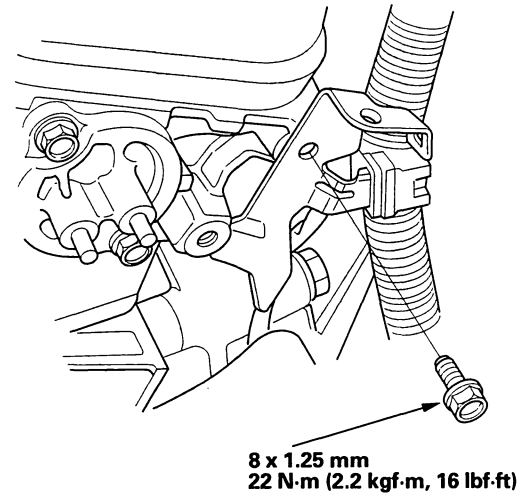
45. Install the steering joint cover (D).

46. Install the P/S pump outlet line (A) with a new O-ring (B) to the pump (C), and install the P/S hose (D) in its clamp (E).

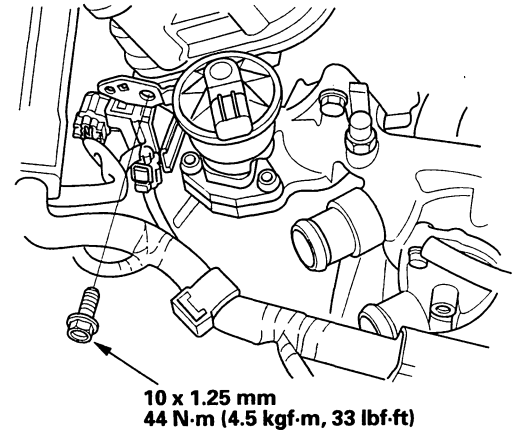


47. Install the power steering system fluid reservoir (F) to the clamp, then install the return hose (G) to the fluid reservoir.

48. Install the harness clamp bracket to the rear cylinder head.



49. Install the connecting bracket to the front cylinder head.



(cont'd)

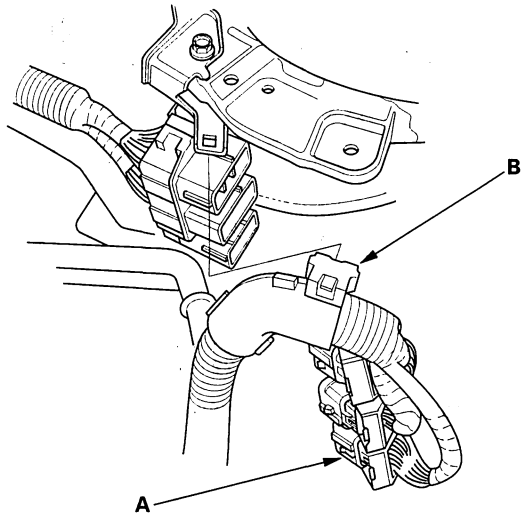
Protected by AR

Engine Installation (cont'd)

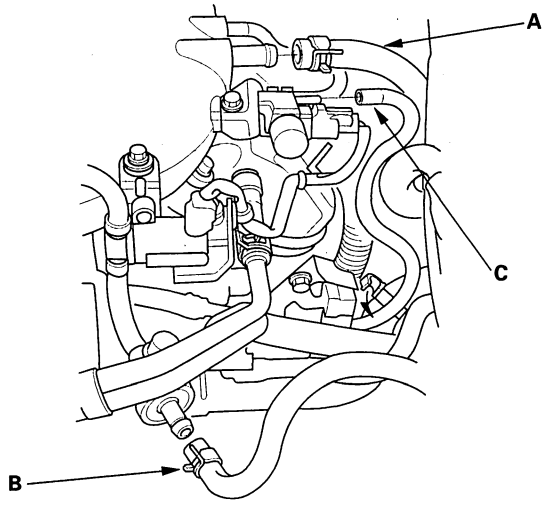
50. Install the drive belt (see page 4-35).

51. Install the fuel line (see page 11-323).

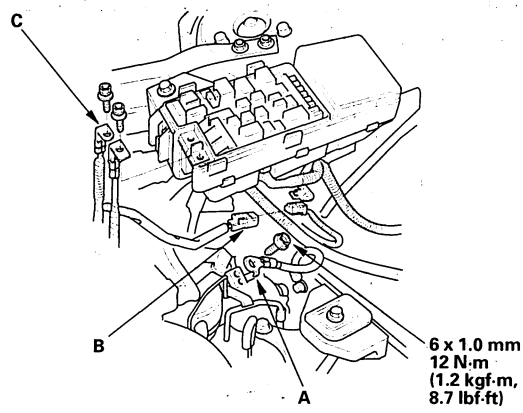
52. Connect the engine wire harness connectors (A), then install the harness clamp (B).



53. Install the brake booster vacuum hose (A), evaporative emission (EVAP) canister hose (B), and vacuum hose (C).

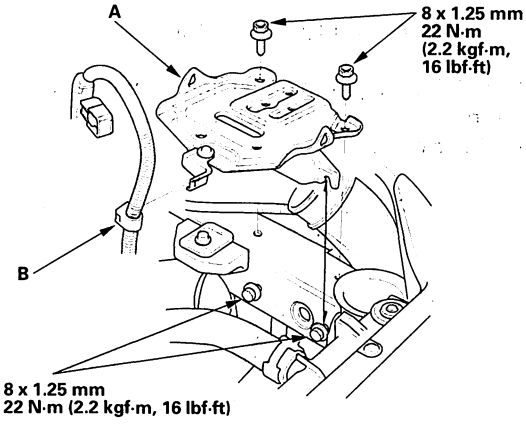


54. Install the ground cable (A), and connect the harness connector (B).



55. Install the battery cables (C).

56. Install the battery base (A), then install the harness clamp (B).



57. Install the air cleaner housing, refer to the 2003-2006 Accord Service Manual (see page 11-361).

58. Install the battery. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.

59. A/T model: Move the shift lever to each gear, and verify that the A/T gear position indicator follows the transmission range switch.

60. Inspect for fuel leaks. Turn the ignition switch ON (II) (do not operate the starter) so the fuel pump runs for about 2 seconds and pressurizes the fuel line. Repeat this operation two or three times, then check for fuel leakage at any point in the fuel line.

BACK

Protected by AR

61. Refill the engine with engine oil (see step 3 on page 8-6).

62. Refill the transmission with fluid:

    - Manual transmission (see page 13-10)
    - Automatic transmission (see page 14-186)

63. Refill the radiator with engine coolant, and bleed air from the cooling system with the heater valve open (see step 8 on page 10-7).

64. Refill the power steering system fluid (see page 17-10).

65. Perform the engine control module (ECM)/ powertrain control module (PCM) reset procedure (see page 11-4).

66. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure (see page 11-4).

67. Inspect the idle speed, refer to the 2003-2006 Accord Service Manual (see page 11-315).

68. Inspect the ignition timing (see page 4-19).

69. Install the cowl cover and windshield wiper arms, refer to the 2003-2006 Accord Service Manual (see page 20-199).

70. Install the bulkhead cover:

    - 2-door, refer to the 2003-2006 Accord Service Manual (see page 20-184)
    - 4-door, refer to the 2003-2006 Accord Service Manual (see page 20-185)

71. Check the wheel alignment, refer to the 2003-2006 Accord Service Manual (see page 18-6).

72. Enter the anti-theft codes for the radio and the navigation system, then enter the customer's audio presets.

73. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

74. Set the clock.

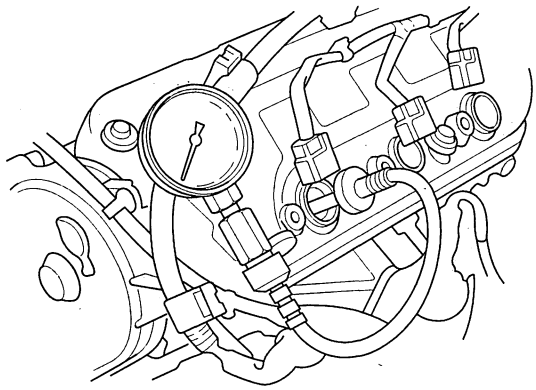
Engine Compression Inspection

NOTE: After this inspection, you must select engine control module (ECM)/powertrain control module (PCM) reset using the Honda Diagnostic System (HDS) (see page 11-4), otherwise ECM/PCM continues to stop the fuel injectors from operating.

1. Warm up the engine to normal operating temperature (cooling fan comes on).
2. Turn the ignition switch OFF.
3. Connect the HDS to the data link connector (DLC) (see page 11-3).
4. Select PGM-FI, INSPECTION, and then ALL INJECTORS OFF on the HDS.
5. Remove the six ignition coils (see page 4-20).
6. Remove the six spark plugs.
7. Attach the compression gauge to the spark plug hole.



8. Open the throttle fully, then crank the engine with the starter motor and measure the compression.

   Compression Pressure:
   Above 930 kPa (9.5 kgf/cm², 135 psi)

9. Measure the compression on the remaining cylinders.

   Maximum Variation:
   Within 200 kPa (2.0 kgf/cm², 28 psi)

10. If the compression is not within specifications, check the following items, then remeasure the compression.

    - Damaged or worn valves and seats
    - Damaged cylinder head gaskets
    - Damaged or worn piston rings
    - Damaged or worn piston and cylinder bore

11. Select ECM/PCM reset (see page 11-4) to cancel the ALL INJECTORS OFF function on the HDS.

VTEC Rocker Arm Test

Special Tools Required
- VTEC air adapter 07VAJ-P8A010A
- VTEC air stopper 070AJ-0030100
- Air pressure regulator 07AAJ-PNAA100

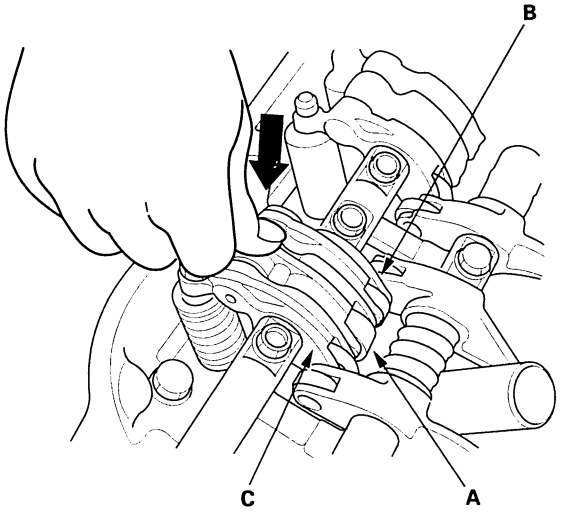
1. Start the engine and let it run for 5 minutes, then turn OFF the ignition switch.

2. Remove the cylinder head covers (see page 6-27).

3. Set the No. 1 piston at top dead center (TDC) (see step 2 on page 6-8).

4. Push on the intake mid rocker arm (A) for the No. 1 cylinder. The mid rocker arm should move independently of the primary rocker arm (B) and secondary rocker arm (C).

   - If the intake mid rocker arm does not move, remove the mid, primary, and secondary intake rocker arms as an assembly, then check that the pistons in the mid and primary rocker arms move smoothly. If any rocker arm needs replacing, replace the mid, primary, and secondary rocker arms as an assembly, and retest.
   - If the mid rocker arm moves freely repeat the above procedure for the remaining intake mid rocker arms with each piston at TDC. When all the mid rocker arms pass the test, go to step 5.

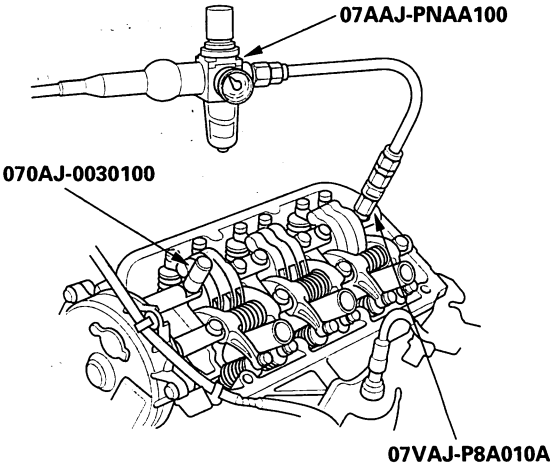


5. Check that the air pressure on the shop air compressor gauge indicates over 690 kPa (7.0 kgf/cm², 100 psi).

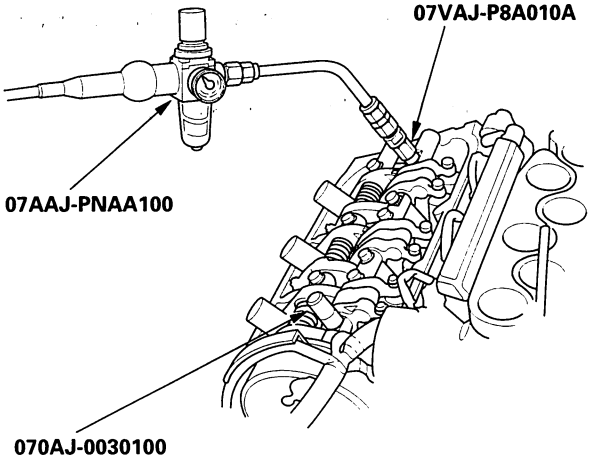
6. Inspect the valve clearance (see step 3 on page 6-9).

7. Remove the No. 1 and No. 6 intake rocker shaft mounting bolts, then install and connect the special tools as shown.

FRONT:



REAR:



8. Loosen the valve on the regulator, and apply the specified air pressure.

   Specified Air Pressure:
   440—540 kPa (4.5—5.5 kgf/cm², 64—78 psi)

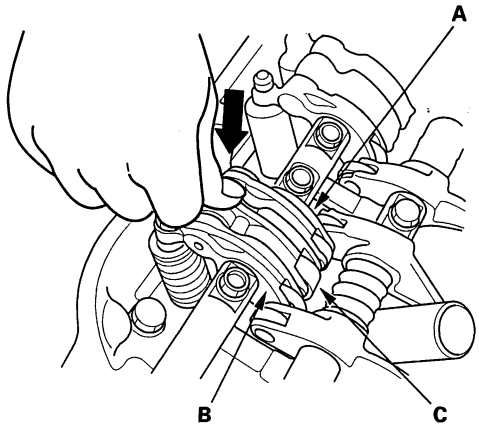
   NOTE: If the synchronizing pistons do not move after applying air pressure, move the primary or secondary rocker arm up and down manually.

(cont'd)

Protected by AR

VTEC Rocker Arm Test (cont'd)

9. Make sure that the intake primary rocker arm (A) and intake secondary rocker arm (B) are mechanically connected by the piston and that the mid rocker arm (C) does not move when pushed manually. If any intake mid rocker arm moves independently of the primary and secondary rocker arms, replace the rocker arms as a set.

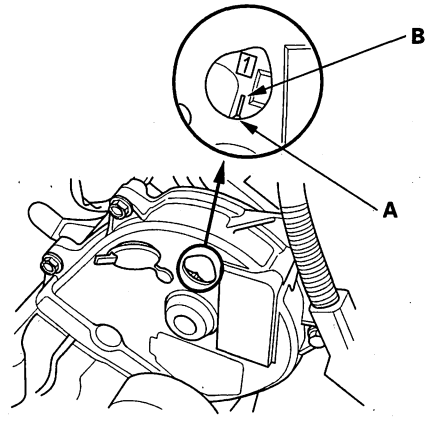


10. Remove the special tools.
11. Tighten the rocker shaft bolts to 24 N·m (2.4 kgf·m, 17 lbf·ft)
12. Install the cylinder head covers (see page 6-28).

Valve Clearance Adjustment

NOTE: Adjust the valves only when the cylinder head temperature is less than 100 °F (38 °C).

1. Remove the cylinder head covers (see page 6-27).
2. Set the No. 1 piston at top dead center (TDC). Align the pointer (A) on the front upper cover with the No. 1 piston TDC mark (B) on the front camshaft pulley.



BACK

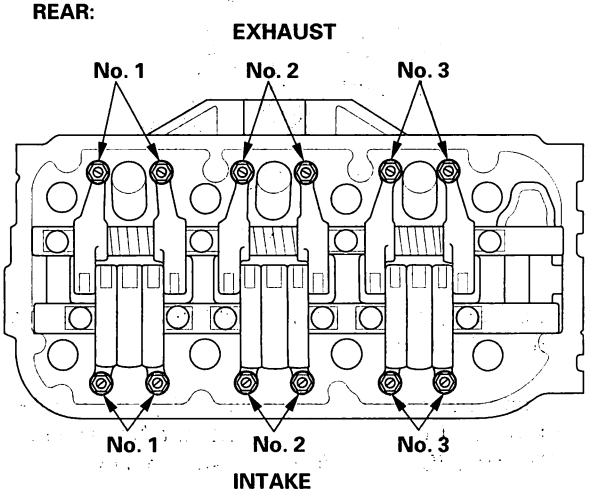
Protected by AR

3. Select the correct thickness feeler gauge for the valves you're going to check.

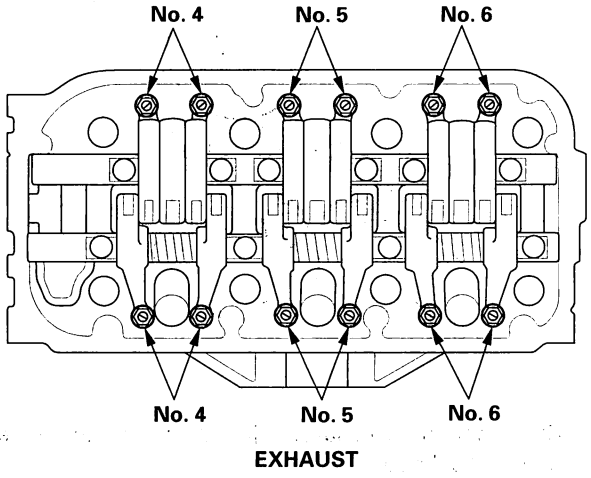
Valve Clearance
Intake: 0.20—0.24 mm (0.008—0.009 in.)
Exhaust: 0.28—0.32 mm (0.011—0.013 in.)

Adjusting screw locations:

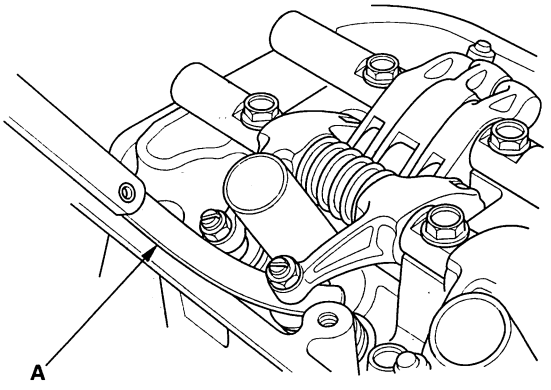
REAR:



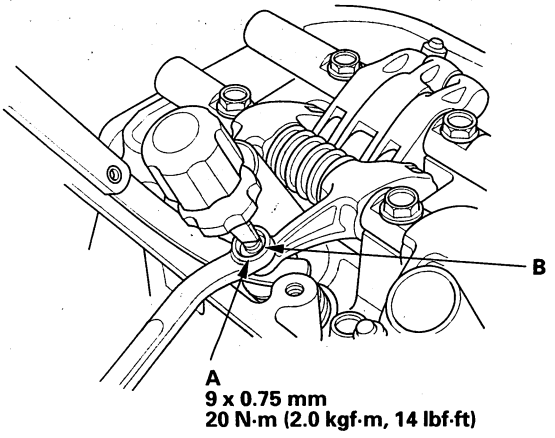
FRONT:



4. Insert the feeler gauge (A) between the adjusting screw and the end of the valve stem on No. 1 cylinder, and slide it back and forth; you should feel a slight amount of drag.



5. If you feel too much or too little drag, loosen the locknut (A), and turn the adjusting screw (B) until the drag on the feeler gauge is correct.



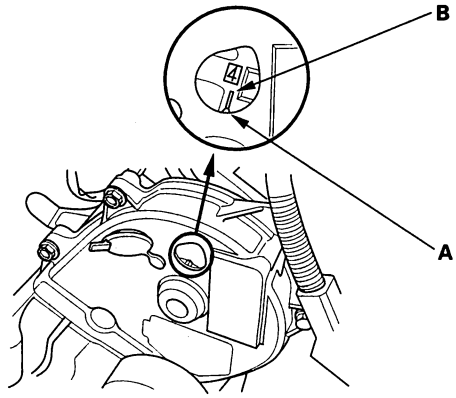
6. Tighten the locknut and recheck the clearance. Repeat the adjustment, if necessary.

(cont'd)

Protected by AR

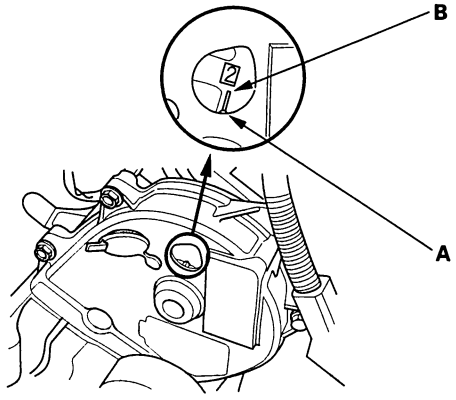
Valve Clearance Adjustment (cont'd)

7. Rotate the crankshaft clockwise. Align the pointer (A) on the front upper cover with the No. 4 piston TDC mark (B) on the front camshaft pulley.



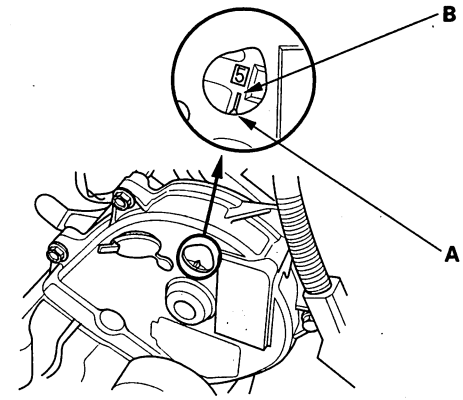
8. Check and, if necessary, adjust the valve clearance on No. 4 cylinder.

9. Rotate the crankshaft clockwise. Align the pointer (A) on the front upper cover with the No. 2 piston TDC mark (B) on the front camshaft pulley.



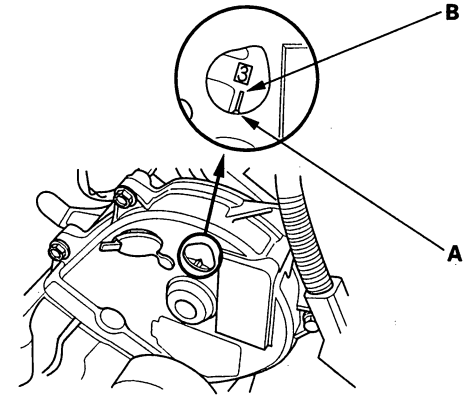
10. Check and, if necessary, adjust the valve clearance on No. 2 cylinder.

11. Rotate the crankshaft clockwise. Align the pointer (A) on the front upper cover with the No. 5 piston TDC mark (B) on the front camshaft pulley.



12. Check and, if necessary, adjust the valve clearance on No. 5 cylinder.

13. Rotate the crankshaft clockwise. Align the pointer (A) on the front upper cover with the No. 3 piston TDC mark (B) on the front camshaft pulley.

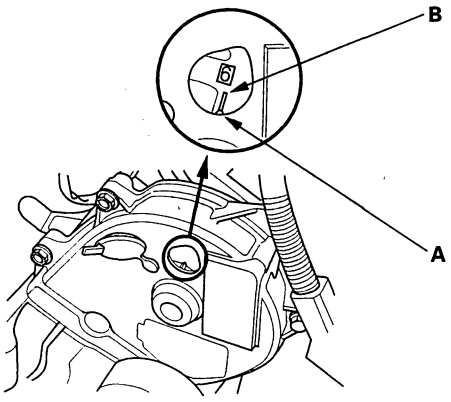


14. Check and, if necessary, adjust the valve clearance on No. 3 cylinder.

BACK

Protected by AR

15. Rotate the crankshaft clockwise. Align the pointer (A) on the front upper cover with the No. 6 piston TDC mark (B) on the front camshaft pulley.



16. Check and, if necessary, adjust the valve clearance on No. 6 cylinder.

17. Install the cylinder head covers (see page 6-28).

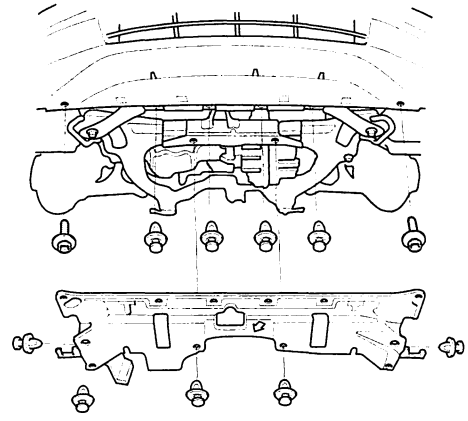
Crankshaft Pulley Removal and Installation

Special Tools Required
- Holder handle 07JAB-001020A
- Holder attachment, 50 mm, offset 07MAB-PY3010A
- Socket, 19 mm 07JAA-001020A, or a commercially available 19 mm socket

Removal

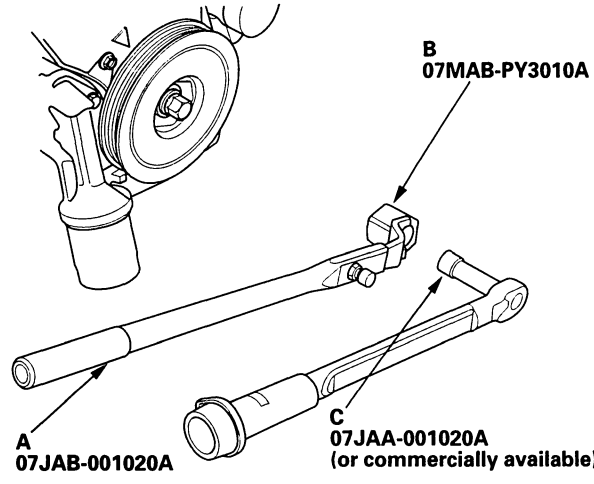
1. Remove the right front tire/wheel.

2. Remove the splash shield.



3. Remove the drive belt (see page 4-35).

4. Hold the pulley with the holder handle (A) and holder attachment (B).



5. Remove the bolt with a heavy duty 19 mm socket (C) and breaker bar, then remove the crankshaft pulley.

(cont'd)

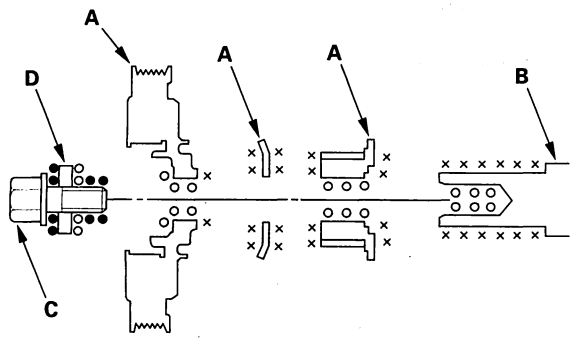
Protected by AR

Crankshaft Pulley Removal and Installation (cont'd)

Installation

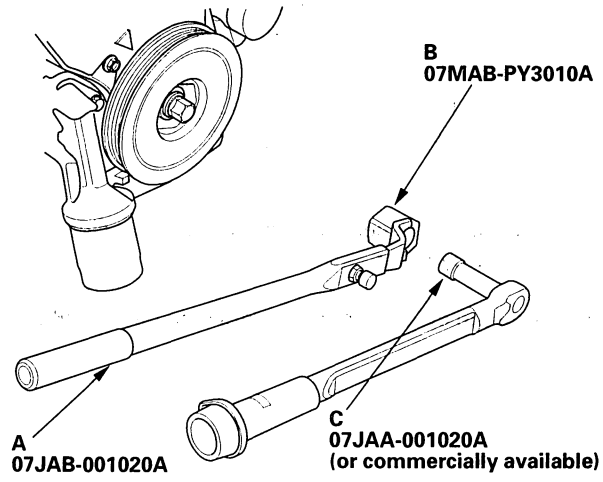
1. Remove any oil or clean the pulleys (A), crankshaft (B), bolt (C), and washer (D). Lubricate with new engine oil as shown.

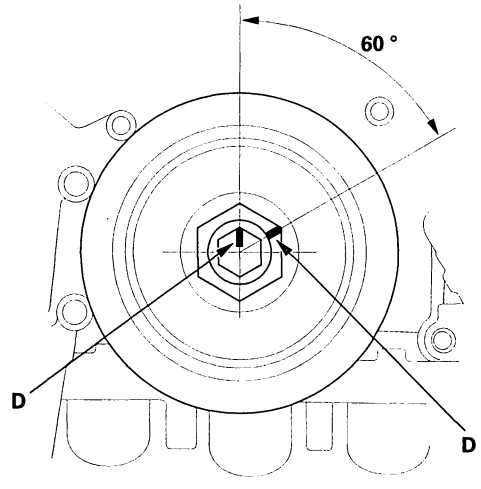
   ×: **Remove any oil**
   ○: **Clean**
   ●: **Lubricate with new engine oil**



2. Install the crankshaft pulley, and tighten the bolt. Do not use an impact wrench.

   –1 Hold the pulley with the holder handle (A) and holder attachment (B), then tighten the bolt to 64 N·m (6.5 kgf·m, 47 lbf·ft) with a torque wrench and 19 mm socket (C).
   –2 Mark (D) the bolt head and crankshaft pulley as shown, then tighten the bolt an additional 60 ° (The mark on the bolt head line up with the mark on the crankshaft pulley).





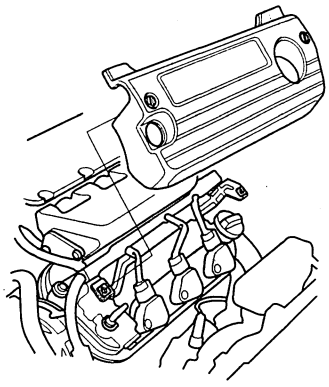
3. Install the drive belt (see page 4-35).
4. Install the splash shield.
5. Install the right front tire/wheel.

BACK

Protected by AR

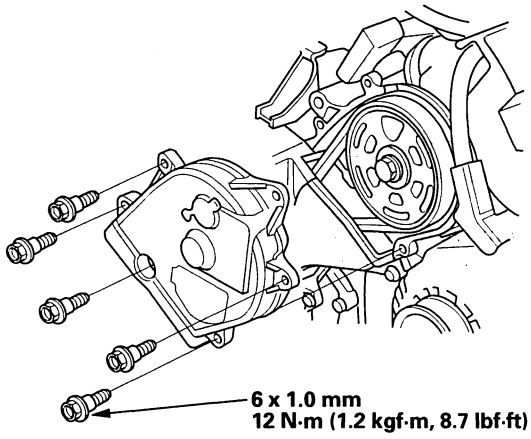
Timing Belt Inspection

1. Remove the ignition coil cover.

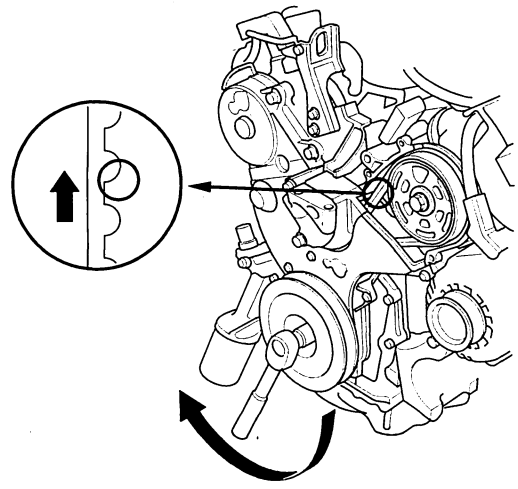


2. Remove the drive belt auto-tensioner (see page 4-37).

3. Remove the front upper cover.



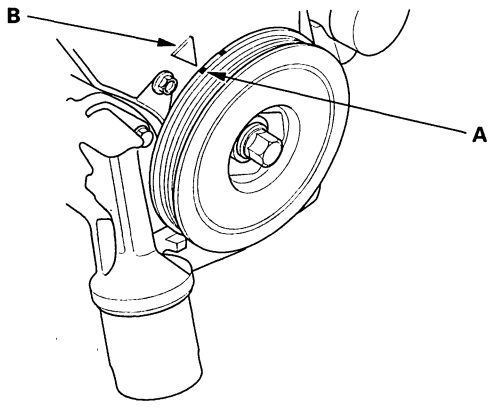
4. Inspect the timing belt for cracks and oil or coolant soaking. Replace the belt if it is cracked or soaked. Remove any oil or solvent that gets on the belt.



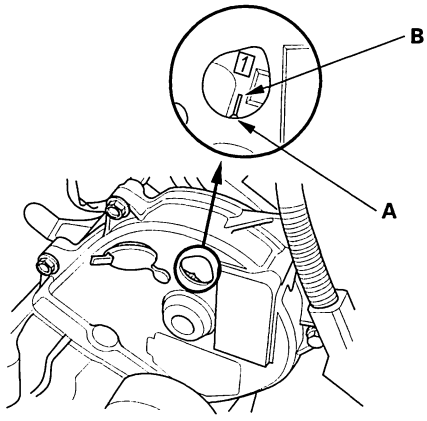
Protected by AR

Timing Belt Removal

1. Turn the crankshaft so its white mark (A) lines up with the pointer (B).

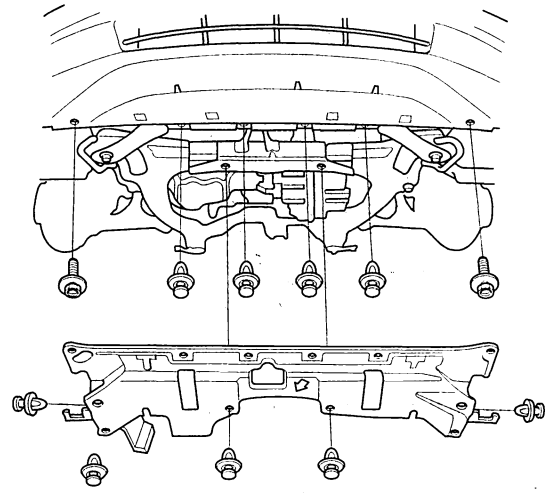


2. Check that the No. 1 piston top dead center (TDC) mark (A) on the front camshaft pulley and the pointer (B) on the front upper cover are aligned.



3. Remove the right front tire/wheel.

4. Remove the splash shield.

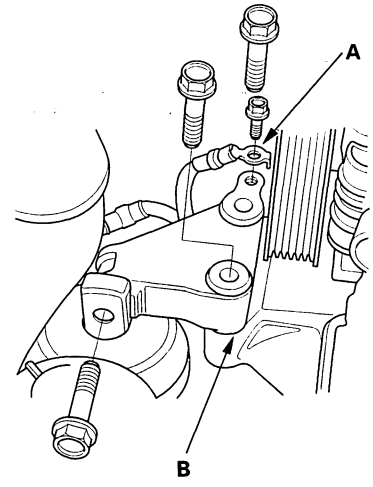


5. Remove the drive belt (see page 4-35).

6. Remove the drive belt auto-tensioner (see page 4-37).

7. Support the engine with a jack and wood block under the oil pan.

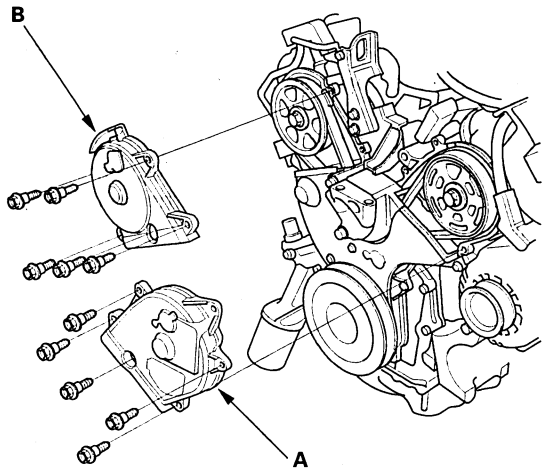
8. Remove the ground cable (A), then remove the side engine mount bracket (B).



BACK

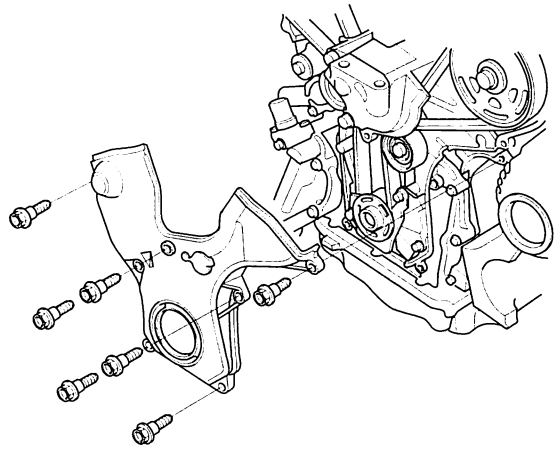
Protected by AR

9. Remove the front upper cover (A) and rear upper cover (B).

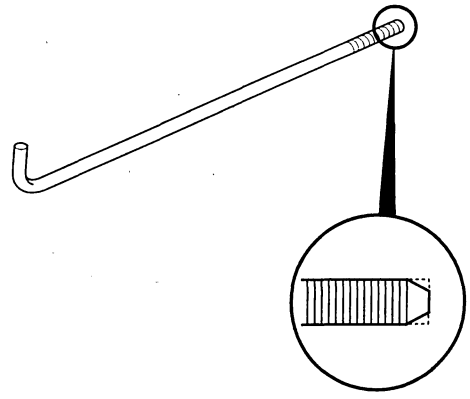


10. Remove the crankshaft pulley (see step 4 on page 6-11).

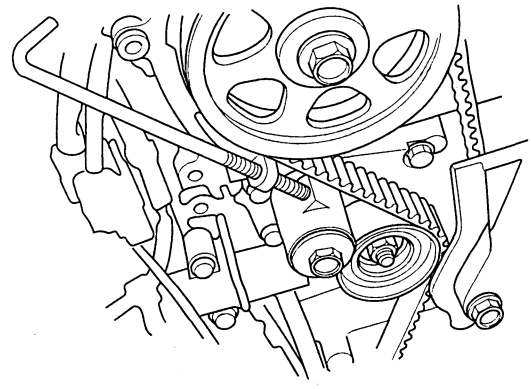
11. Remove the lower cover.



12. Remove one of the battery clamp bolts from the battery tray, and grind the end of it as shown.



13. Screw the battery clamp bolt in as shown to hold the timing belt adjuster in its current position. Tighten it by hand; do not use a wrench.

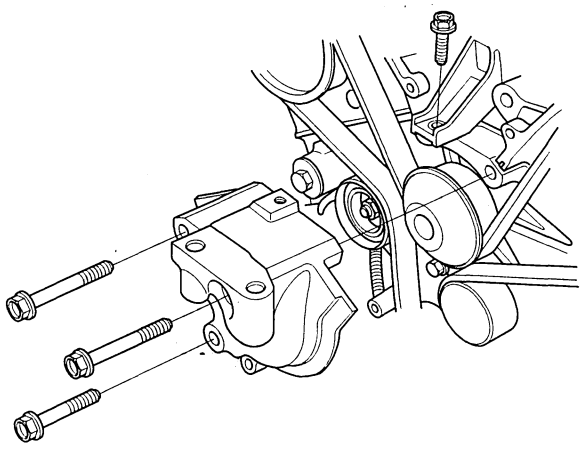


(cont'd)

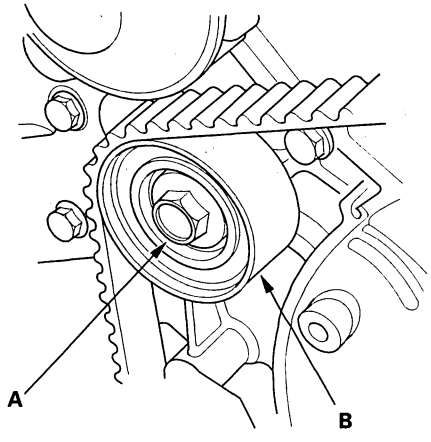
Protected by AR

Timing Belt Removal (cont'd)

14. Remove the engine mount bracket.



15. Remove the idler pulley bolt (A) and idler pulley (B), then remove the timing belt.

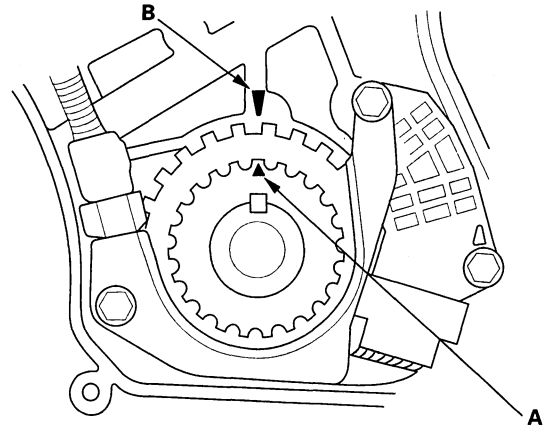


Timing Belt Installation

NOTE: The following procedure is for installation of a used belt. If you are installing a new belt, refer to the timing belt replacement procedure (see page 6-20).

1. Clean the timing belt pulleys, timing belt guide plate, and the upper and lower covers.

2. Set the timing belt drive pulley to top dead center (TDC) by aligning the TDC mark (A) on the tooth of the timing belt drive pulley with the pointer (B) on the oil pump.

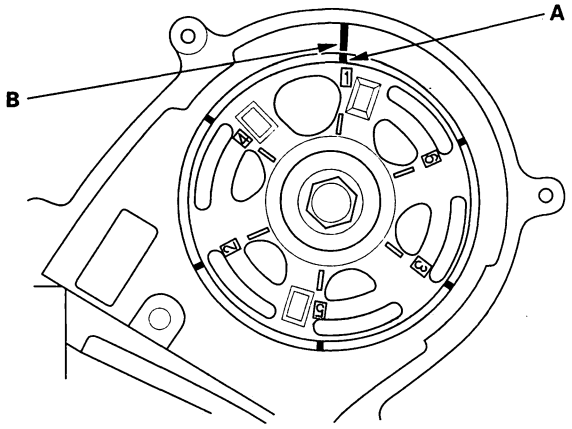


BACK

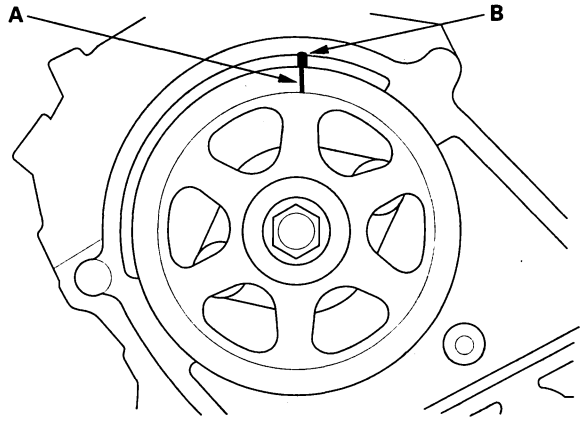
Protected by AR

3. Set the camshaft pulleys to TDC by aligning the TDC marks (A) on the camshaft pulleys with the pointers (B) on the back covers.

FRONT:



REAR:

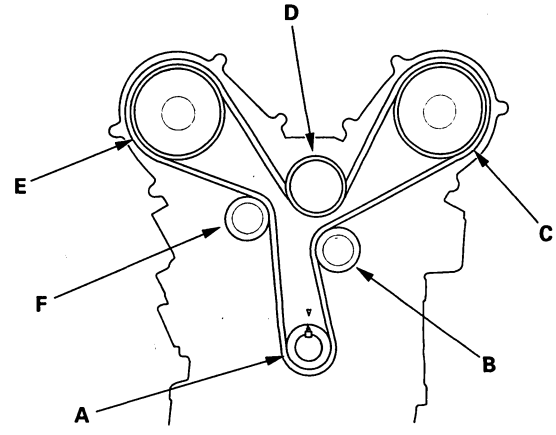


4. Apply liquid thread lock (P/N 08713-0001) to the idler pulley bolt, then loosely install the idler pulley.

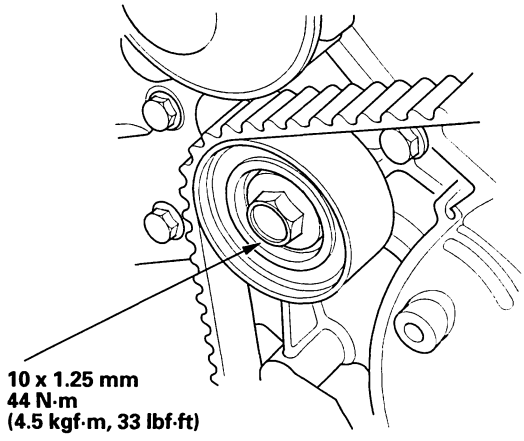
5. If the auto-tensioner has extended and the timing belt cannot be installed, perform the timing belt replacement procedure (see page 6-20).

6. Install the timing belt in a counterclockwise sequence starting with the drive pulley. Take care not to damage the timing belt when installing it.

   –1 Drive pulley (A)
   –2 Idler pulley (B)
   –3 Front camshaft pulley (C)
   –4 Water pump pulley (D)
   –5 Rear camshaft pulley (E)
   –6 Adjusting pulley (F)



7. Tighten the idler pulley bolt.

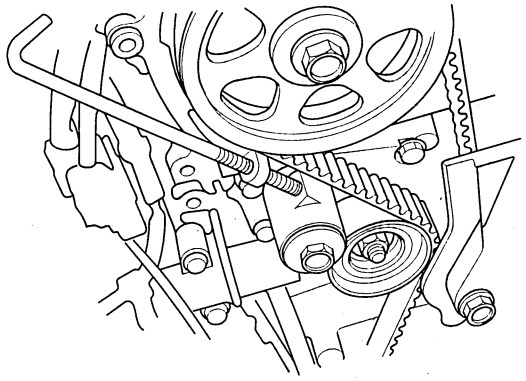


(cont'd)

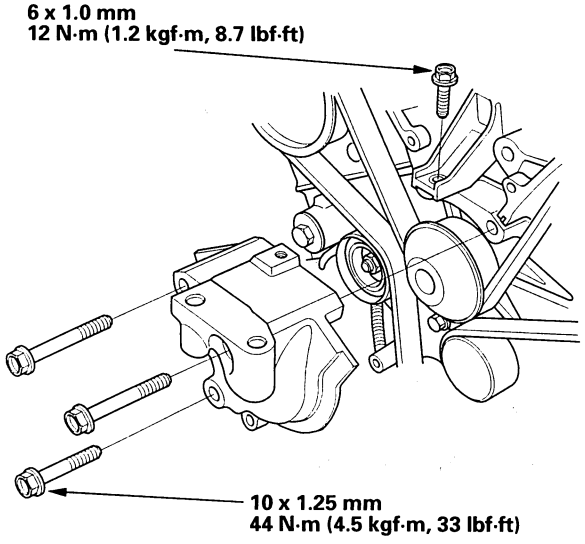
Protected by AR

Timing Belt Installation (cont'd)

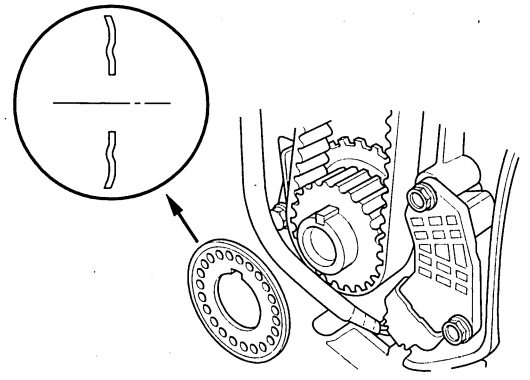
8. Remove the battery clamp bolt from the back cover.



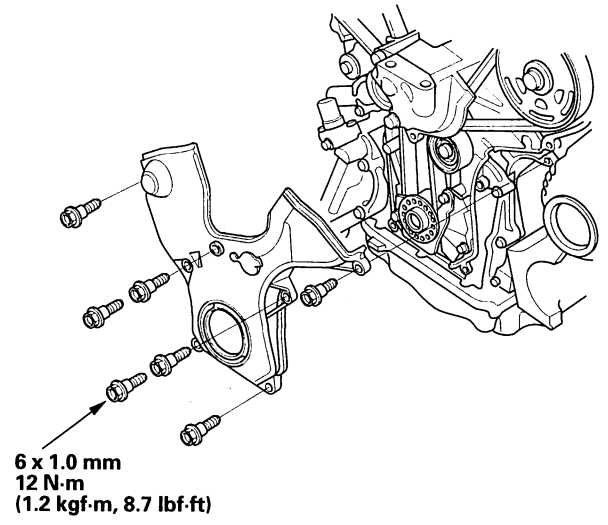
9. Install the engine mount bracket.



10. Install the timing belt guide plate as shown.



11. Install the lower cover.

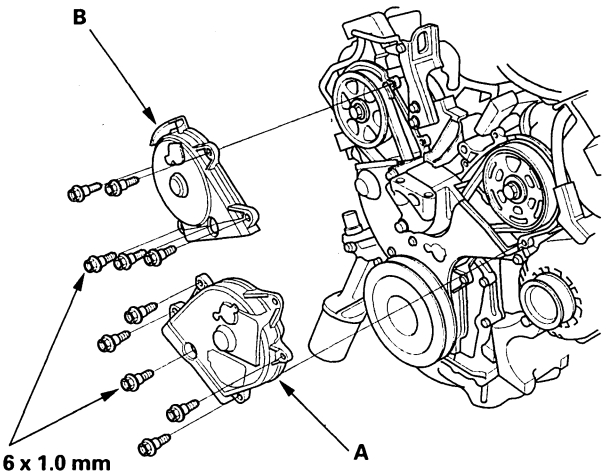


12. Install the crankshaft pulley (see page 6-12).

BACK

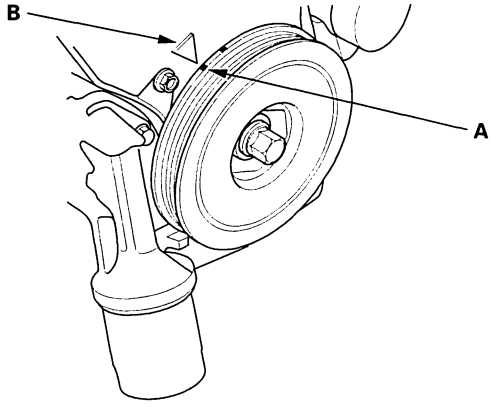
Protected by AR

13. Install the front upper cover (A) and rear upper cover (B).



14. Rotate the crankshaft pulley about five or six turns clockwise so the timing belt positions itself on the pulleys.

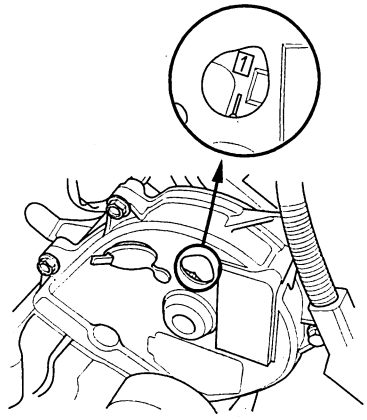
15. Turn the crankshaft pulley so its white mark (A) lines up with the pointer (B).



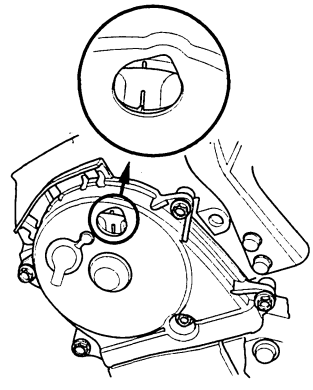
16. Check the camshaft pulley marks.

- If the camshaft pulley marks are at TDC, go to step 17.
- If the camshaft pulley marks are not at TDC, remove the timing belt and repeat steps 2 through 16.

FRONT CAMSHAFT PULLEY:



REAR CAMSHAFT PULLEY:

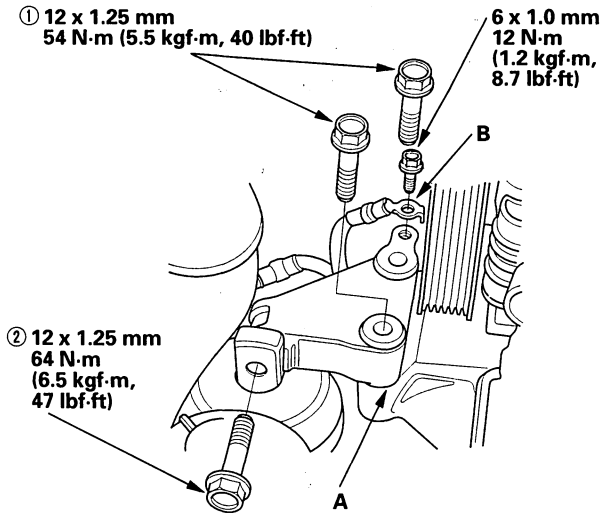


(cont'd)

Protected by AR

Timing Belt Installation (cont'd)

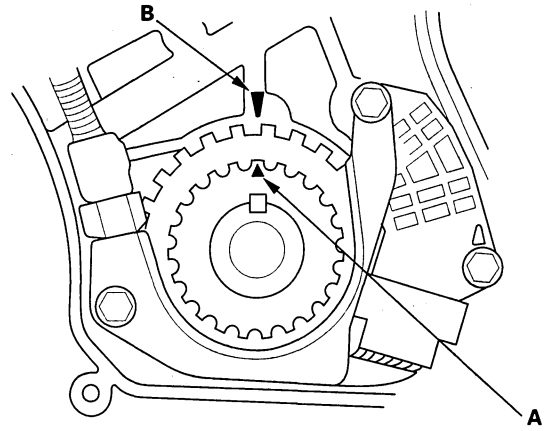
17. Install the side engine mount bracket (A), then tighten the bolts in the numbered sequence shown.



18. Install the ground cable (B).
19. Install the drive belt auto-tensioner (see page 4-37).
20. Install the drive belt (see page 4-35).
21. Install the splash shield.
22. Install the right front tire/wheel.
23. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure (see page 11-4).

Timing Belt Replacement

1. Remove the timing belt (see page 6-14).
2. Clean the timing belt pulleys, timing belt guide plate, and the upper and lower covers.
3. Set the timing belt drive pulley to TDC by aligning the TDC mark (A) on the tooth of the timing belt drive pulley with the pointer (B) on the oil pump.

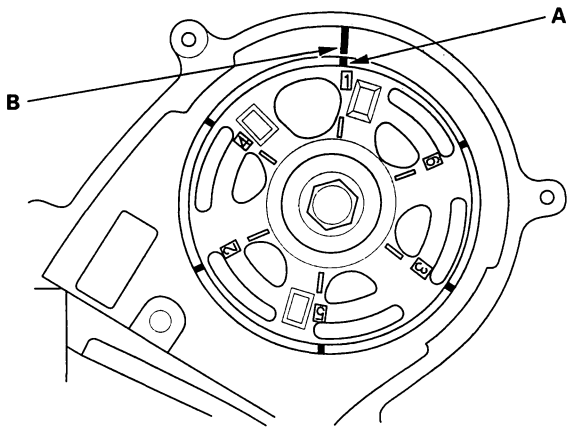


BACK

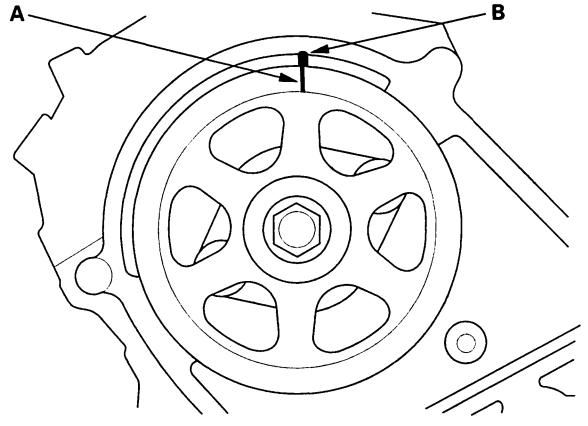
Protected by AR

4. Set the camshaft pulleys to TDC by aligning the TDC marks (A) on the camshaft pulleys with the pointers (B) on the back covers.

FRONT:

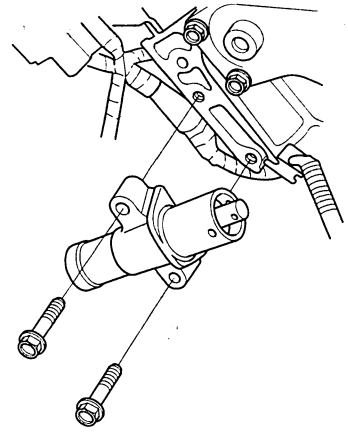


REAR:

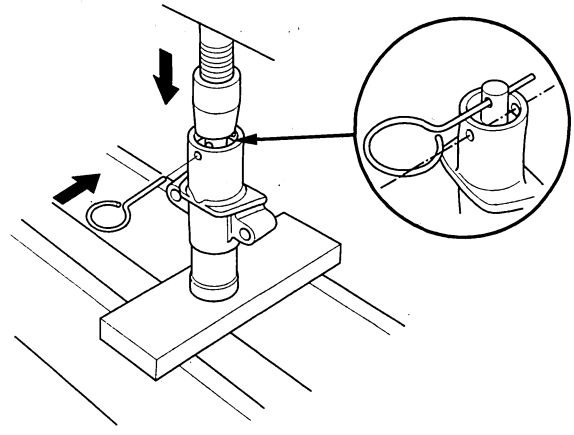


5. Remove the battery clamp bolt from the back cover.

6. Remove the auto-tensioner.



7. Align the holes on the rod and housing of the auto-tensioner.



8. Use a hydraulic press to slowly compress the auto-tensioner. Insert a 2.0 mm (0.08 in.) pin through the housing and the rod.

NOTE: The compression pressure should not exceed 9,800 N (1,000 kgf, 2,200 lbf).

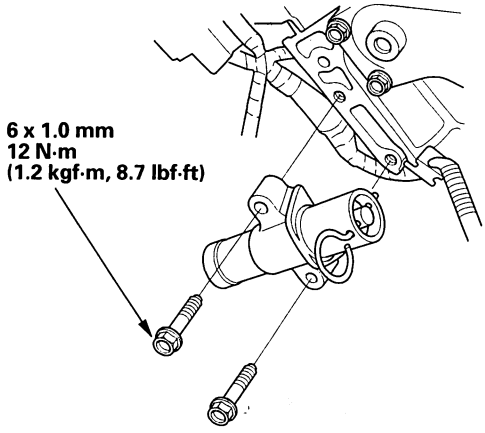
(cont'd)

Protected by AR

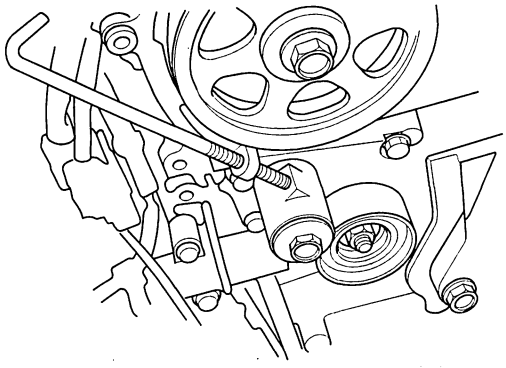
Timing Belt Replacement (cont'd)

9. Install the auto-tensioner.

   NOTE: Make sure the pin stays in place.



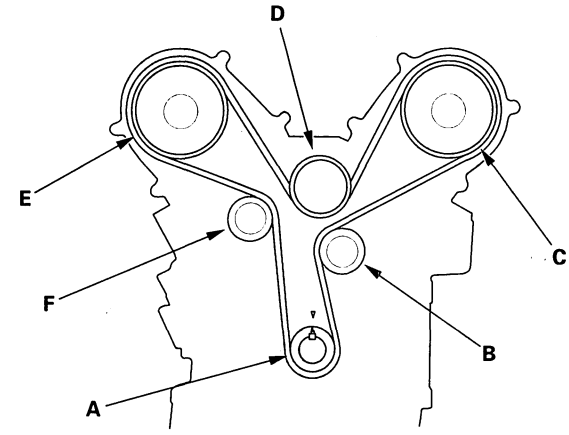
10. Screw the battery clamp bolt in as shown to hold the timing belt adjuster. Tighten it by hand; do not use a wrench.



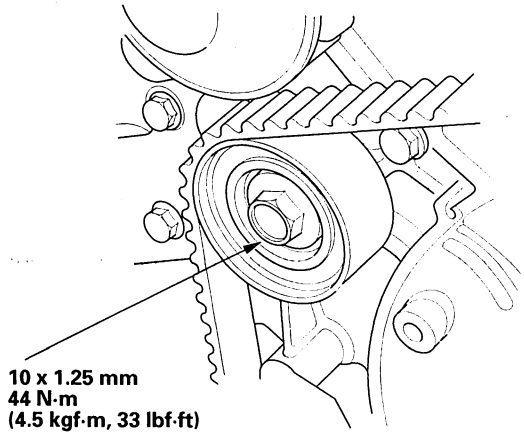
11. Apply liquid thread lock (P/N 08713-0001) to the idler pulley bolt, then loosely install the idler pulley.

12. Install the timing belt in a counterclockwise sequence starting with the drive pulley.

   –1 Drive pulley (A)
   –2 Idler pulley (B)
   –3 Front camshaft pulley (C)
   –4 Water pump pulley (D)
   –5 Rear camshaft pulley (E)
   –6 Adjusting pulley (F)



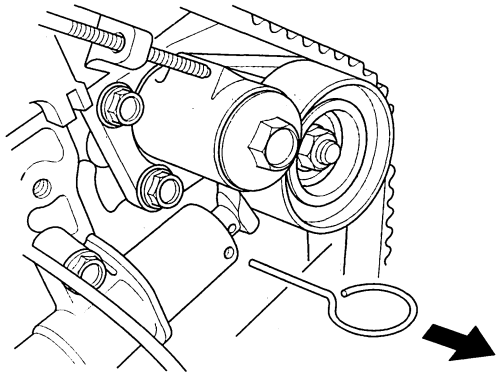
13. Tighten the idler pulley bolt.



BACK

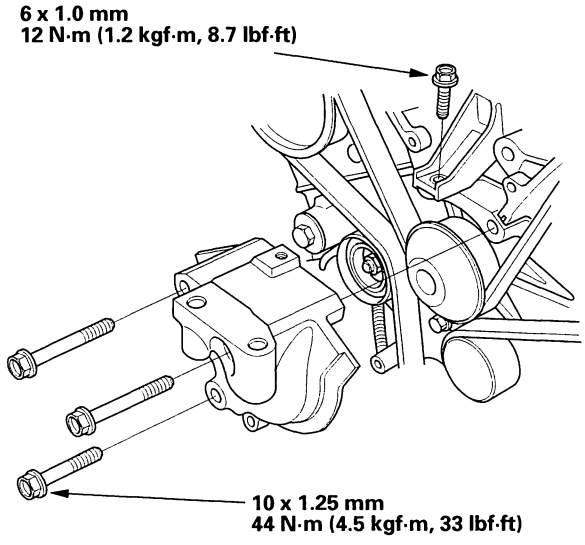
Protected by AR

14. Remove the pin from the auto-tensioner.

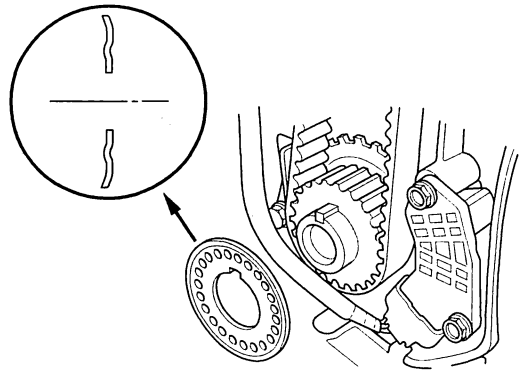


15. Remove the battery clamp bolt from the back cover.

16. Install the engine mount bracket.



17. Install the timing belt guide plate as shown.

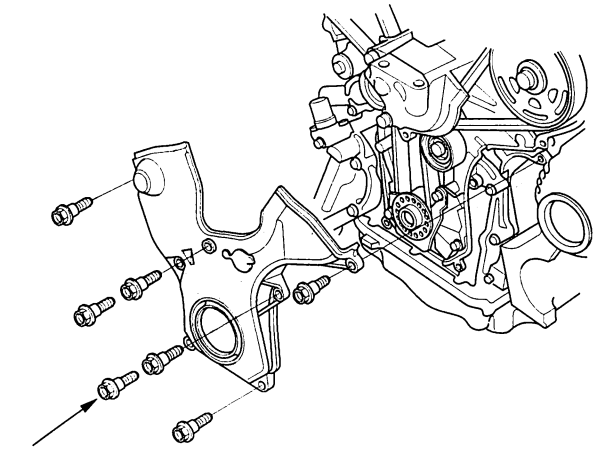


(cont'd)

Protected by AR

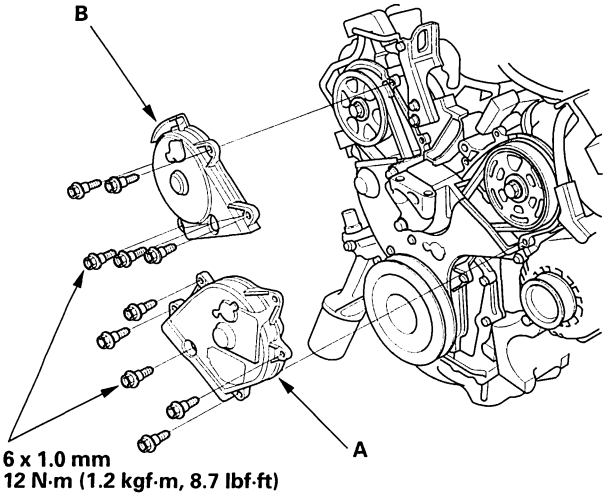
Timing Belt Replacement (cont'd)

18. Install the lower cover.



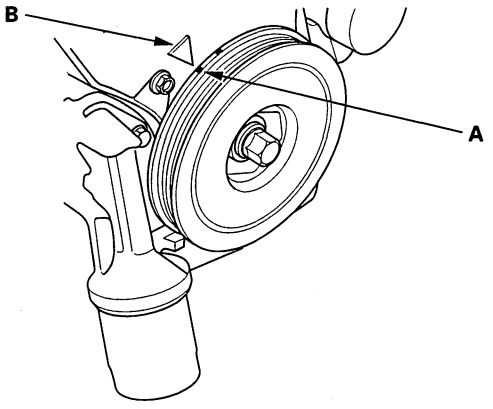
19. Install the crankshaft pulley (see page 6-12).

20. Install the front upper cover (A) and rear upper cover (B).



21. Rotate the crankshaft pulley about five or six turns clockwise so the timing belt positions itself on the pulleys.

22. Turn the crankshaft pulley so its white mark (A) lines up with the pointer (B).



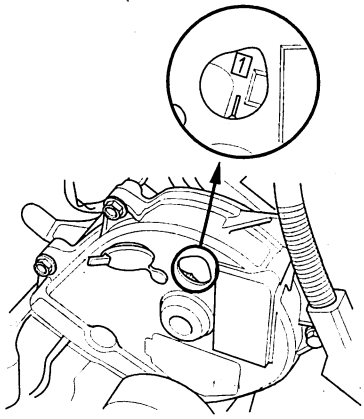
BACK

Protected by AR

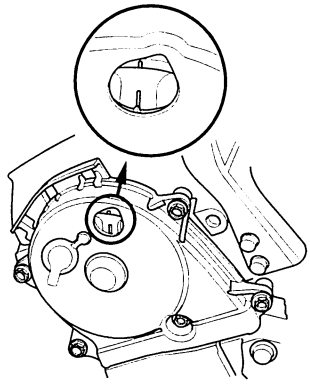
23. Check the camshaft pulley marks.

    - If the camshaft pulley marks are at TDC, go to step 24.
    - If the camshaft pulley marks are not at TDC, remove the timing belt and repeat steps 2 through 23.

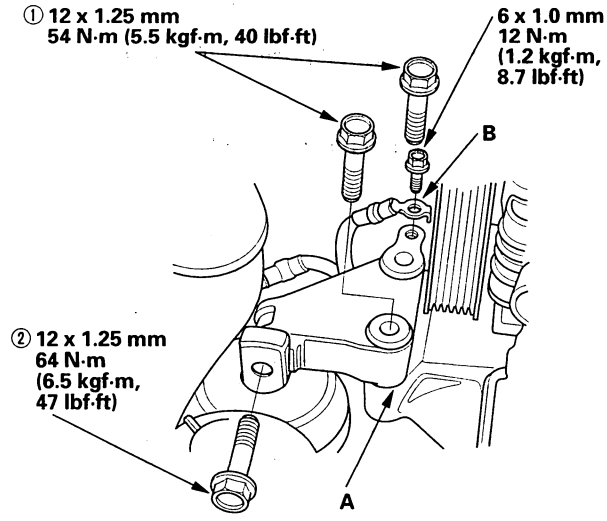
FRONT CAMSHAFT PULLEY:



REAR CAMSHAFT PULLEY:



24. Install the side engine mount bracket (A), then tighten the bolts in the numbered sequence shown.

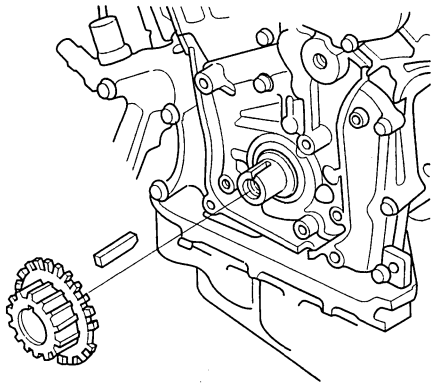


25. Install the ground cable (B).
26. Install the drive belt auto-tensioner (see page 4-37).
27. Install the drive belt (see page 4-35).
28. Install the splash shield.
29. Install the right front tire/wheel.
30. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure (see page 11-4).

Protected by AR

Timing Belt Drive Pulley Replacement

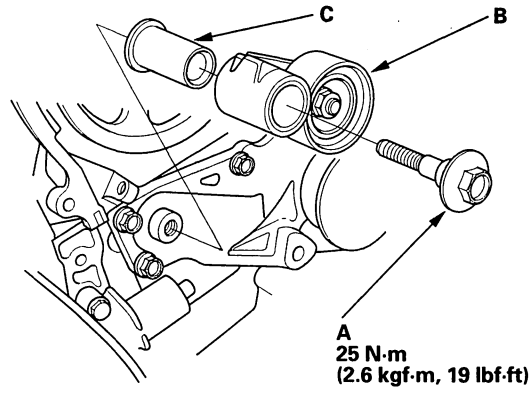
1. Remove the timing belt (see page 6-14).
2. Remove the crankshaft position (CKP) sensor (see page 11-220).
3. Remove the timing belt drive pulley.



4. Install the new timing belt drive pulley.
5. Install the CKP sensor (see page 11-220).
6. Install the timing belt (see page 6-16).

Timing Belt Adjuster Replacement

1. Remove the timing belt (see page 6-14).
2. Remove the auto-tensioner (see step 5 on page 6-17).
3. Remove the bolt (A), then remove the timing belt adjuster (B) and collar (C).



4. Install the timing belt adjuster.
5. Install the timing belt (see page 6-16).

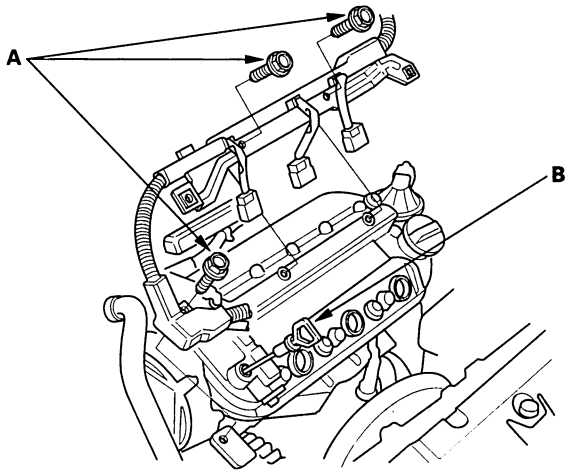
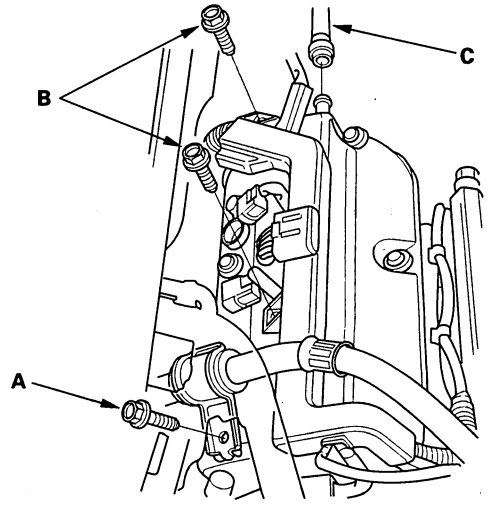
Cylinder Head Cover Removal

1. Remove the intake manifold (see page 9-3).
2. Remove the six ignition coils (see page 4-20).
3. Remove the three bolts (A) securing the harness holder, and remove the dipstick (B).

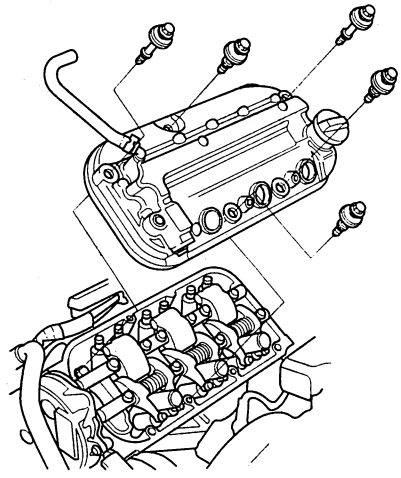


4. Remove the bolt (A) securing the power steering hose clamp.

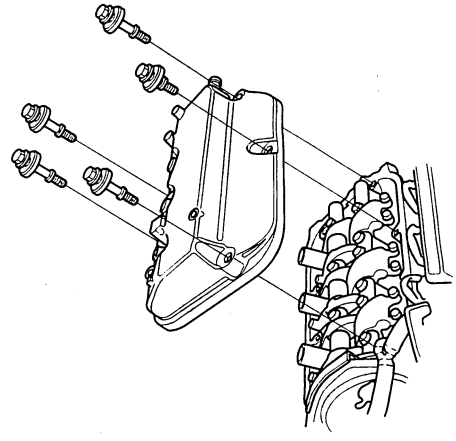


5. Remove the two bolts (B) securing the harness holder.
6. Remove the breather hose (C).
7. Remove the cylinder head covers.

FRONT:



REAR:



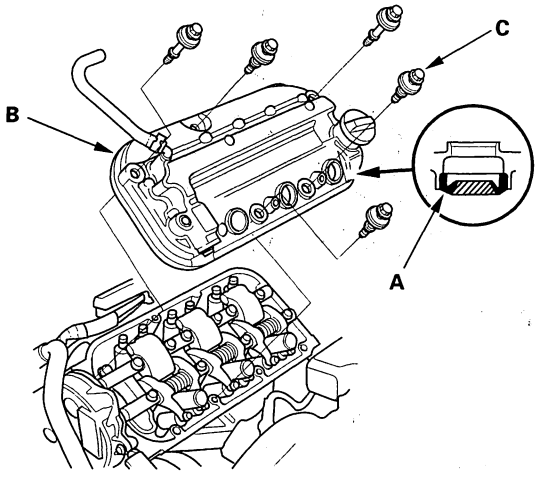
BACK

Protected by AR

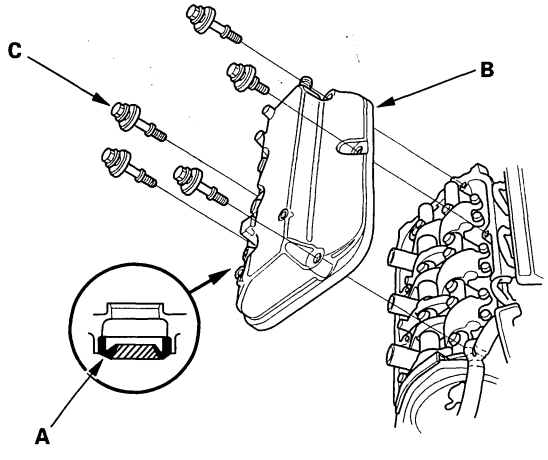
Cylinder Head Cover Installation

1. Check the spark plug seals for damage. If the seal is damaged, replace it.
2. Clean the head cover contacting surfaces with a shop towel.
3. Set the spark plug seals (A) on the spark plug tubes, and install the cylinder head covers (B).

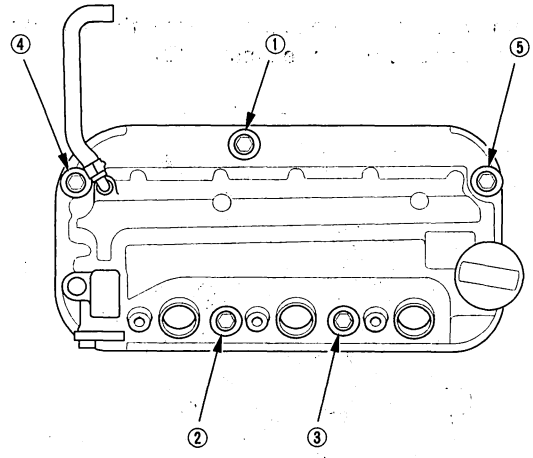
FRONT:



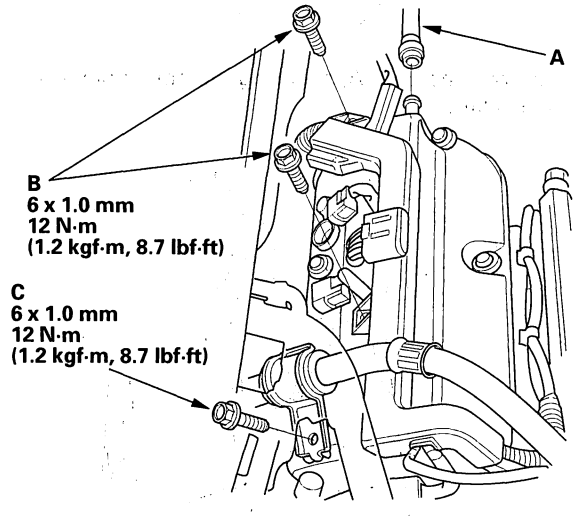
REAR:



4. Visually check the spark plug seals for damage.
5. Inspect the cover washers (C). Replace any washer that is damaged or deteriorated.
6. Tighten the bolts in two or three steps. In the final step, tighten all bolts in sequence, 12 N·m (1.2 kgf·m, 8.7 lbf·ft).



7. Install the breather hose (A).

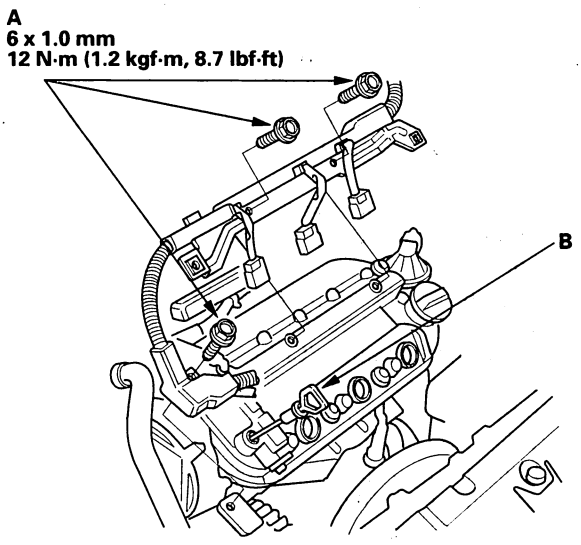


8. Tighten the two bolts (B) securing the harness holder.
9. Tighten the bolt (C) securing the power steering hose bracket.

BACK

Protected by AR

10. Tighten the three bolts (A) securing the harness holder, and install the dipstick (B).



11. Install the six ignition coils (see page 4-20).

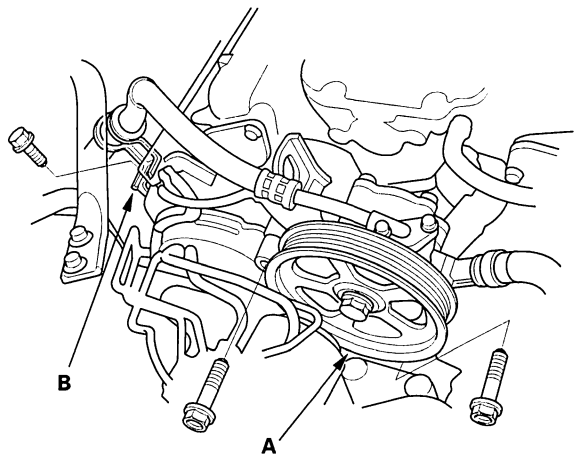
12. Install the intake manifold (see page 9-4).

Protected by AR

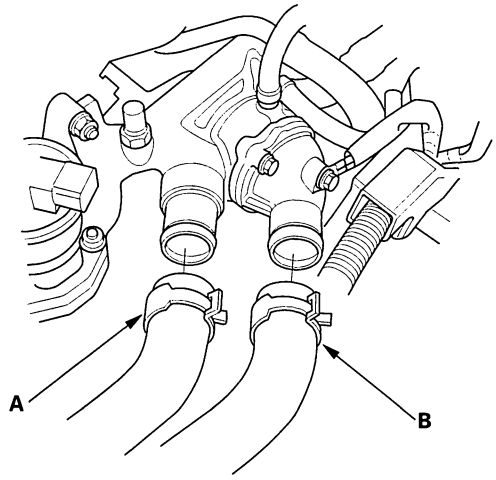
Cylinder Head Removal

NOTE:
- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.
- To avoid damaging the cylinder head, wait until the engine coolant temperature drops below 100 °F (38 °C) before loosening the cylinder head bolts.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

1. Make sure you have the anti-theft codes for the radio and navigation system, then write down the customer's audio presets. Make sure the ignition switch is OFF.
2. Relieve the fuel pressure (see page 11-315).
3. Disconnect the negative cable from the battery.
4. Drain the engine coolant (see page 10-6).
5. Remove the air cleaner, refer to the 2003-2006 Accord Service Manual (see page 11-361).
6. Remove the drive belt (see page 4-35).
7. Remove the timing belt (see page 6-14).
8. Remove the power steering (P/S) pump (A), and P/S hose clamp (B).



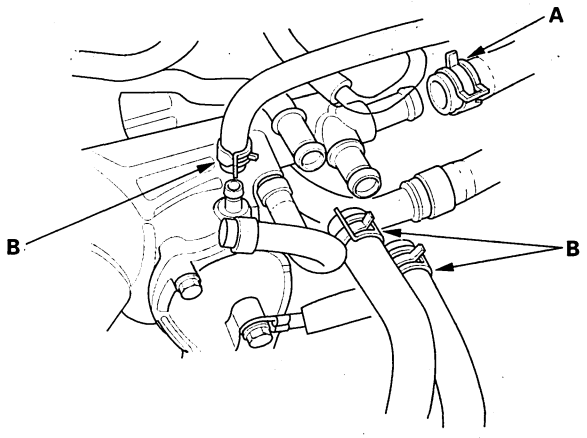
9. Remove the alternator (see page 4-38).
10. Remove the intake manifold (see page 9-3).
11. Remove the six ignition coils (see page 4-20).
12. Remove these engine wire harness connectors and wire harness clamps from the cylinder head.
    - Six injector connectors
    - Engine coolant temperature (ECT) sensor 1 connector
    - Engine coolant temperature (ECT) sensor 2 connector (2005-2006 models)
    - Crankshaft position (CKP) sensor connector
    - Exhaust gas recirculation (EGR) valve connector
    - Rocker arm oil control solenoid (VTEC solenoid valve) connector
    - Rocker arm oil pressure switch (VTEC oil pressure switch) connector
    - Oil pressure switch connector
    - Two air fuel ratio (A/F) sensor connectors
    - Two secondary heated oxygen sensor (secondary HO2S) connectors
13. Remove the upper radiator hose (A), and lower radiator hose (B).



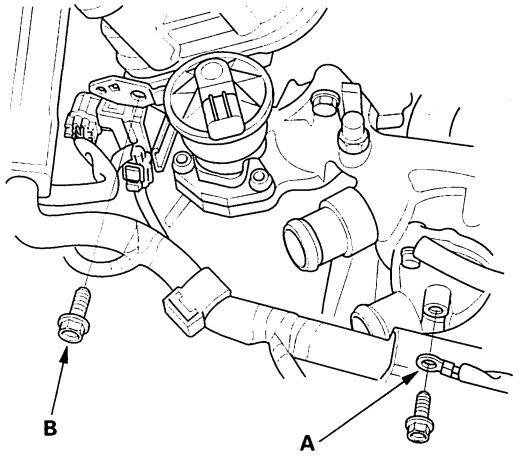
BACK

Protected by AR

14. Remove the heater hose (A) and water bypass hoses (B).

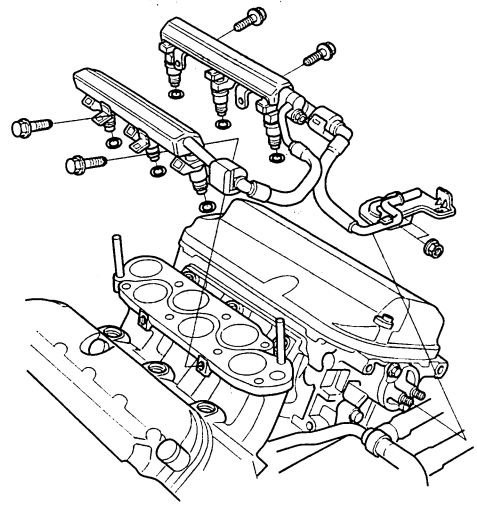


15. Remove the ground cable (A).

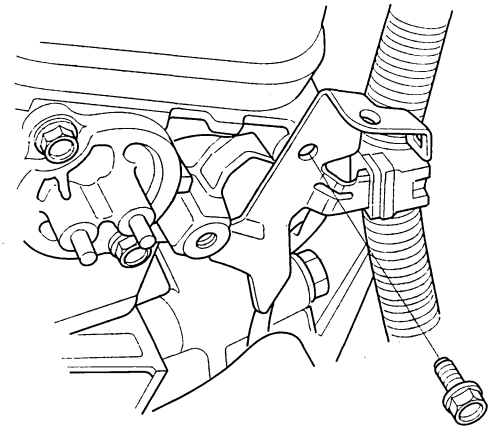


16. Remove the bolt (B) securing the harness bracket.

17. Remove the fuel rails.



18. Remove the bolt securing the harness bracket.



(cont'd)

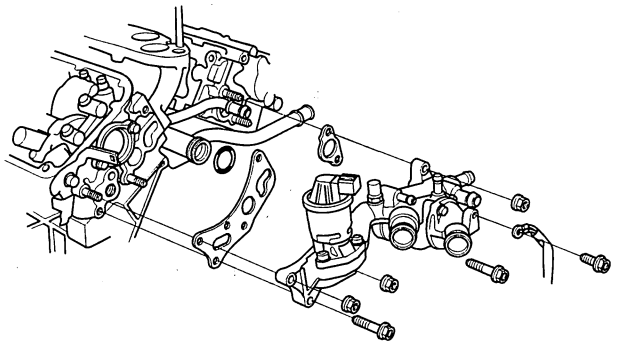
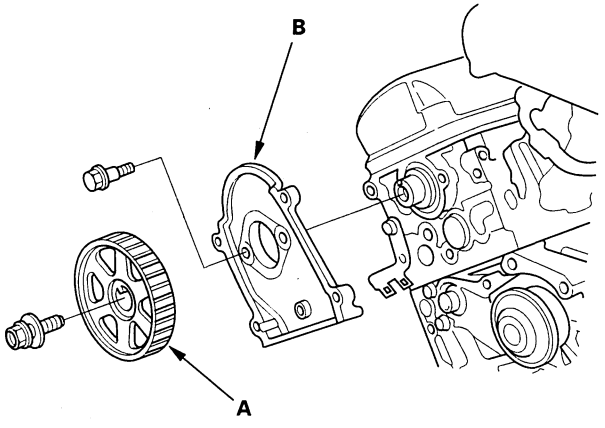
Cylinder Head Removal (cont'd)

19. Remove the front and rear warm up three way catalytic converter (WU-TWC) (see page 11-354).

20. Remove the water passage.

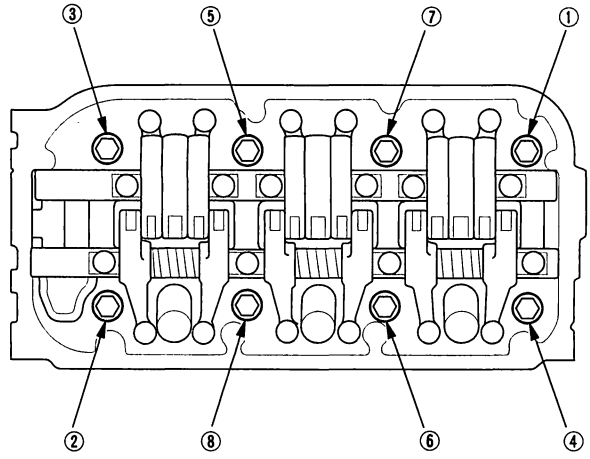


21. Remove the front and rear camshaft pulleys (A) and front and rear back covers (B).



22. Remove the cylinder head covers (see page 6-27).

23. Remove the cylinder head bolts. To prevent warpage, unscrew the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.



24. Remove the cylinder heads.

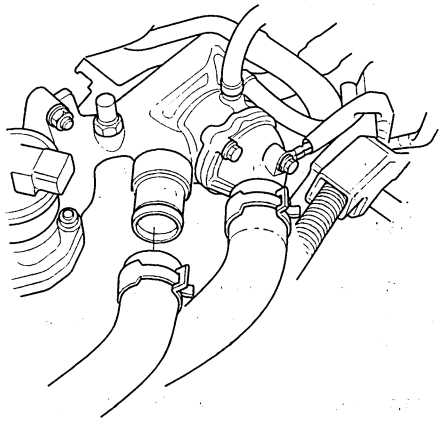
BACK

Protected by AR

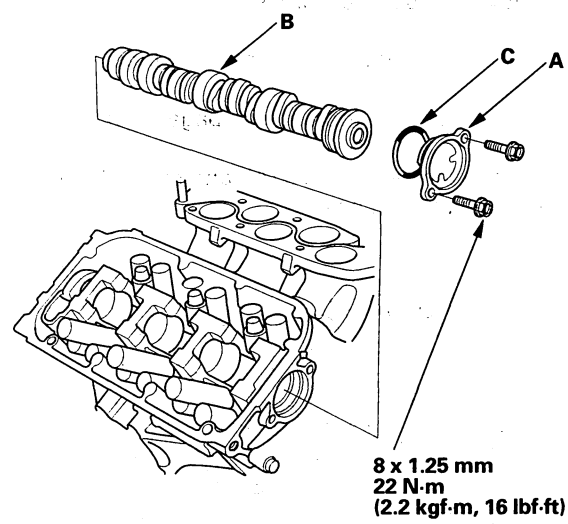
Camshaft Replacement

FRONT

1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the customer's audio presets. Make sure the ignition switch is OFF.
2. Disconnect the negative cable from the battery first, then disconnect the positive cable.
3. Remove the battery.
4. Drain the engine coolant (see page 10-6).
5. Remove the upper radiator hose.



6. Remove the exhaust gas recirculation (EGR) valve (see page 11-368).
7. Remove the timing belt (see page 6-14).
8. Remove the rocker arm assembly (see page 6-35).
9. Remove the front camshaft pulley.
10. Remove the thrust cover (A), then remove the front camshaft (B).



11. Install the front camshaft in the reverse order of removal with a new O-ring (C). Apply new engine oil to the journals and camshaft lobes.
12. Apply new engine oil to the threads of the camshaft pulley mounting bolt, then install the front camshaft pulley (see step 11 on page 6-50).
13. Install the rocker arm assembly, then tighten the mounting bolts (see step 8 on page 6-49).
14. Install the timing belt (see page 6-16).
15. Adjust the valve clearance (see page 6-8).
16. Fill the radiator with engine coolant and bleed the air out (see step 8 on page 10-7).
17. Install the battery. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
18. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure (see page 11-4).
19. Enter the anti-theft codes for the radio and the navigation system, then enter the customer's audio and XM radio channel presets. Set the clock.
20. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

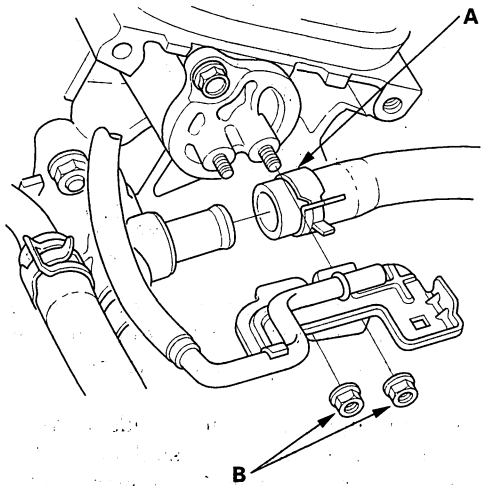
(cont'd)

Protected by AR

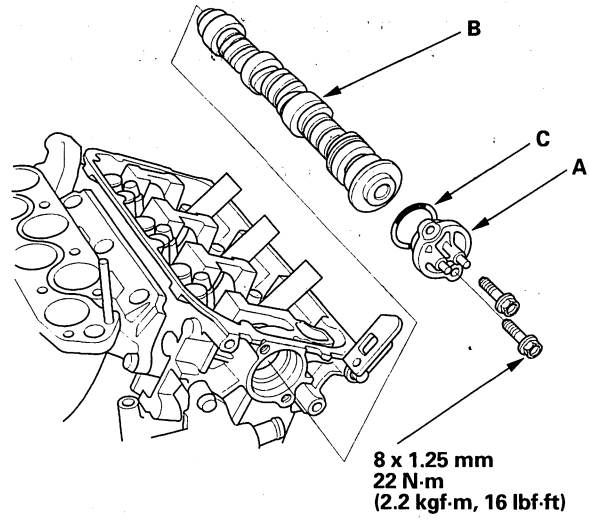
Camshaft Replacement (cont'd)

REAR

1. Relieve the fuel pressure (see page 11-315).
2. Remove the under-hood fuse/relay box.
3. Drain the engine coolant (see page 10-6).
4. Remove the heater hose (A), and two nuts (B) securing the fuel line.



5. Remove the timing belt (see page 6-14).
6. Remove the rocker arm assembly (see page 6-35).
7. Remove the rear camshaft pulley.
8. Remove the thrust cover (A), then remove the rear camshaft (B).



9. Install the rear camshaft in the reverse order of removal with a new O-ring (C). Apply new engine oil to the journals and camshaft lobes.
10. Apply new engine oil to the threads of the camshaft pulley mounting bolt, then install the rear camshaft pulley (see step 11 on page 6-50).
11. Install the rocker arm assembly, then tighten the mounting bolts (see step 8 on page 6-49).
12. Install the timing belt (see page 6-16).
13. Adjust the valve clearance (see page 6-8).
14. Fill the radiator with engine coolant and bleed the air out (see step 8 on page 10-7).
15. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure (see page 11-4).

BACK

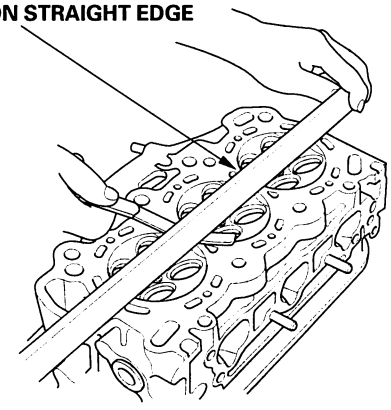
Protected by AR

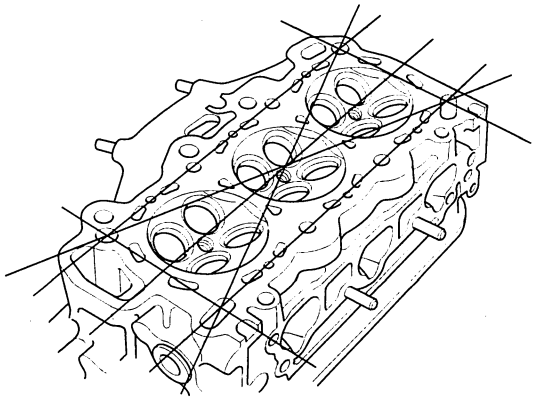
Cylinder Head Inspection for Warpage

1. Remove the cylinder head (see page 6-30).
2. Inspect the camshaft (see page 6-39).
3. Check the cylinder head for warpage. Measure along the edges, and three ways across the center.
   - If warpage is less than 0.05 mm (0.002 in.), cylinder head resurfacing is not required.
   - If warpage is between 0.05 mm (0.002 in.) and 0.2 mm (0.008 in.), resurface the cylinder head.
   - Maximum resurface limit is 0.2 mm (0.008 in.) based on a height of 121 mm (4.76 in.).

Cylinder Head Height
Standard (New): 120.95—121.05 mm (4.762—4.766 in.)

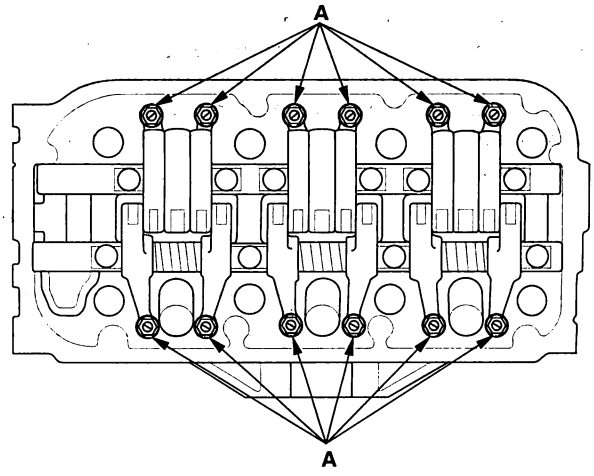
PRECISION STRAIGHT EDGE



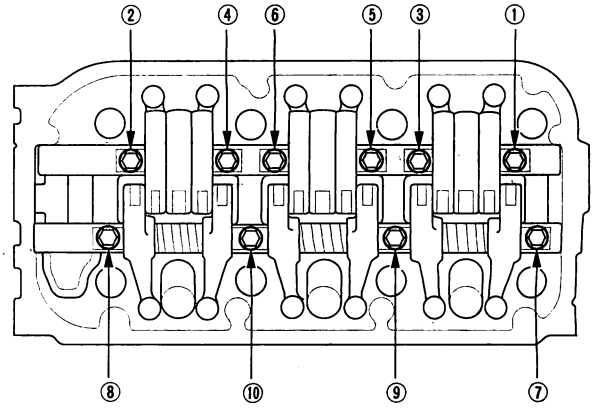


Rocker Arm Assembly Removal

1. Remove the cylinder head cover (see page 6-27).
2. Loosen the adjusting screws (A).



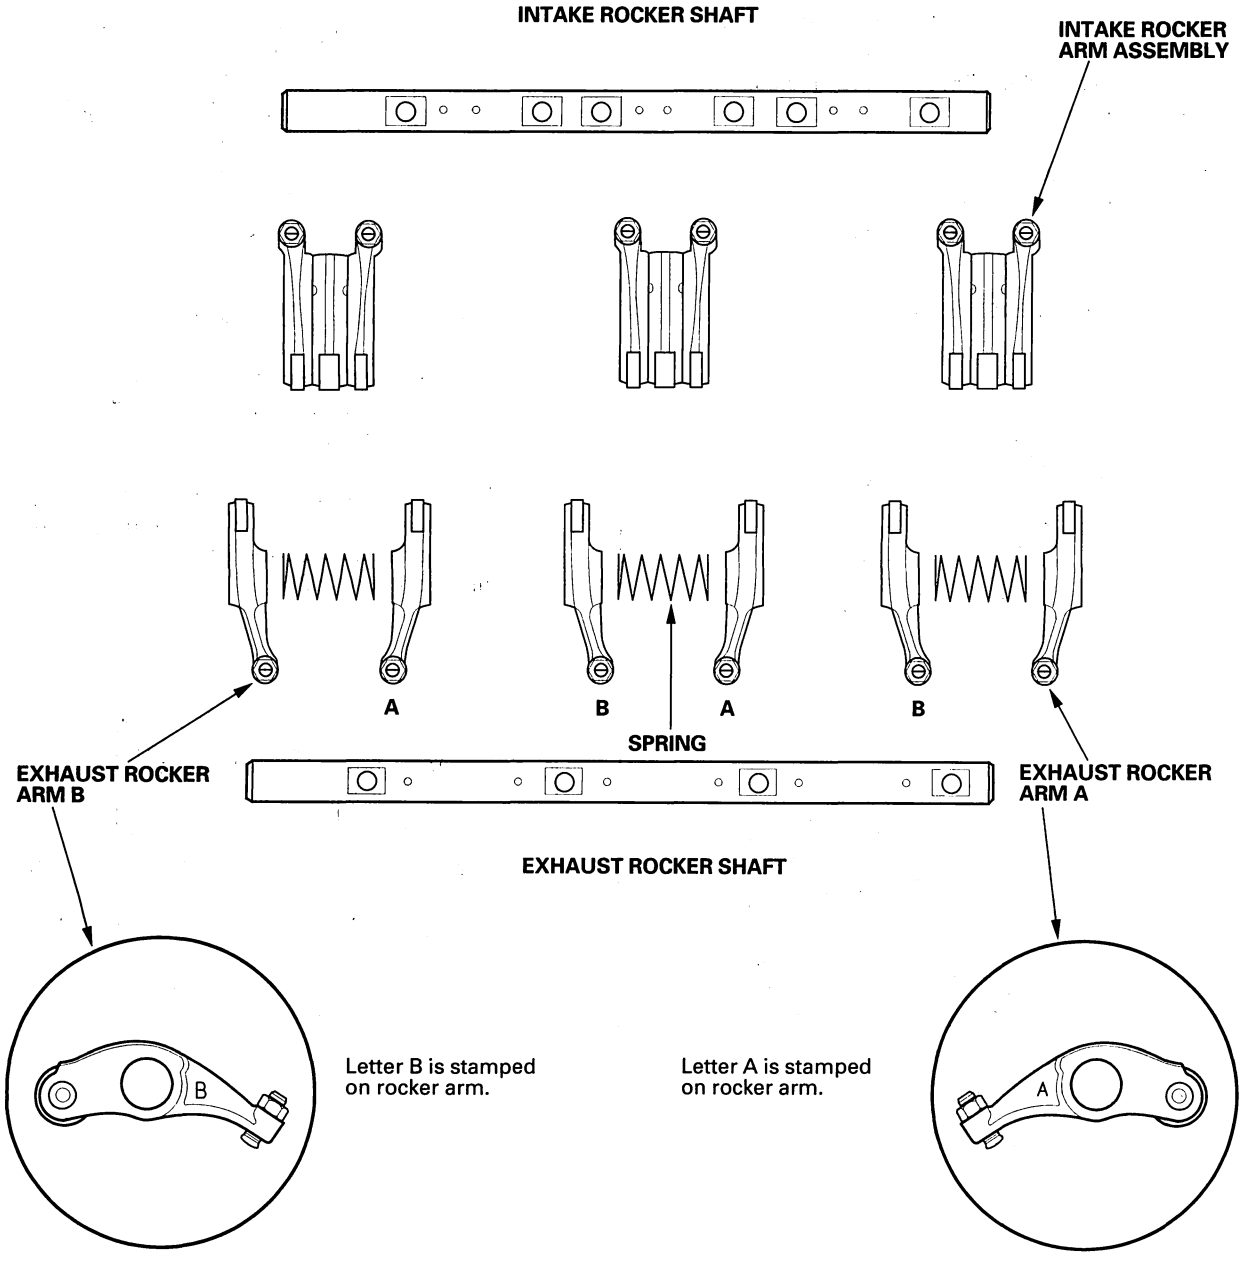
3. Remove the bolts and the rocker arm assembly.
   - –1 Unscrew the rocker shaft mounting bolts two turns at a time, in a crisscross pattern, to prevent damaging the valves or rocker arm assembly.
   - –2 When removing the rocker arm assembly, do not remove the rocker shaft mounting bolts. The bolts will keep the springs and the rocker arms on the shafts.



Protected by AR

Rocker Arm and Shaft Disassembly/Reassembly

NOTE:
- Identify parts as they are removed so they can be reinstalled in their original locations.
- Inspect the rocker shafts and rocker arms (see page 6-37).
- Rocker arms must be installed in the same positions if reused.
- When removing or installing the rocker arm assembly, do not remove the rocker shaft mounting bolts. The bolts will keep the springs and rocker arms on the shaft.
- Bundle the intake rocker arms with rubber bands to keep them together as a set.
- Prior to reassembling, clean all the parts in solvent, dry them and apply new engine oil to any contact points.
- When replacing the intake rocker arm assembly, remove the fastening hardware from the new intake rocker arm assembly.



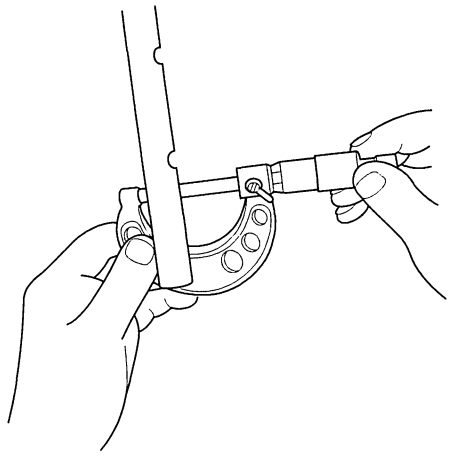
BACK

Protected by AR

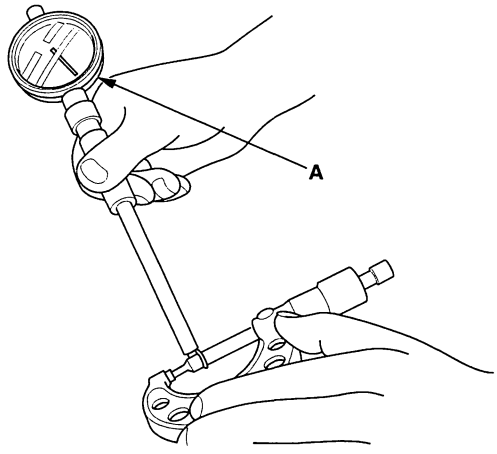
Rocker Arm and Shaft Inspection

1. Remove the rocker arm assembly (see page 6-35), then disassemble the rocker arm assembly (see page 6-36).

2. Measure the diameter of the shaft at the first rocker location.

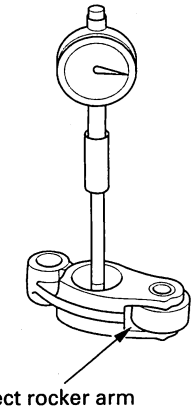


3. Zero the gauge (A) to the shaft diameter.



4. Measure the inside diameter of the rocker arm, and check it for an out-of-round condition.

Rocker Arm-to-Shaft Clearance
Standard (New):
Intake: 0.026—0.067 mm (0.0010—0.0026 in.)
Service Limit: 0.067 mm (0.0026 in.)
Standard (New):
Exhaust: 0.026—0.077 mm (0.0010—0.0030 in.)
Service Limit: 0.077 mm (0.0030 in.)



5. Repeat for all rockers and both shafts. If the clearance is over the limit, replace the rocker shaft and all over-tolerance rocker arms. If any intake rocker arm needs replacement, replace all three rocker arms in that set (primary, mid, and secondary).

(cont'd)

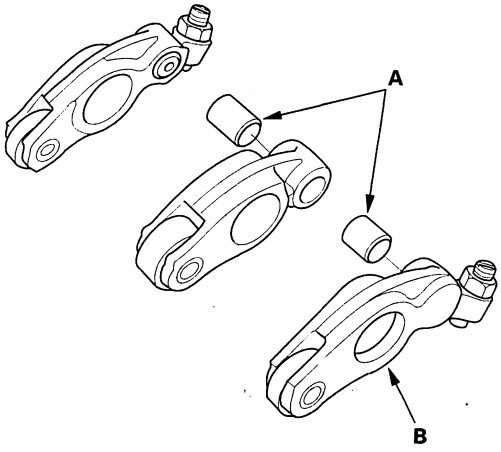
Protected by AR

Rocker Arm and Shaft Inspection (cont'd)

VTEC Rocker Arms

6. Inspect the rocker arm synchronizing pistons (A). Slide them into the rocker arms. If they do not move smoothly, replace the rocker arm set.

   NOTE:
   - Apply new engine oil to the pistons when reassembling.
   - When reassembling the primary rocker arm (B), carefully apply air pressure to the oil passage of the rocker arm.



7. Install the rocker arm assembly (see page 6-49).

BACK

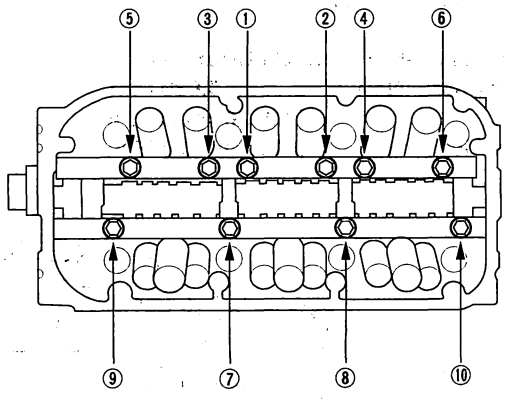
Protected by AR

Camshaft Inspection

1. Remove the cylinder head (see page 6-30).
2. Remove the rocker arms (see page 6-35).
3. Put the rocker shafts on the cylinder head, then tighten the bolts to the specified torque.

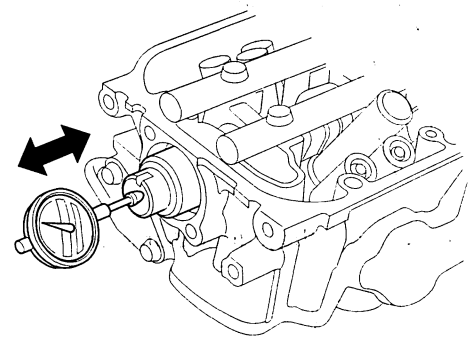
   NOTE: Apply new engine oil to the threads and flange of the exhaust rocker shaft mounting bolts.

   Specified torque
   8 x 1.25 mm: 24 N·m (2.4 kgf·m, 17 lbf·ft)

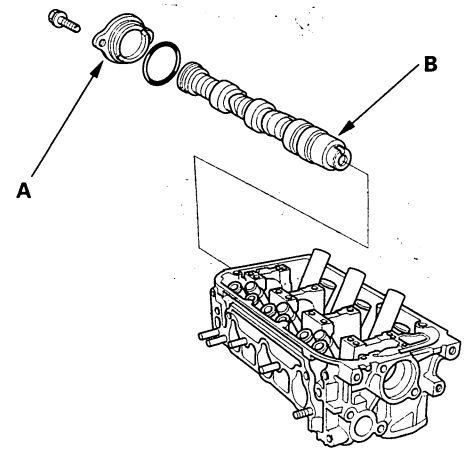


4. Seat the camshaft by pushing it toward the rear of the cylinder head.
5. Zero the dial indicator against the end of the camshaft. Push the camshaft back and forth and read the end play. If the end play is beyond the service limit, replace the thrust cover and recheck. If it is still beyond the service limit, replace the camshaft.

   Camshaft End Play
   Standard (New): 0.05—0.20 mm (0.002—0.008 in.)
   Service Limit: 0.20 mm (0.008 in.)



6. Remove the camshaft thrust cover (A), then pull out the camshaft (B).



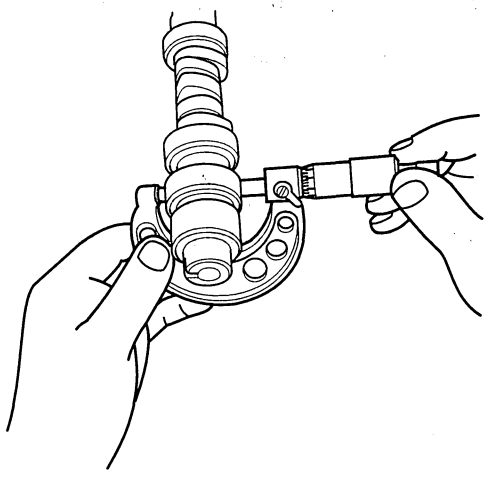
(cont'd)

Protected by AR

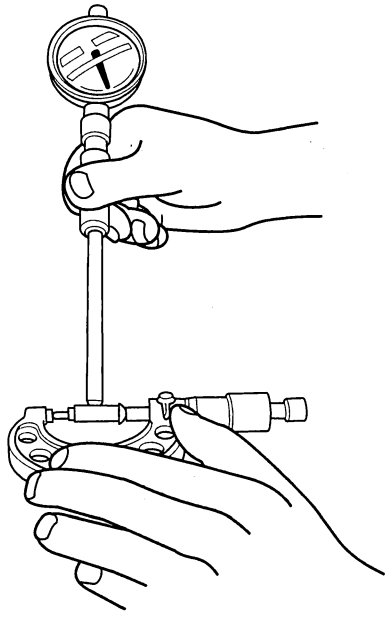
Camshaft Inspection (cont'd)

7. Wipe the camshaft clean, then inspect the lift ramps. Replace the camshaft if any lobes are pitted, scored, or excessively worn.

8. Measure the diameter of each camshaft journal.



9. Zero the gauge to the journal diameter.

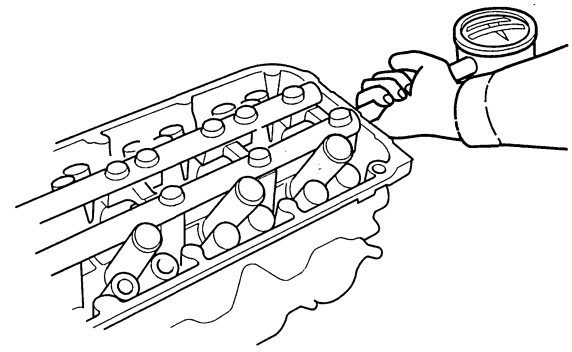


10. Clean the camshaft bearing surfaces in the cylinder head. Measure the inside diameter of each camshaft bearing surface, and check for an out-of-round condition.

- If the camshaft-to-holder clearance is within limits, go to step 12.
- If the camshaft-to-holder clearance is beyond the service limit and the camshaft has been replaced, replace the cylinder head.
- If the camshaft-to-holder clearance is beyond the service limit and the camshaft has not been replaced, go to step 11.

Camshaft-to-Holder Oil Clearance

Standard (New):	**0.050—0.089 mm (0.0020—0.0035 in.)**
Service Limit:	**0.15 mm (0.006 in.)**



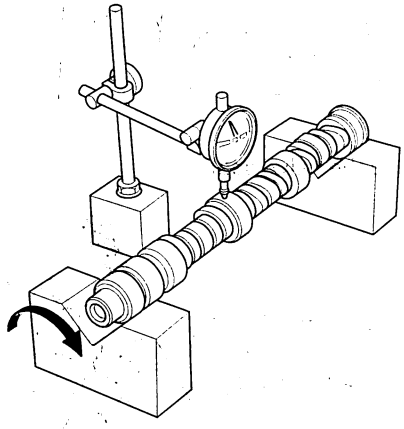
BACK

Protected by AR

11. Check total runout with the camshaft supported on V-blocks.

    - If the total runout of the camshaft is within the service limit, replace the cylinder head.
    - If the total runout is beyond the service limit, replace the camshaft and recheck the oil clearance. If the oil clearance is still out of tolerance, replace the cylinder head.

Camshaft Total Runout
Standard (New): 0.03 mm (0.001 in.) max.
Service Limit: 0.04 mm (0.002 in.)



12. Measure cam lobe height.

Cam Lobe Height Standard (New):

	INTAKE	EXHAUST
PRI	35.041 mm (1.3796 in.)	36.326 mm (1.4302 in.)
MID	36.445 mm (1.4348 in.)	
SEC	35.284 mm (1.3891 in.)	

PRI: Primary MID: Mid SEC: Secondary
IN: Intake EX: Exhaust T/B: Timing belt

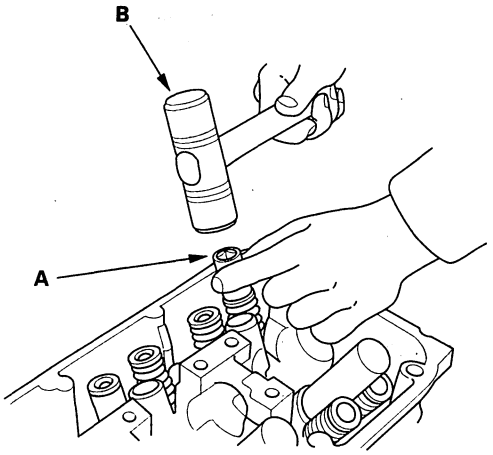
Valve, Spring, and Valve Seal Removal

Special Tools Required
Valve spring compressor attachment
07757-PJ1010A

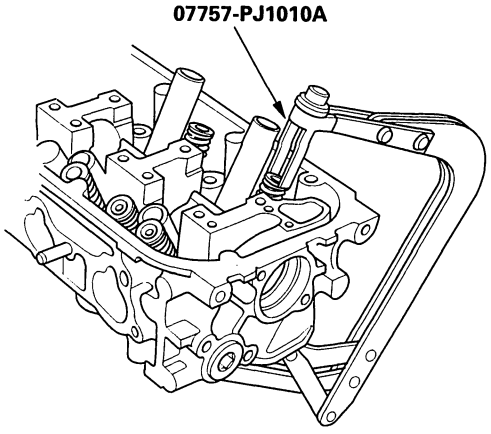
Identify the valves and valve springs as they are removed so that each item can be reinstalled in its original position.

1. Remove the cylinder head (see page 6-30).

2. Using an appropriate-sized socket (A) and plastic mallet (B), lightly tap the valve retainer to loosen the valve cotters.

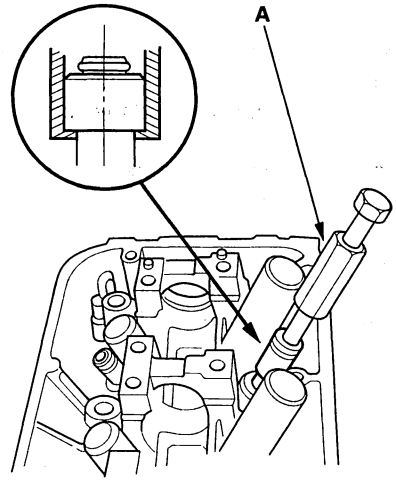


3. Install the valve spring compressor. Compress the spring and remove the valve cotters.

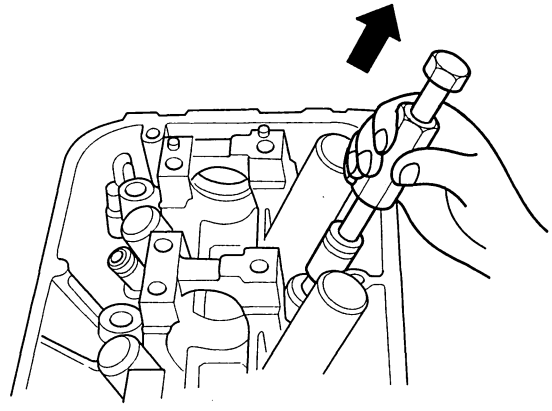


4. Remove the valve spring compressor, then remove the valve retainer, valve spring, and valve.

5. Install the valve guide seal remover (A).



6. Remove the valve seal.



BACK

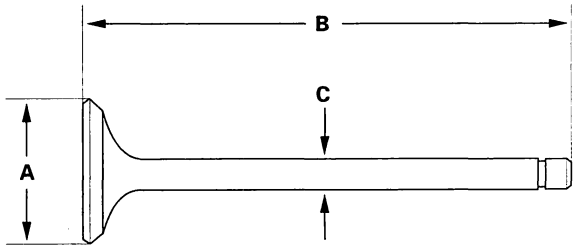
Protected by AR

Valve Inspection

1. Remove the valves (see page 6-42).
2. Measure the valve in these areas.

Intake Valve Dimensions
A Standard (New): 34.90—35.10 mm (1.374—1.382 in.)
B Standard (New): 115.70—116.30 mm (4.555—4.579 in.)
C Standard (New): 5.485—5.495 mm (0.2159—0.2163 in.)
C Service Limit: 5.455 mm (0.2148 in.)

Exhaust Valve Dimensions
A Standard (New): 29.90—30.10 mm (1.177—1.185 in.)
B Standard (New): 113.90—114.50 mm (4.484—4.508 in.)
C Standard (New): 5.450—5.460 mm (0.2146—0.2150 in.)
C Service Limit: 5.420 mm (0.2134 in.)



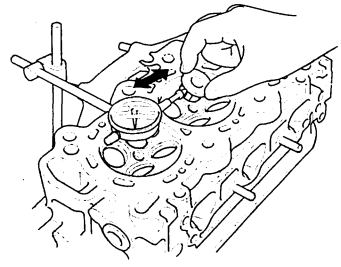
Valve Stem-to-Guide Clearance Inspection

1. Remove the valves (see page 6-42).
2. Slide the valve out of its guide about 10 mm (0.39 in.), then measure the guide-to-stem clearance with a dial indicator while rocking the stem in the direction of normal thrust (wobble method).

- If the measurement exceeds the service limit, recheck it using a new valve.
- If the measurement is now within the service limit, reassemble using a new valve.
- If the measurement with a new valve still exceeds the service limit, go to step 3.

Intake Valve Stem-to-Guide Clearance
Standard (New): 0.04—0.09 mm (0.002—0.004 in.)
Service Limit: 0.16 mm (0.006 in.)

Exhaust Valve Stem-to-Guide Clearance
Standard (New): 0.11—0.16 mm (0.004—0.006 in.)
Service Limit: 0.22 mm (0.009 in.)



3. Subtract the O.D. of the valve stem, measured with a micrometer, from the I.D. of the valve guide, measured with an inside micrometer or ball gauge. Take the measurements in three places along the valve stem and three places inside the valve guide. The difference between the largest guide measurement and the smallest stem measurement should not exceed the service limit.

Intake Valve Stem-to-Guide Clearance
Standard (New): 0.020—0.045 mm (0.0008—0.0018 in.)
Service Limit: 0.08 mm (0.003 in.)

Exhaust Valve Stem-to-Guide Clearance
Standard (New): 0.055—0.080 mm (0.0022—0.0031 in.)
Service Limit: 0.11 mm (0.004 in.)

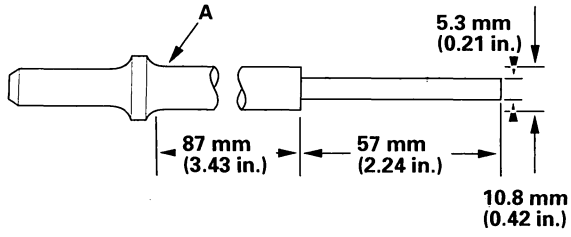
Protected by AR

Valve Guide Replacement

Special Tools Required
- Valve guide driver, 5.5 mm 07742-0010100
- Valve guide reamer, 5.5 mm 07HAH-PJ7A100

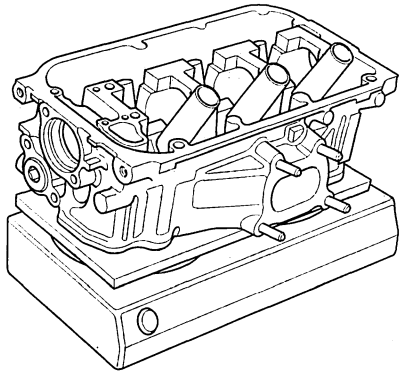
1. Inspect valve stem-to-guide clearance (see page 6-43).

2. As illustrated, use a commercially available air-impact valve guide driver (A) modified to fit the diameter of the valve guides. In most cases, the same procedure can be done using the special tool and a conventional hammer.



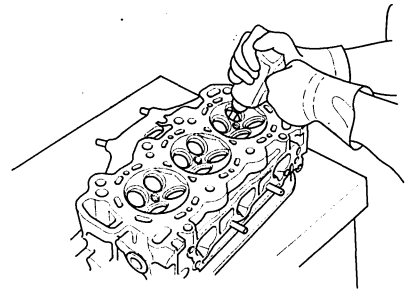
3. Select the proper replacement guides, and chill them in the freezer section of a refrigerator for about an hour.

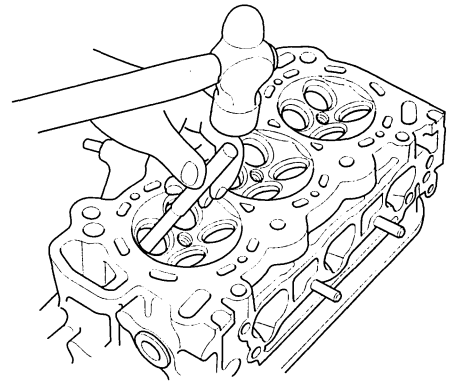
4. Use a hot plate or oven to evenly heat the cylinder head to 300 °F (150 °C). Monitor the temperature with a cooking thermometer. Do not get the head hotter than 300 °F (150 °C); excessive heat may loosen the valve seats.



5. Working from the camshaft side, use the driver and an air hammer to drive the guide about 2 mm (0.1 in.) towards the combustion chamber. This will knock off some of the carbon and make removal easier. Hold the air hammer directly in line with the valve guide to prevent damaging the driver. Wear safety goggles or a face shield.

6. Turn the head over, and drive the guide out toward the camshaft side of the head.





7. If a valve guide still won't move, drill it out with a 8 mm (5/16 in.) bit, then try again.

   NOTE: Drill guides only in extreme cases; you could damage the cylinder head if the guide breaks.

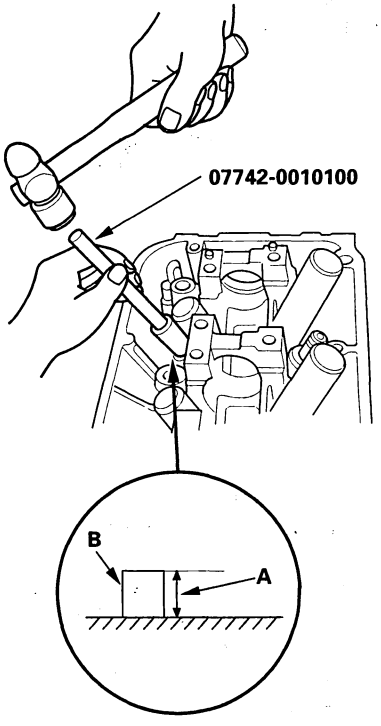
8. Remove the new guide(s) from the freezer, one at a time, as you need them.

BACK

Protected by AR

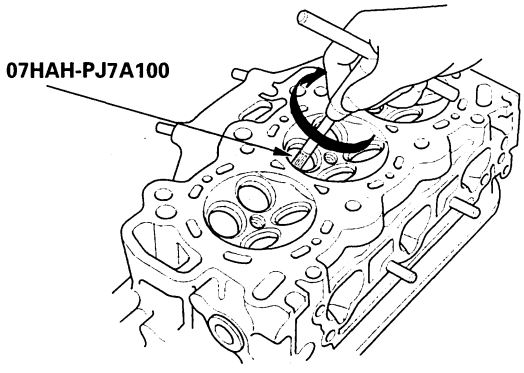
9. Apply a thin coat of clean engine oil to the outside of the new valve guide. Install the guide from the camshaft side of the head; use the special tool to drive the guide to the specified installed height (A) of the guide (B). If you have all 12 guides to do, you may have to reheat the head.

Valve Guide Installed Height
Intake: 21.20—22.20 mm (0.835—0.874 in.)
Exhaust: 20.63—21.63 mm (0.812—0.852 in.)



10. Coat both the reamer and the valve guide with cutting oil.

11. Rotate the reamer clockwise the full length of the valve guide bore.



12. Continue to rotate the reamer clockwise while removing it from the bore.

13. Thoroughly wash the guide in detergent and water to remove any cutting residue.

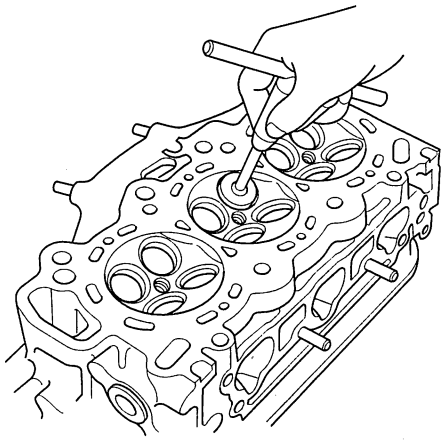
14. Check the clearance with a valve (see page 6-43). Verify that a valve slides in the intake and exhaust valve guides without exerting pressure.

Protected by AR

Valve Seat Reconditioning

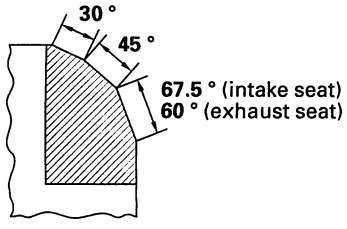
1. Inspect valve stem-to-guide clearance (see page 6-43). If the valve guides are worn, replace them (see page 6-44) before cutting the valve seats.

2. Renew the valve seats in the cylinder head using a valve seat cutter.



3. Carefully cut a 45 ° seat, removing only enough material to ensure a smooth and concentric seat.

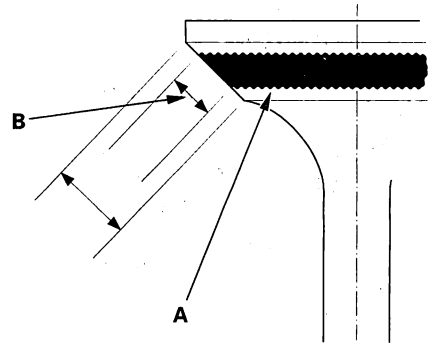
4. Bevel the upper edge of the seat with the 30 ° cutter and the lower edge of the seat with the 67.5 ° cutter (intake seat) or the 60 ° cutter (exhaust seat). Check the width of the seat and adjust accordingly.



5. Make one more very light pass with the 45 ° cutter to remove any possible burrs caused by the other cutters.

Valve Seat Width
Standard (New): 1.25—1.55 mm (0.049—0.061 in.)
Service Limit: 2.00 mm (0.079 in.)

6. After resurfacing the seat, inspect it for even valve seating: Apply Prussian Blue compound (A) to the valve face. Insert the valve in its original location in the head, then lift it and snap it closed against the seat several times.



7. The actual valve seating surface (B), as shown by the blue compound, should be centered on the seat.

- If it is too high (closer to the valve stem), you must make a second cut with the 67.5 ° cutter (intake seat) or the 60 ° cutter (exhaust seat) to move it down, then one more cut with the 45 ° cutter to restore seat width.
- If it is too low (closer to the valve edge), you must make a second cut with the 30 ° cutter to move it up, then one more cut with the 45 ° cutter to restore seat width.

NOTE: The final cut should always be made with the 45 ° cutter.

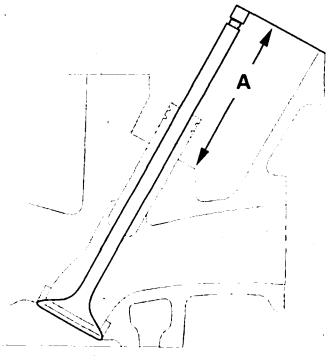
BACK

Protected by AR

8. Insert the intake and exhaust valves in the head, and measure the valve stem installed height (A).

Intake Valve Stem Installed Height
Standard (New): 46.75—47.55 mm (1.841—1.872 in.)
Service Limit: 47.80 mm (1.882 in.)

Exhaust Valve Stem Installed Height
Standard (New): 46.68—47.48 mm (1.838—1.869 in.)
Service Limit: 47.73 mm (1.879 in.)



9. If the valve stem installed height is over the service limit, replace the valve and recheck. If it is still over the service limit, replace the cylinder head; the valve seat in the head is too deep.

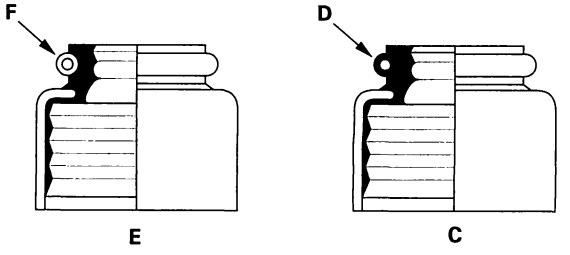
Protected by AR

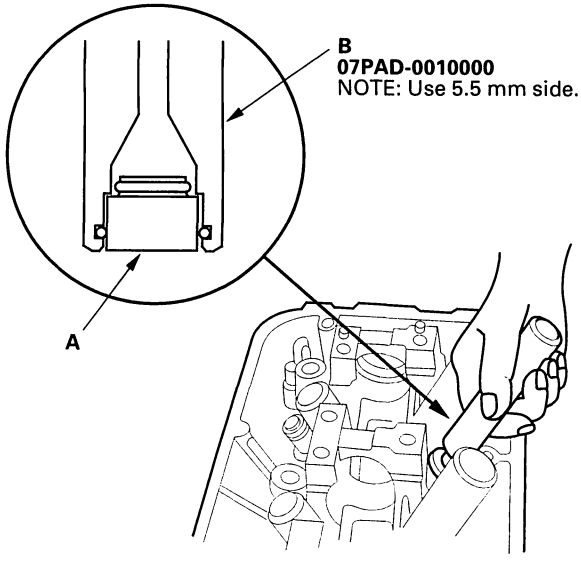
Valve, Spring, and Valve Seal Installation

Special Tools Required
- Stem seal driver 07PAD-0010000
- Valve spring compressor attachment 07757-PJ1010A

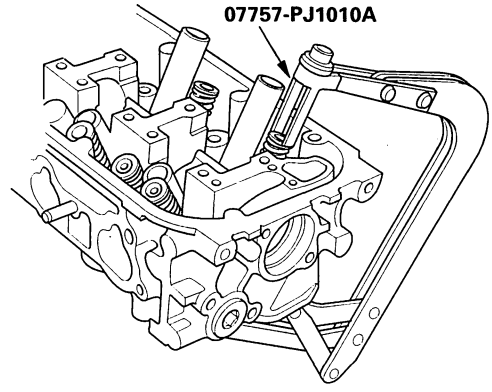
1. Coat the valve stems with new engine oil. Install the valves in the valve guides.
2. Check that the valves move up and down smoothly.
3. Install the spring seats on the cylinder head.
4. Install the new valve seals (A) using the valve guide seal installer (B).

   NOTE: Exhaust valve seals (C) have a black spring (D) and intake valve seals (E) have a white spring (F). They are not interchangeable.

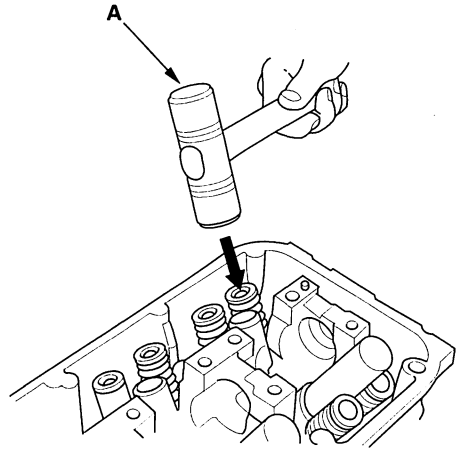




5. Install the valve spring and valve retainer. Place the end of the valve spring with closely wound coils toward the cylinder head.
6. Install the valve spring compressor. Compress the spring and install the valve cotters.



7. Remove the valve spring compressor.
8. Lightly tap the end of each valve stem two or three times with a plastic mallet (A) to ensure proper seating of the valve and valve cotters. Tap the valve stem only along its axis so you do not bend the stem.



BACK

Protected by AR

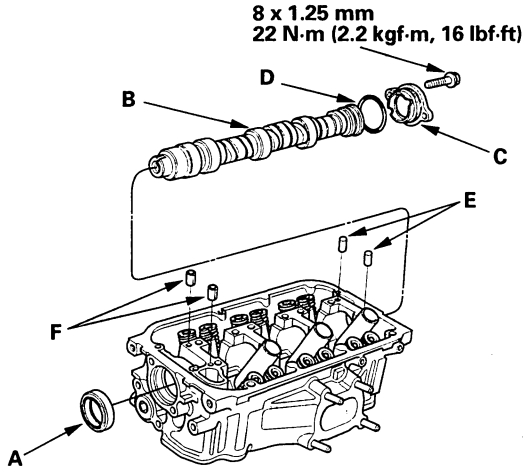
Camshaft, Rocker Arm, Camshaft Seal, and Pulley Installation

1. Apply a light coat of oil around the camshaft oil seal.

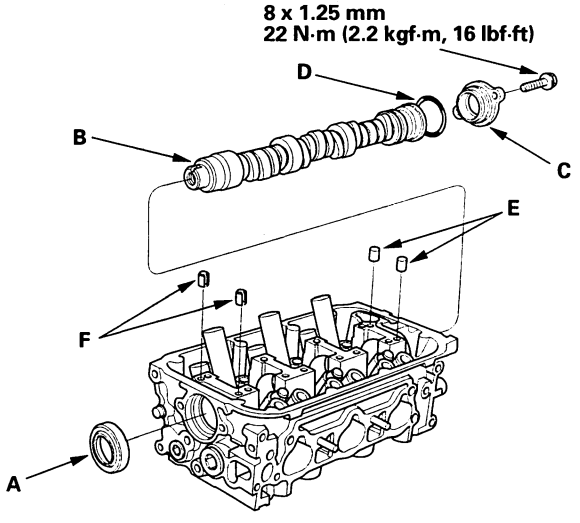
2. Gently tap the new camshaft oil seal (A) into the cylinder head.

   –1 Tap the camshaft oil seal in squarely.
   –2 Install the oil seal about 0.5—1.5 mm (0.02—0.06 in.) below the surface of the cylinder head.

FRONT:



REAR:



3. Insert the camshaft (B) into the cylinder head, then install the camshaft thrust cover (C). Always use a new O-ring (D).

4. Check that the oil seal lips are not distorted.

5. Install the solid dowel pins (E) and the hollow dowel pins (F).

6. Reassemble the rocker arm assembly (see page 6-36).

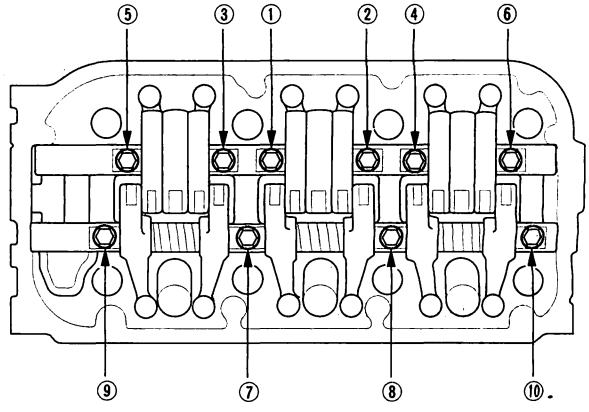
7. Loosen the valve adjusting screws.

8. Set the rocker arm assembly in place, and loosely install the bolts. Make sure that the rocker arms are properly positioned on the valve stems.

9. Tighten each bolt two turns at a time in the sequence shown to ensure that the rockers do not bind on the valves.

   NOTE: Apply new engine oil to the threads and flange of the exhaust rocker shaft mounting bolts.

Specified torque
8 x 1.25 mm: 24 N·m (2.4 kgf·m, 17 lbf·ft)

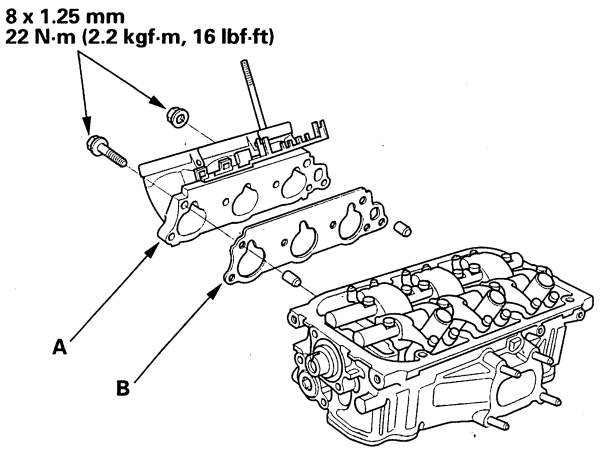


(cont'd)

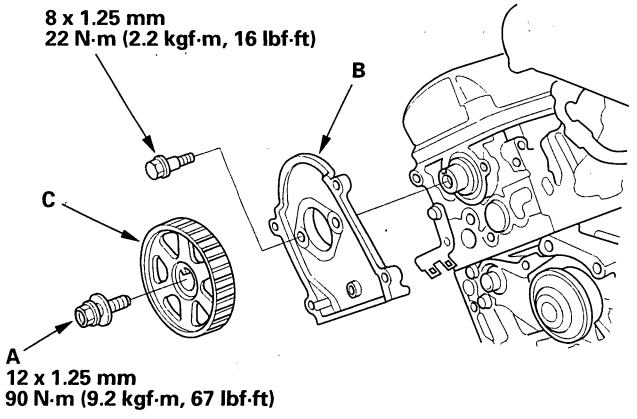
Protected by AR

Camshaft, Rocker Arm, Camshaft Seal, and Pulley Installation (cont'd)

10. Install the injector base (A). Always use a new gasket (B).



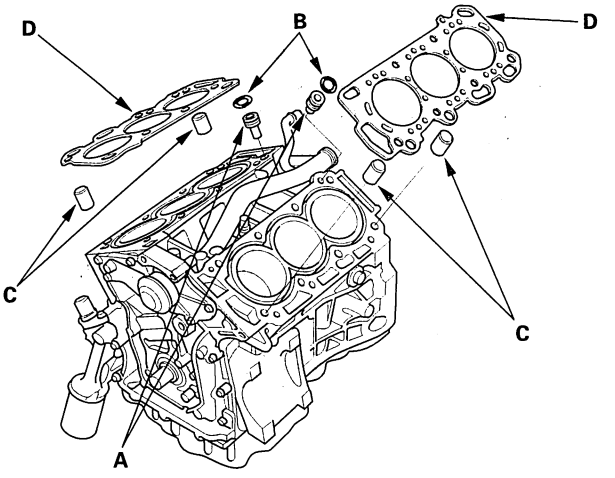
11. Apply new engine oil to the threads of the camshaft pulley mounting bolt (A). Install the back cover (B), then install the camshaft pulley (C).



Cylinder Head Installation

1. Clean the cylinder head and block surface.

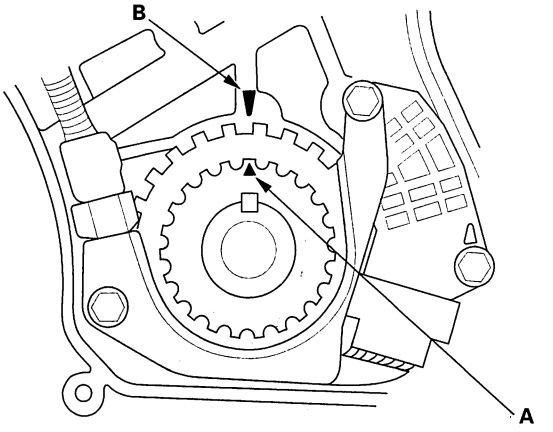
2. Clean and install the oil control orifices (A) with new O-rings (B).



3. Install the dowel pins (C) and new cylinder head gaskets (D).

4. Clean the timing belt pulleys, timing belt guide plate, and the upper and lower covers.

5. Set the timing belt drive pulley to top dead center (TDC) by aligning the TDC mark (A) on the tooth of the timing belt drive pulley with the pointer (B) on the oil pump.

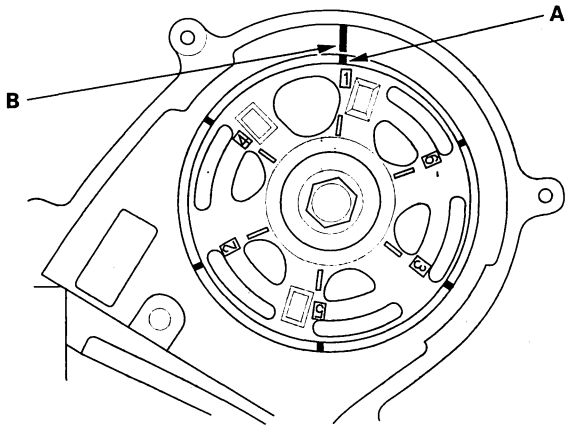


BACK

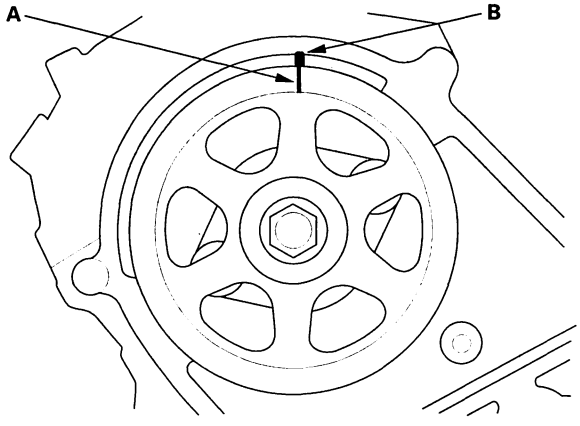
Protected by AR

6. Set the camshaft pulleys to TDC by aligning the TDC marks (A) on the camshaft pulleys with the pointers (B) on the back covers.

FRONT:



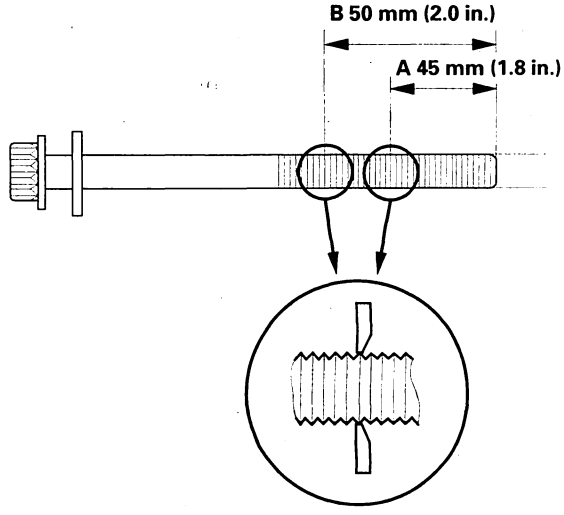
REAR:



7. Put the cylinder head onto the engine block. If the head bolt is dodecagon type, go to step 8. Or if the head bolt is hexagon type, go to step 13.

Dodecagon Bolt Type

8. Measure the diameter of each cylinder head bolt at point A and point B.



9. If either diameter is less than 10.6 mm (0.42 in.), replace the cylinder head bolt.

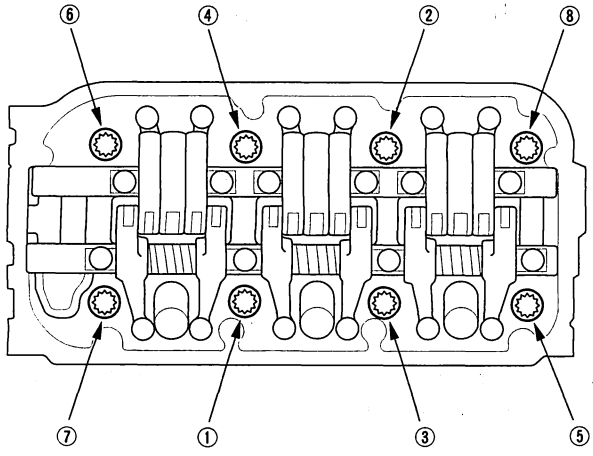
(cont'd)

Protected by AR

Cylinder Head Installation (cont'd)

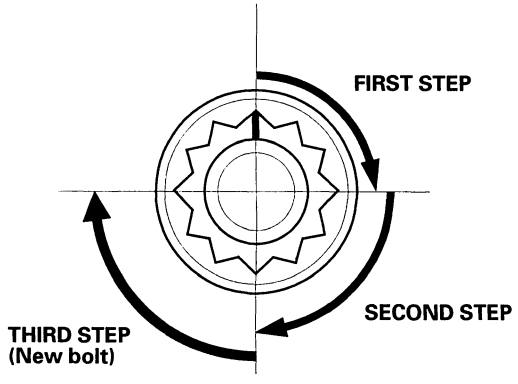
10. Apply engine oil to the threads and under the bolt heads of all cylinder head bolts.

11. Tighten the cylinder head bolts in sequence to 39 N·m (4.0 kgf·m, 29 lbf·ft). Use a beam-type torque wrench. When using a preset-type torque wrench, be sure to tighten slowly and do not overtighten. If a bolt makes any noise while you are torquing it, loosen the bolt and retighten it from the first step.



12. After torquing, tighten all cylinder head bolts in two steps (90 ° per step). If you are using a new cylinder head bolt, tighten the bolt an extra 90 °, then go to step 15.

    NOTE: Remove the cylinder head bolt if you tightened it beyond the specified angle, and go back to step 8 of the procedure. Do not loosen it back to the specified angle.



Hexagon Bolt Type

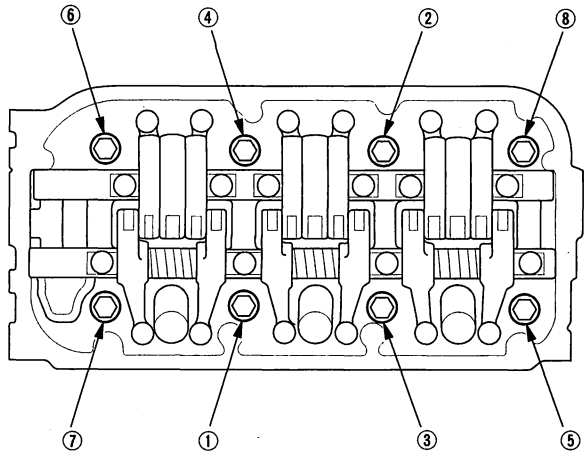
13. Apply new engine oil to the threads and flanges of the cylinder head bolts.

14. Tighten the cylinder head bolts sequentially in three steps.

    NOTE: Perform each step twice.

    1st Step Torque: 39 N·m (4.0 kgf·m, 29 lbf·ft)
    2nd Step Torque: 69 N·m (7.0 kgf·m, 51 lbf·ft)
    3rd Step Torque: 98.1 N·m (10.0 kgf·m, 72.3 lbf·ft)

    Use a beam-type torque wrench. When using a preset-type torque wrench, be sure to tighten slowly and not to overtighten. If a bolt makes any noise while you are torquing it, loosen the bolt, and retighten it from the first step, then go to step 15.

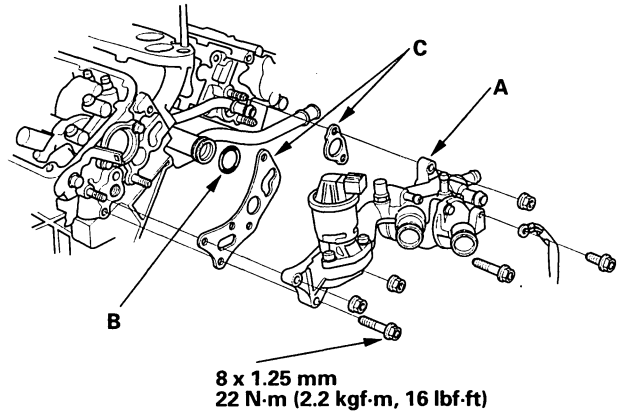


BACK

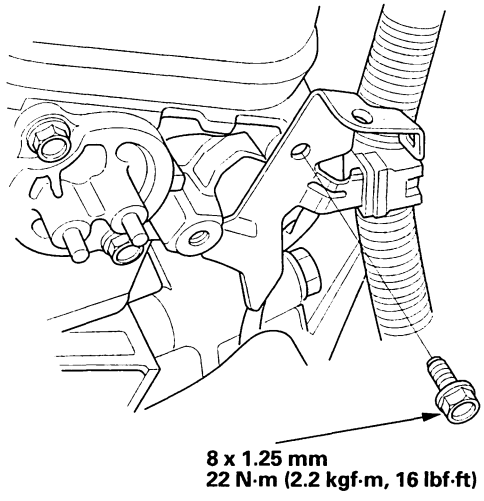
Protected by AR

15. Install the front and rear warm up three way catalytic converter (WU-TWC) (see page 11-354).

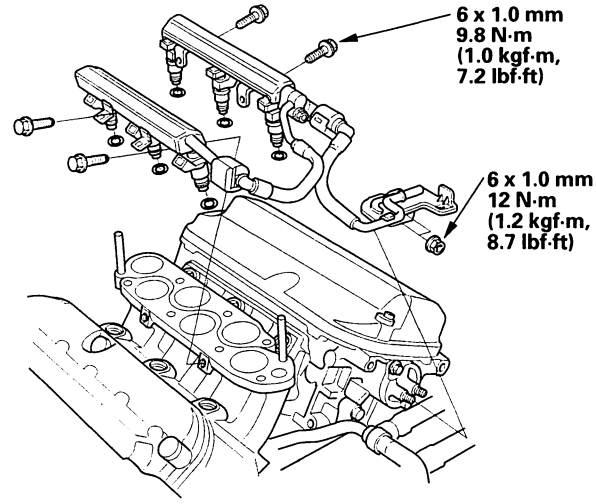
16. Install the water passage (A). Always use a new O-ring (B) and new gaskets (C).



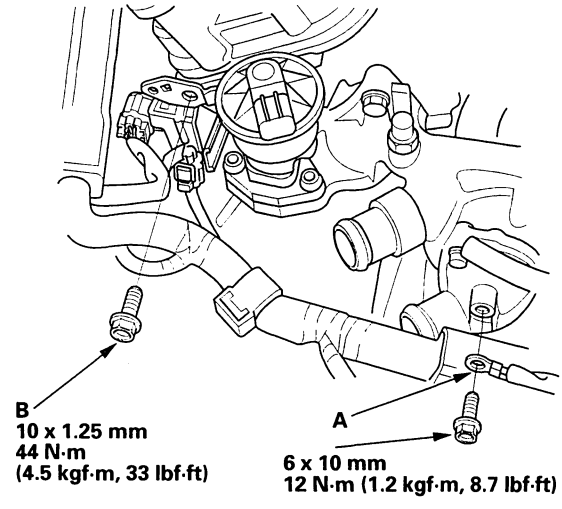
17. Tighten the bolt securing the harness bracket.



18. Set the new O-ring on the injectors, then install the fuel rails.



19. Install the ground cable (A).



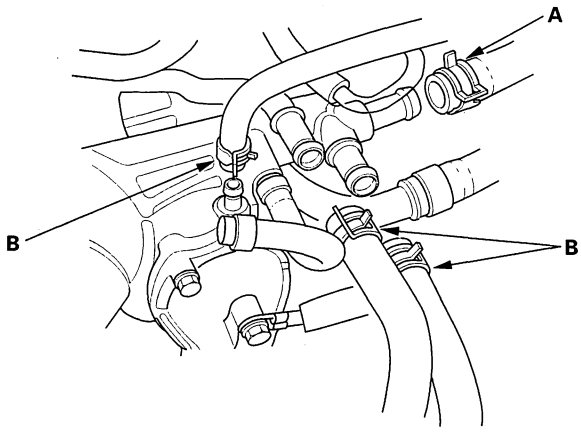
20. Tighten the bolt (B) securing the harness bracket.

(cont'd)

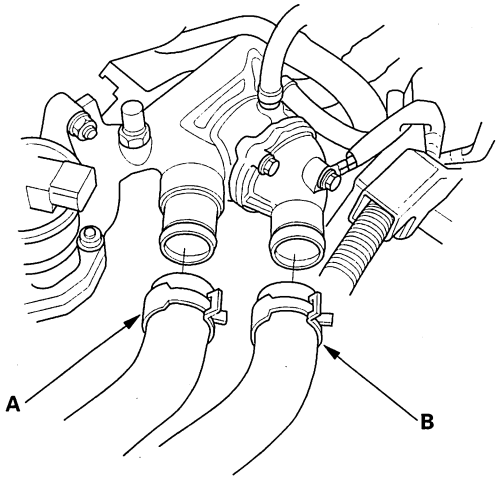
Protected by AR

Cylinder Head Installation (cont'd)

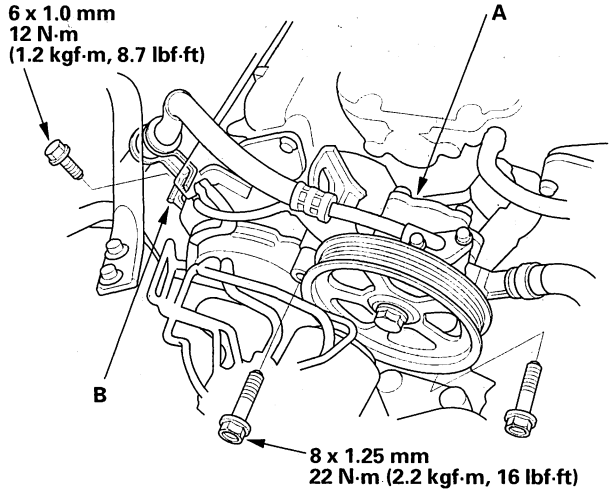
21. Install the heater hose (A) and water bypass hoses (B).



22. Install the upper radiator hose (A), and lower radiator hose (B).



23. Install the power steering (P/S) pump (A) and P/S hose bracket (B).



24. Install the timing belt (see page 6-16).
25. Adjust the valve clearance (see page 6-8).
26. Install the cylinder head covers (see page 6-28).
27. Install the intake manifold (see page 9-4).
28. Install the alternator (see page 4-38).
29. Install the drive belt.
30. Install the fuel line (see page 11-323).
31. Clean the battery posts and cable terminals with sandpaper. Assemble them and apply grease to prevent corrosion.
32. After installation, check that all tubes, hoses, and connectors are installed correctly.
33. Inspect for fuel leaks. Turn the ignition switch ON (II) (do not operate the starter) so the fuel pump runs for about 2 seconds and pressurizes the fuel line. Repeat this operation two or three times, then check for fuel leakage at any point in the fuel line.

BACK

Protected by AR

34. Refill the radiator with engine coolant, and bleed air from the cooling system with the heater valve open (see step 8 on page 10-7).

35. Perform the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

36. Inspect the idle speed (see page 11-301).

37. Inspect the ignition timing (see page 4-19).

38. Enter the anti-theft codes for the radio and the navigation system, then enter the customer's audio presets.

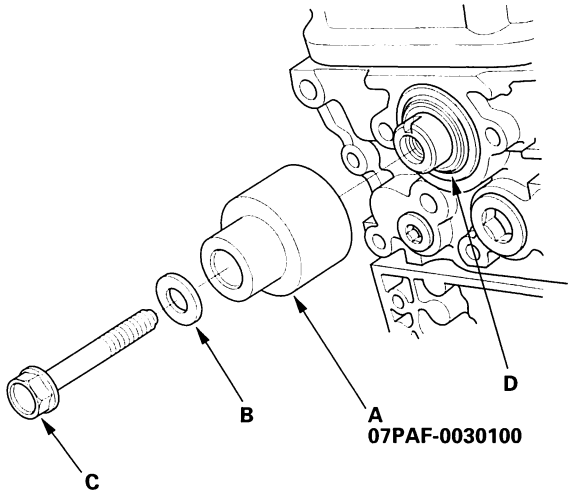
39. Set the clock.

Protected by AR

Camshaft Oil Seal Installation - In Car

Special Tools Required
Camshaft oil seal driver 07PAF-0030100

1. Remove the timing belt (see page 6-14).
2. Remove the camshaft pulley and back cover (see step 21 on page 6-32).
3. Remove the camshaft oil seal.
4. Dry the camshaft oil seal housing.
5. Apply a light coat of multipurpose grease to the lip of the camshaft oil seal.
6. Using the special tool (A), washer (B), and a 12 x 75 x 1.25 mm bolt (C), press in the camshaft oil seal (D) about 0.5—1.5 mm (0.02—0.06 in.) below the surface of the cylinder head.



7. Apply new engine oil to the threads of the camshaft pulley mounting bolt. Install the back cover, then install the camshaft pulley (see step 11 on page 6-50).
8. Install the timing belt (see page 6-16).

Sealing Bolt Installation

NOTE: When installing the sealing bolt (A), always use new washer (B).

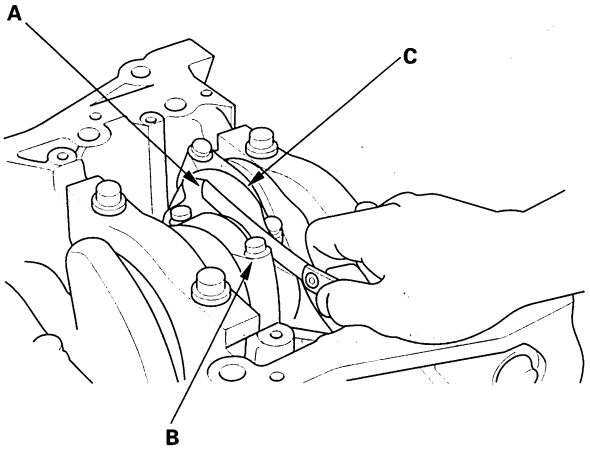
Connecting Rod and Crankshaft End Play Inspection

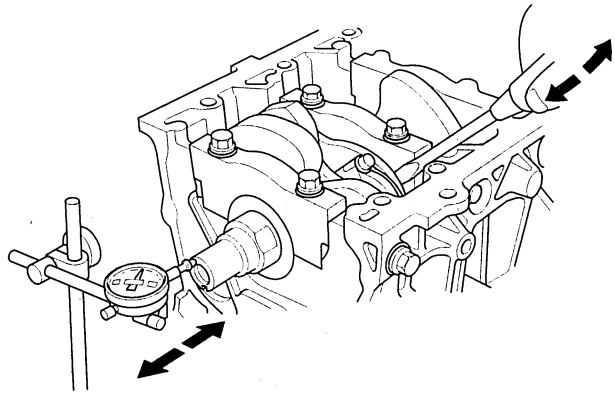
1. Remove the oil pump (see page 8-10).
2. Remove the baffle plate (see step 11 on page 7-12).
3. Measure the connecting rod end play with a feeler gauge (A) between the connecting rod (B) and crankshaft (C).

   Connecting Rod End Play
   Standard (New): 0.15—0.35 mm (0.006—0.014 in.)
   Service Limit: 0.45 mm (0.018 in.)



4. If the connecting rod end play is out-of-tolerance, install a new connecting rod and recheck. If it is still out-of-tolerance, replace the crankshaft (see step 12 on page 7-12).
5. Push the crankshaft firmly away from the dial indicator, and zero the dial against the end of the crankshaft. Then pull the crankshaft firmly back toward the indicator; the dial reading should not exceed the service limit.

   Crankshaft End Play
   Standard (New): 0.10—0.35 mm (0.004—0.014 in.)
   Service Limit: 0.45 mm (0.018 in.)



6. If the end play is excessive, replace the thrust washers and recheck. If it is still out-of-tolerance, replace the crankshaft (see step 12 on page 7-12).

BACK

Protected by AR

Crankshaft Main Bearing Replacement

Main Bearing Clearance Inspection

1. Remove the main caps and bearing halves (see page 7-11).

2. Clean each main journal and bearing half with a clean shop towel.

3. Place one strip of plastigage across each main journal.

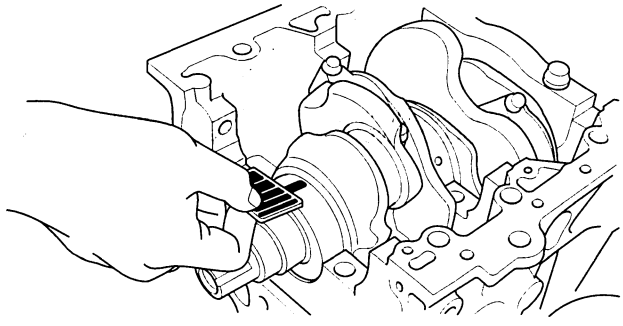
   NOTE: If the engine is still in the vehicle when you bolt the main cap down to check the clearance, the weight of the crankshaft and drive plate will flatten the plastigage further than just the torque on the cap bolt and give you an incorrect reading. For an accurate reading, support the crank with a jack under the counterweights, and check only one bearing at a time.

4. Reinstall the bearings and caps, then torque the bearing cap bolts to 74 N·m (7.5 kgf·m, 54 lbf·ft), and the bearing cap side bolts to 49 N·m (5.0 kgf·m, 36 lbf·ft) in the proper sequence (see step 21 on page 7-25).

   NOTE: Do not rotate the crankshaft during inspection.

5. Remove the cap and bearing half, and measure the widest part of the plastigage.

   Main Bearing-to-Journal Oil Clearance
   Standard (New): 0.020—0.044 mm (0.0008—0.0017 in.)
   Service Limit: 0.050 mm (0.0020 in.)



6. If the plastigage measures too wide or too narrow, remove the crankshaft, and remove the upper half of the bearing. Install a new, complete bearing with the same color code, and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.

7. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below that one), and check again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

(cont'd)

Protected by AR

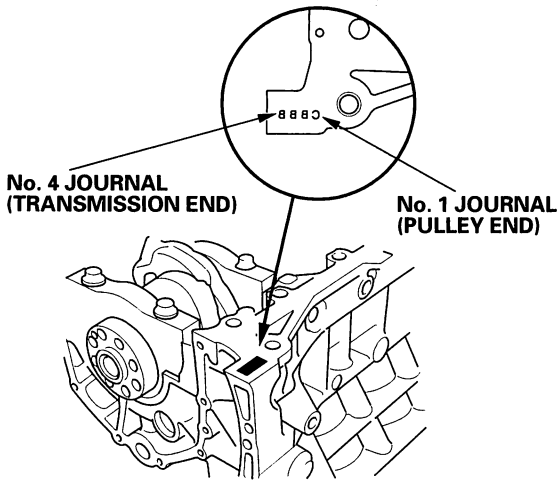
Crankshaft Main Bearing Replacement (cont'd)

Main Bearing Selection

Crankshaft Bore Code Location

Letters or bars have been stamped on the end of the block as a code for the size of each of the four main journal bores.

Use them, and the numbers stamped on the crankshaft (codes for main journal size), to choose the correct bearings. If the codes are indecipherable because of an accumlation of dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.



Bearing Identification

Color code is on the edge of the bearing

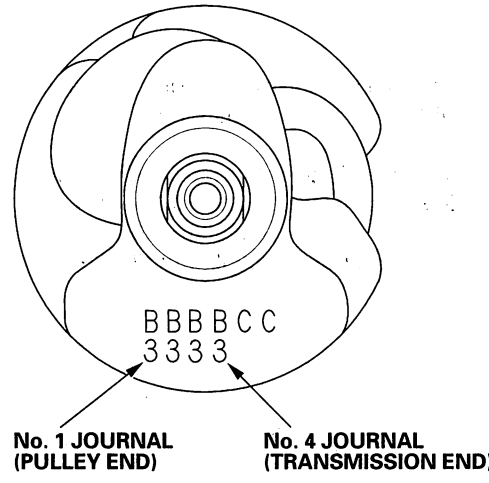
	Larger crank bore →			
	A or I	B or II	C or III	D or IIII
Smaller bearing (Thicker) ↓				
1 or I	Red/ Pink	Pink	Pink/ Yellow	Yellow
2 or II	Pink	Pink/ Yellow	Yellow	Yellow/ Green
3 or III	Pink/ Yellow	Yellow	Yellow/ Green	Green
4 or IIII	Yellow	Yellow/ Green	Green	Green/ Brown
5 or IIIII	Yellow/ Green	Green	Green/ Brown	Brown
6 or IIIIII	Green	Green/ Brown	Brown	Brown/ Black

Smaller main journal

Smaller bearing (Thicker)

NOTE: When using bearing halves of different colors, it does not matter which color is used in the top or bottom.

Main journal code locations (Numbers or Bars)



BACK

Protected by AR

Connecting Rod Bearing Replacement

Rod Bearing Clearance Inspection

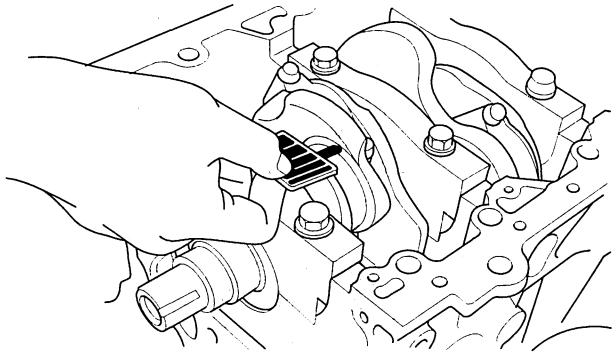
1. Remove the connecting rod cap and bearing half (see page 7-11).
2. Clean the crankshaft rod journal and bearing half with a clean shop towel.
3. Place a strip of plastigage across the rod journal.
4. Reinstall the bearing half and cap, and torque the bolts.

   Tightening torque:
   20 N·m (2.0 kgf·m, 14 lbf·ft) + 90 °
   Apply new engine oil to the bolt threads.

   NOTE: Do not rotate the crankshaft during inspection.

5. Remove the rod cap and bearing half, and measure the widest part of the plastigage.

   Connecting Rod Bearing-to-Journal Oil Clearance
   Standard (New): 0.020—0.044 mm
   (0.0008—0.0017 in.)
   Service Limit: 0.050 mm (0.0020 in.)



6. If the plastigage measures too wide or too narrow, remove the upper half of the bearing, then install a new, complete bearing with the same color code, and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.
7. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below that one), and check clearance again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

(cont'd)

Connecting Rod Bearing Replacement (cont'd)

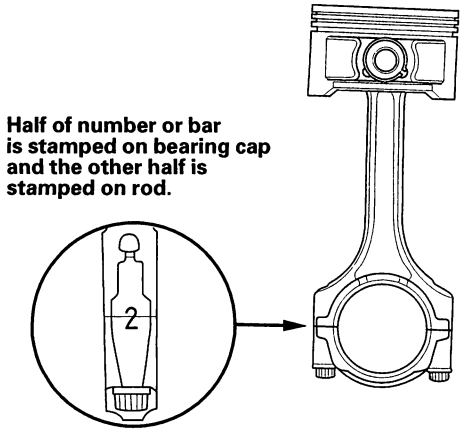
Rod Bearing Selection

Each rod falls into one of four tolerance ranges (from 0 to 0.024 mm (0.0009 in.), in 0.006 mm (0.0002 in.) increments) depending on the size of its big end bore. It's then stamped with a number or bar (1, 2, 3, or 4/I, II, III, or IIII) indicating the range. You may find any combination of 1, 2, 3, or 4/I, II, III, or IIII in any engine.

Normal Bore Size: 56.0 mm (2.20 in.)

Inspect the connecting rod for cracks and heat damage.

Connecting Rod Journal Code Locations
Numbers or bars have been stamped on the side of each connecting rod as a code for the size of the big end. Use them, and the letters or bars stamped on the crank (codes for rod journal size), to choose the correct bearings. If the codes are indecipherable because of an accumulation of dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.



Bearing Identification

Color code is on the edge of the bearing

Smaller rod journal	Larger big end bore → 1 or I	2 or II	3 or III	4 or IIII
A or I	Pink	Pink/ Yellow	Yellow	Yellow/ Green
B or II	Pink/ Yellow	Yellow	Yellow/ Green	Green
C or III	Yellow	Yellow/ Green	Green	Green/ Brown
D or IIII	Yellow/ Green	Green	Green/ Brown	Brown
E or IIIII	Green	Green/ Brown	Brown	Brown/ Black
F or IIIIII	Green/ Brown	Brown	Brown/ Black	Black

Smaller bearing (Thicker) ↓

NOTE: When using bearing halves of different colors, it does not matter which color is used in the top or bottom.

Connecting rod journal code locations (Letters or Bars)

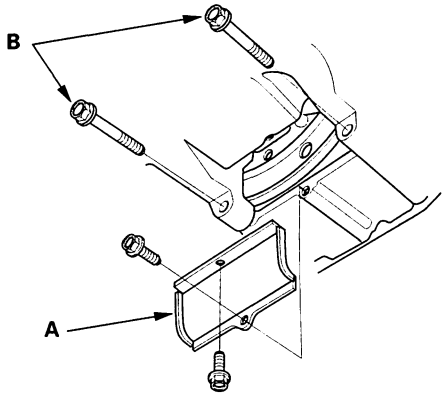
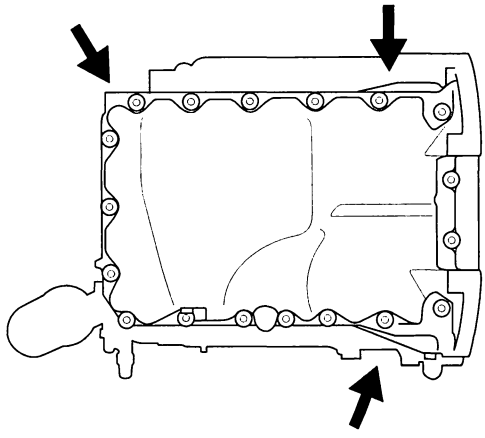
Oil Pan Removal

1. If the engine is out of the vehicle, go to step 5.
2. Raise the vehicle on the hoist to full height.
3. Drain the engine oil (see page 8-6).
4. Remove exhaust pipe A (see step 40 on page 5-5).
5. Remove the torque converter cover (A) and the two bolts (B) securing the transmission.



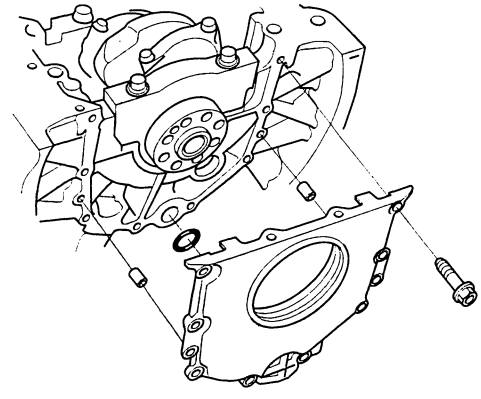
6. Remove the bolts securing the oil pan.
7. Using a flat blade screwdriver, separate the oil pan from the block in the places shown.



8. Remove the oil pan.

Crankshaft and Piston Removal

1. Remove the engine assembly (see page 5-2).
2. Remove the transmission:
   - Manual transmission (see page 13-11)
   - Automatic transmission (see page 14-187)
3. M/T model: Remove the pressure plate (see page 12-11), cluch disc (see page 12-11), and flywheel (see page 12-13).
4. A/T model: Remove the drive plate (see page 14-197).
5. Remove the cylinder heads (see page 6-30).
6. Remove the crankshaft position (CKP) sensor (see page 11-221).
7. Remove the timing belt drive pulley from the crankshaft.
8. Remove the oil pan (see page 7-11).
9. Remove the engine block end cover.

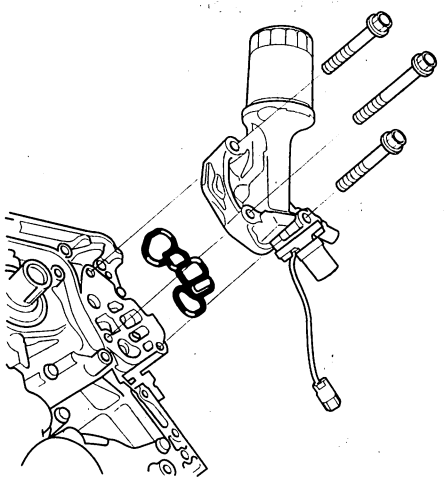


(cont'd)

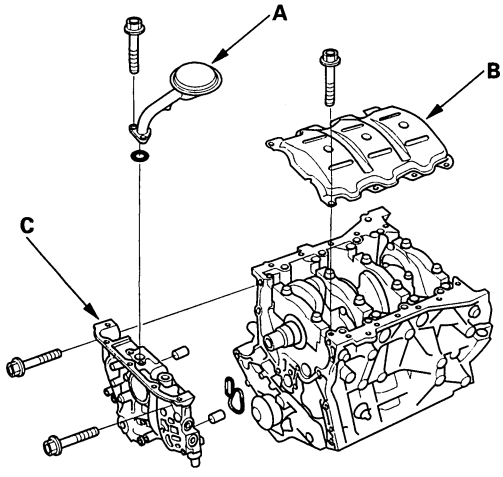
Protected by AR

Crankshaft and Piston Removal (cont'd)

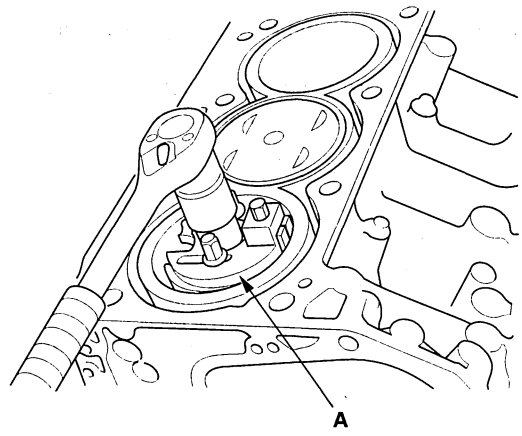
10. Remove the rocker arm oil control solenoid (VTEC solenoid valve)/oil filter assembly.



11. Remove the oil screen (A), baffle plate (B), and oil pump (C).



12. If you can feel a ridge of metal or hard carbon around the top of any cylinder, remove it with a ridge reamer (A). Follow the reamer manufacturer's instructions. If the ridge is not removed, it may damage the pistons as they are pushed out.



BACK

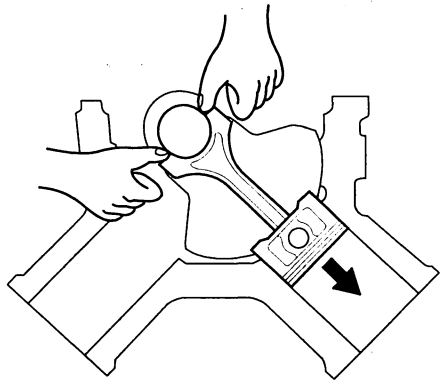
Protected by AR

13. Remove the bearing from the cap. Keep all caps/ bearings in order.

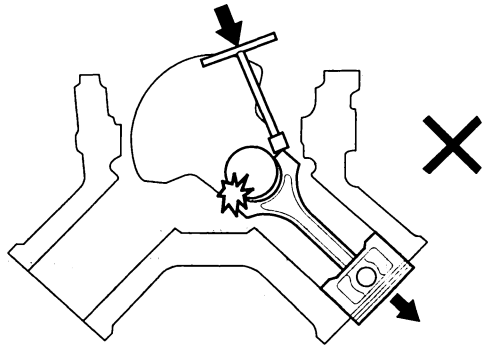
14. Remove the upper bearing halves from the connecting rods, and set them aside with their respective caps.

15. Remove the connecting rod caps after setting the crank pin at bottom dead center (BDC) for each cylinder. Remove the piston assembly by pushing on the connecting rod. Take care not to damage the crank pin or cylinder with the connecting rod.

CORRECT



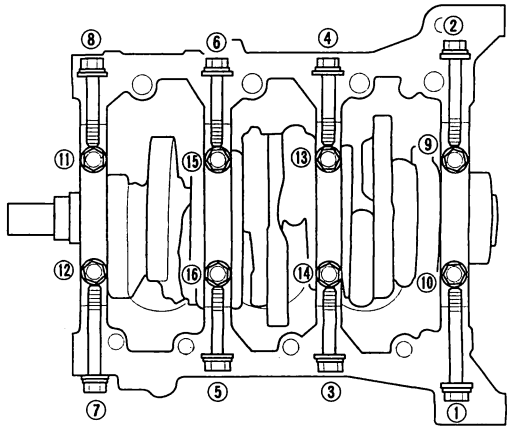
INCORRECT



16. After removing a piston/connecting rod assembly, reinstall the cap on the rod.

17. To avoid confusion during reassembly, mark each piston/connecting rod assembly with its cylinder number.

18. Unscrew the bearing cap bolts and bearing cap side bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.

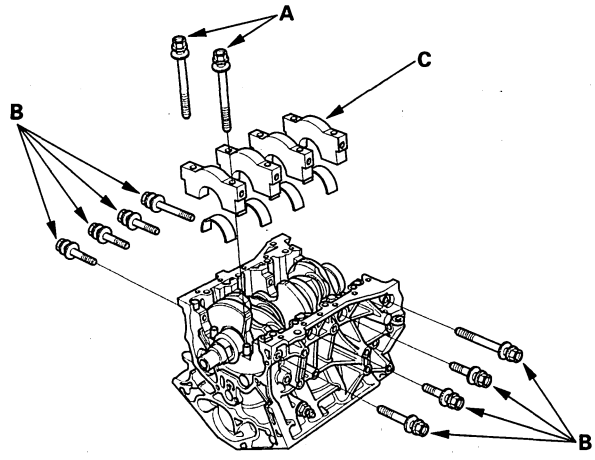


(cont'd)

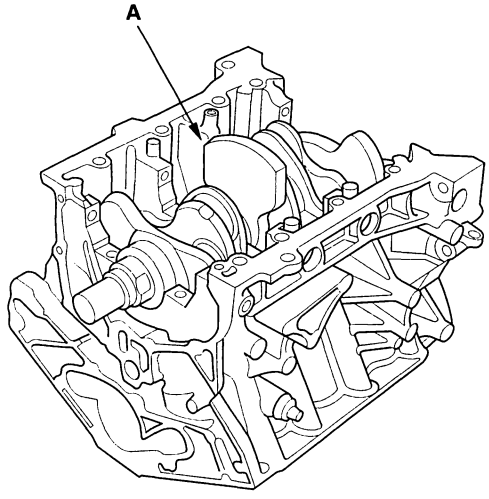
Protected by AR

Crankshaft and Piston Removal (cont'd)

19. Remove the bearing cap bolts (A) and bearing cap side bolts (B), then remove the bearing cap (C).



20. Lift the crankshaft (A) out of the engine block, being careful not to damage the journals.



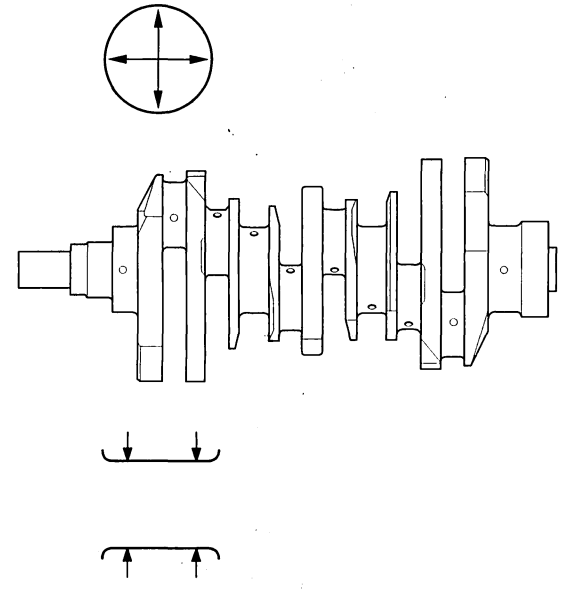
21. Reinstall the main caps and bearings on the engine block in the proper order.

Crankshaft Inspection

Out-of-Round and Taper

1. Remove the crankshaft from the engine block (see page 7-11).
2. Clean the crankshaft oil passages with pipe cleaners or a suitable brush.
3. Check the keyway and threads.
4. Measure out-of-round at the middle of each rod and main journal in two places. The difference between measurements on each journal must not be more than the service limit.

Journal Out-of-Round
Standard (New): 0.005 mm (0.0002 in.) max.
Service Limit: 0.010 mm (0.0004 in.)



5. Measure taper at the edges of each rod and main journal. The difference between measurements on each journal must not be more than the service limit.

Journal Taper
Standard (New): 0.005 mm (0.0002 in.) max.
Service Limit: 0.010 mm (0.0004 in.)

BACK

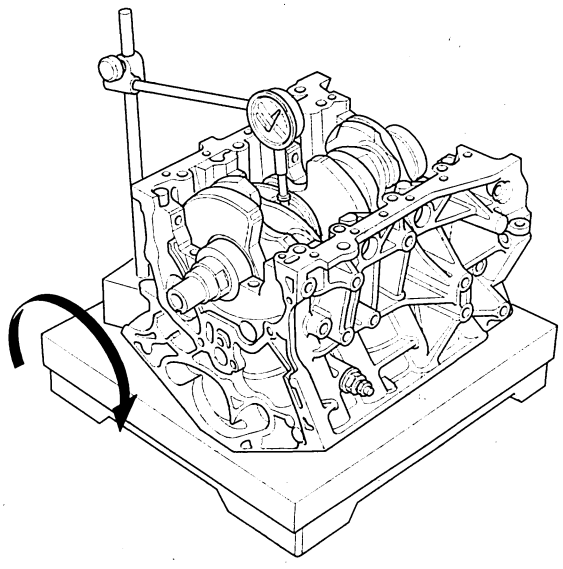
Protected by AR

Block and Piston Inspection

Straightness

6. Place the engine block on the surface plate.
7. Clean and install the bearings on the No. 1 and No. 4 journal of the engine block.
8. Lower the crankshaft into the block.
9. Measure the runout on all of the main journals. Rotate the crankshaft two complete revolutions. The difference between measurements on each journal must not be more than the service limit.

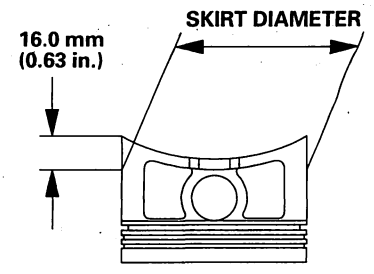
Crankshaft Total Runout
Standard (New): 0.020 mm (0.0008 in.) max.
Service Limit: 0.030 mm (0.0012 in.)

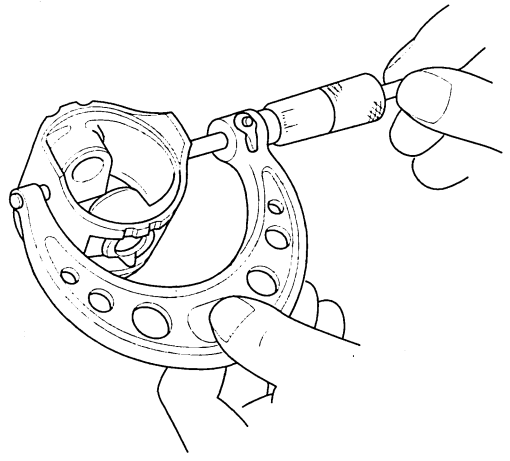


1. Remove the piston from the engine block (see page 7-11).
2. Check the piston for distortion or cracks.
3. Measure the piston diameter at a point 16.0 mm (0.63 in.) from the bottom of the skirt.

Piston Diameter
Standard (New): 85.975—85.985 mm (3.3848—3.3852 in.)
Service Limit: 85.965 mm (3.3844 in.)

Oversize Piston Diameter
0.25: 86.225—86.235 mm (3.3947—3.3951 in.)
0.50: 86.475—86.485 mm (3.4045—3.4049 in.)





(cont'd)

Protected by AR

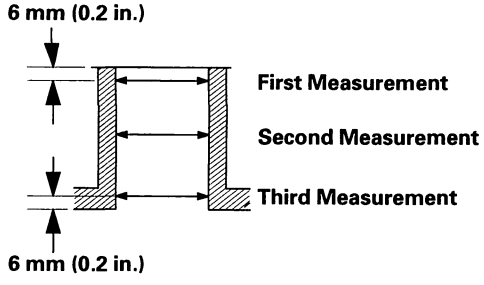
Block and Piston Inspection (cont'd)

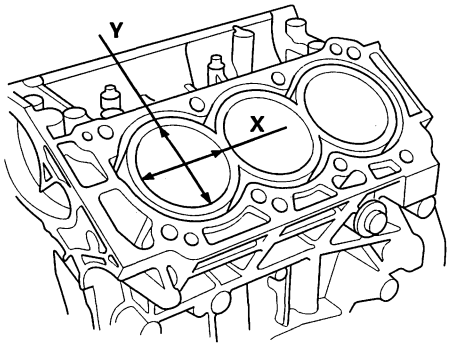
4. Measure wear and taper in direction X and Y at three levels in each cylinder as shown. If measurements in any cylinder are beyond the oversize bore service limit, replace the block. If the block has to be rebored, refer to step 7 after reboring.

Cylinder Bore Size
Standard (New): 86.000—86.015 mm (3.3858—3.3864 in.)
Service Limit: 86.065 mm (3.3884 in.)

Oversize
0.25: 86.250—86.265 mm (3.3957—3.3963 in.)
0.50: 86.500—86.515 mm (3.4055—3.4061 in.)
Reboring Limit: 0.5 mm (0.02 in.)

Bore Taper
Limit: (Difference between first and third measurement) 0.05 mm (0.002 in.)

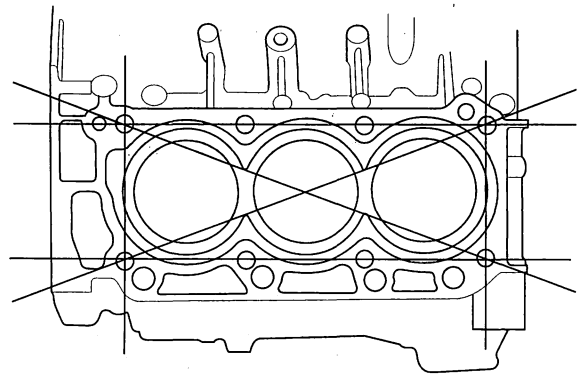


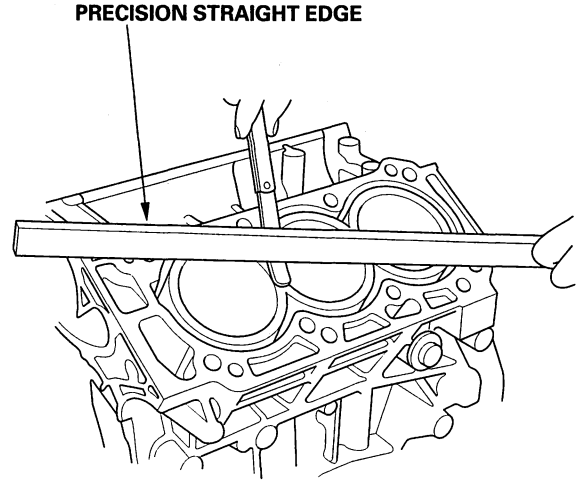


5. Scored or scratched cylinder bores must be honed (see page 7-17).

6. Check the top of the engine block for warpage. Measure along the edges and across the center as shown.

Engine Block Warpage
Standard (New): 0.07 mm (0.003 in.) max.
Service Limit: 0.10 mm (0.004 in.)





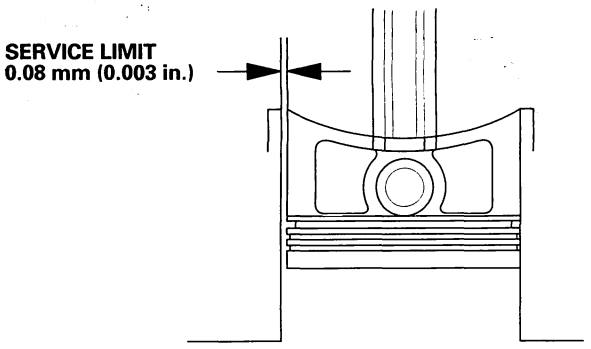
BACK

Protected by AR

Cylinder Bore Honing

7. Calculate the difference between cylinder bore diameter and piston diameter. If the clearance is near or exceeds the service limit, inspect the piston and engine block for excessive wear.

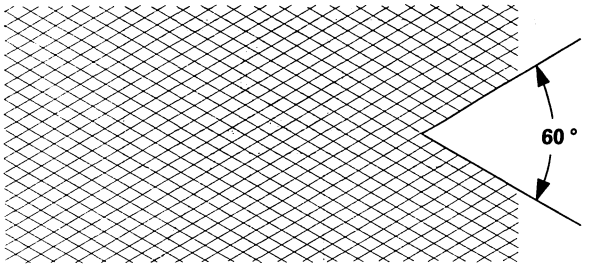
Piston-to-Cylinder Bore Clearance
Standard (New): 0.015—0.040 mm (0.0006—0.0016 in.)
Service Limit: 0.08 mm (0.003 in.)



1. Measure the cylinder bores (see step 4 on page 7-16). If the engine block is to be reused, hone the cylinders and remeasure the bores. Only scored or scratched cylinder bores must be honed.

2. Hone the cylinder bores with honing oil and a fine (400 grit) stone in a 60 degree crosshatch pattern.

   NOTE:
   - Use only a rigid hone with 400 grit or finer stone, such as Sunnen, Ammco, or equivalent.
   - Do not use stones that are worn or broken.



3. When honing is complete, thoroughly clean the engine block of all metal particles. Wash the cylinder bores with hot soapy water, then dry and oil them immediately to prevent rusting. Never use solvent, it will only redistribute the grit on the cylinder walls.

4. If scoring or scratches are still present in the cylinder bores after honing to the service limit, rebore the engine block. Some light vertical scoring and scratching is acceptable if it is not deep enough to catch your fingernail and does not run the full length of the bore.

Protected by AR

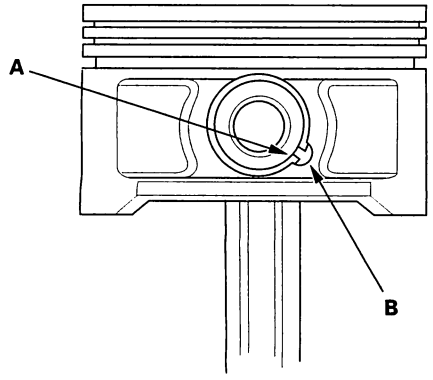
Piston, Pin, and Connecting Rod Replacement

Disassembly

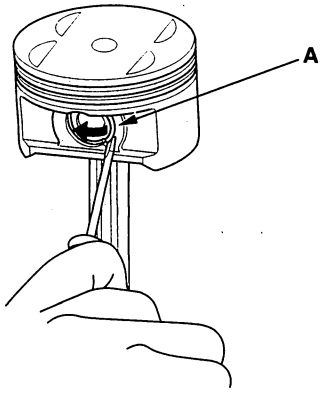
1. Remove the piston from the engine block (see page 7-11).

2. Apply new engine oil to the piston pin snap rings (A) and turn them in the ring grooves until the end gaps are lined up with the cutouts in the piston pin bores (B).

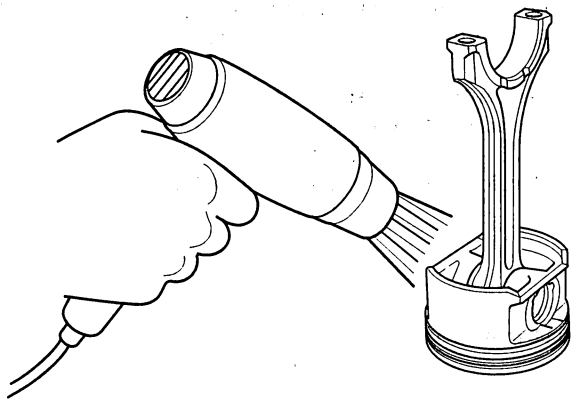
   NOTE: Take care not to damage the ring grooves.



3. Remove snap rings (A) from both sides of the piston. Start at the cutout in the piston pin bore. Remove the snap rings carefully so they do not go flying or get lost. Wear eye protection.



4. Heat the piston and connecting rod assembly to about 158 °F (70 °C), then remove the piston pin.



BACK

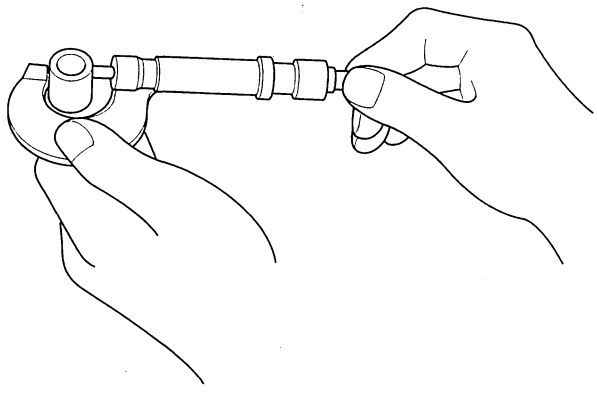
Protected by AR

Inspection

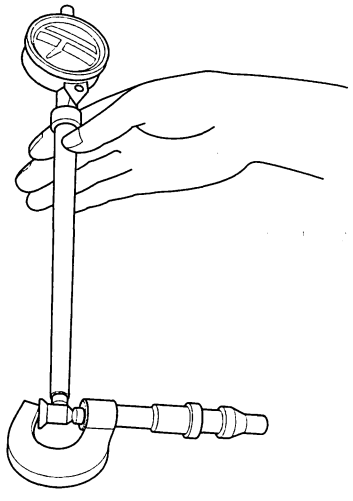
NOTE: Inspect the piston, piston pin, and connecting rod when they are at room temperature.

1. Measure the diameter of the piston pin.

Piston Pin Diameter
Standard (New): 21.962—21.965 mm (0.8646—0.8648 in.)
Service Limit: 21.954 mm (0.8643 in.)

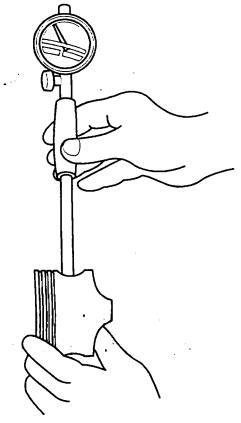


2. Zero the dial indicator to the piston pin diameter.



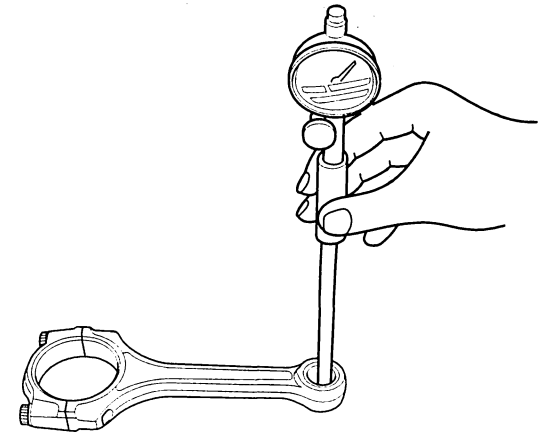
3. Check the difference between the piston pin diameter and piston pin hole diameter on the piston.

Piston Pin-to-Piston Clearance
Standard (New): −0.0050 to +0.0010 mm (−0.00020 to +0.00004 in.)
Service Limit: 0.004 mm (0.0002 in.)



4. Measure the piston pin-to-connecting rod clearance.

Piston Pin-to-Connecting Rod Clearance
Standard (New): 0.005—0.014 mm (0.0002—0.0006 in.)
Service Limit: 0.019 mm (0.0007 in.)



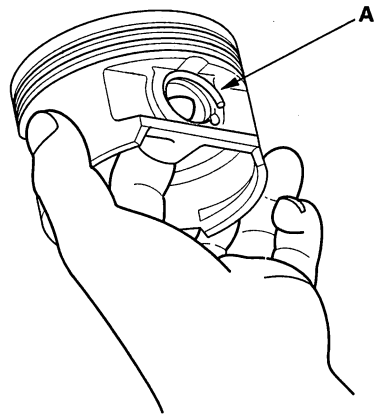
(cont'd)

Protected by AR

Piston, Pin, and Connecting Rod Replacement (cont'd)

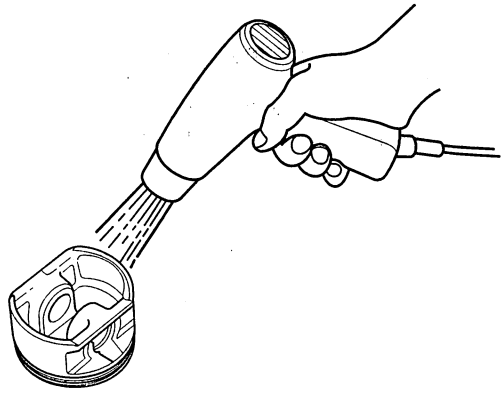
Reassembly

1. Install a piston pin snap ring (A).

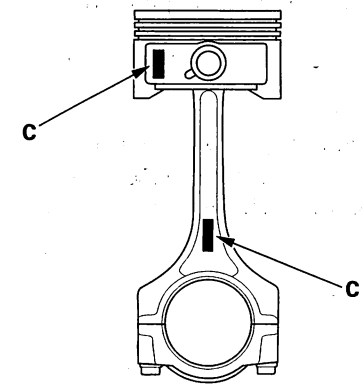


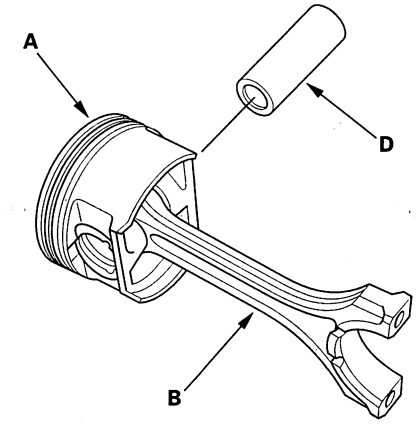
2. Coat the piston pin bore in the piston, the bore in the connecting rod, and the piston pin with new engine oil.

3. Heat the piston to about 158 °F (70 °C).



4. Assemble the piston (A) and connecting rod (B) with the embossed marks (C) on the same side. Install the piston pin (D).





5. Install the remaining snap ring.

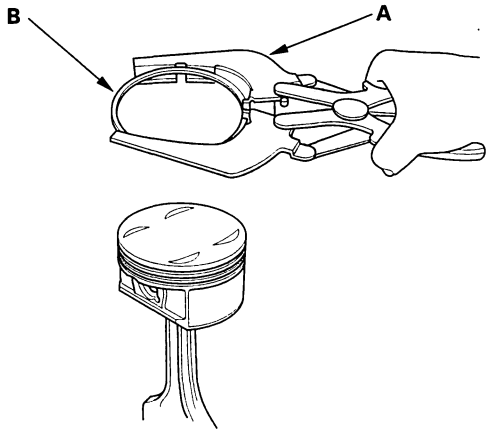
BACK

Protected by AR

Piston Ring Replacement

1. Remove the piston from the engine block (see page 7-11).

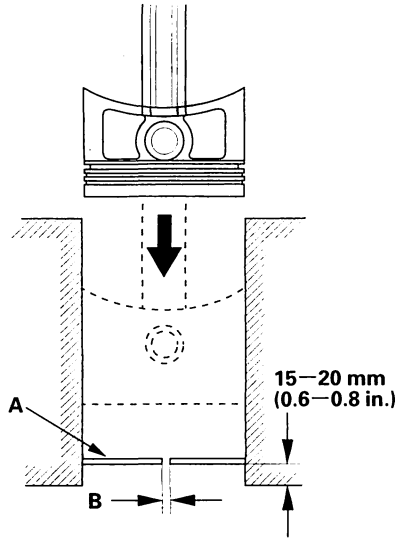
2. Using a ring expander (A), remove the old piston rings (B).



3. Clean all the ring grooves thoroughly with a squared-off broken ring, or a ring groove cleaner with a blade to fit the piston grooves. File down the blade, if necessary.
   The top ring and second ring grooves are 1.2 mm (0.05 in.) wide, and the oil ring groove is 2.8 mm (0.11 in.) wide.
   Do not use a wire brush to clean the ring grooves, or cut the ring grooves deeper with the cleaning tool.

   NOTE: If the piston is to be separated from the connecting rod, do not install new rings yet.

4. Using a piston, push a new ring (A) into the cylinder bore 15—20 mm (0.6—0.8 in.) from the bottom.



5. Measure the piston ring end-gap (B) with a feeler gauge:

   - If the gap is too small, check to see *if you have* the proper rings for your engine.
   - If the gap is too large, recheck the cylinder bore diameter against the wear limits (see step 4 on page 7-16). If the bore is over the service limit, the engine block must be rebored.

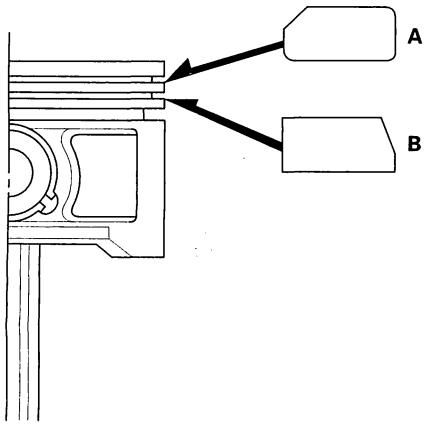
Piston Ring End-Gap
Top Ring:
Standard (New): 0.20—0.35 mm (0.008—0.014 in.)
Service Limit: 0.60 mm (0.024 in.)
Second Ring:
Standard (New): 0.40—0.55 mm (0.016—0.022 in.)
Service Limit: 0.70 mm (0.028 in.)
Oil Ring:
Standard (New): 0.20—0.70 mm (0.008—0.028 in.)
Service Limit: 0.80 mm (0.031 in.)

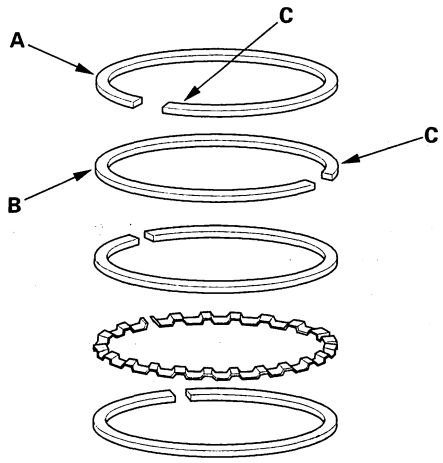
(cont'd)

Protected by AR

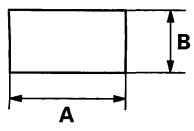
Piston Ring Replacement (cont'd)

6. Install the rings as shown. The top ring (A) has a 1A mark and the second ring (B) has a 2B mark. The manufacturing marks (C) must be facing upward.





Piston Ring Dimensions:



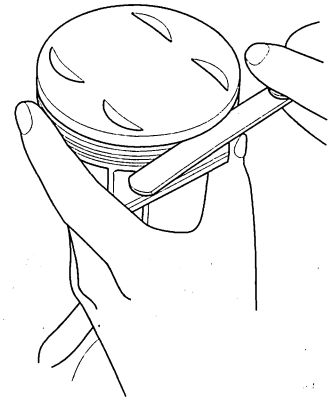
Top Ring (Standard)
A: 3.1 mm (0.12 in.)
B: 1.2 mm (0.05 in.)

Second Ring (Standard)
A: 3.4 mm (0.13 in.)
B: 1.2 mm (0.05 in.)

7. After installing a new set of rings, measure the ring-to-groove clearance:

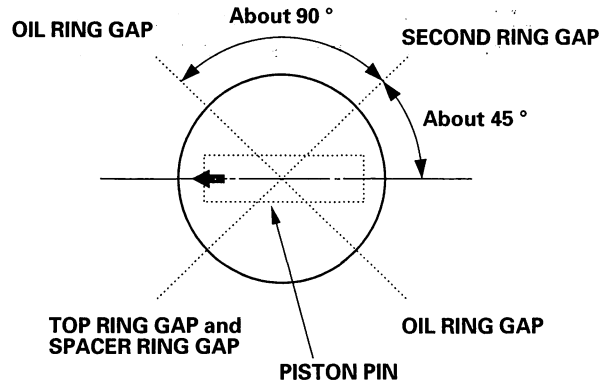
Top Ring Clearance
Standard (New): 0.055—0.080 mm (0.0022—0.0031 in.)
Service Limit: 0.15 mm (0.006 in.)

Second Ring Clearance
Standard (New): 0.030—0.055 mm (0.0012—0.0022 in.)
Service Limit: 0.13 mm (0.005 in.)



8. Rotate the rings in their grooves to make sure they do not bind.

9. Position the ring end gaps as shown:



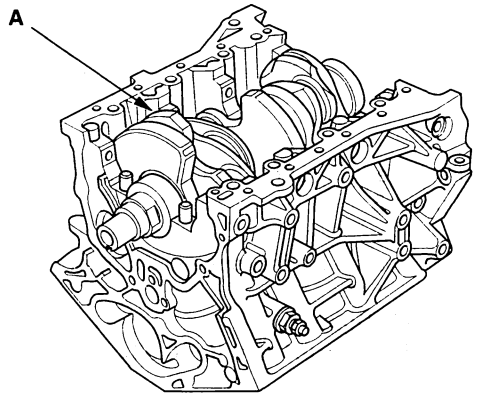
BACK

Protected by AR

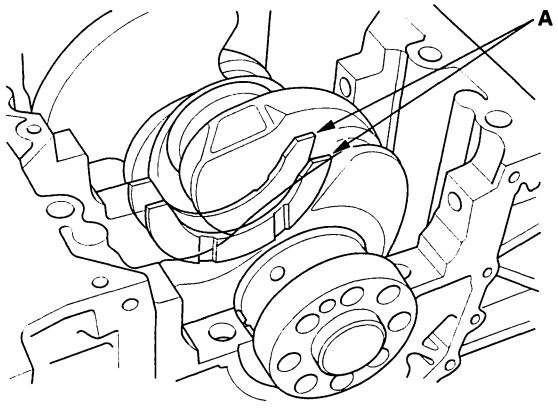
Crankshaft and Piston Installation

Special Tools Required
- Driver 07749-0010000
- Driver attachment, 106 mm 070AD-RCAA200

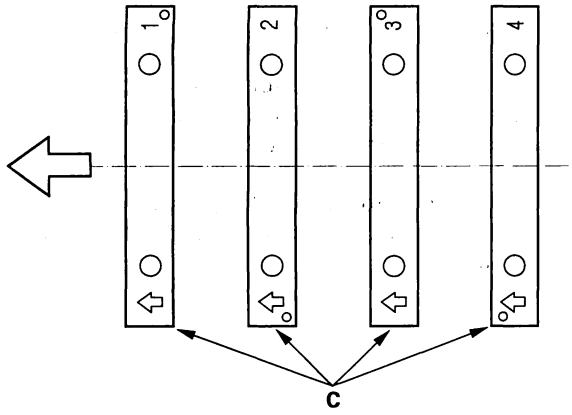
1. Check the connecting rod bearing clearance with plastigage (see page 7-9).
2. Check the main bearing clearance with plastigage (see page 7-7).
3. Install the bearing halves in the engine block and connecting rods.
4. Apply new engine oil to inside of the main bearings and rod bearings.
5. Lower the crankshaft (A) into the engine block.

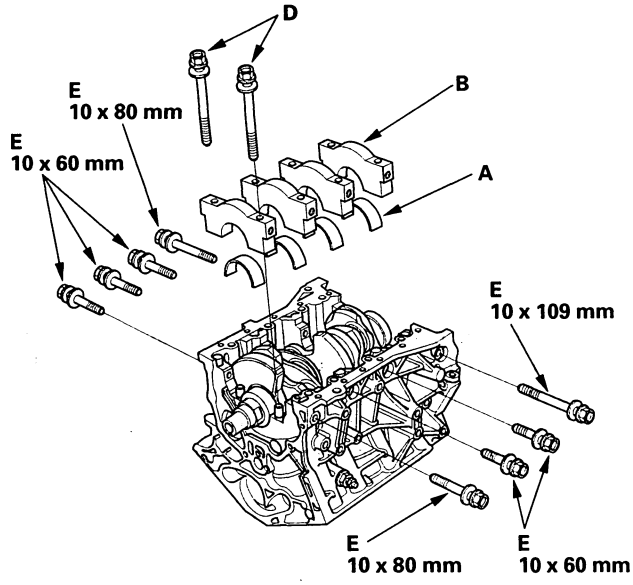


6. Apply new engine oil to the side with the thrust washer groove. Install the thrust washers (A) in the No. 3 journal.



7. Install the bearings (A) and bearing caps (B) with the arrow (C) facing the timing belt end of the engine.





8. Apply new engine oil to the bolt threads and flanges, then loosely install the bearing cap bolts (D) and bearing cap side bolts (E).

(cont'd)

Protected by AR

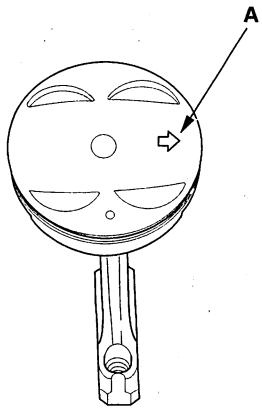
Crankshaft and Piston Installation (cont'd)

9. Set the crankshaft to bottom dead center (BDC) for the cylinder you are installing the piston in.

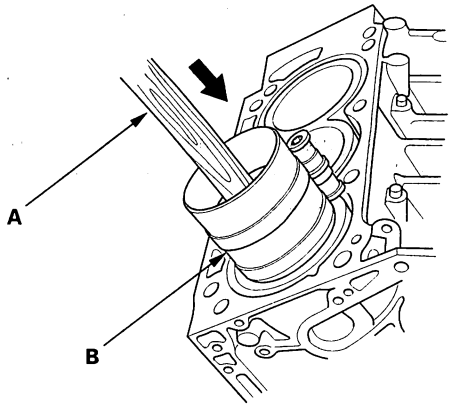
10. Apply new engine oil to the piston, inside of the ring compressor, and the cylinder bore.

11. Attach the ring compressor to the piston/connecting rod assembly, and check that the bearing is securely in place.

12. Position the piston/connecting rod assembly with the arrow (A) facing the timing belt side of the engine.

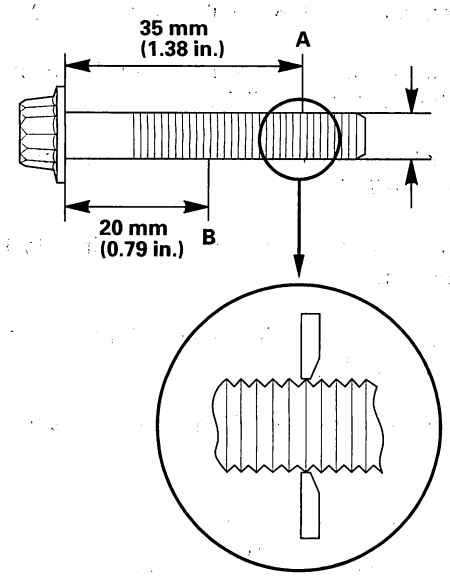


13. Position the piston/connecting rod assembly in the cylinder, and tap it in using the wooden handle of a hammer (A). Maintain downward force on the ring compressor (B) to prevent the rings from expanding before entering the cylinder bore.



14. Stop after the ring compressor pops free, and check the connecting rod-to-crank journal alignment before pushing the piston into place.

15. Measure the diameter of each connecting rod bolt at point A and point B.



16. Calculate the difference in diameter between point A and point B.

Point A—Point B = Difference in Diameter

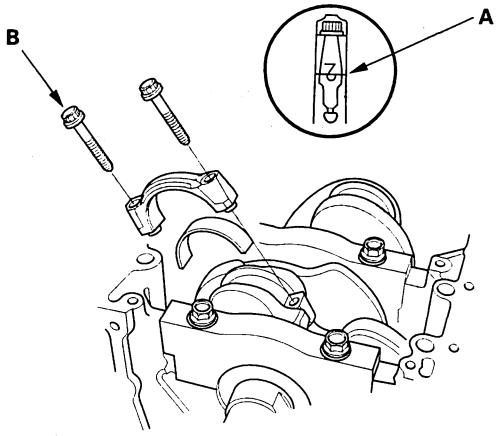
Difference in Diameter
Specification: 0—0.1 mm (0—0.004 in.)

17. If the difference in diameter is out of tolerance, replace the connecting rod bolt.

BACK

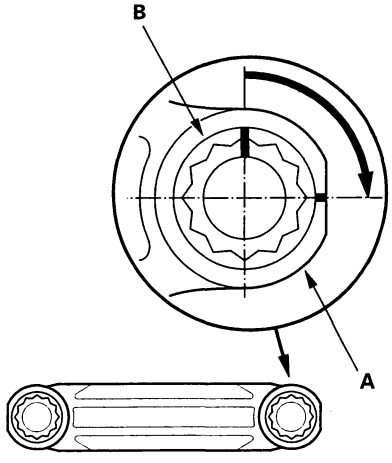
Protected by AR

18. Line up the mark (A) on the connecting rod and cap, then install the cap.



19. Apply new engine oil to the bolt threads and flanges. Torque the bolts (B) to 20 N·m (2.0 kgf·m, 14 lbf·ft).

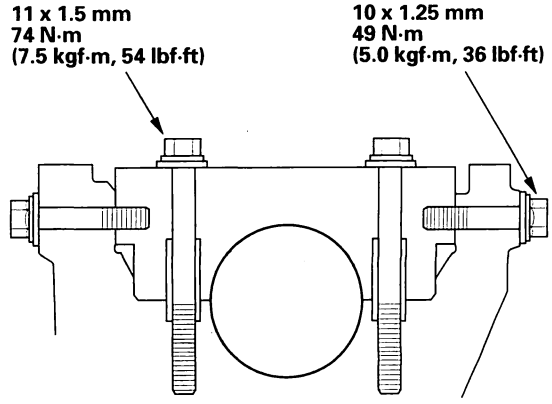
20. Mark the connecting rod (A) and bolt head (B) as shown.

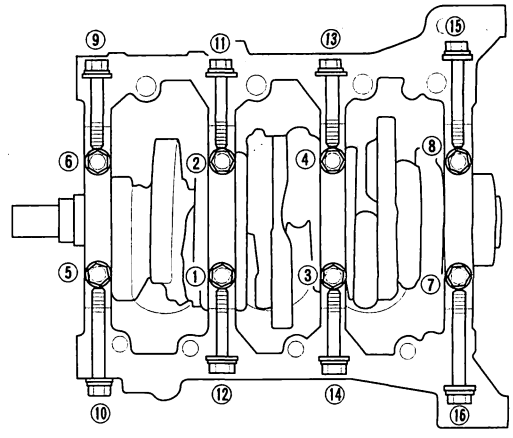


21. Tighten the bolt until the mark on the bolt head lines up with the mark on the connecting rod (turn the bolt 90 °).

NOTE: Remove the connecting rod bolt if you tightened it beyond the specified angle, and go back to step 15 of the procedure. Do not loosen it back to the specified angle.

22. Tighten the bearing cap bolts, and then the bearing cap side bolts to the specified torque in the sequence as shown. Repeat the torque sequence again to measure the bolts are properly torqued.





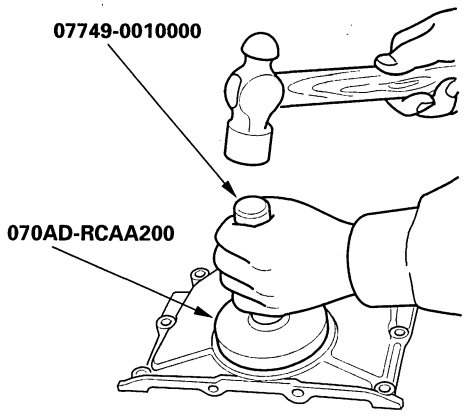
(cont'd)

Protected by AR

Crankshaft and Piston Installation (cont'd)

23. Apply a light coat of multipurpose grease to the crankshaft and to the lip of the seal.

24. Drive the new crankshaft oil seal until the driver attachment bottoms on the engine block end cover.

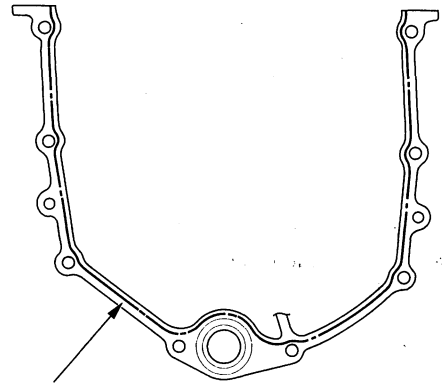


25. Remove all of the old liquid gasket from the engine block end cover mating surfaces, bolts, and bolt holes.

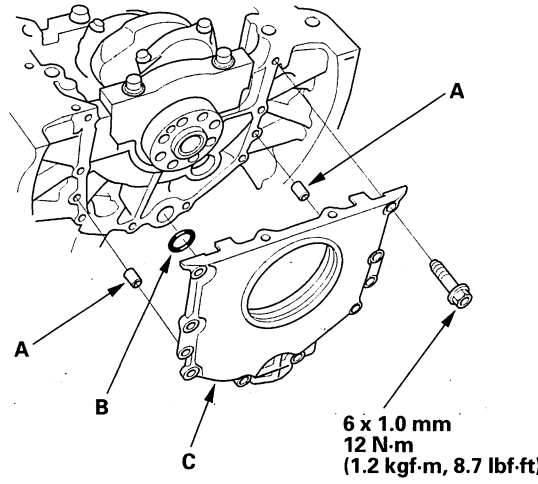
26. Clean and dry the engine block end cover mating surfaces.

27. Apply liquid gasket, P/N 08717-0004, 08718-0001, 08718-0002, 08718-0003, or 08718-0009, evenly to the engine block mating surface of the engine block end cover.

NOTE: Do not install components if too much time has passed after applying the liquid gasket (for P/N 08718-0002, no more than 4 minutes, for all others, no more than 5 minutes). Instead, remove the old residue and reapply the liquid gasket.



28. Install the dowel pins (A), new O-ring (B), and the engine block end cover (C) on the engine block.



29. Clean the excess grease off the crankshaft, and check the seal for distortion.

BACK

Protected by AR

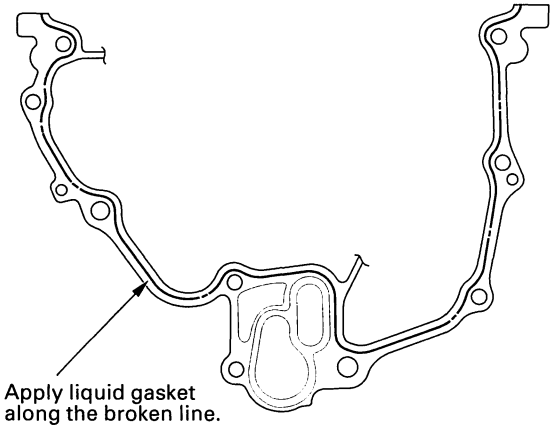
30. Install a new crankshaft oil seal in the oil pump (see step 2 on page 8-12).

31. Remove all of the old liquid gasket from the oil pump mating surfaces, bolts, and bolt holes.

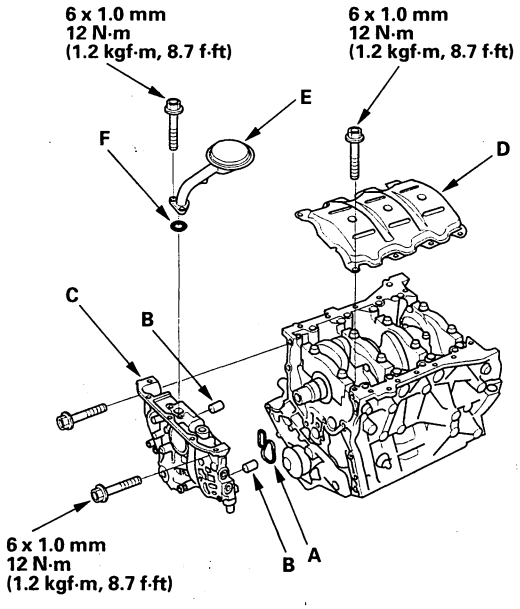
32. Clean and dry the oil pump mating surfaces.

33. Apply liquid gasket, P/N 08717-0004, 08718-0001, 08718-0002, 08718- 0003, or 08718-0009, evenly to the engine block mating surface of the oil pump.

    NOTE: Do not install components if too much time has passed after applying the liquid gasket (for P/N 08718-0002, no more than 4 minutes, for all others, no more than 5 minutes). Instead, remove the old residue and reapply the liquid gasket.



34. Grease the lip of the oil seal, and apply oil to the new O-ring (A).

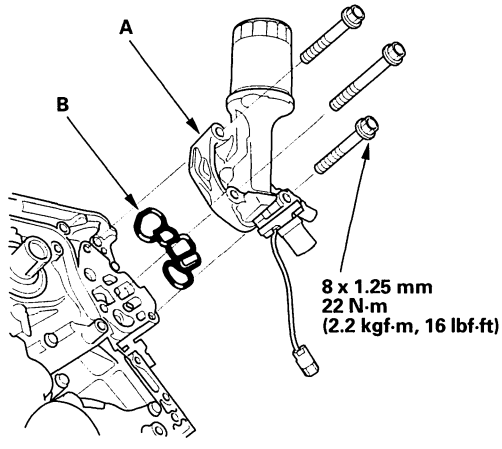


35. Install the dowel pins (B), then align the inner rotor with the crankshaft, and install the oil pump (C).

36. Clean the excess grease off the crankshaft, and check the seal for distortion.

37. Install the baffle plate (D), then install the oil screen (E) with new O-ring (F).

38. Install the rocker arm oil control solenoid (VTEC solenoid valve)/oil filter assembly (A), with a new rocker arm oil control solenoid (VTEC solenoid valve) filter (B).



(cont'd)

Protected by AR

Crankshaft and Piston Installation (cont'd)

39. Install the oil pan (see page 7-29).

40. Install the crankshaft position (CKP) sensor (see page 11-221).

41. Install the cylinder heads (see page 6-50).

42. M/T model: Install the flywheel (see page 12-13), clutch disc (see page 12-11), and pressure plate (see page 12-11).

43. A/T model: Install the drive plate (see page 14-197).

44. Install the transmission:

    - Manual transmission (see page 13-19)
    - Automatic tansmission (see page 14-198)

45. Install the engine assembly (see page 5-11).

    NOTE: When any crankshaft or connecting rod bearing is replaced, after assembly it is necessary to run the engine at idling speed until it reaches normal operating temperature, then continue to run it for about 15 minutes.

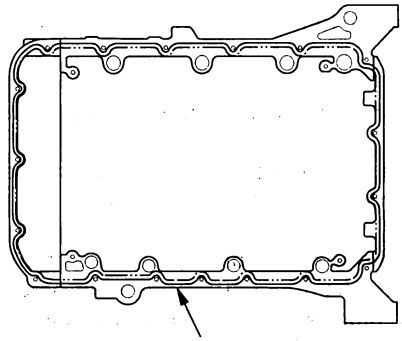
BACK

Protected by AR

Oil Pan Installation

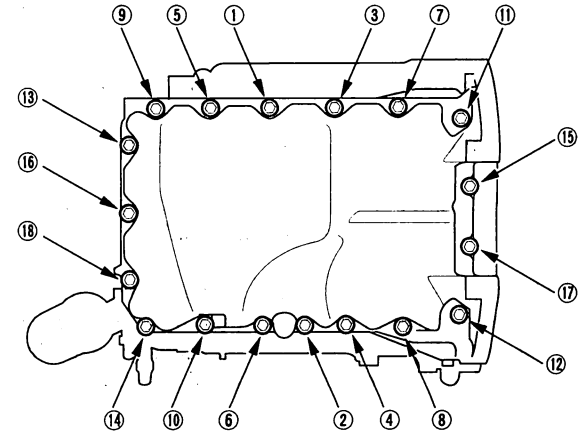
1. Remove all of the old liquid gasket from the oil pan mating surfaces, bolts, and bolt holes.
2. Clean and dry the oil pan mating surfaces.
3. Apply liquid gasket, P/N 08717-0004, 08718-0001, 08718-0002, 08718-0003, or 08718-0009, evenly to the oil pan mating surface of the engine block.

   NOTE: Do not install components if too much time has passed after applying the liquid gasket (for P/N 08718-0002, no more than 4 minutes, for all others, no more than 5 minutes). Instead, remove the old residue and reapply the liquid gasket.

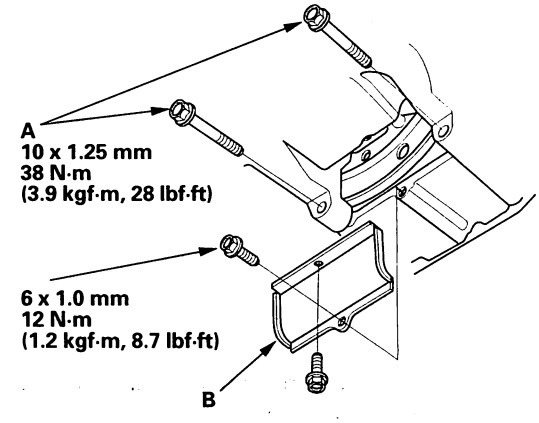


4. Install the oil pan on the engine block.
5. Tighten the bolts in two or three steps. In the final step, tighten all bolts, in sequence, to 12 N·m (1.2 kgf·m, 8.7 lbf·ft).

   NOTE: After assembly, wait at least 30 minutes before filling the engine with oil.



6. Tighten the two bolts (A) securing the transmission, then install the torque converter cover (B).



7. If the engine is still in the vehicle, do the following steps.
8. Install exhaust pipe A using new gaskets and new self-locking nuts (see step 28 on page 5-16).
9. Install the splash shield (see step 34 on page 5-17).
10. Refill the engine with oil (see step 4 on page 8-6).
11. Lower the vehicle on the hoist.

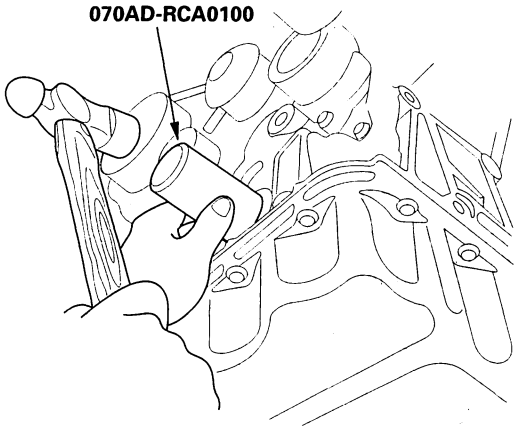
Pulley End Crankshaft Oil Seal Installation - In Car

Special Tools Required
Oil seal driver, 64 mm 070AD-RCA0100

1. Remove the crankshaft position (CKP) sensor, timing belt, and timing belt drive pulley (see page 6-26).
2. Remove the pulley and crankshaft oil seal.
3. Clean and dry the crankshaft oil seal housing.
4. Apply a light coat of multipurpose grease to the crankshaft and to the lip of the seal.
5. Using the seal driver, drive in the crankshaft oil seal until the driver bottoms against the oil pump. When the seal is in place, clean any excess grease off the crankshaft, and check that the oil seal lip is not distorted.

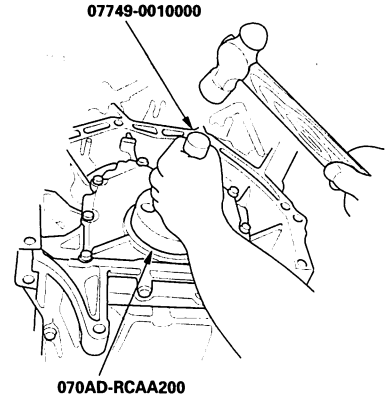


6. Install the timing belt drive pulley, CKP sensor, and timing belt (see page 6-26).

Transmission End Crankshaft Oil Seal Installation - In Car

Special Tools Required
- Driver 07749-0010000
- Driver attachment 106 070AD-RCAA200

1. Remove the transmission:
   - Manual transmission (see page 13-11)
   - Automatic transmission (see page 14-187)
2. M/T model: Removal the pressure plate (see page 12-11), clutch disc (see page 12-11), and flywheel (see page 12-13).
3. A/T model: Removal the drive plate (see page 14-197).
4. Clean and dry the crankshaft oil seal housing.
5. Apply a light coat of multipurpose grease to the crankshaft and to the lip of the seal.
6. Using the special tools, drive in the crankshaft oil seal until the driver attachment bottoms against the engine block end cover. Align the hole in the driver attachment with the pin on the crankshaft.



7. Clean any excess grease off the crankshaft, and check that the oil seal lip is not distorted.
8. M/T model: Install the flywheel (see page 12-13), clutch disc (see page 12-11), and pressure plate (see page 12-11).
9. A/T model: Install the drive plate (see page 14-197).
10. Install the transmission:
    - Manual transmission (see page 13-19)
    - Automatic transmission (see page 14-198)

Symptom Troubleshooting Index

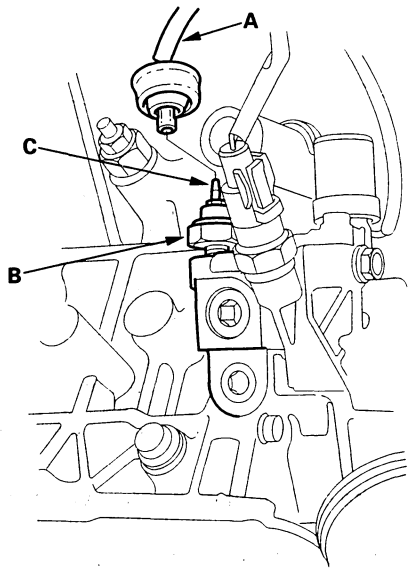
Symptom	Diagnostic procedure	Also check for
Excessive engine oil consumption	1. Check the loose of the engine oil fill cap, oil drain bolt, and oil filter. 2. Check for oil leaks. 3. Check for worn valve guide(s) (see page 6-43) or worn valve stem seal(s) (see page 6-42). 4. Check for damaged or worn piston ring(s) (see page 7-21). 5. Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.) (see page 7-15).	
Low oil pressure indicator does not come on with the ignition switch ON (II)	1. Do the gauge control module self-diagnostic function (see page 22-69). 2. Test the oil pressure switch (see page 8-5).	An open in the wire between the gauge control module and the oil pressure switch
Low oil pressure indicator stays on	1. Check the engine oil level. 2. Do the gauge control module self-diagnostic function (see page 22-69). 3. Test the oil pressure switch (see page 8-5). 4. Check the engine oil pressure (see page 8-6). 5. Check the oil filter for clogging. 6. Check the oil screen for clogging. 7. Check the relief valve. 8. Test the oil pump (see page 8-11).	A wire shorted to ground between the gauge control module and the oil pressure switch

BACK

Protected by AR

Oil Pressure Switch Test

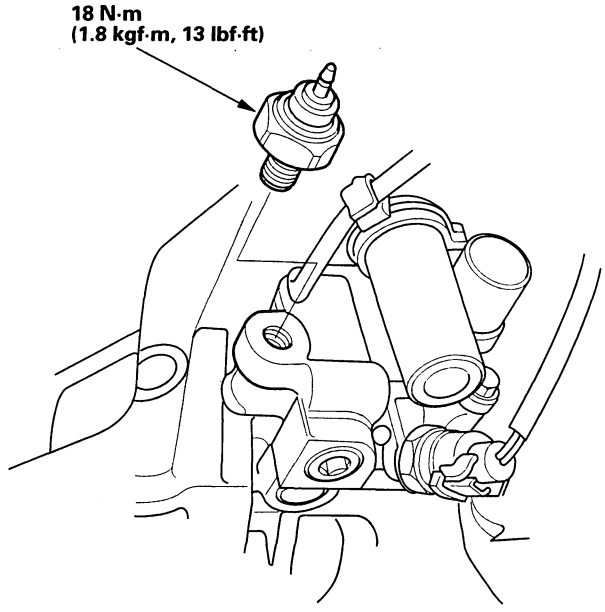
1. Remove the YEL/RED wire (A) from the engine oil pressure switch (B).



2. Check for continuity between the positive terminal (C) and the engine (ground). There should be continuity with the engine stopped. There should be no continuity with the engine running.

Oil Pressure Switch Replacement

1. Disconnect the oil pressure switch connector, then remove the oil pressure switch.



2. Remove all of the old liquid gasket from the switch and switch mounting hole.

3. Apply a very small amount of liquid gasket to the oil pressure switch threads, then install the oil pressure switch.

   NOTE: Using too much liquid gasket may cause liquid gasket to enter the oil passage or the end of the new oil pressure switch.

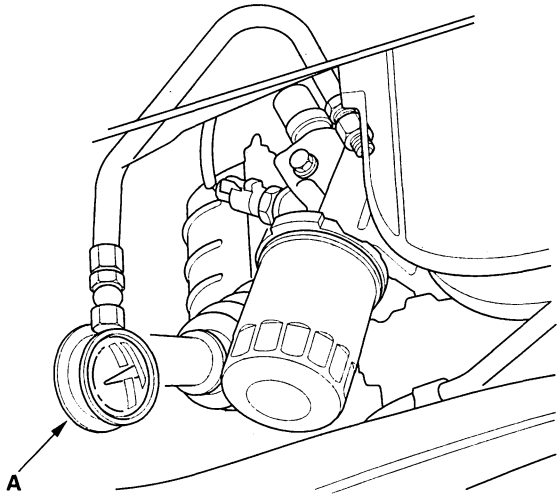
Protected by AR

Engine Lubrication

Oil Pressure Test

If the low oil pressure indicator stays on with the engine running, check the engine oil level. If the oil level is correct:

1. Remove the engine oil pressure switch, then install an oil pressure gauge (A).



2. Start the engine. Shut it off immediately if the gauge registers no oil pressure. Repair the problem before continuing.

3. Allow the engine to reach operating temperature (fan comes on at least twice). The pressure should be:

   Engine Oil Temperature: 176 °F (80 °C)
   Engine Oil Pressure:
   At Idle: 70 kPa (0.7 kgf/cm², 10 psi) min.
   At 3,000 rpm: 490 kPa (5.0 kgf/cm², 71 psi) min.

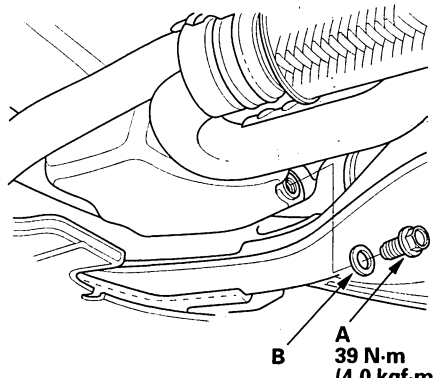
4. If oil pressure is NOT within specifications, inspect these items:

   - Check the oil screen for clogging.
   - Inspect the oil pump (see page 8-11).

Engine Oil Replacement

1. Warm up the engine.

2. Remove the drain bolt (A), and drain the engine oil.



3. Reinstall the drain bolt with a new washer (B).

4. Refill with the recommended oil (see page 3-2).

   Capacity
   At oil change:
   4.0 L (4.2 US qt)
   At oil change including filter:
   4.3 L (4.5 US qt)
   After engine overhaul:
   5.0 L (5.3 US qt)

5. Run the engine for more than 3 minutes, then check for oil leakage.

6. 2006 model: Reset the engine oil life indicator (see page 3-13).

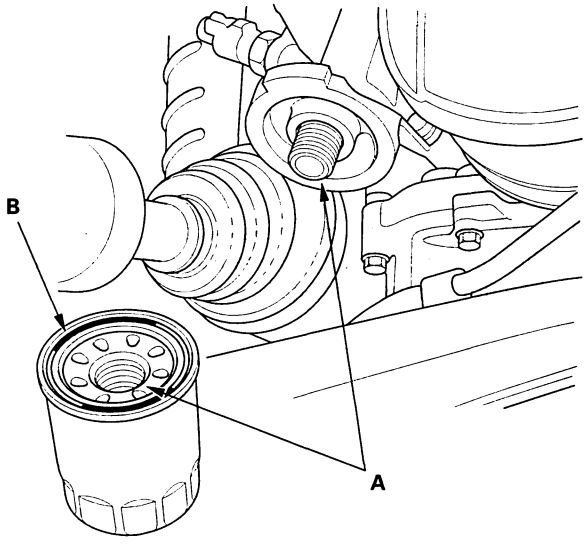
BACK

Protected by AR

Engine Oil Filter Replacement

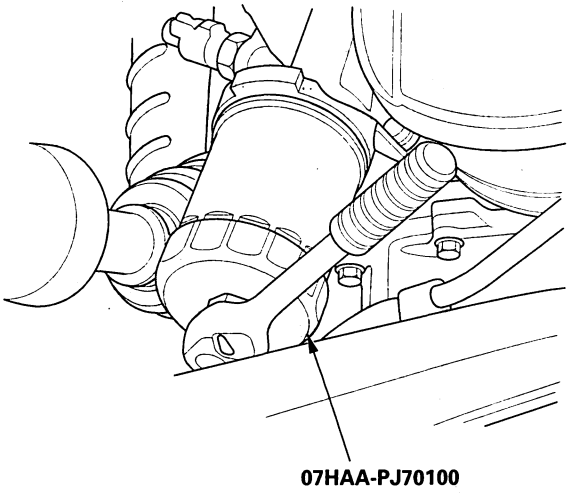
Special Tools Required
Oil filter wrench 07HAA-PJ70100

1. Remove the oil filter with the special tool.
2. Inspect the filter to make sure the rubber seal is not stuck to the oil filter seating surface of the engine.
3. Inspect the threads (A) and rubber seal (B) on the new filter. Clean the seat on the engine block, then apply a light coat of new engine oil to the filter rubber seal. Use only filters with a built-in bypass system.



4. Install the oil filter by hand.
5. After the rubber seal seats, tighten the oil filter clockwise with the special tool.

Tighten: 3/4 turn clockwise
Tightening torque: 12 N·m (1.2 kgf·m, 8.7 lbf·ft)



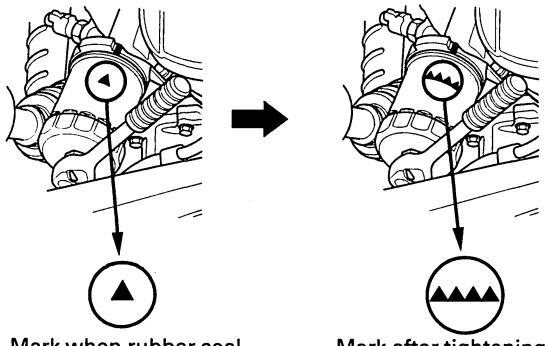
(cont'd)

Protected by AR

Engine Oil Filter Replacement (cont'd)

6. If four numbers or marks (1 to 4 or ▼ to ▼▼▼▼) are printed around the outside of the filter, you can use the following procedure to tighten the filter.

   - Spin the filter on until its seal lightly seats against the block, and note which number or mark is at the bottom.
   - Tighten the filter by turning it clockwise three numbers or marks from the one you noted. For example, if mark ▼ is at the bottom when the seal is lightly seated, tighten the filter until the mark ▼▼▼▼ comes around to the bottom.



Mark when rubber seal is seated.

Mark after tightening.

Number or Mark when rubber seal is seated	1 or ▼	2 or ▼▼	3 or ▼▼▼	4 or ▼▼▼▼
Number or Mark after tightening	4 or ▼▼▼▼	1 or ▼	2 or ▼▼	3 or ▼▼▼

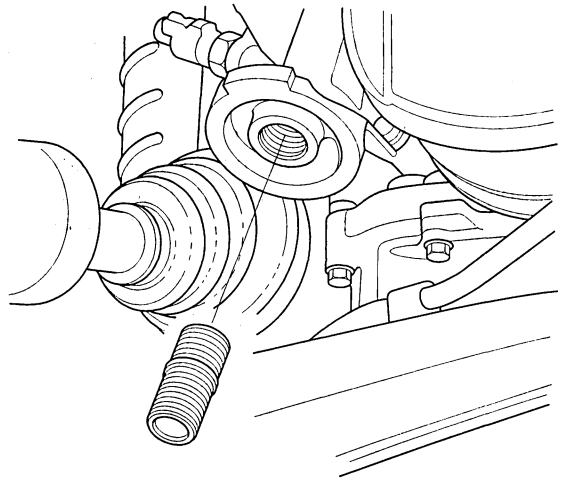
7. After installation, fill the engine with oil up to the specified level, run the engine for more than 3 minutes, then check for oil leakage.

8. 2006 model: Reset the engine oil life indicator (see page 3-13).

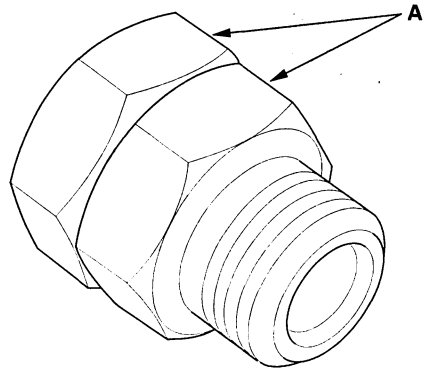
Oil Filter Feed Pipe Replacement

1. Remove the filter (see page 8-7).

2. Remove the oil filter feed pipe.



3. Install two 20 x 1.5 mm nuts (A) onto the new oil filter feed pipe, and hold one nut with a wrench, then tighten the other nut.



4. Tighten the oil filter feed pipe to 49 N·m (5.0 kgf·m, 36 lbf·ft), then remove the nuts from the oil filter feed pipe.

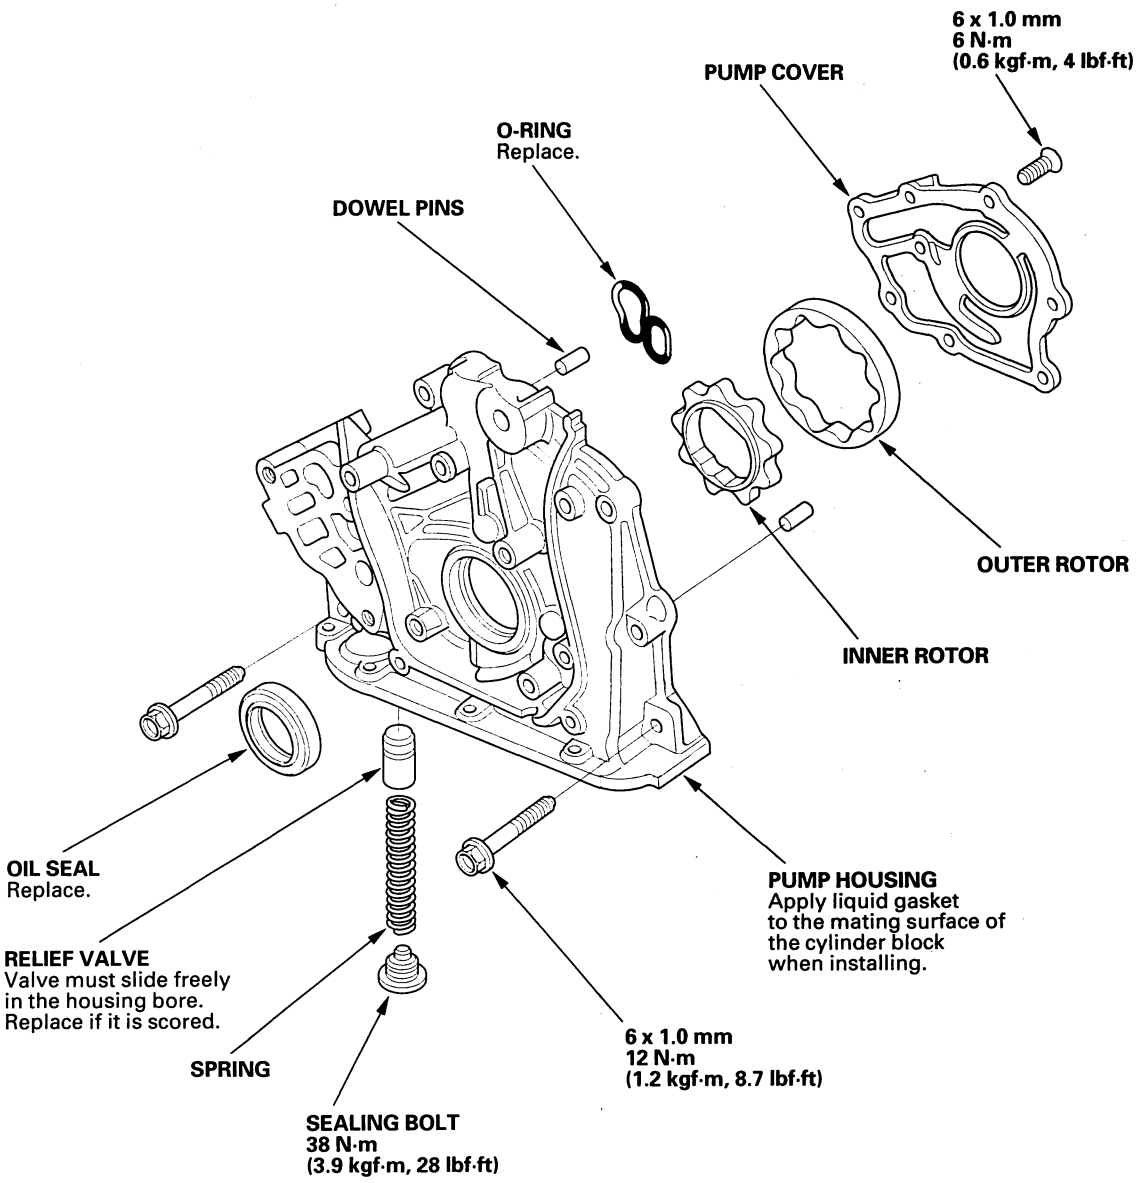
Oil Pump Overhaul

Exploded View



(cont'd)

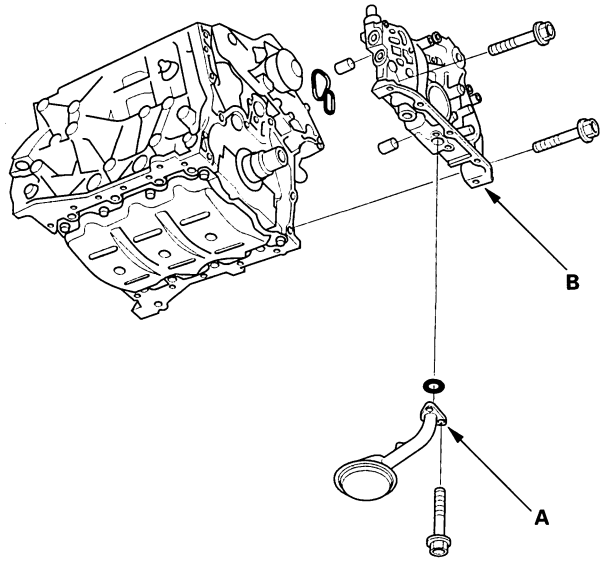
Protected by AR

Oil Pump Overhaul (cont'd)

Special Tools Required
- Oil seal driver, 64 mm 070AD-RCA0100
- Engine support hanger, A and Reds AAR-T-12566 (available through Honda Tool and Equipment program, 888-424-6857)
- Engine hanger balance bar VSB02C000019

Removal

1. Drain the engine oil (see page 8-6).
2. Remove the bulkhead cover:
   - 2-door, refer to the 2003-2006 Accord Service Manual (see page 20-197)
   - 4-door, refer to the 2003-2006 Accord Service Manual (see page 20-197)
3. Remove the windshield wiper arms, then remove the cowl cover, refer to the 2003-2006 Accord Service Manual (see page 20-193).
4. Remove the connector bracket from the front cylinder head; use the bracket bolt hole to attach engine balancer bar front arm (see step 49 on page 5-7).
5. Remove the harness clamp bracket from the rear cylinder head; use the bracket bolt hole to attach engine balancer bar rear arm (see step 50 on page 5-7).
6. Lift and support the engine with engine hanger and engine balancer bar. Attach the front arm to the front cylinder head with a spacer and the connector bracket bolt (10 x 1.25 mm). Attach the rear arm to the rear cylinder head with the harness clamp bracket bolt (8 x 1.25 mm), refer to the 2003-2006 Accord Service Manual (see step 51 on page 5-9).
7. Remove the timing belt (see page 6-16).
8. Remove the crankshaft position (CKP) sensor (see page 11-220).
9. Remove the rocker arm oil control solenoid (VTEC solenoid valve) and oil filter assembly (see page 11-289).
10. Remove the oil pan (see page 7-29).
11. Remove the oil screen (A), then remove the oil pump (B).



BACK

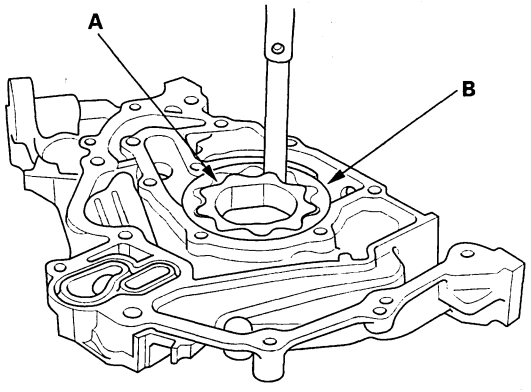
Protected by AR

Inspection

1. Remove the screws from the pump housing, then separate the housing and cover.

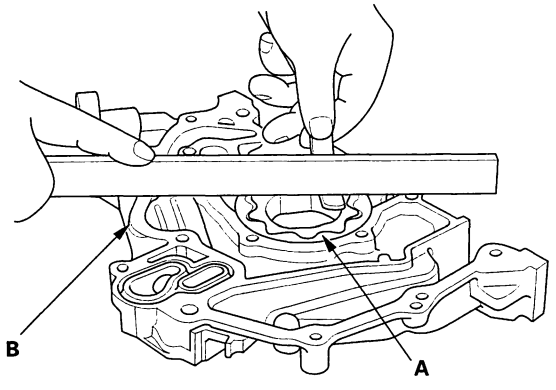
2. Check the inner-to-outer rotor radial clearance between the inner rotor (A) and outer rotor (B). If the inner-to-outer rotor clearance exceeds the service limit, replace the oil pump assembly.

Inner Rotor-to-Outer Rotor Radial Clearance
Standard (New): 0.04—0.16 mm (0.002—0.006 in.)
Service Limit: 0.20 mm (0.008 in.)



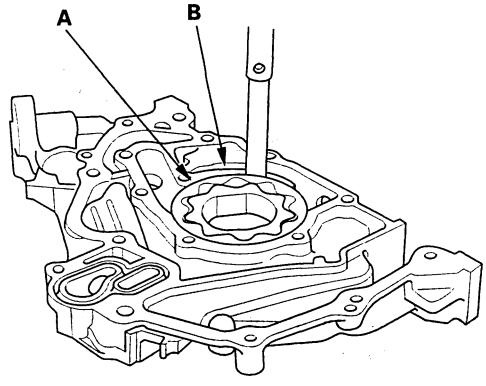
3. Check the housing-to-rotor axial clearance between the rotors (A) and pump housing (B). If the housing-to-rotor axial clearance exceeds the service limit, replace the oil pump assembly.

Housing-to-Rotor Axial Clearance
Standard (New): 0.02—0.07 mm (0.001—0.003 in.)
Service Limit: 0.12 mm (0.005 in.)



4. Check the housing-to-outer rotor radial clearance between the outer rotor (A) and pump housing (B). If the housing-to-outer rotor radial clearance exceeds the service limit, replace the oil pump assembly.

Housing-to-Outer Rotor Radial Clearance
Standard (New): 0.14—0.19 mm (0.006—0.007 in.)
Service Limit: 0.20 mm (0.008 in.)



5. Inspect both rotors and pump housing for scoring or other damage. Replace the parts, if necessary.

6. Apply liquid thread lock to the pump housing screws, then install the oil pump cover.

7. Check that the oil pump turns freely.

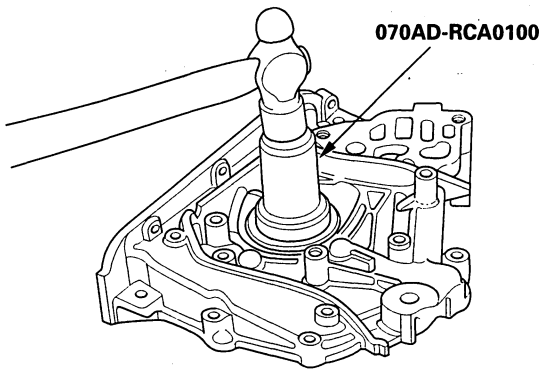
(cont'd)

Protected by AR

Oil Pump Overhaul (cont'd)

Installation

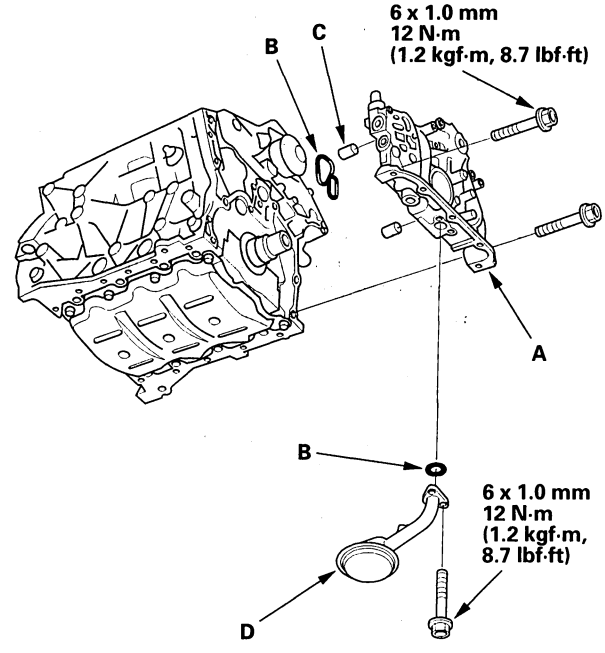
1. Remove the old oil seal from the oil pump.
2. Gently tap in the new oil seal until the special tool bottoms on the pump.



3. Remove all of the old liquid gasket from the oil pump mating surfaces, bolts, and bolt holes.
4. Clean and dry the oil pump mating surfaces.
5. Install the oil pump (A).
   - –1 Apply liquid gasket, P/N 08717-0004, 08718-0001, 08718-0002, 08718-0003, or 08718-0009, evenly to the block mating surface of the oil pump.

     NOTE: Do not install components if too much time has passed after applying the liquid gasket (for P/N 08718-0002, no more than 4 minutes, for all others, no more than 5 minutes). Instead, remove the old residue and reapply the liquid gasket.

   - –2 Grease the lip of the oil seal, and apply oil to the new O-rings (B).
   - –3 Install the dowel pins (C), then align the inner rotor with the crankshaft and install the oil pump.
   - –4 Clean the excess grease off the crankshaft, and check the seal for distortion.



6. Install the oil screen (D).

BACK

Protected by AR

7. Install the oil pan (see page 7-29).
8. Install the rocker arm oil control solenoid (VTEC solenoid valve) and oil filter assembly (see page 11-289).
9. Install the CKP sensor (see page 11-220).
10. Install the idler pulley.
11. Install the timing belt (see page 6-16).
12. Remove the engine balance bar and hanger.
13. Install the connector bracket to the front cylinder head (see step 49 on page 5-19).
14. Install the harness clamp bracket to the rear cylinder head (see step 48 on page 5-19).
15. Install the cowl cover and windshield wiper arms, refer to the 2003-2006 Accord Service Manual (see page 20-199).
16. Install the front bulkhead cover:
    - 2-door, refer to the 2003-2006 Accord Service Manual (see page 20-184)
    - 4-door, refer to the 2003-2006 Accord Service Manual (see page 20-185)
17. Refill the engine with engine oil (see page 8-6).

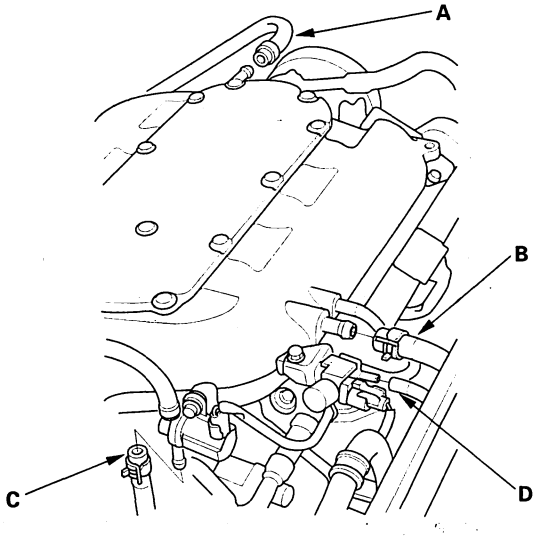
Removal

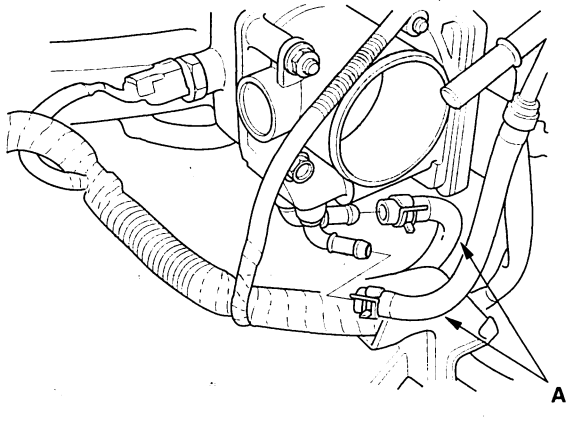
1. Remove the ignition coil cover (see page 4-20).

2. Remove the breather pipe, then remove the air intake duct.

3. Remove the positive crankcase ventilation (PCV) hose (A), brake booster vacuum hose (B), evaporative emission (EVAP) canister hose (C), and vacuum hose (D).



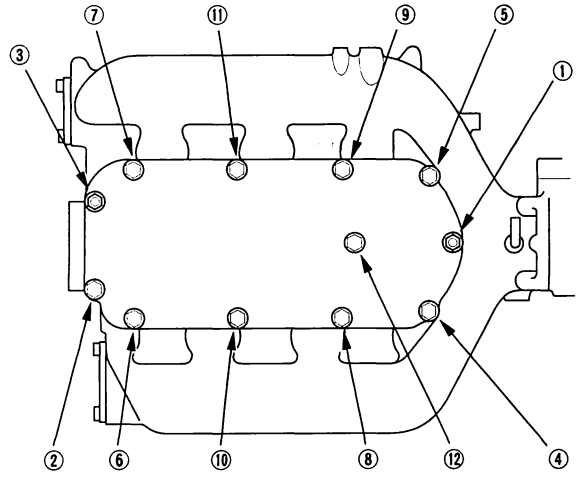
4. Remove the water bypass hoses (A), and plug them.



5. Remove these engine wire harness connectors and wire harness clamps from the intake manifold.

   - Intake air temperature (IAT) sensor connector
   - Throttle actuator connector
   - Manifold absolute pressure (MAP) sensor connector
   - Evaporative emission (EVAP) canister purge valve connector
   - Engine mount control solenoid valve connector
   - Intake manifold tuning (IMT) (Intake manifold runner control (IMRC)) actuator connector (M/T)

6. Remove the upper cover mounting bolts and nuts sequentially in two or three steps, then remove the upper cover.



(cont'd)

BACK

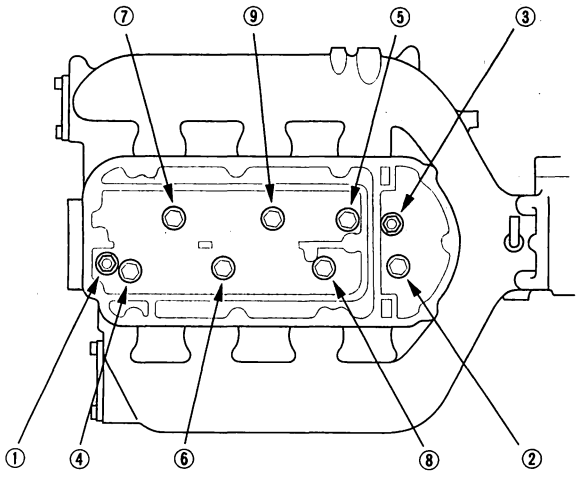
Intake Manifold Removal and Installation (cont'd)

7. Remove the intake manifold mounting bolts and nuts sequentially in two or three steps, then remove the intake manifold and spacer.



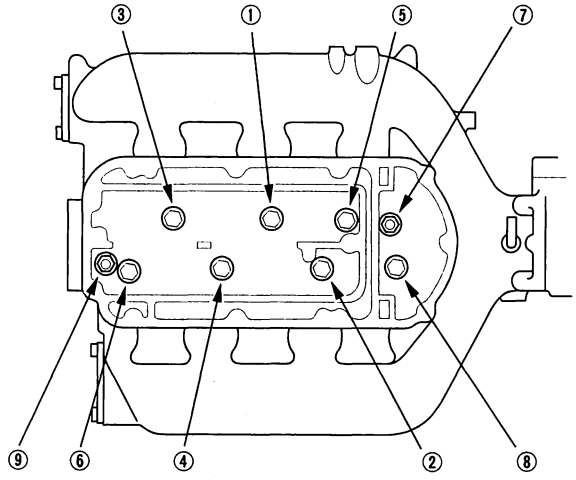
8. Remove the intake manifold.

Installation

1. Put a new gasket and the spacer on the injector base.

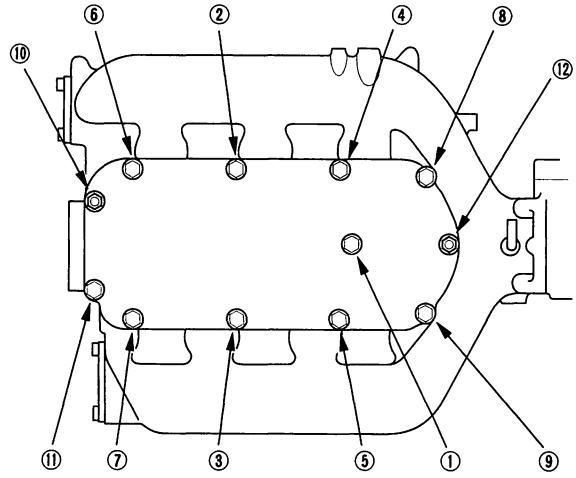
2. Install the intake manifold. Tighten the bolts and nuts sequentially in two or three steps. Always use a new intake manifold gasket.

Specified torque
8 x 1.25 mm: 22 N·m (2.2 kgf·m, 16 lbf·ft)



3. Install the upper cover. Tighten the bolts and nuts sequentially in two or three steps. Always use a new gasket.

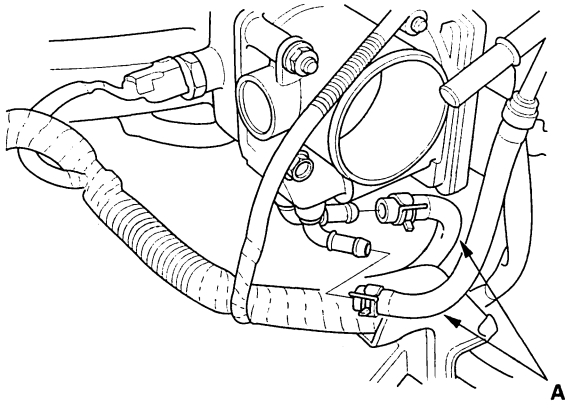
Specified torque
6 x 1.0 mm: 12 N·m (1.2 kgf·m, 8.7 lbf·ft)



BACK

Protected by AR

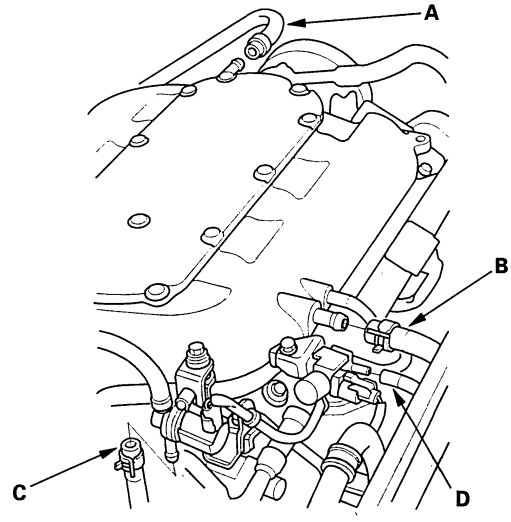
4. Install the water bypass hoses (A).



5. Connect the engine wire harness connectors, and install the wire harness clamps to the intake manifold.

   - Intake air temperature (IAT) sensor connector
   - Throttle actuator connector
   - Manifold absolute pressure (MAP) sensor connector
   - Evaporative emission (EVAP) canister purge valve connector
   - Engine mount control solenoid valve connector
   - Intake manifold tuning (IMT) (Intake manifold runner control (IMRC)) actuator connector (M/T)

6. Install the positive crankcase ventilation (PCV) hose (A), brake booster vacuum hose (B), evaporative emission (EVAP) canister hose (C), and vacuum hose (D).



7. Install the air intake duct, then install the breather pipe.

8. Clean up any spilled engine coolant.

9. After installation, check that all tubes, hoses, and connectors are installed correctly.

10. Install the ignition coil cover (see page 4-20).

11. Refill the radiator with engine coolant, then bleed air from the cooling system with the heater valve open (see step 8 on page 10-7).

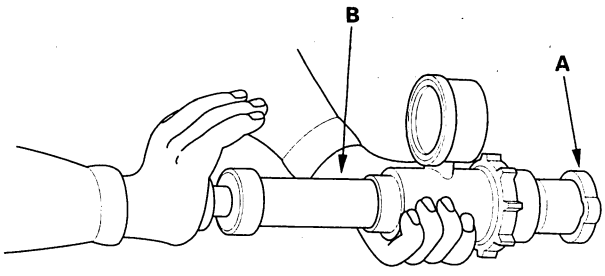
Radiator Cap Test

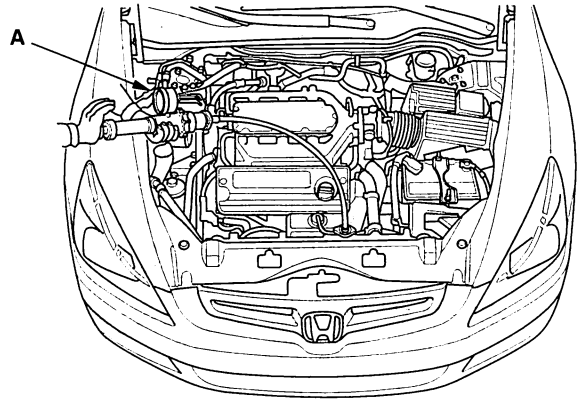
1. Remove the radiator cap (A), wet its seal with engine coolant, then install it on a commercially available pressure tester (B).



2. Apply a pressure of 93—123 kPa (0.95—1.25 kgf/cm², 14—18 psi).
3. Check for a drop in pressure.
4. If the pressure drops, replace the cap.

Radiator Test

1. Wait until the engine is cool, then carefully remove the radiator cap, and fill the radiator with engine coolant to the top of the filler neck.
2. Attach a commercially available pressure tester (A) to the radiator, and apply a pressure of 93—123 kPa (0.95—1.25 kgf/cm², 14—18 psi).

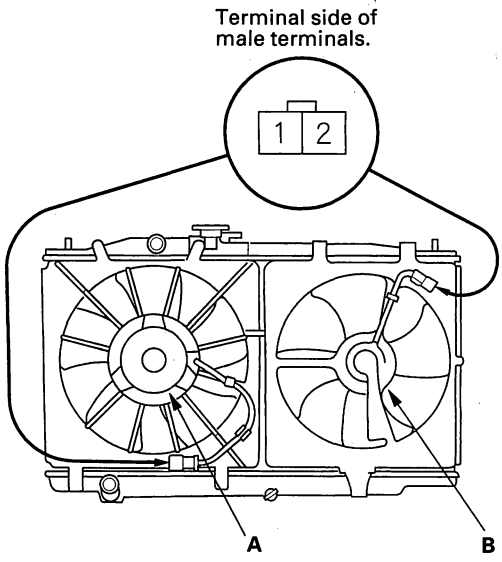


3. Inspect for engine coolant leaks and a drop in pressure.
4. Remove the tester, then reinstall the radiator cap.

Protected by AR

Fan Motor Test

1. Disconnect the 2P connectors from the radiator fan motor (A) and condenser fan motor (B).



2. Test each motor by connecting battery power to the terminal No. 1 and ground to the terminal No. 2.

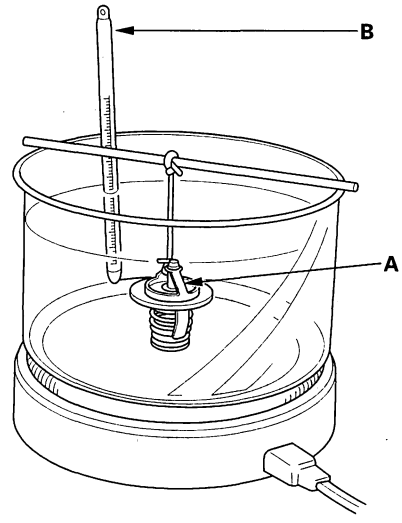
3. If the motor fails to run or does not run smoothly, replace it (see page 10-10).

Thermostat Test

Replace the thermostat if it is open at room temperature.

To test a closed thermostat:

1. Suspend the thermostat (A) in a container of water. Do not let the thermometer (B) touch the bottom of the hot container.



2. Heat the water and check the temperature with a thermometer. Check the temperature at which the thermostat first opens, and at which it is fully open.

3. Measure the lift height of the thermostat when it is fully open.

Standard Thermostat

Lift Height:	**Above 10.0 mm (0.39 in.)**
Starts Opening:	**169—176 °F (76—80 °C)**
Fully Open:	**194 °F (90 °C)**

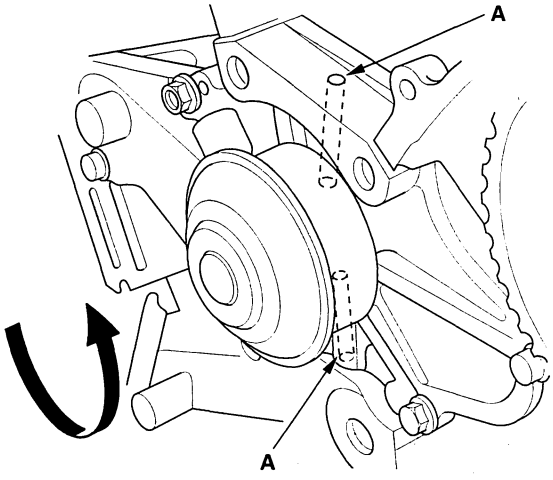
BACK

Protected by AR

Water Pump Inspection

1. Remove the timing belt (see page 6-14).
2. Turn the water pump pulley counterclockwise. Check that it turns freely. If it doesn't turn smoothly, replace the water pump (see page 10-5).

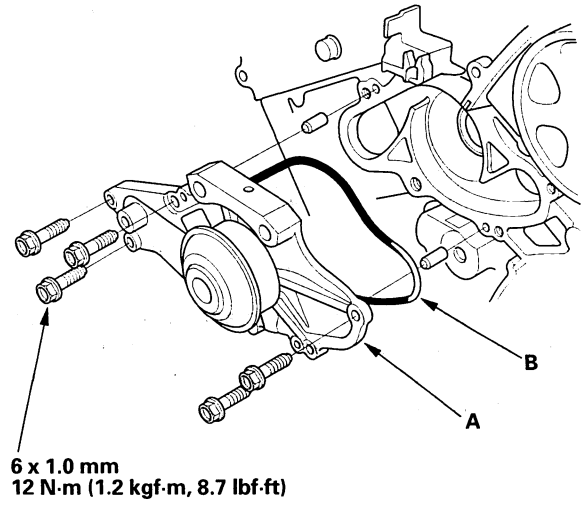
   NOTE: When you check the water pump pulley, you may see a small amount of "weeping" from the bleed holes (A). This is normal.



3. Install the timing belt (see page 6-16).

Water Pump Replacement

1. Drain the engine coolant (see page 10-6).
2. Remove the timing belt (see page 6-14).
3. Remove the timing belt adjuster (see page 6-26).
4. Remove the water pump (A) by removing the five bolts.

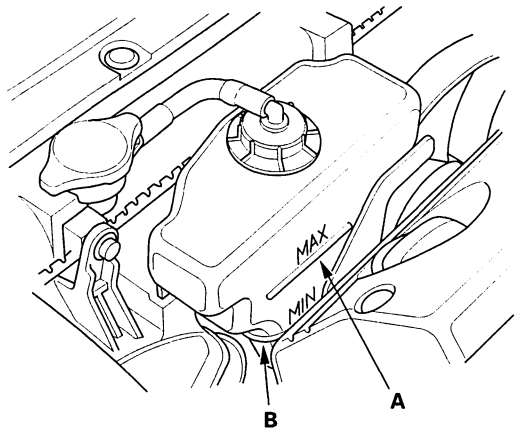


5. Inspect and clean the O-ring groove and the mating surface with the engine block.
6. Install the water pump with a new O-ring (B) in the reverse order of removal.
7. Clean up any spilled engine coolant.
8. Install the timing belt adjuster (see page 6-26).
9. Install the timing belt (see page 6-16).
10. Refill the radiator with engine coolant, then bleed the air from the cooling system (see step 8 on page 10-7).

Protected by AR

Coolant Check

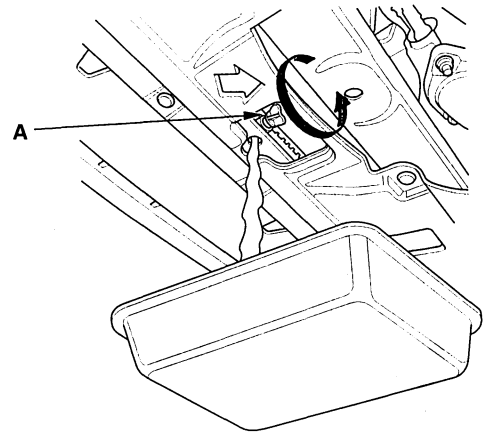
1. Look at the coolant level in the coolant reservoir. Make sure it is between the MAX mark (A) and MIN mark (B).



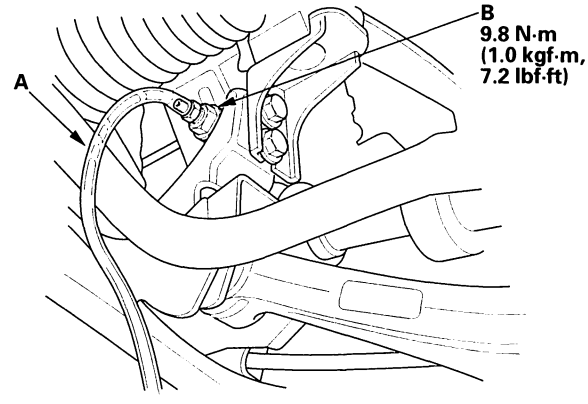
2. If the coolant level in the coolant reservoir is at or below the MIN mark, add coolant to bring it between the MIN and MAX mark, then inspect the cooling system for leaks.

Coolant Replacement

1. Start the engine. Set the heater temperature control dial to maximum heat, then turn off the ignition switch. Make sure the engine and radiator are cool to the touch.
2. Remove the radiator cap.
3. Loosen the drain plug (A), and drain the coolant.



4. Install a rubber hose (A) on the drain bolt (B) located at the rear of the cylinder block, then loosen the drain bolt.



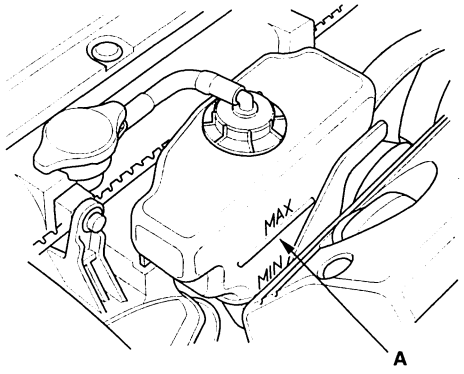
5. When the coolant stops draining, tighten the drain bolt. Remove the rubber hose.
6. Tighten the radiator drain plug securely.

BACK

Protected by AR

7. Remove, drain, and reinstall the reserve tank.

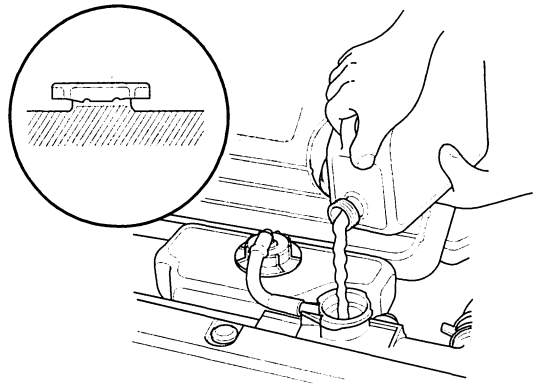
8. Fill the reserve tank to the MAX mark (A) with Honda Long Life Antifreeze/Coolant Type 2 (P/N OL999-9001).



9. Pour Honda Long Life Antifreeze/Coolant Type 2 into the radiator up to the base of the filler neck.

   NOTE:
   - Always use Honda Long Life Antifreeze/Coolant Type 2 (P/N OL999-9001). Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.
   - Honda Long Life Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Do not add water.

   Engine Coolant Refill Capacities (including the reserve tank capacity of 0.6 L (0.16 US gal))
   After Coolant Change:
   M/T: 6.6 L (1.74 US gal)
   A/T: 6.7 L (1.77 US gal)
   After Engine Overhaul:
   M/T: 8.2 L (2.17 US gal)
   A/T: 8.4 L (2.22 US gal)



10. Install the radiator cap loosely.

11. Start the engine and let it run until it warms up (the radiator fan comes on at least twice).

12. Turn off the engine. Check the level in the radiator and add Honda Long Life Antifreeze/Coolant Type 2, if needed.

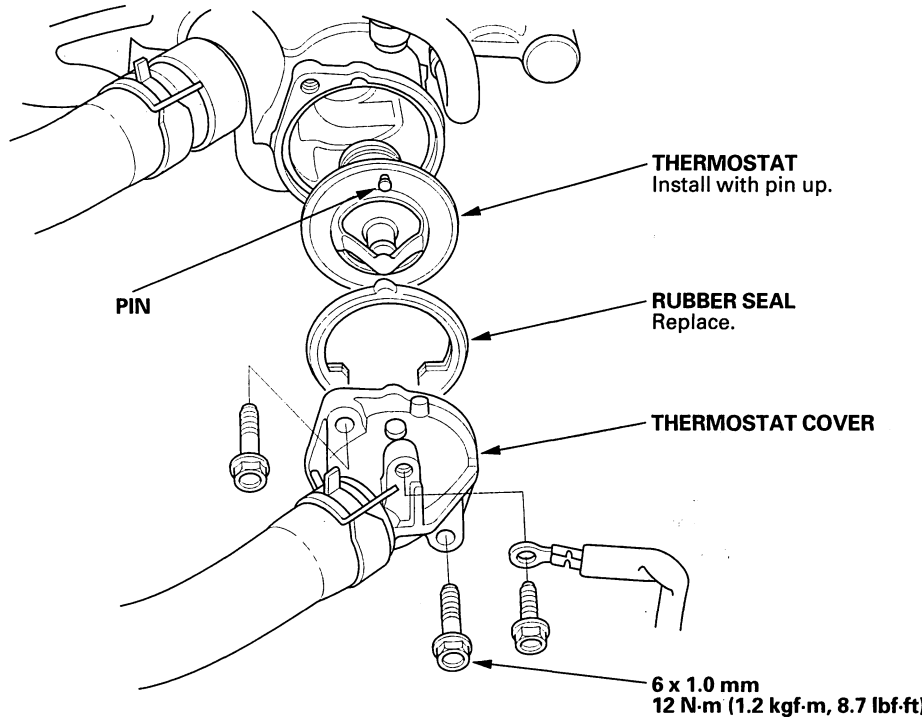
13. Put the radiator cap on tightly, then run the engine again, and check for leaks.

14. Clean up any spilled engine coolant.

Protected by AR

Thermostat Replacement

1. Make sure you have the anti-theft codes for the radio and navigation system, then write down the customer's audio presets. Make sure the ignition switch is OFF.
2. Disconnect the negative cable from the battery first, then the positive cable, then remove the battery.
3. Drain the engine coolant (see page 10-6).
4. Remove the ground cable and thermostat cover, then remove the thermostat.



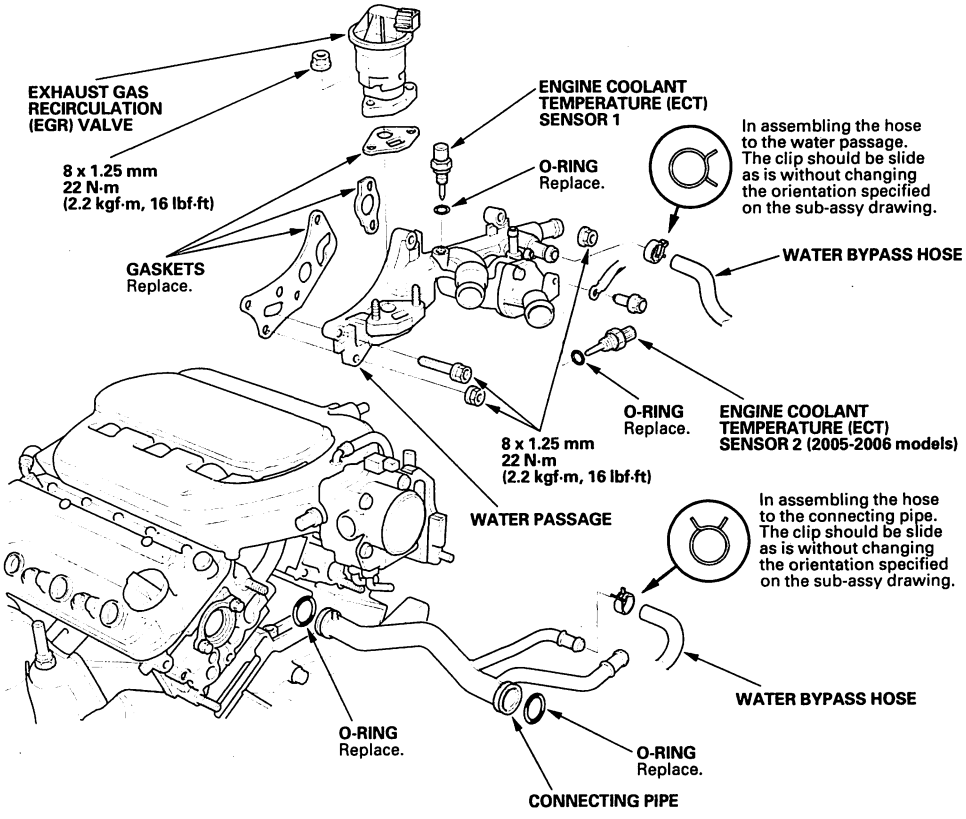
5. Install the thermostat with new rubber seal.
6. Install the battery. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
7. Refill the radiator with engine coolant, then bleed air from the cooling system (see step 8 on page 10-7).
8. Clean up any spilled engine coolant.
9. Enter the anti-theft codes for the radio and the navigation system, then enter the customer's audio presets.
10. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).
11. Set the clock.

BACK

Protected by AR

Water Passage Replacement

1. Make sure you have the anti-theft codes for the radio and navigation system, then write down the customer's audio presets. Make sure the ignition switch is OFF.
2. Disconnect the negative cable from the battery first, then the positive cable. Remove the battery.
3. Drain the engine coolant (see page 10-6).
4. Remove the vacuum hoses, breather pipe, and the intake air duct.
5. Remove the upper radiator hose, lower radiator hose, heater hoses, and water bypass hoses from the water passage. Remove the water passage.

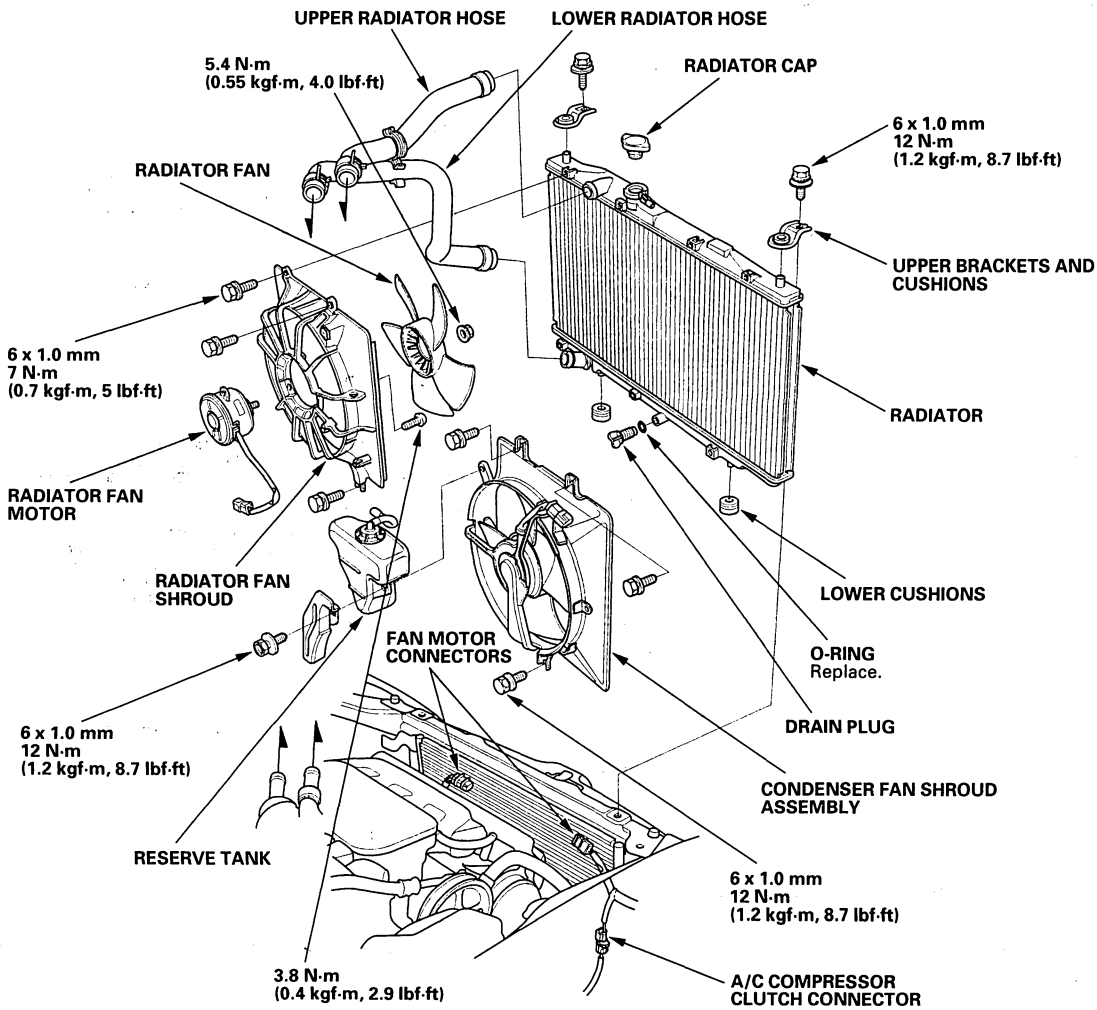


6. Install the water passage in the reverse order of removal.
7. Install the battery. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
8. Refill the radiator with engine coolant, then bleed air from the cooling system (see step 8 on page 10-7).
9. Clean up any spilled engine coolant.
10. Enter the anti-theft codes for the radio and the navigation system, then enter the customer's audio presets.
11. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).
12. Set the clock.

Protected by AR

Radiator and Fan Replacement

1. Drain engine coolant (see page 10-6).
2. Remove the front bulkhead cover:
   - 2-door, refer to the 2003-2006 Accord Service Manual (see page 20-184)
   - 4-door, refer to the 2003-2006 Accord Service Manual (see page 20-185)
3. A/T model: Remove the automatic transmission fluid (ATF) cooler hoses from the radiator (see page 14-232).
4. Remove the upper radiator hose and lower radiator hose from the radiator.



5. Remove the harness clamps and A/C compressor clutch connector.
6. Remove the upper bracket cushions, then pull up the radiator.
7. Disconnect the fan motor connectors, then remove the fan shroud assemblies and other parts from the radiator.
8. Install the radiator in the reverse order of removal. Make sure the upper and lower cushions are set securely.
9. Fill the radiator with engine coolant, then bleed air from the cooling system (see step 8 on page 10-7).

Symptom Troubleshooting Index

Symptom	Diagnostic Procedure	Also check for
Engine overheats	1. Inspect the water pump (see page 10-5). 2. Check the thermostat (see page 10-4). 3. Check for any engine coolant leakage (from gaskets, hoses, O-rings, etc.). 4. Check for dirt, leaves, or insects on radiator and condenser. 5. Check for a damaged or deformed fan shroud. 6. Check for a plugged or deteriorated radiator hoses. 7. Check the radiator cap (see page 10-3). 8. Inspect the fan motors (see page 10-4) or fan relays (see page 22-51). 9. Check for plugged heater core or hoses. 10. Check the coolant level. 11. Check for deteriorated coolant. 12. Check for a damaged cylinder head gasket.	
The radiator fan runs at low speed, but does not run at high speed when the engine coolant temperature is above 206 °F (97 °C)	Radiator fan high speed circuit troubleshooting (see page 10-14).	Cleanliness and tightness of all connectors
With the A/C off and the engine coolant temperature at 206 °F (97 °C) or below, the A/C condenser fan runs at high speed and the radiator fan does not run. When the engine coolant temperature is above 206 °F (97 °C), both fans run at high speed	Remove the fan control relay, and test. • If the relay is faulty, replace it. • If the relay is OK, check for a short in the wire between fan control relay 5P socket terminal No. 1 and condenser fan motor 2P connector terminal No. 1.	Cleanliness and tightness of all connectors
The radiator fan and the A/C condenser fan run at high speed with the ignition switch ON (II), the A/C off, and the engine coolant temperature below 204 °F (95 °C)	Check for a short in the wire between radiator fan relay 4P socket terminal No. 4 and ECM/PCM connector terminal A7.	Cleanliness and tightness of all connectors
Both the radiator fan and the A/C condenser fan run at low speed with the ignition switch ON (II) and the A/C off	Check for a short in the wire between A/C condenser fan relay 4P socket terminal No. 4 and ECM/PCM connector terminal A6.	Cleanliness and tightness of all connectors
Both the radiator fan and the A/C condenser fan do not run at low speed with the A/C on	Radiator and A/C condenser fans low speed circuit troubleshooting (see page 21-22).	Cleanliness and tightness of all connectors
The A/C condenser fan does not run at all. The radiator fan does not run at low speed, but it runs at high speed	A/C condenser fans high speed circuit troubleshooting (see page 21-25).	Cleanliness and tightness of all connectors
Both the radiator fan and the A/C condenser fan do not run at high speed when the engine coolant temperature is above 206 °F (97 °C)	Check for an open in the wire between radiator fan relay 4P socket terminal No. 4 and ECM/PCM connector terminal A7.	Cleanliness and tightness of all connectors

Radiator Fan High Speed Circuit Troubleshooting

1. Check the No. 11 (30 A) fuse in the under-hood fuse/relay box, and the No. 23 (7.5 A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES—Go to step 2.

   NO—Replace the fuse(s) and recheck. ■

2. Remove the radiator fan relay from the under-hood fuse/relay box and test it (see page 22-51).

   Is the relay OK?

   YES—Go to step 3.

   NO—Replace the radiator fan relay. ■

3. Measure the voltage between radiator fan relay 4P socket terminal No. 1 and body ground.

   RADIATOR FAN RELAY 4P SOCKET

   Terminal side of female terminals

   Is there battery voltage?

   YES—Go to step 4.

   NO—Repair an open in the wire between radiator fan relay 4P socket terminal No. 1 and the under-hood fuse/relay box. ■

4. Connect radiator fan relay 4P socket terminals No. 1 and No. 2 with a jumper wire.

   RADIATOR FAN RELAY 4P SOCKET

   Terminal side of female terminals

   Does the radiator fan run at high speed?

   YES—Go to step 5.

   NO—Repair an open in the wire between radiator fan relay 4P socket terminal No. 2 and radiator fan motor 2P connector terminal No. 2. ■

5. Turn the ignition switch ON (II).

6. Measure voltage between radiator fan relay 4P socket terminal No. 3 and body ground.

   RADIATOR FAN RELAY 4P SOCKET

   Terminal side of female terminals

   Is there battery voltage?

   YES—Repair an open in the wire between radiator fan relay 4P socket terminal No. 4 and engine control module (ECM)/ the powertrain control module (PCM) (A3). ■

   NO—Repair an open in the wire between radiator fan relay 4P socket terminal No. 3 and the under-dash fuse/relay box. ■

General Troubleshooting Information

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If the malfunction indicator lamp (MIL) on the dash does not come on, check for poor connections or loose pins at all connectors related to the circuit that you are troubleshooting. If the MIL was on but then went out, the original problem may have been intermittent.

Opens and Shorts

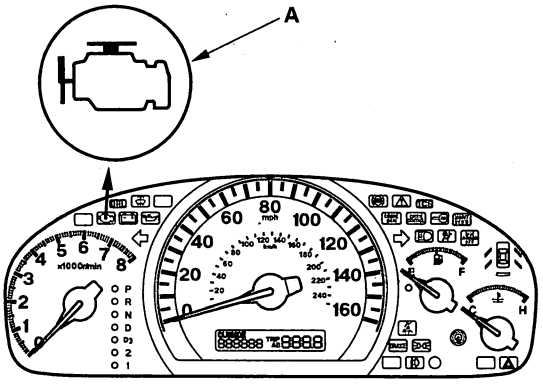
"Open" and "Short" are common electrical terms. An open is a break in a wire or at a connection. A short is an accidental connection of a wire to ground or to another wire. In simple electronics, this usually means something won't work at all. With complex electronics (such as ECMs and PCMs) this can sometimes mean something works, but not the way it's supposed to.

How to Use the HDS (Honda Diagnostic System)

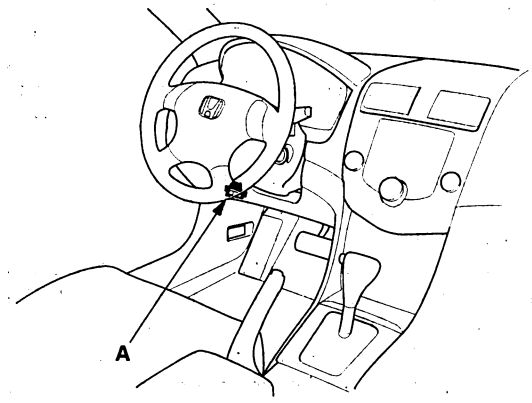
If the MIL (Malfunction Indicator Lamp) has come on

1. Start the engine, and check the MIL (A).

   NOTE: If the ignition switch is turned ON (II), and the engine is not started, the MIL stays on for 15—20 seconds (see page 11-54).



2. If the MIL stays on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.



3. Turn the ignition switch ON (II).

4. Check the diagnostic trouble code (DTC) and note it. Also check the freeze data and/or on board snapshot data, and download any data found. Then refer to the indicated DTC's troubleshooting, and begin the appropriate troubleshooting procedure.

   NOTE:
   - Freeze data indicates the engine conditions when the first malfunction, misfire, or fuel trim malfunction was detected.
   - The HDS can read the DTC, freeze data, current data, and other engine control module (ECM)/ powertrain control module (PCM) data.
   - For specific operations, refer to the user's manual that came with the HDS.

5. If no DTCs are found, go to MIL troubleshooting (see page 11-204).

If the MIL did not stay on

If the MIL did not stay on but there is a driveability problem, do the symptom troubleshooting.

If you can't duplicate the DTC

Some of the troubleshooting requires you to reset the ECM/PCM and try to duplicate the DTC. If the problem is intermittent and you can't duplicate the code, do not continue through the procedure. To do so will only result in confusion and possibly, a needlessly replaced ECM/PCM.

(cont'd)

BACK

Protected by AR

General Troubleshooting Information (cont'd)

HDS Clear Command

The ECM/PCM stores various specific data to correct the system even if there is no electrical power such as when the battery negative terminal or No. 8 FI ECU (ECM/PCM) (15 A) fuse are disconnected. Stored data based on failed parts should be cleared by using the "CLEAR COMMAND" of the HDS, if parts are replaced.

The HDS has three kinds of clear commands to meet this purpose. They are DTC clear, ECM/PCM reset, and CKP pattern clear. DTC clear command erases all stored DTC codes, freeze data, readiness codes, and the on-board snapshot. This must be done with the HDS after reproducing the DTC during troubleshooting.
The ECM/PCM reset command erases all stored DTC codes, freeze data, readiness codes, on-board snapshot, and all specific data to correct the system except CKP pattern. If the CKP pattern data in the ECM/PCM was cleared, you must do the CKP pattern learn procedure.
The CKP pattern clear command erases only CKP pattern data. This command is for repair of a misfire or the CKP sensor.

Scan Tool Clear Command

If you are using a generic scan tool to clear commands, be aware that there is only one setting for clearing the ECM/PCM, and it clears all commands at the same time (CKP pattern learn, idle learn, readiness codes, freeze data, on-board sanpshot, and DTCs). After you clear all commands, you then need to do these procedures, in this order: ECM/PCM idle learn procedure (see page 11-302); CKP pattern learn procedure; Test-drive to set readiness codes to complete (see page 11-54).

DTC Clear

1. Clear the DTC with the HDS while the engine is stopped.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON (II), and wait for 30 seconds.
4. Turn the ignition switch OFF, and disconnect the HDS from the DLC.

ECM/PCM Reset

This command clears stored specific data from each vehicle such as DTCs, freeze data, on-board snapshot, and readiness codes. It does not clear CKP pattern data.

1. Reset the ECM/PCM with the HDS while the engine is stopped.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON (II), and wait for 30 seconds.
4. Turn the ignition switch OFF, and disconnect the HDS from the DLC.
5. Do the ECM/PCM idle learn procedure (see page 11-302).

CKP Pattern Clear/CKP Pattern Learn

NOTE: The ECT needs to be at 176 °F (80 °C) or higher.

1. Clear the CKP pattern while the engine is stopped.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON (II), and wait for 30 seconds.
4. Test-drive the vehicle on a level road: decelerate (with the throttle fully closed) from an engine speed of 2,500 rpm to 1,000 rpm with the A/T in 2 position, or M/T in 1st gear.
5. Stop the vehicle, but keep the engine running.
6. Check PULSER F/B LEARN in the DATA LIST with the HDS. If it is NOT COMPLETED, go to step 4. If it is COMPLETED, go to step 7.

BACK

Protected by AR

7. Test-drive the vehicle on a level road: decelerate (with the throttle fully closed) from an engine speed of 5,000 rpm to 3,000 rpm with the A/T in 2 position, or M/T in 1st gear.
8. Stop the vehicle, but keep the engine running.
9. Check the PULSER F/B LEARN (HIGH RPM) in the DATA LIST with the HDS. If it is NOT COMPLETED, go to step 7. If it is COMPLETED, go to step 10.
10. Turn the ignition switch OFF.
11. Turn the ignition switch ON (II), and wait for 30 seconds. The CKP learning procedure is completed.

How to End a Troubleshooting Session (required after any troubleshooting)

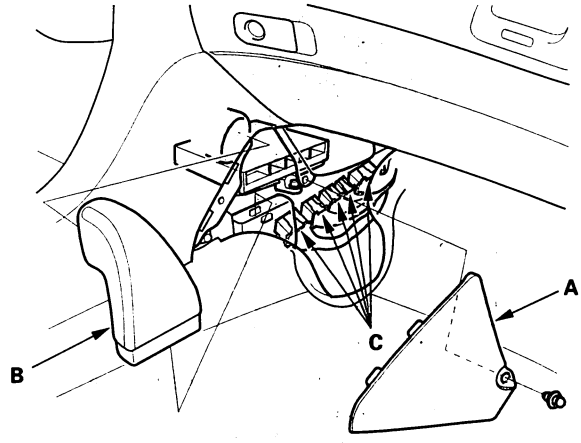
1. Reset the ECM/PCM with the HDS.
2. Do the ECM/PCM idle learn procedure (see page 11-302).
3. Turn the ignition switch OFF.
4. Disconnect the HDS from the DLC.

   NOTE: The ECM/PCM is part of the immobilizer system. If you replace the ECM/PCM, it will have a different immobilizer code. In order for the engine to start, you must rewrite the immobilizer code with the HDS.

How to Remove the ECM/PCM Connectors for Testing

If DTC troubleshooting requires voltage or resistance checks at the ECM/PCM connectors, remove the ECM/PCM connectors and test it:

1. Turn the ignition switch OFF.
2. Jump the SCS line with the HDS.
3. Remove the center lower cover (A).



4. Remove the duct (B).
5. Disconnect ECM/PCM connectors (C).
6. Open the SCS line with the HDS.

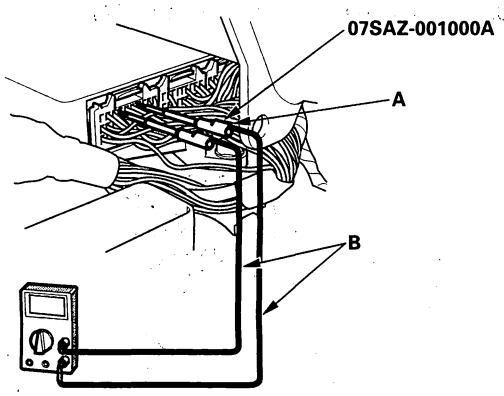
General Troubleshooting Information (cont'd)

How to Troubleshoot Circuits at the ECM/PCM

Special Tools Required
- Digital multimeter KS-AHM-32-003 (1) or a commercially available digital multimeter
- Backprobe set 07SAZ-001000A (2)

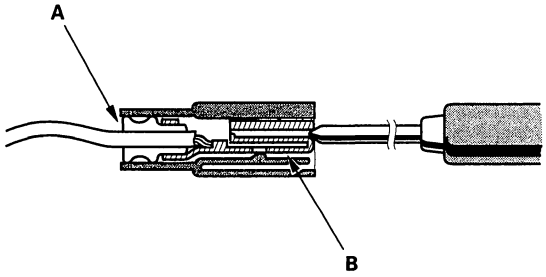
1. Connect the backprobe adapters (A) to the stacking patch cords (B), and connect the cords to a digital multimeter.



2. Using the wire insulation as a guide for the contoured tip of the backprobe adapter, gently slide the tip into the connector from the wire side until it touches the end of the wire terminal.

3. If you cannot get to the wire side of the connector or the wire side is sealed (A), disconnect the connector, and probe the terminals (B) from the terminal side. Do not force the probe into the connector.

NOTICE
Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.



ECM/PCM Updating and Substitution for Testing

Special Tools Required
Honda interface module (HIM) EQS05A35570

Use this procedure when you have to substitute a known-good ECM/PCM in a troubleshooting procedure. Update the ECM/PCM only if the ECM/PCM does not have the latest software loaded.

NOTE: Do not turn the ignition switch OFF while updating the ECM/PCM. If you turn the ignition switch OFF before completion, the ECM/PCM can be damaged.

How to Update the ECM/PCM

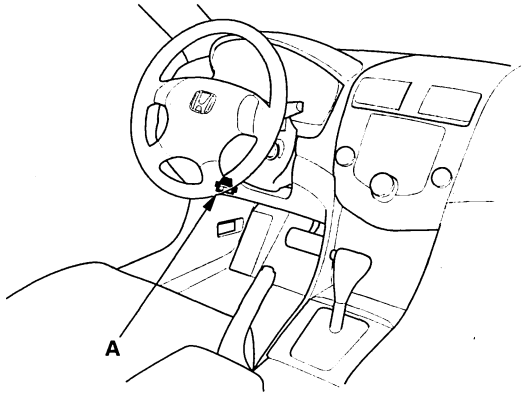
NOTE:
- To ensure the latest program is installed, do an ECM/PCM update whenever the ECM/PCM is substituted or replaced.
- You can not update an ECM/PCM with the program it already has. It will only accept a new program.
- Before you update the ECM/PCM, make sure the vehicle's battery is fully charged.
- To prevent ECM/PCM damage, do not operate anything electrical (audio system, brakes, A/C, power windows, moonroof, door locks, etc.) during the update.
- If you need to diagnose the Honda interface module (HIM) because the HIM's red (#3) light came on or was flashing during the update, leave the ignition switch in the ON (II) position when you disconnect the HIM from the data link connector (DLC). This will prevent ECM/PCM damage.
- High temperature in the engine compartment might cause the ECM/PCM to become too hot to run the update. If the engine has been running before this procedure, open the hood and cool the engine compartment.

1. Turn the ignition switch ON (II). Do not start the engine.

BACK

Protected by AR

2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

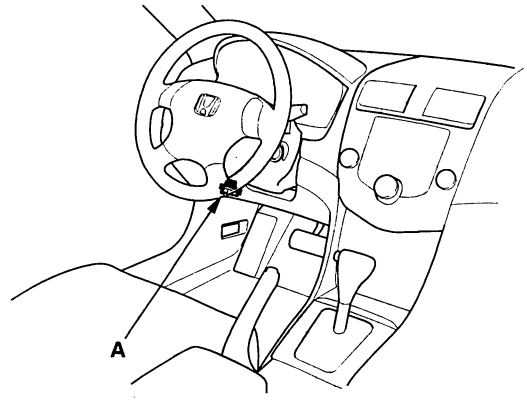


3. Select the INSPECTION MENU with the HDS.
4. Do the TP POSITION CHECK in the ETCS TEST.
5. If the HDS does not have the update function, disconnect the HDS from the vehicle and connect the Honda interface module (HIM).
6. If the software in the ECM/PCM is the latest, disconnect the HDS or the HIM from the DLC, and go back to the procedure that you were doing.
   If the software in the ECM/PCM is not the latest, do the ECM/PCM update procedure as described on the HIM label or in the ECM/PCM update system.

   NOTE: If the ECM/PCM update system requires you to cool the ECM/PCM, follow what is shown in the screen.
7. Do the ECM/PCM idle learn procedure (see page 11-302).
8. Do the CKP pattern clear/pattern learn procedure.

How to Substitute the ECM/PCM

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.



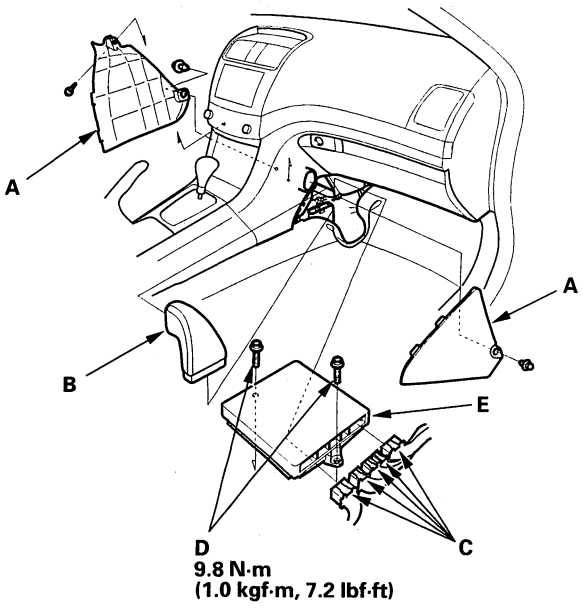
2. Make sure the HDS communicates with the ECM/PCM. If it doesn't, skip steps 3 to 5 and clean the throttle body after this procedure.
3. Turn the ignition switch ON (II).
4. Select the INSPECTION MENU with the HDS.
5. Do the TP POSITION CHECK in the ETCS TEST.
6. Turn the ignition switch OFF.

(cont'd)

Protected by AR

General Troubleshooting Information (cont'd)

7. Jump the SCS line with the HDS.
8. Remove the center lower covers (A).



9. Remove the duct (B).
10. Disconnect ECM/PCM connectors (C).
11. Remove the bolts (D), then remove the ECM/PCM (E).
12. Install a known-good ECM/PCM in the reverse order of removal.
13. Open the SCS with the HDS.
14. Turn the ignition switch ON (II).

NOTE:
2005-2006 models: DTC P0630 "VIN Not Programmed or Mismatch" may be stored because the VIN has not been programmed into the ECM/PCM; ignore it, and continue this procedure.

15. Input the VIN to the ECM/PCM with the HDS.
16. Rewrite the immobilizer code with the ECM/PCM replacement procedure in the HDS; it allows you to start the engine.
17. Reset the ECM/PCM with the HDS.
18. Do the ECM/PCM idle learn procedure (see page 11-302).
19. Do the CKP pattern clear/pattern learn procedure with the HDS.

OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the technician's repair was successfully finished. The results of diagnostic tests for the DTC are displayed as:

- PASSED: On board diagnosis is successfully finished.
- FAILED: On board diagnosis has finished but failed.
- EXECUTING: The vehicle is in enable criteria conditions for the DTC and the on board diagnosis is running.
- NOT COMPLETED: The on board diagnosis was running but is out of the enable conditions for the DTC.
- OUT OF CONDITION: The vehicle has stayed out of the enable conditions for the DTC.

Symptom Troubleshooting Index

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure	Also check for
Engine will not start (MIL works OK, no DTCs set)	1. Test the battery, refer to the 2003-2006 Accord Service Manual (see page 22-78). 2. Test the starter solenoid (see page 4-8). 3. Check the fuel pressure (see page 11-317). 4. Troubleshoot the fuel pump circuit (see page 11-311).	• Low compression • No ignition spark • Intake air leaks • Locked up engine • Broken timing belt • Contaminated fuel
Engine will not start (MIL comes on and stays on, or never comes on at all, no DTCs set)	Troubleshoot the MIL circuit (see page 11-204).	
Engine will not start (immobilizer indicator stays on or flashes)	Troubleshoot the immobilizer system (see page 22-110).	
Engine starts but stalls immediately (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	Troubleshoot the immobilizer system (see page 22-110).	
Engine is hard to start (MIL works OK, no DTCs set)	1. Test the battery, refer to the 2003-2006 Accord Service Manual (see page 22-78). 2. Check the fuel pressure (see page 11-317). 3. Clean the throttle body (see page 11-343).	• Low compression • Intake air leaks • Contaminated fuel • Weak spark
Cold fast idle too low (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure (see page 11-302). 2. Check the idle speed (see page 11-301). 3. Clean the throttle body (see page 11-343).	
Cold fast idle too high (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure (see page 11-302). 2. Check the idle speed (see page 11-301). 3. Inspect/adjust the throttle cable (see page 11-346). 4. Do the throttle position learning check (see page 11-343).	
Idle speed fluctuates (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure (see page 11-302). 2. Check the idle speed (see page 11-301). 3. Inspect/adjust the throttle cable (see page 11-346). 4. Do the carbon accumulation check (see page 11-343).	Intake vacuum leaks
After warming up, idle speed is below specification without load (MIL works OK, no DTCs set)	1. 2003-2004 models: Troubleshoot the alternator FR signal circuit (see page 11-295). 2. 2005-2006 models: Troubleshoot the alternator FR signal circuit (see page 11-297). 3. Do the carbon accumulation check (see page 11-343).

Symptom	Diagnostic procedure	Also check for
After warming up, idle speed is above specification without load (MIL works OK, no DTCs set)	1. Inspect/adjust the throttle cable (see page 11-346). 2. 2003-2004 models: Troubleshoot the alternator FR signal circuit (see page 11-295). 3. 2005-2006 models: Troubleshoot the alternator FR signal circuit (see page 11-297). 4. Inspect the APP sensor (see page 11-277).	
Low power (MIL works OK, no DTCs set)	1. Check the fuel pressure (see page 11-317). 2. Inspect/adjust the throttle cable (see page 11-346).	• Low compression • Incorrect camshaft timing • Incorrect engine oil level
Engine stalls (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure (see page 11-302). 2. Check the fuel pressure (see page 11-317). 3. Check the idle speed (see page 11-301). 4. Troubleshoot the brake pedal position switch signal circuit (see page 11-300).	• Intake air leaks • Faulty harness and sensor connections
Difficult to refuel (MIL works OK, no DTCs set)	1. Check the fuel vent tube between the EVAP canister and the fuel tank. 2. Check the fuel tank vapor recirculation tube between the fuel pipe and the fuel tank. 3. Replace the fuel tank (see page 11-328).	Malfunctioning gas station filling nozzle.
Fuel overflows during refueling (No DTCs set)	Replace the fuel tank (see page 11-328).	Malfunctioning gas station filling nozzle.

System Description

Electronic Control System

The functions of the fuel and emission control systems are managed by the engine control module (ECM) on vehicles with manual transmissions or the powertrain control module (PCM) on vehicles with automatic transmissions.

Self-diagnosis
The ECM/PCM detects a failure of a signal from a sensor or from another control unit and stores a Temporary DTC or a DTC in erasable memory (RAM). Depending on the failure, a DTC is stored in either the first or the second drive cycle. When a DTC is stored, the ECM/PCM turns on the malfunction indicator lamp (MIL) by supplying ground to the MIL circuit.

- **One Drive Cycle Detection Method**
  When an abnormality occurs in the signal from a sensor or from another control unit, the ECM/PCM stores a DTC for the failure in the RAM and turns on the MIL immediately.

- **Two Drive Cycle Detection Method**
  When an abnormality occurs in the signal from a sensor or from another control unit in the first drive cycle, the ECM/PCM stores a Temporary DTC for the failure in RAM. The MIL does not come on at this time. If the failure continues in the second drive cycle, the ECM/PCM stores a DTC in erasable memory and turns on the MIL.

Fail-safe Function
When an abnormality occurs in the signal from a sensor or from another control unit, the ECM/PCM ignores that signal and assumes, pre-programmed value that allows the engine to continue running. This causes a DTC to be stored and the MIL to come on.

MIL Bulb Check and Readiness Code Condition
When the ignition switch is turned ON (II), the ECM/PCM supplies ground to the MIL circuit for about 15 to 20 seconds to check the bulb condition. If any readiness codes are not set to complete, the MIL flashes five times. If all readiness codes are set to complete, the MIL goes off.

Self Shut Down (SSD) Mode
After the ignition switch is turned OFF, the ECM/PCM stays on (up to 15 minutes). If the ECM/PCM connector is disconnected during this time, the ECM/PCM may be damaged. To cancel this mode, disconnect the negative cable from the battery or jump the SCS line with the HDS after the ignition switch is turned OFF.

System Description (cont'd)

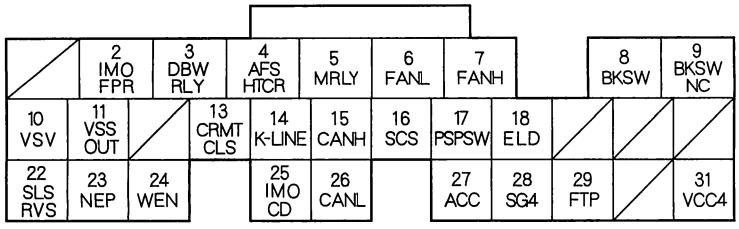
ECM/PCM Inputs and Outputs at Connector A (31P)



Wire side of female terminals

NOTE: Standard battery voltage is 12 V.

Terminal number	Wire color	Terminal name	Description	Signal
2	GRN/YEL	IMOFPR (IMMOBILIZER FUEL PUMP RELAY)	Drives PGM-FI main relay 2 (FUEL PUMP)	0 V for 2 seconds after turning ignition switch ON (II), then battery voltage
3	BRN/YEL	DBWRLY (THROTTLE ACTUATOR CONTROL MODULE (DBW) RELAY)	Drives throttle actuator control module (DBW) relay	With ignition switch ON (II): about 0 V
4	PNK	AFSHTCR (AIR FUEL RATIO (A/F) SENSOR RELAY)	Drives A/F sensor relay	With ignition switch ON (II): about 0 V
5	RED/BLK	MRLY (PGM-FI MAIN RELAY)	Drives PGM-FI main relay 1 (FI MAIN) Power source for DTC memory	With ignition switch ON (II): about 0 V With ignition switch OFF: battery voltage
6	GRN/WHT	FANL (RADIATOR FAN RELAY LOW)	Drives condenser fan relay	With ignition switch ON (II): battery voltage
7	GRN	FANH (RADIATOR FAN RELAY, FAN CONTROL RELAY HIGH)	Drives radiator fan relay, fan control relay	With ignition switch ON (II): battery voltage
8	WHT/BLK	BKSW (BRAKE PEDAL POSITION SWITCH)	Detects brake pedal position switch signal	With brake pedal released: about 0 V With brake pedal pressed: battery voltage
9	BRN/BLK	BKSWNC (BRAKE PEDAL POSITION SWITCH)	Detects brake pedal position switch signal	With ignition switch ON (II) and brake pedal released: battery voltage With ignition switch ON (II) and brake pedal pressed: about 0 V
10	LT GRN/RED	VSV (EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE)	Drives EVAP canister vent shut valve	With ignition switch ON (II): battery voltage
11	BLU/WHT	VSSOUT (VEHICLE SPEED SENSOR OUTPUT SIGNAL)	Sends vehicle speed sensor signal	Depending on vehicle speed: pulses
13*2	LT BLU	CRMTCLS (CLUTCH PEDAL POSITION SWITCH)	Detects clutch pedal position switch signal	With ignition switch ON (II) and clutch pedal released: about 0 V With ignition switch ON (II) and clutch pedal pressed: battery voltage
14	BLU	K-LINE	Sends and receives HDS signal	With ignition switch ON (II) and the HDS disconnected: pulses or battery voltage
15	WHT	CANH (CAN COMMUNICATION SIGNAL HIGH)	Sends communication signal	With ignition switch ON (II): pulses

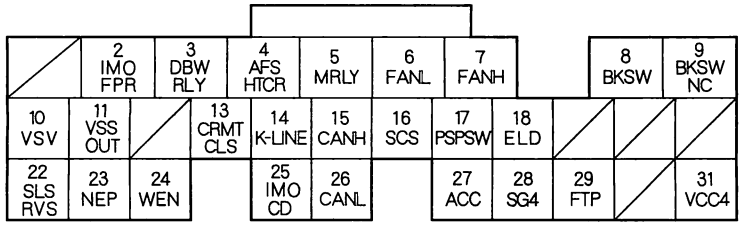
ECM/PCM Inputs and Outputs at Connector A (31P)



Wire side of female terminals

NOTE: Standard battery voltage is 12 V.

Terminal number	Wire color	Terminal name	Description	Signal
16	BRN	SCS (SERVICE CHECK SIGNAL)	Detects service check signal	With the service check signal shorted with the HDS: about 0 V With the service check signal opened: about 5.0 V
17	BLU/YEL	PSPSW (POWER STEERING PRESSURE SWITCH SIGNAL)	Detects PSP switch signal	At idle with steering wheel in straight ahead position: about 0 V At idle with steering wheel at full lock: battery voltage
18	BLU/BLK	ELD (ELECTRICAL LOAD DETECTOR (ELD))	Detects ELD signal	With ignition switch ON (II): about 0.1—4.8 V (depending on electrical load)
22*1	YEL/BLK	SLS (SHIFT LOCK SOLENOID)	Drives shift lock solenoid	With ignition switch ON (II), in Park, brake pedal pressed, and accelerator released: about 0 V
22*2	GRN/WHT	RVS (REVERSE LOCK SOLENOID VALVE)	Drives reverse lock solenoid valve	With vehicle speed below 9 mph (15 km/h): battery voltage With vehicle speed above 13 mph (20 km/h): about 0 V
23	BLU/RED	NEP	Not used	
24	RED/WHT	WEN (WRITE ENABLE SIGNAL)	Detects write enable signal	With ignition switch ON (II): about 0 V
25	RED/BLU	IMOCD (IMMOBILIZER CODE)	Detects immobilizer signal	
26	RED	CANL (CAN COMMUNICATION SIGNAL LOW)	Sends communication signal	With ignition switch ON (II): pulses
27	RED	ACC (A/C CLUTCH RELAY)	Drives A/C clutch relay	With compressor ON: about 0 V With compressor OFF: battery voltage
28	GRN/BLK	SG4 (SENSOR GROUND)	Sensor ground	Less than 1.0 V at all times
29	LT GRN	FTP (FUEL TANK PRESSURE (FTP) SENSOR)	Detects FTP sensor signal	With ignition switch ON (II) and fuel fill cap removed: about 2.5 V
31	YEL/GRN	VCC4 (SENSOR VOLTAGE)	Provides sensor voltage	With ignition switch ON (II): about 5.0 V With ignition switch OFF: about 0 V

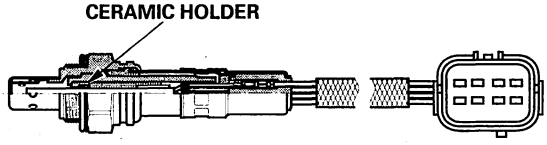
PGM-FI System

The programmed fuel injection (PGM-FI) system is a sequential multiport fuel injection system.

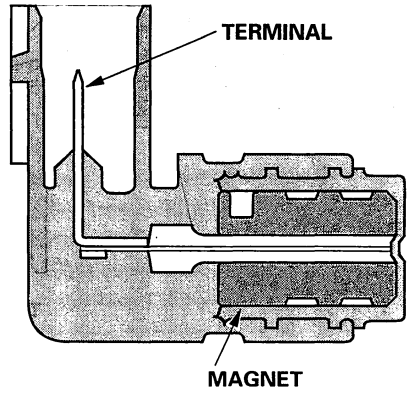
Air Conditioning (A/C) Compressor Clutch Relay
When the ECM receives a demand for cooling from the A/C system, it delays the compressor from being energized and enriches the mixture to assure smooth transition to the A/C mode.

Air Fuel Ratio (A/F) Sensor
The A/F sensor operates over a wide air/fuel range. The A/F sensor is installed upstream of the TWC, and sends signals to the ECM/PCM which varies the duration of fuel injection accordingly.

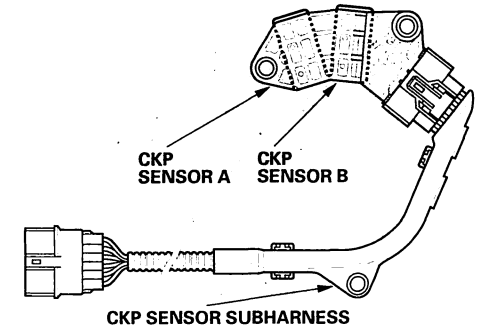


Barometric Pressure (BARO) Sensor
The BARO sensor is inside the ECM/PCM. It converts atmospheric pressure into a voltage signal that is used by the ECM/PCM to modify the basic duration of the fuel injection discharge.

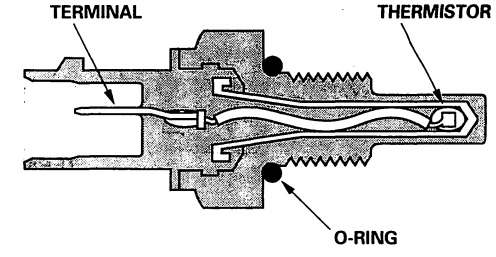
Camshaft Position (CMP) Sensor
The CMP sensor input is used by the ECM/PCM to determines ignition timing at start up (cranking) and when crank angle is abnormal.



Crankshaft Position (CKP) Sensor
This CKP sensor detects crankshaft speed and is used by the ECM/PCM to determine ignition timing and timing for fuel injection of each cylinder as well as detecting engine misfire.



Engine Coolant Temperature (ECT) Sensor (2005-2006 models: Engine Coolant Temperatute (ECT) Sensor 1)
The ECT sensor (2005-2006 models: ECT sensor 1) is a temperature dependent resistor (thermistor). The resistance of the thermistor decreases as the engine coolant temperature increases.



Ignition Timing Control
The ECM/PCM contains the memory for basic ignition timing at various engine speeds and manifold absolute pressure. It also adjusts the timing according to engine coolant temperature.

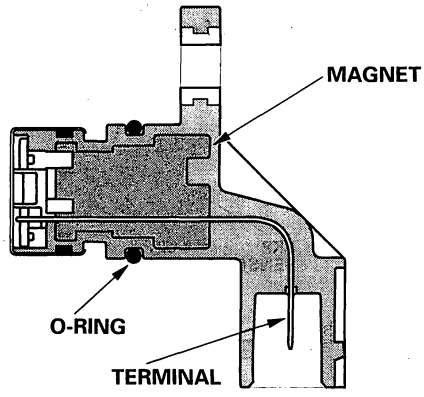
Injector Timing and Duration
The ECM/PCM contains the memory for basic discharge duration at various engine speeds and manifold pressures. The basic discharge duration, after being read out from the memory, is further modified by signals sent from various sensors to obtain the final discharge duration.
By monitoring long term fuel trim, the ECM/PCM detects long term malfunctions in the fuel system and sets a diagnostic trouble code (DTC).

(cont'd)

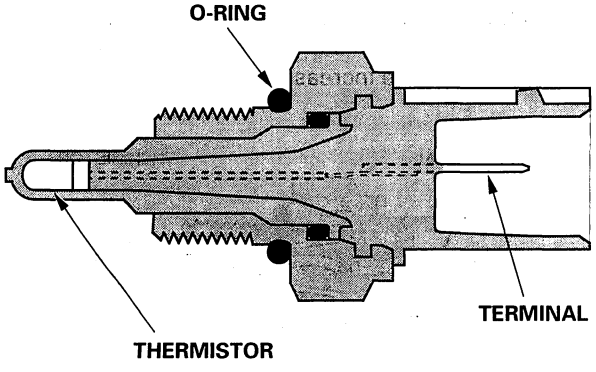
Protected by AR

System Description (cont'd)

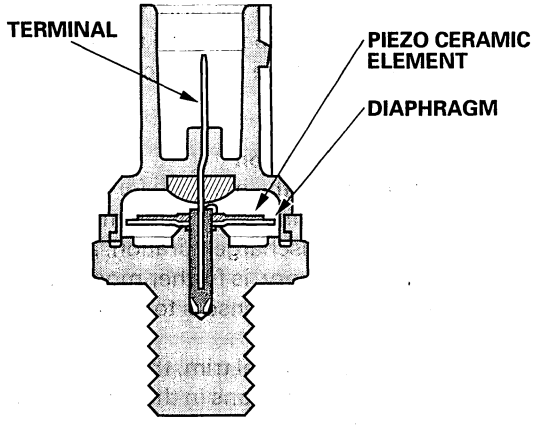
Input Shaft (Mainshaft) Speed Sensor
This sensor detects mainshaft speed.



Intake Air Temperature (IAT) Sensor
The IAT sensor is a temperature dependent resistor (thermistor). The resistance of the thermistor decreases as the intake air temperature increases.



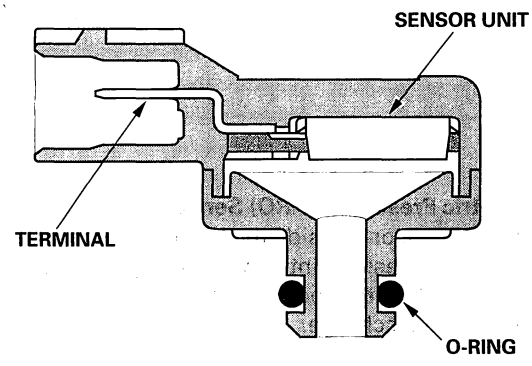
Knock Sensor
The knock control system adjusts the ignition timing to minimize knock.



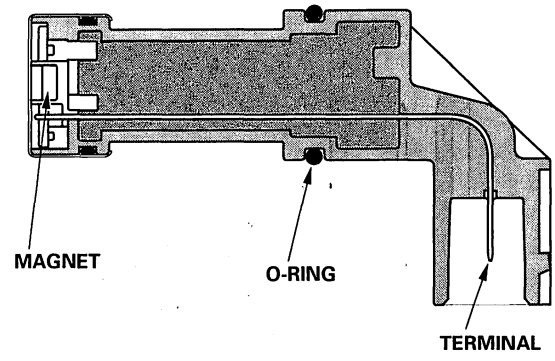
Malfunction Indicator Lamp (MIL) Indication (In relation to Readiness Codes)
The vehicle has certain "readiness codes" that are part of the on-board diagnostics for the emissions systems. If the vehicle's battery has been disconnected or gone dead, if the DTCs have been cleared, or if the ECM/PCM has been reset, these codes are reset. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the ignition switch ON (II), but do not start the engine. The MIL will come on for 15—20 seconds. If it then goes off, the readiness codes are complete. If it flashes five times, one or more readiness codes are not complete. To set each code, drive the vehicle or run the engine as described in the procedures (see page 11-54).

Manifold Absolute Pressure (MAP) Sensor
The MAP sensor converts manifold absolute pressure into electrical signals to the ECM/PCM.



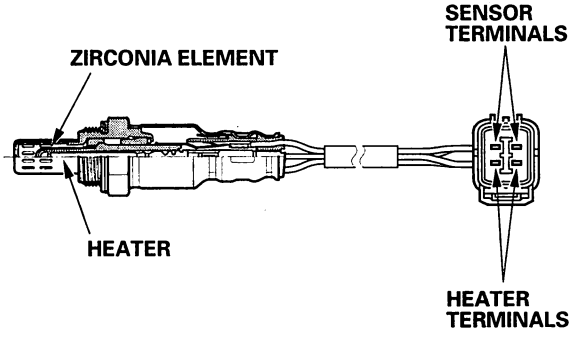
Output Shaft (Countershaft) Speed Sensor
This sensor detects countershaft speed.



BACK

Protected by AR

Secondary Heated Oxygen Sensor (Secondary HO2S)
The secondary HO2S detects the oxygen content in the exhaust gas downstream of the warm up three way catalytic converter (WU-TWC), and sends signals to the ECM/PCM. To stabilize its output, the sensor has an internal heater. The ECM/PCM compares the HO2S output with the A/F sensor output to determine catalyst efficiency. The secondary HO2S is on the WU-TWC.



Electronic Throttle Control System

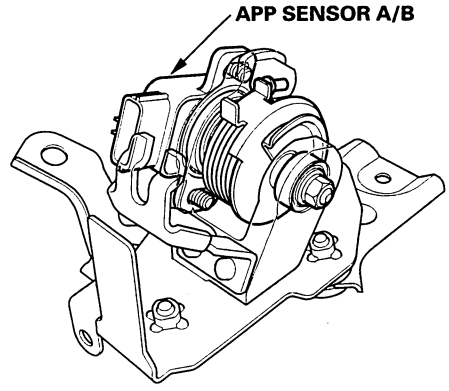
The throttle is electronically controlled by the electronic throttle control system. Refer to the system diagram to see a functional layout of the system.

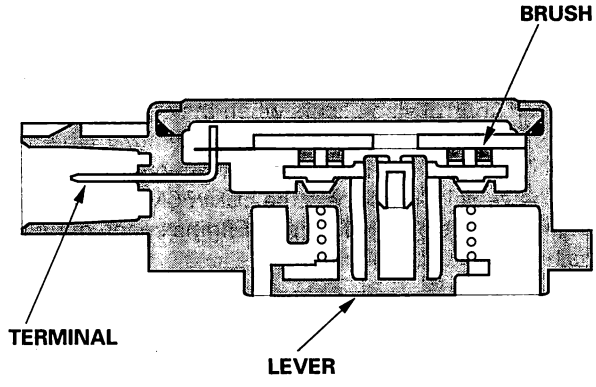
Idle control: When the engine is idling, the ECM/PCM controls the throttle actuator to maintain the proper idle speed according to engine loads.

Acceleration control: When the accelerator pedal is pressed, the ECM/PCM opens the throttle valve depending on the accelerator pedal position (APP) sensor signal.

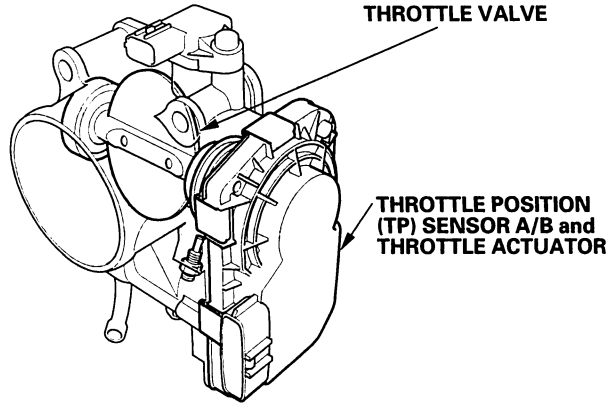
Cruise control: The ECM/PCM controls the throttle actuator to maintain set speed when the cruise control is operating. The throttle actuator takes the place of the cruise control actuator.

Accelerator Pedal Position (APP) Sensor
As the accelerator pedal position changes, the sensor varies the signal voltage to the ECM/PCM.





Throttle Body
The throttle body is a single-barrel side draft type. The lower portion of the throttle valve is heated by engine coolant from the cylinder head to prevent icing of the throttle plate.



(cont'd)

Protected by AR

System Description (cont'd)

Idle Control System

When the engine is cold, the A/C compressor is on, the transmission is in gear, the brake pedal is pressed, the power steering load is high, or the alternator is charging, the ECM/PCM controls current to the throttle actuator to maintain the correct idle speed.

Brake Pedal Position Switch
The brake pedal position switch signals the ECM/PCM when the brake pedal is pressed.

Power Steering Pressure (PSP) Switch
The PSP switch signals the ECM/PCM when the power steering load is high.

Fuel Supply System

Fuel Cutoff Control
During deceleration with the throttle valve closed, current to the injectors is cut off to improve fuel economy at engine speeds over 850 rpm (M/T: 950 rpm). Fuel cutoff control also occurs when the engine speed exceeds 6,900 rpm, regardless of the position of the throttle valve, to protect the engine from over-revving. When the vehicle is stopped, the ECM/PCM cuts the fuel at engine speeds over 5,000 rpm. Engine speed of fuel cut is lower on a cold engine.

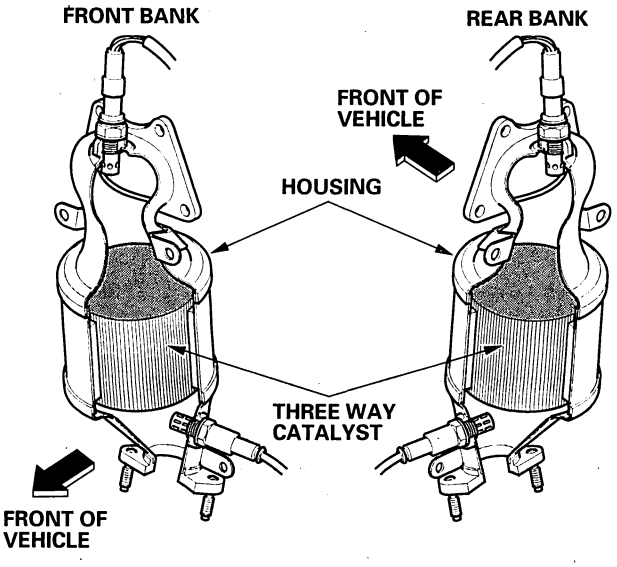
Fuel Pump Control
When the ignition is turned on, the ECM/PCM grounds PGM-FI main relay 2 (FUEL PUMP) which feeds current to the fuel pump for 2 seconds to pressurize the fuel system. With the engine running, the ECM/PCM grounds PGM-FI main relay 2 (FUEL PUMP) and feeds current to the fuel pump. When the engine is not running and the ignition is on, the ECM/PCM cuts ground to PGM-FI main relay 2 (FUEL PUMP) which cuts current to the fuel pump.

PGM-FI Main Relay 1 and 2
PGM-FI main relay 1 (FI MAIN) is energized whenever the ignition switch is ON (II) to supply battery voltage to the ECM/PCM, power to the injectors, and power for PGM-FI main relay 2 (FUEL PUMP). PGM-FI main relay 2 (FUEL PUMP) is energized to supply power to the fuel pump for 2 seconds when the ignition switch is turned ON (II), and when the engine is cranking or running.

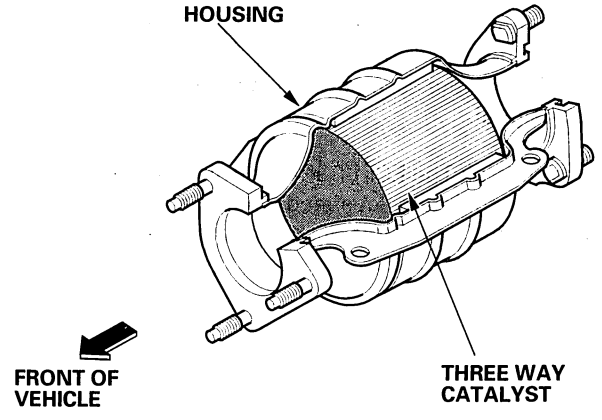
Catalytic Converter System

Warm Up/Three Way Catalytic Converter (WU-TWC) and Three Way Catalytic Converter (TWC)
The WU-TWC/TWC converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to carbon dioxide (CO_2), nitrogen (N_2), and water vapor.

WU-TWC



TWC



BACK

Protected by AR

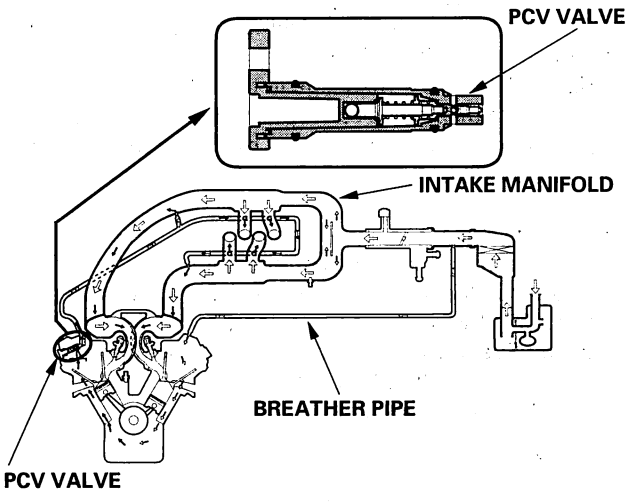
Exhaust Gas Recirculation (EGR) System

Refer to the system diagram to see a functional layout of the system.

EGR Valve
The EGR valve lowers peak combustion temperatures and reduces oxides of nitrogen emissions (NOx) by recirculating exhaust gas through the intake manifold and into the combustion chambers.

Positive Crankcase Ventilation (PCV) System

The PCV valve prevents blow-by gasses from escaping into the atmosphere by venting them into the intake manifold.



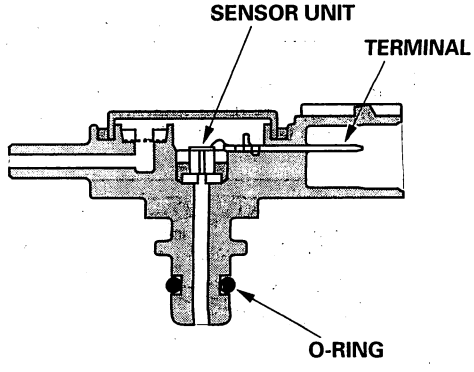
Evaporative Emission (EVAP) Control System

Refer to the system diagram to see a functional layout of the system.

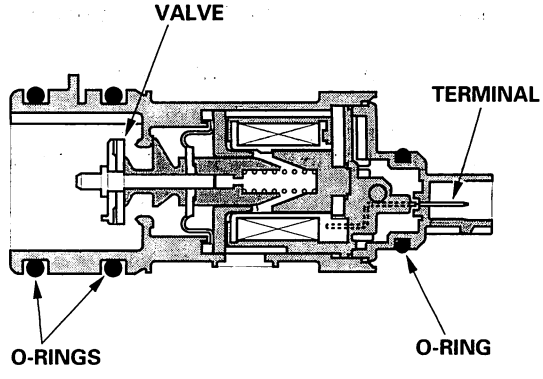
EVAP Canister
The EVAP canister temporarily stores fuel vapor from the fuel tank until it can be purged from the EVAP canister into the engine and burned.

EVAP Canister Purge Valve
When the engine coolant temperature is below 140 °F (60 °C), the ECM/PCM turns off the EVAP canister purge valve which cuts vacuum to the EVAP canister.

Fuel Tank Pressure (FTP) Sensor
The FTP sensor converts fuel tank absolute pressure into an electrical input to the ECM/PCM.



EVAP Canister Vent Shut Valve
The EVAP canister vent shut valve is on the EVAP canister.
The EVAP canister vent shut valve controls the venting of the EVAP canister.



(cont'd)

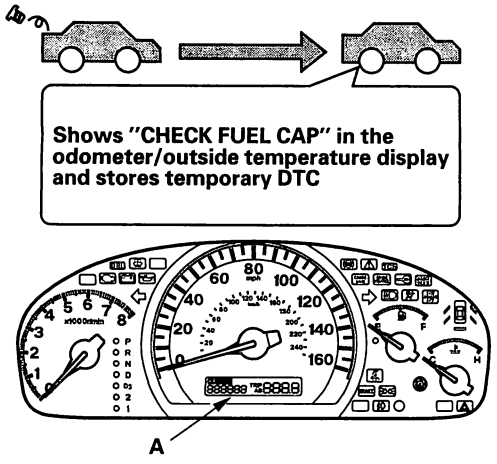
Protected by AR

System Description (cont'd)

Fuel Cap Warning Message

The ECM/PCM detects whether the fuel fill cap is loose or missing under certain conditions and alerts the driver by showing the information in the odometer/outside temperature display. If the ECM/PCM detects a small volume leak, the MIL may come on during the second drive cycle and store a DTC.

First drive cycle
During the first drive cycle after a cold start, the ECM/PCM alerts the driver to check the fuel fill cap by showing a "CHECK FUEL CAP" message in the odometer/outside temperature display (A), and it stores Temporary DTC P0457 "Evaporative Emission (EVAP) System Leak Detected/Fuel Cap Loose or Missing". Tightening the fuel cap does not make the message go off immediately.



To make the message go off (with the HDS)

Procedure

1. Tighten the fuel fill cap three clicks (2003-2004 models), or until it clicks (2005-2006 models).
2. Clear the Temporary DTC with the HDS.
3. Verify there is no leak by doing the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

To make the message go off (without the HDS)

Procedure

1. Tighten the fuel fill cap three clicks (2003-2004 models), or until it clicks (2005-2006 models).
2. Turn the ignition switch OFF.
3. Start the engine, and drive at a steady speed over 28 mph (45 km/h), without moving the accelerator pedal, for about 1 minute. Do step 2 and 3 several times.

Second drive cycle
During the second drive cycle after a cold start, if the fuel fill cap is still loose or missing, the ECM/PCM alerts the driver to check the fuel fill cap by showing a "CHECK FUEL CAP" message in the odometer/outside temperature display as same as the first drive cycle. Tightening the fuel cap does not make the message go off immediately.

Third drive cycle
During the third drive cycle after a cold start, if the fuel fill cap is still loose or missing, the ECM/PCM stores DTC P0457 "Evaporative Emission (EVAP) System Leak Detected/Fuel Cap Loose or Missing". The malfunction indicator lamp (MIL) (A) comes on, and the "CHECK FUEL CAP" message goes off.

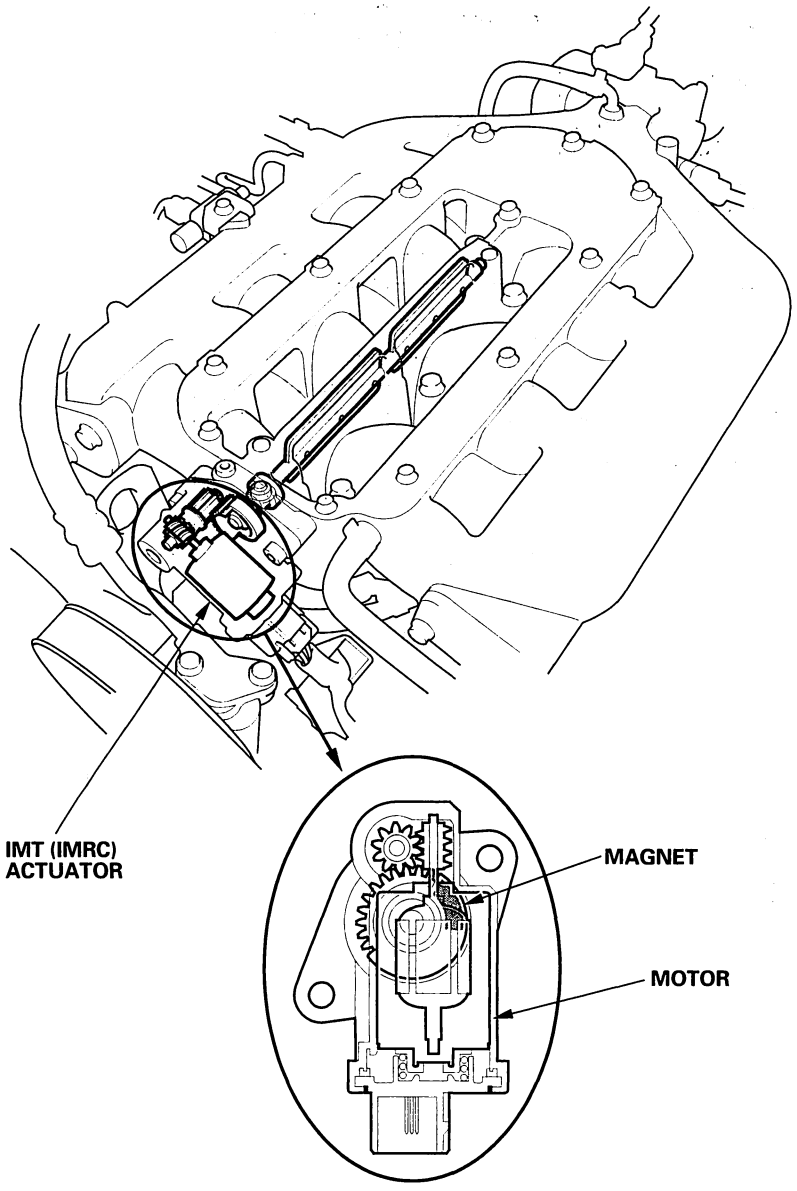
System Description (cont'd)

Intake Manifold Tuning (IMT) (Intake Manifold Runner Control (IMRC)) System

Engine power is achieved by closing and opening the intake manifold tuning (IMT) (intake manifold runner control (IMRC)) actuator. When the valve is closed, there is high torque at low engine speed. When the valve is open, there is high torque at high engine speed.
The intake manifold tuning (IMT) (intake manifold runner control (IMRC)) valve actuator has a sensor that detects the IMT (IMRC) valve position and sends it to the ECM/PCM.



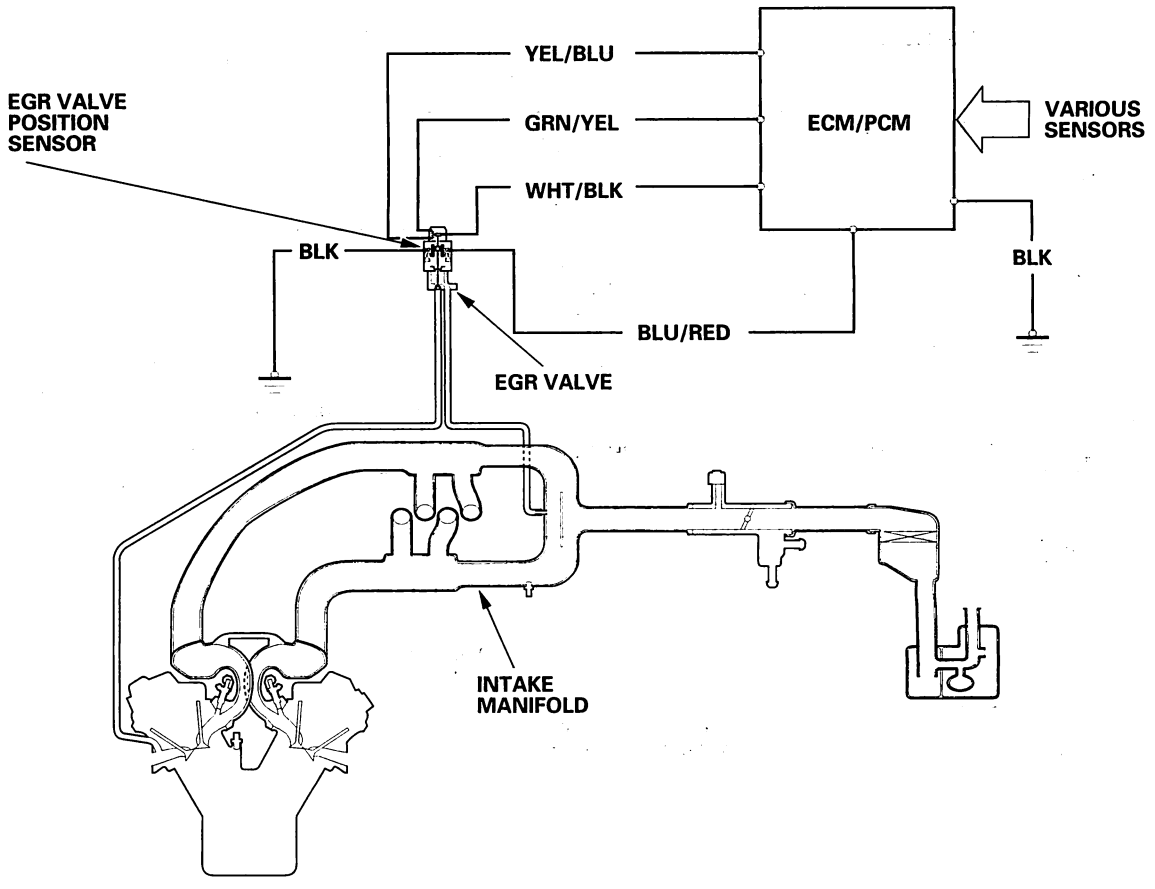
BACK

Protected by AR

Exhaust Gas Recirculation (EGR) System Diagram

The EGR system reduces oxides of nitrogen (NOx) emissions by recirculating exhaust gas through the EGR valve and the intake manifold into the combustion chambers. The ECM/PCM memory includes the ideal EGR valve position for varying operating conditions.

The EGR valve position sensor detects the amount of EGR valve lift and sends it to the ECM/PCM. The ECM/PCM then compares it with the ideal lift in its memory (based on signals sent from other sensors). If there is any difference between the two, the ECM/PCM cuts current to the EGR valve.



(cont'd)

BACK

Protected by AR

System Description (cont'd)

Evaporative Emission (EVAP) Control Diagram

The EVAP controls minimize the amount of fuel vapor escaping to the atmosphere. Vapor from the fuel tank is temporarily stored in the EVAP canister until it can be purged from the canister into the engine and burned.

- The EVAP canister is purged by drawing fresh air through it and into a port on the intake manifold. The purging vacuum is controlled by the EVAP canister purge valve, which operates whenever engine coolant temperature is above 140 °F (60 °C).
- During refueling, the fuel tank vapor control valve opens with the pressure in the fuel tank, and feeds the fuel vapor to the EVAP canister.

How to Set Readiness Codes

Malfunction Indicator Lamp (MIL) Indication (In Relation to Readiness Codes)

The vehicle has certain "readiness codes" that are part of the on-board diagnostics for the emissions systems. If the vehicle's battery has been disconnected or gone dead, if the DTCs have been cleared, or if the ECM/PCM has been reset, these readiness codes are reset. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the emission test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the ignition switch ON (II), but do not start the engine. The MIL will come on for 15—20 seconds. If it then goes off, the readiness codes are complete. If it flashes five times, one or more readiness codes are not set to complete. To set readiness codes from incomplete to complete, do the procedure for the appropriate code.

To check the status of a specific DTC system, check the OBD status in the DTC MENU with the HDS (see page 11-8). This screen displays the code, the current data list of the enable criteria, and the status of the readiness testing.

Catalytic Converter Monitor and Readiness Code

NOTE:
- Do not turn the ignition switch off during the procedure.
- All readiness codes are cleared when the battery is disconnected or when the ECM/PCM is cleared with the HDS.
- Low ambient temperatures or excessive stop-and-go traffic may increase the drive time needed to switch the readiness code from incomplete to complete.
- The readiness code will not switch to complete until all the enable criteria are met.
- If a fault in the secondary HO2S system caused the MIL to come on, the readiness code cannot be set to complete until you correct the fault.

Enable Criteria

- ECT at 158 °F (70 °C) or higher.
- Intake air temperature (IAT) at —13 °F (—25 °C) or higher.
- Vehicle speed sensor (VSS) reads more than 3 mph (5 km/h).

Procedure

1. Connect the HDS to the vehicle's data link connector (DLC), and bring up the READINESS CODEs screen for Catalyst in the DTCs MENU.
2. Start the engine.
3. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. After about 5 miles (8 km), the readiness code should switch to completed.
4. If the readiness code is still not set to complete, check for a Temporary DTC with the HDS. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

BACK

Protected by AR

Evaporative Emission (EVAP) Control System Monitor and Readiness Code

NOTE: All readiness codes are cleared when the battery is disconnected or when the ECM/PCM is cleared with the HDS.

Enable Criteria

- Battery voltage is higher than 10.5 V.
- Engine at idle.
- ECT sensor between 176 °F (80 °C) and 212 °F (100 °C).
- MAP sensor less than 46.6 kPa (14 in.Hg, 350 mmHg).
- Vehicle speed 0 mph (0 km/h).
- IAT sensor between 32 °F (0 °C) and 212 °F (100 °C).

Procedure

1. Connect the HDS to the vehicle's data link connector (DLC).
2. Start the engine.
3. Select EVAP TEST in the INSPECTION MENU with the HDS, then select the FUNCTION TEST in the EVAP TEST MENU.
   - If the functions are normal, readiness is complete.
   - If the functions are not normal, go to the next step.
4. If the readiness code is still not set to complete, check for a Temporary DTC. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

Air Fuel Ratio (A/F) Sensor Monitor and Readiness Code

NOTE:
- Do not turn the ignition switch off during the procedure.
- All readiness codes are cleared when the battery is disconnected or when the ECM/PCM is cleared with the HDS.

Enable Criteria

ECT at 158 °F (70 °C) or higher.

Procedure

1. Start the engine.
2. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. During the drive, decelerate (with the throttle fully closed) for 5 seconds. After about 3.5 miles (5.6 km), the readiness code should switch from incomplete to complete.
3. Check the readiness codes screen for the Air Fuel Ratio (A/F) Sensor in the DTCs MENU with the HDS.
   - If the screen shows complete, readiness is complete.
   - If the screen shows not complete, go to the next step.
4. Check for a Temporary DTC. If there is no DTC, the enable criteria was probably not met. Select the DATA LIST Menu. Check the ECT in the ALL DATA LIST with the HDS. If the ECT is lower than 158 °F (70 °C), run the engine until it is higher than 158 °F (70 °C), then repeat the procedure.

Protected by AR

How to Set Readiness Codes (cont'd)

Air Fuel Ratio (A/F) Sensor Heater Monitor Readiness Code

NOTE: All readiness codes are cleared when the battery is disconnected or when the ECM/PCM is cleared with the HDS.

Procedure

1. Start the engine, and let it idle for 1 minute. The readiness code should switch from incomplete to complete.
2. If the readiness code is still not set to complete, check for a Temporary DTC. If there is no DTC, repeat the procedure.

Misfire Monitor and Readiness Code

- This readiness code is always set to available because misfiring is continuously monitored.
- Monitoring pauses, and the misfire counter resets, if the vehicle is driven over a rough road.
- Monitoring also pauses, and the misfire counter holds at its current value, if the throttle position changes more than a predetermined value, or if driving conditions fall outside the range of any related enable criteria.

Fuel System Monitor and Readiness Code

- This readiness code is always set to available because the fuel system is continuously monitored during closed loop operation.
- Monitoring pauses when the catalytic converter, EVAP control system, and A/F sensor monitors are active.
- Monitoring also pauses when any related enable criteria are not being met. Monitoring resumes when the enable criteria is again being met.

Comprehensive Component Monitor and Readiness Code

This readiness code is always set to available because the comprehensive component monitor is continuously running whenever the engine is cranking or running.

EGR Monitor and Readiness Code

NOTE:
- Do not turn the ignition switch off during the procedure.
- All readiness codes are cleared when the battery is disconnected or when the ECM/PCM is cleared with the HDS.

Enable Criteria

ECT at 176 °F (80 °C) or higher.

Procedure

1. Connect the HDS to the vehicle's data link connector (DLC).
2. Start the engine.
3. Drive at a steady speed with the A/T in D or M/T in 4th gear, 50—62 mph (80—100 km/h) or above for more than 10 seconds.
4. With the A/T in D or M/T in 4th gear, decelerate from 62 mph (100 km/h) or above by completely releasing the throttle for at least 5 seconds. If the engine is stopped during this procedure, go to step 2 and do the procedure again.
5. Check the OBD status screen for DTC P0401 in the DTC's MENU with the HDS.
   - If it is passed, readiness is complete.
   - If it is not passed, go to step 3 and retest.

DTC P0107: MAP Sensor Circuit Low Voltage (2003-2004 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II).
5. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0107, P0112, P0117, P2122, P2127, P2228, P0452, P2627, and P2630 indicated at the same time?

   YES—Go to step 17.

   NO—Go to step 6.
6. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 3 kPa (1.0 in.Hg, 26 mmHg), or 0.23 V or less indicated?

   YES—Go to step 7.

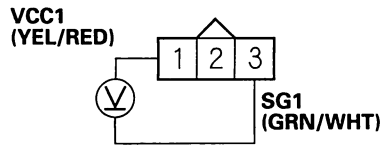
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. ■
7. Turn the ignition switch OFF.
8. Disconnect the MAP sensor 3P connector.
9. Turn the ignition switch ON (II).
10. Check the MAP SENSOR in the DATA LIST with the HDS.

    Is about 3 kPa (1.0 in.Hg, 26 mmHg), or 0.23 V or less indicated?

    YES—Go to step 13.

    NO—Go to step 11.
11. Measure voltage between MAP sensor 3P connector terminals No. 1 and No. 3.

MAP SENSOR 3P CONNECTOR



Wire side of female terminals

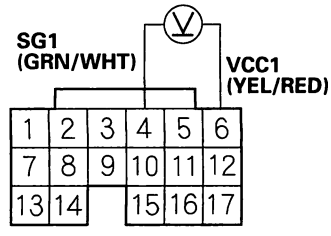
Is there about 5 V?

YES—Go to step 26.

NO—Go to step 12.

12. Measure voltage between ECM/PCM connector terminals D4 and D6.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the ECM/PCM (D6) and the MAP sensor, then go to step 28.

NO—Go to step 33.

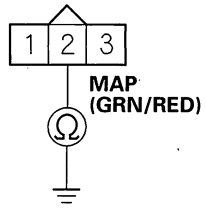
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

13. Turn the ignition switch OFF.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector D (17P).
16. Check for continuity between MAP sensor 3P connector terminal No. 2 and body ground.

MAP SENSOR 3P CONNECTOR



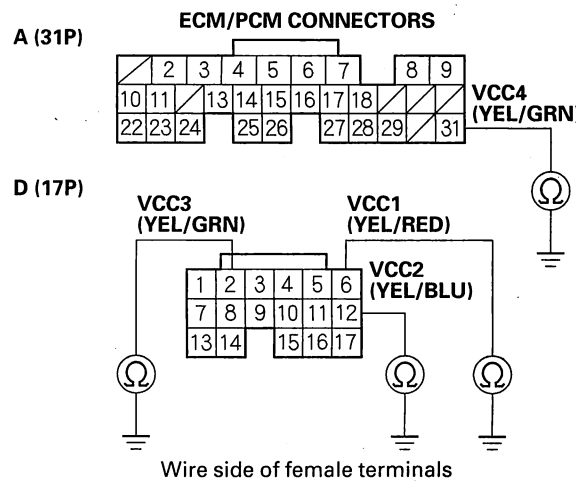
Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (D5) and the MAP sensor, then go to step 28.

NO—Go to step 33.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connectors A (31P) and D (17P).
20. Disconnect the connectors from these parts:
    - MAP sensor
    - IMT (IMRC) actuator
    - APP sensor
    - EGR valve
    - FTP sensor
    - Input shaft (mainshaft) speed sensor
    - Output shaft (countershaft) speed sensor
21. Check for continuity between body ground and ECM/PCM connector terminals A31, D2, D6, and D12 individually.



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A31, D2, D6, or D12) and each sensor, then go to step 28.

NO—Go to step 22.

BACK

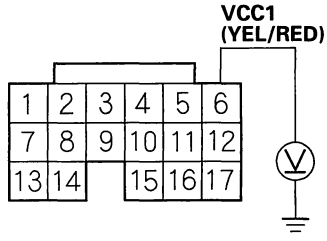
Protected by AR

22. Reconnect ECM/PCM connectors A (31P) and D (17P).

23. Turn the ignition switch ON (II).

24. Measure voltage between ECM/PCM connector terminal D6 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Go to step 25.

NO—Go to step 33.

25. Continue to monitor voltage at ECM/PCM connector terminal D6 while reconnecting these parts, one at a time:

- MAP sensor
- APP sensor
- IMT (IMRC) actuator
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

Did the voltage drop to about 0 V?

YES—Replace the part that caused the voltage to drop, then go to step 28.

NO—Go to step 33.

26. Turn the ignition switch OFF.

27. Replace the MAP sensor (see page 11-223).

28. Reconnect all connectors.

29. Turn the ignition switch ON (II).

30. Reset the ECM/PCM with the HDS.

31. Do the ECM/PCM idle learn procedure (see page 11-302).

32. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0107 is indicated, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

33. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

34. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0107 is indicated, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC P0107: MAP Sensor Circuit Low Voltage (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 3 kPa (1.0 in.Hg, 26 mmHg), or 0.23 V or less indicated?

   YES—Go to step 3.

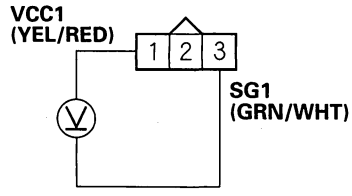
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM.■
3. Turn the ignition switch OFF.
4. Disconnect the MAP sensor 3P connector.
5. Turn the ignition switch ON (II).
6. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 3 kPa (1.0 in.Hg, 26 mmHg), or 0.23 V or less indicated?

   YES—Go to step 9.

   NO—Go to step 7.
7. Measure voltage between MAP sensor 3P connector terminals No. 1 and No. 3.

MAP SENSOR 3P CONNECTOR



Wire side of female terminals

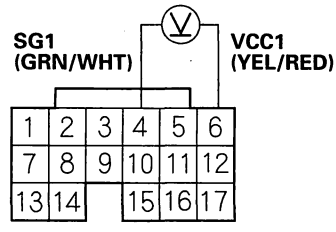
Is there about 5 V?

YES—Go to step 13.

NO—Go to step 8.

8. Measure voltage between ECM/PCM connector terminals D4 and D6.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the ECM/PCM (D6) and the MAP sensor, then go to step 15.

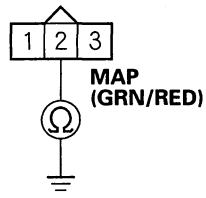
NO—Go to step 20.

BACK

Protected by AR

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector D (17P).
12. Check for continuity between MAP sensor 3P connector terminal No. 2 and body ground.

MAP SENSOR 3P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (D5) and the MAP sensor, then go to step 15.

NO—Go to step 20.

13. Turn the ignition switch OFF.
14. Replace the MAP sensor (see page 11-223).
15. Reconnect all connectors.
16. Turn the ignition switch ON (II).
17. Reset the ECM/PCM with the HDS.
18. Do the ECM/PCM idle learn procedure (see page 11-302).
19. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0107 is indicated, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

20. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
21. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0107 is indicated, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC P0108: MAP Sensor Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

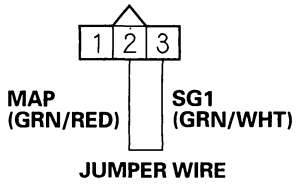
1. Turn the ignition switch ON (II).
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is 160 kPa (47.1 in.Hg, 1,197 mmHg), or 4.49 V or more indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. ■
3. Turn the ignition switch OFF.
4. Disconnect the MAP sensor 3P connector.
5. Connect MAP sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

MAP SENSOR 3P CONNECTOR



Wire side of female terminals

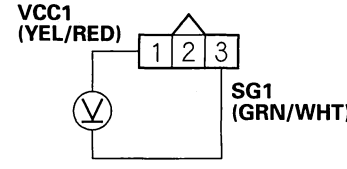
6. Turn the ignition switch ON (II).
7. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is 160 kPa (47.1 in.Hg, 1,197 mmHg), or 4.49 V or more indicated?

   YES—Go to step 8.

   NO—Go to step 19.
8. Remove the jumper wire from MAP sensor 3P connector.
9. Measure voltage between MAP sensor 3P connector terminals No. 1 and No. 3.

MAP SENSOR 3P CONNECTOR



Wire side of female terminals

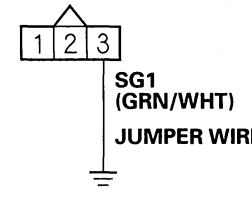
Is there about 5 V?

YES—Go to step 15.

NO—Go to step 10.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector D (17P).
13. Connect MAP sensor 3P connector terminal No. 3 to body ground with a jumper wire.

MAP SENSOR 3P CONNECTOR



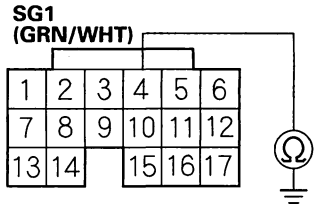
Wire side of female terminals

BACK

Protected by AR

14. Check for continuity between ECM/PCM connector terminal D4 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there continuity?

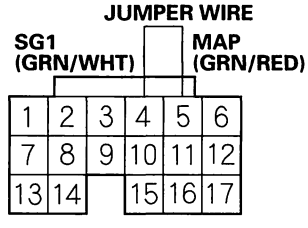
YES—Go to step 26.

NO—Repair open in the wire between the ECM/PCM (D4) and the MAP sensor, then go to step 21.

15. Turn the ignition switch OFF.

16. Connect ECM/PCM connector terminals D4 and D5 with a jumper wire.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

17. Turn the ignition switch ON (II).

18. Check the MAP SENSOR in the DATA LIST with the HDS.

Is 160 kPa (47.1 in.Hg, 1,197 mmHg), or 4.49 V or more indicated?

YES—Go to step 26.

NO—Repair open in the wire between the ECM/PCM (D5) and the MAP sensor, then go to step 21.

19. Turn the ignition switch OFF.

20. Replace the MAP sensor (see page 11-223).

21. Reconnect all connectors.

22. Turn the ignition switch ON (II).

23. Reset the ECM/PCM with the HDS.

24. Do the ECM/PCM idle learn procedure (see page 11-302).

25. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0108 is indicated, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete.■

26. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

27. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0108 is indicated, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC Troubleshooting (cont'd)

DTC P0111: IAT Sensor Circuit Range/ Performance Problem (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Check for poor connections or loose terminals at the ECT sensor and the IAT sensor.

   Are the connections and terminals OK?

   YES—Go to step 2.

   NO—Repair the connectors or terminals, then go to step 15.

2. Remove the IAT sensor (see page 11-219).
3. Allow IAT sensor to cool to 77 °F (25 °C).
4. Note the ambient temperature.
5. Connect the IAT sensor to the 2P connector, but do not install in the intake manifold.
6. Turn the ignition switch ON (II).
7. Note the value of IAT SENSOR quickly in the DATA LIST with the HDS.
8. Compare the value of IAT SENSOR and the ambient temperature.

   Does the value of IAT SENSOR differ 5.4 °F (3 °C) or more?

   YES—Go to step 13.

   NO—Go to step 9.

9. Disconnect the IAT sensor from the 2P connector.
10. Blow hot air on the IAT sensor with a heat gun.
11. Connect IAT sensor to the 2P connector, but do not install in the intake manifold.
12. Check the IAT SENSOR in the DATA LIST with the HDS.

    Does the IAT SENSOR change 58 °F (32 °C) or more?

    YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM/PCM. ■

    NO—Go to step 13.

13. Turn the ignition switch OFF.
14. Replace the IAT sensor (see page 11-219).
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see page 11-302).
18. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0111 is indicated, check for poor connections or loose terminals at the IAT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

BACK

Protected by AR

DTC P0112: IAT Sensor Circuit Low Voltage (2003-2004 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II).
5. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0107, P0112, P0117, P2122, P2127, P2228, P0452, P2627, and P2630 indicated at the same time?

   YES—Go to step 15.

   NO—Go to step 6.
6. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

   YES—Go to step 7.

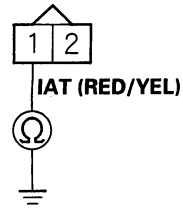
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM/PCM. ■
7. Turn the ignition switch OFF.
8. Disconnect the IAT sensor 2P connector.
9. Turn the ignition switch ON (II).
10. Check the IAT SENSOR in the DATA LIST with the HDS.

    Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

    YES—Go to step 11.

    NO—Go to step 24.
11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector D (17P).
14. Check for continuity between IAT sensor 2P connector terminal No. 1 and body ground.

IAT SENSOR 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the IAT sensor and the ECM/PCM (D16), then go to step 26.

NO—Go to step 31.

15. Turn the ignition switch OFF.
16. Jump the SCS line with the HDS.
17. Disconnect ECM/PCM connectors A (31P) and D (17P).
18. Disconnect the connectors from these parts:

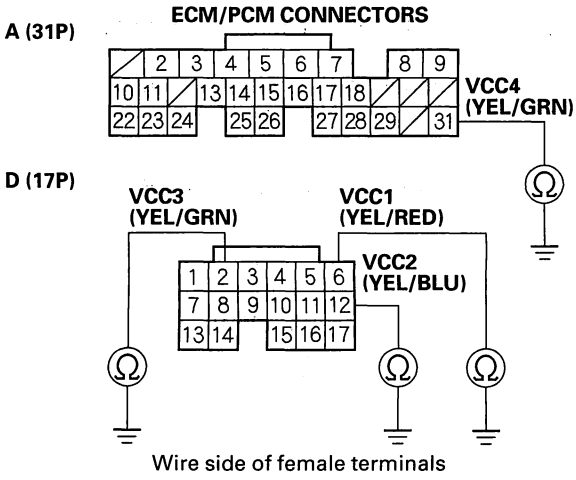
    - MAP sensor
    - APP sensor
    - IMT (IMRC) actuator
    - EGR valve
    - FTP sensor
    - Input shaft (mainshaft) speed sensor
    - Output shaft (countershaft) speed sensor

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

19. Check for continuity between body ground and ECM/PCM connector terminals A31, D2, D6, and D12 individually.



Is there continuity?

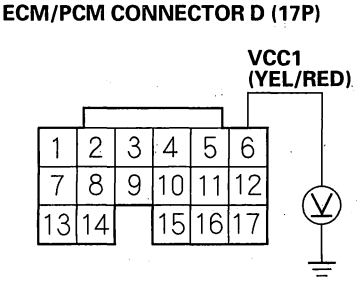
YES—Repair short in the wire between the ECM/PCM (A31, D2, D6, or D12) and each part, then go to step 26.

NO—Go to step 20.

20. Reconnect ECM/PCM connectors A (31P) and D (17P).

21. Turn the ignition switch ON (II).

22. Measure voltage between ECM/PCM connector terminal D6 and body ground.



Is there about 5 V?

YES—Go to step 23.

NO—Go to step 31.

23. Continue to monitor voltage at the ECM/PCM connector terminal D6 while reconnecting these parts, one at a time:

- MAP sensor
- APP sensor
- IMT (IMRC) actuator
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

Did the voltage drop to about 0 V?

YES—Replace the part that caused the voltage to drop, then go to step 26.

NO—Go to step 31.

BACK

Protected by AR

24. Turn the ignition switch OFF.
25. Replace the IAT sensor (see page 11-219).
26. Reconnect all connectors.
27. Turn the ignition switch ON (II).
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see page 11-302).
30. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0112 is indicated, check for poor connections or loose terminals at the IAT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■
31. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
32. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0112 is indicated, check for poor connections or loose terminals at the IAT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0112: IAT Sensor Circuit Low Voltage (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM/PCM. ■
3. Turn the ignition switch OFF.
4. Disconnect the IAT sensor 2P connector.
5. Turn the ignition switch ON (II).
6. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

   YES—Go to step 7.

   NO—Go to step 11.

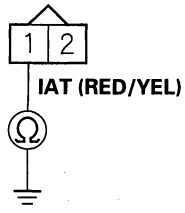
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector D (17P).
10. Check for continuity between IAT sensor 2P connector terminal No. 1 and body ground.

IAT SENSOR 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the IAT sensor and the ECM/PCM (D16), then go to step 13.

NO—Go to step 18.

11. Turn the ignition switch OFF.
12. Replace the IAT sensor (see page 11-219).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see page 11-302).
17. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0112 is indicated, check for poor connections or loose terminals at the IAT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete.■
18. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
19. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0112 is indicated, check for poor connections or loose terminals at the IAT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC P0113: IAT Sensor Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

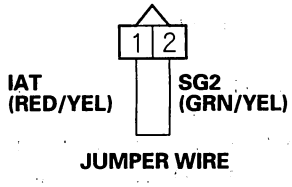
1. Turn the ignition switch ON (II).
2. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about −40 °F (−40 °C) or less, or 4.90 V or more indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM/PCM. ■
3. Turn the ignition switch OFF.
4. Disconnect the IAT sensor 2P connector.
5. Connect IAT sensor 2P connector terminals No. 1 and No. 2 with a jumper wire.

IAT SENSOR 2P CONNECTOR



Wire side of female terminals

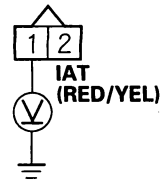
6. Turn the ignition switch ON (II).
7. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about −40 °F (−40 °C) or less, or 4.90 V or more indicated?

   YES—Go to step 8.

   NO—Go to step 18.
8. Turn the ignition switch OFF.
9. Remove the jumper wire from the IAT sensor 2P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between IAT sensor 2P connector terminal No. 1 and body ground.

IAT SENSOR 2P CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Go to step 12.

NO—Go to step 17.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector D (17P).
15. Connect IAT sensor 2P connector terminal No. 2 to body ground with a jumper wire.

IAT SENSOR 2P CONNECTOR

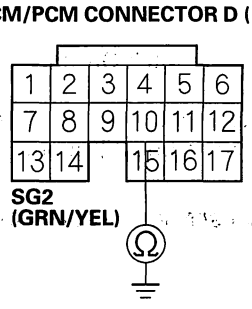
DTC Troubleshooting (cont'd)

16. Check for continuity between ECM/PCM connector terminal D10 and body ground.



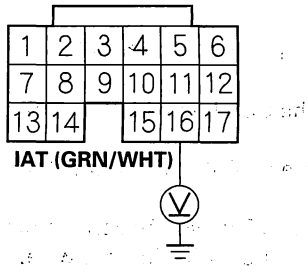
Wire side of female terminals

Is there continuity?

YES—Go to step 25.

NO—Repair open in the wire between the ECM/PCM (D10) and the IAT sensor, then go to step 20.

17. Measure voltage between ECM/PCM connector terminal D16 and body ground.



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the ECM/PCM (D16) and the IAT sensor, then go to step 20.

NO—Go to step 25.

18. Turn the ignition switch OFF.

19. Replace the IAT sensor (see page 11-219).

20. Reconnect all connectors.

21. Turn the ignition switch ON (II).

22. Reset the ECM/PCM with the HDS.

23. Do the ECM/PCM idle learn procedure (see page 11-302).

24. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0113 is indicated, check for poor connections or loose terminals at the IAT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

25. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

26. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0113 is indicated, check for poor connections or loose terminals at the IAT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0116: ECT Sensor Range/Performance Problem (2003-2004 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Check the ECT SENSOR in the DATA LIST with the HDS.

   Is about 176 °F (80 °C) or more, or 0.86 V or less indicated?

   YES—Go to step 3.

   NO—Go to step 7.
3. Note the coolant temperature from step 2.
4. Turn the ignition switch OFF.
5. Let the engine cool for 1 hour.
6. Check the ECT SENSOR in the DATA LIST with the HDS.

   Did the ECT change 3.6 °F (2 °C) or more?

   YES—Intermittent failure, system is OK at this time. Check the thermostat and the cooling system (see page 10-4).■

   NO—Go to step 10.
7. Note the coolant temperature.
8. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
9. Check the ECT SENSOR in the DATA LIST with the HDS.

   Does the ECT change 3.6 °F (2 °C) or more?

   YES—Intermittent failure, system is OK at this time. Check the thermostat and the cooling system (see page 10-4).■

   NO—Go to step 10.
10. Turn the ignition switch OFF.
11. Replace the ECT sensor (see page 11-219).
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see page 11-302).
15. Allow the engine to cool to between 23 °F (−5 °C) and 77 °F (25 °C).
16. Start the engine, and let it idle for 20 minutes.
17. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0116 is indicated, check for poor connections or loose terminals at the ECT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 18.
18. Monitor the OBD STATUS for DTC P0116 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the ECT sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 15 and recheck.

DTC Troubleshooting (cont'd)

DTC P0116: ECT Sensor 1 Range/ Performance Problem (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 176 °F (80 °C) or more, or 0.78 V or less indicated?

   YES—Go to step 6.

   NO—Go to step 3.
3. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Does ECT SENSOR 1 change 18 °F (10 °C) or more?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. ■

   NO—Go to step 11.
6. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.
7. Turn the ignition switch OFF.
8. Open the hood, and let the engine cool for 3 hours.
9. Turn the ignition switch ON (II).
10. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Does ECT SENSOR 1 change 18 °F (10 °C) or more?

    YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. ■

    NO—Go to step 11.
11. Turn the ignition switch OFF.
12. Replace ECT sensor 1 (see page 11-219).
13. Turn the ignition switch ON (II).
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see page 11-302).
16. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0116 is indicated, check for poor connections or loose terminals at ETC sensor 1 and the ECM/PCM, then go to step 1. If any other Temporary DTSs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

BACK

DTC P0117: ECT Sensor Circuit Low Voltage (2003-2004 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II).
5. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0107, P0112, P0117, P2122, P2127, P2228, P0452, P2627, and P2630 indicated at same time?

   YES—Go to step 15.

   NO—Go to step 6.
6. Check the ECT SENSOR in the DATA LIST with the HDS.

   Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

   YES—Go to step 7.

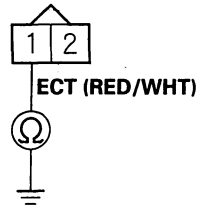
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the ECT sensor and the ECM/PCM. ■
7. Turn the ignition switch OFF.
8. Disconnect the ECT sensor 2P connector.
9. Turn the ignition switch ON (II).
10. Check the ECT SENSOR in the DATA LIST with the HDS.

    Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

    YES—Go to step 11.

    NO—Go to step 24.
11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector D (17P).
14. Check for continuity between ECT sensor 2P connector terminal No. 1 and body ground.

ECT SENSOR 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECT sensor and the ECM/PCM (D17), then go to step 26.

NO—Go to step 31.

15. Turn the ignition switch OFF.
16. Jump the SCS line with the HDS.
17. Disconnect ECM/PCM connectors A (31P) and D (17P).
18. Disconnect the connectors from these parts:

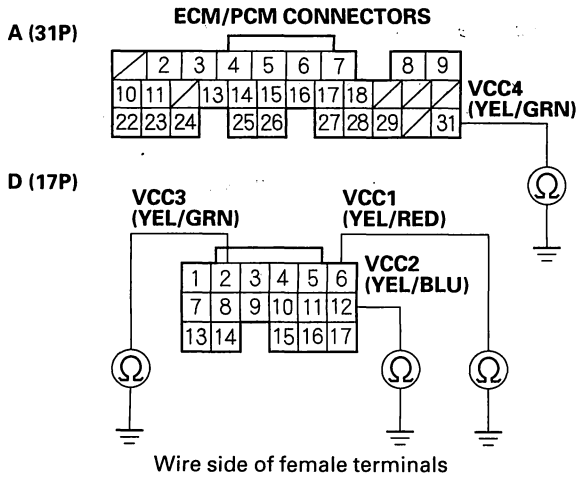
    - MAP sensor
    - APP sensor
    - IMT (IMRC) actuator
    - EGR valve
    - FTP sensor
    - Input shaft (mainshaft) speed sensor
    - Output shaft (countershaft) speed sensor

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

19. Check for continuity between body ground and ECM/PCM connector terminals A31, D2, D6, and D12 individually.



Wire side of female terminals

Is there continuity?

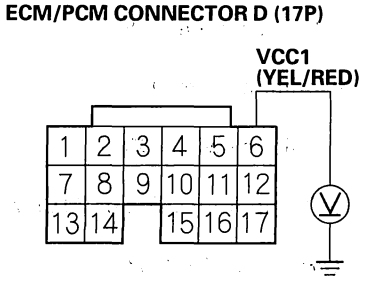
YES—Repair short in the wire between the ECM/PCM (A31, D2, D6, or D12) and each part, then go to step 26.

NO—Go to step 20.

20. Reconnect ECM/PCM connectors A (31P) and D (17P).

21. Turn the ignition switch ON (II).

22. Measure voltage between ECM/PCM connector terminal D6 and body ground.



Wire side of female terminals

Is there about 5 V?

YES—Go to step 23.

NO—Go to step 31.

23. Continue to monitor voltage at the ECM/PCM connector terminal D6 while reconnecting these parts, one at a time:

- MAP sensor
- APP sensor
- IMT (IMRC) actuator
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

Did the voltage drop to about 0 V?

YES—Replace the part that caused the voltage to drop, then go to step 26.

NO—Go to step 31.

BACK

Protected by AR

24. Turn the ignition switch OFF.
25. Replace the ECT sensor (see page 11-219).
26. Reconnect all connectors.
27. Turn the ignition switch ON (II).
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see page 11-302).
30. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0117 is indicated, check for poor connections or loose terminals at the ECT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is completed. ■
31. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
32. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0117 is indicated, check for poor connections or loose terminals at the ECT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0117: ECT Sensor 1 Circuit Low Voltage (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

    YES—Go to step 3.

    NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. ■
3. Turn the ignition switch OFF.
4. Disconnect ECT sensor 1 2P connector.
5. Turn the ignition switch ON (II).
6. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

    YES—Go to step 7.

    NO—Go to step 11.

DTC Troubleshooting (cont'd)

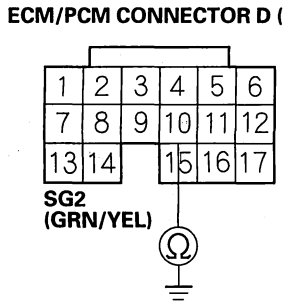
16. Check for continuity between ECM/PCM connector terminal D10 and body ground.



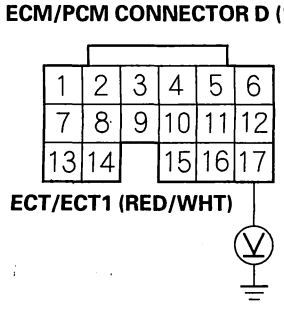
Wire side of female terminals

Is there continuity?

YES—Go to step 25.

NO—Repair open in the wire between the ECM/PCM (D10) and the ECT sensor/ECT sensor 1, then go to step 20.

17. Measure voltage between ECM/PCM connector terminal D17 and body ground.



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the ECM/PCM (D17) and the ECT sensor/ECT sensor 1, then go to step 20.

NO—Go to step 25.

18. Turn the ignition switch OFF.

19. Replace the ECT sensor/ECT sensor 1 (see page 11-219).

20. Reconnect all connectors.

21. Turn the ignition switch ON (II).

22. Reset the ECM/PCM with the HDS.

23. Do the ECM/PCM idle learn procedure (see page 11-302).

24. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0118 is indicated, check for poor connections or loose terminals at the ECT sensor/ECT sensor 1 and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

25. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

26. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0118 is indicated, check for poor connections or loose terminals at the ECT sensor/ECT sensor 1 and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0125: ECT Sensor Slow Response (2003-2004 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Start the engine, and let it idle.
2. Check the ECT SENSOR in the DATA LIST with the HDS.

   Is about 86 °F (30 °C) or less, or 2.61 V or more indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Check the thermostat and the cooling system (see page 10-4).■
3. Let the engine idle for 6 minutes.
4. Check the ECT SENSOR in the DATA LIST with the HDS.

   Is about 86 °F (30 °C) or less, or 2.61 V or more indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check the thermostat and the cooling system (see page 10-4).■
5. Turn the ignition switch OFF.
6. Replace the ECT sensor (see page 11-219).
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see page 11-302).
10. Allow the engine to cool to between 23 °F (—5 °C) and 77 °F (25 °C).
11. Start the engine, and let it idle for 20 minutes.
12. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0125 is indicated, check for poor connections or loose terminals at the ECT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 13.
13. Monitor the OBD STATUS for DTC P0125 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the ECT sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 10 and recheck.

DTC Troubleshooting (cont'd)

DTC P0125: ECT Sensor 1 Slow Response (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Start the engine, and let it idle for 5 minutes or more.
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 10 °F (−12 °C) or less, or 4.45 V or more indicated?

   YES—Go to step 9.

   NO—Go to step 3.
3. Allow the engine to cool to 104 °F (40 °C) or less.
4. Note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.
5. Start the engine, and let it idle.
6. Let the engine idle until ECT SENSOR 1 goes up 49 °F (27 °C) or more from the recorded temperature.
7. Note the value of ECT SENSOR 2 in the DATA LIST with the HDS.
8. Compare ECT SENSOR 2 and the recorded temperature.

   Did ECT SENSOR 2 change 17 °F (9.5 °C) or more?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2 and the ECM/PCM. ■

   NO—Check the thermostat (see page 10-4), then go to step 9.
9. Turn the ignition switch OFF.
10. Replace ECT sensor 1 (see page 11-219).
11. Turn the ignition switch ON (II).
12. Reset the ECM/PCM with the HDS.
13. Do the ECM/PCM idle learn procedure (see page 11-302).
14. Allow the engine to cool to ambient temperature.
15. Start the engine, and let it idle for 20 minutes.
16. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0125 is indicated, check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 17.
17. Monitor the OBD STATUS for DTC P0125 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 14 and recheck.

DTC P0128: Cooling System Malfunction (2003-2004 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If the DTCs listed below are stored at the same time as DTC P0128, troubleshoot those DTCs first, then recheck for P0128.

P0112, P0113: Intake air temperature (IAT) sensor
P0116, P0117, P0118: Engine coolant temperature (ECT) sensor
P0300: Random misfire
P0301, P0302, P0303, P0304: No. 1, No. 2, No. 3, No. 4, No. 5, or No. 6 cylinder misfire
P0335, P0339: Crankshaft position (CKP) sensor A
P0385, P0389: Crankshaft position (CKP) sensor B
P2227, P2228, P2229: Barometric pressure (BARO) sensor
P2646, P2647, P2648, P2649: VTEC system
P0506, P0507: Idle control system malfunction
DTC P0128 can occasionally set when the hood is opened while the engine is running.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the blower switch OFF.
4. Turn the A/C switch OFF.
5. Check the FAN CTRL in the DATA LIST with the HDS.

   Is it OFF?

   YES—Go to step 6.

   NO—Wait until the FAN CTRL is off, then go to step 6.
6. Check the ECT SENSOR in the DATA LIST with the HDS, then check the radiator fan operation.

   Does the radiator fan keep running when the engine coolant temperature less than 158 °F (70 °C)?

   YES—Check for symptoms in the cooling system and the radiator fan relay (see page 22-51). If the circuits and the relay are OK, go to step 21.

   NO—Go to step 7.
7. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
8. Turn the ignition switch OFF.
9. Turn the ignition switch ON (II).
10. Do the RADIATOR FAN TEST in the INSPECTION MENU with the HDS for 20 minutes.
11. Check the ECT SENSOR in the DATA LIST with the HDS.

    Is about 140 °F (60 °C) or less, or 1.25 V or more indicated?

    YES—Intermittent failure, system is OK at this time. ■

    NO—Go to step 12.
12. Turn the ignition switch OFF.
13. Let the engine cool until the coolant temperature is between 23 °F (—5 °C) and 95 °F (35 °C).
14. Replace the thermostat (see page 10-8).
15. Turn the ignition switch ON (II).

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

16. Reset the ECM/PCM with the HDS.

17. Do the ECM/PCM idle learn procedure (see page 11-302).

18. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

19. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0128 is indicated, check the cooling system (see page 10-4), then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 20.

20. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check the cooling system, then go to step 1. If the screen indicates NOT COMPLETED, go to step 18 and recheck.

21. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

22. Let the engine cool until the coolant temperature is between 23 °F (—5 °C) and 95 °F (35 °C).

23. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

24. Check for a Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0128 is indicated, check for poor connections or loose terminals at the ECT sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0128: Cooling System Malfunction (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the blower switch OFF.
4. Turn the A/C switch OFF.
5. Check the FAN CTRL in the DATA LIST with the HDS.

   Is it OFF?

   YES—Go to step 6.

   NO—Wait until the FAN CTRL is off, then go to step 6.
6. Check the radiator fan operation.

   Does the radiator fan keep running?

   YES—Check for symptoms in the cooling system. If they are OK, go to step 20.

   NO—Go to step 7.
7. Let the engine cool until the coolant temperature is 104 °F (40 °C) or less.
8. Note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.
9. Start the engine, and let it idle.
10. Let the engine idle until ECT SENSOR 1 goes up 49 °F (27 °C) or more from the recorded temperature.
11. Check ECT SENSOR 2 in the DATA LIST with the HDS.
12. Compare the value of recorded ECT SENSOR 2 and the value of present ECT SENSOR 2.

    Did temperature rise 17 °F (9.5 °C) or more?

    YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. ■

    NO—Test the thermostat (see page 10-4), then go to step 13.
13. Turn the ignition switch ON (II).
14. Reset the ECM/PCM with the HDS.
15. Let the engine cool until the coolant temperature is between 21 °F (—6 °C) and 104 °F (40 °C).
16. Do the ECM/PCM idle learn procedure (see page 11-302).
17. Test-drive at a steady speed between 15—75 mph (24—120 km/h) for 10 minutes.
18. Check for Temporary DTCs or DTCs with the HDS.

    Are any temporary DTCs or DTCs indicated?

    YES—If DTC P0128 is indicated, check the cooling system, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 19.
19. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check the cooling system, then go to step 1. If the screen indicates NOT COMPLETED, go to step 15 and recheck.

(cont'd)

DTC Troubleshooting (cont'd)

20. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

21. Let the engine cool until the coolant temperature is between 21 °F (—6 °C) and 104 °F (40 °C).

22. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

23. Test-drive at a steady speed between 15—75 mph (24—120 km/h) for 10 minutes.

24. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0128 is indicated, check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0133: Rear A/F Sensor (Bank 1, Sensor 1) Slow Response (2003-2004 models)

DTC P0153: Front A/F Sensor (Bank 2, Sensor 1) Slow Response (2003-2004 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P0139 and/or P0159* is stored at the same time as DTC P0133 and/or P0153*, troubleshoot DTC P0139 and/or P0159* first, then recheck for DTC P0133 and/or P0153*.
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature above 158 °F (70 °C)
   - A/T in D position (M/T in 5th gear)
   - Vehicle speed at 30 mph (48 km/h) or more, and engine speed between 1,350 and 2,350 rpm
5. Monitor the OBD STATUS for DTC P0139 and/or P0159* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 6.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.
6. Turn the ignition switch OFF.
7. Replace the A/F sensor (Sensor 1) (see page 11-217).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see page 11-302).
11. Test-drive under these conditions:
    - Engine coolant temperature above 158 °F (70 °C)
    - A/T in D position (M/T in 5th gear)
    - Vehicle speed at 30 mph (48 km/h) or more, and engine speed between 1,350 and 2,350 rpm
12. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0139 and/or P0159* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 13.
13. Monitor the OBD STATUS for DTC P0139 and/or P0159* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 10 and recheck.

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P0139 and/or P0159* is stored at the same time as DTC P0133 and/or P0153*, troubleshoot DTC P0139 and/or P0159* first, then recheck for DTC P0133 and/or P0153*.
- Information marked with an asterisk (*) applies to the front bank.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm withtout load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature above 176 °F (80 °C)
   - A/T in D position (M/T in 3rd or 4th gear)
   - Drive the vehicle speed at 25 mph (40 km/h) or less for 5 minutes, then drive at steady speed between 26—81 mph (41—130 km/h)
5. Monitor the OBD STATUS for DTC P0133 and/or P0153* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 6.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.
6. Turn the ignition switch OFF.
7. Replace the A/F sensor (Sensor 1) (see page 11-217).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see page 11-302).
11. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
12. Test-drive under these conditions:
    - Engine coolant temperature above 176 °F (80 °C)
    - A/T in D position (M/T in 3rd or 4th gear)
    - Drive the vehicle speed at 25 mph (40 km/h) or less for 5 minute, then drive at steady speed between 26—81 mph (40—130 km/h)
13. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0133 and/or P0153* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 14.
14. Monitor the OBD STATUS for DTC P0133 and/or P0153* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11 and recheck.

DTC P0134: Rear A/F Sensor (Bank 1, Sensor 1) Heater System Malfunction

DTC P0154: Front A/F Sensor (Bank 2, Sensor 1) Heater System Malfunction

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P2251 and/or P2254* is stored at the same time as DTC P0134 and/or P0154*, troubleshoot DTC P2251 and/or P2254* first, then recheck for P0134 and/or P0154*.
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

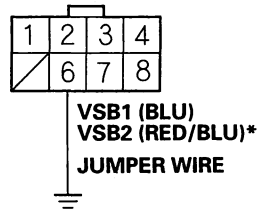
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle 2 minutes.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0134 and/or P0154 indicated?*

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 8P connector.
8. Disconnect ECM/PCM connector B (24P).
9. Connect A/F sensor (Sensor 1) 8P connector terminal No. 6 to body ground with a jumper wire.

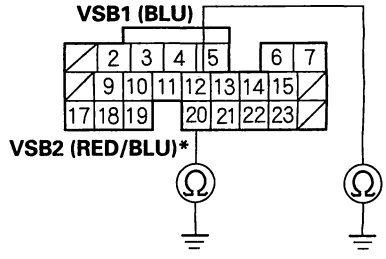
A/F SENSOR (SENSOR 1) 8P CONNECTOR



Wire side of female terminals

10. Check for continuity between ECM/PCM connector terminal B12 (B20)* and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 11.

NO—Repair open in the wire between the ECM/PCM (B12 (B20)*) and the A/F sensor (Sensor 1), then go to step 15.

(cont'd)

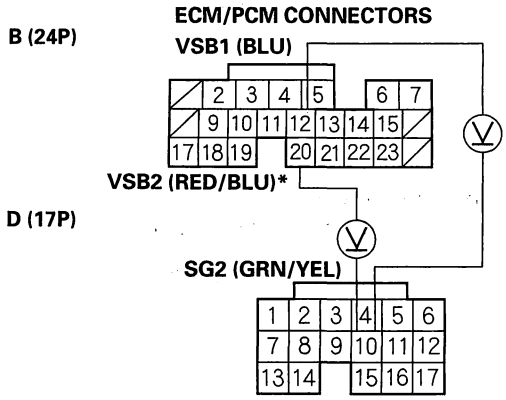
Protected by AR

DTC Troubleshooting (cont'd)

11. Remove the jumper wire from the A/F sensor (Sensor 1) 8P connector, then reconnect ECM/PCM connector B (24P).

12. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle 2 minutes.

13. Measure voltage between ECM/PCM connector terminals B12 (B20)* and D10.



Wire side of female terminals

Is there about 0.2 V or less?

YES—Go to step 21.

NO—Go to step 14.

14. Replace the A/F sensor (see page 11-217).

15. Reconnect all connectors.

16. Turn the ignition switch ON (II).

17. Reset the ECM/PCM with the HDS.

18. Do the ECM/PCM idle learn procedure (see page 11-302).

19. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0134 and/or P0154* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 20.

20. Monitor the OBD STATUS for DTC P0134 and/or P0154* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete.■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 18 and recheck.

21. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

22. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0134 and/or P0154* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC P0135: Rear A/F Sensor (Bank 1, Sensor 1) Heater Circuit Malfunction

DTC P0155: Front A/F Sensor (Bank 2, Sensor 1) Heater Circuit Malfunction

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0135 and/or P0155 indicated?*

   YES—Go to step 5.

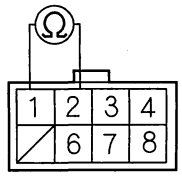
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the A/F sensor relay and the ECM/PCM.■
5. Turn the ignition switch OFF.
6. Check these fuses:
   - No. 19 OPTION (40 A) fuse in the under-hood fuse/relay box.
   - No. 4 A/F SENSOR (15 A) fuse in the under-dash fuse/relay box.
   - No. 23 IGP (7.5 A) fuse in the under-dash fuse/relay box.

   Are any of the fuses blown?

   YES—Repair short in the wire between the A/F sensors, the A/F sensor relay, and the fuses, then go to step 23.

   NO—Go to step 7.
7. Disconnect the A/F sensor (Sensor 1) 8P connector.
8. At the sensor side, measure resistance between A/F sensor (Sensor 1) 8P connector terminals No. 1 and No. 2.

A/F SENSOR (SENSOR 1) 8P CONNECTOR



Terminal side of male terminals

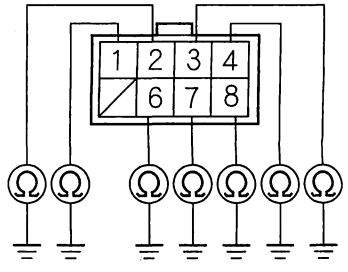
Is there 2.5—3.2 Ω at room temperature?

YES—Go to step 9.

NO—Go to step 22.

9. Check for continuity between each terminal at the A/F sensor (Sensor 1) 8P connector and body ground.

A/F SENSOR (SENSOR 1) 8P CONNECTOR



Terminal side of male terminals

Is there continuity?

YES—Go to step 22.

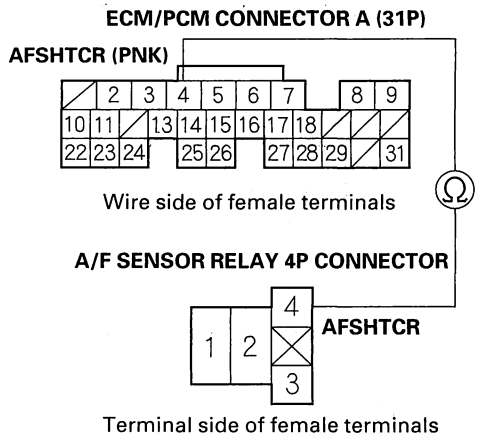
19. Disconnect ECM/PCM connector A (31P).

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

20. Check for continuity between ECM/PCM connector terminal A4 and A/F sensor relay 4P connector terminal No. 4.



Is there continuity?

YES—Go to step 21.

NO—Repair open in the wire between the ECM/PCM (A4) and the A/F sensor relay, then go to step 23.

21. Check the A/F sensor relay (see page 22-51).

Is the A/F sensor relay OK?

YES—Go to step 29.

NO—Replace the A/F sensor relay, then go to step 23.

22. Replace the A/F sensor (Sensor 1) (see page 11-217).

23. Reconnect all connectors.

24. Turn the ignition switch ON (II).

25. Reset the ECM/PCM with the HDS.

26. Do the ECM/PCM idle learn procedure (see page 11-302).

27. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0135 and/or P0155* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the A/F sensor relay, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 28.

28. Monitor the OBD STATUS for DTC P0135 and/or P0155* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete.■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the A/F sensor relay, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 26 and recheck.

29. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

30. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0135 and/or P0155* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the A/F sensor relay, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

Protected by AR

DTC P0137: Rear Secondary HO2S (Bank 1, Sensor 2) Circuit Low Voltage (2003-2004 models)

DTC P0157: Front Secondary HO2S (Bank 2, Sensor 2) Circuit Low Voltage (2003-2004 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 0.29 V or less?

   YES—Go to step 5.

   NO—Go to step 9.
5. Turn the ignition switch OFF.
6. Disconnect the secondary HO2S (Sensor 2) 4P connector.
7. Turn the ignition switch ON (II).
8. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 0.29 V or less?

   YES—Go to step 11.

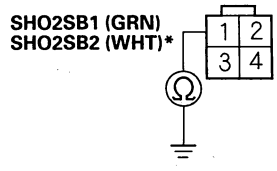
   NO—Go to step 15.
9. Test-drive under these conditions:
   - Engine coolant temperature above 158 °F (70 °C)
   - A/T in D position (M/T in 4th gear)
   - Engine speed at 2,000—3,000 rpm
   - Drive about 10 minutes, then decelerate (with the throttle fully closed) for 5 seconds
10. Monitor the OBD STATUS for DTC P0137 and/or P0157* in the DTCs MENU with the HDS.

    Does the screen indicate FAILED?

    YES—Go to step 16.

    NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 9 and recheck.
11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector B (24P).
14. Check for continuity between secondary HO2S (Sensor 2) 4P connector terminal No. 1 and body ground.

SECONDARY HO2S (SENSOR 2) 4P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (B9 (B18)*) and the secondary HO2S (Sensor 2), then go to step 17.

NO—Go to step 25.

(cont'd)

DTC Troubleshooting (cont'd)

15. Turn the ignition switch OFF.
16. Replace the secondary HO2S (Sensor 2) (see page 11-218).
17. Reconnect all connectors.
18. Turn the ignition switch ON (II).
19. Reset the ECM/PCM with the HDS.
20. Do the ECM/PCM idle learn procedure (see page 11-302).
21. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
22. Test-drive under these conditions:
    - Engine coolant temperature above 158 °F (70 °C)
    - A/T in D position (M/T in 4th gear)
    - Engine speed at 2,000—3,000 rpm
    - Drive about 10 minutes, then decelerate (with the throttle fully closed) for 5 seconds
23. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0137 and/or P0157 * is indicated, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 24.
24. Monitor the OBD STATUS for DTC P0137 and/or P0157 * in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 21 and recheck.
25. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
26. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
27. Test-drive under these conditions:
    - Engine coolant temperature above 158 °F (70 °C)
    - A/T in D position (M/T in 4th gear)
    - Engine speed at 2,000—3,000 rpm
    - Drive about 10 minutes, then decelerate (with the throttle fully closed) for 5 seconds
28. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0137 and/or P0157 * is indicated, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0141 and/or P0161 indicated?*

   YES—Go to step 5.

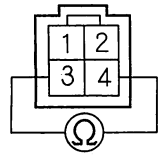
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Check these fuses:
   - No. 19 OPTION (40 A) fuse in under-hood fuse/relay box.
   - No. 4 A/F SENSOR (15 A) fuse in under-dash fuse/relay box.
   - No. 23 IGP (7.5 A) fuse in under-dash fuse/relay box.

   Are any of the fuses blown?

   YES—Repair short in the wire between the A/F sensors, the A/F sensor relay, and the fuses, then go to step 22.

   NO—Go to step 7.
7. Disconnect the secondary HO2S (Sensor 2) 4P connector.
8. At the secondary HO2S (Sensor 2) side, measure resistance between secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4.

SECONDARY HO2S (SENSOR 2) 4P CONNECTOR



Terminal side of male terminals

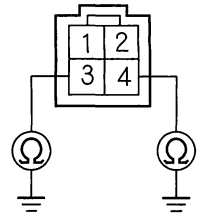
Is there 5.4—6.6 Ω at room temperature?

YES—Go to step 9.

NO—Go to step 21.

9. Check for continuity between body ground and secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4 individually.

SECONDARY HO2S (SENSOR 2) 4P CONNECTOR



Terminal side of male terminals

Is there continuity?

YES—Go to step 21.

NO—Go to step 10.

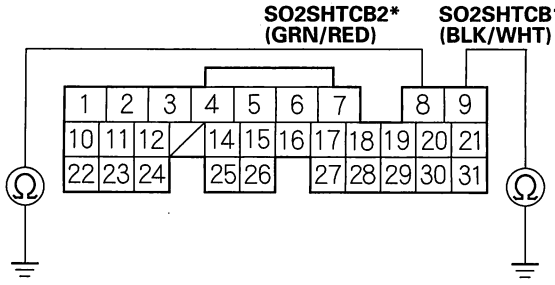
DTC Troubleshooting (cont'd)

10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector E (31P).
12. Check for continuity between ECM/PCM connector terminal E9 (E8)* and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

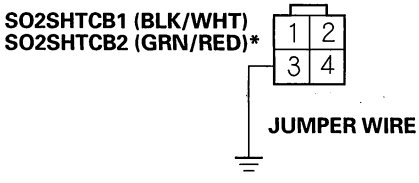
Is there continuity?

YES—Repair short in the wire between the ECM/PCM (E9 (E8)*) and the secondary HO2S (Sensor 2), then go to step 22.

NO—Go to step 13.

13. Connect secondary HO2S (Sensor 2) 4P connector terminal No. 3 to body ground with a jumper wire.

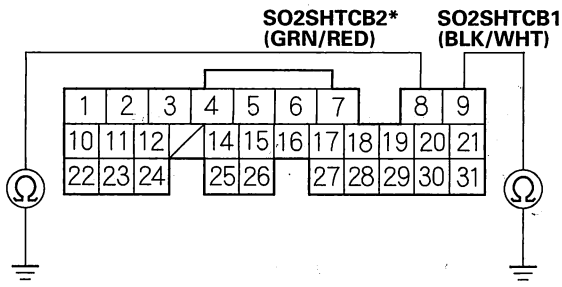
SECONDARY HO2S (SENSOR 2) 4P CONNECTOR



Wire side of female terminals

14. Check for continuity between ECM/PCM connector terminal E9 (E8)* and body ground.

ECM/PCM CONNECTOR E (31P)



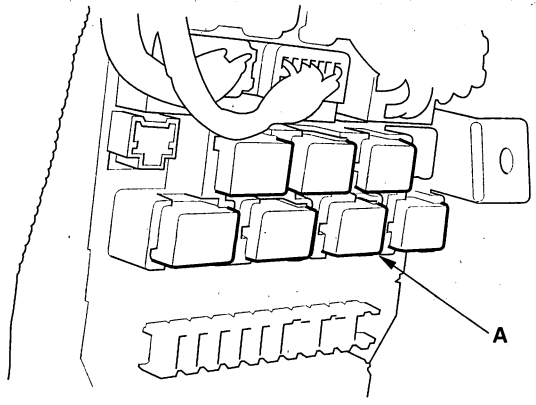
Wire side of female terminals

Is there continuity?

YES—Go to step 15.

NO—Repair open in the wire between the ECM/PCM (E9 (E8)*) and the secondary HO2S (Sensor 2), then go to step 22.

15. Remove the A/F sensor relay (A).

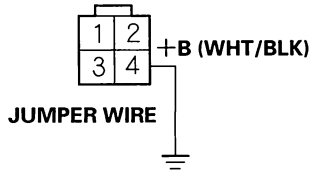


BACK

Protected by AR

16. Connect secondary HO2S (Sensor 2) 4P connector terminal No. 4 to body ground with a jumper wire.

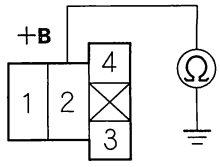
SECONDARY HO2S (SENSOR 2) 4P CONNECTOR



Wire side of female terminals

17. Check for continuity between A/F sensor relay 4P connector terminal No. 2 and body ground.

A/F SENSOR RELAY 4P CONNECTOR



Terminal side of female terminals

Is there continuity?

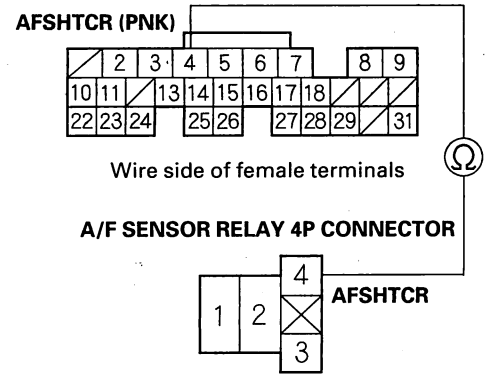
YES—Go to step 18.

NO—Repair open in the wire between the A/F sensor (Sensor 1) and the A/F sensor relay, then go to step 22.

18. Disconnect ECM/PCM connector A (31P).

19. Check for continuity between ECM/PCM connector terminal A4 and A/F sensor relay 4P connector terminal No. 4.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

A/F SENSOR RELAY 4P CONNECTOR

Terminal side of female terminals

Is there continuity?

YES—Go to step 20.

NO—Repair open in the wire between the ECM/PCM (A4) and the A/F sensor relay, then go to step 22.

20. Test the A/F sensor relay (see page 22-51).

Is the A/F sensor relay OK?

YES—Go to step 28.

NO—Replace the A/F sensor relay, then go to step 22.

21. Replace the secondary HO2S (Sensor 2) (see page 11-218).

22. Reconnect all connectors.

23. Turn the ignition switch ON (II).

24. Reset the ECM/PCM with the HDS.

25. Do the ECM/PCM idle learn procedure (see page 11-302).

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

26. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0141 and/or P0161* is indicated, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 27.

27. Monitor the OBD STATUS for DTC P0141 and/or P0161* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 25 and recheck.

28. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

29. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0141 and/or P0161* is indicated, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0171: Rear Bank (Bank 1) Fuel System Too Lean

DTC P0172: Rear Bank (Bank 1) Fuel System Too Rich

DTC P0174: Front Bank (Bank 2) Fuel System Too Lean

DTC P0175: Front Bank (Bank 2) Fuel System Too Rich

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If some of the DTCs listed below are stored at the same time as DTC P0171, P0172, P0174, and/or P0175, troubleshoot those DTCs first, then recheck for P0171, P0172, P0174, and/or P0175.
  P0107, P0108, P1128, P1129: Manifold absolute pressure (MAP) sensor
  P0133, P0153, P1172*, P1173*, P2195, P2197, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2627, P2628, P2630, P2631, P2A00, P2A03: Air fuel ratio (A/F) sensor (Sensor 1)
  P0134, P0135, P0154, P0155: Air fuel ratio (A/F) sensor (Sensor 1) heater
  P0137, P0138, P0139, P0157, P0158, P0159, P2270*, P2271*, P2272*, P2273*: Secondary HO2S (Sensor 2)
  P0141, P0161: Secondary HO2S (Sensor 2) heater
  P2646, P2647, P2648, P2649: VTEC system
  P0401, P0404, P0406, P2413: Exhaust Gas Recirculation (EGR) system
  P2279: Intake air leakage
  *: 2005-2006 models only

1. Check the fuel pressure (see page 11-317).

   Is the fuel pressure OK?

   YES—Check the valve clearances and adjust if necessary. If the valve clearances are OK, replace the injectors (see page 11-215), then go to step 2.

   NO—If the pressure is too high, replace the fuel pressure regulator (see page 11-326), then go to step 2. If the pressure is too low, check the fuel pump, and the fuel feed pipe, then go to step 2.

2. Turn the ignition switch ON (II).

3. Reset the ECM/PCM with the HDS.

4. Do the ECM/PCM idle learn procedure (see page 11-302).

5. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

6. Test-drive under these conditions:

   - Engine coolant temperature above 158 °F (70 °C)
   - A/T in D position (M/T in 5th gear)
   - Drive at a steady speed between 25—55 mph (40—88 km/h) for 5 minutes, then drive at a steady speed between 15—75 mph (24—120 km/h) for 15 minutes.

   NOTE: DTC P0171, P0172, P0174, and/or P0175 may take up to 80 minutes of test driving to set. Using the HDS, monitor the long term fuel trim (LT FUEL TRIM) or the air fuel feed back average (AF FB AVE). If the long term fuel trim/air fuel feed back average stays within 0.85—1.18, there is no problem at this time.

7. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—If DTC P0171, P0172, P0174, or P0175 is indicated, go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

   NO—Troubleshooting is complete.■

DTC Troubleshooting (cont'd)

DTC P0300: Random Misfire and Any Combination of the Following:

DTC P0301: No. 1 Cylinder Misfire

DTC P0302: No. 2 Cylinder Misfire

DTC P0303: No. 3 Cylinder Misfire

DTC P0304: No. 4 Cylinder Misfire

DTC P0305: No. 5 Cylinder Misfire

DTC P0306: No. 6 Cylinder Misfire

Special Tools Required
- Pressure gauge adapter 07NAJ-P07010A
- A/T low pressure gauge w/panel 07406-0070300
- A/T pressure hose 07406-0020201
- A/T pressure hose, 2,210 mm 07MAJ-PY4011A
- A/T pressure adapter 07MAJ-PY40120
- Oil pressure hose 07ZAJ-S5A0200

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If the misfire is frequent enough to trigger detection of increased emissions during two consecutive driving cycles, the MIL will come on, and DTC P0300 (and some combination of P0301 through P0306) will be stored.
- If the misfire is frequent enough to damage the catalyst, the MIL will blink whenever the misfire occurs, and DTC P0300 (and some combination of P0301 through P0306) will be stored. When the misfire stops, the MIL will remain on.
- Troubleshoot the following DTCs first, if any of them were stored along with the random misfire DTC(s):

P0107, P0108, P1128, P1129: Manifold absolute pressure (MAP) sensor
P0171, P0172, P0174, P0175: Fuel system
P0335, P0339, P0385, P0389: Crankshaft position (CKP) sensor A/B
P0506, P0507: Idle control system
P0340, P0344: Camshaft position (CMP) sensor
P0401, P0404, P0406, P2413: Exhaust gas recirculation (EGR) system

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine without load (in Park or neutral), then let it idle.
4. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 9.

   NO—If the screen indicates PASSED, go to step 5. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, wait for several minutes, then recheck.
5. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

   YES—Go to step 9.

   NO—Go to step 6.
6. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

   - Engine speed
   - Vehicle speed
   - Throttle position
   - CLV (calculated load value)

BACK

Protected by AR

7. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 9.

   NO—If the screen indicates PASSED, go to step 8. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6 and recheck.

8. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

   YES—Go to step 9.

   NO—Intermittent failure, system is OK at this time. ■

9. Turn the ignition switch OFF.

10. Check the fuel quality.

    Is the quality good?

    YES—Go to step 11.

    NO—Drain the tank, and fill it with a known-good fuel, then go to step 20.

11. Inspect the spark plugs (see page 4-23). If the spark plugs are fouled or worn, replace them.

12. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

    - Engine speed
    - Vehicle speed
    - Throttle position
    - CLV (calculated load value)

13. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

    YES—Go to step 14.

    NO—Go to step 20.

14. Check the fuel pressure (see page 11-317).

    Is the fuel pressure OK?

    YES—Go to step 15.

    NO—
    - If the pressure is too high, replace the fuel pressure regulator (see page 11-326), then go to step 20.
    - If the pressure is too low, check the fuel pump, the fuel feed pipe, and the fuel filter. If they are OK, replace the fuel pressure regulator (see page 11-326), then go to step 20.

15. Turn the ignition switch OFF.

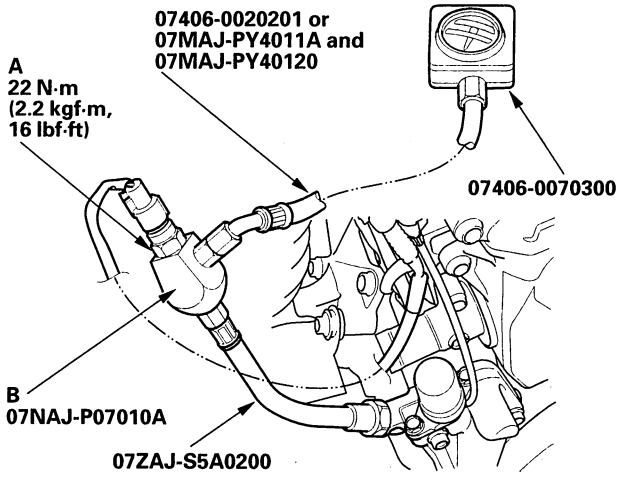
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

16. Remove the rocker arm oil pressure switch (VTEC oil pressure switch) (A), and install the special tools as shown, then install the rocker arm oil pressure switch (VTEC oil pressure switch) in the pressure gauge adapter (B).

    NOTE: Install the switch in the reverse order of removal with a new O-ring.



17. Reconnect the rocker arm oil pressure switch (VTEC oil pressure switch) 2P connector.

18. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.

19. Check the oil pressure at engine speeds of 1,000 and 2,000 rpm. Keep the measuring time as short as possible (less than 1 minute) because the engine is running without load.

    Is the oil pressure below 49 kPa (7 psi, 0.5 kgf/cm²) ?

    YES—Check for air in the fuel line, then go to step 20.

    NO—Inspect the VTEC system (see page 6-7), then go to step 20.

20. Turn the ignition switch ON (II).

21. Reset the ECM/PCM with the HDS.

22. Clear the CKP pattern with the HDS.

23. Do the ECM/PCM idle learn procedure (see page 11-302).

24. Do the CKP pattern learn procedure (see page 11-4).

25. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

    - Engine speed
    - Vehicle speed
    - Throttle position
    - CLV (calculated load value)

26. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0301, P0302, P0303, P0304, P0305, or P0306 are indicated, check for poor connections or loose terminals at the ignition coil, the injector, and the ECM/PCM, then go to troubleshooting DTC P0301, P0302, P0303, P0304, P0305 or P0306 (see page 11-115). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 27.

27. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 25 and recheck.

DTC P0301: No. 1 Cylinder Misfire

DTC P0302: No. 2 Cylinder Misfire

DTC P0303: No. 3 Cylinder Misfire

DTC P0304: No. 4 Cylinder Misfire

DTC P0305: No. 5 Cylinder Misfire

DTC P0306: No. 6 Cylinder Misfire

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine without load (in Park or neutral), then let it idle.
4. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 9.

   NO—If the screen indicates PASSED, go to step 5. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, wait for several minutes, and recheck.
5. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

   YES—Go to step 9.

   NO—Go to step 6.
6. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

   - Engine speed
   - Vehicle speed
   - Throttle position
   - CLV (calculated load value)
7. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 9.

   NO—If the screen indicates PASSED, go to step 8. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6 and recheck.
8. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

   YES—Go to step 9.

   NO—Intermittent failure, system is OK at this time. Check the fuel and ignition system circuit connectors for loose wires or poor connections. ■
9. Turn the ignition switch OFF.
10. Exchange the ignition coil from the problem cylinder with one from another cylinder.
11. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

    - Engine speed
    - Vehicle speed
    - Throttle position
    - CLV (calculated load value)

(cont'd)

DTC Troubleshooting (cont'd)

12. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

    YES—Go to step 13.

    NO—Intermittent misfire due to poor contact at the ignition coil connector (no misfire at this time). Make sure the coil connections are secure. ■

13. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the ignition coil was moved?

    YES—Replace the faulty ignition coil (see page 4-20), then go to step 55.

    NO—Go to step 14.

14. Turn the ignition switch OFF.

15. Exchange the spark plug from the problem cylinder with one from another cylinder.

16. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

    - Engine speed
    - Vehicle speed
    - Throttle position
    - CLV (calculated load value)

17. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

    YES—Go to step 18.

    NO—Intermittent misfire due to spark plug fouling (no misfire at this time). ■

18. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the spark plug was moved?

    YES—Replace the faulty spark plug, then go to step 55.

    NO—Go to step 19.

19. Turn the ignition switch OFF.

20. Exchange the injector from the problem cylinder with one from the another cylinder.

21. Start the engine, and let it idle for 2 minutes.

22. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

    - Engine speed
    - Vehicle speed
    - Throttle position
    - CLV (calculated load value)

23. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

    YES—Go to step 24.

    NO—Intermittent misfire due to bad contact in the injector connector (no misfire at this time). Check for poor connections or loose terminals at the injector. ■

24. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the injector was exchanged?

    YES—Replace the faulty injector (see page 11-215), then go to step 55.

    NO—Go to step 25.

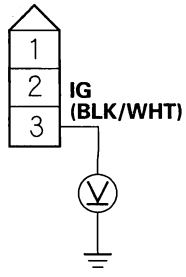
25. Turn the ignition switch OFF.

BACK

Protected by AR

26. Disconnect the ignition coil 3P connector from the problem cylinder.
27. Turn the ignition switch ON (II).
28. Measure voltage between ignition coil 3P connector terminal No. 3 and body ground.

IGNITION COIL 3P CONNECTOR



Wire side of female terminals

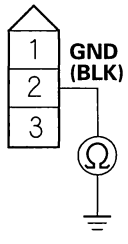
Is there battery voltage?

YES—Go to step 29.

NO—Repair open in the wire between the ignition coil and the ignition coil relay, then go to step 55.

29. Turn the ignition switch OFF.
30. Check for continuity between ignition coil 3P connector terminal No. 2 and body ground.

IGNITION COIL 3P CONNECTOR



Wire side of female terminals

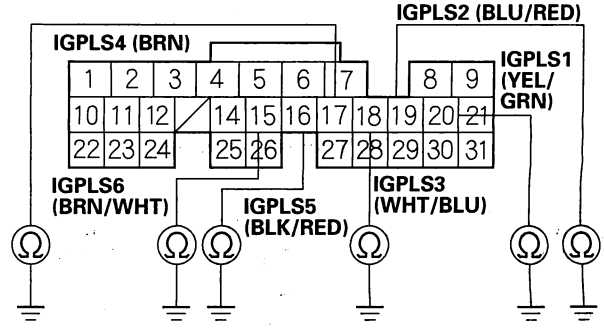
Is there continuity?

YES—Go to step 31.

NO—Repair open in the wire between the ignition coil and G101, then go to step 55.

31. Turn the ignition switch OFF.
32. Jump the SCS line with the HDS.
33. Disconnect ECM/PCM connector E (31P).
34. Check for continuity between body ground and the appropriate ECM/PCM connector terminal (see table).

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

PROBLEM CYLINDER	DTC	ECM/PCM TERMINAL	WIRE COLOR
No. 1	P0301	E20	YEL/GRN
No. 2	P0302	E19	BLU/RED
No. 3	P0303	E18	WHT/BLU
No. 4	P0304	E17	BRN
No. 5	P0305	E16	BLK/RED
No. 6	P0306	E15	BRN/WHT

Is there continuity?

YES—Repair short in the wire between the ECM/PCM and the ignition coil, then go to step 55.

NO—Go to step 35.

NO—Repair open in the wire between the ECM/PCM and the ignition coil, then go to step 55.

BACK

Protected by AR

37. Reconnect the ignition coil 3P connector and ECM/PCM connector E (31P).

38. Do an engine compression and a cylinder leakdown test.

    Did the engine pass both tests?

    YES—Go to step 39.

    NO—Repair the engine, then go to step 55.

39. Do the VTEC rocker arm test (see page 6-7).

    Did the engine pass the test?

    YES—Go to step 40.

    NO—Repair the VTEC rocker arm, then go to step 55.

40. Turn the ignition switch OFF.

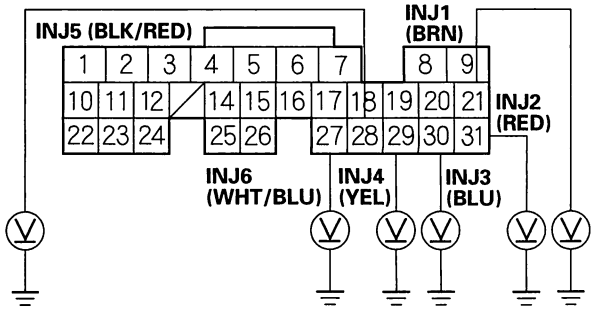
41. Jump the SCS line with the HDS.

42. Disconnect ECM/PCM connector E (31P).

43. Turn the ignition switch ON (II).

44. Measure voltage between body ground and the appropriate ECM/PCM connector terminal (see table).

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

PROBLEM CYLINDER	DTC	ECM/PCM TERMINAL	WIRE COLOR
No. 1	P0301	E21	BRN
No. 2	P0302	E31	RED
No. 3	P0303	E30	BLU
No. 4	P0304	E29	YEL
No. 5	P0305	E28	BLK/RED
No. 6	P0306	E27	WHT/BLU

Is there battery voltage?

YES—Go to step 54.

NO—Go to step 45.

45. Turn the ignition switch OFF.

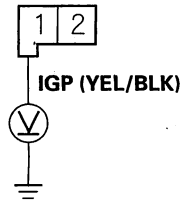
46. Remove the intake manifold (see page 9-3).

47. Disconnect the injector 2P connector from the problem cylinder.

48. Turn the ignition switch ON (II).

49. Measure voltage between injector 2P connector terminal No. 1 and body ground.

INJECTOR 2P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Go to step 50.

NO—Repair open in the wire between the injector and the PGM-FI main relay 1 (FI MAIN), then go to step 55.

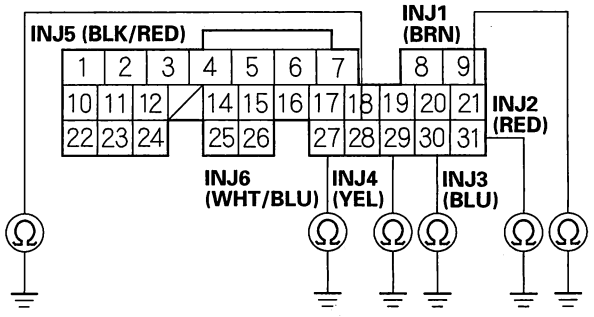
DTC Troubleshooting (cont'd)

50. Turn the ignition switch OFF.

51. Check for continuity between body ground and the appropriate ECM/PCM connector terminal (see table).

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

PROBLEM CYLINDER	DTC	ECM/PCM TERMINAL	WIRE COLOR
No. 1	P0301	E21	BRN
No. 2	P0302	E31	RED
No. 3	P0303	E30	BLU
No. 4	P0304	E29	YEL
No. 5	P0305	E28	BLK/RED
No. 6	P0306	E27	WHT/BLU

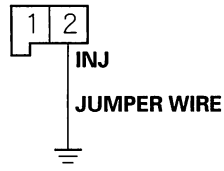
Is there continuity?

YES—Repair short in the wire between the ECM/PCM and the injector, then go to step 55.

NO—Go to step 52.

52. Connect appropriate injector 2P connector terminal No. 2 to body ground with a jumper wire (see table).

INJECTOR 2P CONNECTOR



Wire side of female terminals

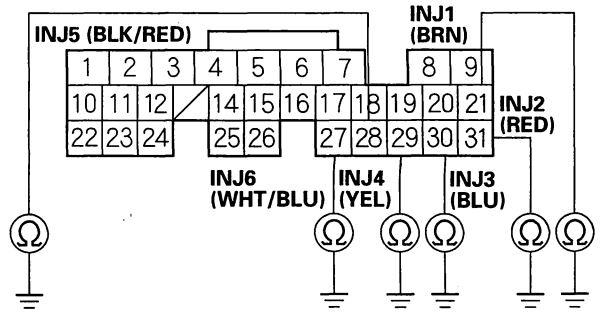
PROBLEM CYLINDER	DTC	WIRE COLOR
No. 1	P0301	BRN
No. 2	P0302	RED
No. 3	P0303	BLU
No. 4	P0304	YEL
No. 5	P0305	BLK/RED
No. 6	P0306	WHT/BLU

BACK

Protected by AR

53. Check for continuity between body ground and the appropriate ECM/PCM connector terminal (see table).

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

PROBLEM CYLINDER	DTC	ECM/PCM TERMINAL	WIRE COLOR
No. 1	P0301	E21	BRN
No. 2	P0302	E31	RED
No. 3	P0303	E30	BLU
No. 4	P0304	E29	YEL
No. 5	P0305	E28	BLK/RED
No. 6	P0306	E27	WHT/BLU

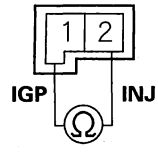
Is there continuity?

YES—Go to step 54.

NO—Repair open in the wire between the ECM/PCM and the injector, then go to step 55.

54. Measure resistance between injector 2P connector terminals No. 1 and No. 2.

INJECTOR 2P CONNECTOR



Terminal side of male terminals

Is there 10— 13 Ω ?

YES—Go to step 64.

NO—Replace the injector (see page 11-215), then go to step 55.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

55. Reconnect all connectors.

56. Turn the ignition switch ON (II).

57. Reset the ECM/PCM with the HDS.

58. Clear the CKP pattern with the HDS.

59. Do the ECM/PCM idle learn procedure (see page 11-302).

60. Do the CKP pattern learn procedure (see page 11-4).

61. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

    - Engine speed
    - Vehicle speed
    - Throttle position
    - CLV (calculated load value)

62. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0301, P0302, P0303, P0304, P0305, or P0306 are indicated, check for poor connections or loose terminals at the ignition coil, the injector, and the ECM/PCM, then go to troubleshooting DTC P0301, P0302, P0303, P0304, P0305, or P0306 (see page 11-112). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 63.

63. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 61 and recheck.

64. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

65. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

    - Engine speed
    - Vehicle speed
    - Throttle position
    - CLV (calculated load value)

66. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0301, P0302, P0303, P0304, P0305, or P0306 are indicated, check for poor connections or loose terminals at the injector, the ignition coil, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0325: Knock Sensor Circuit Malfunction

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

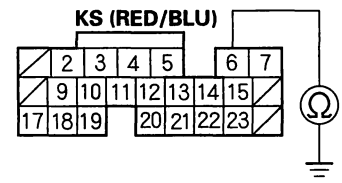
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Hold the engine speed at 3,000—4,000 rpm for at least 10 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0325 indicated?

   YES—Go to step 6.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the ECM/PCM. ■
6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect the knock sensor subharness 1P connector.
9. Disconnect ECM/PCM connector B (24P).
10. Check for continuity between ECM/PCM connector terminal B6 and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

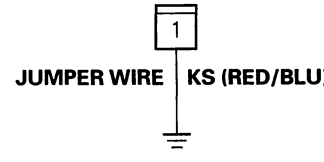
Is there continuity?

YES—Repair short in the wire between the ECM/PCM (B6) and the knock sensor subharness, then go to step 19.

NO—Go to step 11.

11. Connect the engine wire harness 1P connector (C154) terminal to body ground with a jumper wire.

ENGINE WIRE HARNESS 1P CONNECTOR (C154)



Wire side of female terminals

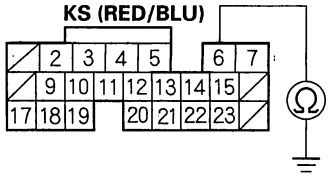
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

12. Check for continuity between ECM/PCM connector terminal B6 and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 13.

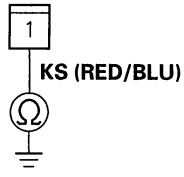
NO—Repair open in the wire between the ECM/PCM (B6) and the knock sensor subharness, then go to step 19.

13. Remove the intake manifold (see page 9-3).

14. Disconnect the knock sensor 1P connector.

15. Check for continuity between the knock sensor subharness 1P connector terminal and body ground.

KNOCK SENSOR SUBHARNESS 1P CONNECTOR



Wire side of female terminals

Is there continuity OK?

YES—Repair short in the knock sensor subharness, then go to step 18.

NO—Go to step 16.

16. Check the knock sensor subharness 1P connector and the knock sensor for an open.

Is the harness OK?

YES—Go to step 17.

NO—Repair open in the knock sensor subharness, then go to step 19.

17. Replace the knock sensor (see page 11-220).

18. Install the intake manifold (see page 9-4).

19. Reconnect all connectors.

20. Turn the ignition switch ON (II).

21. Reset the ECM/PCM with the HDS.

22. Do the ECM/PCM idle learn procedure (see page 11-302).

23. Hold the engine speed at 3,000—4,000 rpm for at least 10 seconds.

24. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—Go to step 26.

NO—Go to step 25.

25. Monitor the OBD STATUS for DTC P0325 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete.■

NO—If the screen indicates FAILED, go to step 1. If the screen indicates NOT COMPLETED, go to step 20 and recheck.

BACK

Protected by AR

26. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

27. Hold the engine speed at 3,000—4,000 rpm for at least 10 seconds.

28. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0325 is indicated, check for poor connections or loose terminals at the knock sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC P0335: CKP Sensor A No Signal

DTC P0385: CKP Sensor B No Signal

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to CKP sensor B.

1. Turn the ignition switch ON (II).

2. Clear the DTC with the HDS.

3. Start the engine.

4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0335 and/or P0385 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at CKP sensor A/B and the ECM/PCM.■

5. Turn the ignition switch OFF.

6. Disconnect the CKP sensor A/B 6P connector (see page 11-220).

7. Turn the ignition switch ON (II).

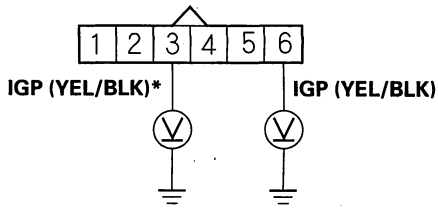
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

8. Measure voltage between CKP sensor A/B 6P connector terminal No. 6 (No. 3)* and body ground.

CKP SENSOR A/B 6P CONNECTOR



Wire side of female terminals

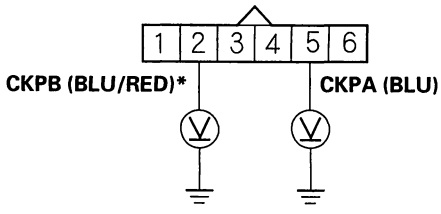
Is there battery voltage?

YES—Go to step 9.

NO—Repair open in the wire between CKP sensor A/B and PGM-FI main relay 1 (FI MAIN), then go to step 18.

9. Measure voltage between CKP sensor A/B 6P connector terminal No. 5 (No. 2)* and body ground.

CKP SENSOR A/B 6P CONNECTOR



Wire side of female terminals

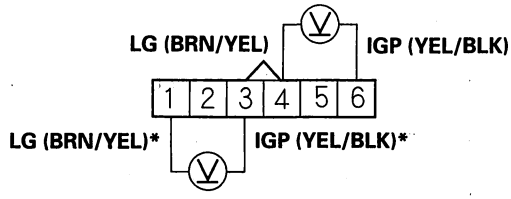
Is there about 5 V?

YES—Go to step 10.

NO—Go to step 11.

10. Measure voltage between CKP sensor A/B 6P connector terminal No. 4 (No. 1)* and No. 6 (No. 3)*.

CKP SENSOR A/B 6P CONNECTOR



Wire side of female terminals

Is there battery voltage?

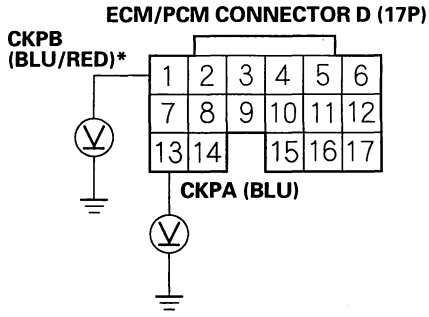
YES—Go to step 16.

NO—Repair open in the wire between CKP sensor A/B and G101, then go to step 18.

BACK

Protected by AR

11. Measure voltage between ECM/PCM connector terminal D13 (D1)* and body ground.



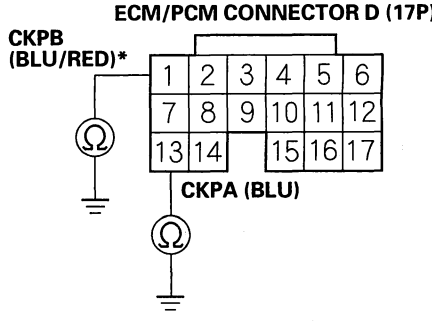
Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the ECM/PCM (D13 (D1)*) and CKP sensor A/B, then go to step 18.

NO—Go to step 12.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector D (17P).
15. Check for continuity between ECM/PCM connector terminal D13 (D1)* and body ground.



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (D13 (D1)*) and CKP sensor A/B, then go to step 18.

NO—Go to step 25.

16. Turn the ignition switch OFF.
17. Replace CKP sensor A/B (see page 11-220).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Clear the CKP pattern with the HDS.
22. Do the ECM/PCM idle learn procedure (see page 11-302).
23. Do the CKP pattern learn procedure (see page 11-4).
24. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0335 and/or P0385* is indicated, check for poor connections or loose terminals at CKP sensor A/B and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

25. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
26. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0335 and/or P0385* is indicated, check for poor connections or loose terminals at CKP sensor A/B and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC P0339: CKP Sensor A Intermittent Interruption

DTC P0389: CKP Sensor B Intermittent Interruption

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to CKP sensor B.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle 10 seconds.
4. Check the CKP A or B* NOISE count in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES—Go to step 7.

   NO—Go to step 5.
5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

   - Engine speed
   - Vehicle speed
6. Check the CKP A or B* NOISE count in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES—Go to step 7.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at CKP sensor A/B and the ECM/PCM. ■
7. Check for poor or loose connections at these connectors and terminals:

   - CKP sensor A/B
   - ECM/PCM
   - Engine ground
   - Body ground

   Are the connections OK?

   YES—Go to step 8.

   NO—Reconnect the connectors or terminals, then go to step 11.
8. Check for damage to the CKP sensor A/B pulse plate on the timing belt drive pulley (see page 6-3).

   Is there damage?

   YES—Replace the CKP sensor A/B pulse plate/ timing belt drive pulley (see page 6-3), then go to step 11.

   NO—Go to step 9.
9. Turn the ignition switch OFF.
10. Replace CKP sensor A/B (see page 11-220).
11. Turn the ignition switch ON (II).
12. Reset the ECM/PCM with the HDS.
13. Clear the CKP pattern with the HDS.
14. Do the ECM/PCM idle learn procedure (see page 11-302).
15. Do the CKP pattern learn procedure (see page 11-4).
16. Start the engine, and let it idle for 10 seconds.
17. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0339 and/or P0389 is indicated, check for poor connections or loose terminals at CKP sensor A/B and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

DTC P0340: CMP Sensor No Signal

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

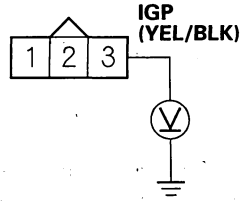
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0340 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Disconnect the CMP sensor 3P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between CMP sensor 3P connector terminal No. 3 and body ground.

CMP SENSOR 3P CONNECTOR



Wire side of female terminals

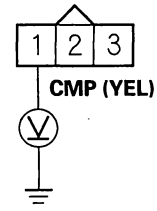
Is there battery voltage?

YES—Go to step 9.

NO—Repair open in the wire between the CMP sensor and PGM-FI main relay 1 (FI MAIN), then go to step 19.

9. Measure voltage between CMP sensor 3P connector terminal No. 1 and body ground.

CMP SENSOR 3P CONNECTOR



Wire side of female terminals

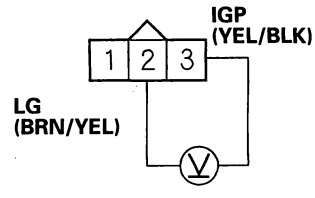
Is there about 5 V?

YES—Go to step 10.

NO—Go to step 11.

10. Measure voltage between CMP sensor 3P connector terminal No. 2 and No. 3.

CMP SENSOR 3P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Go to step 16.

NO—Repair open in the wire between the CMP sensor and G101, then go to step 19.

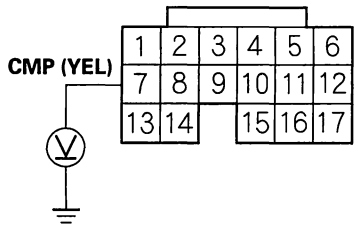
DTC Troubleshooting (cont'd)

11. Measure voltage between ECM/PCM connector terminal D7 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

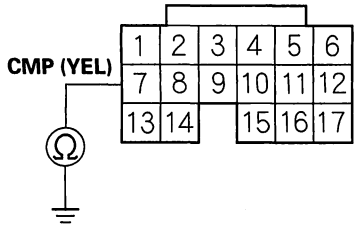
Is there about 5 V?

YES—Repair open in the wire between the ECM/PCM (D7) and the CMP sensor, then go to step 18.

NO—Go to step 12.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector D (17P).
15. Check for continuity between ECM/PCM connector terminal D7 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (D7) and the CMP sensor, then go to step 18.

NO—Go to step 26.

16. Turn the ignition switch OFF.
17. Replace the CMP sensor (see page 11-221).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Clear the CKP pattern with the HDS.
22. Do the ECM/PCM idle learn procedure (see page 11-302).
23. Do the CKP pattern learn procedure (see page 11-4).
24. Start the engine.
25. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0340 is indicated, check for poor connections or loose terminals at the CMP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

26. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
27. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0340 is indicated, check for poor connections or loose terminals at the CMP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0344: CMP Sensor Intermittent Interruption

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.
4. Check the CMP NOISE 2 count in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES—Go to step 7.

   NO—Go to step 5.
5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

   - Engine speed
   - Vehicle speed
6. Check the CMP NOISE 2 count in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES—Go to step 7.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM. ■
7. Check for poor or loose connections at these connectors and terminals:

   - CMP sensor
   - ECM/PCM
   - Engine ground
   - Body ground

   Are the connections OK?

   YES—Go to step 8.

   NO—Reconnect the connectors or terminals, then go to step 11.
8. Check for damage to the CMP sensor pulse projection on the front camshaft pulley (see page 11-221).

   Is there damage?

   YES—Replace the front camshaft pulley (see page 11-221), then go to step 11.

   NO—Go to step 9.
9. Turn the ignition switch OFF.
10. Replace the CMP sensor (see page 11-221).
11. Turn the ignition switch ON (II).
12. Reset the ECM/PCM with the HDS.
13. Clear the CKP pattern with the HDS.
14. Do the ECM/PCM idle learn procedure (see page 11-302).
15. Do the CKP pattern learn procedure (see page 11-4).
16. Start the engine, and let it idle for 10 seconds.
17. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0344 is indicated, check for poor connections or loose terminals at the CKP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

DTC Troubleshooting (cont'd)

DTC P0562: Charging System Low Voltage (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If any high current load accessories are installed, this DTC can be set.
- If DTC P16BB and/or P16BC is stored at the same time as DTC P0562, troubleshoot DTC P16BB and/or P16BC first, then recheck for DTC P0562.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
5. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0562 indicated?

   YES—Replace the alternator (see page 4-38), then go to step 7.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, and check the battery performance, refer to the 2003-2006 Accord Service Manual (see page 22-78). ■
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see page 11-302).
10. Start the engine.
11. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
12. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
13. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0562 is indicated, check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

DTC P0563: ECM/PCM Power Source Circuit Unexpected Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

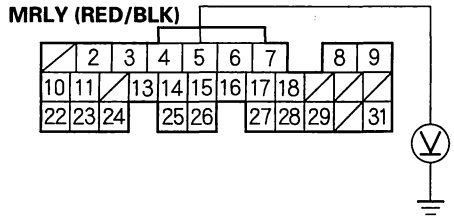
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0563 indicated?

   YES—Go to step 7.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the No. 8 FI-ECU (ECM/PCM) (15 A) fuse in the under-hood fuse/relay box and the ECM/PCM. ■
7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (31P).
10. Measure voltage between ECM/PCM connector terminal A5 and body ground.

ECM/PCM CONNECTOR A (31P)



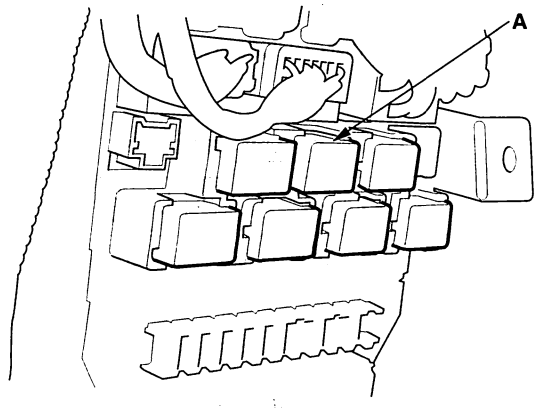
Wire side of female terminals

Is there battery voltage?

YES—Go to step 13.

NO—Go to step 11.

11. Remove the left kick panel, refer to the 2003-2006 Accord Service Manual 2-door (see page 20-90); 4-door (see page 20-91). Then remove PGM-FI main relay 1 (FI MAIN) (A) from the under-dash fuse/relay box.



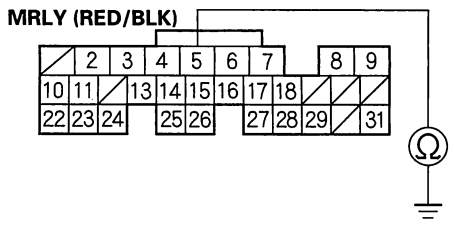
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

12. Check for continuity between ECM/PCM connector terminal A5 and body ground.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there continuity?

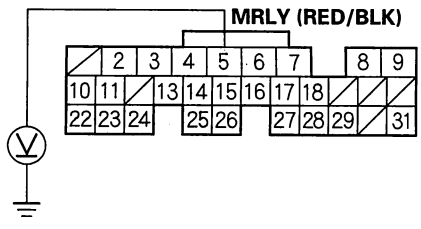
YES—Repair short in the wire between the ECM/PCM (A5) and PGM-FI main relay 1 (FI MAIN), then go to step 20.

NO—Go to step 19.

13. Reconnect ECM/PCM connector A (31P).

14. Measure voltage between ECM/PCM connector terminal A5 and body ground.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there battery voltage?

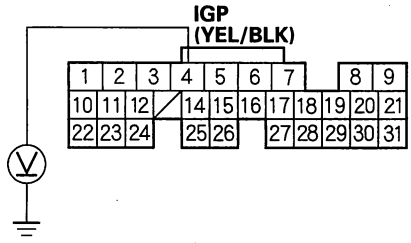
YES—Go to step 15.

NO—Go to step 27.

15. Disconnect ECM/PCM connector E (31P).

16. Measure voltage between ECM/PCM connector terminal E4 and body ground.

ECM/PCM CONNECTOR E (31P)



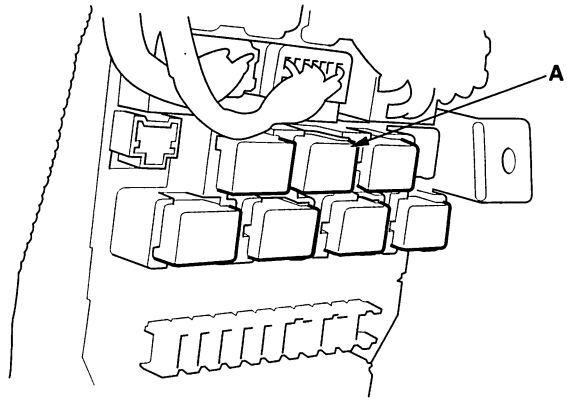
Wire side of female terminals

Is there battery voltage?

YES—Go to step 17.

NO—Go to step 27.

17. Remove the left kick panel, refer to the 2003-2006 Accord Service Manual 2-door (see page 20-90); 4-door (see page 20-91). Then remove PGM-FI main relay 1 (FI MAIN) (A) from the under-dash fuse/relay box.

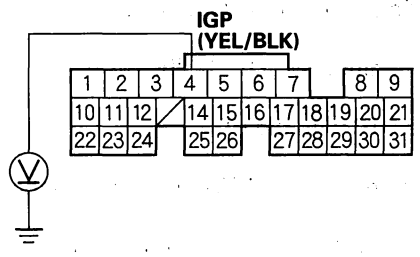


BACK

Protected by AR

18. Measure voltage between ECM/PCM connector terminal E4 and body ground.

ECM/PCM CONNECTOR E (31P)



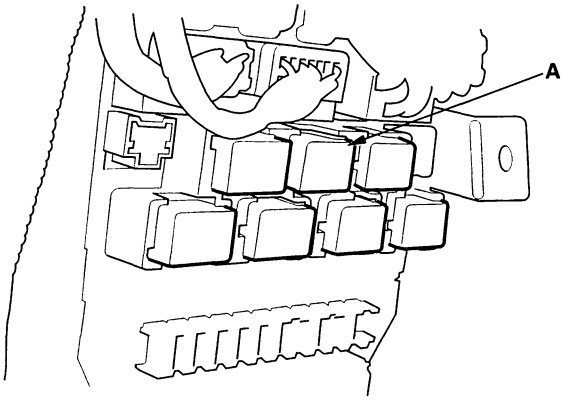
Wire side of female terminals

Is there battery voltage?

YES—Repair short to power in the wire between the ECM/PCM (E4) and PGM-FI main relay 1 (FI MAIN), then go to step 20.

NO—Go to step 19.

19. Replace PGM-FI main relay 1 (FI MAIN).



20. Reconnect all connectors.

21. Turn the ignition switch ON (II).

22. Reset the ECM/PCM with the HDS.

23. Turn the ignition switch OFF.

24. Wait 10 seconds.

25. Do the ECM/PCM idle learn procedure (see page 11-302).

26. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0563 is indicated, check for poor connections or loose terminals at PGM-FI main relay 1 (FI MAIN) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

27. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

28. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0563 is indicated, check for poor connections or loose terminals at PGM-FI main relay 1 (FI MAIN) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC P0602: ECM/PCM Programming Error (2006 model)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- This DTC is indicated when update is not completed.
- Do not turn the ignition switch OFF while updating the ECM/PCM. If you turn the ignition switch OFF before completion, the ECM/PCM can be damaged.

1. Do the ECM/PCM update procedure (see page 11-6).
2. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0602 indicated?

   YES—Replace the original ECM/PCM (see page 11-224).■

   NO—Update is complete.■

DTC P0603: ECM/PCM Internal Control Module Keep Alive Memory (KAM) Error

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224).■

   NO—Intermittent failure, system is OK at this time.■

BACK

Protected by AR

DTC P0630: VIN Not Programmed or Mismatch (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- This DTC is stored only when the ECM/PCM does not have the VIN information of the vehicle. Use the HDS to input the missing VIN information.

1. Turn the ignition switch ON (II).
2. Check the VIN with the HDS.

   Does the HDS show the vehicle's VIN?

   YES—Go to step 5.

   NO—Go to step 3.
3. Input the VIN to the ECM/PCM with the HDS.

   Does the screen show COMPLETE?

   YES—Go to step 5.

   NO—Go to step 4.
4. Check for DTCs with the HDS.

   Is DTC P0603 indicated?

   YES—Go to the DTC P0603 troubleshooting. ■

   NO—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■
5. Clear the DTC with the HDS.
6. Turn the ignition switch OFF.
7. Turn the ignition switch ON (II), and wait 5 seconds.
8. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—If DTC P0630 is indicated, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting. ■

   NO—Intermittent failure, system is OK at this time. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC P0641: Sensor Reference Voltage A Malfunction (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0641 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the ECM/PCM and these connectors: ■

   - MAP sensor
   - APP sensor
   - IMT (IMRC) actuator
   - EGR valve
   - FTP sensor
   - Input shaft (mainshaft) speed sensor
   - Output shaft (countershaft) speed sensor

4. Turn the ignition switch OFF.
5. Disconnect the MAP sensor 3P connector.
6. Turn the ignition switch ON (II).
7. Clear the DTC with the HDS.
8. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0641 indicated?

   YES—Go to step 9.

   NO—Replace the MAP sensor (see page 11-223), then go to step 43.

9. Turn the ignition switch OFF.
10. Disconnect the APP sensor 6P connector.
11. Turn the ignition switch ON (II).
12. Clear the DTC with the HDS.
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0641 indicated?

    YES—Go to step 14.

    NO—Replace the APP sensor (see page 11-278), then go to step 43.

BACK

Protected by AR

14. Turn the ignition switch OFF.
15. Disconnect the IMT (IMRC) actuator 5P connector.
16. Turn the ignition switch ON (II).
17. Clear the DTC with the HDS.
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0641 indicated?

    YES—Go to step 19.

    NO—Replace the IMT (IMRC) actuator (see page 11-346), then go to step 43.
19. Turn the ignition switch OFF.
20. Disconnect the EGR valve 6P connector.
21. Turn the ignition switch ON (II).
22. Clear the DTC with the HDS.
23. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0641 indicated?

    YES—Go to step 24.

    NO—Replace the EGR valve (see page 11-368), then go to step 43.
24. Turn the ignition switch OFF.
25. Disconnect the FTP sensor 3P connector.
26. Turn the ignition switch ON (II).
27. Clear the DTC with the HDS.
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0641 indicated?

    YES—Go to step 29.

    NO—Replace the FTP sensor (see page 11-403), then go to step 43.
29. Turn the ignition switch OFF.
30. Disconnect the input shaft (mainshaft) speed sensor 3P connector.
31. Turn the ignition switch ON (II).
32. Clear the DTC with the HDS.
33. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0641 indicated?

    YES—Go to step 34.

    NO—Replace the input shaft (mainshaft) speed sensor (see page 11-222), then go to step 43.
34. Turn the ignition switch OFF.
35. Disconnect the output shaft (countershaft) speed sensor 3P connector.
36. Turn the ignition switch ON (II).
37. Clear the DTC with the HDS.
38. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0641 indicated?

    YES—Go to step 39.

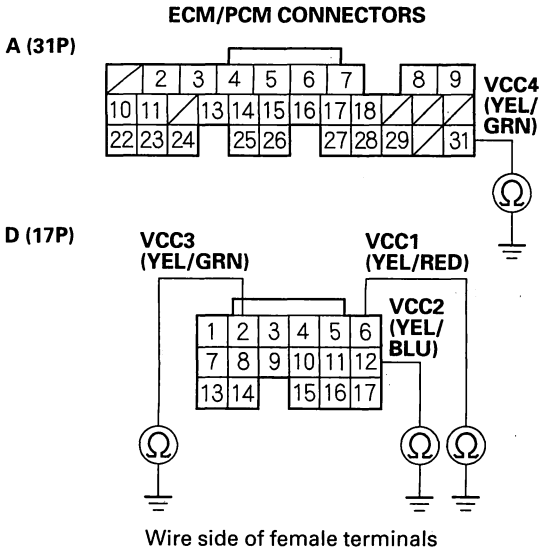
    NO—Replace the output shaft (countershaft) speed sensor (see page 11-222), then go to step 43.
39. Turn the ignition switch OFF.
40. Jump the SCS line with the HDS.
41. Disconnect ECM/PCM connectors A (31P) and D (17P).

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

42. Check for continuity between body ground and ECM/PCM connector terminals A31, D2, D6 and D12 individually.



Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A31, D2, D6, or D12) and each sensor, then go to step 43.

NO—Go to step 49.

43. Turn the ignition switch OFF.

44. Reconnect all connectors.

45. Turn the ignition switch ON (II).

46. Reset the ECM/PCM with the HDS.

47. Do the ECM/PCM idle learn procedure (see page 11-302).

48. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0641 is indicated, check for poor connections or loose terminals at the ECM/PCM and these connectors:

- MAP sensor
- APP sensor
- IMT (IMRC) actuator
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

After checking above, go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

BACK

Protected by AR

49. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

50. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0641 is indicated, check for poor connections or loose terminals at the ECM/PCM and these connectors:

    - MAP sensor
    - APP sensor
    - IMT (IMRC) actuator
    - EGR valve
    - FTP sensor
    - Input shaft (mainshaft) speed sensor
    - Output shaft (countershaft) speed sensor

    After checking above, go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC P0685: ECM/PCM Power Control Circuit/ Internal Circuit Malfunction

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If the problem does not return after clearing the DTC, or if this DTC intermittently stored, check for loose terminals at the IGP line connectors before you replace the ECM/PCM.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/ PCM (see page 11-6), then recheck. If the symptom/ indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224).■

   NO—Intermittent failure, system is OK at this time.■

DTC P0700: A/T Control System Malfunction

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- This DTC is stored when there is a problem in the A/T control system. Check for A/T DTCs with the HDS, and go to the indicated DTC's troubleshooting.

DTC P0715: Input shaft (Mainshaft) Speed Sensor Circuit Malfunction

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

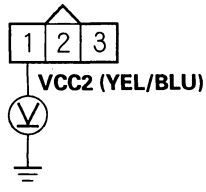
1. Start the engine, and let it idle.
2. Check the M SHAFT SPD in the DATA LIST with the HDS.

   Is any input shaft (mainshaft) speed indicated?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the ECM. ■

   NO—Go to step 3.
3. Turn the ignition switch OFF.
4. Disconnect the input shaft (mainshaft) speed sensor 3P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between input shaft (mainshaft) speed sensor 3P connector terminal No. 1 and body ground.

INPUT SHAFT (MAINSHAFT) SPEED SENSOR 3P CONNECTOR



Wire side of female terminals

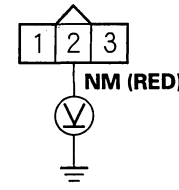
Is there about 5 V?

YES—Go to step 7.

NO—Repair open in the wire between the ECM (D12) and the input shaft (mainshaft) speed sensor, then go to step 16.

7. Measure voltage between input shaft (mainshaft) speed sensor 3P connector terminal No. 2 and body ground.

INPUT SHAFT (MAINSHAFT) SPEED SENSOR 3P CONNECTOR



Wire side of female terminals

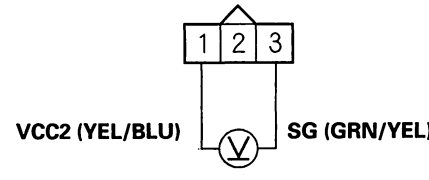
Is there about 5 V?

YES—Go to step 8.

NO—Go to step 9.

8. Measure voltage between input shaft (mainshaft) speed sensor 3P connector terminal No. 1 and No. 3.

INPUT SHAFT (MAINSHAFT) SPEED SENSOR 3P CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Go to step 14.

NO—Repair open in the wire between the ECM (D10) and the input shaft (mainshaft) speed sensor, then go to step 16.

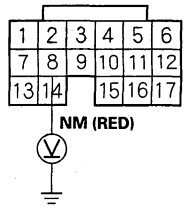
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

9. Measure voltage between ECM connector terminal D8 and body ground.

ECM CONNECTOR D (17P)



Wire side of female terminals

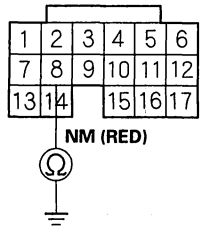
Is there about 5 V?

YES—Repair open in the wire between the ECM (D8) and the input shaft (mainshaft) speed sensor, then go to step 16.

NO—Go to step 10.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector D (17P).
13. Check for continuity between ECM connector terminal D8 and body ground.

ECM CONNECTOR D (17P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM (D8) and the input shaft (mainshaft) speed sensor, then go to step 16.

NO—Go to step 22.

14. Turn the ignition switch OFF.
15. Replace the input shaft (mainshaft) speed sensor (see page 11-222).
16. Reconnect all connectors.
17. Turn the ignition switch ON (II).
18. Reset the ECM with the HDS.
19. Do the ECM idle learn procedure (see page 11-302).
20. Test-drive under these conditions:

- Engine coolant temperature above 158 °F (70 °C)
- Transmission in 3rd gear
- Engine speed at 2,000—3,000 rpm
- Drive for several minutes

21. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0715 is indicated, check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the ECM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete.■

22. Update the ECM if it does not have the latest software, or substitute a known-good ECM (see page 11-6).
23. Test-drive under these conditions:

- Engine coolant temperature above 158 °F (70 °C)
- Transmission in 3rd gear
- Engine speed at 2,000—3,000 rpm
- Drive for several minutes

24. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0715 is indicated, check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the ECM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see page 11-224).■

DTC P0720: Output Shaft (Countershaft) Speed Sensor Circuit Malfunction

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
2. Test-drive the vehicle several miles.
3. Check the C SHAFT SPD in the DATA LIST with the HDS.

   Is any vehicle speed indicated?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM. ■

   NO—Go to step 4.
4. Turn the ignition switch OFF.
5. Disconnect the output shaft (countershaft) speed sensor 3P connector.
6. Turn the ignition switch ON (II).
7. Measure voltage between output shaft (countershaft) speed sensor 3P connector terminal No. 1 and body ground.

   OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR 3P CONNECTOR

   Wire side of female terminals

   Is there about 5 V?

   YES—Go to step 8.

   NO—Repair open in the wire between the ECM (D6) and the output shaft (countershaft) speed sensor, then go to step 17.
8. Measure voltage between output shaft (countershaft) speed sensor 3P connector terminal No. 2 and body ground.

   OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR 3P CONNECTOR

   Wire side of female terminals

   Is there about 5 V?

   YES—Go to step 9.

   NO—Go to step 10.

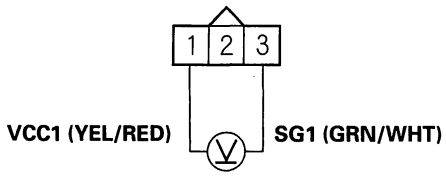
DTC Troubleshooting (cont'd)

9. Measure voltage between output shaft (countershaft) speed sensor 3P connector terminals No. 1 and No. 3.

OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR 3P CONNECTOR



Wire side of female terminals

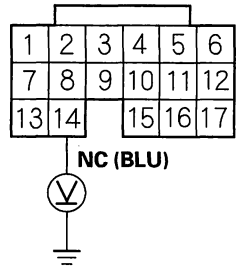
Is there about 5 V?

YES—Go to step 15.

NO—Repair open in the wire between the ECM (D4) and the output shaft (countershaft) speed sensor, then go to step 17.

10. Measure voltage between ECM connector terminal D14 and body ground.

ECM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the ECM (D14) and the output shaft (countershaft) speed sensor, then go to step 17.

NO—Go to step 11.

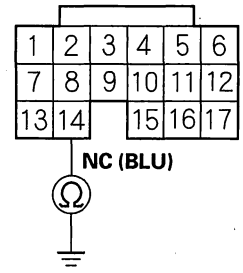
11. Turn the ignition switch OFF.

12. Jump the SCS line with the HDS.

13. Disconnect ECM connector D (17P).

14. Check for continuity between ECM connector terminal D14 and body ground.

ECM CONNECTOR D (17P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM (D14) and the output shaft (countershaft) speed sensor, then go to step 17.

NO—Go to step 24.

BACK

Protected by AR

15. Turn the ignition switch OFF.

16. Replace the output shaft (countershaft) speed sensor (see page 11-222).

17. Reconnect all connectors.

18. Turn the ignition switch ON (II).

19. Reset the ECM with the HDS.

20. Do the ECM idle learn procedure (see page 11-302).

21. Test-drive under these conditions:

    - Engine coolant temperature above 158 °F (70 °C)
    - Transmission in 5th gear
    - Engine speed at 2,000—3,000 rpm
    - Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds

22. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0720 is indicated, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 22.

23. Monitor the OBD STATUS for DTC P0720 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, go to step 20 and recheck.

24. Update the ECM if it does not have the latest software, or substitute a known-good ECM (see page 11-6).

25. Test-drive under these conditions:

    - Engine coolant temperature above 158 °F (70 °C)
    - Transmission in 5th gear
    - Engine speed at 2,000—3,000 rpm
    - Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds

26. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0720 is indicated, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see page 11-224). ■

DTC P1116: ECT Sensor 1 Performance Problem (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P0111 is stored at the same time as DTC P1116, troubleshoot DTC P0111 first, then recheck for DTC P1116.

1. Check for poor connections or loose terminals at ECT sensor 1 and ECT sensor 2.

   Are the connections and terminals OK?

   YES—Go to step 2.

   NO—Repair the connectors or terminals, then go to step 27.

2. Turn the ignition switch ON (II).

3. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P1116 and P2183 indicated at the same time?

   YES—Go to step 15.

   NO—Go to step 4.

4. Start the engine, and let it idle for 10 minutes.

5. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 129 °F (54 °C) or less, or 1.54 V or more indicated?

   YES—Replace ECT sensor 1 (see page 11-219), then go to step 27.

   NO—Go to step 6.

6. Turn the ignition switch OFF.

7. Drain the coolant (see page 10-6).

8. Remove ECT sensor 1 (see page 11-219).

9. Allow ECT sensor 1 to cool to 77 °F (25 °C).

10. Note the ambient temperature.

11. Connect ECT sensor 1 to the 2P connector, but do not install it on in the engine.

12. Turn the ignition switch ON (II).

13. Note the value of ECT SENSOR 1 quickly in the DATA LIST with the HDS.

14. Compare the value of ECT SENSOR 1 and the ambient temperature.

    Does the value of ECT SENSOR 1 differ 5.4 °F (3 °C) or more?

    YES—Replace ECT sensor 1 (see page 11-219), then go to step 27.

    NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. ■

15. Start the engine, and let it idle for 10 minutes.

16. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 118 °F (48 °C) or less, or 1.75 V or more indicated?

    YES—Replace ECT sensor 1 (see page 11-219), then go to step 27.

    NO—Go to step 17.

17. Let the engine idle for 10 minutes.

18. Check ECT SENSOR 2 in the DATA LIST with the HDS.

    Is about 131 °F (55 °C) or less, or 1.50 V or more indicated?

    YES—Replace ECT sensor 2 (see page 11-223), then go to step 27.

    NO—Go to step 19.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

19. Turn the ignition switch OFF.
20. Drain the coolant (see page 10-6).
21. Remove ECT sensor 1 (see page 11-219), and ECT sensor 2 (see page 11-223).
22. Allow the sensors to cool to 77 °F (25 °C).
23. Note the ambient temperature.
24. Connect ECT sensor 1 to the 2P connector, and ECT sensor 2 to the 2P connector, but do not install them into the engine.
25. Note the value of ECT SENSOR 1 and ECT SENSOR 2 quickly in the DATA LIST with the HDS.
26. Compare the value of ECT SENSOR 1 and the ambient temperature, and the value of ECT SENSOR 2 and the ambient temperature individually.

    Does one of the sensors differ more than 5.4 °F (3 °C) from the ambient temperature?

    YES—Replace the sensor, that differed more than 5.4 °F (3 °C) from the ambient temperature, then go to step 27.

    NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. ■
27. Turn the ignition switch ON (II).
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see page 11-302).
30. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1116 is indicated, check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

DTC P1128: MAP Sensor Signal Lower Than Expected

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is there less than 54.1 kPa (16.0 in.Hg, 406 mmHg) or 1.61 V held for more than 5 seconds?

   YES—Go to step 7.

   NO—Go to step 3.
3. Clear the DTC with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Test-drive under these conditions:

   - Engine coolant temperature above 158 °F (70 °C)
   - Engine speed between 1,400 and 6,500 rpm
   - A/T in D position (M/T in 3rd gear)
   - Vehicle speed accelerated from 16 mph (25 km/h) to 31 mph (50 km/h) under half throttle
6. Monitor the OBD STATUS for DTC P1128 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 7.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 4 and recheck.
7. Turn the ignition switch OFF.
8. Replace the MAP sensor (see page 11-223).
9. Turn the ignition switch ON (II).
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see page 11-302).
12. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
13. Test-drive under these conditions:

    - Engine coolant temperature above 158 °F (70 °C)
    - Engine speed between 1,400 and 6,500 rpm
    - A/T in D position (M/T in 3rd gear)
    - Vehicle speed accelerated from 16 mph (25 km/h) to 31 mph (50 km/h) under half throttle
14. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1128 is indicated, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 15.
15. Monitor the OBD STATUS for DTC P1128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 13 and recheck.

Protected by AR

DTC Troubleshooting (cont'd)

DTC P1129: MAP Sensor Signal Higher than Expected

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Check for vacuum leaks in these parts:

   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold
   - Brake booster hose

   Are there any vacuum leaks?

   YES—Repair or replace parts with vacuum leaks, then go to step 9.

   NO—Go to step 2.

2. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

3. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is there more than 36.9 kPa (11.0 in.Hg, 277 mmHg) or 1.14 V held for more than 5 seconds?

   YES—Go to step 7.

   NO—Go to step 4.

4. Clear the DTC with the HDS.

5. Test-drive under these conditions:

   - Engine coolant temperature above 158 °F (70 °C)
   - Engine speed between 1,400 and 6,500 rpm
   - A/T in D position (M/T in 5th gear)
   - Vehicle speed decelerated from more than 50 mph (80 km/h) with the throttle fully closed for at least 5 seconds

6. Monitor the OBD STATUS for DTC P1129 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 7.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 5 and recheck.

7. Turn the ignition switch OFF.

8. Replace the MAP sensor (see page 11-223).

9. Turn the ignition switch ON (II).

10. Reset the ECM/PCM with the HDS.

11. Do the ECM/PCM idle learn procedure (see page 11-302).

12. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

13. Test-drive under these conditions:

    - Engine coolant temperature above 158 °F (70 °C)
    - Engine speed between 1,400 and 6,500 rpm
    - A/T in D position (M/T in 5th gear)
    - Vehicle speed decelerated from more than 50 mph (80 km/h) with the throttle fully closed for at least 5 seconds

14. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1129 is indicated, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 15.

BACK

Protected by AR

15. Monitor the OBD STATUS for DTC P1129 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 12 and recheck.

Protected by AR

DTC Troubleshooting (cont'd)

DTC P1172: Rear A/F Sensor (Bank 1, Sensor 1) Out of Range High (2005-2006 models)

DTC P1174: Front A/F Sensor (Bank 2, Sensor 1) Out of Range High (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Monitor the OBD STAUS for P1172 and/or P1174* in the DTCs MENU with the HDS.

   Dose the screen indicate FAILED?

   YES—Go to step 5.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.
5. Turn the ignition switch OFF.
6. Replace the A/F sensor (Sensor 1) (see page 11-217).
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see page 11-302).
10. Start the engine. Hold the engine speed at 3,000 rpm withtout load (in Park or neutral) until the radiator fan comes on, then let it idle.
11. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1172 and/or P1174* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 12.
12. Monitor the OBD STATUS for DTC P1172 and/or P1174* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 10 and recheck.

DTC P1297: ELD Circuit Low Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Check the ELD in the DATA LIST with the HDS.

   Is 72 A or more indicated?

   YES—Go to step 3.

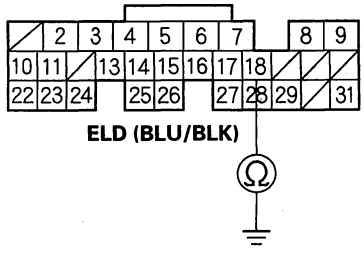
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the ELD and the ECM/PCM. ■
3. Turn the ignition switch OFF.
4. Disconnect the ELD 3P connector.
5. Turn the ignition switch ON (II).
6. Check the ELD in the DATA LIST with the HDS.

   Is 72 A or more indicated?

   YES—Go to step 7.

   NO—Go to step 11.
7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (31P).
10. Check for continuity between ECM/PCM connector terminal A18 and body ground.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A18) and the ELD, then go to step 13.

NO—Go to step 20.

11. Turn the ignition switch OFF.
12. Replace the under-hood fuse/relay box (see page 22-44).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see page 11-302).
17. Start the engine.
18. Turn on the headlights.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

19. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1297 is indicated, check for poor connections or loose terminals at the ELD and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

20. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

21. Start the engine.

22. Turn on the headlights.

23. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1297 is indicated, check for poor connections or loose terminals at the ELD and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

BACK

Protected by AR

DTC P1298: ELD Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

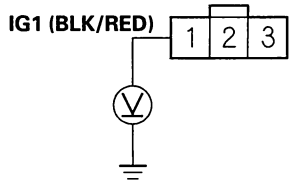
1. Start the engine, and let it idle.
2. Check the ELD in the DATA LIST with the HDS.

   Is 0.2 A or less indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the ELD and the ECM/PCM. ■
3. Turn the ignition switch OFF.
4. Disconnect the ELD 3P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between ELD 3P connector terminal No. 1 and body ground.

ELD 3P CONNECTOR



Wire side of female terminals

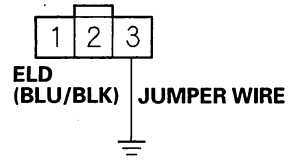
Is there battery voltage?

YES—Go to step 7.

NO—Repair open in the wire between the No. 18 ACG (15 A) fuse and the ELD, then go to step 14.

7. Turn the ignition switch OFF.
8. Connect ELD 3P connector terminal No. 3 to body ground with a jumper wire.

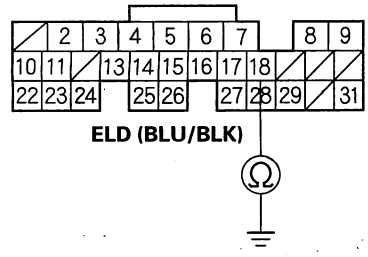
ELD 3P CONNECTOR



Wire side of female terminals

9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector A (31P).
11. Check for continuity between ECM/PCM connector terminal A18 and body ground.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there continuity?

YES—Go to step 12.

NO—Repair open in the wire between the ECM/PCM (A18) and the ELD, then go to step 14.

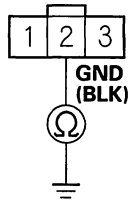
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

12. Check for continuity between ELD 3P connector terminal No. 2 and body ground.

ELD 3P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 13.

NO—Repair open in the wire between the ELD and G302, then go to step 14.

13. Replace the under-hood fuse/relay box (see page 22-44).

14. Reconnect all connectors.

15. Turn the ignition switch ON (II).

16. Reset the ECM/PCM with the HDS.

17. Do the ECM/PCM idle learn procedure (see page 11-302).

18. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—Go to step 19.

NO—Troubleshooting is complete. ■

19. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

20. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P1298 is indicated, check for poor connections or loose terminals at the ELD and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P1549: Charging System High Voltage (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If a high voltage battery (24 V, etc.) is connected to the vehicle, this DTC can be stored.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C off
   - Headlights off
   - Rear window defogger off
5. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1549 indicated?

   YES—Replace the alternator (see page 4-38), then go to step 7.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box. ■
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see page 11-302).
10. Start the engine.
11. Check under these conditions:
    - A/C off
    - Headlights off
    - Rear window defogger off
12. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
13. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1549 is indicated, check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC P16BB: Alternator B Terminal Circuit Low Voltage
(2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
5. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P16BB indicated?

   YES—Go to step 7.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, and check the battery performance, refer to the 2003-2006 Accord Service Manual (see page 22-78). ■
7. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box (+B line).

   Are the connections and terminals OK?

   YES—Go to step 8.

   NO—Repair the connectors or terminals, then go to step 9.
8. Check for an open in the wire between the alternator and under-hood fuse/relay box at the starter subharness.

   Is the harness OK?

   YES—Relace the alternator (see page 4-38), then go to step 9.

   NO—Repair open in the wire between the alternator and the under-hood fuse/relay box, then go to step 9.
9. Turn the ignition switch ON (II).
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see page 11-302).
12. Start the engine.
13. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
14. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
15. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P16BB is indicated, check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

BACK

DTC P16BC: Alternator FR Terminal Circuit/ IGP Circuit Low Voltage (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Check for poor connections at the alternator 4P connector.

   Are the connections OK?

   YES—Go to step 2.

   NO—Reconnect the connector, then go to step 18.

2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS.
4. Start the engine.
5. Check under these conditions:

   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam

6. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
7. Check for Temporary DTCs or DTCs with the HDS.

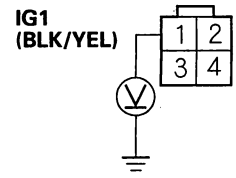
   Is DTC P16BC indicated?

   YES—Go to step 8.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the alternator. ■

8. Turn the ignition switch OFF.
9. Disconnect the alternator 4P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between alternator 4P connector terminal No. 1 and body ground.

ALTERNATOR 4P CONNECTOR



Wire side of female terminals

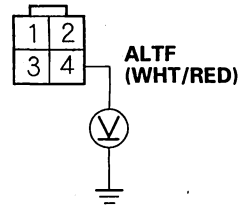
Is there battery voltage?

YES—Go to step 12.

NO—Repair open in the wire between the alternator (IG1 line) and the No. 18 ACG (15 A) fuse in under-dash fuse/relay box, then go to step 18.

12. Measure voltage between alternator 4P connector terminal No. 4 and body ground.

ALTERNATOR 4P CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Replace the alternator (see page 4-38), then go to step 18.

NO—Go to step 13.

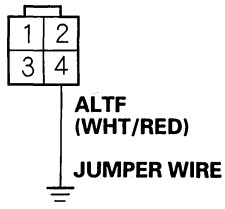
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

13. Turn the ignition switch OFF.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector E (31P).
16. Connect alternator 4P connector terminal No. 4 to body ground with a jumper wire.

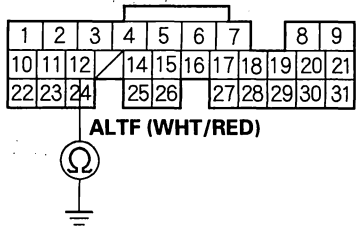
ALTERNATOR 4P CONNECTOR



Wire side of female terminals

17. Check for coutinuity between ECM/PCM connector terminal E12 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there continuity?

YES—Go to step 26.

NO—Repair open in the wire between the ECM/PCM (E12) and the alternator, then go to step 18.

18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see page 11-302).
22. Start the engine.
23. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
24. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
25. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P16BC is indicated, check for poor connections or loose terminals at the alternator and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

BACK

Protected by AR

26. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

27. Start the engine.

28. Check under these conditions:

    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam

29. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.

30. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P16BC is indicated, check for poor connections or loose terminals at the alternator and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P2183: ECT Sensor 2 Circuit Range/ Performance Problem (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P0111 is stored at the same time as DTC P2183, troubleshoot DTC P0111 first, then recheck for DTC P2183.

1. Check for poor connections or loose terminals at ECT sensor 1 and ECT sensor 2.

   Are the connections and terminals OK?

   YES—Go to step 2.

   NO—Repair the connectors or terminals, then go to step 27.

2. Turn the ignition switch ON (II).

3. Check for Temporary DTC s or DTCs with the HDS.

   Are DTC P1116 and P2183 indicated at the same time?

   YES—Go to step 15.

   NO—Go to step 4.

4. Start the engine, and let it idle for 10 minutes.

5. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about 131 °F (55 °C) or less, or 1.50 V or more indicated?

   YES—Replace ECT sensor 2 (see page 11-223), then go to step 27.

   NO—Go to step 6.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

6. Turn the ignition switch OFF.
7. Drain the coolant (see page 10-6).
8. Remove ECT sensor 2 (see page 11-223).
9. Allow ECT sensor 2 to cool to 77 °F (25 °C).
10. Note the ambient temperature.
11. Connect ECT sensor 2 to the 2P connector, but do not install it on the engine.
12. Turn the ignition switch ON (II).
13. Note the value of ECT SENSOR 2 quickly in the DATA LIST with the HDS.
14. Compare the value of ECT SENSOR 2 and the ambient temperature.

    Does ECT SENSOR 2 differ 5.4 °F (3 °C) or more?

    YES—Replace ECT sensor 2 (see page 11-223), then go to step 27.

    NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. ■
15. Start the engine, and let it idle for 10 minutes.
16. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 118 °F (48 °C) or less, or 1.75 V or more indicated?

    YES—Replace ECT sensor 1 (see page 11-219), then go to step 27.

    NO—Go to step 17.
17. Let the engine idle for 10 minutes.
18. Check ECT SENSOR 2 in the DATA LIST with the HDS.

    Is about 131 °F (55 °C) or less, or 1.50 V or more indicated?

    YES—Replace ECT sensor 2 (see page 11-223), then go to step 27.

    NO—Go to step 19.
19. Turn the ignition switch OFF.
20. Drain the coolant (see page 10-6).
21. Remove ECT sensor 1 (see page 11-219), and ECT sensor 2 (see page 11-223).
22. Allow the sensors to cool to 77 °F (25 °C).
23. Note the ambient temperature.

BACK

Protected by AR

24. Connect ECT sensor 1 to the 2P connector, and ECT sensor 2 to the 2P connector, but do not install them into the engine.

25. Note the value of ECT SENSOR 1 and ECT SENSOR 2 quickly in the DATA LIST with the HDS.

26. Compare the value of ECT SENSOR 1 and the ambient temperature, and the value of ECT SENSOR 2 and the ambient temperature individually.

    Does one of the sensors differ more than 5.4 °F (3 °C) from the ambient temperature?

    YES—Replace the sensor that differed more than 5.4 °F (3 °C) from the ambient temperature, then go to step 27.

    NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. ■

27. Turn the ignition switch ON (II).

28. Reset the ECM/PCM with the HDS.

29. Do the ECM/PCM idle learn procedure (see page 11-302).

30. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2183 is indicated, check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

DTC P2184: ECT Sensor 2 Circuit Low Voltage (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).

2. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM. ■

3. Turn the ignition switch OFF.

4. Disconnect ECT sensor 2 2P connector.

5. Turn the ignition switch ON (II).

6. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about 356 °F (180 °C) or more, or 0.08 V or less indicated?

   YES—Go to step 7.

   NO—Go to step 11.

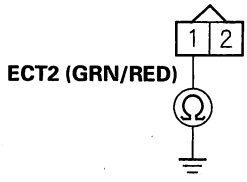
Protected by AR

DTC Troubleshooting (cont'd)

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector B (24P).
10. Check for continuity between ECT sensor 2 2P connector terminal No. 1 and body ground.

ECT SENSOR 2 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between ECT sensor 2 and the ECM/PCM (B17), then go to step 13.

NO—Go to step 18.

11. Turn the ignition switch OFF.
12. Replace ECT sensor 2 (see page 11-223).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see page 11-302).
17. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2184 is indicated, check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■
18. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
19. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2184 is indicated, check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P2185: ECT Sensor 2 Circuit High Voltage (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

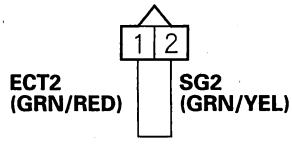
1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about −40 °F (−40 °C) or less, or 4.90 V or more indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM. ■
3. Turn the ignition switch OFF.
4. Disconnect ECT sensor 2 2P connector.
5. Connect ECT sensor 2 2P connector terminals No. 1 and No. 2 with a jumper wire.

ECT SENSOR 2 2P CONNECTOR



Wire side of female terminals

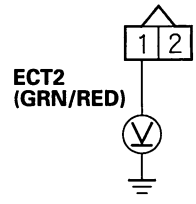
6. Turn the ignition switch ON (II).
7. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about −40 °F (−40 °C) or less, or 4.90 V or more indicated?

   YES—Go to step 8.

   NO—Go to step 18.
8. Turn the ignition switch OFF.
9. Remove the jumper wire from ECT sensor 2 2P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between ECT sensor 2 2P connector terminal No. 1 and body ground.

ECT SENSOR 2 2P CONNECTOR



Wire side of female terminals

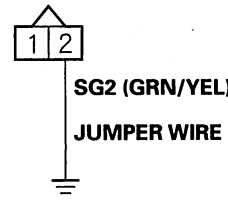
Is there about 5 V?

YES—Go to step 12.

NO—Go to step 17.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector D (17P).
15. Connect ECT sensor 2 2P connector terminal No. 2 to body ground with a jumper wire.

ECT SENSOR 2 2P CONNECTOR



Wire side of female terminals

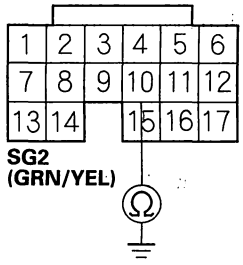
DTC Troubleshooting (cont'd)

16. Check for continuity between ECM/PCM connector terminal D10 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

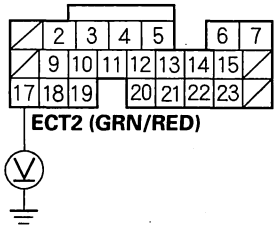
Is there continuity?

YES—Go to step 25.

NO—Repair open in the wire between the ECM/PCM (D10) and ECT sensor 2, then go to step 20.

17. Measure voltage between ECM/PCM connector terminal B17 and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the ECM/PCM (B17) and ECT sensor 2, then go to step 20.

NO—Go to step 25.

18. Turn the ignition switch OFF.
19. Replace ECT sensor 2 (see page 11-223).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see page 11-302).
24. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2185 is indicated, check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

25. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
26. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2185 is indicated, check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

BACK

DTC P2195: Rear A/F Sensor (Bank 1, Sensor 1) Signal Stuck Lean

DTC P2197: Front A/F Sensor (Bank 2, Sensor 1) Signal Stuck Lean

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).
- If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel and clear the DTC with the HDS.
- If DTC P2101, P2108, P2118, P2135, P2138, P2176, U0107 or a combination of P2122 and P2127, P2122 and P2138, or P2127 and P2138 is stored at the same time, troubleshoot them first then recheck for DTC P2195 and/or P2197*.

1. Inspect the condition of the A/F sensor (Sensor 1).

   Is it loose in the exhaust pipe?

   YES—Go to step 6.

   NO—Go to step 2.

2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—If DTC P2195 and/or P2197* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 8. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. ■

6. Turn the ignition switch OFF.
7. Reinstall the A/F sensor (Sensor 1) (see page 11-217).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see page 11-302).
11. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2195 and/or P2197* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 6. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 12.

12. Monitor the OBD STATUS for DTC P2195 and/or P2197* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then then go to step 2. If the screen indicates NOT COMPLETED, go to step 5 and recheck.

Protected by AR

DTC Troubleshooting (cont'd)

DTC P2227: BARO Sensor Range/ Performance Problem

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P0107, P0108, P1128, and/or P1129 are stored at the same time as DTC P2227, troubleshoot those DTCs first, then recheck for DTC P2227.

1. Turn the ignition switch ON (II), and wait 2 seconds.
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 101 kPa (29.9 in.Hg, 760 mmHg), or about 2.9 V at sea level indicated?

   YES—Go to step 3.

   NO—Go to step 7.
3. Clear the DTC with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Test-drive under these conditions, then connect the HDS:
   - Engine coolant temperature above 158 °F (70 °C)
   - A/T in D position (M/T in 4th gear)
   - Throttle position between 14 degrees and 45 degrees for 2 seconds
6. Monitor the OBD STATUS for DTC P2227 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 7.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. If the screen indicates NOT COMPLETED, go to step 4 and recheck.
7. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
8. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—If DTC P2227 is indicated, check for poor connections or loose terminals at the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

   NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

BACK

Protected by AR

DTC P2228: BARO Sensor Circuit Low Voltage (2003-2004 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II).
5. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0107, P0112, P0117, P2122, P2127, P2228, P0452, P2627, and P2630 indicated at the same time?

   YES—Go to step 7.

   NO—Go to step 6.

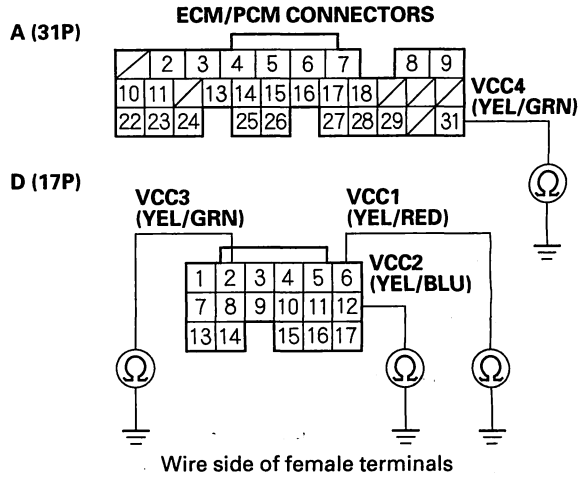
6. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 53 kPa (15.6 in.Hg, 397 mmHg), or 1.58 V or less indicated?

   YES—Go to step 16.

   NO—Intermittent failure, system is OK at this time. ■

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connectors A (31P) and D (17P).
10. Disconnect the connectors from these parts:
    - MAP sensor
    - APP sensor
    - IMT (IMRC) actuator
    - EGR valve
    - FTP sensor
    - Input shaft (mainshaft) speed sensor
    - Output shaft (countershaft) speed sensor
11. Check for continuity between body ground and ECM/PCM connector terminals A31, D2, D6, and D12 individually.



Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A31, D2, D6, or D12) and each part, then go to step 18.

NO—Go to step 12.

(cont'd)

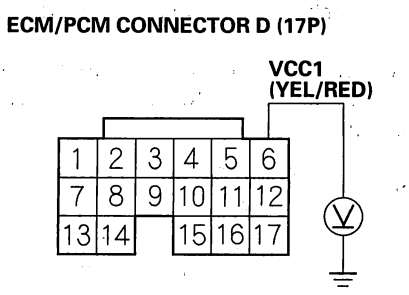
Protected by AR

DTC Troubleshooting (cont'd)

12. Reconnect ECM/PCM connectors A (31P) and D (17P).

13. Turn the ignition switch ON (II).

14. Measure voltage between ECM/PCM connector terminal D6 and body ground.



Wire side of female terminals

Is there about 5 V?

YES—Go to step 15.

NO—Go to step 16.

15. Continue to monitor voltage at ECM/PCM connector terminal D6 while reconnecting these parts, one at a time:

- MAP sensor
- APP sensor
- IMT (IMRC) actuator
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

Did the voltage drop to about 0 V?

YES—Replace the part that caused the voltage to drop, then go to step 20.

NO—Go to step 16.

16. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

17. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2228 is indicated, check for poor connections or loose terminals at the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

18. Reconnect all connectors.

19. Turn the ignition switch ON (II).

20. Reset the ECM/PCM with the HDS.

21. Do the ECM/PCM idle learn procedure (see page 11-302).

22. Turn the ignition switch OFF.

23. Turn the ignition switch ON (II).

24. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2228 is indicated, check for poor connections or loose terminals at the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

DTC P2228: BARO Sensor Circuit Low Voltage (2005-2006 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 53 kPa (15.6 in.Hg, 397 mmHg), or 1.58 V or less indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. ■
3. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
4. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—If DTC P2228 is indicated, check for poor connections or loose terminals at the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

   NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P2229: BARO Sensor Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 160 kPa (47.2 in.Hg, 1,200 mmHg), or 4.5 V or higher indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. ■
3. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
4. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—If DTC P2229 is indicated, check for poor connections or loose terminals at the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

   NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC P2237: Rear A/F Sensor (Bank 1, Sensor 1) IP Line High Voltage

DTC P2240: Front A/F Sensor (Bank 2, Sensor 1) IP Line High Voltage

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P2237 and/or P2240* is stored at the same time as DTC P0134 and/or P0154*, troubleshoot DTC P2237 and/or P2240* first, then recheck for P0134 and/or P0154*.
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

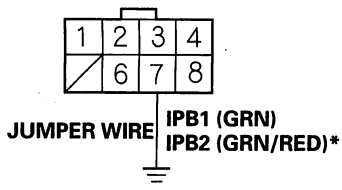
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2237 and/or P2240 indicated?*

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 8P connector.
8. Disconnect ECM/PCM connector B (24P).
9. Connect A/F sensor (Sensor 1) 8P connector terminal No. 7 to body ground with a jumper wire.

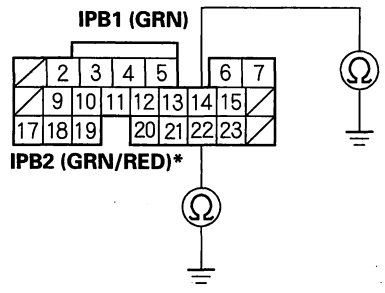
A/F SENSOR (SENSOR 1) 8P CONNECTOR



Wire side of female terminals

10. Check for continuity between ECM/PCM connector terminal B14 (B22)* and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 11.

NO—Repair open in the wire between the ECM/PCM (B14 (B22)*) and the A/F sensor (Sensor 1), then go to step 15.

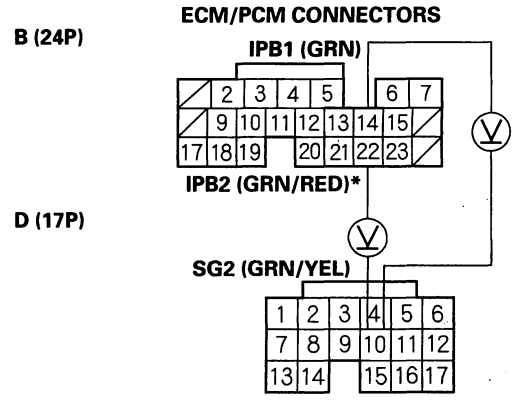
BACK

Protected by AR

11. Remove the jumper wire from the A/F sensor (Sensor 1) 8P connector, then reconnect ECM/PCM connector B (24P).

12. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.

13. Measure voltage between ECM/PCM connector terminals B14 (B22)* and D10.



Wire side of female terminals

Is there about 0.2 V or less?

YES—Go to step 21.

NO—Go to step 14.

14. Replace the A/F sensor (Sensor 1) (see page 11-217).

15. Reconnect all connectors.

16. Turn the ignition switch ON (II).

17. Reset the ECM/PCM with the HDS.

18. Do the ECM/PCM idle learn procedure (see page 11-302).

19. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2237 and/or P2240* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 20.

20. Monitor the OBD STATUS for DTC P2237 and/or P2240* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete. ■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 18 and recheck.

21. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

22. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2237 and/or P2240* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC Troubleshooting (cont'd)

DTC P2243: Rear A/F Sensor (Bank 1, Sensor 1) VCENT Line High Voltage

DTC P2247: Front A/F Sensor (Bank 2, Sensor 1) VCENT Line High Voltage

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

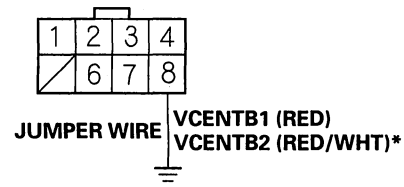
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2243 and/or P2247 indicated?*

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 8P connector.
8. Disconnect ECM/PCM connector B (24P).
9. Connect A/F sensor (Sensor 1) 8P connector terminal No. 8 to body ground with a jumper wire.

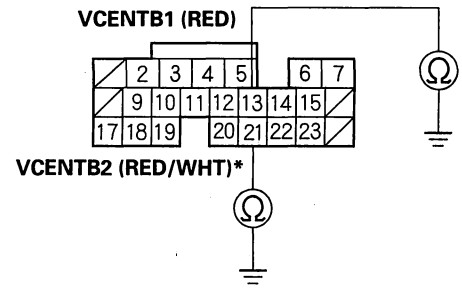
A/F SENSOR (SENSOR 1) 8P CONNECTOR



Wire side of female terminals

10. Check for continuity between ECM/PCM connector terminal B13 (B21)* and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 11.

NO—Repair open in the wire between the ECM/PCM (B13 (B21)*) and the A/F sensor (Sensor 1), then go to step 15.

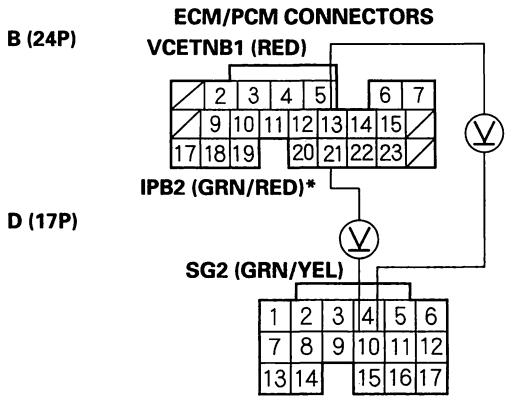
BACK

Protected by AR

11. Remove the jumper wire from the A/F sensor (Sensor 1) 8P connector, then reconnect ECM/PCM connector B (24P).

12. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.

13. Measure voltage between ECM/PCM connector terminals B13 (B21)* and D10.



Wire side of female terminals

Is there about 0.2 V or less?

YES—Go to step 21.

NO—Go to step 14.

14. Replace the A/F sensor (Sensor 1) (see page 11-217).

15. Reconnect all connectors.

16. Turn the ignition switch ON (II).

17. Reset the ECM/PCM with the HDS.

18. Do the ECM/PCM idle learn procedure (see page 11-302).

19. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2243 and/or P2247* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 20.

20. Monitor the OBD STATUS for DTC P2243 and/or P2247* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete.■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 18 and recheck.

21. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

22. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2243 and/or P2247* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC Troubleshooting (cont'd)

DTC P2245: Rear A/F Sensor (Bank 1, Sensor 1) VCENT Line Low Voltage

DTC P2249: Front A/F Sensor (Bank 2, Sensor 1) VCENT Line Low Voltage

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2245 and/or P2249 indicated?*

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 8P connector.
8. Disconnect ECM/PCM connector B (24P).
9. Check for continuity between ECM/PCM connector terminal B13 (B21)* and body ground.

   Is there continuity?

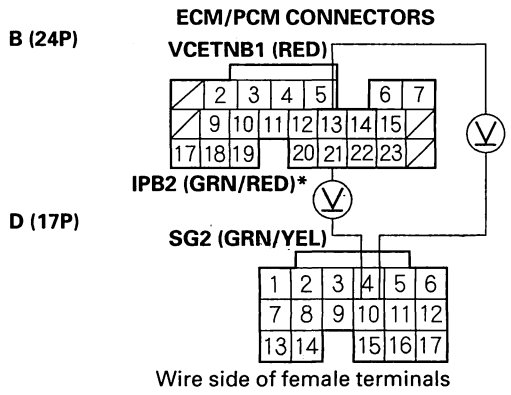
   YES—Repair short in the wire between the ECM/PCM (B13 (B21)*) and the A/F sensor (Sensor 1), then go to step 14.

   NO—Go to step 10.
10. Reconnect ECM/PCM connector B (24P).
11. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

BACK

Protected by AR

12. Measure voltage between ECM/PCM connector terminals B13 (B21)* and D10.



Is there about 0.2 V or less?

YES—Go to step 20.

NO—Go to step 13.

13. Replace the A/F sensor (Sensor 1) (see page 11-217).

14. Reconnect all connectors.

15. Turn the ignition switch ON (II).

16. Reset the ECM/PCM with the HDS.

17. Do the ECM/PCM idle learn procedure (see page 11-302).

18. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2245 and/or P2249* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 19.

19. Monitor the OBD STATUS for DTC P2245 and/or P2249* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete. ■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 17 and recheck.

20. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

21. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2245 and/or P2249* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC P2251: Rear A/F Sensor (Bank 1, Sensor 1) VS Line High Voltage

DTC P2254: Front A/F Sensor (Bank 2, Sensor 1) VS Line High Voltage

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P2251 and/or P2254* is stored at the same time as DTC P0134 and/or P0154*, troubleshoot DTC P2251 and/or P2254* first, then recheck for P0134 and/or P0154*.
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

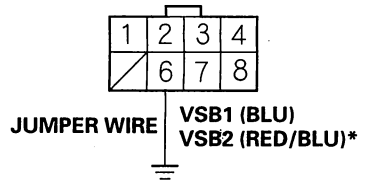
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2251 and/or P2254 indicated?*

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 8P connector.
8. Disconnect ECM/PCM connector B (24P).
9. Connect A/F sensor (Sensor 1) 8P connector terminal No. 6 to body ground with a jumper wire.

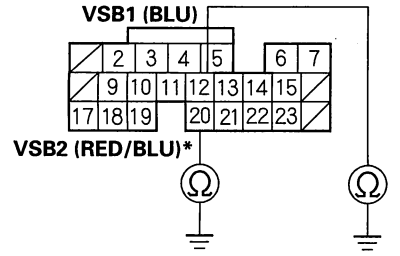
A/F SENSOR (SENSOR 1) 8P CONNECTOR



Wire side of female terminals

10. Check for continuity between ECM/PCM connector terminal B12 (B20)* and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 11.

NO—Repair open in the wire between the ECM/PCM (B12 (B20)*) and the A/F sensor (Sensor 1), then go to step 15.

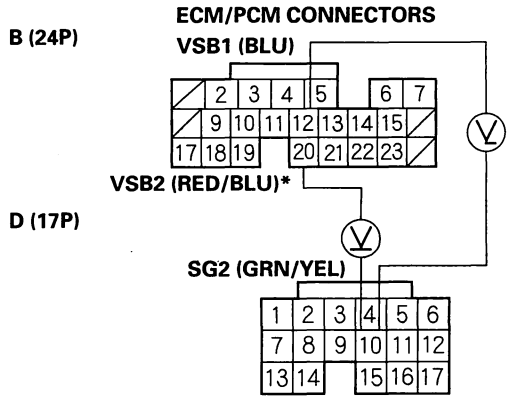
BACK

Protected by AR

11. Remove the jumper wire from the A/F sensor (Sensor 1) 8P connector, then reconnect ECM/PCM connector B (24P).

12. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.

13. Measure voltage between ECM/PCM connector terminals B12 (B20)* and D10.



Wire side of female terminals

Is there about 0.2 V or less?

YES—Go to step 21.

NO—Go to step 14.

14. Replace the A/F sensor (see page 11-217).

15. Reconnect all connectors.

16. Turn the ignition switch ON (II).

17. Reset the ECM/PCM with the HDS.

18. Do the ECM/PCM idle learn procedure (see page 11-302).

19. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2251 and/or P2254* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 20.

20. Monitor the OBD STATUS for DTC P2251 and/or P2254* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete. ■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 18 and recheck.

21. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

22. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2251 and/or P2254* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC P2252: Rear A/F Sensor (Bank 1, Sensor 1) VS Line Low Voltage

DTC P2255: Front A/F Sensor (Bank 2, Sensor 1) VS Line Low Voltage

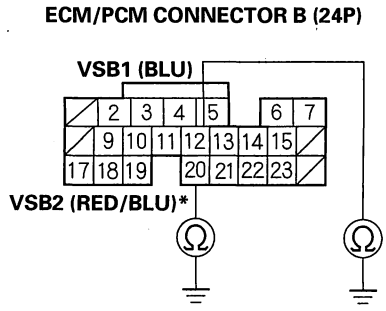
NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2252 and/or P2255 indicated?*

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 8P connector.
8. Disconnect ECM/PCM connector B (24P).
9. Check for continuity between ECM/PCM connector terminal B12 (B20)* and body ground.



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (B12 (B20)*) and the A/F sensor (Sensor 1), then go to step 14.

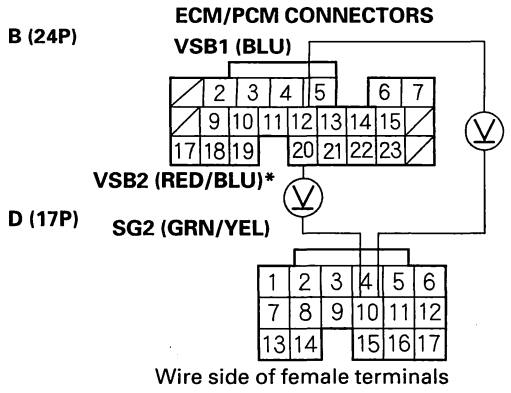
NO—Go to step 10.

10. Reconnect ECM/PCM connector B (24P).
11. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.

BACK

Protected by AR

12. Measure voltage between ECM/PCM connector terminals B12 (B20)* and D10.



Is there about 0.2 V or less?

YES—Go to step 20.

NO—Go to step 13.

13. Replace the A/F sensor (Sensor 1) (see page 11-217).

14. Reconnect all connectors.

15. Turn the ignition switch ON (II).

16. Reset the ECM/PCM with the HDS.

17. Do the ECM/PCM idle learn procedure (see page 11-302).

18. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2252 and/or P2255* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 19.

19. Monitor the OBD STATUS for DTC P2252 and/or P2255* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete.■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 17 and recheck.

20. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

21. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2252 and/or P2255* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC Troubleshooting (cont'd)

DTC P2270: Rear Secondary HO2S (Bank 1, Sensor 2) Circuit Signal Stuck Lean (2005-2006 models)

DTC P2271: Rear Secondary HO2S (Bank 1, Sensor 2) Circuit Signal Stuck Rich (2005-2006 models)

DTC P2272: Front Secondary HO2S (Bank 2, Sensor 2) Circuit Signal Stuck Lean (2005-2006 models)

DTC P2273: Front Secondary HO2S (Bank 2, Sensor 2) Circuit Signal Stuck Rich (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature above 176 °F (80 °C)
   - Vehicle speed between 35—55 mph (56—88 km/h)
   - Drive 1 minute or more
5. Monitor the OBD STATUS for DTC P2270, P2271, P2272* and/or P2273* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 6.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.
6. Turn the ignition switch OFF.
7. Replace the secondary HO2S (Sensor 2) (see page 11-218).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see page 11-302).
11. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
12. Test-drive under these conditions:
    - Engine coolant temperature above 176 °F (80 °C)
    - Vehicle speed between 35—55 mph (56—88 km/h)
    - Drive 1 minute or more
13. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2270, P2271, P2272* and/or P2273* is indicated, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 14.
14. Monitor the OBD STATUS for DTC P2270, P2271, P2272* and/or P2273* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11 and recheck.

DTC Troubleshooting (cont'd)

DTC P2627: Rear A/F Sensor (Bank 1, Sensor 1) Label Circuit Low Voltage (2003-2004 models)

DTC P2630: Front A/F Sensor (Bank 2, Sensor 1) Label Circuit Low Voltage (2003-2004 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0107, P0112, P0117, P2122, P2127, P2228, P0452, P2627, and P2630 indicated at same time?

   YES—Go to step 12.

   NO—Go to step 5.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2627 and/or P2630 indicated?*

   YES—Go to step 6.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. ■
6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector B (24P).
9. Check for continuity between ECM/PCM connector terminal B10 (B19)* and body ground.

   Is there continuity?

   YES—Go to step 10.

   NO—Go to step 27.
10. Disconnect the A/F sensor (Sensor 1) 8P connector.
11. Check for continuity between ECM/PCM connector terminal B10 (B19)* and body ground.

   Is there continuity?

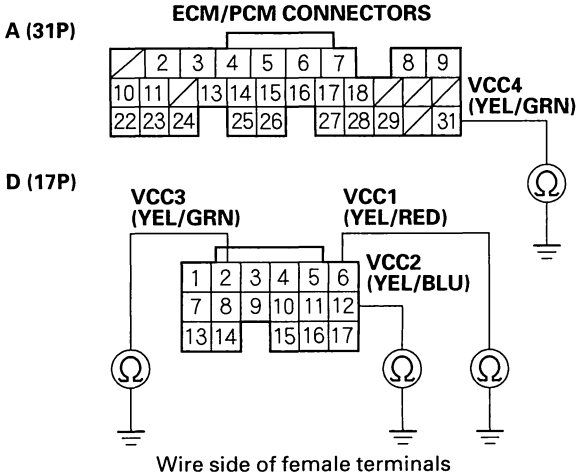
   YES—Repair short in the wire between the ECM/PCM (B10 (B19)*) and the A/F sensor (Sensor 1), then go to step 22.

   NO—Go to step 21.

BACK

Protected by AR

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connectors A (31P) and D (17P).
15. Disconnect the connectors from these parts:
    - MAP sensor
    - APP sensor
    - IMT (IMRC) actuator
    - EGR sensor
    - FTP sensor
    - Input shaft (mainshaft) speed sensor
    - Output shaft (countershaft) sensor
16. Check for continuity between body ground and ECM/PCM connector terminals A31, D2, D6, and D12 individually.



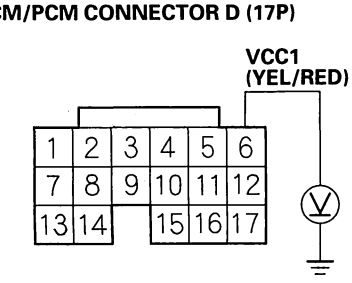
Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A31, D2, D6, or D12) and each part, then go to step 22.

NO—Go to step 17.

17. Reconnect ECM/PCM connectors A (31P) and D (17P).
18. Turn the ignition switch ON (II).
19. Measure voltage between ECM/PCM connector terminal D6 and body ground.



Wire side of female terminals

Is there about 5 V?

YES—Go to step 20.

NO—Go to step 27.

20. Continue to monitor voltage at the ECM/PCM connector terminal D6 while reconnecting these parts, one at a time:
    - MAP sensor
    - APP sensor
    - IMT (IMRC) actuator
    - EGR sensor
    - FTP sensor
    - Input shaft (mainshaft) speed sensor
    - Output shaft (countershaft) sensor

Did the voltage drop to about 0 V?

YES—Replace the part that caused the voltage to drop, then go to step 22.

NO—Go to step 27.

(cont'd)

DTC Troubleshooting (cont'd)

11. Replace the A/F sensor (Sensor 1) (see page 11-217).
12. Reconnect all connectors.
13. Turn the ignition switch ON (II).
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see page 11-302).
16. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2627 and/or P2630* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete.■

17. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
18. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2627 and/or P2630* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC P2628: Rear A/F Sensor (Bank 1, Sensor 1) Label Circuit High Voltage

DTC P2631: Front A/F Sensor (Bank 2, Sensor 1) Label Circuit High Voltage

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

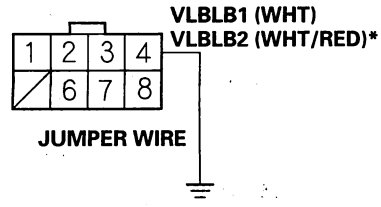
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2628 and/or P2631 indicated?*

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM.■
5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 8P connector.
8. Disconnect ECM/PCM connector B (24P).
9. Connect A/F sensor (Sensor 1) 8P connector terminal No. 4 to body ground with a jumper wire.

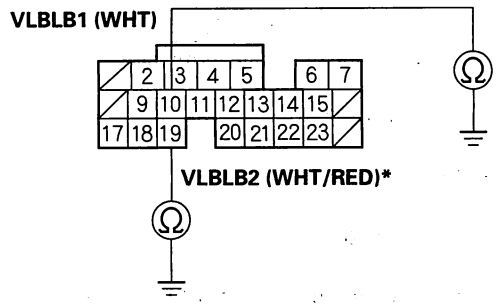
A/F SENSOR (SENSOR 1) 8P CONNECTOR



Wire side of female terminals

10. Check for continuity between ECM/PCM connector terminal B10 (B19)* and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 11.

NO—Repair open in the wire between the ECM/PCM (B10 (B19)*) and the A/F sensor (Sensor 1), then go to step 15.

(cont'd)

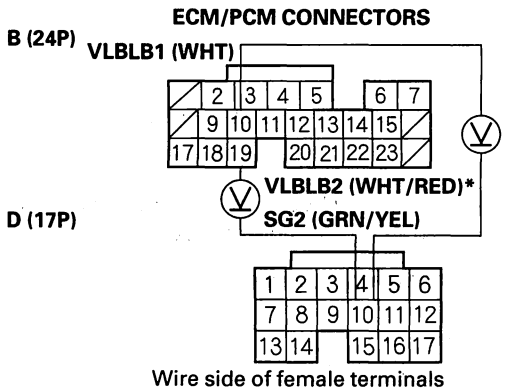
Protected by AR

DTC Troubleshooting (cont'd)

11. Remove the jumper wire from the A/F sensor (Sensor 1) 8P connector, then reconnect ECM/PCM connector B (24P).

12. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

13. Measure voltage between ECM/PCM connector terminals B10 (B19)* and D10.



Is there about 5 V?

YES—Go to step 14.

NO—Go to step 20.

14. Replace the A/F sensor (Sensor 1) (see page 11-217).

15. Reconnect all connectors.

16. Turn the ignition switch ON (II).

17. Reset the ECM/PCM with the HDS.

18. Do the ECM/PCM idle learn procedure (see page 11-302).

19. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2628 and/or P2631* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

20. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

21. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2628 and/or P2631* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

BACK

DTC P2A00: Rear A/F Sensor (Bank 1, Sensor 1) Range/Performance Problem

DTC P2A03: Front A/F Sensor (Bank 2, Sensor 1) Range/Performance Problem

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature above 158 °F (70 °C)
   - A/T in D position (M/T in 3rd gear)
   - Vehicle speed at 30 mph (48 km/h) or more, and engine speed at 2,600 rpm or less
   - Drive at an engine speed of 1,600 rpm. Accelerate to full open throttle for 5 seconds, then slow down with the throttle completely closed.
5. Monitor the OBD STATUS for DTC P2A00 and/or P2A03* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 7.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If it is EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.
6. Turn the ignition switch OFF.
7. Replace the A/F sensor (Sensor 1) (see page 11-217).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see page 11-302).
11. Test-drive under these conditions:
    - Engine coolant temperature above 158 °F (70 °C)
    - A/T in D position (M/T in 3rd gear)
    - Vehicle speed at 30 mph (48 km/h) or more, and engine speed at 2,600 rpm or less
    - Drive at an engine speed of 1,600 rpm. Accelerate to full open throttle for 5 seconds, then slow down with the throttle completely closed.
12. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2A00 and/or P2A03* is indicated, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 13.
13. Monitor the OBD STATUS for DTC P2A00 and/or P2A03* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 10 and recheck.

DTC Troubleshooting (cont'd)

DTC U0073: F-CAN Malfunction (Bus-Off) (2003-2005 models)

DTC U0155: F-CAN Malfunction (Gauge Control Module-ECM/PCM) (2003-2005 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0073 and/or U0155 indicated?

   YES—Go to step 4.

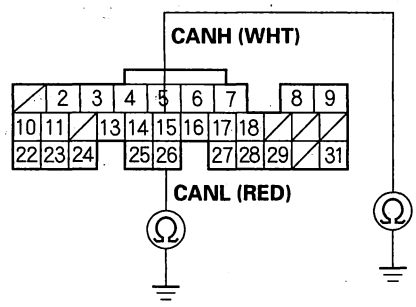
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the gauge control module, the ABS/TCS control unit, the navigation unit, and the ECM/PCM. ■
4. Check for DTCs in the Body Electrical system DTCs menu with the HDS.

   Is DTC B1168, B1169, and/or B1178 indicated?

   YES—Go to step 5.

   NO—Do the gauge control module input test, refer to the 2003-2006 Accord Service Manual (see page 22-127). ■
5. Turn the ignition switch OFF.
6. Remove the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276).
7. Disconnect the gauge module 30P connector.
8. Disconnect the ABS/TCS control unit 47P connector.
9. If equipped with the Honda navigation system, disconnect the navigation unit 20P connector.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector A (31P).
12. Check for continuity between ECM/PCM connector terminals A15, A26, and body ground individually.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there continuity?

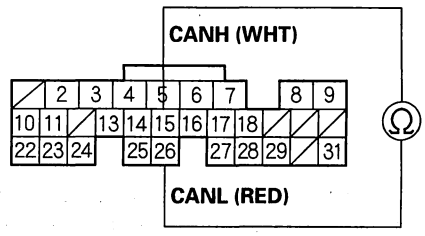
YES—Repair short in the wire between the gauge control module, the ABS/TCS control unit, the navigation unit, and the ECM/PCM (A15 (A26)*), then go to step 17.

NO—Go to step 13.

*: CANL line

13. Check for continuity between ECM/PCM connector terminals A15 and A26.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wires between the ECM/PCM A15 (CANH line) and A26 (CANL line), then go to step 17.

NO—Go to step 14.

BACK

Protected by AR

14. Check for continuity between ECM/PCM connector terminal A15 and the following connector terminals:

Connector	Terminal
Gauge control module 30P	No. 24 (WHT)
ABS/TCS control unit 47P	No. 14 (WHT)
Navigation unit 20P	No. 8 (WHT)

Is there continuity between the ECM/PCM terminal and each of the terminals in the chart?

YES—Go to step 15.

NO—Repair open in the wire between the ECM/PCM and the appropriate connector, then go to step 17.

15. Check for continuity between ECM/PCM connector terminal A26 and the following connector terminals:

Connector	Terminal
Gauge control module 30P	No. 23 (RED)
ABS/TCS control unit 47P	No. 30 (RED)
Navigation unit 20P	No. 18 (RED)

Is there continuity between the ECM/PCM terminal and each of the terminals in the chart?

YES—Go to step 16.

NO—Repair open in the wire between the ECM/PCM and the appropriate connector, then go to step 17.

16. Using the following chart, select the row that most closely represents the combination of DTCs retrieved from the PGM-FI, ABS/TCS, and Body Electrical systems: Check connections at the control module indicated in the last column. If all connections are OK, substitute another control module. After substituting the control module, check for DTCs with the HDS.

PGM-FI	ABS/TCS	Body Electrical	Control module
U0155	86-1	B1168 B1169 B1178	Gauge Control Module
U0073 U0121 U0155	68-1 86-1	B1168 B1169 B1178	ECM/PCM
U0073 U0121 U0155	68-1 86-1	B1168 B1178	ABS/TCS control unit

Are the DTCs still indicated?

YES—Substitute the remaining control modules, one at time, until the DTCs are no longer present, then replace the control module that made the DTCs go away. After replacing the faulty control module, go to step 17.

NO—Replace the faulty control module, then go to step 17.

17. Reconnect all connectors.

18. Turn the ignition switch ON (II).

19. Reset the ECM/PCM with the HDS.

20. Do the ECM/PCM idle learn procedure (see page 11-302).

21. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC U0073 and/or U0155 is indicated, check for poor connections or loose terminals at the gauge assembly, the ABS/TCS control unit, the navigation unit, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete.■

DTC Troubleshooting (cont'd)

DTC U0121: F-CAN Malfunction (TCS-ECM/PCM) (2003-2005 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC U0073 is stored at the same time as DTC U0121, troubleshoot DTC U0073 first, then recheck for DTC U0121.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0121 indicated?

   YES—Go to step 4.

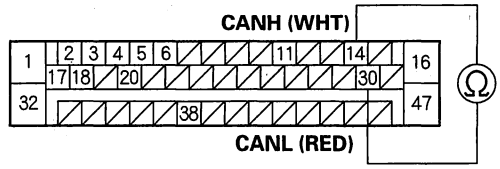
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the gauge assembly, the ABS/TCS control unit, and the ECM/PCM. ■
4. Check for a DTC in the DTCs MENU with the HDS.

   Is TCS DTC 86 indicated?

   YES—Go to step 5.

   NO—Go to step 9.
5. Turn the ignition switch OFF.
6. Disconnect the ABS/TCS control unit 47P connector.
7. Check for continuity between ABS/TCS control unit 47P connector terminals No. 14 and No. 30.

ABS/TCS CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 8.

NO—Repair open in the wire between the ABS/TCS control unit (No. 14 (No. 30)*) and the ECM/PCM (A15 (A26)*), then go to step 14.

*: CANL line

8. Check for a poor connection at the cabin wire harness/dashboard wire harness 20P connector.

   Is the connection OK?

   YES—Substitute a known-good ABS/TCS control unit, then go to step 14 and recheck. If no DTCs are indicated, replace the original ABS/TCS control unit, then go to step 14.

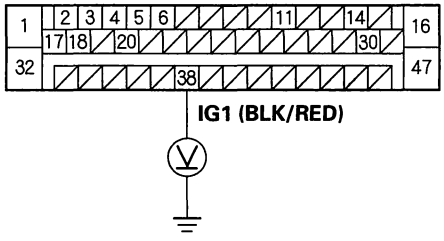
   NO—Repair the poor connection at the cabin wire harness/dashboard wire harness 20P connector, then go to step 14.

BACK

Protected by AR

9. Turn the ignition switch OFF.
10. Disconnect the ABS/TCS control unit 47P connector.
11. Turn the ignition switch ON (II).
12. Measure voltage between ABS/TCS control unit 47P connector terminal No. 38 and body ground.

ABS/TCS CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

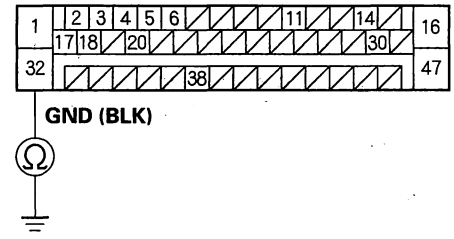
Is there battery voltage?

YES—Go to step 13.

NO—Check the No. 18 ACG (15 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between the No. 18 ACG (15 A) fuse and the ABS/TCS control unit, then go to step 14.

13. Check for continuity between ABS/TCS control unit 47P connector terminal No. 32 and body ground.

ABS/TCS CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good ABS/TCS control unit, then go to step 14 and recheck. If no DTCs are indicated, replace the original ABS/TCS control unit, then go to step 14.

NO—Repair open in the wire between the ABS/TCS control unit and G203, then go to step 14.

14. Reconnect the ABS/TCS control unit 47P connector.
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see page 11-302).
18. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC U0121 is indicated, check for poor connections or loose terminals at the gauge assembly, the ABS/TCS control unit, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete.■

DTC Troubleshooting (cont'd)

DTC U0122: F-CAN Malfunction (VSA-ECM/PCM)
(2006 model)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC U0073 is stored at the same time as DTC U0122, troubleshoot DTC U0073 first, then recheck for DTC U0122.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0122 indicated?

   YES—Go to step 4.

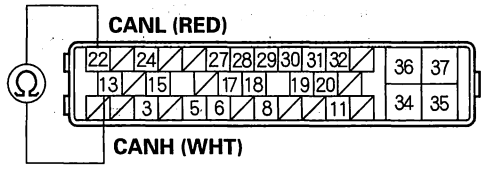
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the gauge assembly, the VSA control unit, and the ECM/PCM. ■
4. Check for DTCs in the DTCs MENU with the HDS.

   Is VSA DTC 86 indicated?

   YES—Go to step 5.

   NO—Go to step 9.
5. Turn the ignition switch OFF.
6. Disconnect the VSA control unit 37P connector.
7. Check for continuity between VSA control unit 37P connector terminals No. 13 and No. 22.

VSA CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 8.

NO—Repair open in the wire between the VSA control unit (No. 13 (No. 22)*) and the ECM/PCM (A15 (A26)*), then go to step 14.

*: CANL line

8. Check for a poor connection at the cabin wire harness/dashboard wire harness 20P connector.

   Is the connection OK?

   YES—Substitute a known-good VSA control unit, then go to step 14 and recheck. If no DTCs are indicated, replace the original VSA control unit, then go to step 14.

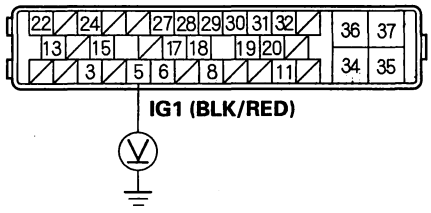
   NO—Repair the poor connection at the cabin wire harness/dashboard wire harness 20P connector, then go to step 14.

BACK

Protected by AR

9. Turn the ignition switch OFF.
10. Disconnect the VSA control unit 37P connector.
11. Turn the ignition switch ON (II).
12. Measure voltage between VSA control unit 37P connector terminal No. 5 and body ground.

VSA CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

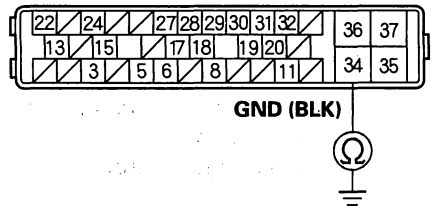
Is there battery voltage?

YES—Go to step 13.

NO—Check the No. 18 ACG (15 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between the No. 18 ACG (15 A) fuse and the VSA control unit, then go to step 14.

13. Check for continuity between VSA control unit 37P connector terminal No. 34 and body ground.

VSA CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good VSA control unit, then go to step 14 and recheck. If no DTCs are indicated, replace the original VSA control unit, then go to step 14.

NO—Repair open in the wire between the VSA control unit and G203, then go to step 14.

14. Reconnect the VSA control unit 37P connector.
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see page 11-302).
18. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC U0122 is indicated, check for poor connections or loose terminals at the gauge assembly, the VSA control unit, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete.■

MIL Circuit Troubleshooting

1. Turn the ignition switch ON (II).
2. Do the gauge self-diagnostic procedure (see page 22-69).

   Does the MIL indicator flash?

   YES—Go to step 3.

   NO—Substitute a known-good gauge control module, and recheck. If the MIL circuit is OK, replace the original gauge control module. ■
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II), and watch the MIL.

   Does the MIL stay off?

   YES—Go to step 17.

   NO—Go to step 5.
5. Turn the ignition switch OFF.
6. Turn the ignition switch ON (II), wait 20 seconds, and watch the MIL.

   Does the MIL stay on more than 20 seconds or flash more than 5 times?

   YES—Go to step 7.

   NO—The MIL circuit is OK. ■
7. Turn the ignition switch OFF.
8. Connect the HDS (see page 11-3).
9. Turn the ignition switch ON (II), and read the HDS.

   Does the HDS communicate with the ECM/PCM?

   YES—Go to step 10.

   NO—Go to "DLC Circuit Troubleshooting" (see page 11-213). ■
10. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—Go to the indicated DTC's troubleshooting. ■

    NO—Go to step 11.
11. Check the MIL in the DATA LIST with the HDS.

    Does it indicate ON?

    YES—Go to step 12.

    NO—Substitute a known-good gauge control module, and recheck. If the MIL circuit is OK, replace the original gauge control module. ■
12. Check the SCS in the DATA LIST with the HDS.

    Is a short indicated?

    YES—Go to step 13.

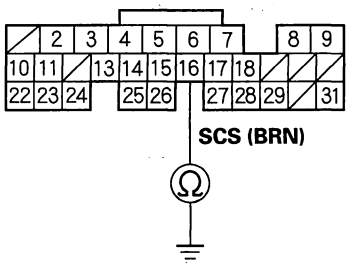
    NO—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■
13. Turn the ignition switch OFF.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector A (31P).

BACK

Protected by AR

16. Check for continuity between ECM/PCM connector terminal A16 and body ground.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A16) and the DLC. ■

NO—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■

17. Try to start the engine.

Does the engine start and idle smoothly?

YES—Go to step 18.

NO—Go to step 22.

18. Turn the ignition switch OFF.

19. Connect the HDS (see page 11-3).

20. Turn the ignition switch ON (II), and read the HDS.

Does the HDS communicate with the ECM/PCM?

YES—Go to step 21.

NO—Go to "DLC Circuit Troubleshooting" (see page 11-213). ■

21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC U0073 and/or U0155 indicated?

YES—Go to the indicated DTC's troubleshooting. ■

NO—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■

22. Turn the ignition swtich OFF.

23. Inspect the No. 23 +B IG MAIN (50 A) fuse in the under-hood fuse/relay box.

Is the fuse OK?

YES—Repair open in the wire between the No. 20 IG (50 A) fuse and the ignition switch.
If the wire is OK, go to step 24.

NO—Repair short in the wire between No. 23 +B IG MAIN (50 A) fuse and the under-dash fuse/relay box. Also replace the No. 23 +B IG MAIN (50 A) fuse. ■

MIL Circuit Troubleshooting (cont'd)

24. Inspect the No. 8 FI ECU (ECM/PCM) (15 A) fuse in the under-hood fuse/relay box.

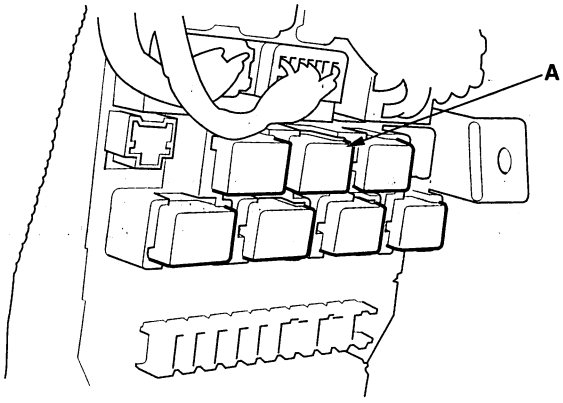
    Is the fuse OK?

    YES—Go to step 31.

    NO—Go to step 25.

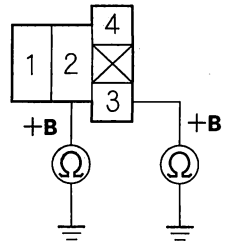
25. Remove the blown No. 8 FI ECU (ECM/PCM) (15 A) fuse from the under-dash fuse/relay box.

26. Remove the left kick panel, refer to the 2003-2006 Accord Service Manual 2-door (see page 20-90); 4-door (see page 20-91), then remove PGM-FI main relay 1 (FI MAIN) (A) from the under-dash fuse/relay box.



27. Check for continuity between body ground and PGM-FI main relay 1 (FI MAIN) 4P connector terminals No. 2 and No. 3 individually.

PGM-FI MAIN RELAY 1 (FI MAIN) 4P CONNECTOR



Terminal side of female terminals

Is there continuity?

YES—Repair short in the wire between the No. 8 FI ECU (PCM) (15 A) and PGM-FI main relay 1 (FI MAIN). Also replace the No. 8 FI ECU (ECM/PCM) (15 A) fuse.■

NO—Go to step 28.

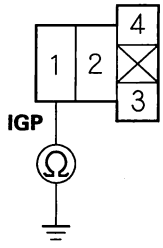
BACK

Protected by AR

28. Disconnect each of the components or connectors below, one at a time, and check for continuity between PGM-FI main relay 1 (FI MAIN) 4P connector terminal No. 1 and body ground.

    - PGM-FI main relay 2 (FUEL PUMP)
    - A/F sensor relay
    - Throttle actuator control module relay
    - ECM/PCM connector E (31P)
    - Each injector 2P connector
    - Camshaft position (CMP) sensor 3P connector
    - Crankshaft position (CKP) sensor A/B 6P connector

PGM-FI MAIN RELAY 1 (FI MAIN) 4P CONNECTOR



Terminal side of female terminals

Does continuity go away when one of the above components is disconnected?

YES—Replace the component that made the short to body ground go away when disconnected. If the item is the ECM/PCM, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). Also replace the No. 8 FI ECU (ECM/PCM) (15 A) fuse.■

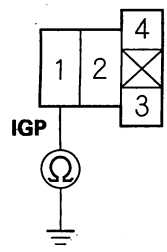
NO—Go to step 29.

29. Disconnect the connectors of all these components.

    - PGM-FI main relay 2 (FUEL PUMP)
    - A/F sensor relay
    - Throttle actuator control module relay
    - ECM/PCM connector E (31P)
    - Injectors
    - Camshaft position (CMP) sensor
    - Crankshaft position (CKP) sensor A/B

30. Check for continuity between PGM-FI main relay 1 (FI MAIN) 4P connector terminal No. 1 and body ground.

PGM-FI MAIN RELAY 1 (FI MAIN) 4P CONNECTOR



Terminal side of female terminals

Is the fuse OK?

YES—Repair short in the wire between PGM-FI main relay 1 (FI MAIN) and each item. Also replace the No. 8 FI ECU (ECM/PCM) (15 A) fuse.■

NO—Replace the PGM-FI main relay (FI MAIN). Also replace the No. 8 FI ECU (ECM/PCM) (15 A) fuse.■

31. Inspect the No. 19 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.

Is there continuity?

YES—Go to step 44.

NO—Go to step 32.

32. Remove the blown No. 19 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.

33. Jump the SCS line with the HDS.

34. Disconnect ECM/PCM connector E (31P).

(cont'd)

BACK

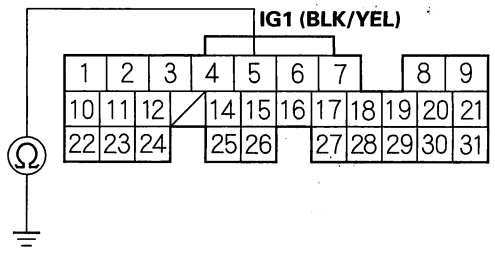
MIL Circuit Troubleshooting (cont'd)

35. Check for continuity between ECM/PCM connector terminal E5 and body ground.

ECM/PCM CONNECTOR E (31P)



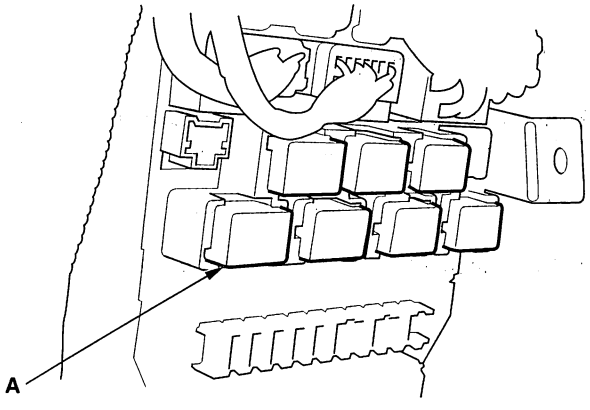
Wire side of female terminals

Is there continuity?

YES—Go to step 36.

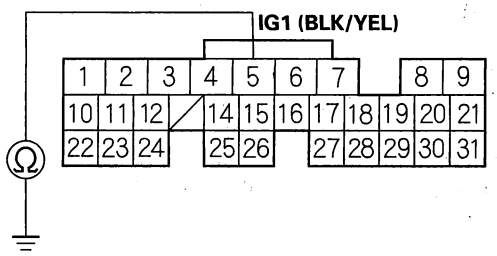
NO—Replace the No. 19 FUEL PUMP (15 A) fuse, and update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224).■

36. Remove the kick panel, refer to the 2003-2006 Accord Service Manual 2-door (see page 20-90); 4-door (see page 20-91). Then remove PGM-FI main relay 2 (FUEL PUMP) (A) from the under-dash fuse/relay box.



37. Check for continuity between ECM/PCM connector terminal E5 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the No. 19 FUEL PUMP (15 A) fuse and the ECM/PCM (E5), or between the No. 19 FUEL PUMP (15 A) fuse and PGM-FI main relay 2 (FUEL PUMP), or between the No. 19 FUEL PUMP (15 A) fuse and the immobilizer control unit. Also replace the No. 19 FUEL PUMP (15 A) fuse.■

NO—Go to step 38.

38. Remove the trunk floor trim panel.

39. Remove the access panel from the floor.

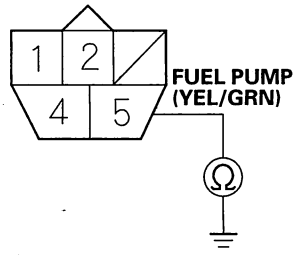
40. Disconnect the fuel pump 5P connector.

BACK

Protected by AR

41. Check for continuity between fuel pump 5P connector terminal No. 5 and body ground.

FUEL PUMP 5P CONNECTOR



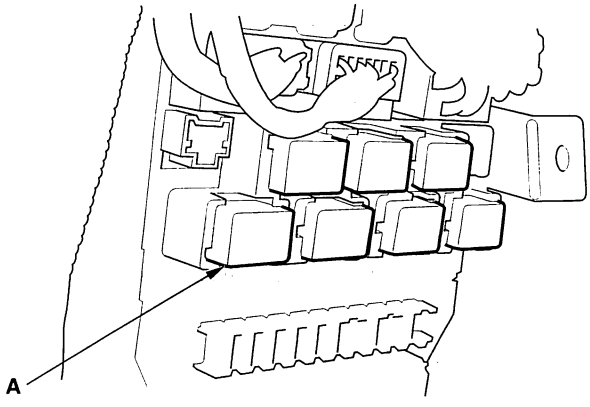
Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the fuel pump and PGM-FI main relay 2 (FUEL PUMP). Also replace the No. 19 FUEL PUMP (15 A) fuse.■

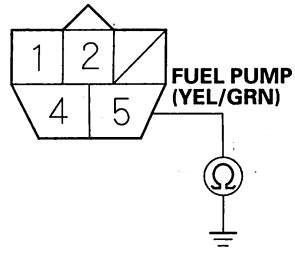
NO—Go to step 42.

42. Reinstall PGM-FI main relay 2 (FUEL PUMP) (A).



43. Check for continuity between fuel pump 5P connector terminal No. 5 and body ground.

FUEL PUMP 5P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Replace PGM-FI main relay 2 (FUEL PUMP). Also replace the No. 19 FUEL PUMP (15 A) fuse.■

NO—Check the fuel pump, and replace it if necessary (see page 11-327). Also replace the No. 19 FUEL PUMP (15 A) fuse.■

44. Jump the SCS line with the HDS.

45. Disconnect ECM/PCM connector E (31P).

46. Turn the ignition switch ON (II).

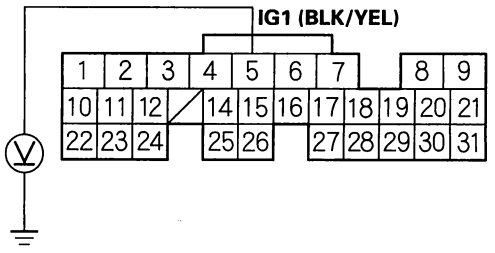
Protected by AR

MIL Circuit Troubleshooting (cont'd)

47. Measure voltage between ECM/PCM connector terminal E5 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

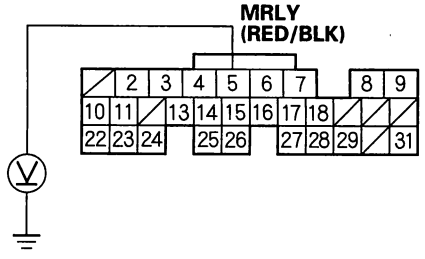
Is there battery voltage?

YES—Go to step 48.

NO—Repair open in the wire between the No. 19 FUEL PUMP (15 A) fuse and the ECM/PCM (E5). ■

48. Measure voltage between ECM/PCM connector terminal A5 and body ground.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

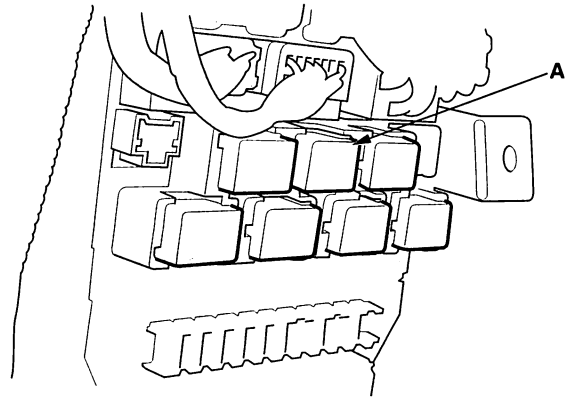
Is there battery voltage?

YES—Go to step 53.

NO—Go to step 49.

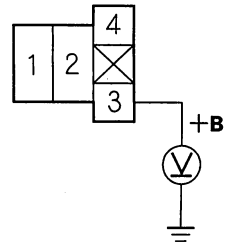
49. Turn the ignition switch OFF.

50. Remove the kick panel, refer to the 2003-2006 Accord Service Manual 2-door (see page 20-90); 4-door (see page 20-91). Then remove PGM-FI main relay 1 (FI MAIN) (A) from the under-dash fuse/ relay box.



51. Measure voltage between PGM-FI main relay 1 (FI MAIN) 4P connector terminal No. 3 and body ground.

PGM-FI MAIN RELAY 1 (FI MAIN) 4P CONNECTOR



Terminal side of female terminals

Is there battery voltage?

YES—Go to step 52.

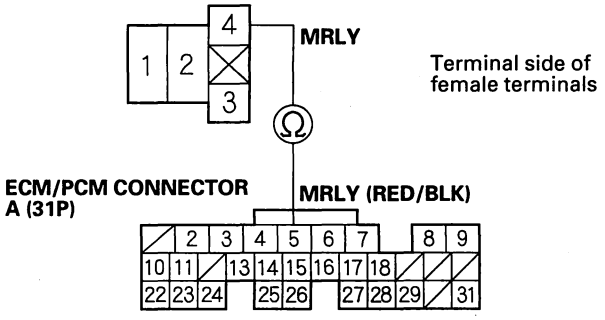
NO—Repair open in the wire between the No. 8 FI ECU (ECM/PCM) (15 A) fuse and PGM-FI main relay 1 (FI MAIN). ■

BACK

Protected by AR

52. Check for continuity between PGM-FI main relay 1 (FI MAIN) 4P connector terminal No. 4 and ECM/PCM connector terminal A5.

PGM-FI MAIN RELAY 1 (FI MAIN) 4P CONNECTOR



Is there continuity?

YES—Test PGM-FI main relay 1 (FI MAIN) (see page 22-51). If the relay is OK, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224).■

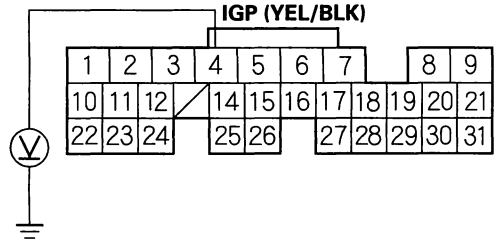
NO—Repair open in the wire between PGM-FI main relay 1 (FI MAIN) and the ECM/PCM (A5).■

53. Reconnect ECM/PCM connector E (31P).

54. Turn the ignition switch ON (II).

55. Measure voltage between body ground and ECM/PCM connector terminal E4.

ECM/PCM CONNECTOR E (31P)



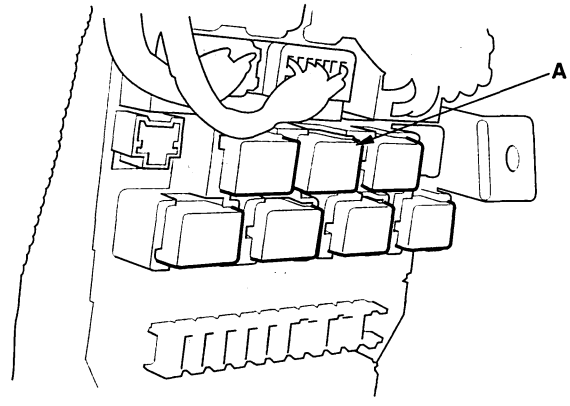
Is there battery voltage?

YES—Go to step 62.

NO—Go to step 56.

56. Turn the ignition switch OFF.

57. Remove the kick panel, refer to the 2003-2006 Accord Service Manual 2-door (see page 20-90); 4-door (see page 20-91). Then remove PGM-FI main relay 1 (FI MAIN) (A) from the under-dash fuse/relay box.



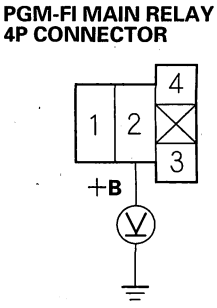
58. Turn the ignition switch ON (II).

(cont'd)

Protected by AR

MIL Circuit Troubleshooting (cont'd)

59. Measure voltage between PGM-FI main relay 1 (FI MAIN) 4P connector terminal No. 2 and body ground.



Terminal side of female terminals

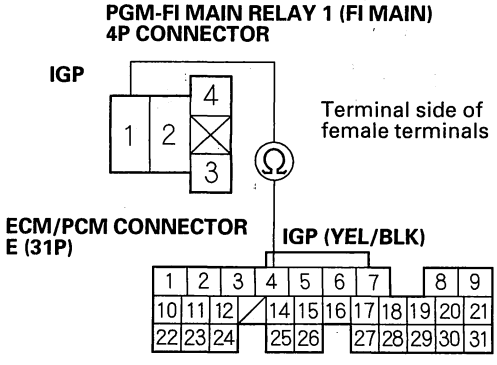
Is there battery voltage?

YES—Go to step 60.

NO—Repair open in the wire between the No. 8 FI ECU (ECM/PCM) (15 A) fuse and PGM-FI main relay 1 (FI MAIN). ■

60. Turn the ignition switch OFF.

61. Check for continuity between PGM-FI main relay 1 (FI MAIN) 4P connector terminal No. 1 and ECM/PCM connector terminal E4.



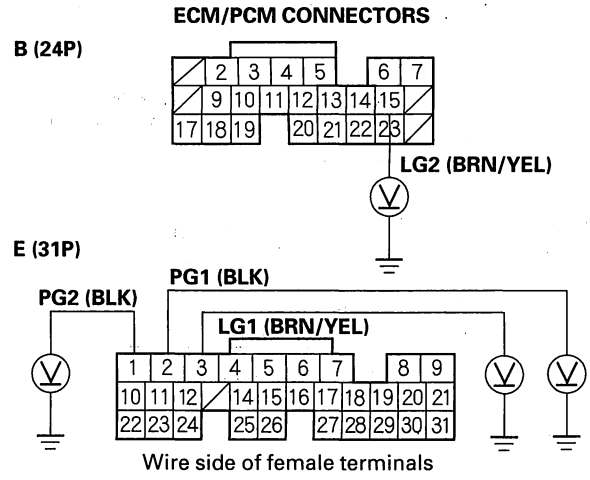
Wire side of female terminals

Is there continuity?

YES—Replace PGM-FI main relay 1 (FI MAIN). ■

NO—Repair open in the wire between PGM-FI main relay 1 (FI MAIN) and the ECM/PCM (E4). ■

62. Measure voltage between body ground and ECM/PCM connector terminals B15, E1, E2, and E3 individually.



Wire side of female terminals

Is there more than 0.2 V?

YES—Repair open in the wire(s) that had more than 0.2 V between G101 and the ECM/PCM (B15, E1, E2, E3). ■

NO—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■

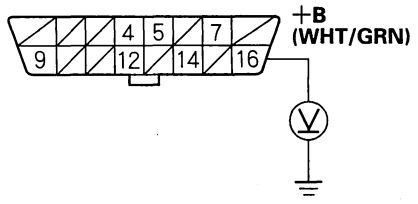
DLC Circuit Troubleshooting

NOTE:
- If the ECM/PCM does not communicate with the HDS, do this troubleshooting procedure.
- Check that MIL circuit is normal, then do this troubleshooting.

1. Measure voltage between DLC terminal No. 16 and body ground.

DATA LINK CONNECTOR (DLC)



Terminal side of female terminals

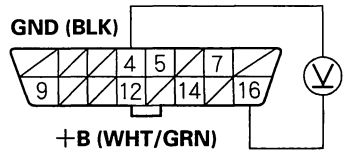
Is there battery voltage?

YES—Go to step 2.

NO—Repair open in the wire between DLC terminal No. 16 and the No. 8 FI ECU (ECM/PCM) (15 A) fuse in the under-hood fuse/relay box.■

2. Measure voltage between DLC terminals No. 4 and No. 16.

DATA LINK CONNECTOR (DLC)



Terminal side of female terminals

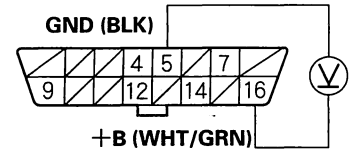
Is there battery voltage?

YES—Go to step 3.

NO—Repair open in the wire between DLC terminal No. 4 and body ground (G501).■

3. Measure voltage between DLC terminals No. 5 and No. 16.

DATA LINK CONNECTOR (DLC)



Terminal side of female terminals

Is there battery voltage?

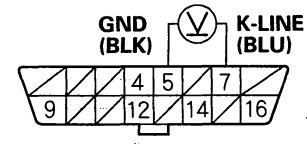
YES—Go to step 4.

NO—Repair open in the wire between DLC terminal No. 5 and body ground (G503).■

4. Turn the ignition switch ON (II).

5. Measure voltage between DLC terminals No. 5 and No. 7.

DATA LINK CONNECTOR (DLC)



Terminal side of female terminals

Is there 8.5 V or more?

YES—Go to step 11.

NO—Go to step 6.

6. Turn the ignition switch OFF.

7. Jump the SCS line with the HDS.

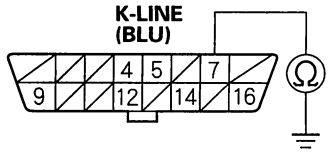
(cont'd)

Protected by AR

DLC Circuit Troubleshooting (cont'd)

8. Disconnect ECM/PCM connector E (31P).
9. Check for continuity between DLC terminal No. 7 and body ground.

DATA LINK CONNECTOR (DLC)



Terminal side of female terminals

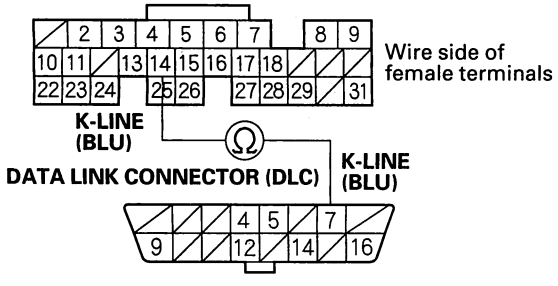
Is there continuity?

YES—Repair short to ground in the wire between DLC terminal No. 7 and the ECM/PCM (A14). After repairing the wire, check for a DTC with the HDS and go to the indicated DTC's troubleshooting. ■

NO—Go to step 10.

10. Check for continuity between DLC terminal No. 7 and ECM/PCM terminal A14.

ECM/PCM CONNECTOR A (31P)



Terminal side of female terminals

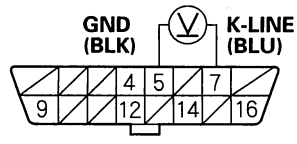
Is there continuity?

YES—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■

NO—Repair open in the wire between DLC terminal No. 7 and the ECM/PCM (A14). After repairing the wire, check for Temporary DTCs or DTCs with the HDS and go to the indicated DTC's troubleshooting. ■

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector A (31P).
14. Turn the ignition switch ON (II).
15. Measure voltage between DLC terminals No. 5 and No. 7.

DATA LINK CONNECTOR (DLC)



Terminal side of female terminals

Is there 0 V?

YES—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■

NO—Repair short to power in the wire between DLC terminal No. 7 and the ECM/PCM (A14). After repairing the wire, check for Temporary DTCs or DTCs with the HDS, and go to the indicated DTC's troubleshooting. ■

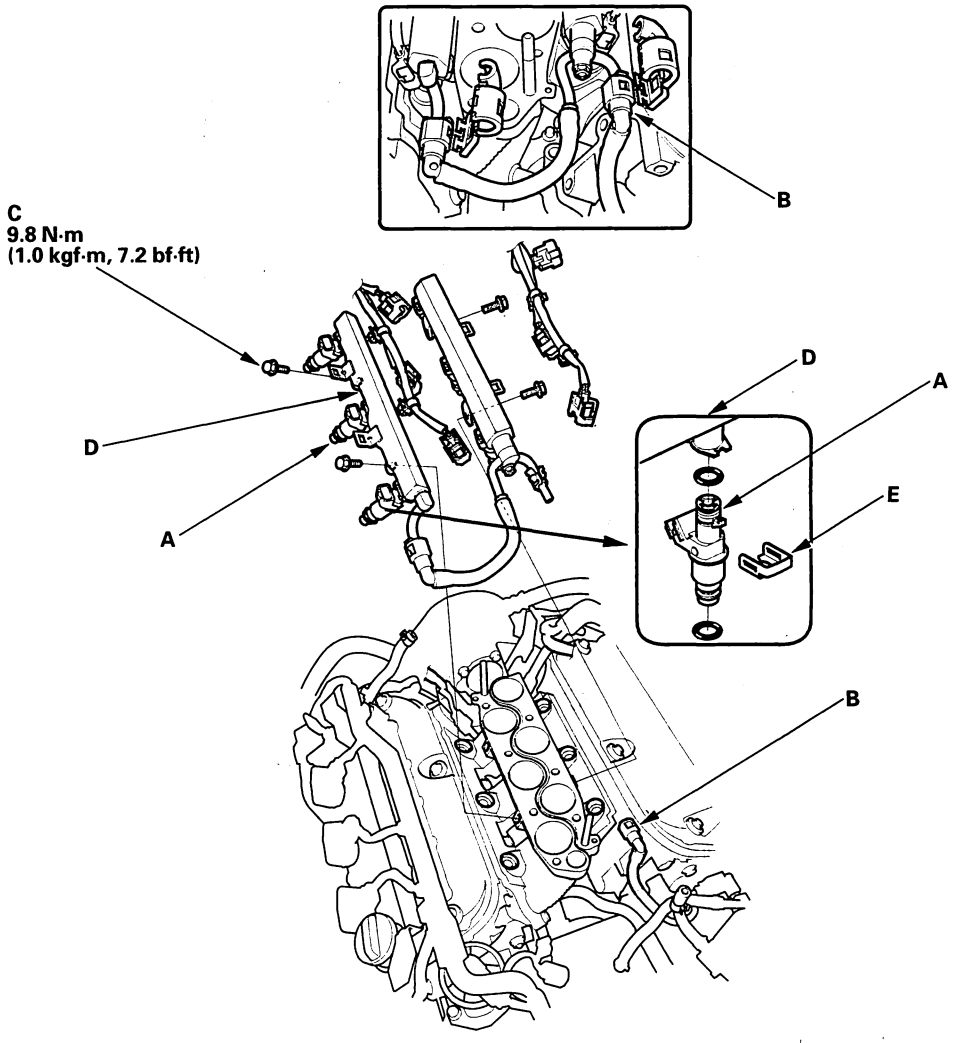
Injector Replacement

1. Relieve fuel pressure (see page 11-315).
2. Remove the intake manifold (see page 9-2).
3. Disconnect the connectors from the injectors (A).



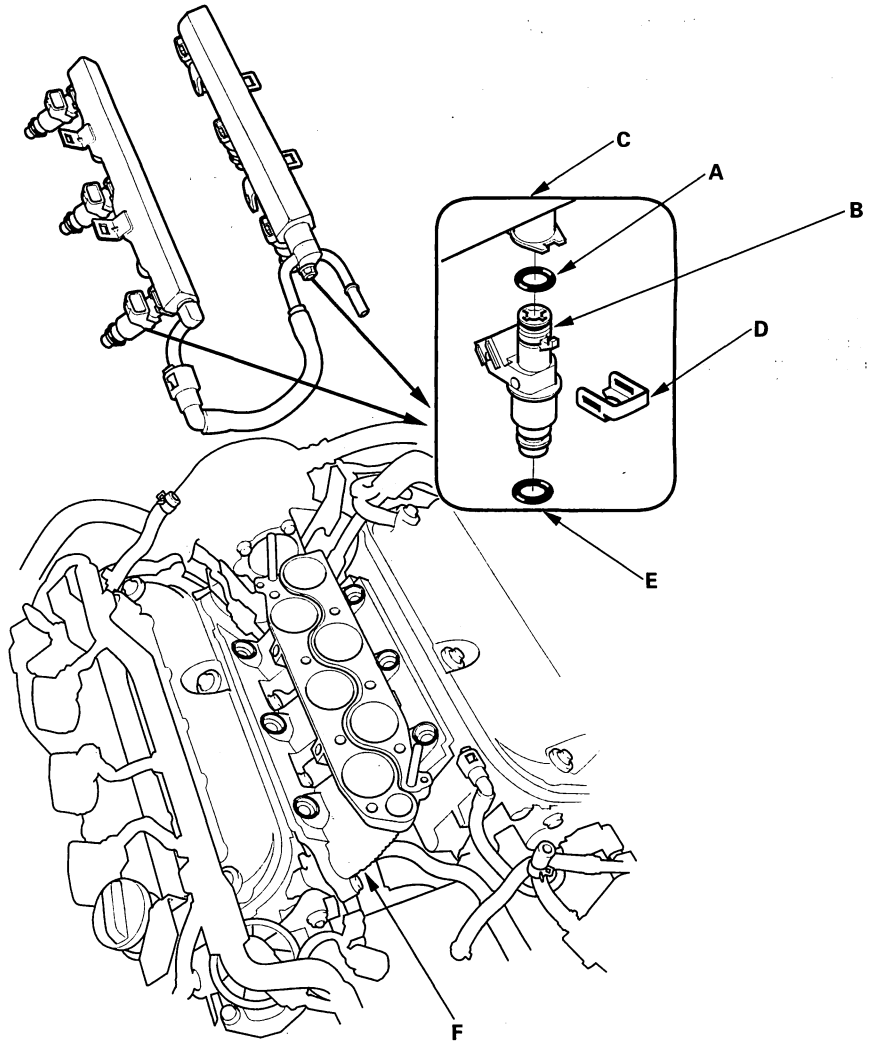
4. Disconnect the quick-connect fittings (B).
5. Remove the fuel rail mounting bolts (C) from the fuel rail (D).
6. Remove the injector clip (E) from the injector.
7. Remove the injector from the fuel rail.

(cont'd)

Protected by AR

Injector Replacement (cont'd)

8. Coat the new O-rings (A) with clean engine oil, and insert the injectors (B) into the fuel rail (C).



9. Install the injector clip (D).
10. Coat the injector O-rings (E) with clean engine oil.
11. Install the injectors in the injector base (F).
12. Install the fuel rail mounting nuts.
13. Connect the connectors on the injectors.
14. Connect the quick-connect fittings.
15. Turn the ignition switch ON (II), but do not operate the starter. After the fuel pump runs for about 2 seconds, the fuel rail will be pressurized. Repeat this two or three times, then check for fuel leakage.

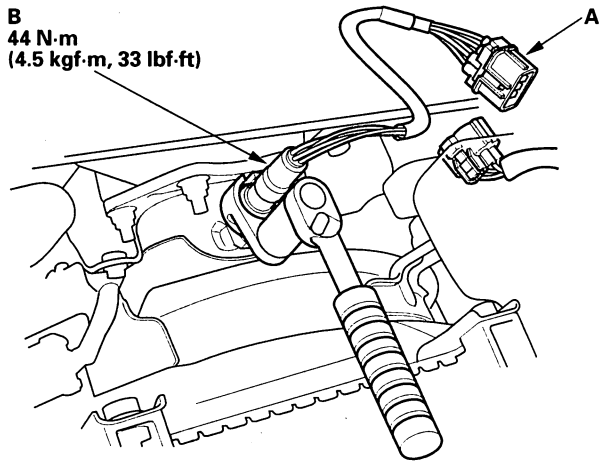
A/F Sensor Replacement

Special Tools Required
O2 sensor socket wrench, Snap-on YA8875, SP Tools 93750, or equivalent, commercially available

Front Bank (Bank 2)

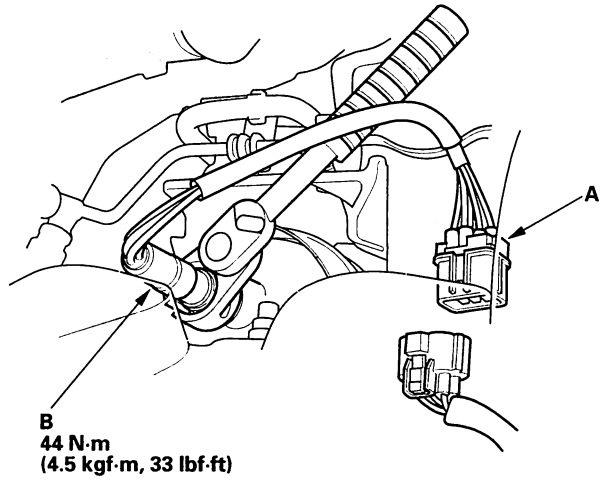
1. Disconnect the front A/F sensor (Bank 2) 8P connector (A), then remove the front A/F sensor (B).



2. Install the front A/F sensor in the reverse order of removal.

Rear Bank (Bank 1)

1. Disconnect the rear A/F sensor (Bank 1) 8P connector (A), then remove the rear A/F sensor (B).



2. Install the rear A/F sensor in the reverse order of removal.

BACK

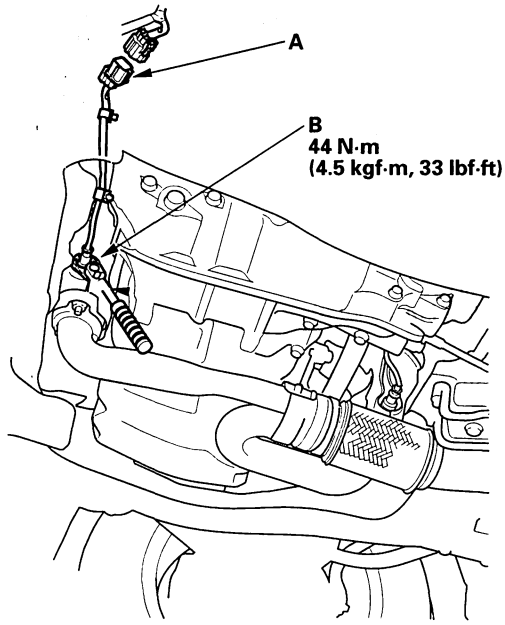
Protected by AR

Secondary HO2S Replacement

Special Tools Required
O2 sensor socket wrench, Snap-on YA8875, SP Tools 93750, or equivalent, commercially available

Front Bank (Bank 2)

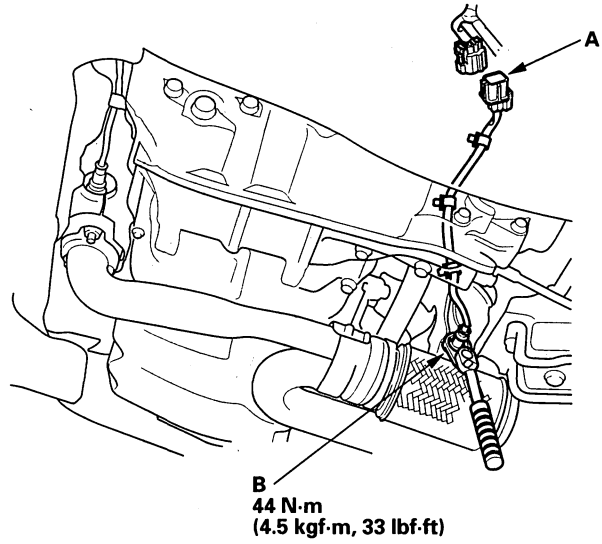
1. Disconnect the front secondary HO2S (Bank 2) 4P connector (A), then remove the front secondary HO2S (B).



2. Install the front secondary HO2S in the reverse order of removal.

Rear Bank (Bank 1)

1. Disconnect the rear secondary HO2S (Bank 1) 4P connector (A), then remove the rear secondary HO2S (B).



2. Install the rear secondary HO2S in the reverse order of removal.

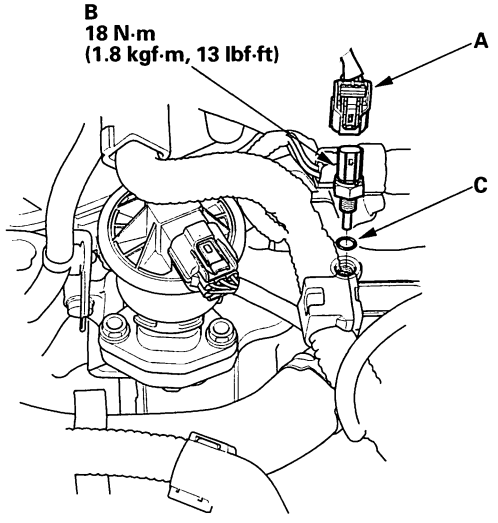
ECT Sensor/ECT Sensor 1 Replacement

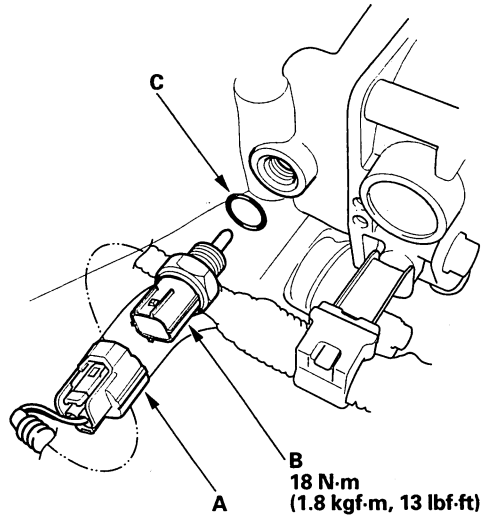
1. Remove the air cleaner (see page 11-344).
2. Disconnect the ECT sensor/ECT sensor 1 connector (A).



3. Remove the ECT sensor/ECT sensor 1 (B).
4. Install the sensor in the reverse order of removal with a new O-ring (C). Then refill the radiator with engine coolant (see page 10-6).

IAT Sensor Replacement

1. Disconnect the IAT sensor connector (A).



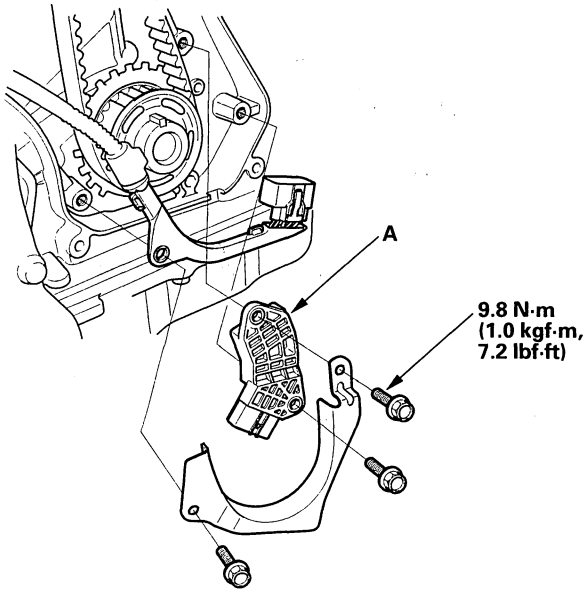
2. Remove the IAT sensor (B).
3. Install the sensor in the reverse order of removal with a new O-ring (C).

BACK

Protected by AR

CKP Sensor Replacement

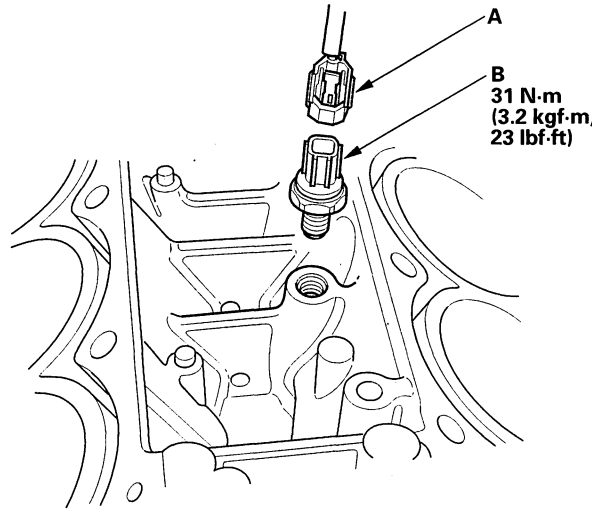
1. Move the auto-tensioner to remove tension from the drive belt, then remove the belt (see page 4-35).
2. Remove the crankshaft pulley (see page 6-11).
3. Remove the upper and lower timing belt covers from the engine (see step 9 on page 6-15).
4. Remove the CKP sensor A/B (A) from the oil pump.



5. Install the sensor in the reverse order of removal.
6. Do the CKP pattern clear/pattern learn procedure (see page 11-4).

Knock Sensor Replacement

1. Remove the intake manifold (see page 9-2).
2. Remove the fuel rails and the intake runner base.
3. Disconnect the knock sensor connector (A), then remove the knock sensor (B).



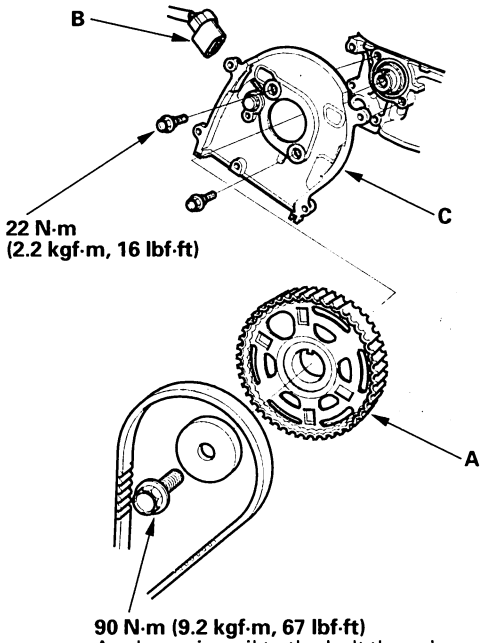
4. Install the sensor in the reverse order of removal.

BACK

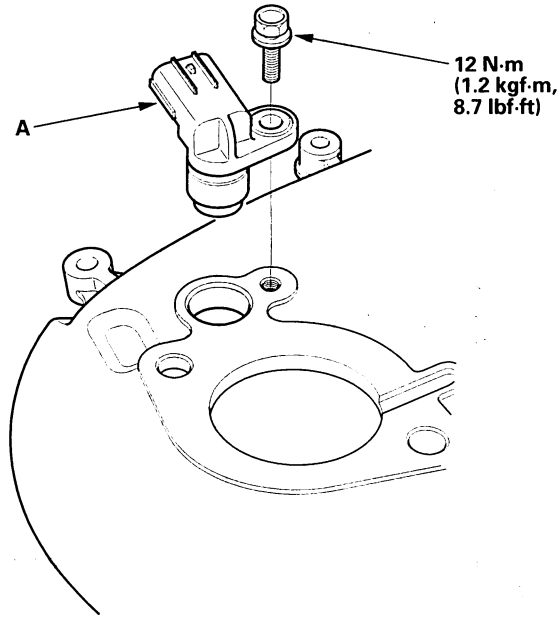
Protected by AR

CMP Sensor Replacement

1. Set the No. 1 piston at top dead center (see page 6-14).
2. Remove the upper covers from the engine (see step 9 on page 6-15).
3. To hold the timing belt adjuster in its current position, thread in the battery clamp bolt hand-tight (see step 13 on page 6-15).
4. Loosen the idler pulley bolt about five or six turns, then remove the timing belt from the front camshaft pulley (see step 15 on page 6-16).
5. Remove the front camshaft pulley (A).



6. Disconnect the CMP sensor connector (B), then remove the back cover (C).
7. Remove the CMP sensor (A) from the back cover.

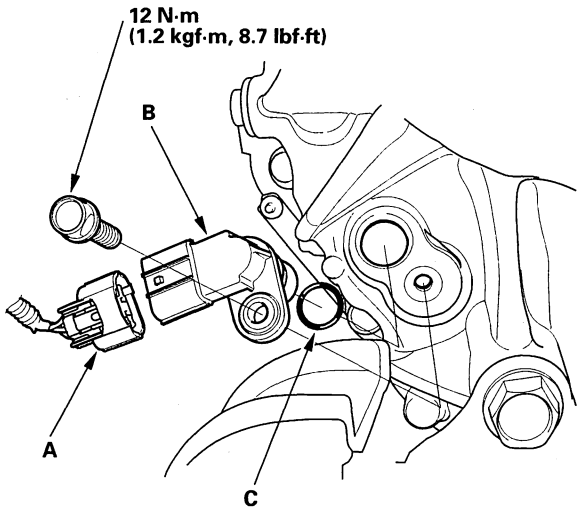


8. Install the sensor in the reverse order of removal. To install the timing belt (see page 6-16).
9. Do the CKP pattern clear/pattern learn procedure (see page 11-4).

Protected by AR

Input Shaft (Mainshaft) Speed Sensor Replacement

1. Disconnect the input shaft (mainshaft) speed sensor 3P connector (A).

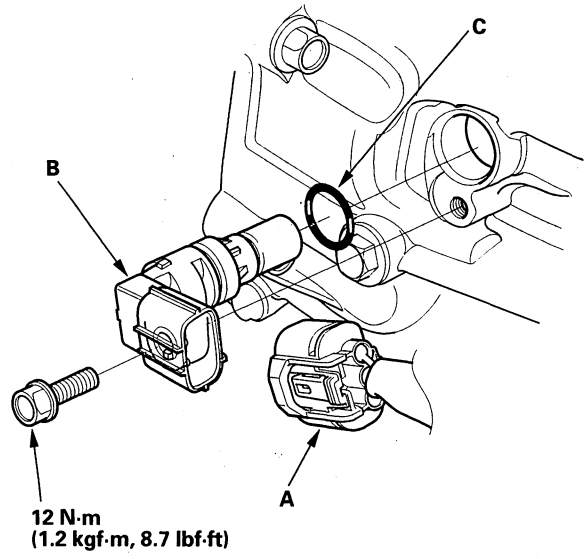


2. Remove the input shaft (mainshaft) speed sensor (B).

3. Install the sensor in the reverse order of removal with a new O-ring (C).

Output Shaft (Countershaft) Speed Sensor Replacement

1. Disconnect the output shaft (countershaft) speed sensor 3P connector (A).



2. Remove the output shaft (countershaft) speed sensor (B).

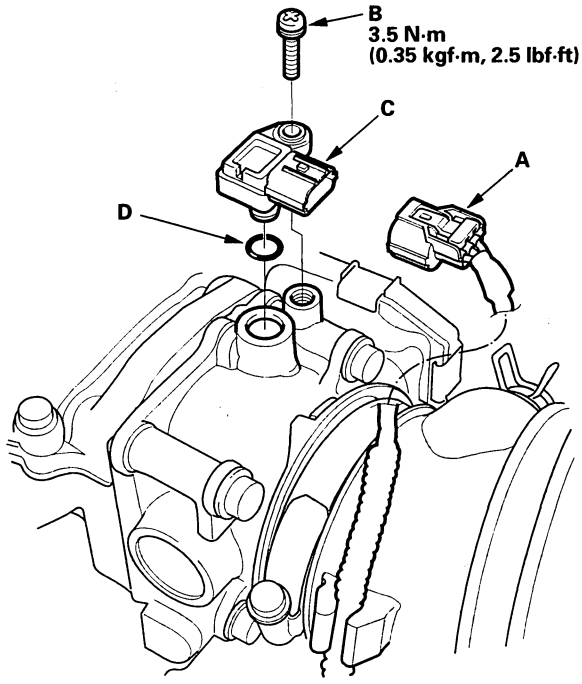
3. Install the sensor in the reverse order of removal with a new O-ring (C).

BACK

Protected by AR

MAP Sensor Replacement

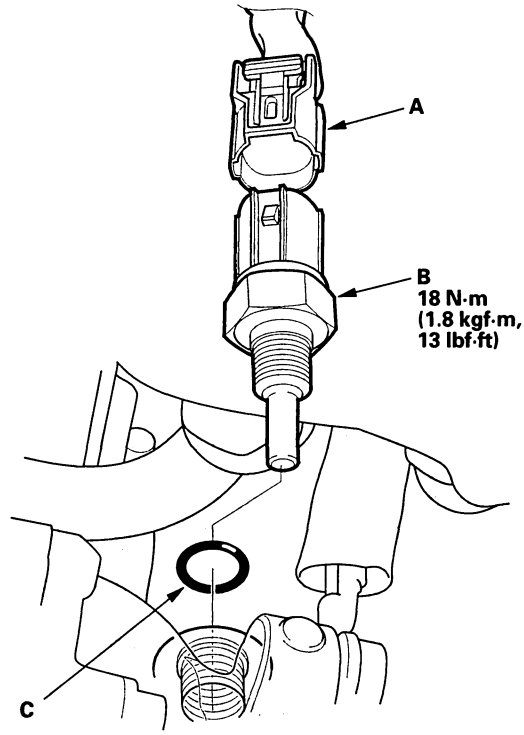
1. Disconnect the MAP sensor connector (A).



2. Remove the screw (B).
3. Remove the MAP sensor (C).
4. Install the sensor in the reverse order of removal with a new O-ring (D).

ECT Sensor 2 Replacement

1. Remove the throttle body (see page 11-348).
2. Disconnect the ECT sensor 2 connector (A).

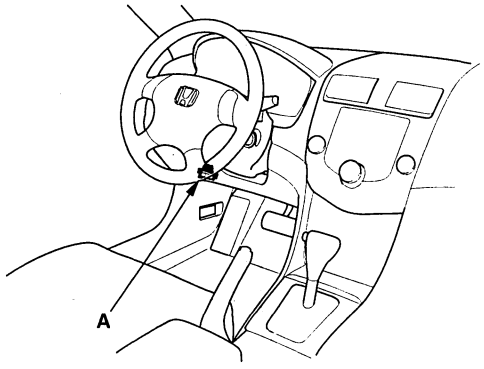


3. Remove ECT sensor 2 (B).
4. Install the sensor in the reverse order of removal with a new O-ring (C), then refill the radiator with engine coolant (see page 10-6).

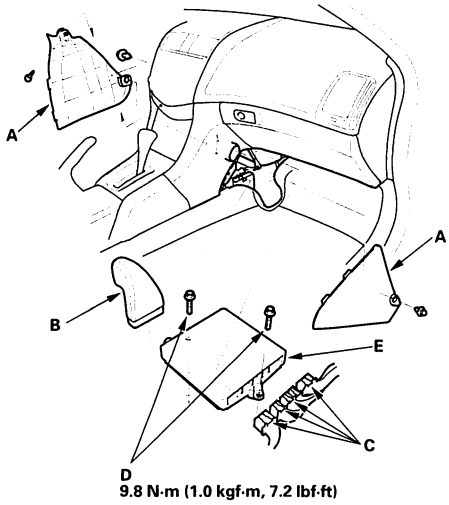
Protected by AR

ECM/PCM Replacement

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.



2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, skip steps 4 to 6 and 17 and clean the throttle body (see page 11-343) and replace the engine oil (see page 8-6) after this procedure
4. Select the INSPECTION MENU with the HDS.
5. Do the TP POSITION CHECK in the ETCS TEST.
6. Select READ DATA in REPLACE ECM/PCM with the HDS.
7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Remove the center lower covers (A).



10. Remove the duct (B).
11. Disconnect ECM/PCM connectors (C).
12. Remove the bolts (D), then remove the ECM/PCM (E).
13. Install the ECM/PCM in the reverse order of removal.
14. Open the SCS line with the HDS.
15. Turn the ignition switch ON (II).

    NOTE:
    2005-2006 models: DTC P0630 "VIN Not Programmed or Mismatch" may be stored because the VIN has not been programmed into the ECM/PCM; ignore it, and continue this procedure.

16. Input the VIN to the ECM/PCM with the HDS.
17. Select WRITE DATA in the REPLACE ECM/PCM with the HDS.
18. Rewrite the immobilizer code with the ECM/PCM replacement procedure in the HDS; it allows you to start the engine.
19. Reset the ECM/PCM with the HDS.
20. Do the ECM/PCM idle learn procedure (see page 11-302).
21. Do the CKP pattern clear/pattern learn procedure (see page 11-4).

DTC Troubleshooting

DTC P0122: TP Sensor A Circuit Low Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES—Go to step 4.

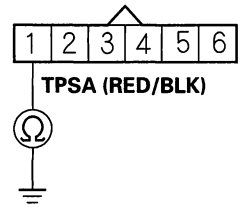
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle body and the throttle actuator control module. ■
4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES—Check for poor connections or loose terminals at the throttle body, the throttle actuator control module, and at the ECM/PCM, then go to step 17. If the connections are OK, go to step 9.

   NO—Go to step 5.
5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Disconnect the throttle actuator control module 16P connector.
8. Check for continuity between throttle body 6P connector terminal No. 1 and body ground.

THROTTLE BODY 6P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the throttle body and the throttle actuator control module (TPSA line), then go to step 17.

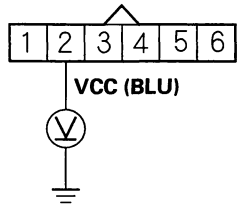
NO—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 17 and recheck. If DTC P0122 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 17. If DTC P0122 is indicated, go to step 15.

BACK

Protected by AR

9. Measure voltage between throttle body 6P connector terminal No. 2 and body ground.

THROTTLE BODY 6P CONNECTOR



Wire side of female terminals

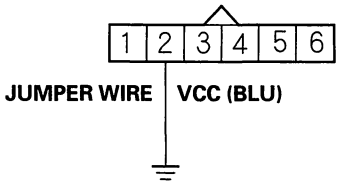
Is there about 5 V?

YES—Go to step 15.

NO—Go to step 10.

10. Turn the ignition switch OFF.
11. Disconnect the throttle actuator control module 16P connector.
12. Disconnect the throttle body 6P connector.
13. Connect throttle body 6P connector terminal No. 2 to body ground with a jumper wire.

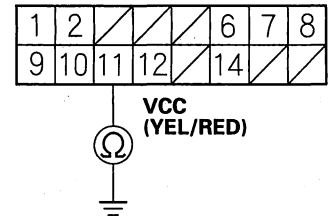
THROTTLE BODY 6P CONNECTOR



Wire side of female terminals

14. Check for continuity between throttle actuator control module 16P connector terminal No. 11 and body ground.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 17 and recheck. If DTC P0122 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 17. If DTC P0122 is indicated, go to step 15.

NO—Repair open in the wire between the throttle body and the throttle actuator control module (VCC line), then go to step 17.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

15. Turn the ignition switch OFF.
16. Replace the throttle body (see page 11-348).
17. Reconnect all connectors.
18. Turn the ignition switch ON (II).
19. Reset the ECM/PCM with the HDS.
20. Do the ECM/PCM idle learn procedure (see page 11-302).
21. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0122 is indicated, check for poor connections or loose terminals at the throttle body and the throttle actuator control module, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

Protected by AR

DTC P0123: TP Sensor A Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 4.8 V or more?

   YES—Go to step 4.

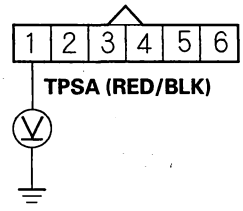
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle body and the throttle actuator control module. ■
4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0123 and P0223 indicated at the same time?

   YES—Go to step 11.

   NO—Go to step 5.
5. Measure voltage between throttle body 6P connector terminal No. 1 and body ground.

THROTTLE BODY 6P CONNECTOR



Wire side of female terminals

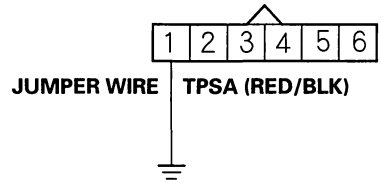
Is there about 5 V?

YES—Go to step 16.

NO—Go to step 6.

6. Turn the ignition switch OFF.
7. Disconnect the throttle actuator control module 16P connector.
8. Disconnect the throttle body 6P connector.
9. Connect throttle body 6P connector terminal No. 1 to body ground with a jumper wire.

THROTTLE BODY 6P CONNECTOR



Wire side of female terminals

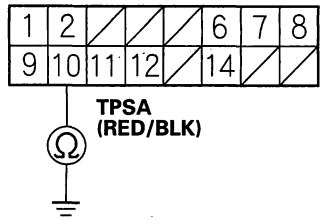
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

10. Check for continuity between throttle actuator control module 16P connector terminal No. 10 and body ground.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 18 and recheck. If DTC P0123 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 18. If DTC P0123 is indicated, go to step 16.

NO—Repair open in the wire between the throttle body and the throttle actuator control module (TPSA line), then go to step 18.

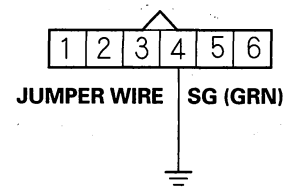
11. Turn the ignition switch OFF.

12. Disconnect the throttle body 6P connector.

13. Disconnect the throttle actuator control module 16P connector.

14. Connect throttle body 6P connector terminal No. 4 to body ground with a jumper wire.

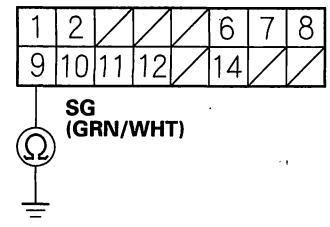
THROTTLE BODY 6P CONNECTOR



Wire side of female terminals

15. Check for continuity between throttle actuator control module 16P connector terminal No. 9 and body ground.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 18 and recheck. If DTC P0123 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 18. If DTC P0123 is indicated, go to step 16.

NO—Repair open in the wire between the throttle body and the throttle actuator control module (SG line), then go to step 18.

BACK

Protected by AR

16. Turn the ignition switch OFF.
17. Replace the throttle body (see page 11-348).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see page 11-302).
22. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0123 is indicated, check for poor connections or loose terminals at the throttle body and the throttle actuator control module, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

DTC Troubleshooting (cont'd)

DTC P0222: TP Sensor B Circuit Low Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES—Go to step 4.

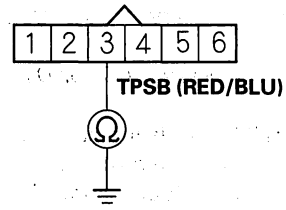
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle body and the throttle actuator control module.■
4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES—Check for poor connections or loose terminals at the throttle body, the throttle actuator control module, and at the ECM/PCM, then go to step 17. If the connections are OK, go to step 9.

   NO—Go to step 5.
5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Disconnect the throttle actuator control module 16P connector.
8. Check for continuity between throttle body 6P connector terminal No. 3 and body ground.

THROTTLE BODY 6P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the throttle body and the throttle actuator control module (TPSB line), then go to step 17.

NO—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 17 and recheck. If DTC P0222 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 17. If DTC P0222 is indicated, go to step 15.

DTC Troubleshooting (cont'd)

DTC P1683: Throttle Valve Default Position Spring Performance Problem

⚠CAUTION

Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

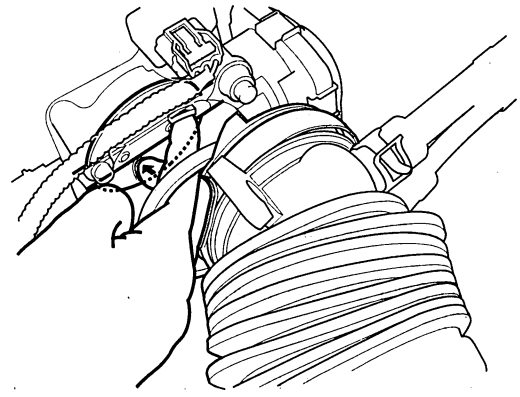
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1683 indicated?

   YES—Go to step 7.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle body and the throttle actuator control module. ■
7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body.
9. Push the throttle valve closed as shown.

   NOTE:
   - Do not operate the ignition switch during the check.
   - Be careful not to pinch your fingers during the check.



10. Release the throttle valve.

    Does the throttle valve return?

    YES—Clean the throttle body (see page 11-343), then go to step 13.

    NO—Go to step 11.
11. Turn the ignition switch OFF.
12. Replace the throttle body (see page 11-348).
13. Turn the ignition switch ON (II).
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see page 11-302).
16. Turn the ignition switch OFF, and wait 10 seconds.
17. Turn the ignition switch ON (II).
18. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1683 is indicated, check for poor connections or loose terminals at the throttle body and the throttle actuator control module, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

DTC P1684: Throttle Valve Return Spring Performance Problem

⚠CAUTION

Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

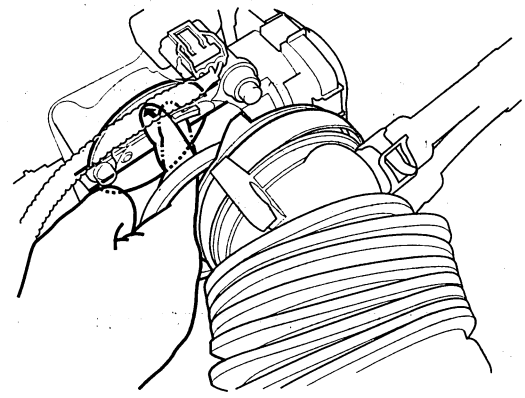
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1684 indicated?

   YES—Go to step 7.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle body and the throttle actuator control module. ■
7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body.
9. Push the throttle valve open as shown.

   NOTE:
   - Do not operate the ignition switch during the check.
   - Be careful not to pinch your fingers during the check.



10. Release the throttle valve.

    Does the throttle valve return?

    YES—Clean the throttle body (see page 11-343), then go to step 13.

    NO—Go to step 11.
11. Turn the ignition switch OFF.
12. Replace the throttle body (see page 11-348).
13. Turn the ignition switch ON (II).
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see page 11-302).
16. Turn the ignition switch OFF, and wait 10 seconds.
17. Turn the ignition switch ON (II).
18. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1684 is indicated, check for poor connections or loose terminals at the throttle body and the throttle actuator control module, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

DTC Troubleshooting (cont'd)

DTC P2101: Throttle Actuator System Malfunction

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2101 indicated?

   YES—Go to step 7.

   NO—Go to step 5.
5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

   - Engine speed
   - Vehicle speed
   - Accelerator position
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2101 indicated?

   YES—Go to step 7.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle body and at the throttle actuator control module, then clean the throttle body (see page 11-343).■
7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body.
9. Turn the ignition switch ON (II).
10. Clear the DTC with the HDS.
11. Do the ETCS TEST in the INSPECTION MENU with the HDS.
12. Visually check the throttle valve operation.

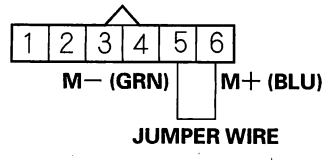
    NOTE: Be careful not to pinch your fingers during the check.

    Does the throttle valve operate smoothly?

    YES—Clean the throttle body (see page 11-343), then go to step 20 and recheck. If DTC P2101 is indicated, go to step 18.

    NO—Go to step 13.
13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Disconnect the throttle actuator control module 16P connector.
16. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

THROTTLE BODY 6P CONNECTOR



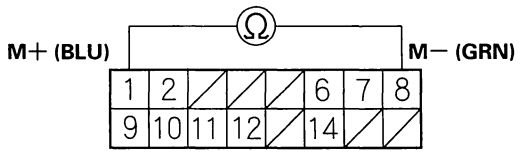
Wire side of female terminals

BACK

Protected by AR

17. Check for continuity between throttle actuator control module 16P connector terminals No. 1 and No. 8.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 20 and recheck. If DTC P2101 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 20. If DTC P2101 is indicated, go to step 18.

NO—Repair open in the wires between the throttle body and the throttle actuator control module (motor drive lines), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see page 11-348).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see page 11-302).
24. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

    - Engine speed
    - Vehicle speed
    - Accelerator position

25. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2101 is indicated, check for poor connections or loose terminals at the throttle body and the throttle actuator control module, then clean the throttle body (see page 11-343), and go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete.■

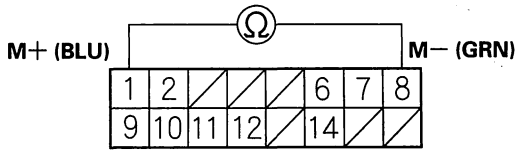
DTC P2118: Throttle Actuator Current Range/ Performance Problem

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Disconnect the throttle actuator control module 16P connector.
2. Measure resistance between throttle actuator control module 16P connector terminals No. 1 and No. 8.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

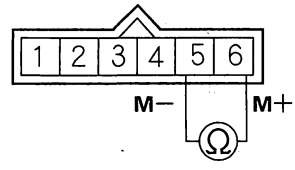
Is there about 1.0 Ω or less?

YES—Go to step 3.

NO—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 6 and recheck. If DTC P2118 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 6.

3. Disconnect the throttle body 6P connector.
4. At the throttle body side, measure resistance between throttle body 6P connector terminals No. 5 and No. 6 with the throttle fully closed.

THROTTLE BODY 6P CONNECTOR



Terminal side of male terminals

Is there about 1.0 Ω or less?

YES—Go to step 5.

NO—Repair short in the wires between the throttle body and the throttle actuator control module (motor drive lines), then go to step 6.

5. Replace the throttle body (see page 11-348).
6. Reconnect all connectors.
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see page 11-302).
10. Turn the ignition switch OFF.
11. Turn the ignition switch ON (II).
12. Slowly press the accelerator pedal to the floor.
13. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2118 is indicated, check for poor connections or loose terminals at the throttle body and the throttle actuator control module, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

DTC Troubleshooting (cont'd)

DTC P2122: APP Sensor A (Throttle Position Sensor D) Circuit Low Voltage (2003-2004 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0107, P0112, P0117, P0452, P2122, P2127, P2228, P2627 and P2630 indicated at the same time?

   YES—Go to step 20.

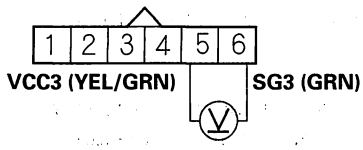
   NO—Go to step 4.
4. Check APP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Disconnect the APP sensor 6P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

APP SENSOR 6P CONNECTOR



Wire side of female terminals

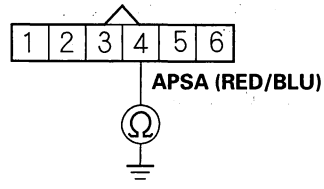
Is there about 5 V?

YES—Go to step 9.

NO—Go to step 19.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector D (17P).
12. Check for continuity between APP sensor 6P connector terminal No. 4 and body ground.

APP SENSOR 6P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between APP sensor A and the ECM/PCM (D3), then go to step 31.

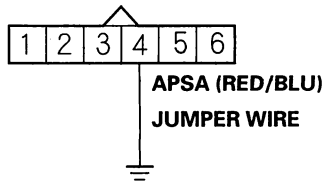
NO—Go to step 13.

BACK

Protected by AR

13. Connect APP sensor 6P connector terminal No. 4 to body ground with a jumper wire.

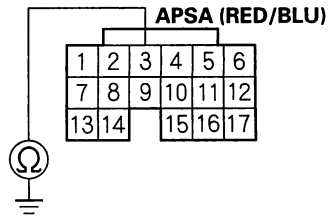
APP SENSOR 6P CONNECTOR



Wire side of female terminals

14. Check for continuity between ECM/PCM connector terminal D3 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there continuity?

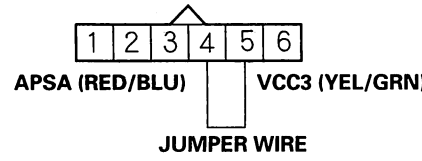
YES—Go to step 15.

NO—Repair open in the wire between APP sensor A and the ECM/PCM (D3), then go to step 31.

15. Reconnect ECM/PCM connector D (17P).

16. Connect APP sensor 6P connector terminals No. 4 and No. 5 with a jumper wire.

APP SENSOR 6P CONNECTOR



Wire side of female terminals

17. Turn the ignition switch ON (II).

18. Check APP SENSOR A in the DATA LIST with the HDS.

Is there about 0.2 V or less?

YES—Go to step 36.

NO—Go to step 29.

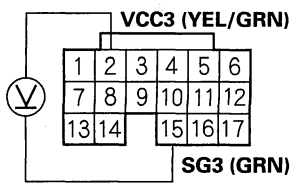
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

19. Measure voltage between ECM/PCM connector terminals D2 and D15.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between APP sensor A and the ECM/PCM (D2), then go to step 31.

NO—Go to step 36.

20. Turn the ignition switch OFF.

21. Jump the SCS line with the HDS.

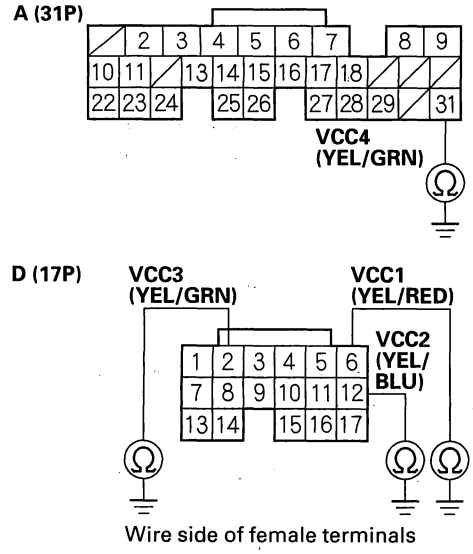
22. Disconnect ECM/PCM connectors A (31P) and D (17P).

23. Disconnect the connectors from these parts:

- MAP sensor
- IMT (IMRC) actuator
- APP sensor
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

24. Check for continuity between body ground and ECM/PCM connector terminals A31, D2, D6 and D12 individually.

ECM/PCM CONNECTORS



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A31, D2, D6, or D12) and each part, then go to step 31.

NO—Go to step 25.

BACK

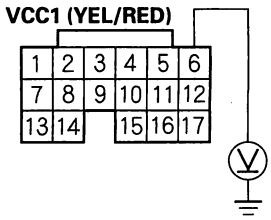
Protected by AR

25. Reconnect ECM/PCM connectors A (31P) and D (17P).

26. Turn the ignition switch ON (II).

27. Measure voltage between ECM/PCM connector terminal D6 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Go to step 28.

NO—Go to step 36.

28. Continue to monitor voltage at ECM/PCM connector terminal D6 while reconnecting these parts, one at a time:

- MAP sensor
- IMT (IMRC) actuator
- APP sensor
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

Did the voltage drop to about 0 V?

YES—Replace the sensor that caused the voltage to drop, then go to step 31.

NO—Go to step 36.

29. Turn the ignition switch OFF.

30. Replace the APP sensor (see page 11-278).

31. Reconnect all connectors.

32. Turn the ignition switch ON (II).

33. Reset the ECM/PCM with the HDS.

34. Do the ECM/PCM idle learn procedure (see page 11-302).

35. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2122 is indicated, check for poor connections or loose terminals at APP sensor A and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

36. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

37. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2122 is indicated, check for poor connections or loose terminals at APP sensor A and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

Is there continuity?

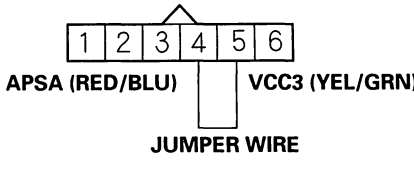
YES—Go to step 13.

NO—Repair open in the wire between APP sensor A and the ECM/PCM (D3), then go to step 20.

13. Reconnect ECM/PCM connector D (17P).

14. Connect APP sensor 6P connector terminals No. 4 and No. 5 with a jumper wire.

APP SENSOR 6P CONNECTOR



Wire side of female terminals

15. Turn the ignition switch ON (II).

16. Check APP SENSOR A in the DATA LIST with the HDS.

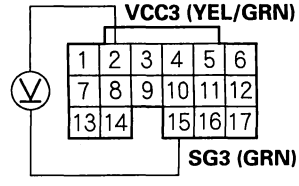
Is there about 0.2 V or less?

YES—Go to step 25.

NO—Go to step 18.

17. Measure voltage between ECM/PCM connector terminals D2 and D15.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between APP sensor A and the ECM/PCM (D2), then go to step 20.

NO—Go to step 25.

DTC Troubleshooting (cont'd)

18. Turn the ignition switch OFF.
19. Replace the APP sensor (see page 11-278).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see page 11-302).
24. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2122 is indicated, check for poor connections or loose terminals at APP sensor A and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■
25. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
26. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2122 is indicated, check for poor connections or loose terminals at APP sensor A and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P2123: APP Sensor A (Throttle Position Sensor D) Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

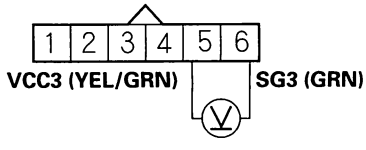
1. Turn the ignition switch ON (II).
2. Check APP SENSOR A in the DATA LIST with the HDS.

   Is there about 4.9 V or more?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM/PCM. ■
3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

APP SENSOR 6P CONNECTOR



Wire side of female terminals

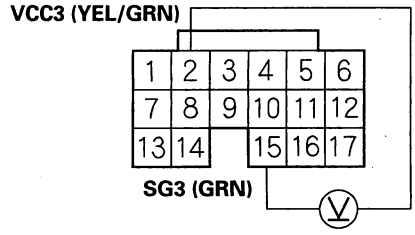
Is there about 5 V?

YES—Go to step 8.

NO—Go to step 7.

7. Measure voltage between ECM/PCM connector terminals D2 and D15.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between APP sensor A and the ECM/PCM (D15), then go to step 10.

NO—Go to step 15.

8. Turn the ignition switch OFF.
9. Replace the APP sensor (see page 11-278).
10. Reconnect the APP sensor 6P connector.
11. Turn the ignition switch ON (II).
12. Reset the ECM/PCM with the HDS.
13. Do the ECM/PCM idle learn procedure (see page 11-302).
14. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2123 is indicated, check for poor connections or loose terminals at APP sensor A and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

DTC 2127: APP Sensor B (Throttle Position Sensor E) Circuit Low Voltage (2003-2004 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0107, P0112, P0117, P0452, P2122, P2127, P2228, P2627 and P2630 indicated at the same time?

   YES—Go to step 20.

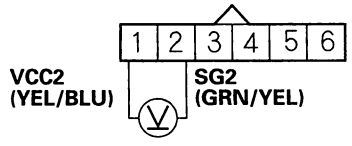
   NO—Go to step 4.
4. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at APP sensor B and the ECM/PCM.■
5. Turn the ignition switch OFF.
6. Disconnect the APP sensor 6P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between APP sensor 6P connector terminals No. 1 and No. 2.

APP SENSOR 6P CONNECTOR



Wire side of female terminals

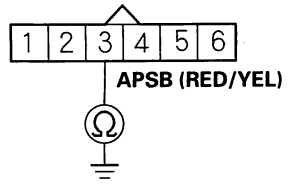
Is there about 5 V?

YES—Go to step 9.

NO—Go to step 19.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector D (17P).
12. Check for continuity between APP sensor 6P connector terminal No. 3 and body ground.

APP SENSOR 6P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between APP sensor B and the ECM/PCM (D9), then go to step 31.

NO—Go to step 13.

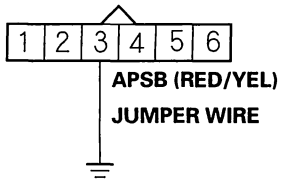
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

13. Connect APP sensor 6P connector terminal No. 3 to body ground with a jumper wire.

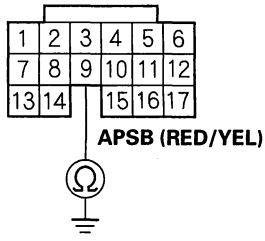
APP SENSOR 6P CONNECTOR



Wire side of female terminals

14. Check for continuity between ECM/PCM connector terminal D9 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there continuity?

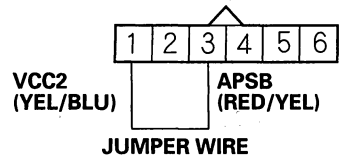
YES—Go to step 15.

NO—Repair open in the wire between APP sensor B and the ECM/PCM (D9), then go to step 31.

15. Reconnect ECM/PCM connector D (17P).

16. Connect APP sensor 6P connector terminals No. 1 and No. 3 with a jumper wire.

APP SENSOR 6P CONNECTOR



Wire side of female terminals

17. Turn the ignition switch ON (II).

18. Check APP SENSOR B in the DATA LIST with the HDS.

Is there about 0.2 V or less?

YES—Go to step 36.

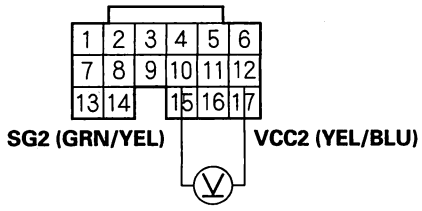
NO—Go to step 29.

BACK

Protected by AR

19. Measure voltage between ECM/PCM connector terminals D10 and D12.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between APP sensor B and the ECM/PCM (D12), then go to step 31.

NO—Go to step 36.

20. Turn the ignition switch OFF.

21. Jump the SCS line with the HDS.

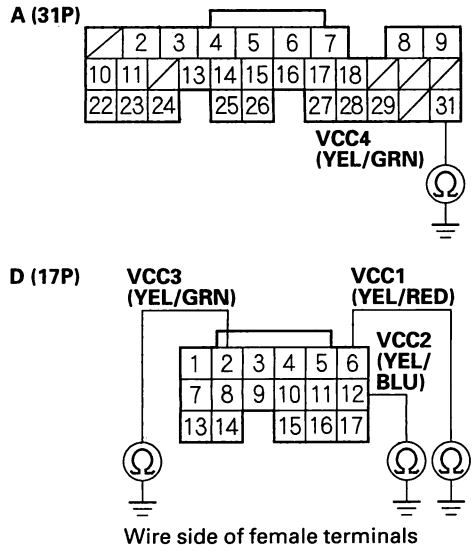
22. Disconnect ECM/PCM connectors A (31P) and D (17P).

23. Disconnect the connectors from these parts:

- MAP sensor
- IMT (IMRC) actuator
- APP sensor
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

24. Check for continuity between body ground and ECM/PCM connector terminals A31, D2, D6 and D12 individually.

ECM/PCM CONNECTORS



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A31, D2, D6, or D12) and each part, then go to step 31.

NO—Go to step 25.

(cont'd)

Protected by AR

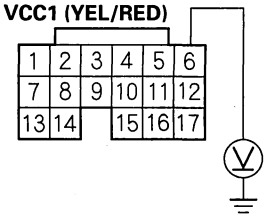
DTC Troubleshooting (cont'd)

25. Reconnect ECM/PCM connectors A (31P) and D (17P).

26. Turn the ignition switch ON (II).

27. Measure voltage between ECM/PCM connector terminal D6 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Go to step 28.

NO—Go to step 36.

28. Continue to monitor voltage at ECM/PCM connector terminal D6 while reconnecting these parts, one at a time:

- MAP sensor
- IMT (IMRC) actuator
- APP sensor
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

Did the voltage drop to about 0 V?

YES—Replace the sensor that caused the voltage to drop, then go to step 31.

NO—Go to step 36.

29. Turn the ignition switch OFF.

30. Replace the APP sensor (see page 11-278).

31. Reconnect all connectors.

32. Turn the ignition switch ON (II).

33. Reset the ECM/PCM with the HDS.

34. Do the ECM/PCM idle learn procedure (see page 11-302).

35. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2127 is indicated, check for poor connections or loose terminals at APP sensor B and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

36. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

37. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2127 is indicated, check for poor connections or loose terminals at APP sensor B and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC P2135: TP Sensor A/B Voltage Incorrect Correlation

⚠CAUTION

Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2135 indicated?

   YES—Go to step 5.

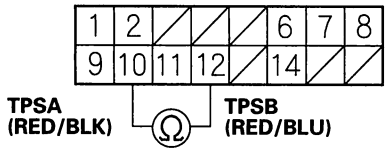
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle body and the throttle actuator control module.■
5. Turn the ignition switch OFF.
6. Disconnect the intake air duct from the throttle body.
7. Turn the ignition switch ON (II).
8. Clear the DTC with the HDS.
9. Visually check the throttle valve operation.

   Does the valve temporarily move to the fully closed position?

   YES—Go to step 15.

   NO—Go to step 10.
10. Turn the ignition switch OFF.
11. Disconnect the throttle actuator control module 16P connector.
12. Check for continuity between throttle actuator control module 16P connector terminals No. 10 and No. 12.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 13.

NO—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 17 and recheck. If DTC P2135 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 17.

DTC Troubleshooting (cont'd)

DTC P2176: Throttle Actuator Control System Idle Position Not Learned

⚠CAUTION

Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P2135 is stored at the same time as DTC P2176, troubleshoot DTC P2135 first, then recheck for DTC P2176.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II), and wait 10 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2176 indicated?

   YES—Go to step 6.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle body and the throttle actuator control module, then clean the throttle body (see page 11-343).■
6. Turn the ignition switch OFF.
7. Disconnect the intake air duct from the throttle body.
8. Turn the ignition switch ON (II).
9. Clear the DTC with the HDS.
10. Do the ETCS TEST in the INSPECTION MENU with the HDS.
11. Visually check the throttle valve operation.

    NOTE: Be careful not to pinch your fingers. Keep your hands away from the throttle valve.

    Does the throttle valve move to its fully closed position?

    YES—Go to step 12.

    NO—Go to step 13.
12. Check for sludge or carbon on the throttle valve.

    Is there sludge or carbon on the throttle valve?

    YES—Clean the throttle body (see page 11-343), then go to step 21 and recheck.

    NO—Go to step 18.
13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Disconnect the throttle actuator control module 16P connector.
16. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

THROTTLE BODY 6P CONNECTOR

DTC Troubleshooting (cont'd)

DTC P2552: Throttle Actuator Control Module Relay Malfunction

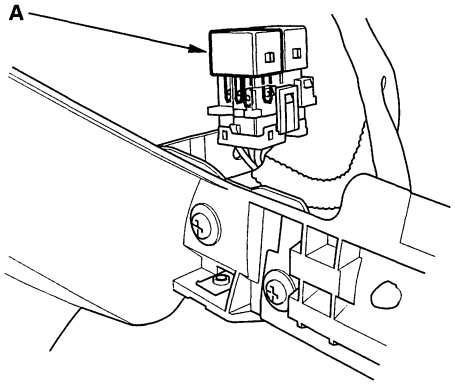
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.

   Is the RELAY Circuit OK?

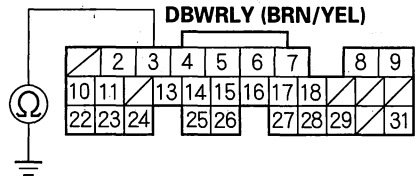
   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle actuator control module relay, the throttle actuator control module, and the ECM/PCM. ■

   NO—Go to step 4.
4. Turn the ignition switch OFF.
5. Jump the SCS line with the HDS.
6. Remove the throttle actuator control module relay (A).



7. Disconnect ECM/PCM connector A (31P).
8. Check for continuity between ECM/PCM connector terminal A3 and body ground.

ECM/PCM CONECTOR A (31P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the throttle actuator control module relay and the ECM/PCM (A3), then go to step 10.

NO—Go to step 9.

9. Test the throttle actuator control module relay (see page 22-51).

   Is the relay OK?

   YES—Go to step 17.

   NO—Replace the throttle actuator control module relay, then go to step 10.

BACK

Protected by AR

10. Reconnect ECM/PCM connector A (31P).
11. Turn the ignition switch ON (II).
12. Reset the ECM/PCM with the HDS.
13. Do the ECM/PCM idle learn procedure (see page 11-302).
14. Turn the ignition switch OFF.
15. Turn the ignition switch ON (II), and wait 10 seconds.
16. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2552 is indicated, check for poor connections or loose terminals at the throttle actuator control module relay, the throttle actuator control module, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■
17. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
18. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2552 is indicated, check for poor connections or loose terminals at the throttle actuator control module relay, the throttle actuator control module, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC Troubleshooting (cont'd)

DTC U0107: Lost Communication With Throttle Actuator Control Module

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0107 indicated?

   YES—Check for poor connections or loose terminals at the throttle body, the throttle actuator control module, and the ECM/PCM, then go to step 50. If the connections are OK, go to step 6.

   NO—Go to step 4.
4. Start the engine.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0107 indicated?

   YES—Go to step 46.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the throttle body, the throttle actuator control module relay, the throttle actuator control module, and the ECM/PCM. ■
6. Clear the DTC with the HDS.
7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body.
9. Press the accelerator pedal to the floor.
10. Turn the ignition switch ON (II).
11. Check the throttle valve operation.

    Does it open after the throttle valve closes?

    YES—Go to step 12.

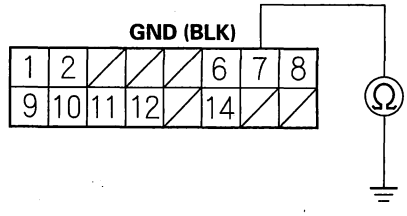
    NO—Go to step 13.
12. Check the throttle valve again.

    Does the throttle valve open fully?

    YES—Go to step 40.

    NO—Go to step 34.
13. Turn the ignition switch OFF.
14. Disconnect the throttle actuator control module 16P connector.
15. Check for continuity between throttle actuator control module 16P connector terminal No. 7 and body ground.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

Is there continuity?

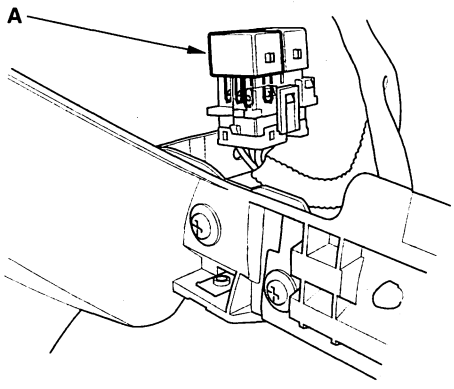
YES—Go to step 16.

NO—Repair open in the wire between the throttle body, the throttle actuator control module, and G101, then go to step 50.

BACK

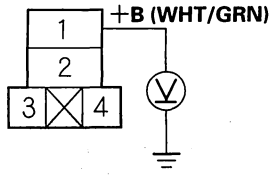
Protected by AR

16. Remove the throttle actuator control module relay (A).



17. Measure voltage between throttle actuator control module relay 4P connector terminal No. 2 and body ground.

THROTTLE ACTUATOR CONTROL MODULE RELAY 4P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Go to step 19.

NO—Go to step 18.

18. Check the No. 1 THROTTLE ACTUATOR CONTROL (15 A) fuse in under-dash fuse/relay box.

Is the fuse OK?

YES—Repair open in the wire between the throttle actuator control module relay (+B line) and the No. 1 THROTTLE ACTUATOR CONTROL (15 A) fuse, then go to step 50.

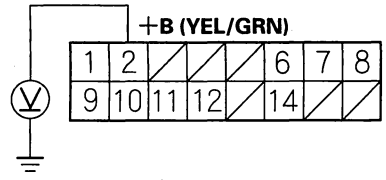
NO—Repair short in the wire between the throttle actuator control module relay (+B line) and the No. 1 THROTTLE ACTUATOR CONTROL (15 A) fuse, then go to step 50.

19. Install the throttle actuator control module relay.

20. Turn the ignition switch ON (II).

21. Measure voltage between throttle actuator control module 16P connector terminal No. 2 and body ground.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

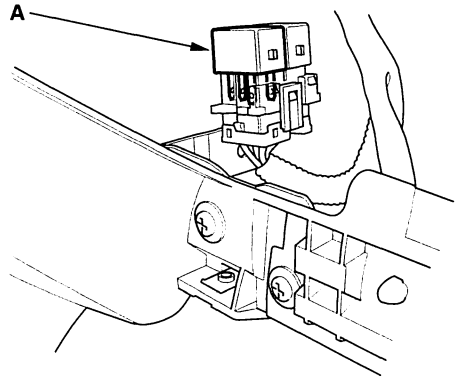
Is there battery voltage for about 2 seconds?

YES—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 50 and recheck. If DTC U0107 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 50.

NO—Go to step 22.

22. Turn the ignition switch OFF.

23. Remove the throttle actuator control module relay (A).



(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

24. Check the throttle actuator control module relay (see page 22-51).

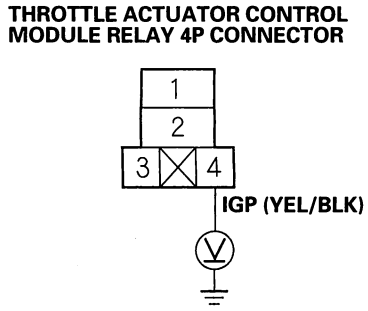
    Is the throttle actuator control module relay OK?

    YES—Go to step 25.

    NO—Replace the throttle actuator control module relay, then go to step 50.

25. Turn the ignition switch ON (II).

26. Measure voltage between throttle actuator control module relay 4P connector terminal No. 4 and body ground.



Wire side of female terminals

Is there battery voltage?

YES—Go to step 27.

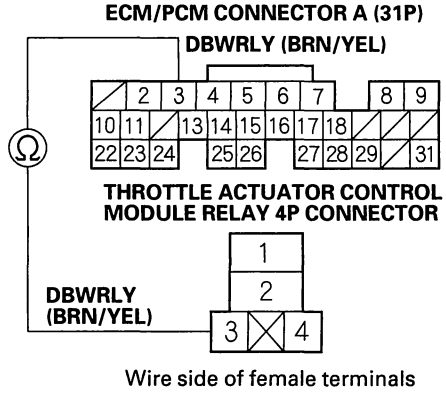
NO—Repair open in the wire between the throttle actuator control module relay and PGM-FI main relay 1 (FI MAIN), then go to step 50.

27. Turn the ignition switch OFF.

28. Jump the SCS line with the HDS.

29. Disconnect ECM/PCM connector A (31P).

30. Check for continuity between ECM/PCM connector terminal A3 and throttle actuator control module relay 4P connector terminal No. 3.



Wire side of female terminals

Is there continuity?

YES—Go to step 31.

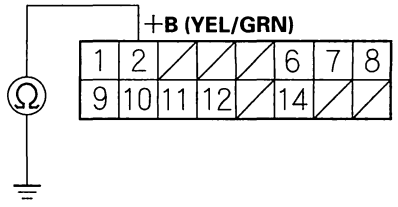
NO—Repair open in the wire between the ECM/PCM (A3) and the throttle actuator control module relay, then go to step 50.

BACK

Protected by AR

31. Check for continuity between throttle actuator control module 16P connector terminal No. 2 and body ground.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

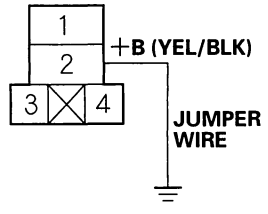
Is there continuity?

YES—Repair short in the wire between the throttle actuator control module and the throttle actuator control module relay (+B line), then go to step 50.

NO—Go to step 32.

32. Connect throttle actuator control module relay 4P connector terminal No. 2 to body ground with a jumper wire.

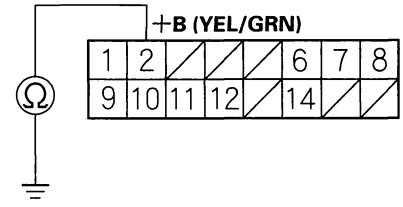
THROTTLE ACTUATOR CONTROL MODULE RELAY 4P CONNECTOR



Wire side of female terminals

33. Check for continuity between throttle actuator control module 16P connector terminal No. 2 and body ground.

THROTTLE ACTUATOR CONTROL MODULE 16P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 56.

NO—Repair open in the wire between the throttle actuator control module and the throttle actuator control module relay (+B line), then go to step 50.

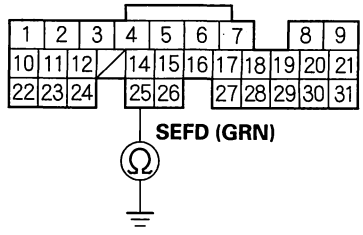
DTC Troubleshooting (cont'd)

34. Turn the ignition switch OFF.
35. Jump the SCS line with the HDS.
36. Disconnect the throttle actuator control module 16P connector.
37. Disconnect ECM/PCM connector E (31P).
38. Check for continuity between ECM/PCM connector terminal E25 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

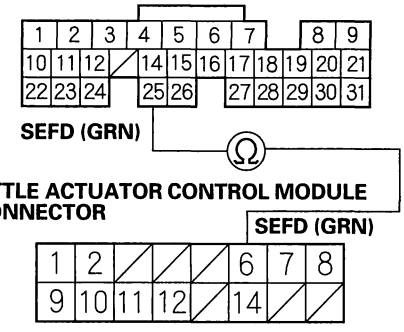
Is there continuity?

YES—Repair short in the wire between the ECM/PCM (E25) and the throttle actuator control module, then go to step 50.

NO—Go to step 39.

39. Check for continuity between ECM/PCM connector terminal E25 and throttle actuator control module 16P connector terminal No. 6.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 50 and recheck. If DTC U0107 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 50. If DTC U0107 is indicated, then go to step 56.

NO—Repair open in the wire between the ECM/PCM (E25) and the throttle actuator control module, then go to step 50.

BACK

Protected by AR

40. Turn the ignition switch OFF.

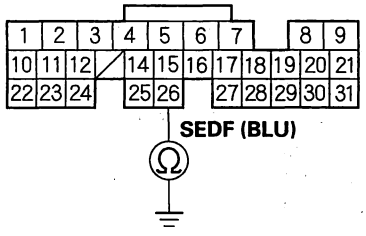
41. Jump the SCS line with the HDS.

42. Disconnect the throttle actuator control module 16P connector.

43. Disconnect ECM/PCM connector E (31P).

44. Check for continuity between ECM/PCM connector terminal E26 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

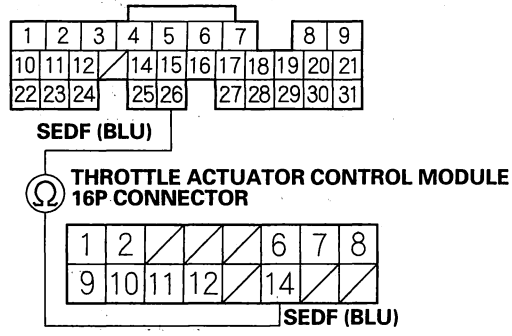
Is there continuity?

YES—Repair short in the wire between the ECM/PCM (E26) and the throttle actuator control module, then go to step 50.

NO—Go to step 45.

45. Check for continuity between ECM/PCM connector terminal E26 and throttle actuator control module 16P connector terminal No. 14.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good throttle actuator control module (see page 11-278), then go to step 50 and recheck. If DTC U0107 is not indicated, replace the original throttle actuator control module (see page 11-278), then go to step 50. If DTC U0107 is indicated, then go to step 56.

NO—Repair open in the wire between the ECM/PCM (E26) and the throttle actuator control module, then go to step 50.

(cont'd)

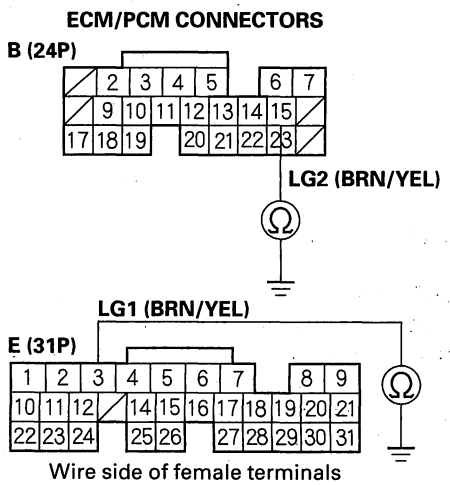
DTC Troubleshooting (cont'd)

46. Turn the ignition switch OFF.
47. Jump the SCS line with the HDS.
48. Disconnect ECM/PCM connectors B (24P) and E (31P).
49. Check for continuity between body ground and ECM/PCM connector terminals B15 and E3 individually.



Is there continuity?

YES—Check for poor connections or loose terminals at the throttle body, the throttle actuator control module relay, the throttle actuator control module, and the ECM/PCM, then go to step 1.

NO—Repair open in the wire between the ECM/PCM (B15, E3) and G101, then go to step 50.

50. Turn the ignition switch OFF.
51. Reconnect all connectors.
52. Turn the ignition switch ON (II).
53. Reset the ECM/PCM with the HDS.
54. Do the ECM/PCM idle learn procedure (see page 11-302).
55. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC U0107 is indicated, check for poor connections or loose terminals at the throttle body, the throttle actuator control module relay, the throttle actuator control module, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■
56. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
57. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC U0107 is indicated, check for poor connections or loose terminals at the throttle body, the throttle actuator control module relay, the throttle actuator control module, and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

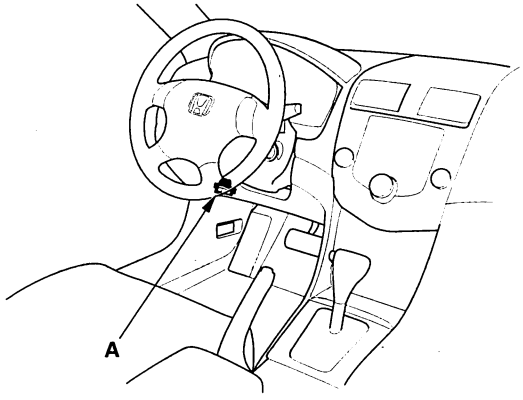
APP Sensor Signal Inspection

NOTE:
- This procedure checks the APP sensor in its fully closed position. In any other position, the APP sensor stores DTCs which are covered in other troubleshooting procedures.
- Check for Temporary DTCs or DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.
- Press the accelerator pedal several times to check its. If it does not operate properly, check the pedal, the throttle cable, and the APP sensor individually. If you find a problem in one of them, replace the part(s) that caused the problem.

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.



2. Turn the ignition switch ON (II).

3. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.

   - If it is below 2 %, the APP sensor is OK.
   - If it is above 2 %, adjust the throttle cable (see page 11-346), then go to step 4.

4. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.

   - If it is below 2 %, the APP sensor is OK.
   - If it is above 2 %, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then go to step 5.

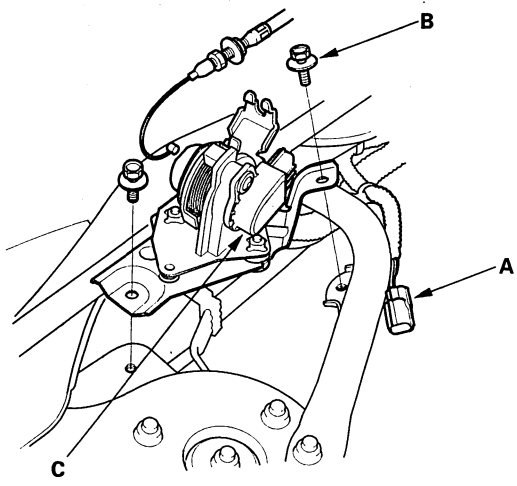
5. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.

   - If it is below 2 %, the APP sensor is OK.
   - If it is above 2 %, replace the APP sensor (see page 11-278), then go to step 1.

Protected by AR

APP Sensor Replacement

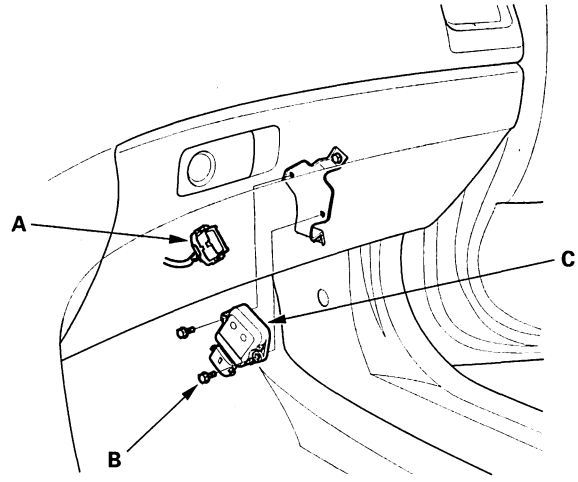
1. Remove the throttle cable (see page 11-347).
2. Disconnect the accelerator pedal position (APP) sensor 6P connector (A).



3. Remove the bolts (B) and the APP sensor (C).
4. Install the sensor in the reverse order of removal.

Throttle Actuator Control Module Replacement

1. Remove the right kick panel, refer to the 2003-2006 Accord Service Manual 2-door (see page 20-90); 4-door (see page 20-91).
2. Disconnect the throttle actuator control module 16P connector (A).



3. Remove the bolts (B) and the throttle actuator control module (C).
4. Install the control module in the reverse order of removal.

DTC Troubleshooting

DTC P2646: Rocker Arm Oil Pressure Switch (VTEC Oil Pressure Switch) Circuit Low Voltage

Special Tools Required
- Pressure gauge adapter 07NAJ-P07010A
- A/T low pressure gauge w/panel 07406-0070300
- A/T pressure hose 07406-0020201
- A/T pressure hose, 2,210 mm 07MAJ-PY4011A
- A/T pressure adapter 07MAJ-PY40120
- Oil pressure hose 07ZAJ-S5A0200

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Check the engine oil level.

   Is the level OK?

   YES—Go to step 2.

   NO—Adjust the engine oil to the proper level, then go to step 19.

2. Turn the ignition switch ON (II).

3. Clear the DTC with the HDS.

4. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure switch (VTEC oil pressure switch), the rocker arm oil control solenoid (VTEC solenoid valve) and the ECM/PCM.■

   NO—Go to step 5.

5. Turn the ignition switch OFF.

6. Disconnect the rocker arm oil pressure switch (VTEC oil pressure switch) 2P connector.

7. Turn the ignition switch ON (II).

8. Check the VTEC PRES SW in the DATA LIST with the HDS.

   Is ON indicated?

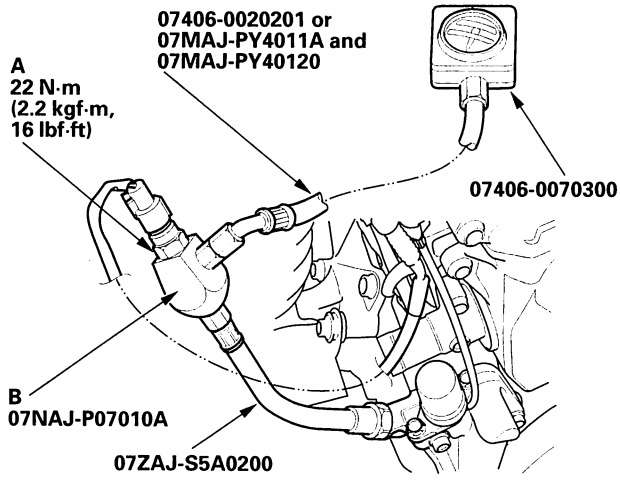
   YES—Go to step 14.

   NO—Go to step 9.

9. Turn the ignition switch OFF.

10. Remove the rocker arm oil pressure switch (VTEC oil pressure switch) (A) and install the special tools as shown, then install the rocker arm oil pressure switch (VTEC oil pressure switch) on the oil pressure gauge adapter (B).

    NOTE: Install the switch in the reverse order of removal with a new O-ring.



11. Start the engine.

12. Do the VTEC TEST in the INSPECTION MENU with the HDS.

13. Check the oil pressure.

    Does the oil pressure increase to at least 392 kPa (56.9 psi, 4.0 kgf/cm²)?

    YES—Replace the rocker arm oil pressure switch (VTEC oil pressure switch) (see page 11-289), then go to step 18.

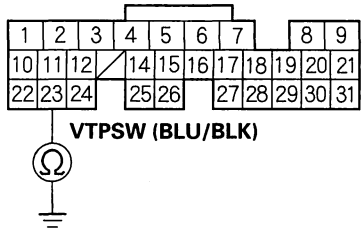
    NO—Inspect the VTEC system. If it is OK. Replace the rocker arm oil control solenoid (VTEC solenoid valve) (see page 11-289), then go to step 18.

BACK

Protected by AR

14. Turn the ignition switch OFF.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector E (31P).
17. Check for continuity between ECM/PCM connector terminal E23 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (E23) and the rocker arm oil pressure switch (VTEC oil pressure switch), then go to step 18.

NO—Go to step 25.

18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see page 11-302).
22. Do the VTEC TEST in the INSPECTION MENU with the HDS.
23. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2646 is indicated, check for poor connections or loose terminals at the rocker arm oil pressure switch (VTEC oil pressure switch), the rocker arm oil control solenoid (VTEC solenoid valve), and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 24.

24. Monitor the OBD STATUS for DTC P2646 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, go to step 22 and recheck.

25. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
26. Do the VTEC TEST in the INSPECTION MENU with the HDS.
27. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2646 is indicated, check for poor connections or loose terminals at the rocker arm oil pressure switch (VTEC oil pressure switch), the rocker arm oil control solenoid (VTEC solenoid valve), and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC Troubleshooting (cont'd)

DTC P2647: Rocker Arm Oil Pressure Switch (VTEC Oil Pressure Switch) Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Check the engine oil level.

   Is the level OK?

   YES—Go to step 2.

   NO—Adjust the engine oil to the proper level, then go to step 14.

2. Turn the ignition switch ON (II).

3. Clear the DTC with the HDS.

4. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure switch (VTEC oil pressure switch) and the ECM/PCM. ■

   NO—Go to step 5.

5. Check the result of step 4.

   - VTEC Switch Failure
   - VTEC Switch Open
   - VTEC Switch SIG Line Open
   - VTEC Switch GND Line Open

   Is the test result any of the above?

   YES—Go to step 6.

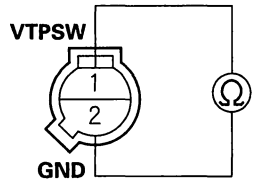
   NO—Check for poor connections or loose terminals at the rocker arm oil pressure switch (VTEC oil pressure switch). If it is OK, replace the rocker arm oil control solenoid (VTEC solenoid valve) (see page 11-289), then go to step 14.

6. Turn the ignition switch OFF.

7. Disconnect the rocker arm oil pressure switch (VTEC oil pressure switch) 2P connector.

8. At the rocker arm oil pressure switch (VTEC oil pressure switch), check for continuity between rocker arm oil pressure switch (VTEC oil pressure switch) 2P connector terminals No. 1 and No. 2.

ROCKER ARM OIL PRESSURE SWITCH (VTEC OIL PRESSURE SWITCH) 2P CONNECTOR



Terminal side of male terminals

Is there continuity?

YES—Go to step 9.

NO—Replace the rocker arm oil pressure switch (VTEC oil pressure switch) (see page 11-289), then go to step 13.

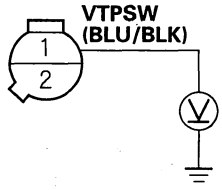
9. Turn the ignition switch ON (II).

BACK

Protected by AR

10. Measure voltage between rocker arm oil pressure switch (VTEC oil pressure switch) 2P connector terminal No. 1 and body ground.

ROCKER ARM OIL PRESSURE SWITCH (VTEC OIL PRESSURE SWITCH) 2P CONNECTOR



Wire side of female terminals

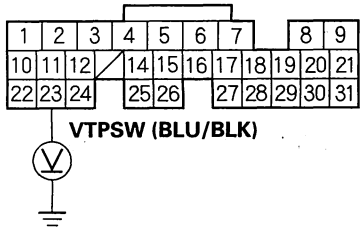
Is there battery voltage?

YES—Repair open in the wire between the rocker arm oil pressure switch (VTEC oil pressure switch) and G101, then go to step 13.

NO—Go to step 11.

11. Measure voltage between ECM/PCM connector terminal E23 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there battery voltage?

YES—Repair open in the wire between the ECM/PCM (E23) and the rocker arm oil pressure switch (VTEC oil pressure switch), then go to step 12.

NO—Go to step 19.

12. Turn the ignition switch OFF.

13. Reconnect the rocker arm oil pressure switch (VTEC oil pressure switch) 2P connector.

14. Turn the ignition switch ON (II).

15. Reset the ECM/PCM with the HDS.

16. Do the ECM/PCM idle learn procedure (see page 11-302).

17. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2647 is indicated, check for poor connections or loose terminals at the rocker arm oil pressure switch (VTEC oil pressure switch) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 18.

18. Monitor the OBD STATUS for DTC P2647 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete.■

NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, go to step 16 and recheck.

19. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

20. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2647 is indicated, check for poor connections or loose terminals at the rocker arm oil pressure switch (VTEC oil pressure switch) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC Troubleshooting (cont'd)

DTC P2648: Rocker Arm Oil Control Solenoid (VTEC Solenoid Valve) Circuit Low Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

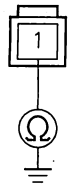
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid (VTEC solenoid valve) and the ECM/PCM. ■

   NO—Go to step 4.
4. Turn the ignition switch OFF.
5. Disconnect the rocker arm oil control solenoid (VTEC solenoid valve) 1P connector.
6. Measure resistance between the rocker arm oil control solenoid (VTEC solenoid valve) 1P connector terminal and the solenoid valve body.

ROCKER ARM OIL CONTROL SOLENOID (VTEC SOLENOID VALVE) 1P CONNECTOR



Terminal side of male terminals

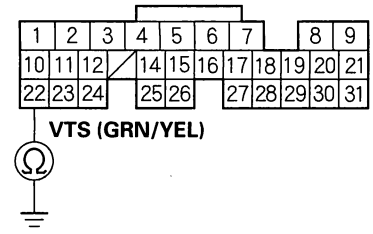
Is there 14—30 Ω at room temperature?

YES—Go to step 7.

NO—Go to step 10.

7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector E (31P).
9. Check for continuity between ECM/PCM connector terminal E22 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (E22) and the rocker arm oil control solenoid (VTEC solenoid valve), then go to step 11.

NO—Go to step 18.

10. Replace the rocker arm oil control solenoid (VTEC solenoid valve) (see page 11-289).
11. Reconnect all connectors.
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.

BACK

Protected by AR

14. Do the ECM/PCM idle learn procedure (see page 11-302).

15. Do the VTEC TEST in the INSPECTION MENU with the HDS.

16. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2648 is indicated, check for poor connections or loose terminals at the rocker arm oil control solenoid (VTEC solenoid valve) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 17.

17. Monitor the OBD STATUS for DTC P2648 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, go to step 15 and recheck.

18. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

19. Do the VTEC TEST in the INSPECTION MENU with the HDS.

20. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2648 is indicated, check for poor connections or loose terminals at the rocker arm oil control solenoid (VTEC solenoid valve) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC Troubleshooting (cont'd)

DTC P2649: Rocker Arm Oil Control Solenoid (VTEC Solenoid Valve) Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

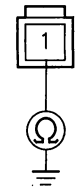
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2649 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid (VTEC solenoid valve) and the ECM/PCM. ■
5. Turn the ignition switch OFF.
6. Disconnect the rocker arm oil control solenoid (VTEC solenoid valve) 1P connector.
7. Measure resistance between the rocker arm oil control solenoid (VTEC solenoid valve) 1P connector terminal and the solenoid valve body.

ROCKER ARM OIL CONTROL SOLENOID (VTEC SOLENOID VALVE) 1P CONNECTOR



Terminal side of male terminals

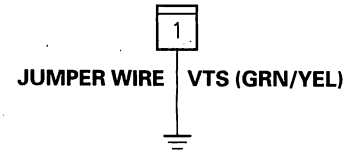
Is there 14—30 Ω ?

YES—Go to step 8.

NO—Go to step 12.

8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector E (31P).
10. Connect the rocker arm oil control solenoid (VTEC solenoid valve) 1P connector terminal to body ground with a jumper wire.

ROCKER ARM OIL CONTROL SOLENOID (VTEC SOLENOID VALVE) 1P CONNECTOR



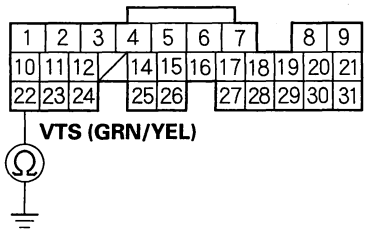
Wire side of female terminals

BACK

Protected by AR

11. Check for continuity between ECM/PCM connector terminal E22 and body ground.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there continuity?

YES—Go to step 20.

NO—Repair open in the wire between the ECM/PCM (E22) and the rocker arm oil control solenoid (VTEC solenoid valve), then go to step 13.

12. Replace the rocker arm oil control solenoid (VTEC solenoid valve) (see page 11-289).

13. Reconnect all connectors.

14. Turn the ignition switch ON (II).

15. Reset the ECM/PCM with the HDS.

16. Do the ECM/PCM idle learn procedure (see page 11-302).

17. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

18. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2649 is indicated, check for poor connections or loose terminals at the rocker arm oil control solenoid (VTEC solenoid valve) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 19.

19. Monitor the OBD STATUS for DTC P2649 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete. ■

NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, go to step 17 and recheck.

20. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

21. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P2649 is indicated, check for poor connections or loose terminals at the rocker arm oil control solenoid (VTEC solenoid valve) and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

Protected by AR

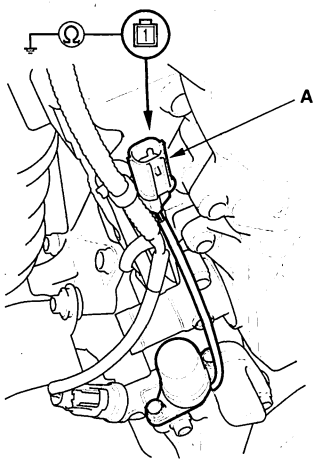
Rocker Arm Oil Control Solenoid (VTEC Solenoid Valve) Test

1. Disconnect the rocker arm oil control solenoid (VTEC solenoid valve) 1P connector.

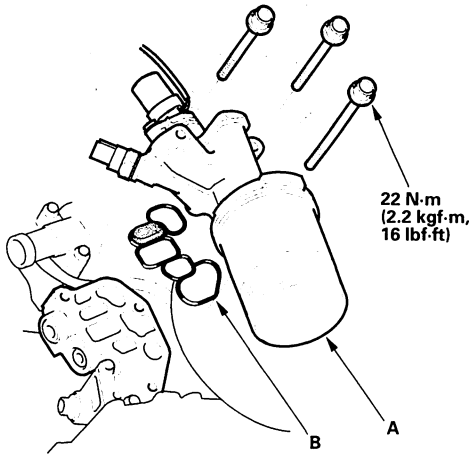
2. Measure resistance between the rocker arm oil control solenoid (VTEC solenoid valve) 1P connector terminal (A) and body ground.

   - If the resistance is as specified, go to step 3.
   - If the resistance is not as specified, replace the rocker arm oil control solenoid (VTEC solenoid valve).

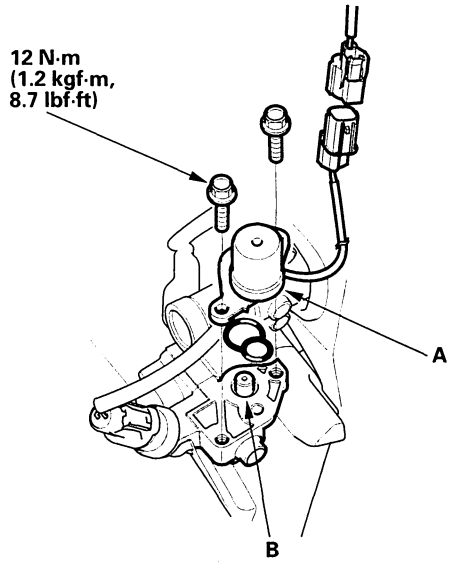
   Resistance: 14—30 Ω



3. Remove the rocker arm oil control solenoid (VTEC solenoid valve)/oil filter assembly (A) from the oil pump, and check the rocker arm oil control solenoid (VTEC solenoid valve) filter (B) for a restriction. If there is a restriction, replace the rocker arm oil control solenoid (VTEC solenoid valve) filter, the engine oil filter, and the engine oil.



4. If the filter is not restricted, remove the rocker arm oil control solenoid (VTEC solenoid valve) (A) and push the valve (B) with your finger to check its movement. If the valve moves freely, it is normal, check the engine oil pressure (see page 8-6). If the valve binds or sticks, replace the rocker arm oil control valve (VTEC valve) assembly.

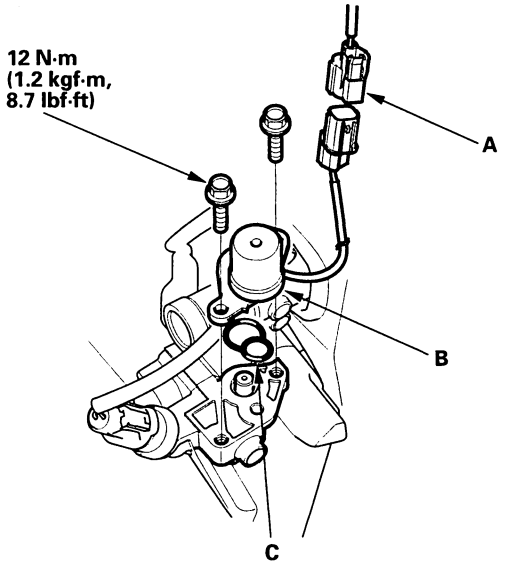


BACK

Protected by AR

Rocker Arm Oil Control Solenoid (VTEC Solenoid Valve) Replacement

1. Disconnect the rocker arm oil control solenoid (VTEC solenoid valve) connector (A).

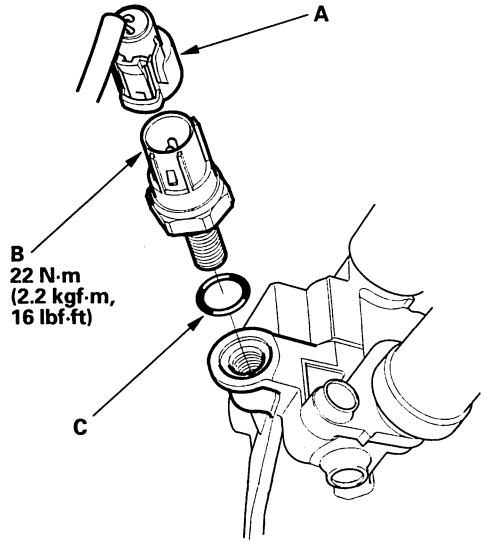


2. Remove the rocker arm oil control solenoid (VTEC solenoid valve) (B).

3. Install the parts in the reverse order of removal with a new O-ring (C).

Rocker Arm Oil Pressure Switch (VTEC Oil Pressure Switch) Removal/Installation

1. Disconnect the rocker arm oil pressure switch (VTEC oil pressure switch) connector (A), then remove the rocker arm oil pressure switch (VTEC oil pressure switch) (B).



2. Install the switch in the reverse order of removal with a new O-ring (C).

DTC Troubleshooting

DTC P0506: Idle Control System RPM Lower Than Expected

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Check this data in the DATA LIST with the HDS:
   - Engine coolant temperature above 158 °F (70 °C)
   - Intake air temperature above 32 °F (0 °C)
   - Vehicle speed is 0 mph (0 km/h)
   - ST FUEL TRIM between 0.73 and 1.47
   - FSS is CLOSED
5. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 6.

   NO—If the screen indicates PASSED, go to step 15. If the screen indicates EXECUTING, let the engine idle until a result comes on. If the screen indicates OUT OF CONDITION, go to step 4 and recheck.
6. Remove the intake air duct from the throttle body.
7. Check for dirt, carbon, or damage in the throttle bore.

   Is there dirt, carbon, or damage in the throttle bore?

   YES—If there is dirt or carbon, clean the throttle body (see page 11-343). Also check for damage at the air cleaner element (see page 11-344), then go to step 9. If there is damage in the throttle bore, go to step 8.

   NO—Check the A/C system or power steering system, then go to step 17.
8. Replace the throttle body (see page 11-348).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see page 11-302).
11. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
12. Check this data in the DATA LIST with the HDS:
    - Engine coolant temperature above 158 °F (70 °C)
    - Intake air temperature above 32 °F (0 °C)
    - Vehicle speed is 0 mph (0 km/h)
    - ST FUEL TRIM between 0.73 and 1.47
    - FSS is CLOSED

DTC Troubleshooting (cont'd)

13. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0506 is indicated, go to step 1 and recheck. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 14.

14. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, let the engine idle until a result comes on. If the screen indicates OUT OF CONDITION, go to step 12 and recheck.

15. Remove the intake air duct from the throttle body.

16. Check for dirt, carbon, or damage in the throttle bore.

    Is there dirt, carbon, or damage in the throttle bore?

    YES—If there is dirt or carbon, clean the throttle body (see page 11-343). Also check for damage at the air cleaner element (see page 11-344), then go to step 9. If there is damage in the throttle bore, go to step 8.

    NO—Go to step 17.

17. Recheck with different load conditions (turn on the headlights, blower motor, rear window defogger and/or A/C, changing the gear position, etc.)

18. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Intermittent failure, system is OK at this time.■

    NO—If the screen indicates FAILED, check the A/C system and/or power steering system, then go to step 1 and recheck. If the screen indicates EXECUTING, let the engine idle until a result comes on. If the screen indicates OUT OF CONDITION, go to step 17 and recheck.

BACK

Protected by AR

DTC P0507: Idle Control System RPM Higher Than Expected

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 5.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. If the screen indicates EXECUTING, let the engine idle until a result comes on. If the screen indicates OUT OF CONDITION, recheck with different load conditions (electrical, A/C, gear position, etc.), then go to step 3.

5. Check for vacuum leaks at these parts:

   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold
   - Brake booster hose

   Are there any leaks?

   YES—Repair or replace faulty parts, then go to step 6.

   NO—Go to step 6.

6. Turn the ignition switch ON (II).
7. Reset the ECM/PCM with the HDS.
8. Do the ECM/PCM idle learn procedure (see page 11-302).
9. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
10. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0507 is indicated, check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 11.

11. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, let the engine idle until a result comes on. If the screen indicates OUT OF CONDITION, recheck with different load conditions (turn on the headlights, blower motor, or A/C; change the gear position, etc.), then go to step 9.

Protected by AR

A/C Signal Circuit Troubleshooting

1. Start the engine.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C CLUTCH in the DATA LIST with the HDS.

   Is it ON?

   YES—Go to step 5.

   NO—Go to the A/C pressure switch circuit troubleshooting (see page 21-62).■
5. Check the A/C system.

   Does the A/C system operate?

   YES—The air conditioning system circuit is OK.■

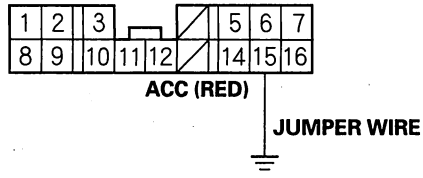
   NO—Go to step 6.
6. Turn the ignition switch OFF.
7. Turn the ignition switch ON (II).
8. Activate the A/C CLUTCH in the INSPECTION MENU with the HDS.

   Is there a clicking noise from the A/C compressor clutch?

   YES—Do the A/C system test (see page 21-48).■

   NO—Go to step 9.
9. Momentarily connect under-hood fuse/relay box 16P connector terminal No. 15 to body ground with a jumper wire several times.

UNDER-HOOD FUSE/RELAY BOX 16P CONNECTOR



Wire side of female terminals

Is there clicking noise from the A/C compressor clutch?

YES—Repair open in the wire between the ECM/PCM (A27) and the A/C clutch relay.■

NO—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224).■

Alternator FR Signal Circuit Troubleshooting

2003-2004 models

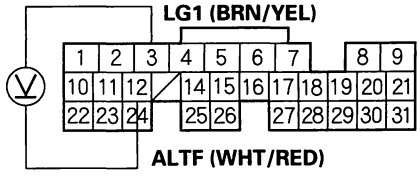
1. Start the engine, and let it idle.
2. Monitor the ALTERNATOR in the DATA LIST with the HDS.
3. Check if the indicated percentage varies when the headlight switch is on.

   Does the percentage vary?

   YES—The alternator signal circuit is OK.■

   NO—Go to step 4.
4. Turn the headlight switch and ignition switch OFF.
5. Disconnect the alternator 4P connector.
6. Turn the ignition switch ON (II).
7. Measure voltage between ECM/PCM connector terminals E3 and E12.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

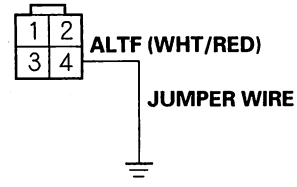
Is there about 5 V?

YES—Go to step 8.

NO—Go to step 13.

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector E (31P).
11. Connect alternator 4P connector terminal No. 4 to body ground with a jumper wire.

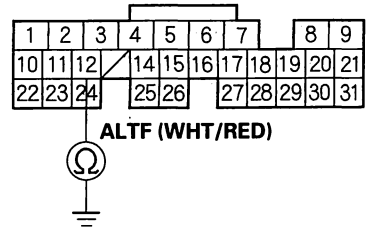
ALTERNATOR 4P CONNECTOR



Wire side of female terminals

12. Check for continuity between body ground and ECM/PCM connector terminal E12.

ECM/PCM CONNECTOR E (31P)



Wire side of female terminals

Is there continuity?

YES—Test the alternator.■

- 2003 4-door model (DELPHI) (see page 4-31)
- 2003-2006 models (DENSO) (see page 4-33)

NO—Repair open in the wire between the ECM/PCM (E12) and the alternator.■

(cont'd)

PSP Switch Signal Circuit Troubleshooting

1. Start the engine, and let it idle.
2. Align the steering wheel straight ahead.
3. Check the PSP SWITCH in the DATA LIST with the HDS.

   Does it indicate ON?

   YES—Go to step 4.

   NO—Go to step 14.
4. Turn the steering wheel to the full lock position.
5. Check the PSP SWITCH in the DATA LIST with the HDS.

   Does it change to OFF?

   YES—The PSP switch signal circuit is OK. ■

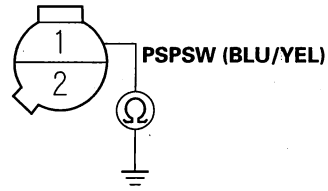
   NO—Go to step 6.
6. Turn the ignition switch OFF.
7. Disconnect the PSP switch 2P connector.
8. Start the engine.
9. Check the PSP SWITCH in the DATA LIST with the HDS.

   Does it change to OFF?

   YES—Replace the PSP switch. ■

   NO—Go to step 10.
10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector A (31P).
13. Check for continuity between PSP switch 2P connector terminal No. 1 and body ground.

PSP SWITCH 2P CONNECTOR



Wire side of female terminals

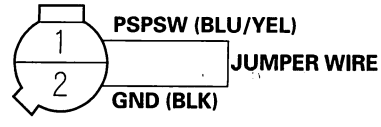
Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A17) and the PSP switch. ■

NO—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■

14. Turn the ignition switch OFF.
15. Disconnect the PSP switch 2P connector.
16. Connect PSP switch 2P connector terminals No. 1 and No. 2 with a jumper wire, then start the engine.

PSP SWITCH 2P CONNECTOR



Wire side of female terminals

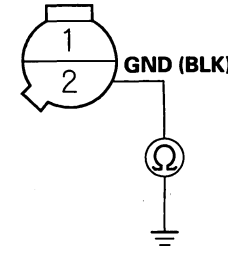
Is there continuity?

YES—Go to step 24.

NO—Repair open in the wire between the PSP switch and the ECM/PCM (A17).■

24. Check for continuity between PSP switch 2P connector terminal No. 2 and body ground.

PSP SWITCH 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224).■

NO—Repair open in the wire between the PSP switch and G202.■

Protected by AR

Brake Pedal Position Switch Signal Circuit Troubleshooting

1. Turn the ignition switch ON (II).
2. Check the BRAKE SWITCH in the DATA LIST with the HDS.

   Does it indicate OFF?

   YES—Go to step 3.

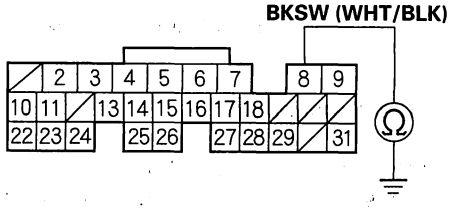
   NO—Inspect the brake pedal position, refer to the 2003-2006 Accord Service Manual (see page 19-6). ■
3. Press the brake pedal, and check the BRAKE SWITCH in the DATA LIST with the HDS.

   Does it change to ON?

   YES—The brake pedal position switch signal circuit (BKSW line) is OK. ■

   NO—Go to step 4.
4. Turn the ignition switch OFF.
5. Jump the SCS line with the HDS.
6. Disconnect the brake pedal position switch 4P connector.
7. Disconnect ECM/PCM connector A (31P).
8. Check for continuity between ECM/PCM connector terminal A8 and body ground.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

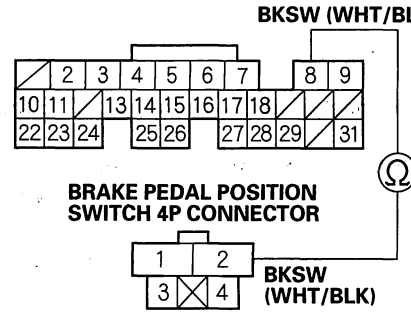
Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A8) and the No. 13 HORN, STOP (20 A) fuse. Replace the No. 13 HORN, STOP (20 A) fuse. ■

NO—Go to step 9.

9. Check for continuity between ECM/PCM connector terminal A8 and brake pedal position switch 4P connector terminal No. 2.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there continuity?

YES—Repair open in the wire between the brake pedal position switch and the No. 13 HORN, STOP (20 A) fuse. Inspect the brake pedal position switch, refer to the 2003-2006 Accord Service Manual (see page 19-6). ■

NO—Repair open in the wire between the ECM/PCM (A8) and the brake pedal position switch. ■

Protected by AR

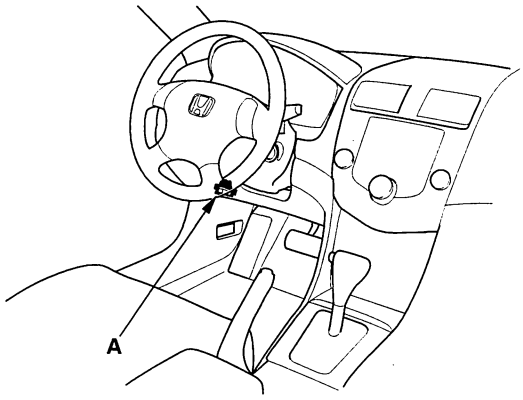
Idle Speed Inspection

- Before checking the idle speed, check these items:
  - The malfuction indicator lamp (MIL) has not been reported on.
  - Ignition timing
  - Spark plugs
  - Air cleaner
  - PCV system
- Pull the parking brake lever up.

NOTE:

1. Disconnect the evaporative emission (EVAP) canister purge valve connector.

2. Connect the HDS to the date link connector (DLC) (A) located under the driver's side of the dashboard.



3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

4. Check the idle speed without load conditions: headlights, blower fan, radiator fan, and air conditioner off.

Idle speed should be:

A/T	**790±50 rpm (in Park or neutral)**
M/T	**750±50 rpm (in neutral)**

5. Let the engine idle for 1 minute with high electric load (A/C switch on, temperature set to max cool, blower fan on High, and headlights on high beam).

Idle speed should be:

A/T	**790±50 rpm (in Park or neutral)**
M/T	**750±50 rpm (in neutral)**

NOTE: If the idle speed is not within specification, do the symptom troubleshooting.

6. Reconnect the EVAP canister purge valve connector.

Protected by AR

ECM/PCM Idle Learn Procedure

The idle learn procedure must be done so the ECM/PCM can learn the engine idle characteristics.

Do the idle learn procedure whenever you do any of these actions:

- Replace ECM/PCM
- Reset ECM/PCM
- Update ECM/PCM
- Replace or clean the throttle body.

NOTE: Erasing DTCs with the HDS does not require you to do the idle learn procedure.

Procedure

1. Make sure all electrical items (A/C, audio, rear window defogger, lights, etc.) are off.
2. Reset the ECM/PCM with the HDS.
3. Turn the ignition switch ON (II), and wait for 2 seconds.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, or until the engine coolant temperature reaches 194 °F (90 °C).
5. Let the engine idle for about 5 minutes with the throttle fully closed.

   NOTE: If the radiator fan comes on, do not include its running time in the 5 minutes.

DTC Troubleshooting

DTC P0461: Fuel Level Sensor (Fuel Gauge Sending Unit) Range/Performance Problem (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Because it requires 162 miles (260 km) of driving without refueling to complete this diagnosis, DTC P0461 cannot be duplicated during this troubleshooting.

1. Test the fuel gauge sending unit (see page 11-332).

   Is the fuel gauge sending unit OK?

   YES—Check for poor connections or loose terminals at the fuel gauge sending unit and the gauge assembly. ■

   NO—Replace the fuel gauge sending unit (see page 11-327), then go to step 2.

2. Turn the ignition switch ON (II).

3. Reset the ECM/PCM with the HDS.

4. Do the ECM/PCM idle learn procedure (see page 11-302).

5. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—If DTC P0461 is indicated, check for poor connections or loose terminals at the fuel gauge sending unit and the gauge assembly, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

   NO—Troubleshooting is complete. ■

BACK

Protected by AR

DTC P0462: Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to 2005 model.
- Information marked with double asterisk (**) applies to 2006 model.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS, and wait 5 seconds.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0462 indicated?

   YES—Go to step 4.

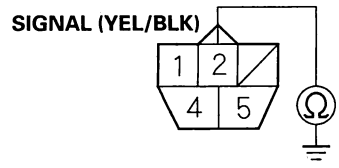
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel gauge sending unit. ■
4. Turn the ignition switch OFF.
5. Remove the trunk floor trim panel.
6. Remove the access panel from the floor.
7. Disconnect the fuel tank unit 5P connector.
8. Turn the ignition switch ON (II).
9. Clear the DTC with the HDS, and wait 5 seconds.
10. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0463 indicated?

    YES—Replace the fuel gauge sending unit (see page 11-327), then go to step 22.

    NO—Go to step 11.
11. Turn the ignition switch OFF.
12. Remove the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276).
13. Disconnect the gauge control module 30P* (36P)** connector.
14. Check for continuity between fuel tank unit 5P connector terminal No. 2 and body ground.

FUEL TANK UNIT 5P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the gauge control module (signal line) and the fuel gauge sending unit, then go to step 23.

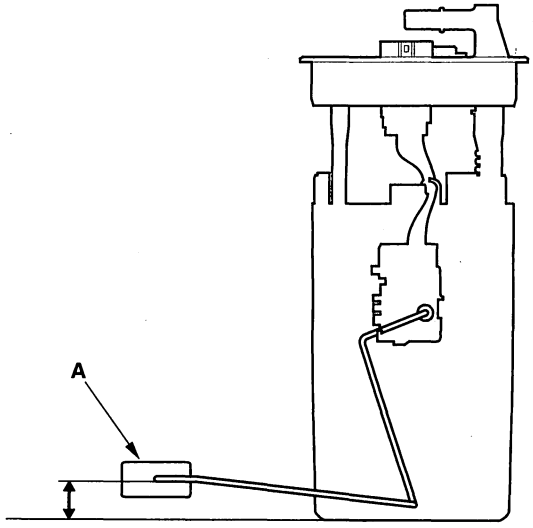
NO—Go to step 15.
15. Reconnect the gauge control module 30P* (36P**) connector.
16. Remove the fuel tank unit (see page 11-327).
17. Connect the fuel tank unit 5P connector.
18. Turn the ignition switch ON (II).
19. Clear the DTC with the HDS.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

20. Set the float (A) to the E position.



21. Check the fuel gauge.

    Does the gauge move to the empty position?

    YES—Go to step 29.

    NO—Replace the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276), then go to step 22.

22. Turn the ignition switch OFF.

23. Reconnect all connectors.

24. Install the parts in the reverse order of removal.

25. Turn the ignition switch ON (II).

26. Reset the ECM/PCM with the HDS.

27. Do the ECM/PCM idle learn procedure (see page 11-302).

28. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0462 is indicated, check for poor connections or loose terminals at the gauge control module and the fuel gauge sending unit, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

29. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

30. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0462 is indicated, check for poor connections or loose terminals at the gauge control module and the fuel gauge sending unit, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0463: Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Information marked with an asterisk (*) applies to 2005 model.
- Information marked with double asterisk (**) applies to 2006 model.

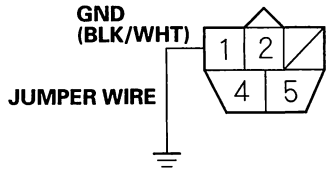
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS, and wait 5 seconds.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0463 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel gauge sending unit. ■
4. Turn the ignition switch OFF.
5. Remove the trunk floor trim panel.
6. Remove the access panel from the floor.
7. Disconnect the fuel tank unit 5P connector.
8. Connect fuel tank unit 5P connector terminal No. 1 to body ground with a jumper wire.

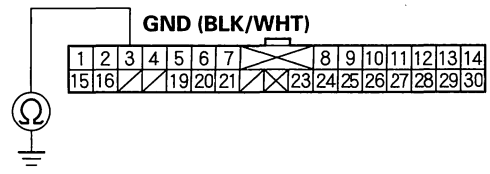
FUEL TANK UNIT 5P CONNECTOR



Wire side of female terminals

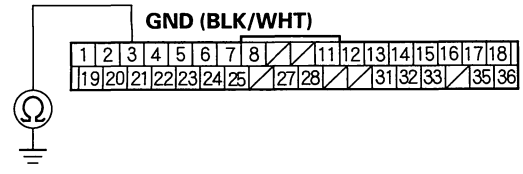
9. Remove the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276).
10. Disconnect the gauge control module 30P* (36P**) connector.
11. Check for continuity between gauge control module 30P* (36P**) connector terminal No. 3 and body ground.

GAUGE CONTROL MODULE 30P CONNECTOR*



Wire side of female terminals

GAUGE CONTROL MODULE 36P CONNECTOR**



Wire side of female terminals

Is there continuity?

YES—Go to step 12.

NO—Repair open in the wire between the gauge control module (GND line) and the fuel gauge sending unit, then go to step 24.

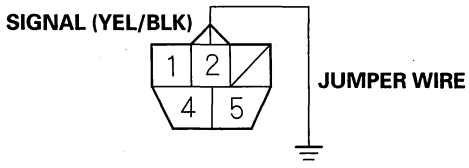
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

12. Connect fuel tank unit 5P connector terminal No. 2 to body ground with a jumper wire.

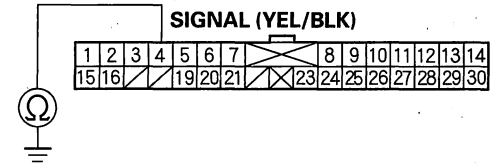
FUEL TANK UNIT 5P CONNECTOR



Wire side of female terminals

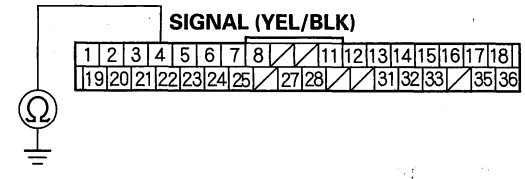
13. Check for continuity between gauge control module 30P* (36P**) connector terminal No. 4 and body ground.

GAUGE CONTROL MODULE 30P CONNECTOR*



Wire side of female terminals

GAUGE CONTROL MODULE 36P CONNECTOR**



Wire side of female terminals

Is there continuity?

YES—Go to step 14.

NO—Repair open in the wire between the gauge control module (signal line) and the fuel gauge sending unit, then go to step 24.

BACK

Protected by AR

14. Remove the jumper wire from the fuel tank unit 5P connector.

15. Remove the fuel tank unit (see page 11-327).

16. Test the fuel gauge sending unit (see page 11-332).

    Is the fuel gauge sending unit OK?

    YES—Go to step 17.

    NO—Replace the fuel gauge sending unit (see page 11-327), then go to step 23.

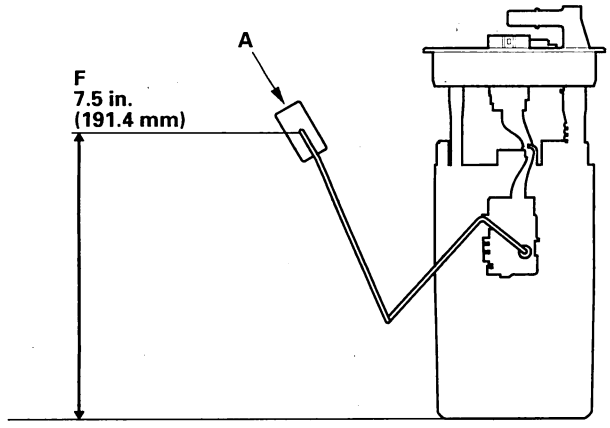
17. Connect the fuel tank unit 5P connector.

18. Reconnect the gauge control module 30P* (36P**) connector.

19. Turn the ignition switch ON (II).

20. Clear the DTC with the HDS.

21. Set the float (A) to the F position.



22. Check the fuel gauge.

    Does the gauge move to the full position?

    YES—Go to step 30.

    NO—Replace the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276), then go to step 23.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

23. Turn the ignition switch OFF.
24. Reconnect all connectors.
25. Install the parts in the reverse order of removal.
26. Turn the ignition switch ON (II).
27. Reset the ECM/PCM with the HDS.
28. Do the ECM/PCM idle learn procedure (see page 11-302).
29. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0463 is indicated, check for poor connections or loose terminals at the gauge control module and the fuel gauge sending unit, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■
30. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
31. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0463 is indicated, check for poor connections or loose terminals at the gauge control module and the fuel gauge sending unit, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

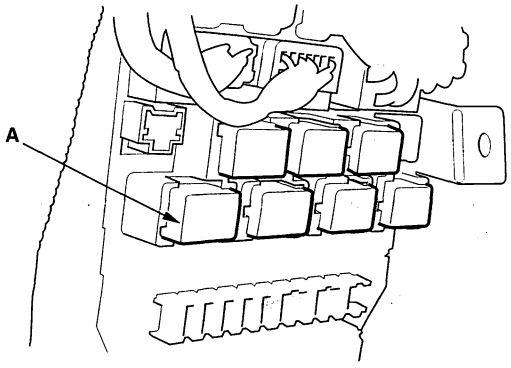
Fuel Pump Circuit Troubleshooting

If you suspect a problem with the fuel pump, check that the fuel pump actually runs; when it is on, you will hear some noise if you listen to the fuel fill port with the fuel fill cap removed. The fuel pump should run for 2 seconds when the ignition switch is first turned on. If the fuel pump does not make noise, check as follows:

1. Turn the ignition switch OFF.

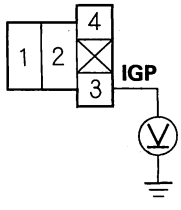
2. Remove the left kick panel, refer to the 2003-2006 Accord Service Manual 2-door (see page 20-90); 4-door (see page 20-91), then remove PGM-FI main relay 2 (FUEL PUMP) (A) from the under-dash fuse/relay box.



3. Turn the ignition switch ON (II).

4. Measure voltage between PGM-FI main relay 2 (FUEL PUMP) 4P connector terminal No. 3 and body ground.

PGM-FI MAIN RELAY 2 (FUEL PUMP) 4P CONNECTOR



Terminal side of female terminals

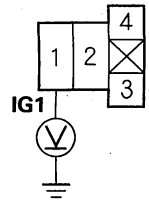
Is there battery voltage?

YES—Go to step 5.

NO—
- Replace PGM-FI main relay 1 (FI MAIN).■
- If needed, replace the under-dash fuse/relay box, refer to the 2003-2006 Accord Service Manual (see page 22-77).■

5. Measure voltage between PGM-FI main relay 2 (FUEL PUMP) 4P connector terminal No. 1 and body ground.

PGM-FI MAIN RELAY 2 (FUEL PUMP) 4P CONNECTOR



Terminal side of female terminals

Is there battery voltage?

YES—Go to step 6.

NO—
- Check the No. 19 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.■
- If needed, replace the under-dash fuse/relay box, refer to the 2003-2006 Accord Service Manual (see page 22-77).■

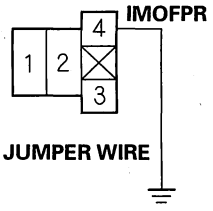
Fuel Pump Circuit Troubleshooting (cont'd)

6. Turn the ignition switch OFF.
7. Connect PGM-FI main relay 2 (FUEL PUMP) 4P connector terminal No. 4 to body ground with a jumper wire.

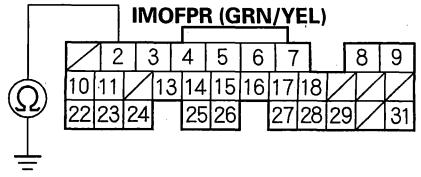
PGM-FI MAIN RELAY 2 (FUEL PUMP) 4P CONNECTOR



Terminal side of female terminals

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector A (31P).
11. Check for continuity between body ground and ECM/PCM connector terminal A2.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

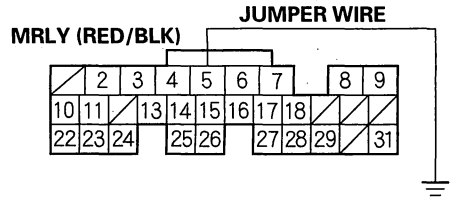
Is there continuity?

YES—Go to step 12.

NO—Repair open in the wire between PGM-FI main relay 2 (FUEL PUMP) and the ECM/PCM (A2). ■

12. Reinstall PGM-FI main relay 2 (FUEL PUMP).
13. Connect ECM/PCM connector terminal A5 to body ground with jumper wire.

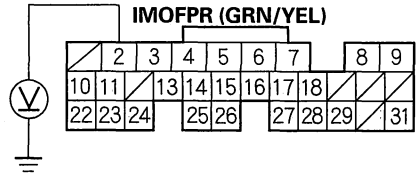
ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

14. Turn the ignition switch ON (II).
15. Measure voltage between ECM/PCM connector terminal A2 and body ground.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there battery voltage?

YES—Go to step 16.

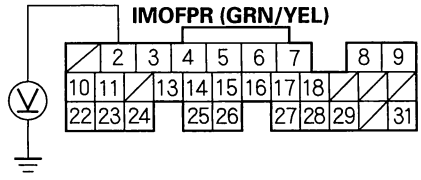
NO—Replace PGM-FI main relay 2 (FUEL PUMP). ■

BACK

Protected by AR

16. Turn the ignition switch OFF.
17. Reconnect ECM/PCM connector A (31P).
18. Open the SCS line with the HDS.
19. Turn the ignition switch OFF.
20. Turn the ignition switch ON (II), and measure voltage between ECM/PCM connector terminal A2 and body ground within 2 seconds.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

Is there battery voltage?

YES—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224), then go to step 21.

NO—If needed, replace the under-dash fuse/relay box, refer to the 2003-2006 Accord Service Manual (see page 22-77), then go to step 21.

21. Turn the ignition switch OFF.
22. Remove the trunk floor trim panel.
23. Remove the access panel from the floor (see page 11-327).
24. Turn the ignition switch ON (II), and measure voltage between fuel pump 5P connector terminal No. 5 and body ground within 2 seconds.

FUEL PUMP 5P CONNECTOR

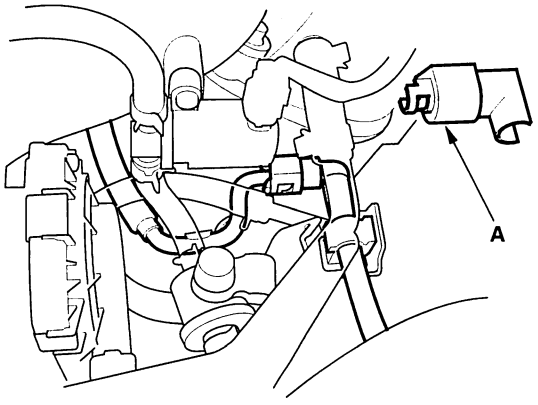
Fuel Pressure Relieving

Before disconnecting fuel lines or hoses, relieve pressure from the system by stopping the fuel pump and disconnecting the fuel tube/quick connect fitting in the engine compartment.

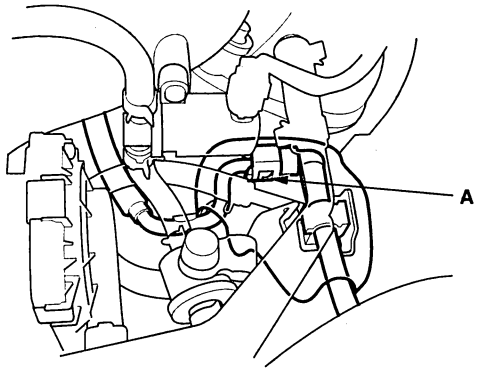
With the HDS

1. Remove the fuel fill cap.
2. Turn the ignition switch ON (II).
3. From the INSPECTION MENU of the HDS, select Fuel Pump OFF, then start the engine, and let it idle until it stalls.
4. Turn the ignition switch OFF.

   NOTE:
   - Do not allow the engine to idle above 1,000 rpm or the ECM/PCM will continue to operate the fuel pump.
   - A DTC or a Temporary DTC may be set during this procedure. Check for DTCs, and clear them as needed (see page 11-3).
5. Turn the ignition switch OFF.
6. Make sure you have the anti-theft code for the radio and the navigation system (if equipped), then write down the frequencies for the radio's preset buttons.
7. Disconnect the negative cable from the battery.
8. Remove the quick-connect fitting cover (A).

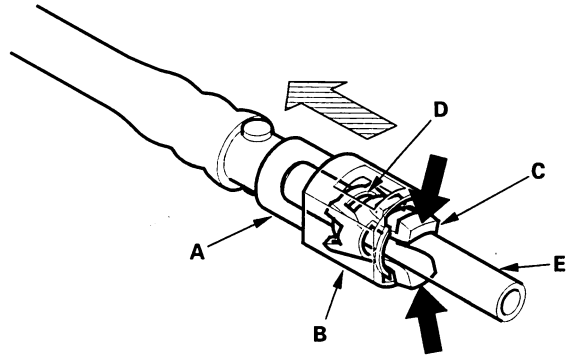


9. Check the fuel quick-connect fitting for dirt, and clean it if needed.
10. Place a rag or shop towel over the quick-connect fitting (A).



11. Disconnect the quick-connect fitting (A): Hold the connector (B) with one hand, and squeeze the retainer tabs (C) with the other hand to release them from the locking tabs (D). Pull the connector off.

    NOTE:
    - Be careful not to damage the line (E) or other parts.
    - Do not use tools.
    - If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.
    - Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.



(cont'd)

Protected by AR

Fuel Pressure Relieving (cont'd)

12. After disconnecting the quick-connect fitting, check it for dirt or damage (see step 4 on page 11-322).

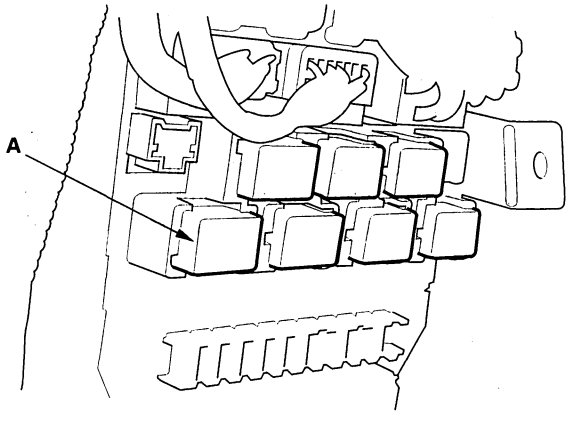
13. Reconnect the negative cable to the battery, and do these items:

    - Power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).
    - Enter the anti-theft codes for the radio and the navigation system, then enter the customer's radio station presets.
    - Reset the clock.

Without the HDS

1. Make sure you have the anti-theft code for the radio, and the navigation system (if equipped), then write down the frequencies for the radio's preset buttons.

2. Remove the left kick panel, refer to the 2003-2006 Accord Service Manual 2-door (see page 20-90); 4-door (see page 20-91), then remove PGM-FI main relay 2 (FUEL PUMP) (A) from the under-dash fuse/relay box.



3. Start the engine, and let it idle until it stalls.

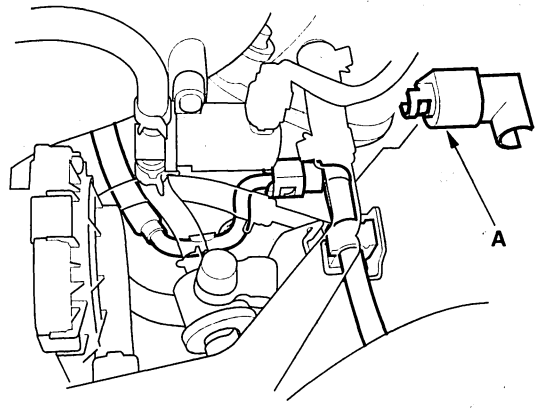
   NOTE: If any DTCs are stored, clear and ignore them.

4. Turn the ignition switch OFF.

5. Remove the fuel fill cap.

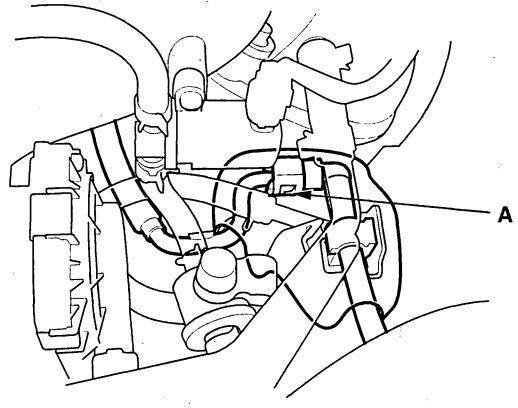
6. Disconnect the negative cable from the battery.

7. Remove the quick-connect fitting cover (A).



8. Check the fuel quick-connect fitting for dirt, and clean it if needed.

9. Place a rag or shop towel over the quick-connect fitting (A).

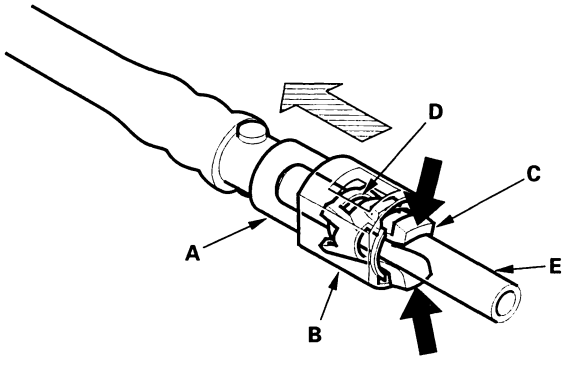


BACK

Protected by AR

10. Disconnect the quick-connect fitting (A): Hold the connector (B) with one hand, and squeeze the retainer tabs (C) with the other hand to release them from the locking tabs (D). Pull the connector off.

    NOTE:
    - Be careful not to damage the line (E) or other parts.
    - Do not use tools.
    - If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.
    - Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.



11. After disconnecting the quick-connect fitting, check it for dirt or damage (see step 4 on page 11-322).

12. Reconnect the negative cable to the battery, and do these items:

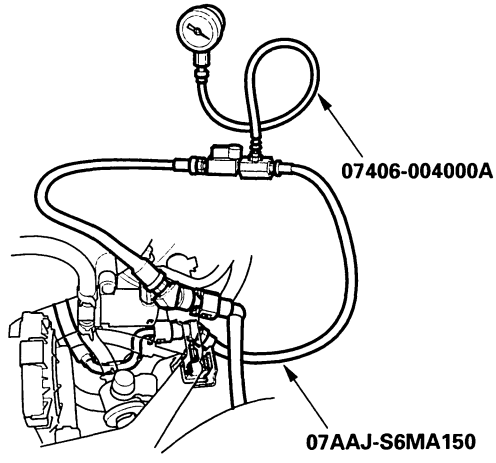
    - Power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).
    - Enter the anti-theft codes for the radio and the navigation system, then enter the customer's radio station presets.
    - Reset the clock.

Fuel Pressure Test

Special Tools Required
- Fuel pressure gauge 07406-004000A
- Fuel pressure gauge attachment set 07AAJ-S6MA150

1. Relieve the fuel pressure (see page 11-315).

2. Disconnect the quick-connect fitting. Attach the fuel pressure gauge set and the fuel pressure gauge.



3. Start the engine, and let it idle.

    - If the engine starts, go to step 5.
    - If the engine does not start, go to step 4.

4. Check to see if the fuel pump is running: listen to the fuel filler port with the fuel fill cap removed. The fuel pump should run for 2 seconds when the ignition switch is first turned on.

    - If the pump runs, go to step 5.
    - If the pump does not run, do the fuel pump circuit troubleshooting (see page 11-311).

5. Read the fuel pressure gauge. The pressure should be 380—430 kPa (3.9—4.4 kgf/cm^2, 55—63 psi).

    - If the pressure is OK, the test is complete.
    - If the pressure is out of specification, replace the fuel pressure regulator (see page 11-326) and the fuel filter (see page 11-326), then recheck the fuel pressure.

Protected by AR

Fuel Tank Draining

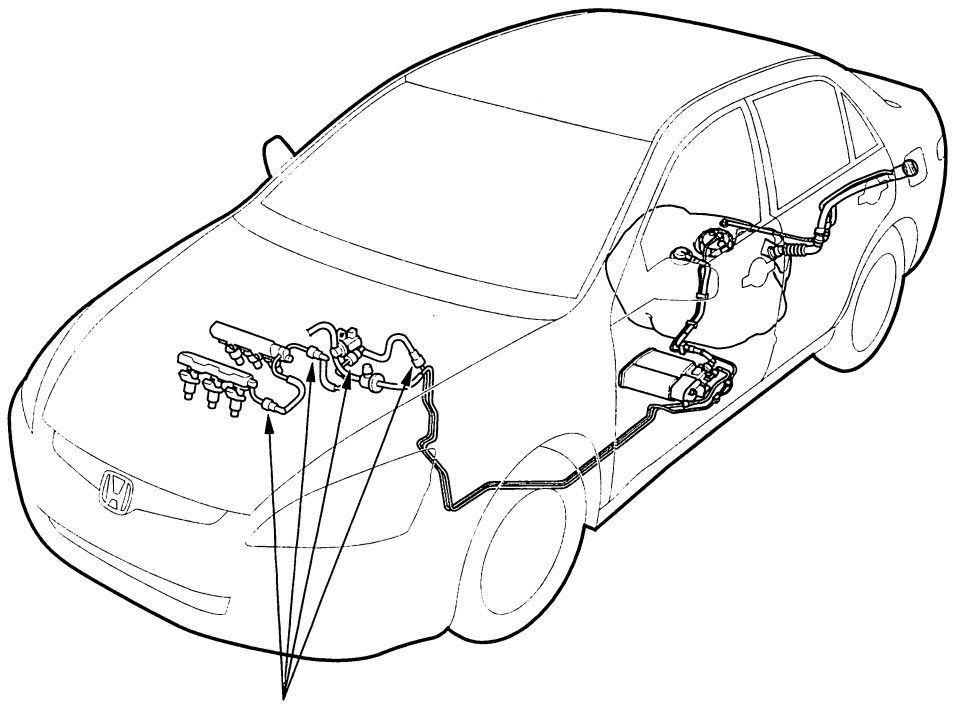
1. Remove the fuel tank unit (see page 11-327).
2. Using a hand pump, a hose, and a container suitable for fuel, draw the fuel from the fuel tank.
3. Install the fuel tank unit (see page 11-327).

BACK

Protected by AR

Fuel Line Inspection

Check the fuel system lines, hoses, and fuel filter for damage, leaks, or deterioration. Replace any damaged parts.



Make sure the connections are secure and the quick-connect fitting covers are firmly locked in place.

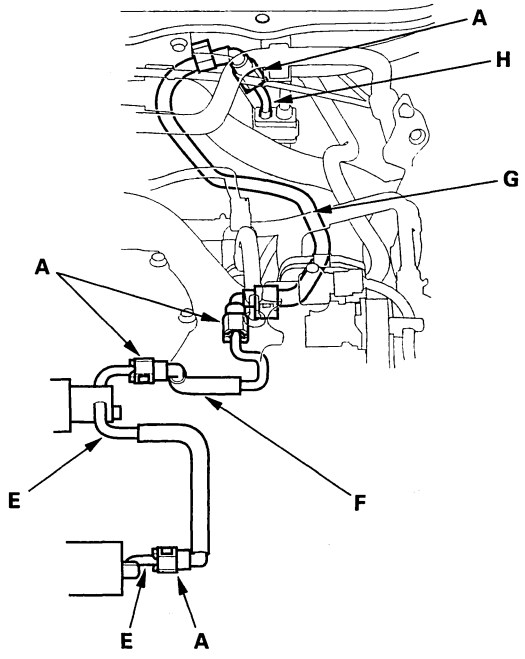
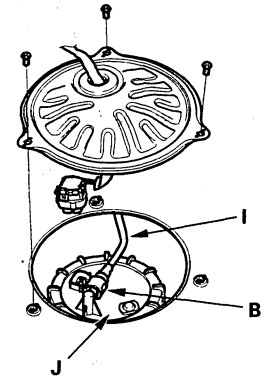
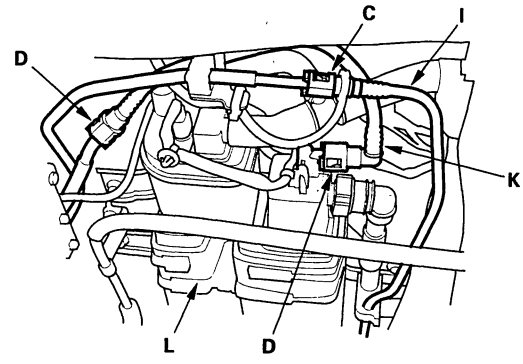
Fuel Line/Quick-Connect Fitting Precautions

The fuel line/quick-connect fittings (A), (B), (C), (D) connect the fuel rail (E) to the fuel feed hose (F), the fuel feed hose to the fuel feed hose (G), the fuel feed hose to the fuel line (H), and the fuel line (I) to the fuel tank unit (J) and the fuel vapor line (K) to the EVAP canister (L). When removing or installing the fuel feed hose, fuel tank unit or fuel tank, it is necessary to disconnect or connect the quick-connect fittings.
Pay attention to the following:

- The fuel feed hoses, fuel line, and quick-connect fittings are not heat-resistant; be careful not to damage them during welding or other heat-generating procedures.
- The fuel feed hoses, fuel line, and quick-connect fittings are not acid-proof; do not touch them with a shop towel that was used for wiping battery electrolyte. Replace them if they came into contact with electrolyte or something similar.
- When connecting or disconnecting the fuel feed hoses, fuel line, and quick-connect fittings, be careful not to bend or twist them excessively. Replace them if they are damaged.







A disconnected quick-connect fitting can be reconnected, but the retainer on the mating line cannot be reused once it has been removed from the line. Replace the retainer when:

- replacing the fuel rail.
- replacing the fuel line.
- replacing the fuel pump.
- replacing the fuel filter.
- replacing the fuel gauge sending unit.
- replacing EVAP purge line.
- replacing EVAP canister.
- it has been removed from the line.
- it is damaged.

Place	Manufacturer	Retainer color	Piping diameter
A	Tokai	Blue green	0.3 in. (8 mm)
B	Tokai	Orange	0.4 in. (9.5 mm)
C	Tokai	Green	0.2 in. (6.3 mm)
D	Tokai	Orange	0.4 in. (9.5 mm)

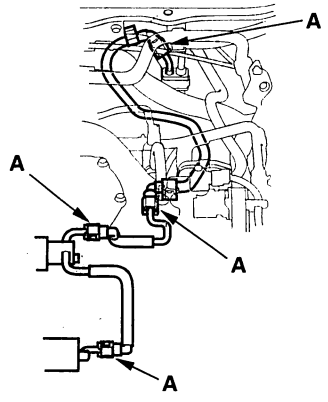
Protected by AR

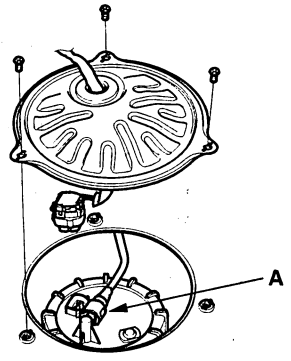
Fuel Line/Quick-Connect Fitting Removal

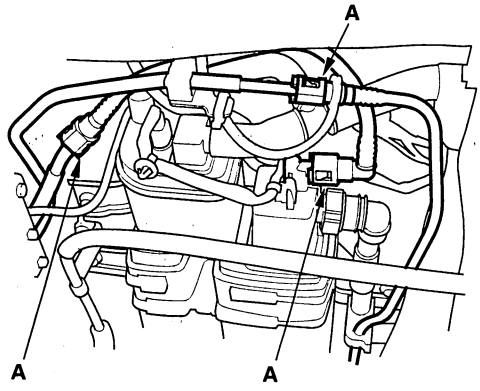
NOTE: Before you work on the fuel lines and fittings, read the "Fuel Line/Quick-Connect Fitting Precautions" (see page 11-321).

1. Relieve the fuel pressure (see page 11-315).

2. Check the fuel quick-connect fitting (A) for dirt, and clean it if needed.

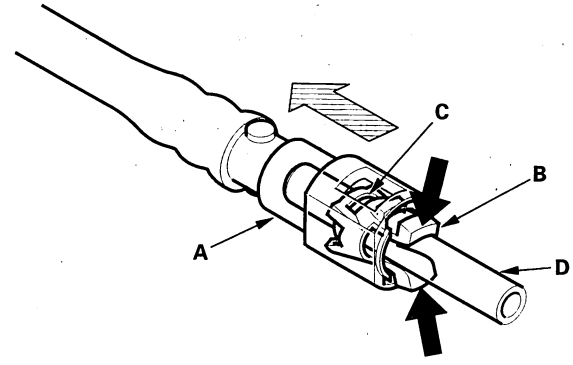






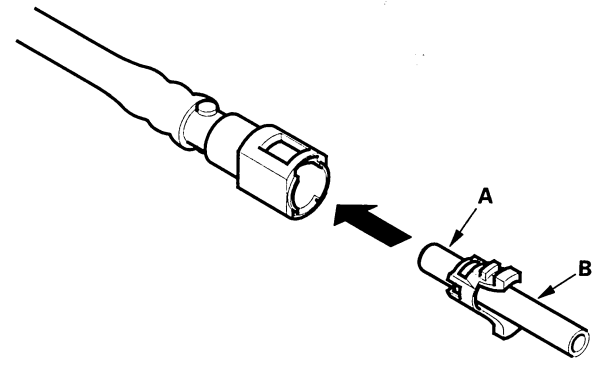
3. Place a rag or shop towel over the quick-connect fitting.
   Hold the connector (A) with one hand, and squeeze the retainer tabs (B) with the other hand to release them from the locking tabs (C). Pull the connector off.

   NOTE:
   - Be careful not to damage the line (D) or other parts. Do not use tools.
   - If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.
   - Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.



4. Check the contact area (A) of the line (B) for dirt or damage.

   - If it is dirty, clean it.
   - If it is rusty or damaged, replace the fuel pump, fuel filter, or fuel feed line.

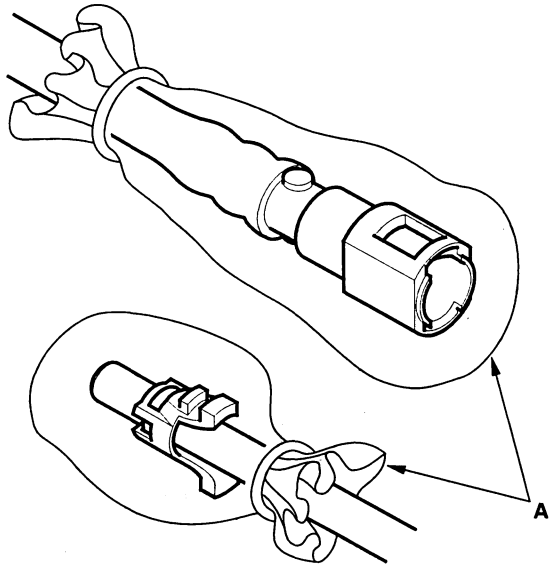


BACK

Protected by AR

5. To prevent damage and keep foreign matter out, cover the disconnected connector and line ends with plastic bags (A).

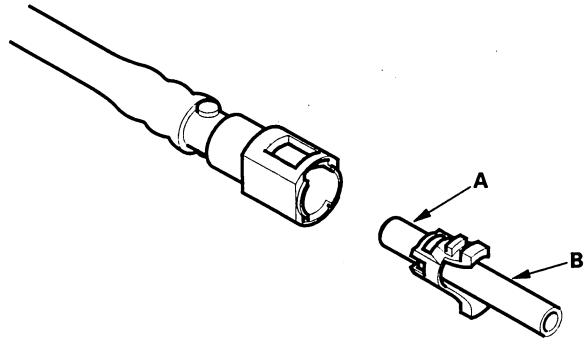
   NOTE: The retainer cannot be reused once it has been removed from the line.
   Replace the retainer when:
   - replacing the fuel rail.
   - replacing the fuel feed line.
   - replacing the fuel pump.
   - replacing the fuel filter.
   - replacing the fuel gauge sending unit.
   - it has been removed from the line.
   - replacing EVAP purge line.
   - replacing EVAP canister.
   - It is damaged.



Fuel Line/Quick-Connect Fitting Installation

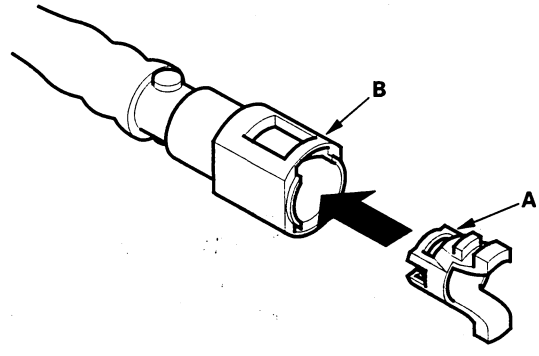
NOTE: Before you work on the fuel lines and fittings, read the "Fuel Line/Quick-Connect Fitting Precautions" (see page 11-321).

1. Check the contact area (A) of the line (B) for dirt or damage, and clean it if needed.



2. Insert a new retainer (A) into the connector (B) if the retainer is damaged, or after:

   - replacing the fuel rail.
   - replacing the fuel feed line.
   - replacing the fuel pump.
   - replacing the fuel filter.
   - replacing the fuel gauge sending unit.
   - replacing EVAP purge line.
   - replacing EVAP canister.
   - removing the retainer from the line.

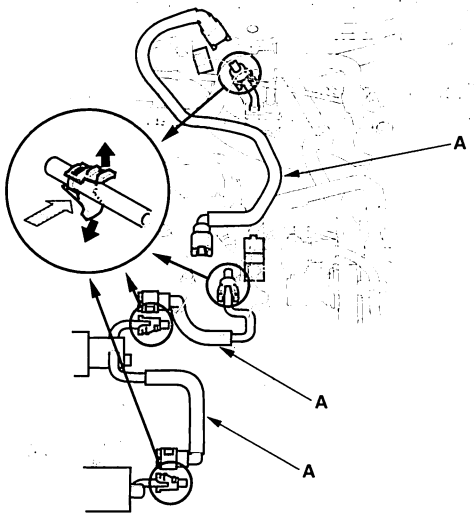


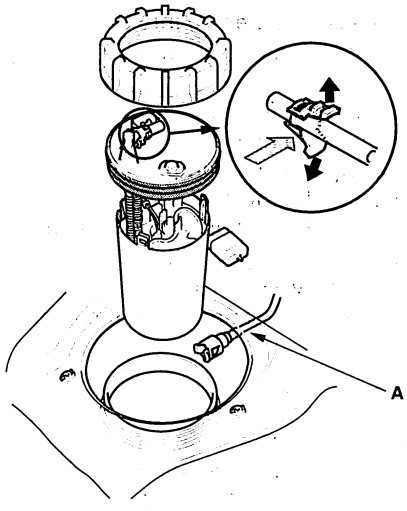
(cont'd)

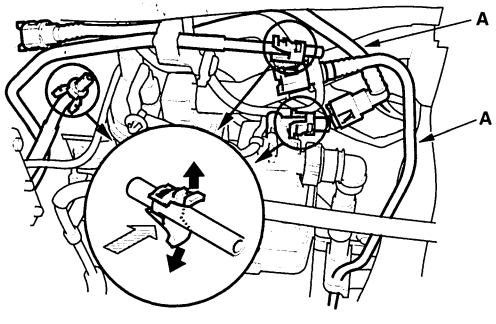
Protected by AR

Fuel Line/Quick-Connect Fitting Installation (cont'd)

3. Before connecting a new fuel tube/quick-connect fitting assembly (A), remove the old retainer from the mating line.



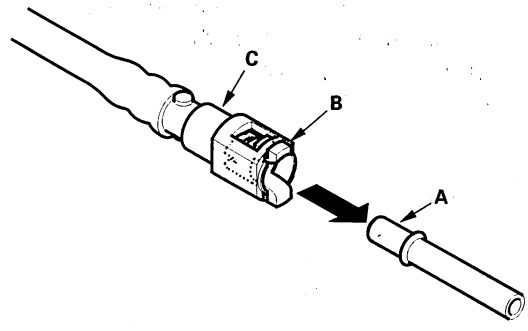




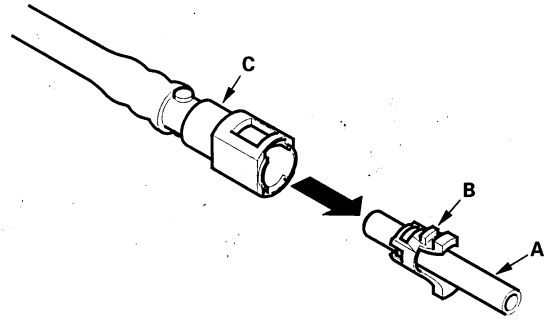
4. Align the quick-connect fittings with the line (A), and align the retainer locking tabs (B) with the connector tabs (C). Then press the quick-connect fittings onto the line until both retainer pawls lock with a clicking sound.

NOTE: If it is hard to connect, put a small amount of new engine oil on the line end.

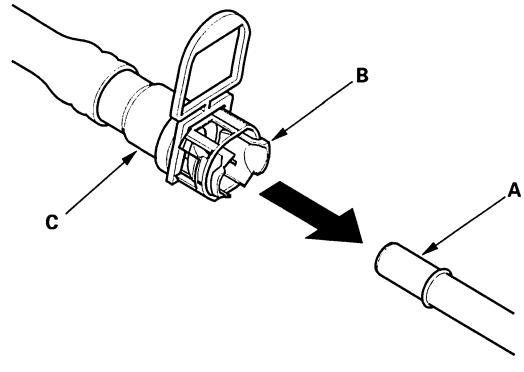
Connection with new retainer



Reconnection to existing retainer



Connection to new fuel line



BACK

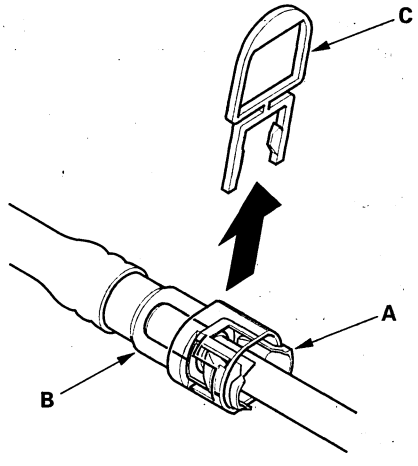
Protected by AR

5. When you are reconnecting the connector with the old retainer, make sure the connection is secure and the tabs (A) are firmly locked into place; check visually and also by pulling the connector (B). When you are replacing the fuel line with a new one, make sure you remove the ring pull (C) upwards after you confirm the connection is secure.

   NOTE: Before you remove the ring pull, make sure the fuel line connection is secure. If the connection is not secure, the ring pull could break when you try to remove it.

   Reconnection to existing retainer

   Connection to new fuel line

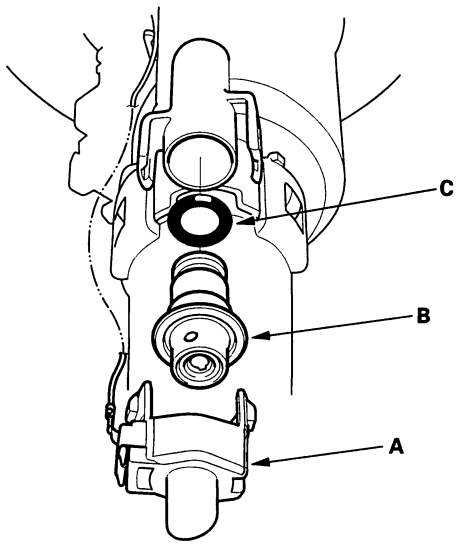


6. Turn the ignition switch ON (II). The fuel pump will run for about 2 seconds, and fuel pressure will rise. Repeat two or three times, and check that there is no leakage in the fuel supply system.

Protected by AR

Fuel Pressure Regulator Replacement

1. Remove the fuel tank unit (see page 11-327).
2. Remove the holder (A).



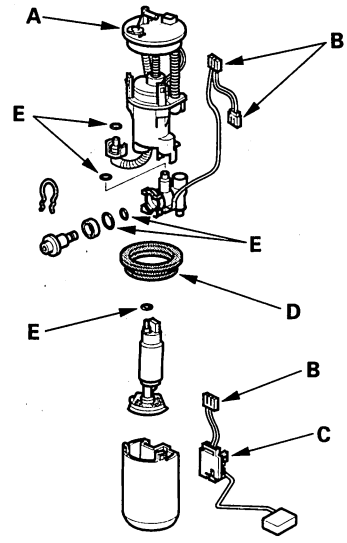
3. Remove the fuel pressure regulator (B).
4. Install the regulator in the reverse order of removal with a new O-ring (C).

   NOTE: Coat the O-ring with clean engine oil.

Fuel Filter Replacement

The fuel filter should be replaced whenever the fuel pressure drops below the specified value (see page 11-317), after making sure that the fuel pump and the fuel pressure regulator are OK.

1. Remove the fuel tank unit (see page 11-327).
2. Remove the fuel filter set (A).



3. Check these items before installing the fuel tank unit:

   - When connecting the wire harness, make sure the connection is secure and the connectors (B) are firmly locked into place.
   - When installing the fuel gauge sending unit (C), make sure the connection is secure and the connector is firmly locked into place. Be careful not to bend or twist it excessively.

4. Install the parts in the reverse order of removal with a new base gasket (D) and new O-rings (E). When installing the fuel tank unit, align the marks on the unit and the fuel tank (see page 11-327).

   NOTE: Replace the fuel tank unit locknut (A), and base gasket as a set.

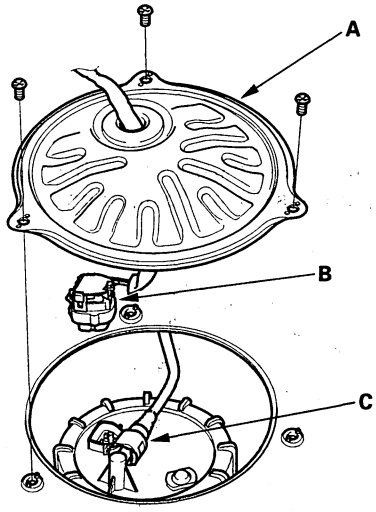
BACK

Protected by AR

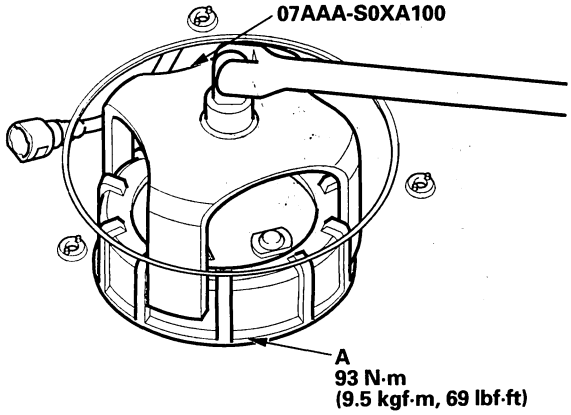
Fuel Pump/Fuel Gauge Sending Unit Replacement

Special Tools Required
Fuel sender wrench 07AAA-S0XA100

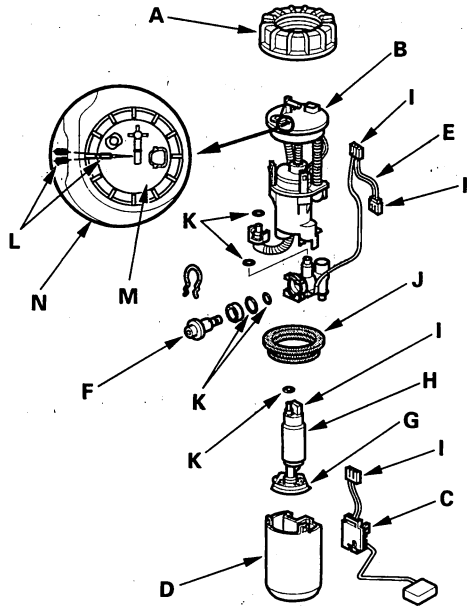
1. Relieve the fuel pressure (see page 11-315).
2. Remove the fuel fill cap.
3. Remove the trunk floor.
4. Remove the access panel (A) from the floor.



5. Disconnect the fuel pump 5P connector (B).
6. Disconnect the quick-connect fitting (C) from the fuel tank unit.
7. Using the special tool, loosen the fuel tank unit locknut (A).



8. Remove the locknut (A) and the fuel tank unit.



9. Remove the fuel filter (B), the fuel gauge sending unit (C), the case (D), the wire harness (E), and the fuel pressure regulator (F).
10. Check these items before installing the fuel tank unit:
    - Make sure the connection is secure and the suction filter (G) is firmly connected to the fuel pump (H).
    - When connecting the wire harness, make sure the connection is secure and the connectors (I) are firmly locked into place.
    - When installing the fuel gauge sending unit, make sure the connection is secure and the connector is firmly locked into place. Be careful not to bend or twist it excessively.
11. Install the parts in the reverse order of removal with a new base gasket (J), new locknut, and new O-rings (K). When installing the fuel tank unit, align the marks (L) on the unit (M) and the fuel tank (N).

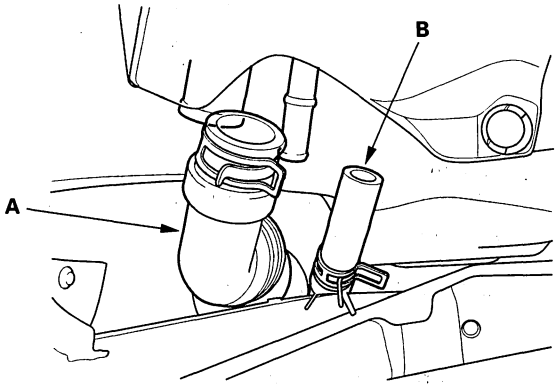
BACK

Protected by AR

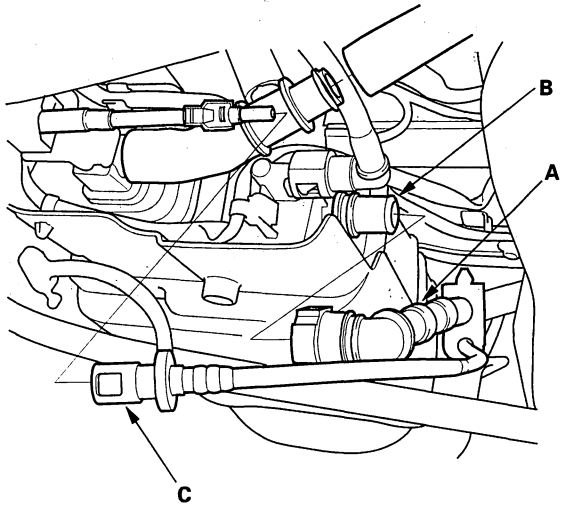
Fuel Tank Replacement

Removal

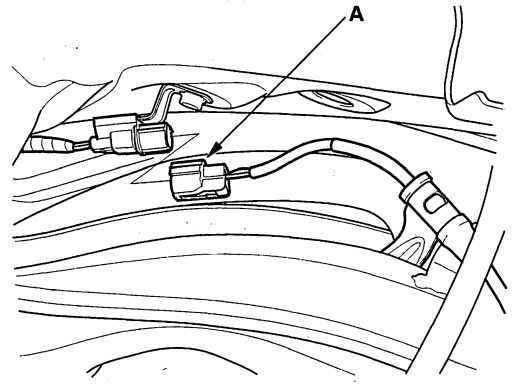
1. Relieve the fuel pressure (see page 11-315).
2. Drain the fuel tank (see page 11-318).
3. Loosen the rear wheel nuts slightly, then raise the vehicle, and make sure it is securely supported. Remove the rear wheels.
4. Release the parking brake.
5. Remove the mufflers and exhaust pipe B (see page 9-6).
6. Disconnect the fuel fill neck tube (A) and breather hose (B).



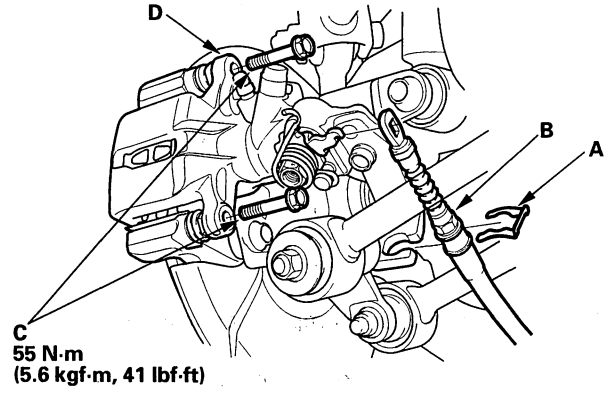
7. Disconnect the vapor line (A) from the EVAP canister (B). then disconnect the fuel line (C).



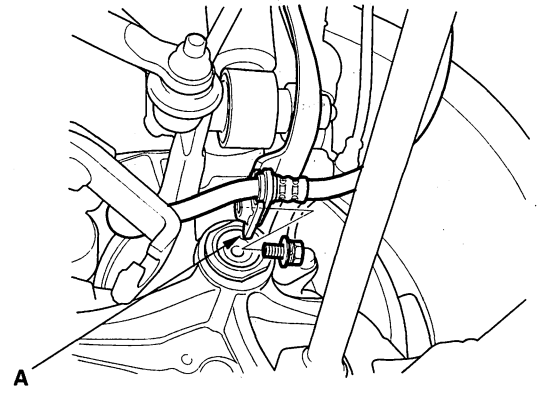
8. Disconnect the wheel sensor 2P connector (A).



9. Remove the clip (A), parking brake cable (B), two caliper bolts (C), and caliper body (D).



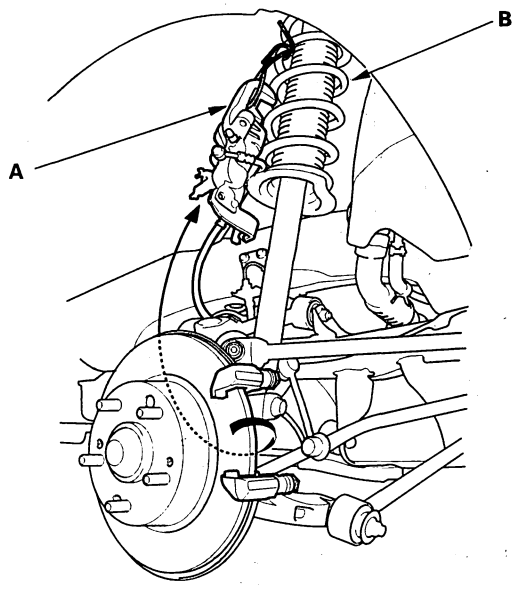
10. Remove the brake hose bracket (A).



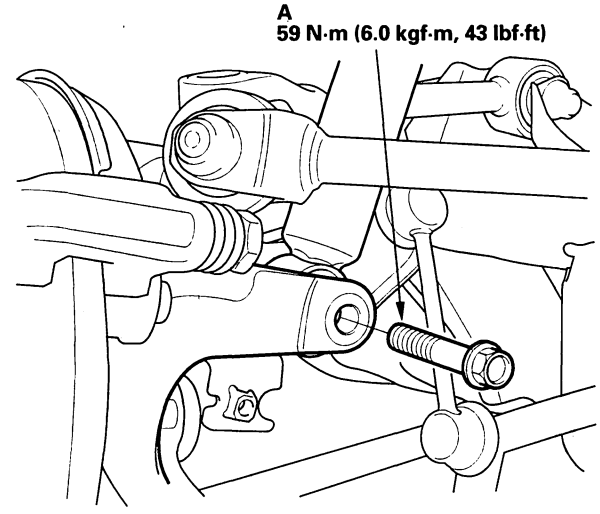
BACK

Protected by AR

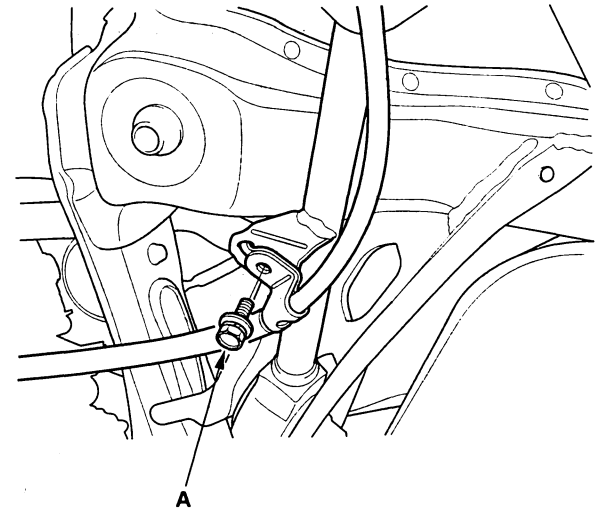
11. Hook the caliper body (A) onto the damper spring (B).



12. Remove the flange bolt (A).



13. Remove the parking brake cable bracket bolt (A).

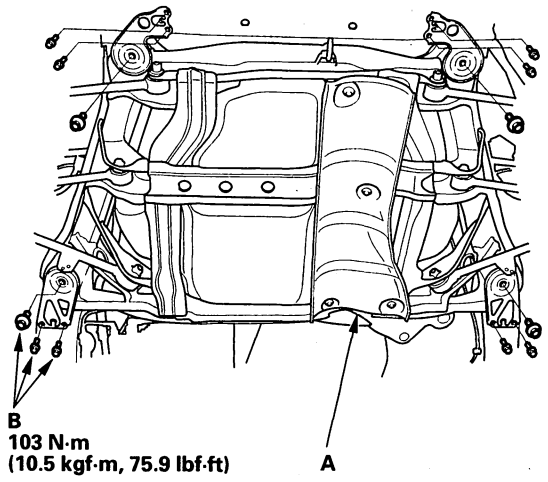


(cont'd)

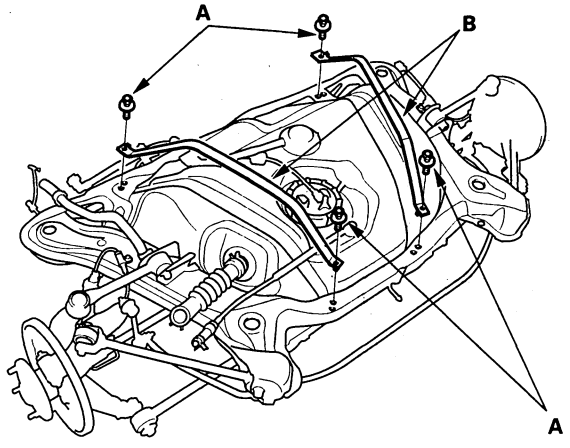
Protected by AR

Fuel Tank Replacement (cont'd)

14. Remove the heat shield (A). Place a jack or support under the rear suspension subframe. Remove the mounting bolts (B). Remove the rear suspension subframe.



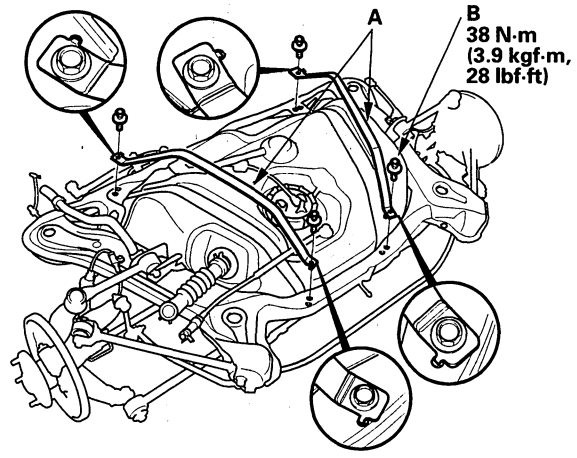
15. Remove the bolts (A) and the fuel tank straps (B).



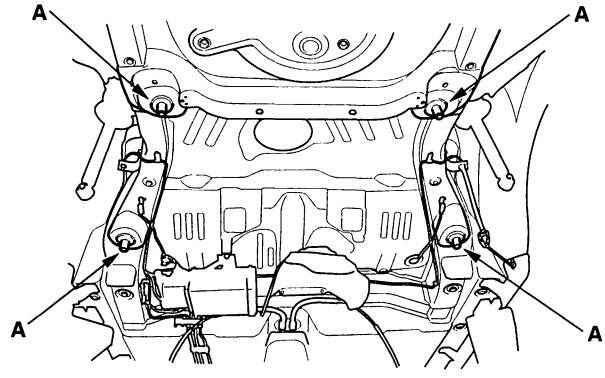
16. Lift the fuel tank out of the subframe.

Installation

1. Install the fuel tank straps (A), and tighten the bolts (B).



2. Place a jack or support under the rear suspension subframe. Install the subframe, aligning the pins (A) with the holes in the subframe.



3. Install the remaining parts in the reverse order of removal.

4. If equipped with drum brakes, bleed the brake system after installing the brake hose, refer to the 2003-2006 Accord Service Manual (see page 19-9). If not, go to step 5.

5. After installation, do a wheel alignment, refer to the 2003-2006 Accord Service Manual (see page 18-6).

Fuel Gauge Sending Unit Test

2003-2004 models

NOTE: For the fuel gauge system circuit diagram, refer to the Gauges Circuit Diagram (see page 22-72).

1. Do multiplex integrated control system troubleshooting test mode A, refer to the 2003-2006 Accord Service Manual (see page 22-91).

   - If no problem is found, go to step 2.
   - If DTC B1175 is indicated, go to the DTC B1175 troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-283).

2. Check the No. 21 METER (7.5 A) fuse in the under-dash fuse/relay box.

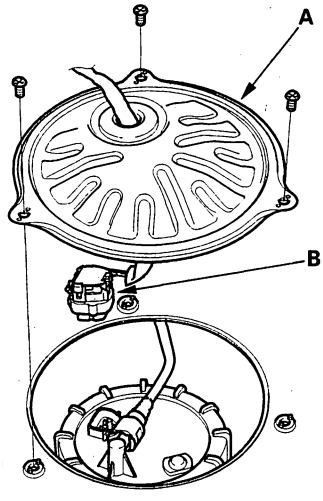
3. Do the gauge drive circuit check, refer to the 2003-2006 Accord Service Manual (see page 22-259).

   - If the fuel gauge needle sweeps from the minimum to maximum position and then returns to minimum, the gauge is OK. Go to step 4.
   - If the fuel gauge needle does not sweep correctly, replace the gauge assembly and retest.

4. Turn the ignition switch OFF.

5. Remove the trunk floor.

6. Remove the access panel (A) from the floor.



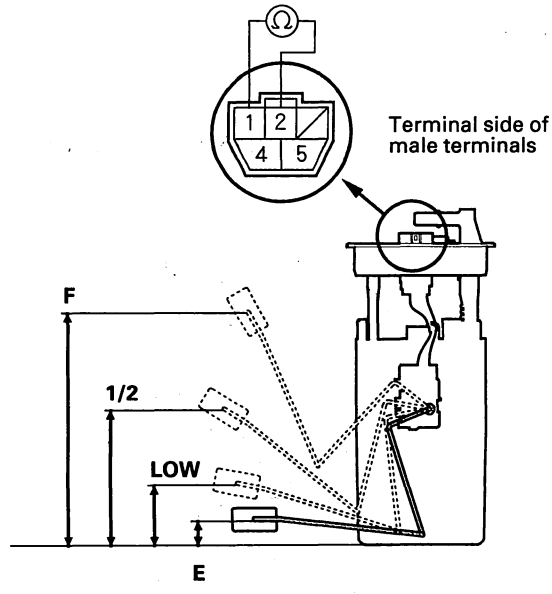
7. Disconnect the fuel pump 5P connector (B).

8. Remove the fuel tank unit from the fuel tank (see page 11-327).

9. Measure resistance between the No. 1 and No. 2 terminals of the fuel pump 5P connector with the float at E (EMPTY), 1/2 (HALF FULL), and F (FULL) positions.
   If you do not get the following readings, replace the fuel gauge sending unit (see page 11-327).

Float Position	F 7.6 in. (191.4 mm)	1/2 4.4 in. (113.1 mm)	LOW 2.0 in. (52.4 mm)	E 0.8 in. (25.6 mm)
Resistance (Ω)	19 to 21	205.5 to 215.5	487.9 to 617.1	770 to 790

NOTE: Remove the No. 15 BACK UP (40 A) fuse from the under-hood fuse/relay box for at least 10 seconds after completing troubleshooting, otherwise it may take up to 20 minutes for the fuel gauge to indicate the correct fuel level.



BACK

Fuel Gauge Sending Unit Test (cont'd)

2005-2006 models

NOTE: For the fuel gauge system circuit diagram, refer to the Gauges Circuit Diagram; 2005 model (see page 22-72), 2006 model (see page 22-80).

1. Check the No. 21 METER (7.5 A) fuse in the under-dash fuse/relay box before testing.

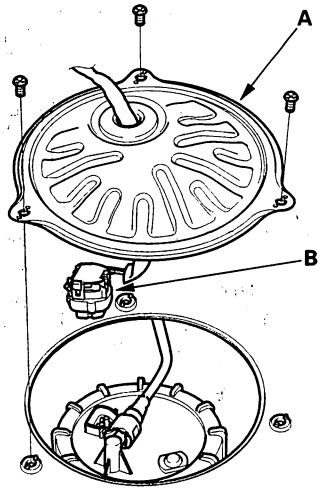
2. 2005 model:
   Do multiplex integrated control system troubleshooting test mode A, refer to the 2003-2006 Accord Service Manual (see page 22-91).
   2006 model:
   Do the B-CAN system diagnosis Test Mode A troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-91).

   - If no problem is found, go to step 3.
   - If DTC B1175 or B1176 is indicated, go to the indicated DTC's troubleshooting.

3. Turn the ignition switch OFF.

4. Remove the trunk floor.

5. Remove the access panel (A) from the floor.

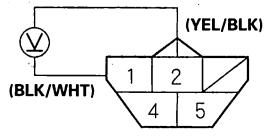


6. Disconnect the fuel tank unit 5P connector (B).

7. Measure voltage between fuel tank unit 5P connector terminals No. 1 and No. 2 with the ignition switch ON (II). There should be battery voltage.

   - If the voltage is OK, go to step 8.
   - If the voltage is not as specified, check for:
     – a short in the YEL/BLK wire to ground.
     – an open in the YEL/BLK or BLK/WHT wire.

FUEL TANK UNIT 5P CONNECTOR



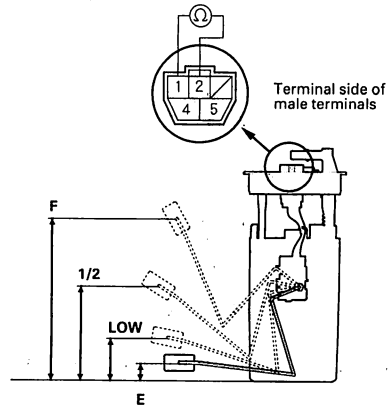
Wire side of female terminals

8. Turn the ignition switch OFF.

9. Remove the fuel tank unit from the fuel tank (see page 11-327).

10. Measure resistance between fuel tank unit 5P connector terminals No. 1 and No. 2 with the float at E (EMPTY), LOW (LOW FUEL INDICATOR), 1/2 (HALF FULL), and F (FULL) positions.
    If you do not get the following readings, replace the fuel gauge sending unit (see page 11-327).

Float Position	F 7.6 in. (191.4 mm)	1/2 4.4 in. (113.1 mm)	LOW 2.0 in. (52.4 mm)	E 0.8 in. (25.6 mm)
Resistance (Ω)	19 to 21	205.5 to 215.5	487.9 to 617.1	770 to 790



BACK

Protected by AR

Low Fuel Indicator Test

11. Reconnect the fuel tank unit 5P connector.

12. Remove the No. 15 BACK UP (40 A) fuse from the under-hood fuse/relay box for at least 10 seconds, then reinstall it.

13. Turn the ignition switch ON (II).

14. Check that the pointer of the fuel gauge indicates "F" with the float at F.

    - If the pointer of the fuel gauge does not indicate "F" replace the gauge assembly.
    - If the gauge is OK, the test is complete.

    NOTE:
    - The pointer of the fuel gauge returns to the bottom of the gauge dial when the ignition switch is OFF, regardless of the fuel level.
    - Remove the No. 15 BACK UP (40 A) fuse from the under-hood fuse/relay box for at least 10 seconds after completing troubleshooting, otherwise it may take up to 20 minutes for the fuel gauge to indicate the correct fuel level.

1. Do the gauge drive circuit check, refer to the 2003-2006 Accord Service Manual (see page 22-259).

    - If the low fuel indicator flashes, go to step 2.
    - If the low fuel indicator does not flash, replace the gauge control module assembly.

2. 2003-2005 models:
   Do multiplex integrated control system troubleshooting test mode A, refer to the 2003-2006 Accord Service Manual (see page 22-91).
   2006 model:
   Do the B-CAN system diagnosis Test Mode A troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-91).

    - If any DTCs are indicated, go to the indicated DTC's troubleshooting.
    - If no DTCs are indicated, go to step 3.

3. Do the fuel gauge sending unit test (see page 11-331).

DTC Troubleshooting

DTC P1077: IMT (IMRC) Valve Stuck Short

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Start the engine, and let it idle.
2. Check the IMT (IMRC) VALVE CMD in the DATA LIST with the HDS.

   Is CLOSE indicated?

   YES—Go to step 3.

   NO—Go to step 29.
3. Check the IMT (IMRC) VALVE SW in the DATA LIST with the HDS.

   Is OPEN indicated?

   YES—Go to step 4.

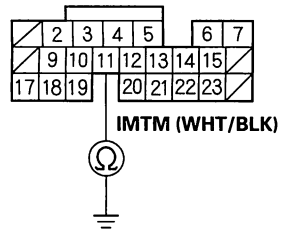
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the IMT (IMRC) actuator and the ECM. ■
4. Turn the ignition switch OFF.
5. Disconnect the IMT (IMRC) actuator 5P connector.
6. Turn the ignition switch ON (II).
7. Check the IMT (IMRC) VLV SW in the DATA LIST with the HDS.

   Is CLOSE indicated?

   YES—Go to step 12.

   NO—Go to step 8.
8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect ECM connector B (24P).
11. Check for continuity between ECM connector terminal B11 and body ground.

ECM CONNECTOR B (24P)



Wire side of female terminals

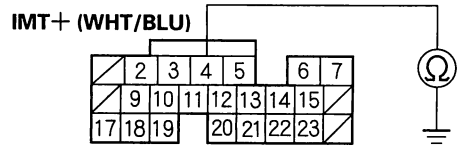
Is there continuity?

YES—Repair short in the wire between the ECM (B11) and the IMT (IMRC) actuator, then go to step 23.

NO—Go to step 29.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM connector B (24P).
15. Check for continuity between ECM connector terminal B4 and body ground.

ECM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM (B4) and the IMT (IMRC) actuator, then go to step 23.

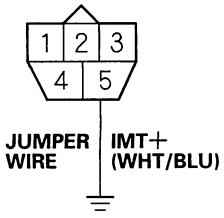
NO—Go to step 16.

BACK

Protected by AR

16. Connect IMT (IMRC) actuator 5P connector terminal No. 5 to body ground with a jumper wire.

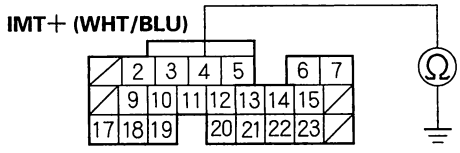
IMT (IMRC) ACTUATOR 5P CONNECTOR



Wire side of female terminals

17. Check for continuity between ECM connector terminal B4 and body ground.

ECM CONNECTOR B (24P)



Wire side of female terminals

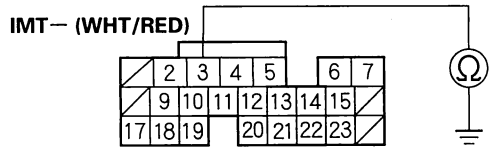
Is there continuity?

YES—Go to step 18.

NO—Repair open in the wire between the ECM (B4) and the IMT (IMRC) actuator, then go to step 23.

18. Check for continuity between ECM connector terminal B3 and body ground.

ECM CONNECTOR B (24P)



Wire side of female terminals

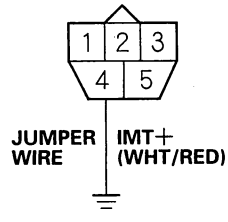
Is there continuity?

YES—Repair short in the wire between the ECM (B3) and the IMT (IMRC) actuator, then go to step 23.

NO—Go to step 19.

19. Connect IMT (IMRC) actuator 5P connector terminal No. 4 to body ground with a jumper wire.

IMT (IMRC) ACTUATOR 5P CONNECTOR



Wire side of female terminals

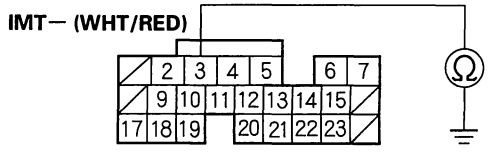
Protected by AR

DTC Troubleshooting (cont'd)

20. Check for continuity between ECM connector terminal B3 and body ground.

ECM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 21.

NO—Repair open in the wire between the ECM (B3) and the IMT (IMRC) actuator, then go to step 23.

21. Remove the IMT (IMRC) actuator (see page 11-346).

22. Move the IMT (IMRC) valve by hand.

Does it move smoothly?

YES—Substitute a known-good IMT (IMRC) actuator (see page 11-346), then go to step 23 and recheck. If DTC P1077 is not indicated, replace the IMT (IMRC) actuator (see page 11-346), then go to step 23. If DTC P1077 is indicated, go to step 29.

NO—Remove the intake manifold upper cover (see page 9-2), and repair the stuck valve. If necessary, replace the intake manifold (see page 9-2), then go to step 23.

23. Reconnct all connectors.

24. Turn the ignition switch ON (II).

25. Reset the ECM with the HDS.

26. Do the ECM idle learn procedure (see page 11-302).

27. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P1077 is indicated, check for poor connections or loose terminals at the IMT (IMRC) actuator and the ECM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 28.

28. Monitor the OBD STATUS for DTC P1077 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete. ■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the IMT (IMRC) actuator and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 26 and recheck.

29. Update the ECM if it does not have the latest software, or substitute a known-good ECM (see page 11-6).

30. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P1077 is indicated, check for poor connections or loose terminals at the IMT (IMRC) actuator and the ECM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see page 11-224). ■

DTC P1078: IMT (IMRC) Valve Stuck Long

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Start the engine, and hold the engine speed above 4,000 rpm.
2. Check the IMT (IMRC) VALVE CMD in the DATA LIST with the HDS.

   Is OPEN indicated?

   YES—Go to step 3.

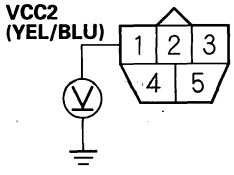
   NO—Go to step 32.
3. Check the IMT (IMRC) VALVE SW in the DATA LIST with the HDS.

   Is CLOSE indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the IMT (IMRC) actuator and the ECM. ■
4. Turn the ignition switch OFF.
5. Disconnect the IMT (IMRC) actuator 5P connector.
6. Turn the ignition switch ON (II).
7. Measure voltage between IMT (IMRC) actuator 5P connector terminal No. 1 and body ground.

IMT (IMRC) ACTUATOR 5P CONNECTOR



Wire side of female terminals

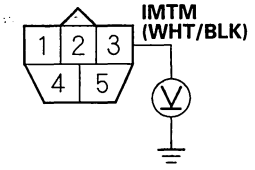
Is there about 5 V?

YES—Go to step 8.

NO—Repair open in the wire between the ECM (D12) and the IMT (IMRC) actuator, then go to step 25.

8. Measure voltage between IMT (IMRC) actuator 5P connector terminal No. 3 and body ground.

IMT (IMRC) ACTUATOR 5P CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Go to step 9.

NO—Go to step 14.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM connector D (17P).
12. Connect IMT (IMRC) actuator 5P connector terminal No. 2 to body ground with a jumper wire.

IMT (IMRC) ACTUATOR 5P CONNECTOR

DTC Troubleshooting (cont'd)

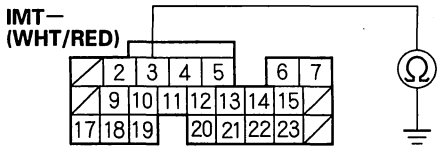
22. Check for continuity between ECM connector terminal B3 and body ground.

ECM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 23.

NO—Repair open in the wire between the ECM (B3) and the IMT (IMRC) actuator, go to step 25.

23. Remove the IMT (IMRC) actuator (see page 11-346).

24. Move the IMT (IMRC) valve by hand.

Does it move smoothly?

YES—Substitute a known-good IMT (IMRC) actuator (see page 11-346), then go to step 25 and recheck. If DTC P1078 is not indicated, replace the IMT (IMRC) actuator (see page 11-346), then go to step 25. If DTC P1078 is indicated, then go to step 31.

NO—Remove the intake manifold upper cover (see page 9-2), and repair the stuck valve. If necessasy, replace the intake manifold (see page 9-2), then go to step 25.

25. Reconnect all connectors.

26. Turn the ignition switch ON (II).

27. Reset the ECM with the HDS.

28. Do the ECM idle learn procedure (see page 11-302).

29. Start the engine, hold the engine speed at 4,000 rpm for 10 seconds, then let it idle.

30. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P1078 is indicated, check for poor connections or loose terminals at the IMT (IMRC) actuator and the ECM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 30.

31. Monitor the OBD STATUS for DTC P1078 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete. ■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the IMT (IMRC) actuator and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 28 and recheck.

32. Update the ECM if it does not have the latest software, or substitute a known-good ECM (see page 11-6).

33. Start the engine, hold the engine speed at 4,000 rpm for 10 seconds, then let it idle.

34. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P1078 is indicated, check for poor connections or loose terminals at the IMT (IMRC) actuator and the ECM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see page 11-224). ■

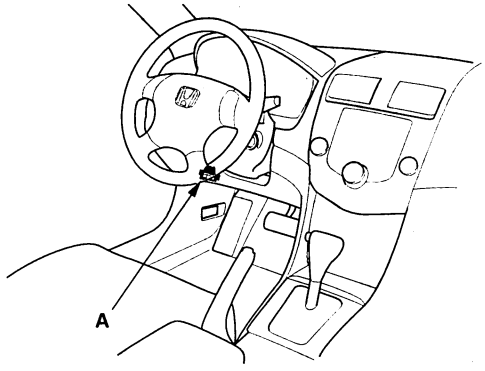
Throttle Body Test

Carbon Accumulation Check

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble code (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.



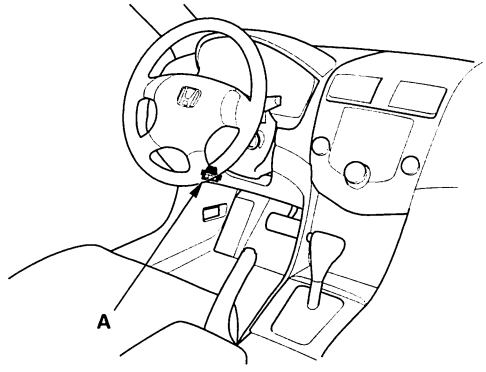
2. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

3. Check the REL TP SENSOR in the DATA LIST with the HDS. The reading should be below 2.73 %. If it is not, clean the throttle body (see page 11-343).

Throttle Position Learning Check

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble code (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.



2. Select the INSPECTION MENU with the HDS.

3. Do the TP POSITION CHECK in the ETCS TEST. If needed, clean the throttle body (see page 11-343).

Throttle Body Cleaning

⚠CAUTION

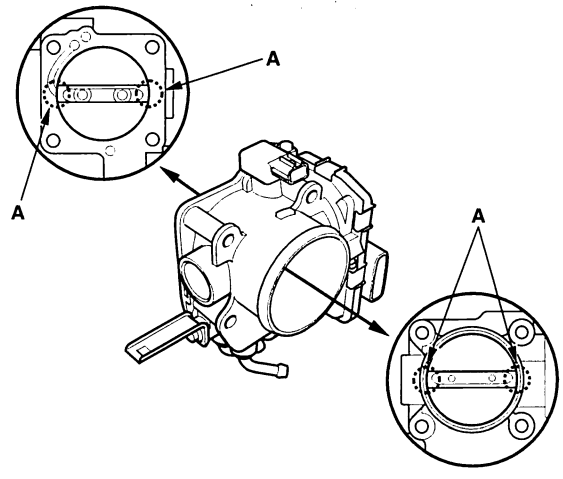
Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

1. Check for damage to the air cleaner. If the air cleaner is damaged, replace it (see page 11-344).

2. Remove the throttle body (see page 11-348).

3. Clean off the carbon from the throttle valve and inside the throttle body with a paper towel soaked in throttle plate and induction cleaner.

   NOTE:
   - Remove the throttle body to clean it.
   - Be careful not to pinch your fingers.
   - To avoid removing the molybdenum coating, do not clean the bearing area of the throttle shaft (A).
   - Do not spray throttle plate and induction cleaner directly on the throttle body.
   - Use Honda genuine throttle plate and induction cleaner.



4. Install the throttle body (see page 11-348).

5. Reset the ECM/PCM with the HDS.

6. Turn the ignition switch ON (II), and wait for 2 seconds.

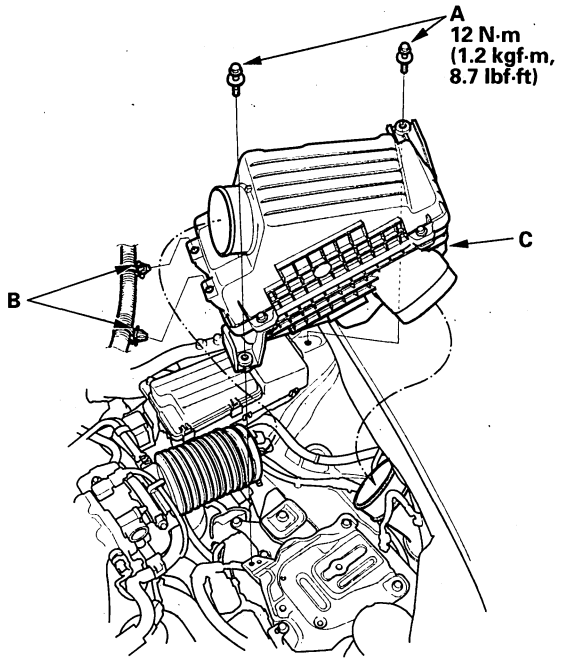
7. Do the ECM/PCM idle learn procedure (see page 11-302).

Protected by AR

Intake Air System

Air Cleaner Removal/Installation

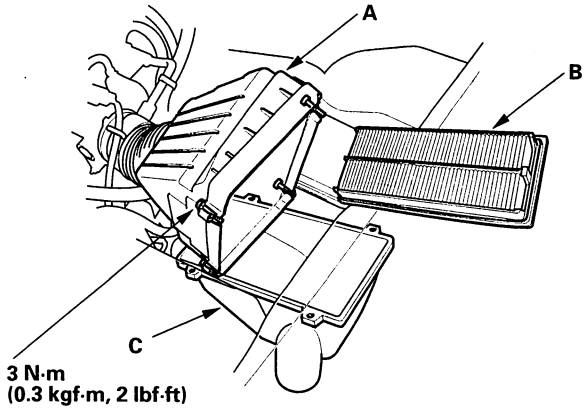
1. Remove the bolts (A) and clamps (B).



2. Remove the air cleaner (C).
3. Install the parts in the reverse order of removal.

Air Cleaner Element Inspection/ Replacement

1. Open the air cleaner housing cover (A).



2. Remove the air cleaner (B) from the air cleaner housing (C).
3. Check the air cleaner element for damage or clogging. If needed, replace the air cleaner element.

   NOTE: Do not use compressed air to clean the air cleaner element.

4. Install the parts in the reverse order of removal.

BACK

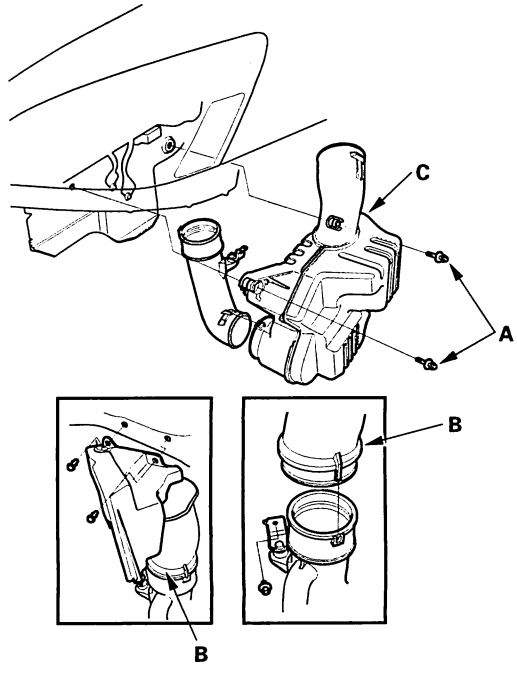
Resonator Removal/Installation

A/T

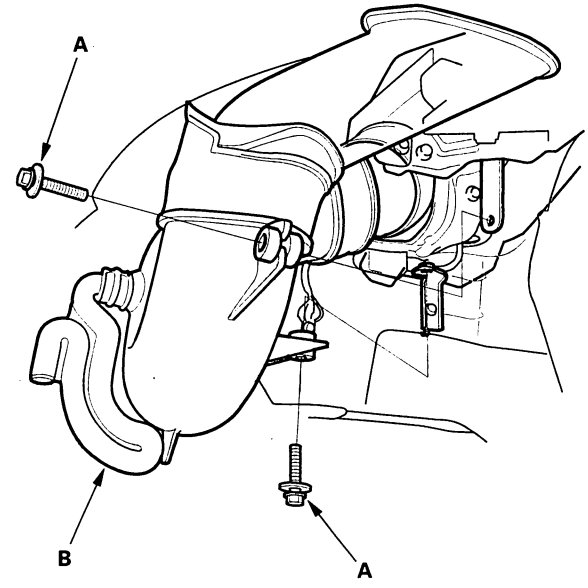
1. Remove the front bumper; 2-door, refer to the 2003-2006 Accord Service Manual (see page 20-184), 4-door, refer to the 2003-2006 Accord Service Manual (see page 20-185).
2. Remove the bolts (A) and the intake air duct (B).



3. Remove the resonator (C).
4. Install the parts in the reverse order of removal.

M/T

1. Remove the front bumper; 2-door, refer to the 2003-2006 Accord Service Manual (see page 20-184), 4-door, refer to the 2003-2006 Accord Service Manual (see page 20-185).
2. Remove the bolts (A).

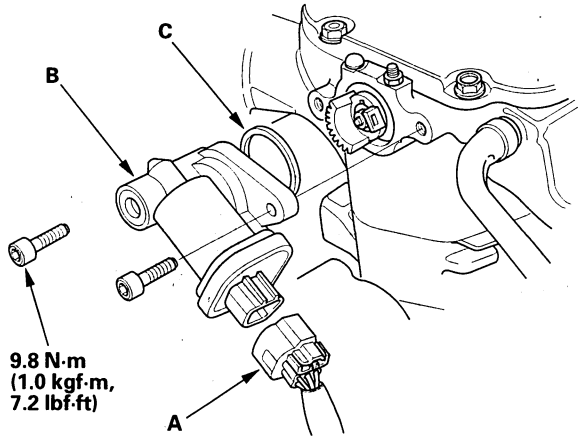


3. Remove the resonator (B).
4. Install the parts in the reverse order of removal.

Protected by AR

IMT (IMRC) Actuator Replacement

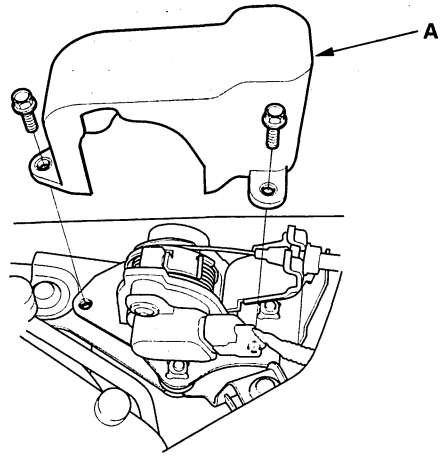
1. Remove the intake manifold cover (see page 9-2).
2. Disconnect the IMT (IMRC) actuator 5P connector (A).



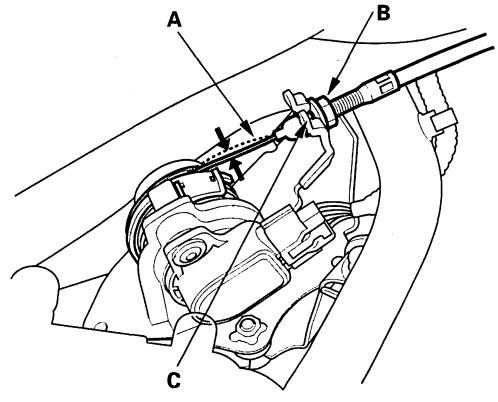
3. Remove the bolts and the IMT (IMRC) actuator (B).
4. Install the actuator in the reverse order of removal with a new O-ring (C).

Throttle Cable Adjustment

1. Remove the throttle cable cover (A).



2. Check cable free play at the throttle linkage. Cable free play (A) should be 10—12 mm (3/8—1/2 in.).



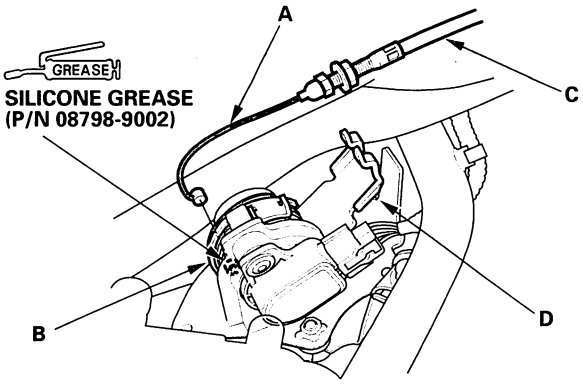
3. If the free play (A) is not within spec (10—12 mm, 3/8—1/2 in.), loosen the locknut (B), turn the adjusting nut (C) until the free play (A) is as specified, then retighten the locknut.
4. With the cable properly adjusted, check the throttle link to be sure it opens fully when you push the accelerator pedal to the floor. Also check the throttle link to be sure it returns to the idle position whenever you release the accelerator pedal.

BACK

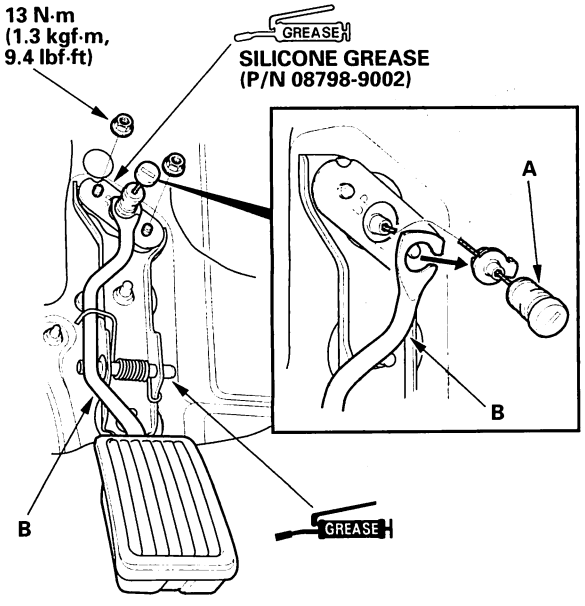
Protected by AR

Throttle Cable Removal/Installation

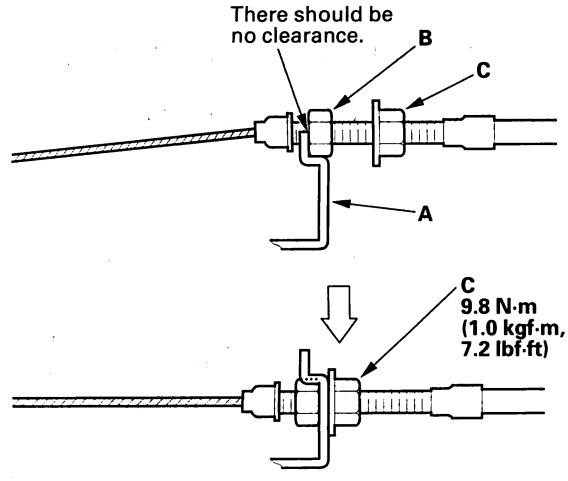
1. Remove the throttle cable cover (see page 11-346).
2. Fully open the throttle link, then remove the throttle cable (A) from the throttle link (B).



3. Remove the cable housing (C) from the cable bracket (D).
4. Remove the throttle cable (A) from the accelerator pedal (B).



5. Install the cable in the reverse order of removal.
6. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
7. Hold the cable, removing all slack from it.
8. Set the cable on the bracket (A).
   Adjust the adjusting nut (B) so that its free play is 0 mm.



9. Position the adjusting nut on the other side of the bracket, then tighten the locknut (C).
10. Check the throttle cable free play (see step 2 on page 11-346).
11. With the cable properly adjusted, check the throttle link to be sure it opens fully when you push the accelerator pedal to the floor. Also check the throttle link to be sure it returns whenever you release the accelerator pedal.

BACK

Protected by AR

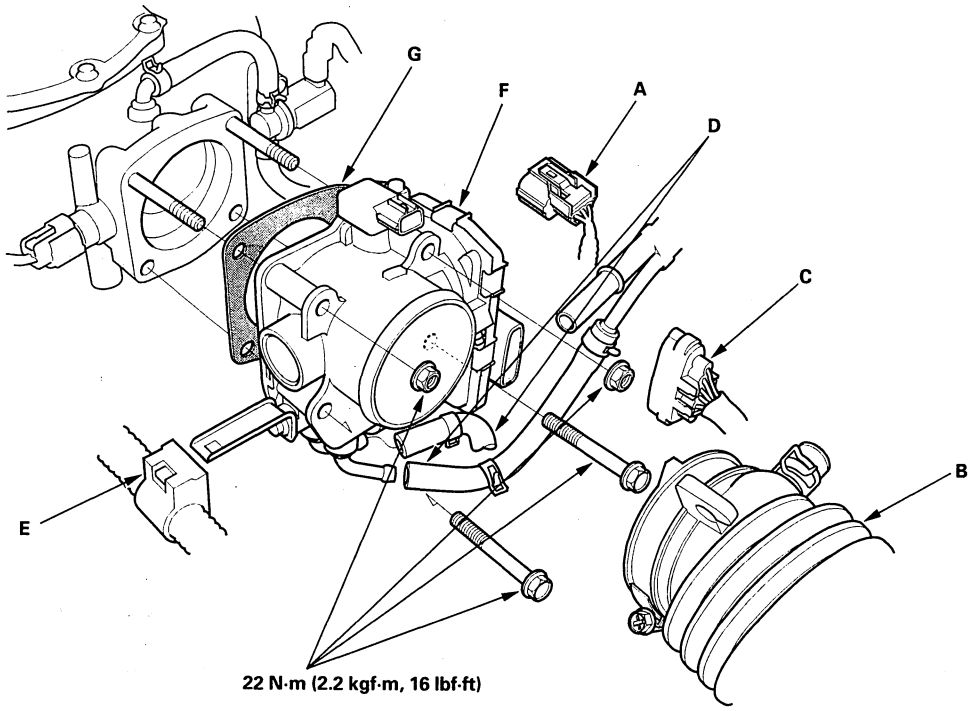
Throttle Body Removal/Installation

⚠CAUTION

Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: If you are replacing or cleaning the throttle body, begin from step 1. If you are removing the throttle body temporarily, begin from step 4.

1. Connect the HDS while the engine is stopped.
2. Select the INSPECTION MENU with the HDS.
3. Do the TP POSITION CHECK in the ETCS TEST.
4. Disconnect the MAP sensor connector (A).



5. Remove the intake air duct (B).
6. Disconnect the throttle body connector (C).
7. Disconnect and plug the water bypass hoses (D).
8. Remove the harness clip (E) and the throttle body (F).
9. Install the parts in the reverse order of removal with a new gasket (G).

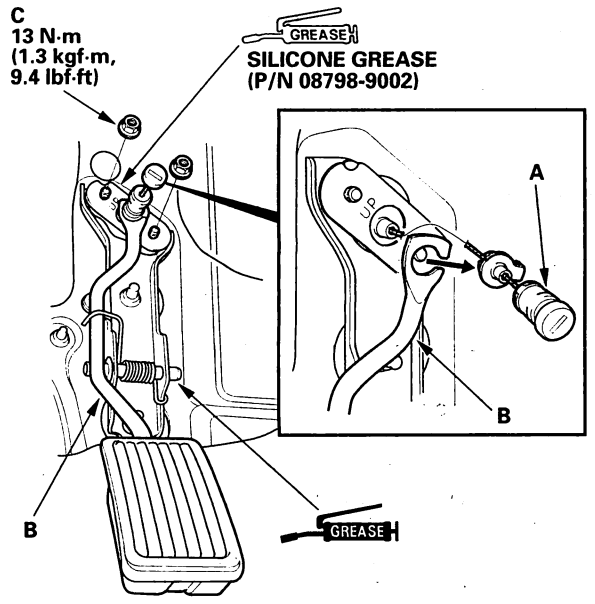
NOTE:
- Do the ECM/PCM idle learn procedure after the throttle body has been replaced (see page 11-302).
- Refill the radiator with engine coolant (see page 10-6).

BACK

Protected by AR

Accelerator Pedal Replacement

1. Remove the throttle cable (A) from the accelerator pedal (B).



2. Remove the nuts (C) and the accelerator pedal.

3. Install in the reverse order of removal.

DTC Troubleshooting

DTC P0420: Rear Bank Catalyst System Efficiency Below Threshold (Bank 1) (2003-2004 models)

DTC P0430: Front Bank Catalyst System Efficiency Below Threshold (Bank 2) (2003-2004 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If some of the DTCs listed below are stored at the same time as DTC P0420 and/or P0430*, troubleshoot those DTCs first, then recheck for DTC P0420 and/or P0430*.
  P0137, P0138, P0157, P0158: Secondary HO2S (Sensor 2)
  P0141, P0161: Secondary HO2S (Sensor 2) heater
- Poor quality fuel can cause these DTCs.
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature above 158 °F (70 °C)
   - Transmission in 5th gear (A/T in D position)
   - Vehicle speed between 50—55 mph (80—88 km/h) with cruise control set
   - Drive about 2 minutes, decelerate for at least 4 seconds with the throttle completely closed, then maintain 55 mph (88 km/h) for 20 minutes with cruise control set
5. Monitor the OBD STATUS for DTC P0420 and/or P0430* in the DTCs MENU with the HDS.

   Does the screen indicate EXECUTING?

   YES—Go to step 6.

   NO—Go to step 4 and recheck.
6. Continue test driving until a result comes on.
7. Monitor the OBD STATUS for DTC P0420 and/or P0430* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 8.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 4 and recheck.
8. Turn the ignition switch OFF.
9. Replace the WU-TWC (see page 11-354).
10. Turn the ignition switch ON (II).
11. Reset the ECM/PCM with the HDS.
12. Do the ECM/PCM idle learn procedure (see page 11-302).

BACK

Protected by AR

13. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

14. Test-drive for about 10 minutes, continually changing the vehicle speed.

15. Check the CATA MON TEMP in the DATA LIST with the HDS.

    Is the temperature OK?

    YES—Go to step 16.

    NO—Go to step 13 and recheck.

16. Test-drive under these conditions:

    - Engine coolant temperature above 158 °F (70 °C)
    - Transmission in 5th gear (A/T in D position)
    - Vehicle speed between 50—55 mph (80—88 km/h) with cruise control set
    - Drive about 2 minutes, decelerate for at least 4 seconds with the throttle completely closed, then maintain 55 mph (88 km/h) for 20 minutes with cruise control set

17. Monitor the OBD STATUS for DTC P0420 and/or P0430 in the DTCs MENU with the HDS.

    Does the screen indicate EXECUTING?

    YES—Go to step 18.

    NO—Go to step 16 and recheck.

18. Continue test driving until a result comes on.

19. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—Go to the indicated DTC's troubleshooting. ■

    NO—Go to step 20.

20. Monitor the OBD STATUS for DTC P0420 and/or P0430 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check the fuel quality. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 13 and recheck.

DTC Troubleshooting (cont'd)

DTC P0420: Rear Bank Catalyst System Efficiency Below Threshold (Bank 1) (2005-2006 models)

DTC P0430: Front Bank Catalyst System Efficiency Below Threshold (Bank 2) (2005-2006 models)

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If some of the DTCs listed below are stored at the same time as DTC P0420 and/or P0430*, troubleshoot those DTCs first, then recheck for DTC P0420 and/or P0430*.
  P0137, P0138, P0157, P0158, P2270, P2271, P2272*, P2273*: Secondary HO2S (Sensor 2)
  P0141, P0161: Secondary HO2S (Sensor 2) heater
- Poor quality fuel can cause these DTCs.
- Information marked with an asterisk (*) applies to the front bank (Bank 2).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature above 158 °F (70 °C)
   - Transmission in 5th gear (A/T in D position)
   - Vehicle speed between 45—75 mph (72—120 km/h) for 5 minutes or more with cruise control set
   - Maintain the vehicle speed at 55 mph (88 km/h) for 5 minutes or more with cruise control set
5. Monitor the OBD STATUS for DTC P0420 and/or P0430* in the DTCs MENU with the HDS.

   Does the screen indicate EXECUTING?

   YES—Go to step 6.

   NO—Go to step 4 and recheck.
6. Continue test driving until a result comes on.
7. Monitor the OBD STATUS for DTC P0420 and/or P0430* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 8.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 4 and recheck.
8. Turn the ignition switch OFF.
9. Replace the WU-TWC (see page 11-354).
10. Turn the ignition switch ON (II).
11. Reset the ECM/PCM with the HDS.
12. Do the ECM/PCM idle learn procedure (see page 11-302).

BACK

Protected by AR

13. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

14. Test-drive for about 10 minutes, continually changing the vehicle speed.

15. Check the CATA MON TEMP in the DATA LIST with the HDS.

    Is the temperature OK?

    YES—Go to step 16.

    NO—Go to step 13 and recheck.

16. Test-drive under these conditions:

    - Engine coolant temperature above 158 °F (70 °C)
    - Transmission in 5th gear (A/T in D position)
    - Vehicle speed at 55 mph (88 km/h) for 5 minutes or more with cruise control set

17. Monitor the OBD STATUS for DTC P0420 and/or P0430' in the DTCs MENU with the HDS.

    Does the screen indicate EXECUTING?

    YES—Go to step 18.

    NO—Go to step 16 and recheck.

18. Continue test driving until a result comes on.

19. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—Go to the indicated DTC's troubleshooting.■

    NO—Go to step 20.

20. Monitor the OBD STATUS for DTC P0420 and/or P0430' in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, check the fuel quality. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 13 and recheck.

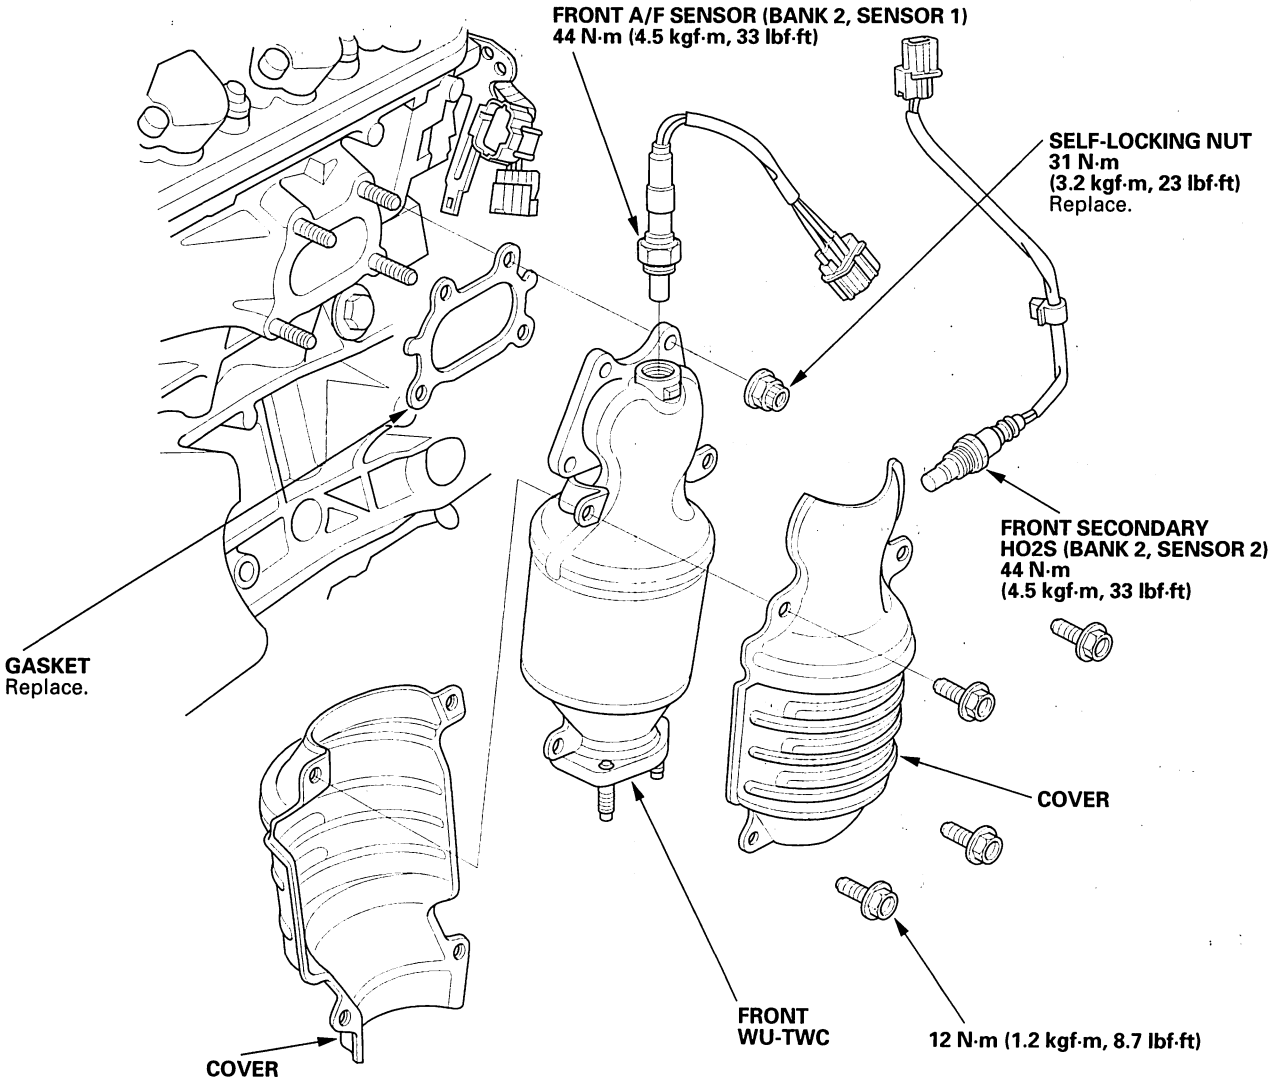
Catalytic Converter System

Warm Up Three Way Catalytic Converter Removal/Installation

FRONT

1. Remove the condenser fan shroud (see page 10-10).
2. Disconnect the front air fuel ratio (A/F) sensor connector and front secondary heated oxygen sensor (secondary HO2S) connector.
3. Remove the front WU-TWC.



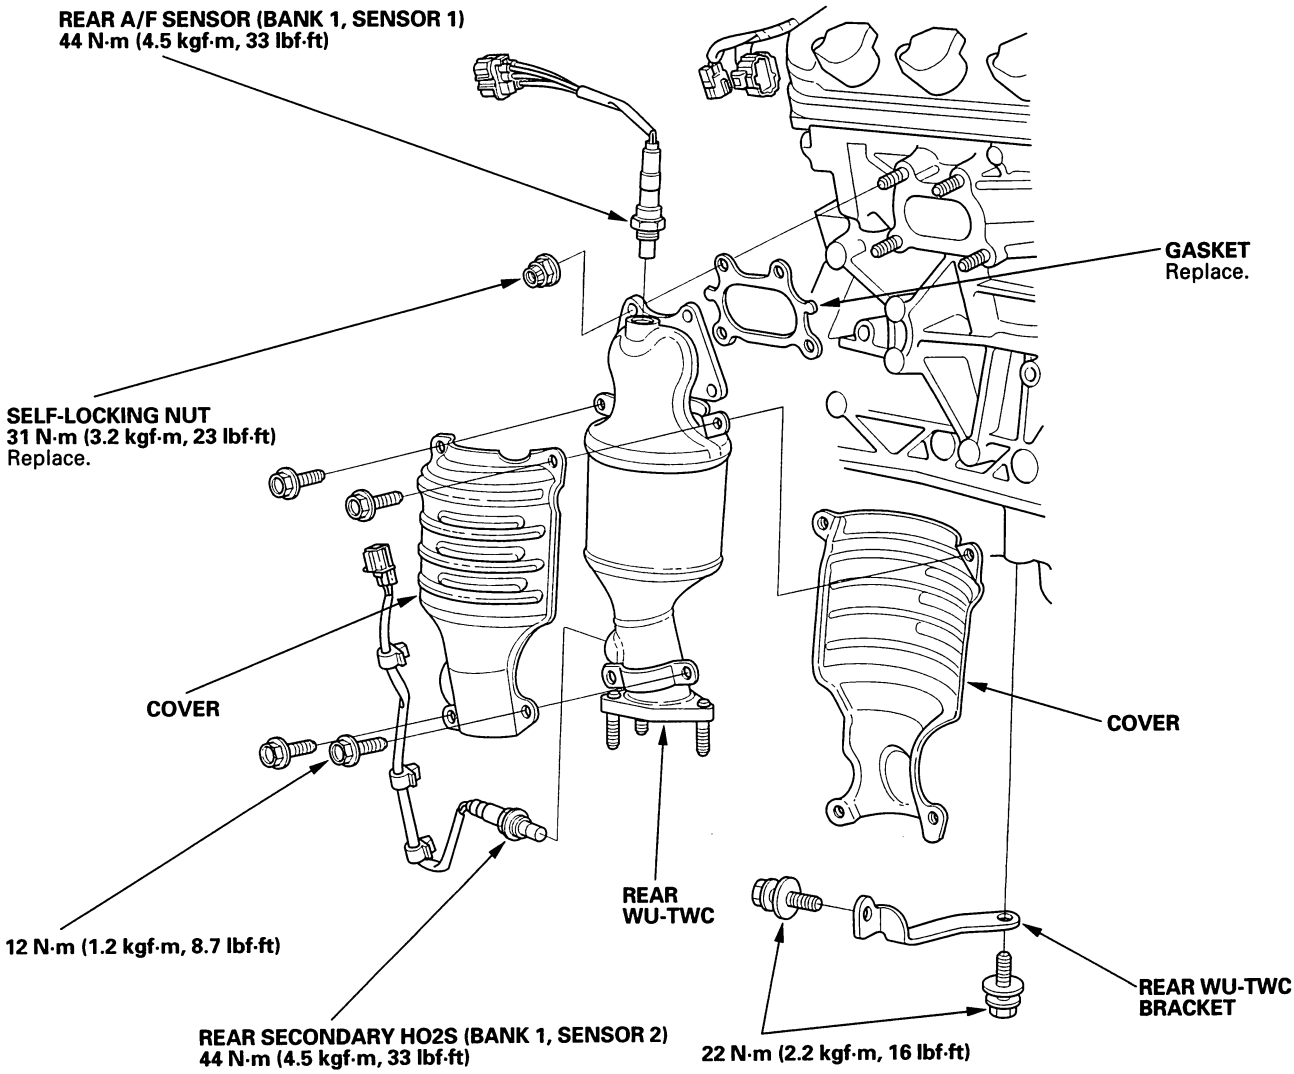
4. Install the front WU-TWC, and tighten the nuts in a crisscross pattern in two or three steps.
5. Install the other parts in the reverse order of removal.

BACK

Protected by AR

REAR

1. Remove the intermediate shaft (see page 16-22).
2. Disconnect the rear air fuel ratio (A/F) sensor connector and rear secondary heated oxygen sensor (secondary HO2S) connector.
3. Remove the rear WU-TWC bracket, then remove the rear WU-TWC.



4. Install the rear WU-TWC, and tighten the nuts in a crisscross pattern in two or three steps.
5. Install the other parts in the reverse order of removal.

DTC Troubleshooting

DTC P0401: EGR Insufficient Flow

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Go to step 5.

   NO—Go to step 7.
5. Test-drive under these conditions:

   - Engine coolant temperature above 158 °F (70 °C)
   - Transmission in 4th gear (A/T in D position)
   - Vehicle speed at 25 mph (40 km/h) or more, and engine speed between 1,100 rpm and 3,000 rpm
   - During the drive, decelerate (with the throttle fully closed) for 5 seconds
6. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Remove the intake manifold cover (see page 9-2), and clean the intake manifold, and EGR ports with throttle plate and induction cleaner, then go to step 9.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 5 and recheck.
7. Turn the ignition switch OFF.
8. Replace the EGR valve (see page 11-368).
9. Turn the ignition switch ON (II).
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see page 11-302).
12. Test-drive under these conditions:

    - Engine coolant temperature above 158 °F (70 °C)
    - Transmission in 4th gear (A/T in D position)
    - Vehicle speed at 25 mph (40 km/h) or more, and engine speed between 1,100 rpm and 3,000 rpm
    - During the drive, decelerate (with the throttle fully closed) for 5 seconds
13. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated OK?

    YES—If DTC P0401 is indicated, check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the connections are OK, go to step 15. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 14.
14. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 12 and recheck.

DTC Troubleshooting (cont'd)

15. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

16. Test-drive under these conditions:

    - Engine coolant temperature above 158 °F (70 °C)
    - Transmission in 4th gear (A/T in D position)
    - Vehicle speed at 25 mph (40 km/h) or more, and engine speed between 1,100 rpm and 3,000 rpm
    - During the drive, decelerate (with the throttle fully closed) for 5 seconds

17. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0401 is indicated, check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC P0404: EGR Control Circuit Range/ Performance Problem

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).

2. Clear the DTC with the HDS.

3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Intermittent failure, system is OK at this time. Clean any carbon build-up on the EGR valve with throttle plate and induction cleaner.■

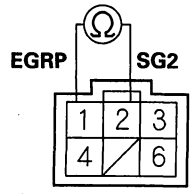
   NO—Go to step 5.

5. Turn the ignition switch OFF.

6. Disconnect the EGR valve 6P connector.

7. At the sensor side, measure resistance between EGR valve 6P connector terminals No. 1 and No. 2.

EGR VALVE 6P CONNECTOR



Terminal side of male terminals

Is there 100 kΩ or more?

YES—Go to step 26.

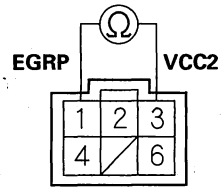
NO—Go to step 8.

BACK

Protected by AR

8. Measure resistance between EGR valve 6P connector terminals No. 1 and No. 3.

EGR VALVE 6P CONNECTOR



Terminal side of male terminals

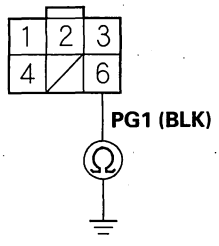
Is there 100 kΩ or more?

YES—Go to step 26.

NO—Go to step 9.

9. Check for continuity between EGR valve 6P connector terminal No. 6 and body ground.

EGR VALVE 6P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 10.

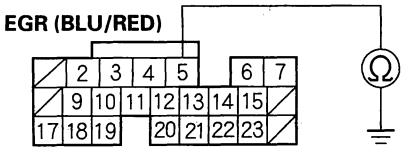
NO—Repair open in the wire between the EGR valve and G101, then go to step 27.

10. Jump the SCS line with the HDS.

11. Disconnect ECM/PCM connector B (24P).

12. Check for continuity between ECM/PCM connector terminal B5 and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (B5) and the EGR valve, then go to step 27.

NO—Go to step 13.

13. Connect EGR valve 6P connector terminal No. 4 to body ground with a jumper wire.

EGR VALVE 6P CONNECTOR

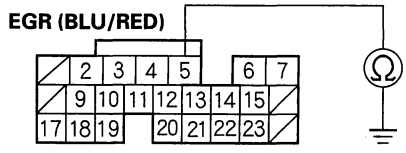
DTC Troubleshooting (cont'd)

14. Check for continuity between ECM/PCM connector terminal B5 and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 15.

NO—Repair open in the wire between the ECM/PCM (B5) and the EGR valve, then go to step 27.

15. Remove the EGR valve (see page 11-368).
16. Clean the intake manifold EGR port with throttle plate and induction cleaner. Also, clean the passage inside the EGR valve with throttle plate and induction cleaner.
17. Install the EGR valve (see page 11-368).
18. Reconnect the EGR valve 6P connector.
19. Reconnect ECM/PCM connector B (24P).
20. Turn the ignition switch ON (II).
21. Reset the ECM/PCM with the HDS.
22. Do the ECM/PCM idle learn procedure (see page 11-302).
23. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
24. Do the EGR TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES—Go to step 33.

NO—Go to step 25.

25. Turn the ignition switch OFF.
26. Replace the EGR valve (see page 11-368).
27. Reconnect all connectors.
28. Turn the ignition switch ON (II).
29. Reset the ECM/PCM with the HDS.
30. Do the ECM/PCM idle learn procedure (see page 11-302).
31. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
32. Do the EGR TEST in the INSPECTION MENU with the HDS.
33. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0404 is indicated, check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the connections and terminals are OK, go to step 35. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 34.

BACK

Protected by AR

34. Monitor the OBD STATUS for DTC P0404 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 31 and recheck.

35. Update the ECM/PCM if it does not have the latest software, or substitute a know-good ECM/PCM (see page 11-6).

36. Do the EGR TEST in the INSPECTION MENU with the HDS.

37. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0404 is indicated, check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0406: EGR Valve Position Sensor Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).

2. Check the EGR VLS in the DATA LIST with the HDS.

   Is 4.88 V or higher indicated?

   YES—Go to step 3.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. ■

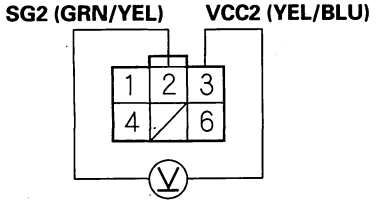
3. Turn the ignition switch OFF.

4. Disconnect the EGR valve 6P connector.

5. Turn the ignition switch ON (II).

6. Measure voltage between EGR valve 6P connector terminals No. 2 and No. 3.

EGR VALVE 6P CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Go to step 8.

NO—Go to step 7.

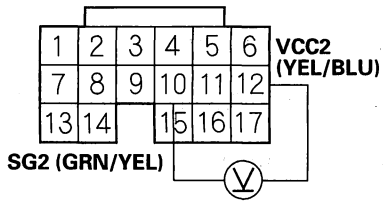
Protected by AR

DTC Troubleshooting (cont'd)

7. Measure voltage between ECM/PCM connector terminals D12 and D10.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the EGR valve and the ECM/PCM (D10) , then go to step 10.

NO—Go to step 14.

8. Turn the ignition switch OFF.
9. Replace the EGR valve (see page 11-368).
10. Turn the ignition switch ON (II).
11. Reset the ECM/PCM with the HDS.
12. Do the ECM/PCM idle learn procedure (see page 11-302).
13. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0406 is indicated, check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Troubleshooting is complete. ■

14. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).
15. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0406 is indicated, check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P2413: EGR System Malfunction

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. ■

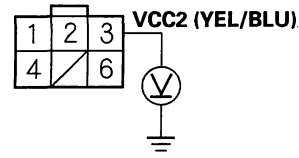
   NO—Go to step 5.
5. Turn the ignition switch OFF.
6. Turn the ignition switch ON (II).
7. Check the EGR VLS in the DATA LIST with the HDS.

   Is about 0 V indicated?

   YES—Go to step 8.

   NO—Go to step 19.
8. Turn the ignition switch OFF.
9. Disconnect the EGR valve 6P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between EGR valve 6P connector terminal No. 3 and body ground.

EGR VALVE 6P CONNECTOR



Wire side of female terminals

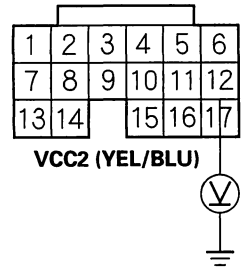
Is there about 5 V?

YES—Go to step 13.

NO—Go to step 12.

12. Measure voltage between ECM/PCM connector terminal D12 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the EGR valve and the ECM/PCM (D12), then go to step 44.

NO—Go to step 51.

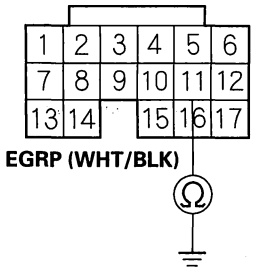
DTC Troubleshooting (cont'd)

13. Turn the ignition switch OFF.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector D (17P).
16. Check for continuity between ECM/PCM connector terminal D11 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

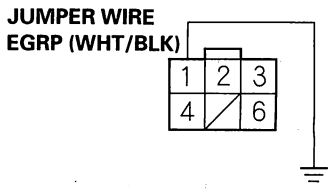
Is there continuity?

YES—Repair short in the wire between the ECM/PCM (D11) and the EGR valve, then go to step 44.

NO—Go to step 17.

17. Connect EGR valve 6P connector terminal No. 1 to body ground with a jumper wire.

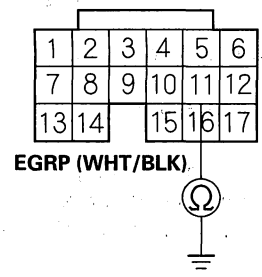
EGR VALVE 6P CONNECTOR



Wire side of female terminals

18. Check for continuity between ECM/PCM connector terminal D11 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

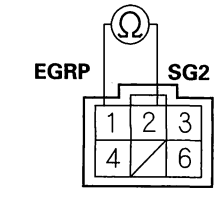
Is there continuity?

YES—Go to step 19.

NO—Repair open in the wire between the ECM/PCM (D11) and the EGR valve, then go to step 44.

19. Turn the ignition switch OFF.
20. If not already done, disconnect the EGR valve 6P connector.
21. At the sensor side, measure resistance between EGR valve 6P connector terminals No. 1 and No. 2.

EGR VALVE 6P CONNECTOR



Terminal side of male terminals

Is there continuity or resistance of 100 kΩ or more?

YES—Go to step 43.

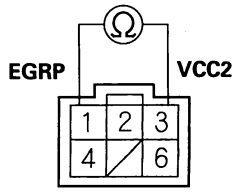
NO—Go to step 22.

BACK

Protected by AR

22. Measure resistance between EGR valve 6P connector terminals No. 1 and No. 3.

EGR VALVE 6P CONNECTOR



Terminal side of male terminals

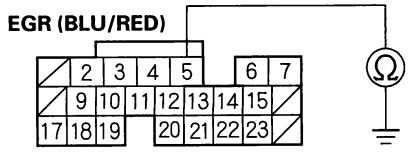
Is there 100 kΩ or more?

YES—Go to step 43.

NO—Go to step 23.

23. If not already done, jump the SCS line with the HDS.
24. If not already done, disconnect ECM/PCM connector B (24P).
25. Check for continuity between ECM/PCM connector terminal B5 and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

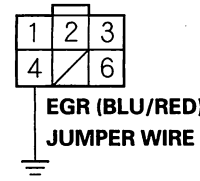
Is there continuity?

YES—Repair short in the wire between the ECM/PCM (B5) and the EGR valve, then go to step 44.

NO—Go to step 26.

26. Connect EGR valve 6P connector terminal No. 4 to body ground with a jumper wire.

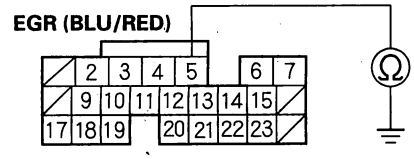
EGR VALVE 6P CONNECTOR



Wire side of female terminals

27. Check for continuity between ECM/PCM connector terminal B5 and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

Is there continuity?

YES—Go to step 28.

NO—Repair open in the wire between the ECM/PCM (B5) and the EGR valve, then go to step 44.

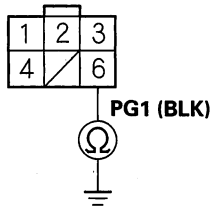
DTC Troubleshooting (cont'd)

28. Remove the jumper wire from the EGR valve 6P connector.

29. Check for continuity between EGR valve 6P connector terminal No. 6 and body ground.

EGR VALVE 6P CONNECTOR



Wire side of female terminals

Is there continuity?

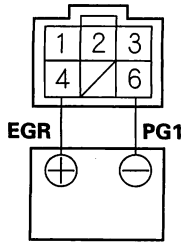
YES—Go to step 30.

NO—Repair open in the wire between the EGR valve and G101, then go to step 44.

30. Reconnect ECM/PCM connector B (24P).

31. Connect the battery positive terminal to EGR valve 6P connector terminal No. 4 with a jumper wire.

EGR VALVE 6P CONNECTOR



Terminal side of male terminals

32. Start the engine and let it idle, then connect the battery negative terminal to EGR valve 6P connector terminal No. 6 with a jumper wire.

Does the engine stall or run rough?

YES—Go to step 51.

NO—Go to step 33.

33. Turn the ignition switch OFF.

34. Remove the EGR valve (see page 11-368).

35. Clean the intake manifold EGR port with throttle plate and induction cleaner. Also, clean the passage inside the EGR valve with throttle plate and induction cleaner.

36. Install the EGR valve (see page 11-368).

37. Reconnect the EGR valve 6P connector.

38. Turn the ignition switch ON (II).

39. Reset the ECM/PCM with the HDS.

40. Do the ECM/PCM idle learn procedure (see page 11-302).

41. Do the EGR TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES—Go to step 49.

NO—Go to step 42.

BACK

Protected by AR

42. Turn the ignition switch OFF.

43. Replace the EGR valve (see page 11-368).

44. Reconnect all connectors.

45. Turn the ignition switch ON (II).

46. Reset the ECM/PCM with the HDS.

47. Do the ECM/PCM idle learn procedure (see page 11-302).

48. Do the EGR TEST in the INSPECTION MENU with the HDS.

49. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P2413 is indicated, check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 50.

50. Monitor the OBD STATUS for DTC P2413 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 48 and recheck.

51. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

52. Do the EGR TEST in the INSPECTION MENU with the HDS.

53. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

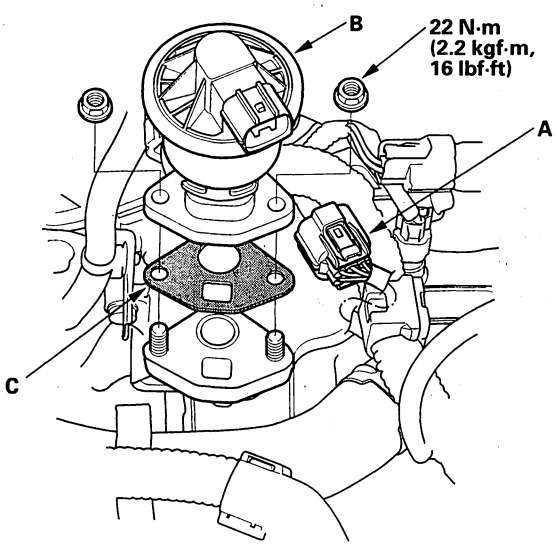
    YES—If DTC P2413 is indicated, check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

Protected by AR

EGR Valve Replacement

1. Remove the ignition coil cover (see step 1 on page 4-20).
2. Disconnect the EGR valve 6P connector (A).



3. Remove the EGR valve (B).
4. Install the valve in the reverse order of removal with a new gasket (C).
5. Install the ignition coil cover.

DTC Troubleshooting

DTC P2279: Intake Air System Leak

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P0443 is stored at the same time as DTC P2279, troubleshoot DTC P0443 first, then recheck for DTC P2279.

1. Check for vacuum leaks at these parts:

   - PCV valve
   - PCV hose
   - Purge (PCS) line
   - Throttle body
   - Intake manifold
   - Brake booster hose

   Are the parts OK?

   YES—Go to step 2.

   NO—Repair or replace the damaged parts, then go to step 4.

2. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 1 minute.

3. Monitor the OBD STATUS for DTC P2279 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Check the camshaft timing (see step 1 on page 6-14), then go to step 4.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. If the screen indicates NOT COMPLETED, go to step 2 and recheck.

4. Reset the ECM/PCM with the HDS.

5. Do the ECM/PCM idle learn procedure (see page 11-302).

6. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 1 minute.

7. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES—If DTC P2279 is indicated, check for vacuum leaks at the PCV valve, the PCV hose, the purge (PCS) line, the throttle body, the intake manifold, or the brake booster hose, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

   NO—Go to step 8.

8. Monitor the OBD STATUS for DTC P2279 in the DTCs MENU with the HDS.

   Does the screen indicate PASSED?

   YES—Troubleshooting is complete.■

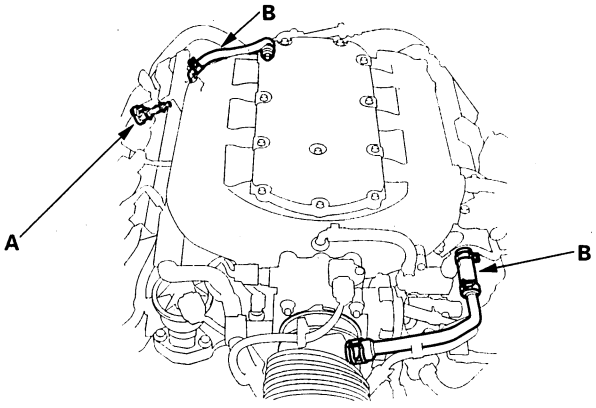
   NO—If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, go to step 6 and recheck.

Protected by AR

PCV System

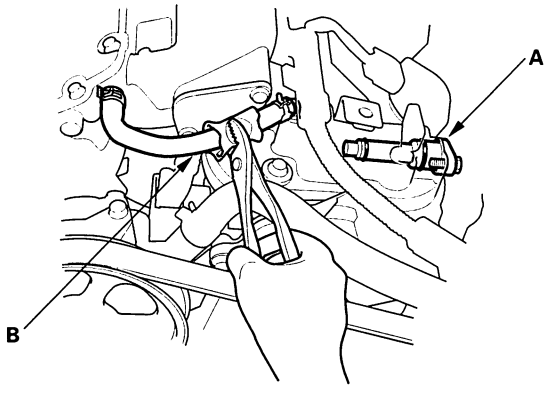
PCV Valve Inspection

1. Remove the ignition coil cover (see step 1 on page 4-20).
2. Check the PCV valve (A), hoses (B), and connections for leaks or restrictions.



3. At idle, listen to the PCV valve (A) with a stethoscope as you lightly pinch the PCV hose (B) with your fingers or pliers several times. Each time the hose is pinched, the valve should click.

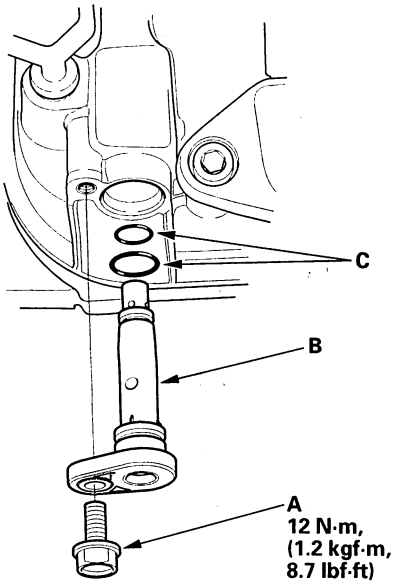
   If there is no clicking sound, check the PCV valve grommet for cracks or damage. If the grommet is OK, replace the PCV valve and recheck.



PCV Valve Replacement

1. Remove the ignition cover.
2. Disconnect the bolt (A).

   NOTE: Take care not to spill oil on the hot exhaust manifold.



3. Remove the PCV valve (B).
4. Install the valve in the reverse order of removal.

   NOTE:
   - When installing a new PCV valve, make sure the O-rings (C) are in place.
   - When installing a used PCV valve, use new O-rings.

DTC Troubleshooting

DTC P0442: EVAP System Small Leak Detected
(2003-2004 models)

DTC P0455: EVAP System Large Leak Detected
(2005-2006 models)

DTC P0456: EVAP System Very Small Leak Detected

NOTICE

The fuel system is designed to allow specified maximum vacuum and pressure conditions. Do not deviate from the vacuum and pressure tests as indicated in these procedures. Excessive pressure/vacuum would damage the EVAP components or cause eventual fuel tank failure.

Special Tools Required

- Vacuum/pressure gauge, 0—4 in.Hg, 07JAZ-001000B
- Vacuum pump/gauge, 0—30 in.Hg, Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- Fresh fuel has a higher volatility that will create greater pressure/vacuum. The optimum condition for testing is less than a full tank of fresh fuel, If possible, to assist in leak detection, add 1 gallon of fresh fuel to the tank (as long as it will not fill the tank), just before starting these procedures.

1. Check the fuel fill cap (the cap must say "Tighten to click"). It should turn 1/4 turn after it's tight, then it clicks.

   Is the correct fuel fill cap installed and properly tightened?

   YES—Go to step 2.

   NO—Replace or tighten the cap, then go to step 22.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

   Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

   YES—Replace the fuel fill cap or the fuel fill pipe, then go to step 22.

   NO—Go to step 3.

3. Turn the ignition switch ON (II).

4. Clear the DTC with the HDS.

5. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM/PCM. ■

   NO—Go to step 6.

BACK

Protected by AR

6. Turn the ignition switch OFF.

7. Turn the ignition switch ON (II).

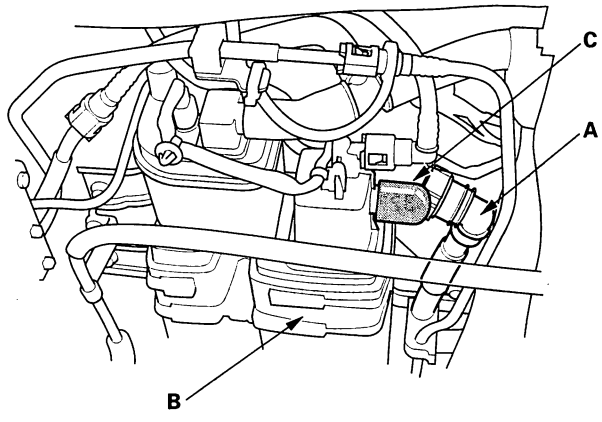
8. Check for a poor connection or damage at the fuel tank vapor recirculation tube.

   Is the tube OK?

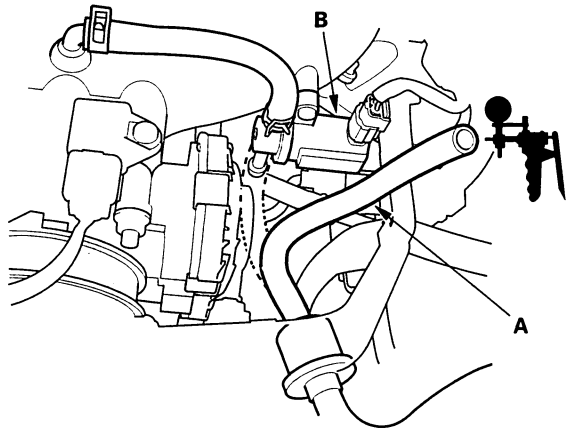
   YES—Go to step 9.

   NO—
   - Replace the fuel tank vapor recirculation tube, then go to step 22.
   - If necessary, replace the fuel tank (see page 11-328), then go to step 22.

9. Disconnect the fuel tank vapor recirculation tube (A) from the EVAP canister (B), and plug the EVAP canister port (C).



10. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0—30 in.Hg, to the hose.



11. Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

12. Apply vacuum to the hose until the FTP reads 1.90 V (0.59 in.Hg, −15.1 mmHg).

    NOTE: Be careful not to exceed the pressure. If you exceed the pressure, the FTP sensor can be damaged.

13. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the HDS.

    Does the voltage increase more than 0.2 V (0.1 in.Hg, 2.5 mmHg)?

    YES—Go to step 14.

    NO—Go to step 19.

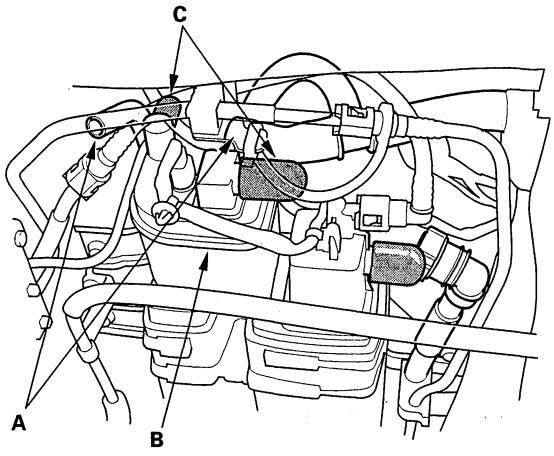
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

14. Do the EVAP CVS OFF in the INSPECTION MENU with the HDS.

15. Disconnect the fresh air hoses (A) from the EVAP canister vent shut valve (B), and plug the EVAP canister vent shut valve ports (C).



16. Apply vacuum to the hose (disconnected in step 10) until the FTP reads 1.90 V (−0.59 in.Hg, −15.1 mmHg).

    NOTE: Be careful not to exceed the pressure. If you exceed the pressure, the FTP sensor can be damaged.

17. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the the HDS.

    Does the voltage increase more than 0.2 V (0.1 in.Hg, 2.5 mmHg)?

    YES—Go to step 18.

    NO—Replace the EVAP canister vent shut valve (see page 11-404), then go to step 21.

18. Check for a loose or damaged EVAP canister purge line between the EVAP canister and the EVAP canister purge valve.

    Is the line OK?

    YES—Replace the following parts, then go to step 21.

    - FTP sensor O-ring
    - EVAP canister vent shut valve case and O-ring
    - EVAP canister

    NO—Reconnect or repair the EVAP canister purge hose, then go to step 21.

19. Do the EVAP CVS OFF in the INSPECTION MENU with the HDS.

20. Check these parts for looseness or damage.

    - Fuel fill pipe
    - Fuel vapor return pipe

    Are the parts OK?

    YES—Check the fuel tank unit base gasket (see page 11-327), and check the fuel tank, then go to step 21.

    NO—Repair or replace the damaged parts, then go to step 21.

21. Reconnect all hoses and connectors.

22. Turn the ignition switch ON (II).

23. Reset the ECM/PCM with the HDS.

24. Do the ECM/PCM idle learn procedure (see page 11-302).

25. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES—Troubleshooting is complete.■

    NO—Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM/PCM, then go to step 1.

DTC P0443: EVAP Canister Purge Valve Circuit Malfunction

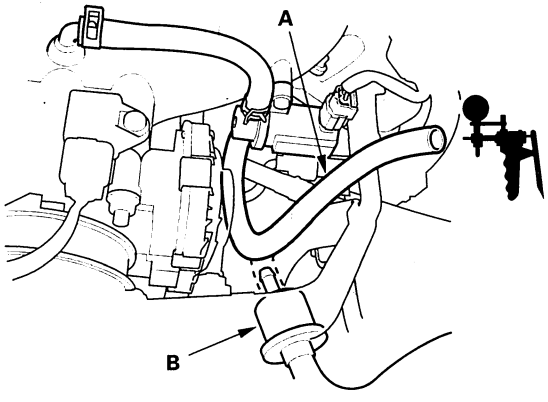
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0443 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM. ■
5. Turn the ignition switch OFF, and allow the engine to cool below 140 °F (60 °C).
6. Disconnect the vacuum hose (A) from the EVAP canister purge joint (B) in the engine compartment, and connect a vacuum pump/gauge, 0—30 in.Hg, to the hose.



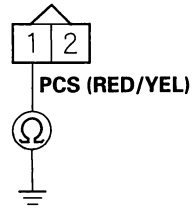
7. Start the engine, and let it idle.

   Is there vacuum?

   YES—Go to step 8.

   NO—Go to step 14.
8. Turn the ignition switch OFF.
9. Disconnect the EVAP canister purge valve 2P connector.
10. Check for continuity between EVAP canister purge valve 2P connector No. 1 and body ground.

EVAP CANISTER PURGE VALVE 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 11.

NO—Go to step 24.

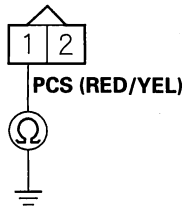
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector B (24P).
13. Check for continuity between EVAP canister purge valve 2P connector terminal No. 1 and body ground.

EVAP CANISTER PURGE VALVE 2P CONNECTOR



Wire side of female terminals

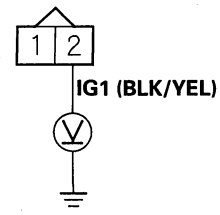
Is there continuity?

YES—Repair short in the wire between the EVAP canister purge valve and the ECM/PCM (B2), then go to step 25.

NO—Go to step 31.

14. Turn the ignition switch OFF.
15. Disconnect the EVAP canister purge valve 2P connector.
16. Turn the ignition switch ON (II).
17. Measure voltage between EVAP canister purge valve 2P connector terminal No. 2 and body ground.

EVAP CANISTER PURGE VALVE 2P CONNECTOR



Wire side of female terminals

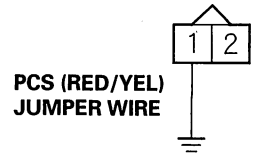
Is there battery voltage?

YES—Go to step 18.

NO—Repair open in the wire between the EVAP canister purge valve and the No. 18 ACG (15 A) fuse in the under-dash fuse/relay box, then go to step 25.

18. Turn the ignition switch OFF.
19. Jump the SCS line with the HDS.
20. Disconnect ECM/PCM connector B (24P).
21. Connect EVAP canister purge valve 2P connector terminal No. 1 to body ground with a jumper wire.

EVAP CANISTER PURGE VALVE 2P CONNECTOR



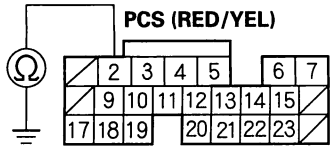
Wire side of female terminals

BACK

Protected by AR

22. Check for continuity between ECM/PCM connector terminal B2 and body ground.

ECM/PCM CONNECTOR B (24P)



Wire side of female terminals

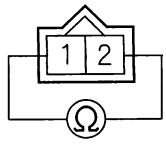
Is there continuity?

YES—Go to step 23.

NO—Repair open in the wire between the EVAP canister purge valve and the ECM/PCM (B2), then go to step 25.

23. Measure resistance between EVAP canister purge valve 2P connector terminals No. 1 and No. 2.

EVAP CANISTER PURGE VALVE 2P CONNECTOR



Terminal side of male terminals

Is there about 33 Ω at room temperature?

YES—Go to step 31.

NO—Go to step 24.

24. Replace the EVAP canister purge valve (see page 11-403).

25. Reconnect all connectors.

26. Turn the ignition switch ON (II).

27. Reset the ECM/PCM with the HDS.

28. Do the ECM/PCM idle learn procedure (see page 11-302).

29. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0443 is indicated, check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—2003 model: Troubleshooting is complete.■ 2004-2006 models: Go to step 30.

30. Monitor the OBD STATUS for DTC P0443 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete.■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 28 and recheck.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

31. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

32. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0443 is indicated, check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

DTC P0451: FTP Sensor Range/Performance Problem

NOTE:
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).
- If DTC P2422 is stored at the same time as DTC P0451, troubleshoot DTC P2422 first, then recheck for DTC P0451.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 1 minute.
4. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 5.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 3 and recheck.
5. Turn the ignition switch OFF.
6. Replace the FTP sensor (see page 11-403).
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see page 11-302).
10. Start the engine, and let it idle for 1 minute.
11. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0451 is indicated, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 12.
12. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 10 and recheck.

DTC Troubleshooting (cont'd)

DTC P0452: FTP Sensor Circuit Low Voltage (2003-2004 models)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II).
5. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0107, P0112, P0117, P2122, P2127, P2228, P0452, P2627, and P2630 indicated at the same time?

   YES—Go to step 23.

   NO—Go to step 6.
6. Turn the ignition switch OFF.
7. Remove the fuel fill cap.
8. Turn the ignition switch ON (II).
9. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is about −7.3 kPa (−2.16 in.Hg, −55 mmHg), or 0.3 V or less indicated?

   YES—Go to step 13.

   NO—Go to step 10.
10. Install the fuel fill cap.
11. Start the engine.
12. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

    Does the screen indicate FAILED?

    YES—Go to step 13.

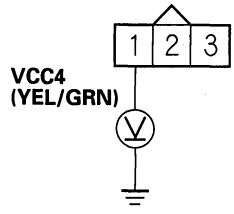
    NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 6 and recheck.
13. Turn the ignition switch OFF.
14. Disconnect the FTP sensor 3P connector.
15. Turn the ignition switch ON (II).
16. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is about 7.3 kPa (2.15 in.Hg, 54.7 mmHg), or 4.90 V indicated?

    YES—Go to step 32.

    NO—Go to step 17.
17. Measure voltage between FTP sensor 3P connector terminal No. 1 and body ground.

FTP SENSOR 3P CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Go to step 19.

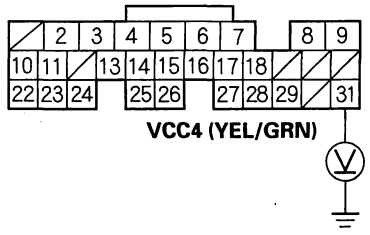
NO—Go to step 18.

BACK

Protected by AR

18. Measure voltage between ECM/PCM connector terminal A31 and body ground.

ECM/PCM CONECTOR A (31P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between the ECM/PCM (A31) and the FTP sensor, then go to step 34.

NO—Go to step 40.

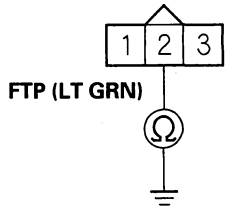
19. Turn the ignition switch OFF.

20. Jump the SCS line with the HDS.

21. Disconnect ECM/PCM connector A (31P).

22. Check for continuity between FTP sensor 3P connector terminal No. 2 and body ground.

FTP SENSOR 3P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A29) and the FTP sensor, then go to step 34.

NO—Go to step 40.

23. Turn the ignition switch OFF.

24. Jump the SCS line with the HDS.

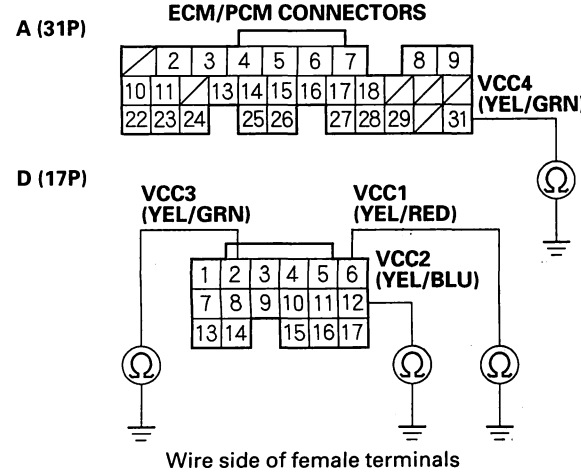
25. Disconnect ECM/PCM connectors A (31P) and D (17P).

26. Disconnect the connectors from these parts:

- MAP sensor
- APP sensor
- IMT (IMRC) actuator
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

27. Check for continuity between body ground and ECM/PCM connector terminals A31, D2, D6, and D12 individually.

ECM/PCM CONNECTORS



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM (A31, D2, D6, or D12) and each part, then go to step 34.

NO—Go to step 28.

(cont'd)

Protected by AR

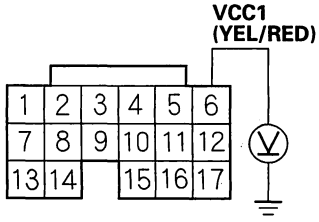
DTC Troubleshooting (cont'd)

28. Reconnect ECM/PCM connectors A (31P) and D (17P).

29. Turn the ignition switch ON (II).

30. Measure voltage between ECM/PCM connector terminal D6 and body ground.

ECM/PCM CONNECTOR D (17P)



Wire side of female terminals

Is there about 5 V?

YES—Go to step 31.

NO—Go to step 40.

31. Continue to monitor voltage at ECM/PCM connector terminal D6 while reconnecting these parts, one at a time:

- MAP sensor
- APP sensor
- IMT (IMRC) actuator
- EGR valve
- FTP sensor
- Input shaft (mainshaft) speed sensor
- Output shaft (countershaft) speed sensor

Did the voltage drop to about 0 V?

YES—Replace the part that caused the voltage to drop, then go to step 34.

NO—Go to step 40.

32. Turn the ignition OFF.

33. Replace the FTP sensor (see page 11-403).

34. Reconnect all connectors.

35. Turn the ignition switch ON (II).

36. Reset the ECM/PCM with the HDS.

37. Do the ECM/PCM idle learn procedure (see page 11-302).

38. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0452 is indicated, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—Go to step 39.

39. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES—Troubleshooting is complete.■

NO—If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 37 and recheck.

40. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

41. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES—If DTC P0452 is indicated, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC Troubleshooting (cont'd)

DTC P0453: FTP Sensor Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Remove the fuel fill cap.
5. Turn the ignition switch ON (II).
6. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is about 7.3 kPa (2.16 in.Hg, 55 mmHg), or 4.7 V or more indicated?

   YES—Go to step 10.

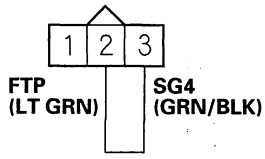
   NO—Go to step 7.
7. Install the fuel fill cap.
8. Start the engine.
9. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 10.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 6 and recheck.
10. Turn the ignition switch OFF.
11. Disconnect the FTP sensor 3P connector.
12. Connect FTP sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

FTP SENSOR 3P CONNECTOR



Wire side of female terminals

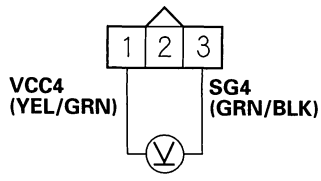
13. Turn the ignition switch ON (II).
14. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is about 7.3 kPa (2.16 in.Hg, 55 mmHg), or 4.7 V or more indicated?

    YES—Go to step 15.

    NO—Go to step 25.
15. Measure voltage between FTP sensor 3P connector terminals No. 1 and No. 3.

FTP SENSOR 3P CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Go to step 21.

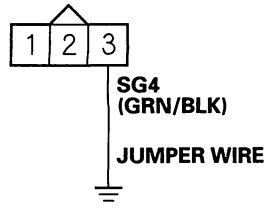
NO—Go to step 16.

BACK

Protected by AR

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector A (31P).
19. Connect FTP sensor 3P connector terminal No. 3 to body ground with a jumper wire.

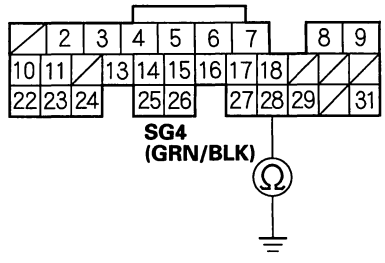
FTP SENSOR 3P CONNECTOR



Wire side of female terminals

20. Check for continuity between ECM/PCM connector terminals A28 and body ground.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

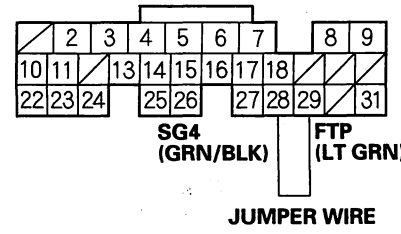
Is there continuity?

YES—Go to step 33.

NO—Repair open in the wire between the ECM/PCM (A28) and the FTP sensor, then go to step 27.

21. Turn the ignition switch OFF.
22. Connect ECM/PCM connector terminals A28 and A29 with a jumper wire.

ECM/PCM CONNECTOR A (31P)



Wire side of female terminals

23. Turn the ignition switch ON (II).
24. Check the FTP SENSOR in the DATA LIST with the HDS.

Is about 7.3 kPa (2.16 in.Hg, 55 mmHg), or 4.7 V or more indicated?

YES—Go to step 33.

NO—Repair open in the wire between the ECM/PCM (A29) and the FTP sensor, then go to step 27.

25. Turn the ignition switch OFF.
26. Replace the FTP sensor (see page 11-403).
27. Reconnect all connectors.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

28. Turn the ignition switch ON (II).

29. Reset the ECM/PCM with the HDS.

30. Do the ECM/PCM idle learn procedure (see page 11-302).

31. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0453 is indicated, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 32.

32. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 30 and recheck.

33. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

34. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0453 is indicated, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224).■

DTC P0457: EVAP System Leak Detected Fuel Fill Cap Loose or Missing

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Check the fuel fill cap (the cap must say "Tighten to click"). If should turn 1/4 turn after it's tight, then it clicks.

   Is the correct fuel fill cap installed and properly tightened?

   YES—Go to step 2.

   NO—Replace or tighten the cap, then go to step 19.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

   Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

   YES—Replace the fuel fill cap or the fuel fill pipe, then go to step 19.

   NO—Go to step 3.

3. Turn the ignition switch ON (II).

4. Clear the DTC with the HDS.

5. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, or the EVAP canister vent shut valve and the ECM/PCM. ■

   NO—Go to step 6.

6. Turn the ignition switch OFF.

7. Remove the EVAP canister vent shut valve from the EVAP canister (see page 11-404).

8. Connect the 2P connector to the EVAP canister vent shut valve.

9. Turn the ignition switch ON (II).

10. Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

11. Check the EVAP canister vent shut valve (A) operation.

   Does the valve operate?

   YES—Check the routing of the EVAP canister vent tube, then go to step 18.

   NO—Go to step 12.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

12. Turn the ignition switch OFF.
13. Replace the EVAP canister vent shut valve (see page 11-404).
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see page 11-302).
17. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES—Troubleshooting is complete.■

    NO—Check for poor connections or loose terminals at the FTP sensor, or the EVAP canister vent shut valve and the ECM/PCM, then go to step 1.
18. Reinstall the EVAP canister vent shut valve.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see page 11-302).
22. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES—Troubleshooting is complete.■

    NO—Check for poor connections or loose terminals at the FTP sensor, or the EVAP canister vent shut valve and the ECM/PCM, then go to step 1.

DTC P0496: EVAP System High Purge Flow

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM/PCM. ■

   NO—Go to step 4.
4. Turn the ignition switch OFF.
5. Replace the EVAP canister purge valve (see page 11-403).
6. Turn the ignition switch ON (II).
7. Reset the ECM/PCM with the HDS.
8. Do the ECM/PCM idle learn procedure (see page 11-302).
9. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Troubleshooting is complete. ■

   NO—Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM/PCM, then go to step 1.

DTC Troubleshooting (cont'd)

DTC P0497: EVAP System Low Purge Flow

Special Tools Required
- Vacuum/pressure gauge, 0—4 in.Hg, 07JAZ-001000B
- Vacuum pump/gauge, 0—30 in.Hg, Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Check the fuel fill cap installation.

   Is the fuel fill cap installed and properly tightened?

   YES—Go to step 2.

   NO—Properly install the fuel fill cap (the cap must say "Tighten to click"). If should turn 1/4 turn after it's tight, then go to step 23.

2. Turn the ignition switch ON (II).

3. Clear the DTC with the HDS.

4. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM/PCM. ■

   NO—Go to step 5.

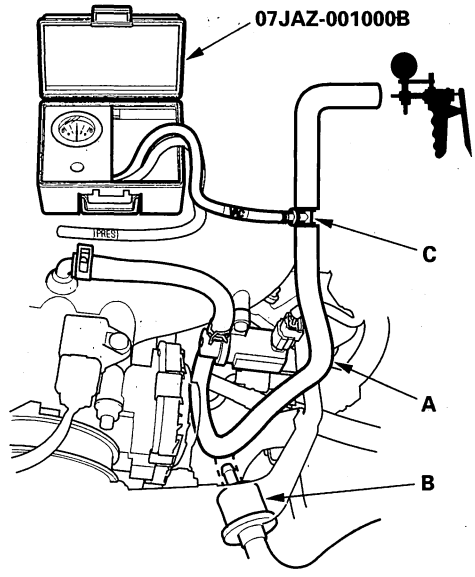
5. Check for a loose or damaged EVAP canister purge line between the intake manifold and the EVAP canister purge valve.

   Is the line OK?

   YES—Go to step 6.

   NO—Reconnect or repair the EVAP canister purge line, then go to step 23.

6. Disconnect the vacuum hose (A) from the EVAP canister purge valve joint (B) in the engine compartment, and connect a T-fitting (C) from the vacuum gauge and the vacuum pump/gauge, 0—30 in.Hg, to the vacuum hose (A) as shown.



7. Do the EVAP PCS ON in the INSPECTION MENU with the HDS.

8. Slowly apply about 0.6 in.Hg (15 mmHg) of vacuum to the hose.

   Does it hold vacuum?

   YES—Check for blockage in the PCS line between the intake manifold and the EVAP canister purge valve, and the line between the EVAP canister purge valve and the EVAP canister purge joint. If the vacuum hoses are OK, replace the EVAP canister purge valve, then go to step 22.

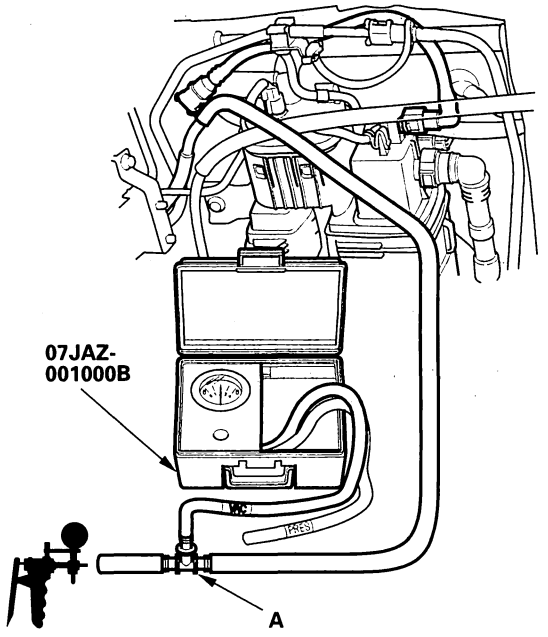
   NO—Go to step 9.

9. Reconnect the vacuum hose to the EVAP canister purge joint.

BACK

Protected by AR

10. Disconnect the vacuum hose from the EVAP canister purge line (EVAP canister side), and connect a T-fitting (A) from the vacuum gauge and the vacuum pump/gauge, 0—30 in.Hg, to the hose as shown.



11. Do the EVAP PCS ON in the INSPECTION MENU with the HDS.

12. Slowly apply about 2 kPa (0.6 in.Hg, 15 mmHg) of vacuum to the hose.

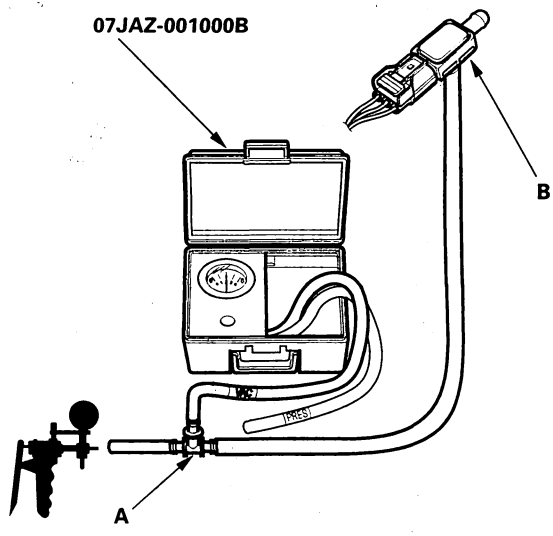
    Does it hold vacuum?

    YES—Check for a restricted EVAP canister purge line between the EVAP canister purge valve and the EVAP canister, then go to step 22.

    NO—Go to step 13.

13. Remove the FTP sensor with its connector connected (see page 11-403).

14. Connect a T-fitting (A) from the vacuum gauge and a commercially available vacuum pump/gauge, 0—30 in.Hg, to the FTP sensor (B) as shown.



15. Check and record the FTP SENSOR reading in the DATA LIST with the HDS.

16. Slowly apply about 1.3 kPa (0.4 in.Hg, 10 mmHg) of vacuum to the hose.

17. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is the difference more than 1.1 kPa (0.31 in.Hg, 8 mmHg) before and after applying vacuum?

    YES—Go to step 18.

    NO—Replace the FTP sensor (see page 11-403), then go to step 22.

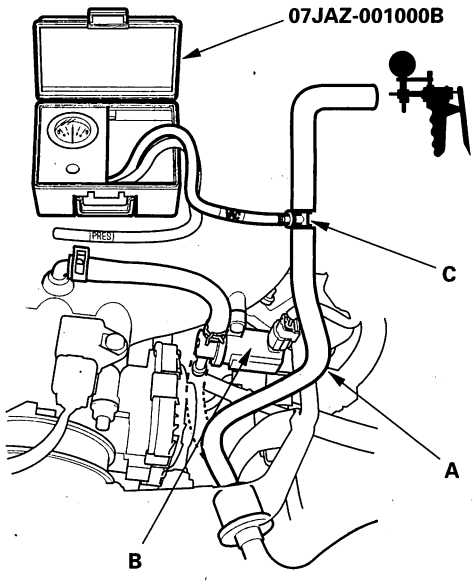
18. Reconnect the vacuum hoses to the EVAP canister purge line (EVAP canister side), and reinstall the FTP sensor.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

19. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B), and connect a T-fitting (C) from the vacuum gauge and the vacuum pump/gauge, 0—30 in.Hg, to the hose as shown.



20. Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

21. Slowly apply about 2 kPa (0.6 in.Hg, 15 mmHg) of vacuum to the hose.

    Does the hose hold vacuum?

    YES—Check for blockage on the EVAP canister purge joint, then go to step 22.

    NO—Replace the EVAP canister vent shut valve (see page 11-404), then go to step 22.

22. Reconnect all hoses.

23. Turn the ignition switch ON (II).

24. Reset the ECM/PCM with the HDS.

25. Do the ECM/PCM idle learn procedure (see page 11-302).

26. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES—Troubleshooting is complete.■

    NO—Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM/PCM, then go to step 1.

DTC P0498: EVAP Canister Vent Shut Valve Control Circuit Low Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0498 indicated?

   YES—Go to step 6.

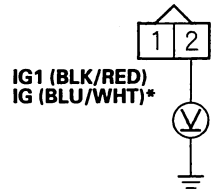
   NO—Go to step 4.
4. Do the EVAP CVS ON in the INSPECTION MENU with the HDS.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0498 indicated?

   YES—Go to step 6.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. ■
6. Turn the ignition switch OFF.
7. Disconnect the EVAP canister vent shut valve 2P connector.
8. Turn the ignition switch ON (II).
9. Measure voltage between EVAP canister vent shut valve 2P connector terminal No. 2 and body ground.

EVAP CANISTER VENT SHUT VALVE 2P CONNECTOR



Wire side of female terminals

*: 2005-2006 models

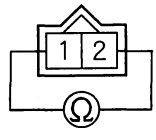
Is there battery voltage?

YES—Go to step 10.

NO—2003-2004 models: Repair open in the wire between the EVAP canister vent shut valve and the No. 18 ACG (15 A) fuse in the under-dash fuse/relay box, then go to step 19.
2005-2006 models: Repair open in the wire between the EVAP canister vent shut valve and the A/F sensor relay, then go to step 19.

10. Turn the ignition switch OFF.
11. Measure resistance between EVAP canister vent shut valve 2P connector terminals No. 1 and No. 2.

EVAP CANISTER VENT SHUT VALVE 2P CONNECTOR



Terminal side of male terminals

Is there about 25—30 Ω at room temperature?

YES—Go to step 12.

NO—Go to step 18.

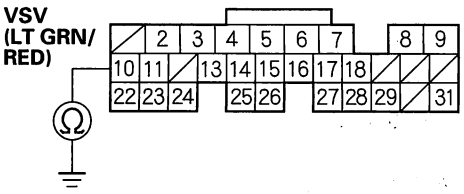
Protected by AR

DTC Troubleshooting (cont'd)

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector A (31P).
15. Check for continuity between ECM/PCM connector terminal A10 and body ground.

ECM/PCM CONECTOR A (31P)



Wire side of female terminals

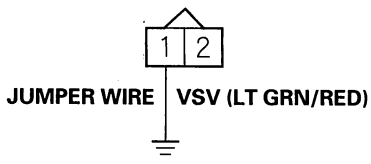
Is there continuity?

YES—Repair short in the wire between the EVAP canister vent shut valve and the ECM/PCM (A10), then go to step 19.

NO—Go to step 16.

16. Connect EVAP canister vent shut valve 2P connector terminal No. 1 to body ground with a jumper wire.

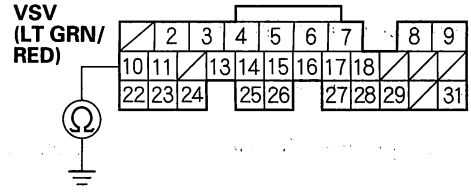
EVAP CANISTER VENT SHUT VALVE 2P CONNECTOR



Wire side of female terminals

17. Check for continuity between ECM/PCM connector terminal A10 and body ground.

ECM/PCM CONECTOR A (31P)



Wire side of female terminals

Is there continuity?

YES—Go to step 25.

NO—Repair open in the wire between the EVAP canister vent shut valve and the ECM/PCM (A10), then go to step 19.

18. Replace the EVAP canister vent shut valve (see page 11-404).
19. Reconnect all connectors.

BACK

Protected by AR

20. Turn the ignition switch ON (II).

21. Reset the ECM/PCM with the HDS.

22. Do the ECM/PCM idle learn procedure (see page 11-302).

23. Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

24. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0498 is indicated, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Troubleshooting is complete. ■

25. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6).

26. Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

27. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P0498 is indicated, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see page 11-224). ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC P0499: EVAP Canister Vent Shut Valve Control Circuit High Voltage

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the EVAP CVS ON in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0499 indicated?

   YES—Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM (see page 11-6), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see page 11-224). ■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. ■

BACK

Protected by AR

DTC P1454: FTP Sensor Range/Performance Problem

DTC P2422: EVAP Canister Vent Shut Valve Close Malfunction

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see page 11-3).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Remove the fuel fill cap, and wait 1 minute.
5. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is it between −0.67 kPa and 0.67 kPa (−0.2 and 0.2 in.Hg, −5 and 5 mmHg), or 2.4−2.6 V?

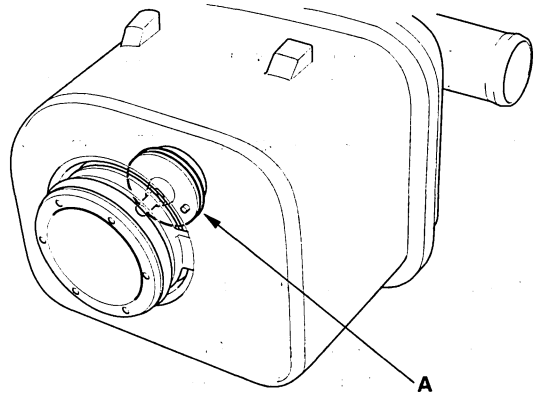
   YES—Go to step 6.

   NO—Go to step 17.
6. Install the fuel fill cap.
7. Clear the DTC with the HDS.
8. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park on neutral) until the radiator fan comes on, then let it idle.
9. Monitor the OBD STATUS for DTC P1454 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES—Go to step 10.

   NO—If the screen indicates PASSED, intermittent failure, system is OK at this time, check for a poor connections or loose terminals at the FTP sensor, or the EVAP canister vent shut valve and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 8 and recheck.
10. Clear the DTC with the HDS.
11. Turn the ignition switch OFF.
12. Remove the EVAP canister vent shut valve from the EVAP canister (see page 11-404).
13. Connect the 2P connector to the EVAP canister vent shut valve.
14. Turn the ignition switch ON (II).
15. Do the EVAP CVS ON in the INSPECTION MENU with the HDS.
16. Check the EVAP canister vent shut valve (A) operation.



Does the valve operate?

YES—Check for a blockage in the EVAP canister, canister filter, vent hoses, and drain joint, then install the EVAP canister vent shut valve, and go to step 23.

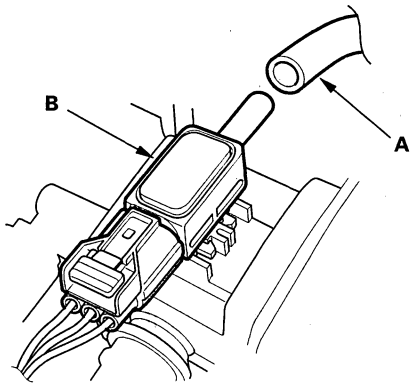
NO—Replace the EVAP canister vent shut valve (see page 11-404), then go to step 23.

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

17. Disconnect the air tube (A) from the FTP sensor (B).



18. Check the FTP SENSOR in the DATA LIST with the HDS.

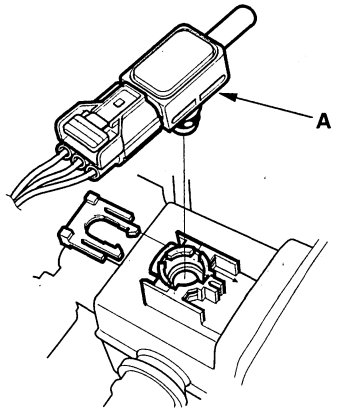
    Is it between −0.67 kPa and 0.67 kPa (−0.2 and 0.2 in.Hg, −5 and 5 mmHg), or 2.4−2.6 V?

    YES—Check for a blockage in the FTP sensor air tube, then go to step 23.

    NO—Go to step 19.

19. Turn the ignition switch OFF.

20. Remove the FTP sensor (A) from the EVAP canister with its connector connected (see page 11-403).



21. Turn the ignition switch ON (II).

22. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is it between −0.67 kPa and 0.67 kPa (−0.2 and 0.2 in.Hg, −5 and 5 mmHg), or 2.4−2.6 V?

    YES—Check for debris or clogging at the EVAP canister and the FTP sensor port, then go to step 23.

    NO—Replace the FTP sensor (see page 11-403), then go to step 23.

23. Turn the ignition switch ON (II).

24. Reset the ECM/PCM with the HDS.

25. Do the ECM/PCM idle learn procedure (see page 11-302).

26. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

27. Check for Temporary DTCs or DTCs with the HDS.

    Are any Temporary DTCs or DTCs indicated?

    YES—If DTC P1454 and/or P2422 is indicated, check for poor connections or loose terminals at the FTP sensor, or the EVAP canister vent shut valve and the ECM/PCM, then go to step 1. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO—Go to step 28.

BACK

Protected by AR

28. Monitor the OBD STATUS for DTC P1454 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor, or the EVAP canister vent shut valve and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 26 and recheck.

Clutch

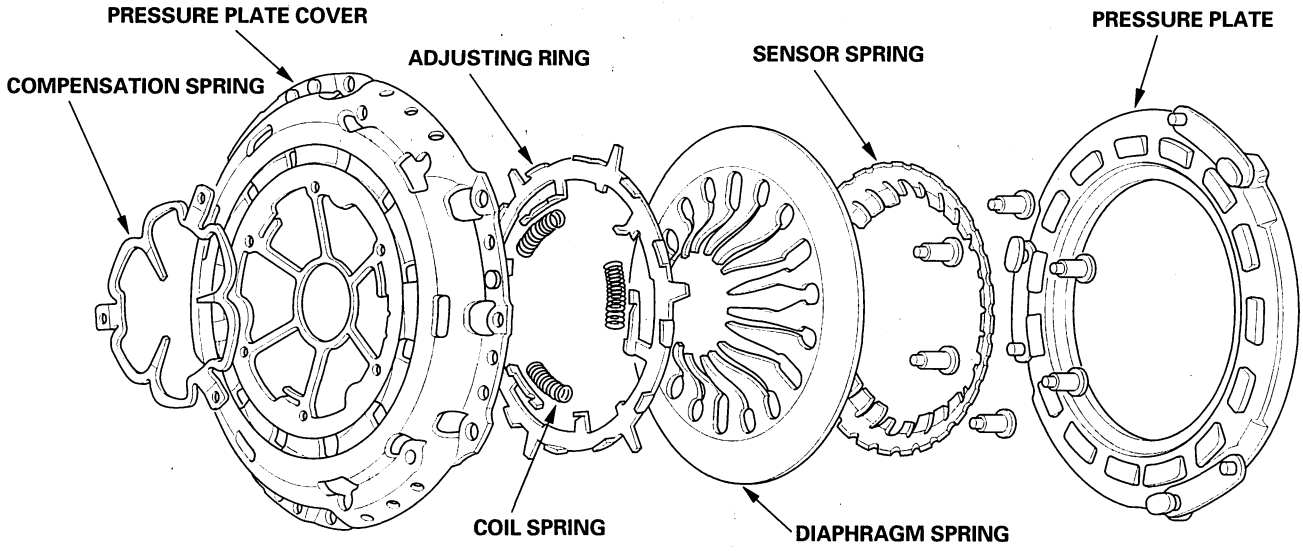
System Description

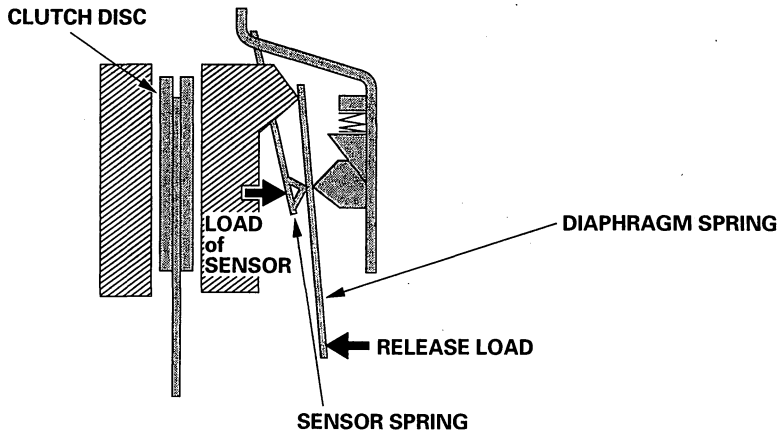
Self-Adjusting Clutch (SAC)

Function
On ordinary clutches, the clutch pedal load increases as the clutch disc wears. The self-adjusting clutch is designed so the clutch pedal load will not increase even when the clutch disc wears. This is done by automatically adjusting the fulcrum of the diaphragm spring in accordance with the wear of the clutch disc. The clutch pedal load stays consistant even when the clutch disc is worn.

Construction
The self-adjusting clutch consists of a pressure plate, a sensor spring, a diaphragm spring, an adjusting ring, three coil springs, a pressure plate cover, and a compensation spring. They are riveted together and must not be disassembled. If there is problem with any part of the pressure plate or clutch disc, they must be replaced as a set.



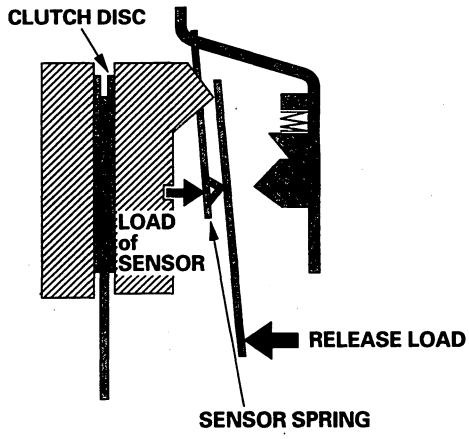
Operation
1. When the clutch disc wears slightly.
   As the clutch begins to wear, the release load increases slightly. However, this does not affect operation of the clutch because the release load does not exceed that of the sensor.



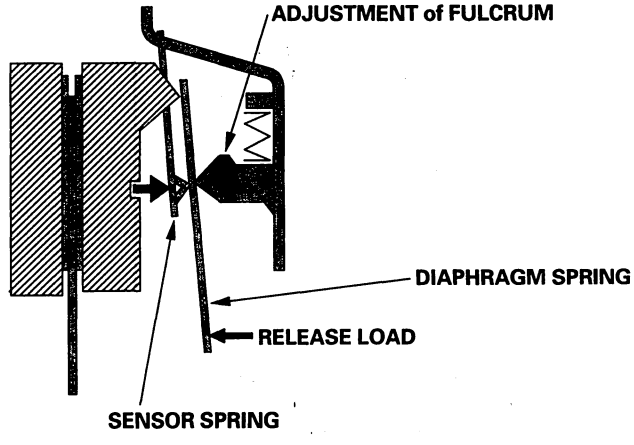
BACK

Protected by AR

2. When the clutch disc wears considerably.
   The sensor spring starts to deflect as the clutch disc is worn further and the release load exceeds that of the sensor.



The fulcrum then moves following the amount of sensor spring deflection. As this takes place, the fulcrum of the diaphragm spring is adjusted, keeping the release load consistent.

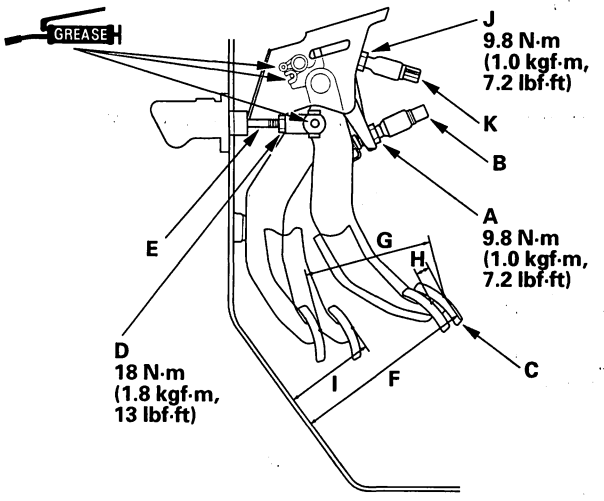


Protected by AR

Clutch Pedal, Clutch Pedal Position Switch, and Clutch Interlock Switch Adjustment

NOTE:
- Check the clutch pedal position switch (see page 4-51).
- Check the clutch interlock switch (see page 4-8).
- Remove the driver's floor mat before adjusting the clutch pedal.
- The clutch is self-adjusting to compensate for wear.
- If there is no clearance between the master cylinder piston and pushrod, the release bearing will be held against the diaphragm spring, which can result in clutch slippage or other clutch problems.

1. Loosen the clutch pedal position switch locknut (A), and back off the clutch pedal position switch (B) until it no longer touches the clutch pedal (C).



2. Loosen the clutch pushrod locknut (D), and turn the pushrod (E) in or out to get the specified height (F), stroke (G), free play (H), and disengagement height (I) at the clutch pedal.

Clutch Pedal Stroke:	**130—140 mm (5.12—5.51 in.)**
Clutch Pedal Free Play:	**10—18 mm (0.39—0.71 in.)**
Clutch Pedal Height:	**191 mm (7.52 in.)**
Clutch Pedal Disengagement Height:	**90.5 mm (3.56 in.)**

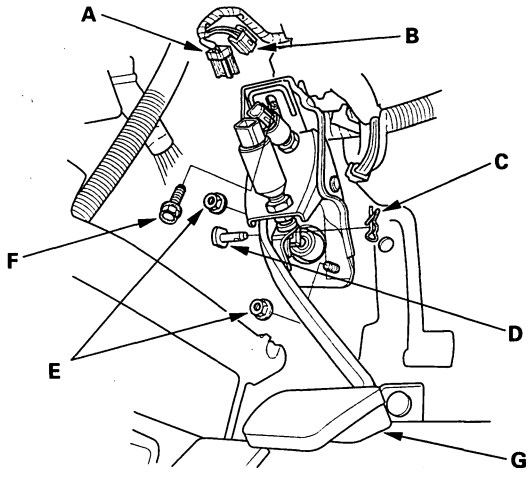
3. Tighten the clutch pushrod locknut.
4. With the clutch pedal released, turn in the clutch pedal position switch until it contacts the clutch pedal.
5. Turn in the clutch pedal position switch an additional 3/4 to 1 turn.
6. Tighten the clutch pedal position switch locknut.
7. Press the clutch pedal to the floor.
8. Release the clutch pedal 9—12 mm (0.35—0.47 in.) from the fully pressed position, and hold it there. Adjust the position of the clutch interlock switch (K) so the engine will start with the clutch pedal in this position.
9. Tighten the clutch interlock switch locknut (J).

BACK

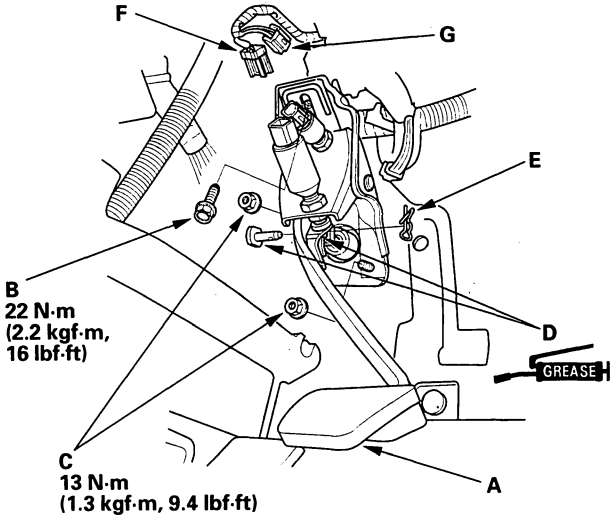
Protected by AR

Clutch Pedal Replacement

1. Disconnect the clutch pedal position switch connector (A) and clutch interlock switch connector (B).



2. Pry out the lock pin (C), and pull the pedal pin (D) out of the yoke.
3. Remove the master cylinder mounting nuts (E) and clutch pedal mounting bolt (F).
4. Remove the clutch pedal (G).
5. Install the clutch pedal (A).



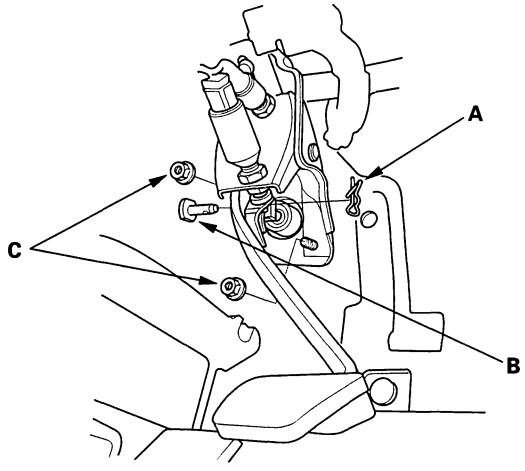
6. Install the clutch pedal mounting bolt (B) and master cylinder mounting nuts (C).
7. Apply grease to the pedal pin (D), and slide it into the yoke, then install a new lock pin (E).
8. Connect the clutch pedal position switch connector (F) and clutch interlock switch connector (G).
9. Adjust the clutch pedal, clutch pedal position switch, and clutch interlock switch (see page 12-6).

Protected by AR

Clutch Master Cylinder Replacement

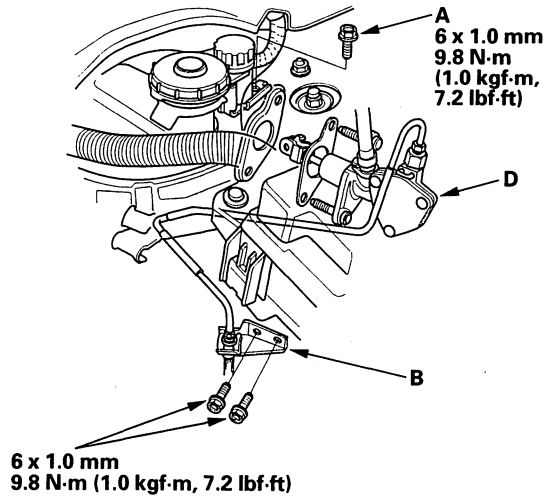
NOTE: Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.

1. Remove the brake fluid from the clutch master cylinder reservoir with a syringe.
2. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the customer's radio station and XM radio channel presets.
3. Disconnect the negative cable from the battery first, then disconnect the positive cable. Remove the battery.
4. Remove the air cleaner housing (see page 11-344).
5. Remove the battery base (see step 6 on page 13-12).
6. Pry out the lock pin (A), and pull the pedal pin (B) out of the yoke. Remove the master cylinder mounting nuts (C).

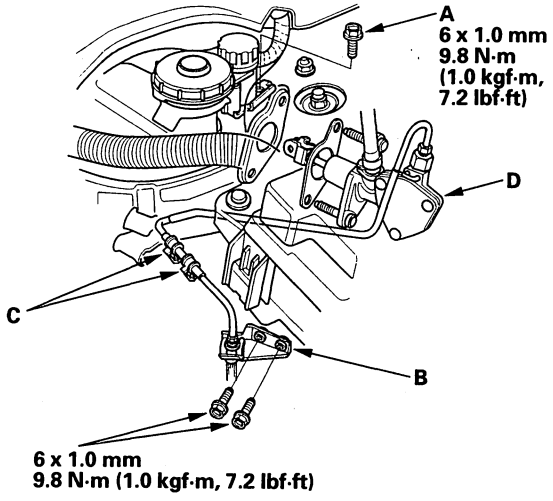


7. Remove the reservoir mounting bolt (A).

Type A:



Type B:

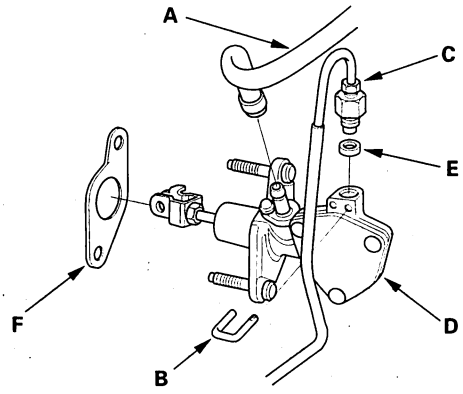


8. Remove the clutch line bracket (B).
9. Remove the clutch line clips (C).
10. Remove the clutch master cylinder (D).

BACK

Protected by AR

11. Disconnect the reservoir hose (A), then remove the retaining clip (B), and remove clutch line (C) from the clutch master cylinder (D). Plug the end of the reservoir hose and clutch line with a shop towel to prevent brake fluid from coming out.

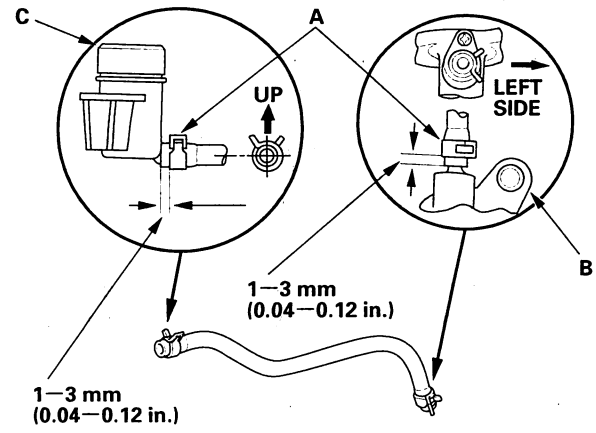


12. Remove the O-ring (E) and clutch master cylinder seal (F) from the clutch master cylinder.

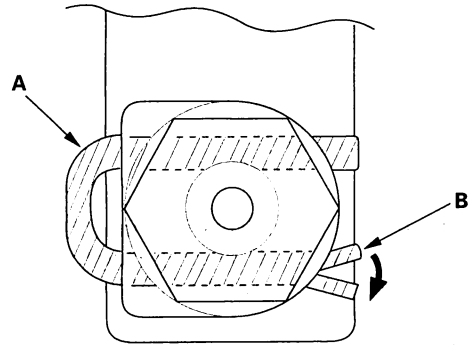
13. Install the clutch master cylinder in the reverse order of removal, and note these items.

- Apply brake assembly lube to the clutch line, and install a new O-ring.
- Tighten the master cylinder mounting nuts to 13 N·m (1.3 kgf·m, 9.4 lbf·ft).
- Install the battery base (see step 45 on page 13-26).
- Install the air cleaner housing (see page 11-344).
- Install the battery. Connect the positive cable to the battery first, then connect the negative cable.
- Enter the anti-theft codes for the radio and the navigation system, then enter the customer's radio station and XM radio channel presets.
- Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

14. Make sure the hose clamps (A) are positioned on the master cylinder (B) and reservoir (C) as shown.



15. To prevent the retaining clip (A) from coming off, pry apart the tip of the retaining clip (B) with a screwdriver.



16. Bleed the clutch master hydraulic system (see step 8 on page 12-10).

NOTE: Reservoir filling is covered in the bleeding procedure.

Protected by AR

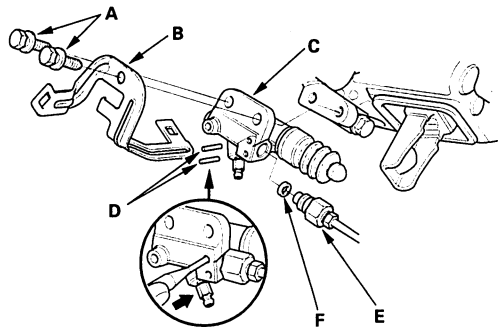
Slave Cylinder Replacement

NOTE:
- Use fender covers to avoid damaging painted surfaces.
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.

1. Make sure you have the anti-theft codes for the radio and navigation system, then write down the customer's radio station and XM radio channel presets.

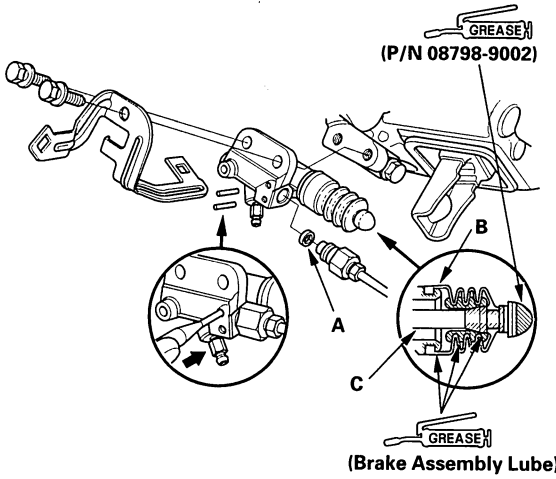
2. Disconnect the negative cable from the battery first, then disconnect the positive cable. Remove the battery.

3. Remove the mounting bolts (A), harness bracket (B), and slave cylinder (C).



4. Remove the roll pins (D). Disconnect the clutch line (E), and remove the O-ring (F). Plug the end of the clutch line to prevent brake fluid from coming out.

5. Install the slave cylinder in the reverse order of removal. Install a new O-ring (A).

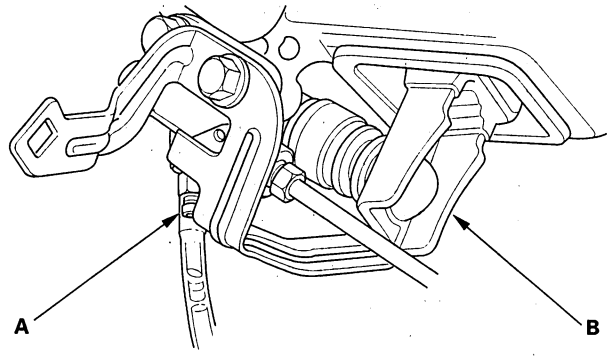


6. Pull back the boot (B), and apply brake assembly lube to the boot and slave cylinder rod (C). Reinstall the boot.

7. Apply super high temp urea grease (P/N 08798-9002) to the pushrod of the slave cylinder. Tighten the slave cylinder mounting bolts to 22 N·m (2.2 kgf·m, 16 lbf·ft).

8. Bleed the clutch hydraulic system.

   - Attach a hose to the bleeder screw (A), and suspend the hose in a container of brake fluid.
   - Make sure there is an adequate supply of fluid in the reservoir, then slowly pump the clutch pedal until no more bubbles appear at the bleeder hose.
   - It may be necessary to limit the movement of the release fork (B) with a block of wood to remove all the air from the system.
   - Tighten the bleeder screw to 8 N·m (0.8 kgf·m, 5.8 lbf·ft); do not overtighten it.
   - After bleeding, refill the reservoir to the MAX mark with fluid.
   - Use only Honda DOT 3 brake fluid from an unopened container.
   - Confirm clutch operation, and check for leaking fluid.



9. Reconnect the positive cable to the battery first, then connect the negative cable.

10. Enter the anti-theft codes for the radio and navigation system, then enter the customer's radio station and XM radio channel presets.

11. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

Clutch Replacement

Special Tools Required
- Pressure plate compressor 07AAE-P8EA000
- Clutch alignment shaft 07AAF-P8EA000
- Pressure plate compressor adapter 07AAK-P8EA000
- Ring gear holder 07LAB-PV00100 or 07924-PD20003
- Attachment, 37 x 40 mm 07746-0010200
- Driver 07749-0010000

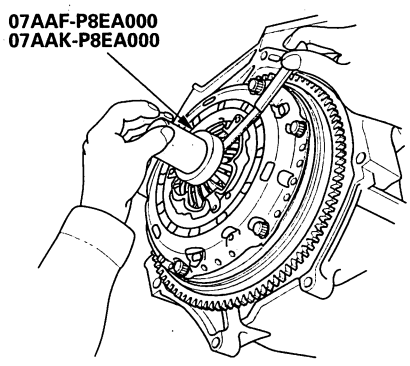
NOTICE

You must use the special tools required to remove and install the clutch pressure plate or you will irreversibly damage it.

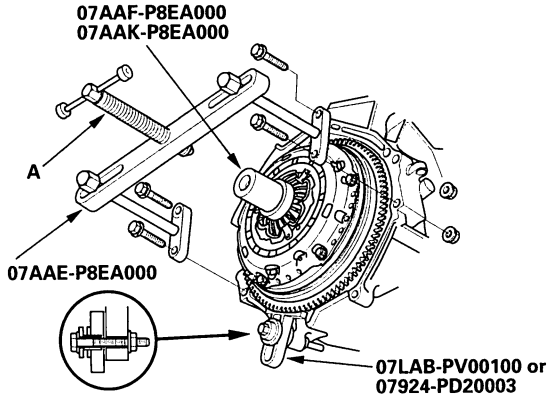
Pressure Plate and Clutch Disc Removal

1. Check the diaphragm spring fingers for height using the special tool and a feeler gauge. If the height is more than the service limit, replace the pressure plate and clutch disc as a set.

   Standard (New): 0.6 mm (0.02 in.) max.
   Service Limit: 0.8 mm (0.03 in.)

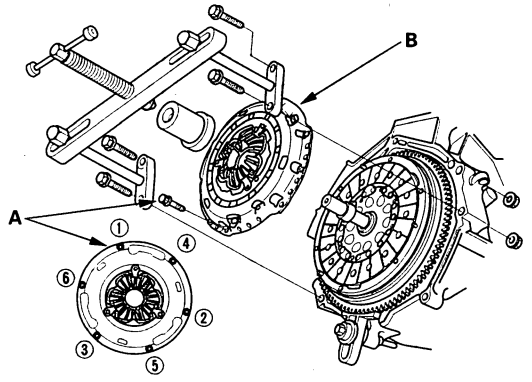


2. Install the special tools.



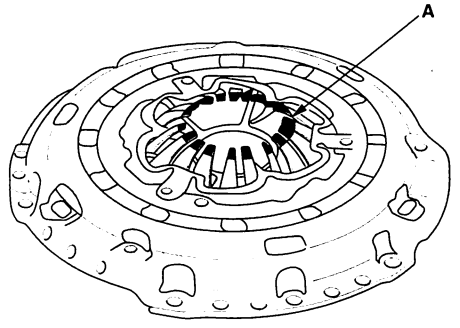
3. Turn the center screw (A) clockwise by hand to apply pressure on the diaphragm spring. Continue turning the center screw until it stops.

4. Loosen the pressure plate mounting bolts (A) in the pattern shown in several steps, then remove the bolts.

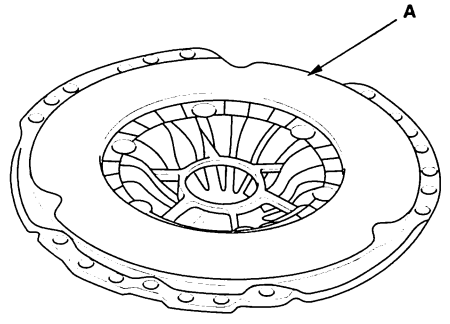


5. Turn the center screw on the pressure plate compressor counterclockwise by hand to release the pressure, then install two pressure plate mounting bolts, hand-tight, to hold the pressure plate (B). Remove the special tools and the pressure plate.

6. Inspect the fingers of the diaphragm spring (A) for wear at the release bearing contact area.



7. Inspect the pressure plate surface (A) for wear, cracks, and burning.



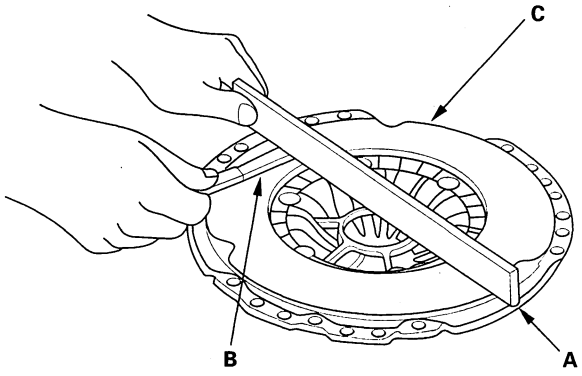
(cont'd)

Protected by AR

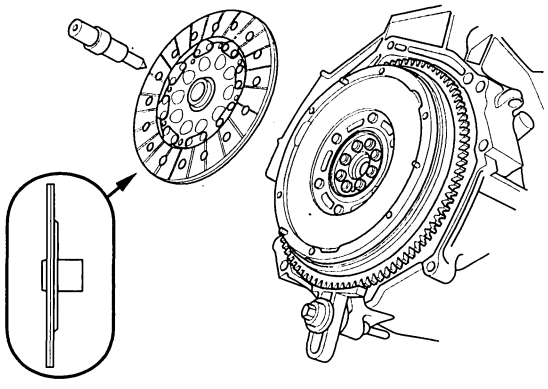
Clutch Replacement (cont'd)

8. Inspect for warpage using a straight edge (A) and a feeler gauge (B). Measure across the pressure plate (C). If the warpage is more than the service limit, replace the pressure plate and clutch disc as a set.

   Standard (New): 0.03 mm (0.001 in.) max.
   Service Limit: 0.15 mm (0.006 in.)



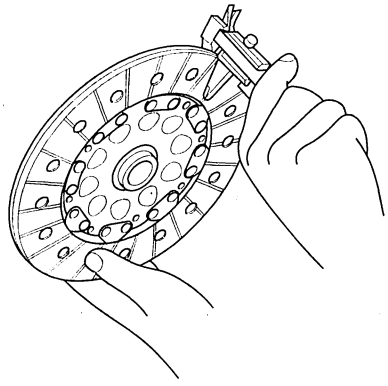
9. Remove the clutch disc and special tools.



10. Inspect the lining of the clutch disc for signs of slippage or oil. If the clutch looks burnt or is oil soaked, replace it and the pressure plate as a set. Find and repair the source of the oil leak if the clutch disc is soaked.

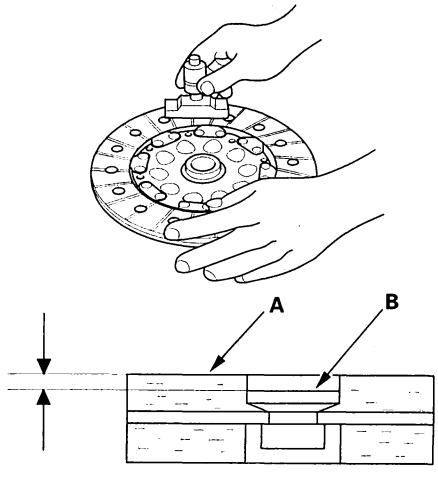
11. Measure the clutch disc thickness. If the thickness is less than the service limit, replace the clutch disc and pressure plate as a set.

    Standard (New): 8.68—9.53 mm (0.342—0.375 in.)
    Service Limit: 7.2 mm (0.283 in.)



12. Measure the rivet depth from the clutch disc lining surface (A) to the rivets (B) on both sides. If the rivet depth is less than the service limit, replace the clutch disc and the pressure plate as a set.

    Standard (New): 1.0 mm (0.039 in.)
    Service Limit: 0.2 mm (0.008 in.)



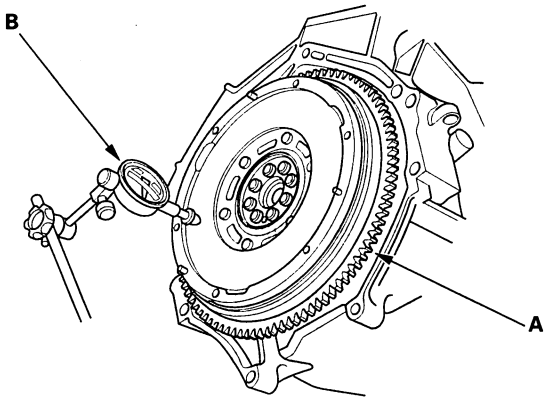
BACK

Protected by AR

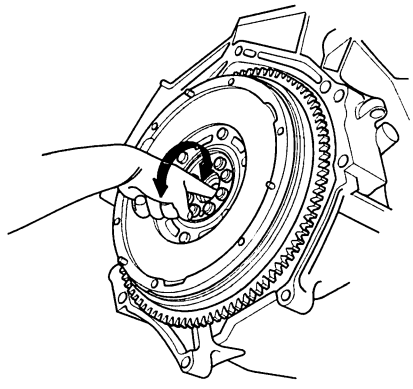
Flywheel and Pilot Bearing Inspection

1. Inspect the ring gear teeth for wear and damage.
2. Inspect the clutch disc mating surface on the flywheel for wear, cracks, and burning.
3. Measure the flywheel runout with the flywheel (A) installed on the engine. Set the dial indicator (B). Turn the flywheel at least two turns while pressing the flywheel. If the runout is not within the standard, replace the flywheel, and recheck the runout. Resurfacing the flywheel is not recommended.

   Standard (New): 0.05—0.45 mm (0.002—0.018 in.)

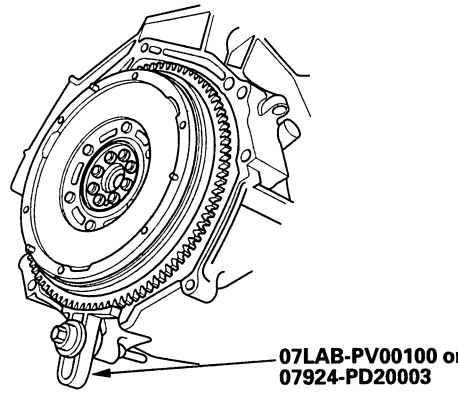


4. Turn the inner race of the pilot bearing with your finger. The pilot bearing should turn smoothly and quietly. Check that the pilot bearing outer race fits tightly in the flywheel. If the race does not turn smoothly, quietly, or fit tight in the flywheel, replace the pilot bearing.

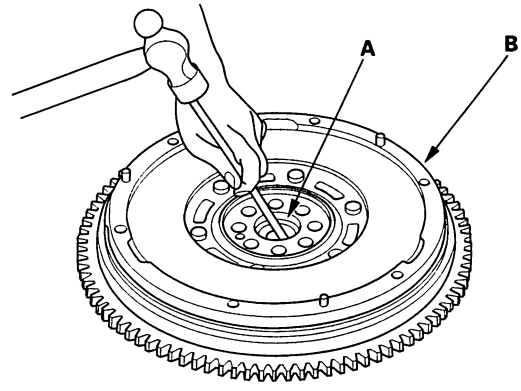


Flywheel and Pilot Bearing Replacement

1. Install the special tool.



2. Loosen the flywheel mounting bolts in a crisscross pattern in several steps. Remove the bolts, then remove the flywheel.
3. Remove the pilot bearing (A) from the flywheel (B).

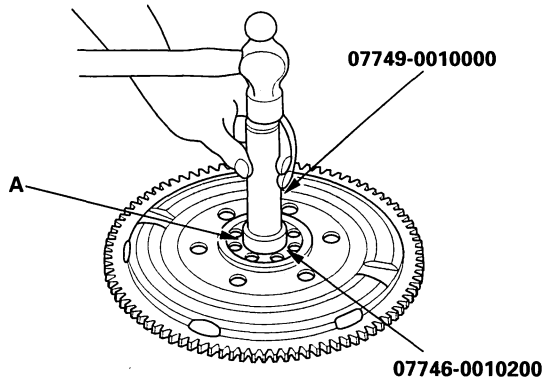


(cont'd)

Protected by AR

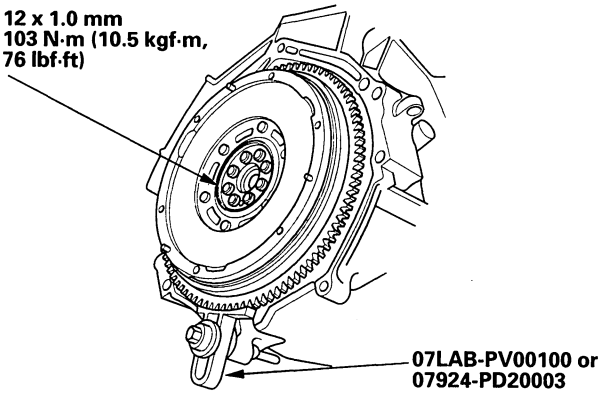
Clutch Replacement (cont'd)

4. Install the new pilot bearing (A) into the flywheel using the special tools. Apply a light coat of oil to the bearing surface.



5. Install the flywheel and mounting bolts, finger-tight.

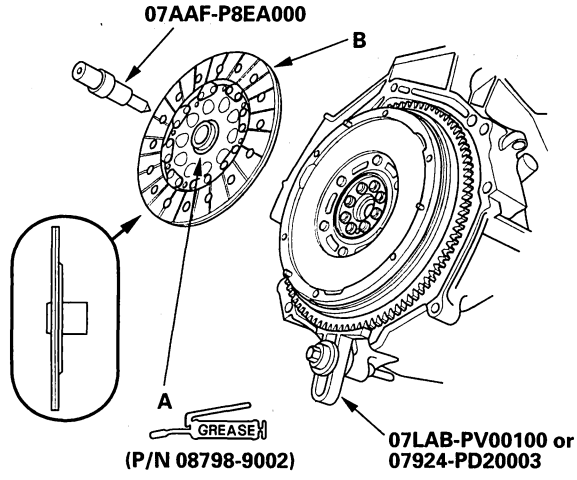
6. Install the special tool, then torque the flywheel mounting bolts in a crisscross pattern in several steps.



Clutch Disc and Pressure Plate Installation

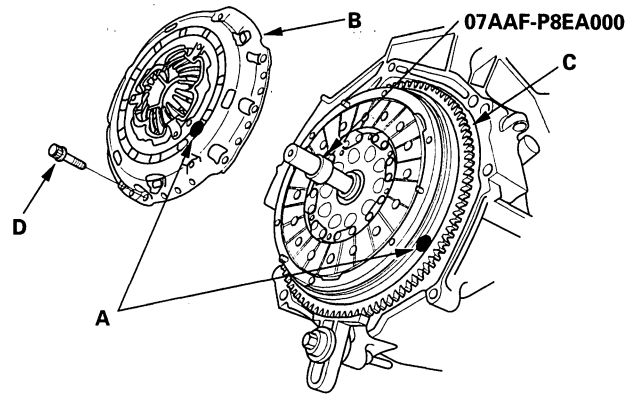
1. Temporarily install the clutch disc onto the splines of the transmission mainshaft. Make sure the clutch disc slides freely on the mainshaft.

2. Install the ring gear holder.



3. Apply super high temp urea grease (P/N 08798-9002) to the splines (A) of the clutch disc (B), then install the clutch disc using the special tools.

4. Align a white mark (A) across the pressure plate (B) and flywheel (C).

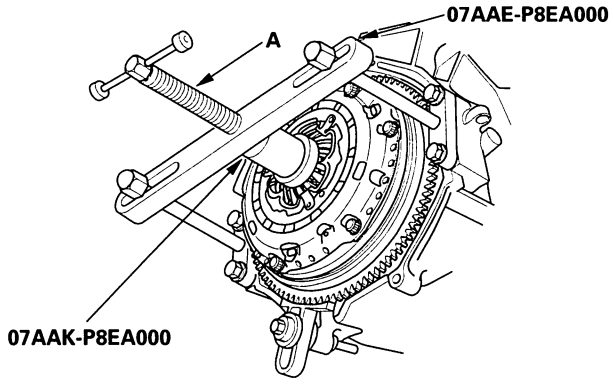


5. Install the pressure plate and the mounting bolts (D), finger-tight.

BACK

Protected by AR

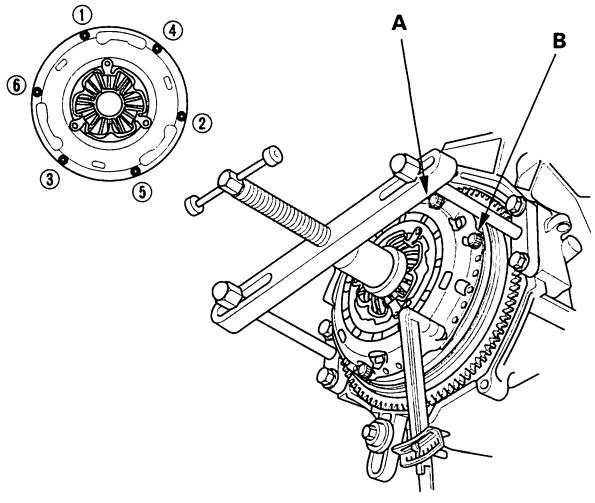
6. Install the special tools.



7. Turn the center screw (A) clockwise by hand to apply pressure on the diaphragm spring. Continue turning the center screw unit it stops.

8. Be careful not to damage the pressure plate (A). Tighten (180 degrees apart) the pressure plate mounting bolts (B) in a star pattern in several steps.

   PRESSURE PLATE MOUNTING BOLT TORQUE: 25 N·m (2.6 kgf·m, 19 lbf·ft)

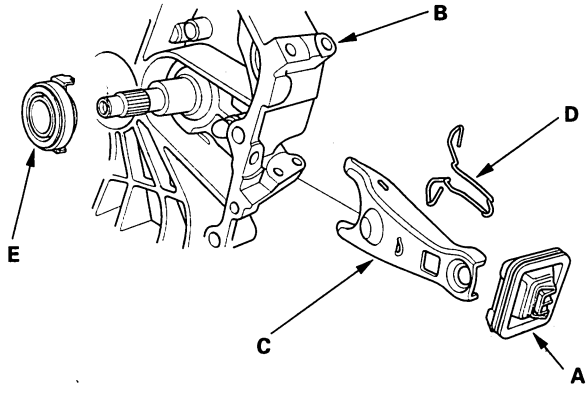


9. Turn the center screw on the pressure plate compressor counterclockwise by hand to release the pressure, then remove the special tools.

10. Make sure the diaphragm spring fingers are all the same height.

Release Bearing Replacement

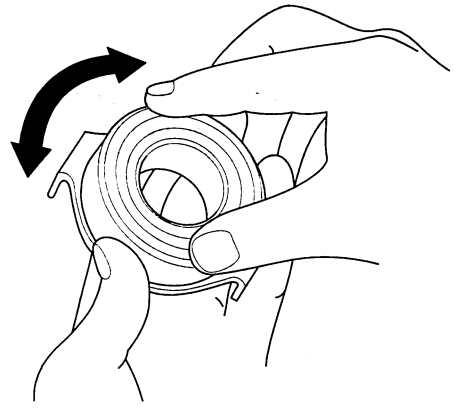
1. Remove the release fork boot (A) from the clutch housing (B).



2. Remove the release fork (C) from the clutch housing by squeezing the release fork set spring (D). Remove the release bearing (E).

3. Check the play of the release bearing by spinning it with your hand. If there is excessive play, replace the release bearing.

   NOTE: The release bearing is packed with grease. Do not wash it in solvent.

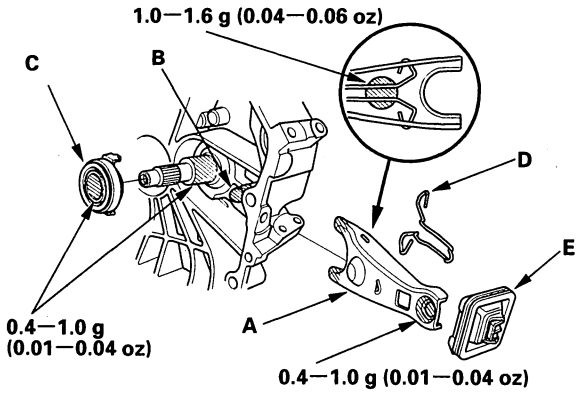


(cont'd)

Protected by AR

Clutch Replacement (cont'd)

4. Apply super high temp urea grease (P/N 08798-9002) to the release fork (A), the release fork bolt (B), the release bearing (C), and the release fork set spring (D) in the shaded areas.



5. With the release fork slid between the release bearing pawls, install the release bearing on the mainshaft while inserting the release fork through the hole in the clutch housing.

6. Align the detent of the release fork with the release fork bolt, then press the release fork over the release fork bolt squarely.

7. Install the release fork boot (E). Make sure the boot seals around the release fork and the clutch housing.

8. Move the release fork (A) right and left to make sure it fits properly against the release bearing (B) and the release bearing slides smoothly. Wipe off the excess grease.

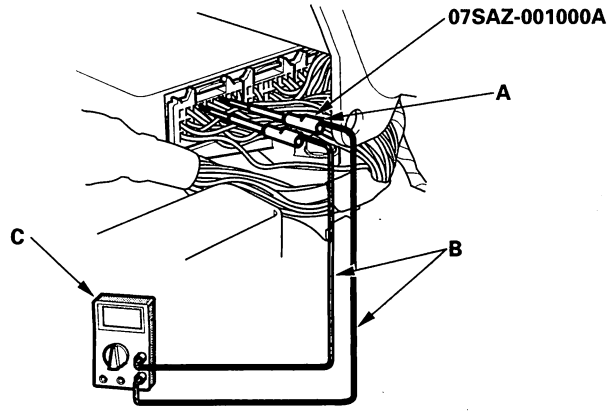
General Troubleshooting Information

How to Troubleshoot Circuits at the ECM

Special Tools Required
Backprobe set 07SAZ-001000A (2 required)

1. Connect the backprobe adapters (A) to the stacking patch cords (B), and connect the cords to a digital multimeter (C).

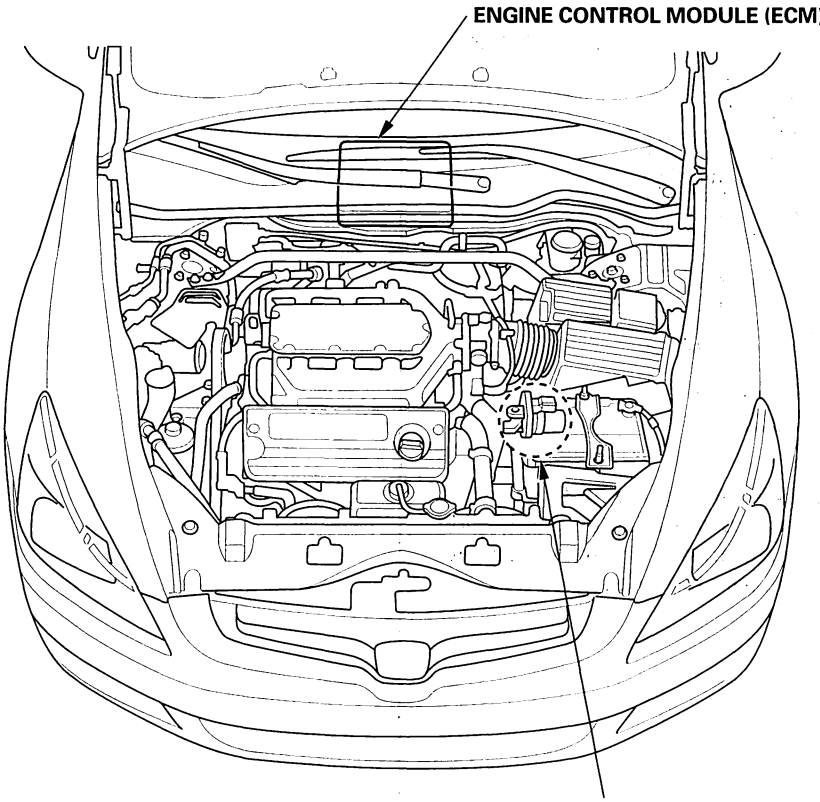


2. Using the wire insulation as a guide for the contoured tip of the backprobe adapter, gently slide the tip into the connector from the wire side until it touches the end of the wire terminal.

Protected by AR

Reverse Lockout System

Component Location Index



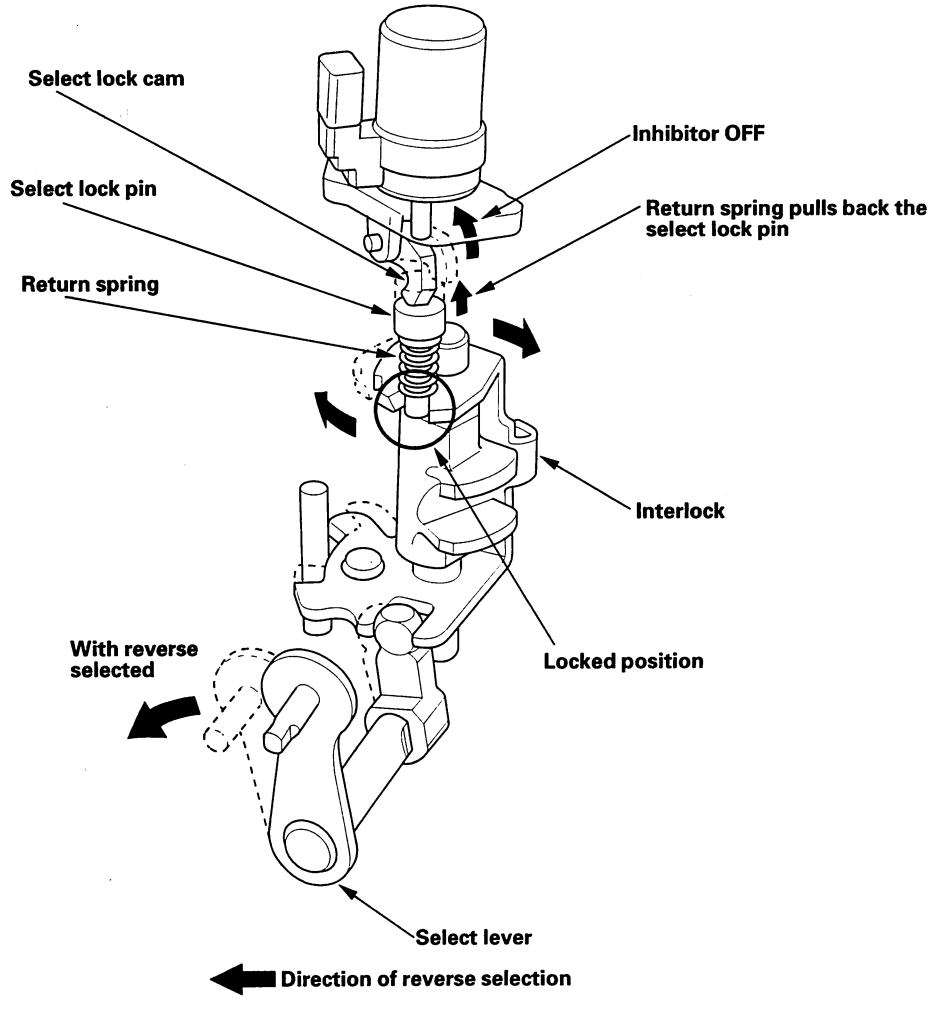
BACK

Protected by AR

System Description

At a vehicle speed of 12 mph (20 km/h) or more, a signal from the ECM activates the reverse lockout solenoid, which pushes the select lock cam and select lock pin into the locked position. As a result, the interlock cannot rotate to the reverse select position, making it impossible to engage reverse gear. At a vehicle speed of 9 mph (15 km/h) or less, the signal from the ECM is interrupted which turns off the reverse lockout solenoid. The return spring pulls back the select lock pin enabling the interlock to move freely so reverse gear can be selected.

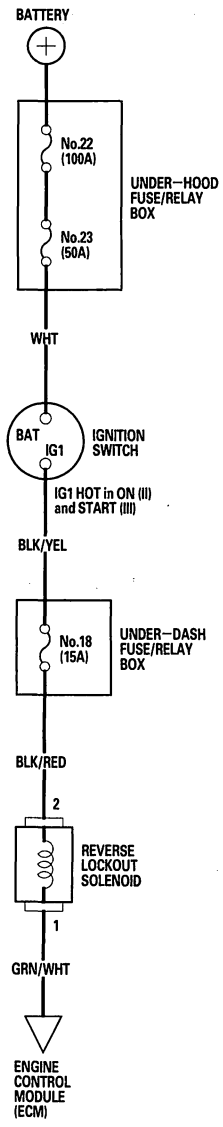
Vehicle speed	Inhibitor	Reverse selection
Above 12 mph (20 km/h)	ON	Not allowed
Below 9 mph (15 km/h)	OFF	OK
IG-S/W OFF	OFF	OK



Protected by AR

Reverse Lockout System

Circuit Diagram



Circuit Troubleshooting

1. Check the No. 18 (15 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 2.

   NO—Replace the fuse, and recheck. ■

2. Start the engine, and check the Malfunction Indicator Lamp (MIL).

   Does the MIL come on?

   YES—Troubleshoot the DTC (see page 11-3), and recheck. ■

   NO—Go to step 3.

3. Turn the ignition switch OFF.

4. Shift into reverse gear.

   Can the transmission be shifted into reverse gear?

   YES—Go to step 5.

   NO—Repair the transmission, and recheck. ■

5. Turn the ignition switch ON (II). With the vehicle moving slowly (vehicle speed below 9 mph (15 km/h)), shift the transmission into reverse gear.

   Can the transmission be shifted into reverse gear?

   YES—Go to step 6.

   NO—Go to step 7.

6. Raise the front wheels, and block the rear wheels. Run the engine so the speedometer reads above 12 mph (20 km/h).

   Can the transmission be shifted into reverse gear?

   YES—Go to step 7.

   NO—Intermittent failure, system is OK at this time. ■

BACK

Protected by AR

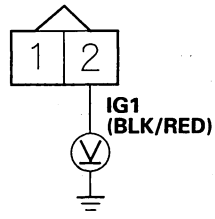
7. Turn the ignition switch OFF.

8. Disconnect the reverse lockout solenoid 2P connector.

9. Turn the ignition switch ON (II).

10. Measure the voltage between the reverse lockout solenoid 2P connector terminal No. 2 and body ground.

REVERSE LOCKOUT SOLENOID 2P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Go to step 11.

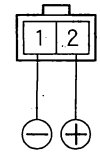
NO—Check for loose or poor connections at the connector. If the connections are OK, repair open in the wire between the No. 18 (15 A) fuse in the under-dash fuse/relay box and the reverse lockout solenoid. ■

11. Turn the ignition switch OFF.

12. Remove the reverse lockout solenoid (see page 13-8).

13. Connect the No. 2 terminal of the reverse lockout solenoid to the battery positive terminal, and connect the No. 1 terminal to the battery negative terminal. Check that the reverse lockout solenoid operates.

REVERSE LOCKOUT SOLENOID 2P CONNECTOR



Terminal side of male terminals

Does the reverse lockout solenoid operate properly?

YES—Go to step 14.

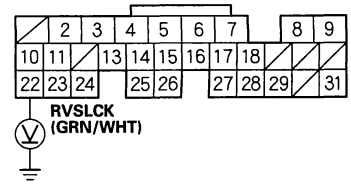
NO—Replace the reverse lockout solenoid. ■

14. Reinstall the reverse lockout solenoid, and reconnect the solenoid 2P connector.

15. Turn the ignition switch ON (II).

16. Measure the voltage between ECM connector A22 and body ground.

ECM CONNECTOR A



Wire side of female terminals

Is there battery voltage?

YES—Check for loose connectors at ECM connector A (31P). If necessary, update the ECM if it does not have the latest software, or substitute a known-good ECM, then recheck (see page 11-6). If the symptom/indication goes away with a known-good ECM, replace the original ECM. ■

NO—Repair open in the wire between the reverse lockout solenoid and the ECM (A22). ■

BACK

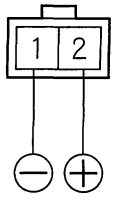
Protected by AR

Reverse Lockout System

Reverse Lockout Solenoid Test

1. Remove the reverse lockout solenoid (see page 13-8).
2. Connect the battery positive terminal to the No. 2 terminal of the reverse lockout solenoid 2P connector, and connect the battery negative terminal to the No. 1 terminal.

REVERSE LOCKOUT SOLENOID 2P CONNECTOR

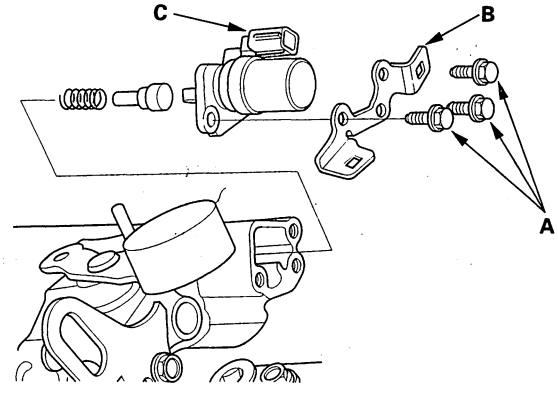


Terminal side of male terminals

3. Check that the reverse lockout solenoid works.
4. If the reverse lockout solenoid does not work, replace it.

Reverse Lockout Solenoid Disassembly/Reassembly

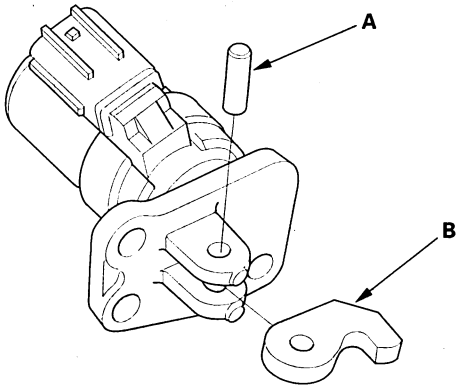
1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the customer's radio station and XM radio channel presets.
2. Disconnect the negative cable from the battery first, then disconnect the positive cable. Remove the battery.
3. Remove the air cleaner housing (see page 11-344).
4. Remove the battery base (see step 6 on page 13-12).
5. Carefully remove the shift cable, select cable, and cable bracket together to avoid bending the cables (see step 13 on page 13-13).
6. Disconnect the reverse lockout solenoid connector.
7. Remove the bolts (A), transmission harness stay (B), and reverse lockout solenoid assembly (C).



BACK

Protected by AR

8. Remove the roller (A) and select lock cam (B).

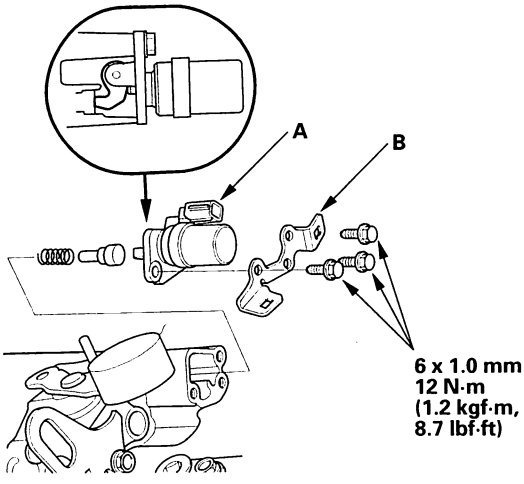


9. Install in the reverse order of removal.

10. Remove the dirt and oil from the sealing surface. Apply liquid gasket (P/N 08718-0002) to the sealing surface.

    NOTE: Do not install components if 4 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.

11. Install the reverse lockout solenoid assembly (A) and transmission harness stay (B).



12. Connect the reverse lockout solenoid connector.

13. Install the cable bracket, select cable, and shift cable (see step 37 on page 13-25).

14. Install the battery base (see step 45 on page 13-26).

15. Install the air cleaner housing (see page 11-344).

16. Install the battery. Connect the positive cable to the battery first, then connect the negative cable.

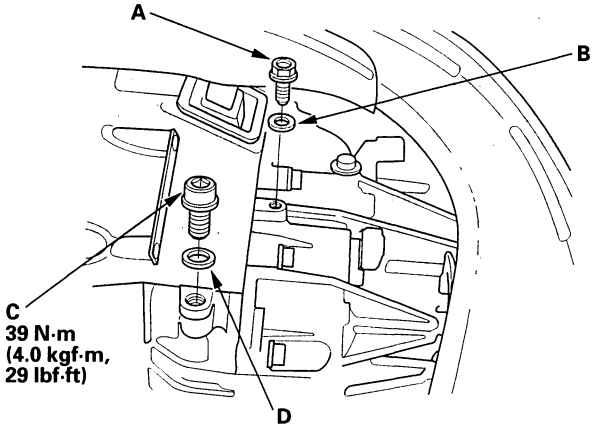
17. Enter the anti-theft codes for the radio and navigation system, then enter the customer's radio station and XM radio channel presets.

18. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

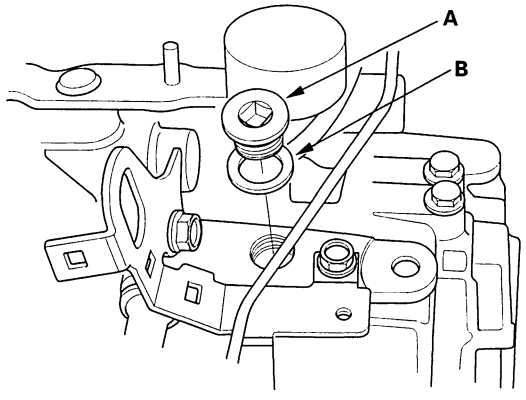
Protected by AR

Transmission Fluid Inspection and Replacement

1. Park the vehicle on level ground, and turn the ignition switch OFF.
2. Remove the splash shield (see step 28 on page 13-15).
3. Remove the oil check bolt (A) and washer (B). Check the condition of the fluid. If the fluid is dirty, remove the drain plug (C) and washer (D).



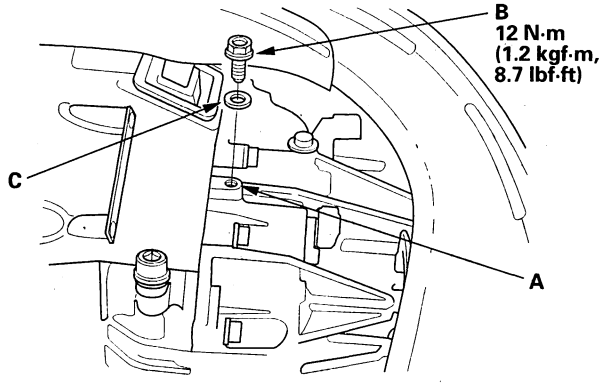
4. Install the drain plug with a new washer.
5. Remove the oil filler plug (A) and washer (B).



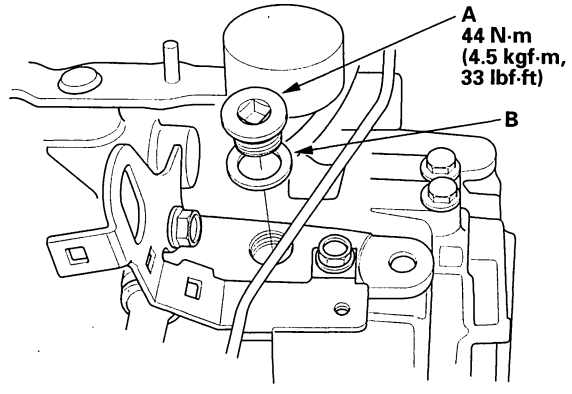
6. Refill the transmission fluid from the oil filler plug hole, and until the transmission fluid overflows from the oil check bolt hole (A).
7. After the fluid stops overflowing, install the oil check bolt (B) with a new washer (C).

Fluid Capacity
2.2 L (2.3 US qt) at fluid change
2.5 L (2.6 US qt) at overhaul

Always use Honda Manual Transmission Fluid (MTF). Using engine oil can cause stiffer shifting because it does not contain the proper additives.



8. Install the oil filler plug (A) with a new washer (B).

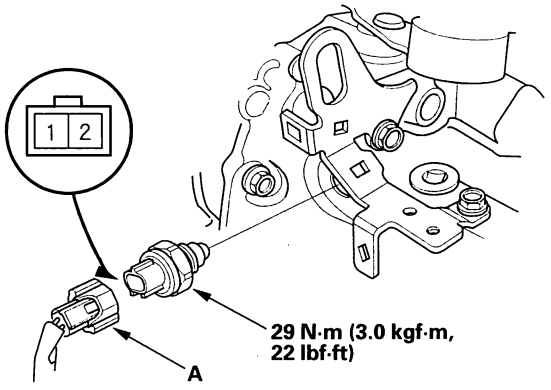


BACK

Protected by AR

Back-up Light Switch Test

1. Disconnect the back-up light switch connector (A).



2. Check for continuity between the No. 1 and No. 2 terminals of the back-up light switch. There should be continuity when the shift lever is in Reverse.

3. If necessary, replace the back-up light switch. Apply liquid gasket (P/N 08718-0001), and install it on the transmission housing. Tighten the back-up light switch to the specified torque.

Transmission Removal

Special Tools Required
- Engine support hanger, A and Reds AAR-T-12566 (Available through the Honda Tool and Equipment Program 888-424-6857)
- Engine hanger balance bar VSB02C000019
- Front subframe adapter VSB02C000016

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the customer's radio station and XM radio channel presets.

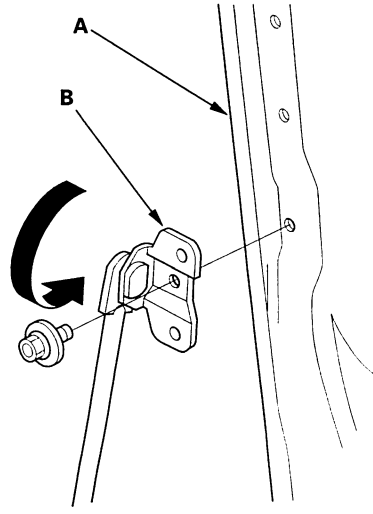
2. Set the wheels in the straight ahead position.

3. Lock the steering wheel.

4. Disconnect the negative cable from the battery first, then disconnect the positive cable. Remove the battery.

5. Remove the bolts securing the support strut brackets on both sides of the hood. Secure the hood (A) in a vertical position, then install the right strut bracket (B) by turning it over with its bolt in the lower position.

   NOTE: Do not attempt to close the hood with the support strut in the vertical position; it will damage the support strut and hood.

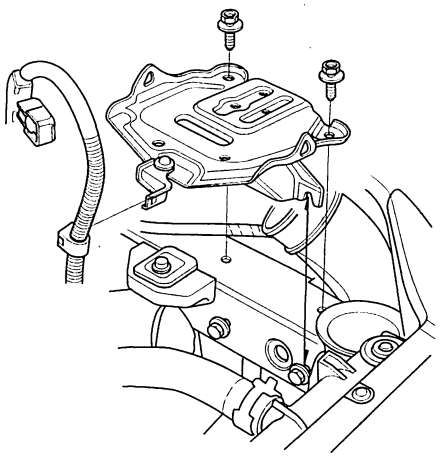


(cont'd)

Protected by AR

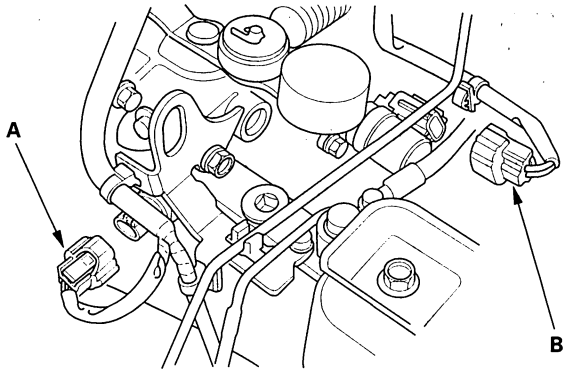
Transmission Removal (cont'd)

6. Remove the battery base.

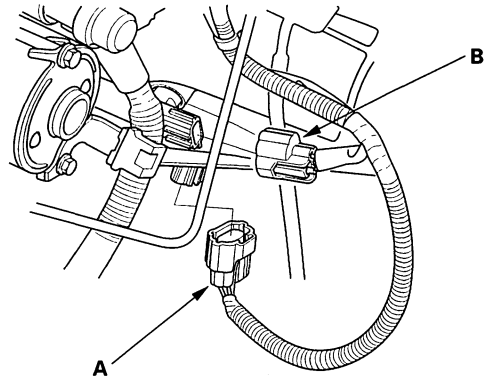


7. Remove the air cleaner housing (see page 11-344).

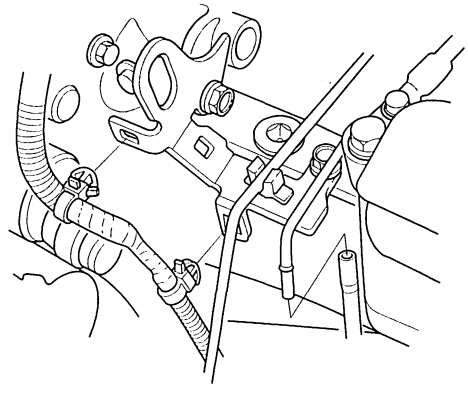
8. Disconnect the back-up light switch connector (A) and reverse lockout solenoid connector (B).



9. Disconnect the output shaft (countershaft) speed sensor connector (A) and input shaft (mainshaft) speed sensor connector (B).



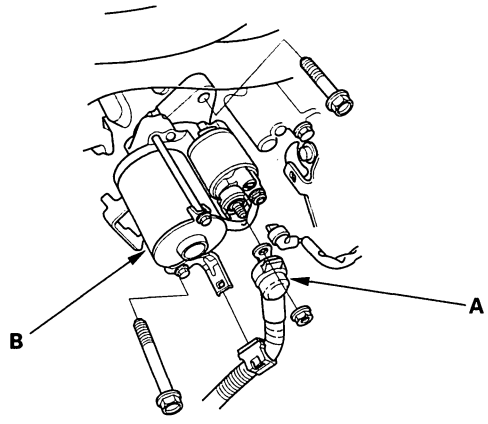
10. Remove the harness clips.



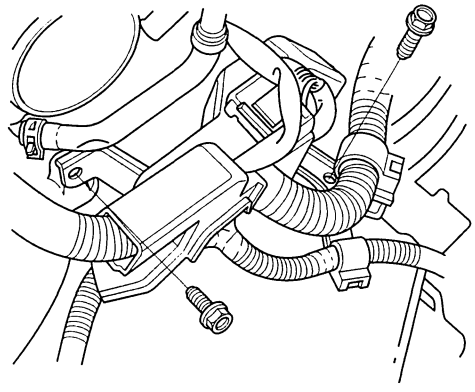
BACK

Protected by AR

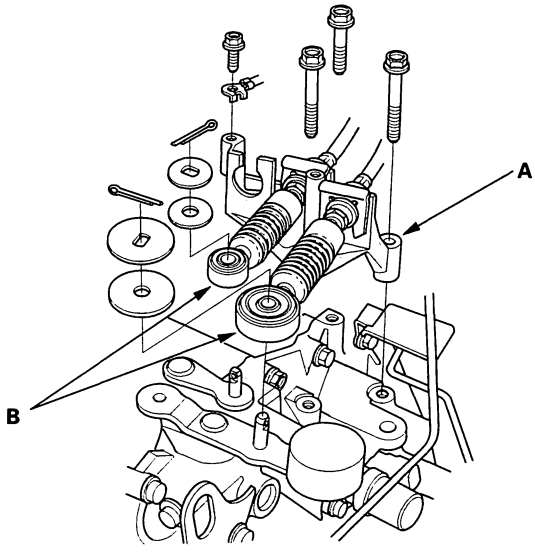
11. Disconnect the starter cable (A), then remove the starter motor (B).



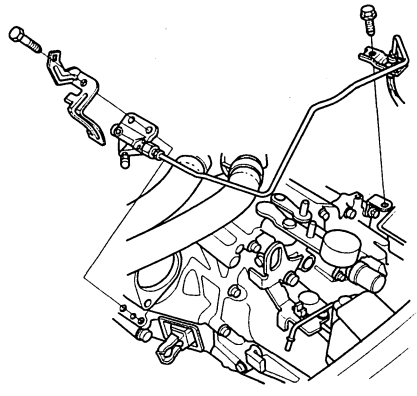
12. Remove the harness bracket.



13. Remove the cable bracket (A), then disconnect the cables (B) from the top of the transmission housing. Carefully remove both cables and the bracket together to avoid bending the cables.



14. Carefully remove the slave cylinder without bending the clutch line. Do not press the clutch pedal once the slave cylinder has been removed.

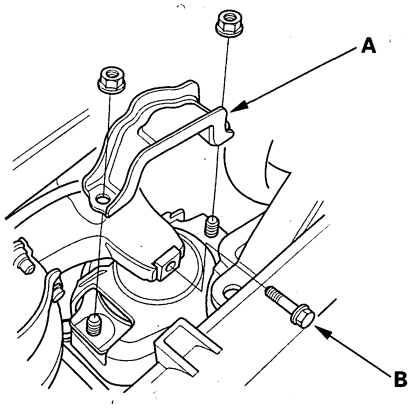


(cont'd)

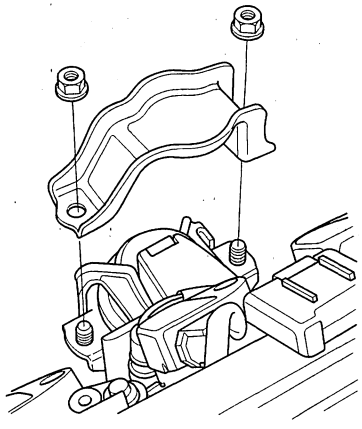
Protected by AR

Transmission Removal (cont'd)

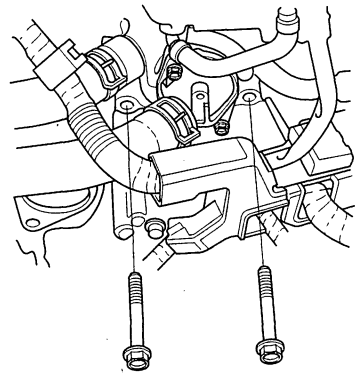
15. Remove the front mount stop (A), then remove the front mount bolt (B).



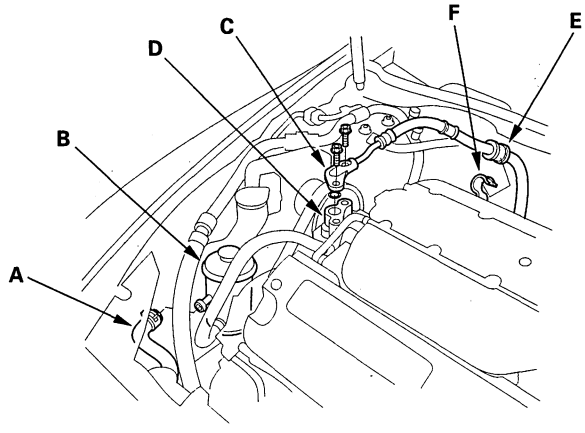
16. Remove the rear mount stop.



17. Remove the transmission upper mounting bolts.



18. Remove and plug the return hose (A) from the power steering fluid reservoir (B). Wipe off any spilled fluid at once.



19. Remove the power steering pump outlet line (C) from the power steering pump (D), and remove the hose (E) from its clamp (F).

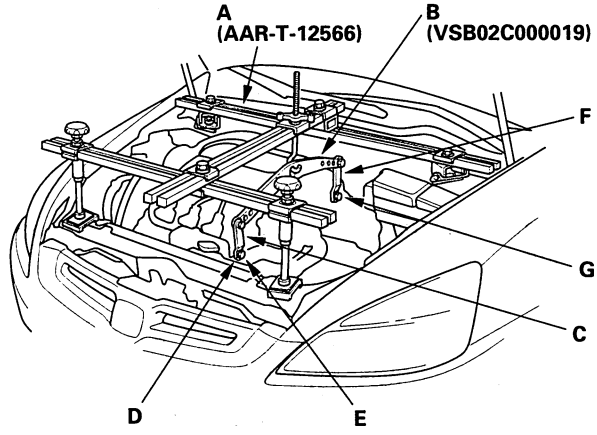
BACK

Protected by AR

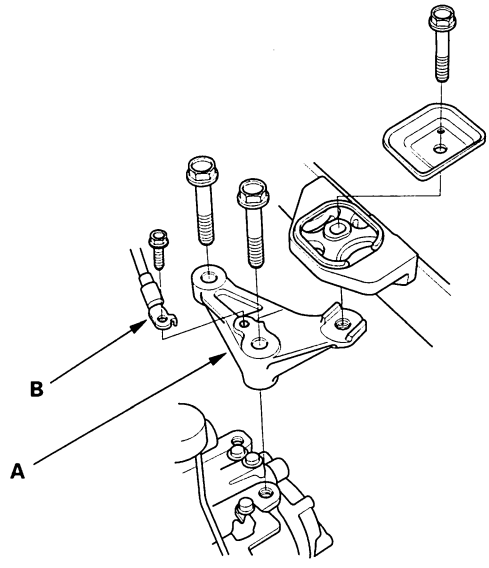
20. Remove the front bulkhead cover, refer to the 2003-2006 Accord Service Manual:

    - 2-door (see page 20-184)
    - 4-door (see page 20-185)

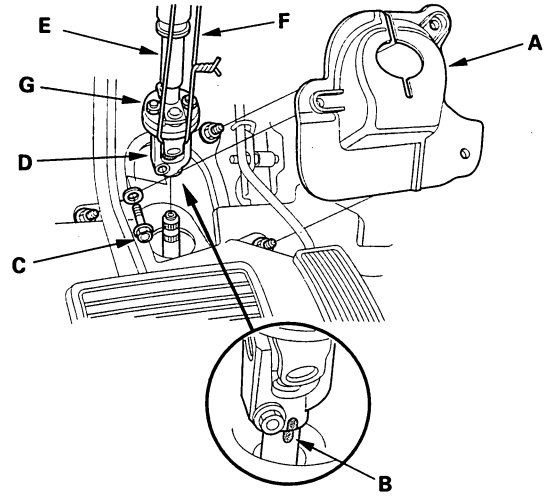
21. Lift and support the engine with the engine support hanger (A) and the engine balance bar (B). Attach the front arm (C) to the front cylinder head with a spacer (D) and the 10 x 1.25 mm bolt (E). Attach the rear arm (F) to the rear cylinder head with the 8 x 1.25 mm bolt (G).



22. Remove the transmission mount bracket (A) and ground cable (B).



23. Remove the steering joint cover (A).



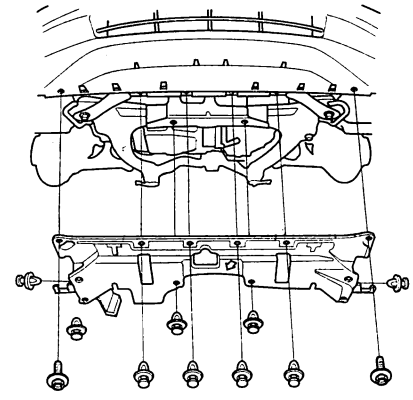
24. Make a reference mark (B) across the steering joint and steering gearbox pinion shaft. Remove the steering joint bolt (C), and disconnect the steering joint (D) by removing the steering joint toward the steering column. Hold the slider shaft (E) on the column with a piece of wire (F) between the joint yoke (G) on the slider shaft and the joint yoke on the upper shaft, refer to the 2003-2006 Accord Service Manual (see page 17-25).

25. Raise the vehicle, and make sure it is securely supported.

26. Remove the front wheels.

27. Drain the transmission fluid. Install the drain bolt with a new washer (see page 13-10).

28. Remove the splash shield.



(cont'd)

Protected by AR

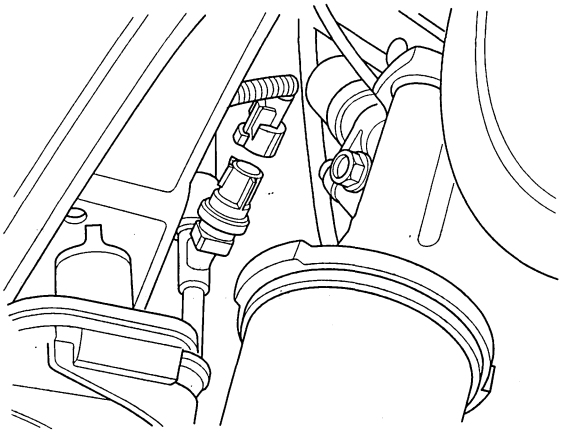
Transmission Removal (cont'd)

29. Separate the tie-rod ball joint, refer to the 2003-2006 Accord Service Manual (see step 8 on page 17-31).

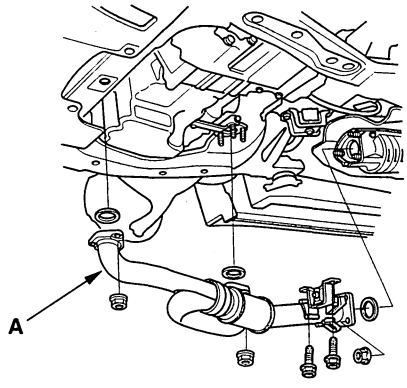
30. Remove the damper fork (see step 6 on page 16-4).

31. Separate the knuckle from the lower arm (see step 7 on page 16-4).

32. Disconnect the power steering pressure switch connector.



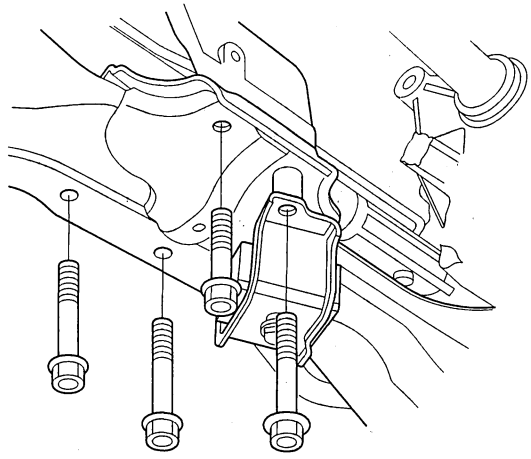
33. Remove exhaust pipe A.



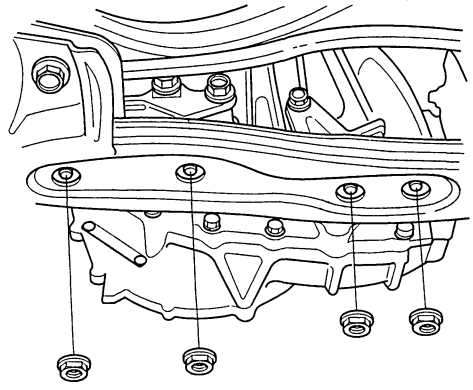
34. Remove the left and right driveshaft inboard joints (see page 16-4).

35. Remove the intermediate shaft (see page 16-22).

36. Remove the engine lower rear mount mounting bolts.



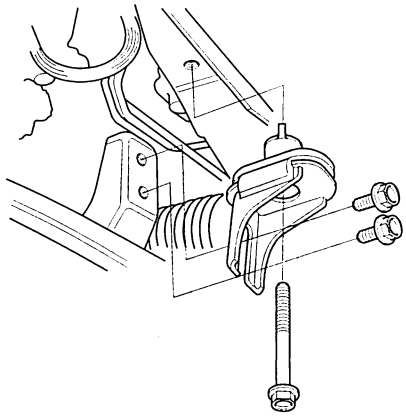
37. Remove the transmission lower mount mounting nuts.



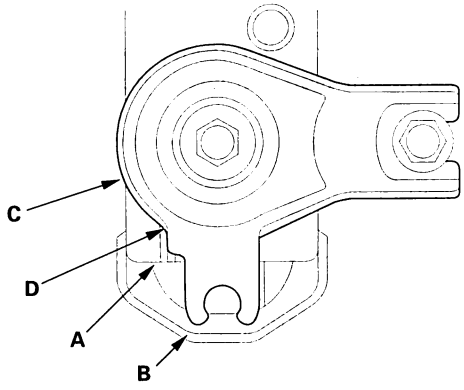
BACK

Protected by AR

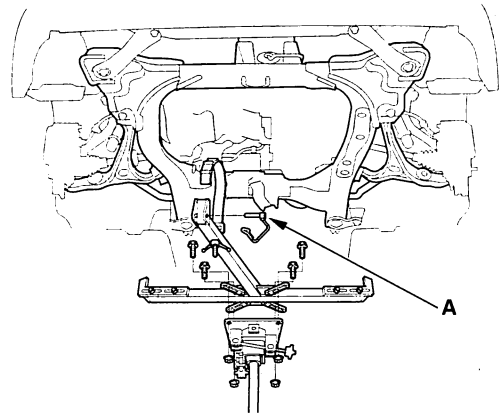
38. Remove the subframe mid mounts from both sides.



39. Make the appropriate reference lines (A) at both ends of the subframe (B) that line up with the edge (C) of the stiffeners (D).

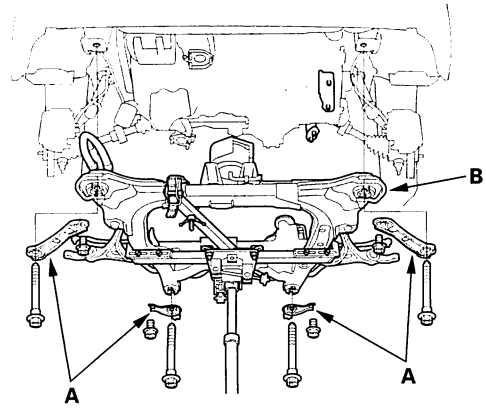


40. Attach the special tool to the subframe by wrapping the band over the subframe and attaching the end of the band to the tool with a pin (A).



41. Raise the jack, and line up the slots in the arms with the bolt holes on the corner of the jack base, then attach them securely.

42. Remove the front suspension subframe stays (A) and the front suspension subframe (B).

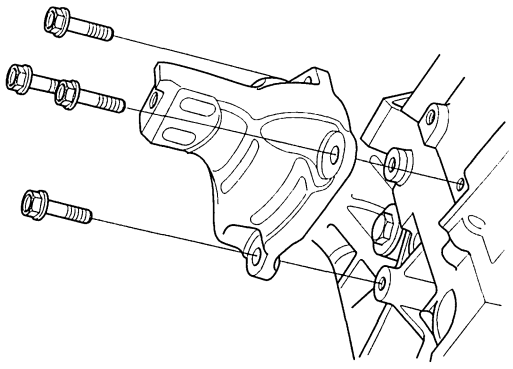


(cont'd)

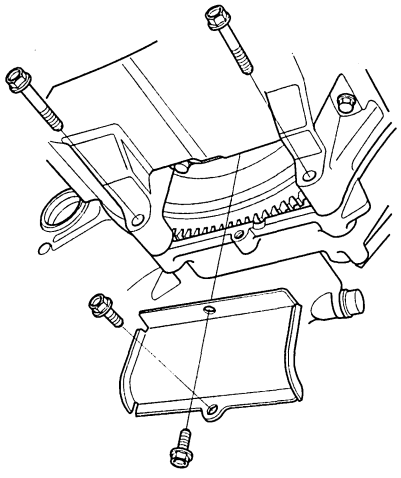
Protected by AR

Transmission Removal (cont'd)

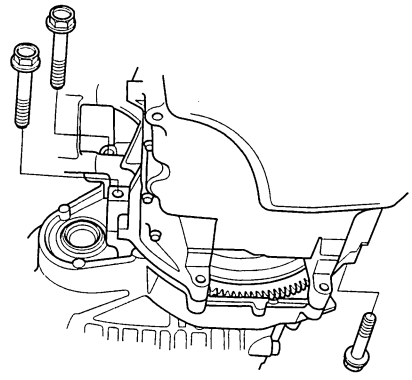
43. Remove the front engine mount upper bracket.



44. Remove the clutch cover.

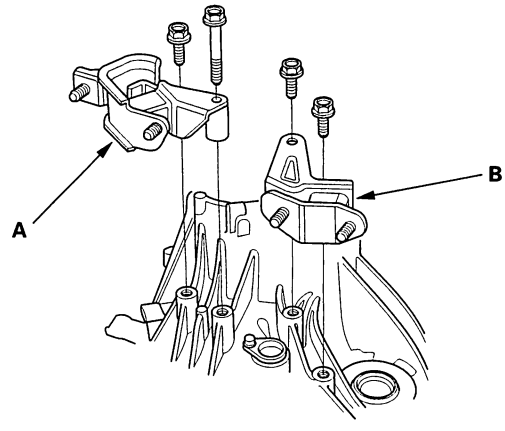


45. Place the transmission jack under the transmission, and remove the transmission lower mounting bolts.



46. Pull the transmission away from the engine until the transmission mainshaft clears the clutch pressure plate, then lower the transmission on the transmission jack.

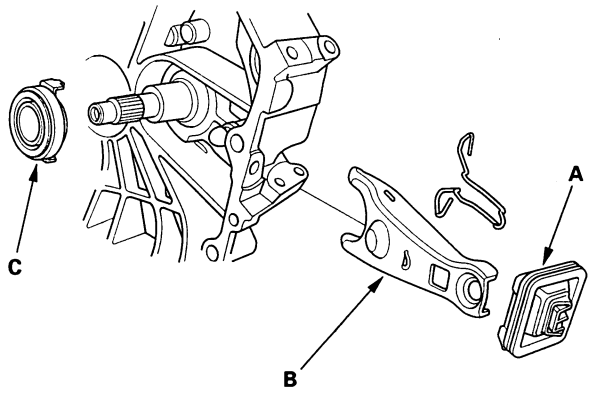
47. Remove the transmission front lower mount (A) and the transmission rear lower mount (B).



BACK

Protected by AR

48. Remove the boot (A), release fork (B), and release bearing (C) from the transmission.

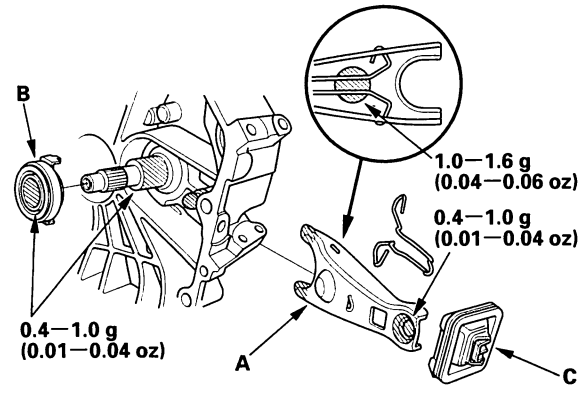


Transmission Installation

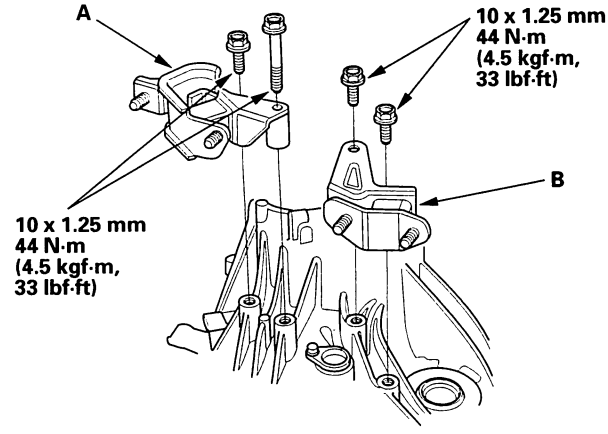
Special Tools Required
- Engine support hanger, A and Reds AAR-T-12566 (Available through the Honda Tool and Equipment Program 888-424-6857)
- Engine hanger balance bar VSB02C000019
- Front subframe adapter VSB02C000016

1. Make sure the two dowel pins are installed in the clutch housing.

2. Apply super high temp urea grease (P/N 08798-9002) to the release fork (A), the release bearing (B) and the mainshaft splines. Install the release fork, the release bearing, and the boot (C).



3. Install the transmission front lower mount (A) and the transmission rear lower mount (B).



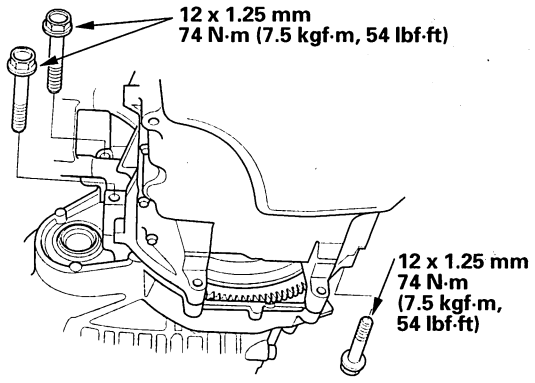
4. Place the transmission on the transmission jack, and raise it to engine level.

(cont'd)

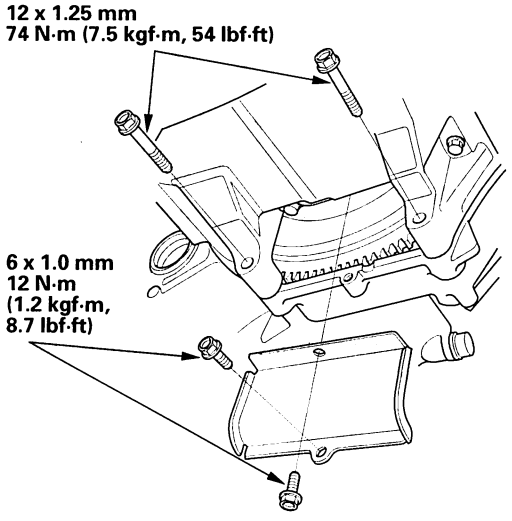
Protected by AR

Transmission Installation (cont'd)

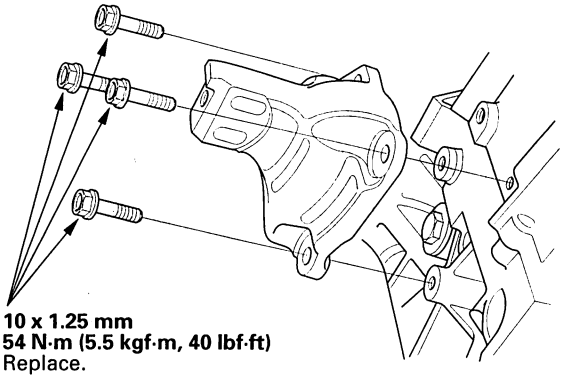
5. Install the transmission lower mounting bolts.



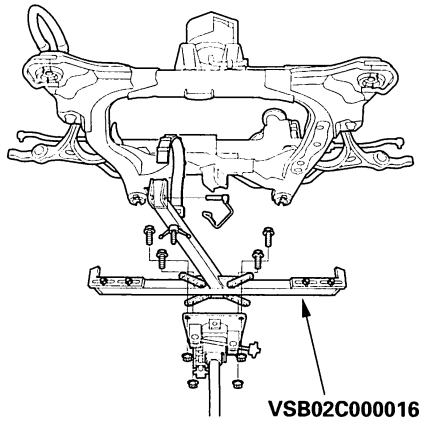
6. Install the clutch cover.



7. Install the front engine mount upper bracket.



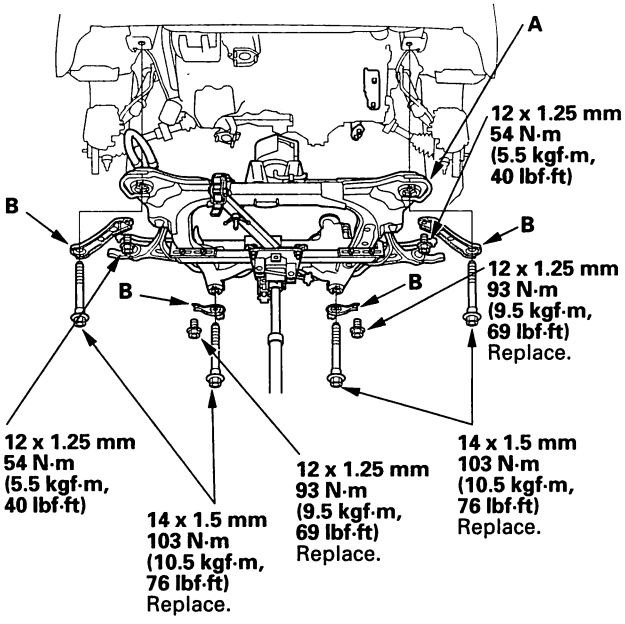
8. Support the subframe with the subframe adapter and a jack.



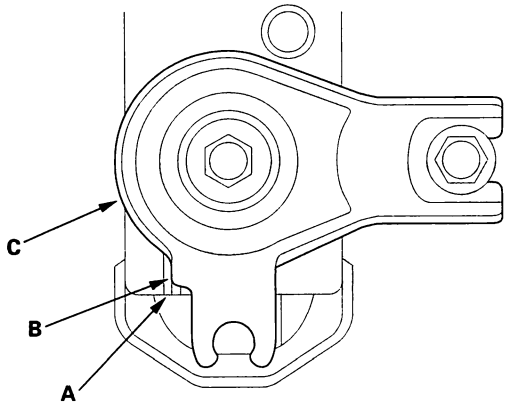
BACK

Protected by AR

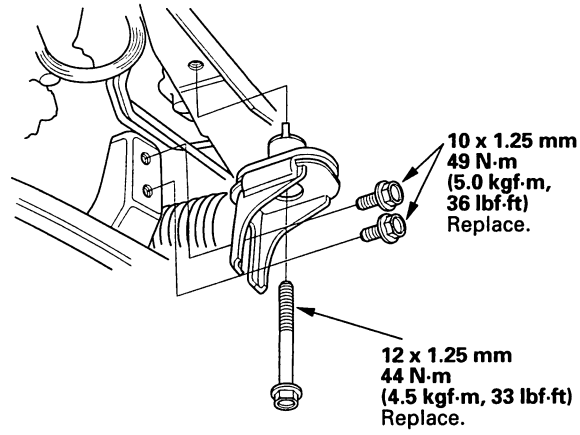
9. Install the front suspension subframe (A) and front suspension subframe stays (B).



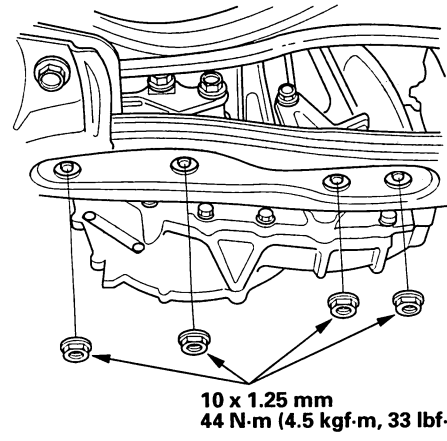
10. Align the reference marks (A) with the edge (B) of both rear stiffeners (C), then tighten the rear subframe mounting bolts, the front bolts, and the stiffener bolts to the specified torque.



11. Install the subframe mid mounts on both sides.



12. Install the transmission lower mount mounting nuts.

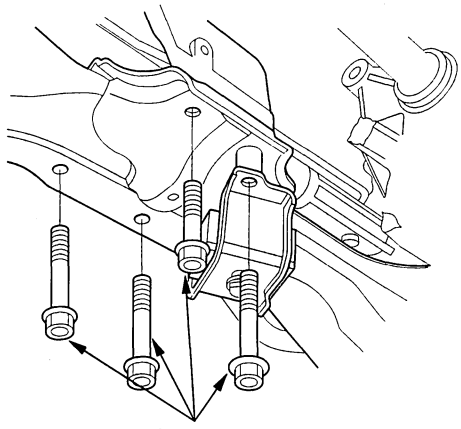


(cont'd)

Protected by AR

Transmission Installation (cont'd)

13. Install the engine lower rear mount mounting bolts.



10 x 1.25 mm
49 N·m (5.0 kgf·m, 36 lbf·ft)
Replace.

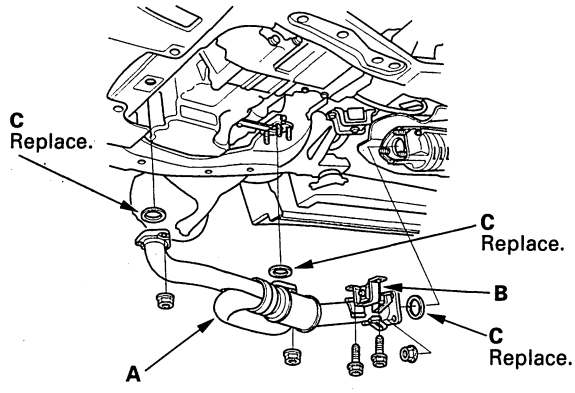
14. Install the intermediate shaft (see page 16-26).

15. Install the left and right driveshaft inboard joints (see page 16-20).

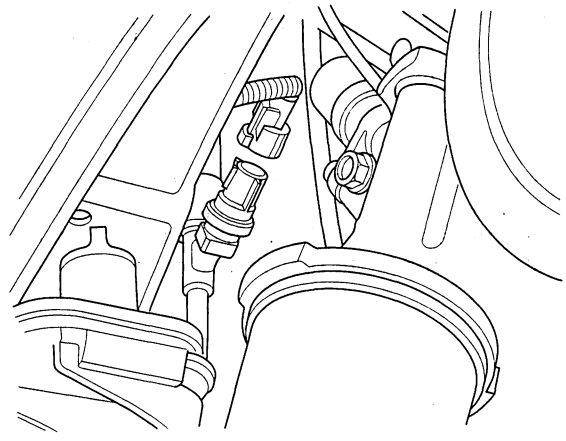
16. Install the knuckle onto the lower arm (see step 5 on page 16-21).

17. Install the damper fork (see step 7 on page 16-21).

18. Install exhaust pipe A, the mount (B), and new gaskets (C).



19. Connect the power steering pressure switch connector.



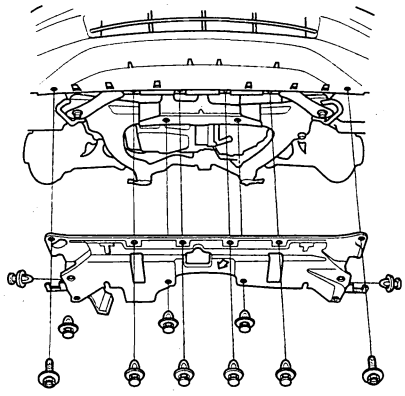
20. Connect the return line to the power steering fluid reservoir.

21. Install the tie-rod ball joint, refer to the 2003-2006 Accord Service Manual (see step 23 on page 17-54).

BACK

Protected by AR

22. Install the splash shield.



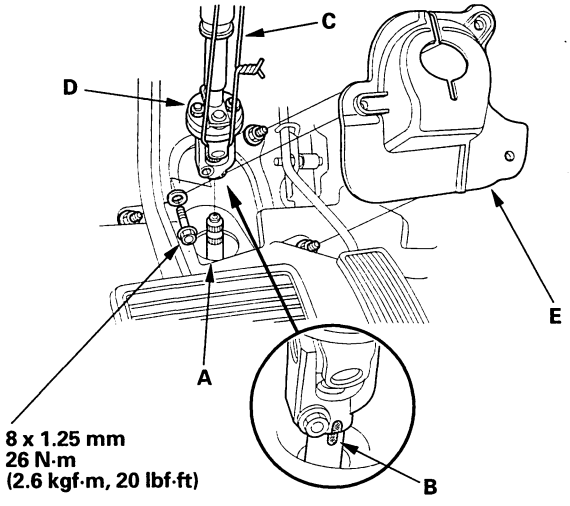
23. Refill the transmission with fluid.

24. Install the front wheels, and set them in the straight ahead position.

25. Lower the vehicle.

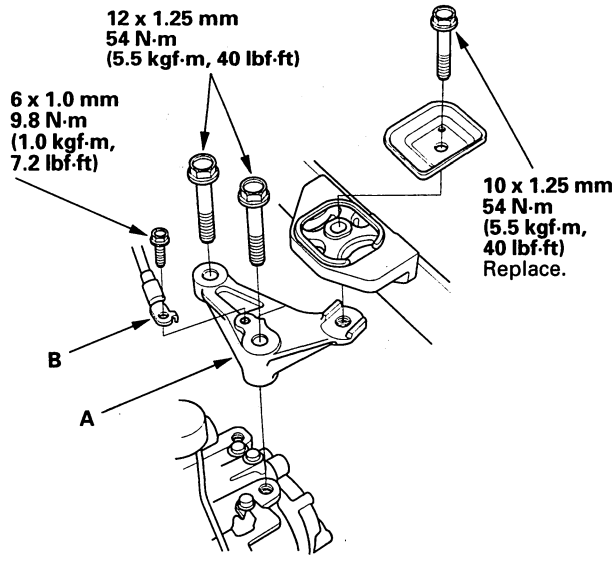
26. Unlock the steering wheel.

27. Connect the steering joint to the steering gearbox pinion shaft (A) by aligning the reference mark (B), and remove the wire (C) from the joint yoke (D).



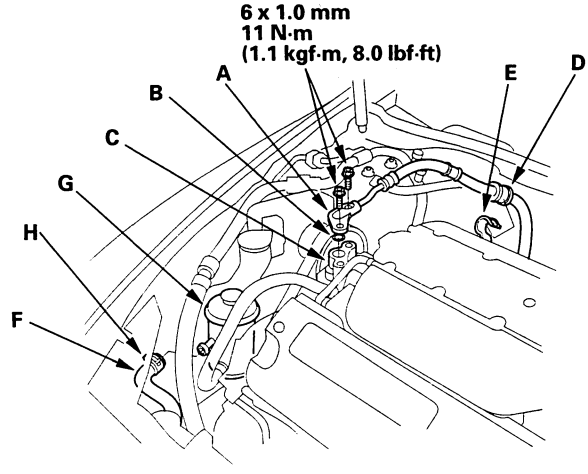
28. Install the steering joint cover (E).

29. Install the transmission mount bracket (A) and ground cable (B).



30. Remove the engine hanger and special tool from the engine.

31. Install the power steering pump outlet line (A) with a new O-ring (B) to the pump (C), and install the hose (D) in its clamp (E).



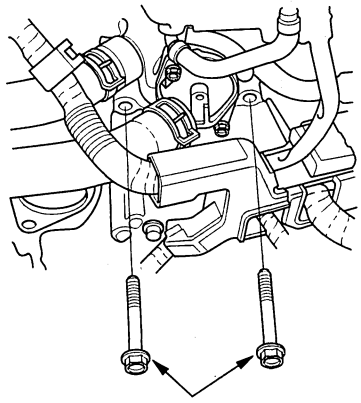
32. Connect the return the hose (F) to the power steering fluid reservoir (G), then secure the hose with its clamp (H).

(cont'd)

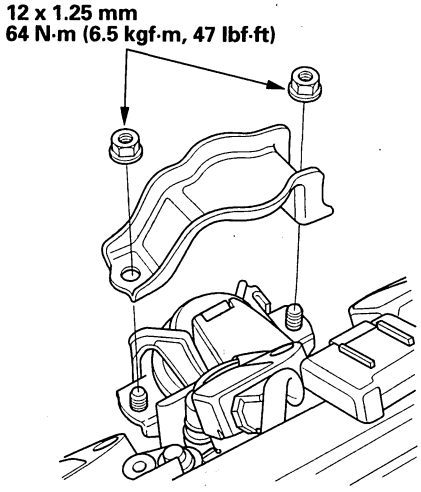
Protected by AR

Transmission Installation (cont'd)

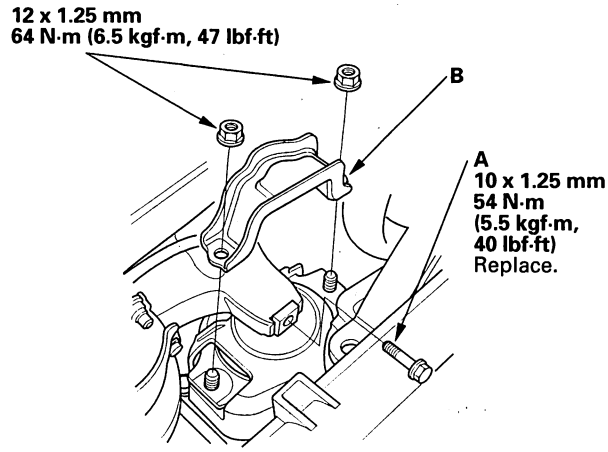
33. Install the transmission upper mounting bolts.



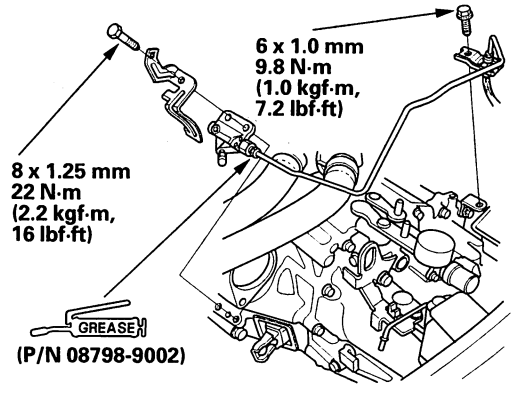
34. Install the rear mount stop.



35. Install the engine front mount mounting bolt (A) and the front mount stop (B).



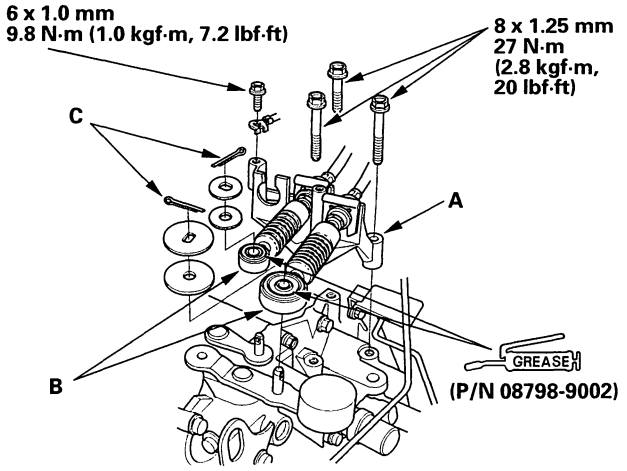
36. Apply super high temp urea grease (P/N 08798-9002) to the end of the cylinder rod. Install the slave cylinder. Be careful not to bend the clutch line.



BACK

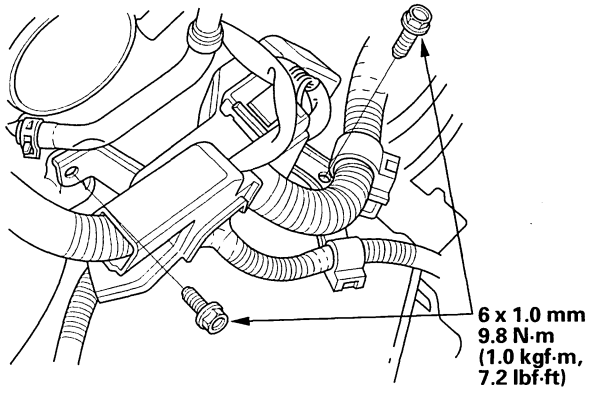
Protected by AR

37. Install the cable bracket (A) and cables (B).

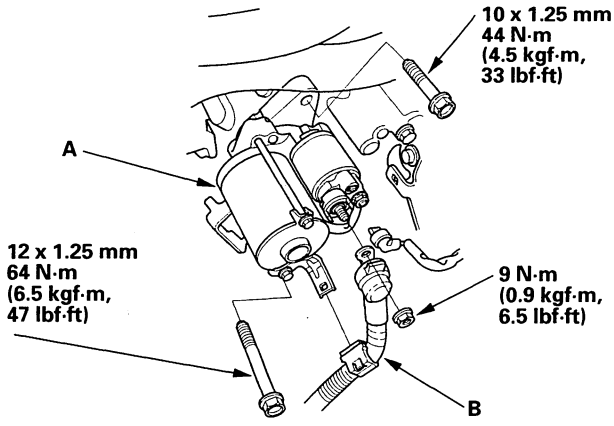


38. Apply a light coat of super high temp urea grease (P/N 08798-9002) to the cable ends, and install new cotter pins (C).

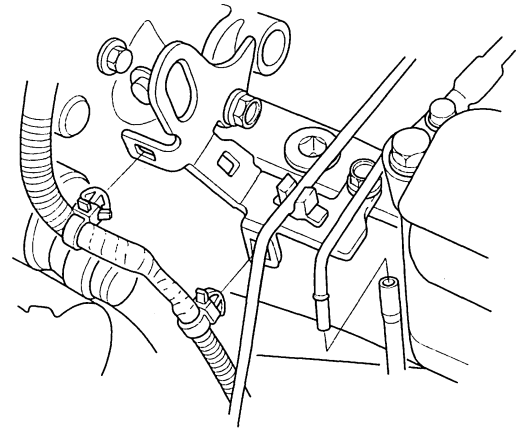
39. Install the harness bracket.



40. Install the starter motor (A), then connect the starter cable (B).



41. Install the harness clips.

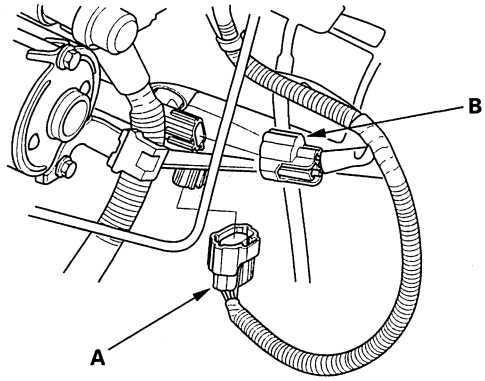


(cont'd)

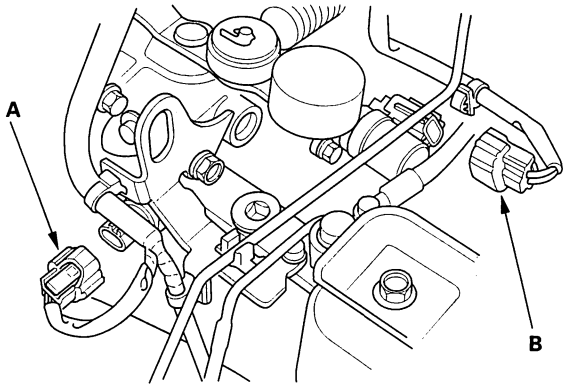
Protected by AR

Transmission Installation (cont'd)

42. Connect the output shaft (countershaft) speed sensor connector (A) and input shaft (mainshaft) speed sensor connector (B).

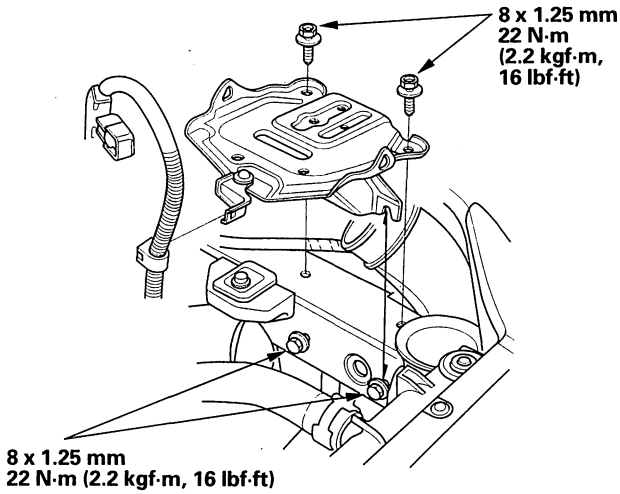


43. Connect the back-up light switch connector (A) and reverse lockout solenoid connector (B).

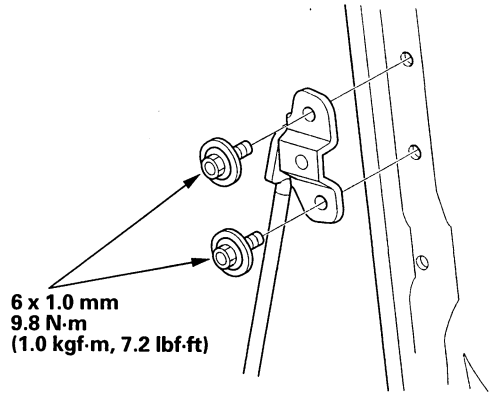


44. Install the air cleaner housing (see page 11-344).

45. Install the battery base.



46. Reinstall the support strut bracket with the bolts to the proper locations on both sides of the hood.



BACK

Protected by AR

47. Remove the steering wheel, refer to the 2003-2006 Accord Service Manual (see page 17-22).

48. Center the cable reel by first rotating it clockwise until it stops. Then rotate it counterclockwise (about three full turns) until the arrow mark on the label points straight up.

49. Reinstall the steering wheel, refer to the 2003-2006 Accord Service Manual (see page 17-24).

50. Fill the power steering fluid reservoir with fluid to the upper level line.

51. Install the battery. Connect the positive cable to the battery first, then connect the negative cable.

52. Start the engine, and run it at fast idle, then turn the steering wheel from lock-to-lock several times to bleed air from the system.

53. Recheck the fluid level, and refill if necessary.

54. Check the front wheel alignment, refer to the 2003-2006 Accord Service Manual (see page 18-6).

55. Check the steering wheel spoke angle. If the steering spoke angles to the right and left are not equal (steering wheel and rack are not centered), correct the engagement of the joint/pinion shaft serrations, then adjust the front toe by turning the tie-rod ends if necessary. If you need to correct the engagement of the joint/pinion shaft, repeat steps 52 thru 54.

56. Test-drive the vehicle.

57. Check the clutch operation.

58. Enter the anti-theft code for the radio and navigation system, then enter the customer's radio station and XM radio channel presets.

59. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

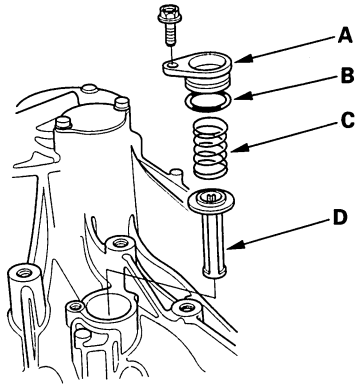
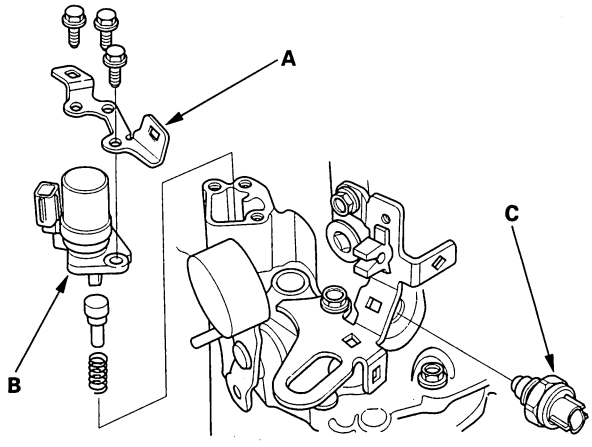
Transmission Disassembly (cont'd)

NOTE: Place the clutch housing on two pieces of wood thick enough to keep the mainshaft from hitting the workbench.

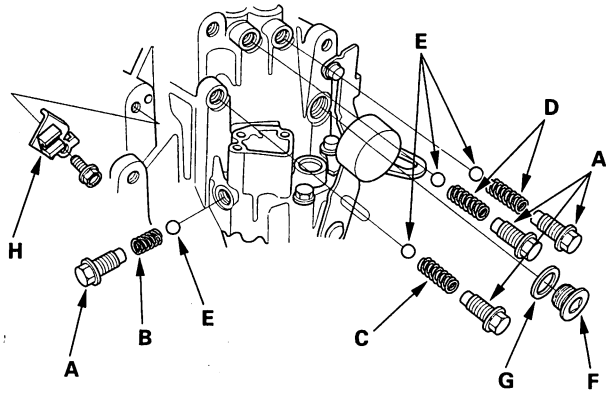
1. Remove the strainer cover (A), O-ring (B), strainer set spring (C), and oil pump strainer (D).



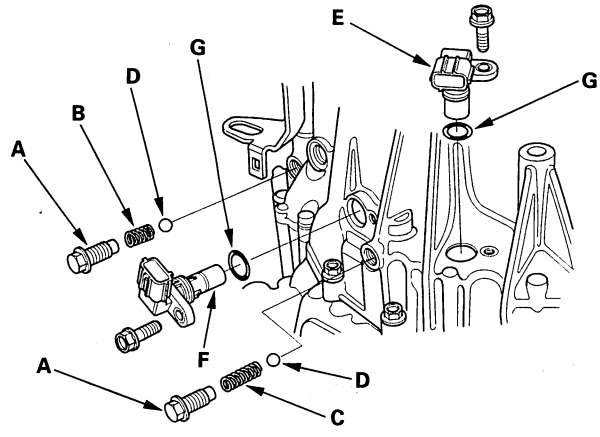
2. Remove the transmission harness stay (A), reverse lockout solenoid (B), and back-up light switch (C).



3. Remove the set screws (A), 22.0 mm spring (B), 26.1 mm spring (C), 27.4 mm springs (D), steel balls (E), oil filler plug (F), washer (G), and clutch line bracket (H).



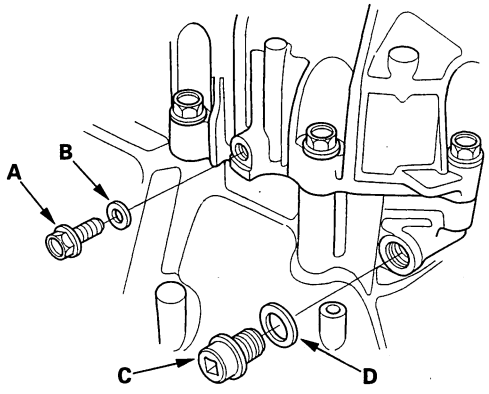
4. Remove the set screws (A), 22.0 mm spring (B), 27.4 mm spring (C), steel balls (D), output shaft (countershaft) speed sensor (E), input shaft (mainshaft) speed sensor (F), and O-rings (G).



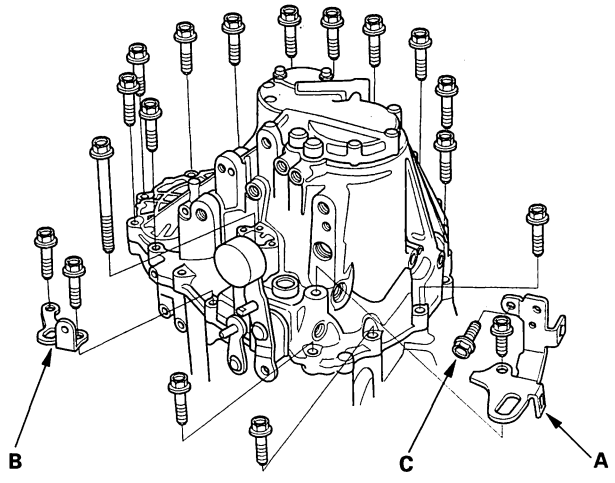
BACK

Protected by AR

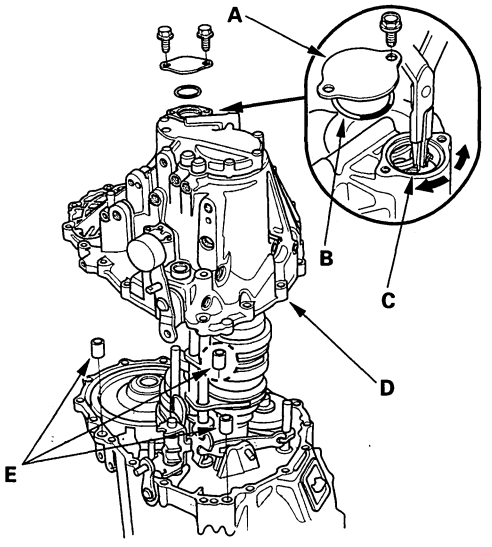
5. Remove the oil check bolt (A), 6 mm washer (B), drain plug (C), and 14 mm washer (D).



6. Remove the transmission hanger (A), transmission hanger (B), and 8 mm flange bolt (C). Loosen the 10 mm flange bolts in a crisscross pattern in several steps, then remove them.

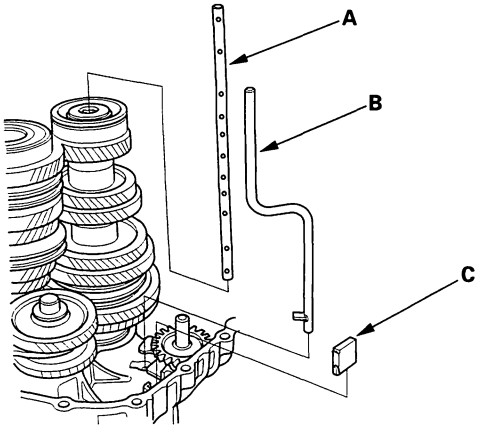


7. Remove the transmission case cap (A) and 37.7 mm O-ring (B).



8. While expanding the 75 mm snap ring (C) of the countershaft ball bearing with snap ring pliers, lift the transmission housing (D). Release the snap ring pliers, and remove the transmission housing and 14 x 20 mm dowel pins (E).

9. Remove the oil guide pipe A, oil guide pipe (B), and magnet (C).

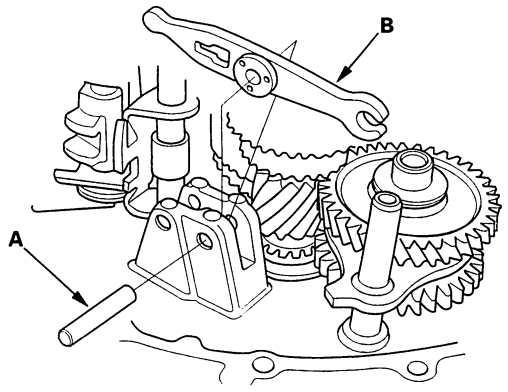


(cont'd)

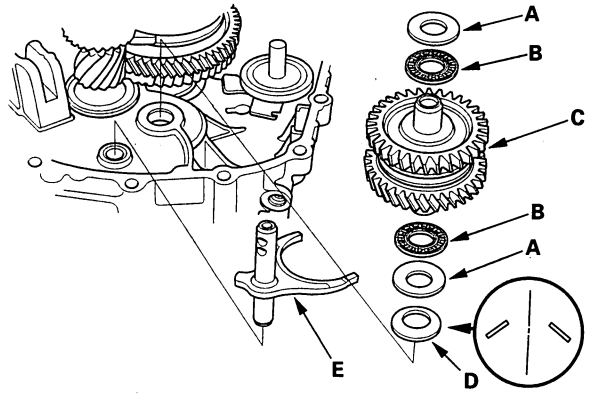
Protected by AR

Transmission Disassembly (cont'd)

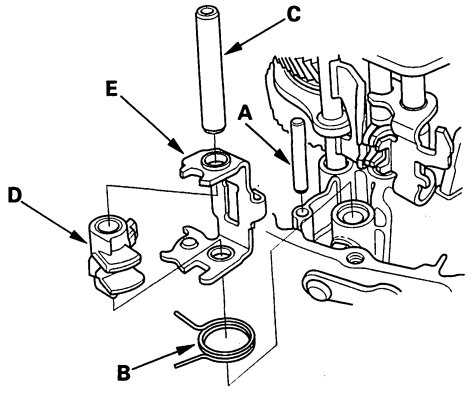
10. Remove the pin (A) and reverse shift lever (B).



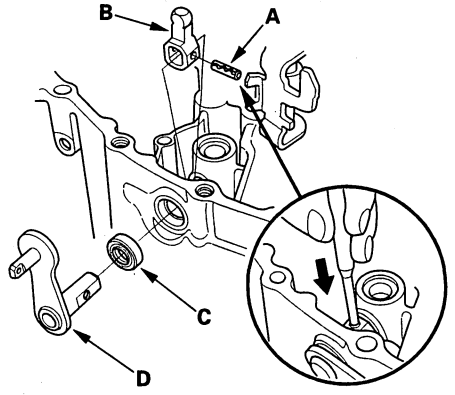
11. Remove the 20 mm thrust washers (A), 20 mm thrust needle bearings (B), reverse idler gear shaft assembly (C), 33 mm spring washer (D), and reverse shift fork (E) as an assembly.



12. Remove the pin (A), select return spring (B), shift piece shaft (C), shift piece (D), and interlock (E).



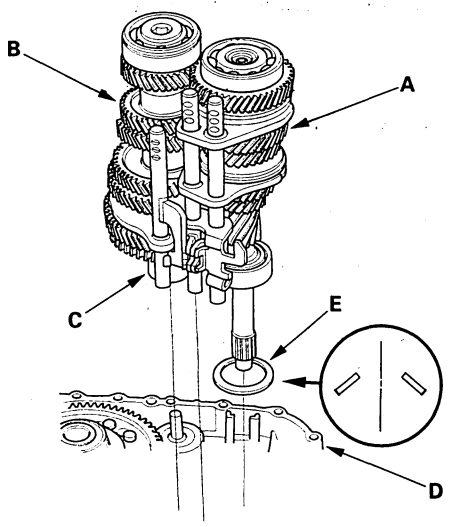
13. Remove the 5 mm spring pin, 3 mm spring pin (A), select arm (B), 14 x 20 x 5 mm dust seal (C), and select lever (D).



BACK

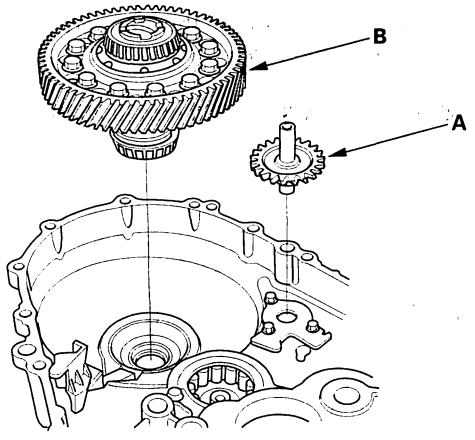
Protected by AR

14. Apply tape to the mainshaft splines to protect the seal, then remove the mainshaft assembly (A) and countershaft assembly (B) with the shift forks (C) from the clutch housing (D).

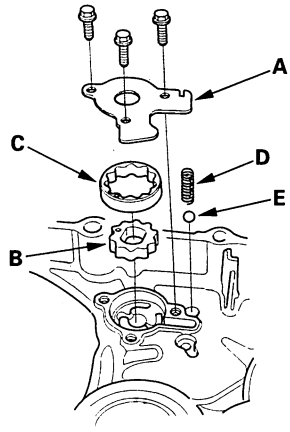


15. Remove the 64 mm spring washer (E).

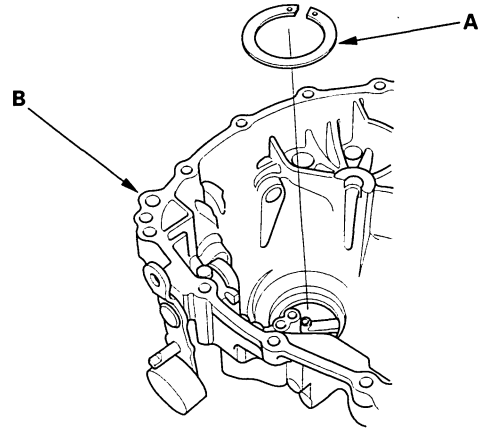
16. Remove the oil pump shaft (A) and differential assembly (B).



17. Remove the oil pump plate (A), oil pump inner rotor (B), oil pump outer rotor (C), relief valve spring (D), and steel ball (E).



18. Remove the 82 mm shim (A) from the transmission housing (B).

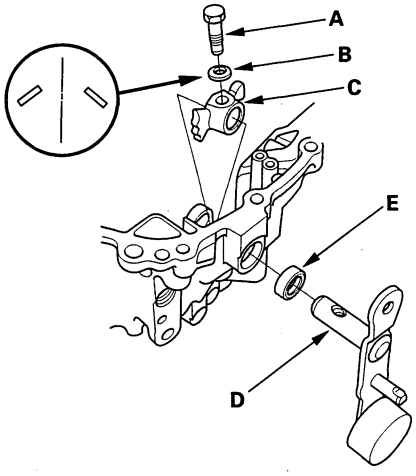


(cont'd)

Protected by AR

Transmission Disassembly (cont'd)

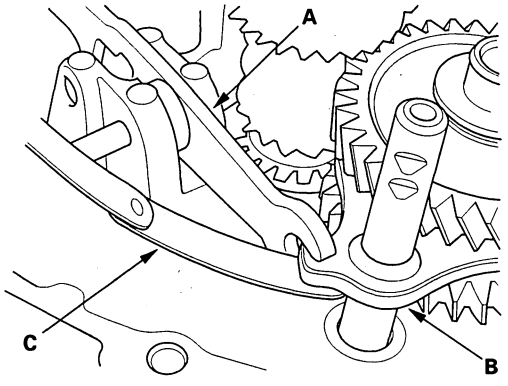
19. Remove the 8 mm special bolt (A), 8 mm spring washer (B), shift arm (C), change lever (D), and 16 x 23 x 5 mm dust seal (E).



Reverse Shift Lever Clearance Inspection

1. Measure the clearance between the reverse shift lever (A) and reverse shift fork (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 2.

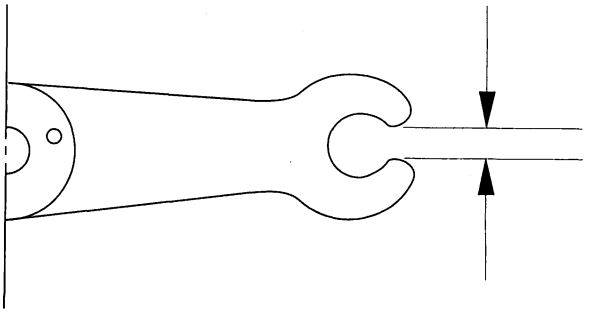
Standard: **0.05—0.50 mm (0.002—0.020 in.)**
Service Limit: **0.6 mm (0.024 in.)**



2. Measure the width of the reverse shift lever.

- If the width is not within the standard, replace the reverse shift lever.
- If the width is within the standard, replace the reverse shift fork.

Standard: 6.400—6.650 mm (0.2520—0.2618 in.)

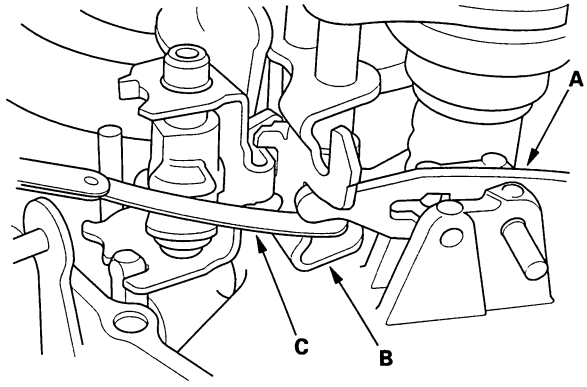


BACK

Protected by AR

3. Measure the clearance between the reverse shift lever (A) and reverse shift piece (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 4.

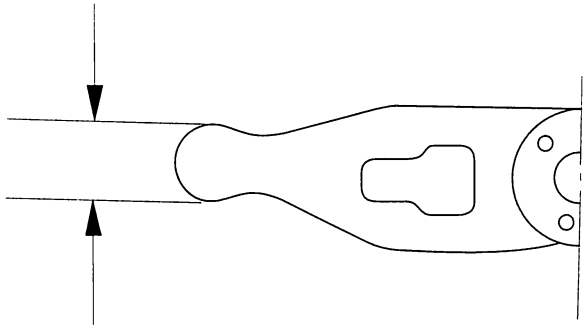
Standard: 0—0.4 mm (0—0.015 in.)
Service Limit: 0.5 mm (0.020 in.)



4. Measure the width of the reverse shift lever.

- If the width is not within the standard, replace the reverse shift lever.
- If the width is within the standard, replace the reverse shift piece.

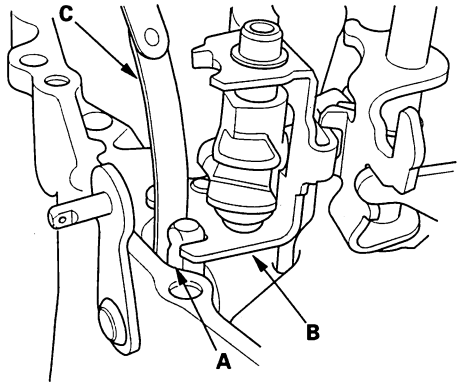
Standard: 13.0—13.2 mm (0.51—0.52 in.)



Select Arm Clearance Inspection

1. Measure the clearance between the select arm (A) and interlock (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 2.

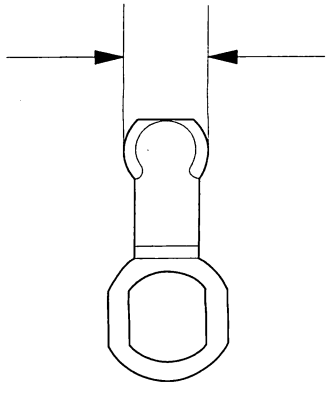
Standard: 0.05—0.25 mm (0.002—0.010 in.)
Service Limit: 0.5 mm (0.020 in.)



2. Measure the width of the select arm.

- If the width is not within the standard, replace the select arm.
- If the width is within the standard, replace the interlock.

Standard: 12.9—13.0 mm (0.50—0.51 in.)

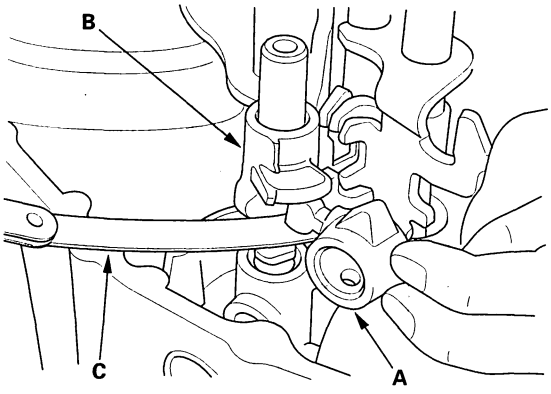


Protected by AR

Shift Arm Clearance Inspection

1. Measure the clearance between the shift arm (A) and shift piece (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 2.

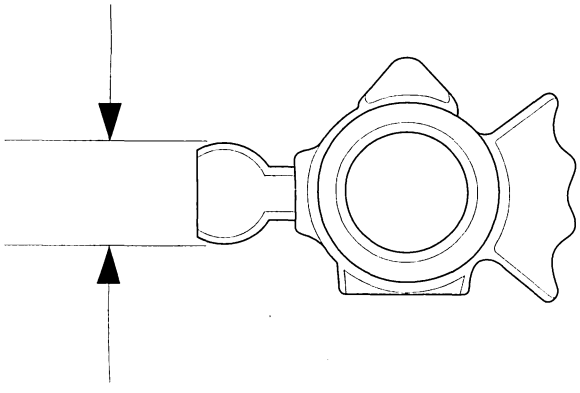
Standard: 0.05—0.25 mm (0.002—0.010 in.)
Service Limit: 0.5 mm (0.020 in.)



2. Measure the width of the shift arm.

- If the width is not within the standard, replace the shift arm.
- If the width is within the standard, replace the shift piece.

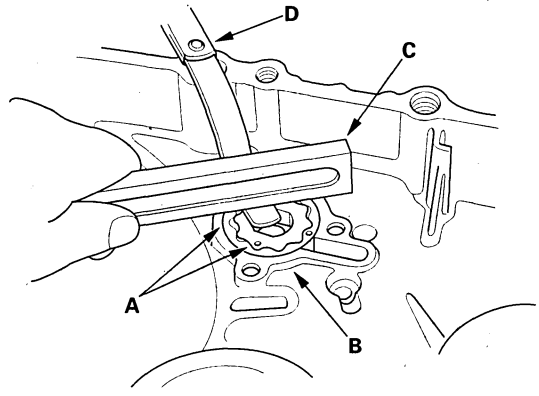
Standard: 13.9—14.0 mm (0.54—0.55 in.)



Oil Pump Clearance Inspection

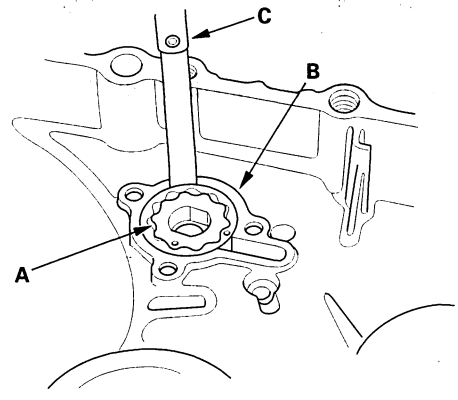
1. Measure the thrust clearance between the oil pump gears (A) and clutch housing (B) with a straight edge (C) and a feeler gauge (D).

Standard (new): 0.03—0.13 mm (0.001—0.005 in.)
Service Limit: 0.15 mm (0.006 in.)



2. Measure the side clearance between the outer rotor (A) and clutch housing (B) with a feeler gauge (C).

Standard (new): 0.1—0.2 mm (0.004—0.008 in.)
Service Limit: 0.22 mm (0.009 in.)

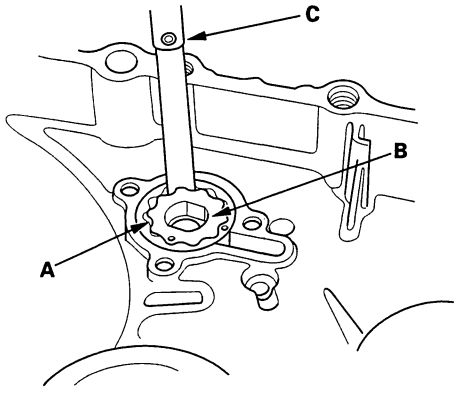


BACK

Protected by AR

3. Measure the side clearance between the outer rotor (A) and inner rotor (B) with a feeler gauge (C).

Standard (new) : 0.14 mm (0.006 in.)
Service Limit: 0.2 mm (0.008 in.)



4. If the clearance is not within the standard, replace the oil pump outer and inner rotors.

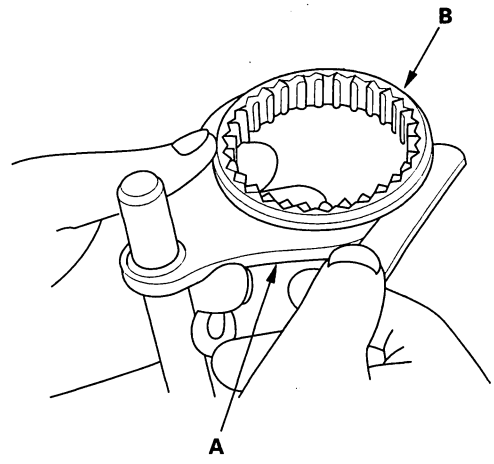
Shift Fork Clearance Inspection

NOTE: The synchro sleeve and synchro hub should be replaced as a set.

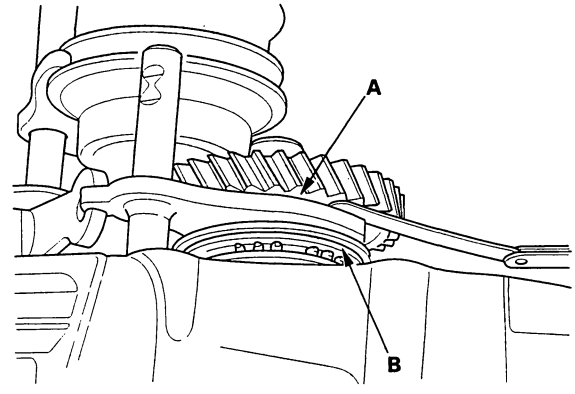
1. Measure the clearance between each shift fork (A) and its matching synchro sleeve (B). If the clearance exceeds the service limit, go to step 2.

Standard: 0.35—0.65 mm (0.014—0.026 in.)
Service Limit: 1.0 mm (0.039 in.)

1ST/2ND, 3RD/4TH, 5TH/6TH:



REVERSE:



(cont'd)

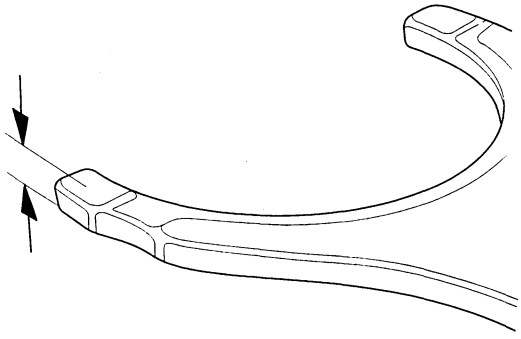
Protected by AR

Shift Fork Clearance Inspection (cont'd)

2. Measure the thickness of the shift fork fingers.

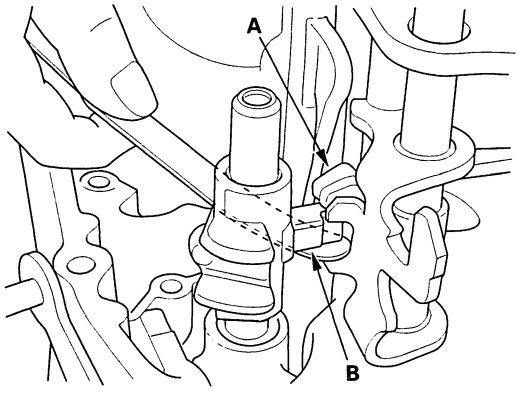
   - If the thickness is not within the standard, replace the shift fork.
   - If the thickness is within the standard, replace the synchro sleeve.
   - If one arm of the shift fork shows more wear than others, the fork may be bent and needs to be replaced.

   Standard:
   1st/2nd, 3rd/4th, 5th/6th: 7.4—7.6 mm (0.29—0.30 in.)
   Reverse: 6.2—6.4 mm (0.24—0.25 in.)



3. Measure the clearance between the shift fork (A) and shift piece (B). If the clearance exceeds the service limit, go to step 4.

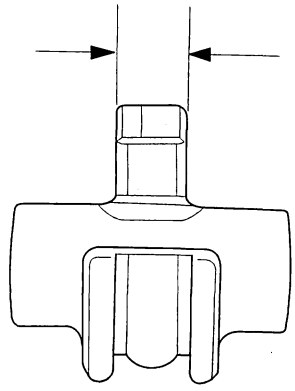
   Standard: 0.2—0.6 mm (0.008—0.024 in.)
   Service Limit: 0.7 mm (0.028 in.)



4. Measure the width of the shift piece.

   - If the width is not within the standard, replace the shift piece.
   - If the width is within the standard, replace the shift fork.

   Standard: 12.8—13.0 mm (0.50—0.51 in.)



BACK

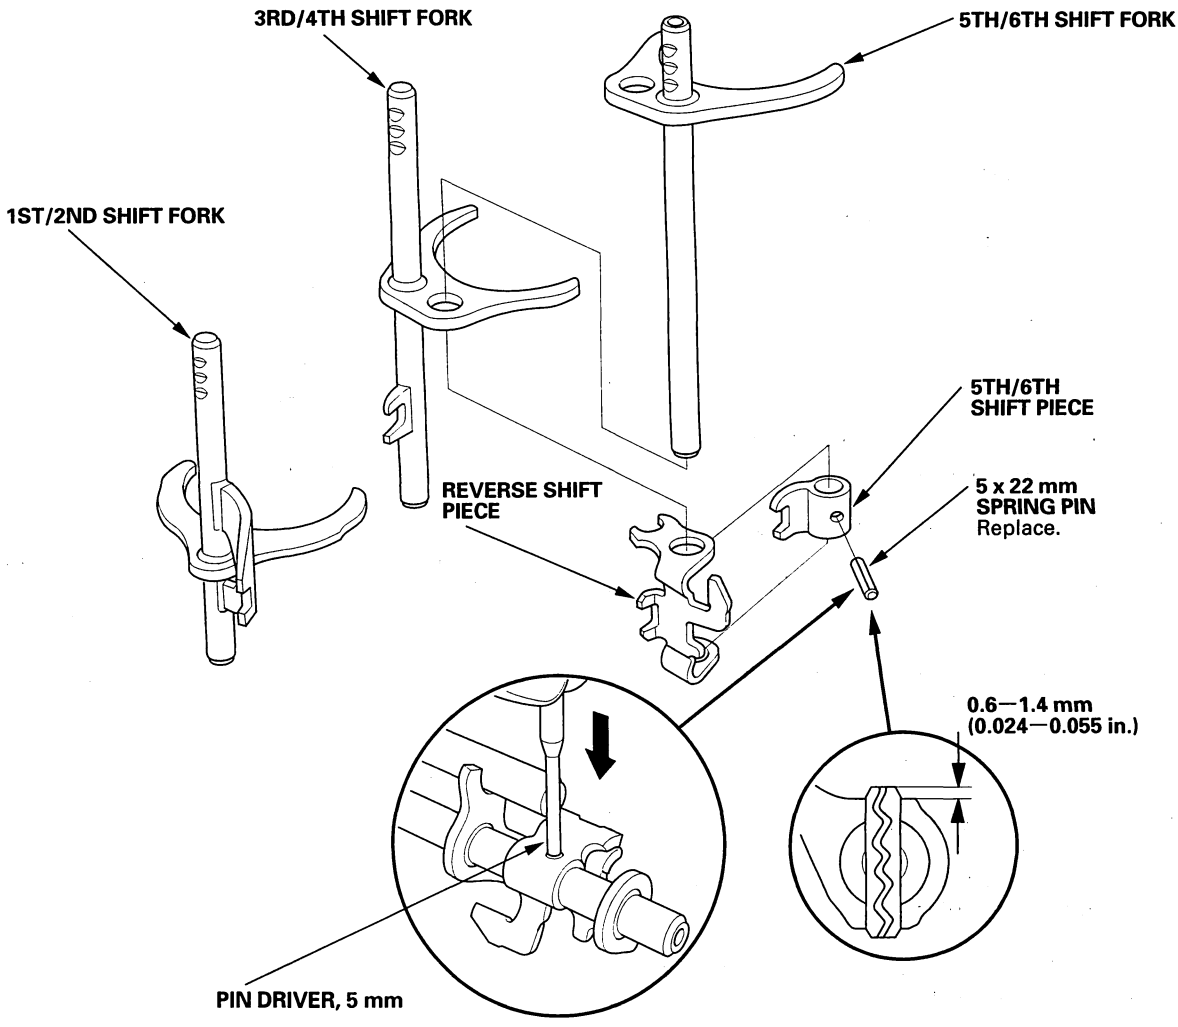
Shift Fork Disassembly/Reassembly

Prior to reassembling, clean all parts in solvent, dry them, and apply lubricant to all contact surfaces.

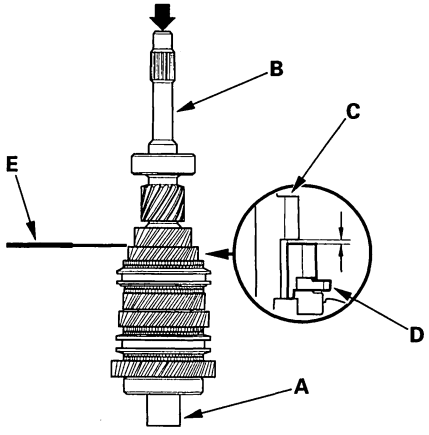


Protected by AR

Mainshaft Assembly Clearance Inspection

NOTE: If replacement is required, always replace the synchro sleeve and hub as a set.

1. Support the bearing inner race with an appropriate sized socket (A), and push down on the mainshaft (B).



2. Measure the clearance between 2nd gear (C) and 3rd gear (D) with a feeler gauge (E).

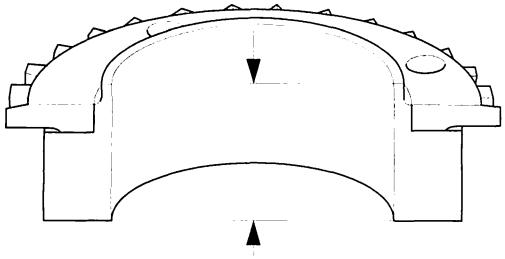
   - If the clearance is more than the service limit, go to step 3.
   - If the clearance is within the service limit, go to step 4.

   Standard: 0.06—0.19 mm (0.002—0.007 in.)
   Service Limit: 0.3 mm (0.01 in.)

3. Measure the thickness of 3rd gear.

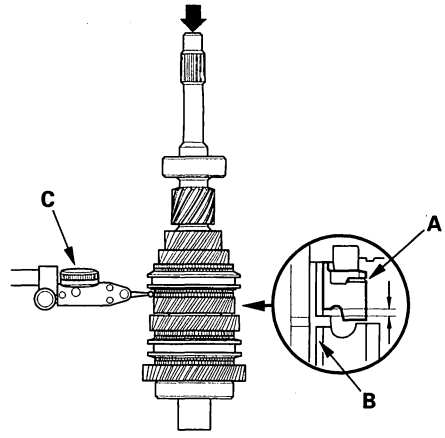
   - If the thickness is less than the service limit, replace 3rd gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub/sleeve.

   Standard: 23.89—23.97 mm (0.941—0.944 in.)
   Service Limit: 23.8 mm (0.94 in.)



4. Measure the clearance between 4th gear (A) and the distance collar (B) with a dial indicator (C). If the clearance is more than the service limit, go to step 5.

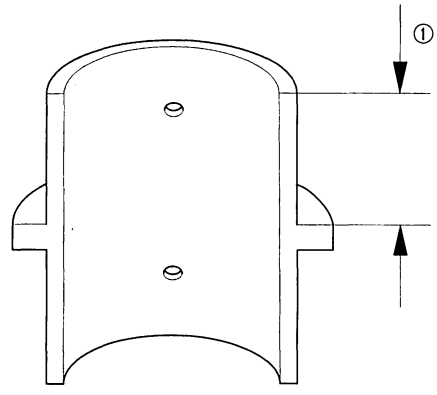
   Standard: 0.06—0.19 mm (0.002—0.007 in.)
   Service Limit: 0.3 mm (0.01 in.)



5. Measure distance ① on the 4th gear side distance collar.

   - If distance ① is not within the standard, replace the distance collar.
   - If distance ① is within the standard, go to step 6.

   Standard: 22.53—22.58 mm (0.887—0.889 in.)



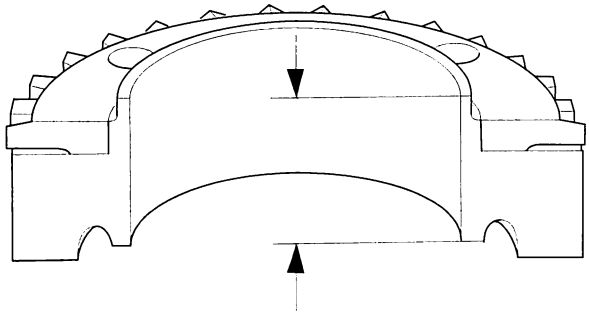
BACK

Protected by AR

6. Measure the thickness of 4th gear.

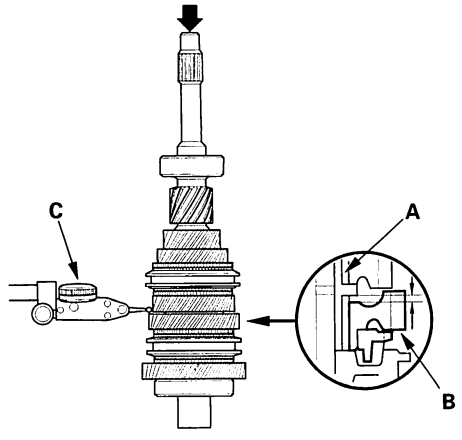
   - If the thickness is less than the service limit, replace 4th gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub/sleeve.

   Standard: 22.39—22.47 mm (0.881—0.885 in.)
   Service Limit: 22.3 mm (0.88 in.)



7. Measure the clearance between the distance collar (A) and 5th gear (B) with a dial indicator (C). If the clearance is more than the service limit, go to step 8.

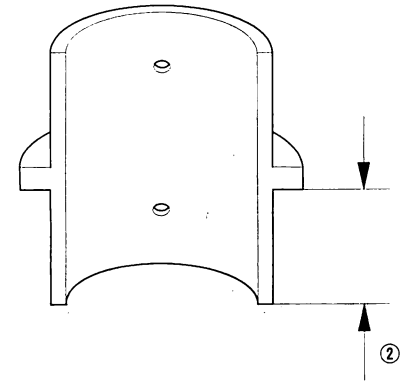
   Standard: 0.06—0.19 mm (0.002—0.007 in.)
   Service Limit: 0.3 mm (0.01 in.)



8. Measure distance ② on the 5th gear side distance collar.

   - If distance ② is not within the standard, replace the distance collar.
   - If distance ② is within the standard, go to step 9.

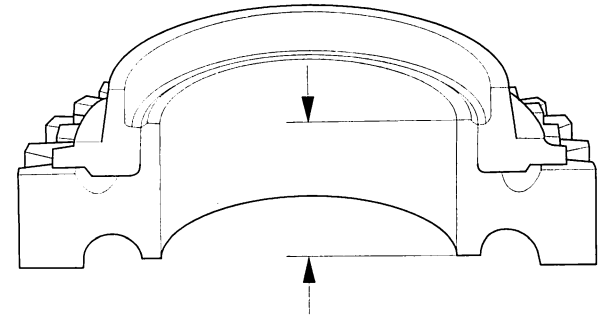
   Standard: 22.53—22.58 mm (0.887—0.889 in.)



9. Measure the thickness of 5th gear.

   - If the thickness is less than the service limit, replace 5th gear.
   - If the thickness is within the service limit, replace the 5th/6th synchro hub/sleeve.

   Standard: 22.39—22.47 mm (0.881—0.885 in.)
   Service Limit: 22.3 mm (0.88 in.)



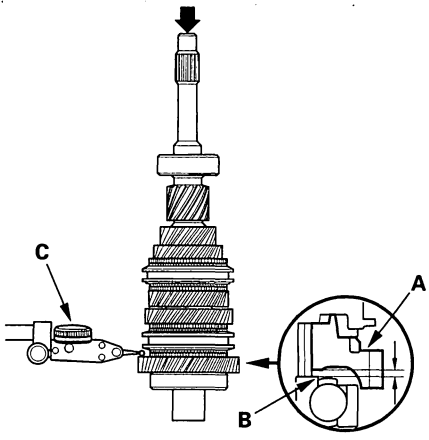
(cont'd)

Protected by AR

Mainshaft Assembly Clearance Inspection (cont'd)

10. Measure the clearance between 6th gear (A) and the angular ball bearing inner race (B) with a dial indicator (C). If the clearance is more than the service limit, go to step 11.

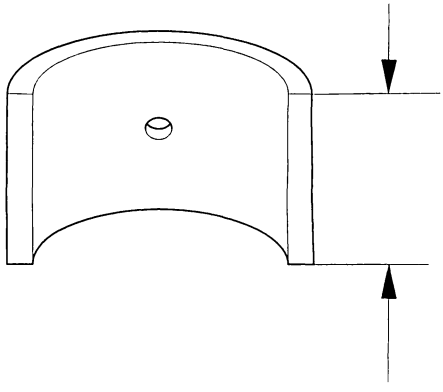
Standard: 0.06—0.19 mm (0.002—0.007 in.)
Service Limit: 0.3 mm (0.01 in.)



11. Measure the thickness of the distance collar.

- If the thickness is less than the standard, replace the distance collar.
- If the thickness is within the standard, go to step 12.

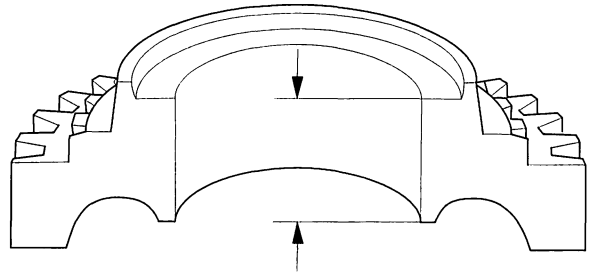
Standard: 22.03—22.08 mm (0.867—0.869 in.)



12. Measure the thickness of 6th gear.

- If the thickness is less than the service limit, replace 6th gear.
- If the thickness is within the service limit, replace the 5th/6th synchro hub/sleeve.

Standard: 21.89—21.97 mm (0.862—0.865 in.)
Service Limit: 21.8 mm (0.86 in.)

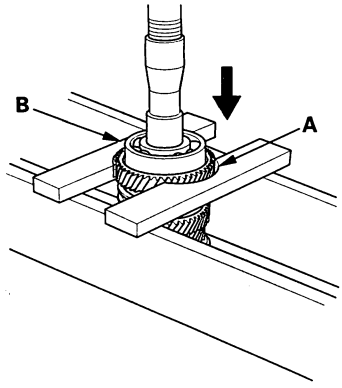


BACK

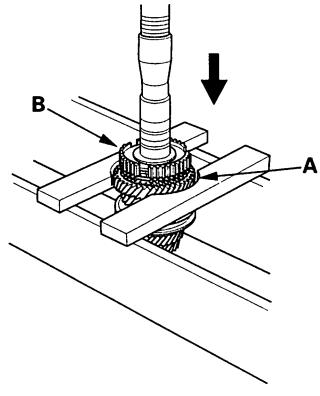
Protected by AR

Mainshaft Disassembly

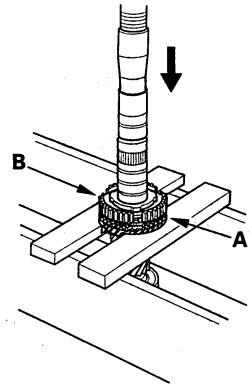
1. Support 6th gear (A) on the steel blocks, and press the mainshaft out of the ball bearing (B). Use of a jaw-type puller can damage the gear teeth.



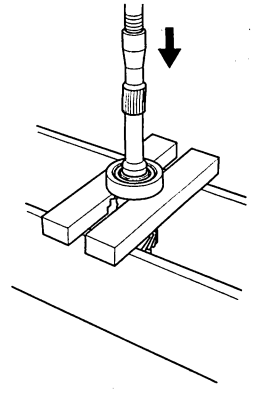
2. Support 5th gear (A) on the steel blocks, and press the mainshaft out of the 5th/6th synchro hub (B). Use of a jaw-type puller can damage the gear teeth.



3. Support 3rd gear (A) on the steel blocks, and press the mainshaft out of the 3rd/4th synchro hub (B). Use of a jaw-type puller can damage the gear teeth.



4. Support the angular ball bearing on the steel blocks, and press out the mainshaft.



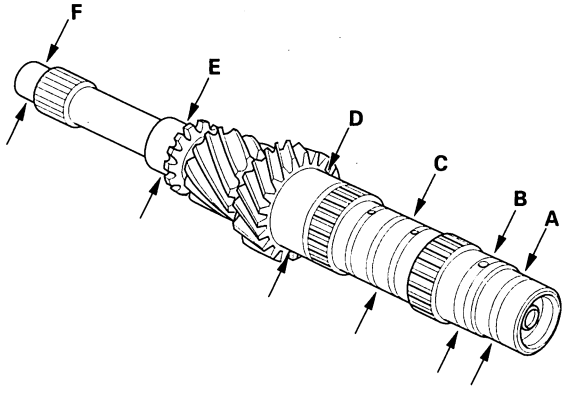
BACK

Protected by AR

Mainshaft Inspection

1. Inspect the oil passage, gear, and bearing surfaces for wear and damage, then measure the mainshaft at points A, B, C, D, E, and F. If any part of the mainshaft is less than the service limit, replace it.

Standard:
A Ball bearing surface (transmission housing side):
30.987—31.000 mm (1.2200—1.2205 in.)
B 6th gear distance collar surface:
32.987—33.000 mm (1.2987—1.2992 in.)
C 4th/5th gear distance collar surface:
35.987—36.000 mm (1.4168—1.4173 in.)
D Needle bearing surface:
41.984—42.000 mm (1.6529—1.6535 in.)
E Ball bearing surface (clutch housing side):
28.002—28.015 mm (1.1024—1.1030 in.)
F Pilot bearing surface:
19.967—19.980 mm (0.7861—0.7866 in.)
Service Limit:
A: 30.93 mm (1.218 in.)
B: 32.93 mm (1.296 in.)
C: 35.93 mm (1.415 in.)
D: 41.93 mm (1.651 in.)
E: 27.95 mm (1.100 in.)
F: 19.91 mm (0.784 in.)



2. Inspect the runout by supporting both ends of the mainshaft. Then rotate the mainshaft two complete turns while measuring with a dial gauge. If the runout is more than the service limit, replace the mainshaft.

Standard: 0.02 mm (0.001 in.)
Service Limit: 0.05 mm (0.002 in.)

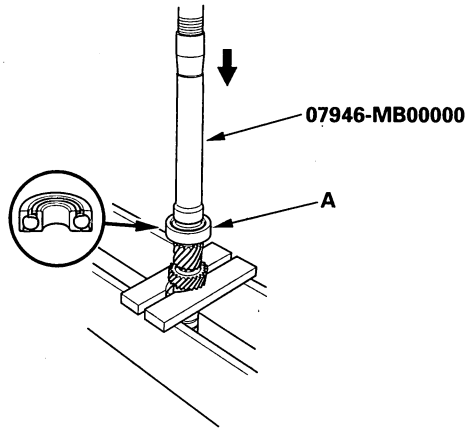
Mainshaft Reassembly (cont'd)

Special Tools Required
- Driver, 40 mm I.D. 07746-0030100
- Driver, 30 mm I.D. 07946-MB00000

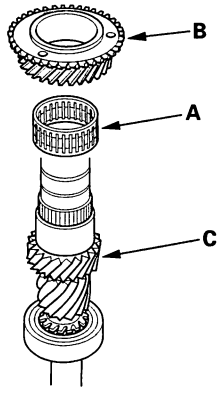
NOTE: Refer to the Exploded View as needed during this procedure.

1. Clean all parts in solvent, dry them, and apply lubricant to all contact surfaces except the 3rd/4th and 5th/6th synchro hubs.

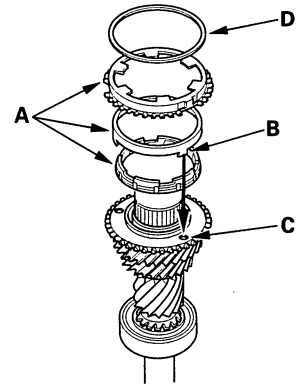
2. Install the new angular ball bearing (A) using the special tool and a press. Note the direction of installation.



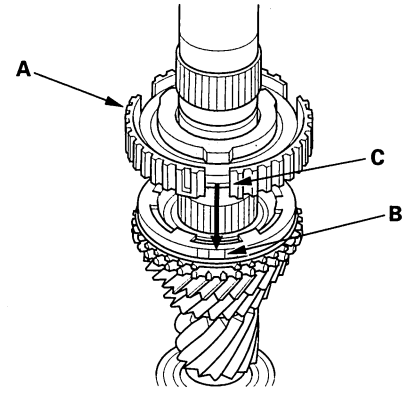
3. Install the needle bearing (A) and 3rd gear (B) on the mainshaft (C).



4. Install the double cone synchro assembly (A) by aligning the synchro cone fingers (B) with the holes in 3rd gear (C), then install the synchro spring (D).



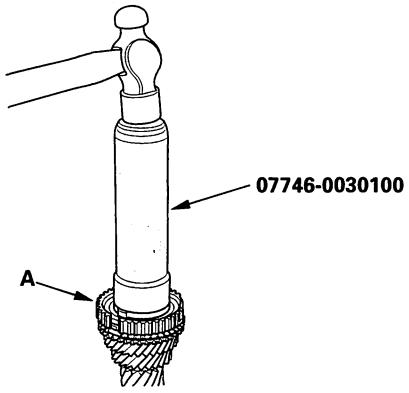
5. Install the 3rd/4th synchro hub (A) by aligning the outer synchro ring fingers (B) with the grooves in the 3rd/4th synchro hub (C).



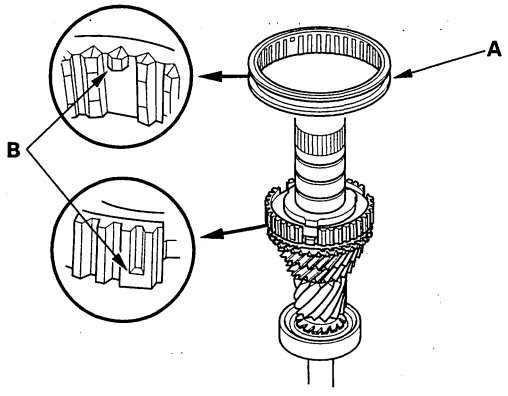
BACK

Protected by AR

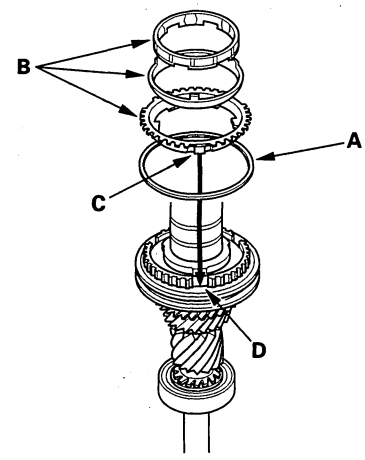
6. Install the 3rd/4th synchro hub (A) using the special tool.



7. Install the 3rd/4th synchro sleeve (A) by aligning the stops (B) with the 3rd/4th synchro sleeve and hub. After installing, check the operation of the 3rd/4th synchro hub set.

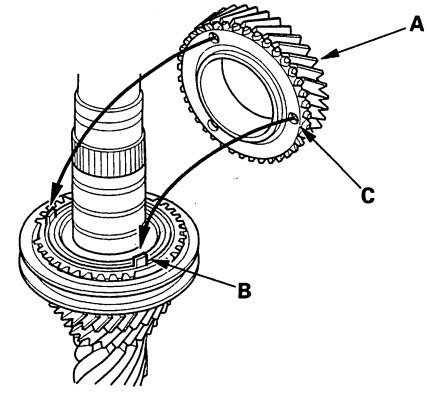


8. Install the synchro spring (A).



9. Install the double cone synchro assembly (B) by aligning the outer synchro ring fingers (C) with the grooves in the 3rd/4th synchro hub (D).

10. Install 4th gear (A) by aligning the synchro cone fingers (B) with the holes in 4th gear (C).



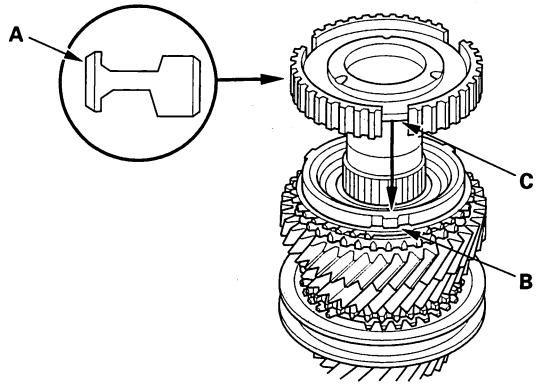
11. Install the needle bearings, distance collar, 5th gear, synchro ring, and synchro spring.

(cont'd)

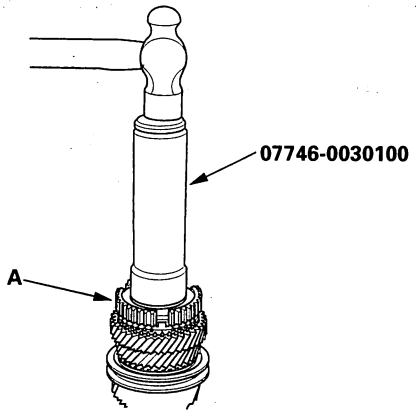
Protected by AR

Mainshaft Reassembly (cont'd)

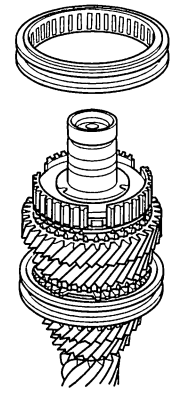
12. Install the 5th/6th synchro hub (A) by aligning the outer synchro ring fingers (B) with the grooves in the 5th/6th synchro hub (C).



13. Install the 5th/6th synchro hub (A) using the special tool.



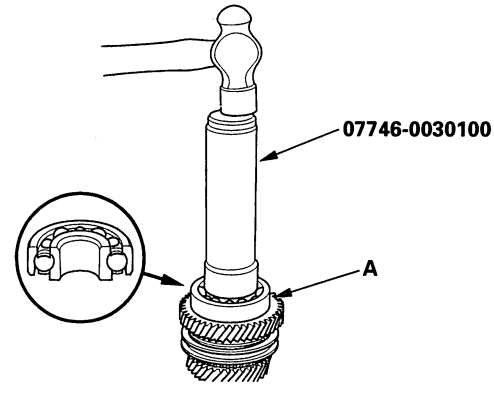
14. Install the 5th/6th synchro sleeve.



15. Install the synchro spring and synchro ring.

16. Install the distance collar, needle bearing, and 6th gear.

17. Install the new angular ball bearing (A) using the special tool. Note the direction of installation.



BACK

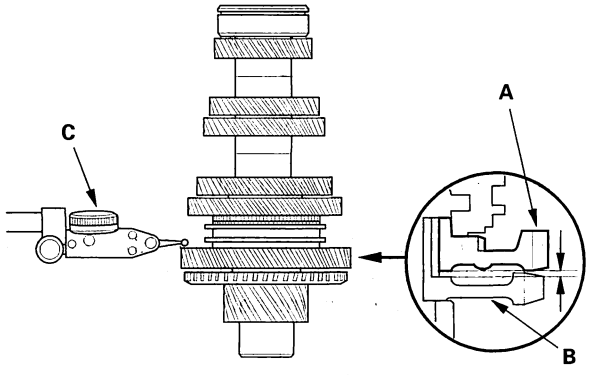
Protected by AR

Countershaft Assembly Clearance Inspection

NOTE: Before inspection, make sure the 20 mm special bolt is tightened to the specified torque.

1. Measure the clearance between 1st gear (A) and the countershaft reverse gear (B) with a dial indicator (C). If the clearance is more than the service limit, go to step 2.

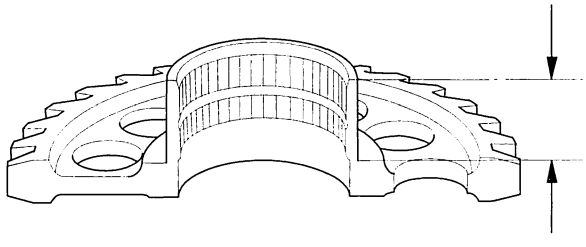
   Standard: 0.04—0.17 mm (0.002—0.007 in.)
   Service Limit: 0.28 mm (0.011 in.)



2. Measure the distance of the countershaft reverse gear.

   - If the distance is less than the standard, replace the countershaft reverse gear.
   - If the thickness is within the standard, go to step 3.

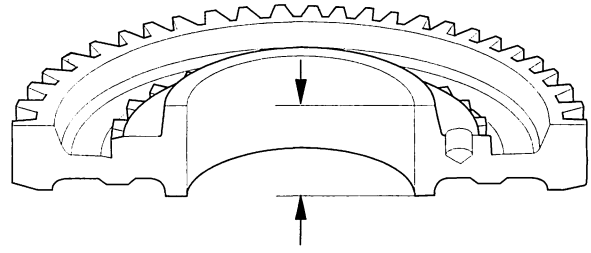
   Standard: 23.03—23.08 mm (0.907—0.909 in.)



3. Measure the thickness of 1st gear.

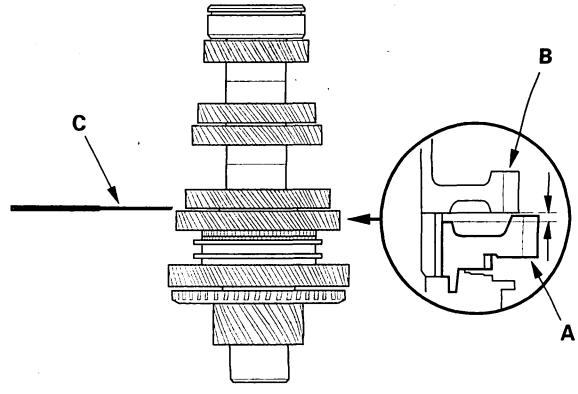
   - If the thickness is less than the service limit, replace 1st gear.
   - If the thickness is within the service limit, replace the 1st/2nd synchro hub/sleeve.

   Standard: 22.91—22.99 mm (0.902—0.905 in.)
   Service Limit: 22.86 mm (0.900 in.)



4. Measure the clearance between 2nd gear (A) and 3rd gear (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 5.

   Standard: 0.04—0.17 mm (0.002—0.007 in.)
   Service Limit: 0.28 mm (0.011 in.)



(cont'd)

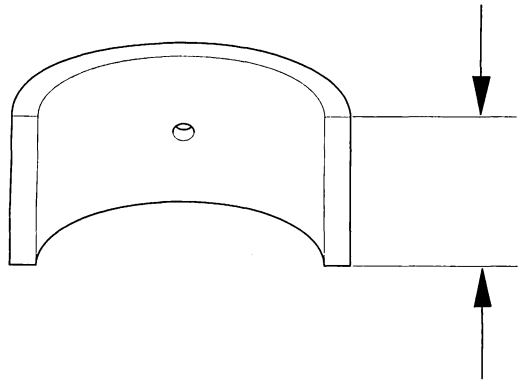
Protected by AR

Countershaft Assembly Clearance Inspection (cont'd)

5. Measure the thickness of the distance collar.

   - If the thickness is less than the standard, replace the distance collar.
   - If the thickness is within the standard, go to step 6.

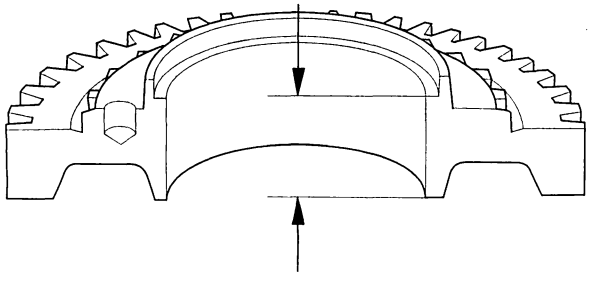
   Standard: 23.03—23.08 mm (0.907—0.909 in.)



6. Measure the thickness of 2nd gear.

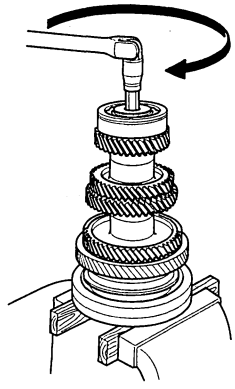
   - If the thickness is less than the service limit, replace 2nd gear.
   - If the thickness is within the service limit, replace the 1st/2nd synchro hub.

   Standard: 22.91—22.99 mm (0.902—0.905 in.)
   Service Limit: 22.86 mm (0.900 in.)



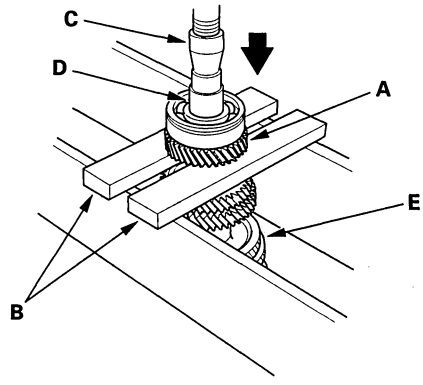
Countershaft Disassembly

1. Securely clamp the countershaft assembly in a vise with wood blocks.



2. Remove the 20 mm special bolt (left-hand threads).

3. Support 6th gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft (E) out of the ball bearing.

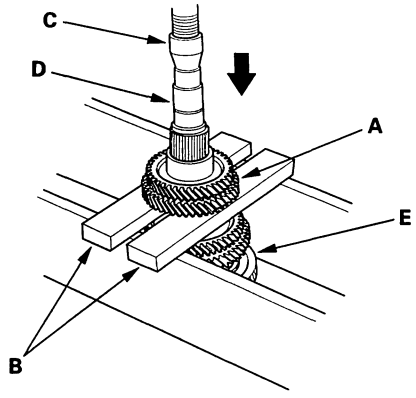


4. Remove the 35 mm shim and 6th gear.

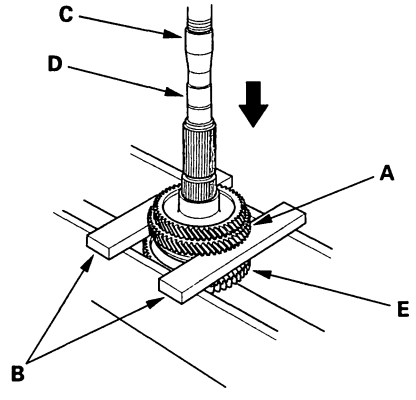
BACK

Protected by AR

5. Support 4th gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft (E) out of 4th and 5th gear.



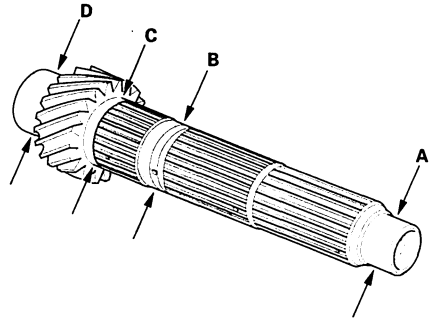
6. Support 2nd gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft (E) out of 2nd and 3rd gear.



Countershaft Inspection

1. Inspect the oil passage, gear, and bearing surfaces for wear and damage, then measure the countershaft at points A, B, C, and D. If any part of the countershaft is less than the service limit, replace it.

Standard:
A Ball bearing surface (transmission housing side):
30.002—30.015 mm (1.1812—1.1817 in.)
B Distance collar surface:
42.975—42.991 mm (1.6919—1.6926 in.)
C Countershaft reverse gear surface:
45.934—45.950 mm (1.8084—1.8091 in.)
D Needle bearing surface (clutch housing side):
43.974—43.990 mm (1.7313—1.7319 in.)
Service Limit:
A: 29.95 mm (1.179 in.)
B: 42.92 mm (1.690 in.)
C: 45.88 mm (1.806 in.)
D: 43.92 mm (1.729 in.)



2. Inspect the runout by supporting both ends of the countershaft. Then rotate the countershaft two complete turns while measuring with a dial gauge. If the runout exceeds the service limit, replace the countershaft.

Standard: 0.02 mm (0.001 in.) max.
Service Limit: 0.05 mm (0.002 in.)

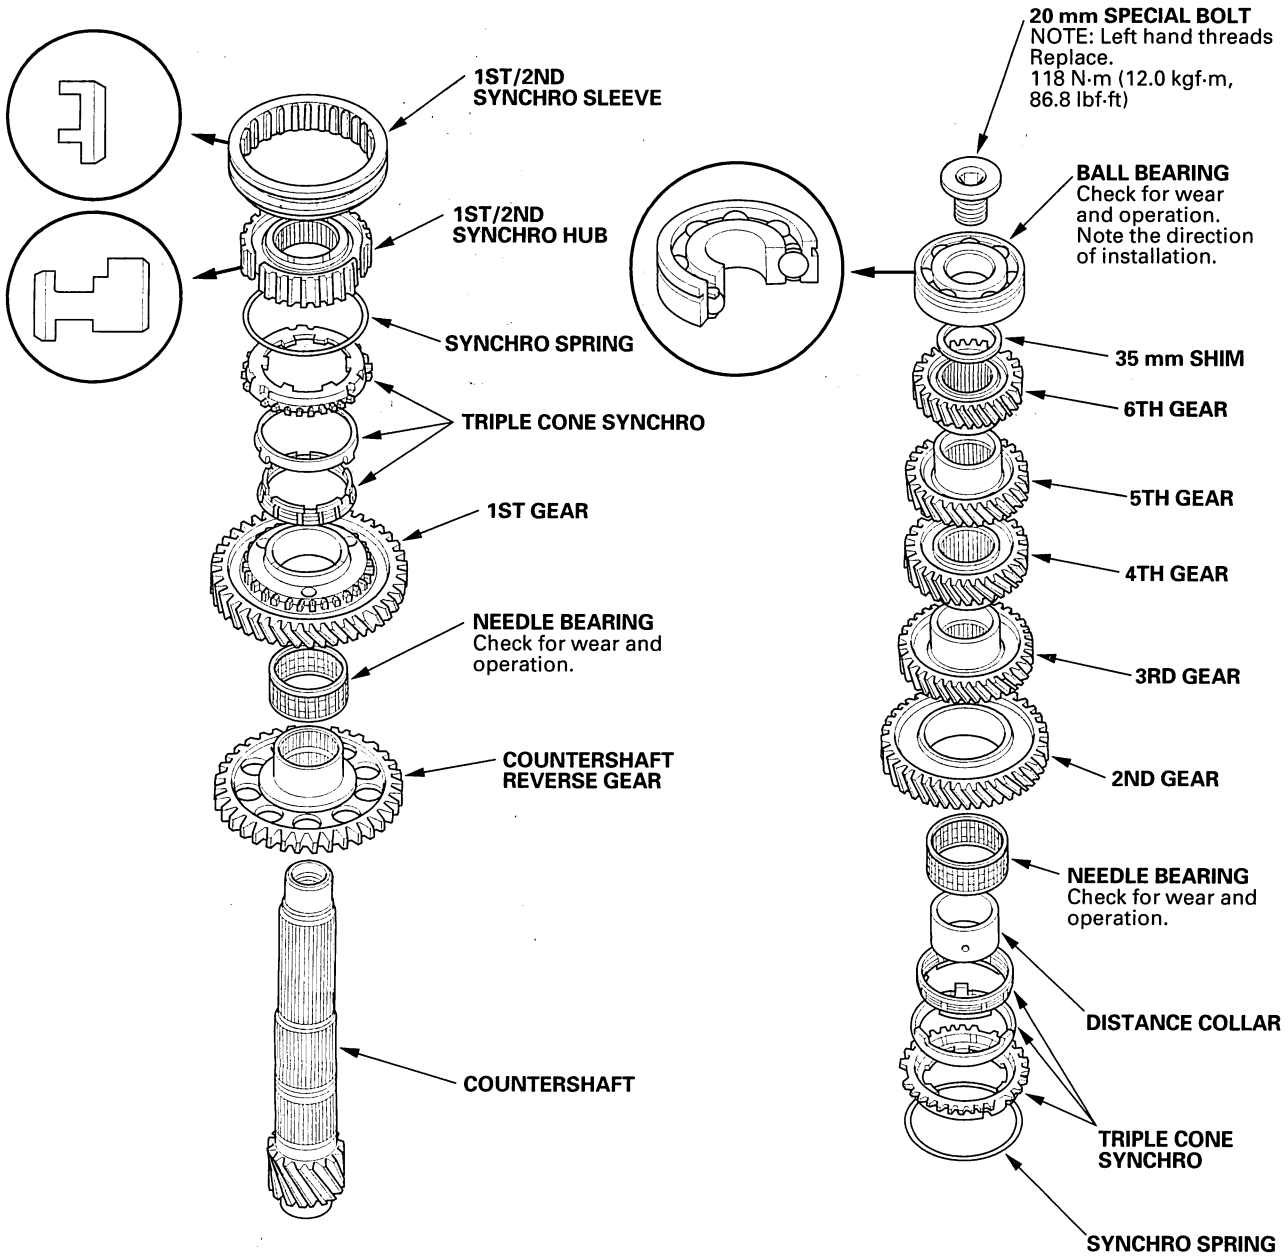
Countershaft Reassembly

Exploded View



BACK

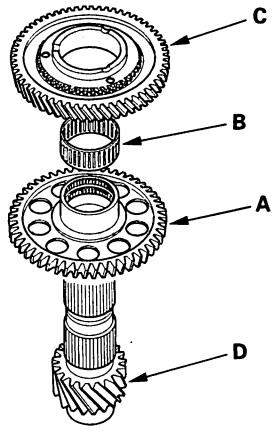
Protected by AR

Special Tools Required
- Driver, 56 x 62 mm 070AD-PYZA100
- Driver, 40 mm I.D. 07746-0030100

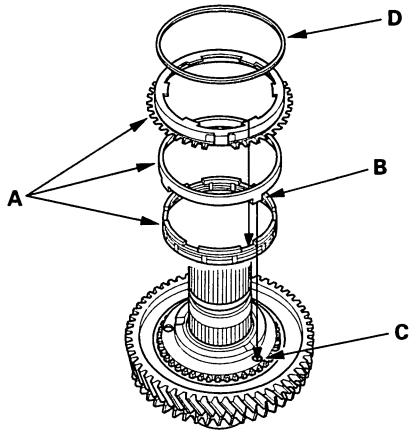
NOTE: Refer to the Exploded View as needed during this procedure.

1. Clean all parts in solvent, dry them, and apply lubricant to all contact surfaces.

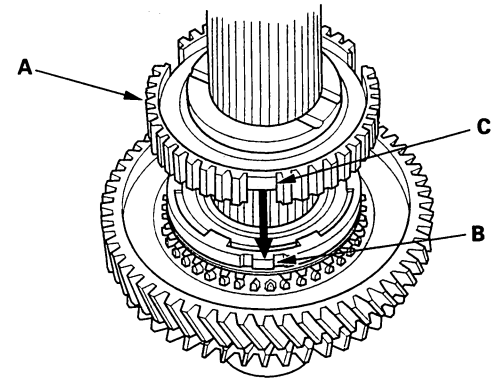
2. Install the countershaft reverse gear (A), needle bearing (B), and 1st gear (C) onto the countershaft (D).



3. Install the triple cone synchro assembly (A) by aligning the synchro cone fingers (B) with the holes in 1st gear (C), then install the synchro spring (D).

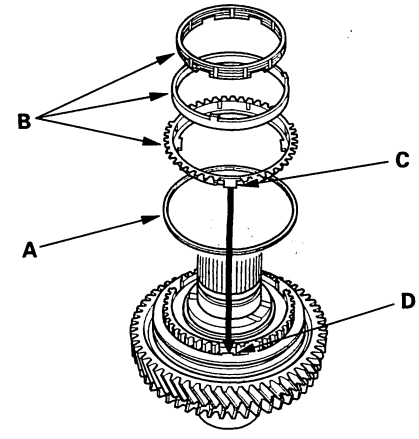


4. Install the 1st/2nd synchro hub (A) by aligning the outer synchro ring fingers (B) with the grooves in the 1st/2nd synchro hub (C).



5. Install the 1st/2nd synchro sleeve.

6. Install the synchro spring (A).



7. Install the triple cone synchro assembly (B) by aligning the outer synchro ring fingers (C) with the grooves in the 1st/2nd synchro hub (D).

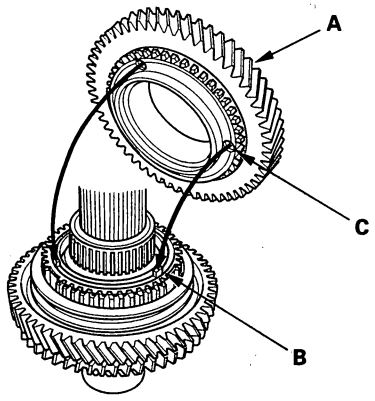
8. Install the distance collar and needle bearing.

(cont'd)

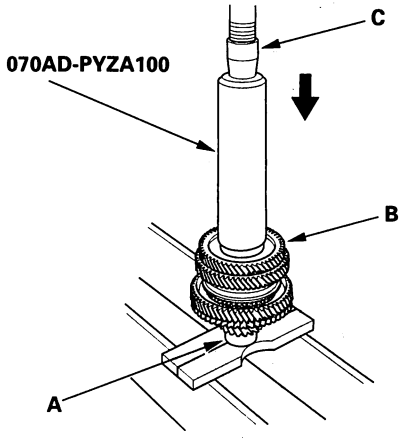
Protected by AR

Countershaft Reassembly (cont'd)

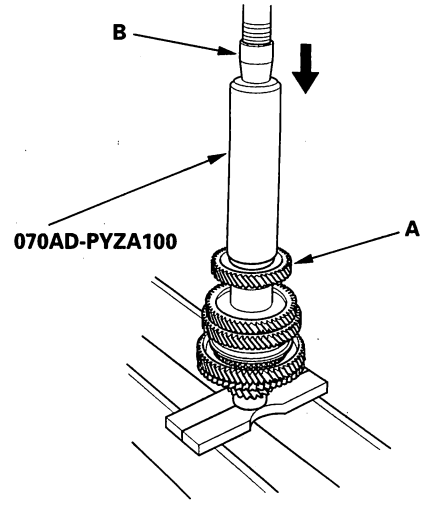
9. Install 2nd gear (A) by aligning the synchro cone fingers (B) with the holes in 2nd gear (C).



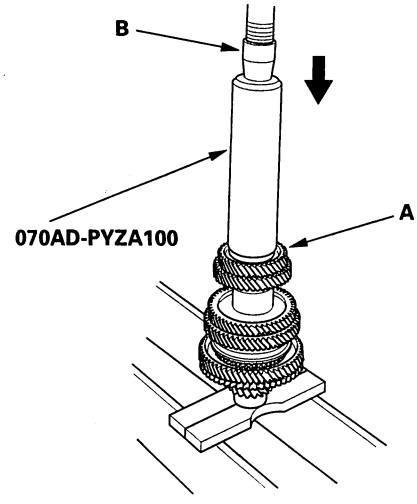
10. Support the countershaft (A) on the steel blocks, then install 3rd gear (B) using the special tool and a press (C).



11. Install 4th gear (A) using the special tool and a press (B).



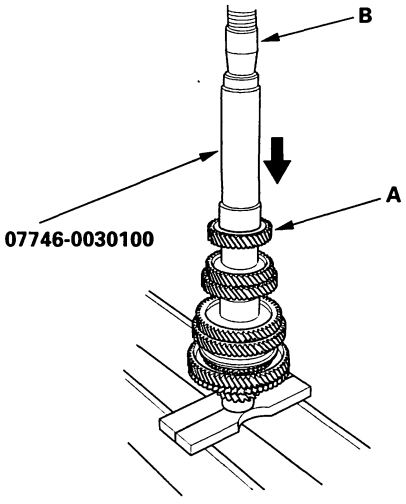
12. Install 5th gear (A) using the special tool and a press (B).



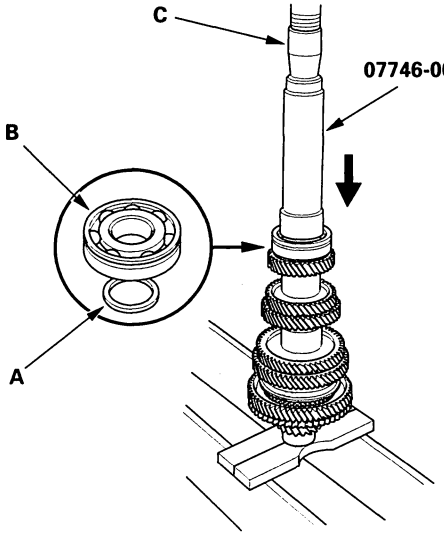
BACK

Protected by AR

13. Install 6th gear (A) using the special tool and a press (B).

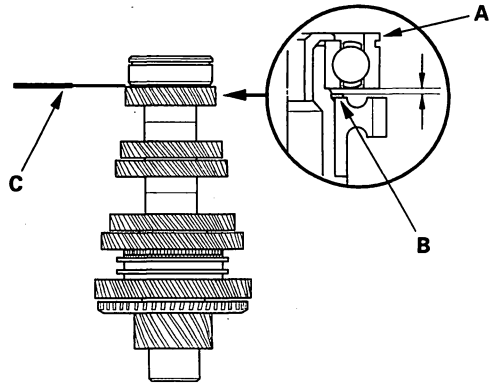


14. Install the 35 mm shim (A) and the old ball bearing (B) using the special tool and a press (C).



15. Measure the clearance between the old ball bearing (A) and the 35 mm shim (B) with a feeler gauge (C).

Standard: 0.04—0.10 mm (0.0016—0.0039 in.)



(cont'd)

Protected by AR

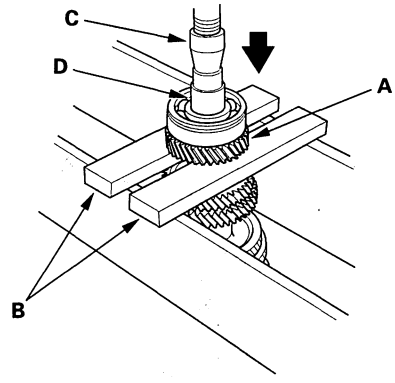
Countershaft Reassembly (cont'd)

16. If the clearance is more than the standard, select a new shim from the following table. If the clearance measured in step 15 is within the standard, replace only the ball bearing.

35 mm Shim

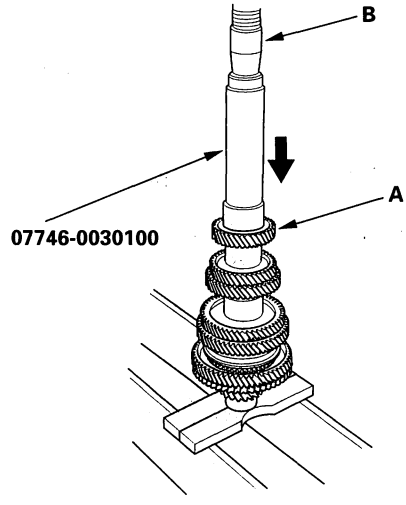
	Part Number	Thickness
A	23981-PPP-000	0.87 mm (0.034 in.)
AA	23981-PPP-900	0.91 mm (0.036 in.)
B	23982-PPP-000	0.95 mm (0.037 in.)
AB	23982-PPP-900	0.99 mm (0.039 in.)
C	23983-PPP-000	1.03 mm (0.041 in.)
AC	23983-PPP-900	1.07 mm (0.042 in.)
D	23984-PPP-000	1.11 mm (0.044 in.)
AD	23984-PPP-900	1.15 mm (0.045 in.)
E	23985-PPP-000	1.19 mm (0.047 in.)
AE	23985-PPP-900	1.23 mm (0.048 in.)
F	23986-PPP-000	1.27 mm (0.050 in.)
AF	23986-PPP-900	1.31 mm (0.052 in.)
G	23987-PPP-000	1.35 mm (0.053 in.)
AG	23987-PPP-900	1.39 mm (0.055 in.)
H	23988-PPP-000	1.43 mm (0.056 in.)
AH	23988-PPP-900	1.47 mm (0.058 in.)
J	23989-PPP-000	1.51 mm (0.059 in.)
AJ	23989-PPP-900	1.55 mm (0.061 in.)
K	23990-PPP-000	1.59 mm (0.063 in.)
AK	23990-PPP-900	1.63 mm (0.064 in.)
L	23991-PPP-000	1.67 mm (0.066 in.)
AL	23991-PPP-900	1.71 mm (0.067 in.)
M	23992-PPP-000	1.75 mm (0.069 in.)
AM	23992-PPP-900	1.79 mm (0.070 in.)
N	23993-PPP-000	1.83 mm (0.072 in.)
AN	23993-PPP-900	1.87 mm (0.074 in.)
P	23994-PPP-000	1.91 mm (0.075 in.)
AP	23994-PPP-900	1.95 mm (0.077 in.)
Q	23995-PPP-000	1.99 mm (0.078 in.)

17. Support 6th gear (A) on steel blocks (B), then using a press (C) and an attachment (D), press the countershaft out of the old ball bearing.



18. If necessary, install the 35 mm shim selected in step 16, then recheck the clearance.

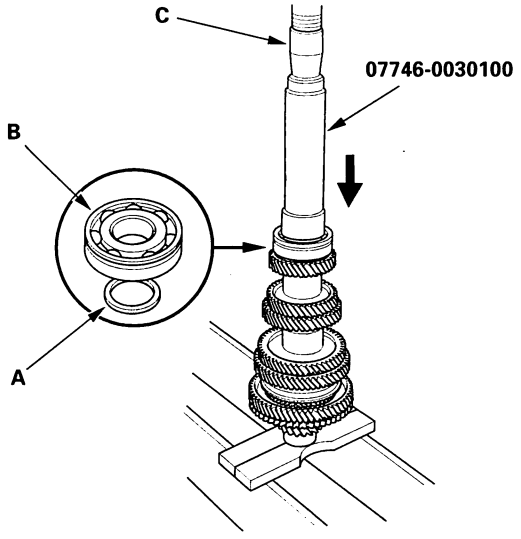
19. Install 6th gear (A) using the special tool and a press (B).



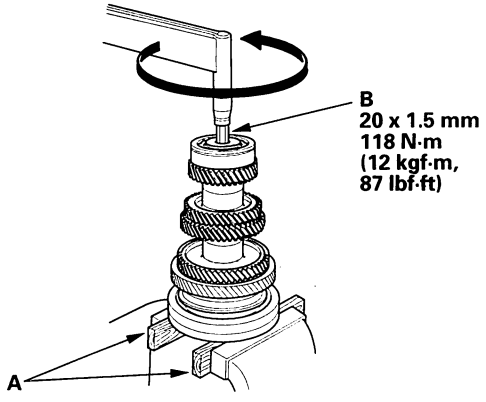
BACK

Protected by AR

20. Install the 35 mm shim (A) and new bearing (B) using the special tool and a press (C).



21. Securely clamp the countershaft assembly in a vise with wood blocks (A).



22. Tighten the new 20 mm special bolt (B) (left-hand threads).

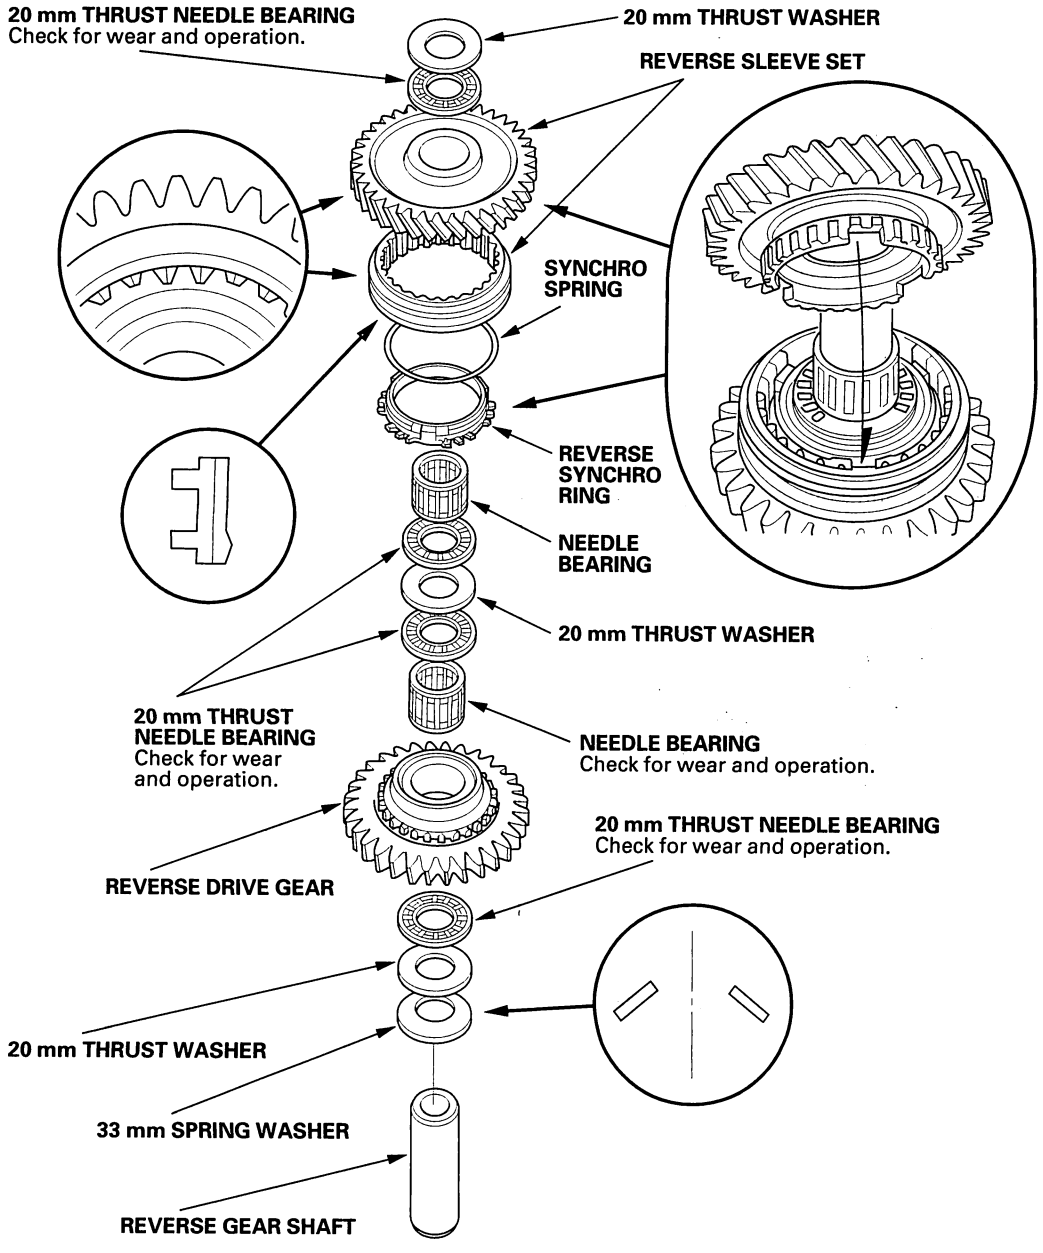
Reverse Idler Gear Shaft Assembly Disassembly/Reassembly

Prior to reassembling, clean all the parts in solvent, dry them, and apply lubricant to any contact surface.



BACK

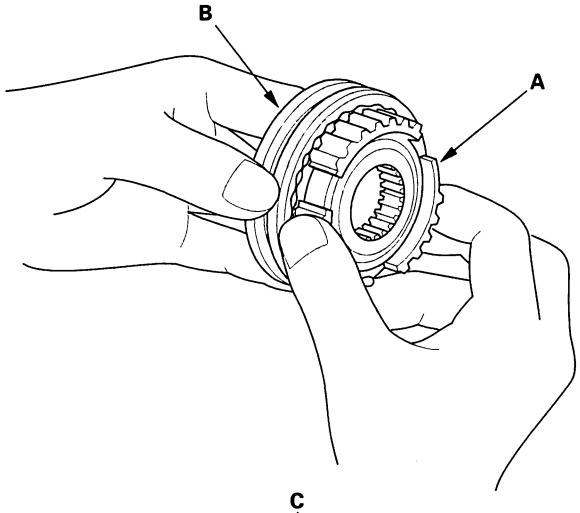
Protected by AR

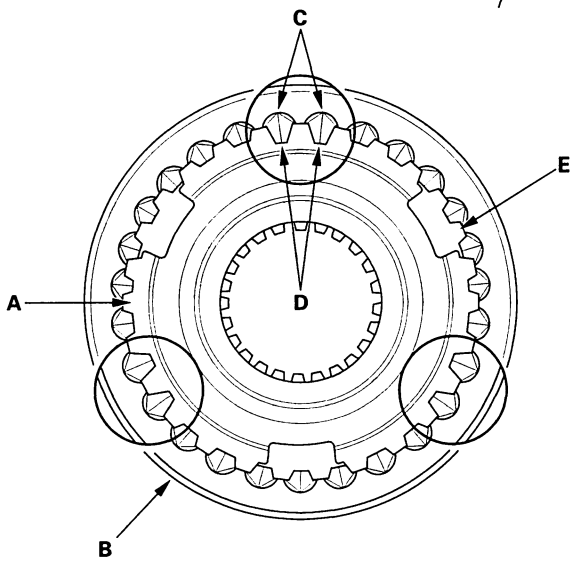
Synchro Sleeve and Hub Inspection and Reassembly

1. Inspect gear teeth on all synchro hubs and synchro sleeves for wear (rounded off corners).

2. Install each synchro hub (A) in its mating synchro sleeve (B), and check for freedom of movement. Make sure you match the three sets of longer teeth (C) (120 degrees apart) on the synchro sleeve with the three sets of deeper grooves (D) in the synchro hub. Do not install the synchro sleeve with its longer teeth in the synchro hub slots (E) because it will damage the spring ring.

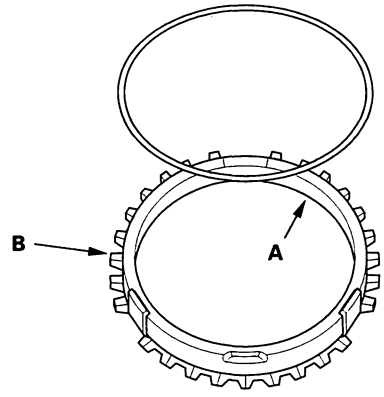
   NOTE: If replacement is required, always replace the synchro sleeve and synchro hub as a set.



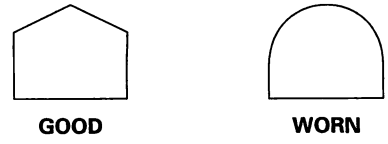


Synchro Ring and Gear Inspection

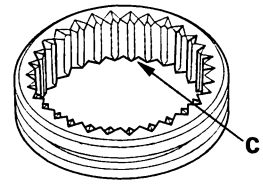
1. Inspect the inside of each synchro ring (A) for wear. Inspect the teeth (B) on each synchro ring for wear (rounded off).



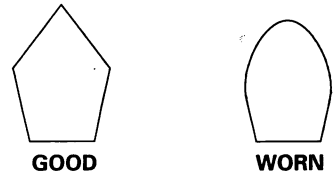
Example of synchro ring teeth



2. Inspect the teeth (C) on each synchro sleeve and matching teeth on each gear for wear (rounded off).



Example of synchro sleeve teeth and gear teeth

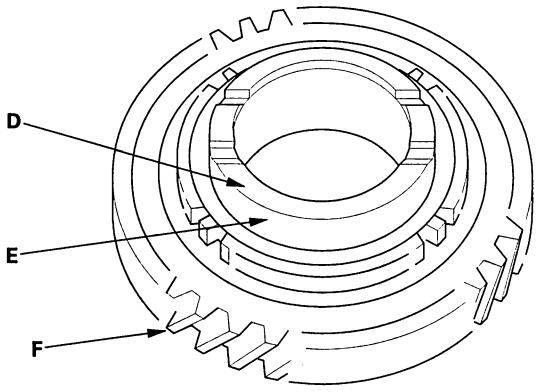


(cont'd)

Protected by AR

Synchro Ring and Gear Inspection (cont'd)

3. Inspect the thrust surface (D) on each gear hub for wear.



4. Inspect the cone surface (E) on each gear for wear and roughness.

5. Inspect the teeth on all gears (F) for uneven wear, scoring, galling, and cracks.

6. Coat the cone surface of each gear (E) with oil, and place its synchro ring on it. Rotate the synchro ring, making sure that it does not slip.

7. Measure the clearance between each gear (A) and its synchro ring (B) all around the gear. Hold the synchro ring against the gear evenly while measuring the clearance. If the clearance is less than the service limit, replace the synchro ring and gear.

Synchro Ring-to-Gear Clearance
Standard:
5th gear: 0.70—1.49 mm (0.028—0.059 in.)
6th gear: 0.73—1.44 mm (0.029—0.057 in.)
Service Limit: 0.4 mm (0.016 in.)

Double Cone Synchro-to-Gear Clearance
Standard:
①: Outer Synchro Ring (B) to Synchro Cone (C)
0.70—1.19 mm (0.028—0.047 in.)
②: Synchro Cone (C) to Gear (A)
0.50—1.04 mm (0.020—0.041 in.)
③: Outer Synchro Ring (B) to Gear (A)
0.95—1.68 mm (0.037—0.066 in.)
Service Limit:
①: 0.3 mm (0.012 in.)
②: 0.3 mm (0.012 in.)
③: 0.6 mm (0.024 in.)

Triple Cone Synchro-to-Gear Clearance
Standard:
①: Outer Synchro Ring (B) to Synchro Cone (C)
1st gear: 0.70—1.19 mm (0.028—0.047 in.)
2nd gear: 0.70—1.19 mm (0.028—0.047 in.)
②: Synchro Cone (C) to Gear (A)
1st gear: 0.45—1.14 mm (0.018—0.045 in.)
2nd gear: 0.60—1.88 mm (0.024—0.074 in.)
③: Outer Synchro Ring (B) to Gear (A)
1st gear: 1.12—1.68 mm (0.044—0.066 in.)
2nd gear: 0.87—1.82 mm (0.034—0.072 in.)
Service Limit:
①: 0.3 mm (0.012 in.)
②: 0.3 mm (0.012 in.)
③: 0.6 mm (0.024 in.)

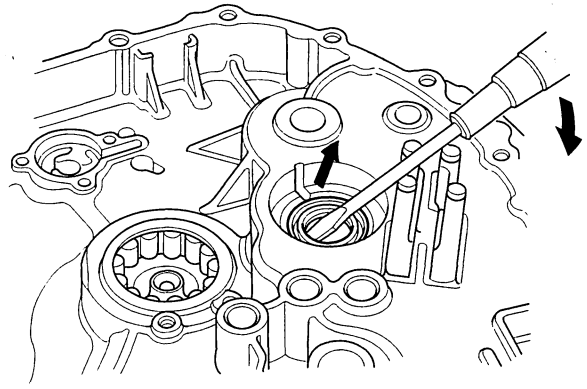
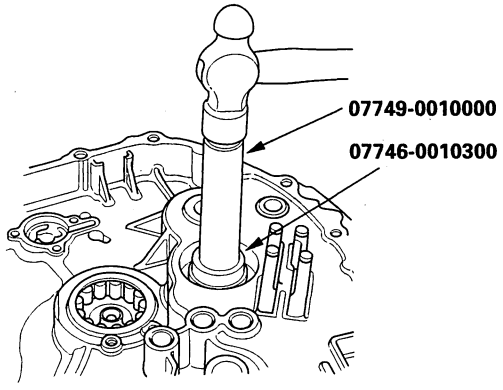
Mainshaft Oil Seal Replacement

Special Tools Required
- Attachment, 42 x 47 mm 07746-0010300
- Driver 07749-0010000

1. Remove the mainshaft assembly.
2. Remove the oil seal from the clutch housing. Be careful when removing the seal to avoid damaging the clutch housing.



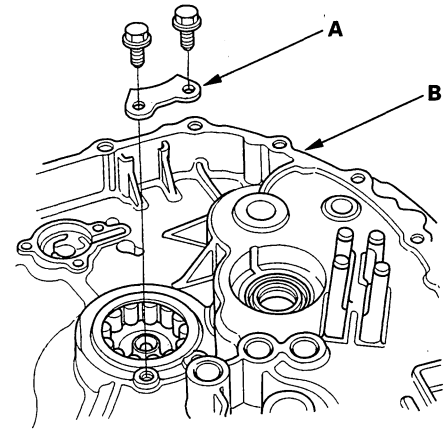
3. Drive in the new oil seal from the transmission side using the special tools.



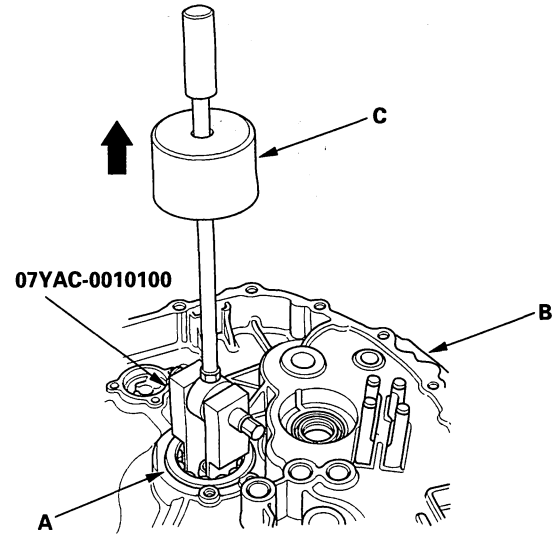
Countershaft Bearing Replacement

Special Tools Required
- Adjustable bearing puller, 45—75 mm 07YAC-0010100
- Attachment, 72 x 75 mm 07746-0010600
- Driver 07749-0010000

1. Remove the bearing set plate (A) from the clutch housing (B).



2. Remove the needle bearing (A) from the clutch housing (B) using the special tool and a commercially available 3/8"—16 slide hammer (C).

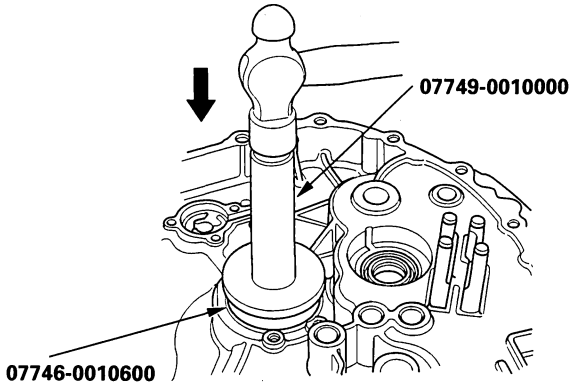


(cont'd)

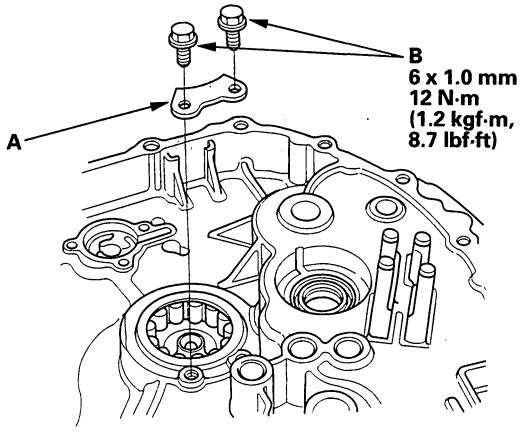
Protected by AR

Countershaft Bearing Replacement (cont'd)

3. Install the new needle bearing using the special tool.



4. Install the bearing set plate (A) with the bolts (B).

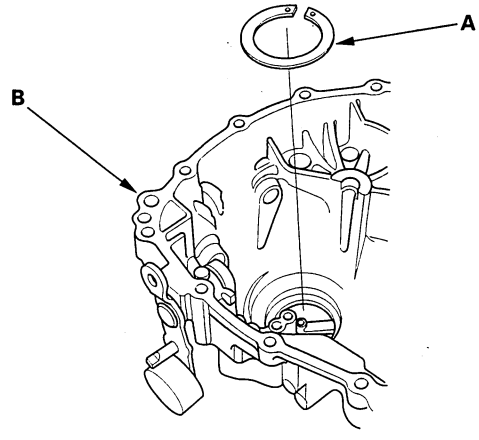


Mainshaft Thrust Clearance Adjustment

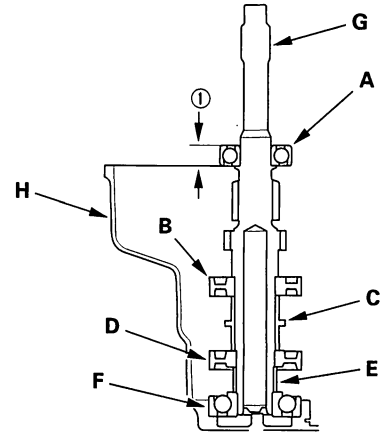
Special Tools Required
- Mainshaft holder 07GAJ-PG20110
- Mainshaft base 07GAJ-PG20130

NOTE:
- Carry out the measurement at normal room temperature.
- Clean all the parts thoroughly before installation.

1. Remove the 82 mm shim (A) from the transmission housing (B).



2. Install the ball bearing (A), 3rd/4th synchro hub (B), distance collar (C), 5th/6th synchro hub (D), distance collar (E), and ball bearing (F) on the mainshaft (G), then install the assembled mainshaft in the transmission housing (H).

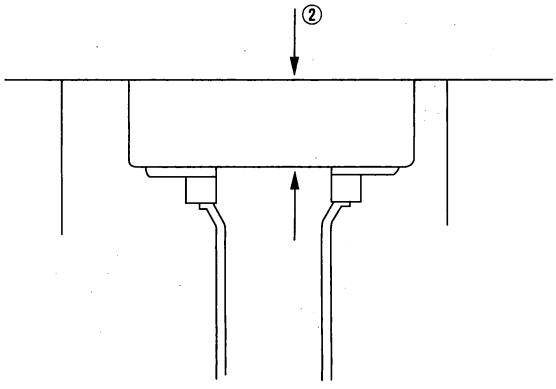


3. Measure distance ① between the end of the transmission housing and ball bearing with a straight edge and a depth gauge. Measure at three locations, and average the reading.

BACK

Protected by AR

4. Measure distance ② (the depth of the clutch housing) with a straight edge and a depth gauge. Measure at three locations, and average the reading.



Shim Selection Formula

5. Select the proper 82 mm shim from the chart. Follow the example below, and use the measurements you made in steps 3 and 4.

(Basic Formula)
② − ① − (0.85 + 0.14) = shim thickness (maximum)
② − ① − (0.85 + 0.21) = shim thickness (minimum)

- Subtract distance ② (step 4) from distance ① (step 3).
- 0.85 mm (0.033 in.): Spring washer, a dimension in the installation.
- 0.14 mm (0.006 in.): Minimum thrust clearance.
- 0.21 mm (0.008 in.): Maximum thrust clearance.

(For example)
21.04 − 17.97 − (0.85 + 0.14) = 2.08 mm (0.082 in.)
21.04 − 17.97 − (0.85 + 0.21) = 2.01 mm (0.079 in.)

Take the middle value 2.04 mm (0.080 in.) of the minimum value and the maximum value, and select the 0.93 mm (0.037 in.) and 1.11 mm (0.044 in.) shims.

NOTE: You may need to select two thicknesses of the 82 mm shim from the chart.

82 mm Shim

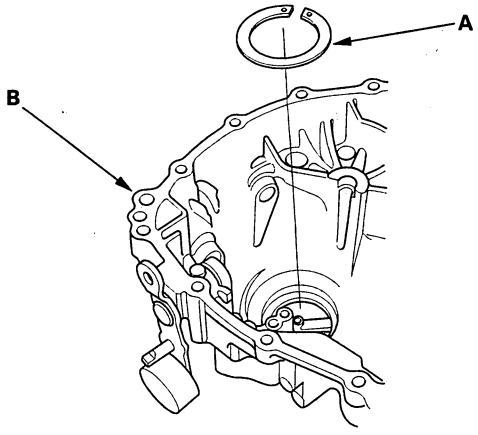
	Part Number	Thickness
A	23931-PR8-F00	0.60 mm (0.024 in.)
B	23932-PR8-F00	0.63 mm (0.025 in.)
C	23933-PR8-F00	0.66 mm (0.026 in.)
D	23934-PR8-F00	0.69 mm (0.027 in.)
E	23935-PR8-F00	0.72 mm (0.028 in.)
F	23936-PR8-F00	0.75 mm (0.030 in.)
G	23937-PR8-F00	0.78 mm (0.031 in.)
H	23938-PR8-F00	0.81 mm (0.032 in.)
I	23939-PR8-F00	0.84 mm (0.033 in.)
J	23940-PR8-F00	0.87 mm (0.034 in.)
K	23941-PR8-F00	0.90 mm (0.035 in.)
L	23942-PR8-F00	0.93 mm (0.037 in.)
M	23943-PR8-F00	0.96 mm (0.038 in.)
N	23944-PR8-F00	0.99 mm (0.039 in.)
O	23945-PR8-F00	1.02 mm (0.040 in.)
P	23946-PR8-F00	1.05 mm (0.041 in.)
Q	23947-PR8-F00	1.08 mm (0.043 in.)
R	23948-PR8-F00	1.11 mm (0.044 in.)
S	23949-PR8-F00	1.14 mm (0.045 in.)
T	23950-PR8-F00	1.17 mm (0.046 in.)
U	23951-PR8-F00	1.20 mm (0.047 in.)

(cont'd)

Protected by AR

Mainshaft Thrust Clearance Adjustment (cont'd)

6. Install the 82 mm shim (A) selected in the transmission housing (B).



7. Thoroughly clean the spring washer (A) before installing it on the clutch housing (B). Note the installation direction of the spring washer (see page 13-28).

8. Install the mainshaft in the clutch housing.

9. Place the transmission housing over the mainshaft and onto the clutch housing.

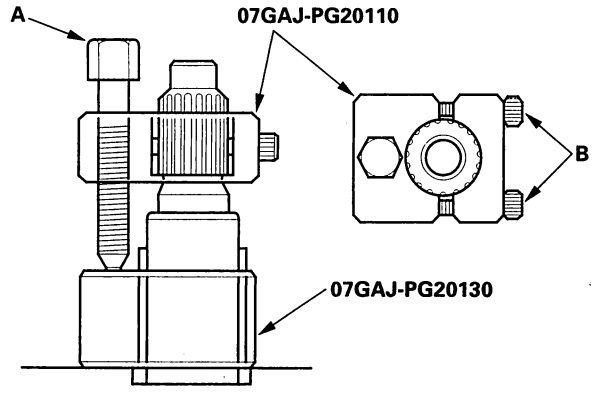
10. Tighten the clutch and transmission housings with several 10 mm bolts.

    NOTE: It is not necessary to use sealing agent between the housings.

11. Lightly tap on the mainshaft with a plastic hammer.

12. Attach the special tool to the mainshaft as follows:

    - Back-out the mainshaft holder bolt (A), and loosen the two hex bolts (B).
    - Fit the holder over the mainshaft so its lip is towards the transmission.
    - Align the mainshaft holder lip around the groove at the inside of the mainshaft splines, then tighten the hex bolts.



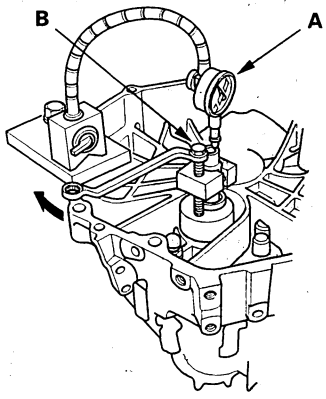
13. Fully seat the mainshaft by tapping on its end with a plastic hammer.

14. Thread in the mainshaft holder bolt until it just contacts the wide surface of the mainshaft base.

BACK

Protected by AR

15. Zero a dial gauge (A) on the end of the mainshaft.



16. Turn the mainshaft holder bolt (B) clockwise; stop turning when the dial gauge has reached its maximum movement. The reading on the dial gauge is the amount of mainshaft end play.

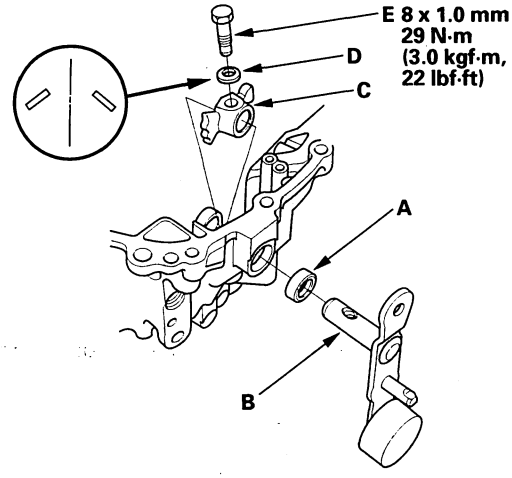
    NOTE: Do not turn the mainshaft holder bolt more than 60 degrees after the needle of the dial gauge stops moving. Applying more pressure with the mainshaft holder bolt may damage the transmission.

17. If the reading is within the standard, the clearance is correct. If the reading is not within the standard, recheck the shim thickness.

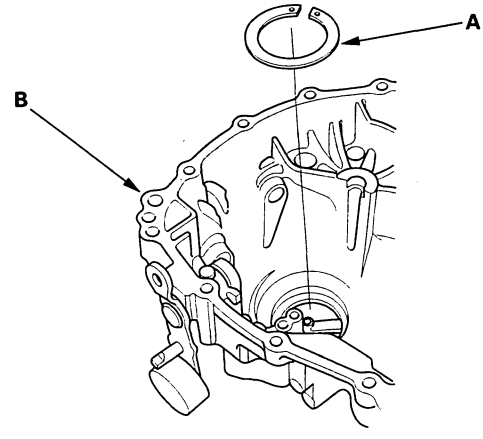
    Standard: 0.14—0.21 mm (0.006—0.008 in.)

NOTE: Prior to reassembling, clean all parts in solvent, dry them, and apply lubricant to all contact surfaces.

1. Press the new dust seal (A) into the transmission housing surface, then install the shift lever (B), shift arm (C), 8 mm spring washer (D), and 8 mm special bolt (E).



2. Select the proper size 82 mm shim (A) according to the measurements made during the Mainshaft Thrust Clearance Adjustment (see page 13-62). Install it into the transmission housing (B).

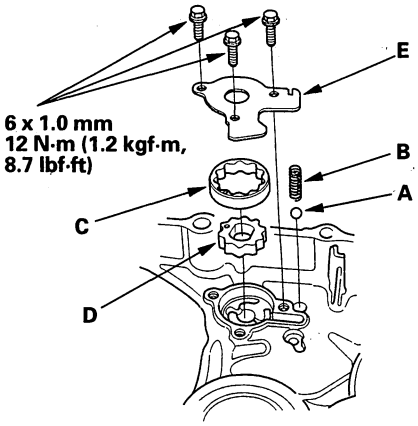


(cont'd)

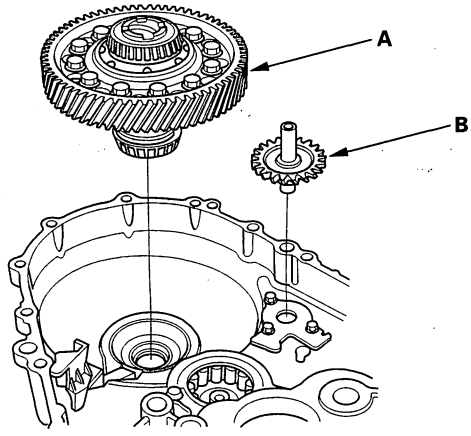
Protected by AR

Transmission Reassembly (cont'd)

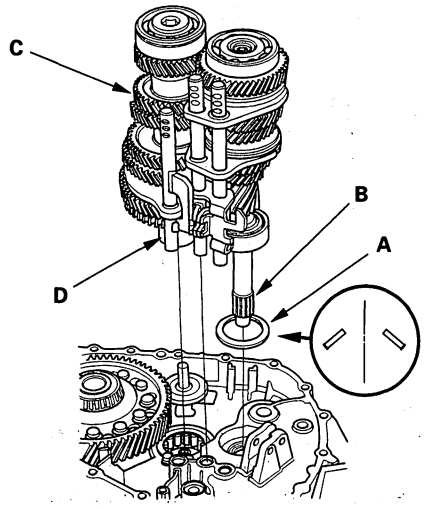
3. Install the steel ball (A), relief valve spring (B), oil pump outer rotor (C), oil pump inner rotor (D), and oil pump plate (E).



4. Install the differential assembly (A) and oil pump shaft (B).

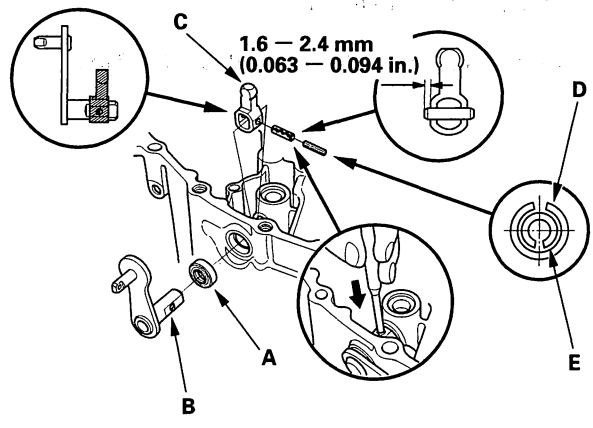


5. Install the 64 mm spring washer (A). Note the installation direction of the 64 mm spring washer.



6. Apply tape to the mainshaft splines (B) to protect the seal. Install the mainshaft and countershaft (C) into the shift forks (D) as an assembly.

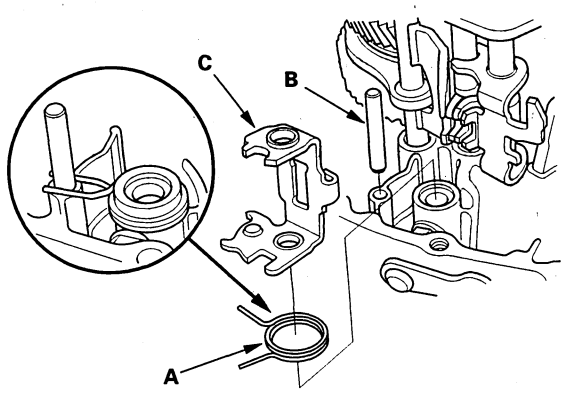
7. Press the new dust seal (A) into the clutch housing surface, then install the select lever (B), select arm (C), new 5 mm spring pin (D), and new 3 mm spring pin (E).



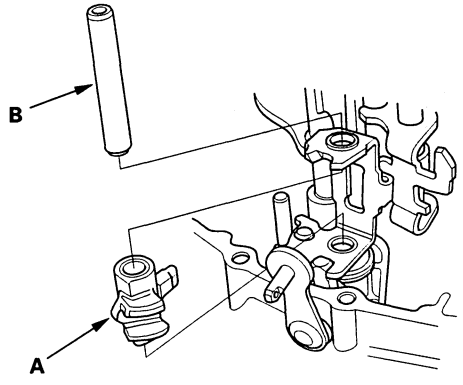
BACK

Protected by AR

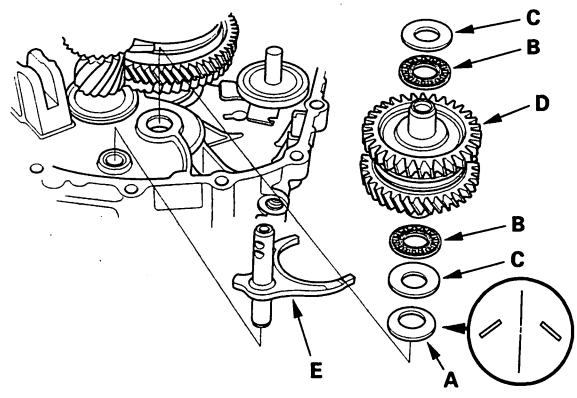
8. Set the select return spring (A), pin (B), and interlock (C) as shown.



9. Install the shift piece (A) and shift piece shaft (B).

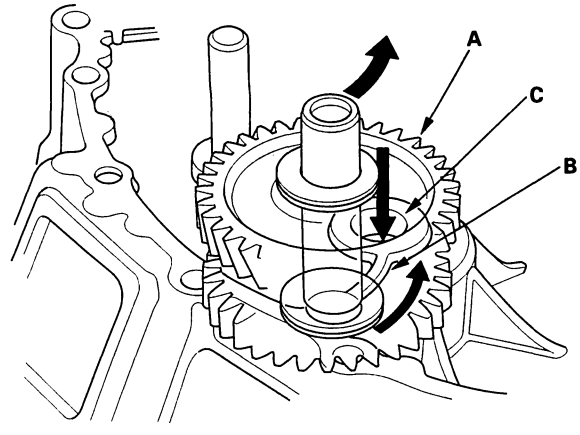


10. Install the 33 mm spring washer (A). Note the installation direction of the spring washer.



11. Install the 20 mm thrust needle bearing (B), 20 mm thrust washers (C), reverse idler gear shaft assembly (D), and reverse shift fork (E) as an assembly.

12. Slide the reverse idler gear shaft assembly (A) on the rib (B) of the clutch housing, then install it into the hole (C) of the clutch housing.

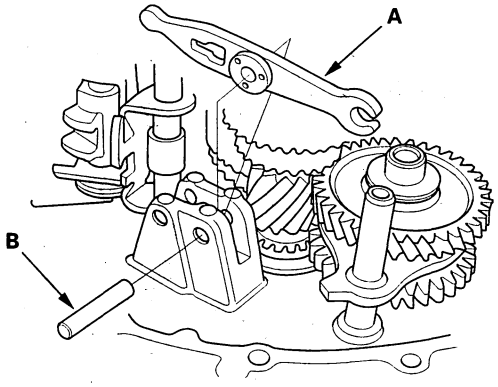


(cont'd)

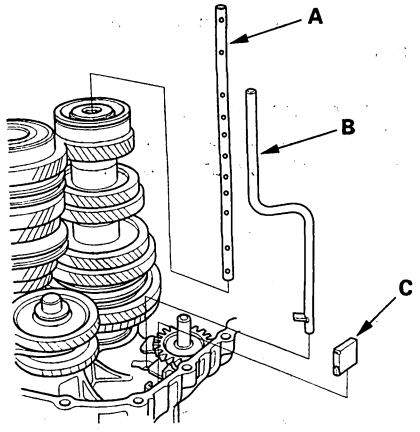
Protected by AR

Transmission Reassembly (cont'd)

13. Install the reverse shift lever (A), and pin (B).

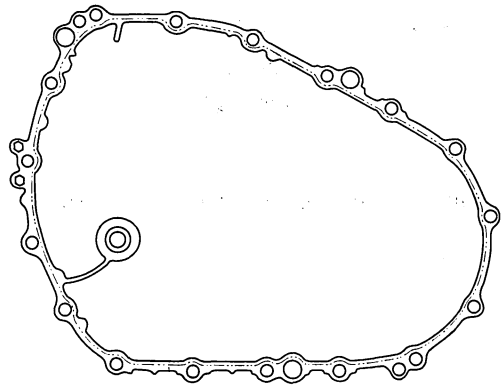


14. Install the oil guide pipe A, oil guide pipe (B), and magnet (C).



15. Remove any dirt or oil from the transmission housing sealing surface. Apply liquid gasket (P/N 08718-0002) to the sealing surface. Make sure you seal the entire circumference of the bolt holes to prevent oil leakage.

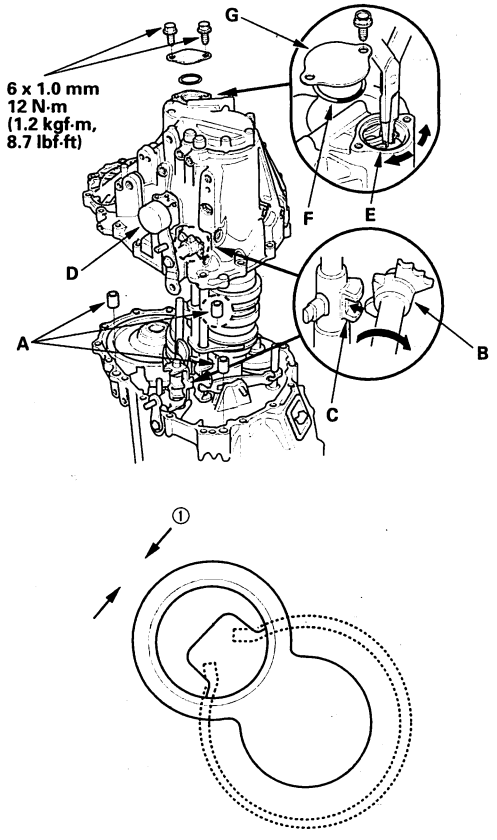
    NOTE: Do not install components if 4 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



BACK

Protected by AR

16. Install the 14 x 20 mm dowel pins (A).



17. Lower the transmission housing, then place the shift arm (B) in the groove of the shift piece (C) by turning the change lever (D).

18. While expanding the 75 mm snap ring (E) of the countershaft ball bearing with snap ring pliers, push the transmission housing down to start the countershaft ball bearing through the snap ring. Then release the pliers, and push down the housing until it bottoms and the snap ring snaps in place in the counter shaft ball bearing snap ring groove.

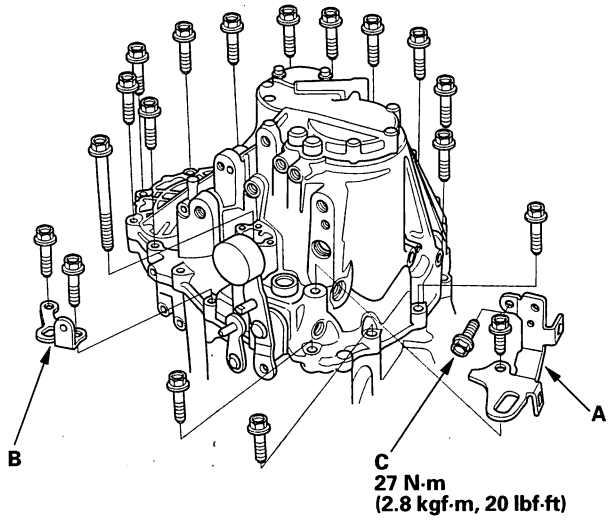
19. Make sure the 75 mm snap ring is securely seated in the groove of the countershaft bearing.

Dimension ① as installed: 9.91—11.52 mm (0.390—0.454 in.)

20. Install the new 37.7 mm O-ring (F) and transmission case cap (G).

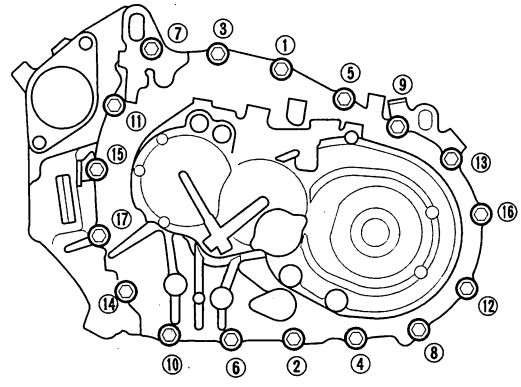
NOTE: Check the operation of the change lever.

21. Install the transmission hanger (A), transmission hanger (B), 8 mm flange bolt (C), and the 10 mm flange bolts, finger-tight.



22. Tighten the 10 mm flange bolts in a crisscross pattern in several steps.

10 x 1.25 mm: 44 N·m (4.5 kgf·m, 33 lbf·ft)

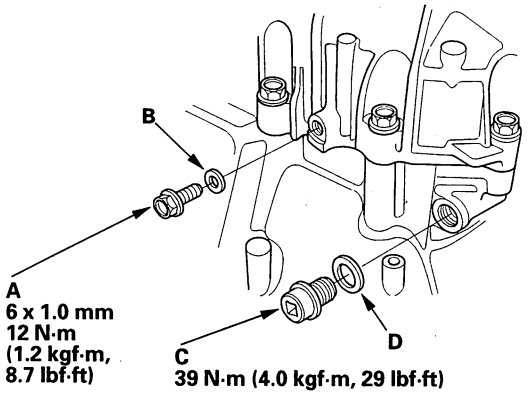


(cont'd)

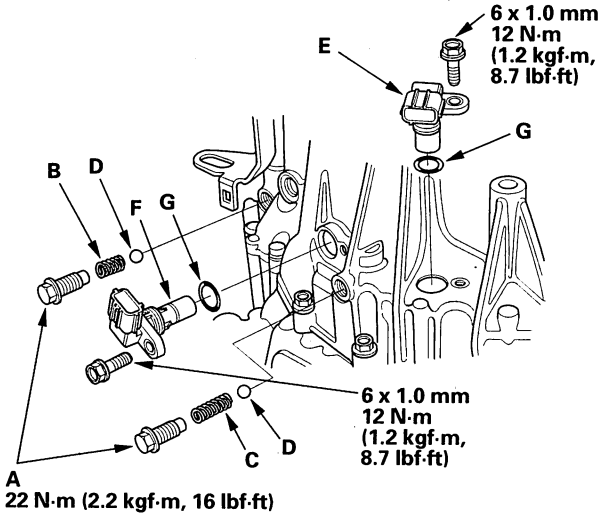
Protected by AR

Transmission Reassembly (cont'd)

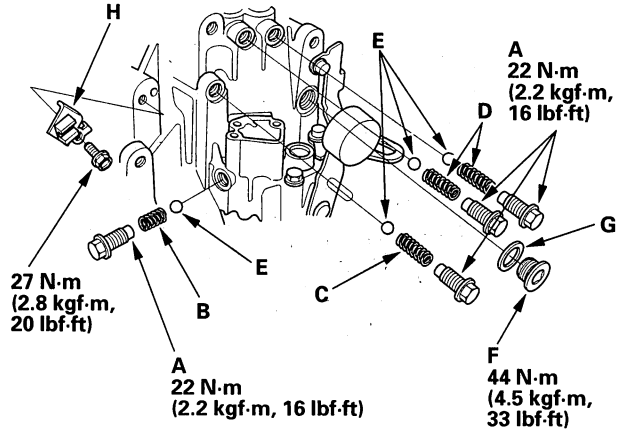
23. Install the oil check bolt (A), new 6 mm washer (B), drain plug (C), and new 14 mm washer (D).



24. Apply liquid gasket (P/N 08718-0002) to the set screws (A), then install the set screws, 22 mm spring (B), 27.4 mm spring (C), steel balls (D), output shaft (countershaft) speed sensor (E), input shaft (mainshaft) speed sensor (F), and new O-rings (G).

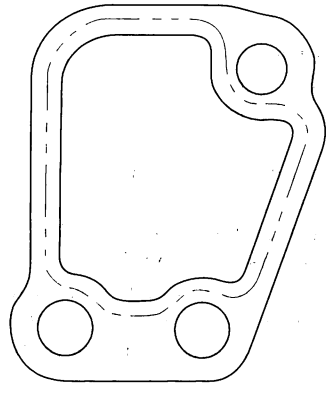


25. Apply liquid gasket (P/N 08718-0002) to the set screws (A), then install the set screws, 22.0 mm spring (B), 26.1 mm spring (C), 27.4 mm springs (D), steel balls (E), oil filler plug (F), washer (G), and clutch line bracket (H).



26. Remove any dirt or oil from the reverse lockout solenoid sealing surface. Apply liquid gasket (P/N 08718-0002) to the sealing surface.

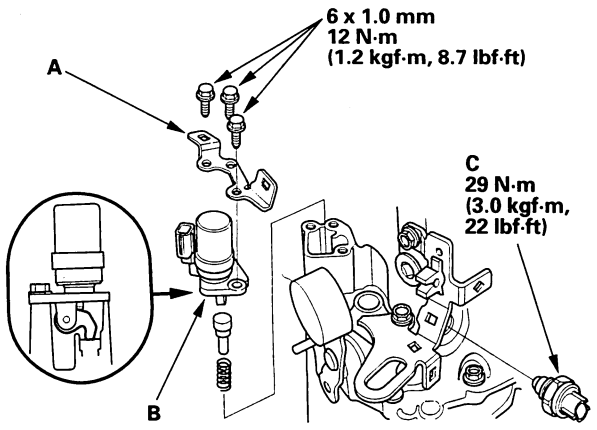
NOTE: Do not install components if 4 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



BACK

Protected by AR

27. Install the transmission harness stay (A) and reverse lockout solenoid (B).



28. Apply liquid gasket (P/N 08718-0002) to the threads of the back-up light switch (C), and install the switch in the transmission housing.

29. Install the strainer cover (A), new O-ring (B), strainer set spring (C), and oil pump strainer (D).

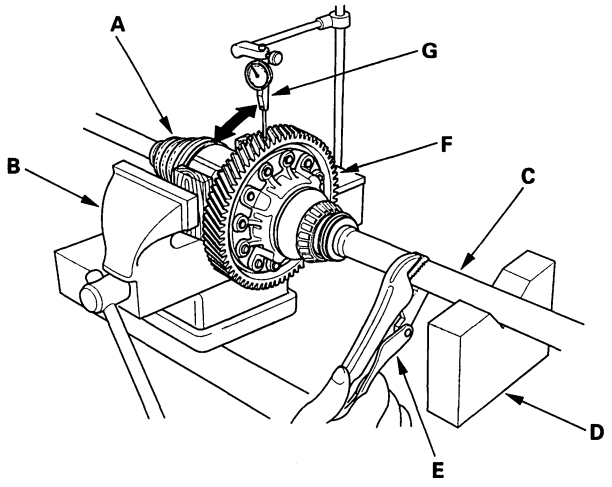
Backlash Inspection

1. Install the driveshaft and intermediate shaft into the differential assembly.
2. Carefully clamp the driveshaft (A) in a vise (B).



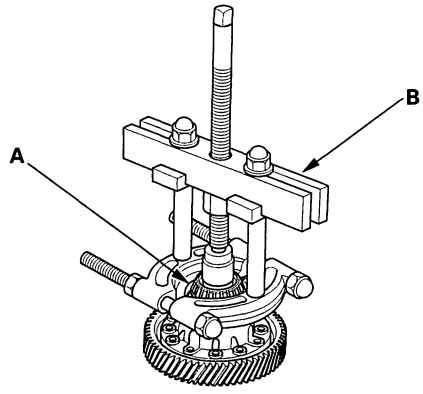
3. Place the intermediate shaft (C) on a V-block (D), then fix the intermediate shaft using a vise or equivalent (E).
4. Measure the backlash of the final driven gear (F) with a dial indicator (G). If the backlash is not within the standard, replace the differential carrier.

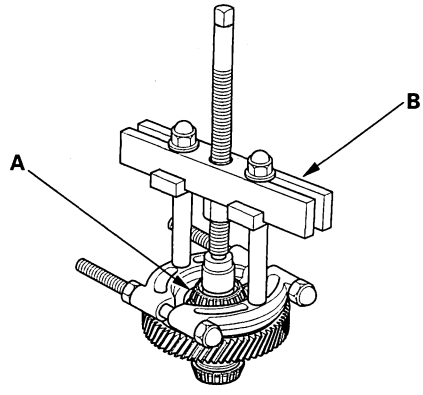
Standard (New): 0.4—1.3 mm (0.016—0.051 in.)

Carrier Bearing Replacement

Special Tools Required
Installer, 46 mm I.D. 07PAF-0030100

1. Check the carrier bearings for wear and rough rotation. If they rotate smoothly and their rollers show no signs of wear, the bearings are OK.
2. Remove the carrier bearing (A) with a commercially-available bearing puller (B).

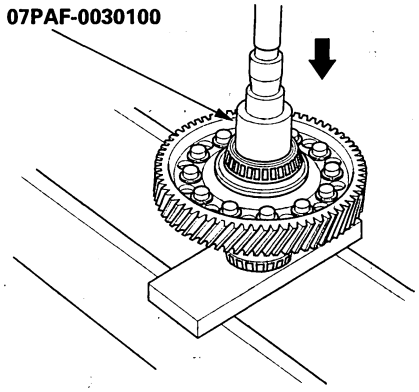


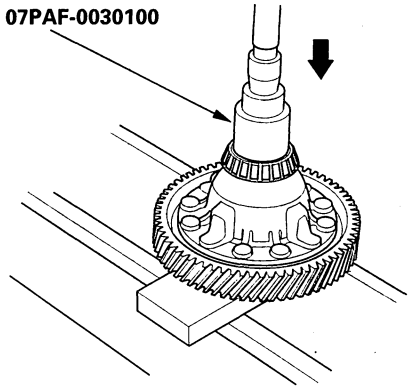


BACK

Protected by AR

3. Install the new bearings with the special tool and a press. Press each bearing on until it bottoms out. There should be no clearance between the bearings and the carrier.



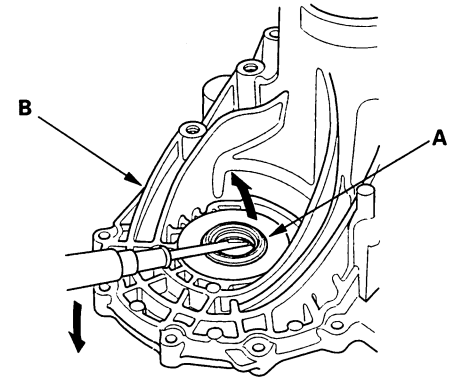


Oil Seal Replacement

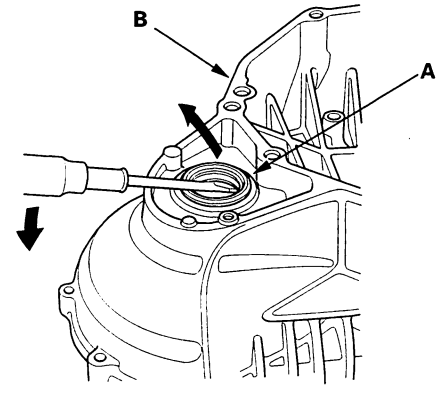
Special Tools Required
- Driver 07749-0010000
- Oil seal driver attachment 07NAD-P20A100

1. Remove the differential assembly.

2. Remove the oil seal (A) from the transmission housing (B).



3. Remove the oil seal (A) from the clutch housing (B).

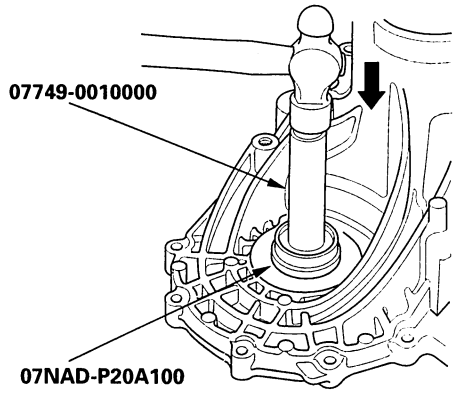


(cont'd)

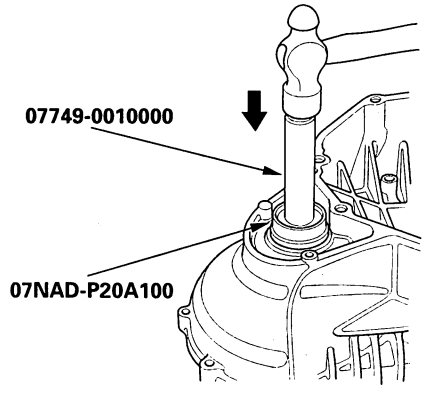
Protected by AR

Oil Seal Replacement (cont'd)

4. Install the new oil seal in the transmission housing with the special tools.



5. Install the new oil seal in the clutch housing with the special tools.



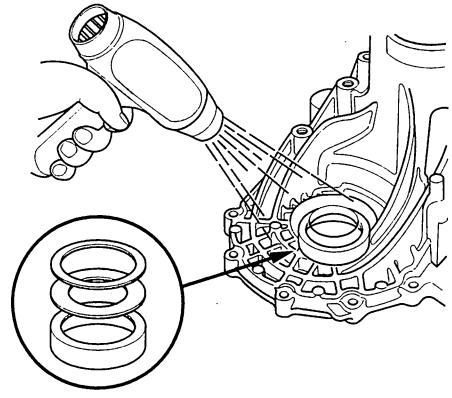
Bearing Outer Race Replacement

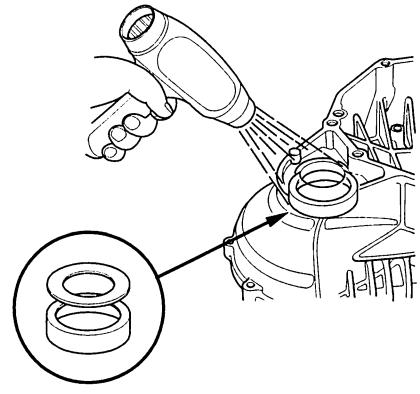
Special Tools Required
- Driver 07749-0010000
- Attachment, 78 x 80 mm 07NAD-PX40100

NOTE:
- The bearing outer race and tapered roller bearing should be replaced as a set.
- Inspect and adjust the tapered roller bearing preload whenever the tapered roller bearing is replaced.

1. Remove the oil seals from the transmission housing and clutch housing (see page 13-75).

2. Remove the bearing outer race, spacer, and 81 mm shim from the transmission housing and clutch housing by heating the housing to about 212 °F (100 °C) with a heat gun. Do not reuse the thrust shim if the outer race was driven out.

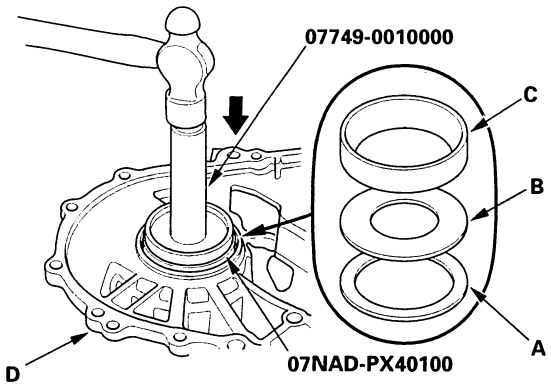




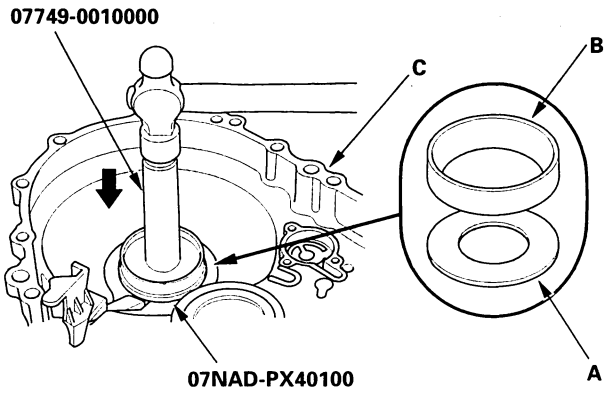
BACK

Protected by AR

3. Install the 81 mm shim (A), spacer (B), and bearing outer race (C) into the transmission housing (D) using the special tools.



4. Install the spacer (A), and bearing outer race (B) into the clutch housing (C) using the special tools.



5. Install the oil seals into the transmission housing (see step 4 on page 13-76) and clutch housing (see step 5 on page 13-76).

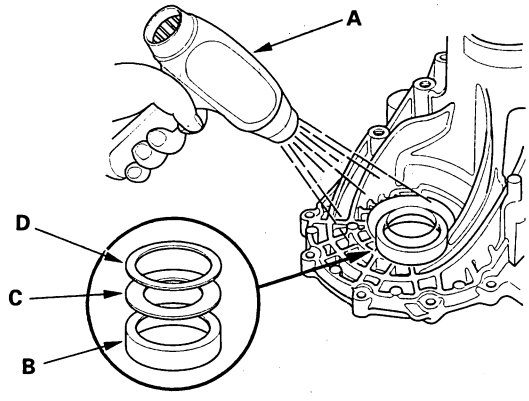
Special Tools Required
- Driver 07749-0010000
- Attachment, 78 x 80 mm 07NAD-PX40100
- Preload inspection tool 07XAJ-S0KA100

If any of the items listed were replaced, the carrier bearing preload must be adjusted.

- Transmission housing
- Clutch housing
- Differential carrier
- Spacer
- Carrier bearing and outer race

1. Remove the oil seals from the transmission housing and clutch housing (see page 13-75).

2. If you replaced the carrier bearing on the transmission housing side of the carrier, remove and discard the bearing outer race, Heat up the transmission housing to about 212 °F (100 °C) with a heat gun (A), then remove the bearing outer race (B), spacer (C), and 81 mm shim (D). Do not heat the housing in excess of 212 °F (100 °C).

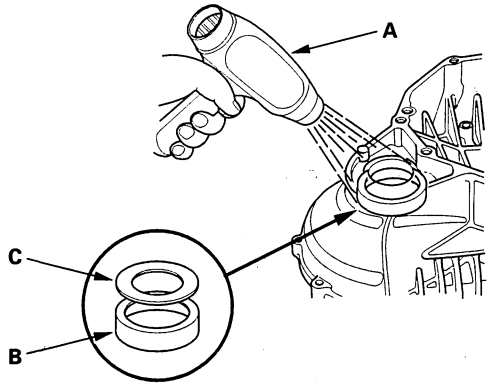


(cont'd)

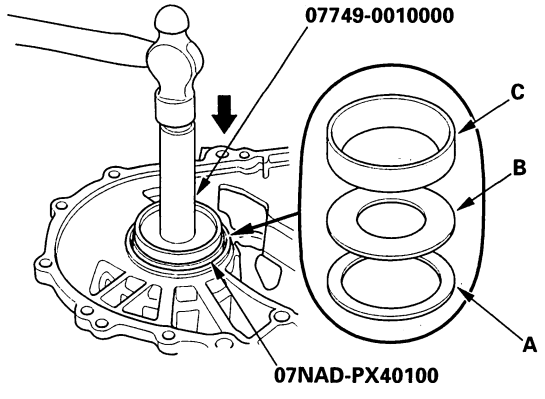
Protected by AR

Carrier Bearing Preload Adjustment (cont'd)

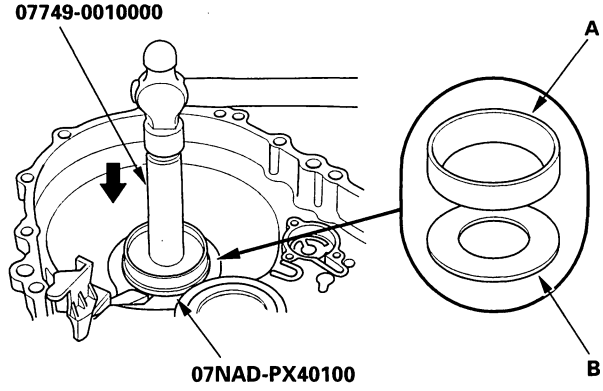
3. If you replaced the carrier bearing on the clutch housing side of the carrier, remove and discard the bearing outer race, Heat up the clutch housing to about 212 °F (100 °C) with a heat gun (A), then remove the bearing outer race (B) and spacer (C). Do not heat the housing in excess of 212 °F (100 °C).



4. Install the 81 mm shim (A), spacer (B), and bearing outer race (C) in the transmission housing by using the special tools. (Use a new race if you replaced the bearing.) There should be no space between the race, spacer, and housing.



5. If you removed the bearing outer race from the clutch housing, use the special tools to install a new bearing outer race (A) and spacer (B). There should be no space between the race, spacer, and housing.



6. With the mainshaft and countershaft removed, install the differential assembly, and bolt the transmission and clutch housing together. Tighten the bolts to 44 N·m (4.5 kgf·m, 33 lbf·ft).

   NOTE: It is not necessary to use sealing agent between the housings for this adjustment.

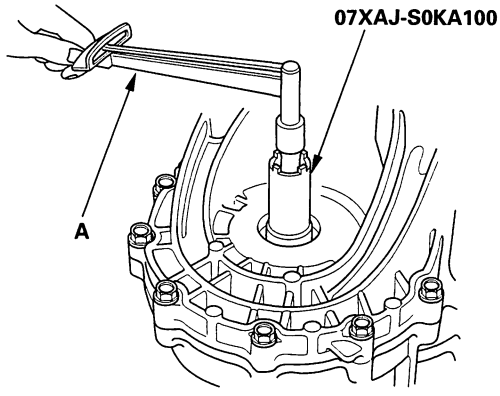
7. Rotate the differential assembly in both directions to seat the tapered roller bearings.

BACK

Protected by AR

8. At normal room temperature, measure the starting torque of the differential assembly by rotating it in both directions with the special tool and a torque wrench (A).

Standard: 3.43—4.51 N·m (35—46 kgf·cm, 30—40 lbf·in.)



9. If the carrier bearing preload is not within the standard, select a 81 mm thrust shim that will provide the correct preload:

- Compare the bearing preload you got on the first try with the specified preload of 3.43—4.51 N·m (35—46 kgf·cm, 30—40 lbf·in.).
- If the preload you measure was less than specified, subtract it from the specified preload.
- If the preload you measure was more than specified, subtract it from the specified preload.

For example, with a 2.50 mm (0.098 in.) thrust shim:

① specified 4.51 N·m (46 kgf·cm, 40 lbf·in.)
— you got less 2.55 N·m (26 kgf·cm, 23 lbf·in.)
1.96 N·m (20 kgf·cm, 17 lbf·in.) less

② you got more 5.29 N·m (54 kgf·cm, 47 lbf·in.)
— specified 4.51 N·m (46 kgf·cm, 40 lbf·in.)
0.78 N·m (8 kgf·cm, 7 lbf·in.) more

NOTE: Each shim size up or down from the standard makes about 0.3—0.4 N·m (3—4 kgf·cm, 2.6—3.5 lbf·in.) difference in preload.

In example ①, your preload was 1.96 N·m (20 kgf·cm, 17 lbf·in.) less than the standard, so you need a thrust shim five sizes thicker than the standard (try the 2.65 mm (0.104 in.) 81 mm thrust shim, and recheck).

In example ②, your preload was 0.78 N·m (8 kgf·cm, 7 lbf·in.) more than the standard, so you need a thrust shim two sizes thinner (try the 2.44 mm (0.096 in.) 81 mm thrust shim, and recheck).

81 mm Shim

	Part Number	Thickness
A	41438-PYZ-000	2.05 mm (0.081 in.)
B	41439-PYZ-000	2.08 mm (0.082 in.)

Carrier Bearing Preload Adjustment (cont'd)

10. Once the carrier bearing preload is correct, disassemble the transmission housing, and install new oil seals in the differential (see step 4 on page 13-76).
11. Reassemble the transmission (see page 13-65).
12. Reinstall the transmission (see page 13-19).

Symptom Troubleshooting Index (cont'd)

Symptom	Probable cause(s)	Notes
Engine runs, but vehicle does not move in any gear	1. Low ATF level 2. Shift cable broken or out of adjustment 3. Shift cable worn 4. ATF pump worn or binding 5. Regulator valve stuck or spring worn 6. ATF strainer clogged 7. Mainshaft worn or damaged 8. Final gears worn or damaged 9. Transmission-to-engine assembly error 10. Axle disengaged	• Check the ATF level, and check the ATF cooler lines for leakage and loose connections. • Check for a loose shift cable at the shift lever and the transmission control lever. • Improper alignment of ATF pump and torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Check the line pressure. • Check the ATF strainer for debris. If the ATF strainer is clogged with particles of steel or aluminum, inspect the ATF pump. If the ATF pump is OK, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the differential assembly, replace the ATF strainer, and thoroughly clean the transmission. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will result in ATF pump seizure if not detected. Use the proper tools. • Install the main seal flush with the torque converter housing. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage.
Vehicle moves in R, but not in D, D3, or 1	1. 1st accumulator defective 2. 1st clutch defective	• Check the 1st clutch pressure. • Inspect the secondary shaft and 1st/1st-hold/2nd clutch assembly for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clutch end-plate-to-top disc clearance. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage. If the discs and plates are worn and damaged, replace them as a set. If they are OK, adjust the clutch end plate clearance.
Vehicle moves in 2 and R, but not in D, D3, or 1	1. 1st gear one-way clutch defective 2. 1st gears worn or damaged 3. 1st clutch defective	• Check the 1st clutch pressure. • Inspect the secondary shaft and 1st/1st-hold/2nd clutch assembly for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clutch end-plate-to-top-disc clearance. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clutch end plate clearance.

BACK

Symptom	Probable cause(s)	Notes
Vehicle moves in D, D3, 2, and R, but not in 1	1. 1st-hold accumulator defective 2. 1st-hold clutch defective	• Check the 1st-hold clutch pressure. • Inspect the secondary shaft and 1st/1st-hold/2nd clutch assembly for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clutch end-plate-to-top-disc clearance. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clutch end plate clearance.
Vehicle moves in D, D3, 1, and R, but not in 2	1. 2nd accumulator defective 2. 2nd gears worn or damaged 3. 2nd clutch defective	• Check the 2nd clutch pressure. • Inspect the secondary shaft and 1st/1st-hold/2nd clutch assembly for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clutch end-plate-to-top-disc clearance. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clutch end plate clearance.
Vehicle moves in D, D3, 2, and 1, but not in R (or moves forward in R)	1. Shift fork shaft stuck 2. Modulator valve defective 3. Reverse CPC valve defective 4. 5th accumulator defective 5. 5th clutch defective 6. Reverse gears worn or damaged	• Check the line pressure and 5th clutch pressure. • Check for a missing shift fork bolt on the shift fork shaft. • Check the ATF strainer for debris. If the ATF strainer is clogged with particles of steel or aluminum, inspect the ATF pump. If the ATF pump is OK, find the damaged components that caused the debris. If no cause for the contamination is found, replace the torque converter. • Inspect the reverse selector gear teeth chamfers, and inspect engagement teeth chamfers of the countershaft 5th gear and reverse gear. Replace the reverse gears and the reverse selector if they are worn or damaged. If the transmission makes clicking, grinding, or whirring noises, also replace the mainshaft 5th gear, reverse idler gear, and countershaft 5th gear. • If the 5th clutch feed pipe guide in the end cover is scored by the mainshaft, inspect the ball bearing for excessive movement in the transmission housing. If the ball bearing is OK, replace the end cover as it is dented. The O-ring under the guide is probably worn. • Replace the mainshaft if the bushing for the 4th and 5th clutch feed pipes are loose or damaged. If the 5th clutch feed pipe is damaged or out of round, replace the end cover. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clutch end-plate-to-top-disc clearance. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the clutch end plate.

Symptom Troubleshooting Index (cont'd)

Symptom	Probable cause(s)	Notes
Poor acceleration; flares when starting off in D and D3; stall speed high in D, D3, 2, and 1	1. Low ATF level 2. Shift cable broken or out of adjustment 3. ATF pump worn or binding 4. Regulator valve stuck or spring worn 5. ATF strainer clogged 6. Torque converter check valve defective	• Check the ATF level, and check the ATF cooler lines for leakage and loose connections. • Check for a loose shift cable at the shift lever and the transmission control lever. • Check the line pressure. • Improper alignment of ATF pump and torque converter housing may cause ATF pump seizure. The symptom is mostly an rpm-ticking noise or a high pitched squeak. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will result in ATF pump seizure if not detected. Use the proper tools.
Poor acceleration; flares when starting off in D and D3; stall speed high in 2	2nd clutch defective	• Check the 2nd clutch pressure. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clutch end-plate-to-top-disc clearance. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clutch end plate clearance.
Poor acceleration; flares when starting off in R; stall speed high in R	1. Shift cable broken or out of adjustment 2. 5th clutch defective	• Check for a loose shift cable at the shift lever and the transmission control shaft. • Check the 5th clutch pressure. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clutch end-plate-to-top-disc clearance. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clutch end plate clearance.

Speedometer and odometer do not work	Output shaft (countershaft) speed sensor defective	Check the D indicator, and check for loose connectors.
The engine does not rev to high rpm, and the transmission upshifts at low rpm (engine at normal operating temperature)	VTEC rocker arms defective	Check the engine rocker arms.

Protected by AR

System Description

General Operation

The automatic transmission is a combination of a 3-element torque converter and triple-shaft electronically controlled unit which provides 5 speeds forward and 1 reverse. The entire unit is positioned in line with the engine.

Torque Converter, Gears, and Clutches

The torque converter consists of a pump, turbine, and stator assembly in a single unit. The converter housing (pump) is connected to the engine crankshaft and turns as the engine turns. Around the outside of the torque converter is a ring gear which meshes with the starter pinion when the engine is being started. The entire torque converter assembly serves as a flywheel, transmitting power to the transmission mainshaft. The transmission has three parallel shafts: the mainshaft, the countershaft, and the secondary shaft. The mainshaft is in line with the engine crankshaft. The mainshaft includes the 4th and 5th clutches, and gears for 3rd, 4th, 5th, and reverse (reverse gear is integral with the 5th gear). The countershaft includes the 3rd clutch, and gears for the final drive, 1st, 4th, 5th, reverse, 2nd, park, and 3rd (the final drive gear is integral with the countershaft). The secondary shaft includes the 1st, 1st-hold and 2nd clutches, and gears for 1st, 2nd, and idler. The countershaft 5th gear and the countershaft reverse gear can be locked to the countershaft at its center, providing 5th gear or reverse, depending with which way the selector is moved. The gears on the mainshaft and the secondary shaft are in constant mesh with those on the countershaft. When certain combinations of gears in the transmission are engaged by the clutches, power is transmitted through the mainshaft, then to the secondary shaft to the countershaft provide drive.

Electronic Control

The electronic control system consists of the powertrain control module (PCM), sensors, and seven solenoid valves. Shifting and lock-up are electronically controlled for comfortable driving under all conditions. The PCM is located below the dashboard, under the front lower panel behind the center console.

Hydraulic Control

The valve bodies include the main valve body, the regulator valve body, the servo body, and the accumulator body. They are bolted to the torque converter housing. The main valve body contains the manual valve, the modulator valve, the shift valve C, the shift valve D, the kick-down valve, the servo control valve, the torque converter check valve, the reverse CPC valve, the lock-up shift valve, the relief valve, the cooler check valve, and the ATF pump gears. The regulator valve body contains the regulator valve, the lock-up timing valve, and the lock-up control valve. The servo body contains the servo valve, the shift valve A, the shift valve B, the CPC valves A and B. The top accumulator body contains shift valve E, CPC valve C, 1st-hold accumulator piston, 4th accumulator piston, and 5th accumulator piston. The accumulator body contains the 1st and 2nd accumulators and lubrication check valve. Fluid from the regulator passes through the manual valve to the various control valves. The 1st, 3rd, 4th, and 5th clutches receive fluid from their respective feed pipes, and the 1st-hold and 2nd clutches receive fluid from the internal hydraulic circuit.

Shift Control Mechanism

To shift gears, the PCM controls shift solenoid valves A, B, and C, and automatic transaxle (A/T) clutch pressure control solenoid valves A and B, while receiving input signals from various sensors and switches located throughout the vehicle. The shift solenoid valves shift the positions of the shift valves to switch the port leading hydraulic pressure to the clutch. The A/T clutch pressure control solenoid valves A and B control the CPC valves A and B to shift smoothly between lower gear and higher gear. This pressurizes a line to one of the clutches, engaging the clutch and its corresponding gear.

Lock-up Mechanism

The lock-up mechanism operates in the D position (2nd, 3rd, 4th, and 5th), and D3 position (2nd and 3rd). The pressurized fluid is drained from the back of the torque converter through a fluid passage, causing the torque converter clutch piston to be held against the torque converter cover. As this takes place, the mainshaft rotates at the same speed as the engine crankshaft. Together with hydraulic control, the PCM optimizes the timing of the lock-up mechanism. When the torque converter clutch solenoid valve activates, modulator pressure changes to switch lock-up on and off. The lock-up control valve and the lock-up timing valve control the volume of lock-up according to A/T clutch pressure control solenoid valve C. The torque converter clutch solenoid valve is mounted on the torque converter housing, and A/T clutch pressure control solenoid valve C is mounted on the transmission housing. They are all controlled by the PCM.

Protected by AR

Gear Selection
The shift lever has seven positions; P: PARK, R: REVERSE, N: NEUTRAL, D: 1st through 5th gear ranges, D3: 1st through 3rd gear ranges, 2: 2nd gear, and 1: 1st gear.

Position	Description
P: PARK	Front wheels locked; park pawl engaged with park gear on countershaft. All clutches are released.
R: REVERSE	Reverse; reverse selector engaged with countershaft reverse gear and 5th clutch engaged.
N: NEUTRAL	All clutches are released.
D: DRIVE (1st through 5th)	General driving; starts off in 1st, shifts automatically to 2nd, 3rd, 4th, then 5th, depending on vehicle speed and throttle position. Downshifts through 4th, 3rd, 2nd, and 1st on deceleration to stop. The lock-up mechanism operates in 2nd, 3rd, 4th, and 5th gear.
D3: DRIVE (1st through 3rd)	Used for rapid acceleration at highway speeds and general driving; up-hill and down-hill driving; starts off in 1st, shifts automatically to 2nd, then 3rd, depending on vehicle speed and throttle position. Downshifts through 2nd to 1st on deceleration to stop. The lock-up mechanism operates in 2nd and 3rd gear.
2: SECOND	Used for engine braking or better traction starting off on loose or slippery surfaces; stays in 2nd gear; does not shift up or down.
1: FIRST	Used for engine braking; stays in 1st gear; does not shift up.

Starting is possible only in the P and N positions because of a slide-type neutral-safety switch.

Automatic Transmission (A/T) Gear Position Indicator
The A/T gear position indicator in the instrument panel shows which shift lever position has been selected without having to look down at the shift lever.

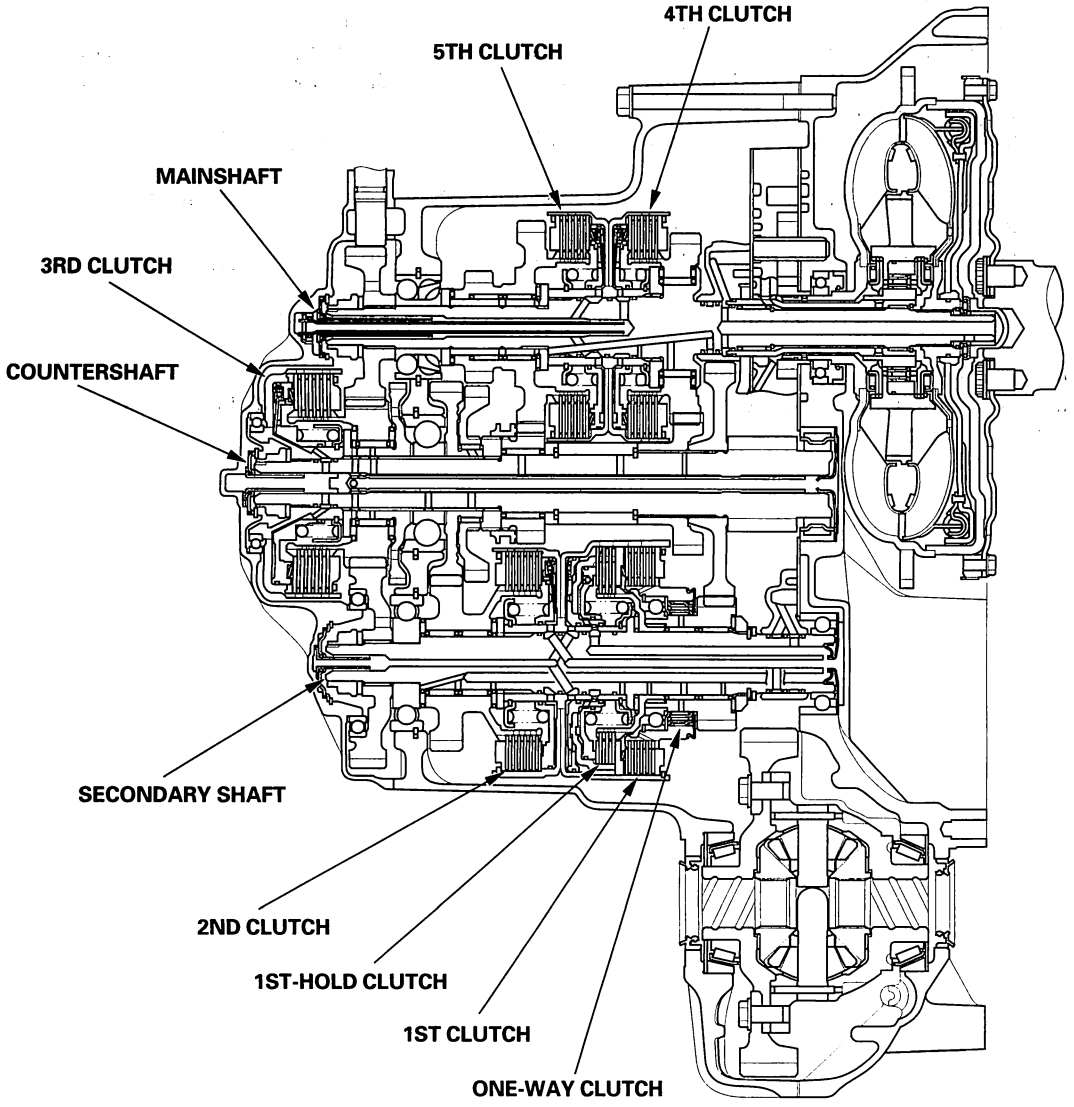
System Description (cont'd)

Clutches

The five-speed automatic transmission uses hydraulically-actuated clutches to engage or disengage the transmission gears. When hydraulic pressure is introduced into the clutch drum, the clutch piston moves. This presses the friction discs and steel plates together, locking them so they don't slip. Power is then transmitted through the engaged clutch pack to its hub-mounted gear. Likewise, when the hydraulic pressure is bled from the clutch pack, the piston releases the friction discs and steel plates, and they are free to slide past each other. This allows the gear to spin independently on its shaft, transmitting no power.

Transmission Cutaway View:



BACK

Protected by AR

1st Clutch
The 1st clutch engages/disengages 1st gear, and is located at the middle of the secondary shaft. The 1st clutch is joined back-to-back to the 2nd clutch. The 1st clutch is supplied hydraulic pressure by its ATF feed pipe within the secondary shaft.

1st-hold Clutch
The 1st-hold clutch engages/disengages 1st-hold in 1 position, and is located in the 1st clutch drum. The 1st-hold clutch is supplied hydraulic pressure through the orifice inside the secondary shaft by a circuit connected to the internal hydraulic circuit.

2nd Clutch
The 2nd clutch engages/disengages 2nd gear, and is located at the middle of the secondary shaft. The 2nd clutch is joined back-to-back to the 1st clutch. The 2nd clutch is supplied hydraulic pressure through the orifice inside the secondary shaft by a circuit connected to the internal hydraulic circuit.

3rd Clutch
The 3rd clutch engages/disengages 3rd gear, and is located at the end of the countershaft, just behind the end cover. The 3rd clutch is supplied hydraulic pressure by its ATF feed pipe in the countershaft.

4th Clutch
The 4th clutch engages/disengages 4th gear, and is located at the middle of the mainshaft. The 4th clutch is joined back-to-back to the 5th clutch. The 4th clutch is supplied hydraulic pressure by its ATF feed pipe within the mainshaft.

5th Clutch
The 5th clutch engages/disengages 5th gear, as well as reverse gear, and is located at the middle of the mainshaft. The 5th clutch is joined back-to-back to the 4th clutch. The 5th clutch is supplied hydraulic pressure by its ATF feed pipe within the mainshaft.

One-way Clutch
The one-way clutch is positioned between the 1st clutch hub and the secondary shaft 1st gear. The secondary shaft 1st gear is splined to the 1st-hold clutch hub, with the 1st-hold clutch hub splined to the secondary shaft. The secondary shaft 1st gear provides the outer race surface, and the 1st clutch hub provides the inner race surface. The one-way clutch locks when power is transmitted from the secondary shaft 1st gear to the countershaft 1st gear. The 1st clutch and gears remain engaged in the 1st, 2nd, 3rd, 4th, and 5th gear ranges in the D, D3, or 2 position.
However, the one-way clutch disengages when the 2nd, 3rd, 4th, or 5th clutches and gears are applied in the D, D3, or 2 position. This is because the increased rotational speed of the gears on the secondary shaft causes the one-way clutch to free-wheels with the 1st clutch still engaged.

Protected by AR

System Description (cont'd)

Power Flow

Gear Operation

Gears on the mainshaft:

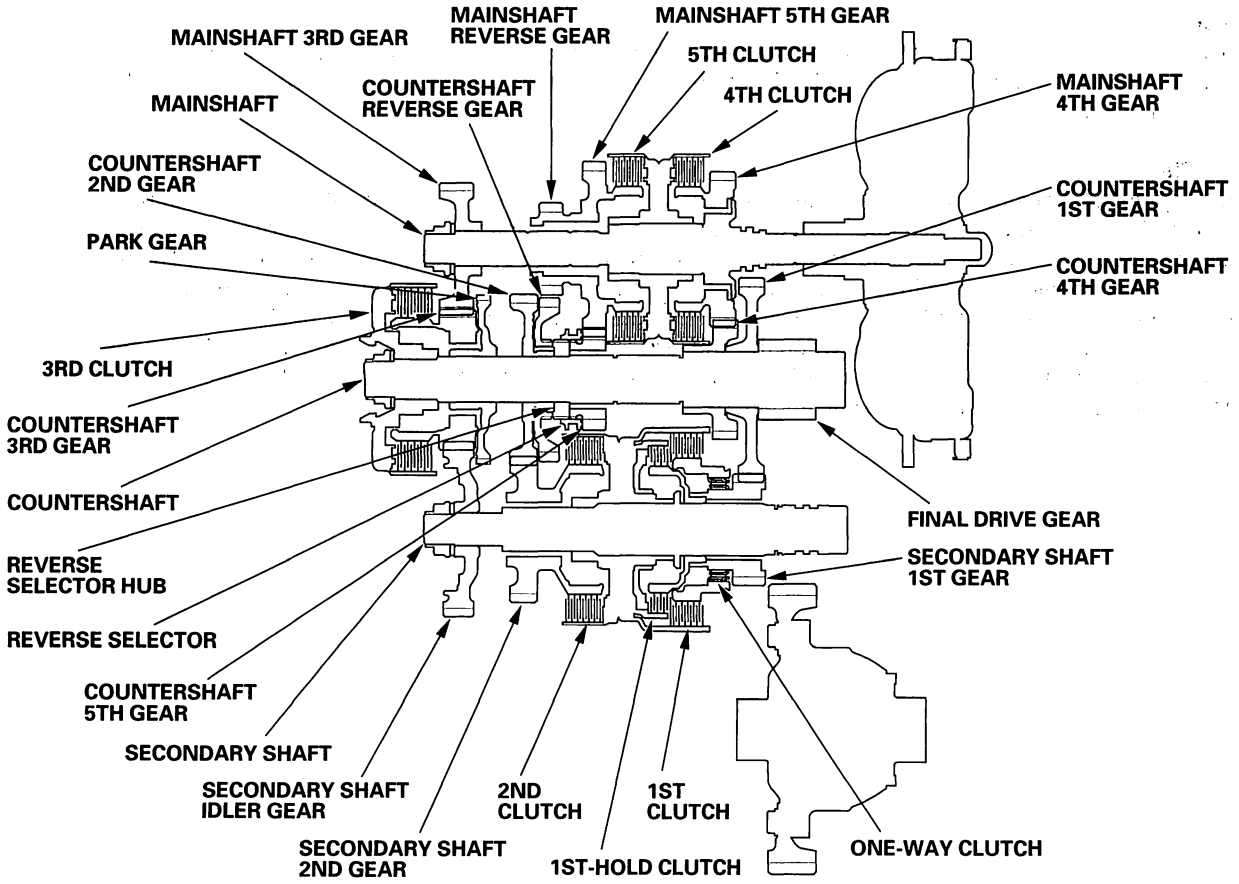
- 4th gear is engaged/disengaged with the mainshaft by the 4th clutch.
- 5th gear is engaged/disengaged with the mainshaft by the 5th clutch.
- Reverse gear is engaged/disengaged with the mainshaft by the 5th clutch.
- 3rd gear is splined with the mainshaft and rotates with the mainshaft.

Gears on the countershaft:

- Final gear is integral with the countershaft.
- 1st gear, 4th gear, 2nd gear, and park gear are splined with the countershaft, and rotate with the countershaft.
- 5th gear and reverse gear rotate freely from the countershaft. The reverse selector engages 5th gear and reverse gear with the reverse selector hub. The reverse selector hub is splined to the countershaft so 5th gear and reverse gear engage with the countershaft.
- 3rd gear is engaged/disengaged with the countershaft by the 3rd clutch.

Gears on the secondary shaft:

- 1st gear is engaged/disengaged with the secondary shaft by the 1st clutch. 1st gear is engaged with the secondary shaft by the one-way clutch and the 1st-hold clutch when decelerating for engine braking.
- 2nd gear is engaged/disengaged with the secondary shaft by the 2nd clutch.
- Idler gear is splined with the secondary shaft, and rotates with the secondary shaft.



BACK

Protected by AR

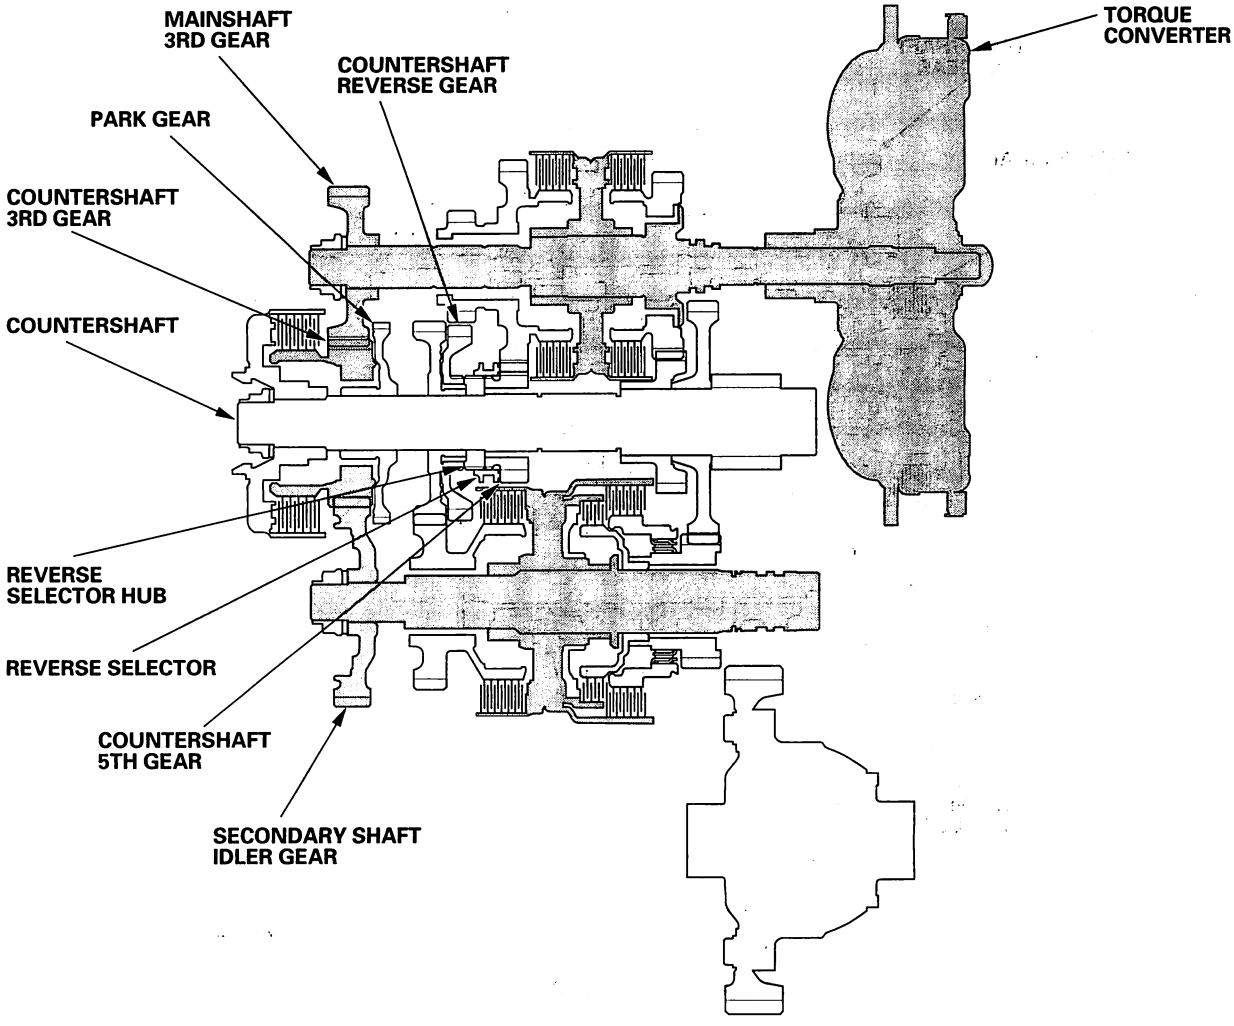
P Position

Hydraulic pressure is not applied to the clutches. Power is not transmitted to the countershaft. The countershaft is locked by the park pawl interlocking the park gear.

N Position

Engine power transmitted from the countershaft drives the mainshaft 3rd gear, the countershaft 3rd gear, and the secondary shaft idler gear, but hydraulic pressure is not applied to the clutches. Power is not transmitted to the countershaft. In this position, the position of the reverse selector differs according to whether the shift lever shifted from the D or P position:

- When shifted from the D position, the reverse selector engages with the countershaft 5th gear and the reverse selector hub, and the 5th gear engages with the countershaft.
- When shifted from the R position, the reverse selector engages with the countershaft reverse gear and the reverse selector hub, and the reverse gear engages with the countershaft.



(cont'd)

Protected by AR

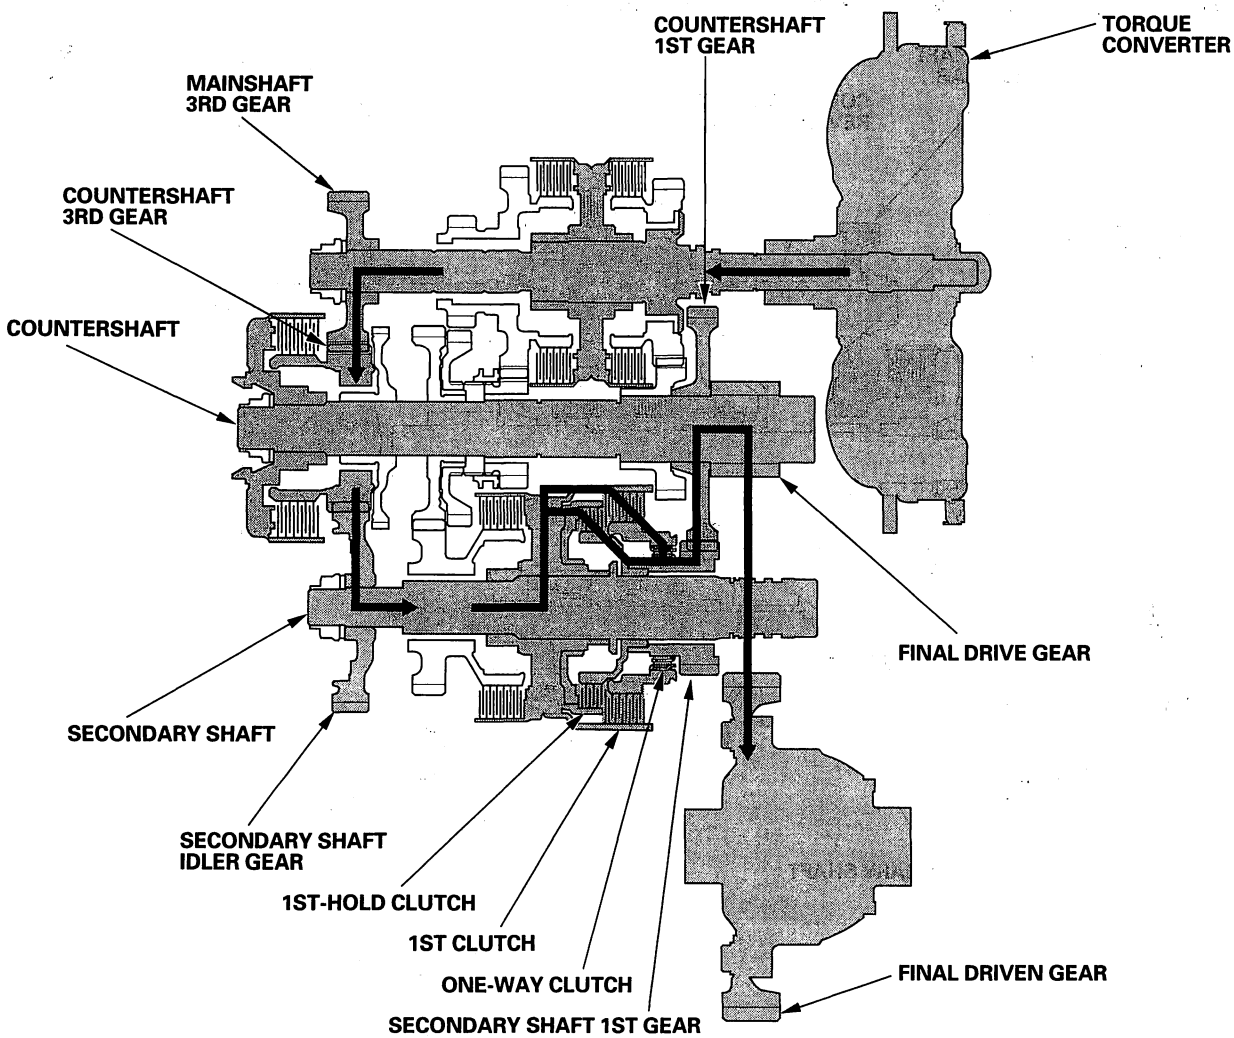
System Description (cont'd)

Power Flow (cont'd)

1 Position

In the 1 position, hydraulic pressure is applied to the 1st clutch and the 1st-hold clutch. The power flow when accelerating is as follows:

- Hydraulic pressure is applied to the 1st clutch, then the 1st clutch engages the secondary shaft 1st gear with the secondary shaft by the one-way clutch.
- Hydraulic pressure is also applied to the 1st-hold clutch, and the 1st-hold clutch engages the secondary shaft 1st gear with the secondary shaft.
- The mainshaft 3rd gear drives the secondary shaft via the countershaft 3rd gear and the secondary shaft idler gear.
- The secondary shaft 1st gear drives the countershaft 1st gear and the countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.



BACK

Protected by AR

1 Position

The power flow when decelerating as follows:

- Hydraulic pressure is applied to the 1st clutch and the 1st-hold clutch. Rolling resistance from the road surface goes through the front wheels to the final drive gear, then to the secondary shaft idler gear.
- The one-way clutch disengages because the application of torque is reversed.
- The counterforce conveyed to the secondary shaft idler gear turns the mainshaft 3rd gear via the countershaft 3rd gear. As a result, engine braking can be obtained with 1st gear.

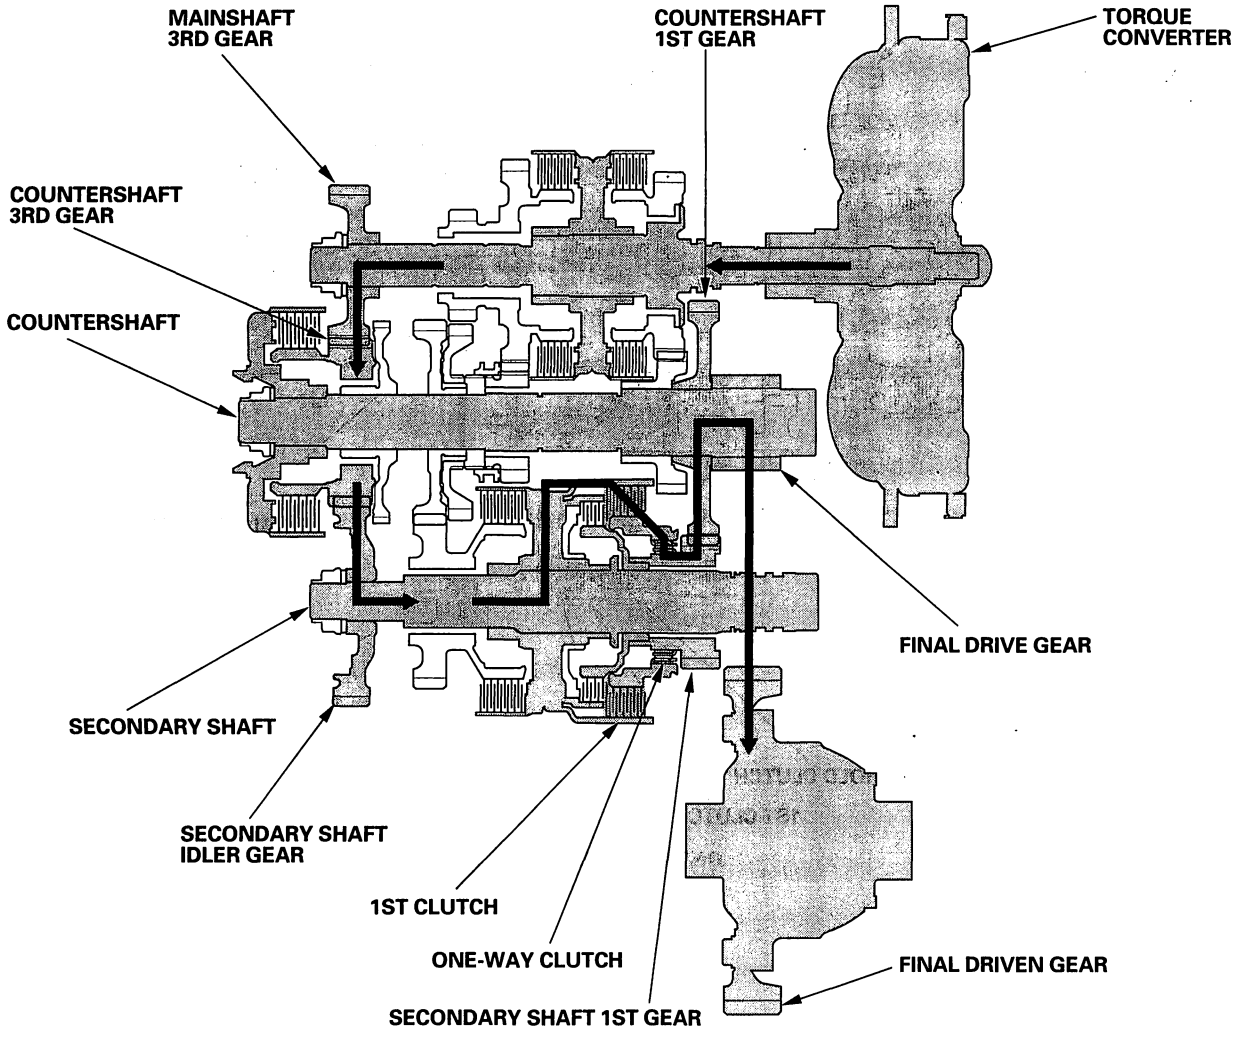
System Description (cont'd)

Power Flow (cont'd)

In the D or D3 position, the optimum gear is automatically selected from the 1st, 2nd, 3rd, 4th, and 5th gears according to conditions such as the balance between the throttle opening (engine loading) and vehicle speed.

D or D3 Position in 1st gear

- Hydraulic pressure is applied to the 1st clutch, then the 1st clutch engages the secondary shaft 1st gear with the secondary shaft by the one-way clutch.
- The mainshaft 3rd gear drives the secondary shaft via the countershaft 3rd gear and secondary shaft idler gear.
- The secondary shaft 1st gear drives the countershaft 1st gear and the countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.

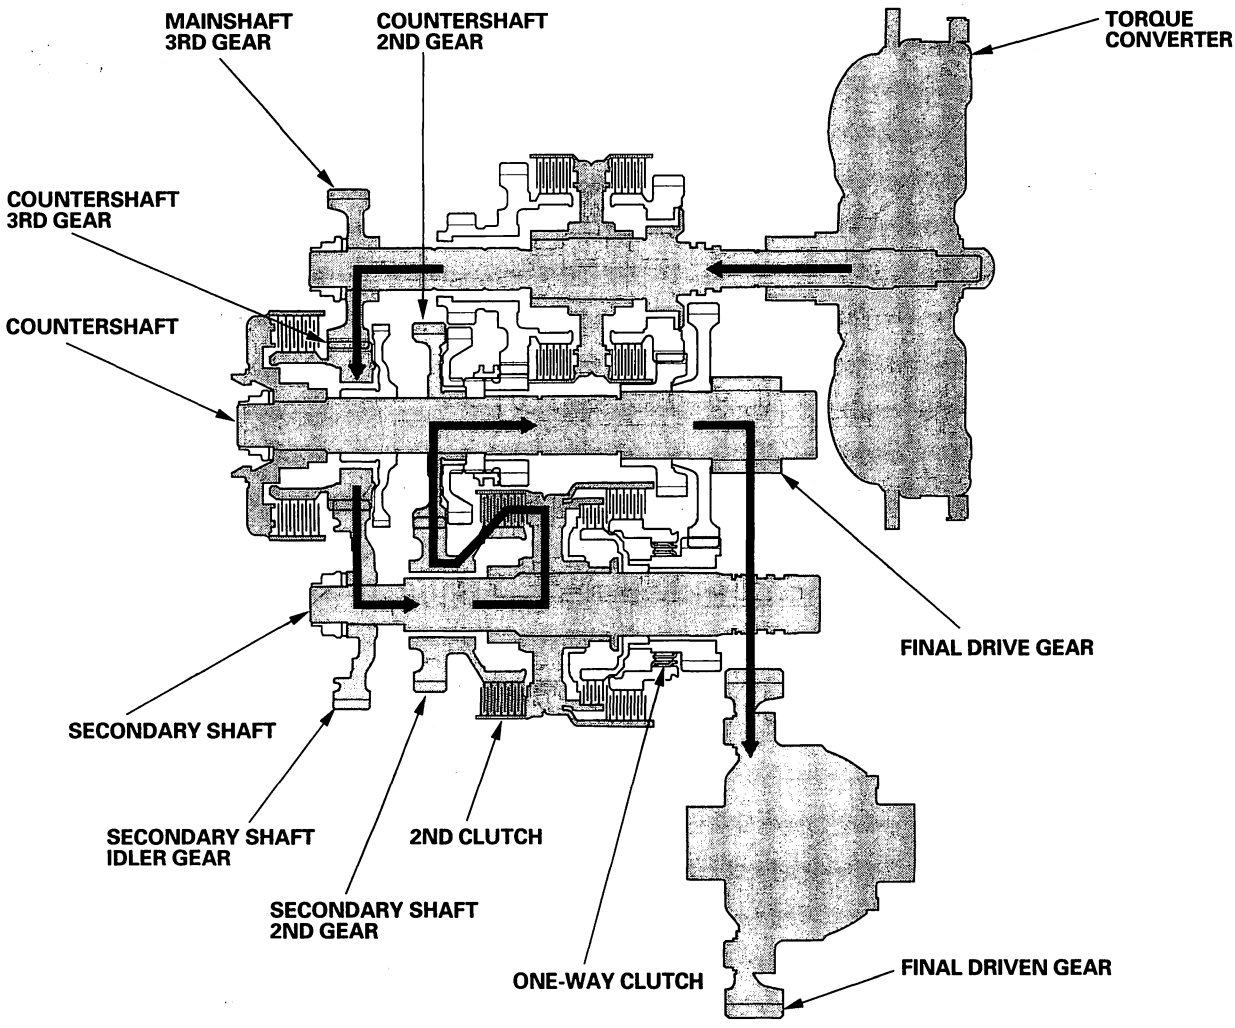


BACK

Protected by AR

D or D3 Position in 2nd gear and 2 Position

- Hydraulic pressure is applied to the 2nd clutch, then the 2nd clutch engages the secondary shaft 2nd gear with the secondary shaft.
- The mainshaft 3rd gear drives the secondary shaft via the countershaft 3rd gear and secondary shaft idler gear.
- The secondary shaft 2nd gear drives the countershaft 2nd gear and the countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of 2nd gear exceeds that of 1st gear, power from 1st gear is cut off at the one-way clutch.



(cont'd)

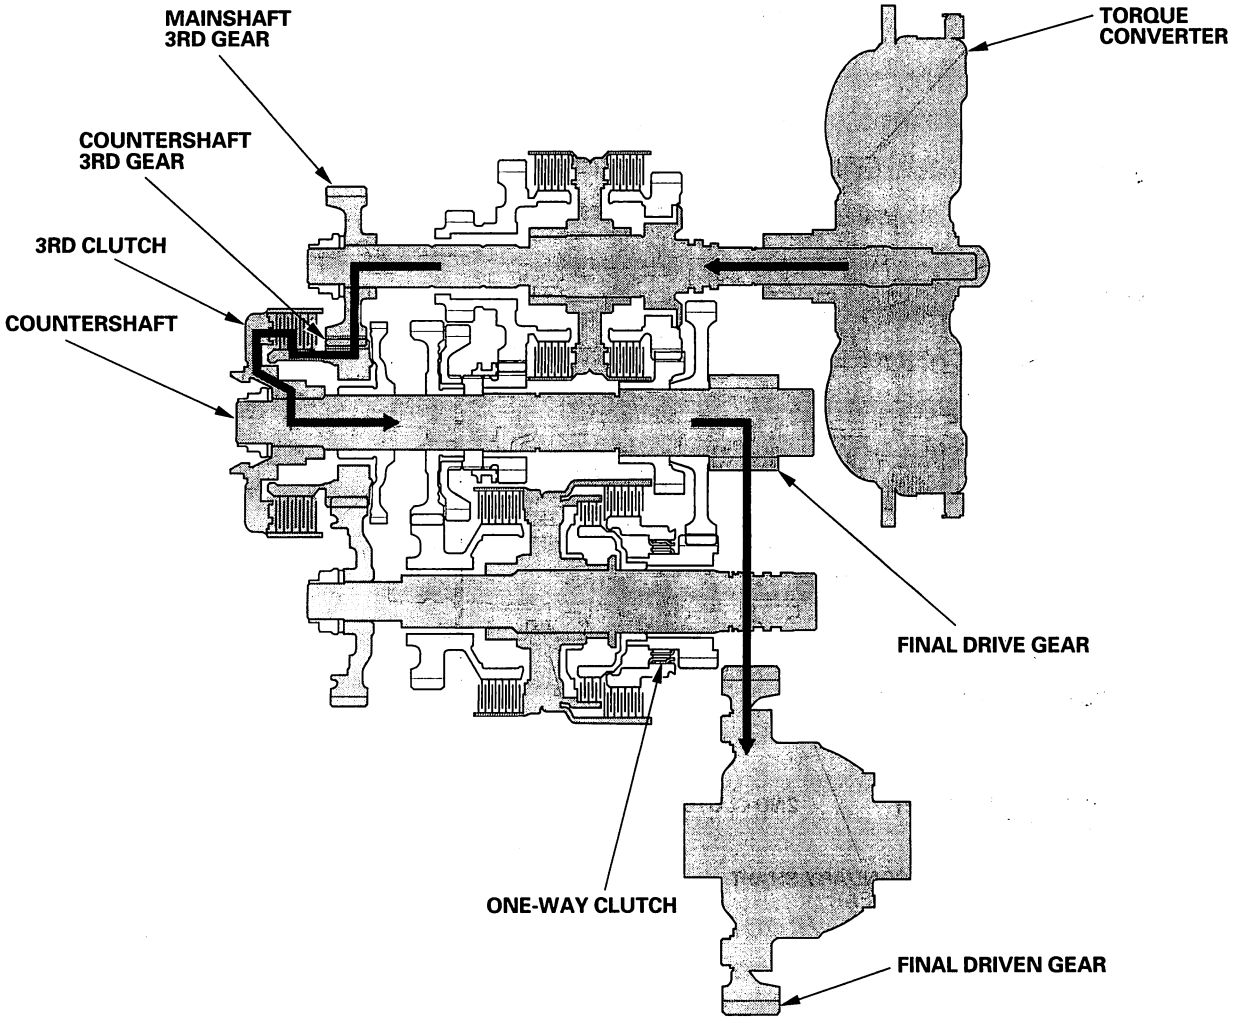
System Description (cont'd)

Power Flow (cont'd)

D or D3 Position in 3rd gear

- Hydraulic pressure is applied to the 3rd clutch, then 3rd clutch engages the countershaft 3rd gear with the countershaft.
- The mainshaft 3rd gear drives the countershaft 3rd gear and countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of 3rd gear exceeds that of 1st gear, power from 1st gear is cut off at the one-way clutch.

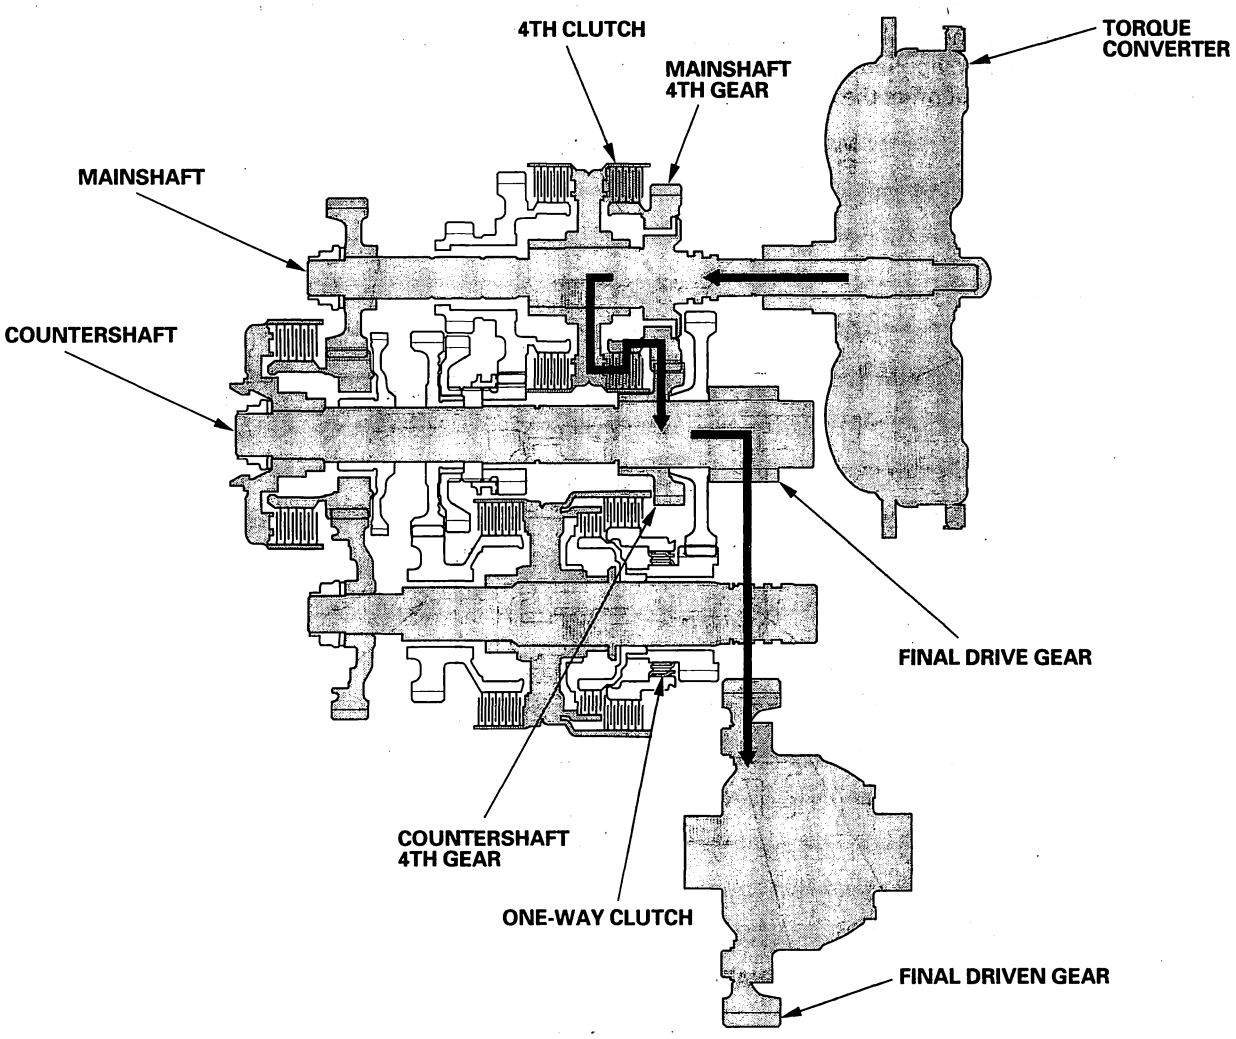


BACK

Protected by AR

D Position in 4th gear

- Hydraulic pressure is applied to the 4th clutch, then the 4th clutch engages the mainshaft 4th gear with the mainshaft.
- The mainshaft 4th gear drives the countershaft 4th gear and the countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of 4th gear exceeds that of 1st gear, power from 1st gear is cut off at the one-way clutch.



(cont'd)

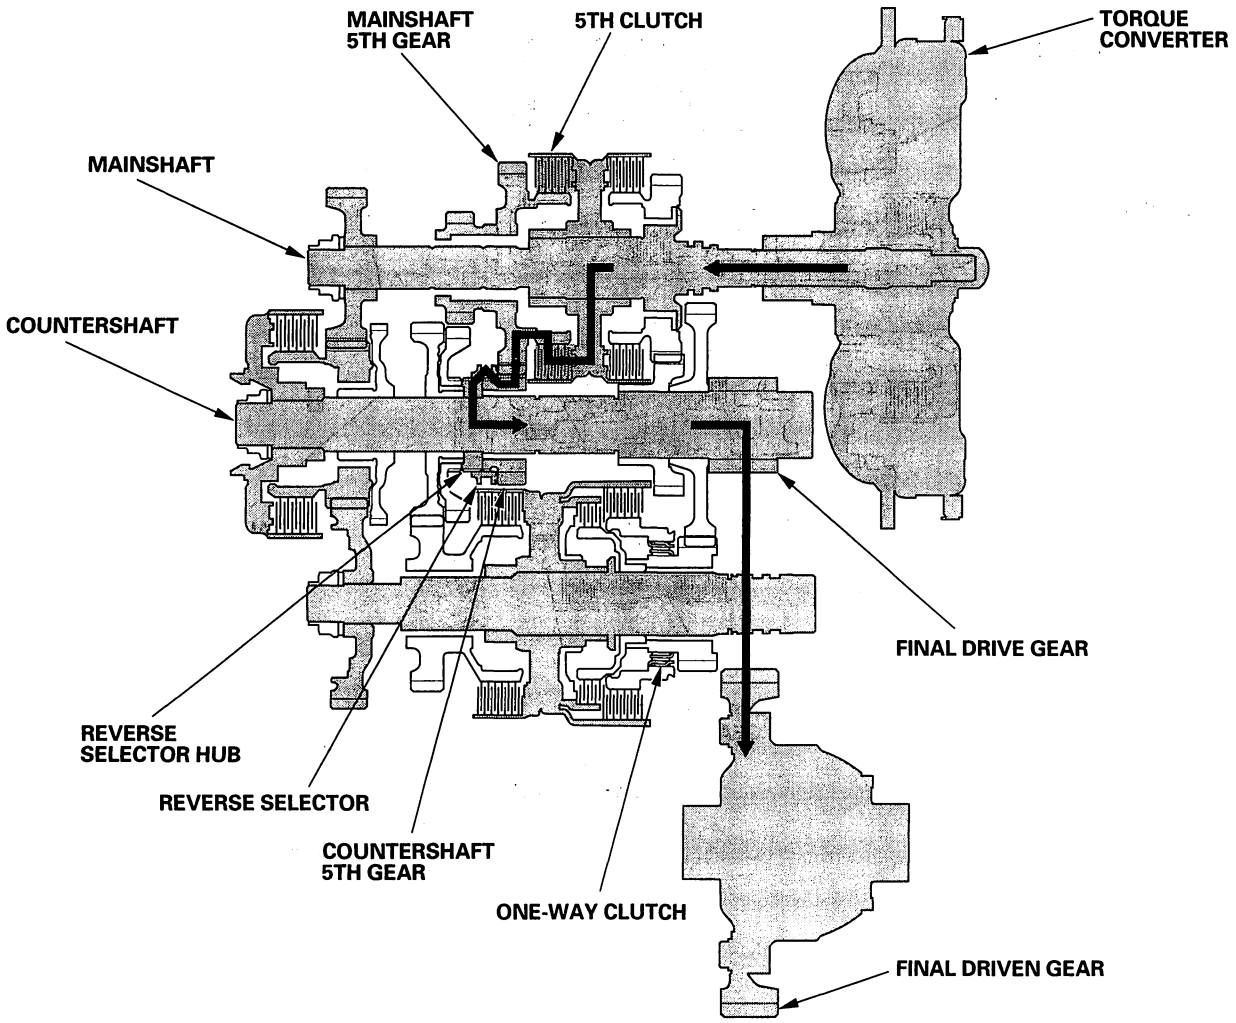
Protected by AR

System Description (cont'd)

Power Flow (cont'd)

D Position in 5th gear

- Hydraulic pressure is applied to the servo valve to engage the reverse selector with the countershaft 5th gear while the shift lever in the forward range (D, D3, 2, and 1 positions).
- Hydraulic pressure is also applied to the 5th clutch, then the 5th clutch engages the mainshaft 5th gear with the mainshaft.
- The mainshaft 5th gear drives the countershaft 5th gear, which drives the reverse selector hub and the countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of 5th gear exceeds that of 1st gear, power from 1st gear is cut off at the one-way clutch.



BACK

Protected by AR

R Position

- Hydraulic pressure is applied to the servo valve to engage the reverse selector with the countershaft (reverse gear while the shift lever is in R position).
- Hydraulic pressure is also applied to the 5th clutch, then the 5th clutch engages the mainshaft reverse gear with the mainshaft.
- The mainshaft reverse gear drives the countershaft reverse gear via the reverse idler gear.
- The rotation direction of the countershaft reverse gear is changed via the reverse idler gear.
- The countershaft reverse gear drives the countershaft via the reverse selector which drives the reverse selector hub.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.

System Description (cont'd)

Electronic Control System

Functional Diagram

The electronic control system consists of the powertrain control module (PCM), sensors, and solenoid valves. Shifting and lock-up are electronically controlled for comfortable driving under all conditions.

The PCM recieves input signals from the sensors, switches, and other control units, perform processing data, and outputs signals for the engine control system and A/T control system. The A/T control system includes shift control, grade logic control, clutch pressure control, and lock-up control is stored in the PCM.
The PCM switches the shift solenoid valves and the A/T clutch pressure control solenoid valves to control shifting transmission gears and lock-up torque converter clutch.

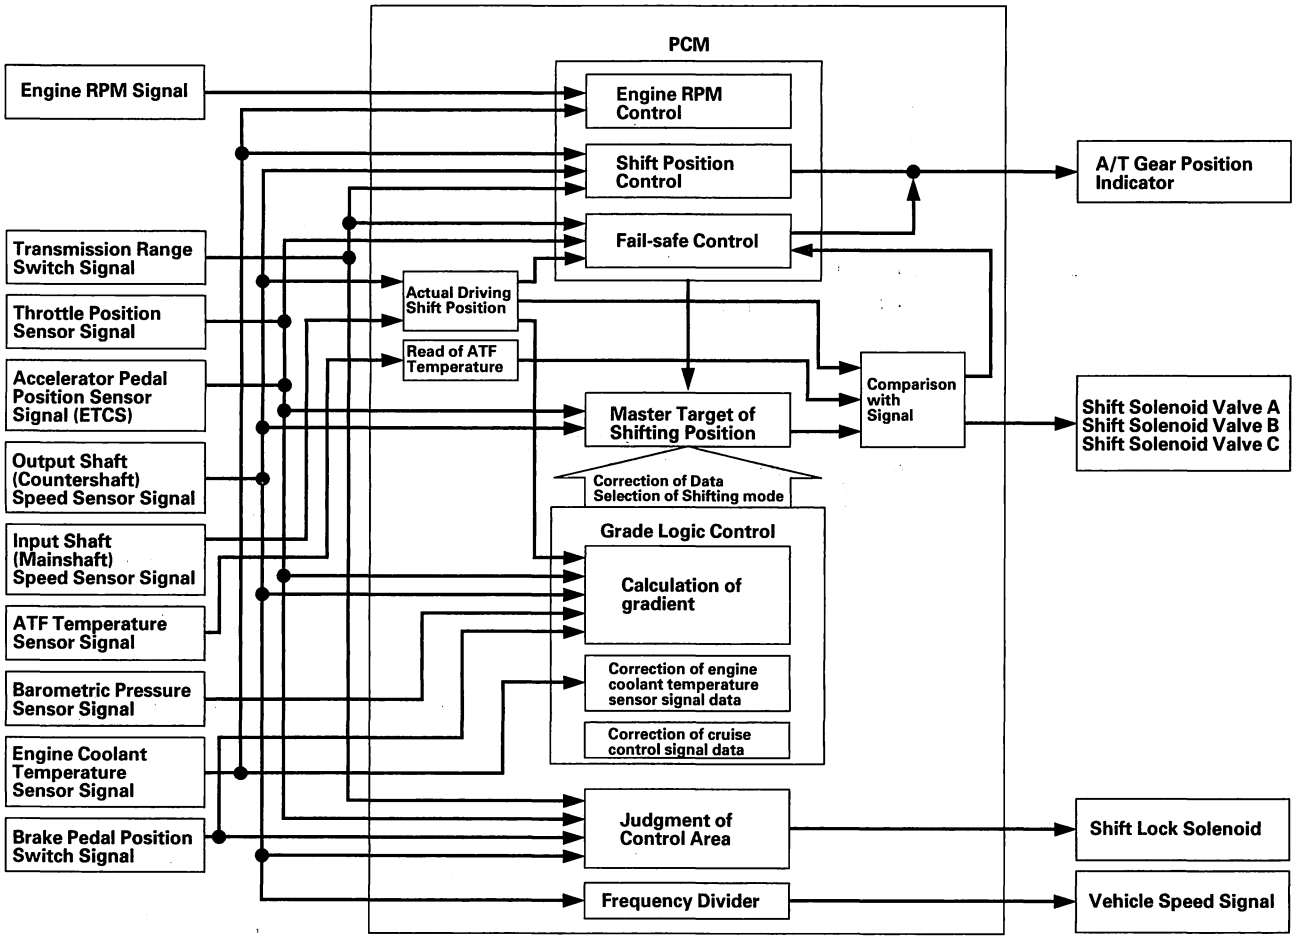
System Description (cont'd)

Electronic Control System (cont'd)

Shift Control
The PCM instantly determines which gear should be selected by various signals sent from sensors and switches, and it actuates the shift solenoid valves A, B, and C to control shifting.

Also, as grade logic control system has been adopted to control shifting in the D and D3 positions. The PCM compares actual driving conditions with memorized driving conditions, based on the input from the accelerator pedal position sensor, the engine coolant temperature sensor, the barometric pressure sensor, the brake pedal position switch signal, and the shift lever position signal, to control shifting while the vehicle is ascending or descending a slope.



BACK

Protected by AR

The PCM turns on and off the shift solenoid valves A, B, and C to control shifting of the transmission gears. The combination of driving signals to shift solenoid valves A, B, and C are shown in the table.

Position	Gear position	Shift solenoid valves		
		A	B	C
D, D3	Shifting from the N position	OFF	ON	OFF
	Stays in 1st	ON	ON	ON

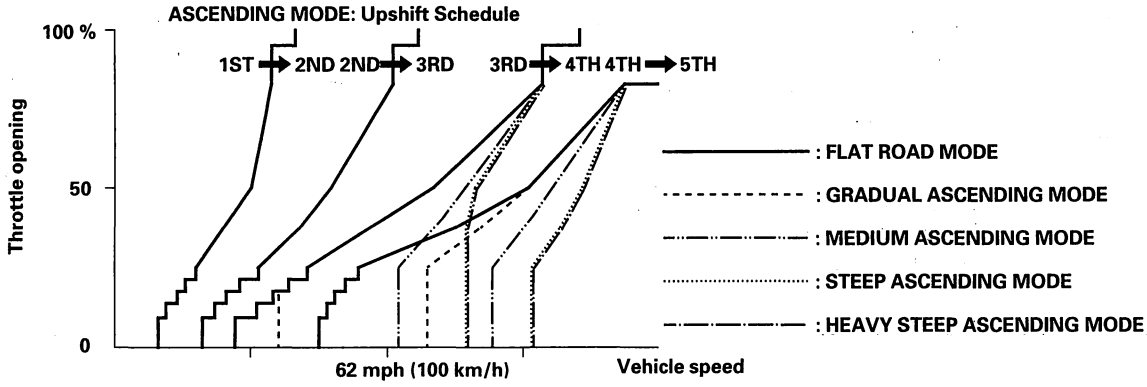
System Description (cont'd)

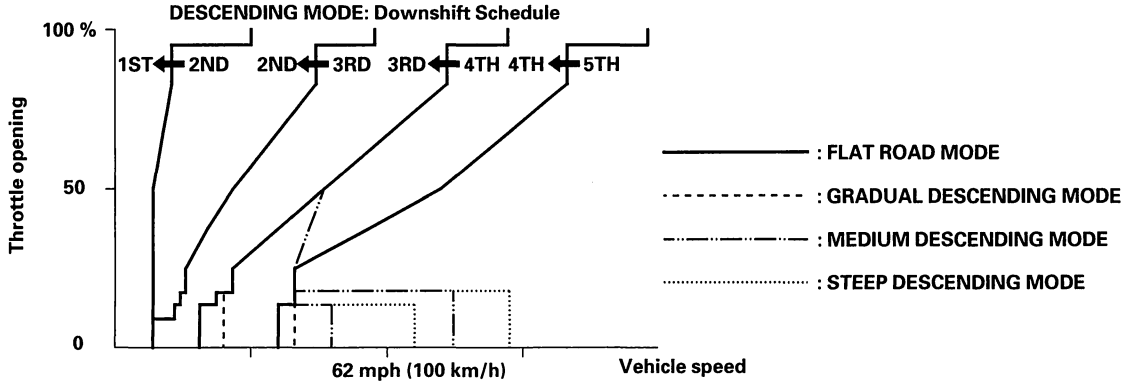
Electronic Control System (cont'd)

Grade Logic Control: Ascending Control
When the PCM determines that the vehicle is climbing a hill in the D and D3 positions, the system extends the engagement area of 2nd gear, 3rd gear, and 4th gear to prevent the transmission from frequently shifting between 2nd and 3rd gears, between 3rd and 4th gears, and between 4th and 5th gears, so the vehicle can run smooth and have more power when needed.

NOTE: Shift schedules stored in the PCM between 2nd and 3rd gears, between 3rd and 4th gears, and between 4th and 5th gears, enable the PCM to automatically select the most suitable gear according to the magnitude of a gradient.



Grade Logic Control: Descending Control
When the PCM determines that the vehicle is going down a hill in the D and D3 positions, the shift-up speed from 4th to 5th gear, 3rd to 4th gear, and from 2nd to 3rd (when the throttle is closed) becomes faster than the set speed for flat road driving to widen the 4th gear, 3rd gear, and 2nd gear driving areas. This, in combination with engine braking from the deceleration lock-up, achieves smooth driving when the vehicle is descending. There are three descending modes with different 4th gear driving areas, 3rd gear driving areas and 2nd gear driving areas according to the magnitude of a gradient stored in the PCM. When the vehicle is in 5th or 4th gear and you are decelerating while applying the brakes on a steep hill, the transmission will downshift to a lower gear. When you accelerate, the transmission will then return to a higher gear.



Deceleration Control
When the vehicle goes around a corner and needs to decelerate first and then accelerate, the PCM sets the data for deceleration control to reduce the number of times the transmission shifts. When the vehicle is decelerating from speeds above 27 mph (43 km/h), the PCM shifts the transmission from 5th or 4th to 2nd earlier than normal to cope with upcoming acceleration.

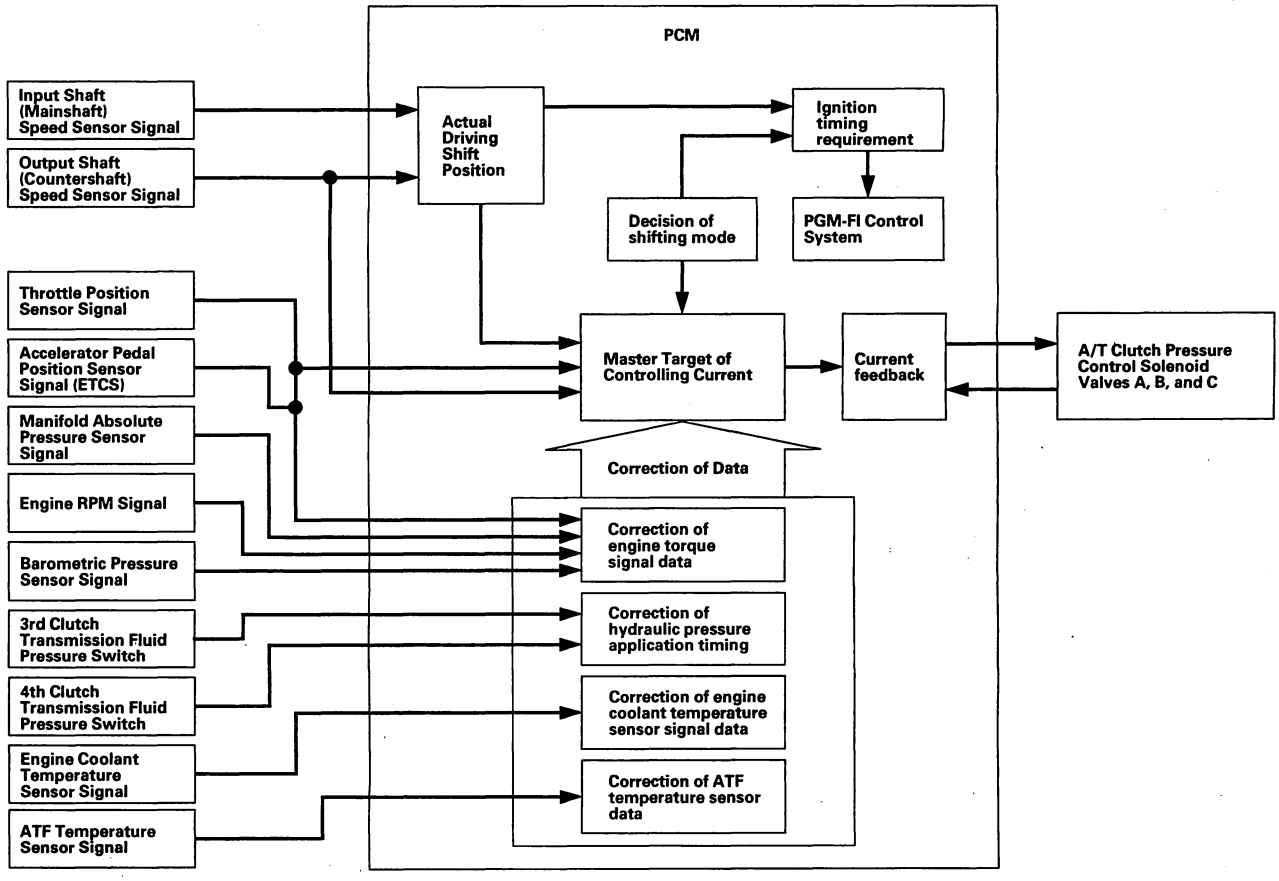
BACK

Protected by AR

Clutch Pressure Control

The PCM actuates the A/T clutch pressure control solenoid valves A, B, and C to control the clutch pressure. When shifting between lower and higher gears, the clutch pressure regulated by the A/T clutch pressure control solenoid valves A, B, and C engages and disengages the clutch smoothly.

The PCM receives input signals from the various sensors and switches, performs processing data, and outputs a current to the A/T clutch pressure control solenoid valves A, B, and C.



(cont'd)

Protected by AR

System Description (cont'd)

Electronic Control System (cont'd)

Lock-up Control

The torque converter clutch solenoid valve controls the hydraulic pressure to switch the lock-up shift valve and lock-up ON and OFF. The PCM actuates the torque converter clutch solenoid valve and the A/T clutch pressure control solenoid valve ON, the condition of the lock-up starts. The A/T clutch pressure control solenoid valve C regulates and apply the hydraulic pressure to the lock-up control valve to control the amount of the lock-up.
The lock-up mechanism operates in the D position (2nd, 3rd, 4th, and 5th), and in the D3 position (2nd and 3rd).

System Description (cont'd)

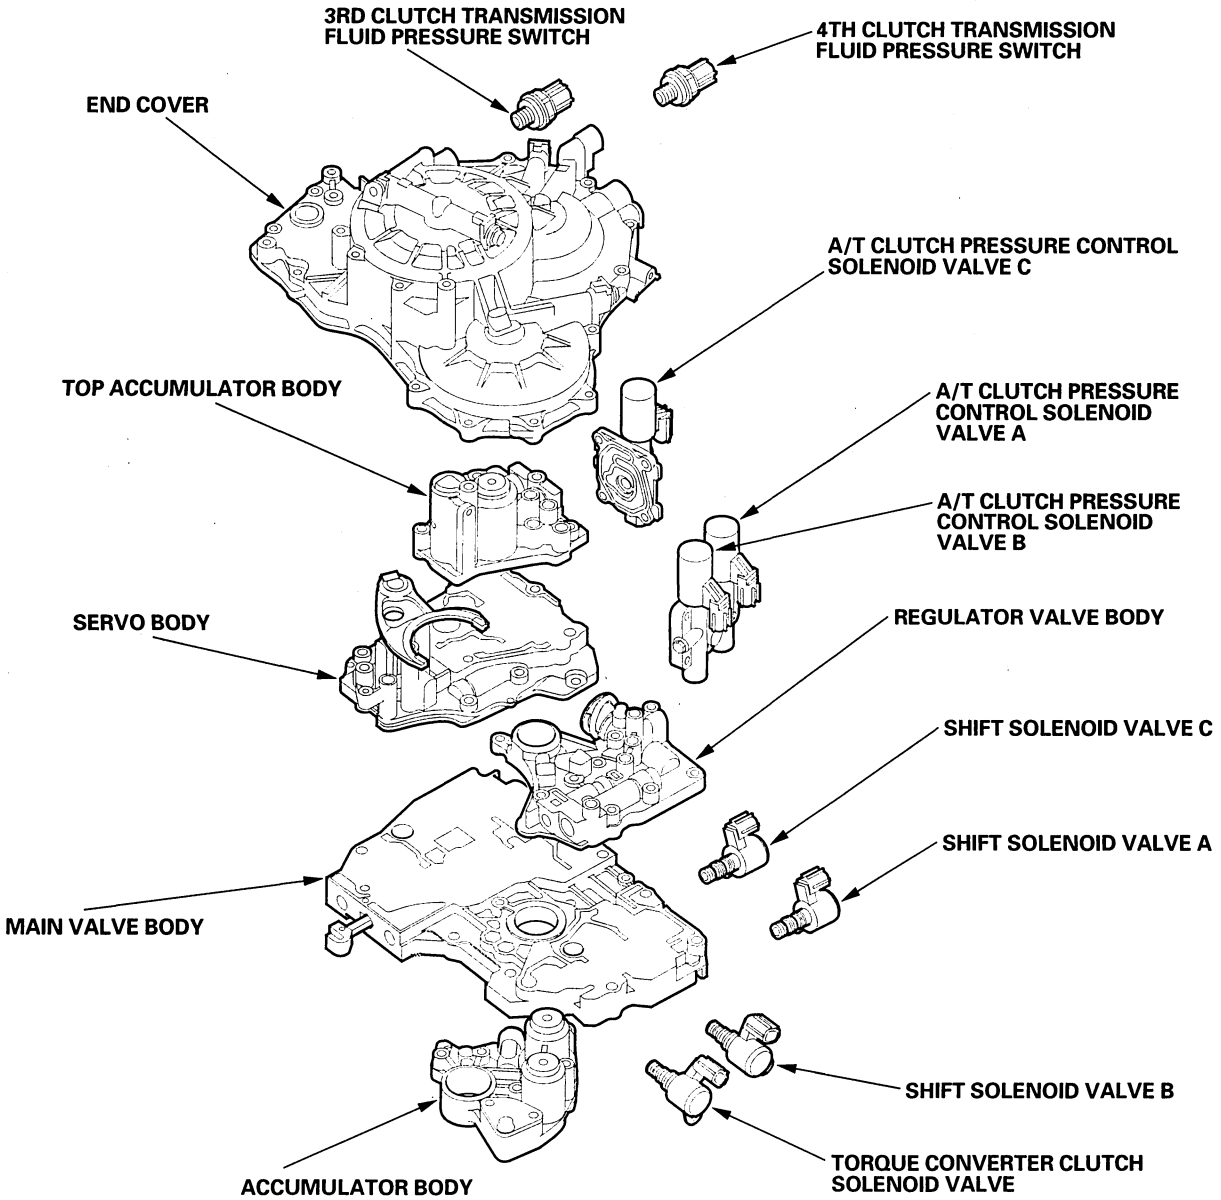
Hydraulic Controls

The valve body includes the main valve body, the regulator valve body, the servo body, the top accumulator body, and the accumulator body. The ATF pump is driven by splines on the left end of the torque converter which is attached to the engine. Fluid flows through the regulator valve to maintain specified pressure through the main valve body to the manual valve, directing pressure to each of the clutches. The shift solenoid valves A and C are mounted on the outside of the torque converter housing. The shift solenoid valve B and the torque converter clutch solenoid valve are mounted on the torque converter housing. The A/T clutch pressure control solenoid valves A and B, and the A/T clutch pressure control solenoid valve C are mounted on the transmission housing.

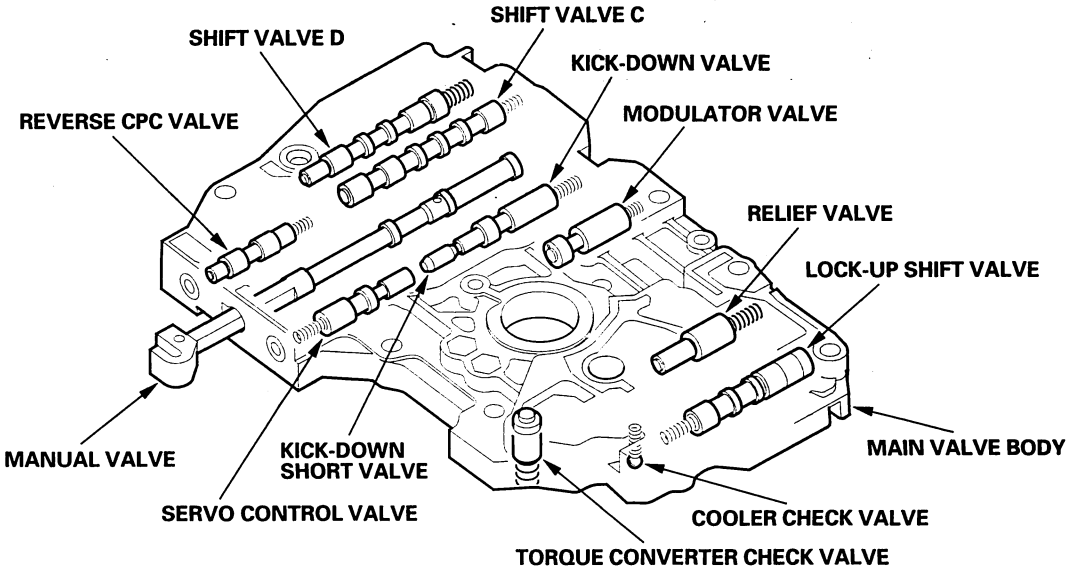


BACK

Protected by AR

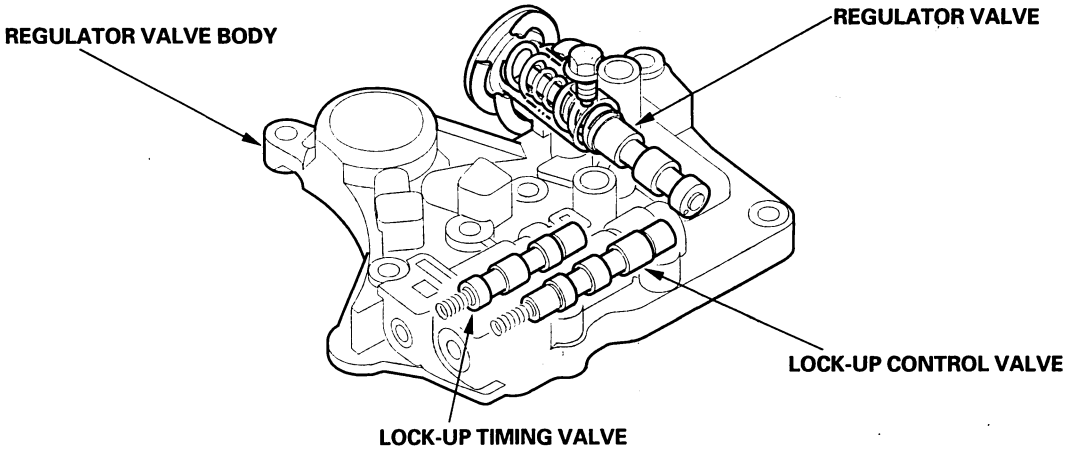
Main Valve Body

The main valve body contains the manual valve, the modulator valve, the shift valve C, the shift valve D, the servo control valve, the cooler check valve, the torque converter check valve, the reverse CPC valve, the lock-up shift valve, the relief valve, the kick-down valve, the kick-down short valve, and the ATF pump gears. The primary function of the main valve body is to switch fluid pressure on and off and to control hydraulic pressure going to the hydraulic control system.



Regulator Valve Body

The regulator valve body is located on the main valve body. The regulator valve body contains the regulator valve, the lock-up timing valve, and the lock-up control valve.



(cont'd)

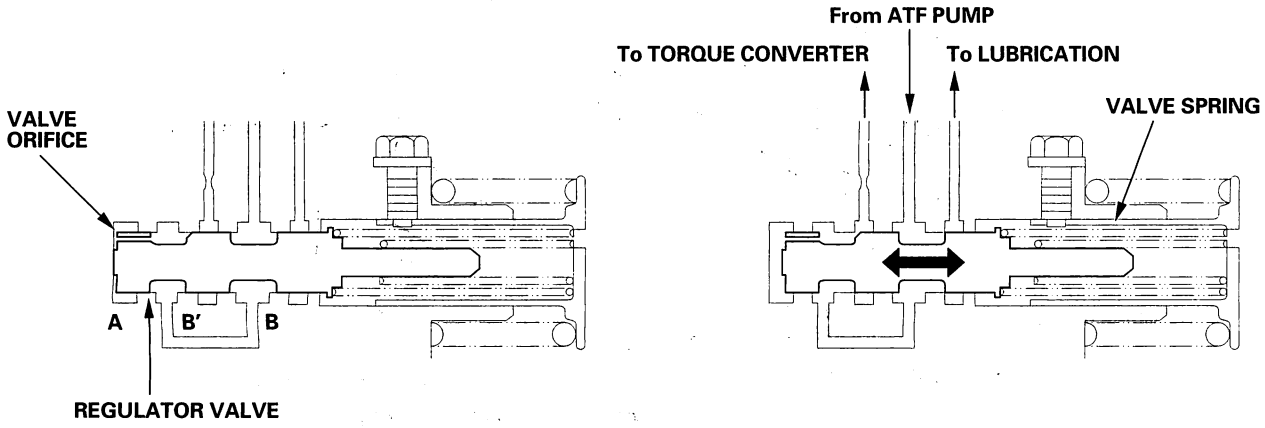
Protected by AR

System Description (cont'd)

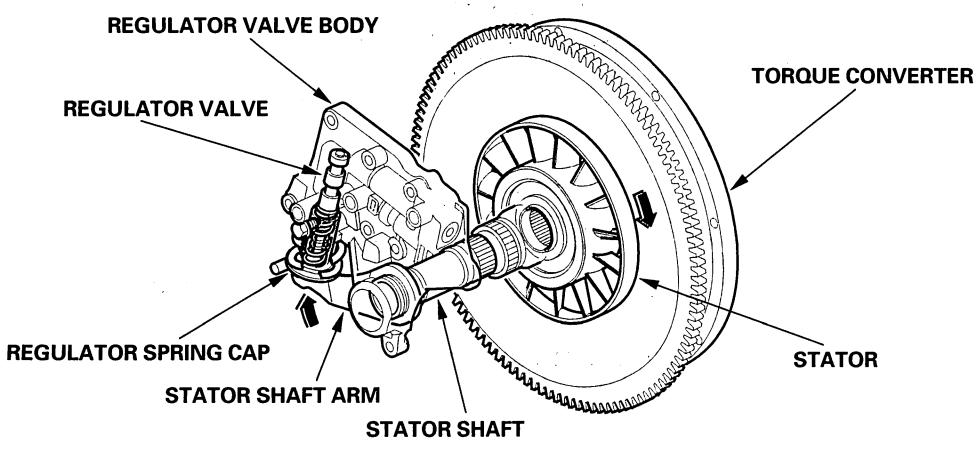
Hydraulic Controls (cont'd)

Regulator Valve

The regulator valve maintains constant hydraulic pressure from the ATF pump to the hydraulic control system, while also furnishing fluid to the lubricating system and torque converter. Fluid from the ATF pump flows through B and B'. Fluid entering from B flows through the valve orifice to the A cavity. This pressure of the A cavity pushes the regulator valve to the spring side, and this movement of the regulator valve uncovers the fluid port to the torque converter and the relief valve. The fluid flows out to the torque converter and the relief valve, and the regulator valve returns under spring force. According to the level of the hydraulic pressure through B, the position of the regulator valve changes, and the amount of fluid from B' through the torque converter changes. This operation is continued, maintaining the line pressure.



Increases in hydraulic pressure according to torque are performed by the regulator valve using stator torque reaction. The stator shaft is splined to the stator in the torque converter, and its arm end contacts the regulator spring cap. When the vehicle is accelerating or climbing (torque converter range), stator torque reaction acts on the stator shaft, and the stator arm pushes the regulator spring cap in the direction of the arrow in proportion to the reaction. The stator reaction spring compresses, and the regulator valve moves to increase the line pressure which is regulated by the regulator valve. The line pressure reaches its maximum when the stator torque reaction reaches its maximum.

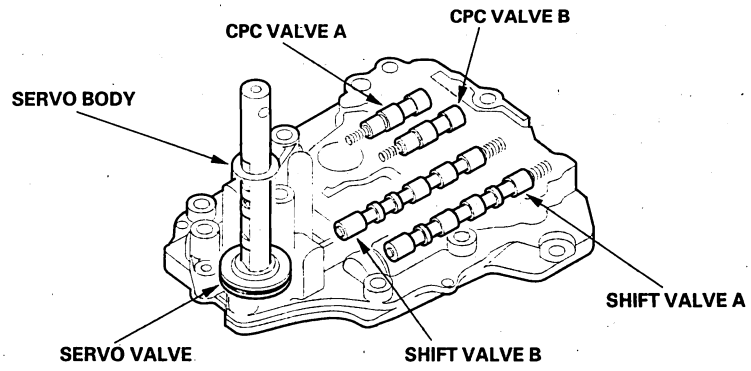


BACK

Protected by AR

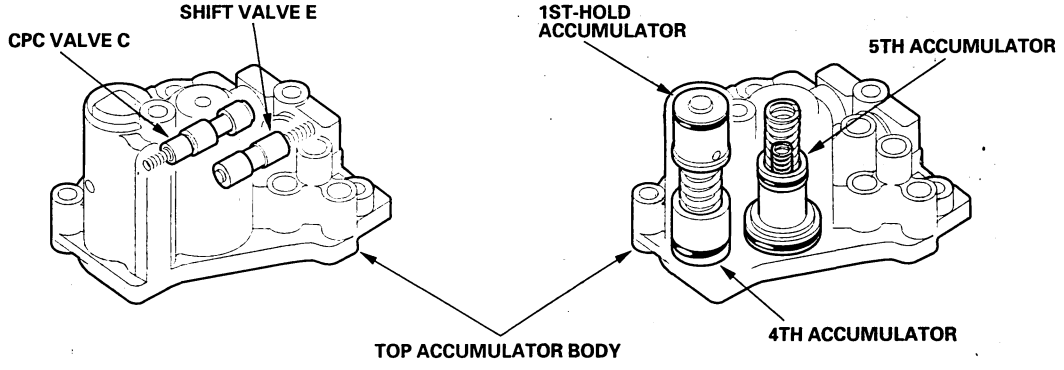
Servo Body

The servo body is on the main valve body. It contains the servo valve, shift valve A, shift valve B, and CPC valves A and B.



Top Accumulator Body

The top accumulator body contains shift valve E, CPC valve C, 4th/1st-hold accumulator, and 5th accumulator.

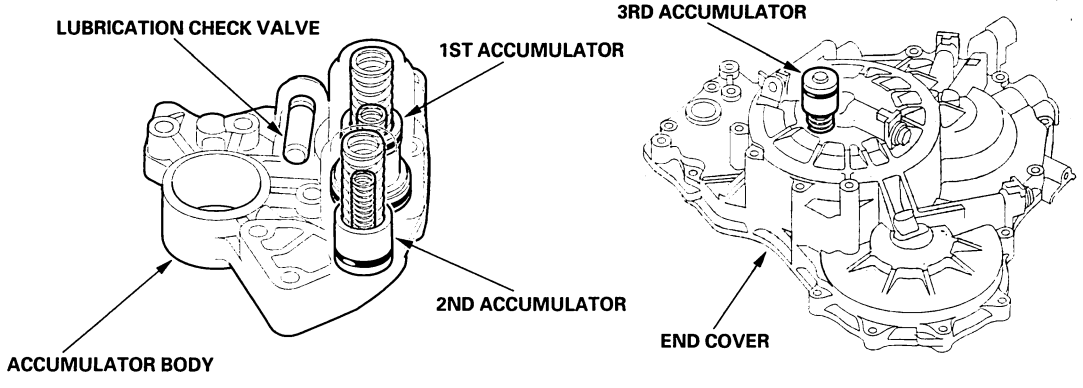


Accumulator Body

The accumulator body is on the torque converter housing, next to the main valve body. It contains the 1st and 2nd accumulators and the lubrication check valve.

3rd Accumulator

The 3rd accumulator is in the end cover.



Protected by AR

System Description (cont'd)

Hydraulic Flow

Distribution of Hydraulic Pressure

As the engine runs, the ATF pump starts to operate. Automatic transmission fluid (ATF) is drawn through the ATF strainer (filter) and discharged into the hydraulic circuit. Then, ATF flowing from the ATF pump becomes line pressure that is regulated by the regulator valve. Torque converter pressure from the regulator valve enters the torque converter through the lock-up shift valve and it is discharged from the torque converter. The torque converter check valve prevents torque converter pressure from rising.

The PCM controls the shift solenoid valves ON and OFF, and the shift solenoid valves control shift solenoid pressure to the shift valves. Applying shift solenoid pressure to the shift valves moves the position of the shift valve, and switches the port of hydraulic pressure. The PCM also controls A/T clutch pressure control solenoid valves A and B. The A/T clutch pressure control solenoid valves A and B regulate the A/T clutch pressure control solenoid pressure and apply the A/T clutch pressure control solenoid pressure to CPC valves A and B.

When shifting between upper gear and lower gear, the clutch is engaged by pressure from the CPC pressure mode. The PCM controls one of the shift solenoid valves to move the position of the shift valve. This movement switches the port of the CPC and line pressure. Line pressure is then applied to the clutch, and the CPC pressure is intercepted. Engaging the clutch with line pressure happens after CPC pressure mode has completed.

Hydraulic pressure at the ports is as follows:

PORT No.	DESCRIPTION OF PRESSURE	PORT No.	DESCRIPTION OF PRESSURE	PORT No.	DESCRIPTION OF PRESSURE
1	LINE	5N	CPC A or LINE	56	LS A
2	LINE	5D	CPC B or LINE	57	LS B

System Description (cont'd)

Hydraulic Flow (cont'd)

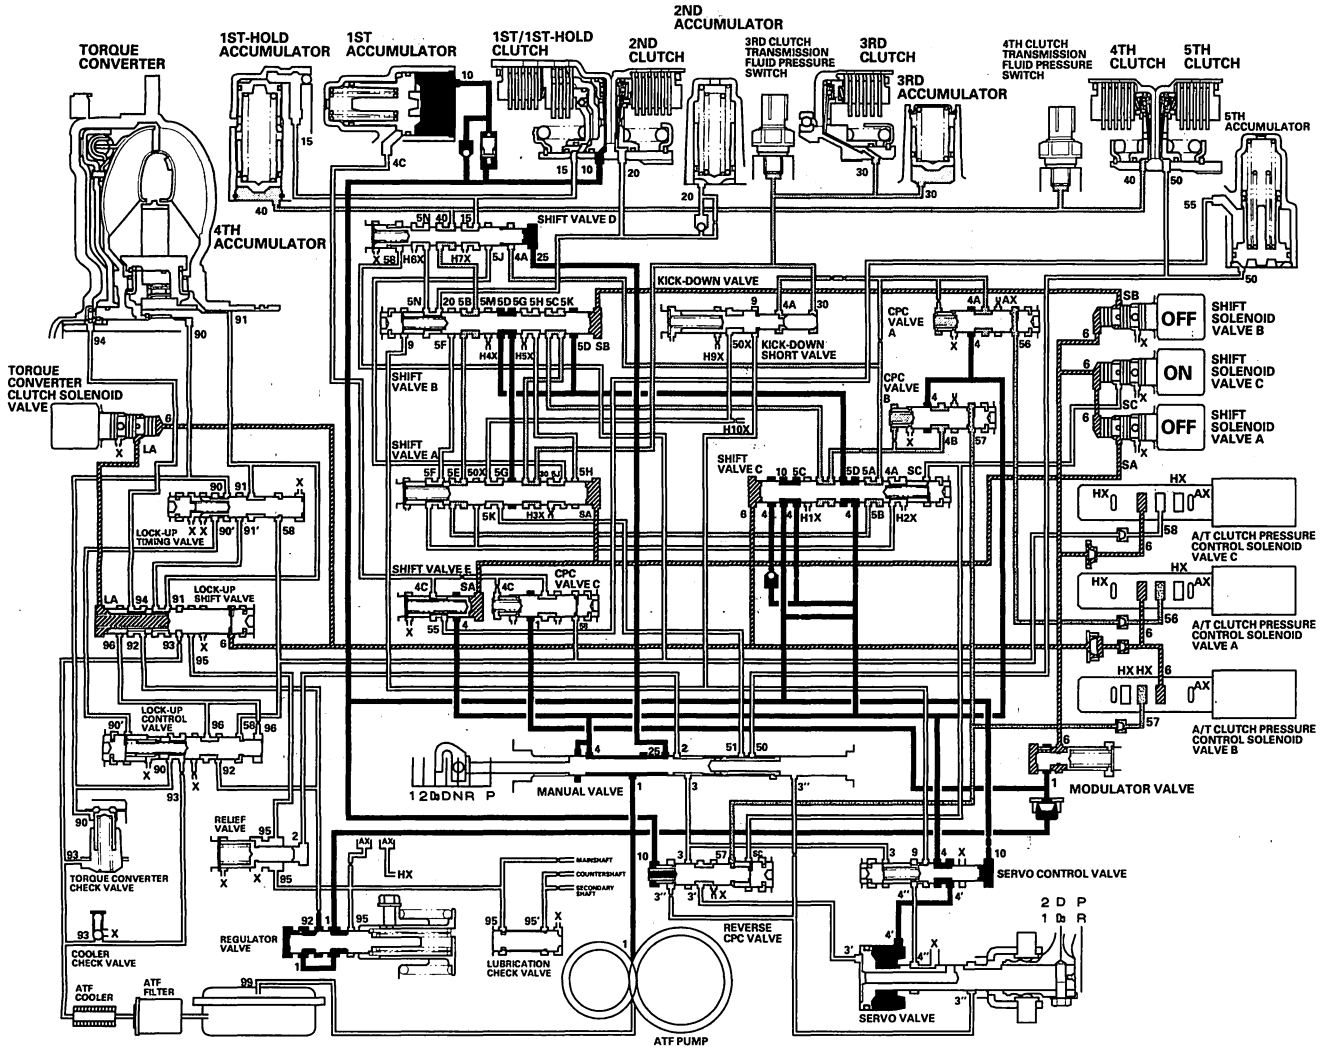
D Position: Shifting between 3rd gear and 4th gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve B OFF. The PCM also controls the A/T clutch pressure control solenoid valve A to apply LS A pressure (56) to CPC valve A. Shift solenoid valve A stays OFF, and C stays ON. Shift solenoid valve B is turned OFF, and SH B pressure (SB) is applied to the right side of shift valve B. Then shift valve B is moved to the left side to switch the line pressure port and CPC pressure port. Line pressure (4) becomes CPC A pressure (4A) at CPC valve A, and becomes CPC B pressure (4B) at CPC valve B. CPC A pressure (4A) becomes 4th clutch pressure (40) at shift valve D via shift valves C, A, and B, and flows to the 4th clutch. The 3rd clutch pressure is changed to CPC pressure mode by switching the position of shift valve B. The 1st clutch is also engaged. No power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.



BACK

Protected by AR

D Position: Driving in 4th gear

The PCM turns shift solenoid valve C OFF, and controls A/T clutch pressure control solenoid valve B to release LS B pressure (57) in CPC valve B. Shift solenoid valves A and B stay OFF. Releasing LS B pressure (57) in CPC valve B releases CPC B pressure in the 3rd clutch pressure circuit. Shift solenoid valve C is turned OFF, and SH C pressure (SC) is applied to the right side of shift valve C. Then shift valve C is moved to the left side to switch the line pressure port and CPC pressure port. Line pressure (4) from the manual valve becomes 4th clutch pressure (40) at shift valve D via shift valves C, A, and B, and flows to the 4th clutch. The 4th clutch pressure is changed to line pressure mode by switching the position of shift valve C, and the 4th clutch is engaged securely. The 1st clutch is also engaged. No power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

BACK

Protected by AR

System Description (cont'd)

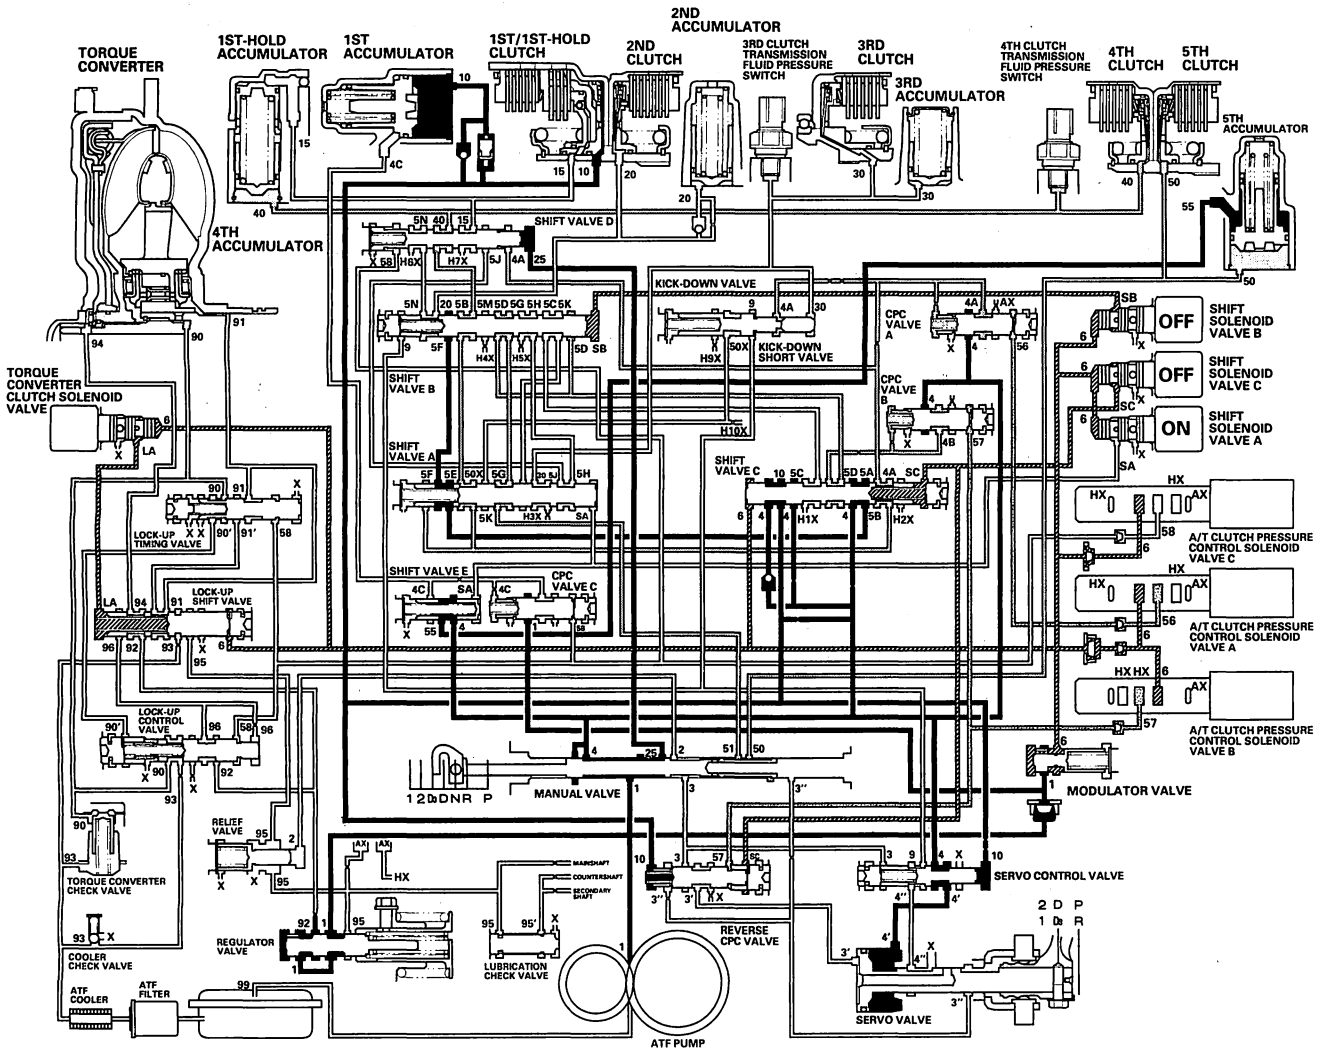
Hydraulic Flow (cont'd)

D Position: Shifting between 4th gear and 5th gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve A ON. The PCM also controls the A/T clutch pressure control solenoid valve B to apply LS B pressure (57) to CPC valve B.

Shift solenoid valve B and C stay OFF. Shift solenoid valve A is turned ON, and SH A pressure (SA) in the right side of shift valves A and E is released. Then shift valves A and E are moved to the left side to switch the line pressure port and CPC pressure port. Line pressure (4) becomes CPC A pressure (4A) at CPC valve A, and becomes CPC B pressure (4B) at CPC valve B. CPC B pressure (4B) becomes 5th clutch pressure (50) at shift valve C, and flows to the 5th clutch via shift valves B and A and the manual valve. The 4th clutch pressure is changed to CPC pressure mode by switching the position of shift valve A. The 1st clutch is also engaged. No power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.



BACK

Protected by AR

D Position: Driving in 5th gear

The PCM turns shift solenoid valve C ON, and controls A/T clutch pressure control solenoid valve A to release LS A pressure (56) in CPC valve A. Shift solenoid valve A stays ON, and B stays OFF. Releasing LS A pressure (56) in CPC valve A releases CPC A pressure in the 4th clutch pressure circuit. Shift solenoid valve C is turned ON, and SH C pressure (SC) in the right side of shift valve C is released. Then shift valve C is moved to the right side to switch the line pressure port and CPC pressure port. Line pressure (4) from the manual valve becomes 5th clutch pressure (50) at the manual valve, via shift valves C, B, and A, and flows to the 5th clutch. The 5th clutch pressure is changed to line pressure mode by switching the position of shift valve C. The 5th clutch is engaged securely, and the 1st clutch is also engaged. No power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Protected by AR

System Description (cont'd)

Hydraulic Flow (cont'd)

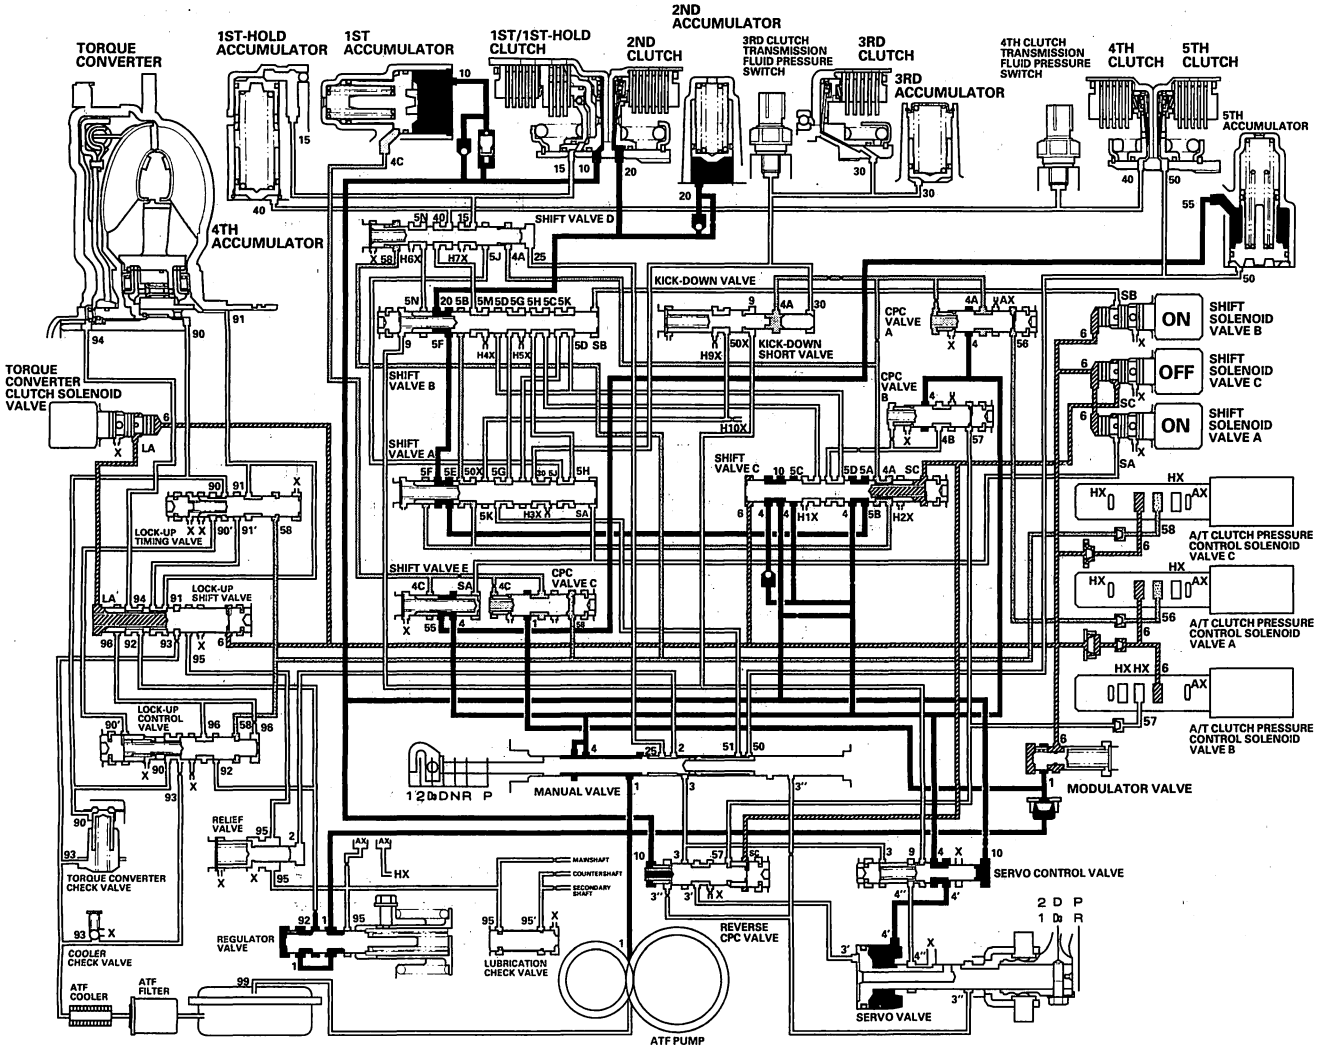
2 Position

The PCM controls the shift solenoid valves and the A/T clutch pressure control solenoid valves. The conditions of the shift solenoid valves and the positions of shift valves are as follows:

- Shift solenoid valve A is turned ON, and shift valve A stays on the right side.
- Shift solenoid valve B is turned ON, and shift valve B stays on the right side.
- Shift solenoid valve C is turned OFF, and shift valve C stays on the left side.

The PCM also controls A/T clutch pressure control solenoid valve A to apply LS A pressure (56) to CPC valve A. Line pressure (4) from the manual valve becomes 2nd clutch pressure (20) at shift valve B, via shift valves C and A. 2nd clutch pressure (20) is applied to the 2nd clutch, and the 2nd clutch is engaged. The 1st clutch is also engaged. No power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.



BACK

Protected by AR

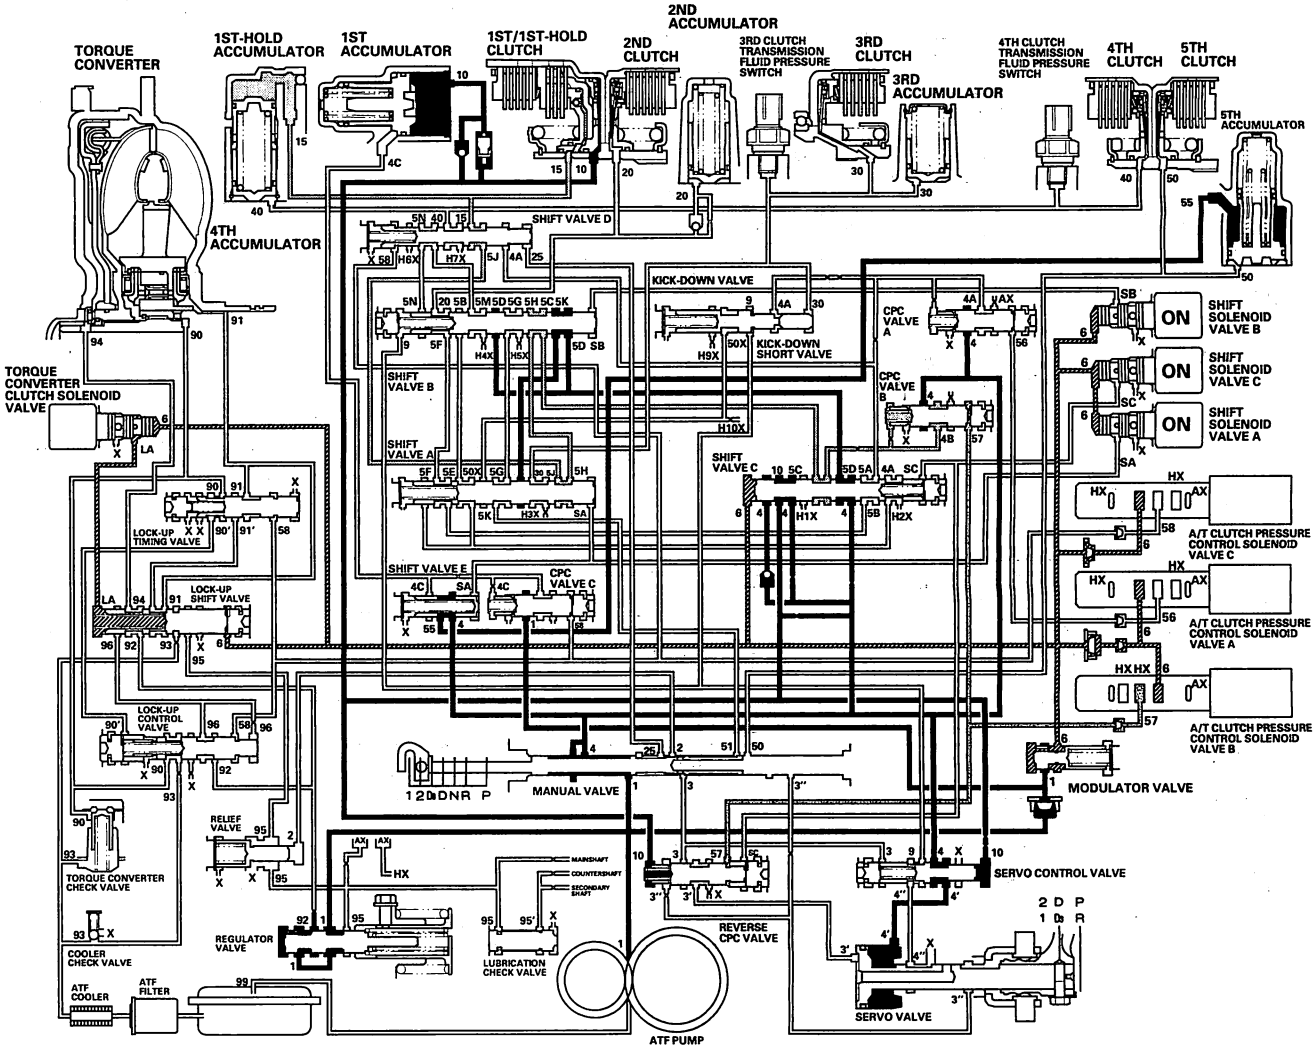
1 Position

The PCM controls the shift solenoid valves and the A/T clutch pressure control solenoid valves. The conditions of the shift solenoid valves and the positions of shift valves are as follows:

- Shift solenoid valve A is turned ON, and shift valve A stays on the right side.
- Shift solenoid valve B is turned ON, and shift valve B stays on the right side.
- Shift solenoid valve C is turned ON, and shift valve C moves to the right side by modulator pressure (6).

The PCM also controls A/T clutch pressure control solenoid valve B to apply LS B pressure (57) to CPC valve B. Line pressure (4) from the manual valve becomes 1st clutch pressure (10) at shift valve C. 1st clutch pressure (10) is applied to the 1st clutch, and the 1st clutch is engaged. Line pressure (4) also flows to CPC valve B, and becomes CPC B pressure (4B). CPC B pressure (4B) becomes 1st-hold clutch pressure (15) at shift valve D, via shift valves C, B, and A. 1st-hold clutch pressure (15) is applied to the 1st-hold clutch, and the 1st-hold clutch is engaged.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.



(cont'd)

Protected by AR

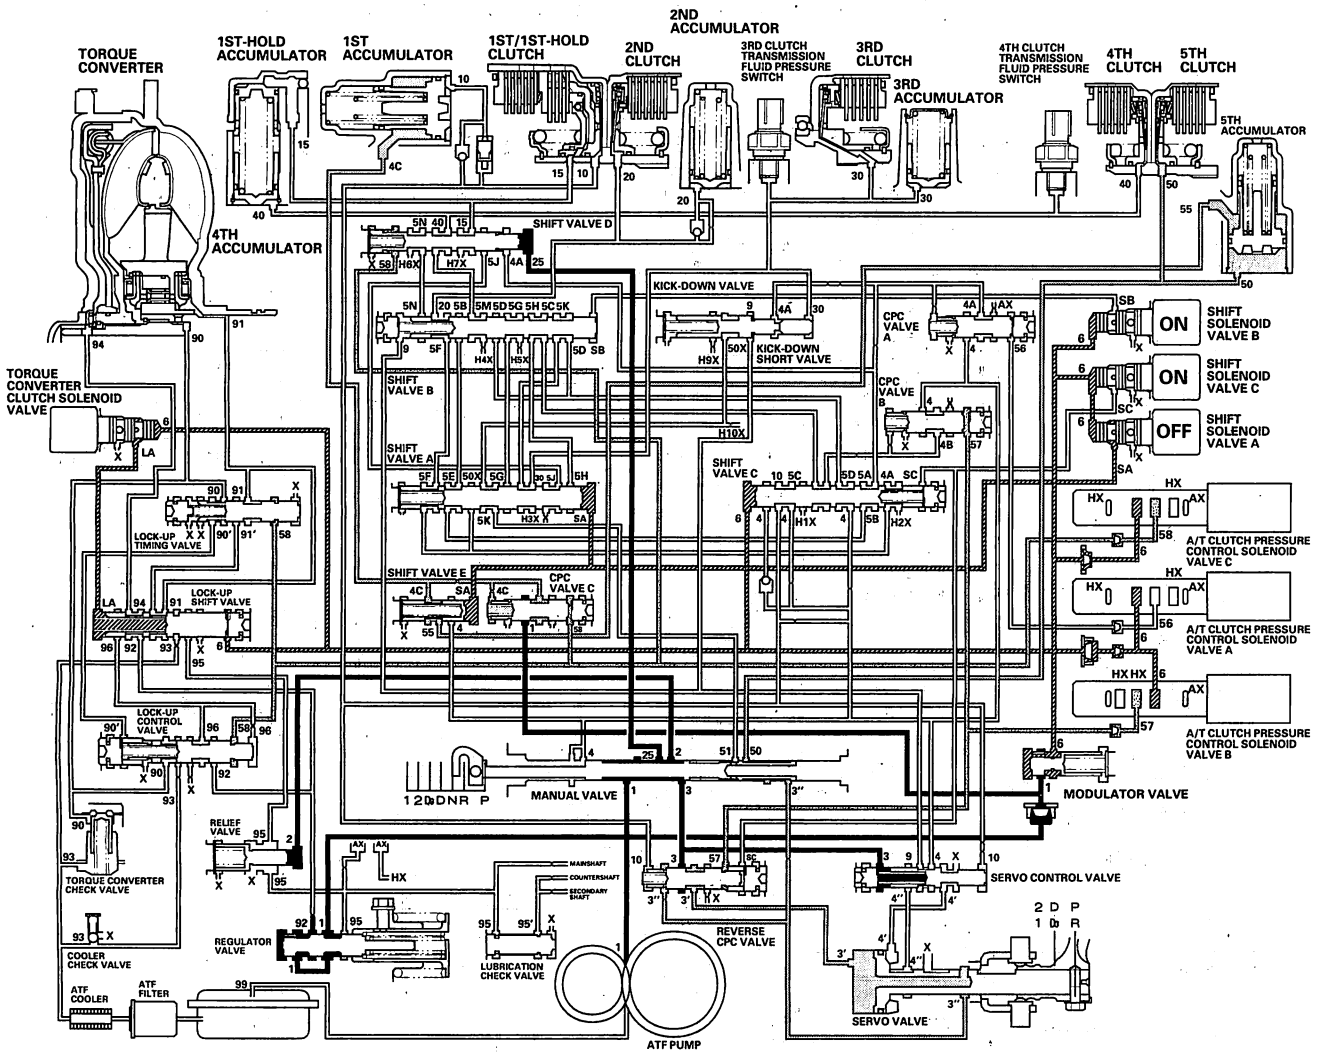
System Description (cont'd)

Hydraulic Flow (cont'd)

R Position: Shifting to the R position from the P or N position

Line pressure (1) becomes line pressure (3) at the manual valve, and flows to the reverse CPC valve. Line pressure (3) is regulated by the reverse CPC valve and becomes line pressure (3'). Line pressure (3') pushes the servo valve to the reverse position, passes through the servo valve, and flows to the manual valve. Line pressure (3'') becomes 5th clutch pressure (50). The 5th clutch pressure (50) is applied to the 5th clutch, and 5th clutch is engaged with the reverse CPC pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.



BACK

Protected by AR

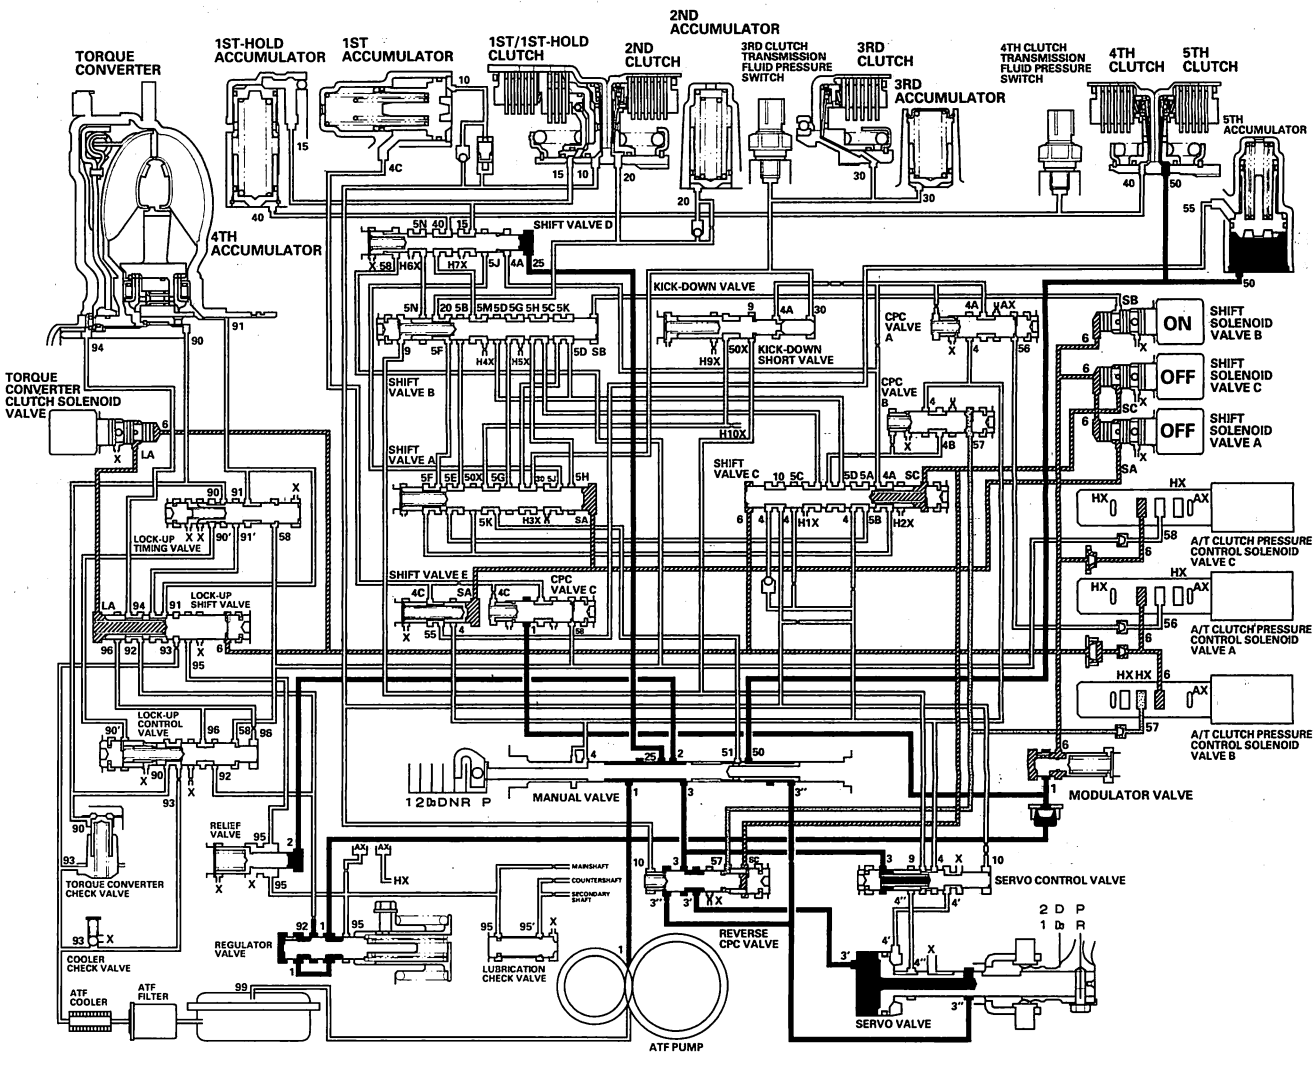
R Position: Driving in reverse gear

The PCM turns shift solenoid valve C OFF. Shift solenoid valve A stays OFF and B stays ON. Shift solenoid valve C is turned OFF, and SH C pressure (SC) is applied to the right side of the reverse CPC valve. Then the reverse CPC valve moves to the left side, creating full line pressure. Line pressure to the 5th clutch is the same as when shifting to the R position, and 5th clutch pressure increases. The 5th clutch is engaged with line pressure mode.

Reverse Inhibitor Control

When the R position is selected while the vehicle is moving forward at speeds over 6 mph (10 km/h), the PCM outputs to turn shift solenoid valves A and C ON; and shift solenoid valve B remains ON. The reverse CPC valve is moved to right side and covers the port to stop the line pressure (3') to the servo valve. The line pressure (3') is not applied to the servo valve, and the 5th clutch pressure (50) is not applied to the 5th clutch. As a result, power is not transmitted to the reverse position.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.



(cont'd)

Protected by AR

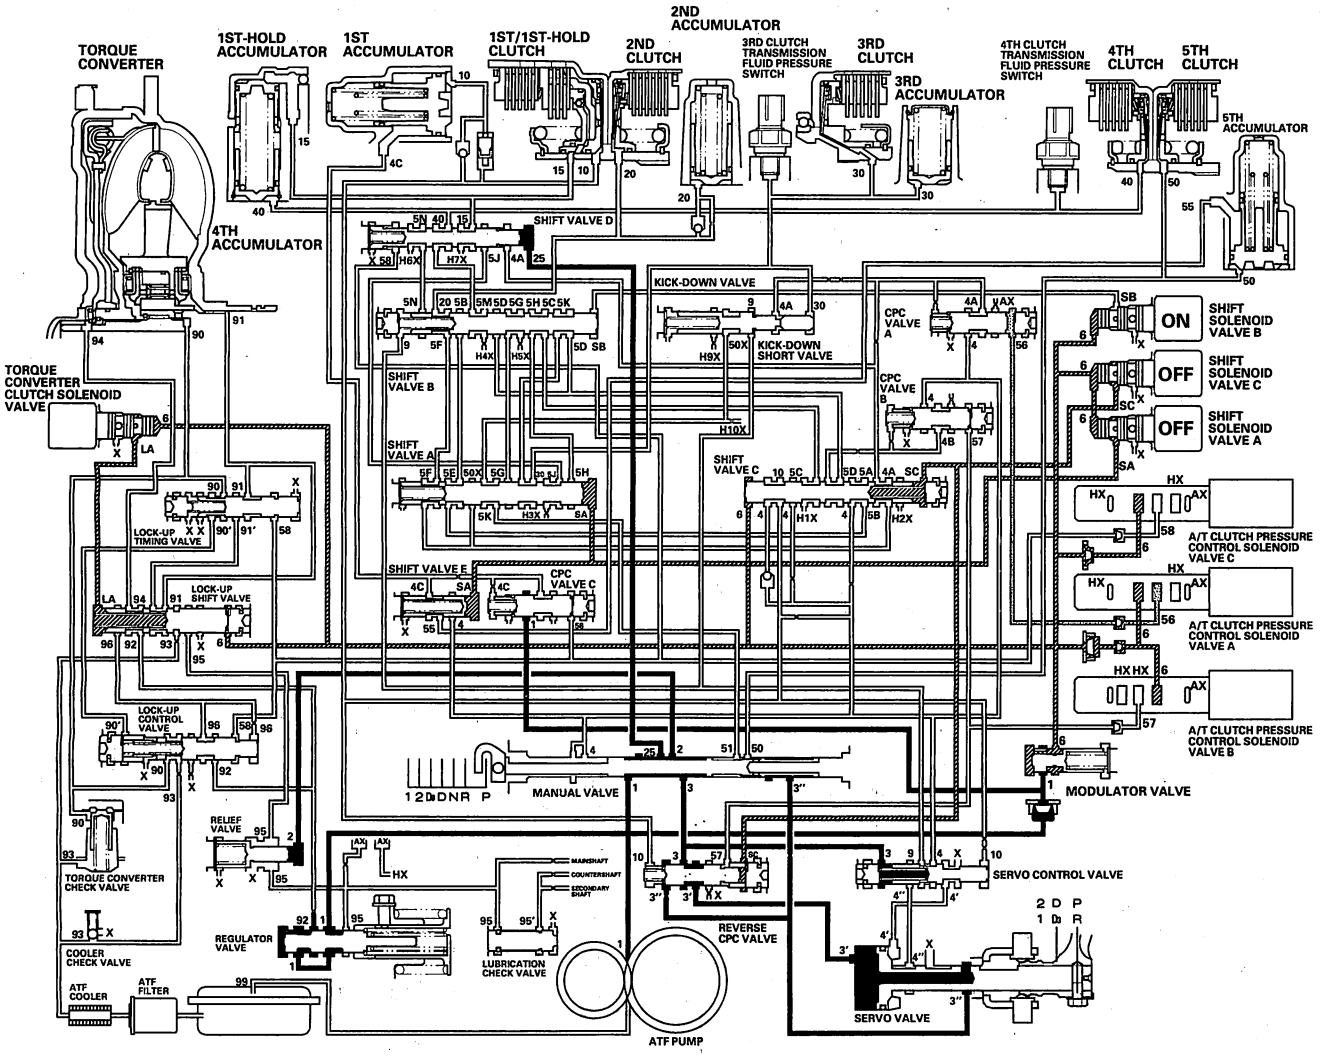
System Description (cont'd)

Hydraulic Flow (cont'd)

P Position

Shift solenoid valve C is turned OFF by the PCM, and SH C pressure (SC) is applied to the right side of the reverse CPC valve. Then the reverse CPC valve is moved to the left side to uncover the port leading line pressure (3) to the servo valve. Line pressure (3') passes through the servo valve and flows to the manual valve. Line pressure (3'') is intercepted at the manual valve, and is not applied to the clutches.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

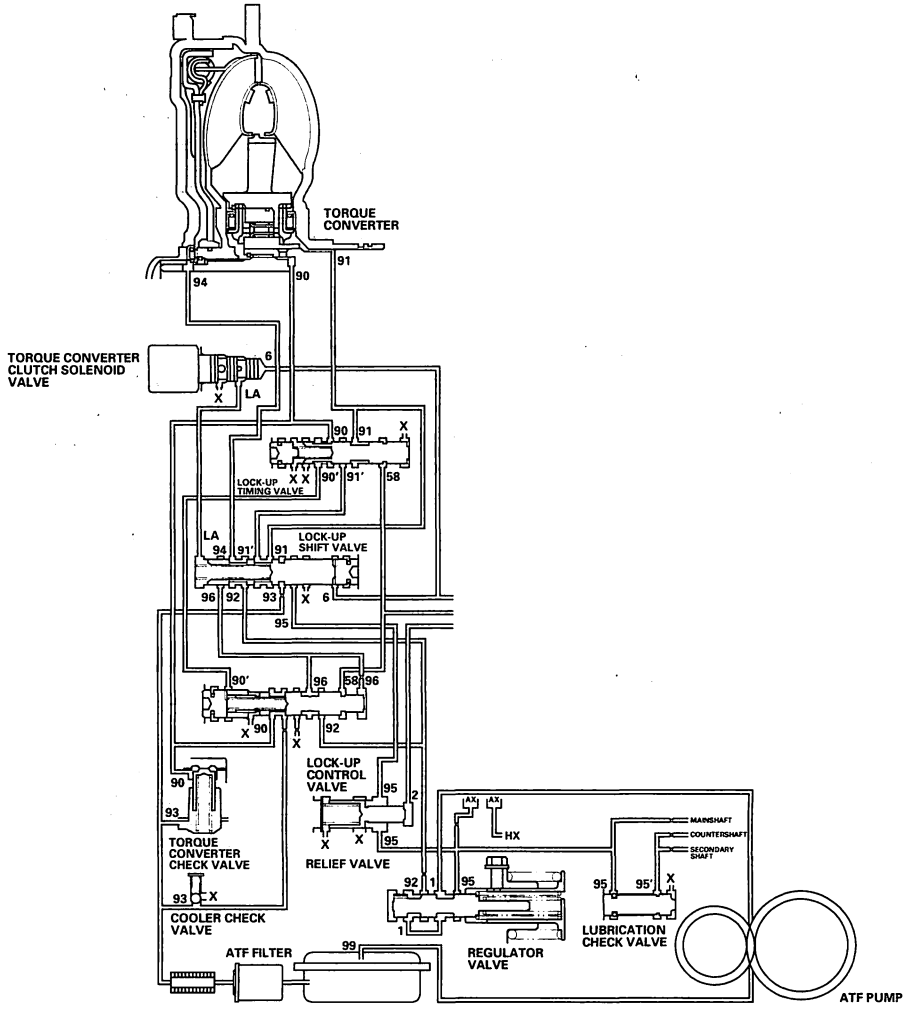


BACK

Protected by AR

Lock-up System

The lock-up mechanism operates in the D position (2nd, 3rd, 4th, and 5th), and D3 position (2nd and 3rd). The pressurized fluid is drained from the back of the torque converter through a fluid passage, causing the torque converter clutch piston to be held against the torque converter cover. As this takes place, the mainshaft rotates at the same speed as the engine crankshaft. Together with hydraulic control, the PCM optimizes the timing of the lock-up mechanism. When the torque converter clutch solenoid valve activates, modulator pressure changes to switch lock-up ON and OFF. The lock-up control valve and the lock-up timing valve control the amount of lock-up according to A/T clutch pressure control solenoid valve C. The torque converter clutch solenoid valve is mounted on the torque converter housing, and A/T clutch pressure control solenoid valve C is mounted on the transmission housing. They are controlled by the PCM.



(cont'd)

Protected by AR

System Description (cont'd)

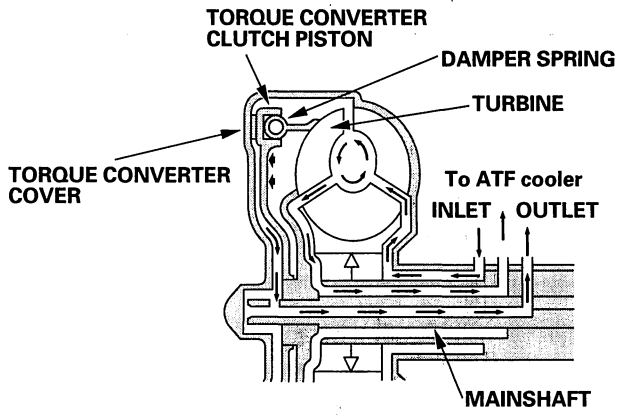
Lock-up System (cont'd)

Torque Converter Clutch Lock-up ON (Engaging Torque Converter Clutch)
Fluid in the chamber between the torque converter cover and the torque converter clutch piston is drained off, and fluid entering from the chamber between the pump and stator exerts pressure through the torque converter clutch piston against the torque converter cover. The torque converter clutch piston engages with the torque converter cover; torque converter clutch lock-up ON, and the mainshaft rotates at the same speed as the engine.

Power flow

The power flows by way of:

Engine
↓
Drive plate
↓
Torque converter cover
↓
Torque converter clutch piston
↓
Damper spring
↓
Turbine
↓
Mainshaft



Torque Converter Clutch Lock-up OFF (Disengaging Torque Converter Clutch)
Fluid entered from the chamber between the torque converter cover and the torque converter clutch piston passes through the torque converter and goes out through the chambers between the turbine and the stator, and between the pump and the stator. As a result, the torque converter clutch piston moves away from the torque converter cover, and the torque converter clutch is released; torque converter clutch lock-up OFF.

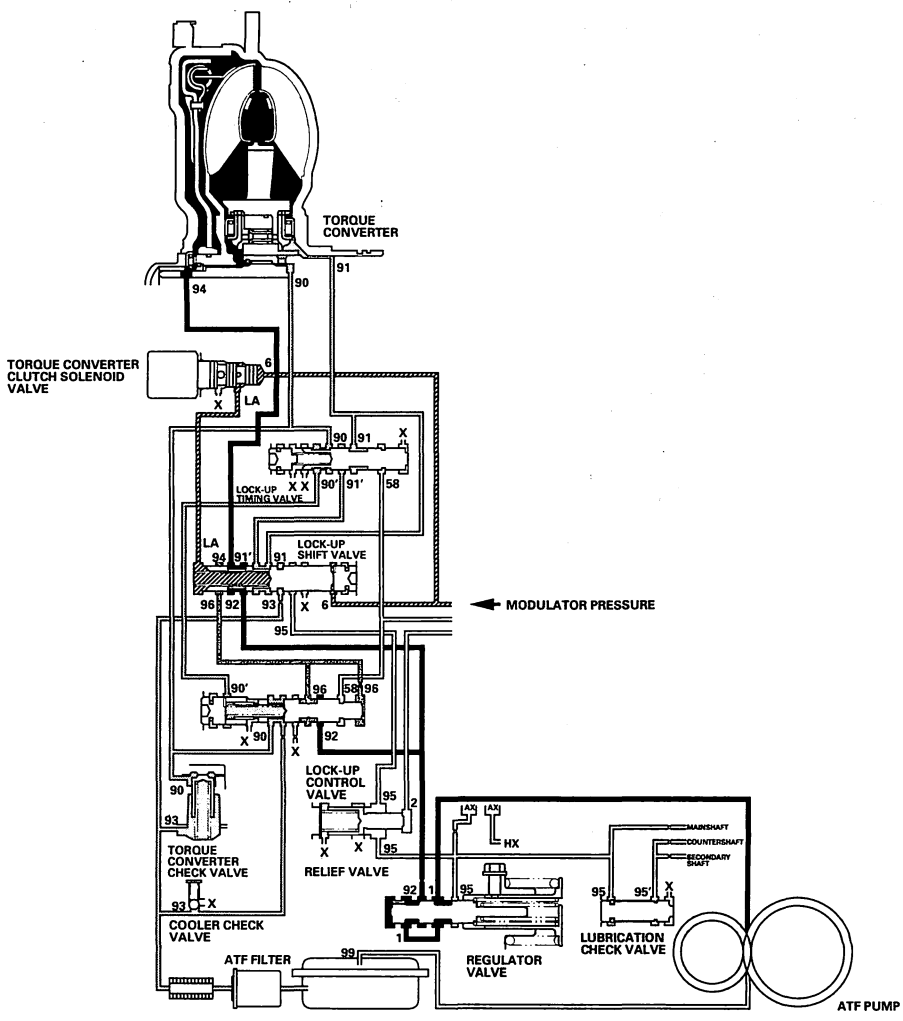
BACK

Protected by AR

No Lock-up

The torque converter clutch solenoid valve is turned OFF by the PCM. The lock-up shift valve receives LC pressure (LA) on the left side, and modulator pressure (6) on the right side. The lock-up shift valve is in the right side to uncover the port leading torque converter pressure (92) to the left side of the torque converter. Torque converter pressure (92) becomes torque converter pressure (94), and enters into the left side of the torque converter to disengage the torque converter clutch. The lock-up is OFF.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.



(cont'd)

Protected by AR

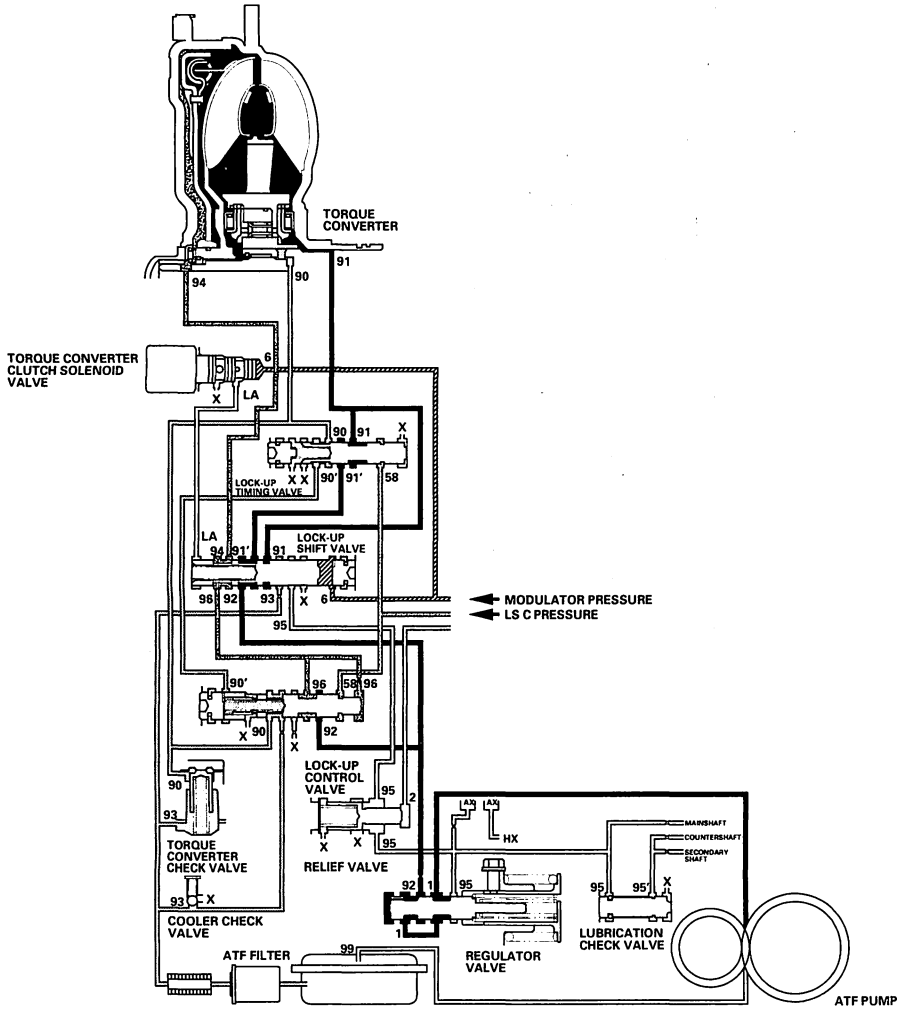
System Description (cont'd)

Lock-up System (cont'd)

Partial Lock-up

As the speed of the vehicle reaches the programmed value, the torque converter clutch solenoid valve is turned ON by the PCM to release LC pressure (LA) in the left cavity of the lock-up shift valve. Modulator pressure (6) is applied to the right side of the lock-up shift valve, then the lock-up shift valve is moved in the left side to switch the port leading torque converter pressure to the right side of the torque converter. Torque converter pressure (91) is applied to the right side of the torque converter to engage the torque converter clutch. The PCM also controls A/T clutch pressure control solenoid valve C, and LS C pressure (58) is applied to the lock-up control valve and the lock-up timing valve. When LS C pressure (58) is lower, torque converter pressure (91) from the lock-up timing valve is lower. The torque converter clutch is engaged partially. LS C pressure (58) increases, and the lock-up timing valve is moved to the left side to uncover the port leading torque converter pressure to high. The torque converter clutch is then engaged securely. Under this condition, the torque converter clutch is engaged by pressure from the right side of the torque converter; this lock-up condition is in partial lock-up.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.



BACK

Protected by AR

Full Lock-up

When the vehicle speed increases, the PCM sends a signal to the A/T clutch pressure control solenoid valve C to increase LS C pressure (58). The LS C pressure (58) is applied to the lock-up control valve and the lock-up timing valve, and moves them to the left side. Under this condition, torque converter back pressure (F2) is released fully, causing the torque converter clutch to be fully engaged.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

DTC Troubleshooting

DTC P0705: Short in Transmission Range Switch Circuit (Multiple Shift-position Input)

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine.
3. Move the shift lever through all positons. Stop for at least 1 second in each position, and monitor the OBD status for P0705 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

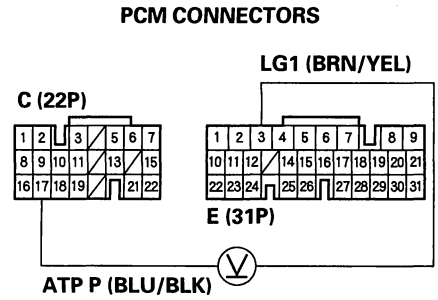
   YES—Go to step 4.

   NO—Intermittent failure, the system is OK at this time. Check for an intermittent short in the wires between the transmission range switch and PCM. If the tester indicates NOT COMPLETED, return to step 1 and recheck.■
4. Inspect the transmission range switch (see page 14-215).

   Is the switch OK?

   YES—Go to step 5.

   NO—Replace the transmission range switch (see page 14-218), then go to step 56.
5. Turn the ignition switch ON (II).
6. Shift to all positions other than P.
7. Measure the voltage between PCM connector terminals C17 and E3.



Wire side of female terminals

Is there battery voltage?

YES—Go to step 14.

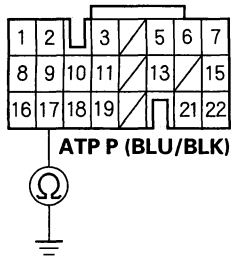
NO—Go to step 8.

BACK

Protected by AR

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector C (22P).
11. Check for continuity between PCM connector terminal C17 and body ground.

PCM CONNECTOR C (22P)



Wire side of female terminals

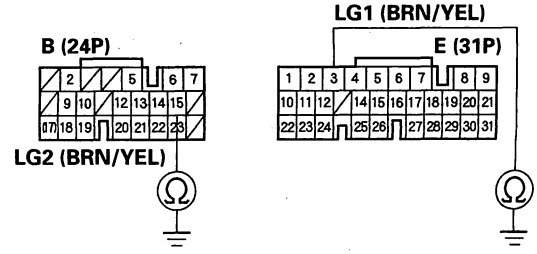
Is there continuity?

YES—Repair short in the wire between PCM connector terminal C17 and the transmission range switch, then go to step 56.

NO—Go to step 12.

12. Disconnect PCM connectors B (24P) and E (31P).
13. Check for continuity between PCM connector terminals B15 and body ground, and between E3 and body ground.

PCM CONNECTORS



Wire side of female terminals

Is there continuity?

YES—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Repair open in the wire between PCM connector terminals B15, E3, and ground (G101, G102), or repair poor ground (G101, G102), then go to step 56.

DTC P0706: Open in Transmission Range Switch Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely.
3. Start the engine, drive the vehicle in the D position until the vehicle speed reaches 35 mph (56 km/h), then slow down and stop the wheels.
4. Monitor the OBD status for P0706 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 5.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmission range switch and PCM. If the tester indicates NOT COMPLETED, return to step 1 and recheck. ■
5. Inspect the transmission range switch (see page 14-215).

   Is the switch OK?

   YES—Inspect the end of the selector control shaft (see step 6 on page 14-217), then go to step 6.

   NO—Replace the transmission range switch (see page 14-218), then go to step 24.
6. Install the transmission range switch correctly, and adjust the shift cable, refer to the 2003-2006 Accord Service Manual (see page 14-241).
7. Clear the DTC with the HDS.
8. Shift the shift lever into the D position, and verify the ATP FWD and ATP D inputs with the HDS in the A/T data list.

   Is the ATP FWD and ATP D ON?

   YES—Go to step 9.

   NO—Go to step 16.
9. Monitor the OBD status for P0706 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 10.

   NO—Go to step 16.
10. Shift to the 2 position, and verify the ATP FWD and ATP 2 inputs with the HDS in the A/T data list.

    Is the ATP FWD and ATP 2 ON?

    YES—Go to step 11.

    NO—Go to step 16.
11. Shift to the 1 position, and verify the ATP 1 signal with the HDS in the A/T data list.

    Is the ATP 1 ON?

    YES—Go to step 12.

    NO—Go to step 16.
12. Clear the DTC with the HDS, and turn the ignition switch OFF.
13. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely.
14. Start the engine, drive the vehicle in the D position until the vehicle speed reaches 35 mph (56 km/h), then slow down and stop the wheels.

DTC Troubleshooting (cont'd)

DTC P0711: Problem in ATF Temperature Sensor Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Check the ATF temperature with the HDS in the A/T data list.

   Does the ATF temperature exceed the ambient-air temperature?

   YES—Record the ATF temperature. Leave the engine off for more than 30 minutes, and go to step 2.

   NO—Record the ATF temperature. Test the stall speed RPM (see page 14-161) three times. Go to step 2 after stall speed testing.

2. Check the ATF temperature with the HDS.

   Did the ATF temperature change?

   YES—Leave the engine off for more than 30 minutes, and go to step 3.

   NO—Replace the ATF temperature sensor (see page 14-183), then go to step 5.

3. Check the ECT SENSOR with the HDS.

   Is the ECT SENSOR equal to the ambient-air temperature?

   YES—Go to step 4.

   NO—Leave the engine off until ECT sensor equals ambient-air temperature, then go to step 4.

4. Check the ATF temperature with the HDS.

   Is the ATF temperature almost equal to ECT SENSOR?

   YES—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ATF temperature sensor and PCM. ■

   NO—Replace ATF temperature sensor (see page 14-183), then go to step 5.

5. Clear the DTC with the HDS.

6. Test-drive the vehicle for several minutes in the D position through all five gears.

7. Monitor the OBD status for P0711 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate PASSED?

   YES—Troubleshooting is complete. ■

   NO—Return to step 1 and recheck.

DTC P0712: Short in ATF Temperature Sensor Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Check ATF temperature sensor voltage with the HDS in the A/T data list.

   Is ATF temperature sensor voltage 0.07 V or less?

   YES—Go to step 2.

   NO—Intermittent failure, the system is OK at this time. Check for intermittent short in the wires between the ATF temperature sensor and PCM.■

2. Disconnect the ATF temperature sensor connector at the transmission end cover.

3. Check ATF temperature sensor voltage with the HDS.

   Is ATF temperature sensor voltage 0.07 V or less?

   YES—Go to step 4.

   NO—Replace ATF temperature sensor (see page 14-183), then go to step 8.

4. Turn the ignition switch OFF.

5. Jump the SCS line with the HDS.

6. Disconnect PCM connector C (22P).

7. Check for continuity between ATF temperature sensor connector terminal No. 2 and body ground.

   ATF TEMPERATURE SENSOR CONNECTOR

   Wire side of female terminals

   Is there continuity?

   YES—Repair short to ground between PCM connector terminal C3 and the ATF temperature sensor connector terminal No. 2 then, go to step 8.

   NO—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM.■

8. Clear the DTC with the HDS.

9. Test-drive the vehicle for several minutes in the D position through all five gears.

10. Monitor the OBD status for P0712 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—Return to step 1 and recheck.

DTC Troubleshooting (cont'd)

DTC P0713: Open in ATF Temperature Sensor Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Check ATF temperature sensor voltage with the HDS in the A/T data list.

   Does ATF temperature sensor voltage exceed 4.93 V?

   YES—Go to step 2.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ATF temperature sensor and PCM. ■

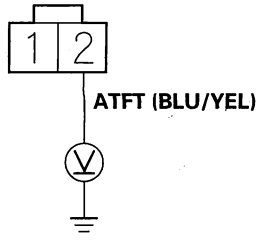
2. Turn the ignition switch OFF.

3. Disconnect the ATF temperature sensor connector at the transmission end cover.

4. Turn the ignition switch ON (II).

5. Measure the voltage between ATF temperature sensor connector terminal No. 2 and body ground.

ATF TEMPERATURE SENSOR CONNECTOR



Wire side of female terminals

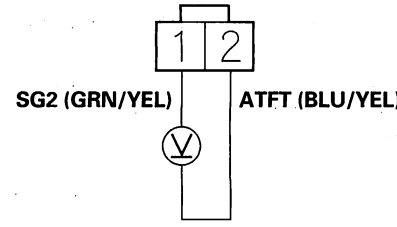
Is there about 5 V?

YES—Go to step 6.

NO—Go to step 7.

6. Measure the voltage between ATF temperature sensor connector terminals No. 1 and No. 2.

ATF TEMPERATURE SENSOR CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Replace the ATF temperature sensor (see page 14-183), then go to step 8.

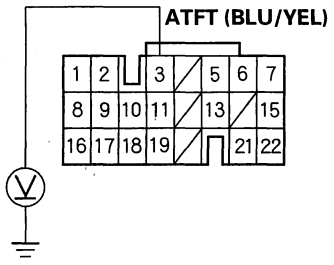
NO—Repair open in the wire between PCM connector terminal D10 and the ATF temperature sensor connector. ■

BACK

Protected by AR

7. Measure the voltage between PCM connector terminal C3 and body ground.

PCM CONNECTOR C (22P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between PCM connector terminal C3 and the ATF temperature sensor connector, then go to step 8.

NO—Check for loose or poor connections at PCM connector terminal C3. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

8. Clear the DTC with the HDS.

9. Test-drive the vehicle for several minutes in the D position through all five gears.

10. Monitor the OBD status for P0713 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooitng is complete. ■

NO—Return to step 1 and recheck.

DTC Troubleshooting (cont'd)

DTC P0716: Problem in Input Shaft (Mainshaft) Speed Sensor Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

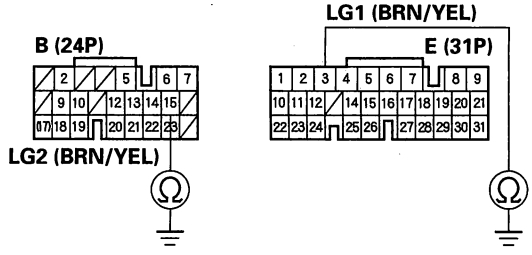
1. Clear the DTC with the HDS.
2. Check for proper input shaft (mainshaft) speed sensor installation (see page 14-179).
3. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely.
4. Start the engine, drive the vehicle in the D position, and hold the vehicle at speeds over 30 mph (48 km/h) for more than 10 seconds.
5. Monitor the OBD status for P0716 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 6.

   NO—Intermittent failure, the system is OK at this time. Check for loose or poor connections at the PCM and input shaft (mainshaft) speed sensor connectors. If the tester indicates NOT COMPLETED, return to step 4 and recheck.■
6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect PCM connectors B (24P) and E (31P), and input shaft (mainshaft) speed sensor connector.
9. Check for continuity between PCM connector terminals B15 and body ground, and between E3 and body ground.

PCM CONNECTORS



Wire side of female terminals

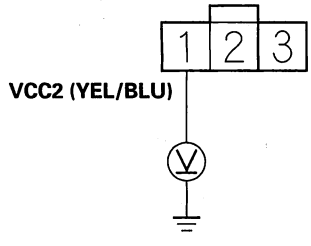
Is there continuity?

YES—Go to step 10.

NO—Repair open in the wire between PCM connector terminals B15, E3, and ground (G101, G102), or repair poor ground (G101, G102), then go to step 30.

10. Connect PCM connectors B (24P) and E (31P).
11. Turn the ignition switch ON (II).
12. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 1 and body ground.

INPUT SHAFT (MAINSHAFT) SPEED SENSOR CONNECTOR



Wire side of female terminals

Is there about 5 V?

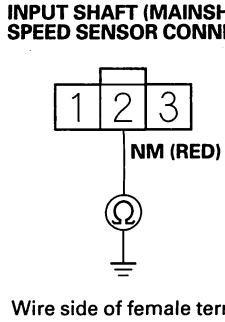
YES—Go to step 13.

NO—Go to step 24.

BACK

Protected by AR

13. Turn the ignition switch OFF.
14. Disconnect PCM connector D (17P).
15. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.



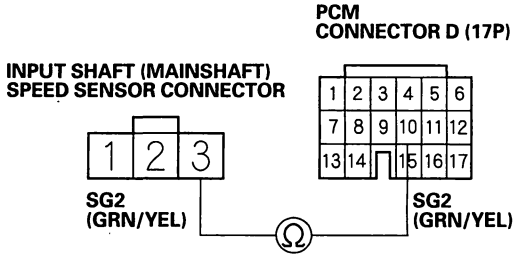
Wire side of female terminals

Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal D8 and mainshaft speed sensor, then go to step 30.

NO—Go to step 16.

16. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 3 and PCM connector terminal D10.



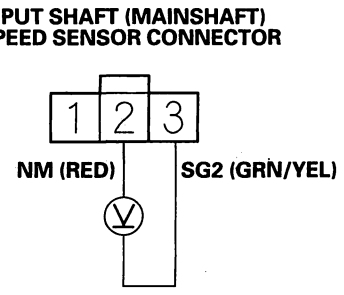
Wire side of female terminals

Is there continuity?

YES—Go to step 17.

NO—Repair open in the wire between the input shaft (mainshaft) speed sensor connector and PCM connector terminal D10, then go to step 30.

17. Reconnect PCM connector D (17P).
18. Turn the ignition switch ON (II).
19. Measure the voltage between input shaft (mainshaft) speed sensor connector terminals No .2 and No. 3.



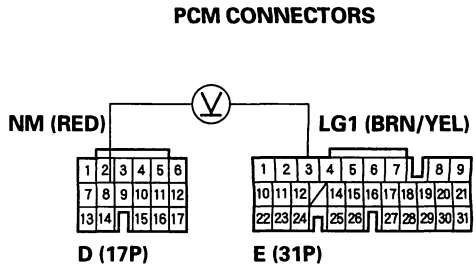
Wire side of female terminals

Is there about 5 V?

YES—Go to step 20.

NO—Go to step 29.

20. Connect the input shaft (mainshaft) speed sensor connector.
21. Measure the voltage between PCM connector terminals D8 and E3.



Wire side of female terminals

Is the voltage 0 V or about 5 V?

YES—Go to step 22.

NO—Replace the input shaft (mainshaft) speed sensor (see page 14-179), then go to step 30.

(cont'd)

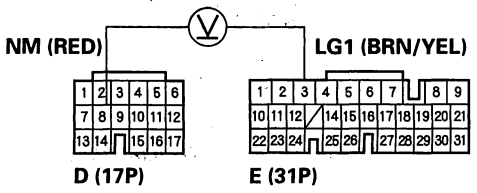
Protected by AR

DTC Troubleshooting (cont'd)

22. Shift to the P position. Start the engine, and let it idle.

23. With the engine idling, measure the voltage between PCM connector terminals D8 and E3.

PCM CONNECTORS



Wire side of female terminals

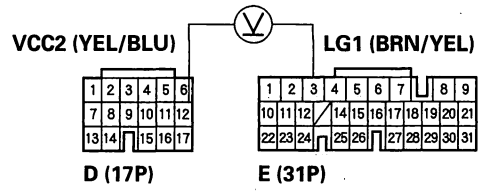
Is there 1.5—3.5 V?

YES—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Replace the input shaft (mainshaft) speed sensor (see page 14-179), then go to step 30.

24. Measure the voltage between PCM connector terminals D12 and E3.

PCM CONNECTORS



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between PCM connector terminal D12 and the input shaft (mainshaft) speed sensor, then go to step 30.

NO—Go to step 25.

25. Turn the ignition switch OFF.

26. Jump the SCS line with the HDS.

27. Disconnect PCM connector D (17P).

BACK

DTC Troubleshooting (cont'd)

DTC P0718: Input Shaft (Mainshaft) Speed Sensor Intermittent Failure

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle for several minutes in the D position through all five gears.
3. Monitor the OBD status for P0718 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 4.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and PCM. If the tester indicates NOT COMPLETED, return to step 2 and recheck.■
4. Turn the ignition switch OFF.
5. Disconnect the input shaft (mainshaft) speed sensor connector, and inspect the connector and connector terminals to be sure they are making good contact.

   Are the connector terminals OK?

   YES—Go to step 6.

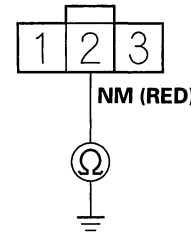
   NO—Repair the connector terminals, then go to step 6.
6. Connect the input shaft (mainshaft) speed sensor connector.
7. Test-drive the vehicle for several minutes, and monitor the OBD status for P0718 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—The problem has been corrected. If the tester indicates NOT COMPLETED, return to step 7 and recheck.■
8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector D (17P).
11. Disconnect the input shaft (mainshaft) speed sensor connector.
12. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

INPUT SHAFT (MAINSHAFT) SPEED SENSOR CONNECTOR



Wire side of female terminals

Is there continuity?

DTC Troubleshooting (cont'd)

DTC P0722: Problem in Output Shaft (Countershaft) Speed Sensor Circuit (No Signal Input)

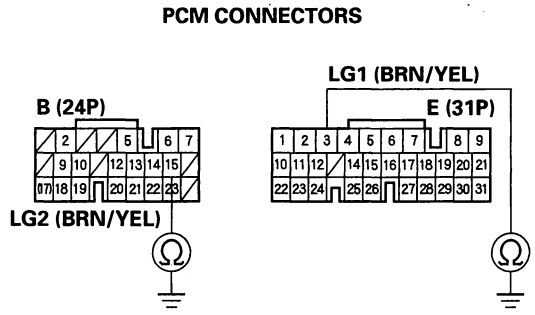
NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely.
3. Start the engine, drive the vehicle in the D position with engine speed 2,000 rpm or higher for more than 10 seconds. Slow down and stop the wheels.
4. Monitor the OBD status for P0722 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 5.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and PCM. If the tester indicates NOT COMPLETED, return to step 3 and recheck. ■
5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect PCM connectors B (24P) and E (31P), and output shaft (countershaft) speed sensor connector.
8. Check for continuity between PCM connector terminals B15 and body ground, and between E3 and body ground.



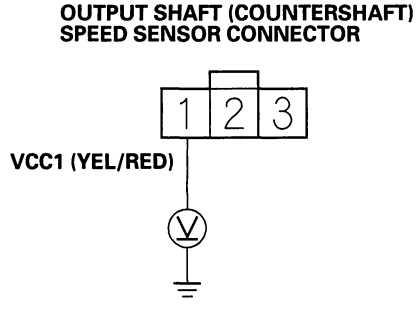
Wire side of female terminals

Is there continuity?

YES—Go to step 9.

NO—Repair open in the wires between PCM connector terminals B15, E3, and ground (G101, G102), or repair poor ground (G101, G102), then go to step 29.

9. Connect PCM connectors B (24P) and E (31P).
10. Turn the ignition switch ON (II).
11. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 1 and body ground.



Wire side of female terminals

Is there about 5 V?

YES—Go to step 12.

NO—Go to step 23.

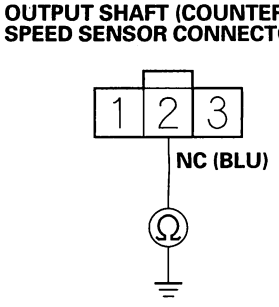
BACK

Protected by AR

12. Turn the ignition switch OFF.

13. Disconnect PCM connector D (17P).

14. Check for continuity between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.



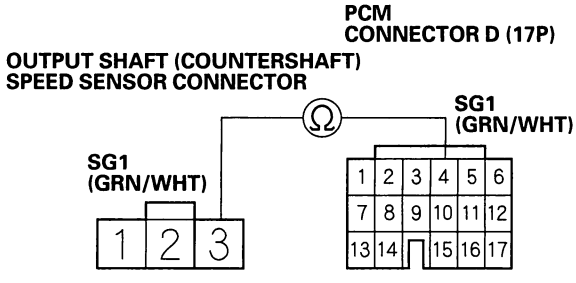
Wire side of female terminals

Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal D14 and output shaft (countershaft) speed sensor, then go to step 29.

NO—Go to step 15.

15. Check for continuity between output shaft (countershaft) speed sensor connector terminal No. 3 and PCM connector terminal D4.



Wire side of female terminals

Is there continuity?

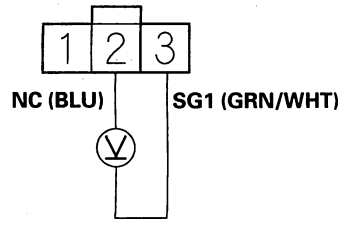
YES—Go to step 16.

NO—Repair open in the wire between the output shaft (countershaft) speed sensor connector and PCM connector terminal D4, then go to step 29.

16. Connect PCM connector D(17P).

17. Turn the ignition switch ON (II).

18. Measure the voltage between output shaft (countershaft) speed sensor connector terminals No. 2 and No. 3.



Wire side of female terminals

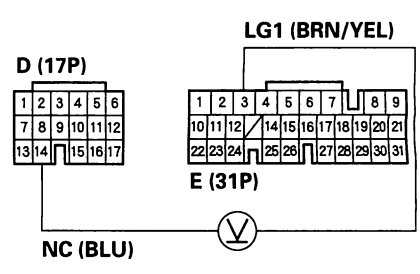
Is there about 5 V?

YES—Go to step 19.

NO—Go to step 28.

19. Connect the output shaft (countershaft) speed sensor connector.

20. Measure the voltage between PCM connector terminals D14 and E3.



Wire side of female terminals

Is the voltage 0 V or about 5 V?

YES—Go to step 21.

NO—Replace the output shaft (countershaft) speed sensor (see page 14-180), then go to step 29.

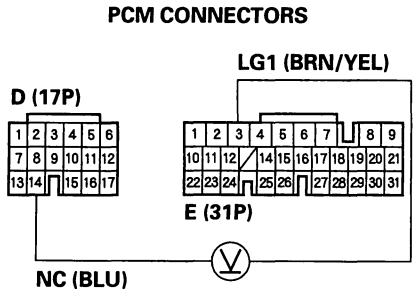
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

21. Shift to the P position. Start the engine, and let it idle.

22. Shift to the D position, and measure the voltage between PCM connector terminals D14 and E3.



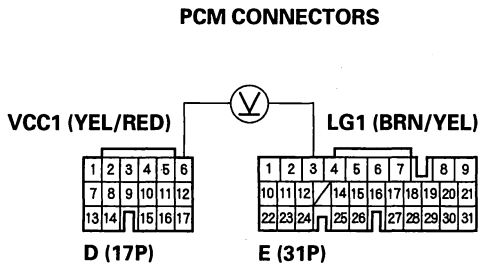
Wire side of female terminals

Is there 1.5—3.5 V?

YES—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Replace the output shaft (countershaft) speed sensor (see page 14-180), then go to step 29.

23. Measure the voltage between PCM connector terminals D6 and E3.



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between PCM connector terminal D6 and the output shaft (countershaft) speed sensor, then go to step 29.

NO—Go to step 24.

BACK

Protected by AR

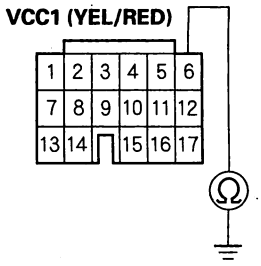
24. Turn the ignition switch OFF.

25. Jump the SCS line with the HDS.

26. Disconnect PCM connector D (17P).

27. Check for continuity between PCM connector terminal D6 and body ground.

PCM CONNECTOR D (17P)



Wire side of female terminals

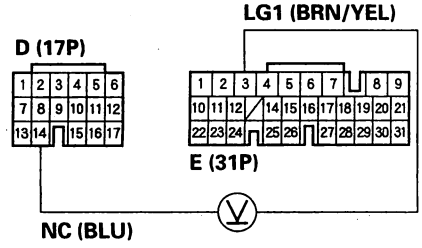
Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal D6 and the output shaft (countershaft) speed sensor, then go to step 29.

NO—Check for loose or poor connections at PCM connector terminal D6. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM.■

28. Measure the voltage between PCM connector terminals D14 and E3.

PCM CONNECTORS



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between PCM connector terminal D14 and the output shaft (countershaft) speed sensor, then go to step 29.

NO—Check for loose or poor connections at PCM connector terminal D14. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM.■

29. Clear the DTC with the HDS.

30. Start the engine, drive the vehicle in the D position with engine speed 2,000 rpm or higher for more than 10 seconds. Slow down and stop the wheels.

31. Monitor the OBD status for P0722 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete.■

NO—Return to step 1 and recheck.

Protected by AR

DTC Troubleshooting (cont'd)

DTC P0723: Output Shaft (Countershaft) Speed Sensor Intermittent Failure

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle for more than 10 minutes under the same conditions as those indicated by the freeze data, and monitor the OBD status for P0723 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 3.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the output shaft (countershaft) and PCM. If the tester indicates NOT COMPLETED, return to step 2 and recheck. ■
3. Turn the ignition switch OFF.
4. Disconnect the output shaft (countershaft) speed sensor connector, and inspect the connector and connector terminals to be sure they are making good contact.

   Are the connector terminals OK?

   YES—Go to step 5.

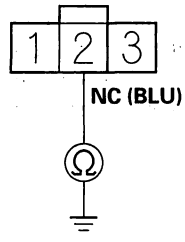
   NO—Repair the connector terminals, then go to step 5.
5. Connect the output shaft (countershaft) speed sensor connector.
6. Test-drive the vehicle for several minutes, and monitor the OBD status for P0723 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 7.

   NO—The problem has been corrected. If the tester indicates NOT COMPLETED, return to step 6 and recheck. ■
7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect PCM connector D (17P).
10. Disconnect the output shaft (countershaft) speed sensor connector.
11. Check for continuity between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CONNECTOR



Wire side of female terminals

Is there continuity?

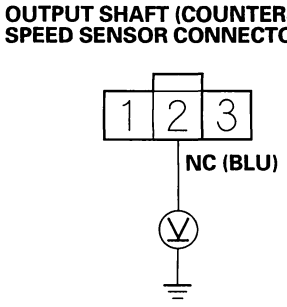
YES—Repair short to ground in the wire between PCM connector terminal D14 and the output shaft (countershaft) speed sensor, then go to step 18.

NO—Go to step 12.

BACK

Protected by AR

12. Connect PCM connector D (17P).
13. Turn the ignition switch ON (II).
14. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.



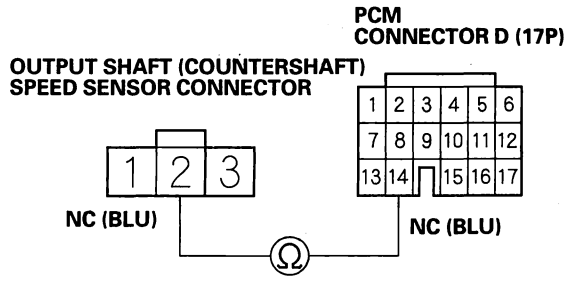
Wire side of female terminals

Is there about 5 V?

YES—Replace the output shaft (countershaft) speed sensor (see page 14-180), then go to step 18.

NO—Go to step 15.

15. Turn the ignition switch OFF.
16. Disconnect PCM connector D (17P).
17. Check for continuity between PCM connector terminal D14 and output shaft (countershaft) speed sensor connector terminal No. 2.



Wire side of female terminals

Is there continuity?

YES—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Repair open in the wire between PCM connector terminal D14 and the output shaft (countershaft) speed sensor, then go to step 18.

18. Clear the DTC with the HDS.
19. Test-drive the vehicle for several minutes in the D position through all five gears.
20. Monitor the OBD status for P0723 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete. ■

NO—Return to step 1 and recheck.

DTC Troubleshooting (cont'd)

DTC P0731: Problem in 1st Clutch and 1st Clutch Hydraulic Circuit

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Measure the line pressure (see page 14-162).

   Is the line pressure within service limit?

   YES—Go to step 5.

   NO—Repair the ATF pump and regulator valve, or replace the transmission. ■
5. Clear the DTC with the HDS.
6. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in 1st gear in the D position at speeds over 10 mph (16 km/h) for 20 seconds.
7. Turn the ignition switch OFF, then turn it ON (II) again.
8. Monitor the OBD status for P0731 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Repair 1st clutch, or replace the transmission. ■

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 6 and recheck. ■

BACK

DTC P0732: Problem in 2nd Clutch and 2nd Clutch Hydraulic Circuit

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).

2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.

3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.

4. Measure the line pressure (see page 14-162).

   Is the line pressure within service limit?

   YES—Go to step 5.

   NO—Repair the ATF pump and regulator valve, or replace the transmission. ■

5. Measure 2nd clutch pressure (see page 14-162).

   Is 2nd clutch pressure within service limit?

   YES—Go to step 6.

   NO—Shift valves A, B, and C are stuck. Repair these shift valves and hydraulic circuit, or replace the transmission. ■

6. Clear the DTC with the HDS.

7. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in the 2nd gear in the D position at speeds over 10 mph (16 km/h) for 20 seconds.

8. Turn the ignition switch OFF, then turn it ON (II) again.

9. Monitor the OBD status for P0732 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Repair the 2nd clutch, or replace the transmission. ■

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 7 and recheck. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC P0733: Problem in 3rd Clutch and 3rd Clutch Hydraulic Circuit

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Measure the line pressure (see page 14-162).

   Is the line pressure within service limit?

   YES—Go to step 5.

   NO—Repair the ATF pump and regulator valve, or replace the transmission. ■
5. Measure 3rd clutch pressure (see page 14-162).

   Is 3rd clutch pressure within service limit?

   YES—Go to step 6.

   NO—Shift valves A, B, and C are stuck. Repair these shift valves and hydraulic circuit, or replace the transmission. ■
6. Clear the DTC with the HDS.
7. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in the 3rd gear in the D position at speeds over 10 mph (16 km/h) for 20 seconds.
8. Turn the ignition switch OFF, then turn it ON (II) again.
9. Monitor the OBD status for P0733 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Repair the 3rd clutch, or replace the transmission. ■

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 7 and recheck. ■

DTC P0734: Problem in 4th Clutch and 4th Clutch Hydraulic Circuit

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).

2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.

3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.

4. Measure the line pressure (see page 14-162).

   Is the line pressure within service limit?

   YES—Go to step 5.

   NO—Repair the ATF pump and regulator valve, or replace the transmission. ■

5. Measure 4th clutch pressure (see page 14-162).

   Is 4th clutch pressure within service limit?

   YES—Go to step 6.

   NO—Shift valves A, B, C, and D are stuck. Repair these valves and hydraulic circuit, or replace the transmission. ■

6. Clear the DTC with the HDS.

7. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in the 4th gear in the D position at speeds over 10 mph (16 km/h) for 20 seconds.

8. Turn the ignition switch OFF, then turn it ON (II) again.

9. Monitor the OBD status for P0734 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Repair the 4th clutch, or replace the transmission. ■

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 7 and recheck. ■

DTC Troubleshooting (cont'd)

DTC P0735: Problem in 5th Clutch and 5th Clutch Hydraulic Circuit

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission.■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Measure the line pressure (see page 14-162).

   Is the line pressure within service limit?

   YES—Go to step 5.

   NO—Repair the ATF pump and regulator valve, or replace the transmission.■
5. Measure 5th clutch pressure (see page 14-162).

   Is 5th clutch pressure within service limit?

   YES—Go to step 6.

   NO—Shift valves A, B, and C are stuck. Repair these valves and hydraulic circuit, replace the transmission.■
6. Clear the DTC with the HDS.
7. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in the 5th gear in the D position at speeds over 10 mph (16 km/h) for 20 seconds.
8. Turn the ignition switch OFF, then turn it ON (II) again.
9. Monitor the OBD status for P0735 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Repair the 5th clutch, or replace the transmission.■

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 7 and recheck.■

DTC P0741: Torque Converter Clutch Circuit Stuck OFF

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission.■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Choose Lockup Solenoid Test in Miscellaneous Test Menu, and check that the torque converter clutch solenoid valve operates with the HDS.

   Is a clicking sound heard?

   YES—Go to step 6.

   NO—Replace the torque converter clutch solenoid valve (see page 14-171), then go to step 10.
6. Choose Clutch Pressure Control (Linear) Solenoid A in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve A with the HDS.

   Is the system OK?

   YES—Go to step 7.

   NO—Follow instructions indicated on the HDS by the tester result. Go to step 10 if any part was replaced.
7. Run the engine until the engine coolant temperature reaches 176 °F (80 °C).
8. Test-drive the vehicle at 55 mph (88 km/h) for 2 minutes while monitoring the vehicle speed with the HDS.
9. Monitor the OBD status for P0741 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Repair the faulty torque converter clutch mechanism, torque converter clutch hydraulic circuit, lock-up shift valve, or lock-up control valve, or replace the transmission.■

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 8 and recheck.■
10. Clear the DTC with the HDS.
11. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data.
12. Monitor the OBD status for P0741 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—Return to step 5 and recheck.

DTC Troubleshooting (cont'd)

DTC P0746: A/T Clutch Pressure Control Solenoid Valve A Stuck OFF

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission.■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0746 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck.■
8. Clear the DTC with the HDS.
9. Choose Clutch Pressure Control (Linear) Solenoid A in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve A with the HDS.

   Is the system OK?

   YES—Intermittent failure, the system is OK at this time.■

   NO—Follow instructions indicated on the HDS by the test result, but the tester has not determined the cause of the failure, go to step 10. If any part was replaced, go to step 11.
10. Inspect A/T clutch pressure control solenoid valve A (see page 14-172).

    Does the A/T clutch pressure control solenoid valve A work properly?

    YES—Repair hydraulic system related with CPC valve A, or replace the transmission, then go to step 11.

    NO—Replace A/T clutch pressure control solenoid valve A (see page 14-175), then go to step 11.
11. Clear the DTC with the HDS.
12. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
13. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
14. Monitor the OBD status for P0746 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—Return to step 5 and recheck.

DTC P0747: A/T Clutch Pressure Control Solenoid Valve A Stuck ON

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0747 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck. ■
8. Clear the DTC with the HDS.
9. Choose Clutch Pressure Control (Linear) Solenoid A in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve A with the HDS.

   Is the system OK?

   YES—Intermittent failure, the system is OK at this time. ■

   NO—Follow instructions indicated on the HDS by the test result, but the tester has not determined the cause of the failure, go to step 10. If any part was replaced, go to step 11.
10. Inspect A/T clutch pressure control solenoid valve A (see page 14-172).

    Does the A/T clutch pressure control solenoid valve A work properly?

    YES—Repair hydraulic system related with CPC valve A, or replace the transmission, then go to step 11.

    NO—Replace A/T clutch pressure control solenoid valve A (see page 14-175), then go to step 11.
11. Clear the DTC with the HDS.
12. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
13. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
14. Monitor the OBD status for P0747 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 5 and recheck.

DTC Troubleshooting (cont'd)

DTC P0751: Shift Solenoid Valve A Stuck OFF

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0751 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck. ■
8. Clear the DTC with the HDS.
9. Choose Shift Solenoid A in Miscellaneous Test Menu, and check that the shift solenoid valve A operates with the HDS.

   Is a clicking sound heard?

   YES—Go to step 10.

   NO—Replace shift solenoid valve A (see page 14-165), then go to step 13.
10. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
11. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
12. Monitor the OBD status for P0751 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate FAILED?

    YES—Repair shift valves A and E, or replace the transmission, then go to step 13.

    NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 10 and recheck. ■
13. Clear the DTC with the HDS.
14. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
15. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
16. Monitor the OBD status for P0751 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 5 and recheck.

DTC P0752: Shift Solenoid Valve A Stuck ON

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0752 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck. ■
8. Clear the DTC with the HDS.
9. Choose Shift Solenoid A in Miscellaneous Test Menu, and check that the shift solenoid valve A operates with the HDS.

   Is a clicking sound heard?

   YES—Go to step 10.

   NO—Replace shift solenoid valve A (see page 14-165), then go to step 13.
10. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
11. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
12. Monitor the OBD status for P0752 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate FAILED?

    YES—Repair shift valves A and E, or replace the transmission, then go to step 13.

    NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 10 and recheck. ■
13. Clear the DTC with the HDS.
14. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
15. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
16. Monitor the OBD status for P0752 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 5 and recheck.

DTC Troubleshooting (cont'd)

DTC P0756: Shift Solenoid Valve B Stuck OFF

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0756 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck. ■
8. Clear the DTC with the HDS.
9. Choose Shift Solenoid B in Miscellaneous Test Menu, and check that the shift solenoid valve B operates with the HDS.

   Is a clicking sound heard?

   YES—Go to step 10.

   NO—Replace shift solenoid valve B (see page 14-167), then go to step 13.
10. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
11. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
12. Monitor the OBD status for P0756 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate FAILED?

    YES—Repair shift valve B, or replace the transmission, then go to step 13.

    NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 10 and recheck. ■
13. Clear the DTC with the HDS.
14. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
15. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
16. Monitor the OBD status for P0756 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 5 and recheck.

DTC P0757: Shift Solenoid Valve B Stuck ON

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).

2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.

3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.

4. Clear the DTC with the HDS.

5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.

6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.

7. Monitor the OBD status for P0757 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck. ■

8. Clear the DTC with the HDS.

9. Choose Shift Solenoid B in Miscellaneous Test Menu, and check that the shift solenoid valve B operates with the HDS.

   Is a clicking sound heard?

   YES—Go to step 10.

   NO—Replace shift solenoid valve B (see page 14-167), then go to step 13.

10. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.

11. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.

12. Monitor the OBD status for P0757 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate FAILED?

    YES—Repair shift valve B, or replace the transmission, then go to step 13.

    NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 10 and recheck. ■

13. Clear the DTC with the HDS.

14. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.

15. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.

16. Monitor the OBD status for P0757 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 5 and recheck.

DTC Troubleshooting (cont'd)

DTC P0761: Shift Solenoid Valve C Stuck OFF

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0761 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck. ■
8. Clear the DTC with the HDS.
9. Choose Shift Solenoid C in Miscellaneous Test Menu, and check that the shift solenoid valve C operates with the HDS.

   Is a clicking sound heard?

   YES—Go to step 10.

   NO—Replace shift solenoid valve C (see page 14-169), then go to step 13.
10. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
11. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
12. Monitor the OBD status for P0761 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate FAILED?

    YES—Repair shift valves C and E, or replace the transmission, then go to step 13.

    NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 10 and recheck. ■
13. Clear the DTC with the HDS.
14. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
15. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
16. Monitor the OBD status for P0761 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 5 and recheck.

DTC P0762: Shift Solenoid Valve C Stuck ON

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0762 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck. ■
8. Clear the DTC with the HDS.
9. Choose Shift Solenoid C in Miscellaneous Test Menu, and check that the shift solenoid valve C operates with the HDS.

   Is a clicking sound heard?

   YES—Go to step 10.

   NO—Replace shift solenoid valve C (see page 14-169), then go to step 13.
10. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
11. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
12. Monitor the OBD status for P0762 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate FAILED?

    YES—Repair shift valves C and E, or replace the transmission, then go to step 13.

    NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 10 and recheck. ■
13. Clear the DTC with the HDS.
14. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
15. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
16. Monitor the OBD status for P0762 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 5 and recheck.

DTC Troubleshooting (cont'd)

DTC P0776: A/T Clutch Pressure Control Solenoid Valve B Stuck OFF

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0776 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck. ■
8. Clear the DTC with the HDS.
9. Choose Clutch Pressure Control (Linear) Solenoid B in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve B with the HDS.

   Is the system OK?

   YES—Intermittent failure, the system is OK at this time. ■

   NO—Follow instructions indicated on the HDS by the test result, but the tester has not determined the cause of the failure, go to step 10. If any part was replaced, go to step 11.
10. Inspect A/T clutch pressure control solenoid valve B (see page 14-172).

    Does the A/T clutch pressure control solenoid valve B work properly?

    YES—Repair hydraulic system related with CPC valve B, or replace the transmission, then go to step 11.

    NO—Replace A/T clutch pressure control solenoid valve B (see page 14-175), then go to step 11.
11. Clear the DTC with the HDS.
12. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
13. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
14. Monitor the OBD status for P0776 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 5 and recheck.

DTC P0777: A/T Clutch Pressure Control Solenoid Valve B Stuck ON

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission.■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0777 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck.■
8. Clear the DTC with the HDS.
9. Choose Clutch Pressure Control (Linear) Solenoid B in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve B with the HDS.

   Is the system OK?

   YES—Intermittent failure, the system is OK at this time.■

   NO—Follow instructions indicated on the HDS by the test result, but the tester has not determined the cause of the failure, go to step 10. If any part was replaced, go to step 11.
10. Inspect A/T clutch pressure control solenoid valve B (see page 14-172).

    Does the A/T clutch pressure control solenoid valve B work properly?

    YES—Repair hydraulic system related with CPC valve B, or replace the transmission, then go to step 11.

    NO—Replace A/T clutch pressure control solenoid valve B (see page 14-175), then go to step 11.
11. Clear the DTC with the HDS.
12. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
13. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
14. Monitor the OBD status for P0777 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete.■

    NO—Return to step 5 and recheck.

DTC Troubleshooting (cont'd)

DTC P0780: Problem in Shift Control System

NOTE: Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3 on page 14-186) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer contain metal debris or excessive clutch material?

   YES—Replace the transmission. ■

   NO—Replace the ATF (see step 5 on page 14-186), then go to step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
6. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
7. Monitor the OBD status for P0780 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 8.

   NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 5 and recheck. ■
8. Clear the DTC with the HDS.
9. Run the engine until the engine coolant temperature reaches 176 °F (80 °C).
10. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
11. Retest-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
12. Monitor the OBD status for P0780 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate FAILED?

    YES—Repair shift valve D, or replace the transmission, then go to step 13.

    NO—Intermittent failure, the system is OK at this time. If the tester indicates NOT COMPLETED, return to step 1 and recheck. ■
13. Clear the DTC with the HDS.
14. Test-drive the vehicle in the D position through all five gears at speeds over 12 mph (20 km/h) for more than 20 seconds, then slow down to a stop.
15. Monitor the OBD status for P0780 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 5 and recheck.

DTC P0847: Short in 3rd Clutch Transmission Fluid Pressure Switch Circuit, or 3rd Clutch Transmission Fluid Pressure Switch Stuck ON

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check the 3rd PRES SWITCH signal with the HDS in the A/T data list when not in 3rd gear.

   Is the 3rd PRES SWITCH ON?

   YES—Go to step 3.

   NO—Go to step 5.
3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Drive the vehicle in 3rd gear in the D3 position for about 5 seconds, then shift to the D position, and drive in 4th gear for about 5 seconds. Slow down and stop the wheels.
4. Monitor the OBD status for P0847 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 5.

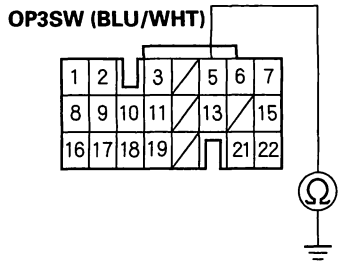
   NO—Intermittent failure, the system is OK at this time. Check the BLU/WHT wire for an intermittent short to ground between the 3rd clutch transmission fluid pressure switch and PCM. If the tester indicates NOT COMPLETED, return to step 3 and recheck. ■
5. Turn the ignition switch OFF.
6. Disconnect the 3rd clutch transmission fluid pressure switch connector.
7. Turn the ignition switch ON (II).
8. Check the 3rd PRES SWITCH signal with the HDS in the A/T data list.

   Is the 3rd PRES SWITCH OFF?

   YES—Replace the 3rd clutch transmission fluid pressure switch (see page 14-181), then go to step 13.

   NO—Go to step 9.
9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect PCM connector C (22P).
12. Check for continuity between PCM connector terminal C5 and body ground.

PCM CONNECTOR C (22P)



Wire side of female terminals

Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal C5 and the 3rd clutch transmission fluid pressure switch, then go to step 13.

NO—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

13. Clear the DTC with the HDS.

14. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Drive the vehicle in 3rd gear in the D3 position for about 5 seconds, then shift to the D position, and drive in 4th gear for about 5 seconds. Slow down and stop the wheels.

15. Monitor the OBD status for P0847 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 1 and recheck.

DTC P0848: Open in 3rd Clutch Transmission Fluid Pressure Switch Circuit, or 3rd Clutch Transmission Fluid Pressure Switch Stuck OFF

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.

2. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Drive the vehicle in the 3rd gear in the D3 position, and verify that the SHIFT MAP NUMBER indicates 3rd with the HDS in the A/T data list.

3. Check the 3rd PRES SWITCH signal with the HDS in the A/T data list.

   Is the 3rd PRES SWITCH ON?

   YES—Go to step 4.

   NO—Go to step 6.

4. Drive the vehicle in 3rd gear in the D3 position for about 5 seconds, then shift to D position, and drive in 4th gear for about 5 seconds. Slow down and stop the wheels.

5. Monitor the OBD status for P0848 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 6.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 3rd clutch transmission fluid pressure switch and PCM. If the tester indicates NOT COMPLETED, return to step 4 and recheck. ■

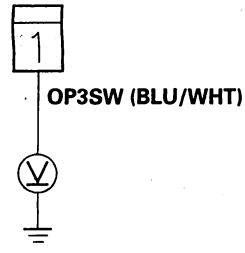
6. Turn the ignition switch OFF.

7. Disconnect the 3rd clutch transmission fluid pressure switch connector.

8. Turn the ignition switch ON (II).

9. Measure the voltage between the 3rd clutch transmission fluid pressure switch connector terminal and body ground.

3RD CLUTCH TRANSMISSION FLUID PRESSURE SWITCH CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Replace the 3rd clutch transmission fluid pressure switch (see page 14-181), then go to step 11.

NO—Go to step 10.

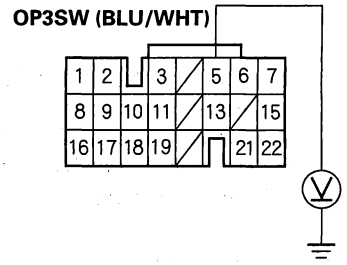
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

10. Measure the voltage between PCM connector terminal C5 and body ground.

PCM CONNECTOR C (22P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between PCM connector terminal C5 and the 3rd clutch transmission fluid pressure switch, then go to step 11.

NO—Check for loose or poor connections at PCM connector terminal C5. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

11. Clear the DTC with the HDS.

12. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Drive the vehicle in 3rd gear in the D3 position for about 5 seconds, then shift to the D position, and drive in 4th gear for about 5 seconds. Slow down and stop the wheels.

13. Monitor the OBD status for P0848 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete. ■

NO—Return to step 1 and recheck.

BACK

DTC P0872: Short in 4th Clutch Transmission Fluid Pressure Switch Circuit, or 4th Clutch Transmission Fluid Pressure Switch Stuck ON

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check the 4th PRES SWITCH signal with the HDS in the A/T data list when not in 4th gear.

   Is the 4th PRES SWITCH ON?

   YES—Go to step 3.

   NO—Go to step 5.
3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Drive the vehicle in 4th gear in the D position for about 5 seconds. Slow down and stop the wheels.
4. Monitor the OBD status for P0872 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 5.

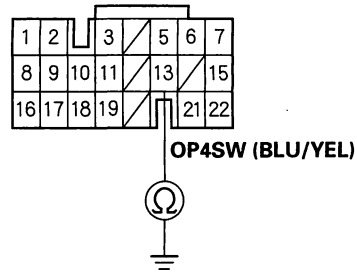
   NO—Intermittent failure, the system is OK at this time. Check the BLU/YEL wire for an intermittent short to ground between the 4th clutch transmission fluid pressure switch and PCM. If the tester indicates NOT COMPLETED, return to step 3 and recheck. ■
5. Turn the ignition switch OFF.
6. Disconnect the 4th clutch transmission fluid pressure switch connector.
7. Turn the ignition switch ON (II).
8. Check the 4th PRES SWITCH signal with the HDS in the A/T data list.

   Is the 4th PRES SWITCH OFF?

   YES—Replace the 4th clutch transmission fluid pressure switch (see page 14-182), then go to step 13.

   NO—Go to step 9.
9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect PCM connector C (22P).
12. Check for continuity between PCM connector terminal C13 and body ground.

PCM CONNECTOR C (22P)



Wire side of female terminals

Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal C13 and the 4th clutch transmission fluid pressure switch, then go to step 13.

NO—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

13. Clear the DTC with the HDS.

14. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Drive the vehicle in 4th gear in the D position for about 5 seconds. Slow down and stop the wheels.

15. Monitor the OBD status for P0872 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

    Does the result indicate PASSED?

    YES—Troubleshooting is complete. ■

    NO—Return to step 1 and recheck.

DTC P0873: Open in 4th Clutch Transmission Fluid Pressure Switch Circuit, or 4th Clutch Transmission Fluid Pressure Switch Stuck OFF

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.

2. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Drive the vehicle in 4th gear in the D position, and verify that the SHIFT MAP NUMBER indicates 4th with the HDS in the A/T data list.

3. Check the 4th PRES SWITCH signal with the HDS in the A/T data list.

   Is the 4th PRES SWITCH ON?

   YES—Go to step 4.

   NO—Go to step 6.

4. Drive the vehicle in 4th gear in the D position for about 5 seconds, then slow down and stop the wheels.

5. Monitor the OBD status for P0873 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 6.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 4th clutch transmission fluid pressure switch and PCM. If the tester indicates NOT COMPLETED, return to step 4 and recheck. ■

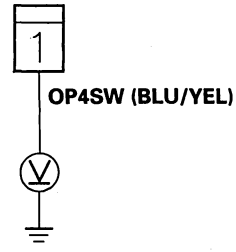
6. Turn the ignition switch OFF.

7. Disconnect the 4th clutch transmission fluid pressure switch connector.

8. Turn the ignition switch ON (II).

9. Measure the voltage between the 4th clutch transmission fluid pressure switch connector terminal and body ground.

4TH CLUTCH TRANSMISSION FLUID PRESSURE SWITCH CONNECTOR



Wire side of female terminals

Is there about 5 V?

YES—Replace the 4th clutch transmission fluid pressure switch (see page 14-182), then go to step 11.

NO—Go to step 10.

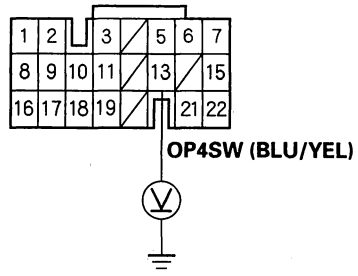
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

10. Measure the voltage between PCM connector terminal C13 and body ground.

PCM CONNECTOR C (22P)



Wire side of female terminals

Is there about 5 V?

YES—Repair open in the wire between PCM connector terminal C13 and the 4th clutch transmission fluid pressure switch, then go to step 11.

NO—Check for loose or poor connections at PCM connector terminal C13. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM.■

11. Clear the DTC with the HDS.

12. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Drive the vehicle in 4th gear in the D position for about 5 seconds. Slow down and stop the wheels.

13. Monitor the OBD status for P0873 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete.■

NO—Return to step 1 and recheck.

DTC P0962: Problem in A/T Clutch Pressure Control Solenoid Valve A Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0962 recurs.

   Is DTC P0962 indicated?

   YES—Go to step 6.

   NO—Go to step 3.
3. Choose Clutch Pressure Control Solenoid Control in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve A with the HDS.
4. Drive with the A/T clutch pressure control solenoid valve A at 1.0A in Clutch Pressure Control Solenoid Control menu.
5. Monitor the OBD status for P0962 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 6.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/T clutch pressure control solenoid valve A and PCM. If the tester indicates NOT COMPLETED, return to step 3 and recheck. ■
6. Turn the ignition switch OFF.
7. Disconnect the A/T clutch pressure control solenoid valve A connector.
8. Measure A/T clutch pressure control solenoid valve A resistance at the solenoid connector.

   A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A CONNECTOR

   Terminal side of male terminals

   Is there 3— 10 Ω ?

   YES—Go to step 9.

   NO—Replace A/T clutch pressure control solenoid valve A (see page 14-175), then go to step 13.
9. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No.2 and body ground.

   A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A CONNECTOR

   Wire side of female terminals

   Is there continuity?

   YES—Go to step 10.

   NO—Repair open in the wire between the A/T clutch pressure control solenoid valve A and ground (G151), or repair poor ground (G151), or repair poor ground (G151), then go to step 13.

(cont'd)

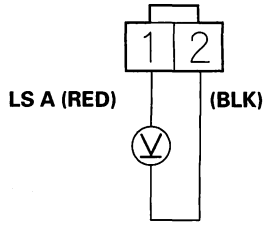
Protected by AR

DTC Troubleshooting (cont'd)

10. Turn the ignition switch ON (II).

11. Measure the voltage between A/T clutch pressure control solenoid valve A connector terminals No. 1 and No. 2 as the ignition switch is turned ON.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A CONNECTOR



Wire side of female terminals

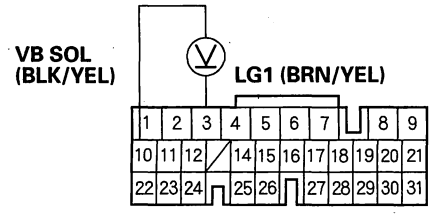
Is there battery voltage?

YES—Go to step 12.

NO—Repair open or short in the wire between PCM connector terminal C7 and A/T clutch pressure control solenoid valve A, then go to step 13.

12. Measure the voltage between PCM connector terminals E10 and E3.

PCM CONNECTOR E (31P)



Wire side of female terminals

Is there battery voltage?

YES—Check for loose or poor connections at PCM connector terminal E10. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO— Check for blown No. 18 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal E10 and the under-dash fuse/relay box, then go to step 13.

13. Clear the DTC with the HDS.

14. Test-drive the vehicle for several minutes in the D position through all five gears.

15. Monitor the OBD status for P0962 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete. ■

NO—Return to step 1 and recheck.

DTC P0963: Problem in A/T Clutch Pressure Control Solenoid Valve A

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0963 recurs.

   Is DTC P0963 indicated?

   YES—Go to step 6.

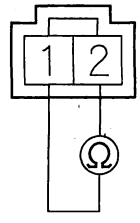
   NO—Go to step 3.
3. Choose Clutch Pressure Control Solenoid Control in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve A with the HDS.
4. Drive with the A/T clutch pressure control solenoid valve A at 0.2 A in Clutch Pressure Control Solenoid Control menu.
5. Monitor the OBD status for P0963 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 6.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/T clutch pressure control solenoid valve A and PCM. If the tester indicates NOT COMPLETED, return to step 3 and recheck. ■
6. Turn the ignition switch OFF.
7. Disconnect the A/T clutch pressure control solenoid valve A connector.
8. Measure A/T clutch pressure control solenoid valve A resistance at the solenoid connector.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A CONNECTOR



Terminal side of male terminals

Is there 3– 10 Ω ?

YES—Go to step 9.

NO—Replace A/T clutch pressure control solenoid valve A (see page 14-175), then go to step 10.

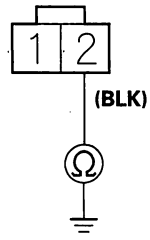
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

9. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 2 and body ground.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Repair open in the wire between the A/T clutch pressure control solenoid valve A and ground (G151), or repair poor ground (G151), then go to step 10.

10. Clear the DTC with the HDS.

11. Test-drive the vehicle for several minutes in the D position through all five gears.

12. Monitor the OBD status for P0963 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete. ■

NO—Return to step 1 and recheck.

DTC P0966: Problem in A/T Clutch Pressure Control Solenoid Valve B Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0966 recurs.

   Is DTC P0966 indicated?

   YES—Go to step 6.

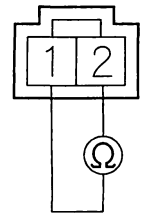
   NO—Go to step 3.
3. Choose Clutch Pressure Control Solenoid Control in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve B with the HDS.
4. Drive with the A/T clutch pressure control solenoid valve B at 1.0 A in Clutch Pressure Control Solenoid Control menu.
5. Monitor the OBD status for P0966 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 6.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/T clutch pressure control solenoid valve B and PCM. If the tester indicates NOT COMPLETED, return to step 3 and recheck. ■
6. Turn the ignition switch OFF.
7. Disconnect the A/T clutch pressure control solenoid valve B connector.
8. Measure A/T clutch pressure control solenoid valve B resistance at the solenoid connector.

   A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B CONNECTOR



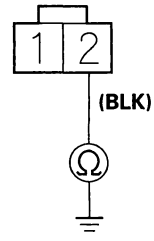
Terminal side of male terminals

   Is there 3— 10 Ω ?

   YES—Go to step 9.

   NO—Replace A/T clutch pressure control solenoid valve B (see page 14-175), then go to step 13.
9. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 2 and body ground.

   A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B CONNECTOR



Wire side of female terminals

   Is there continuity?

   YES—Go to step 10.

   NO—Repair open in the wire between the A/T clutch pressure control solenoid valve B and ground (G151), or repair poor ground (G151), then go to step 13.

(cont'd)

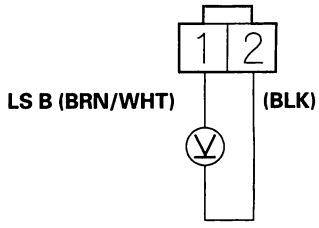
Protected by AR

DTC Troubleshooting (cont'd)

10. Turn the ignition switch ON (II).

11. Measure the voltage between A/T clutch pressure control solenoid valve B connector terminals No. 1 and No. 2 as the ignition switch is turned ON.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B CONNECTOR



Wire side of female terminals

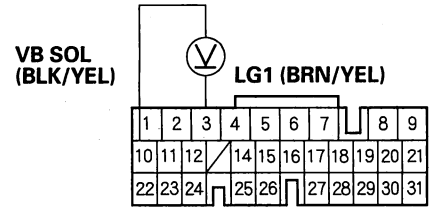
Is there battery voltage?

YES—Go to step 12.

NO—Repair open or short in the wire between PCM connector terminal C15 and A/T clutch pressure control solenoid valve B, then go to step 13.

12. Measure the voltage between PCM connector terminals E10 and E3.

PCM CONNECTOR E (31P)



Wire side of female terminals

Is there battery voltage?

YES—Check for loose or poor connections at PCM connector terminal E10. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual, (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Check for blown No. 18 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal E10 and the under-dash fuse/relay box, then go to step 13.

13. Clear the DTC with the HDS.

14. Test-drive the vehicle for several minutes in the D position through all five gears.

15. Monitor the OBD status for P0966 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete. ■

NO—Return to step 1 and recheck.

DTC P0967: Problem in A/T Clutch Pressure Control Solenoid Valve B

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0967 recurs.

   Is DTC P0967 indicated?

   YES—Go to step 6.

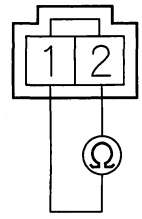
   NO—Go to step 3.
3. Choose Clutch Pressure Control Solenoid Control in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve B with the HDS.
4. Drive with the A/T clutch pressure control solenoid valve B at 0.2 A in Clutch Pressure Control Solenoid Control menu.
5. Monitor the OBD status for P0967 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 6.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/T clutch pressure control solenoid valve B and PCM. If the tester indicates NOT COMPLETED, return to step 3 and recheck.■
6. Turn the ignition switch OFF.
7. Disconnect the A/T clutch pressure control solenoid valve B connector.
8. Measure A/T clutch pressure control solenoid valve B resistance at the solenoid connector.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B CONNECTOR



Terminal side of male terminals

Is there 3– 10 Ω ?

YES—Go to step 9.

NO—Replace A/T clutch pressure control solenoid valve B (see page 14-175), then go to step 10.

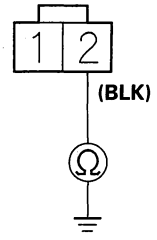
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

9. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 2 and body ground.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM.■

NO—Repair open in the wire between the A/T clutch pressure control solenoid valve B and ground (G151), or repair poor ground (G151), then go to step 10.

10. Clear the DTC with the HDS.

11. Test-drive the vehicle for several minutes in the D position through all five gears.

12. Monitor the OBD status for P0967 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete.■

NO—Return to step 1 and recheck.

DTC P0970: Problem in A/T Clutch Pressure Control Solenoid Valve C Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0970 recurs.

   Is DTC P0970 indicated?

   YES—Go to step 6.

   NO—Go to step 3.
3. Choose Clutch Pressure Control Solenoid Control in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve C with the HDS.
4. Drive with the A/T clutch pressure control solenoid valve C at 1.0 A in Clutch Pressure Control Solenoid Control menu.
5. Monitor the OBD status for P0970 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 6.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/T clutch pressure control solenoid valve C and PCM. If the tester indicates NOT COMPLETED, return to step 3 and recheck. ■
6. Turn the ignition switch OFF.
7. Disconnect the A/T clutch pressure control solenoid valve C connector.
8. Measure A/T clutch pressure control solenoid valve C resistance at the solenoid connector.

   A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C CONNECTOR

   Terminal side of male terminals

   Is there 3— 10 Ω ?

   YES—Go to step 9.

   NO—Replace A/T clutch pressure control solenoid valve C (see page 14-178), then go to step 13.
9. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 2 and body ground.

   A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C CONNECTOR

   Wire side of female terminals

   Is there continuity?

   YES—Go to step 10.

   NO—Repair open in the wire between the A/T clutch pressure control solenoid valve C and ground (G101), or repair poor ground (G101), then go to step 13.

(cont'd)

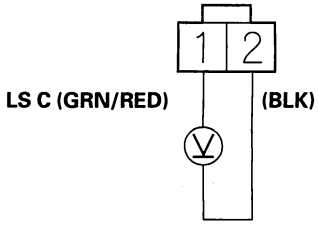
Protected by AR

DTC Troubleshooting (cont'd)

10. Turn the ignition switch ON (II).

11. Measure the voltage between A/T clutch pressure control solenoid valve C connector terminals No. 1 and No. 2 as the ignition switch is turned ON.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C CONNECTOR



Wire side of female terminals

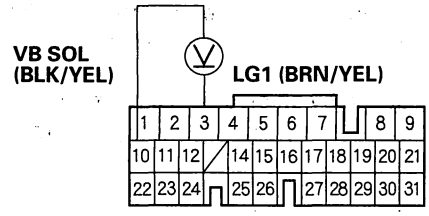
Is there battery voltage?

YES—Go to step 12.

NO—Repair open or short in the wire between PCM connector terminal C22 and A/T clutch pressure control solenoid valve C, then go to step 13.

12. Measure the voltage between PCM connector terminals E10 and E3.

PCM CONNECTOR E (31P)



Wire side of female terminals

Is there battery voltage?

YES—Check for loose or poor connections at PCM connector terminal E10. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM.■

NO—Check for blown No. 18 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal E10 and the under-dash fuse/relay box, then go to step 13.

13. Clear the DTC with the HDS.

14. Test-drive the vehicle for several minutes in the D position through all five gears.

15. Monitor the OBD status for P0970 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

DTC P0971: Problem in A/T Clutch Pressure Control Solenoid Valve C

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0971 recurs.

   Is DTC P0971 indicated?

   YES—Go to step 6.

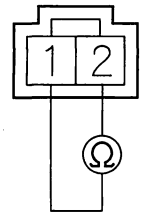
   NO—Go to step 3.
3. Choose Clutch Pressure Control Solenoid Control in Miscellaneous Test Menu, and test the A/T clutch pressure control solenoid valve C with the HDS.
4. Drive with the A/T clutch pressure control solenoid valve C at 0.2 A in Clutch Pressure Control Solenoid Control menu.
5. Monitor the OBD status for P0971 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 6.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/T clutch pressure control solenoid valve C and PCM. If the tester indicates NOT COMPLETED, return to step 3 and recheck. ■
6. Turn the ignition switch OFF.
7. Disconnect the A/T clutch pressure control solenoid valve C connector.
8. Measure A/T clutch pressure control solenoid valve C resistance at the solenoid connector.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C CONNECTOR



Terminal side of male terminals

Is there 3— 10 Ω ?

YES—Go to step 9.

NO—Replace A/T clutch pressure control solenoid valve C (see page 14-178), then go to step 10.

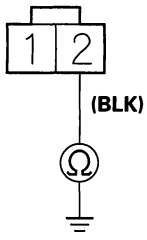
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

9. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No.2 and body ground.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM.■

NO—Repair open in the wire between the A/T clutch pressure control solenoid valve C and ground (G151), or repair poor ground (G151), then go to step 10.

10. Clear the DTC with the HDS.

11. Test-drive the vehicle for several minutes in the D position through all five gears.

12. Monitor the OBD status for P0971 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete.■

NO—Return to step 1 and recheck.

DTC P0973: Short in Shift Solenoid Valve A Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle for several minutes in the D position through all five gears.
3. Check that DTC P0973 recurs.

   Is DTC P0973 indicated?

   YES—Go to step 7.

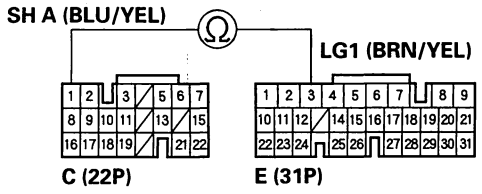
   NO—Go to step 4.
4. Choose Shift Solenoid A in Miscellaneous Test Menu, and test the shift solenoid valve A with the HDS.
5. Test drive the vehicle for several minutes in the D position through all five gears.
6. Monitor the OBD status for P0973 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 7.

   NO—Intermittent failure, the system is OK at this time. Check the BLU/YEL wire for an intermittent short to ground between shift solenoid valve A and PCM. If the tester indicates NOT COMPLETED, return to step 4 and recheck.■
7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (24P), C (22P), and E (31P).
10. Measure the resistance between PCM connector terminals C1 and E3.

PCM CONNECTORS



Wire side of female terminals

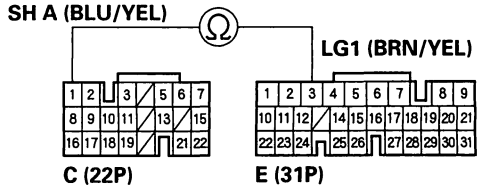
Is there less than 12 Ω ?

YES—Go to step 11.

NO—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM, replace the original PCM.■

11. Disconnect shift solenoid valve A connector.
12. Check for continuity between PCM connector terminals C1 and E3.

PCM CONNECTORS



Wire side of female terminals

Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal C1 and shift solenoid valve A, then go to step 16.

NO—Go to step 13.

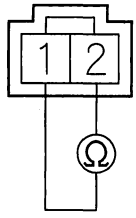
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

13. Measure shift solenoid valve A resistance at the solenoid valve connector.

SHIFT SOLENOID VALVE A CONNECTOR



Terminal side of male terminals

Is there 12— 15 Ω ?

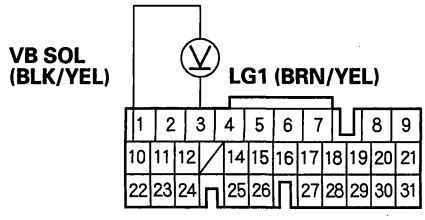
YES—Go to step 14.

NO—Replace shift solenoid valve A (see page 14-165), then go to step 16.

14. Turn the ignition switch ON (II).

15. Measure the voltage between PCM connector terminals E10 and E3.

PCM CONNECTOR E (31P)



Wire side of female terminals

Is there battery voltage?

YES—Check for loose or poor connections at PCM connector terminal E10. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Check for blown No. 18 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal E10 and the under-dash fuse/relay box, then go to step 16.

16. Clear the DTC with the HDS.

17. Test-drive the vehicle for several minutes in the D position through all five gears.

18. Monitor the OBD status for P0973 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete. ■

NO—Return to step 1 and recheck.

DTC P0974: Open in Shift Solenoid Valve A Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle for several minutes in the D position through all five gears.
3. Check that DTC P0974 recurs.

   Is DTC P0974 indicated?

   YES—Go to step 7.

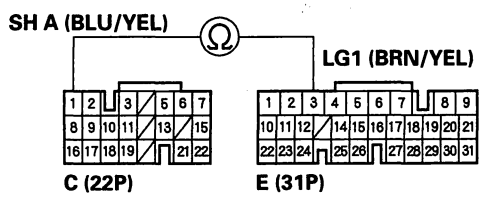
   NO—Go to step 4.
4. Choose Shift Solenoid A in Miscellaneous Test Menu, and test the shift solenoid valve A with the HDS.
5. Test-drive the vehicle for several minutes in the D position through all five gears.
6. Monitor the OBD status for P0974 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 7.

   NO—Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at shift solenoid valve A and PCM. If the tester indicates NOT COMPLETED, return to step 4 and recheck. ■
7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (24P), C (22P), and E (31P).
10. Measure the resistance between PCM connector terminals C1 and E3.

PCM CONNECTORS



Wire side of female terminals

Is there 12—25 Ω ?

YES—Check for loose or poor connections at PCM connector terminal C1. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Go to step 11.

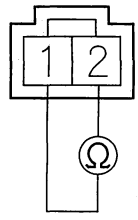
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

11. Disconnect shift solenoid valve A connector.
12. Measure shift solenoid valve A resistance at the solenoid valve connector.

SHIFT SOLENOID VALVE A CONNECTOR



Terminal side of male terminals

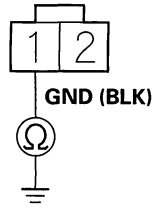
Is there 12—25 Ω ?

YES—Go to step 13.

NO—Replace shift solenoid valve A (see page 14-165), then go to step 14.

13. Check for continuity between shift solenoid valve A connector terminal No. 1 and body ground.

SHIFT SOLENOID VALVE A CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair open in the wire between PCM connector terminal C1 and shift solenoid valve A, then go to step 14.

NO—Repair open in the wire between shift solenoid valve A and ground (G151), or repair poor ground(G151) then go to step 14.

14. Clear the DTC with the HDS.
15. Test-drive the vehicle for several minutes in the D position through all five gears.
16. Monitor the OBD status for P0974 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete.■

NO—Return to step 1 and recheck.

DTC P0976: Short in Shift Solenoid Valve B Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle for several minutes in the D position through all five gears.
3. Check that DTC P0976 recurs.

   Is DTC P0976 indicated?

   YES—Go to step 7.

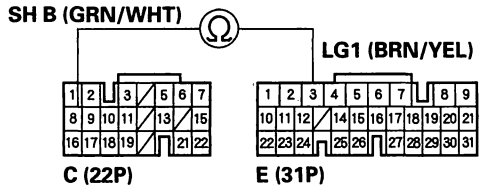
   NO—Go to step 4.
4. Choose Shift Solenoid B in Miscellaneous Test Menu, and test the shift solenoid valve B with the HDS.
5. Test-drive the vehicle for several minutes in the D position through all five gears.
6. Monitor the OBD status for P0976 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 7.

   NO—Intermittent failure, the system is OK at this time. Check the GRN/WHT wire for an intermittent short to ground between shift solenoid valve B and PCM. If the tester indicates NOT COMPLETED, return to step 4 and recheck. ■
7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (24P), (22P), and E (31P).
10. Measure the resistance between PCM connector terminals C8 and E3.

PCM CONNECTORS



Wire side of female terminals

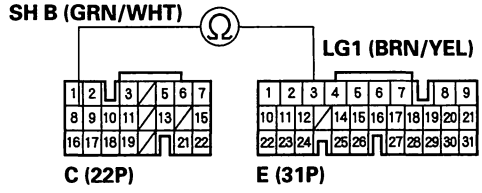
Is there less than 12 Ω ?

YES—Go to step 11.

NO—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

11. Disconnect shift solenoid valve B connector.
12. Check for continuity between PCM connector terminals C8 and E3.

PCM CONNECTORS



Wire side of female terminals

Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal C8 and shift solenoid valve B, then go to step 16.

NO—Go to step 13.

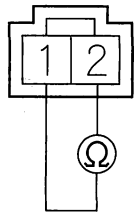
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

13. Measure shift solenoid valve B resistance at the solenoid valve connector.

SHIFT SOLENOID VALVE B CONNECTOR



Terminal side of male terminals

Is there 12— 15 Ω ?

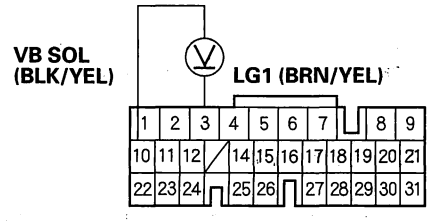
YES—Go to step 14.

NO—Replace shift solenoid valve B (see page 14-167), then go to step 16.

14. Turn the ignition switch ON (II).

15. Measure the voltage between PCM connector terminals E10 and E3.

PCM CONNECTOR E (31P)



Wire side of female terminals

Is there battery voltage?

YES—Check for loose or poor connections at PCM connector terminal E10. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Check for blown No. 18 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal E10 and the under-dash fuse/relay box, then go to step 16.

16. Clear the DTC with the HDS.

17. Test-drive the vehicle for several minutes in the D position through all five gears.

18. Monitor the OBD status for P0976 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES—Troubleshooting is complete. ■

NO—Return to step 1 and recheck.

DTC P0979: Short in Shift Solenoid Valve C Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle for several minutes in the D position through all five gears.
3. Check that DTC P0979 recurs.

   Is DTC P0979 indicated?

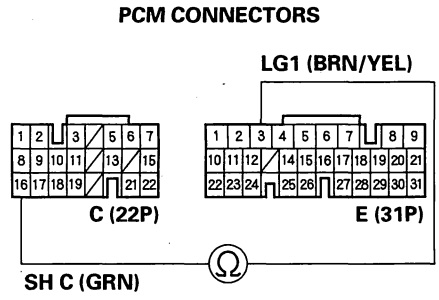
   YES—Go to step 7.

   NO—Go to step 4.
4. Choose Shift Solenoid C in Miscellaneous Test Menu, and test the shift solenoid valve C with the HDS.
5. Test-drive the vehicle for several minutes in the D position through all five gears.
6. Monitor the OBD status for P0979 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 7.

   NO—Intermittent failure, the system is OK at this time. Check the GRN wire for an intermittent short to ground between shift solenoid valve C and PCM. If the tester indicates NOT COMPLETED, return to step 4 and recheck.■
7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (24P), C (22P), and E (31P).
10. Measure the resistance between PCM connector terminals C16 and E3.



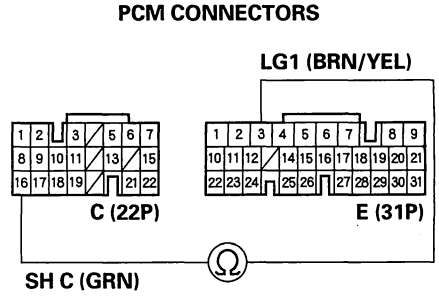
Wire side of female terminals

Is there less than 12 Ω ?

YES—Go to step 11.

NO—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM.■

11. Disconnect shift solenoid valve C connector.
12. Check for continuity between PCM connector terminals C16 and E3.



Wire side of female terminals

Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal C16 and the shift solenoid valve C, then go to step 16.

NO—Go to step 13.

DTC P2769: Short in Torque Converter Clutch Solenoid Valve Circuit

NOTE:
- Record all freeze data and review General Troubleshooting Information, refer to the 2003-2006 Accord Service Manual (see page 14-3) before you troubleshoot.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Test- drive the vehicle for several minutes in the D position through all five gears.
3. Check that DTC P2769 recurs.

   Is DTC P2769 indicated?

   YES—Go to step 7.

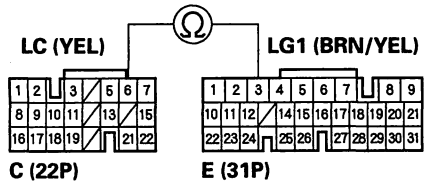
   NO—Go to step 4.
4. Choose Lockup Solenoid Test in Miscellaneous Test Menu, and test the torque converter clutch solenoid valve with the HDS.
5. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Test- drive the vehicle for several minutes in the D position through all five gears.
6. Monitor the OBD status for P2769 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

   Does the result indicate FAILED?

   YES—Go to step 7.

   NO—Intermittent failure, the system is OK at this time. Check the YEL wire for an intermittent short to ground between torque converter clutch solenoid valve and PCM. If the tester indicates NOT COMPLETED, return to step 4 and recheck.■
7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (24P), C (22P), and E (31P).
10. Measure the resistance between PCM connector terminals C6 and E3.

PCM CONNECTORS



Wire side of female terminals

Is there less than 12 Ω ?

YES—Go to step 11.

NO—Update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM.■
11. Disconnect torque converter clutch solenoid valve connector.

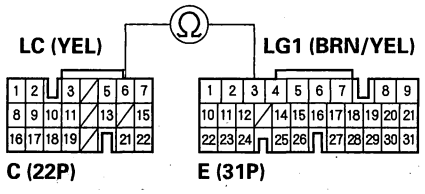
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

12. Check for continuity between PCM connector terminals C6 and E3.

PCM CONNECTORS



Wire side of female terminals

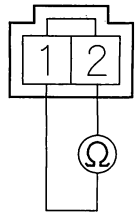
Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal C6 and torque converter clutch solenoid valve, then go to step 16.

NO—Go to step 13.

13. Measure torque converter clutch solenoid valve resistance at the solenoid valve connector.

TORQUE CONVERTER CLUTCH SOLENOID VALVE CONNECTOR



Terminal side of male terminals

Is there 12—25 Ω ?

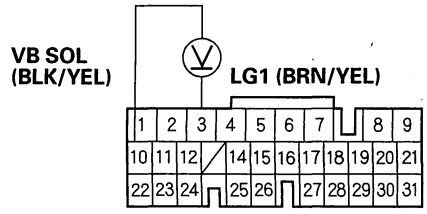
YES—Go to step 14.

NO—Replace the torque converter clutch solenoid valve (see page 14-171), then go to step 16.

14. Turn the ignition switch ON (II).

15. Measure the voltage between PCM connector terminals E10 and E3.

PCM CONNECTOR E (31P)



Wire side of female terminals

Is there battery voltage?

YES—Check for loose or poor connections at PCM connector terminal E10. If the connection is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM, refer to the 2003-2006 Accord Service Manual (see page 14-6), then recheck. If the symptom/indication goes away with a known-good PCM, replace the original PCM. ■

NO—Check for blown No. 18 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal E10 and the under-dash fuse/relay box, then go to step 16.

16. Clear the DTC with the HDS.

17. Start the engine, and warm it to normal operating temperature (the radiator fan comes on). Test-drive the vehicle for several minutes in the D position through all five gears.

18. Monitor the OBD status for P2769 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

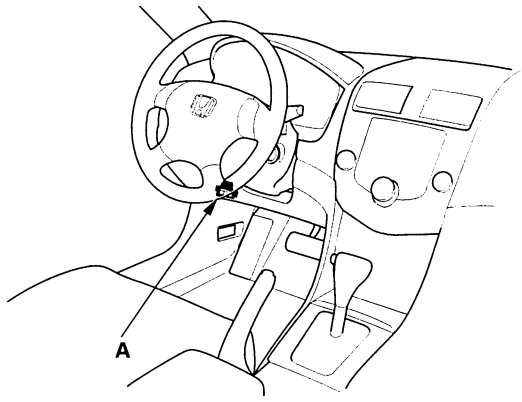
Road Test

1. Warm up the engine to normal operating temperature (the radiator fan comes on).

2. Apply the parking brake, and block both rear wheels. Start the engine, then shift to the D position while pressing the brake pedal. Press the accelerator pedal, and release it suddenly. The engine should not stall.

3. Repeat step 2 in the D3 position.

4. Connect the HDS to the DLC (A), and go to the A/T data list.



5. Test-drive the vehicle on a flat road in the D position. Check for abnormal noise and clutch slippage. While driving, check that the shift points occur at the proper speeds by monitoring the accelerator pedal position sensor voltage with the HDS and comparing your shift point speeds and voltage to those in the table. (The accelerator pedal position sensor voltage represents the throttle opening.)

Upshift: D position

Accelerator pedal position sensor voltage: 1.02 V	
1st → 2nd	9—12 mph (14—19 km/h)
2nd → 3rd	19—22 mph (30—35 km/h)
3rd → 4th	30—34 mph (48—54 km/h)
4th → 5th	45—50 mph (73—81 km/h)
Lock-up ON	41—48 mph (66—78 km/h)
Accelerator pedal position sensor voltage: 2.58 V	
1st → 2nd	23—27 mph (37—44 km/h)
2nd → 3rd	42—47 mph (67—75 km/h)
3rd → 4th	63—69 mph (101—111 km/h)
4th → 5th	90—100 mph (145—161 km/h)
Lock-up ON	91—101 mph (147—163 km/h)
Fully-opened throttle Accelerator pedal position sensor voltage: 4.65 V	
1st → 2nd	35—40 mph (57—65 km/h)
2nd → 3rd	60—68 mph (96—109 km/h)
3rd → 4th	94—105 mph (151—169 km/h)
4th → 5th	———
Lock-up ON	122—134 mph (196—216 km/h)

(cont'd)

Road Test (cont'd)

Downshift: D position

Accelerator pedal position sensor voltage: 1.02 V	
Lock-up OFF	40—47 mph (65—75 km/h)
5th → 4th	29—34 mph (46—54 km/h)
4th → 3rd	17—19 mph (27—31 km/h)
3rd → 1st	6—9 mph (10—15 km/h)
Accelerator pedal position sensor voltage: 2.58 V	
Lock-up OFF	76—86 mph (123—138 km/h)
Fully-opened throttle Accelerator pedal position sensor voltage: 4.65 V	
Lock-up OFF	107—117 mph (172—188 km/h)
5th → 4th	134—146 mph (215—235 km/h)
4th → 3rd	83—93 mph (134—150 km/h)
3rd → 2nd	52—58 mph (84—93 km/h)
2nd → 1st	27—30 mph (43—49 km/h)

6. Accelerate to about 35 mph (57 km/h) so the transmission is in 4th or 5th, then shift from the D position to the 2 position. The vehicle should immediately begin slowing down from engine braking.

7. Check for abnormal noise and clutch slippage in the following positions.

   1 (1st Gear) Position
   Accelerate from a stop at full throttle. Check that there is no abnormal noise or clutch slippage. Upshifts should not occur with the shift lever in this position.

   2 (2nd Gear) Position
   Accelerate from a stop at full throttle. Check that there is no abnormal noise or clutch slippage. Upshifts and downshifts should not occur with the shift lever in this position.

   R (Reverse) Position
   Accelerate from a stop at full throttle, and check for abnormal noise and clutch slippage.

8. Test in P (Park) Position.
   Park the vehicle on a slope (about 16 °), apply the brake, and shift into the P position. Release the brake; the vehicle should not move.

   NOTE: Always use the brake to hold the vehicle, when stopped on an incline in gear. Depending on the grade of the incline, the vehicle could roll backwards if the brake is released.

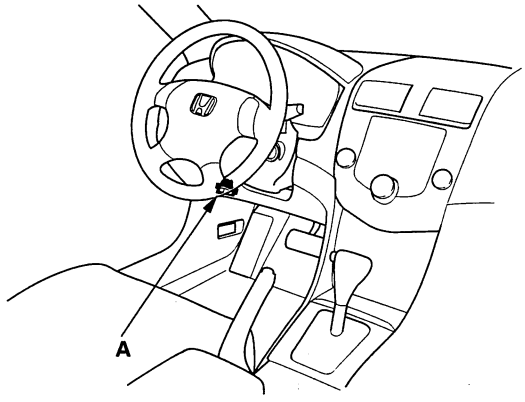
Protected by AR

Stall Speed Test

1. Make sure the transmission fluid is filled to the proper level (see page 14-185).
2. Apply the parking brake, and block all four wheels.
3. Connect the HDS to the DLC (A), and go to the A/T data list.



4. Make sure the A/C switch is OFF.
5. After the engine has warmed up to normal operating temperature (the radiator fan comes on), shift to the 2 position.
6. Firmly press the brake pedal and accelerator pedal for 6 to 8 seconds, and note the engine speed. Do not move the shift lever while raising the engine speed.
7. Allow 2 minutes for cooling, then repeat the test in the D, 1, and R positions.

   NOTE:
   - Do not test stall speed for more than 10 seconds at a time.
   - Stall speed tests should be used for diagnostic purposes only.
   - Stall speed should be the same in D, 2, 1, and R positions.
   - Do not test stall speed with the A/T pressure gauges installed.

   Stall Speed rpm:
   Specification: 2,000 rpm
   Service Limit: 1,850—2,150 rpm

8. If the measurements are out of the service limit, problems and probable causes are listed in the table.

Problem	Probable causes
Stall speed rpm high in the D, 2, 1, and R positions	• ATF pump output low • Clogged ATF strainer • Regulator valve stuck • Slipping clutch
Stall speed rpm high in the 1 position	Slippage of 1st clutch or 1st gear one-way clutch defective
Stall speed rpm high in the 2 position	Slippage of 2nd clutch
Stall speed rpm high in the R position	Slippage of 5th clutch
Stall speed low in the D, 2, 1, and R positions	• Engine output low • Engine throttle valve closed • Torque converter one-way clutch slipping

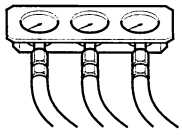
Protected by AR

Pressure Test

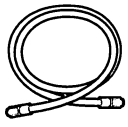
Special Tools Required
- A/T clutch pressure gauge set 07406-0020400 or 07406-0020401
- A/T pressure hose, 2,210 mm 07MAJ-PY4011A
- A/T pressure hose adapter 07MAJ-PY40120

1. Make sure the transmission fluid is filled to the proper level (see page 14-185).
2. Lift the vehicle up on a hoist or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
3. Remove the splash shield.
4. Allow the front wheels to rotate freely.
5. Connect the oil pressure gauges to the line pressure inspection port (A), 2nd clutch pressure inspection port (B), and 1st-hold clutch pressure inspection port (C). Do not allow dust or other foreign particles to enter the holes while connecting the gauges.

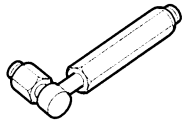
A/T OIL PRESSURE GAUGE SET W/PANEL 07406-0020400 or 07406-0020401

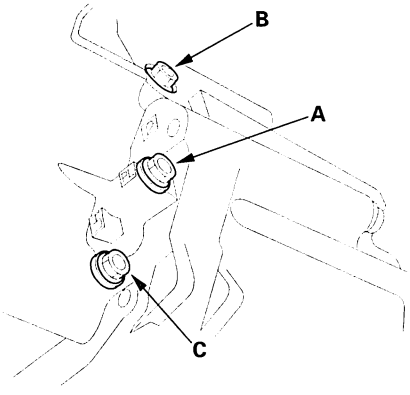


A/T PRESSURE HOSE, 2,210 mm 07MAJ-PY4011A (3 Required)

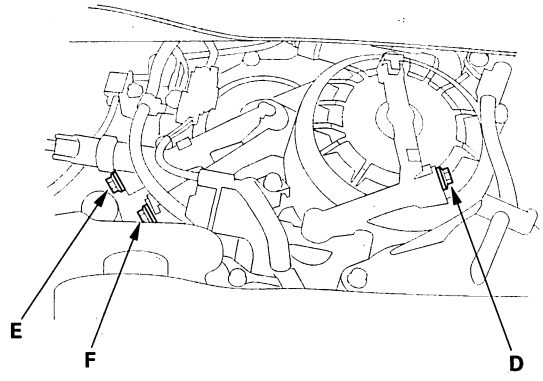


A/T PRESSURE HOSE ADAPTER 07MAJ-PY40120 (3 Required)

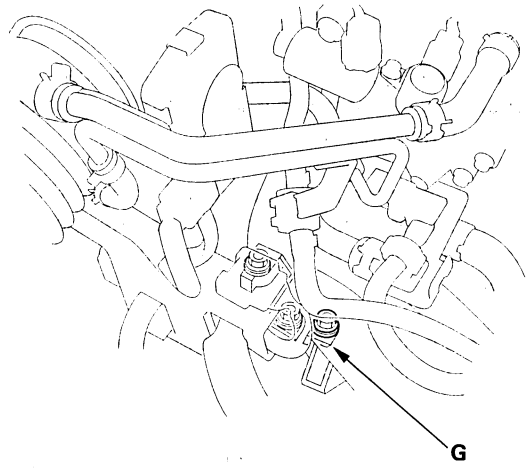




6. Connect the oil pressure gauges to the 3rd clutch pressure inspection port (D), 4th clutch pressure inspection port (E), and 5th clutch pressure inspection port (F).



7. Connect the oil pressure gauge to the 1st clutch pressure inspection port (G).



8. Warm up the engine (the radiator fan comes on), then stop it and connect the HDS to the DLC.

BACK

Protected by AR

9. Start the engine, and run it at 2,000 rpm in the P or N position.

10. Measure the line pressure at the line pressure inspection port (A).

    NOTE: Higher pressure may be indicated if measurements are made in shift lever position other than N or P.

Pressure	Fluid Pressure	
	Standard	Service Limit
Line (A)	900—960 kPa (9.2—9.8 kgf/cm², 130—140 psi)	850 kPa (8.7 kgf/cm², 120 psi)

11. Shift to the 1 position, and measure the 1st clutch pressure at the 1st clutch pressure inspection port (G) and 1st-hold clutch pressure at the 1st-hold clutch pressure inspection port (C).

12. Shift to the 2 position, and measure the 2nd clutch pressure at the 2nd clutch pressure inspection port (B).

13. Shift to the P position, then press the brake pedal and hold it.

14. Shift to the D3 position, press the accelerator pedal to increase the engine speed to 2,500 rpm; the transmission shifts into 2nd gear.

15. Release the accelerator pedal; the engine speed decreases to 1,000 rpm with the transmission in 2nd gear.

16. Press the accelerator pedal very slowly so that the engine speed increases to 2,000 rpm on 5 seconds, then hold the accelerator; the transmission shifts into 3rd gear. Measure the 3rd clutch pressure at the 3rd clutch pressure inspection port (D) while holding the engine speed at 2,000 rpm.

17. Shift to the D position, and measure the 4th clutch pressure at the 4th clutch pressure inspection port (E) while holding the engine speed at 2,000 rpm, then in about 15 seconds, the transmission will shift to 5th gear.

18. Measure the 5th clutch pressure at the 5th clutch pressure inspection port (F) while holding the engine speed 2,000 rpm.

19. Bring the engine back to an idle, then apply the brake to stop the wheels from rotating.

20. Shift to the R position. Raise the engine rpm to 2,000 rpm, and measure the reverse clutch pressure at the 5th clutch pressure inspection port (F).

Pressure	Fluid Pressure	
	Standard	Service Limit
1st-hold clutch (C)	760—830 kPa (7.7—8.5 kgf/cm², 110—120 psi)	710 kPa (7.2 kgf/cm², 100 psi)
1st clutch (G)	890—970 kPa (9.1—9.9 kgf/cm², 130—140 psi)	840 kPa (8.6 kgf/cm², 120 psi)
2nd clutch (B)		
3rd clutch (D)		
4th clutch (E)		
5th clutch (F)		

21. If the measurements are out of service limit, problems and probable causes are listed in the table.

Problem	Probable causes
No or low line pressure	• Torque converter • ATF pump • Regulator valve • Torque converter check valve
No or low 1st clutch pressure	• 1st clutch • O-rings
No or low 2nd clutch pressure	• 2nd clutch • O-rings
No or low 3rd clutch pressure	• 3rd clutch • O-rings
No or low 4th clutch pressure	• 4th clutch • O-rings
No or low 5th clutch pressure	• 5th clutch • O-rings
No or low 5th clutch pressure in the R position	• Servo valve • 5th clutch • O-rings

22. Install the sealing bolts with the new sealing washers, and tighten the bolts to the specified torque. Do not reuse old sealing washers.

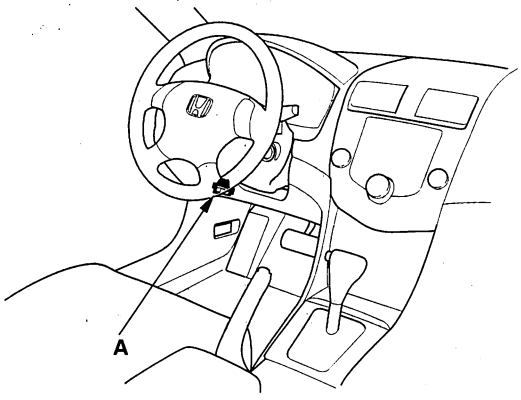
    Torque: 18 N·m (1.8 kgf·m,13 lbf·ft)

23. Install the splash shield.

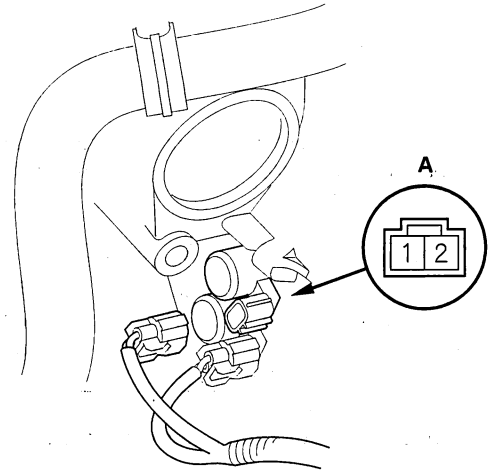
Protected by AR

Shift Solenoid Valve A Test

1. Connect the HDS to the DLC (A).



2. Choose Shift Solenoid A in Miscellaneous Test Menu on the HDS.
3. Check that the shift solenoid valve A operates with the HDS. A clicking sound should be heard.
   - If a clicking sound is heard, the valve is OK.
   - If no clicking sound is heard, go to step 4.
4. Get the audio and navigation anti-theft codes, and write down the audio presets.
5. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.
6. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.
7. Remove the intake air duct and air cleaner housing.
8. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.
9. Remove the starter.
10. Disconnect shift solenoid valve A connector.



11. Measure shift solenoid valve A resistance at the solenoid valve connector terminals.

    Standard: 12—25 Ω

12. Replace shift solenoid valve A if the resistance is out of standard (see page 14-165).
13. If the resistance is within the standard, connect the battery negative terminal to shift solenoid valve A connector terminal No. 1, and connect the battery positive terminal to the terminal No. 2.
    - If a clicking sound is heard, the valve is OK.
    - If no clicking sound is heard, replace shift solenoid valve A (see page 14-165).
14. Install the starter.
15. Install the battery base, then install the air cleaner housing and intake air duct.
16. Install the battery tray, battery, and battery cover, then secure the battery with its hold-down bracket.
17. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
18. Enter the audio and navigation anti-theft codes, then enter the presets, and set the clock.
19. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

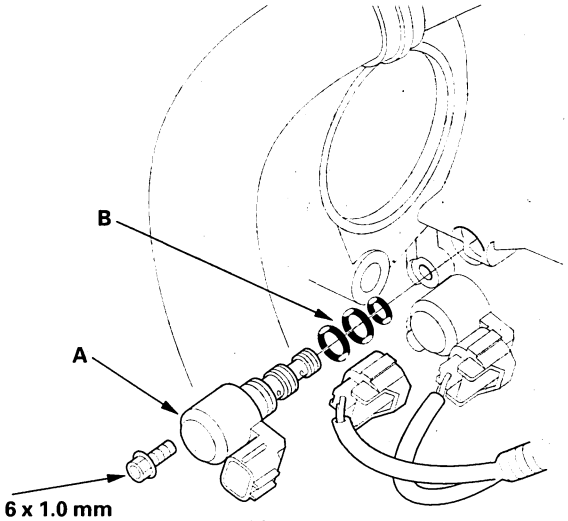
Shift Solenoid Valve A Replacement

1. Get the audio and navigation anti-theft codes, and write down the audio presets.
2. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.
3. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.
4. Remove the intake air duct and air cleaner housing.
5. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.
6. Remove the starter.
7. Disconnect shift solenoid valve A connector, and remove shift solenoid valve A .



8. Install a new shift solenoid valve A with new O-rings (B). While installing the solenoid valve, do not allow dust or other foreign particles to enter the transmission.
9. Check the connector for rust, dirt, or oil, then connect the connector.
10. Install the starter.
11. Install the battery base, then install the air cleaner housing and intake air duct.
12. Install the battery tray, battery, and battery cover, then secure the battery with its hold-down bracket.
13. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
14. Enter the audio and navigation anti-theft codes, then enter the presets, and set the clock.
15. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

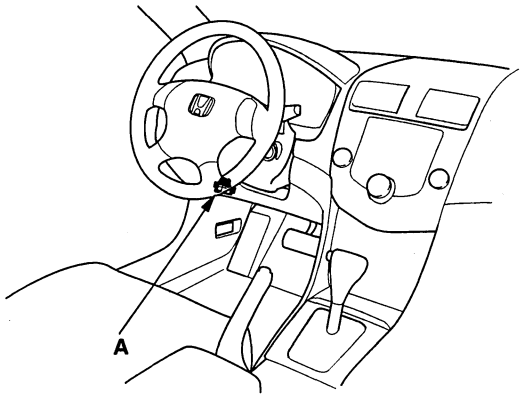
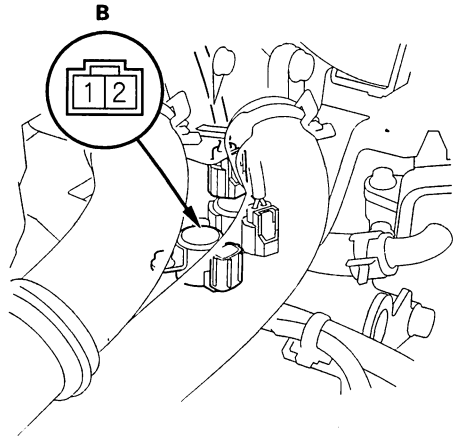
Shift Solenoid Valve B Test

1. Connect the HDS to the DLC (A).



2. Choose Shift Solenoid B in Miscellaneous Test Menu on the HDS.
3. Check that the shift solenoid valve B operates with the HDS. A clicking sound should be heard.
   - If a clicking sound is heard, the valve is OK.
   - If no clicking sound is heard, go to step 4.
4. Remove the intake air duct and air cleaner housing.
5. Disconnect shift solenoid valve B connector.



6. Measure shift solenoid valve B resistance at the solenoid valve connector terminals.

   Standard: 12—25 Ω
7. Replace shift solenoid valve B if the resistance is out of standard (see page 14-167).
8. If the resistance is within the standard, connect the battery negative terminal to shift solenoid valve B connector terminal No. 1, and connect the battery positive terminal to the terminal No. 2.
   - If a clicking sound is heard, the valve is OK.
   - If no clicking sound is heard, replace shift solenoid valve B (see page 14-167).
9. Install the air cleaner housing and intake air duct.

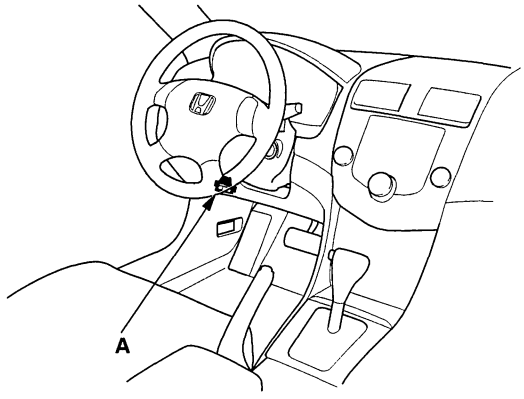
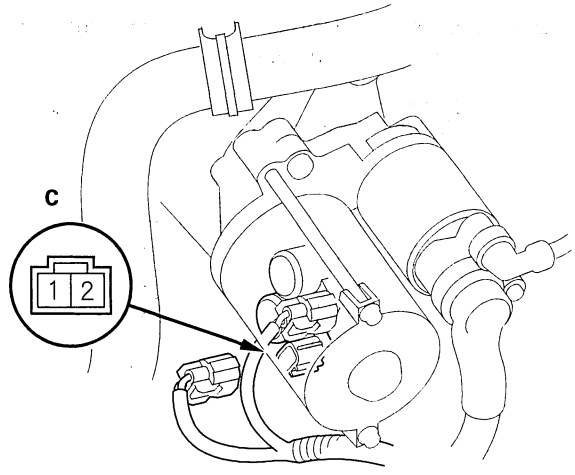
Shift Solenoid Valve C Test

1. Connect the HDS to the DLC (A).



2. Choose Shift Solenoid C in Miscellaneous Test Menu on the HDS.
3. Check that the shift solenoid valve C operates with the HDS. A clicking sound should be heard.
   - If a clicking sound is heard, the valve is OK.
   - If no clicking sound is heard, go to step 4.
4. Get the audio and navigation anti-theft codes, and write down the audio presets.
5. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.
6. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.
7. Remove the intake air duct and air cleaner housing.
8. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.
9. Disconnect shift solenoid valve C connector.



10. Measure shift solenoid valve C resistance at the solenoid valve connector terminals.

    Standard: 12—25 Ω
11. Replace shift solenoid valve C if the resistance is out of standard (see page 14-169).
12. If the resistance is within the standard, connect the battery negative terminal to shift solenoid valve C connector terminal No. 1, and connect the battery positive terminal to the terminal No. 2.
    - If a clicking sound is heard, the valve is OK.
    - If no clicking sound is heard, replace shift solenoid valve C (see page 14-169).
13. Install the battery base, then install the air cleaner housing and intake air duct.
14. Install the battery tray, battery, and battery cover, then secure the battery with its hold-down bracket.
15. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
16. Enter the audio and navigation anti-theft codes, then enter the presets, and set the clock.

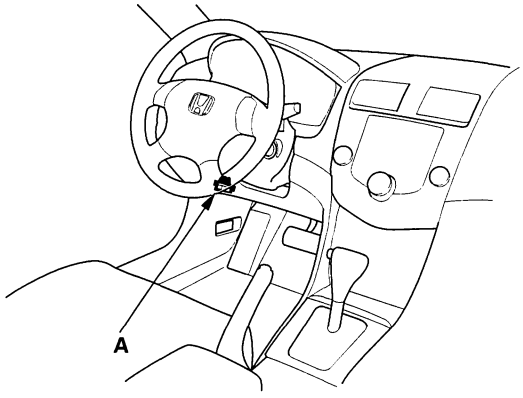
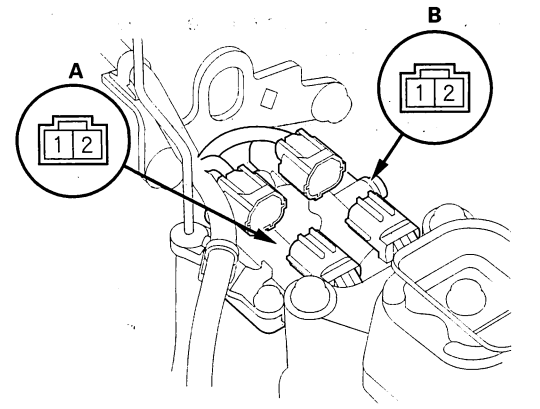
A/T Clutch Pressure Control Solenoid Valve A and B Test

1. Connect the HDS to the DLC (A).



2. Choose Clutch Pressure Control (Linear) Solenoid A and B in *Miscellaneous* Test Menu on the HDS.
3. Test the A/T clutch pressure control solenoid valve A and B with the HDS.
4. Follow instructions on the HDS.
   - If the test results are OK, the valves are OK.
   - If the test results are not OK, go to step 5.
5. Get the audio and navigation anti-theft codes, and write down the audio presets.
6. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.
7. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.
8. Remove the intake air duct and air cleaner housing.
9. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.
10. Disconnect A/T clutch pressure control solenoid valve A connector and solenoid valve B connector.



11. Measure A/T clutch pressure control solenoid valve A and B resistances at each solenoid valve connector.

    Standard: 3—10 Ω
12. If the resistance of either solenoid valve is out of standard, replace A/T clutch pressure control solenoid valve A and B (see page 14-175).
13. If the resistance is within the standard, connect the battery negative terminal to A/T clutch pressure control solenoid valve A and B connector terminal No. 2, and connect the battery positive terminal to the terminal No. 1.
    - If a clicking sound is heard, go to step 24.
    - If no clicking sound is heard, go to step 14 and remove A/T clutch pressure control solenoid valve.

1. Get the audio and navigation anti-theft codes, and write down the audio presets.
2. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.
3. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.
4. Remove the intake air duct and air cleaner housing.
5. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.
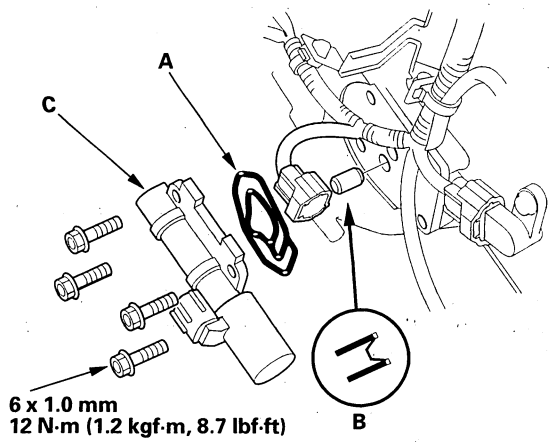
6. Disconnect A/T clutch pressure control solenoid valve C connector.
7. Remove A/T clutch pressure control solenoid valve C.



8. Remove the gasket (A) and 8 x 12 mm ATF feed pipe (B).
9. Check the fluid passage of the A/T clutch pressure control solenoid valve for dust and dirt, and clean the passage if necessary.
10. Install the 8 x 12 mm ATF feed pipe with its filter side into the transmission housing.
11. Install the new gasket in the mounting groove of the A/T clutch pressure control solenoid valve C body properly, then install A/T clutch pressure control solenoid valve C on the transmission housing. Do not pinch the gasket.
12. Check the A/T clutch pressure control solenoid valve C connector for rust, dirt, or oil, then connect it securely.
13. Install the battery base, then install the air cleaner housing and intake air duct.
14. Install the battery tray, battery, and battery cover, then secure the battery with its hold-down bracket.
15. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
16. Enter the audio and navigation anti-theft codes, then enter the presets, and set the clock.
17. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

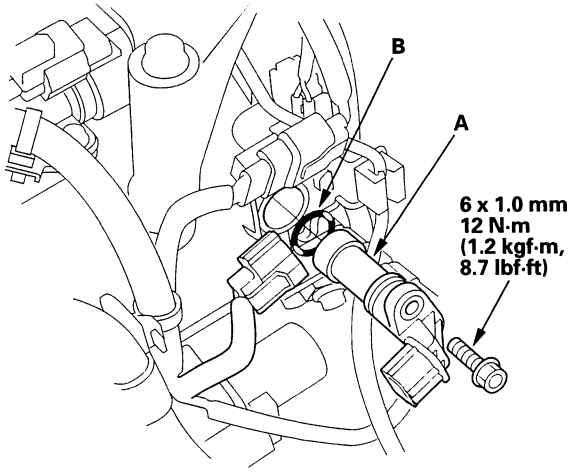
Input Shaft (Mainshaft) Speed Sensor Replacement

1. Get the audio and navigation anti-theft codes, and write down the audio presets.
2. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.
3. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.
4. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.
5. Disconnect input shaft (mainshaft) speed sensor connector.
6. Remove the bolt securing the input shaft (mainshaft) speed sensor, then remove the input shaft (mainshaft) speed sensor (A) from the end cover.

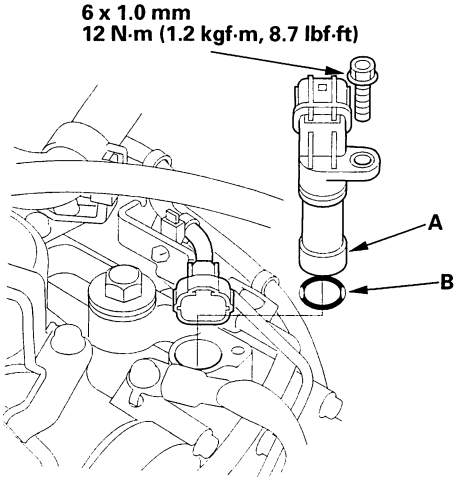


7. Install the new O-ring (B) on the input shaft (mainshaft) speed sensor, then install the input shaft (mainshaft) speed sensor in the end cover. Do not allow dust or foreign particles to enter the transmission.
8. Check the connector for rust, dirt, or oil, then connect the connector securely.
9. Install the battery base and battery, then connect the battery terminals.
10. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
11. Enter the audio and navigation anti-theft codes, then enter the presets, and set the clock.
12. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

Protected by AR

Output Shaft (Countershaft) Speed Sensor Replacement

1. Get the audio and navigation anti-theft codes, and write down the audio presets.
2. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.
3. Unbolt the under-hood fuse/relay box.
4. Reposition the under-hood fuse/relay box to gain access to the output shaft (countershaft) speed sensor.
5. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.
6. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.
7. Disconnect output shaft (countershaft) speed sensor connector.
8. Remove the bolt securing the output shaft (countershaft) speed sensor (A) from the transmission housing.



9. Install the new O-ring (B) on the output shaft (countershaft) speed sensor, then install the output shaft (countershaft) speed sensor in the transmission housing. Do not allow dust or foreign particles to enter the transmission.
10. Check for rust, dirt, or oil, then connect the connector securely.
11. Install the battery base and battery, then connect the battery terminals.
12. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
13. Enter the audio and navigation anti-theft codes, then enter the presets, and set the clock.
14. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

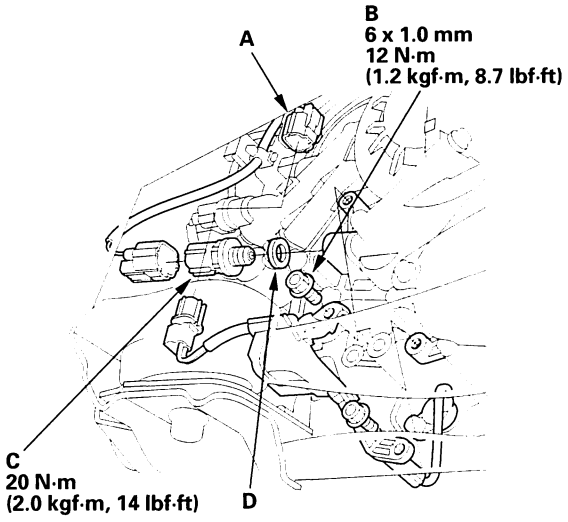
3rd Clutch Transmission Fluid Pressure Switch Replacement

1. Lift the vehicle up on a hoist or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the splash shield.
3. Disconnect the ATF temperature sensor connector (A).

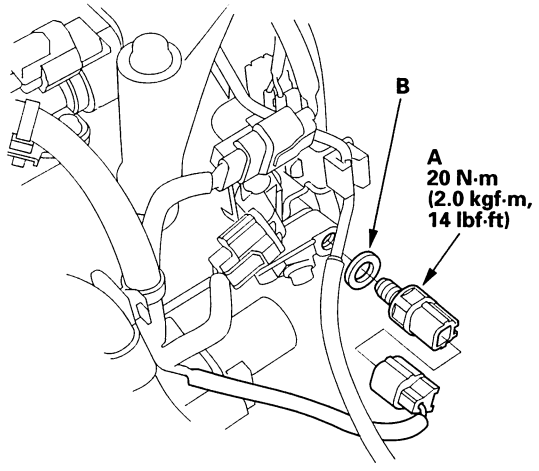


4. Remove ATF temperature sensor harness clamp bolt (B).
5. Disconnect the connector from the 3rd clutch transmission fluid pressure switch (C).
6. Replace the switch, then install a new one with a new sealing washer (D). Tighten the switch on the metal part, not the plastic part.
7. Check the connector for water, oil, dust, or other particles inside it, and connect the connector securely.
8. Install ATF temperature sensor harness clamp bolt, and connect the ATF temperature sensor connector.
9. Install the splash shield.

Protected by AR

4th Clutch Transmission Fluid Pressure Switch Replacement

1. Get the audio and navigation anti-theft codes, and write down the audio presets.
2. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.
3. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.
4. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.
5. Disconnect the connector from the 4th clutch transmission fluid pressure switch (A).



6. Replace the switch, then install a new one with a new sealing washer (B). Tighten the switch on the metal part, not the plastic part.
7. Check the connector for water, oil, dust, or other particles inside it, and connect the connector securely.
8. Install the battery base and battery, then connect the battery terminals.
9. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.
10. Enter the audio and navigation anti-theft codes, then enter the presets, and set the clock.
11. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

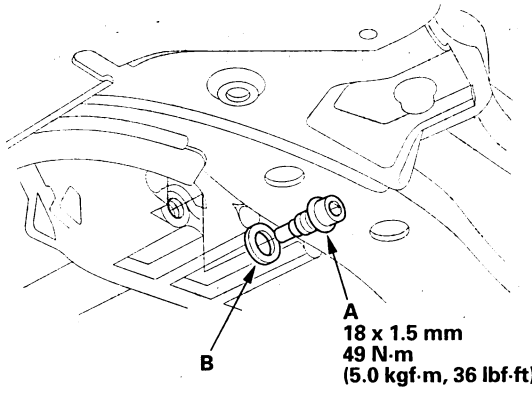
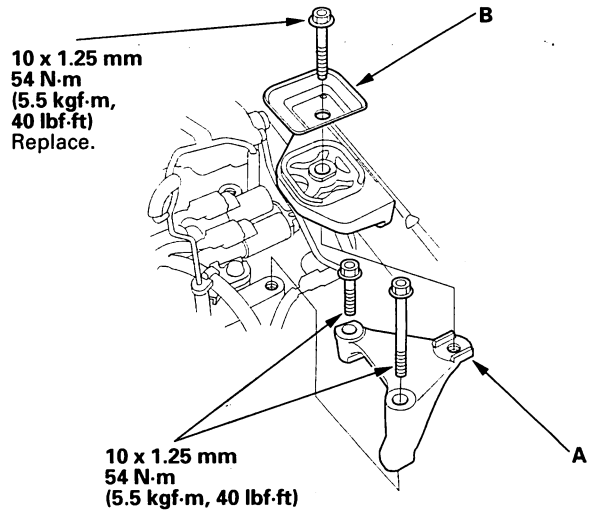
ATF Temperature Sensor Replacement

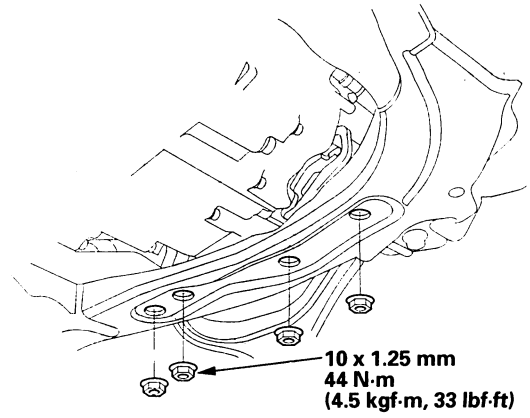
1. Get the audio and navigation anti-theft codes, and write down the audio presets.
2. Lift the vehicle up on a hoist or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
3. Remove the splash shield.
4. Remove the drain plug (A), and drain the automatic transmission fluid (ATF). Then reinstall the drain plug with a new sealing washer (B).



5. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.
6. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.
7. Remove the intake air duct and air cleaner housing.
8. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.
9. Remove the transmission upper mount bracket (A) and bracket plate (B).



10. Place the transmission jack under the transmission, and remove the transmission lower mount nuts.



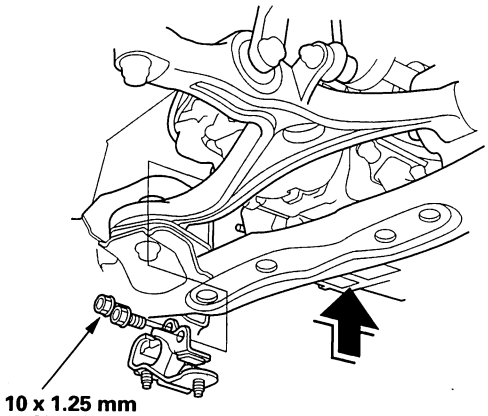
(cont'd)

Protected by AR

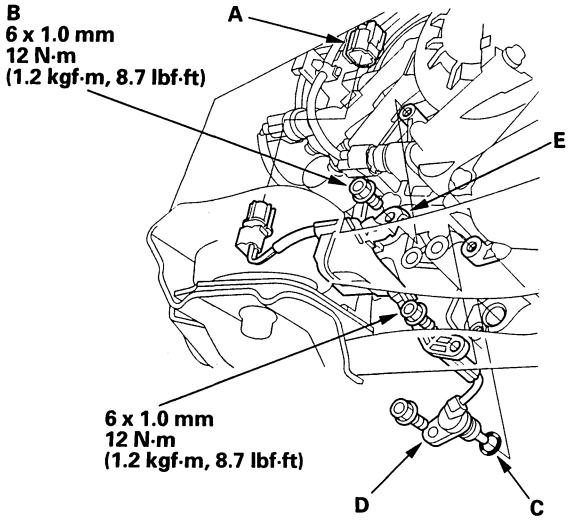
ATF Temperature Sensor Replacement (cont'd)

11. Lift the transmission up to create clearance between the transmission and front subframe with the jack.

12. Remove the transmission lower front mount.



13. Disconnect the ATF temperature sensor connector (A).



14. Remove ATF temperature sensor harness clamp bolt (B), then remove the sensor.

15. Install the new O-ring (C) on the new ATF temperature sensor (D), then install the sensor.

16. Secure the ATF temperature sensor harness clamp (E) with the bolts.

17. Check the connector for rust, dirt, or oil, then connect the connector securely.

18. Install the transmission lower front mount.

19. Install the transmission lower mount nuts.

20. Install the transmission upper mount bracket, bracket plate, and remove the transmission jack.

21. Refill the transmission with ATF (see step 5 on page 14-186).

22. Install the battery base, then install the air cleaner housing and intake air duct.

23. Install the battery tray, battery, and battery cover, then secure the battery with its hold-down bracket.

24. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.

25. Install the splash shield.

26. Enter the audio and navigation anti-theft codes, then enter the presets, and set the clock.

27. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

BACK

Protected by AR

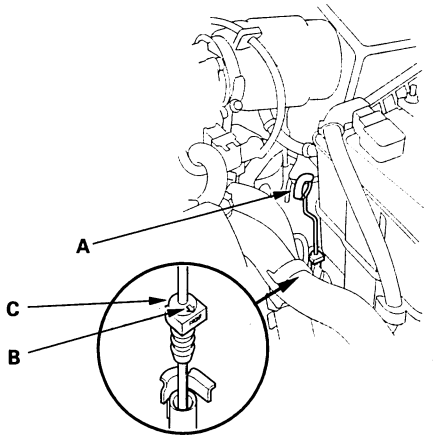
ATF Level Check

NOTE: Keep all foreign particles out of the transmission.

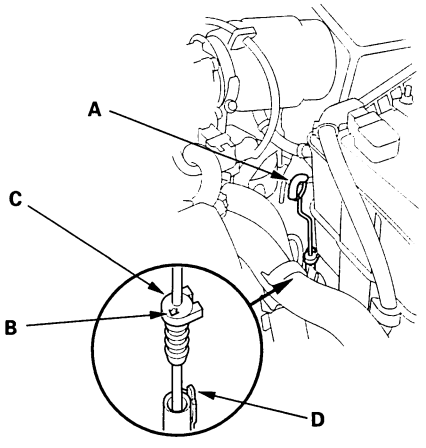
1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Park the vehicle on level ground, and turn the engine off.

   NOTE: Check the fluid level within 60—90 seconds after turning the engine off.

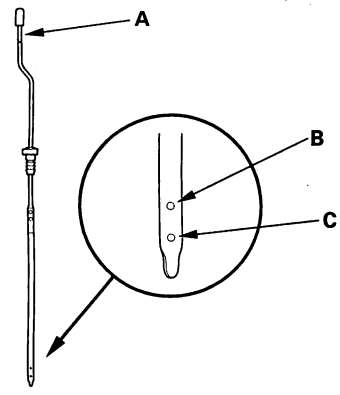
3. Remove the dipstick (yellow loop) from the ATF dipstick guide pipe, and wipe it with a clean cloth.
4. For 2003 model: Insert the dipstick (A) back with pointing the arrow (B) on the cap (C) to the front of the vehicle.



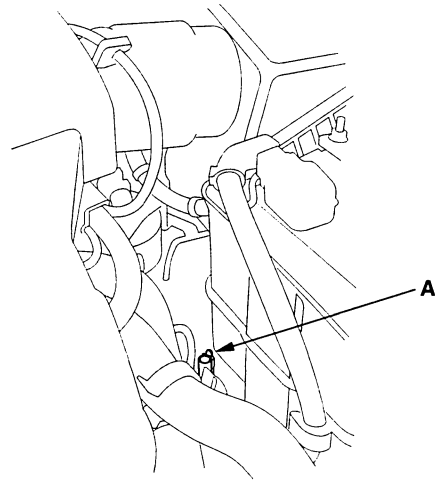
5. For 2004-2006 models: Insert the dipstick (A) back with pointing the arrow (B) on the cap (C) to the front of the vehicle, and aligning the notch on the cap with the guide tab (D).



6. Remove the dipstick (A) and check the fluid level. It should be between upper mark (B) and lower mark (C).



7. If the level is below the lower mark, check for fluid leaks at the transmission, hose and line joints.
   If a problem is found, fix it before filling the transmission.
   If the level is above the upper mark, drain the ATF to proper level (see step 3 on page 14-186).
8. If necessary fill the transmission through the dipstick guide pipe opening (A) to bring the fluid level up to the upper mark. Always use Honda ATF-Z1 Automatic Transmission Fluid (ATF). Using a non-Honda ATF can affect shift quality.



9. Insert the dipstick back into the dipstick guide pipe.

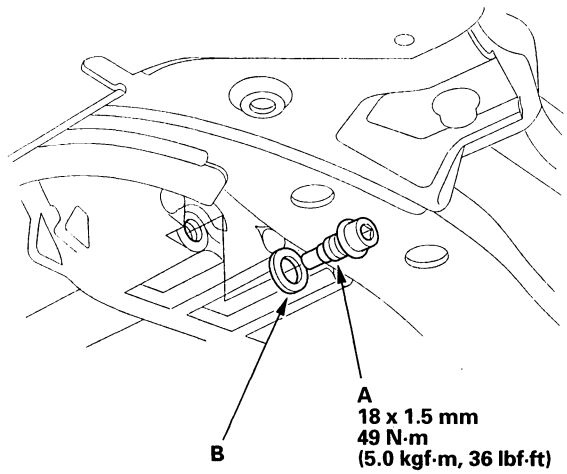
BACK

Protected by AR

ATF Replacement

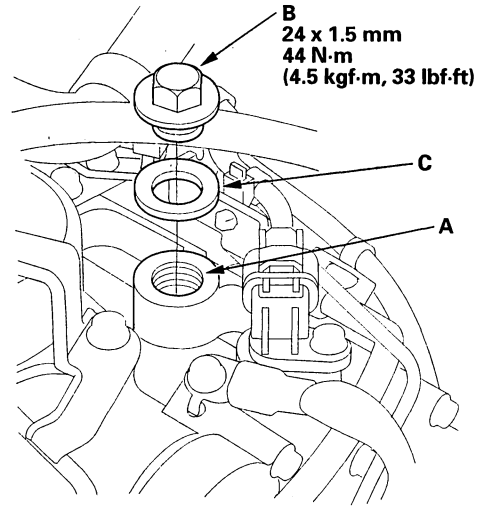
NOTE: Keep all foreign particles out of the transmission.

1. Bring the transmission up to normal operating temperature (the radiator fan comes on).
2. Park the vehicle on level ground, and turn the engine off.
3. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).



4. Reinstall the drain plug with a new sealing washer (B).
5. Refill transmission with the recommended fluid into the filler hole (A) to the upper mark on the dipstick. Always use Honda ATF-Z1 Automatic Transmission Fluid (ATF). Using a non-Honda ATF can affect shift quality.

Automatic Transmission Fluid Capacity:
3.0 L (3.2 US qt) at change
7.0 L (7.4 US qt) at overhaul



6. Install the ATF filler bolt (B) with a new sealing washer (C).

BACK

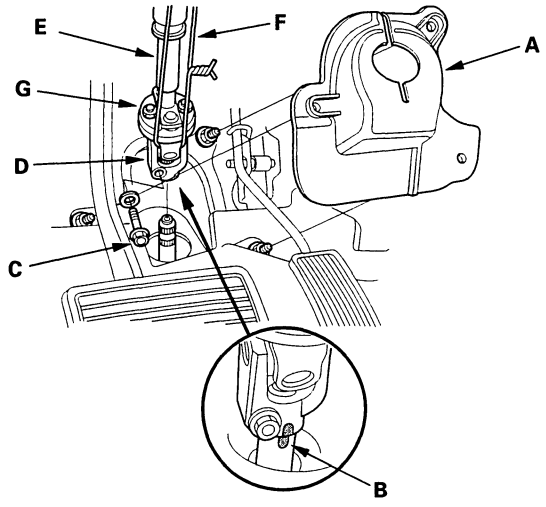
Transmission Removal

Special Tools Required
- Engine support hanger, A and Reds AAR-T-12566
- Engine hanger balancer bar VSB02C000019
- Front subframe adapter VSB02C000016

These special tools are available through the Honda Tool and Equipment Program 1-888-424-6857.

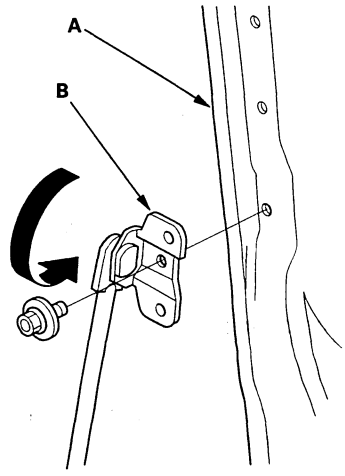
NOTE:
- Use fender covers to avoid damaging painted surfaces.
- Special tool Reds engine support hanger AAR-T-12566 must be used with the side engine mount installed.

1. Get the audio and navigation anti-theft codes, and write down the audio presets.
2. Set the wheels in the straight ahead position.
3. Lock the steering wheel.
4. Drain the power steering system fluid from the reservoir (see page 17-12).
5. Remove the steering joint cover (A).

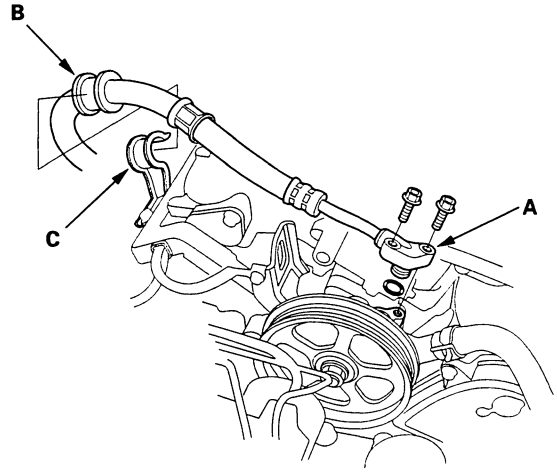


6. Make a reference mark (B) across the steering joint and steering gearbox pinion shaft. Remove the steering joint bolt (C), and disconnect the steering joint (D) by removing the steering joint toward the steering column. Hold the slider shaft (E) on the column with a peace of wire (F) between the joint yoke (G) on the slider shaft to the joint yoke on the upper shaft, refer to the 2003-2006 Accord Service Manual (see step 8 on page 17-25).
7. Remove the bolts securing the support strut brackets on the both side hood. Secure the hood (A) in a vertical position, then install the right strut bracket (B) by turning it over with its bolt in lower position.

   NOTE: Do not attempt to close the hood with the support strut in the vertical position; it will damage the support strut and hood.



8. Raise the vehicle, and make sure it is supported securely.
9. Remove the splash shield.
10. Remove the power steering pump outlet line (A) from the power steering pump. Wipe off any spilled fluid at once.



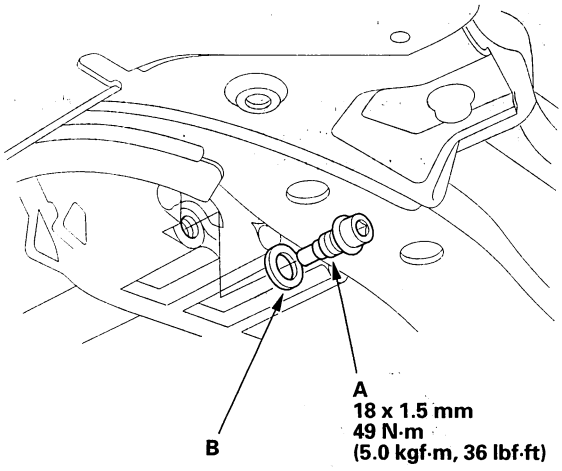
11. Remove the hose (B) from its clamp (C).

(cont'd)

Protected by AR

Transmission Removal (cont'd)

12. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).



13. Reinstall the drain plug with a new sealing washer (B).

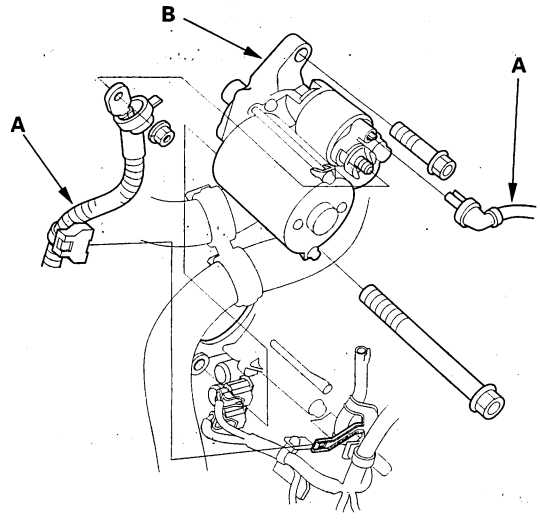
14. Disconnect the negative cable from the battery, then disconnect the positive cable from the battery.

15. Remove the battery hold-down bracket, then remove the battery cover, battery, and battery tray.

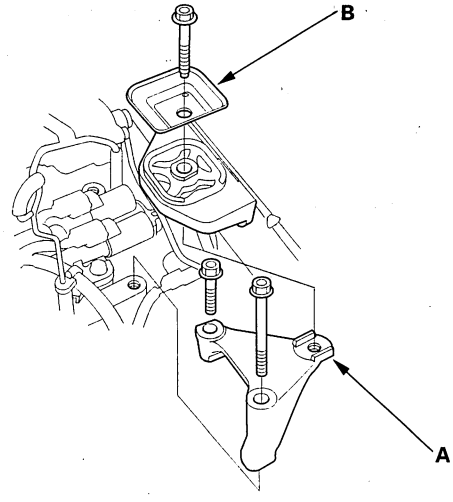
16. Remove the intake air duct and air cleaner housing.

17. Loosen the two bolts securing the battery base from under the vehicle, and remove the two bolts securing the battery base in the engine compartment, then remove the battery base.

18. Remove the starter cables (A) from the starter (B), then remove the starter.



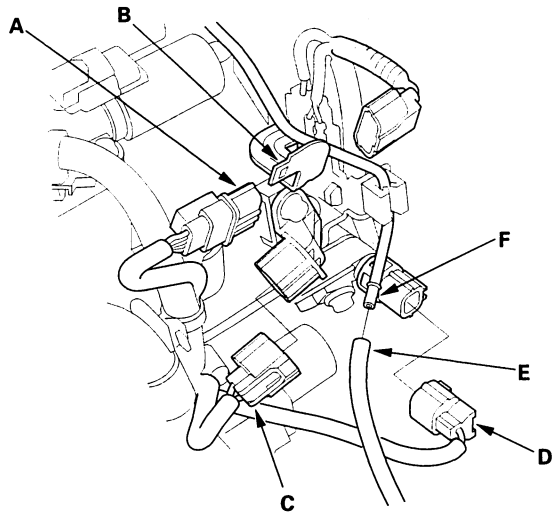
19. Remove the transmission upper mount bracket (A) and bracket plate (B).



BACK

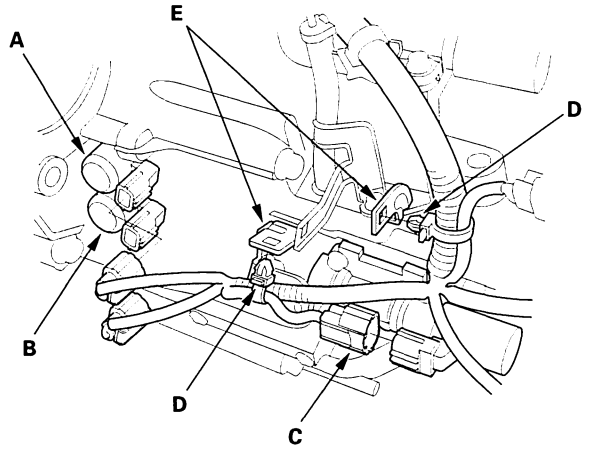
Protected by AR

20. Remove the transmission sub harness connector (A) from its bracket (B), then disconnect it.

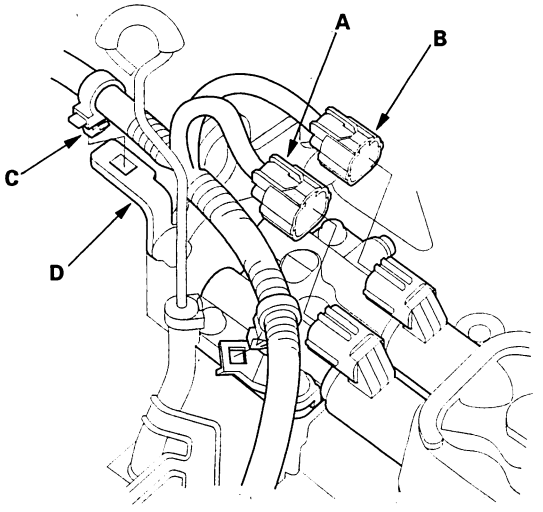


21. Disconnect the input shaft (mainshaft) speed sensor connector (C) and 4th clutch transmission fluid pressure switch connector (D), and disconnect the vacuum hose (E) from the vacuum line (F).

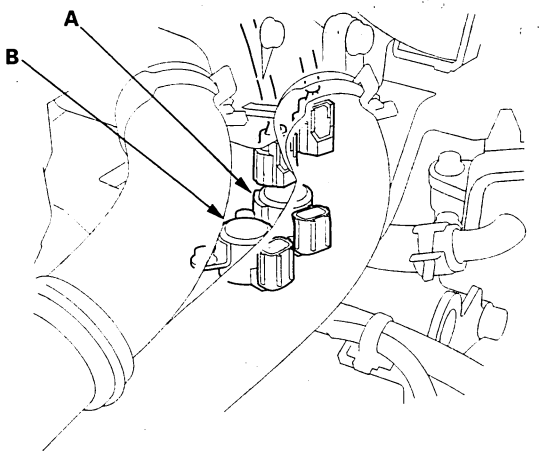
22. Disconnect shift solenoid valve A connector, solenoid valve C connector, and A/T clutch pressure control solenoid valve C connector (B), and remove the harness clamps (D) from the clamp brackets (E).



23. Disconnect the A/T clutch pressure control solenoid valve A connector, and solenoid valve B connector, and remove the harness clamp (C) from the clamp bracket (D).



24. Disconnect the connectors from the torque converter clutch solenoid valve (A) and shift solenoid valve B.

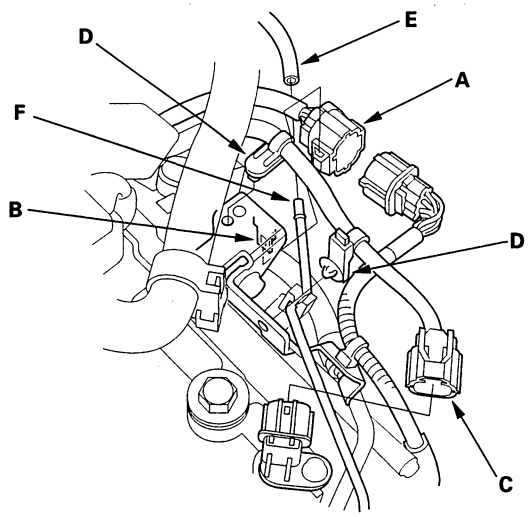


(cont'd)

Protected by AR

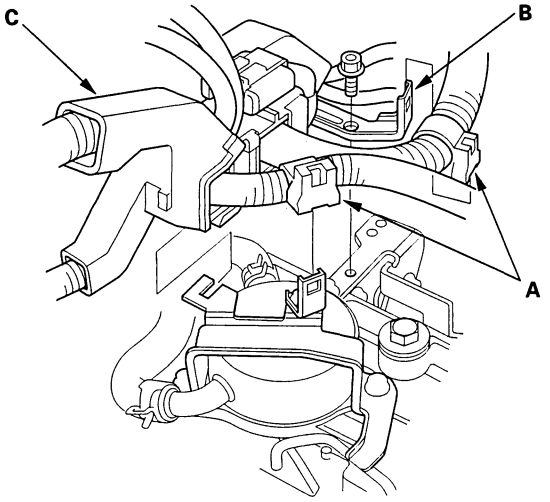
Transmission Removal (cont'd)

25. Remove the transmission range switch connector (A) from its bracket (B), and disconnect it.

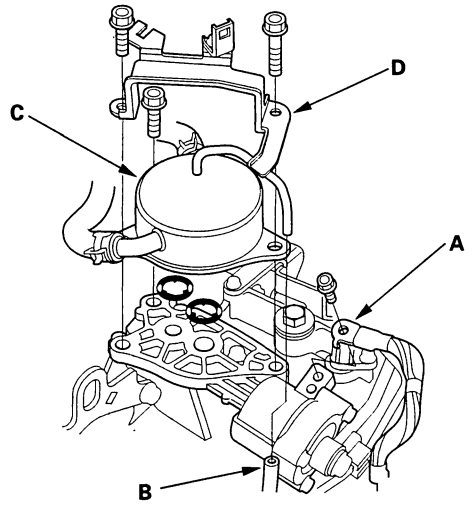


26. Disconnect the output shaft (countershaft) speed sensor connector (C), and remove the harness clamps (D) from the brackets. Disconnect the vacuum hose (E) from the vacuum line (F).

27. Remove the harness clamps (A) from the brackets, and remove the bolt securing the bracket.



28. Remove the transmission ground cable (A), and disconnect the breather tube (B).



29. Put a shop rags around the ATF warmer (C) to remove the ATF that flows out.

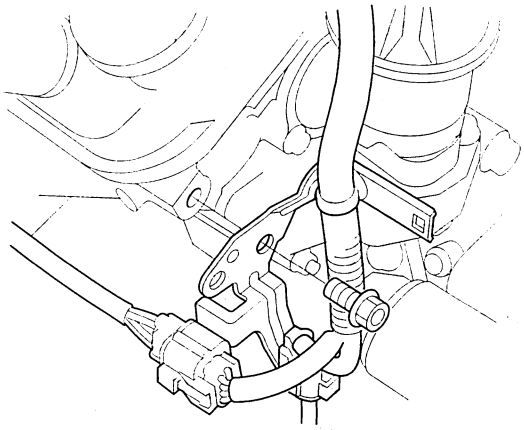
30. Remove the bolts securing the ATF warmer and the bracket (D), then remove the ATF warmer from the transmission housing. Cover the fluid passages on the transmission and ATF warmer with tape. Do not disconnect the hoses.

    NOTE: Replace the ATF warmer with a new one whenever the transmission assembly is replaced.

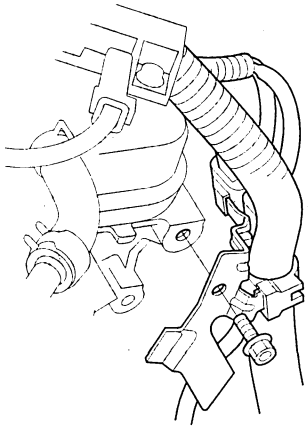
BACK

Protected by AR

31. Remove the connector bracket from the engine front cylinder head; use the bracket bolt hole to attach engine balancer bar front arm.

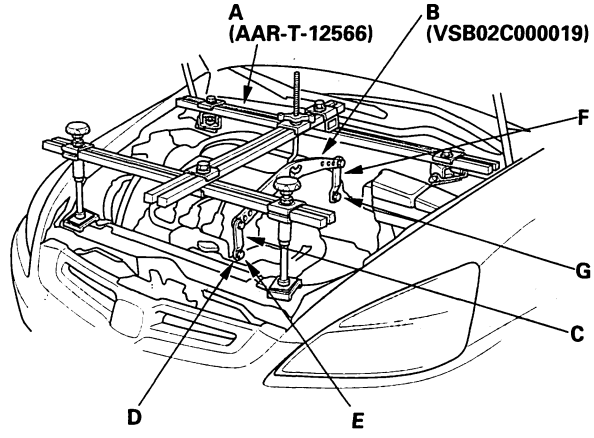


32. Remove the harness clamp bracket from the engine rear cylinder head; use the bracket bolt hole to attach engine balancer bar rear arm.



33. Remove the front bulkhead cover, refer to the 2003-2006 Accord Service Manual (see step 1 on page 20-197).

34. Lift and support the engine with engine support hanger (A) and engine balance bar (B).
Attach the front arm (C) to the front cylinder head with a spacer (D) and the 10 x 1.25 mm bolt (E).
Attach the rear arm (F) to the rear cylinder head with the 8 x 1.25 mm bolt (G).

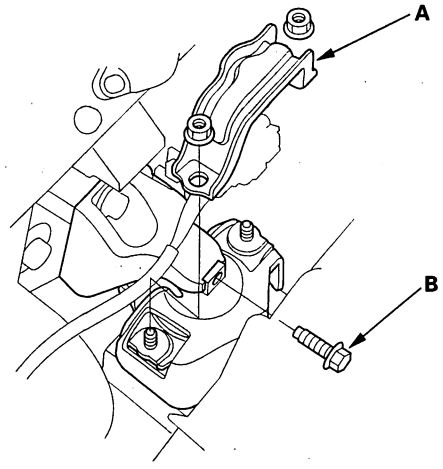


(cont'd)

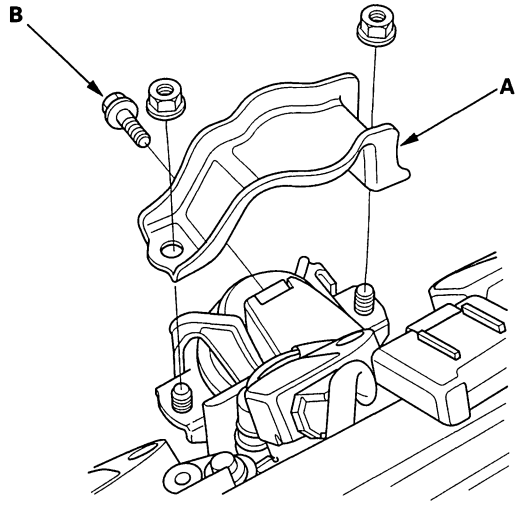
Protected by AR

Transmission Removal (cont'd)

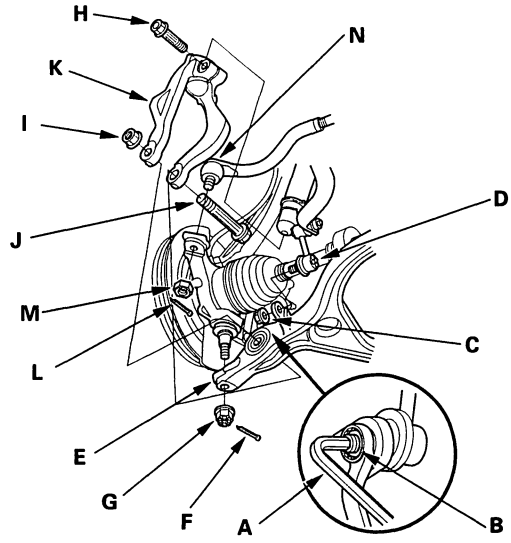
35. Remove the front mount stop (A), and remove the front mount bolt (B).



36. Remove the rear mount stop (A), and remove the rear mount bolt (B).



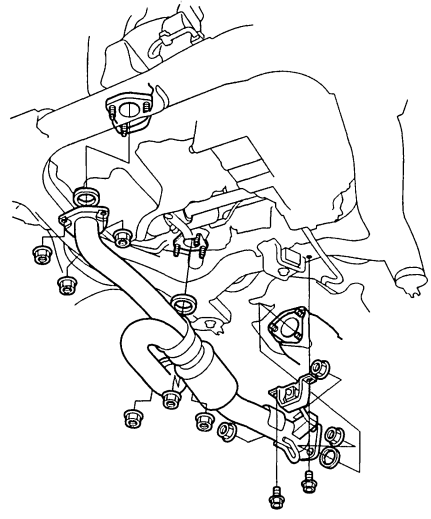
37. Insert a 6 mm Allen wrench (A) in the top of the ball joint pin (B), and remove the nuts (C), then separate the stabilizer link (D) from the lower arms (E).



38. Remove the cotter pins (F), castle nuts (G), damper pinch bolt (H), self-locking nut (I), bolt (J), and damper forks (K), then separate the ball joints from the lower arms, refer to the 2003-2006 Accord Service Manual (see page 18-11).

39. Remove the cotter pins (L), and nuts (M), and separate the tie-rod end ball joints (N) from the knuckles, refer to the 2003-2006 Accord Service Manual (see step 10 on page 18-14).

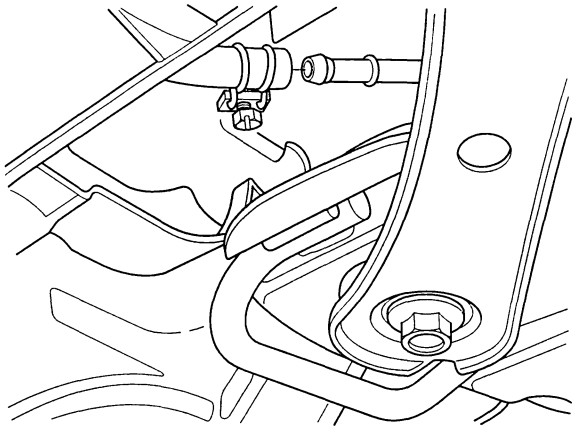
40. Remove the exhaust pipe A and its mount.



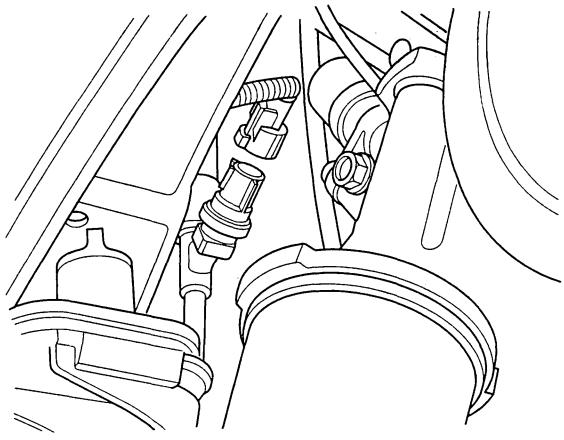
BACK

Protected by AR

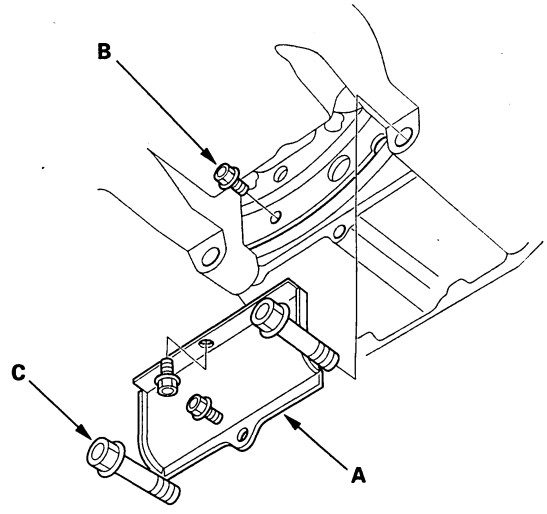
41. Remove the power steering fluid hose from its line on the front subframe.



42. Disconnect the power steering pressure switch connector.



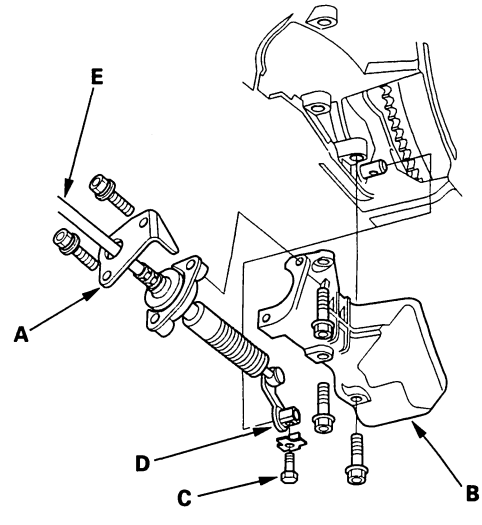
43. Remove the torque converter cover (A), and remove the drive plate bolts (B) while rotating the crankshaft pulley.



44. Remove the engine-to-torque converter housing mounting bolts (C).

45. Remove the bolts securing shift cable holder (A), then remove shift cable cover (B).

NOTE: To prevent damage to the control lever joint, remove the bolts securing the holder before removing the bolts securing the cover.



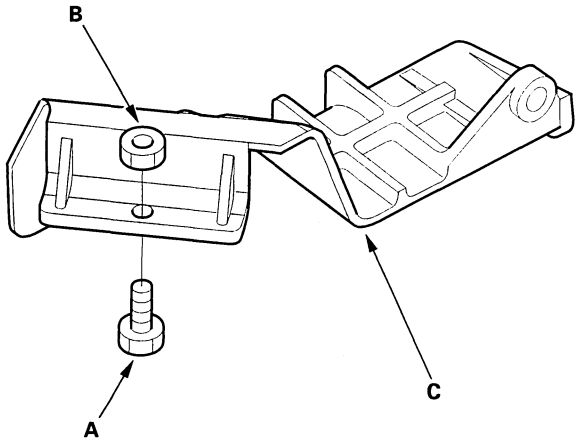
46. Remove the lock bolt (C) securing the control lever (D), then remove the shift cable (E) and the control lever. Do not bend the shift cable excessively.

(cont'd)

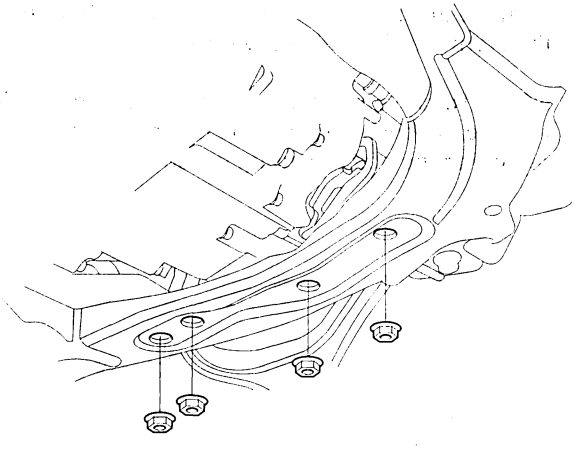
Protected by AR

Transmission Removal (cont'd)

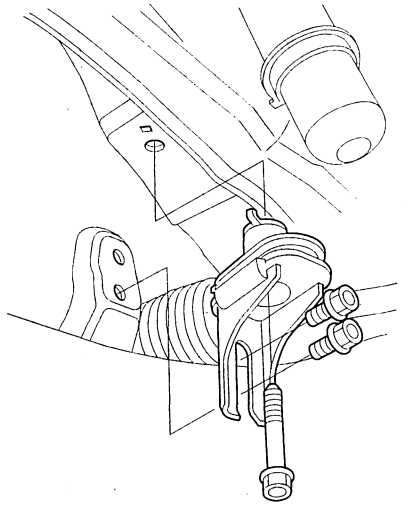
47. Install a 6 x 1.0-14 mm bolt (A) and nut (B) on the shift cable cover (C), then reinstall the shift cable cover to the torque converter housing. If you don't do this, the bolt head of the cable cover may prevent you from removing the torque converter during transmission removal.



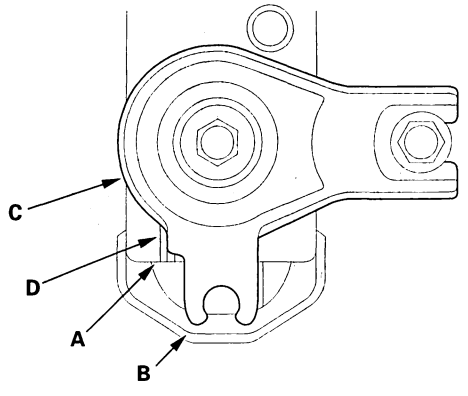
48. Remove the transmission lower mount nuts.



49. Remove both middle-mounts.



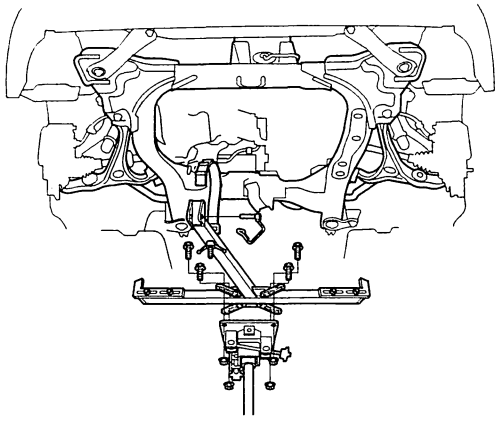
50. Make the appropriate reference lines (A) at both ends of the subframe (B) that line up with the edge (C) of the stiffeners (D).



BACK

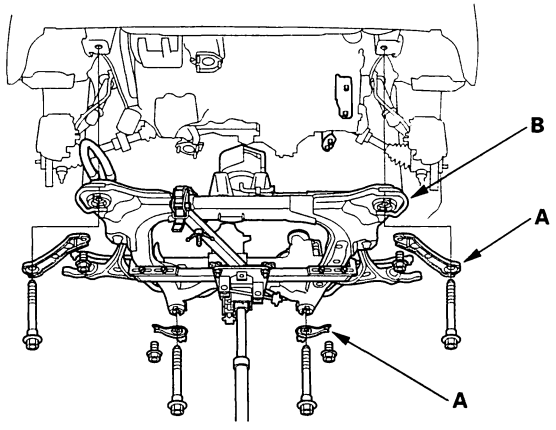
Protected by AR

51. Attach the special tool to the subframe by hanging the belt of the special tool over the front of the subframe, then secure the belt with its stop.

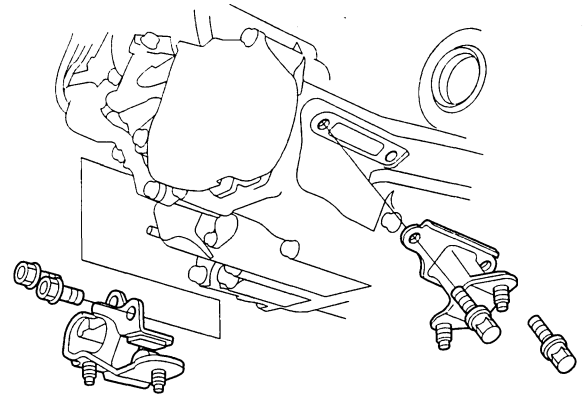


52. Raise the jack and line up the slots in the arms with the bolt holes on the corner of the jack base, then attach them with bolts securely.

53. Remove the four bolts securing the stiffeners (A), and four bolts securing the front subframe (B), and lower the front subframe.

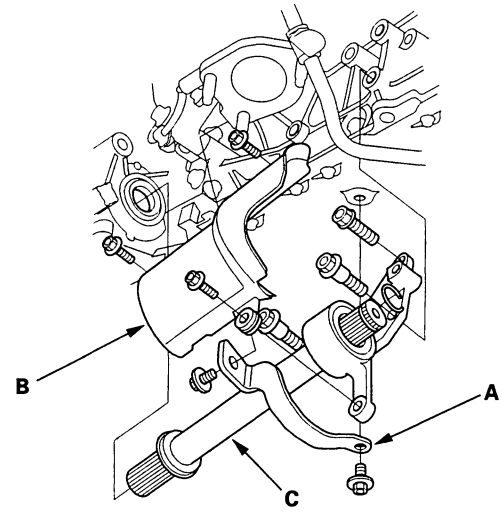


54. Remove the transmission lower mounts.



55. Remove the driveshafts from the differential and intermediate shaft (see step 10 on page 16-5).

56. Remove the exhaust manifold bracket (A) and heat shield (B).



57. Remove the intermediate shaft (C).

58. Coat all precision finished surfaces with clean engine oil, then tie plastic bags over both ends of the driveshaft and the intermediate shaft.

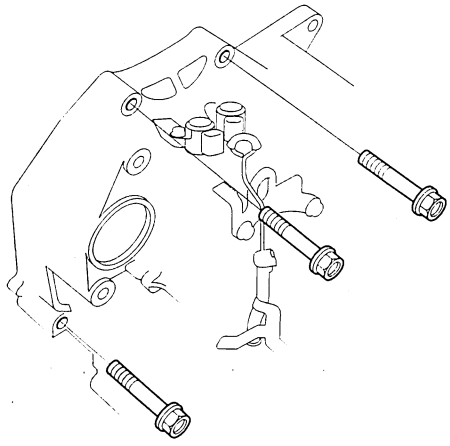
(cont'd)

Protected by AR

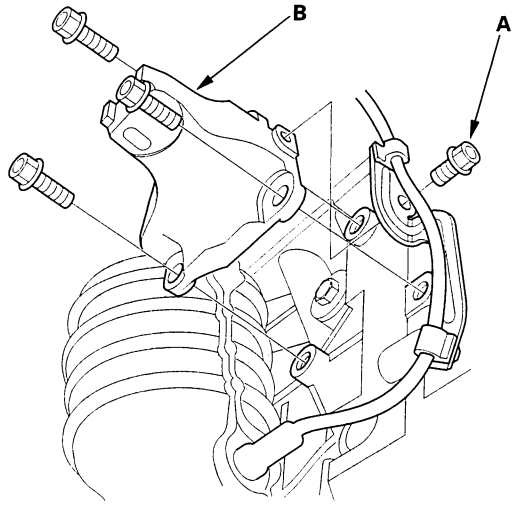
Transmission Removal (cont'd)

59. Place a jack under the transmission.

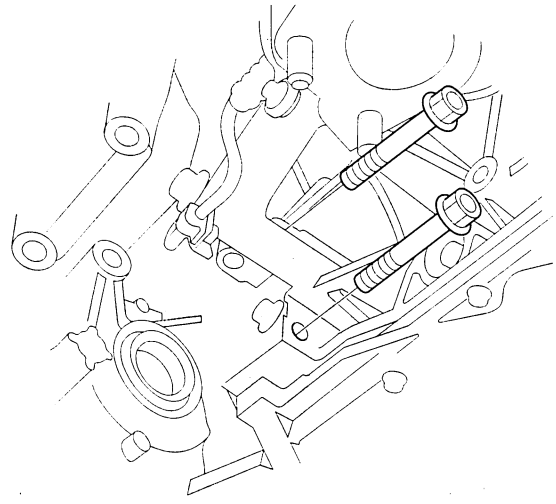
60. Remove the upper and front transmission housing mounting bolts.



61. Remove the bolt (A) securing the harness clamp bracket, and remove the front mount bracket (B).

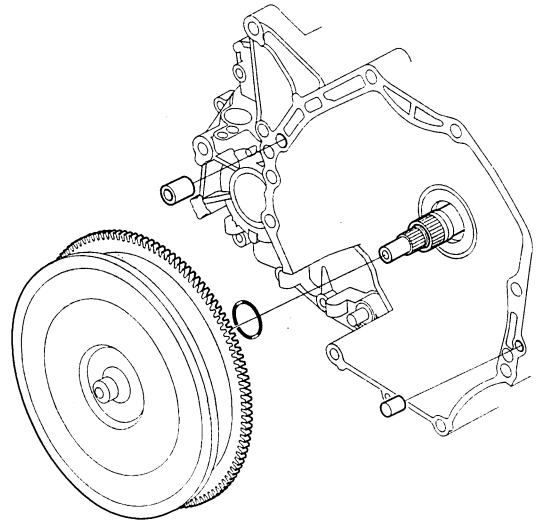


62. Remove the rear transmission housing mounting bolts.



63. Slide the transmission away from the engine to remove it from the vehicle.

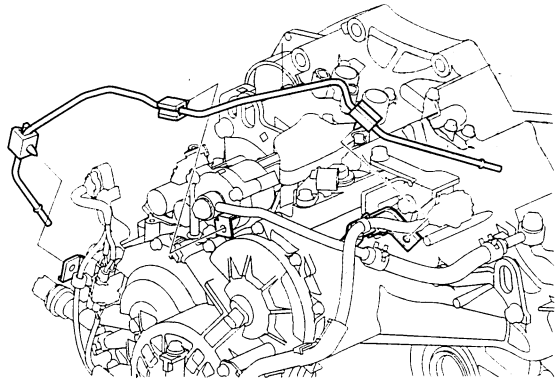
64. Remove the shift cable cover, then remove the torque converter.



BACK

Protected by AR

65. Remove the vacuum line from the transmission.

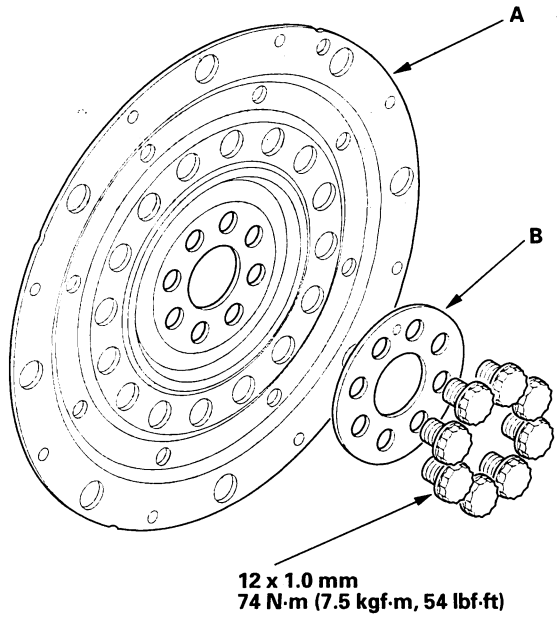


66. Remove the 6 x 1.0-14 mm bolt and nut that you installed on the shift cable cover in step 47.

67. Inspect the drive plate, and replace it if it's damaged.

Drive Plate Removal and Installation

1. Remove the transmission assembly (see page 14-187).
2. Remove the drive plate (A) and washer (B) from the engine crankshaft.



3. Install the drive plate and washer on the engine crankshaft, and tighten the eight bolts in a crisscross pattern in two or more steps.

4. Install the transmission assembly (see page 14-198).

Protected by AR

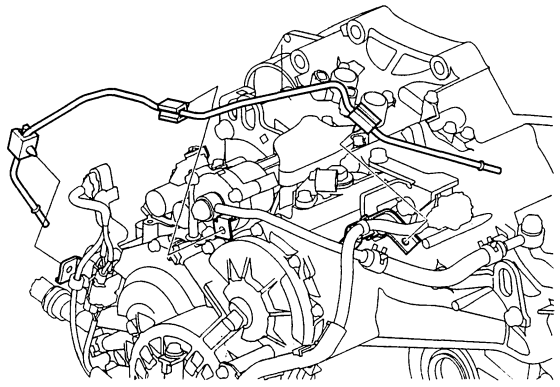
Transmission Installation

Special Tools Required
- Engine support hanger, A and Reds AAR-T-12566
- Engine hanger balancer bar VSB02C000019
- Front subframe adapter VSB02C000016

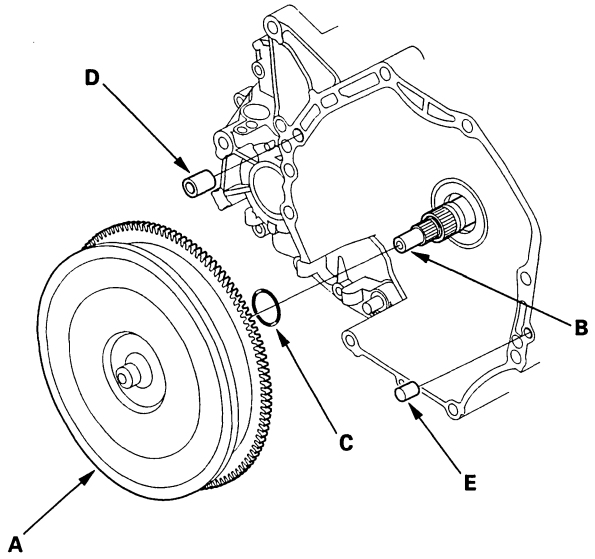
These special tools are available through the Honda Tool and Equipment Program 1-888-424-6857.

NOTE:
- Use fender covers to avoid damaging painted surfaces.
- Replace the ATF warmer with a new one whenever the transmission assembly is replaced.

1. Install the vacuum line on the transmission.



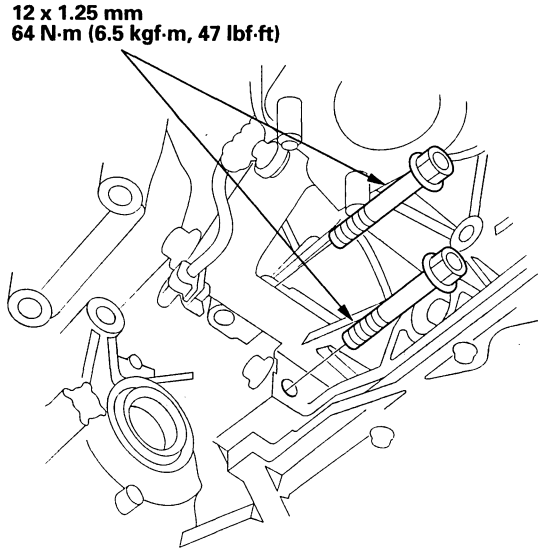
2. Install the torque converter assembly (A) on the mainshaft (B) with the new O-ring (C).



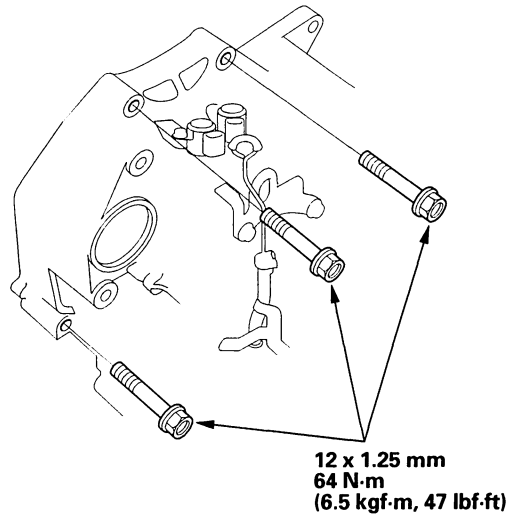
3. Install the 14 x 20 mm dowel pin (D) and 10 x 20 mm dowel pin (E) in the torque converter housing.

4. Place the transmission on the jack, and raise the transmission to the engine level.

5. Attach the transmission to the engine, then install the rear transmission housing mounting bolts.



6. Install the upper and front transmission housing mounting bolts.

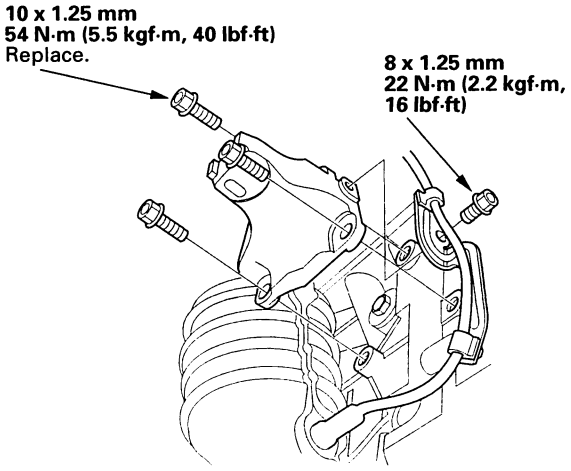


7. Remove the jack from the transmission.

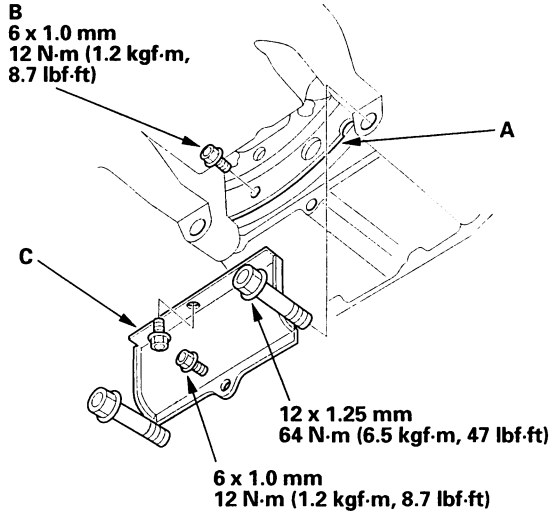
BACK

Protected by AR

8. Install the front mount bracket with the new bolts, and install the harness clamp on the mount bracket.



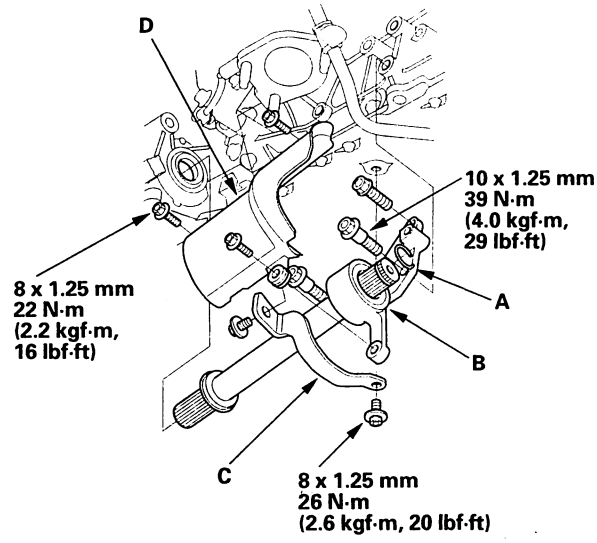
9. Install the engine-to-torque converter housing mounting bolts.



10. Attach the torque converter to the drive plate (A) with eight bolts (B). Rotate the crankshaft pulley as necessary to tighten the bolts to 1/2 of the specified torque, then to the final torque, in a crisscross pattern. After tightening the last bolt, check that the crankshaft rotates freely.

11. Install the torque converter cover (C).

12. Install the new set ring (A) on the intermediate shaft (B).



13. Install the exhaust manifold bracket (C) and heat shield (D).

14. Install the new set ring on the left driveshaft, then install the left driveshaft in the differential (see page 16-20). While installing the driveshaft in the differential, be sure not to allow dust or other foreign particles to enter the transmission. Install the left driveshaft over the intermediate shaft.

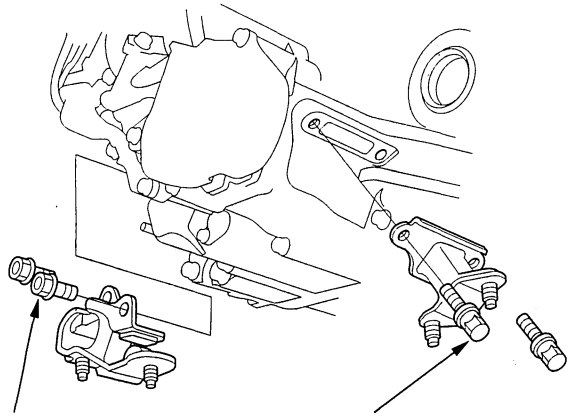
NOTE:
- Clean the areas where the driveshaft and intermediate shaft contact the transmission (differential) with solvent or carburetor cleaner, and dry with compressed air.
- Turn the right and left steering knuckle fully outward, and slide the driveshaft and intermediate shaft into the differential and intermediate shaft until you feel its set ring engage the side gear.

(cont'd)

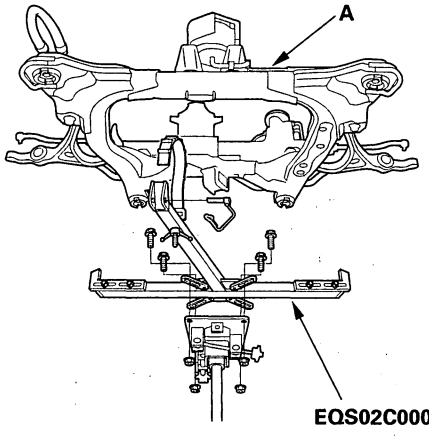
Protected by AR

Transmission Installation (cont'd)

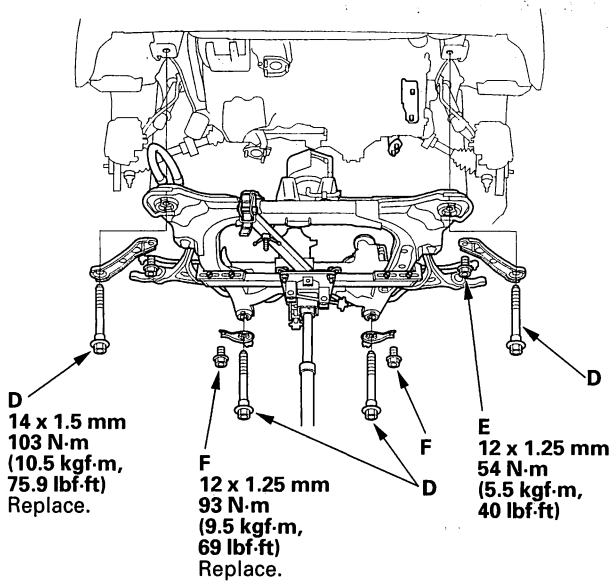
15. Install the transmission lower mounts.



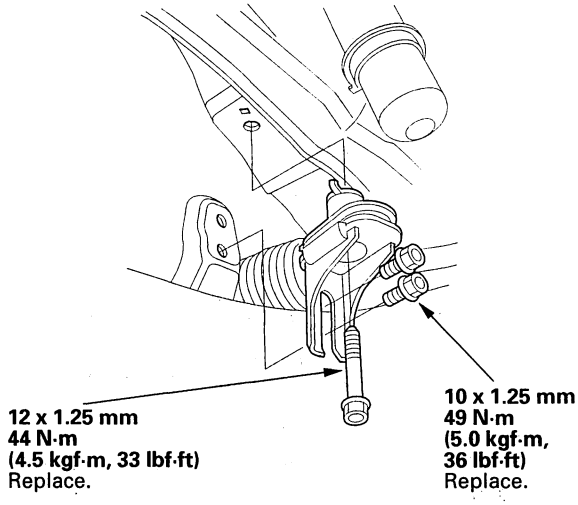
16. Support the front subframe (A) with the special tool and a jack, and lift it up to body.



17. Loosely install the new subframe mounting bolts (D), stiffener mounting bolts (E), and new stiffener mounting bolts (F).



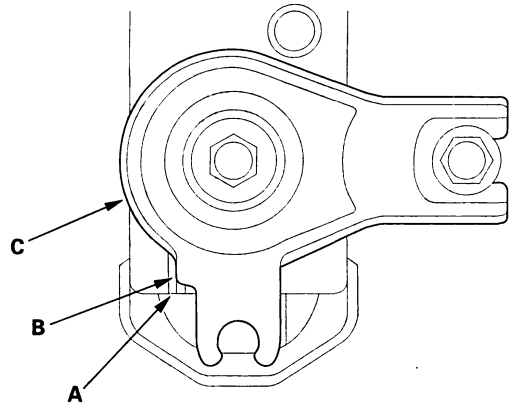
18. Loosely install both of the new middle-mount mounting bolts.



BACK

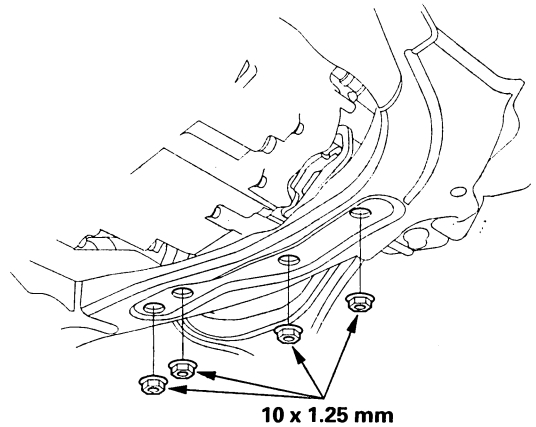
Protected by AR

19. Align the reference marks (A) with edge (B) of both rear stiffener (C), and tighten the rear subframe mounting bolts, then front bolts, and tighten the stiffener bolts to the specified torque.

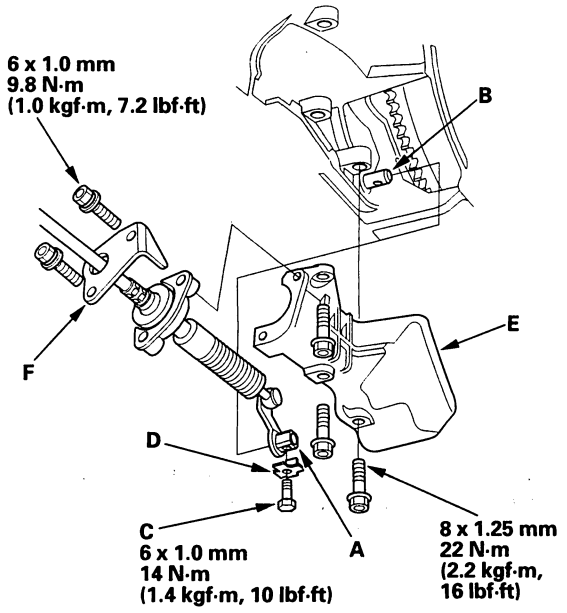


20. Tighten the mid-mount mounting bolts.

21. Install the transmission lower mount nuts.



22. Install control lever (A) on the selector control shaft (B). Do not bend the shift cable excessively.

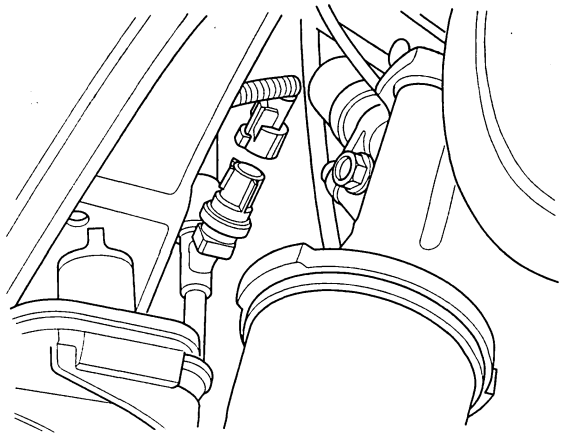


23. Install the lock bolt (C) with a new lock washer (D), then bend the lock washer tab against the bolt head.

24. Install the shift cable cover (E), then secure the shift cable holder (F) on the cover with the bolts.

    NOTE: To prevent damage to the control lever joint, be sure install the shift cable holder after installing the shift cable cover to the torque converter housing.

25. Connect the power steering pressure switch connector.



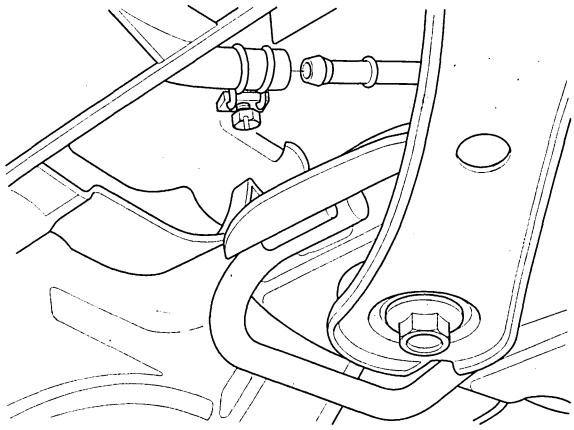
(cont'd)

BACK

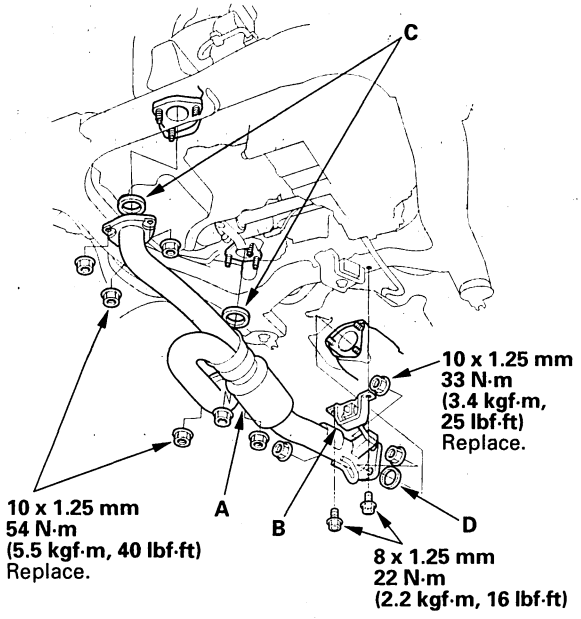
Protected by AR

Transmission Installation (cont'd)

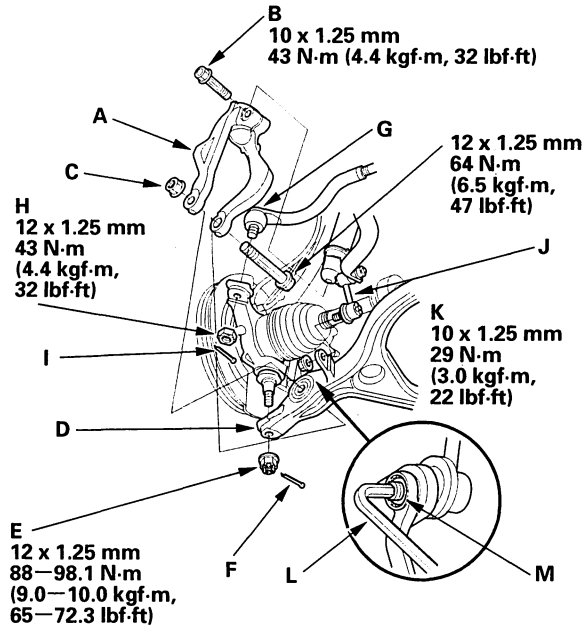
26. Connect the power steering fluid hose to the power steering line on the front subframe.



27. Install the exhaust pipe A with the new self-locking nuts, its mount (B), and new gaskets (C) (D).



28. Install the damper forks (A) with damper pinch bolts (B) and the new self-locking nuts (C), then install the ball joints on the lower arms (D) with the castle nuts (E) and new cotter pins (F), refer to the 2003-2006 Accord Service Manual (see step 17 on page 18-15).



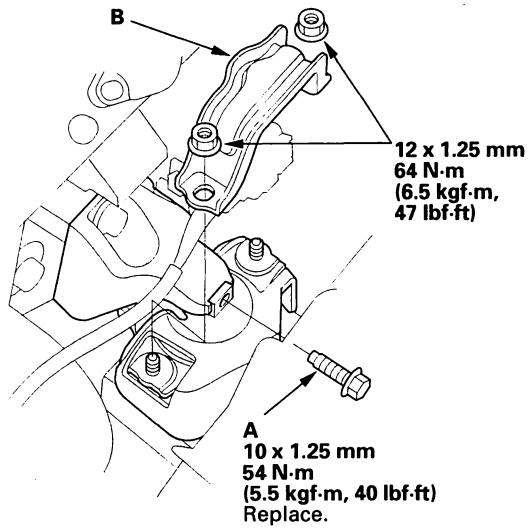
29. Install the tie-rod end ball joints (G) to each knuckle with the nuts (H) and new cotter pins (I), refer to the 2003-2006 Accord Service Manual (see step 17 on page 18-15).

30. Install the stabilizer links (J) to the lower arms, and install the nuts (K). Insert a 6 mm Allen wrench (L) in the ball joint pin (M), and tighten the nuts.

BACK

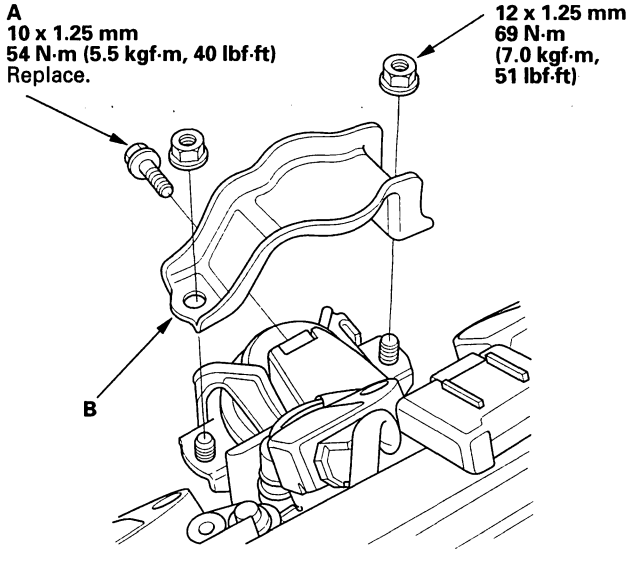
Protected by AR

31. Install the new front mount bolt (A).



32. Install the front mount stop (B).

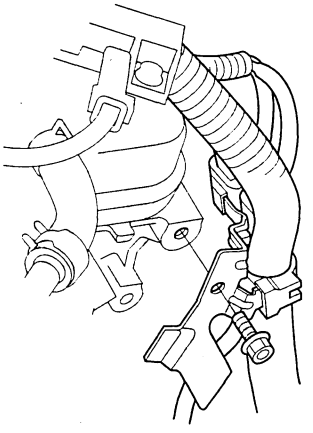
33. Install the new rear mount bolt (A).



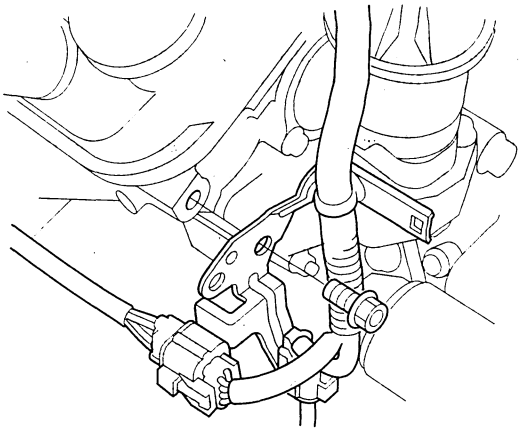
34. Install the rear mount stop (B).

35. Remove the engine hanger and engine balancer bar.

36. Install the harness clamp bracket to the engine rear cylinder head.



37. Install the connector bracket to the engine front cylinder head.

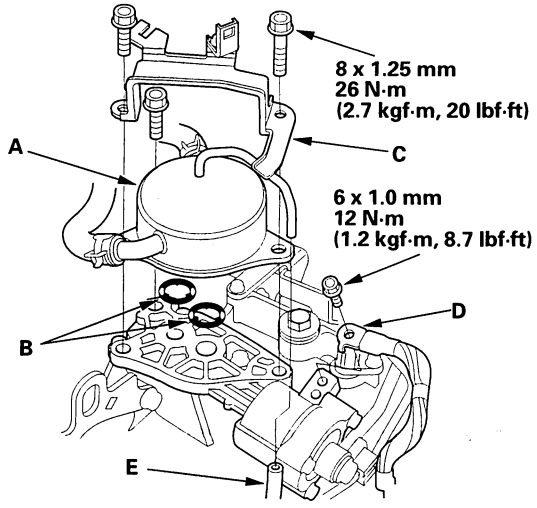


(cont'd)

Protected by AR

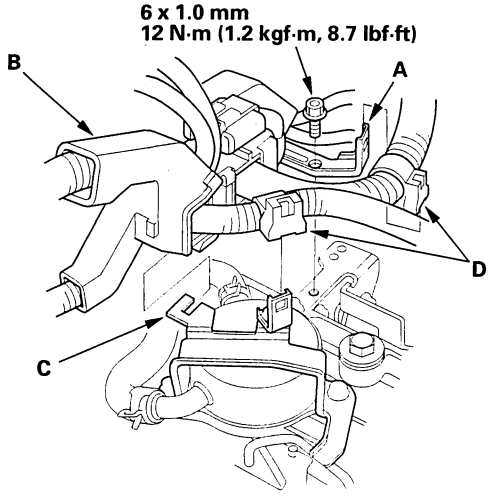
Transmission Installation (cont'd)

38. Install the ATF warmer (A) with new O-rings (B) and the bracket (C) on the transmission housing. Do not pinch the O-rings.



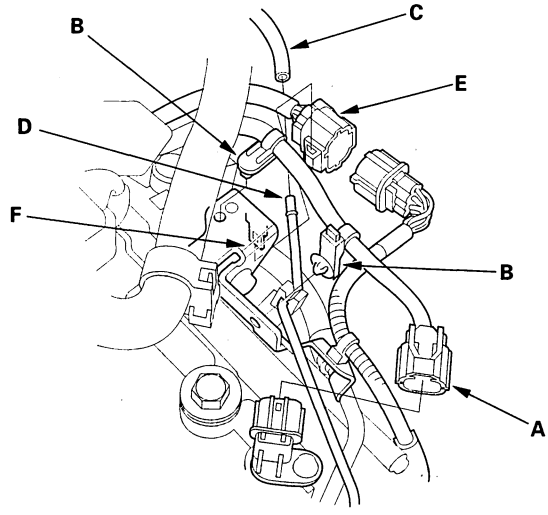
39. Install the transmission ground cable (D), and connect the breather tube (E).

40. Install the harness clamp bracket (A), and install the harness cover (B) on the bracket (C).



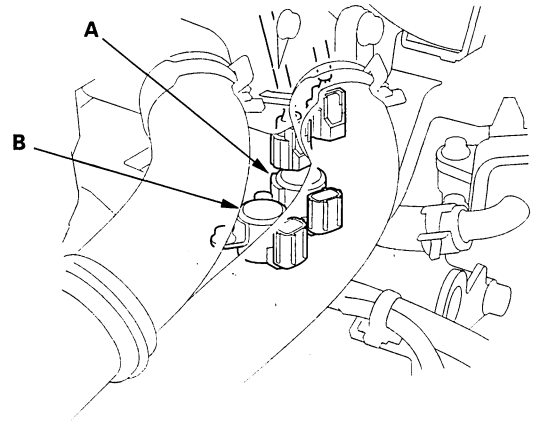
41. Install the harness clamps (D) on the clamp brackets.

42. Connect the output shaft (countershaft) speed sensor connector (A), and install the harness clamps (B) on the brackets. Connect the vacuum hose (C) to the vacuum line (D).



43. Connect the transmission range switch connector (E), then install it on its bracket (F).

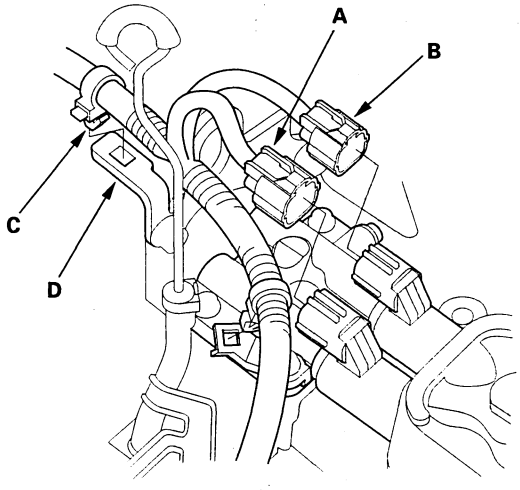
44. Connect the connectors to the torque converter clutch solenoid valve (A) and shift solenoid valve B.



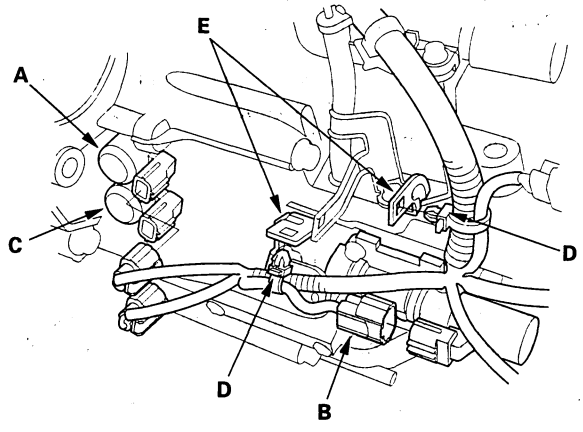
BACK

Protected by AR

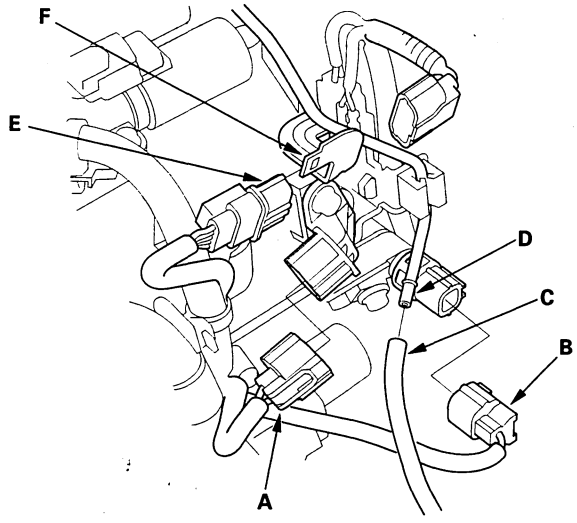
45. Connect the A/T clutch pressure control solenoid valve A connector, and solenoid valve B connector, and install the harness clamp (C) on the clamp bracket (D).



46. Connect shift solenoid valve A connector, solenoid valve C connector, and A/T clutch pressure control solenoid valve C connector (B), and install the harness clamps (D) on the clamp brackets (E).

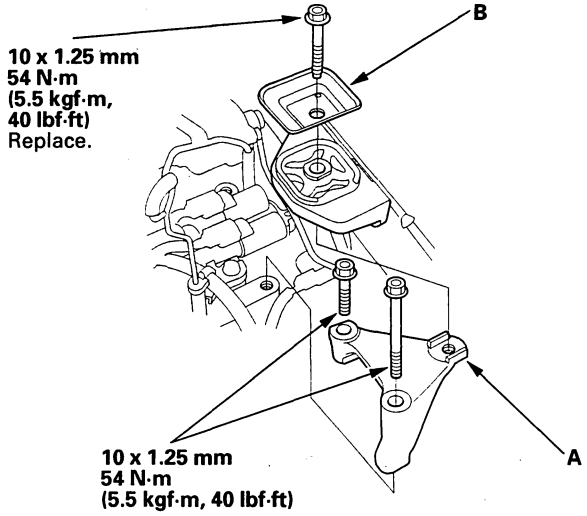


47. Connect the input shaft (mainshaft) speed sensor connector (A) and 4th clutch transmission fluid pressure switch connector (B), and connect the vacuum hose (C) to the vacuum line (D).



48. Connect the transmission subharness connector (E), then install it on its bracket (F).

49. Install the transmission upper mount bracket (A) on the transmission with two bolts.



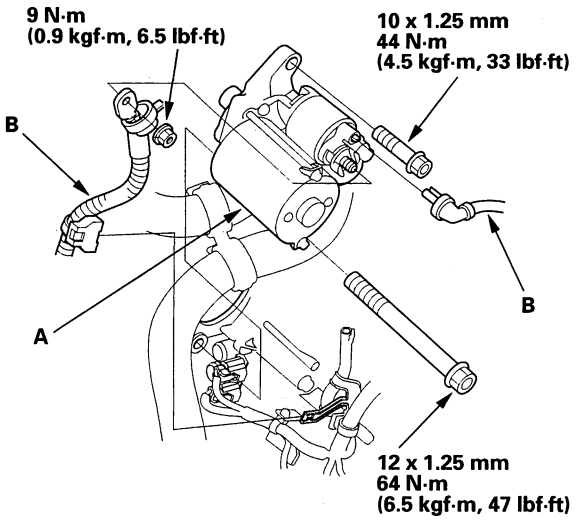
50. Install the new upper mount bolt and bracket plate (B).

(cont'd)

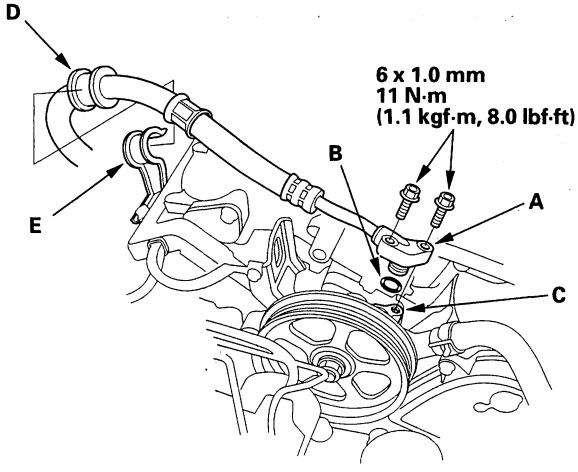
Protected by AR

Transmission Installation (cont'd)

51. Install the starter (A) on the torque converter housing. Connect the starter cables (B) to the starter, and install the harness clamp on the clamp bracket.



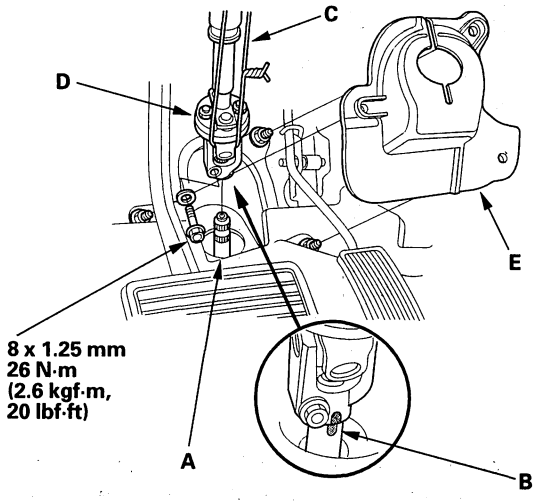
52. Install the power steering pump outlet line (A) with a new O-ring (B) to the pump (C), and install the hose (D) in its clamp (E).



53. Refill the power steering system with fluid (see page 17-10).

54. Refill the transmission with ATF (see step 5 on page 14-186).

55. Connect the steering joint to the steering gearbox pinion shaft (A) by aligning the reference mark (B), and remove the wire (C) from the joint yoke (D).



56. Install the steering joint cover (E).

57. Remove the steering wheel, refer to the 2003-2006 Accord Service Manual (see page 17-22).

58. Center the SRS cable reel and install the steering wheel, refer to the 2003-2006 Accord Service Manual (see page 17-24).

59. Install the battery base.

60. Install the air cleaner housing and intake air duct.

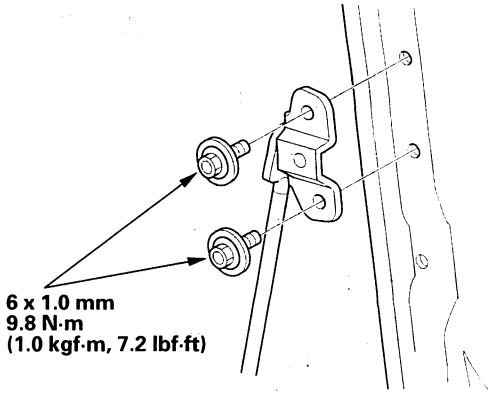
61. Install the battery tray, battery, and battery cover, then secure the battery with its hold-down bracket.

62. Clean the battery posts and cable terminals with sandpaper, then assemble them and apply grease to prevent corrosion.

BACK

Protected by AR

63. Reinstall the support strut bracket with the bolts to proper locations on both sides hood.



64. Set the parking brake. Start the engine, and shift the transmission through all gears three times.

65. Check the shift lever operation, A/T gear position indicator operation, and shift cable adjustment.

66. Check and adjust the front wheel alignment, refer to the 2003-2006 Accord Service Manual (see page 18-6).

67. Install the splash shield.

68. Start the engine in the P or N position, and warm it up to normal operating temperature (the radiator fan comes on).

69. Turn off the engine, and check the ATF level (see page 14-185).

70. Do the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

71. Do the road test (see page 14-159).

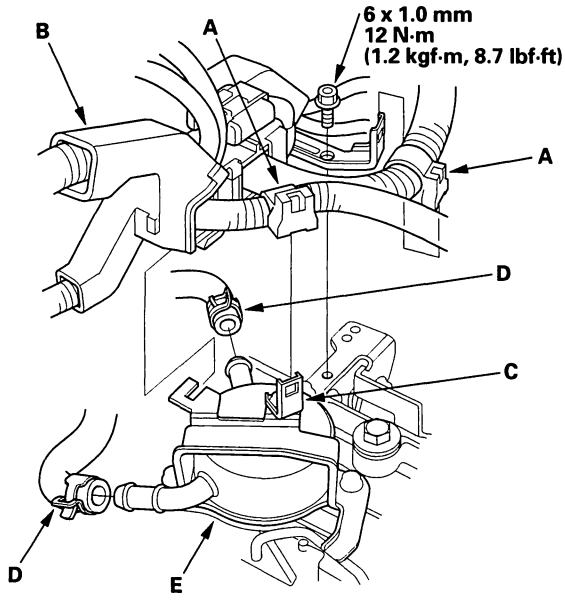
72. Enter the audio and navigation anti-theft codes, then enter the presets, and set the clock.

Protected by AR

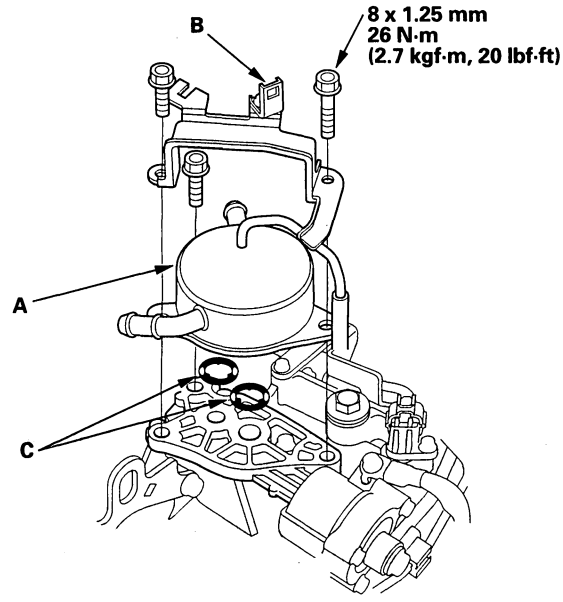
ATF Warmer Replacement

NOTE: Replace the ATF warmer with a new one whenever the transmission assembly is replaced.

1. Lift the vehicle up on a lift or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the splash shield.
3. Drain the engine coolant (see page 10-6).
4. Remove the intake air duct and air cleaner housing.
5. Remove the harness clamps (A) and harness cover (B) from the harness clamp bracket (C), and remove the bolt securing the bracket.



6. Disconnect the water hoses (D) from the ATF warmer (E).
7. Put a shop rugs around the ATF warmer (A) to catch the ATF that flows out.



8. Remove the bolts securing the ATF warmer and the bracket (B), then remove the ATF warmer from the transmission
9. Clean the mounting surfaces and fluid passages. Do not allow dust or other foreign particles to enter the transmission
10. Install the new ATF warmer with the new O-rings (C) and the bracket. Do not pinch the O-rings.
11. Connect the water hoses on the ATF warmer, and secure the hoses with the clips.
12. Install the harness clamp bracket bolt, and install the harness clamps and harness cover on the bracket.
13. Install the intake air duct and air cleaner housing.
14. Fill the radiator with the engine coolant, then bleed air from the cooling system (see step 6 on page 10-6).
15. Install the splash shield.

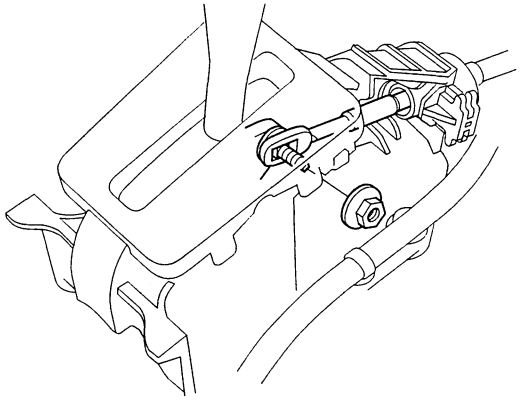
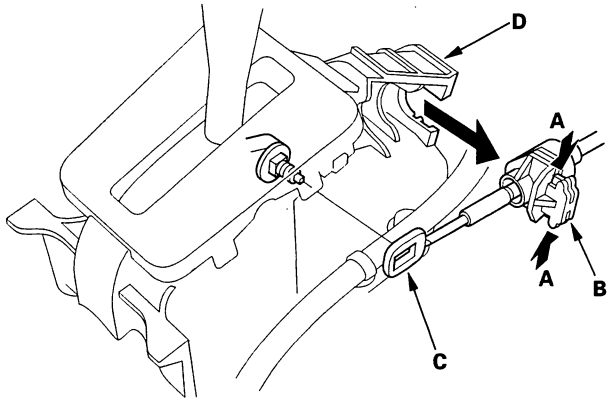
Shift Cable Replacement

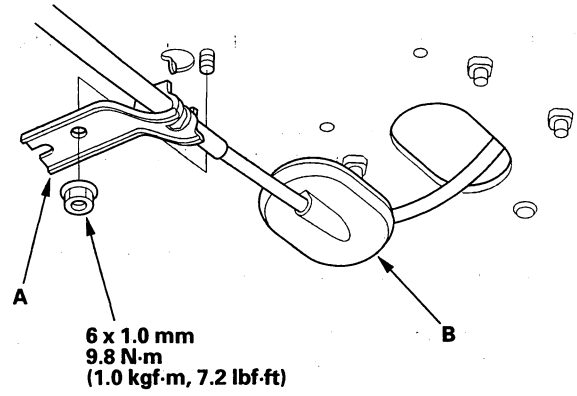
1. Raise the vehicle, and make sure it is securely supported.
2. Remove the center console, refer to the 2003-2006 Accord Service Manual (see page 20-125).
3. Shift the transmission into the R position.
4. Remove the nut securing the shift cable end.



5. Press the holder lock release (A), and pull out the socket holder (B) on the shift cable (C) of the shift lever bracket base (D).

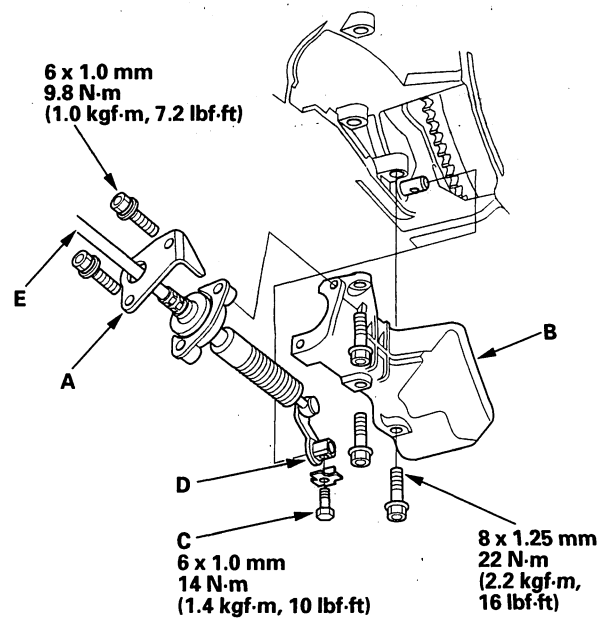


6. Remove the heat shield under the shift cable grommet.
7. Remove the shift cable bracket (A) and grommet (B).



8. Remove the bolts securing shift cable holder (A), then remove the shift cable cover (B).

   NOTE: To prevent damage to the control lever joint, remove the bolts securing the holder before removing the bolts securing the cover.



9. Remove the lock bolt (C) securing the control lever (D), then remove the shift cable (E) and the control lever. Do not bend the shift cable excessively.

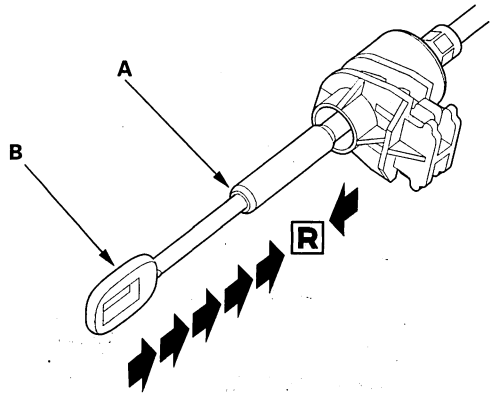
(cont'd)

Protected by AR

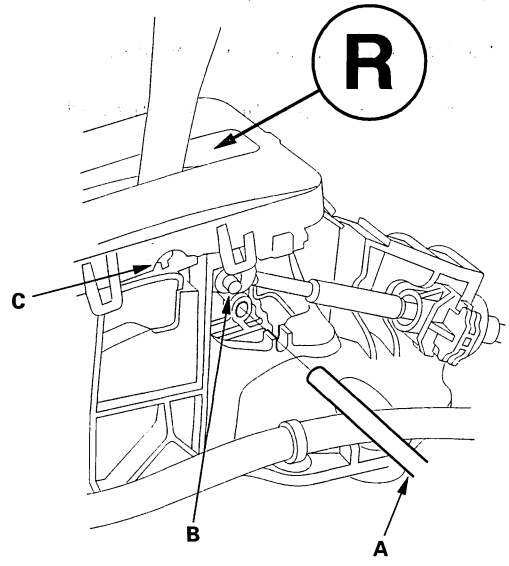
Shift Cable Replacement (cont'd)

10. Insert the new shift cable through the grommet hole. Do not bend the shift cable excessively.
11. Install the shift cable bracket on the body, then install the grommet.
12. Verify that the transmission is in the R position at the control lever.
13. Install the selector control lever on the selector control shaft. Do not bend the shift cable excessively.
14. Install the lock bolt with a new lock washer, then bend the lock washer tab against the bolt head.
15. Install the shift cable cover, then secure the shift cable holder on the cover with the bolts.

    NOTE: To prevent damage to the control lever joint, be sure install the shift cable holder after installing the shift cable cover to the torque converter housing.
16. Install the heat shield.
17. Turn the ignition switch ON (II), and verify that the R position indicator comes on.
18. If necessary, push the shift cable until it stops, then release it. Pull the shift cable back one step so that the shift position is in R. Do not hold the shift cable guide (A) to adjust the shift cable (B).



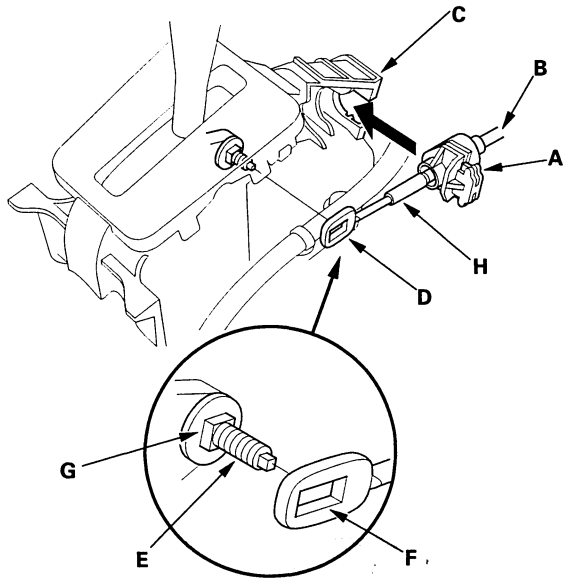
19. Turn the ignition switch OFF.
20. Insert a 6.0 mm (0.24 in.) pin (A) through the positioning hole (B) on the shift lever bracket base and into the positioning hole (C) on the shift lever. The shift lever is secured in the R position.



BACK

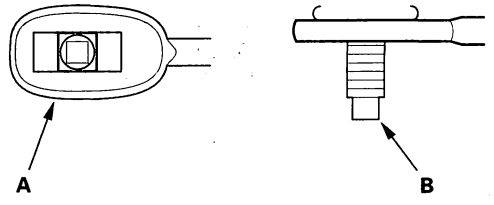
Protected by AR

21. Align the socket holder (A) on the shift cable (B) with the slot in the bracket base (C), then slide the holder into base. Install the shift cable end (D) over the mounting stud (E) by aligning its square hole (F) with the square fitting (G) at the bottom of the stud. Push the holder until it snaps securely in place. Do not install the shift cable by holding the shift cable guide (H).

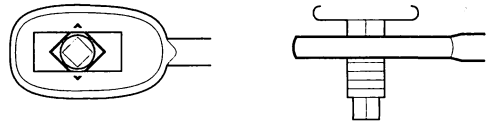


22. Verify that the shift cable end (A) is properly installed on the mounting stud (B).

Properly Installed:



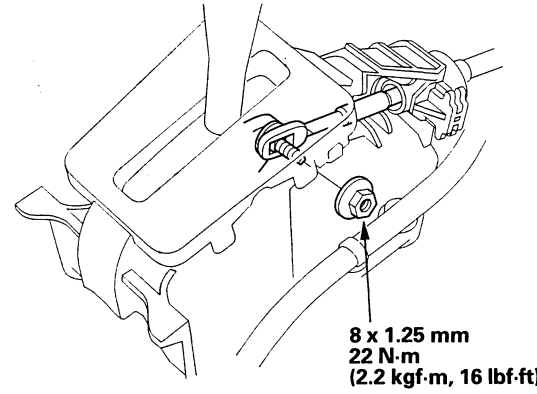
Improperly Installed:



Cable end rides on the bottom of the mounting stud.

23. If improperly installed, remove the shift cable from the bracket base, and reinstall the shift cable. Do not install the shift cable end on the mounting stud while the shift cable is on the bracket base.

24. Install and tighten the nut.



25. Remove the 6.0 mm (0.24 in.) pin that was installed to hold the shift lever.

26. Move the shift lever to each position, and verify that the A/T gear position indicator follows the transmission range switch.

27. Allow the front wheels to rotate freely.

28. Start the engine, and check the shift lever operation in all gears.

29. Push the shift lock release, and verify that the shift lever releases.

30. Reinstall the center console, refer to the 2003-2006 Accord Service Manual (see page 20-125).

A/T Gear Position Indicator

A/T Gear Position Indicator Circuit Troubleshooting

Symptom: A/T gear position indicator does not indicate the shift lever position, the D indicator does not blink, and no transmission range switch, CAN line DTCs are indicated.

1. Check the indicator drive circuit and communication line in the gauge control module with the self-diagnostic procedure of the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-259).

   Is the system OK?

   YES—Go to step 2.

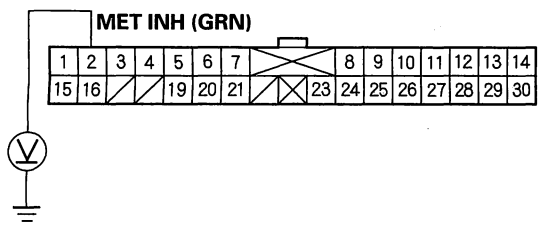
   NO—Record the ODO data in the old gauge control module, and replace the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276). Input the old ODO data in the new gauge control module with the HDS, refer to the 2003-2006 Accord Service Manual (see page 22-276). ■

2. Remove the gauge control module.

3. Turn the ignition switch ON (II).

4. Measure the voltage between gauge control module connector terminal B2 and body ground. The shift lever can be in any position.

GAUGE CONTROL MODULE CONNECTOR B (30P)



Wire side of female terminals

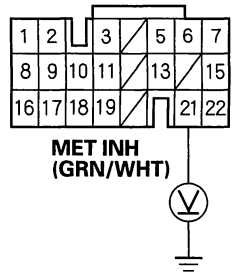
Is there battery voltage?

YES—Faulty A/T gear position indicator in the gauge control module, replace the gauge control module. ■

NO—Go to step 5.

5. Measure the voltage between PCM connector terminal C21 and body ground.

PCM CONNECTOR C (22P)



Wire side of female terminals

Is there battery voltage?

YES—Repair open or short in the wire between PCM connector terminal C21 and the gauge control module connector terminal B2. ■

NO—Check for loose terminal fit in the PCM connectors. If necessary, substitute a known-good PCM and recheck. ■

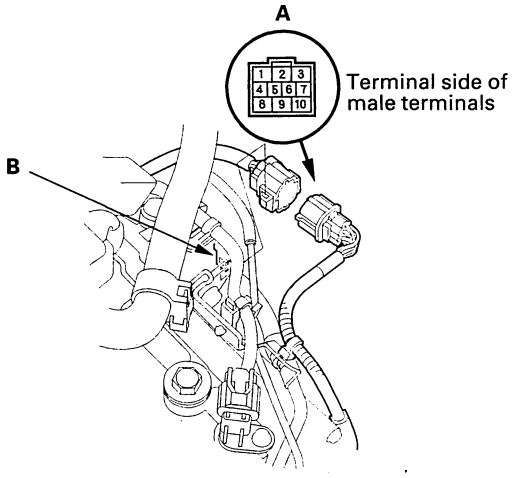
BACK

Protected by AR

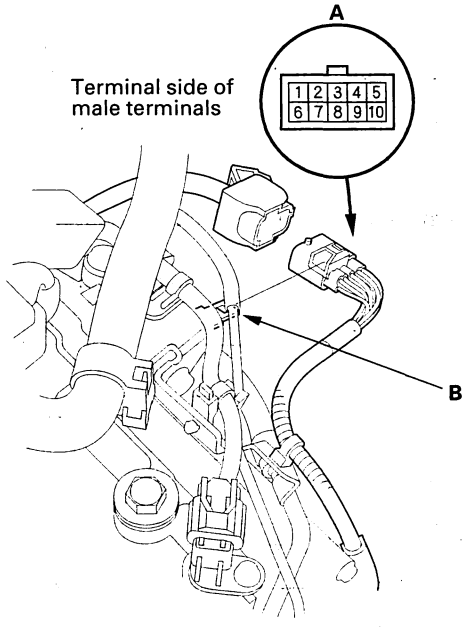
Transmission Range Switch Test

1. Remove the transmission range switch harness connector (A) from the connector bracket (B), then disconnect the connector.

2003-2005 Models:



2006 Model:



2. Check for continuity between terminals at the harness connector. There should be continuity between the terminals in the following table for each switch position.

- If the continuity test for each position is good, the switch is OK. Reconnect the connector.
- If there is no continuity at one or more switch positions, go to step 3.

Transmission Range Switch Harness Connector 2003-2005 Models:

Position	Connector Terminal/Signal									
	1	2	3	4	5	6	7	8	9	10
	ATP NP	ATP FWD	GND	1	2	D3	D	N	R	P
P	○		○							○
R			○						○	
N	○		○					○		
D		○	○				○			
D3		○	○			○				
2		○	○		○					
1			○	○

Protected by AR

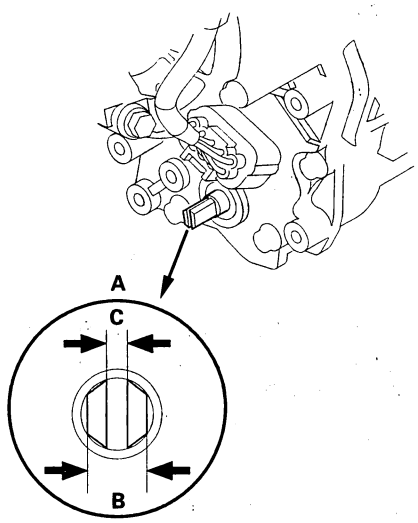
6. Remove the transmission range switch, and check the end of the selector control shaft (A).

Standard:
Selector Control Shaft Width (B):
6.1—6.2 mm (0.240—0.244 in.)
Selector Control Shaft End Gap (C):
1.8—2.0 mm (0.07—0.08 in.)

- If the measurement of the selector control shaft end is within the standard, replace the transmission range switch (see page 14-218).
- If the measurement is out of standard, repair the selector control shaft end, and recheck the transmission range switch continuity.

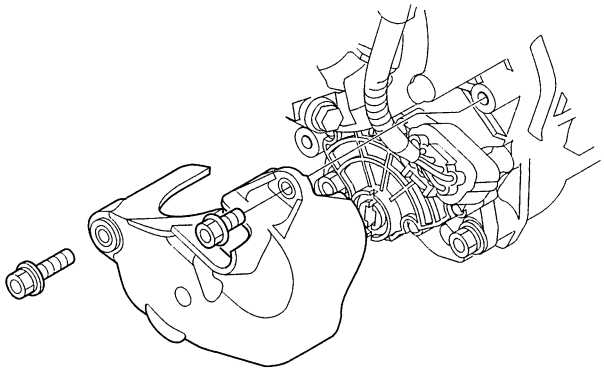


Protected by AR

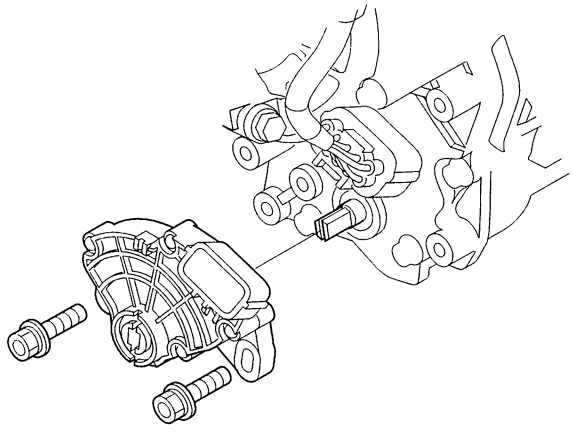
A/T Gear Position Indicator

Transmission Range Switch Replacement

1. Raise the vehicle, and make sure it is securely supported.
2. Shift to the N position.
3. Remove the transmission range switch cover.

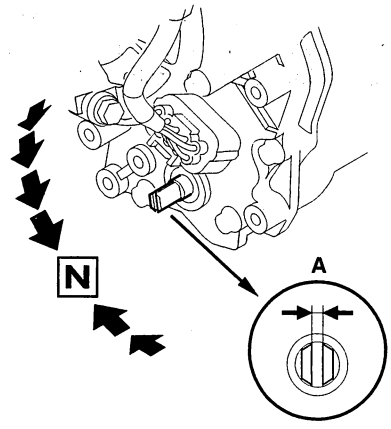


4. Disconnect the transmission range switch connector.



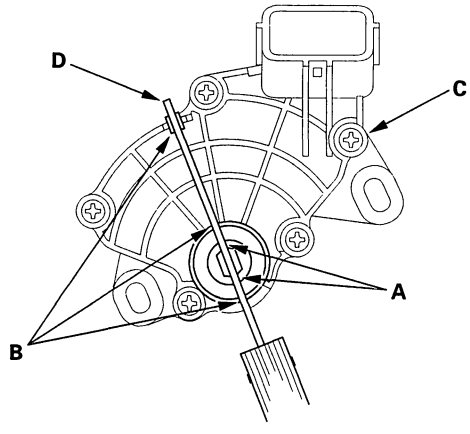
5. Remove the transmission range switch, and replace the new switch.
6. Make sure the selector control shaft is in the N position. If necessary, move the shift lever to the N position.

   NOTE: Do not use the selector control shaft to adjust the shift position. If the selector control shaft tips are squeezed together it will cause a faulty signal or position due to play between the selector control shaft and the switch. The clearance (A) between selector control shaft tips is 2.0 mm (0.08 in.)



7. Align the cutouts (A) on the rotary-frame with the neutral positioning cutouts (B) on the transmission range switch (C), then put a 2.0 mm (0.08 in.) feeler gauge blade (D) in the cutouts to hold the switch in the N position.

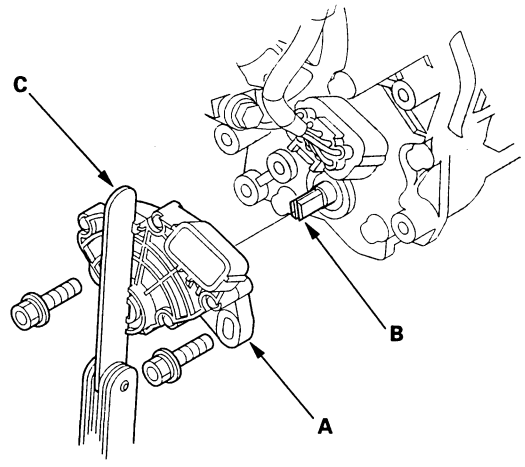
   NOTE: Be sure to use a 2.0 mm (0.08 in.) blade or equivalent to hold the switch in the N position.



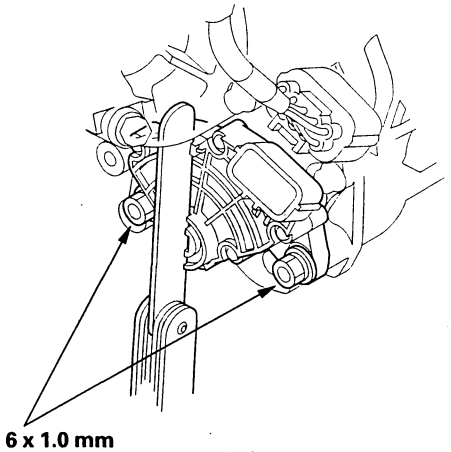
BACK

Protected by AR

8. Install the transmission range switch (A) gently on the selector control shaft (B) while holding it in the N position with the 2.0 mm (0.08 in.) blade (C).

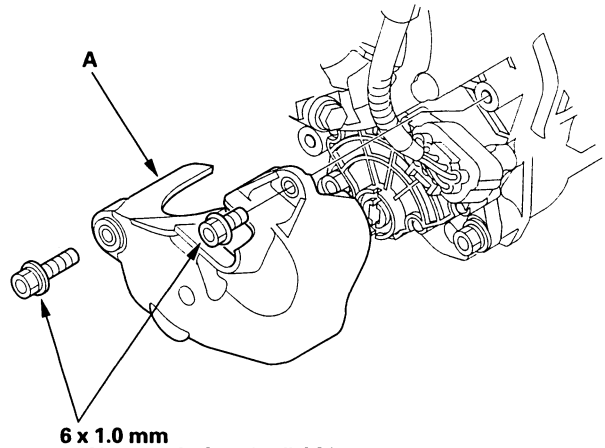


9. Tighten the bolts on the transmission range switch while you continue to hold the N position. Do not move the transmission range switch when tightening the bolts. Remove the feeler gauge.



6 x 1.0 mm
12 N·m (1.2 kgf·m, 8.7 lbf·ft)

10. Connect the connector securely, then install the transmission range switch cover (A).



6 x 1.0 mm
12 N·m (1.2 kgf·m, 8.7 lbf·ft)

11. Turn the ignition switch ON (II). Move the shift lever through all positions, and check the transmission range switch synchronization with the A/T gear position indicator.

12. Check that the engine will start in the P and N positions, and will not start in any other shift lever position.

13. Check that the back-up lights come on when the shift lever is in the R position.

14. Allow the front wheels to rotate freely, then start the engine, and check the shift lever operation.

Shift Lock System Circuit Troubleshooting

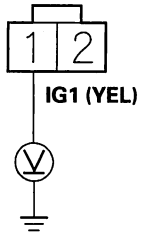
1. Connect the HDS to the DLC.
2. Choose Shift Lock Solenoid Test in Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.

   Does the shift lock solenoid work properly?

   YES—Go to step 14.

   NO—Go to step 3.
3. Remove the center console, refer to the 2003-2006 Accord Service Manual (see page 20-125).
4. Disconnect the shift lock solenoid connector.
5. Turn the ignition switch ON (II).
6. Measure the voltage between shift lock solenoid connector terminal No. 1 and body ground.

   SHIFT LOCK SOLENOID CONNECTOR



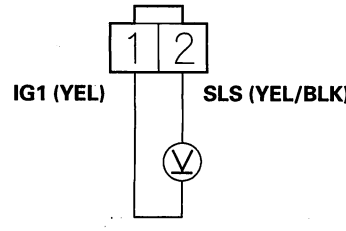
Wire side of female terminals

   Is there battery voltage?

   YES—Go to step 7.

   NO—Check for a blown No. 21 (7.5 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open or short in the wire between the shift lock solenoid connector and the under-dash fuse/relay box.■
7. Shift the shift lever into the P position, and press the brake pedal. Do not press the accelerator.
8. Measure the voltage between shift lock solenoid connector terminals No. 1 and No. 2 while pressing the brake pedal.

   SHIFT LOCK SOLENOID CONNECTOR



Wire side of female terminals

   Is there battery voltage?

   YES—Go to step 9.

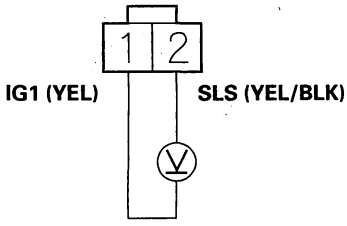
   NO—Go to step 10.

BACK

Protected by AR

9. Release the brake pedal, and measure the voltage between connector terminals No. 1 and No. 2. The shift lever must be in the P position.

SHIFT LOCK SOLENOID CONNECTOR



Wire side of female terminals

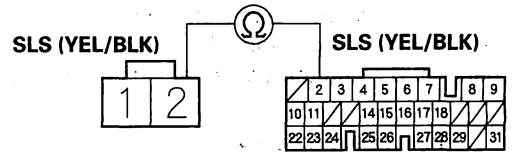
Is there battery voltage?

YES—Repair a short to ground in the wire between PCM connector terminal A22 and the shift lock solenoid. ■

NO—Check the shift lock mechanism. If the mechanism is OK, replace the shift lock solenoid, refer to the 2003-2006 Accord Service Manual (see page 14-260).

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector A (31P).
13. Check for continuity between PCM connector terminal A22 and shift lock solenoid connector terminal No. 2.

SHIFT LOCK SOLENOID CONNECTOR **PCM CONNECTOR A (31P)**



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good PCM and recheck. ■

NO—Repair open in the wire between PCM connector terminal A22 and the shift lock solenoid. ■

(cont'd)

Protected by AR

Shift Lock System Circuit Troubleshooting (cont'd)

14. Press the brake pedal.

    Are the brake lights ON?

    YES—Go to step 15.

    NO—Repair faulty brake light circuit. ■

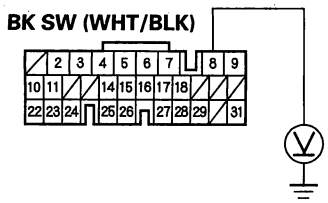
15. Turn the ignition switch OFF.

16. Jump the SCS line with the HDS.

17. Disconnect PCM connector A (31P).

18. Measure the voltage between PCM connector terminal A8 and body ground while pressing the brake pedal and when the brake pedal is released.

PCM CONNECTOR A (31P)



Wire side of female terminals

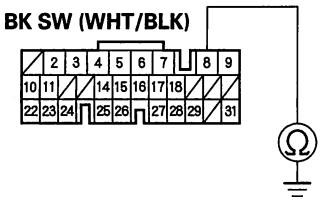
Is there battery voltage while the brake pedal is pressing, and no voltage when the pedal is released?

YES—Go to step 20.

NO—Go to step 19.

19. Check for continuity between PCM connector terminal A8 and body ground.

PCM CONNECTOR A (31P)



Wire side of female terminals

Is there continuity?

YES—Repair short to ground in the wire between PCM connector terminal A8 and the brake pedal position switch. ■

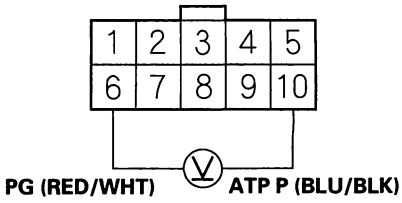
NO—Repair open in the wire between PCM connector terminal A8 and the brake pedal position switch. ■

BACK

Protected by AR

20. Connect PCM connector A (31P).
21. Disconnect the transmission range switch connector.
22. Turn the ignition switch ON (II).
23. Measure the voltage between transmission range switch connector terminals No. 6 and No. 10.

TRANSMISSION RANGE SWITCH CONNECTOR



Wire side of female terminals

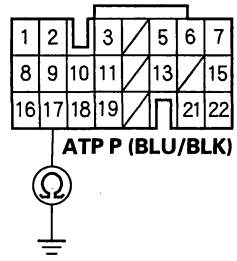
Is there battery voltage?

YES—Go to step 29.

NO—Go to step 24.

24. Turn the ignition switch OFF.
25. Disconnect PCM connector C (17P).
26. Check for continuity between PCM connector terminal C17 and body ground.

PCM CONNECTOR C (22P)



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between PCM connector terminal C17 and the transmission range switch. ■

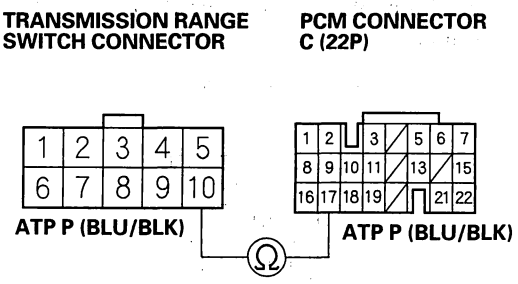
NO—Go to step 27.

(cont'd)

Protected by AR

Shift Lock System Circuit Troubleshooting (cont'd)

27. Check for continuity between PCM connector terminal C17 and transmission range switch connector terminal No. 10.



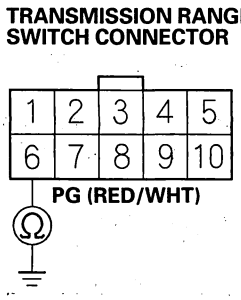
Wire side of female terminals

Is there continuity?

YES—Go to step 28.

NO—Repair open in the wire between PCM connector terminal C17 and the transmission range switch. ■

28. Check for continuity between transmission range switch connector terminal No. 6 and body ground.



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good PCM and recheck. ■

NO—Repair open in the wire between transmission range switch connector terminal No. 6 and ground (G101), or repair poor ground (G101). ■

BACK

Protected by AR

29. Test the transmission range switch (see page 14-215).

    Is the switch OK?

    YES—Go to step 30.

    NO—Replace the transmission range switch (see page 14-218).

30. Connect the HDS to the DLC.

31. Check the accelerator pedal position sensor in the A/T data list with the HDS. Do not press the accelerator.

    Is the accelerator pedal position sensor opening 11% and above, or the sensor voltage 0.90 V and above?

    YES—Check the throttle body (see page 11-343).

    NO—Check the throttle cable adjustment (see page 11-346). If the throttle cable adjustment is OK, substitute a known-good PCM and recheck. ■

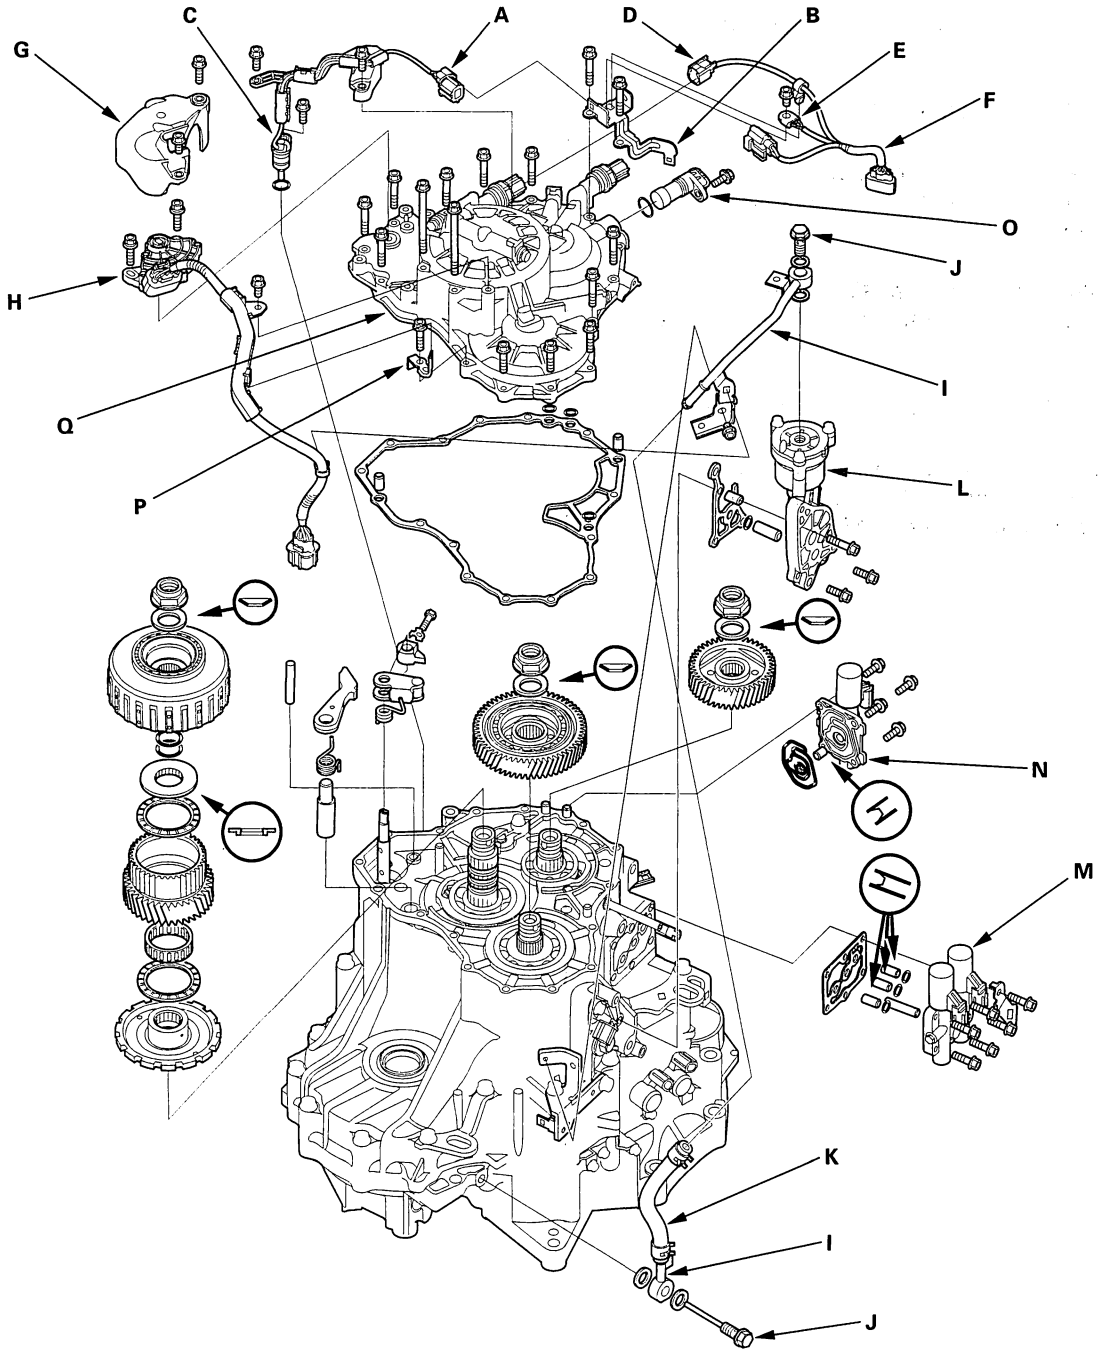
Protected by AR

Transmission End Cover

End Cover, 3rd Gear, Idler Gear, and 3rd Clutch Removal

Special Tools Required
- Mainshaft holder 07GAB-PF50101 or 07GAB-PF50100
- Adjustable bearing puller, 25—40 mm 07736-A01000B or 07736-A01000A

1. Remove the ATF temperature sensor connector (A) from the connector bracket (B), then disconnect the connector, and remove the ATF temperature sensor (C) (three bolts).



BACK

Protected by AR

2. Disconnect the 3rd clutch transmission fluid pressure switch (D), remove the ground terminal (E), then remove the sensor subharness (F).

3. Remove the transmission range switch cover (G), then remove the transmission range switch (H) (three bolts).

4. Remove the 6 mm bolt securing the harness clamp bracket on the ATF line (I), and remove the line bolts (J), then remove the ATF line and sealing washers. Remove the ATF hose (K) from the ATF line if necessary.

5. Remove the ATF passage body (L), ATF pipe, O-ring, dowel pin, and gasket (three bolts).

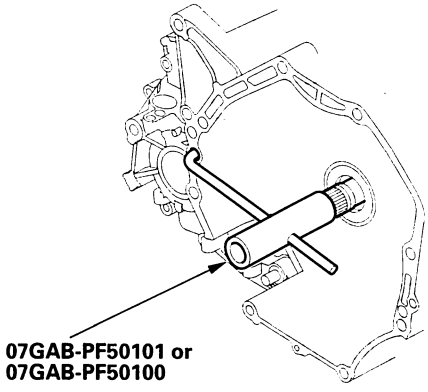
6. Remove the A/T clutch pressure control solenoid valves A and B (M), clamp bracket, ATF pipes, O-rings, and gasket (six bolts).

7. Remove the A/T clutch pressure control solenoid valve C (N), ATF pipe, and gasket (four bolts).

8. Remove the input shaft (mainshaft) speed sensor (O).

9. Remove the 16 bolts securing the end cover, connector bracket (B), harness cover bracket (P), then remove the end cover (Q), two dowel pins, O-rings, and gasket.

10. Slip the special tool onto the mainshaft.

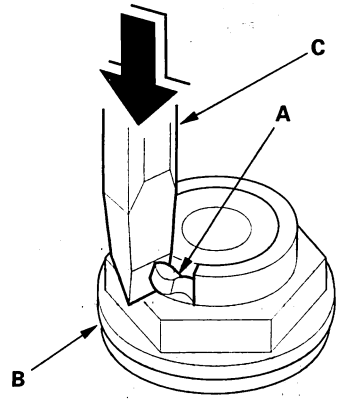


07GAB-PF50101 or 07GAB-PF50100

11. Engage the park pawl with the park gear.

12. Cut the lock tab (A) of each shaft locknut (B) using a chisel (C). Then remove the locknuts and conical spring washers from each shaft.

NOTE:
- Countershaft and secondary shaft locknuts have left-hand threads.
- Keep all of the chiseled particles out of the transmission.
- Clean the old locknuts; they are used to install the press fit mainshaft 3rd gear, secondary shaft idler gear, and 3rd clutch assembly on the countershaft.



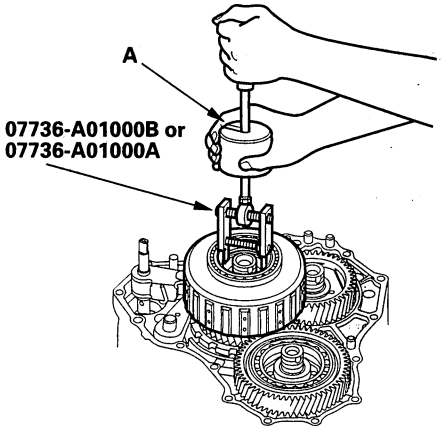
13. Remove the special tool from the mainshaft.

(cont'd)

Protected by AR

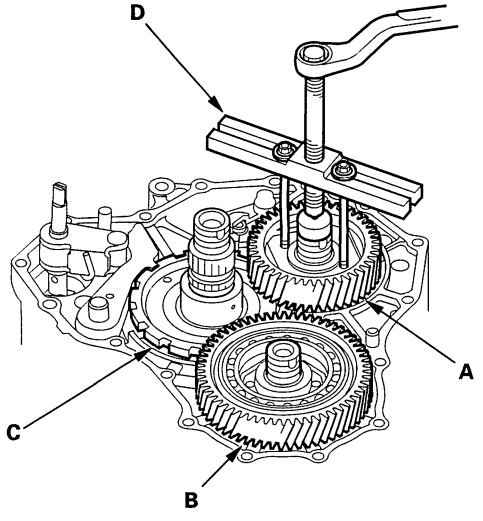
End Cover, 3rd Gear, Idler Gear, and 3rd Clutch Removal (cont'd)

14. Remove the 3rd clutch assembly using the special tool and a commercially available 3/8 "-16 slide hammer (A).



15. Remove the splined washer, thrust needle bearing, countershaft 3rd gear, needle bearing, and thrust needle bearing from the countershaft.

16. Remove the mainshaft 3rd gear (A), secondary shaft idler gear (B), and park gear (C) with a puller (D).

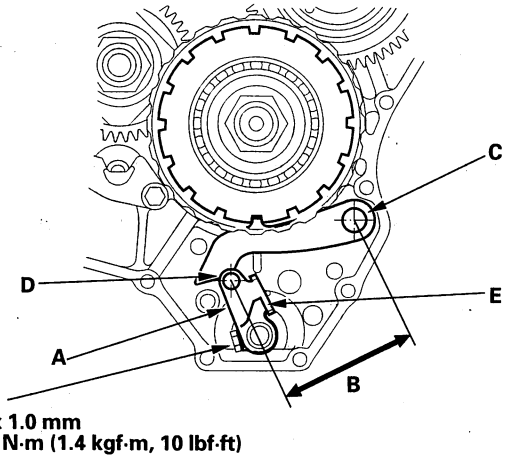


17. Remove the park pawl, park pawl spring, park pawl shaft, and stop shaft.

18. Remove the park lever from the selector control shaft.

Park Lever Stop Inspection and Adjustment

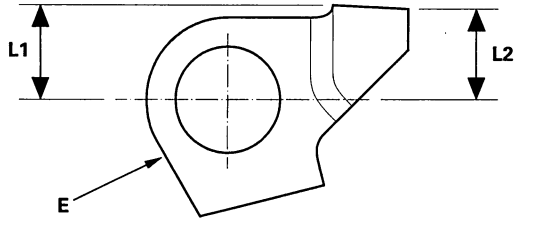
1. Set the park lever (A) in the P position.



2. Measure the distance (B) between the park pawl shaft (C) and the park lever roller pin (D).

   Standard: 84.6—85.6 mm (3.33—3.37 in.)

3. If the measurement is out of tolerance, select and install the appropriate park lever stop (E) from the table.



PARK LEVER STOP

Mark	Part Number	L1	L2
1	24537-PA9-003	11.00 mm (0.433 in.)	11.00 mm (0.433 in.)
2	24538-PA9-003	10.80 mm (0.425 in.)	10.65 mm (0.419 in.)
3	24539-PA9-003	10.60 mm (0.417 in.)	10.30 mm (0.406 in.)

4. After replacing the park lever stop, make sure the distance is within tolerance.

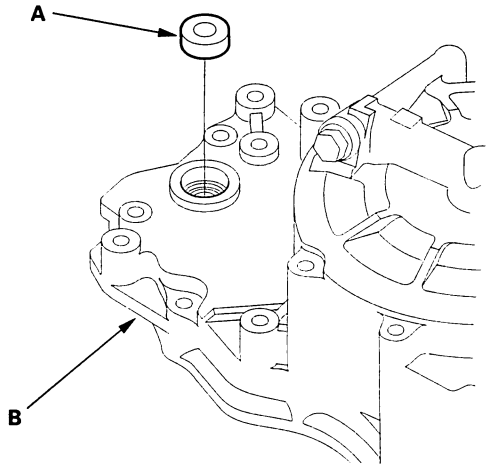
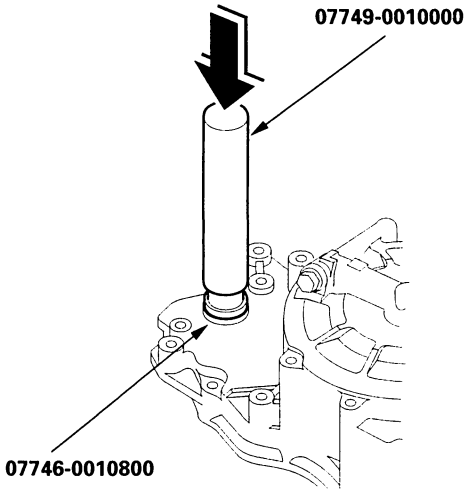
Selector Control Shaft Oil Seal Replacement

Special Tools Required
- Driver 07749-0010000
- Attachment, 22 x 24 mm 07746-0010800

1. Remove the oil seal (A) from the end cover (B).



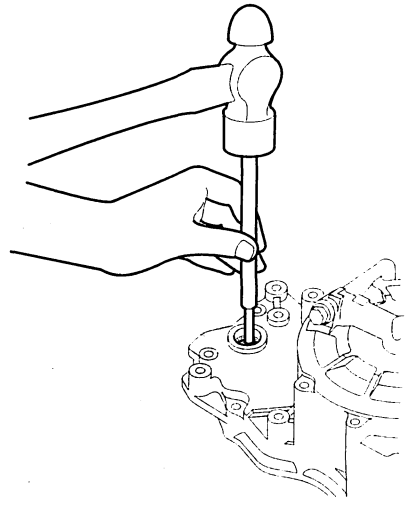
2. Install the new oil seal flush to the end cover with the special tools.



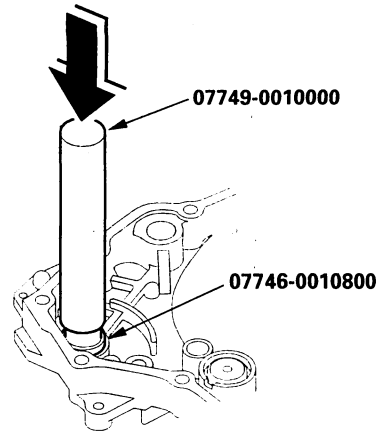
Selector Control Shaft Bearing Replacement

Special Tools Required
- Driver 07749-0010000
- Attachment, 22 x 24 mm 07746-0010800

1. Remove the oil seal from the end cover, then remove the bearing.



2. Install the new bearing flush to the end cover with the special tools.



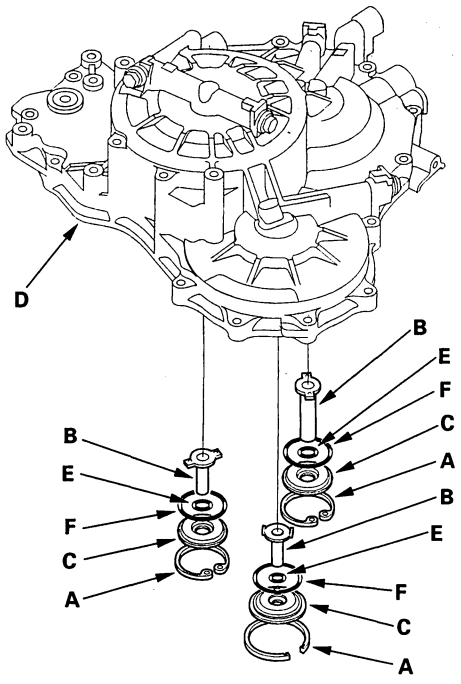
3. Install the new oil seal.

Protected by AR

Transmission End Cover

ATF Feed Pipe Replacement

1. Remove the snap rings (A), ATF feed pipes (B) and feed pipe flanges (C) from the end cover (D).



2. Install the new O-ring (E) over the ATF feed pipe.
3. Install the ATF feed pipe in the end cover by aligning the feed pipe tabs with the indentations in the end cover.
4. Install the new O-ring (F) in the end cover, then install the feed pipe flange over the ATF feed pipe and O-rings.
5. Secure the ATF feed pipe and feed pipe flange with the snap ring.

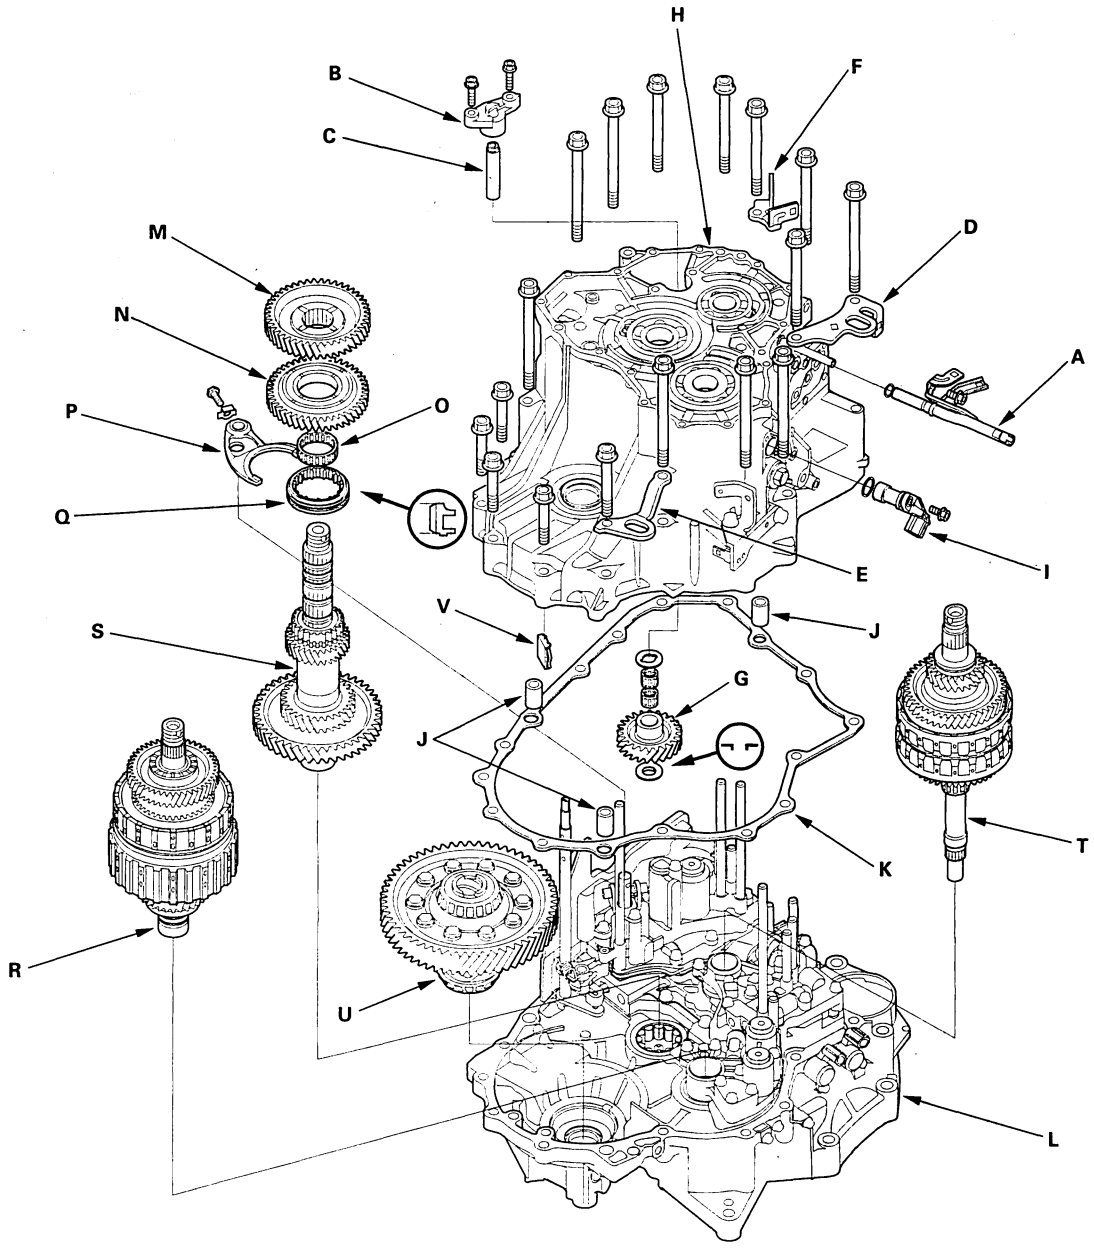
BACK

Protected by AR

Housing and Shaft Assembly Removal

Special Tools Required
Housing puller 07HAC-PK40102

1. Remove the ATF dipstick guide pipe (A).



2. Remove the two bolts securing the reverse idler gear shaft holder, then remove the reverse idler gear shaft holder (B) and shaft (C).

3. Remove the transmission housing mounting bolts (17 bolts), transmission hangers (D) (E), and harness clamp bracket (F).

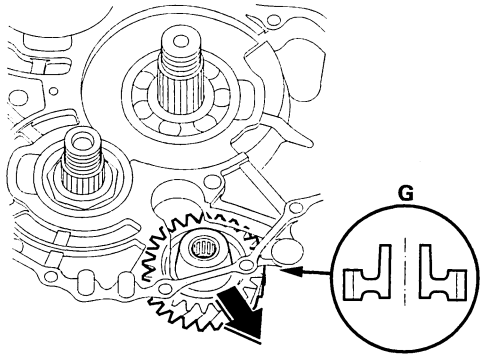
(cont'd)

Protected by AR

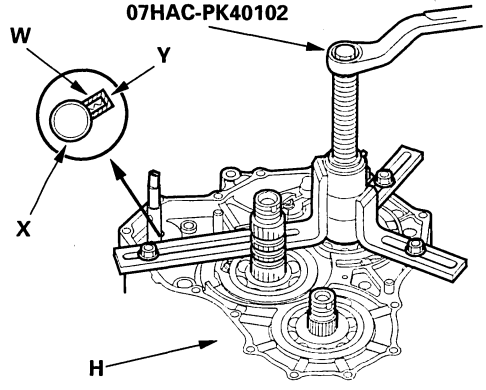
Housing and Shaft Assembly Removal (cont'd)

4. Move the reverse idler gear (G) to disengage it from the mainshaft and countershaft idler gear.

   NOTE: The transmission housing will not separate from the torque converter housing if the reverse idler gear is not moved.



5. Align the spring pin (W) on the selector control shaft (X) with the transmission housing groove (Y) by turning the selector control shaft.



6. Install the special tool over the mainshaft, then remove the transmission housing (H).

   NOTE: If the top arm of your housing puller is too short, replace it with Housing Puller Arm, 205 mm T/N 07SAC-P0Z0101.

7. Remove the reverse idler gear (G), needle bearings, and washers from the transmission housing.

8. Remove the output shaft (countershaft) speed sensor (I).

9. Remove the three dowel pins (J) and gasket (K) from the torque converter housing (L).

10. Remove the countershaft 2nd gear (M), countershaft reverse gear (N), and needle bearing (O).

11. Remove the lock bolt securing the shift fork, then remove the shift fork (P) and reverse selector (Q). If the reverse selector hub is not press-fitted, remove the reverse selector hub, countershaft 5th gear, and needle bearing from the countershaft.

12. Remove the secondary shaft subassembly (R). If the reverse selector hub is press-fitted, remove the secondary shaft subassembly, countershaft subassembly (S) and mainshaft subassembly (T) together.

13. Remove the countershaft subassembly.

14. Remove the mainshaft subassembly.

15. Remove the differential assembly (U).

16. Remove the ATF magnet (V), and clean it. Reinstall the magnet in the transmission housing.

BACK

Protected by AR

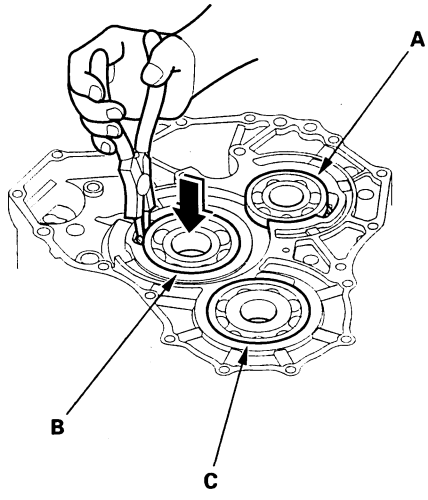
Bearing Removal and Installation

Special Tools Required
- Driver 07749-0010000
- Seal driver attachment 07GAD-PG40101 or 07GAD-PG40100
- Attachment, 62 x 68 mm 07746-0010500
- Attachment, 72 x 75 mm 07746-0010600 (for 2003-2005 models countershaft bearing use)
- Attachment, 78 x 80 mm 07NAD-PX40100 (for 2006 model countershaft bearing use)

NOTE: Coat all parts with ATF before assembly.

1. To remove the mainshaft bearing (A), countershaft bearing (B), and secondary shaft bearing (C) from the transmission housing, expand each snap ring with the snap ring pliers, then push the bearing out.

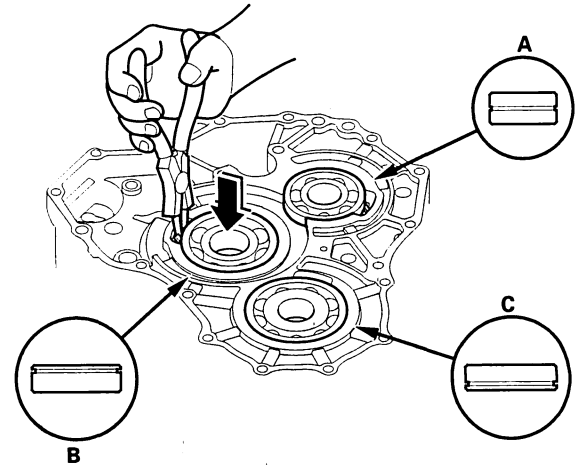
   NOTE: Do not remove the snap rings unless it's necessary to clean the grooves in the housing.



2. Install the bearings in the direction shown.

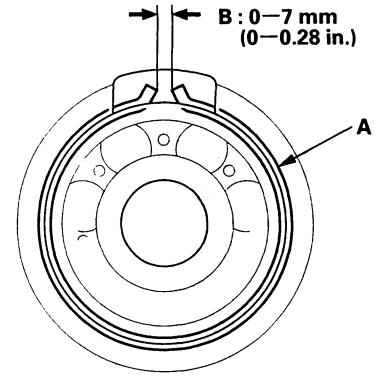
3. Expand each snap ring with the snap ring pliers, and insert the bearing part-way into the housing.

4. Release the pliers, then push the bearing down into the housing until the snap ring snaps in place around it.



5. After installing the bearings verify the following:

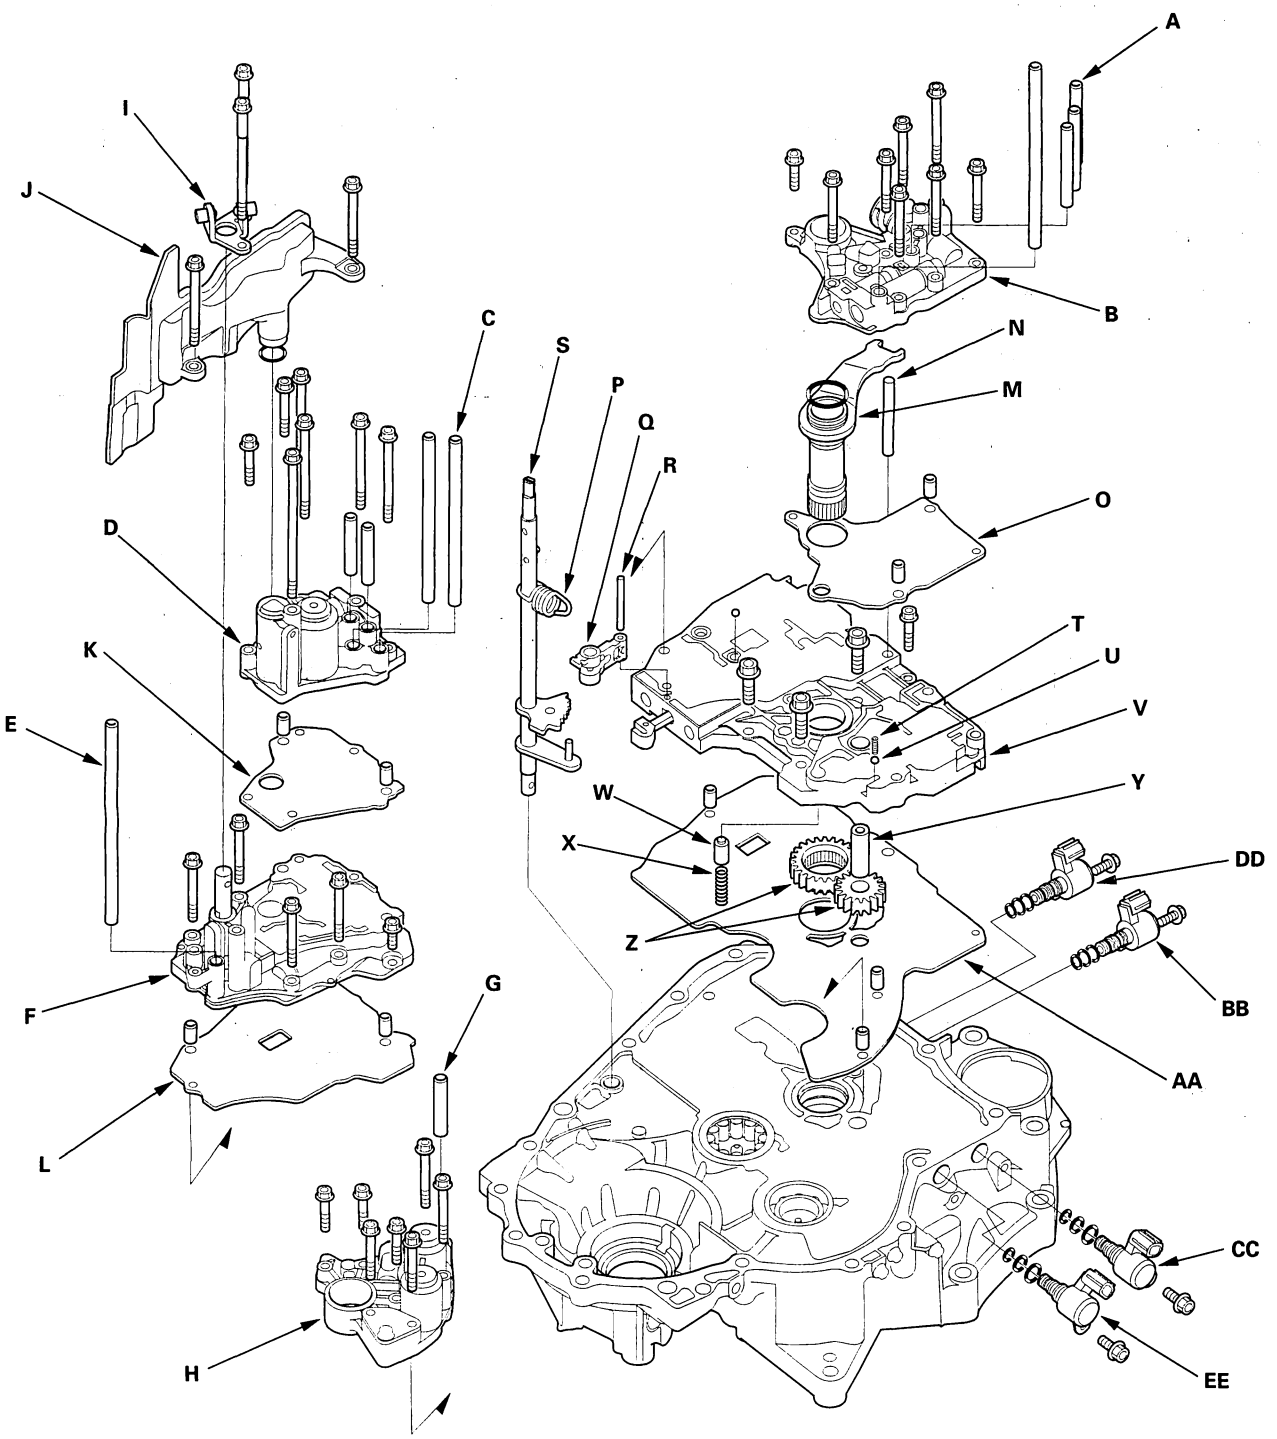
   - The snap rings (A) are seated in the bearing and housing grooves.
   - The ring end gaps (B) are correct.



Protected by AR

Valve Body and ATF Strainer Removal

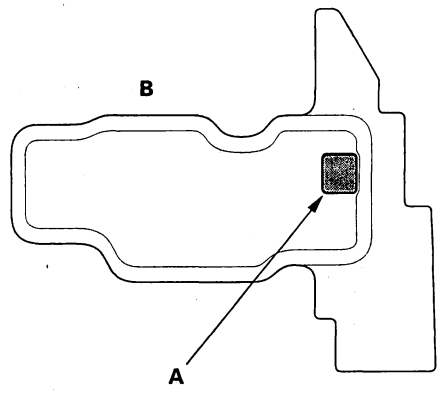
1. Remove the three ATF feed pipes (A) from the regulator valve body (B), four pipes (C) from the top accumulator body (D), one pipe (E) from the servo body (F), and one 10 mm pipe (G) from the accumulator body (H).



BACK

Protected by AR

2. Remove the servo detent base (I) (two bolts).
3. Remove the ATF strainer (J) (two bolts).
4. Remove the top accumulator body (D) (seven bolts), then remove the top accumulator body separator plate (K) and two dowel pins.
5. Remove the servo body (F) (five bolts), then remove servo separator plate (L) and two dowel pins.
6. Remove the regulator valve body (B) (eight bolts).
7. Remove the stator shaft (M) and stator shaft stop (N).
8. Remove the regulator separator plate (O) and two dowel pins.
9. Remove the accumulator body (H) (seven bolts).
10. Unhook the detent spring (P) from the detent arm (Q), then remove the detent arm shaft (R), detent arm, and selector control shaft (S).
11. Remove the cooler check valve spring (T) and cooler check valve (U).
12. Remove the main valve body (V) (four bolts).
13. Remove the torque converter check valve (W) and valve spring (X).
14. Remove the ATF pump driven gear shaft (Y), then remove the ATF pump gears (Z).
15. Remove the main separator plate (AA) and three dowel pins.
16. Remove shift solenoid valves (BB) (CC) (DD) and torque converter clutch solenoid valve (EE) from the torque converter housing.
17. Clean the inlet opening (A) of the ATF strainer (B) thoroughly with compressed air, then check that it is in good condition and that the inlet opening is not clogged.



18. Test the ATF strainer by pouring clean ATF through the inlet opening, and replace it if it is clogged or damaged.

Protected by AR

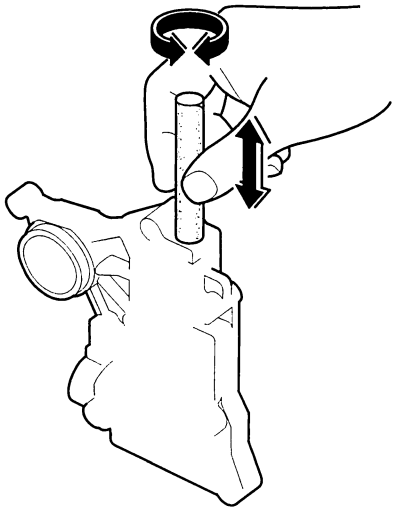
Valve Body

Valve Body Repair

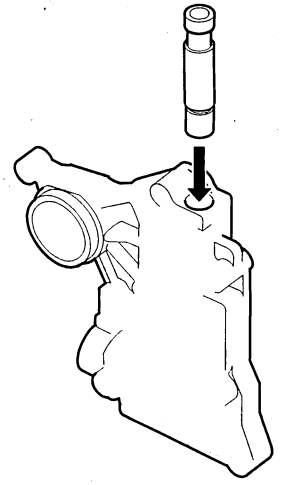
NOTE: This repair is only necessary if one or more of the valves in a valve body do not slide smoothly in their bores. Use this procedure to free the valves.

1. Soak a sheet of #600 abrasive paper in ATF for about 30 minutes.
2. Carefully tap the valve body so the sticking valve drops out of its bore. It may be necessary to use a small screwdriver to pry the valve free. Be careful not to scratch the bore with the screwdriver.
3. Inspect the valve for any scuff marks. Use the ATF-soaked #600 paper to polish off any burrs that are on the valve, then wash the valve in solvent and dry it with compressed air.
4. Roll up half a sheet of ATF-soaked #600 paper and insert it in the valve bore of the sticking valve. Twist the paper slightly, so that it unrolls and fits the bore tightly, then polish the bore by twisting the paper as you push it in and out.

   NOTE: The valve body is aluminum and doesn't require much polishing to remove any burrs.



5. Remove the #600 paper. Thoroughly wash the entire valve body in solvent, then dry it with compressed air.
6. Coat the valve with ATF, then drop it into its bore. It should drop to the bottom of the bore under its own weight. If not, repeat steps 4 and 5, then retest. If the valve still sticks, replace the valve body.



7. Remove the valve, and thoroughly clean it and the valve body with solvent. Dry all parts with compressed air, then reassemble using ATF as a lubricant.

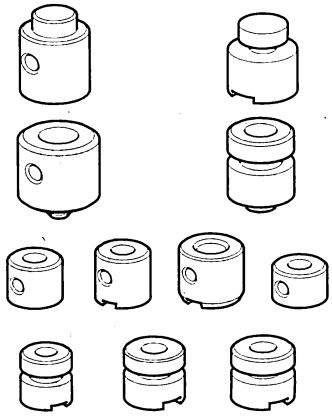
Protected by AR

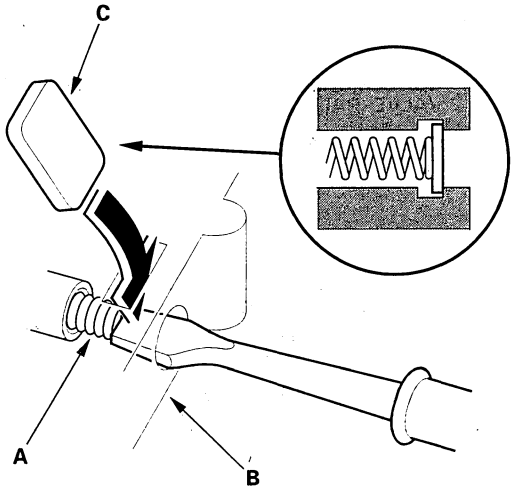
Valve Body Valve Installation

1. Coat all parts with ATF before assembly.

2. Install the valves and springs in the sequence shown for the main valve body (see page 14-240), regulator valve body (see page 14-242), servo body (see page 14-243), and top accumulator body (see page 14-244). Refer to the following valve cap illustrations, and install each valve cap so the end shown facing up will be facing the outside of the valve body.



3. Install all the springs and seats. Insert the spring (A) in the valve, then install the valve in the valve body (B). Push the spring in with a screwdriver, then install the spring seat (C).

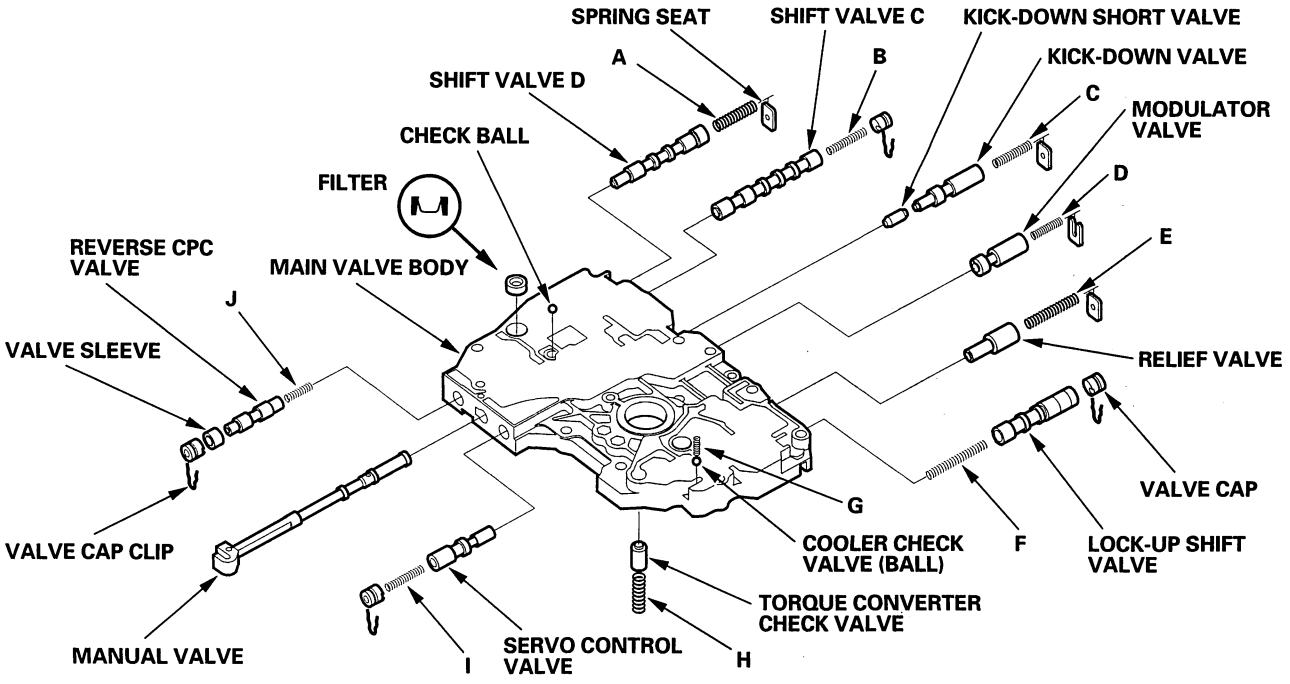


Protected by AR

Valve Body

Main Valve Body Disassembly, Inspection, and Reassembly

1. Clean all parts thoroughly in solvent or carburetor cleaner, and dry them with compressed air. Blow out all passages.
2. Do not use a magnet to remove the check ball, it may magnetize the ball.
3. Inspect the valve body for scoring and damage. Replace the valve body as an assembly if any parts are worn or damaged.
4. Check all valves for free movement. If any fail to slide freely, refer to valve body repair (see page 14-238).
5. Coat all parts with ATF during assembly.
6. Install the new filter in the direction shown.



SPRING SPECIFICATIONS

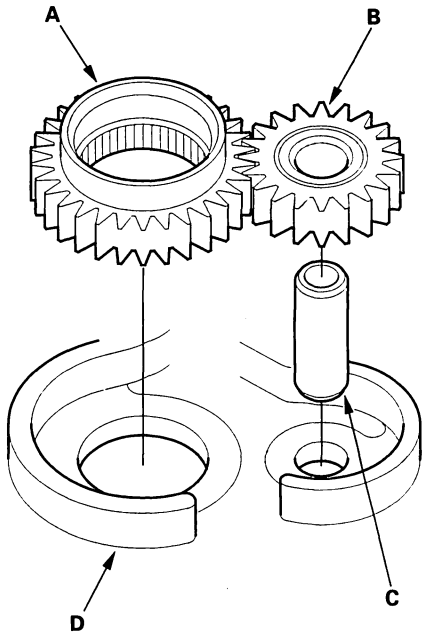
Springs		Standard (New)-Unit: mm (in.)			
		Wire Dia.	O.D.	Free Length	No. of Coils
A	Shift valve D spring	0.7 (0.028)	6.6 (0.260)	33.7 (1.327)	11.6
B	Shift valve C spring	0.8 (0.031)	6.6 (0.260)	49.1 (1.933)	21.7
C	Kick-down valve spring	0.8 (0.031)	6.6 (0.260)	49.1 (1.933)	21.7
D	Modulator valve spring	1.6 (0.063)	10.4 (0.409)	33.5 (1.319)	9.8
E	Relief valve spring	1.2 (0.047)	11.1 (0.437)	39.0 (1.535)	9.9
F	Lock-up shift valve spring	0.9 (0.035)	7.6 (0.299)	63.0 (2.480)	22.4
G	Cooler check valve spring	0.6 (0.024)	5.8 (0.228)	14.5 (0.571)	6.8
H	Torque converter check valve spring	1.2 (0.047)	8.6 (0.339)	34.4 (1.354)	11.7
I	Servo control valve spring	0.9 (0.035)	6.4 (0.252)	32.5 (1.280)	17.5
J	Reverse CPC valve spring	0.7 (0.028)	6.1 (0.240)	17.8 (0.701)	7.9

BACK

Protected by AR

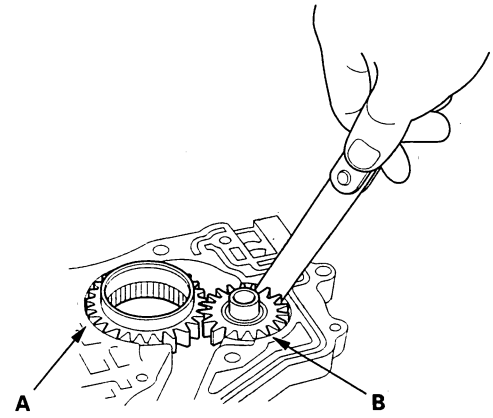
ATF Pump Inspection

1. Install the ATF pump drive gear (A), driven gear (B), and ATF pump driven gear shaft (C) in the main valve body (D). Lubricate all parts with ATF, and install the ATF pump driven gear with its grooved and chamfered side facing up.



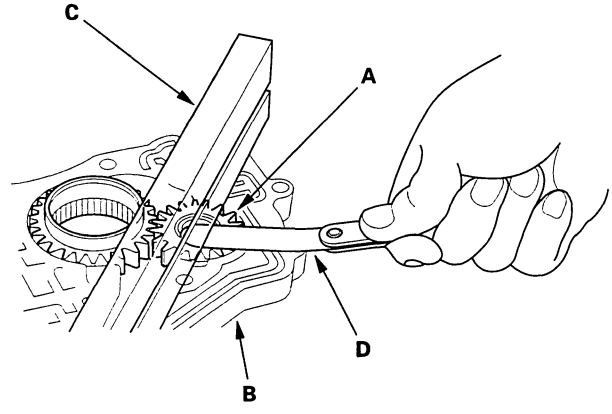
2. Measure the side clearance of the ATF pump drive gear (A) and driven gear (B).

ATF Pump Gears Side (Radial) Clearance:
Standard (New):
ATF Pump Drive Gear
0.210—0.265 mm (0.0083—0.00104 in.)
ATF Pump Driven Gear
0.070—0.125 mm (0.0028—0.0050 in.)



3. Remove the ATF pump driven gear shaft. Measure the thrust clearance between the ATF pump driven gear (A) and the valve body (B) with a straight edge (C) and a feeler gauge (D).

ATF Pump Drive/Driven Gear Thrust (Axial) Clearance:
Standard (New): 0.03—0.06 mm (0.001—0.002 in.)
Service Limit: 0.07 mm (0.003 in.)



Protected by AR

Valve Body

Regulator Valve Body Disassembly, Inspection, and Reassembly

1. Clean all parts thoroughly in solvent or carburetor cleaner, and dry them with compressed air. Blow out all passages.
2. Inspect the valve body for scoring and damage.
3. Check all valves for free movement. If any fail to slide freely, refer to valve body repair (see page 14-238).
4. Replace the valve body as an assembly if any parts are worn or damaged.
5. Hold the regulator spring cap in place while removing the stop bolt. The regulator spring cap is spring loaded. Once the stop bolt is removed, release the spring cap slowly so it does not pop out.
6. Reassembly is the reverse of disassembly. Install the filter in the direction shown.
7. Coat all parts with ATF during assembly.
8. Align the hole in the regulator spring cap with the hole in the valve body, then press the spring cap into the valve body, and tighten the stop bolt.
9. Install the new filter in the direction shown.

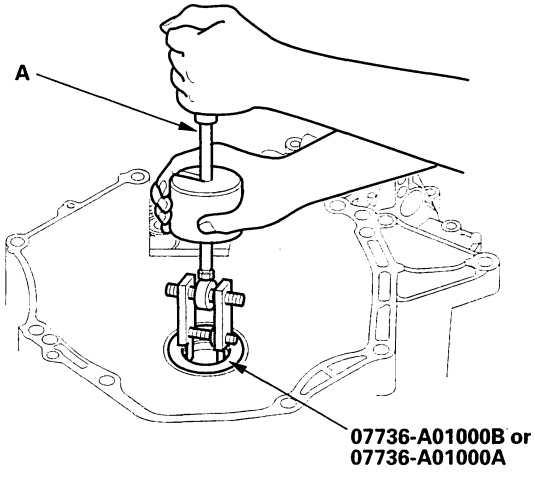
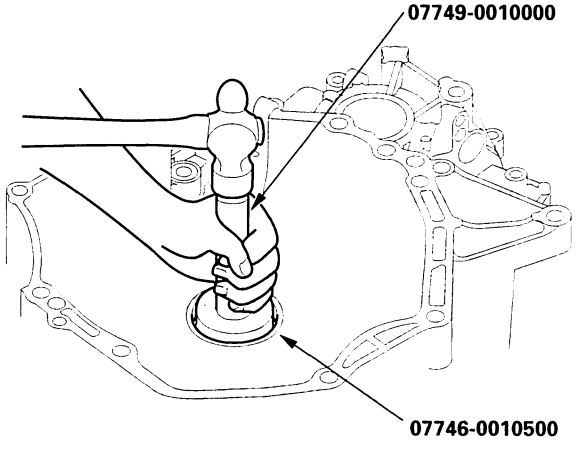
Mainshaft Bearing and Oil Seal Replacement

Special Tools Required
- Adjustable bearing puller, 25—40 mm 07736-A01000B or 07736-A01000A
- Driver 07749-0010000
- Attachment, 62 x 68 mm 07746-0010500
- Attachment, 72 x 75 mm 07746-0010600

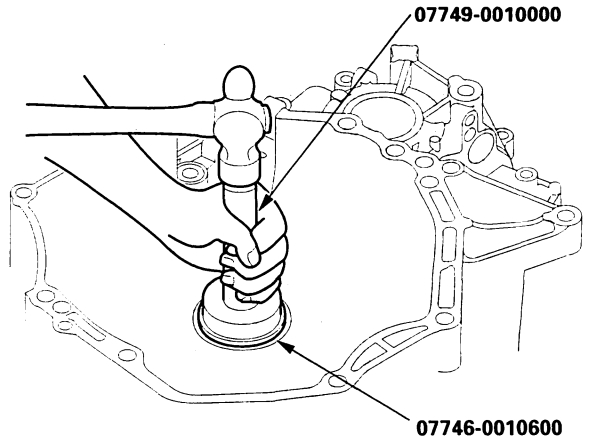
1. Remove the mainshaft bearing and oil seal with the special tool and a commercially available 3/8 "-16 slide hammer (A).



2. Install the new mainshaft bearing until it bottoms in the housing with the special tools.



3. Install the new oil seal flush to the housing with the special tools.

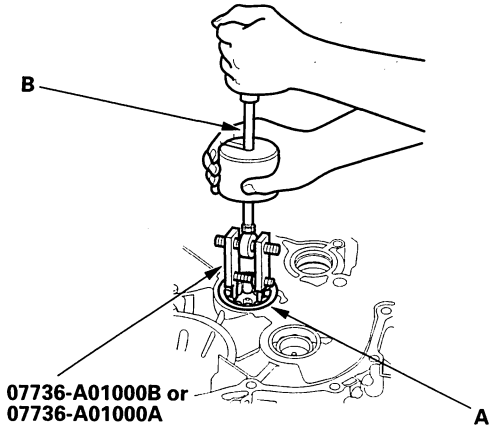


Protected by AR

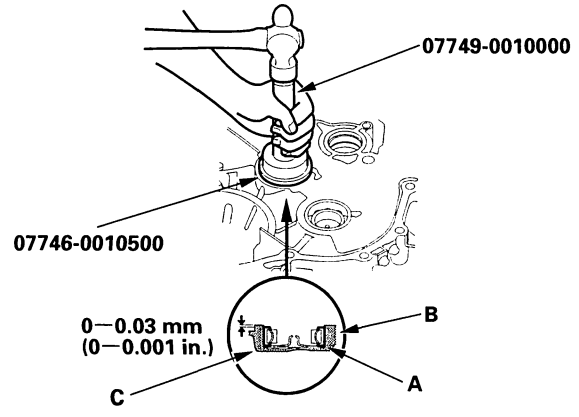
Countershaft Bearing Replacement

Special Tools Required
- Adjustable bearing puller, 25—40 mm 07736-A01000B or 07736-A01000A
- Driver 07749-0010000
- Attachment, 62 x 68 mm 07746-0010500

1. Remove the countershaft bearing (A) with the special tool and a commercially available 3/8 ″-16 slide hammer (B).



2. Install the ATF guide plate (A).

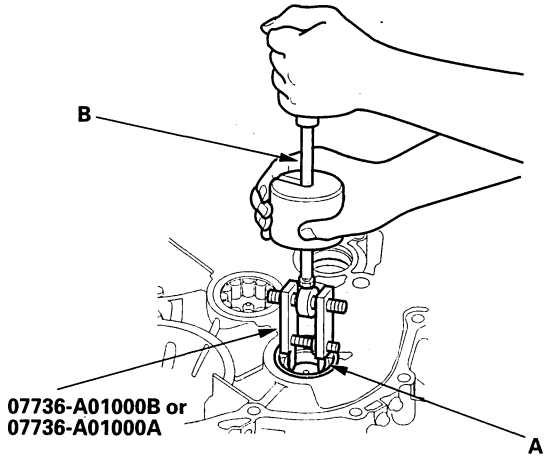


3. Install the new bearing (B) into the housing (C) with the special tools.

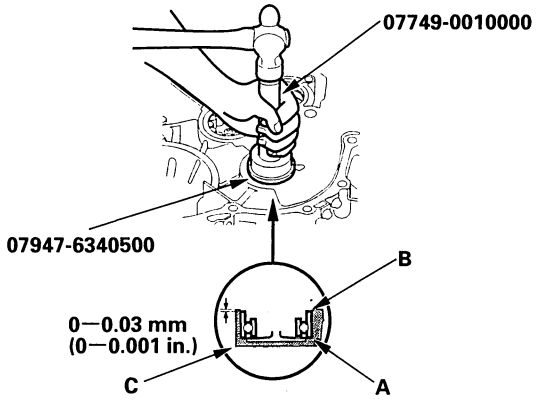
Secondary Shaft Bearing Replacement

Special Tools Required
- Adjustable bearing puller, 25—40 mm 07736-A01000B or 07736-A01000A
- Driver 07749-0010000
- Driver attachment 07947-6340500

1. Remove the secondary shaft bearing (A) with the special tool and a commercially available 3/8 ″-16 slide hammer (B).



2. Install the ATF guide plate (A).



3. Install the new bearing (B) into the housing (C) with the special tools.

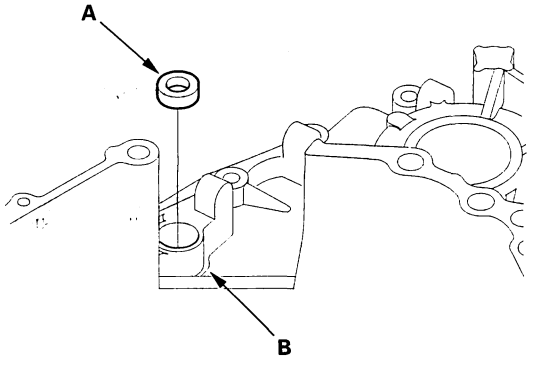
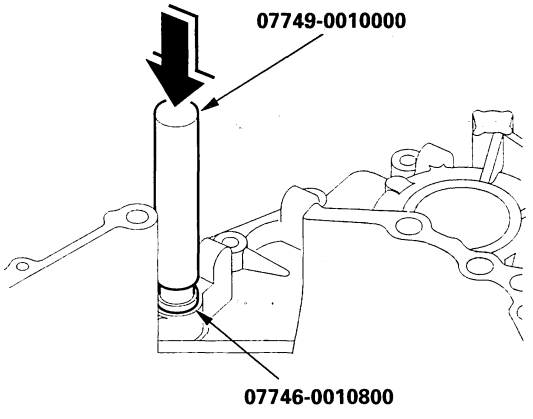
Selector Control Shaft Oil Seal Replacement

Special Tools Required
- Driver 07749-0010000
- Attachment, 22 x 24 mm 07746-0010800

1. Remove the oil seal (A), from the torque converter housing (B).



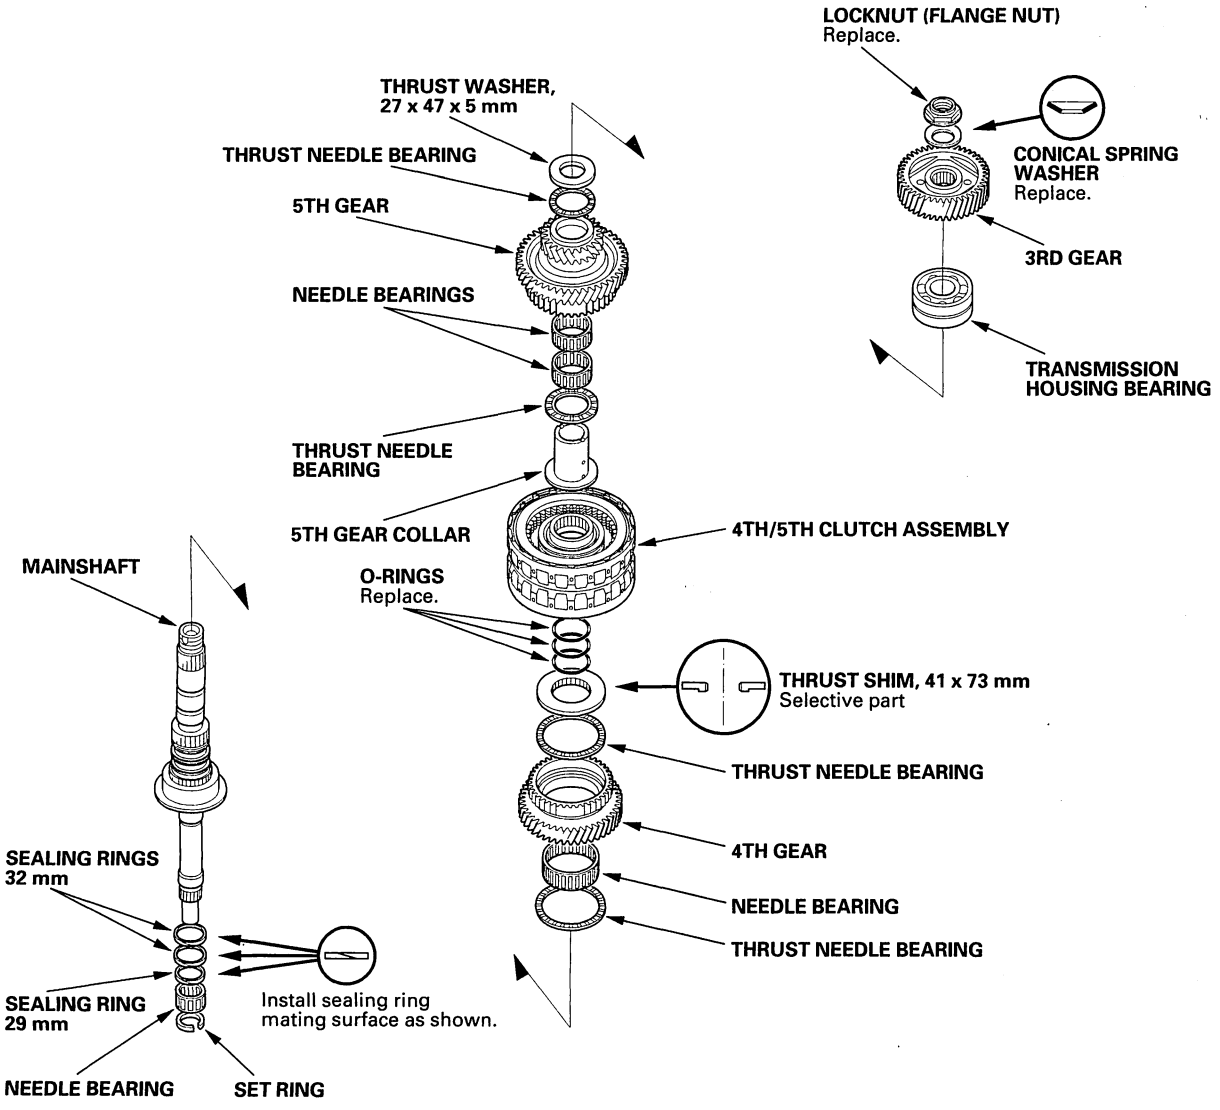
2. Install the new oil seal flush to the torque converter housing with the special tools.



Protected by AR

Mainshaft Disassembly, Inspection, and Reassembly

1. Lubricate all parts with ATF during assembly.



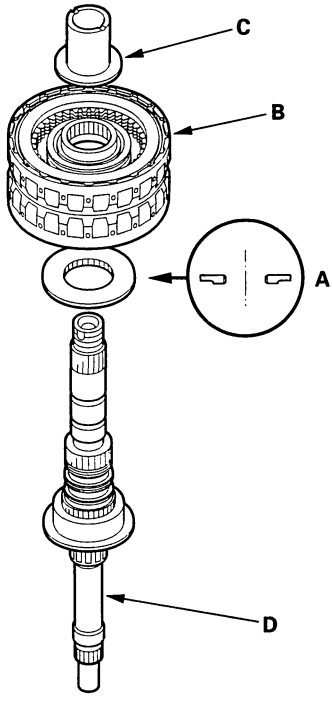
2. Check the clearance of the 4th/5th clutch assembly (see page 14-251).
3. Inspect the thrust needle bearing and the needle bearing for scoring and rough movement.
4. Inspect the splines for excessive wear and damage.
5. Check shaft bearing surfaces for scoring and excessive wear.
6. Before installing the O-rings, wrap the shaft splines with tape to prevent O-ring damage.
7. Install the 41 x 73 mm thrust shim and conical spring washer in the direction shown.
8. Inspect the condition of the sealing rings. If the sealing rings are worn, distorted, or damaged, replace them (see page 14-252).

BACK

Protected by AR

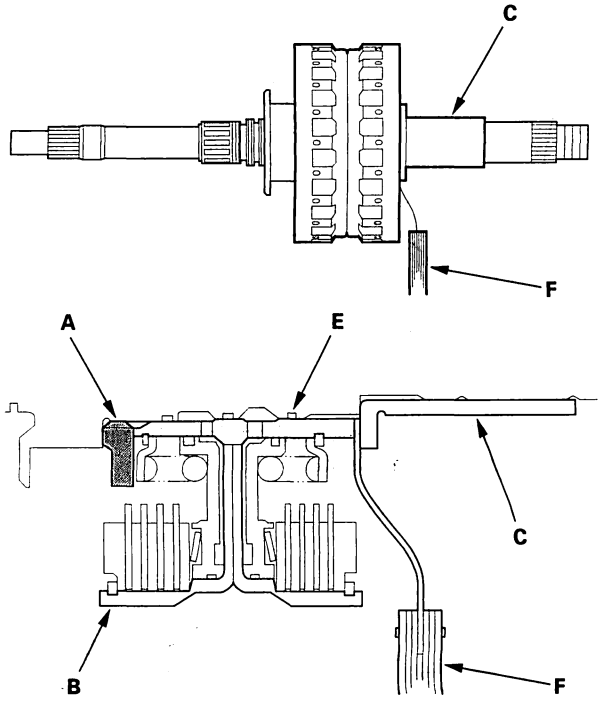
4th/5th Clutch Clearance Inspection

1. Remove the O-rings from the mainshaft.
2. Assemble the 41 x 73 mm thrust shim (A), 4th/5th clutch assembly (B), and 5th gear collar (C) on the mainshaft (D).



3. Hold the 5th gear collar (C) against the clutch assembly (B), then measure the clearance between the clutch guide (E) and the 5th gear collar with a feeler gauge (F) in at least three places. Use the average as the actual clearance.

Standard: 0.03—0.11 mm (0.001—0.004 in.)



4. If the clearance is out of standard, remove the thrust shim and measure its thickness.
5. Select and install a new shim, then recheck.

THRUST SHIM, 41 x 73 mm

No.	Part Number	Thickness
1	90414-P7W-000	7.85 mm (0.309 in.)
2	90415-P7W-000	7.90 mm (0.311 in.)
3	90416-P7W-000	7.95 mm (0.313 in.)
4	90417-P7W-000	8.00 mm (0.315 in.)
5	90418-P7W-000	8.05 mm (0.317 in.)
6	90419-P7W-000	8.10 mm (0.319 in.)

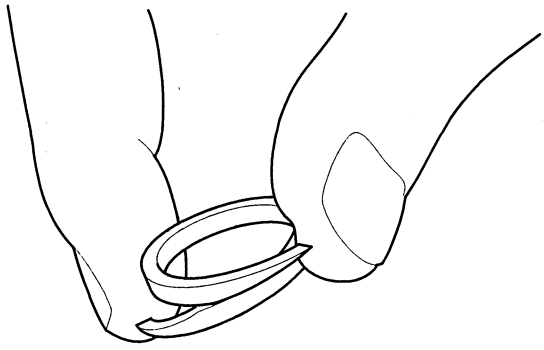
6. After replacing the thrust shim, make sure the clearance is within standard.

Protected by AR

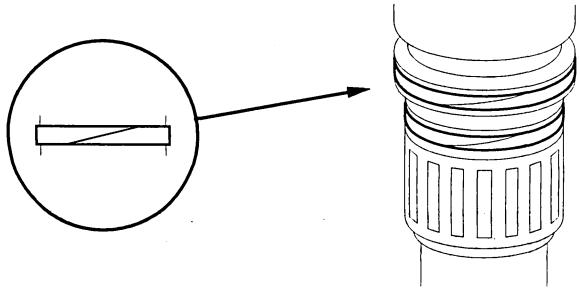
Mainshaft Sealing Ring Replacement

The sealing rings are synthetic resin with chamfered ends. Check the condition of the sealing rings, and replace them only if they are worn, distorted, or damaged.

1. For a better fit, squeeze sealing rings together slightly before installing them.



2. Apply ATF to the new sealing rings then install them on the mainshaft.



3. After installing the sealing rings, verify the following:

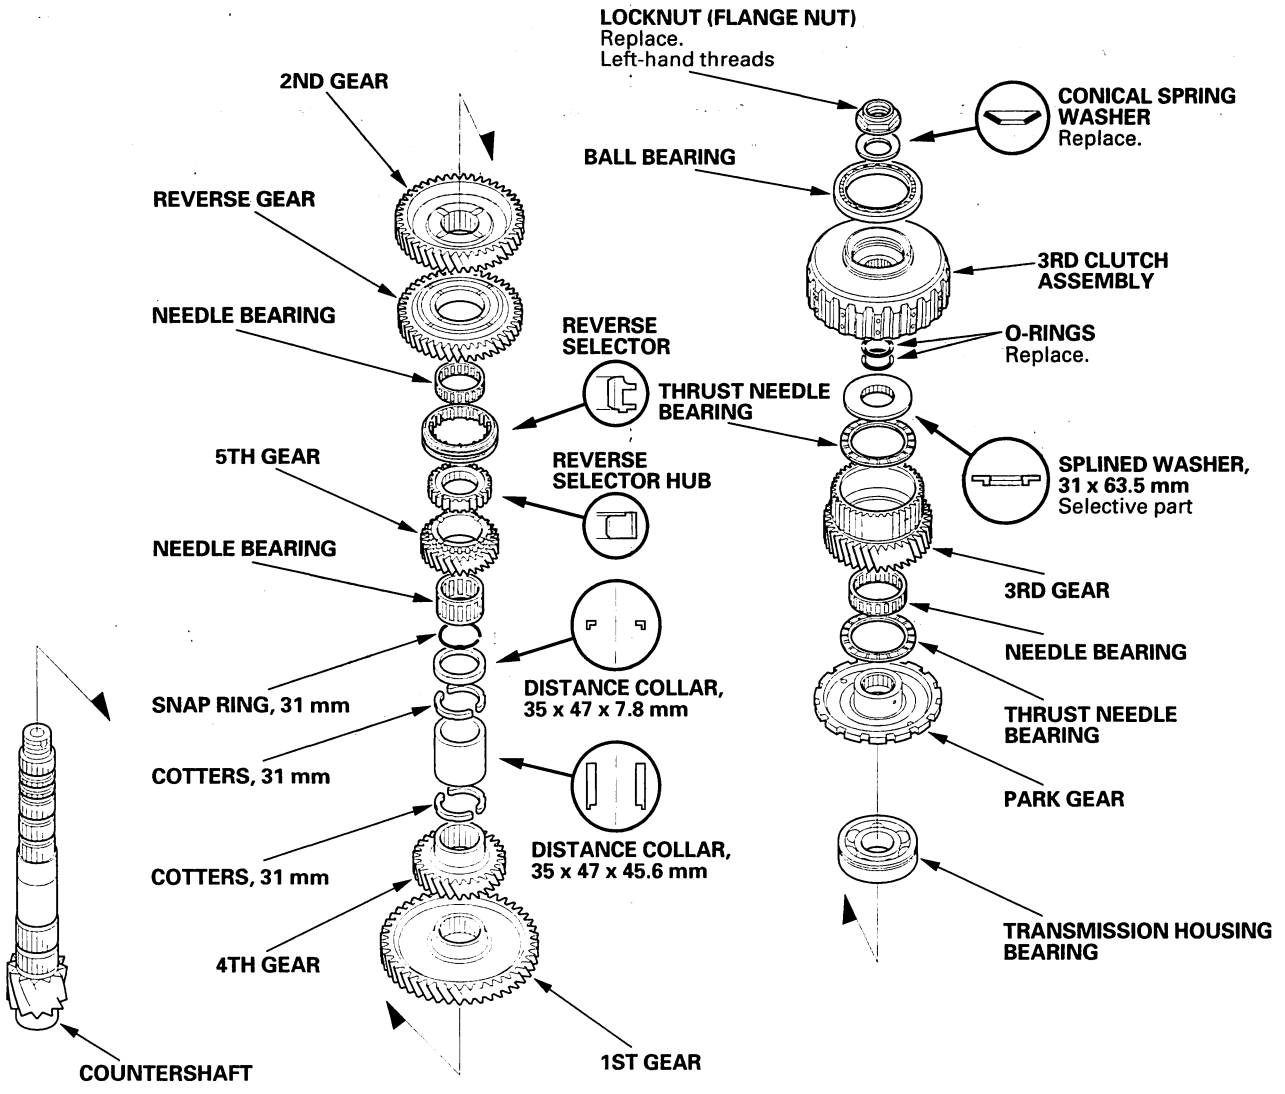
   - The rings are fully seated in the groove.
   - The rings are not twisted.
   - The chamfered ends of the rings are properly joined.

BACK

Protected by AR

Countershaft Disassembly, Inspection, and Reassembly

1. Remove the locknut, and take off components down to the reverse selector hub.



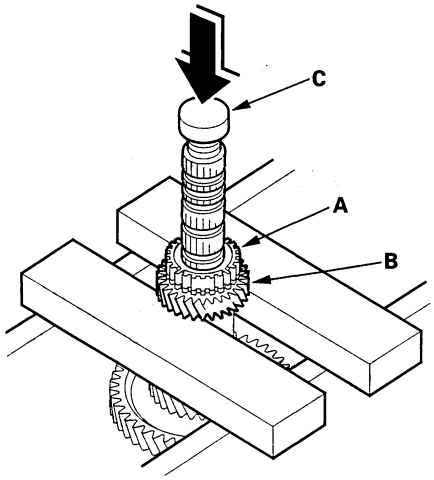
2. Remove the reverse selector hub, 4th gear, and 1st gear (see page 14-254).
3. Check the bearing on the 3rd clutch for wear and rough movement. If the bearing is worn or damaged, replace it (see page 14-256).
4. Inspect the thrust needle bearing and the needle bearing for scoring and rough movement.
5. Check the splines for excessive wear and damage.
6. Check the shaft bearing surfaces for scoring and excessive wear.
7. Lubricate all parts with ATF, and reassemble the shaft and gears.
8. Install the distance collars, reverse selector hub, reverse selector, splined washer, and conical spring washer in the direction shown.

Protected by AR

Countershaft Reverse Selector Hub and 4th Gear Removal

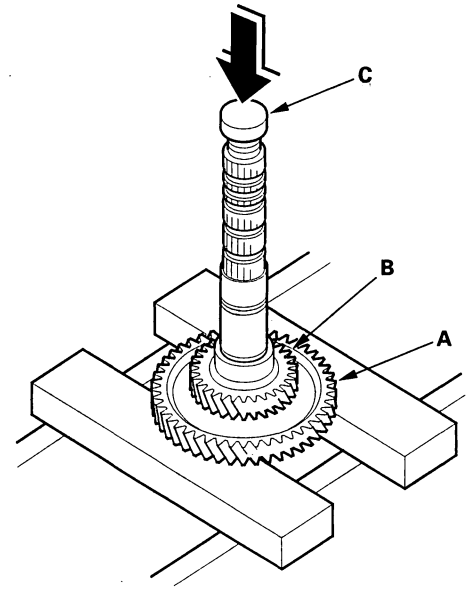
1. Remove the reverse selector hub (A) and the 5th gear (B) from the countershaft with a press. Place a shaft protector (C) between the countershaft and press to prevent damaging the countershaft.

   NOTE: Some reverse selector hubs are not press-fitted, and can be removed without using a press.



2. Remove the needle bearing, snap ring, 35 x 47 x 7.8 mm distance collar, 31 mm cotters, 35 x 47 x 45.6 mm distance collar, and 31 mm cotters from the countershaft.

3. Remove the 1st gear (A) and 4th gear (B) from the countershaft with a press. Place a shaft protector (C) between the countershaft and press to prevent damaging the countershaft.



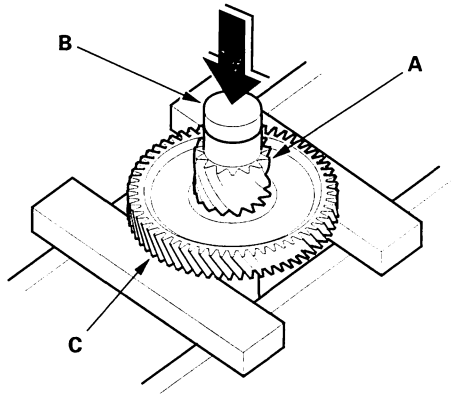
BACK

Protected by AR

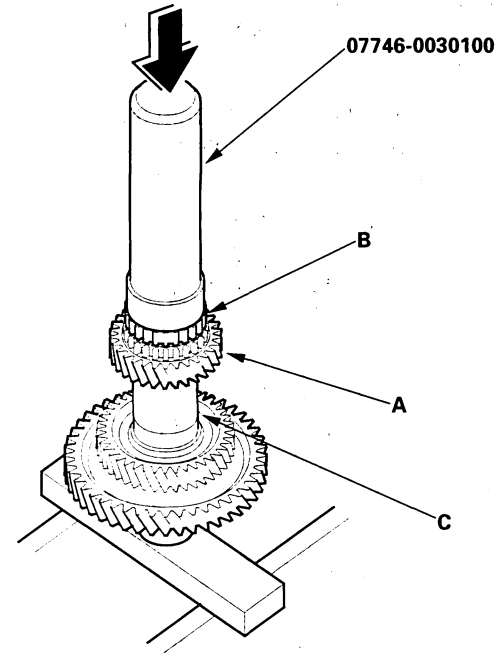
Countershaft 4th Gear and Reverse Selector Hub Installation

Special Tools Required
Driver, 40 mm I.D. 07746-0030100

1. Apply ATF to the parts.
2. Install the 1st gear on the countershaft by hand.
3. Align the shaft splines with those on 4th gear, then press the countershaft (A) into the 4th gear with a press. Place a shaft protector (B) between the countershaft and press to prevent damaging the countershaft.



4. Stop pressing the countershaft when the 4th gear contacts the 1st gear (C).
5. Install the 31 mm cotters, 35 x 47 x 45.6 mm distance collar, 31 mm cotters, 35 x 47 x 7.8 mm distance collar, snap ring, needle bearing, and 5th gear (A) on the countershaft.



6. Slide the reverse selector hub (B) over the countershaft (C), then press it into place with the special tool and a press.

   NOTE: Some reverse selector hubs are not press fitted, and can be installed without using the special tool and a press.

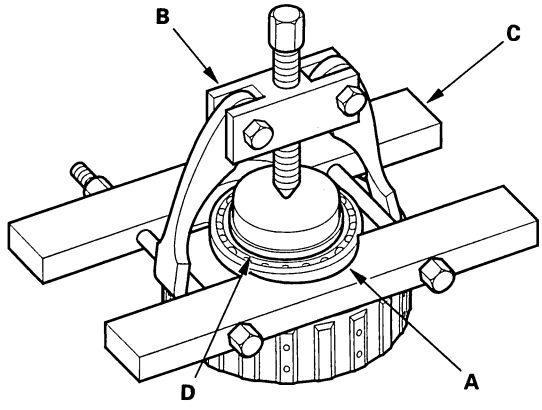
Protected by AR

3rd Clutch Ball Bearing Replacement

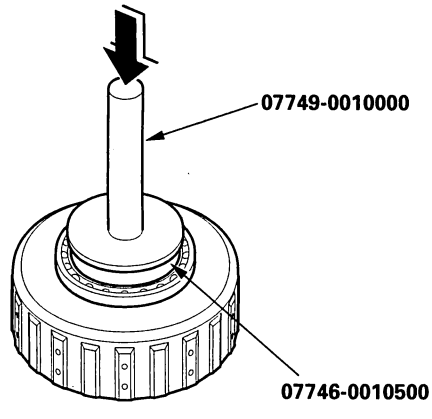
Special Tools Required
- Driver 07749-0010000
- Attachment, 62 x 68 mm 07746-0010500

NOTE: Check the bearing for wear and rough movement. If the bearing is OK, removal is not necessary.

1. Remove the ball bearing (A) from the 3rd clutch with a commercially available bearing puller (B), bearing separator (C), and stepper adapter (D).



2. Install the new bearing on the 3rd clutch with the special tools and a press.

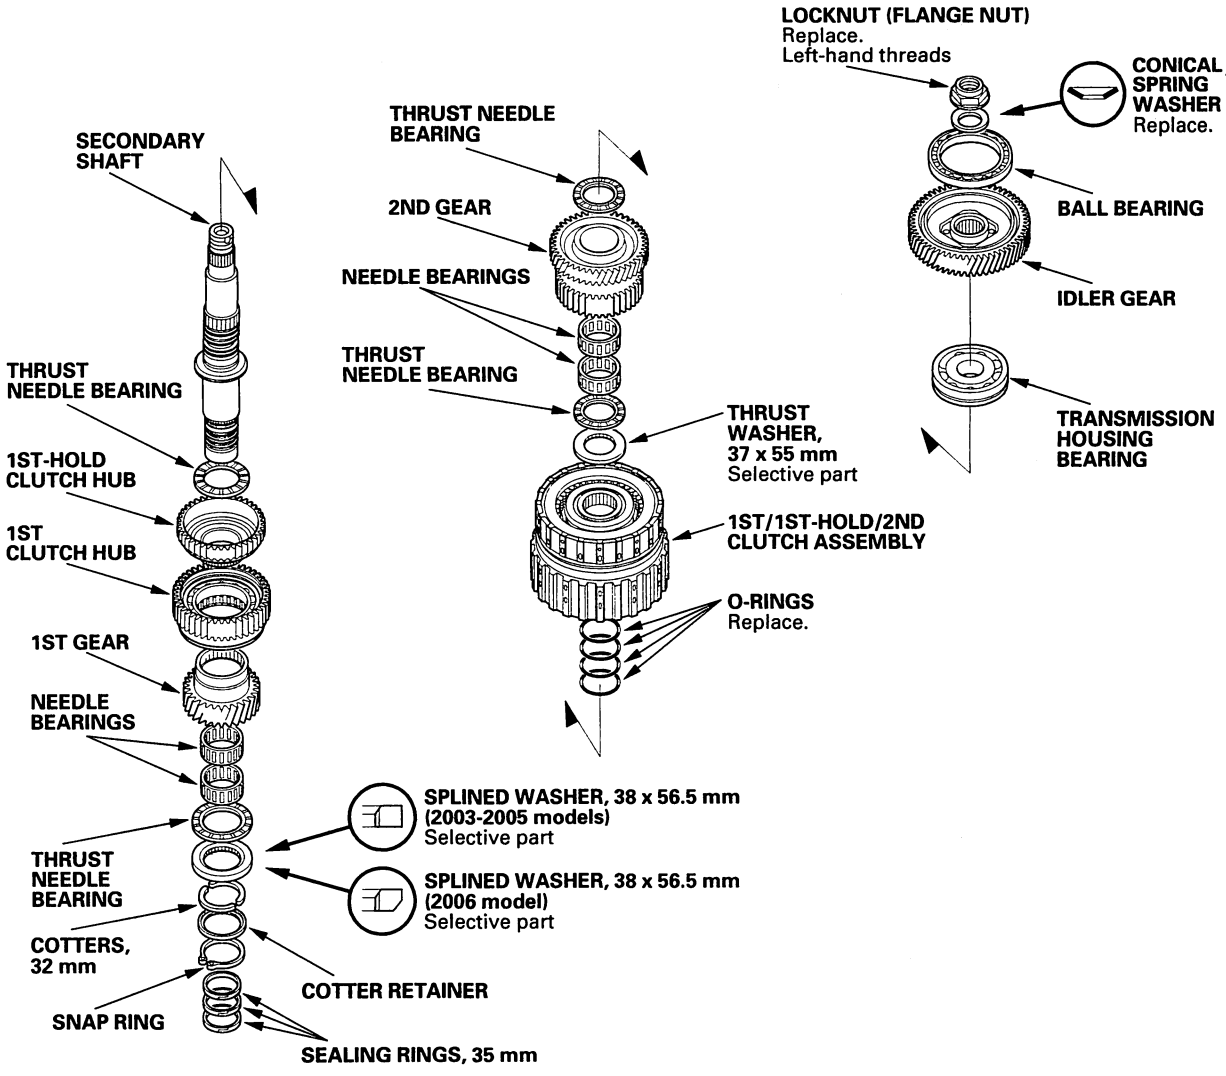


BACK

Protected by AR

Secondary Shaft Disassembly, Inspection, and Reassembly

1. Remove the locknut, and disassemble the shaft and gears.

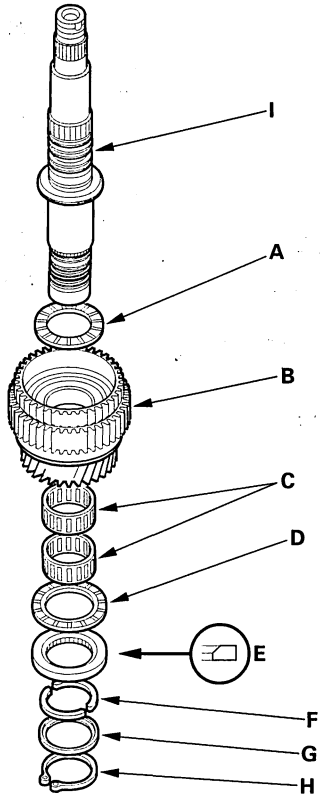


2. Inspect the thrust needle bearing and needle bearing for wear and rough movement.
3. Check the clearance of the secondary shaft assembly.
4. Check the splines for excessive wear and damage.
5. Check the shaft bearing surfaces for scoring and excessive wear.
6. Check the idler gear bearing for wear and rough movement. If the bearing is worn or damaged, replace it (see page 14-260).
7. Before installing the O-rings, wrap the shaft splines with tape to prevent damage to the O-rings.
8. Lubricate all parts with ATF during reassembly.
9. Install the splined washer and conical spring washer in the direction shown.

Protected by AR

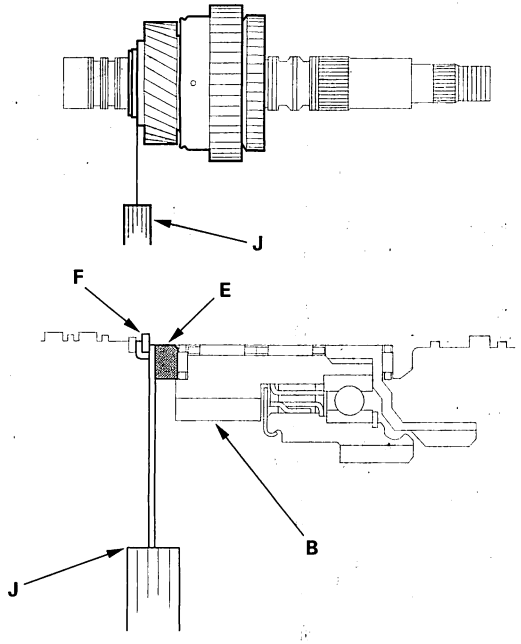
Secondary Shaft Clearance Inspection

1. Remove the O-rings from the secondary shaft.
2. Assemble the thrust needle bearing (A), 1st gear assembly (B), needle bearings (C), thrust needle bearing (D), 38 x 56.5 mm splined washer (E), 32 mm cotters (F), cotter retainer (G), and snap ring (H) on the secondary shaft (I).



3. Measure the clearance between the 38 x 56.5 mm splined washer (E) and cotters (F) with a feeler gauge (J) in at least three places. Use the average as the actual clearance.

Standard: 0.07—0.15 mm (0.003—0.006 in.)



4. If the measurement is out of standard, remove the splined washer, and measure its thickness.
5. Select and install a new splined washer, then recheck the clearance.

SPLINED WASHER, 38 x 56.5 mm:
2003-2005 Models

No.	Part Number	Thickness
1	90502-P0Z-000	6.85 mm (0.270 in.)
2	90503-P0Z-000	6.90 mm (0.272 in.)
3	90504-P0Z-000	6.95 mm (0.274 in.)
4	90505-P0Z-000	7.00 mm (0.276 in.)
5	90506-P0Z-000	7.05 mm (0.278 in.)
6	90507-P0Z-000	7.10 mm (0.280 in.)

SPLINED WASHER, 38 x 56.5 mm:
2006 Model

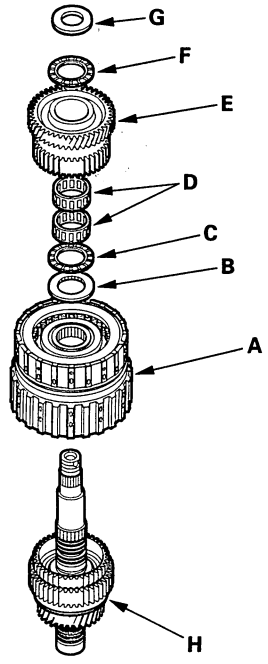
No.	Part Number	Thickness
1	90502-RAY-A00	6.85 mm (0.270 in.)
2	90503-RAY-A00	6.90 mm (0.272 in.)
3	90504-RAY-A00	6.95 mm (0.274 in.)
4	90505-RAY-A00	7.00 mm (0.276 in.)
5	90506-RAY-A00	7.05 mm (0.278 in.)
6	90507-RAY-A00	7.10 mm (0.280 in.)

BACK

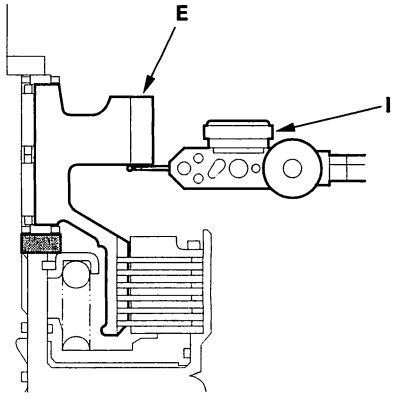
Protected by AR

6. Remove the 27 x 47 x 5 mm thrust washer from the mainshaft.

7. Assemble the 1st/1st-hold/2nd clutch assembly (A), 37 x 55 mm thrust washer (B), thrust needle bearing (C), needle bearings (D), 2nd gear (E), thrust needle bearing (F), and 27 x 47 x 5 mm thrust washer (removed from mainshaft) (G) on the secondary shaft sub-assembly (H).

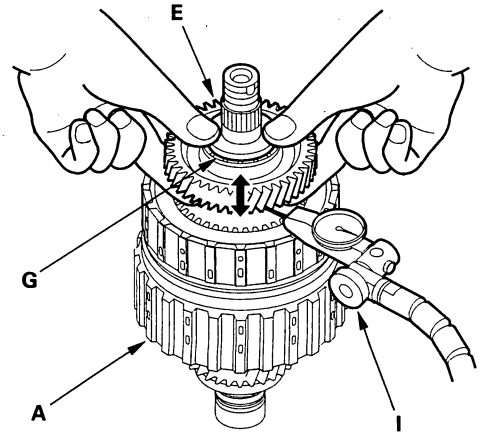


8. Set the dial indicator (I) on the 2nd gear (E).



9. Hold the 27 x 47 x 5 mm thrust washer (G) against the clutch assembly (A), and measure the 2nd gear axial clearance in at least three places while moving the 2nd gear (E). Use the average as the actual clearance.

Standard: 0.04—0.12 mm (0.002—0.005 in.)



10. If the measurement is out of standard, remove the 37 x 55 mm thrust washer and measure its thickness.

11. Select and install a new thrust washer, then recheck the clearance.

THRUST SHIM, 37 x 55 mm

No.	Part Number	Thickness
1	90406-P0Z-000	4.90 mm (0.193 in.)
2	90407-P0Z-000	4.95 mm (0.195 in.)
3	90408-P0Z-000	5.00 mm (0.197 in.)
4	90409-P0Z-000	5.05 mm (0.199 in.)
5	90410-P0Z-000	5.10 mm (0.201 in.)
6	90411-P0Z-000	5.15 mm (0.203 in.)
7	90412-P0Z-000	5.20 mm (0.205 in.)

12. Disassemble the shaft and gears.

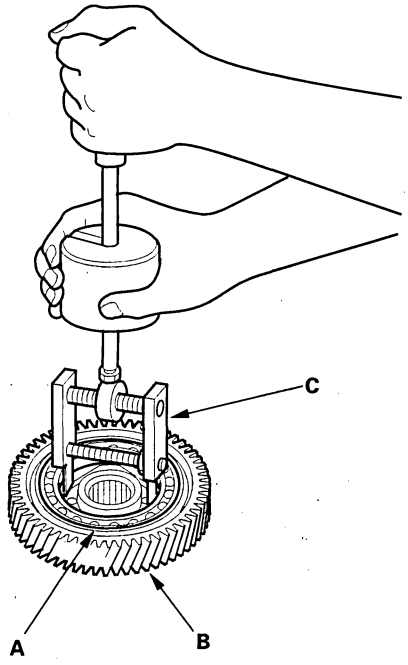
13. Reinstall the 27 x 47 x 5 mm thrust washer on the mainshaft.

Protected by AR

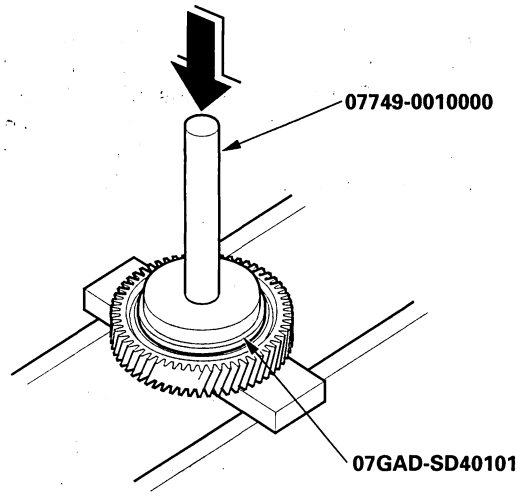
Secondary Shaft Idler Gear Bearing Replacement

Special Tools Required
- Driver 07749-0010000
- Attachment, 78 x 90 mm 07GAD-SD40101

1. Check the bearing for wear, damage, and rough movement. If the bearing is worn or damaged, go to step 2.
2. Place the secondary shaft idler gear in a vise with soft jaws.
3. Remove the bearing (A) from the secondary shaft idler gear (B) with a commercially available bearing puller (C).



4. Install the bearing on the secondary shaft idler gear with the special tools and a press.

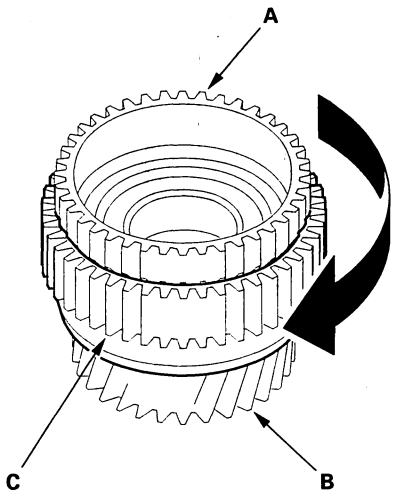


BACK

Protected by AR

1st Gear One-way Clutch Inspection

1. Hold the 1st-hold clutch hub (A), and turn the 1st gear (B) in the direction shown to be sure it turns freely. Also make sure the 1st gear does not turn in the opposite direction.



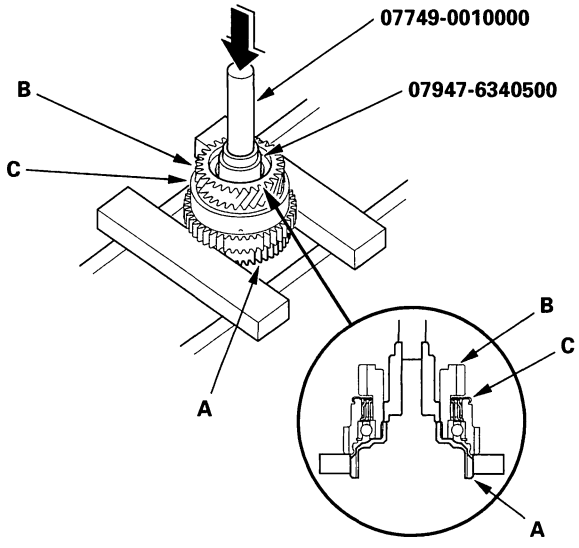
2. If any problem occurs on the 1st gear one-way clutch, replace the 1st clutch hub (C). The 1st gear one-way clutch is not available separately from the 1st clutch hub.

Protected by AR

1st Clutch Hub Replacement

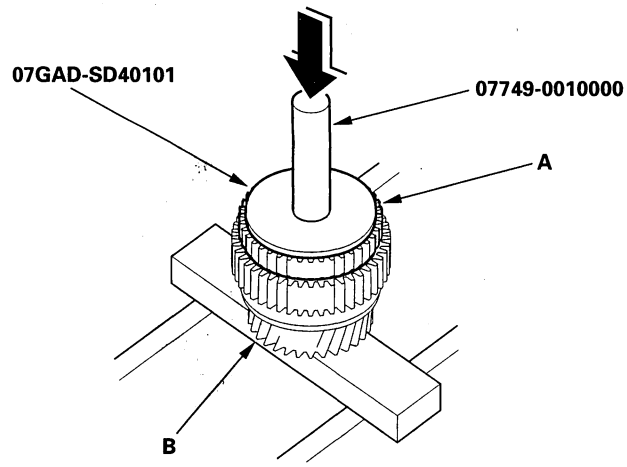
Special Tools Required
- Driver 07749-0010000
- Driver attachment 07947-6340500
- Attachment, 78 x 90 mm 07GAD-SD40101

1. Remove the 1st-hold clutch hub (A) from the 1st gear (B) with the special tools and a press.



2. Remove the 1st clutch hub (C) from the 1st gear, then install the new 1st clutch hub in the 1st gear.

3. Install the 1st-hold clutch hub (A) in the 1st gear (B) with the special tools and a press.



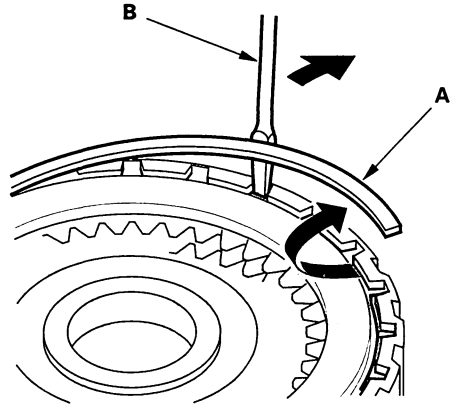
BACK

Protected by AR

Clutch Disassembly

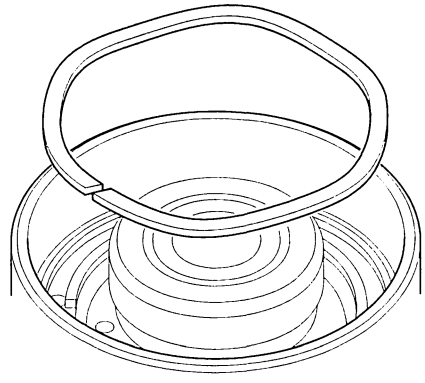
Special Tools Required
- Clutch spring compressor attachment 07LAE-PX40100 or 07HAE-PL50101
- Clutch spring compressor bolt assembly 07GAE-PG40200 or 07GAE-PG4020A

1. Remove the snap ring (A), then remove the clutch end plate, the clutch discs, and the plates with a screwdriver (B).



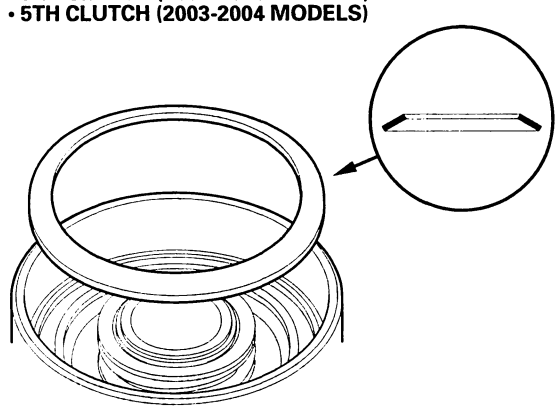
2. Make reference marks on the 2nd clutch waved-plates on the 2006 model.

3. Remove the waved spring from the 3rd clutch (2003 model) and 4th clutch (2003-2004 models).

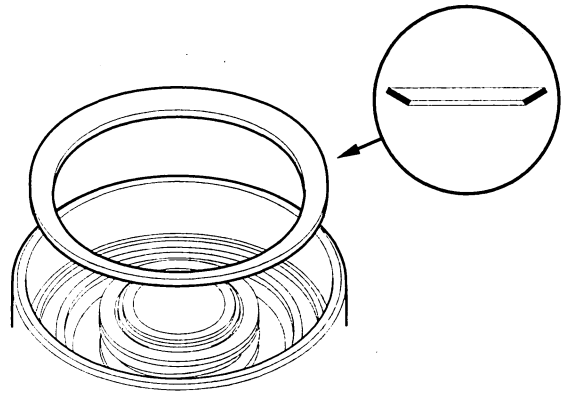


4. Remove the disc spring from the 1st clutch, 5th clutch, 3rd clutch (2004-2006 models), and 4th clutch (2005-2006 models).

- **1ST CLUTCH**
- **3RD CLUTCH (2004-2006 MODELS)**
- **5TH CLUTCH (2003-2004 MODELS)**



- **4TH CLUTCH (2005-2006 MODELS)**
- **5TH CLUTCH (2005-2006 MODELS)**

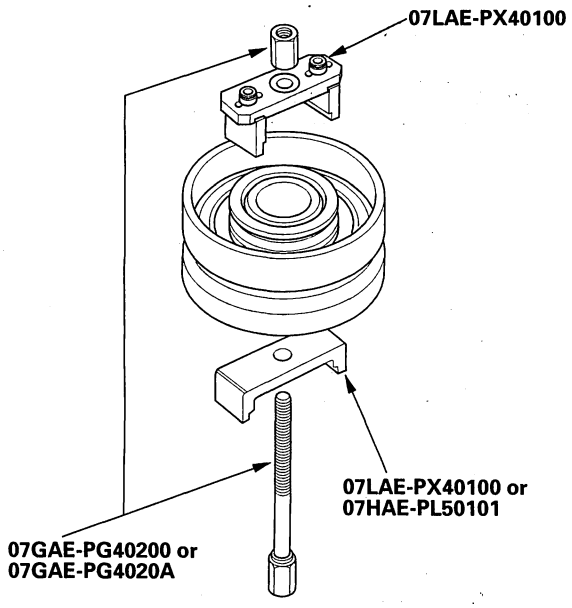


(cont'd)

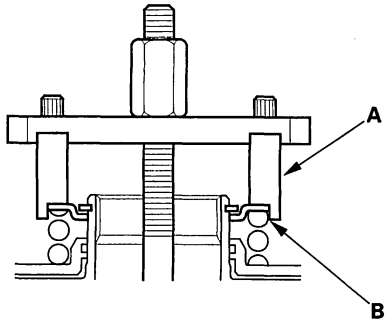
Protected by AR

Clutch Disassembly (cont'd)

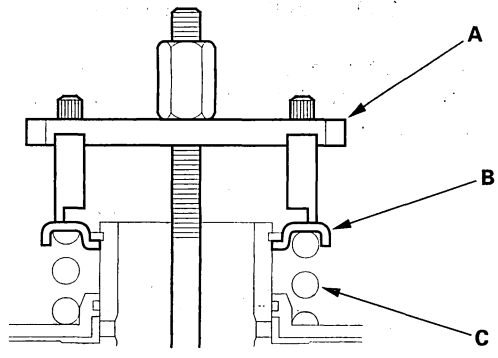
5. Install the special tools on the clutch assembly.



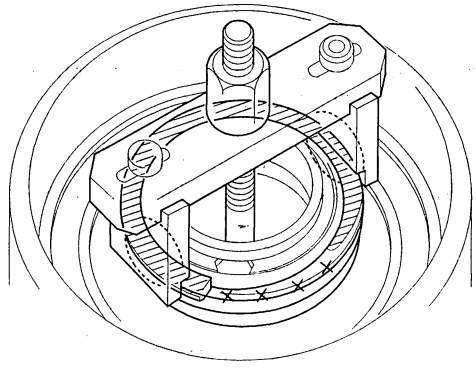
6. Be sure the special tool (A) is adjusted to have full contact with the spring retainer (B) on the 1st, 4th, and 5th clutches.



7. Set the special tool (A) on the spring retainer (B) of the 2nd and 3rd clutches so the special tool works on the clutch return spring (C).



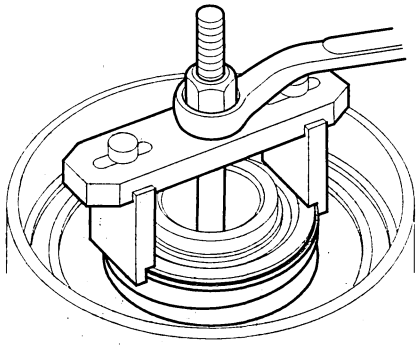
8. If either end of the special tool is set over an area of the spring retainer which is unsupported by the return spring, the retainer may be damaged.



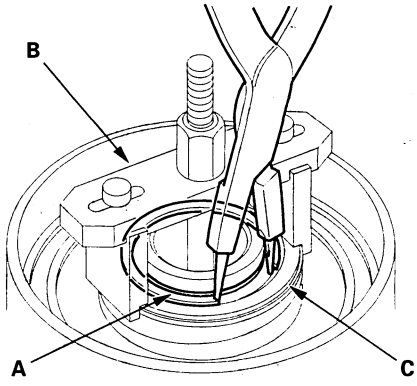
BACK

Protected by AR

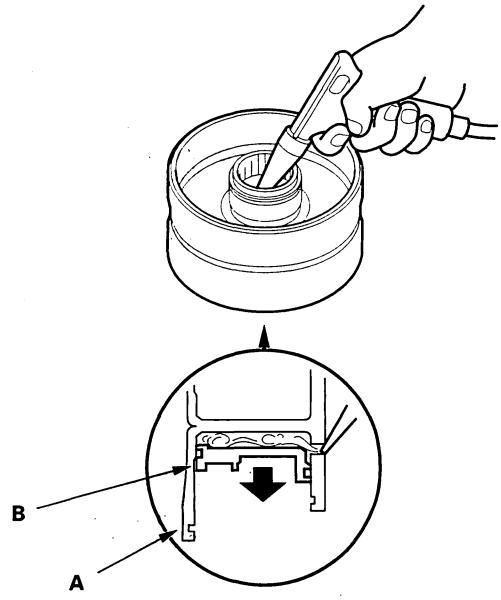
9. Compress the spring until the snap ring can be removed.



10. Remove the snap ring (A). Then remove the special tools (B), spring retainer (C), and return spring.



11. Wrap a shop rag around the clutch drum (A), and apply air pressure to the fluid passage to remove the piston (B). Place a finger tip on the other end while applying air pressure.

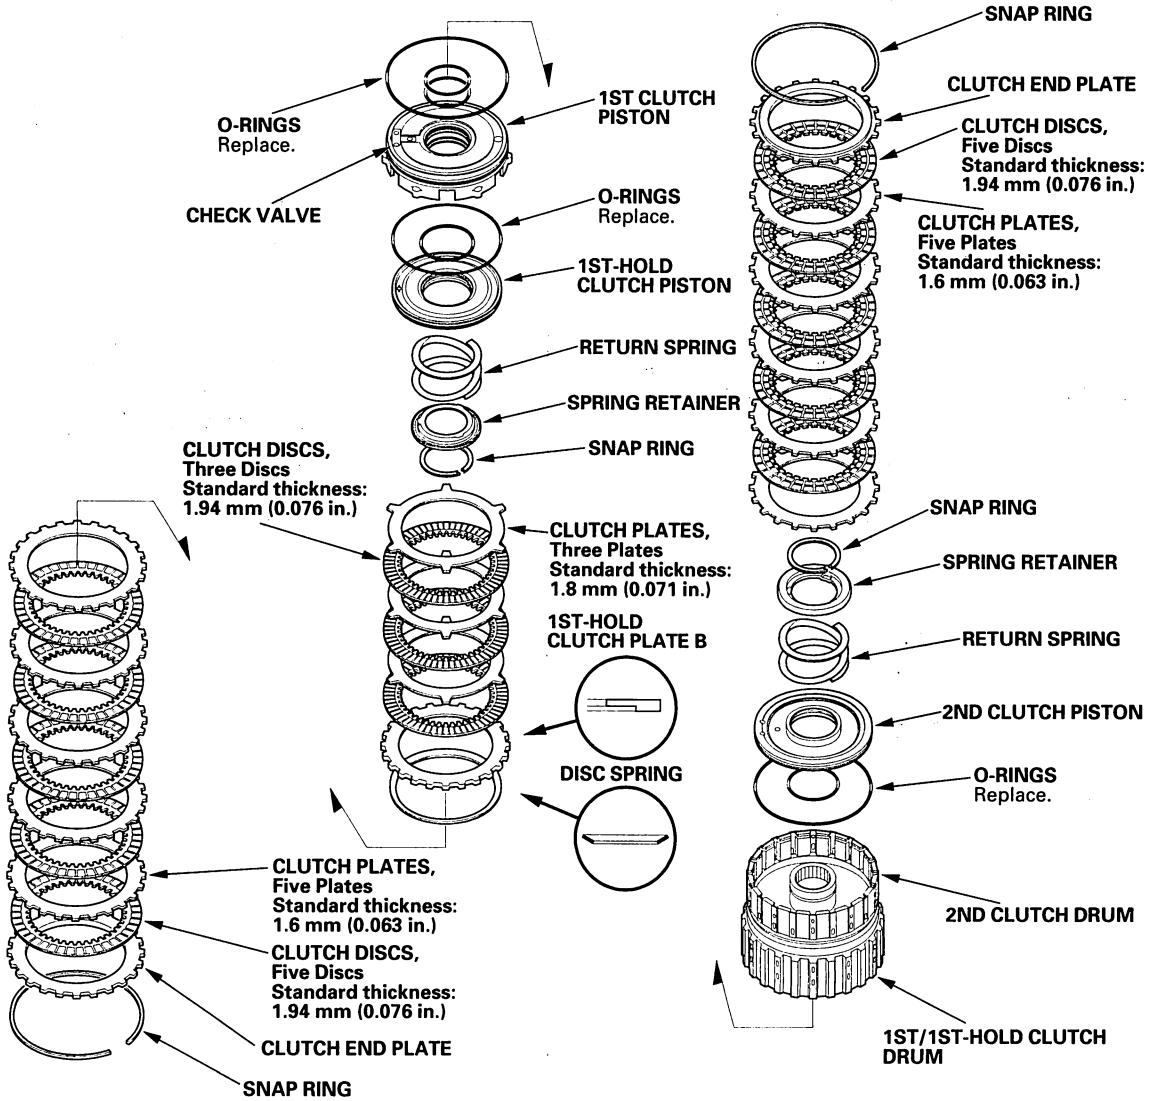


Protected by AR

Clutch Inspection

1st/1st-hold/2nd Clutch (2003-2005 Models)

1. Inspect the clutch piston and clutch piston check valve. If the clutch check valve is loose or stuck damaged, replace the clutch piston.



2. Check the spring retainer for wear and damage.

3. Inspect the clutch discs, clutch plates, and clutch end plate for wear, damage, and discoloration.

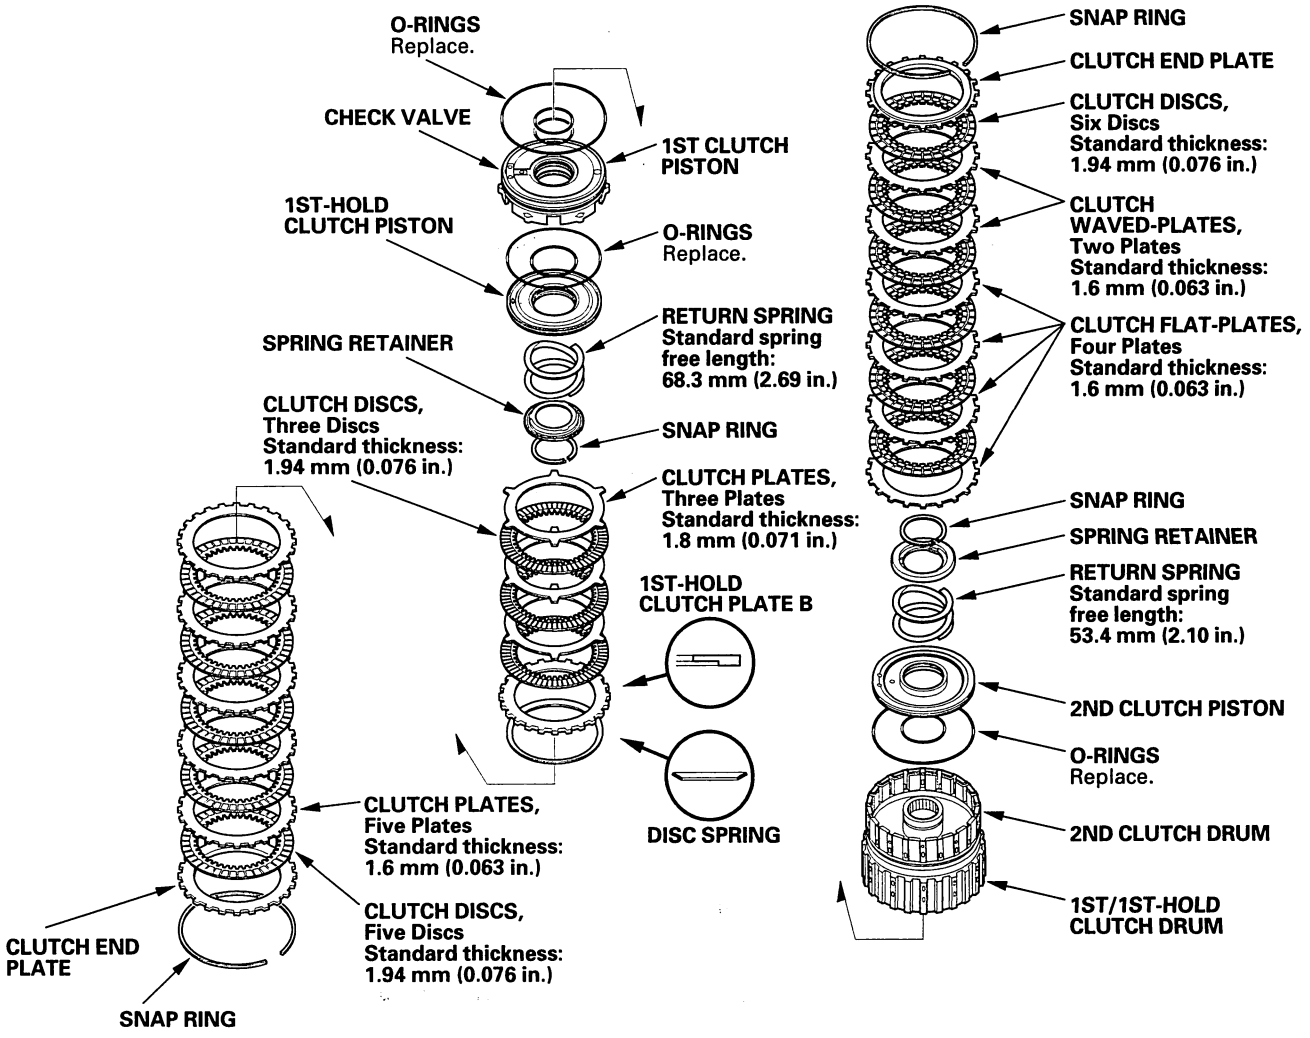
   - If the clutch discs are worn or damaged, replace the discs as a set.
   - If the clutch plates are worn, damaged, or discolored, replace the plates as a set.
   - If the clutch end plate is worn, damaged, or discolored, inspect the clutch end-plate-to-top-disc clearance, then replace the clutch-end-plate.
   - If the 1st-hold clutch plate B is worn, damaged, or discoloration, inspect the 1st-hold clutch plate B-to-top-disc clearance, then replace plate B.

BACK

Protected by AR

1st/1st-hold/2nd Clutch (2006 Models)

1. Inspect the clutch piston and clutch piston check valve. If the clutch check valve is loose, stuck, or damaged, replace the clutch piston.



2. Check the spring retainer for wear and damage.

3. Inspect the clutch discs, clutch plates, and clutch end plate for wear, damage, and discoloration. Inspect the 2nd clutch waved-plate phase difference on the 2006 model (see page 14-273).

   - If the clutch discs are worn or damaged, replace the discs as a set.
   - If the clutch plates are worn, damaged, or discolored, replace the plates as a set.
   - If the clutch end plate is worn, damaged, or discolored, inspect the clutch end-plate-to-top-disc clearance, then replace the clutch-end-plate.
   - If the 1st-hold clutch plate B is worn, damaged, or discolored, inspect the 1st-hold clutch plate B-to-top-disc clearance, then replace plate B.

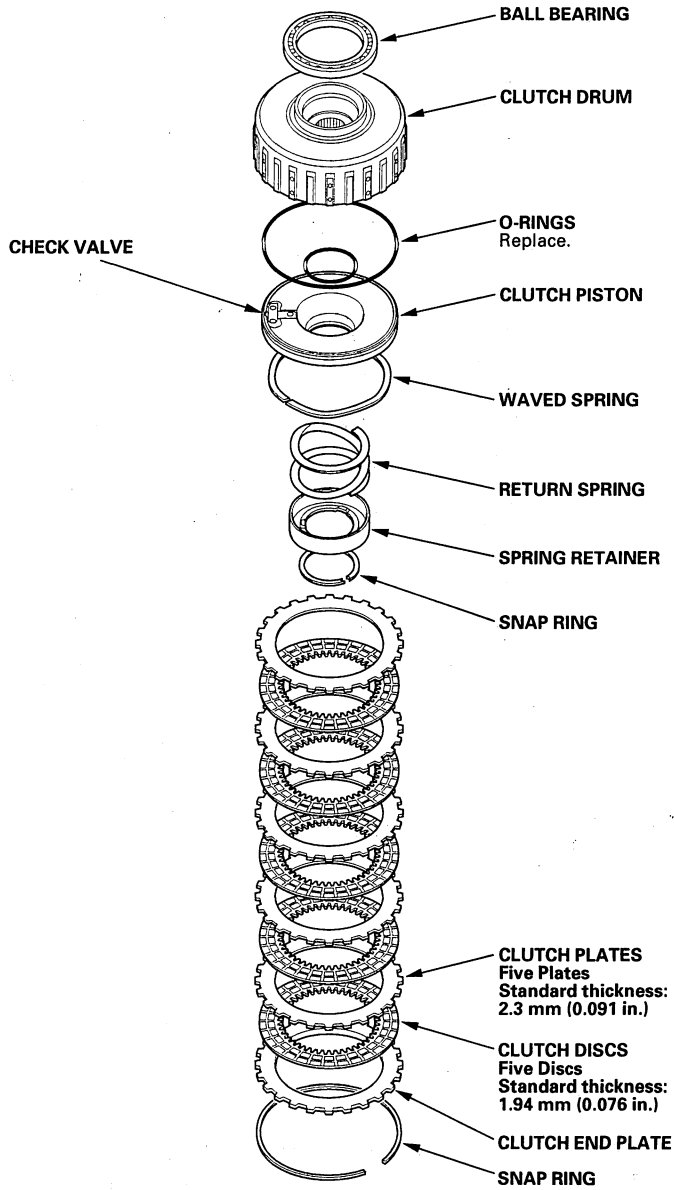
(cont'd)

Protected by AR

Clutch Inspection (cont'd)

3rd Clutch (2003 Model)

1. Inspect the clutch piston and clutch piston check valve. If the clutch check valve is loose or stuck damaged, replace the clutch piston.



2. Check the spring retainer for wear and damage.

3. Inspect the clutch discs, clutch plates, and clutch end plate for wear, damage, and discoloration.

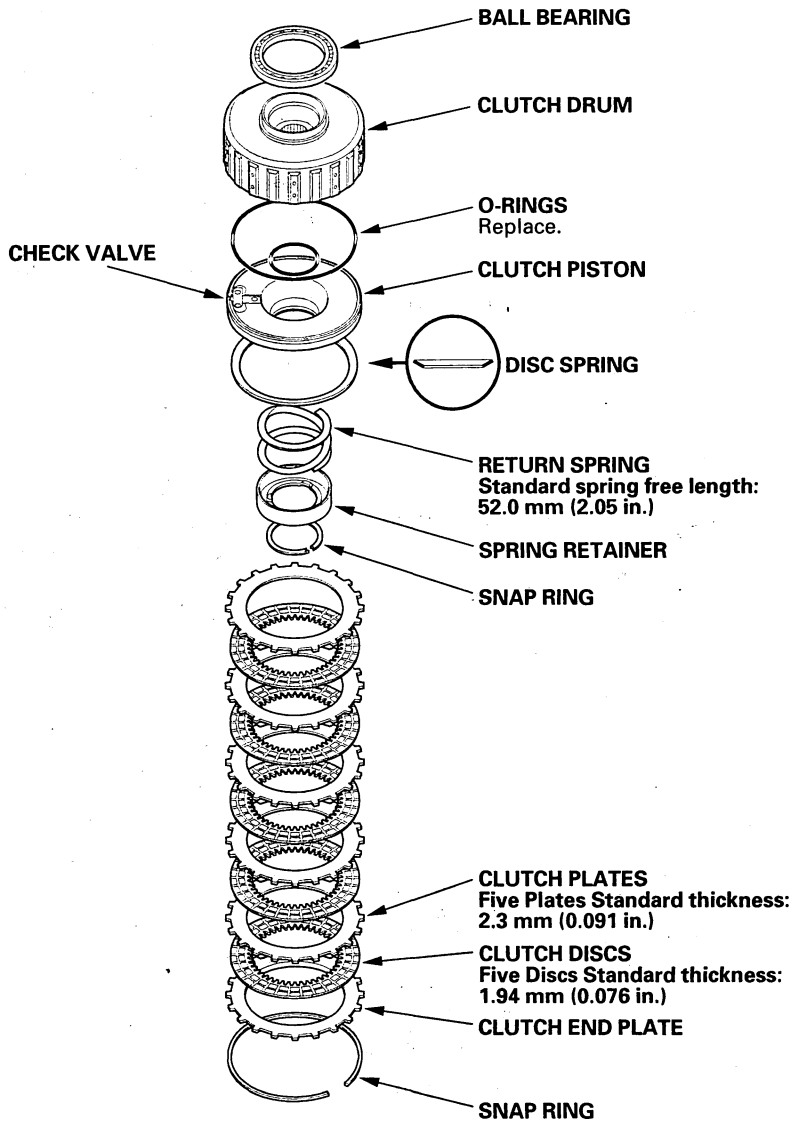
   - If the clutch discs are worn or damaged, replace the discs as a set.
   - If the clutch plates are worn, damaged, or discolored, replace the plates as a set.
   - If the clutch end plate is worn, damaged, or discolored, inspect the clutch end-plate-to-top-disc clearance, then replace the clutch end-plate.

BACK

Protected by AR

3rd Clutch (2004-2006 Models)

1. Inspect the clutch piston and clutch piston check valve. If the clutch check valve is loose, stuck, or damaged, replace the clutch piston.



2. Check the spring retainer for wear and damage.

3. Inspect the clutch discs, clutch plates, and clutch end plate for wear, damage, and discoloration.

   - If the clutch discs are worn or damaged, replace the discs as a set.
   - If the clutch plates are worn, damaged, or discolored, replace the plates as a set.
   - If the clutch end plate is worn, damaged, or discolored, inspect the clutch end-plate-to-top-disc clearance, then replace the clutch end-plate.

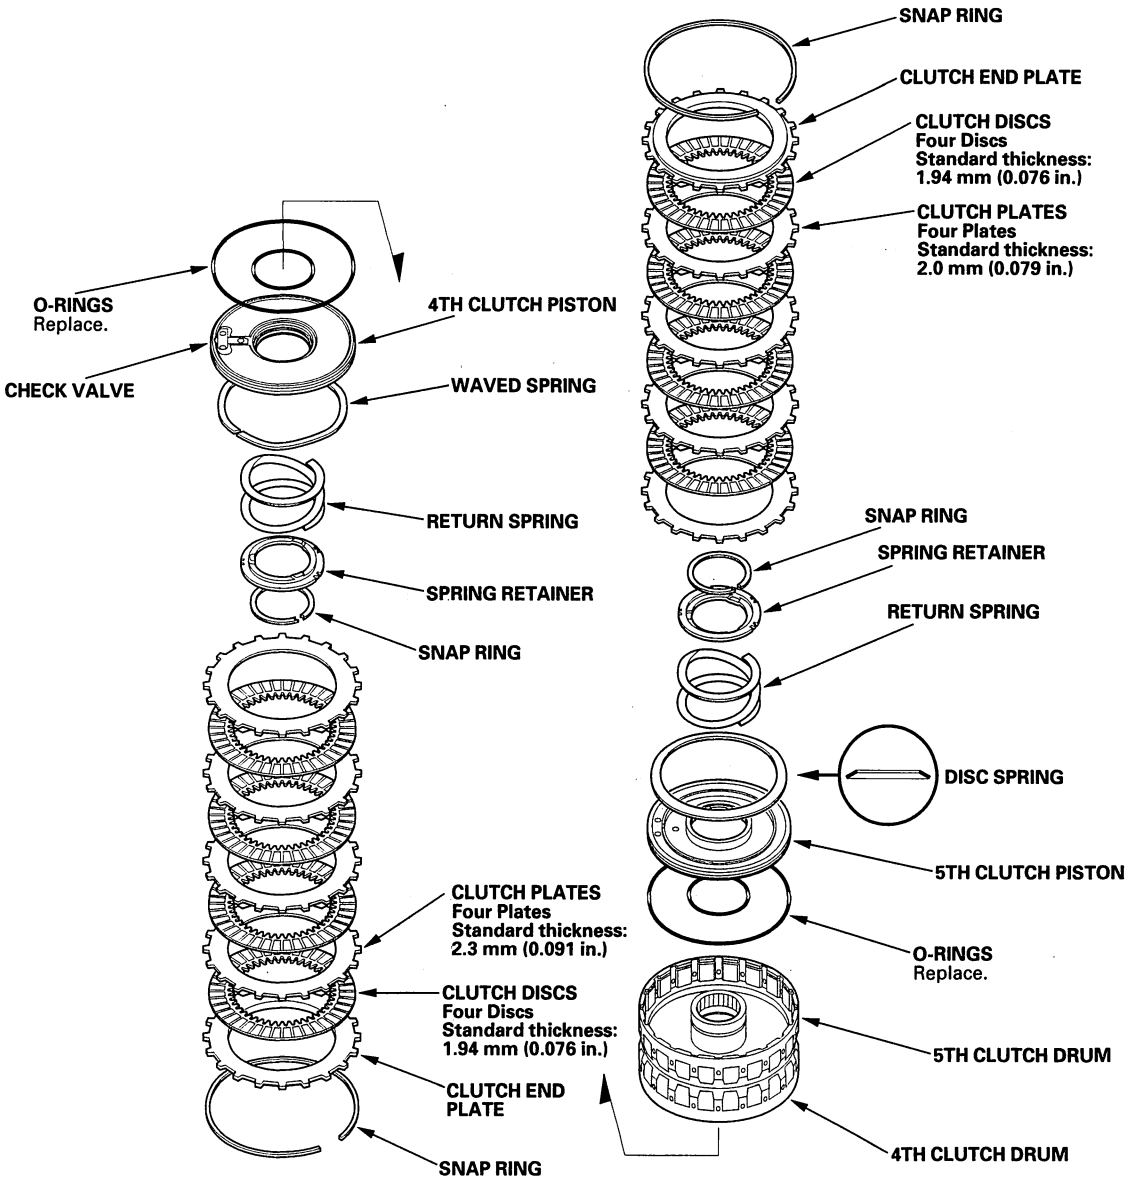
Clutch Inspection (cont'd)

4th/5th Clutch (2003-2004 Models)

1. Inspect the clutch piston and clutch piston check valve. If the clutch check valve is loose or stuck damaged, replace the clutch piston.



2. Check the spring retainer for wear and damage.

3. Inspect the clutch discs, clutch plates, and clutch end plate for wear, damage, and discoloration.

   - If the clutch discs are worn or damaged, replace the discs as a set.
   - If the clutch plates are worn, damaged, or discolored, replace the plates as a set.
   - If the clutch end plate is worn, damaged, or discolored, inspect the clutch end-plate-to-top-disc clearance, then replace the clutch end-plate.

BACK

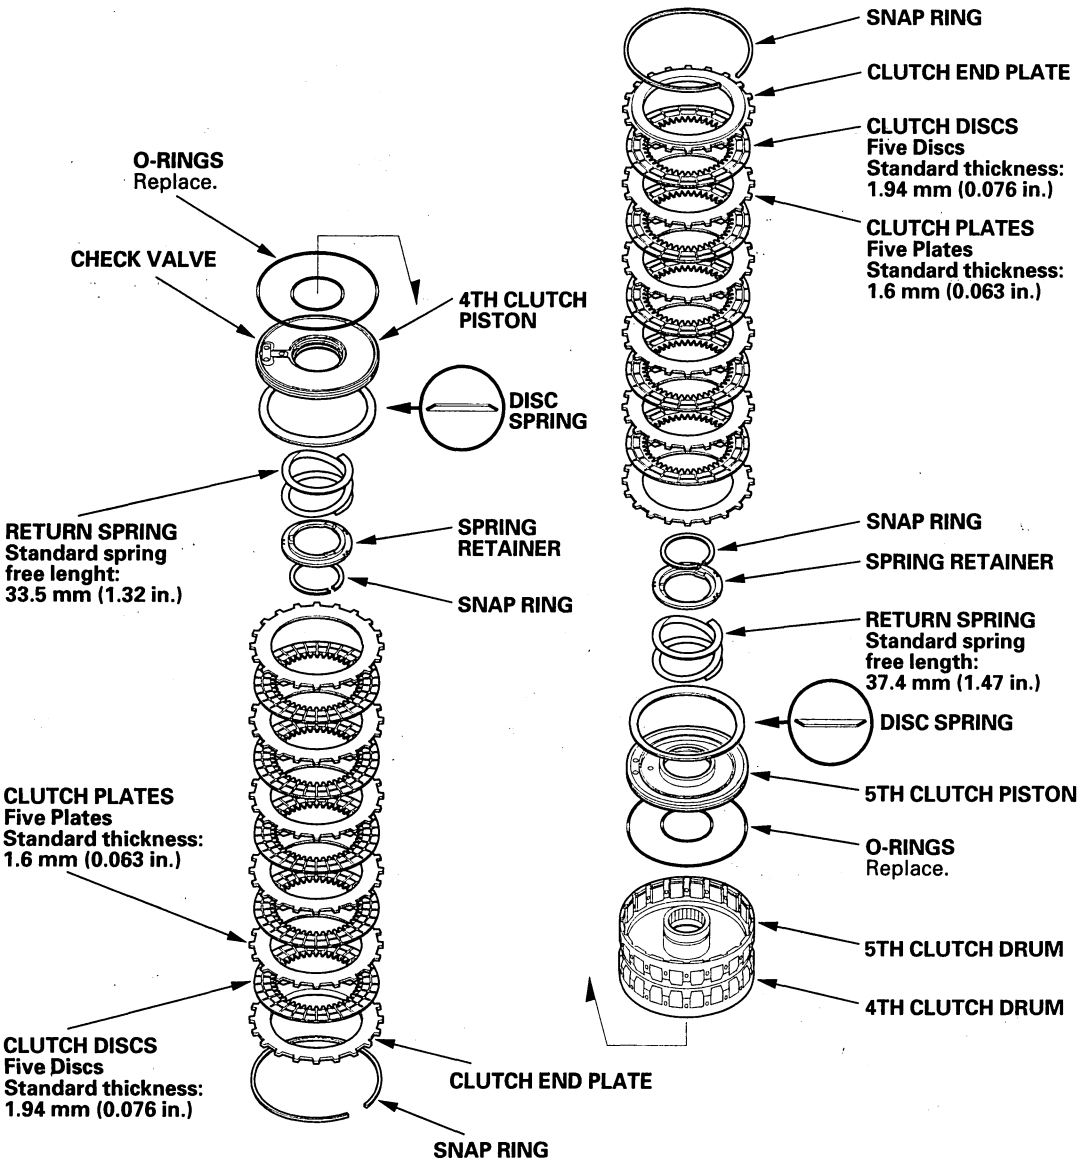
Clutch Inspection (cont'd)

4th/5th Clutch (2006 Model)

1. Inspect the clutch piston and clutch piston check valve. If the clutch check valve is loose, stuck, or damaged, replace the clutch piston.



2. Check the spring retainer for wear and damage.

3. Inspect the clutch discs, clutch plates, and clutch end plate for wear, damage, and discoloration.

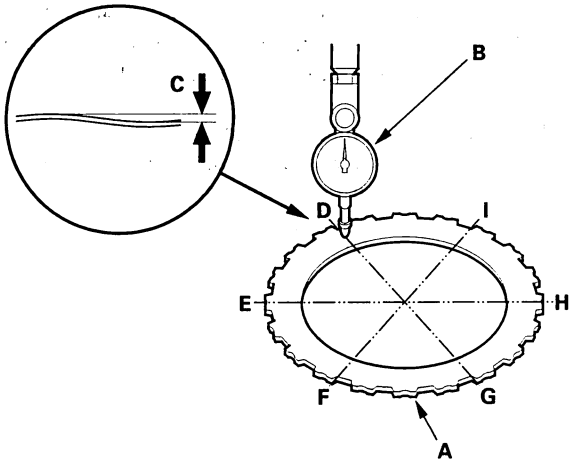
   - If the clutch discs are worn or damaged, replace the discs as a set.
   - If the clutch plates are worn, damaged, or discolored, replace the plates as a set.
   - If the clutch end plate is worn, damaged, or discolored, inspect the clutch end-plate-to-top-disc clearance, then replace the clutch end-plate.

BACK

Protected by AR

Clutch Waved-plate Phase Difference Inspection

1. Place the clutch waved-plate (A) on a surface plate, and set a dial indicator (B) on the waved-plate.



2. Find the bottom (D) of a phase difference of the waved-plate, zero the dial indicator and make a reference mark on the bottom of the waved-plate.

3. Rotate the waved-plate about 72-degrees or 54-degrees apart from the bottom while holding the waved-plate by its circumference. The dial indicator should be at the top (E) of a phase difference. Do not rotate the waved-plate while holding its surface, always rotate it with holding its circumference.

4. Read the dial indicator. The dial indicator reads the phase difference (C) of the waved-plate between bottom and top.

   Standard: 0.08—0.20 mm (0.003—0.008 in.)

5. Rotate the waved-plate about 54-degrees or 72-degrees. The dial indicator should be at the bottom of a phase difference (F and H), and zero the dial indicator.

6. Measure the phase difference at the other two tops (G and I) of the waved-plate by following steps 3 thru 5.

7. If the two values of the three measurements are within the standard, the waved-plate is OK. If the two values of the three measurements are out of the standard, replace the waved-plate.

Protected by AR

Clutch Clearance Inspection

Special Tools Required
Clutch compressor attachment 07ZAE-PRP0100

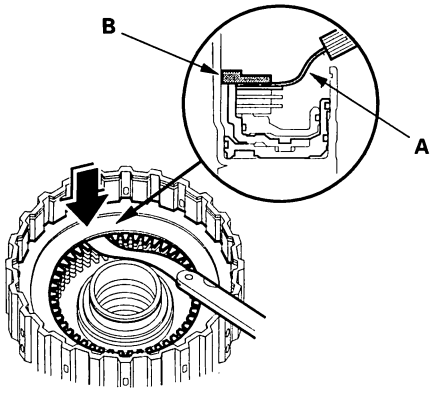
1. Inspect the clutch piston, discs, plates, and end plate for wear and damage, and inspect the 2nd clutch waved-plate phase difference (on 2006 model) (see page 14-273), if necessary.

2. Install the 1st-hold clutch piston in the 1st clutch piston, and install 1st/1st-hold clutch piston in the 1st/1st-hold clutch drum. Do not install the O-rings on the clutch pistons during inspection.

3. Starting with the 1st-hold clutch plate, alternately install the plates and discs, then install the 1st-hold clutch plate B with the flat side down on the top disc.

4. Measure the 1st-hold clutch plate B-to-top-disc clearance with a feeler gauge (A) while pressing the 1st-hold clutch plate B down. Take measurements in at least three places, and use the average as the actual clearance.

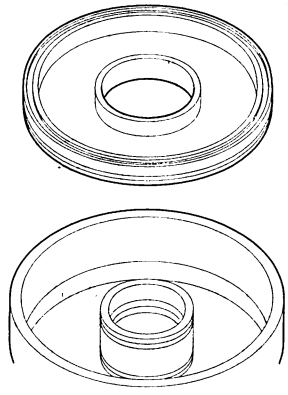
   1st-hold Clutch Plate B-to-Top-Disc Clearance
   Service Limit: 0.5—0.9 mm (0.020—0.035 in.)



5. If the clearance is out of standard, replace the 1st-hold clutch plates and discs as a set, and recheck.

6. Install the disc spring on the 1st-hold clutch plate B with the large end down. Starting with the clutch plate, alternately install the plates and discs in the 1st clutch drum, then install the clutch-end-plate with the flat side down on the top disc. Install the snap ring to secure the clutch-end-plate.

7. Install the clutch pistons in the 2nd, 3rd, 4th, and 5th clutch drums. Do not install the O-rings on the clutch pistons during inspection.

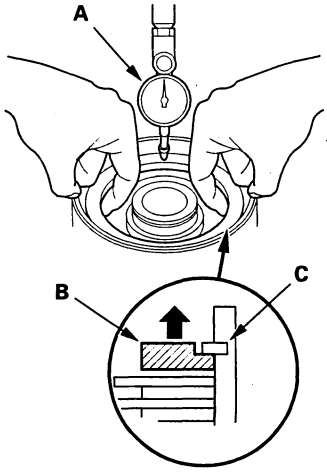


8. Starting with the clutch plate, alternately install the clutch plates and discs in the clutch drums, then install the clutch-end-plate with the flat side down on the top disc. Install the snap ring to secure the clutch-end-plate.

BACK

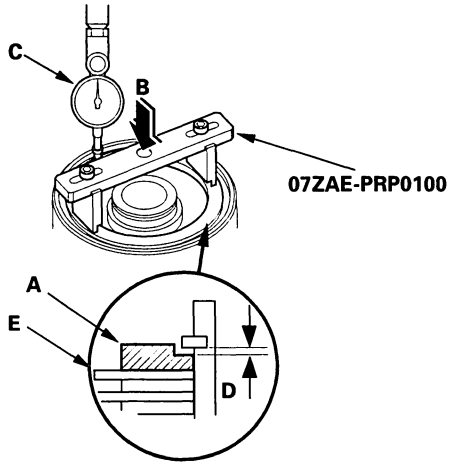
Protected by AR

9. Set a dial indicator (A) on the clutch-end-plate (B).



10. Zero the dial indicator with the clutch-end-plate lifted up to the snap ring (C).

11. Release the clutch-end-plate to lower the clutch-end-plate, then put the special tool on the end-plate (A).



12. Press the special tool down with 39 N (4 kgf, 9 lbf) (B) using a force gauge, and read the dial indicator (C). The dial indicator reads the clearance (D) between the clutch-end-plate and top disc (E). Take measurements in at least three places, and use the average as the actual clearance.

13. Only for the 2nd clutch on the 2006 model: Press the special tool down with 150—160 N (15—16 kgf, 33—35 lbf) (B) using a force gauge, and read the dial indicator (C). The dial indicator reads the clearance (D) between the clutch-end-plate and top disc (E). Take measurements in at least three places, and use the average as the actual clearance.

Clutch-End-Plate-to-Top Disc Clearance
Service Limit:

2003-2005 Models
1st clutch: 1.1—1.3 mm (0.043—0.051 in.)
2nd clutch: 0.7—0.9 mm (0.028—0.035 in.)
3rd clutch: 0.7—0.9 mm (0.028—0.035 in.)
4th clutch: 0.55—0.75 mm (0.022—0.030 in.)
5th clutch: 0.55—0.75 mm (0.022—*0.030 in.*)

2006 Model
1st clutch: 1.1—1.3 mm (0.043—0.051 in.)
2nd clutch: 0.85—1.05 mm (0.033—0.041 in.)
3rd clutch: 0.7—0.9 mm (0.028—0.035 in.)
4th clutch: 0.7—0.9 mm (0.028—0.035 in.)
5th clutch: 0.7—0.9 mm (0.028—0.035 in.)

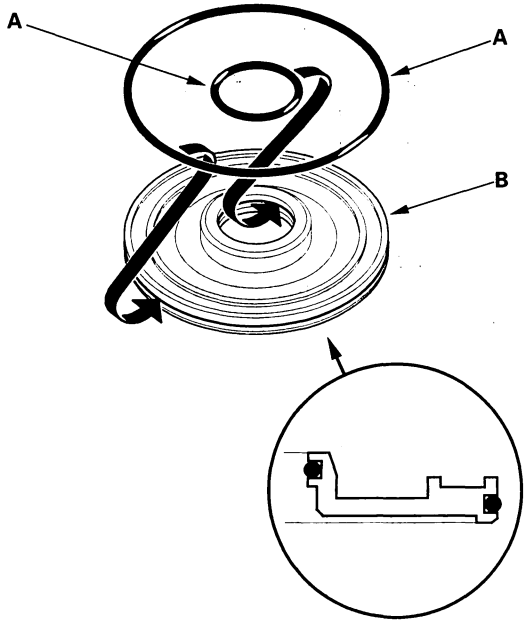
Clutch Reassembly

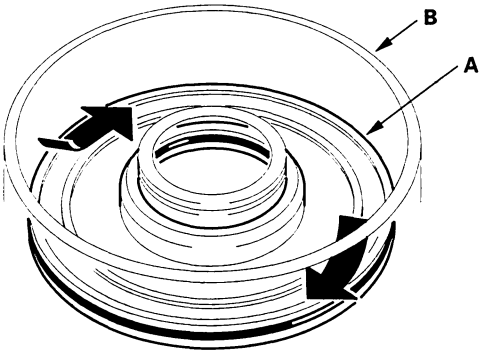
Special Tools Required
- Clutch spring compressor attachment 07LAE-PX40100 or 07HAE-PL50101
- Clutch spring compressor bolt assembly 07GAE-PG40200 or 07GAE-PG4020A

1. Soak the clutch discs thoroughly in ATF for a minimum of 30 minutes.

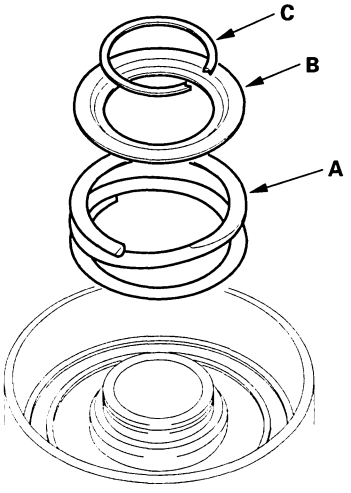
2. Install the new O-rings (A) on the clutch piston.



3. Install the clutch pistons in the clutch drums while applying pressure and rotating to ensure proper seating. Do not pinch the O-ring.



4. Install the return spring (A) and spring retainer (B), and position the snap ring (C) on the spring retainer.

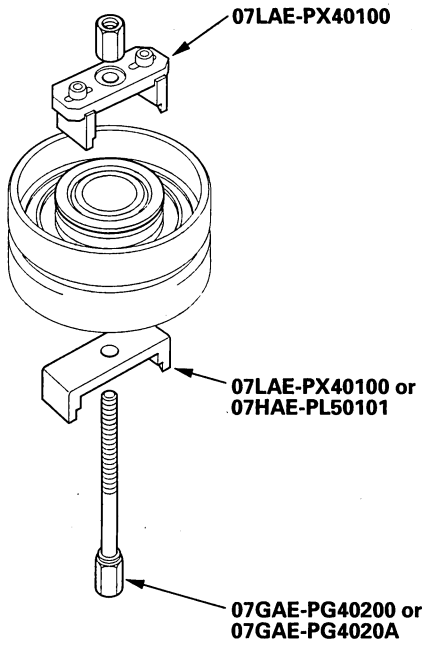


(cont'd)

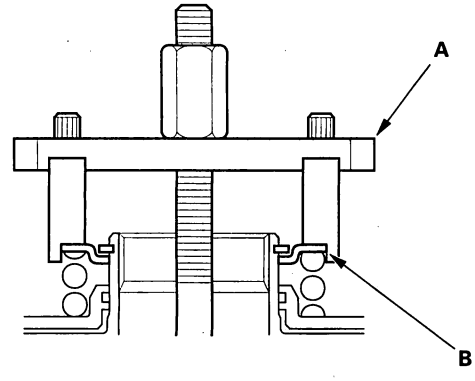
Protected by AR

Clutch Reassembly (cont'd)

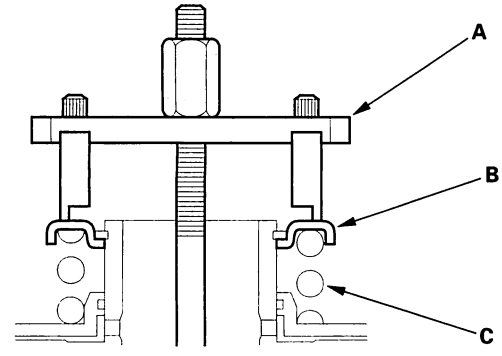
5. Install the special tools.



6. Set the special tool (A) over the spring retainer (B), and make sure the special tool is adjusted to have full contact with the spring retainer on the 1st, 4th, and 5th clutches.



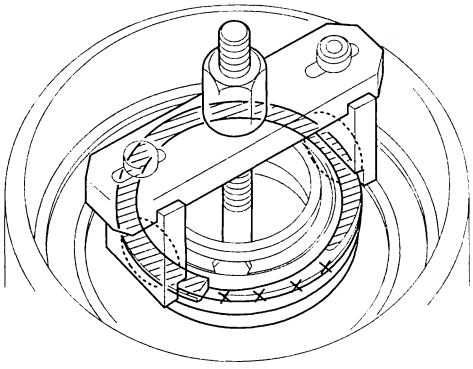
7. Set the special tool (A) on the spring retainer (B) of the 2nd clutch so the tool works on the clutch return spring (C).



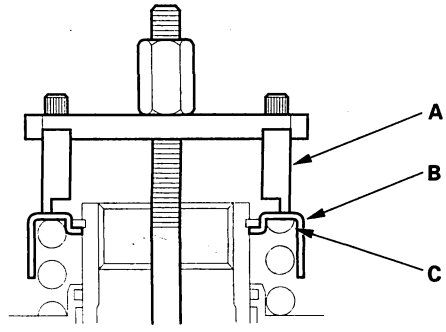
BACK

Protected by AR

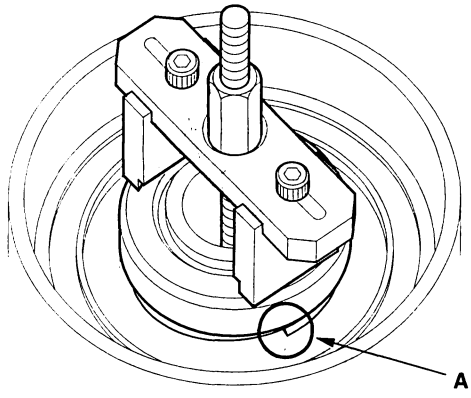
8. If either end of the special tool is set over an area of the spring retainer that is unsupported by the return spring, the retainer may be damaged.



9. Set the special tool (A) on the spring retainer (B) of the 3rd clutch so the special tool works on the clutch return spring (C).



10. If either end of the special tool is not set over the clutch return spring end (A), the retainer may be damaged,

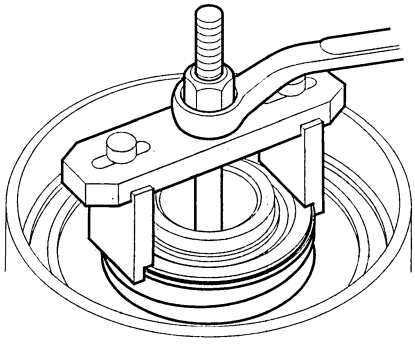


(cont'd)

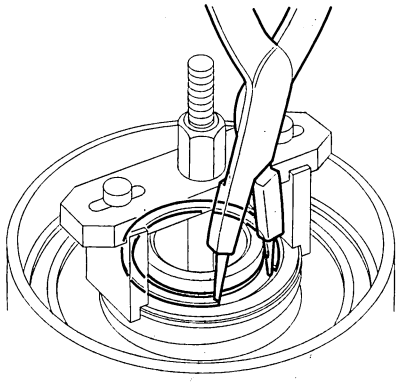
Protected by AR

Clutch Reassembly (cont'd)

11. Compress the return spring until the snap ring can be installed.

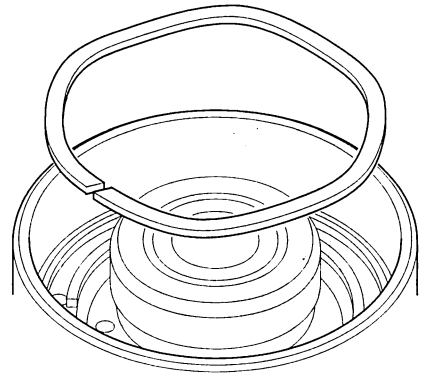


12. Install the snap ring with the snap ring pliers.



13. Remove the special tools.

14. Install the waved spring in the 3rd clutch (2003 model) and 4th clutch (2003-2004 models).

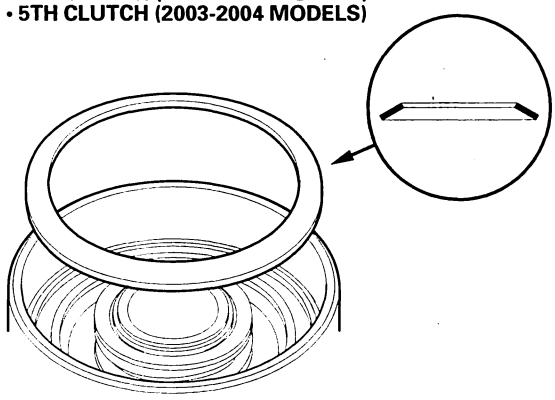


BACK

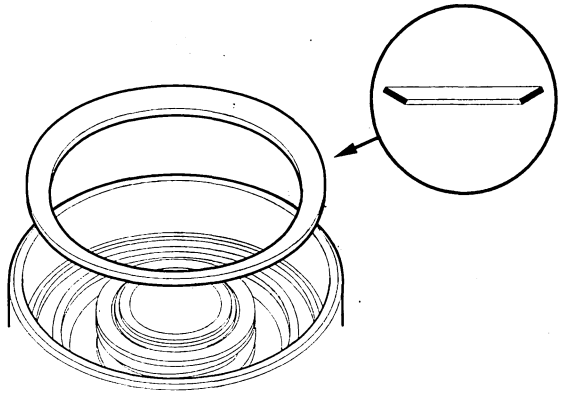
Protected by AR

15. Install the disc spring in the 1st clutch, 5th clutch, 3rd clutch (2004-2006 models), and 4th clutch (2005-2006 models).

- **1ST CLUTCH**
- **3RD CLUTCH (2004-2006 MODELS)**
- **5TH CLUTCH (2003-2004 MODELS)**

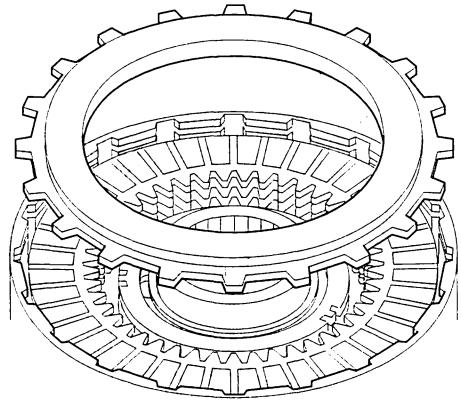


- **4TH CLUTCH (2005-2006 MODELS)**
- **5TH CLUTCH (2005-2006 MODELS)**



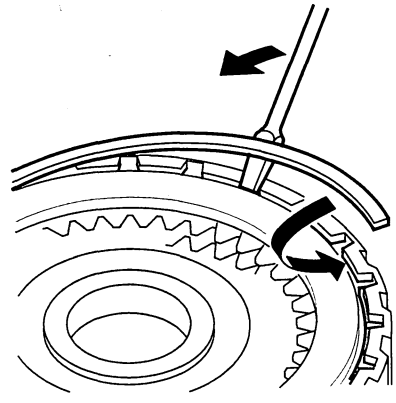
16. Make sure the inside of the clutch drum is free of dirt and other foreign particles.

17. For 1st, 3rd, 4th, and 5th clutches:
Starting with the clutch plate, alternately install the clutch plates and discs in the clutch drums, then install the *clutch-end-plate* with the flat side down on the top disc.



18. For 2nd clutch:
Starting with the 2nd clutch plate, alternately install the clutch flat-plates (4) and discs (4) in the clutch drum, and alternately install the clutch waved-plates (2) and discs (2), then install the clutch-end-plate with the flat side down on the top disc.

19. Install the snap ring with a screwdriver to secure the clutch-end-plate.

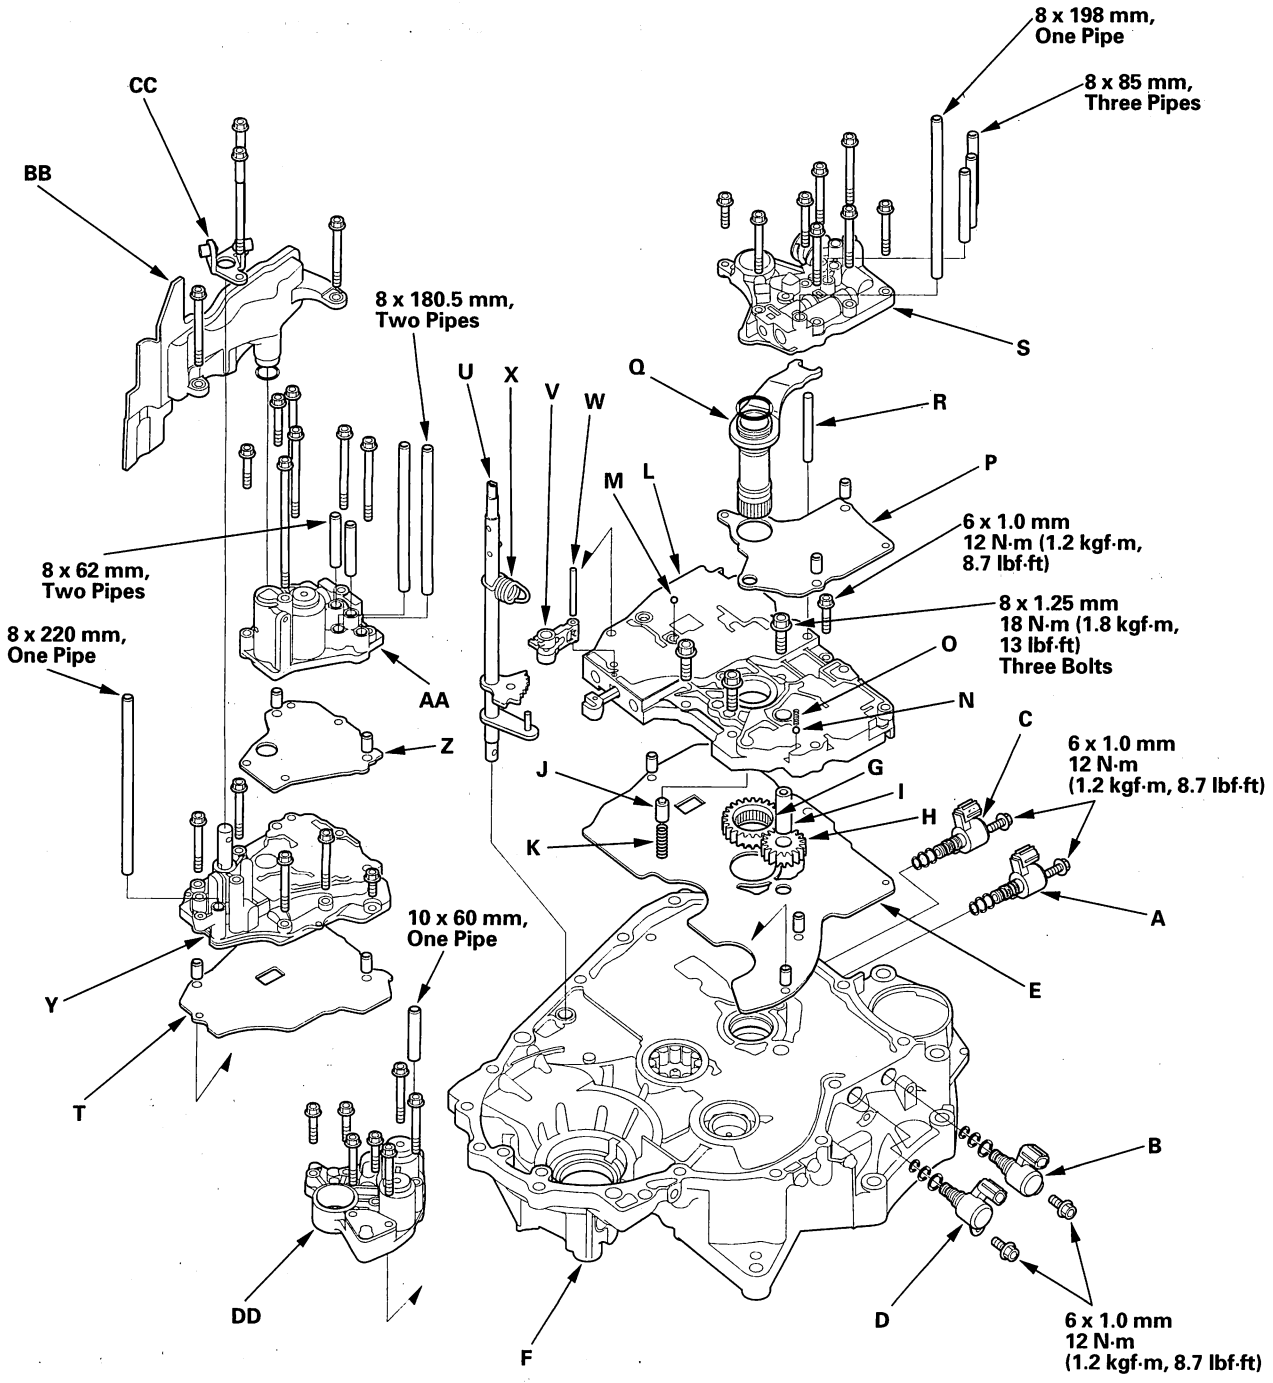


20. Check that the clutch piston moves by applying air pressure into fluid passage.

Protected by AR

Valve Body and ATF Strainer Installation

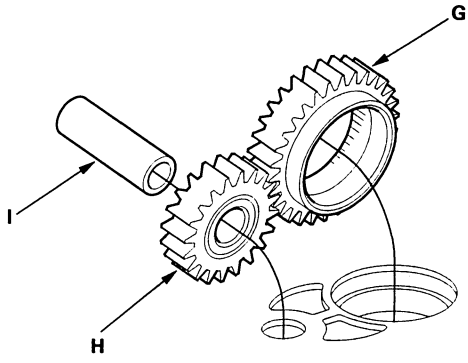
1. Install the main separator plate (E) and three dowel pins on the torque converter housing (F).



BACK

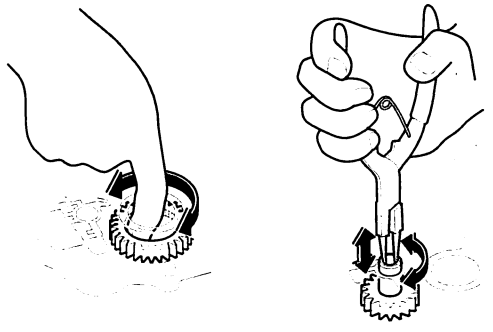
Protected by AR

2. Install the ATF pump drive gear (G), driven gear (H), and ATF pump driven gear shaft (I). Install the ATF pump driven gear with it grooved and chamfered side facing down.



3. Install the torque converter check valve (J) and spring (K) in the main valve body (L), then install the main valve body.

4. Make sure the ATF pump drive gear (G) rotates smoothly in the normal operating direction, and the ATF pump driven gear shaft (I) moves smoothly in the axial and normal operating direction.



5. If the ATF pump drive gear and ATF pump driven gear shaft do not move smoothly, loosen the main valve body bolts. Realign the ATF pump driven gear shaft, and retighten the bolts to the specified torque, then recheck. Failure to align the ATF pump driven gear shaft correctly will result in a seized ATF pump drive gear or ATF pump driven gear shaft.

6. Make sure that the one check ball (M) and the cooler check valve (N) are in the main valve body, then install the cooler check valve spring (O) on the cooler check valve.

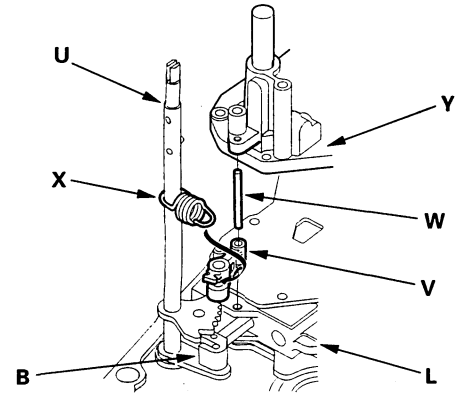
7. Install the regulator separator plate (P) and two dowel pins.

8. Install the new O-ring on the stator shaft (Q), and install it and stator shaft stop (R).

9. Install the regulator valve body (S) (eight bolts).

10. Install the servo separator plate (T) and two dowel pins.

11. Install the selector control shaft (U) in the torque converter housing along with the manual valve.



12. Install the detent arm (V) and arm shaft (W) in the main valve body (L), then hook the detent arm spring (X) to the detent arm.

13. Install the servo body (Y) (five bolts).

14. Install the top accumulator separator plate (Z) and two dowel pins, then install the top accumulator body (AA) (seven bolts).

15. Install the new O-ring on the ATF strainer (BB), and install it in the top accumulator body (two bolts).

16. Install the servo detent base (CC) (two bolts).

17. Install the accumulator body (DD) (seven bolts).

18. Install the 8 x 198 mm pipe, and three 8 x 85 mm pipes in the regulator valve body.

19. Install two 8 x 180.5 mm pipes, and two 8 x 62 mm pipes in the top accumulator body.

20. Install the 8 x 220 mm pipe in the servo body.

21. Install the 10 x 60 mm pipe in the accumulator body.

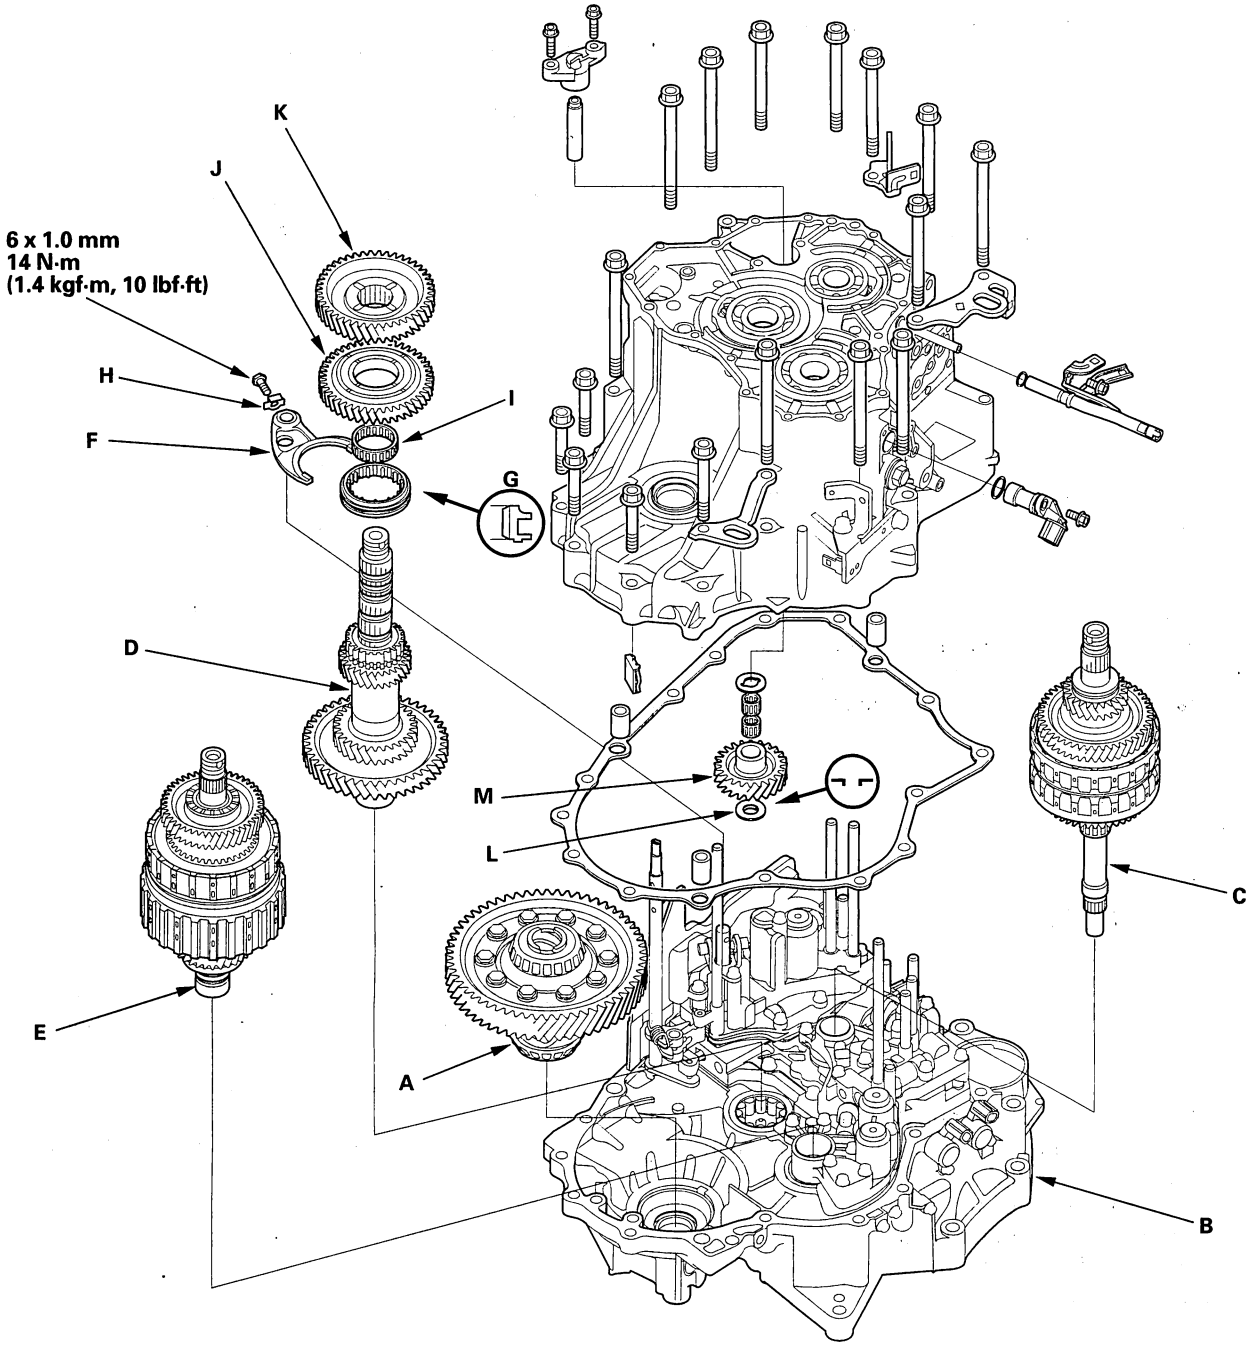
22. Install shift solenoid valves A, B, C, and torque converter clutch solenoid valve (D) with the new O-rings.

Protected by AR

Transmission Housing

Shaft Assembly and Housing Installation

1. Install the differential assembly (A) in the torque converter housing (B).



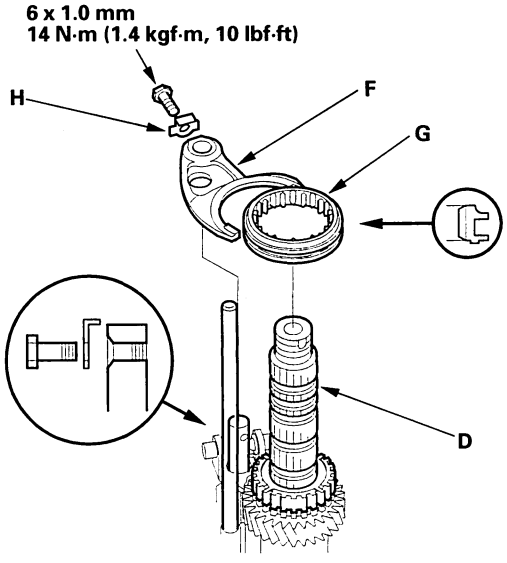
BACK

Protected by AR

2. If the reverse selector hub is press-fitted type, join the mainshaft (C), countershaft (D), and secondary shaft (E) together, then install them in the torque converter housing.

3. If the reverse selector hub in not press-fitted type, install the countershaft, mainshaft, and secondary shaft in the torque converter housing, then install the countershaft 5th gear and reverse selector hub on the countershaft.

4. Turn the shift fork shaft so the large chamfered hole is facing the fork bolt hole.

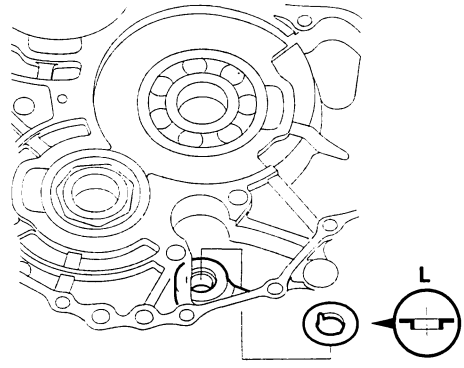


5. Install the shift fork (F) and reverse selector (G) together on the shift fork shaft and countershaft (D). Install the reverse selector in the direction shown.

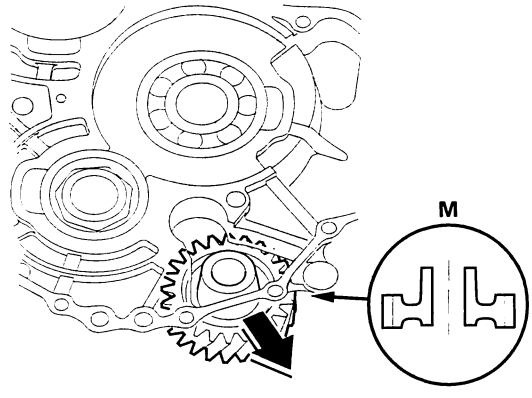
6. Secure the shift fork to the shift fork shaft with the lock bolt and a new lock washer (H), then bend the lock washer against the lock bolt head.

7. Install the needle bearing (I), countershaft reverse gear (J), and countershaft 2nd gear (K) on the countershaft.

8. Place the thrust washer (L) in the transmission housing.



9. Place the reverse idler gear (M) in the transmission housing, and slide it in the direction shown.

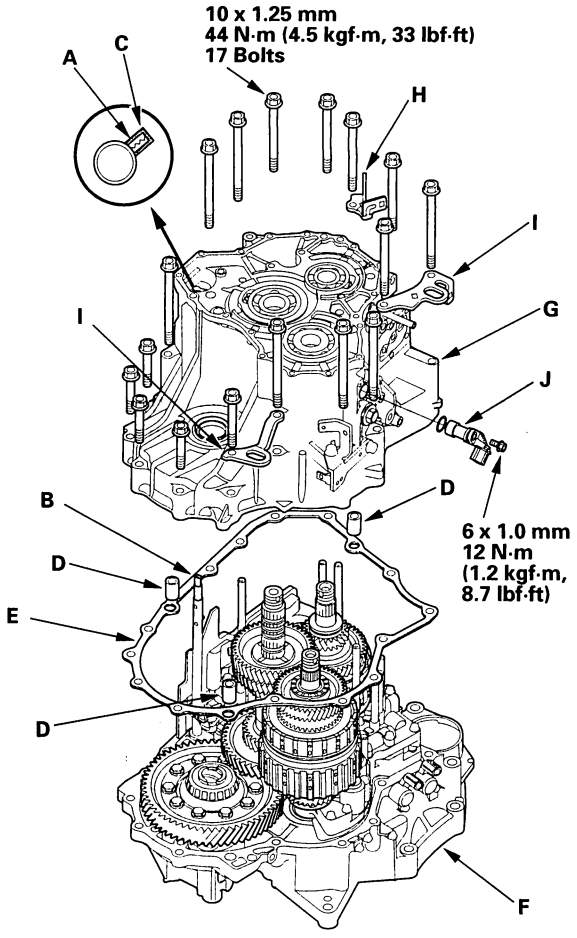


(cont'd)

Protected by AR

Shaft Assembly and Housing Installation (cont'd)

10. Align the spring pin (A) on the selector control shaft (B) with the transmission housing groove (C) by turning the selector control shaft.



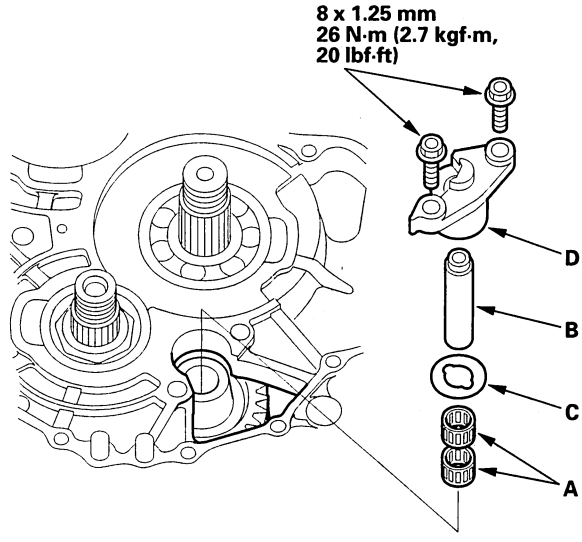
11. Install three dowel pins (D) and a new gasket (E) on the torque converter housing (F).

12. Place the transmission housing (G) on the torque converter housing, then install the transmission housing mounting bolts along with the harness clamp bracket (H) and transmission hangers (I).

13. Tighten the mounting bolts in two or more steps in a crisscross pattern.

14. Install the new O-ring on the output shaft (countershaft) speed sensor (J), then install it in the transmission housing.

15. Engage the reverse idler gear with the countershaft reverse gear and mainshaft reverse gear. Then install the needle bearings (A), reverse idler gear shaft (B), and thrust washer (C) in the reverse idler gear, and install the reverse idler gear shaft holder (D) on the transmission housing.



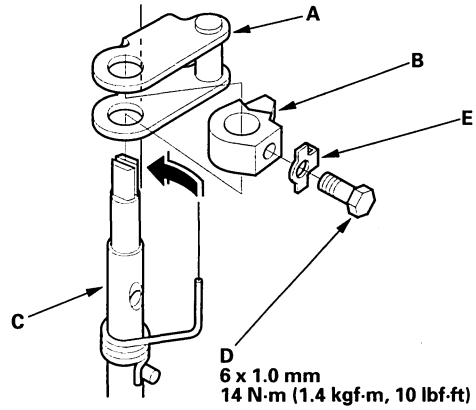
BACK

Protected by AR

End Cover, 3rd Gear, Idler Gear, and 3rd Clutch Installation

Special Tools Required
- Mainshaft holder
  07GAB-PF50101 or 07GAB-PF50100
- Adjustable bearing puller, 25—40 mm
  07736-A01000B or 07736-A01000A

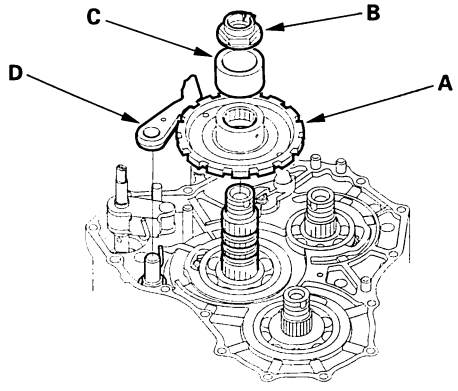
1. Install the park lever (A) and park lever stop (B), on the selector control shaft (C), then install the lock bolt (D) with a new lock washer (E). Do not bend the lock tab of the lock washer until step 28.



2. Lubricate the following parts with ATF:
   - Splines of the countershaft, the park gear, and the old locknut.
   - Threads of the countershaft and the old locknut.
   - Old conical spring washer.

3. Install the park gear (A) using the old locknut (B) and a collar (C). Hold the park pawl (D) against the park gear, then tighten the old locknut until the shaft splines come out over the park gear splines.

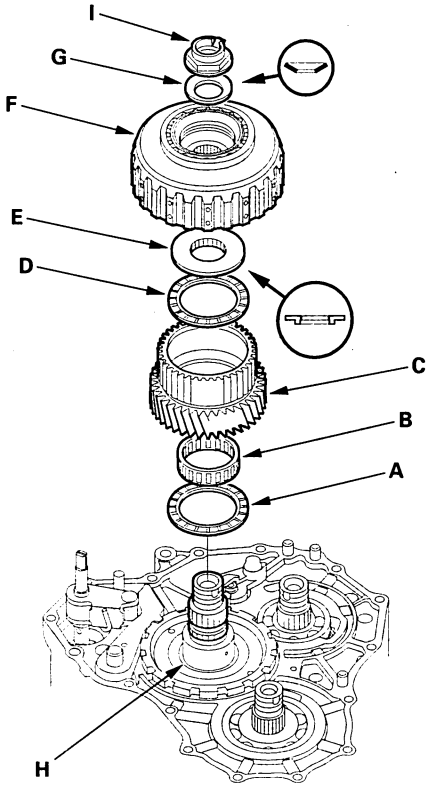
   NOTE:
   - Do not use an impact wrench.
   - Countershaft locknut has left-hand threads.



4. Remove the locknut and collar.

5. Install the thrust needle bearing (A), needle bearing (B), 3rd gear (C), thrust needle bearing (D), 31 x 63.5 mm splined washer (E), 3rd clutch assembly (F), and old conical spring washer (G) on the countershaft (H). Tighten the old locknut (I) to 226 N·m (23.0 kgf·m, 166 lbf·ft).

   NOTE: Use a torque wrench to tighten the locknut. Do not use an impact wrench.

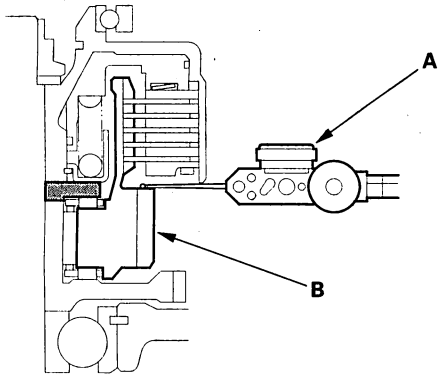


(cont'd)

Protected by AR

End Cover, 3rd Gear, Idler Gear, and 3rd Clutch Installation (cont'd)

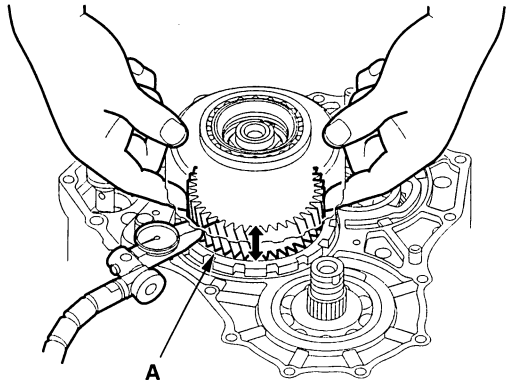
6. Set the dial indicator (A) to the countershaft 3rd gear (B).



7. Measure the countershaft 3rd gear axial clearance in at least three places, while moving the countershaft 3rd gear (A).
   Use the average as the actual clearance.

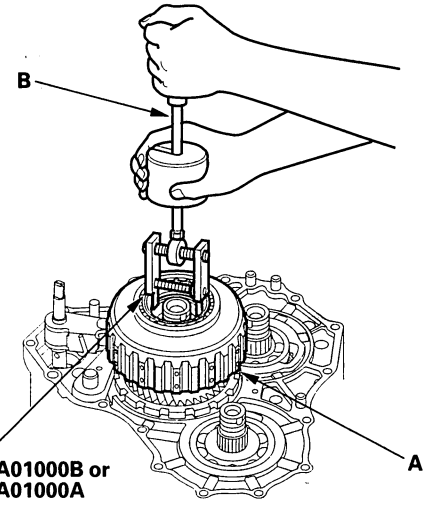
   If the clearance is out of standard, select the appropriate 31 x 63.5 mm splined washer in step 16.

   Standard: 0.015—0.045 mm (0.0006—0.0018 in.)



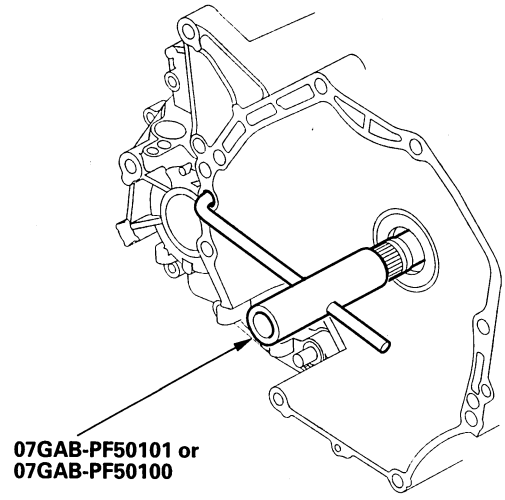
8. Remove the locknut and conical spring washer.

9. Remove the 3rd clutch assembly (A) with the special tool and a commercially available 3/8 "-16 slide hammer (B).



10. Remove the parts that were installed in step 5.

11. Install the special tool onto the mainshaft.



BACK

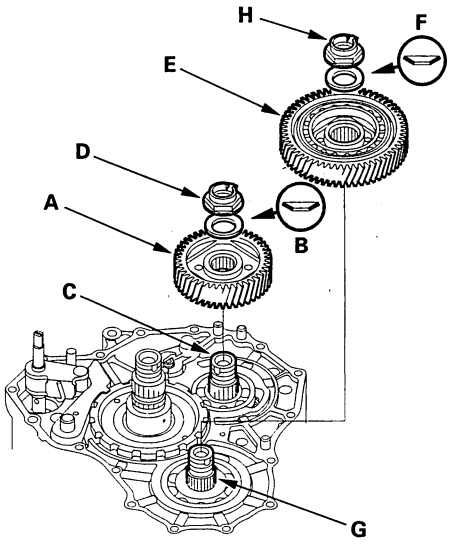
Protected by AR

12. Lubricate the following parts with ATF:

    - Splines of the mainshaft 3rd gear and secondary shaft idler gear.
    - Threads of the mainshaft and secondary shaft.
    - Threads of the old mainshaft and secondary shaft locknuts.
    - Old conical spring washer.

13. Install the mainshaft 3rd gear (A) and the old conical spring washer (B) on the mainshaft (C). Tighten the old locknut (D) to seat the 3rd gear to 226 N·m (23.0 kgf·m, 166 lbf·ft).

    NOTE: Use a torque wrench to tighten the locknut. Do not use an impact wrench.

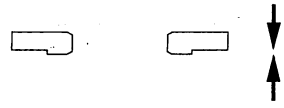


14. Install the secondary shaft idler gear (E) and the old conical spring washer (F) on the secondary shaft (G). Tighten the old locknut (H) to seat the secondary shaft idler gear to 226 N·m (23.0 kgf·m, 166 lbf·ft).

    NOTE:
    - Use a torque wrench to tighten the locknut. Do not use an impact wrench.
    - Secondary shaft locknut has left-hand threads.

15. Remove the old locknuts and old conical spring washers from the mainshaft and secondary shaft.

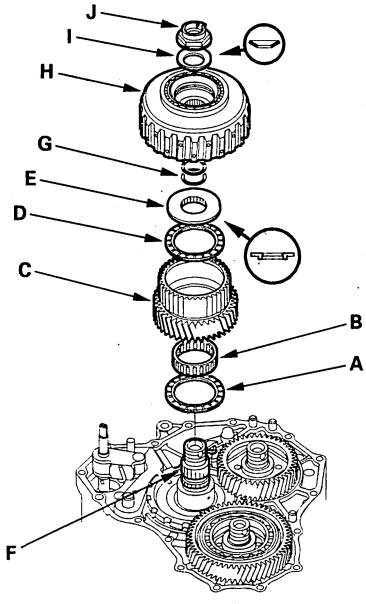
16. If the 3rd gear axial clearance is out of standard (measured in step 7), measure the difference of the 31 x 63.5 mm splined washer, and select the appropriate splined washer from the table.



SPLINED WASHER, 31 x 63.5 mm

Mark	Part Number	Difference
A	90520-P7W-000	3.503 mm (0.1379 in.)
B	90521-P7W-000	3.490 mm (0.1374 in.)
C	90522-P7W-000	3.477 mm (0.1369 in.)
D	90523-P7W-000	3.464 mm (0.1364 in.)

17. Install the thrust needle bearing (A), needle bearing (B), 3rd gear (C), thrust needle bearing (D), and 31 x 63.5 mm splined washer (E) on the countershaft (F).



18. Wrap the shaft splines with tape to prevent O-ring damage, then install new O-rings (G).

19. Remove the tape, then install the 3rd clutch assembly (H), and old conical spring washer (I). Tighten the old locknut (J) to 226 N·m (23.0 kgf·m, 166 lbf·ft).

    NOTE: Use a torque wrench to tighten the locknut. Do not use an impact wrench.

(cont'd)

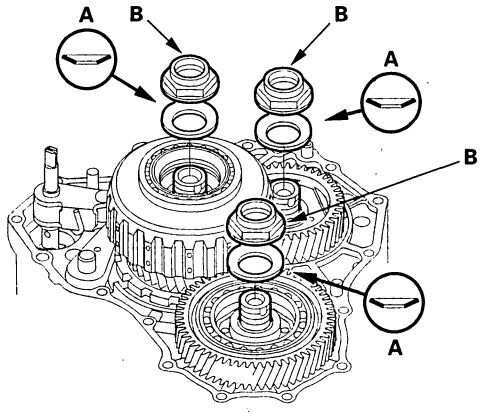
Protected by AR

End Cover, 3rd Gear, Idler Gear, and 3rd Clutch Installation (cont'd)

20. Remove the old locknut and old conical spring washer from the countershaft.

21. Lubricate the threads of each shaft, the new locknuts, and new conical spring washers with ATF.

22. Install the new conical spring washers (A) in the direction shown, and install the new locknuts (B).

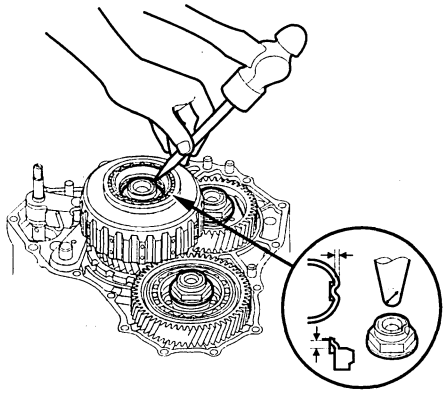


23. Tighten the locknuts to 167 N·m (17.0 kgf·m, 123 lbf·ft).

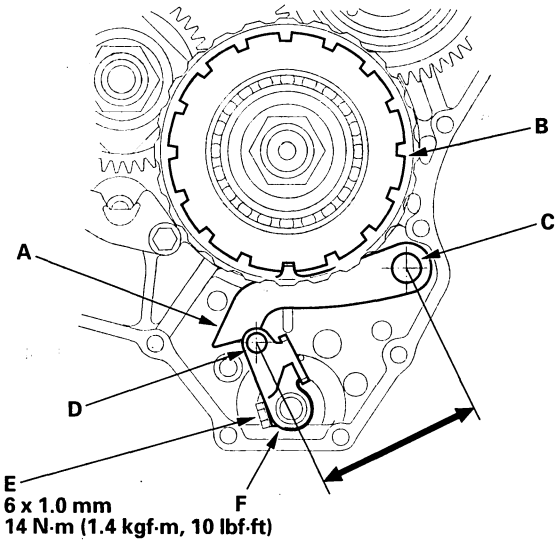
    NOTE:
    - Use a torque wrench to tighten the locknuts. Do not use an impact wrench.
    - Countershaft and secondary shaft locknuts have left-hand threads.

24. Remove the special tool from the mainshaft.

25. Stake each locknut into its shaft using 3.5 mm punch.



26. Set the park lever in P position, then verify that the park pawl (A) engages the park gear (B).



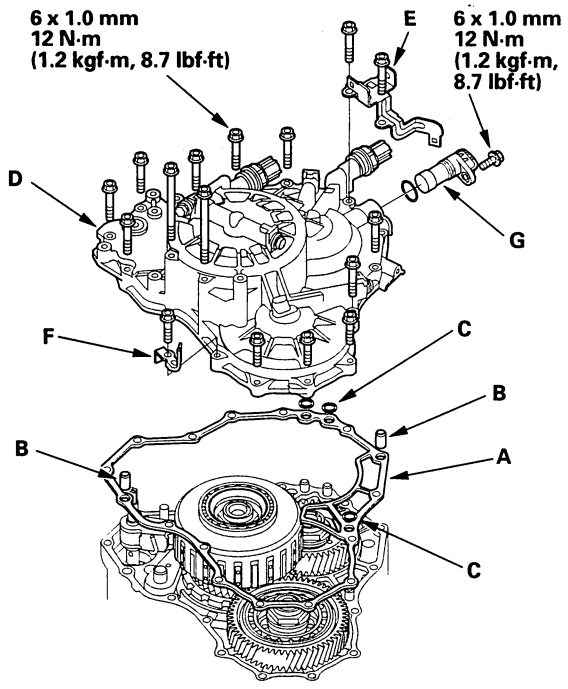
27. If the park pawl does not engage fully, check the distance between the pawl shaft (C) and the park lever roller pin (D) (see page 14-230).

28. Tighten the lock bolt (E), and bend the lock tab of the lock washer (F) against the lock bolt head.

BACK

Protected by AR

29. Install the new gasket (A) on the transmission housing, and install the two dowel pins (B) and new O-rings (C) over the top of the ATF feed pipes.

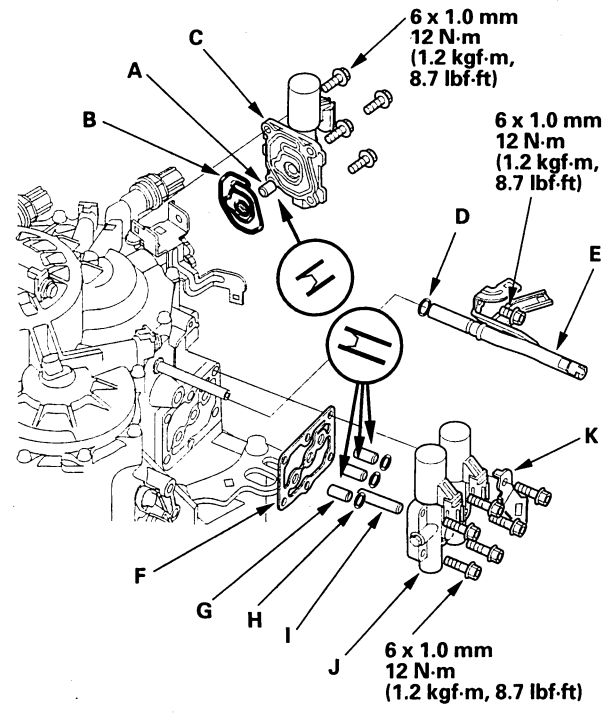


30. Install the end cover (D), and install the 16 bolts, connector bracket (E) and harness holder bracket (F).

31. Tighten the bolts in two or more steps in a crisscross pattern.

32. Install the new O-ring on the input shaft (mainshaft) speed sensor (G), then install it in the end cover.

33. Install the 8 x 12 mm ATF feed pipe (A) with its filter side into the transmission housing.



34. Install the new gasket (B) in the mounting groove of the A/T clutch pressure control solenoid valve C body (C) properly, then install them on the transmission housing. Do not pinch the gasket.

35. Install the new O-ring (D) on the ATF dipstick guide pipe (E), then install in the transmission housing.

36. Place the new gasket (F) on the transmission housing, then install the 8 x 18 mm ATF feed pipes (G) with their filter side into the transmission housing.

37. Install the new O-rings (H) over the feed pipes, and install the 8 x 40 mm ATF feed pipe (I).

38. Install the A/T clutch pressure control solenoid valves A and B (J) and the harness clamp bracket (K).

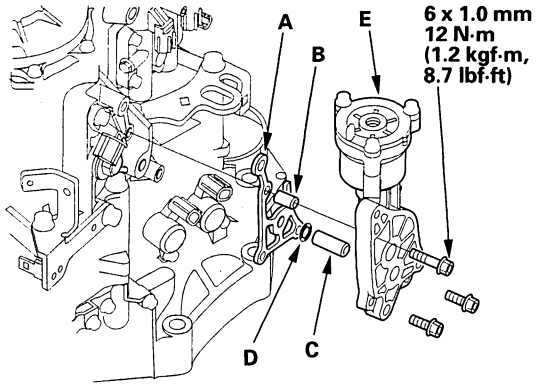
(cont'd)

Protected by AR

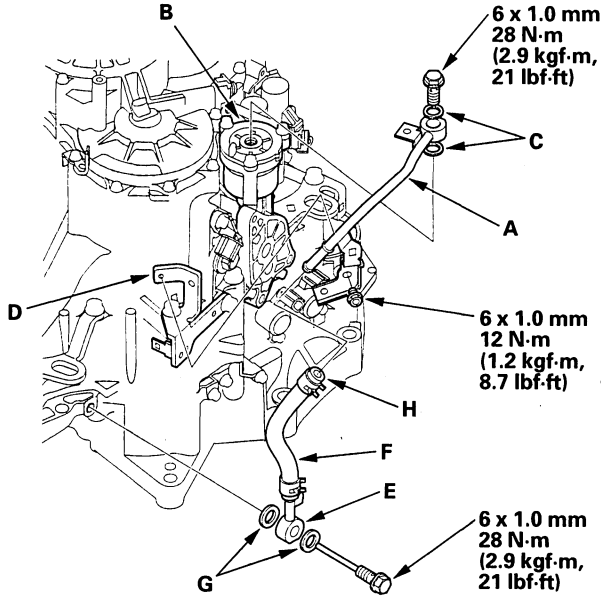
Transmission End Cover

End Cover, 3rd Gear, Idler Gear, and 3rd Clutch Installation (cont'd)

39. Install the new gasket (A) on the transmission housing, then install the 8 x 14 mm dowel pin (B), 10 x 25.5 mm ATF feed pipe (C), and new O-ring (D) over the feed pipe. Install the ATF passage body (E).



40. Install the ATF line (A) on the ATF passage body (B) with the line bolt and new sealing washers (C). Secure the ATF line with the 6 mm bolt on the harness clamp bracket (D).

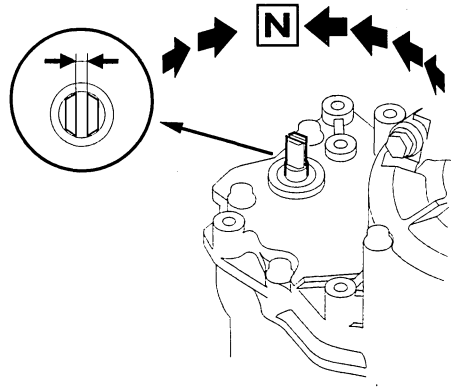


41. Install the ATF line (E) and hose (F) on the torque converter housing with the line bolt and new sealing washers (G).

42. Connect the ATF hose to the line, and secure the hose with hose clamp (H).

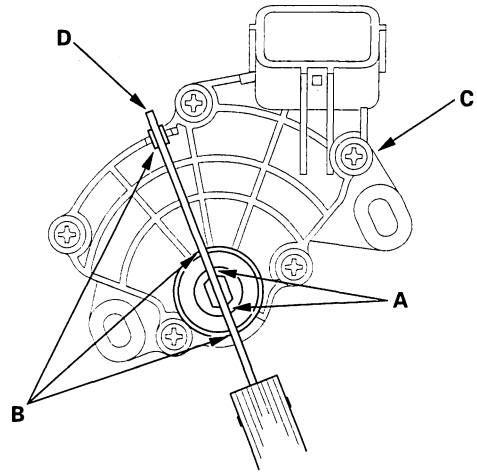
43. Set the selector control shaft to the N position by turning the control shaft.

NOTE: Do not squeeze the end of the selector control shaft tips together when turning the shaft. If the tips are squeezed together it will cause a faulty shift position signal or position due to the play between the selector control shaft and the switch. The clearance (A) between selector control shaft tips is 2.0 mm (0.08 in.)



44. Align the cutouts (A) on the rotary-frame with the neutral positioning cutouts (B) on the transmission range switch (C), then put a 2.0 mm (0.08 in.) feeler gauge blade (D) in the cutouts to hold the switch in the N position.

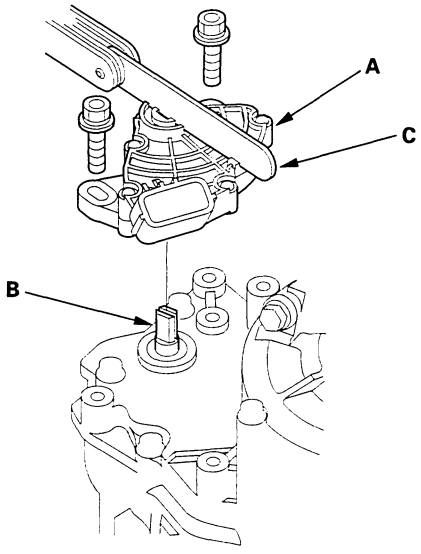
NOTE: Be sure to use a 2.0 mm (0.08 in.) blade or equivalent to hold the switch in the N position.



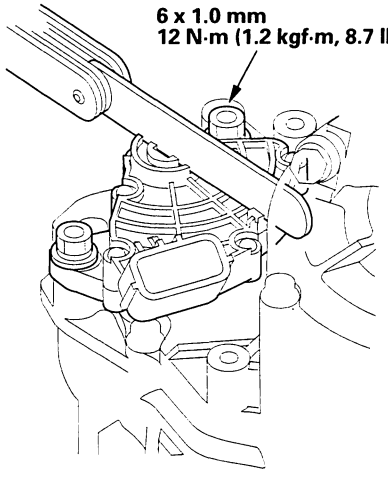
BACK

Protected by AR

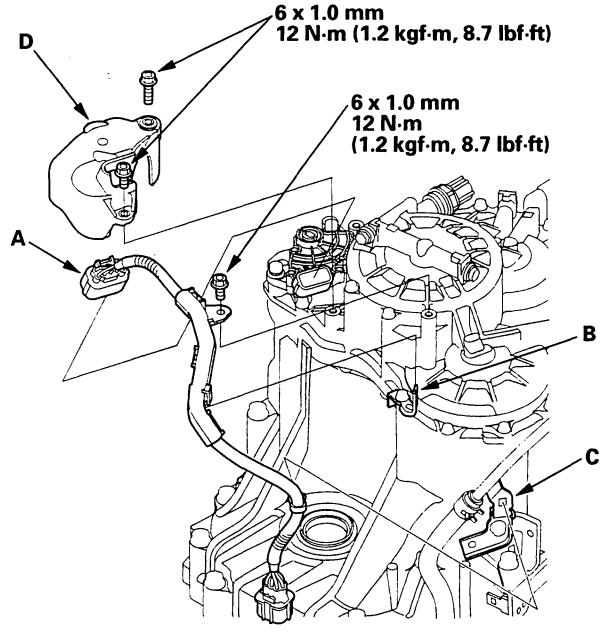
45. Install the transmission range switch (A) gently on the selector control shaft (B) while holding it in the N position with the 2.0 mm (0.08 in.) blade (C).



46. Tighten the bolts on the transmission range switch while you continue to hold it in the N position. Do not move the transmission range switch when tightening the bolts. Remove the feeler gauge.



47. Connect the transmission range switch connector (A) securely, then secure the switch harness on the end cover, harness cover bracket (B), and the clamp bracket (C).



48. Install the transmission range switch cover (D).

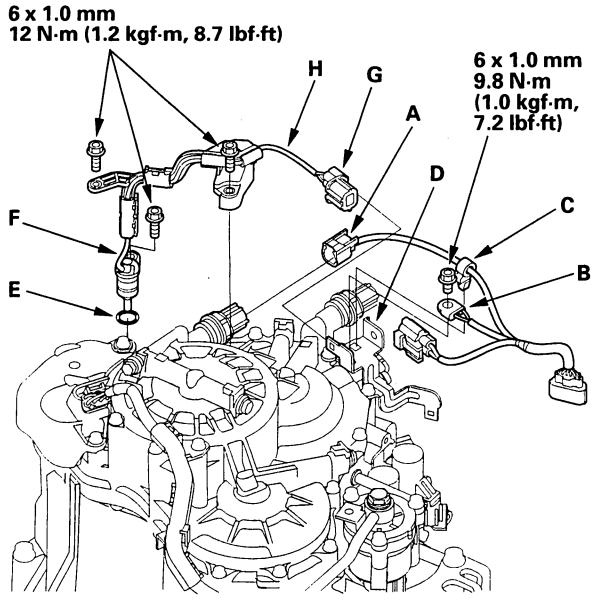
(cont'd)

Protected by AR

Transmission End Cover

End Cover, 3rd Gear, Idler Gear, and 3rd Clutch Installation (cont'd)

49. Connect the 3rd clutch transmission fluid pressure switch connector (A), and install the ground terminal (B) and harness clamp (C) on the connector bracket (D).



50. Install the new O-ring (E) on the ATF temperature sensor (F), then install the sensor in the end cover.

51. Connect the sensor connector (G), and install it on the connector bracket. Secure the sensor harness (H) on the end cover.

52. Install the dipstick in the dipstick guide pipe.

Protected by AR

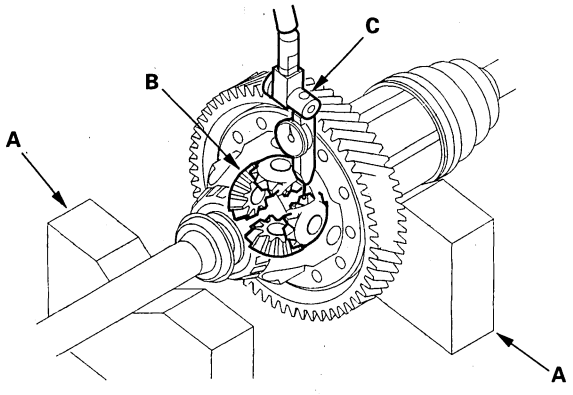
Backlash Inspection

1. Install both axles into the differential, and place the axles on V-blocks (A).



2. Measure the backlash of the pinion gears (B) with a dial indicator (C).

   Standard: 0.05—0.15 mm (0.002—0.006 in.)

3. If the backlash is out of standard, replace the differential carrier.

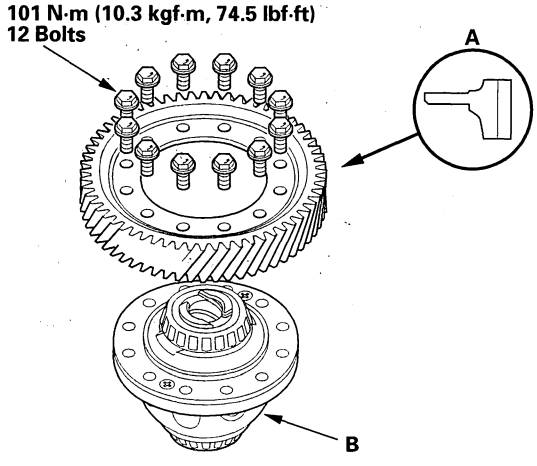
Differential Carrier, Final Driven Gear Replacement

NOTE: Inspect and adjust the carrier bearing preload whenever the differential carrier is replaced.

1. Remove the final driven gear (A) from the differential carrier (B). The final driven gear bolts have left-hand threads.

   2003-2005 Models:

   2006 Model:



2. Install the final driven gear on the differential carrier in the direction shown. Tighten the bolts to 101 N·m (10.3 kgf·m, 74.5 lbf·ft) in a crisscross pattern in two or more steps.

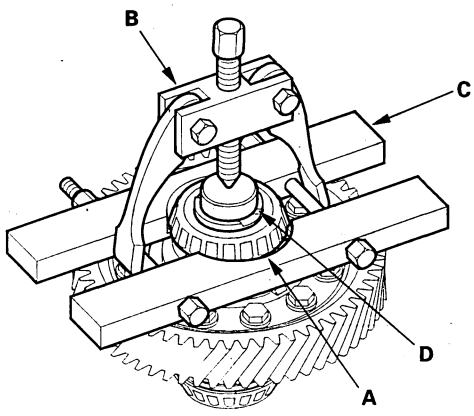
Carrier Bearing Replacement

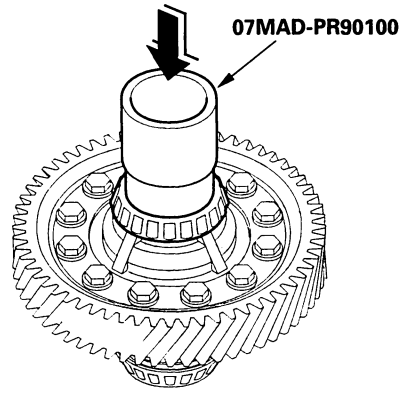
Special Tools Required
Attachment, 45 x 55 mm 07MAD-PR90100

NOTE:
- The bearing and outer race should be replaced as a set.
- Inspect and adjust the bearing preload whenever bearing is replaced.
- Check the bearing for wear and rough rotation. If the bearing is OK, removal is not necessary.

1. Remove the carrier bearing (A) with a commercially available bearing puller (B), bearing separator (C), and stepper adapter (D).



2. Install the carrier bearing with the special tool using the small end and a press until it bottoms. Press the bearing on securely so there is no clearance between the bearing and the differential carrier.

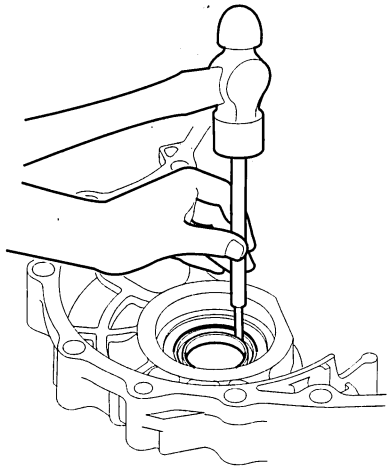


Protected by AR

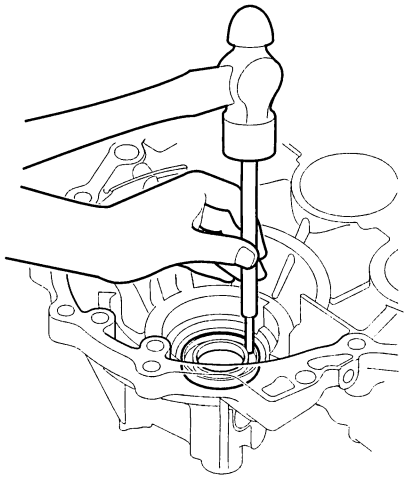
Oil Seal Replacement

Special Tools Required
- Driver 07749-0010000
- Seal driver attachment 07GAD-PG40101 or 07GAD-PG40100
- Oil seal driver attachment 07JAD-PH80101

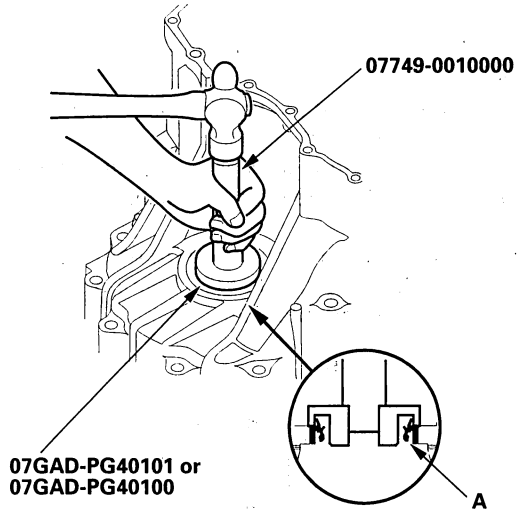
1. Remove the oil seal from the transmission housing.



2. Remove the oil seal from the torque converter housing.



3. Install the new oil seal (A) in the transmission housing with the special tools.



4. Install the oil seal (A) in the torque converter housing with the special tools.

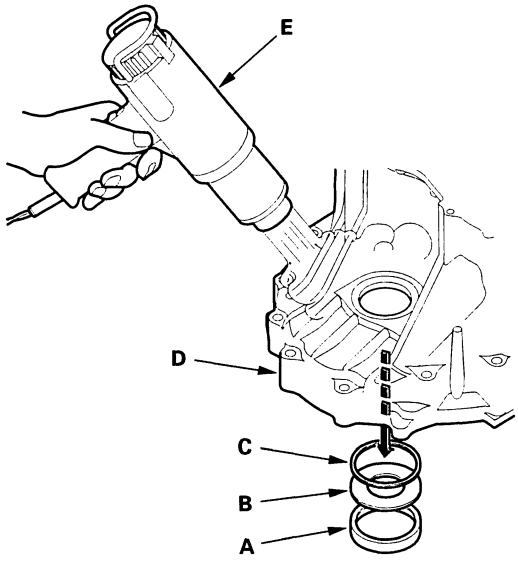
Carrier Bearing Outer Race Replacement

Special Tools Required
- Driver 07749-0010000
- Attachment, 78 x 80 mm 07NAD-PX40100
- Attachment, 78 x 90 mm 07GAD-SD40101(2006 model)

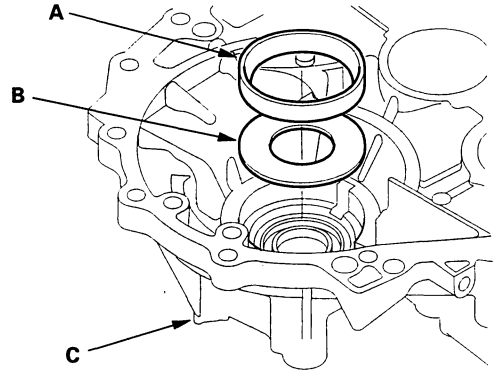
NOTE:
- The bearing and bearing outer race should be replaced as a set.
- Replace the bearing with a new one whenever the outer race is replaced.
- Do not use shim(s) on the torque converter housing side.
- Adjust bearing preload after replacing the bearing and outer race.
- Coat all parts with ATF during installation.

1. Remove the bearing outer race (A), thrust washer (B), and thrust shim (C) from the transmission housing (D) by heating the housing to about 212 °F (100 °C) with a heat gun (E). Do not heat the housing to more than 212 °F (100 °C).

   NOTE: Let the transmission housing cool to room temperature before installing the bearing outer race.

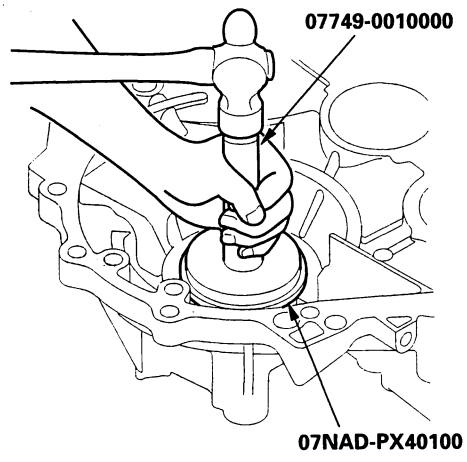


2. Remove the bearing outer race (A) and thrust washer (B) from the torque converter housing (C).



3. Install the thrust washer and the new bearing outer race in the torque converter housing.

4. Drive the bearing outer race into the housing with the special tools.

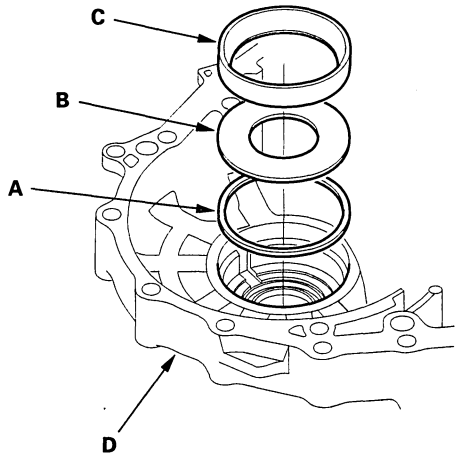


(cont'd)

Protected by AR

Carrier Bearing Outer Race Replacement (cont'd)

5. Install the thrust shim (A), thrust washer (B), and the new bearing outer race (C) in the transmission housing (D).



6. Drive the bearing outer race into the housing with the special tools so there is no clearance between the outer race, thrust washer, shim and housing.

Carrier Bearing Preload Inspection

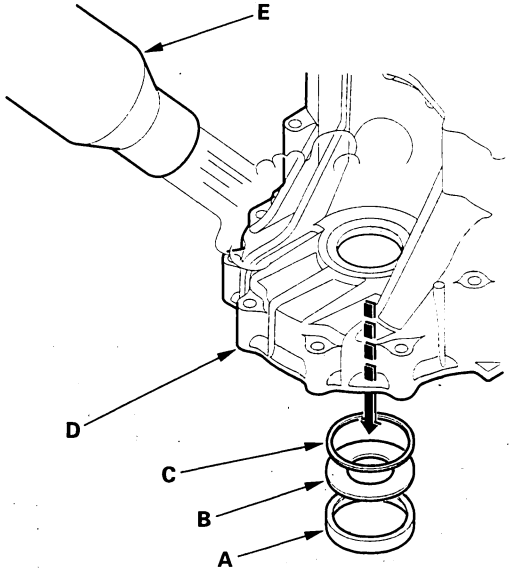
Special Tools Required
- Driver 07749-0010000
- Attachment, 78 x 80 mm 07NAD-PX40100
- Preload inspection tool 07HAJ-PK40201

2003-2005 Models

NOTE: If the transmission housing, torque converter housing, differential carrier, tapered roller bearing, outer race, or thrust shim were replaced, the bearing preload must be adjusted.

1. Remove the bearing outer race (A), thrust washer (B), and thrust shim (C) from the transmission housing (D) by heating the housing to about 212 °F (100 °C) with a heat gun (E). Do not heat the housing to more than of 212 °F (100 °C).

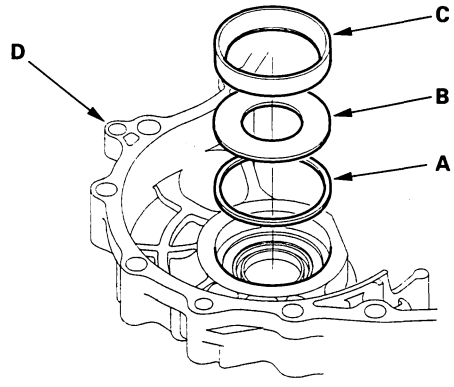
   NOTE: Let the transmission housing cool to room temperature before adjusting the bearing preload.



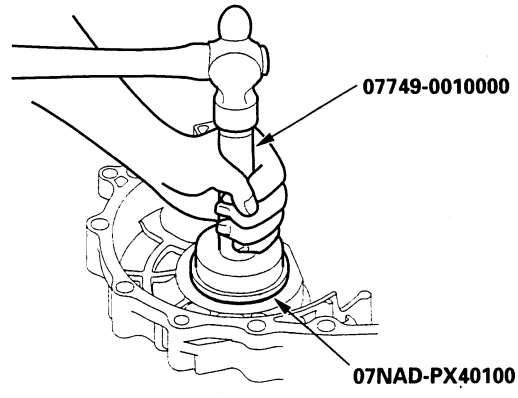
2. Replace the tapered roller bearing when the outer race is to be replaced.

3. Do not use a shim on the torque converter housing side.

4. Install the 81 mm thrust shim (A), thrust washer (B), and bearing outer race (C) in the transmission housing (D).
   If you replace the 81 mm thrust shim with a new one, use the same thickness shim as the old one.



5. Drive in the outer race with the special tools.



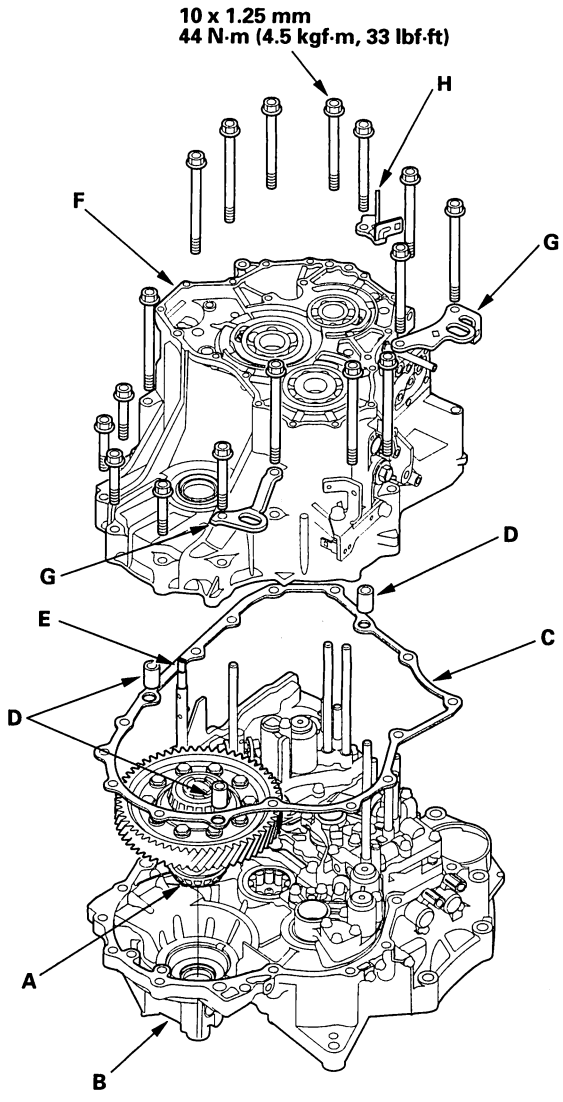
6. Check that there is no clearance between the thrust washer, outer race, shim, and transmission housing.

(cont'd)

Protected by AR

Carrier Bearing Preload Inspection (cont'd)

7. Install the differential assembly (A) in the torque converter housing (B), and install the gasket (C) and dowel pins (D) on the housing.



8. Align the spring pin on the selector control shaft (E) with the transmission housing groove.

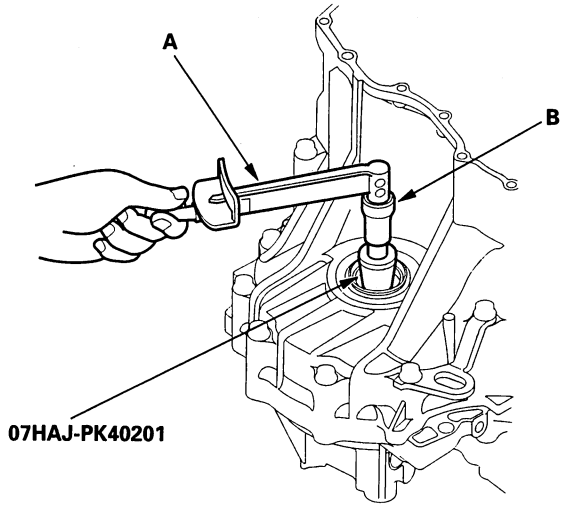
9. Install the transmission housing (F), transmission hangers (G), and harness clamp bracket (H) then tighten the bolts.

10. Rotate the differential assembly in both directions to seat the bearing.

11. Measure the starting torque of the differential assembly with the special tool, a torque wrench (A) and socket (B) at normal room temperature in both directions.

Standard

New bearing:	**2.7—3.9 N·m (28—40 kgf·cm, 24—35 lbf·in.)**
Reused bearings:	**2.5—3.6 N·m (25—37 kgf·cm, 22—32 lbf·in.)**



12. If the measurement is out of standard, remove the thrust shim and select the thrust shim from table. Install the new thrust shim and recheck. To increase the starting torque, increase the thickness of the thrust shim. To decrease the starting torque, decrease the thickness of the shim. Changing the shim to the next size will increase or decrease starting torque about 0.3—0.4 N·m (3—4 kgf·cm, 3—3 lbf·in.).

Carrier Bearing Preload Inspection (cont'd)

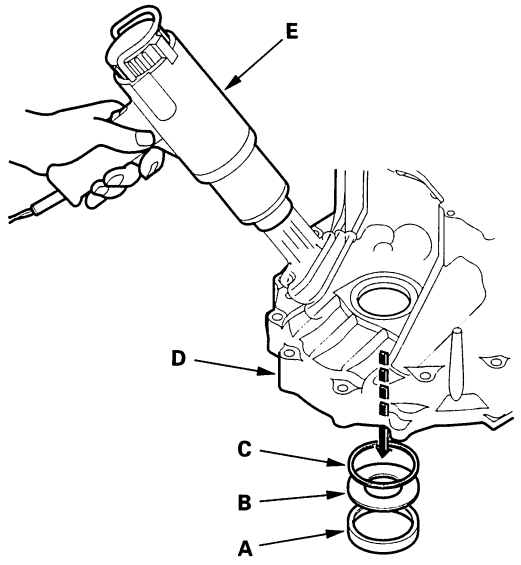
Special Tools Required
- Driver 07749-0010000
- Attachment, 78 x 90 mm 07GAD-SD40101
- Preload inspection tool 070AJ-0020101

2006 Models

NOTE: If the transmission housing, torque converter housing, differential carrier, tapered roller bearing, outer race, or thrust shim were replaced, the bearing preload must be adjusted.

1. Remove the bearing outer race (A), thrust washer (B), and thrust shim (C) from the transmission housing (D) by heating the housing to about 212 °F (100 °C) with a heat gun (E). Do not heat the housing to more than of 212 °F (100 °C).

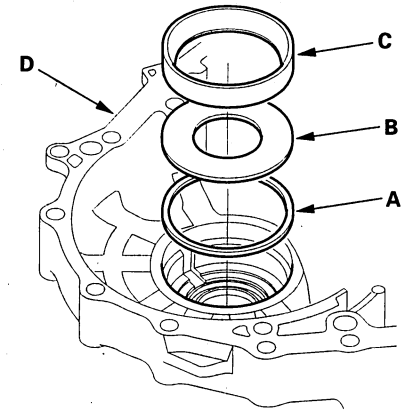
   NOTE: Let the transmission housing cool to room temperature before adjusting the bearing preload.



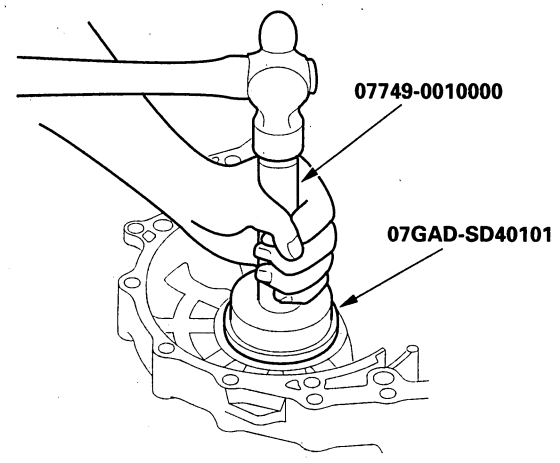
2. Replace the tapered roller bearing when the outer race is to be replaced.

3. Do not use a shim on the torque converter housing side.

4. Install the 85 mm thrust shim (A), thrust washer (B), and bearing outer race (C) in the transmission housing (D). If you replace the 85 mm thrust shim with a new one, use the same thickness shim as the old one.



5. Drive in the outer race with the special tools.

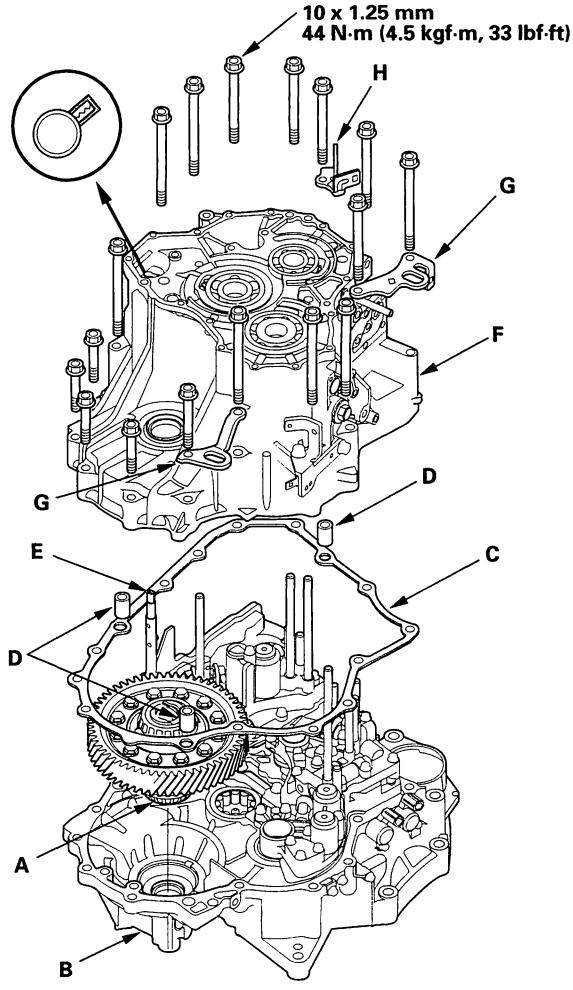


6. Check that there is no clearance between the thrust washer, outer race, shim, and transmission housing.

BACK

Protected by AR

7. Install the differential assembly (A) in the torque converter housing (B), and install the gasket (C) and dowel pins (D) on the housing.



8. Align the spring pin on the selector control shaft (E) with the transmission housing groove.

9. Install the transmission housing (F), transmission hangers (G), and harness clamp bracket (H) then tighten the bolts.

10. Rotate the differential assembly in both directions to seat the bearing.

11. Measure the starting torque of the differential assembly with the special tool, a torque wrench (A) and socket (B) at normal room temperature in both directions.

Standard

New bearing:	**2.9—4.1 N·m (30—42 kgf·cm, 26—37 lbf·in.)**
Reused bearings:	**2.7—3.8 N·m (27—39 kgf·cm, 23—34 lbf·in.)**

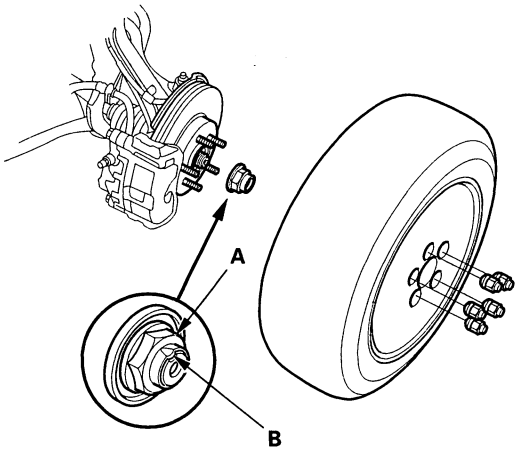
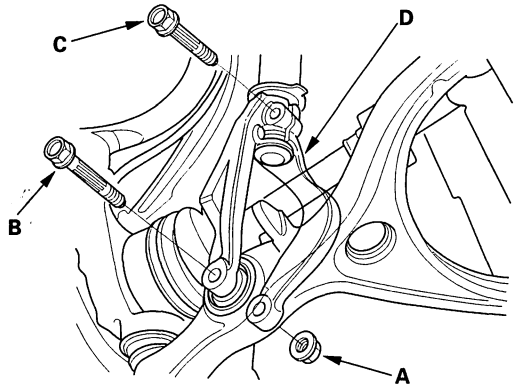
Driveshaft Removal

Special Tools Required
- Ball joint remover, 28 mm 07MAC-SL0A202
- Ball joint thread protector, 12 mm 07AAF-SDAA100

1. Loosen the wheel nuts slightly.
2. Raise the front of the vehicle, and support it with safety stands in the proper locations, refer to the 2003-2006 Accord Service Manual (see page 1-14).
3. Remove the wheel nuts and front wheels.

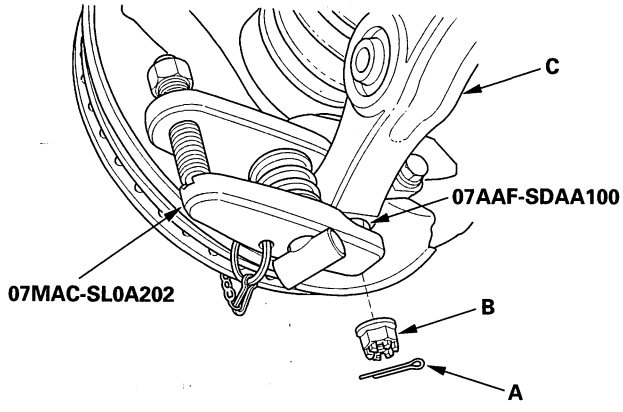


4. Lift up the locking tab (A) on the spindle nut (B), then remove the nut.
5. Drain the transmission fluid. Reinstall the drain plug using a new washer:
   - Manual transmission (see page 13-10)
   - Automatic transmission (see page 14-186)
6. Remove the self-locking nut (A), 12 mm flange bolt (B), and 10 mm flange bolt (C), then remove the damper fork (D).



7. Remove the cotter pin (A) from the lower arm ball joint castle nut (B), and remove the nut.

   NOTE:
   - To avoid damaging the ball joint, install the ball joint thread protector onto the threads of the ball joint.
   - Be careful not to damage the ball joint boot when installing the remover.

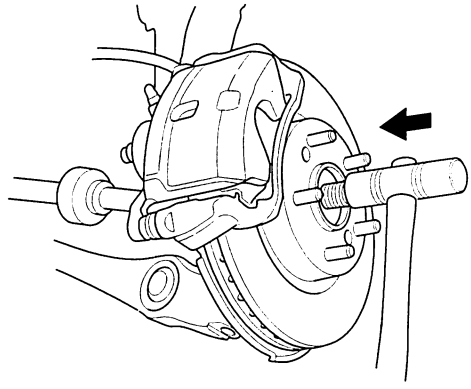


8. Separate the ball joint from the lower arm (C) with the special tool, refer to the 2003-2006 Accord Service Manual (see page 18-11).

BACK

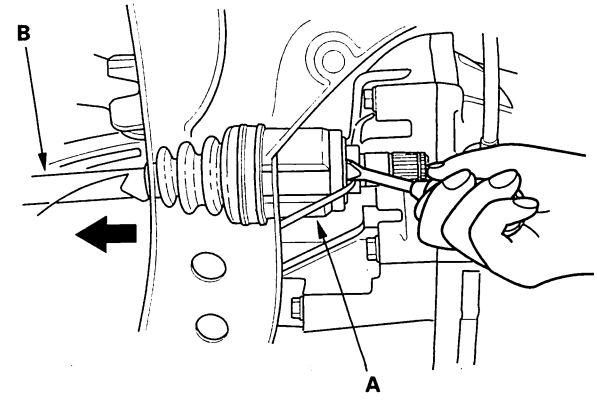
Protected by AR

9. Pull the knuckle outward, and remove the outboard joint from the front wheel hub using a plastic hammer.

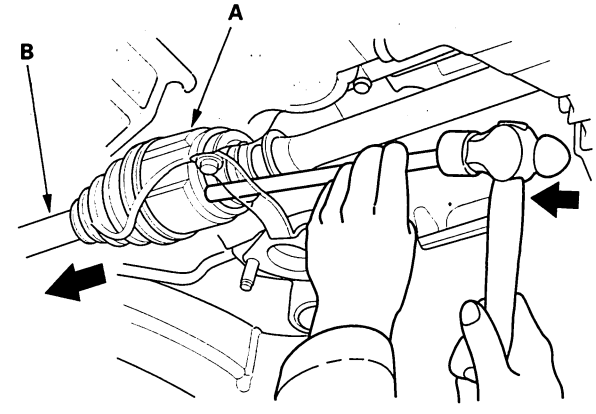


10. Left driveshaft: Pry the inboard joint (A) from the differential case with a prybar. Right driveshaft: Drive the inboard joint off of the intermediate shaft with a drift and hammer. Remove the driveshaft as an assembly. Do not pull on the driveshaft (B), because the inboard joint may come apart. Pull the driveshaft straight out to avoid damaging the oil seal.

Left driveshaft



Right driveshaft



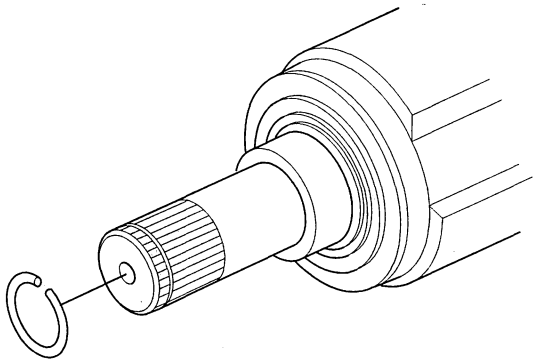
Protected by AR

Driveshaft Disassembly

Special Tools Required
- Threaded adapter, 24 x 1.5 mm 07XAC-001020A
- Boot band pincers, commercially available
- Slide hammer, 5/8"-18 UNF, commercially available

Inboard Joint Side

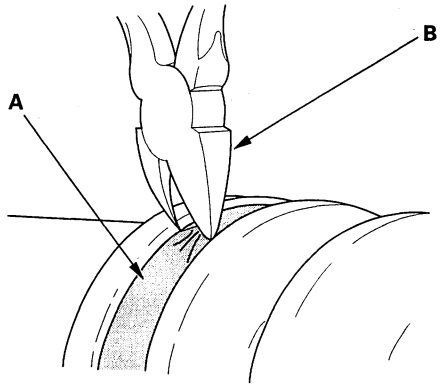
1. Remove the set ring from the inboard joint.



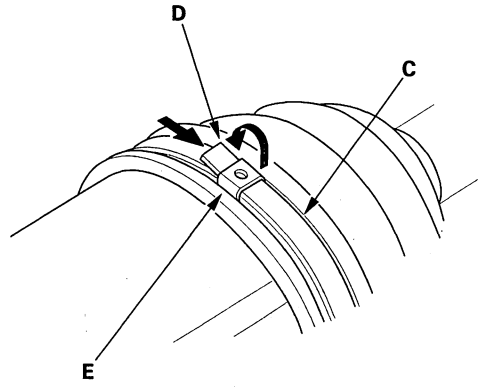
2. Remove the boot bands. Be careful not to damage the boot.

   - If the boot band is a welded type (A), cut the boot band (B).
   - If the boot band is a double loop type (C), lift up the band end (D), and push it into the clip (E).
   - If the boot band is a low profile type (F), pinch the boot band using a commercially available boot band pincers (G).

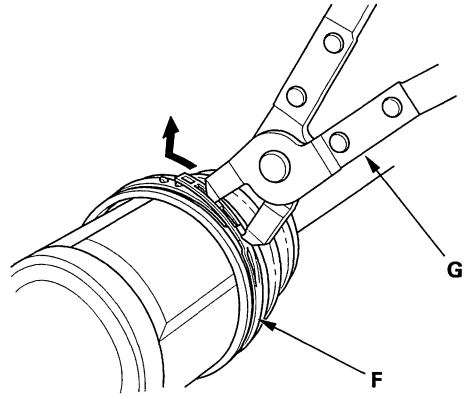
Welded Type



Double Loop Type



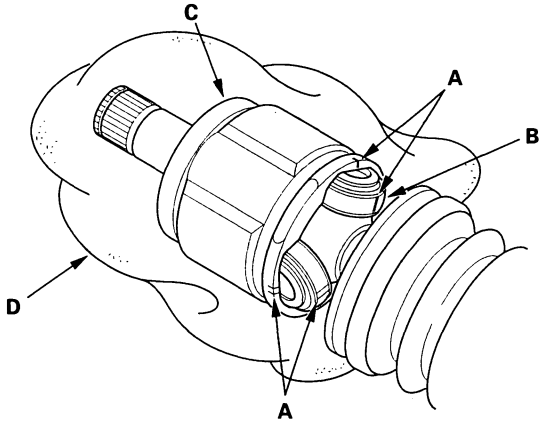
Low Profile Type



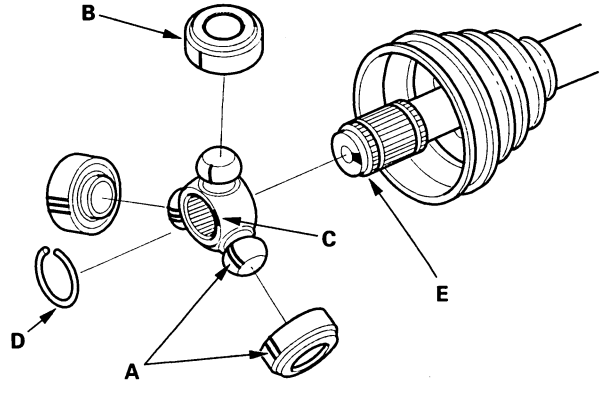
BACK

Protected by AR

3. Make a mark (A) on each roller (B) and inboard joint (C) to identify the locations of rollers and grooves in the inboard joint. Then remove the inboard joint on the shop towel (D). Be careful not to drop the rollers when separating them from the inboard joint.



4. Make a mark (A) on the rollers (B) and spider (C) to identify the locations of the rollers on the spider, then remove the rollers.

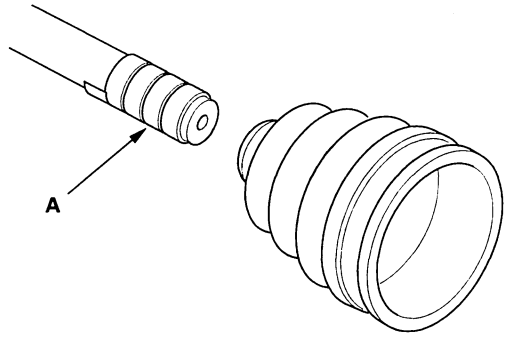


5. Remove the circlip (D).

6. Mark the spider and driveshaft (E) to identify the position of the spider on the shaft.

7. Remove the spider.

8. Wrap the splines on the driveshaft with vinyl tape (A) to prevent damage to the boot.



9. Remove the inboard boot. Be careful not to damage the boot.

10. Remove the vinyl tape.

(cont'd)

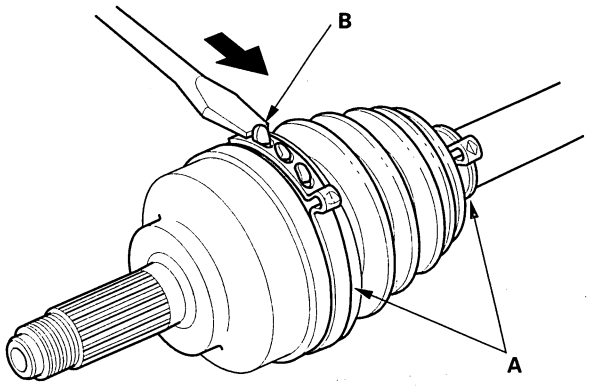
Protected by AR

Driveshaft Disassembly (cont'd)

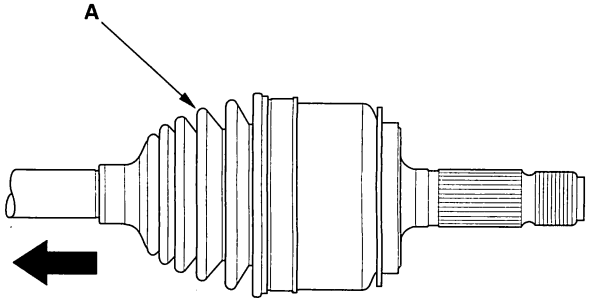
Outboard Joint Side

1. Remove the boot bands (A). Lift up the three tabs (B) with a screwdriver. Be careful not to damage the boot and dynamic damper.

Ear Clamp Type

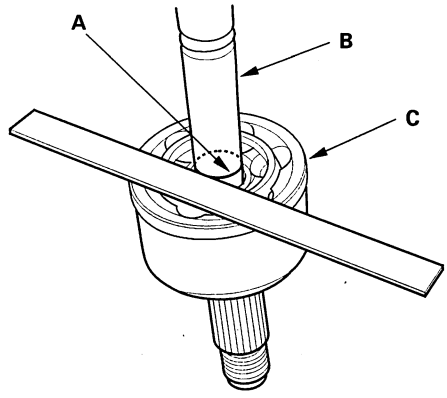


2. Slide the outboard boot (A) partially to the inboard joint side. Be careful not to damage the boot.

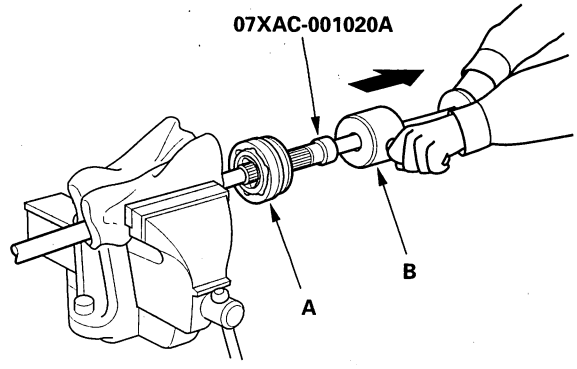


3. Wipe off the grease to expose the driveshaft and the outboard joint inner race.

4. Make a mark (A) on the driveshaft (B) at the same position as the outboard joint end (C).



5. Carefully clamp the driveshaft in a vise.



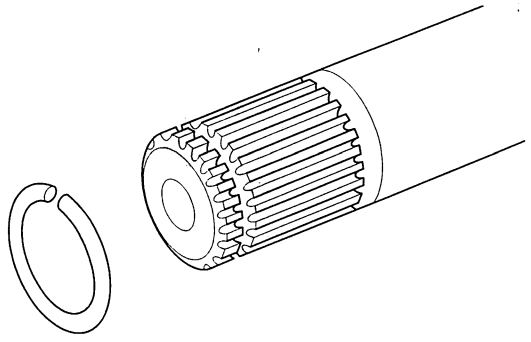
6. Remove the outboard joint (A) using the special tool and a commercially available 5/8''-18 UNF slide hammer (B).

7. Remove the driveshaft from the vise.

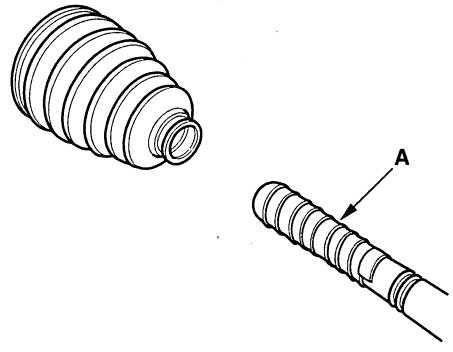
BACK

Protected by AR

8. Remove the stop ring from the driveshaft.



9. Wrap the splines on the driveshaft with vinyl tape (A) to prevent damage to the boot.



10. Remove the outboard boot. Be careful not to damage the boot.

11. Remove the vinyl tape.

Dynamic Damper Replacement

Special Tools Required
Bearing separator 07KAF-PS30200

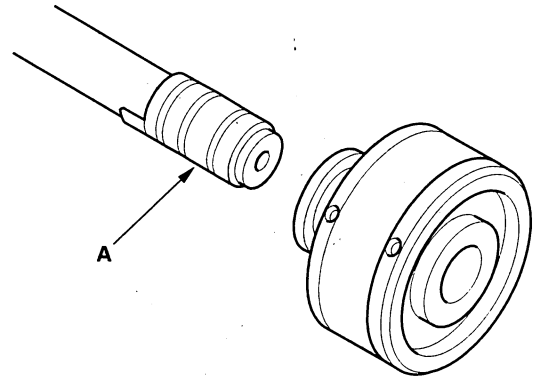
Band type

1. Remove the inboard joint (see page 16-6).

2. Remove the dynamic damper bands. Be careful not to damage the dynamic damper (see page 16-6).

   - If the band is a welded type, cut the band.
   - If the band is a double loop type, lift up the band end, and push it into the clip.
   - If the band is a low profile type, pinch the band using a commercially available boot band pincers.

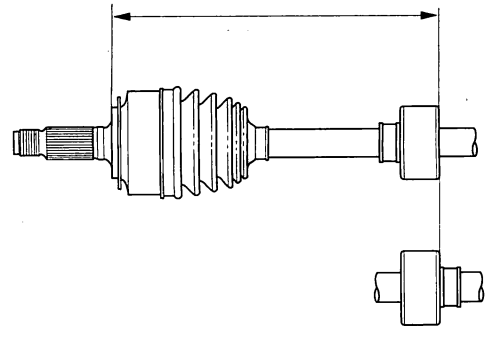
3. Wrap the splines on the driveshaft with vinyl tape (A) to prevent damage to the dynamic damper.



4. Remove the dynamic damper. Be careful not to damage the dynamic damper.

5. Adjust the position of the new dynamic damper to the figure follow.

Left driveshaft: 270—274 mm (10.63—10.79 in.)
Right driveshaft: 283—287 mm (11.14—11.30 in.)



(cont'd)

Protected by AR

Dynamic Damper Replacement (cont'd)

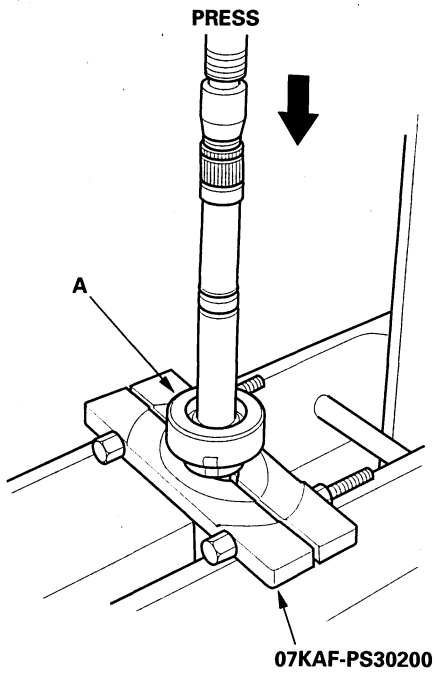
6. Install the dynamic damper band (see step 9 on page 16-14).

7. Install the inboard joint (see step 1 on page 16-13).

Bandless type

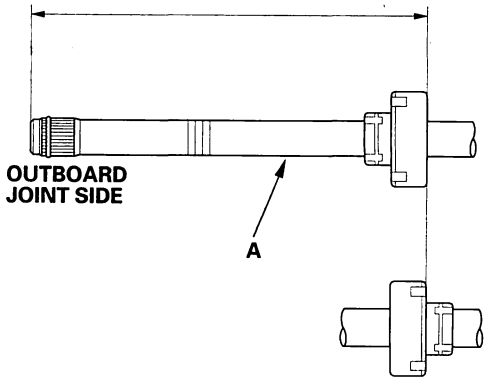
1. Remove the inboard joint and outboard joint.

2. Remove the dynamic damper (A) using the special tool and a press as shown.

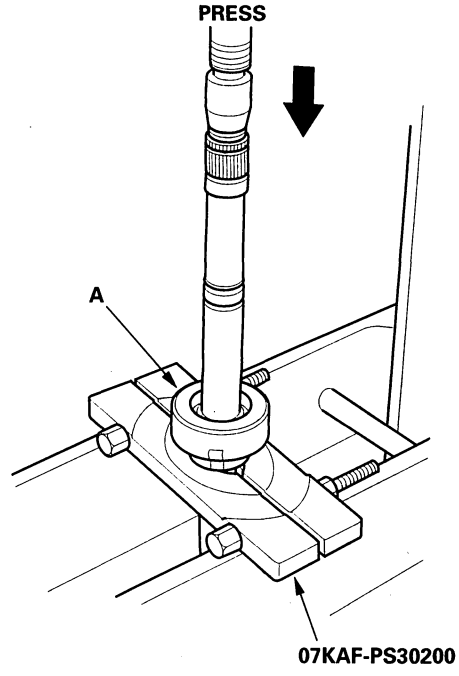


3. Mark the following position on the driveshaft (A).

Left driveshaft: 249.35—253.35 mm (9.82—9.97 in.)
Right driveshaft: 262.35—266.35 mm (10.33—10.49 in.)



4. Install the dynamic damper (A) to the marked position using the special tool and a press as shown.



5. Install the inboard joint and outboard joint (see page 16-13).

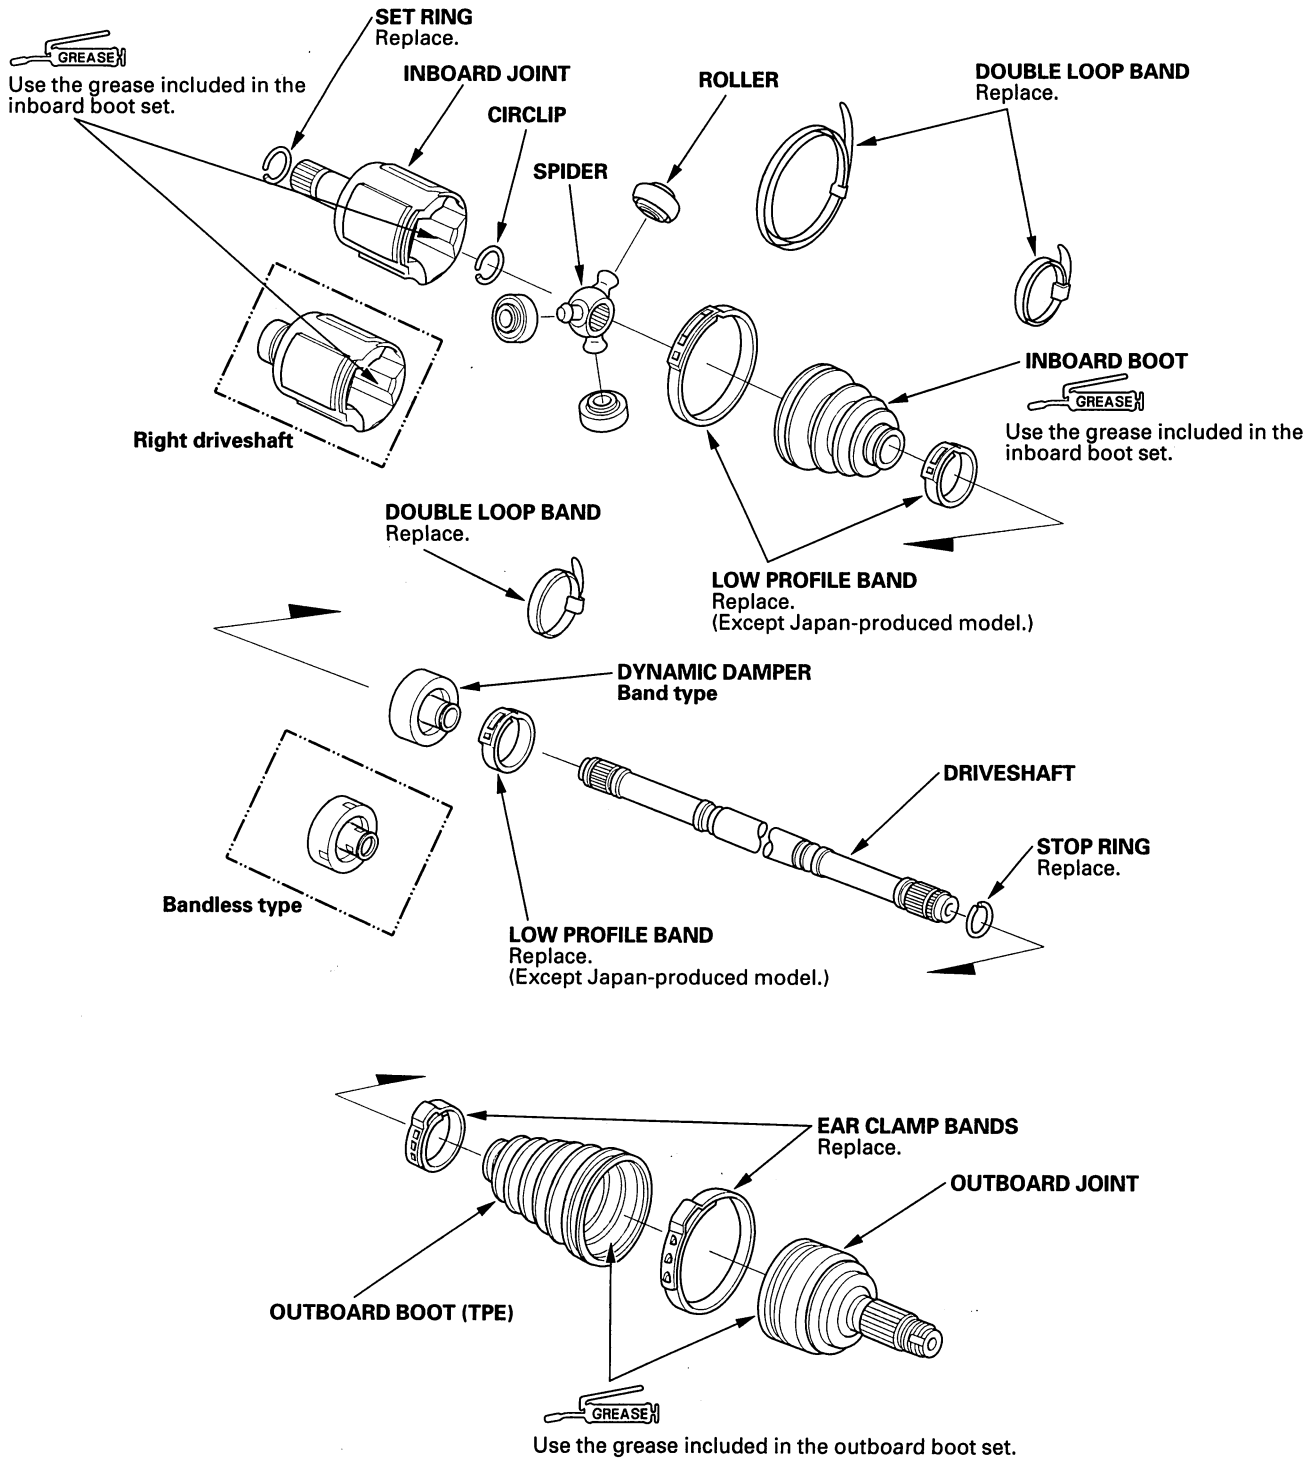
A/T model:



BACK

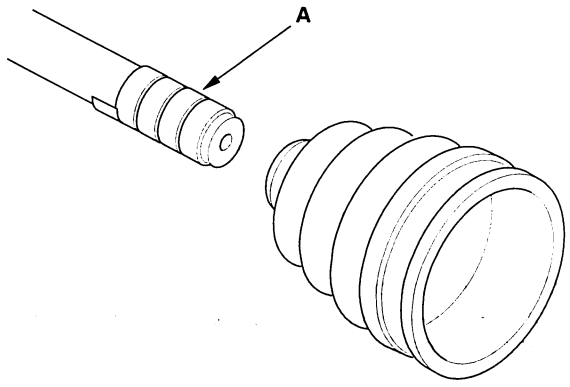
Protected by AR

Special Tools Required
- Boot band tool, KD-3191 or equivalent, commercially available
- Boot band pincers, Kent-Moore J-35910 or equivalent, commercially available
- Boot band pincers, commercially available

NOTE: Refer to the Exploded View as needed during this procedure.

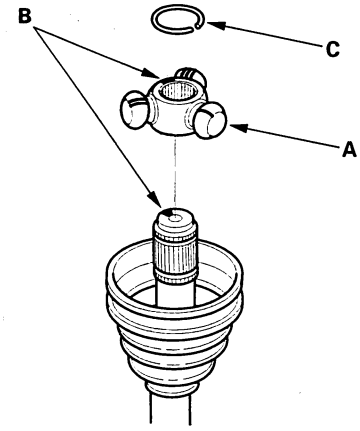
Inboard Joint Side

1. Wrap the splines with vinyl tape (A) to prevent damage to the inboard boot.



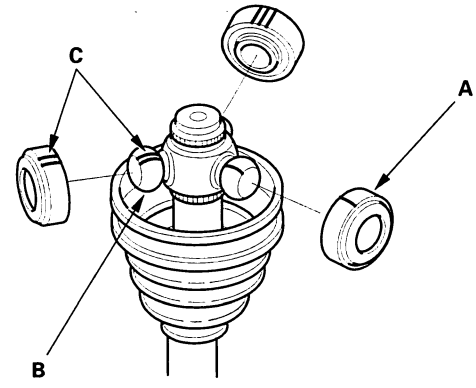
2. Install the inboard boot onto the driveshaft, then remove the vinyl tape. Be careful not to damage the inboard boot.

3. Install the spider (A) onto the driveshaft by aligning the marks (B) on the spider and the end of the driveshaft.



4. Fit the circlip (C) into the driveshaft groove. Rotate the circlip in its groove to make sure it is fully seated.

5. Fit the rollers (A) onto the spider (B) with their high shoulders facing outward, and note these items:
   - Reinstall the rollers in their original positions on the spider by aligning the marks (C).
   - Hold the driveshaft pointed up to prevent the rollers from falling off.



(cont'd)

Protected by AR

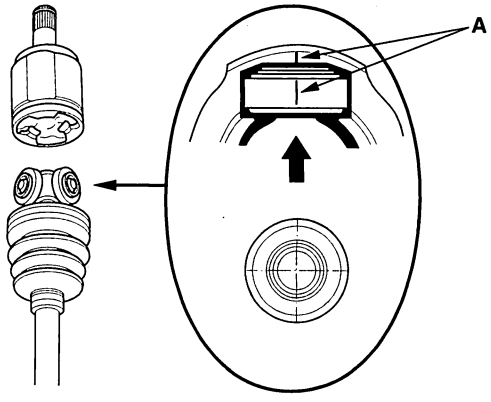
Driveshaft Reassembly (cont'd)

6. Pack the inboard joint with the joint grease included in the new driveshaft set.

   Grease quantity
   Inboard joint: 150—160 g (5.3—5.6 oz)

7. Fit the inboard joint onto the driveshaft, and note these items:

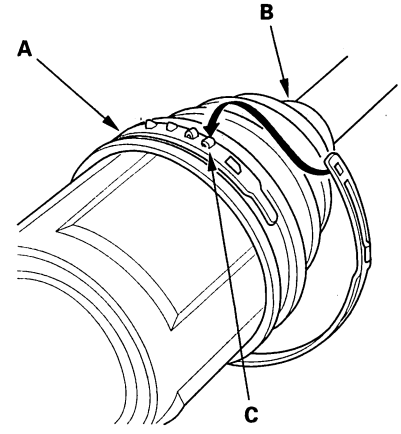
   - Reinstall the inboard joint onto the driveshaft by aligning the marks (A) on the inboard joint and the rollers.
   - Hold the driveshaft so the inboard joint is pointing up to prevent it from falling off.



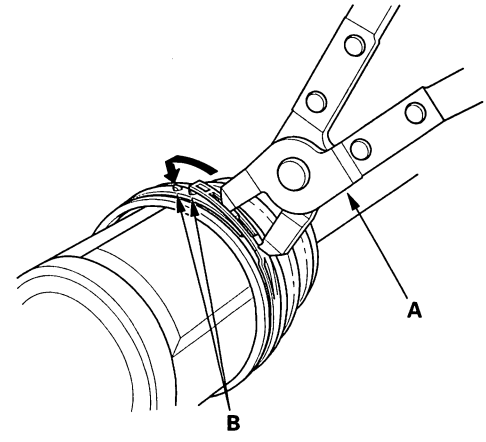
8. Install the boot bands.

   - For the double loop type, go to step 13. (Boot band replacement only)
   - For the low profile type, go to step 9.

9. Install the new low profile band (A) onto the boot (B), then hook the tab (C) of the band.



10. Close the hook portion of the band with commercially available boot band pincers (A), then hook the tabs (B) of the band.



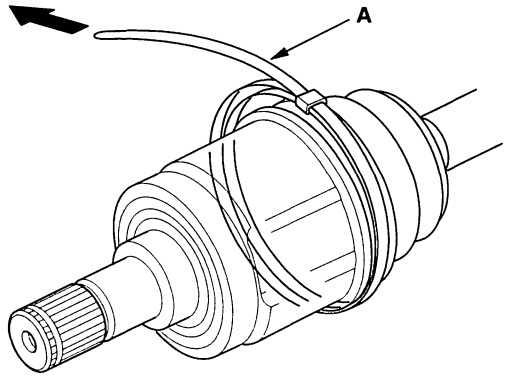
11. Install the boot band on the other end of the boot, and repeat steps 9 through 10.

BACK

Protected by AR

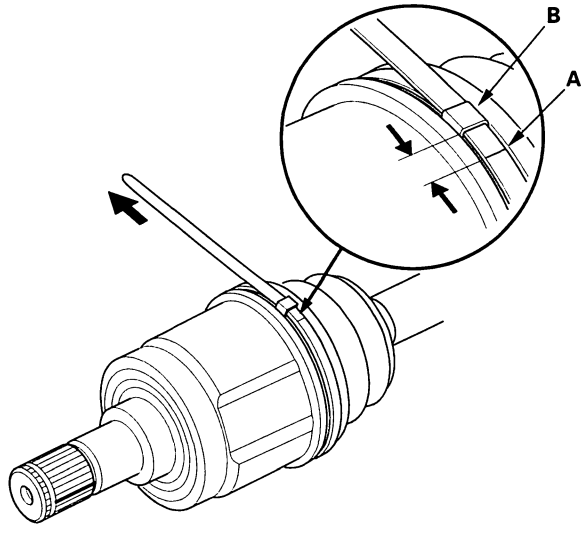
12. Adjust the inboard joint until the rollers are in the middle of the joint.

13. Fit the boot ends onto the driveshaft and the inboard joint, then install the new double loop band (A) onto the boot.

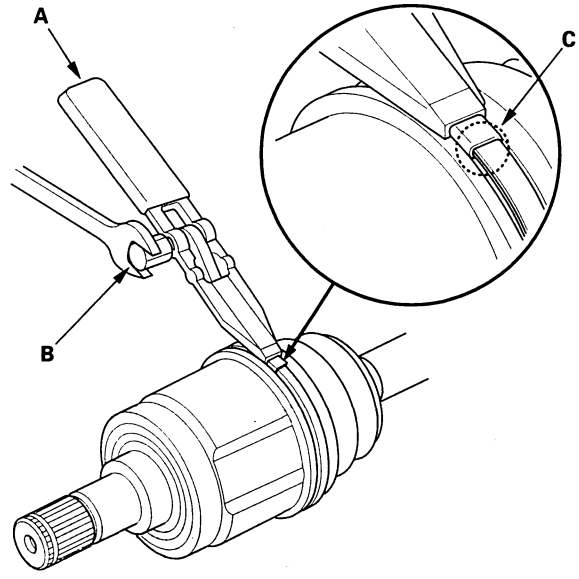


14. Pull up the slack in the band by hand.

15. Mark a position (A) on the band 10—14 mm (0.4—0.6 in.) from the clip (B).

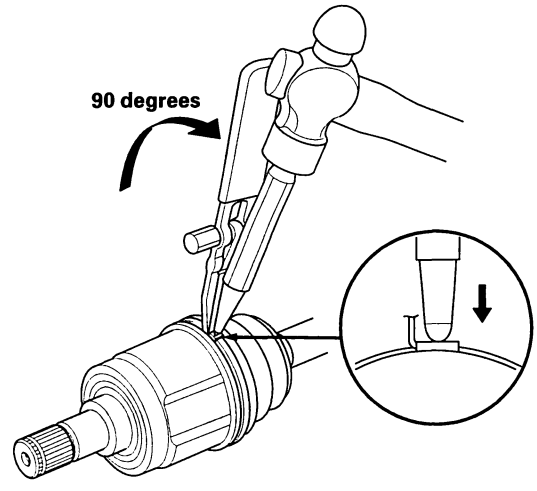


16. Thread the free end of the band through the nose section of the commercially available boot band tool KD-3191 or equivalent (A), and into the slot on the winding mandrel (B).



17. Place a wrench on the winding mandrel of the boot band tool, and tighten the band until the marked spot (C) on the band meets the edge of the clip.

18. Lift up the boot band tool to bend the free end of the band 90 degrees to the clip. Center-punch the clip, then fold over the remaining tail onto the clip.

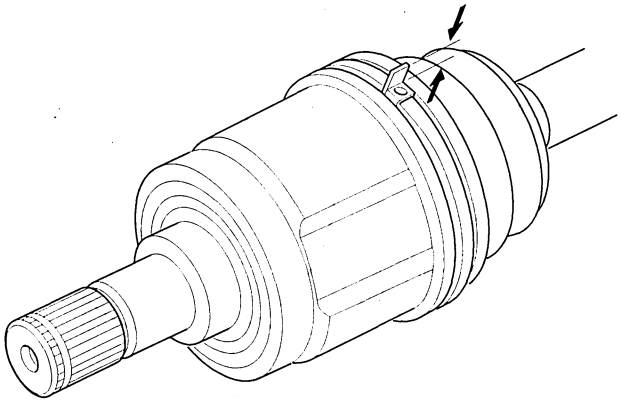


(cont'd)

Protected by AR

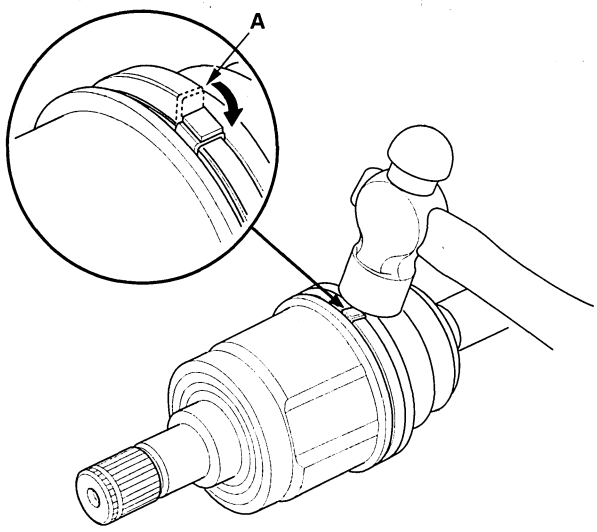
Driveshaft Reassembly (cont'd)

19. Unwind the boot band tool, and cut off the excess free end of the band to leave a 5—10 mm (0.2—0.4 in.) tail protruding from the clip.



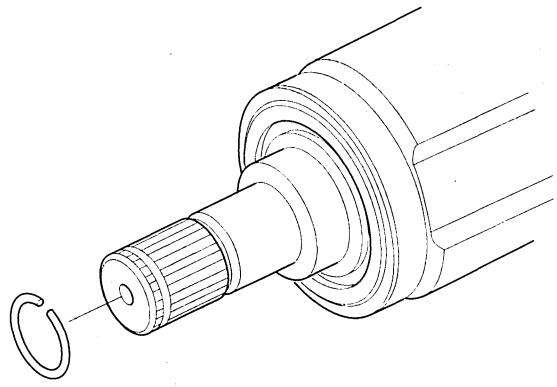
20. Bend the band end (A) by tapping it down with a hammer.

NOTE:
- Make sure the band and clip do not interfere with anything on the vehicle and the band does not move.
- Remove any grease remaining on the surrounding surfaces.



21. Repeat steps 13 through 20 for the band on the other end of the boot.

22. Install the new set ring.

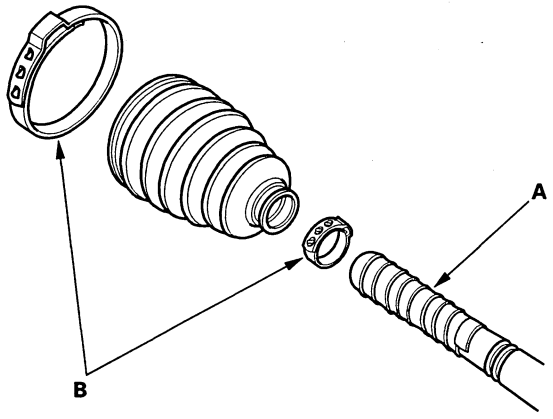


BACK

Protected by AR

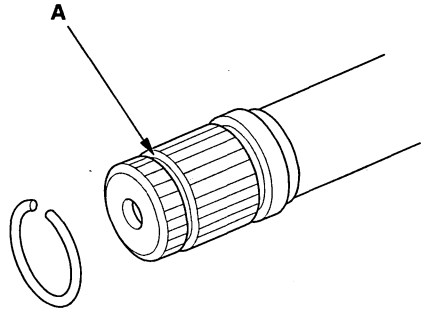
Outboard Joint Side

1. Wrap the splines with vinyl tape (A) to prevent damage to the outboard boot.

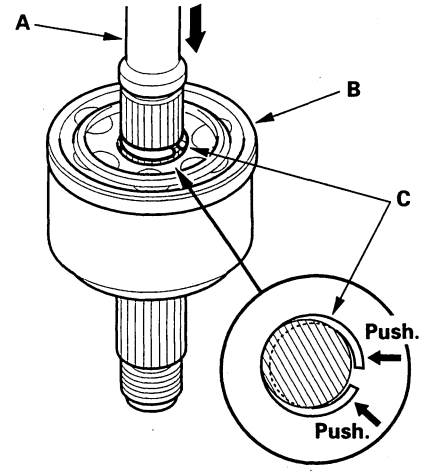


2. Install the new ear clamp bands (B) and outboard boot, then remove the vinyl tape. Be careful not to damage the outboard boot.

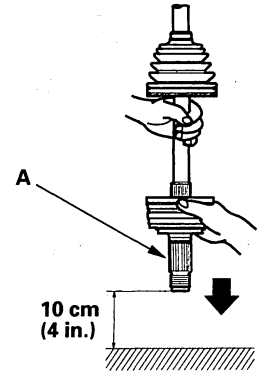
3. Install the new stop ring in the driveshaft groove (A).



4. Insert the driveshaft (A) into the outboard joint (B) until the stop ring (C) is close to the joint.



5. To completely seat the outboard joint, pick up the driveshaft and joint, and drop them from about 10 cm (4 in.) onto a hard surface. Do not use a hammer as excessive force may damage the driveshaft. Be careful not to damage the threaded section (A) of the outboard joint.

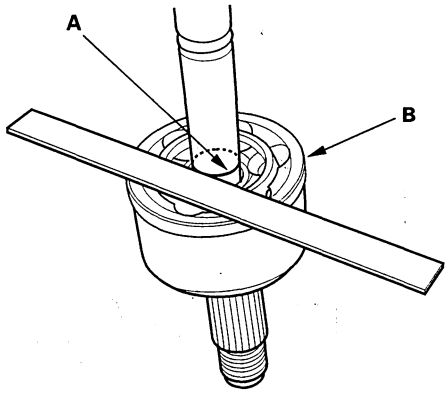


(cont'd)

Protected by AR

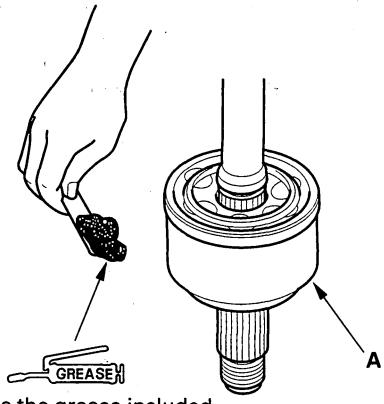
Driveshaft Reassembly (cont'd)

6. Check the alignment of the paint mark (A) with the outboard joint end (B).



7. Pack the outboard joint (A) with the joint grease included in the new joint boot set.

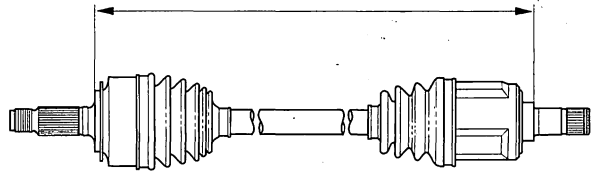
Grease quantity
Outboard joint: 140—150 g (4.9—5.3 oz)



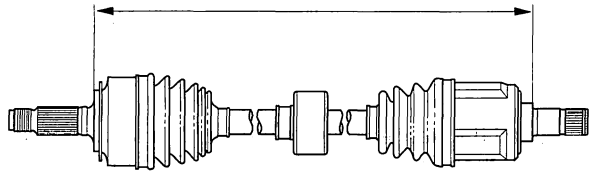
Use the grease included in the outboard boot set.

8. Adjust the length of the driveshafts as shown in the figure, then adjust the boots to halfway between full compression and full extension. Make sure the ends of the boots seat in the groove of the driveshaft and joint.

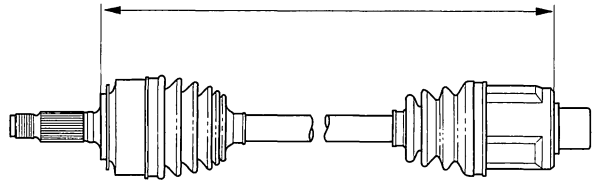
M/T model Left driveshaft: 554—559 mm (21.81—22.01 in.)



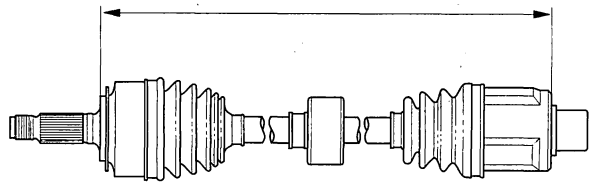
A/T model Left driveshaft: 554—559 mm (21.81—22.01 in.)



M/T model Right driveshaft: 512—517 mm (20.16—20.35 in.)



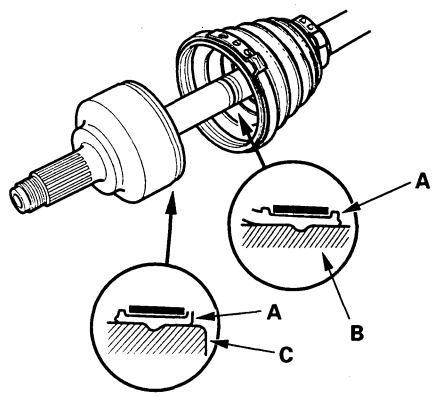
A/T model Right driveshaft: 512—517 mm (20.16—20.35 in.)



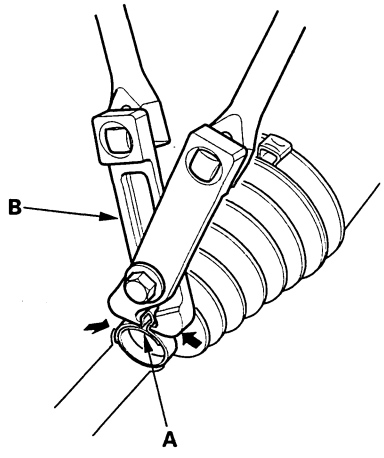
BACK

Protected by AR

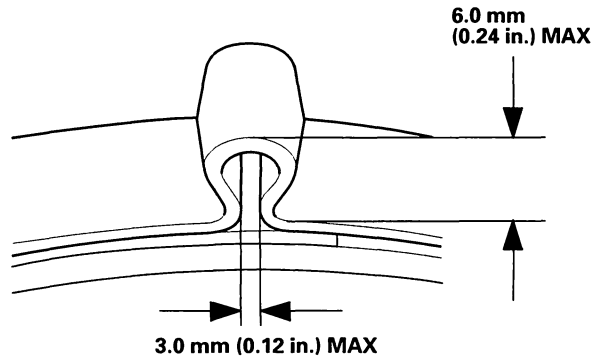
9. Fit the boot (A) ends onto the driveshaft (B) and outboard joint (C).



10. Close the ear portion (A) of the band with commercially available boot band pincers Kent-Moore J-35910 or equivalent (B).



11. Check the clearance between the closed ear portion of the band. If the clearance is not within the standard, close the ear portion of the band farther.

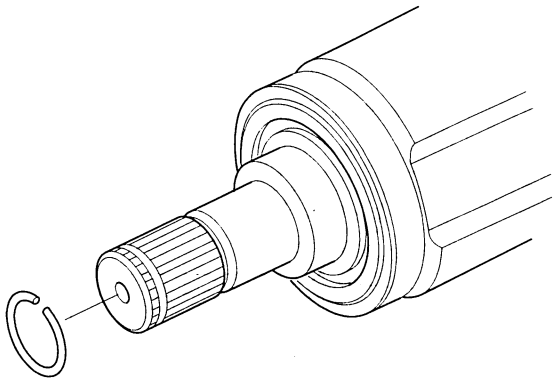


12. Repeat steps 10 and 11 for the band on the other end of the boot.

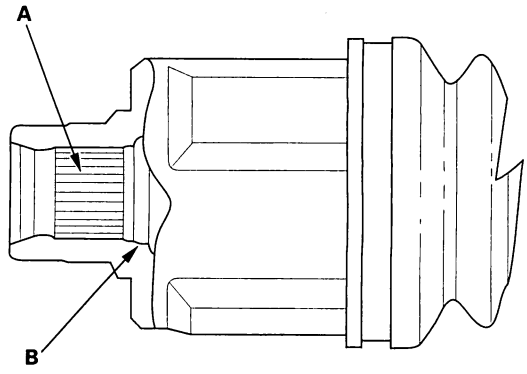
Protected by AR

Driveshaft Installation

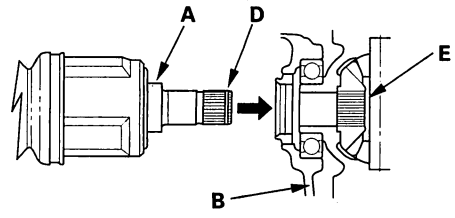
1. Install a new set ring in the set ring groove of the driveshaft (left driveshaft).

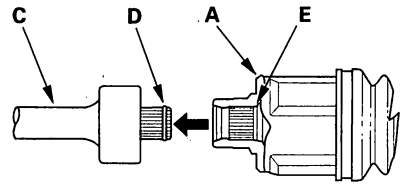


2. Apply 0.5—1.0 g (0.02—0.04 oz) of specified grease to the whole splined surface (A) of the right driveshaft. After applying grease, remove the grease from the splined grooves at intervals of 2—3 splines and from the set ring groove (B) so that air can bleed from the intermediate shaft.

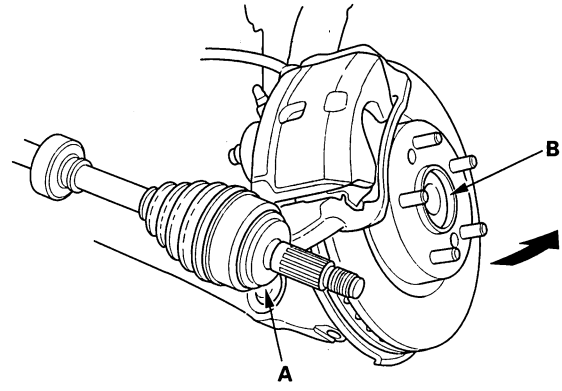


3. Clean the areas where the driveshaft contacts the differential thoroughly with solvent or brake cleaner, and dry with compressed air. Insert the inboard end (A) of the driveshaft into the differential (B) or intermediate shaft (C) until the new set ring (D) locks in the groove (E).





4. Install the outboard joint (A) into the front hub (B).

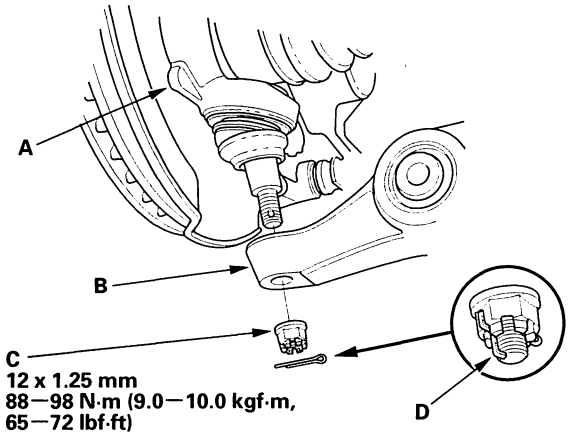


BACK

Protected by AR

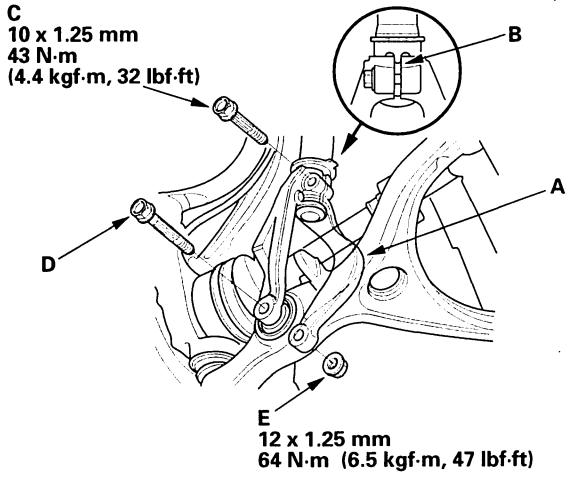
5. Install the knuckle (A) onto the lower arm (B). Wipe off the grease before tightening the nut at the ball joint. Torque the new castle nut (C) to the lower torque specification, then tighten it only far enough to align the slot with the pin hole. Do not align the nut by loosening it.

   NOTE: Make sure the ball joint boot is not damaged or cracked.



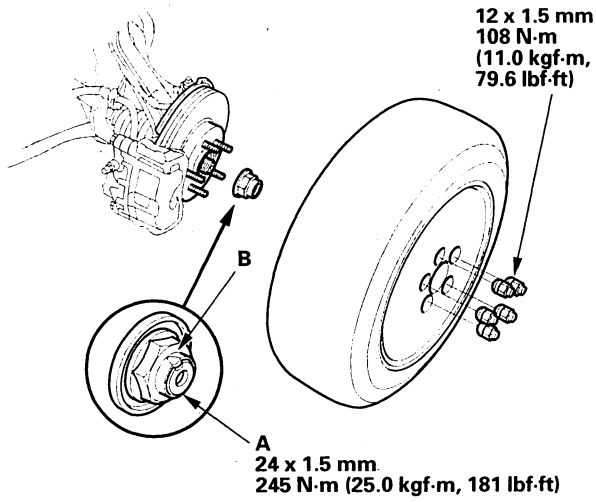
6. Install the new cotter pin (D) into the pin hole, and bend the cotter pin as shown.

7. Install the damper fork (A) over the driveshaft and onto the lower arm. Install the damper in the damper fork so the aligning tab (B) is aligned with the slot in the damper fork. Loosely install the flange bolt (C).



8. Loosely install the flange bolt (D) and a new self-locking nut (E).

9. Install a new spindle nut (A), then tighten the nut. After tightening, use a drift to stake the spindle nut shoulder (B) against the driveshaft.



10. Clean the mating surfaces of the brake disc and the front wheel, then install the front wheel with the wheel nuts.

11. Turn the front wheel by hand, and make sure there is no interference between the driveshaft and surrounding parts.

12. Tighten the flange bolts and the self-locking nut with the vehicle's weight on the damper.

13. Refill the transmission with recommended transmission fluid:

    - Manual transmission (see page 13-10)
    - Automatic transmission (see page 14-186)

14. Check the front wheel alignment, and adjust it if necessary, refer to the 2003-2006 Accord Service Manual (see page 18-6).

Protected by AR

Intermediate Shaft Removal

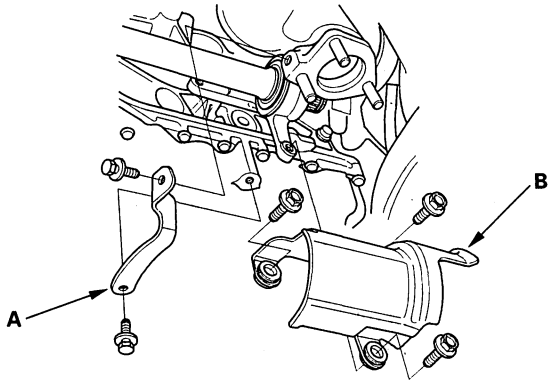
1. Drain the transmission fluid. Reinstall the drain plug, use a new washer:

   - Manual transmission (see page 13-10)
   - Automatic transmission (see page 14-186)

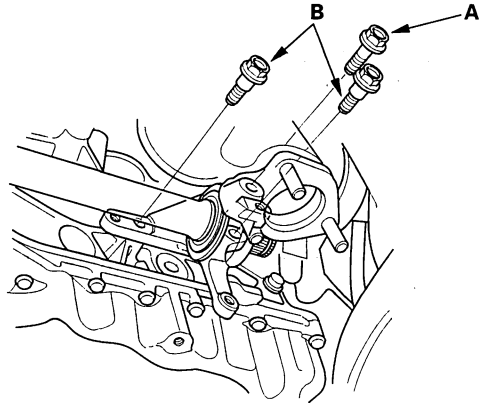
2. Remove the right driveshaft (see page 16-4).

3. Remove the exhaust pipe A (see step 40 on page 5-5).

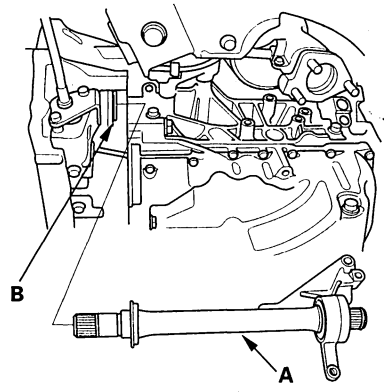
4. Remove the rear warm up three way catalytic converter (rear WU-TWC) bracket (A) and heat shield (B).



5. Remove the flange bolt (A) and two dowel bolts (B).



6. Remove the intermediate shaft (A) from the differential. Hold the intermediate shaft horizontally until it is clear of the differential to prevent damage to the differential oil seal (B).



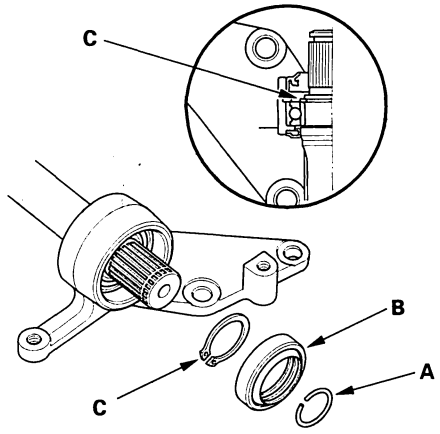
BACK

Protected by AR

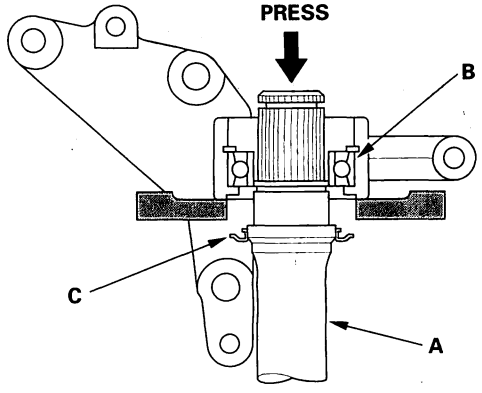
Intermediate Shaft Disassembly

Special Tools Required
- Oil seal driver 07947-SB00100
- Half shaft base 07NAF-SR30101

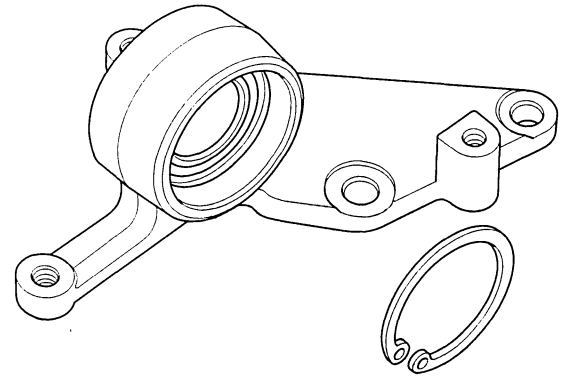
1. Remove the set ring (A), outer seal (B), and external snap ring (C).



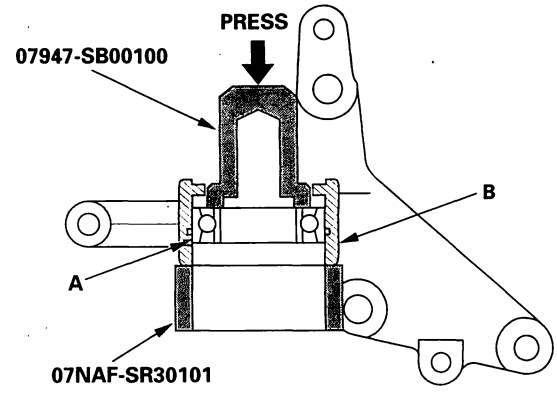
2. Press the intermediate shaft (A) out of the intermediate shaft bearing (B) using a press. Be careful not to damage the metal rings (C) on the intermediate shaft during disassembly.



3. Remove the internal snap ring.



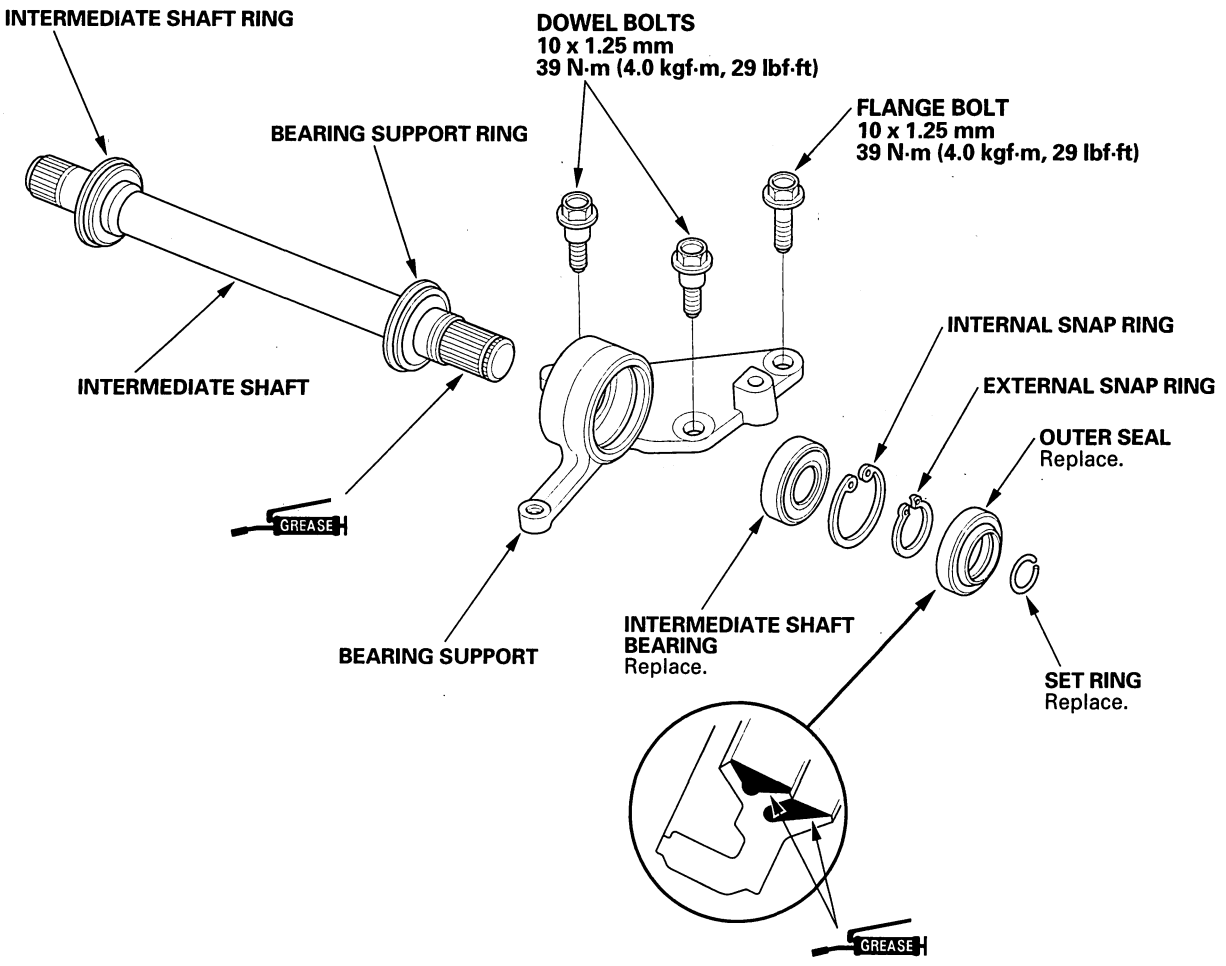
4. Press the intermediate shaft bearing (A) out of the bearing support (B) using the special tools and a press.



Protected by AR

Intermediate Shaft Reassembly

Exploded View



Pack the interior of the outer seal.

BACK

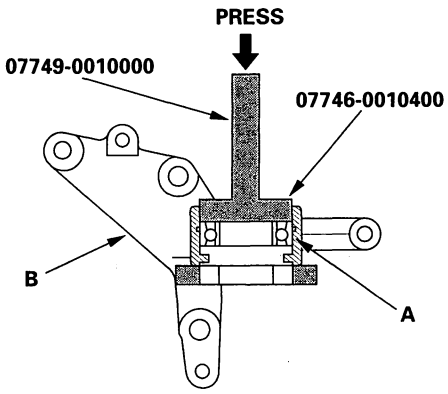
Protected by AR

Special Tools Required
- Driver 07749-0010000
- Attachment, 52 x 55 mm 07746-0010400
- Attachment, 35 mm I.D. 07746-0030400
- Oil seal driver 07GAD-PH70201

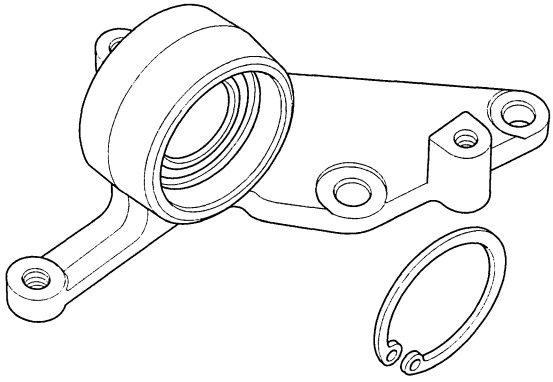
NOTE: Refer to the Exploded View as needed during this procedure.

1. Clean the disassembled parts with solvent, and dry them with compressed air. Do not wash the rubber parts with solvent.

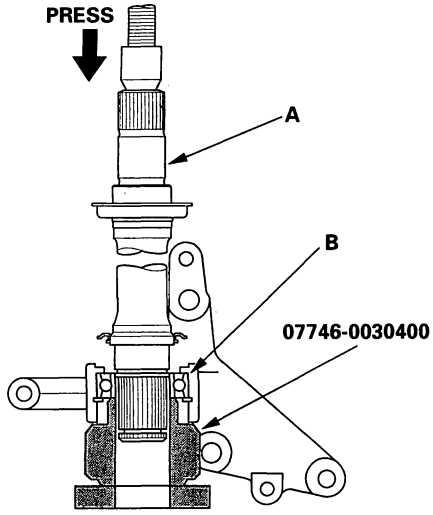
2. Press the intermediate shaft bearing (A) into the bearing support (B) using the special tools and a press.



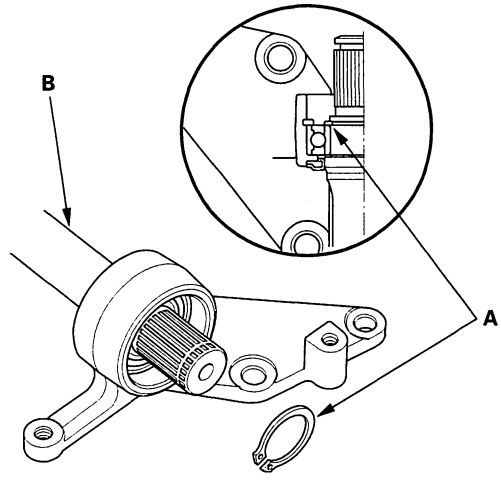
3. Install, then seat the internal snap ring in the groove of the bearing support.



4. Press the intermediate shaft (A) into the shaft bearing (B) using the special tool and a press.



5. Install, then seat the external snap ring (A) in the groove of the intermediate shaft (B).

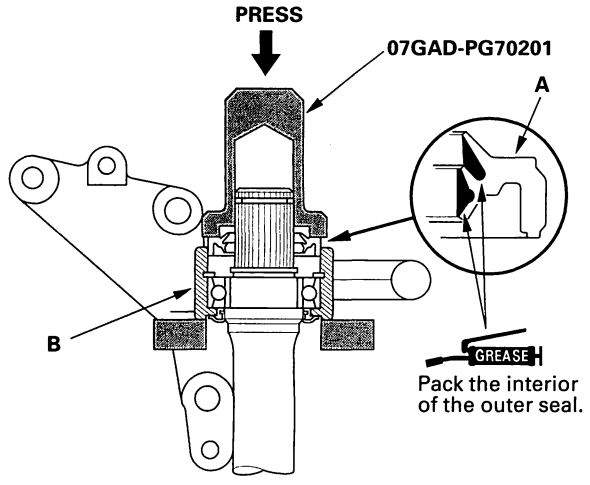


(cont'd)

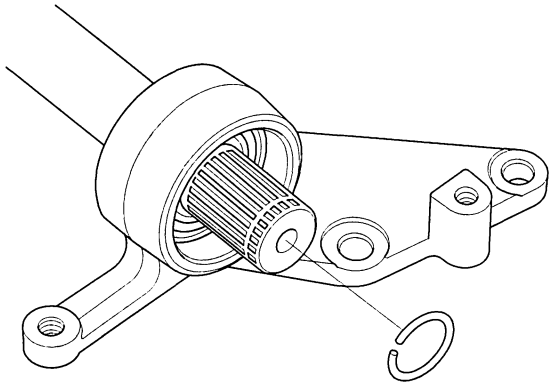
Protected by AR

Intermediate Shaft Reassembly (cont'd)

6. Install the outer seal (A) into the bearing support (B) using the special tool and a press.

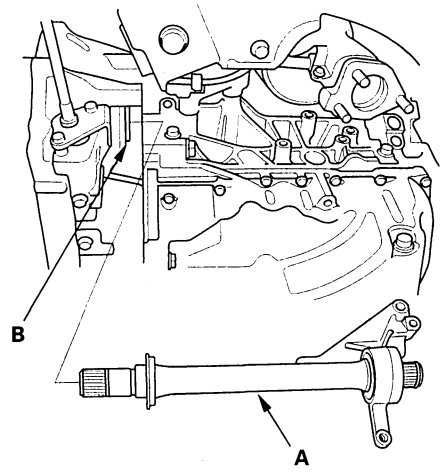


7. Install the set ring.

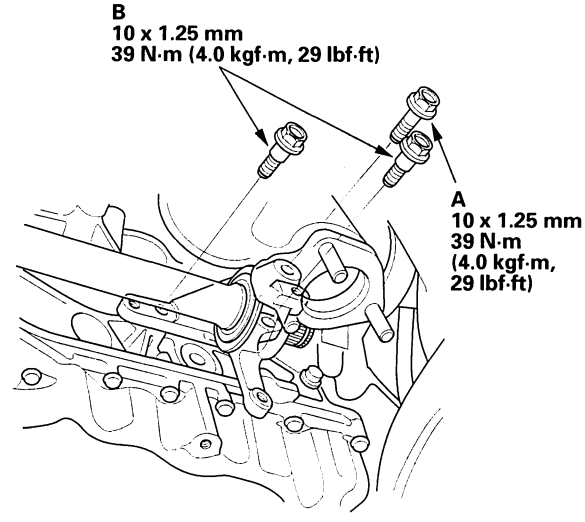


Intermediate Shaft Installation

1. Use solvent or brake cleaner to thoroughly clean the areas where the intermediate shaft (A) contacts the transmission (differential), and dry them with compressed air. Insert the intermediate shaft assembly into the differential. Hold the intermediate shaft horizontally to prevent damage to the differential oil seal (B).



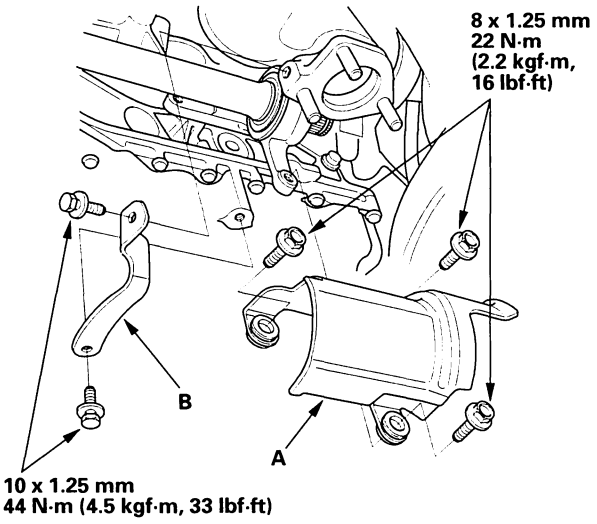
2. Install the flange bolt (A) and two dowel bolts (B).



BACK

Protected by AR

3. Install the heat shield (A) and rear warm up three way catalytic converter (rear WU-TWC) bracket (B).



4. Install the exhaust pipe A (see step 28 on page 5-16).

5. Install the right driveshaft (see page 16-20).

6. Refill the transmission fluid.

   - Manual transmission (see page 13-10)
   - Automatic transmission (see page 14-186)

Symptom Troubleshooting Index

Find the symptom in the chart below, and do the related procedures in the order listed until you find the cause.

Symptom	Procedure(s)	Also check for:
Hard steering	Troubleshoot the system (see page 17-6).	• Modified suspension • Damaged suspension • Tire sizes, tire varieties, and air pressure
Assist (excessively light steering at high speed)	Check the rack guide adjustment (see page 17-18).	Front wheel alignment, refer to the 2003-2006 Accord Service Manual (see page 18-6).
Shock or vibration when the steering wheel is turned to full lock	1. Check the rack guide adjustment (see page 17-18). 2. Check the drive belt for slippage (see page 4-35). 3. Replace the steering gearbox (see page 17-20).	
Steering wheel will not return smoothly	1. Check cylinder lines A and B for deformation. 2. Check wheel alignment, refer to the 2003-2006 Accord Service Manual (see page 18-6). 3. Replace the steering gearbox (see page 17-20).	
Uneven or rough steering	1. Check the rack guide adjustment (see page 17-18). 2. Check the drive belt (see page 4-35). 3. Check for low or erratic engine idle speed (see page 11-301). 4. Check for air in the power steering system due to low fluid level or an air leak at the pump inlet hose. 5. Check for low fluid level in the power steering reservoir due to possible leaks in system. 6. Replace the steering gearbox (see page 17-20).	
Steering wheel kicks back during wide turns	1. Check the drive belt (see page 4-35). 2. Check the power steering pump fluid pressure with T/N 07406-0010001 (see page 17-7) or T/N 07406-001000A (see page 17-8).	
Humming noise from the power steering system	1. Check when the noise occurs: • If the noise is heard 2—3 minutes after starting the engine in cold weather, this is normal. • If the noise is heard when the wheel is turned with the vehicle stopped, this is normal due to the fluid pulsation. 2. Check for the high-pressure hose touching the subframe or body. 3. Check for automatic transmission converter noise. 4. Check for air bubbles in the power steering fluid.	Pump pressure
Power steering rack rattle or chattering	1. Check for loose steering components (tie-rod and ball joints). Tighten or replace as necessary. 2. Check the steering column shaft for wobbling. If the steering column wobbles, replace the steering column assembly, refer to the 2003-2006 Accord Service Manual (see page 17-25). 3. Check the rack guide adjustment (see page 17-18). 4. Check the power steering pump pulley. • If the pulley is loose, tighten it (see step 33 on page 17-17). • If the pump shaft is loose, replace the pump (see page 17-12).	

BACK

Protected by AR

Symptom	Procedure(s)	Also check for:
Hissing noise/ foaming fluid in reservoir	• Check the fluid level. If low, fill the reservoir to the proper level and check for leaks. • Check the reservoir for leaks. • Check for crushed inlet hose or loose hose clamp allowing air into the suction side of the system. • Check the power steering pump shaft oil seal for leaks.	Air in the P/S fluid
Noise from the power steering pump	• Compare the pump noise at normal operating temperature to another alike vehicle (pump noise up to 2—3 minutes after starting the engine in cold weather is normal). • Remove and inspect the pump for wear and damage (see page 17-13).	• P/S pump pressure • Air in the P/S fluid
Squeaking from the power steering pump	Check the drive belt (see page 4-35).	
Fluid leaks from the steering gearbox	• Fluid leaks from the top of the valve body unit: Replace the valve body unit. • Fluid leaks from the left tie-rod boot: Replace the valve body unit. Replace the cylinder end seal on the gearbox side. • Fluid leaks from the right tie-rod boot: Replace the cylinder end seal. • Fluid leaks from pinion shaft near the lower steering joint bolt: Replace the valve body unit. • Fluid leaks from the steering damping valve covers on the valve body unit (SHOWA-steering gearbox): Replace the valve housing. • Fluid leaks from the steering damping valve connector A and B on the cylinder, or the connectors are loosening (TKS-steering gearbox): Replace the cylinder housing.	
Fluid leaks from the power steering line	• Fluid leaks from the cylinder line A or B connections (flare nuts): Tighten the connection and retest. If it still leaks, replace the fitting O-rings. • Fluid leaks from a damaged cylinder line A or B: Replace the cylinder line. • Fluid leaks from the pump outlet hose or return line fitting on the valve body unit (flare nuts): Tighten the fitting and retest. If it still leaks, replace the hose, the line, or valve body unit as necessary.	
Fluid leaks from the power steering pump	• Fluid leaks from the front oil seal: Replace the front oil seal. • Fluid leaks from the power steering pump housing: Replace the leaking O-rings or seals (see page 17-13), and if necessary replace the power steering pump.	
Fluid leaks from the power steering reservoir	• Fluid leaks from around the reservoir cap: Fluid level is too high: drain the reservoir to the proper level. Aerated fluid: Check for on air leak on the inlet side of pump. • Fluid leaks from reservoir: Check the reservoir for cracks and replace as necessary.	
Fluid leaks from the power steering pump outlet hose (high-pressure)	• Check the fitting for loose bolts. If the bolts are tight, replace the fitting O-ring. • Fluid leaks at the swagged joint: Replace the outlet hose.	
Fluid leaks from the power steering pump inlet hose (low-pressure)	Check the hose for damage, deterioration, or improper assembly. Replace or repair as necessary.	

Protected by AR

Symptom Troubleshooting

Hard Steering

1. Check the power assist, refer to the 2003-2006 Accord Service Manual (see page 17-7).

   Is the power assist more than 29 N (3.0 kgf, 6.6 lbf)?

   YES—Go to step 2.
   NO—Power assist is OK. ■

2. Measure steady-state fluid pressure from the pump at idle with T/N 07406-0010001 (see page 17-7) or T/N 07406-001000A (see page 17-8).

   Is the pressure 1,470 kPa (15 kgf/cm², 213 psi) or less?

   YES—Go to step 3.
   NO—Go to step 7.

3. Measure the pump relief pressure at idle with T/N 07406-0010001 (see page 17-7) or T/N 07406-001000A (see page 17-8).

   Is the pressure 7,940—8,630 kPa (81—88 kgf/cm², 1,150—1,250 psi) or less?

   YES—Go to step 4.
   NO—Go to step 8.

4. With a spring scale, measure the power assist in both directions, to the left and to the right.

   Are the two measurements within 5.0 N (0.51 kgf, 1.12 lbf) of each other?

   YES—Go to step 5.
   NO—Go to step 9.

5. Measure the fluid pressure with T/N 07406-0010001 (see step 11 on page 17-7) or T/N 07406-001000A (see step 10 on page 17-8) with both pressure gauge valves open (if so equipped), while turning the steering wheel fully to the left and fully to the right.

   Is the pressure 7,940—8,630 kPa (81—88 kgf/cm², 1,150—1,250 psi) or less?

   YES—Go to step 6.
   NO—Faulty gearbox. ■

6. Adjust the rack guide (see page 17-18), and retest.

   Is the steering OK?

   YES—Repair is completed. ■

   NO—Faulty gearbox. ■

7. Check for feed and return lines between the pump and the gearbox for clogging and deformation.

   Are the lines clogged or deformed?

   YES—Repair or replace the lines. ■

   NO—Faulty valve body unit. ■

8. Check the flow control valve (see step 11 on page 17-14) for smooth movement and leaks.

   Is the flow control valve OK?

   YES—Faulty pump assembly. ■

   NO—Faulty flow control valve. ■

9. Check the cylinder lines A and B for deformation (see page 17-11).

   Are the A or B lines deformed?

   YES—Replace the lines. ■

   NO—Go to step 10.

10. Check for a bent rack shaft or misadjusted rack guide (too tight).

    Is the rack shaft bent or the rack guide adjusted too tight?

    YES—Replace the rack shaft or readjust the rack guide. ■

    NO—Faulty valve body unit. ■

BACK

Protected by AR

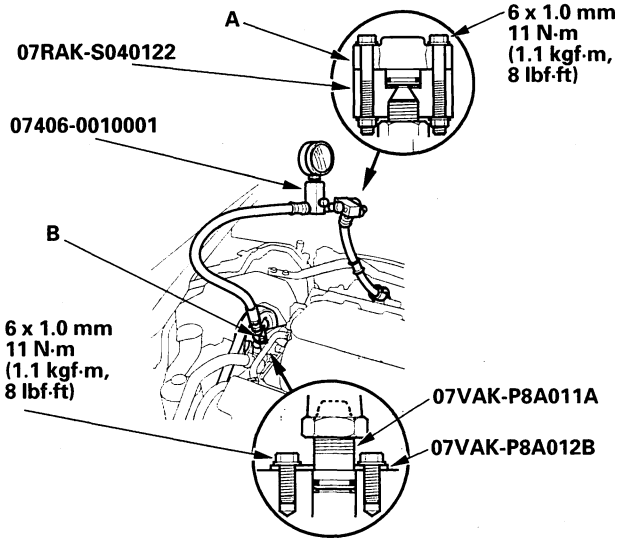
Pump Pressure Test with T/N 07406-0010001

Special Tools Required
- P/S joint adapter (pump) 07VAK-P8A011A
- P/S joint adapter plate (pump) 07VAK-P8A012B
- P/S joint adapter (hose) 07RAK-S040122
- P/S pressure gauge 07406-0010001

Check the fluid pressure as follows to determine whether the trouble is in the pump or gearbox.

1. Check the power steering fluid level (see page 17-10).

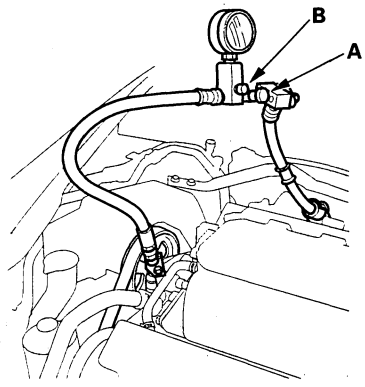
2. Disconnect the pump outlet hose (A) from the pump outlet with care so as not to spill the power steering fluid on the frame and other parts, then install the P/S joint adapter (pump) on the pump outlet (B) with the P/S joint outlet plate.



3. Connect the P/S joint adapter (hose) to the P/S pressure gauge, then connect the pump outlet hose to the P/S joint adapter (hose).

4. Install the P/S pressure gauge to the P/S joint adapter (pump).

5. Fully open the shut-off valve (A).



6. Fully open the pressure control valve (B).

7. Start the engine and let it idle.

8. Turn the steering wheel from lock-to-lock several times to warm the fluid to operating temperature.

9. Measure steady-state fluid pressure while the engine is idling. If the pump is in good condition, the gauge should read no more than 1,470 kPa (15 kgf/cm^2, 213 psi).

   If it reads high, check for:
   - Clogged or deformed feed or return line between the pump and gearbox.
   - Clogged valve body unit.

10. Close the shut-off valve, then close the pressure control valve gradually until the pressure gauge needle is stable. Read the pressure.

    NOTICE
    Do not keep the shut-off valve closed more than 5 seconds or the pump could be damaged by over-heating.

11. Immediately open the shut-off valve fully. If the pump is in good condition, the gauge should read at least 7,940—8,630 kPa (81—88 kgf/cm^2, 1,150—1,250 psi). A low reading means pump output is too low for full assist. Repair or replace the pump.

Protected by AR

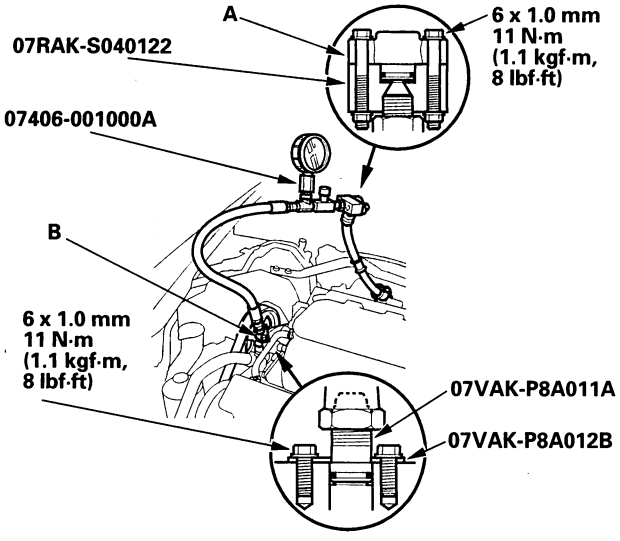
Pump Pressure Test with T/N 07406-001000A

Special Tools Required
- P/S joint adapter (pump) 07VAK-P8A011A
- P/S joint adapter plate (pump) 07VAK-P8A012B
- P/S joint adapter (hose) 07RAK-S040122
- P/S pressure gauge 07406-001000A

Check the fluid pressure as follows to determine whether the trouble is in the pump or gearbox.

1. Check the power steering fluid level (see page 17-10).

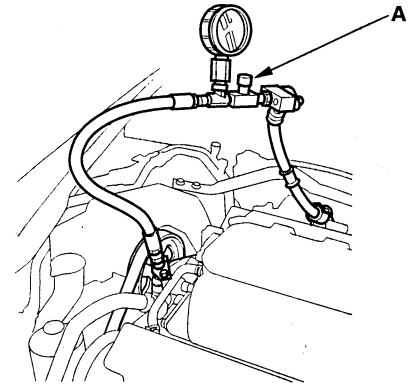
2. Disconnect the pump outlet hose (A) from the pump outlet with care so as not to spill the power steering fluid on the frame and other parts, then install the P/S joint adapter (pump) on the pump outlet (B) with the P/S joint outlet plate.



3. Connect the P/S joint adapter (hose) to the P/S pressure gauge, then connect the pump outlet hose to the P/S joint adapter (hose).

4. Install the P/S pressure gauge to the P/S joint adapter (pump).

5. Open the pressure control valve (A) fully.



6. Start the engine and let it idle.

7. Turn the steering wheel from lock-to-lock several times to warm the fluid to operating temperature.

8. Measure steady-state fluid pressure while the engine is idling. If the pump is in good condition, the gauge should read no more than 1,470 kPa (15 kgf/cm², 213 psi).

   If it reads high, check for:
   - Clogged or deformed feed or return line between the pump and gearbox.
   - Clogged valve body unit.

9. Lower the engine speed and let it idle. Gradually close the pressure control valve and immediately read the pressure.

   NOTICE
   Do not keep the pressure control valve closed more than 5 seconds or the pump could be damaged by over-heating.

10. Immediately open the pressure control valve fully. If the pump is in good condition, the gauge should read at least 7,940—8,630 kPa (81—88 kgf/cm², 1,150—1,250 psi). A low reading means pump output is too low for full assist. Repair or replace the pump.

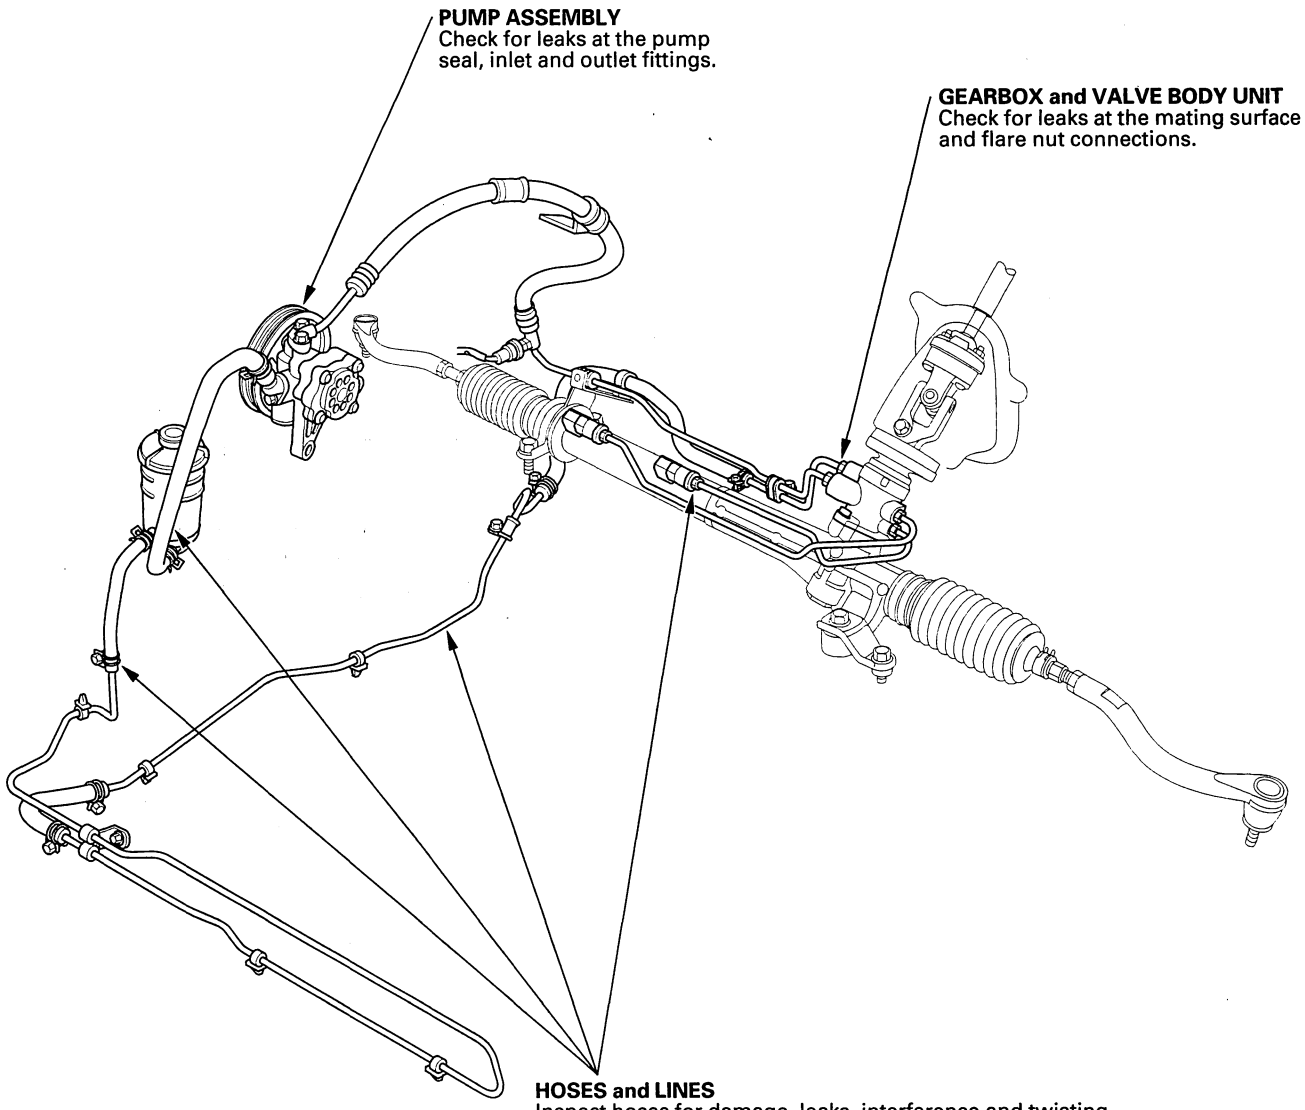
Fluid Leakage Inspection

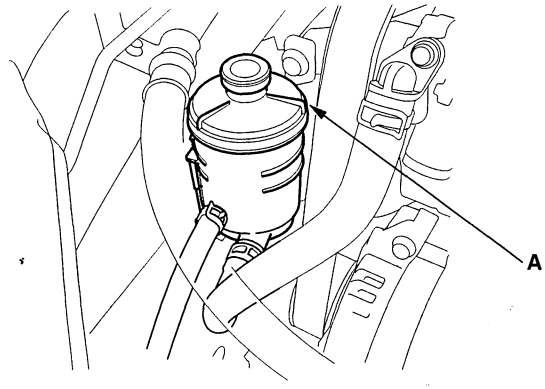


Protected by AR

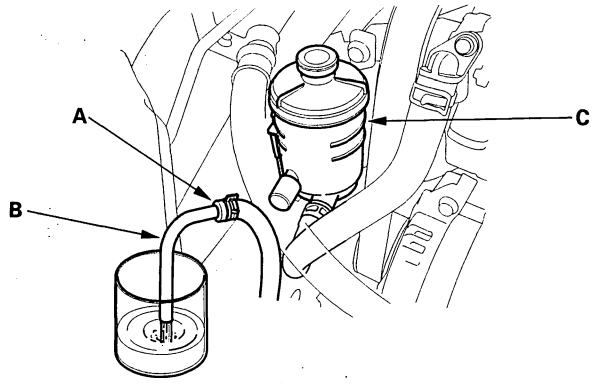
Fluid Replacement

Check the reservoir (A) at regular intervals, and add the recommended fluid as necessary. Always use Honda Power Steering Fluid. Using any other type of power steering fluid or automatic transmission fluid can cause increased wear and poor steering in cold weather.

System capacity:
1.1 L (1.16 US.qt) at disassembly
Reservoir capacity:
0.4 L (0.42 US.qt)



1. Raise the reservoir, then disconnect the return hose (A) to drain the reservoir. Take care not to spill the fluid on the body and parts. Wipe off any spilled fluid at once.



2. Connect a hose (B) of suitable diameter to the disconnected return hose, and put the hose end in a suitable container.
3. Start the engine, let it run at idle, and turn the steering wheel from lock-to-lock several times. When fluid stops running out of the hose, shut off the engine. Discard the fluid.
4. Reinstall the return hose on the reservoir.
5. Fill the reservoir to the upper level line (C).
6. Start the engine and run it at fast idle, then turn the steering wheel from lock-to-lock several times to bleed air from the system.
7. Recheck the fluid level and add some if necessary. Do not fill the reservoir beyond the upper level line.
8. If the fluid is contaminated, dark, or discolored, repeat procedure as necessary.

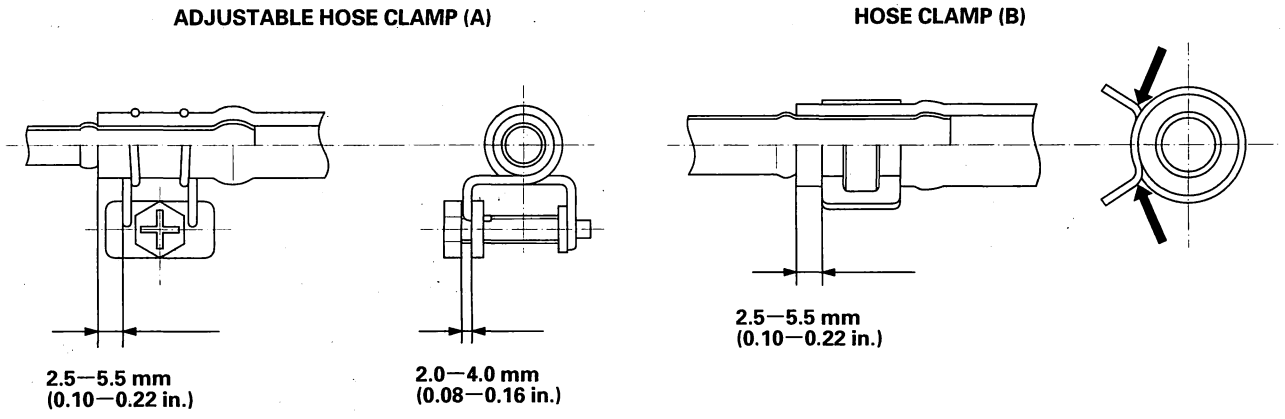
BACK

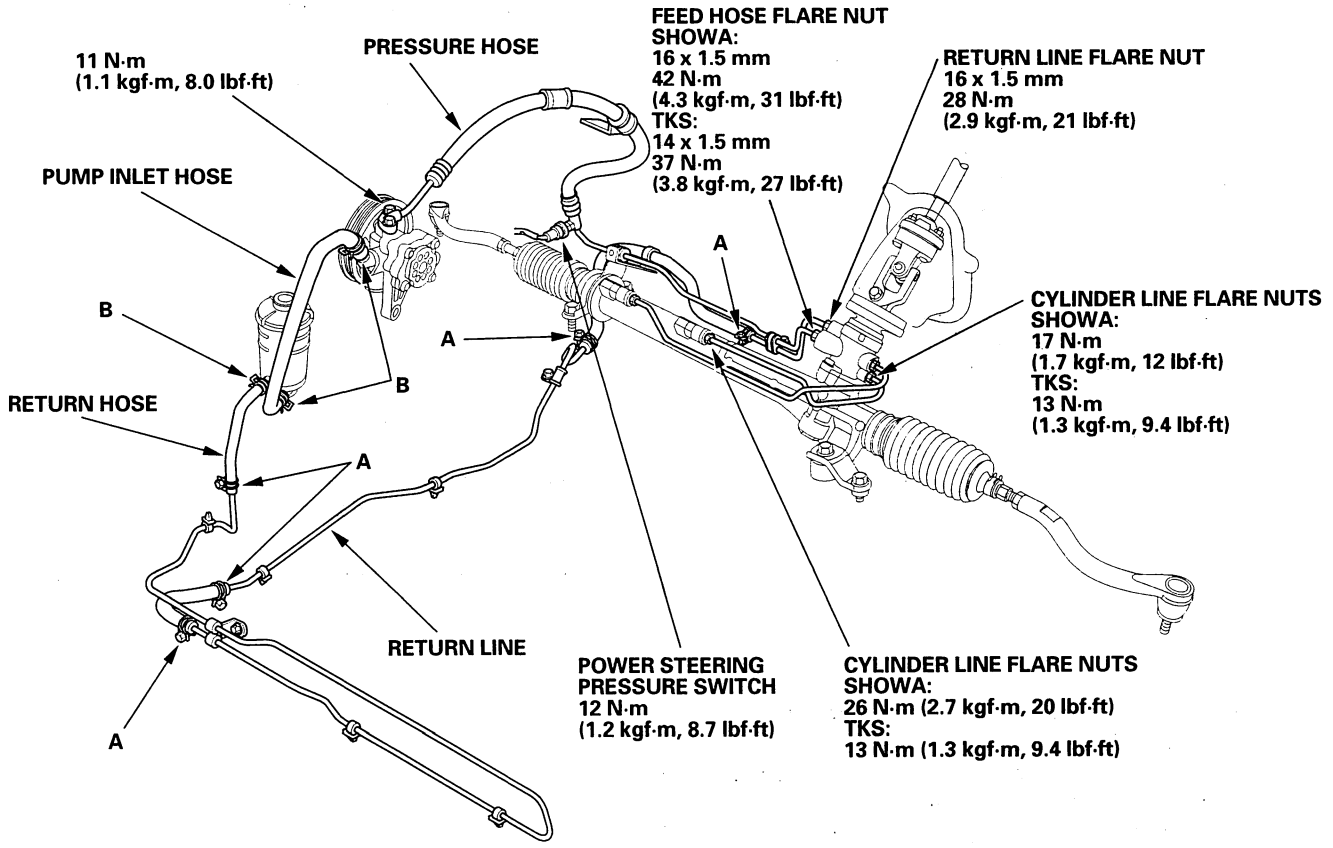
Protected by AR

Power Steering Hose, Line, and Pressure Switch Replacement

Note these items during installation:

- Connect each hose to the corresponding line securely until it contacts the stop on the line. Install the clamp or adjustable clamp at the specified distance from the hose end as shown.
- Check all clamps for deterioration or deformation; replace the clamps with new ones if necessary.
- Add the recommended power steering fluid to the specified level on the reservoir and check for leaks.

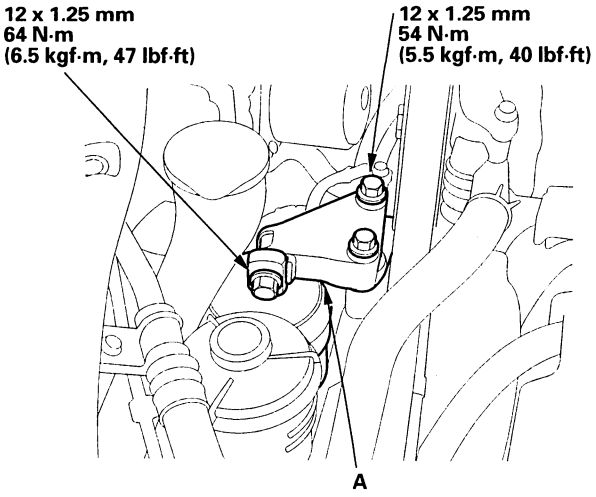




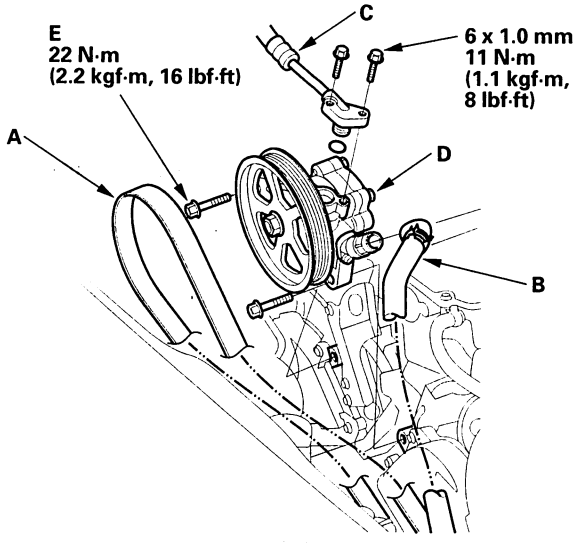
Protected by AR

Pump Replacement

1. Place a suitable container under the vehicle.
2. Drain the power steering fluid from the reservoir.
3. Remove the side engine mount bracket (A).

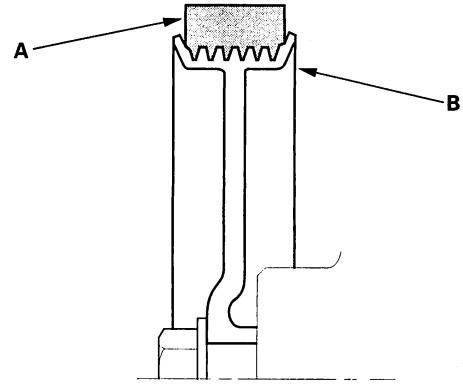


4. Remove the drive belt (A) from the pump pulley (see page 4-35).



5. Cover the auto-tensioner, alternator, and A/C compressor with several shop towels to protect them from spilled power steering fluid. Disconnect the pump inlet hose (B) and pump outlet hose (C) from the pump (D), and plug them. Take care not to spill the fluid on the body or parts. Wipe off any spilled fluid at once. Do not turn the steering wheel with the pump removed.
6. Remove the pump mounting bolts (E).
7. Cover the opening of the pump with a piece of tape to prevent foreign material from entering the pump.
8. Connect the pump inlet hose and pump outlet hose onto the new pump.
9. Loosely install the pump in the pump bracket with the mounting bolts, then tighten the pump fittings securely.
10. Tighten the pump mounting bolts to the specified torque.
11. Install the drive belt (A).

    Note these items during belt installation:
    - Make sure that the belt is properly positioned on the pulleys (B).
    - Do not get power steering fluid or grease on the auto-tensioner, alternator, A/C compressor, and drive belt or pulley faces. Clean off any fluid or grease before installation.



12. Install the side engine mount bracket. Tighten the bolts to the specified torque.
13. Fill the reservoir to the upper level line (see page 17-10).

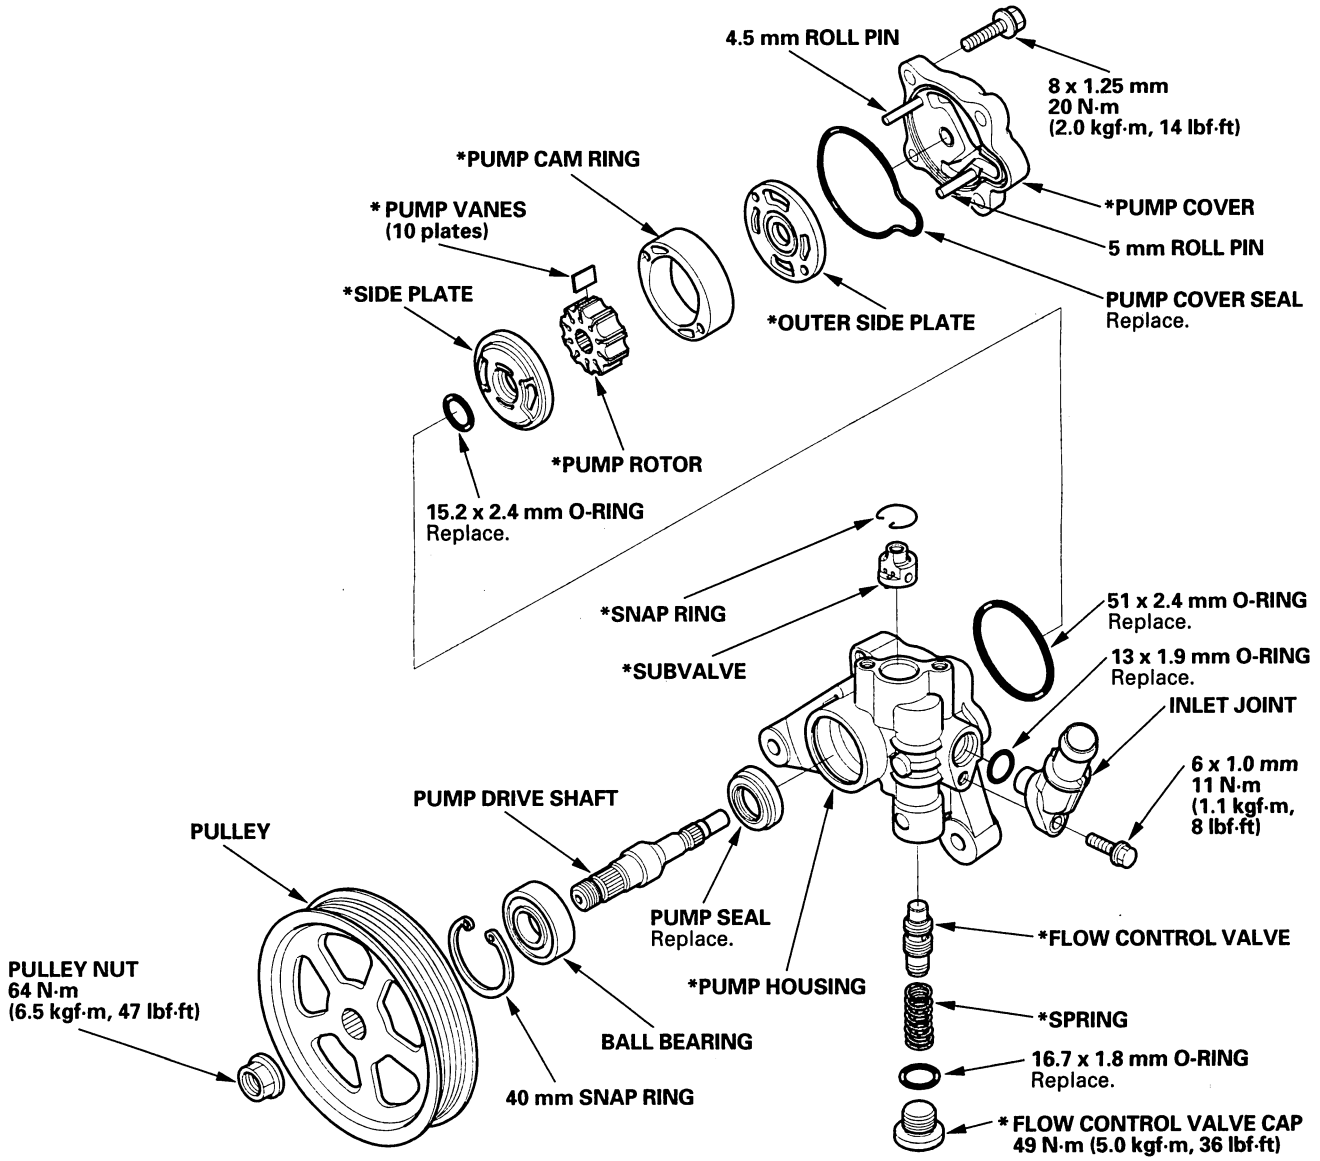
Pump Overhaul

Exploded View

Replace the pump as an assembly if the parts indicated with asterisk (*) are worn or damaged.



(cont'd)

Protected by AR

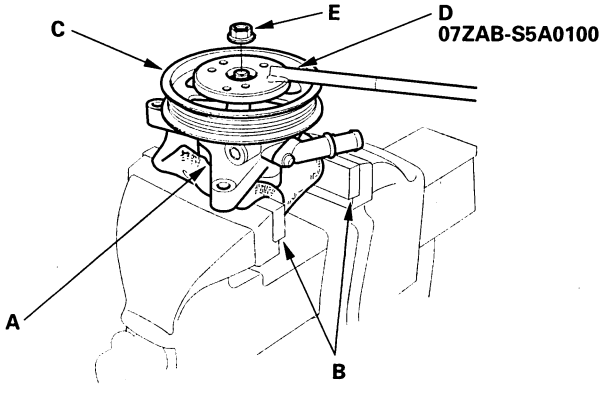
Pump Overhaul (cont'd)

Special Tools Required
Pulley holder 07ZAB-S5A0100

Disassembly

NOTE: Refer to the Exploded View as needed during the following procedure.

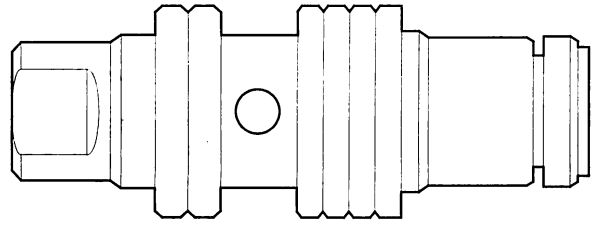
1. Drain the fluid from the pump (see step 1 on page 17-10).
2. Remove the power steering pump (see page 17-12).
3. Hold the power steering pump (A) in a vise with soft jaws (B), hold the pulley (C) with the special tool (D), and remove the pulley nut (E) and pulley. Be careful not to damage the pump housing with the jaws of the vise.



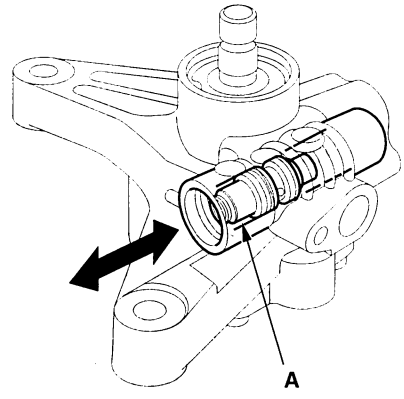
4. Remove the inlet joint and O-ring.
5. Loosen the flow control valve cap with a hex wrench, and remove it and the O-ring, flow control valve and spring.
6. Remove the pump cover and pump cover seal.
7. Remove the outer side plate, cam ring, rotor, vanes, side plate and O-rings.
8. Remove the snap ring, then remove the sub-valve from the pump housing.
9. Remove the snap ring, then remove the pump drive shaft by tapping the shaft end with the plastic hammer.
10. Remove the seal from the pump housing.

Inspection

11. Check the flow control valve for wear, burrs, and other damage to the edges of the grooves in the valve.



12. Inspect the bore of the flow control valve on the pump housing for scratches and wear.
13. Slip the flow control valve back in the pump housing, and check that it moves in and out smoothly. If OK, go to step 14; if not, replace the pump as an assembly. The flow control valve (A) is not available separately.

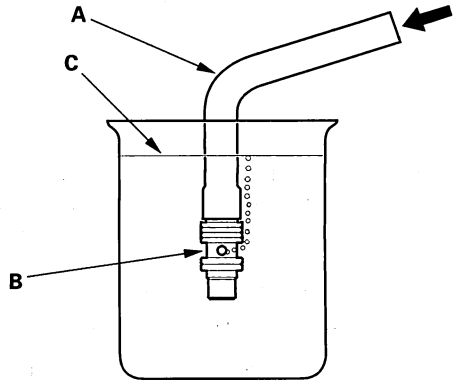


BACK

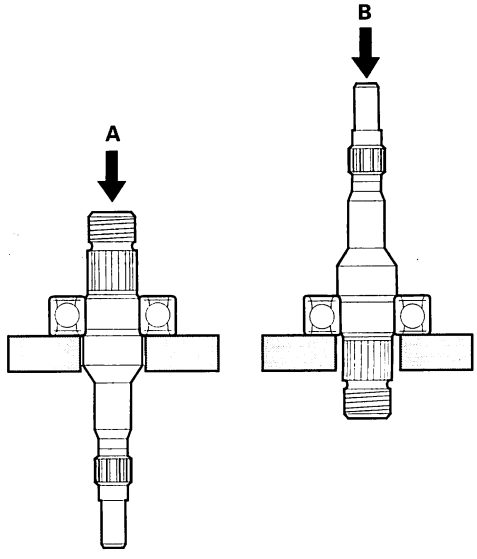
Protected by AR

14. Attach a hose (A) to the end of the flow control valve (B) as shown. Then submerge the flow control valve in a container of power steering fluid or solvent (C), and blow in the hose.

    - If air bubbles leak through the valve at less than 98 kPa (1.0 kgf/cm², 14.2 psi), replace the pump as an assembly. The flow control valve is not available separately.
    - If the flow control valve OK, set it aside for reassembly later.



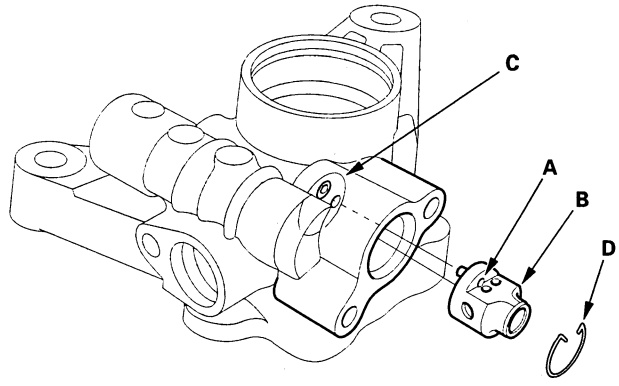
15. Inspect the ball bearing by rotating the outer race slowly. If you feel any play (axial or radial) or roughness remove the faulty ball bearing (A), and install a new one (B).



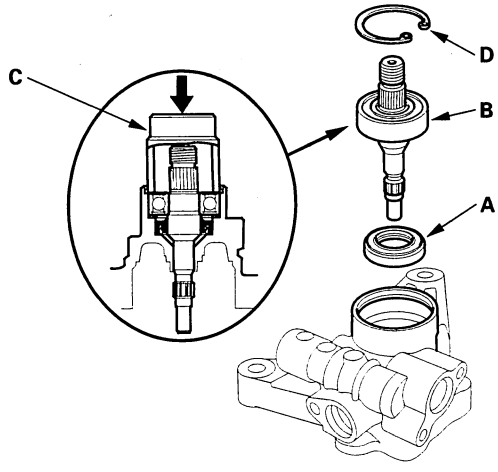
16. Inspect each part shown with an asterisk in the Exploded View; if any of them are worn or damaged, replace the pump as an assembly.

Reassembly

17. Align the pin (A) of the sub-valve (B) with the oil passage (C) in the pump housing, and push the subvalve into place, then install the snap ring (D).



18. Install the new pump seal (A) (with its grooved side facing in) into the pump housing by hand first then position the pump drive shaft (B) in the pump housing. Press the pump drive shaft and pump seal with the appropriate size socket wrench (C) as shown.



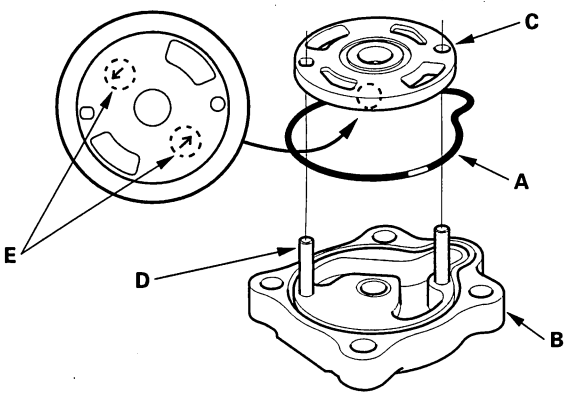
19. Install the 40 mm snap ring (D) with its radiused edge facing out.

(cont'd)

Protected by AR

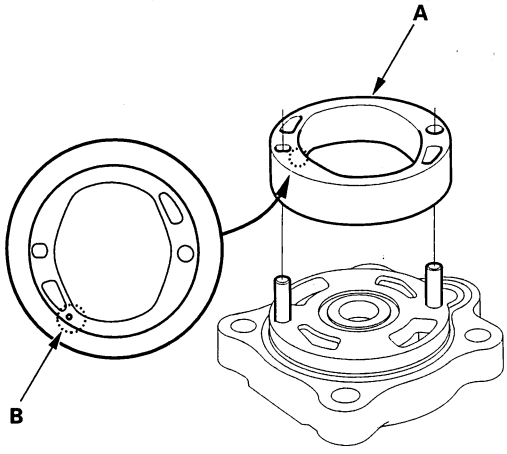
Pump Overhaul (cont'd)

20. Coat the new pump cover seal (A) with power steering fluid, and install it into the groove in the pump cover (B).

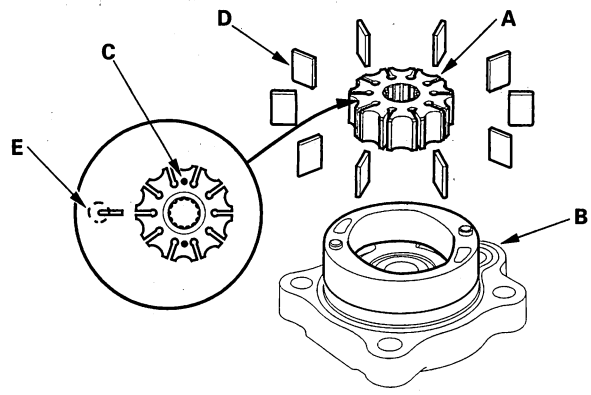


21. Install the outer side plate (C) over the two roll pins (D) with its arrow marks stamped (E) facing down.

22. Set the pump cam ring (A) over the two roll pins with its "•" mark (B) facing down.

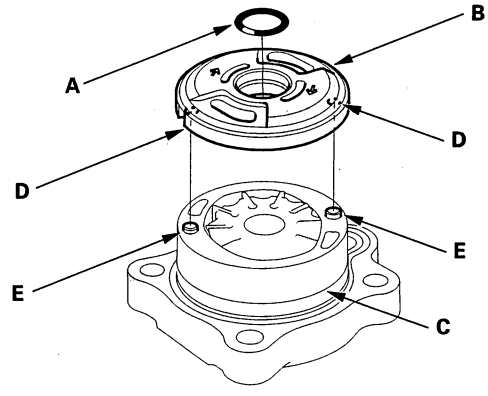


23. Assemble pump rotor (A) to the pump cover (B) with its "•" mark (C) facing up.



24. Set the 10 vanes (D) in the grooves in the rotor. Make sure that the round ends (E) of the vanes are in contact with the sliding surface of the cam ring.

25. Coat the new O-ring (A) with power steering fluid, and install it into the groove in the side plate (B).

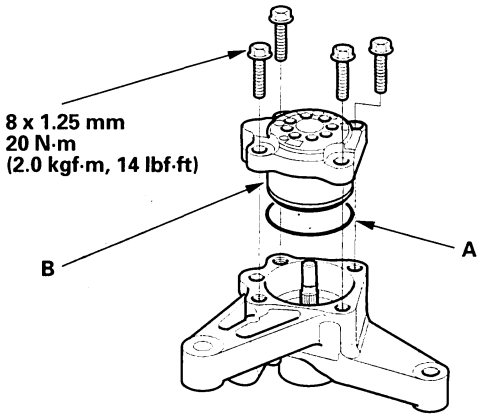


26. Install the side plate on the cam ring (C) by aligning the roll pins set holes (D) in the side plate with the roll pins (E).

BACK

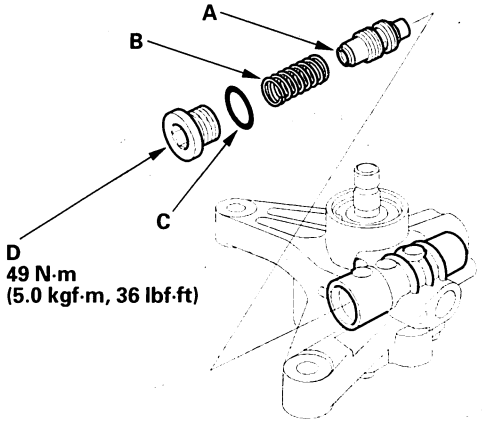
Protected by AR

27. Coat the new O-ring (A) with power steering fluid, and position it in the bottom of the pump housing.



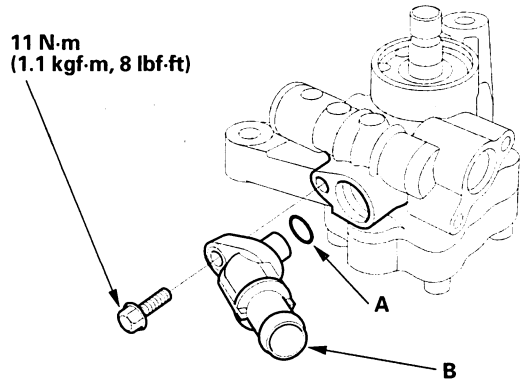
28. Install the pump cover assembly (B) in the pump housing. Tighten the bolts to the specified torque.

29. Coat the flow control valve (A) with power steering fluid, then install it and the spring (B) in the pump housing.

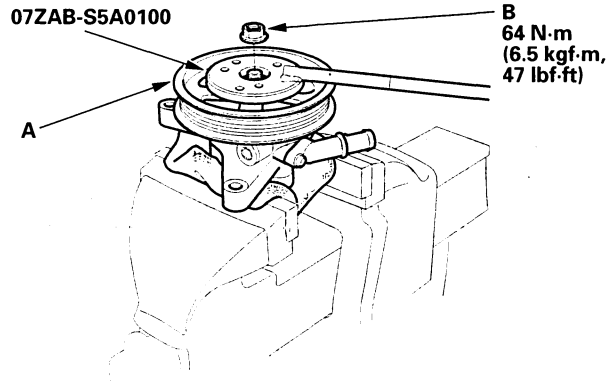


30. Coat the new O-ring (C) with power steering fluid, and install it on the flow control valve cap (D), then install the cap on the pump housing, and tighten it to the specified torque.

31. Coat the new O-ring (A) with power steering fluid, and install it on the inlet joint (B). Install the inlet joint on the pump housing.



32. Install the pulley (A), then loosely install the pulley nut (B). Hold the steering pump in a vise with soft jaws. Be careful not to damage the pump housing with the jaws of the vise.



33. Hold the pulley with the special tool, and tighten the pulley nut to the specified torque.

34. Check that the pump turns smoothly by turning the pulley by hand. If it turns hard, loosen the four flange bolts on the cover, then retighten them in same manner as in step 28. Turn the pump again by hand.

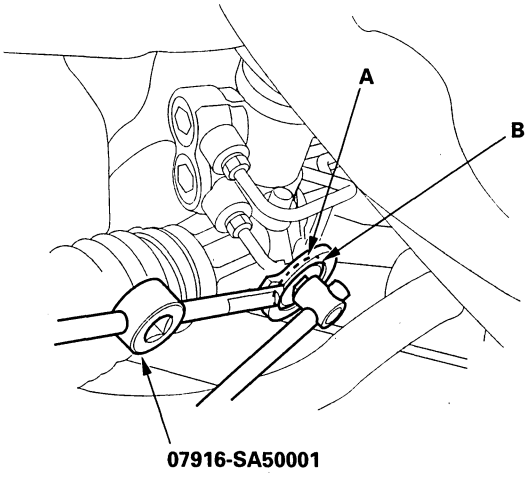
Protected by AR

Rack Guide Adjustment

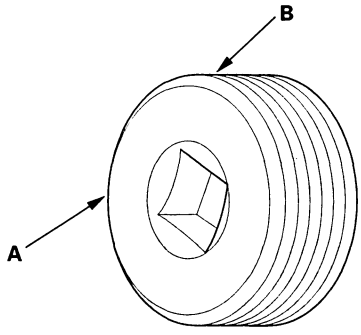
Special Tools Required
Locknut wrench, 40 mm 07916-SA50001

SHOWA-Steering Gearbox

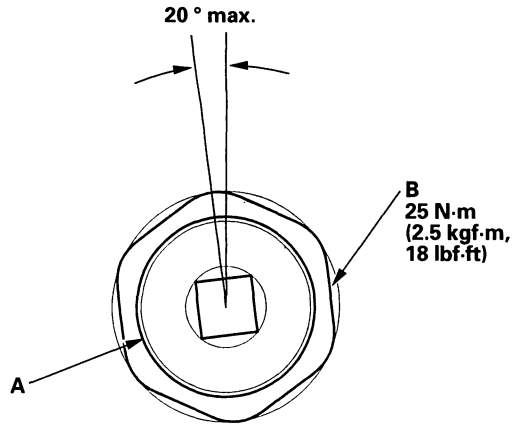
1. Set the wheels in the straight ahead position.
2. Loosen the rack guide screw locknut (A) with the special tool, then remove the rack guide screw (B).



3. Remove the old sealant from the rack guide screw (A), and apply new sealant (Three Bond 1215 or Loctite 5699) all around the threads (B). Loosely install the rack guide screw on the steering gearbox.



4. Tighten the rack guide screw (A) to 25 N·m (2.5 kgf·m, 18 lbf·ft), then loosen it.



5. Retighten the rack guide screw to 3.9 N·m (0.4 kgf·m, 3 lbf·ft), then back it off to the specified angle.

   Specified return angle: 20 ° max.

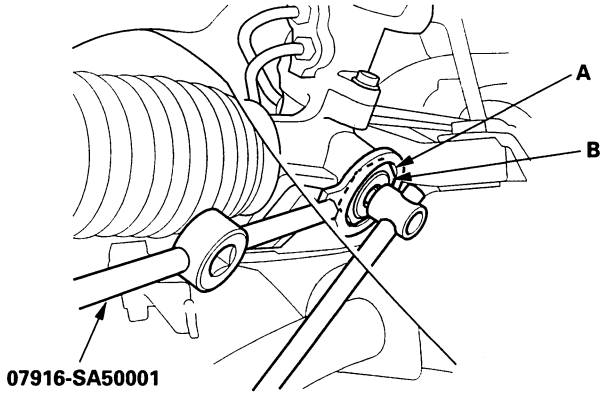
6. Hold the rack guide screw stationary with a wrench, and tighten the locknut by hand until it's fully seated.
7. Install the special tool on the locknut (B), and hold the rack guide screw stationary with a wrench. Tighten the locknut to the specified torque with the special tool.
8. Check for unusual steering effort through the complete turning travel.
9. Check the steering wheel rotation play and the power assist, refer to the 2003-2006 Accord Service Manual (see page 17-7).

BACK

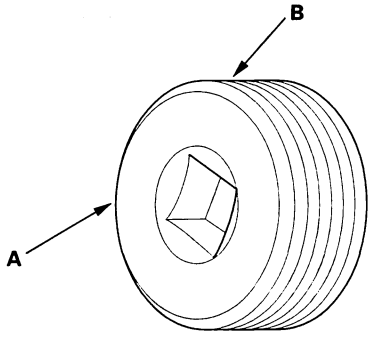
Protected by AR

TKS-Steering Gearbox

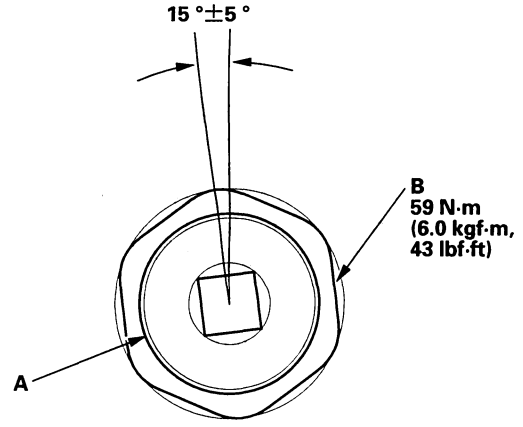
1. Set the wheels in the straight ahead position.
2. Loosen the rack guide screw locknut (A) with the special tool, then remove the rack guide screw (B).



3. Remove the old sealant from rack guide screw (A) threaded section, and apply new sealant (Loctite 565) all around the first three threads (B). Loosely install the rack guide screw on the steering gearbox.



4. Tighten the rack guide screw (A) to 22 N·m (2.2 kgf·m, 16 lbf·ft), then loosen it.



5. Retighten the rack guide screw to 3.9 N·m (0.4 kgf·m, 3 lbf·ft), then back it off to the specified angle.

   Specified return angle: 15 °±5 °

6. Hold the rack guide screw stationary with a wrench, and tighten the locknut by hand until it's fully seated.
7. Install the special tool on the locknut (B), and hold the rack guide screw stationary with a wrench. Tighten the locknut to the specified torque with the special tool.
8. Check for unusual steering effort through the complete turning travel.
9. Check the steering wheel rotation play and the power assist, refer to the 2003-2006 Accord Service Manual (see page 17-7).

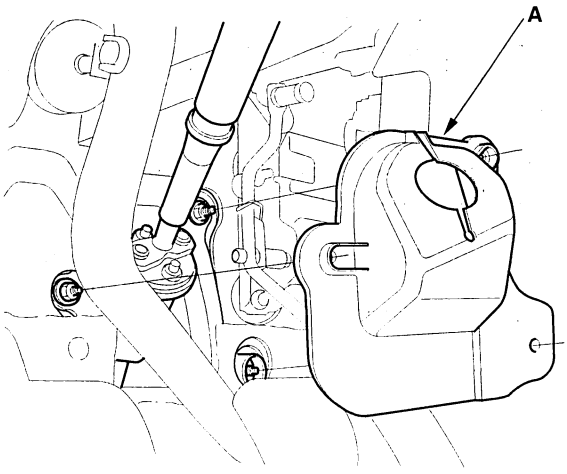
Protected by AR

Steering Gearbox Removal

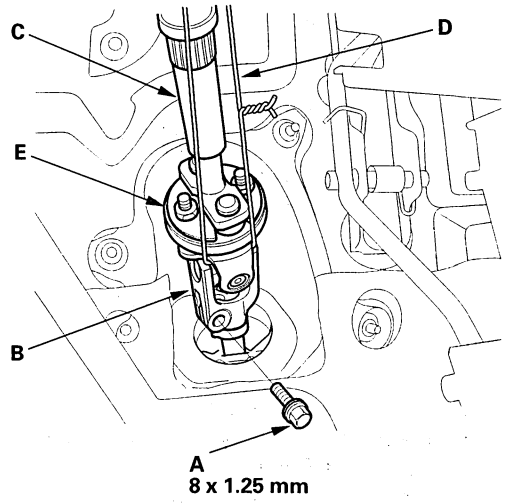
Special Tools Required
- Ball joint remover, 28 mm 07MAC-SL0A202
- Subframe adaptor EQS02C000016
  (Available through the Honda Tool and Equipment program 888-424-6857)

Note these items during removal:
- Using solvent and a brush, wash any oil and dirt off the valve body unit, its lines, and the end of the gearbox. Blow dry with compressed air.
- Make sure to remove the steering wheel before disconnecting the steering joint. Damage to the cable reel can occur.

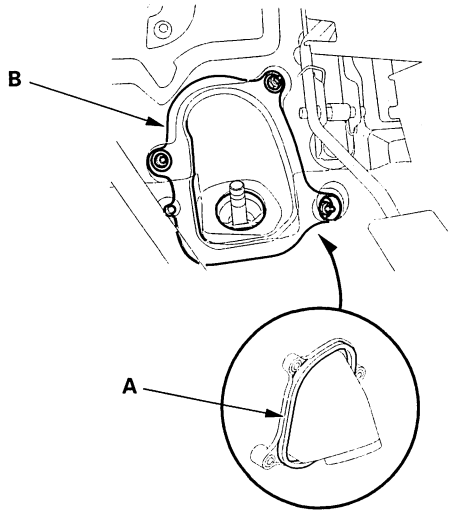
1. Drain the power steering fluid (see step 1 on page 17-10).
2. Raise the front of vehicle, and support it with safety stands in the proper locations, refer to the 2003-2006 Accord Service Manual (see page 1-14).
3. Remove the front wheels.
4. Remove the steering wheel, refer to the 2003-2006 Accord Service Manual (see page 17-22).
5. Remove the steering joint cover A.



6. Remove the steering joint bolt (A), and disconnect the steering joint by moving the steering joint (B) toward the column. Hold the slider shaft (C) on the column with a piece of wire (D) between the joint yoke (E) on the slider shaft to the joint yoke on the upper shaft, refer to the 2003-2006 Accord Service Manual (see page 17-25).



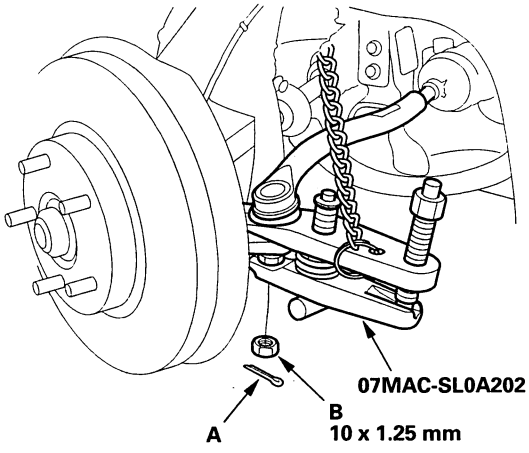
7. Remove the steering joint cover B. Be careful not to damage the mating surface on the joint cover B and pinion shaft grommet. Replace the cover seal (A) if necessary.



BACK

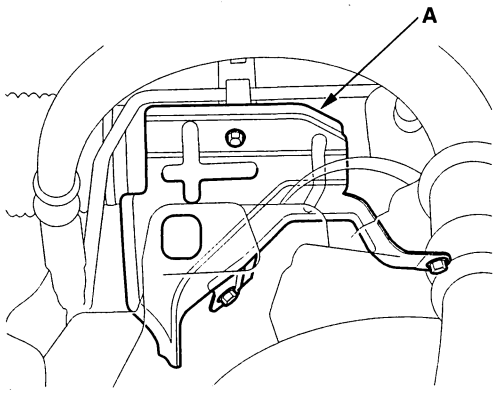
Protected by AR

8. Remove and discard the cotter pin (A) from the tie-rod ball joint nut (B), then loosen the nut.

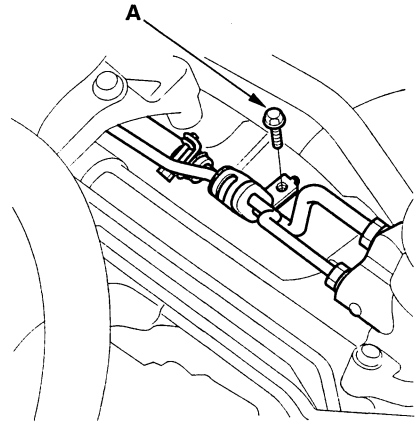


9. Separate the tie-rod ball joint and knuckle using the special tool, refer to the 2003-2006 Accord Service Manual (see page 18-11).

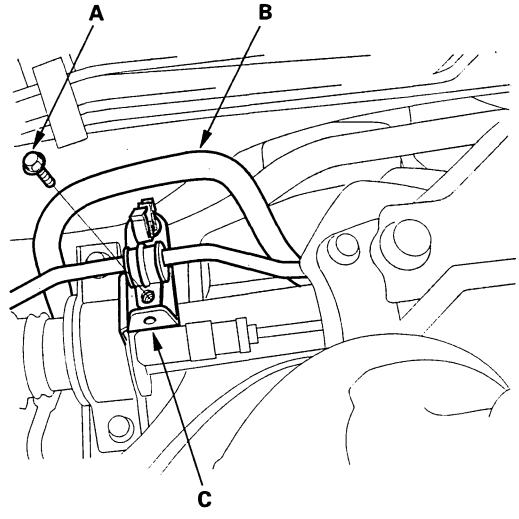
10. Remove the P/S heat baffle plate (A).



11. Remove the feed line holder mounting bolt (A) on the front suspension subframe.



12. Remove the feed line holder mounting bolt (A) and return hose (B) from the gearbox mounting bracket (C).

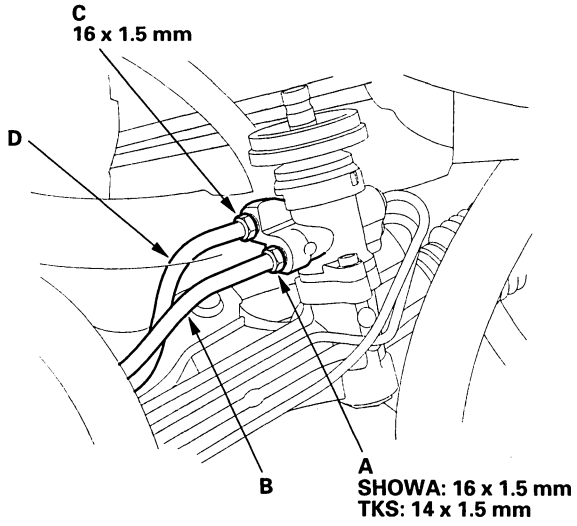


(cont'd)

Protected by AR

Steering Gearbox Removal (cont'd)

13. Place several shop towels under the line connections, and cover the gearbox mounting part to protect it from the power steering fluid. Loosen the flare nut (A), and disconnect the feed line (B).

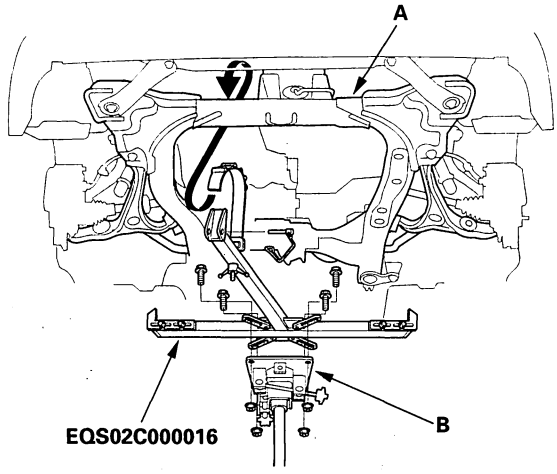


14. Loosen the flare nut (C), and disconnect the return line (D).

15. After disconnecting the lines, plug or seal them with a piece of tape or equivalent to prevent foreign materials from entering.

    NOTE: Do not loosen the cylinder line A and B between the valve body unit and the cylinder.

16. Attach the special tool to the front suspension subframe (A) with hanging the hook of the special tool over the front of the subframe, then tighten the special tool screw.

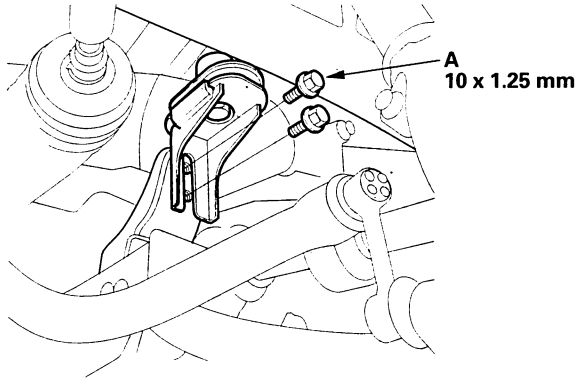


17. Raise the jack (B) and line up the slots in the arms with the bolt holes on the corner of the jack base, then attach them with bolts securely.

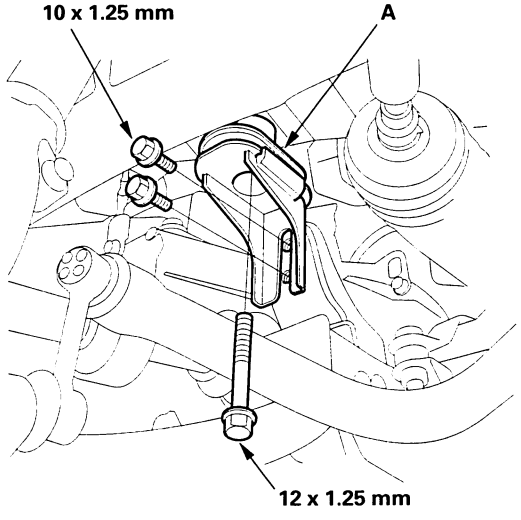
BACK

Protected by AR

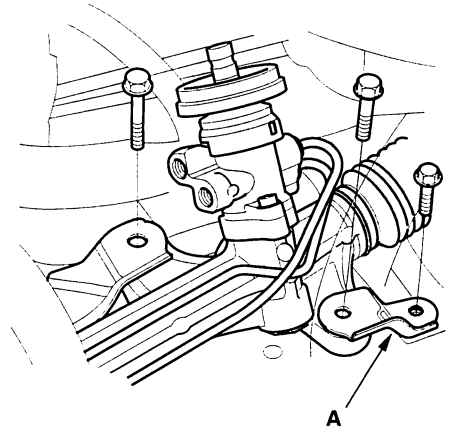
18. Remove the front suspension subframe right middle mount bolts (A).



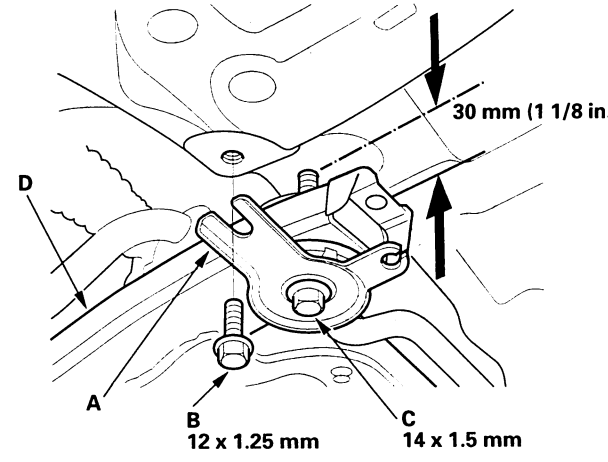
19. Remove the front suspension subframe left middle mount (A).



20. Remove the steering gearbox mounting bolts on the left gearbox mount, and remove the steering stiffener plate (A).



21. Remove the front suspension subframe rear bracket (A) mounting bolt (B).



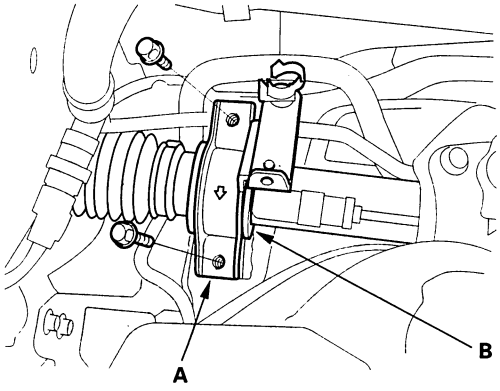
22. Loosen the two front suspension subframe mounting bolts (C) on right and left, and slowly lower the jack supporting subframe (D) with special tool until the subframe has dropped 30 mm (1 1/8 in.) total.

(cont'd)

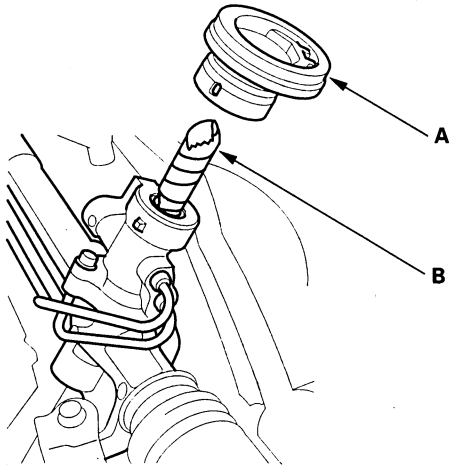
Protected by AR

Steering Gearbox Removal (cont'd)

23. Remove the two flange bolts from the right side of the gearbox, then remove the gearbox mounting bracket (A) and cushion (B).

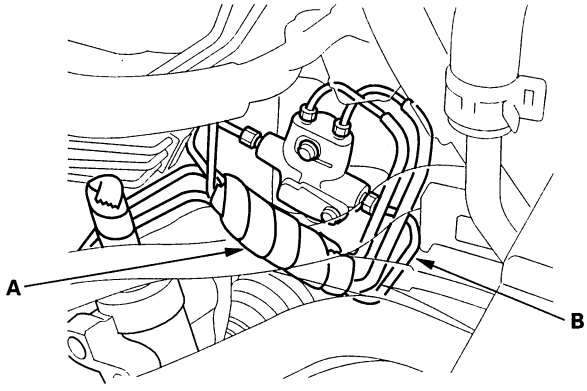


24. Move the steering gearbox toward the front, and remove the pinion shaft grommet (A) from the top of the valve body unit.



25. Apply vinyl tape (B) to the splines on the pinion shaft.

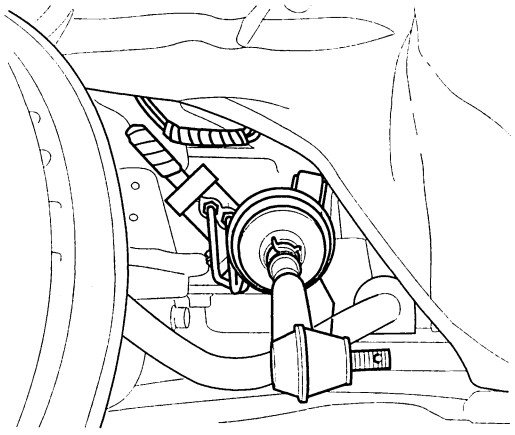
26. Apply vinyl tape or equivalent material (A) to brake lines (B) to protect it from the pinion shaft.



BACK

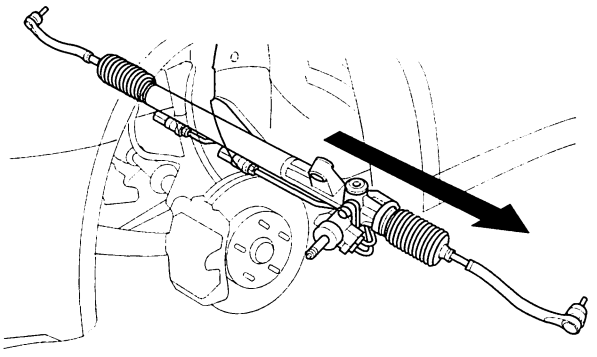
Protected by AR

27. Move the steering gearbox to the driver's side, and rotate it so the pinion shaft points toward the front of the vehicle.



28. Carefully move the steering gearbox as an assembly toward the driver's side of the vehicle until the pinion shaft clears the wheelwell opening. Be careful not to damage the brake lines with the pinion shaft.

29. Remove the steering gearbox through the wheelwell opening on the driver's side.



30. After removing the steering gearbox, make sure that no power steering fluid gets on the gearbox mount cushions, gearbox housing, surface of the subframe and stiffener. Wipe off any spilled fluid at once.

Special Tools Required
- Driver handle, 480 mm 070GD-0010100
- Attachment, 24 x 26 mm 07746-0010700
- Pilot, 22 mm 07746-0041000
- Driver 07749-0010000
- Attachment, 42 x 47 mm 07746-0010300
- Piston seal ring guide 07ZAG-S7A0100
- Piston seal ring sizing tool 07ZAG-S7A0200
- Pincer Oetiker 1098, or equivalent, commercially available

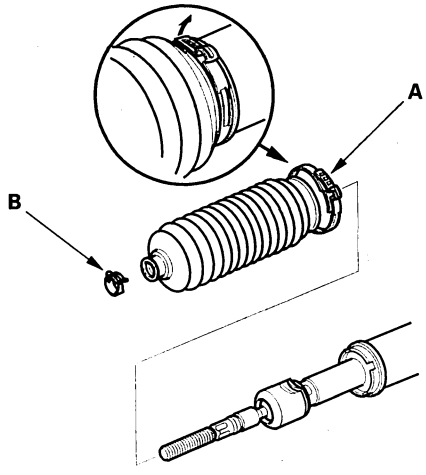
NOTE:
- Refer to the Exploded View as needed during the following procedure.
- For the Showa-made steering gearbox overhaul procedures, refer to the 2003-2006 Accord Service Manual (see page 17-37).

Removal

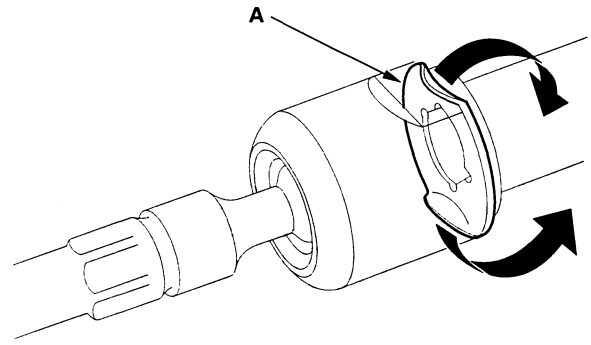
1. Remove the steering gearbox (see page 17-20).

Disassembly: TKS-Made Steering Gearbox

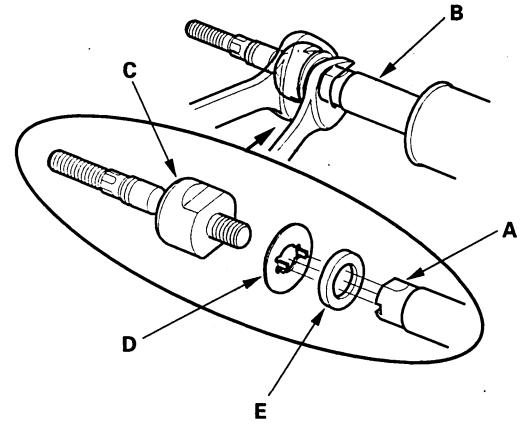
2. Remove the boot bands (A) and tie-rod clips (B). Pull the boots away from the ends of the steering gearbox.



3. Unbend the lock washer (A).



4. Hold the flat surface sections (A) of the steering rack (B) with a wrench, and unscrew both rack ends (C) with a wrench. Be careful not to damage the rack surface with the wrench.



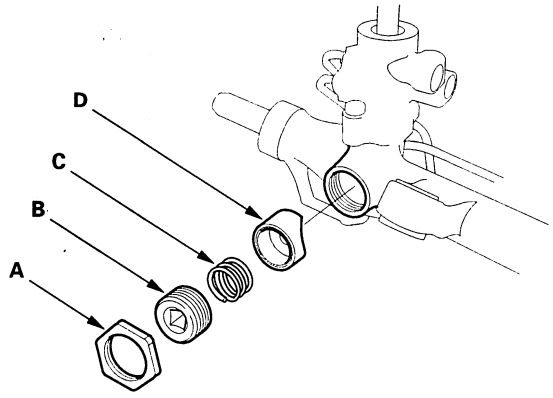
5. Remove the lock washer (D) and stop washer (E).

(cont'd)

Protected by AR

Steering Gearbox Overhaul (cont'd)

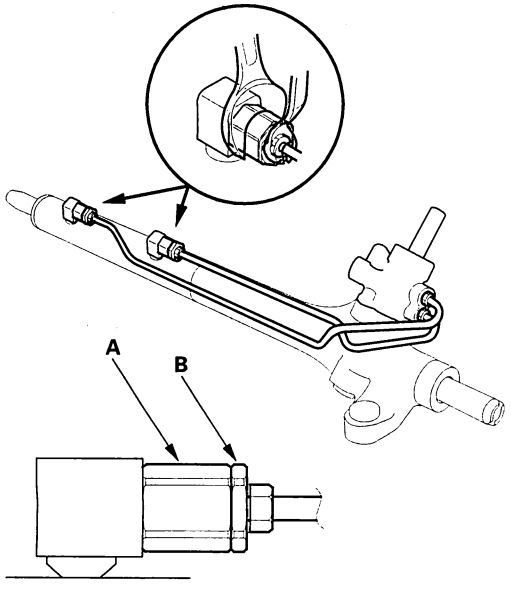
6. Loosen the locknut (A), then remove the rack guide screw (B).



7. Remove the spring (C) and the rack guide (D) from the gearbox housing.

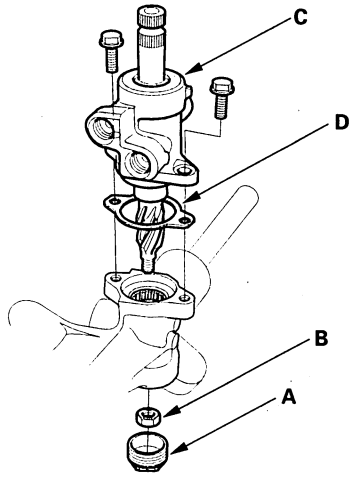
8. Remove the cylinder lines from the gearbox.

   NOTE: Use a second wrench when loosening the cylinder lines to avoid damage to the fittings on the steering gearbox. Do not loosen the A and B connectors.



9. Drain the fluid from the cylinder fittings by slowly moving the steering rack back and forth.

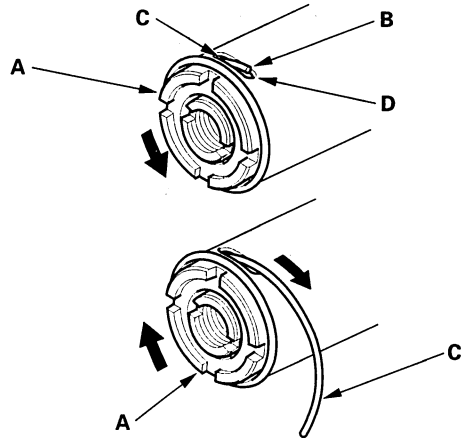
10. Remove the end plug (A) from the gearbox housing, then remove the nut (B) from the pinion shaft end.



11. Remove the two flange bolts, the valve body unit (C), and gasket (D) from the gearbox. Check that the valve turns smoothly by turning the pinion shaft. If any play or roughness is felt, replace the valve body unit with a new part. Do not try to disassemble the valve body unit.

12. Slide the steering rack all the way to the left.

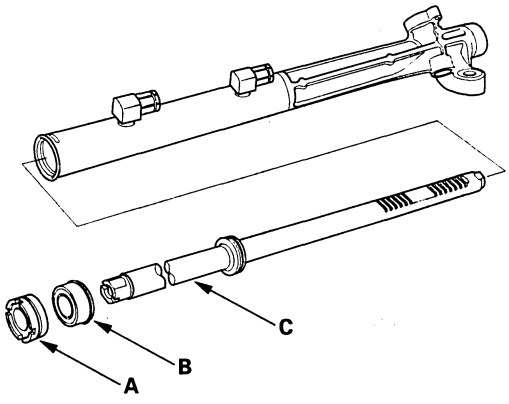
13. Turn the rack stop (A) counterclockwise until the end (B) of the circlip (C) sticks out from the hole (D) in the cylinder housing. Then turn it clockwise to remove the circlip.



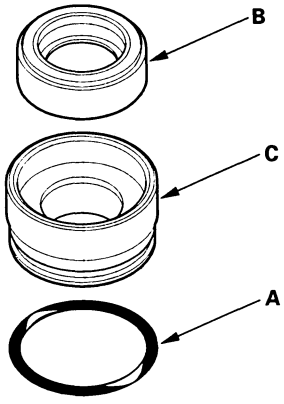
BACK

Protected by AR

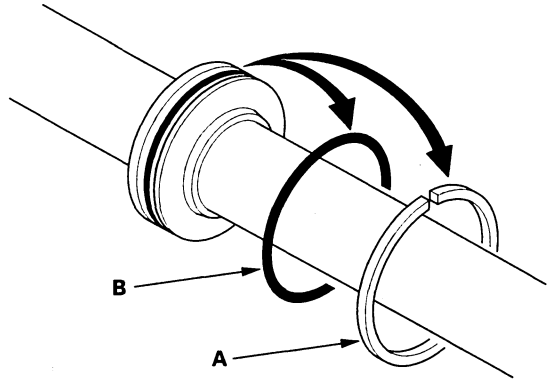
14. Remove the rack stop (A), rack bushing (B), and steering rack (C) from the steering gearbox.



15. Remove the O-ring (A) and cylinder end seal (B) from the rack bushing (C).



16. Carefully pry the piston seal ring (A) and O-ring (B) off the rack piston. Be careful not to damage the inside of seal ring groove and piston edges when removing the seal ring.

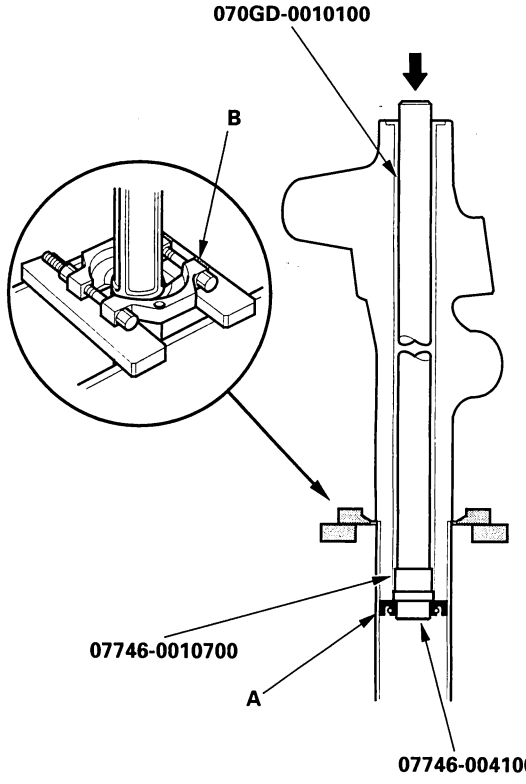


(cont'd)

Protected by AR

Steering Gearbox Overhaul (cont'd)

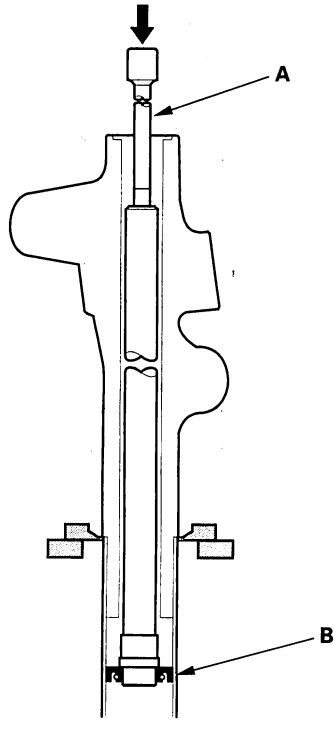
17. Insert the special tools, and carefully place it on the cylinder end seal (A) as shown. Make sure that the special tool is securely positioned on the cylinder end seal.



18. Install the bearing separetor (B) on the gearbox housing. Set the steering gearbox in a press so the gearbox housing points upward, then push out the cylinder end seal by pressing on the end of the special tool.

19. Remove the steering gearbox from the press, and set a driver extension (A) on the special tool (driver handle). Place the steering gearbox in a press, then remove the cylinder end seal (B) from the gearbox by pressing on the end of the extension.

    Note these items when pressing the cylinder end seal:
    - Keep the tool straight to avoid damaging the cylinder wall. Check the tool angle, and correct it if necessary, when removing the cylinder end seal.
    - Use a press to remove the cylinder end seal. Do not try to remove the seal by striking the tool; striking the tool would break the cylinder end seal, and the seal would remain in the gearbox.



BACK

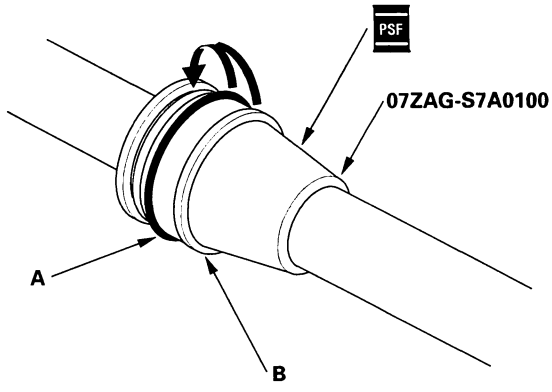
Protected by AR

Reassembly

20. Coat the special tool with power steering fluid, then slide it onto the rack, big end first.

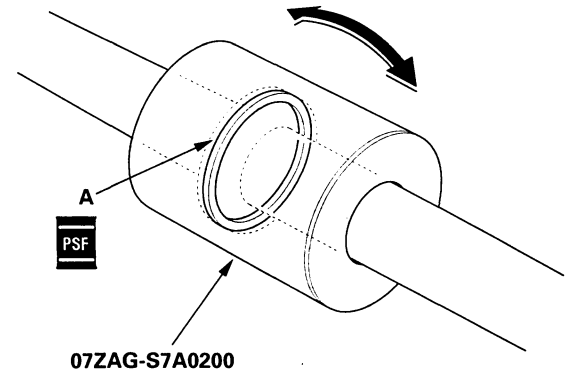
21. Position the new O-ring (A) and new piston seal ring (B) on the special tool, then slide them down toward the big end of the tool.

    Note these items during reassembly:
    - Do not over expand the resin seal rings. Install the resin seal rings with care so as not to damage them. After installation, make sure you contract the seal ring using the special tool (sizing tool).
    - Replace the piston's O-ring and seal ring as a set.



22. Pull the O-ring off into the piston groove, then pull the piston seal ring off into the piston groove on top of the O-ring.

23. Coat the piston seal ring (A) and the inside of the special tool with power steering fluid, then carefully slide the tool onto the rack and over the piston seal ring.



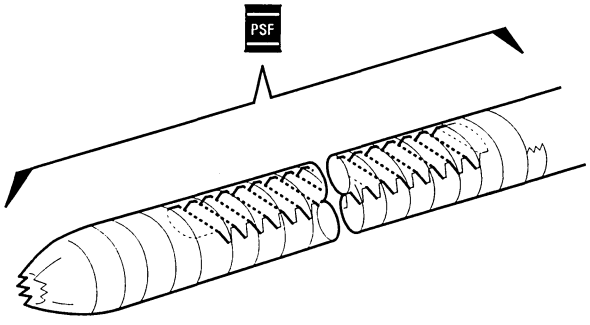
24. Move the special tool back and forth several times to make sure the piston seal ring fits snugly in the piston.

(cont'd)

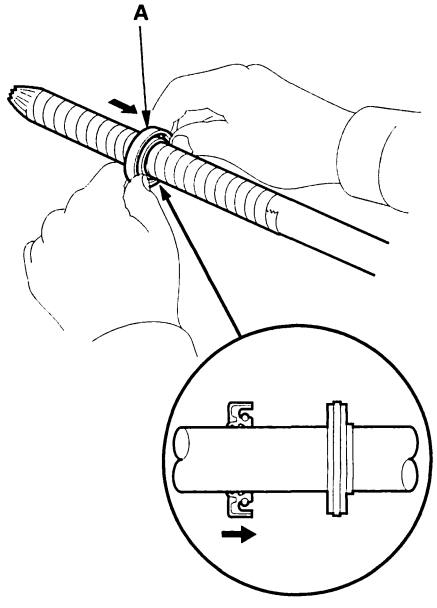
Protected by AR

Steering Gearbox Overhaul (cont'd)

25. Wrap vinyl tape around the rack teeth and rack end edges, then coat the surface of the tape with power steering fluid. Make sure that the vinyl tape is wrapped carefully so that there is no stepped portion.

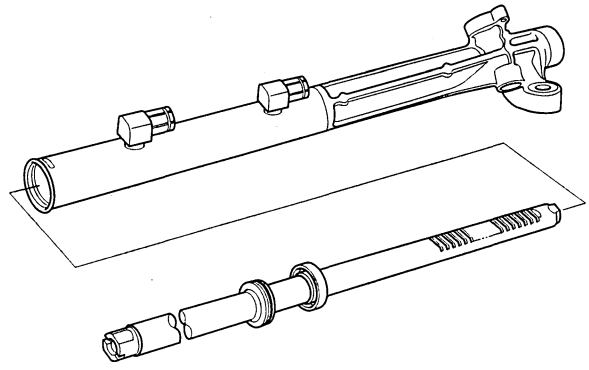


26. Coat the inside surface of the new cylinder end seal (A) with power steering fluid, then install it onto the steering rack with its grooved side toward the piston. When installing the cylinder end seal, be careful not to damage the lip of the seal with the edges or teeth of the steering rack.

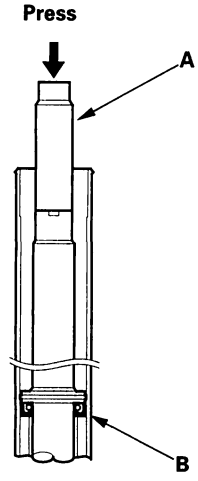


27. Remove the vinyl tape from the steering rack, then remove any adhesive residue.

28. Apply multipurpose grease to the steering rack teeth, then insert the steering rack into the gearbox housing. Be careful not to damage to inner surface of the cylinder wall with the rack edges.



29. Insert a deep socket (A) onto the steering rack as shown.



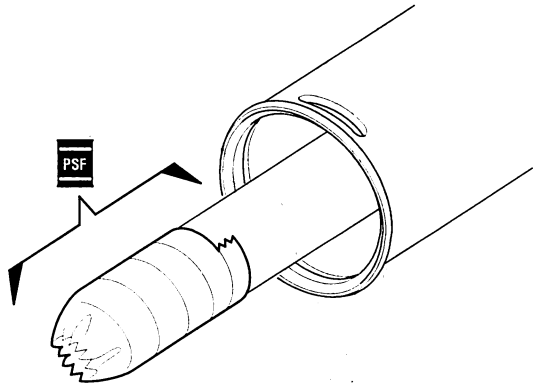
30. Install the cylinder and seal (B) into the bottom of the cylinder by pressing on the tool with a press. Do not push on the tool with excessive force as it may damage the cylinder end seal.

31. Remove the tool, and center the steering rack.

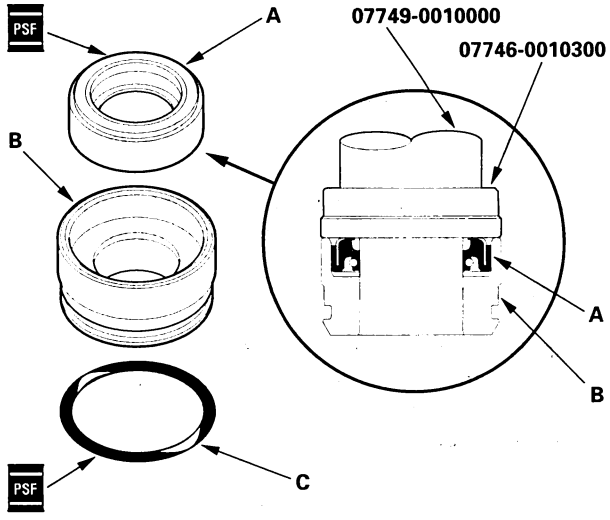
BACK

Protected by AR

32. Wrap vinyl tape around the rack end edges, and coat the surface of the tape with power steering fluid. Make sure that the vinyl tape is wrapped carefully so there is no stepped portion.

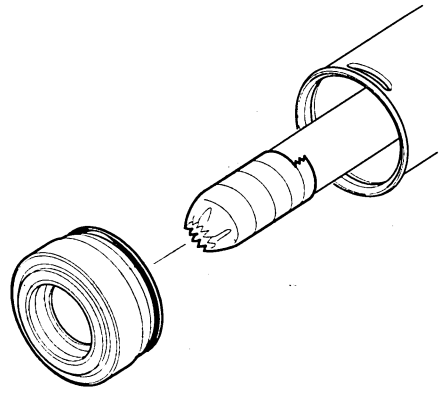


33. Coat the inside surface of the new cylinder end seal (A) with power steering fluid, then press it into the rack bushing (B) using the special tools.



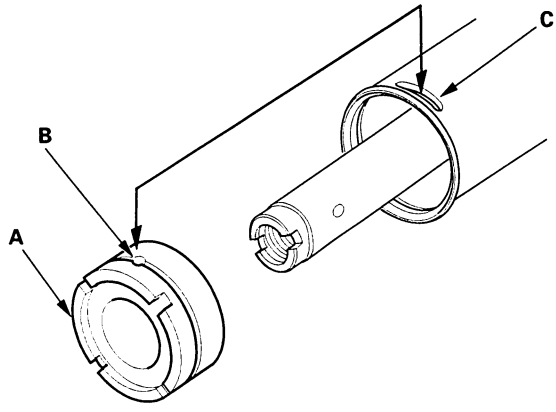
34. Coat the new O-ring (C) with power steering fluid, and carefully fit it in the groove of the rack bushing.

35. Install the rack bushing onto the steering rack with the cylinder end seal grooved side toward the piston. Push in the rack bushing with your finger.



36. Remove the vinyl tape from the steering rack, then remove any adhesive residue.

37. Install the rack stop (A) onto the steering rack so the hole (B) is aligned with the slot (C) on the cylinder housing.

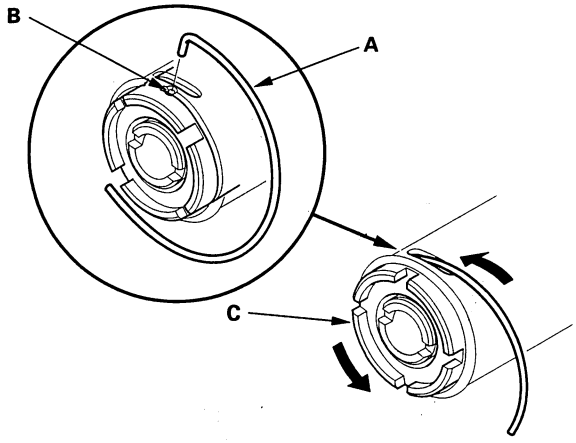


(cont'd)

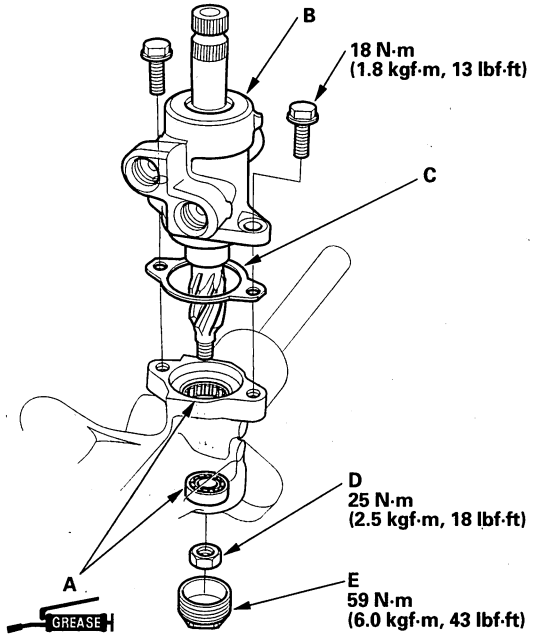
Protected by AR

Steering Gearbox Overhaul (cont'd)

38. Insert the end of the circlip (A) into the hole (B) of the rack stop (C). Turn the rack stop counterclockwise until the circlip is fully seated in the rack stop.



39. Apply multipurpose grease to the bearings (A) in the gearbox housing, and install the valve body unit (B) and new gasket (C) by engaging the gears. Note the valve body unit installation position (direction of line connections). Then loosely install the two flange bolts.

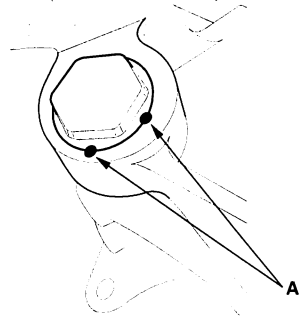


40. Install the new self-locking nut (D) onto the pinion shaft end, and tighten to the specified torque.

41. Tighten the flange bolts to the specified torque.

42. Apply new sealant (Loctite 565) all the way around the threads on the end plug (E), install the end plug onto the gearbox housing, and tighten it to the specified torque.

43. After tightening, use a drift to stake (A) the end plug shoulder against the gearbox housing.



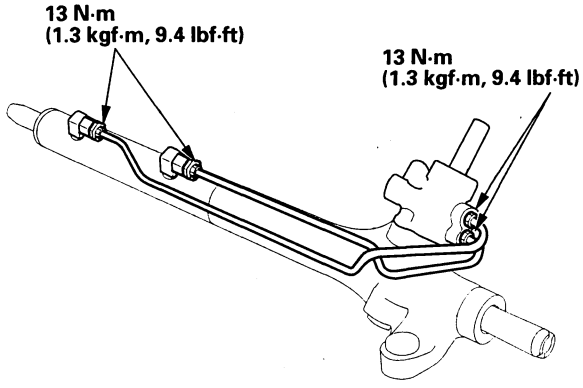
BACK

Protected by AR

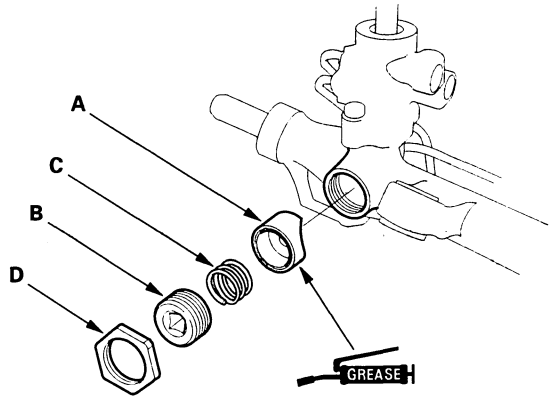
44. Before installing the cylinder lines, coat the new O-rings with power steering fluid, then install the lines.

    Note these items during reassembly:
    - Thoroughly clean the joints of the cylinder lines. The joints must be free of foreign material.
    - Install the cylinder lines by tightening the flare nuts by hand first, then tighten the flare nuts to the specified torque.

    NOTE: Use a second wrench when tightening the cylinder lines to avoid damaging the fittings on the steering gearbox.



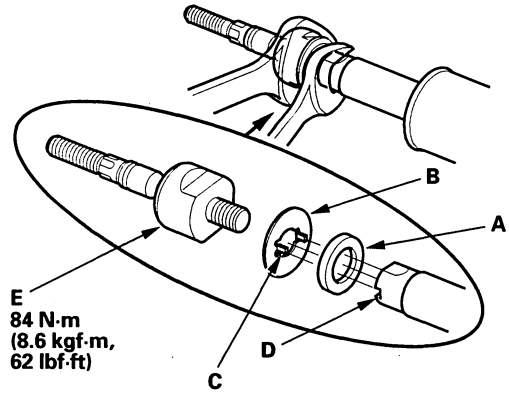
45. Apply multipurpose grease to the sliding surface of the rack guide (A), and install it onto the gearbox housing.



46. Apply new sealant (Loctite 565) all the way around the first three threads of the rack guide screw (B), then install the spring (C), rack guide screw, and locknut (D).

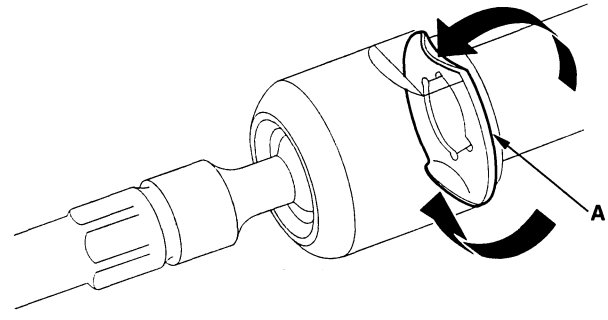
47. Adjust the rack guide screw (see page 17-19). After adjusting, check that the rack moves smoothly by sliding it right and left.

48. Install the new stop washer (A) and lock washer (B). Align the lock washer tabs (C) with the slots (D). Install the rack end (E) while holding the lock washer in place. Repeat this step for the other side of the rack.



49. Hold the flat surface sections of the steering rack with a wrench, and tighten both rack ends. Be careful not to damage the rack surface with the wrench.

50. Bend the lock washer (A) back against the flat spots on the rack end joint housing.

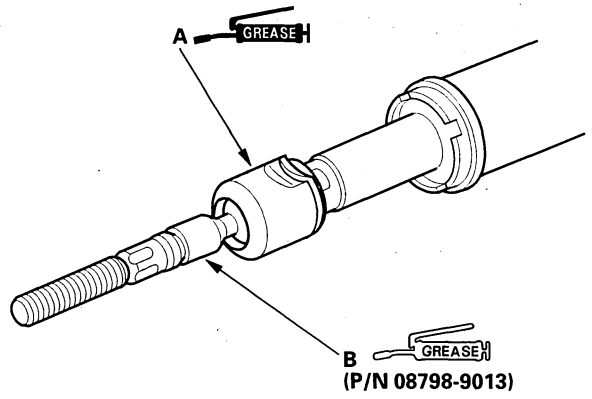


(cont'd)

Protected by AR

Steering Gearbox Overhaul (cont'd)

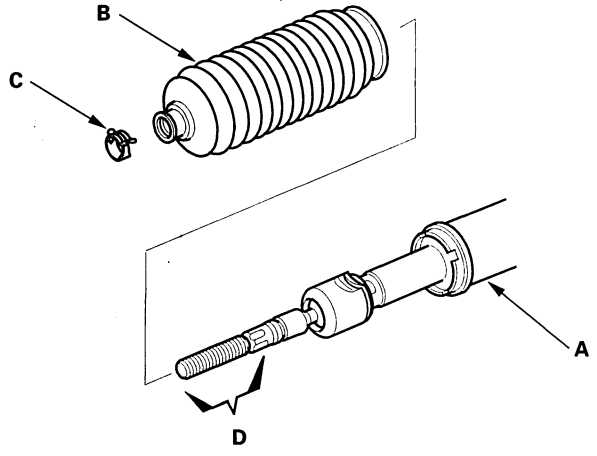
51. Apply multipurpose grease to the circumference of the rack end joint housing (A).



52. Apply a light coat of silicone grease to the boot grooves (B) on the rack ends.

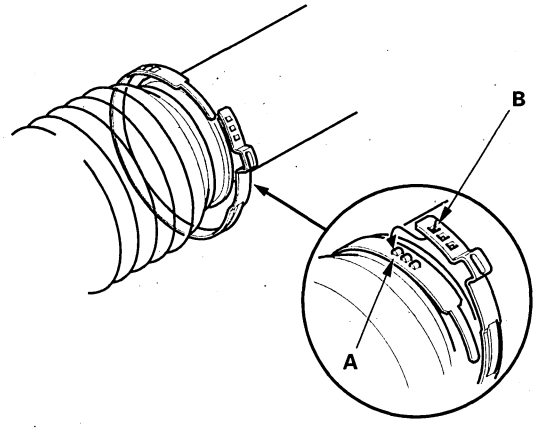
53. Center the steering rack within its stroke.

54. Clean off any grease or contamination from the boot installation surfaces (A) on the gearbox housing. Install the boots (B) on the rack ends with the tie-rod clips (C), and fit the boot end on the housing properly.

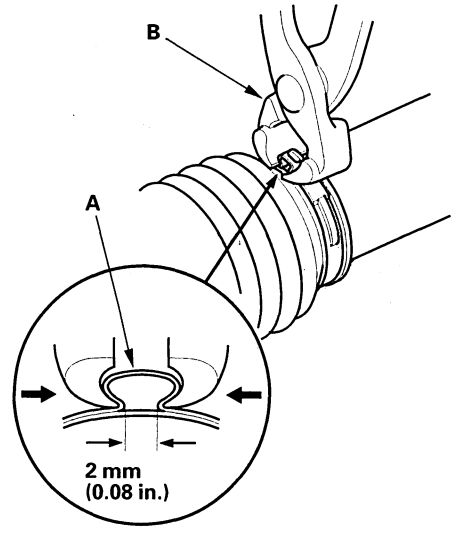


55. After installing the boots, wipe the grease off the threaded section (D) of the rack end.

56. Install the new boot bands by aligning the tabs (A) with the holes (B) of the band.



57. Close the ear portion (A) of the band with a commercially available Oetiker 1098 pincer or equivalent (B).



58. Slide the rack right and left to be certain that the boots are not deformed or twisted.

BACK

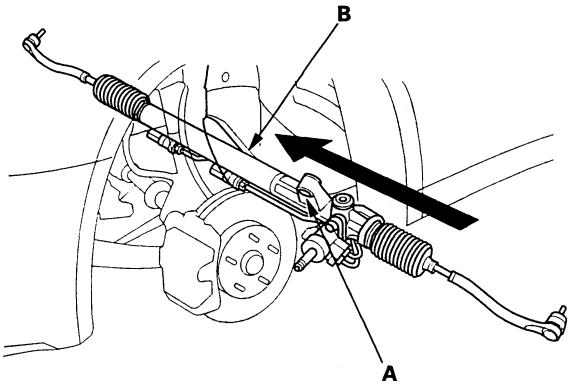
Protected by AR

Steering Gearbox Installation

Special Tools Required
Subframe adaptor EQS02C000016
(Available through the Honda Tool and Equipment program 888-424-6857)

1. Before installing the steering gearbox, make sure that no power steering fluid is on the mating surface of the gearbox and the front suspension subframe. To prevent the gearbox mounting bolts from loosening after the installation, remove the power steering fluid from the mount cushions and bolt holes.

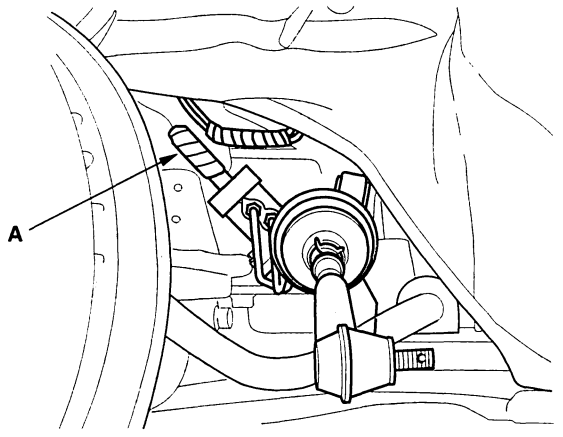
2. Apply a mild soap and water solution to both sides of the mount cushion mating surfaces (A).



3. Pass the cylinder of the steering gearbox (B) through the wheelwell opening on the driver's side.

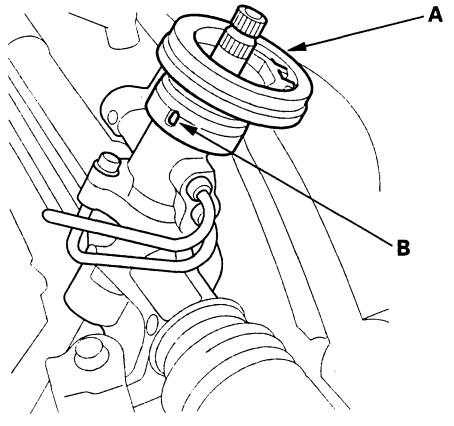
4. Carefully move the steering gearbox toward the passenger's side until the pinion shaft clears the wheelwell opening on the body.

5. Rotate the steering gearbox so the pinion shaft (A) points upward.



6. Continue moving the gearbox toward the passenger's side until the steering gearbox is in position. Make sure the power steering return line and feed line are routed above the gearbox.

7. Remove the vinyl tape from the pinion shaft, and install the pinion shaft grommet (A). Align the slot in the pinion shaft grommet with the lug portion (B) on the valve housing.

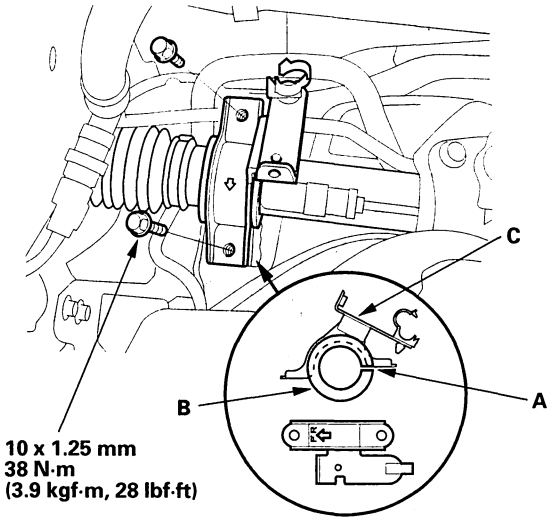


(cont'd)

Protected by AR

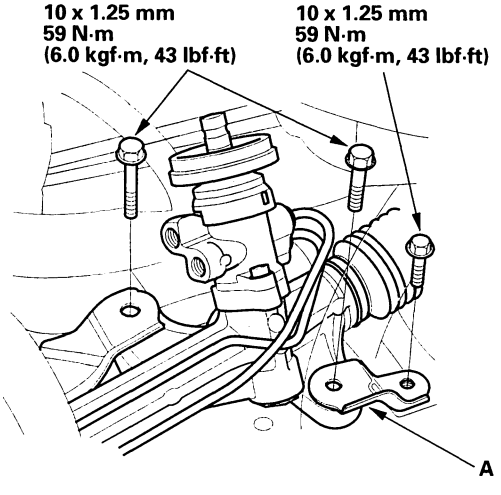
Steering Gearbox Installation (cont'd)

8. Position the cutout (A) on the mounting cushion (B) as shown, and install it on the cylinder of the gearbox securely.



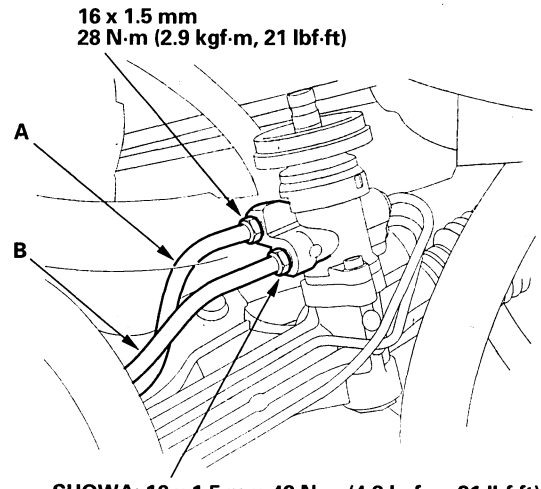
9. Install the gearbox mounting bracket (C) over the mounting cushion, and loosely install the two flange bolts.

10. Install the steering stiffener plate (A) and gearbox mounting bolts on the left side of the gearbox, then tighten them to the specified torque.



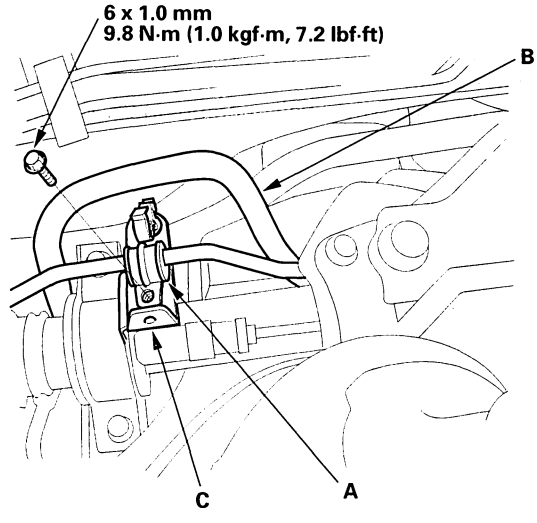
11. Tighten the flange bolts on the right side of the gearbox alternately in two or more steps to the specified torque.

12. Connect the return line (A) securely, and tighten the flare nut to the specified torque.



13. Connect the feed line (B) securely, and tighten the flare nut to the specified torque.

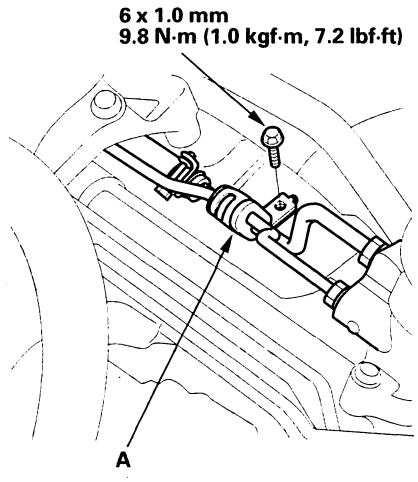
14. Install the feed line holder (A) and return hose (B) on the gearbox mounting bracket (C).



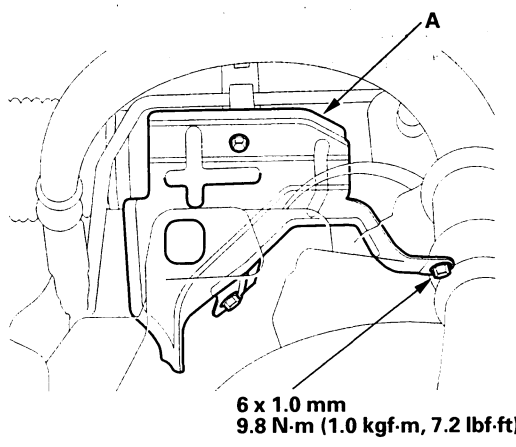
BACK

Protected by AR

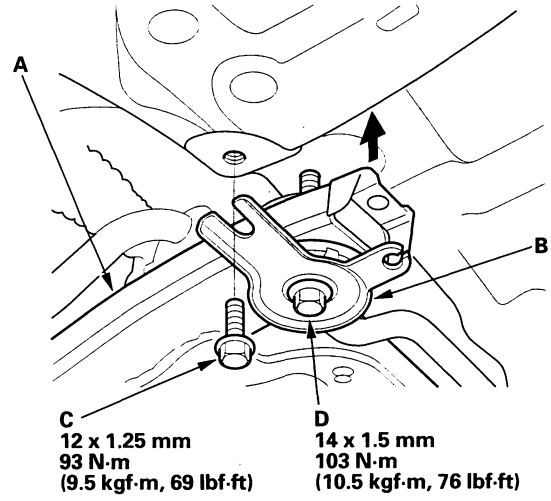
15. Install the feed line holder (A) on the subframe. Make sure that there is no interference between the feed and return lines any other parts.



16. Install the P/S heat baffle plate (A).



17. Raise the jack supporting front suspension subframe (A) with the special tool until the subframe is in position, refer to the 2003-2006 Accord Service Manual (see page 20-228).



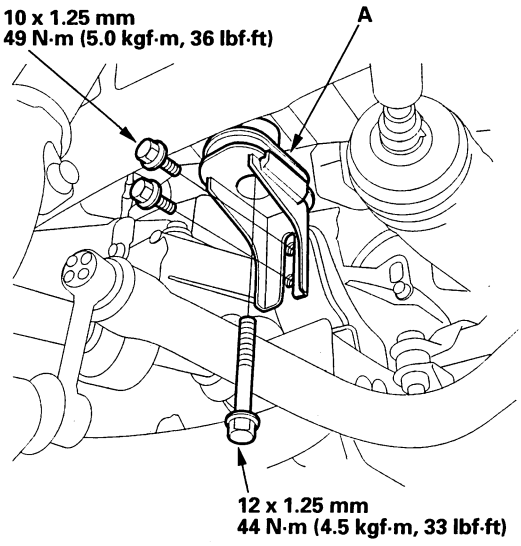
18. Install the front suspension subframe rear bracket (B) mounting bolt (C), then tighten the new subframe mounting bolt (D) to the specified torque.

(cont'd)

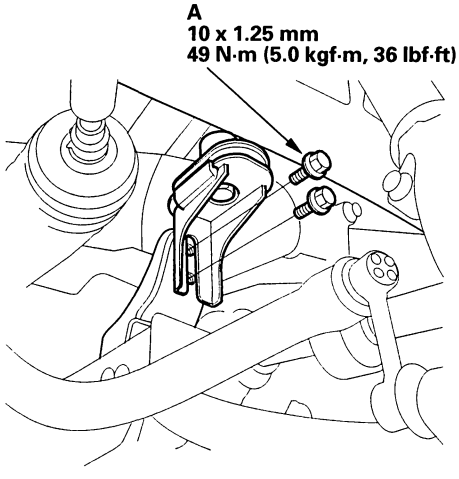
Protected by AR

Steering Gearbox Installation (cont'd)

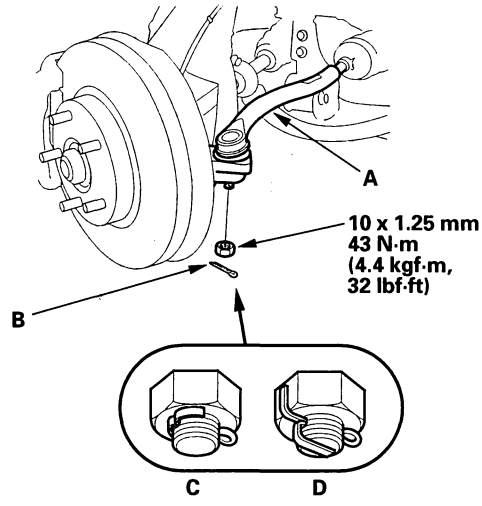
19. Install the front suspension subframe left middle mount (A).



20. Install the front suspension subframe right middle mount bolts (A).



21. Wipe off any grease contamination from the ball joint tapered section and threads. Then reconnect the tie-rod end (A) to the knuckle arms.

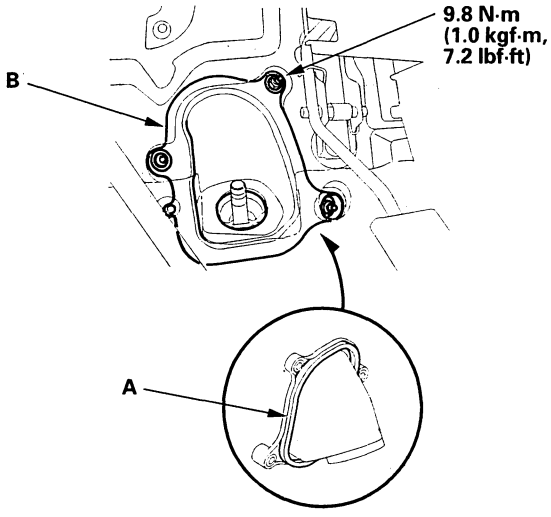


22. Install the tie-rod end ball joint nut, and tighten it to the specified torque. Then install the new cotter pin (B), and bend it as shown (C) or (D).

BACK

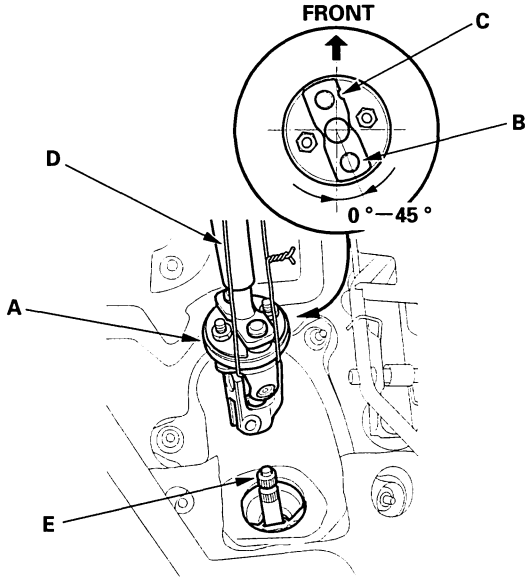
Protected by AR

23. Install the new cover seal (A) all the way around in the steering joint cover B. Make sure there are no wrinkles in the seal, then install the steering joint cover B.



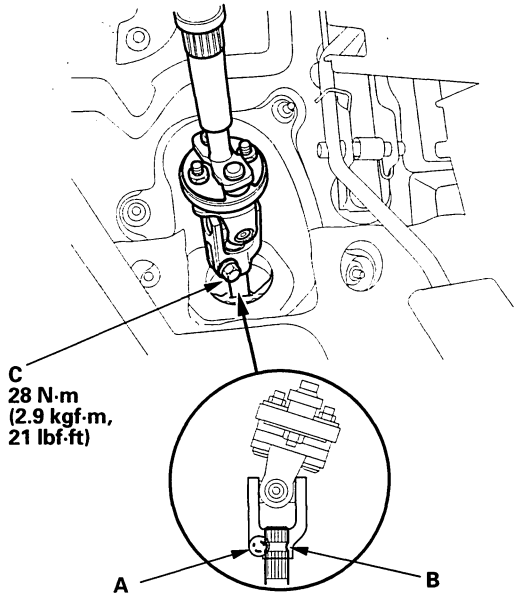
24. Center the steering rack within its stroke.

25. Position the steering column joint (A) so the bolt (B) opposite to the notch (C) is within the range shown.



26. With the rack in the straight ahead driving position, cut the wire (D) and slip the lower end of the steering joint on to the pinion shaft (E).

27. Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft, and loosely install the joint bolt (C). Make sure that the joint bolt is securely in the groove of the pinion shaft. Pull on the steering joint to make sure that the steering joint is fully seated.



28. Tighten the steering joint bolt to the specified torque.

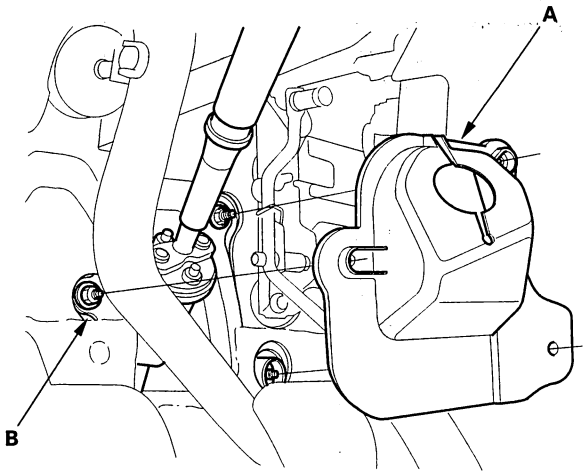
Steering Gearbox Installation (cont'd)

29. Install the steering joint cover A until it contacts the mating surfaces on the cover B evenly around.



30. Install the front wheel, then set the wheels in the straight ahead position.

31. Center the cable reel by first rotating it clockwise until it stops. Then rotate it counterclockwise (about three full turns) until the arrow mark on the label points straight up. Reinstall the steering wheel, refer to the 2003-2006 Accord Service Manual (see page 17-24).

32. Fill the system with power steering fluid, and bleed air from the system (see page 17-10).

33. After installation, do the following checks.

    - Start the engine, allow it to idle, and turn the steering wheel from lock-to-lock several times to warm up the fluid. Check the gearbox for leaks (see page 17-9).
    - Do the front toe inspection, refer to the 2003-2006 Accord Service Manual (see page 18-6).
    - Check the steering wheel spoke angle. If steering spoke angles to the right and left are not equal (steering wheel and rack are not centered), correct the engagement of the joint/pinion shaft serrations, and repeat step 31. Then adjust the front toe by turning the tie-rod ends, if necessary.

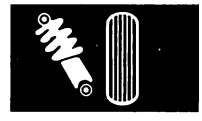
Suspension

Front and Rear Suspension

Wheel Alignment 18-2

NOTE: Refer to the 2003-2006 Accord Service Manual, P/N 61SDA08 for items not shown in this section.



Outline of V6 Model Change

The tire size and tire pressure has been changed to suit the V6 engine model.

Protected by AR

Wheel Alignment

The suspension can be adjusted for front camber, front toe, and rear toe. However, each of these adjustments are related to each other. For example, when you adjust camber, the toe will change. Therefore, you adjust camber or toe.

Pre-Alignment Checks

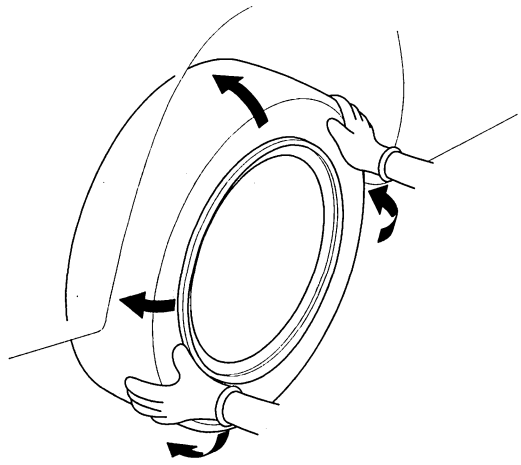
For proper inspection and adjustment of the wheel alignment, do these checks:

1. Release the parking brake to avoid an incorrect measurement.
2. Make sure the suspension is not modified.
3. Check the tire size and tire pressure.

Tire size:
('03-05 models)
Without 2 door EX, MT models:
P205/60R16 91V M+S
2 door EX, MT model:
P215/50R17 93V M+S
('06 model)
P205/50R17 93V M+S

Tire pressure:
('03-05 models)
Front: 220 kPa (2.2 kgf/cm², 32 psi)
Rear:
4 door LX, EX models:
220 kPa (2.2 kgf/cm², 32 psi)
2 door LX, EX models:
210 kPa (2.1 kgf/cm², 30 psi)
2 door EX, MT model:
200 kPa (2.0 kgf/cm², 29 psi)
('06 model)
Front: 220 kPa (2.2 kgf/cm², 32 psi)
Rear: 200 kPa (2.0 kgf/cm², 29 psi)

4. Check the runout of the wheels and tires.
5. Check the suspension ball joints. (Hold a wheel with your hands, and move it up and down and right and left to check for wobbling.)



6. Bounce the vehicle up and down several times to stabilize the suspension.

Caster Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Check the caster angle.

Caster angle: 3 ° 15 ′±45 ′

2. If out of specification, check for bent or damaged suspension components.

BACK

Protected by AR

Camber Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Check the camber angle.

   Camber angle:
   Front: 0 ° 00 ′±45 ′
   Maximum difference between the right and left side: 0 ° 45 ′
   Rear: −1 ° 00 ′±30 ′

2. If out of specification, check for bent or damaged suspension components.

Front Toe Inspection/Adjustment

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

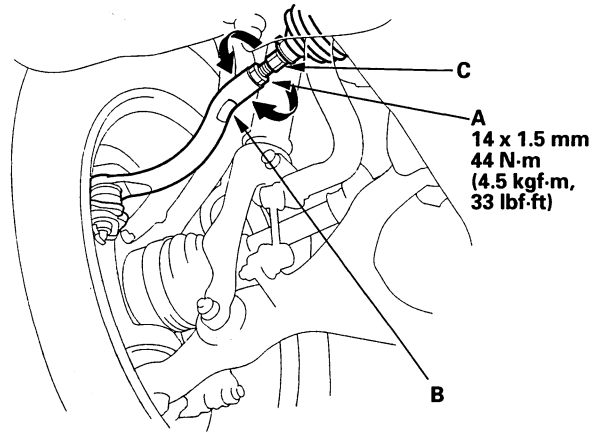
1. Center the steering wheel spokes, and install a commercially available steering wheel holder tool.

2. Check the toe with the wheels pointed straight ahead.

   Front toe-in: 0±2 mm (0±1/16 in.)

   - If no adjustment is required, remove the alignment equipment.
   - If adjustment is required, go to step 3.

3. Loosen the tie-rod locknuts (A) while holding the flat surface sections (B) of the tie-rod end with a wrench, and turn both rack ends (C) until the front toe is within specifications.



4. After adjusting, tighten the tie-rod locknuts. Reposition the rack-rod boot if it is twisted or displaced.

(cont'd)

Protected by AR

Wheel Alignment (cont'd)

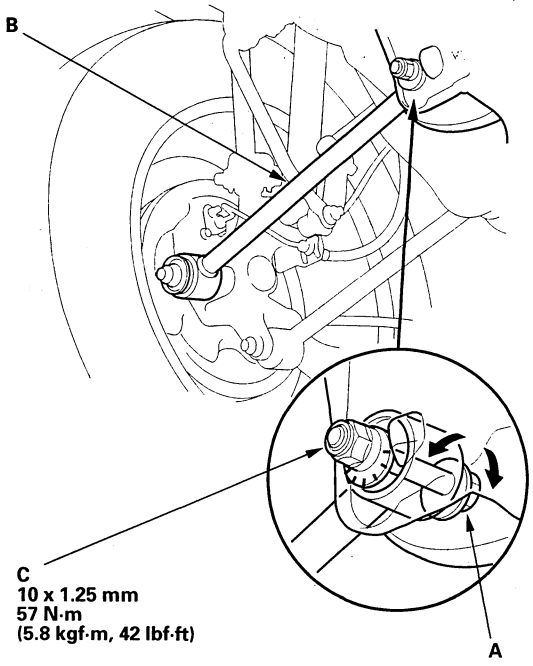
Rear Toe Inspection/Adjustment

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Release the parking brake to avoid an incorrect measurement.
2. Check the toe.

   Rear toe-in: 2±2 mm (1/16±1/16 in.)

   - If no adjustment is required, remove the alignment equipment.
   - If adjustment is required, go to step 3.
3. Hold the adjusting bolt (A) on the rear control arm (B), and loosen the self-locking nut (C).



4. Replace the self-locking nut with a new one, and lightly tighten it.

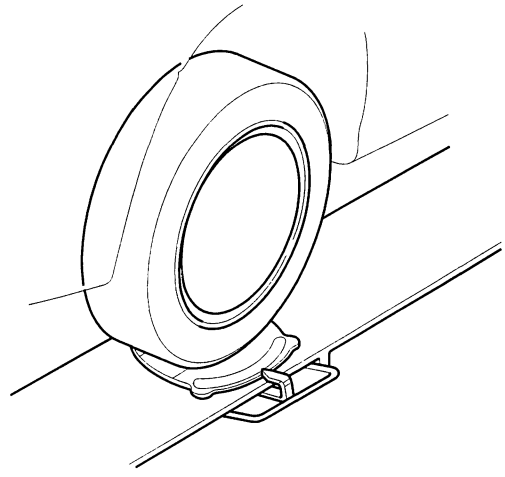
   NOTE: Always use a new self-locking nut whenever it has been loosened.
5. Adjust the rear toe by turning the adjusting bolt until the toe is correct.
6. Tighten the self-locking nut while holding the adjusting bolt.

Turning Angle Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels.

   Turning angle:
   Inward:
   ('03-05 models): 38 ° 50 ′±2 °
   ('06 model): 35 ° 20 ′±2 °
   Outward:
   ('03-05 models): 31 ° 40 ′ (reference)
   ('06 model): 29 ° 40 ′ (reference)



2. If the turning angle is not within the specifications, check for bent or damaged suspension components.

Brake Booster Replacement 19-8

ABS/TCS (Anti-lock Brake System/ Traction Control System) Components ('03-05 models) 19-11

VSA (Vehicle Stability Assist) System Components ('06 model) 19-61

NOTE: Refer to the 2003-2006 Accord Service Manual, P/N 61SDA08 for items not shown in this section.

Outline of V6 Model Changes

- The front brake has been changed to suit the V6 engine model.
- The specified torque values in the master cylinder has been changed.
- VSA models has been added.

Protected by AR

Conventional Brake Components

Front Brake Pad Inspection and Replacement

⚠CAUTION

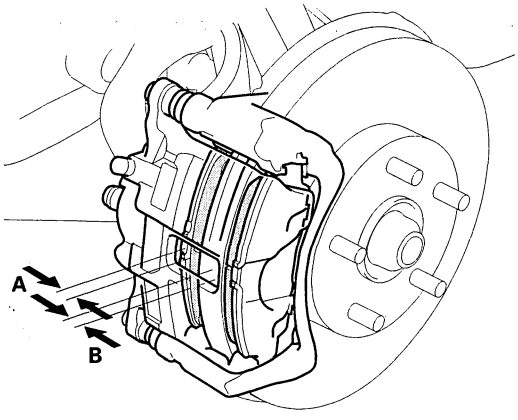
Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

Inspection

1. Raise the front of the vehicle, and support it with safety stands in the proper locations. Refer to the 2003-2006 Accord Service Manual (see page 1-14).
2. Remove the front wheels.
3. Check the thickness of the inner pad (A) and outer pad (B). Do not include the thickness of the brake pad backing plate.

   Brake pad thickness:
   Standard: 10.5—11.5 mm (0.41—0.45 in.)
   Service limit: 1.6 mm (0.06 in.)

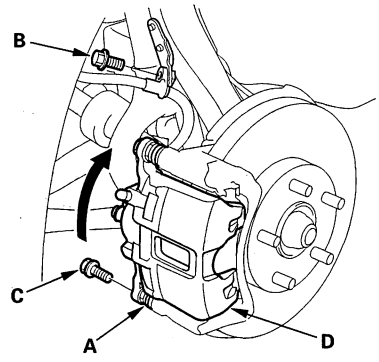
   Inner pad/Outer pad



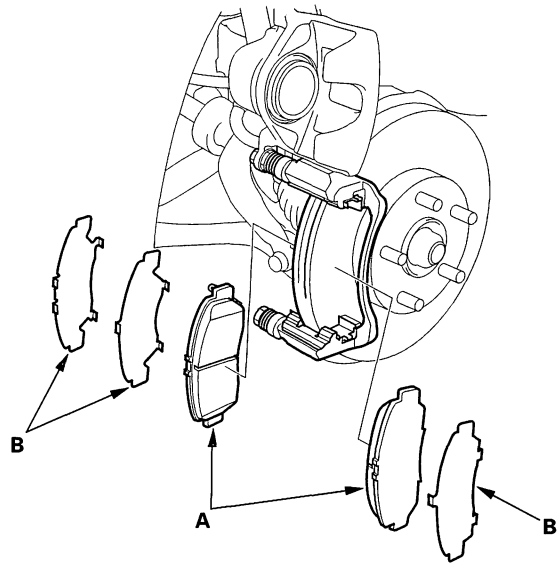
4. If the brake pad thickness is less than the service limit, replace all the brake pads as a set.

Replacement

1. Raise the front of the vehicle, and support it with safety stands in the proper locations. Refer to the 2003-2006 Accord Service Manual (see page 1-14).
2. Remove the front wheels.
3. Remove the brake hose mounting bolt (B).



4. Remove the flange bolt (C) while holding the pin A with a wrench being careful not to damage the pin boot, and pivot the caliper (D) up out of the way. Check the brake hose and pin boots for damage and deterioration.
5. Remove the brake pads (A) and pad shims (B).

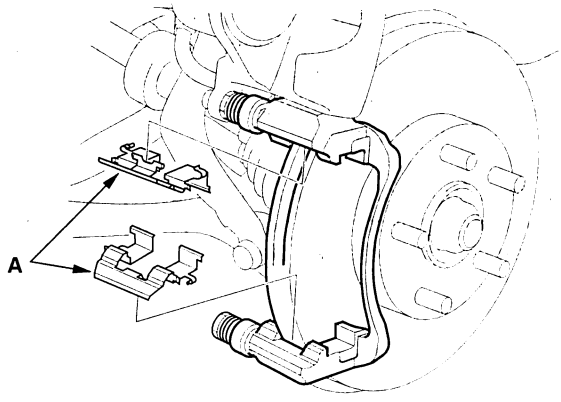


6. Check the hose and pin boots for damage and deterioration.

BACK

Protected by AR

7. Remove the pad retainers (A), and check the caliper pins for free movement.

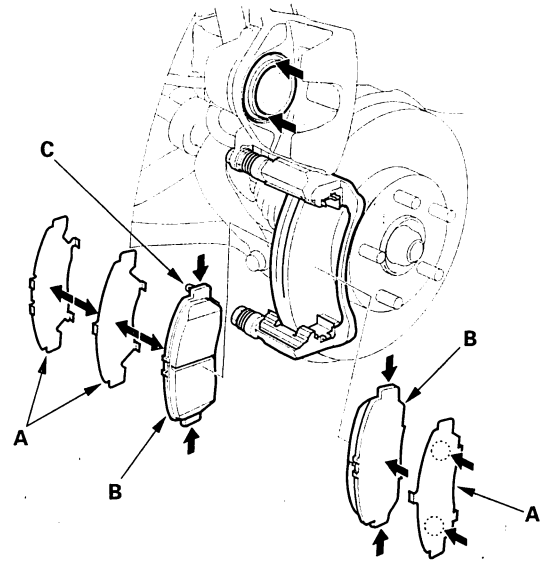


8. Clean the caliper thoroughly; remove any rust, and check for grooves and cracks.

9. Check the brake disc for damage and cracks.

10. Clean and install the pad retainers.

11. Apply a light coat of M-77 assembly paste (P/N 08798-9010) to the pad sides of shims (A), the back of the brake pads (B), and to the other areas indicated by the arrows.
Wipe excess paste off the pad shim and brake pads. Contaminated brake discs and pads reduce stopping ability. Keep assembly paste off the brake discs and pad material.



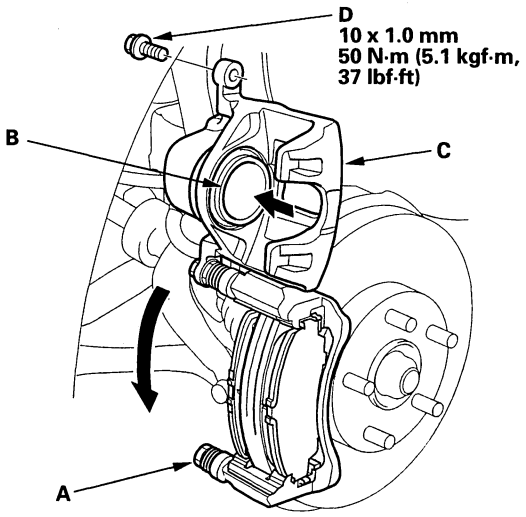
12. Install the brake pads and pad shims correctly.
Install the brake pads with the wear indicator (C) on the inside. The wear indicator should be on the top of the pad.
If you are reusing the pads, always reinstall the brake pads in their original positions to prevent a momentary loss of braking efficiency.

(cont'd)

Protected by AR

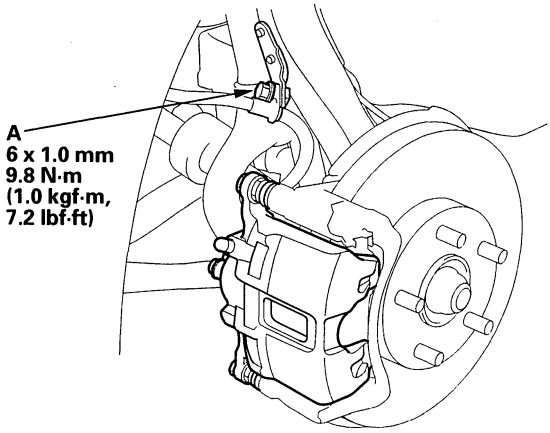
Front Brake Pad Inspection and Replacement (cont'd)

13. Push in the piston (B) so the caliper will fit over the brake pads. Check the brake fluid level. The brake fluid may overflow if the reservoir is too full. Make sure the piston boot is in position to prevent damaging it when pivoting the caliper down.



14. Pivot the caliper (C) down into position. Install the flange bolt (D), and tighten it to the specified torque while holding the pin A with a wrench being careful not to damage the pin boot.

15. Install the brake hose mounting bolt (A), and tighten it to the specified torque.



16. Press the brake pedal several times to make sure the brakes work.

    NOTE: Engagement of the brake may require a greater pedal stroke immediately after the brake pads have been replaced as a set. Several applications of the brake pedal will restore the normal pedal stroke.

17. After installation, check for leaks at hose and line joints or connections, and retighten if necessary. Then test-drive the vehicle.

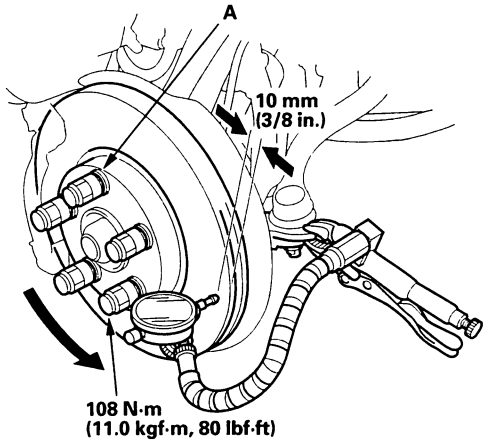
BACK

Protected by AR

Front Brake Disc Inspection

Runout

1. Raise the front of the vehicle, and support it with safety stands in the proper locations. Refer to the 2003-2006 Accord Service Manual (see page 1-14).
2. Remove the front wheels.
3. Remove the brake pads (see page 19-2).
4. Inspect the brake disc surface for damage and cracks. Clean the brake disc thoroughly, and remove all rust.
5. Install suitable flat washers (A) and wheel nuts, and tighten the nuts to the specified torque to hold the brake disc securely against the hub.



6. Set up the dial gauge against the brake disc as shown, and measure the runout at 10 mm (3/8 in.) from the outer edge of the brake disc.

   Brake disc runout:
   Service limit: 0.10 mm (0.004 in.)

7. If the brake disc is beyond the service limit, refinish the brake disc with an on-car brake lathe. The Kwik-Lathe produced by Kwik-way Manufacturing Co. and the "Front brake Disc Lathe" offered by Snap-on Tools Co. are approved for this operation.

   Max. refinish limit: 21.0 mm (0.83 in.)

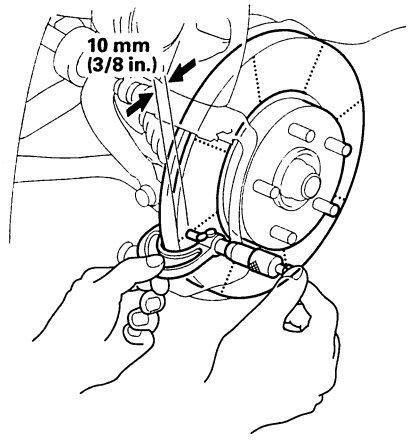
   NOTE:
   - If the brake disc is beyond the service limit for refinishing, replace it.
   - A new disc should be refinished if its runout is greater than 0.10 mm (0.004 in.).

Thickness and Parallelism

1. Raise the front of the vehicle, and support it with safety stands in the proper locations. Refer to the 2003-2006 Accord Service Manual (see page 1-14).
2. Remove the front wheels.
3. Remove the brake pads (see page 19-2).
4. Using a micrometer, measure brake disc thickness at eight points, approximately 45 ° apart and 10 mm (3/8 in.) in from the outer edge of the brake disc.
   Replace the brake disc if the smallest measurement is less than the max. refinishing limit.

   A/T model
   Brake disc thickness:
   Standard: 22.9—23.1 mm (0.90—0.91 in.)
   Max. refinishing limit: 21.0 mm (0.83 in.)
   M/T model
   Brake disc thickness:
   Standard: 27.9—28.1 mm (1.10—1.11 in.)
   Max. refinishing limit: 26.0 mm (1.02 in.)
   Brake disc parallelism: 0.015 mm (0.0006 in.) max.

   NOTE: This is the maximum allowable difference between the thickness measurements.



5. If the smallest measurement is less than the max refinishing limit, replace the brake disc.
6. If the brake disc is beyond the service limit for parallelism, refinish the brake disc with an on-car brake lathe. The Kwik-Lathe produced by Kwik-way Manufacturing Co. and the "Front Brake Disc Lathe" offered by Snap-on Tools Co. are approved for this operation.

Conventional Brake Components

Front Brake Caliper Overhaul

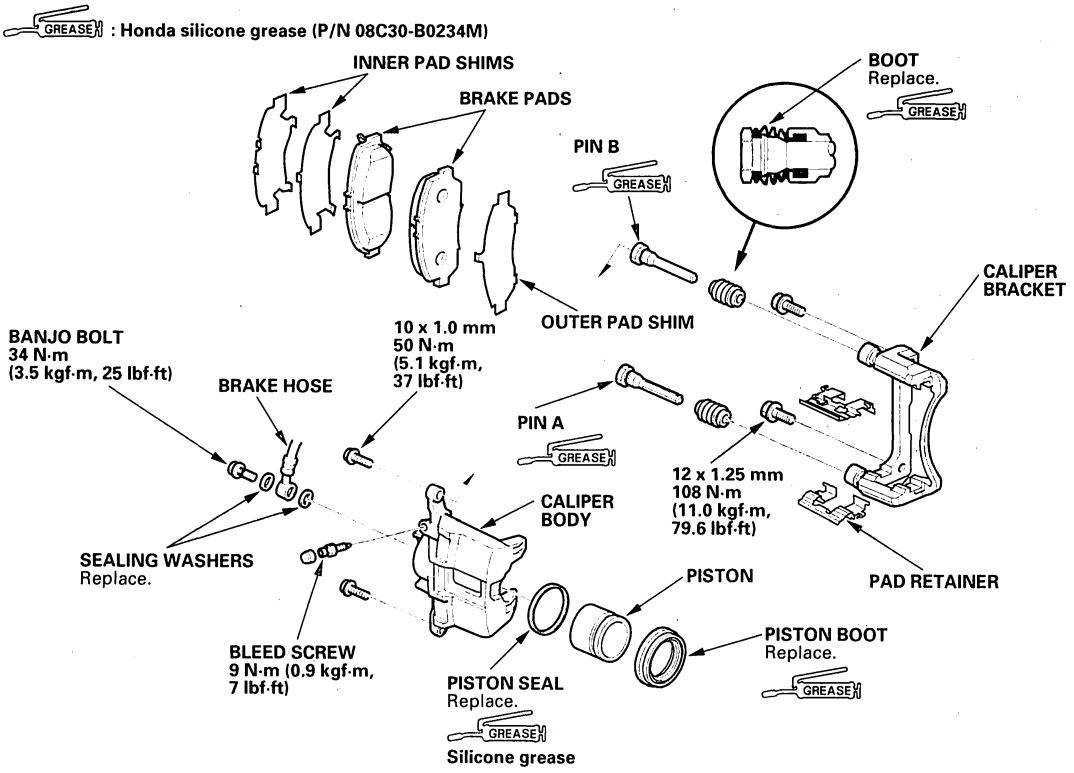
⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

Remove, disassemble, inspect, reassemble, and install the caliper, and note these items:

NOTE: Make sure that the caliper pins are installed correctly.
The upper and lower caliper pins are different. If the caliper pins are installed in the wrong location, it will cause uneven tire wear, vibration, and or uneven or rapid pad wear.

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- To prevent dripping brake fluid, cover disconnected hose joints with rags or shop towels.
- Clean all parts in brake fluid and air dry; blow out all passages with compressed air.
- Before reassembling, check that all parts are free of dust and other foreign particles.
- Replace parts with new ones as specified in the illustration.
- Make sure no dirt or other foreign matter get in the brake fluid.
- When reusing brake pads, always reinstall them in their original positions to prevent loss of braking efficiency.
- Do not reuse drained brake fluid. Use only clean Honda DOT 3 Brake Fluid from an unopened container. Using a non-honda brake fluid can cause corrosion and shorten the life of the system.
- Do not mix different brands of brake fluid as they may not be compatible.
- Coat the piston, piston seal groove, and caliper bore with clean brake fluid.
- Make sure no grease or oil gets on the brake discs or pads.
- Replace all rubber parts with new ones whenever disassembled.
- After installing the caliper, check the brake hose and line for leaks, interference, and twisting.



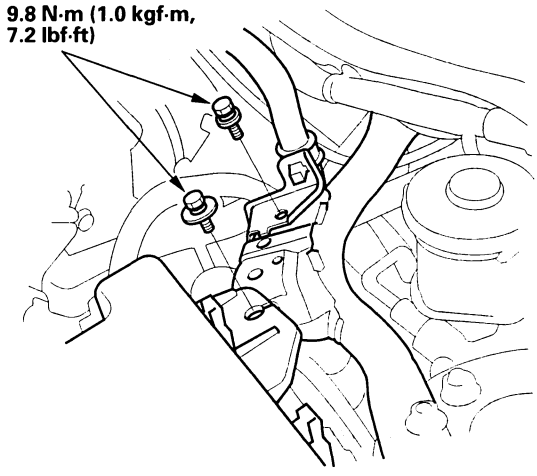
BACK

Protected by AR

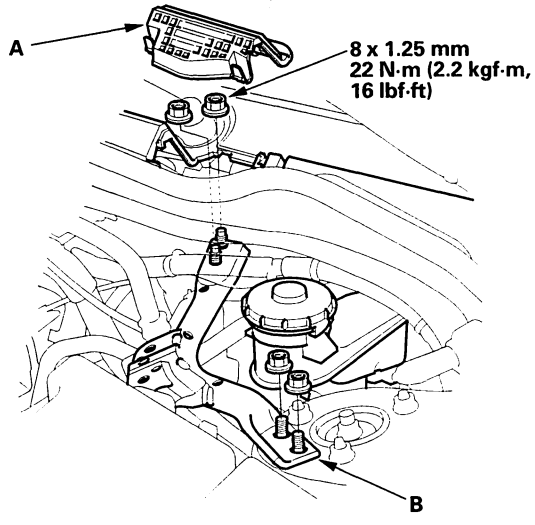
Master Cylinder Replacement

NOTE: Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.

1. Remove the cable clamps from the body.

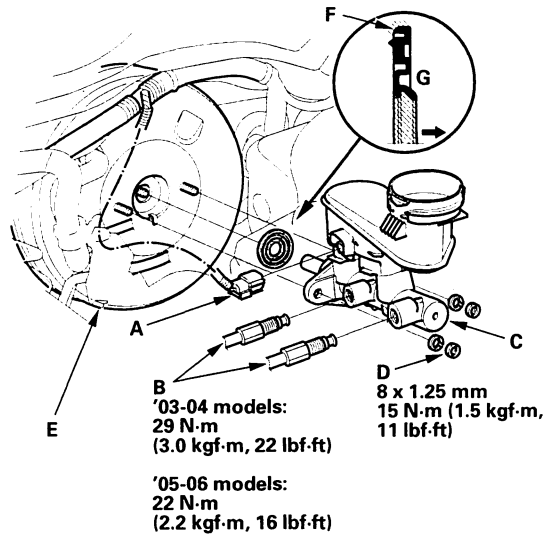


2. Remove the access panel (A), then remove the right strut brace (B).



3. Remove the reservoir cap and brake fluid from the master cylinder reservoir.

4. Disconnect the brake fluid level switch connector (A).



5. Disconnect the brake lines (B) from the master cylinder (C). To prevent spills, cover the hose joints with rags or shop towels.

6. Remove the master cylinder mounting nuts (D) and washers.

7. Remove the master cylinder from the brake booster (E). Be careful not to bend or damage the brake lines when removing the master cylinder.

8. Remove the rod seal (F) from the master cylinder or brake booster.

9. Install the master cylinder in the reverse order of removal, and note these items:

   - Replace all the rubber parts with new ones whenever the master cylinder is removed.
   - Use a new rod seal on reassembly.
   - Coat the inner bore lip and outer circumference of the new rod seal with the recommended seal grease in the master cylinder set.
   - Install the rod seal onto the master cylinder with its grooved side (G) toward the master cylinder.
   - Check the brake pedal height and free play after installing the master cylinder, and adjust it if necessary.

10. Bleed system, refer to the 2003-2006 Accord Service Manual (see page 19-9).

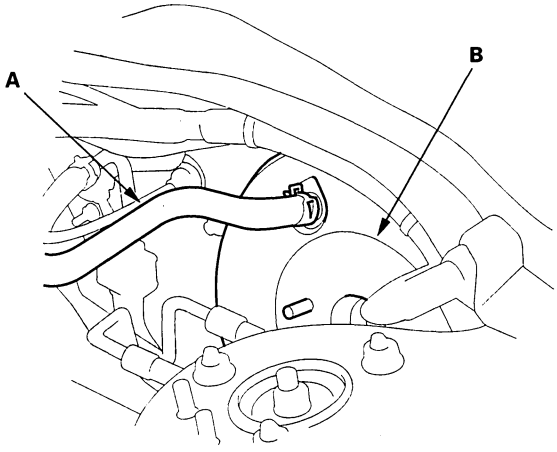
11. Spin the wheels to check for brake drag.

BACK

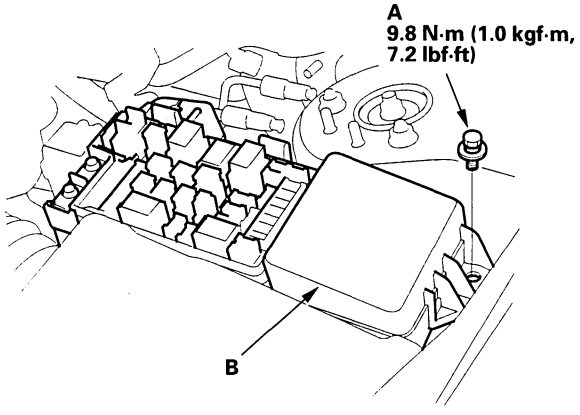
Protected by AR

Brake Booster Replacement

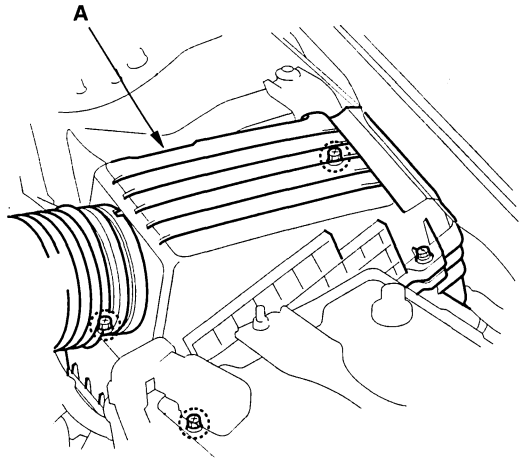
1. Remove the master cylinder (see page 19-7).
2. Disconnect the vacuum hose (A) from the brake booster (B).



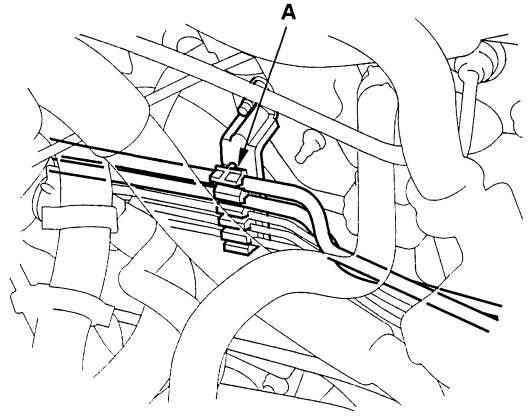
3. Remove the under-hood fuse/relay box cover.
4. Remove the under-hood fuse/relay box mounting bolt (A), then remove the under-hood fuse/relay box (B) from the body.



5. Remove the air cleaner assembly (A).



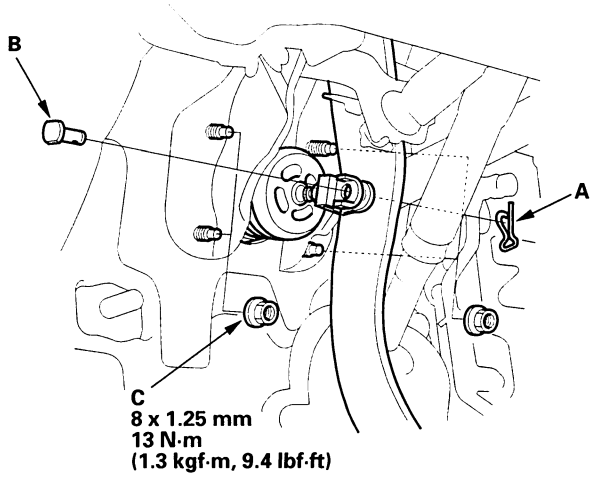
6. Remove the primary and secondary brake lines from the hose clamp (A).



BACK

Protected by AR

7. Remove the lock pin (A) and the joint pin (B), then disconnect the yoke from the brake pedal.

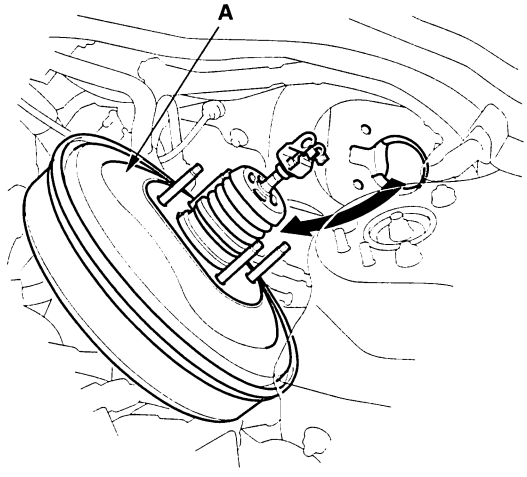


8. Remove the brake booster mounting nuts (C).

9. Remove the brake booster (A) from the engine compartment.

NOTICE

- Be careful not to damage the booster surfaces and threads of the booster stud bolts.
- Be careful not to bend or damage the brake lines.



10. Install the brake booster in the reverse order of removal, and note these items:

- Adjust the pushrod length before installing the brake booster.
- Use a new lock pin whenever installing.
- After installing the brake booster and master cylinder, fill the reservoir with new brake fluid, bleed the brake system, and adjust the brake pedal height and free play.

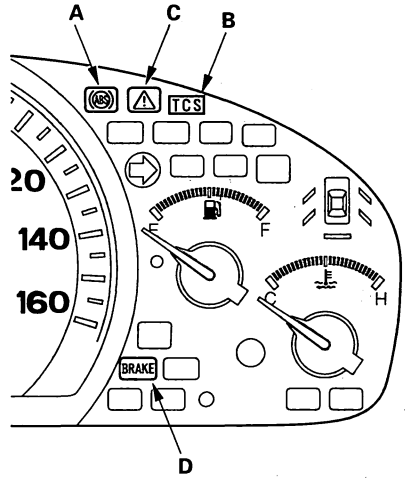
General Troubleshooting Information

System Indicator

This system has four indicators; ABS indicator (A), TCS indicator (B), TCS activation indicator (C) and brake system indicator (D). When the system detects a problem, it illuminates the appropriate indicators. Depending on the failure, the ABS/TCS modulator-control unit determines which indicators are turned on.



- When ABS function is lost:
  ABS indicator, TCS indicator and TCS activation indicator turn on.
- When TCS function is lost:
  TCS indicator and TCS activation indicator turn on.
- When all functions are lost:
  All four indicators turn on.
- When the gauge control module detects F-CAN circuit problem:
  ABS indicator, TCS indicator and brake system indicator turn on.

ABS/TCS Indicator

- If the system is OK, the ABS and TCS indicators go off 2 seconds after turning the ignition switch ON (II).
- The ABS and TCS indicators come on when the ABS/TCS modulator-control unit detects a problem in the system. However, even though the system is operating properly, the indicator may come on under these conditions.
  - The vehicle goes into a spin
  - The ABS or TCS continues to operate for a long time
  - The vehicle is subject to an electrical signal disturbance

To determine the actual cause of the problem, question the customer about the conditions when the problem occurred, taking the above conditions into consideration.

TCS Activation Indicator

- If the system is OK, the indicator goes off 2 seconds after turning the ignition switch ON (II).
- The indicator comes on if the TCS OFF switch is pressed after the ignition switch is turned ON (II).
- The indicator flashes while the TCS system is active.
- When a problem is detected and the ABS indicator comes on, but not the TCS indicator, there are cases when the indicator stays on until the ignition switch is turned OFF, and cases when the indicator goes off automatically when the system returns to normal.
  - DTC 61 or 62:
    The ABS and TCS indicators go off automatically when the system returns to normal.
  - DTC 11, 13, 15, 17, 31, 32, 33, 34, 35, 36, 37, 38, 53, 54, 71, 81, 112, 121, 122, 123 or 124:
    The ABS and TCS indicators stay on until the ignition switch is turned OFF whether or not the system returns to normal.
  - DTC 12, 14, 16, 18, 21, 22, 23, 24, 41, 42, 43, 44, 51 or 52:
    The ABS indicator stays on until the system returns to normal and the vehicle is driven.
  - DTC 64, 65, 66, 68, 83, 84 or 86:
    The TCS indicator stays on until the ignition switch is turned OFF whether or not the system returns to normal.

Protected by AR

General Troubleshooting Information (cont'd)

Diagnostic Trouble Code (DTC)

- The memory can hold any number of DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are indicated in ascending number order, not in the order they occur.
- The DTCs are memorized in the EEPROM (non-volatile memory). Therefore, the memorized DTCs cannot be canceled by disconnecting the battery. Do the specified procedures to clear the DTCs.

Self-diagnosis

- Self-diagnosis can be classified into two categories:
  - Initial diagnosis: Done right after the engine starts and until the ABS and TCS indicators go off.
  - Regular diagnosis: Done right after the initial diagnosis until the ignition switch is turned OFF.
- When a problem is detected by self-diagnosis, the ABS/TCS modulator-control unit shifts to fail-safe mode.

Kickback

The pump motor operates when the ABS modulator-control unit is functioning, and the fluid in the reservoir is forced out to the master cylinder, causing kickback at the brake pedal.

Pump Motor

- The pump motor operates when the ABS or TCS modulator-control unit is functioning.
- The ABS/TCS modulator-control unit checks the pump motor operating during initial diagnosis when the vehicle is driven over 12 mph (20 km/h) the first time after the ignition switch is turned ON (II). You may hear the motor operate at this time, but it is normal.

Brake Fluid Replacement/Air Bleeding

Brake fluid replacement and air bleeding procedures are identical to the procedures used on vehicles not equipped with ABS/TCS. To ease bleeding, start with the front wheels.

How to Troubleshoot DTCs

The troubleshooting flowchart procedures assume that the cause of the problem is still present and the ABS and/or TCS indicator is still on. Following the flowchart when the ABS and/or TCS indicator does not come on can result in incorrect diagnosis.
The connector illustrations show the female terminal connectors with a single outline and the male terminal connectors with a double outline.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the ABS and/or TCS indicator came on, such as during ABS control, after ABS control, when vehicle speed was at a certain speed, etc.

2. When the ABS or TCS indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. before you start troubleshooting.

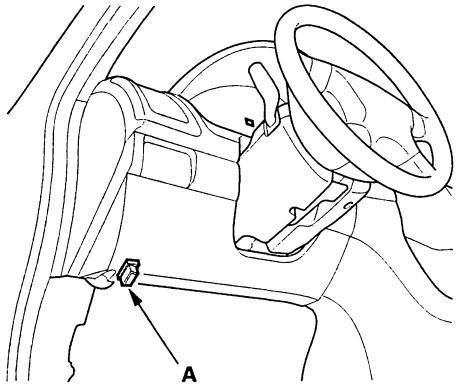
3. After troubleshooting, or repairs are done, clear the DTCs, and test-drive the vehicle. Make sure the ABS and TCS indicators do not come on.

BACK

Protected by AR

How to Retrieve DTCs

1. With the ignition switch OFF, connect the Honda Diagnostic System (HDS) to the 16P data link connector (DLC) (A) under the left side of the dashboard.

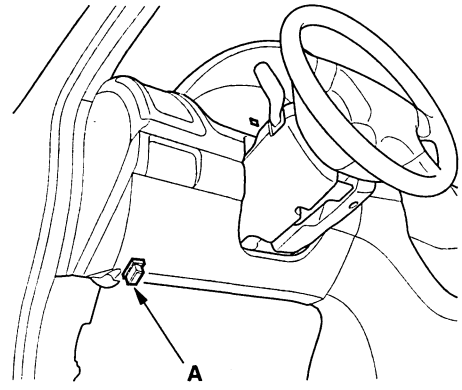


2. Turn the ignition switch ON (II), and follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC Troubleshooting.

   NOTE: See the HDS Help menu for specific instructions.

How to Clear DTCs

1. With the ignition switch OFF, connect the HDS to the 16P data link connector (DLC) (A) under the left side of the dashboard.



2. Turn the ignition switch ON (II), and clear the DTC(s) by following the screen prompts on the HDS.

   NOTE: See the HDS Help menu for specific instructions.

3. Perform the TCS pressure sensor neutral position memorization (see page 19-55).

ABS/TCS Components

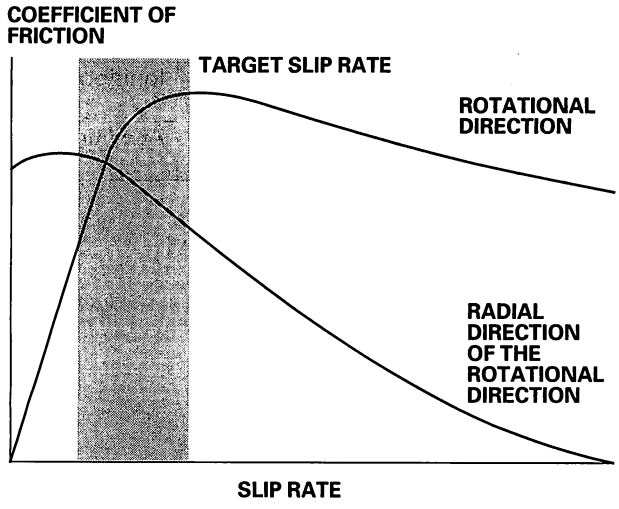
System Description (cont'd)

ABS Features

When the brake pedal is pressed while driving, the wheels can lock before the vehicle comes to a stop. In such an event, the maneuverability of the vehicle is reduced if the front wheels are locked, and the stability of the vehicle is reduced if the rear wheels are locked, creating an extremely unstable condition. The ABS precisely controls the slip rate of the wheels to ensure maximum grip force from the tires, and it thereby ensures maneuverability and stability of the vehicle.

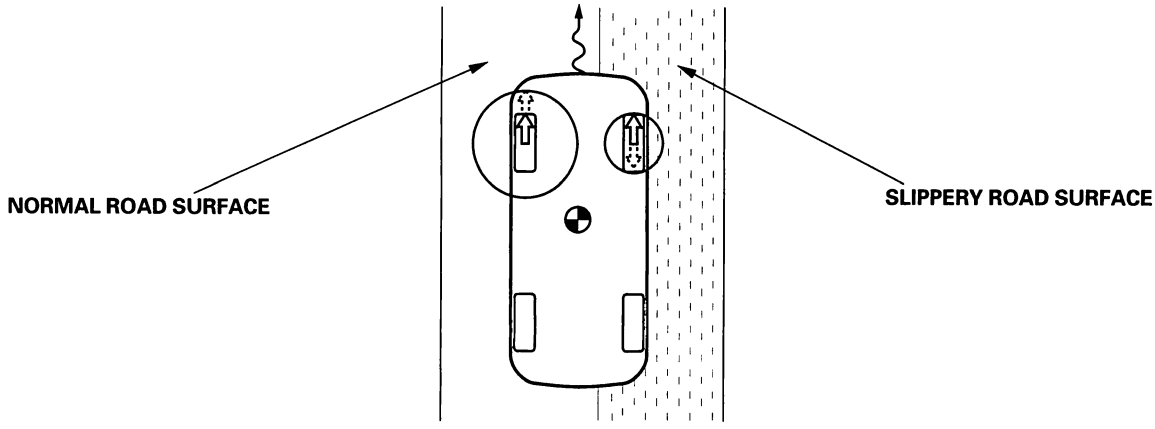
The ABS calculates the slip rate of the wheels based on the vehicle speed and the wheel speed, then it controls the brake fluid pressure to attain the target slip rate.

Grip Force of Tire and Road Surface



TCS Features

The TCS provides low-speed traction. When a drive wheel loses traction on a slippery road surface and starts to spin, the ABS/TCS modulator-control unit applies brake pressure to slow the spinning wheel. At that time, the ABS/TCS modulator-control unit sends an engine retard signal to the ECM/PCM to prevent damage to the transmission.

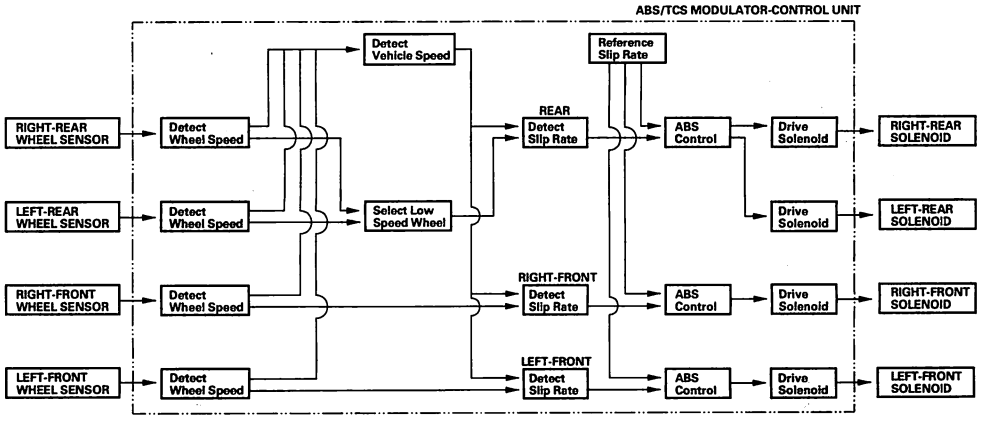


BACK

Protected by AR

ABS Main Control

The ABS/TCS modulator-control unit detects the wheel speed based on the wheel sensor signals it receives, then calculates the vehicle speed based on the detected wheel speed. The control unit detects the vehicle speed during deceleration based on the rate of deceleration.
The ABS/TCS modulator-control unit calculates the slip rate of each wheel, and it transmits the control signal to the modulator unit solenoid valve when the slip rate is high.
The pressure reduction control has three modes: Pressure reducing, pressure retaining, and pressure intensifying.



TCS Main Control

The ABS/TCS modulator-control unit controls the TCS based on signal inputs from the accelerator pedal position sensor, engine speed, shifter position, and the wheel sensors. In addition, the ABS/TCS modulator-control unit sends an engine retard request signal to the ECM/PCM if necessary. The pressure intensifying control has three modes: Pressure intensifying, pressure retaining, and pressure reducing.

System Description (cont'd)

Self-Diagnosis

- The ABS/TCS modulator-control unit is equipped with a main CPU and a monitor IC. They check each other for problems.
- The CPUs also check the circuit of the system.
- When a problem is detected by self-diagnosis, the ABS/TCS modulator-control unit turns on the appropriate indicator(s).

DTC	Detection Item	ABS indicator	Brake system indicator	TCS indicator	TCS activation indicator
11, 13, 15, 17	Wheel sensor (open/short to body ground/ short to power)	ON	ON or OFF	ON	ON
12, 14, 16, 18	Wheel sensor (electrical noise/intermittent interruption)	ON	ON or OFF	ON	ON

On-board Diagnosis Function

The ABS and TCS can be diagnosed with the HDS.

The ALB Checker cannot be used with this system. For air bleeding, and checking wheel sensor signals, use the HDS. See the HDS Help menu for specific operating instructions.

Protected by AR

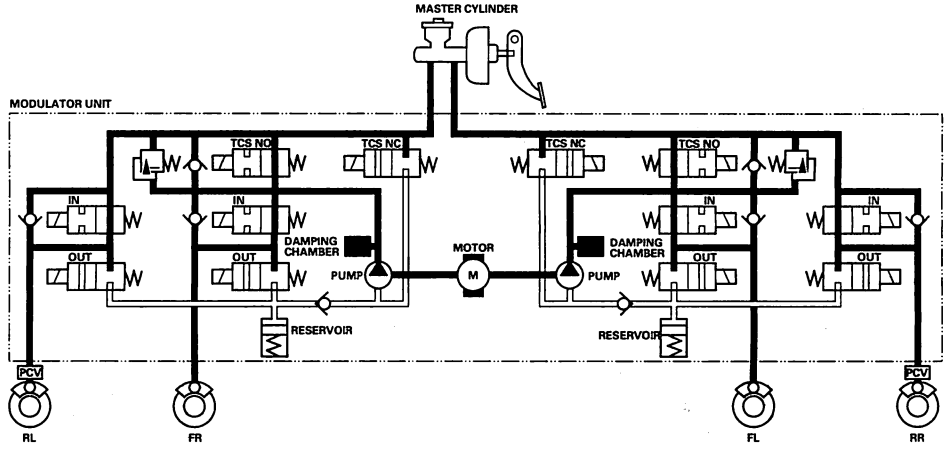
Modulator Unit

The modulator unit consists of the inlet solenoid valve, outlet solenoid valve, TCS normally open (NO) solenoid valve, TCS normally closed (NC) solenoid valve, reservoir, pump, pump motor, and the damping chamber.
The modulator controls the caliper fluid pressure directly. It is a circulating-type modulator because the brake fluid circulates through the caliper, the reservoir, and the master cylinder.
The hydraulic control has three modes: Pressure intensifying, pressure retaining, and pressure reducing.
The hydraulic circuit is an independent four channel type, one channel for each wheel.

ABS Control

Pressure intensifying mode
TCS NO valve open, TCS NC valve closed, inlet valve open, outlet valve closed.
Master cylinder fluid is pumped out to the caliper.

Pump motor
When starting the pressure reducing mode, the pump motor is ON. When stopping ABS operation, the pump motor is OFF.
The reservoir fluid is pumped out by the pump, through the damping chamber, to the master cylinder.



Pressure retaining mode
TCS NO valve open, TCS NC valve closed, inlet valve closed, outlet valve closed.
Caliper fluid is retained by the inlet valve and outlet valve.

System Description (cont'd)

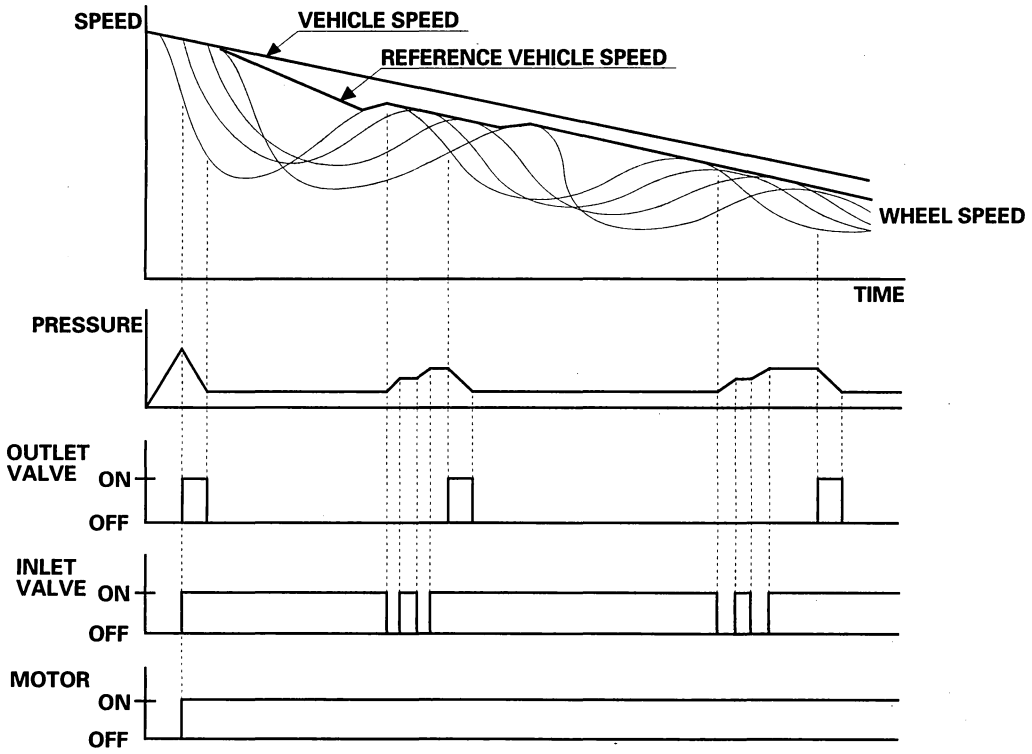
Wheel Sensor

The wheel sensors are the magnetic contactless type. The wheel sensors detect changing of magnetic polarity on the magnetic encoder. The ABS/TCS modulator-control unit calculates the wheel speed based on signals sent from the wheel sensor.

Wheel Speed and Modulator Control (ABS)

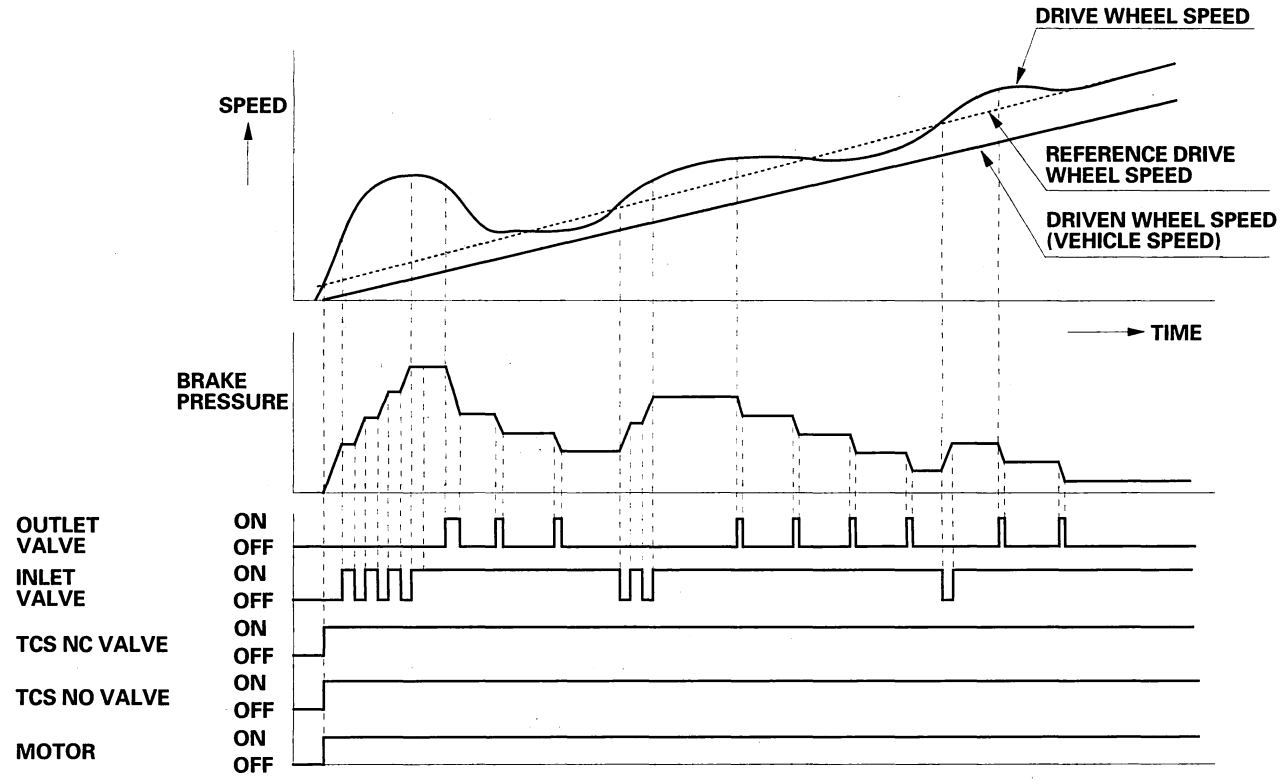


When the wheel speed drops sharply below the vehicle speed, the outlet valve opens momentarily to reduce the caliper fluid pressure. The pump motor starts at this time. As the wheel speed is restored, the inlet valve opens momentarily to increase the caliper fluid pressure.

BACK

Protected by AR

Wheel Speed and Modulator Control (TCS)



When the front wheel speed rises sharply above the vehicle speed, the TCS NC valve opens, the TCS NO valve closes, and the pump motor starts to intensify the front caliper fluid pressure. When the wheel speed drops, the front inlet valve closes momentarily to retain the front caliper fluid pressure. When the wheel speed drops further, the front outlet valve opens momentarily to reduce the front caliper fluid pressure.

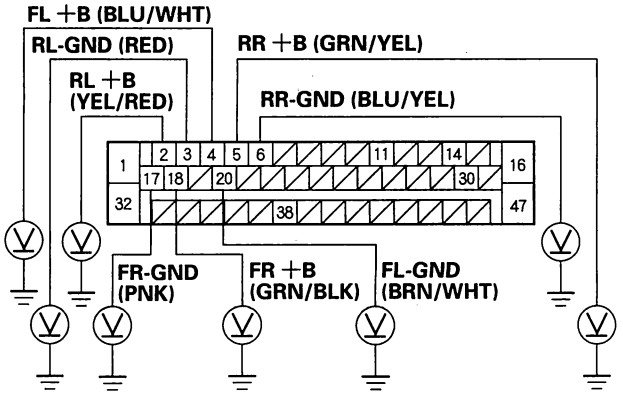
DTC Troubleshooting

DTC 11, 13, 15, 17: Wheel Sensor (Open/Short to Body Ground/Short to Power)

1. Disconnect the ABS/TCS modulator-control unit 47P connector.
2. Start the engine.
3. Measure the voltage between body ground and the appropriate wheel sensor +B and GND terminals of the ABS/TCS modulator-control unit 47P connector individually (see table).

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 18	FR-GND: No. 17
13 (Left-front)	FL +B: No. 4	FL-GND: No. 20
15 (Right-rear)	RR +B: No. 5	RR-GND: No. 6
17 (Left-rear)	RL +B: No. 2	RL-GND: No. 3

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there battery voltage?

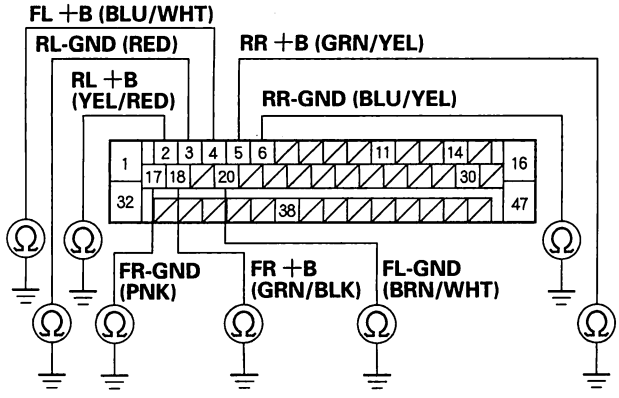
YES—Repair short to power in the wire between the ABS/TCS modulator-control unit and the appropriate wheel sensor. ■

NO—Go to step 4.

4. Turn the ignition switch OFF.
5. Check for continuity between body ground and the appropriate wheel sensor +B and GND terminals of the ABS/TCS modulator-control unit 47P connector individually (see table).

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 18	FR-GND: No. 17
13 (Left-front)	FL +B: No. 4	FL-GND: No. 20
15 (Right-rear)	RR +B: No. 5	RR-GND: No. 6
17 (Left-rear)	RL +B: No. 2	RL-GND: No. 3

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 6.

NO—Go to step 8.

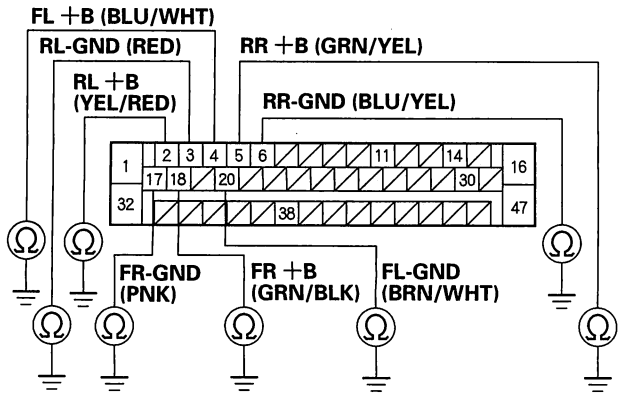
DTC Troubleshooting (cont'd)

6. Disconnect the appropriate wheel sensor 2P connector.

7. Check for continuity between body ground and the appropriate wheel sensor +B and GND terminals of the ABS/TCS modulator-control unit 47P connector individually (see table).

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 18	FR-GND: No. 17
13 (Left-front)	FL +B: No. 4	FL-GND: No. 20
15 (Right-rear)	RR +B: No. 5	RR-GND: No. 6
17 (Left-rear)	RL +B: No. 2	RL-GND: No. 3

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there continuity?

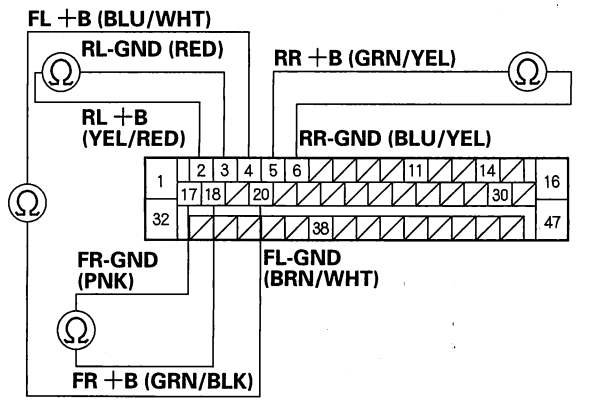
YES—Repair short to body ground in the wire between the ABS/TCS modulator-control unit and the wheel sensor. ■

NO—Replace the wheel sensor (see page 19-59). ■

8. Measure the resistance between the appropriate wheel sensor +B and GND terminals of the ABS/TCS modulator-control unit 47P connector (see table), then measure the resistance between the same terminals after reversing the positive tester probe and negative tester probe.

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 18	FR-GND: No. 17
13 (Left-front)	FL +B: No. 4	FL-GND: No. 20
15 (Right-rear)	RR +B: No. 5	RR-GND: No. 6
17 (Left-rear)	RL +B: No. 2	RL-GND: No. 3

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is the resistance infinity (open circuit) in both directions?

YES—Go to step 9.

NO—Go to step 11.

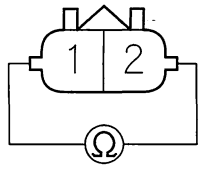
BACK

Protected by AR

9. Disconnect the appropriate wheel sensor 2P connector.

10. Measure the resistance between the appropriate wheel sensor 2P connector terminals, then remeasure the resistance between the same terminals after reversing the positive tester probe and negative tester probe. Each wheel sensor has a diode in the circuit.

WHEEL SENSOR 2P CONNECTOR



Wire side of female terminals

Is the resistance infinity (open circuit) in both directions?

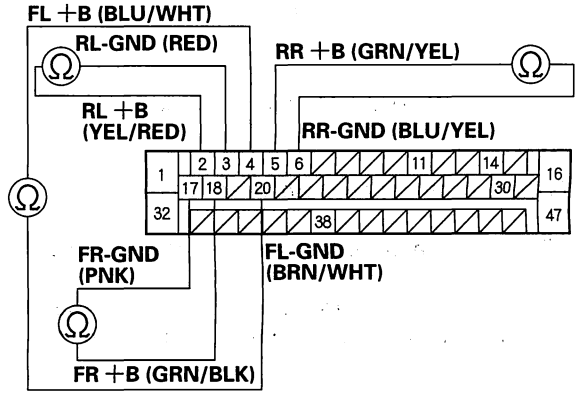
YES—Replace the wheel sensor (see page 19-59). ■

NO—Repair open in the wire between the ABS/TCS modulator-control unit and the wheel sensor. ■

11. Check for continuity between the appropriate wheel sensor +B and GND terminals of the ABS/TCS modulator-control unit 47P connector (see table), then recheck for continuity between the same terminals after reversing the positive tester probe and negative tester probe.

DTC	Appropriate Terminal	
	+B	GND
11 (Right-front)	FR +B: No. 18	FR-GND: No. 17
13 (Left-front)	FL +B: No. 4	FL-GND: No. 20
15 (Right-rear)	RR +B: No. 5	RR-GND: No. 6
17 (Left-rear)	RL +B: No. 2	RL-GND: No. 3

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there continuity in both directions?

YES—Go to step 12.

NO—Check for loose terminals in the ABS/TCS modulator-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck. ■

(cont'd)

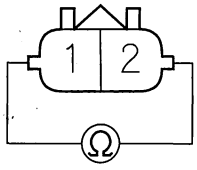
DTC Troubleshooting (cont'd)

12. Disconnect the appropriate wheel sensor 2P connector.

13. Check for continuity between the appropriate wheel sensor 2P connector terminals, then recheck for continuity between the same terminals after reversing the positive tester probe and negative tester probe. Each wheel sensor has a diode in the circuit.

WHEEL SENSOR 2P CONNECTOR



Wire side of female terminals

Is there continuity in both directions?

YES—Replace the wheel sensor (see page 19-59). ■

NO—Repair short in the wire between the ABS/TCS modulator-control unit and the wheel sensor. ■

DTC 12, 14, 16, 18: Wheel Sensor (Electrical Noise/Intermittent Interruption)

NOTE: If the ABS indicator comes on because of electrical noise, the indicator goes off when you test-drive the vehicle at 19 mph (30 km/h).

1. Check the appropriate wheel sensor, magnetic encoder (front) and pulser (rear) (see page 19-58).

DTC	Appropriate Wheel Sensor
12	Right-front
14	Left-front
16	Right-rear
18	Left-rear

Are they OK?

YES—Go to step 2.

NO—Reinstall or replace the appropriate wheel sensor, magnetic encoder (front) or pulser (rear). ■

2. Disconnect the ABS/TCS modulator-control unit 47P connector.

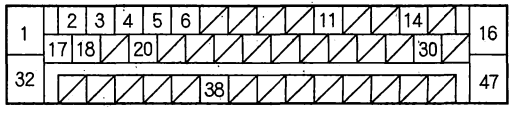
BACK

Protected by AR

3. Check for continuity between the appropriate wheel sensor GND terminal and other wheel sensor GND terminals of the ABS/TCS modulator-control unit (see table).

DTC	Appropriate Terminal	Other Terminals		
12	FR-GND: No. 17	No. 20	No. 6	No. 3
14	FL-GND: No. 20	No. 17	No. 6	No. 3
16	RR-GND: No. 6	No. 17	No. 20	No. 3
18	RL-GND: No. 3	No. 17	No. 20	No. 6

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the appropriate wheel sensor and the other wheel sensor. ■

NO—Clear the DTC, and test-drive the vehicle. If the ABS indicator comes on and the same DTC is indicated, replace the appropriate wheel sensor. If after clearing the DTC and test driving the vehicle, the ABS indicator comes on and the same DTC is indicated, replace the ABS/TCS modulator-control unit (see page 19-56). ■

DTC 21, 22: Magnetic Encoder (Front)

DTC 23, 24: Pulser (Rear)

1. Clear the DTC (see page 19-15).
2. Test-drive the vehicle at 19 mph (30 km/h) or more.

   Does the ABS indicator come on, and are DTCs 21, 22, 23, and/or 24 indicated?

   YES—Go to step 3.

   NO—The system is OK at this time. ■
3. Check the appropriate encoder or pulser (see table) (see page 19-58).

DTC	Appropriate Encoder or Pulser
21	Right-front
22	Left-front
23	Right-rear
24	Left-rear

Is the encoder or pulser OK?

YES—Check for loose terminals in the ABS/TCS modultor-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck. ■

NO—Replace the magnetic encoder or pulser. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 31, 32, 33, 34, 35, 36, 37, 38: ABS Solenoid

1. Clear the DTC (see page 19-15).
2. Turn the ignition switch ON (II).
3. Verify the DTC.

   Does the ABS indicator come on, and are DTCs 31, 32, 33, 34, 35, 36, 37, and/or 38 indicated?

   YES—Check for loose terminals in the ABS/TCS modulator-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck. ■

   NO—The system is OK at this time. ■

DTC 41, 42, 43, 44: Wheel Lock

1. Check for brake drag.

   Do the brakes drag?

   YES—Repair the brake drag. ■

   NO—Go to step 2.

2. Check the installation of the appropriate wheel sensor (see table).

DTC	Appropriate Wheel Sensor
41	Right-front
42	Left-front
43	Right-rear
44	Left-rear

   Is it correct?

   YES—Clear the DTC and test-drive the vehicle. If the ABS indicator comes on and the same DTC is indicated, replace the ABS/TCS modulator-control unit (see page 19-56). If the ABS indicator does not come back on, the probable cause was the vehicle spun during cornering. ■

   NO—Reinstall the wheel sensor correctly. ■

BACK

Protected by AR

DTC 51: Motor Lock

1. Check the No. 17 (30 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES—Reinstall the fuse, and go to step 2.

   NO—Replace the fuse, and recheck.■

2. Disconnect the ABS/TCS modulator-control unit 47P connector.

3. Measure the voltage between the ABS/TCS modulator-control unit 47P connector terminal No. 16 and body ground.

DTC Troubleshooting (cont'd)

DTC 68: Brake Pedal Position Switch

1. Check the DTC.

   Is DTC 86 indicated?

   YES—Go to troubleshooting for DTC 86. ■

   NO—Go to step 2.

2. Check the brake pedal position switch, refer to the 2003-2006 Accord Service Manual (see page 22-195).

   Is the switch OK?

   YES—Go to step 3.

   NO—Replace the brake pedal position switch. ■

3. Clear the DTC (see page 19-15).

4. Test-drive the vehicle.

   Does the ABS indicator come on, and is DTC 68 indicated?

   YES—Go to step 5.

   NO—The system is OK at this time. ■

5. Check the BRAKE SWITCH indication in the PGM-FI data list using the HDS.

   Does the BRAKE SWITCH data indicate ON with the brake pedal pressed, and OFF with the brake pedal released?

   YES—Check for loose terminals in the ABS/TCS modulator-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck. ■

   NO—Repair open or short in brake pedal position switch circuit. If the circuit is OK, substitute a known-good ECM/PCM, and recheck. ■

DTC 71: Different Diameter Tire

1. Clear the DTC (see page 19-15).

2. Test-drive the vehicle.

   Does the ABS indicator come on, and is DTC 71 indicated?

   YES—Go to step 3.

   NO—Intermittent failure; the vehicle is OK at this time. ■

3. Check that all four tires are the specified size and are inflated to the proper specification.

   Are all four tires the correct size and properly inflated?

   YES—Go to step 4.

   NO—Install the correct tires or set the tires to the correct inflation, and retest. ■

4. With the vehicle on level ground, mark each tire with a small spot of grease. Roll the vehicle until each of the tires makes two grease spots on the floor.

5. Measure and record the distance between the two grease spots.

   Is the difference between the shortest and the longest measurement more than 10 %?

   YES—Replace the tire/tires that is smaller or larger than the others. ■

   NO—Replace the ABS/TCS modulator-control unit (see page 19-56). ■

BACK

Protected by AR

DTC 81: Central Processing Unit (CPU)

1. Check for other DTCs.

   Is another DTC indicated?

   YES—Do the appropriate troubleshooting for the DTC indicated. ■

   NO—Go to step 2.

2. Clear the DTC (see page 19-15).

3. Test-drive the vehicle.

   Does the ABS indicator come on, and is DTC 81 indicated?

   YES—Check for loose terminals in the ABS/TCS modulator-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck. ■

   NO—Intermittent failure; the vehicle is OK at this time. ■

DTC 83: ECM/PCM

1. Check the DTC.

   Is DTC 86 indicated?

   YES—Do the troubleshooting for DTC 86. ■
   NO—Go to step 2.

2. Clear the DTC (see page 19-15).

3. Test-drive the vehicle.

   Do the TCS and TCS activation indicators come on, and is DTC 83 indicated?

   YES—Go to step 4.
   NO—The system is OK at this time. ■

4. Check the PGM-FI system.

   Does the MIL indicator come on or are PGM-FI or A/T- related DTCs indicated?

   YES—Do the troubleshooting for the DTC indicated. ■
   NO—Go to step 5.

5. Check the gear position.

   Does the D indicator come on while the neutral position N is selected or is the ECM/PCM's DTC indicated?

   YES—Do the troubleshooting for the DTC indicated. ■
   NO—Check for loose terminals in the ECM/PCM connectors, and go to step 6.

6. Clear the DTC (see page 19-15).

7. Test-drive the vehicle.

   Is DTC 83 indicated with no PGM-FI or A/T-related DTCs?

   YES—Check for loose terminals in the ECM/PCM. If the terminals are OK, check for loose terminals in the ABS/TCS modulator-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck. ■
   NO—The system is OK at this time. ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 84: TCS Pressure Sensor Neutral Position

1. Clear the DTC (see page 19-15).
2. Test-drive the vehicle.

   Does the TCS indicator come on, and is DTC 84 indicated?

   YES—Replace the ABS/TCS modulator-control unit (see page 19-56). ■

   NO—The system is OK at this time. ■

DTC 86: F-CAN Communication

1. Clear the DTC (see page 19-15).
2. Turn the ignition switch OFF then back to the ON (II).
3. Start and run the engine for at least 5 seconds then turn the engine off.
4. Check for DTCs by selecting the DTCs MENU (DTCs) from the HDS.

   Is DTC 86 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, the F-CAN communication line is OK at this time. ■

5. Check for DTCs in the ECM/PCM.

   Are any DTCs indicated?

   YES—Troubleshoot the ECM/PCM DTCs. ■

   NO—Replace the ABS/TCS modulator-control unit (see page 19-56). ■

BACK

DTC 107: TCS Operation

NOTE: If the ABS/TCS modulator-control unit detected this problem, only the TCS activation indicator comes on.

1. Clear the DTC (see page 19-15).
2. Test-drive the vehicle.

   Does the TCS activation indicator come on, and is DTC 107 indicated?

   YES—Leave the vehicle for about 1 hour. And then, test-drive the vehicle. If the TCS activation indicators are indicated, check for loose terminals of the ABS/TCS modulator-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck.■

   NO—Intermittent failure; the system is OK at this time.■

DTC 112: Internal Power Source Stuck OFF

NOTE: If the battery cable is disconnected three times with the ignition switch ON (II), this DTC may be stored.

1. Check for other DTCs.

   Is another DTC indicated?

   YES—Do the appropriate troubleshooting for the DTC.■

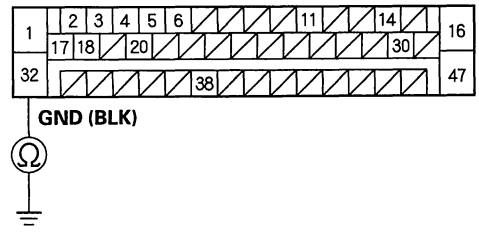
   NO—Go to step 2.
2. Clear the DTC (see page 19-15).
3. Test-drive the vehicle.

   Does the ABS indicator come on, and is DTC 112 indicated?

   YES—Go to step 4.

   NO—Intermittent failure; the vehicle is OK at this time.■
4. Check for continuity between the ABS/TCS modulator-control unit 47P connector terminal No. 32 and body ground.

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Check for loose terminals in the ABS/TCS modulator-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck.■

NO—Repair open in the wire between the ABS/TCS modulator-control unit 47P connector terminal No. 32 and body ground. If the wire is OK, check the ground connector at the body.■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 121, 122, 123, 124: TCS Solenoid

1. Clear the DTC (see page 19-15).
2. Test-drive the vehicle.

   Does the TCS indicator come on, and is DTC 121, 122, 123, or 124 indicated?

   YES—Check for loose terminals in the ABS/TCS modulator-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck. ■

   NO—Intermittent failure; the system is OK at this time. ■

Symptom Troubleshooting

ABS indicator does not come on

1. Turn the ignition switch ON (II), and watch the ABS indicator.

   Does the ABS indicator come on for several seconds?

   YES—The system is OK at this time. ■

   NO—Go to step 2.
2. Turn the ignition switch OFF.
3. Substitute a known-good ABS/TCS modulator-control unit.
4. Turn the ignition switch ON (II).

   Does the ABS indicator come on?

   YES—Replace the ABS/TCS modulator-control unit (see page 19-56). ■

   NO—Do the gauges self-diagnostic procedure, refer to the 2003-2006 Accord Service Manual (see page 22-259). ■

BACK

ABS indicator does not go off, and no DTCs are stored

1. Check the No. 18 (40 A) fuse in the under-hood fuse /relay box.

   Is the fuse OK?

   YES—Reinstall the fuse, and go to step 2.

   NO—Replace the fuse, and recheck. If the fuse is blown, check for a short to body ground in this fuse circuit. If the circuit is OK, replace the ABS/TCS modulator-control unit (see page 19-56).■

2. Check the No. 18 (15 A) fuse in the under-dash fuse/ relay box.

   Is the fuse OK?

   YES—Reinstall the fuse, and go to step 3.

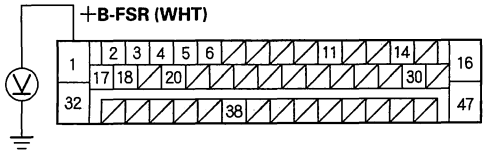
   NO—Replace the fuse, and recheck. If the fuse is blown, check for a short to body ground in this fuse circuit. If the circuit is OK, replace the ABS/TCS modulator-control unit (see page 19-56).■

3. Turn the ignition switch OFF.

4. Disconnect the ABS/TCS modulator-control unit 47P connector.

5. Measure the voltage between the ABS/TCS modulator-control unit 47P connector terminal No. 1 and body ground.

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there battery voltage?

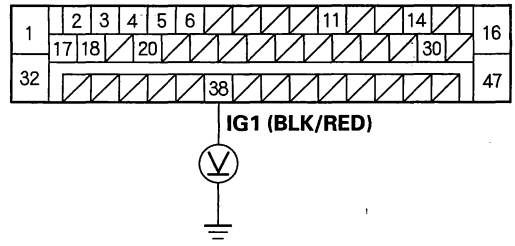
YES—Go to step 6.

NO—Repair open in the wire between the No. 18 (40 A) fuse and the ABS/TCS modulator-control unit.■

6. Turn the ignition switch ON (II).

7. Measure the voltage between the ABS/TCS modulator-control unit 47P connector terminal No. 38 and body ground.

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Go to step 8.

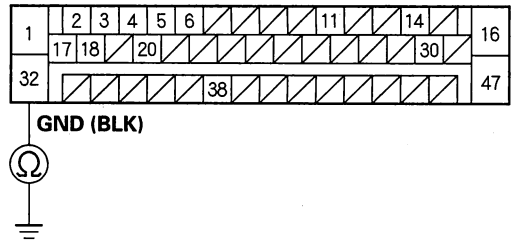
Symptom Troubleshooting (cont'd)

9. Check for continuity between the ABS/TCS modulator-control unit 47P connector terminal No. 32 and body ground.

ABS/TCS MODULATOR-CONTROL UNIT 47P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 10.

NO—Repair open in the wire between the ABS/TCS modulator-control unit and body ground (G203). ■

10. Do the gauges self-diagnostic procedure, refer to the 2003-2006 Accord Service Manual (see page 22-259).

Does the ABS indicator flash on and off?

YES—Check for loose terminals in the ABS/TCS modulator-control unit 47P connector. If necessary, substitute a known-good ABS/TCS modulator-control unit, and recheck. ■

NO—Replace the gauge control module. ■

Brake system indicator does not come on at bulb check and/or with parking brake applied

1. With the parking brake applied, turn the ignition switch ON (II), and watch the brake system indicator.

Does the brake system indicator come on?

YES—Go to step 3.

NO—Go to step 2.

2. Turn the ignition switch OFF then ON (II) again.

Does the ABS indicator come on for several seconds?

YES—Replace the gauge control module. ■

NO—Repair open in the indicator power source circuit. If necessary, substitute a known-good gauge control module, and recheck. ■

3. Turn the ignition switch OFF.

4. Release the parking brake.

5. Turn the ignition switch ON (II).

Does the brake system indicator come on for several seconds?

YES—Go to step 6.

NO—Check for loose terminals in the gauge control module connectors. If necessary, substitute a known-good gauge control module, and recheck. ■

6. Apply the parking brake.

Does the brake system indicator come on?

YES—The system is OK at this time. ■

NO—Go to step 7.

7. Turn the ignition switch OFF.

8. Disconnect the parking brake switch connector.

BACK

Protected by AR

9. Turn the ignition switch ON (II).

10. Measure the voltage between the parking brake switch connector terminal and body ground.

    Is there battery voltage?

    YES—Replace the parking brake switch. ■

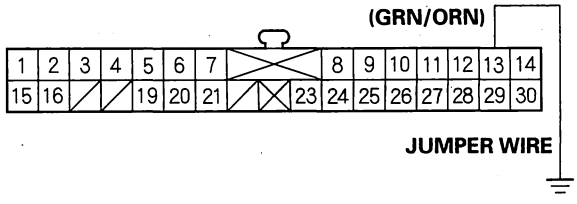
    NO—Go to step 11.

11. Turn the ignition switch OFF.

12. Remove the gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276).

13. Connect gauge control module connector B (30P) terminal No. 13 and body ground with a jumper wire.

GAUGE CONTROL MODULE CONNECTOR B (30P)



Wire side of female terminals

14. Turn the ignition switch ON (II).

    Does the brake system indicator come on and stay on?

    YES—Repair open in the wire between the gauge control module and the parking brake switch. ■

    NO—Replace the gauge control module. ■

Brake system indicator does not go off, and no DTCs are stored

1. Turn the ignition switch ON (II).

2. Release the parking brake.

    Does the brake system indicator go off after several seconds?

    YES—The system is OK at this time. ■

    NO—Go to step 3.

3. Check the brake fluid level and the brake fluid level switch.

    Is the switch and fluid level OK?

    YES—Go to step 4.

    NO—Refill the brake fluid or replace the switch, and recheck. ■

4. Check the ABS indicator.

    Does the ABS indicator stay on?

    YES—Read the ABS DTC (see page 19-15), and do the applicable troubleshooting for the DTC. ■

    NO—Check the brake system indicator circuit:

- Short to body ground between the gauge control module and the parking brake switch. ■
- Short to body ground between the gauge control module and the brake fluid level switch. ■
- Parking brake switch stuck ON. ■
- Faulty gauge control module. ■
- Faulty ABS/TCS modulator-control unit. ■

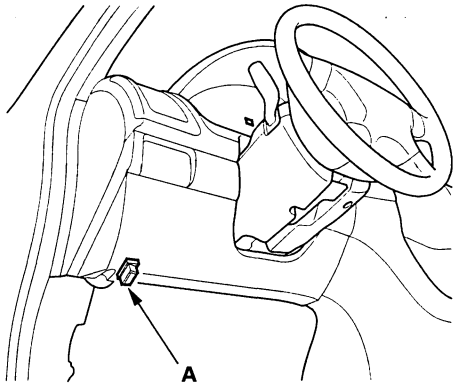
TCS Pressure Sensor Neutral Position Memorization

1. With the ignition switch OFF, connect the HDS to the 16P Date Link Connector (DLC) (A) under the driver's side of the dashboard.



2. Short the SCS circuit to body ground using the HDS.
3. The HDS screen will display the message: "The SCS line has been shorted. Do you want to leave the SCS line shorted?" Choose YES.
4. Turn the ignition switch ON (II).
5. The ABS indicator comes on for 2 seconds.
6. Push the TCS OFF switch once within 2 seconds after the ABS indicator goes off.
7. Push the TCS OFF switch once within 2 seconds after the ABS indicator comes back on.
8. The TCS activation indicator blinks, and the system starts TCS pressure sensor neutral position memorization.
9. When the ABS indicator, TCS indicator and TCS activation indicator go off, the memorizing is done.

   NOTE: On the left bottom side of the HDS screen you will notice "SCS" blinking during steps 4 to 9.
10. Disconnect the HDS from the DLC, or go back into the SCS Menu and remove the short from there.
11. If the indicators do not go off, retry step 10.

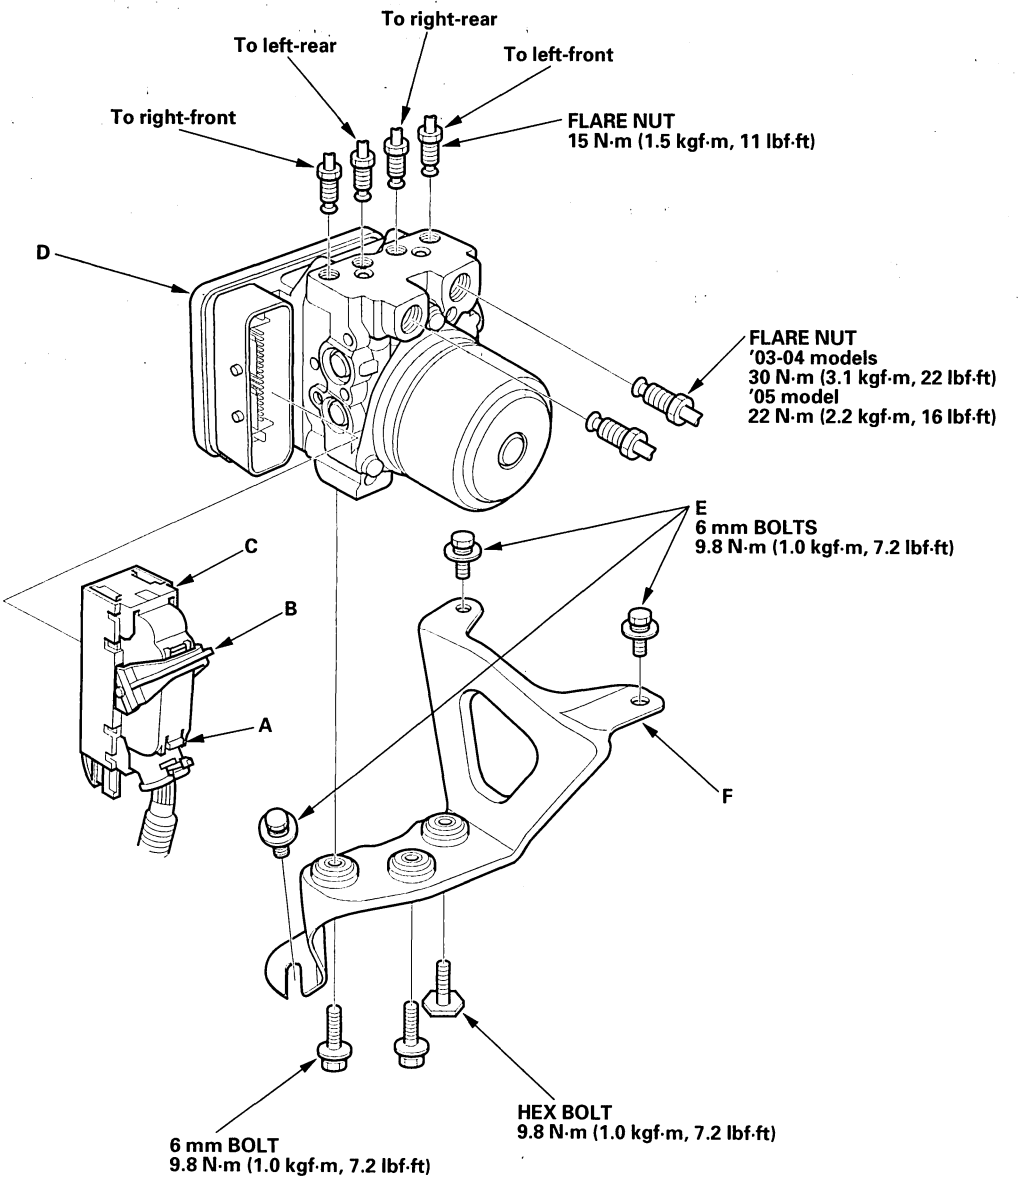
ABS/TCS Components

ABS/TCS Modulator-Control Unit Removal and Installation

NOTE:
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- Be careful not to damage or deform the brake lines during removal and installation.
- To prevent the brake fluid from flowing, plug and cover the hose ends and joints with a shop towel or equivalent material.

Removal

1. Push in on the lock (A), then pull up the lever (B) of the ABS/TCS modulator-control unit 47P connector (C), and the connector disconnects itself.



BACK

Protected by AR

2. Disconnect the six brake lines from the ABS/TCS modulator-control unit (D).
3. Remove the three 6 mm bolts (E).
4. Remove the ABS/TCS modulator-control unit and bracket (F).
5. Remove the two 6 mm bolts and hex bolt, then remove the bracket.

Installation

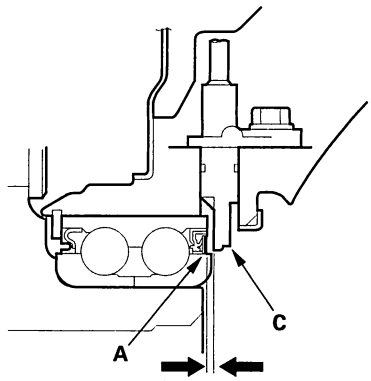
1. Install the ABS/TCS modulator-control unit to the bracket, then tighten the two 6 mm bolts and the hex bolt.
2. Install the ABS/TCS modulator-control unit/bracket, then tighten the three 6 mm bolts.
3. Reconnect the six brake lines, then tighten the flare nuts.
4. Align the connecting surface of the ABS/TCS modulator-control unit 47P connector.
5. Pull down the lever of the ABS/TCS modulator-control unit 47P connector until you hear it click into place, then connect the connector.
6. Bleed the brake system, starting with the front wheels.
7. Perform the TCS pressure sensor neutral position memorization (see page 19-55).
8. Start the engine, and check that the ABS, TCS and TCS activation indicators goes off.
9. Test-drive the vehicle, and check that the ABS, TCS and TCS activation indicators do not come on.

Protected by AR

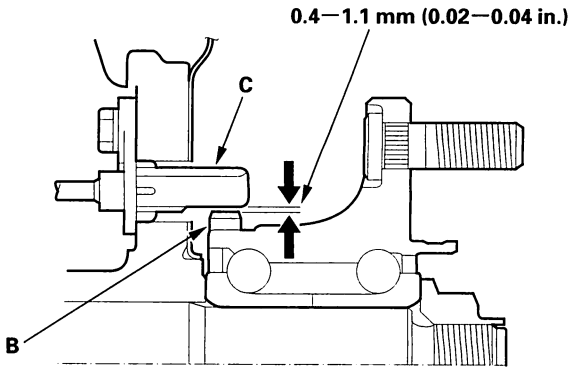
Wheel Sensor Inspection

1. Check the magnetic encoder (A) or pulser (B) after cleaning it. If necessary, replace the encoder or pulser.

Front



Rear



2. Measure the air gap between the wheel sensor (C) and the magnetic encoder or pulsar all the way around while rotating the encoder or pulsar.

Standard:
Front: 0.5—1.2 mm (0.02—0.05 in.)
Rear: 0.4—1.1 mm (0.02—0.04 in.)

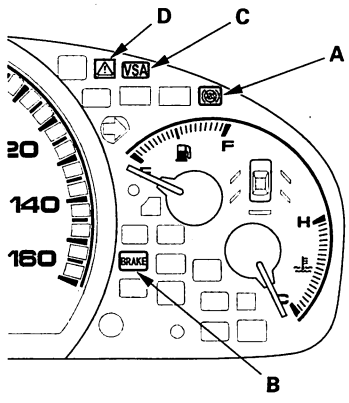
General Troubleshooting Information

System Indicator

This system has four indicators:

- ABS indicator (A)
- Brake system indicator (B)
- VSA indicator (C)
- VSA activation indicator (D)

When the system detects a problem, it turn the appropriate indicators on. Depending on the failure, the VSA modulator-control unit determines which indicators are turn on.
When the system is OK, each indicator comes on for about 2 seconds after turning the ignition switch ON (II), then go off.



ABS indicator

ABS indicator comes on, when ABS function is lost. The brakes still work like a conventional system.

Brake system indicator

Brake system indicator comes on, when EBD function is lost, the parking brake is applied, and/or the brake fluid level is low.

VSA indicator

VSA indicator comes on, when VSA function is lost.

VSA activation indicator

VSA activation indicator blinks, when VSA function is activating. VSA activation indicator comes on, when VSA is off, or VSA function is lost.

ABS and VSA indicators go off

Each indicator will go off after a problem goes away, but the timing which the VSA modulator-control unit turns off the indicators varies between DTCs.

How to Use the HDS (Honda Diagnostic-System)

1. If the system indicators stays on, connect the HDS to the data link connector (DLC) located under the driver's side of the dashboard.

2. Turn the ignition switch on (II).

3. Check the diagnostic trouble code (DTC) and note it. Also check the download any data found. Then refer to the indicated DTC's troubleshooting, and begin the appropriate troubleshooting procedure.

   NOTE:
   - The HDS communication will be shut out when the vehicle speed at 31 mph (50 km/h) or more.
   - The HDS can read the DTC, and other system data.
   - For specific operations, refer to the user's manual that came with the HDS.

(cont'd)

Protected by AR

General Troubleshooting Information (cont'd)

Diagnostic Trouble Code (DTC)

- The memory can hold 10 DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are indicated in the order they occur.
- The DTCs are memorized in the EEPROM. Therefore, the memorized DTCs cannot be canceled by disconnecting the battery. Do the specified procedures to clear the DTCs.

Self-diagnosis

- Self-diagnosis can be classified into two categories:
  - Initial diagnosis: Done right after the ignition switch is turned ON (II) and until the ABS and VSA indicators go off.
  - Regular diagnosis: Done right after the initial diagnosis until the ignition switch is turned OFF.
- When the system detects a problem, the VSA modulator-control unit shifts to fail-safe mode.

Kickback

The pump motor operates when the VSA modulator-control unit is functioning, and the fluid in the reservoir is forced out to the master cylinder, causing kickback at the brake pedal.

Pump Motor

- The pump motor operates when the VSA modulator-control unit is functioning.
- The VSA modulator-control unit checks the pump motor operating during regular diagnosis when the vehicle is driven over 10 mph (15 km/h) the first time after the ignition switch is turned ON (II). You may hear the motor operate at this time, but it is normal.

Brake Fluid Replacement/Air Bleeding

Brake fluid replacement and air bleeding procedures are identical to the procedures used on vehicles not equipped with VSA system (see page 19-8).

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the ABS and/or VSA indicator is still on. Following the flowchart when the ABS and/or VSA indicator does not come on can result in incorrect diagnosis.
The connector illustrations show the female terminal connectors with a single outline and the male terminal connectors with a double outline.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the ABS and/or VSA indicator came on, such as during control, after control, when vehicle was traveling at a certain speed, etc.

2. When the ABS or VSA indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. before you start troubleshooting.

3. After troubleshooting, or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as originally set with the DTCs. Make sure the ABS and VSA indicators do not come on.

4. Check for other unit DTCs which connected via F-CAN, if there are DTCs that are related to F-CAN, the most likely cause was that the ignition switch was turned ON (II) with the VSA modulator-control unit connector disconnected. Clear the DTCs. Check for PGM-FI and ABS codes, and troubleshoot those first.

Intermittent Failures

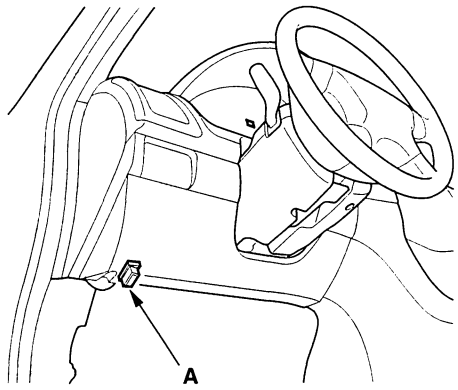
The team "intermittent failure" means a system may have had a failure, but it checks OK now. If the system indicators in the gauge control module does not come on, check for poor connections or loose pins at all connectors related to the circuit that you are troubleshooting. If the indicators were on but then went out, the original problem may have been intermittent.

BACK

Protected by AR

How to Retrieve DTCs

1. With the ignition switch OFF, connect the HDS to the 16P data link connector (DLC) (A) under the left side of the dashboard.



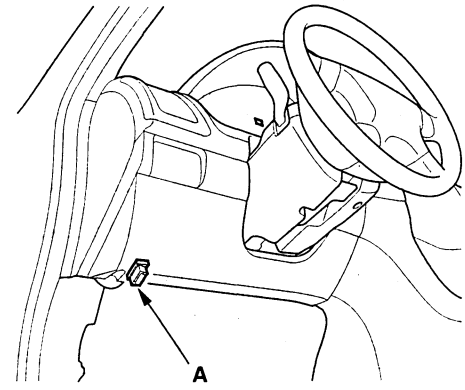
2. Turn the ignition switch ON (II), and follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting.

   NOTE: See the HDS Help menu for specific instructions.

3. Turn the ignition switch OFF.

How to Clear DTCs

1. With the ignition switch OFF, connect the HDS to the 16P data link connector (DLC) (A) under the left side of the dashboard.



2. Turn the ignition switch ON (II), and clear the DTC(s) by following the screen prompts on the HDS.

   NOTE: See the HDS Help menu for specific instructions.

3. Turn the ignition switch OFF.

Symptom Troubleshooting Index

When the vehicle has one of these symptoms, check for diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure
ABS indicator and VSA indicator do not go off, and no DTCs are stored	Symptom Troubleshooting (see page 19-125).
ABS indicator does not come on	1. Do the gauge control module troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-279). 2. Substitute a known-good VSA modulator-control unit, then recheck. If it is OK, replace the original VSA modulator-control unit (see page 19-132).
Brake system indicator does not come on	1. Do the gauge control module troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-279). 2. Substitute a known-good VSA modulator-control unit, then recheck. If it is OK, replace the original VSA modulator-control unit (see page 19-132).
Brake system indicator does not go off	Do the gauge control module troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-279).
VSA indicator does not come on	1. Do the gauge control module troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-279). 2. Substitute a known-good VSA modulator-control unit, then recheck. If it is OK, replace the original VSA modulator-control unit (see page 19-132).
VSA activation indicator does not go off, and no DTCs are stored	1. Do the gauge control module troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-279). 2. Substitute a known-good VSA modulator-control unit, then recheck. If it is OK, replace the original VSA modulator-control unit (see page 19-132). 3. Symptom Troubleshooting (see page 19-126).
VSA activation indicator does not come on at start-up (bulb check)	1. Do the gauge control module troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-279). 2. Substitute a known-good VSA modulator-control unit, then recheck. If it is OK, replace the original VSA modulator-control unit (see page 19-132).

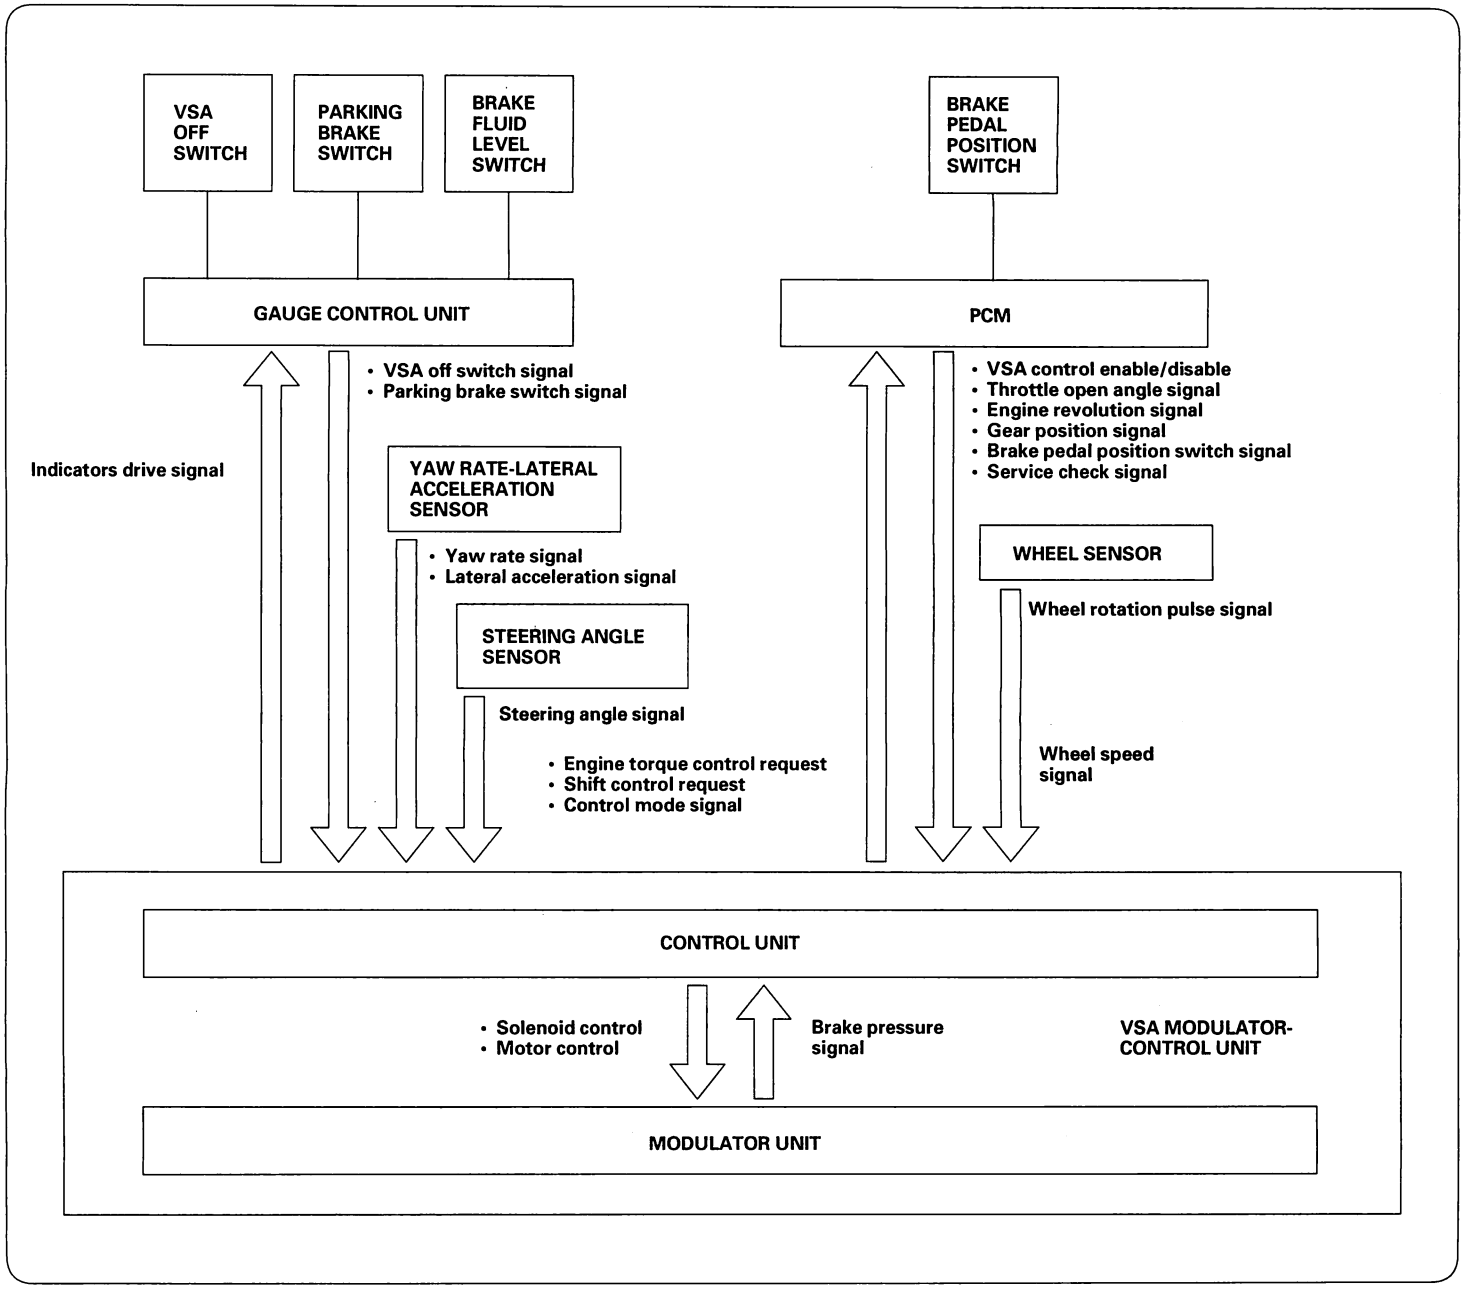
System Outline

This system is composed of the VSA modulator-control unit, the wheel sensor, steering angle sensor, and yaw rate-lateral acceleration sensor, and do the ABS, EBD, TCS, VSA, and brake assist control by controlling the brake pressure of each wheel and the engine torque.



(cont'd)

Protected by AR

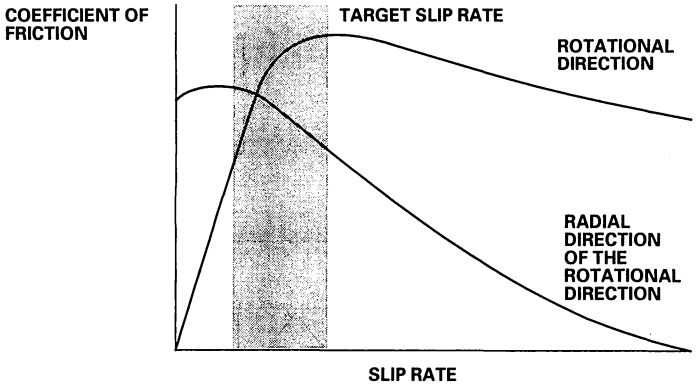
VSA System Components

System Description (cont'd)

ABS Features

Anti-lock control
When the brake pedal is pressed while driving, the wheels sometimes lock before the vehicle comes to a stop. In such an event, the maneuverability of the vehicle is reduced if the front wheels are locked, and the stability of the vehicle is reduced if the rear wheels are locked, creating an extremely unstable condition. The ABS precisely controls the slip rate of the wheels to ensure maximum grip force from the tires, and it thereby ensures maneuverability and stability of the vehicle. The ABS calculates the slip rate of the wheels based on the four wheel speed, then it controls the brake fluid pressure to reach the target slip rate.

Grip Force of Tire and Road Surface

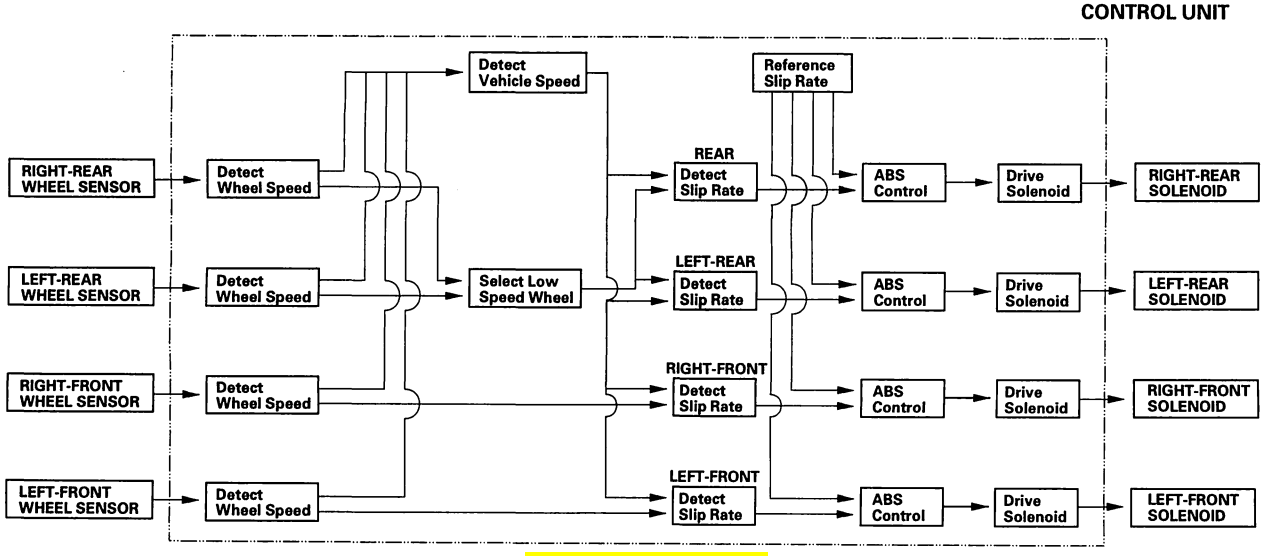


ABS Control Unit

Main Control
The control unit detects the wheel speed based on the wheel sensor signal it received, then it calculates the vehicle speed based on the detected wheel speed. The control unit detects the vehicle speed during deceleration based on the rate of deceleration.

The control unit calculates the slip rate of each wheel, and transmits the control signal to the modulator unit solenoid valve when the slip rate is high.

The hydraulic control has three modes pressure: Pressure reducing pressure, pressure retaining, pressure intensifying.

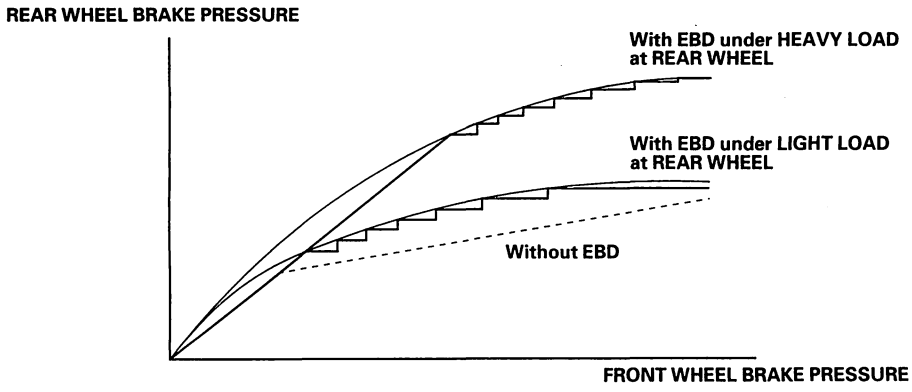


BACK

Protected by AR

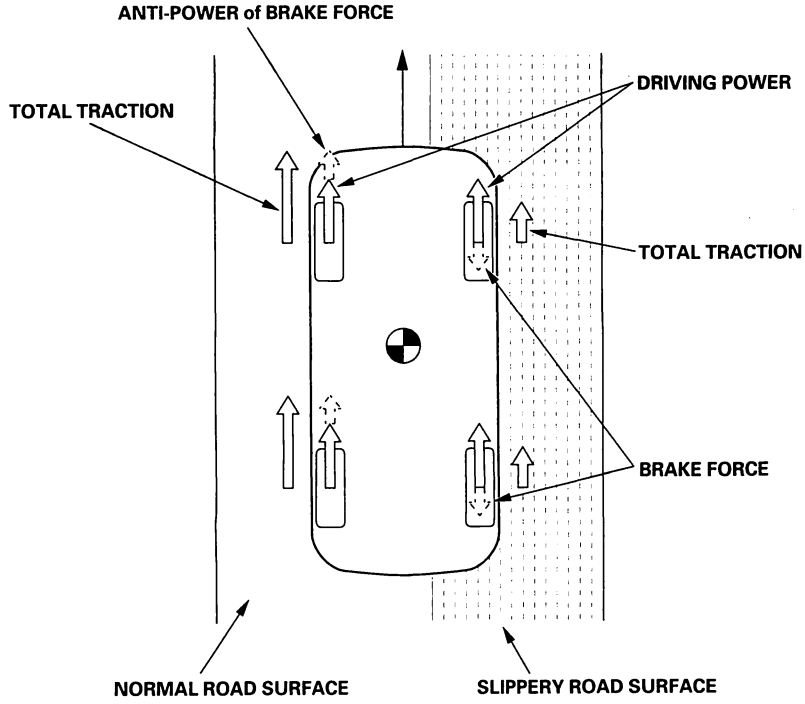
EBD Features

The electronic brake distribution (EBD) helps control vehicle braking by adjusting the rear brake force in accordance with rear wheel load before the ABS operates. Based on wheel sensor signals, the ABS control unit uses the modulator to control the rear brakes individually. When the rear wheel speed is less than the front wheel speed, the VSA modulator-control unit retains the current rear brake fluid pressure by closing the inlet valve in the modulator. As the rear wheel speed increases and approaches the front wheel speed, the VSA modulator-control unit increases the rear brake fluid pressure by momentarily opening the inlet valve. This whole process is repeated very rapidly. While this is happening, there is kickback at the brake pedal.



TCS Features

When a drive wheel loses traction on a slippery road surface and starts to spin, the VSA modulator-control unit applies brake pressure to the spinning wheel and sends engine torque control request to the ECM/PCM to slow the spinning wheel and keep traction.



(cont'd)

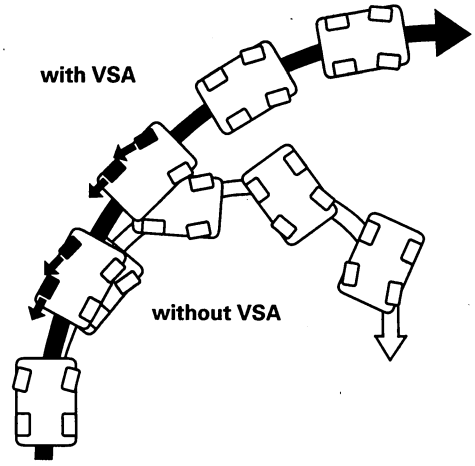
Protected by AR

VSA System Components

System Description (cont'd)

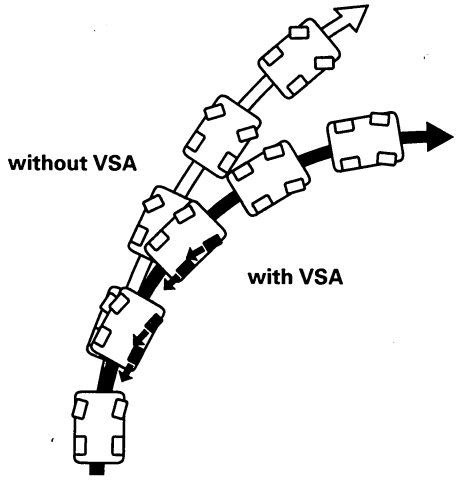
VSA System Features

Oversteer control
Applies the brake to the front and rear outside wheels



The brake makes the yaw rate opposite to the turning direction

Understeer control
- Applies the brake to the front and rear inside wheels
- Controls the engine torque when accelerating



The brake increases the yaw rate toward the turning direction

The throttle control effect;
- **reduces vehicle speed**
- **increases cornering force**

BACK

Protected by AR

Brake Assist Features

Brake assist helps ensure that any driver can achieve the full braking potential of the vehicle by increasing brake system pressure in a panic situation, bringing the vehicle into a full ABS stop.
Each time the ignition switch is turned ON (II), the VSA modulator-control unit learns the current driver's normal braking characteristics by monitoring the brake pressure sensor and the brake pedal position switch at each stop. Using these inputs and their values, the VSA modulator-control unit is able to learn the driver's normal braking habits, and then determine the difference between a normal stop and a panic stop for the individual driver of the vehicle. If during a panic stop the VSA modulator-control unit determines that the brake system pressure increases above a learned threshold in less than a learned amount of time, the VSA modulator-control unit engages brake assist. Because the brake system pressure crossed the threshold before the time threshold had expired, the VSA modulator-control unit goes into brake assist mode.

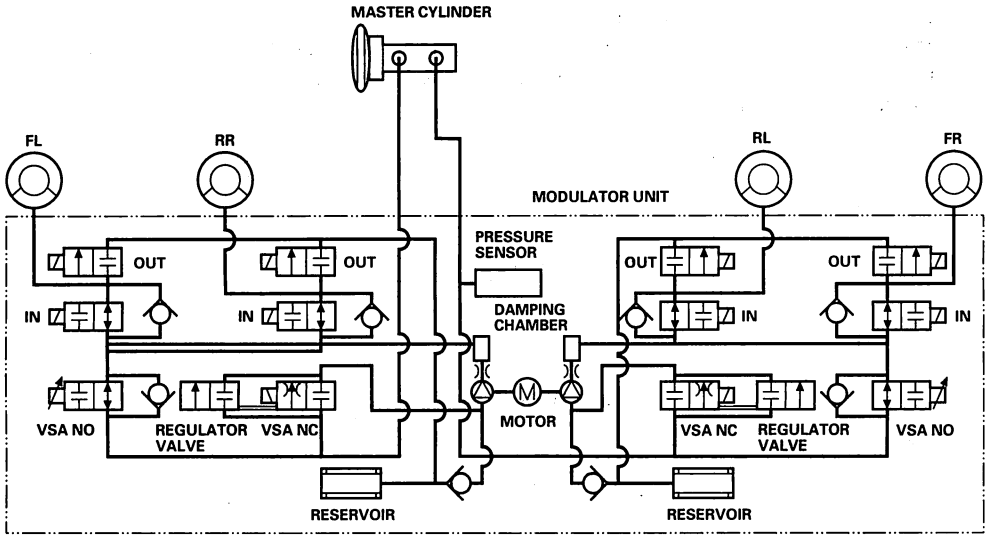
Protected by AR

VSA System Components

System Description (cont'd)

Modulator Unit

The modulator unit consists of the inlet solenoid valve, outlet solenoid valve, VSA NO (normally open) solenoid valve, VSA NC (normally closed) solenoid valve, reservoir, pump, pump motor, and the damping chamber.
The hydraulic control has three modes at ABS action; pressure intensifying, pressure retaining, and pressure reducing. And pressure adding mode is combined at TCS, VSA, and brake assist action.
The hydraulic circuit is an independent four channel type, one channel for each wheel.



IN : INLET SOLENOID VALVE (NORMALLY OPEN)
OUT : OUTLET SOLENOID VALVE (NORMALLY CLOSED)

Mode	VSA NO Valve	VSA NC Valve	Inlet Solenoid Valve	Outlet Solenoid Valve	Brake Fluid
Pressure intensifying mode	open	closed	open	closed	Master cylinder fluid is pumped out to the caliper.
Pressure retaining mode	open	closed	closed	closed	Caliper fluid is retained by the inlet valve and outlet valve.
Pressure reducing mode	open	closed	closed	open	• Caliper fluid flows through the outlet valve to the reservoir. • The reservoir fluid is pumped out by the pump with motor*, through the damping chamber, to the master cylinder.
Pressure adding mode	closed	open	open	closed	• Master cylinder fluid is pumped out by pump with motor through VSA NC valve to the caliper. • Caliper fluid pressure exceed master cylinder pressure.

*: The motor will be keep the action until operation of the one anti-lock brake control is finished from the first pressure reducing mode.

DTC Troubleshooting

DTC 11-13: Right-front Wheel Sensor Circuit Malfunction

DTC 13-13: Left-front Wheel Sensor Circuit Malfunction

DTC 15-13: Right-rear Wheel Sensor Circuit Malfunction

DTC 17-13: Left-rear Wheel Sensor Circuit Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

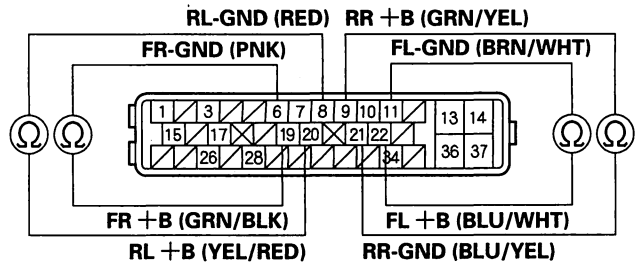
   Is DTC 11-13, 13-13, 15-13, and/or 17-13 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the wheel sensor and the VSA modulator-control unit. ■
4. Turn the ignition switch OFF.
5. Disconnect the VSA modulator-control unit 37P connector.
6. Check for continuity between the appropriate VSA modulator-control unit 37P connector wheel sensor +B and GND terminals (see table), then check for continuity between the same terminals and reverse the positive and negative tester probes.

DTC	VSA Modulator-control Unit 37P Connector Terminal No.	
11-13	No. 19	No. 6
13-13	No. 22	No. 11
15-13	No. 9	No. 21
17-13	No. 20	No. 8

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Are there continuity in both directions?

YES—Go to step 7.

NO—If there are not continuity in both directions, go to step 9. If the are continuity in only one way, go to step 11.

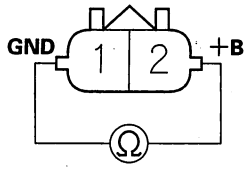
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

7. Disconnect the appropriate wheel sensor 2P connector.
8. Check for continuity between appropriate wheel sensor 2P connector terminals No. 1 and No. 2, then check for continuity between the same terminals and reverse the positive and negative tester probes.

WHEEL SENSOR 2P CONNECTOR



Wire side of female terminals

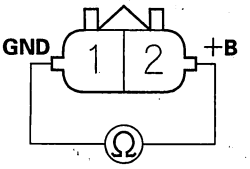
Are there continuity in both direction?

YES—Replace the appropriate wheel sensor (see page 19-135). ■

NO—Repair short in the wire between the appropriate wheel sensor and the VSA modulator-control unit. ■

9. Disconnect the appropriate wheel sensor 2P connector.
10. Check for continuity between appropriate wheel sensor 2P connector terminals No. 1 and No. 2, then check for continuity between the same terminals and reverse the positive and negative tester probes.

WHEEL SENSOR 2P CONNECTOR



Wire side of female terminals

Is there continuity in only one direction?

YES—Repair open in the wire between the appropriate wheel sensor and the VSA modulator-control unit. ■

NO—Replace the appropriate wheel sensor (see page 19-135). ■

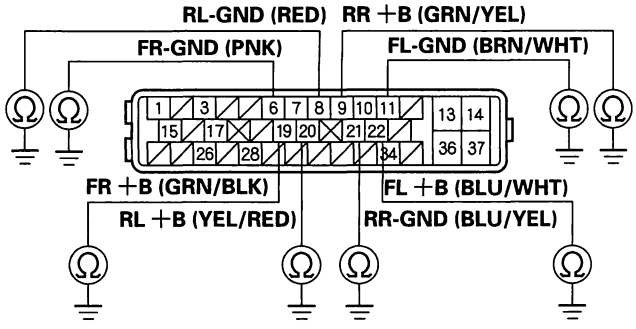
BACK

Protected by AR

11. Check for continuity between body ground and the appropriate VSA modulator-control unit 37P connector terminal (see table).

DTC	VSA Modulator-control Unit 37P Connector Terminal No.	
11-13	No. 19	No. 6
13-13	No. 22	No. 11
15-13	No. 9	No. 21
17-13	No. 20	No. 8

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Go to step 12.

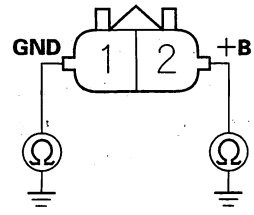
NO—Go to step 14.

12. Disconnect the appropriate wheel sensor 2P connector.

13. Check for continuity between body ground and appropriate wheel sensor 2P connector terminal No. 1 and No. 2.

NOTE: Check the wheel sensor with mounted on the vehicle

WHEEL SENSOR 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Replace the appropriate wheel sensor (see page 19-135).■

NO—Repair short in the wire between the appropriate wheel sensor and the VSA modulator-control unit.■

14. Turn the ignition switch ON (II).

(cont'd)

DTC 12-11: Right-front Wheel Sensor Electrical Noise or Intermittent Interruption

DTC 14-11: Left-front Wheel Sensor Electrical Noise or Intermittent Interruption

DTC 16-11: Right-rear Wheel Sensor Electrical Noise or Intermittent Interruption

DTC 18-11: Left-rear Wheel Sensor Electrical Noise or Intermittent Interruption

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle.
4. Check for DTCs with the HDS.

   Is DTC 12-11, 14-11, 16-11, and/or 18-11 indicated?

   YES—Troubleshooting DTC 12-12, 14-12, 16-12, and/or 18-12. ■

   NO—Go to step 5.
5. Turn the ignition switch OFF.
6. Turn the ignition switch ON (II).
7. Clear the DTC with the HDS.
8. Test-drive the vehicle.
9. Check for DTCs with the HDS.

   Is DTC 12-11, 14-11, 16-11, and/or 18-11 indicated?

   YES—Go to step 10.

   NO—If any DTCs are indicated, go to the indicated DTCs troubleshooting. If DTC is not indicated, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the wheel sensor. ■
10. Turn the ignition switch OFF.
11. Remove the appropriate wheel sensor.
12. Check the appropriate wheel sensor.

DTC	Appropriate Wheel Sensor
12-11	Right-front
14-11	Left-front
16-11	Right-rear
18-11	Left-rear

Is there o-ring biting, and inclination the wheel sensor?

YES—Reinstall the wheel sensor, and check the mounting position (see page 19-134). ■

NO—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

DTC Troubleshooting (cont'd)

DTC 12-12: Right-front Wheel Sensor Short to the Other Sensor Line (13 mph (20 km/h) or more)

DTC 14-12: Left-front Wheel Sensor Short to the Other Sensor Line (13 mph (20 km/h) or more)

DTC 16-12: Right-rear Wheel Sensor Short to the Other Sensor Line (13 mph (20 km/h) or more)

DTC 18-12: Left-rear Wheel Sensor Short to the Other Sensor Line (13 mph (20 km/h) or more)

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle. Drive the vehicle speed at 13 mph (20 km/h) or more, and go a distance of 7 miles (100 m) or more.

   NOTE: Drive the vehicle on the road, not on the hoist.
4. Check for DTCs with the HDS.

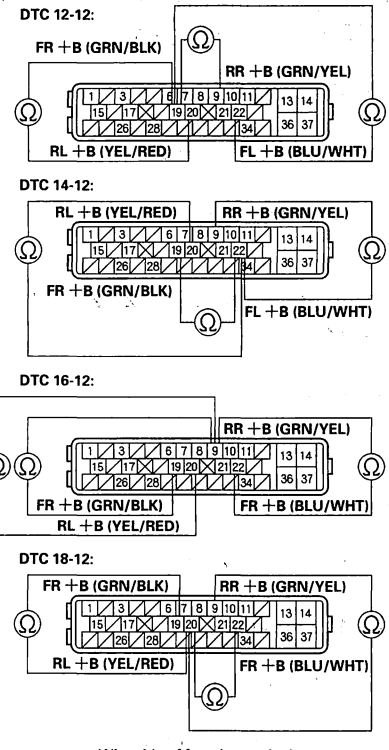
   Is DTC 12-12, 14-12, 16-12, and/or 18-12 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the wheel sensor. Refer to intermittent failure (see page 19-64). ■
5. Turn the ignition switch OFF.
6. Disconnect the VSA modulator-control unit 37P connector.
7. Check for continuity between the appropriate wheel sensor +B terminal and other wheel sensor +B terminals of the VSA modulator-control unit 37P connector (see table).

DTC	VSA Modulator-control Unit 37P Connector Terminal No.			
	Appropriate Terminal	Other Terminals		
12-12	No. 19	No. 22	No. 9	No. 20
14-12	No. 22	No. 19	No. 9	No. 20
16-12	No. 9	No. 19	No. 22	No. 20
18-12	No. 20	No. 19	No. 22	No. 9

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the appropriate wheel sensor and the VSA modulator-control unit. ■

NO—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

DTC 12-21: Right-front Wheel Sensor Installation Error (Start to 15 Seconds)

DTC 14-21: Left-front Wheel Sensor Installation Error (Start to 15 Seconds)

DTC 16-21: Right-rear Wheel Sensor Installation Error (Start to 15 Seconds)

DTC 18-21: Left-rear Wheel Sensor Installation Error (Start to 15 Seconds)

1. Test-drive the vehicle. Drive the vehicle speed at 7 mph (10 km/h).
2. Check the RF, LF, RR, LR WHEEL SPD in the DATA LIST with the HDS.

   Are all the same as the indicated values?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the wheel sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

   NO—Go to step 3.
3. Turn the ignition switch OFF.
4. Check the appropriate wheel sensor is properly mounted.

DTC	Appropriate Wheel Sensor
12-21	Right-front
14-21	Left-front
16-21	Right-rear
18-21	Left-rear

   Is the wheel sensor installation OK?

   YES—Replace the appropriate wheel sensor (see page 19-135). ■

   NO—Reinstall the wheel sensor, and check the mounting position (see page 19-134). ■

DTC 12-22: Right-front Wheel Sensor Installation Error (19 mph (30 km/h) or more)

DTC 14-22: Left-front Wheel Sensor Installation Error (19 mph (30 km/h) or more)

DTC 16-22: Right-rear Wheel Sensor Installation Error (19 mph (30 km/h) or more)

DTC 18-22: Left-rear Wheel Sensor Installation Error (19 mph (30 km/h) or more)

1. Test-drive the vehicle. Drive the vehicle speed between 19 mph (30 km/h) and 31 mph (50 km/h) for 70 seconds or more.
2. Check the RF, LF, RR, LR WHEEL SPD of all the wheel sensors in the DATA LIST with the HDS.

   Are all the same as the indicated values?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the wheel sensor. ■

   NO—Go to step 3.
3. Turn the ignition switch OFF.
4. Check the appropriate wheel sensor is properly mounted.

DTC	Appropriate Wheel Sensor
12-22	Right-front
14-22	Left-front
16-22	Right-rear
18-22	Left-rear

   Is the wheel sensor installation OK?

   YES—Replace the appropriate wheel sensor (see page 19-135). ■

   NO—Reinstall the wheel sensor, and check the mounting position (see page 19-134). ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 12-23: Right-front Wheel Sensor Installation Error (0 to 9 mph (0 to 15 km/h))

DTC 14-23: Left-front Wheel Sensor Installation Error (0 to 9 mph (0 to 15 km/h))

DTC 16-23: Right-rear Wheel Sensor Installation Error (0 to 9 mph (0 to 15 km/h))

DTC 18-23: Left-rear Wheel Sensor Installation Error (0 to 9 mph (0 to 15 km/h))

1. Test-drive the vehicle. Drive the vehicle speed between 1 mph (1 km/h) and 9 mph (15 km/h).
2. Check the RF, LF, RR, LR WHEEL SPD of all the wheel sensors in the DATA LIST with the HDS.

   Are all the same as the indicated values?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the wheel sensor. ■

   NO—Go to step 3.
3. Turn the ignition switch OFF.
4. Check the appropriate wheel sensor is properly mounted.

DTC	Appropriate Wheel Sensor
12-23	Right-front
14-23	Left-front
16-23	Right-rear
18-23	Left-rear

   Is the wheel sensor installation OK?

   YES—Replace the appropriate wheel sensor (see page 19-135). ■

   NO—Reinstall the wheel sensor, and check the mounting position (see page 19-134). ■

DTC 21-11: Right-front Magnetic Encoder Malfunction (Corrugated Missing)

DTC 22-11: Left-front Magnetic Encoder Malfunction (Corrugated Missing)

DTC 23-11: Right-rear Pulser Malfunction (Corrugated Missing)

DTC 24-11: Left-rear Pulser Malfunction (Corrugated Missing)

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle. Drive the vehicle speed at 13 mph (20 km/h) or more, and go a distance of 6.2 miles (100 m) or more.
4. Check for DTCs with the HDS.

   Is DTC 21-11, 22-11, 23-11, and/or 24-11 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the wheel sensor. ■
5. Turn the ignition switch OFF.

BACK

Protected by AR

6. Inspect the appropriate magnetic encoder, or pulser (see table).

DTC	Appropriate Magnetic Encoder (Front), Pulser (Rear)	Note
21-11	Right-front	Remove the outboard joint on the driveshaft from the wheel hub (see page 16-3).
22-11	Left-front	
23-11	Right-rear	Remove the wheel bearing unit, refer to the 2003-2006 Accord Service Manual (see page 18-29).
24-11	Left-rear	

Is the magnetic encoder surface, or the pulser gears OK?

YES—Replace the wheel bearing or wheel bearing unit:■

- Front: Replace the front wheel bearing, refer to the 2003-2006 Accord Service Manual (see page 18-12).
- Rear: Replace the rear wheel bearing, refer to the 2003-2006 Accord Service Manual (see page 18-29).

NO—Clean off dust or dirt from the appropriate magnetic encoder surface on the wheel bearing, or the wheel bearing unit, or replace the appropriate pulser gears for a chipped or damaged tooth, then go to step 1 and recheck.■

DTC 25-11: Yaw Rate Sensor Internal Circuit Malfunction (Initial)

DTC 25-12: Yaw Rate Sensor Internal Circuit Malfunction (Open, Short)

DTC 25-21: Yaw Rate Sensor Neutral Position Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 25-11, 25-12, or 25-21 indicated?

   YES—Replace the yaw rate-lateral acceleration sensor (see page 19-128).■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the yaw rate-lateral acceleration sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64).■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 25-22: Yaw Rate Sensor Stuck

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle around a number of corners.
4. Check for DTCs with the HDS.

   Is DTC 25-22 indicated?

   YES—Go to step 5.

   NO—If any DTCs are indicated, go to the indicated DTCs troubleshooting. If DTC is not indicated, intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the yaw rate-lateral acceleration sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■
5. Check the LATERAL ACCELERATION SENSOR and YAW RATE S in the DATA LIST with the HDS.

   Are there 0 m/s indicated?

   YES—Go to step 6.

   NO—Do the VSA sensor neutral position memorization (see page 19-130), then go to step 1 and recheck. ■
6. Test-drive the vehicle. Check the YAW RATE S in the DATA LIST with the HDS while driving in corners.

   Does the indicated value change?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the yaw rate-lateral acceleration sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

   NO—Replace the yaw rate-lateral acceleration sensor (see page 19-128). ■

BACK

Protected by AR

DTC 25-23: Yaw Rate Sensor Circuit Intermittent Interruption

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 25-23 indicated?

   YES—Replace the yaw rate-lateral acceleration sensor (see page 19-128).■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the yaw rate-lateral acceleration sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64).■

DTC 25-24: Yaw Rate Sensor Gain High

DTC 25-25: Yaw Rate Sensor Gain Low

DTC 26-24: Lateral Acceleration Sensor Gain High

DTC 26-25: Lateral Acceleration Sensor Gain Low

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle. Drive the vehicle speed at 10 mph (15 km/h) or more.
4. Check for DTCs with the HDS.

   Is DTC 25-24, 25-25, 26-24, or 26-25 indicated?

   YES—Replace the yaw rate-lateral acceleration sensor (see page 19-128).■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the yaw rate-lateral acceleration sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64).■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 26-11: Lateral Acceleration Sensor Internal Circuit Malfunction (Initial)

DTC 26-12: Lateral Acceleration Sensor Internal Circuit Malfunction (Open, Short)

DTC 26-21: Lateral Acceleration Sensor Stuck

DTC 26-23: Lateral Acceleration Sensor Circuit Intermittent Interruption

NOTE: While Do this troubleshooting, avoid vibration and wobble of the vehicle.

1. Park the vehicle on a flat and level surface.
2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
4. Wait 15 seconds or more.
5. Check for DTCs with the HDS.

   Is DTC 26-11, 26-12, 26-21, or 26-23 indicated?

   YES—Replace the yaw rate-lateral acceleration sensor (see page 19-128). ■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the yaw rate-lateral acceleration sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

DTC 26-22: Lateral Acceleration Sensor Neutral Position Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle around a number of corners.
4. Check for DTCs with the HDS.

   Is DTC 26-22 indicated?

   YES—Go to step 5.

   NO—If any DTCs are indicated, go to the indicated DTCs troubleshooting. If DTC is not indicated, intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the yaw rate-lateral acceleration sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

5. Check the LATERAL ACCELERATION SENSOR and YAW RATE S in the DATA LIST with the HDS.

   Are there 0 m/s indicated?

   YES—Go to step 6.

   NO—Do the VSA sensor neutral position memorization (see page 19-130), then go to step 1 and recheck. ■

BACK

Protected by AR

6. Test-drive the vehicle. Check the YAW RATE S in the DATA LIST with the HDS while driving in corners.

   Does the indicated value change?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the yaw rate-lateral acceleration sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

   NO—Replace the yaw rate-lateral acceleration sensor (see page 19-128). ■

DTC 27-11: Steering Angle Sensor DIAG Signal Error

DTC 27-26: Steering Angle Sensor DIAG Signal Error

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 27-11, or 27-26 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the steering angle sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■
4. Turn the ignition switch OFF.
5. Disconnect the steering angle sensor 5P connector.
6. Disconnect the VSA modulator-control unit 37P connector.

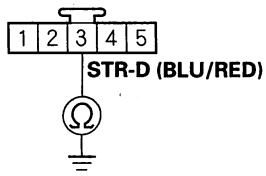
(cont'd)

Protected by AR

DTC Troubleshooting (cont'd)

7. Check for continuity between steering angle sensor 5P connector terminal No. 3 and body ground.

STEERING ANGLE SENSOR 5P CONNECTOR



Wire side of female terminals

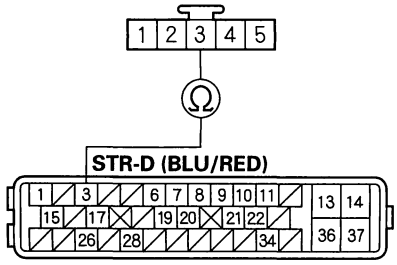
Is there continuity?

YES—Repair short in the wire between the steering angle sensor and the VSA modulator-control unit. ■

NO—Go to step 8.

8. Check for continuity between VSA modulator-control unit 37P connector terminal No. 3 and steering angle sensor 5P connector terminal No. 3.

STEERING ANGLE SENSOR 5P CONNECTOR



VSA MODULATOR-CONTROL UNIT 37P CONNECTOR

Wire side of female terminals

Is there continuity?

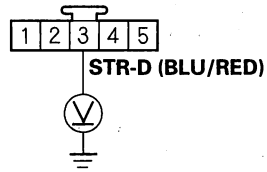
YES—Go to step 9.

NO—Repair open in the wire between the steering angle sensor and the VSA modulator-control unit. ■

9. Turn the ignition switch ON (II).

10. Measure voltage between steering angle sensor 5P connector terminal No. 3 and body ground.

STEERING ANGLE SENSOR 5P CONNECTOR



Wire side of female terminals

Is there 0.1 V or more?

YES—Repair short to power in the wire between the steering angle sensor and the VSA modulator-control unit. ■

NO—Replace the steering angle sensor (see page 19-127). ■

BACK

Protected by AR

DTC 27-21: Steering Angle Sensor Stuck Neutral Position

DTC 27-22: Steering Angle Sensor Stuck Offset Position

1. Turn the steering wheel left and right. Check the STEERING ANGLE in the DATA LIST while the HDS while moving the steering wheel.

   Do change the indicated values?

   YES—Go to step 2.

   NO—Go to step 5.

2. Clear the DTC with the HDS.
3. Turn the steering wheel left and right.
4. Check for DTCs with the HDS.

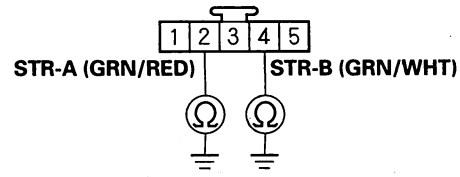
   Is DTC 27-21, or 27-22 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the steering angle sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

5. Turn the ignition switch OFF.
6. Disconnect the steering angle sensor 5P connector.
7. Disconnect the VSA modulator-control unit 37P connector.
8. Check for continuity between body ground and steering angle sensor 5P connector terminals No. 2 and No. 4 individually.

STEERING ANGLE SENSOR 5P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the steering angle sensor and the VSA modulator-control unit. ■

NO—Go to step 9.

(cont'd)

Wire side of female terminals

Is there 0.1 V or more?

YES—Repair short to power in the wire between the steering angle sensor and the VSA modulator-control unit. ■

NO—Replace the steering angle sensor (see page 19-127). ■

DTC 27-23: Steering Angle Sensor Exchange Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Turn the steering wheel from lock to lock.
4. Check for DTCs with the HDS.

   Is DTC 27-23 indicated?

   YES—Check for the steering angle sensor installation. If installation is OK, replace the steering angle sensor.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the steering angle sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 27-24: Steering Angle Sensor Counter Malfunction

1. Turn the ignition switch ON (II).
2. Turn the steering wheel at 1 turn. Check the STEERING ANGLE in the DATA LIST with the HDS.

   Is there about 288— 432 °?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the steering angle sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64).■

   NO—Replace the steering angle sensor (see page 19-127).■

DTC 31-xx*: ABS Right-front Inlet Solenoid Valve Malfunction

DTC 32-xx*: ABS Right-front Outlet Solenoid Valve Malfunction

DTC 33-xx*: ABS Left-front Inlet Solenoid Valve Malfunction

DTC 34-xx*: ABS Left-front Outlet Solenoid Valve Malfunction

DTC 35-xx*: ABS Right-rear Inlet Solenoid Valve Malfunction

DTC 36-xx*: ABS Right-rear Outlet Solenoid Valve Malfunction

DTC 37-xx*: ABS Left-rear Inlet Solenoid Valve Malfunction

DTC 38-xx*: ABS Left-rear Outlet Solenoid Valve Malfunction

*: -xx means any subcode

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.

BACK

Protected by AR

3. Check for DTCs with the HDS.

DTC	xx-01: Solenoid Initial Puls	xx-21: Solenoid Puls	xx-22: Solenoid Speculative	xx-23: Solenoid Stick ON
31-xx	Right-front inlet valve			
32-xx	Right-front outlet valve			
33-xx	Left-front inlet valve			
34-xx	Left-front outlet valve			
35-xx	Right-rear inlet valve			
36-xx	Right-rear outlet valve			
37-xx	Left-rear inlet valve			
38-xx	Left-rear outlet valve			

Is DTC 31-xx, 32-xx, 33-xx, 34-xx, 35-xx, 36-xx, 37-xx, or 38-xx indicated?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

DTC 41-21: Right-front Wheel Lock

DTC 42-21: Left-front Wheel Lock

DTC 43-21: Right-rear Wheel Lock

DTC 44-21: Left-rear Wheel Lock

The DTCs may indicated under these conditions:

- The vehicle goes into a spin.
- The ABS or VSA continues to operate for a long time.

1. Raise the vehicle, and support it with safety stands in the proper locations, refer to the 2003-2006 Accord Service Manual (see page 1-14).

2. Turn the appropriate wheel by hand.

DTC	Appropriate Wheel
41-21	Right-front
42-21	Left-front
43-21	Right-rear
44-21	Left-rear

Is there the brake drag?

YES—Repair the brake drag. ■

NO—Go to step 3.

3. Check the appropriate wheel sensor is properly mounted.

Is the wheel sensor installation OK?

YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the wheel sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

NO—Reinstall the wheel sensor, and check the mounting position (see page 19-134). ■

DTC Troubleshooting (cont'd)

DTC 51-11: Motor Lock

DTC 51-13: Motor Relay OFF Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Wait 5 seconds.
4. Do the MOTOR FUNCTION TEST in the INSPECTION MENU repeat test five times with the HDS.
5. Check for DTCs with the HDS.

   Is DTC 51-11 or 51-13 indicated?

   YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

DTC 51-12: Motor Lock Circuit Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check the DTCs with the HDS.

   Is DTC 51-12 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■
4. Check the No. 17 MR +B (30 A) fuse in the under-hood fuse/relay box.

   Is the fuse blown?

   YES—Go to step 5.

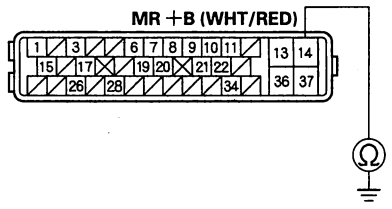
   NO—Reinstall the fuse, then go to step 9.
5. Turn the ignition switch OFF.
6. Disconnect the VSA modulator-control unit 37P connector.

BACK

Protected by AR

7. Check for continuity between VSA modulator-control unit 37P connector terminal No. 14 and body ground.

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there continuity?

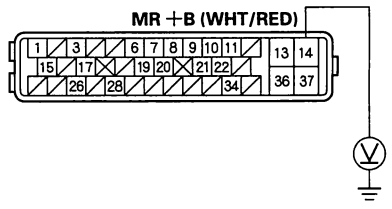
YES—Repair short in the wire between the No. 17 MR +B (30 A) fuse and the VSA modulator-control unit. ■

NO—Install the new No. 17 MR +B (30 A) fuse, then go to step 8.

8. Turn the ignition switch ON (II).

9. Measure voltage between VSA modulator-control unit 37P connector terminal No. 14 and body ground.

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Repair open in the wire between the No. 17 MR +B (30 A) fuse and the VSA modulator-control unit. ■

DTC 52-12: Motor Lock Circuit Malfunction

1. Turn the ignition switch ON (II).

2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.

3. Do the each SOLENOID or VSA in the FUNCTION TEST repeat test five times with the HDS.

4. Check for DTCs with the HDS.

Is DTC 51-12 indicated?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 53-01: Motor Relay Stuck ON

DTC 53-12: Motor Relay Stuck ON

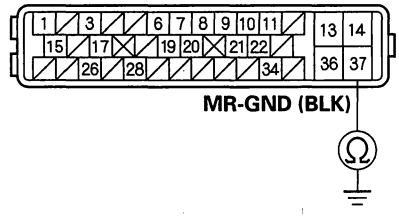
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 53-01 or 53-12 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■
4. Turn the ignition switch OFF.
5. Disconnect the VSA modulator-control unit 37P connector.
6. Check for continuity between VSA modulator-control unit 37P connector terminal No. 37 and body ground.

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Repair open in the wire between the VSA modulator-control unit and body ground (G203). ■

Protected by AR

DTC 54-03: Fail-safe Relay 1 Stuck ON

DTC 54-04: Fail-safe Relay 1 Stuck OFF 1

DTC 54-21: Fail-safe Relay 1 Stuck OFF 2

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

Is DTC 54-03, 54-04, or 54-21 indicated?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

DTC 56-01: Initial VIG FET Stuck OFF

DTC 56-02: Initial VIG FET Stuck ON

DTC 56-11: VIG FET Stuck OFF

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

Is DTC 56-01, 56-02, or 56-11 indicated?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

DTC Troubleshooting (cont'd)

DTC 61-01: VSA Modulator-control Unit Initial IG Low Voltage

DTC 61-21: VSA Modulator-control Unit Power Source Low Voltage

DTC 61-22: VSA Modulator-control Unit Power Source Low Voltage

DTC 61-23: VSA Modulator-control Unit Power Source Low Voltage

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 61-01, 61-21, 61-22, or 61-23 indicated?

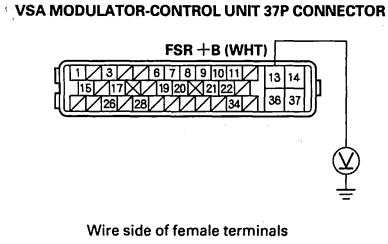
   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64).■
4. Check the IG1 and BATTERY in the DATA LIST with the HDS.

   Are there 9.5 V or more indicated?

   YES—If the voltage is 9.5 V, go to step 5. If there is the any voltage, check the battery performance, refer to the 2003-2006 Accord Service Manual (see page 22-78), and do the alternator and regulator circuit troubleshooting (see page 4-31).■

   NO—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■
5. Turn the ignition switch OFF.
6. Disconnect the VSA modulator-control unit 37P connector.
7. Measure voltage between VSA modulator-control unit 37P connector terminal No. 13 and body ground.



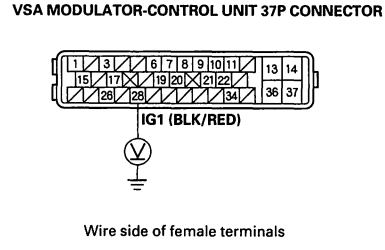
Wire side of female terminals

Is there battery voltage?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Repair open in the wire between the No. 18 FSR +B (40 A) fuse and the VSA modulator-control unit.■

8. Turn the ignition switch ON (II).
9. Measure voltage between the VSA modulator-control unit 37P connector terminal No. 28 and body ground.



Wire side of female terminals

Is there battery voltage?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Repair open in the wire between the No. 18 IG (15 A) fuse and the VSA modulator-control unit.■

DTC 62-22: VSA Modulator-control Unit IG High Voltage

NOTE: If MIL is indicated at the same time as ABS or VSA indicator troubleshooting the PGM-FI system first (see page 11-3), then recheck for VSA DTCs.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 62-22 indicated?

   YES—Go to step 4.

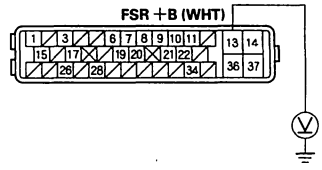
   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. ■
4. Check the IG1 and BATTERY in the DATA LIST with the HDS.

   Are there battery voltage indicated?

   YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

   NO—If the voltage is 0 V, go to step 5. If there is the any voltage, check the battery performance, refer to the 2003-2006 Accord Service Manual (see page 22-78), and do the alternator and regulator circuit troubleshooting (see page 4-26). ■
5. Turn the ignition switch OFF.
6. Disconnect the VSA modulator-control unit 37P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between VSA modulator-control unit 37P connector terminal No. 13 and body ground.

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

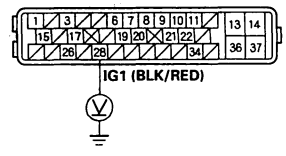
Is there battery voltage indicated?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Repair open in the wire between the No. 18 FSR +B (40 A) fuse and the VSA modulator-control unit. ■

9. Turn the ignition switch ON (II).
10. Measure voltage between VSA modulator-control unit 37P connector terminal No. 28 and body ground.

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Repair open in the wire between the No. 18 IG (15 A) fuse and the VSA modulator-control unit. ■

DTC 64-12: Steering Angle Sensor Power Circuit Open

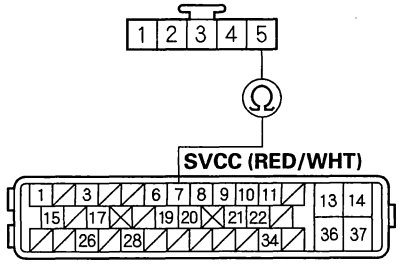
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 64-12 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the steering angle sensor and the VSA modulator-control unit. ■
4. Turn the ignition switch OFF.
5. Disconnect the steering angle sensor 5P connector.
6. Disconnect the VSA modulator-control unit 37P connector.
7. Check for continuity between VSA modulator-control unit 37P connector terminal No. 7 and steering angle sensor 5P connector terminal No. 5.

STEERING ANGLE SENSOR 5P CONNECTOR



VSA MODULATOR-CONTROL UNIT 37P CONNECTOR

Wire side of female terminals

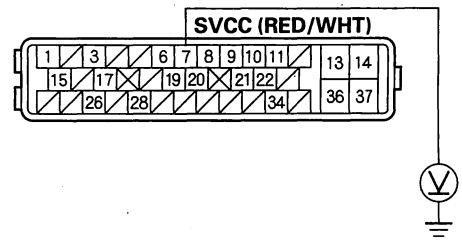
Is there continuity?

YES—Go to step 8.

NO—Repair open in the wire between steering angle sensor and the VSA modulator-control unit. ■

8. Turn the ignition switch ON (II).
9. Measure voltage between VSA modulator-control unit 37P connector terminal No. 7 and body ground.

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Repair open in the wire between steering angle sensor and the VSA modulator-control unit. ■

NO—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 65-21: Brake Fluid Level Stuck ON

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 65-21 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the brake pedal position switch, the ECM/PCM, and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■
4. Release the parking brake.
5. Turn the ignition switch ON (II).
6. Check the brake system indicator in the gauge control module after several seconds with ignition switch turned ON (II).

   The indicator comes on then goes off?

   YES—Go to step 8.

   NO—Go to step 7.
7. Check the FLUID LEVEL in the DATA LIST with the HDS while moving the brake fluid reservoir tank float.

   Does it indicate ON with float is lowered and OFF with float raised?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the brake fluid level switch, gauge control module, and VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

   NO—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■
8. Check the brake fluid level in the master cylinder reservoir tank.

   Is brake fluid level OK?

   YES—Go to step 9.

   NO—Do the brake pad inspection: Front (see page 19-2), rear with disc brake type, refer to the 2003-2006 Accord Service Manual (see page 19-21), check for brake fluid leaks, repair leaks or replace worn pads, then go to step 1 and recheck. ■
9. Check the FLUID LEVEL in the DATA LIST with the HDS while moving the brake fluid reservoir tank float.

   Does it indicate ON with float is lowered and OFF with float raised?

   YES—Go to step 10.

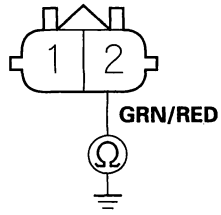
   NO—Replace the brake fluid reservoir tank (brake fluid level switch is included), refer to the 2003-2006 Accord Service Manual (see page 19-16). ■
10. Turn the ignition switch OFF.
11. Disconnect the gauge control module 36P connector.
12. Disconnect the brake fluid level switch 2P connector.

BACK

Protected by AR

13. Check for continuity between brake fluid level switch 2P connector terminal No. 2 and body ground.

BRAKE FLUID LEVEL SWITCH 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the gauge control module and the brake level position switch. ■

NO—Substitute a known-good gauge control module, then go to step 1 and recheck. If no DTCs are indicated, replace the original gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-279). ■

DTC 66-11: Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction

DTC 66-12: Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction

DTC 66-13: Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction

DTC 66-14: Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction

DTC 66-16: Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 66-11, 66-12, 66-13, 66-14, or 66-16 indicated?

   YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 66-15: Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTC 66-15 indicated?

   YES—Go to step 4.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the brake pedal position switch, the ECM/PCM and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■
4. Check the PRESSURE SWITCH in the DATA LIST with the HDS, while moving the brake pedal.

   Do the indicated value change?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the brake pedal position switch, the ECM/PCM, and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

   NO—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

DTC 68-21: Brake Pedal Position Switch Stuck OFF

1. Turn the ignition switch ON (II).
2. Check the BRK PRESS in the DATA LIST with the HDS.

   Is 0.5 V or less?

   YES—Go to step 3.

   NO—Replace the VSA modulator-control unit (see page 19-132). ■
3. Check the BRAKE PEDAL POSITION SWITCH in the DATA LIST with the HDS while moving the brake pedal.

   Does it indicate ON when the pedal is pushed, and OFF when pedal is released?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the brake pedal position switch, the ECM/PCM, and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

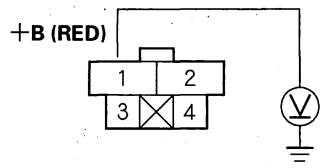
   NO—Go to step 4.
4. Turn the ignition switch OFF.
5. Disconnect the brake pedal position switch 4P connector.

BACK

Protected by AR

6. Check for voltage between body ground and the the brake pedal position switch 4P connector terminal No. 1.

BRAKE PEDAL POSITION SWITCH 4P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES - Go to step 7.

NO - Go to step 8.

7. Test the brake pedal position switch, refer to the 2003-2006 Accord Service Manual (see page 19-6).

Is the switch OK?

YES—Repair open in the wire between the ECM/PCM and the brake pedal position switch. ■

NO—Replace the brake pedal position switch and retest. ■

Is the fuse OK?

8. Check fuse No. 13 (15A) in the under-hood fuse/relay box.

YES-Repair open in the wire between the under-hood fuse/relay box fuse No. 13 (15A) and the brake pedal position switch. ■

NO- Go to step 9.

9. Reconnect the brake pedal position switch 4P connector, and disconnect ECM/PCM connector A.

10. Replace the blown fuse.

11. Press the brake pedal.

Does fuse No. 13 blow again?

YES-Repair short to body ground on the wire between the under-hood fuse/relay box fuse No. 13A (15A) and the ECM/PCM. ■

NO-Replace the ECM/PCM. ■

BACK

Protected by AR

DTC Troubleshooting (cont'd)

DTC 68-22: Brake Pedal Position Switch Stuck ON

1. Turn the ignition switch ON (II).
2. Check the BRK PRESS in the DATA LIST with the HDS.

   Is 0.5 V or less?

   YES—Go to step 3.

   NO—Replace the VSA modulator-control unit (see page 19-132). ■
3. Check the BRAKE SWITCH in the DATA LIST while the HDS with moving the brake pedal.

   Does it indicate ON when the pedal is pushed, and OFF when pedal is released?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the brake pedal position switch, the ECM/PCM, and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

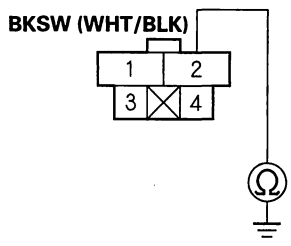
   NO—Go to step 4.
4. Check the BRAKE SWITCH in the DATA LIST with the HDS, and disconnect the brake pedal position switch 4P connector.

   Does indicator change to OFF?

   YES—Substitute a known-good ECM/PCM, then go to step 1 and recheck. If DTCs are not indicated, replace the original ECM/PCM (see page 11-244). ■

   NO—Go to step 5.
5. Check for continuity between brake pedal position switch 4P connector terminal No. 2 and body ground.

BRAKE PEDAL POSITION SWITCH 4P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the ECM/PCM and the brake pedal position switch. ■

NO—Replace the brake pedal position switch. ■

DTC Troubleshooting (cont'd)

DTC 81-xx*: Central Processing Unit (CPU) Internal Circuit Malfunction

*: Except DTC 81-11, 81-51, 81-52, 81-53, 81-54, 81-55, 81-56, 81-57, 81-58, 81-59, 81-3D, and 81-3E

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is DTCs 81-xx indicated?

   YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

DTC 81-11: Central Processing Unit (CPU) Internal Circuit Malfunction

DTC 81-52: Central Processing Unit (CPU) Internal Circuit Malfunction

DTC 81-54: Central Processing Unit (CPU) Internal Circuit Malfunction

DTC 81-56: Central Processing Unit (CPU) Internal Circuit Malfunction

DTC 81-58: Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle.
4. Check for DTCs with the HDS.

   Is DTC 81-11, 81-52, 81-54, 81-56, or 81-58 indicated?

   YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

DTC 81-51: Central Processing Unit (CPU) Internal Circuit Malfunction

DTC 81-53: Central Processing Unit (CPU) Internal Circuit Malfunction

DTC 81-55: Central Processing Unit (CPU) Internal Circuit Malfunction

DTC 81-57: Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle.
4. Check for DTCs with the HDS.

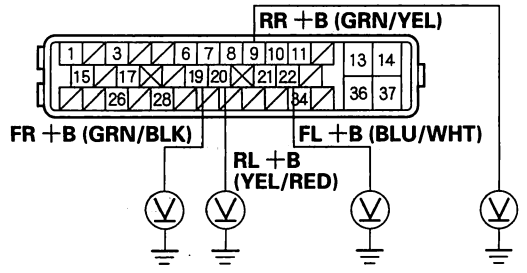
   Is DTC 81-51, 81-53, 81-55, or 81-57 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the appropriate wheel sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■
5. Turn the ignition switch OFF.
6. Disconnect the VSA modulator-control unit 37P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between VSA modulator-control unit 37P connector (see table).

DTC	Appropriate Terminal	Appropriate Wheel Sensor
81-51	19	Right-front
81-53	22	Left-front
81-55	9	Right-rear
81-57	20	Left-rear

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Repair short in the wire between the appropriate wheel sensor and the VSA modulator-control unit. ■

NO—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 81-59: Central Processing Unit (CPU) Internal Circuit Malfunction

DTC 81-3D: Central Processing Unit (CPU) Internal Circuit Malfunction

DTC 81-3E: Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Turn the steering wheel from lock to lock.
4. Check for DTCs with the HDS.

   Is DTCs 81-59, 81-3D or 81-3E indicated?

   YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

BACK

Protected by AR

DTC 83-13: ECM/PCM Relation Failure

DTC 83-14: ECM/PCM Relation Failure

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle.
4. Check for DTCs with the HDS.

   Is DTC 83-13, or 83-14 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the brake pedal position switch, the ECM/PCM, and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■
5. Check the PGM-FI DTCs with the HDS (see page 11-3).

   Are there PGM-FI DTCs indicated?

   YES—Go to the indicated DTCs troubleshooting. ■

   NO—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

DTC 84-21: VSA Sensor Neutral Position not Writing

Do the VSA sensor neutral position memorization (see page 19-130).

Protected by AR

DTC Troubleshooting (cont'd)

DTC 86-01: F-CAN Malfunction (BUS-OFF)

1. Check for PGM-FI DTCs (see page 11-3).

   Is DTC U0073 indicated?

   YES—Do the troubleshooting for DTC U0073. ■

   NO—Go to step 2.

2. Turn the ignition switch ON (II).

3. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.

4. Check for DTCs with the HDS.

   Is DTC 86-01 indicated?

   YES—Go to step 5.

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the yaw rate-lateral acceleration sensor, the ECM/PCM, the gauge control module, and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

5. Turn the ignition switch OFF.

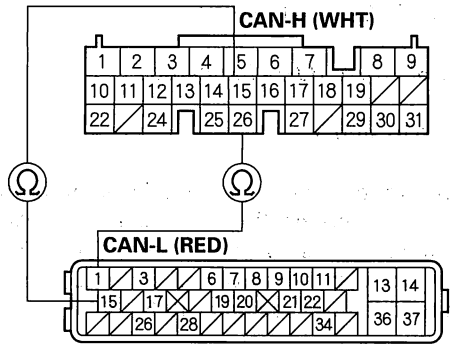
6. Disconnect the VSA modulator-control unit 37P connector.

7. Disconnect the ECM/PCM connector A (31P).

8. Check for continuity between VSA modulator-control unit 37P terminal and ECM/PCM connector A (31P) terminal (see table).

Sign	Connector Terminal No.	
	VSA Modulator-control Unit	ECM/PCM
CAN-L	1	26
CAN-H	15	15

ECM/PCM CONNECTOR A (31P)



VSA MODULATOR-CONTROL UNIT 37P CONNECTOR

Wire side of female terminals

Is there continuity?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Repair open in the wire between the ECM/PCM and the VSA modulator-control unit. ■

DTC 86-11: F-CAN Communication with ECM/PCM Malfunction

DTC 86-21: F-CAN Communication with Engine Malfunction

DTC 86-22: F-CAN Communication with Engine Malfunction

DTC 86-23: F-CAN Communication with Engine Malfunction

DTC 86-41: F-CAN Communication with EAT Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Test-drive the vehicle. Drive the vehicle speed at 7 mph (10 km/h) or more.
4. Check for DTCs with the HDS.

   Is 86-11, 86-21, 86-22, 86-23, and/or 86-41 DTC indicated?

   YES—If the DTC 86-01 is indicated at the same time, do the DTC 86-01 troubleshooting (see page 19-120). If 86-01 is not indicated, go to step 7.

   NO—If any DTCs are indicated, go to the indicated DTCs troubleshooting. If DTC is not indicated, intermittent failure, system is OK at this time. Check for poor connections or loose terminals between the yaw rate-lateral acceleration sensor, the ECM/PCM, the gauge control module, and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■
5. Turn the ignition switch OFF.
6. Disconnect ECM/PCM connector A (31P).
7. Disconnect the VSA modulator-control unit 37P connector.
8. Check for continuity between the VSA modulator-control unit 37P connector terminal and ECM/PCM connector A (31P) terminal (see table).

Sign	Connector Terminal No.

DTC Troubleshooting (cont'd)

DTC 86-31: F-CAN Communication with Gauge Control Module Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

   Is 86-31 DTC indicated?

   YES—If the DTC 86-01 is indicated as same time, do the DTC 86-01 troubleshooting (see page 19-120). If 86-01 is not indicated, go to step 4.

   NO—If any DTCs are indicated, go to the indicated DTCs troubleshooting. If DTC is not indicated, intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the yaw rate-lateral acceleration sensor, the ECM/PCM, the gauge control module, and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64).■
4. Turn the ignition switch ON (II).
5. Check the indicators in the gauge control module when turning ignition switch ON (II).

   Do any indicators come on?

   YES—Go to step 6.

   NO—Do the gauge control module troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-279).■
6. Turn the ignition switch OFF.
7. Disconnect the gauge control module 28P connector.
8. Disconnect the VSA modulator-control unit 37P connector.
9. Check for continuity between the VSA modulator-control unit 37P connector terminal and gauge control module connector (36P) terminal (see table).

Sign	Connector Terminal No.

DTC 107-22: Central Processing Unit (CPU) Internal Circuit Malfunction

Turn the ignition switch OFF to cool the VSA modulator-control unit, and wait 1 hour or more, then recheck the DTCs with the HDS.

DTC 108-21: Steering Angle Sensor Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle.
4. Check for DTCs with the HDS.

   Is DTC 81-21 indicated?

   YES—Replace the steering angle sensor (see page 19-127). ■

   NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the steering angle sensor and the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

Protected by AR

DTC Troubleshooting (cont'd)

DTC 112-01: Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

Is DTC B2-01 indicated?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. If DTCs are not indicated, replace the VSA modulator-control unit (see page 19-132). ■

NO—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit. Refer to intermittent failure (see page 19-64). ■

DTC 121-xx: VSA Solenoid Valve Malfunction

DTC 122-xx: VSA Solenoid Valve Malfunction

DTC 123-xx: VSA Solenoid Valve Malfunction

DTC 124-xx: VSA Solenoid Valve Malfunction

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS. Turn the ignition switch OFF, then ON (II) again.
3. Check for DTCs with the HDS.

Symptom Troubleshooting

ABS indicator and VSA indicator do not go off, and no DTCs are stored

NOTE: If MIL is indicated at the same time as ABS and/or VSA indicator, troubleshoot the PGM-FI system (see page 11-3) first.

1. Check the No. 18 IG1 (15 A) fuse in the under-dash fuse/relay box.

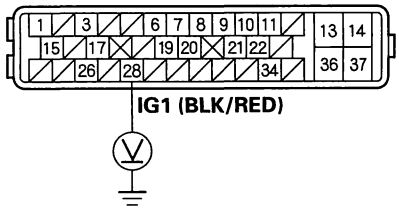
   Is the fuse blown?

   YES—Install the new No. 18 IG1 (15 A) fuse, and recheck. ■

   NO—Reinstall the checked fuse, then go to step 2.

2. Turn the ignition switch OFF.
3. Disconnect the VSA modulator-control unit 37P connector.
4. Turn the ignition switch ON (II).
5. Measure voltage between VSA modulator-control unit 37P connector terminal No. 28 and body ground.

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

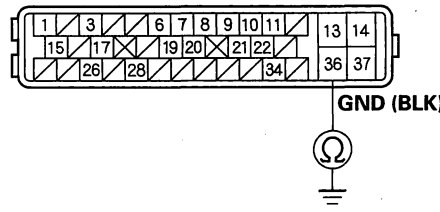
Is there battery voltage?

YES—Go to step 6.

NO—Repair open in the wire between the No. 18 IG1 (15 A) in the under-dash fuse/relay box and the VSA modulator-control unit. ■

6. Turn the ignition switch OFF.
7. Reconnect the VSA modulator control unit 37P connector.
8. Turn the ignition ON (11).
9. Check for voltage between VSA modulator control unit 37P connector terminal No. 36 and body ground.

VSA MODULATOR-CONTROL UNIT 37P CONNECTOR



Wire side of female terminals

Is there 0.1 volts or less?

YES—Check for loose terminals in the VSA modulator-control unit 37P connector. If necessary, substitute a known-good VSA modulator-control unit and retest. ■

NO—Repair open in the wire between the VSA modulator-control unit and body ground (G203). ■

Protected by AR

Symptom Troubleshooting (cont'd)

VSA activation indicator does not go off, and no DTCs are stored

1. Turn the ignition switch ON (II).
2. Check the VSA activation indicator in the gauge control module when ignition switch is turned ON (II) after several seconds.

   The indicator comes on then goes off?

   YES—Intermittent failure, system is OK at this time. Check for poor connections or loose terminals at the VSA OFF switch, the gauge control module, and VSA modulator-control unit. ■

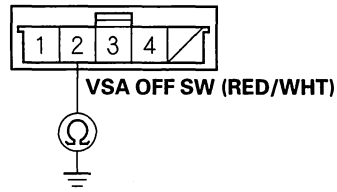
   NO—Go to step 3.
3. Turn the ignition switch OFF.
4. Check the VSA OFF switch.

   Is the VSA off switch OK?

   YES—Go to step 5.

   NO—Replace the VSA OFF switch (see page 19-131). ■
5. Disconnect the gauge control module 28P connector.
6. Disconnect the brake fluid level switch 2P connector.
7. Check for continuity between VSA OFF switch 5P connector terminal No. 2 and body ground.

VSA OFF SWITCH 5P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair short in the wire between the gauge control module and the VSA OFF position switch. ■

NO—Substitute a known-good gauge control module, then go to step 1 and recheck. If it is OK, replace the original gauge control module, refer to the 2003-2006 Accord Service Manual (see page 22-276). ■

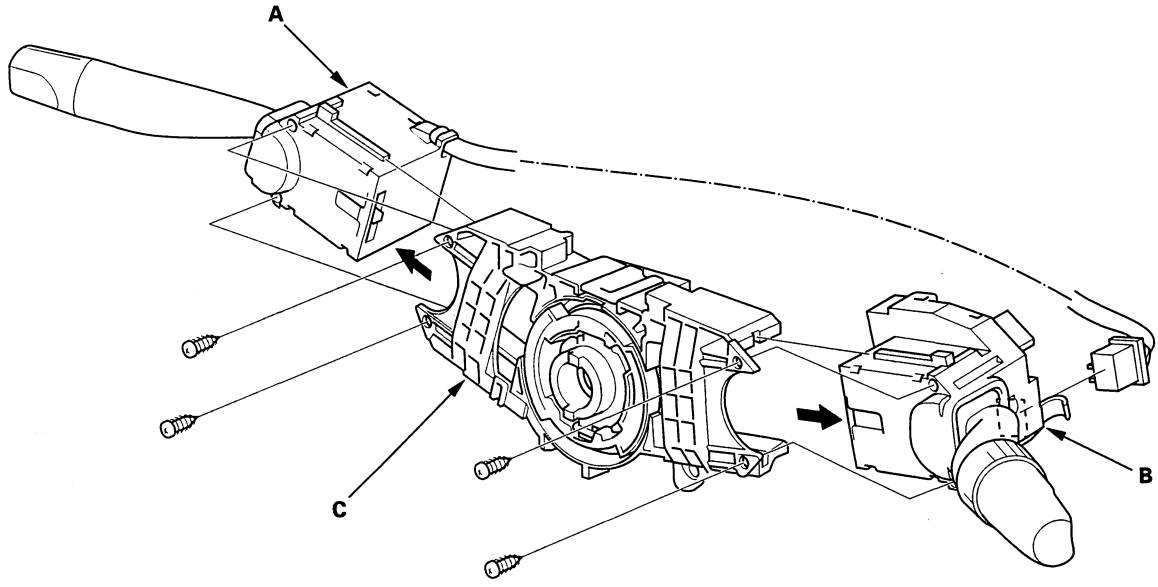
BACK

Protected by AR

Steering Angle Sensor Replacement

NOTE: Do not damage or drop the combination switch as the steering angle sensor is sensitive to shock and vibration.

1. Remove the steering wheel, refer to the 2003-2006 Accord Service Manual (see page 17-22) and steering column cover, refer to the 2003-2006 Accord Service Manual (see step 4 on page 17-25).
2. Remove the combination switch assembly, refer to the 2003-2006 Accord Service Manual (see step 10 on page 17-26).
3. Remove the combination light switch (A) and the wiper/washer switch (B).



4. Replace the combination switch body complete (C).
5. Install the combination switch in the reverse order of removal.

   NOTE: Do not remove the steering angle sensor from the combination switch body.

6. Do the VSA sensor neutral position memorization (see page 19-130).

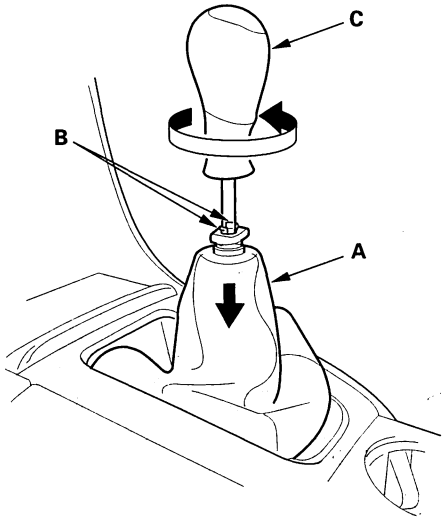
Protected by AR

VSA System Components

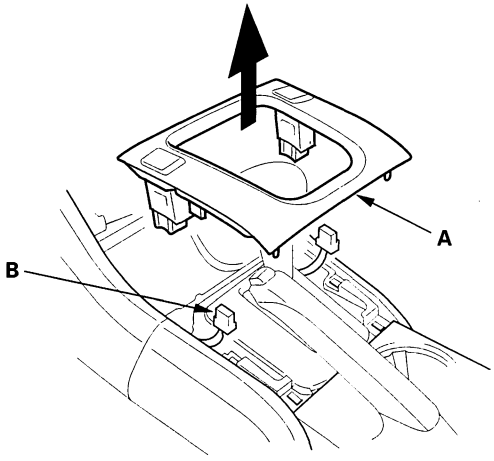
Yaw Rate-Lateral Acceleration Sensor Replacement

NOTE:
- Do not damage or drop the sensor as it is sensitive.
- Do not use an impact wrench.

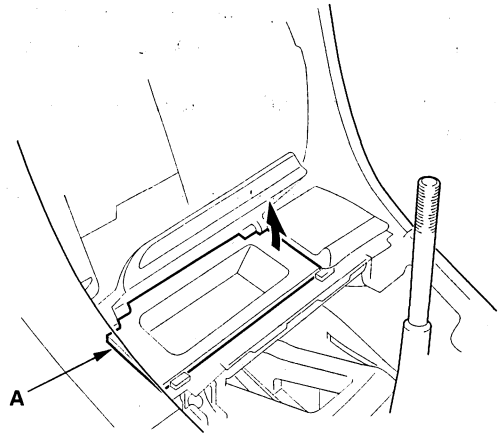
1. M/T model: Lower the shift lever boot (A) to release the hooks (B) from the knob, then remove the shift knob (C).



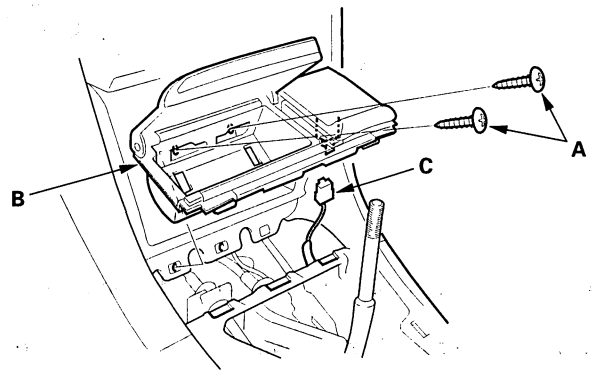
2. Remove the center console front panel (A). If equipped, disconnect the seat heater switch connectors (B).



3. Remove the console packet (A).



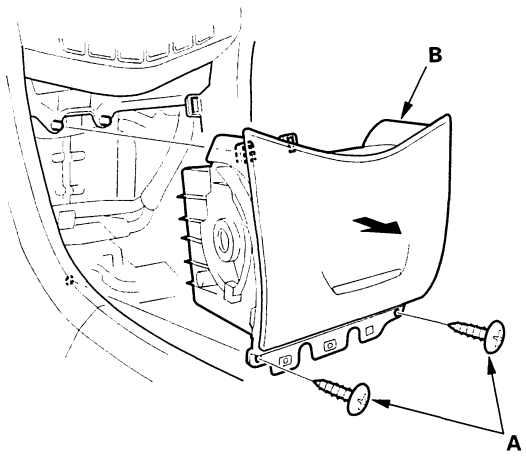
4. Remove the screws (A), then remove the center holder (B) and disconnect the front accessory power socket connector (C).



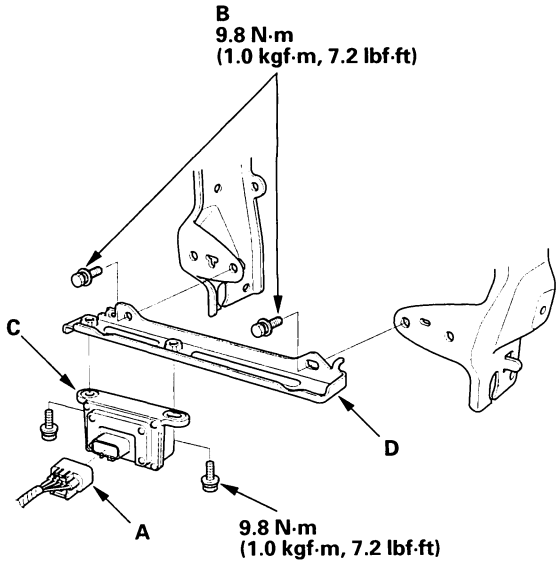
BACK

Protected by AR

5. Remove the screws (A), then remove the center pocket (B).



6. Disconnect the connector (A).



7. Remove the sensor bracket mounting bolts (B).
8. Remove the yaw rate-lateral acceleration sensor (C) with the bracket (D).
9. Remove the sensor from the bracket.
10. Install the sensor in the reverse order of removal.

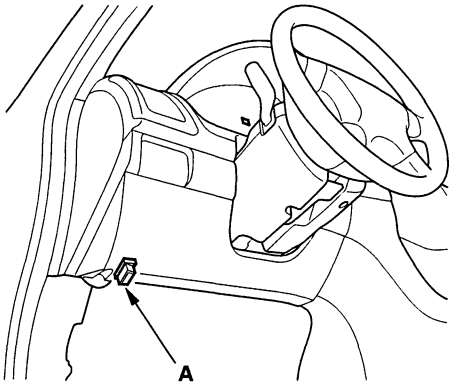
BACK

Protected by AR

VSA Sensor Neutral Position Memorization

NOTE: Do not press the brake pedal during this procedure.

1. Park the vehicle on a flat and level surface.
2. With the ignition switch OFF, connect the HDS to the 16P data link connector (DLC) (A) under the driver's side of the dashboard.

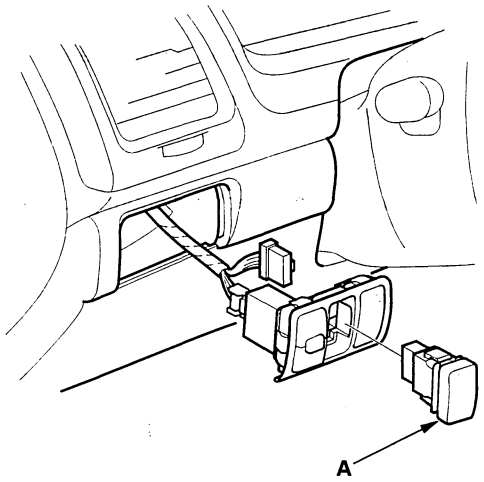


BACK

Protected by AR

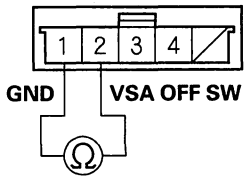
VSA Off Switch Test

1. Remove the VSA OFF switch (A) from the switch panel.



2. Disconnect the VSA OFF switch 5P connector.
3. Check for continuity between VSA OFF switch connector terminal No. 1 and No. 2. There should be continuity when the switch is pushed.

VSA OFF SWITCH 5P CONNECTOR



Terminal side of male terminals

4. Check for continuity between VSA OFF switch connector terminal No. 3 and No. 4. There should be continuity at all times.

VSA OFF SWITCH 5P CONNECTOR

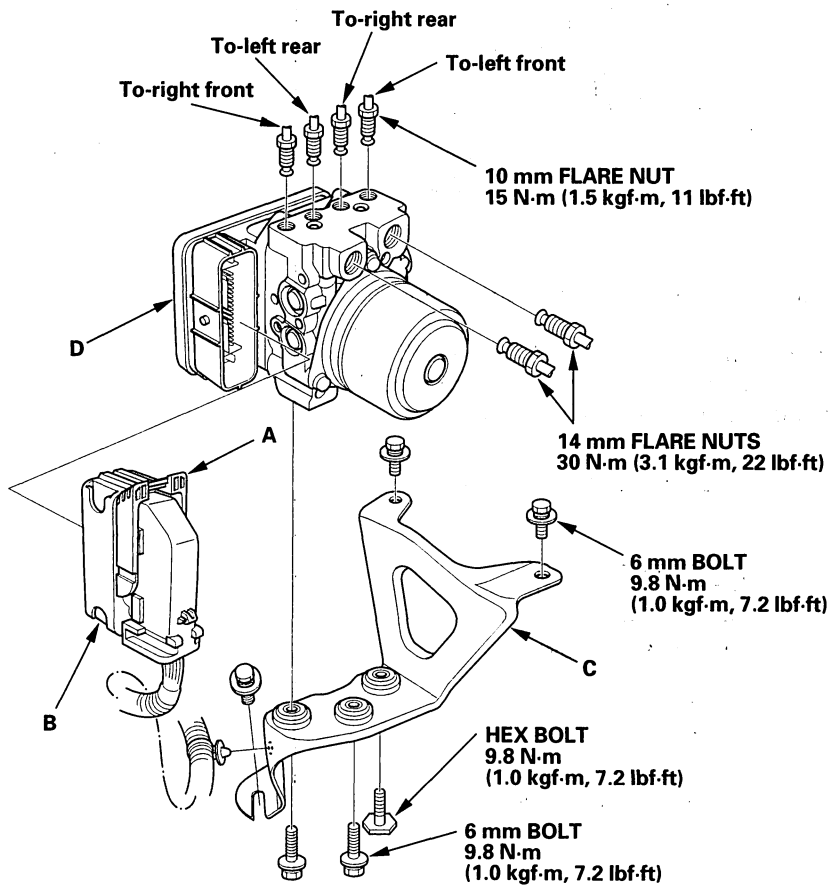
VSA System Components

VSA Modulator-Control Unit Removal and Installation

NOTE:
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- Be careful not to damage or deform the brake lines during removal and installation.
- To prevent the brake fluid from flowing, plug and cover the hose ends and joints with a shop towel or equivalent material.

Removal

1. Pull up the lock (A) of the VSA modulator-control unit 37P connector (B), and the connector disconnects itself.



2. Disconnect the six brake lines.
3. Remove the three 6 mm bolts, then remove the bracket (C) with the VSA modulator-control unit (D) from the body.
4. Remove the two 6 mm bolts and the hex bolt, then remove the VSA modulator-control unit from the bracket.

BACK

Protected by AR

Installation

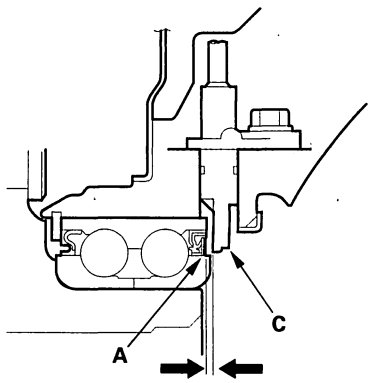
1. Install the VSA modulator-control unit on the bracket, then tighten the two 6 mm bolts and the hex bolt.
2. Install the bracket with the VSA modulator-control unit, then tighten the three 6 mm bolts.
3. Reconnect the six brake lines, then tighten the flare nuts to the specified torque.
4. Align the connecting surface of the VSA modulator-control unit 37P connector to the VSA modulator-control unit.
5. Lower the lock of the VSA modulator-control unit 37P connector, then confirm the connector is fully seated.
6. Bleed the brake system, starting with the front wheels, refer to the 2003-2006 Accord Service Manual (see page 19-9).
7. Perform the VSA sensor neutral position memorization (see page 19-130).
8. Start the engine, and check that the ABS and VSA indicators go off.
9. Test-drive the vehicle, and check that the ABS and VSA indicators do not come on.
10. If the brake pedal is now spongy, there may be air trapped in the modulator and then induced into the normal brake system during modulation. Bleed the brake system again, starting with the front wheels, refer to the 2003-2006 Accord Service Manual (see page 19-9).

Protected by AR

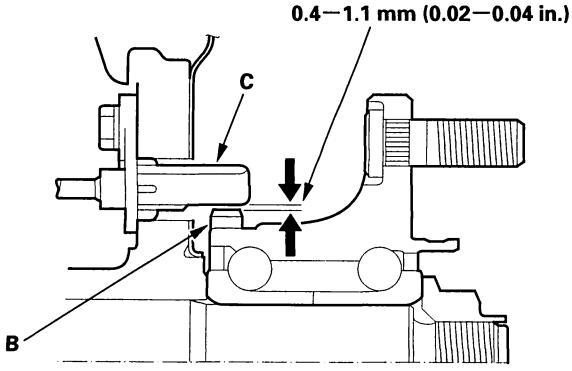
Wheel Sensor Inspection

1. Check the magnetic encoder (A) or pulser (B) after cleaning it. If necessary, replace the encoder or pulser.

Front



Rear



2. Measure the air gap between the wheel sensor (C) and the magnetic encoder or pulser all the way around while rotating the encoder or pulser.

Standard:
Front: 0.5—1.2 mm (0.02—0.05 in.)
Rear: 0.4—1.1 mm (0.02—0.04 in.)

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If body maintenance required)

The Accord SRS includes a driver's airbag in the steering wheel hub, a passenger's airbag in the dashboard above the glove box, seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in the 2003-2006 Accord Service Manual, P/N 61SDA08. Items marked with an asterisk (*) on the contents page include or are located near SRS components. Servicing, disassembling, or replacing these items require special precautions and tools, and should be done only by an authorized Honda dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work must be performed by an authorized Honda dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the airbags and/or side airbags.
- Do not bump or impact the SRS unit, front impact sensors, or side impact sensors when the ignition switch is ON (II), or for at least 3 minutes after the ignition switch is turned OFF; otherwise, the system may fail in a collision, or the airbags may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, front console, dashboard, dashboard lower panel, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

Front Seat Removal/Installation

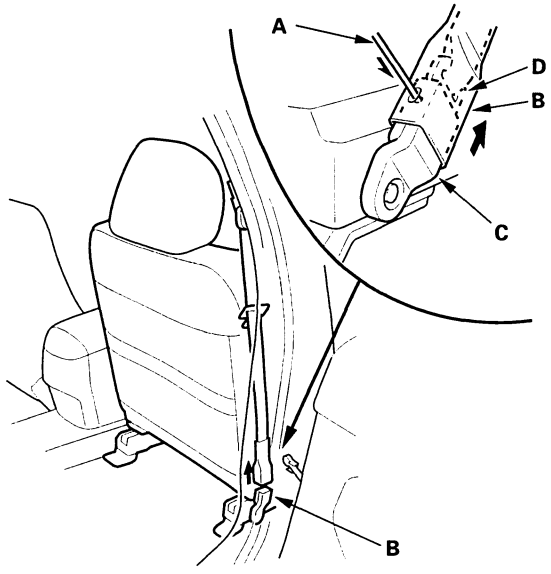
SRS components are located in this area. Review the SRS component locations, refer to the 2003-2006 Accord Service Manual (see page 23-17) and the precautions and procedures, refer to the 2003-2006 Accord Service Manual (see page 23-19) before performing repairs or service.

4-Way Power Seat

NOTE:
- Use the appropriate tool from the KTC tool set to avoid damage when prying components.
- Take care not to scratch the body or tear the seat covers.
- Put on gloves to protect your hands.

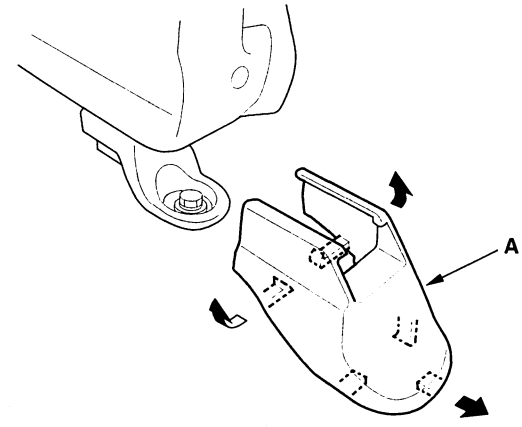
1. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the frequencies for the preset buttons.

2. '04-06 models passenger's seat: Carefully insert the tip of a small screwdriver (A) through the hole in the back of the front seat belt lower anchor cover (B) and into the hole in the front seat belt lower anchor (C).
   Unlock the lower anchor by pushing in on the screwdriver. Remove the screwdriver, and then detach the front seat belt anchor plate (D) and anchor cover from the lower anchor.

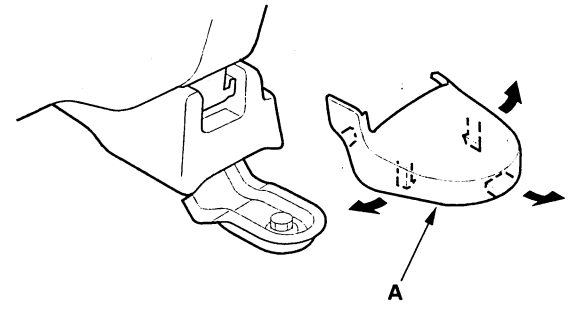


3. Slide the seat all the way forward, then remove the seat track end covers (A) from the back of both seat tracks.

'03 model



'04-06 models



4. Slide the seat about halfway to the rear so you can access the mounting bolts.

5. Disconnect the negative cable from the battery, and wait at least 3 minutes before removing the seat.

8. With the help of an assistant, carefully remove the front seat through the front door opening.

BACK

Protected by AR

9. Install the seat in the reverse order of removal, and note these items:

- Apply medium strength type liquid thread lock to the front seat mounting bolts before reinstallation.
- Make sure each connector is plugged in properly.
- Tighten the seat mounting bolts to the specified torque in the sequence shown. Slide the seat all the way back and tighten ① and ②, then slide it forward and tighten ③ and ④.
- Before attaching the lower anchor bolts, make sure there are no twists or kinks in the seat belts.
- '04-06 models passenger's seat: The triangle marks (A) on the anchor plate (B) and the lower anchor (C) must face the same side. Insert the anchor plate into the lower anchor, and make sure that it is locked securely.
- Reconnect the negative cable to the battery.
- Enter the anti-theft codes for the audio and the navigation system, then enter the customer's audio station and XM radio channel presets.
- Reset the clock.
- Perform the power window control unit reset procedure, refer to the 2003-2006 Accord Service Manual (see page 22-232).

'04-06 Models 4-door

- SRS components are located in this area. Review the SRS component locations, refer to the 2003-2006 Accord Service Manual (see page 23-17) and the precautions and procedures, refer to the 2003-2006 Accord Service Manual (see page 23-19) before performing repairs or service.
- '04-05 models: The front passenger's weight sensor (SWS) unit must be calibrated after any of these actions, refer to the 2003-2006 Accord Service Manual (see page 23-33):
  - Front passenger's seat replacement (including any seat components)
  - Replacement of the seat weight sensors
  - Replacement of the seat weight sensor unit
- '06 model: The ODS unit must be calibrated after any for this actions, refer to the 2003-2006 Accord Service Manual (see page 23-33):
  - Front passenger's seat replacement (including any seat components)
  - Replacement of the seat weight sensors

NOTE:
- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.
- Use the appropriate tool from the KTC trim tool set to avoid damage when prying components.
- Apply multipurpose grease to the moving parts of the seat track.
- To prevent wrinkles in the seat cushion cover, stretch the material evenly over the pad.

'04-06 Models

- '04-05 models: The front passenger's weight sensor (SWS) unit must be calibrated after any of these actions, refer to the 2003-2006 Accord Service Manual (see page 23-33):
  - Front passenger's seat replacement (including any seat components)
  - Replacement of the seat weight sensors
  - Replacement of the seat weight sensor unit
- '06 model: The ODS unit must be calibrated after any for this actions, refer to the 2003-2006 Accord Service Manual (see page 23-33):
  - Front passenger's seat replacement (including any seat components)
  - Replacement of the seat weight sensors

NOTE:
- Put on gloves to protect your hands.
- Apply multipurpose grease to the sliding and pivot portions of the linkage.
- When tightening the weight sensor mounting nuts, tighten the nuts in the sequence shown. Improper tightening could cause the passenger's airbag system to malfunction.
- Make sure the weight sensor unit ('04-05 models) connectors are plugged in properly.
- Make sure the weight sensor wires are routed properly so they are not pinched and do not interfere with other parts.

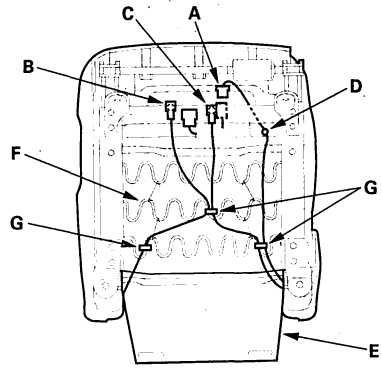
Front Seat Cover Replacement

- SRS components are located in this area. Review the SRS component locations, refer to the 2003-2006 Accord Service Manual (see page 23-17) and the precautions and procedures, refer to the 2003-2006 Accord Service Manual (see page 23-19) before performing repairs or service.
- '04-05 models: The front passenger's weight sensor (SWS) unit must be calibrated after any of the these actions, refer to the 2003-2006 Accord Service Manual (see page 23-33):
  - Front passenger's seat replacement (including any seat components)
  - Seat weight sensor replacement
  - Seat weight sensor unit replacement
- '06 model: The ODS unit must be calibrated after any for this actions, refer to the 2003-2006 Accord Service Manual (see page 23-33):
  - Front passenger's seat replacement (including any seat components)
  - Replacement of the seat weight sensors

NOTE:
- Seats with a side airbag have a "SIDE AIRBAG" label on the seat-back. Because the component parts (seat-back cover, cushion, etc.) of seats with and without airbags are different, make sure you install only the correct replacement parts.
- Do not repair any tears or frayed spots in the seat-back cover. If necessary, replace the seat-back cover.
- Take care not to tear the seams or damage the seat covers.
- Do not touch the OPDS sensor in the seat-back pad, and keep it away from oil. Oil can corrode the sensor causing it to fail.
- Put on gloves to protect your hands.

Seat-back Cover - 4-Way Power Seat

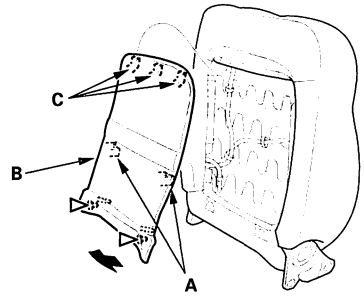
1. Remove the front seat (see page 20-3).
2. Remove the headrest.
3. From under the seat cushion, disconnect the recline motor connector (A), detach the side airbag connector clip (B), the OPDS/ODS unit connector clip (C), and harness clip (D). Release the seat cushion cover (E) from the seat cushion frame spring (F), then pull the cover back and remove the wire ties (G).



4. Remove these items from the front seat, then remove the seat-back, '03 model (see page 20-6), '04-06 models (see page 20-7):
   - Recline cover
   - Center cover
5. Detach the clips and hooks (A) by carefully pulling the bottom of the back panel (B) back, pull the panel downward to release the hooks (C) from the seat-back frame, then remove the panel.

Fastener Locations

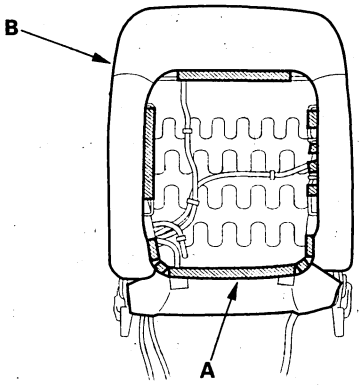
▷ : Clip, 2



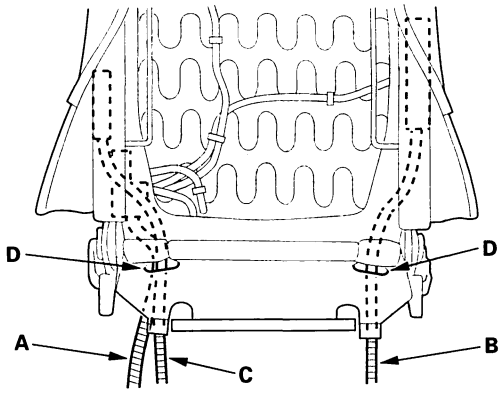
BACK

Protected by AR

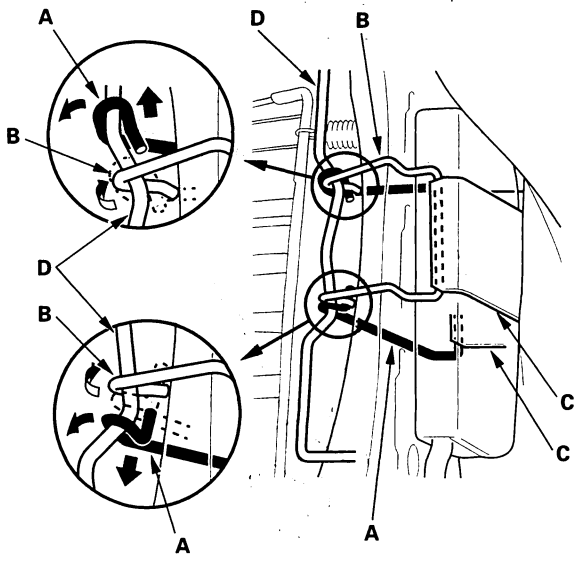
6. Release the hook strips (A), then loosen the seat-back cover (B).



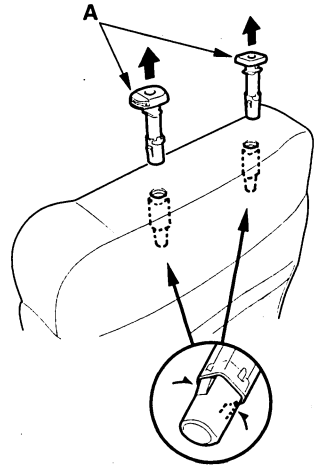
7. Pull the recline motor harness (A), side airbag harness (B) and the OPDS/ODS harness (C) out through the holes (D) in the seat-back cover.



8. Release the front hook (A) and rear hook (B) of the reinforcing cloth (C) from seat-back frame (D).



9. Pull out the headrest guides (A) by pinching the tabs on the ends of the guides, and remove them.

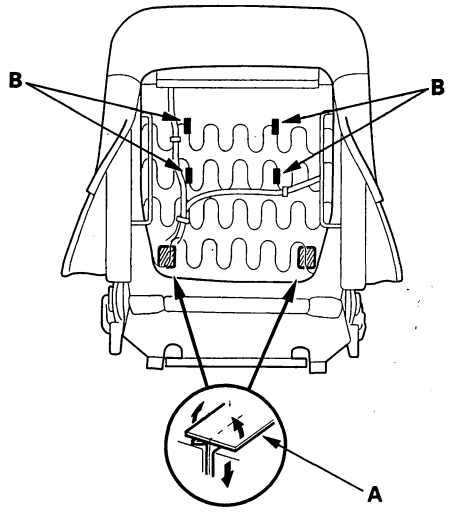


(cont'd)

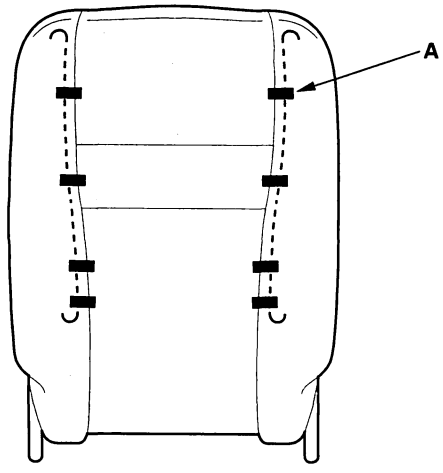
Protected by AR

Front Seat Cover Replacement (cont'd)

10. From the back of the seat-back, pass both lower retainers (A) through the slots in the seat-back pad, and release all of the clips (B).

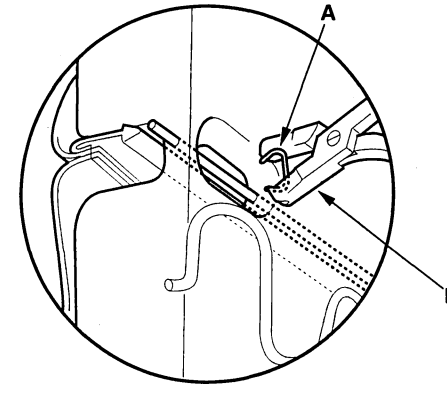


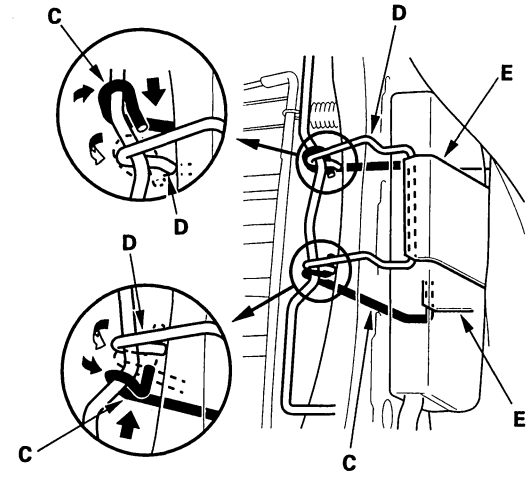
11. Pull back the edge of the seat-back cover all the way around, and release the clips (A), then remove the seat-back cover.



12. Install the cover in the reverse order of removal, and note these items:

- Reinitialize the OPDS/ODS control unit, refer to the 2003-2006 Accord Service Manual (see page 23-32).
- To prevent wrinkles when installing a seat-back cover, make sure the material is stretched evenly over the pad before securing the clips, hooks, and hook strips.
- Replace any clips you removed with new ones (A). Install them with commercially available upholstery ring pliers (B).
- Reinstall the front hook (C) and rear hook (D) of the reinforcing cloth (E) securely.
- Use only original Honda replacement seat-back covers.
- Make sure the Recline motor harness, side airbag harness, and OPDS/ODS harness are routed properly.





BACK

Protected by AR

Seat Cushion Cover

1. Remove the front seat (see page 20-3).

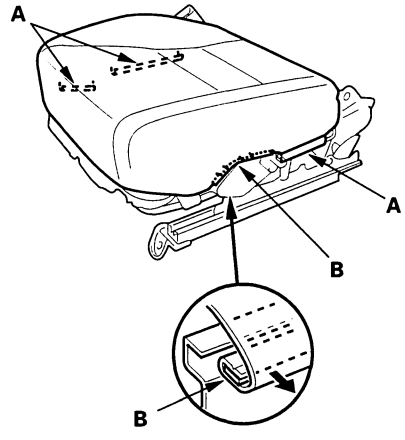
2. With recline motor and/or side airbag: From under the seat cushion, detach the recline motor connector clip, the side airbag connector clip, and on the passenger's seat, the OPDS/ODS unit connector clip. Release the hook springs (on some driver's seats) and the seat cushion cover from the seat cushion frame spring, then pull the cover back, and remove the wire ties.

3. Remove these items from the front seat, then remove the seat-back, '03 model (see page 20-6), '04-06 models (see page 20-7):

   - Recline cover
   - Center cover

4. Release the hook strips (A) and retainers (B) (manual height adjustable seat) from both sides the seat cushion.

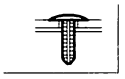
   NOTE: Manual height adjustable seat is shown; other seats are similar, except for the height ratchet unit portion.

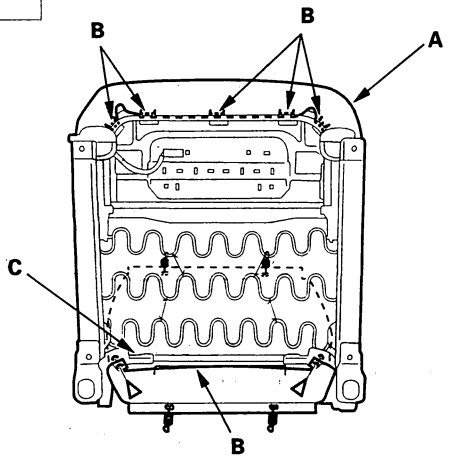


5. Pull back the seat cushion cover (A), and release the hooks (B) from under the seat cushion. On manual height adjustable/2-way power seat, detach the clips from the seat cushion frame (C).

Fastener Locations

▷ : **Clip, 2**





6. Remove the cushion cover/pad from the seat cushion frame.

7. Release the clips (A) from under the seat cushion (B).

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If HVAC maintenance is required)

The Accord SRS includes a driver's airbag in the steering wheel hub, a passenger's airbag in the dashboard above the glove box, seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in the 2003-2006 Accord Service Manual, P/N 61SDA08. Items marked with an asterisk (*) on the contents page include or are located near SRS components. Servicing, disassembling, or replacing these items require special precautions and tools, and should be done only by an authorized Honda dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work must be performed by an authorized Honda dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the airbags and/or side airbags.
- Do not bump or impact the SRS unit, front impact sensors, or side impact sensors when the ignition switch is ON (II), or for at least 3 minutes after the ignition switch is turned OFF; otherwise, the system may fail in a collision, or the airbags may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, front console, dashboard, dashboard lower panel, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

A/C Refrigerant Oil Replacement

Recommended PAG oil: DENSO ND-OIL 8

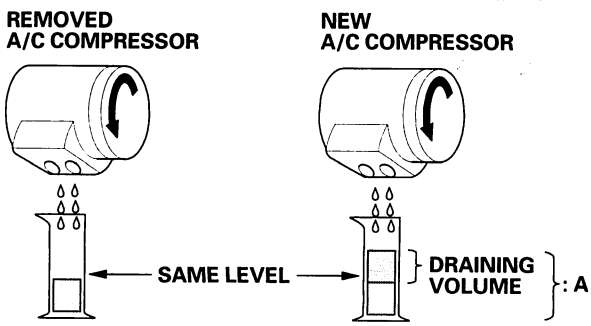
- P/N 38897-PR7-A01AH: 120 mL (4 fl·oz)
- P/N 38899-PR7-A01: 40 mL (1 1/3 fl·oz)

Add the recommended refrigerant oil in the amount listed if you replace any of the following parts.

- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if it gets on the paint, wash it off immediately.

A/C condenser .....25 mL (5/6 fl·oz)
Evaporator .....45 mL (1 1/2 fl·oz)
Line or hose .....10 mL (1/3 fl·oz)
Receiver/Dryer .....10 mL (1/3 fl·oz)
Leakage repair .....25 mL (5/6 fl·oz)
A/C compressor .....For A/C compressor replacement, subtract the volume of oil drained from the removed A/C compressor from 160 mL (5 1/3 fl·oz), and drain the calculated volume of oil from the new A/C compressor: 160 mL (5 1/3 fl·oz) — Volume of removed A/C compressor = Volume to drain from new A/C compressor.

NOTE: Even if no oil is drained from the removed A/C compressor, don't drain more than 50 mL (1 2/3 fl·oz) from the new A/C compressor.



A: 160 mL (5 1/3 fl·oz)

Symptom Troubleshooting Index (cont'd)

Symptom	Diagnostic procedure	Also check for
Recirculation button does not work	1. Turn the ignition switch ON (II). 2. Press the recirculation button several times and check the button's LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to recirculation control motor test, refer to the 2003-2006 Accord Service Manual, 2-door (see page 21-47), 4-door (see page 21-47). • If the LED does not turn on or off, replace the audio-HVAC display panel.	
Defroster button does not work	1. Turn the ignition switch ON (II). 2. Press the defroster button several times and check the button's LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-11). • If the LED does not turn on or off, replace the audio-HVAC display panel.	
Rear window defogger button does not work	1. Turn the ignition switch ON (II). 2. Press the rear window defogger button several times and check the button's LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to rear window defogger troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-299). • If the LED does not turn on or off, replace the audio-HVAC display panel.	
A/C button does not work	1. Turn the ignition switch ON (II). 2. Turn the fan control dial ON. 3. Press the A/C button several times and check the button's LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-11). • If the LED does not turn on or off, replace the audio-HVAC display panel.	
MAX A/C button does not work	1. Turn the ignition switch ON (II). 2. Turn the fan control dial ON. 3. Press the MAX A/C button several times and check the button's LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-11). • If the LED does not turn on or off, replace the audio-HVAC display panel.	
Mode button (VENT) does not work	1. Turn the ignition switch ON (II). 2. Press the MODE (VENT) button several times and check the button's LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-11). • If the LED does not turn on or off, replace the audio-HVAC display panel.

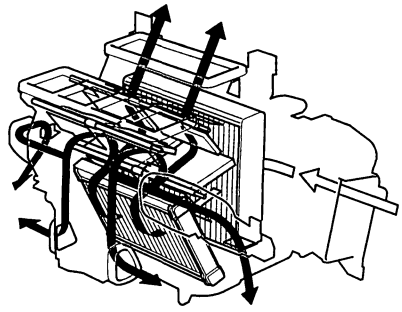
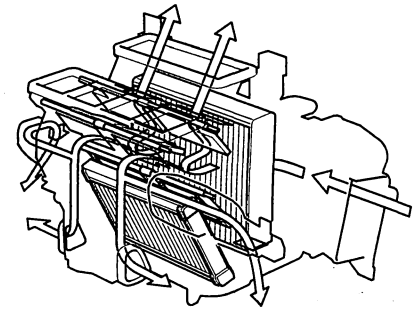
(HEAT/DEF)

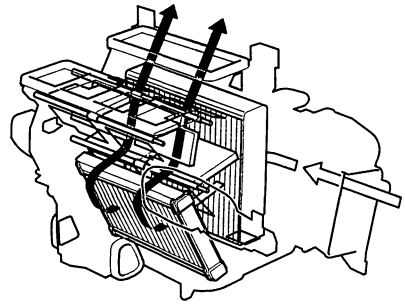
HOT

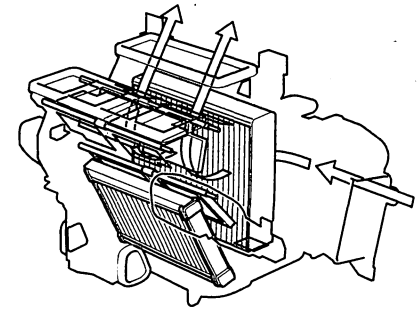


COOL



(DEF)



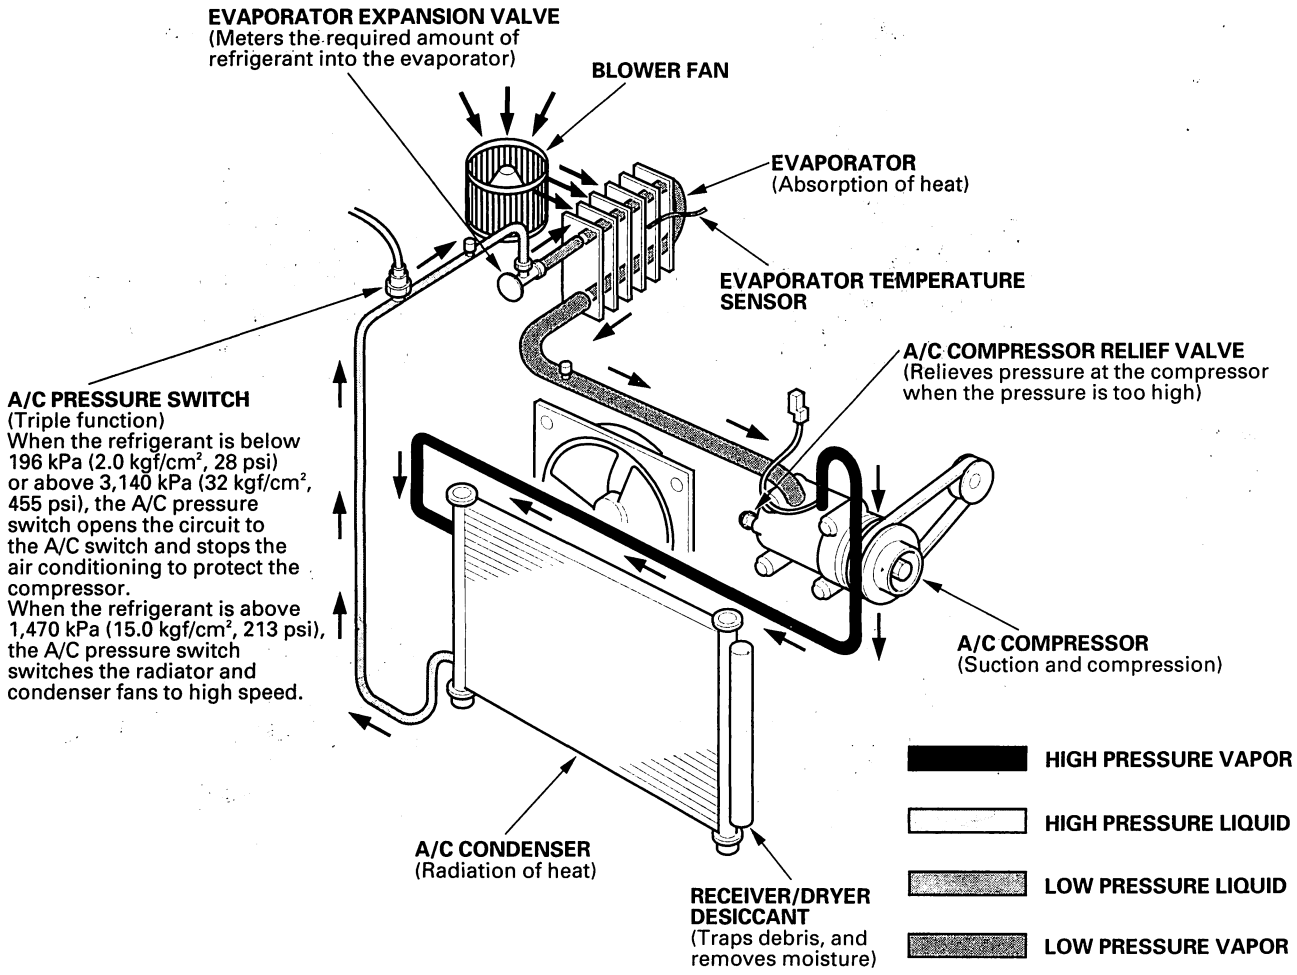


(cont'd)

Protected by AR

System Description (cont'd)

The air conditioning system removes heat from the passenger compartment by circulating refrigerant through the system.



This vehicle uses HFC-134a (R-134a) refrigerant which does not contain chlorofluorocarbons. Pay attention to the following service items:

- Do not mix refrigerants CFC-12 (R-12) and HFC-134a (R-134a). They are not compatible.
- Use only the recommended polyalkyleneglycol (PAG) refrigerant oil (DENSO ND-OIL 8) designed for the R-134a compressor. Intermixing the recommended (PAG) refrigerant oil with any other refrigerant oil will result in compressor failure.
- All A/C system parts (compressor, discharge line, suction line, evaporator, condenser, receiver/dryer, expansion valve, O-rings for joints) are designed for refrigerant R-134a. Do not exchange with R-12 parts.
- Use a halogen gas leak detector designed for refrigerant R-134a.
- R-12 and R-134a refrigerant servicing equipment are not interchangeable. Use only a recovery/recycling/charging station that is U.L.-listed and is certified to meet the requirements of SAE J2210 to service the R-134a air conditioning systems.
- Always recover the refrigerant R-134a with an approved recovery/recycling/charging station before disconnecting any A/C fitting.

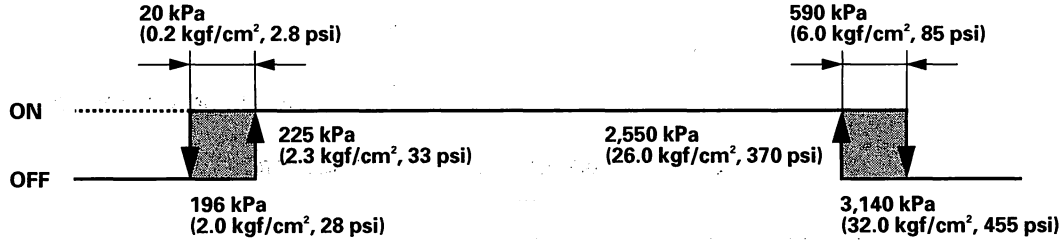
BACK

Protected by AR

A/C Pressure Switch

The A/C pressure switch consists of a high-low pressure switch (A/C pressure switch A) and a middle pressure switch (A/C pressure switch B).

- High-low pressure switch
  If the refrigerant pressure becomes too high (due to blockage or lack of airflow at the condenser), or too low (due to leakage), the A/C pressure switch stops the A/C request signal to the PCM and the compressor stops operating.



- Middle pressure switch
  If the refrigerant pressure goes above or below 1,470 kPa (15.0 kgf/cm², 213 psi), the A/C pressure switch opens or closes to signal the PCM to change the speed of the condenser fan and radiator fan (high-low).

Radiator and A/C Condenser Fan Low Speed Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if the compressor is inoperative. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Check the No. 9 (20A) fuse in the under-hood fuse/relay box, and the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES—Go to step 2.

   NO—Replace the fuse(s), and recheck. ■

2. Remove the A/C condenser fan relay from the under-hood fuse/relay box, and test it, refer to the 2003-2006 Accord Service Manual (see page 22-79).

   Is the relay OK?

   YES—Go to step 3.

   NO—Replace the A/C condenser fan relay. ■

3. Measure the voltage between the No. 1 terminal of the A/C condenser fan relay 4P socket and body ground.

   A/C CONDENSER FAN RELAY 4P SOCKET

   Is there battery voltage?

   YES—Go to step 4.

   NO—Replace the under-hood fuse/relay box. ■

4. Connect the No. 1 and No. 2 terminals of the A/C condenser fan relay 4P socket with a jumper wire.

   A/C CONDENSER FAN RELAY 4P SOCKET

   Does the A/C condenser fan run?

   YES—Go to step 5.

   NO—Go to step 13.

5. Disconnect the jumper wire.

6. Turn the ignition switch ON (II).

7. Measure the voltage between the No. 3 terminal of the A/C condenser fan relay 4P socket and body ground.

   A/C CONDENSER FAN RELAY 4P SOCKET

   Is there battery voltage?

   YES—Go to step 8.

   NO—Go to step 31.

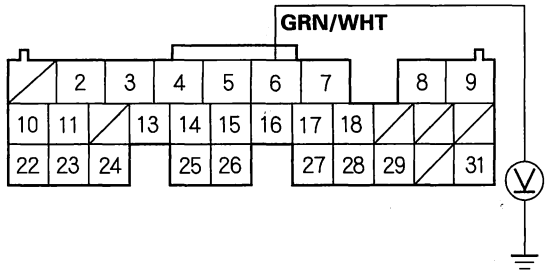
8. Turn the ignition switch OFF.

BACK

Protected by AR

9. Reinstall the A/C condenser fan relay.
10. Make sure the A/C switch is OFF.
11. Turn the ignition switch ON (II).
12. Using the backprobe set, measure the voltage between the No. 6 terminal of PCM connector A (31P) and body ground with the PCM connectors connected.

PCM CONNECTOR A (31P)



Wire side of female terminals

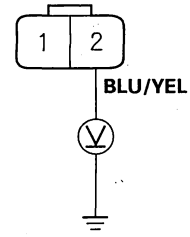
Is there battery voltage?

YES—Check for loose wires or poor connections at No. 6 terminal of PCM connector A (31P). If the connections are good, substitute a known-good PCM, and recheck. If the symptom/indication goes away, replace the original PCM, then perform the PCM idle learn procedure (see page 11-302).■

NO—Repair open in the wire between the condenser fan relay and the PCM.■

13. Disconnect the jumper wire.
14. Reinstall the A/C condenser fan relay.
15. Disconnect the A/C condenser fan 2P connector.
16. Turn the ignition switch ON (II), then turn the A/C and blower fan switches ON.
17. Measure the voltage between the No. 2 terminal of the A/C condenser fan 2P connector and body ground.

A/C CONDENSER FAN 2P CONNECTOR



Wire side of female terminals

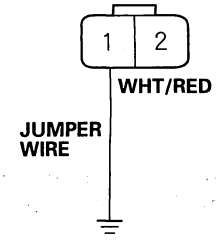
Is there battery voltage?

YES—Go to step 18.

NO—Repair open in the wire between the A/C condenser fan relay and the A/C condenser fan.■

18. Turn the A/C and fan switches OFF, then turn the ignition switch OFF.
19. Reconnect the A/C condenser fan 2P connector.
20. Connect the No. 1 terminal of the A/C condenser fan 2P connector to body ground with jumper wire.

A/C CONDENSER FAN 2P CONNECTOR



Wire side of female terminals

21. Turn the ignition switch ON (II), then turn the A/C and fan switches ON.

Does the A/C condenser fan run?

YES—Go to step 22.

NO—Replace the A/C condenser fan motor.■

(cont'd)

Protected by AR

Radiator and A/C Condenser Fan Low Speed Circuit Troubleshooting (cont'd)

22. Turn the A/C and fan switches OFF, then turn the ignition switch OFF.

23. Disconnect the jumper wire.

24. Remove the fan control relay from the multi-relay box, and test it (see page 22-51).

Is the relay OK?

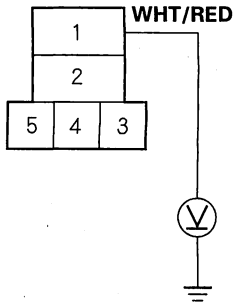
YES—Go to step 25.

NO—Replace the fan control relay. ■

25. Turn the ignition switch ON (II), then turn the A/C and fan switches ON.

26. Measure the voltage between the No. 1 terminal of the fan control relay 5P socket and body ground.

FAN CONTROL RELAY 5P SOCKET



Is there battery voltage?

YES—Go to step 27.

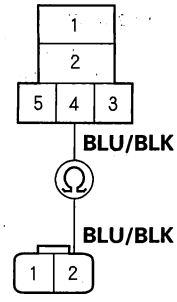
NO—Repair open in the wire between the A/C condenser fan and the fan control relay. ■

27. Turn the A/C and fan switches OFF, then turn the ignition switch OFF.

28. Disconnect the radiator fan 2P connector.

29. Check for continuity between the No. 4 terminal of the fan control relay 5P socket and the No. 2 terminal of the radiator fan 2P connector.

FAN CONTROL RELAY 5P SOCKET



RADIATOR FAN 2P CONNECTOR
Wire side of female terminals

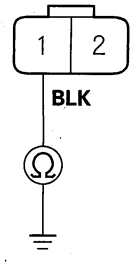
Is there continuity?

YES—Go to step 30.

NO—Repair open in the wire between the fan control relay and the radiator fan. ■

30. Check for continuity between the No. 1 terminal of the radiator fan 2P connector and body ground.

RADIATOR FAN 2P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Replace the radiator fan motor. ■

NO—Check for an open in the wire between the radiator fan and body ground. If the wire is OK, check for poor ground at G301. ■

BACK

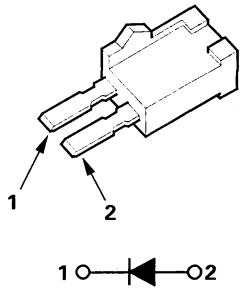
Protected by AR

31. Turn the ignition switch OFF.

32. Remove A/C diode A from the under-hood fuse/relay box.

33. Check for current flow in both directions between the No. 1 and No. 2 terminals of A/C diode A.

A/C DIODE A



Is there current flow in only one direction?

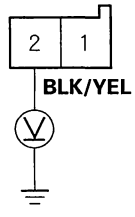
YES—Go to step 34.

NO—Replace A/C diode A. ■

34. Turn the ignition switch ON (II).

35. Measure the voltage between the No. 2 terminal of A/C diode A 2P socket and body ground.

A/C DIODE A 2P SOCKET



Is there battery voltage?

YES—Replace the under-hood fuse/relay box. ■

NO—Repair open in the wire between the No. 30 fuse in the under-dash fuse/relay box and A/C diode A. ■

A/C Condenser Fan High Speed Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if the radiator fan and/or the A/C compressor is inoperative. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Check the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES—Go to step 2.

   NO—Replace the fuse, and recheck. ■

2. Remove the fan control relay from the multi-relay box, and test it (see page 22-51).

   Is the relay OK?

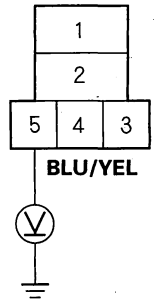
   YES—Go to step 3.

   NO—Replace the fan control relay. ■

3. Turn the ignition switch ON (II).

4. Measure the voltage between the No. 5 terminal of the fan control relay 5P socket and body ground.

FAN CONTROL RELAY 5P SOCKET



Is there battery voltage?

YES—Go to step 5.

NO—Go to step 9.

5. Turn the ignition switch OFF.

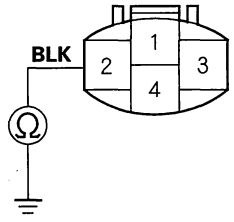
Radiator and A/C Condenser Fan High Speed Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if only one fan is inoperative, or if the A/C compressor is inoperative. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Disconnect the A/C pressure switch 4P connector.

2. Check for continuity between the No. 2 terminal of the A/C pressure switch 4P connector and body ground.

A/C PRESSURE SWITCH 4P CONNECTOR



Wire side of female terminals

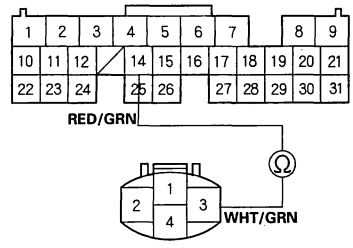
Is there continuity?

YES—Go to step 3.

NO—Check for an open in the wire between the A/C pressure switch and body ground. If the wire is OK, check for poor ground at G201.■

3. Using the backprobe set, check for continuity between the No. 14 terminal of PCM connector E (31P) and the No. 3 terminal of the A/C pressure switch 4P connector.

PCM CONNECTOR E (31P)
Wire side of female terminals



A/C PRESSURE SWITCH 4P CONNECTOR
Wire side of female terminals

Is there continuity?

YES—Go to step 4.

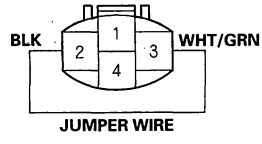
NO—Repair open in the wire between the PCM and the A/C pressure switch.■

4. Turn the ignition switch ON (II).

5. Turn the A/C and blower fan switches on.

6. Connect the No. 2 and No. 3 terminals of the A/C pressure switch 4P connector with a jumper wire.

A/C PRESSURE SWITCH 4P CONNECTOR



Wire side of female terminals

Does the radiator and A/C condenser fans run high speed?

YES—Replace the A/C pressure switch.■

NO—Check for loose wires or poor connections at PCM connector E (31P) and at the A/C pressure switch 4P connector. If the connections are good, substitute a known-good PCM, and recheck. If the symptom/indication goes away, replace the original PCM, the perform the PCM idle learn procedure (see page 11-302).■

A/C Compressor Clutch Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if the fans are also inoperative with the A/C on. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Check the No. 12 (7.5A) fuse in the under-hood fuse/relay box, and the No. 30 (7.5A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES—Go to step 2.

   NO—Replace the fuse(s), and recheck. ■

2. Check the engine coolant temperature, throttle position, and idle speed (use the HDS PGM-FI data list if possible).

ECT Sensor	169—194°F (76—90°C)
TP Sensor	About 0.5 V
RPM	MT: More than 750 AT: More than 730

   Is the coolant temperature, throttle position, or idle speed OK?

   YES—Go to step 3.

   NO—Troubleshoot and repair the cause of the high engine coolant temperature, low idle, or excessively high throttle position sensor reading. ■

3. Remove the A/C compressor clutch relay from the under-hood fuse/relay box, and test it, refer to the 2003-2006 Accord service Manual (see page 22-79).

   Is the relay OK?

   YES—Go to step 4.

   NO—Replace the A/C compressor clutch relay. ■

4. Measure the voltage between the No. 1 terminal of the A/C compressor clutch relay 4P socket and body ground.

   A/C COMPRESSOR CLUTCH RELAY 4P SOCKET

   Is there battery voltage?

   YES—Go to step 5.

   NO—Replace the under-hood fuse/relay box. ■

5. Connect the No. 1 and No. 2 terminals of the A/C compressor clutch relay 4P socket with a jumper wire.

   A/C COMPRESSOR CLUTCH RELAY 4P SOCKET

   Does the A/C compressor clutch click?

   YES—Go to step 6.

   NO—Go to step 14.

BACK

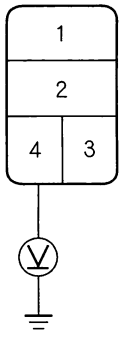
Protected by AR

6. Disconnect the jumper wire.

7. Turn the ignition switch ON (II).

8. Measure the voltage between the No. 4 terminal of the A/C compressor clutch relay 4P socket and body ground.

A/C COMPRESSOR CLUTCH RELAY 4P SOCKET



Is there battery voltage?

YES—Go to step 9.

NO—Repair open in the wire between the No. 30 fuse in the under-dash fuse/relay box and the A/C compressor clutch relay. ■

9. Turn the ignition switch OFF.

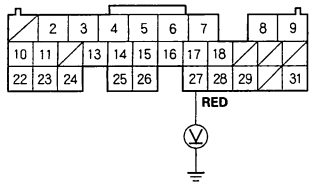
10. Reinstall the A/C compressor clutch relay.

11. Make sure the A/C switch is OFF.

12. Turn the ignition switch ON (II).

13. Using the backprobe set, measure the voltage between the No. 27 terminal of PCM connector A (31P) and body ground with the PCM connectors connected.

PCM CONNECTOR A (31P)



Wire side of female terminals

Is there battery voltage?

YES—Check for loose wires or poor connections at No. 27 terminal of PCM connector A (31P). If the connections are good, substitute a known-good PCM, and recheck. If the symptom/indication goes away, replace the original PCM then perform the PCM idle learn procedure (see page 11-302). ■

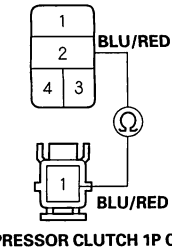
NO—Repair open in the wire between the A/C compressor clutch relay and the PCM. ■

14. Disconnect the jumper wire.

15. Disconnect the A/C compressor clutch 1P connector.

16. Check for continuity between the No. 2 terminal of the A/C compressor clutch relay 4P socket and the No. 1 terminal of the A/C compressor clutch 1P connector.

A/C COMPRESSOR CLUTCH RELAY 4P SOCKET



A/C COMPRESSOR CLUTCH 1P CONNECTOR
Terminal side of male terminals

Is there continuity?

YES—Check the A/C compressor clutch clearance, and the A/C compressor clutch field coil (see page 21-43). Repair as needed. ■

NO—Repair open in the wire between the A/C compressor clutch relay and the A/C compressor clutch. ■

Protected by AR

A/C Pressure Switch Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if any of the following items are operative; A/C condenser fan, radiator fan, A/C compressor, or if the heater is inoperative. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Check for body DTCs in test mode A of the MICS, refer to the 2003-2006 Accord Service Manual (see page 22-91).

   Are there any DTCs indicated?

   YES—Do the appropriate troubleshooting for the DTC indicated. ■

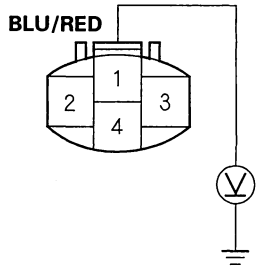
   NO—Go to step 2.

2. Disconnect the A/C pressure switch 4P connector.

3. Turn the ignition switch ON (II).

4. Measure the voltage between the No. 1 terminal of the A/C pressure switch 4P connector and body ground.

A/C PRESSURE SWITCH 4P CONNECTOR



Wire side of female terminals

Is there 5 V or more?

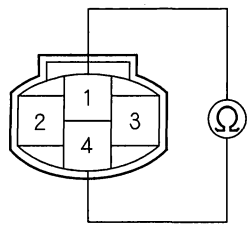
YES—Go to step 5.

NO—Repair open in the wire between the relay module and the A/C pressure switch. If the wire is OK, replace the relay module. ■

5. Turn the ignition switch OFF.

6. Check for continuity between the No. 1 and No. 4 terminals of the A/C pressure switch.

A/C PRESSURE SWITCH



Is there continuity?

YES—Go to step 7.

NO—Go to step 16.

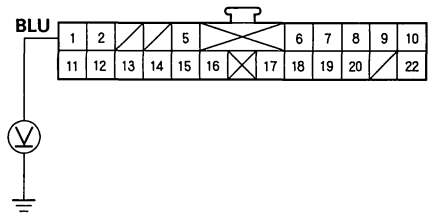
7. Reconnect the A/C pressure switch 4P connector.

8. Disconnect audio-HVAC display panel 22P connector.

9. Turn the ignition switch ON (II).

10. Measure the voltage between the No. 1 terminal of audio-HVAC display panel 22P connector and body ground.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR



Wire side of female terminals

Is there 5 V or more?

YES—Go to step 11.

NO—Repair open in the wire between the audio-HVAC display panel and the A/C pressure switch. ■

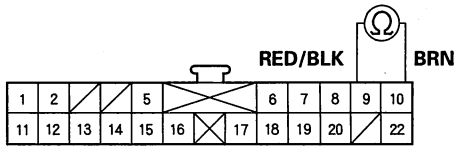
BACK

Protected by AR

11. Turn the ignition switch OFF.

12. Measure the resistance between the No. 9 and No. 10 terminals of the audio-HVAC display panel 22P connector.

AUDIO-HVAC DISPLAY PANEL 22P CONNECTOR



Wire side of female terminals

Is the resistance less than 24 kΩ ?

YES—Go to step 13.

NO—Repair cause of high resistance in the evaporator temperature circuit. ■

13. Reconnect the audio-HVAC display panel 22P connector.

14. Turn the ignition switch ON (II).

15. Check the blower motor operation at several speeds.

Does the blower motor operate at all speeds?

YES—Check for loose wires or poor connections at the audio-HVAC display panel 22P connector and at the A/C pressure switch 4P connector. If the connections are good, substitute a known-good audio-HVAC display panel, and recheck. If the symptom/indication goes away, replace the original front panel assembly. ■

NO—Repair the problem in the blower motor circuit. ■

16. Check for proper A/C system pressure.

Is the pressure within specifications?

YES—Replace the A/C pressure switch. ■

NO—Repair the A/C pressure problem. ■

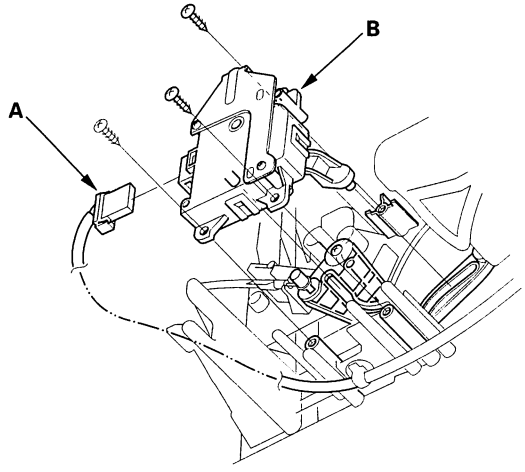
Air Mix Control Motor Replacement

4-door

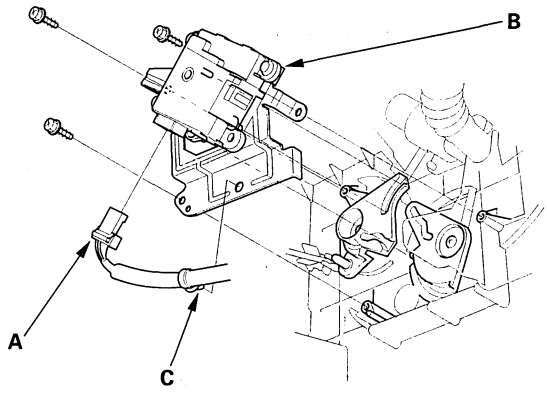
1. Remove the driver's dashboard lower cover, then remove the driver's dashboard under cover, refer to the 2003-2006 Accord Service Manual (see page 20-130).
2. Disconnect the 7P connector (A) from the air mix control motor (B). Remove the self-tapping screws and the air mix control motor from the heater unit.



3. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

2-door

1. Remove the driver's dashboard lower cover, then remove the driver's dashboard under cover, refer to the 2003-2006 Accord Service Manual (see page 20-130).
2. Disconnect the 5P connector (A) from the air mix control motor (B). Remove wire harness clip (C), the self-tapping screws and the air mix control motor from the heater unit.



3. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

BACK

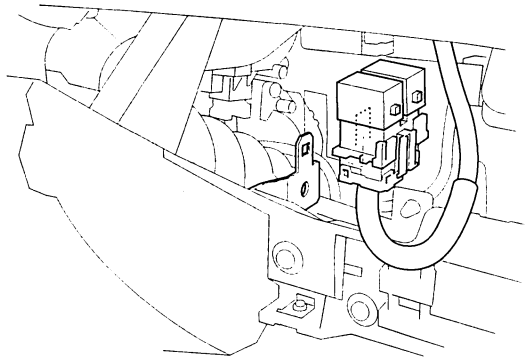
Mode Control Motor Replacement

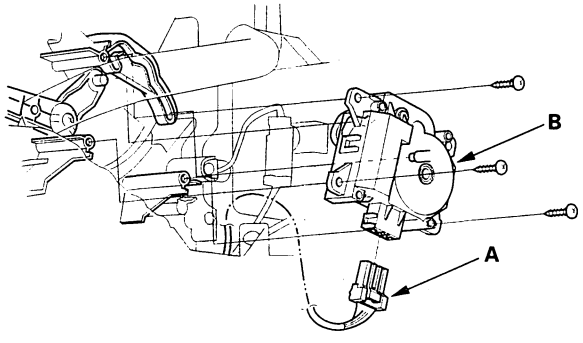
4-door

1. Open the glove box. Remove the damper from the glove box, then release the glove box stops and let the glove box hang down, refer to the 2003-2006 Accord Service Manual (see page 20-132).

2. Remove the relays from the bracket.



3. Disconnect the 7P connector (A) from the mode control motor (B). Remove the self-tapping screws and the mode control motor from the heater unit.

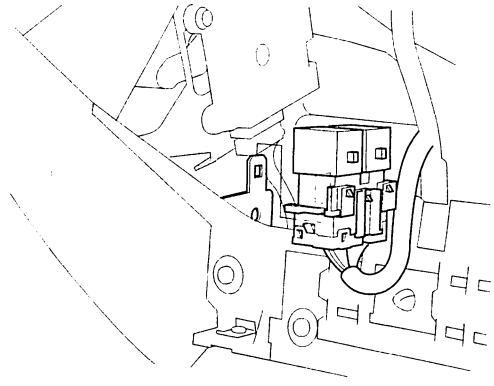


4. Install the motor in the reverse order of removal. After installation, make sure the motor runs smoothly.

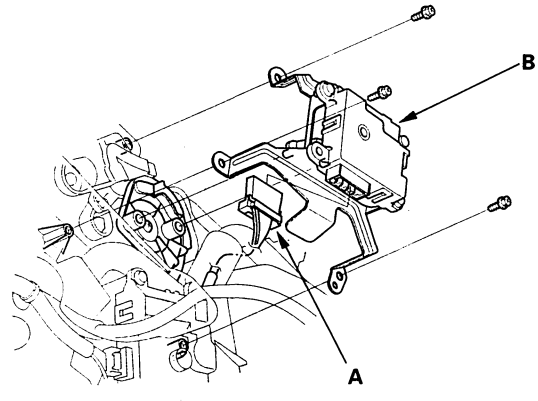
2-door

1. Open the glove box. Remove the damper from the glove box, then release the glove box stops and let the glove box hang down, refer to the 2003-2006 Accord Service Manual (see page 20-132).

2. Remove the relays from the bracket.



3. Disconnect the 10P connector (A) from the mode control motor (B). Remove the self-tapping screws and the mode control motor from the heater unit.



4. Install the motor in the reverse order of removal. After installation, make sure the motor runs smoothly.

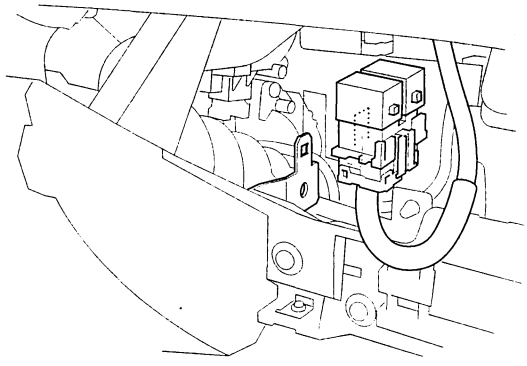
Evaporator Temperature Sensor Replacement

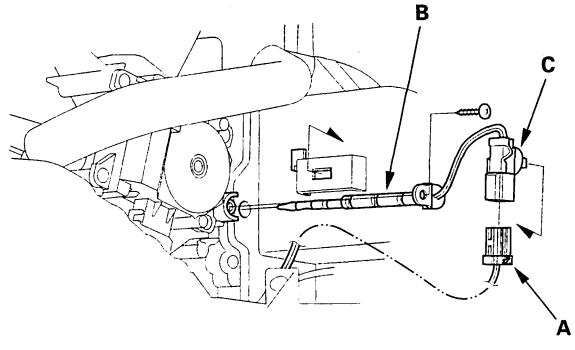
4-door

1. Open the glove box. Remove the damper from the glove box, then release the glove box stops and let the glove box hang down, refer to the 2003-2006 Accord Service Manual (see page 20-132).

2. Remove the relays from the bracket.



3. Disconnect the 2P connector (A) from the evaporator temperature sensor (B), then remove the connector clip (C). Remove the self-tapping screw, and carefully pull out the evaporator temperature sensor.

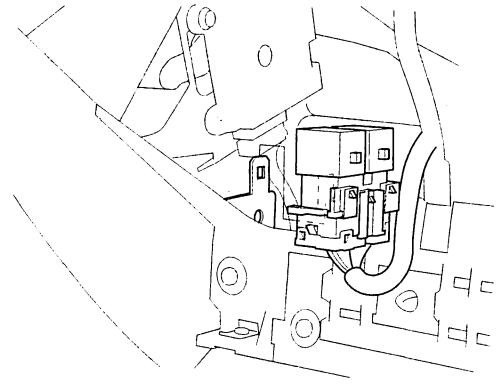


4. Install the sensor in the reverse order of removal.

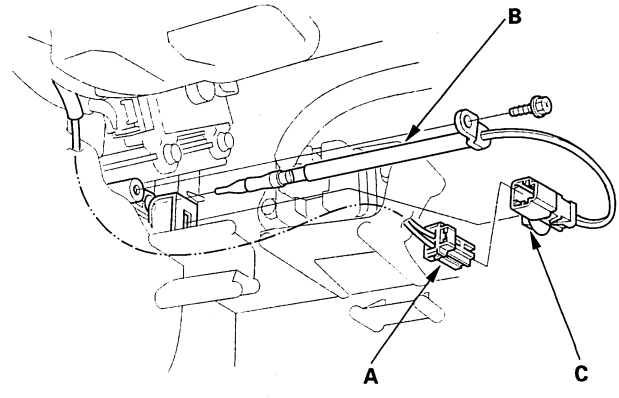
2-door

1. Open the glove box. Remove the damper from the glove box, then release the glove box stops and let the glove box hang down, refer to the 2003-2006 Accord Service Manual (see page 20-132).

2. Remove the relays from the bracket.



3. Disconnect the 2P connector (A) from the evaporator temperature sensor (B), then remove the connector clip (C). Remove the self-tapping screw, and carefully pull out the evaporator temperature sensor.



4. Install the sensor in the reverse order of removal.

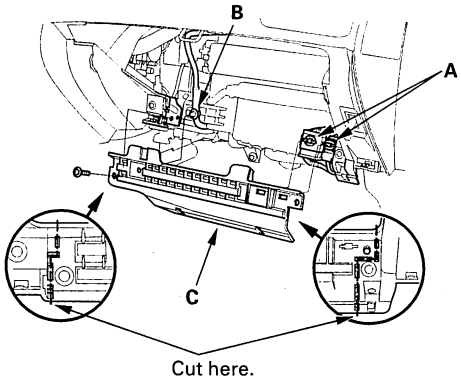
Protected by AR

Blower Unit Removal and Installation

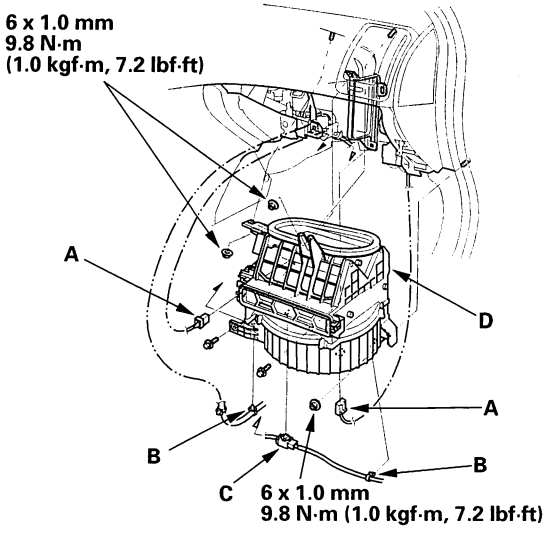
4-door

1. Remove the glove box, refer to the 2003-2006 Accord Service Manual (see page 20-132), passenger's dashboard lower cover, refer to the 2003-2006 Accord Service Manual (see page 20-130) and the passenger's kick panel, refer to the 2003-2006 Accord Service Manual (see page 20-90).

2. Remove the connector clips (A), the wire harness clip (B), and bolt. Cut the plastic cross brace (C) in the glove box opening with diagonal cutters in the area shown. Retain these parts to be reinstalled later.



3. Disconnect the connectors (A) from the blower motor and the recirculation control motor, then remove the wire harness clips (B) and the connector clip (C). Remove the mounting nuts, the mounting bolts and the blower unit (D).

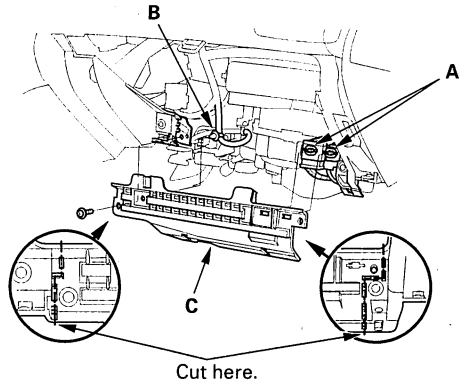


4. Install the unit in the reverse order of removal. Make sure that there is no air leakage.

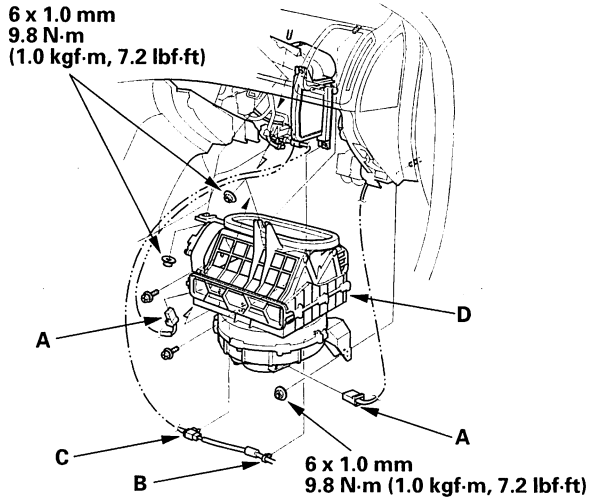
2-door

1. Remove the glove box, refer to the 2003-2006 Accord Service Manual (see page 20-132), passenger's dashboard lower cover, refer to the 2003-2006 Accord Service Manual (see page 20-130) and the passenger's kick panel, refer to the 2003-2006 Accord Service Manual (see page 20-90).

2. Remove the connector clips (A), the wire harness clip (B), and bolt. Cut the plastic cross brace (C) in the glove box opening with diagonal cutters in the area shown. Retain these parts to be reinstalled later.



3. Disconnect the connectors (A) from the blower motor and the recirculation control motor, then remove the wire harness clip (B) and the connector clip (C). Remove the mounting nuts, the mounting bolts and the blower unit (D).



4. Install the unit in the reverse order of removal. Make sure that there is no air leakage.

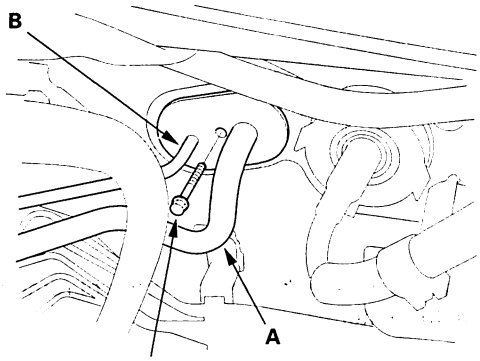
Evaporator Core Replacement

4-door

1. Recover the refrigerant with a recovery/recycling/charging station, refer to the 2003-2006 Accord Service Manual (see page 21-65).

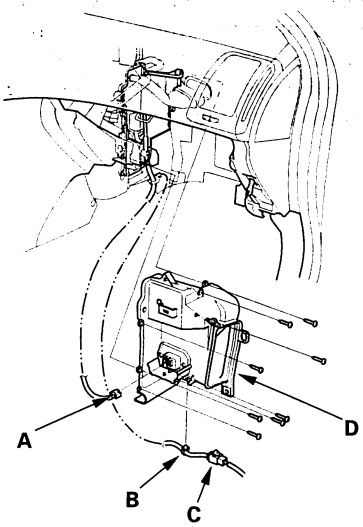
2. Remove the bolt, then disconnect the suction line (A) and the receiver line (B) from the evaporator core.



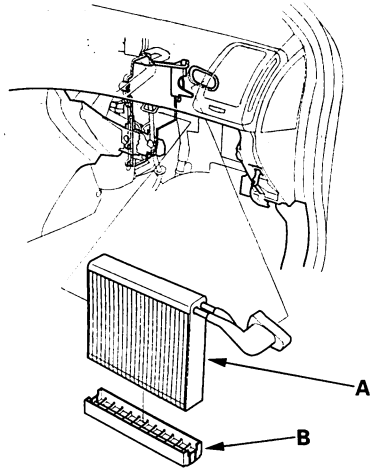
3. Remove the blower unit (see page 21-36).

4. Remove the evaporator temperature sensor (see page 21-35).

5. Disconnect the connector (A) from the power transistor, then remove the wire harness clip (B), the connector clip (C), the self-tapping screws, and the expansion valve cover (D).



6. Carefully pull out the evaporator core (A) and the plate (B) without bending the pipes.



7. Install the core in the reverse order of removal, and note these items:

- If you're installing a new evaporator core, add refrigerant oil (DENSO ND-OIL 8), refer to the 2003-2006 Accord Service Manual (see page 21-8).
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
- Make sure that there is no air leakage.
- Charge the system, refer to the 2003-2006 Accord Service Manual (see page 21-67).

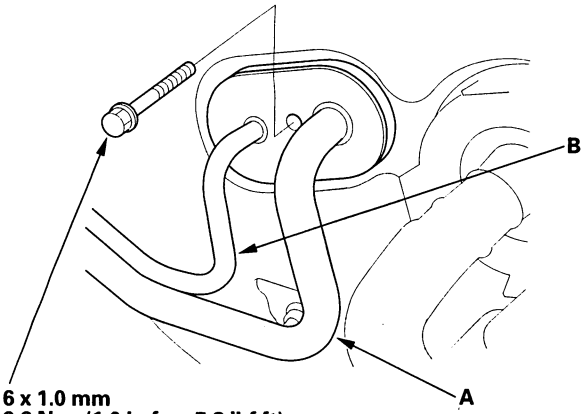
Protected by AR

Evaporator Core Replacement (cont'd)

2-door

1. Recover the refrigerant with a recovery/recycling/charging station, refer to the 2003-2006 Accord Service Manual (see page 21-65).

2. Remove the bolt, then disconnect the suction line (A) and the receiver line (B) from the evaporator core.

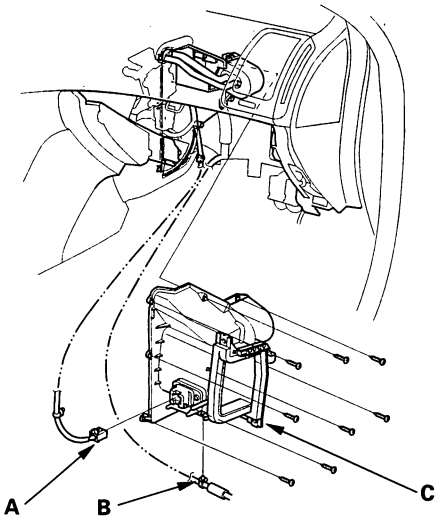


6 x 1.0 mm
9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)

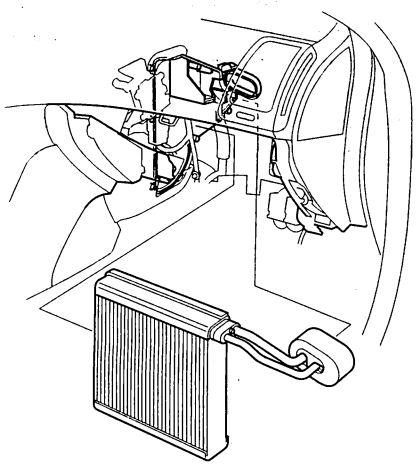
3. Remove the blower unit (see page 21-36).

4. Remove the evaporator temperature sensor (see page 21-35).

5. Disconnect the connector (A) from the power transistor, then remove the wire harness clip (B), the self-tapping screws, and the expansion valve cover (C).



6. Carefully pull out the evaporator core without bending the pipes.



7. Install the core in the reverse order of removal, and note these items:

- If you're installing a new evaporator core, add refrigerant oil (DENSO ND-OIL 8), refer to the 2003-2006 Accord Service Manual (see page 21-8).
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
- Make sure that there is no air leakage.
- Charge the system, refer to the 2003-2006 Accord Service Manual (see page 21-67).

Heater Unit/Core Replacement

SRS components are located in this area. Review the SRS component locations, refer to the 2003-2006 Accord Service Manual (see page 23-17) and the precautions and procedures, refer to the 2003-2006 Accord Service Manual (see page 23-19) before performing repairs of service.

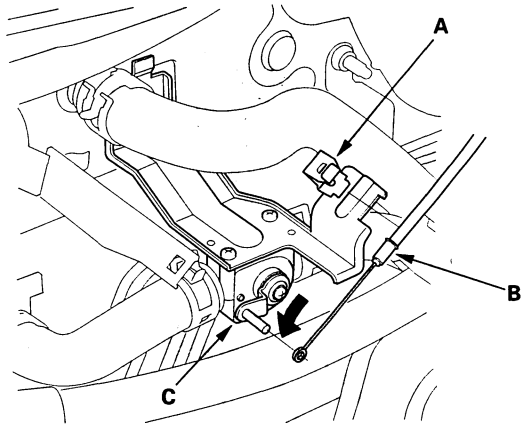
1. Make sure you have the anti-theft code for the radio and the navigation system, then write down the frequencies for the radio's preset buttons.

2. Disconnect the negative cable from the battery.

3. With air conditioning; disconnect the suction and receiver lines from the evaporator core.

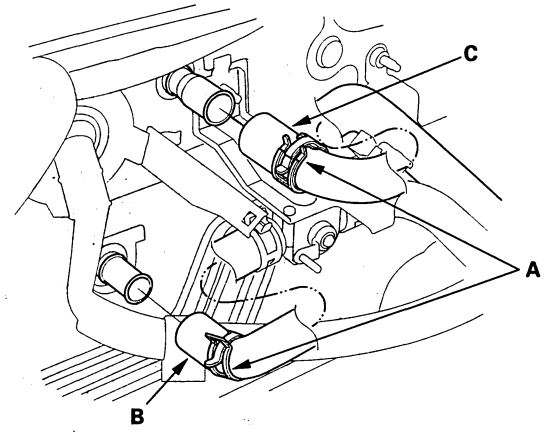
   - 4-door (see page 21-37)
   - 2-door (see page 21-38)

4. From under the hood, open the cable clamp (A), then disconnect the heater valve cable (B) from the heater valve arm (C). Turn the heater valve arm to the fully opened position as shown.

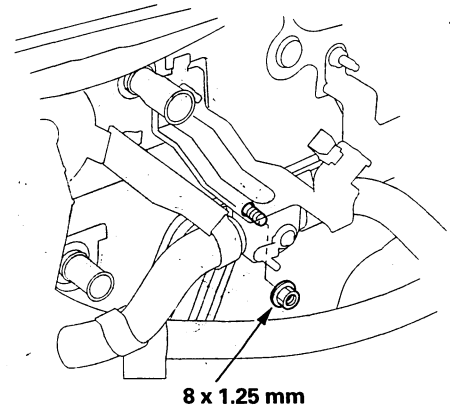


5. When the engine is cool, drain the engine coolant from the radiator, refer to the 2003-2006 Accord Service Manual (see page 10-6).

6. Slide the hose clamps (A) back, then disconnect the inlet heater hose (B) and the outlet heater hose (C) from the heater unit. Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.



7. Remove the mounting nut from the heater unit. Take care not to damage or bend the fuel lines and the brake lines, etc..



8. Remove the dashboard, refer to the 2003-2006 Accord Service Manual (see page 20-136).

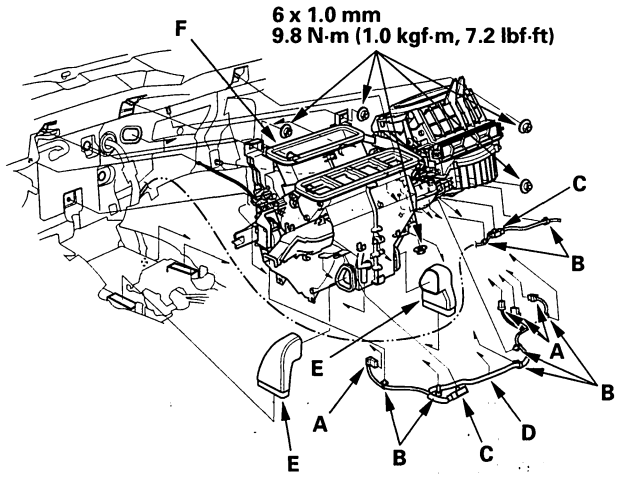
(cont'd)

Protected by AR

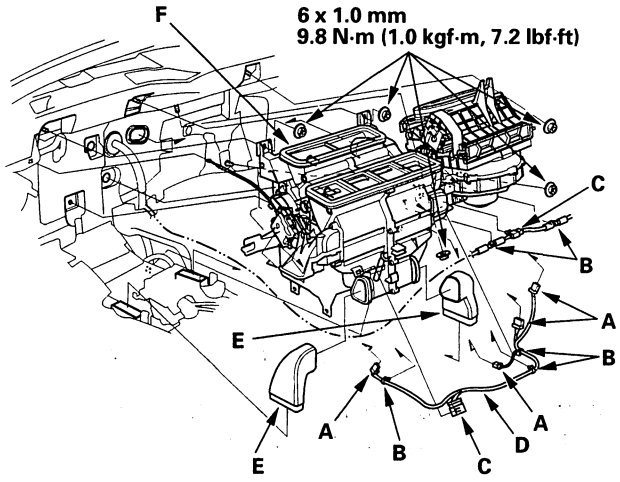
Heater Unit/Core Replacement (cont'd)

9. Disconnect the connectors (A) from the air mix control motor, the evaporator temperature sensor, the power transistor, and the recirculation control motor, then remove the wire harness clips (B), the connector clips (C) and the wire harness (D). Remove the heater ducts (E), then remove the mounting nuts and the blower-heater unit (F).

4-door

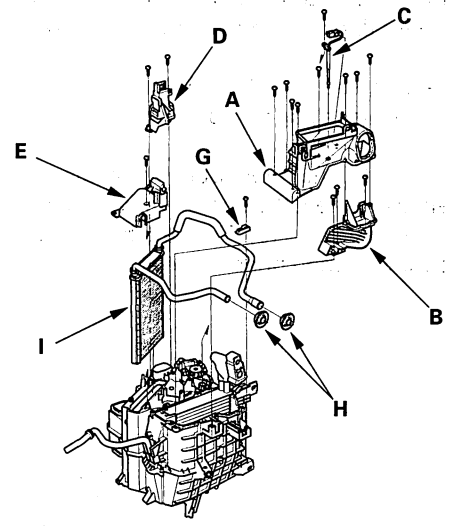


2-door

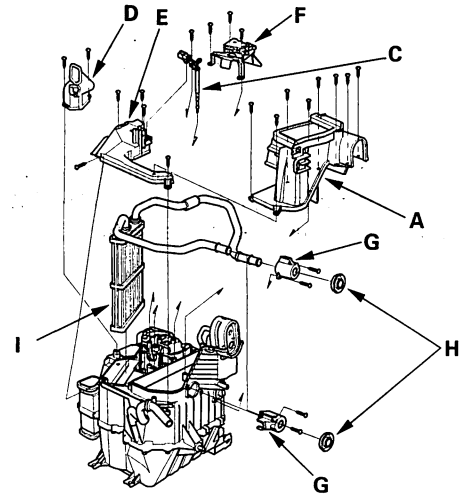


10. Remove the self-tapping screws, the evaporator temperature sensor (C) and the joint duct A, then remove the self-tapping screws and the joint duct B (4-door). Remove the self-tapping screws, then remove the passenger's heater outlet (D), and the heater core cover (E). Remove the self-tapping screws and the mode control motor (F) (2-door). Remove the self-tapping screws, the heater pipe brackets (G), the grommets (H) and carefully pull out the heater core (I) so you don't bend the inlet outlet pipes.

4-door



2-door



BACK

Protected by AR

11. Install the heater core, and the evaporator core in the reverse order of removal.

12. Install the heater unit in the reverse order of removal, and note these items:

    - Do not interchange the inlet and outlet heater hoses, and install the hose clamps securely.
    - Refill the cooling system with engine coolant, refer to the 2003-2006 Accord Service Manual (see page 10-6).
    - Adjust the heater valve cable, refer to the 2003-2006 Accord Service Manual (see page 21-56).
    - Make sure that there is no coolant leakage.
    - Make sure that there is no air leakage.
    - Refer to evaporator core replacement (see step 6 on page 21-37).
    - Reset the power window control unit, refer to the 2003-2006 Accord Service Manual (see page 22-232).
    - Enter the anti-theft codes for the radio and the navigation system, then enter the customer's radio station presets.

1. If the A/C compressor is marginally operable, run the engine at idle speed, and let the air conditioning work for a few minutes, then shut the engine off.

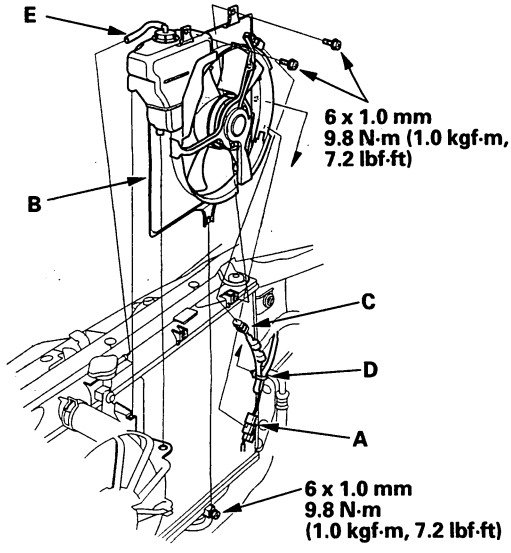
2. Make sure you have the anti-theft codes for the radio and the navigation system, then write down the frequencies for the radio's preset buttons.

3. Disconnect the negative cable from the battery.

4. Recover the refrigerant with a recovery/recycling/charging station, refer to the 2003-2006 Accord Service Manual (see page 21-65).

5. Remove the ignition coil cover (see step 1 on page 4-20), and the alternator (see page 4-38).

6. Remove the A/C compressor clutch connector (A) from the A/C condenser fan shroud (B). Disconnect the A/C condenser fan connector (C), then remove the wire harness clip (D) from the A/C condenser fan shroud. Remove the hose (E) from the radiator. Loosen the lower mounting bolt, then remove the upper mounting bolts and the A/C condenser fan shroud. Be careful not to damage the radiator fins when removing the A/C condenser fan shroud.

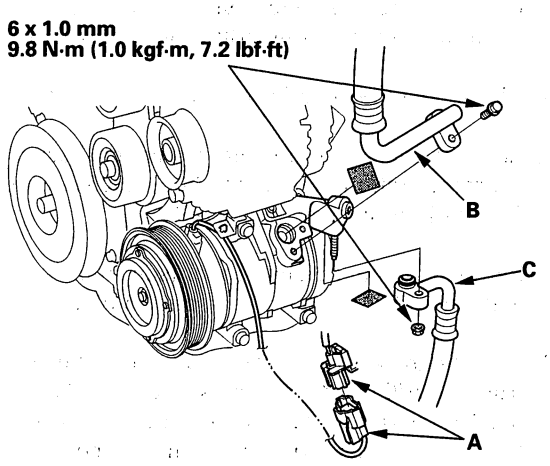


(cont'd)

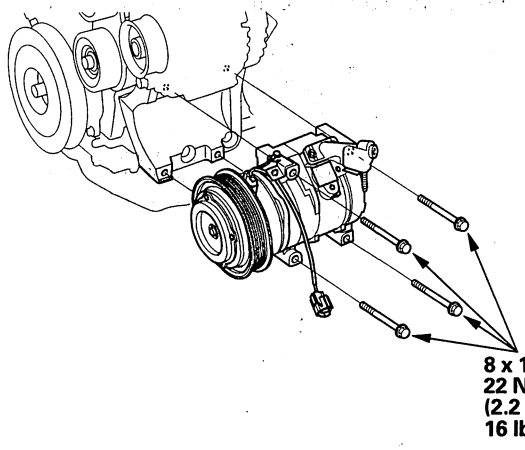
Protected by AR

A/C Compressor Replacement (cont'd)

7. Disconnect the A/C compressor clutch connector (A). Remove the bolt and the nut, then disconnect the suction line (B) and discharge line (C) from the A/C compressor. Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.



8. Remove the mounting bolts and the A/C compressor. Be careful not to damage the radiator fins when removing the A/C compressor.



9. Install the A/C compressor in the reverse order of removal, and note these items:

- If you're installing a new A/C compressor, you must calculate the amount of refrigerant oil to be removed from it, refer to the 2003-2006 Accord Service Manual (see page 21-8).
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
- Use refrigerant oil (DENSO ND-OIL 8) for HFC-134a DENSO piston type A/C compressor only.
- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
- Be careful not to damage the radiator fins when installing the A/C compressor, the alternator or the A/C condenser fan shroud.
- Charge the system, refer to the 2003-2006 Accord Service Manual (see page 21-67).
- Reset the power window control unit, refer to the 2003-2006 Accord Service Manual (see page 22-232).
- Enter the anti-theft codes for the radio and the navigation system, then enter the customer's radio station presets.

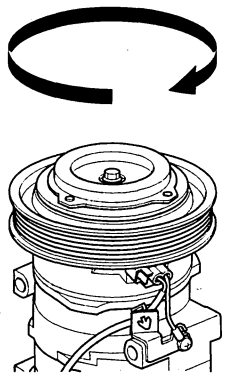
A/C Compressor Clutch Check

1. Check the pressure plate for discoloration, peeling, or other damage. If there is damage, replace the clutch set (see page 21-44).

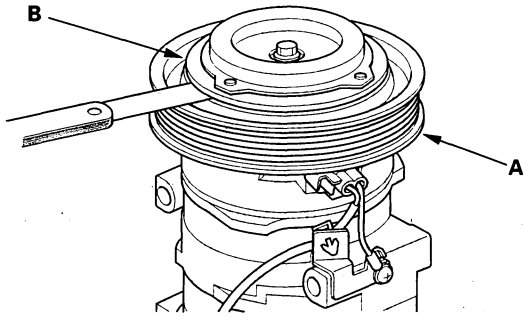
2. Check the pulley bearing play and drag by rotating the pulley by hand. Replace the clutch set with a new one if it is noisy or has excessive play/drag (see page 21-44).



3. Measure the clearance between the rotor pulley (A) and the pressure plate (B) all the way around. If the clearance is not within specified limits, remove the pressure plate (see page 21-44) and add or remove shims as needed to increase or decrease clearance.

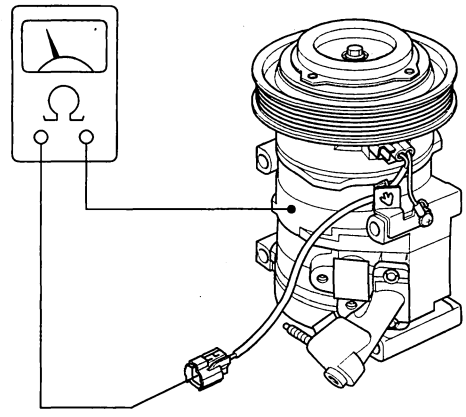
   Clearance: 0.35—0.6 mm (0.014—0.024 in.)

   NOTE: The shims are available in three thicknesses: 0.1 mm, 0.3 mm and 0.5 mm.



4. Check resistance of the field coil. If resistance is not within specifications, replace the field coil (see page 21-44).

   Field Coil Resistance: 3.9—4.3 Ω at 68°F (20°C)

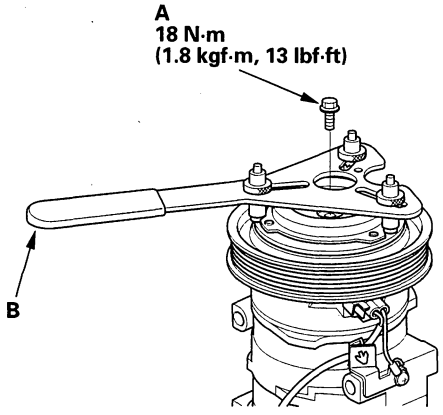


Protected by AR

A/C Compressor Clutch Overhaul

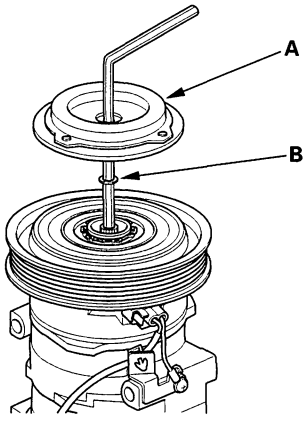
Special Tools Required
A/C clutch holder, Robinair 10204 or Kent-Moore J37872, or Honda Tool and Equipment KMT-J33939, commercially available

1. Remove the center bolt (A) while holding the pressure plate with a commercially available A/C clutch holder (B).

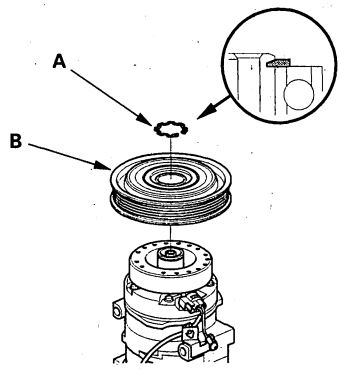


2. Remove the pressure plate (A) and shim(s) (B), taking care not to lose the shim(s). If the clutch needs adjustment, increase or decrease the number and thickness of shims as nesessary, then reinstall the pressure plate, and recheck its clearance (see page 21-43).

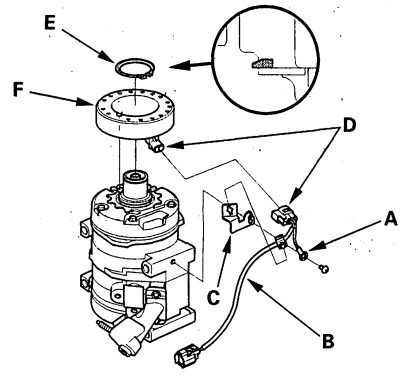
   NOTE: The shims are available in three thicknesses: 0.1 mm, 0.3 mm and 0.5 mm.



3. If you are replacing the field coil, remove the snap ring (A) with snap ring pliers, then remove the pulley (B). Be careful not to damage the pulley or the A/C compressor.



4. Remove the screw from the field coil ground terminal (A), then remove the wire harness (B) and the bracket (C). Disconnect the field coil connector (D). Remove the snap ring (E) with snap ring pliers, then remove the field coil (F). Be careful not to damage the field coil or the A/C compressor.



5. Reassemble the clutch in the reverse order of disassembly, and note these items:

   - Install the field coil with the wire side facing down, and align the boss on the field coil with the hole in the A/C compressor.
   - Clean the pulley and A/C compressor sliding surfaces with contact cleaner or other non-petroleum solvent.
   - Install new snap rings, note the installation direction, and make sure they are fully seated in the groove.
   - Make sure that the pulley turns smoothly after it's reassembled.
   - Route and clamp the wires properly or they can be damaged by the pulley.

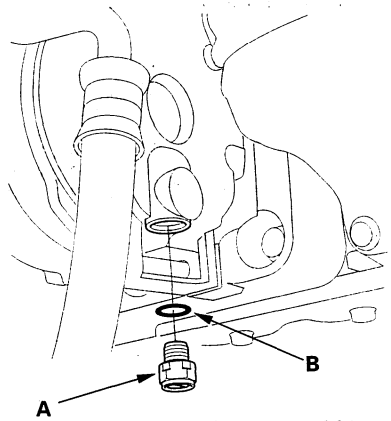
Protected by AR

A/C Compressor Relief Valve Replacement

1. Recover the refrigerant with a recovery/recycling/charging station, refer to the 2003-2006 Accord Service Manual (see page 21-65).

2. Remove the relief valve (A) and the O-ring (B). Plug the opening to keep foreign matter from entering the system and the A/C compressor oil from running out.



13.2 N·m (1.35 kgf·m, 9.76 lbf·ft)

3. Clean the mating surfaces.

4. Replace the O-ring with a new one at the relief valve, and apply a thin coat of refrigerant oil before installing it.

5. Remove the plug, and install and tighten the relief valve.

6. Charge the system, refer to the 2003-2006 Accord Service Manual (see page 21-67).

Protected by AR

A/C Condenser Replacement

1. Make sure you have the anti-theft code for the radio and the navigation system, then write down the frequencies for the radio's preset buttons.

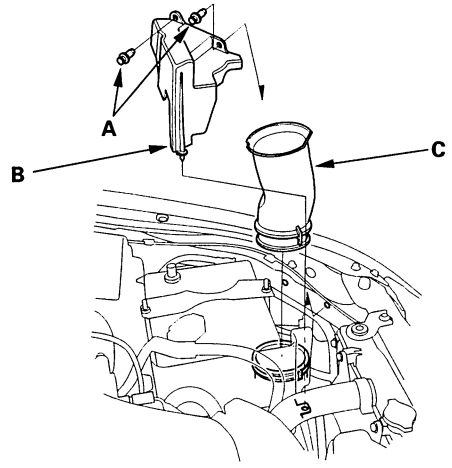
2. Recover the refrigerant with a recovery/recycling charging station, refer to the 2003-2006 Accord Service Manual (see page 21-65).

3. Remove the front bulkhead cover, refer to the 2003-2006 Accord Service Manual.

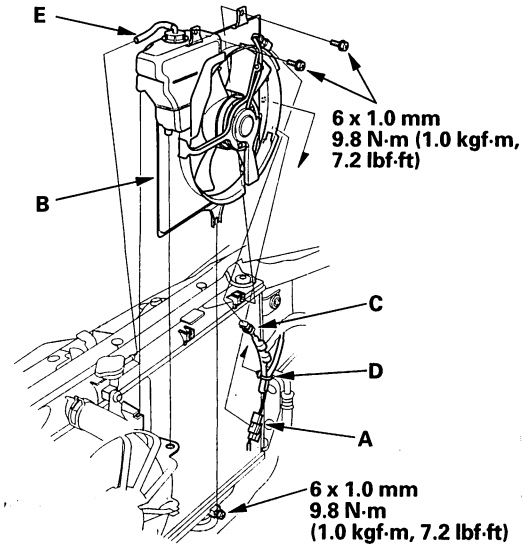
   - 2-door (see page 20-184)
   - 4-door (see page 20-185)

4. Remove the battery and the battery box.

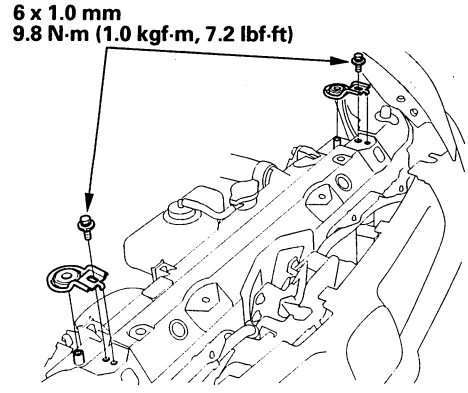
5. Remove the clips (A), then remove the air intake cover (B) and the air intake tube or duct (C).



6. Remove the A/C compressor clutch connector (A) from the A/C condenser fan shroud (B). Disconnect the A/C condenser fan connector (C), then remove the wire harness clip (D) from the A/C condenser fan shroud. Remove the hose (E) from the radiator. Loosen the lower mounting bolt, then remove the upper mounting bolts and the A/C condenser fan shroud. Be careful not to damage the radiator fins when removing the A/C condenser fan shroud.



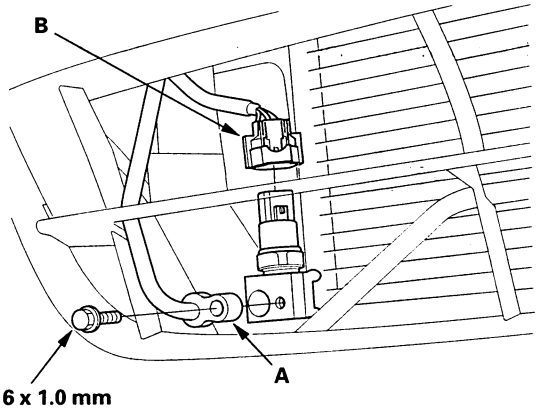
7. Remove the bolts and the radiator upper mount brackets.



BACK

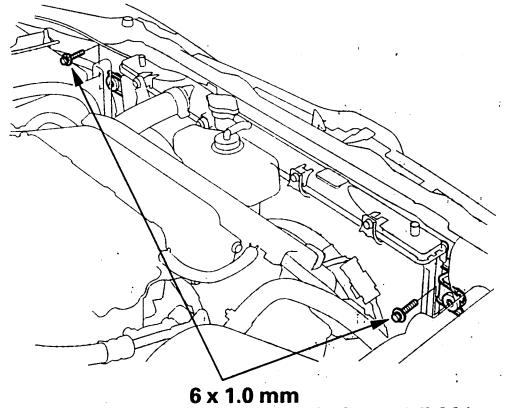
Protected by AR

8. Remove the bolt, then disconnect the receiver line (A) from the A/C condenser. Disconnect the A/C pressure switch connector (B).



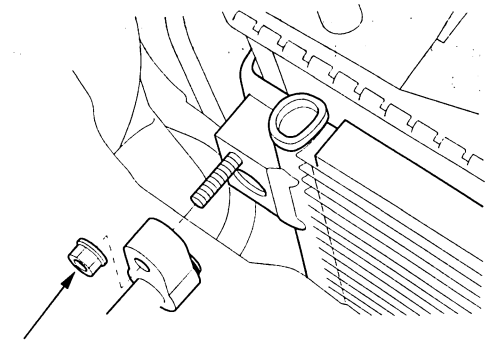
6 x 1.0 mm
9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)

9. Remove the bolts from the A/C condenser.



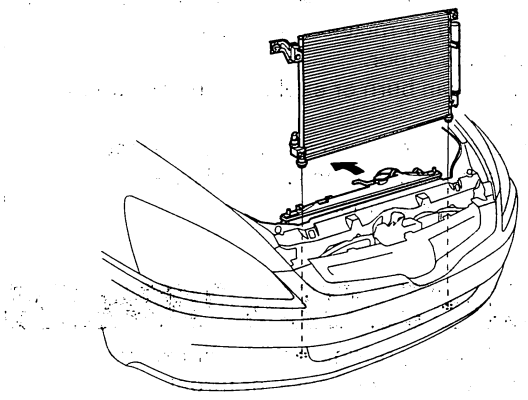
6 x 1.0 mm
9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)

10. Remove the nut, then disconnect the discharge line from the A/C condenser.



6 x 1.0 mm
9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)

11. Remove the A/C condenser by lifting it up. Be careful not to damage the radiator and A/C condenser fins when removing the A/C condenser.



12. Install the A/C condenser in the reverse order of removal, and note these items:

- If you're installing a new A/C condenser, add refrigerant oil (DENSO ND-OIL 8), refer to the 2003-2006 Accord Service Manual (see page 21-8).
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
- Be careful not to damage the radiator or the A/C condenser fins when installing the A/C condenser.
- Charge the system, refer to the 2003-2006 Accord Service Manual (see page 21-67).
- Reset the power window control unit, refer to the 2003-2006 Accord Service Manual (see page 22-232).
- Enter the anti-theft codes for the radio and the navigation system, then enter the customer's radio station presets.

Protected by AR

A/C System Test

Performance Test

⚠WARNING

- Compressed air mixed with R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.

⚠CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

The performance test will help determine if the air conditioner system is operating within specifications.

Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2210 to remove HFC-134a (R-134a) from the air conditioning system.

If accidental system discharge occurs, ventilate work area before resuming service.

R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.

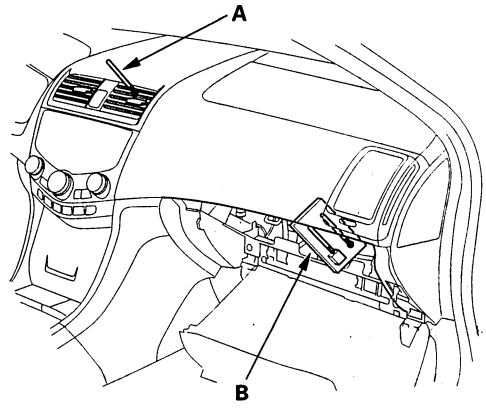
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect a R-134a refrigerant recovery/recycling/charging station to the high-pressure service port and the low-pressure service port, following the equipment manufacturer's instructions.

2. Determine the relative humidity and air temperature.

3. Open the glove box. Remove the damper from the glove box, then release the glove box stops and let the glove box hang down, refer to the 2003-2006 Accord Service Manual (see page 20-132).

4. Insert a thermometer (A) in the center vent.



5. Place a thermometer (B) near the blower unit.

6. Test conditions:

   - Avoid direct sunlight.
   - Open hood.
   - Open front doors.
   - Set the temperature control dial to Max Cool, the mode control switch to Vent and the recirculation control switch to Recirculate.
   - Turn the A/C switch on and the fan switch to Max.
   - Run the engine at 1,500 rpm.
   - No driver or passengers in vehicle.

7. After running the air conditioning for 10 minutes under the above test conditions, read the delivery temperature from the thermometer in the center vent, the intake temperature near the blower unit, and the high and low system pressure from the A/C gauges.

BACK

Protected by AR

Pressure Test

Test results	Related symptoms	Probable cause	Remedy
Discharge (high) pressure abnormally high	After stopping A/C compressor, pressure drops about 196 kPa (2.0 kgf/cm², 28 psi) quickly, and then falls gradually.	Air in system	Recover, evacuate, refer to the 2003-2006 Accord Service Manual (see page 21-66), and recharge with specified amount, refer to the 2003-2006 Accord Service Manual (see page 21-67).
	Reduced or no airflow through A/C condenser.	• Clogged A/C condenser or radiator fins • A/C condenser or radiator fan not working properly	• Clean. • Check voltage and fan rpm. • Check fan direction.
	Line to A/C condenser is excessively hot.	Restricted flow of refrigerant in system	Restricted lines.
Discharge pressure abnormally low	High and low-pressures are balanced soon after stopping A/C compressor. Low side is higher than normal.	• Faulty A/C compressor discharge valve • Faulty A/C compressor seal	Replace the A/C compressor.
	Outlet of expansion valve is not frosted, low-pressure gauge indicates vacuum.	• Faulty expansion valve • Moisture in system	• Replace. • Recover, evacuate, and recharge with specified amount.
Suction (low) pressure abnormally low	Expansion valve is not frosted, and low-pressure line is not cold. Low-pressure gauge indicates vacuum.	• Frozen expansion valve (Moisture in system) • Faulty expansion valve	• Recover, evacuate, and recharge with specified amount. • Replace the expansion valve.
	Discharge temperature is low, and the airflow from vents is restricted.	Frozen evaporator	Run the fan with A/C compressor off, then check evaporator temperature sensor.
	Expansion valve is frosted.	Clogged expansion valve	Clean or replace.
Suction pressure abnormally high	Low-pressure hose and check joint are cooler than the temperature around evaporator.	Expansion valve open too long	Repair or replace.
	Suction pressure is lowered when A/C condenser is cooled by water.	Excessive refrigerant in system	Recover, evacuate, and recharge with specified amount.
	High and low-pressure are equalized as soon as the A/C compressor is stopped, and both gauges fluctuate while running.	• Faulty gasket • Faulty high-pressure valve • Foreign particle stuck in high-pressure valve	Replace the A/C compressor.
Suction and discharge pressures abnormally high	Reduced airflow through A/C condenser.	• Clogged A/C condenser or radiator fins • A/C condenser or radiator fan not working properly	• Clean. • Check voltage and fan rpm. • Check fan direction.
Suction and discharge pressures abnormally low	Low-pressure hose and metal end areas are cooler than evaporator.	Clogged or kinked low-pressure hose parts	Repair or replace.
	Temperature around expansion valve is too low compared with that around receiver/dryer.	Clogged high-pressure line	Repair or replace.
Refrigerant leaks	A/C compressor clutch is dirty.	A/C compressor shaft seal leaking	Replace the A/C compressor.
	A/C compressor bolt(s) are dirty.	Leaking around bolt(s)	Tighten bolt(s) or replace A/C compressor.
	A/C compressor gasket is wet with oil.	Gasket leaking	Replace the A/C compressor.
	A/C fitting is dirty.	Leaking O-ring	Clean A/C fitting and replace O-ring.

A/C System Test (cont'd)

8. To complete the charts:

- Mark the delivery temperature along the vertical line.
- Mark the intake temperature (ambient air temperature) along the bottom line.
- Draw a line straight up from the air temperature to the humidity.
- Mark a point 10 % above and 10 % below the humidity level.
- From each point, draw a horizontal line across the delivery temperature.
- The delivery temperature should fall between the two lines.
- Complete the low-side pressure test and high-side pressure test in the same way.
- Any measurements outside the line may indicate the need for further inspection.

Example	Intake temperature (dry):	86°F (30°C) Humidity level 70 %
	Intake temperature (wet):	77.9°F (25.5°C)
	Intake pressure:	245 kPa (2.5 kgf/cm²) (78.3 psi)
	Delivery temperature:	61.2°F (16.2°C)
	Delivery pressure:	1902 kPa (19.4 kgf/cm²) (275.9 psi)
Results:	Within normal range

Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Recirculation control doors do not change between Fresh and Recirculate	Recirculation control motor circuit troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 21-117)	• HVAC DTCs, refer to the 2003-2006 Acoord Service Manual (see page 21-77) • Blown fuse No. 30 (7.5A) in the under-dash fuse/relay box • Cleanliness and tightness of all connectors
Blower, heater controls, and A/C do not work	Climate control power and ground circuits troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 21-119)	• HVAC DTCs, refer to the 2003-2006 Accord Service Manual (see page 21-77) • Blown fuse No. 30 (7.5A) in the under-dash fuse/relay box • Poor ground at G503 • Cleanliness and tightness of all connectors
Both fans do not run at low speed with the A/C on (but the A/C compressor runs with the A/C on)	Radiator and A/C condenser fan low speed circuit troubleshooting (see page 21-22)	• HVAC DTCs, refer to the 2003-2006 Accord Service Manual (see page 21-77) • Blown fuse No. 9 (20A) in the under-hood fuse/relay box, and No. 30 (7.5A) in the under-dash fuse/relay box • Poor ground at G301 • Cleanliness and tightness of all connectors
The A/C condenser fan does not run at high speed with the A/C on (but both fans run at low speed and the A/C compressor operates with the A/C on)	A/C condenser fan high speed circuit troubleshooting (see page 21-25)	• HVAC DTCs, refer to the 2003-2006 Accord Service Manual (see page 21-77) • Blown fuse No. 30 (7.5A) in the under-dash fuse/relay box • Poor ground at G201 • Cleanliness and tightness of all connectors
Both fans do not run at high speed with the A/C on (but both fans run at low speed and the A/C compressor operates with the A/C on)	Radiator and A/C condenser fan high speed circuit troubleshooting (see page 21-27)	• HVAC DTCs, refer to the 2003-2006 Accord Service Manual (see page 21-77) • Cleanliness and tightness of all connectors
The A/C compressor clutch does not engage (but both fans run with the A/C on)	A/C compressor clutch circuit troubleshooting (see page 21-28)	• HVAC DTCs, refer to the 2003-2006 Accord Service Manual (see page 21-77) • Blown fuse No. 12 (7.5A) in the under-hood fuse/relay box, and No. 30 (7.5A) in the under-dash fuse/relay box • Cleanliness and tightness of all connectors
A/C system does not come on (both fans and the A/C compressor do not work); heater is OK	A/C pressure switch circuit troubleshooting (see page 21-62)	• HVAC DTCs, refer to the 2003-2006 Accord Service Manual (see page 21-77) • Cleanliness and tightness of all connectors
Blower fan runs slower than expected in cold weather	ECT troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 11-3) NOTE: It is normal for the blower to run slowly until the engine coolant temperature begins to rise. If the blower continues to run slowly for an abnormal length of time, continue to troubleshoot the problem.	• Powertrain DTCs, refer to the 2003-2006 Accord Service Manual (see page 11-3)

Symptom	Diagnostic procedure	Also check for
AUTO button does not work	1. Turn the ignition switch ON (II). 2. Press the OFF button, then press the AUTO button and check the display. • If AUTO is displayed, but the climate control is not working properly, do the self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-77). • If AUTO is not displayed, check for poor connections at the climate control connector, if the connections are OK, replace the audio-HVAC display panel.	Climate control power and ground circuit troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 21-119)
OFF button does not work	1. Turn the ignition switch ON (II). 2. Press the AUTO button, then press the OFF button and check the display. • If climate control display turns off, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-77). • If the climate control display does not turn on, replace the audio-HVAC display panel.	
Dual button does not work	1. Turn the ignition switch ON (II). 2. Press the AUTO button, then press the DUAL button several times and check the DUAL button LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-77). • If the LED does not turn on or off, replace the audio-HVAC display panel.	
Recirculation button does not work	1. Turn the ignition switch ON (II). 2. Press the recirculation button several times and check the button's LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to recirculation control motor test, refer to the 2003-2006 Accord Service Manual, 4-door (see page 21-47), 2-door (see page 21-47). • If the LED does not turn on or off, replace the audio-HVAC display panel.	
Defroster button does not work	1. Turn the ignition switch ON (II). 2. Press the AUTO button, then press the defroster button several times and check the button's LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-77). • If the LED does not turn on or off, replace the audio-HVAC display panel.	
Rear window defogger button does not work	1. Turn the ignition switch ON (II). 2. Press the rear window defogger button several times and check the button's LED. The LED should toggle on and off as the button is pressed. • If the LED turns on and off, go to rear window defogger troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-299). • If the LED does not turn on or off, replace the audio-HVAC display panel.	
MODE button does not work	1. Turn the ignition switch ON (II). 2. Press the MODE button and check the display. • If the display scrolls through the modes as the MODE button is pressed, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-77). • If the display does not scroll the modes as the MODE button is pressed, replace the audio-HVAC display panel.

Symptom Troubleshooting Index (cont'd)

Symptom	Diagnostic procedure	Also check for
Fan control button does not work	1. Turn the ignition switch ON (II). 2. Press the AUTO button, then adjust the fan control button up/down and check the display. • If the display indicates the fan speed selection up/down, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-77). • If the display does not indicate the fan speed selection up/down, replace the audio-HVAC display panel.	
TEMP control dial does not work	1. Turn the ignition switch ON (II). 2. Press the AUTO button, then adjust the TEMP control dial up/down and check the display. • If the display indicates the change in temperature up/down, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-77). • If the display does not indicate the change in temperature up/down, replace the audio-HVAC display panel.	
Passenger's TEMP dial does not work	1. Turn the ignition switch ON (II). 2. Press the AUTO button, press the DUAL button, then adjust the passenger's TEMP control dial up/down and check the display. • If the display indicates the change in temperature up/down for the passenger's side, go to self-diagnostic, refer to the 2003-2006 Accord Service Manual (see page 21-77). • If the display does not indicate the change in temperature up/down for the passenger's side, replace the audio-HVAC display panel.	
Audio-HVAC display panel will not run self-diagnosis	1. Turn the ignition switch ON (II). 2. Press the A/C button, and then OFF button and check the display. • If the display turns on and off as the buttons are pressed, there are no DTCs stored, troubleshoot the individual symptoms. • If the display does not respond as the buttons are pressed, check for loose or poor connections at the audio-HVAC display panel. If the connections are OK, replace the audio-HVAC display panel.	
More than one button is not working	Climate control power and ground circuit troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 21-119).	HVAC DTCs, refer to the 2003-2006 Accord Service Manual (see page 21-77)
Audio-HVAC display/button illumination problems	Audio-HVAC display module illumination troubleshooting, refer to the 2003-2006 Accord Service Manual (see page 22-368).

A/C Pressure Switch Circuit Troubleshooting

NOTE:
- Do not use this troubleshooting procedure if the heater is inoperative or if any of the following items are operative; A/C condenser fan, radiator fan, A/C compressor. Refer to the symptom troubleshooting index.
- Before performing symptom troubleshooting, check for powertrain DTCs (see page 11-3).

1. Check for body DTCs in test mode A of the MICS, refer to the 2003-2006 Accord Service Manual (see page 22-91).

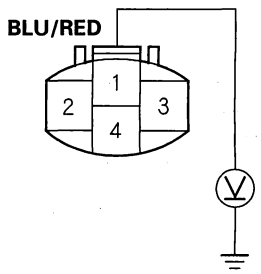
   Are there any DTCs indicated?

   YES—Do the appropriate troubleshooting for the DTC indicated.■

   NO—Go to step 2.

2. Disconnect the A/C pressure switch 4P connector.
3. Turn the ignition switch ON (II).
4. Measure the voltage between the No. 1 terminal of the A/C pressure switch 4P connector and body ground.

A/C PRESSURE SWITCH 4P CONNECTOR



Wire side of female terminals

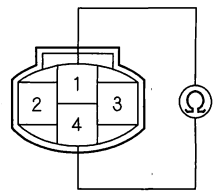
Is there 5 V or more?

YES—Go to step 5.

NO—Repair open in the wire between the relay module and the A/C pressure switch.■

5. Turn the ignition switch OFF.
6. Check for continuity between the No. 1 and No. 4 terminals of the A/C pressure switch.

A/C PRESSURE SWITCH



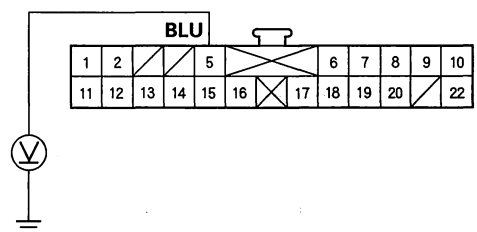
Is there continuity?

YES—Go to step 7.

NO—Go to step 16.

7. Reconnect the A/C pressure switch 4P connector.
8. Disconnect audio-HVAC display panel connector A (22P).
9. Turn the ignition switch ON (II).
10. Measure the voltage between the No. 5 terminal of audio-HVAC display panel connector A (22P) and body ground.

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Wire side of female terminals

Is there 5 V or more?

YES—Go to step 11.

NO—Repair the open in the wire between the climate control unit and the A/C pressure switch.■

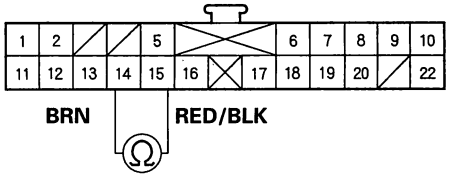
BACK

Protected by AR

11. Turn the ignition swtich OFF.

12. Measure the resistance between the No. 14 and No. 15 terminals of audio-HVAC display panel connector A (22P).

AUDIO-HVAC DISPLAY PANEL CONNECTOR A (22P)



Wire side of female terminals

Is the resistance less than 24 kΩ ?

YES—Go to step 13.

NO—Repair cause of high resistance in the evaporator temperature circuit. ■

13. Reconnect audio-HVAC display panel connector A (22P).

14. Turn the ignition switch ON (II).

15. Check the blower motor at several speeds.

Does the blower motor operate at all speeds?

YES—Check for loose wires or poor connections at audio-HVAC display panel connector A (22P) and at the A/C pressure switch 2P connector. If the connections are good, substitute a known-good audio-HVAC display panel and recheck. If the symptom/indication goes away, replace the original audio-HVAC display panel. ■

NO—Repair the problem in the blower motor circuit. ■

16. Check for proper A/C system pressure.

Is the pressure within specifications?

YES—Replace the A/C pressure switch. ■

NO—Repair the A/C pressure problem. ■

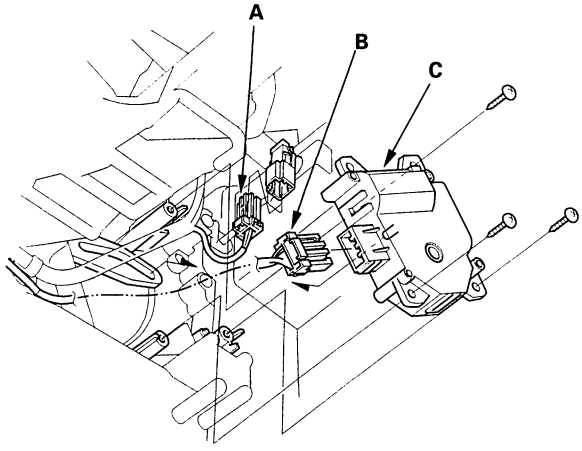
Passenger's Air Mix Control Motor Replacement

4-door

1. Remove the passenger's dashboard lower cover, refer to the 2003-2006 Accord Service Manual (see page 20-134).

2. Disconnect the 2P connector (A) from the evaporator temperature sensor. Disconnect the 7P connector (B) from the passenger's air mix control motor (C). Remove the self-tapping screws and the passenger's air mix control motor from the heater unit.

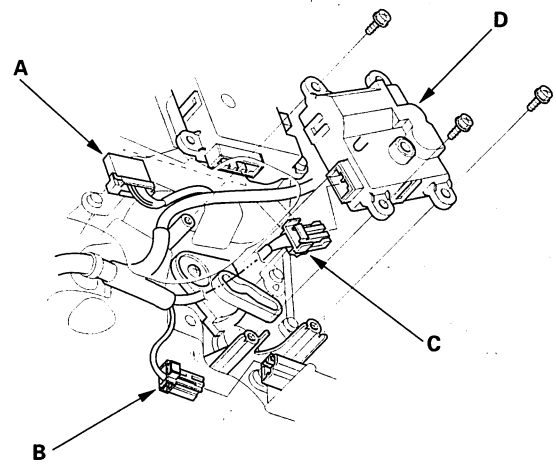


3. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

2-door

1. Remove the passenger's dashboard lower cover, refer to the 2003-2006 Accord Service Manual (see page 20-134).

2. Disconnect the 10P connector (A) from the mode control motor. Disconnect the 2P connector (B) from the evaporator temperature sensor. Disconnect the 5P connector (C) from the passenger's air mix control motor (D). Remove the self-tapping screws and the passenger's air mix control motor from the heater unit.



3. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If electrical maintenance is required)

The Accord SRS includes a driver's airbag in the steering wheel hub, a passenger's airbag in the dashboard above the glove box, seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in the 2003-2006 Accord Service Manual, P/N 61SDA08. Items marked with an asterisk (*) on the contents page include or are located near SRS components. Servicing, disassembling, or replacing these items require special precautions and tools, and should be done only by an authorized Honda dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work must be performed by an authorized Honda dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the airbags and/or side airbags.
- Do not bump or impact the SRS unit, front impact sensors, or side impact sensors when the ignition switch is ON (II), or for at least 3 minutes after the ignition switch is turned OFF; otherwise, the system may fail in a collision, or the airbags may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, front console, dashboard, dashboard lower panel, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

Power Relay Test

Use this chart to identify the type of relay, then do the test listed for it.

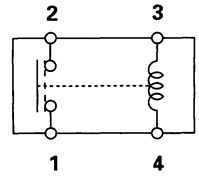
NOTE: For the turn signal/hazard relay input test, refer to the 2003-2006 Accord Service Manual (see page 22-214).

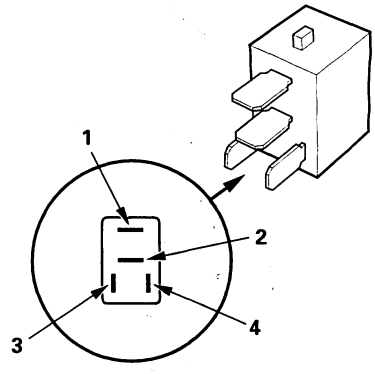
Relay	Test
A/C compressor clutch relay	Normally-open type
Accessory power socket relay	
Air fuel ratio sensor relay	
Blower motor relay	
A/C condenser fan relay	
Ignition coil relay	
PGM-FI main relay 1, 2	
Power window relay	
Radiator fan relay	
Rear window defogger relay	
Starter cut relay	
Throttle actuator control module relay	
Daytime running lights relay (Canada)	Five-terminal type
Fan control relay	
Moonroof close relay	
Moonroof open relay	
Seat heater relay	

Normally-open type

Check for continuity between the terminals.

- There should be continuity between the No. 1 and No. 2 terminals when power and ground are connected to the No. 3 and No. 4 terminals.
- There should be no continuity between the No. 1 and No. 2 terminals when power is disconnected.





(cont'd)

Protected by AR

Power Relay Test (cont'd)

Five-terminal type B

Check for continuity between the terminals.

- There should be continuity between the No. 1 and No. 2 terminals when power and ground are connected to the No. 3 and No. 5 terminals.
- There should be continuity between the No. 1 and No. 4 terminals when power is disconnected.

System Description

Body Controller Area Network (B-CAN) and Fast Controller Area Network (F-CAN)

Fast controller Area Network (F-CAN) and Body Controller Area Network (B-CAN) share information between multiple Electronic Control Units (ECUs). B-CAN communication moves at a slower speed for convenience related items, and for other functions. F-CAN information moves at a faster speed for "real time" functions such as fuel and emissions data. To allow both systems to share information, the Gauge Control Module translates information from B-CAN to F-CAN and from F-CAN to B-CAN.

The ECUs on the B-CAN and F-CAN transmit and receive information in the form of structured messages that may be received by several different ECUs on the network at one time. These message are transmitted and received across a communication circuit that consists of a single wire that is shared by all the ECUs on the curcuit. Since messages on the F-CAN network are typically of higher importance, a second wire is used for communication circuit integrity monitoring. A backup circuit is aiso added to the headlight and wiper circuits on the B-CAN network in the event of a network wire or ECU failure that would effect the operation of the system.

Protected by AR

Multiplex Integrated Control System (MICS)

System Description (cont'd)

Messages are transmitted by an ECU (that monitors an input) over the communication circuit. ECUs that use the message (information related to that input) are the receivers. For example, the Combination Switch Control Unit monitors the wiper switch. When the wiper switch is placed in the low speed position, the Combination Switch Control Unit transmits that message on the communication circuit. The Relay Control Module receives the message and turns on the wipers by providing a ground for the relay.

"Connected" ECUs

Several ECUs are connected to each of the two networks. The Gauge Control Module is part of both networks since it is the "Gateway" between them. Below is a list of ECUs and the network they are connected to.

B-CAN ECUs

- Gauge Control Module
- Relay Control Module
- Multiplex Intergrated Control Unit (MICU)
- Door Multiplex Control Unit
- Combination Switch Control Unit
- Climate Control Unit
- Optional Security (LX model, SE model (Canada) option)
- Optional Unit (B-CAN option)

F-CAN ECUs

- Gauge Control Module
- ECM/PCM
- Navigation Control Unit
- ABS/TCS (Traction Control System) ('03-05 models)
- VSA (Vehicle Stability Assist) ('06 model)

Multiplex Integrated Control System (MICS)

System Description (cont'd)

Network "Loss of Communication" Error Checking

The B-CAN and F-CAN systems send messages to each other to check the integrity of the network communication circuit. They do this by sending a specific digital message out after an event. For example, turning the ignition switch to ON. After the switch to ON, all the ECUs on the communication circuit expect to receive a message from other specific units within a specified amount of time. If the message is not received, the ECU will transmit a DTC reporting that the control units did not communicate.

Example of communication circuit test

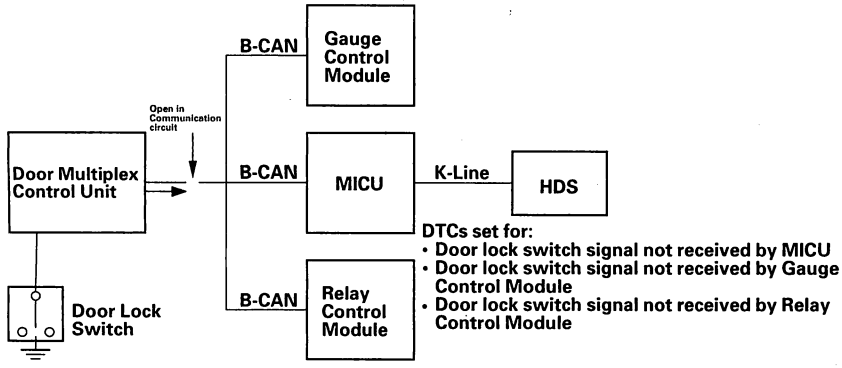
Normal circuit

1. Ignition switch turned ON.
2. The door multiplex control unit transmits a door switch signal.
3. The multiplex integrated control unit (MICU), relay control module and gauge control module receive the door lock switch signal.
4. Communication circuit test is passed.

Since the door lock switch message was received by all the ECUs expecting to receive a signal, the communication circuit between those units is OK. There are multiple signal sent and received by each ECU during this time to insure that the communication circuit is intact.

Failed circuit

5. Ignition switch is turned ON.
6. The door multiplex control unit transmits a door switch signal.
7. The multiplex integrated control unit (MICU), relay control module and gauge control module expect to receive the door lock switch signal, but since there is a break in the communication circuits, it is not received.
8. Each ECU that expects to receive the door lock switch signal from the door multiplex control unit will transmit DTCs for the signal that it did not receive.



Since there is a break in the communication circuit, the door lock switch signal could not be received by the gauge control module, multiplex integrated control unit (MICU) or the relay control module. Each of these units will set "loss of communication" error codes for the signal(s) they did not receive. There may be multiple communication DTCs if the unit that has become disconnected from the network would normally transmit multiple messages during the communication line test. For example, the door multiplex control unit sends keyless panic signal and door lock switch signal during the communication circuit test.

Diagnostic Trouble Codes

There are three DTC types used by the CAN networks.

Internal error DTCs	The ECUs run internal checks. If one finds that there is an internal ECU problem, it will set an internal error DTC. Confirm that the battery and charging system are OK. If so, this indicates that the ECU needs to be replaced.
Loss of communication DTCs	Loss of communication DTCs (and Bus-off DTCs) are set when there is a problem with the communication between ECUs. This could be in the connections, the wiring, or the ECU (as called out in the DTC Troubleshooting index).
Signal error DTCs	The ECUs can run diagnostics on some input circuits to determine if that circuits is functioning properly (no opens or shorts). If a circuit falls the diagnostic test, a DTC will set (NOTE: Not all input circuits are tested for errors).

Troubleshooting the CAN circuit related problems

Using the HDS (Preferred method)

1. Go to B-CAN System Diagnosis Test Mode A to check for "Connected units" and DTCs, refer to the 2003-2006 Accord Service Manual (see page 22-91).
2. If no DTCs are retrieved, go to B-CAN System Diagnosis Test Mode C or D.

Without the HDS (Should be used only if HDS is unavailable)

3. Check for communication circuit problems using B-CAN System Diagnosis Test Mode 1, refer to the 2003-2006 Accord Service Manual (see page 22-91).
4. Check for DTCs while in Mode 1, refer to the 2003-2006 Accord Service Manual (see page 22-91).
5. Sort, and then troubleshoot the DTCs in the order below. Refer to the DTC troubleshooting Index for DTC descriptions.

   1st. Internal error and voltage failure DTCs

   2nd. Loss of communication DTCs

   3rd. Signal error DTCs

6. If no DTCs are retrieved, use B-CAN System Diagnosis Test Mode 2 to check all inputs related to failure, refer to the 2003-2006 Accord Service Manual (see page 22-91).

Loss of Communication DTC cross-reference chart

When an ECU is unable to communicate with the other ECUs on the circuit, the other units will set loss of communication DTCs. Use this chart to find the control unit that is not communicating.

7. Find the Transmitting Unit that is in the same row as all of the loss of communication DTCs retrieved.
8. Perform the input test for the transmitting unit.

Transmitting Unit	Message	Receiving Unit/Loss of Communication DTC					
		MICU	Relay Control Module	Door Multiplex Control unit	Gauge Control Module	Combination Switch Control Unit	Climate Control Unit
MICU	Alarm		B1056				
	MICU		B1055	RX	B1157	B1255	
	Door Switch		B1057	RX	B1159		
Relay Control Module	Relay Control Module	B1005			B1158		
Door Multiplex Control unit	Panic	B1010	B1059				
	Door Lock Switch	B1006	B1058		B1160		
Gauge Control Module	VSP/NE		B1060				B1205
	A/T	B1008	B1061				
	ENGTEMP						B1206
	ILLUMI						B1207
Combination Switch Control Unit	Headlight Switch	B1007	B1062		B1155		
	Wiper Switch	B1009	B1063		B1156		
PCM	Engine				B1168		
	A/T				B1169		

RX: Receiving unit does not set a loss of communication DTC.

System Description (cont'd)

B-CAN System Switch Device Index

Combination Switch Control Unit	
Input signal	**Output signal/device**
Dimmer switch, Lighting switch, Passing switch, Turn signal switch, Wiper/washer switch, Intermittent dwell time controller.	None

Relay Control Module	
Input signal	**Output signal/Device**
A/C pressure switch, Climate control switch, Daytime running lights control (Canada), Hood switch, Horn switch, Windshield wiper motor.	Daytime running lights control (Canada), Headlight, Parking light, Horn, Windshield washer motor, Windshield wiper motor.

Door Multiplex Control Unit	
Input signal	**Output signal**
Driver's door key cylinder switch (lock/unlock), Driver's door lock knob switch (lock/unlock), Driver's door lock switch. Driver's power window switches (up, down, auto up, auto down), Passenger's power window switches (up, down), Driver's power window motor pulser.	Driver's power window motor, Passenger's power window switches, Power window relay control.

Multiplex Integrated Control Unit	
Input signal	**Output signal/Device**
Audio-HVAC display module security ground, Brake pedal position switch, Door switches, Ignition key cylinder switch, Park pin switch (A/T), Passenger's door lock knob switches (unlock), Passenger's door lock switch, Power window motor, Seat belt switch (unbuckled), Transmission range switch (P, R position), Trunk latch switch.	Door lock actuators, Hazard warning lights, Interior lights, Ignition key light, Key interlock solenoid, Turn signal lights, Moonroof relay, Trunk lid opener solenoid, Door courtesy lights, Daytime running lights.

Self-diagnostic Function

Before troubleshooting the gauge system, refer to multiplex integrated control system B-CAN System Diagnosis Test Mode A, refer to the 2003-2006 Accord Service Manual (see page 22-91).

The gauge control module has a self-diagnostic function.
- The beeper drive circuit check
- The indicator drive circuit check
- The switch input test
- The LCD segments check
- The gauges drive circuit check (Speedometer, Tachometer, Fuel gauge, Coolant temperature gauge)
- The communication line check (of the body-controller area network (B-CAN) communication line and the fast-controller area network (F-CAN) communication line between the gauges).

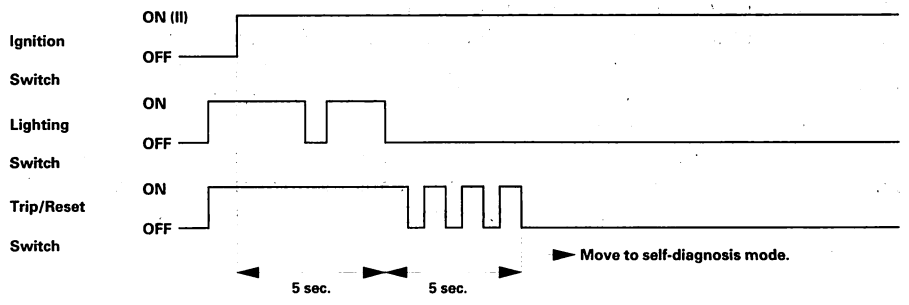
NOTE: Indicators are also controlled via the communication line.

Entering the self-diagnostic function

Before running the self-diagnostic function, check the No. 7 (10 A) fuse and the No. 21 (7.5 A) fuse in the under-dash fuse/relay box.

1. Push and hold the trip/reset button.
2. Turn the headlights ON.
3. Turn the ignition switch ON (II).
4. Within 5 sec., turn the headlights OFF, then ON and OFF again.
5. Within 5 sec., release the trip/reset button, and then push and release the button three times repeatedly.

NOTE:
- While in the self-diagnostic mode, the dash lights brightness controller operates normally.
- While in the self-diagnostic mode, the trip/reset button is used to start the Beeper Drive Circuit Test and the Gauge Drive Circuit Check.
- If the vehicle speed exceeds 1.2 mph (2 km/h) or the ignition switch is turned OFF, the self-diagnostic mode ends.



The Beeper Drive Circuit Check

When entering the self-diagnostic mode, the beeper sounds five times.

The Indicator Drive Circuit Check

When entering the self-diagnostic mode, the following indicator lights blink:
Seat belt indicator, charging system indicator, low fuel indicator, maintenance required indicator, security indicator, high beam indicator, lights on indicator, malfunction indicator lamp (MIL), A/T gear position indicator, ABS indicator, cruise main indicator and safety indicators (doors and trunk).

Switch Input Check

After the intermittent beeper sounds at the initial stage of the self-diagnostic function, a beeper sounds continuously while any of the following switch inputs are switched from OFF to ON:
Cruise control main cruise set, cruise cancel, cruise resume, TCS OFF ('03-05 models), VSA OFF ('06 model), and parking brake switches.

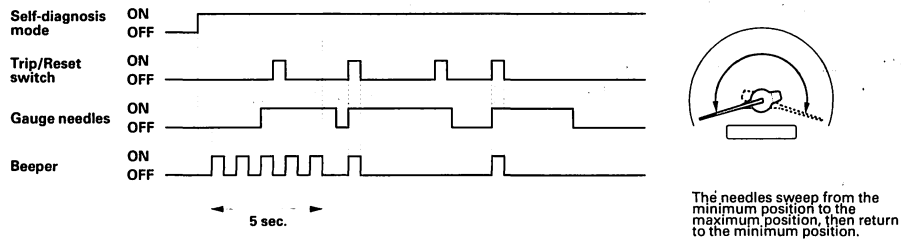
(cont'd)

Protected by AR

Self-diagnostic Function (cont'd)

The LCD Segment Check
When entering the self-diagnostic mode, the odo/trip segments and outside air temperature segment blink five times.

The Gauge Drive Circuit Check
When entering the self-diagnostic mode, the speedometer, the tachometer, the fuel gauge, and the coolant temperature gauge needles sweep from the minimum position to maximum position, then return to the minimum position.
NOTE:
After the beeper stops sounding and the gauge needles return to the minimum position, pushing the trip/reset button starts the Beeper Drive Circuit Check (one beep) and the Gauge Drive Circuit Check again.
The check cannot be started again until the gauge needles return to the minimum position.



If a needle fails to sweep or the beeper does not sound, replace the gauge control module.

The Communication Line Check
While in the self-diagnostic mode, the Communication Line Check starts after the odo/trip LCD Segments Check.
If all segments comes on, the communication line is OK.

- If the word "Error 1" is indicated, there is a malfunction in the communication line between the gauge control module and the fast-controller area network (F-CAN). Check for DTCs in the ECM/PCM. If no DTCs are found, go to B-CAN System Diagnosis Test Mode A, refer to the 2003-2006 Accord Service Manual (see page 22-91).
- If the word "Error 2" is indicated, there is a malfunction in the communication line between the gauge control module and the body-controller area network (B-CAN). Go to B-CAN System Diagnosis Test Mode A, refer to the 2003-2006 Accord Service Manual (see page 22-91).
- If the word "Error 3" is indicated, there is a malfunction in the communication line between the gauge control module and the body-controller area network (B-CAN) and the fast-controller area network (F-CAN). Check for DTCs in the ECM/PCM. If no DTCs are found, go to B-CAN System Diagnosis Test Mode A, refer to the 2003-2006 Accord Service Manual (see page 22-91).

Normal:

Faulty (example Error 1):

If any communicaiton line errors are found, go to B-CAN System Diagnosis Test Mode A, refer to the 2003-2006 Accord Service Manual (see page 22-91).

Ending the self-diagnostic function
Turn the ignition switch OFF.
Note: If the vehicle speed exceeds 1.2 mph (2 km/h), the self-diagnostic function ends.

Resetting the Maintenance Required Indicator

Blinking pattern:

Miles (km)	Maintenance Reminder Light
At 5,900 (9,440) to 6,100 (9,760)	Blinks for 10 seconds when the ignition switch is turned ON (II).
At 7,400 (11,840) to 7,600 (12,160)	Comes on and stays on while the ignition switch is ON (II).

How to Reset

Push and hold the trip/reset button, turn the ignition switch ON (II), and continue to hold the button for more than 10 seconds or until the indicator goes out.

Power Seats

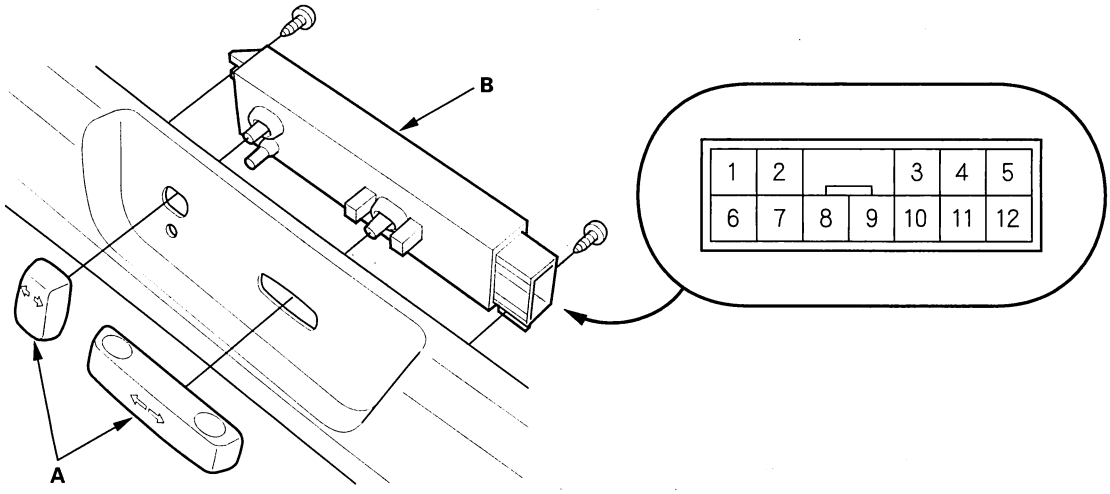
Switch Test/Replacement

Front Passenger's power Seat (4-way Adjustable)

1. Remove the power seat adjustment switch knobs (A).



2. Remove the recline cover from the front passenger's power seat.
   - '03 model (see page 20-6)
   - '04-06 models (see page 20-7)
3. Remove the two screws and the power seat switch (B).
4. Disconnect the 12P connector from the power seat adjustment switch (A).
5. Reinstall the adjustment switch knobs to the switch.
6. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal		1	2	3	4	5	6	7	8	9	10	11	12
SLIDE SWITCH	Forward							○	○		○	○	
	Backward							○	○		○	○	
RECLINE SWITCH	Forward		○		○		○						○
	Backward		○		○		○						○

No. 1, 3, 5 and 9 terminals are not used.

7. If the continuity is not as specified, replace the switch.

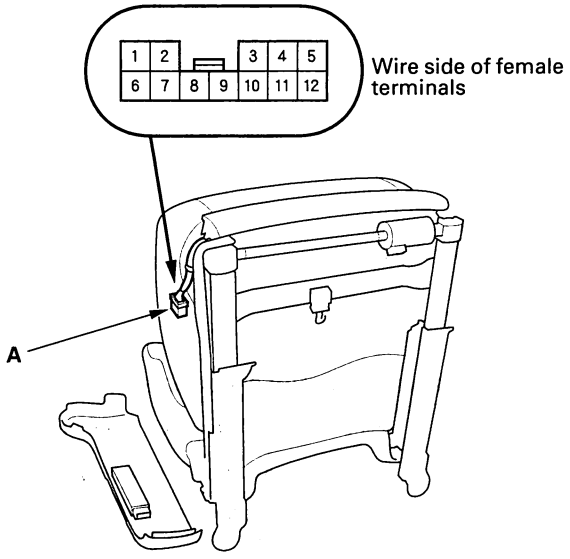
BACK

Protected by AR

Motor Test

Front Passenger's 4-way Adjustable power Seat

1. Remove the front passenger's seat (see page 20-3).
2. Disconnect the 12P connector (A) from the power seat adjustment switch.



3. Test each motor by applying battery voltage and body ground to the terminals.

Slide motor

Terminal / Position	7	11
Forward	⊖	⊕
Backward	⊕	⊖

Recline motor

Terminal / Position	6	12
Forward	⊖	⊕
Backward	⊕	⊖

4. If the motor does not run or fails to run smoothly, check for an open in the passenger's seat wire harness between the 12P connector and each motor connector. If the harness is OK, replace the motor (see page 20-6).

Crossover Network Unit Removal/Installation

2-door M/T

SRS components are located in this area.
Review the SRS component locations, refer to the 2003-2006 Accord Service Manual (see page 23-17) and the precautions and procedures, refer to the 2003-2006 Accord Service Manual (see page 23-19) before performing repairs or service.

NOTE:
- Put on gloves to protect your hands.
- Take care not to scratch the dashboard and related parts.
- Lay a workshop towel under the parts when working on them to protect the face panel from scratches or other damage.
- Do not work in a dusty or dirty place.
- Discharge static electricity from your body before and during the work.
- Do not touch the circuit board with your bare hands.
- Do not work with dirty hands.
- Be careful not to fold the flat plate cable.
- Do not touch the terminal connector of the flat plate cable with your bare hands. (If you have touched it, wipe it off thoroughly.)

1. Make sure you have the anti-theft codes for the radio and navigation system, then write down the frequencies for the radio's preset buttons.

2. Remove the upper panel, refer to the 2003-2006 Accord Service Manual (see page 20-131).

3. Remove the screws and bolts, disconnect the audio-HVAC display module connectors (A) and the antenna lead (B), then remove the audio-HVAC display module (C).

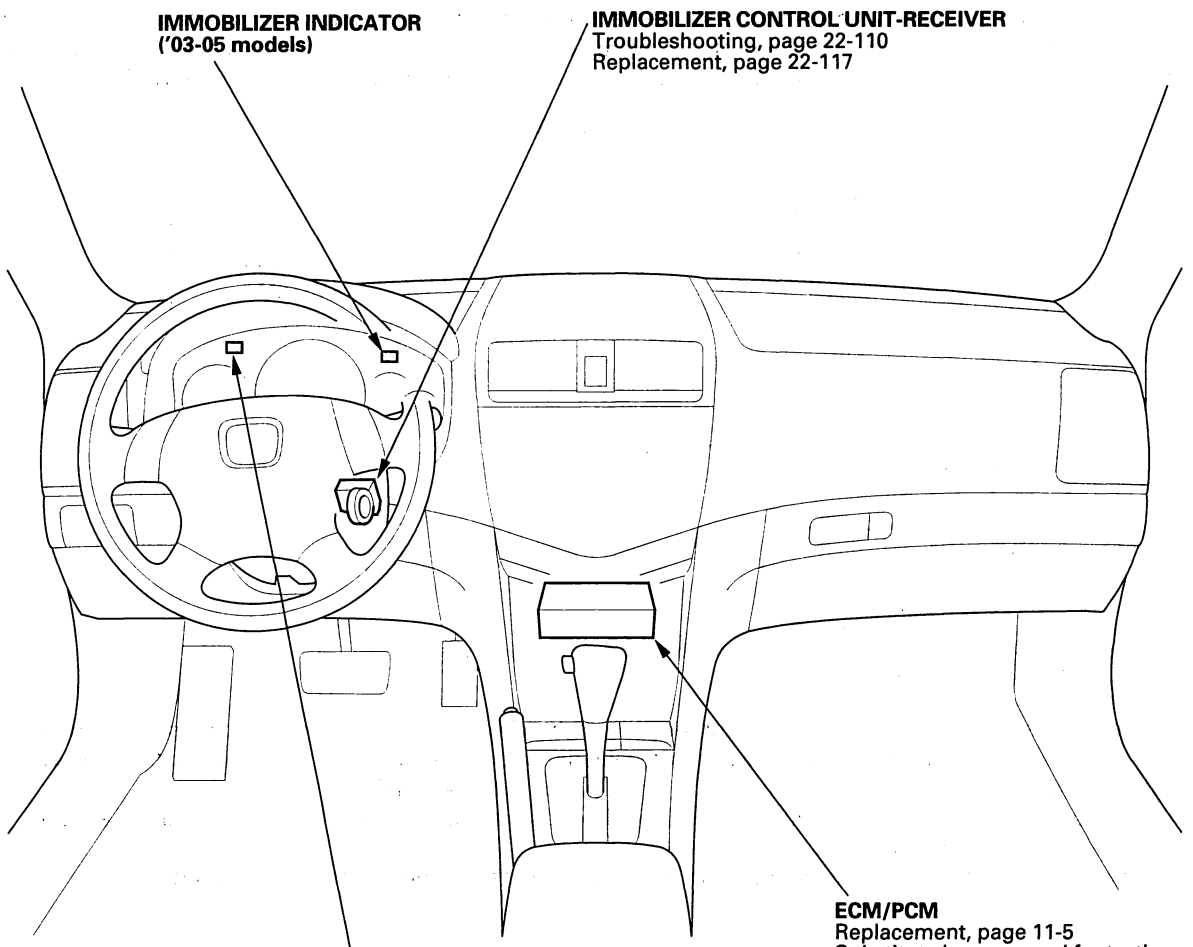
Immobilizer System

Component Location Index



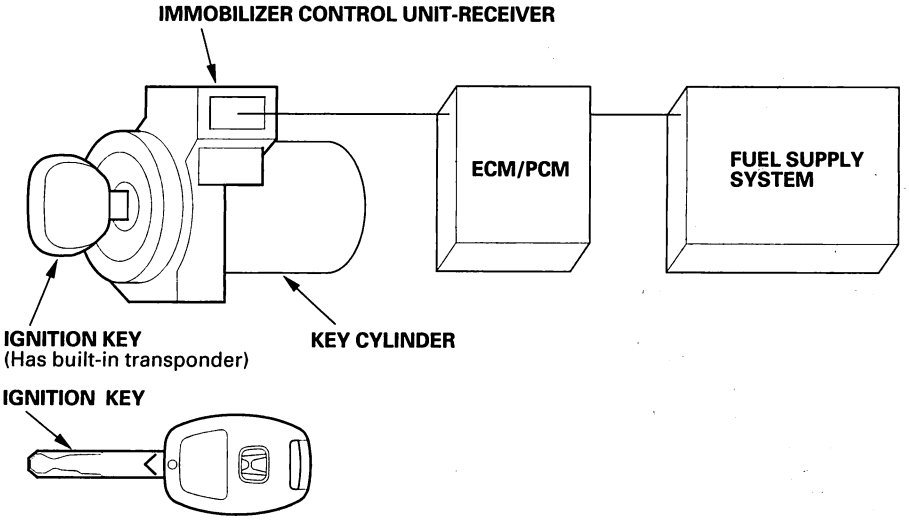
Protected by AR

Immobilizer System

System Description

The vehicle is equipped with an immobilizer system Type (IV) that will disable the vehicle unless the proper ignition key is used. This system consists of a transponder located in the ignition key, an immobilizer control unit-receiver, an indicator light, and the ECM/PCM.

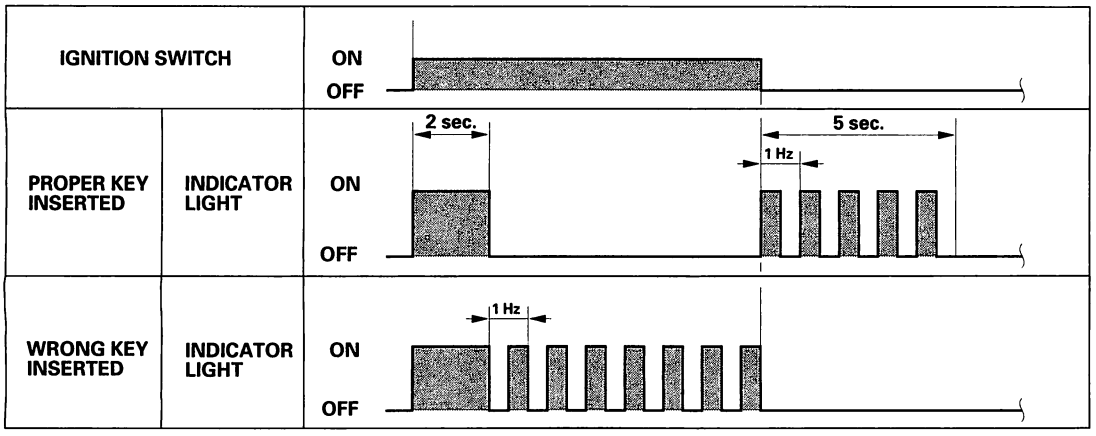
When the key is inserted in the ignition switch and turned to the ON (II) position, the immobilizer control unit-receiver sends power to the transponder in the ignition key. The transponder then sends a coded signal back to the immobilizer control unit-receiver which then sends a coded signal to the ECM/PCM (rolling code embedded in receiver, handshake required at ECM/PCM repair and replacement, all keys required at control unit-receiver repair and replacement).



NOTE: This key is slimilar in appearance to other models, but it is a rolling code type. Only key with a V on the shank can be used.

- If the proper key has been used, the immobilizer indicator light will come on for about 2 seconds, then go off.
- If the wrong key has been used or the code was not received or recognized by the unit, the indicator light will come on for about 2 seconds, then it will blink until the ignition switch is turned OFF.
- If the ignition switch is turned OFF, the indicator will blink for about 5 seconds to signal that the unit has reset correctly, then the indicator will go off.
- If the customer has lost their key, and cannot start the engine, contact Honda Customer Relations.

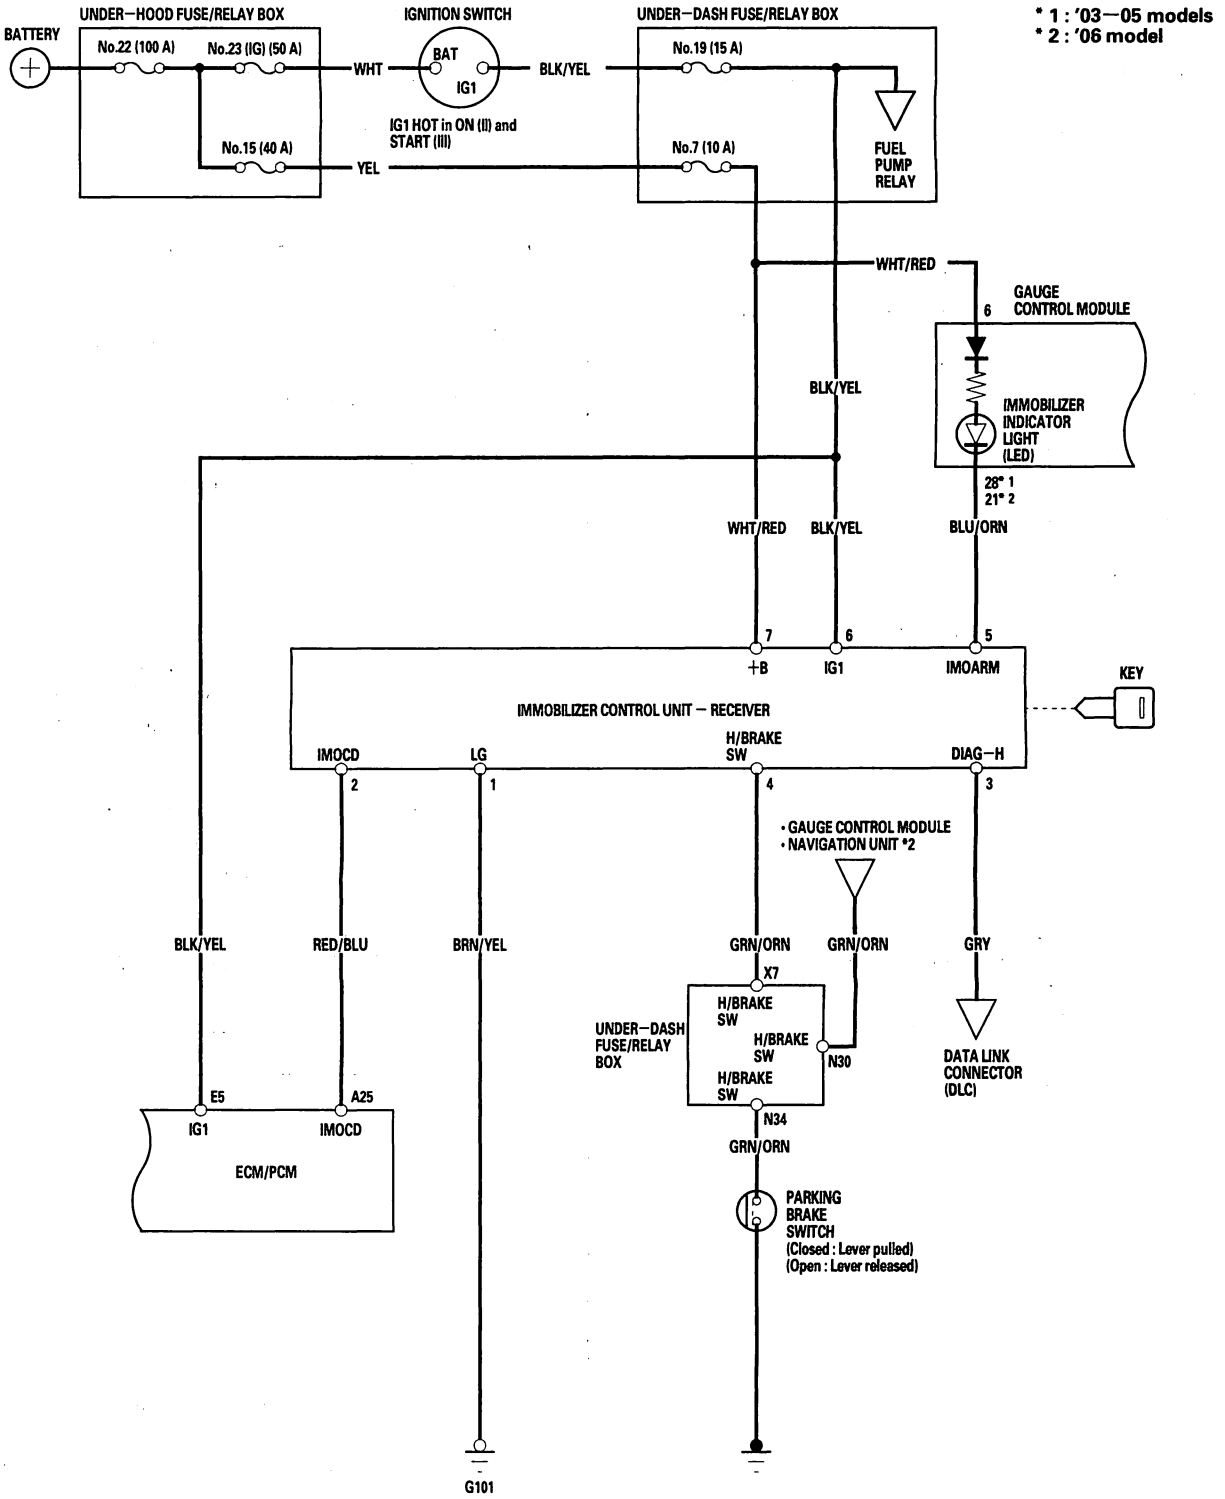
IMMOBILIZER INDICATOR LIGHT BLINKING PATTERN:



BACK

Protected by AR

Circuit Diagram



Protected by AR

Troubleshooting

1. Turn the ignition switch ON (II) with a programmed key.
2. Check to see if the immobilizer indicator comes on.

   Does the indicator come on?

   YES—Go to step 3.

   NO—Go to step 12.
3. Check the immobilizer indicator operation.

   Does the indicator come on for 2 seconds, then go off?

   YES—Go to step 4.

   NO—Go to step 6.
4. Try to crank the engine.

   Does the starter motor operate?

   YES—Go to step 5.

   NO—Check the starter motor. ■
5. Try to start the engine.

   Does the engine start?

   YES—If available, check the Status Log in the Immobilizer Info with the HDS (see page 22-116). If the Status Log is not available, the Immobilizer system is OK at this time. ■

   NO—Go to step 24.
6. Check to see if the immobilizer indicator comes on and blinks.

   Does the indicator blink?

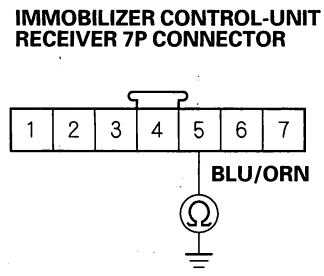
   YES—Go to step 24.

   NO—Go to step 7.
7. Disconnect the 7P connector from the immobilizer control unit-receiver.
8. Check to see if the immobilizer indicator goes off.

   Does the indicator go off?

   YES—Substitute a known-good immobilizer control unit-receiver and/or ECM/PCM. ■

   NO—Go to step 9.
9. Turn the ignition switch OFF.
10. Remove the gauge control module, and disconnect its 30P ('03-05 models) or 36P ('06 model) connector, refer to the 2003-2006 Accord Service Manual (see page 22-276).
11. Check for continuity between the immobilizer control unit-receiver 7P connector No.5 (IMOARM) terminal and body ground.



Wire side of female terminals

Is there continuity?

YES—Repair a short in the wire. ■

NO—Faulty immobilizer indicator, replace the gauge control module. ■

BACK

Protected by AR

12. Try to start the engine.

    Does the engine start?

    YES—Go to step 13.

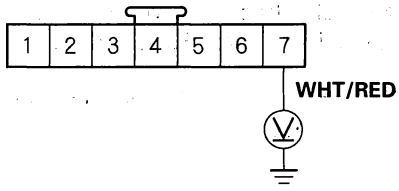
    NO—Go to step 18.

13. Turn the ignition switch OFF.

14. Disconnect the 7P connector from the immobilizer control unit-receiver.

15. Check for voltage between the immobilizer control unit-receiver 7P connector No. 7 (+B) terminal and body ground.

IMMOBILIZER CONTROL-UNIT RECEIVER 7P CONNECTOR



Wire side of female terminals

Is there battery voltage?

YES—Go to step 16.

NO—Faulty No.7 (10 A) fuse in the under-dash fuse /relay box. If the fuse is OK, check for an open in the wire between the immobilizer control unit-receiver and under-dash fuse/relay box.■

16. Remove the gauge control module, and disconnect its 30P ('03-05 models) or 36P ('06 model) connector, refer to the 2003-2006 Accord Service Manual (see page 22-276).

17. Check for continuity between the immobilizer control unit-receiver 7P connector No. 5 (IMOARM) terminal and gauge control module 30P ('03-05 models) or 36P ('06 model) connector No. 28 ('03-05 models) or No. 21 ('06 model) terminal.

'03-05 models

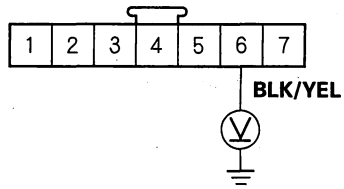
Troubleshooting (cont'd)

21. Check for voltage between the immobilizer control unit-receiver 7P connector No. 6 (IG1) terminal and body ground.

IMMOBILIZER CONTROL-UNIT RECEIVER 7P CONNECTOR



Wire side of female terminals

Is there battery voltage?

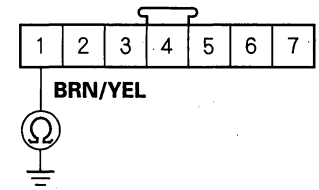
YES—Go to step 22.

NO—Faulty No. 19 (15 A) fuse in the under-dash fuse/relay box. If the fuse is OK, check for an open in the wire between the immobilizer control unit-receiver and under-dash fuse/relay box. ■

22. Turn the ignition switch OFF.

23. Check for continuity between the immobilizer control unit-receiver 7P connector No. 1 (LG3) terminal and body ground.

IMMOBILIZER CONTROL-UNIT RECEIVER 7P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Substitute a known-good immobilizer control unit-receiver and/or ECM/PCM. ■

NO—Repair an open in the wire. If wire is OK, repair G101. ■

BACK

Protected by AR

24. Turn the ignition switch OFF.

25. Connect the HDS to the data link connector.

26. Turn the ignition switch ON (II).

27. Look at the System Check in the Immobilizer Info with the HDS (see page 22-115).

    Is the immobilizer system normal?

    YES—Go back to step 1.

    NO—Go to step 28.

28. Verify the System Check display on the HDS for the following information:

    - Harness short from the ECM/PCM to the immobilizer unit. (IMOCD short)
    - The communication was not good between the ECM/PCM and the immobilizer unit by the battery voltage low.
    - The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise.
    - Immobilizer unit failure
    - ECM/PCM failure

    Does the HDS display any of the above information?

    YES—Go to step 29.

    NO—Go to step 33.

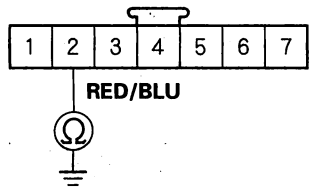
29. Turn the ignition switch OFF.

30. Disconnect the 7P connector from the immobilizer control unit-receiver.

31. Disconnect the 31P E connector from the ECM/PCM.

32. Check for continuity between the immobilizer control unit-receiver 7P connector No. 2 (IMOCD) terminal and body ground.

IMMOBILIZER CONTROL-UNIT RECEIVER 7P CONNECTOR



Wire side of female terminals

Is there continuity?

YES—Repair a short in the wire. ■

NO—Substitute a known-good immobilizer control unit-receiver and/or ECM/PCM. ■

33. Verify the System Check display on the HDS for the following information:

    - Blown fuse
    - Harness open from the ECM/PCM and the immobilizer unit.
    - The communication was not good between the ECM/PCM and the immobilizer unit by the battery voltage low.
    - The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise.
    - Immobilizer unit failure
    - ECM/PCM failure

    Does the HDS display any of the above information?

    YES—Go to step 34.

    NO—Check the Possible Failures shown on the System Check Troubleshooting (see page 22-115). ■

System Check

1. Connect the HDS to the data link connector.
2. Turn the ignition switch ON (II).
3. Monitor the System Check in the Immobilizer Info with the HDS.
4. If the HDS displays the "Immobilizer system is normal", the immobilizer system is OK. If the HDS displays any other messages, check as follows:

Status Log No.	System Check	Possible Failures
A-1	Immobilizer system is not normal	• This key is not registered in the immobilizer unit. Try to register keys by using "KEYS". • The communication was not good between the antenna and the immobilizer key by influence of metal such as key chains. • The communication was not good between the antenna and the immobilizer key by battery voltage low.
A-2	Immobilizer system is not normal	• Intermittent interruption between transponder and immobilizer unit. • The immobilizer key type is different. It is not for this vehicle but for another one or for other company's one. • Key failure (transponder failure) • The communication was not good between the antenna and the immobilizer key by influence of metal such as key chains. • The communication was not good between the antenna and the immobilizer key by battery voltage low.
A-3	Immobilizer system is not normal	• The ignition switch was turned on with a non-immobilizer key. • The immobilizer key type is defferent. It is not for this vehicle but for another one or for other company's one. • Key failure (transponder failure) • The communication was not good between the antenna and the immobilizer key by influence of metal such as key chains. • The communication was not good between the antenna and the immobilizer key by battery voltage low. • Immobilizer unit failure
B-1	Immobilizer system is not normal	• The ECM/PCM was not registered. Try to register the ECM/PCM by using "REPLACE ECM/PCM". • The communication was not good between the ECM/PCM and the immobilizer unit by battery voltage low. • The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise.
B-2	Immobilizer system is not normal	• The ECM/PCM was not registered. Try to register the ECM/PCM by using "REPLACE ECM/PCM". • The communication was not good between the ECM/PCM and the immobilizer unit by battery voltage low. • The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise.
D-1	Immobilizer system is not normal	• Harness short from the ECM/PCM to the immobilizer unit. (IMOCD short) • The communication was not good between the ECM/PCM and the immobilizer unit by battery voltage low. • The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise. • Immobilizer unit failure • ECM/PCM failure
D-3	Immobilizer system is not normal	• Blown fuse • Harness open from the ECM/PCM to the immobilizer unit. • The communication was not good between the ECM/PCM and the immobilizer unit by battery voltage low. • The communication was not good between the immobilizer unit and the ECM/PCM by influence of some noise. • Immobilizer unit failure • ECM/PCM failure

Protected by AR

Status Log

If you suspect there is a immobilizer system problem, check the status log.

NOTE: Status log may not be available for all models. If you have an updated immobilizer control unit-receiver ('03-05 models) or a '06 model, status log should be available.

1. Connect the HDS to the data link connector.
2. Turn the ignition switch ON (II).
3. On the HDS screen, select Honda systems, select immobilizer set-up, select immobilizer information, then select status log.
4. Check the Status log count. Troubleshoot the status with the highest count first. If no counts are listed, the immobilizer system is OK. Continue with normal symptom troubleshooting.

Status Log No.	Detected Item	Probable Cause
A-1	KEY CODE MISMATCH (Code format normal, but code data is mismatch)	1. The key was not registered 2. Interference from metal such as key chains 3. Low battery voltage
A-2	KEY CODE MISMATCH (Code format failure)	1. Ignition switch was turned on with another type of immobilizer key or aftermarket key 2. Interference from metal such as key chains 3. Low battery voltage
A-3	KEY CODE MISMATCH (No key code or non-immobilizer key)	1. Ignition switch was turned on with another type of immobilizer key or aftermarket key 2. Interference from metal such as key chains 3. Low battery voltage 4. Key failure 5. Immobilizer control unit-receiver failure
B-1	ECM/PCM CODE MISMATCH (Code format normal, but code data is mismatch)	1. ECM/PCM was not registered correctly 2. Low battery voltage 3. Poor or loose terminal connections at the immobilizer control unit-receiver 4. Communication line electrical noise
B-2	ECM/PCM MISMATCH (Code format failure)	1. ECM/PCM was not registered correctly 2. Low battery voltage 3. Poor or loose terminal connections at the immobilizer control unit-receiver 4. Communication line electrical noise
D-1	IMOCD LINE PROBLEM (Short to ground)	1. Low battery voltage 2. Poor or loose terminal connections at the immobilizer control unit-receiver and the ECM/PCM 3. Communication line electrical noise
D-3	IMOCD LINE PROBLEM (Open line or ECM/PCM failure)	1. Open or short in the harness from the ECM/PCM to the immobilizer control unit-receiver 2 Low battery voltage 3 Poor or loose terminal connections at the immobilizer control unit-receiver and the ECM/PCM 4 Communication line electrical noise

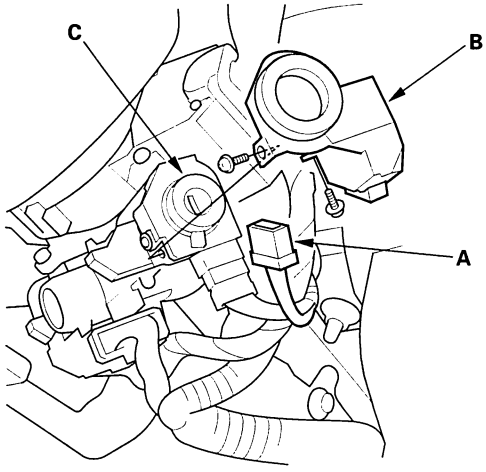
Immobilizer Control Unit-Receiver Replacement

1. Remove the dashboard lower cover, refer to the 2003-2006 Accord Service Manual (see page 20-130).
2. Remove the steering column covers, refer to the 2003-2006 Accord Service Manual (see page 17-25).
3. Disconnect the 7P connector (A) from the immobilizer control unit-receiver (B).



4. Remove the two screws and the immobilizer control unit-receiver from the ignition key cylinder (C).
5. Install the immobilizer control unit-receiver in the reverse order of removal.
6. After replacement, check the immobilizer system.

S

Seat Cover, Front
Replacement 20-10

Seat, Front
Removal/Installation 20-3
Disassembly/Reassembly 20-6, 7

Secondary Shaft Bearing, Torque Converter Housing
Replacement 14-248

Secondary Shaft Idler Gear Bearing
Replacement 14-260

Select Arm
Clearance Inspection 13-35

Servo Body
Disassembly/Inspection/
Reassembly 14-243

Shift Arm
Clearance Inspection 13-36

Shift Control Solenoid Valves
Test 14-164, 166, 168
Replacement 14-165, 167, 169

Shift Forks
Clearance Inspection 13-37
Disassembly/Reassembly 13-39

Shift Lock System Circuit
Troubleshooting 14-222

Side Sill Panels
Replacement 20-19

Spark Plugs
Inspection 4-23

Specifications
(See section 2)

Starter
Test 4-9
Removal/Installation 4-10
Overhaul 4-12

Starter Solenoid
Test 4-8

Starting System
Component Location Index 4-3
Circuit Diagram 4-5
Troubleshooting 4-6

Steering
Component Location Index 17-3
Troubleshooting 17-6
Inspection 17-9

Steering Angle Sensor
Replacement 19-127

Steering Gearbox
Removal 17-20
Overhaul 17-26
Installation 17-37

Steering Rack Guide
Adjustment 17-18

Subframes
Replacement 20-23

Suspension
Adjustment 18-2

Synchro Ring
Inspection 13-59

Synchro Sleeve
Inspection/Reassembly 13-59

T

TCS Activation indicator Circuit
Troubleshooting 19-52

TCS Indicator Circuit
Troubleshooting 19-50

TCS OFF Switch
Test 19-54

TCS Pressure Sensor
Neutral Position Memorization 19-55

Thermostat
Test 10-4
Replacement 10-8

Throttle Actuator Control Module
Replacement 11-278

Throttle Body
Cleaning 11-343
Test 11-343
Removal/Installation 11-348

Throttle Cable
Adjustment 11-346
Removal/Installation 11-347

Timing Belt
Inspection 6-13
Removal 6-14
Installation 6-16
Replacement 6-20

Timing Belt Adjuster
Replacement 6-26

Timing Belt Drive Pulley
Replacement 6-26

Top Accumulator Body
Disassembly/Inspection/
Reassembly 14-244

Torque Converter
Description 14-63
Stall Speed Test 14-161

Torque Converter Clutch Solenoid Valve
Test 14-170
Replacement 14-171

Transmission Housing
Removal 14-233
Installation 14-284

Transmission Range Switch
Test 14-215
Replacement 14-218

Troubleshooting
(See first page of this Index)

Trunk Lid Dynamic Damper
Replacement 20-18

V

Valve Guides
Inspection 6-43
Replacement 6-44

Valve Seats
Reconditioning 6-46

Valves
Clearance Adjustment 6-8
Removal 6-42
Inspection 6-43
Installation 6-48

VSA Activation Indicator Circuit
Troubleshooting 19-126

Service Manual Index

(cont'd)

VSA Modulator-control Unit
Removal/Installation 19-132

VSA Off Switch
Test 19-131

VSA Pressure Sensor
Neutral Position Memorization 19-130

VSA System (includes ABS, TCS)
Component Location Index 19-62
How-to Information 19-63
Description 19-71
Circuit Diagram 19-80

VTEC System
Component Location Index 11-279

W

Water Passage
Replacement 10-9

Water Pump
Inspection 10-5
Replacement 10-5

Wheel Speed Sensors
Inspection
ABS-TCS Components 19-58
VSA System (includes ABS, TCS) 19-134
Replacement
ABS-TCS Components 19-59
VSA System (includes ABS, TCS) 19-135

Wire Harnesses
(See first page of this Index)

Wiring System
Relay and Control Unit Locations 22-2, 3

Y

Yaw Rate/Lateral Acceleration Sensor
Replacement 19-128

1

1st Clutch Hub
Replacement 14-262

1st Gear One-way Clutch
Inspection 14-261

1st/1st-hold/2nd Clutch Assembly
Disassembly 14-263
Inspection 14-266
Resassembly 14-277

3

3rd Accumulator Body Spring
Disassembly/Inspection/ Reassembly 14-246

3rd Clutch Ball Bearing
Replacement 14-256

3rd Clutch Transmission Fluid Pressure Switch
Replacement 14-181

4

4th Clutch Transmission Fluid Pressure Switch
Replacement 14-182

4th/5th Clutch Assembly
Clearance Inspection 14-251
