Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0485 or P0486 set?	—	Go to Applicable DTC	Go to Step 3
3	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Perform the EGR Control test with the Tech 2 several times. 5. Command the Desired EGR Position “Increase” and “Decrease” with the Tech 2 while observing the EGR Position Variance. Does the EGR Position Variance parameter follow within the specified value?	± 5%	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition for 30 seconds. 2. Disconnect the EGR valve harness connector. 3. Connect a test lamp between the EGR valve motor voltage feed circuit (pin 4 of E-94 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp blink then go out?	—	Go to Step 6	Go to Step 5
5	Does the test lamp continuously illuminate at Step 4?	—	Go to Step 10	Go to Step 9
6	1. Turn OFF the ignition for 30 seconds. 2. Connect a test lamp between the EGR valve duty signal circuit (pin 6 of E-94 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Does the test lamp blink then go out (note that the test lamp will not blink normally)?	—	Go to Step 14	Go to Step 7
7	Does the test lamp continuously illuminate at Step 6?	—	Go to Step 11	Go to Step 8
8	1. Turn OFF the ignition. 2. Connect a test lamp between the EGR valve duty signal circuit (pin 6 of E-94 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 12	Go to Step 13
9	1. Test the EGR valve motor voltage feed circuit between the engine control module (ECM) (pin 111 of E-111 connector) and the EGR valve (pin 4 of E-94 connector) for the following conditions: • An open circuit • A short to ground • A short to the EGR valve position sensor low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 16
10	1. Test the EGR valve motor voltage feed circuit between the ECM (pin 111 of E-111 connector) and the EGR valve (pin 4 of E-94 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 19
11	1. Test the EGR valve motor duty signal circuit between the ECM (pin 103 of E-111 connector) and the EGR valve (pin 6 of E-94 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 19

Step	Action	Value(s)	Yes	No
12	1. Test the EGR valve motor duty signal circuit between the ECM (pin 103 of E-111 connector) and the EGR valve (pin 6 of E-94 connector) for the following conditions: • A short to ground • A short to the EGR valve position sensor low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 19
13	1. Test the EGR valve motor duty signal circuit between the ECM (pin 103 of E-111 connector) and the EGR valve (pin 6 of E-94 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 15
14	1. Test the EGR valve motor voltage feed circuit and motor duty signal circuit between the ECM (pins 103 and 111 of E-111 connector) and the EGR valve (pins 4 and 6 of E-94 connector) for a short circuit each other. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 19
15	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Inspect for an intermittent and for poor connections at the EGR valve harness connector (pins 4 and 6 of E-94 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent and for a poor connection on the EGR valve motor duty signal circuit at the harness connector of the ECM (pin 103 of E-111 connector). 6. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 17
16	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the EGR valve motor voltage feed circuit at the harness connector of the ECM (pin 111 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 19
17	Replace the EGR valve. Refer to EGR Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—

Step	Action	Value(s)	Yes	No
18	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Perform the EGR Control test with the Tech 2 several times. 6. Command the Desired EGR Position “Increase” and “Decrease” with the Tech 2 while observing the EGR Position Variance. Does the EGR Position Variance parameter follow within the specified value?	± 5%	Go to Step 20	Go to Step 19
19	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 20	—
20	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 21
21	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0500 (Flash Code 25)

Circuit Description

The vehicle speed sensor (VSS) is used by the engine control module (ECM) and speedometer, which generates a speed signal from the transmission output shaft. The VSS has the following circuits.

- Ignition voltage feed circuit
- VSS signal circuit
- VSS low reference circuit

The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The ECM calculates the vehicle speed by the VSS. If the ECM detects VSS signals are not generated, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The engine speed is more than 2000 RPM.
- The commanded fuel is OFF (accelerator pedal is released).

Condition for Setting the DTC

- The ECM detects that the VSS signals are not generated for 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electrical or magnetic interference may affect intermittent condition.

DTC P0500 (Flash Code 25)

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Drive the vehicle. 3. Observe the Vehicle Speed parameter with the Tech 2. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse in the glove box fuse block. Is the Meter (10A) fuse open?	—	Go to Step 4	Go to Step 5
4	Replace the Meter (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that fed by the Meter (10A) fuse or replace the shorted attached component fed by the Meter (10A) fuse. Did you complete the repair?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
5	1. Remove the vehicle speed sensor (VSS). Refer to Vehicle Speed Sensor (VSS) replacement in this section. 2. Visually inspect the VSS for the following conditions: • Physical damage • Being loose • Improper installation • For transmission output shaft teeth damage 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the VSS harness connector. 3. Connect a test lamp between the ignition voltage feed circuit of the VSS harness (pin 1 of J-32 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 9
7	1. Keep the ignition switch ON. 2. Connect a test lamp between the low reference circuit of the VSS harness (pin 2 of J-32 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 10
8	1. Turn ON the ignition, with the engine OFF. 2. Intermittently jump the signal circuit of the VSS (pin 3 of J-32 connector) with a test lamp that is connected to 12 volts (apply from a battery) while monitoring the Vehicle Speed parameter with the Tech 2. Does the Tech 2 indicate any vehicle speed when the circuit is intermittently pulled to 12 volts?	—	Go to Step 12	Go to Step 11
9	Repair the open circuit or high resistance on the VSS ignition voltage feed circuit between the VSS (pin 1 of J-32 connector) and the Meter (10A) fuse. Did you complete the repair?	—	Go to Step 16	—
10	Repair the open or high resistance in the VSS low reference circuit between the VSS (pin 2 of J-32 connector) and ground terminal (B-1). Did you complete the repair?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
11	1. Test the VSS signal circuit between the engine control module (ECM) (pin 19 of J-191 connector) and the VSS (pin 3 of J-32 connector), then between the instrument panel cluster (IPC) (pin 17 of B-52 connector) and the VSS (pin 3 of J-32 connector) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the VSS harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the VSS (pins 1, 2 and 3 of J-32 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14
13	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the VSS signal circuit at the harness connector of the ECM (pin 19 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
14	Replace the VSS. Refer to Vehicle Speed Sensor (VSS) Replacement in this section. Did you complete the replacement?	—	Go to Step 16	—
15	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 16	—
16	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle. 5. Observe the Vehicle Speed parameter with the Tech 2. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Step 17	Go to Step 3
17	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0501 (Flash Code 25)

Circuit Description

The vehicle speed sensor (VSS) is used by the engine control module (ECM) and speedometer, which generates a speed signal from the transmission output shaft. The VSS has the following circuits.

- Ignition voltage feed circuit
- VSS signal circuit
- VSS low reference circuit

The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The ECM calculates the vehicle speed by the VSS. If the ECM detects VSS signals are changed sharply, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the VSS signal are changed larger than a predetermined vehicle speed.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electrical or magnetic interference may affect intermittent condition.

1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Inspect all of the circuits going to the vehicle speed sensor (VSS) for the following: • Routed too closely to fuel injection wiring or components • Routed too closely to after-market add-on electrical equipment • Routed too closely to solenoids, relays, and motors 2. If you find incorrect routing, correct the harness routing. Did you find and correct the condition?	—	Go to Step 7	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the VSS harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the VSS (pins 1, 2 and 3 of J-32 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Inspect for an intermittent and for a poor connection on VSS circuit at the harness connector of the ECM (pin 19 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	1. Remove the VSS. Refer to Vehicle Speed Sensor (VSS) Replacement in this section. 2. Visually inspect the VSS for the following conditions: • Physical damage • Being loose • Improper installation 3. The following conditions may cause this DTC to set: • Electromagnetic interference in the VSS circuits 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	Replace the VSS. Refer to Vehicle Speed Sensor (VSS) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle. 5. Observe the Vehicle Speed parameter with the Tech 2. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Step 8	Go to Step 2
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0601 (Flash Code 53)

Circuit Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM).

Condition for Setting the MIL / DTC

- The ECM detects a malfunction in its internal flash read only memory (ROM).

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM stops engine running.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If this DTC is present, the engine cranks but does not start.

DTC P0601 (Flash Code 53)

1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If engine does not start, crank over the engine for 10 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0603 (Flash Code 54)

Circuit Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM).

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a malfunction in its internal electrically erasable & programmable read only memory (EEPROM).
- The ECM detects that the calculated checksum does not agree with the ECM internal registered checksum.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0606 (Flash Code 51, 52)

Circuit Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM).

Condition for Running the DTC

- The ignition switch is ON.
- The battery voltage is more than 16 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a malfunction in its internal main central processing unit (CPU). (Flash Code 51)
- The ECM detects a malfunction in its internal sub CPU. (Flash Code 52)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

P0611 (Flash Code 34)

Circuit Description

The charge up circuit in the engine control module (ECM) steps up the voltage for fuel injectors and is divided into two banks, common 1 and 2. The common 1 covers fuel injectors in cylinders 1 and 4, and the common 2 covers fuel injectors in cylinders 2 and 3. If the common 1 fuel injector charge up voltage circuit in the ECM is excessively low, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The battery voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the common 1 fuel injector charge up circuit is insufficient charge.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

P0612 (Flash Code 34)

Circuit Description

The charge up circuit in the engine control module (ECM) steps up the voltage for fuel injectors and is divided into two banks, common 1 and 2. The common 1 covers fuel injectors in cylinders 1 and 4, and the common 2 covers fuel injectors in cylinders 2 and 3. If the common 2 fuel injector charge up voltage circuit in the ECM is excessively low, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The battery voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the common 2 fuel injector charge up circuit is insufficient charge.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

3	1. Test each ground circuit between the engine control module (ECM) (pins 1, 3, 4, 43, 62 and 81 of J-191 connector) and the chassis ground terminal (J-9) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 4
4	1. Turn OFF the ignition. 2. Inspect for an intermittent, for poor tightening and corrosion at the chassis ground terminal (J-9). 3. Repair the tightening or clean the corrosion as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 5
5	1. Test each ECM main relay voltage feed circuit between the ECM (pins 2 and 5 of J-191 connector) and the ECM main relay (pin 2 of X-18 connector) for high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM 1, 2, 3, 4, 5, 43, 62 and 81 of J-191 connector. 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
7	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected relay or harness connector(s). 2. Clear the DTCs with he Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 9
9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0615 (Flash Code 19)

Circuit Description

The engine control module (ECM) controls the starter cut relay which de-energizes the starter relay based on engine speed inputs. The starter cut relay uses normally close type relay. During engine stopping, the relay is closed to allow grounding the starter relay. Once engine run, the ECM energizes the starter cut relay to open the starter relay circuit and starter motor is cut even the ignition is positioned at START. If the ECM detects an improper voltage on the starter cut relay control circuit, this DTC will set. This diagnostic only applies manual transmission model.

Condition for Running the DTC

- The ignition switch is ON.
- The battery voltage is between 16 – 32 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a low voltage condition on the starter cut relay control circuit when the relay is commanded OFF for longer than 10 seconds.
- The ECM detects a high voltage condition on the starter cut relay control circuit when the relay is commanded ON for longer than 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0615 (Flash Code 19)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 3
3	1. Start the engine. 2. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 8	Go to Diagnostic Aids
4	Start the engine. Does the engine start?	—	Go to Step 6	Go to Step 5
5	1. Turn OFF the ignition. 2. Replace the starter cut relay with the marker lamp relay or replace with a known good relay. 3. Start the engine. Does the engine start?	—	Go to Step 14	Go to Step 9

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Remove the starter cut relay. 3. Connect a test lamp between the starter cut relay voltage feed circuit (pin 3 of X-26 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 10
7	1. Reinstall the starter cut relay. 2. Start the engine. 3. Disconnect the starter cut relay. 4. Connect a test lamp between the starter cut relay control circuit (pin 5 of X-26 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 12	Go to Step 11
8	1. Test the starter cut relay control circuit between the engine control module (ECM) (pin 14 of J-191 connector) and the starter cut relay (pin 5 of X-26 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
9	1. Test the starter cut relay control circuit between the ECM (pin 14 of J-191 connector) and the starter cut relay (pin 5 of X-26 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
10	Repair the open circuit or high resistance on the voltage feed circuit between the ECM (10A) fuse and the starter cut relay (pin 3 of X-26 connector). Check the ECM (10A) fuse first. Did you complete the repair?	—	Go to Step 16	—
11	1. Test the starter cut relay control circuit between the ECM (pin 14 of J-191 connector) and the starter cut relay (pin 5 of X-26 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 13
12	1. Turn OFF the ignition. 2. Remove the starter cut relay. 3. Inspect for an intermittent and for a poor connection on each starter cut relay terminal. 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14

Step	Action	Value(s)	Yes	No
13	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the starter cut relay circuit at the harness connector of the ECM (pin 14 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
14	Replace the starter cut relay. Did you complete the replacement?	—	Go to Step 16	—
15	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 16	—
16	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition for 5 seconds. 5. Start the engine. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 17
17	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0650 (Flash Code 77)

Circuit Description

The malfunction indicator lamp (MIL) is located on the instrument panel cluster (IPC). The MIL informs the driver that an emission system or a performance related fault has occurred and that the engine control system requires service. The engine control module (ECM) monitors the MIL control circuit for conditions that are incorrect for the commanded state of the MIL. For example, a failure condition exists if the ECM detects low voltage when the MIL is commanded OFF, or high voltage when the MIL is commanded ON. If the ECM detects an improper voltage on the MIL control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a low voltage condition on the MIL control circuit when the indicator is commanded OFF for longer than 3 seconds.
- The ECM detects a high voltage condition on the MIL control circuit when the indicator is commanded ON for longer than 3 seconds.

Action Taken When the DTC Sets

- The ECM does not illuminate the MIL when the diagnostic runs and fails.

Condition for Clearing the DTC

- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0650 (Flash Code 77)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Verify whether the instrument cluster is operational. If the instrument panel cluster (IPC) is completely inoperative, refer to Diagnostic System Check. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition for 30 seconds while observing the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse in the glove box. Is the Meter (10A) fuse open?	—	Go to Step 4	Go to Step 5
4	Replace the Meter (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (10A) fuse or replace the shorted attached component fed by the Meter (10A) fuse. Did you complete the repair?	—	Go to Step 19	—
5	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) J-191 harness connector. 3. Turn ON the ignition, with the engine OFF. Is the malfunction indicator lamp (MIL) OFF?	—	Go to Step 6	Go to Step 13

Step	Action	Value(s)	Yes	No
6	1. Remove the Meter (10A) fuse that supplies voltage to the MIL. 2. Turn ON the ignition, with the engine OFF. 3. Measure the voltage from the MIL control circuit in the ECM harness connector (pin 6 of J-191 connector) to a good ground. Is the voltage less than the specified value?	1 volt	Go to Step 7	Go to Step 14
7	1. Turn OFF the ignition. 2. Install the Meter (10A) fuse that supplies ignition voltage to the MIL. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the MIL control circuit of the ECM harness connector (pin 6 of J-191 connector) and a known good ground. Is the MIL illuminated?	—	Go to Step 12	Go to Step 8
8	1. Turn OFF the ignition. 2. Remove the IPC. 3. Remove the MIL bulb from the IPC. Is the MIL bulb burned out?	—	Go to Step 16	Go to Step 9
9	1. Connect a test lamp between the MIL ignition voltage circuit of the IPC harness connector (pin 18 of B-51 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 10	Go to Step 15
10	1. Test the MIL control circuit between the ECM (pin 6 of J-191 connector) and the IPC (pin 5 or 13 of B-51 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 11
11	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the IPC (pins 5 or 13 and 18 of B-51 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the MIL control circuit at the harness connector of the ECM (pin 6 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
13	Repair the short to ground on the control circuit of the MIL between the ECM (pin 6 of J-191 connector) and the IPC (pin 5 or 13 of B-51 connector). Did you complete the repair?	—	Go to Step 19	—

Step	Action	Value(s)	Yes	No
14	Repair the short to battery or ignition voltage on the control circuit of the MIL between the ECM (pin 6 of J-191 connector) and the IPC (pin 5 or 13 of B-51 connector). Did you complete the repair?	—	Go to Step 19	—
15	Repair the open or high resistance on the ignition voltage circuit of the MIL between the Meter (10A) fuse and the IPC (pin 18 of B-51 connector). Did you complete the repair?	—	Go to Step 19	—
16	Replace the MIL bulb. Did you compete the replacement?	—	Go to Step 19	—
17	Repair or replace the IPC. Did you complete the repair or replacement?	—	Go to Step 19	—
18	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition for 30 seconds while observing the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 20
20	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1093 (Flash Code 227)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the engine control module (ECM) using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. In case of fuel rail overpressure, a pressure limiter valve threaded into the fuel rail will open to release overpressure and return fuel back to the fuel tank.
If the ECM detects that the fuel pressure is a certain pressure lower than the desired fuel rail pressure for a certain length of time, this DTC will set.

Condition for Running the DTC

- DTCs P0090, P0192, P0193, P0201 – P0204, P0611, P0612, P1095, P1261, P1262, P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The FRP regulator command is less than 33% or commanded fuel supply is more than a predetermined value.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the differential fuel rail pressure is -10 MPa (-1,450 psi) for longer than 15 seconds when the engine speed is between 0 – 900 RPM.
- The ECM detects that the differential fuel rail pressure is -15 MPa (-2,170 psi) for longer than 15 seconds when the engine speed is higher than 1200 RPM.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become low enough to set this DTC.
- Normal FRP Sensor readings on the Tech 2 with the engine running in neutral at idle is around 1.4 – 1.6 volts.
- An intermittently sticking fuel injector may have allowed the fuel pressure to drop too much. Use the Tech 2 to perform the Injector Balancing test for each injector. Verify a consistent engine speed change when commanding each fuel injector ON and OFF.
- A skewed FRP sensor value (shifted to a lower pressure) can set this DTC. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes.

Notice:

- This DTC most likely indicates a loss of fuel pressure by a fuel leak from the high pressure side. Inspect the high pressure side fuel leakage between the fuel supply pump and fuel injector FIRST.

Notice:

- The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight or if there is a crack in one of the fuel hoses. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC.

Notice:

- If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the supply pump is interrupted and this DTC may set. Perform bleeding of fuel system after refilling.

Test Description

The numbers below refers to the step number on the diagnostic table.
5. This step checks for a fuel restriction by determining if a high vacuum is being pulled on the fuel system during normal operation.
6. This step checks for an air leak on the suction side of the fuel system by determining if a vacuum can be pulled when a fuel line is plugged.

DTC P1093 (Flash Code 227)

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0090, P0192, P0193, P0201 – P0204, P1094, P1095, P1261 or P1262 set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Wait 2 minutes for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition with the engine OFF. DO NOT start the engine. 4. Observe the Fuel Rail Pressure (FRP) Sensor parameter with the Tech 2. Is the FRP Sensor parameter the specified value?	0.9 – 1.0 volt	Go to Step 4	Go to Step 11
4	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC. 3. Pump the priming pump on the fuel filter until it becomes firm. If there is a leak on the suction side of the fuel system between the priming pump and the fuel supply pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Start the engine and check for high side fuel system leaks at the fuel supply pump and fuel rail. **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 5. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Remove the rubber fuel hose from the fuel filter housing (fuel supply pump side). Use a pan to catch the fuel leakage from the removed fuel line. **Important:** The fuel vacuum pump / pressure gauge connector and the adapter hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the tools line may damage the fuel supply pump. 3. Connect the suction side fuel pressure / vacuum gauge adapter (5-8840-2844-0 / EN-47667) with fuel pressure / vacuum gauge assembly (5-8840-2844-0 / J-44638) in series with the filter housing and the disconnected fuel hose. Ensure the service tool and fuel line connections are tight. 4. Bleed the fuel system by priming the priming pump until it becomes firm, then crank over the engine for a maximum of 5 seconds. Repeat as necessary until the engine starts. 5. Let the engine run at idle for at least 1 minute. 6. Monitor the fuel pressure / vacuum gauge while holding the engine speed higher than 2500 RPM for a minimum of 1 minute. Does the fuel pressure / vacuum gauge indicate a larger vacuum than the specified amount during the test?	5 inHg	Go to Step 7	Go to Step 6
6	1. Fully clamp off a fuel hose as close to the fuel tank as possible (this will draw vacuum on the fuel system). You can also disconnect a fuel line and plug it. 2. Start the engine and turn the idle up control knob to the highest position. (Full clockwise direction. The idle speed is increased up to 1600 RPM.) 3. Monitor the fuel pressure / vacuum gauge. **Notice:** Release the clamp or open the plug when the gauge is likely to be more than 8 inHg during the test. Can a vacuum of at least the specified amount be pulled on the fuel system?	8 inHg	Go to Step 9	Go to Step 8
7	1. Inspect the fuel lines between the fuel supply pump and fuel tank for being crushed or kinked. 2. Inspect for a plugged fuel tank vent hose. 3. Inspect inside the fuel tank (if possible) for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. 4. Repair as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 12

Step	Action	Value(s)	Yes	No
8	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 3. Repair as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 10
9	1. Turn OFF the ignition. 2. Unclamp or unplug the fuel line from the previous step and reconnect the fuel line (if disconnected). 3. Start the engine and allow it to run for at least 1 minute. 4. Perform the Injector Balancing test with the Tech 2. 5. Command each injector OFF and verify an engine speed change for each injector. Is there an injector that does not change engine speed when commanded OFF?	—	Go to Step 14	Go to Step 16
10	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-116). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP regulator circuit at the harness connector of the ECM (pins 89, 97, 105 and 113 of E-111 connector). 6. Test for high resistance on each FRP regulator circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 15
11	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-113 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP sensor circuit at the harness connector of the ECM (pins 82, 87, 90 and 101 of E-111 connector). 6. Test for high resistance on each FRP circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 13

Step	Action	Value(s)	Yes	No
12	Replace the fuel filter cartridge. Refer to Fuel Filter Cartridge Replacement in the Fuel System Section. Did you complete the replacement?	—	Go to Step 17	—
13	Replace the FRP sensor. Refer to Fuel Rail Pressure (FRP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—
14	**Important:** Replacement injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 17	—
15	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement in this section and Fuel Filter Cartridge Replacement in Fuel System section. Did you complete the replacement?	—	Go to Step 17	—
16	**Notice:** There is a possibility that the pressure limiter valve stuck open or opening pressure has fallen. Replace the pressure limiter valve. Refer to Fuel Rail Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—
17	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 18
18	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1094 (Flash Code 226)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the engine control module (ECM) using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. In case of fuel rail overpressure, a pressure limiter valve threaded into the fuel rail will open to release overpressure and return fuel back to the fuel tank.
If the ECM detects that the differential fuel rail pressure is small at low engine speed but the FRP regulator commanded fuel is certain amount high for a certain length of time, this DTC will set. (FRP Regulator Command High DTC)
If the ECM detects that the fuel rail pressure sensor signal voltage is certain amount low for a certain length of time when fuel cut, DTC will also set. (FRP Drop DTC)

Condition for Running the DTC

FRP Regulator Command High DTC

- DTCs P0090, P0117, P0118, P0192, P0193, P0201 – P0204, P0500, P0501, P0611, P0612, P1095, P1261, P1262, P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The engine is running.
- The accelerator pedal position is 0%.
- The engine coolant temperature is more than 50°C (122°F).
- The vehicle speed is less than 5 km/h (4 MPH).
- The engine speed does not vary more than 50 RPM.

FRP Drop DTC

- DTCs P0090, P0192, P0193, P0201 – P0204, P0611, P0612, P1095, P1261, P1262, P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The engine is running.
- The accelerator pedal position is 0%.
- The engine coolant temperature is more than 50°C (122°F).
- The vehicle speed is more than 50 km/h (30 MPH).
- The commanded fuel injection quantity is OFF.

Condition for Setting the DTC

FRP Regulator Command High DTC

- The ECM detects that the FRP regulator commanded fuel is more than a predetermined range for longer than 15 seconds when the engine speed is between 600 – 1500 RPM.

FRP Drop DTC

- The ECM detects that the FRP sensor signal voltage is shapely dropped more than 0.2 volts when the engine cuts fuel.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become low enough to set this DTC.
- Normal FRP Sensor readings on the Tech 2 with the engine running in neutral at idle is around 1.4 – 1.6 volts.
- An intermittently sticking fuel injector may have allowed the fuel pressure to drop too much. Use the Tech 2 to perform the Injector Balancing test for each injector. Verify a consistent engine speed change when commanding each fuel injector ON and OFF.
- A skewed FRP sensor value (shifted to a lower pressure) can set this DTC. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes.

Notice:

- This DTC most likely indicates a loss of fuel pressure by a fuel leak from the high pressure side. Inspect the high pressure side fuel leakage between the fuel supply pump and fuel injector FIRST.

Notice:

- The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight or if there is a crack in one of the fuel hoses. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC.

Notice:

- If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the supply pump is interrupted and this DTC may set. Perform bleeding of fuel system after refilling.

Test Description

The numbers below refers to the step number on the diagnostic table.
7. This step checks for a fuel restriction by determining if a high vacuum is being pulled on the fuel system during normal operation.
8. This step checks for an air leak on the suction side of the fuel system by determining if a vacuum can be pulled when a fuel line is plugged.

DTC P1094 (Flash Code 226)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Inspect the high pressure side between the fuel supply pump and the fuel injectors for fuel leakage. The following components may contain an external leak. • Fuel supply pump • Fuel rail • Pressure limiter valve • Flow damper valve • Fuel rail pressure (FRP) sensor • Fuel pipe between the fuel supply pump and fuel rail • Fuel pipe between the fuel rail and fuel injectors • Each fuel pipe sleeve nuts **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. **Notice:** Remove and inspect the inlet high pressure joint to the fuel injectors for fuel leaking from the sleeve nut(s). Replace the fuel injector and injection pipe when foreign material was in contact. 2. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Remove each glow plug from the cylinder head. 2. Inspect the tip of the plugs for wet fuel. **Notice:** Use the engine compression gauge (5-8840-2675-0 / J-26999-12) and gauge adapter (5-8840-2815-0 / EN-46722) to inspect the damage of engine. If poor engine compression (less than 1960 kPa [284 psi]) or variation of each cylinder (more than 294 kPa [43 psi]) is found, inspect the engine mechanical. Refer to the Engine Mechanical section. Repair as necessary. Did you find wet fuel on the glow plug(s)?	—	Go to Step 16	Go to Step 4
4	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0090, P0192, P0193, P0201 – P0204, P1094, P1095, P1261 or P1262 set?	—	Go to Applicable DTC	Go to Step 5
5	1. Turn OFF the ignition. 2. Wait 2 minutes for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition with the engine OFF. DO NOT start the engine. 4. Observe the FRP Sensor parameter with the Tech 2. Is the FRP Sensor parameter the specified value?	0.9 – 1.0 volt	Go to Step 6	Go to Step 13

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC. 3. Pump the priming pump on the fuel filter until it becomes firm. If there is a leak on the suction side of the fuel system between the priming pump and the fuel supply pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Start the engine and check for high side fuel system leaks at the fuel supply pump and fuel rail. **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 5. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 7
7	1. Turn OFF the ignition. 2. Remove the rubber fuel hose from the fuel filter housing (fuel supply pump side). Use a pan to catch the fuel leakage from the removed fuel line. **Important:** The fuel vacuum pump / pressure gauge connector and the adapter hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the tools line may damage the fuel supply pump. 3. Connect the suction side fuel pressure / vacuum gauge adapter (5-8840-2844-0 / EN-47667) with fuel pressure / vacuum gauge assembly (5-8840-2844-0 / J-44638) in series with the filter housing and the disconnected fuel hose. Ensure the service tool and fuel line connections are tight. 4. Bleed the fuel system by priming the priming pump until it becomes firm, then crank over the engine for a maximum of 5 seconds. Repeat as necessary until the engine starts. 5. Let the engine run at idle for at least 1 minute. 6. Monitor the fuel pressure / vacuum gauge while holding the engine speed higher than 2500 RPM for a minimum of 1 minute. Does the fuel pressure / vacuum gauge ever indicate a larger vacuum than the specified amount during the test?	5 inHg	Go to Step 9	Go to Step 8

Step	Action	Value(s)	Yes	No
8	1. Fully clamp off a fuel hose as close to the fuel tank as possible (this will draw vacuum on the fuel system). You can also disconnect a fuel line and plug it. 2. Start the engine and turn the idle up control knob to the highest position. (Full clockwise direction. The idle speed is increased up to 1600 RPM.) 3. Monitor the fuel pressure / vacuum gauge. **Notice:** Release the clamp or open the plug when the gauge is likely to be more than 8 inHg during the test. Can a vacuum of at least the specified amount be pulled on the fuel system?	8 inHg	Go to Step 11	Go to Step 10
9	1. Inspect the fuel lines between the fuel supply pump and fuel tank for being crushed or kinked. 2. Inspect for a plugged fuel tank vent hose. 3. Inspect inside the fuel tank (if possible) for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. 4. Repair as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 14
10	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 3. Repair as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 12
11	1. Turn OFF the ignition. 2. Unclamp or unplug the fuel line from the previous step and reconnect the fuel line (if disconnected). 3. Start the engine and allow it to run for at least 1 minute. 4. Perform the Injector Balancing test with the Tech 2. 5. Command each injector OFF and verify an engine speed change for each injector. Is there an injector that does not change engine speed when commanded OFF?	—	Go to Step 17	Go to Step 19

Step	Action	Value(s)	Yes	No
12	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-116). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP regulator circuit at the harness connector of the ECM (pins 89, 97, 105 and 113 of E-111 connector). 6. Test for high resistance on each FRP regulator circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 18
13	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-113 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP sensor circuit at the harness connector of the ECM (pins 82, 87, 90 and 101 of E-111 connector). 6. Test for high resistance on each FRP circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 15
14	Replace the fuel filter cartridge. Refer to Fuel Filter Cartridge Replacement in the Fuel System Section. Did you complete the replacement?	—	Go to Step 20	—
15	Replace the FRP sensor. Refer to Fuel Rail Pressure (FRP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 20	—
16	**Important:** Replacement injector must be programmed. Replace the appropriate injector that was leaking fuel found at Step 3. Refer to Fuel Injector Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 20	—

Step	Action	Value(s)	Yes	No
17	**Important:** Replacement injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 20	—
18	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement in this section and Fuel Filter Cartridge Replacement in Fuel System section. Did you complete the replacement?	—	Go to Step 20	—
19	**Notice:** There is a possibility that the pressure limiter valve stuck open or opening pressure has fallen. Replace the pressure limiter valve. Refer to Fuel Rail Replacement in this section. Did you complete the replacement?	—	Go to Step 20	—
20	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 21
21	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1095 (Flash Code 225)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the engine control module (ECM) using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. In case of fuel rail overpressure, a pressure limiter valve threaded into the fuel rail will open to release overpressure and return fuel back to the fuel tank.
If the ECM detects that the fuel rail pressure went excessively high, then sharply decreased, this DTC will set indicating high fuel pressure, which activated the pressure limiter valve.

Condition for Running the DTC

- DTCs P0192, P0193, P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the FRP sensor signal voltage drops quickly from more than 3.7 volts to less than 2.3 volts, and then the differential fuel rail pressure is more than -30 MPa (4,350 psi).

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become high enough to open the pressure limiter valve.
- Normal FRP Sensor readings on the Tech 2 with the engine running in neutral at idle is around 1.4 – 1.6 volts.
- A skewed FRP sensor value (shifted to a higher pressure) can set this DTC. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes.

Notice:

- The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight or if there is a crack in one of the fuel hoses. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC.

Notice:

- If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the supply pump is interrupted and this DTC may set. Perform bleeding of fuel system after refilling.

Test Description

The numbers below refers to the step number on the diagnostic table.
6. This step checks for a fuel restriction by determining if a high vacuum is being pulled on the fuel system during normal operation.
7. This step checks for an air leak on the suction side of the fuel system by determining if a vacuum can be pulled when a fuel line is plugged.

DTC P1095 (Flash Code 225)

Schematic Reference: Engine Controls Schematics

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls

Step	Action	Value(s)	Yes	No
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0089, P0090, P0192, P0193, P0201 – P0204, P1261 or P1262 set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition for 30 seconds. 2. Place the transmission in Neutral and set the park brake. 3. Start the engine. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Wait 2 minutes for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition with the engine OFF. DO NOT start the engine. 4. Observe the Fuel Rail Pressure (FRP) Sensor parameter with the Tech 2. Is the FRP Sensor parameter the specified value?	0.9 – 1.0 volt	Go to Step 5	Go to Step 12
5	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC. 3. Pump the priming pump on the fuel filter until it becomes firm. If there is a leak on the suction side of the fuel system between the priming pump and the fuel supply pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Start the engine and check for high side fuel system leaks at the fuel supply pump and fuel rail. **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 5. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Remove the rubber fuel hose from the fuel filter housing (fuel supply pump side). Use a pan to catch the fuel leakage from the removed fuel line. **Important:** The fuel vacuum pump / pressure gauge connector and the adapter hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the tools line may damage the fuel supply pump. 3. Connect the suction side fuel pressure / vacuum gauge adapter (5-8840-2844-0 / EN-47667) with fuel pressure / vacuum gauge assembly (5-8840-2844-0 / J-44638) in series with the filter housing and the disconnected fuel hose. Ensure the service tool and fuel line connections are tight. 4. Bleed the fuel system by priming the priming pump until it becomes firm, then crank over the engine for a maximum of 5 seconds. Repeat as necessary until the engine starts. 5. Let the engine run at idle for at least 1 minute. 6. Monitor the fuel pressure / vacuum gauge while holding the engine speed higher than 2500 RPM for a minimum of 1 minute. Does the fuel pressure / vacuum gauge ever indicate a larger vacuum than the specified amount during the test?	5 inHg	Go to Step 8	Go to Step 7
7	1. Fully clamp off a fuel hose as close to the fuel tank as possible (this will draw vacuum on the fuel system). You can also disconnect a fuel line and plug it. 2. Start the engine and turn the idle up control knob to the highest position. (Full clockwise direction. The idle speed is increased up to 1600 RPM.) 3. Monitor the fuel pressure / vacuum gauge. **Notice:** Release the clamp or open the plug when the gauge is likely to be more than 8 inHg during the test. Can a vacuum of at least the specified amount be pulled on the fuel system?	8 inHg	Go to Step 10	Go to Step 9
8	1. Inspect the fuel lines between the fuel supply pump and fuel tank for being crushed or kinked. 2. Inspect for a plugged fuel tank vent hose. 3. Inspect inside the fuel tank (if possible) for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. 4. Repair as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 13

Step	Action	Value(s)	Yes	No
9	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 3. Repair as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 11
10	1. Turn OFF the ignition. 2. Unclamp or unplug the fuel line from the previous step and reconnect the fuel line (if disconnected). 3. Start the engine and allow it to run for at least 1 minute. 4. Perform the Injector Balancing test with the Tech 2. 5. Command each injector OFF and verify an engine speed change for each injector. Is there an injector that does not change engine speed when commanded OFF?	—	Go to Step 15	Go to Step 11
11	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-116). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP regulator circuit at the harness connector of the ECM (pins 89, 97, 105 and 113 of E-111 connector). 6. Test for high resistance on each FRP regulator circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
12	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-113 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP sensor circuit at the harness connector of the ECM (pins 82, 87, 90 and 101 of E-111 connector). 6. Test for high resistance on each FRP circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 14

Step	Action	Value(s)	Yes	No
13	Replace the fuel filter cartridge. Refer to Fuel Filter Cartridge Replacement in the Fuel System Section. Did you complete the replacement?	—	Go to Step 17	—
14	Replace the FRP sensor. Refer to Fuel Rail Pressure (FRP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—
15	**Important:** Replacement injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 17	—
16	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement in this section and Fuel Filter Cartridge Replacement in Fuel System section. Did you complete the replacement?	—	Go to Step 17	—
17	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 18
18	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1173 (Flash Code 542)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor has a signal circuit and a low reference circuit. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit. If the ECM detects an excessive high coolant temperature, this DTC will set.

Condition for Running the DTC

- DTCs P0117, P0118, P1630 and P1634 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the engine coolant temperature is more than 110°C (230°F) for 15 seconds.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- After starting the engine, the ECT should rise steadily to about 80°C – 85°C (176°F – 185°F) then stabilize when the thermostat opens.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

Notice:

- This DTC is caused by an engine overheat condition (i.e. low engine coolant level). Since this DTC does not illuminate any lamps, clear the DTC and ensure there are no signs of engine damage. Excessive engine overheat may damage internal engine components.

DTC P1173 (Flash Code 542)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0117 also set?	—	Go to DTC P0117	Go to Step 3
3	1. Start the engine and wait until engine is fully warms upped. 2. Observe the Coolant Temperature parameter with the Tech 2. Is the Coolant Temperature parameter more than the specified value?	110°C (230°F)	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	Ask the driver if overheat is caused by low engine coolant level, etc. If engine overheat has experienced, the engine must be inspected and repaired as necessary. Did you complete the action?	—	Go to Step 7	—
5	1. Test the engine coolant temperature (ECT) sensor at various temperature levels to evaluate the possibility if a skewed sensor. 2. Replace the ECT sensor as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	1. Test the engine cooling system for the following condition. Refer to diagnosis of the engine cooling system section for testing. • Engine coolant level • Engine coolant leakage • Cooling fan belt slippage • Cooling fan clutch working • Thermostat working • Water pump working • Radiator clogging 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Diagnostic Aids
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and wait until engine is fully warms upped. 5. Observe the Coolant Temperature parameter with the Tech 2. Is the Coolant Temperature parameter more than the specified value?	110°C (230°F)	Go to Step 2	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1220 (Flash Code 28)

Circuit Description

The power take off (PTO) throttle sensor (body builder installed) detects the PTO control throttle angle. The engine control module (ECM) receives the PTO control throttle angle from the throttle sensor and controls the fuel injection quantity (engine speed) during PTO. The PTO throttle sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- PTO throttle sensor signal circuit

The ECM supplies 5 volts to the PTO throttle sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The ECM monitors the PTO throttle sensor signal for voltages outside the normal range of the PTO throttle sensor. If the ECM detects an excessively high PTO throttle sensor signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1631 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the PTO throttle sensor signal voltage is more than 4.8 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM disables PTO throttle sensor control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- PTO throttle sensor may have an intermittent open somewhere in the operating range.

DTC P1220 (Flash Code 28)

4	1. Turn OFF the ignition. 2. Disconnect the PTO throttle sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the PTO Remote Throttle Sensor parameter with the Tech 2. Is the PTO Remote Throttle Sensor parameter less than the specified value?	0.2 volts	Go to DTC P1631	Go to Step 7

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the PTO throttle sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the PTO Remote Throttle Sensor parameter with the Tech 2. Is the PTO Remote Throttle Sensor parameter less than the specified value?	0.2 volts	Go to Step 6	Go to Step 7
6	1. Turn OFF the ignition. 2. Connect a test lamp between the low reference circuit of the PTO throttle sensor harness (pin 3 of J-166 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
7	**Important:** The PTO throttle sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the engine control module (ECM) (pin 70 of J-191 connector) and the PTO throttle sensor (pin 2 of J-166 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the low reference circuit between the ECM (pin 41 of J-191 connector) and the PTO throttle sensor (pin 3 of J-166 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
9	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the PTO throttle sensor (pin 3 of J-166 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the PTO throttle sensor circuit at the harness connector of the ECM (pin 41 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the PTO throttle sensor. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the PTO Remote Throttle Sensor parameter with the Tech 2 while turning the PTO throttle sensor. Is the PTO Remote Throttle Sensor parameter more than the specified value?	4.8 volts	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1225 (Flash Code 31)

Circuit Description

The idle up sensor controls the idle speed during warm-up and it is installed in the driver's side instrument panel. This sensor is active only when the gear position is in the neutral position. When the selector lever is moved to another position, the signal is ignored. The engine control module (ECM) receives the idle up signal from the idle up sensor and controls the fuel injection quantity. The idle up sensor has following circuits.

- 5 volts reference circuit
- Low reference circuit
- Idle up sensor signal circuit

The ECM monitors the idle up sensor signals for voltages outside the normal range of the idle up sensor. If the ECM detects an excessively low or high idle up sensor voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1631 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the idle up sensor signal voltage is less than 0.1 volts for 5 second.
- The ECM detects that the idle up sensor signal voltage is more than 4.9 volts for 5 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM disables idle up sensor control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Idle up sensor may have an intermittent open somewhere in the operating range.

DTC P1225 (Flash Code 31)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Fully turn the idle up sensor to lowest position (full counterclockwise direction) and highest position (full clock wise direction) while observing the Idle Up Sensor parameter with the Tech 2. Is the Idle Up Sensor parameter within the specified valve?	0.2 – 4.8 volts	Go to Diagnostic Aids	Go to Step 3
3	1. Start the engine. 2. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P1631 also set?	—	Go to Step 4	Go to Step 5
4	Is the Idle Up Sensor parameter less than the specified value at Step 2?	0.1 volts	Go to DTC P1631	Go to Step 8

Step	Action	Value(s)	Yes	No
5	1. Turn ON the ignition, with the engine OFF. 2. Turn the idle up sensor to lowest position (full counterclockwise direction). 3. Observe the Idle Up Sensor parameter with the Tech 2. Is the Idle Up Sensor parameter less than the specified value?	0.1 volts	Go to Step 6	Go to Step 9
6	1. Turn OFF the ignition. 2. Disconnect the idle up sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit of the idle up sensor harness (pin 3 of B-281 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 7	Go to Step 11
7	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit of the idle up sensor harness (pin 2 and 3 of B-281 connector). 3. Turn ON the ignition, with the engine OFF. 4. Observe the Idle Up Sensor parameter with the Tech 2. Is the Idle Up Sensor parameter more than the specified value?	4.5 volts	Go to Step 15	Go to Step 12
8	1. Turn OFF the ignition. 2. Disconnect the idle up sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Idle Up Sensor parameter with the Tech 2. Is the Idle Up Sensor parameter less than the specified value?	0.1 volts	Go to DTC P0631	Go to Step 13
9	1. Turn OFF the ignition. 2. Disconnect the idle up sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Idle Up Sensor parameter with the Tech 2. Is the Idle Up Sensor parameter less than the specified value?	0.1 volts	Go to Step 10	Go to Step 13
10	1. Turn OFF the ignition. 2. Connect a test lamp between the low reference circuit of the idle up sensor harness (pin 1 of B-281 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 15	Go to Step 14

Step	Action	Value(s)	Yes	No
11	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 42 of J-191 connector) and the idle up sensor harness (pin 3 of B-281 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
12	1. Test the signal circuit between the ECM (pin 66 of J-191 connector) and the idle up sensor (pin 2 of B-281 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
13	**Important:** The idle up sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 66 of J-191 connector) and the idle up sensor (pin 2 of B-281 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
14	1. Test the low reference circuit between the ECM (pin 41 of J-191 connector) and the idle up sensor (pin 1 of B-281 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the idle up sensor harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the idle up sensor (pins 1, 2 and 3 of B-281 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
16	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the idle up sensor circuits at the harness connector of the ECM (pins 41, 42 and 66 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18

Step	Action	Value(s)	Yes	No
17	Replace the idle up sensor. Refer to Idle Up Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
18	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully turn the idle up sensor to lowest position (full counterclockwise direction) and highest position (full clock wise direction) while observing the Idle Up Sensor parameter with the Tech 2. Is the Idle Up Sensor parameter within the specified valve?	0.2 – 4.8 volts	Go to Step 20	Go to Step 3
20	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1261 (Flash Code 158)

Circuit Description

The common 1 fuel injector drive circuit is a high-voltage supply which drives injectors for cylinder number 1 and 4 in conjunction with the engine control module (ECM) grounding the fuel injector control circuit. The ECM also supplies battery voltage to the fuel injector solenoid control circuit to allow for fault detection. If the common 1 fuel injector drive circuit is open circuit, short to ground or short to voltage, this DTC will set. Or, if the cylinder number 1 or number 4 fuel injector solenoid control circuit is shorted to ground, this DTC will also set.

Condition for Running the DTC

- DTC P0611 is not set.
- The ignition switch is ON.
- The battery voltage is more than 18 volts.
- The engine is running.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the common 1 fuel injector drive circuit is open circuit, shorted to ground or shorted to voltage during engine rotations.
- The ECM detects that the cylinder number 1 or number 4 fuel injector solenoid coil control circuit is shorted to ground during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL and exhaust brake indicator lamp when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1261 (Flash Code 158)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	**Important:** If DTC P0201 or P0204 is also set, diagnose that DTC first. 1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (H-125) from the cylinder head cover case. 3. Connect a DMM between the cylinder number 1 fuel injector control circuit (pin 5 of H-125 female side connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	12.0 volt	Go to Step 4	Go to Step 6

Step	Action	Value(s)	Yes	No
4	1. Connect a test lamp between the common 1 fuel injector drive circuit (pin 1 or 4 of H-125 female side connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 5
5	1. Connect a test lamp between the common 1 fuel injector drive circuit (pins 1 or 4 of H-125 female side connector) and battery voltage. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 9
6	1. Test the cylinder number 1 or number 4 fuel injector solenoid control circuit between the engine control module (ECM) and the in-line harness connector (H-125 connector) for a short to ground. • Cylinder #1: Between pin 119 of E-111 connector and 5 of H-125 connector • Cylinder #4: Between pin 117 of E-111 connector and 8 of H-125 connector 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
7	1. Test the common 1 fuel injector drive circuit between the ECM (pin 121 of E-111 connector) and the in-line harness connector (pins 1 and 4 of H-125 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
8	1. Test the common 1 fuel injector drive circuit between the ECM (pin 121 of E-111 connector) and the in-line harness connector (pins 1 and 4 of H-125 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
9	1. Inspect for an intermittent and for a poor connection at the in-line harness connector (pins 1 and 4 of H-125 connector). 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the common 1 fuel injector drive circuit at the harness connector of the ECM (pin 121 of E-111 connector). 4. Inspect for an open circuit or high resistance on the common 1 fuel injector drive circuit between the ECM (pin 121 of E-111 connector) and the in-line harness connector (pins 1 and 4 of H-125 connector). 5. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 10

Step	Action	Value(s)	Yes	No
10	1. Remove the cylinder head cover. Refer to Fuel Injector Replacement in this section. 2. Inspect the fuel injector harness for loose injector terminal nuts, objects touching injector terminals. 3. Inspect for an intermittent and for a poor connection at the in-line harness connector (pins 1 and 4 of H-126 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 11
11	1. Disconnect the fuel injector harness from the cylinder number 1 and number 4 fuel injectors (E-138 and E-141 connector). 2. Measure the insulation resistance between cylinder number 1 fuel injector terminals and a known good ground. 3. Measure the insulation resistance between cylinder number 4 fuel injector terminals and a known good ground. Is the insulation resistance more than the specified value on each measurement?	1 MΩ	Go to Step 12	Go to Step 13
12	Repair or replace the injector harness. Refer to Fuel Injector Replacement in this section. Did you complete the repair or replace?	—	Go to Step 15	—
13	**Important:** Replacement injector must be programmed. Replace the appropriate fuel injector that was less insulation resistance found at Step 11. Refer to Fuel Injector Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1262 (Flash Code 159)

Circuit Description

The common 2 fuel injector drive circuit is a high-voltage supply which drives injectors for cylinder number 2 and 3 in conjunction with the engine control module (ECM) grounding the fuel injector control circuit. The ECM also supplies battery voltage to the fuel injector solenoid control circuit to allow for fault detection. If the common 2 fuel injector drive circuit is open circuit, short to ground or short to voltage, this DTC will set. Or, if the cylinder number 2 or number 3 fuel injector solenoid control circuit is shorted to ground, this DTC will also set.

Condition for Running the DTC

- DTC P0612 is not set.
- The ignition switch is ON.
- The battery voltage is more than 18 volts.
- The engine is running.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the common 2 fuel injector drive circuit is open circuit, shorted to ground or shorted to voltage during engine rotations.
- The ECM detects that the cylinder number 2 or number 3 fuel injector solenoid coil control circuit is shorted to ground during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL and exhaust brake indicator lamp when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

P1271 (Flash Code 24)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The sensor is made up of two individual sensors within one housing. The APP sensor 1 and APP sensor 2 are potentiometer type sensors, each with the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Signal circuit

The engine control module (ECM) supplies 5 volts to the APP sensor on the 5 volts reference circuits. The ECM also provides a ground on the low reference circuits. The APP sensor provides a signal to the ECM on the APP sensor signal circuits, which is relative to the position changes of the accelerator pedal angle. The APP sensor 1 signal voltage is low at rest and increases as the pedal is depressed. The APP sensor 2 signal voltage is high at rest and decreases as the pedal is depressed. If the ECM detects that the APP sensor 1 signal and the APP sensor 2 signal are out of the correlation, this DTC will set.

Condition for Running the DTC

- DTCs P1630, P1631 and P1632 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the APP sensor 1 and sensor 2 are more than 45% out of range of each other.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL and exhaust brake indicator lamp when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1271 (Flash Code 24)

Schematic Reference: Engine Controls Schematics

P1277 (Flash Code 24)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The sensor is made up of two individual sensors within one housing. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injector control. The APP sensor 1 has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor 1 signal circuit

The ECM supplies 5 volts to the APP sensor 1 on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor 1 provides a signal to the ECM on the APP sensor 1 signal circuit, which is relative to the position changes of the accelerator pedal angle. The ECM monitors the APP sensor 1 signal for voltages outside the normal range of the APP sensor 1. If the ECM detects an excessively low APP sensor 1 signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1631 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the APP sensor 1 signal voltage is less than 0.2 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL and exhaust brake indicator lamp when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- APP sensor 1 may have an intermittent open somewhere in the pedal range.

DTC P1277 (Flash Code 24)

12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the APP Sensor 1 parameter with the Tech 2. Is the APP Sensor 1 parameter less than the specified value?	0.2 volts	Go to Step 3	Go to Step 13
13	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1278 (Flash Code 24)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The sensor is made up of two individual sensors within one housing. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injector control. The APP sensor 1 has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor 1 signal circuit

The ECM supplies 5 volts to the APP sensor 1 on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor 1 provides a signal to the ECM on the APP sensor 1 signal circuit, which is relative to the position changes of the accelerator pedal angle. The ECM monitors the APP sensor 1 signal for voltages outside the normal range of the APP sensor 1. If the ECM detects an excessively high APP sensor 1 signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1631 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the APP sensor 1 signal voltage is more than 4.9 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL and exhaust brake indicator lamp when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- APP sensor 1 may have an intermittent open somewhere in the pedal range.

Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the APP sensor. Refer to Accelerator Pedal Position (APP) Sensor Replacement in this section. (APP sensor 1 is internal to APP sensor assembly) Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the APP Sensor 1 parameter with the Tech 2. Does the APP Sensor 1 parameter ever exceed the specified value?	4.8 volts	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1282 (Flash Code 24)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The sensor is made up of two individual sensors within one housing. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injector control. The APP sensor 2 has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor 2 signal circuit

The ECM supplies 5 volts to the APP sensor 2 on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor 2 provides a signal to the ECM on the APP sensor 2 signal circuit, which is relative to the position changes of the accelerator pedal angle. The ECM monitors the APP sensor 2 signal for voltages outside the normal range of the APP sensor 2. If the ECM detects an excessively low APP sensor 2 signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1632 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the APP sensor 2 signal voltage is less than 0.2 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL and exhaust brake indicator lamp when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- APP sensor 2 may have an intermittent open somewhere in the pedal range.

P1283 (Flash Code 24)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The sensor is made up of two individual sensors within one housing. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injector control. The APP sensor 2 has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor 2 signal circuit

The ECM supplies 5 volts to the APP sensor 2 on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor 2 provides a signal to the ECM on the APP sensor 2 signal circuit, which is relative to the position changes of the accelerator pedal angle. The ECM monitors the APP sensor 2 signal for voltages outside the normal range of the APP sensor 2. If the ECM detects an excessively high APP sensor 2 signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1632 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the APP sensor 2 signal voltage is more than 4.9 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL and exhaust brake indicator lamp when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- APP sensor 2 may have an intermittent open somewhere in the pedal range.

13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the APP Sensor 2 parameter with the Tech 2. Does the APP Sensor 2 parameter ever exceed the specified value?	4.8 volts	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1345 (Flash Code 16)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 56 notches spaced 6° apart and a 30° section that is open span. This open span portion allows for the detection of cylinder #1 top dead center (TDC).
The camshaft position (CMP) sensor is installed on the cylinder head at the rear of the camshaft gear. The CMP sensor detects a total of five through holes (four holes arranged equally every 90° and one reference hole on the camshaft gear flange surface).
Detecting the open span portion from the CKP sensor and one reference hole from the CMP sensor, the engine control module (ECM) determines cylinder #1 compression top dead center (TDC) to ensure they correlate with each other. If the ECM detects both signals are out of synchronization, this DTC will set.

Condition for Running the DTC

- DTCs P0335, P0336, P0340 and P0341 are not set.
- The ignition switch is ON.
- The CKP sensor signal is detected.
- The CMP sensor signal is detected.

Condition for Setting the DTC

- The ECM detects that the CKP sensor signals and CMP sensor signals are out of synchronization during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- This DTC is caused by an incorrect mechanical timing condition, which was most likely cased by wrong installation of timing gear, flywheel or camshaft.

DTC P1345 (Flash Code 16)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If engine does not start, crank over the engine for 10 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is the DTC P0335, P0336, P0340 or P0341 also set?	—	Go to Applicable DTC	Go to Step 3
3	Inspect the engine mechanical timing. Refer to the Engine Mechanical section. Repair as necessary. **Notice:** If the flywheel dowel pin is missing or pushed in and the flywheel is incorrectly installed, this DTC may set. Did you complete the repair?	—	Go to Step 4	—
4	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. If engine does not start, crank over the engine for 10 seconds. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 5

Step	Action	Value(s)	Yes	No
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1625 (Flash Code 416)

Circuit Description

The engine control module (ECM) main relay is energized to feed the battery voltage to the ECM through the relay switch side when the ECM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the ECM main relay is de-energized after a certain length of time passed.
If the ECM detects the ECM main relay is turned OFF before ECM commanded OFF, this DTC will set. (ECM main relay open stuck DTC)
If the ECM detects the ECM has been ON when the relay is commanded OFF, this DTC will also set. (ECM main relay close stuck DTC)

Condition for Running the DTC

ECM main relay open stuck DTC

- DTC P1630 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The ignition ON time is longer than 3 seconds.

Condition for Setting the DTC

ECM main relay open stuck DTC

- The ECM detects a low voltage condition on the ECM main relay voltage feed circuit when the relay is commanded ON for longer than 5 seconds.

ECM main relay close stuck DTC

- The ECM detects that the ECM has been ON when the relay is commanded OFF for longer than 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Faulty or sticking ECM main relay will set this DTC.

DTC P1625 (Flash Code 416)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Does the engine start?	—	Go to Step 4	Go to Step 8
4	1. Turn OFF the ignition. 2. Disconnect the ECM main relay. Does the engine start?	—	Go to Step 5	Go to Step 6
5	Repair the short to battery on the voltage feed circuits to the engine control module (ECM) between the ECM (pins 2 and 5 of J-191 connector) and the ECM main relay (pin 2 of X-18 connector). Did you complete the repair?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition for 30 seconds. 2. Replace the ECM main relay with the glow relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. 4. Turn ON the ignition. 5. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 7	Go to Step 11
7	1. Test the voltage supply circuits to the ECM main relay between the ECM (pins 21 and 40 of J-191 connector) and the ECM main relay (pin 4 of X-18 connector) for a short to battery. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Turn OFF the ignition for 30 seconds. 2. Replace the ECM main relay with the glow relay or replace with a known good relay. 3. Start the engine. Does the engine start?	—	Go to Step 11	Go to Step 9
9	1. Turn OFF the ignition. 2. Inspect for an intermittent, for poor tightening and corrosion at the chassis ground terminal (J-9). 3. Repair the tightening or clean the corrosion as necessary. 4. Inspect the ECM (40A) slow blow fuse for open. 5. Replace the ECM (40A) slow blow fuse if open. If it continues to open, repair the short to ground on one of the circuits that is fed by the ECM (40A) slow blow fuse. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10

Step	Action	Value(s)	Yes	No
10	1. Turn OFF the ignition. 2. Disconnect the ECM main relay. 3. Inspect for an intermittent and for poor connections and corrosion on each ECM main relay terminal (pins 2, 3, 4 and 5 of X-18 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on the ECM main relay voltage supply and feed circuits at the harness connector of the ECM (pins 2, 5, 21 and 40 of J-191 connector). 6. Test for high resistance on each ECM main relay circuit. • Between pins 2 and 5 of J-191 and pin 2 of X-18 connector • Between pins 21 and 40 of J-191 connector and pin 4 of X-18 connector • Between ECM (40A) slow blow fuse and pin 3 of X-18 connector • Between pin 5 of X-18 connector and chassis ground (J-9) 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the ECM main relay. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected relay or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1630 (Flash Code 36)

Circuit Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM).

Condition for Setting the DTC

- The ECM detects a malfunction in its internal analog / digital (A/D) converter.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

DTC P1630 (Flash Code 36)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5

P1631 (Flash Code 55)

Circuit Description

The engine control module (ECM) provides 5 volts reference voltage through the reference circuit 1 to the following sensors:

- Accelerator pedal position (APP) sensor 1
- PTO throttle sensor
- Idle up sensor

The 5 volts reference circuits are bussed together outside the ECM. Therefore, a short circuit condition on one sensor 5 volts reference circuit may affect the entire 5 volt reference circuit 1. The ECM monitors the voltage on the 5 volts reference circuit 1. If the ECM detects the voltage is excessively low or high, this DTC will set.

Condition for Running the DTC

- DTC P1630 is not set.
- The ignition switch is ON.
- The battery voltage is between 16 – 32 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the 5 volts reference circuit 1 voltage is less than 4.5 volts.
- The ECM detects that the 5 volts reference circuit 1 voltage is more than 5.5 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- The ECM turns OFF the exhaust brake indicator lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the idle up sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit of the idle up sensor harness (pin 3 of B-281 connector) and a known good ground. 4. Turn ON the ignition, with engine OFF. Is the DMM voltage less than the specified value?	5.5 volts	Go to Step 4	Go to Step 7
4	Is the DMM voltage more than the specified value at Step 3?	4.5 volts	Go to Step 9	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Keep the DMM with connected to the idle up sensor harness connector. 2. Turn OFF the ignition. 3. Disconnect the accelerator pedal position (APP) sensor harness connector. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage change to more than the specified value when the APP harness connector is disconnected?	4.5 volts	Go to Step 10	Go to Step 6
6	**Notice:** If no PTO throttle sensor is installed, skip to Step 8. 1. Keep the DMM with connected to the idle up sensor harness connector. 2. Turn OFF the ignition. 3. Disconnect the PTO throttle sensor harness connector. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage change to more than the specified value when the PTO throttle sensor harness connector is disconnected?	4.5 volts	Go to Step 11	Go to Step 8
7	1. Test the 5 volts reference circuit 1 between the engine control module (ECM) (pin 42 of J-191 connector) and the following components for a short to battery or ignition voltage: • APP sensor 1 (pin 4 of B-280 connector) • PTO throttle sensor (pin 1 of J-166 connector) • Idle up sensor (pin 3 of B-281 connector) 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the 5 volts reference circuit 1 between the ECM (pin 42 of J-191 connector) and the following components for a short to ground or short to the low reference circuit: • APP sensor 1 (pin 4 of B-280 connector) • PTO throttle sensor (pin 1 of J-166 connector) • Idle up sensor (pin 3 of B-281 connector) 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
9	Replace the idle up sensor. Refer to Idle Up Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
10	Replace the APP sensor. Refer to Accelerator Pedal Position (APP) Sensor Replacement in this section. (APP sensor 1 is internal to APP sensor assembly) Did you complete the replacement?	—	Go to Step 13	—
11	Replace the PTO throttle sensor. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1632 (Flash Code 55)

Circuit Description

The engine control module (ECM) provides 5 volts reference voltage through the reference circuit 2 to the following sensors:

- Accelerator pedal position (APP) sensor 2
- Barometric pressure (BARO) sensor

The ECM also provides 5 volts reference voltage through the reference circuit 5 to the following sensors:

- Fuel rail pressure (FRP) sensor
- EGR valve position sensor

The 5 volts reference circuits 2 and 5 are independent of each other outside of the ECM, but are bussed together inside the ECM. Therefore, a short circuit condition on one sensor 5 volts reference circuit may affect the entire 5 volt reference circuit 2 and 5. The ECM monitors the voltage on the 5 volts reference circuit 2 and 5. If the ECM detects the voltage is excessively low or high, this DTC and DTC P1635 will also set.

Condition for Running the DTC

- DTC P1630 is not set.
- The ignition switch is ON.
- The battery voltage is between 16 – 32 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the 5 volts reference circuit 2 or 5 voltage is less than 4.5 volts.
- The ECM detects that the 5 volts reference circuit 2 or 5 voltage is more than 5.5 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR valve control.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL and exhaust brake indicator lamp when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

P1633 (Flash Code 55)

Circuit Description

The engine control module (ECM) has ability to provide 5 volts reference voltage through the reference circuit 3. But it is not used. The ECM provides 5 volts reference voltage through the reference circuit 4 to the boost pressure sensor. The 5 volts reference circuits 3 and 4 are independent of each other outside of the ECM, but are bussed together inside the ECM. Therefore, a short circuit condition on one sensor 5 volts reference circuit may affect the entire 5 volt reference circuit 3 and 4. The ECM monitors the voltage on the 5 volts reference circuit 3 and 4. If the ECM detects the voltage is excessively low or high, this DTC and DTC P1634 will also set.

Condition for Running the DTC

- DTC P1630 is not set.
- The ignition switch is ON.
- The battery voltage is between 16 – 32 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the 5 volts reference circuit 3 or 4 voltage is less than 4.5 volts.
- The ECM detects that the 5 volts reference circuit 3 or 4 voltage is more than 5.5 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

P1635 (Flash Code 55)

Circuit Description

The engine control module (ECM) provides 5 volts reference voltage through the reference circuit 5 to the following sensors:

- Fuel rail pressure (FRP) sensor
- EGR valve position sensor

The ECM also provides 5 volts reference voltage through the reference circuit 2 to the following sensors:

- Accelerator pedal position (APP) sensor 2
- Barometric pressure (BARO) sensor

The 5 volts reference circuits 2 and 5 are independent of each other outside of the ECM, but are bussed together inside the ECM. Therefore, a short circuit condition on one sensor 5 volts reference circuit may affect the entire 5 volt reference circuit 2 and 5. The ECM monitors the voltage on the 5 volts reference circuit 2 and 5. If the ECM detects the voltage is excessively low or high, this DTC and DTC P1632 will also set.

Condition for Running the DTC

- DTC P1630 is not set.
- The ignition switch is ON.
- The battery voltage is between 16 – 32 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the 5 volts reference circuit 2 or 5 voltage is less than 4.5 volts.
- The ECM detects that the 5 volts reference circuit 2 or 5 voltage is more than 5.5 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR valve control.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL and exhaust brake indicator lamp when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1635 (Flash Code 55)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to DTC P1632	Go to Diagnostic Aids

P1681 (Flash Code 46)

Circuit Description

The engine control module (ECM) controls the exhaust brake which energizes the intake throttle solenoid valve and exhaust brake solenoid valve based on vehicle running condition. The ECM commands each solenoid valve to close each throttle valve by applying vacuum. If the ECM detects that an open circuit or short to ground on the exhaust brake solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The battery voltage is between 16 – 32 volts.
- The engine is running.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the exhaust brake solenoid valve control circuit for longer than 10 seconds when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- The ECM turns OFF the exhaust brake indicator lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1681 (Flash Code 46)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Perform the Exhaust Brake Control test with the Tech 2. 5. Command the Exhaust Brake ON with the Tech 2. Does the exhaust brake solenoid valve click when commanded ON with the Tech 2 (note that intake throttle solenoid valve also click when commanded ON)?	—	Go to Step 3	Go to Step 4
3	1. Turn OFF the ignition for 30 seconds. 2. Start the engine. 3. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 13	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the exhaust brake solenoid valve harness connector. 3. Connect a test lamp between the voltage feed circuit of the exhaust brake solenoid valve harness (pin 1 of J-31 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 5	Go to Step 7

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Connect a test lamp between the control circuit of the exhaust brake solenoid valve harness (pin 2 of J-31 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 6
6	1. Keep the test lamp with connected. 2. Perform the Exhaust Brake Control test with the Tech 2. 3. Command the Exhaust Brake ON with the Tech 2. Does the test lamp illuminate?	—	Go to Step 10	Go to Step 8
7	Repair the open circuit or high resistance on the voltage feed circuit between the ECM (10A) fuse and the exhaust brake solenoid valve (pin 1 of J-31 connector). Check the ECM (10A) fuse first. Did you complete the repair?	—	Go to Step 14	—
8	1. Test the control circuit between the engine control module (ECM) (pin 15 of J-191 connector) and the exhaust brake solenoid valve (pin 2 of J-31 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
9	1. Test the control circuit between the ECM (pin 15 of J-191 connector) and the exhaust brake solenoid valve (pin 2 of J-31 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
10	1. Turn OFF the ignition. 2. Disconnect the exhaust brake solenoid valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the exhaust brake solenoid valve (pins 1 and 2 of J-31 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the exhaust brake solenoid valve control circuit at the harness connector of the ECM (pin 15 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
12	Replace the exhaust brake solenoid valve. Refer to Exhaust Brake Solenoid Valve Replacement in Exhaust System section. Did you complete the replacement?	—	Go to Step 14	—

Step	Action	Value(s)	Yes	No
13	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 14	—
14	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 15
15	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1682 (Flash Code 46)

Circuit Description

The engine control module (ECM) controls the exhaust brake which energizes the intake throttle solenoid valve and exhaust brake solenoid valve based on vehicle running condition. The ECM commands each solenoid valve to close each throttle valve by applying vacuum. If the ECM detects that a short to battery or ignition voltage on the exhaust brake solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The battery voltage is between 16 – 32 volts.
- The engine is running.

Condition for Setting the DTC

- The ECM detects a high voltage condition on the exhaust brake solenoid valve control circuit for longer than 10 seconds when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- The ECM turns OFF the exhaust brake indicator lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.
3. If the exhaust brake solenoid valve control circuit between the ECM and the solenoid valve is normal, voltage level low DTC P1681 will set.

DTC P1682 (Flash Code 46)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Perform the Exhaust Brake Control test with the Tech 2. 5. Command the Exhaust Brake ON with the Tech 2. Does the exhaust brake solenoid valve click when commanded ON with the Tech 2 (note that intake throttle solenoid valve also click when commanded ON)?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the exhaust brake solenoid valve harness connector. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does DTC P1681 set, but not DTC P1682?	—	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the control circuit between the engine control module (ECM) (pin 15 of J-191 connector) and the exhaust brake solenoid valve (pin 2 of J-31 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Replace the exhaust brake solenoid valve. Refer to Exhaust Brake Solenoid Valve Replacement in Exhaust System section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run so that the exhaust brake may operate enough time (longer than 3 seconds). Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

U2104, U2106 (Flash Code 84, 85)

Circuit Description

The engine control module (ECM), the transmission control module (TCM), the electric hydraulic control module (EHCU) (ABS module) and the data recording module (DRM) communicate control and diagnostic information via a controller area network (CAN) communication bus. The ECM monitors CAN operational status by expecting a constant flow of messages from the TCM, EHCU and DRM. If the ECM fails to receive an expected message from the TCM, EHCU and DRM, DTC U2104 or U2106 will set depending on what communication is lost.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

U2104

- The ECM detects that the CAN Bus OFF status.

U2106

- The ECM detects that the CAN Bus messages from the TCM are not being received.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM blinks the exhaust brake indicator lamp when the diagnostic runs and fails.
- The ECM inhibits exhaust brake control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- The ECM turns OFF the exhaust brake indicator lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Diagnostic charts are different depending on the specification of the vehicle.

DTC U2104, U2106 (Flash Code 84, 85)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Chart for without Smoother and ABS

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Monitor the engine control module (ECM) Diagnostic Trouble Code (DTC) Information with the Tech 2. 4. Start the engine. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Measure the resistance across the controller area network (CAN) Low and High circuits by back probing the resistor 1 (pins 1 and 2 of B-387 connector) (resistor 1 is located near the driver's side dash panel. It is blue connector). Is the resistance within the specified value (parallel resistance of the 120 Ω resister 1 and the 120 Ω resistor 2 should be 60 Ω)?	50 – 70 Ω	Go to Step 9	Go to Step 4
4	Is the resistance less than the specified value at Step 3?	—	Go to Step 5	Go to Step 7

Step	Action	Value(s)	Yes	No
5	1. Keep the DMM with connected. 2. Disconnect the engine control module (ECM) harness connectors. Is the resistance within the specified value?	50 – 70 Ω	Go to Step 23	Go to Step 6
6	1. Keep the DMM with connected. 2. Disconnect the data recording module (DRM) harness connector (DRM is located behind the glove box). Is the resistance within the specified value?	50 – 70 Ω	Go to Step 22	Go to Step 16
7	1. Disconnect the resistor 1 harness connector. 2. Measure the resistance of the resistor 1. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 8	Go to Step 20
8	1. Disconnect the resister 2 harness connector (resistor 2 is located behind the radio and above the heater unit. It is blue connector). 2. Measure the resistance of the resistor 2. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 17	Go to Step 21
9	1. Disconnect the resistor 1 and resistor 2 harness connector. 2. Turn ON the ignition, with the engine OFF. 3. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 4. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 10	Go to Step 12
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 11	Go to Step 14

Step	Action	Value(s)	Yes	No
11	1. Turn OFF the ignition. 2. Reconnect the ECM harness connectors. 3. Disconnect the DRM harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Diagnostic Aids	Go to Step 15
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connectors. 3. Disconnect the DRM harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Test the CAN Low and CAN High circuits among the resistor 1, resistor 2, ECM and DRM for a short to ground and short to voltage. Did you find and correct the condition?	—	Go to Step 24	Go to Step 13
13	1. Turn OFF the ignition. 2. Reconnect the ECM harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 22	Go to Step 23
14	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 – 3.7 volts in Step 10) between the DRM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 24	Go to Step 18
15	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 – 3.7 volts in Step 11) between the ECM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 24	Go to Step 19

Step	Action	Value(s)	Yes	No
16	Repair the short circuit each other across the CAN Low and High circuits among the resistor 1, resistor 2, ECM and DRM. Did you complete the repair?	—	Go to Step 24	—
17	1. Repair the open circuit or high resistance on the CAN Low and High circuits between the resistor 1 (pins 1 and 2 of B-387 connector) and the resistor 2 (pins 1 and 2 of B-431 connector). 2. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the each resistor. Did you complete the repair?	—	Go to Step 24	—
18	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the DRM (pins 2 and 8 of B-429 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 24	Go to Step 22
19	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the ECM (pins 18 and 37 of J-191 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 24	Go to Step 23
20	Replace the resistor 1. Did you complete the replacement?	—	Go to Step 24	—
21	Replace the resistor 2. Did you complete the replacement?	—	Go to Step 24	—
22	Replace the DRM. Refer to Data Recording Module (DRM) Replacement. Did you complete the replacement?	—	Go to Step 24	—
23	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 24	—
24	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 25
25	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

5	Is the resistance less than the specified value at Step 4?	—	Go to Step 6	Go to Step 10
6	1. Keep the DMM with connected. 2. Disconnect the EHCU harness connector. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 7	Go to Step 20
7	Measure the resistance across the CAN Low and High circuits by back probing the resistor 2 (pins 1 and 2 of B-431 connector) (resistor 2 is located behind the radio and above the heater unit. It is blue connector). Is the resistance within the specified value?	110 – 130 Ω	Go to Step 29	Go to Step 8

Step	Action	Value(s)	Yes	No
8	1. Keep the DMM with connected. 2. Disconnect the engine control module (ECM) harness connectors. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 30	Go to Step 9
9	1. Keep the DMM with connected. 2. Disconnect the data recording module (DRM) harness connector (DRM is located behind the glove box). Is the resistance within the specified value?	110 – 130 Ω	Go to Step 28	Go to Step 21
10	1. Disconnect the resistor 1 harness connector. 2. Measure the resistance of the resistor 1. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 11	Go to Step 26
11	1. Disconnect the resister 2 harness connector (resistor 2 is located behind the radio and above the heater unit. It is blue connector). 2. Measure the resistance of the resistor 2. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 22	Go to Step 27
12	1. Disconnect the resistor 1 and resistor 2 harness connector. 2. Turn ON the ignition, with the engine OFF. 3. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 4. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 13	Go to Step 15
13	1. Turn OFF the ignition. 2. Disconnect the ECM harness connectors. 3. Disconnect the EHCU harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-431 connector) and a known good ground at the resistor 2 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-431 connector) and a known good ground at the resistor 2 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 14	Go to Step 18

Step	Action	Value(s)	Yes	No
14	1. Turn OFF the ignition. 2. Reconnect the ECM harness connectors. 3. Disconnect the DRM harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-431 connector) and a known good ground at the resistor 2 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-431 connector) and a known good ground at the resistor 2 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Diagnostic Aids	Go to Step 19
15	1. Turn OFF the ignition. 2. Disconnect the ECM harness connectors. 3. Disconnect the EHCU harness connector. 4. Disconnect the DRM harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Test the CAN Low and CAN High circuits among the resistor 1, resistor 2, ECM, EHCU and DRM for a short to ground and short to voltage. Did you find and correct the condition?	—	Go to Step 31	Go to Step 16
16	1. Turn OFF the ignition. 2. Keep the ECM and DRM harness connectors with disconnect. 3. Reconnect the EHCU harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 17	Go to Step 29
17	1. Turn OFF the ignition. 2. Reconnect the ECM harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 28	Go to Step 30

Step	Action	Value(s)	Yes	No
18	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 – 3.7 volts in Step 13) between the DRM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 23
19	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 – 3.7 volts in Step 14) between the ECM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 25
20	Repair the short circuit each other across the CAN Low and High circuits between the resistor 1 and EHCU. Did you complete the repair?	—	Go to Step 31	—
21	Repair the short circuit each other across the CAN Low and High circuits among the resistor 2, ECM, DRM and EHCU. Did you complete the repair?	—	Go to Step 31	—
22	1. Test the CAN Low and High circuits between the resistor 1 (pins 1 and 2 of B-387 connector) and the EHCU (pins 14 and 15 of J-177 connector) for an open circuit or high resistance. 2. Test the CAN Low and High circuits between the resistor 2 (pins 1 and 2 of B-431 connector) and the EHCU (pins 26 and 27 of J-177 connector) for an open circuit or high resistance. 3. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the each resistor. 4. Repair the circuit(s) or connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 24
23	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the DRM (pins 2 and 8 of B-429 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 28
24	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the EHCU (pins 14, 15, 26 and 27 of J-177 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 29

Step	Action	Value(s)	Yes	No
25	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the ECM (pins 18 and 37 of J-191 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 30
26	Replace the resistor 1. Did you complete the replacement?	—	Go to Step 31	—
27	Replace the resistor 2. Did you complete the replacement?	—	Go to Step 31	—
28	Replace the DRM. Refer to Data Recording Module (DRM) Replacement. Did you complete the replacement?	—	Go to Step 31	—
29	Replace the EHCU. Refer to Electric Hydraulic Control Unit (EHCU Replacement in the Anti-lock Brake section). Did you complete the replacement?	—	Go to Step 31	—
30	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 31	—
31	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 32
32	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

Chart for with Smoother and ABS

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Monitor the engine control module (ECM) Diagnostic Trouble Code (DTC) Information with the Tech 2. 4. Start the engine. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Attempt to communicate with the transmission control module (TCM) via the Transmission Data table. Does the Tech 2 communicate with the TCM?	—	Go to Step 4	Go to Diagnostic System Check – Transmission Controls

Step	Action	Value(s)	Yes	No
4	Attempt to communicate with the electrical hydraulic control unit (EHCU) (ABS module) via the ABS Data table. Does the Tech 2 communicate with the EHCU?	—	Go to Step 5	Go to Diagnostic System Check – Anti-lock Brake System Controls
5	1. Turn OFF the ignition. 2. Measure the resistance across the controller area network (CAN) Low and High circuits by back probing the resistor 1 (pins 1 and 2 of B-387 connector) (resistor 1 is located near the driver's side dash panel. It is blue connector). Is the resistance within the specified value (parallel resistance of the 120 Ω resister 1 and the 120 Ω resistor 2 should be 60 Ω)?	50 – 70 Ω	Go to Step 14	Go to Step 6
6	Is the resistance less than the specified value at Step 5?	—	Go to Step 7	Go to Step 12
7	1. Keep the DMM with connected. 2. Disconnect the EHCU harness connector. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 9	Go to Step 8
8	1. Keep the DMM with connected. 2. Disconnect the TCM harness connectors. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 35	Go to Step 25
9	Measure the resistance across the CAN Low and High circuits by back probing the resistor 2 (pins 1 and 2 of B-431 connector) (resistor 2 is located behind the radio and above the heater unit. It is blue connector). Is the resistance within the specified value?	110 – 130 Ω	Go to Step 36	Go to Step 10
10	1. Keep the DMM with connected. 2. Disconnect the engine control module (ECM) harness connectors. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 37	Go to Step 11
11	1. Keep the DMM with connected. 2. Disconnect the data recording module (DRM) harness connector (DRM is located behind the glove box). Is the resistance within the specified value?	110 – 130 Ω	Go to Step 34	Go to Step 26
12	1. Disconnect the resistor 1 harness connector. 2. Measure the resistance of the resistor 1. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 13	Go to Step 32
13	1. Disconnect the resister 2 harness connector (resistor 2 is located behind the radio and above the heater unit. It is blue connector). 2. Measure the resistance of the resistor 2. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 27	Go to Step 33

Step	Action	Value(s)	Yes	No
14	1. Disconnect the resistor 1 and resistor 2 harness connector. 2. Turn ON the ignition, with the engine OFF. 3. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 4. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 15	Go to Step 18
15	1. Turn OFF the ignition. 2. Disconnect the ECM harness connectors. 3. Disconnect the EHCU harness connectors. 4. Disconnect the DRM harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 7. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 16	Go to Step 23
16	1. Turn OFF the ignition. 2. Reconnect the DRM harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-431 connector) and a known good ground at the resistor 2 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-431 connector) and a known good ground at the resistor 2 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 17	Go to Step 22
17	1. Turn OFF the ignition. 2. Reconnect the ECM harness connectors. 3. Disconnect the DRM harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-431 connector) and a known good ground at the resistor 2 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-431 connector) and a known good ground at the resistor 2 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Diagnostic Aids	Go to Step 24

Step	Action	Value(s)	Yes	No
18	1. Turn OFF the ignition. 2. Disconnect the ECM harness connectors. 3. Disconnect the TCM harness connectors. 4. Disconnect the EHCU harness connector. 5. Disconnect the DRM harness connector. 6. Turn ON the ignition, with the engine OFF. 7. Test the CAN Low and CAN High circuits among the resistor 1, resistor 2, ECM, EHCU and DRM for a short to ground and short to voltage. Did you find and correct the condition?	—	Go to Step 38	Go to Step 19
19	1. Turn OFF the ignition. 2. Keep the ECM, TCM and DRM harness connectors with disconnect. 3. Reconnect the EHCU harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 20	Go to Step 36
20	1. Turn OFF the ignition. 2. Reconnect the TCM harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 21	Go to Step 35
21	1. Turn OFF the ignition. 2. Reconnect the ECM harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 – 3.7 volts	Go to Step 34	Go to Step 37

Step	Action	Value(s)	Yes	No
22	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 – 3.7 volts in Step 16) between the DRM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 28
23	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 – 3.7 volts in Step 15) between the TCM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 29
24	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 – 3.7 volts in Step 17) between the ECM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 31
25	Repair the short circuit each other across the CAN Low and High circuits among the resistor 1, TCM and EHCU. Did you complete the repair?	—	Go to Step 38	—
26	Repair the short circuit each other across the CAN Low and High circuits among the resistor 2, ECM, DRM and EHCU. Did you complete the repair?	—	Go to Step 38	—
27	1. Test the CAN Low and High circuits between the resistor 1 (pins 1 and 2 of B-387 connector) and the EHCU (pins 14 and 15 of J-177 connector) for an open circuit or high resistance. 2. Test the CAN Low and High circuits between the resistor 2 (pins 1 and 2 of B-431 connector) and the EHCU (pins 26 and 27 of J-177 connector) for an open circuit or high resistance. 3. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the each resistor. 4. Repair the circuit(s) or connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 30
28	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the DRM (pins 2 and 8 of B-429 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 34

Step	Action	Value(s)	Yes	No
29	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the TCM (pins 2 and 3 of B-427 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 35
30	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the EHCU (pins 14, 15, 26 and 27 of J-177 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 36
31	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the ECM (pins 18 and 37 of J-191 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 37
32	Replace the resistor 1. Did you complete the replacement?	—	Go to Step 38	—
33	Replace the resistor 2. Did you complete the replacement?	—	Go to Step 38	—
34	Replace the DRM. Refer to Data Recording Module (DRM) Replacement. Did you complete the replacement?	—	Go to Step 38	—
35	Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in the transmission section. Did you complete the replacement?	—	Go to Step 38	—
36	Replace the EHCU. Refer to Electric Hydraulic Control Unit (EHCU Replacement in the Anti-lock Brake section). Did you complete the replacement?	—	Go to Step 38	—
37	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 38	—
38	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 39
39	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

EGR Control System Check

Description

The engine control module (ECM) controls the EGR valve opening based on the barometric pressure, engine speed, engine coolant temperature and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR motor. The EGR valve position is detected by the EGR valve position sensor, and relayed to ECM.

Condition for Running the EGR Control

- The engine coolant temperature is between 65°C (149°F) and 95°C (198°F).
- The barometric pressure (BARO) is more than 90 kPa (13 psi).

EGR Control System Check

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Are any DTCs set in which the “Action Taken When the DTC Sets” under that particular code states, “The ECM inhibits EGR valve control”?	—	Refer to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Inspect for the following conditions: • An EGR valve gasket that is missing or damaged. • EGR gas leakage any of the EGR passages between the exhaust manifold and intake manifold. • Restricted or collapsed EGR passage between the exhaust manifold and the EGR valve. • Any type of restriction in the exhaust system. • Restrict air cleaner element, restrict or collapsed air tubing between the air cleaner and the intake manifold. • Skewed engine coolant temperature (ECT) sensor. Refer to Temperature vs Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. • Skewed barometric pressure (BARO) sensor. Determine the outside barometric pressure from your location specified in the altitude vs barometric pressure table. Refer to Altitude vs Barometric Pressure. • Any water intrusion in the induction system. • Air leaking around any of the air induction tubing between the air cleaner and the intake manifold. 3. Repair the condition as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition for 30 seconds. 2. Start the engine and warm up (allow engine coolant temperature to reach at least 70°C [158°F]). 3. Observe the EGR Position Variance parameter with the Tech 2. Does the EGR Position Variance parameter within the specified value?	± 5%	Go to Step 5	Go to Step 6
5	1. Perform the EGR Control test with the Tech 2 several times. 2. Command the Desired EGR Position “Increase” and “Decrease” with the Tech 2 while observing the EGR Position Variance. Does the EGR Position Variance parameter follow within the specified value?	± 5%	System OK	Go to Step 6
6	1. Turn OFF the ignition. 2. Remove the EGR valve assembly from the engine. Refer to EGR Valve Replacement in this section. 3. Inspect the following for possible causes of EGR valve sticking. • Restricted EGR valve by foreign materials • Excessive deposits at valve Did you find and correct the condition?	—	Go to Step 10	Go to Step 7
7	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the EGR valve (pins 1, 2, 3, 4 and 6 of E-94 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Inspect for an intermittent, for poor connections and corrosion on the EGR valve circuits at the harness connector of the ECM (pins 86, 87, 101, 103 and 111 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
9	Replace the EGR valve. Refer to EGR Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
10	Reconnect all previously disconnected components or harness connector(s). Is the action complete?	—	Go to Step 2	—

Glow Control System Check

Description

The glow control system consists of the engine control module (ECM), the glow relay, the glow indicator lamp and glow plugs. The glow control system is operated when the engine coolant temperature is low, which allows easier engine starting. The ECM commands the glow relay ON for a certain length of time at ignition switch is ON with engine OFF. In after glow phase, the glow plugs remain energized for a certain period with engine run.

Glow Control Operation

- The glow control system operates when the engine coolant temperature is less than 10°C (50°F).
- The glow indicator lamp is illuminated between 0.5 seconds and 15 seconds according to the engine coolant temperature. It illuminates 0.5 seconds at 10°C (50°F) or more.
- The glow relay is energized between 1 second and 30 seconds according to the engine coolant temperature. It energizes 1 second at 10°C (50°F) or more.

Glow Control System Check

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0117, P0118, P0380 or P0381 set?	—	Refer to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Make sure the metal bus bar that connects switched battery voltage supply terminal (E-3) and all glow plugs is secured tightly. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the metal bus bar (glow plug power supply E-3 terminal) and a known good ground. 5. Perform the Glow Relay Test with the Tech 2. 6. Command the Glow Relay ON with the Tech 2 while observing the test lamp. Does the test lamp turn ON only when commanded ON with the Tech 2?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Remove the metal bus bar from the glow plugs. 3. Measure resistance of each glow plug between the glow plug terminals and a known good ground. Make sure to record all measurements and take them quickly as to not allow engine temperature changes between measurements. Are the resistances within the specified value each other?	1 Ω	System OK	Go to Step 15

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Replace the glow relay with the starter relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the metal bus bar (glow plug power supply E-3 connector) and a known good ground. 5. Perform the Glow Relay Test with the Tech 2. 6. Command the Glow Relay ON with the Tech 2 while observing the test lamp. Does the test lamp turn ON only when commanded ON with the Tech 2?	—	Go to Step 9	Go to Step 6
6	Inspect the Glow (60A) slow blow fuse in the chassis side fuse & relay box. Is the Glow (60A) slow blow fuse open?	—	Go to Step 10	Go to Step 7
7	1. Turn OFF the ignition. 2. Remove the glow relay in the chassis side fuse & relay box. 3. Connect a test lamp between the voltage feed circuit of the glow relay terminal (pin 3 of X-20 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 11
8	1. Turn ON the ignition, with the engine OFF. 2. Connect a test lamp between the power supply circuit to the glow plugs (pin 2 of X-20 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 12
9	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the glow relay terminals (pins 2 and 3 of X-20 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14
10	1. Replace the Glow (60A) slow blow fuse. If the slow blow fuse continues to open, repair the short to ground on a circuit fed by the slow blow fuse or check for a shorted attached component. 2. Repair the short to ground or replace the component as necessary. Did you complete the repair?	—	Go to Step 16	—
11	Repair the open circuit in the battery voltage supply circuit between the Glow (60A) slow blow fuse and the glow relay (pin 3 of X-20 connector). Did you complete the repair?	—	Go to Step 16	—
12	Repair the open circuit in the switched battery voltage supply circuit between the glow relay (pin 2 of X-20 connector) and the glow plugs (E-3 terminal). Did you complete the repair?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
13	**Important:** The glow plugs may be burnt out if the battery voltage supply circuit is shorted to a voltage source. Repair the short to battery or ignition voltage on the switched battery voltage supply circuit between the glow relay (pin 2 of X-20 connector) and the glow plugs (E-3 terminal). Did you complete the repair?	—	Go to Step 16	—
14	Replace the glow relay. Did you complete the replacement?	—	Go to Step 16	—
15	Replace the appropriate glow plug. Did you complete the replacement?	—	Go to Step 16	—
16	1. Reconnect all previously disconnected components, relay, fuse or harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the metal bus bar (glow plug power supply E-3 connector) and a known good ground. 5. Perform the Glow Relay Test with the Tech 2. 6. Command the Glow Relay ON with the Tech 2 while observing the test lamp. Does the test lamp turn ON only when commanded ON with the Tech 2?	—	Go to Step 4	Go to Step 5

Engine Warm Up Control System Check

Description

The engine warm up system consists of the engine control module (ECM), the intake throttle valve, the intake throttle solenoid valve, the exhaust brake valve, the exhaust brake solenoid valve and the engine warm up switch. The engine warm up system is operated when the engine coolant temperature is low, which promotes engine warm up. The ECM commands the both intake throttle solenoid valve and the exhaust brake solenoid valve to close each valve by applying vacuum pressure based on engine coolant temperature and warm up request switch input signal.

Condition for Running the Engine Warm Up Control

- The engine warm up switch is ON.
- The accelerator pedal is not depressed.
- The engine coolant temperature is less than 65°C (149°F).
- The vehicle is stationary.

Test Description

The number below refers to the step number on the diagnostic table.
7. Use the Tech 2 to observe the Accelerator Pedal Position (APP) Angle. The APP Angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation.
8. Use the Tech 2 to observe the Vehicle Speed. The Vehicle Speed parameter should indicate correct vehicle speed.

Engine Warm Up Control System Check

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	Does the exhaust brake operate correctly?	—	Go to Step 3	Go to Exhaust Brake Control System Check
3	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0117, P0118, P1271, P1277, P1278, P1282, P1283, P1631, P1632, P1635, P1681 or P1682 set?	—	Refer to Applicable DTC	Go to Step 4
4	1. Park the vehicle. 2. Make sure the idle up control knob to the lowest position. (Full counterclockwise direction) 3. Cool down the engine as necessary (allow engine coolant temperature to cool down at least 60°C [140°F]). 4. Start the engine. 5. Turn ON the engine warm up switch. Are the intake throttle valve and the exhaust brake valve closed when switched ON?	—	Go to Step 5	Go to Step 9
5	Does the engine warm up switch indicator lamp illuminate?	—	Go to Step 6	Go to Step 15
6	Turn OFF the engine warm up switch. Does the engine warm up system cancel?	—	Go to Step 7	Go to Step 19

Step	Action	Value(s)	Yes	No
7	1. Turn ON the engine warm up switch. 2. Press the accelerator pedal. Does the engine warm up system cancel?	—	Go to Step 8	Observe the Accelerator Pedal Position (APP) Angle parameter and refer to APP sensor DTC
8	1. Lift the driving wheels or drive the vehicle. 2. Turn ON the engine warm up switch. Does the engine warm up system cancel?	—	System OK	Observe the Vehicle Speed parameter and refer to DTC P0500
9	1. Start the engine. 2. Turn ON the engine warm up switch. 3. Observe the Engine Warm Up Switch parameter with the Tech 2. Does the Engine Warm Up Switch parameter indicate ON?	—	Go to Step 10	Go to Step 11
10	Observe the Exhaust Brake Solenoid Command parameter with the Tech 2. Does the Exhaust Brake Solenoid Command parameter indicate ON when engine warm up switch is ON?	—	Problem is relating to either solenoid valves, throttle valves and vacuum pressure lines. Refer to applicable diagnostic chart in the Exhaust System Section or refer to Exhaust Brake Control System Check	The ECM is not allowing engine warm up control. Refer to Condition for Running the Engine Warm Up Control
11	1. Turn OFF the ignition. 2. Remove the bezel surrounding the instrument panel cluster (IPC) enough to disconnect the engine warm up switch. 3. Disconnect the engine warm up switch. 4. Connect a test lamp between the voltage feed circuit of the engine warm up switch harness (pin 3 of B-31 connector) and a known good ground. 5. Start the engine. Does the test lamp illuminate?	—	Go to Step 12	Go to Step 13
12	1. Start the engine. 2. Observe the Engine Warm Up Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the engine warm up switch harness connector between pins 3 and 6 of B-31 connector. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 21	Go to Step 14
13	Repair the open circuit or high resistance on the voltage feed circuit between the Fuel Heater (10A) fuse and the engine warm up switch (pin 3 of B-31 connector). Did you complete the repair?	—	Go to Step 25	—

Step	Action	Value(s)	Yes	No
14	1. Test the engine warm up switch signal circuit between the engine control module (ECM) (pin 51 of J-191 connector) and the engine warm up switch (pin 6 of B-31 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 22
15	1. Turn OFF the ignition. 2. Remove the bezel surrounding the IPC enough to disconnect the engine warm up switch. 3. Connect the engine warm up switch if disconnected. 4. Probe a test lamp between the engine warm up switch indicator lamp harness (pin 4 of B-31 connector) and a known good ground. 5. Start the engine. 6. Turn ON the engine warm up switch. Does the test lamp illuminate?	—	Go to Step 16	Go to Step 17
16	1. Probe a test lamp across the engine warm up switch indicator lamp harness (pins 1 and 4 of B-31 connector). 2. Start the engine. 3. Turn ON the engine warm up switch. Does the test lamp illuminate?	—	Go to Step 21	Go to Step 18
17	Repair the open circuit between the engine warm up switch signal circuit and the indicator lamp circuit (pins 4 and 6 of B-31 connector). Did you compete the repair?	—	Go to Step 25	—
18	Repair the open circuit or high resistance on the engine warm up switch indicator lamp ground circuit between the engine warm up switch (pin 1 of B-31 connector) and ground terminal (B-1). Did you complete the repair?	—	Go to Step 25	—
19	1. Turn OFF the ignition. 2. Remove the bezel surrounding the IPC enough to disconnect the engine warm up switch. 3. Disconnect the engine warm up switch if disconnected. 4. Start the engine. Does the engine warm up system cancel?	—	Go to Step 23	Go to Step 20
20	1. Test the engine warm up switch signal circuit between the ECM (pin 51 of J-191 connector) and the engine warm up switch (pin 6 of B-31 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 24

Step	Action	Value(s)	Yes	No
21	1. Turn OFF the ignition. 2. Disconnect the engine warm up switch harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the engine warm up switch (pins 1, 3, 4 and 6 of B-31 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 23
22	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the engine warm up switch signal circuit at the harness connector of the ECM (pin 51 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 24
23	Replace the engine warm up switch. Did you complete the replacement?	—	Go to Step 25	—
24	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 25	—
25	Reconnect all previously disconnected fuse or harness connector(s). Is the action complete?	—	Go to Step 2	—

Exhaust Brake Control System Check

Description

The exhaust brake control system consists of the engine control module (ECM), the intake throttle valve, the intake throttle solenoid valve, the exhaust brake valve, the exhaust brake solenoid valve and the exhaust brake switch. The ECM commands the both intake throttle solenoid valve and the exhaust brake solenoid valve to close each valve by applying vacuum pressure based on vehicle running conditions and exhaust brake switch input signal.

Condition for Running the Exhaust Brake Control

- The exhaust brake switch is ON.
- The accelerator pedal is not depressed.
- The clutch pedal is not depressed.
- The neutral switch is OFF (other than neutral).
- The vehicle speed is higher than predetermined range.

Test Description

The number below refers to the step number on the diagnostic table.
7. Use the Tech 2 to observe the Accelerator Pedal Position (APP) Angle. The APP Angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation.
10. If the Exhaust Brake Solenoid Command parameter indicates OFF, use the Tech 2 to observe the Vehicle Speed, APP Angle, Clutch Switch and Neutral Switch parameters which allows the exhaust brake control. Refer to Engine Controls Schematic for each input.

Exhaust Brake Control System Check

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Chart 1 of 2

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Are any DTCs set in which the “Action Taken When the DTC Sets” under that particular code states, “The ECM inhibits exhaust brake control”?	—	Refer to Applicable DTC	Go to Step 3
3	1. Start the engine. 2. Turn ON the exhaust brake switch. Does the exhaust brake indicator lamp in the instrument panel cluster (IPC) illuminate?	—	Go to Step 4	Go to Chart 2 of 2 Step 1
4	Turn OFF the exhaust brake switch. Does the exhaust brake indicator lamp in the IPC go out?	—	Go to Step 5	Go to Chart 2 of 2 Step 2
5	1. Turn ON the ignition, with the engine OFF. 2. Perform the Exhaust Brake Control test with the Tech 2. 3. Command the Exhaust Brake ON with the Tech 2. Does the exhaust brake solenoid valve and intake throttle solenoid valve click when commanded ON with the Tech 2 (note that intake throttle solenoid valve and exhaust brake solenoid valve energized at the same time)?	—	Go to Step 6	If both solenoid valves or only exhaust brake solenoid valve is not operated, refer to DTC P1681 or P1682. If only intake throttle solenoid valve is not operated, Go to Step 11

Step	Action	Value(s)	Yes	No
6	1. Lift the driving wheels or drive the vehicle. 2. Turn ON the exhaust brake. 3. Let the vehicle run so that the exhaust brake may operate enough. Does the exhaust brake operate (note that if the vehicle speed is reduced but engine valve noise is heard, intake throttle valve may not be operated)?	—	Go to Step 7	Go to Step 10
7	1. Turn ON the exhaust brake switch. 2. Let the vehicle run so that the exhaust brake may operate enough. 3. Press the accelerator pedal during the exhaust brake is operating. Does the exhaust brake cancel?	—	Go to Step 8	Observe the Accelerator Pedal Position (APP) Angle parameter and refer to APP sensor DTC
8	**Notice:** If the vehicle fitted with Smoother, skip to Step 9. 1. Turn ON the exhaust brake switch. 2. Let the vehicle run so that the exhaust brake may operate enough. 3. Press the clutch pedal during the exhaust brake is operating. Does the exhaust brake cancel?	—	System OK	Go to Step 18
9	1. Turn ON the exhaust brake switch. 2. Let the vehicle run so that the exhaust brake may operate enough. 3. Operate the selector lever during the exhaust brake is operating. Does the exhaust brake cancel?	—	System OK	Refer to Diagnostic System Check – Transmission Controls
10	1. Turn ON the exhaust brake switch. 2. Trigger the Snapshot function in order to capture and store engine parameters while the vehicle is running. 3. Let the vehicle run so that the exhaust brake may operate enough. 4. Review the Exhaust Brake Solenoid Command parameter with the Tech 2 in order to see the specific running conditions. Does the Exhaust Brake Solenoid Command parameter indicate ON when the exhaust brake may operate enough?	—	Problem is relating to either solenoid valves, throttle valves and vacuum pressure lines. Refer to applicable diagnostic chart in the Exhaust System Section	The ECM is not allowing exhaust brake control. Refer to Condition for Running the Exhaust Brake Control
11	1. Turn OFF the ignition. 2. Disconnect the intake throttle solenoid valve harness connector. 3. Connect a test lamp between the voltage feed circuit of the intake throttle solenoid valve harness (pin 1 of J-40 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 12	Go to Step 14

Step	Action	Value(s)	Yes	No
12	1. Connect a test lamp across the intake throttle solenoid valve harness (pin 1 and 2 of J-40 connector). 2. Turn ON the ignition, with the engine OFF. 3. Perform the Exhaust Brake Control test with the Tech 2. 4. Command the Exhaust Brake ON with the Tech 2. Does the test lamp illuminate when commanded ON with the Tech 2, then goes out?	—	Go to Step 15	Go to Step 13
13	1. Test the control circuit of the intake throttle solenoid valve between the engine control module (ECM) (pin 102 of E-111 connector) and the intake throttle solenoid valve (pin 2 of J-40 connector) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 16
14	Repair the open circuit or high resistance on the voltage feed circuit between the ECM (10A) fuse and the intake throttle solenoid valve (pin 1 of J-40 connector). Did you complete the repair?	—	Go to Step 30	—
15	1. Turn OFF the ignition. 2. Disconnect the intake throttle valve. 3. Inspect for an intermittent and for poor connections at the harness connector of the intake throttle solenoid valve (pins 1 and 2 of J-40 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 17
16	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the intake throttle solenoid valve control circuit at the harness connector of the ECM (pin 102 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 29
17	Replace the intake throttle solenoid valve. Did you complete the replacement?	—	Go to Step 30	—
18	1. Turn ON the ignition, with the engine OFF. 2. Observe the Clutch Pedal Switch parameter with the Tech 2 while fully depressing and releasing the clutch pedal. Does the Tech 2 indicate Applied when the clutch pedal is applied and Released when the clutch pedal is released?	—	Problem is intermittent. Refer to Condition for Running the Exhaust Brake Control	Go to Step 19

Step	Action	Value(s)	Yes	No
19	1. Check to ensure the clutch pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the clutch pedal full upward travel. 2. Adjust the clutch pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 20
20	1. Turn OFF the ignition. 2. Disconnect the clutch pedal switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Clutch Pedal Switch parameter with the Tech 2 while momentarily jumping across the clutch pedal switch harness connector between pins 1 and 2 of B-89 connector. Does the Tech 2 indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 26	Go to Step 21
21	1. Connect a test lamp between the ignition voltage feed circuit of the clutch pedal switch harness (pin 1 of B-89 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 22	Go to Step 23
22	1. Connect a test lamp between the signal circuit of the clutch pedal switch harness (pin 2 of B-89 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 24	Go to Step 25
23	Repair the open circuit or high resistance on the ignition voltage feed circuit between the ENG (IG) (10A) fuse and the clutch pedal switch (pin 1 of B-89 connector). Check the ENG (IG) (10A) fuse is first. Did you complete the repair?	—	Go to Step 30	—
24	1. Test the clutch pedal switch signal circuit between the ECM (pin 47 of J-191 connector) and the clutch pedal switch (pin 2 of B-89 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 29
25	1. Test the clutch pedal switch signal circuit between the ECM (pin 47 of J-191 connector) and the clutch pedal switch (pin 2 of B-89 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 27

Step	Action	Value(s)	Yes	No
26	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the clutch pedal switch (pins 1 and 2 of B-89 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 28
27	1. Turn OFF the ignition. 2. Disconnect for an intermittent and for a poor connection on the clutch pedal switch signal circuit at the harness connector of the ECM (pin 47 of J-191 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 29
28	Replace the clutch pedal switch. Refer to Clutch Pedal Switch Replacement. Did you complete the replacement?	—	Go to Step 30	—
29	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 30	—
30	Reconnect all previously disconnected fuse or harness connector(s). Is the action complete?	—	Go to Step 2	—

Chart 2 of 2

Step	Action	Value(s)	Yes	No
1	1. Start the engine, if stopped. 2. Turn ON the exhaust brake switch. 3. Observe the Exhaust Brake Switch parameter with the Tech 2. Does the Exhaust Brake Switch parameter indicate ON?	—	Go to Step 14	Go to Step 5
2	1. Start the engine, if stopped. 2. Turn OFF the exhaust brake switch. 3. Observe the Exhaust Brake Switch parameter with the Tech 2. Does the Exhaust Brake Switch parameter indicate OFF?	—	Go to Step 16	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the exhaust brake switch B-69 harness connector (located on the steering column support bracket). 3. Start the engine. 4. Observe the Exhaust Brake Switch parameter with the Tech 2. Does the Exhaust Brake Switch parameter indicate OFF?	—	Go to Step 13	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the exhaust brake switch signal circuit between the engine control module (ECM) (pin 45 of J-191 connector) and the exhaust brake switch (pin 2 of B-69 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 29
5	1. Turn OFF the ignition. 2. Inspect the Fuel Heater (10A) fuse in the glove box fuse block. Is the Fuel Heater (10A) fuse open?	—	Go to Step 6	Go to Step 7
6	Replace the Fuel Heater (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that fed by the Fuel Heater (10A) fuse or replace the shorted attached component fed by the Fuel Heater (10A) fuse. Did you complete the repair?	—	Go to Step 30	—
7	1. Turn OFF the ignition. 2. Disconnect the exhaust brake switch B-69 harness connector (located on the steering column support bracket). 3. Connect a test lamp between the voltage feed circuit of the exhaust brake switch harness (pin 5 of B-69 male side connector) and a known good ground. 4. Start the engine. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 9
8	1. Observe the Exhaust Brake Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the exhaust brake switch harness connector between pins 2 and 5 of the B-69 connector. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 11	Go to Step 10
9	Repair the open circuit or high resistance on the voltage feed circuit between the Fuel Heater (10A) fuse and the exhaust brake switch (pin 5 of B-69 connector). Did you complete the repair?	—	Go to Step 30	—
10	1. Test the exhaust brake switch signal circuit between the ECM (pin 45 of J-191 connector) and the exhaust brake switch (pin 2 of B-69 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 12

Step	Action	Value(s)	Yes	No
11	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the exhaust brake switch (pins 2 and 5 of B-69 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect for an intermittent and for a poor connection on the exhaust brake switch signal circuit at the harness connector of the ECM (pin 45 of J-191 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 29
13	Repair or Replace the exhaust brake switch. Did you complete the replacement?	—	Go to Step 30	—
14	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse in the glove box. Is the Meter (10A) fuse open?	—	Go to Step 15	Go to Step 17
15	Replace the Meter (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (10A) fuse or replace the shorted attached component fed by the Meter (10A) fuse. Did you complete the repair?	—	Go to Step 30	—
16	1. Turn OFF the ignition. 2. Disconnect the ECM J-191 harness connector. 3. Turn ON the ignition, with the engine OFF. Is the exhaust brake indicator lamp OFF?	—	Go to Step 29	Go to Step 24
17	1. Turn OFF the ignition. 2. Remove the Meter (10A) fuse that supplies voltage to the exhaust brake indicator lamp. 3. Disconnect the ECM J-191 harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Measure the voltage from the exhaust brake indicator lamp control circuit in the ECM harness connector (pin 7 of J-191 connector) to a good ground. Is the voltage less than the specified value?	1 volt	Go to Step 18	Go to Step 25
18	1. Turn OFF the ignition. 2. Install the Meter (10A) fuse that supplies ignition voltage to the exhaust brake indicator lamp. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the exhaust brake indicator lamp control circuit of the ECM harness connector (pin 7 of J-191 connector) and a known good ground. Is the exhaust brake indicator lamp illuminated?	—	Go to Step 23	Go to Step 19

Step	Action	Value(s)	Yes	No
19	1. Turn OFF the ignition. 2. Remove the instrument panel cluster (IPC). 3. Remove the exhaust brake indicator lamp bulb from the IPC. Is the exhaust brake indicator lamp bulb burned out?	—	Go to Step 27	Go to Step 20
20	1. Connect a test lamp between the exhaust brake indicator lamp ignition voltage circuit of the IPC harness connector (pin 18 of B-51 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 21	Go to Step 26
21	1. Test the exhaust brake indicator lamp control circuit between the ECM (pin 7 of J-191 connector) and the IPC (pin 6 of B-51 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 22
22	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the IPC (pins 6 and 18 of B-51 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 28
23	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the exhaust brake indicator lamp control circuit at the harness connector of the ECM (pin 7 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 30	Go to Step 29
24	Repair the short to ground on the control circuit of the exhaust brake indicator lamp between the ECM (pin 7 of J-191 connector) and the IPC (pin 6 of B-51 connector). Did you complete the repair?	—	Go to Step 30	—
25	Repair the short to battery or ignition voltage on the control circuit of the exhaust brake indicator lamp between the ECM (pin 7 of J-191 connector) and the IPC (pin 6 of B-51 connector). Did you complete the repair?	—	Go to Step 30	—
26	Repair the open or high resistance on the voltage feed circuit of the exhaust brake indicator lamp between the Meter (10A) fuse and the IPC (pin 6 of B-51 connector). Did you complete the repair?	—	Go to Step 30	—
27	Replace the exhaust brake indicator lamp bulb. Did you compete the replacement?	—	Go to Step 30	—

Step	Action	Value(s)	Yes	No
28	Repair or replace the IPC. Did you complete the repair or replacement?	—	Go to Step 30	—
29	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 30	—
30	Reconnect all previously disconnected fuse or harness connector(s). Is the action complete?	—	Go to Chart 1 of 2 Step 2	—

Symptoms – Engine Controls

Symptoms – Engine Controls

Important Preliminary Inspections Before Starting

Perform Diagnostic System Check – Engine Controls before using the symptom tables, and verify that all of the following are true:

- The engine control module (ECM) and malfunction indicator lamp (MIL) are operating correctly.
- There are no diagnostic trouble codes (DTCs) stored, or a DTC exists but without the MIL.
- The Tech 2 data is within the normal operating range. Refer to Tech 2 Data List in this section.
- Verify the customer concern and locate the correct symptom in the table of contents. Inspect the items indicated under that symptom.

Visual and Physical Inspection

Several of the symptom procedures ask for careful visual and physical inspection. This step is extremely important. The visual and physical inspection can lead to correcting a problem without further inspections, and can save valuable time. Ensure that:

- The ECM grounds are clean, tight, and in their proper location.
- The vacuum hoses are not split or kinked, and properly connected. Inspect throughly for any type of leak or restriction.
- The air intake ducts are not collapsed or damaged.
- The engine harness wiring and terminals are properly connected and are not pinched or cut.

Intermittent

Important:
Inspect for improper installation of electrical components if an intermittent condition exists. Inspect for aftermarket add-on electrical equipment devices, lights, and cellular phones. Verify that no aftermarket equipment is connected to the keyword 2000 serial data circuit. If you cannot locate an intermittent condition, a cellular phone communication signal may cause the condition.

Important:
The problem may or may not turn ON the MIL or store a DTC.

Faulty electrical connections or wiring cause most intermittent problems. Perform a careful visual and physical inspection of the suspect connectors for the following conditions:

- Improperly mated connector halves
- Terminals that are not seated
- Terminals that are damaged or improperly formed

Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension. Remove the terminal from the connector body in order to inspect for poor terminal wire connection.
Road test the vehicle with the DMM connected to the suspected circuit. An abnormal reading that occurs when the malfunction occurs is a good indication that there is a malfunction in the circuit being monitored.
Use the Tech 2 in order to help detect intermittent conditions. Useful features of the Tech 2 include the following:

- Trigger the Snapshot feature in order to capture and store engine parameters when the malfunction occurs. Review this stored information in order to see the specific running conditions that caused the malfunction.
- Use the Plot Function on the Tech 2 in order to plot selected data parameters. Review this stored information to aid in locating an intermittent problem. Refer to the Tech 2 Users Guide for more information.

Important:
If the intermittent condition exists as a start and then stall, test for DTCs relating to the vehicle theft deterrent system. Test for improper installation of electrical options such as lights, cellular phones, etc.

Any of the following may cause an intermittent MIL with no stored DTC:

- The ECM grounds are loose or dirty. Refer to Engine Controls Schematics.
- The MIL circuit intermittently shorted to ground.
- Electrical system interference caused by a malfunctioning relay, ECM driven solenoid, or switch. The electrical component can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating.
- There are any open diodes.

Important:
The following symptom tables contain groups of possible causes for each symptom. The order of these procedures is not important. If the Tech 2 readings do not indicate the problems, then proceed in a logical order, easiest to check or most likely to cause first. In order to determine if a specific vehicle is using a particular system or component, refer to Engine Controls Schematics for an application.

Use the following tables when diagnosing a symptom complaint:

- Intermittent Conditions
- Hard Start
- Rough, Unstable, or Incorrect Idle and Stalling

- High Idle
- Cuts Out, Misses
- Surge / Chuggles
- Lack of Power, Sluggishness, or Sponginess
- Hesitation, Sag, Stumble
- Fuel Knock / Combustion Noise
- Poor Fuel Economy
- Excessive Smoke (Black Smoke)
- Excessive Smoke (White Smoke)

Intermittent Conditions

Checks	Action
DEFINITION: The problem is not currently present but is indicated in DTC History. OR There is a customer complaint, but the symptom cannot currently be duplicated, if the problem is not DTC related.	
Preliminary Checks	• Refer to Symptoms – Engine Controls before starting.
Harness / Connector	Many intermittent open or shorted circuits are affected by harness / connector movement that is caused by vibration, engine torque, bumps / rough pavement, etc. Test for this type of condition by performing the applicable procedure from the following list: • Move related connectors and wiring while monitoring the appropriate Tech 2 data. • Move related connectors and wiring with the component commanded ON, and OFF, with the Tech 2. Observe the component operation. • With the engine running, move related connectors and wiring while monitoring engine operation. If harness or connector movement affects the data displayed, component / system operation, or engine operation, inspect and repair the harness / connections as necessary. Refer to Electrical Connections or Wiring.
Electrical Connections or Wiring	Poor electrical connections, terminal tension or wiring problems cause most intermittent. To perform the following inspections: • Inspect for poor mating of the connector halves, or terminals improperly seated in the connector body. • Inspect for improperly formed or damaged terminals. Test for poor terminal tension. • Inspect for poor terminal to wire connections including terminals crimped over insulation. This requires removing the terminal from the connector body. • Inspect for corrosion / water intrusion. Pierced or damaged insulation can allow moisture to enter the wiring. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits. • Inspect for wires that are broken inside the insulation. • Inspect the harness for pinched, cut or rubbed through wiring. • Ensure that the wiring does not come in contact with hot exhaust components.
Control Module Power and Grounds Component Power and Grounds	Poor power or ground connections can cause widely varying symptoms. • Test all control module power supply circuits. Many vehicles have multiple circuits supplying power to the control module. Other components in the system may have separate power supply circuits that may also need to be tested. Inspect connections at the module / component connectors, fuses, and any intermediate connections between the power source and the module / component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Ensure that the circuit can carry the current necessary to operate the component. • Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Ensure that the circuit can carry the current necessary to operate the component.

Checks	Action
Temperature Sensitivity	• An intermittent condition may occur when a component / connection reaches normal operating temperature. The condition may occur only when the component / connection is cold, or only when the component / connection is hot. • If the intermittent is related to heat, review the data for a relationship with the following: - High ambient temperatures - Underhood / engine generated heat - Circuit generated heat due to a poor connection, or high electrical load - Higher than normal load conditions, towing, etc. • If the intermittent is related to cold, review the data for the following: - Low ambient temperatures-In extremely low temperatures, ice may form in a connection or component. Test for water intrusion. - The condition only occurs on a cold start. - The condition goes away when the vehicle warms up. • Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
Electromagnetic Interference (EMI) and Electrical Noise	Some electrical components / circuits are sensitive to EMI or other types of electrical noise. Inspect for the following conditions: • A misrouted harness that is too close to high voltage / high current devices such as injection components, motors, generator etc. These components may induce electrical noise on a circuit that could interfere with normal circuit operation. • Electrical system interference caused by a malfunctioning relay, or the engine control module (ECM) driven solenoid or switch. These conditions can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating. • Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use. • Test for any open diodes. Some relays may contain a clamping diode. • Test the generator for a bad rectifier bridge that may be allowing AC noise into the electrical system.
Duplicating Failure Conditions	• If none of the previous tests are successful, attempt to duplicate and/or capture the failure conditions. • An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the problem occurs, may help you locate the problem.
Tech 2 Snapshot	The Tech 2 can be set up to take a Snapshot of the parameters available via serial data. The Snapshot function records live data over a period of time. The recorded data can be played back and analyzed. The Tech 2 can also graph parameters singly or in combinations of parameters for comparison. The Snapshot can be triggered manually at the time the symptom is noticed, or set up in advance to trigger when a DTC sets. An abnormal value captured in the recorded data may point to a system or component that needs to be investigated further. Refer to the Tech 2 user instructions for more information on the Snapshot function.

Hard Start

Checks	Action
DEFINITION: The engine cranks OK, but does not start for a long time. The engine does eventually run, or may start but immediately dies.	

Checks	Action
Preliminary Checks	• Diagnostic System Check – Engine Controls. • Ensure the driver is using the correct starting procedure. • Inspect the engine control module (ECM) grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Tech 2 Data List in this section.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel teeth are not damaged. • Inspect the camshaft position (CMP) sensor is tight and the camshaft gear flange surface is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Inspect for air in the fuel system. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or high engine oil level. • Measure the fuel return rate from the fuel injectors. • Inspect the fuel lines between the fuel tank and fuel supply pump for being crushed or kinked. • Inspect for a plugged fuel tank vent hose. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. • Inspect the fuel lines between the fuel tank and fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. • Inspect the fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. • Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contents an interrupted noise or has abnormal nose when commanded ON. • Inspect the fuel rail pressure (FRP) regulator feedback current on the Tech 2.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect the intake throttle valve for a stuck closed position. • Inspect for a restriction or leak in the intake manifold.

Checks	Action
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect the exhaust brake valve for a stuck closed position. • Inspect for a restriction in the exhaust pipes.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi). • Improper mechanical timing (timing gear) • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Electrical System Checks	Inspect the engine electrical for the following conditions. Refer to the Engine Electrical section. • Inspect the glow plug control (preheating) system operation. Refer to Glow Control System Check in this section. • Inspect the fuel heater operation. • Inspect for slow cranking speed. • Inspect for weakened batteries.

Rough, Unstable, or Incorrect Idle And Stalling

Checks	Action
DEFINITION: Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.	
Preliminary Checks	• Diagnostic System Check – Engine Controls. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the Engine Control Module (ECM) grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Tech 2 Data List in this section.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Use the Tech 2 to observe the Differential Fuel Rail Pressure parameter at idle in Neutral. Differential Fuel Rail Pressure parameter should always be within ± 5 MPa (± 725 psi). • Inspect the crankshaft position (CKP) sensor is tight and the flywheel teeth are not damaged. • Inspect the camshaft position (CMP) sensor is tight and the camshaft gear flange surface is not damaged.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Inspect for air in the fuel system. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or high engine oil level. • Measure the fuel return rate from the fuel injectors. • Inspect the fuel lines between the fuel tank and fuel supply pump for being crushed or kinked. • Inspect for a plugged fuel tank vent hose. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. • Inspect the fuel lines between the fuel tank and fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. • Inspect the fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. • Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contents an interrupted noise or has abnormal nose when commanded ON. • Use the Tech 2 to observe the Cylinder Compensation for each cylinder at idle. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code. • Inspect the fuel rail pressure (FRP) regulator feedback current on the Tech 2.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect the intake throttle valve for a stuck closed position. • Inspect for a restriction or leak in the intake manifold.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect the exhaust brake valve for a stuck closed position. • Inspect for a restriction in the exhaust pipes.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi). • Improper mechanical timing (timing gear) • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc.

Checks	Action
Additional Checks	• Electromagnetic interference (EMI) on the reference circuit can cause an engine miss condition. The Tech 2 can usually detect EMI by monitoring the engine speed. A sudden increase in speed with little change in actual engine speed change indicates that EMI is present. If a problem exists, check routing of high voltage components, such as fuel injector solenoid valve wiring, near the sensor circuits. • Inspect for faulty engine mounts. • Inspect faulty crank pulley. • Inspect faulty generator & A/C compressor. • Inspect the generator output voltage. • Inspect the EGR system operating correctly. Refer to EGR Control System Check in this section. • Inspect the A/C operation.

High Idle

Checks	Action
DEFINITION: Engine idle speed is higher than normal in regardless of engine coolant temperature.	
Preliminary Checks	• Diagnostic System Check – Engine Controls. • Inspect that the harness connectors are correctly connected. • Inspect the idle up control knob turned fully counterclockwise. • Use the Tech 2 to compare the engine speed and tachometer on the instrument panel cluster (IPC). • Inspect the fuel type and quality. • Inspect the engine oil level. • Inspect the Tech 2 Data List in this section.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Use the Tech 2 to observe the Differential Fuel Rail Pressure parameter at idle in Neutral. Differential Fuel Rail Pressure parameter should always be within ± 5 MPa (± 725 psi). • Use the Tech 2 to observe the Idle Up Sensor parameter. Idle Up Sensor parameter should be less than 0.7 volts at full turned counterclockwise. If not, check for high resistance in low reference circuit or skewed sensor. • Use the Tech 2 to observe the Accelerator Pedal Position (APP) Angle. APP Angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect the fuel injectors. Remove the injectors and visually inspect. (Injector tip(s) may be damaged) • Measure the fuel return from the fuel injectors. See Fuel System Check Chart in the Fuel System section.

Cut Out, Misses

Checks	Action
DEFINITION: A constant jerking that follows the engine speed, usually more pronounced as the engine load increase. The exhaust has a steady spitting sound at idle, low speed, or hard acceleration for the fuel starvation that can cause the engine to cut-out.	
Preliminary Check	• Diagnostic System Check – Engine Controls. • Inspect that the harness connectors are correctly connected. • Inspect the engine control module (ECM) grounds for being clean, tight, and in their proper locations. • Inspect the Tech 2 Data List in this section.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to observe the Accelerator Pedal Position (APP) Angle. APP Angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Use the Tech 2 to observe the Differential Fuel Rail Pressure parameter at idle and W.O.T. (accelerator pedal full travel) in Neutral. Differential Fuel Rail Pressure parameter should always be within ± 5 MPa (± 725 psi). • Inspect the crankshaft position (CKP) sensor is tight and the flywheel teeth are not damaged. • Inspect the camshaft position (CMP) sensor is tight and the camshaft gear flange surface is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Inspect for air in the fuel system. • Inspect for water contamination in the fuel. • Inspect the fuel lines between the fuel tank and fuel supply pump for being crushed or kinked. • Inspect for a plugged fuel tank vent hose. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. • Inspect the fuel lines between the fuel tank and fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. • Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. • Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contents an interrupted noise or has abnormal nose when commanded ON. • Use the Tech 2 to observe the Cylinder Compensation for each cylinder at idle. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect the intake throttle valve for a stuck closed position. • Inspect for a restriction or leak in the intake manifold.

Checks	Action
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect the exhaust brake valve for a stuck closed position. • Inspect for a restriction in the exhaust pipes.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi). • Improper valve timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the generator output voltage. • Electromagnetic interference (EMI) on the reference circuit can cause an engine miss condition. The Tech 2 can usually detect EMI by monitoring the engine speed. A sudden increase in speed with little change in actual engine speed change indicates that EMI is present. If a problem exists, check routing of high voltage components, such as fuel injector solenoid wiring, near the sensor circuits.

Surges / Chuggles

Checks	Action
DEFINITION: The engine has a power variation under a steady throttle or cruise. The vehicle seems to speed up and slow down with no change in the accelerator pedal.	
Preliminary Checks	• Diagnostic System Check – Engine Controls. • Ensure the driver understands the A/C compressor operation. • Use the Tech 2 in order to make sure the Vehicle Speed parameter reading matches the vehicle speedometer. • Inspect the engine control module (ECM) grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Tech 2 Data List in this section.

Checks	Action
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Use the Tech 2 to observe the Differential Fuel Rail Pressure parameter at idle and W.O.T. (accelerator pedal full travel) in Neutral. Differential Fuel Rail Pressure parameter should always be within ± 5 MPa (± 725 psi). • Use the Tech 2 to observe the Accelerator Pedal Position (APP) Angle. APP Angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation. Also inspect the APP Angle when the accelerator pedal is steady. If the indicating angle fluctuates, check for an intermittent open, high resistance in the circuits or for a skewed sensor. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel teeth are not damaged. • Inspect the camshaft position (CMP) sensor is tight and the camshaft gear flange surface is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Install a fuel pressure / vacuum gauge (5-8840-2844-0 / J-44638) between the fuel filter and fuel tank to check the fuel pressure. If the fuel pressure at any engine speed is a larger vacuum than 5 inHg, a restriction exists in the fuel supply lines between the fuel tank and the fuel supply pump. • Inspect the fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. • Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contents an interrupted noise or has abnormal nose when commanded ON.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect the intake throttle valve for a stuck closed position. • Inspect for a restriction or leak in the intake manifold.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect the exhaust brake valve for a stuck closed position. • Inspect for a restriction in the exhaust pipes.
Additional Checks	• Inspect the generator output voltage. • Inspect the EGR system operating correctly. Refer to EGR Control System Check in this section. • Inspect the A/C operation.

Lack of Power, Sluggishness, Sponginess

Checks	Action
DEFINITION: The engine delivers less than expected power. There is little or no increase in speed when partially applying the accelerator pedal.	
Preliminary Checks	• Diagnostic System Check – Engine Controls. • Compare the vehicle with a similar unit. Ensure the vehicle has an actual problem. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Have the tire sizes changed • Are excessively heavy loads being carried? • Inspect for clutch slip. • Inspect brake drag. • Inspect for a proper transmission shift pattern and down shift operation. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Use the Tech 2 in order to make sure the Vehicle Speed parameter reading matches the vehicle speedometer. • Inspect the engine control module (ECM) grounds for being clean, tight, and in their proper locations. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Tech 2 Data List in this section.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Use the Tech 2 to observe the Differential Fuel Rail Pressure parameter at idle and W.O.T. (accelerator pedal full travel) in Neutral. Differential Fuel Rail Pressure parameter should always be within ± 5 MPa (± 725 psi). • Use the Tech 2 to observe the Boost Pressure and Barometric Pressure (BARO) with ignition ON and engine OFF. Boost Pressure and BARO parameters should be within the 1.0 psi (7.0 kPa) each other. • Use the Tech 2 to observe the Accelerator Pedal Position (APP) Angle. APP Angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Install a fuel pressure / vacuum gauge (5-8840-2844-0 / J-44638) between the fuel filter and fuel tank to check the fuel pressure. If the fuel pressure at any engine speed is a larger vacuum than 5 inHg, a restriction exists in the fuel supply lines between the fuel tank and the fuel supply pump. • Inspect the fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. • Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contents an interrupted noise or has abnormal nose when commanded ON.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect the intake throttle valve for a stuck closed position. • Inspect for a restriction or leak in the intake manifold. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section. • Inspect for turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect the exhaust brake valve for a stuck closed position. • Inspect for a restriction in the exhaust pipes.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi). • Improper valve timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the generator output voltage. • Inspect the EGR system operating correctly. Refer to EGR Control System Check in this section. • Inspect the engine overheat condition. Refer to the Engine Cooling section. • Inspect the A/C operation.

Hesitation, Sag, Stumble

Checks	Action
DEFINITION: The vehicle has a momentary lack of response when pushing down on the accelerator. The condition can occur at any vehicle speed. The condition is usually most severe when trying to make the vehicle move from a stop. If severe enough, the condition may cause the engine to stall.	

Checks	Action
Preliminary Checks	• Diagnostic System Check – Engine Controls. • Compare the vehicle with a similar unit. Ensure the vehicle has an actual problem. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect for a proper transmission shift pattern and down shift operation. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Inspect the engine control module (ECM) grounds for being clean, tight, and in their proper locations. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Tech 2 Data List in this section.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Use the Tech 2 to observe the Differential Fuel Rail Pressure parameter at idle and W.O.T. (accelerator pedal full travel) in Neutral. Differential Fuel Rail Pressure parameter should always be within ± 5 MPa (± 725 psi). • Use the Tech 2 to observe the Boost Pressure and Barometric Pressure (BARO) with ignition ON and engine OFF. Boost Pressure and BARO parameters should be within the 1.0 psi (7.0 kPa) each other. • Use the Tech 2 to observe the Accelerator Pedal Position (APP) Angle. APP Angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel teeth are not damaged. • Inspect the camshaft position (CMP) sensor is tight and the camshaft gear flange surface is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Install a fuel pressure / vacuum gauge (5-8840-2844-0 / J-44638) between the fuel filter and fuel tank to check the fuel pressure. If the fuel pressure at any engine speed is a larger vacuum than 5 inHg, a restriction exists in the fuel supply lines between the fuel tank and the fuel supply pump. • Inspect the fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. • Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contents an interrupted noise or has abnormal nose when commanded ON.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect the intake throttle valve for a stuck closed position. • Inspect for a restriction or leak in the intake manifold. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section. • Inspect for turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the exhaust pipes.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi). • Improper valve timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the generator output voltage. • Inspect the EGR system operating correctly. Refer to EGR Control System Check in this section. • Inspect the engine overheat condition. Refer to the Engine Cooling section. • Inspect the A/C operation.

Fuel Knock / Combustion Noise

Checks	Action
DEFINITION: A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with the throttle opening.	
Preliminary Checks	• Diagnostic System Check – Engine Controls. • Ensure the vehicle has an actual problem. • Inspect for smoke associated with the combustion noise. • Inspect the fuel quality (cetane index). • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Tech 2 Data List in this section.

Checks	Action
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Use the Tech 2 to observe the Differential Fuel Rail Pressure parameter at idle and W.O.T. (accelerator pedal full travel) in Neutral. Differential Fuel Rail Pressure parameter should always be within ± 5 MPa (± 725 psi). • Inspect the crankshaft position (CKP) sensor is tight and the flywheel teeth are not damaged. • Inspect the camshaft position (CMP) sensor is tight and the camshaft gear flange surface is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Install a fuel pressure / vacuum gauge (5-8840-2844-0 / J-44638) between the fuel filter and fuel tank to check the fuel pressure. If the fuel pressure at any engine speed is a larger vacuum than 5 inHg, a restriction exists in the fuel supply lines between the fuel tank and the fuel supply pump. • Inspect the fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Inspect the fuel injectors. Remove the injectors and visually inspect. • Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. • Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contents an interrupted noise or has abnormal nose when commanded ON. • Perform the Pre Injection Stop test with the Tech 2. Replace the injectors if engine noise does not change when commanded Stop. • Use the Tech 2 to observe the Cylinder Compensation for each cylinder at idle. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi). • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc. • Inspect for any excessive oil entering combustion chamber.
Additional Checks	• Inspect the EGR system operating correctly. Refer to EGR Control System Check in this section. • Inspect other possible causes that can make similar noise such as loose component parts, bracket, mount and weak clutch damper spring.

Poor Fuel Economy

Checks	Action
DEFINITION: Fuel economy, as measured by actual road tests and several tanks of fuel, is noticeably lower than expected. Also, the economy is noticeably lower than it was on this vehicle at one time, as previously shown by actual road tests.	
Preliminary Checks	• Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the driving habits of the owner. • Is the A/C ON full time, defroster mode ON? • Are the tires at the correct pressure? • Are the tire sizes changed • Are excessively heavy loads being carried? • Is the acceleration too much, too often? • Inspect for clutch slip. • Inspect brake drag. • Inspect dive belt tension. • Inspect for a proper transmission shift pattern and down shift operation. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Suggest to the owner to fill the fuel tank and recheck the fuel economy. • Suggest to the driver to read the Important Facts on Fuel Economy in the Owner Manual. • Inspect the odometer is correctly operated. • Inspect the programmed fuel injector ID code for each cylinder.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect the fuel type and quality. • Check fuel leak.
Cooling System Checks	Inspect the cooling system for the following conditions. Refer to the Cooling System Section. • Inspect the engine coolant level. • Inspect the engine thermostat for always being open or for the wrong heat range. • Inspect the engine cooling fan for always being ON.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect the intake throttle valve for a stuck closed position. • Inspect for a restriction or leak in the intake manifold.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect the exhaust brake valve for a stuck closed position. • Inspect for a restriction in the exhaust pipes.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi).

Excessive Smoke (Black Smoke)

Checks	Action
DEFINITION: Black smoke under load, idle or start up hot or cold.	
Preliminary Check	• Ensure the vehicle has an actual problem. • Inspect the engine control module (ECM) grounds for being clean, tight, and in their proper locations. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Inspect the programmed fuel injector ID code for each cylinder.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Use the Tech 2 to observe the Differential Fuel Rail Pressure parameter at idle and W.O.T. (accelerator pedal full travel) in Neutral. Differential Fuel Rail Pressure parameter should always be within ± 5 MPa (± 725 psi). • Use the Tech 2 to observe the Boost Pressure and Barometric Pressure (BARO) with ignition ON and engine OFF. Boost Pressure and BARO parameters should be within the 1.0 psi (7.0 kPa) each other. • Use the Tech 2 to observe the Accelerator Pedal Position (APP) Angle. APP Angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect the fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. • Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contents an interrupted noise or has abnormal nose when commanded ON. • Use the Tech 2 to observe the Cylinder Compensation for each cylinder at idle. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code. • Inspect the fuel injectors. Remove the injectors and visually inspect.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect the intake throttle valve for a stuck closed position. • Inspect for a restriction or leak in the intake manifold. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect the exhaust brake valve for a stuck closed position. • Inspect for a restriction in the exhaust pipes.
Engine Mechanical Check	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi). • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc. • Inspect for any excessive oil entering combustion chamber. • Improper valve timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the EGR system operating correctly. Refer to EGR Control System Check in this section. • Inspect the excessive blow-by gasses. • Inspect the Tech 2 Data List in this section.

Excessive Smoke (White Smoke)

Checks	Action
DEFINITION: White smoke under load, idle or start up hot or cold.	
Preliminary Check	• Ensure the vehicle has an actual problem. • Inspect the engine control module (ECM) grounds for being clean, tight, and in their proper locations. • Inspect the fuel quality (cetane index). • Inspect the programmed fuel injector ID code for each cylinder.

Checks	Action
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. • Use the Tech 2 to observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes. If not, check for high resistance in the 5 volts reference circuit, low reference circuit, signal circuits or for a skewed sensor. • Use the Tech 2 to observe the Differential Fuel Rail Pressure parameter at idle and W.O.T. (accelerator pedal full travel) in Neutral. Differential Fuel Rail Pressure parameter should always be within ± 5 MPa (± 725 psi). • Use the Tech 2 to observe the Boost Pressure and Barometric Pressure (BARO) with ignition ON and engine OFF. Boost Pressure and BARO parameters should be within the 1.0 psi (7.0 kPa) each other. • Use the Tech 2 to observe the Accelerator Pedal Position (APP) Angle. APP Angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel teeth are not damaged. • Inspect the camshaft position (CMP) sensor is tight and the camshaft gear flange surface is not damaged.
Fuel System Checks	• Check for a stuck open fuel injector. Remove each glow plug from the cylinder head and inspect the tip of the glow plugs for wet fuel. Use the cylinder compression gauge. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi). If poor compression is observed, inspect the engine mechanical. • Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. • Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contents an interrupted noise or has abnormal nose when commanded ON. • Use the Tech 2 to observe the Cylinder Compensation for each cylinder at idle. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code. • Inspect the fuel injectors. Remove the injectors and visually inspect.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect the intake throttle valve for a stuck closed position. • Inspect for a restriction or leak in the intake manifold. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section.

Checks	Action
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 1960 kPa (284 psi) and variation of each cylinder is less than 294 kPa (43 psi). • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc. • Improper valve timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes • Inspect for any excessive fuel entering combustion chamber. • Inspect for coolant entering the combustion chamber.
Electrical System Checks	Inspect the engine electrical for the following conditions. • Inspect the glow plug control (preheating) system operation. Refer to Glow Control System Check in this section.

Repair Instructions

Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming

If the ECM is replaced the Fuel Injector ID Code Data (24, 0-9 or A-F characters for each fuel injector) MUST be reprogrammed into the new ECM.

Uploading the Fuel Injector ID Code Data from the ECM

Important:
Only perform this procedure if the ECM is being replaced. The current fuel injector ID code data can be determined with the Tech 2. If the ECM does not communicate with the Tech 2, go to the next procedure.

1. Install the Tech 2.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > appropriate vehicle identification > 4HK1 (Common Rail) > Programming > Injector ID Code > Upload ID Code.
4. After complete the upload, turn OFF the Tech 2.
5. Turn OFF the ignition.

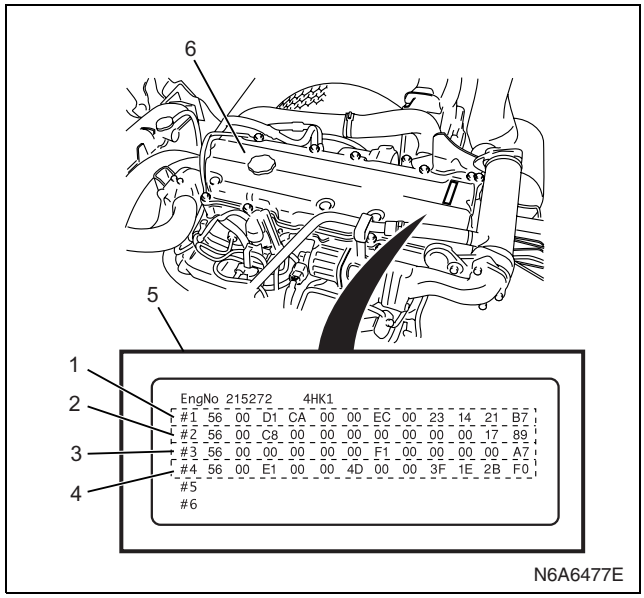
Retrieving the Fuel Injector ID Code Data with a Non-communicating ECM

Important:
Only perform following procedure if the ECM is being replaced and the Tech 2 does not communicate. The current fuel injector ID code data can not be determined with the Tech 2, the fuel injector numbers must be recorded from the factory affixed label on the cylinder head cover or each fuel injector ID plate.

Recording from the label on cylinder head cover;

Important:
Only perform this procedure if the fuel injectors are not being replaced in the past.

1. Record all numbers of each cylinder on the label.

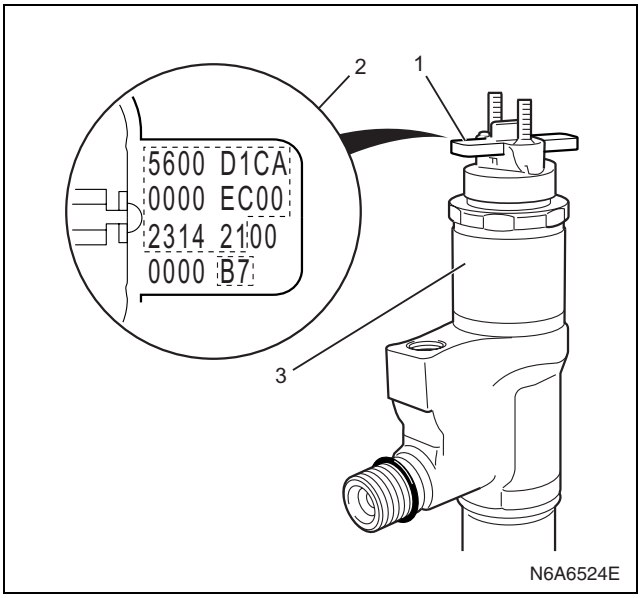


Legend

1. Cylinder Number 1 Fuel Injector ID Code
2. Cylinder Number 2 Fuel Injector ID Code
3. Cylinder Number 3 Fuel Injector ID Code
4. Cylinder Number 4 Fuel Injector ID Code
5. Injector ID Code Label
6. Cylinder Head Cover

Recording from the each fuel injector ID plate

1. Remove the cylinder head cover. Refer to Fuel Injector replacement in this section.
2. Record 24 figures of each fuel injector ID plate. The correct order for the fuel injector ID code for the following illustration is as follows:
   56 00 D1 CA 00 00 EC 00 23 14 21 B7

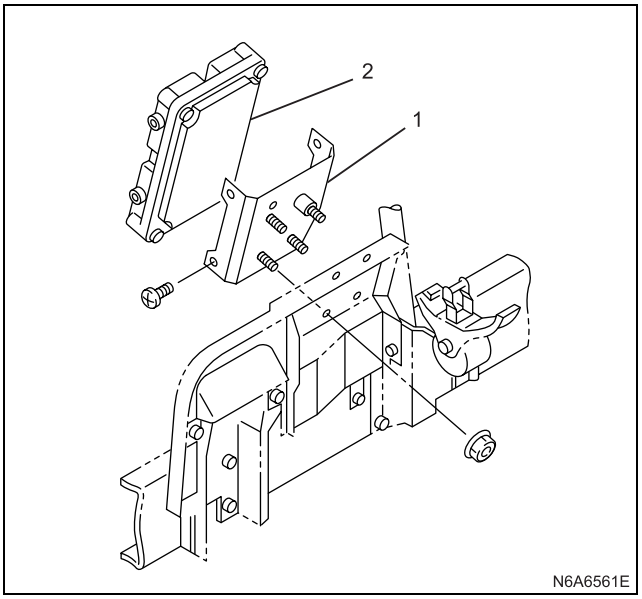


Legend
1. Fuel Injector ID Plate
2. Fuel Injector ID Code
3. Fuel Injector

Removal Procedure

Important:
Take care not to give a strong impact to the ECM.

1. Turn OFF the ignition.
2. Disconnect the negative battery cable.
3. Disconnect the ECM connectors.
4. Remove the ECM bracket fixing nuts.
5. Remove the ECM bracket with the ECM.
6. Remove the ECM fixing bolts.
7. Remove the ECM.



Legend
1. ECM Bracket
2. ECM

Installation Procedure

Important:
Do not use a fallen ECM or the ECM that received a strong impact.

1. Install the ECM on the ECM bracket.

   Tighten:
   Bolts to 8.6 — 13.5 N·m (0.88 — 1.38 kg·m / 6.4 — 10.0 lb·ft)
2. Install the ECM bracket with the ECM.
3. Tighten the ECM bracket fixing nuts.
4. Connect the ECM connectors.
5. Connect the negative battery cable.

Fuel Injector ID Code Data Programming Procedure

Important:
Only perform this procedure if the fuel injector ID code data can be uploaded with the Tech 2. If the ECM can not be uploaded with the Tech 2, go to the next procedure.

1. Install the Tech 2.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > appropriate vehicle identification > 4HK1 (Common Rail) > Programming > Injector ID Code > Download ID Code.
4. After complete the download, turn OFF the ignition for 30 second.
5. Turn ON the ignition.
6. Select Diagnostics > appropriate vehicle identification > 4HK1 (Common Rail) > Programming > Injector ID Code > Injector ID Code. At this point, all downloaded fuel injector ID code data can be verified. Compare the ID code values downloaded into the ECM and each fuel injector.
7. Start the engine and let idle.

Important:
In order to make the fuel supply pump characteristic learn into the replaced ECM, let the engine idle until warm-up. If the fuel system DTC's stored in the meantime, once clear DTC and warm-up the engine again.

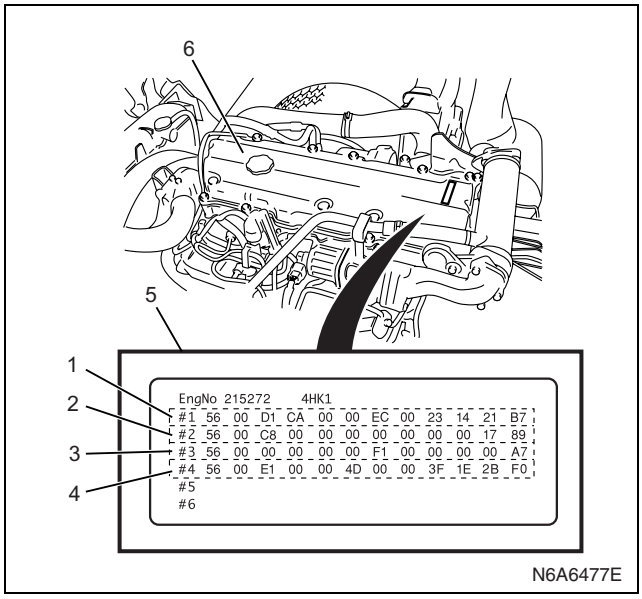
8. Inspect for a proper engine running condition and for no DTC's. Refer to the Diagnostic System Check-Engine Controls if needed.

Important:
If the current injector ID code data can not be uploaded with the Tech 2, the recorded all numbers must be entered into the Tech 2.

1. Install the Tech 2.
2. Turn ON the ignition, with the engine OFF.

3. Select Diagnostics > appropriate vehicle identification > 4HK1 (Common Rail) > Programming > Injector ID Code > ID Code Registration.
4. Select the cylinder 1 to 4 and press Change. If the ID code data are recorded from the label on cylinder head cover, go to a..
   If the ID code data are recorded from the each fuel injector ID plate, go to b..
   a. Input 22 figures. The correct order for the cylinder number 1 fuel injector ID code for the following illustration is as follows:
      56 00 D1 CA 00 00 EC 00 23 14 21

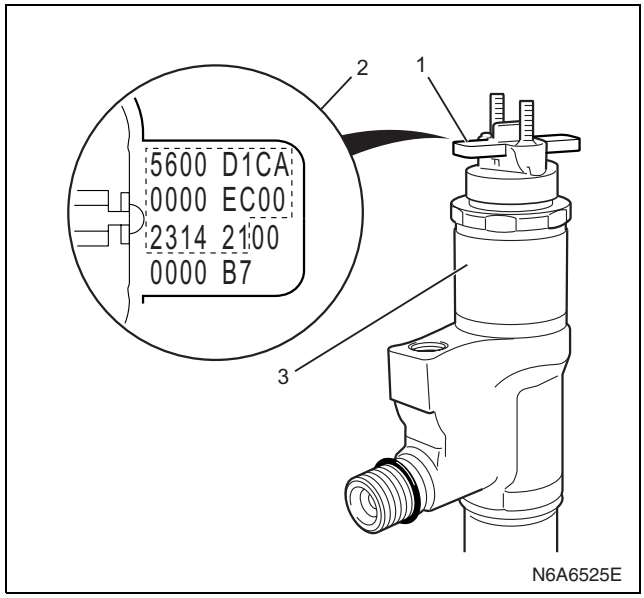
Important:
The number of places required for input is 22 figures except last 2 figures.



Legend
1. Cylinder Number 1 Fuel Injector ID Code
2. Cylinder Number 2 Fuel Injector ID Code
3. Cylinder Number 3 Fuel Injector ID Code
4. Cylinder Number 4 Fuel Injector ID Code
5. Injector ID Code Label
6. Cylinder Head Cover

   b. Input 22 figures. Then, input in order from the left edge of upper sequence to the right edge of lower sequence. The correct order for the fuel injector ID code for the following illustration is as follows:
      56 00 D1 CA 00 00 EC 00 23 14 21

Important:
The number of places required for input is 22 figures except last 2 figures.



Legend
1. Fuel Injector ID Plate
2. Fuel Injector ID Code
3. Fuel Injector

5. After complete the registration, turn OFF the ignition for 30 second.
6. Turn ON the ignition.
7. Select Diagnostics > appropriate vehicle identification > 4HK1 (Common Rail) > Programming > Injector ID Code > Injector ID Code. At this point, all registered fuel injector ID code data can be verified. Compare the ID code values registered into the ECM and each fuel injector including the last 2 figures. If the registered ID code is incorrect, go back to Step 4 ID Code Registration.
8. Start the engine and let idle.

Important:
In order to make the fuel supply pump characteristic learn into the replaced ECM, let the engine idle until warm-up. If the fuel system DTC's stored in the meantime, once clear DTC and warm-up the engine again.

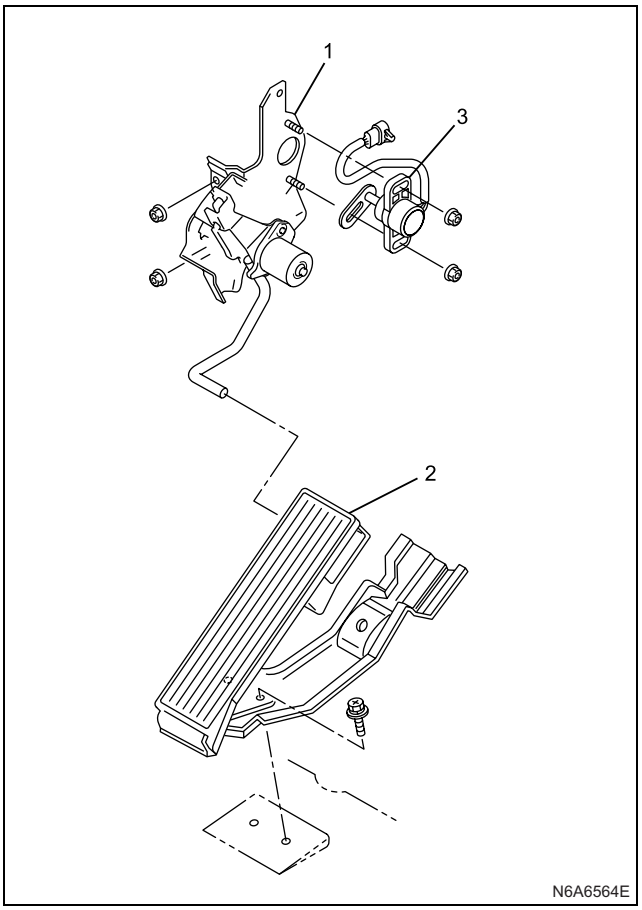
9. Inspect for a proper engine running condition and for no DTC's. Refer to the Diagnostic System Check-Engine Controls if needed.

Accelerator Pedal Position (APP) Sensor Replacement

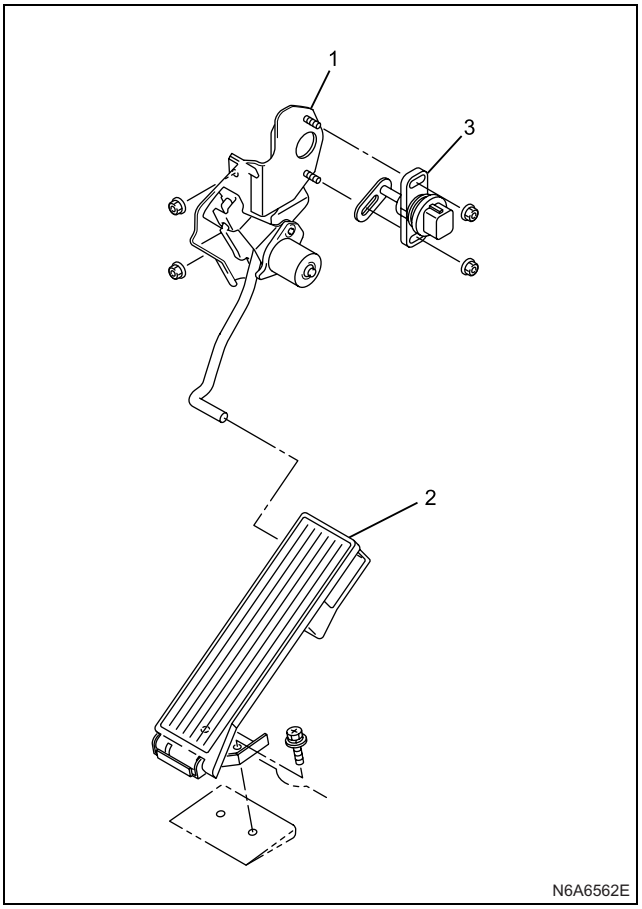
Removal Procedure

1. Turn off the ignition.
2. Disconnect the negative battery cable.
3. Remove the control link bracket assembly (1) fixing nuts.

• LHD Model



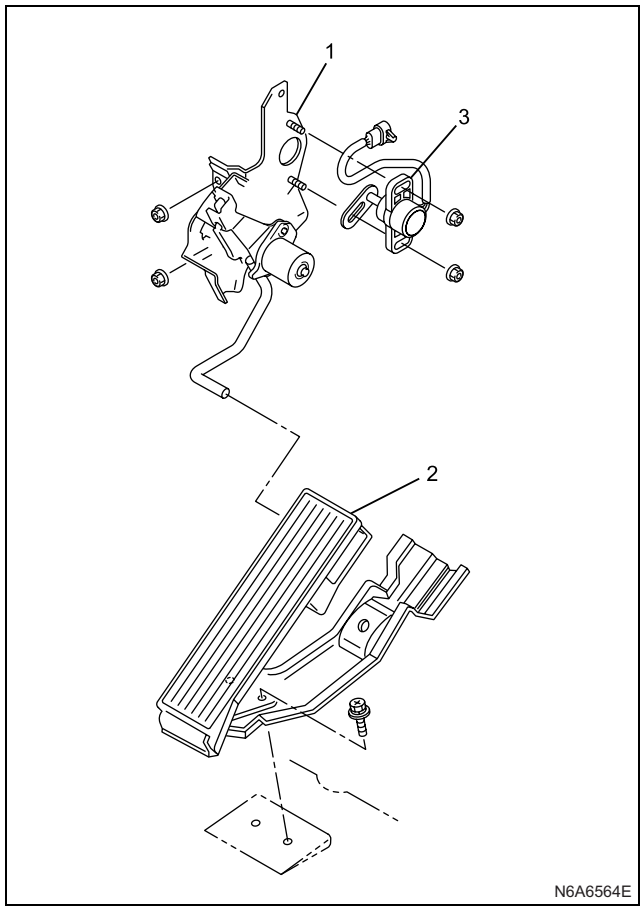
• RHD Model



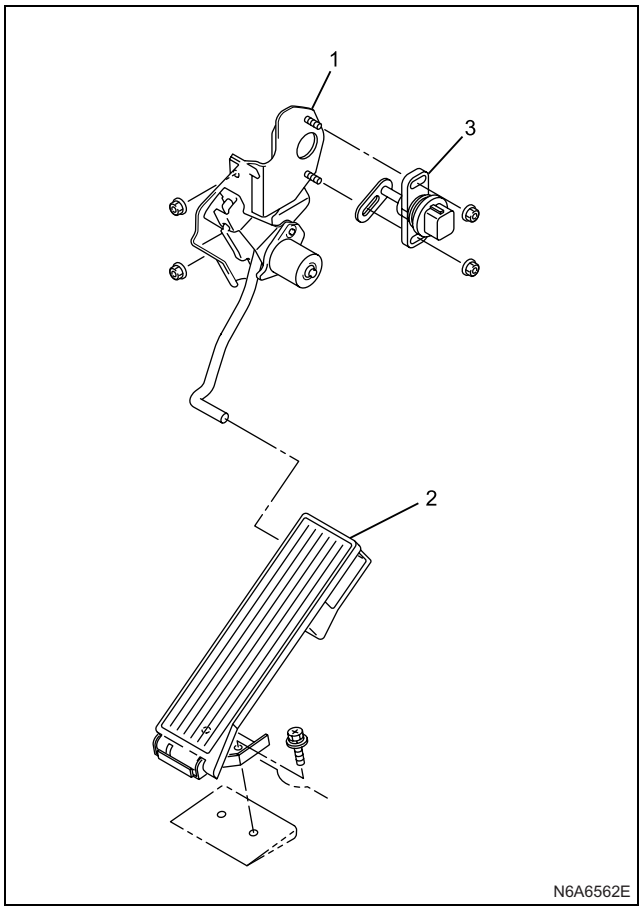
4. Remove the pedal assembly (2) fixing bolts.
5. Disconnect the accelerator pedal position (APP) sensor (3) connector.
6. Remove the APP sensor (3) fixing nuts.

Installation Procedure

• LHD Model



- RHD Model

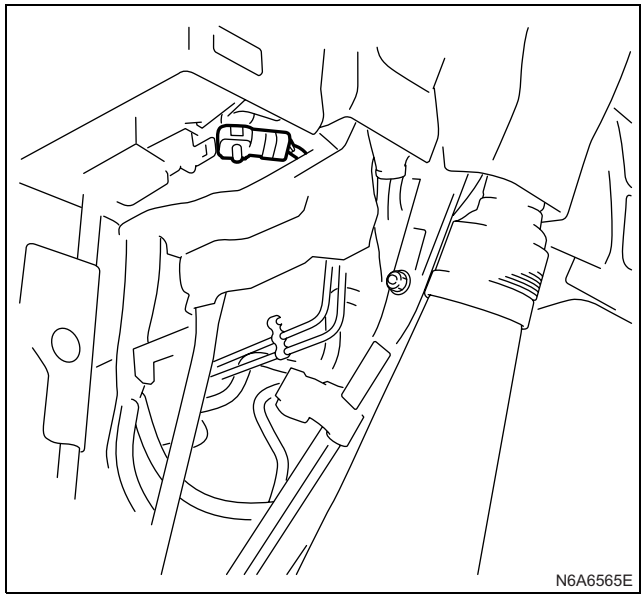


1. Install the APP sensor (3) on the control link bracket assembly (1).
2. Connect the APP sensor (3) connector.
3. Install the pedal assembly (2).
4. Install the control link bracket assembly (1).
5. Connect the nagative battery cable.

Barometric Pressure (BARO) Sensor Replacement

Removal Procedure

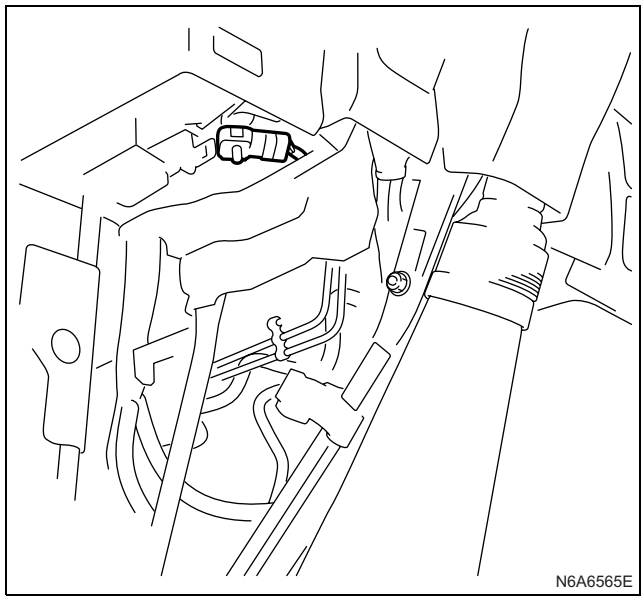
1. Turn off the ignition.
2. Disconnect the negative battery cable.
3. Disconnect the barometric pressure (BARO) sensor connector that is located under the instrument panel cluster (IPC).



4. Remove the BARO sensor.

Installation Procedure

1. Install the BARO sensor on the installation bracket.

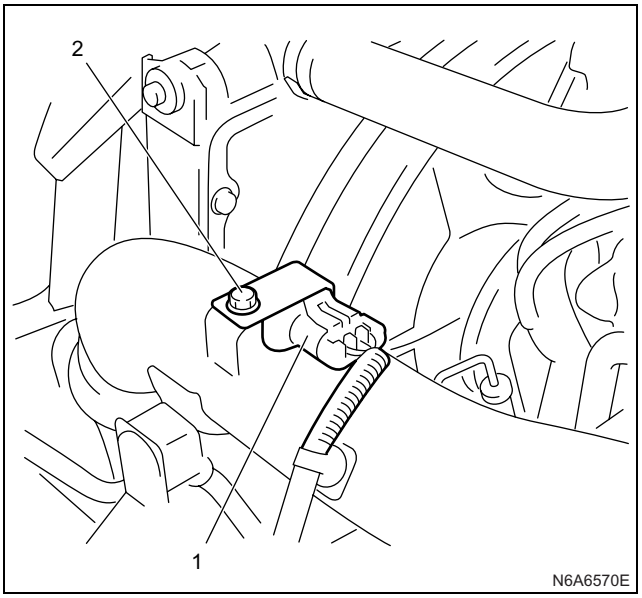


2. Connect the BARO sensor connector.
3. Connect the nagative battery cable.

Boost Pressure Sensor Replacement

Removal Procedure

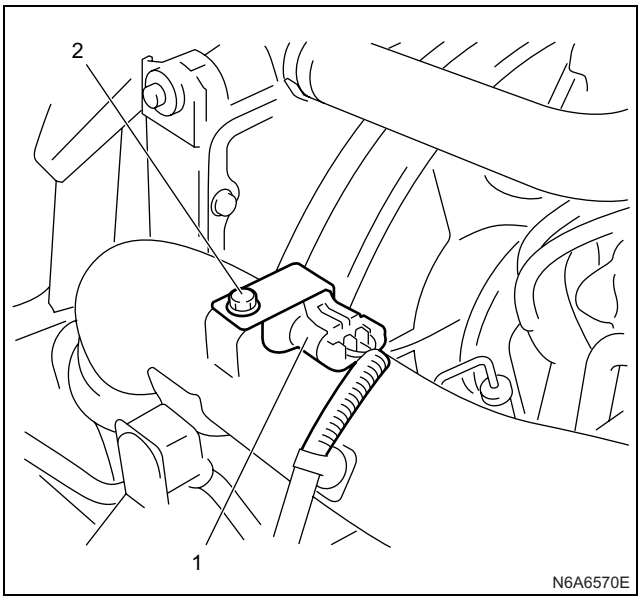
1. Turn off the ignition.
2. Loosen the boost pressure sensor bolt (2).
3. Disconnect the boost pressure sensor connector.
4. Remove the boost pressure sensor (1).



Installation Procedure

1. Install the boost pressure sensor (1).
2. Tighten the boost pressure sensor bolt (2).

   Tighten:
   Bolt to 8 N·m (0.8 kg·m / 69 lb·in)

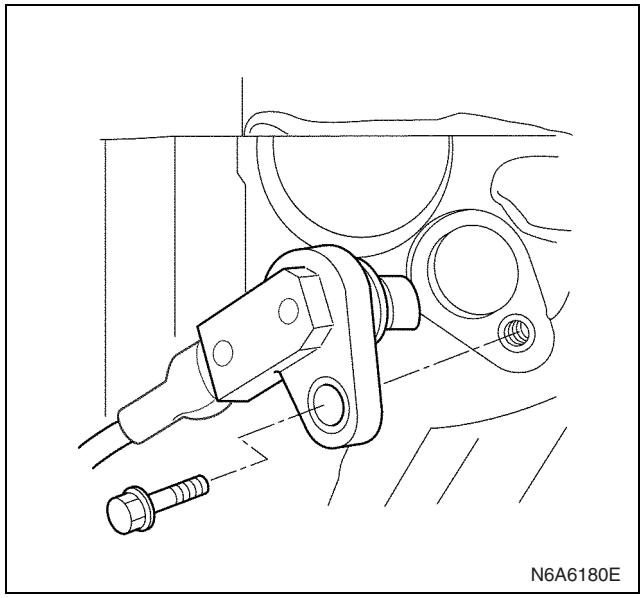


3. Connect the boost pressure sensor connector.

Camshaft Position (CMP) Sensor Replacement

Removal Procedure

1. Turn off the ignition.
2. Loosen the camshaft position (CMP) sensor retaining bolt.

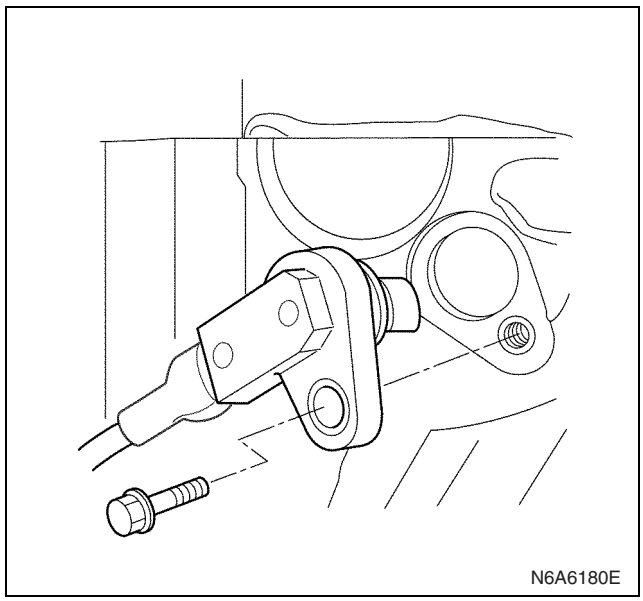


3. Remove the CMP sensor.

Installation Procedure

1. Install the CMP sensor.
   - Apply engine oil over the O-ring nice and thin and install it.
2. Tighten the CMP sensor retaining bolt.

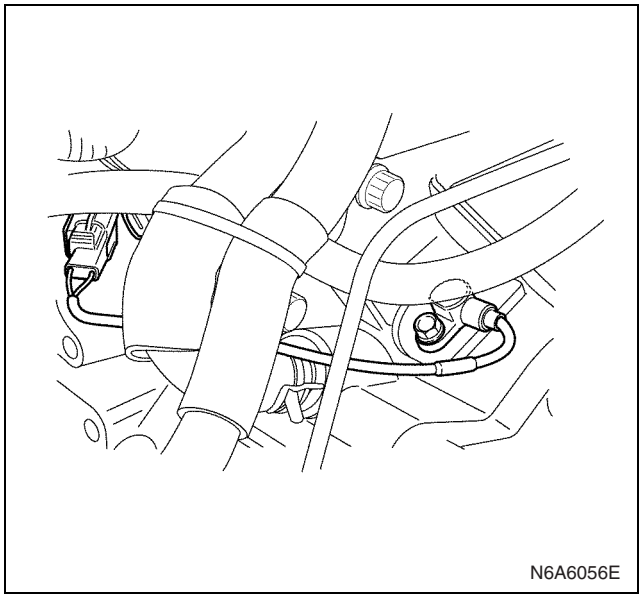
   Tighten:
   Bolt to 8 N·m (0.8 kg·m / 69 lb·in)



Crankshaft Position (CKP) Sensor Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Loosen the crankshaft position (CKP) sensor retaining bolt.



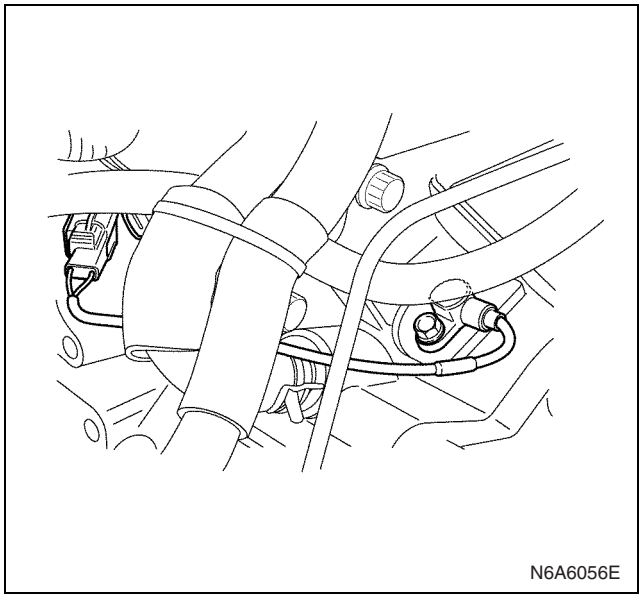
N6A6056E

3. Remove the CKP sensor.

Installation Procedure

1. Install the CKP sensor.
2. Tighten the CKP sensor retaining bolt.

   Tighten:
   Bolt to 8 N·m (0.8 kg·m / 69 lb·in)

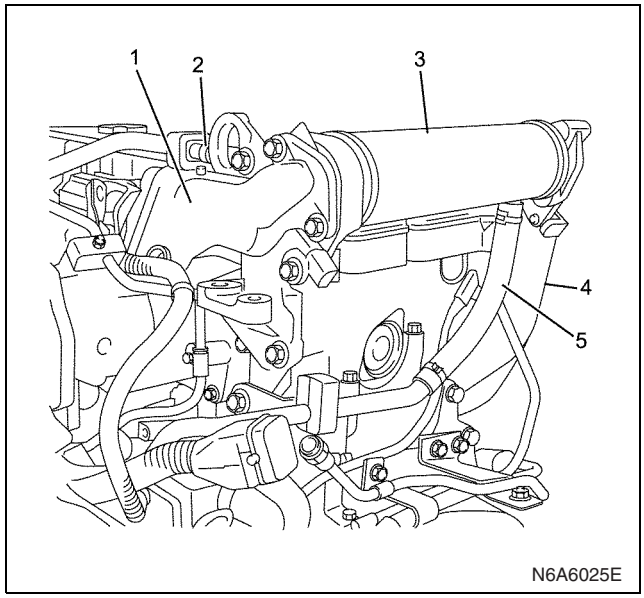


N6A6056E

EGR Valve Replacement

Removal Procedure

1. Drain engine coolant. Refer to Engine Cooling System section.
2. Remove the EGR valve connector.
3. Remove the EGR pipe.



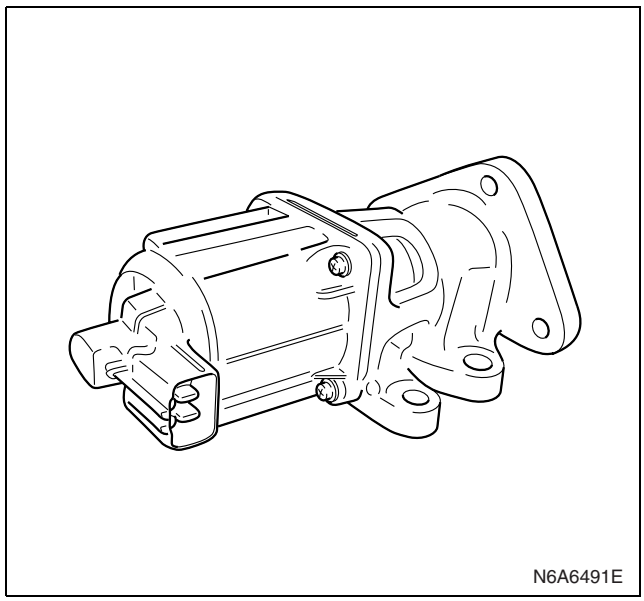
N6A6025E

Legend

1. EGR Adapter
2. Water Return Pipe
3. EGR Cooler
4. EGR Pipe
5. Water Feed Pipe

4. Remove the cooling water pipes.
5. Remove the EGR adapter.
6. Remove the EGR cooler.
7. Remove the EGR valve.

Caution:
After removing the EGR valve and EGR adapter, seal the opening so that foreign matter does not enter.



N6A6491E

Inspection Procedure

- **Gas leak check**
  - Check for gas leak in various parts of the EGR gas line.

If the results of the check show abnormalities, repair or replace the defective parts.

- **EGR valve check**

Installation Procedure

1. Mount the EGR valve.
   - Insert the gasket and temporarily fit the EGR valve.

Notice:
Temporarily tighten the bolts.

2. Install the EGR cooler.
   - Temporarily fit the EGR cooler to the bracket.

Notice:
Temporarily tighten the bolts.

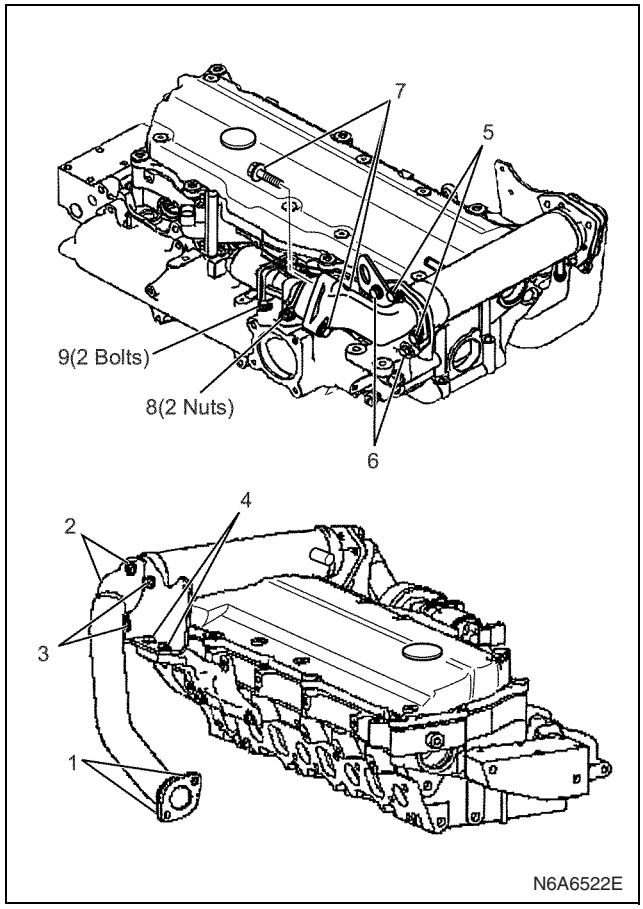
3. Install the EGR adapter.
   - Temporarily fit the EGR adapter between the EGR cooler and exhaust manifold.

Notice:
Temporarily tighten the bolts.

4. Install the EGR pipe.
   - Insert the gasket between the two ends of the EGR pipe and temporarily fit it.

Notice:
Temporarily tighten the bolts.

During temporary assembly, tighten the nuts and bolts to the specified torque in the order shown in the illustration.



Legend

1 ~ 9 Show The Order of Tighten Bolts and Nuts.

Tighten:

1 : 31 N·m (3.2 kg·m / 23 lb·ft)

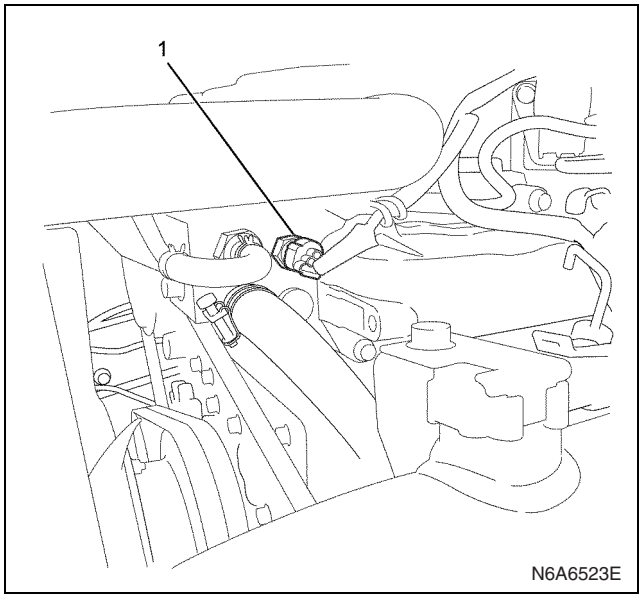
2, 4 : 28 N·m (2.9 kg·m / 21 lb·ft)

3, 5, 6, 7, 8, 9 : 24 N·m (2.4 kg·m / 17 lb·ft)

Engine Coolant Temperature (ECT) Sensor Replacement

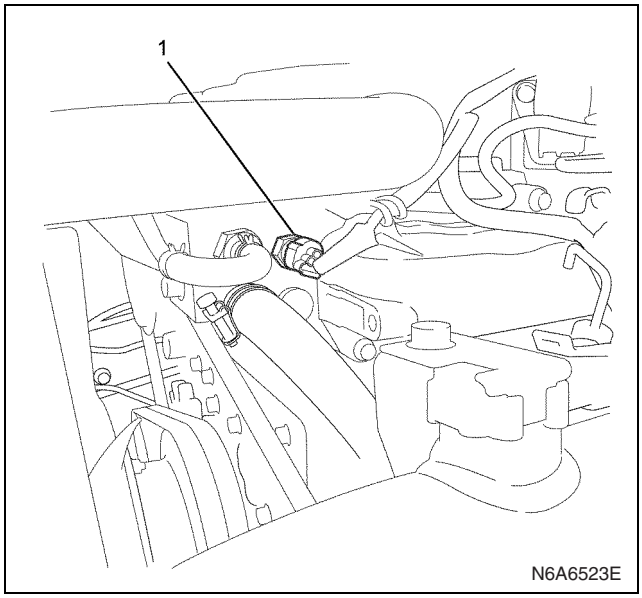
Removal Procedure

1. Turn off the ignition.
2. Disconnect the engine coolant temperature (ECT) sensor connector.
3. Remove the ECT sensor (1).



Installation Procedure

1. Install the ECT sensor (1).



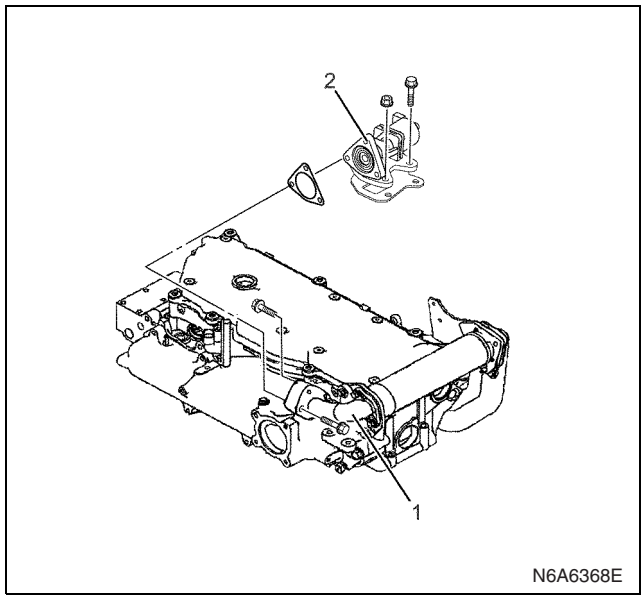
2. Connect the ECT sensor connector.
3. Replenish any lost engine coolant.

Fuel Injector Replacement / Fuel Injector ID Code Data Programming

Important:
The Fuel Injector ID Code Data Programming MUST be done when the fuel injector is being replaced. The Fuel Injector ID Code information MUST be recorded before assembling the cylinder head cover.

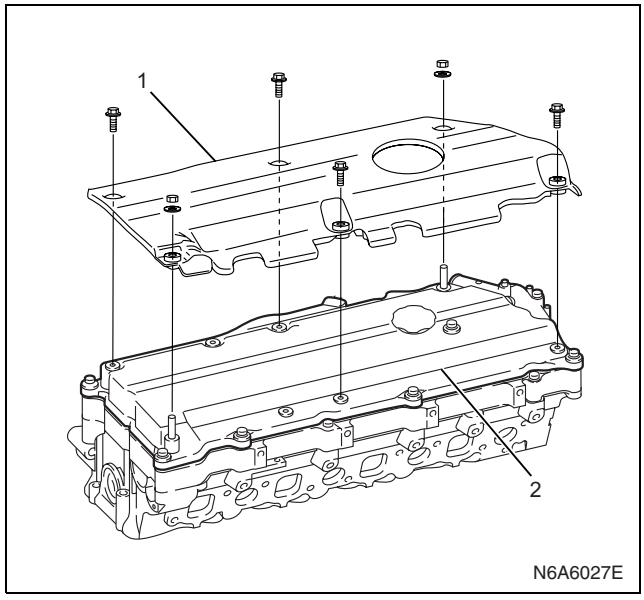
Removal Procedure

1. Remove the engine harness, the throttle position sensor, the EGR valve, the pressure sensor, and all of the fuel injector connectors.
2. Remove the EGR valve and the EGR adapter.
3. Tape the EGR case holes shut to prevent the entry of foreign material.



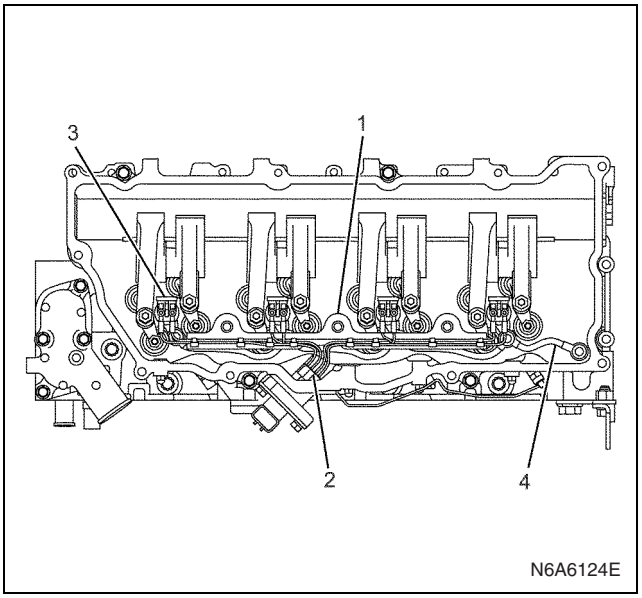
Legend
1. EGR Adapter
2. EGR Valve

4. Remove the sound insulation cover.
5. Remove the head cover.



Legend
1. Sound Insulation Cover (For Europe)
2. Head Cover

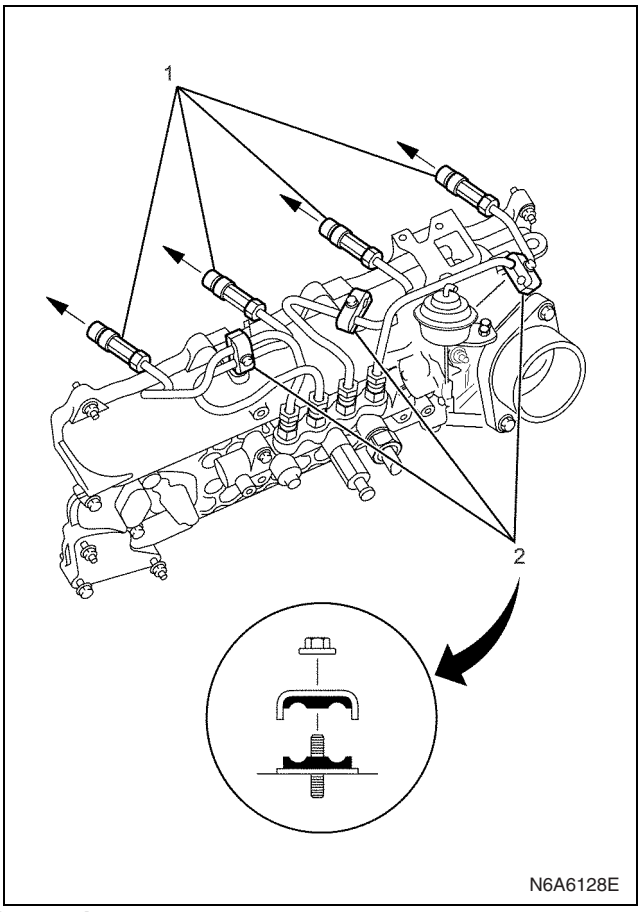
6. Loosen the fuel injector terminal nuts.
7. Loosen the fuel injector harness bracket bolts. Remove the inside connector and the harness bracket.
8. Remove the fuel injector leak-off pipe.
9. Remove the lower cover.



Legend

1. Harness Bracket
2. Harness Connector
3. Fuel Injector Terminal
4. Fuel Leak-Off Pipe

10. Remove the fuel injection pipe clips and the injection pipes.



Legend

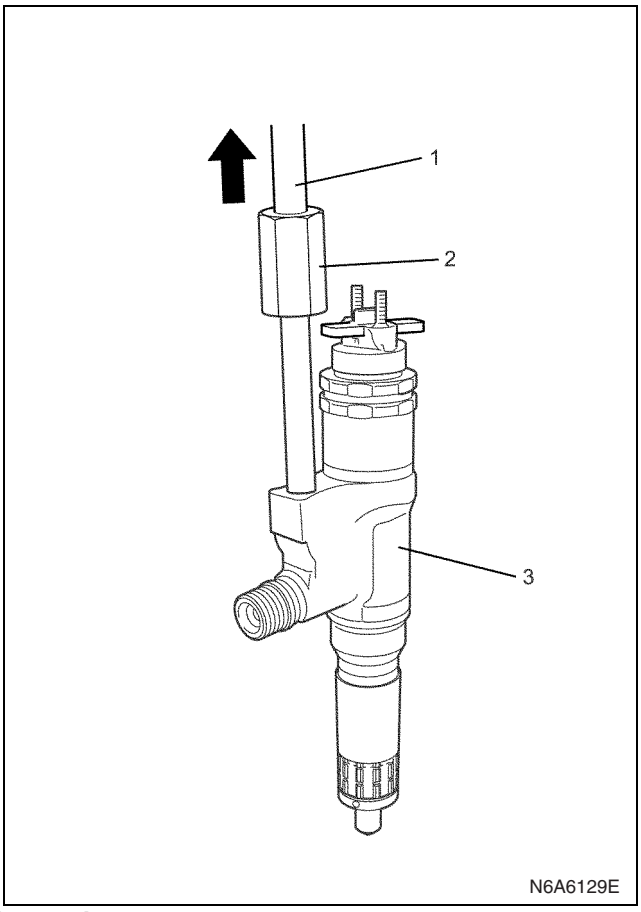
1. Fuel Injection Pipe
2. Pipe Clip

11. Loosen the fuel injector clamp fixing bolts and remove the fuel injectors.

If the fuel injectors are difficult to remove, use the fuel injector remover. Install the fuel injector remover to the leak-off pipe attachment part on the fuel injector. Use a sliding hammer to force the fuel injector clamp off the fuel injector.

Caution:
Do not remove the fuel injector sleeve.

Special tools
Fuel injector remover: 5-8840-2826-0 (EN-46720)
Sliding hammer: 5-8840-0019-0 (J-23907)



Legend

1. Sliding Hammer
2. Remover
3. Fuel Injector Assembly

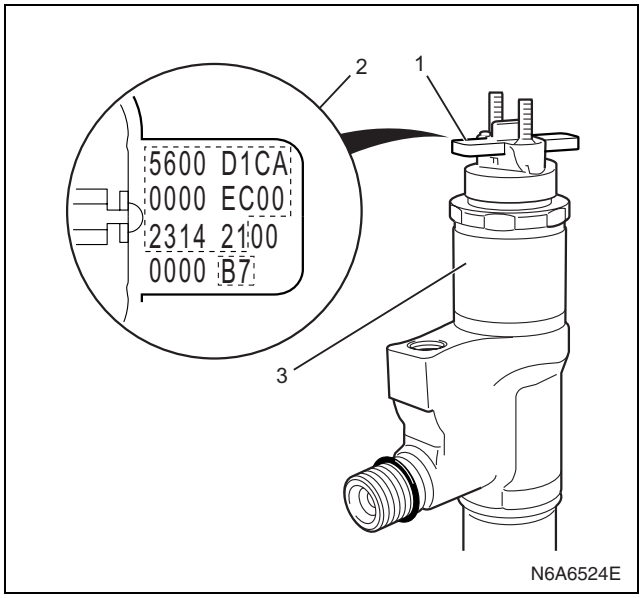
12. Mark each fuel injector with the number of the cylinder from which it was removed. Store the fuel injectors in a safe place. Position the fuel injector so that the nozzle is protected.

Caution:

- Do not tamper with the electromagnetic portion of the fuel injector. Reduced electromagnetic function will result in injector failure.

Recording from the each fuel injector ID plate

Record 24 figures of each fuel injector ID plate. The correct order for the fuel injector ID code for the following illustration is as follows:
56 00 D1 CA 00 00 EC 00 23 14 21 B7

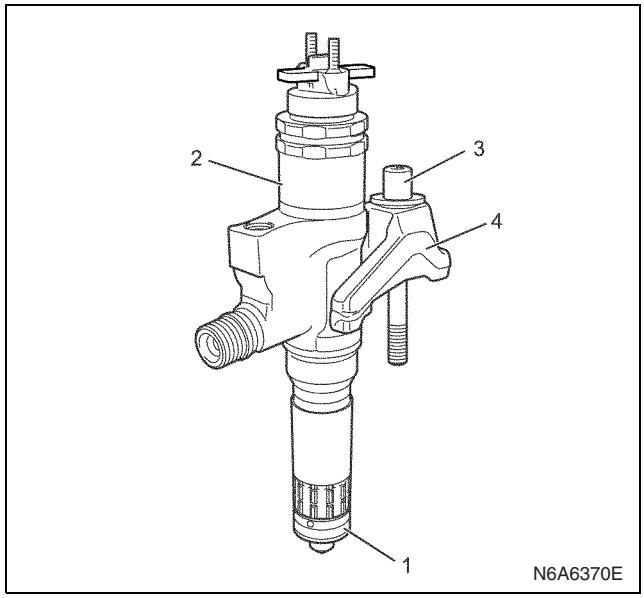


Legend
1. Fuel Injector ID Plate
2. Fuel Injector ID Code
3. Fuel Injector

Installation Procedure

Important:
Install each of the fuel injectors on its original position. (the cylinder from which it was removed)

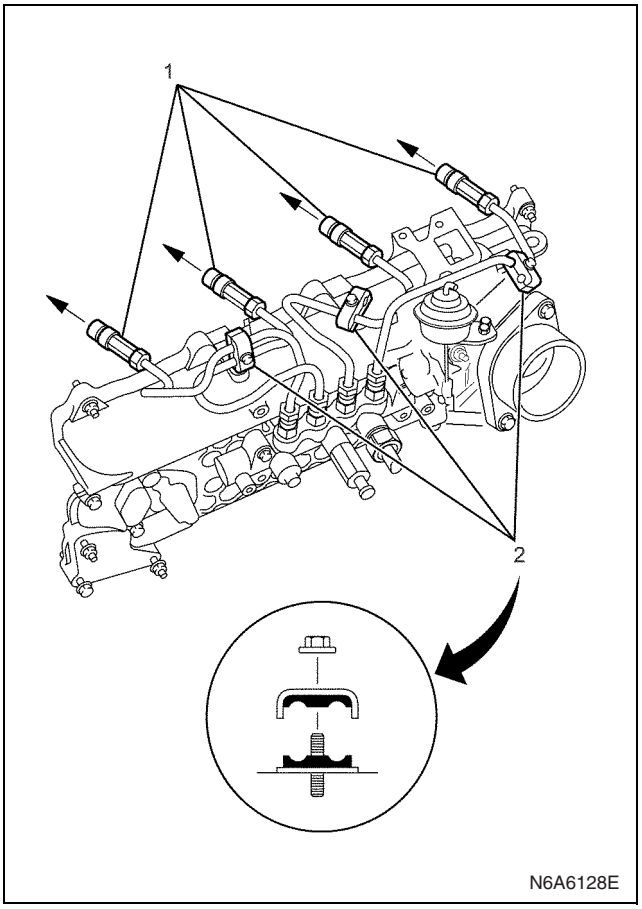
1. Install a new gasket and O-ring to each of the fuel injector clamps. Refer to the illustration.



Legend
1. Gasket
2. Fuel Injector
3. Bolt
4. Fuel Injector Clamp

2. Apply molybdenum to the threads and seating surfaces of the clamp bolts.
3. Install the fuel injector clamps to the cylinder head.
4. Temporarily tighten the clamp bolts.
5. Apply a thin coat of engine oil to the outer surface of the fuel injector side sleeve nuts.
6. Install the fuel injection pipes to the position shown in the illustration.
7. Use a spanner to carefully the sleeve nuts until the fuel injection pipes contact the fuel injector and common rail.
8. Tighten the fuel injection pipe clips to the specified torque.

   Tighten:
   Clips to 6 N·m (0.6 kg·m / 52 lb·in)



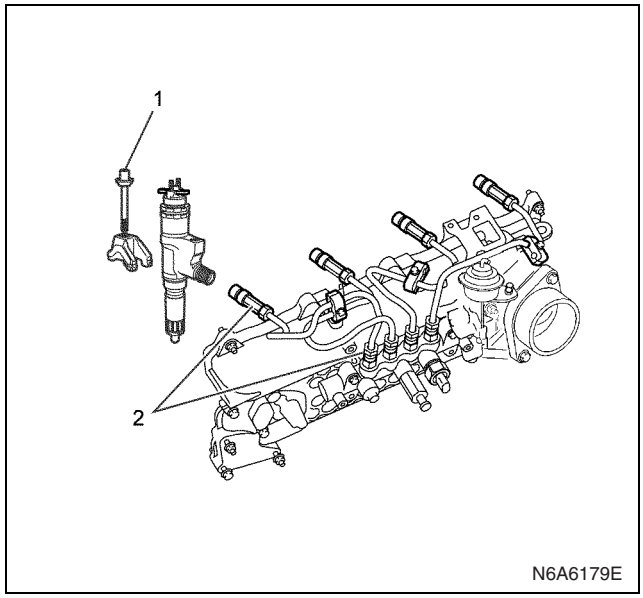
Legend
1. Fuel Injection Pipe
2. Pipe Clip

9. Final tighten the injection clamp bolts to the specified torque.

   Tighten:
   Bolts to 30 N·m (3.1 kg·m / 22 lb·ft)

10. Tighten the injection pipes to the specified torque.

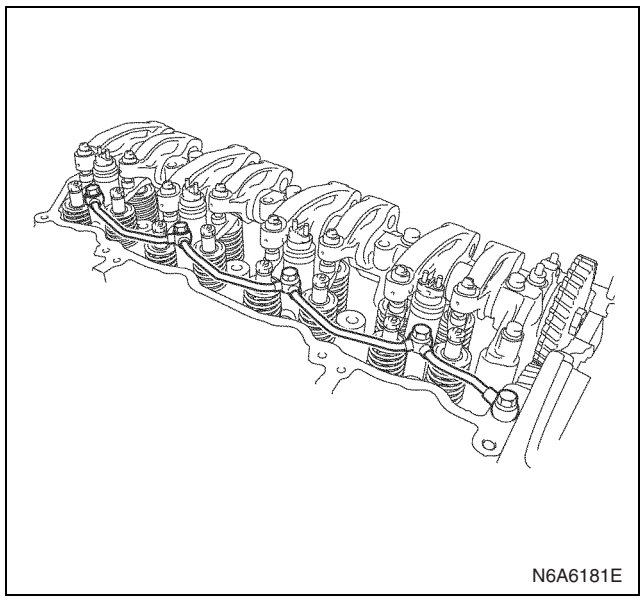
    Tighten:
    Injection pipes to 44 N·m (4.5 kg·m / 33 lb·ft)



Legend
1. Clamp Bolt
2. Sleeve Nut

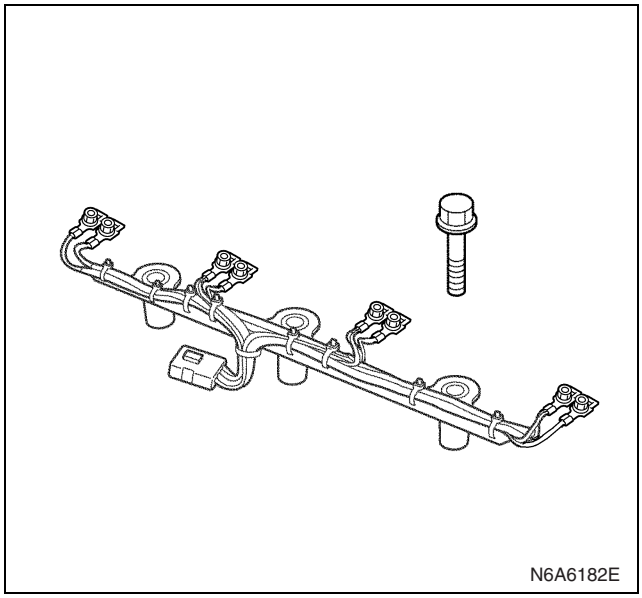
11. Install the nozzle leak off pipes together with the new gaskets. Tighten the pipes to the specified torque.

    Tighten:
    Pipes to 12 N·m (1.2 kg·m / 104 lb·in)



12. Install the fuel injector harness connectors. Work from the inside out.
13. Install the harness bracket and tighten the bolts to the specified torque.

    Tighten:
    Bolts to 48 N·m (4.9 kg·m / 35 lb·ft)

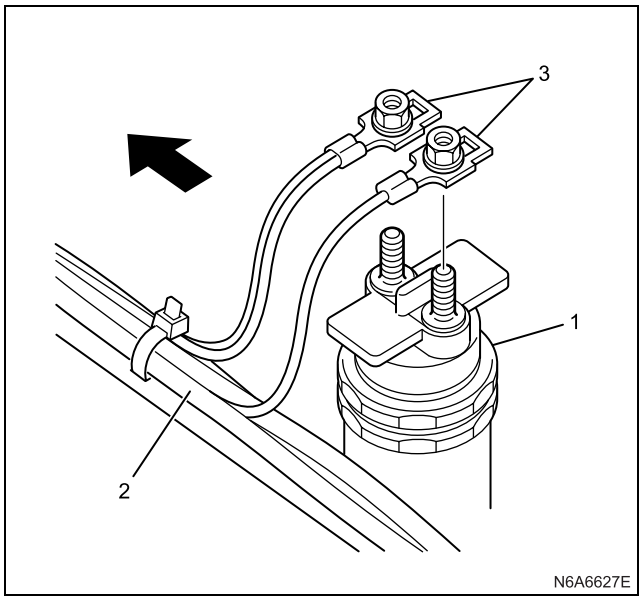


14. Install the fuel injector terminal nuts to the injector.

    Tighten:
    Nut to 2 N·m (0.2 kg·m / 17 lb·in)

Caution:

- Do not overtighten the nuts. Damage to the terminal studs will result.
- The terminal nut with two wires is engine front side.

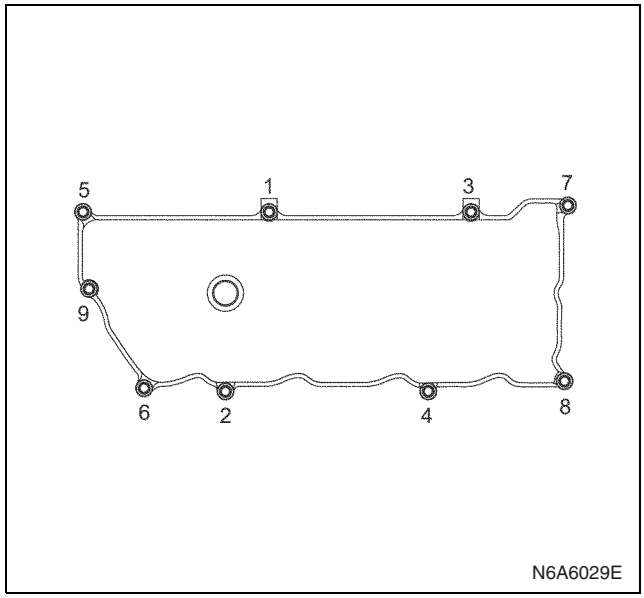


Legend

1. Fuel Injector
2. Harness
3. Terminal Nut

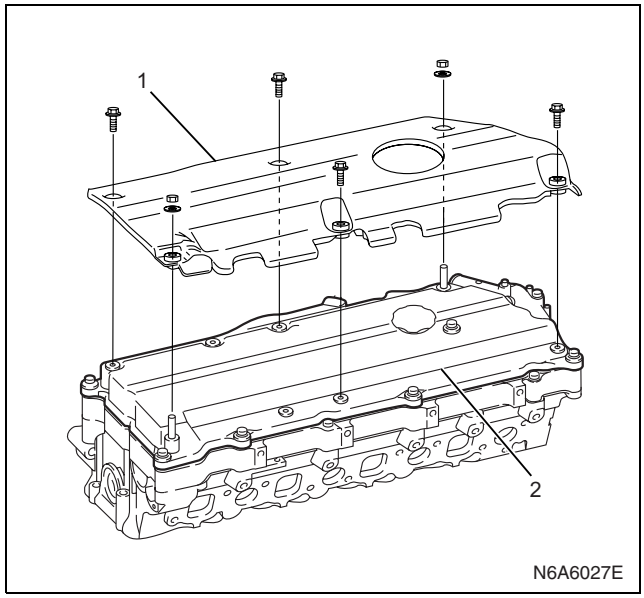
15. Install the gasket to the cylinder head cover.
16. Install the cylinder head cover and tighten up according to the order.

    Tighten:
    Bolts to 18 N·m (1.8 kg·m / 13 lb·ft)



17. Install the sound insulation cover (For Europe)

    Tighten:
    Bolts to 8 N·m (0.8 kg·m / 6 lb·ft)



Legend

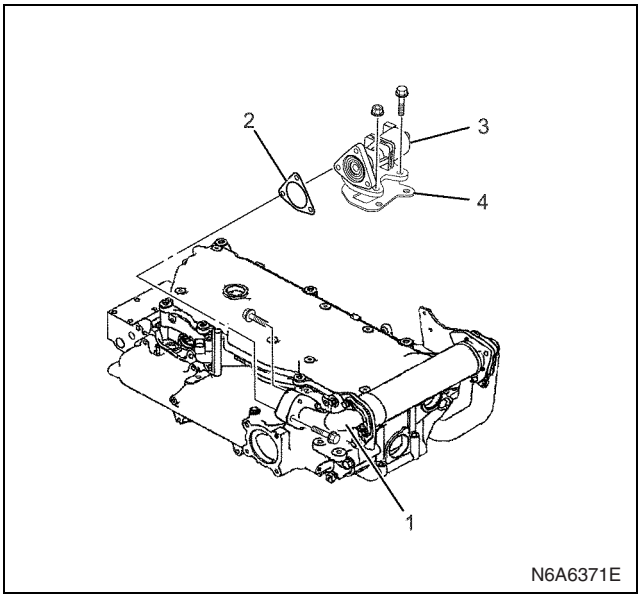
1. Sound Insulation Cover (For Europe)
2. Head Cover

18. Install the gasket to the EGR valve and tighten the bolts to the specified torque.

    Tighten:
    Bolts to 24 N·m (2.4 kg·m / 17 lb·ft)

19. Install the gasket to the EGR adapter and tighten the bolts to the specified torque.

    Tighten:
    Bolts to 24 N·m (2.4 kg·m / 17 lb·ft)



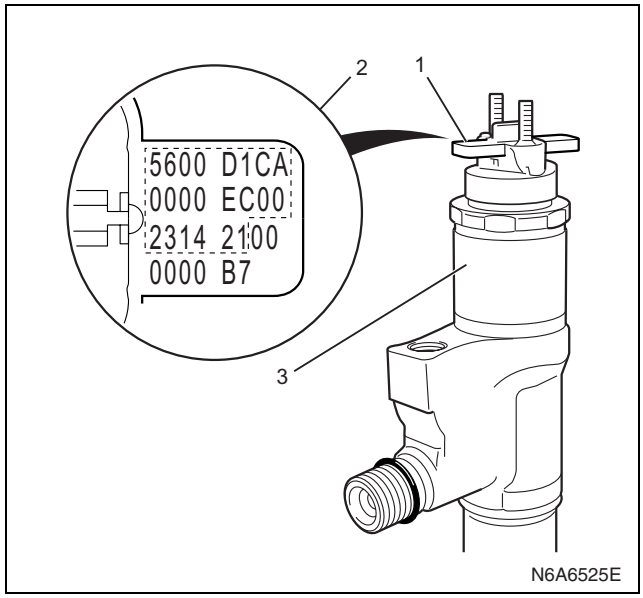
Legend
1. EGR Adapter
2. EGR Valve Gasket
3. EGR Valve
4. EGR Valve Gasket

20. Attach the engine harness connectors. Each composite connector should make a loud click when it is securely attached.

Fuel Injector ID Code Data Programming Procedure

1. Install the Tech 2.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > appropriate vehicle identification > 4HK1 (Common Rail) > Programming > Injector ID Code > ID Code Registration.
4. Select replaced cylinder and press Change. Input 22 figures. Then, input in order from the left edge of upper sequence to the right sequence. The correct order for the fuel injector ID code for the following illustration is as follows:
   56 00 D1 CA 00 00 EC 00 23 14 21

Important:
The number of places required for input is 22 figures except last 2 figures.



Legend
1. Fuel Injector ID Plate
2. Fuel Injector ID Code
3. Fuel Injector

5. After complete the registration, turn OFF the ignition for 30 second.
6. Turn ON the ignition.
7. Select Diagnostics > appropriate vehicle identification > 4HK1 (Common Rail) > Programming > Injector ID Code > Injector ID Code. At this point, all registered fuel injector ID code data can be verified. Compare the ID code values registered into the ECM and each fuel injector including the last 2 figures. If the registered ID code is incorrect, go back to Step 4 ID Code Registration.
8. Start the engine and let idle.
9. Inspect for a proper engine running condition and for no DTC's. Refer to the Diagnostic System Check-Engine Controls if needed.

Notice:
After replacement of the fuel injector, perform the following procedure.
All fuel injectors are replaced:
Remove the fuel injector ID code label on the cylinder head cover.
Any fuel injector(s) is replaced:
Blackout the replaced cylinder fuel injector ID code on the cylinder head cover with a marking pen or equivalent.

Fuel Rail Pressure (FRP) Sensor Replacement

Removal Procedure

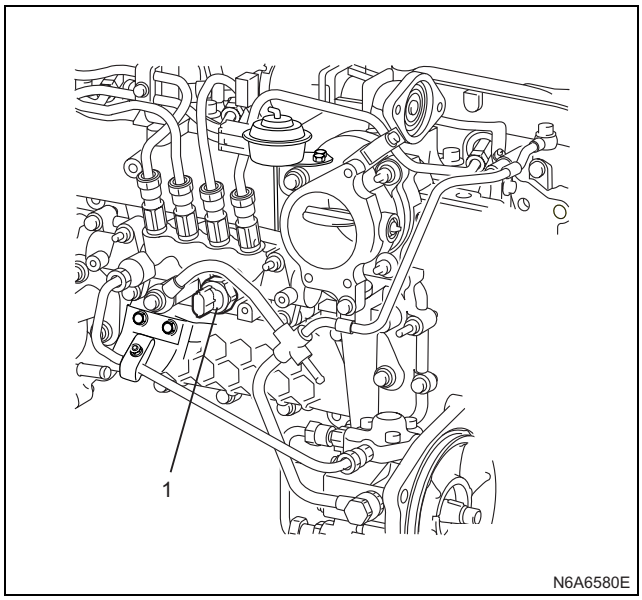
WARNING:
TO PREVENT LEAKED FUEL FROM CATCHING FIRE, DO NOT WORK WHILE THE ENGINE IS HOT.

Preparation:

- Pour detergent into a steam cleaner, and throughly wash around the sensor and the fuel rail.
- Remove water completely using air blow.

Notice:
Make sure that foreign matter will be prevented from getting in.

1. Remove the air intake pipe.
2. Disconnect the fuel rail pressure (FRP) sensor connector.
3. Remove the FRP sensor.



Legend
1. Fuel Rail Pressure (FRP) Sensor

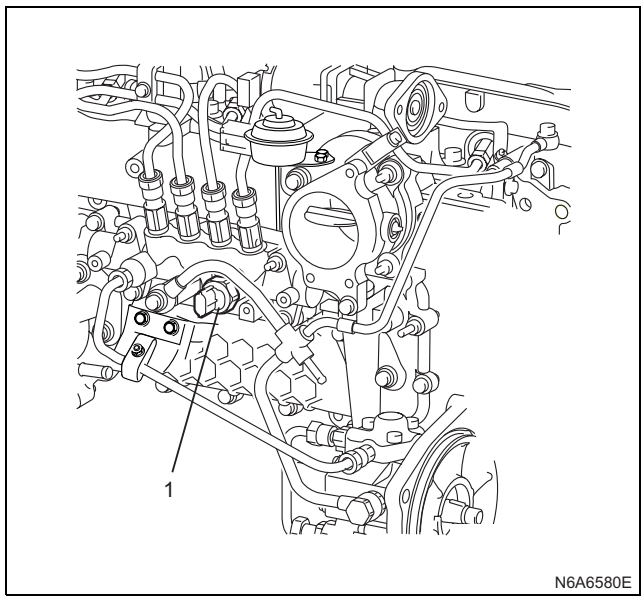
Installation Procedure

Important:

- FRP sensor cannot be reused after assembly. (The seal is deformed after tightening. This may result in defective seal if reused.)
- Keep the protective cap attached until assembly.
- Take care not to allow water or foreign matter to get inside the connector.
- Do not let foreign matter attach to the threaded portion. Also, make sure the installation part is free of foreign matter before installation.

1. Apply grease to the threads of the FRP sensor.
2. Install the FRP sensor.

   Tighten:
   FRP sensor to 98 N·m (10 kg·m / 72 lb·ft)



Legend
1. Fuel Rail Pressure (FRP) Sensor

3. Connect the FRP sensor connector.
4. Install the air intake pipe.

Notice:

- Carefully check for fuel leak after starting the engine.
- After the sensor is replaced, clear the trouble code and make sure the sensor operates normally using a scan tool.

Fuel Pressure Limiter Replacement

Removal Procedure

WARNING:
TO PREVENT LEAKED FUEL FROM CATCHING FIRE, DO NOT WORK WHILE THE ENGINE IS HOT.

Preparation:

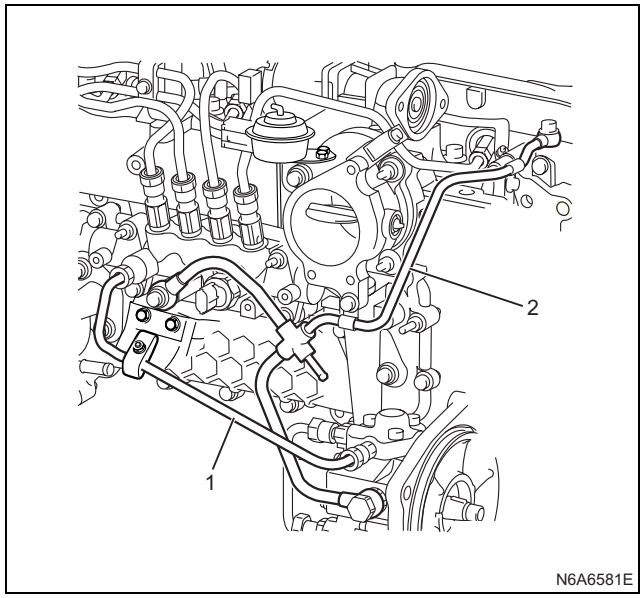
- Pour detergent into a steam cleaner, and throughly wash around the sensor and the fuel rail.
- Remove water completely using air blow.

Notice:
Make sure that foreign matter will be prevented from getting in.

1. Remove the air intake pipe.
2. Remove the fuel leak off hose from the leak off pipe.
   - Cover the removed fuel hose, keep it facing upward and secure it using wire, etc.
3. Remove the fuel pipe.

Important:
Loosen the fuel pipe gradually not to scatter high pressure fuel.

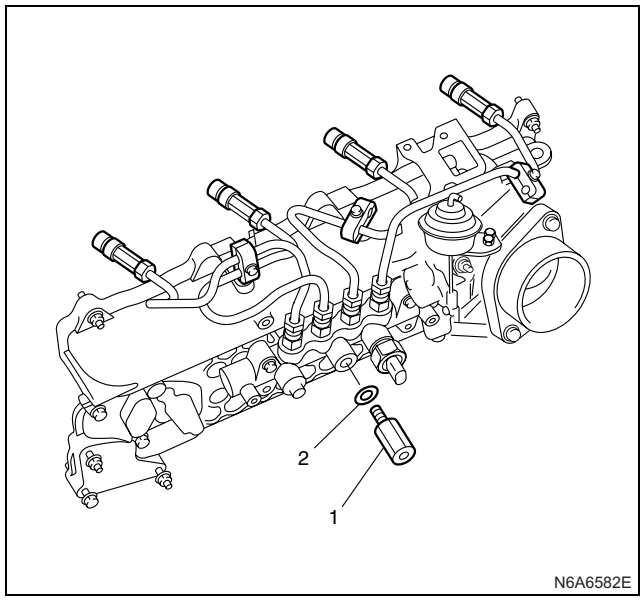
4. Remove the clips and the fuel leak off pipe.



Legend
1. Fuel Pipe
2. Fuel Leak Off Pipe

5. Remove the fuel pressure limiter.

Important:
Do not damage the seat surface when removing the gasket.



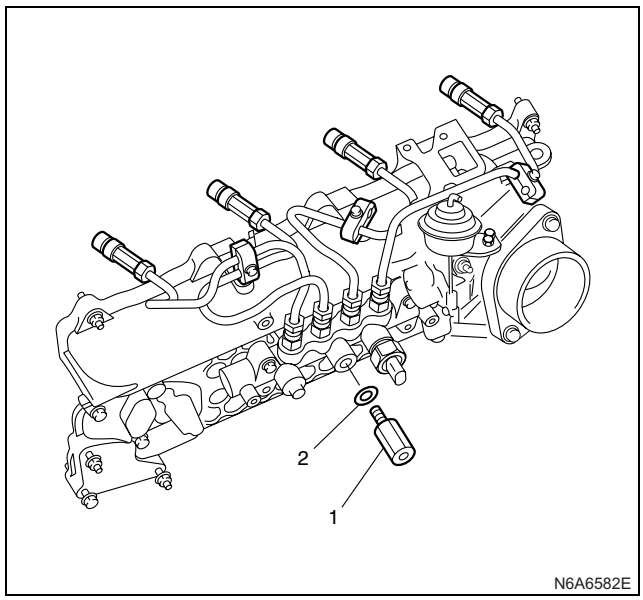
Legend
1. Fuel Pressure Limiter
2. Gasket

Installation Procedure

Important:
- Do not reuse the removed fuel pressure limiter and gaskets.
- Do not let foreign matter attach to the threaded portion. Also, make sure the installation part is free of foreign matter before installation.

1. Install the fuel pressure limiter.

   Tighten:
   Fuel pressure limiter to 172 N·m (17.5 kg·m / 127 lb·ft)



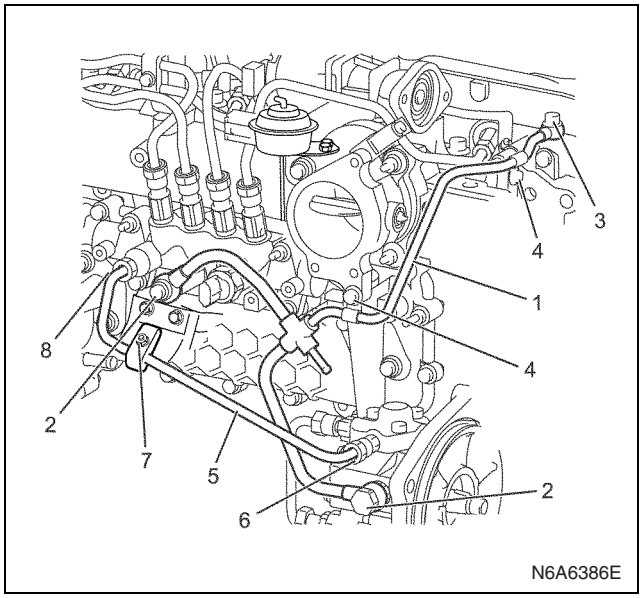
Legend
1. Fuel Pressure Limiter
2. Gasket

2. Tighten the fuel leak off pipe (1) using the mounting eyebolt and the clips using the specified torque.

   Tighten:
   (2): 18 N·m (1.8 kg·m / 13 lb·ft)
   (3): 12 N·m (1.2 kg·m / 9 lb·ft)
   (4): 8 N·m (0.8 kg·m / 69 lb·in)

3. Tighten the fuel pipe (5) using the mounting sleeve nut and the clip using the specified torque.

   Tighten:
   (6): 44 N·m (4.5 kg·m / 33 lb·ft)
   (7): 6 N·m (0.6 kg·m / 52 lb·in)
   (8): 44 N·m (4.5 kg·m / 33 lb·ft)



4. Install the fuel leak off hose to the fuel leak off pipe.
5. Install the air intake pipe.

Notice:

- Carefully check for fuel leak after starting the engine.
- After the fuel pressure limiter is replaced, clear the trouble code and make sure the fuel pressure limiter operates normally using a scan tool.

Fuel Rail Replacement

Removal Procedure

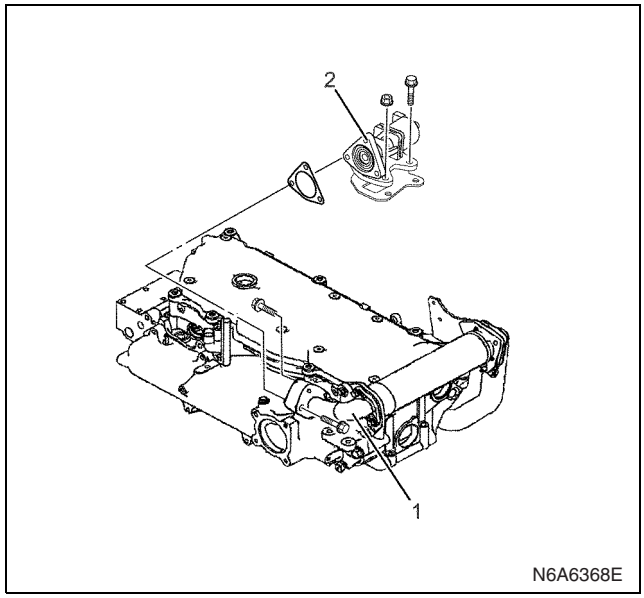
WARNING:
TO PREVENT LEAKED FUEL FROM CATCHING FIRE, DO NOT WORK WHILE THE ENGINE IS HOT.

Preparation:

- Pour detergent into a steam cleaner, and throughly wash around the sensor and the fuel rail.
- Remove water completely using air blow.

Notice:
Make sure that foreign matter will be prevented from getting in.

1. Remove the air intake pipe.
   - Disconnect the connector for the intake air temperature sensor.
2. Remove the fuel leak off hose from the leak off pipe.
   - Cover the removed fuel hose, keep it facing upward and secure it using wire, etc.
3. Disconnect the fuel rail pressure sensor harness connector.
4. Remove the EGR valve and the EGR adapter.
5. Tape the EGR case holes shut to prevent the entry of foreign material.

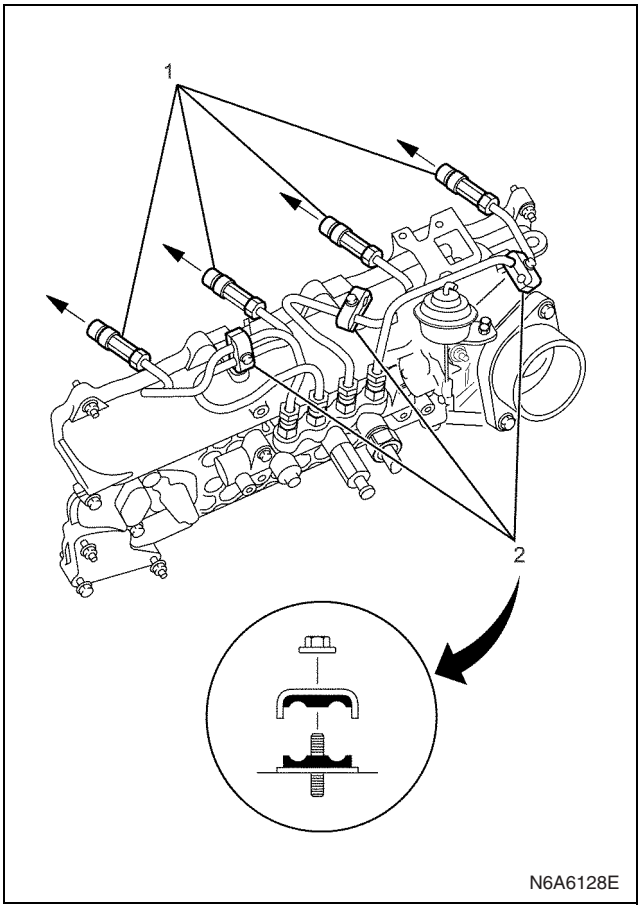


Legend

1. EGR Adapter
2. EGR Valve

6. Remove the injection pipe clip and remove the injection pipes.

Important:
Loosen the injection pipes gradually not to scatter high pressure fuel.

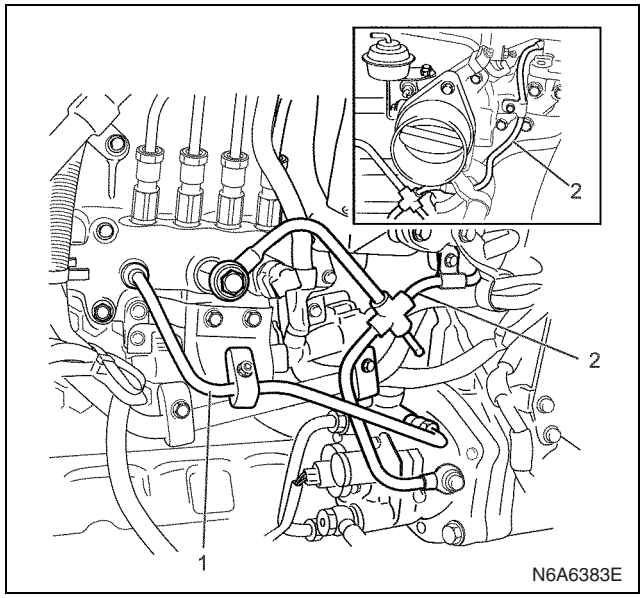


Legend
1. Fuel Injection Pipe
2. Fuel Injection Pipe Clip

7. Remove the fuel pipe.

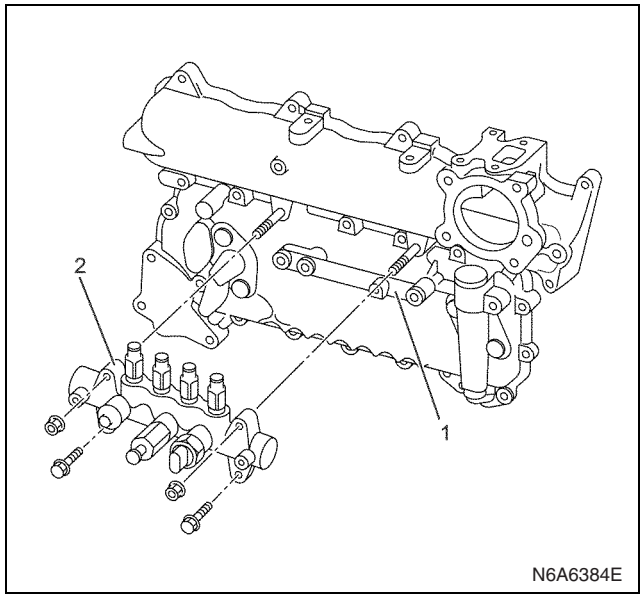
Important:
Loosen the fuel pipe gradually not to scatter high pressure fuel.

8. Remove the clips and the fuel leak off pipe.



Legend
1. Fuel Pipe
2. Fuel Leak-Off Pipe

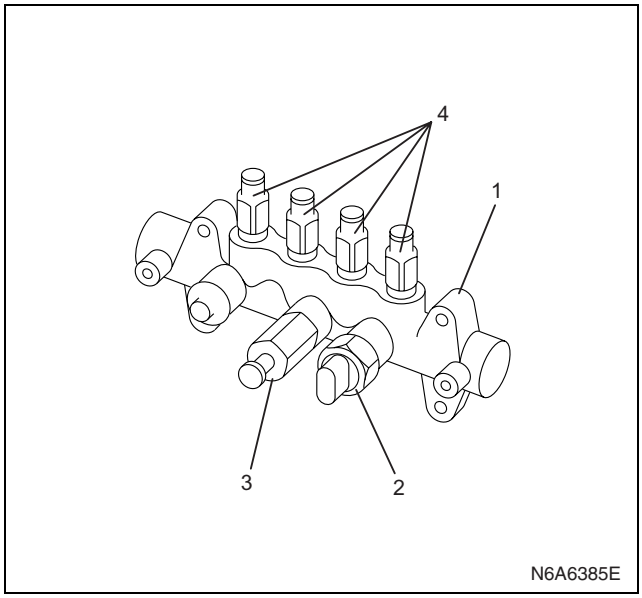
9. Remove the fuel rail and the fuel rail bracket.
   - Do not remove the flow damper. The dampers should always remain in the fuel rail.
   - Take care not to damage the connector unit of the pressure sensor.



Legend
1. Fuel Rail Bracket
2. Fuel Rail

Disassembly

1. Remove the fuel pressure limiter.
2. Remove the fuel rail pressure sensor.



Legend
1. Fuel Rail
2. Fuel Rail Pressure Sensor
3. Fuel Pressure Limiter
4. Flow Damper

Reassembly

1. Install the fuel pressure limiter.

   Tighten:
   Fuel pressure limiter to 172 N·m (17.5 kg·m / 127 lb·ft)

2. Install the fuel rail pressure sensor.

   Tighten:
   Fuel rail pressure sensor to 98 N·m (10 kg·m / 72 lb·ft)

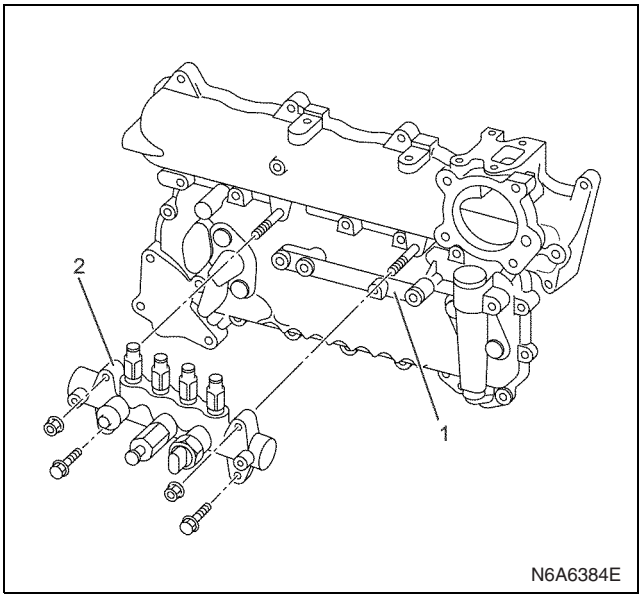
Installation Procedure

1. Tighten the fuel rail bracket using the specified mounting torque.

   Tighten:
   Nuts to 19 N·m (1.9 kg·m / 14 lb·ft)

2. Tighten the fuel rail using the specified mounting torque.

   Tighten:
   Bolts to 19 N·m (1.9 kg·m / 14 lb·ft)



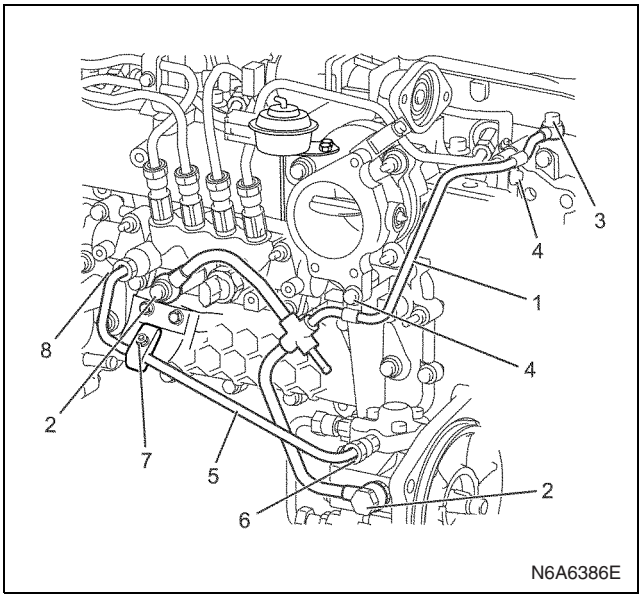
Legend
1. Fuel Rail Bracket
2. Fuel Rail

3. Tighten the fuel leak off pipe (1) using the mounting eyebolt and the clips using the specified torque.

   Tighten:
   (2): 18 N·m (1.8 kg·m / 13 lb·ft)
   (3): 12 N·m (1.2 kg·m / 9 lb·ft)
   (4): 8 N·m (0.8 kg·m / 69 lb·in)

4. Tighten the fuel pipe (5) using the mounting sleeve nut and the clip using the specified torque.

   Tighten:
   (6): 44 N·m (4.5 kg·m / 33 lb·ft)
   (7): 6 N·m (0.6 kg·m / 52 lb·in)
   (8): 44 N·m (4.5 kg·m / 33 lb·ft)



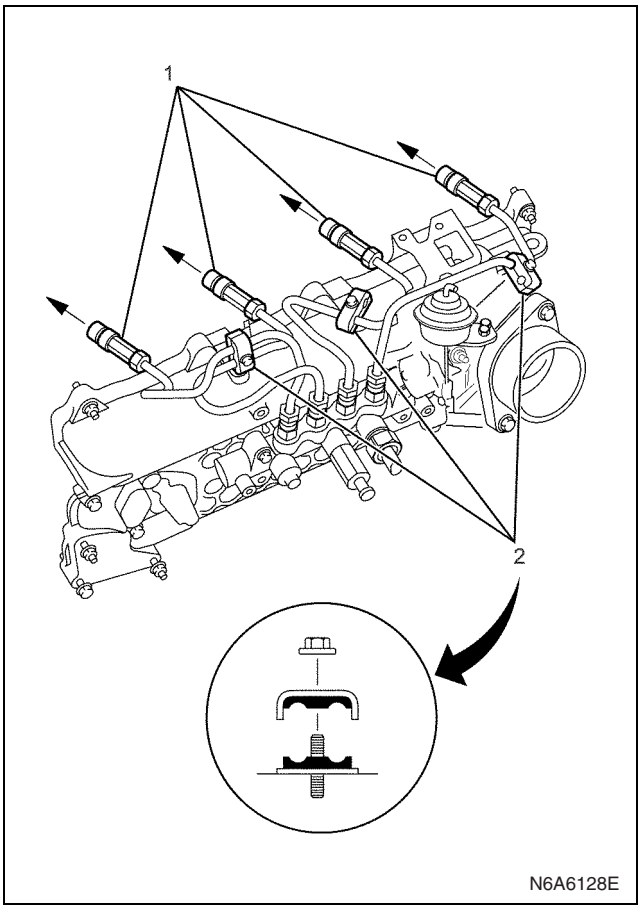
5. Install the fuel leak off hose to the fuel leak off pipe.

6. Tighten the injection pipe and the clip using the specified mounting torque.

   Tighten:
   Injection pipe sleeve nut to 44 N·m (4.5 kg·m / 33 lb·ft)

   Injection pipe clip to 6 N·m (0.6 kg·m / 52 lb·in)

   - Apply a thin coat of engine oil on the periphery of the sleeve nut on the injector side and assemble.



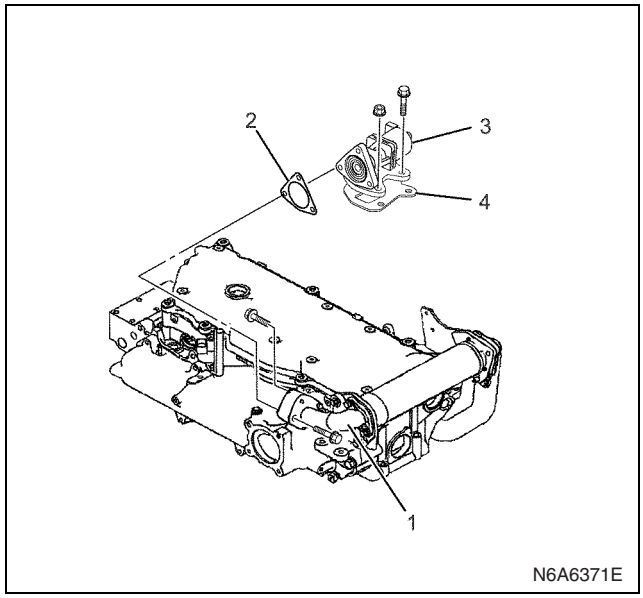
Legend
1. Fuel Injection Pipe
2. Fuel Injection Pipe Clip

7. Connect the fuel rail pressure (FRP) sensor connector.
8. Install the gasket to the EGR valve and tighten the bolts to the specified torque.

   Tighten:
   Bolts to 24 N·m (2.4 kg·m / 17 lb·ft)

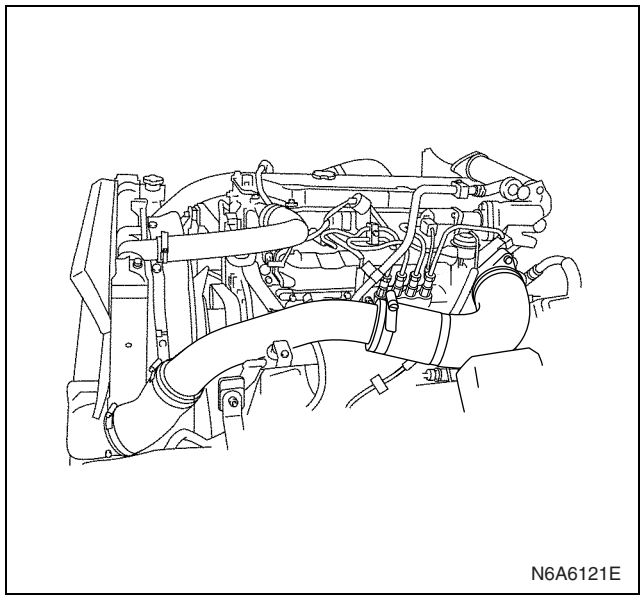
9. Install the gasket to the EGR adapter and tighten the bolts to the specified torque.

   Tighten:
   Bolts to 24 N·m (2.4 kg·m / 17 lb·ft)



Legend
1. EGR Adapter
2. EGR Valve Gasket
3. EGR Valve
4. EGR Valve Gasket

10. Install the air intake duct.
    - Connect the connector for the intake air temperature sensor.

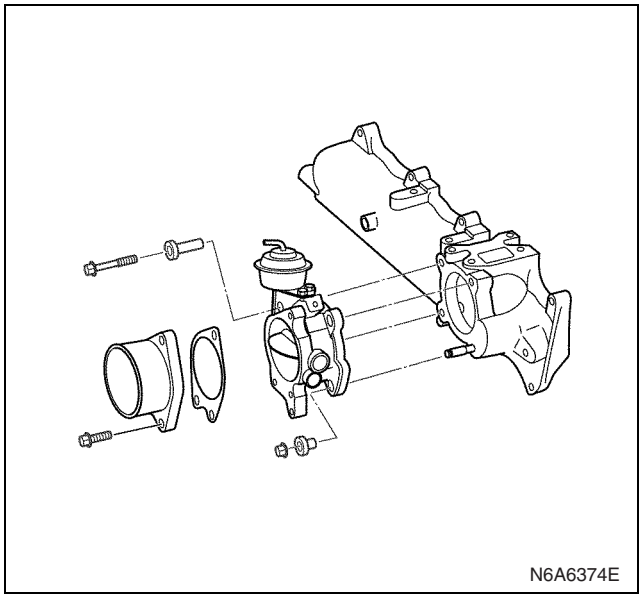


Fuel Supply Pump Replacement

Removal Procedure

Important:
The fuel supply pump must be timed to the engine.

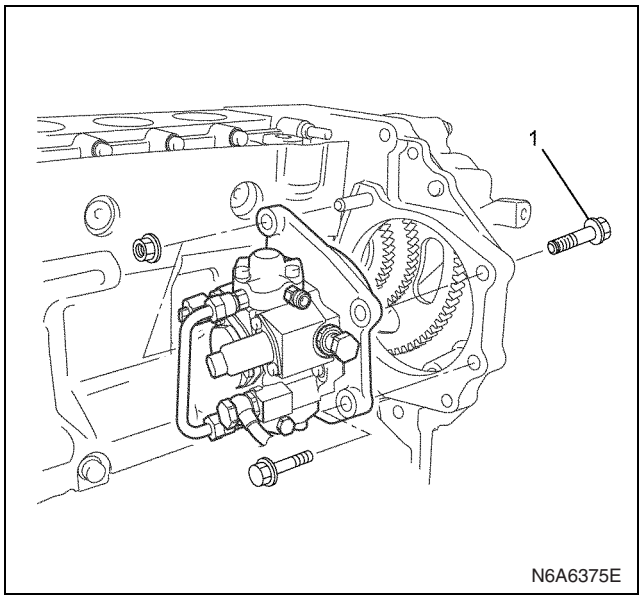
1. Remove the intake pipe and the intake throttle valve.
2. Remove the fuel pipe and fuel leak-off pipe.



N6A6374E

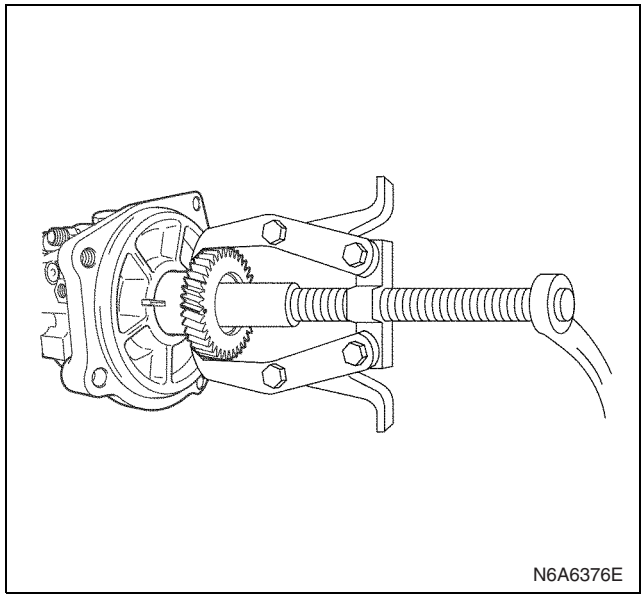
3. Remove the fuel feed hose.
4. Disconnect the fuel temperature sensor and the fuel rail pressure regulator harness connector from the fuel supply pump.
5. Remove the fuel supply pump attachment bolts and nuts, then remove the fuel supply pump.

Notice:
One of the attachment bolt (1) secures the fuel supply pump to the flywheel housing as denoted in the picture below.



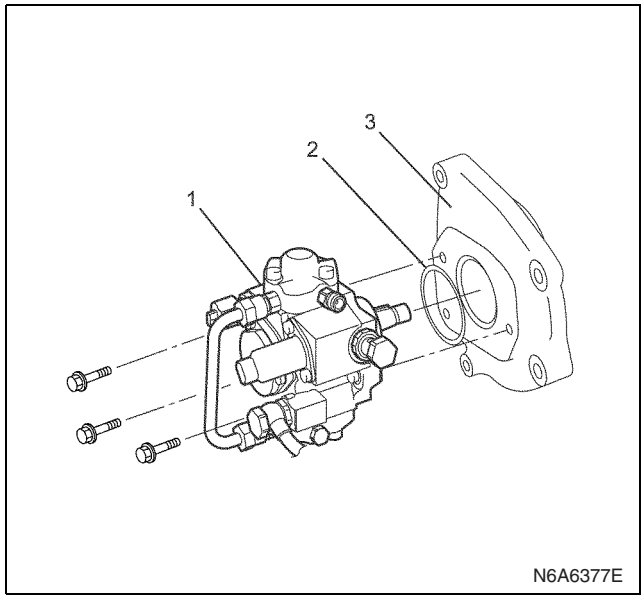
N6A6375E

6. Use a gear puller to remove the fuel supply pump gear and the O-ring.



N6A6376E

7. Loosen the 3 bolts holding the fuel supply pump bracket. Remove the bracket and the O-ring.



N6A6377E

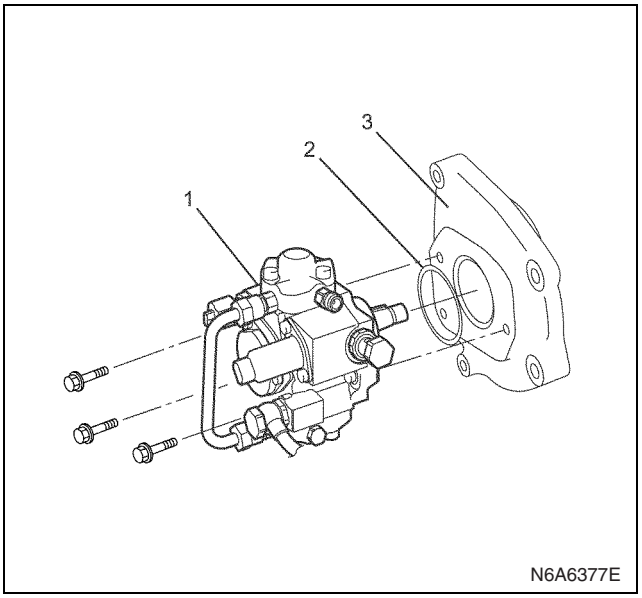
Legend
1. Fuel Supply Pump
2. O-Ring
3. Fuel Supply Pump Bracket

Installation Procedure

1. Install the O-ring to the fuel supply pump.
2. Install the pump to the bracket and tighten the 3 bolts to the specified torque.

   Tighten:
   Bolts to 19 N·m (1.9 kg·m / 14 lb·ft)

Caution:
Take care not to twist the O-ring.

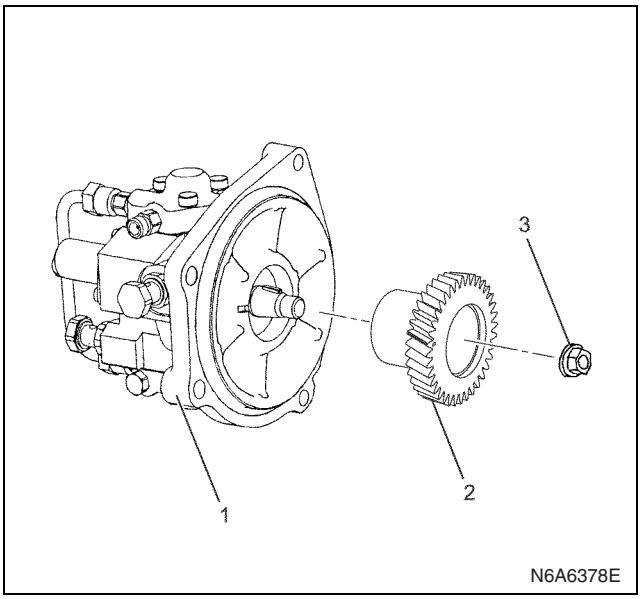


Legend

1. Fuel Supply Pump
2. O-Ring
3. Fuel Supply Pump Bracket

3. Align the fuel supply pump shaft key and gear. Install the gear and tighten the nut to the specified torque.
   There is a round alignment mark on the gear (white paint).

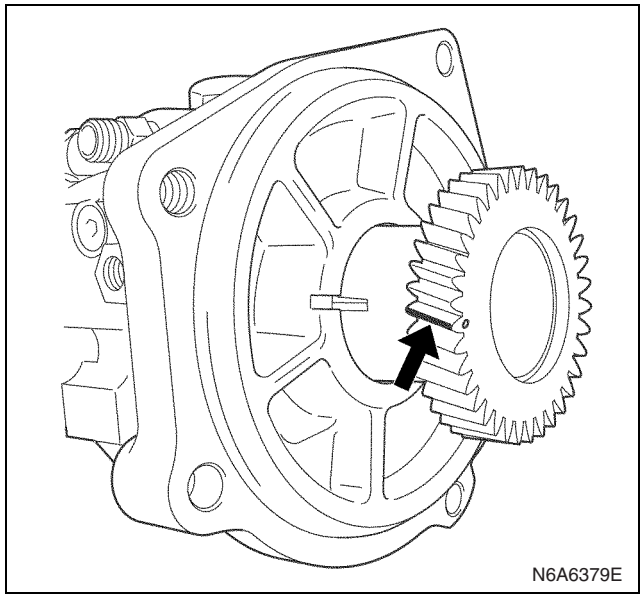
   Tighten:
   Nut to 64 N·m (6.5 kg·m / 47 lb·ft)



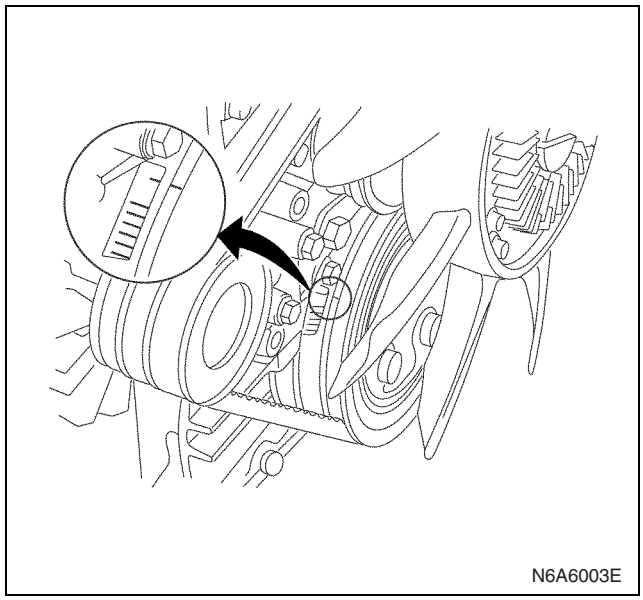
Legend

1. Fuel Supply Pump
2. Fuel Supply Gear
3. Nut

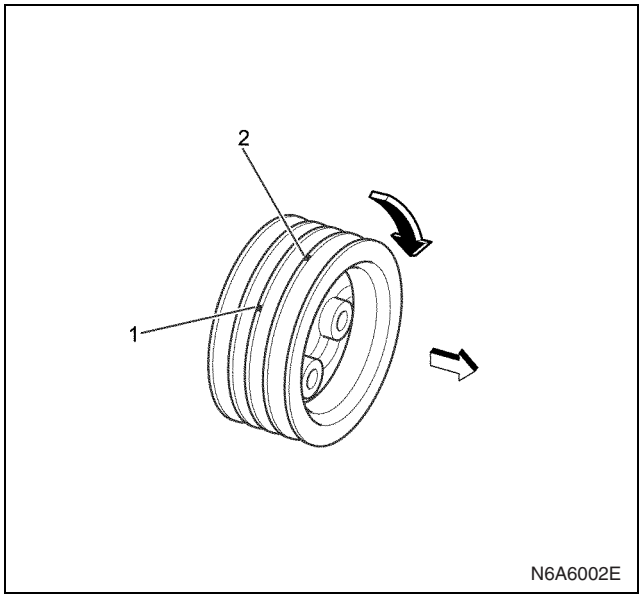
4. Apply white paint to the top of the fuel supply pump gear tooth directly above the stamped ‘O’ mark. Refer to the illustration.



5. Turn the crankshaft in the normal direction of engine rotation until the No.1 or No.4 cylinder is at TDC on the compression stroke.
   Refer to illustration.



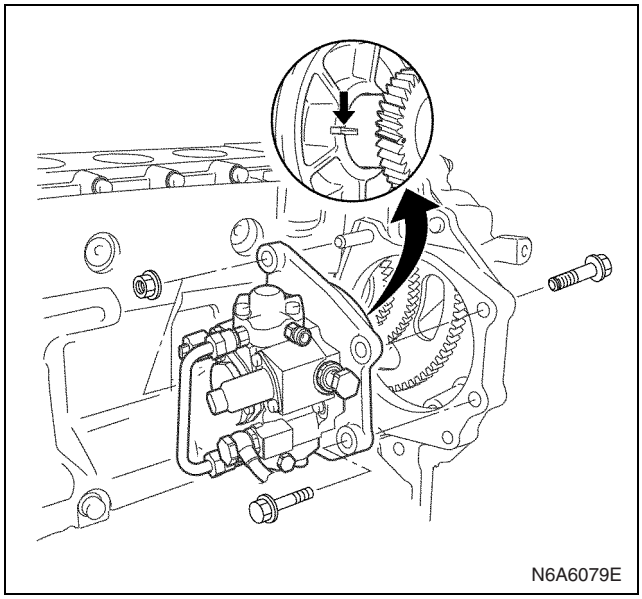
Notice:
There are 2 timing marks on the crankshaft pulley.
Mark (1) is near the front cover and is used to bring the 4HK1-TC engine to TDC.
Mark (2) is not applicable to this engine.
Be sure to use mark (1) when bringing the engine to TDC.



6. Remove the oil drain adapter.
7. Install the O-ring to the fuel supply pump.
8. Align the slits as shown in the illustration.
9. Insert the stud bolts into the guides and temporarily tighten them.

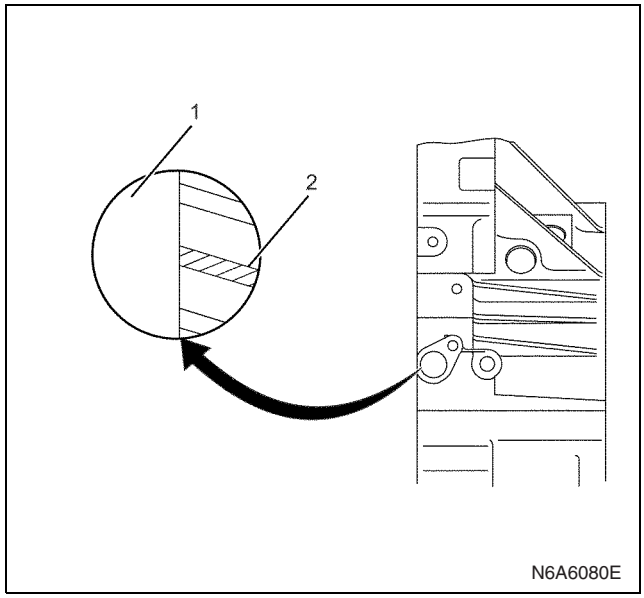
Caution:

- If the stud bolts (cylinder block side) have been loosened or replaced, apply Locktite No. 262 to the recessed portion of the bolts.



- Check that the round alignment mark (white paint) is positioned as shown in the illustration when viewed from the plug hole. If necessary, reposition the gear.
- Tighten the stud bolts and the nuts to the specified torque.

  Tighten:
  Nuts to 50 N·m (5.1 kg·m / 37 lb·ft)
  Bolts to 76 N·m (7.7 kg·m / 56 lb·ft)

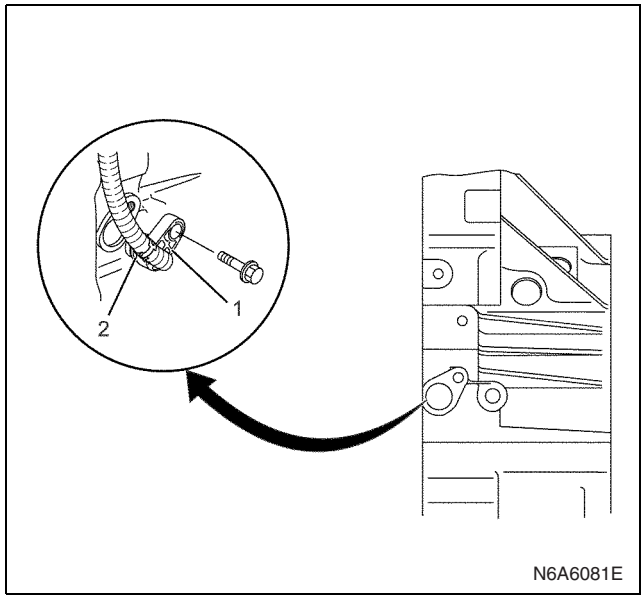


Legend

1. Plug Hole
2. Alignment Mark

10. Apply a light coat of engine oil to the O-ring.
11. Install the oil drain adapter to the plug hole. Tighten the bolt to the specified torque.

    Tighten:
    Bolt to 8 N·m (0.8 kg·m / 69 lb·in)



Legend

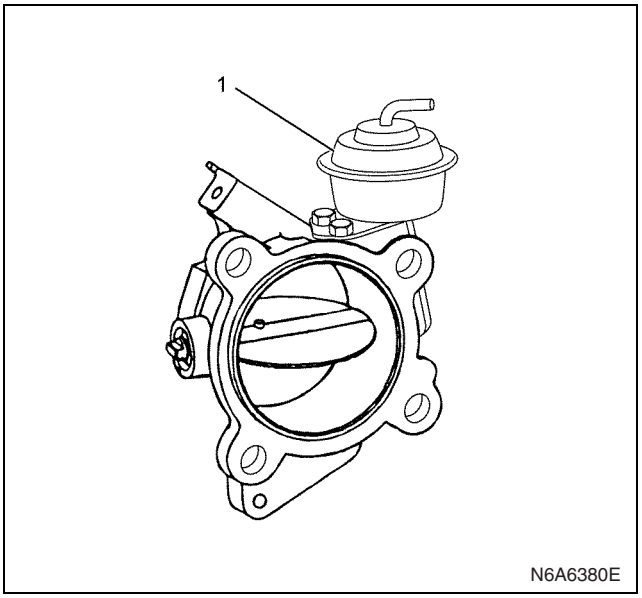
1. Oil Drain Adapter
2. O-Ring

12. Connect the fuel temperature sensor and the suction control valve connectors to the fuel supply pump.
13. Install the fuel feed hose.
14. Install the throttle assembly.

- Coat the fluid gasket and mount within 7 minutes.

  Tighten:
  Throttle assembly to 24 N·m (2.4 kg·m / 17 lb·ft)

- Install the intake throttle valve chamber hose.



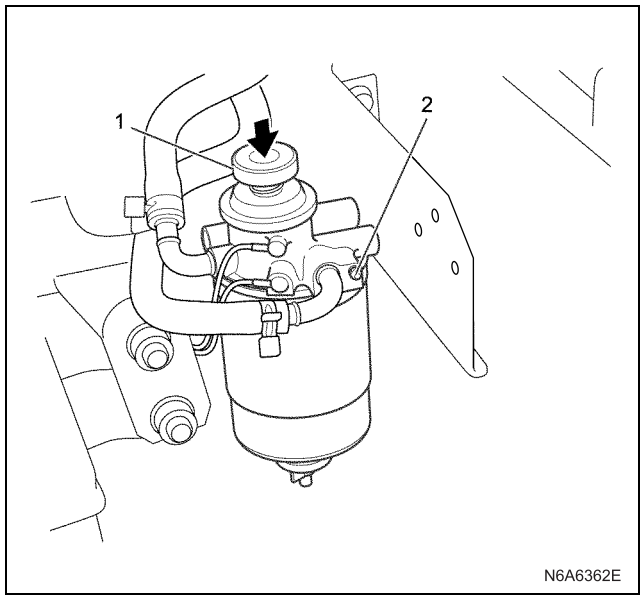
Legend
1. Intake throttle Valve Chamber

15. Install the fuel pipe and fuel leak-off pipe.

Important:
In order to make the fuel supply pump characteristic learn into the ECM, let the engine idle until warm-up. If the fuel system DTC's stored in the meantime, once clear DTC and warm-up the engine again.

16. Inspect for a proper engine running condition and for no DTC's. Refer to the Diagnostic System Check-Engine Controls if needed.

Fuel System Air Bleeding



Legend
1. Priming Pump
2. Air Bleed Plug

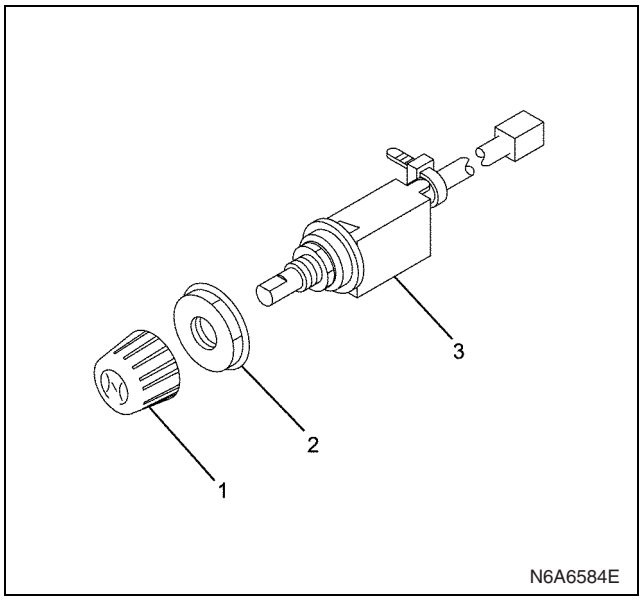
1. Before starting the engine
   a. Fit a tray below the fuel filter (below the air bleed plug).
   b. Loosen the plug adequately and operate the priming pump more than 20 times until the fuel overflows from plug hole.
   c. Tighten the plug, and operate the priming pump more than 10 times until it is filled with fuel. After waiting for approximately a minute, loosen the plug and bleed off the air in the fuel filter. (This work must be repeated a minimum of three times until no more air comes out from the plug.)
   d. Tighten the plug firmly and wipe the fuel in the surrounding area. Operate the priming pump (10 to 15 times) till it is filled with fuel and then send fuel to the engine.
2. After starting the engine
   a. Start the engine by rotating the starter without depressing the accelerator pedal.
   b. After starting, maintain the idling rotation for 5 seconds.
   c. Slowly rotate the idling control knob clockwise and maintain it for 3 minutes.
   d. Fully depress the accelerator pedal and increase the rotations to maximum. (Repeat this operation several times)
   e. Rotate the idling knob counterclockwise and return to idling mode.

Caution:
If the air bleeding work is insufficient then it could lead to faults in the engine. Therefore, the procedures after starting the engine should always be implemented.

Idle Up Sensor Replacement

Removal Procedure

1. Turn off the ignition.
2. Remove the idle up sensor knob (1).
3. Disconnect the idle up sensor connector.
4. Remove the idle up sensor holder (2).



5. Remove the idle up sensor (3).

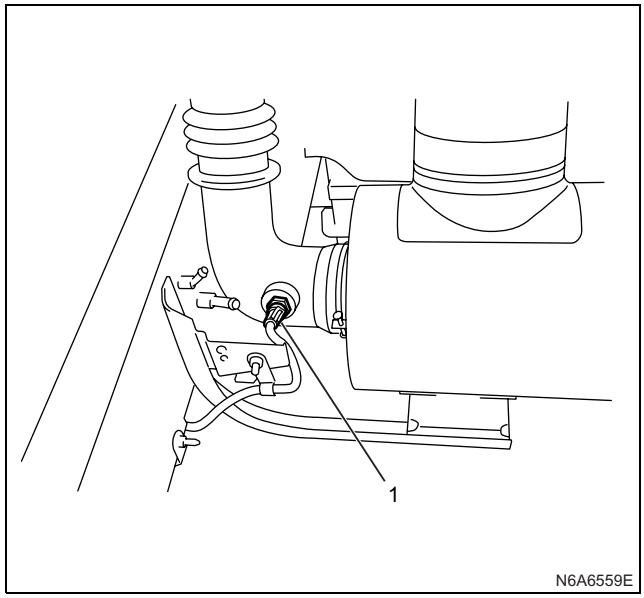
Installation Procedure

1. Install the idle up sensor (3).
2. Install the idle up sensor holder (2).
3. Install the idle up sensor knob (1).
4. Connect the idle up sensor connector.

Intake Air Temperature (IAT) Sensor Replacement

Removal Procedure

1. Turn off the ignition.
2. Disconnect the intake air temperature (IAT) sensor connector (1).
3. Remove the IAT sensor.



Installation Procedure

1. Coat threads of the IAT sensor with sealer (9985490) in full circumference.
2. Tighten the IAT sensor.

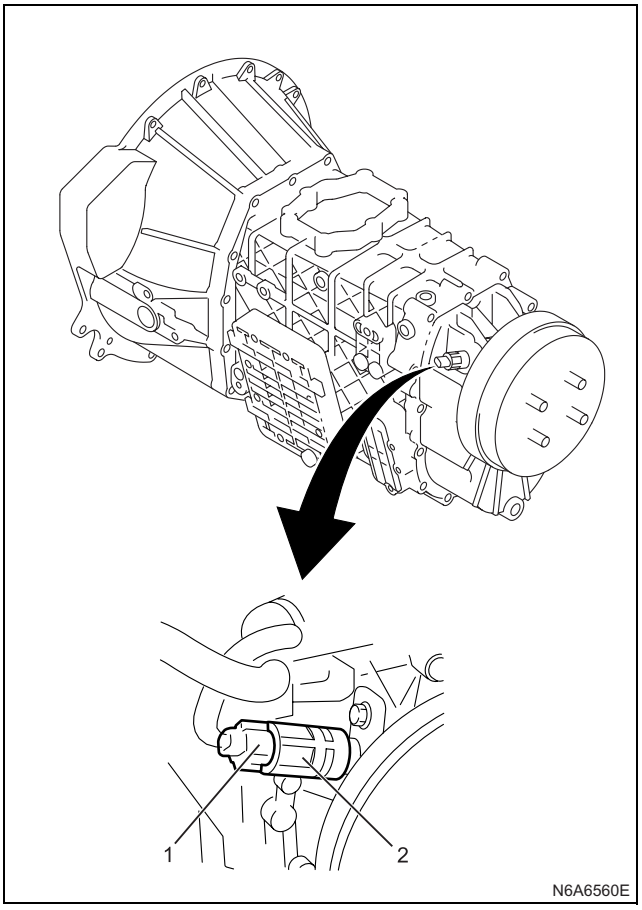
   Tighten:
   IAT sensor to 10.8 — 16.3 N·m (1.1 — 1.7 kg·m / 8.0 — 12.0 lb·ft)

3. Connect the IAT sensor connector.

Vehicle Speed Sensor (VSS) Replacement

Removal procedure

1. Turn off the ignition.
2. Disconnect the vehicle speed sensor connector (1).
3. Remove the vehicle speed sensor (2).



Installation procedure

1. Tighten the vehicle speed sensor (2).

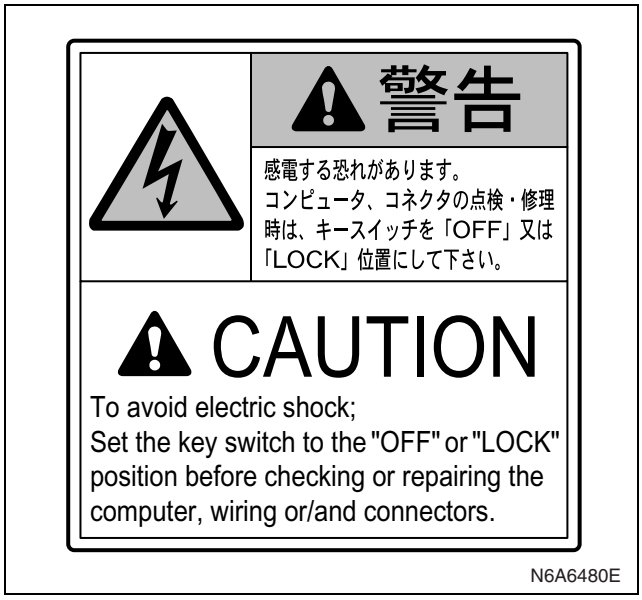
   Tighten:
   Vehicle speed sensor to 27 N·m (2.8 kg·m / 20 lb·ft)

2. Connect the vehicle speed sensor connector (1).

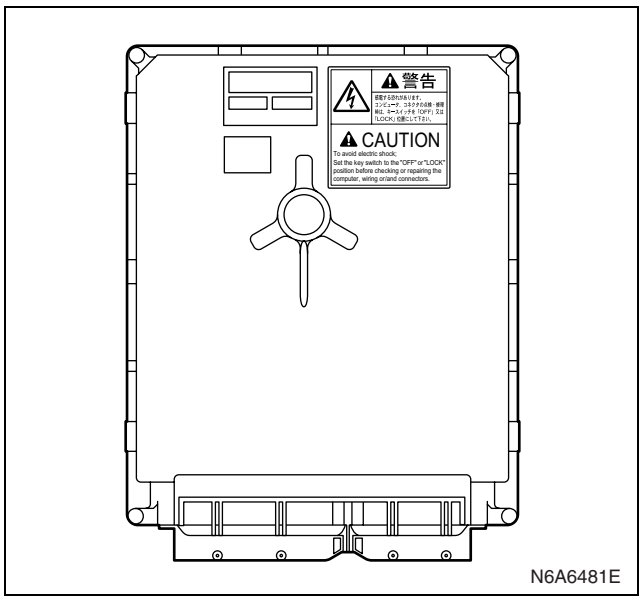
Description and Operation

Engine Control Module (ECM) Description

Engine Control Module (ECM) Service Precautions



Important:
Symbol warns you of an electric shock hazard. To avoid shock and possible serious injury, DO NOT touch the terminals. When disconnecting the harness connectors, always turn OFF the ignition switch or disconnect the battery cable.



The engine control module (ECM) is designed to withstand normal current draws associated with vehicle operation. Avoid overloading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the ECM circuits unless instructed to do so. In some cases, these circuits should only be tested using a digital multimeter (DMM). The ECM should remain connected to the ECM harness.

The engine control module (ECM) is located inside of engine side cover on the left via mounting bracket and is beside the engine. The ECM mainly controls the following:

- The fuel system control
- The exhaust gas recirculation (EGR) system control
- The preheating (glow) system control
- On-board diagnostics for engine control

The ECM constantly observes the information from various sensors. The ECM controls the systems that affect vehicle performance. The ECM performs the diagnostic function of the system. The ECM can recognize operational problems, alert the driver through the malfunction indicator lamp (MIL), and store diagnostic trouble codes (DTCs). DTCs identify the system faults to aid the technician in making repairs.

ECM Voltage Description

The ECM supplies a buffered voltage to various switches and sensors. The ECM can do this because resistance in the ECM is so high in value that a test lamp may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megaohm input impedance DMM, to ensure accurate voltage readings. The input and/or output devices in the ECM include analog-to-digital converters, signal buffers, counters, and special drivers. The ECM controls most components with electronic switches which complete a ground circuit when turned ON.

Aftermarket Electrical and Vacuum Equipment

Aftermarket or add-on electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after the vehicle leaves the factory. No allowances have been made in the vehicle design for this type of equipment. No add-on vacuum equipment should be added to this vehicle. Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery power and ground. Add-on electrical equipment, even when installed to these guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and audios. Therefore, the first step in diagnosing any powertrain fault is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the fault still exists, the fault may be diagnosed in the normal manner.

Electrostatic Discharge Damage

Electronic components used in the ECM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. By comparison, as much as 4,000 volts may be needed for a person to feel even the zap of a static discharge. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

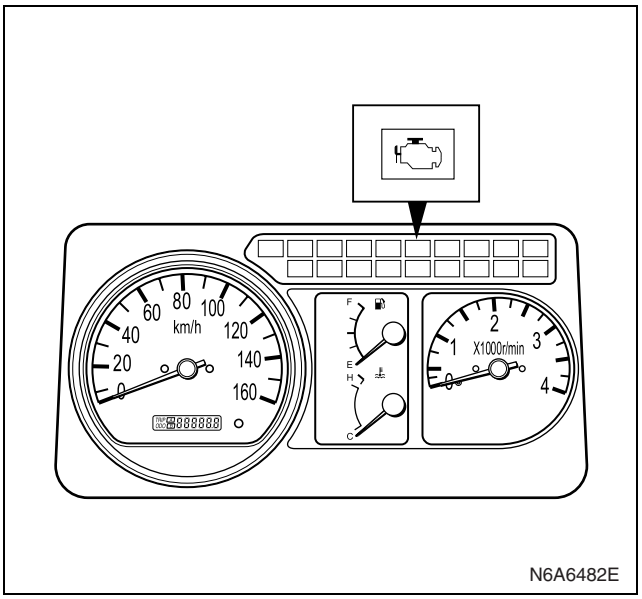
- An example of charging by friction is a person sliding across a vehicle seat.

Important:
To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the ECM connector pins or soldered components on the ECM circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.
- Charge by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with opposite polarity.

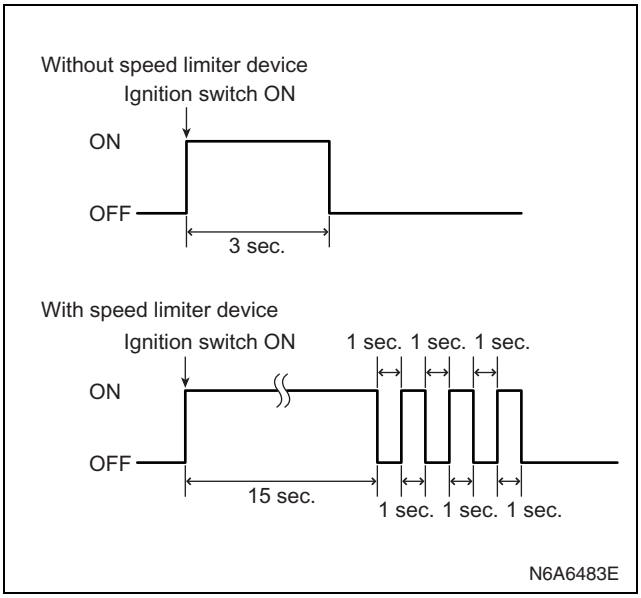
Malfunction Indicator Lamp (MIL) Operation

The malfunction indicator lamp (MIL) is located in the instrument panel cluster. The MIL will display the following symbols when commanded ON:



The MIL indicates that an emission or performance related fault has occurred and vehicle service is required. The following is a list of the modes of operation for the MIL:

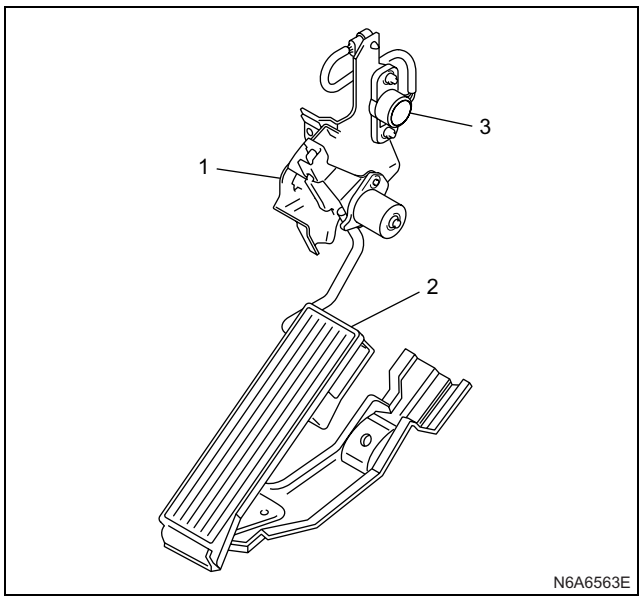
- The MIL illuminates for approximately 3 seconds when the ignition switch is turned ON, with the engine OFF. This is a bulb test to ensure the MIL is able to illuminate. (Without speed limiter device)
- The MIL illuminates for approximately 15 seconds and blinks 3 times when the ignition switch is turned ON, with the engine OFF. This is a bulb test to ensure the MIL is able to illuminate and a speed limiter device installation check. (With speed limiter device)
- The MIL remains illuminated if the engine control module (ECM) detects a fault. A diagnostic trouble code (DTC) is stored any time the ECM illuminates the MIL due to an emission or performance related fault.



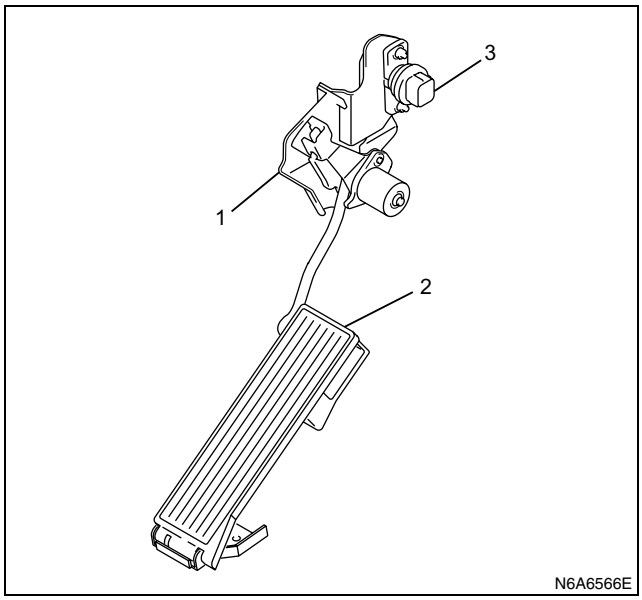
Engine Control Component Description

Accelerator Pedal Position (APP) Sensor

- LHD Model



- RHD Model

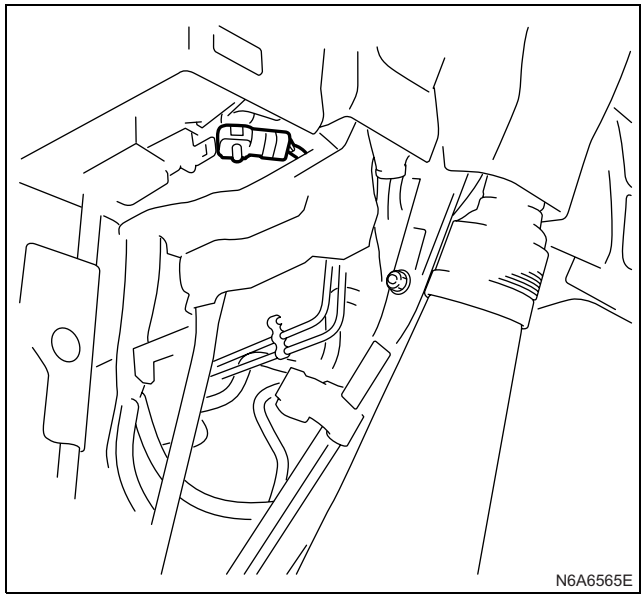


Legend

1. Control Link Bracket Assembly
2. Pedal Assembly
3. Accelerator Pedal Position (APP) Sensor

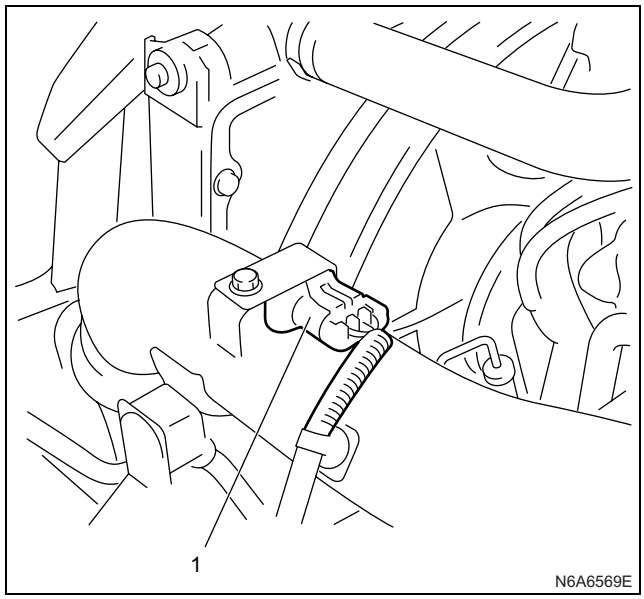
The accelerator pedal position (APP) sensor is mounted on the control link bracket assembly. The sensor is made up of two individual sensors within one housing. The engine control module (ECM) uses the APP sensor to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injector control.

Barometric Pressure (BARO) Sensor



The barometric pressure (BARO) sensor is located under the instrument panel cluster (IPC) near the pedal bracket. The BARO sensor is a transducer that varies voltage according to the barometric pressure changes and the generated voltage is input to the engine control module (ECM) for the BARO signal. The ECM should detect a low signal voltage at a low barometric pressure, such as high altitude place. The ECM should detect high signal voltage at a high barometric pressure. The ECM uses this voltage signal to calibrate the fuel injection quantity and injection timing for altitude compensation.

Boost Pressure Sensor

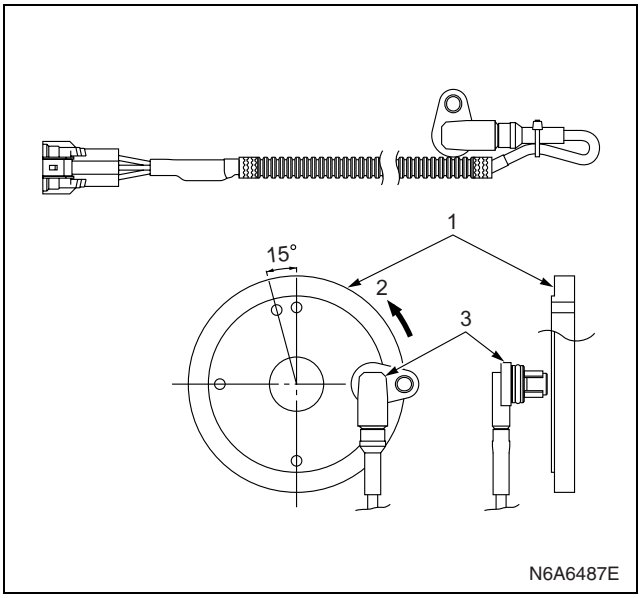


Legend

1. Boost Pressure Sensor

The boost pressure sensor is located in the air induction tubing. The boost pressure sensor is a transducer that varies voltage according to changes in the air pressure inside the air tubing. The boost pressure sensor provides a signal to the engine control module (ECM) on the boost pressure signal circuit which is relative to the pressure changes in the induction tubing. The ECM should detect a low signal voltage at a low boost pressure, such as low engine load. The ECM should detect high signal voltage at a high boost pressure, such as high engine load.

Camshaft Position (CMP) Sensor

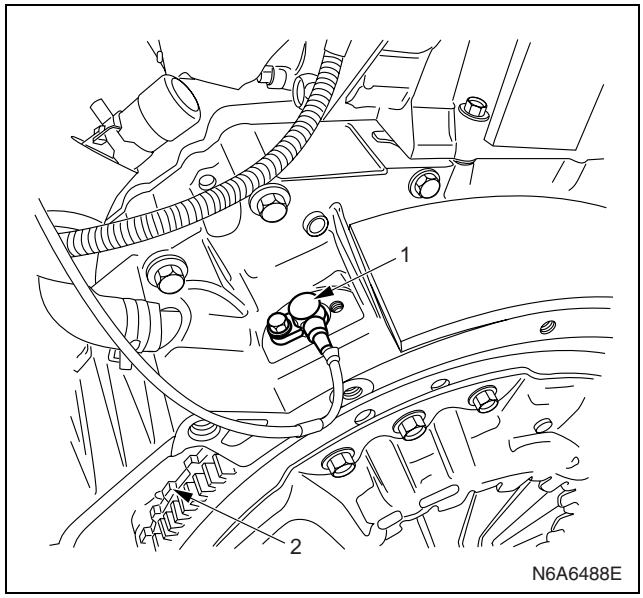


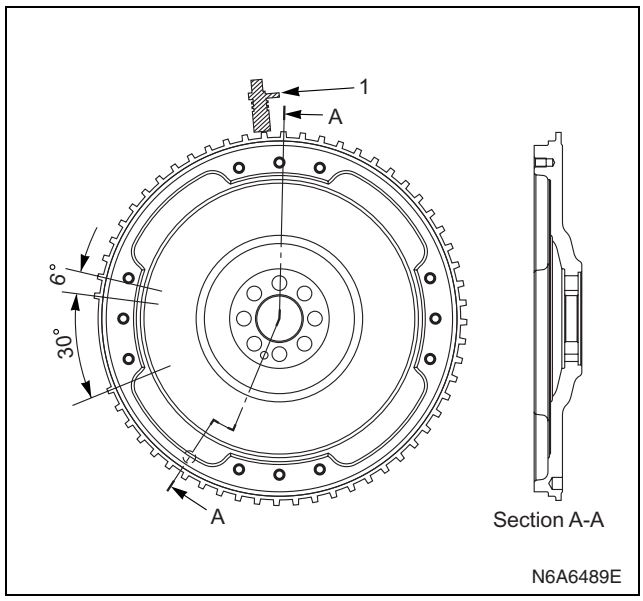
Legend

1. Camshaft Gear
2. Gear Rotating Direction
3. Camshaft Position (CMP) Sensor

The camshaft position (CMP) sensor is installed on the cylinder head at the rear of the camshaft gear. The CMP sensor detects a total of five through holes (four holes arranged equally every 90° and one reference hole on the camshaft gear flange surface) and sends signals to the engine control module (ECM). Receiving these signals, the ECM determines cylinder #1 compression top dead center (TDC).

Crankshaft Position (CKP) Sensor



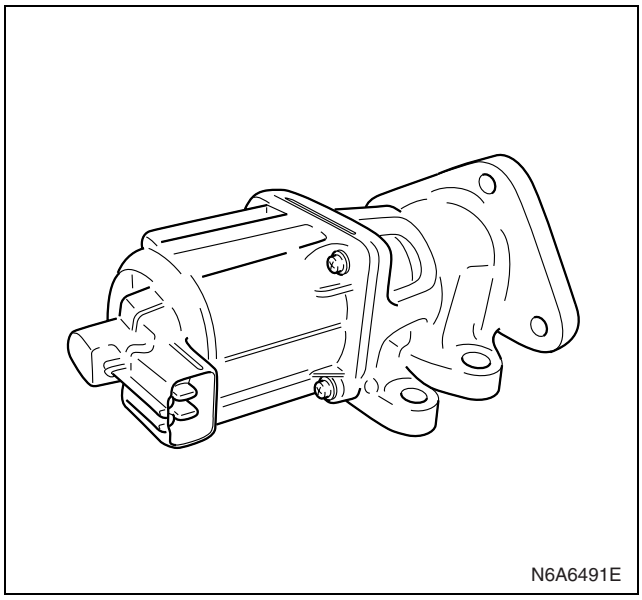


Legend

1. Crankshaft Position (CKP) Sensor
2. Flywheel hollow

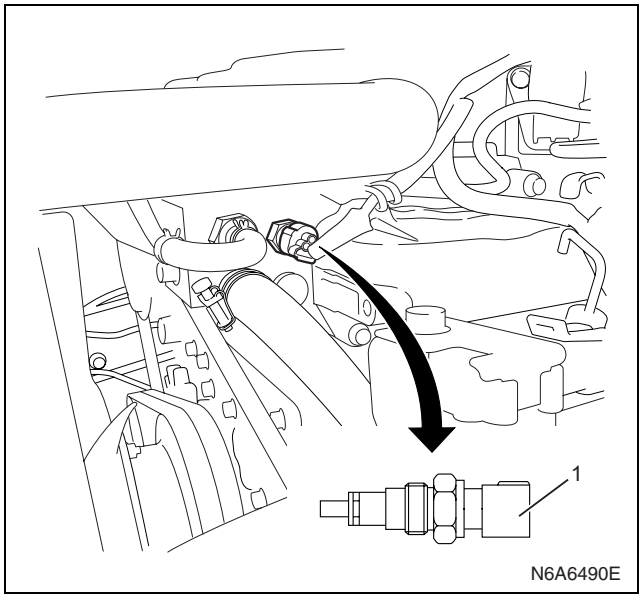
The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 56 notches spaced 6° apart and a 30° section that is open span. This open span portion allows for the detection of cylinder #1 top dead center (TDC). The CKP sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the crankshaft rotational speed. The engine control module (ECM) monitors both the CKP sensor and camshaft position (CMP) sensor signals to ensure they correlate with each other.

Exhaust Gas Recirculation (EGR) Valve and Position Sensor



The control current from the engine control module (ECM) operates the EGR motor to control the lift amount of EGR valve. Also, a valve position sensor is provided at the rear of the motor to feed actual valve lift amount back to the ECM for more precision control of the EGR amount. The EGR valve position sensor is applied with reference voltage (5 volts) at all times from the ECM to detect the EGR valve lift amount in the form of voltage change and sends its signal to the ECM.

Engine Coolant Temperature (ECT) Sensor

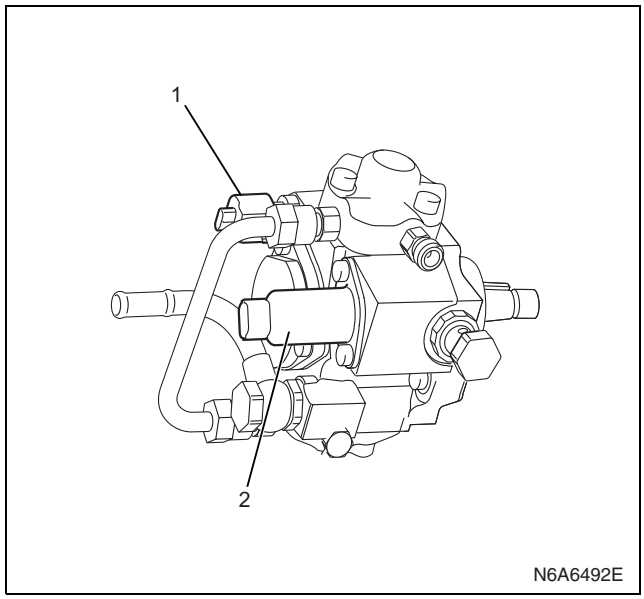


Legend

1. Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit.

Fuel Rail Pressure (FRP) Regulator

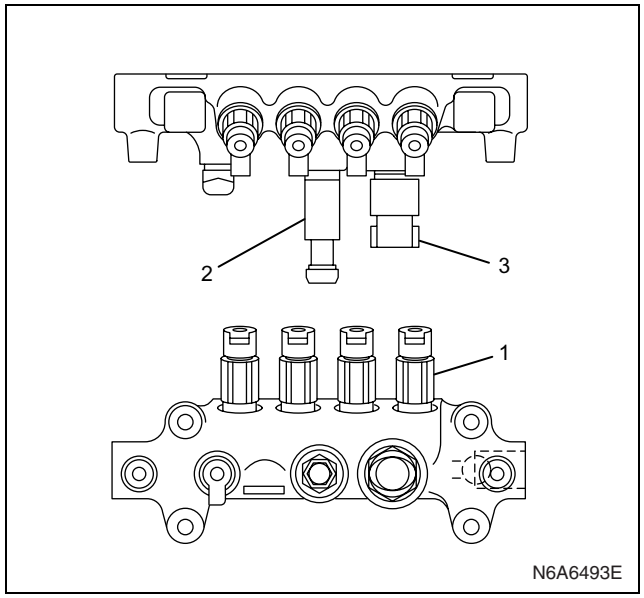


Legend

1. Fuel Temperature (FT) Sensor
2. Fuel Rail Pressure (FRP) Regulator

The fuel rail pressure (FRP) regulator is installed to the fuel supply pump and controls the suction fuel quantity into the fuel rail. The FRP regulator is fully opened in the normal state and larger drive current results in smaller opening. The engine control module (ECM) calculates desired fuel rail pressure and fuel flow rate and it compares the calculated desired fuel rail pressure to the actual value to determine the FRP regulator position. When the actual fuel rail pressure is higher than the desired value, the FRP regulator is closed to decease the flow rate.

Fuel Rail Pressure (FRP) Sensor

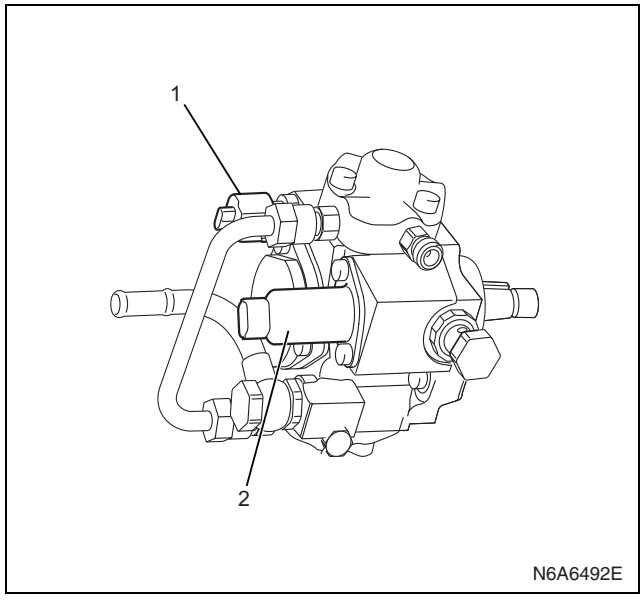


Legend

1. Flow Damper
2. Pressure Limiter
3. Fuel Rail Pressure (FRP) Sensor

The fuel rail pressure (FRP) sensor is installed to the fuel rail and it detects the fuel pressure in the fuel rail, converts the pressure into a voltage signal, and sends the signal to the engine control module (ECM). Higher fuel rail pressure provides higher FRP sensor voltage while lower pressure provides lower FRP sensor voltage. The ECM calculates actual fuel rail pressure (fuel pressure) from the voltage signal and uses the result in fuel injection control and other control tasks.

Fuel Temperature (FT) Sensor

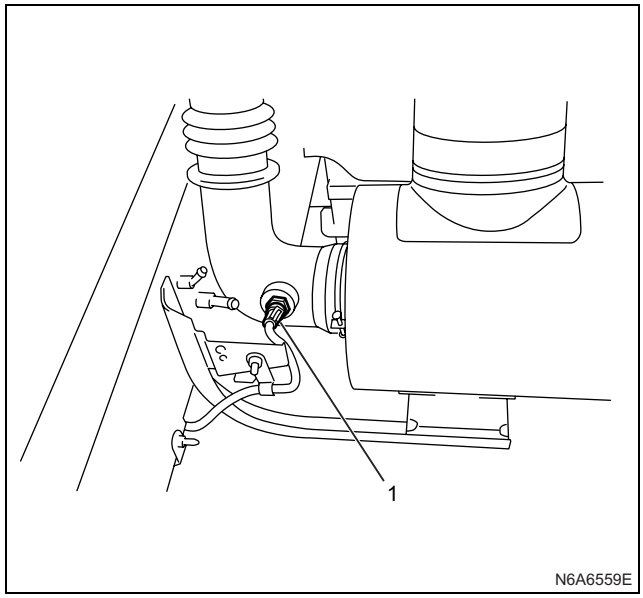


Legend

1. Fuel Temperature (FT) Sensor
2. Fuel Rail Pressure (FRP) Regulator

The fuel temperature (FT) sensor is installed to the fuel supply pump. The FT sensor is a variable resistor. The FT sensor measures the fuel temperature of the fuel. The engine control module (ECM) supplies 5 volts to the FT signal circuit and a ground for the FT low reference circuit. When the FT sensor is cold, the sensor resistance is high. When the fuel temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the FT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the FT signal circuit.

Intake Air Temperature (IAT) Sensor

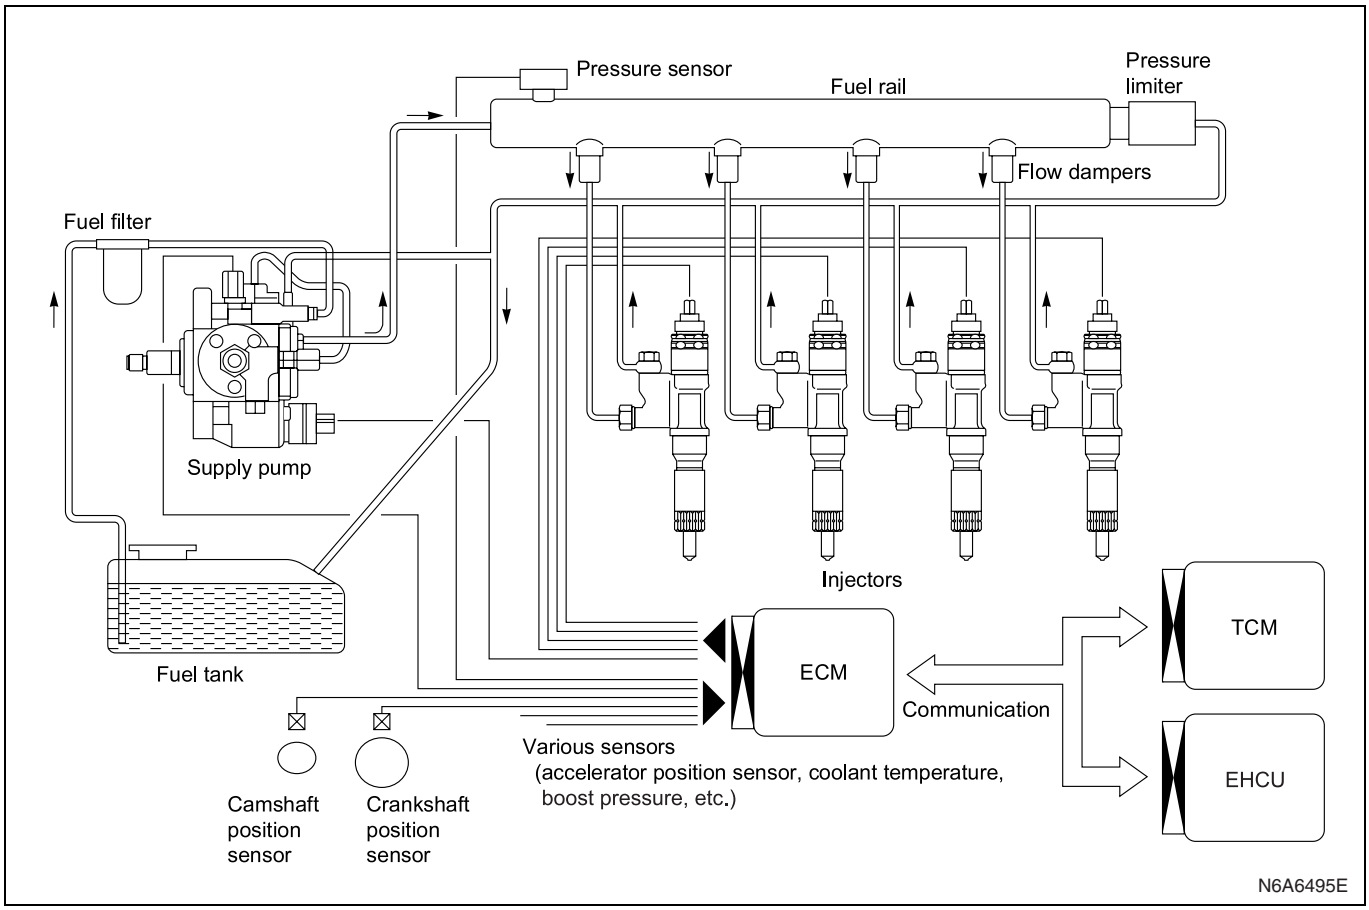


Legend

1. Intake Air Temperature (IAT) Sensor

The intake air temperature (IAT) sensor is fitted between the air cleaner and turbocharger. The IAT sensor is a variable resistor. The IAT sensor measures the temperature of the air entering the engine. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and a ground for the IAT low reference circuit. When the IAT sensor is cold, the sensor resistance is high. When the air temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the IAT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the IAT signal circuit.

Fuel System Description



The common rail system uses a type of accumulator chamber called the fuel rail to store pressurized fuel, and injectors that contain electronically controlled solenoid valves to spray the pressurized fuel in the combustion chambers. The injection system (injection pressure, injection rate, and injection timing) is controlled by the engine control module (ECM), and therefore the common rail system can be controlled independently, free from the influence of engine speed and load. This ensures a stable injection pressure at all time, particularly in the low engine speed range, so that black smoke specific to diesel engines generated during vehicle starting or acceleration can be reduced dramatically. As a result, exhaust gas emissions are clear and reduced, and higher output is achieved.

1. High Pressure Control

- Enables high pressure injection from low engine speed range.
- Optimizes control to minimize particulate matter and NOx emissions.

2. Injection Timing Control

- Enables finely tuned optimized control in accordance with running conditions.

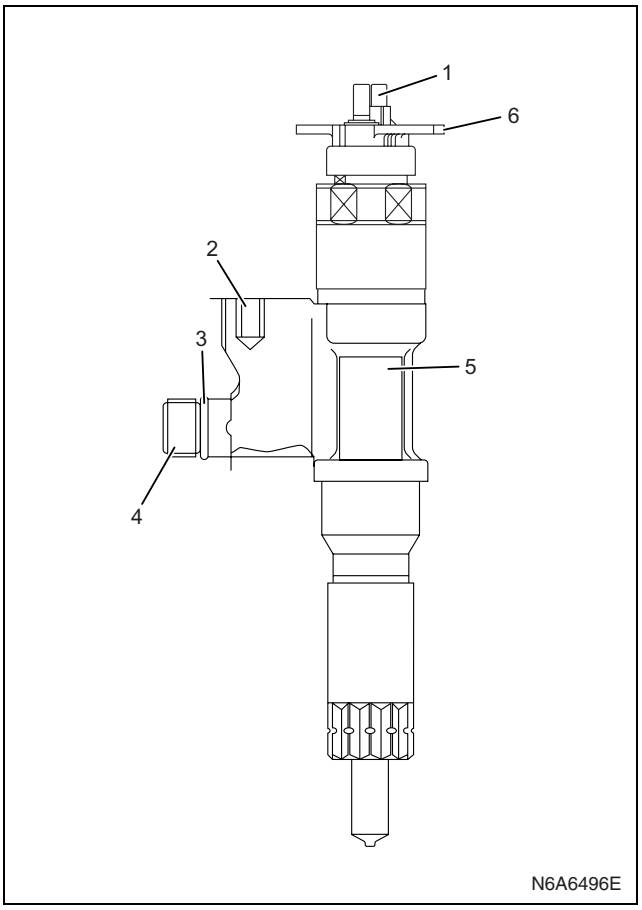
3. Injection Rate Control

- Pilot injection control that performs a small amount of injection before main injection.

The fuel rail system consists primarily of a fuel supply pump, fuel rail, injectors, and ECM.

Fuel System Component Description

Injector



Legend

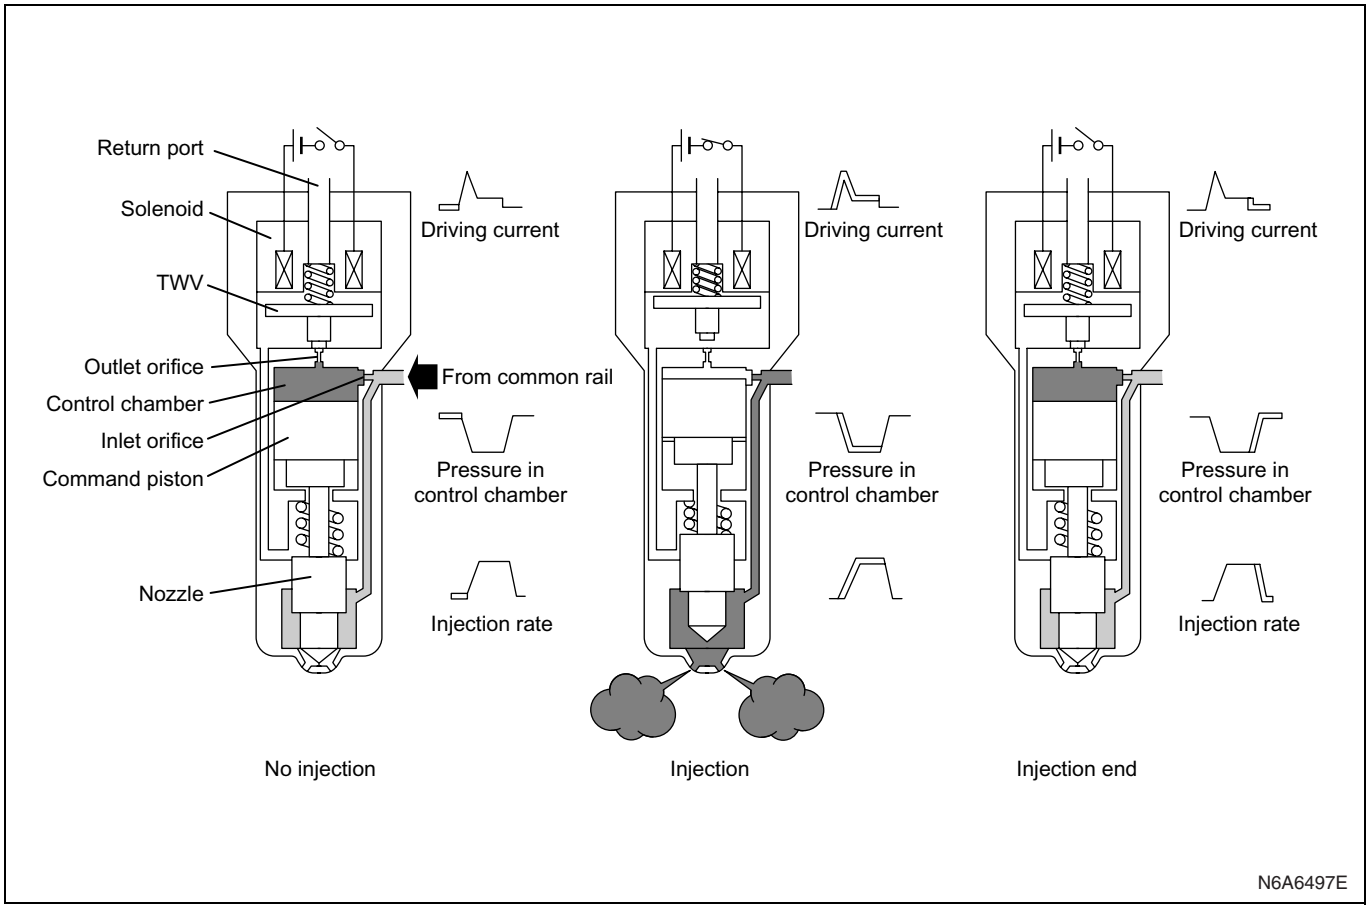
2. Fuel Leak Off Port
3. O-ring
4. Fuel Inlet Port
5. Injector Parts Number Marking
6. Fuel Injector ID Plate

Electronic control type injectors controlled by the engine control module (ECM) are used. Compared with conventional injection nozzles, a command piston, solenoid valve, etc. are added.

ID codes displaying various injector characteristic are laser marked in the plate, and ID codes showing these in numeric form (30 alphanumeric figures are displayed and only 24 are used) are laser marked in the plate. This system uses fuel injector flow rate information (ID codes) to optimize injection quantity control. When an injector is newly installed in a vehicle, it is necessary to input the ID codes in the ECM.

QR (Quick Response) codes or fuel injector flow rate (ID codes) have been adopted to enhance the injection quantity precision of the injectors. The adoption of codes enables injection quantity dispersion control throughout all pressure ranges, contributing to improvement in combustion efficiency, reduction in exhaust gas emissions and consistent horsepower throughout the vehicle built.



1) Non-injection state

The two way valve (TWV) closes the outlet orifice by means of a spring force, when no current is supplied from the engine control module (ECM) to the solenoid. At this time, the fuel pressure applied to the nozzle leading end is equal to the fuel pressure applied to the control chamber through the inlet orifice. As for the force competition in this state, the pressure on the command piston upper surface + nozzle spring force defeat the pressure on the nozzle leading end, and consequently the nozzle is pushed downward to close the injection holes.

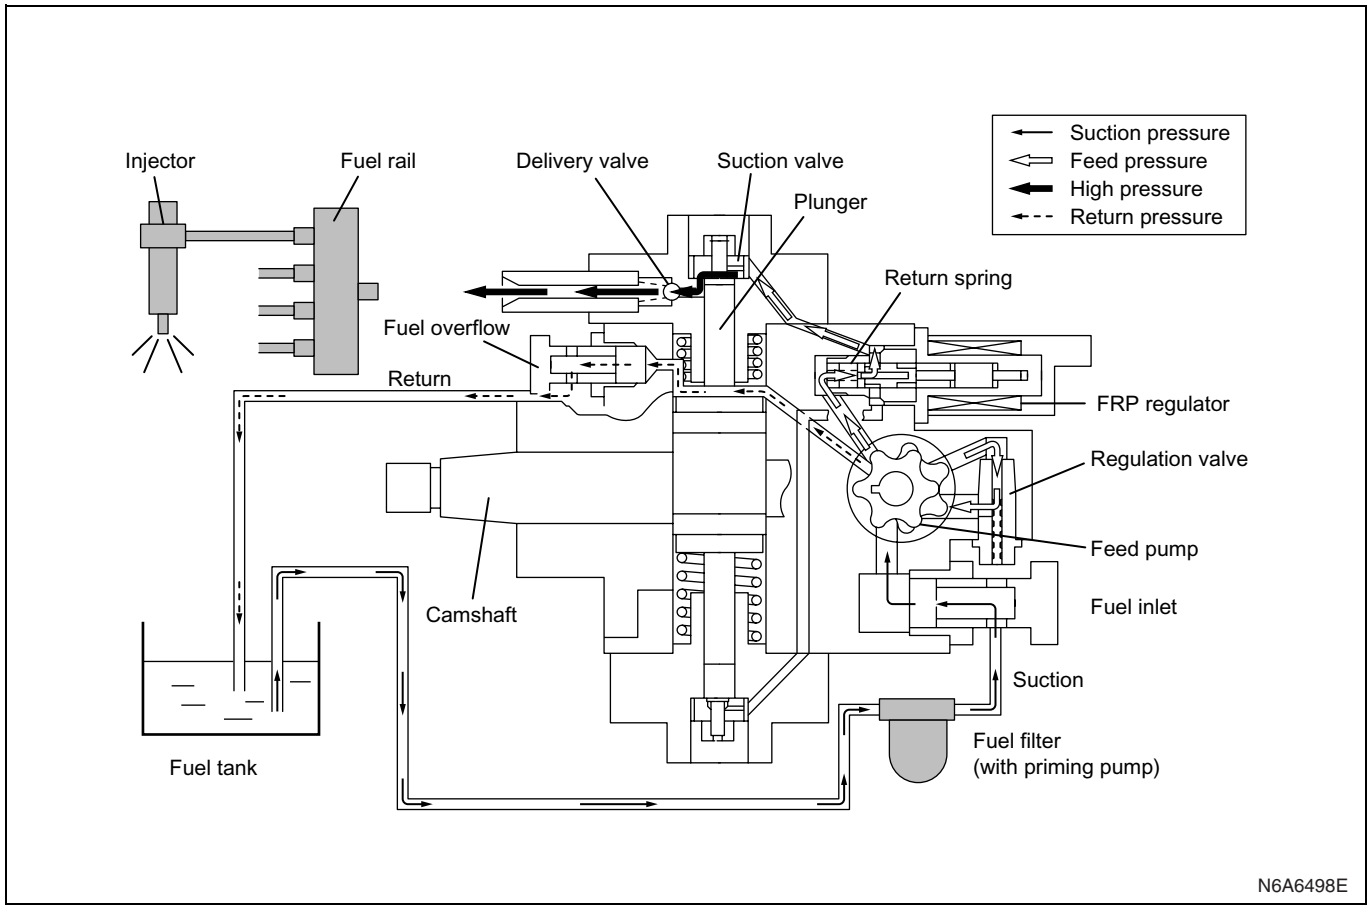
2) Injection start

The TWV is pulled up to open the outlet orifice, and thus the fuel leaks toward the return port, when the current is supplied from the ECM to the solenoid. As a result, the nozzle is pushed up together with the command piston by the fuel pressure applied to the nozzle leading end, and then the nozzle injection holes open to inject the fuel.

3) Injection end

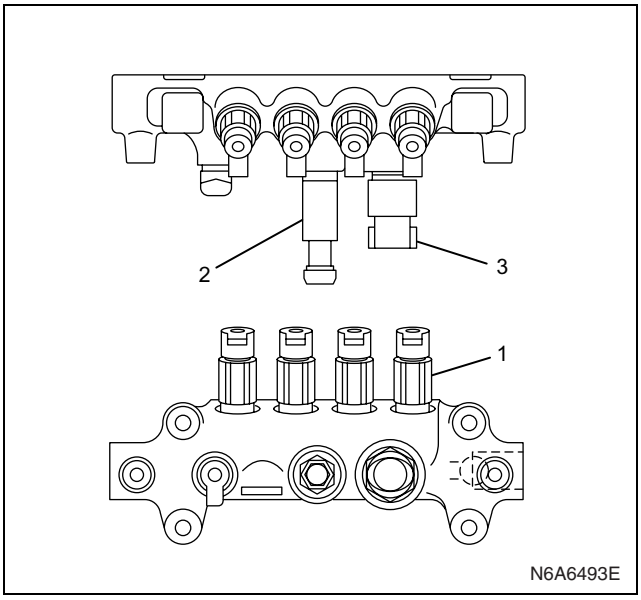
The TWV lowers to close the outlet orifice, when the ECM shuts off a current supply to the solenoid. As a result, the fuel cannot leak from the control chamber, and thus the fuel pressure in the control chamber rises abruptly and then the nozzle is pushed down by the command piston to close the nozzle injection holes, resulting in the end of fuel injection.

Fuel Supply Pump



The fuel supply pump is the heart of the common rail type electronic fuel injection system. The fuel supply pump is installed at the same location as the conventional injection type pump, which spins at a 1 to 1 ratio of fuel supply pump to crankshaft speed. A fuel rail pressure (FRP) regulator and fuel temperature sensor are part of the fuel supply pump assembly.
Fuel is drawn from the fuel tank via the fuel supply pump by the use of an internal feed pump (trochoid type). This feed pump pumps fuel into a 2-plunger chamber also internal to the fuel supply pump. Fuel into this chamber is regulated by the FRP regulator solely controlled by current supplied from the engine control module (ECM). No current to the solenoid results in maximum fuel flow whereas full current to the solenoid produces no fuel flow. As the engine spins, these two plungers produce high pressure in the fuel rail. Since the ECM controls the flow of fuel into this 2-plunger chamber, it therefore controls the quantity and pressure of the fuel supply to the fuel rail. This optimizes performance, improves economy and reduces NOx emissions.

Fuel Rail (Common Rail)

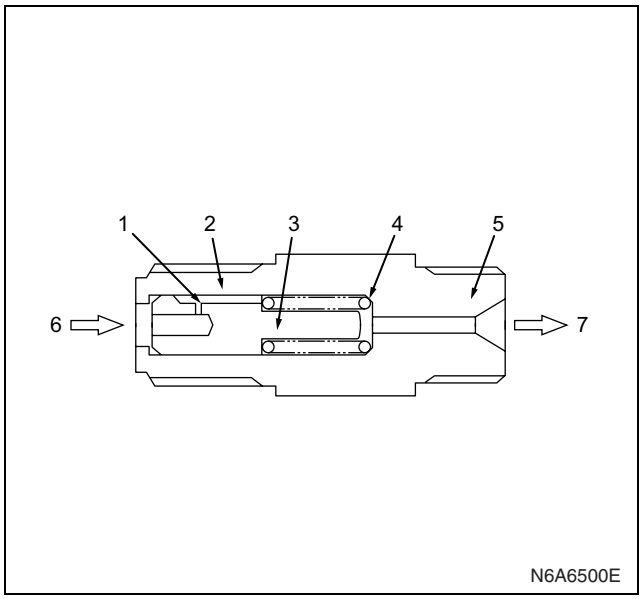


Legend

1. Flow Damper
2. Pressure Limiter
3. Fuel Rail Pressure (FRP) Sensor

Along with the employment of a common rail type electronic control fuel injection system, the fuel rail is provided to store high pressure fuel between supply pump and injectors. A pressure sensor and a pressure limiter are installed on the fuel rail. The pressure sensor detects the fuel pressure inside the fuel rail and sends its signal to the engine control module (ECM). Based on this signal, the ECM controls the fuel pressure inside the fuel rail via the fuel rail pressure (FRP) regulator of the supply pump. The pressure limiter opens the valve mechanically to relieve the pressure when the fuel pressure inside the fuel rail is excessive.

Flow Damper



Legend

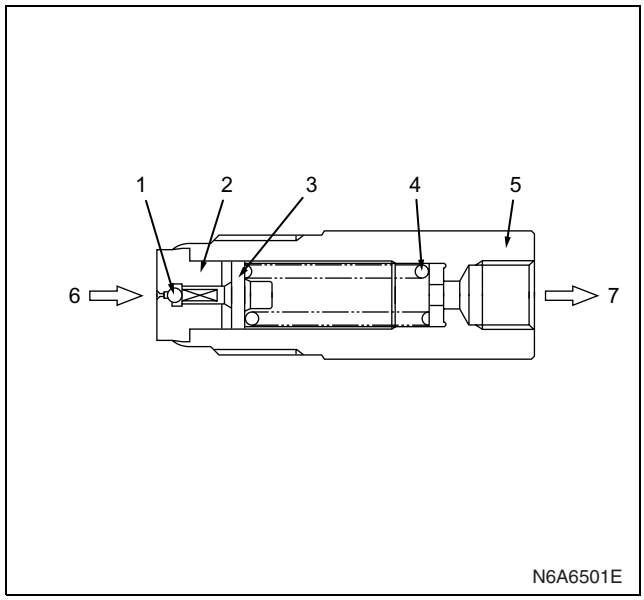
1. Orifice
2. Slit
3. Piston
4. Return Spring
5. Housing
6. Fuel Rail
7. Injector

The flow dampers are installed at the outlet of fuel rail to damp a pulsation of fuel pressure inside the fuel rail or to cut off the fuel supply when the fuel leaks downstream of flow damper. The fuel is supplied to the injectors through an orifice of the piston. The pressure pulsation occurring in the fuel rail is dampered by a resistive force of the return spring and a passing resistance of the orifice, wherein the piston acts as a damper. Also, the leading end of piston closes the fuel supply port to cut off the fuel supply, if the fuel leak occurs in the injection pipe or injectors. Since fuel pressure on the downstream side of flow damper supplied through an orifice + resistive force of return spring do not balance, the fuel pressure applied on the piston surface prior to the orifice will allow the fuel to be cut off. The piston will return when the fuel pressure inside the fuel rail is less than 1.0 MPa (145 psi).

Fuel Rail Pressure Sensor

Refer to Engine Control Component Description.

Pressure Limiter

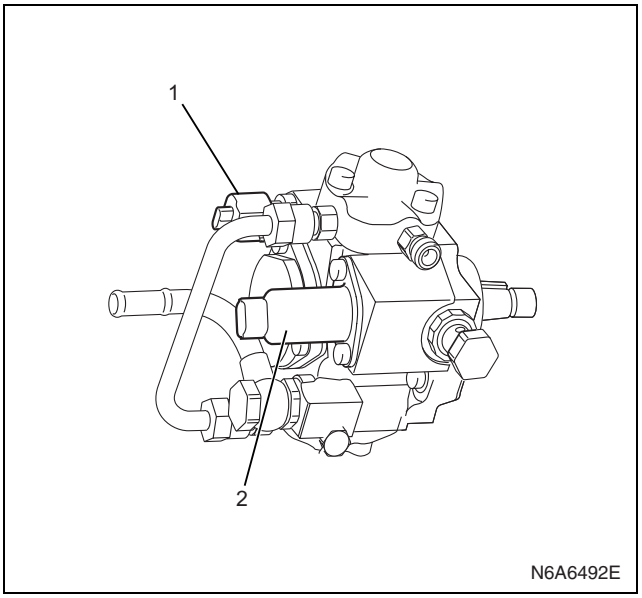


Legend

1. Valve
2. Valve Body
3. Valve Guide
4. Spring
5. Housing
6. Fuel Rail
7. Fuel Return Pipe

The pressure limiter relieves pressure by opening the valve if abnormally high pressure is generated. The valve opens when pressure in rail reaches approximately 200 MPa (29,000 psi), and closes when pressure falls to approximately 50 MPa (7,250 psi). Fuel leakage through the pressure limiter re-turns to the fuel tank.

Fuel Rail Pressure (FRP) Regulator



Legend

1. Fuel Temperature (FT) Sensor
2. Fuel Rail Pressure (FRP) Regulator

The engine control module (ECM) controls the duty ratio of the linear type fuel rail pressure (FRP) regulator (the length of time that the current is applied to the FRP regulator), in order to control the quantity of fuel that is supplied to the high-pressure plungers. Since only the quantity of fuel that is required for achieving the target rail pressure is drawn in, the drive load of the supply pump is decreased.

When current flows to the FRP regulator, variable electromotive force is created in accordance with the duty ratio, moving the armature to the left side. The armature moves the cylinder to the left side, changing the opening of the fuel passage and thus regulating the fuel quantity. With the FRP regulator OFF, the return spring contracts, completely opening the fuel passage and supplying fuel to the plungers (Full quantity intake and full quantity discharge). When the FRP regulator is ON, the force of the return spring moves the cylinder to the right, closing the fuel passage (normally opened).

By turning the FRP regulator ON/OFF, fuel is supplied in an amount corresponding to the actuation duty ratio, and fuel is discharged by the plungers.

Fuel Injection Quantity Control Description

Fuel Injection Quantity Control

This control determines the fuel injection quantity by adding coolant temperature, fuel temperature, intake air temperature, barometric pressure, vehicle speed and some switch inputs information corrections to the basic injection quantity is calculated by the engine control module (ECM) based on the engine operating conditions (engine speed, accelerator pedal pressing amount and boost pressure sensor). More fuel rate indicates if the engine load is increased as the accelerator pedal is stepped on at constant engine speed.

Combined with high pressure injection of atomized fuel, this control improves exhaust gas and ensures proper fuel consumption. Compared with conventional mechanical governors, an electronic control system provides higher degree of freedom of fuel injection quantity control, thereby presenting high accelerator response (acceleration feeling and pressing feeling).

Starting Injection Quantity Control

At the engine starting (after the key switch is turned to the START position to start the engine, up to return of key switch to the ON position), optimum fuel injection quantity is controlled based on the information on the engine speed and coolant temperature. At low temperature, the fuel injection quantity increases. When the engine started completely, this boosted quantity mode at the starting is cancelled and normal running mode is restored.

Idle Speed Control

A control is made so as to achieve stable idling speed at all time regardless of engine secular changes or engine condition variations. The ECM sets target idling speed and controls the fuel injection quantity according to the engine conditions (actual engine speed, coolant temperature and engine load) to follow actual engine speed to the target idling speed so as to ensure stable idling speed.

Idle Vibration Control

A control is made so as to reduce the engine vibration caused by torque variations between cylinders due to variations in fuel injection quantity of each cylinder or injector performance. The ECM corrects the injection quantity between cylinders based on the revolution signals from the crankshaft position (CKP) sensor. Normal range of correction quantity between cylinders is within $\pm$ 5 mm^3.

Fuel Injection Timing Control Description

The injection timing suitable for the vehicle conditions is controlled based on the inputs from respective sensors. The injection timing is determined by comparing actually measured values of pulse signals from the CKP sensor with the target injection timing stored in the map of the ECM.

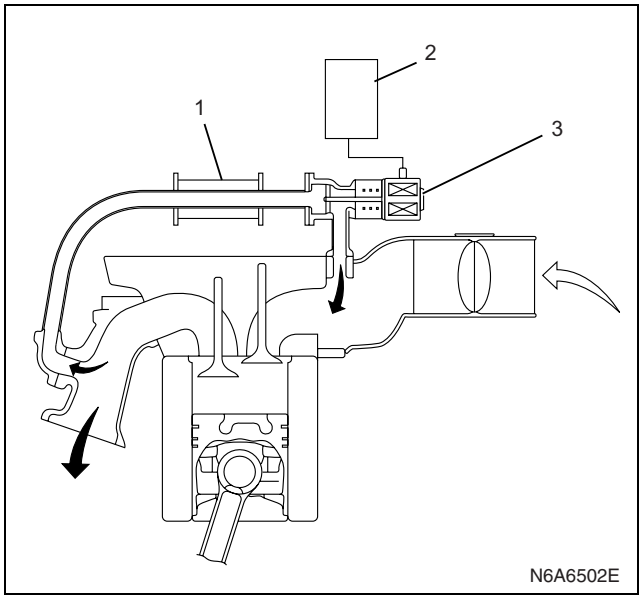
Coolant Temperature Compensation

At the engine starting when the engine coolant temperature is low, the coolant temperature is detected to advance the injection timing for reduction of white smoke emission.

High Altitude Compensation

During running at a highland where air density is low, the atmospheric pressure is detected to advance the injection timing for reduction of white smoke emission.

Exhaust Gas Recirculation (EGR) System Description



Legend

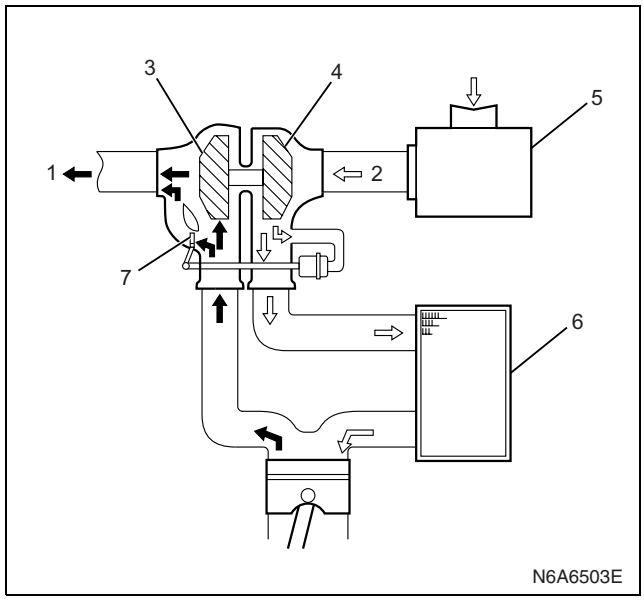
1. EGR Cooler
2. ECM
3. EGR Valve

The EGR system recirculates a part of exhaust gas back into the intake manifold, which results in reducing nitrogen oxide (NOx) emissions. The EGR control system uses an electronic control system to ensure both driveability and low emission. The control current from the engine control module (ECM) operates the motor to control the lift amount of EGR valve. Also, an EGR position sensor is provided at the rear of the motor to feed actual valve lift amount back to the ECM for more precision control of the EGR amount.

The EGR control starts when the conditions for engine speed, engine coolant temperature and barometric pressure are satisfied. Then, the valve opening is calculated according to the engine speed, and target fuel injection quantity. Based on this valve opening, the drive duty of the motor is determined and the motor is driven accordingly.

A potentiometer type EGR valve position sensor is employed and installed on the EGR valve body. The EGR valve position sensor is supplied with reference voltage (5V) and ground at all times from the ECM. The ECM reads the EGR position sensor voltage input and determines the EGR lift position.

Turbocharger Description



Legend

1. Exhaust Gas
2. Clean Air
3. Turbine Wheel
4. Compressor Wheel
5. Air Cleaner
6. Charge Air Cooler (Intercooler)
7. Wastegate Valve

The turbocharger is used to increase the amount of air that enters the engine cylinders. This allows a proportional increase of fuel to be injected into the cylinders, resulting in increased power output, more complete combustion of fuel, and increased cooling of the cylinder heads, pistons, valves, and exhaust gas. This cooling effect helps extend engine life.

Heat energy and pressures in the engine exhaust gas are utilized to drive the turbine. Exhaust gas is directed to the turbine housing. The turbine housing acts as a nozzle to direct the shaft wheel assembly. Since the compressor wheel is attached directly to the shaft, the compressor wheel rotates at the same speed as the turbine wheel. Clean air from the air cleaner is drawn into the compressor housing and wheel. The air is compressed and delivered through a crossover pipe to

the engine air intake manifold, then into the cylinders. The amount of air pressure rise and air volume delivered to the engine from the compressor outlet is regulated by a waste gate valve in the exhaust housing. The position of the waste gate valve is controlled by the amount of pressure built up on the intake side of the turbocharger. The diaphragm on the inside of the waste gate is pressure sensitive, and controls the position of the valve inside the turbocharger. The position of the valve will increase or decrease the amount of boost to the turbocharger.

The charge air cooler also helps the performance of the diesel. Intake air is drawn through the air cleaner and into the turbocharger compressor housing. Pressurized air from the turbocharger then flows forward through the charge air cooler located in the front of the radiator. From the charge air cooler, the air flows back into the intake manifold.

The charge air cooler is a heat exchanger that uses air flow to dissipate heat from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases the engine efficiency and power by packing more air molecules into the same space.

1	BLK/YEL	VSS 12 Volts Feed
2	BLK	VSS Low Reference
3	YEL/GRN	VSS Signal

Diagnostic Information and Procedures

General Service Information

Non-OEM Parts

All of the on-board diagnostic (OBD) has been calibrated to run with original equipment manufacturer (OEM) parts. Accordingly, if commercially sold sensor or switch is installed, it makes a wrong diagnosis and turn on the malfunction indicator lamp (MIL). Aftermarket electronics, such as cellular phones, stereos, and anti-theft devices, may indicate electromagnetic interference (EMI) into the control system if they are improperly installed. This may cause a false sensor reading and turn on the MIL.

Poor Vehicle Maintenance

The sensitivity of OBD will cause the MIL turn on if the vehicle is not maintained properly. Restricted oil filters, fuel filters, and crankcase deposits due to lack of oil changes or improper oil viscosity can trigger actual vehicle faults that were not previously monitored prior to OBD. Poor vehicle maintenance cannot be classified as a “non-vehicle fault”, but with the sensitivity of OBD diagnostics, vehicle maintenance schedules must be more closely followed.

Visual/Physical Engine Compartment Inspection

Perform a careful visual and physical engine compartment inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual/physical inspection:

- Inspect all vacuum hoses for punches, cuts, disconnects, and correct routing.
- Inspect hoses that are difficult to see behind other components.
- Inspect all wires in the engine compartment for proper connections, burned or chafed spots, pinched wires, contact with sharp edges or contact with hot exhaust manifolds or pipes.

Basic Knowledge of Tools Required

Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in an incorrect diagnosis or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge. A basic understanding of hand tools is necessary to effectively use this section of the service manual.

Malfunction Indicator Lamp (MIL)

Basically, the MIL is turned on when the ECM detects a DTC that will impact the vehicle emissions. When the MIL remains “ON” while the engine is running, or when a malfunction is suspected due to a driveability or emissions problem, a Diagnostic System Check must be performed. The procedures for these checks are given in Diagnostic System Check – Engine Controls.

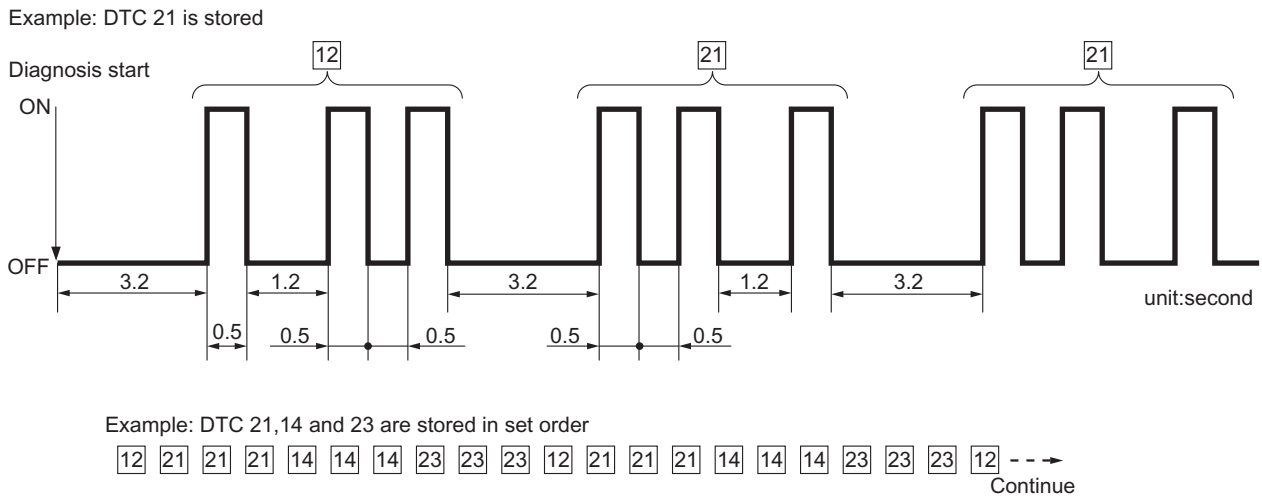
DTC Types

Characteristic of Code

- Non-Emissions related
- Dose not request illumination of any lamp
- Stores a DTC on the first trip with a fail

Reading Flash Diagnostic Trouble Codes

The provision for communicating with the ECM is the Data Link Connector (DLC). The DTCs stored in the ECM memory can be read either through a hand-held diagnostic scanner such as Tech 2 plugged into the DLC or by counting the number of flashes of the MIL when the diagnostic test terminal of the DLC is grounded. The DLC terminal “6” (diagnostic request switch) is pulled “Low” (grounded) by jumped to DLC terminal “4”, which is a ground wire.
Once terminals “4” and “6” have been connected, the ignition switch must be moved to the “ON” position, with the engine not running. The MIL will initially flash 12. Then, the MIL will flash the first stored DTC three times, second stored DTC three times and so on. All the stored DTCs are flashed, then return 12 and continue to flash the DTC. If no DTC exists, the MIL flashes 12 continuously. The flash DTC display will continue as long as the DLC is shorted.



Reading Diagnostic Trouble Codes (DTCs) with The Tech 2

The procedure for reading DTC(s) is used a diagnostic Tech 2. To read DTCs, use the Tech 2 “Read DTC Info As Stored By ECU”.

Clearing Diagnostic Trouble Codes (DTCs) with The Tech 2 or without Tech 2

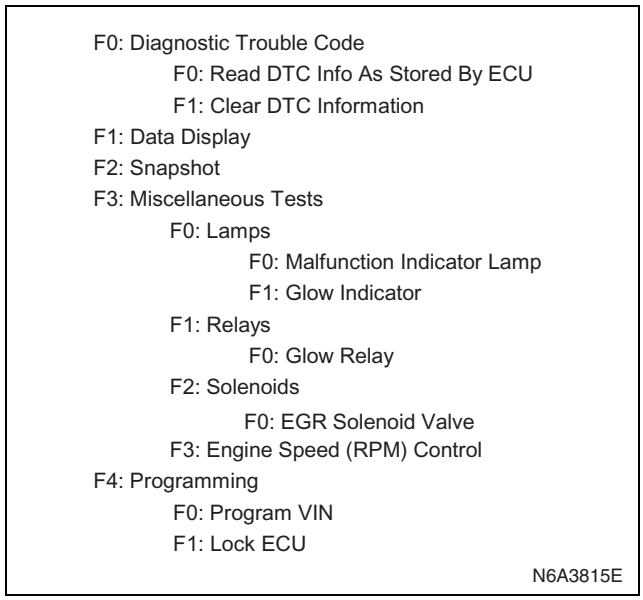
Do not clear DTCs unless directed to do so by the service information provided for each diagnostic procedure. To clear DTCs, use the Tech 2 “Clear DTC Information”. If there is no Tech 2, history DTCs can also be cleared after 40 consecutive driving cycles without a fault.

Tech 2 Scan Tool

Isuzu recommend using Tech 2. Refer to the Tech 2 Users Guide for proper start up procedures.

Operating Procedure

1. Press Enter at start screen.
2. Select Diagnostic > appropriate vehicle identification > Powertrain > 4JH1-TC.
3. The following table shows, which functions are used the available equipment versions.

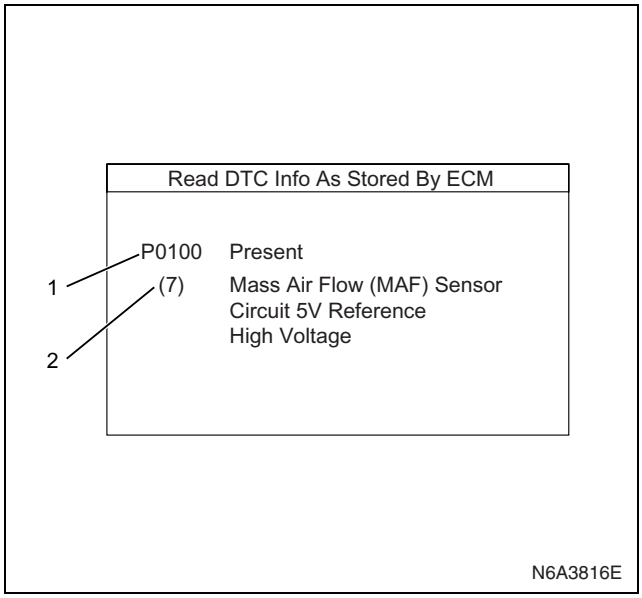


F0: Diagnostic Trouble Code

The purpose of this mode is to display stored trouble code in the ECM. When “Clear DTC Information” is selected, “Clear DTC Information”, warning screen appears. This screen informs you that by cleaning DTCs “all stored DTC information in the ECM will be erased”.

Symptom Code

Symptom Code is located under the DTC column. A parenthetic alphabet or number means identification of the malfunction. Each DTC includes individual symptoms, such as DTC P0100 has four symptom codes (7), (9), (B) and (C). DTC chart is separated depending on this symptom code.



Legend

1. Diagnostic Trouble Code (DTC)
2. Symptom Code

F1: Data Display

The purpose of this mode is to continuously monitor data parameters. The current actual values of all important sensors and signals in the system are display through this mode. Refer to the Tech 2 Data List in this section.

F2: Snapshot

"Snapshot" allow you to focus on making the condition occur, rather than trying to view all of the data in anticipation of the fault. The snapshot will collect parameter information around a trigger point that you select. Refer to the Tech 2 user instructions for more information.

F3: Miscellaneous Test

The purpose of this mode is to check for correct operation of electronic system actuators. Using miscellaneous test menus can test the state of each actuator and related sensors. Especially when DTC cannot be detected, a faulty circuit can be diagnosed by testing. Even DTC has been detected, the circuit tests using these menus could help discriminate between a mechanical trouble and an electrical trouble. Refer to the Tech 2 Output Controls in this section.

F4: Programming

The purpose of this mode is to program the vehicle identification number (VIN) into the ECM and lock the programmed VIN. Refer to Engine Control Module (ECM) Replacement in this section.

Tech 2 Data List

The Tech 2 Data List contains all engine related parameters that are available on the Tech 2. Use the Tech 2 Data List only after the following is determined:

- The Diagnostic System Check – Engine Controls is completed.
- No diagnostic trouble codes (DTCs) are present.
- On-board diagnostics are functioning properly.

Tech 2 values from a properly running engine may be used for comparison with the engine you are diagnosing. The Tech 2 Data List represents values that would be seen on a normal running engine.

Important:
A Tech 2 that displays faulty data should not be used. The Tech 2 problem should be reported to the manufacturer. Use of a faulty Tech 2 can result in misdiagnosis and unnecessary parts replacement. Only the parameters listed below are referenced in this service manual for use in diagnosis.

Tech 2 Parameter	Units Displayed	Typical Data Value at Engine Idle	Typical Data Value at 2000 RPM
Operating Conditions: Engine Idling or 2000 RPM / Engine Coolant Temperature is between 75-85°C (167-185°F) / Accelerator Pedal is Constant / Park or Neutral / Accessories OFF / Vehicle Located at Sea Level			
Ignition Switch	On/Off	On	On
System Voltage	V	11.0 – 15.0	11.0 – 15.0
ECM Main Relay	On/Off	On	On
Engine Speed	RPM	650 – 750	1950 – 2050
Desired Idle Speed	RPM	700	700
Injection Pump Speed	RPM	325 – 375	975 – 1025
Accelerator Pedal Position	%	0.0	19.0 – 23.0
Idle Switch	On/Off	On	Off
Intake Air Temperature	°C/°F	20 – 40°C / 68 – 104°F	20 – 40°C / 68 – 104°F
Engine Coolant Temperature	°C/°F	75 – 85°C / 167 – 185°F	75 – 85°C / 167 – 185°F

Tech 2 Parameter	Units Displayed	Typical Data Value at Engine Idle	Typical Data Value at 2000 RPM
Fuel Temperature	°C/°F	20 – 60°C / 68 – 140°F	20 – 60°C / 68 – 140°F
Barometric Pressure	hPa	Nearly 1010 hPa at sea level	Nearly 1010 hPa at sea level
EGR Solenoid Command	%	Nearly 70%	Nearly 30%
Mass Air Flow Sensor	mg/strk	More than 480 mg/strk at sea level	More than 1200 mg/strk at sea level
Desired Mass Air Flow	mg/strk	More than 480 mg/strk at sea level	More than 1200 mg/strk at sea level
Actual Injection Quantity	mg/strk	7.0 – 10.0	8.0 – 12.0
Desired Injection Quantity	mg/strk	7.0 – 10.0	8.0 – 12.0
Actual Injection Timing	°CA	3.0 – 5.0	5.0 – 7.0
Desired Injection Timing	°CA	3.0 – 5.0	5.0 – 7.0
Neutral Switch	On/Off	On	On
Brake Pedal 1 Switch	Applied/ Released	Released	Released
Brake Pedal 2 Switch	Applied/ Released	Released	Released
Clutch Pedal Switch	Applied/ Released	Released	Released
Engine Warm Up Switch	On/Off	Off	Off
Exhaust Brake Switch	On/Off	Off	Off
Intake Throttle Solenoid Command	On/Off	Off	Off
Exhaust Brake Solenoid Command	On/Off	Off	Off
ABS Input Signal	On/Off	Off	Off
ABS Output Signal	On/Off	Off	Off
Vehicle Speed	km/h / MPH	0	0
Glow Relay Command	On/Off	Off	Off
Glow Indicator Lamp Command	On/Off	Off	Off
Malfunction Indicator Lamp (MIL) Command	On/Off	Off	Off
A/C Request Signal	On/Off	Off	Off
A/C Relay Command	On/Off	Off	Off

Tech 2 Data Definitions

A list of each message displayed on the Tech 2 will be explained in Engine Controls. This information will assist in emission or driveability problems. The displays can be viewed while the vehicle is being driven. Always perform the Diagnosis System Check – Engine Controls first. The Diagnostic System Check will confirm proper system operation.

Ignition Switch
This parameter displays the input status of the ignition switch to the ECM terminal (pin 39). The Tech 2 will display On or Off. On indicates the ignition switch is turned ON position.

System Voltage
This parameter displays the system voltage measured by the ECM terminal (pin 3) at the voltage feed from the ECM main relay.

ECM Main Relay
This parameter displays the commanded state of the ECM main relay control circuit (pin 58). The Tech 2 will display On or Off. On indicates the ECM main relay control circuit is being grounded by the ECM, allowing the main relay to supply voltage to the other circuits of the ECM. Off indicates the main relay is not being commanded On by the ECM.

Engine Speed
This parameter displays the speed of the crankshaft as calculated by the ECM based on input from the crankshaft position (CKP) sensor or camshaft position (CMP) sensor. The Tech 2 will display the engine speed in revolution per minute (RPM).

Desired Idle Speed
This parameter displays the idle speed requested by the ECM. The ECM will compensate for various engine loads based on engine coolant temperature (ECT) and A/C system status. If the A/C system is activated, the ECM sets 50 RPM higher than normal idle speed.

Injection Pump Speed
This parameter displays the speed of the injection pump as calculated by the fuel injection pump control unit (PCU) based on the input from the fuel injection pump camshaft position (CMP) sensor. The Tech 2 will display the injection pump speed in revolution per minute (RPM).

Accelerator Pedal Position
This parameter displays the angle of the accelerator pedal as calculated by the ECM using the signal from the accelerator pedal position (APP) sensor. The accelerator pedal position indicated angle is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.

Idle Switch
This parameter displays the input status of the idle switch to the ECM terminal (pin 69). The Tech will display On or Off. On indicates the accelerator pedal is not being pushed down. Off indicates the accelerator pedal is being depressed.

Intake Air Temperature
This parameter displays the temperature of the intake air based on a voltage input from the intake air temperature (IAT) sensor to the ECM. The Tech 2 will display a low temperature when signal voltage is high, and high temperature when the signal voltage is low. Note that the IAT sensor is internal to the mass air flow (MAF) sensor and the MAF sensor is heated.

Engine Coolant Temperature
This parameter displays the temperature of the engine coolant based on a voltage input from the engine coolant temperature (ECT) sensor to the ECM. The Tech 2 will display a low temperature when the signal voltage is high, and a high temperature when the signal voltage is low.

Fuel Temperature
This parameter displays the temperature of the fuel as calculated by the fuel injection pump control unit (PCU) using the signal from the fuel temperature sensor inside of the PCU.

Barometric Pressure
This parameter displays the barometric pressure as calculated by the ECM using the signal from the barometric pressure (BARO) sensor inside of the ECM.

EGR Solenoid Command
This parameter displays the EGR solenoid valve control duty ratio commanded by the ECM terminal (pin 97) using the signal from engine speed, and injection volume and various sensor inputs. When a small duty ratio, the EGR valve is controlled to close. When a large duty ratio, the EGR valve is controlled to open.

Mass Air Flow Sensor
This parameter displays the air flow into the engine as calculated by the ECM based on the mass air flow (MAF) sensor input. The Tech 2 will display a high value at higher engine speeds, and a low value at idle. This can be compared to the Desired Mass Air Flow to determine MAF sensor accuracy, EGR problem or intake problem. Note that the MAF on the Tech 2 will only update with the engine running.

Desired Mass Air Flow
This parameter displays a mass air flow desired by the ECM based on current driving condition.

Actual Injection Quantity
This parameter displays the injection quantity calculated by the PCU based on the fuel injection solenoid valve On time which compensated from the timing device position and fuel temperature inputs. This can be compared to the Desired Injection Quantity to determine fuel system problem.

Desired Injection Quantity
This parameter displays an injection quantity desired by the ECM based on current driving condition using target injection maps.

Actual Injection Timing
This parameter displays the injection timing calculated by the PCU based on the timing device position which determined from the crankshaft position sensor and camshaft position sensor inputs. This can be compared to the Desired Injection Timing to determine timing device problem or fuel system problem.

Desired Injection Timing
This parameter displays injection timing desired by the ECM based on current driving condition using target injection timing maps. This timing is compensated by engine coolant temperature, altitude and intake air temperature, etc.

Neutral Switch
This parameter displays the state of the neutral switch as determined by the ECM terminal (pin 87) based on an input from the neutral switch.

Brake Pedal 1 Switch
This parameter displays the state of the brake pedal as determined by the ECM terminal (pin 30) based on an input from the brake pedal 1 switch. This switch turns On the stop lamps when the brake pedal is depressed. The Tech 2 will display Applied when the brake pedal is depressed.

Brake Pedal 2 Switch
This parameter displays the state of the brake pedal 2 switch as determined by the ECM terminal (pin 65). The Tech 2 will display Released or Applied. Released indicates the brake pedal is not being pushed down. Applied indicates the brake switch is being depressed.

Clutch Pedal Switch
This parameter displays the state of the clutch pedal as determined by the ECM terminal (pin 31) based on an input from the clutch pedal switch. The Tech 2 will display Release or Applied. Release indicates the clutch pedal is not being push down. Applied indicates the clutch switch is being depressed.

Engine Warm Up Switch
This parameter displays the input status of the engine warm up switch to the ECM terminal (pin 46). The Tech 2 will display On or Off. On indicates the engine warm up switch is closing the engine quick warm up system request circuit to the ECM. Off indicates the engine warm up switch is open.

Exhaust Brake Switch
This parameter displays the input status of the exhaust brake switch to the ECM terminal (pin 64). The Tech 2 will display On or Off. On indicates the exhaust brake switch is closing the exhaust brake request circuit to the ECM and allowing to energize the intake throttle solenoid and exhaust brake solenoid depending on driving condition. Off indicates the exhaust brake switch is open and exhaust brake will not engage.

Intake Throttle Solenoid Command
This parameter displays the commanded state of the intake throttle solenoid valve control circuit (pin 95). The Tech 2 will display On or Off. On indicates the intake throttle solenoid valve circuit is being energized by the ECM. Off indicates the intake throttle solenoid valve is not being commanded On by the ECM.

Exhaust Brake Solenoid Command
This parameter displays the commanded state of the exhaust brake solenoid valve control circuit (pin 40). The Tech 2 will display On or Off. On indicates the exhaust brake solenoid valve circuit is being energized by the ECM. Off indicates the exhaust brake solenoid valve is not being commanded On by the ECM.

ABS Input Signal
This parameter displays the input status of the exhaust brake cut request from the EHCU (ABS unit) to the ECM terminal (pin 32). The Tech 2 will display On or Off. On indicates the EHCU is commanding to the ECM to release the exhaust brake. Off indicates the EHCU is not being commanded.

ABS Output Signal
This parameter displays a feedback (output) signal of exhaust brake cut request from the ECM terminal (pin 62) to the EHCU (ABS unit). On indicates the ECM is commanding to the EHCU to return a feedback signal. Off indicates the ECM is not being commanded.

Vehicle Speed
This parameter displays the vehicle speed calculated by the ECM based on an input from the vehicle speed sensor (VSS). The Tech 2 will display a high value at higher vehicle speeds, and low value at lower vehicle speeds.

Glow Relay Command
This parameter displays the commanded state of the glow plug relay control circuit (pin 94). The Tech 2 will display On or Off. On indicates the glow plug relay control circuit is being grounded by the ECM, allowing voltage to the glow plugs. Off indicates the glow plug relay is not being commanded On by the ECM.

Glow Indicator Lamp Command
This parameter displays the commanded state of the glow indicator lamp control circuit (pin 43). The glow indicator lamp should be On when the Tech 2 indicates On. The glow indicator should be Off when the Tech 2 indicates Off.

Malfunction Indicator Lamp (MIL) Command
This parameter displays the commanded state of the malfunction indicator lamp (MIL) control circuit (pin 42). The MIL should be On when the Tech 2 indicates On. The MIL should be Off when the Tech 2 indicates Off. The ECM will command the MIL On for a certain length of time when the ignition is On with the engine Off in order to perform a bulb check.

A/C Request Signal
This parameter displays the state of the air conditioning (A/C) request input to the ECM terminal (pin 33) from the heating, ventilation, and air conditioning (HVAC) controls. The Tech 2 will display On or Off. On indicates the ECM is receiving a request from the HVAC system to ground the A/C compressor relay control circuit, engaging the A/C compressor clutch. Off indicates the ECM is not receiving a request from the HVAC system.

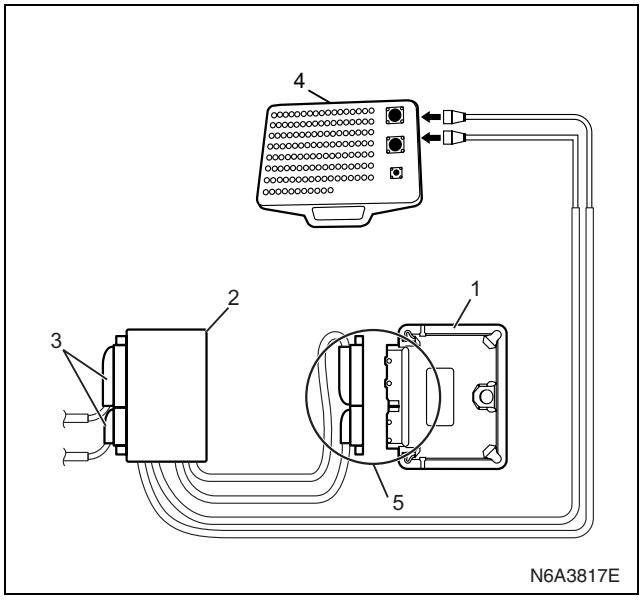
A/C Relay Command
This parameter displays the commanded state of the A/C compressor relay control circuit (pin 41). The Tech 2 will display On or Off. On indicates the A/C compressor relay control circuit is being grounded by the ECM, allowing voltage to the A/C compressor clutch. Off indicates the A/C compressor relay is not being commanded On by the ECM.

Tech 2 Output Controls

Tech 2 Output Control	Additional Menu Selection(s)	Descriptions
EGR Solenoid Valve	Solenoids	The purpose of this test is for checking whether the EGR valve is correctly moved with command. Restricted valve movement by foreign materials, excessive deposits, a faulty vacuum hose routing, a faulty EGR valve or a faulty EGR solenoid could be considered if the mass air flow (MAF) sensor is not changed when commanded ON or OFF.
Engine Speed (RPM) Control	—	The purpose of this test is for checking whether the actual engine idle speed can change to match the commanded RPM.
Glow Indicator	Lamps	The purpose of this test is for checking whether the glow indicator lamp is operating when commanded ON. Faulty circuit(s) or an open bulb could be considered if not operating when commanded ON.
Glow Relay	Relays	The purpose of this test is for checking whether the glow relay is operating when commanded ON. Faulty circuit(s) or a faulty glow relay could be considered if not energizing when commanded ON.
Malfunction Indicator Lamp	Lamps	The purpose of this test is for checking whether the malfunction indicator lamp (MIL) is operating when commanded ON. Faulty circuit(s) or an open bulb could be considered if not operating when commanded ON.

Breaker Box

Breaker Box Connection Type A

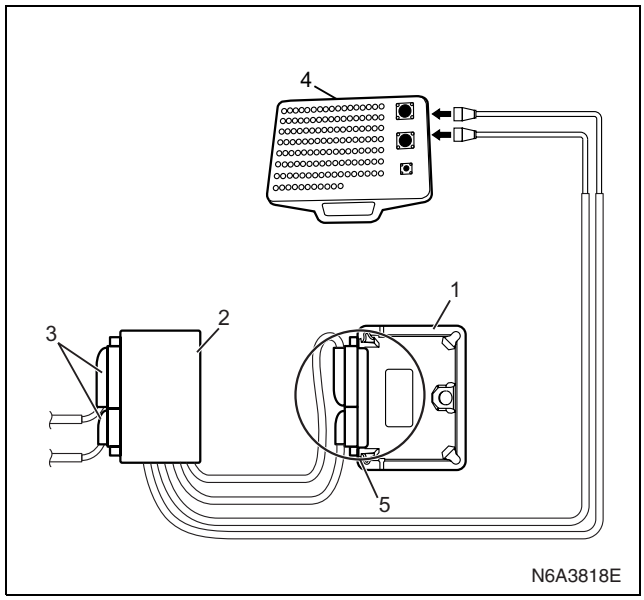


Legend

1. Engine Control Module (ECM)
2. Harness Adapter
3. ECM – Harness Connector
4. Breaker Box
5. ECM disconnected

Although probe to the engine control module (ECM) harness connector is possible by Test Adapter, Breaker Box Connection Type A is suitable usage to prevent misprobe and damage of female terminals when test open circuit or short to ground between the ECM and electrical components, since the terminals where the harness connector of the ECM is thin have gathered.

Breaker Box Connection Type B



Legend

1. Engine Control Module (ECM)
2. Harness Adapter
3. ECM – Harness Connector
4. Breaker Box
5. ECM connected

The ECM and other connectors have water proof terminal that is not allowed to back probe. Breaker Box Connection Type B is suitable usage to test short to voltage circuit or signal check between the ECM and electrical components.

Engine Control System Check Sheet

ENGINE CONTROL SYSTEM CHECK SHEET		Inspectors Name	
Customer's Name		Model & Model Year	
Driver's Name		Chassis No.	
Date Vehicle Brought In		Engine No.	
License No.		Odometer Reading	Km/miles

Problem Symptoms	☐ Engine Does Not Run	☐ Engine does not crank ☐ No initial combustion ☐ No complete combustion
	☐ Hard Start	☐ Engine cranks slowly ☐ Other ( )
	☐ Incorrect Idle	☐ Abnormal idling speed ☐ High idling speed (RPM) ☐ Low idling speed (RPM) ☐ Rough idling ☐ Other ( )
	☐ Poor Driveability	☐ Hesitation, sag, stumble ☐ Surge, chuggles ☐ Cut out, misses ☐ Lack of power, sluggishness, sponginess ☐ Other ( )
	☐ Engine Stall	☐ Soon after starting ☐ After accelerator pedal depressed ☐ During A/C operation ☐ After accelerator pedal released ☐ Shifting from N to D ☐ Other ( )
	☐ Others	☐ Black smoke ☐ White smoke ☐ Poor fuel economy ☐ Fuel knock, combustion noise ☐ Other ( )

Dates problem occurred		
Problem frequency		☐ Constant ☐ Intermittently (times per day/month) ☐ Once only ☐ Other ( )
Condition When Problem Occurs	Weather	☐ Fine ☐ Cloudy ☐ Rainy ☐ Snow ☐ Various/Other ( )
	Outside Temperature	☐ Hot (approx.) ☐ Warm ☐ Cool ☐ Cold (approx.) ☐ Any temperature
	Place	☐ Highway ☐ Suburbs ☐ City area ☐ Uphill ☐ Downhill ☐ Rough road ☐ Other ( )
	Load Condition	☐ Over (approx. tons) ☐ No load ☐ Other (approx. tons)
	Engine Temperature	☐ Cold ☐ Warming up ☐ After warming up ☐ Any temperature ☐ Other ( )
	Engine Operation	☐ Starting ☐ Just after starting (Min.) ☐ Idling ☐ Racing ☐ Driving ☐ Constant speed ☐ Acceleration ☐ Deceleration ☐ A/C switch On/Off ☐ Other ( )
	Fuel Amount	☐ Full ☐ Above 1/2 ☐ Below 1/2 ☐ Near empty
	Fuel Bland	

Condition of MIL		☐ Remains On ☐ Intermittently turns On ☐ Does not turn On

Diagnostic Starting Point – Engine Controls

Begin the system diagnosis with Diagnostic System Check – Engine Controls. The Diagnostic System Check – Engine Controls will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and their statuses.

The use of the Diagnostic System Check – Engine Controls will identify the correct procedure for diagnosing the system and where the procedure is located.

Important:
Engine Control System Check Sheet must be used to verify the customer complaint, you need to know the correct (normal) operating behavior of the system and verify that the customer complaint is a valid failure of the system.

Diagnostic System Check – Engine Controls

Description

The Diagnostic System Check – Engine Controls is an organized approach to identifying a condition that is created by a malfunction in the electronic engine control system. The Diagnostic System Check must be the starting point for any driveability concern. The Diagnostic System Check directs the service technician to the next logical step in order to diagnose the concern. Understanding and correctly using the diagnostic table reduces diagnostic time, and prevents the replacement of good parts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.
2. Lack of communication may be because of a partial or a total malfunction of the Keyword 2000 serial data circuit. The specified procedure determines the particular condition.
11. If there are other modules with DTCs set, refer to the DTC list. The DTC list directs you to the appropriate diagnostic procedure. If the control module stores multiple DTCs, diagnose the DTCs in the following order.

- Component level DTCs, such as sensor DTCs, solenoid DTCs, actuator DTCs, and relay DTCs. Diagnose the multiple DTCs within this category in numerical order. Begin with the lowest numbered DTC, unless the diagnostic table directs you otherwise.

Diagnostic System Check – Engine Controls

Important:

- DO NOT perform this diagnostic if there is not a driveability concern, unless another procedure directs you to this diagnostic.
- Before you proceed with diagnosis, search for applicable service bulletins.
- Unless a diagnostic procedure instructs you, DO NOT clear the DTCs.
- If there is a condition with the starting system, refer to the starting system section in the engine mechanical.
- Ensure the battery has a full charge.
- Ensure the battery cables (+) (-) are clean and tight.
- Ensure the ECM grounds are clean, tight, and in the correct location.
- Ensure the ECM harness connectors are clean and correctly connected.
- Ensure the ECM terminals are clean and correctly mating.
- Ensure the fuel injection pump control unit (PCU) ground is clean, tight, and in the correct location.
- Ensure the PCU harness connectors are clean and correctly connected.
- Ensure the PCU terminals are clean and correctly mating.
- Ensure the vehicle maintenance has been done enough.

Step	Action	Value(s)	Yes	No
1	Install the Tech 2. Does the Tech 2 turn ON?	—	Go to Step 2	Go to Tech 2 Does Not Power Up
2	1. Turn ON the ignition, with the engine OFF. 2. Attempt to establish communication with the engine control module (ECM). Does the Tech 2 communicate with the ECM?	—	Go to Step 3	Go to Lost Communication with The Engine Control Module (ECM)

Step	Action	Value(s)	Yes	No
3	Attempt to start the engine. Does the engine start and idle?	—	Go to Step 4	Go to Engine Cranks but Does Not Run
4	Select the DTC display function of the ECM. Does the Tech 2 display any DTCs?	—	Go to Step 5	Go to Step 12
5	1. Turn OFF the ignition for 30 seconds. 2. Start the engine. 3. Monitor the DTC Information with the Tech 2. Did you complete the action?	—	Go to Step 6	—
6	Does the Tech 2 display ECM DTC P0602?	—	Go to Applicable DTC	Go to Step 7
7	Does the Tech 2 display ECM DTC P0251 (Symptom Code 9 or A), P0606 (Symptom Code A or B) or P1605 (Symptom Code C, D or E)?	—	Go to Applicable DTC	Go to Step 8
8	Does the Tech 2 display ECM DTC P0560 (Symptom Code 1, 2 or A)?	—	Go to Applicable DTC	Go to Step 9
9	Does the Tech 2 display ECM DTC P0561 (Symptom Code A or B) or P1625 (Symptom Code A or B)?	—	Go to Applicable DTC	Go to Step 10
10	Does the Tech 2 display ECM DTC P1650 (Symptom Code A or B) or P1651 (Symptom Code A or B)?	—	Go to Applicable DTC	Go to Step 11
11	Is there any other code in any controller that has not been diagnosed?	—	Go to Applicable DTC	Go to Step 12
12	1. Review the following symptoms. 2. Refer to the applicable symptom diagnostic table: • Hard Start • Rough, Unstable, or Incorrect Idle and Stalling • Cuts Out, Misses • Surge/Chuggles • Lack of Power, Sluggishness, or Sponginess • Hesitation, Sag, Stumble • Fuel Knock/Combustion Noise • Poor Fuel Economy • Excessive Smoke (Black Smoke) • Excessive Smoke (White Smoke) Did you find and correct the condition?	—	System OK	Go to Intermittent Conditions

Tech 2 Does Not Power Up

Circuit Description

The data link connector (DLC) is a standardized 16–cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Tech 2 power battery positive voltage at terminal 16.
- Tech 2 power ground at terminal 4.
- Common signal ground at terminal 5.

The Tech 2 will power up with the ignition OFF. Some modules however, will not communicate unless the ignition is ON.

Tech 2 Does Not Power Up

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views

Step	Action	Value(s)	Yes	No
1	**Important:** Make sure the Tech 2 works properly on another vehicle before using this chart. 1. Turn OFF the ignition. 2. Inspect the ENG(B1)(B2) (15A) fuse (F-8 & F-9) in the glove box fuse block. Is the ENG(B1)(B2) (15A) fuse (F-8 & F-9) open?	—	Go to Step 2	Go to Step 3
2	Replace the ENG(B1)(B2) (15A) fuse (F-8 & F-9). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the ENG(B1)(B2) (15A) fuse (F-8 & F-9) or replace the shorted attached component fed by the ENG(B1)(B2) (15A) fuse (F-8 & F-9). Did you complete the repair?	—	Go to Step 7	—
3	1. Check each circuit at the data link connector (DLC) (B-79 connector) for a backed out, spread or missing terminal. 2. Repair the terminal as necessary. Did you find and complete the repair?	—	Go to Step 7	Go to Step 4
4	Connect a test lamp between the B+ circuit (pin 16 of B-79 connector) at the DLC and a known ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the open in the battery voltage circuit to the DLC. Did you complete the repair?	—	Go to Step 7	—
6	1. Test each ground circuit at the DLC (pins 4 and 5 of B-79 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Intermittent Conditions
7	1. Connect the Tech 2 to the DLC. 2. Attempt to turn ON the Tech 2. Does the Tech 2 ON?	—	System OK	Go to Step 1

Lost Communication with The Engine Control Module (ECM)

Circuit Description

The engine control module (ECM) communicates with the Tech 2 over the Keyword 2000 serial data link. However, the ECM and fuel injection pump control unit (PCU) communicates with each other over the controller area network (CAN) link. The CAN link is not used for communication with the Tech 2 and is shared only between the ECM and PCU.

Diagnostic Aids

The following conditions will cause a loss of Keyword 2000 serial data communication between the Tech 2 and any control module:

- A Keyword 2000 serial data circuit open.
- A Keyword 2000 serial data circuit shorted to ground.
- A Keyword 2000 serial data circuit shorted to voltage.
- An internal condition within a module or connector on the Keyword 2000 serial data circuit, that causes a short to voltage or ground to the Keyword 2000 serial data circuit.
- Open ground circuit (pin 5) at the DLC.

Lost Communication with The Engine Control Module (ECM)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	Attempt to establish engine control module (ECM) communications with the Tech 2. Does the ECM communicate with the Tech 2?	—	Go to Step 3	Go to Step 4
3	Test the Keyword 2000 serial data circuit for an intermittently short to ground or intermittently short to voltage. Did you find and correct the condition?	—	Go to Step 17	System OK
4	Check the ECM B-234 and B-233 connectors for poor connections. Did you find and correct the condition?	—	Go to Step 17	Go to Step 5
5	1. Turn ON the ignition, with the engine OFF. 2. Check the Main (100A) (SBF-1), Key (50A) (SBF-2) and ENG(B1)(B2) (15A) fuse (F-8 & F-9). Replace and retest if open. If any fuse continues to open, check for a short to ground on each circuit fed by that fuse. 3. Turn OFF the ignition. 4. Disconnect the ECM B-234 harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Connect a test lamp to ground and check for voltage at the ignition voltage supply circuit at the ECM (pin 39 of B-234 connector). Does the test lamp illuminate?	—	Go to Step 6	Go to Step 14
6	Test the data link connector (DLC) ground circuit at terminal 5 for an open circuit or poor connection. Did you find and correct the condition?	—	Go to Step 17	Go to Step 7
7	Test the Keyword 2000 serial data circuit between the ECM (pin 35 of B-234 connector) and the DLC (pin 7 of B-79 connector) for a short to ground or voltage. Did you find and correct the condition?	—	Go to Step 17	Go to Step 8

Step	Action	Value(s)	Yes	No
8	**Important:** An open in a ground circuit at the ECM will not cause a loss of communication. 1. Check ECM ground for corrosion and tightness. 2. Clean or tighten grounds as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 9
9	1. Turn OFF the ignition. 2. Reconnect the ECM harness connector if previously disconnected. 3. Turn ON the ignition, with the engine OFF. 4. Replace the ECM main relay with the horn relay or replace with a known good relay. 5. Attempt to establish Tech 2 communications with the ECM. Does the ECM communicate with the Tech 2?	—	Go to Step 15	Go to Step 10
10	1. Turn OFF the ignition. 2. Remove the ECM main relay. 3. Turn ON the ignition, with the engine OFF. 4. Using a test lamp, check for battery voltage at both of the battery voltage supply circuits to the ECM main relay (pins 1 and 2 of X-14 connector). 5. Repair the open in the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 11
11	1. Reinstall the ECM main relay. 2. Turn the ignition ON and OFF while listening or feeling for the ECM main relay click. Wait 2 seconds between transitions. Does the ECM main relay click when the ignition is turned ON or OFF?	—	Go to Step 13	Go to Step 12
12	Repair the ECM main relay control circuit between the ECM main relay (pin 4 of X-14 connector) and the ECM (pin 58 of B-234 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance or a poor connection at both the ECM and ECM main relay Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
13	1. Check ECM main relay voltage supply circuit to the ECM between the ECM main relay (pin 5 of X-14 connector) and the ECM (pin 3 of B-234 connector) for the following conditions: • An open circuit • High resistance or a poor connection at the ECM and ECM main relay 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
14	Repair the open in the ignition voltage circuit to the ECM. Did you complete the repair?	—	Go to Step 17	—

Step	Action	Value(s)	Yes	No
15	Replace the ECM main relay. Did you complete the replacement?	—	Go to Step 17	—
16	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—
17	1. Turn OFF the ignition. 2. Reconnect all disconnected connectors. 3. Turn ON the ignition, with the engine OFF. 4. Attempt to establish Tech 2 communications with the ECM. Does the Tech 2 communicate with the ECM?	—	System OK	Go to Step 3

Engine Cranks but Does Not Run

Description

The Engine Cranks but Does Not Run diagnostic table is an organized approach to identifying a condition that causes an engine to not start. The diagnostic table directs the service technician to the appropriate system diagnosis. The diagnostic table assumes the following conditions are met:

- The battery is completely charged and terminals are cleaned and tight.
- The engine cranking speed is normal.
- There is adequate fuel in the fuel tank.
- There is no fuel leak in the fuel line.
- There is no air in the fuel line.
- Filters (Air, Fuel) are clean.
- Fuse and slow blow fuse are normal.

Diagnostic Aids

If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Engine Cranks but Does Not Run

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Crank the engine for specified amount of time. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the Tech 2 display any DTCs that failed this ignition?	15 seconds	Go to Diagnostic Trouble Code (DTC) List	Go to Step 3
3	1. Check for normal readings at key up for the following inputs and output: Refer to the Tech 2 Data List or a known good vehicle to determine normal values. • System Voltage • Engine Coolant Temperature (ECT) • Intake Air Temperature (IAT) • Mass Air Flow (MAF) Sensor • Barometric Pressure 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Inspect the high pressure side between the fuel injection pump and the fuel injection nozzles for fuel leakage. The following components may contain an external leak. • Fuel injection pump • Fuel injection pump control unit (PCU) • Fuel injection solenoid valve • Timing control valve (TCV) • Constant pressure valve (CPV) • Fuel pipe between the fuel injection pump and fuel injection nozzles • Each fuel pipe sleeve nuts • Each fuel pipe connectors • Each gaskets **Notice:** Fuel may leak into the engine from the fuel injection pump. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 2. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 5
5	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 3. Pump the priming pump on the fuel filter until it becomes firm. If there is a leak on the suction side of the fuel system between the priming pump and the fuel injection pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 6
6	1. Remove the fuel hose that connects to the fuel injection pump suction side. 2. Remove the fuel pipe connector that connects to the fuel injection pump suction side. 3. Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Disconnect the fuel hose that connects to the fuel injection pump suction side. In order to measure the discharged fuel amount, put the hose into a bottle or a container. 2. Pump the priming pump on the fuel filter. **Notice:** If there is a leak on the suction side of the fuel system, the fuel from the disconnected hose will not flow out sufficiently and fuel leakage may occur. Also if there is a restriction on the suction side of the fuel system, the fuel from the disconnected hose will not flow out sufficiently that is most likely caused by clogged fuel filter or kinked fuel hose or pipe. 3. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. 4. Repair any fuel system leaks and restrictions as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	1. Other possible causes for the no-start condition: • Fuel injection pump mechanical timing incorrect • Flywheel installed incorrectly causing the crankshaft position (CKP) sensor to be incorrectly timed to the engine. Disconnect sensor and attempt to start engine to verify. • Heavily restricted intake, exhaust or catalytic converter plugged solid • Poor engine compression • Water or gasoline contamination in fuel 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
9	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Attempt to start the engine. Does the engine start and continue to run?	—	Go to Step 11	Go to Step 2
11	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

Diagnostic Trouble Code (DTC) List

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0100 (7)	65	ON	Mass Air Flow (MAF) Sensor Circuit 5V Reference High Voltage	• The ignition switch is ON.	• The ECM detects that the MAF sensor 5 volts reference circuit voltage is more than 5.2 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage. • Sensor 5V reference circuit is short to the sensor ignition voltage circuit. • Faulty MAF sensor. • Faulty ECM.
P0100 (9)	65	ON	Mass Air Flow (MAF) Sensor Voltage 5V Reference Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the MAF sensor 5 volts reference circuit voltage is less than 4.6 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to ground. • Sensor 5V reference circuit is short to the low reference circuit. • Faulty MAF sensor. • Faulty ECM.
P0100 (B)	65	ON	Mass Air Flow (MAF) Sensor Circuit Low Voltage	• The ignition switch is ON. • The engine is running.	• The ECM calculated MAF is lower than -18.6 kg/h for 5 seconds.	• Sensor ignition voltage feed circuit is open circuit or high resistance. • Sensor 5V reference circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty MAF sensor installation. • Faulty MAF sensor. • Faulty ECM.
P0100 (C)	65	ON	Mass Air Flow (MAF) Sensor Circuit High Voltage	• The ignition switch is ON. • The engine is running.	• The ECM calculated MAF is higher than 806 kg/h for 10 seconds.	• Sensor signal circuit is short to any 5V reference circuit, short to battery or ignition voltage circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty MAF sensor. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0110 (1)	23	ON	Intake Air Temperature (IAT) Sensor Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the IAT sensor signal voltage is more than 4.7 volts for 3 seconds.	• Sensor signal circuit is open circuit, high resistance, short to any 5V reference circuit, short to battery or ignition voltage. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty IAT sensor. • Faulty ECM.
P0110 (2)	23	ON	Intake Air Temperature (IAT) Sensor Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the IAT sensor signal voltage is less than 0.3 volts for 3 seconds.	• Sensor signal circuit is short to ground or short to the low reference circuit. • Faulty IAT sensor. • Faulty ECM.
P0115 (1)	14	ON	Engine Coolant Temperature (ECT) Sensor Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the ECT sensor signal voltage is more than 4.7 volts for 3 seconds.	• Sensor signal circuit is open circuit, high resistance, short to any 5V reference circuit, short to battery or ignition voltage. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty ECT sensor. • Faulty ECM.
P0115 (2)	14	ON	Engine Coolant Temperature (ECT) Sensor Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the ECT sensor signal voltage is less than 0.3 volts for 3 seconds.	• Sensor signal circuit is short to ground or short to the low reference circuit. • Faulty ECT sensor. • Faulty ECM.
P0180 (B)	15	ON	Fuel Temperature Sensor Circuit	• The ignition switch is ON.	• The PCU internal FT sensor output is lower than -40°C (-40°F) for 3 seconds or higher than 150°C (302°F) for 3 seconds.	• Faulty PCU.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0215 (A)	52	ON at next ignition cycle	Engine Shutoff (ESO) Solenoid Control Circuit	• The ignition switch is OFF. • The engine speed is lower than 1500 RPM. • The vehicle speed is lower than 1.5 km/h (1 MPH).	• After the condition for running the DTC for 2 seconds, the engine speed is higher than 200 RPM when the ESO solenoid valve is commanded shutoff from the PCU.	• Faulty fuel injection pump.
P0215 (B)	52	ON	Engine Shutoff (ESO) Solenoid Control Circuit	• The ignition switch is ON.	• The PCU detects high voltage condition on the ESO solenoid valve control circuit for longer than 1 second when the ECM does not command shutoff.	• ESO solenoid valve control circuit is short to battery or ignition voltage. • Faulty PCU. • Faulty ECM.
P0215 (C)	52	ON	Engine Shutoff (ESO) Solenoid Control Circuit	• The ignition switch is OFF. • The engine speed is lower than 1500 RPM. • The vehicle speed is lower than 1.5 km/h (1 MPH).	• The engine speed is higher than 200 RPM within 2 seconds after the condition for running the DTC are met.	• ESO solenoid valve control circuit is open circuit, high resistance or short to ground. • Faulty PCU. • Faulty ECM.
P0215 (D)	52	ON	Engine Shutoff (ESO) Solenoid Control Circuit	• The ignition switch is OFF.	• The ECM detects internal CAN controller does not Bus OFF mode.	• Faulty ECM.
P0216 (A)	54	ON	Injection Timing Control Circuit	• The engine speed is higher than 700 RPM. • The fuel injection quantity is higher than 4 mg/strk.	• The PCU monitored actual fuel injection timing is advanced more than desired by 3°CA for longer than 12 seconds or retarded more than desired by 6°CA for longer than 12 seconds.	• Excessive air in the fuel system. • Loss fuel. • Fuel suction side looseness, kinks or blocked. • Faulty or clogged fuel filter. • Contaminated fuel. • Faulty timing device. • Faulty fuel injection pump CMP sensor.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0216 (B)	54	ON	Injection Timing Control Circuit	• The engine speed is higher than 2014 RPM.	• The PCU monitored actual fuel injection timing is oscillated higher than desired by 5.2°CA.	• Excessive air in the fuel system. • Loss fuel. • Fuel suction side looseness, kinks or blocked. • Faulty or clogged fuel filter. • Contaminated fuel. • Faulty timing device. • Faulty fuel injection pump CMP sensor.
P0251 (6)	53	ON	Injection Pump Fuel Metering Control	• The fuel injection pump CMP sensor signal is generated. • The CAN communication between the ECM and PCU is normal.	• The PCU detects that the fuel injection solenoid valve is operated when the desired fuel injection quantity is commanded 0 mg/strk.	• Faulty fuel injection pump. • Faulty PCU.
P0251 (7)	53	ON	Injection Pump Fuel Metering Control	• The fuel injection pump CMP sensor signal is generated. • The CKP sensor signal is generated. • The engine speed is higher than 500 RPM.	• The PCU detects that the doubled fuel injection pump speed is lower than engine speed by 800 RPM for longer than 0.2 seconds.	• Faulty CKP sensor signal. • Faulty fuel injection pump CMP sensor signal. • Electrical interference. • Magnetic interference. • Faulty PCU.
P0251 (9)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The PCU detects internal fuel injection pump control maps are not programmed during self-test.	• Faulty PCU.
P0251 (A)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The PCU detects internal EEPROM or A/D converter is failed during self-test.	• Faulty PCU.
P0251 (B)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The PCU detects that the fuel injection solenoid valve drive circuit is failed during self-test.	• Faulty fuel injection pump. • Faulty PCU.
P0251 (D)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The PCU detects that the fuel injection solenoid valve drive circuit voltage level is abnormal during self-test.	• Faulty fuel injection pump. • Faulty PCU.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0251 (E)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The ECM detects communication message from the PCU is not received for longer than 1 second.	• CAN high circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • CAN low circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty PCU. • Faulty ECM.
P0335 (B)	43	ON	Crankshaft Position (CKP) Sensor Circuit	• The ignition switch is ON. • The engine speed is higher than 665 RPM.	• The ECM detects extra or missing CKP sensor signals while engine is running.	• Sensor signal circuit is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Sensor low reference circuit is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Sensor shield ground is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Faulty CKP sensor. • Faulty ECM. • Electrical interference. • Magnetic interference. • Faulty sensor installation. • Faulty flywheel circumference.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0335 (D)	43	ON	Crankshaft Position (CKP) Sensor Circuit	• DTC P0335 (Symptom Code B) is not set. • The ignition switch is ON. • The fuel injection pump CMP sensor signal is generated. • The CAN communication between the ECM and PCU is normal.	• The ECM detects that the CKP sensor signals are not generated when doubled fuel injection pump rotation speed is higher than 50 RPM.	• Sensor signal circuit is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Sensor low reference circuit is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Sensor shield ground is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Faulty CKP sensor. • Faulty ECM. • Electrical interference. • Magnetic interference. • Faulty sensor installation. • Faulty flywheel circumference.
P0335 (E)	43	ON	Crankshaft Position (CKP) Sensor Circuit	• The ignition switch is ON.	• The ECM detects that the engine speed is higher than 5700 RPM for 0.2 seconds.	• Engine overrun. • Faulty CKP sensor. • Faulty ECM. • Electrical interference. • Magnetic interference. • Faulty flywheel circumference.
P0380 (4)	66	ON	Glow Plug Relay Control Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the low voltage condition on the glow relay control circuit for longer than 3 seconds when the relay is commanded OFF.	• Glow relay ignition voltage feed circuit on coil side is open circuit or high resistance. • Glow relay control circuit is open circuit, high resistance or short to ground. • Glow relay is poor installation. • Faulty glow relay. • Faulty ECM.
P0380 (8)	66	ON	Glow Plug Relay Control Circuit High Voltage	• The ignition switch is ON.	• The ECM detect that the high voltage condition on the glow relay control circuit for longer than 1 second when the relay is commanded ON.	• Glow relay control circuit is short to battery or ignition voltage circuit. • Faulty glow relay. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0381 (4)	67	ON	Glow Plug Indicator Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the low voltage condition on the glow indicator lamp control circuit for longer than 3 seconds when the indicator lamp is commanded OFF.	• Meter (10A) fuse (F-16) open. • Glow indicator lamp ignition voltage feed circuit is open circuit or high resistance. • Glow indicator lamp control circuit is open circuit, high resistance or short to ground. • Poor harness connector connection. • Glow indicator lamp bulb burned out. • Faulty instrument panel cluster (meter assembly). • Faulty ECM.
P0381 (8)	67	ON	Glow Plug Indicator Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the high voltage condition on the glow indicator lamp control circuit for longer than 1 second when the indicator lamp is commanded ON.	• Glow indicator lamp control circuit is short to battery or ignition voltage circuit. • Faulty instrument panel cluster (meter assembly). • Faulty ECM.
P0400 (3)	32	ON	Exhaust Gas Recirculation (EGR) System Performance	• The ignition switch is ON. • The engine is running. • The BARO is between 880 hPa and 1100 hPa. • The IAT is between 16°C (61°F) and 34°C (93°F). • The ECT is between 70°C (158°F) and 100°C (212°F).	• The ECM detects that the MAF amount is 150 mg/strk lower than the desired MAF for 60 seconds.	• MAF sensor circuits are high resistance. • MAF sensor signal circuit is short to IAT sensor signal circuit. • Intake air leakage. • Intake duct disconnected. • Intake system is obstructed. • Faulty turbocharger. • Faulty exhaust system. • Faulty EGR valve vacuum control system. • Faulty EGR valve. • Faulty EGR solenoid valve. • Faulty EGR solenoid valve vacuum hose routing. • Faulty MAF sensor.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0400 (4)	32	ON	Exhaust Gas Recirculation (EGR) Solenoid Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the low voltage condition on the EGR solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.	• EGR solenoid valve ignition voltage feed circuit is open circuit or high resistance. • EGR solenoid valve control circuit is open circuit, high resistance or short to ground. • Poor harness connector connection. • Faulty EGR solenoid valve. • Faulty ECM.
P0400 (5)	32	ON	Exhaust Gas Recirculation (EGR) System Performance	• The ignition switch is ON. • The engine is running. • The BARO is between 880 hPa and 1100 hPa. • The IAT is between 16°C (61°F) and 34°C (93°F). • The ECT is between 70°C (158°F) and 100°C (212°F).	• The ECM detects that the MAF amount is 150 mg/strk higher than the desired MAF for 60 seconds.	• MAF sensor low reference circuit is high resistance. • Faulty EGR valve vacuum control system. • Faulty EGR valve. • Faulty vacuum pump. • Faulty EGR solenoid valve. • Faulty EGR solenoid valve vacuum hose routing. • Faulty MAF sensor. • Faulty ECM.
P0400 (8)	32	ON	Exhaust Gas Recirculation (EGR) Solenoid Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the high voltage condition on the EGR solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.	• EGR solenoid valve control circuit is short to battery or ignition voltage circuit. • Faulty EGR solenoid valve. • Faulty ECM.
P0500 (1)	24	OFF	Vehicle Speed Sensor (VSS) Circuit	• The ignition switch is ON.	• The ECM detects that the vehicle speed is higher than 190 km/h (119 MPH) for 5 seconds.	• Vehicle speed too high. • Electrical interference. • Magnetic interference. • Faulty VSS. • Faulty ECM.
P0500 (A)	24	OFF	Vehicle Speed Sensor (VSS) Circuit	• The ignition switch is ON.	• The ECM detects that the vehicle speed sensor signal frequency is too high for 0.6 seconds.	• Electrical interference. • Magnetic interference. • Faulty VSS. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0500 (B)	24	OFF	Vehicle Speed Sensor (VSS) Circuit	• The ignition switch is ON. • The engine speed is higher than 3600 RPM. • The fuel injection quantity is more than 41 mg/strk.	• The ECM detects that the vehicle speed is lower than 1.5 km/h (1 MPH) for 60 seconds.	• Meter (10A) fuse (F-16) open. • Sensor ignition voltage circuit is open circuit or high resistance. • Sensor signal circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty instrument panel cluster (meter assembly). • Faulty VSS. • Faulty ECM.
P0560 (1)	35	OFF	System Voltage	—	• The ECM detects that the battery voltage feed circuit voltage is more than 20 volts.	• Incorrect “Jump Starting”. • Faulty charging system. • Faulty ECM.
P0560 (2)	35	OFF	System Voltage	—	• The ECM detects that the battery voltage feed circuit voltage is less than 7 volts.	• Faulty charging system. • Battery voltage feed circuit is high resistance. • Faulty ECM.
P0560 (A)	35	OFF	System Voltage	—	• The PCU battery voltage feed circuit voltage is less than 4.5 volts or more than 27 volts.	• Incorrect “Jump Starting”. • Faulty charging system. • Battery voltage feed or ground circuit is high resistance. • Faulty PCU.
P0561 (A)	18	OFF	Ignition Switch Circuit	—	• The ECM detects that the ignition voltage circuit is changed ON to OFF during initialization.	• ECM main relay control circuit is short to ground. • Ignition voltage feed circuit is intermittently open circuit or high resistance. • Faulty ignition switch.
P0561 (B)	18	OFF	Ignition Switch Circuit	—	• The ECM detects internal ignition voltage feed circuit is failed after initialization.	• Faulty ECM.
P0602 (25)	–	ON	Control Module Not Programmed	—	• VIN in the ECM is not programmed.	• VIN is not programmed.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0606 (A)	28	ON	Control Module Internal Performance	—	• The ECM detects that the internal CPU does not react.	• Faulty ECM.
P0606 (B)	28	ON	Control Module Internal Performance	• The accelerator pedal position is less than 1%. • The desired fuel injection quantity is 0 mg/strk.	• The ECM detects that the engine speed is higher than 2000 RPM.	• Faulty ECM.
P0645 (4)	46	ON	Air Conditioning (A/C) Clutch Relay Control Circuit Low Voltage	• The ignition switch is ON. • The A/C compressor relay is once commanded ON.	• The ECM detects that the low voltage condition on the A/C compressor relay control circuit for longer than 3 seconds when the relay is commanded OFF.	• A/C compressor relay ignition voltage feed circuit on coil side is open circuit or high resistance. • A/C compressor relay control circuit is open circuit, high resistance or short to ground. • A/C compressor relay is poor installation. • Faulty A/C compressor relay. • Faulty ECM.
P0645 (8)	46	ON	Air Conditioning (A/C) Clutch Relay Control Circuit High Voltage	• The ignition switch is ON. • The A/C compressor relay is once commanded ON.	• The ECM detects that the high voltage condition on the A/C compressor relay control circuit for longer than 3 seconds when the relay is commanded ON.	• A/C compressor relay control circuit is short to battery or ignition voltage circuit. • Faulty A/C compressor relay. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0703 (A)	25	ON	Brake Switch Circuit	• The ignition switch is ON. • The engine speed is higher than 1500 RPM. • The accelerator pedal position is more than 10%. • The vehicle speed is higher than 15 km/h (9 MPH).	• The ECM detects that the brake pedal 1 switch is ON (Applied) when the brake pedal 2 switch is OFF (Released) for longer than 30 seconds within the enabling conditions ever since ignition switch is ON.	• Stop (15A) fuse (F-5) open. • Brake pedal 1 switch battery voltage feed circuit is open circuit or high resistance. • Brake pedal 1 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Brake pedal 2 switch ignition voltage feed circuit is open circuit or high resistance. • Brake pedal 2 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Misadjusted brake pedal switch. • Brake pedal switch is poor connection. • Faulty brake pedal switch. • Faulty ECM.
P0703 (B)	25	ON	Brake Switch Circuit	• The ignition switch is ON. • The engine speed is higher than 1500 RPM. • The accelerator pedal position is more than 10%. • The vehicle speed is higher than 15 km/h (9MPH).	• The ECM detects that the brake pedal 1 switch is OFF (Released) when the brake pedal 2 switch is ON (Applied) for longer than 30 seconds.	• Stop (15A) fuse (F-5) open. • Brake pedal 1 switch battery voltage feed circuit is open circuit or high resistance. • Brake pedal 1 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Brake pedal 2 switch ignition voltage feed circuit is open circuit or high resistance. • Brake pedal 2 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Misadjusted brake pedal switch. • Brake pedal switch is poor connection. • Faulty brake pedal switch. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0704 (6)	57	ON	Clutch Switch Input Circuit	• The ignition switch is ON.	• The ECM detects that the clutch pedal switch signal does not change during the vehicle speed changes between 5 km/h (3MPH) and 80 km/h (50MPH).	• Clutch pedal switch ignition voltage feed circuit is open circuit or high resistance. • Clutch pedal switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Misadjusted clutch pedal switch. • Clutch pedal switch is poor connection. • Faulty clutch pedal switch. • Faulty ECM.
P1105 (2)	86	ON	Barometric Pressure (BARO) Sensor Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the BARO sensor signal voltage is more than 4.4 volts for 1 second.	• Faulty ECM.
P1105 (2)	86	ON	Barometric Pressure (BARO) Sensor Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the BARO sensor signal voltage is less than 1.5 volts for 1 second.	• Faulty ECM.
P1110 (4)	72	ON	Intake Throttle Solenoid Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the low voltage condition on the intake throttle solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.	• Intake throttle solenoid valve ignition voltage feed circuit is open circuit or high resistance. • Intake throttle solenoid valve control circuit is open circuit, high resistance or short to ground. • Poor harness connector connection. • Faulty intake throttle solenoid valve. • Faulty ECM.
P1110 (8)	72	ON	Intake Throttle Solenoid Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the high voltage condition on the intake throttle solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.	• Intake throttle solenoid valve control circuit is short to battery or ignition voltage circuit. • Faulty intake throttle solenoid valve. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1120 (1)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the APP sensor signal voltage is more than 4.9 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage. • Sensor 5V reference circuit is short to ground or short to the low reference circuit. • Sensor signal circuit is short to any 5V reference circuit, short to battery or ignition voltage circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty APP sensor. • Faulty ECM.
P1120 (2)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the APP sensor signal voltage is less than 0.3 volts for 0.5 seconds.	• Sensor 5V reference circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty APP sensor. • Faulty ECM.
P1120 (7)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit 5V Reference High Voltage	• The ignition switch is ON.	• The ECM detects that the APP sensor voltage supply circuit is more than 5.2 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage circuit. • Faulty ECM.
P1120 (9)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit 5V Reference Low Voltage	• The ignition switch is ON.	• The ECM detects that the APP sensor voltage supply circuit is less than 4.6 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to ground or short to the low reference circuit. • Faulty APP sensor. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1120 (D)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit Correlation	• The ignition switch is ON. • The engine speed is higher than 1700 RPM. • The vehicle speed is higher than 1.5 km/h (1MPH).	• The ECM detects APP sensor angle is stationary more than 18%, then brake pedal is depressed for longer than 2 seconds.	• Brake pedal 1 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Accelerator pedal stuck. • Intake throttle valve stuck. • Intake throttle valve control cable damaged, stuck or no free play. • Misadjusted APP sensor. • Faulty APP sensor. • Misadjusted brake pedal switch. • Faulty brake pedal switch. • Faulty ECM.
P1120 (E)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit Correlation	• The ignition switch is ON.	• The ECM detects APP sensor angle is more than 18%, then idle switch is ON for longer than 0.6 seconds.	• APP sensor low reference circuit is high resistance. • Idle switch signal circuit is short to ground. • Poor harness connector connection. • Faulty APP sensor. • Faulty idle switch. • Faulty ECM.
P1173 (3)	22	OFF	Limitation of Injection Quantity	• The ignition switch is ON.	• The ECM detects an excessive high coolant temperature for longer than 30 seconds.	• Engine overheat. • Faulty engine cooling system. • Faulty ECT sensor.
P1173 (7)	22	OFF	Limitation of Injection Quantity	• The ignition switch is ON.	• The ECM detects an excessive high FT for longer than 30 seconds.	• Faulty PCU.
P1173 (A)	22	OFF	Limitation of Injection Quantity	• The ignition switch is ON.	• The ECM detects an excessive low FT for longer than 30 seconds.	• Faulty PCU.
P1335 (A)	43	ON	Crankshaft Position (CKP) Sensor Circuit	• The ignition switch is ON.	• The PCU detects CKP sensor signal from the ECM is faulty.	• CKP sensor signal output circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Poor harness connector connection. • Faulty PCU. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1345 (A)	41	ON	Crankshaft Position (CKP) – Camshaft Position (CMP) Correlation	—	• The PCU received faulty fuel injection pump CMP sensor signal for 1 second.	• Faulty fuel injection pump. • Faulty PCU.
P1520 (A)	47	ON	Park/Neutral Position Switch Circuit	• The ignition switch is ON. • The engine speed is higher than 1500 RPM. • The vehicle speed is higher than 64 km/h (40MPH). • The clutch pedal is released.	• The ECM detects that the neutral switch signal is continuously ON (neutral) during three consecutive driving cycles.	• Neutral switch signal circuit is short to battery or ignition voltage. • Faulty neutral switch. • Faulty ECM.
P1520 (B)	47	ON	Park/Neutral Position Switch Circuit	• The ignition switch is ON. • The engine speed is higher than 665 RPM. • The vehicle speed is lower than 2 km/h (3MPH). • The clutch pedal is released after once depressed.	• The ECM detects that the neutral switch signal is continuously OFF (other than neutral) during three consecutive driving cycles.	• Neutral switch ignition voltage feed circuit is open circuit or high resistance. • Neutral switch signal circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty neutral switch. • Faulty ECM.
P1576 (4)	71	ON	Exhaust Brake Solenoid Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the low voltage condition on the exhaust brake solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.	• Exhaust brake solenoid valve ignition voltage feed circuit is open circuit or high resistance. • Exhaust brake solenoid valve control circuit is open circuit, high resistance or short to ground. • Poor harness connector connection. • Faulty exhaust brake solenoid valve. • Faulty ECM.
P1576 (8)	71	ON	Exhaust Brake Solenoid Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the high voltage condition on the exhaust brake solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.	• Exhaust brake solenoid valve control circuit is short to battery or ignition voltage circuit. • Faulty exhaust brake solenoid valve. • Faulty ECM.
P1605 (C)	55	ON	Control Module Internal Performance	—	• The ECM detects internal seed or key file in EEPROM data is destroyed.	• Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1605 (D)	55	ON	Control Module Internal Performance	—	• The ECM detects reading or writing from the EEPROM data is failed during initialization.	• Faulty ECM.
P1605 (E)	55	ON	Control Module Internal Performance	—	• The ECM detects total sum of EEPROM data is not equal to registered value during initialization.	• Faulty ECM.
P1625 (A)	76	OFF	ECM Main Relay Circuit	—	• The ECM detects that the ECM main relay is turned OFF before commanded turned OFF.	• ECM main relay control circuit is intermittently open circuit or high resistance. • ECM battery voltage feed circuit is intermittently open or high resistance. • Faulty ECM main relay.
P1625 (B)	76	OFF	ECM Main Relay Circuit	• The ignition switch is OFF.	• The ECM detects that the ECM main relay is turned ON for longer than 2 seconds.	• ECM main relay control circuit is short to ground. • ECM battery voltage circuit is short to battery. • Faulty ECM main relay. • Faulty ECM.
P1630 (A)	51	ON	Injection Pump Fuel Metering Control	—	• The ECM detects that the PCU monitored fuel injection solenoid valve control current is too high.	• Faulty fuel injection pump. • Faulty PCU.
P1630 (B)	51	ON	Injection Pump Fuel Metering Control	—	• The ECM detects that the PCU continuously flow the control current to the fuel injection solenoid valve.	• Faulty fuel injection pump. • Faulty PCU.
P1650 (A)	44	ON	CAN Device Offline	—	• The ECM detects that the PCU receives from the CAN controller reset or Bus Offline.	• CAN high circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • CAN low circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty PCU. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1650 (B)	44	ON	CAN Device Hang-up	—	• The ECM detects internal CAN controller does not react.	• Faulty ECM.
P1651 (A)	45	ON	CAN Malfunction	—	• The ECM detects that the PCU does not receive the CAN messages from the ECM.	• CAN high circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • CAN low circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty PCU. • Faulty ECM.
P1651 (B)	45	ON	CAN Malfunction	—	• The ECM does not receive the CAN messages from the PCU.	• CAN high circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • CAN low circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty PCU. • Faulty ECM.
P1690 (4)	77	OFF	Malfunction Indicator Lamp (MIL) Control Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects a low voltage condition on the MIL control circuit for longer than 3 seconds when the MIL is commanded OFF.	• Meter (10A) fuse (F-16) open. • MIL ignition voltage feed circuit is open circuit or high resistance. • MIL control circuit is open circuit, high resistance or short to ground. • Poor harness connector connection. • MIL bulb burned out. • Faulty instrument panel cluster (meter assembly). • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on Tech 2	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1690 (8)	77	OFF	Malfunction Indicator Lamp (MIL) Circuit High Voltage	• The ignition switch is ON.	• The ECM detects a high voltage condition on the MIL control circuit for longer than 1 second when the MIL is commanded ON.	• MIL control circuit is short to battery or ignition voltage circuit. • Faulty instrument panel cluster (meter assembly). • Faulty ECM.

P0100 (Symptom Code 7) (Flash Code 65)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor has the following circuits.

- Ignition voltage circuit
- 5 volts reference circuit
- Low reference circuit
- MAF sensor signal circuit

The engine control module (ECM) provides 5 volts reference voltage through the reference circuit to the MAF sensor. The ECM monitors the voltage on the 5 volts reference circuit. If the ECM detects an excessively high MAF sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the MAF sensor 5 volts reference circuit voltage is more than 5.2 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a MAF substitution of 1600 mg/strk for engine control.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The MAF Sensor parameter on the Tech 2 will only update with engine running.

Test Description

The number below refers to the step number on the diagnostic table.
3. If the MAF sensor 5 volts reference circuit between the ECM and the sensor is normal, the sensor signal voltage low DTC P0100 (Symptom Code B) will set.

DTC P0100 (Symptom Code 7) (Flash Code 65)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the mass air flow (MAF) sensor harness connector. 3. Start the engine and let idle for 30 seconds. 4. Monitor the DTC Information with the Tech 2. Does DTC P0100 (Symptom Code B) set, but not DTC P0100 (Symptom Code 7)?	—	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 83 of B-233 connector) and the MAF sensor (pin 4 of J-182 connector) for the following conditions: • A short to battery or ignition voltage • A short to the sensor ignition voltage 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Replace the MAF sensor. Refer to Mass Air Flow Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0100 (Symptom Code 9) (Flash Code 65)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor has the following circuits.

- Ignition voltage circuit
- 5 volts reference circuit
- Low reference circuit
- MAF sensor signal circuit

The engine control module (ECM) provides 5 volts reference voltage through the reference circuit to the MAF sensor. The ECM monitors the voltage on the 5 volts reference circuit. If the ECM detects an excessively low MAF sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the MAF sensor 5 volts reference circuit voltage is less than 4.6 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a MAF substitution of 1600 mg/strk for engine control.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The MAF Sensor parameter on the Tech 2 will only update with engine running.

Test Description

The number below refers to the step number on the diagnostic table.
3. If the MAF sensor 5 volts reference circuit between the ECM and the sensor is normal, the sensor signal voltage low DTC P0100 (Symptom Code B) will set.

DTC P0100 (Symptom Code 9) (Flash Code 65)

P0100 (Symptom Code B) (Flash Code 65)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor has the following circuits.

- Ignition voltage circuit
- 5 volts reference circuit
- Low reference circuit
- MAF sensor signal circuit

The engine control module (ECM) monitors the MAF sensor signal for voltage outside the normal range of the MAF sensor. If the ECM detects an excessively low MAF sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM calculated MAF is lower than -18.6 kg/h for 5 seconds. This indicates the ECM detects that the MAF sensor signal voltage is smaller than a predetermined range during engine run.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a MAF substitution of 1600 mg/strk for engine control.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL that the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Wrong direction of MAF sensor installation will cause this DTC to set.
- Contaminated or restricted MAF sensor will cause this DTC to set.
- The MAF Sensor parameter on the Tech 2 will only update with engine running.

Test Description

The number below refers to the step number on the diagnostic table.
5. If the MAF sensor signal circuit between the ECM and the sensor is short to ground or any low reference circuits, the sensor 5 volts reference voltage low DTC P0100 (Symptom Code 9) will set.
6. If the MAF sensor signal circuit between the ECM and the sensor is normal, the sensor signal voltage high DTC P0100 (Symptom Code C) will set.

DTC P0100 (Symptom Code B) (Flash Code 65)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
3	1. Turn OFF the ignition. 2. Disconnect the mass air flow (MAF) sensor harness connector. 3. Connect a test lamp between the ignition voltage feed circuit of the MAF sensor harness (pin 2 of J-182 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 7
4	1. Keep the ignition ON, with the engine OFF. 2. Connect a DMM between the 5 volts reference circuit of the MAF sensor harness (pin 4 of J-182 connector) and a known good ground. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 5	Go to Step 8
5	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit of the MAF sensor harness (pins 4 and 5 of J-182 connector). 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Monitor the DTC Information with the Tech 2. Does DTC P0100 (Symptom Code 9) set, but not DTC P0100 (Symptom Code B)?	—	Go to Step 9	Go to Step 6
6	1. Keep the 3-amp fused jumper wire with connected. 2. Start the engine and let idle for 30 seconds. Does DTC P0100 (Symptom Code C) set, but not DTC P0100 (Symptom Code B)?	—	Go to Step 11	Go to Step 10
7	Repair the open circuit or high resistance on the ignition voltage feed circuit between the ECM main relay (pin 5 of X-14 connector) and the MAF sensor (pin 2 of J-182 connector). Did you complete the repair?	—	Go to Step 15	—
8	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 83 of B-233 connector) and the MAF sensor (pin 4 of J-182 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
9	1. Test the signal circuit between the ECM (pin 88 of B-233 connector) and the MAF sensor (pin 5 of J-182 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14

Step	Action	Value(s)	Yes	No
10	1. Test the signal circuit between the ECM (pin 88 of B-233 connector) and the MAF sensor (pin 5 of J-182 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
11	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the MAF sensor (pins 2, 4 and 5 of J-182 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the MAF sensor circuits at the harness connector of the ECM (pins 83 and 88 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Replace the MAF sensor. Refer to Mass Air Flow Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0100 (Symptom Code C) (Flash Code 65)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor has the following circuits.

- Ignition voltage circuit
- 5 volts reference circuit
- Low reference circuit
- MAF sensor signal circuit

The engine control module (ECM) monitors the MAF sensor signal for voltage outside the normal range of the MAF sensor. If the ECM detects an excessively high MAF sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM calculated MAF is higher than 806 kg/h for 10 seconds. This indicates the ECM detects that the MAF sensor signal voltage is higher than a predetermined range during engine run.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a MAF substitution of 1600 mg/strk for engine control.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The MAF Sensor parameter on the Tech 2 will only update with engine running.

Test Description

The number below refers to the step number on the diagnostic table.
3. If the MAF sensor signal circuit between the ECM and the sensor is normal, the sensor signal voltage low DTC P0100 (Symptom Code B) will set.

P0110 (Symptom Code 1) (Flash Code 23)

Circuit Description

The intake air temperature (IAT) sensor is fitted between the air cleaner and turbocharger internal to the mass air flow (MAF) sensor. The IAT sensor is a variable resistor. The IAT sensor has a signal circuit and a low reference circuit. The IAT sensor measures the temperature of the air entering the engine. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and a ground for the IAT low reference circuit. When the IAT sensor is cold, the sensor resistance is high. When the air temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the IAT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the IAT signal circuit. If the ECM detects an excessively high IAT signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the IAT sensor signal voltage is more than 4.7 volts for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an IAT substitution of 0°C (32°F) for engine control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the IAT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

Notice:

- The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake temperature if the ignition switch is being ON.

P0115 (Symptom Code 1) (Flash Code 14)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor has a signal circuit and a low reference circuit. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit. If the ECM detects an excessively high ECT signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the ECT sensor signal voltage is more than 4.7 volts for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an ECT substitution of fuel temperature for engine control.
- The ECM uses an ECT substitution of 60°C (120°F) for injection timing control.
- The ECM uses an ECT substitution of -25°C (-13°F) for glow control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- After starting the engine, the ECT should rise steadily to about 80°C – 85°C (176°F – 185°F) then stabilize when the thermostat opens.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

6	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the signal circuit of the ECT sensor harness (pin 1 of E-16 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. 4. Observe the ECT parameter with the Tech 2. Is the ECT parameter more than the specified value?	135°C (275°F)	Go to Step 8	Go to Step 7
7	1. Test the signal circuit between the ECM (pin 89 of B-233 connector) and the ECT sensor (pin 1 of E-16 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
8	1. Test the low reference circuit between the ECM (pin 93 of B-233 connector) and the ECT sensor (pin 2 of E-16 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
9	1. Test the signal circuit between the ECM (pin 89 of B-233 connector) and the ECT sensor (pin 1 of E-16 connector) for a short to any 5 volts reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 10
10	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the ECT sensor (pins 1 and 2 of E-16 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12

Step	Action	Value(s)	Yes	No
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the ECT sensor circuits at the harness connector of the ECM (pins 89 and 93 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
12	Replace the ECT sensor. Refer to Engine Coolant Temperature Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—
13	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—
14	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 15
15	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0115 (Symptom Code 2) (Flash Code 14)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor has a signal circuit and a low reference circuit. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit. If the ECM detects an excessively low ECT signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the ECT sensor signal voltage is less than 0.3 volts for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an ECT substitution of fuel temperature for engine control.
- The ECM uses an ECT substitution of 60°C (120°F) for injection timing control.
- The ECM uses an ECT substitution of -25°C (-13°F) for glow control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- After starting the engine, the ECT should rise steadily to about 80°C – 85°C (176°F – 185°F) then stabilize when the thermostat opens.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

P0180 (Symptom Code B) (Flash Code 15)

Circuit Description

The fuel temperature (FT) sensor is internal to the fuel injection pump control unit (PCU). It detects fuel temperature in the fuel injection pump. The engine control module (ECM) and PCU communicates with each other over the controller area network (CAN) link. If the PCU internal FT sensor output is an excessively high or low, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The PCU internal FT sensor output is lower than -40°C (-40°F) for 3 seconds or higher than 150°C (302°F).

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a default FT substitution for engine control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- FT sensor is internal to the PCU and it is part of the fuel injection pump assembly.

DTC P0180 (Symptom Code B) (Flash Code 15)

3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. (Fuel temperature (FT) sensor is internal to the fuel injection pump control unit (PCU) and it is part of the fuel injection pump assembly.) Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0215 (Symptom Code A) (Flash Code 52)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the ECM detects that the engine is continuously run after the ignition switch is OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is OFF.
- The engine speed is lower than 1500 RPM.
- The vehicle speed is lower than 1.5 km/h (1MPH).

Condition for Setting the DTC

- After the condition for running this DTC for 2 seconds, the engine speed is higher than 200 RPM when the ESO solenoid valve is commanded shutoff from the PCU. This indicates the PCU reacts to the command from the ECM but ESO solenoid valve does not react to the command from the PCU and fuel cannot shutoff.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) at next ignition cycle.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—

Step	Action	Value(s)	Yes	No
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. 5. Turn OFF the engine. Does the DTC fail this ignition before the ECM turns OFF?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0215 (Symptom Code B) (Flash Code 52)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the PCU detects that the ESO solenoid valve control circuit voltage level from the ECM to PCU is high, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The PCU detects high voltage condition on the ESO solenoid valve control circuit for longer than 1 second when the ECM does not command shutoff.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.
- If this DTC is present, engine will not start.

P0215 (Symptom Code C) (Flash Code 52)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the ECM detects that the engine is continuously run after the ignition switch is OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is OFF.
- The engine speed is lower than 1500 RPM.
- The vehicle speed is lower than 1.5 km/h (1MPH).

Condition for Setting the DTC

- The engine speed is higher than 200 RPM within 2 seconds after the condition for running the DTC are met. This indicates the PCU does not react to the command from the ECM and fuel cannot shutoff.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

P0215 (Symptom Code D) (Flash Code 52)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM detects that the internal CAN controller does not Bus OFF when the ignition switch is OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is OFF.

Condition for Setting the DTC

- The ECM detects internal CAN controller does not Bus OFF mode.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- CAN controller is internal to the ECM.

P0216 (Symptom Code A,B) (Flash Code 54)

Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The timing device changes the optimum injection timing against various engine conditions. The pressure of the fuel fed from the feed pump is adjusted and it acts to the timing plunger by TCV controlled fuel pressure. (The TCV is installed to the fuel injection pump rear side and it is controlled by duty ratio cycle from the PCU.) The timing plunger is connected to the cam ring by a ball pin. Axial movement of the timing plunger is transferred to the cam ring in the form of rotational movement. Movement to the right of the timing plunger advances injection timing. If the PCU detects an excessive difference between actual and desired fuel injection timing, this DTC will set.

Condition for Running the DTC

Symptom Code A

- The engine speed is higher than 700 RPM.
- The fuel injection quantity is higher than 4 mg/strk.

Symptom Code B

- The engine speed is higher than 2014 RPM.

Condition for Setting the DTC

Symptom Code A

- The PCU monitored actual fuel injection timing is advanced more than desired by 3°CA for longer than 12 seconds or retarded more than desired by 6°CA for longer than 12 seconds.

Symptom Code B

- The PCU monitored actual fuel injection timing is oscillated higher than desired by 5.2°CA.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The fuel injection pump installation with incorrect mechanical timing may set this DTC.
- This DTC most likely indicate loss fuel pressure by restricted fuel line. Inspect the fuel line restriction between the fuel injection pump and fuel tank.
- The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight or if there is a crack in one of the fuel hoses. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load, which may set this DTC.
- Improper fuel will cause this DTC to set. Inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system.
- Contaminated fuel will cause this DTC to set. Inspect the pipe connector fixing bolt (eye bolt) on the fuel injection pump suction side.

Important:
If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the fuel injection pump is interrupted and this DTC may set. Refer to air bleeding procedure in Fuel System Section.

DTC P0216 (Symptom Code A,B) (Flash Code 54)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls

Step	Action	Value(s)	Yes	No
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0335 (Symptom Code B or D), P1335 (Symptom Code A) or P1345 (Symptom Code A) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the engine. 2. Place the transmission in neutral and set the park brake. 3. Start the engine and let engine idle for 30 seconds while observing the Actual Injection Timing parameter with the Tech 2. 4. Accelerate the engine and keep the constant engine speed around 2000 RPM while observing the Actual Injection Timing parameter with the Tech 2. 5. Accelerate the engine and keep the constant engine speed around 3000 RPM while observing the Actual Injection Timing parameter with the Tech 2. Does the Actual Injection Timing parameter follow the Desired Injection Timing within 2°CA on each engine speed?	—	Go to Diagnostic Aids	Go to Step 4
4	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load, which may set this DTC. 3. Pump the priming pump on the fuel filter until it becomes firm. If there is a leak on the suction side of the fuel system between the priming pump and the fuel injection pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Remove the fuel hose that connects to the fuel injection pump suction side. 2. Remove the fuel pipe connector that connects to the fuel injection pump suction side. 3. Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 6
6	1. Disconnect the fuel hose that connects to the fuel injection pump suction side. In order to measure the discharged fuel amount, put the hose into a bottle or a container. 2. Pump the priming pump on the fuel filter. **Notice:** If there is a leak on the suction side of the fuel system, the fuel from the disconnected hose will not flow out sufficiently and fuel leakage may occur. Also if there is a restriction on the suction side of the fuel system, the fuel from the disconnected hose will not flow out sufficiently that is most likely caused by clogged fuel filter or kinked fuel hose or pipe. 3. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. 4. Repair any fuel system leaks and restrictions as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Reconnect the fuel pipe connector that connects to the fuel injection pump suction side. 2. Remove the fuel hose that connects to the fuel injection pump suction side. 3. Substitute a clear hose. **Notice:** A hose must be cleaned. 4. Connect the clear hose to the fuel injection pump. 5. Bleed the fuel system. Refer to the Diagnostic Aids. 6. Let the engine run at idle for at least 2 minutes. 7. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 8. Repair as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 8
8	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 9	—
9	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Place the transmission in neutral and set the park brake. 4. Start the engine and let engine idle for 30 seconds while observing the Actual Injection Timing parameter with the Tech 2. 5. Accelerate the engine and keep the constant engine speed around 2000 RPM while observing the Actual Injection Timing parameter with the Tech 2. 6. Accelerate the engine and keep the constant engine speed around 3000 RPM while observing the Actual Injection Timing parameter with the Tech 2. Does the Actual Injection Timing parameter follow the Desired Injection Timing within 2°CA on each engine speed?	—	Go to Step 10	Go to Step 2
10	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0251 (Symptom Code 6) (Flash Code 53)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the PCU detects that the fuel injection solenoid valve is operated when the desired injection quantity from the ECM is 0 mg/strk, this DTC will set.

Condition for Running the DTC

- The fuel injection pump CMP sensor signal is generated.
- The CAN communication between the ECM and PCU is normal.

Condition for Setting the DTC

- The PCU detects that the fuel injection solenoid valve is operated when the desired fuel injection quantity is commanded 0 mg/strk.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P0251 (Symptom Code 6) (Flash Code 53)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—

Step	Action	Value(s)	Yes	No
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0251 (Symptom Code 7) (Flash Code 53)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU. The PCU also compares the engine speed signal sent from the ECM and the fuel injection pump speed. If the PCU detects that the doubled fuel injection pump speed is excessively lower than engine speed, this DTC will set.

Condition for Running the DTC

- The fuel injection pump CMP sensor signal is generated.
- The crankshaft position (CKP) sensor signal is generated.
- The engine speed is higher than 500 RPM.

Condition for Setting the DTC

- The PCU detects that the doubled fuel injection pump speed is lower than engine speed by 800 RPM for longer than 0.2 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- Electrical or magnetic interference may affect intermittent condition.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection pump CMP sensor is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P0251 (Symptom Code 7) (Flash Code 53)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If the engine does not start, crank over the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0335 (Symptom Code B, D or E), P1335 (Symptom Code A) or P1345 (Symptom Code A) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Start the engine. 2. Monitor the DTC Information with the Tech 2. 3. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
4	1. Observe the Engine Speed parameter with the Tech 2. 2. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Tech 2. Does the Engine Speed parameter indicate correct engine speed?	—	Go to Step 9	Go to Step 5
5	1. Inspect the crankshaft position (CKP) sensor for tightness. 2. Remove the CKP sensor and check for damage, metal particles on magnet and for flywheel circumference damage. Did you find and correct the condition?	—	Go to Step 10	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the CKP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion on the CKP sensor terminal (pins 1, 2 and 3 of J-183 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 7
7	1. Turn OFF the ignition. 2. Disconnect the fuel injection pump control unit (PCU) harness connector. 3. Inspect for an intermittent, for a poor connection and corrosion on the CKP sensor signal input at the harness connector of the PCU (pin 8 of E-110 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Inspect for an intermittent, for poor connections and corrosion on at the harness connector of the ECM (pins 90, 91, 98 and 101 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
9	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	—

Step	Action	Value(s)	Yes	No
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 2	Go to Step 11
11	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0251 (Symptom Code 9, A, B, D) (Flash Code 53)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The PCU detects internal fuel injection pump control maps are not programmed during self-test. (Symptom Code 9)
- The PCU detects internal EEPROM or A/D converter is failed during self-test. (Symptom Code A)
- The PCU detects that the fuel injection solenoid valve drive circuit is failed during self-test. (Symptom Code B)
- The PCU detects that the fuel injection solenoid valve drive circuit voltage level is abnormal during self-test. (Symptom Code D)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection. (Symptom Code 9)
- The ECM limits fuel injection quantity. (Symptom Code A)

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P0251 (Symptom Code 9, A, B, D) (Flash Code 53)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the igniton, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—

Step	Action	Value(s)	Yes	No
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0251 (Symptom Code E) (Flash Code 53)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM detects that the communication message from the PCU is not received, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects communication message from the PCU is not received for longer than 1 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- PCU is part of the fuel injection pump assembly.

DTC P0251 (Symptom Code E) (Flash Code 53)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If the engine does not start, crank over the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P1650 (Symptom Code A or B) or P1651 (Symptom Code A or B) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn ON the ignition, with the engine OFF. 2. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 5
4	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 5	—
5	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 2	Go to Step 6

Step	Action	Value(s)	Yes	No
6	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0335 (Symptom Code B, D) (Flash Code 43)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 4 slits spaced 90° on the flywheel circumference. The CKP sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the crankshaft rotational speed. The engine control module (ECM) monitors both the CKP sensor and injection pump camshaft position (CMP) sensor signals to ensure they correlate with each other.
If the ECM receives extra or missing CKP sensor signal pulses, this DTC will set. (Symptom Code B)
If the ECM receives a certain amount of injection pump CMP sensor signal pulses without a CKP sensor signal, this DTC will set. (Symptom Code D)

Condition for Running the DTC

Symptom Code B

- The ignition switch is ON.
- The engine speed is higher than 665 RPM.

Symptom Code D

- DTC P0335 (Symptom Code B) is not set.
- The ignition switch is ON.
- The fuel injection pump CMP sensor signal is generated.
- The controller area network (CAN) communication between the ECM and PCU is normal.

Condition for Setting the DTC

Symptom Code B

- The ECM detects extra or missing CKP sensor signals while engine is running.

Symptom Code D

- The ECM detects that the CKP sensor signals are not generated when doubled fuel injection pump rotation speed is higher than 50 RPM.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails. The ECM uses an engine speed substitution of doubled fuel injection pump speed for engine control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the sensor is tight and the flywheel circumference is not damaged.

DTC P0335 (Symptom Code B, D) (Flash Code 43)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine (Note a slight start delay may be noticed). 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the crankshaft position (CKP) sensor harness connector. 3. Connect a DMM across the CKP sensor terminals (pins 1 and 2 of J-183 connector). 4. Measure the resistance across the CKP sensor. Is the CKP sensor resistance within the specified value?	870 – 930 Ω	Go to Step 4	Go to Step 20

Step	Action	Value(s)	Yes	No
4	1. Connect a DMM across the CKP sensor terminals (measure the sensor output voltage). 2. Place the DMM on the AC volt scale. 3. Start the engine. 4. Monitor the DMM while accelerating the engine between idle and W.O.T. (accelerator pedal full travel). Does the DMM indicate an AC voltage increase in accordance with an engine speed increase (the range of approximately 1.4 volts is indicated from approximately 0.7 volts)?	—	Go to Step 5	Go to Step 19
5	1. Turn ON the ignition, with the engine OFF. 2. Connect a test lamp between the low reference circuit of the CKP sensor harness (pin 1 of J-183 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 11	Go to Step 6
6	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a test lamp between the low reference circuit of the CKP sensor harness (pin 1 of J-183 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 12
7	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a test lamp between the shield ground circuit of the CKP sensor harness (pin 3 of J-183 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 8
8	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a test lamp between the shield ground circuit of the CKP sensor harness (pin 1 of J-183 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 14
9	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a test lamp between the signal circuit of the CKP sensor harness (pin 2 of J-183 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 15	Go to Step 10
10	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a DMM between the signal circuit of the CKP sensor harness (pin 2 of J-183 connector) and a known good ground. Is the DMM voltage more than the specified value?	1 volt	Go to Step 16	Go to Step 17

Step	Action	Value(s)	Yes	No
11	**Important:** The ECM may be damaged if the sensor low reference circuit is shorted to a voltage source. 1. Test the low reference circuit of the CKP sensor between the engine control module (ECM) (pin 98 of B-233 connector) and the CKP sensor (pin 1 of J-183 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21
12	1. Test the low reference circuit of the CKP sensor between the ECM (pin 98 of B-233 connector) and the CKP sensor (pin 1 of J-183 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 18
13	**Important:** The ECM may be damaged if the sensor shield ground circuit is shorted to a voltage source. 1. Test the shield ground circuit of the CKP sensor between the ECM (pin 101 of B-233 connector) and the CKP sensor (pin 3 of J-183 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21
14	1. Test the shield ground circuit of the CKP sensor between the ECM (pin 101 of B-233 connector) and the CKP sensor (pin 3 of J-183 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 18
15	1. Test the signal circuit of the CKP sensor between the ECM (pin 90 of B-233 connector) and the CKP sensor (pin 2 of J-183 connector) for the following conditions: • A short to ground • A short to the low reference circuit • A short to the shield ground 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21

Step	Action	Value(s)	Yes	No
16	**Important:** The CKP sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit of the CKP sensor between the ECM (pin 90 of B-233 connector) and the CKP sensor (pin 2 of J-183 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21
17	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the CKP sensor (pins 1, 2 and 3 of J-183 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 20
18	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the CKP sensor circuits at the harness connector of the ECM (pins 90, 98 and 101 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21
19	1. Inspect the CKP sensor for tightness. Retest if the sensor was loose. 2. Remove the CKP sensor and check for damage, metal particles on magnet and for flywheel circumference damage. Did you find and correct the condition?	—	Go to Step 22	Go to Step 20
20	Replace the CKP sensor. Refer to Crankshaft Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 22	—
21	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 22	—
22	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 23
23	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0335 (Symptom Code E) (Flash Code 43)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. The engine control module (ECM) calculates the engine speed and exact position of the crankshaft based on the signal from the CKP sensor. If the ECM detects an engine overrun condition, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the engine speed is higher than 5700 RPM for 0.2 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- Ensure the sensor is tight and the flywheel circumference is not damaged.

Notice:

- This DTC is caused by an engine overspeed condition, which was most likely caused by driver error (i.e. downshifting a manual transmission on a steep grade). Ensure there are no signs of engine damage. Excessive engine overspeed may damage internal engine components.

DTC P0335 (Symptom Code E) (Flash Code 43)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Start the engine. 3. Observe the Engine Speed parameter with the Tech 2. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Tech 2. Does the Engine Speed parameter ever exceed the specified value?	5000 RPM	Go to Step 4	Go to Step 3
3	Ask the driver if overrun is caused by gear slip-out, shift error, down-slope diving, etc. If engine overrun has experienced, the engine must be inspected and repaired as necessary. Did you complete the action?	—	Go to Step 7	—
4	1. Remove the crankshaft position (CKP) sensor. Refer to CKP Sensor replacement in this section. 2. Visually inspect the CKP sensor for the following conditions: • For physical damage • For being loose • For improper installation Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	Visually inspect the flywheel circumference for damage. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6

Step	Action	Value(s)	Yes	No
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the Engine Speed parameter with the Tech 2. 6. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Tech 2. Does the Engine Speed parameter ever exceed the specified value?	5000 RPM	Go to Step 4	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0380 (Symptom Code 4) (Flash Code 66)

Circuit Description

The engine control module (ECM) controls the glow relay which supplies power to the glow plugs based on engine coolant temperature. In the after glow phase, the glow indicator light is not illuminated but glow plugs remain active for a certain period. If the ECM detects an open circuit or short to ground on the glow relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the low voltage condition on the glow relay control circuit for longer than 3 seconds when the relay is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Notice:

- The glow relay is commanded OFF with ignition ON and engine OFF when the engine coolant temperature is reached at 30°C (86°F).
- The glow relay is commanded OFF with engine run when the engine coolant temperature is reached at 30°C (86°F).

DTC P0380 (Symptom Code 4) (Flash Code 66)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Perform the Glow Relay test with the Tech 2. 4. Command the Glow Relay ON with the Tech 2. Does the glow relay click when commanded ON with the Tech 2?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Replace the glow relay with the starter relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. 4. Command the Glow Relay ON with the Tech 2. Does the glow relay click when commanded ON with the Tech 2?	—	Go to Step 10	Go to Step 4
4	1. Turn OFF the ignition. 2. Remove the glow relay. 3. Connect a test lamp between the voltage feed circuit of the glow relay coil side (pin 4 of X-20 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 5	Go to Step 7

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Connect a test lamp between the control circuit of the glow relay (pin 5 of X-20 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp continuously illuminate (the test lamp blinks then goes out normally if the engine coolant temperature lower than 30°C [86°F])?	—	Go to Step 8	Go to Step 6
6	1. Keep the test lamp with connected. 2. Command the Glow Relay ON with the Tech 2. Does the test lamp illuminate when commanded ON with the Tech 2?	—	Go to Step 10	Go to Step 9
7	Repair the voltage feed circuit between the ECM main relay (pin 5 of X-14 connector) and the glow relay (pin 4 of X-20 connector) for an open circuit or high resistance. Did you complete the repair?	—	Go to Step 14	—
8	1. Test the control circuit of the glow relay between the engine control module (ECM) (pin 94 of B-233 connector) and the glow relay (pin 5 of X-20 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
9	1. Test the control circuit of the glow relay between the ECM (pin 94 of B-233 connector) and the glow relay (pin 5 of X-20 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
10	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections on the glow relay terminals (pins 4 and 5 of X-20 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the glow relay control circuit at the harness connector of the ECM (pin 94 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
12	Replace the glow relay. Did you complete the replacement?	—	Go to Step 14	—
13	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—

Step	Action	Value(s)	Yes	No
14	1. Reconnect all previously disconnected relay or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up (allow engine coolant temperature to reach at least 35°C [95°F]). 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 15
15	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0380 (Symptom Code 8) (Flash Code 66)

Circuit Description

The engine control module (ECM) controls the glow relay which supplies power to the glow plugs based on engine coolant temperature. In the after glow phase, the glow indicator light is not illuminated but glow plugs remain active for a certain period. If the ECM detects a short to battery or ignition voltage on the glow relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the high voltage condition on the glow relay control circuit for longer than 1 second when the relay is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Notice:

- The glow relay is commanded OFF with ignition ON and engine OFF when the engine coolant temperature is reached at 30°C (86°F).
- The glow relay is commanded OFF with engine run when the engine coolant temperature is reached at 30°C (86°F).

Cool down the engine as necessary (allow engine coolant temperature to cool down at least 25°C [77°F]). 5. Start the engine. 6. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0381 (Symptom Code 4) (Flash Code 67)

Circuit Description

The glow indicator lamp is located on the instrument panel cluster (IPC). The glow control system is operated when the engine coolant temperature is low, which allows easier engine starting. If the ignition switch is turned ON when the engine coolant temperature is low, the engine control module (ECM) illuminates the glow indicator lamp and turns ON the glow plugs. After a fixed time passes, the ECM turns OFF the glow indicator lamp and the glow plugs. The ECM monitors the glow indicator lamp control circuit for conditions that are incorrect for the commanded state of the glow indicator lamp. If the ECM detects an open circuit or short to ground on the glow indicator control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the low voltage condition on the glow indicator lamp control circuit for longer than 3 seconds when the lamp is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The glow indicator lamp is commanded OFF with the ignition ON and engine OFF when the engine coolant temperature is reached at 30°C (86°F).

DTC P0381 (Symptom Code 4) (Flash Code 67)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Perform the Glow Indicator test with the Tech 2. 4. Command the Glow Indicator ON with the Tech 2. Does the glow indicator lamp turn ON when commanded ON with the Tech 2?	—	Go to Step 3	Go to Step 4
3	Command the Glow Indicator OFF with the Tech 2. Does the glow indicator lamp OFF?	—	Go to Step 17	Go to Step 10
4	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse (F-16) in the glove box fuse block. Is the Meter (10A) fuse (F-16) open?	—	Go to Step 5	Go to Step 6
5	Replace the Meter (10A) fuse (F-16). If the fuse continues to open, repair the short to ground on one of the circuits that fed by the Meter (10A) fuse (F-16) or replace the shorted attached component fed by the Meter (10A) fuse (F-16). Did you complete the repair?	—	Go to Step 19	—

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the glow indicator lamp control circuit of the ECM harness connector (pin 43 of B-234 connector) and a known good ground. Does the glow indicator lamp illuminate?	—	Go to Step 11	Go to Step 7
7	1. Turn OFF the ignition. 2. Remove the instrument panel cluster (IPC). 3. Remove the glow indicator bulb from the IPC (meter assembly). Is the glow indicator bulb burned out?	—	Go to Step 15	Go to Step 8
8	1. Disconnect the IPC harness B-51 connector. 2. Connect a test lamp between the voltage feed circuit of the glow indicator lamp (pin 8 of B-51 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 12
9	1. Turn OFF the ignition. 2. Reconnect the ECM harness connector. 3. Connect a test lamp between the voltage feed circuit and control circuit of the glow indicator lamp (pins 6 and 8 of B-51 connector). 4. Turn ON the ignition, with the engine OFF. 5. Perform the Glow Indicator test with the Tech 2. 6. Command the Glow Indicator ON with the Tech 2. Does the test lamp turn ON when commanded ON with the Tech 2?	—	Go to Step 14	Go to Step 13
10	1. Test the control circuit of the glow indicator lamp between the ECM (pin 43 of B-234 connector) and the IPC (pin 6 of B-51 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the glow indicator lamp control circuit at the harness connector of the ECM (pin 43 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
12	Repair the open circuit or high resistance on the voltage feed circuit of the glow indicator lamp between the IPC (pin 8 of B-51 connector) and Meter (10A) fuse (F-16). Did you complete the repair?	—	Go to Step 19	—

Step	Action	Value(s)	Yes	No
13	1. Repair the open circuit or high resistance on the control circuit of the glow indicator lamp between the ECM (pin 43 of B-234 connector) and the IPC (pin 6 of B-51 connector). 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	—
14	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections on the glow indicator lamp circuits at the IPC (pins 6 and 8 of B-51 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
15	Replace the glow indicator bulb. Did you complete the replacement?	—	Go to Step 19	—
16	Repair or replace the IPC (meter assembly). Did you complete the repair or replacement?	—	Go to Step 19	—
17	1. Turn OFF the ignition for 30 seconds. 2. Turn ON the ignition for 30 seconds, with the engine OFF. 3. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 18	Go to Diagnostic Aids
18	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 20
20	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0381 (Symptom Code 8) (Flash Code 67)

Circuit Description

The glow indicator lamp is located on the instrument panel cluster (IPC). The glow control system is operated when the engine coolant temperature is low, which allows easier engine starting. If the ignition switch is turned ON when the engine coolant temperature is low, the engine control module (ECM) illuminates the glow indicator lamp and turns ON the glow plugs. After a fixed time passes, the ECM turns OFF the glow indicator lamp and the glow plugs. The ECM monitors the glow indicator lamp control circuit for conditions that are incorrect for the commanded state of the glow indicator lamp. If the ECM detects a short to battery or ignition voltage on the glow indicator control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the high voltage condition on the glow indicator lamp control circuit for longer than 1 second when the lamp is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The glow indicator lamp is commanded OFF with the ignition ON and engine OFF when the engine coolant temperature is reached at 30°C (86°F).

Test Description

The number below refers to the step number on the diagnostic table.
3. If the control circuit of the glow indicator lamp between the ECM and the IPC is normal, the control circuit voltage low DTC P0381 (Symptom Code 4) will set.

DTC P0381 (Symptom Code 8) (Flash Code 67)

7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Cool down the engine as necessary (allow engine coolant temperature to cool down at least 25°C [77°F]). 5. Turn ON the ignition, with the engine OFF. 6. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0400 (Symptom Code 3) (Flash Code 32)

Circuit Description

The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running. If the ECM detects the actual MAF amount is lower than desired MAF amount, this DTC will set. This indicates excessive amount of EGR gas flow.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.
- The barometric pressure (BARO) is between 880 hPa and 1100 hPa.
- The intake air temperature (IAT) is between 16°C (61°F) and 34°C (93°F).
- The ECT is between 70°C (158°F) and 100°C (211°F).

Condition for Setting the DTC

- The ECM detects that the MAF amount is 150 mg/strk lower than the desired MAF for 60 seconds. This indicates excessive amount of EGR flow.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking the EGR valve will cause this DTC to set.
- Misrouted vacuum hoses will cause this DTC to set.

DTC P0400 (Symptom Code 3) (Flash Code 32)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0100 (Symptom Code 7, 9, B or C) or P0400 (Symptom Code 4 or 8) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and warm up (allow engine coolant temperature to reach at least 75°C [167°F]). 4. Perform the EGR Solenoid Valve test with the Tech 2. 5. Command the EGR Solenoid Valve ON and OFF with the Tech 2 while observing the Mass Air Flow (MAF) Sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk within 2 seconds when the EGR Solenoid Valve is commanded ON?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Inspect for the following conditions: • An EGR valve control vacuum hose is damaged or kinked. • An EGR solenoid valve vacuum hose and ventilation hose that is damaged or kinked. • An EGR valve is stuck open. • Any type of restriction in the exhaust system. • Air leakage around the MAF sensor or debris in the sensor housing. • Air leaking around any of the air induction tubing between the MAF sensor and intake manifold. • Turbine shaft binding causing lower turbocharger shaft spinning speeds. Refer to the Turbocharger in Engine Mechanical section for diagnosis. • Restricted air cleaner element, restricted or collapsed air tubing between the air cleaner and the turbocharger. • Oil in the air tubing causing an incorrect MAF sensor signal. When there is adhesion of oil, inside of the tubing, intercooler and turbocharger needs to be wiped off. • Contaminated, skewed or slow MAF sensor. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the EGR valve control vacuum hose from the EGR valve. 3. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the disconnected vacuum hose. 4. Start the engine and let engine idle. 5. Perform the EGR Solenoid Valve test with the Tech 2. 6. Command the EGR Solenoid Valve ON and OFF with the Tech 2. Does the hand-held vacuum pump indicate more than 50 cmHg (20 inHg) when commanding the ON and less than 10 cmHg (4 inHg) when commanding OFF?	—	Go to Step 6	Go to Step 9

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Disconnect the hand-held vacuum pump from the vacuum hose. 3. Connect the hand-held vacuum pump to the vacuum port of EGR valve. 4. Start the engine and let engine idle. 5. Apply vacuum pressure to the EGR valve while observing the MAF Sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk when the vacuum pressure is applied?	—	Go to Diagnostic Aids	Go to Step 7
7	1. Turn OFF the ignition. 2. Disconnect the MAF sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the MAF sensor (pins 2, 4 and 5 of J-182 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each MAF sensor circuit at the harness connector of the ECM (pins 83 and 88 of B-233 connector). 6. Test for high resistance on each MAF sensor circuit. 7. Test the MAF sensor signal circuit short to intake air temperature (IAT) sensor signal. 8. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	Replace the EGR valve. Refer to EGR Valve Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	—
9	Replace the EGR solenoid valve. Refer to EGR Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up (allow engine coolant temperature to reach at least 75°C [167°F]) while observing the MAF Sensor parameter with the Tech 2. Does the MAF Sensor parameter follow the Desired MAF parameter within 50 mg/strk?	—	Go to Step 11	Go to Step 2
11	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0400 (Symptom Code 4) (Flash Code 32)

Circuit Description

The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running. If the ECM detects that an open circuit or short to ground on the EGR solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the low voltage condition on the EGR solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0400 (Symptom Code 4) (Flash Code 32)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the EGR control solenoid valve harness connector. 3. Connect a test lamp between the voltage feed circuit of the EGR control solenoid valve harness (pin 1 of J-105 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 6
4	1. Connect a test lamp between the control circuit of the EGR solenoid valve harness (pin 2 of J-105 connector) and battery voltage. 2. Perform the EGR Solenoid Valve test with the Tech 2. 3. Command the EGR Solenoid Valve ON with the Tech 2. Does the test lamp illuminate when commanded ON with the Tech 2?	—	Go to Step 5	Go to Step 7

Step	Action	Value(s)	Yes	No
5	Command the EGR Solenoid Valve OFF with the Tech 2. Does the test lamp continuously illuminate same as Step 4 when commanded OFF with the Tech 2 (the test lamp slightly illuminates if the circuit is normal when commanded OFF)?	—	Go to Step 8	Go to Step 9
6	Repair the open circuit or high resistance on the voltage feed circuit between the ECM main relay (pin 5 of X-14 connector) and the EGR solenoid valve (pin 1 of J-105 connector). Did you complete the repair?	—	Go to Step 13	—
7	1. Test the control circuit between the engine control module (ECM) (pin 97 of B-233 connector) and the EGR solenoid valve (pin 2 of J-105 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
8	1. Test the control circuit between the ECM (pin 97 of B-233 connector) and the EGR solenoid valve (pin 2 of J-105 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
9	1. Turn OFF the ignition. 2. Disconnect the EGR solenoid valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the EGR solenoid valve (pins 1 and 2 of J-105 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the EGR solenoid valve control circuit at the harness connector of the ECM (pin 97 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the EGR solenoid valve. Refer to EGR Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
13	1. Reconnect all previously disconnected or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0400 (Symptom Code 5) (Flash Code 32)

Circuit Description

The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running. If the ECM detects the actual MAF amount is higher than desired MAF amount, this DTC will set. This indicates insufficient amount of EGR gas flow.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.
- The barometric pressure (BARO) is between 880 hPa and 1100 hPa.
- The intake air temperature (IAT) is between 16°C (61°F) and 34°C (93°F).
- The ECT is between 70°C (158°F) and 100°C (211°F).

Condition for Setting the DTC

- The ECM detects that the MAF amount is 150 mg/strk higher than the desired MAF for 60 seconds. This indicates insufficient amount of EGR flow.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking the EGR valve will cause this DTC to set.
- Misrouted vacuum hoses will cause this DTC to set.
- A vacuum pump problem will cause this DTC to set.

DTC P0400 (Symptom Code 5) (Flash Code 32)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0100 (Symptom Code 7, 9, B or C) or P0400 (Symptom Code 4 or 8) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and warm up (allow engine coolant temperature to reach at least 75°C [167°F]). 4. Perform the EGR Solenoid Valve test with the Tech 2. 5. Command the EGR Solenoid Valve ON and OFF with the Tech 2 while observing the Mass Air Flow (MAF) Sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk within 2 seconds when the EGR Solenoid Valve is commanded ON?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Inspect for the following conditions: • An EGR valve control vacuum hose is damaged or kinked. • An EGR solenoid valve control vacuum hose and ventilation hose that is damaged or kinked. • An EGR valve is stuck close. • Restricted or collapsed EGR passage between the exhaust manifold and EGR valve. • A vacuum hose from the vacuum pump is damaged or kinked. • A vacuum pump is damaged. • Oil in the air tubing causing an incorrect MAF sensor signal. When there is adhesion of oil, inside of the tubing, intercooler and turbocharger needs to be wiped off. • Contaminated or skewed MAF sensor. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the EGR valve control vacuum hose from the EGR valve. 3. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the disconnected vacuum hose. 4. Start the engine and let engine idle. 5. Perform the EGR Solenoid Valve test with the Tech 2. 6. Command the EGR Solenoid Valve ON and OFF with the Tech 2. Does the hand-held vacuum pump indicate more than 50 cmHg (20 inHg) when commanding the ON and less than 10 cmHg (4 inHg) when commanding OFF?	—	Go to Step 6	Go to Step 9
6	1. Turn OFF the ignition. 2. Disconnect the hand-held vacuum pump from the vacuum hose. 3. Connect the hand-held vacuum pump to the vacuum port of EGR valve. 4. Start the engine and let engine idle. 5. Apply vacuum pressure to the EGR valve while observing the MAF Sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk when the vacuum pressure is applied?	—	Go to Diagnostic Aids	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Disconnect the MAF sensor harness connector. 3. Inspect for an intermittent, for a poor connection and corrosion at the harness connector of the MAF sensor (pin 3 of J-182 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for a poor connection and corrosion on each MAF sensor circuit at the harness connector of the ECM (pin 92 of B-233 connector). 6. Test for high resistance on each MAF sensor circuit. 7. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	Replace the EGR valve. Refer to EGR Valve Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	—
9	Replace the EGR solenoid valve. Refer to EGR Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up (allow engine coolant temperature to reach at least 75°C [167°F]) while observing the MAF Sensor parameter with the Tech 2. Does the MAF Sensor parameter follow the Desired MAF parameter within 50 mg/strk?	—	Go to Step 11	Go to Step 2
11	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0400 (Symptom Code 8) (Flash Code 32)

Circuit Description

The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running. If the ECM detects a short to battery or ignition voltage on the EGR solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the high voltage condition on the EGR solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.
3. If the control circuit of the EGR solenoid valve between the ECM and the solenoid valve is normal, the control circuit voltage low DTC P0400 (Symptom Code 4) will set.

DTC P0400 (Symptom Code 8) (Flash Code 32)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and warm up (allow engine coolant temperature to reach at least 75°C [167°F]). 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the EGR control solenoid valve harness connector. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Does the DTC P0400 (Symptom Code 4) set, but not DTC P0400 (Symptom Code 8)?	—	Go to Step 5	Go to Step 4
4	1. Test the control circuit between the engine control module (ECM) (pin 97 of B-233 connector) and the EGR solenoid valve (pin 2 of J-105 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Replace the EGR solenoid valve. Refer to EGR Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up (allow engine coolant temperature to reach at least 75°C [167°F]). 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0500 (Symptom Code 1, A) (Flash Code 24)

Circuit Description

The vehicle speed sensor (VSS) is used by the engine control module (ECM) and speedometer, which generates a speed signal from the transmission output shaft. The VSS has the following circuits.

- Ignition voltage feed circuit
- VSS signal circuit
- VSS low reference circuit

The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The ECM calculates the vehicle speed by the VSS. If the ECM detects VSS signals are generated with high frequencies, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the vehicle speed is higher than 190 km/h (119 MPH) for 5 seconds. (Symptom Code 1)
- The ECM detects that the vehicle speed sensor signal frequency is too high for 0.6 seconds. (Symptom Code A)

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a vehicle speed substitution of 5 km/h (3 MPH) for engine control.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- Electrical or magnetic interference may affect intermittent condition.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0500 (Symptom Code 1, A) (Flash Code 24)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Inspect all of the circuits going to the vehicle speed sensor (VSS) for the following: • Routed too closely to fuel injection solenoid wiring or components • Routed too closely to after-market add-on electrical equipment • Routed too closely to solenoids, relays, and motors 2. If you find incorrect routing, correct the harness routing. Did you find and correct the condition?	—	Go to Step 7	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the VSS harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the VSS (pins 1, 2 and 3 of J-32 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Inspect for an intermittent and for a poor connection on VSS circuit at the harness connector of the ECM (pin 68 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	1. Remove the VSS. Refer to Vehicle Speed Sensor (VSS) Replacement in this section. 2. Visually inspect the VSS for the following conditions: • Physical damage • Being loose • Improper installation 3. The following conditions may cause this DTC to set: • Electromagnetic interference in the VSS circuits 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	Replace the VSS. Refer to Vehicle Speed Sensor (VSS) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle. 5. Observe the Vehicle Speed parameter with the Tech 2. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Step 8	Go to Step 2
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0500 (Symptom Code B) (Flash Code 24)

Circuit Description

The vehicle speed sensor (VSS) is used by the engine control module (ECM) and speedometer, which generates a speed signal from the transmission output shaft. The VSS has the following circuits.

- Ignition voltage feed circuit
- VSS signal circuit
- VSS low reference circuit

The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The ECM calculates the vehicle speed by the VSS. If the ECM detects VSS signals are not generated, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 3600 RPM.
- The fuel injection quantity is more than 41 mg/strk.

Condition for Setting the DTC

- The ECM detects that the vehicle speed is lower than 1.5 km/h (1 MPH) for 60 seconds.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- Electrical or magnetic interference may affect intermittent condition.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0500 (Symptom Code B) (Flash Code 24)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Drive the vehicle. 3. Observe the Vehicle Speed parameter with the Tech 2. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse (F-16) in the glove box fuse block. Is the Meter (10A) fuse (F-16) open?	—	Go to Step 4	Go to Step 5
4	Replace the Meter (10A) fuse (F-16). If the fuse continues to open, repair the short to ground on one of the circuits that fed by the Meter (10A) fuse (F-16) or replace the shorted attached component fed by the Meter (10A) fuse (F-16). Did you complete the repair?	—	Go to Step 18	—

Step	Action	Value(s)	Yes	No
5	1. Remove the vehicle speed sensor (VSS). Refer to Vehicle Speed Sensor (VSS) Replacement in this section. 2. Visually inspect the VSS for the following conditions: • Physical damage • Being loose • Improper installation • For transmission output shaft teeth damage 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the VSS harness connector. 3. Connect a test lamp between the ignition voltage feed circuit of the VSS harness (pin 1 of J-32 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 9
7	1. Keep the ignition switch ON. 2. Connect a test lamp between the ignition voltage feed circuit and low reference circuit of the VSS harness (pins 1 and 2 of J-32 connector). Does the test lamp illuminate?	—	Go to Step 8	Go to Step 10
8	1. Turn ON the ignition, with the engine OFF. 2. Intermittently jump the signal circuit of the VSS (pin 3 of J-32 connector) with a test lamp that is connected to a known good ground while monitoring the Vehicle Speed parameter with the Tech 2. Does the Tech 2 indicate any vehicle speed when the circuit is intermittently pulled to ground?	—	Go to Step 12	Go to Step 11
9	1. Test the VSS ignition voltage feed circuit between the VSS (pin 1 of J-32 connector) and the instrument panel cluster (IPC) (pin 3 of B-55 connector) for an open circuit or high resistance, then between the IPC (pin 8 of B-51 connector) and the Meter (10A) fuse (F-16) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 13
10	Repair the open or high resistance in the VSS low reference circuit between the VSS (pin 2 of J-32 connector) and ground terminal (B-7 terminal). Did you complete the repair?	—	Go to Step 18	—

Step	Action	Value(s)	Yes	No
11	1. Test the VSS signal circuit between the engine control module (ECM) (pin 68 of B-234 connector) and the VSS (pin 3 of J-32 connector). • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 14
12	1. Turn OFF the ignition. 2. Disconnect the VSS harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the VSS (pins 1, 2 and 3 of J-32 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
13	1. Turn OFF the ignition. 2. Disconnect the IPC B-51 and B-55 harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the IPC (pin 8 of B-51 and pin 3 of B-55 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 16
14	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the VSS signal circuit at the harness connector of the ECM (pin 68 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
15	Replace the VSS. Refer to Vehicle Speed Sensor (VSS) Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—
16	Replace the IPC (meter assembly). Refer to Meter Replacement in electrical section. Did you complete the replacement?	—	Go to Step 18	—
17	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—

Step	Action	Value(s)	Yes	No
18	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle. 5. Observe the Vehicle Speed parameter with the Tech 2. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Step 19	Go to Step 3
19	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0560 (Symptom Code 1) (Flash Code 35)

Circuit Description

The engine control module (ECM) monitors the system voltage on the ECM main relay load supply voltage terminal to make sure that the voltage stays within the proper range. If the ECM detects an excessively high system voltage, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the battery voltage feed circuit voltage is more than 20 volts.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- A charging system problem may set this DTC.
- Jump starting the vehicle or a battery charger may have set this DTC.

DTC P0560 (Symptom Code 1) (Flash Code 35)

Schematic Reference: Engine Controls Schematics & Starting and Charging Schematics

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Was the vehicle recently jump started from 24 volts system?	—	Go to Step 8	Go to Step 4
4	1. Start the engine and let idle for 30 seconds. 2. Observe the System Voltage parameter with the Tech 2. Is the System Voltage parameter less than the specified value?	16 volts	Go to Diagnostic Aids	Go to Step 5
5	Test the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you find a charging system problem?	—	Go to Step 6	Go to Step 7
6	Repair the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you complete the repair?	—	Go to Step 8	—
7	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 8	—

Step	Action	Value(s)	Yes	No
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the System Voltage parameter with the Tech 2. Is the System Voltage parameter less than the specified value?	16 volts	Go to Step 9	Go to Step 5
9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0560 (Symptom Code 2) (Flash Code 35)

Circuit Description

The engine control module (ECM) monitors the system voltage on the ECM main relay load supply voltage terminal to make sure that the voltage stays within the proper range. If the ECM detects an excessively low system voltage, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the battery voltage feed circuit voltage is less than 7 volts.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A charging system problem may set this DTC.

DTC P0560 (Symptom Code 2) (Flash Code 35)

Schematic Reference: Engine Controls Schematics & Starting and Charging Schematics
Connector End View Reference: Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Start the engine and let idle for 30 seconds. 2. Load the electrical system by turning ON the headlights, A/C, etc. 3. Observe the System Voltage parameter with the Tech 2. Is the System Voltage parameter more than the specified value?	10 volts	Go to Diagnostic Aids	Go to Step 4
4	Test the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you find a charging system problem?	—	Go to Step 5	Go to Step 6
5	Repair the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you complete the repair?	—	Go to Step 8	—
6	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent, for a poor connection and corrosion on the battery voltage feed at the harness connector of the ECM (pin 3 of B-234 connector). 4. Repair or clean the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7

Step	Action	Value(s)	Yes	No
7	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Load the electrical system by turning ON the headlights, A/C, etc. 6. Observe the System Voltage parameter with the Tech 2. Is the System Voltage parameter more than the specified value?	10 volts	Go to Step 9	Go to Step 4
9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0560 (Symptom Code A) (Flash Code 35)

Circuit Description

The fuel injection pump control unit (PCU) monitors the system voltage on the engine control module (ECM) main relay load supply voltage terminal to make sure that the voltage stays within the proper range. If the ECM detects an excessively high or low system voltage, this DTC will set.

Condition for Setting the DTC

- The PCU detects that the battery voltage feed circuit voltage is less than 4.5 volts or more than 27 volts.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A charging system problem may set this DTC.
- Jump starting the vehicle or a battery charger may have set this DTC.

Notice:

- PCU is part of the fuel injection pump assembly.

DTC P0560 (Symptom Code A) (Flash Code 35)

Connector End View Reference: Engine Controls Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0560 (Symptom Code 1 or 2) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Start the engine and let idle for 30 seconds. 2. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the fuel injection pump control unit (PCU) harness connector. 3. Inspect for an intermittent, for poor connections and corrosion on the voltage feed or ground at the harness connector of the PCU (pins 6 and 7 of E-110 connector). 4. Repair or clean the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 6	—

Step	Action	Value(s)	Yes	No
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and let idle for 30 seconds. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 7
7	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0561 (Symptom Code A) (Flash Code 18)

Circuit Description

The engine control module (ECM) main relay is energized when the ECM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the ECM main relay is de-energized after a certain length of time passed. If the ECM detects the ignition voltage switch signal is changed to OFF during the ECM is energized, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the ignition voltage circuit is changed ON to OFF during initialization.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM turns OFF the ECM if the ignition voltage circuit is OFF even 1 second passes from the judgement.
- The ECM limits fuel injection quantity if the ignition voltage circuit is returned ON within 1 second from the judgement.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Faulty or sticking ECM main relay may set this DTC.

Notice:

- Quick repetition ON and OFF of ignition switch may set this DTC.

Test Description

The numbers below refer to the step number on the diagnostic table.
2. If DTC P1625 (Symptom Code B) is present, Tech 2 can communicate with the ECM when the ignition switch is OFF.

DTC P0561 (Symptom Code A) (Flash Code 18)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P1625 (Symptom Code B) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the ignition switch harness connector (B-67) to the ignition switch (behind the steering column). 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ignition switch (pins 2 and 3 of B-67 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Inspect for an intermittent, for a poor connection and corrosion on ignition voltage feed circuit at the harness connector of the ECM (pin 39 of B-234 connector). 4. Test for high resistance on ignition voltage feed circuit. 5. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	Replace the ignition switch. Did you complete the replacement?	—	Go to Step 6	—
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the DTC Information with the Tech 2. 6. Turn OFF the ignition. Does the DTC fail this ignition before the ECM turns OFF?	—	Go to Step 2	Go to Step 7
7	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0561 (Symptom Code B) (Flash Code 18)

Circuit Description

The engine control module (ECM) main relay is energized when the ECM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the ECM main relay is de-energized after a certain length of time passed. If the ECM detects the ignition voltage switch signal is changed to OFF during the ECM is energized, this DTC will set.

Condition for Setting the DTC

- The ECM detects internal ignition voltage feed circuit is failed after initialization.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM turns OFF the ECM.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0561 (Symptom Code B) (Flash Code 18)

P0602

Description

The engine control module (ECM) has the ability to set a diagnostic trouble code (DTC) if it detects that there is no vehicle identification (VIN) programmed.

Diagnostic Aids

Notice:

- Production and service ECM does not require software programming when it is replaced except calibration software update. This DTC indicates that a production or service ECM does not program VIN.

DTC P0602

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 6
3	**Important:** Blank engine control module (ECM) must be programmed. Program the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the programming?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 5	Go to Step 7
5	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 6	—
6	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 7
7	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0606 (Symptom Code A, B) (Flash Code 28)

Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM).

Condition for Running the DTC

Symptom Code B

- The accelerator pedal position is less than 1%.
- The desired fuel injection quantity is 0 mg/strk.

Condition for Setting the DTC

Symptom Code A

- The ECM detects that the internal CPU does not react.

Symptom Code B

- The ECM detects that the engine speed is higher than 2000 RPM.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

DTC P0606 (Symptom Code A, B) (Flash Code 28)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0645 (Symptom Code 4) (Flash Code 46)

Circuit Description

The engine control module (ECM) controls the air conditioning (A/C) compressor relay, which supplies power to the A/C compressor clutch based on A/C request input to the ECM from the heating, ventilation and air conditioning (HVAC) controls. The ECM commands the A/C compressor relay ON at engine run. If the ECM detects an open circuit or short to ground on the A/C compressor relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The A/C compressor relay is once commanded ON.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the A/C compressor relay control circuit for longer than 3 seconds when the relay is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The A/C compressor relay is commanded OFF when the engine coolant temperature is reached around 115°C (239°F) and it commanded ON again below 110°C (230°F).

DTC P0645 (Symptom Code 4) (Flash Code 46)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle. 4. Turn ON the blower motor switch and the A/C compressor switch. 5. Turn OFF the A/C compressor switch. 6. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Replace the A/C compressor relay with the marker light relay or replace with a known good relay. 3. Start the engine and let idle. 4. Turn ON the blower motor switch and the A/C compressor switch. 5. Turn OFF the A/C compressor switch. 6. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 12

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Remove the A/C compressor relay. 3. Connect a test lamp between the voltage feed circuit of the A/C compressor relay coil side (pin 4 of X-24 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 5	Go to Step 7
5	1. Turn OFF the ignition. 2. Connect a test lamp between the A/C compressor relay control circuit (pin 2 of X-24 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 6
6	1. Keep the test lamp with connected. 2. Start the engine. 3. Turn ON the blower motor switch and the A/C compressor switch. Does the test lamp illuminate when the A/C Compressor Relay parameter is ON?	—	Go to Step 10	Go to Step 9
7	Repair the open circuit or high resistance on the voltage feed circuit between the ECM main relay (pin 5 of X-14 connector) and the A/C compressor relay (pin 4 of X-24 connector). Did you complete the repair?	—	Go to Step 14	—
8	1. Test the control circuit of the A/C compressor relay between the ECM (pin 41 of B-234 connector) and the A/C compressor relay (pin 2 of X-24 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
9	1. Test the control circuit of the A/C compressor relay between the engine control module (ECM) (pin 41 of B-234 connector) and the A/C compressor relay (pin 2 of X-24 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
10	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections on the A/C compressor relay terminal (pins 2 and 4 of X-24 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the A/C compressor relay control circuit at the harness connector of the ECM (pin 41 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13

Step	Action	Value(s)	Yes	No
12	Replace the A/C compressor relay. Did you complete the replacement?	—	Go to Step 14	—
13	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—
14	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and let idle. 5. Turn ON the blower motor switch and the A/C compressor switch. 6. Turn OFF the A/C compressor switch. 7. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 15
15	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0645 (Symptom Code 8) (Flash Code 46)

Circuit Description

The engine control module (ECM) controls the air conditioning (A/C) compressor relay, which supplies power to the A/C compressor clutch based on A/C request input to the ECM from the heating, ventilation and air conditioning (HVAC) controls. The ECM commands the A/C compressor relay ON at engine run. If the ECM detects a short to battery or ignition voltage on the A/C compressor relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The A/C compressor relay is once commanded ON.

Condition for Setting the DTC

- The ECM detects a high voltage condition on the A/C compressor relay control circuit for longer than 3 seconds when the relay is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The A/C compressor relay is commanded OFF when the engine coolant temperature is reached around 115°C (239°F) and it commanded ON again below 110°C (230°F).

Turn ON the blower motor switch and the A/C compressor switch. 6. Monitor the DTC Information with the Tech 2 when the A/C Relay Command parameter is ON. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0703 (Symptom Code A, B) (Flash Code 25)

Circuit Description

The brake pedal switch is installed on the brake pedal bracket. The brake pedal 1 switch is a normally open type switch and the brake pedal 2 switch is a normally closed type switch. When the brake pedal is pressed, the brake pedal 1 switch signal is provided to the engine control module (ECM) and the stoplights are turned ON. Then, the brake pedal 2 switch signal to the ECM is stopped (low voltage). If the ECM detects the brake switch signals out of correlation, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 1500 RPM.
- The accelerator pedal position is more than 10%.
- The vehicle speed is higher than 15 km/h (9 MPH).

Condition for Setting the DTC

- The ECM detects that the brake pedal 1 switch (normally open type switch) signal and brake pedal 2 switch (normally closed type switch) signal correlation error for longer than 30 seconds within the enabling conditions ever since ignition switch is ON. (Symptom Code A)
- The ECM detects that the brake pedal 1 switch (normally open type switch) signal and brake pedal 2 switch (normally closed type switch) signal correlation error for longer than 30 seconds. (Symptom Code B)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Misadjusted brake pedal switch will cause this DTC to set.

DTC P0703 (Symptom Code A, B) (Flash Code 25)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Brake Pedal 1 Switch parameter with the Tech 2 while fully depressing and releasing the brake pedal. Does the Tech 2 indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Step 10	Go to Step 3
3	1. Check to ensure the brake pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 4
4	1. Turn OFF the ignition. 2. Inspect the Stop Light (10A) fuse (F-5) in the glove box fuse block. Is the Stop Light (10A) fuse (F-5) open?	—	Go to Step 5	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Replace the Stop Light (10A) fuse (F-5). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Stop Light (10A) fuse (F-5) or replace the shorted attached component fed by the Stop Light (10A) fuse (F-5). Did you complete the repair?	—	Go to Step 20	—
6	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Connect a test lamp between the voltage feed circuit of the brake pedal 1 switch harness (pin 1 of B-66 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 8
7	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Pedal 1 Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the brake pedal 1 switch harness connector between pins 1 and 4 of the B-66 connector. Does the Tech 2 indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 16	Go to Step 9
8	Repair the open circuit or high resistance on the voltage feed circuit between the Stop Light (10A) fuse (F-5) and the brake pedal 1 switch (pin 1 of B-66 connector). Did you complete the repair?	—	Go to Step 20	—
9	1. Test the brake pedal 1 switch signal circuit between the ECM (pin 30 of B-234 connector) and the brake pedal 1 switch (pin 4 of B-66 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 17
10	Observe the Brake Pedal 2 Switch parameter with the Tech 2 while fully depressing and releasing the brake pedal. Does the Tech 2 indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Diagnostic Aids	Go to Step 11
11	1. Check to ensure the brake pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 12

Step	Action	Value(s)	Yes	No
12	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the voltage feed circuit of the brake pedal 2 switch harness (pin 2 of B-66 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 14
13	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Pedal 2 Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the brake pedal 2 switch harness connector between pins 2 and 3 of the B-66 connector. Does the Tech 2 indicate Released when the circuit is jumpered and Applied when the circuit is not jumpered?	—	Go to Step 16	Go to Step 15
14	Repair the open circuit or high resistance on the voltage feed circuit between the ECM main relay (pin 5 of X-14 connector) and the brake pedal 2 switch (pin 2 of B-66 connector). Did you complete the repair?	—	Go to Step 20	—
15	1. Test the brake pedal 2 switch signal circuit between the ECM (pin 65 of B-234 connector) and the brake pedal 2 switch (pin 3 of B-66 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 17
16	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the brake pedal switch (pins 1, 2, 3 and 4 of B-66 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 18
17	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the brake switch circuits at the harness connector of the ECM (pins 30 and 65 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 19
18	Replace brake pedal switch. Refer to Brake Switch Replacement in this section. Did you complete the replacement?	—	Go to Step 20	—

Step	Action	Value(s)	Yes	No
19	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 20	—
20	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Brake Pedal 1 Switch and the Brake Pedal 2 Switch with the Tech 2 while fully depressing and releasing the brake pedal. Does the Tech 2 indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Step 21	Go to Step 2
21	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0704 (Symptom Code 6) (Flash Code 57)

Circuit Description

The clutch pedal switch is installed on the clutch pedal bracket. The clutch pedal switch is a normally closed type switch. When the clutch pedal is pressed, the clutch pedal switch signal to the engine control module (ECM) is stopped (low voltage). If the ECM detects the clutch pedal switch signal does not change during a predetermined vehicle speed range, this DTC will set. This DTC will only run once per ignition cycle within the enabling condition.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the clutch pedal switch signal does not change during the vehicle speed changes between 5 km/h (3 MPH) and 80 km/h (50 MPH). This DTC will only run once per ignition cycle within the enabling condition.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Misadjusted clutch pedal switch will cause this DTC to set.

DTC P0704 (Symptom Code 6) (Flash Code 57)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Clutch Pedal Switch parameter with the Tech 2 while fully depressing and releasing the clutch pedal. Does the Tech 2 indicate Applied when the clutch pedal is applied and Released when the clutch pedal is released?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Check to ensure the clutch pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the clutch pedal full upward travel. 2. Adjust the clutch pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the clutch pedal switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Clutch Pedal Switch parameter with the Tech 2 while momentarily jumping across the clutch pedal switch harness connector between pins 1 and 2 of B-89 connector. Does the Tech 2 indicate Applied when the circuit is jumped and Released when the circuit is not jumped?	—	Go to Step 10	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Connect a test lamp between the ignition voltage feed circuit of the clutch pedal switch harness (pin 1 of B-89 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 7
6	1. Connect a test lamp between the signal circuit of the clutch pedal switch harness (pin 2 of B-89 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 9
7	Repair the open circuit or high resistance on the ignition voltage feed circuit between the ECM main relay (pin 5 of X-14 connector) and the clutch pedal switch (pin 1 of B-89 connector). Did you complete the repair?	—	Go to Step 14	—
8	1. Test the clutch pedal switch signal circuit between the engine control module (ECM) (pin 31 of B-234 connector) and the clutch pedal switch (pin 2 of B-89 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
9	1. Test the clutch pedal switch signal circuit between the ECM (pin 31 of B-234 connector) and the clutch pedal switch (pin 2 of B-89 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
10	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the clutch pedal switch (pins 1 and 2 of B-89 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the clutch pedal switch circuit at the harness connector of the ECM (pin 31 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
12	Replace the clutch pedal switch. Refer to Clutch Pedal Switch Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—

Step	Action	Value(s)	Yes	No
13	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—
14	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Clutch Pedal Switch parameter with the Tech 2 while fully depressing and releasing the clutch pedal. Does the Tech 2 indicate Applied when the clutch pedal is applied and Released when the clutch pedal is released?	—	Go to Step 15	Go to Step 3
15	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1105 (Symptom Code 1) (Flash Code 86)

Circuit Description

The barometric pressure (BARO) sensor is installed inside of the engine control module (ECM) and converts the BARO into a voltage signal. The ECM uses this voltage signal to calibrate the fuel injection quantity and injection timing for altitude compensation. If the ECM detects an excessively high BARO sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the BARO sensor signal voltage is more than 4.4 volts for 1 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a BARO substitution of 1013 hPa.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

DTC P1105 (Symptom Code 1) (Flash Code 86)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1105 (Symptom Code 2) (Flash Code 86)

Circuit Description

The barometric pressure (BARO) sensor is installed inside of the engine control module (ECM) and converts the BARO into a voltage signal. The ECM uses this voltage signal to calibrate the fuel injection quantity and injection timing for altitude compensation. If the ECM detects an excessively low BARO sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the BARO sensor signal voltage is less than 1.5 volts for 1 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a BARO substitution of 1013 hPa.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

DTC P1105 (Symptom Code 2) (Flash Code 86)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1110 (Symptom Code 4) (Flash Code 72)

Circuit Description

The engine control module (ECM) controls the exhaust brake which energizes the intake throttle solenoid valve and exhaust brake solenoid valve based on vehicle running condition. The ECM commands each solenoid valve to close each throttle valve by applying vacuum. If the ECM detects that an open circuit or short to ground on the intake throttle solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the intake throttle solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.
5. If the intake throttle solenoid valve control circuit between the ECM and the solenoid valve is normal, voltage level high DTC P1110 (Symptom Code 8) will set.

DTC P1110 (Symptom Code 4) (Flash Code 72)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the intake throttle solenoid valve harness connector. 3. Connect a test lamp between the voltage feed circuit of the intake throttle solenoid valve harness (pin 1 of J-40 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 6
4	1. Turn OFF the ignition. 2. Connect a test lamp between the control circuit of the intake throttle solenoid valve harness (pin 2 of J-40 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Connect a 3-amp fused jumper wire across the intake throttle solenoid valve harness connector between pins 1 and 2 of the J-40 connector. 2. Lift the driving wheels or drive the vehicle. 3. Let the vehicle run so that the exhaust brake may operate while observing the Intake Throttle Solenoid Command parameter with the Tech 2. Does DTC P1110 (Symptom Code 8) set when the exhaust brake is operating, but not DTC P1110 (Symptom Code 4)?	—	Go to Step 9	Go to Step 7
6	Repair the open circuit or high resistance on the voltage feed circuit between the ECM main relay (pin 5 of X-14 connector) and the intake throttle solenoid valve (pin 1 of J-40 connector). Did you complete the repair?	—	Go to Step 13	—
7	1. Test the control circuit between the engine control module (ECM) (pin 95 of B-233 connector) and the intake throttle solenoid valve (pin 2 of J-40 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
8	1. Test the control circuit between the ECM (pin 95 of B-233 connector) and the intake throttle solenoid valve (pin 2 of J-40 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
9	1. Turn OFF the ignition. 2. Disconnect the intake throttle solenoid valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the intake throttle solenoid valve (pins 1 and 2 of J-40 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the intake throttle solenoid valve control circuit at the harness connector of the ECM (pin 95 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the intake throttle solenoid valve. Refer to Intake Throttle Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1110 (Symptom Code 8) (Flash Code 72)

Circuit Description

The engine control module (ECM) controls the exhaust brake which energizes the intake throttle solenoid valve and exhaust brake solenoid valve based on vehicle running condition. The ECM commands each solenoid valve to close each throttle valve by applying vacuum. If the ECM detects that a short to battery or ignition voltage on the intake throttle solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a high voltage condition on the intake throttle solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.
3. If the intake throttle solenoid valve control circuit between the ECM and the solenoid valve is normal, voltage level low DTC P1110 (Symptom Code 4) will set.

DTC P1110 (Symptom Code 8) (Flash Code 72)

8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1120 (Symptom Code 1) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal bracket. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM supplies 5 volts to the APP sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor provides a signal to the ECM on the APP sensor signal circuit, which is relative to the position changes of the accelerator pedal angle. The ECM monitors the APP sensor signal for voltages outside the normal range of the APP sensor. If the ECM detects an excessively high APP sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the APP sensor signal voltage is more than 4.9 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1120 (Symptom Code 1) (Flash Code 21)

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the accelerator pedal position (APP) sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Accelerator Pedal Position (APP) parameter with the Tech 2. Does the APP parameter less than the specified value?	1%	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Connect a test lamp between the low reference circuit of the APP sensor harness (pin 1 of B-80 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 11	Go to Step 8

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Connect a DMM between the 5 volts reference circuit of the APP sensor harness (pin 3 of B-80 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 6	Go to Step 9
6	Is the DMM voltage less than the specified value at step 5?	5.3 volts	Go to Step 7	Go to Step 10
7	**Important:** The APP sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the engine control module (ECM) (pin 38 of E-234 connector) and the APP sensor (pin 2 of B- 80 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
8	1. Test the low reference circuit between the ECM (pin 49 of B-234 connector) and the APP sensor (pin 1 of B-80 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
9	1. Test the 5 volts reference circuit between the ECM (pin 57 of B-234 connector) and the APP sensor (pin 3 of B-80 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
10	1. Test the 5 volts reference circuit between the ECM (pin 57 of B-234 connector) and the APP sensor (pin 3 of B-80 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
11	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the APP sensor (pin 1 of B-80 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13

Step	Action	Value(s)	Yes	No
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the APP sensor circuit at the harness connector of the ECM (pin 49 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Replace APP sensor. Refer to Accelerator Pedal Position (APP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Fully depress and release the accelerator pedal many times. 6. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1120 (Symptom Code 2) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal bracket. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM supplies 5 volts to the APP sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor provides a signal to the ECM on the APP sensor signal circuit, which is relative to the position changes of the accelerator pedal angle. The ECM monitors the APP sensor signal for voltages outside the normal range of the APP sensor. If the ECM detects an excessively low APP sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the APP sensor signal voltage is less than 0.3 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.
4. If the APP sensor signal circuit between the ECM and the sensor is normal, the sensor signal voltage high DTC P1120 (Symptom Code 1) will set.

DTC P1120 (Symptom Code 2) (Flash Code 21)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the accelerator pedal position (APP) sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit of the APP sensor harness (pin 3 of B-80 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 4	Go to Step 5

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire across the APP sensor connector between pins 2 and 3 of the B-80 connector. 3. Turn ON the ignition, with the engine OFF. Does DTC P1120 (Symptom Code 1) set, but not P1120 (Symptom Code 2)?	—	Go to Step 7	Go to Step 6
5	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 57 of B-234 connector) and the APP sensor (pin 3 of B-80 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
6	1. Test the signal circuit between the ECM (pin 38 of E-234 connector) and the APP sensor (pin 2 of B-80 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
7	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the APP sensor (pins 2 and 3 of B-80 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connection on the APP sensor circuit at the harness connector of the ECM (pins 38 and 57 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	Replace APP sensor. Refer to Accelerator Pedal Position (APP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 11	—

Step	Action	Value(s)	Yes	No
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Fully depress and release the accelerator pedal many times. 6. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 12
12	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1120 (Symptom Code 7) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal bracket. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM provides 5 volts reference voltage through the reference circuit to the APP sensor. The ECM monitors the voltage on the 5 volts reference circuit. If the ECM detects an excessively high APP sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

The ECM detects that the APP sensor voltage supply circuit is more than 5.2 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1120 (Symptom Code 7) (Flash Code 21)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 57 of B-234 connector) and the accelerator pedal position (APP) sensor (pin 3 of B-80 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 5	Go to Step 4
4	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 5	—

Step	Action	Value(s)	Yes	No
5	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Fully depress and release the accelerator pedal many times. 6. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 6
6	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1120 (Symptom Code 9) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal bracket. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM provides 5 volts reference voltage through the reference circuit to the APP sensor. The ECM monitors the voltage on the 5 volts reference circuit. If the ECM detects an excessively high APP sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the APP sensor voltage supply circuit is less than 4.6 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.
3. If the APP sensor 5 volts reference circuit between the ECM and the sensor is normal, the sensor signal low DTC P1120 (Symptom Code 2) will set.

DTC P1120 (Symptom Code 9) (Flash Code 21)

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the accelerator pedal position (APP) sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Depress and release the accelerator pedal. 5. Monitor the DTC Information with the Tech 2. Does DTC P1120 (Symptom Code 2) set, but not DTC P1120 (Symptom Code 9)?	—	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 57 of B-234 connector) and the APP sensor (pin 3 of B-80 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Replace the accelerator pedal position sensor. Refer to Accelerator Pedal Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Fully depress and release the accelerator pedal many times. 6. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1120 (Symptom Code D) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal bracket. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM supplies 5 volts to the APP sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor provides a signal to the ECM on the APP sensor signal circuit, which is relative to the position changes of the accelerator pedal angle.
The brake pedal switch is installed on the brake pedal bracket. The brake pedal 1 switch is a normally open type switch and the brake pedal 2 switch is a normally closed type switch. When the brake pedal is pressed, the brake pedal 1 switch signal is provided to the ECM and the stoplights are turned ON. Then, the brake pedal 2 switch signal to the ECM is stopped (low voltage).
If the ECM detects accelerator pedal or APP sensor signal is stuck while brake pedal is depressed, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 1700 RPM.
- The vehicle speed is higher than 1.5 km/h (1 MPH).

Condition for Setting the DTC

- The ECM detects APP sensor angle is stationary more than 18%, then brake pedal is depressed for longer than 2 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Misadjusted brake pedal switch may set this DTC.
- Misadjusted APP sensor may set this DTC.
- A sticking or intermittently sticking the pedal may set this DTC.

DTC P1120 (Symptom Code D) (Flash Code 21)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Was DTC P0703 (Symptom Code A or B) or P1120 (Symptom Code 1, 7, 9 or E) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Pedal 1 Switch parameter with the Tech 2 while fully depressing and releasing the brake pedal. Does the Tech 2 indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Step 9	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Check to ensure the brake pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Brake Pedal 1 Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the brake pedal 1 switch harness connector between pins 1 and 4 of the B-66 connector. Does the Tech 2 indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 8	Go to Step 6
6	1. Test the brake pedal 1 switch signal circuit between the ECM (pin 30 of B-234 connector) and the brake pedal 1 switch (pin 4 of B-66 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 7
7	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the brake switch circuit at the harness connector of the ECM (pin 30 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	Replace the brake pedal switch. Refer to Brake Pedal Switch Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
9	1. Turn ON the ignition, with the engine OFF. 2. Fully depress and release the accelerator pedal many times while observing the Accelerator Pedal Position (APP) parameter with the Tech 2. Is the APP parameter smoothly changed within 0 to 100% when the accelerator pedal is depressed and released?	—	Go to Diagnostic Aids	Go to Step 10

Step	Action	Value(s)	Yes	No
10	1. Turn OFF the ignition. 2. Inspect for the following conditions: • APP sensor is misadjusted. • An accelerator pedal that is stuck depressed. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
11	Replace the accelerator pedal position sensor. Refer to Accelerator Pedal Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Observe the APP parameter while fully depressing and releasing the accelerator pedal many times. 6. Also observe the Brake Pedal 1 Switch parameter with the Tech 2 while depressing and releasing the brake pedal. Does the Tech 2 indicate the APP parameter smoothly changed within 0 to 100% when the accelerator pedal is depressed and released, then Tech 2 indicate the Brake Pedal 1 Switch parameter Applied when the brake pedal is depressed and Released when the brake pedal is released?	—	Go to Step 14	Go to Step 2
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1120 (Symptom Code E) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal bracket. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM supplies 5 volts to the APP sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor provides a signal to the ECM on the APP sensor signal circuit, which is relative to the position changes of the accelerator pedal angle.
The idle switch is also mounted on the accelerator pedal bracket. The idle switch is a normally closed type switch. When the accelerator pedal is released, the idle switch signal to the ECM is low voltage.
If the ECM detects the APP sensor signal and the idle switch out of correlation, this DTC will set.

Condition for Running the DTC

The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects APP sensor angle is more than 18%, then the idle switch is ON for longer than 0.6 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1120 (Symptom Code E) (Flash Code 21)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Turn ON the ignition, with the engine OFF. 2. Observe the Idle Switch parameter with the Tech 2 while depressing and releasing the accelerator pedal. Does the Tech 2 indicate OFF when the accelerator pedal is depressed and ON when the accelerator pedal is released?	—	Go to Step 5	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the idle switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Idle Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the idle switch harness connector between pins 1 and 2 of the B-340 connector. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 7	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the switch signal circuit between the engine control module (ECM) (pin 69 of B-234 connector) and the idle switch (pin 1 of B-340 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
5	1. Turn ON the ignition, with the engine OFF. 2. Fully depress and release the accelerator pedal many times while observing the Accelerator Pedal Position (APP) parameter with the Tech 2. Is the APP parameter smoothly changed within 0 to 100% when the accelerator pedal is depressed and released?	—	Go to Diagnostic Aids	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the APP sensor harness connector. 3. Inspect for an intermittent, for poor connection and corrosion at the harness connector of the APP sensor (pin 1 of B-80 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for a poor connection and corrosion on the APP sensor circuit at the harness connector of the ECM (pin 49 of B-234 connector). 6. Test for high resistance on the APP sensor low reference circuit. 7. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
7	Replace the idle switch. Refer to Idle Switch Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
8	Replace the accelerator pedal position sensor. Refer to Accelerator Pedal Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
9	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—

Step	Action	Value(s)	Yes	No
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Observe the Idle Switch and APP parameter while fully depressing and releasing the accelerator pedal many times. Does the Tech 2 indicate the APP parameter smoothly changed within 0 to 100% when the accelerator pedal is depressed and released, then Tech 2 indicate the Idle Switch parameter OFF when the accelerator pedal is depressed and ON when the accelerator pedal is released?	—	Go to Step 11	Go to Step 2
11	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1173 (Symptom Code 3) (Flash Code 22)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor has a signal circuit and a low reference circuit. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit. If the ECM detects an excessive high coolant temperature, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects an excessive high coolant temperature for longer than 30 seconds.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- After starting the engine, the ECT should rise steadily to about 80°C – 85°C (176°F – 185°F) then stabilize when the thermostat opens.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

Notice:

- This DTC is caused by an engine overheat condition (i.e. low engine coolant level). Since this DTC does not illuminate any lamps, clear the DTC and ensure there are no signs of engine damage. Excessive engine overheat may damage internal engine components.

DTC P1173 (Symptom Code 3) (Flash Code 22)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and wait until engine is fully warms upped. 4. Observe the Engine Coolant Temperature (ECT) parameter with the Tech 2. Is the ECT parameter more than the specified value?	100°C (212°F)	Go to Step 4	Go to Step 3
3	Ask the driver if overheat is caused by low engine coolant level, etc. If engine overheat has experienced, the engine must be inspected and repaired as necessary. Did you complete the action?	—	Go to Step 6	—
4	1. Test the ECT sensor at various temperature levels to evaluate the possibility if a skewed sensor. 2. Replace the ECT sensor as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Test the engine cooling system for the following condition. Refer to diagnosis of the engine cooling system section for testing. • Engine coolant level • Engine coolant leakage • Cooling fan belt slippage • Cooling fan clutch working • Thermostat working • Water pump working • Radiator clogging 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Diagnostic Aids
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and wait until engine is fully warms upped. 5. Observe the ECT parameter with the Tech 2. Is the ECT parameter more than the specified value?	100°C (212°F)	Go to Step 4	Go to Step 7
7	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1173 (Symptom Code 7, A) (Flash Code 22)

Circuit Description

The fuel temperature (FT) sensor is internal to the fuel injection pump control unit (PCU). It detects fuel temperature in the fuel injection pump. If the PCU detects an excessively high or low fuel temperature, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects an excessive high FT for longer than 30 seconds. (Symptom Code 7)
- The ECM detects an excessive low FT for longer than 30 seconds. (Symptom Code A)

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The PCU limits fuel injection quantity. (Symptom Code 7)

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- FT sensor is internal to the PCU and it is part of the fuel injection pump assembly.

DTC P1173 (Symptom Code 7, A) (Flash Code 22)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. (Fuel temperature [FT] sensor is internal to the fuel injection pump control unit [PCU] and it is part of the fuel injection pump assembly.) Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1335 (Symptom Code A) (Flash Code 43)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 4 slits spaced 90° on the flywheel circumference. The CKP sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the crankshaft rotational speed. The engine control module (ECM) monitors both the CKP sensor and injection pump camshaft position (CMP) sensor signals to ensure they correlate with each other. If the fuel injection pump control unit (PCU) receives faulty CKP sensor signal pulses, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The PCU detects CKP sensor signal from the ECM is faulty.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- PCU is part of the fuel injection pump assembly.

DTC P1335 (Symptom Code A) (Flash Code 43)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine (Note a slight start delay may be noticed). 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0335 (Symptom Code B or D) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) B-233 harness connector. Keep the B-234 harness connector with connected. 3. Connect a DMM between the crankshaft position (CKP) sensor signal output circuit (pin 91 of B-233 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage more than the specified value?	10 volts	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the CKP sensor signal output circuit between the ECM (pin 91 of B-233 connector) and the fuel injection pump (pin 8 of E-110 connector) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 6
5	1. Test the CKP sensor signal output circuit between the ECM (pin 91 of B-233 connector) and the fuel injection pump control unit (PCU) (pin 8 of E-110 connector) for a short to battery or ignition voltage. **Notice:** Perform this by connecting a test lamp between the ECM harness connector (pin 91 of B-233 connector) and a known good ground. If the test lamp illuminates, circuit is short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 7
6	1. Turn OFF the ignition. 2. Disconnect the PCU harness connector. 3. Inspect for an intermittent and for a poor connection on the CKP sensor signal circuit at the harness connector of the PCU (pin 8 of E-110 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
7	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the CKP sensor signal output circuit at the harness connector of the ECM (pin 92 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
8	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	—
9	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—

Step	Action	Value(s)	Yes	No
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 11
11	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1345 (Symptom Code A) (Flash Code 41)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU. The PCU also compares the engine speed signal sent from the ECM and the fuel injection pump speed. If the PCU received faulty fuel injection pump CMP sensor signal, this DTC will set.

Condition for Setting the DTC

- The PCU received faulty fuel injection pump CMP sensor signal for 1 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection pump CMP sensor is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P1345 (Symptom Code A) (Flash Code 41)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1520 (Symptom Code A) (Flash Code 47)

Circuit Description

The neutral switch is installed on the transmission gear control box. When the gear position is neutral, the switch is closed and the switch signal is provided to the engine control module (ECM). If the ECM detects the neutral switch signal is not changed from neutral during the predetermined engine speed and vehicle speed range, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 1500 RPM.
- The vehicle speed is higher than 64 km/h (40 MPH).
- The clutch pedal is released.

Condition for Setting the DTC

- The ECM detects that the neutral switch signal is continuously ON (neutral) during three consecutive driving cycles.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

Important:

- Following conditions must be met two consecutive driving cycles. (One driving cycle: Ignition switch ON > Engine run > Vehicle run > Ignition switch OFF for 10 seconds)
  - The engine speed is higher than 1500 RPM
  - The vehicle speed is higher than 64 km/h (40 MPH)
  - The clutch pedal is released
  - Other than neutral
- After the above procedure is done, a history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1520 (Symptom Code A) (Flash Code 47)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Neutral Switch parameter with the Tech 2 while shift to neutral and other positions. Does the Tech 2 indicate ON when the position is neutral and OFF when other than the neutral?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the neutral switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Neutral Switch parameter with the Tech 2. Does the Tech 2 indicate ON?	—	Go to Step 4	Go to Step 5
4	1. Test the neutral switch input signal circuit between the engine control module (ECM) (pin 87 of B-233 connector) and the neutral switch (pin 2 of J-50 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Replace the neutral switch. Refer to Neutral Switch Replacement in Transmission Section. Did you complete the replacement?	—	Go to Step 7	—

Step	Action	Value(s)	Yes	No
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. **Important:** Following conditions must be met two consecutive driving cycles before clear with the Tech 2. (One driving cycle: Ignition switch ON > Engine run > Vehicle run > Ignition switch OFF for 10 seconds) • The engine speed is higher than 1500 RPM • The vehicle speed is higher than 64 km/h (40 MPH) • The clutch pedal is released • Other than neutral 3. Turn ON the ignition, with the engine OFF. 4. Observe the Neutral Switch parameter with the Tech 2 while shift to neutral and other positions. Does the Tech 2 indicate ON when the position is neutral and OFF when other than the neutral?	—	Go to Step 8	Go to Step 3
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1520 (Symptom Code B) (Flash Code 47)

Circuit Description

The neutral switch is installed on the transmission gear control box. When the gear position is neutral, the switch is closed and the switch signal is provided to the engine control module (ECM). If the ECM detects the neutral switch signal is not changed from other than neutral during the predetermined engine speed and vehicle speed range, this DTC will set. This DTC runs only manual transmission.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 665 RPM.
- The vehicle speed is lower than 2 km/h (3 MPH).
- The clutch pedal is released after once depressed.

Condition for Setting the DTC

- The ECM detects that the neutral switch signal is continuously OFF (other than neutral) during three consecutive driving cycles.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

Important:

- Following conditions must be met two consecutive driving cycles. (One driving cycle: Ignition switch ON > Engine run > Ignition switch OFF for 10 seconds)
  - The engine speed is higher than 665 RPM
  - The vehicle speed is lower than 2 km/h (3 MPH)
  - The clutch pedal is released after once depressed
  - Neutral position
- After the above procedure is done, a history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1520 (Symptom Code B) (Flash Code 47)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Neutral Switch parameter with the Tech 2 while shift to neutral and other positions. Does the Tech 2 indicate ON when the position is neutral and OFF when other than the neutral?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the neutral switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Neutral Switch parameter with the Tech 2 while momentarily jumping across the neutral switch harness connectors between pins 1 and 2 of J-50 connector. Does the Tech 2 indicate ON when the circuit is jumped and OFF when the circuit is not jumped?	—	Go to Step 7	Go to Step 4
4	1. Connect a test lamp between the ignition voltage feed circuit of the neutral switch harness (pin 1 of J-50 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 5

Step	Action	Value(s)	Yes	No
5	Repair the open circuit or high resistance on the ignition voltage feed circuit between the ECM main relay (pin 5 of X-14 connector) and the neutral switch (pin 1 of J-50 connector). Did you complete the repair?	—	Go to Step 11	—
6	1. Test the neutral switch signal circuit between the engine control module (ECM) (pin 87 of B-233 connector) and the neutral switch (pin 2 of J-50 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
7	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connectors of the neutral switch (pins 1 and 2 of J-50 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the neutral switch circuit at the harness connector of the ECM (pin 87 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	Replace the neutral switch. Refer to Neutral Switch Replacement in Transmission Section. Did you complete the replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 11	—

Step	Action	Value(s)	Yes	No
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. **Important:** Following conditions must be met two consecutive driving cycles before clear with the Tech 2. (One driving cycle: Ignition switch ON > Engine run > Ignition switch OFF for 10 seconds) • The engine speed is higher than 665 RPM • The vehicle speed is lower than 2 km/h (3 MPH) • The clutch pedal is released after once depressed • Neutral position 3. Turn ON the ignition, with the engine OFF. 4. Observe the Neutral Switch parameter with the Tech 2 while shift to neutral and other positions. Does the Tech 2 indicate ON when the position is neutral and OFF when other than the neutral?	—	Go to Step 12	Go to Step 3
12	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1576 (Symptom Code 4) (Flash Code 71)

Circuit Description

The engine control module (ECM) controls the exhaust brake which energizes the intake throttle solenoid valve and exhaust brake solenoid valve based on vehicle running condition. The ECM commands each solenoid valve to close each throttle valve by applying vacuum. If the ECM detects that an open circuit or short to ground on the exhaust brake solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the exhaust brake solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.
5. If the exhaust brake solenoid valve control circuit between the ECM and the solenoid valve is normal, voltage level high DTC P1576 (Symptom Code 8) will set.

DTC P1576 (Symptom Code 4) (Flash Code 71)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the exhaust brake solenoid valve harness connector. 3. Connect a test lamp between the voltage feed circuit of the exhaust brake solenoid valve harness (pin 1 of J-31 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 6
4	1. Turn OFF the ignition. 2. Connect a test lamp between the control circuit of the exhaust brake solenoid valve harness (pin 2 of J-31 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Connect a 3-amp fused jumper wire across the exhaust brake solenoid valve harness connector between pins 1 and 2 of the J-31 connector. 2. Lift the driving wheels or drive the vehicle. 3. Let the vehicle run so that the exhaust brake may operate while observing the Exhaust Brake Solenoid Command parameter with the Tech 2. Does DTC P1576 (Symptom Code 8) set when the exhaust brake is operating, but not DTC P1576 (Symptom Code 4)?	—	Go to Step 9	Go to Step 7
6	Repair the open circuit or high resistance on the voltage feed circuit between the ECM main relay (pin 5 of X-14 connector) and the exhaust brake solenoid valve (pin 1 of J-31 connector). Did you complete the repair?	—	Go to Step 13	—
7	1. Test the control circuit between the engine control module (ECM) (pin 40 of B-234 connector) and the exhaust brake solenoid valve (pin 2 of J-31 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
8	1. Test the control circuit between the ECM (pin 40 of B-234 connector) and the exhaust brake solenoid valve (pin 2 of J-31 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
9	1. Turn OFF the ignition. 2. Disconnect the exhaust brake solenoid valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the exhaust brake solenoid valve (pins 1 and 2 of J-31 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the exhaust brake solenoid valve control circuit at the harness connector of the ECM (pin 40 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the exhaust brake solenoid valve. Refer to Exhaust Brake Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1576 (Symptom Code 8) (Flash Code 71)

Circuit Description

The engine control module (ECM) controls the exhaust brake which energizes the intake throttle solenoid valve and exhaust brake solenoid valve based on vehicle running condition. The ECM commands each solenoid valve to close each throttle valve by applying vacuum. If the ECM detects that a short to battery or ignition voltage on the exhaust brake solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a high voltage condition on the exhaust brake solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.
3. If the exhaust brake solenoid valve control circuit between the ECM and the solenoid valve is normal, voltage level low DTC P1576 (Symptom Code 4) will set.

DTC P1576 (Symptom Code 8) (Flash Code 71)

7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run so that the exhaust brake may operate while observing the Exhaust Brake Solenoid Command with the Tech 2. Does the DTC fail this ignition when the exhaust brake is operating?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1605 (Symptom Code C, D, E) (Flash Code 55)

Circuit Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). The electronically erasable programmable read only memory (EEPROM) memorize some data for engine control and communication with other control module. If the ECM detects memory area malfunction inside of the ECM, this DTC will set.

Condition for Setting the DTC

- The ECM detects internal seed or key file in EEPROM data is destroyed (Symptom Code C).
- The ECM detects reading or writing from the EEPROM data is failed during initialization (Symptom Code D).
- The ECM detects total sum of EEPROM data is not equal to registered value during initialization (Symptom Code E).

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses default EEPROM data substitution of faulty EEPROM. (Symptom Code D & E).

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

DTC P1605 (Symptom Code C, D, E) (Flash Code 55)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1625 (Symptom Code A) (Flash Code 76)

Circuit Description

The engine control module (ECM) main relay is energized when the ECM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the ECM main relay is de-energized after a certain length of time passed. If the ECM detects the ECM main relay is turned OFF before ECM commanded OFF, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the ECM main relay is turned OFF before commanded turned OFF.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Faulty ECM main relay may set this DTC.

DTC P1625 (Symptom Code A) (Flash Code 76)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. 5. Turn OFF the ignition. 6. Turn ON the ignition, with the engine OFF. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the ECM main relay. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM main relay (pins 1, 2, 4 and 5 of X-14 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on ECM main relay control and battery voltage feed circuit at the harness connector of the ECM (pins 3 and 58 of B-234 connector). 6. Test for high resistance on each ECM main relay circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 5	Go to Step 4
4	Replace the ECM main relay. Did you complete the replacement?	—	Go to Step 5	—

Step	Action	Value(s)	Yes	No
5	1. Reconnect all previously disconnected relay or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the DTC Information with the Tech 2. 6. Turn OFF the ignition. 7. Turn ON the ignition, with the engine OFF. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 6
6	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1625 (Symptom Code B) (Flash Code 76)

Circuit Description

The engine control module (ECM) main relay is energized when the ECM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the ECM main relay is de-energized after a certain length of time passed. If the ECM detects the ECM main relay has been ON since the ignition switch was turned OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is OFF.

Condition for Setting the DTC

- The ECM detects that the ECM main relay is turned ON for longer than 2 seconds.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Faulty or sticking ECM main relay may set this DTC.

Test Description

The numbers below refer to the step number on the diagnostic table.
2. If this DTC is present, Tech 2 can communicate with the ECM when the ignition switch is OFF.

DTC P1625 (Symptom Code B) (Flash Code 76)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail with the ignition switch OFF?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Disconnect the ECM main relay. 2. Monitor the DTC Information with the Tech 2. Does the DTC fail with the ignition switch OFF?	—	Go to Step 6	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the ECM main relay. 3. Connect a test lamp between the control circuit of the ECM main relay harness (pin 4 of X-14 connector) and battery voltage. 4. Keep the ignition switch OFF. Does the test lamp illuminate?	—	Go to Step 5	Go to Step 7
5	1. Test the control circuit of the ECM main relay between the engine control module (ECM) (pin 58 of B-234 connector) and the ECM main relay (pin 4 of X-14 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 8
6	Repair the short to battery on the voltage feed supply circuit to the ECM between the ECM (pin 3 of B-234 connector) and the ECM main relay (pin 5 of X-14 connector). Did you complete the repair?	—	Go to Step 9	—

Step	Action	Value(s)	Yes	No
7	Replace the ECM main relay. Did you complete the replacement?	—	Go to Step 9	—
8	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 9	—
9	1. Reconnect all previously disconnected relay or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Monitor the DTC Information with the Tech 2. Does the DTC with the ignition switch OFF?	—	Go to Step 3	Go to Step 10
10	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1630 (Symptom Code A, B) (Flash Code 51)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the ECM detects that the fuel injection solenoid valve control current problem, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the PCU monitored fuel injection solenoid valve control current is too high. (Symptom Code A)
- The ECM detects that the PCU continuously flow the control current to the fuel injection solenoid valve. (Symptom Code B)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity. (Symptom Code A)
- The ECM cuts fuel injection. (Symptom Code B)

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P1630 (Symptom Code A, B) (Flash Code 51)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—

Step	Action	Value(s)	Yes	No
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1650 (Symptom Code A) (Flash Code 44)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM detects that the PCU receives from the CAN controller rest or Bus Offline, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the PCU receives from the CAN controller reset or Bus Offline.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts the fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1650 (Symptom Code A) (Flash Code 44)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P1651 (Symptom Code A or B) set?	—	Go to Applicable DTC	Go to Step 3
3	Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the fuel injection pump control unit (PCU) harness connector. 3. Connect a DMM across the controller area network (CAN) harness (pins 1 and 2 of E-110 connector). 4. Measure the resistance across the CAN terminals. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 5	Go to Step 10
5	1. Connect a DMM between the CAN Low signal circuit (pin 1 of E-110 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage within the specified value?	1.5 – 2.5 volts	Go to Step 6	Go to Step 11

Step	Action	Value(s)	Yes	No
6	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a DMM between the CAN High signal circuit (pin 2 of E-110 connector) and a known good ground. Is the DMM voltage within the specified value?	3.0 – 4.0 volts	Go to Step 7	Go to Step 12
7	1. Turn OFF the ignition. 2. Reconnect the PCU harness connector. 3. Disconnect the engine control module (ECM) B-233 harness connector. Keep the ECM B-234 harness connector with connected. 4. Connect a DMM across the CAN harness (pins 99 and 100 of B-233 connector). 5. Measure the resistance across the CAN terminals. Is the resistance within the specified value?	110 – 130 Ω	Go to Step 8	Go to Step 14
8	1. Connect a DMM between the CAN Low signal circuit of the ECM harness (pin 99 of B-233 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage within the specified value?	1.5 – 2.5 volts	Go to Step 9	Go to Step 16
9	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a DMM between the CAN High signal circuit of the ECM harness (pin 100 of B-233 connector) and a known good ground. Is the DMM voltage within the specified value?	3.0 – 4.0 volts	Go to Step 13	Go to Step 16
10	1. Test the CAN Low and High circuit between the ECM (pins 99 and 100 of B-233 connector) and the PCU (pins 1 and 2 of E-110 connector) for the following conditions: • An open circuit • A short each other • High resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
11	1. Test the CAN Low circuit between the ECM (pin 99 of B-233 connector) and the PCU (pin 1 of E-110 connector) for the following conditions: • A short to ground • A short to battery or ignition voltage 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
12	1. Test the CAN Low circuit between the ECM (pin 100 of B-233 connector) and the PCU (pin 2 of E-110 connector) for the following conditions: • A short to ground • A short to battery or ignition voltage 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17

Step	Action	Value(s)	Yes	No
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Monitor the DTC Information with the Tech 2. Is DTC P0251 (Symptom Code E) set?	—	Go to Step 16	Go to Diagnostic Aids
14	1. Turn OFF the ignition. 2. Disconnect the PCU harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the PCU (pins 1 and 2 of E-110 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the CAN Low or High circuits at the harness connector of the ECM (pins 99 and 100 of B-233 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
16	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. (PCU is part of the fuel injection pump assembly) Did you complete the replacement?	—	Go to Step 18	—
17	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—
18	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 2	Go to Step 19
19	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1650 (Symptom Code B) (Flash Code 44)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM detects internal CAN controller does not react, this DTC will set.

Condition for Setting the DTC

- The ECM detects internal CAN controller does not react.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts the fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Notice:

- CAN controller is internal to the ECM.

DTC P1650 (Symptom Code B) (Flash Code 44)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1651 (Symptom Code A, B) (Flash Code 45)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM fails to receive an expected message from the PCU, this will set depending on what communication is lost.

Condition for Setting the DTC

- The ECM detects that the PCU does not receive the CAN messages from the ECM. (Symptom Code A)
- The ECM does not receive the CAN messages from the PCU. (Symptom Code B)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts the fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

P1690 (Symptom Code 4) (Flash Code 77)

Circuit Description

The malfunction indicator lamp (MIL) is located on the instrument panel cluster (IPC). The battery voltage is supplied to the MIL. The engine control module (ECM) turns the MIL ON by grounding the MIL control circuit. After a fixed time passes, the ECM turns OFF the MIL with the ignition ON and the engine OFF. The MIL has the following functions:

- The MIL informs the driver that a malfunction has occurred and the vehicle should be taken in for service as soon as possible.
- The MIL illuminates during a bulb test and a system test.
- A DTC will be stored if a MIL is requested by the ECM.

If the ECM detects an open circuit or short circuit on the MIL control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the MIL control circuit for longer than 3 seconds when the MIL is commanded OFF.

Action Taken When the DTC Sets

- The ECM does not illuminates the MIL when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1690 (Symptom Code 4) (Flash Code 77)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Perform the Malfunction Indicator Lamp (MIL) test with the Tech 2. 4. Command the MIL ON with the Tech 2. Does the MIL turn ON when commanded ON with the Tech 2?	—	Go to Step 3	Go to Step 4
3	Command the MIL OFF with the Tech 2. Does the MIL OFF?	—	Go to Step 17	Go to Step 10
4	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse (F-16) in the glove box fuse block. Is the Meter (10A) fuse (F-16) open?	—	Go to Step 5	Go to Step 6
5	Replace the Meter (10A) fuse (F-16). If the fuse continues to open, repair the short to ground on one of the circuits that fed by the Meter (10A) fuse (F-16) or replace the shorted attached component fed by the Meter (10A) fuse (F-16). Did you complete the repair?	—	Go to Step 19	—

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the MIL control circuit of the ECM harness connector (pin 42 of B-234 connector) and a known good ground. Does the MIL illuminate?	—	Go to Step 11	Go to Step 7
7	1. Turn OFF the ignition. 2. Remove the instrument panel cluster (IPC). 3. Remove the MIL bulb from the IPC (meter assembly). Is the MIL bulb burned out?	—	Go to Step 15	Go to Step 8
8	1. Disconnect the IPC harness B-51 connector. 2. Connect a test lamp between the voltage feed circuit of the MIL (pin 8 of B-51 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 12
9	1. Turn OFF the ignition. 2. Reconnect the ECM harness connector. 3. Connect a test lamp between the voltage feed circuit and control circuit of the MIL (pins 4 and 8 of B-51 connector). 4. Turn ON the ignition, with the engine OFF. 5. Perform the MIL test with the Tech 2. 6. Command the MIL ON with the Tech 2. Does the test lamp turn ON when commanded ON with the Tech 2?	—	Go to Step 14	Go to Step 13
10	1. Test the control circuit of the MIL between the ECM (pin 42 of B-234 connector) and the IPC (pin 4 of B-51 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the MIL control circuit at the harness connector of the ECM (pin 42 of B-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
12	Repair the open circuit or high resistance on the voltage feed circuit of the MIL between the IPC (pin 8 of B-51 connector) and Meter (10A) fuse (F-16). Did you complete the repair?	—	Go to Step 19	—

Step	Action	Value(s)	Yes	No
13	Repair the open circuit or high resistance on the control circuit of the MIL between the ECM (pin 42 of B-234 connector) and the IPC (pin 4 of B-51 connector). Did you complete the repair?	—	Go to Step 19	—
14	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections on the MIL circuits at the IPC (pins 4 and 8 of B-51 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
15	Replace the MIL bulb. Did you complete the replacement?	—	Go to Step 19	—
16	Repair or replace the IPC (meter assembly). Did you complete the repair or replacement?	—	Go to Step 19	—
17	1. Turn OFF the ignition for 30 seconds. 2. Turn ON the ignition for 10 seconds, with the engine OFF. 3. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 18	Go to Diagnostic Aids
18	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 20
20	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1690 (Symptom Code 8) (Flash Code 77)

Circuit Description

The malfunction indicator lamp (MIL) is located on the instrument panel cluster (IPC). The battery voltage is supplied to the MIL. The engine control module (ECM) turns the MIL ON by grounding the MIL control circuit. After a fixed time passes, the ECM turns OFF the MIL with the ignition ON and the engine OFF. The MIL has the following functions:

- The MIL informs the driver that a malfunction has occurred and the vehicle should be taken in for service as soon as possible.
- The MIL illuminates during a bulb test and a system test.
- A DTC will be stored if a MIL is requested by the ECM.

If the ECM detects a short to battery or ignition voltage on the MIL control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a high voltage condition on the MIL control circuit for longer than 1 second when the MIL is commanded ON.

Action Taken When the DTC Sets

- The ECM does not illuminates the MIL when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the Tech 2.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.
3. If the control circuit of the MIL between the ECM and the IPC is normal, the control circuit voltage low DTC P1690 (Symptom Code 4) will set.

DTC P1690 (Symptom Code 8) (Flash Code 77)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Perform the Malfunction Indicator Lamp (MIL) test with the Tech 2. 4. Command the MIL ON with the Tech 2. Does the MIL turn ON when commanded ON with the Tech 2?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Remove the instrument panel cluster (IPC) in order to disconnect the IPC harness B-51 connector. 3. Disconnect the IPC harness B-51 connector. 4. Turn ON the ignition, with the engine OFF. 5. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does DTC P1690 (Symptom Code 4) set, but not DTC P1690 (Symptom Code 8)?	—	Go to Step 5	Go to Step 4
4	1. Test the control circuit of the MIL between the engine control module (ECM) (pin 42 of B-234 connector) and the IPC (pin 4 of B-51 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Repair or replace the IPC (meter assembly). Did you complete the repair or replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

Glow Control System Check

Description

The glow control system consists of the engine control module (ECM), the glow relay and glow plugs. The glow control system is operated when the engine coolant temperature is low, which allows easier engine starting. The ECM commands the glow relay ON for a certain length of time at ignition switch is ON with engine OFF. In after glow phase, the glow plugs remain energized for a certain period with engine run.

Glow Control Operation

- The pre glow control system operates when the engine coolant temperature is less than 30°C (86°F).
- The after glow control system operates when the engine coolant temperature is less than 30°C (86°F).

Glow Control System Check

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information of the engine control system with the Tech 2 and check whether following DTC(s) is set: • P0115 (Symptom Code 1 & 2) • P0380 (Symptom Code 4 & 8) • P0381 (Symptom Code 4 & 8) Are any of the above DTC(s) set?	—	Refer to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Make sure the metal bus bar that connects switched battery voltage supply terminal (J-122) and all glow plugs is secured tightly. 3. Turn ON the ignition, with the engine OFF 4. Connect a test lamp between the metal bus bar (glow plug power supply J-122 terminal) and a known good ground. 5. Perform the Glow Relay test with the Tech 2. 6. Command the Glow Relay ON with the Tech 2 while observing the test lamp. Does the test lamp turn ON only when commanded ON with the Tech 2?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Remove the metal bus bar from the glow plugs. 3. Measure resistance of each glow plug between the glow plug terminals and a known good ground. Make sure to record all measurements and take them quickly as to not allow engine temperature changes between measurements. Are the resistances within the specified value each other?	1 Ω	System OK	Go to Step 15

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Replace the glow relay with the starter relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the metal bus bar (glow plug power supply J-122 connector) and a known good ground. 5. Perform the Glow Relay test with the Tech 2. 6. Command the Glow Relay ON with the Tech 2 while observing the test lamp. Does the test lamp turn ON only when commanded ON with the Tech 2?	—	Go to Step 9	Go to Step 6
6	Inspect the Glow (60A) slow blow fuse (SBF-3) in the fuse & relay box. Is the Glow (60A) slow blow fuse (SBF-3) open?	—	Go to Step 10	Go to Step 7
7	1. Turn OFF the ignition. 2. Remove the glow relay in the fuse & relay box. 3. Connect a test lamp between the voltage feed circuit of the glow relay terminal (pin 3 of X-20 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 11
8	1. Turn ON the ignition, with the engine OFF. 2. Connect a test lamp between the power supply circuit of glow plugs (pin 2 of X-20 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 12
9	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the glow relay terminals (pins 2 and 3 of X-20 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14
10	1. Replace the Glow (60A) slow blow fuse (SBF-3). If the slow blow fuse continues to open, repair the short to ground on a circuit fed by the slow blow fuse or check for a shorted attached component. 2. Repair the short to ground or replace the component as necessary. Did you complete the repair?	—	Go to Step 16	—
11	Repair the open circuit in the battery voltage supply circuit between the Glow (60A) slow blow fuse (SBF-3) and the glow relay (pin 3 of X-20 connector). Did you complete the repair?	—	Go to Step 16	—
12	Repair the open circuit in the switched battery voltage supply circuit between the glow relay (pin 2 of X-20 connector) and the glow plugs (J-122 terminal). Did you complete the repair?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
13	**Important:** The glow plugs may be burnt out if the battery voltage supply circuit is shorted to a voltage source. Repair the short to battery or ignition voltage on the switched battery voltage supply circuit between the glow relay (pin 2 of X-20 connector) and the glow plugs (J-122 terminal). Did you complete the repair?	—	Go to Step 16	—
14	Replace the glow relay. Did you complete the replacement?	—	Go to Step 16	—
15	Replace the appropriate glow plug. Did you complete the replacement?	—	Go to Step 16	—
16	1. Reconnect all previously disconnected components, relay, fuse or harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the metal bus bar (glow plug power supply J-122 connector) and a known good ground. 5. Perform the Glow Relay test with the Tech 2. 6. Command the Glow Relay ON with the Tech 2 while observing the test lamp. Does the test lamp turn ON only when commanded ON with the Tech 2?	—	Go to Step 4	Go to Step 2

Symptoms – Engine Controls

Symptoms – Engine Controls

Important Preliminary Inspections Before Starting

Perform Diagnostic System Check – Engine Controls before using the symptom tables, and verify that all of the following are true:

- The engine control module (ECM) and malfunction indicator lamp (MIL) are operating correctly.
- There are no diagnostic trouble codes (DTCs) stored, or a DTC exists but without the MIL.
- The Tech 2 data is within the normal operating range. Refer to the Tech 2 Data List in this section.
- Verify the customer concern and locate the correct symptom in the table of contents. Inspect the items indicated under that symptom.

Visual and Physical Inspection

Several of the symptom procedures ask for careful visual and physical inspection. This step is extremely important. The visual and physical inspection can lead to correcting a problem without further inspections, and can save valuable time. Ensure that:

- The ECM grounds are clean, tight, and in their proper location.
- The vacuum hoses are not split or kinked, and properly connected. Inspect thoroughly for any type of leak or restriction.
- The mass air flow (MAF) sensor is properly installed. The arrows on the plastic portion of the sensor must point toward the engine.
- The air intake ducts are not collapsed or damaged.
- There are no leaks at the MAF sensor, any connections or intake manifold sealing surfaces.
- The engine harness wiring and terminals are properly connected and are not pinched or cut.

Intermittent

Important:
Inspect for improper installation of electrical components if an intermittent condition exists. Inspect for aftermarket add-on electrical equipment devices, lights, and cellular phones. Verify that no aftermarket equipment is connected to the keyword 2000 serial data circuit. If you cannot locate an intermittent condition, a cellular phone communication signal may cause the condition.

Important:
The problem may or may not turn ON the MIL or store a DTC.

Faulty electrical connections or wiring cause most intermittent problems. Perform a careful visual and physical inspection of the suspect connectors for the following conditions:

- Improperly mated connector halves
- Terminals that are not seated
- Terminals that are damaged or improperly formed

Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension. Remove the terminal from the connector body in order to inspect for poor terminal wire connection.
Road test the vehicle with the DMM connected to the suspected circuit. An abnormal reading that occurs when the malfunction occurs is a good indication that there is a malfunction in the circuit being monitored.
Use the Tech 2 in order to help detect intermittent conditions. Useful features of the Tech 2 include the following:

- Trigger the Snapshot feature in order to capture and store engine parameters when the malfunction occurs. Review this stored information in order to see the specific running conditions that caused the malfunction.
- Use the Plot Function on the Tech 2 in order to plot selected data parameters. Review this stored information to aid in locating an intermittent problem. Refer to the Tech 2 Users Guide for more information.

Important:
If the intermittent condition exists as a start and then stall, test for DTCs relating to the vehicle theft deterrent system. Test for improper installation of electrical options such as lights, cellular phones, etc.

Any of the following may cause an intermittent MIL with no stored DTC:

- The ECM grounds are loose or dirty. Refer to Engine Controls Schematics.
- The MIL circuit intermittently shorted to ground.
- Electrical system interference caused by a malfunctioning relay, ECM driven solenoid, or switch. The electrical component can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating.
- There is an open diode across the A/C compressor clutch or any other open diodes.

Important:
The following symptom tables contain groups of possible causes for each symptom. The order of these procedures is not important. If the Tech 2 readings do not indicate the problems, then proceed in a logical order, easiest to check or most likely to cause first. In order to determine if a specific vehicle is using a particular system or component, refer to Engine Controls Schematics for an application.
Use the following tables when diagnosing a symptom complaint:

- Intermittent Conditions
- Hard Start
- Rough, Unstable, or Incorrect Idle and Stalling
- Cuts Out, Misses
- Surge/Chuggles
- Lack of Power, Sluggishness, or Sponginess
- Hesitation, Sag, Stumble
- Fuel Knock/Combustion Noise
- Poor Fuel Economy
- Excessive Smoke (Black Smoke)
- Excessive Smoke (White Smoke)

Intermittent Conditions

Checks	Action
DEFINITION: The problem is not currently present but is indicated in DTC History. OR There is a customer complaint, but the symptom cannot currently be duplicated, if the problem is not DTC related.	
Preliminary Checks	• Refer to Symptoms – Engine Controls before starting.
Harness/Connector	Many intermittent open or shorted circuits are affected by harness/connector movement that is caused by vibration, engine torque, bumps/rough pavement, etc. Test for this type of condition by performing the applicable procedure from the following list: • Move related connectors and wiring while monitoring the appropriate Tech 2 data. • Move related connectors and wiring with the component commanded ON, and OFF, with the Tech 2. Observe the component operation. • With the engine running, move related connectors and wiring while monitoring engine operation. If harness or connector movement affects the data displayed, component/system operation, or engine operation, inspect and repair the harness/connections as necessary. Refer to Electrical Connections or Wiring.
Electrical Connections or Wiring	Poor electrical connections, terminal tension or wiring problems cause most intermittent. To perform the following inspections: • Inspect for poor mating of the connector halves, or terminals improperly seated in the connector body. • Inspect for improperly formed or damaged terminals. Test for poor terminal tension. • Inspect for poor terminal to wire connections including terminals crimped over insulation. This requires removing the terminal from the connector body. • Inspect for corrosion/water intrusion. Pierced or damaged insulation can allow moisture to enter the wiring. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits. • Inspect for wires that are broken inside the insulation. • Inspect the harness for pinched, cut or rubbed through wiring. • Ensure that the wiring does not come in contact with hot exhaust components.
Control Module Power and Grounds Component Power and Grounds	Poor power or ground connections can cause widely varying symptoms. • Test all control module power supply circuits. Many vehicles have multiple circuits supplying power to the control module. Other components in the system may have separate power supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the power source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Ensure that the circuit can carry the current necessary to operate the component. • Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Ensure that the circuit can carry the current necessary to operate the component.

Checks	Action
Temperature Sensitivity	• An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/ connection is cold, or only when the component/connection is hot. • If the intermittent is related to heat, review the data for a relationship with the following: - High ambient temperatures - Underhood/engine generated heat - Circuit generated heat due to a poor connection, or high electrical load - Higher than normal load conditions, towing, etc. • If the intermittent is related to cold, review the data for the following: - Low ambient temperatures – In extremely low temperatures, ice may form in a connection or component. Test for water intrusion. - The condition only occurs on a cold start. - The condition goes away when the vehicle warms up. • Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
Electromagnetic Interference (EMI) and Electrical Noise	Some electrical components/circuits are sensitive to EMI or other types of electrical noise. Inspect for the following conditions: • A misrouted harness that is too close to high voltage/high current devices such as injection components, motors, generator etc. These components may induce electrical noise on a circuit that could interfere with normal circuit operation. • Electrical system interference caused by a malfunctioning relay, or the engine control module (ECM) driven solenoid or switch. These conditions can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating. • Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use. • Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode. • Test the generator for a bad rectifier bridge that may be allowing AC noise into the electrical system.
Incorrect ECM Programming	• There are only a few situations where reprogramming a ECM is appropriate: **Important:** DO NOT reprogram the ECM with the SAME software/calibration files that are already present in the ECM. This is not an effective repair for any type of driveability problem. - A ECM from another vehicle is installed. - Revised software/calibration files have been released for this vehicle. • Verify that the ECM contains the correct software/calibration. If incorrect programming is found, reprogram the ECM with the most current software/ calibration.
Duplicating Failure Conditions	• If none of the previous tests are successful, attempt to duplicate and/or capture the failure conditions. • An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the problem occurs, may help you locate the problem.
Tech 2 Snapshot	The Tech 2 can be set up to take a Snapshot of the parameters available via serial data. The Snapshot function records live data over a period of time. The recorded data can be played back and analyzed. The Tech 2 can also graph parameters singly or in combinations of parameters for comparison. The Snapshot can be triggered manually at the time the symptom is noticed, or set up in advance to trigger when a DTC sets. An abnormal value captured in the recorded data may point to a system or component that needs to be investigated further. Refer to the Tech 2 user instructions for more information on the Snapshot function.

Hard Start

Checks	Action
DEFINITION: The engine cranks OK, but does not start for a long time. The engine does eventually run, or may start but immediately dies.	
Preliminary Checks	• Diagnostic System Check – Engine Controls. • Ensure the driver is using the correct starting procedure. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the Tech 2 Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/ J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.

Checks	Action
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Improper mechanical timing (timing gear) • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Electrical System Checks	Inspect the engine electrical for the following conditions. Refer to the Engine Electrical section. • Inspect the glow plug control (preheating) system operation. • Inspect for slow cranking speed. • Inspect for weakened batteries.

Rough, Unstable, or Incorrect Idle And Stalling

Checks	Action
DEFINITION: Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.	
Preliminary Checks	• Diagnostic System Check – Engine Controls. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the Engine Control Module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the Tech 2 Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the Tech 2 to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/ J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.

Checks	Action
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes • Inspect for incorrect basic engine parts.
Additional Checks	• Electromagnetic interference (EMI) on the reference circuit can cause an engine miss condition. The Tech 2 can usually detect EMI by monitoring the engine speed. A sudden increase in speed with little change in actual engine speed change indicates that EMI is present. If a problem exists, check routing of high voltage components, such as fuel injection solenoid valve wiring, near the sensor circuits. • Inspect for faulty engine mounts. • Inspect faulty crank pulley. • Inspect faulty generator & A/C compressor. • Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Inspect the EGR system operating correctly. • Inspect the A/C operation.

Cut Out, Misses

Checks	Action
DEFINITION: A constant jerking that follows the engine speed, usually more pronounced as the engine load increase. The exhaust has a steady spitting sound at idle, low speed, or hard acceleration for the fuel starvation that can cause the engine to cut-out.	
Preliminary Check	• Diagnostic System Check — Engine Controls. • Inspect that the harness connectors are correctly connected. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect the Tech 2 Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to observe the Accelerator Pedal Position. Accelerator Pedal Position indicating angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/ J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at mass air flow (MAF) sensor.
Additional Checks	• Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Electromagnetic interference (EMI) on the reference circuit can cause an engine miss condition. The Tech 2 can usually detect EMI by monitoring the engine speed. A sudden increase in speed with little change in actual engine speed change indicates that EMI is present. If a problem exists, check routing of high voltage components, such as fuel injection solenoid wiring, near the sensor circuits.

Surges/Chuggles

Checks	Action
DIFINITION: The engine has a power variation under a steady throttle or cruise. The vehicle seems to speed up and slow down with no change in the accelerator pedal.	
Preliminary Checks	• Diagnostic System Check — Engine Controls. • Ensure the driver understands the A/C compressor operation. • Use the Tech 2 in order to make sure the Vehicle Speed parameter reading matches the vehicle speedometer. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the Tech 2 Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Mass Air Flow (MAF) Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Use the Tech 2 to observe the Accelerator Pedal Position. Accelerator Pedal Position parameter should change linearly from 0% to 100% according to the accelerator pedal operation. Also inspect the Accelerator Pedal Position indicating angle when the accelerator pedal is steady. If the indicating angle fluctuates, check for an intermittent open, high resistance in the circuits or for a skewed sensor. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/ J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the Tech 2 while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM > around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor.

Checks	Action
Additional Checks	• Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Inspect the EGR system operating correctly. • Inspect the A/C operation.

Lack of Power, Sluggishness, Sponginess

Checks	Action
DEFINITION: The engine delivers less than expected power. There is little or no increase in speed when partially applying the accelerator pedal.	
Preliminary Checks	• Diagnostic System Check — Engine Controls. • Compare the vehicle with a similar unit. Ensure the vehicle has an actual problem. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Are the tire sizes changed? • Are excessively heavy loads being carried? • Inspect for clutch slip. • Inspect brake drag. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Use the Tech 2 in order to make sure the Vehicle Speed parameter reading matches the vehicle speedometer. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect the Tech 2 Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the Tech 2 to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF sensor parameter must follow the Desired MAF parameter within 100 mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Use the Tech 2 to observe the Accelerator Pedal Position. Accelerator Pedal Position parameter should change linearly from 0% to 100% according to the accelerator pedal operation.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/ J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the Tech 2 while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM > around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section. • Inspect for turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.
Engine Mechanical Check	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Inspect the EGR system operating correctly. • Inspect the engine overheat condition. Refer to the Engine Cooling section. • Inspect the A/C operation.

Hesitation, Sag, Stumble

Checks	Action
DEFINITION: The vehicle has a momentary lack of response when pushing down on the accelerator. The condition can occur at any vehicle speed. The condition is usually most severe when trying to make the vehicle move from a stop. If severe enough, the condition may cause the engine to stall.	
Preliminary Checks	• Diagnostic System Check — Engine Controls. • Compare the vehicle with a similar unit. Ensure the vehicle has an actual problem. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Inspect the Tech 2 Data List in this section. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect the Service Bulletins for ECM software updates.

Checks	Action
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the Tech 2 to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor • Use the Tech 2 to observe the Accelerator Pedal Position. Accelerator Pedal Position parameter should change linearly from 0% to 100% according to the accelerator pedal operation.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/ J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the Tech 2 while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM > around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section. • Inspect for turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.
Engine Mechanical Check	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Inspect the EGR system operating correctly. • Inspect the A/C operation.

Fuel Knock/Combustion Noise

Checks	Action
DEFINITION: A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with the throttle opening.	
Preliminary Checks	• Diagnostic System Check — Engine Controls. • Ensure the vehicle has an actual problem. • Inspect for smoke associated with the combustion noise. • Inspect the fuel quality (cetane index). • Inspect the Tech 2 Data List in this section. • Inspect the Service Bulletins for ECM software updates.

Checks	Action
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the Tech 2 to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor paramater must follow the Desired MAF parameter within 100mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.
Fuel System Checks	• If excessive smoke is present, check for an injection nozzle(s). Remove each glow plug from the cylinder head and inspect the tip of the glow plugs for wet by fuel. Use the cylinder compression gauge. Proper compression is more than 2100 kPa (309 psi). If poor compression is observed, inspect the engine mechanical. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the Tech 2 while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM > around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc. • Inspect for any excessive oil entering combustion chamber.
Additional Checks	• Inspect the EGR system operating correctly. • Inspect other possible causes that can make similar noise such as loose component parts, bracket, mount and weak clutch damper spring.

Poor Fuel Economy

Checks	Action
DEFINITION: Fuel economy, as measured by actual road tests and several tanks of fuel, is noticeably lower than expected. Also, the economy is noticeably lower than it was on this vehicle at one time, as previously shown by actual road tests.	

Checks	Action
Preliminary Checks	• Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the driving habits of the owner. • Is the A/C ON full time, defroster mode ON? • Are the tires at the correct pressure? • Have the tire sizes changed? • Are excessively heavy loads being carried? • Is the acceleration too much, too often? • Inspect for clutch slip. • Inspect brake drag. • Inspect dive belt tension. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Suggest to the owner to fill the fuel tank and recheck the fuel economy. • Suggest to the driver to read the Important Facts on Fuel Economy in the Owner Manual. • Inspect the odometer is correctly operated. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect the fuel type and quality. • Check fuel leak.
Cooling System Checks	Inspect the cooling system for the following conditions. Refer to the Cooling System Section. • Inspect the engine coolant level. • Inspect the engine thermostat for always being open or for the wrong heat range. • Inspect the engine cooling fan for always being ON.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi).

Excessive Smoke (Black Smoke)

Checks	Action
DEFINITION: Black smoke under load, idle or start up hot or cold.	
Preliminary Check	• Ensure the vehicle has an actual problem. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the Tech 2 to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor • Use the Tech 2 to observe the Accelerator Pedal Position. Accelerator Pedal Position indicating angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the Tech 2 while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM > around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.

Checks	Action
Engine Mechanical Check	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc. • Inspect for any excessive oil entering combustion chamber. • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the EGR system operating correctly. • Inspect the excessive blow-by gasses. • Inspect the Tech 2 Data List in this section.

Excessive Smoke (White Smoke)

Checks	Action
DIFINITION: White smoke under load, idle or start up hot or cold.	
Preliminary Check	• Ensure the vehicle has an actual problem. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect the fuel quality (cetane index). • Inspect the Service Bulletins for ECM software updates.
Sensor Check	Inspect the engine control sensors for the following conditions. Refer to the Tech 2 Data List in this section. • Use the Tech 2 to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the Tech 2 while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM > around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc. • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes • Inspect for any excessive fuel entering combustion chamber. • Inspect for coolant entering the combustion chamber.
Electrical System Checks	Inspect the engine electrical for the following conditions. Refer to the Engine Electrical section. • Inspect the glow plug control (preheating) system operation.

Repair Instructions

Engine Control Module (ECM) Replacement

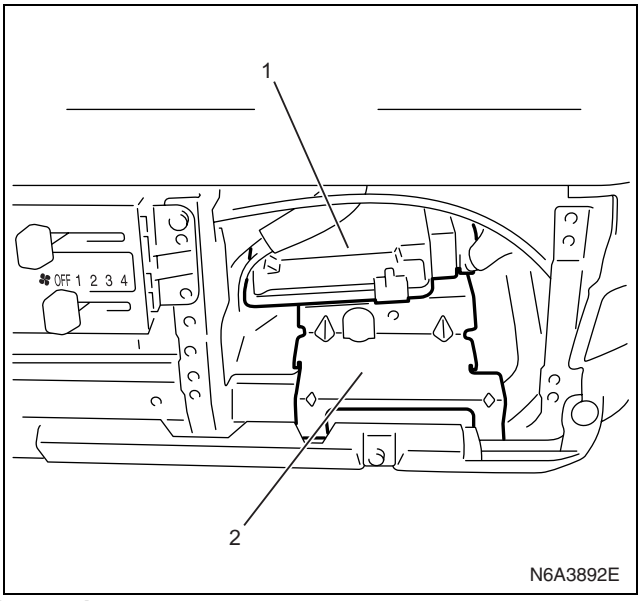
Engine Control Module (ECM) Replacement Procedure

Important:
If the ECM is to be replaced the following programmed contents MUST be reprogrammed into the new ECM.

- Vehicle identification number (VIN).
- Latest software/calibrations if released. Refer to Service Programming System (SPS) Description and Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure) in this section.

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the instrument cover.
3. Remove a bolt from the ECM bracket.
4. Disconnect the two connectors from the ECM.



Legend
1. ECM
2. Bracket

Installation Procedure

1. Connect the two connectors to the ECM.
2. Put on the ECM to the bracket and tighten by a bolt.
3. Refit the instrument cover by four screws.
4. Connect the negative battery cable.

Vehicle Identification Number (VIN) Programming Procedure

Important:
If the ECM from another vehicle is installed, VIN is not programmed by the Tech 2. Use the SPS to change the original VIN. Refer to Service Programming System (SPS) Description and Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure) in this section.

Important:
If an updated software/calibrations is released, DO NOT program the VIN now. The VIN is programmed at SPS procedure. Refer to Service Programming System (SPS) Description and Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure) in this section.

1. Connect the Tech 2 to the vehicle DLC, with the engine and the Tech 2 OFF.
2. Turn ON the Tech 2.
3. Select Diagnostic > appropriate vehicle identification > Powertrain > 4JH1-TC > Programming > Program VIN.
4. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle.
5. Select Lock ECU and lock the programmed VIN.

Service Programming System (SPS) Description

The service programming system (SPS) allows a technician to program a control module through the data link connector (DLC). The information transfer circuit that is used at the DLC is the same serial data circuit used be the Tech 2 for retrieving diagnostic trouble codes (DTCs), displaying data, clearing DTCs etc. This procedure offers the ability to install software/ calibrations matched to a particular vehicle.
Most control modules have two types of memory. The software/calibrations reside in the flash memory. The two types of memory are listed below:

- Electrically Erasable Programmable Read Only Memory (EEPROM).
  This type of memory allows selected portions of memory to be programmed while other portions remain unchanged.
  Certain learned values reside in the EEPROM, such as:
  - The vehicle identification number (VIN)
  - The software/calibrations identification numbers
  - The control module security information

- Flash Read Only Memory-Flash MemoryFlash memory has increased memory storage capacity. During programming, all information within this type of memory is erased, and then replaced with entirely new information.

Service Programming Methods

The two methods of programming an engine control module (ECM) are listed below:

- Remote Programming
- Pass Thru Programming

For information on programming an ECM using one of the methods listed above, refer to Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure).

Before Programming a Control Module

Important:
DO NOT program an existing ECM with the identical software/calibration package. This procedure is not a short cut to correct the driveability condition. This is an ineffective repair. An ECM should only be programmed when the following occurs:

- When a service procedure instructs you to replace the ECM. When the ECM from another vehicle is installed, VIN must be changed. And change vehicle information as necessary such as type of transmission.
- An updated software/calibrations is released.

Ensure that the following conditions are met before programming an ECM:

- The Tech 2 PCMCIA card is programmed with the latest software.
- The TIS 2000 is installed with the latest software.
- The hardware key is plugged into the computer port.
- Vehicle system voltage:
  - There are no charging system concerns. All charging system concerns must be repaired before programming the ECM.
  - The battery voltage is greater than 12 volts but less than 16 volts. The battery must be fully charged before programming the ECM.
  - A battery charger is NOT connected to the vehicles battery. Incorrect system voltage or voltage fluctuations from a battery charger may cause programming failure or ECM damage.
  - Turn OFF or disable any system that may put a load on the vehicles battery. Turn OFF or disable systems such as:
    - ◊ Heating, ventilation, and air conditioning (HVAC) systems
    - ◊ Headlights
    - ◊ Room lights
    - ◊ Accessory equipment
- The ignition switch is in the proper position. The Tech 2 prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the programming procedure unless instructed to do so.
- All tool connections are secure:
  - The RS-232 cable
  - The connection at the DLC
  - The voltage supply circuits
- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or ECM damage may occur.
- If you are performing the Pass-Thru programming procedure using a notebook computer without the power cord, ensure that the internal battery is fully charged.

Service Programming System (SPS) (Remote Procedure)

The Remote Service Programming System (SPS) method is a three-step process that involves the following procedures:

1. Connecting the Tech 2 to the vehicle and obtaining the information from the engine control module (ECM).
2. Connecting the Tech 2 to the terminal and downloading a new calibration file from the terminal into the Tech 2 memory.
3. Reconnecting the Tech 2 to the vehicle and uploading the new calibration file into the ECM.

Performing the Remote Procedure

1. Connect the Tech 2 to the vehicle and obtain the ECM information using the following procedure:

Important:
Ensure the ECM is installed in the vehicle and the battery is fully charged before programming.

   a. Connect the Tech 2 to the vehicle data link connector (DLC), with the engine and the Tech 2 OFF.
   b. Turn ON the Tech 2.
   c. Press Enter at the title screen.
   d. Turn ON the ignition, with the engine OFF.
   e. Select Service Programming System at the Main Menu.
   f. Select Request Info.

g. If there is already stored in the Tech 2, the existing data is displayed on the screen. The Tech 2 asks user to keep existing data Keep Data or Continue to request new vehicle information from the ECM. If there is no data in the Tech 2, it will immediately start vehicle identification.
h. Enter the vehicle description by following the on-screen instructions based on stamped VIN or affixed VIN plate on the vehicle.
i. During obtaining information, the Tech 2 is receiving information from any modules at the same time. But only ECM information is displayed on the screen.
j. Turn OFF all accessories and select Continue.
k. Verify that the correct VIN is entered on the Tech 2. If the VIN is incorrect, write down the correct VIN.

2. Turn OFF the Tech 2.
3. Disconnect the Tech 2 from the vehicle.
4. Turn OFF the ignition.
5. Transfer the data from the terminal to the Tech 2 using the following procedure:

Important:
The TIS supports service programming with the Tech 2 scan tool only.

a. Connect the Tech 2 to the terminal.
b. Launch the TIS application at the terminal.
c. Select the Service Programming System at the main screen.
d. Highlight the following information on the Select Diagnostic Tool and Programming Process screen:
   - Select Diagnostic Tool-Select Tech 2.
   - Select Programming Process-Identify whether an existing ECM is being reprogrammed or an ECM is being replaced with a new one.
   - Select ECU Location-Select Vehicle.
e. Select Next.
f. Verify the connections on the Preparing for Communication screen and select Next.
g. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen and select Next.

Important:
If the ECM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the ECM from another vehicle is installed, input correct VIN by same way.

h. Highlight Engine on the System Type screen and select Next, if requested.
i. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until Next is highlighted:
   - Model
   - Model Year
   - Engine
   - Type of Transmission
   - Destination Code
j. Select Next.
k. Verify your selection on the Summary screen.

Important:
Refer to Service Bulletins before service programming is performed if the bulletins are listed along with the calibration files.

Important:
Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the ECM and reprogramming with the same download is not allowed.

l. Select Reprog.
m. The Transfer Data screen will appear until the progress bar reaches 100%.

6. Close the application and return to the TIS application selection screen after the download is complete.
7. Turn OFF the Tech 2.
8. Disconnect the Tech 2 from the terminal.
9. Transfer the data from the Tech 2 to the ECM using the following procedure:
   a. Connect the Tech 2 to the vehicle DLC, with the engine and the Tech 2 OFF.
   b. Turn ON the Tech 2.
   c. Press Enter at the Title screen.
   d. Turn ON the ignition, with the engine OFF.
   e. Select Service Programming System.
   f. Select the Program ECU on the Tech 2.
   g. Follow the on-screen instructions and select Continue.
   h. Programming in Process will appear until the progress bar reaches 100%.

Important:
The vehicle fitted with automatic transmission, Check Trans lamp may blink while programming the ECM since communication between the ECM and TCM is interrupted. Clear DTC in any module after programming.

   i. Select Continue and exit the program after the Tech 2 displays Programming Was Successful.

10. Turn OFF the ignition.
11. Turn OFF the Tech 2.
12. Disconnect the Tech 2 from the vehicle.

Service Programming System (SPS) (Pass-Thru Procedure)

Pass-Thru programming allows the Tech 2 to remain connected to the terminal and to the vehicle throughout the programming process. The vehicle must be in close proximity to the terminal while using Pass-Thru.

Important:
The TIS supports service programming with the Tech 2 scan tool only.

1. Launch the TIS application at the terminal application at the terminal.
2. Select the Service Programming System at the main screen.
3. Highlight the following information on the Select Diagnostic Tool and Programming Process screen:
   - Select Diagnostic Tool-Select Pass-Thru
   - Select Programming Process-Identify whether as existing engine control module (ECM) is being reprogrammed or an ECM is being replaced with a new one.
   - Select ECU Location-Select Vehicle.
4. Select Next.
5. Complete all vehicle data on the Preparing for Communication/Determine Vehicle screen until Next is highlighted.
6. Select Next.
7. Follow the instruction on the Preparing for Communication screen.

Important:
In order to reduce the potential for signal loss, the RS-232 cable should not be more than 25 feet long.

8. Select Next.
9. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen and select Next.

Important:
If the ECM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the ECM from another vehicle is installed, input correct VIN by same way.

10. Highlight Engine on the System Type screen and select Next, if requested.
11. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until Next is highlighted:
    - Model
    - Model Year
    - Engine
    - Type of Transmission
    - Destination Code
12. Select Next.
13. Verify your selection on the Summary screen.

Important:
Refer to Service Bulletins before service programming is performed if the bulletins are listed along with the calibration files.

Important:
Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the Tech 2 and reprogramming with the same download is not allowed.

14. Select Reprog.
15. The Transfer Data screen will appear until the progress bar reaches 100%.

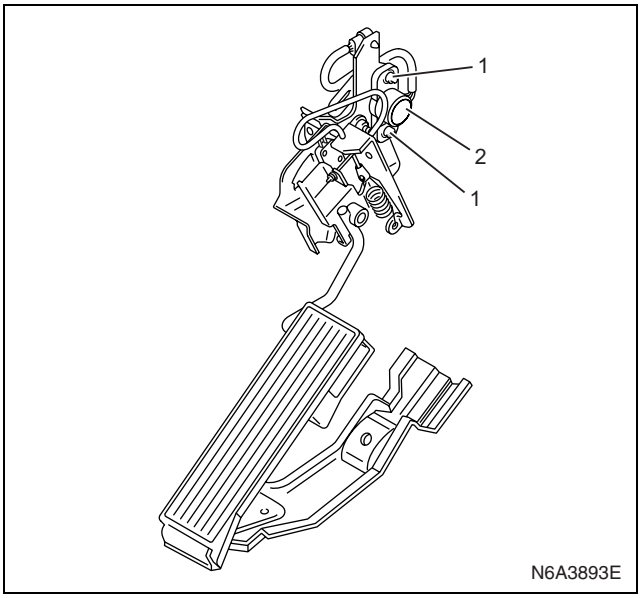
Important:
The vehicle fitted with automatic transmission, Check Trans lamp may blink while programming the ECM since communication between the ECM and TCM is interrupted. Clear DTC in any module after programming.

16. Select Close on the Programming Complete screen.
17. Turn OFF the Tech 2.
18. Disconnect the Tech 2 from the vehicle.

Accelerator Pedal Position (APP) Sensor Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the APP and idle switch connector.
3. Remove the accelerator pedal assembly from the bracket.
4. Loosen two nuts and remove APP from the accelerator pedal bracket.



Legend
1. Accelerator Pedal Position (APP) Sensor
2. Nut

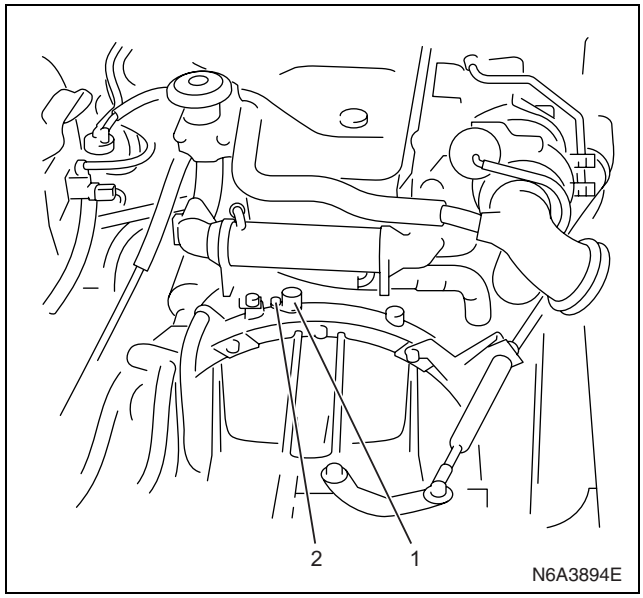
Installation Procedure

1. Temporary tighten the APP by two nuts.
2. Refit the accelerator pedal bracket to the body.
3. Connect the idle switch and APP connector.
4. Connect the Tech 2 to the vehicle.
5. Connect the negative battery cable.
6. Select “Data Display” with the Tech 2.
7. Check the accelerator pedal position data and adjust the APP position.
8. Tighten two nuts.

Crankshaft Position (CKP) Sensor Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect connector from the CKP sensor.
3. Loosen a bolt and remove the CKP sensor from the clutch housing.



Legend
1. Crankshaft Position (CKP) Sensor
2. Bolt

Installation Procedure

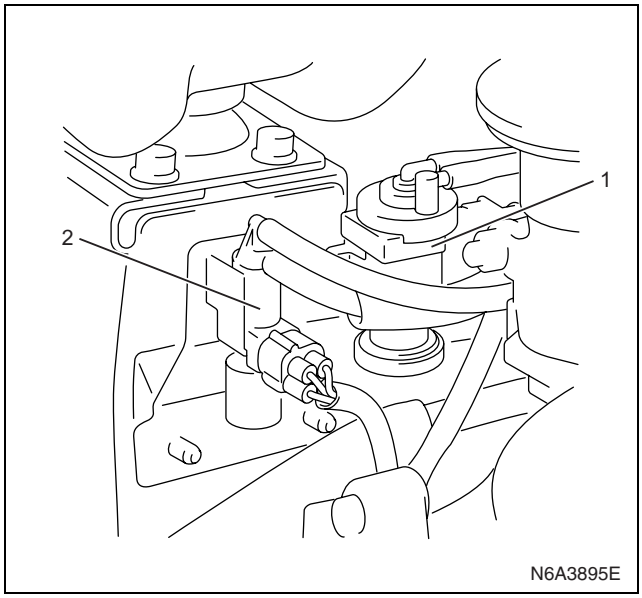
1. Install the CKP sensor to the clutch housing.
2. Tighten CKP sensor by a bolt with specified tightening torque.

   Tighten:
   Bolts to 8.0 – 12.0 N·m (0.8 – 1.2 kg·m / 5.9 – 8.9 lb·ft)
3. Connect a CKP sensor connector to the CKP sensor.
4. Connect the negative battery cable.

EGR Solenoid Valve Replacement

Removal Procedure

1. Disconenct the negative battery cable.
2. Disconnect a EGR solenoid valve connector from the EGR solenoid valve.
3. Disconnect two hoses from the EGR solenoid valve.
4. Loosen two bolts and remove the EGR solenoid valve from the bracket.



Legend
1. EGR Solenoid Valve
2. Intake Throttle Solenoid Valve

Installation Procedure

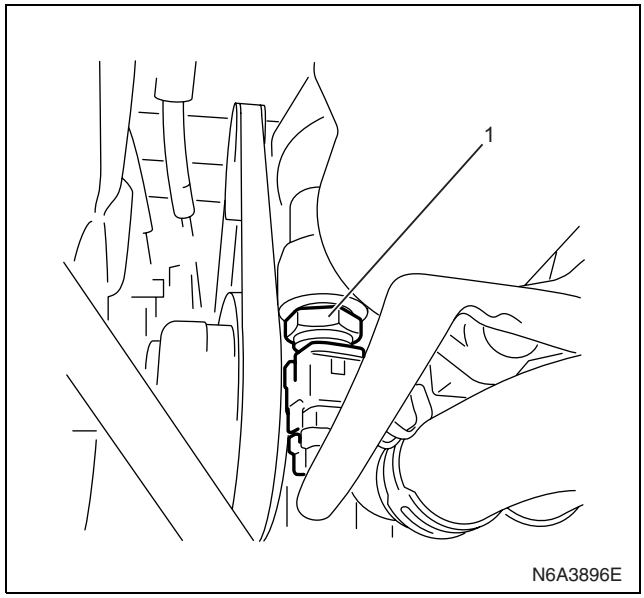
1. Tighten the purge solenoid by tow bolts.
2. Connect a connector to the EGR solenoid valve.
3. Connect two hoses to the EGR solenoid valve.
4. Connect the negative battery cable.

Engine Coolant Temperature (ECT) Sensor Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Drain enough engine coolant so that the coolant level will be below the ECT sensor.
3. Disconnect connector from the ECT sensor.
4. Loosen and remove the ECT sensor from the thermostat housing.

Notice:
Cool down the engine before above procedures are carried out.



Legend
1. Engine Coolant Temperature (ECT) Sensor

Installation Procedure

1. Apply sealer to threads of screw at the ECT sensor.
2. Tighten the ECT sensor with specified tightening torque.

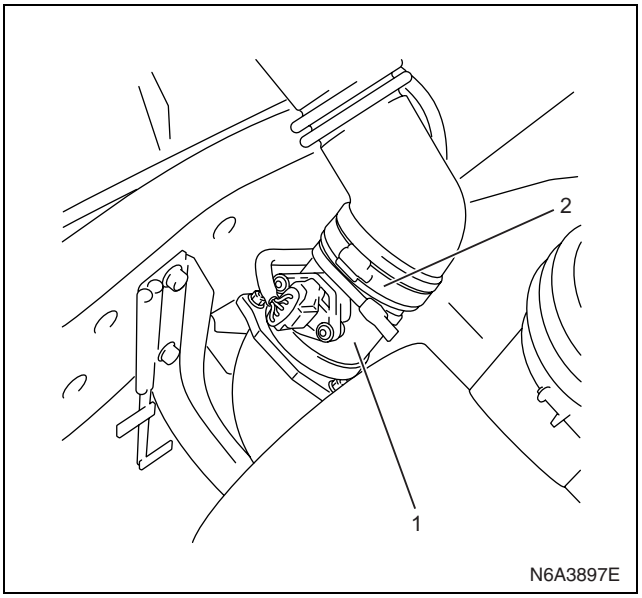
   Tighten:
   Bolt to 13 N·m (1.3 kg·m / 9.6 lb·ft)
3. Connect a ECT sensor connector to the ECT sensor.
4. Fill the engine coolant.
5. Connect the negative battery cable.

Notice:
Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.
Verify no engine coolant leaking from the sensor threads after replacement.

Mass Air Flow (MAF) / Intake Air Temperature (IAT) Sensor Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect a MAF & IAT sensor connector from the MAF & IAT sensor assembly.
3. Loosen the clips and remove the MAF & IAT sensor assembly from the intake duct housing.



Legend

1. Mass Air Flow (MAF) and Intake Air Temperature (IAT) Sensor
2. Clip

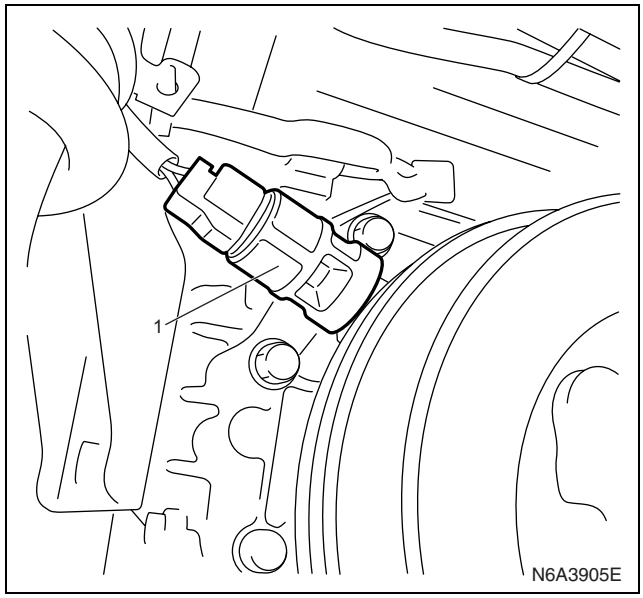
Installation Procedure

1. Install the MAF & IAT sensor assembly into intake air duct.
2. Tighten the clips.
3. Connect a MAF & IAT sensor connector to the MAF & IAT sensor assembly.
4. Connect the negative battery cable.

Vehicle Speed Sensor (VSS) Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the vehicle speed sensor connector.
3. Loosen and remove the vehicle speed sensor.



Legend

1. Vehicle Speed Sensor (VSS)

Installation Procedure

1. Tighten the vehicle speed sensor to the specified tightening torque.

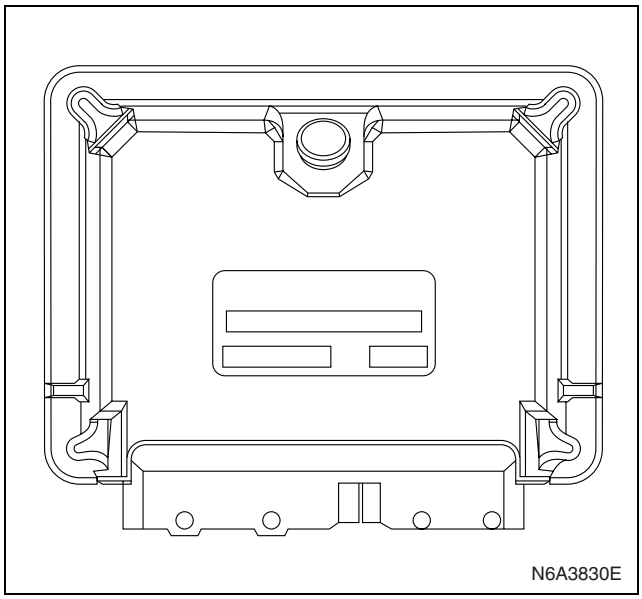
   Tighten:
   Hexagonal part of the sensor: 25 N·m (2.5 kg·m / 18 lb·ft)

Caution:
Tightening must be made at the hexagonal part of the sensor. To tighten the connector itself would cause damage.

2. Connect the vehicle speed sensor connector to the vehicle speed sensor.
3. Connect the negative battery cable.

Description and Operation

Engine Control Module (ECM) Description



The engine control module (ECM) is designed to withstand normal current draws associated with vehicle operation. Avoid overloading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the ECM circuits unless instructed to do so. In some cases, these circuits should only be tested using a digital multimeter (DMM). The ECM should remain connected to the ECM harness.
The ECM is located behind the radio via mounting bracket. The ECM mainly controls the following.

- The fuel system control
- The exhaust gas recirculation (EGR) system control
- The preheating (glow) system control
- A/C compressor control
- Exhaust brake control
- On-board diagnostics for engine control

The ECM constantly observes the information from various sensors. The ECM controls the systems that affect vehicle performance. The ECM performs the diagnostic function of the system. The ECM can recognize operational problems, alert the driver through the malfunction indicator lamp (MIL), and store diagnostic trouble codes (DTCs). DTCs identify the system faults to aid the technician in making repairs.

ECM Voltage Description

The ECM supplies a buffered voltage to various switches and sensors. The ECM can do this because resistance in the ECM is so high in value that a test lamp may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megaohm input impedance DMM, to ensure accurate voltage readings. The input and/or output devices in the ECM include analog-to-digital converters, signal buffers, counters, and special drivers. The ECM controls most components with electronic switches which complete a ground circuit when turned ON.

Aftermarket Electrical and Vacuum Equipment

Aftermarket or add-on electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after the vehicle leaves the factory. No allowances have been made in the vehicle design for this type of equipment. No add-on vacuum equipment should be added to this vehicle. Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery power and ground. Add-on electrical equipment, even when installed to these guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and audios. Therefore, the first step in diagnosing any powertrain fault is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the fault still exists, the fault may be diagnosed in the normal manner.

Electrostatic Discharge Damage

Electronic components used in the ECM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. By comparison, as much as 4,000 volts may be needed for a person to feel even the zap of a static discharge. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

- An example of charging by friction is a person sliding across a vehicle seat.

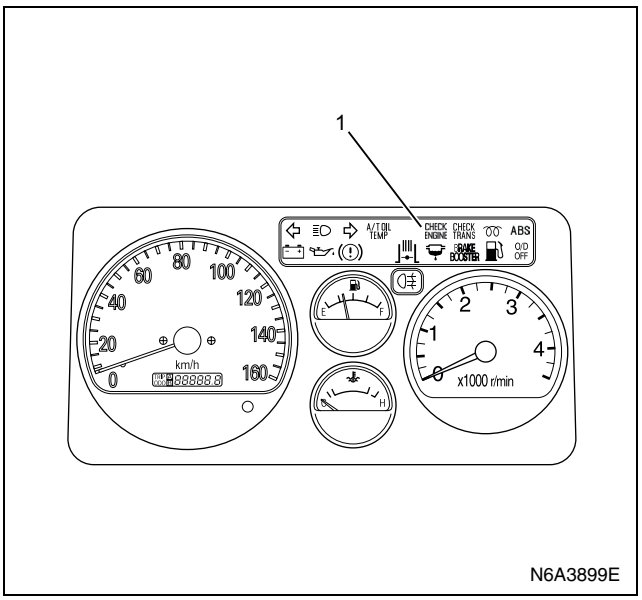
Important:
To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the ECM connector pins or soldered components on the ECM circuit board.
- Do not open the replacement part package until the part is ready to be installed.

- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.
- Charge by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with opposite polarity.

Malfunction Indicator Lamp (MIL) Operation

The malfunction indicator lamp (MIL) is located in the instrument panel cluster (IPC). The MIL will display the CHECK ENGINE when commanded ON:



Legend

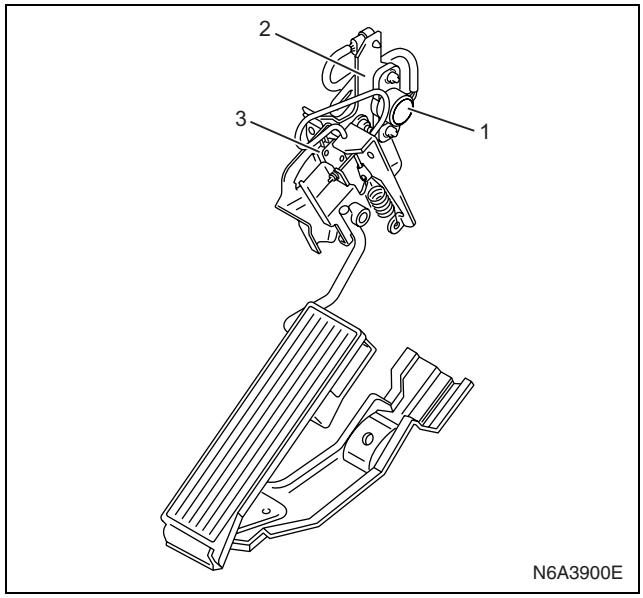
1. Malfunction Indicator Lamp (MIL)

The MIL indicates that an emission or performance related fault has occurred and vehicle service is required. The following is a list of the modes of operation for the MIL:

- The MIL illuminates for approximately 2 seconds when the ignition switch is turned ON, with the engine OFF. This is a bulb test to ensure the MIL is able to illuminate.
- The MIL remains illuminated after the engine is started if the engine control module (ECM) detects a fault. A DTC is stored any time the ECM illuminates the MIL due to an emission or performance related fault.

Engine Control Component Description

Accelerator Pedal Position (APP) Sensor & Idle Switch



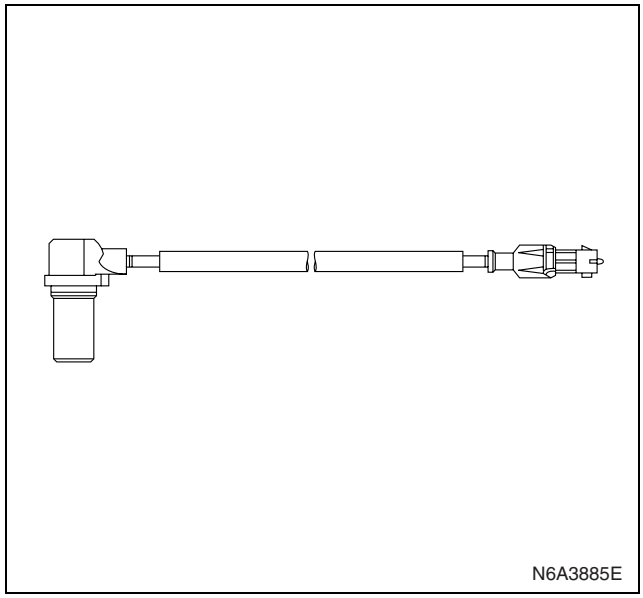
Legend

1. Accelerator Pedal Position (APP) Sensor
2. Accelerator Pedal Bracket
3. Idle Switch

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal bracket. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control.

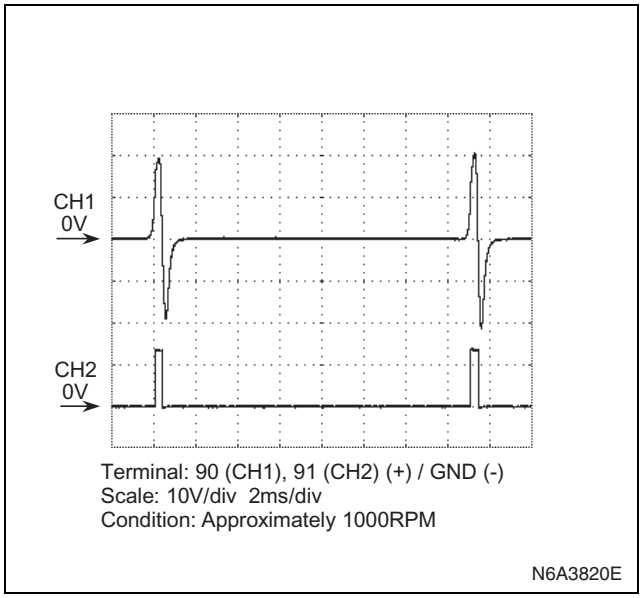
The idle switch is also mounted on the accelerator pedal bracket. The idle switch is a normally closed type switch. When the accelerator pedal is released, the idle switch signal to the ECM is low voltage.

Crankshaft Position (CKP) Sensor

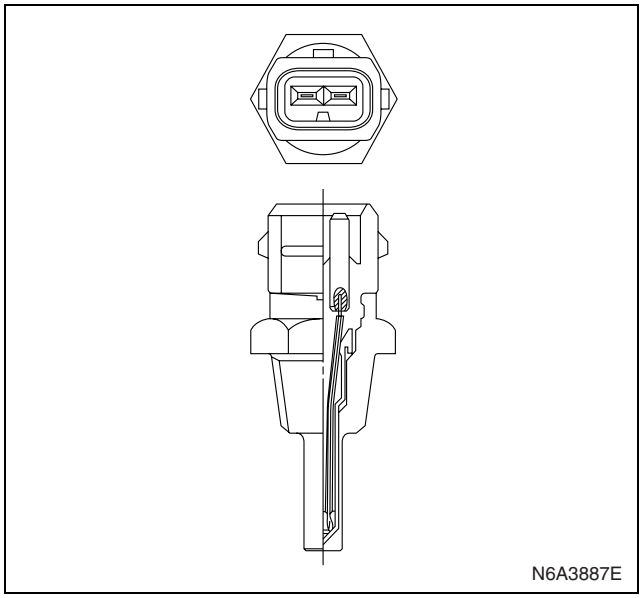


The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 4 slits spaced 90° on the flywheel circumference. The CKP sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the crankshaft rotational speed. The ECM monitors both the CKP sensor and injection pump camshaft position (CMP) sensor signals to ensure they correlate with each other.
The following waveform aids to diagnose when there is an oscilloscope or equivalent.

- Amplitudes of CKP sensor signal (CH1) increase as engine speed increases.
- Each waveform cycle shorten as the engine speed increases.



Engine Coolant Temperature (ECT) Sensor

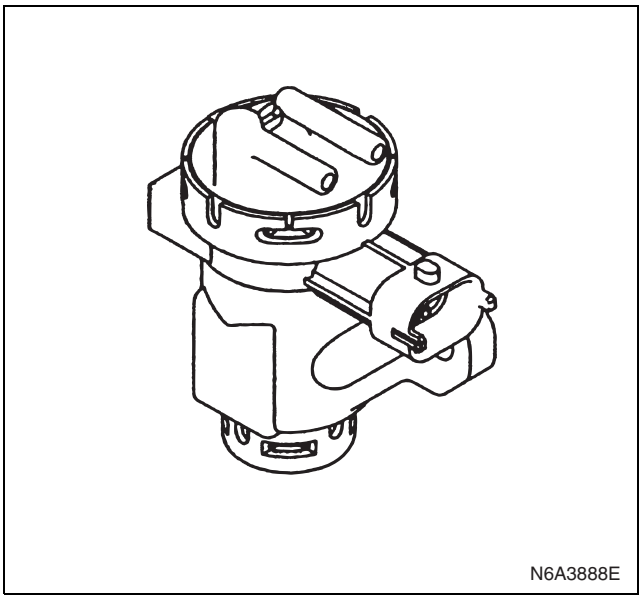


Legend

1. Engine Coolant Temperature (ECT) Sensor

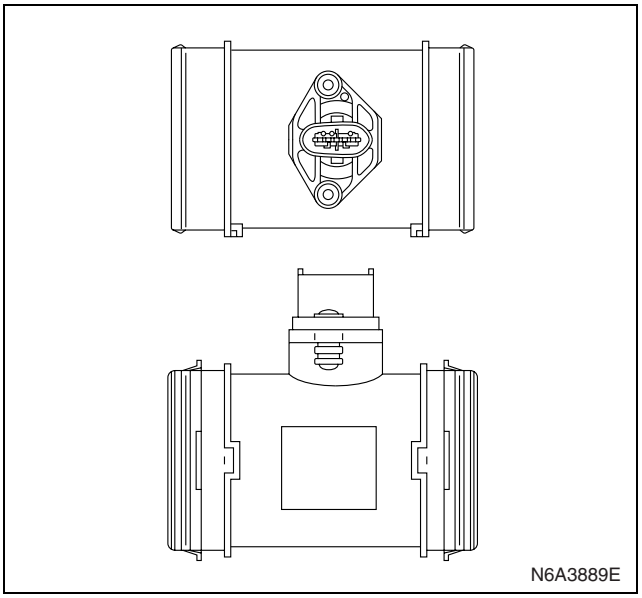
The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit.

Exhaust Gas Recirculation (EGR) Solenoid Valve



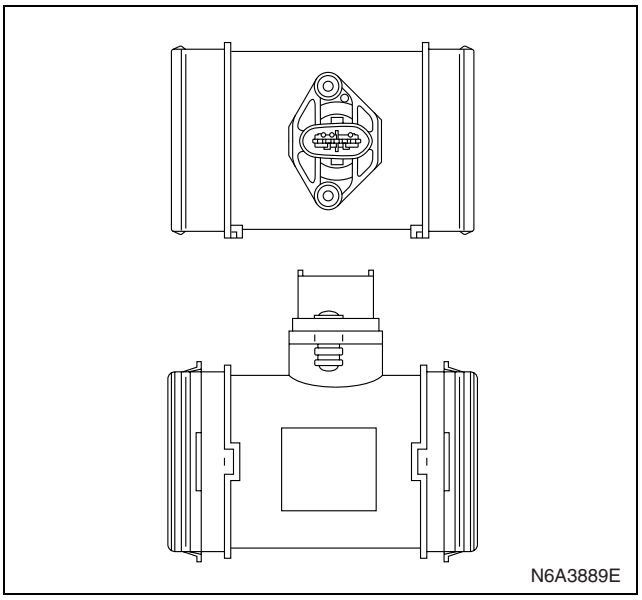
The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running.

Intake Air Temperature (IAT) Sensor



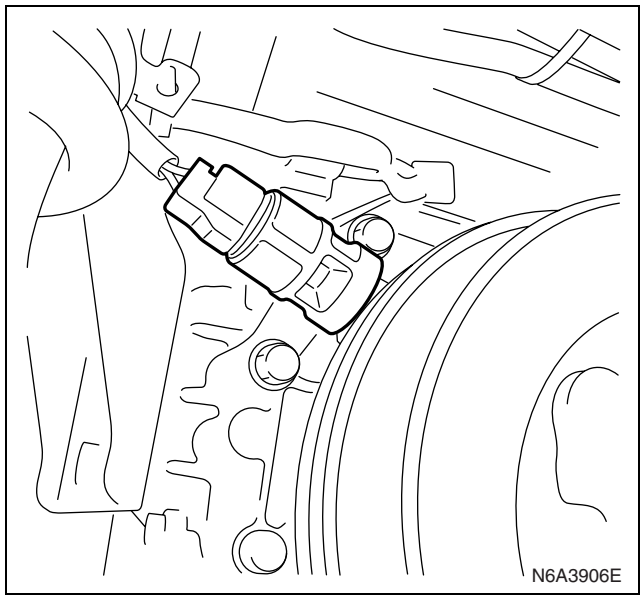
The intake air temperature (IAT) sensor is fitted between the air cleaner and turbocharger internal to the mass air flow (MAF) sensor. The IAT sensor is a variable resistor. The IAT sensor measures the temperature of the air entering the engine. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and a ground for the IAT low reference circuit. When the IAT sensor is cold, the sensor resistance is high. When the air temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the IAT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the IAT signal circuit.

Mass Air Flow (MAF) Sensor

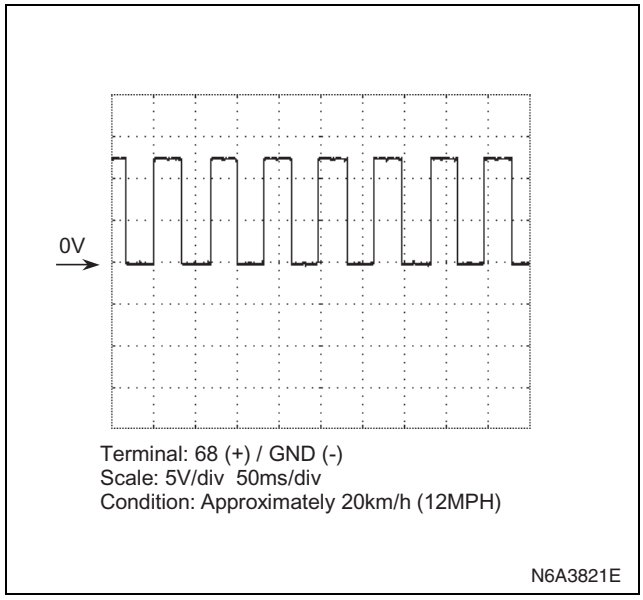


The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor assembly consists of a MAF sensor element and an intake air temperature sensor that are both exposed to the air flow to be measured. The MAF sensor element measures the partial air mass through a measurement duct on the sensor housing.

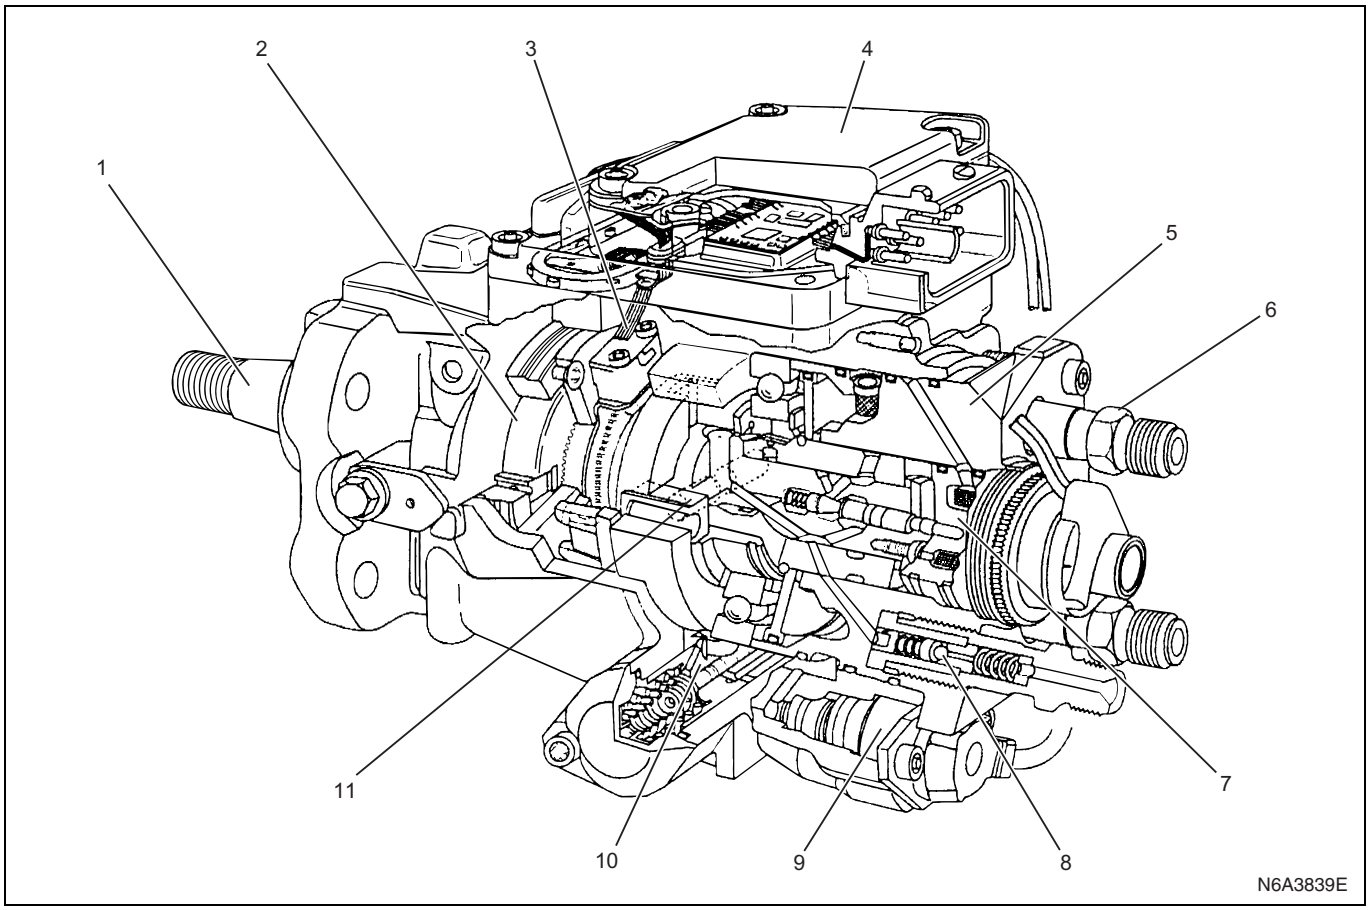
Vehicle Speed Sensor (VSS)



The vehicle speed sensor (VSS) is used by the engine control module (ECM) and speedometer, which generates a speed signal from the transmission output shaft. The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The ECM calculates the vehicle speed by the VSS.



Fuel Injection System Description



Legend

8. Constant Pressure Valve (CPV)
9. Timing Control Valve (TCV)
10. Timer
11. Radial Plunger

Bosch VP44 Fuel Injection Pump

Instead of the previous face cam type, the radial plunger distributor type injection pump utilizes a cam ring to enable fuel injection at high-pressures, marking it suitable for small, high-speed direct injection diesel engines. This pump was developed to provide the most suitable fuel injection quantity and injection timing to satisfy the demand for engine reliability, driveability, low smoke, low noise, high output and low exhaust emissions.

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The timing device changes the optimum injection timing against various engine conditions. The pressure of the fuel fed from the feed pump is adjusted and it acts to the timing plunger by TCV controlled fuel pressure. (The TCV is installed to the fuel injection pump rear side and it is controlled by duty ratio cycle from the PCU.) The timing plunger is connected to the cam ring by a ball pin. Axial movement of the timing plunger is transferred to the cam ring in the form of rotational movement.

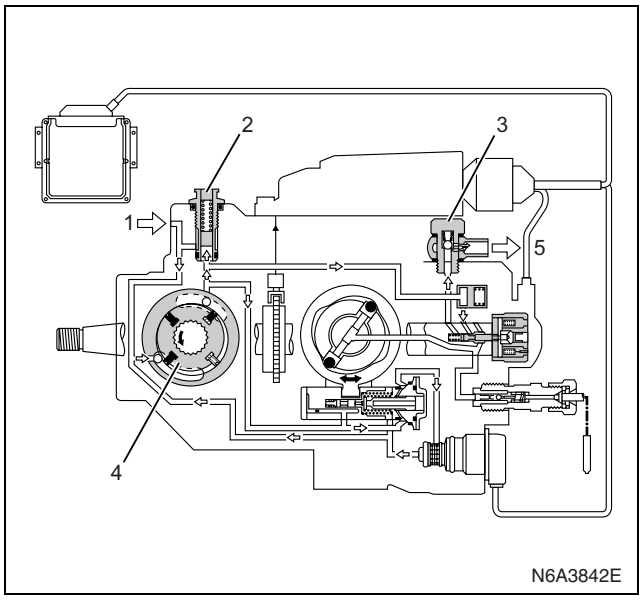
Low Pressure Fuel Circuit Description

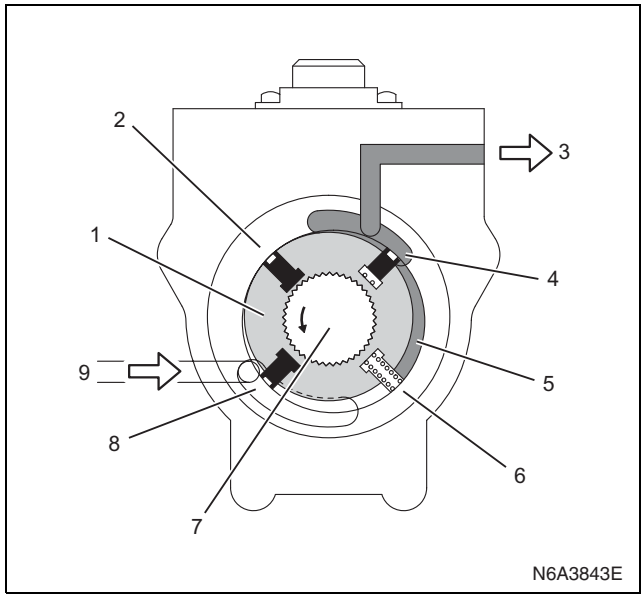


Legend

1. Fuel Suction
2. Regulating Valve
3. Overflow Valve
4. Feed Pump
5. To Fuel Tank

The low pressure fuel circuit must supply sufficient fuel to the high pressure fuel circuit. The main components are the feed pump, the regulating valve and the overflow valve.

Feed Pump

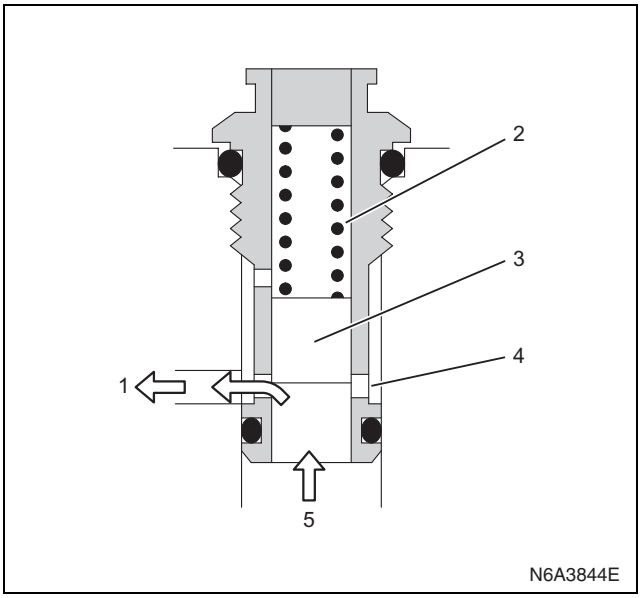


Legend

1. Rotor
2. Casing Ring
3. Fuel Supply
4. Outlet
5. Chamber
6. Vane
7. Driveshaft
8. Inlet
9. Fuel Suction

The feed pump is driven by the drive shaft, performs suction and supply of fuel. The vanes assembled in the rotor are pressed against the inside of the casing ring by spring forces and centrifugal force during rotation to form chambers. When the vanes rotate, the volume of these chambers increase when they reach recesses the casing ring connected to the inlet port. Pressure then decreases and fuel is drawn in. When the chambers have passed the inlets and recesses, the volume decreases and the fuel is compressed. Fuel pressure increases until the chamber reaches the outlet, where the fuel passes through the regulating valve to the high pressure fuel circuit.

Regulating Valve

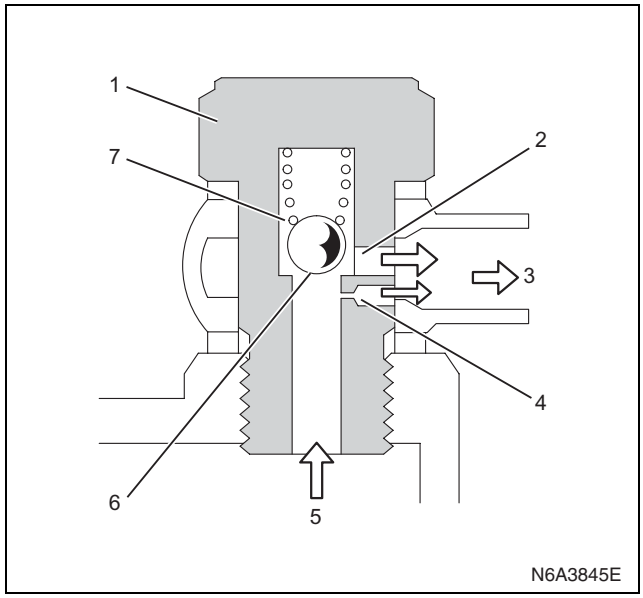


Legend

1. To Inlet
2. Spring
3. Valve Piston
4. Port
5. From Outlet

When feed pump speed increases so that the delivery pressure of the fuel delivered from the outlet exceeds the regulating valve spring force, the plunger is pushed upwards. Excess fuel passes through the ports and returns to the inlet side, and the delivery pressure is maintained within a specified range. When feed pump speed decreases so that the delivery pressure decreases, the plunger is pushed downwards by spring force to close the port.

Overflow Valve

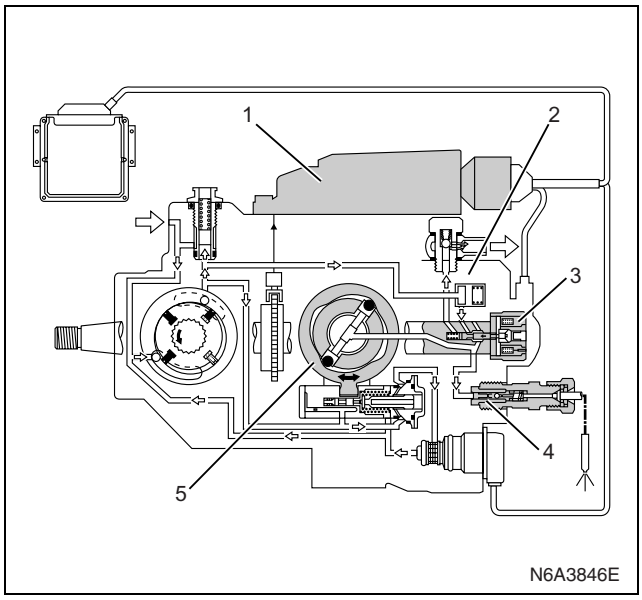


Legend

1. Valve Holder
2. Port
3. To Fuel Tank
4. Orifice Port
5. From Fuel Tank
6. Ball Valve
7. Spring

When the pressure of the fuel, returned from the distributor head, exceeds the spring force, the overflow valve's ball valve is pushed up. Excess fuel presses through the port and returns to the tank, and fuel pressure inside the pump chamber does not exceed a specified pressure. The flow of excess fuel serves cooling and automatic bleeding of the fuel pump during operation. Also the orifice port is installed to assist in automatic air bleeding.

High Pressure Fuel Circuit Description



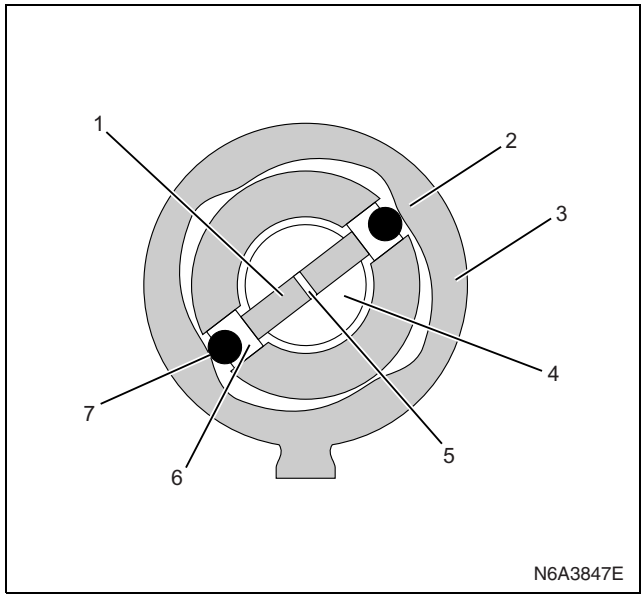
Legend

1. Fuel Injection Pump Control Unit (PCU)
2. Distributor Head
3. Fuel Injection Solenoid Valve
4. Constant Pressure Valve (CPV)
5. Radial Plunger

In addition high pressure generating device, the high pressure circuit also consists of fuel piping, and devices to set the beginning of injection and fuel injection quantity. The main components are as follows:

- High pressure generation: Radial Plunger
- Fuel distribution: Distributor Head
- Beginning of injection timing: Timing Device
- Prevention of secondary injection: Constant Pressure Valve (CPV)

Radial Plunger

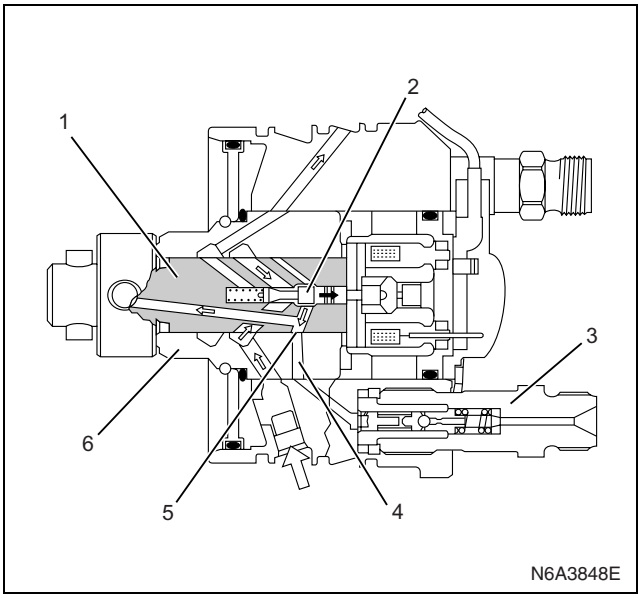


Legend

1. Radial Plunger
2. Internal Cam
3. Cam Ring
4. Rotor Shaft
5. Plunger Chamber
6. Roller Shoe
7. Roller

While the radial plungers assembled to the rotor shaft rotate, they are held against the inside of the cam ring (via the roller shoes and rollers) by fuel delivery pressure from the feed pump and centrifugal force. The radial plungers perform rotational movement as well as internal cam induced reciprocating movement to suck in and compress the fuel in the plunger chamber.

Distributor Head

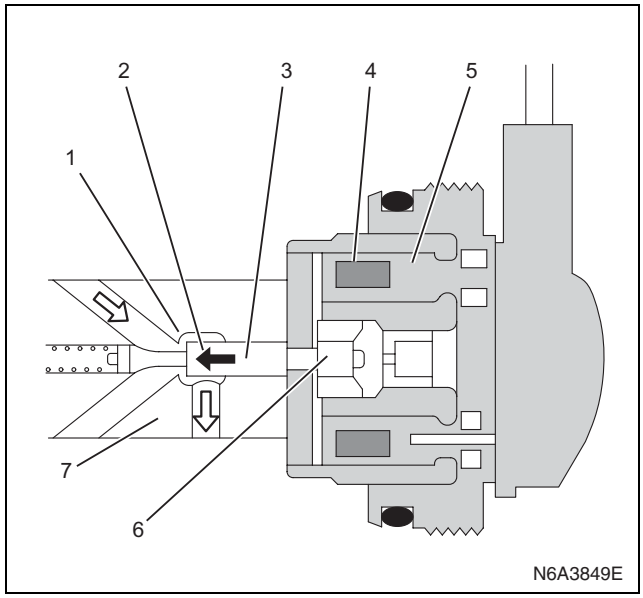


Legend

1. Rotor Shaft
2. Valve Needle
3. Constant Pressure Valve (CPV) Holder
4. High Pressure Outlet
5. Distributor Shaft
6. Barrel

The distributor head distribute the high pressure fuel that has flowed through the rotating rotor shaft's distributor slits and the barrel's high pressure outlets (4 cylinders) to the engine cylinders via the constant pressure valve (CPV) and the nozzle holder assemblies. The fuel injection solenoid valve needle changes the passage to the radial plunger high pressure pump between fuel suction and fuel compression.

Fuel Injection Solenoid Valve

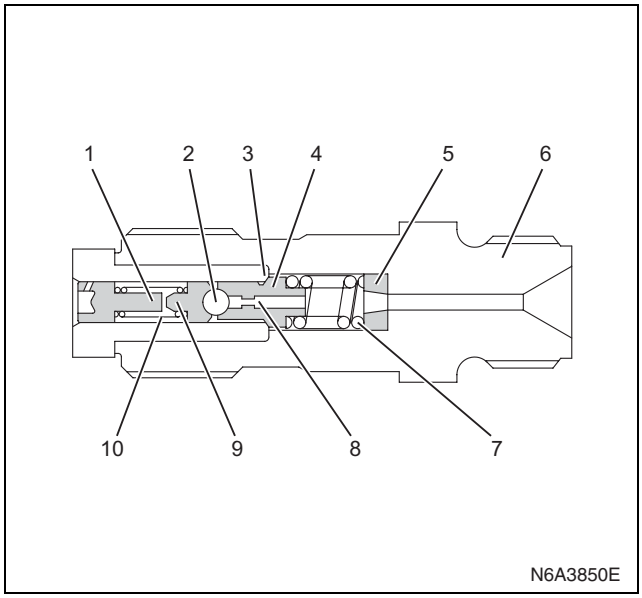


Legend

1. Valve Seat
2. Valve Closing Direction
3. Valve Needle
4. Coil
5. Magnet
6. Magnet Anchor
7. Rotor Shaft

The fuel injection solenoid valve consists of a valve seat, a valve needle, and a magnet anchor (a movable iron core), a coil and a magnet. The valve needle rotates together with the rotor shaft. When current controlled by the fuel injection pump control unit (PCU) flows to the coil, the magnet anchor and the valve needle are pushed towards the valve seat. When the valve seat is completely closed by the valve needle, the fuel in the high pressure passage is isolated from the low pressure passage, is compressed by the radial plunger high pressure pump, and injected into the engine cylinder through the nozzle holder assembly. When the required injection quantity is reached, the current to the coil is cut, the valve seat opens and injection of fuel is completed.

Constant Pressure Valve (CPV)

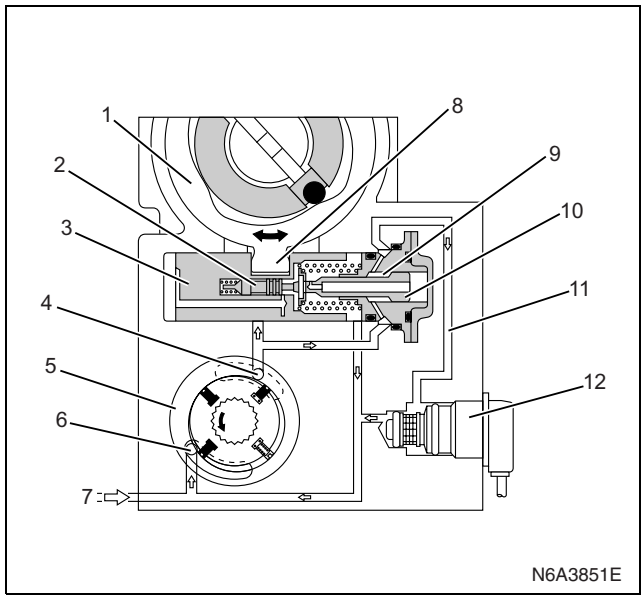


Legend

1. Plug
2. Ball
3. Seat
4. Valve
5. Spacer
6. Holder
7. Valve Spring
8. Oriffice
9. Ball Support
10. Spring

The constant pressure valve (CPV) consists of a holder, a spacer, a valve spring, a valve, a seat, a ball, a ball support, a spring and a plug. The valve is equipped with an orifice to suppress the reflected pressure wave (the cause of secondary injection) caused by nozzle closing at the end of the injection and maintains a stable pressure in the injection pipe (residual pressure) to ensure stabilized injection timing for subsequent injection. The valve is opened by pressurized fuel and this high pressure fuel is delivered to the nozzle holder assembly.

Timing Control Device Description

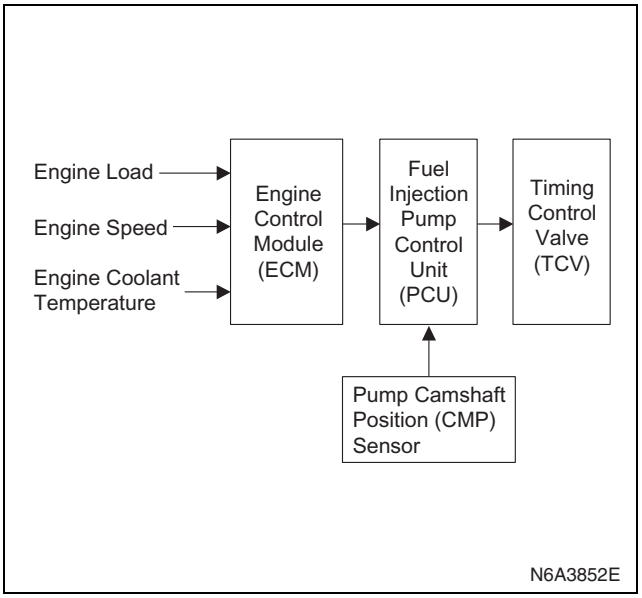


Legend

1. Cam Ring
2. Servo Valve
3. Timer Piston
4. Outlet
5. Feed Pump
6. Inlet
7. Fuel Suction
8. Ball Pin
9. Annular Chamber
10. Hydraulic Stopper
11. Return Passage
12. Timing Control Valve (TCV)

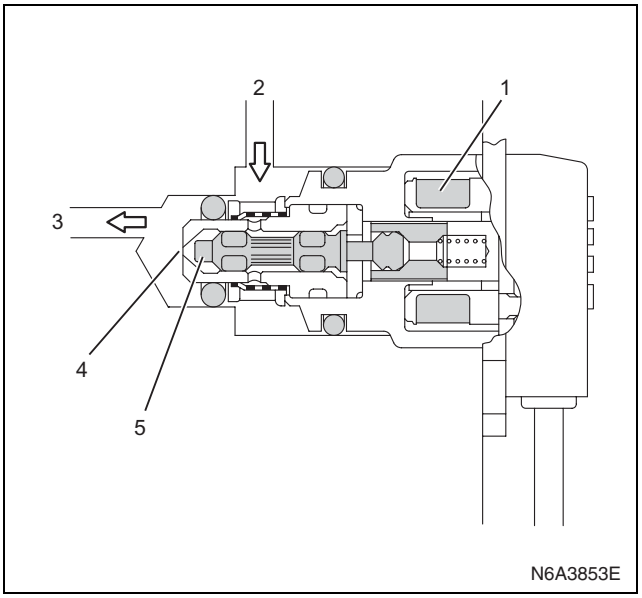
The timing device determines the optimum injection timing against variations in engine speed. The pressure of the fuel fed from the feed pump is adjusted in accordance with speed by the regulating valve. This delivery pressure acts on the hydraulic stopper's annular chamber as control pressure. The chamber pressure of the annular chamber is controlled by the timing control valve (TCV). The timing plunger is connected to the cam ring by a ball pin. Axial movement of the timing plunger is transferred to the cam ring in the form of rotational movement. Movement to the right of the timing plunger (to the spring side) advances injection timing. The main components are timing plunger, the TCV and pump camshaft position (CMP) sensor.

Beginning of Injection Staring



The engine control module (ECM) contains characteristic maps of the beginning of injection, corresponding to engine operating conditions (engine load, engine speed and engine coolant temperature). The fuel injection pump control unit (PCU) is constantly comparing the set beginning of injection timing and the actual beginning of injection timing. If there is a difference, the timing control valve (TCV) is controlled by the duty ratio. (The actual beginning of injection timing is determined from the pump camshaft position (CMP) sensor.)

Timing Control Valve



Legend

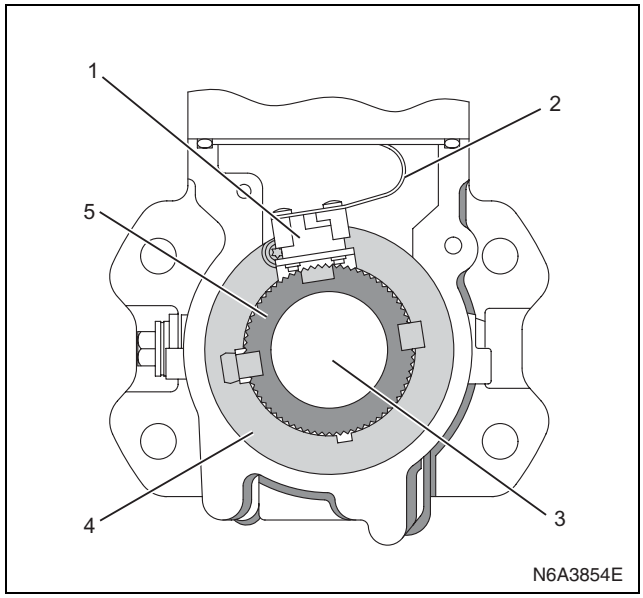
1. Coil
2. From Annular Chamber
3. To Feed Pump
4. Orifice
5. Valve Needle

The timing control valve (TCV) acts as a variable throttle, using the rapid opening and closing (cycling) of the valve needle in the TCV. At normal operation, the TCV controls the pressure acting on the annular chamber so that the hydraulic stopper cam move to any position, from the retard position to the advance position. At this time, the duty ratio is set by the fuel injection pump control unit (PCU).

When control current flows to the TCV coil, the valve needle opens and the fuel annular chamber flows through the orifice to the feed pump inlet. Consequently, the pressure of the annular chamber decreases and the hydraulic stopper is moved to the retard side.

When control current to the TCV coil is cut, the valve needle closes and the return passage is closed. Consequently, the pressure of the annular chamber increases and the hydraulic stopper is moved to the advance side.

Pump Camshaft Position (CMP) Sensor

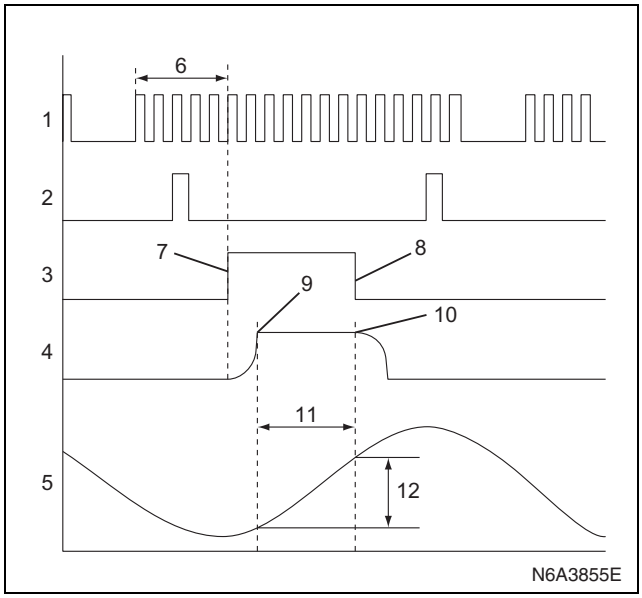


Legend

1. Pump Camshaft Position (CMP) Sensor
2. Flexible Connecting Harness
3. Drive Shaft
4. Pump Camshaft Position (CMP) Sensor Retaining Ring
5. Sensor Wheel

When the drive shaft rotates, the pump camshaft position (CMP) sensor receives signal from the sensor wheel, and an electric pulse is sent through the flexible connecting harness to the fuel injection pump control unit (PCU). From these signals the PCU can determine the average pump speed and the momentary pump speed. The pump CMP sensor is mounted to the cam ring. Thus, the relationship between the cam ring and the pump CMP sensor signal is constant. The pump CMP sensor signal is utilized for the following purposes:

- To determine the momentary angular position of the cam ring.
- To calculate the actual speed of the fuel injection pump.
- To determine the actual timing plunger position.

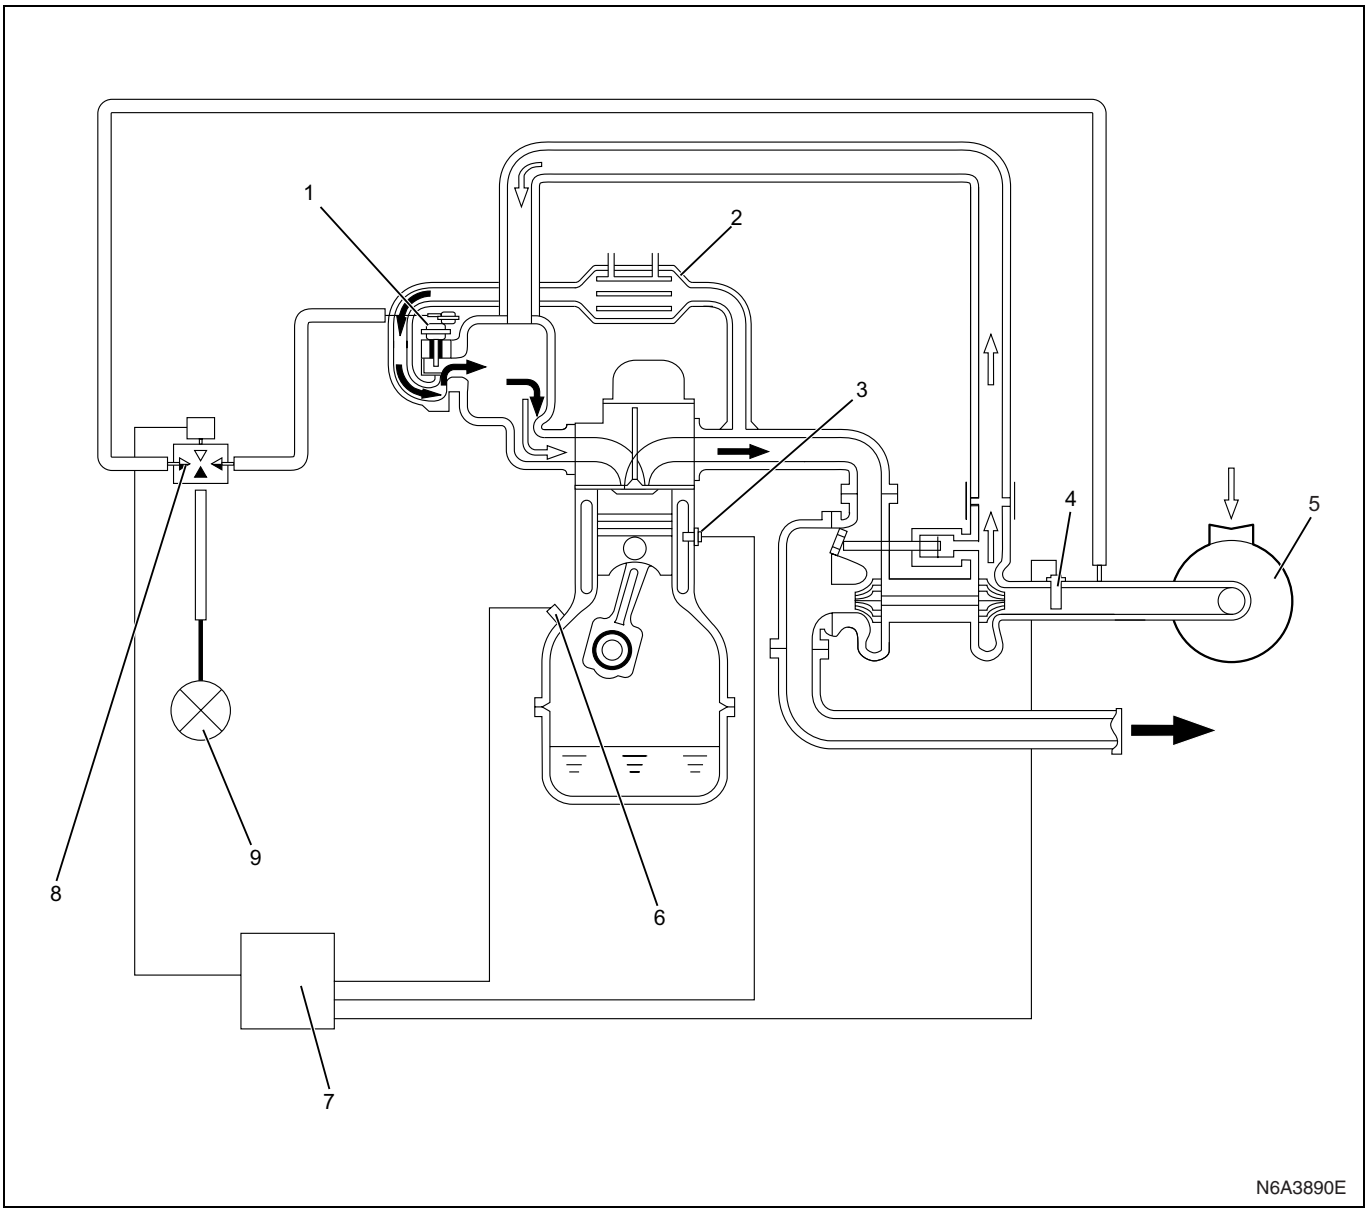


Legend

1. Pump Camshaft Position (CMP) Sensor Signal
2. Crankshaft Position (CKP) Sensor Signal
3. Fuel Injection Solenoid Valve Control Pulse
4. Fuel Injection Solenoid Needle Valve Lift
5. Cam Lift (Cam Profile)
6. Pulse Count
7. Fuel Injection Solenoid Valve Close
8. Fuel Injection Solenoid Valve Open
9. Start of Pressure Delivery
10. End of Pressure Delivery
11. Pressure Delivery Angle
12. Effective Stroke

- Momentary Cam Ring Angular Position
  The momentary angular position of the cam ring is input into the fuel injection PCU as a fuel injection solenoid valve control signal. From momentary input of angular position for fluctuations in running conditions, the fuel injection solenoid valve open and close intervals corresponding to the cam ring's cam lift can be accurately determined.
- Actual Injection Pump Speed
  When the crankshaft speed (CKP) sensor is faulty, the engine control module (ECM) uses the pump CMP signal as a replacement signal.
- Actual Timing Plunger Position
  The actual timing plunger position can be determined by comparing the CKP sensor signal with the pump CMP sensor angle. This position is used for timer control.

Exhaust Gas Recirculation (EGR) System Description

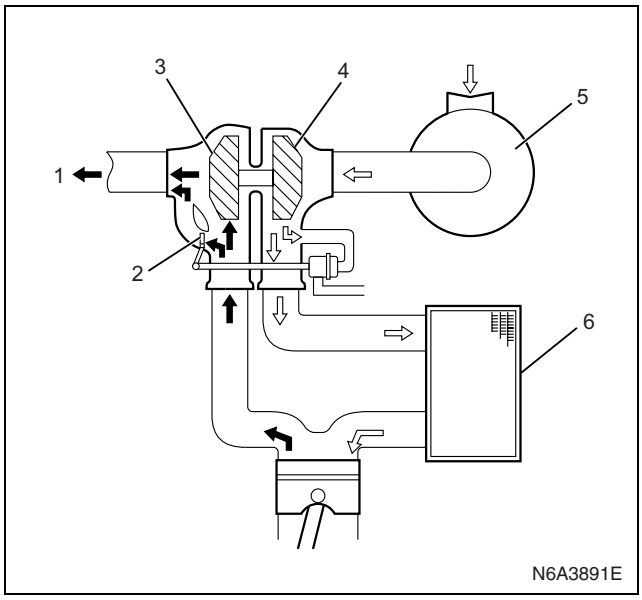


Legend

1. EGR Valve
2. EGR Cooler
3. ECT Sensor
4. MAF & IAT Sensor
5. Air Cleaner
6. CKP Sensor
7. ECM
8. EGR Solenoid Valve
9. Vacuum Pump

The EGR system recirculates a part of exhaust gas back into the intake manifold, which results in reducing nitrogen oxide (NOx) emissions. The EGR control system uses an electronic control system solenoid valve and vacuum control EGR valve to ensure both driveability and low emission. The engine control module (ECM) controls the EGR flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve opening by controlling the EGR solenoid valve drive duty. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running.

Turbocharger Description



Legend

1. Exhaust Gas
2. Waste Gate Valve
3. Turbine Wheel
4. Compressor Wheel
5. Air Cleaner
6. Charge Air Cooler (Intercooler)

The turbocharger is used to increase the amount of air that enters the engine cylinders. This allows a proportional increase of fuel to be injected into the cylinders, resulting in increased power output, more complete combustion of fuel, and increased cooling of the cylinder heads, pistons, valves, and exhaust gas. This cooling effect helps extend engine life.

Heat energy and pressures in the engine exhaust gas are utilized to drive the turbine. Exhaust gas is directed to the turbine housing. The turbine housing acts as a nozzle to direct the shaft wheel assembly. Since the compressor wheel is attached directly to the shaft, the compressor wheel rotates at the same speed as the turbine wheel. Clean air from the air cleaner is drawn into the compressor housing and wheel. The air is compressed and delivered through a crossover pipe to the engine air intake manifold, then into the cylinders. The amount of air pressure rise and air volume delivered to the engine from the compressor outlet is regulated by a waste gate valve in the exhaust housing. The position of the waste gate valve is controlled by the amount of pressure built up on the intake side of the turbocharger. The diaphragm on the inside of the waste gate is pressure sensitive, and controls the position of the valve inside the turbocharger. The position of the valve will increase or decrease the amount of boost to the turbocharger.

The charge air cooler also helps the performance of the diesel. Intake air is drawn through the air cleaner and into the turbocharger compressor housing. Pressurized air from the turbocharger then flows forward through the charge air cooler located in the front of the radiator.

From the charge air cooler, the air flows back into the intake manifold.

The charge air cooler is a heat exchanger that uses air flow to dissipate heat from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases the engine efficiency and power by packing more air molecules into the same space.

TROUBLESHOOTING

Transmission

PROBLEM	POSSIBLE CAUSE	CORRECTION
Abnormal Noise	1. Flywheel pilot bearing worn.	1. Replace.
	2. Bearing worn or broken (Main shaft or counter shaft).	2. Repair or replace.
	3. Anti-lash plate malfunction.	3. Repair or replace.
	4. Gear tooth contact surface worn or scuffed (Main shaft, counter shaft and/or reverse idle gear).	4. Repair or replace.
	5. Spline worn (Synchronizer clutch hub).	5. Replace.
	6. Gear, clutch hub or thrust washer thrust face seized.	6. Replace.
	7. Lack of backlash between mating gears.	7. Replace.
Hard Shifting	1. Improper church pedal free play.	1. Readjust.
	2. Wrong oil in use.	2. Replace with recommended oil.
	3. Gear control linkage misadjust.	3. Readjust.
	4. Change lever sliding portions worn.	4. Repair or replace.
	5. Shift block, shift rod and/or control box sliding faces worn.	5. Repair or replace.
	6. Shift arm and/or synchronizer sleeve groove worn.	6. Replace.
	7. Synchronizer parts worn or weakened.	7. Replace.
	8. Thrust washer, collar, and/or gear thrust faces worn (Main shaft and/or counter shaft thrust play).	8. Replace.
Walking or Jumping out of Gear	1. Gear control linkage misadjust.	1. Readjust.
	2. Detent spring weakened or broken.	2. Replace.
	3. Detent ball worn.	3. Replace.
	4. Change lever sliding portions worn.	4. Repair or replace.
	5. Shift block, shift rod and/or control box sliding faces worn.	5. Repair or replace.
	6. Shift arm and/or synchronizer sleeve groove worn.	6. Replace.
	7. Synchronizer parts worn or weakened.	7. Replace.
	8. Thrust washer, collar, and/or gear thrust faces worn (Main shaft and/or counter shaft thrust play).	8. Replace.
	9. Spline worn (Synchronizer hub).	9. Replace.
	10. Bearings worn or broken.	10. Replace.

Clutch

PROBLEM	POSSIBLE CAUSE	CORRECTION
Dragging	1. Hydraulic line leakage.	1. Repair.
	2. Air in line.	2. Bleed and check for damage.
	3. Master cylinder and/or slave cylinder piston cup worn.	3. Replace.
	4. Driven plate worn or warped.	4. Replace driven plate.
	5. Diaphragm spring weak or tip of finger worn.	5. Replace pressure plate assembly.
	6. Driven plate sticking on spline.	6. Clean and free spline and lubricate with grease.
	7. Release bearing worn or damaged.	7. Replace release bearing.
	8. Clutch pedal excessive free play.	8. Readjust.
Slipping	1. Driven plate facing worn or oil soaked.	1. Replace driven plate and check for leaks as needed.
	2. Diaphragm spring weak.	2. Replace pressure plate assembly.
	3. Pressure plate and/or flywheel warped.	3. Repair or replace.
	4. Clutch pedal lack of free play.	4. Readjust.
Shudder (Chattering)	1. Engine mounting loose or broken.	1. Tighten or replace.
	2. Driven plate facing warped.	2. Replace driven plate.
	3. Driven plate surface of facing hardened.	3. Replace driven plate.
	4. Driven plate facing oil soaked.	4. Replace driven plate and check for leaks.
	5. Driven plate damper spring weakened or broken.	5. Replace driven plate.
	6. Pressure plate and/or flywheel warped.	6. Repair or replace.
Noisy	1. Release bearing binding.	1. Clean or replace if damaged, and lubricate.
	2. Release bearing worn or broken.	2. Replace.
	3. Release bearing insufficiently lubricate.	3. Lubricate with grease or replace.
	4. Driven plate damper springs weakened or broken.	4. Replace driven plate.
	5. Pilot bearing worn or broken.	5. Replace.
	6. Driven plate rivet loosen.	6. Replace driven plate.
	7. Ball stud insufficiently lubricate.	7. Lubricate with grease.
	8. Clutch pedal lack of free play.	8. Readjust.
	9. Clutch pedal shaft insufficiently lubricate.	9. Lubricate with grease.
	10. Pilot bearing loose or broken.	10. Replace.
Pedal is Hard to Push	1. hydraulic line blocked or crimped.	1. Clean out or replace.
	2. Clutch pedal shaft insufficiently lubricate.	2. Lubricate with grease.

SERVICING

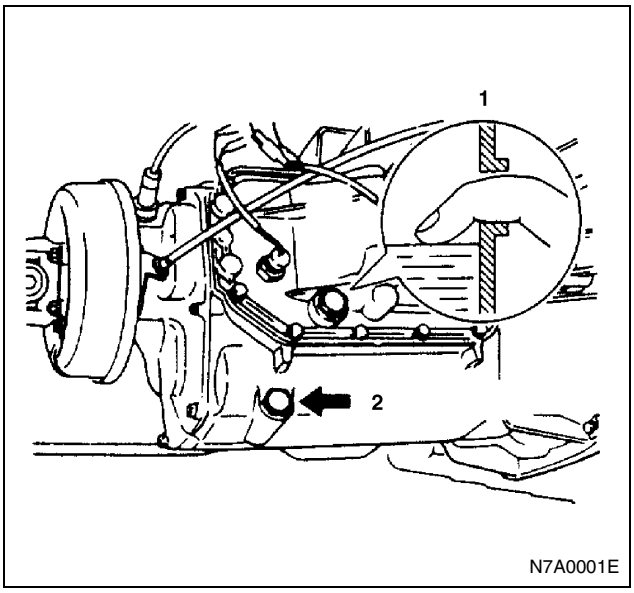
Transmission Oil Level Check

1. Remove Filler Plug.
2. Check Oil Level.
   - Add lubricant to within 0 to10 mm (0 to 0.4 in) of bottom edge of the filler hole if necessary.

Caution:
Use ENGINE OIL SAE 5W-30 for transmission case.

3. Install Filler Plug.

Tighten:
Filler plug to 49 N·m (5.0 kg·m / 36 lb·ft)



Legend
1. Filler plug
2. Drain plug

Transmission Oil Change

1. Drain Oil.
   - Remove the drain plug from the transmission case and drain the oil.
2. Install Drain Plug.

Tighten:
Drain plug to 49 N·m (5.0 kg·m / 36 lb·ft)

3. Remove Filler Plug.
4. Fill Oil.
   - Fill the transmission case from the filler plug hole with new oil of specified grade.

Oil Capacity	Liters (US·qt/Imp·qt)
2.7 (2.9/2.4)	

Caution:
Use ENGINE OIL SAE 5W-30 for transmission case.

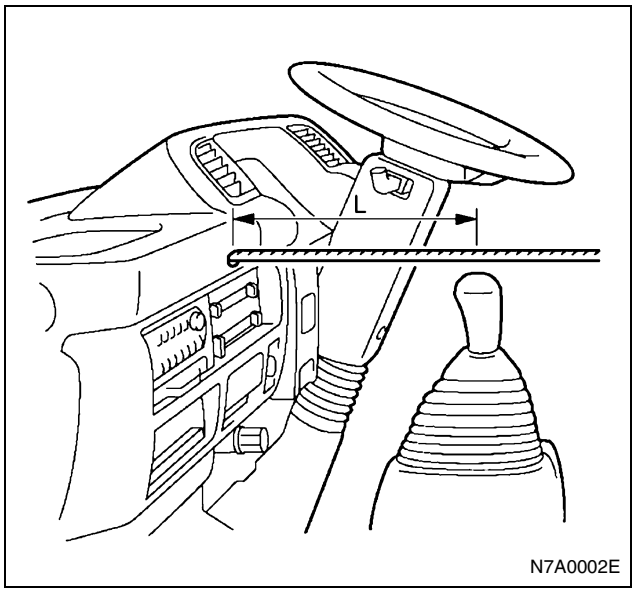
5. Install Filler Plug.

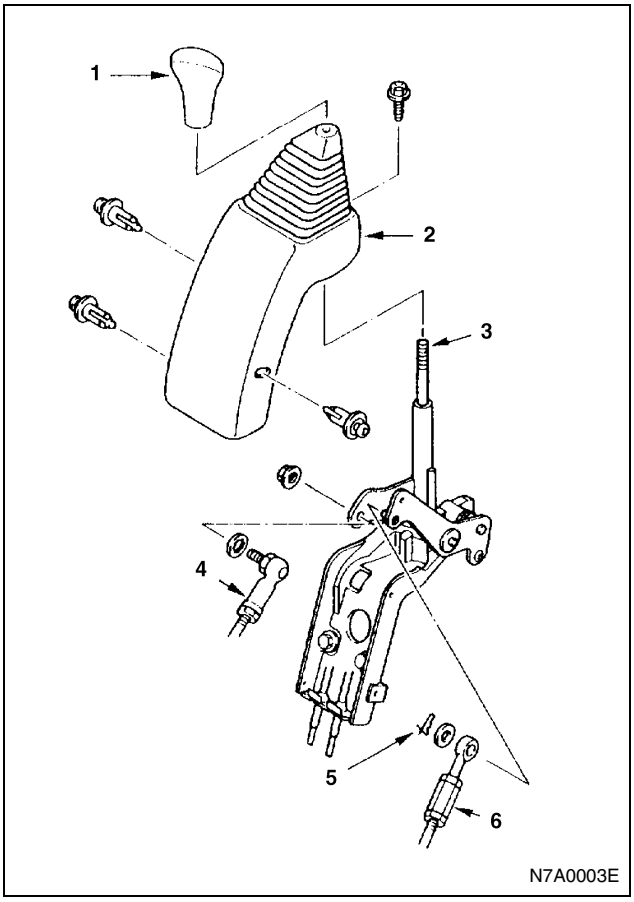
Tighten:
Filler plug to 49 N·m (5.0 kg·m / 36 lb·ft)

Gear Control Cable Adjustment

1. Measure
   - Set the change lever in the neutral position, then confirm if the dimension (L) between the center of the change lever play and the instrument center cluster is within the reference value.

Change Lever Position	mm (in)
Standard Cab: 247±15 (9.7±0.6) Wide Cab: 238±15 (11.1±0.6)	





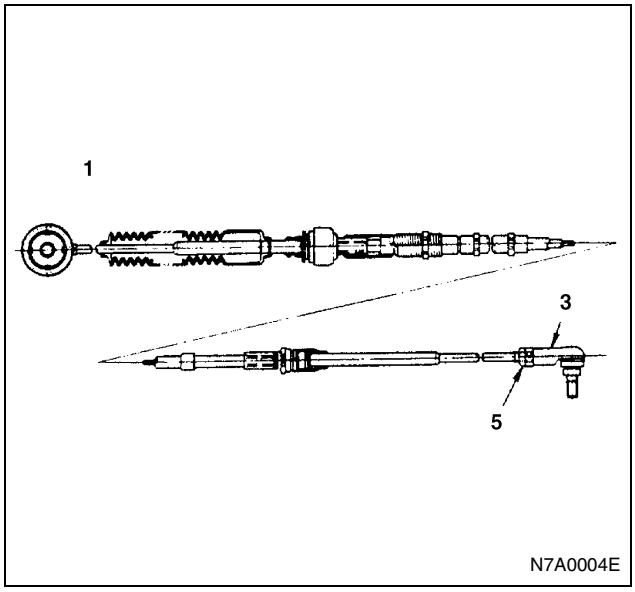
Legend

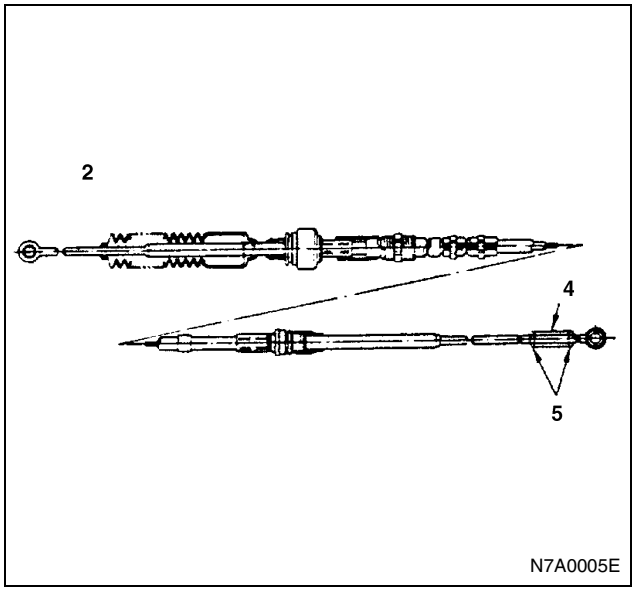
1. Knob
2. Cover assembly
3. Change lever
4. Shift cable
5. Snap pin
6. Select cable

2. Adjust
   - If the dimension is out of the reference, adjust as required.
   1) Remove the change lever knob.
   2) Remove the cover assembly.
   3) Disconnect the shift cable from the change lever.
   4) Set the transmission in the neutral position.
   5) Loosen the lock nut of the shift cable ball joint and the select cable turnbuckle, then turn the ball joint and turnbuckle as necessary for hole and pin.
   6) Tighten the lock nuts and install the shift cable to the change lever.

Tighten:
Lock nut to 6 N·m (0.6 kg·m / 4.4 lb·ft)

   7) Install the cover assembly and the change lever knob.





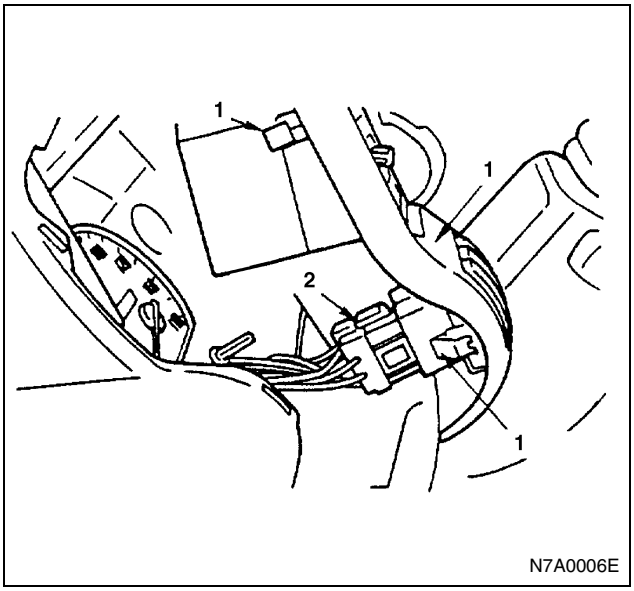
Legend

1. Shift cable (transmission side)
2. Select cable (transmission side)
3. Ball joint
4. Turnbuckle
5. Lock nut (change lever side)

Clutch Pedal Travel and Free Play Adjustment

Clutch Pedal Height and Stroke

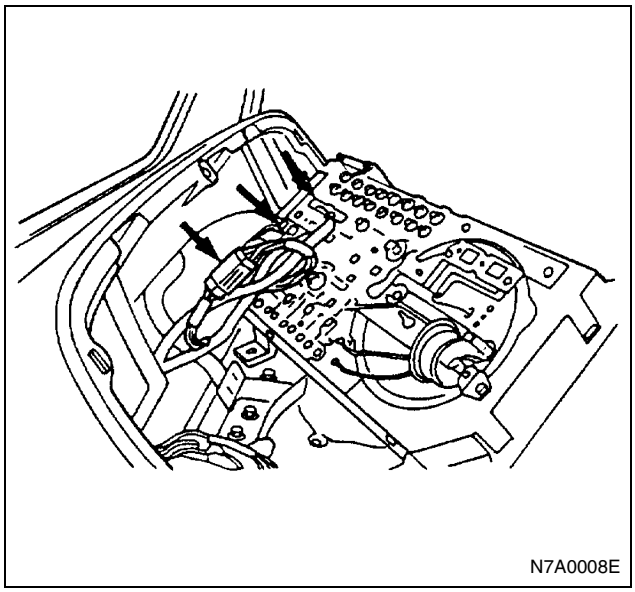
1. Remove Meter Cluster.
   - Pull out the meter cluster and disconnect the harness connectors.



Legend
1. Clip
2. Connector

2. Remove Meter Assembly.
   - Remove the 5 fixing screws.

   - Disconnect the harness connectors.

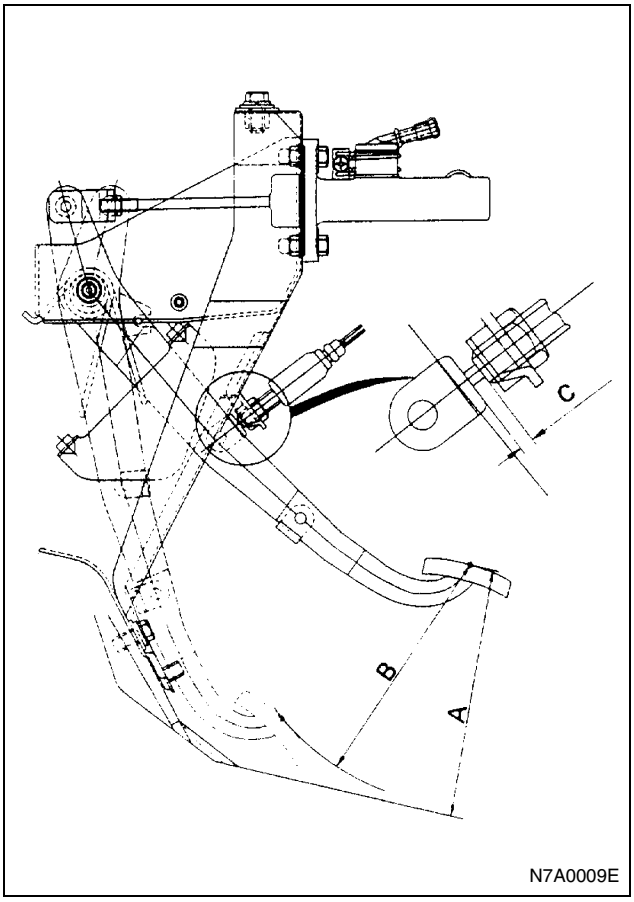


3. Adjust
   - Loosen the lock nut of the clutch master cylinder push rod.
   - Adjust the pedal height by turning the push rod.

Clutch Pedal Height and Stroke	mm (in)
Height (A): 160 — 170 (6.3 — 6.7) Stroke (B): 159 — 169 (6.3 — 6.7)	

4. Tighten Lock Nut.

Tighten:
Lock nut to 20 N·m (2.0 kg·m / 14 lb·ft)



5. Install Meter Assembly and Meter Cluster.

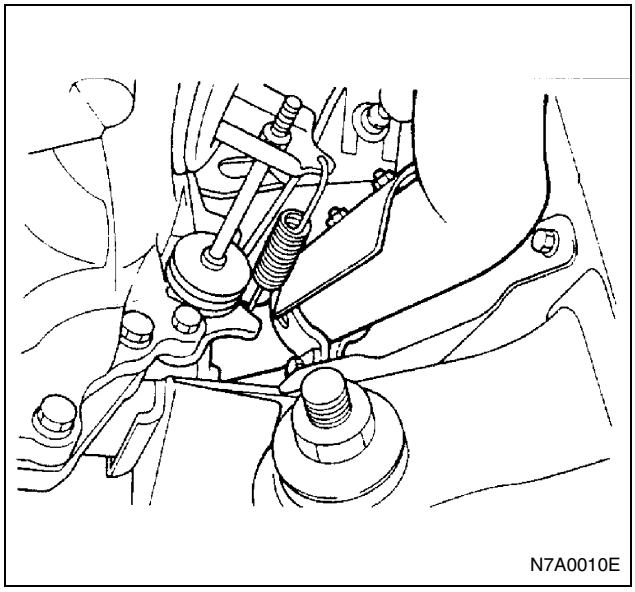
Clutch Pedal Free Play

Slave Cylinder

1) Remove the slave cylinder return spring.
2) Loosen the lock nut of the push rod.
3) Turn the adjust nut until it reaches the shift fork.
4) Back off the adjust nut 1.5 turns (shift fork free play approximately 2 mm/0.1 in.).
5) Tighten the lock nut.

Tighten:
Lock nut to 16 N·m (1.6 kg·m / 12 lb·ft)

6) Install the return spring.



Clutch Switch or Stopper Bolt

After completion of clutch pedal height adjustment, adjust the clutch switch or stopper bolt clearance.

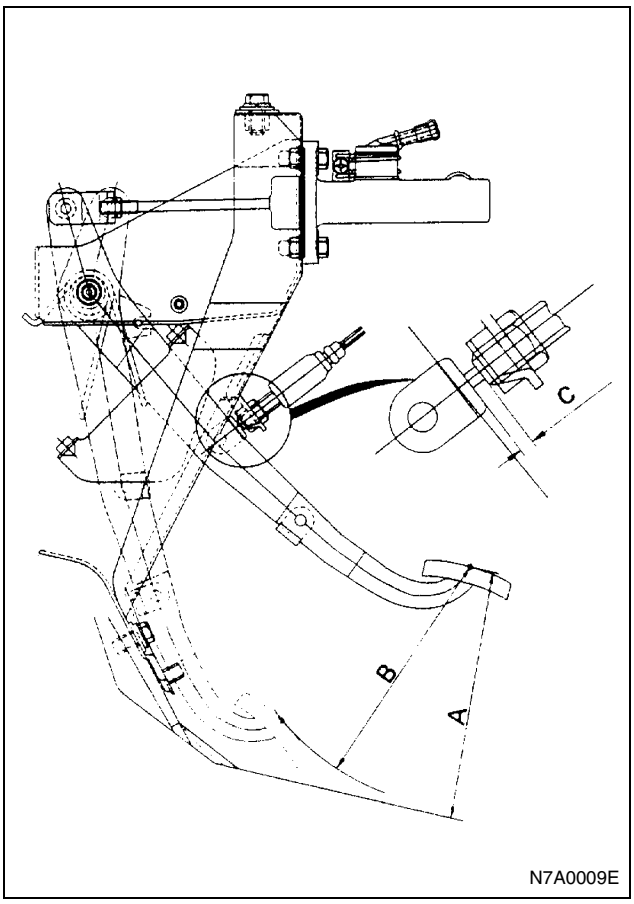
1) Loosen the lock nut of clutch switch or stopper bolt.
2) Adjust the clutch switch or stopper bolt clearance by turning clutch switch or stopper bolt.

Clutch Switch or Stopper Bolt Clearance (C)	mm (in)
0.5 — 1.0 (0.02 — 0.04)	

Clutch Pedal Free Play	mm (in)
15 — 25 (0.6 — 1.0)	

3) Tighten the lock nut.

Tighten:
Lock nut to 19 N·m (1.9 kg·m / 14 lb·ft)



Clutch Hydraulic Circuits Bleeding

If air enters the clutch circuit, it will cause clutch dragging. Therefore, bleeding operation should be performed if the clutch fluid reservoir has been emptied due to failure to mal-replenishment or if the hydraulic circuit has been disassembled. Bleeding operation calls for cooperative action of two men.

1) Check the level of clutch fluid in the reservoir and replenish if necessary.
2) Remove the rubber cap from the bleeder screw and wipe clean the bleeder screw.
   Connect a vinyl tube to the bleeder screw and insert the other end of the vinyl tube into a transparent container.
3) Pump the clutch pedal repeatedly and hold it depressed.
4) Loosen the bleeder screw on the clutch slave cylinder to release clutch fluid with air bubbles into the container and tighten the bleeder screw immediately.
5) Release the clutch pedal carefully. Repeat the above operation until air bubbles disappear from the clutch fluid being pumped out into the container. During the bleeding operation, keep the clutch fluid reservoir filled to the specified level.
   Reinstall the rubber cap.

Caution:
Do not let clutch fluid remain on a painted surface. Wash it off immediately.

3. 3rd
4. 4th
5. 5th
6. Rev.

For MSB model transmission, a forward 5-shift all synchromesh type and a backward 1-shift constant mesh type transmission are employed.

The transmission case is made of a high rigidity cast iron, and the front cover integral with the clutch housing is made of aluminum die-cast. An aluminum die-cast control box containing a gear shift and gear select mechanism is installed on the right side of the transmission case. A window for power take-off is also provided on the left side.

For all the gears, helical gears are employed to reduce noises.

The synchromesh mechanism that employs balking rings use block rings of special brass to obtain improved synchromesh performance.

With the main shaft screwed up at the rear, ball bearings are employed for the bearings on both sides of the main shaft and the counter shaft, and needle roller bearings employed for the bearings at the tip end of the main shaft and also for those of the 1st gear, 2nd gear, 3rd gear and reverse gear to secure improved durability and reduced noises.

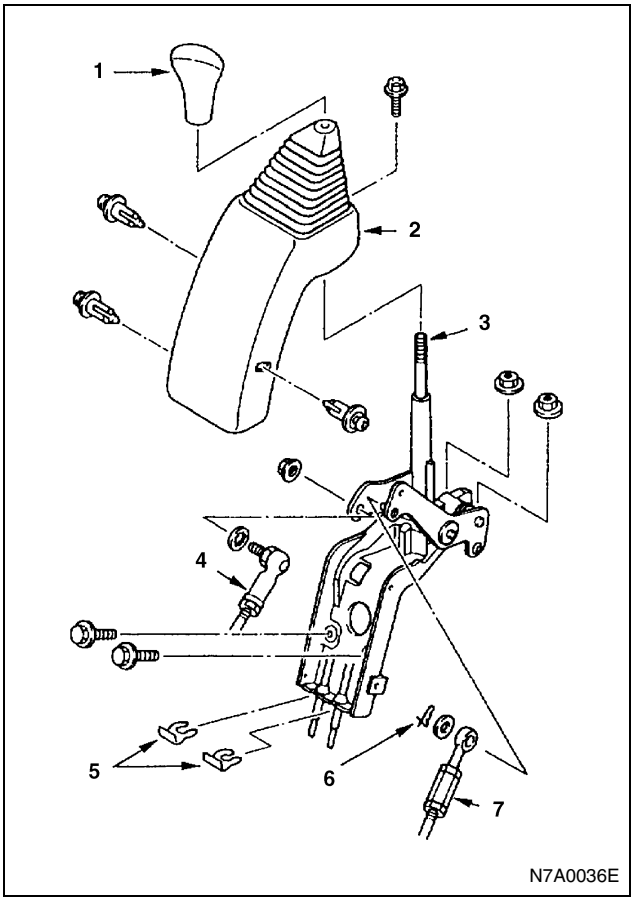
Furthermore, with the anti-lash mechanism employed for the engagement of the top gear with the counter gear, fine-pitch gears are also employed for the 4th gear and the 5th gear to reduce noises.

ON-VEHICLE SERVICE

Change Lever Assembly Replacement

Removal

1. Change Lever Knob
2. Cover Assembly
   - Remove the fixing screw and three clips.
3. Shift Cable and Select Cable
   - Disconnect the cables from the change lever.
   - Remove the clips and disconnect the cables from bracket.
4. Change Lever Assembly



Legend

1. Knob
2. Cover assembly
3. Change lever
4. Shift cable
5. Clip
6. Snap pin
7. Select cable

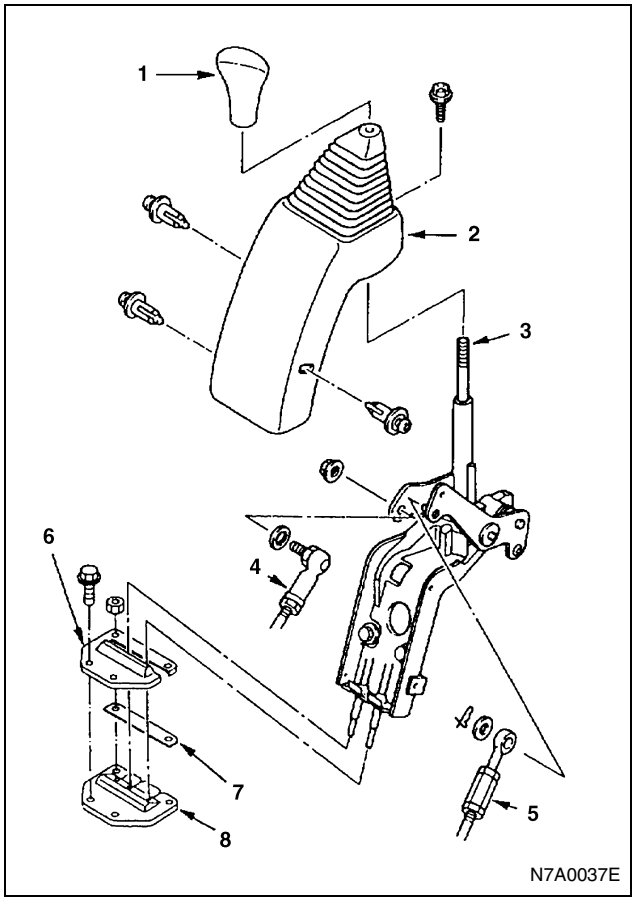
Installation

1. Change Lever Assembly
2. Shift Cable and Select Cable
   When connecting the shift cable and the select cable to the change lever, adjust the cable.
   Refer to “SERVICING: GEAR CONTROL CABLE ADJUSTMENT” given previously in this section.
3. Cover Assembly
4. Change Lever Knob

Gear Control Cable Replacement

Removal

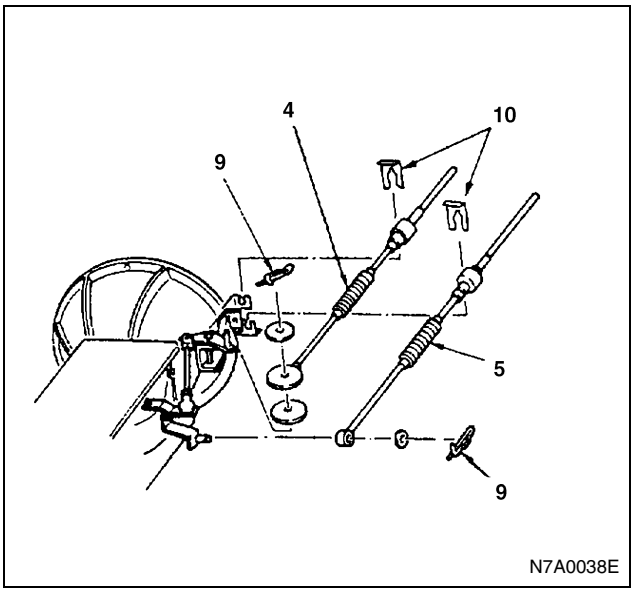
1. Change Lever Knob
2. Cover Assembly
3. Shift Cable and Select Cable
   1) Disconnect the shift and select cables from change lever.
   2) Remove the clips and disconnect the cables from change lever bracket.
   3) Remove the grommet retainer, grommet seal and grommet.
   4) Tilt the cab.



Legend

1. Knob
2. Cover assembly
3. Change lever
4. Shift cable
5. Select cable
6. Grommet retainer
7. Grommet seal
8. Grommet

5) Disconnect the shift cable and the select cable on the transmission side.
6) Remove the clips and disconnect the shift cable and the select cable from the bracket.
7) Remove the clips that fix the cables to the frames.
8) Remove the shift and select cable assemblies.



Legend

4. Shift cable
5. Select cable
9. Snap pin
10. Clip

Inspection and Repair

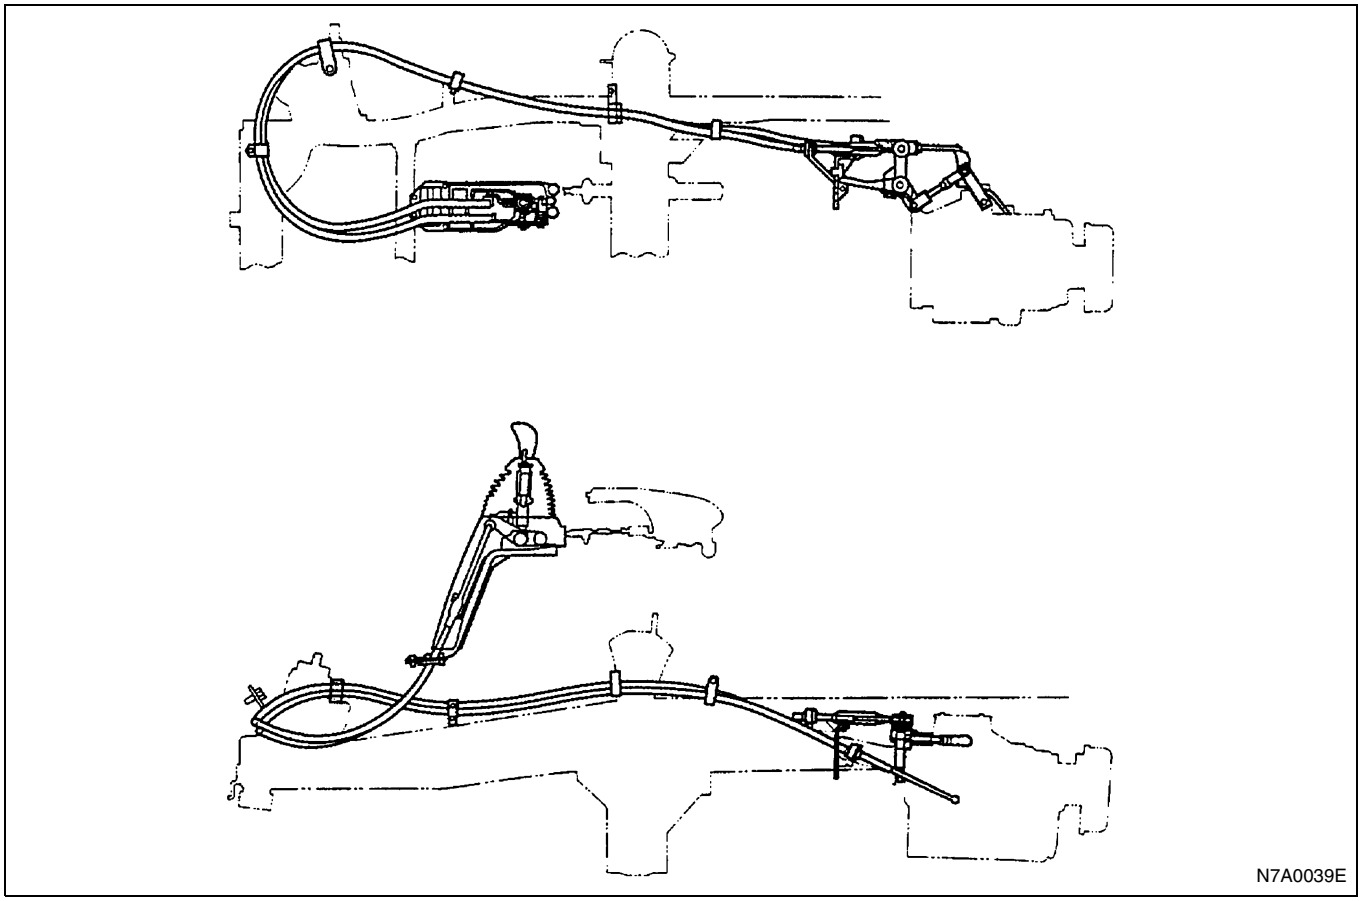
Check the cables for any deformation, damage or rust, and also check the sliding portion for any abnormal condition.
When there is any abnormal condition, replace it with a new one.

Installation

1. Shift Cable and Select Cable
   1) Install the shift cable and the select cable temporarily.

Caution:
Never bend the cables to radius less than 450 mm (18 in) unless it is necessary to do so for wiring purposes. And never bend the cables to radius less than 180 mm (7 in) even during wiring. Install the cables carefully without unnecessary twisting the cable boots.

   2) Connect the shift cable and the select cable to the transmission.
   3) Fasten the cables with clips to the brackets on the transmission side.
   4) Fasten the cables with clips to the change lever bracket.
   5) Fasten the cables with clips to the frames. At this time, take care that the select cable comes above the shift cable.
   6) Install the grommet, grommet seal and grommet retainer.
   7) When connecting the shift cable and the select cable to the change lever, adjust the cables. Refer to “SERVICING: GEAR CONTROL CABLE ADJUSTMENT” given previously in this section.
2. Cover Assembly
3. Change Lever Knob

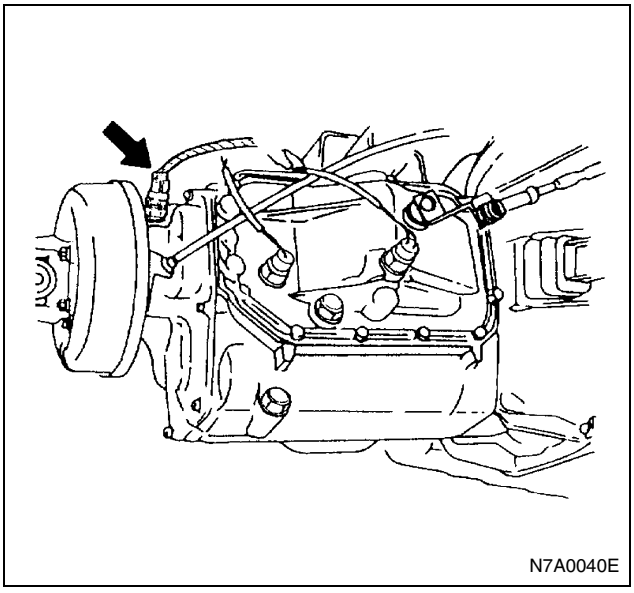


N7A0039E

Vehicle Speed Sensor Driven Gear Replacement

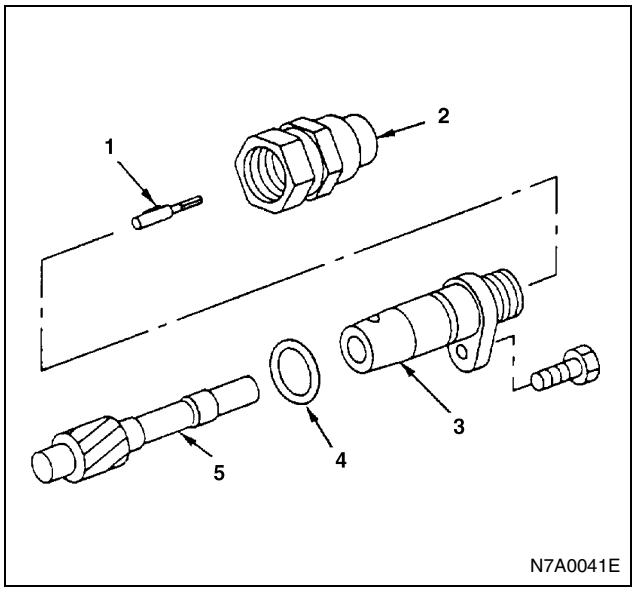
Removal

1. Wiring Connector



N7A0040E

2. Vehicle Speed Sensor with Key Rod
3. Vehicle Speed Sensor Driven Gear Assembly
   - Remove the fixing bolt.
   - Remove the driven gear assembly.



N7A0041E

Legend

1. Key rod
2. Vehicle speed sensor
3. Bushing
4. O-ring
5. Driven gear

Installation

1. Vehicle Speed Sensor Driven Gear Assembly

Tighten:
Fixing bolt to 15 N·m (1.5 kg·m / 11 lb·ft)

2. Vehicle Speed Sensor with Key Rod

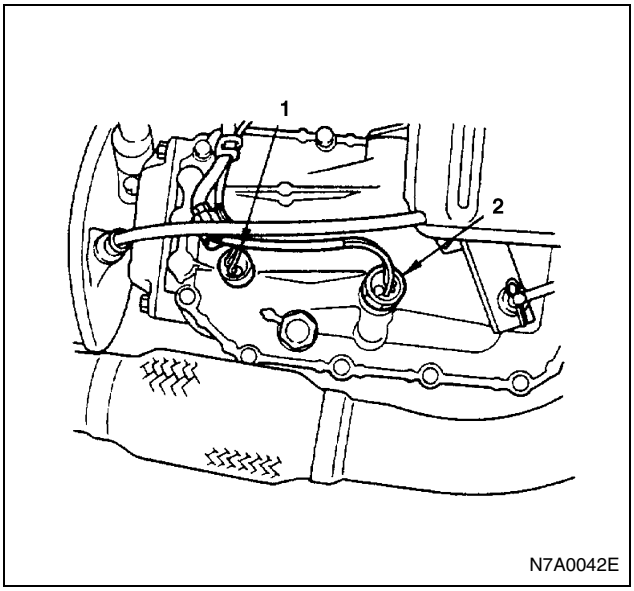
Tighten:
Fixing bolt to 25 N·m (2.5 kg·m / 18 lb·ft)

3. Wiring Connector

Back-up Light Switch and Neutral Switch Replacement

Removal

1. Wiring Connector
2. Switch

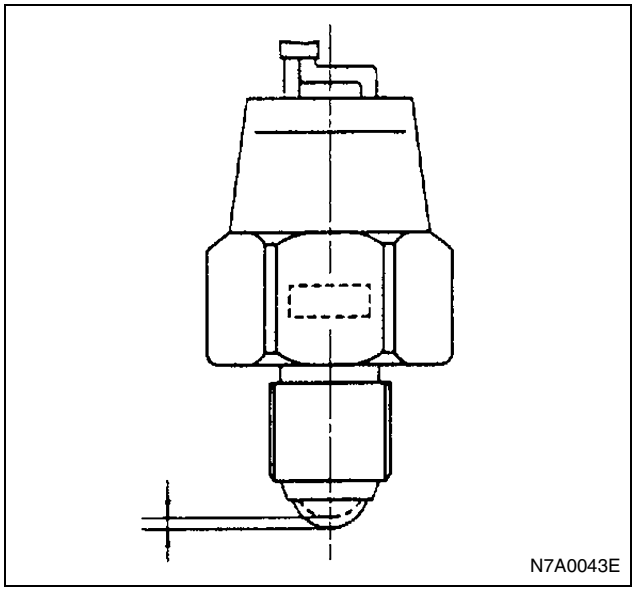


Legend
1. Back-up light switch
2. Neutral switch

Inspection and Repair

- When there is continuity between the terminals in the condition as it is, and when the continuity between the terminals is turned off by pressing the ball of the switch, the switch is normal.

Switch Operating Stroke	mm (in)
0.93 (0.037)	



Installation

1. Switch
   - Apply liquid gasket (Three Bond 1141 or equivalent) to the switch's threaded portion to prevent oil leakage, and install the switch to the control box.
   - Color of connector
     Back-up Light Switch: Brown
     Neutral Switch: Gray

Tighten:
Switch to 34 N·m (3.5 kg·m / 25 lb·ft)

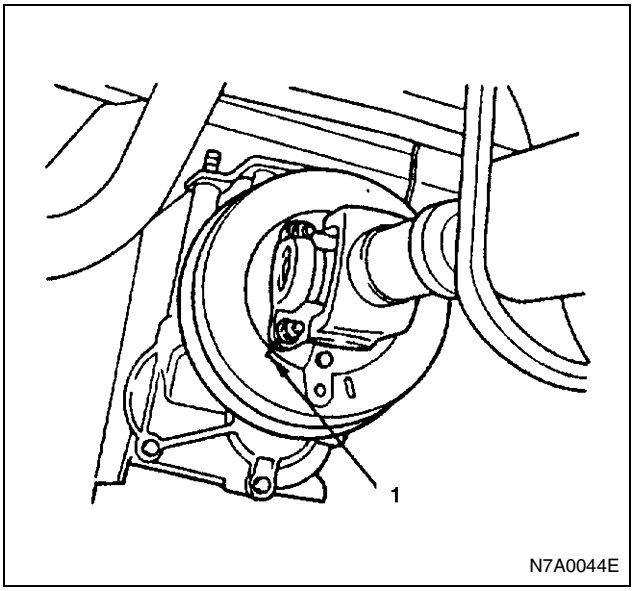
2. Wiring Connector

Rear Oil Seal Replacement

Removal

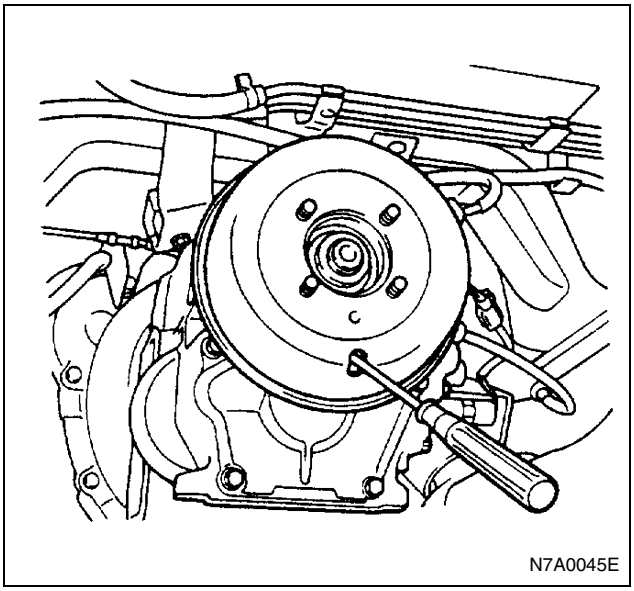
- Raise vehicle and support with suitable safety stands.

1. Propeller Shaft
   - Put a reference mark (1) on the flange yoke and the parking brake drum.

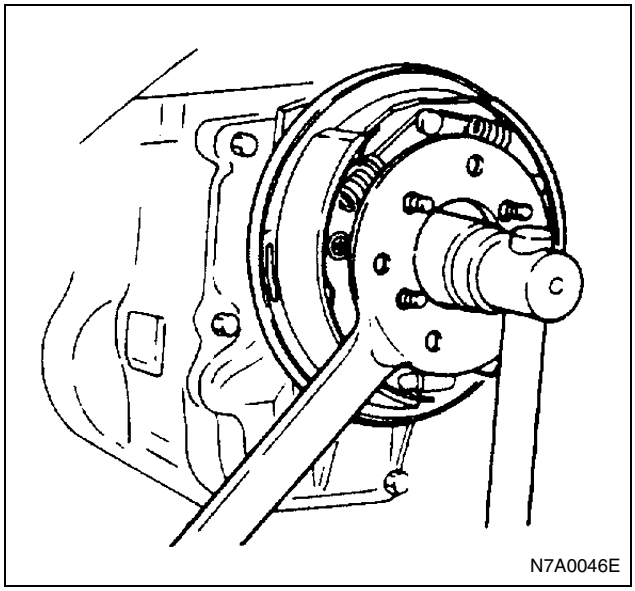


- Disconnect the propeller shaft at flange yoke.
- Put aside the propeller shaft and tie it to the frame so it does not interfere with servicing work.

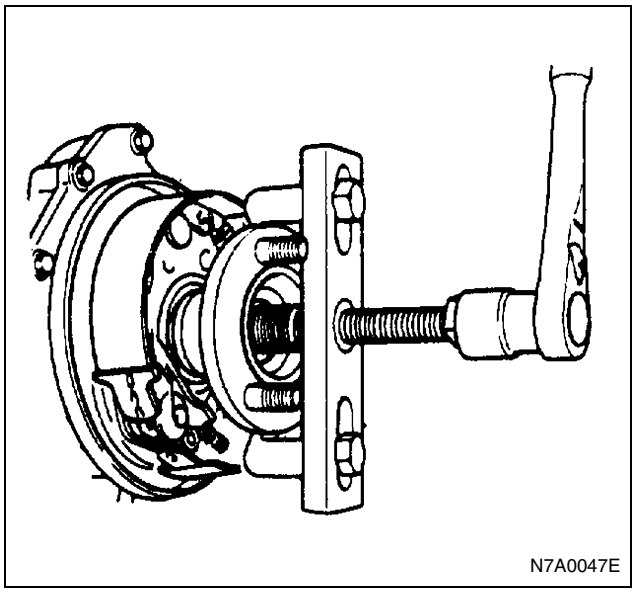
2. Parking Brake Drum
   - Remove the screw and the adjust hole cover.
   - It may be necessary to back off the shoe adjuster.



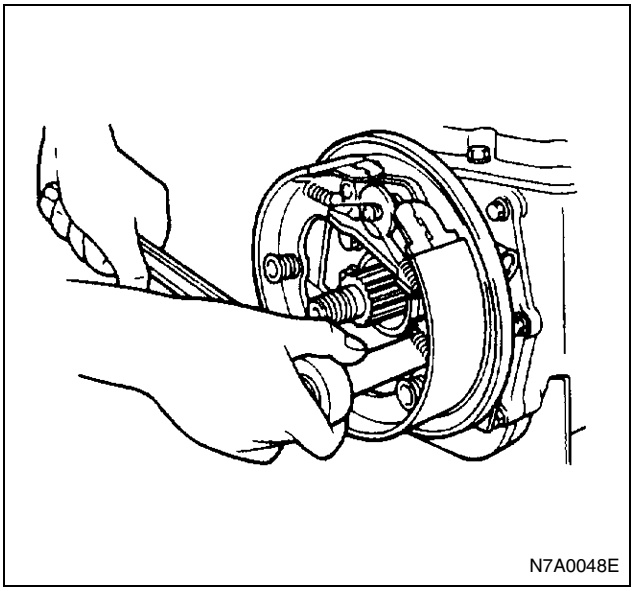
3. Lock Nut
   - Make sure to raise the caulking of the coupling driver lock nut, then remove the lock nut.
   - Use the handle to remove the lock nut.
     Handle: 5-8840-2043-0



4. Coupling Driver
   - Remove the coupling driver using the universal puller.
     Universal Puller: 5-8840-2027-0
   - Remove the conical washer and the O-ring.



5. Parking Brake Assembly



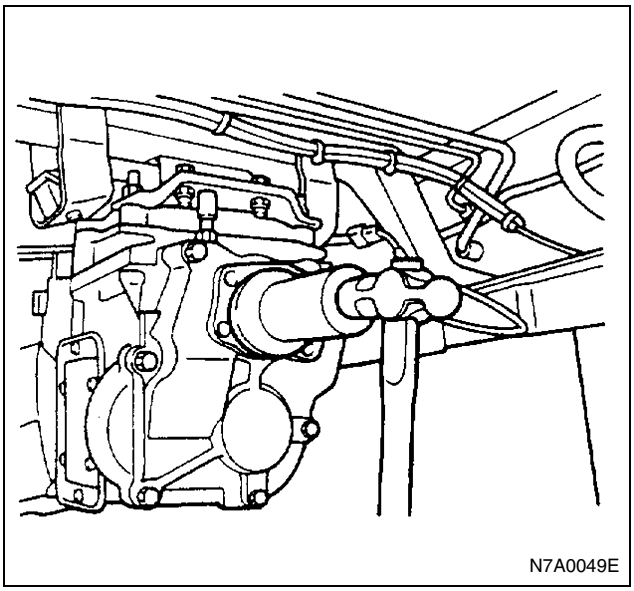
N7A0048E

6. Oil Seal
   - Use the screwdriver to remove the oil seal from the rear cover.

Caution:
Take care not to damage the sealing seat of the rear cover.

Installation

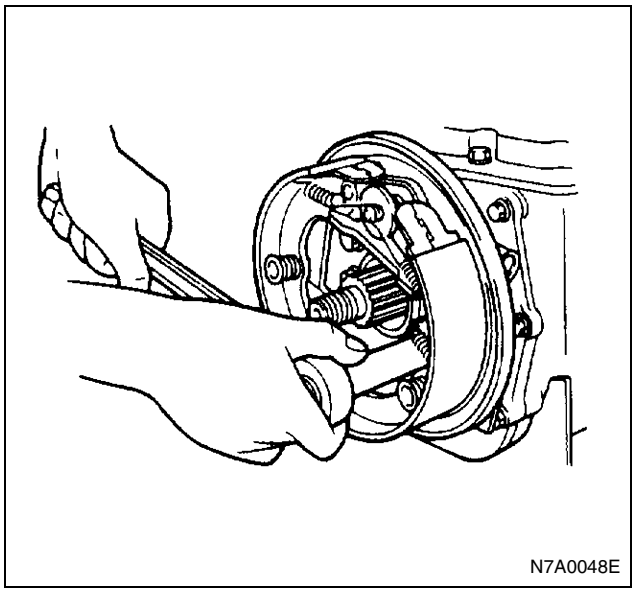
1. Oil Seal
   - Apply engine oil to the new oil seal outer circumference and apply multi-purpose grease to the oil seal lip.
   - Use the oil seal installer to install the oil seal to the rear cover.
     Oil Seal Installer: 5-8840-2242-0



N7A0049E

2. Parking Brake Assembly

Tighten:
- Parking brake bolts to 25 N·m (2.5 kg·m / 18 lb·ft)
- Parking brake nut to 113 N·m (11.5 kg·m / 83 lb·ft)



N7A0048E

3. Coupling Driver
4. Lock Nut
   - Install the O-ring and the conical washer.
     The conical washer is to be set up with its identification groove to the nut side.

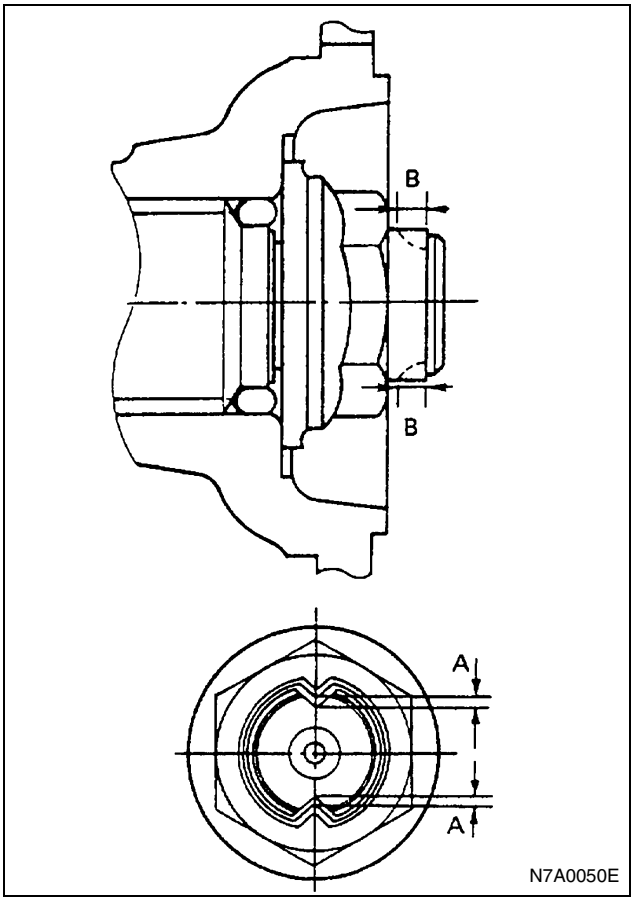
Caution:
Do not reuse the lock nut.

   - Apply the engine oil to the setting face of the new lock nut and tighten it up to the specified torque.
     Handle: 5-8840-2043-0

Tighten:
Lock nut to 226 N·m (23.0 kg·m / 166 lb·ft)

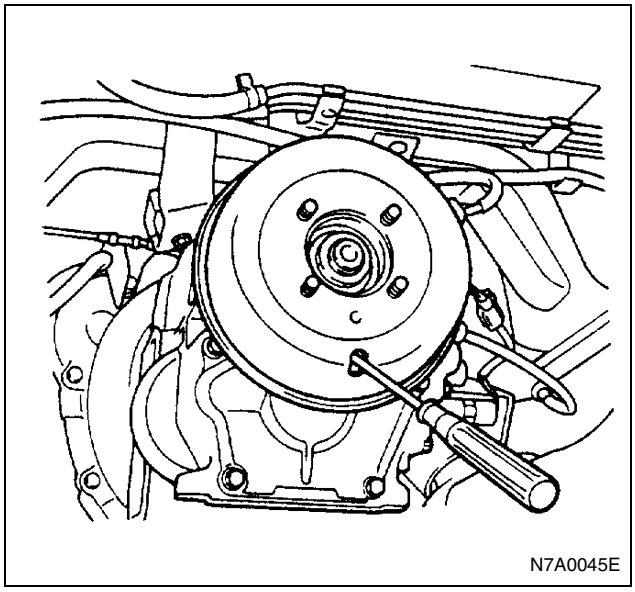
   - Align the lock nut with the V-shaped groove at the tip of the main shaft, and caulk the nut lip portion by using a chisel.
     (Round edge approximately 1 mm (0.04 in) × 60°).
   - As shown in the illustration, be sure to caulk the nut lip so that the clearance between the V-shaped groove portion at the tip of the main shaft and the caulked up lip (A) is less than 1.5 mm (0.06 in), and the caulking length (B) is 5 mm (0.2 in) or more.

Caution:
Be sure to confirm that there is no crack at the caulked portion of the end nut after caulking.

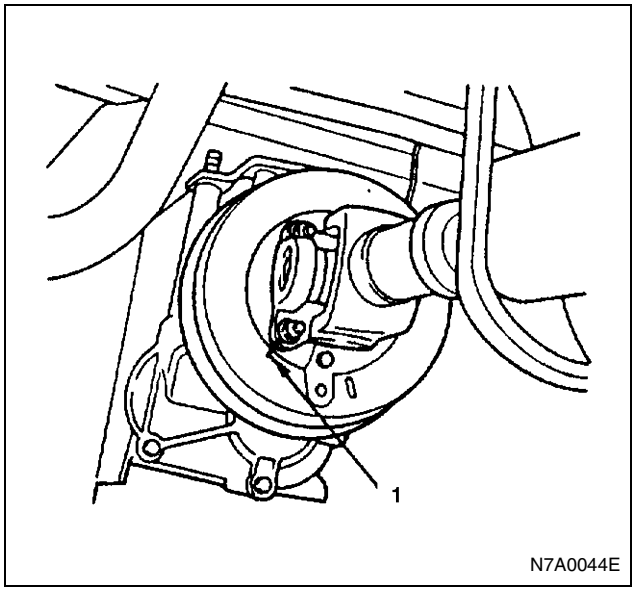


5. Parking Brake Drum
   - Adjust the parking brake after installation.
   1) Rotate the brake drum to align the adjust hole with the adjuster.
   2) Move the camshaft lever from side to side several times to center the brake shoes.
   3) Insert a screwdriver into the hole and rotate the adjuster by pushing it upward until the shoes drag on the drum.
   4) Back off the adjuster 30 notches.
   - Install the adjust hole cover.

Tighten:
Adjust hole cover bolt to 8 N·m (0.8 kg·m / 69 lb·in)



6. Propeller Shaft
   - Line up reference mark (1).



Tighten:
Propeller shaft bolt to 66 N·m (6.7 kg·m / 48 lb·ft)

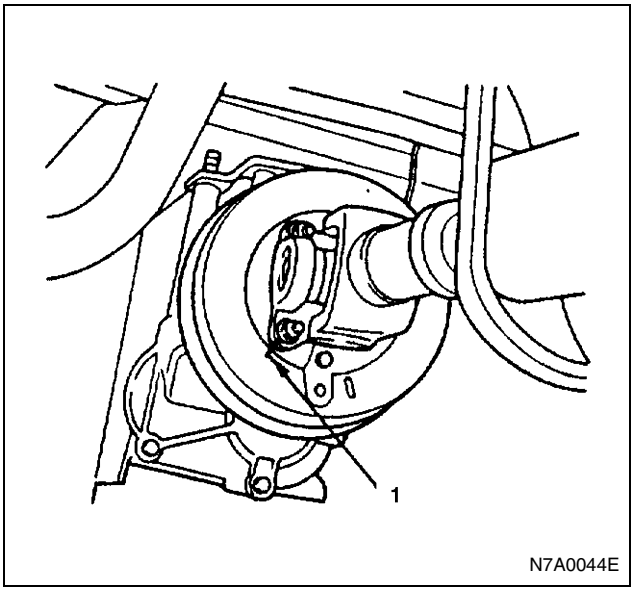
- Remove the safety stands.

Transmission Assembly Replacement

Removal

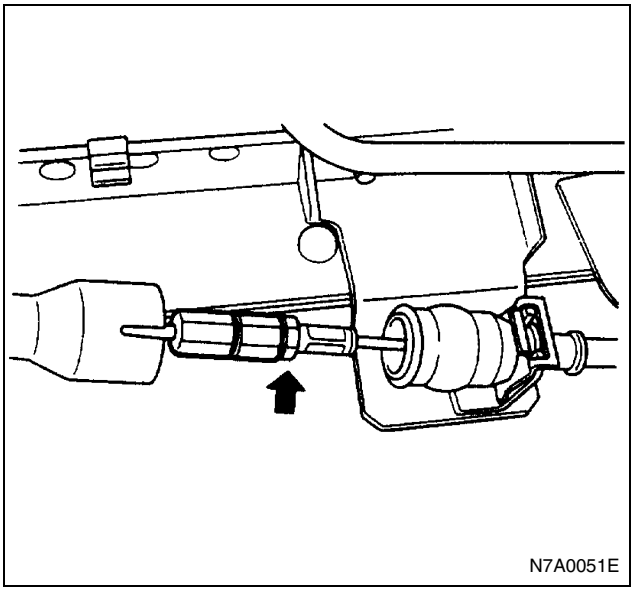
- Raise vehicle and support with suitable safety stands.

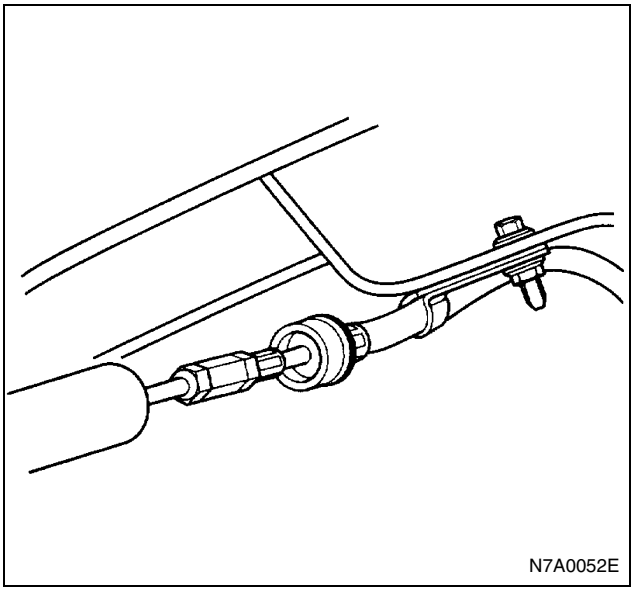
1. Propeller Shaft
   - Put a reference mark (1) on the flange yoke and the parking brake drum.



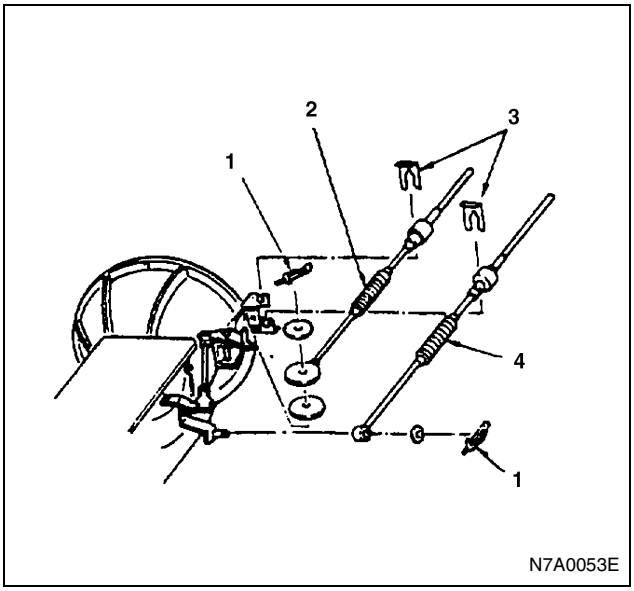
- Disconnect the propeller shaft at flange yoke.
- Put aside the propeller shaft and tie it to the frame so that it does not interfere with servicing work.

2. Parking Brake Cable
   - Move the joint cover.
   - Disconnect the joint bolt.
   - Remove the clip, and then disconnect the cable from the bracket.





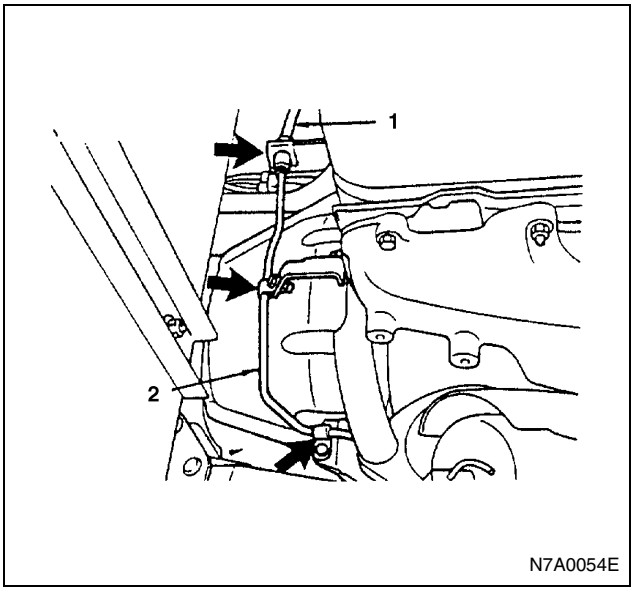
3. Wiring Connector
   - Disconnect the wiring connectors from the vehicle speed sensor, the neutral switch and the back-up light switch.
4. Shift Cable and Select Cable
   - Disconnect the shift cable and select cable on the transmission side.



Legend

1. Snap pin
2. Shift cable
3. Clip
4. Select cable

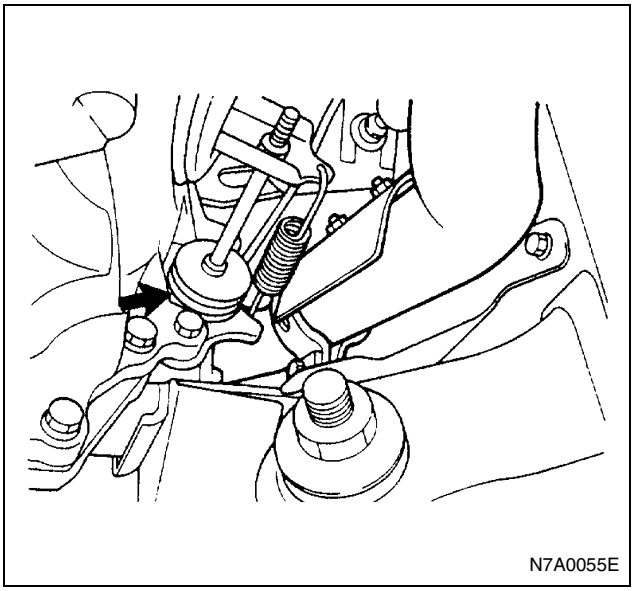
5. Clutch Slave Cylinder
   - Remove the clutch pipe fixing clips and the clip bracket (Right hand drive models only).



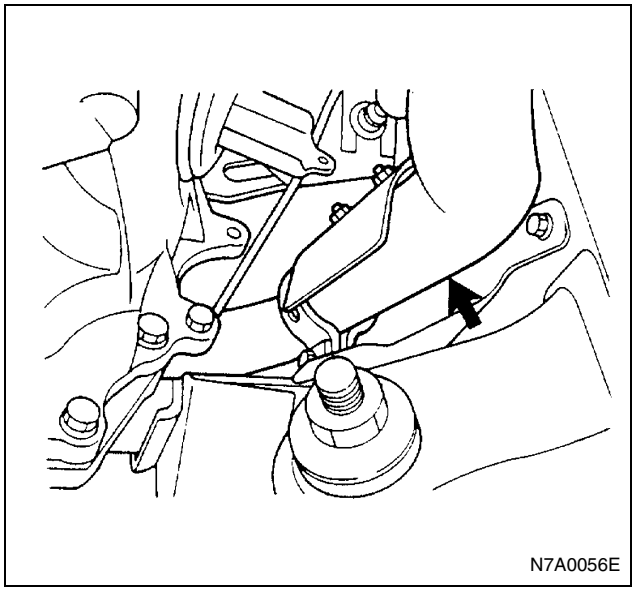
Legend

1. Flexible hose
2. Shift cable

- Remove the slave cylinder assembly with the flexible hose attached, and then tie it to the frame so that it does not interfere with servicing work.



6. Exhaust Brake Assembly
7. Front Exhaust Pipe



8. Transmission Assembly

Notice:

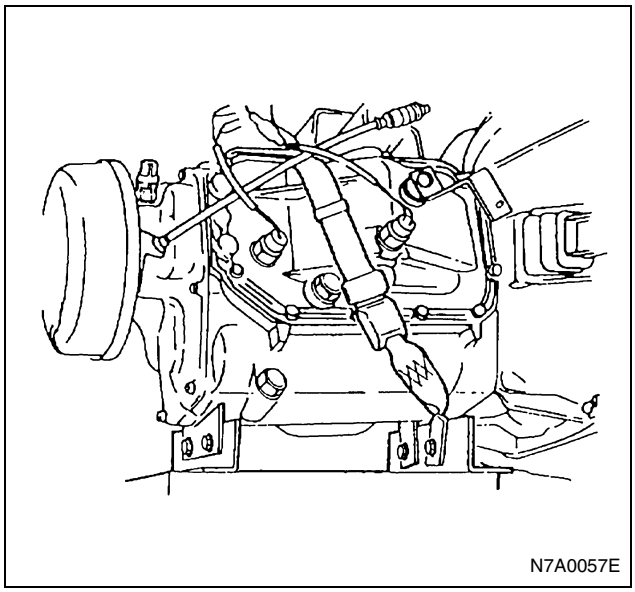
The exhaust pipe bracket, the gear control bracket and the clips are sometimes installed in the wrong position or direction confusedly. To prevent incorrect installation of these parts, put a correct installation mark on them.

- Support the transmission with mission jack.

Caution:

To prevent the falling of the transmission, tie it firmly to the jack with a chain or belt.

Do not allow transmission to hang unsupported from clutch. Damage to the clutch assembly will result.



- Remove the nuts of the transmission mounting bracket on the crossmember side.
- Engine and transmission angles may need to be adjusted for removal.
- Hold the rear section of the engine by the jack or hoist.

Caution:
When lifting the engine by the jack, use wood blocks to prevent any possible damage to the oil pan.

- Remove transmission fastening bolts.
- Pull out the transmission assembly rearward.

9. Mounting Bracket

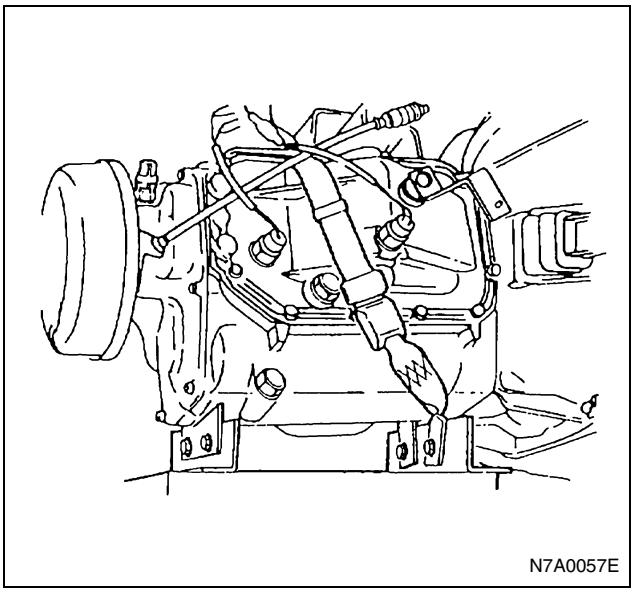
Installation

1. Mounting Bracket

Tighten:
Mounting bracket nuts to 69 N·m (7.0 kg·m / 51 lb·ft)

2. Transmission Assembly
   - Support the transmission with mission jack.

Caution:
To prevent the falling of the transmission, tie it securely to the jack with a chain or belt.



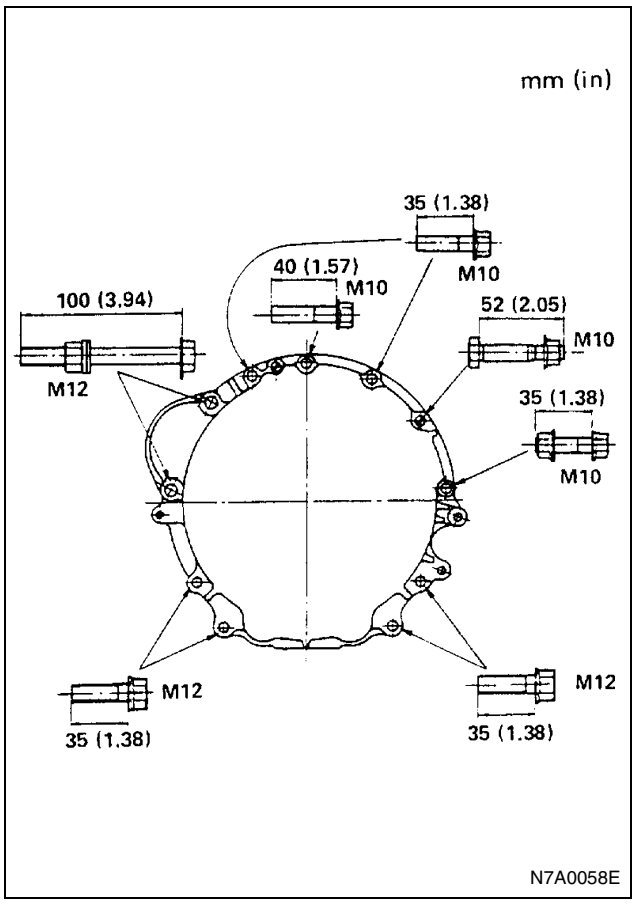
N7A0057E

- Shift transmission into high gear.
- Align transmission with engine slope.
- Turn output parking brake drum to aid clutch spline engagement.

Tighten:
Clutch housing to flywheel housing bolts to
- M10: 46 N·m (4.7 kg·m / 34 lb·ft)
- M12: 91 N·m (9.3 kg·m / 67 lb·ft)

- Raise engine and transmission up into rear transmission mount.

Tighten:
Engine rear mounting nuts and bolts to
- M10: 40 N·m (4.1 kg·m / 30 lb·ft)
- M12: 69 N·m (7.0 kg·m / 51 lb·ft)



N7A0058E

3. Front Exhaust Pipe

Tighten:
Front exhaust pipe bolts to 37 N·m (3.8 kg·m / 27 lb·ft)

4. Exhaust Brake Assembly

Tighten:
Exhaust brake bolts to 17 N·m (1.8 kg·m / 12 lb·ft)

5. Clutch Slave Cylinder

Tighten:
Slave cylinder bolts to 19 N·m (1.9 kg·m / 14 lb·ft)

- Perform slave cylinder adjustment before installation of the return spring.

1) Loosen the lock nut of the push rod.
2) Turn the adjust nut until it reaches the shift fork.
3) Back off the adjust nut 1.5 turns. (shift fork free play Approximately 2 mm/0.1 in).
4) Tighten the lock nut.

Tighten:
Push rod lock nut to 16 N·m (1.6 kg·m / 12 lb·ft)

6. Shift Cable and Select Cable
7. Wiring Connector
   - Color of Connector
     Back-up Light Switch: Brown
     Neutral Switch: Gray
8. Parking Brake Cable
9. Propeller Shaft
   - Line up reference mark.

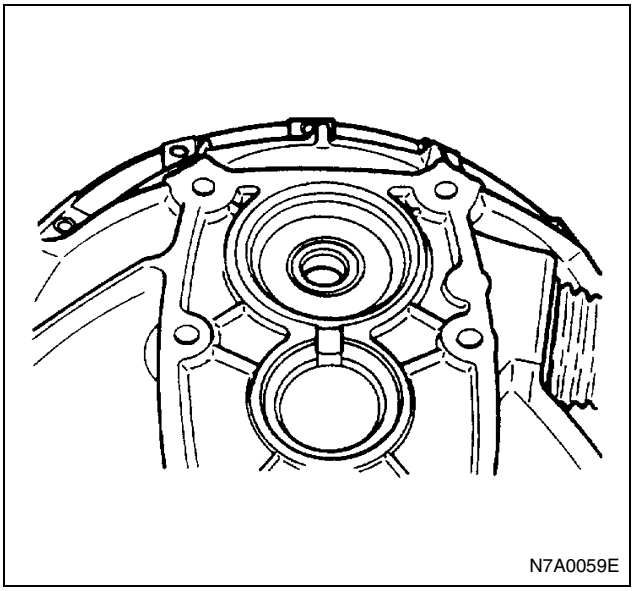
Tighten:
Propeller shaft nuts to 66 N·m (6.7 kg·m / 48 lb·ft)

Front Oil Seal Replacement

Removal

1. Transmission Assembly
   Refer to "ON-VEHICLE SERVICE: TRANSMISSION ASSEMBLY REPLACEMENT" previously in this section.
2. Clutch Housing
3. Oil Seal
   - Use the screwdriver to remove the oil seal from the clutch housing.

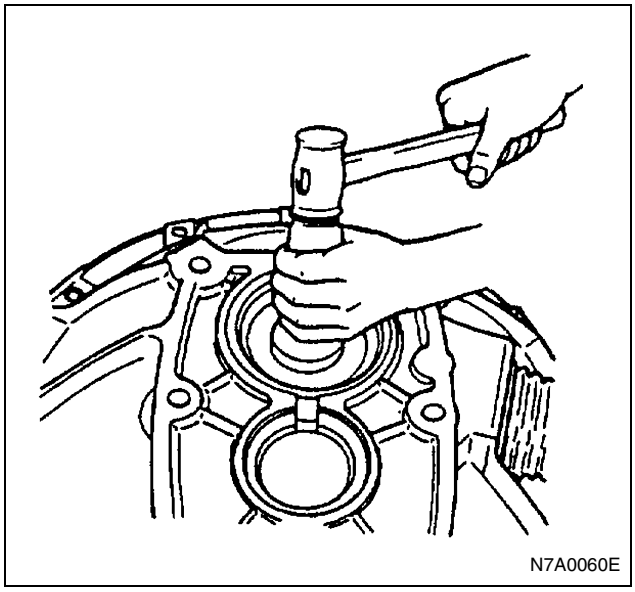
Caution:
Take care not to damage the sealing seat of the clutch housing.



N7A0059E

Installation

1. Oil Seal
   - Apply engine oil to the new oil seal outer circumference and apply multi-purpose grease to the oil seal lip.
   - Use the oil seal installer to install the oil seal to the clutch housing.
     Oil Seal Installer: 5-8840-2064-0

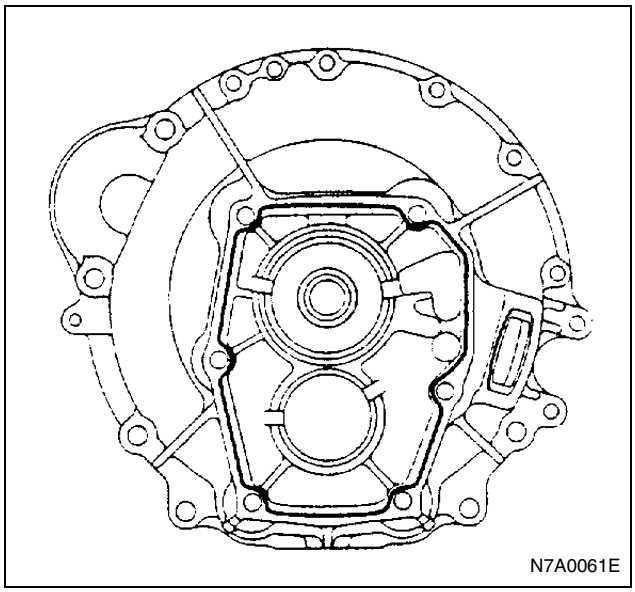


N7A0060E

2. Clutch Housing
   - Remove water and oil on the mating face before applying the liquid gasket.
   - Apply ϕ2 mm (0.1 in) bead of the liquid gasket (Three Bond 1215 or equivalent) to the clutch housing surface shown in the illustration.

Notice:
Install the clutch housing on the transmission case within 30 minutes after liquid gasket application.

Tighten:
Clutch housing to transmission case bolts to 81 N·m (8.3 kg·m / 60 lb·ft)



N7A0061E

3. Transmission Assembly
   Refer to "ON-VEHICLE SERVICE: TRANSMISSION ASSEMBLY REPLACEMENT" previously in this section.

Tighten:
Clutch housing to flywheel housing bolts to
- M10: 46 N·m (4.7 kg·m / 34 lb·ft)
- M12: 91 N·m (9.3 kg·m / 67 lb·ft)

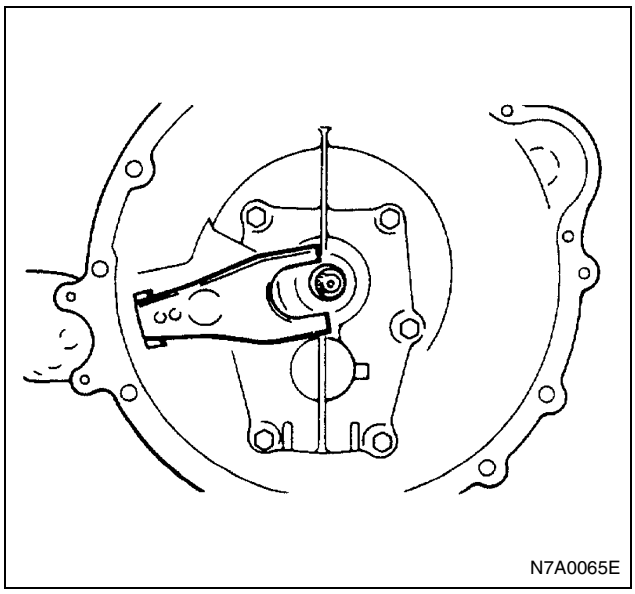
N7A0064E

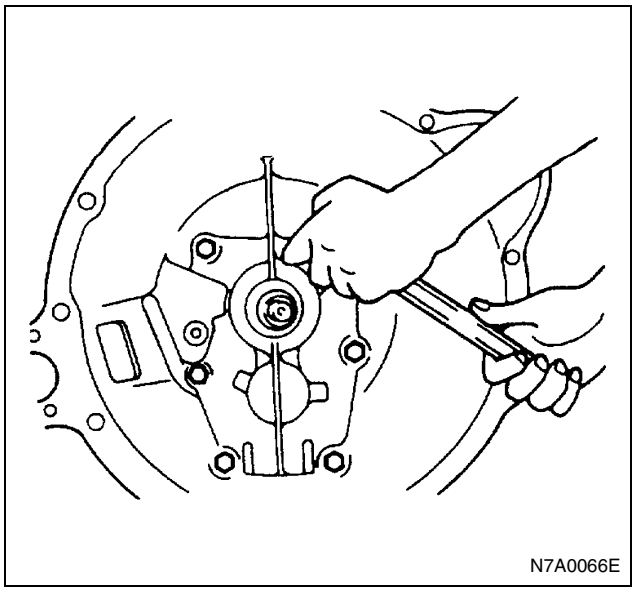
3. Shift Fork and Support Bolt



N7A0065E

4. Clutch Housing
   - Remove the clutch housing from the transmission case.
   - Use the screwdriver to remove the oil seal from the clutch housing.

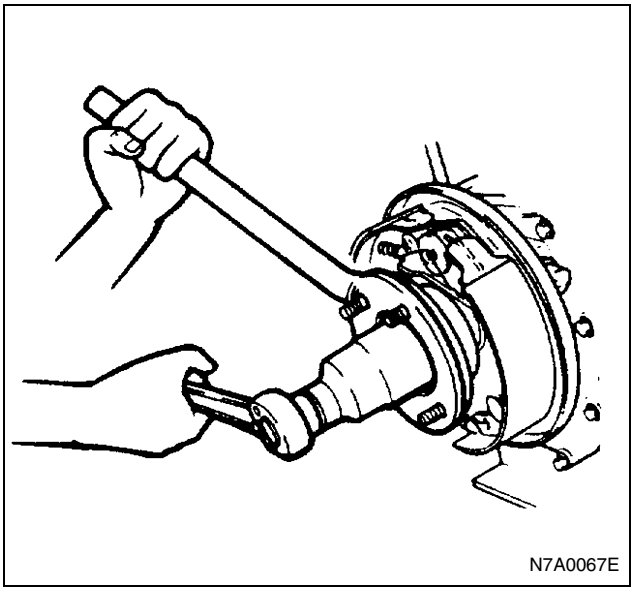
Caution:
Take care not to damage the sealing seat of the clutch housing.



N7A0066E

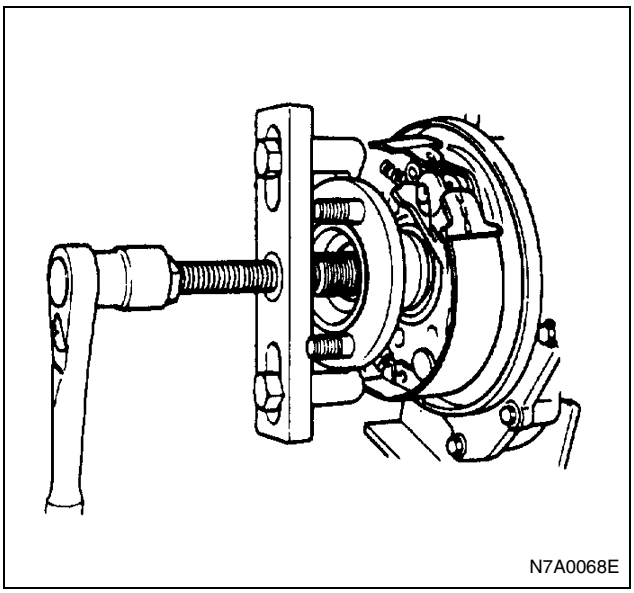
5. Parking Brake Drum
   - Remove the screw and the adjust hole cover.
   - It may be necessary to back off the shoe adjuster.

6. Lock Nut
   - Make sure to raise the caulking of the coupling driver lock nut.
   - Use the handle to remove the lock nut.
     Handle: 5-8840-2043-0



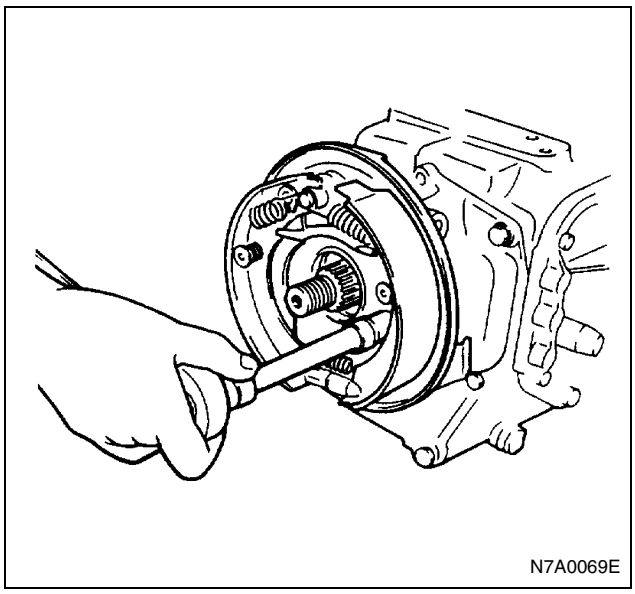
N7A0067E

7. Coupling Driver
   - Remove coupling driver using the universal puller.
     Universal Puller: 5-8840-2027-0
   - Remove the conical washer and the O-ring.

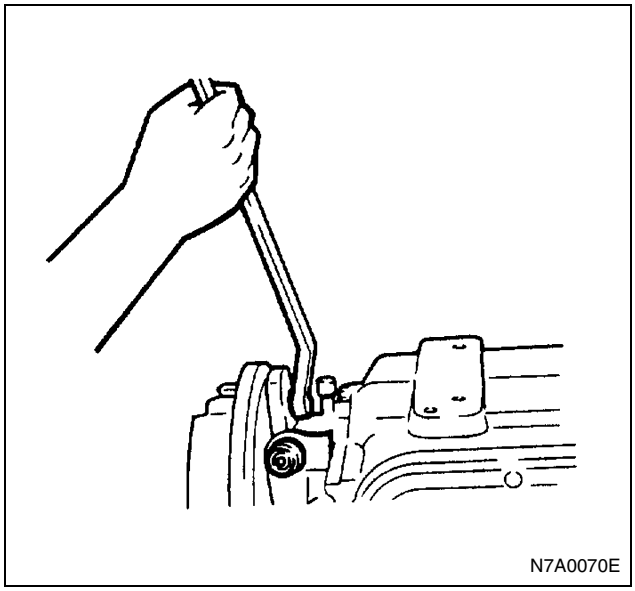


N7A0068E

8. Parking Brake Assembly

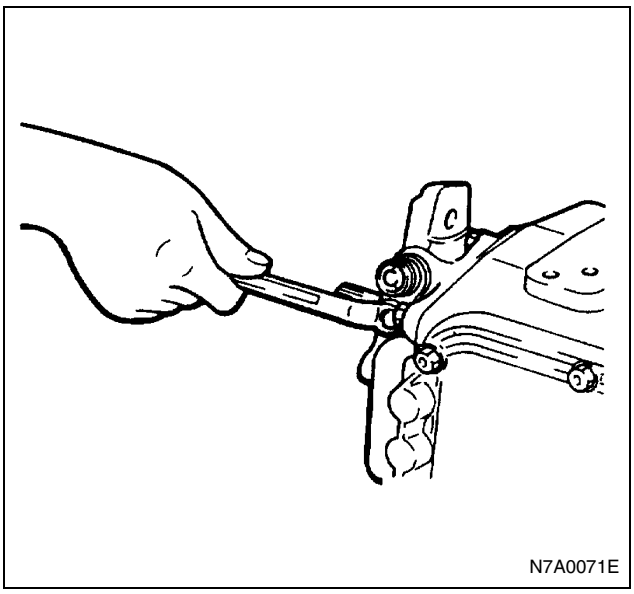


N7A0069E

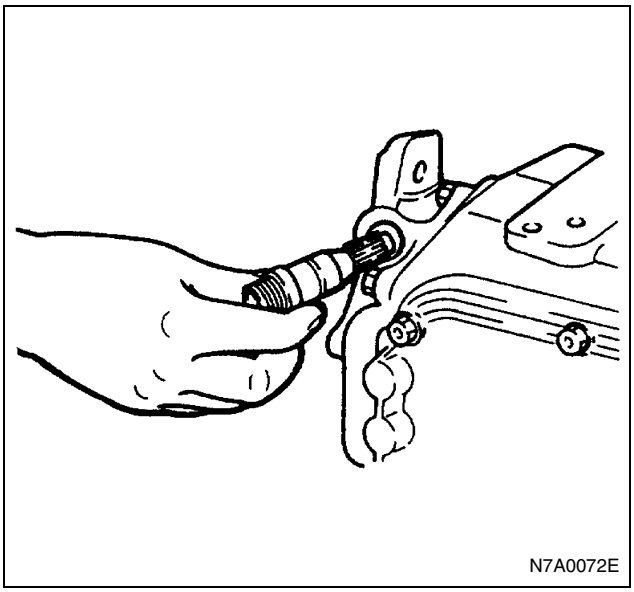


N7A0070E

9. Vehicle Speed Sensor Driven Gear Assembly
   - Remove the vehicle speed sensor with the key rod.
   - Remove the fixing bolt.

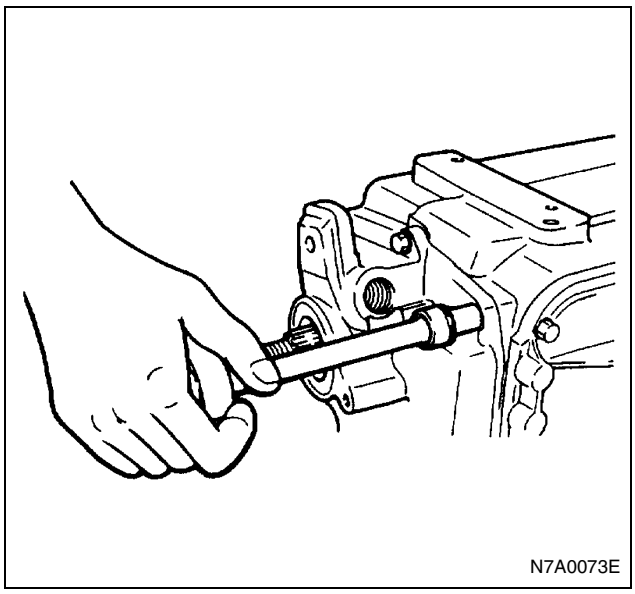


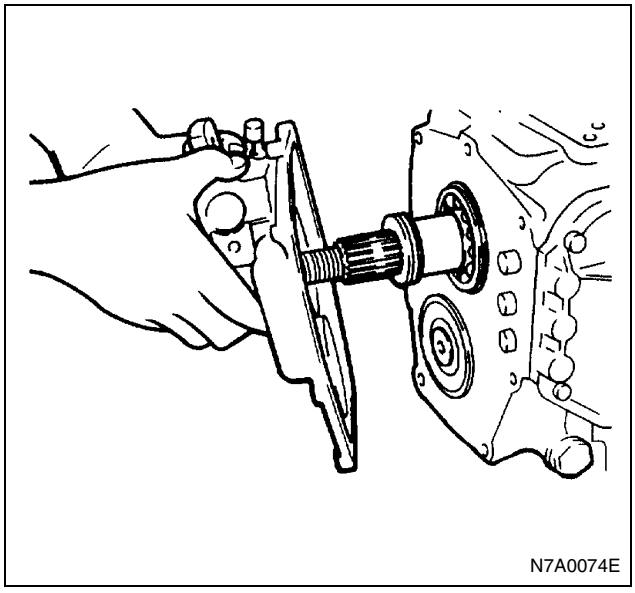
- Remove the driven gear assembly.



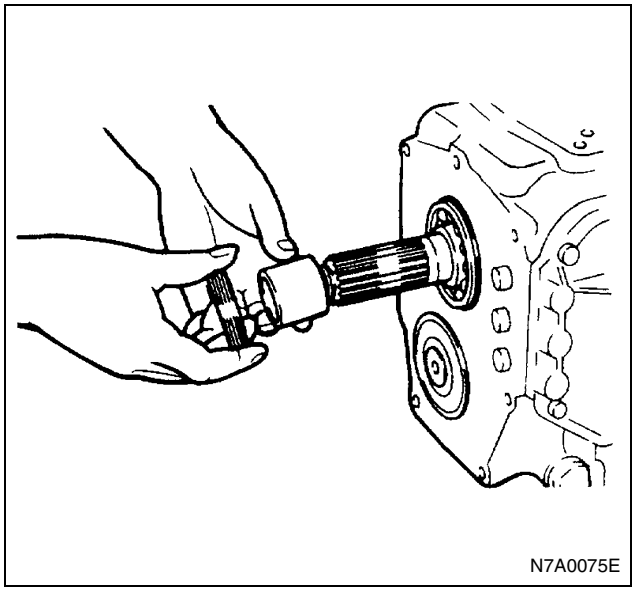
10. Rear Cover
    - Remove 7 fixing bolts. Tap the rear cover with a copper or plastic hammer to remove it. The rear cover is provided with lugs for hammering both side.
    - Remove the oil seal using the screwdriver.

Caution:
Take care not to damage the sealing seat of the rear cover with the screwdriver.



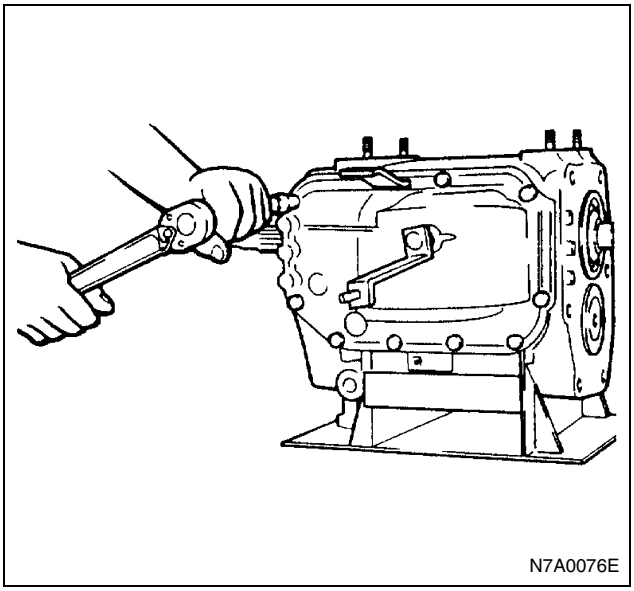


11. Vehicle Speed Sensor Drive Gear
12. Spacer



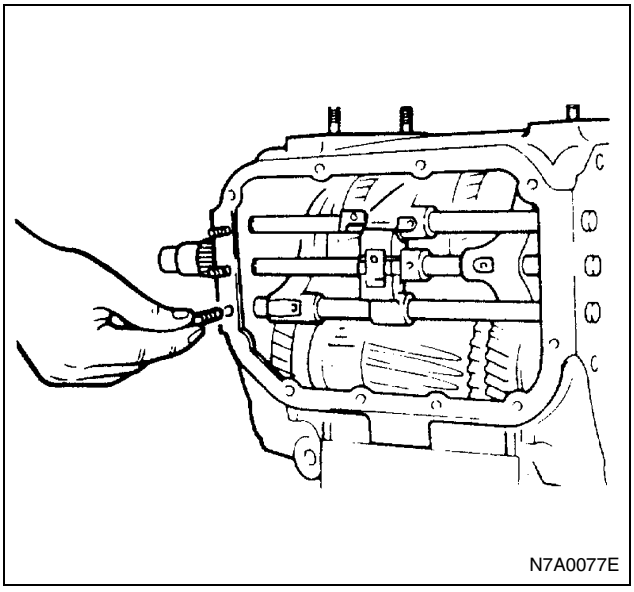
13. Control Box Assembly
    - Remove 10 control box fixing bolts, and then prize open the four corners of the control box with a screwdriver to remove the control box assembly.

Notice:
Be careful not to lose the detent springs and balls of the transmission case.



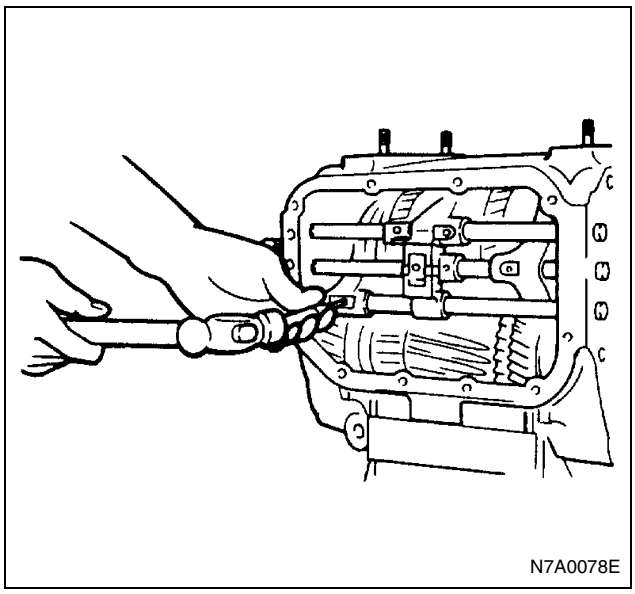
N7A0076E

14. Detent Spring
15. Detent Ball
    - Take out the three detent springs and the three detent balls from the transmission case.



N7A0077E

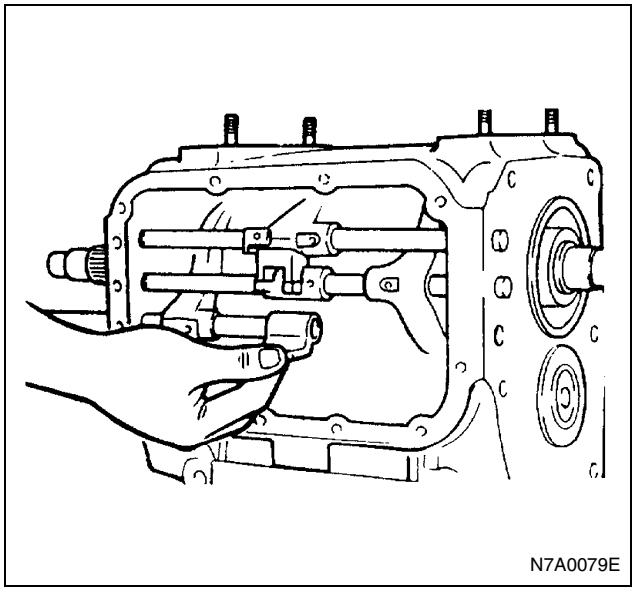
16. Spring Pin
    - Before removal, set all shift rods in neutral position.
      Spring Pin Remover: 9-8529-2201-0



N7A0078E

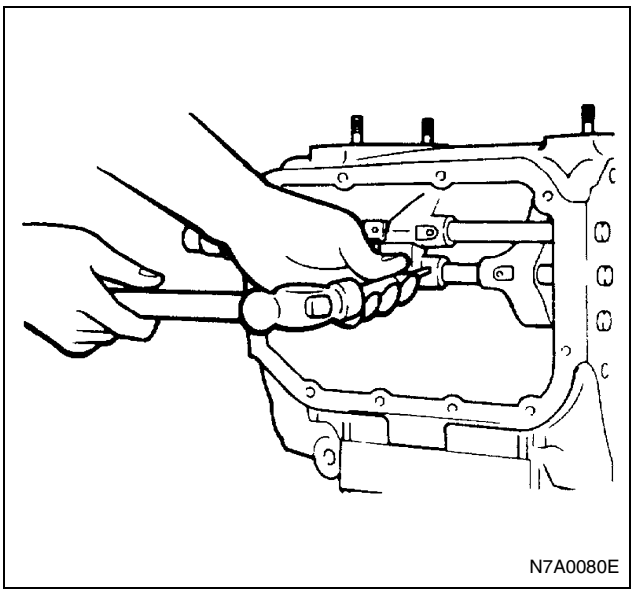
17. 5th/Reverse Shift Block
18. 5th/Reverse Shift Rod
    - Move the 5th/reverse shift rod rearward and remove the shift block and shift rod.

Notice:
When removing the parts, exercise care to prevent the interlock balls and pin fitted to the front part from falling apart.



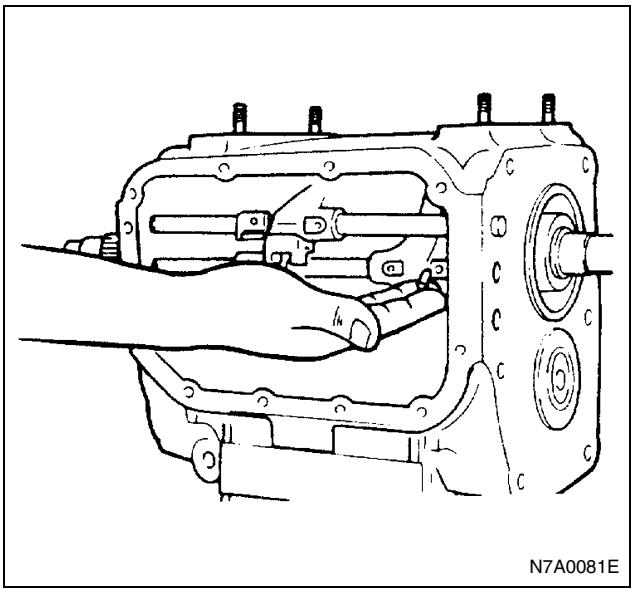
N7A0079E

19. Spring Pin
    - Spring Pin Remover: 9-8529-2201-0



N7A0080E

20. Interlock Pin
    - Move the 3rd/4th shift rod rearward by pushing its front end.
      Then take out the interlock pin from the 3rd/4th shift rod.
21. Interlock Ball
    - Take out the 2 interlock balls from the transmission case.

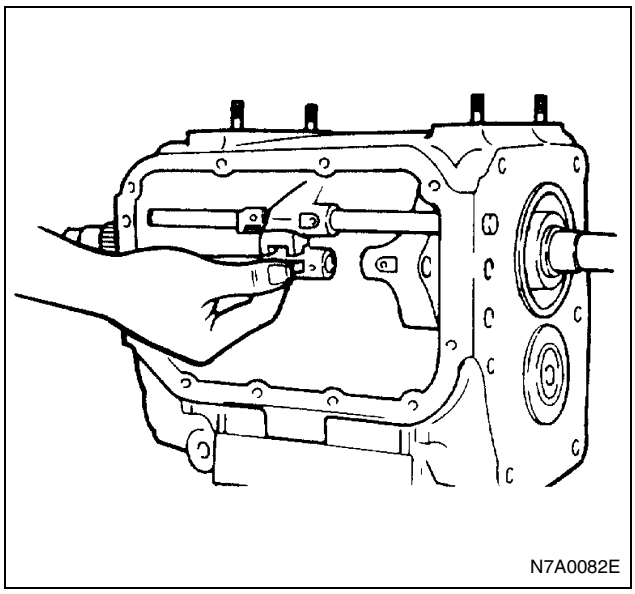


N7A0081E

22. 3rd/4th Shift Block
23. 3rd/4th Shift Rod
    - Move the shift rod rearward and remove the shift block and shift rod.

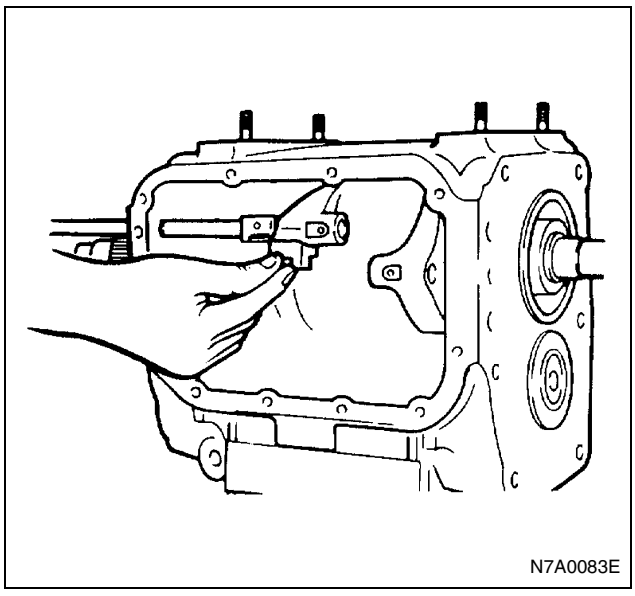
Notice:
When removing the parts, exercise care to prevent the interlock balls fitted to the front part from falling apart.

24. Spring Pin
    Spring Pin Remover: 9-8529-2201-0



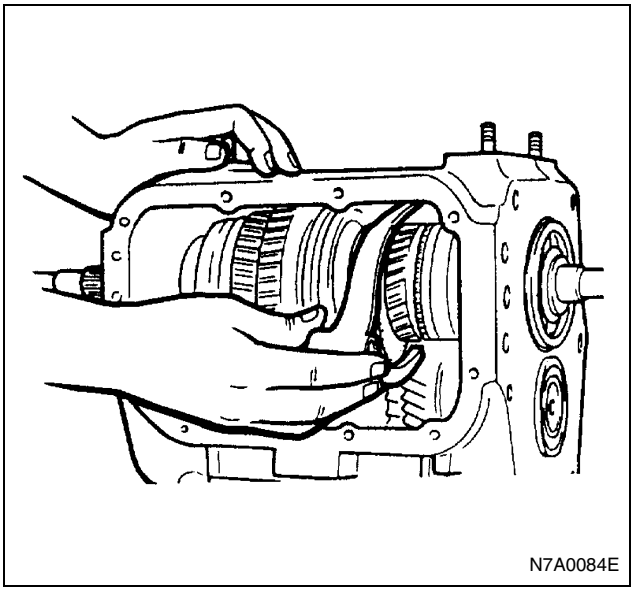
N7A0082E

25. 1st/2nd Shift Block
26. 1st/2nd Shift Rod
    - Move the shift rod rearward and remove the shift block and shift rod.
27. Interlock Ball
    - Take out the 2 interlock balls from the transmission case.



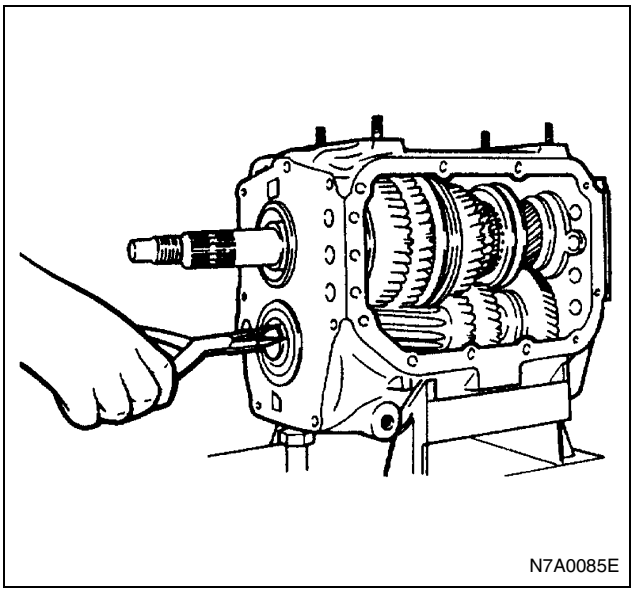
N7A0083E

28. 5th/Reverse Shift Arm
29. 3rd/4th Shift Arm
30. 1st/2nd Shift Arm



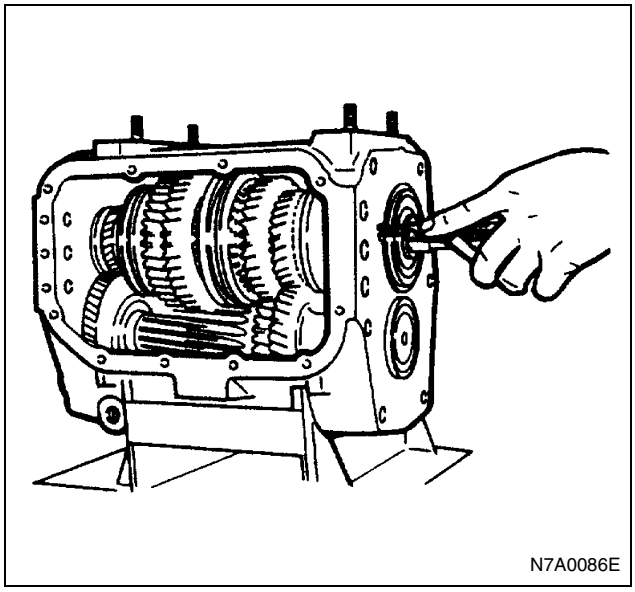
N7A0084E

31. Counter Shaft Rear Bearing
    - Remove the snap ring from the counter shaft rear end.



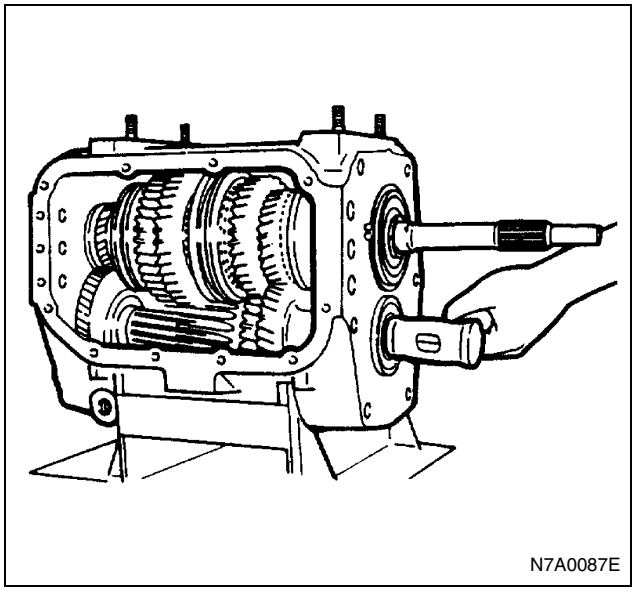
N7A0085E

- Remove the snap ring from the top gear shaft bearing outer circumference.



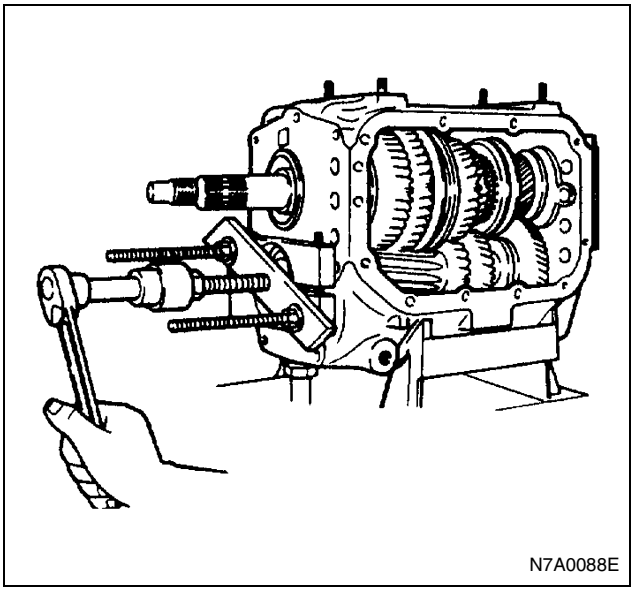
N7A0086E

- Move the counter shaft approximately 3 mm (0.1 in) rearward by tapping on its front end with brass or plastic hammer.
- Remove the snap ring from the rear bearing outer circumference.



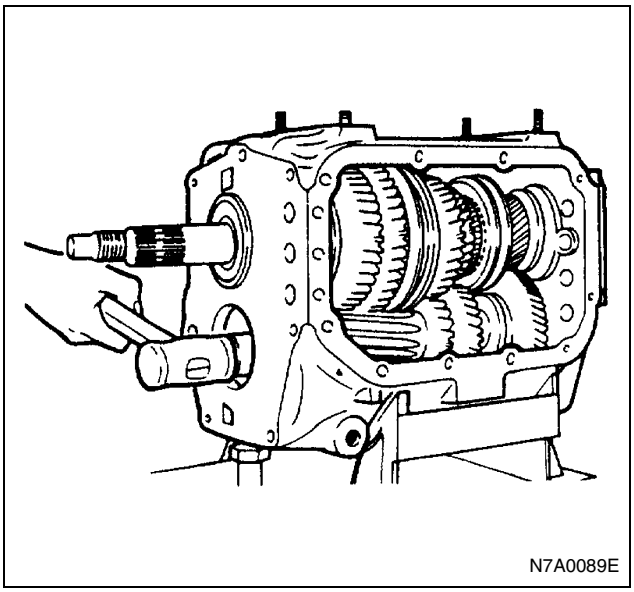
N7A0087E

- Set the bearing remover to the snap ring groove to remove the rear bearing.
  Bearing Remover: 5-8840-2042-0
  Universal Puller: 5-8840-2027-0



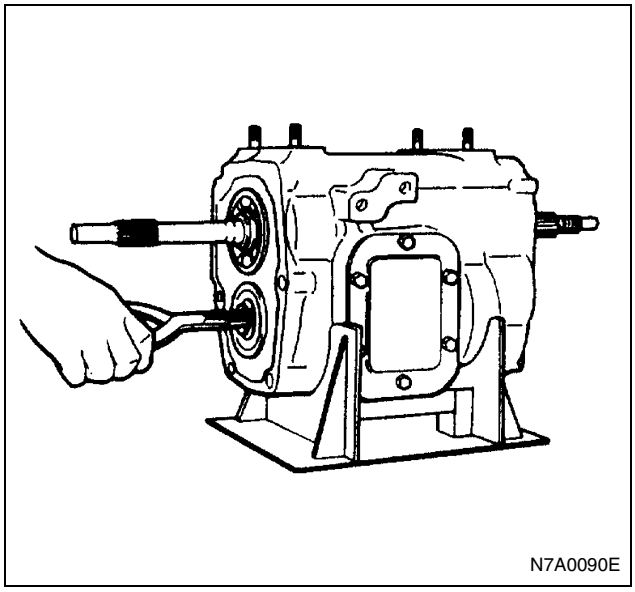
N7A0088E

32. Counter Shaft Front Bearing
    - Move the counter shaft approximately 3 mm (0.1 in) forward by tapping on its rear end with brass or plastic hammer.



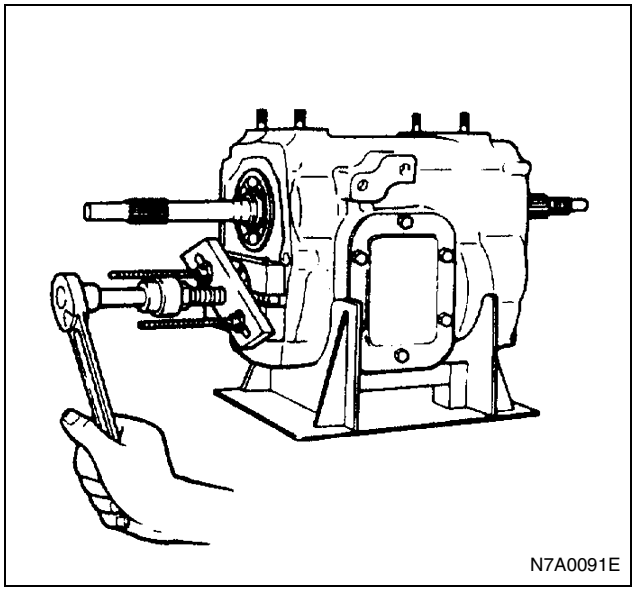
N7A0089E

- Remove the snap ring from the counter shaft front end.



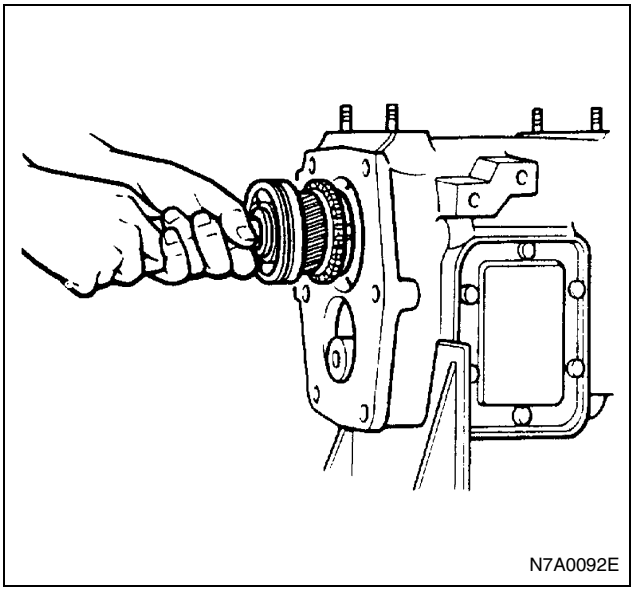
N7A0090E

- Set the bearing remover to the snap ring groove to remove the front bearing.
  Bearing Remover: 5-8840-2078-0
  Universal Puller: 5-8840-2027-0



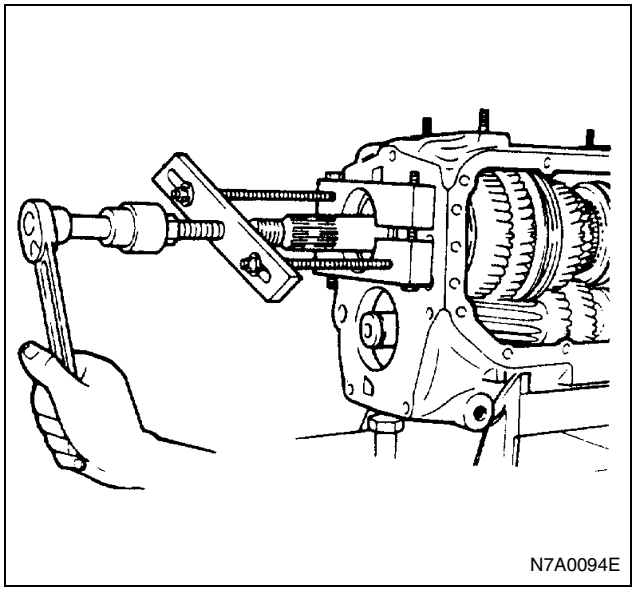
N7A0091E

33. Top Gear Shaft Assembly
    - Remove the top gear shaft bearing outer race toward front end using a hammer and soft metal bar.
    - Remove the block ring and needle bearing.

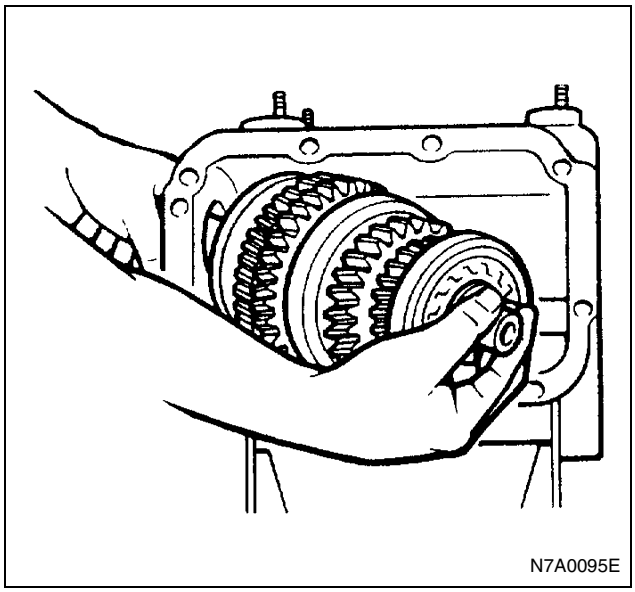


34. Main Shaft Rear Bearing
    - Move the main shaft approximately 3 mm (0.1 in) rearward by tapping on its front end with brass or plastic hammer.

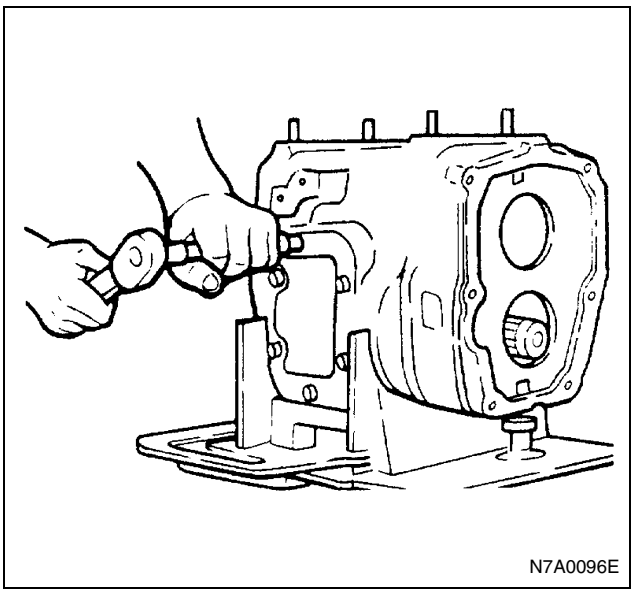
    - Remove the snap ring and set the bearing remover to the snap ring groove to remove the bearing.
      Bearing Remover: 5-8840-2078-0
      Universal Puller: 5-8840-2027-0



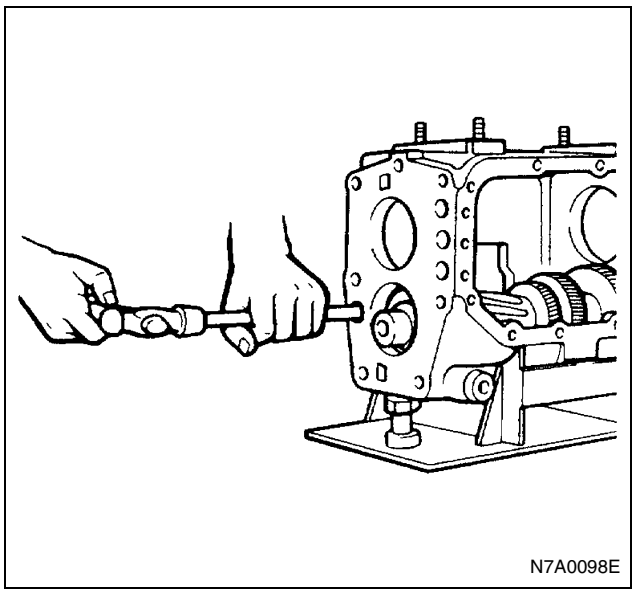
35. Main Shaft Assembly
    - Take main shaft assembly out from the transmission case.



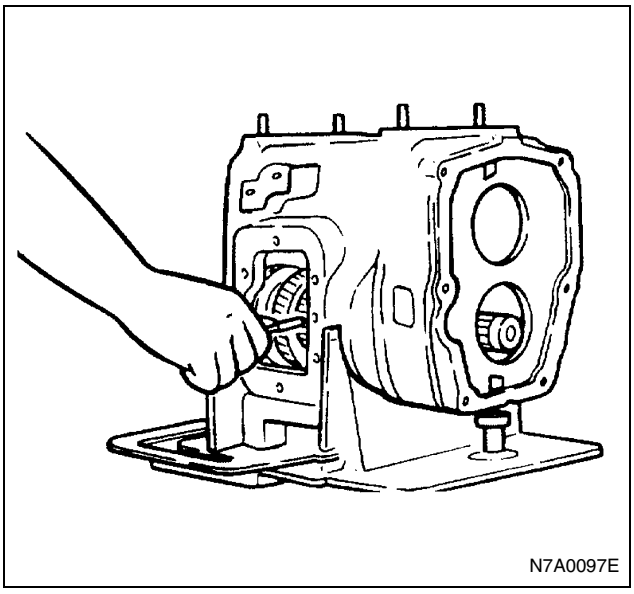
36. Side Cover



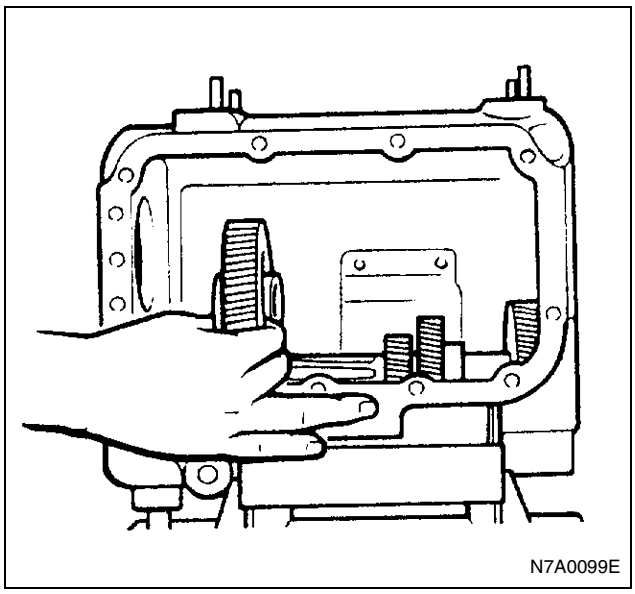
37. Reverse Idle Gear Shaft
    - Take out the pin of reverse idle gear shaft from the transmission case.



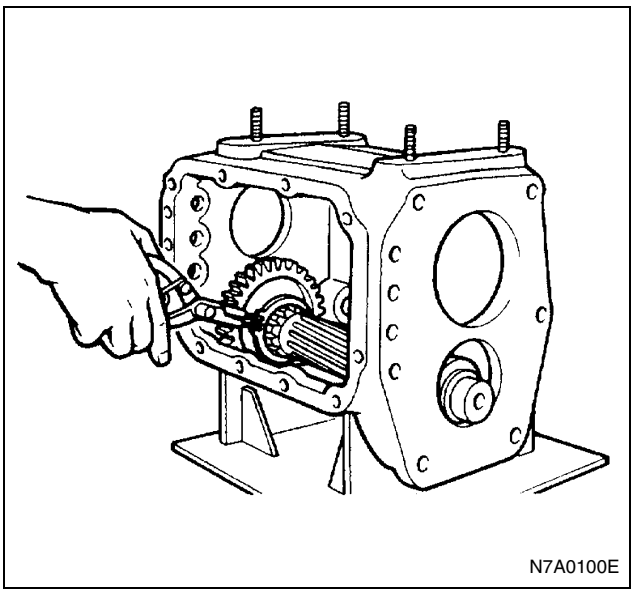
38. Reverse Idle Gear
39. Thrust Washer
40. Conical Spring



- Drive out the reverse idle gear shaft inward the transmission case, with a suitable bar at the end of reverse gear shaft.

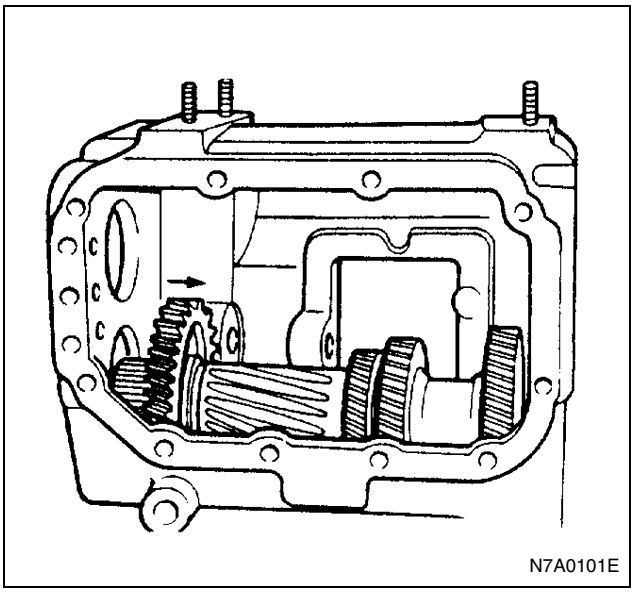


41. Counter Shaft Assembly
    - Remove the snap ring of the counter 5th gear and place aside inward temporarily.



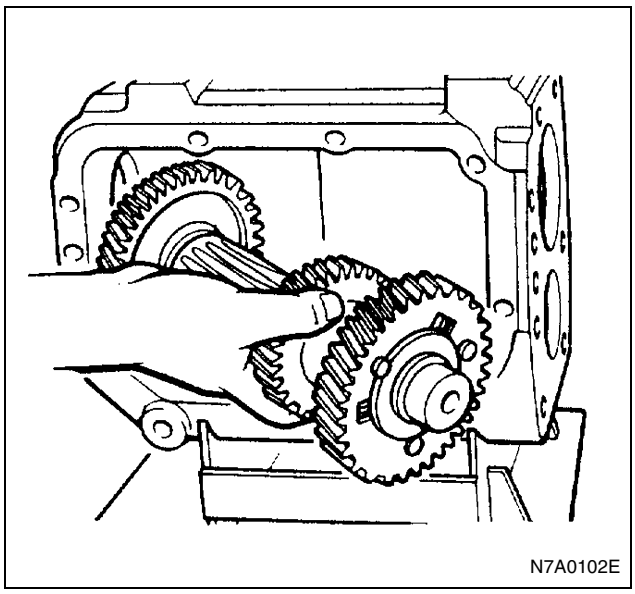
N7A0100E

- Move the counter 5th gear inward and take it out together with the counter shaft assembly.



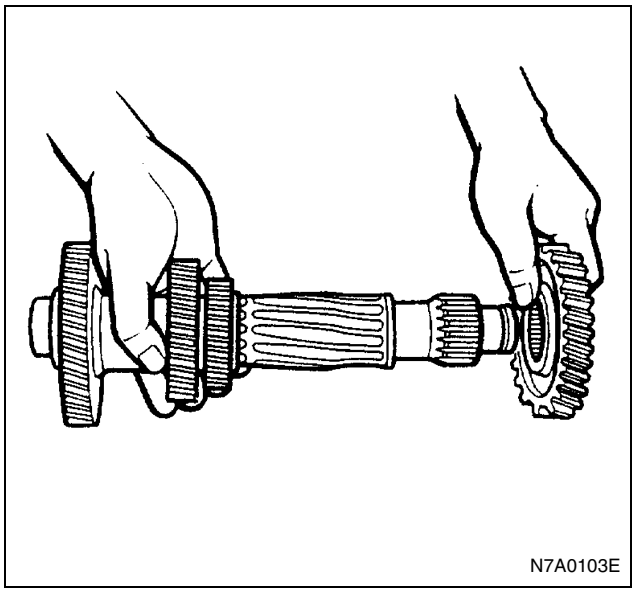
N7A0101E

- Remove the counter shaft assembly from the transmission case.



N7A0102E

- Remove the counter 5th gear and the snap ring from the counter shaft.



N7A0103E

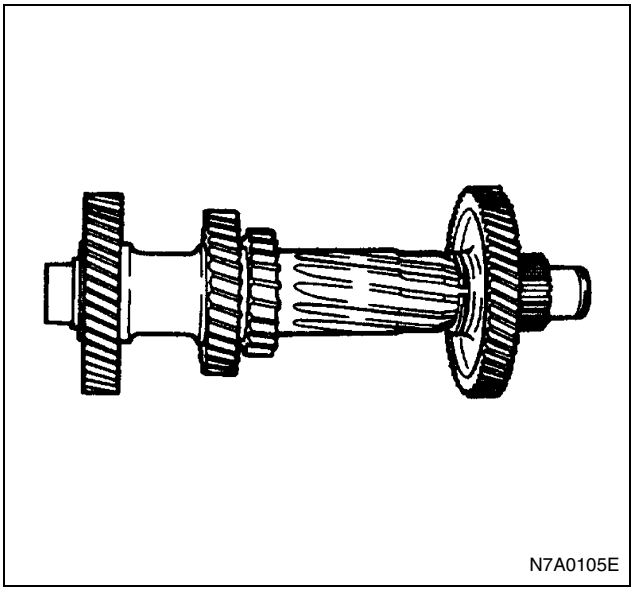
Reassembly

Notice:

Clean each part thoroughly.

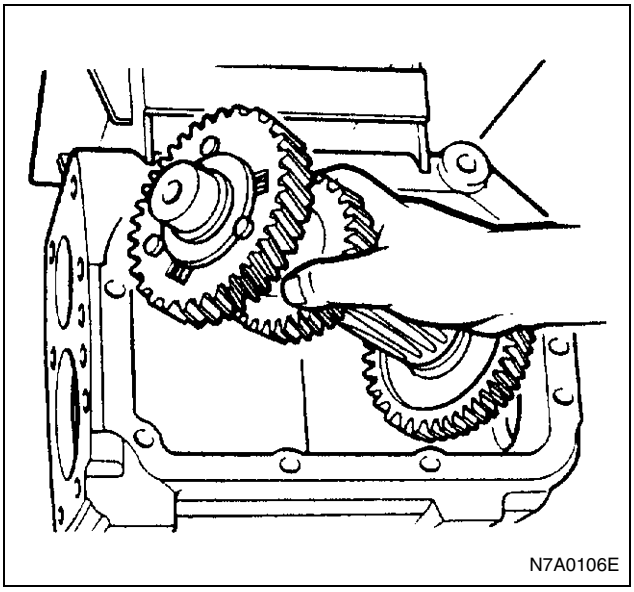
When assembling parts, apply clean engine oil (SAE 5W-30) to their sliding and mating sections.

1. Counter Shaft Assembly
   - Install the snap ring to the counter shaft and place it aside inward temporarily.
   - Then install the counter 5th gear and move it inward.

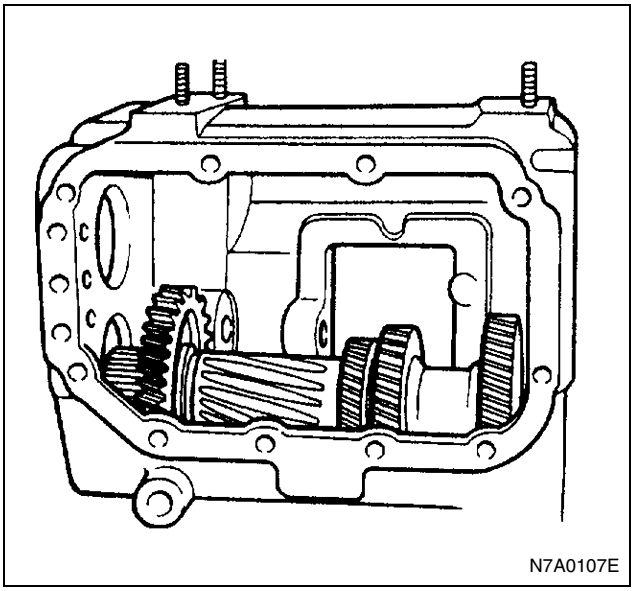


N7A0105E

- Install the counter shaft assembly in the transmission case.

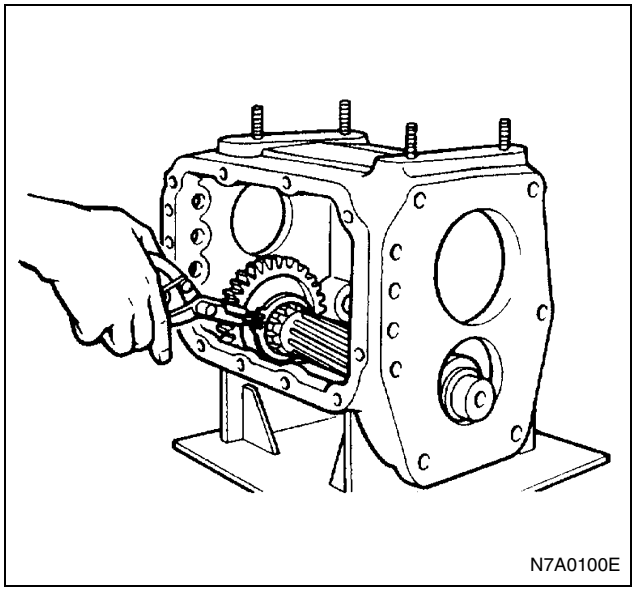


N7A0106E



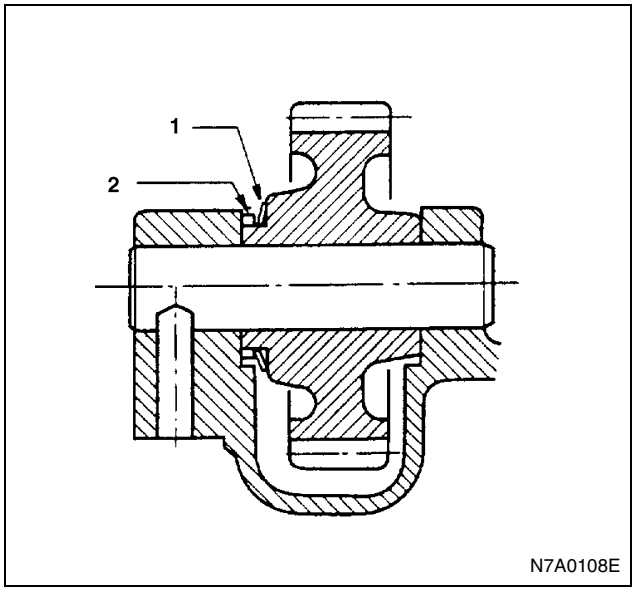
N7A0107E

- Install the snap ring to fix the counter 5th gear.



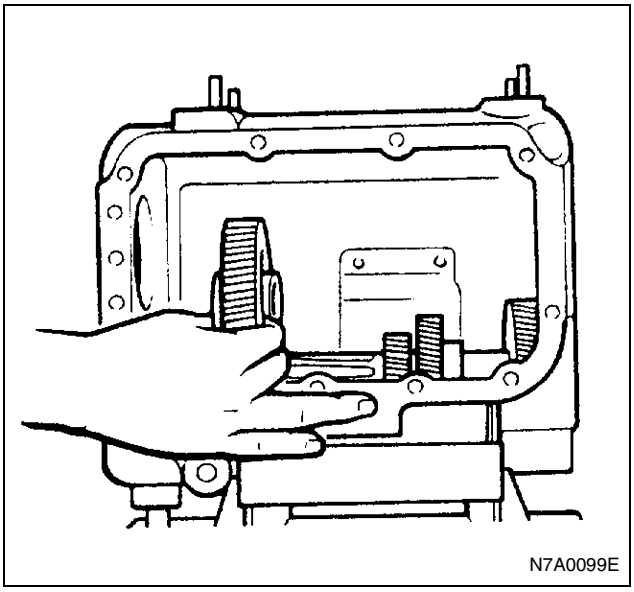
N7A0100E

2. Reverse Idle Gear
3. Conical Spring
4. Thrust Washer
   - Install the conical spring (1) and the thrust washer (2) to the reverse idle gear.
   - The conical spring is to be set up with its concave face to the gear side shown in the illustration.



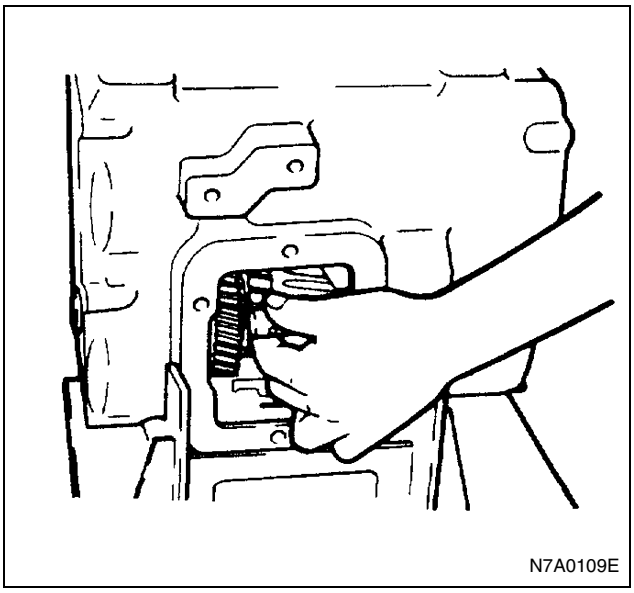
N7A0108E

- The reverse idle gear should be installed with the thrust washer side turned to the forward.



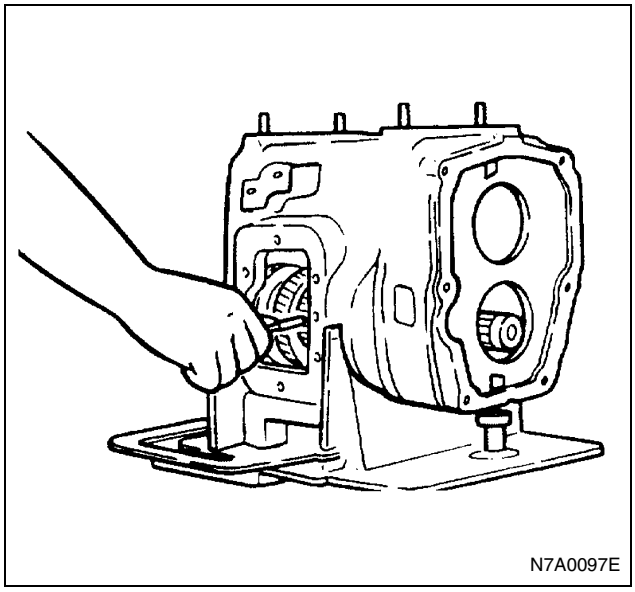
N7A0099E

5. Reverse Idle Gear Shaft
   - Aligning the knock pin hole on the reverse idle gear shaft with its hole of the transmission case.



N7A0109E

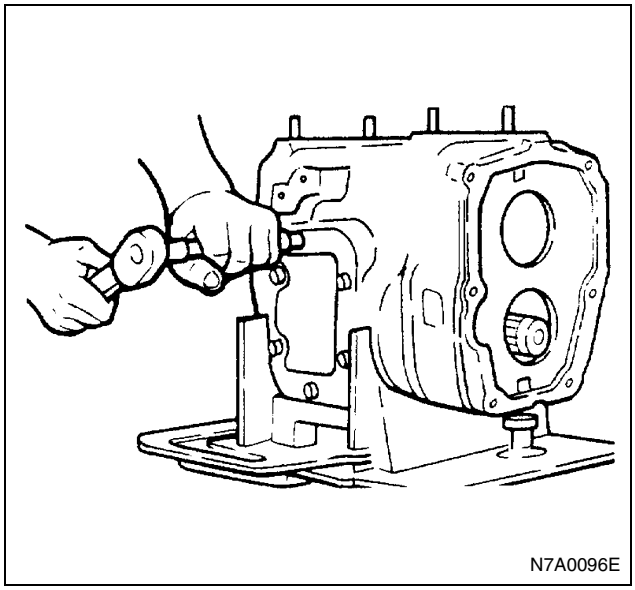
- Then insert the knock pin.



N7A0097E

6. Side Cover
   - Install the side cover with new gasket.

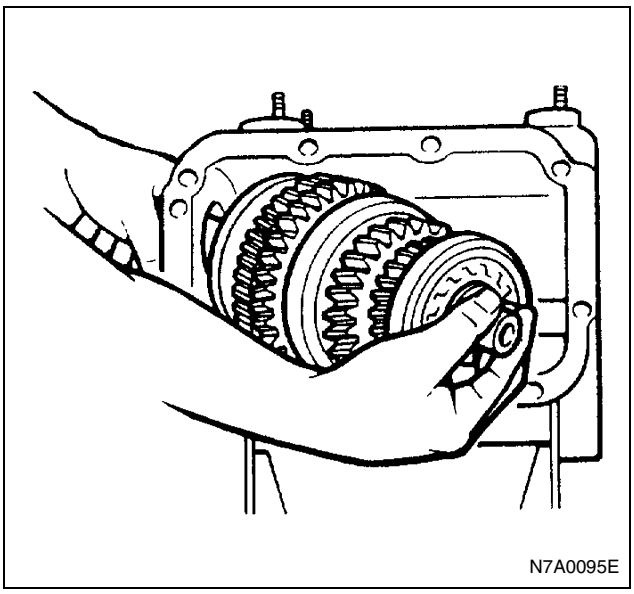
Tighten:
Side cover bolt to 18 N·m (1.8 kg·m / 13 lb·ft)



N7A0096E

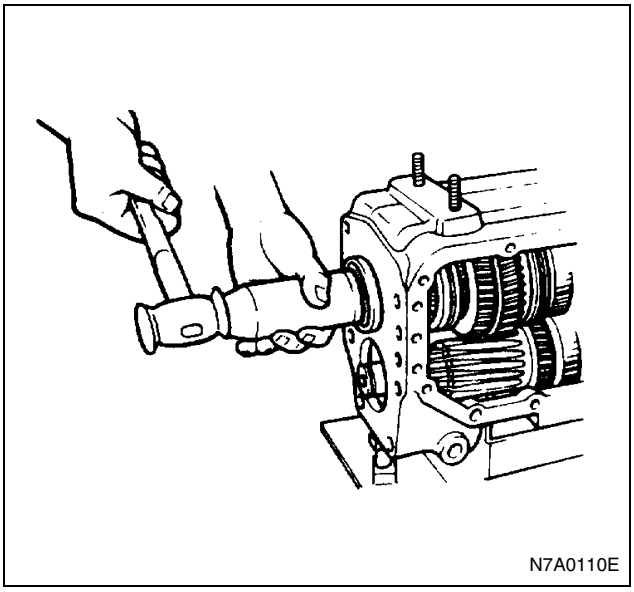
7. Main Shaft Assembly

Notice:
Take care that the thrust washer of the reverse gear does not drop off.



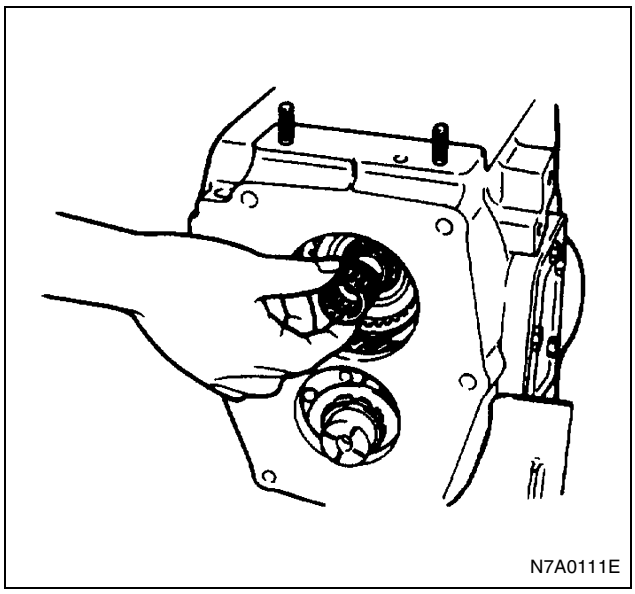
N7A0095E

8. Main Shaft Rear Bearing
   - Install the snap ring to the rear bearing outer circumference.
   - Install the rear bearing using the bearing installer.
     Bearing Installer: 9-8522-1615-0
   - Check to be certain the block ring on the 5th gear side fitted properly to the inserts.

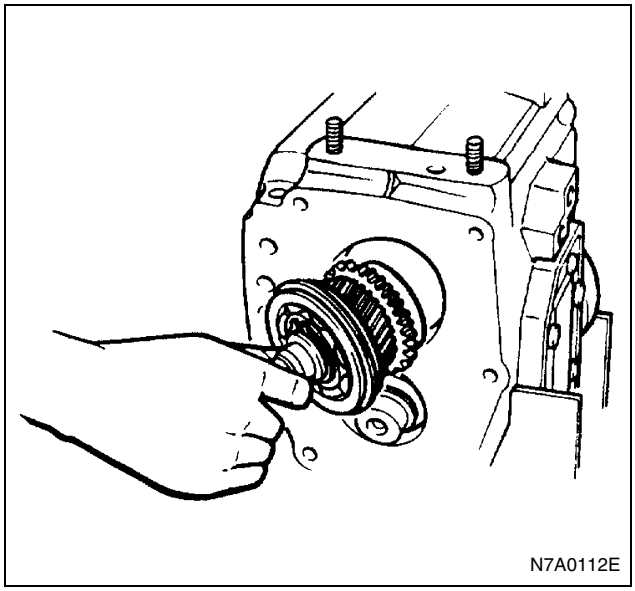


N7A0110E

9. Top Gear Shaft Assembly
   - Install the needle bearing to the top gear shaft.
   - Install the top gear shaft assembly into the transmission case.
   - Check to be certain the block ring on the 4th gear side fitted properly to the inserts.
   - Press in the bearing until the snap ring of the bearing outer circumference comes into contact with the transmission case.

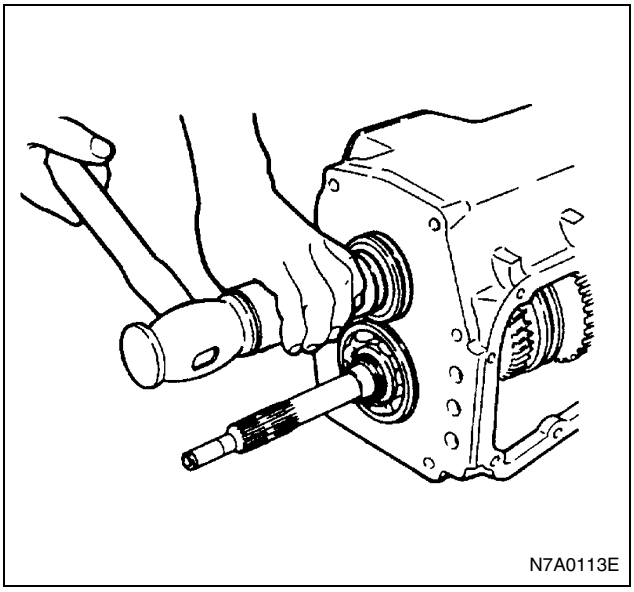


N7A0111E



N7A0112E

10. Counter Shaft Front Bearing
    - Use the bearing installer to install the front bearing.
      Bearing installer: 5-8840-2244-0
    - Install the counter shaft snap ring.

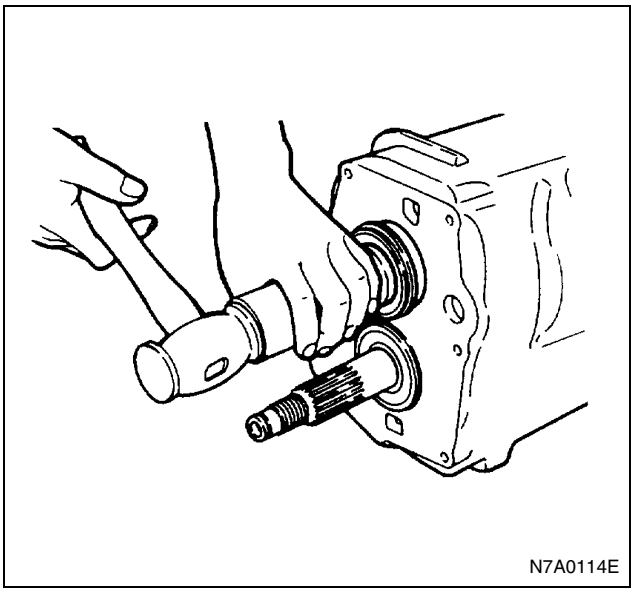


N7A0113E

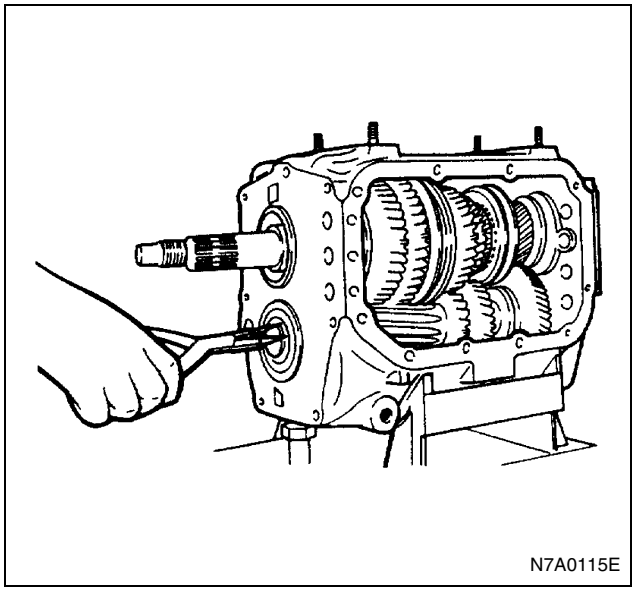
11. Counter Shaft Rear Bearing
    - Install the snap ring to the rear bearing outer circumference.
    - Install the rear bearing using bearing installer and install the snap ring.
      Bearing Installer: 5-8840-2244-0

Notice:
With each gear set to the neutral position, check to see if the shaft and each gear rotate smoothly.

Check to see if each block ring is free. When it gets caught and stuck in the taper cone, use a screwdriver to make it free.

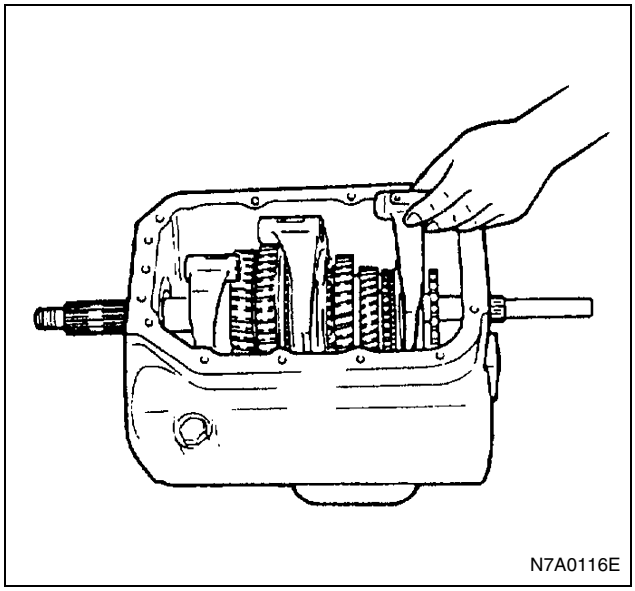


N7A0114E



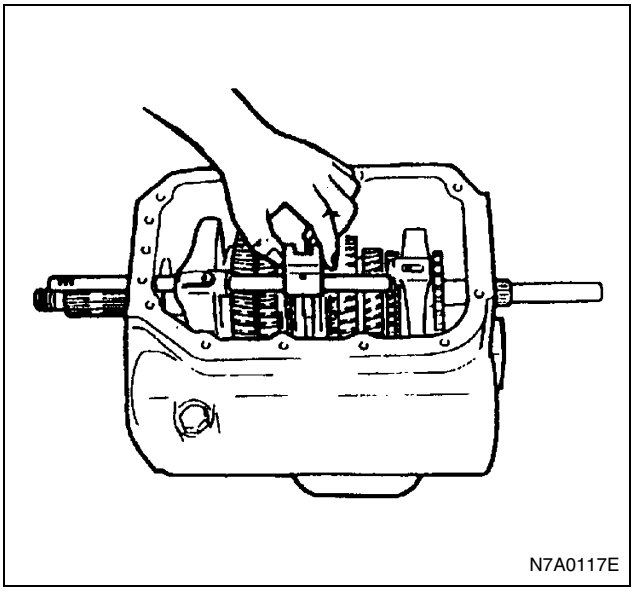
N7A0115E

12. 1st/2nd Shift Arm
    - With the longer boss side set to the front.
13. 3rd/4th Shift Arm
    - With the longer boss side set to the rear.
14. 5th/Reverse Shift arm
    - With the longer boss side set to the front.



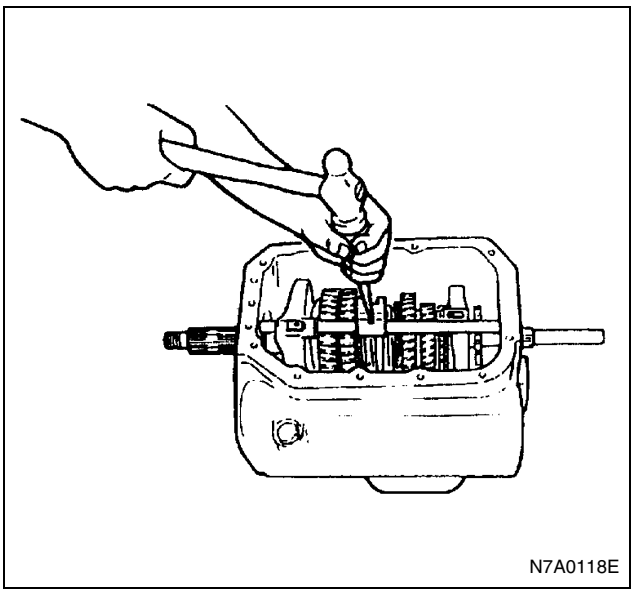
N7A0116E

15. 5th/Reverse Shift Rod
16. 5th/Reverse Shift Block
    - Turning the detent groove to the outside (detent ball side), insert the shift rod from the rear side with the detent groove side at the rear.



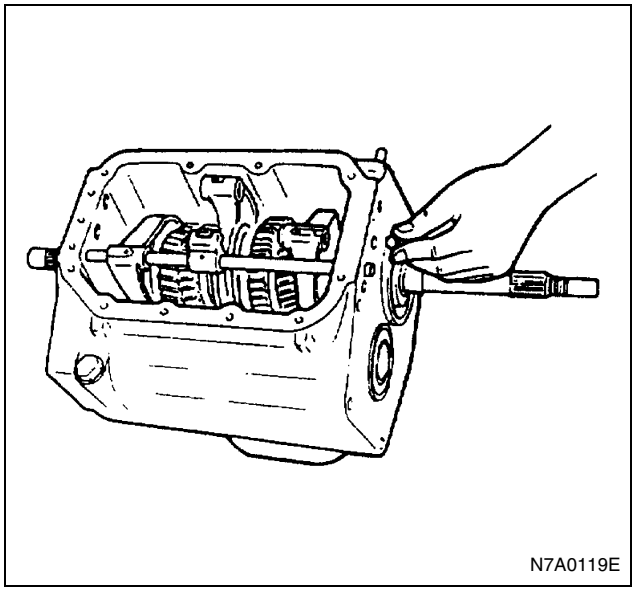
N7A0117E

17. Spring Pin
    - Setting the hole of the shift arm and shift block to that of the shift rod, fix them with a new spring pin.
    - Install spring pin properly with the slit in line with the shaft center line.



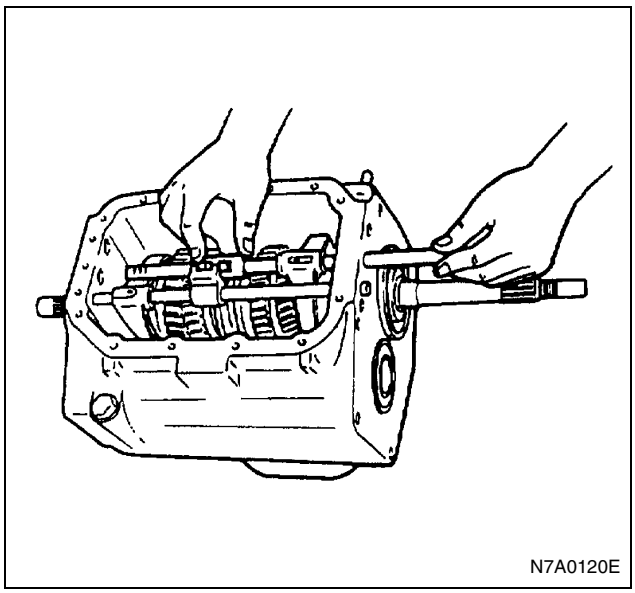
N7A0118E

18. Interlock Ball
    - Apply small amount of multi-purpose grease to the interlock balls.
    - Install the 2 interlock balls in position between the 5th/reverse shift rod and 3rd/4th shift rod.



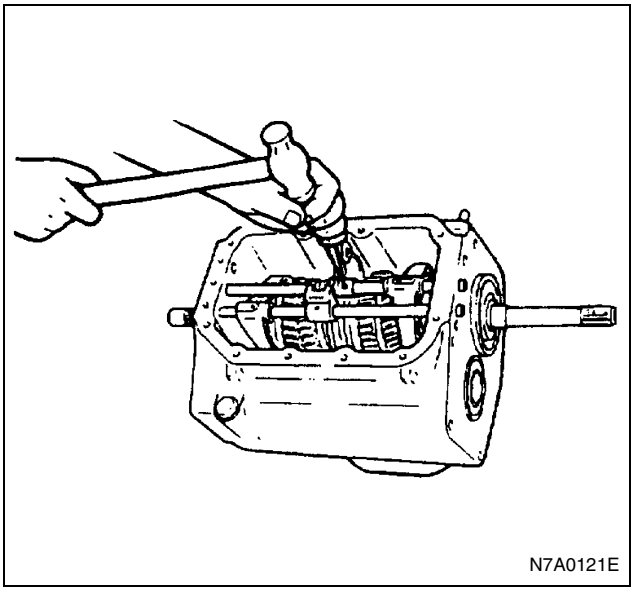
N7A0119E

19. Interlock Pin
20. 3rd/4th Shift Rod
21. 3rd/4th Shift Block
    - Apply small amount of multi-purpose grease to the interlock pin.
    - Insert an interlock pin into the 3rd/4th shift rod.
    - Turning the detent groove to the outside (detent ball side), insert the shift rod from the front side with the detent groove side at the front.



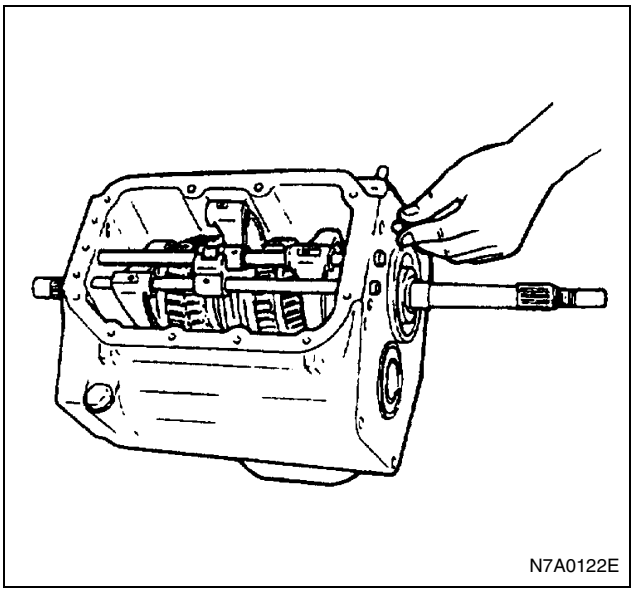
N7A0120E

22. Spring Pin
    - Setting the hole of the shift arm and shift block to that of the shift rod, fix them with a new spring pin.
    - Install spring pin properly with the slit in line with the shaft center line.



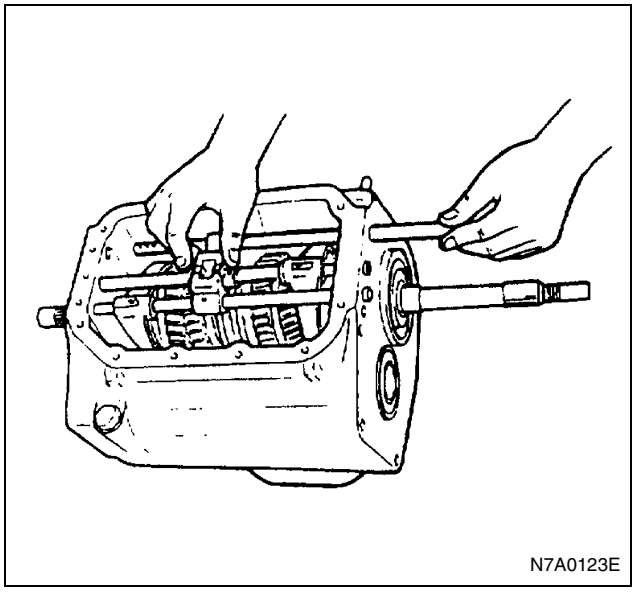
N7A0121E

23. Interlock Ball
    - Apply small amount of multi-purpose grease to the interlock balls.
    - Install the 2 interlock balls in position between the 3rd/4th shift rod and 1st/2nd shift rod.



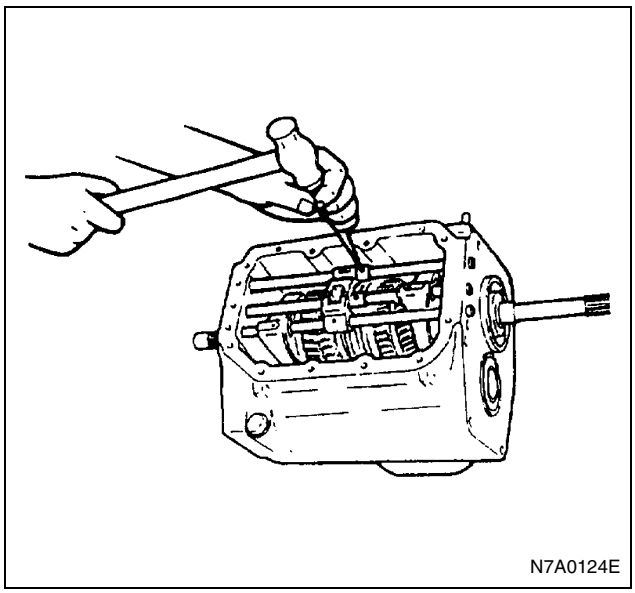
N7A0122E

24. 1st/2nd Shift Rod
25. 1st/2nd Shift Block
    - Before reassembly, set the 5th/reverse and 3rd/4th shift rods already reassembled in neutral position.
    - Turning the detent groove to the outside (detent ball side), insert the shift rod from the front side with the detent groove side at the front.



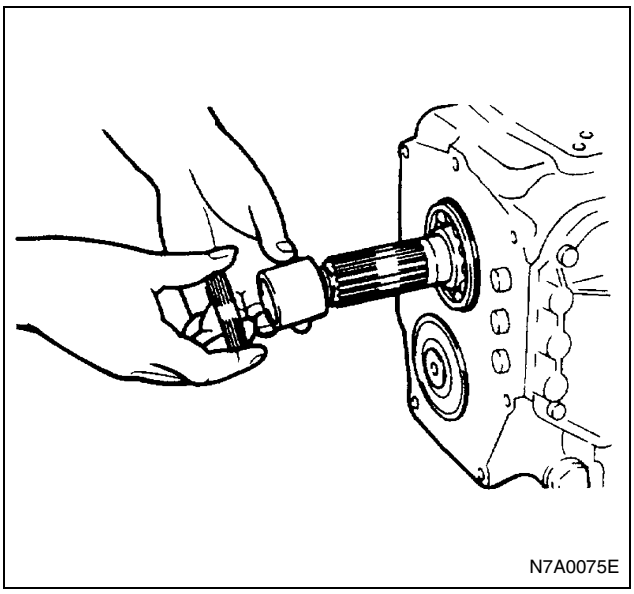
N7A0123E

26. Spring Pin
    - Setting the hole of the shift arm and shift block to that of the shift rod, fix them with a new spring pin.
    - Install spring pin properly with the slit in line with the shaft center line.



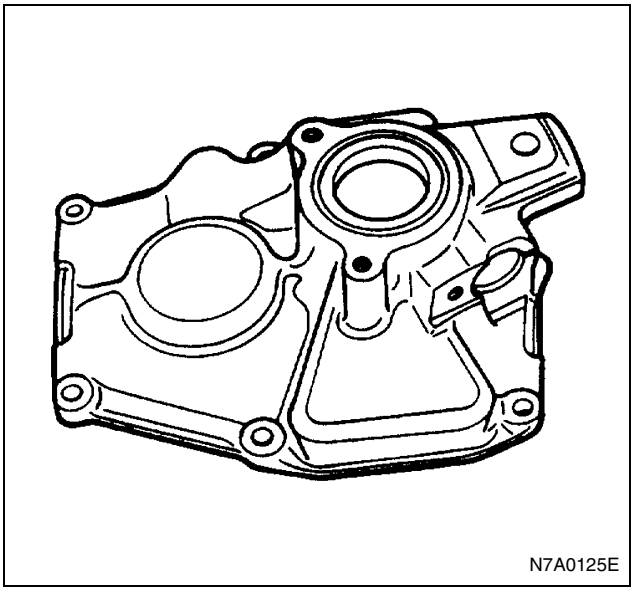
N7A0124E

27. Spacer
28. Vehicle Speed Sensor Drive Gear



N7A0075E

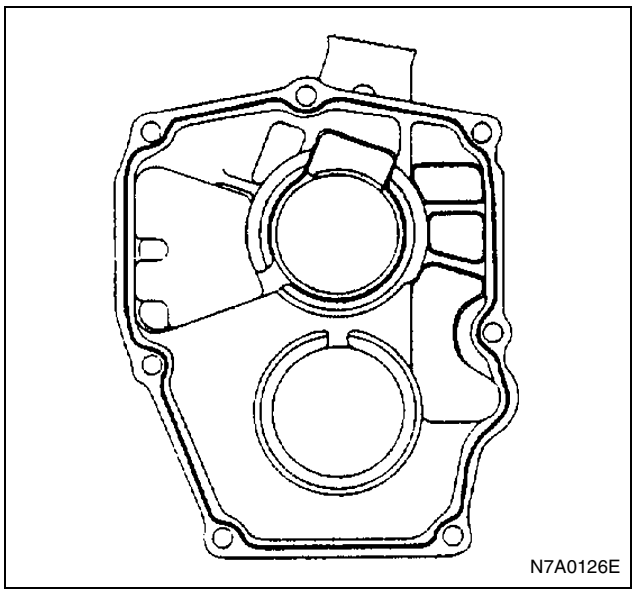
29. Rear Cover
    - Apply engine oil to the new oil seal outer circumference and apply multi-purpose grease to the oil seal lip.
    - Use the oil seal installer to install oil seal to the rear cover.
      Oil Seal Installer: 5-8840-2242-0



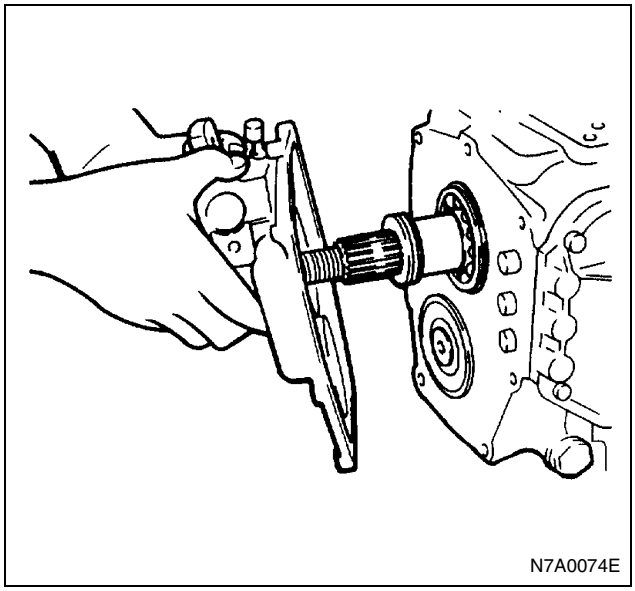
N7A0125E

- Remove water and oil on the mating face before applying the liquid gasket.
- Apply a ϕ2 mm (0.1 in) bead of the liquid gasket (Three Bond 1215 or equivalent) to the rear cover surface shown in the illustration.

Caution:
Install the rear cover on the transmission case within 30 minutes after liquid gasket application.

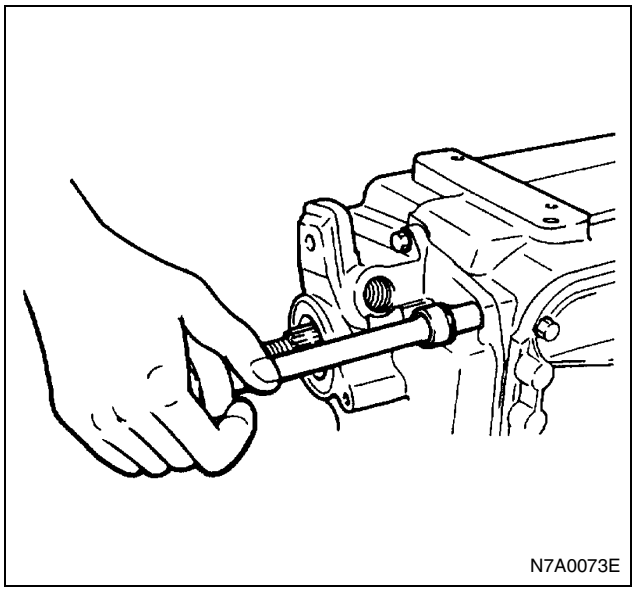


N7A0126E



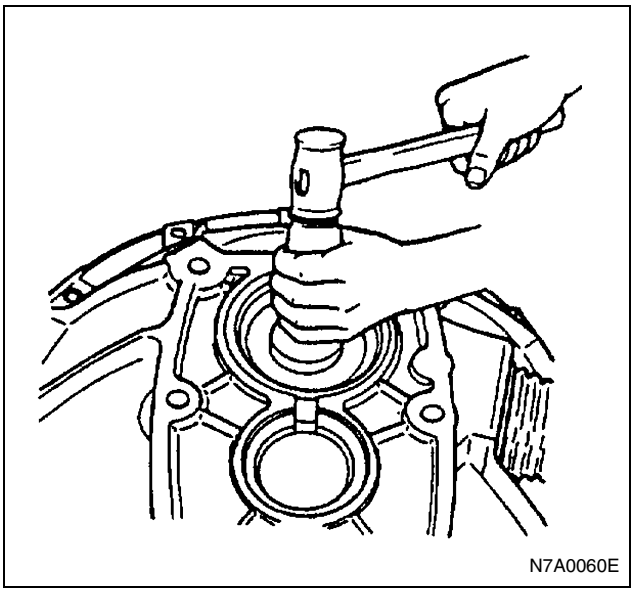
N7A0074E

Tighten:
Rear cover bolts to 20 N·m (2.0 kg·m / 14 lb·ft)



N7A0073E

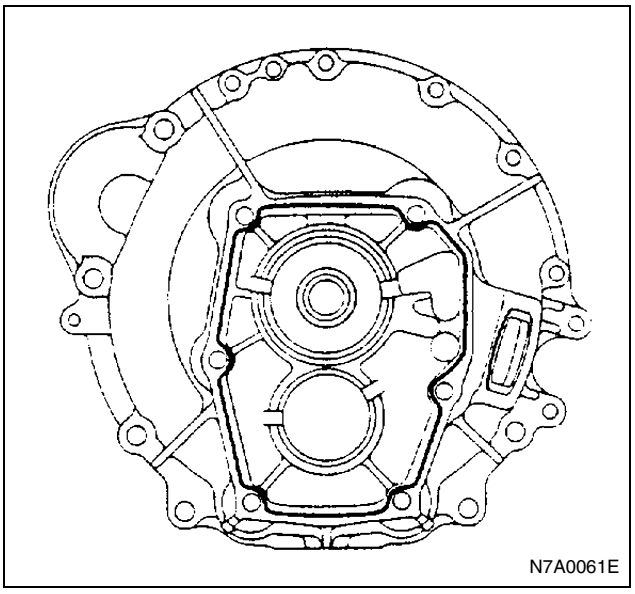
30. Clutch Housing
    - Apply engine oil to the new oil seal outer circumference and apply multi-purpose grease to the oil seal lip.
    - Use the oil seal installer to install the oil seal to the clutch housing.
      Oil Seal Installer: 5-8840-2064-0



N7A0060E

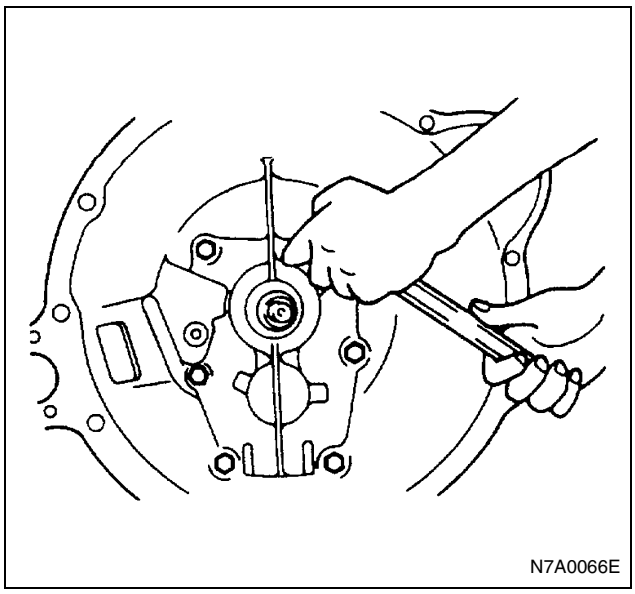
- Remove water and oil on the mating face before applying the liquid gasket.
- Apply a ϕ2 mm (0.1 in) bead of the liquid gasket (Three Bond 1215 or equivalent) to the clutch housing surface shown in the illustration.

Caution:
Install the clutch housing on the transmission case within 30 minutes after liquid gasket application.



N7A0061E

Tighten:
Clutch housing to transmission case bolts to 81 N·m (8.3 kg·m / 60 lb·ft)



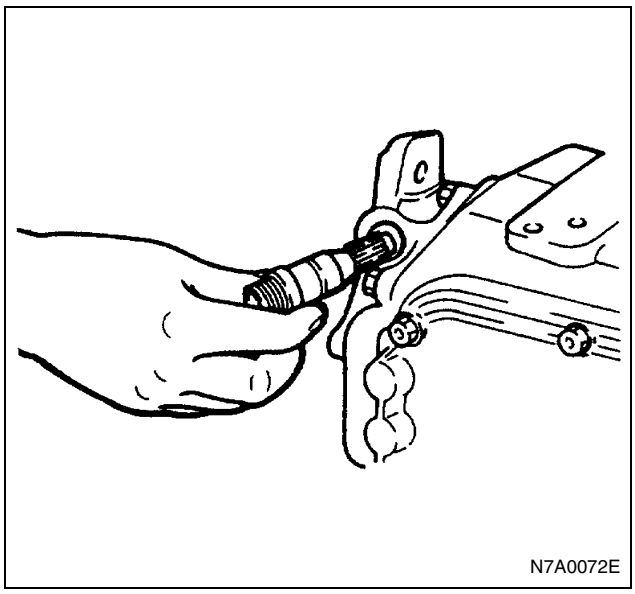
N7A0066E

31. Vehicle Speed Sensor Driven Gear Assembly

Tighten:
Driven gear lock plate bolt to 15 N·m (1.5 kg·m / 11 lb·ft)

- Install the vehicle speed sensor with key rod.

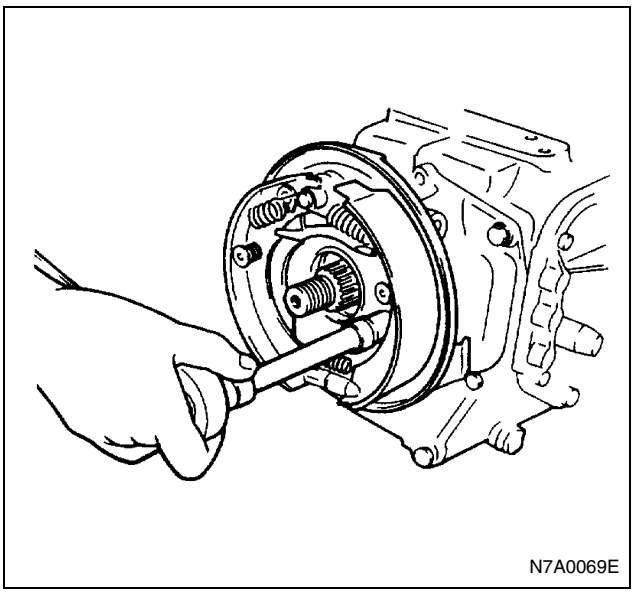
Tighten:
Vehicle speed sensor to 25 N·m (2.5 kg·m / 18 lb·ft)



N7A0072E

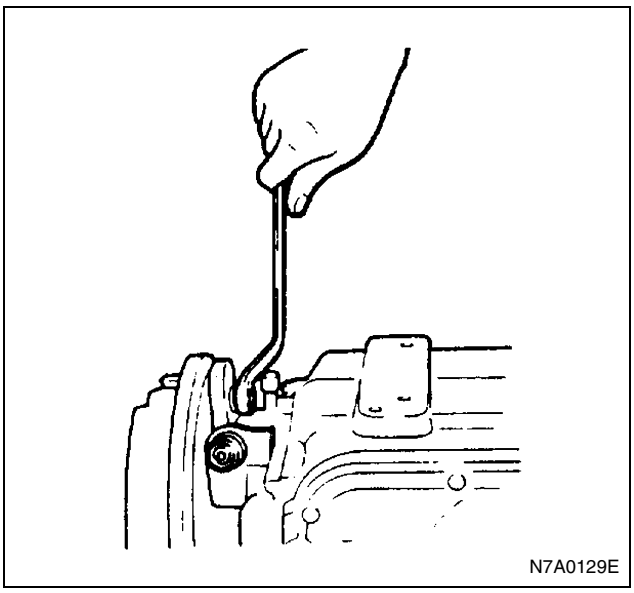
32. Parking Brake Assembly

Tighten:
Parking brake bolts M8 to 25 N·m (2.6 kg·m / 19 lb·ft)



N7A0069E

Tighten:
Parking brake nut M12 to 113 N·m (11.5 kg·m / 83 lb·ft)



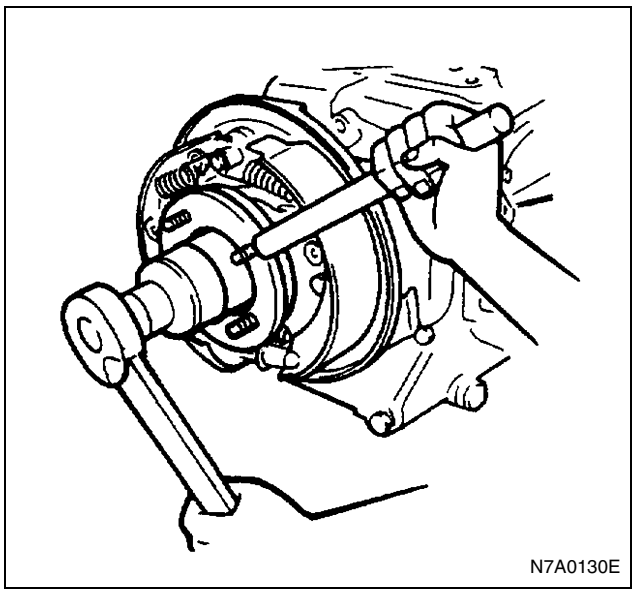
N7A0129E

33. Coupling Driver
34. Lock Nut
    - Install the O-ring and conical washer. The conical washer is to be set up with its identification groove to the nut side.
    - Apply the engine oil to the setting face of the new lock nut and tighten it up to the specified torque.

Caution:
Do not reuse the lock nut.

Handle: 5-8840-2043-0

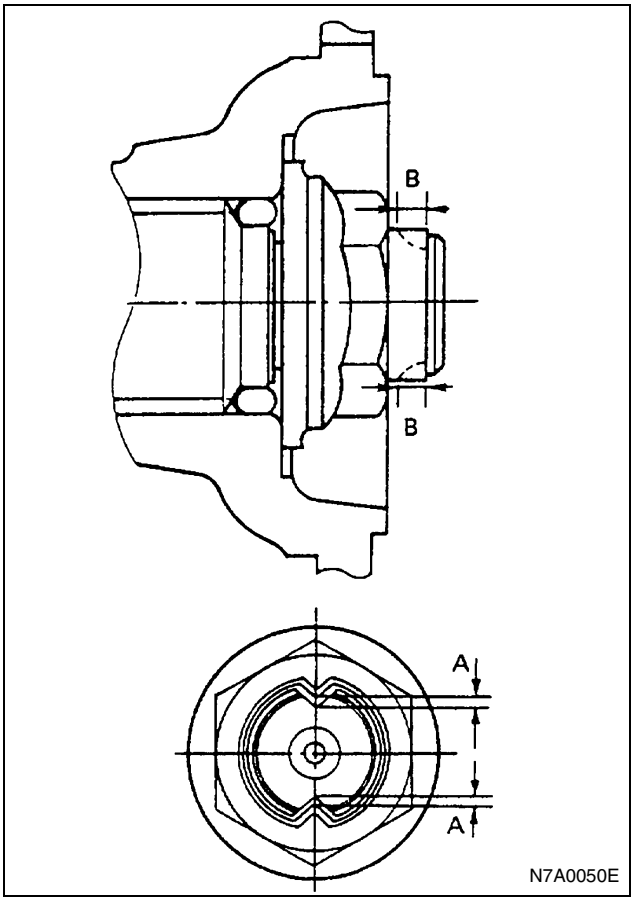
Tighten:
Lock nut to 226 N·m (23.0 kg·m / 166 lb·ft)



N7A0130E

- Align the lock nut with the V-shaped groove at the tip of the main shaft, and caulk the nut lip portion by using a chisel. (Round edge approximately 1 mm (0.04 in) × 60°).
- As shown in the illustration, be sure to caulk the nut lip so that the clearance between the V-shaped groove portion at the tip of the main shaft and the caulked up lip (A) is less than 1.5 mm (0.06 in), and the caulking length (B) is 5 mm (0.2 in) or more.

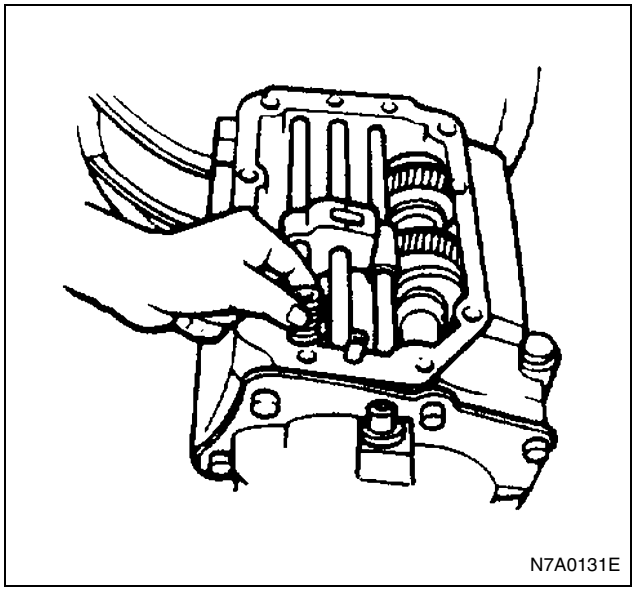
Caution:
Be sure to confirm that there is no crack at the caulked portion of the lock nut after caulking.



35. Parking Brake Drum
    - Adjust the parking brake after installation.
    1) Rotate the brake drum to align the adjust hole with the adjuster.
    2) Move the camshaft lever from side to side several times to center the brake shoes.
    3) Insert a screwdriver into the hole and rotate the adjuster by pushing it upward until the shoes drag on the drum.
    4) Back off the adjuster 30 notches.
    - Install the adjust hole cover.

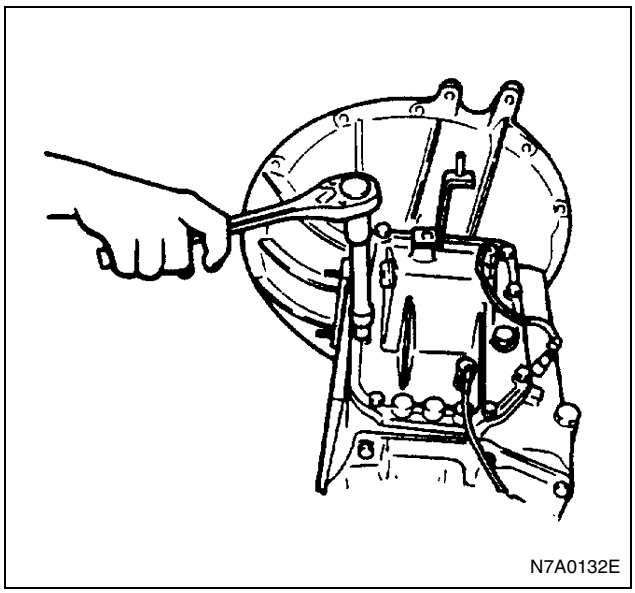
Tighten:
Adjust hole cover bolt to 8 N·m (0.8 kg·m / 69 lb·in)

36. Detent Ball
37. Detent Spring
38. Control Box Assembly
    - Apply small amount of multi-purpose grease to the detent balls.
    - Install the 3 detent balls and the 3 detent springs to the transmission case.
    - Install the control box assembly with new gasket.



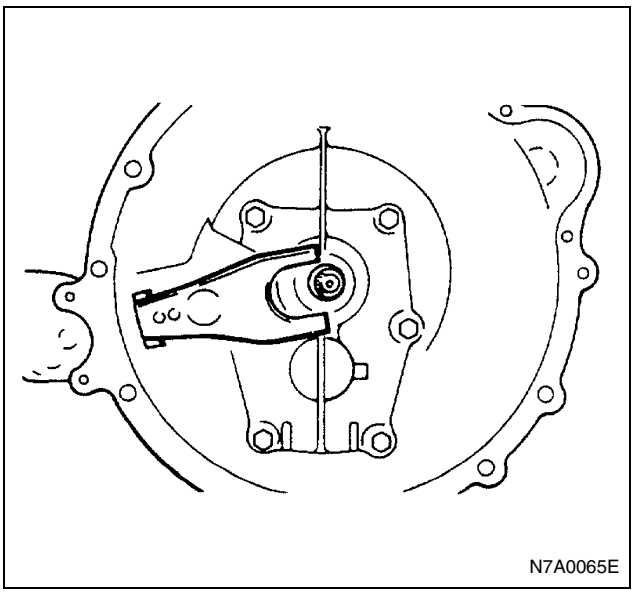
Tighten:
Control box to transmission case bolts to 20 N·m (2.0 kg·m / 14 lb·ft)

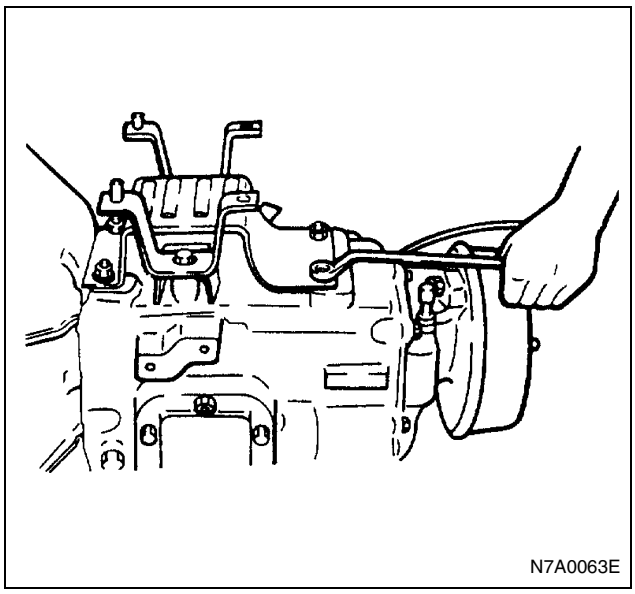
Notice:
Operating the shift lever and the select lever, make sure that they shift to each position smoothly.



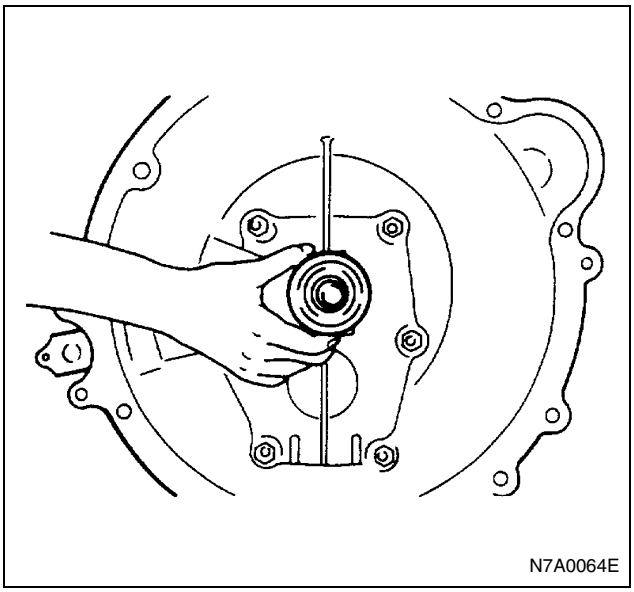
39. Shift Fork and Support Bolt

Tighten:
Support bolt to 52 N·m (5.3 kg·m / 38 lb·ft)





40. Release Bearing Assembly



41. Mission Mounting Assembly

Tighten:
Mission mounting bolt to 69 N·m (7.0 kg·m / 51 lb·ft)

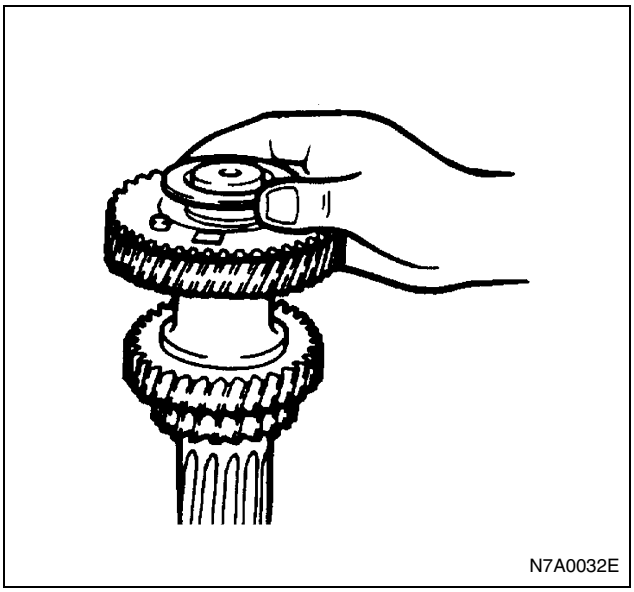
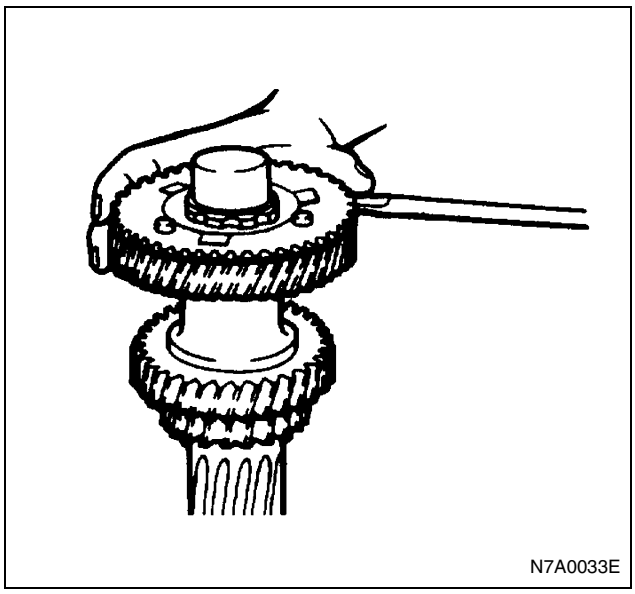
26. Conical Washer



N7A0032E

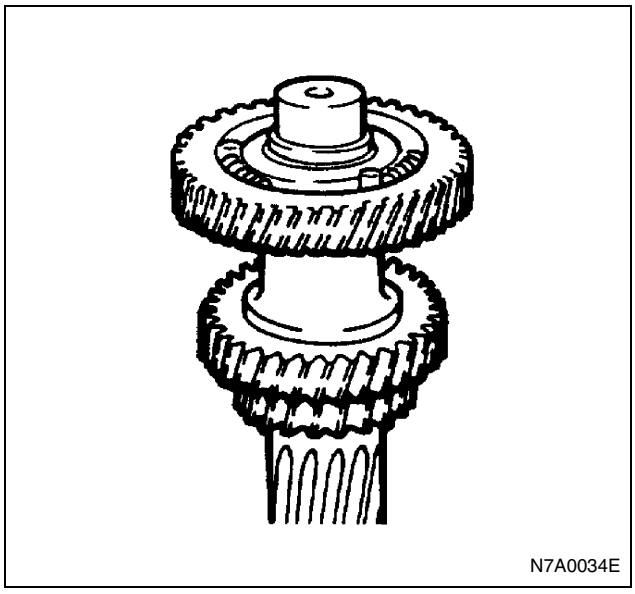
27. Anti-lash Plate
    - Insert a flat-end screwdriver between the anti-lash plate and the counter drive gear, and remove the anti-lash plate.

WARNING:
THE ANTI-LASH PLATE SHOULD BE REMOVED VERY SLOWLY WITH SPECIAL CARE OTHERWISE SOME SPRINGS INSTALLED INSIDE THE PLATE COULD POP OUT AND CAUSE INJURY.



N7A0033E

28. Spring
    - Remove the 3 springs that are assembled to the counter drive gear side.



N7A0034E

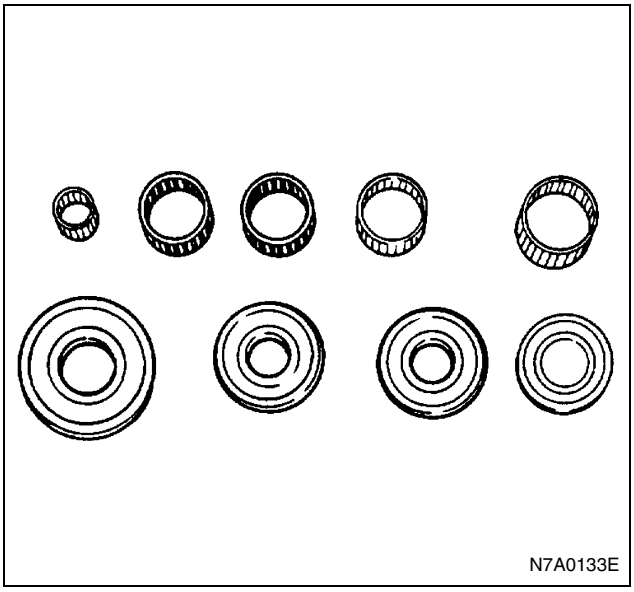
Inspection and Repair

Make the necessary adjustment, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Bearings

Check each bearing, and replace in either of the following cases.

- Rotation is not smooth.
- Abnormal sound is generated.
- There is extreme damage or rust.
- Rolling element or rolling contact surface of needle roller bearing is discolored, extremely worn or pitted.



N7A0133E

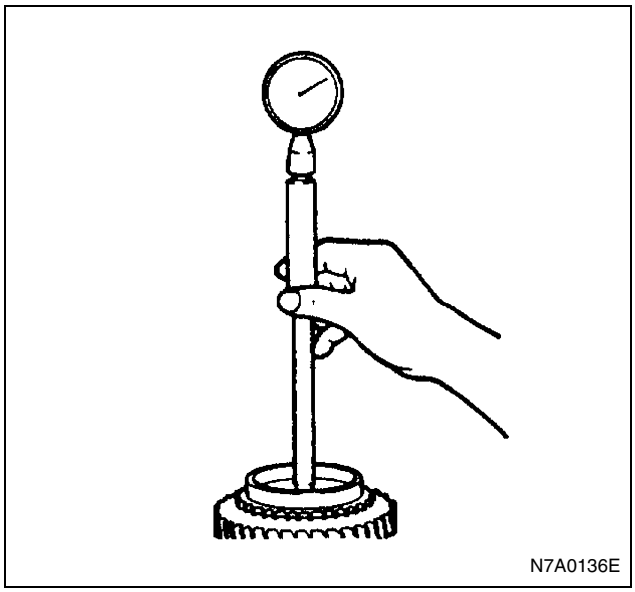
N7A0134E



N7A0136E

Gears

Check each gear for the following points. Correct a slight stepped wear or surface roughness with an oil stone or pencil grinder, or replace the gear if unrecoverable damage is found.

- Break or damage of tooth.
- Roughness or damage of taper cone (contact surface with block ring).
- Extreme wear of tooth.
- Inspect the dog gear teeth, and replace if hard contact is found on the force receive side (coast side) during engine braking.

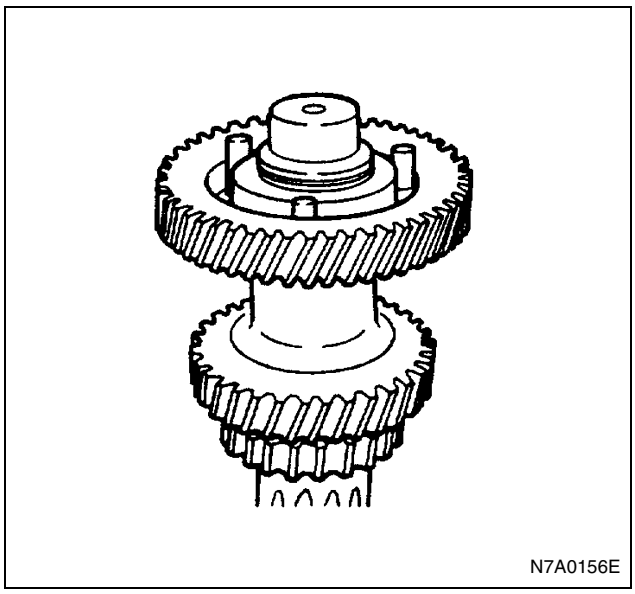
Reassembly

Notice:
Clean each part thoroughly.

When assembling parts, apply clean engine oil (SAE 5W-30) to their sliding and mating sections.

Counter Shaft Assembly

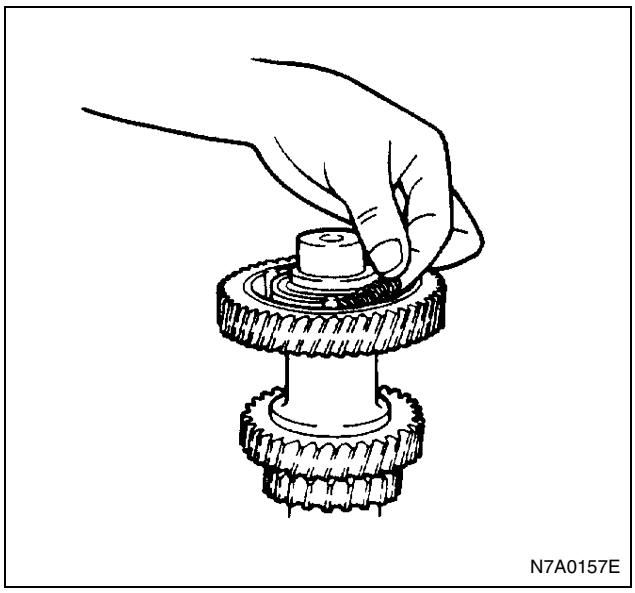
1. Spring
   - Attach a backing plate to the vise, secure the counter shaft rear end, and install the springs.



N7A0156E

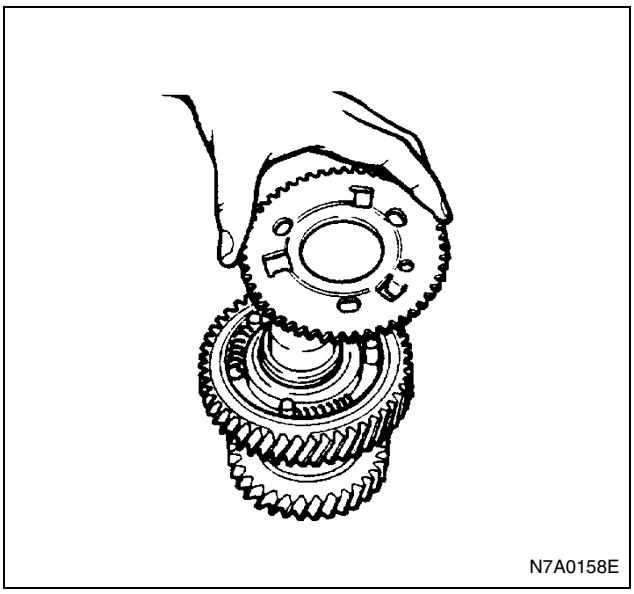
- The spring should be installed to the left of the inside counter drive gear pin.

Notice:
When replacing the pin with a new one, hammer it in until its height becomes 3 mm (0.12 in) from the gear end face.



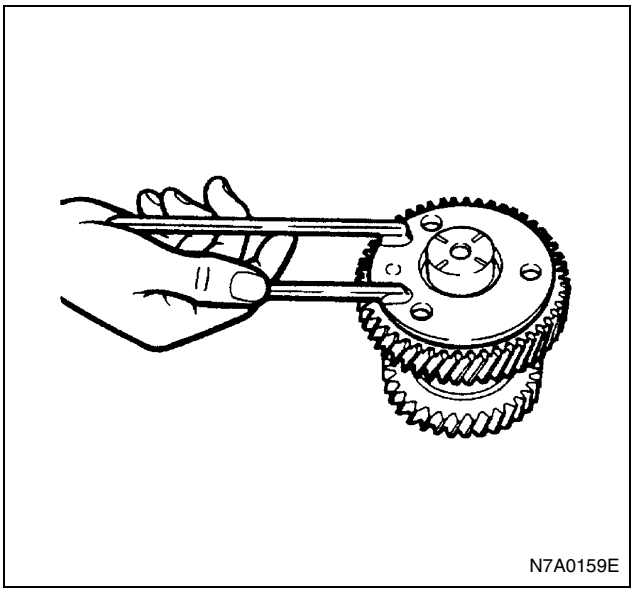
N7A0157E

2. Anti-lash Plate
   - Assemble the anti-lash plate to the drive gear so that the drive gear hole (ϕ7.7 mm/0.3 in) comes roughly in line with the hole (ϕ7.7 mm/0.3 in) of the anti-lash plate.



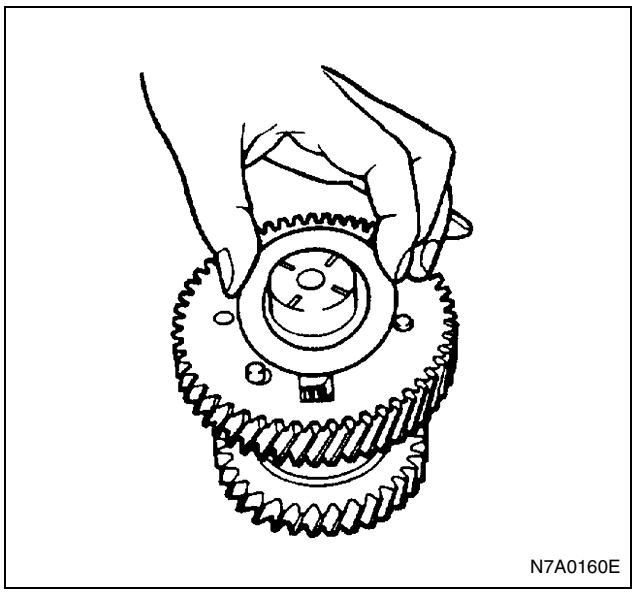
N7A0158E

- With the guide pin aligned with the drive gear hole (ϕ7.7 mm/0.3 in), set the installer to the guide pin.
  Anti-lash Plate Installer: 5-8840-2044-0
- Turn the installer clockwise. When the drive gear pin comes to the position where it can be seen fully, put the installer into the drive gear side to fix the anti-lash plate to the drive gear.



N7A0159E

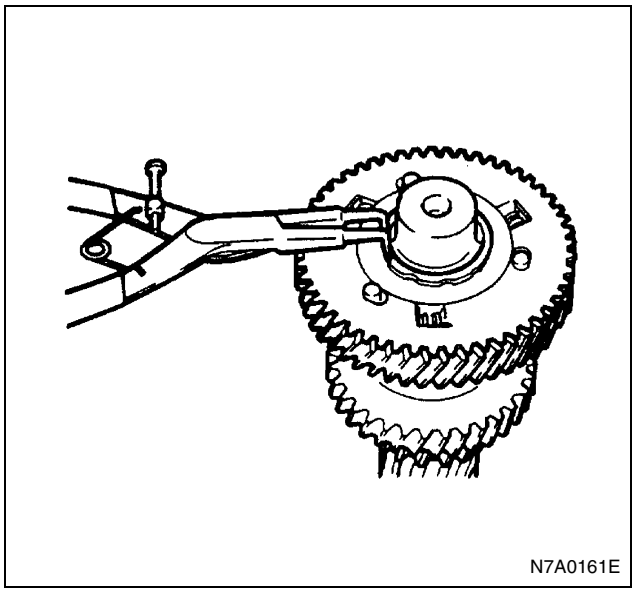
3. Conical Washer
   - Install the conical washer above the anti-lash plate with the convex side (front side) up.



N7A0160E

4. Snap Ring
   - Use a new snap ring to fix the conical washer.

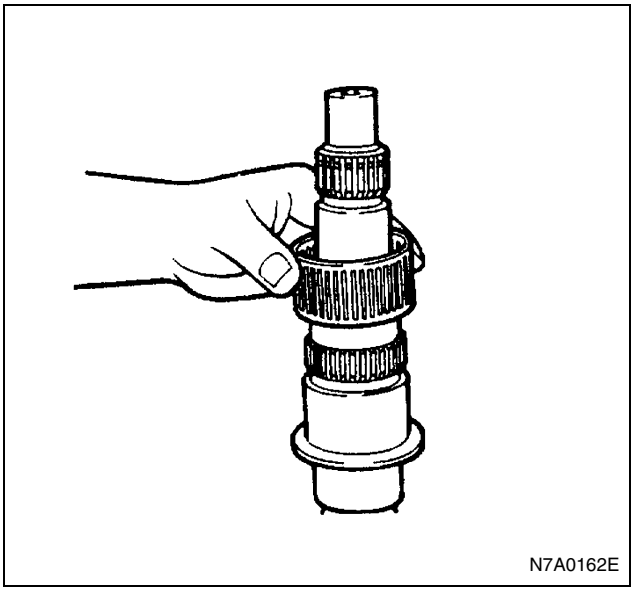
Notice:
Avoid the reuse of snap ring.
Check visually the anti-lash plate for a warp or curve after assembly.



N7A0161E

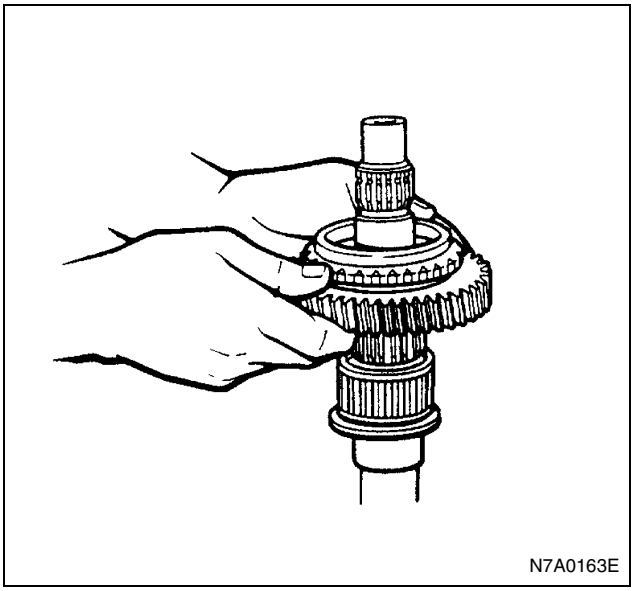
Main Shaft Assembly

5. Needle Bearing
   - Attach a backing plate to the vise, secure the main shaft at the spline end.



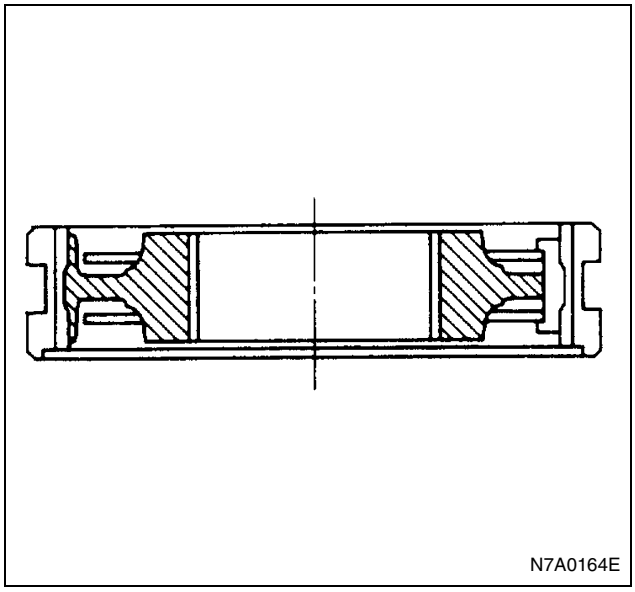
N7A0162E

6. 1st Gear
   - Install the 1st gear with its taper cone side upward (front of transmission).
7. Block Ring
   - Align the insert groove of the block ring with the insert.



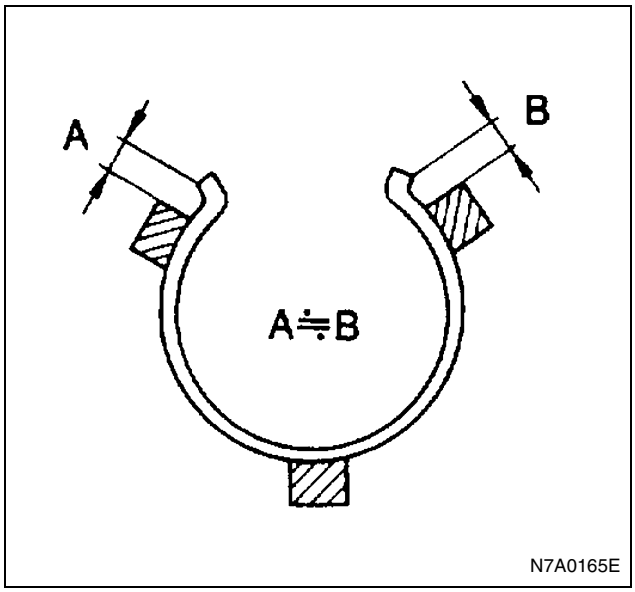
N7A0163E

8. 1st/2nd Synchronizer Assembly
   - Assemble the sleeve to the clutch hub. The clutch hub has no specific directionality.
   - Put the inserts into the clutch hub groove, and install the insert spring.



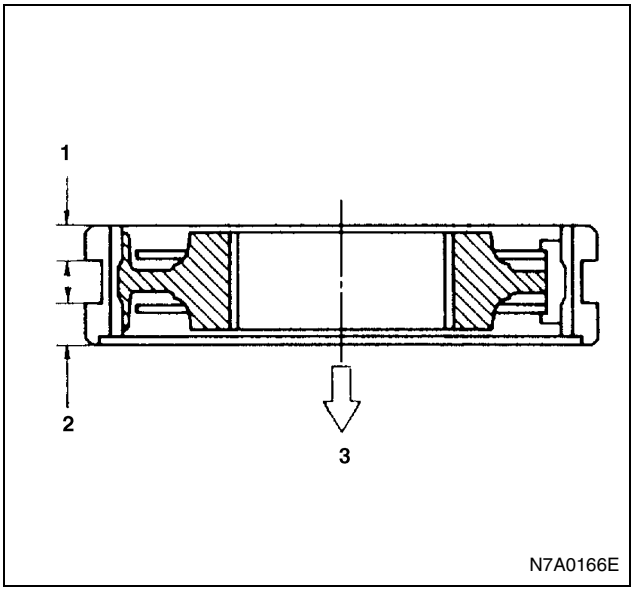
N7A0164E

   - Assemble the insert springs so that the distances (A and B) between inserts and the opening of the spring can be nearly equal, and also this opening may not be the same direction on both side.



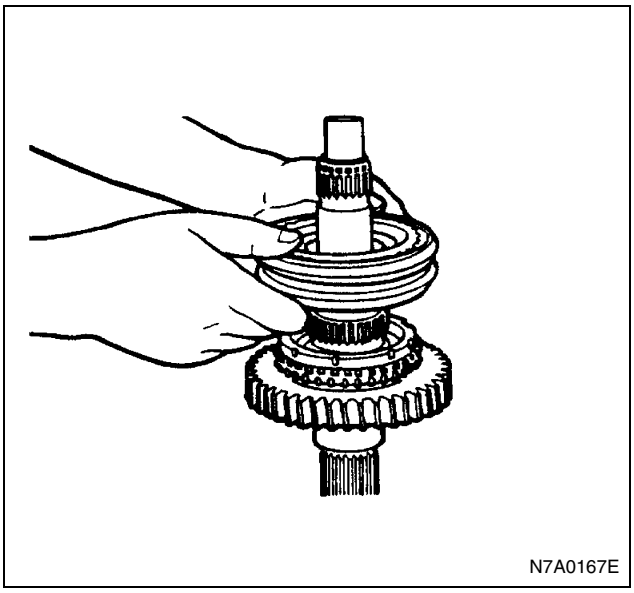
N7A0165E

   - Larger width side of the sleeve outer circumference should be positioned toward the 1st gear side (rear of transmission).
   - Align the insert with the insert groove of the block ring.



Legend
1. Smaller
2. Larger
3. 1st gear

- Tap the clutch hub boss section with a plastic hammer to press it in until it contacts closely with the main shaft stepped section.
- When it is difficult to engage the clutch hub boss with the main shaft spline, heat the clutch hub boss section to a temperature between 80 and 120°C (176 and 248°F) with the piston heater before assembling.
- Check to see if the 1st gear rotates smoothly.

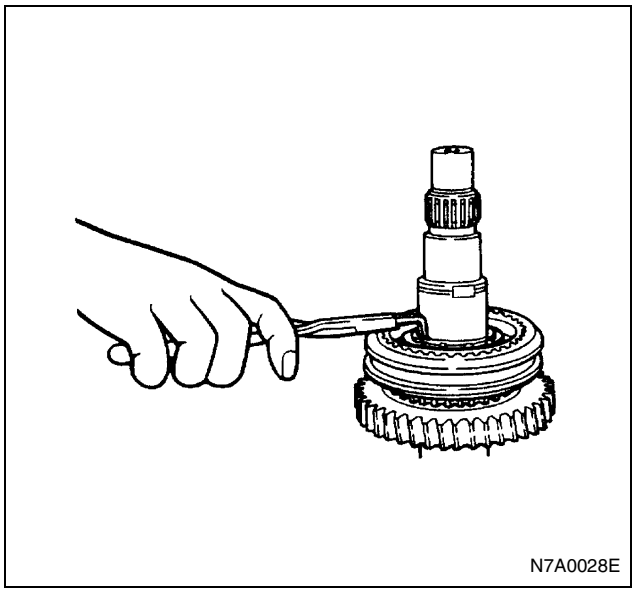


9. Snap Ring
   - Install the built-in snap ring and measure the clearance between the snap ring and the clutch hub.

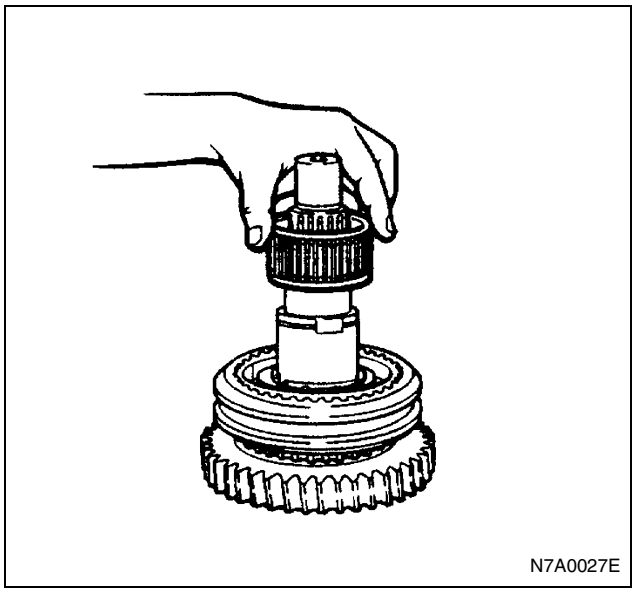
Clutch Hub and Snap Ring Clearance	mm (in)
0 — 0.09 (0 — 0.004)	

- When the clearance is out of the reference value, select a snap ring with the maximum thickness that can be inserted from among the following three types, and built it in.

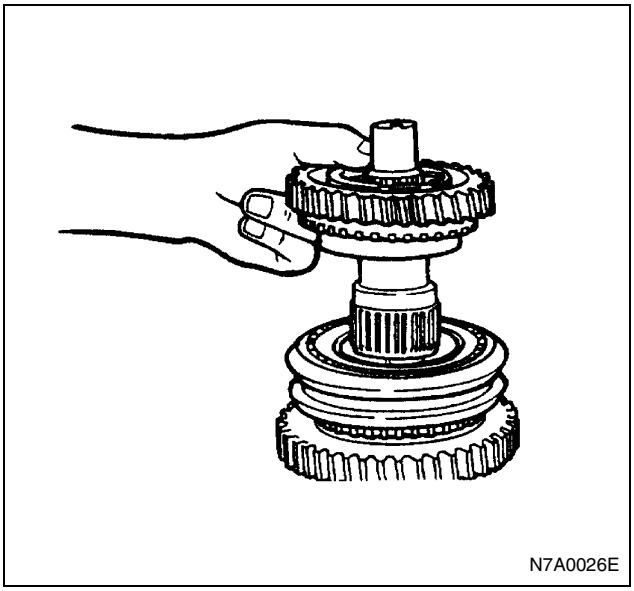
Snap Ring	mm (in)
Color	Thickness (Reference)
Pink	1.75 — 1.80 (0.069 — 0.071)
White	1.80 — 1.85 (0.071 — 0.073)
Yellow	1.85 — 1.90 (0.073 — 0.075)



10. Block Ring
    - Align the insert groove of the block ring with the insert.
11. Needle Bearing

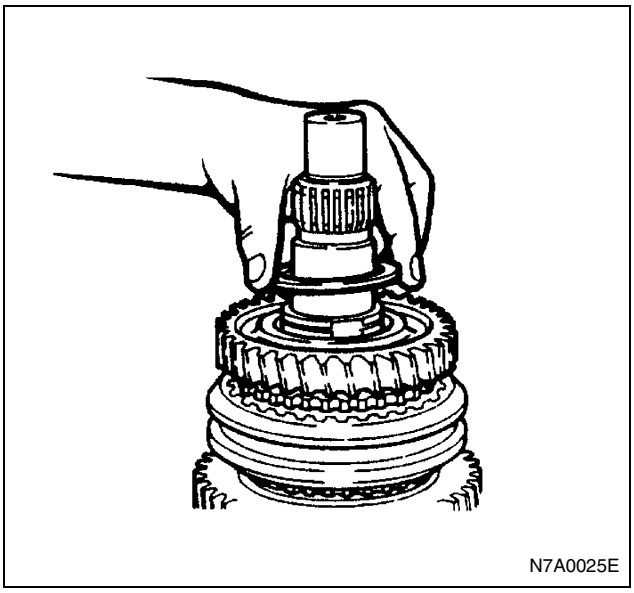


12. 2nd Gear
    - Install the 2nd gear with the taper cone side turned to the 1st gear side (to the bottom).



N7A0026E

13. Thrust Washer
    - With the thrust washer set to main shaft groove, assemble it.



N7A0025E

14. Snap Ring
    - After installation, measure distance (T) and select the optimum snap ring from the table.

Snap Ring		mm (in)
Distance (T)	Color	Thickness (Reference)
2.20 — 2.27 (0.087 — 0.089)	Yellow	1.85 — 1.90 (0.073 — 0.075)
2.27 — 2.32 (0.089 — 0.091)	Blue	1.90 — 1.95 (0.075 — 0.077)
2.32 — 2.37 (0.091 — 0.093)	Brown	1.95 — 2.00 (0.077 — 0.079)
2.37 — 2.43 (0.093 — 0.096)	Green	2.00 — 2.05 (0.079 — 0.081)

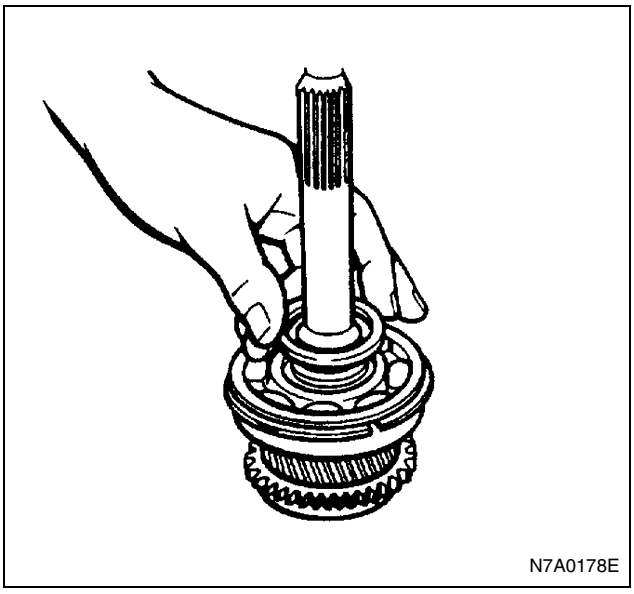
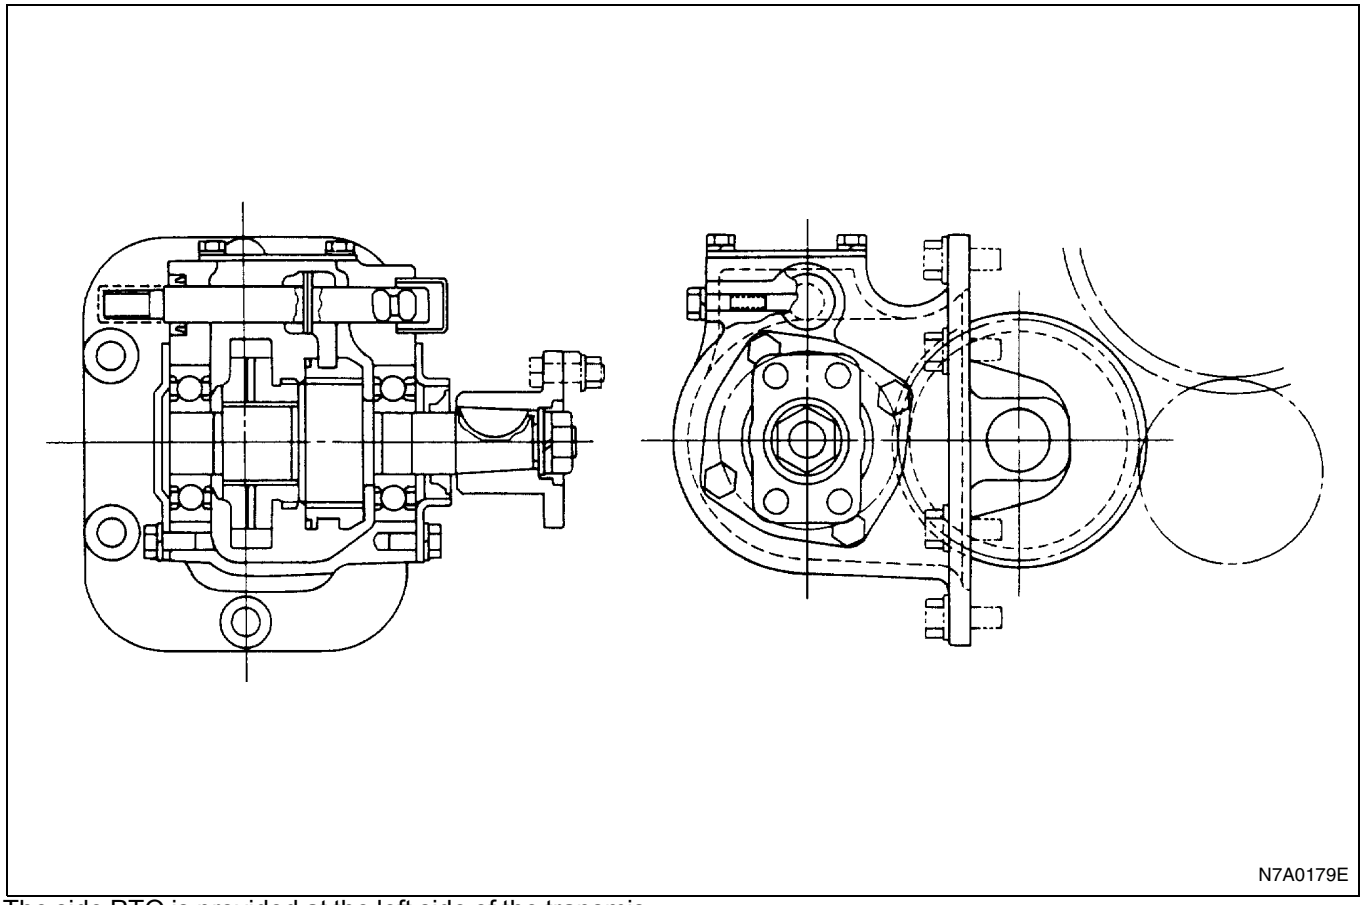
28. Snap Ring



N7A0178E

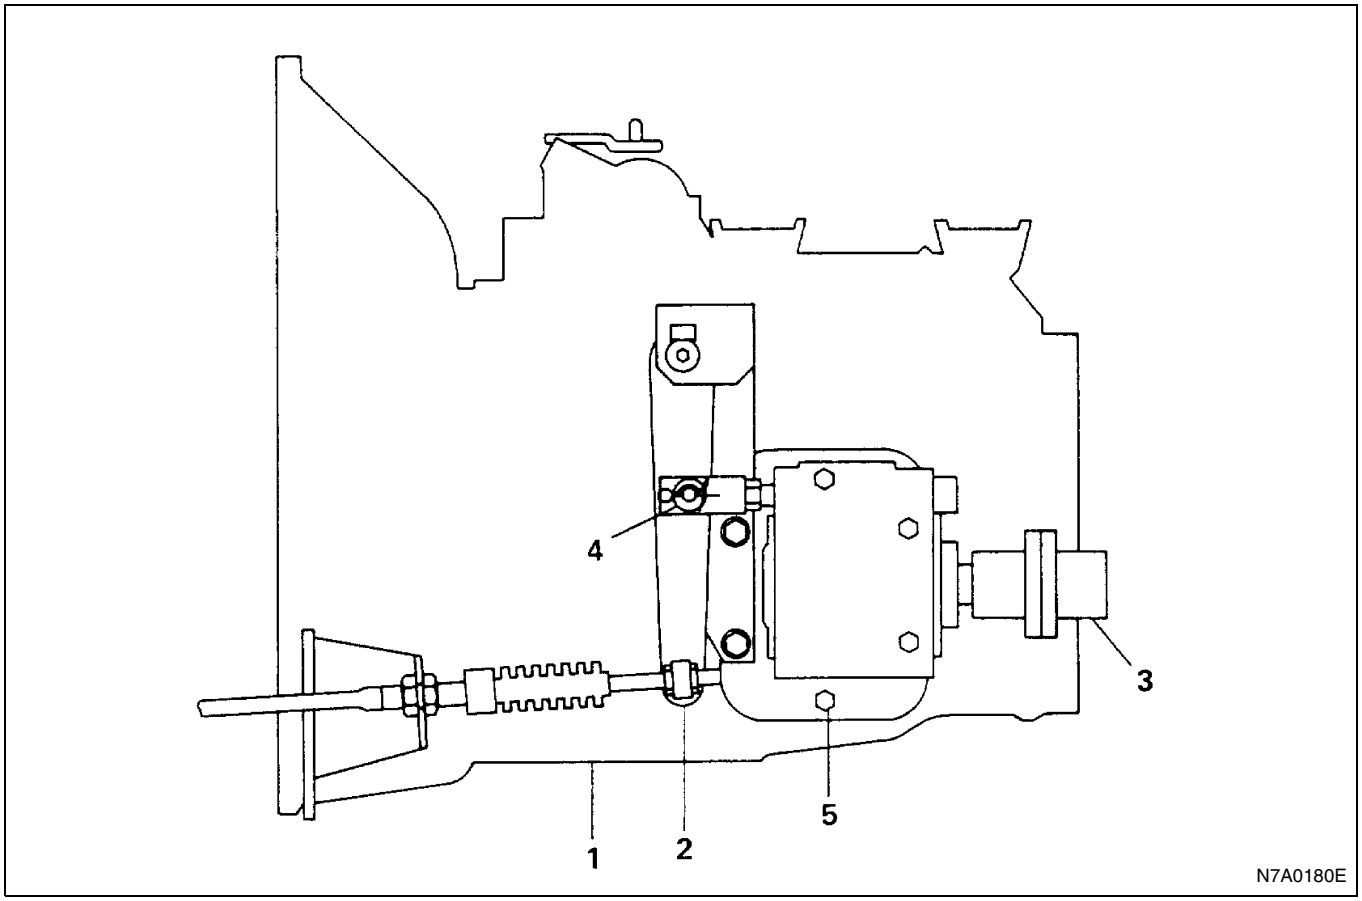
POWER TAKE OFF (PTO)

General Description



The side PTO is provided at the left side of the transmission.
For the gear, the same helical gear as the one used for the transmission is employed to reduce noises.
The roller type needle bearing is employed for the idle shaft and the ball bearing for the output shaft to obtain the increased durability and quietness.
The gear employed is of a constant-mesh type. The gear engagement control (ON/OFF) by a cable is made by the shift rod provided at the upper section of the case, which slides the sleeve on the output shaft through the shaft arm.

Power Take Off (PTO) Replacement



Legend

1. Transmission oil
2. Control cable
3. PTO output propeller shaft
4. Connecting pin
5. PTO assembly

Removal

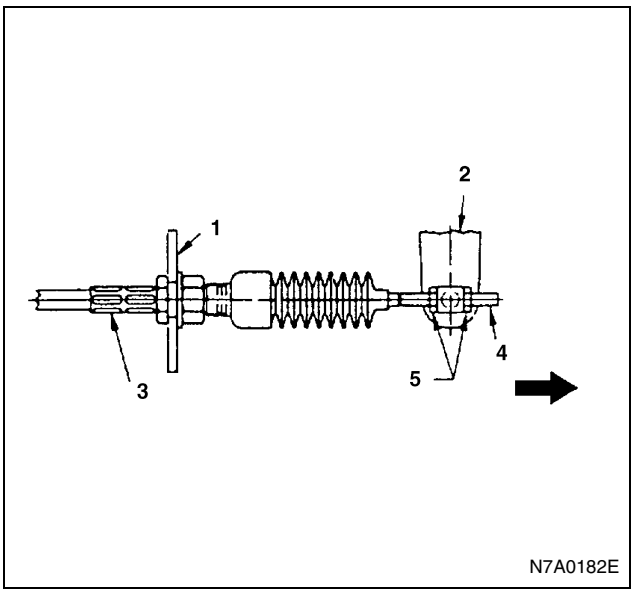
1. Transmission Oil
   - Remove the drain plug from the transmission case and drain the oil.
2. Control Cable
   - Disconnect the control cable from the PTO shift lever.
3. PTO Output Propeller Shaft
   - Disconnect the propeller shaft from the PTO output flange.
4. Connecting Pin
   - Remove the snap pin, washer and the connecting pin from the shift rod and the shift lever.
5. PTO Assembly
   - Remove the 6 PTO fixing bolts, and the PTO assembly.

Installation

1. PTO Assembly
   - Clean and dry on the mating faces before applying the liquid gasket.
   - Apply liquid gasket (Three Bond 1141E or equivalent) to the PTO and transmission surfaces, and both sides of the distance plate (if installed).
   - Install the distance plate (if installed) and PTO with new gasket(s).

Tighten:
PTO bolt to 37 N·m (3.8 kg·m / 27 lb·ft)

2. Connecting Pin
   - Install the connecting pin to the shift rod and shift lever and install the snap pin with washer.
3. PTO Output Propeller Shaft
4. Control Cable
   Inner Cable Adjudtment Type
   1) Fix the outer cable.
   2) Set the PTO shift lever in the OFF position. Be sure to confirm the PTO control lever is in the OFF position (PTO indicator light turned off).
   3) Remove slack from the inner cable by pulling the inner cable in the direction of the arrow.
   4) Tighten the lock nuts.

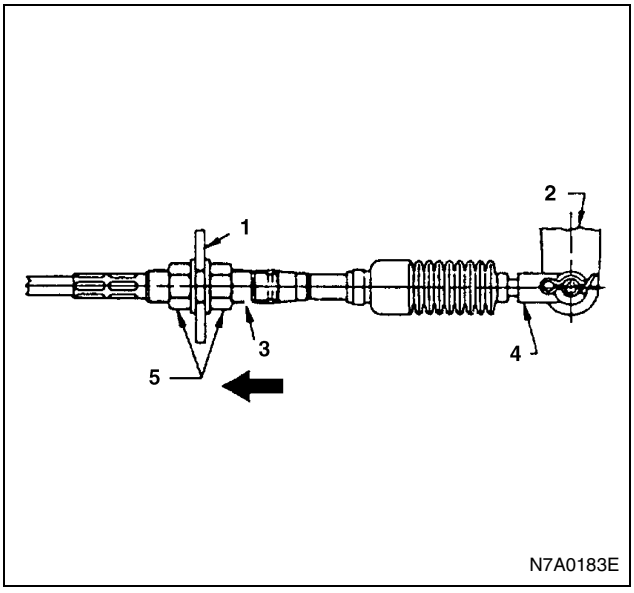


Legend

1. Bracket
2. Shift lever
3. Outer cable
4. Inner cable
5. Lock nut

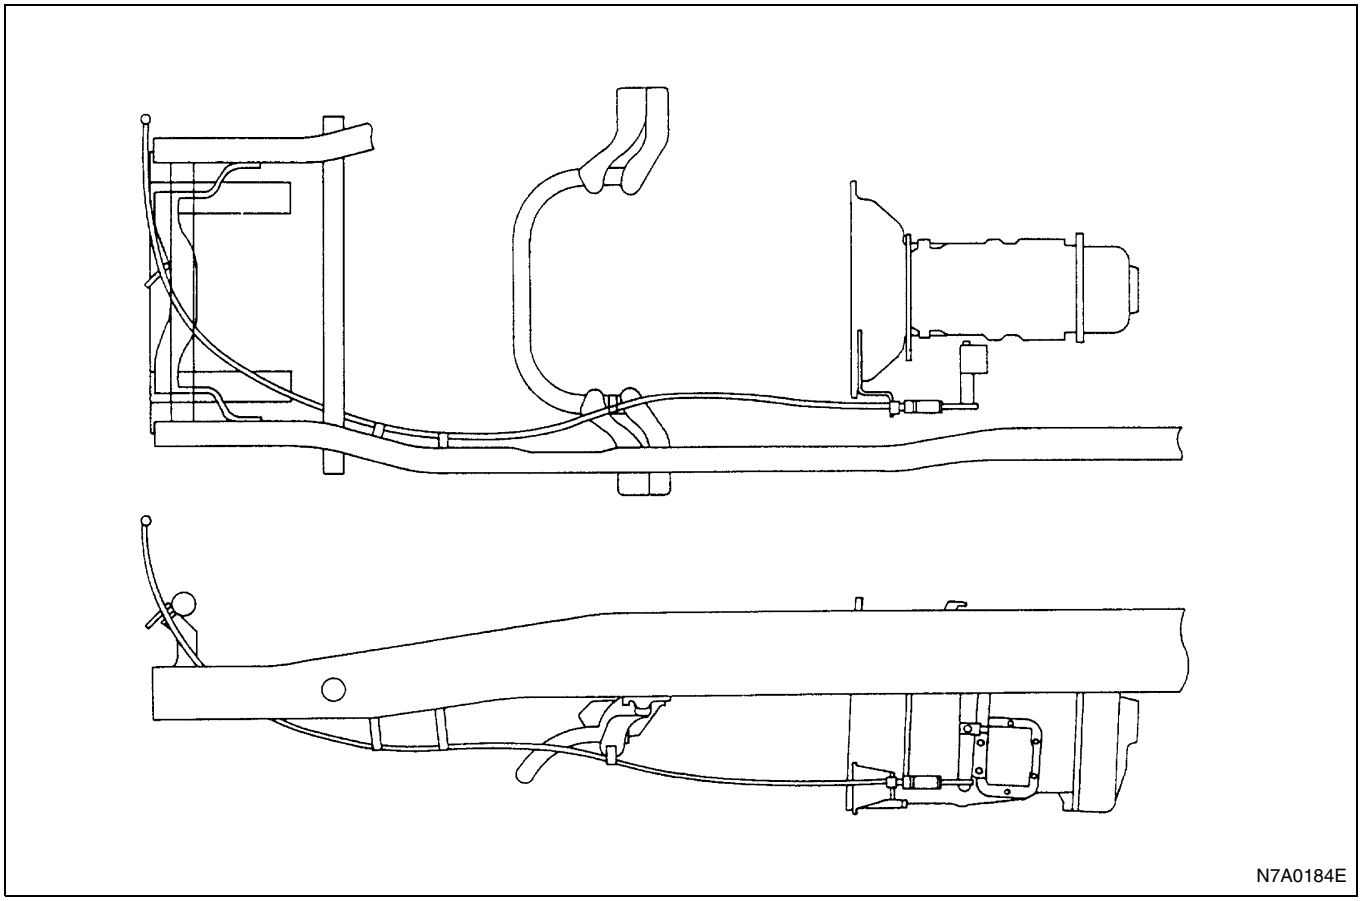
Outer Cable Adjustment Type

1) Set the PTO shift lever in the OFF position. Be sure to confirm the PTO control lever is in the OFF position (PTO indicator light turned off).
2) Connect the inner cable to the PTO shift lever.
3) Remove slack from the inner cable by pulling the outer cable in the direction of the arrow.
4) Tighten the lock nuts.



Legend

1. Bracket
2. Shift lever
3. Outer cable
4. Inner cable
5. Lock nut



5. Transmission Oil
   1) Install the drain plug.

Tighten:
Drain plug to 49 N·m (5.0 kg·m / 36 lb·ft)

   2) Remove the filler plug and fill the transmission case with the specified engine oil through the filler plug hole.

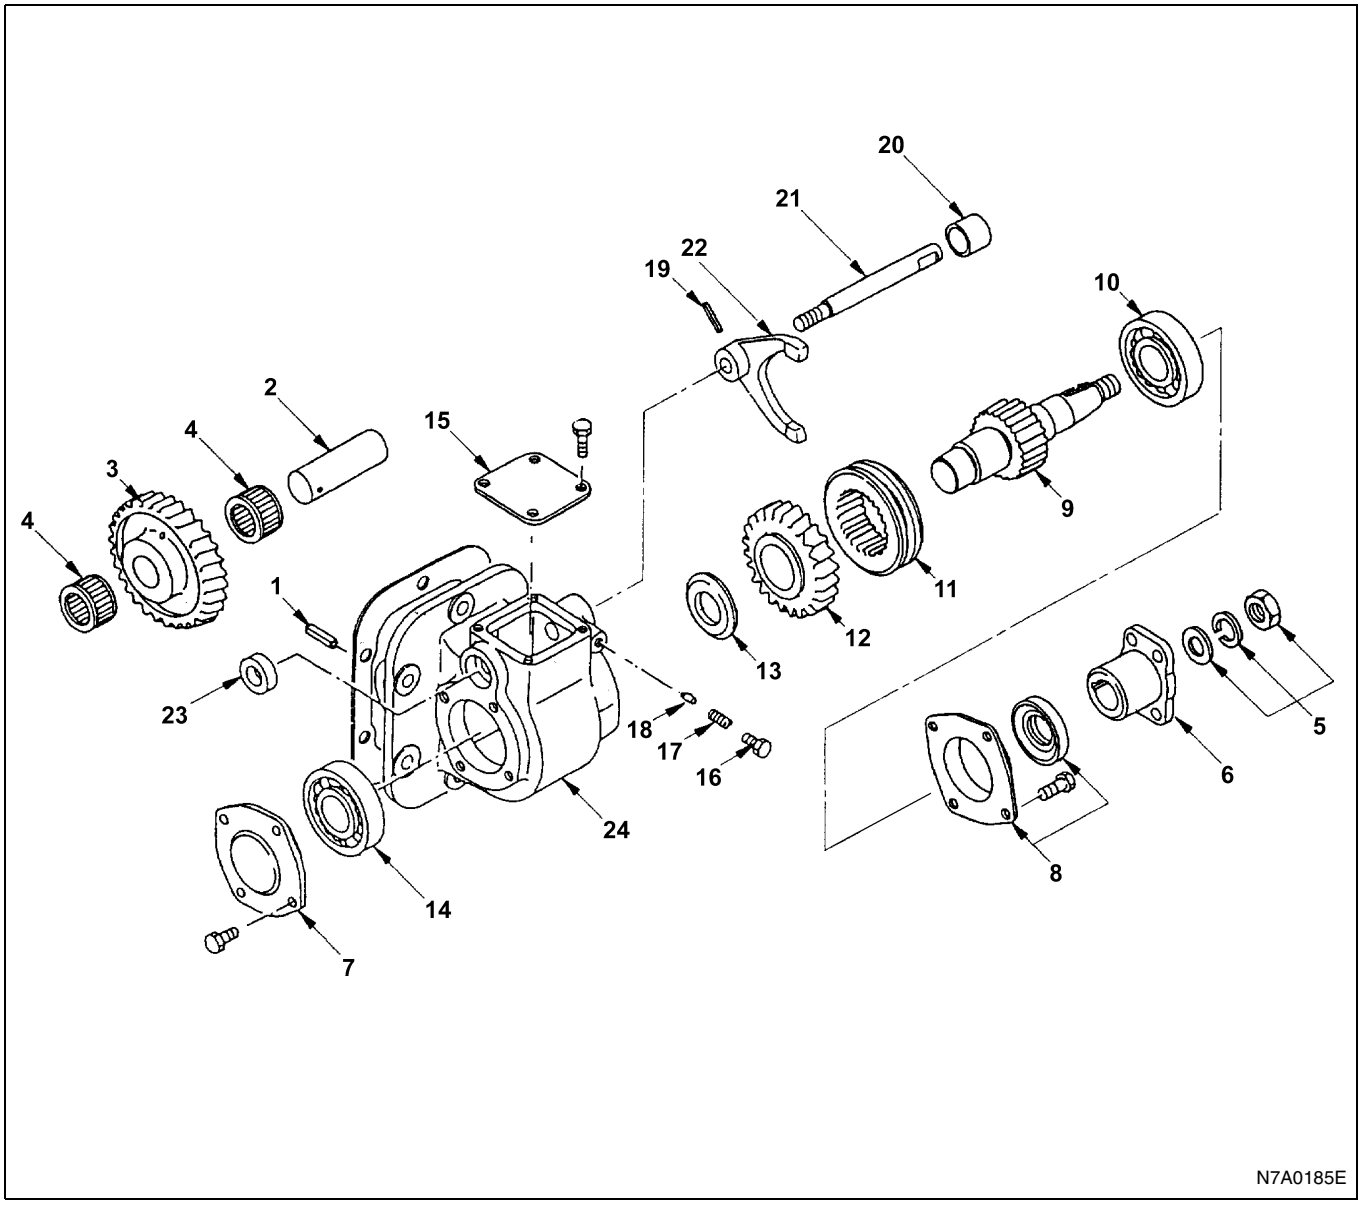
Oil Capacity	Liters (US·qt/Imp·qt)
2.7 (2.9/2.4)	

Caution:
Use ENGINE OIL SAE 5W-30 for transmission case.

   3) Install the filler plug.

Tighten:
Filler plug to 49 N·m (5.0 kg·m / 36 lb·ft)

Unit Repair



Legend

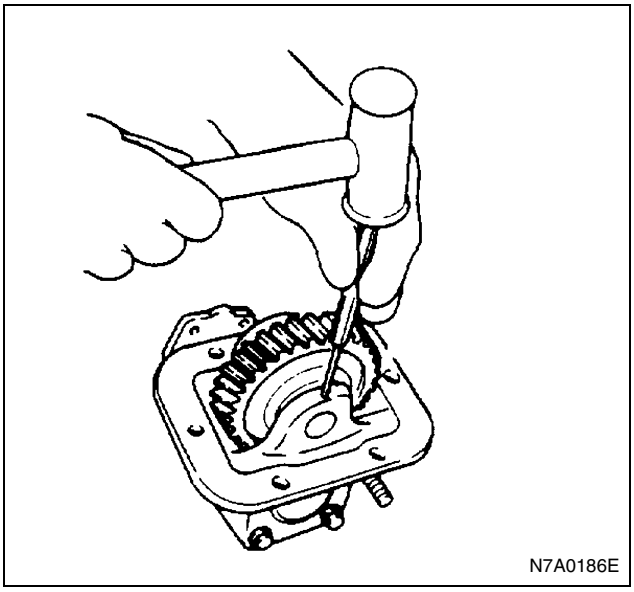
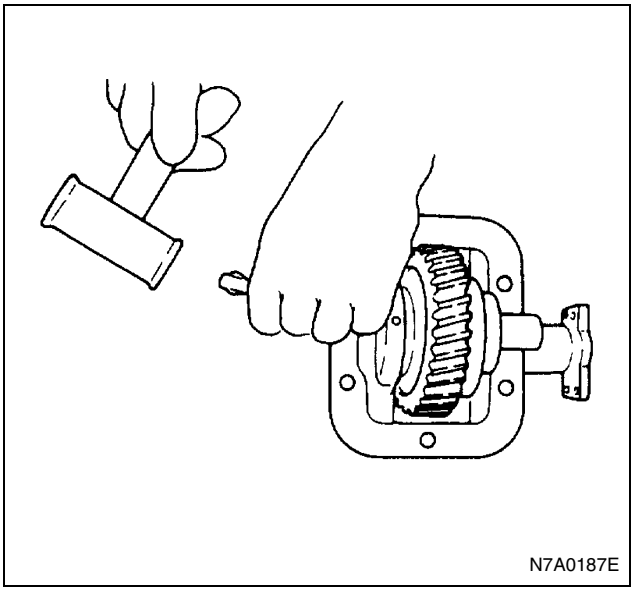
24. Gear case

Disassembly

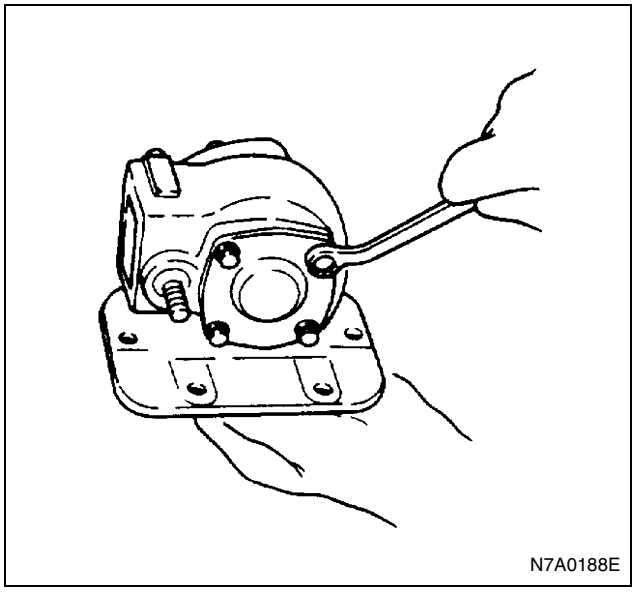
1. Spring Pin
   - Tap the spring pin into the idle shaft.
     Spring Pin Remover: 9-8529-2201-0



2. Idle Gear Shaft
   - Drive out the idle gear shaft by tapping on its front end with a suitable bar and hammer.
   - Remove the spring pin from the idle gear shaft.
     Spring Pin Remover: 9-8529-2201-0
3. Idle Gear
4. Needle Bearing



5. Lock Nut and Washer
   - Attach a backing plate to the vice, secure the coupling driver, and remove the lock nut, spring washer and plain washer.
6. Coupling Driver
7. Front Cover



8. Rear Cover (with Oil Seal)
   - Remove the oil seal from the rear cover.
9. Output Shaft
10. Rear Bearing
    - Drive out the output shaft by tapping on its front end with a suitable bar and hammer.
    - Remove the rear bearing from the output shaft.

24. Gear Case

Inspection and Repair

Make the necessary adjustments, repairs and part replacement if excessive wear or damage is discovered during inspection.

Bearings

Check the each bearing, and replace in either of the following cases.

- Rotation is not smooth.
- Abnormal sound is generated.

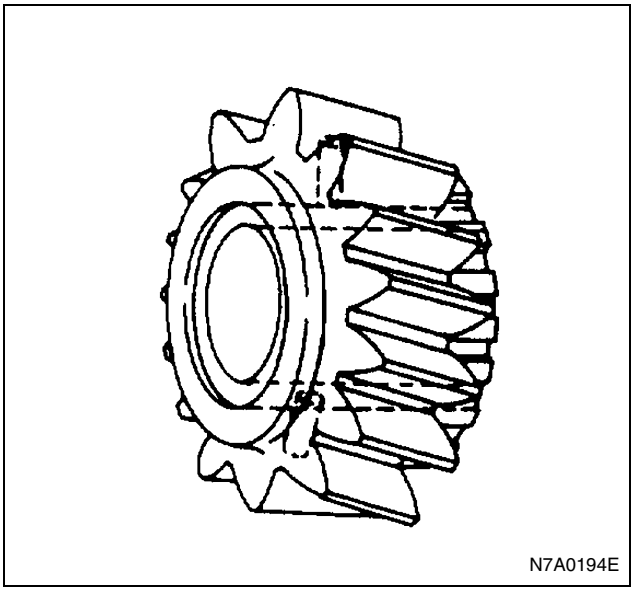
- There is extreme damage or rust.
- Rolling element or rolling contact surface of needle roller bearing is discolored, extremely worn or pitted.

Ball Bearing Run-out	mm (in)
Limit	
0.2 (0.01)	

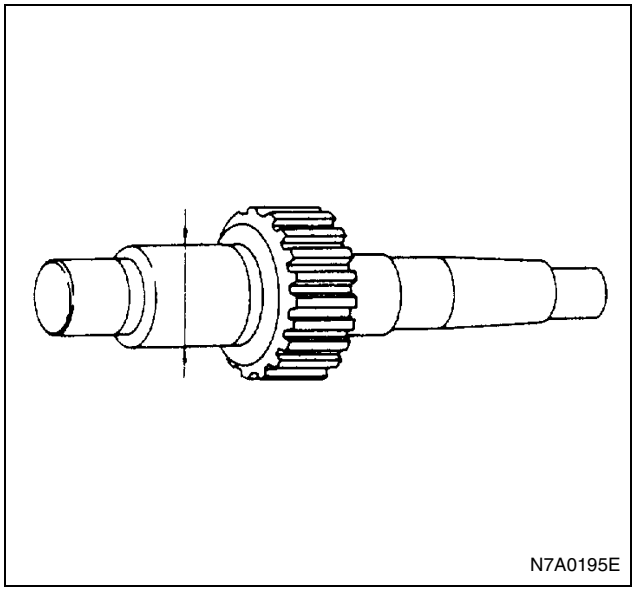
Gears
Check each gear for the following points. Correct a slight stepped wear or surface roughness with an oil stone or pencil grinder, or replace the gear if unrecoverable damage is found.

- Break or damage of tooth.
- Extreme wear of tooth.

Output Shaft and Output Gear Bushing Clearance	mm (in)
Limit	
0.2 (0.01)	



N7A0194E



N7A0195E

Idle Gear Shaft and Output Shaft
Check the shaft external surface for any damage or wear, and its spline section for wear, damage or bent.
When there is any abnormal condition, or when it is used excessively beyond a proper use limit, replace it with new one.

Shift Mechanism
Inspect all disassembled parts for wear, damage or other abnormal conditions.

- Check the shift rod for wear, bent and damage.
- Check the shift arm for wear or deformation.

Shift Arm Thickness	mm (in)
Standard	Limit
9.0 (0.35)	8.0 (0.31)

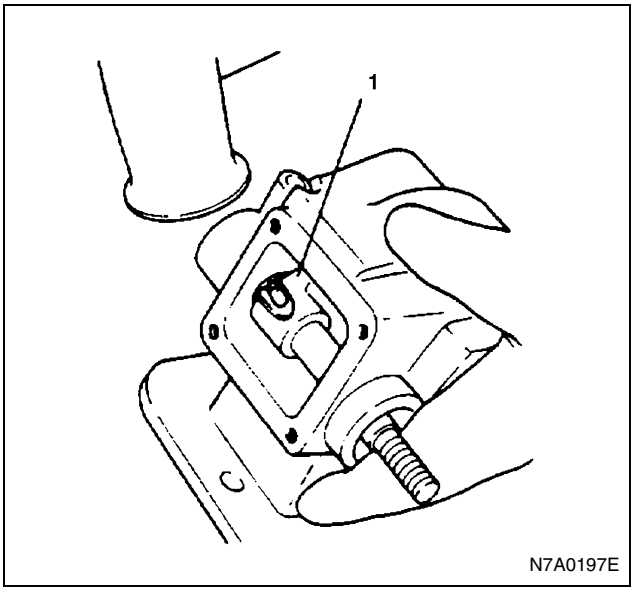
- Check the detent spring and detent pin for wear, weakening and deformation.
- The wear of the shift rod, and the awkward operation of the gear case.

Sleeve
Check the sleeve for any abnormal conditions.
Correct a slight stepped wear or surface roughness with an oil stone or pencil grinder, or replace the sleeve if unrecoverable damage is found.

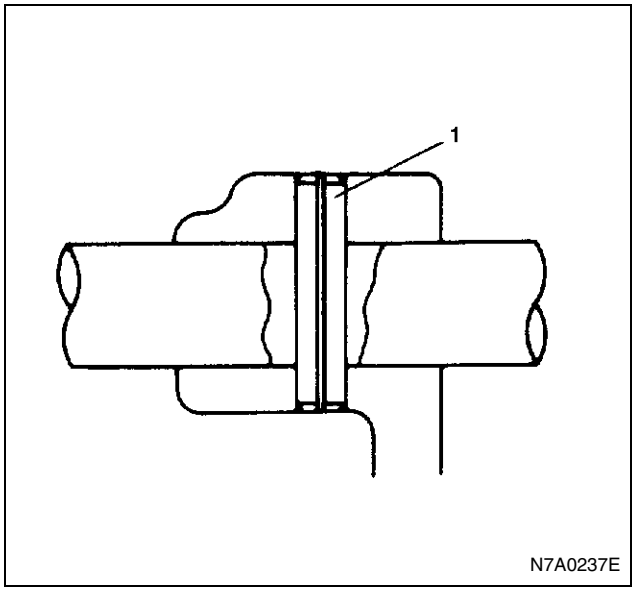
Reassembly

Notice:
Clean each part thoroughly.
When assembling parts, apply clean engine oil (SAE 5W-30) to their sliding and mating sections.

1. Gear Case
2. Shift Rod Oil Seal
   - Clean and dry on the mating faces before applying the liquid gasket.
   - Apply liquid gasket (Three Bond 1141E or equivalent) to the new oil seal outer circumference and apply multi-purpose grease to the oil seal lip.
   - Use the oil seal installer to install the oil seal.
     Oil Seal Installer: 5-8840-2065-0
3. Shift Arm
   - With the boss side of the shift arm (1) set to the rear.



4. Shift Rod
   - Turning the detent groove to the outside (detent pin side), insert the shift rod from the front side with the detent groove side at the front.
5. Spring Pin
   - Setting the hole of the shift arm to that of the shift rod, fix them with a new spring pin (1).

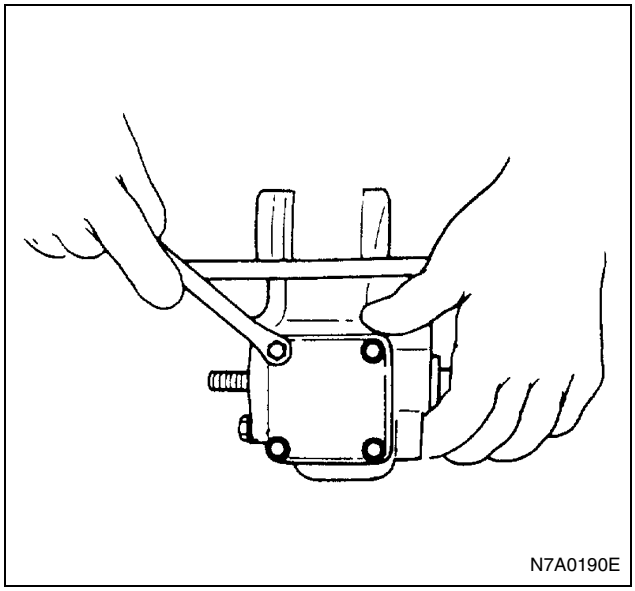


6. Shift Rod Plug
   - Clean and dry on the mating faces before applying the liquid gasket.
   - Apply liquid gasket (LOCTITE 962T or equivalent) to the cap outer circumference.
   - Use the plug installer to install the shift rod cap.
     Plug Installer: 5-8840-2067-0

Notice:
When there is any warp or flaw found with the shift rod cap, replace it with new one.

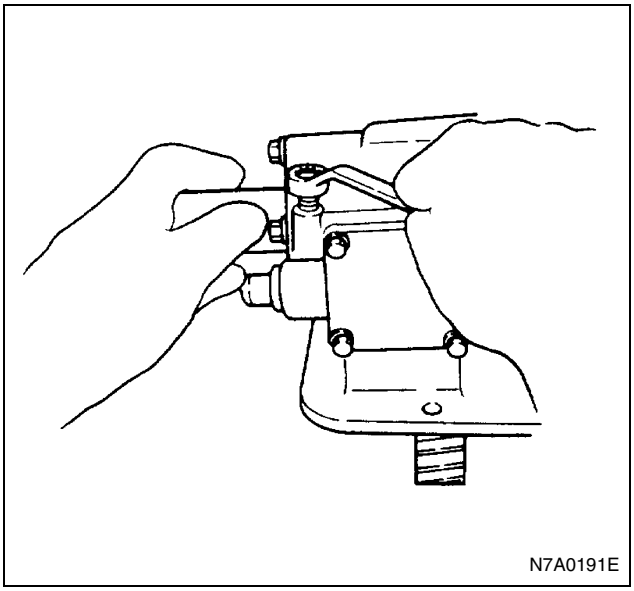
7. Upper Cover
   - Clean and dry on the mating faces before applying the liquid gasket.
   - Apply liquid gasket (FMD-127 or equivalent) to the gear case and upper cover surfaces.
   - Install the upper cover with new gasket.

Tighten:
Upper cover bolt to 25 N·m (2.5 kg·m / 18 lb·ft)



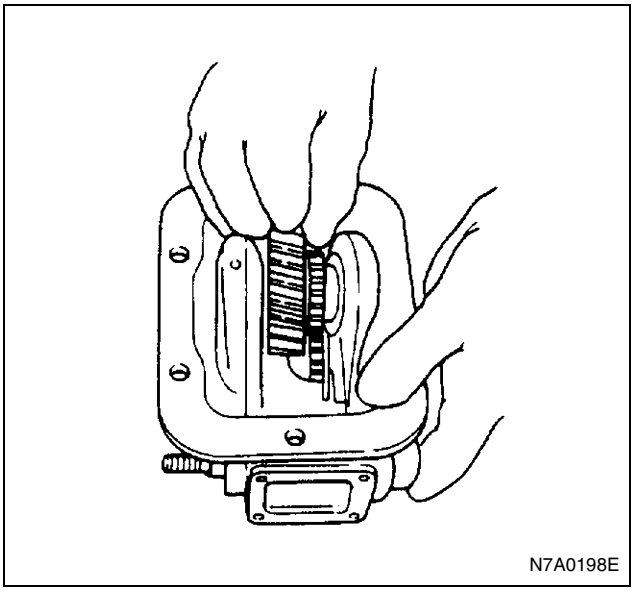
8. Detent Pin
9. Detent Spring
10. Plug
    - Remove sealant from the plug and female threaded surfaces and the surfaces must be perfectly dry.
    - Apply liquid gasket (LOCTITE 242 or equivalent) to the plug's threaded portion.

Tighten:
Detent pin plug to 25 N·m (2.5 kg·m / 18 lb·ft)



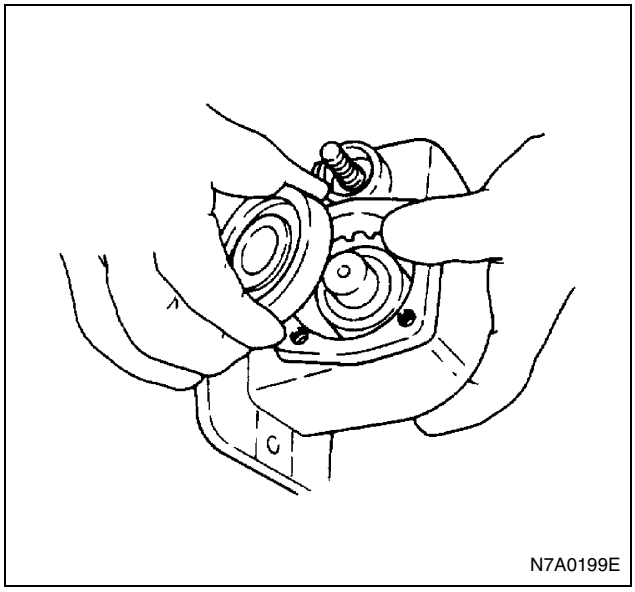
N7A0191E

11. Output Gear with Bushing
    - Install with the dog gear side turned to the coupling driver side (to the rear).



N7A0198E

12. Sleeve
    - Chamfer face of the sleeve outer circumference should be positioned toward the coupling driver and assemble the sleeve groove to the shift arm.
13. Output Shaft
14. Thrust Collar
15. Front Bearing
    - Install the thrust collar and front bearing using bearing installer.
      Bearing Installer: 5-8840-2066-0

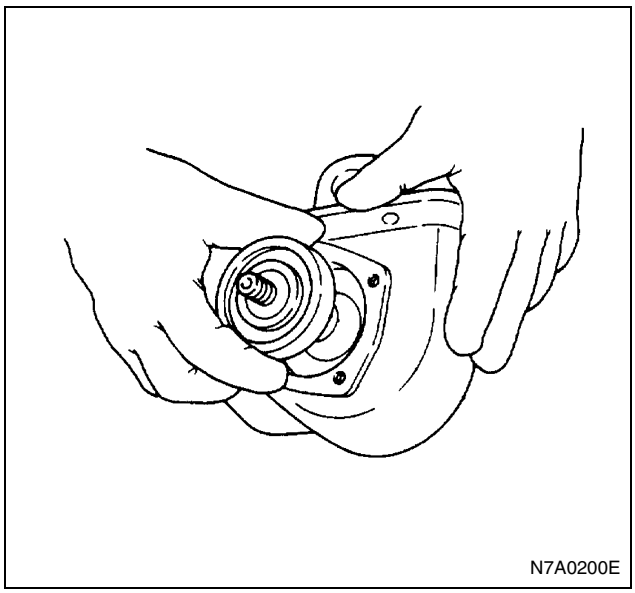


N7A0199E

16. Front Cover
    - Clean and dry on the mating faces before applying the liquid gasket.
    - Apply liquid gasket (FMD-127 or equivalent) to the gear case and front cover surfaces.
    - Install the front cover with new gasket.
    - Apply liquid gasket (LOCTITE 242 or equivalent) to the fixing bolt's threaded portion.

Tighten:
Upper cover bolt to 25 N·m (2.5 kg·m / 18 lb·ft)

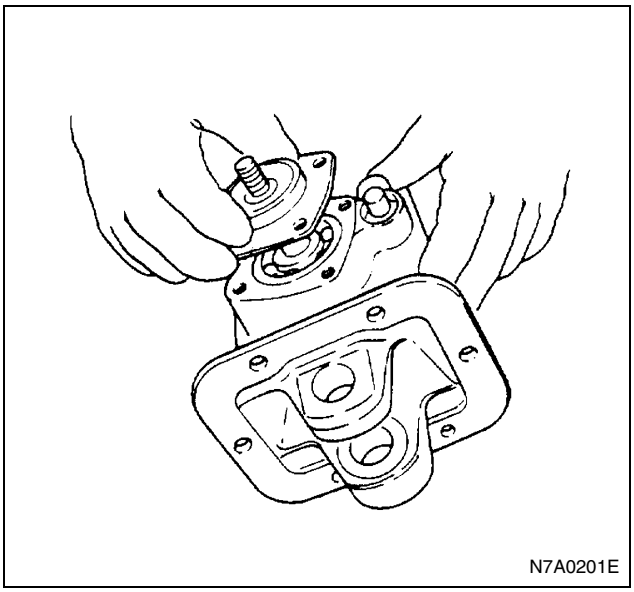
17. Rear Bearing
    - Use the bearing installer to install the rear bearing.
      Bearing Installer: 5-8840-2066-0



N7A0200E

18. Rear Cover
    - Apply liquid gasket (FMD-127 or equivalent) to the new oil seal outer circumference and apply multi-purpose grease to the oil seal lip.
    - Use oil seal installer to install the oil seal to the rear cover.
      Oil Seal Installer: 5-8840-2064-0
    - Apply approx. 3 grams (0.1 ounce) of the Multi-purpose with MOS_2 type grease to the inside of rear cover.
    - Clean and dry on the mating faces before applying the liquid gasket.
    - Apply liquid gasket (Three Bond 1141E or equivalent) to the rear cover and gear case surfaces.
    - Install the rear cover with new gasket.

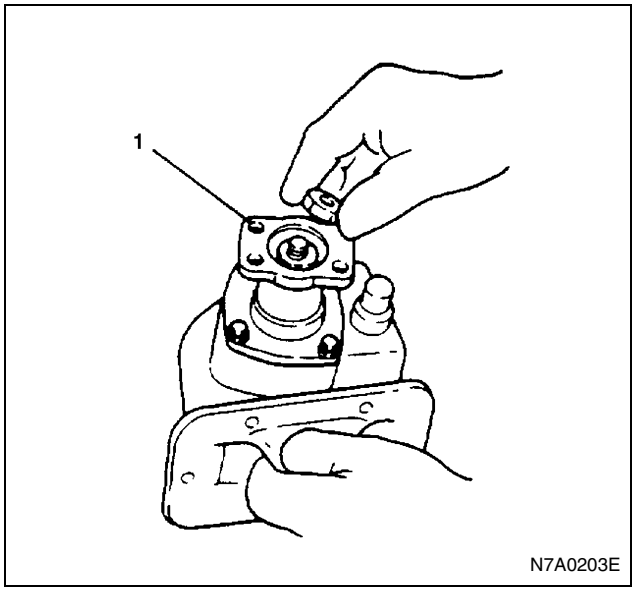
Tighten:
Rear cover bolt to 25 N·m (2.5 kg·m / 18 lb·ft)



N7A0201E

19. Coupling Driver
20. Lock Nut and Washer
    - Attach a backing plate to the vice, secure the coupling driver, and tighten the lock nut.

Tighten:
Lock nut to 105 N·m (10.7 kg·m / 77 lb·ft)



N7A0203E

Legend
1. Flange

21. Needle Bearing
22. Idle Gear
    - Install with the oil holes side turned to the rear.
23. Idle Gear Shaft
24. Spring Pin

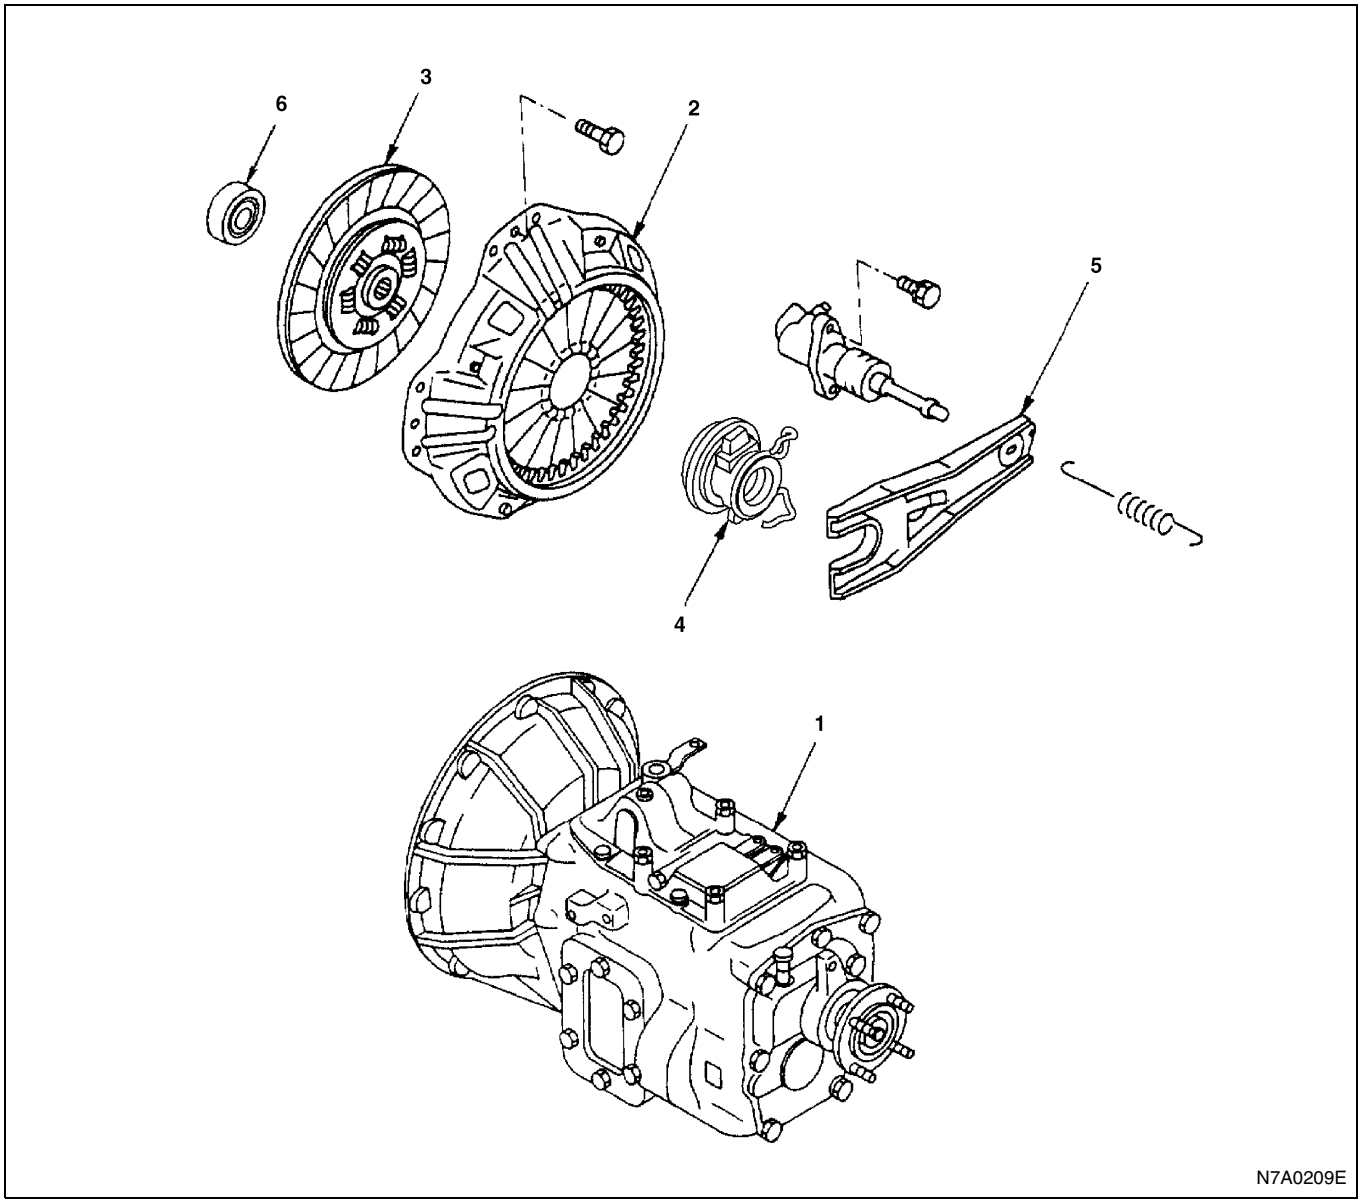
ON-VEHICLE SERVICE

Clutch Assembly



Legend

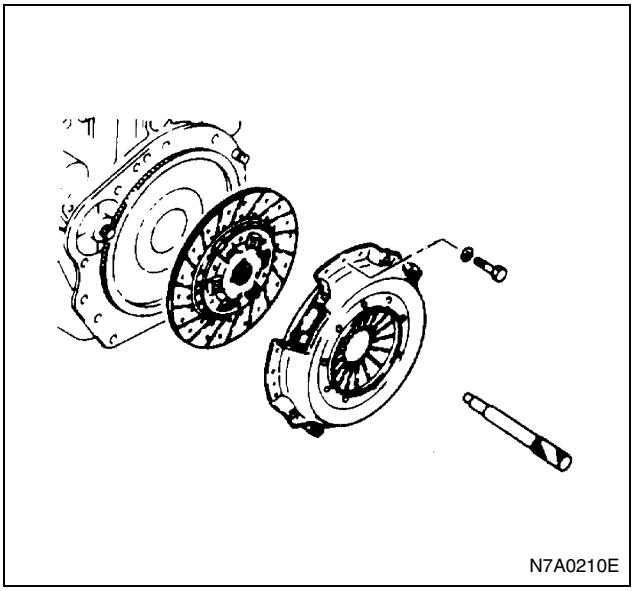
1. Transmission assembly
2. Pressure plate assembly
3. Driven plate assembly
4. Release bearing assembly
5. Shift fork
6. Pilot bearing

Removal

- Raise vehicle and support with suitable safety stands.

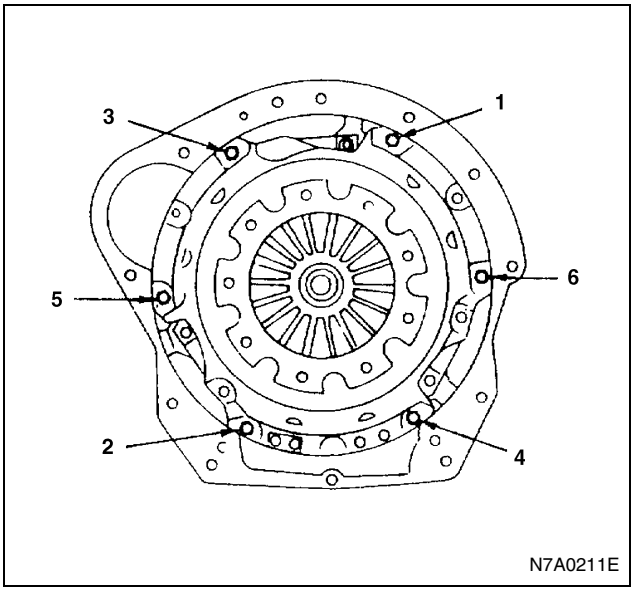
Caution:
Do not let clutch fluid remain on a painted surface. Wash it off immediately.

1. Transmission Assembly
   Refer to “SECTION 7B ON-VEHICLE SERVICE: TRANSMISSION ASSEMBLY REPLACEMENT” in this manual.
2. Pressure Plate Assembly
3. Driven Plate Assembly
   - Use the pilot aligner to prevent the driven plate assembly from falling free.
     Pilot Aligner: 5-8525-3001-0
   - Mark the flywheel and pressure plate lug for alignment when installing.



N7A0210E

- Loosen the pressure plate assembly fixing bolts in the numerical order shown in the illustration.

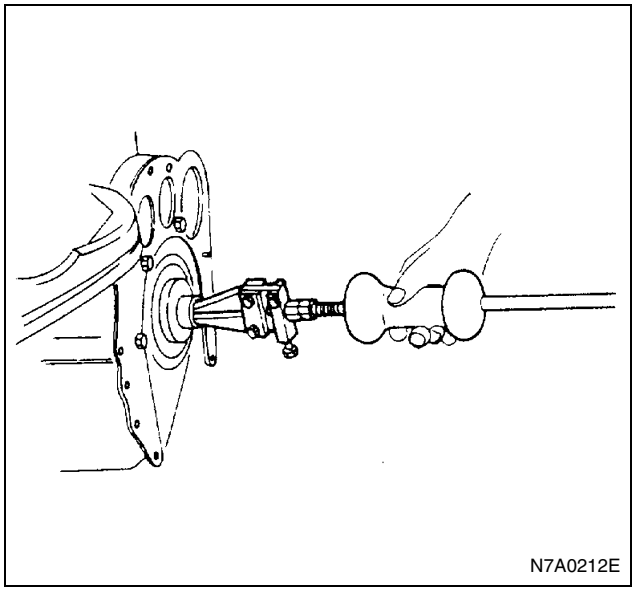


N7A0211E

4. Release Bearing Assembly
5. Shift Fork
6. Pilot Bearing

Notice:
Do not remove pilot bearing unless absolutely necessary.

- Use the pilot bearing remover to remove the pilot bearing.
  Pilot Bearing Remover: 5-8840-2000-0
  Sliding Hammer: 5-8840-0084-0



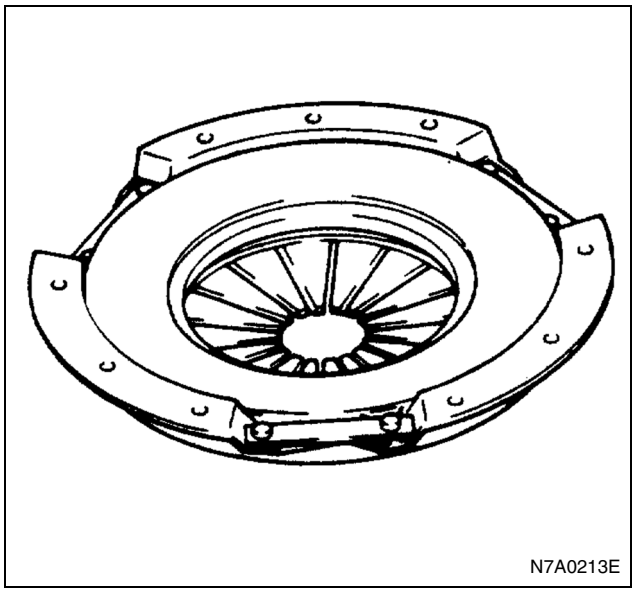
N7A0212E

Inspection and Repair

Make the necessary adjustments, repairs, and part replacement if excessive wear or damage is discovered during inspection.

Pressure Plate Assembly

- Visually inspect the pressure plate friction surface for excessive wear and heat cracks. If excessive wear or deep heat cracks are present, the pressure plate assembly must be replaced.

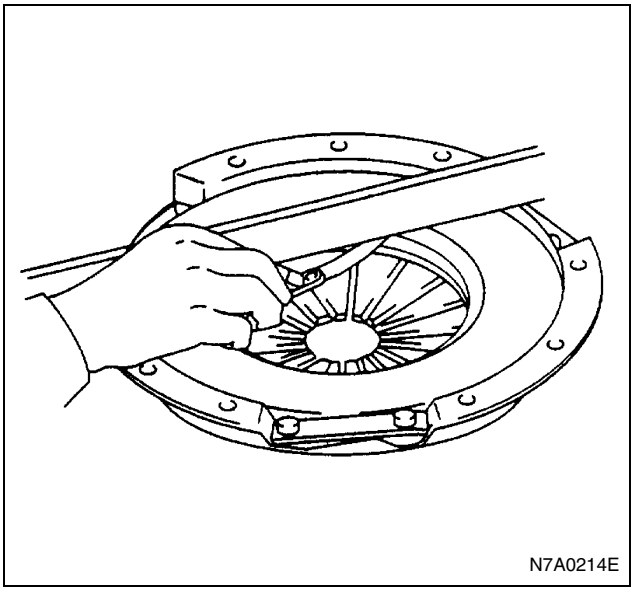


N7A0213E

Pressure Plate Warpage

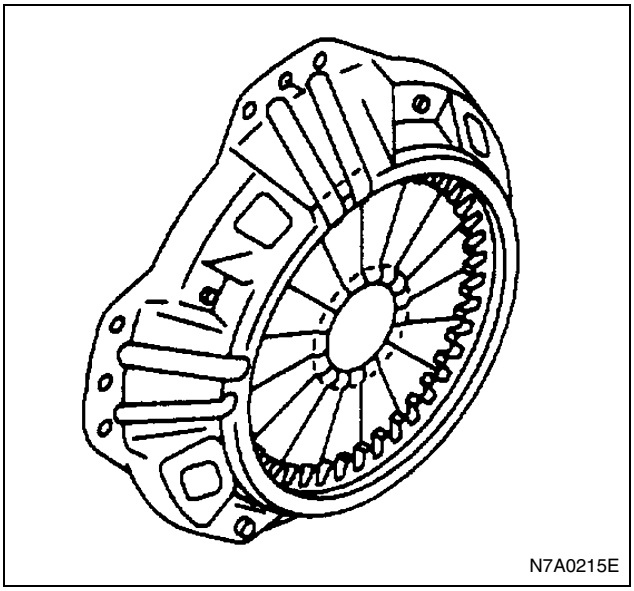
- Use a straight edge and a feeler gauge to measure the pressure plate friction surface flatness in four directions.
  If any of the measured values exceed the specified limit, the pressure plate assembly must be replaced.

Pressure Plate Warpage	mm (in)
Limit	
0.3 (0.01)	



Clutch Cover

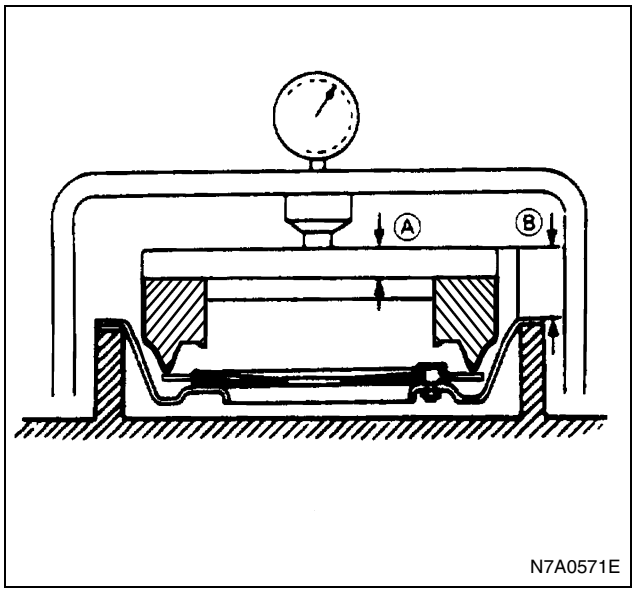
- Visually inspect the entire clutch cover for excessive wear, cracking, and other damage. The pressure plate assembly must be replaced if any of these conditions are present.



Clutch Set Force

1) Invert the pressure plate assembly.
2) Place a metal sheet with thickness “A” on the pressure plate.
3) Compress the pressure plate assembly until the distance “B” becomes specified.

Thickness and Distance		mm (in)
	A	B
NKR55 Clutch Size ϕ 240	7.4 (0.29)	18 (0.71)
NHR55/NKR55/NHR69 Clutch Size ϕ 250	8.0 (0.31)	18 (0.71)



4) Note the pressure plate gauge reading.

Clutch Set Force		N (kg/lb)
	Standard	Limit
NKR55 Clutch Size ϕ 240	4,116 (420/926)	3,785 (386/851)
NHR55/NKR55/NHR69 Clutch Size ϕ 250	6,276 (640/1,411)	5,776 (589/1,299)

Diaphragm Spring Finger Height

1) Place distance pieces beneath the pressure plate and clutch cover.

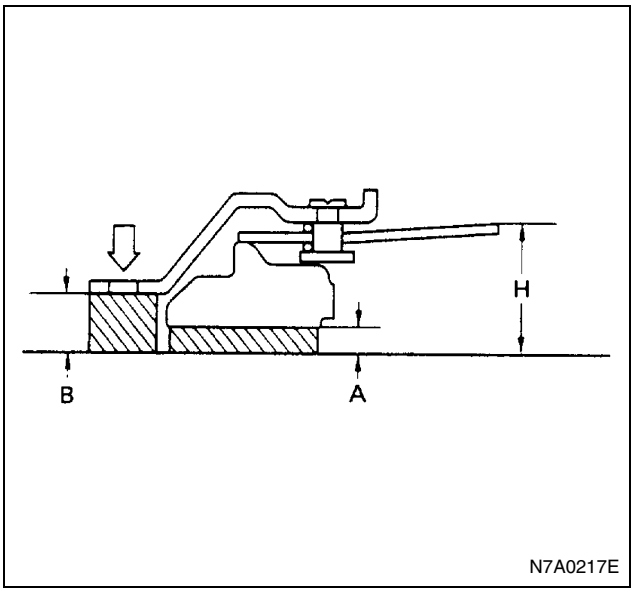
Distance Piece		mm (in)
	A	B
NKR55 Clutch Size ϕ 240	7.4 (0.29)	18 (0.71)
NHR55/NKR55/NHR69 Clutch Size ϕ 250	8.0 (0.31)	18 (0.71)

2) Fully compress the pressure plate assembly. There are two ways to do this.

a. Use a bench press to press down on the pressure plate assembly from the top.
b. Tighten the pressure plate assembly fixing bolts.

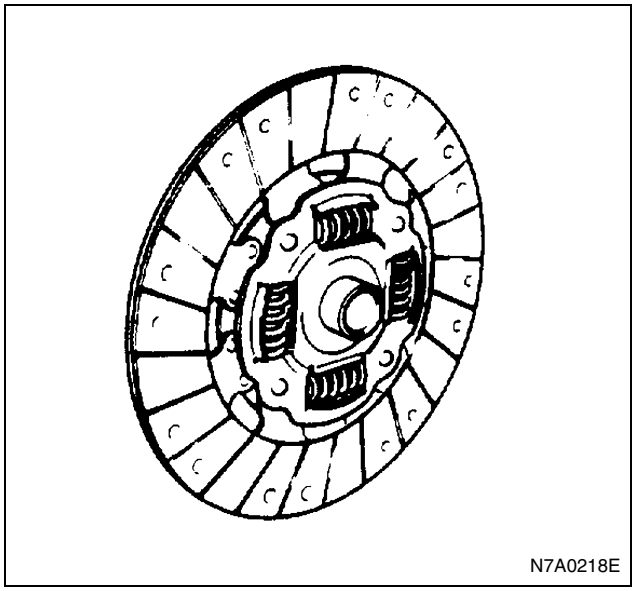
3) Measure the spring finger height from base to spring tip.

Spring Finger Height (H)	mm (in)
	Standard
NKR55 Clutch Size ϕ 240	40.7 — 42.7 (1.60 — 1.68)
NHR55/NKR55/NHR69 Clutch Size ϕ 250	39.0 — 41.0 (1.54 — 1.61)



Driven Plate Assembly

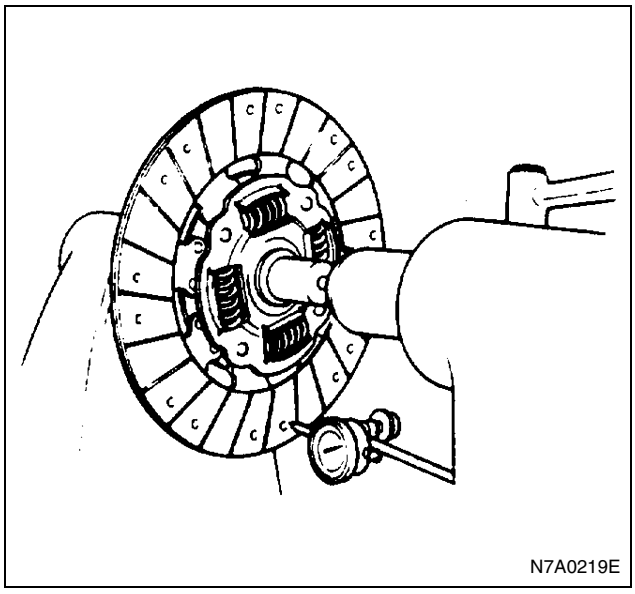
- Visually inspect the torsion spring for looseness, breakage, and weakening.
  If any of these conditions are discovered, the driven plate assembly must be replaced.
- Visually inspect the facing surfaces for cracking and excessive scorching.
  Visually inspect the facing surfaces for the presence of oil or grease.
  If any of these conditions are discovered, the facing must be cleaned or the driven plate assembly replaced.
- Check that the driven plate moves smoothly on the transmission top gear shaft spline.
  Minor ridges on the top gear shaft spline may be removed with an oil stone or pencil grinder.



Driven Plate Warpage

- Insert the pilot aligner into the driven plate spline hub.
  The pilot aligner must be held perfectly horizontal.
  Pilot Aligner: 5-8525-3001-0
- Set a dial indicator to the driven plate outside circumference.
- Slowly turn the driven plate.
  Read the dial indicator as you turn the driven plate.
  If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

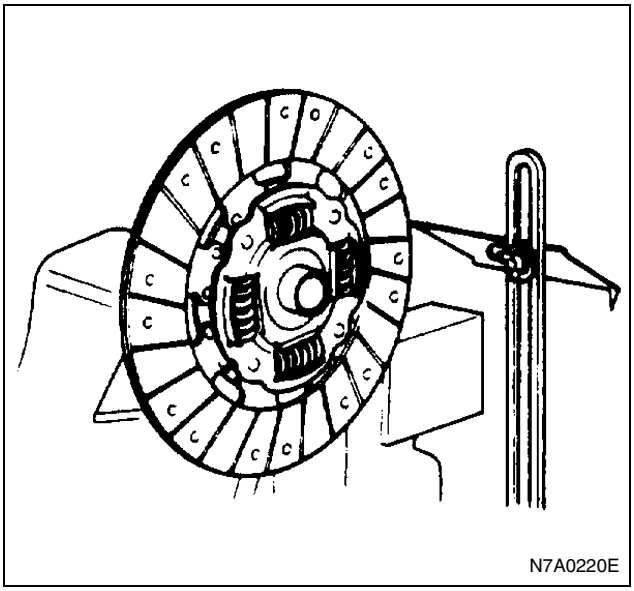
Driven Plate Warpage	mm (in)
Standard	Limit
Less than 0.7 (0.03)	1.0 (0.04)



Driven Plate Splined Hub Spline Wear

- Clean the driven plate splined hub.
- Install the driven plate to the transmission top gear shaft spline.
- Set a surface gauge to the driven plate outside circumference.
- Slowly turn the driven plate. Measure the spline rotation play as you turn the driven plate.
  If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Splined Hub Spline Wear	mm (in)
Standard	Limit
Less then 0.5 (0.02)	1.0 (0.04)

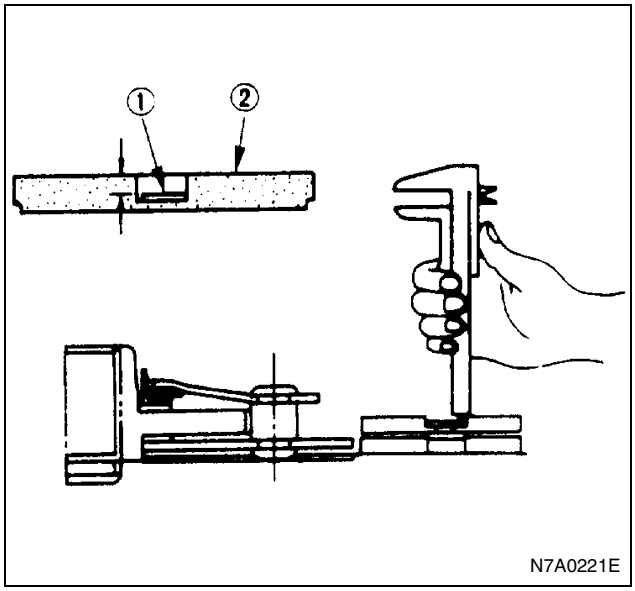


N7A0220E

Driven Plate Rivet Head Depression

- Use the depth gauge or a straight edge with steel rule to measure the rivet head depression (1) from the facing surface (2).
  Be sure to measure the rivet head depression (1) on both sides of the driven plate (2).
  If the measured value is less than the specified limit, the driven plate must be replaced.

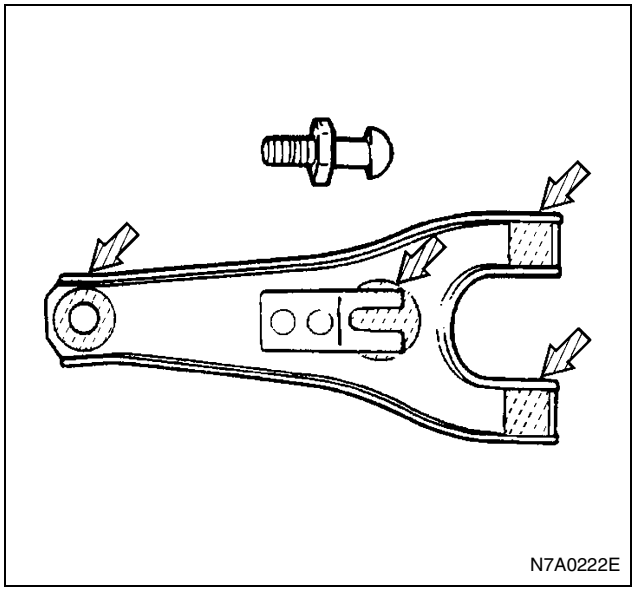
Rivet Head Depression		mm (in)
	Standard	Limit
NKR55 Clutch Size ϕ 240	1.1 — 1.7 (0.04 — 0.07)	0.2 (0.01)
NHR55/NKR55/NHR69 Clutch Size ϕ 250	1.65 — 2.25 (0.06 — 0.09)	0.2 (0.01)



N7A0221E

Shift Fork and Support Bolt

- Visually inspect the surfaces of the shift fork making contact with the shift block (release bearing) and support bolt.
- Correct a slight stepped wear or surface roughness with an oil stone or pencil grinder, or replace the shift fork and/or support bolt if unrecoverable damage is found.
- Apply multi-purpose with MOS_2 type grease.



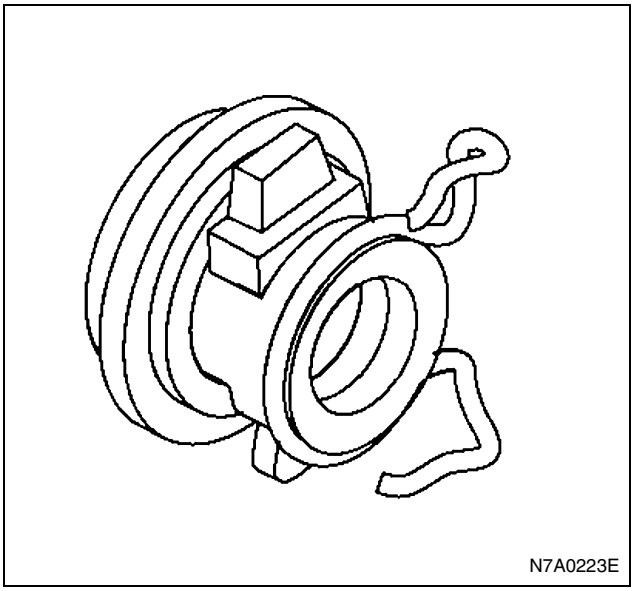
N7A0222E

Release Bearing Assembly

- Visually inspect the release bearing assembly for breakage and weakening.
- If any of these conditions are discovered, release bearing assembly must be replaced.

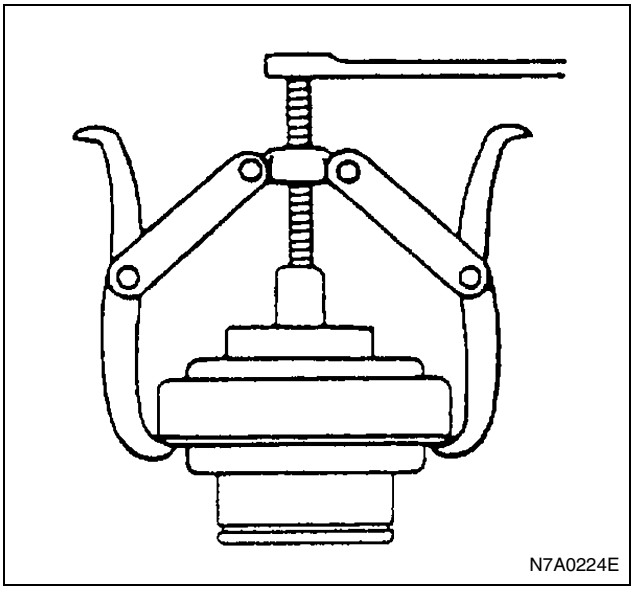
Caution:
The release bearing is permanently packed with lubricant and should not be soaked in cleaning solvent, as this will dissolve the lubricant.

Notice:
Do not disassemble the shift block assembly if no fault is apparent.



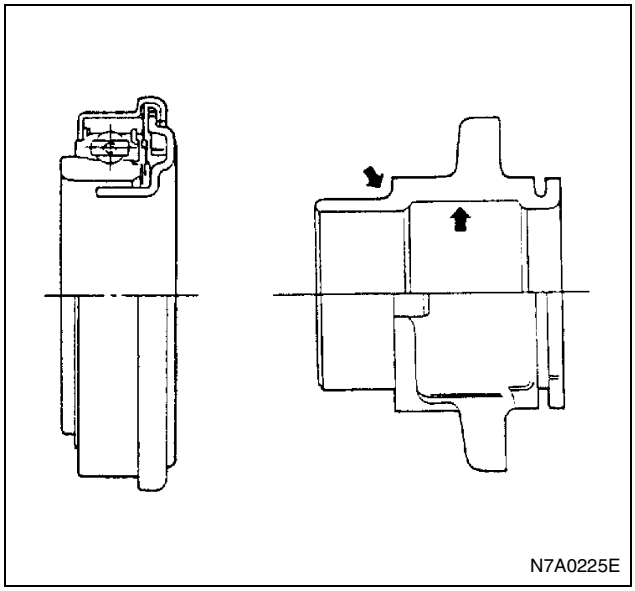
N7A0223E

- Use the bearing remover and bench press to remove the release bearing.
  Bearing Remover: 5-8840-0013-0



N7A0224E

- Install the parts as shown after applying multi-purpose with MOS_2 type grease.
  Use a bench press.



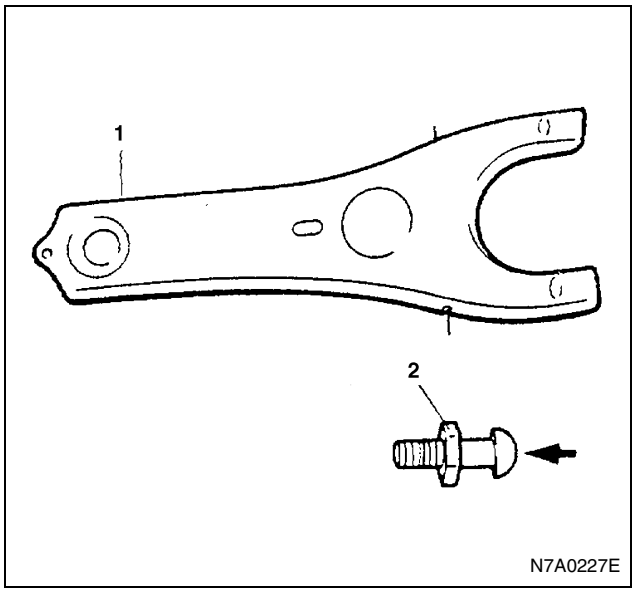
N7A0225E

Support Spring

- Visually inspect the support spring for breakage and weakening.
- If any of these condition are discovered, parts must be replaced.

Installation

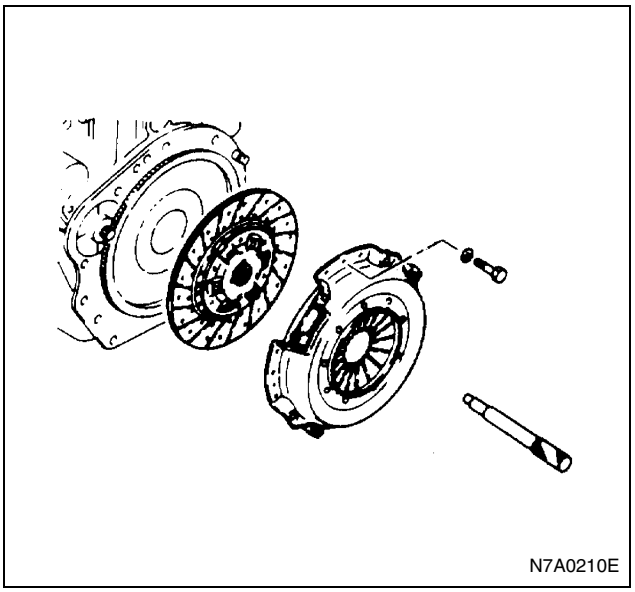
1. Pilot Bearing
   - Use the pilot bearing installer to install the clutch pilot bearing.
     Pilot Bearing Installer: 5-8522-0024-0
2. Shift Fork
   - Apply multi-purpose with MOS_2 type grease to the contact surfaces with the shift block and support bolt head.



N7A0227E

Legend
1. Shift fork
2. Support bolt

3. Release Bearing Assembly
4. Driven Plate Assembly
   - Apply multi-purpose with MOS_2 type grease to the driven plate hub spline.
   - Use the pilot aligner to install the driven plate assembly.
     Pilot Aligner: 5-8525-3001-0



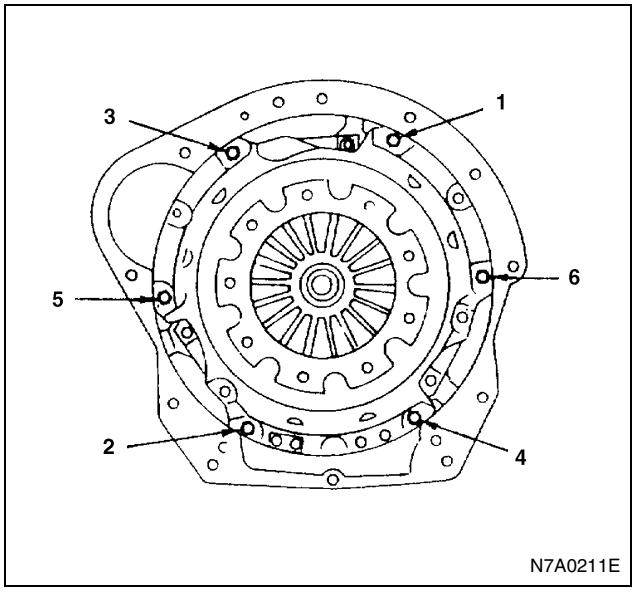
N7A0210E

5. Pressure Plate Assembly
   - Tighten pressure plate assembly fixing bolts in numerical order.

Tighten:
Pressure plate fixing bolt to 18 N·m (1.8 kg·m / 13 lb·ft)

   - Remove the pilot aligner.

Notice:
In case a new pressure plate assembly is mounted, after tightening a pressure plate to the specified torque, be sure to remove the wire for protection of a diaphragm spring.



N7A0211E

6. Transmission Assembly
   Refer to "SECTION 7B ON-VEHICLE SERVICE: TRANSMISSION ASSEMBLY REPLACEMENT" in this manual.

Tighten:
Clutch housing to flywheel housing bolts to
- M10: 46 N·m (4.7 kg·m / 34 lb·ft)
- M12: 91 N·m (9.3 kg·m / 67 lb·ft)

Tighten:
Engine rear mounting nuts and bolts to
- M10: 40 N·m (4.1 kg·m / 30 lb·ft)
- M12: 69 N·m (7.0 kg·m / 51 lb·ft)

Tighten:
Front exhaust pipe bolts to 37 N·m (3.8 kg·m / 27 lb·ft)

Tighten:
Exhaust brake bolts to 17 N·m (1.7 kg·m / 12 lb·ft)

Tighten:
Slave cylinder bolts to 16 N·m (1.6 kg·m / 12 lb·ft)

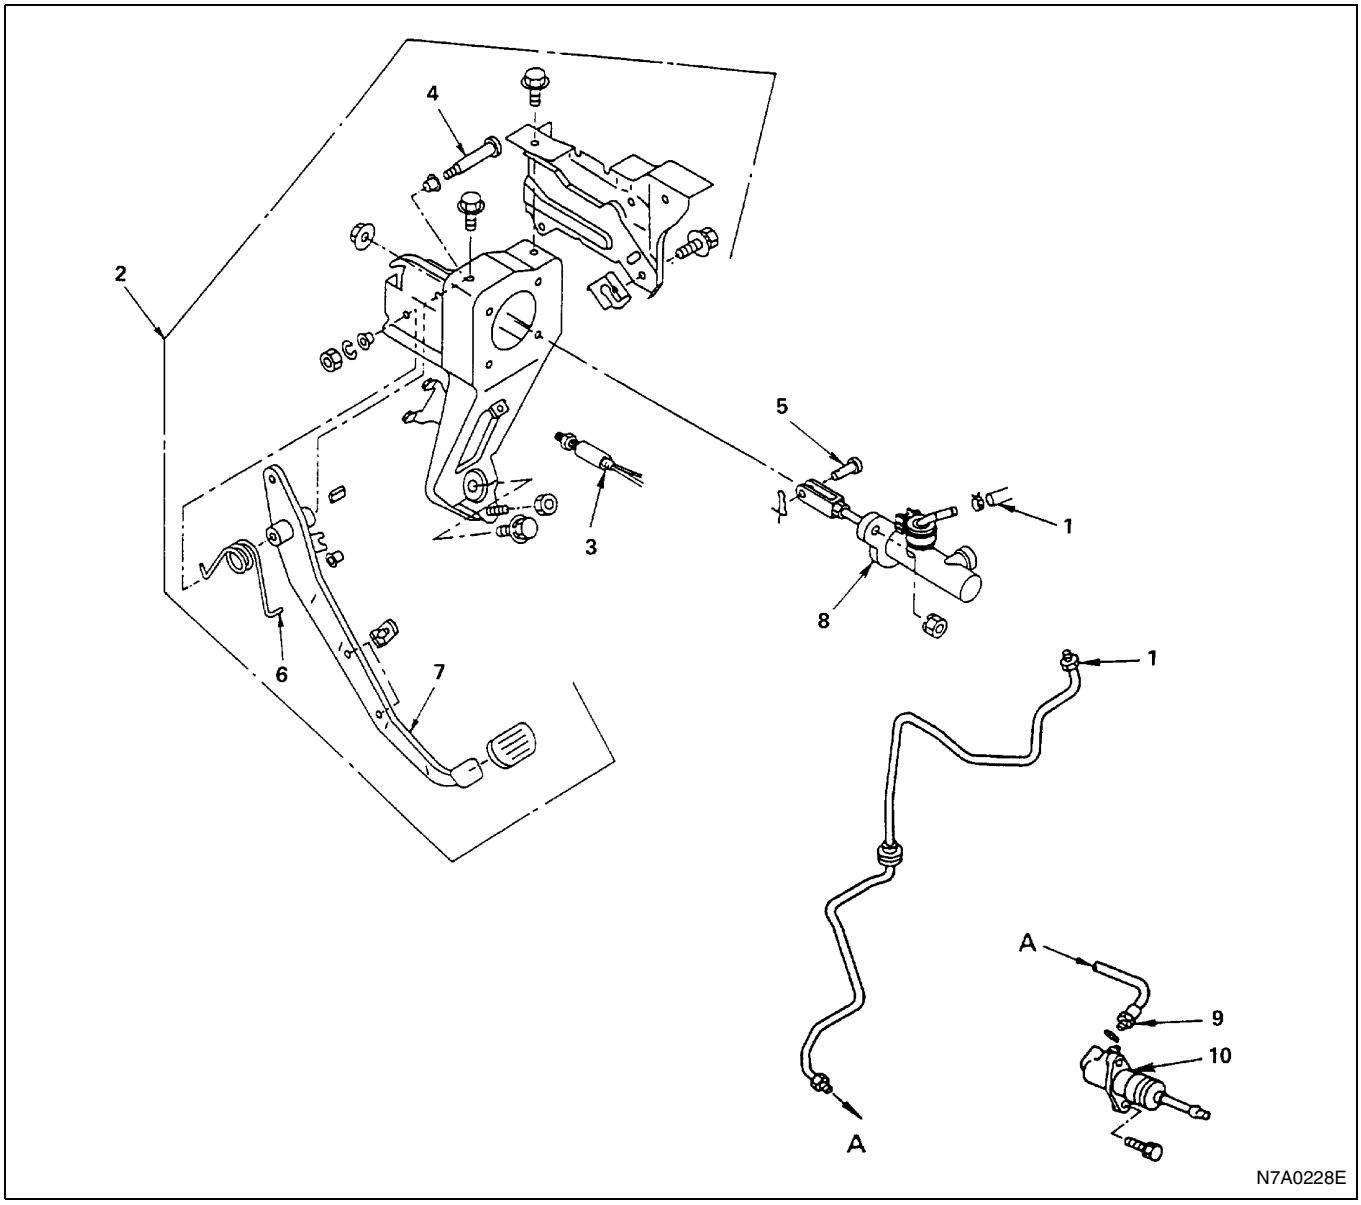
Perform slave cylinder adjustment before installation of the return spring.
1) Loosen the lock nut of the push rod.
2) Turn the adjust nut until it reaches the shift fork.
3) Back off the adjust nut 1.5 turns (shift fork free play Approximately 2 mm/0.1 in).
4) Tighten the lock nut.

Tighten:
Push rod lock nut to 19 N·m (1.9 kg·m / 14 lb·ft)

Wiring Connector Color
Back-up Light Switch: Brown
Neutral Switch: Gray

Tighten:
Propeller shaft nuts to 66 N·m (6.7 kg·m / 48 lb·ft)

Clutch Control



Legend

1. Clutch pipe and hose
2. Clutch pedal and bracket assembly
3. Clutch switch or stopper bolt
4. Shaft
5. Clevis pin
6. Return spring
7. Clutch pedal
8. Master cylinder
9. Flexible hose
10. Slave cylinder

Preparation

1. Meter Cluster
   - Pull out the meter cluster and disconnect the harness connectors.
2. Meter Assembly
   - Remove the 5 fixing screws, then remove the meter assembly and disconnect the harness connector.

Removal

- Drain the clutch fluid from the clutch hydraulic line.

Caution:
Do not let clutch fluid remain on a painted surface. Wash it off immediately.

1. Clutch Pipe and Hose
2. Clutch Pedal and Bracket Assembly
3. Clutch Switch or Stopper Bolt
4. Shaft

7. Clutch Pedal
8. Master Cylinder
9. Flexible Hose
10. Slave Cylinder

Inspection and Repair

Make the necessary adjustment, repairs, and part replacement if excessive wear or damage is discovered during inspection.

Installation

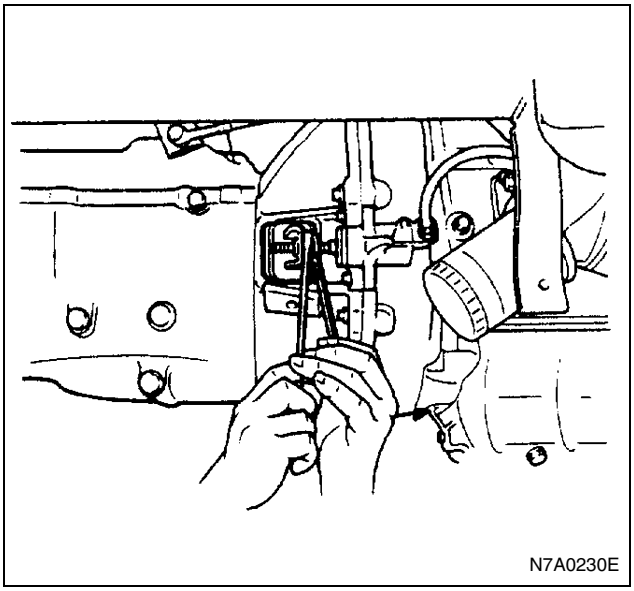
1. Slave Cylinder

Tighten:
Slave cylinder bolt to 19 N·m (1.9 kg·m / 14 lb·ft)

- Perform slave cylinder adjustment before installation of the return spring.

1) Loosen the lock nut of the push rod.
2) Turn the adjust nut until it reaches the shift fork.
3) Back off the adjust nut 1.5 turns. (shift fork free play approximately 2 mm/0.1 in).
4) Tighten the lock nut.

Tighten:
Push rod lock nut to 16 N·m (1.6 kg·m / 12 lb·ft)



2. Flexible Hose
3. Master Cylinder

- Install the master cylinder assembly to the clutch pedal bracket.

Tighten:
Fixing nuts to 13 N·m (1.3 kg·m / 113 lb·in)

4. Clutch Pedal
5. Return Spring
6. Clevis Pin
7. Shaft
8. Clutch Switch or Stopper Bolt
9. Clutch Pedal and Bracket Assembly

Tighten:
Clutch bracket bolts to 37 N·m (3.8 kg·m / 27 lb·ft)

- Perform the clutch pedal adjustment after installation of clutch control.

Clutch Pedal Height and Stroke

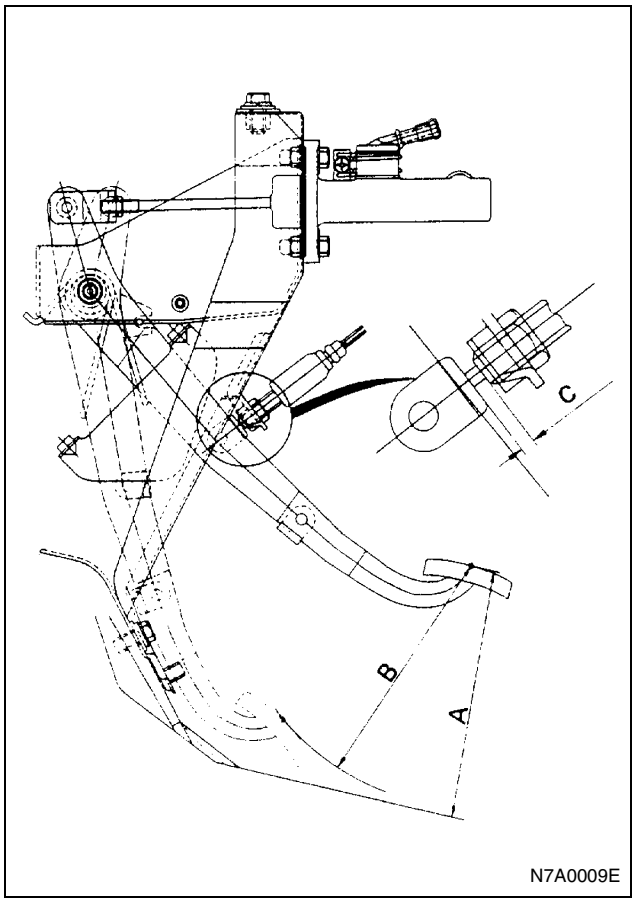
1) Loosen the lock nut of the master cylinder push rod.
2) Adjust the pedal height by turning the push rod.

Clutch Pedal Height and Stroke	mm (in)
Height (A): 160 — 170 (6.3 — 6.7) Stroke (B): 159 — 169 (6.2 — 6.7)	

3) Tighten the lock nut.

Tighten:
Lock nut to 17 N·m (1.7 kg·m / 12 lb·ft)

4) Install the meter assembly and meter cluster.



Clutch Pedal Free Play

Clutch Switch or Stopper Bolt

After completion of clutch pedal height and slave cylinder adjustment, adjust the clutch switch or stopper bolt clearance.

1) Loosen the lock nut of clutch switch or stopper bolt.

2) Adjust the clutch switch or stopper bolt clearance by turning clutch switch or stopper bolt.

Clutch Switch or Stopper Bolt Clearance (C)	mm (in)
0.5 — 1.0 (0.02 — 0.04)	

Clutch Pedal Free Play	mm (in)
15 — 25 (0.6 — 1.0)	

3) Tighten the lock nut.

Tighten:
Lock nut to 19 N·m (1.9 kg·m / 14 lb·ft)

10. Clutch Pipe and Hose
    - Perform the clutch hydraulic circuit bleeding after installation of the clutch control.
      Bleeding operation calls for cooperative action of two men.
    1) Check the level of clutch fluid in the reservoir and replenish if necessary.
    2) Remove the rubber cap from the bleeder screw and wipe clean the bleeder screw.
       Connect a vinyl tube to the bleeder screw and insert the other end of the vinyl tube into transparent container.
    3) Pump the clutch pedal repeatedly and hold it depressed.
    4) Loosen the bleeder screw on the clutch slave cylinder to release clutch to release clutch fluid with air bubbles into the container and tighten the bleeder screw immediately.
    5) Release the clutch pedal carefully. Repeat the above operation until air bubbles disappear from the clutch fluid being pumped out into the container. During the bleeding operation, keep the clutch fluid reservoir filled to the specified level.
       Reinstall the rubber cap.

8. Piston assembly
9. Return spring
10. Cylinder body

Disassembly

1. Pipe Joint
2. Clevis Yoke
3. Lock Nut
4. Dust Cover
5. Snap Ring
   - Press down the piston with your finger to prevent it from jumping out.
6. Stopper
7. Push Rod
8. Piston Assembly
9. Return Spring
10. Cylinder Body

Inspection and Repair

Make the necessary adjustments, repairs, and parts replacements if excessive wear or damage is discovered during inspection.

Cylinder Body

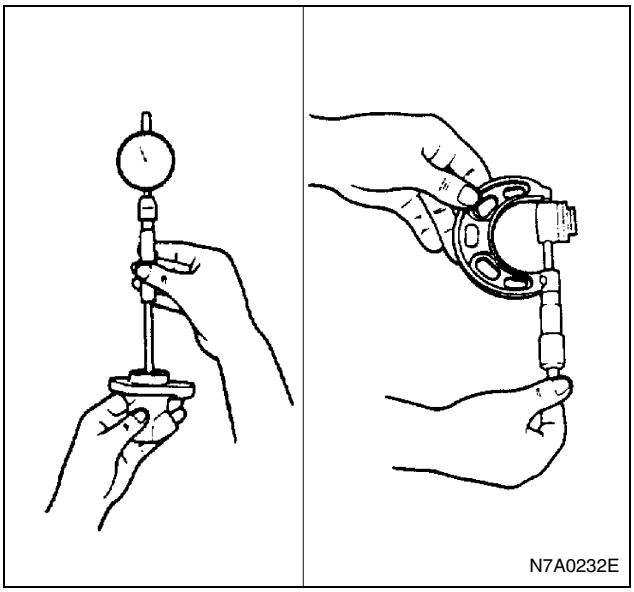
- Wash clean the cylinder body in brake fluid.
- Check the fluid return port for restrictions and clean it if necessary.
- Measure the cylinder bore diameter.

Master Cylinder Bore Diameter	mm (in)
Standard	
ϕ19.050 — 19.102 (0.7500 — 0.7520)	

Clearance between Cylinder Bore and Piston Clearance	mm (in)
Standard	Limit
0.03 — 0.11 (0.001 — 0.004)	0.12 (0.005)

- If excessive wear or any abnormal conditions are present, the master cylinder assembly must be replaced with new one.

Caution:
If the master cylinder has been disassembled, the repair kit must be replaced with new one.



Reassembly

1. Cylinder Body
   - Immerse the cylinder body in clean brake fluid.
2. Return Spring
   - Install the return spring to the piston assembly.
3. Piston Assembly
   - Before installing, apply a thin coat of rubber grease to the piston.

Caution:
Use care to prevent damaging the lip of the piston cup.

4. Push Rod
5. Stopper
6. Snap Ring
7. Dust Cover
8. Lock Nut

Tighten:
Lock nut to 17 N·m (1.7 kg·m / 12 lb·ft)

9. Clevis Yoke
10. Pipe Joint

Tighten:
Pipe joint to 5 N·m (0.5 kg·m / 43 lb·in)

Slave Cylinder

Disassembly

1. Push Rod
2. Boot
3. Piston Assembly
4. Bleeder Screw
5. Cylinder Body

Inspection and Repair

Make the necessary adjustments, repairs, and parts replacements if excessive wear or damage is discovered during inspection.

Cylinder Body

- Wash clean the cylinder body in brake fluid.
- Measure the cylinder bore diameter.

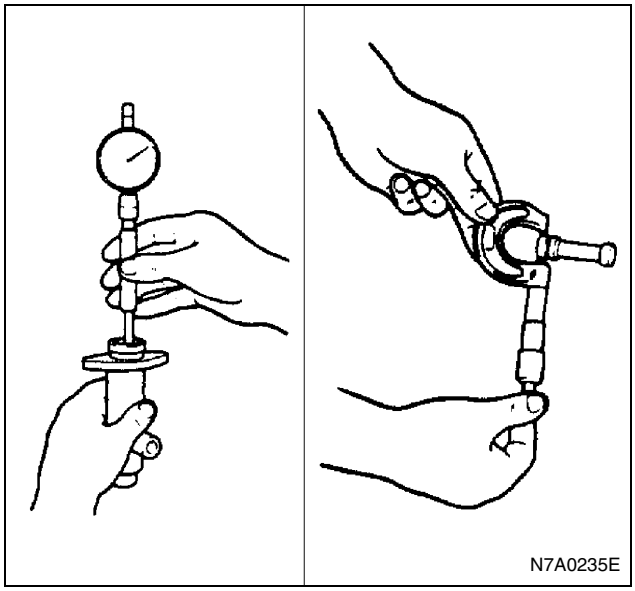
Cylinder Bore Diameter	mm (in)
Standard	
ϕ26.990 — 27.042 (1.0626 — 1.0646)	

Clearance between Cylinder Bore and Piston Clearance	mm (in)
Standard	Limit
0.02 — 0.10 (0.0008 — 0.0039)	0.11 (0.0043)

- If excessive wear or any abnormal conditions are present, the slave cylinder assembly must be replaced with new one.

Caution:

If the slave cylinder has been disassembled, the repair kit must be replaced with new one.



Reassembly

1. Cylinder Body
2. Bleeder Screw
3. Piston Assembly
   - Before installing, apply a thin coat of rubber grease to the piston.

Caution:

Use care to prevent damaging the lip of the piston cup.

4. Boot
5. Push Rod

NOTICE

Before using this Workshop Manual to assist you in performing vehicle service and maintenance operations, it is recommended that you carefully read and thoroughly understand the information contained in Section-0A under the headings "GENERAL REPAIR INSTRUCTIONS" and "HOW TO USE THIS MANUAL".

All material contained in this Manual is based on latest product information available at the time of publication.
All rights are reserved to make changes at any time without prior notice.

Applicable Model:

N-Series

This manual is applicable to 2005 year model.

THIS MANUAL INCLUDES THE FOLLOWING SECTIONS:

SECTION No.	CONTENTS
0A	GENERAL INFORMATION

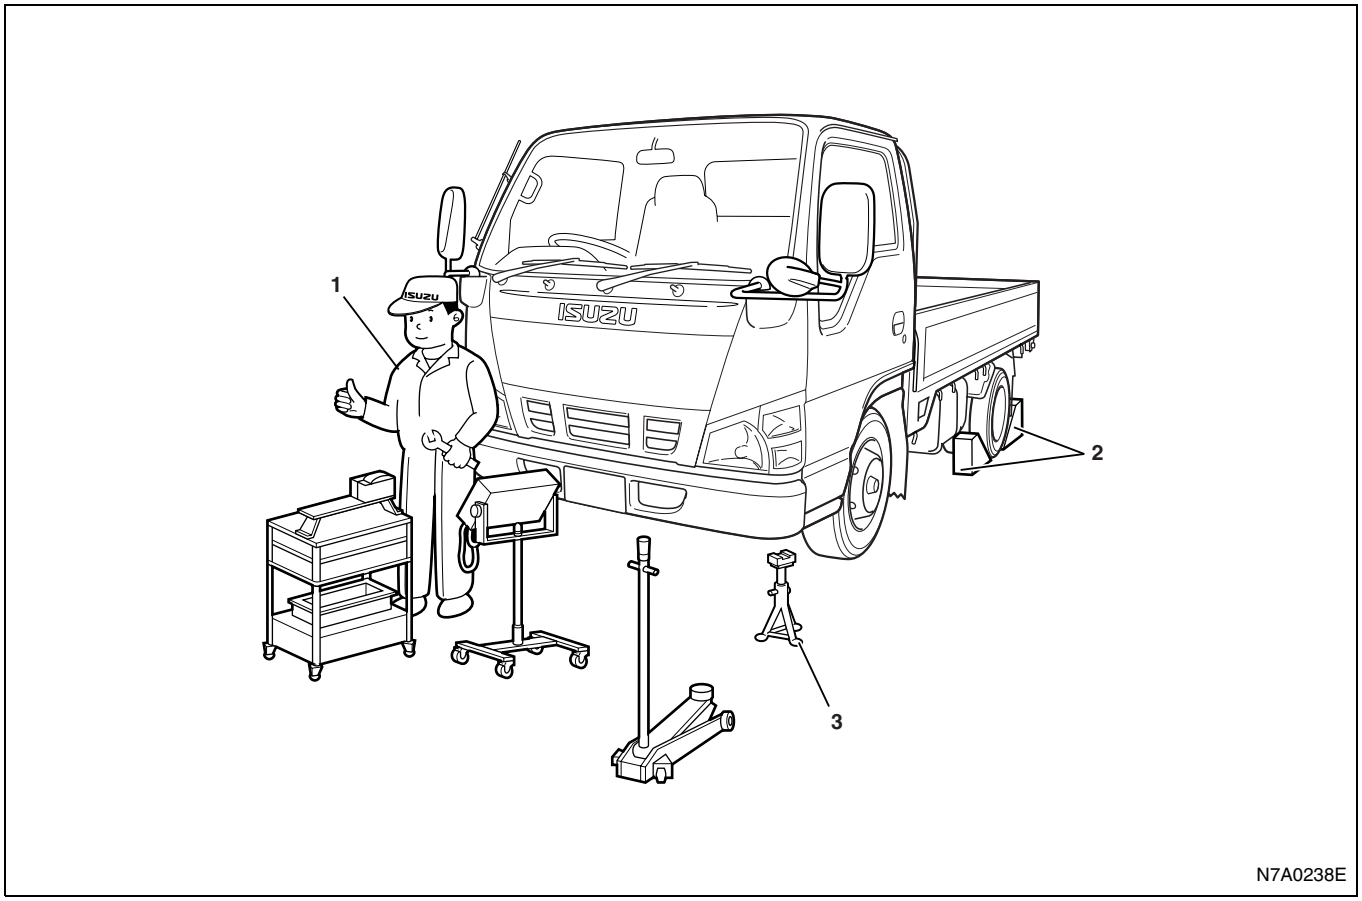
GENERAL REPAIR INSTRUCTIONS

General Precautions



N7A0238E

Preparation

- Prepare all the necessary tools, gauges and special tools before performing service operations.
- Prepare beforehand alternative parts which must be replaced or cannot be reused.

Work Clothes

- Make sure to wear a clean service uniform, cap and safety shoes (1).

Damage Prevention

- Make sure to use a cover on the vehicle body.
- Disconnect the ground cable from the battery before carrying out service operations.

Safety First

- Make sure to set chocks (2) before raising the vehicle using a jack set.
- After completing jacking-up the vehicle, make sure to set a safety stand (3) at the specified point to support the vehicle.
- Make sure to apply safety lock after raising the vehicle using a lift.
- If service operations are to be carried out by two persons or more, make sure to confirm safety of each other before performing service operations.

Precautions During Operations

- Keep the disassembled parts in good order to prevent them from confusing with unusable parts.
- When performing installation and assembly, clean or wash the relevant parts.
- Also, remove grease from the parts on which liquid packing etc. are applied.

Check After Operations

- When service operation is completed, make a final check that the service has been done properly and problem has been corrected.
- Check that there is no leakage of fuel, oil or coolant.

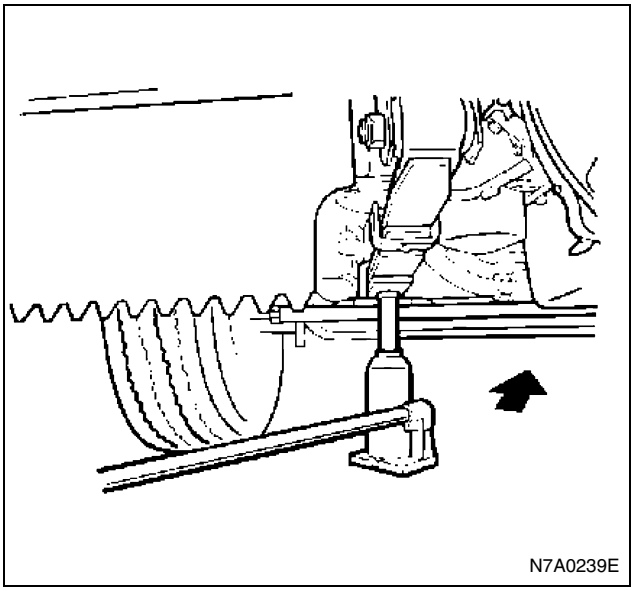
LIFTING POINTS

Lifting Points for Originally Equipped Jack

- The arrow indicates the front side of the vehicle.

Front wheels of front wheel leaf spring type suspension vehicle (NHR, NKR, NPR, NQR)

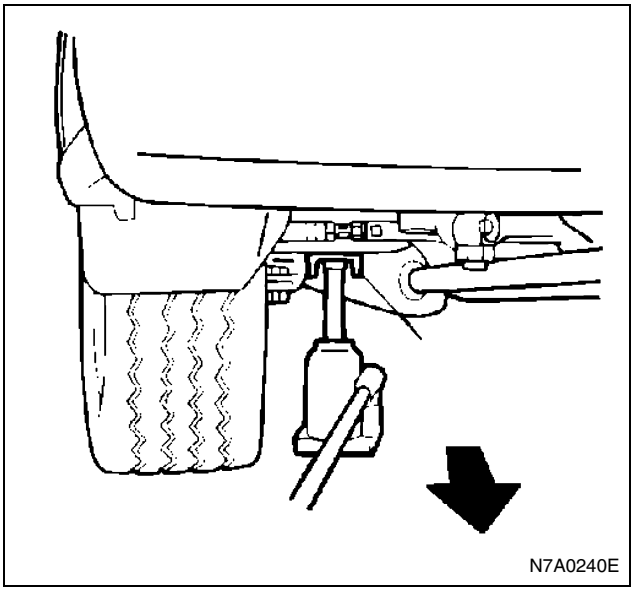
- Set the jack at the leaf spring.



N7A0239E

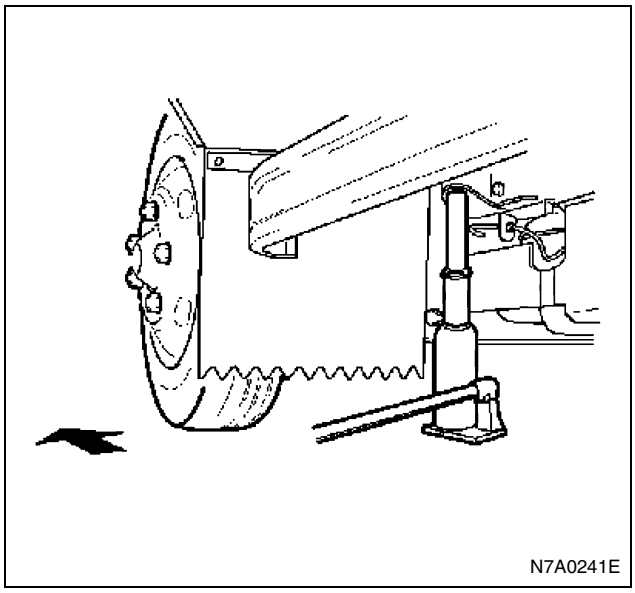
Front wheels of front wheel wishbone type suspension vehicle (NHR, NKR)

- Set the jack at the jack-up bracket on the front side of the lower link.



N7A0240E

Front wheels of front wheel wishbone type suspension vehicle (NHR, NKR, NPR)
Set the jack at the lower side of the jack-up bracket.

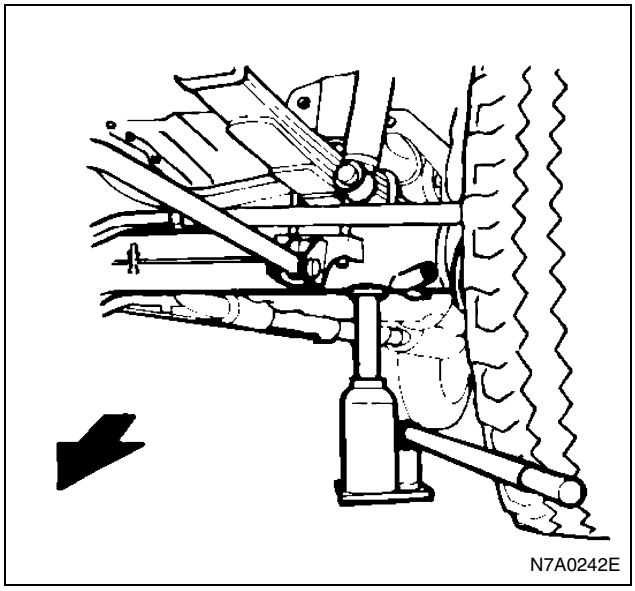


N7A0241E

Caution:
Jack-up points for the vehicles of independent front suspension differ according to vehicle types. Make sure to check the jack-up bracket before jacking up the vehicle.

Front wheels (NPS)

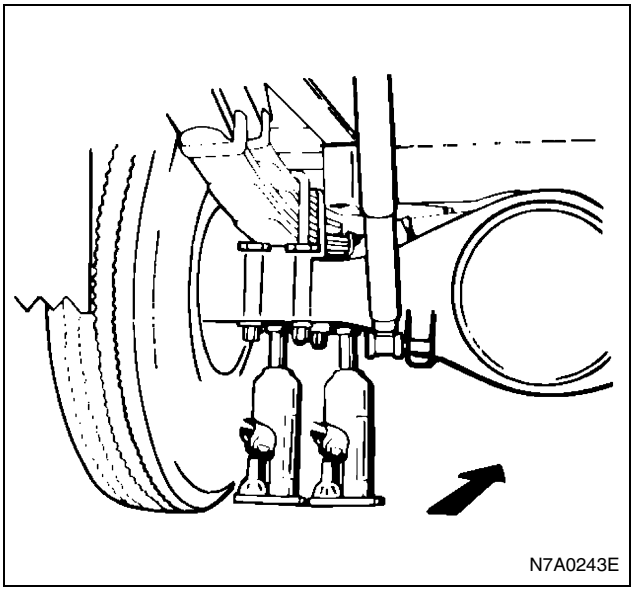
- Set the jack at the lower side of the axle.



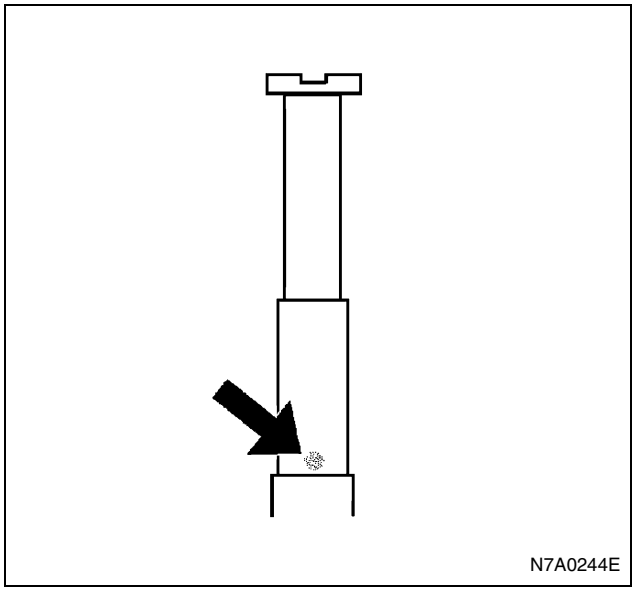
N7A0242E

Rear wheels

- Set the jack at the lower side of the leaf spring or axle case.



N7A0243E



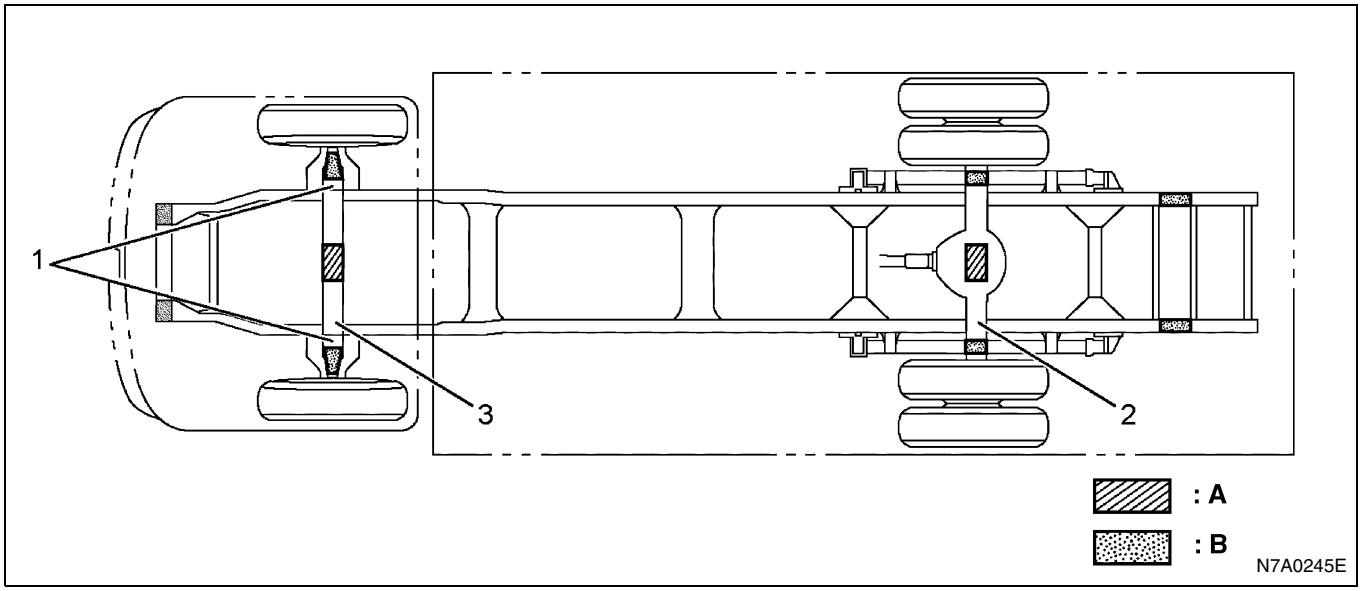
N7A0244E

Caution:
If a yellow mark appears when lifting the vehicle using the originally equipped jack, stop lifting. Continuing lifting may damage the jack.

Front wheel wishbone type (NHR, NKR, NPR)

Floor Jack Lifting Points and Chassis Stand Position

- Make sure to set the floor jack and the chassis stand properly at the specified positions.

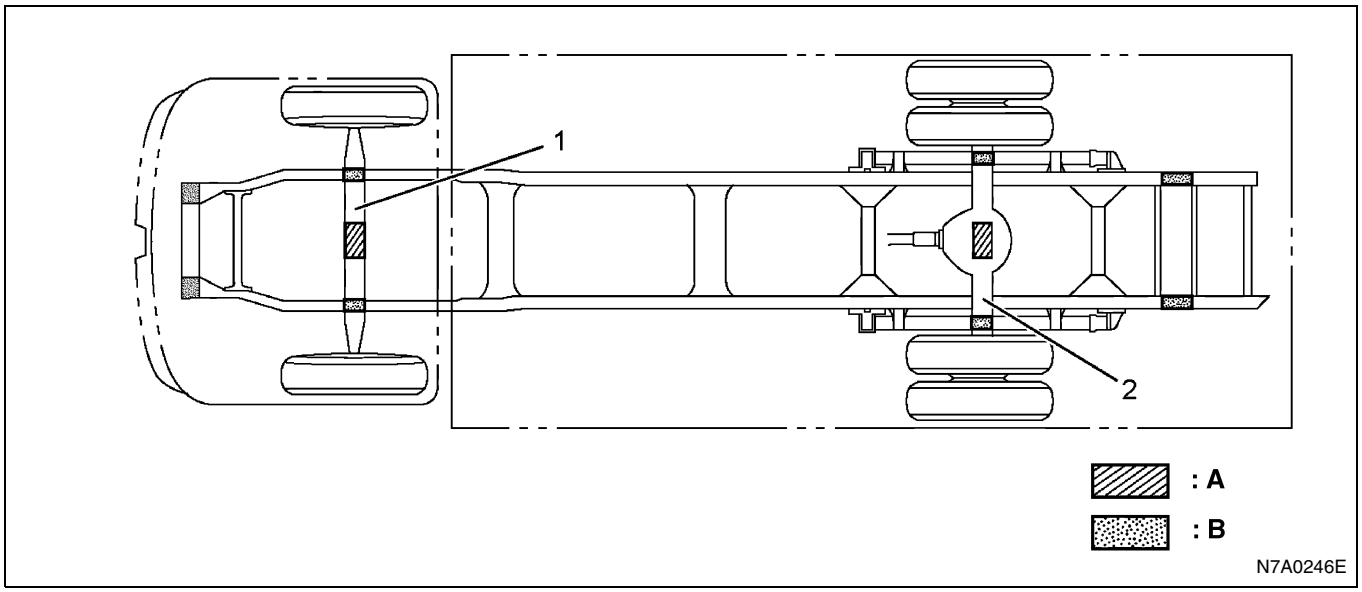


N7A0245E

Legend

A: Floor jack point
B: Chassis stand lifting position
1. Lower link (except NPR independent suspension vehicles)
2. Rear axle
3. Front suspension crossmember

Front wheel leaf spring type (NHR, NKR, NPR, NQR)

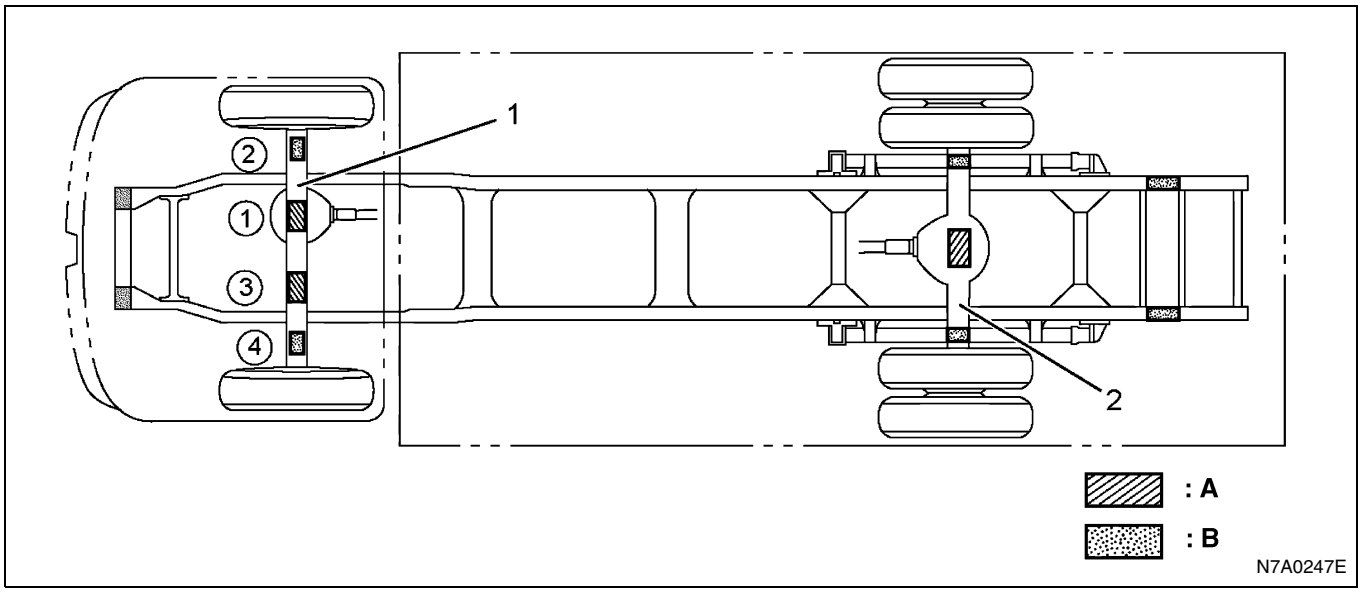


Legend

A: Floor jack point
B: Chassis stand lifting position
1. Front axle
2. Rear axle

Front wheel leaf spring type (NPS)

- Follow the numbers in circle when jacking up the front wheel side.



Legend

A. Floor jack point
B. Chassis stand lifting position
1. Front axle
2. Rear axle

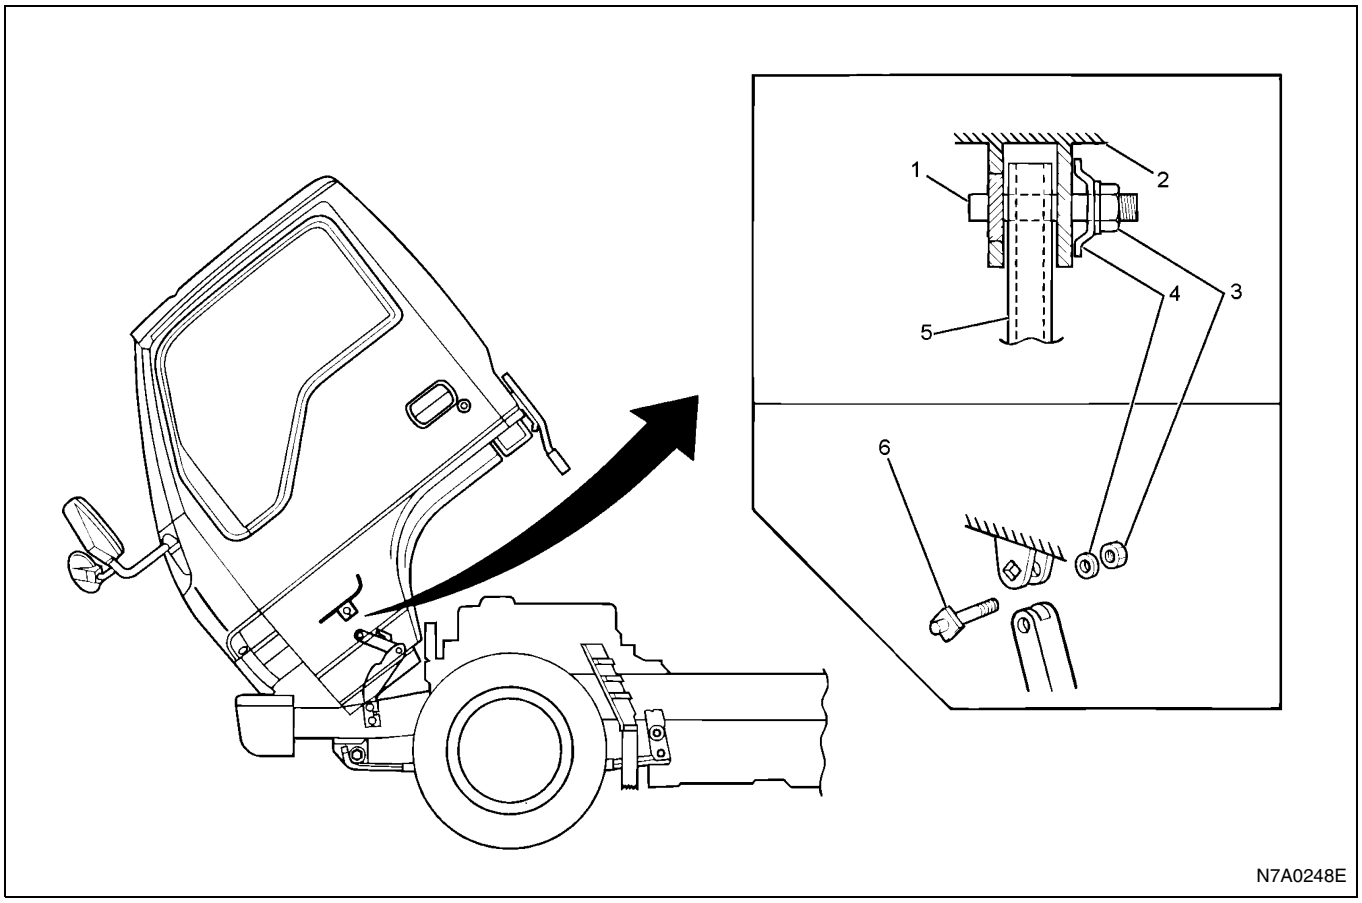
CAB TILTING

Notes for Tilting of the Cab

Make sure to observe the precautions below when removing the cab tilt stay assembly to tilt the cab in order to carry out service operations.

- When lifting the cab by tilting, use shop cloth to prevent damage to the cab.
- When tilting, the maximum tilt angle of the cab is 50 degrees. If the cab is tilted at an angle of more than 50 degrees, the torsion bar supporting the cab may be damaged.
- When tilting the cab, pay special attention not to let the cab come into contact with peripheral parts.
- The nut securing the cab tilt stay assembly is tightened with its thread deformed. Do not reuse the nut because the specified fixing torque is not obtained when reused.
- Strictly observe the specified fixing torques when tightening the nut.

Tighten:
Nut to 22±5 N·m (2.2±0.5 kg·m / 16±3.7 lb·ft)



Legend

1. Cab tilt stay pin
2. Cab side bracket
3. Nut
4. Washer
5. Cab tilt stay
6. Cab tilt stay pin

NOTES FOR WORKING ON ELECTRIC EQUIPMENT

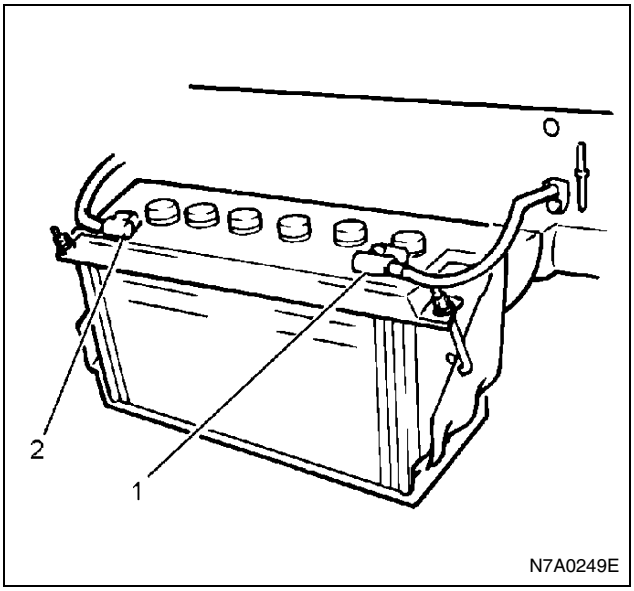
Battery Cable

Disconnecting The Battery Cable

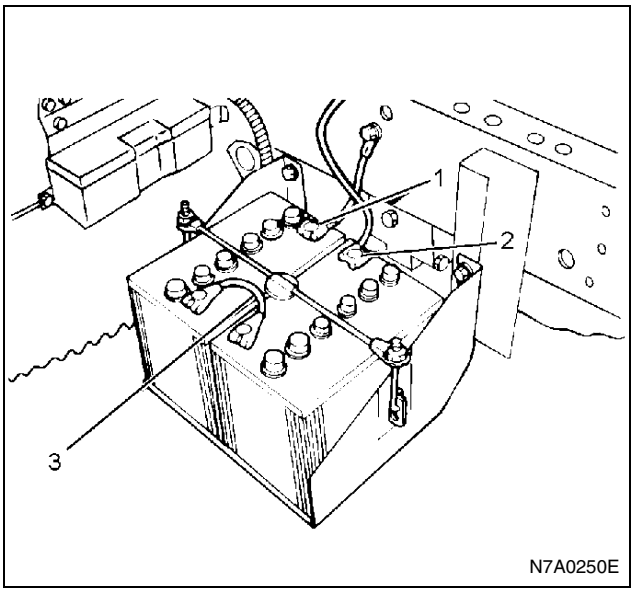
1. Turn all the switches to “OFF” positions.
2. Disconnect the battery ground cable (1).
3. Disconnect the battery positive cable (2).
4. Disconnect the battery cable (3) (Only 24V model).

Caution:
It is important that the battery ground cable should be disconnected first.
Disconnecting the battery positive cable first may result in a short circuit.

- For 12V model



- For 24V model



Connecting The Battery Cable

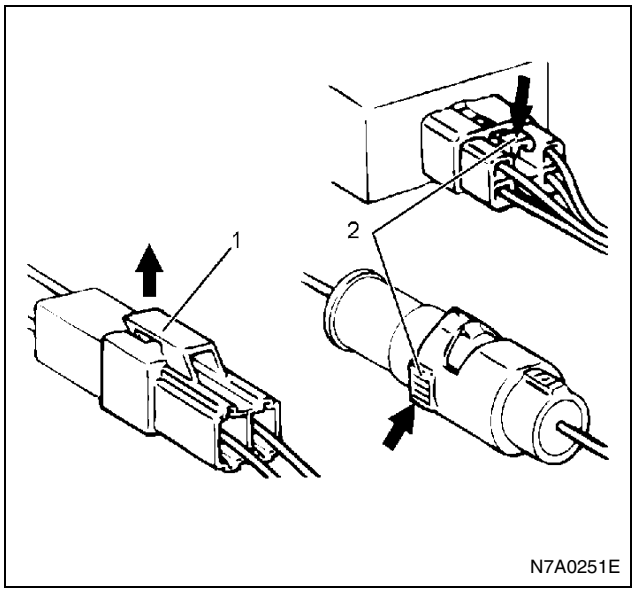
Connect in the reverse order of removal.

Caution:
Clean the battery terminal and apply a light coat of grease to prevent terminal corrosion.

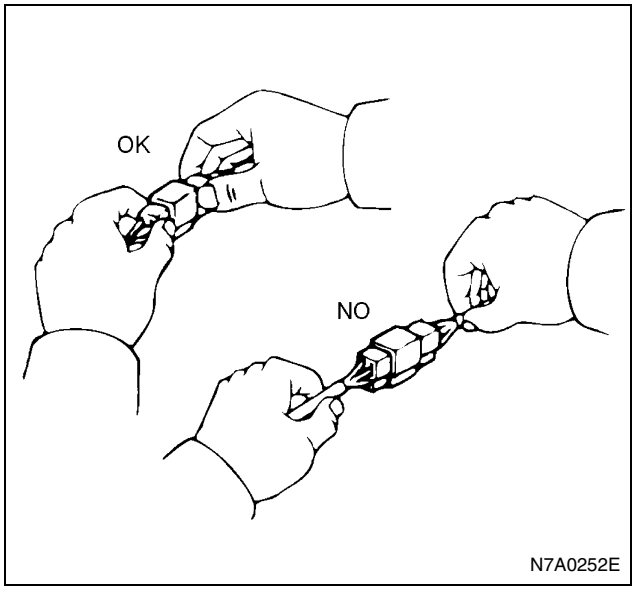
Connector Handling

Disconnecting The Connectors

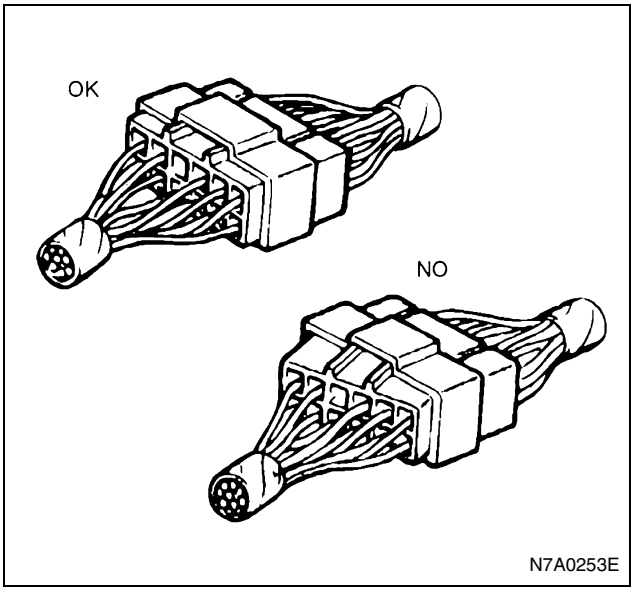
Most of the connectors have a tang lock to hold the connectors together.
Some tang locks are released by pulling them up (1).
Other tang locks are released by pressing them forward (2).
Determine which type of tang lock is adopted on the connector when disconnecting.



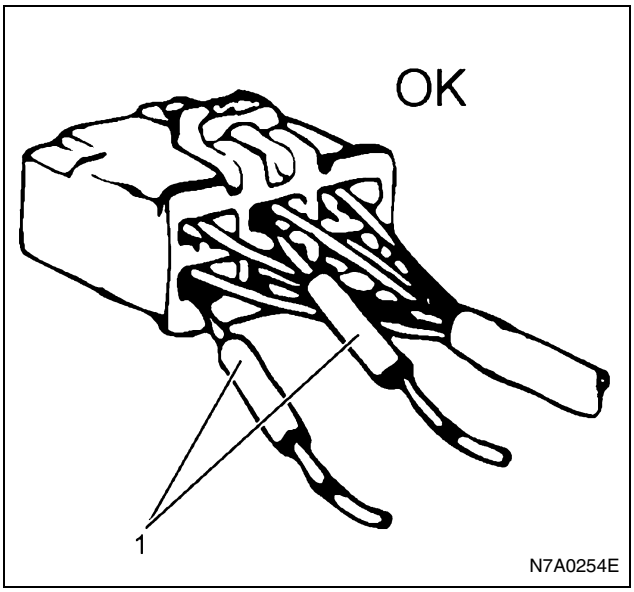
Firmly grasp both sides (male and female) of the connector.
Release the tang lock and carefully pull the two halves of the connector apart.
Never pull on the harness to separate the connectors. This will result in wire breakage.



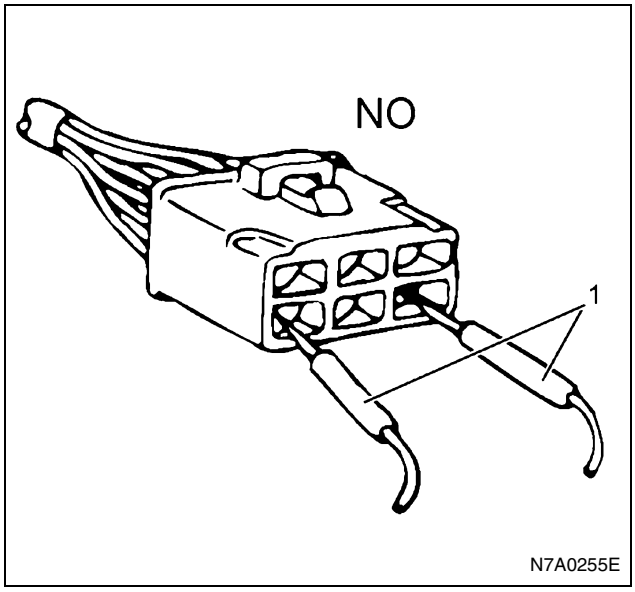
Connecting The Connector
Firmly grasp both sides (male and female) of the connector.
Firmly but carefully push the two sides of the connector together until a distinct click is heard.



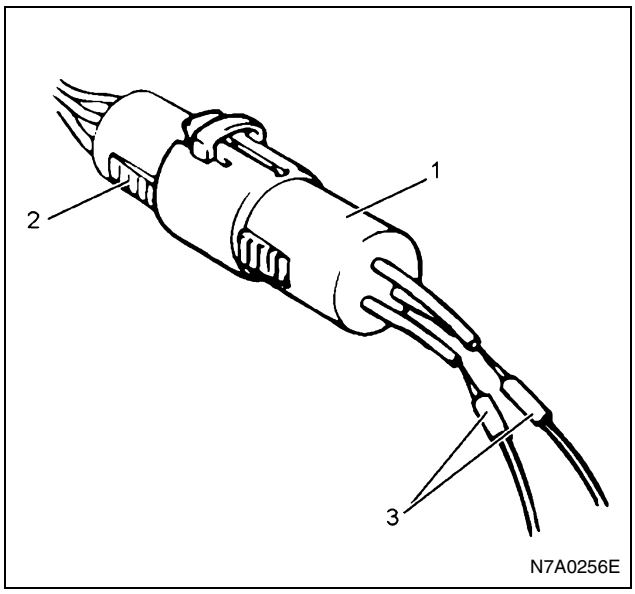
Connector Inspection
Use a circuit tester to check the connector for continuity. Insert the test probes (1) from the connector harness side.



Never insert the circuit tester test probes (1) into the connector open end to test the continuity. Broken connector terminals will result.

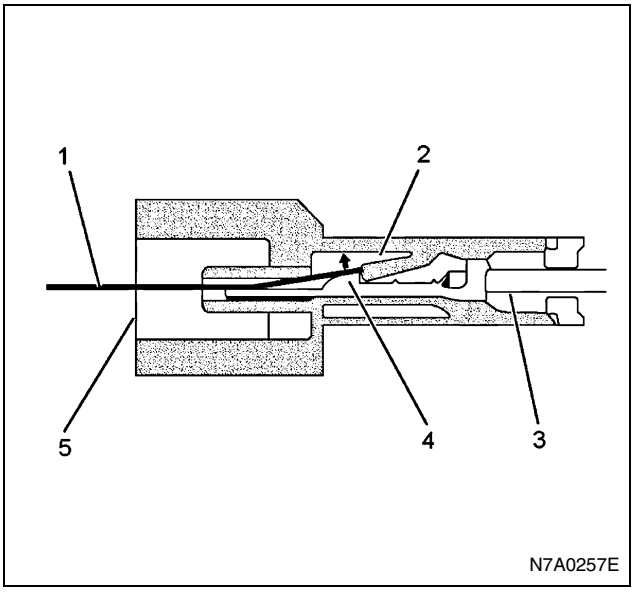


Waterproof Connector Inspection
It is not possible to insert the test probes into the connector wire side of a waterproof connector. Use a previously made connector (1) with its wires cut to carry out the test. Connect the test connector (2) to the connector to be tested. Connect the test probes (3) to the cut wires to check the connector continuity.



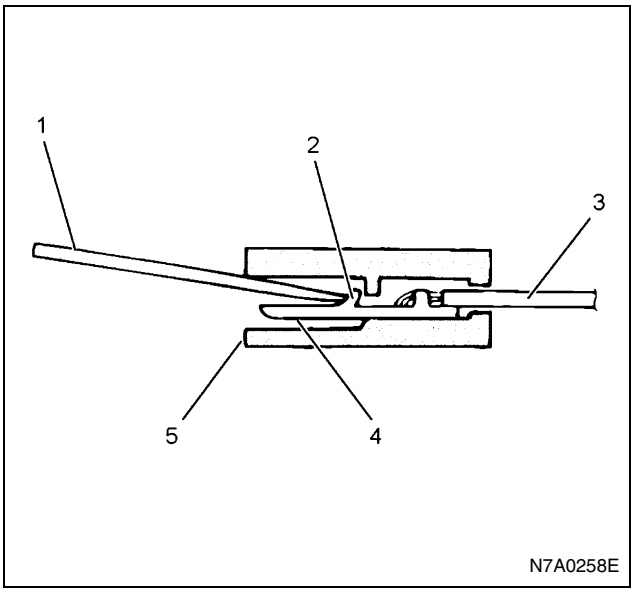
Connector Pin Removal
Connector Housing Tang Lock Type

1. Insert a thin flat-tip screwdriver or equivalent (1) into the connector housing open end (5).
2. Push the tang lock (2) up (in the direction of the arrow in the figure). Pull the wire (3) with pin (4) free from the wire side of the connector.



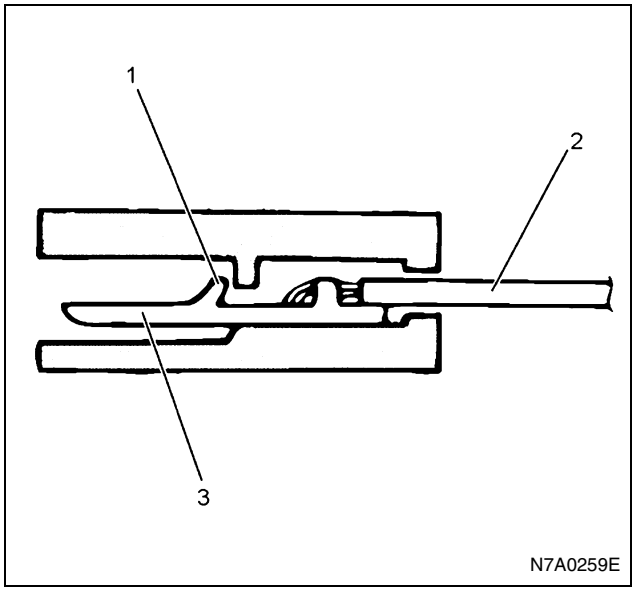
Pin Tang Lock Type

1. Insert a thin flat-tip screwdriver or equivalent (1) into the connector housing open end (5).
2. Push the tang lock (2) flat (toward the wire side of the connector). Pull the wire (3) with pin (4) free from the wire side of the connector.



Connector Pin Insertion

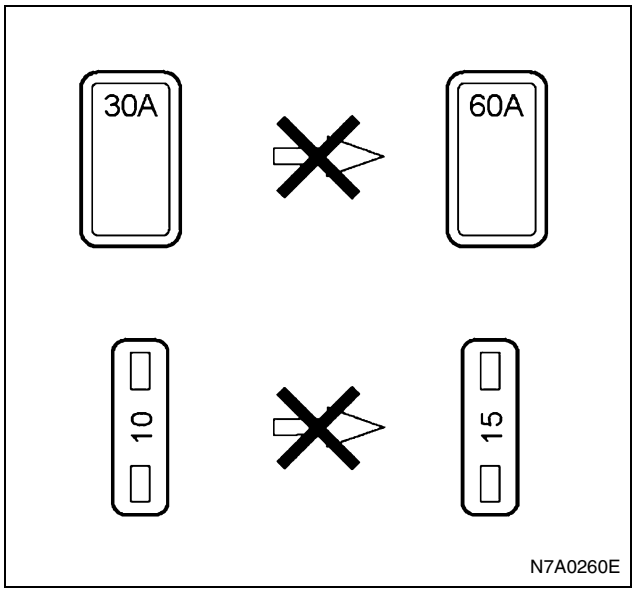
1. Check that the tang lock (1) is fully up.
2. Insert the pin (3) from the connector wire (2) side. Push the pin in until the tang lock closes firmly.
3. Gently pull on the wires to make sure that the connector pin is firmly set in place.



Fuse Replacement

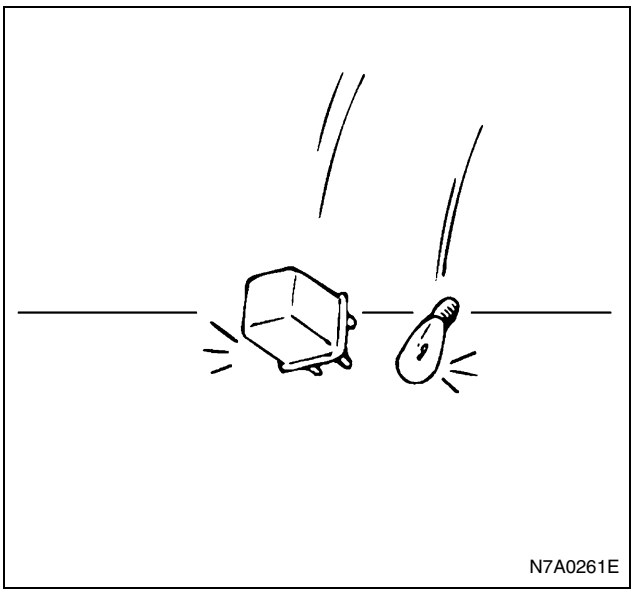
WARNING:
WHEN A FUSE IS BLOWN OUT, REPLACE IT WITH A NEW ONE OF THE SAME CAPACITY AFTER FINDING THE CAUSE.

IF A FUSE OF TOO LARGE CAPACITY IS USED, IT RESULTS TO BE MEANINGLESS WHEN AN OVER CURRENT FLOWS. THEREFORE, A WIRE MAY BE BURNED RESULTING IN A FIRE.



Electric Equipment Handling

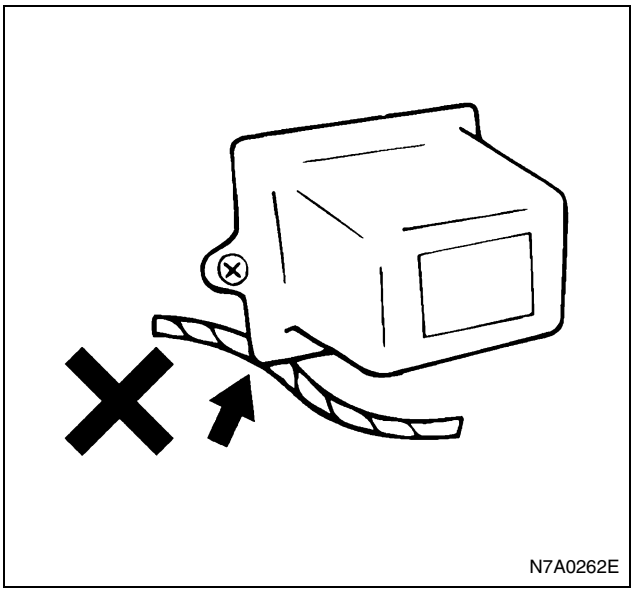
Be careful when handling electrical parts. They should not be dropped or thrown, because short circuit or other damage may result.



N7A0261E

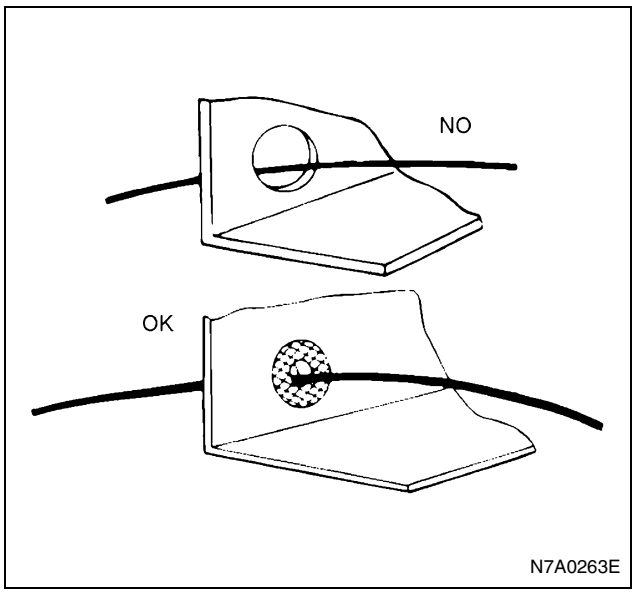
Cable Harness

1. When installing the parts, be careful not to pinch or wedge the wiring harness.



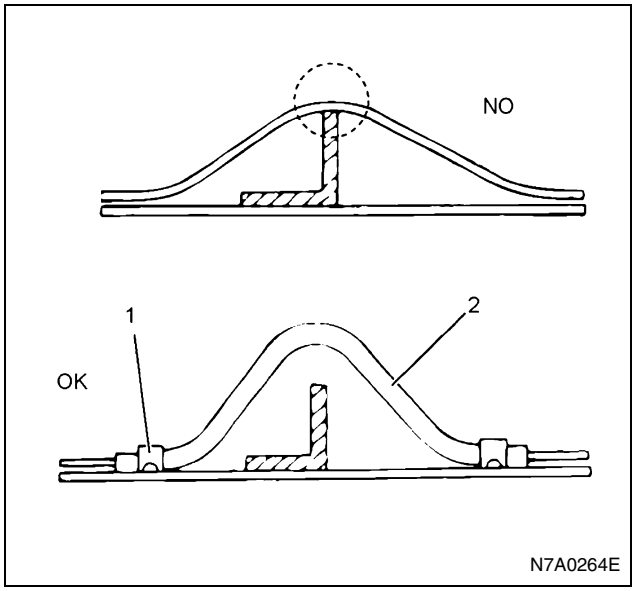
N7A0262E

2. All electrical connections must be kept clean and tight.
3. Use a grommet or guard tube to protect the wiring harness from contacting a sharp edge or surface.



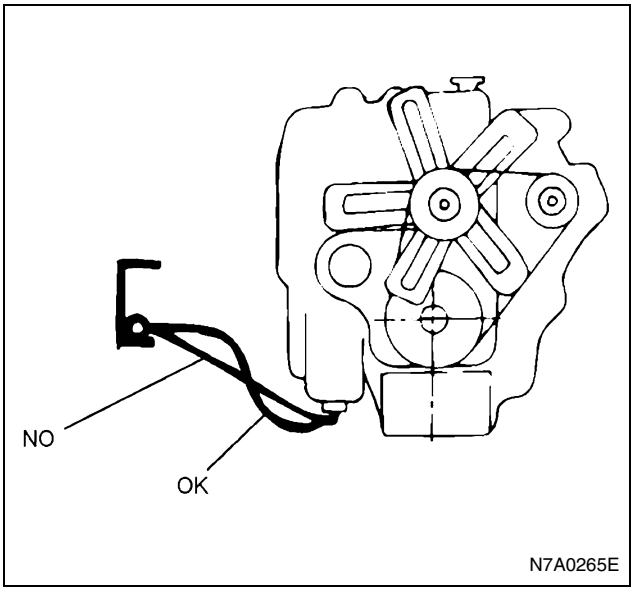
N7A0263E

4. Position the wiring harness with an enough clearance from the other parts, and guard the wiring harness with a vinyl tube (2) and clips (1) to avoid direct contact.



N7A0264E

5. The wiring harness between engine and chassis should be long enough to prevent chafing or damage due to various vibrations.



NO
OK
N7A0265E

VEHICLES WITH SRS AIRBAG SYSTEM

Notes for Handling SRS Airbag System

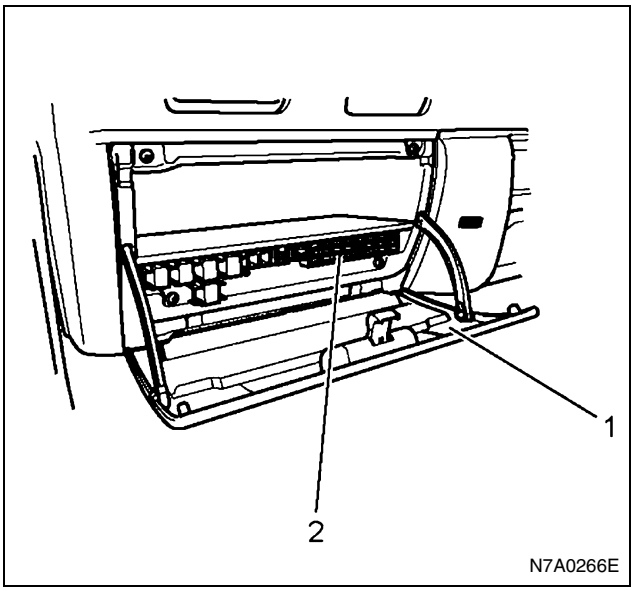
All the information necessary to securely and properly carry out service operations for SRS airbag system is provided in the section “Seat Belt, SRS Airbag.” In this section, notes related to the SRS airbag system are provided, which are to be observed when carrying out service operations for items other than SRS airbag system. When doing an inspection work, make sure to set the ignition switch to “LOCK”.

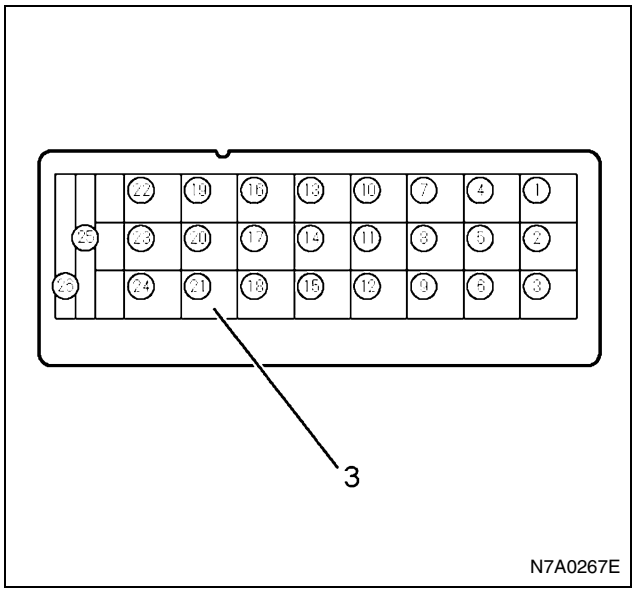
Be careful not to impact the SRS airbag system and its peripheral parts to prevent the deployment of the airbag. Also, before carrying out service operations for SRS parts, SRS harnesses and other service operations as shown below, make sure to temporarily deactivate the SRS airbag system. Not observing the following procedure may result in an injury because of sudden deployment of the airbag, or damage to the SRS airbag system.

1. Repairs around the steering wheel
2. Repairs around the instrument panel, glove box and fuse box.
3. Repairs around the dashboard and center console.
4. Installation of car stereo etc.
5. Sheet metal coating on the right side of the cab

Deactivation of SRS Airbag System

- Turn the ignition key to “LOCK”, and release the key.
- Remove the SRS fuse (3) from the fuse box (2) located in the lower part of the glove box (1), or disconnect the ground cable from the battery. And leave all these parts untouched for about 15 seconds or more.
- In 15 seconds or more after removing the fuse and the ground cable of the battery, remove the two yellow connectors located in the lower part of the steering column.





Reactivation of SRS Airbag System

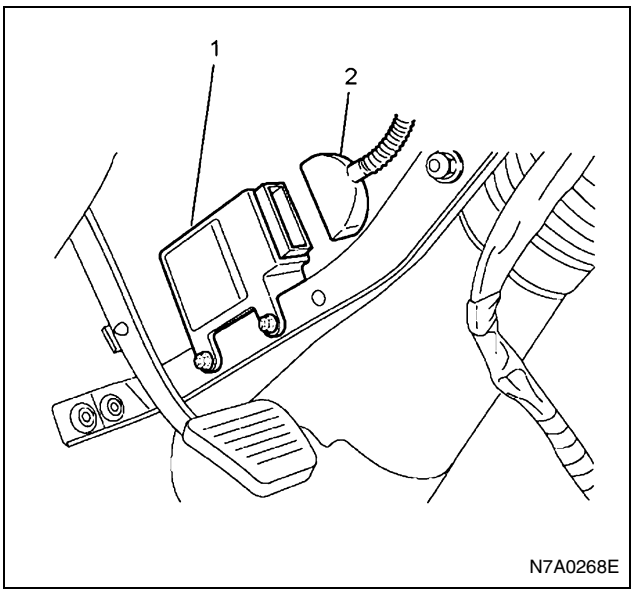
- Carry out the operation in the reverse order of deactivation.
- Turn the ignition switch to “ON.”
- Check that the AIRBAG warning lamp turns off after blinking seven times. (If the warning lamp is not activated correctly, refer to “SRS Control System.”)

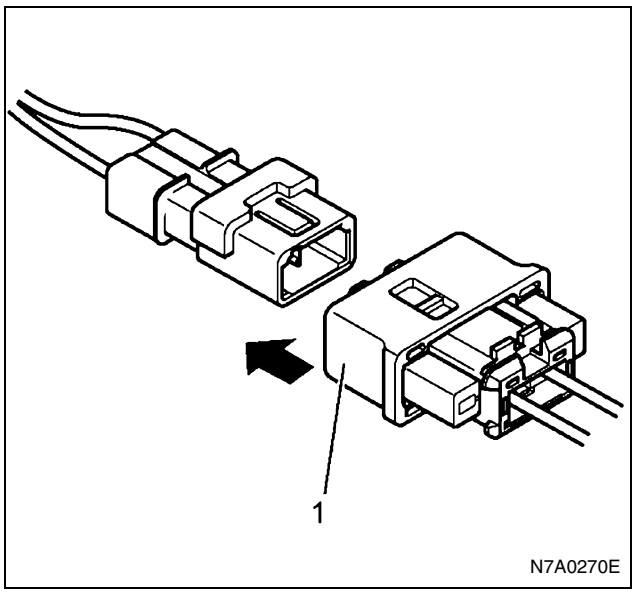
Caution:

- Do not expose the airbag assembly to the temperature of 93°C (199°F) or more. Accidental airbag deployment may result.
- If the airbag assembly and controller are dropped from a height of about one meter or more, do not use the airbag assembly.
- Check the part number before installing the airbag assembly. If a not applicable item is installed, malfunction may result.
- When disposing of the airbag assembly, make sure to deploy the airbag. If the airbag is discarded without being deployed, secondary accident may result.

Handling of Airbag Controller Connector

- Removal of connector (2)
  Remove the connector from controller (1) by pressing the arrow mark on the connector.

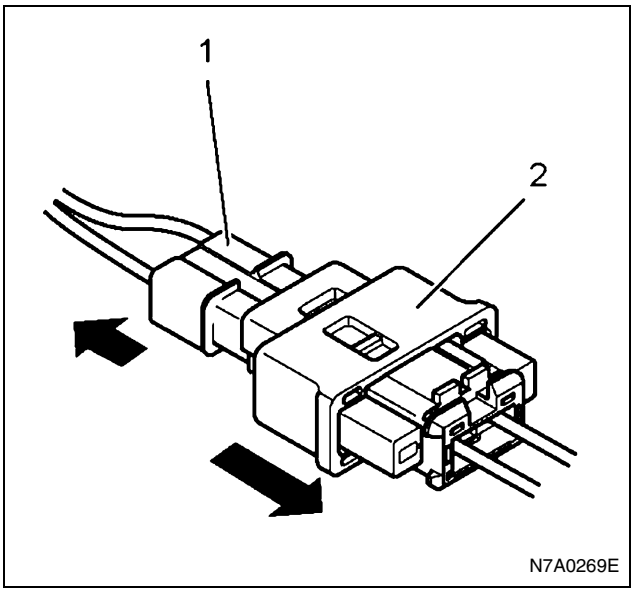




- Connection of connector
  Push connector (2) inside, and check that the connector is installed securely.

Handling of Inflator Connector

- Removal of connector
  Remove connector (1) on the pin side (male side) by pulling cover insulator (2) in the direction indicated by an arrow.



- Connecting of connector
  Hold socket insulator (1) and push it inside until a click is heard.

NOTES FOR ELECTRONIC CONTROL SYSTEM INSPECTION AND SERVICE

Scan Tool (External Diagnosis Device)

Use the specified scan tool in order to carry out fast and correct inspection of parts.
Make sure to refer to detailed description in the repair manual because the type and connection of a scan tool to be used differ according to vehicles and devices.

Circuit Tester

When using a circuit tester, observe the procedure indicated in the repair manual. If the procedure is not observed, other relevant parts may be damaged. If a specific type of circuit tester is specified, do not use any circuit tester of other type. If a circuit tester, which is not of the specified type, is used, other relevant parts may be damaged, and measurement may not be done correctly.

Caution:
If any circuit tester, which is not of the specified type, is used, the SRS and other electronic control system may malfunction.

Failure due to Static Electricity Discharge

When static electricity is discharged, relevant parts are charged with high voltage, and may be damaged. Observe the following items and take a proper action.

- Repair staff may be charged with static electricity through work place and clothes. Touch any normal grounding before inspecting and replacing relevant parts.
- Do not directly touch the connector pins of relevant parts. Do not rub them with other parts or cover.
- Connect the replacement parts to the normal grounding without unwrapping them. And then, take them out without letting them come into contact with the connector pins.

Additional Electric Equipment

If the vehicle is equipped with additional electric parts including lights, audio and radio devices, the electronic control system may be adversely affected by electric noises including radio wave emitted by those devices, depending on the installing condition. Turn off the additional electric parts beforehand, or carry out removal inspection and service.

Notes for Welding

Take the following actions before carrying out welding operation to protect the relevant parts.

- Remove the battery cable.
- Remove harnesses from all the control units.
- Turn all the switches to “OFF”.
- Install the grounding of the welding machine in a place as close to the welding point as possible.

Repetition of Trouble

If the same trouble is generated repeatedly or momentarily, or the trouble does not repeat whereas the trouble display is indicated, check whether the trouble repeats by taking following actions.

- Shake by hand the relevant parts, including control units, sensors, relays and harnesses.
  The trouble may repeat in case of connection failure.
- Heat the relevant parts using a dryer, or cool these parts using a refrigerant. The trouble may repeat if it is caused by temperature change.

Caution:
Do not heat the parts excessively to the level that cannot be touched.

- Sprinkle the vehicle with water. The trouble may repeat if it is caused by humidity change.

Caution:
Do not sprinkle water directly on the electric parts.

RECOMMENDED LIQUID GASKET AND LOCTITE

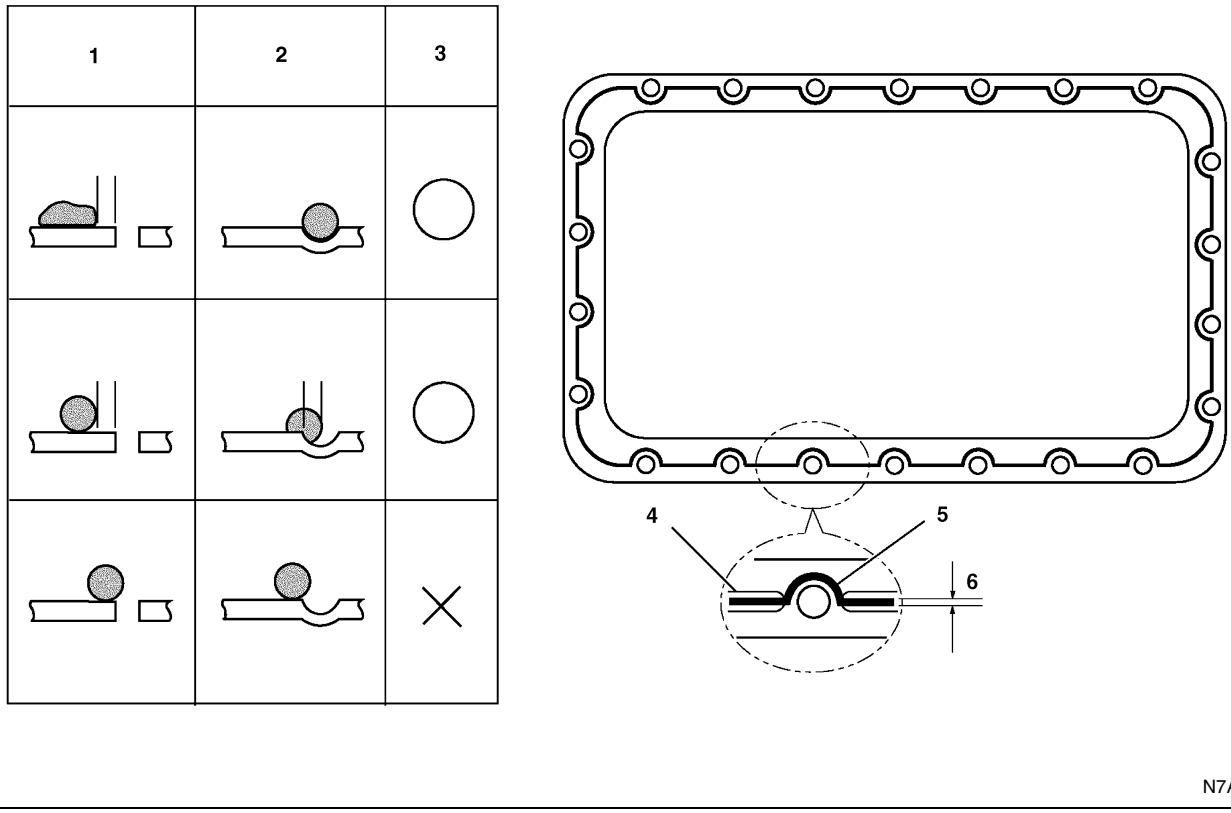
Liquid Gasket

TYPE	PRODUCT NAME	MANUFACTURER	APPLICATION PARTS (EXAMPLE)
Silicon Base (Room Temperature Vulcanizer)	ThreeBond 1207B ThreeBond 1207C ThreeBond 1215 ThreeBond 1216	ThreeBond ThreeBond ThreeBond ThreeBond	Engine Oil Seal Retainer Engine Oil Pan Timing Gear Case Cylinder Head Cover
Water Base	ThreeBond 1141	ThreeBond	Fuel Pump
Solvent	ThreeBond 1104 BelcoBond 4 BelcoBond 401 BelcoBond 402	ThreeBond ISUZU ISUZU ISUZU	Water Pump Rear Axle etc.
Anaerobic	LOCTITE 515 LOCTITE 518 FMD127	LOCTITE LOCTITE LOCTITE	Engine Oil Seal Retainer Water Pump Transaxle etc.

- It is very important that the liquid gasket listed above or their exact equivalent be used on the vehicle.
- LOCTITE 515, LOCTITE 518 and FMD127 harden upon contact with a metal surface. Do not apply LOCTITE 515, LOCTITE 518 or FMD127 between two metal surfaces having a clearance of greater than 0.25 mm (0.001 in). Poor adhesion will result.
- Use a proper amount of the liquid gasket. Observe the precautions for each product.

Application Procedure

1. Completely remove lubricant and moisture from the connecting surfaces. The surfaces must be perfectly dry.
2. Apply specified bead width 2 — 3 mm (0.08 — 0.12 in) of liquid gasket to one of the connecting surfaces. And the bead should be continuous.



Legend

1. BOLT HOLE
2. DEPRESSION
3. JUDGEMENT
4. Depression
5. Apply liquid gasket to the bolt hole interior.
6. Specified bead width: 2 — 3 mm (0.08 — 0.12 in)

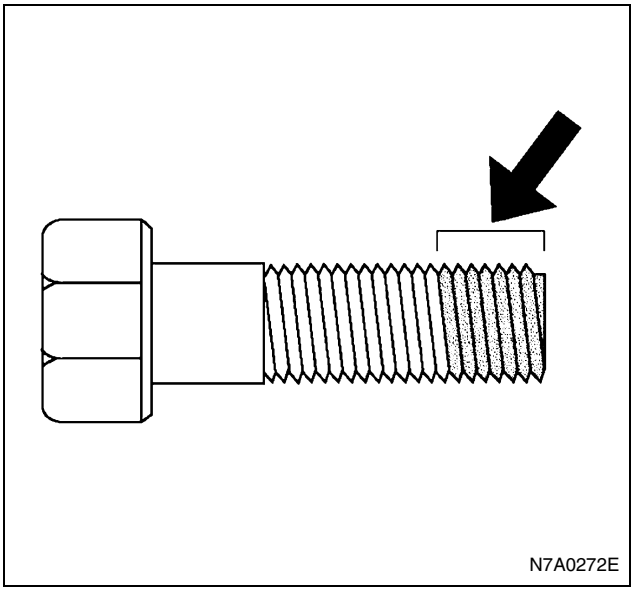
Notice:
When the application procedures are specified in this workshop manual, follow them.

Recommended Loctite (Thread Locking Agent)

TYPE	COLOR
LOCTITE242	Blue
LOCTITE262	Red
LOCTITE271	Red

Application Steps

1. Completely wipe all lubricant and moisture from the bolts and bolt holes, and the female thread connecting surfaces. The surfaces must be perfectly dry.
2. Apply LOCTITE to the 1/3 tip of the bolt's threaded area.



3. Tighten the bolts to the specified torque.

Important:
After tightening, be sure to keep the bolts free from vibration and torque for at least an hour until LOCTITE hardens.

TERMS AND ABBREVIATIONS

Term Definition

TERM	DESCRIPTION
DIMENSION	The standard dimension values to be observed when manufacturing.
STANDARD	The standard values to be observed when carrying out service operations, including inspection, adjustment, assembly and installation.
LIMIT	The maximum or minimum values, which must not be exceeded when service operations are carried out. If this value is exceeded, replacement or repair is required.
WARNING:	If not observed, danger of death or serious injury will result.
CAUTION:	If not observed, danger of injury or accident will result.
IMPORTANT:	If not observed, normal performance of relevant parts and system is not guaranteed, and failure of the vehicle may result.
NOTE:	Matters, which should be specially mentioned.

WOT	Wide Open Throttle

Introduction of SI (International System of Unit)

The SI was founded with an aim to standardize various unit systems, e.g. the metric system, pound system etc., and to get rid of complicated conversion of units using calculators.
Introduction of the SI in Japan is standardized in JIS-Z-8203.
In this manual, all the units are indicated based on the International System of Units, along with conventional units in ( ).

- SI is the abbreviation of “Le Systeme Internationale d’Unites.”

STANDARD BOLTS TIGHTENING

Isuzu Standard Fixing Torque Specifications

The torque values given in the following table should be applied where a particular torque is not specified.

N·m (kg·m/lb·ft)

Strength Class	4.8 4T		7T	
Bolt Identification	Hexagon Head Bolt	Flange Bolt	Hexagon Head Bolt	Flange Bolt
M6 × 1	3.9 — 7.8 (0.4 — 0.8/2.9 — 5.8)	4.6 — 8.5 (0.5 — 0.9/3.4 — 6.3)	4.9 — 9.8 (0.5 — 1.0/3.6 — 7.2)	5.7 — 10.6 (0.6 — 1.1/4.2 — 7.8)

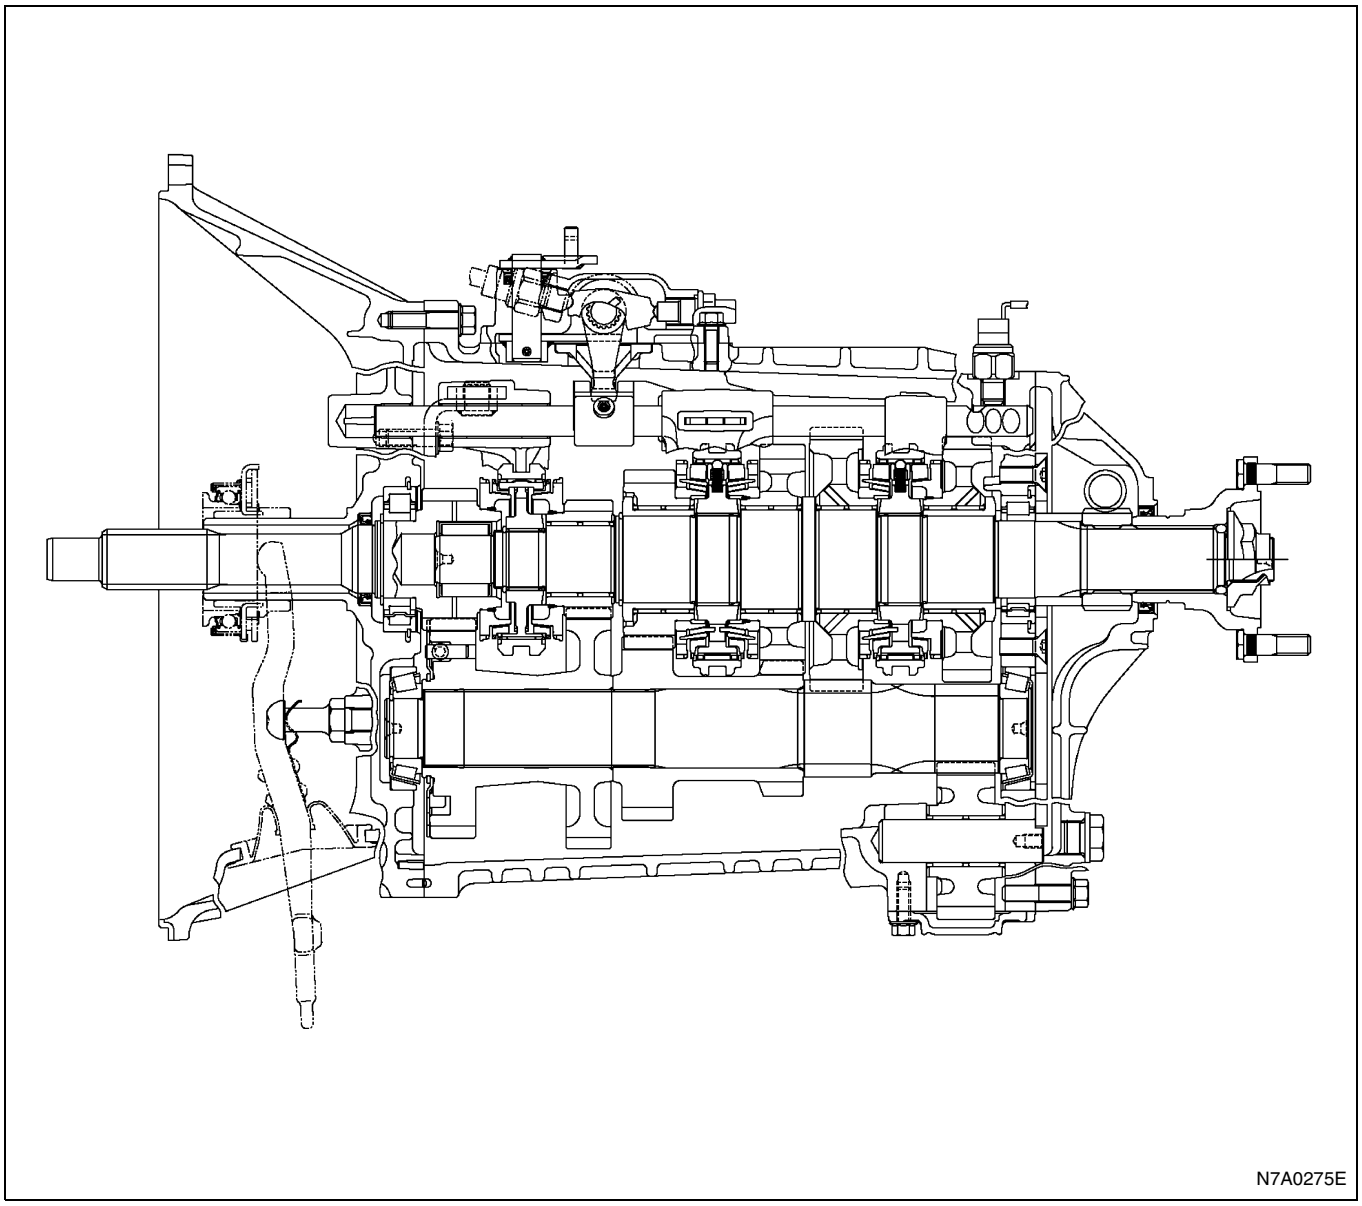
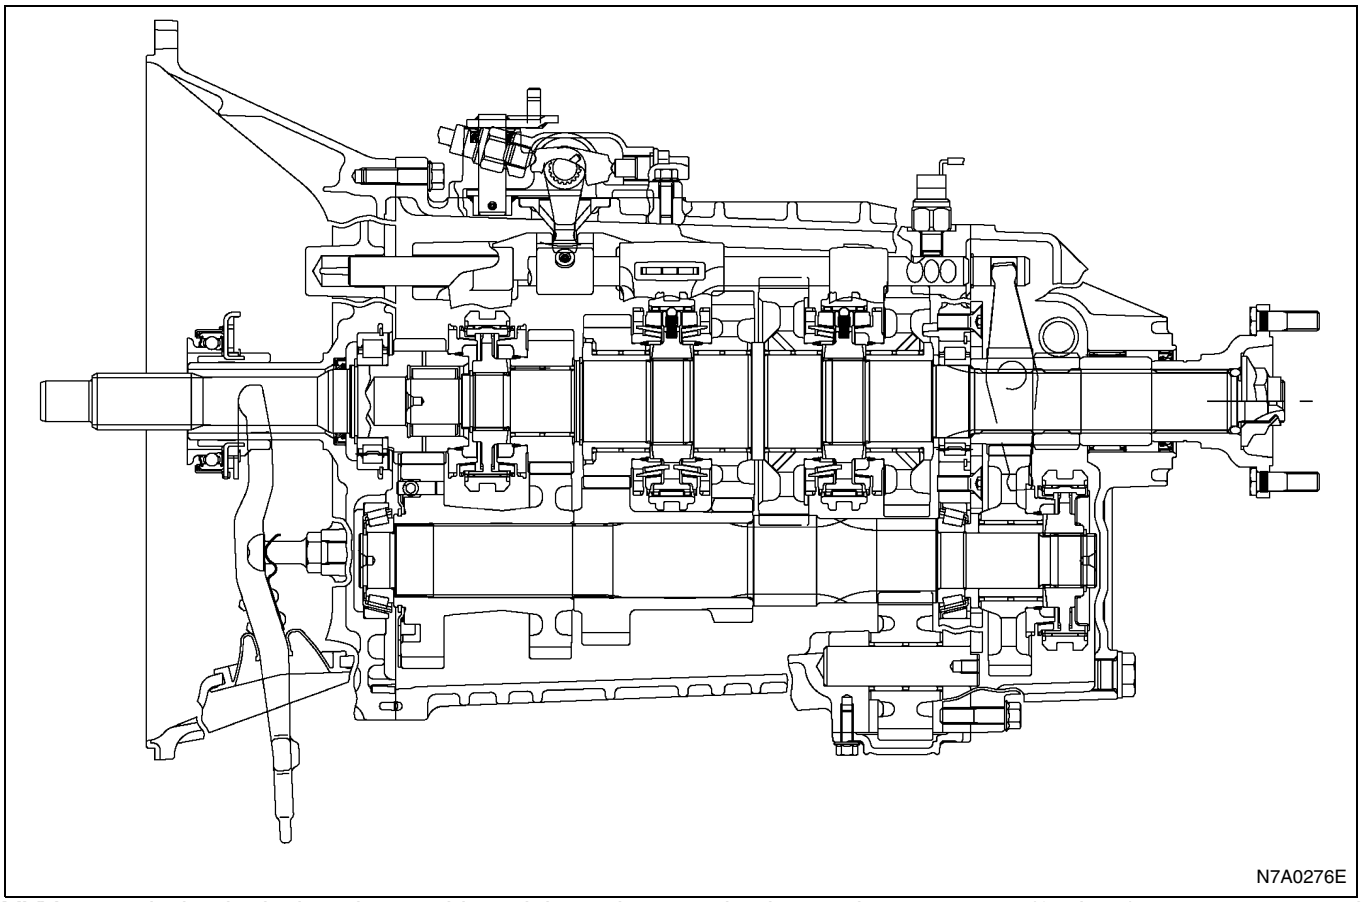
MANUAL TRANSMISSION MECHANISM

Function and Operation

- 5MT



• 6MT



MYY transmission is designed to enable weight saving and to adapt larger available torque input 392 N·m (40 kg·m/289.3 lb·ft). New technology is adopted such as aluminum-tube type case (3 piece) structure, tapered roller bearing (main shaft front and rear, counter shaft front and rear) and twin-rod type shift control layout.

Inspection

Diagnostic chart for troubleshooting

Trouble	Cause	Treatment
Noise	Wear of flywheel pilot bearing	Replace
	Wear or damage of bearing (main shaft, counter shaft)	Replace
	Wear, crack and damage of gear (main shaft, counter shaft, reverse idle gear)	Replace
	Wear of spline (main shaft, synchronizer clutch hub)	Replace
	Seizure of gear or bearing thrust surface	Replace
	Backlash shortage of mesh gear	Replace
Shift difficulty	Clutch pedal play inaccuracy	Adjust
	Wear of change lever sliding portion	Repair or replace, lubricate grease
	Wear of shift block, shift rod or control box sliding portion	Replace
	Wear of shift arm or synchronizer sleeve groove	Replace the worn parts
	Wear of thrust washer, collar or gear thrust surface (main shaft and counter shaft thrust play)	Replace the worn parts
	Wear of synchronizer parts	Replace

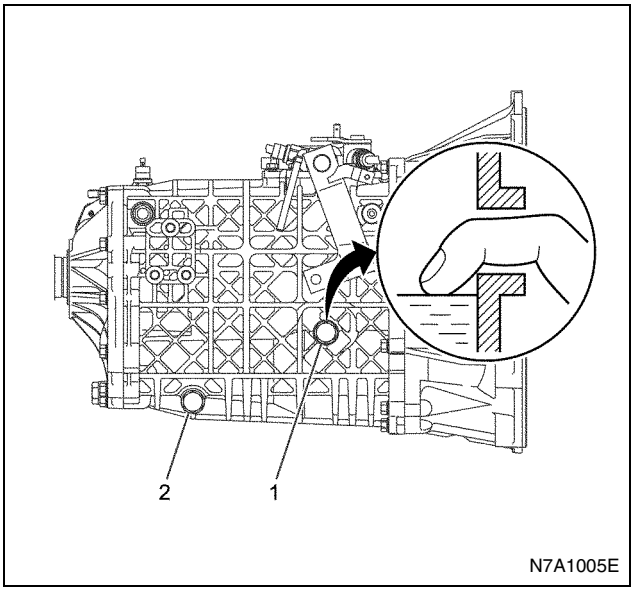
Trouble	Cause	Treatment
Out of gear	Wear of detent ball	Replace
	Wear of shift rod or control box sliding portion	Replace
	Wear of shift arm or synchronizer sleeve groove	Replace the worn parts
	Wear of thrust washer, collar or gear thrust surface (main shaft and counter shaft thrust play)	Replace the worn parts
	Wear or damage of bearing	Replace
	Wear of spline (main shaft, synchronizer hub)	Replace
	Fatigue or damage of synchronizer spring	Replace
Oil leakage	Looseness of drain plug or filler plug	Tighten the plug or refill oil
	Damaged gasket	Replace
	Wear or damage of oil seal	Replace

Oil Inspection

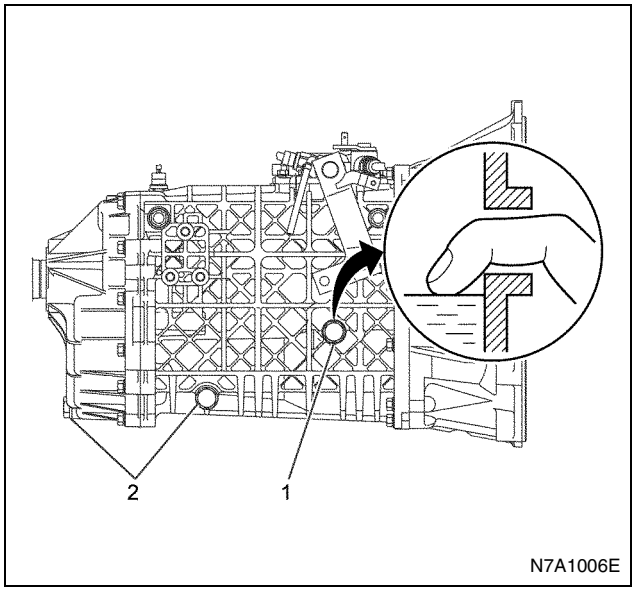
1. Remove the filler plug.
2. Check the oil level by inserting a finger to the filler plug hole.
3. Refill oil when the oil level is out of the specified amount.
   - Applicable oil = Besco gear oil transaxle (5W-30)
4. Fix the filler plug to the specified torque.

Tighten:
Filler plug to 39 N·m (4.0 kg·m / 29 lb·ft)

- 5MT



- 6MT



Legend
1. Filler plug
2. Drain plug

Oil Replacement

1. Start the engine and idle the transmission sufficiently.
2. Stop the engine, remove the drain plug, and then drain oil.
3. Fix the drain plug.

Tighten:
Drain plug to 39 N·m (4.0 kg·m / 29 lb·ft)

4. Remove the filler plug.
5. Fill oil through the filler plug hole to the lower edge of the hole.
   - Applicable oil = Besco gear oil transaxle (5W-30)

Oil Capacity		L (US qt/Imp qt)
	6MT	5MT
Normal	3.5 (3.7 / 3.1)	2.8 (3.0 / 2.5)
4WD	—	3.5 (3.7 / 3.1)
With front PTO	—	5.5 — 6.0 (5.8 — 6.3 / 4.8 — 5.3)
With side PTO	3.8 (4.0 / 3.3)	3.1 (3.3 / 2.7)
With side PTO (4WD)	—	3.8 (4.0 / 3.3)

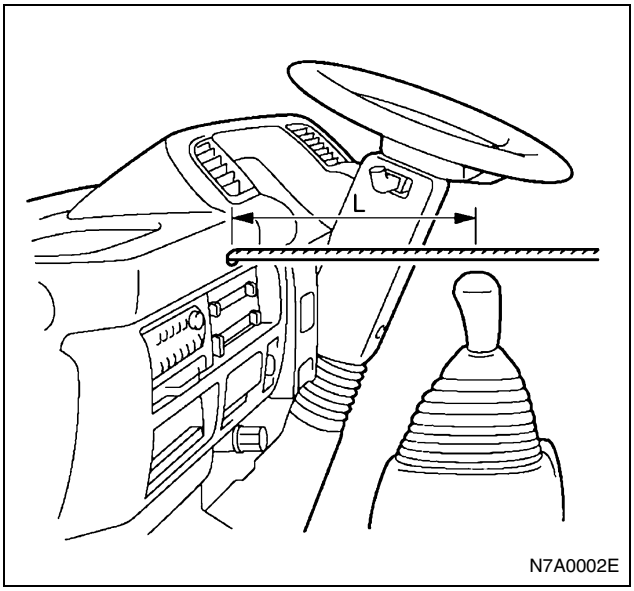
6. Fix the filler plug to the specified torque.

Tighten:
Filler plug to 39 N·m (4.0 kg·m / 29 lb·ft)

Inspection and Adjustment of The Gear Control

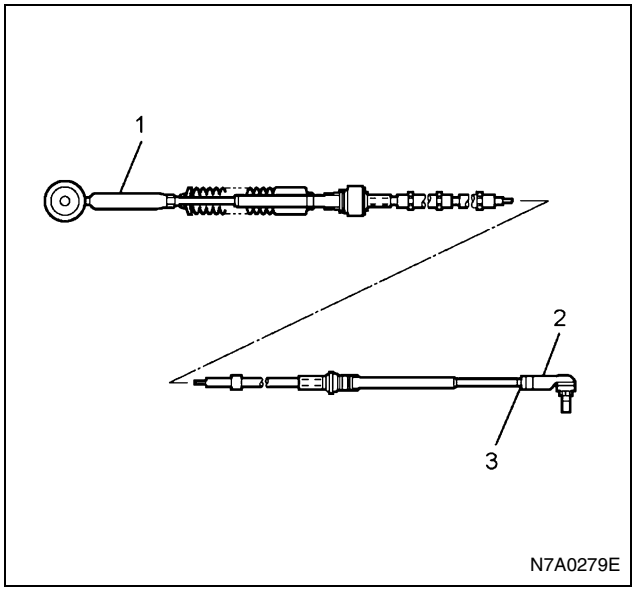
1. Shift the shift select external lever of the transmission side to neutral.
2. Measure the dimension (L) between the center of the change lever play and the instrument panel.
   L dimension

Standard cab model = 247 ± 15 mm (9.72 ± 0.6 in)
Wide cab model = 283 ± 15 mm (11.1 ± 0.6 in)



3. When the L dimension is out of specification, adjust it by the following:
   - Remove the change lever knob.
   - Remove the boot.
   - Remove the console box assembly.
   - Remove the shift select cable at the change lever side.
   - Shift the shift select external lever of the transmission side to neutral.
   - Loosen the lock nut of the shift cable, and install it by adjusting the cable length and making the L dimension become within specification.
   - Fix the lock nut.

Tighten:
Lock nut to 6 N·m (0.6 kg·m / 4 lb·ft)

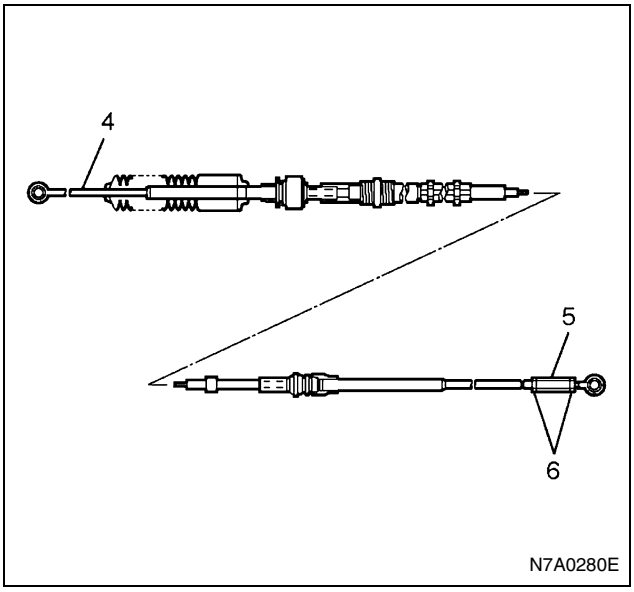


Legend
1. Transmission side
2. Joint ball
3. Change lever side

   - Loosen the lock nut of the select cable joint, adjust the select cable length to make the change lever select direction (right and left direction) tilt a little (2.7°) to the left against the vertical direction, and then joint the change lever.
   - Fix the lock nut.

Tighten:
Lock nut to 6 N·m (0.6 kg·m / 4 lb·ft)

   - Install the console box, the boot and the change lever knob.



Legend

4. Transmission side
5. Turn buckle
6. Lock nut

ON-VEHICLE SERVICE

Change Lever

3. Change lever assembly
4. Snap pin
5. Plain washer
6. Shift & select cable
7. Clip
8. Shift & select cable
9. Lock washer
10. Nut

Removal

1. Remove the change lever knob.
2. Remove the gear control cover.
3. Disconnect the change lever and cable from the shift & select cable.
4. Remove the change lever assembly.
   - Remove the parking brake cable from the bracket and put it aside, remove the bracket securing bolt and nut, and then remove the change lever assembly with the bracket.

Installation

1. Install the change lever assembly.
2. Install the shift & select cable.

- Adjustment should be done after fixing the shift cable securing nut to the specified torque.
- Install the parking brake cable to the bracket.
- For adjustment, refer to MANUAL TRANSMISSION MECHANISM.

Tighten:
Shift cable securing nut to 21 N·m (2.1 kg·m / 15 lb·ft)

3. Install the gear control cover.
4. Install the change lever knob.

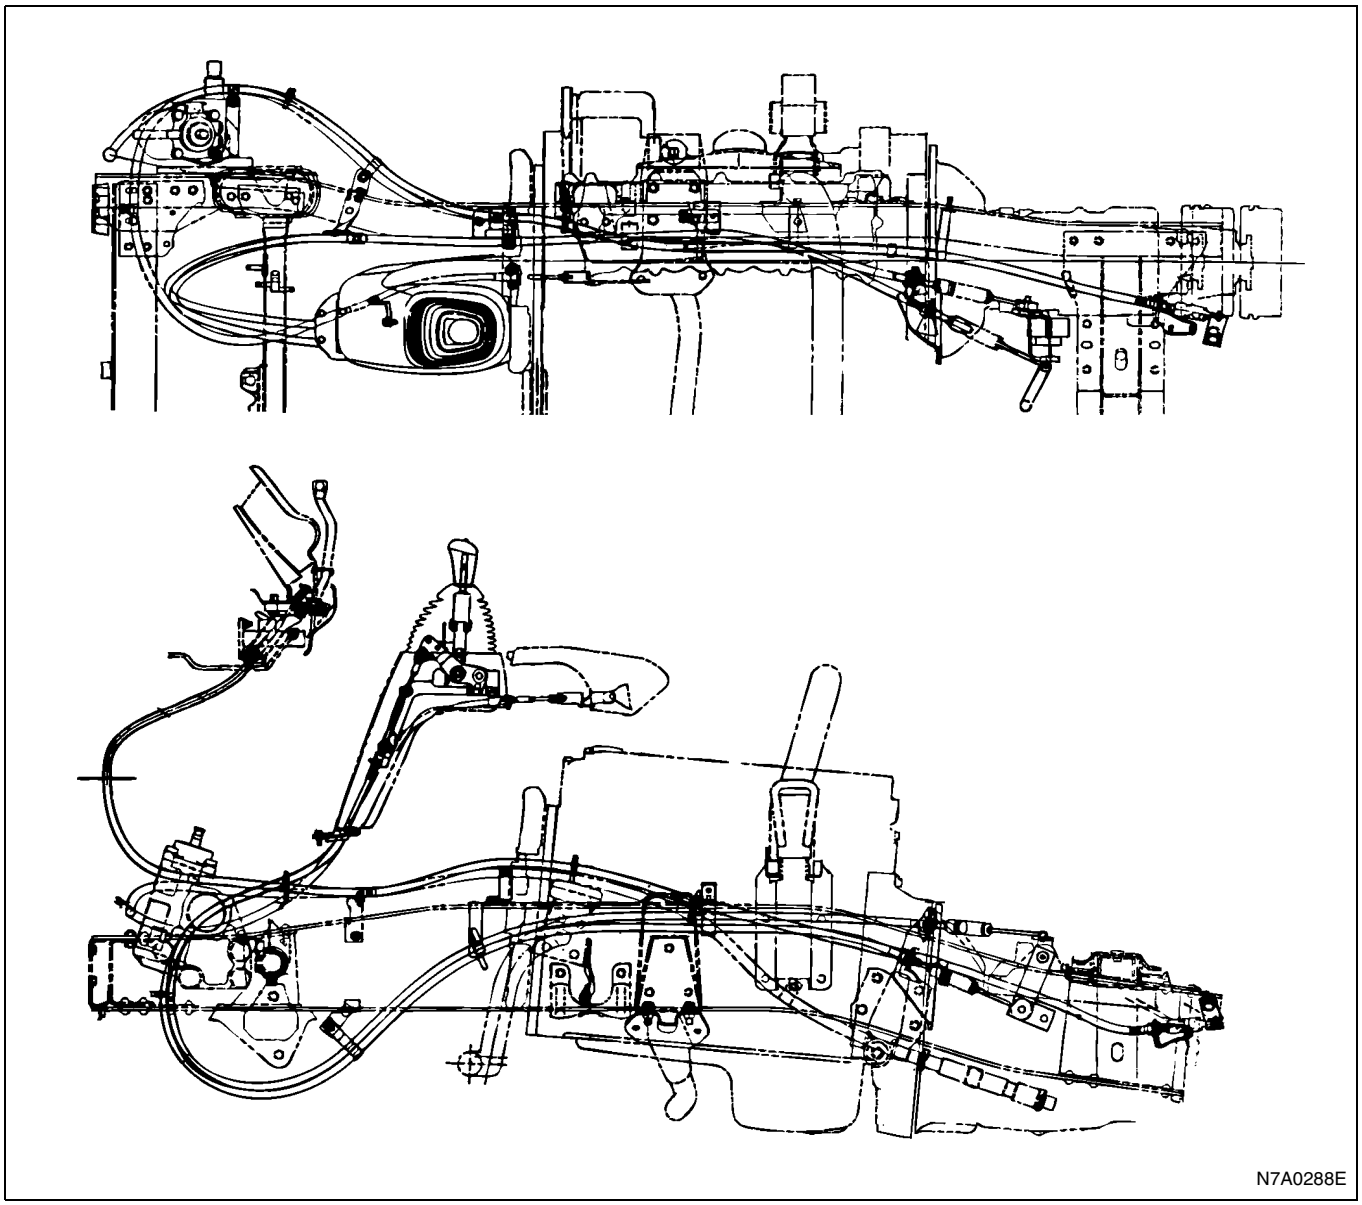
NPS



Removal

1. Remove the change lever knob.
2. Remove the gear control cover.
   - Remove the screw and clip, and then remove the cover.
3. Remove the shift & select cable from the change lever side.
   - Disconnect the cable from the change lever.
   - Remove the clip securing the cable.
4. Remove the grommet retainer and the grommet seat.
   - Remove the securing bolt and nut, and then remove the grommet retainer and the seal.
5. Remove the grommet.
6. Remove the shift & select cable of the transmission side.
7. Remove all the clips and clamps.
   - Remove all the clips and clamps securing the cable to the frame, etc.
8. Remove the shift & select cable.

Inspection

- Check whether the cable is deformed, damaged, corroded or not, and whether the boot is damaged, poor-slid or not, and then replace abnormal parts found by the check.

Installation

1. Install the shift & select cable.
2. Secure the cable with a clip and clamp.
3. Fix the shift & select cable nut of the transmission side.

Tighten:

- Select cable nut to 21 N·m (2.1 kg·m / 15 lb·ft)
- Shift weight nut to 103 N·m (10.5 kg·m / 76 lb·ft)

4. Install the grommet.

5. Install the grommet retainer.

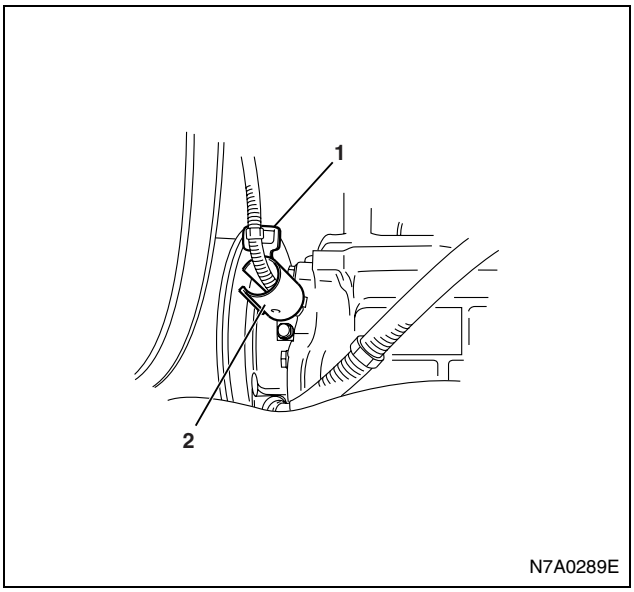
Tighten:
Securing bolt & nut to 11 N·m (1.1 kg·m / 8 lb·ft)

6. Install the shift & select cable joint portion (change lever side).
   - Adjust it after fixing the shift cable securing nut to the specified torque.
   - For adjustment, refer to MANUAL TRANSMISSION MECHANISM.
7. Install the gear control cable cover.
8. Install the change lever knob.
9. Install the seal behind the cab.

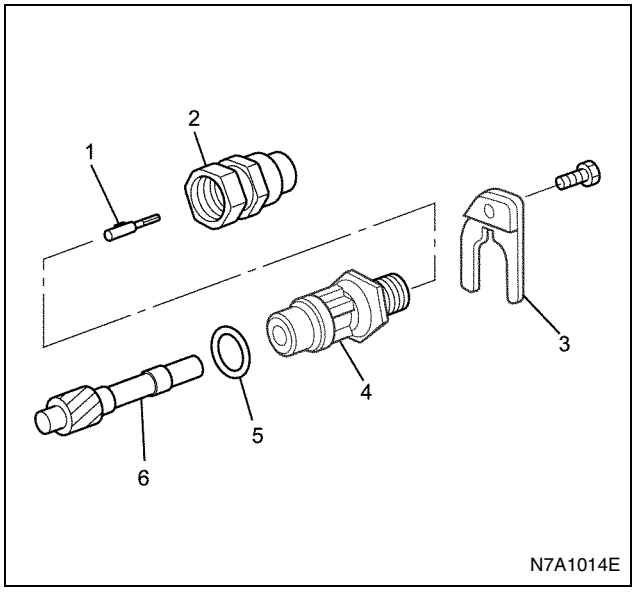
Vehicle Speed Sensor

Removal

1. Remove the clip (1), and then remove the protector (2).
2. Remove the wiring connector.



3. Remove the securing screw, and then remove the vehicle speed sensor.



Legend
1. Plug sensor
2. Vehicle speed sensor
3. Plate
4. Bush
5. O-ring
6. Driven gear

Installation

1. Install the vehicle speed sensor with a securing screw.

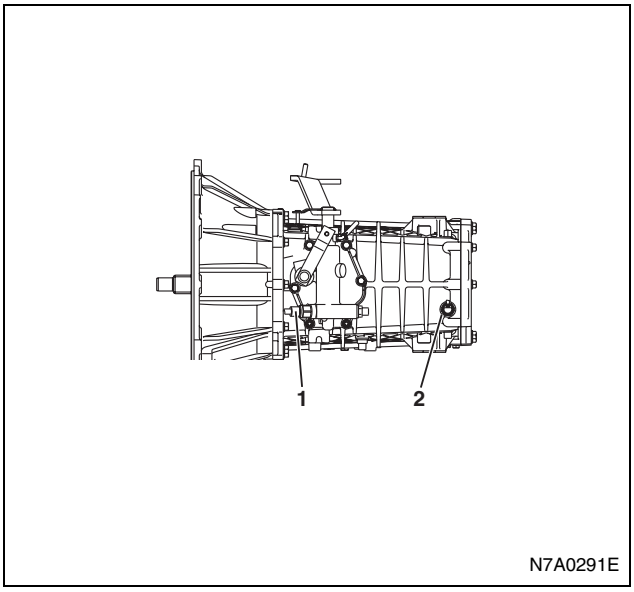
Tighten:
- Securing screw to 20 N·m (2.0 kg·m / 15 lb·ft)
- Bush and vehicle speed sensor to 25 N·m (2.5 kg·m / 18 lb·ft)

2. Connect the wiring connector.
3. Secure the protector with a clip.

Reverse and Neutral Switch

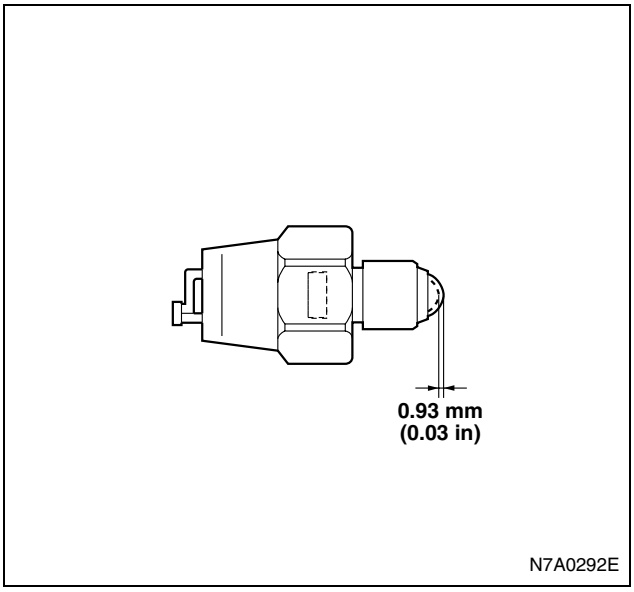
Removal

1. Remove the wiring connector.
2. Remove the reverse switch (2) (black connector).
3. Remove the neutral switch (1) (black connector).



Inspection

- It is normal if there is continuity between the switch terminals when the ball is not pushed, and no continuity when pushing in the ball.
- Switch operating stroke = 0.93 mm (0.03 in)



Installation

1. Install the neutral switch.

Liquid gasket: Three Bond 1141

Tighten:
Neutral switch to 34 N·m (3.5 kg·m / 25 lb·ft)

2. Install the reverse switch.
   - Apply liquid gasket to the switch thread before installation.

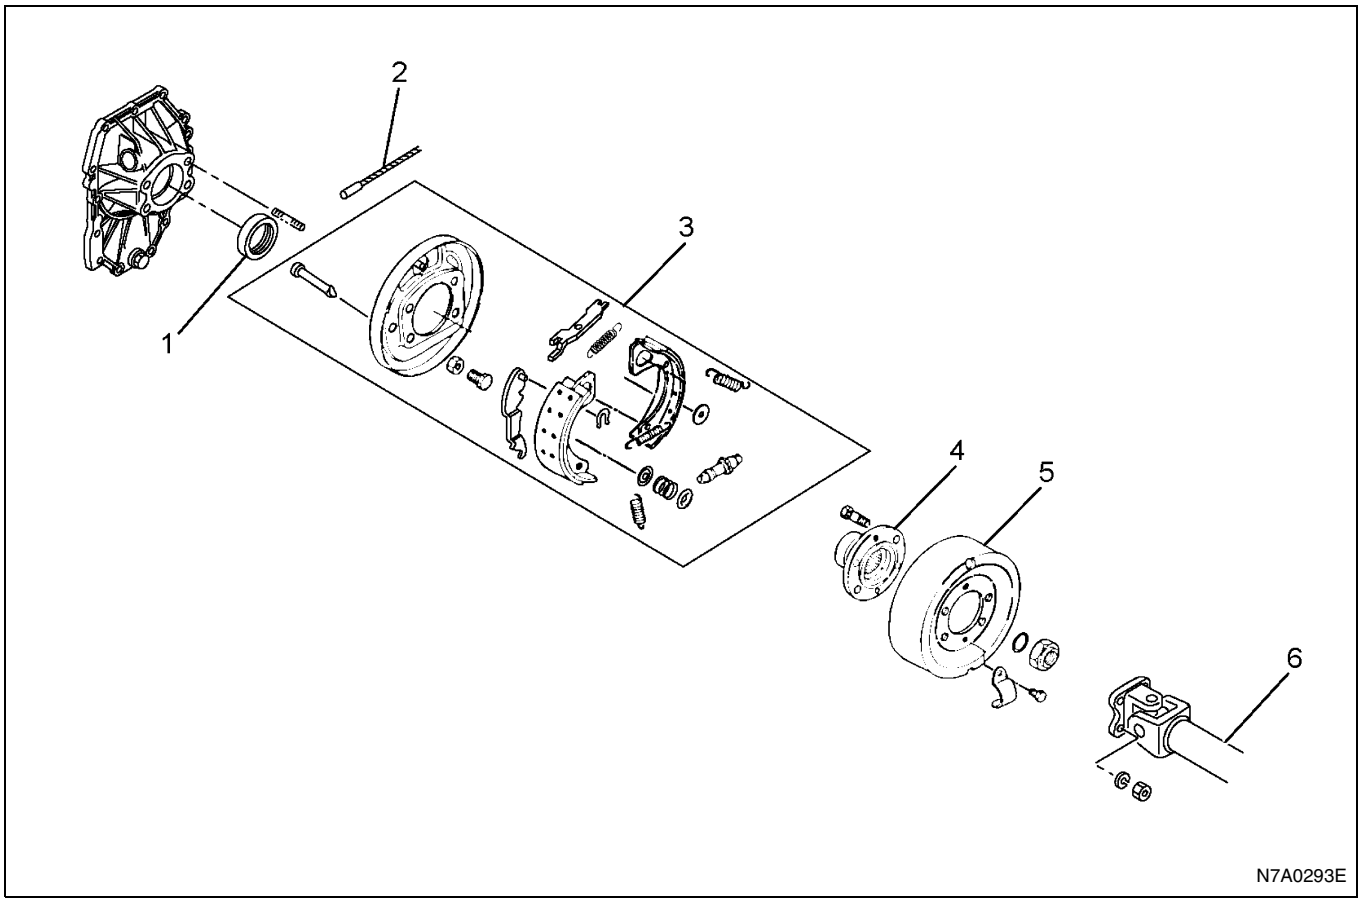
Liquid gasket: Three Bond 1141

Tighten:
Reverse switch to 39 N·m (4.0 kg·m / 29 lb·ft)

3. Connect the wiring connector.

Rear Oil Seal (5MT)

Components

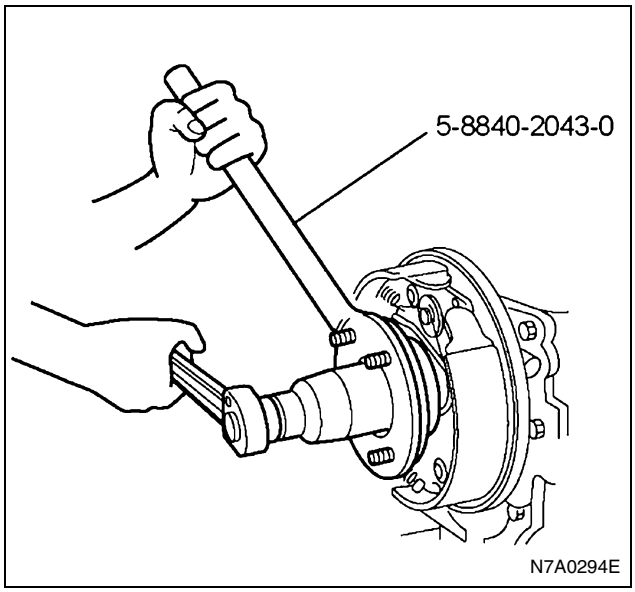


Legend

1. Oil seal
2. Parking brake cable
3. Parking brake assembly
4. Coupling driver
5. Parking brake drum
6. Rear propeller shaft assembly

Removal

1. Remove the rear propeller shaft assembly.
   - Refer to REAR PROPELLER SHAFT ASSEMBLY.
2. Remove the parking brake cable.
   - Refer to PARKING BRAKE CABLE.
3. Remove the parking brake drum.
   - Refer to PARKING BRAKE ASSEMBLY.
4. Remove the coupling driver and O-ring.
   - Raise the lock nut caulking portion (two parts) securely, and then remove the lock nut using the flange holder 5-8840-2043-0.



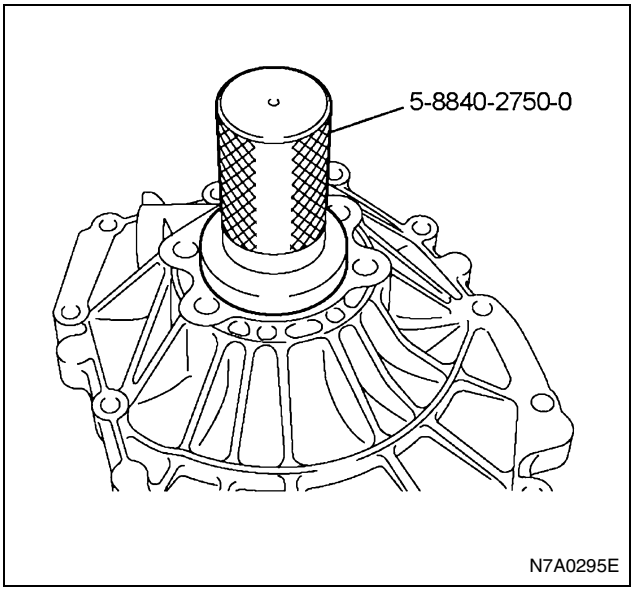
5. Remove the parking brake assembly.
   - Refer to PARKING BRAKE ASSEMBLY.

6. Remove the rear oil seal using the flat-tip screwdriver.

Installation

1. Apply engine oil 5W-30 around a new oil seal, and then press in the oil seal to the rear cover using the installer 5-8840-2750-0.
   - Apply Besco L2 grease on the lip of the oil seal.

Caution:
Be careful not to damage the lip of the oil seal.

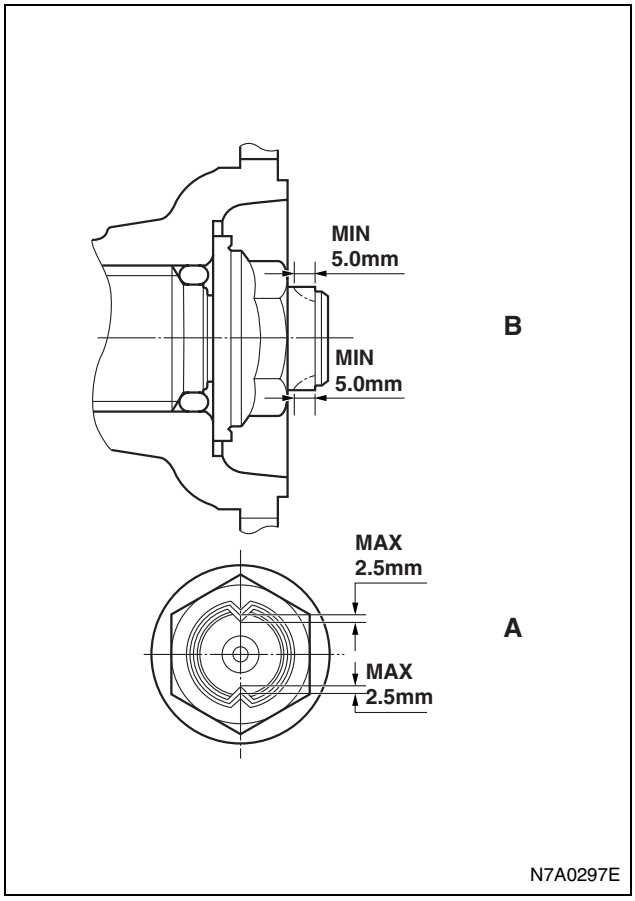


2. Install the parking brake assembly.
   - Refer to PARKING BRAKE ASSEMBLY.
3. Install the coupling driver.
   a. Apply engine oil 5W-30 to the O-ring, and then install the coupling driver and the O-ring.
   b. Use a new lock nut and apply engine oil 5W-30 on its seat, and then fix the lock nut using the flange holder 5-8840-2043-0.

Tighten:
Lock nut to 289 N·m (29.5 kg·m / 213 lb·ft)

   - After fixing it to the specified torque, align the lip part of the nut to the V-groove of the shaft edge. Securely caulk the two parts of the nut lip using a chisel whose tip form is approx. 1 mm (0.04 in) radius by 60°, to make a length (B) of 5 mm (0.2 in) or more, and a clearance between the bottom of the shaft and the nut lip (A) of 1.5 mm (0.06 in) or less.

Caution:
If any crack is found on the caulking portions of the nut after the check, replace the lock nut and caulk it again.



4. Install the parking brake drum.
   - Refer to PARKING BRAKE ASSEMBLY.
5. Install the parking brake cable.
   - Refer to PARKING BRAKE CABLE.
6. Install the rear propeller shaft assembly.
   - Refer to REAR PROPELLER SHAFT ASSEMBLY.

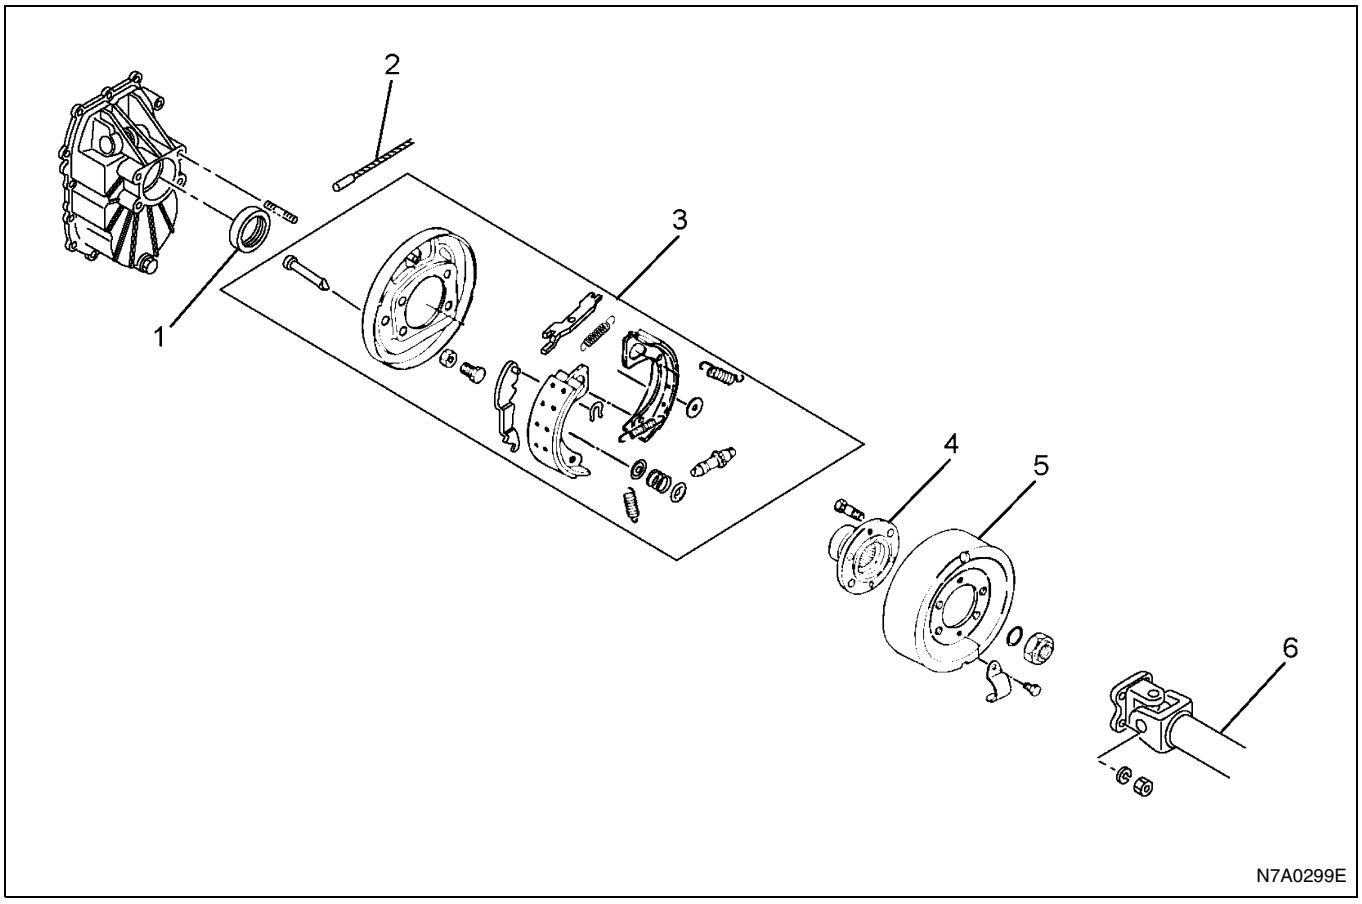
Rear Oil Seal (6MT)

Components

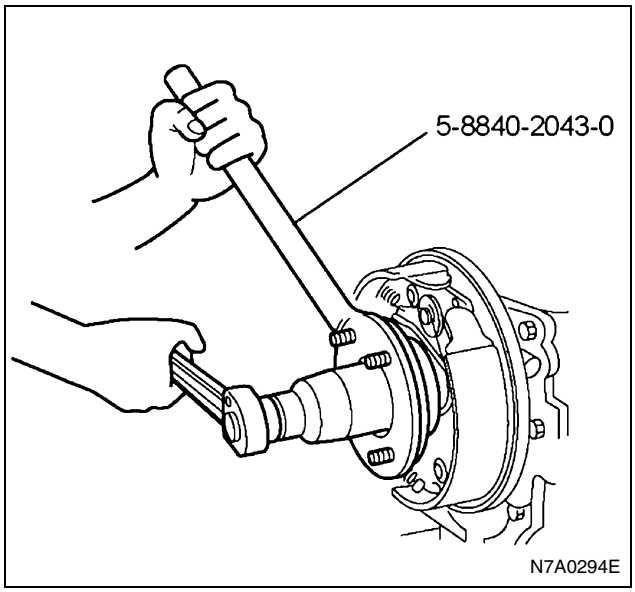


Legend

1. Oil seal
2. Parking brake cable
3. Parking brake assembly
4. Coupling driver
5. Parking brake drum
6. Rear propeller shaft assembly

Removal

1. Remove the rear propeller shaft assembly.
   - Refer to REAR PROPELLER SHAFT ASSEMBLY.
2. Remove the parking brake cable.
   - Refer to PARKING BRAKE CABLE.
3. Remove the parking brake drum.
   - Refer to PARKING BRAKE ASSEMBLY.
4. Remove the coupling driver and O-ring.
   - Raise the caulking portion (2 parts) of the lock nut securely, and remove it using the flange holder 5-8840-2043-0.



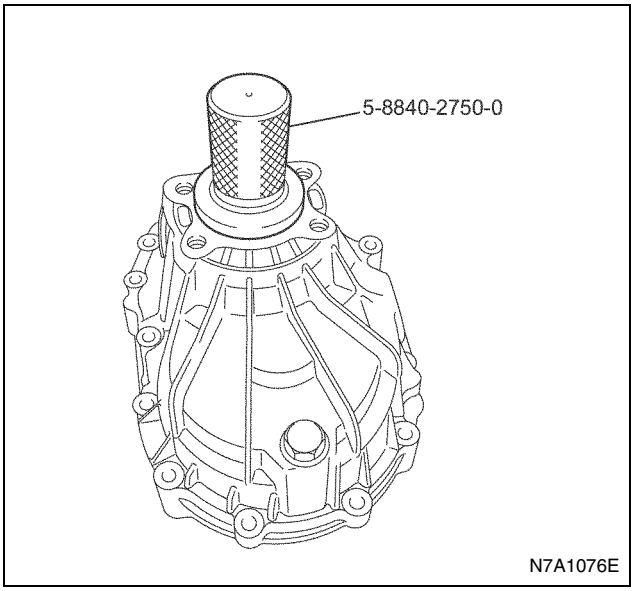
5. Remove the parking brake assembly.
   - Refer to PARKING BRAKE ASSEMBLY.

6. Remove the rear oil seal using the flat-tip screwdriver.

Installation

1. Apply engine oil 5W-30 around a new oil seal, and then press in the oil seal to the rear cover using the installer 5-8840-2750-0.
   - Apply Besco L2 grease to the lip portion of the oil seal.

Caution:
Be careful not to damage the oil seal lip portion.

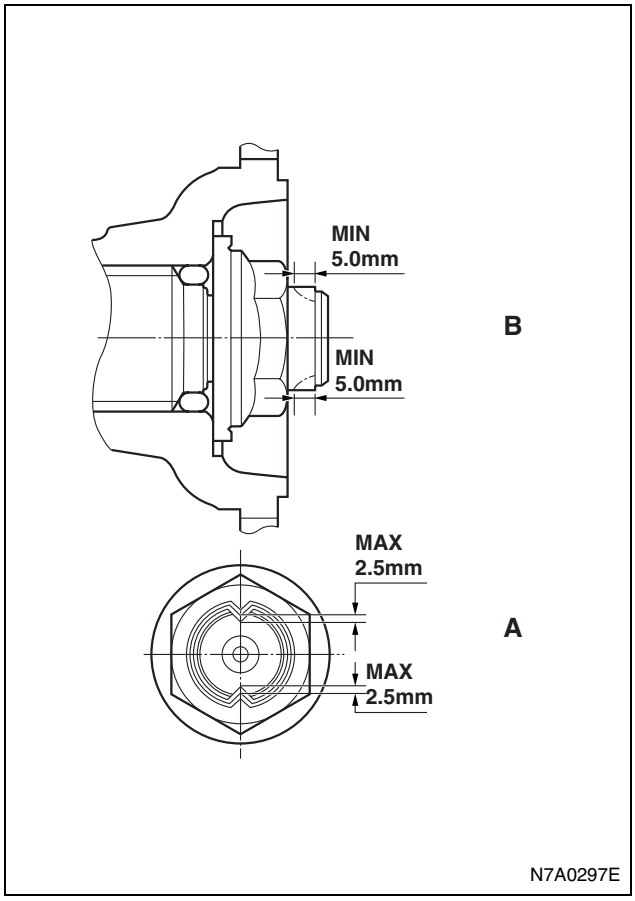


2. Install the parking brake assembly.
   - Refer to PARKING BRAKE ASSEMBLY.
3. Install the coupling driver.
   a. Apply engine oil 5W-30 to the O-ring, and then install the coupling driver and the O-ring.
   b. Use a new lock nut and apply engine oil 5W-30 on its seat, and then fix the lock nut using the flange holder 5-8840-2043-0.

Tighten:
Lock nut to 289 N·m (29.5 kg·m / 213 lb·ft)

   - After fixing it to the specified torque, align the lip part of the nut to the V-groove of the shaft edge. Securely caulk the two parts of the nut lip using a chisel whose tip form is approx. 1 mm (0.04 in) radius by 60°, to make a length (B) of 5 mm (0.2 in) or more, and a clearance between the bottom of the shaft and the nut lip (A) of 1.5 mm (0.06 in) or less.

Caution:
If any crack is found on the caulking portions of the nut after the check, replace the lock nut and caulk it again.



4. Install the parking brake drum.
   - Refer to PARKING BRAKE ASSEMBLY.
5. Install the parking brake cable.
   - Refer to PARKING BRAKE CABLE.
6. Install the rear propeller shaft assembly.
   - Refer to REAR PROPELLER SHAFT ASSEMBLY.

 5884027500	5-8840-2750-0 / Oil Seal Installer

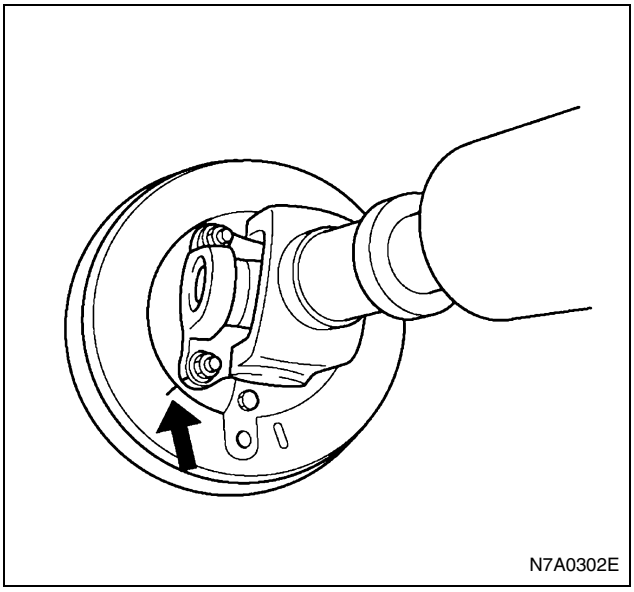
Transmission Assembly

Removal

Preparation: Jack up the vehicle, and support it with rigid racks.

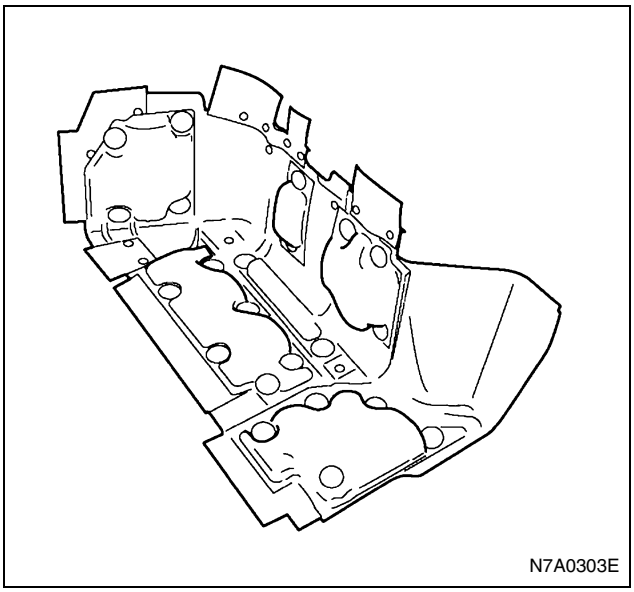
1. Remove the rear propeller shaft assembly.

Caution:
Put an alignment mark on the drum and the flange yoke. Put them aside and hang them up using a wire or something to prevent them from interrupting the work.



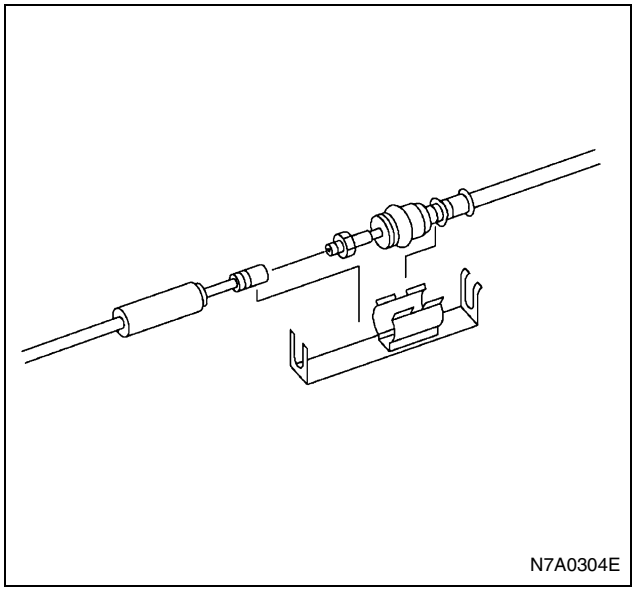
N7A0302E

2. Remove the transmission side cover.



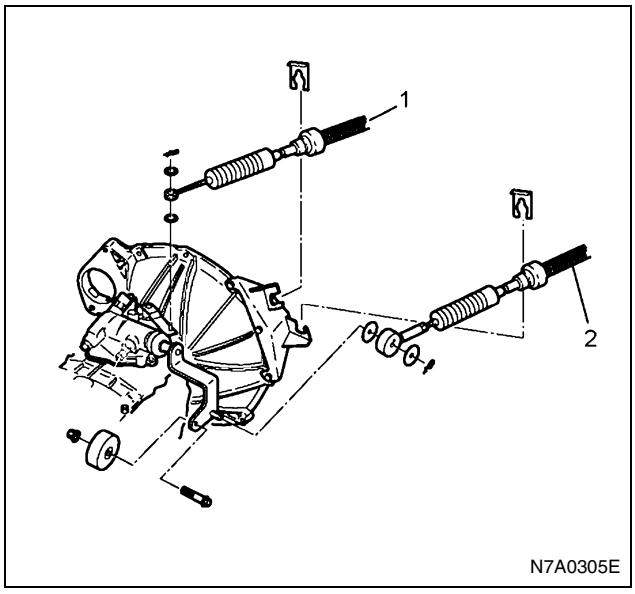
N7A0303E

3. Remove the connection of the vehicle speed sensor connector.
4. Remove the connection of the neutral switch connector.
5. Remove the connection of the reverse switch connector.
6. Remove the connector from the harness bracket taking care not to damage the clip portion.
7. Disconnect the parking cable.
   - Remove the cable bracket and move the cover, and then disconnect the cable by loosening the longer nut located to the vehicle front side.



N7A0304E

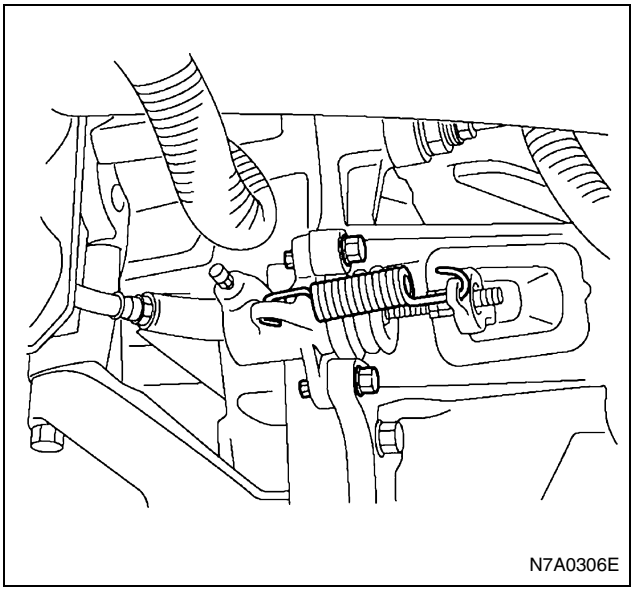
8. Remove the shift cable split pin and disconnect the shift cable.
9. Remove the select cable split pin and disconnect the select cable.



N7A0305E

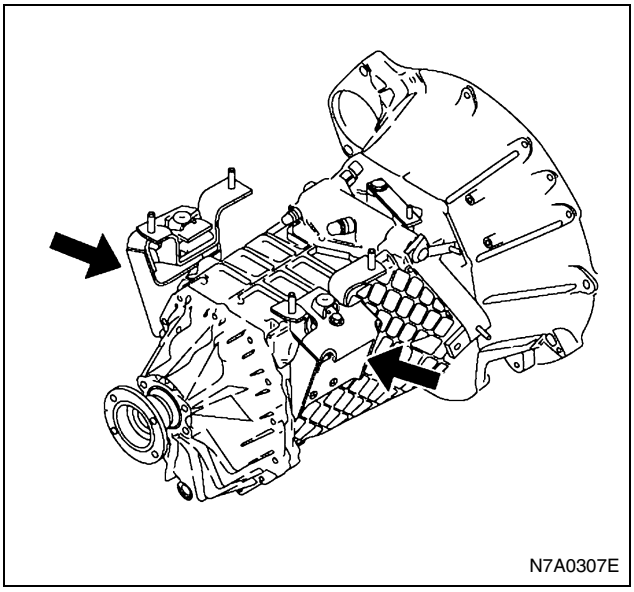
Legend
1. Select cable
2. Shift cable

10. Remove the clutch slave cylinder assembly.
    - Remove the return spring and the securing bolt, and then hang them up using a wire or something to prevent them from interrupting the work.



N7A0306E

11. Remove the starter ground cable.
12. Remove the starter motor assembly.
    - Hang them up using a wire or something to prevent them from interrupting the work.
13. Remove the nut securing the transmission and the frame (crossmember).
    - Support the engine using a garage jack or a wire, and then set the transmission jack under the transmission and secure it with a chain not to fall down.
    - For the vehicles with a double wishbone type suspension, remove the mounting bracket bolt on the transmission side, if necessary, and remove the mounting bracket.
14. Remove the transmission assembly.
    - Remove the bolt securing the clutch housing, and then remove the transmission assembly by operating the transmission jack.
15. Remove the mounting bracket assembly bolt, and then remove the bracket.



N7A0307E

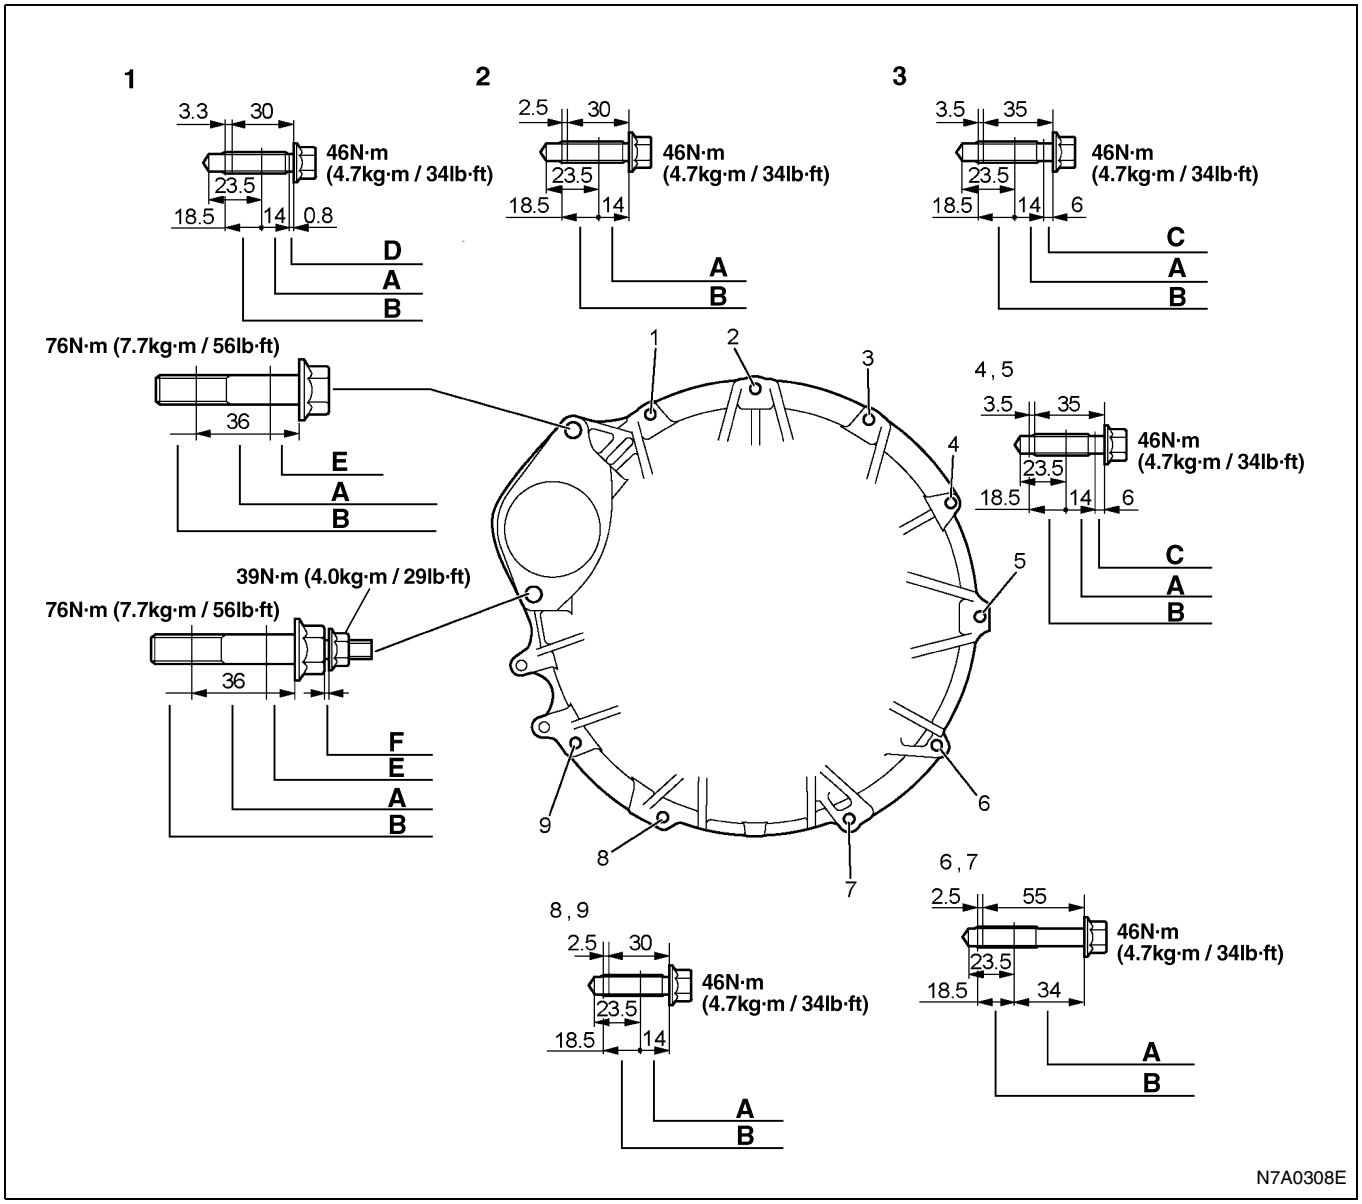
Installation

1. Install the mounting bracket assembly.

Tighten:
Mounting bracket to 97 N·m (9.9 kg·m / 72 lb·ft)

2. Install the transmission assembly.
    - Fix and secure the transmission in the same way of removal.

Tighten:
Transmission assembly to 46 N·m (4.7 kg·m / 34 lb·ft)



Legend

A: Clutch housing
B: Fly wheel housing
C: Gear control bracket
D: Harness clip
E: Starter
F: Engine ground cable

3. Fix the nut securing the transmission and the frame (crossmember).

Tighten:
Nut to 40 N·m (4.1 kg·m / 30 lb·ft)

- For the vehicles with a double wishbone type suspension, install the mounting bracket on the transmission after installing the transmission.

Tighten:
Mounting bracket on the transmission to 46 N·m (4.7 kg·m / 34 lb·ft)

4. Install the starter motor assembly.

Tighten:
Starter motor assembly to 76 N·m (7.7 kg·m / 56 lb·ft)

5. Install the starter ground cable.

Tighten:
Starter ground cable to 39 N·m (4.0 kg·m / 29 lb·ft)

6. Install the clutch slave cylinder assembly.

Tighten:
Clutch slave cylinder assembly 16 N·m (1.6 kg·m / 12 lb·ft)

7. Install the select cable.
   - For installation, refer to GEAR CONTROL CABLE.
8. Install the shift cable.
   - For installation, refer to GEAR CONTROL CABLE.

9. Install the parking brake cable.
10. Install the harness connector.
11. Install the reverse switch connector.
12. Install the neutral switch connector.
13. Install the vehicle speed sensor connector.
14. Install the transmission side cover.
15. Install the rear propeller shaft assembly aligning it to the alignment mark.

Tighten:
Rear propeller shaft assembly to 102 N·m (10.5 kg·m / 75 lb·ft)

UNIT REPAIR

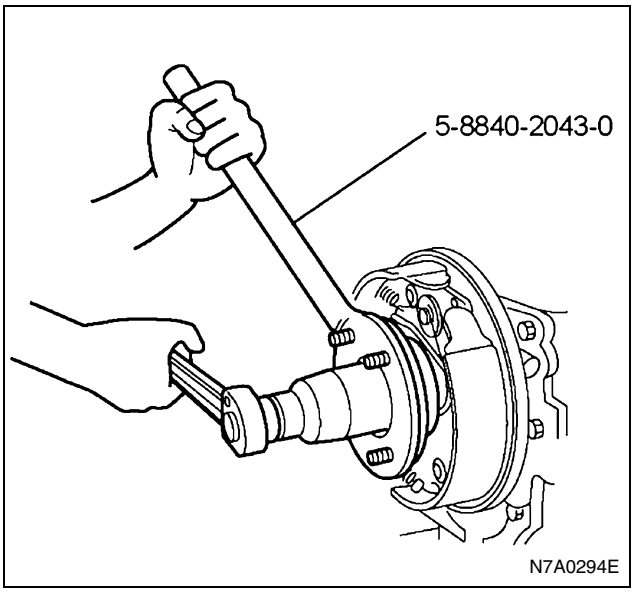
Disassembly

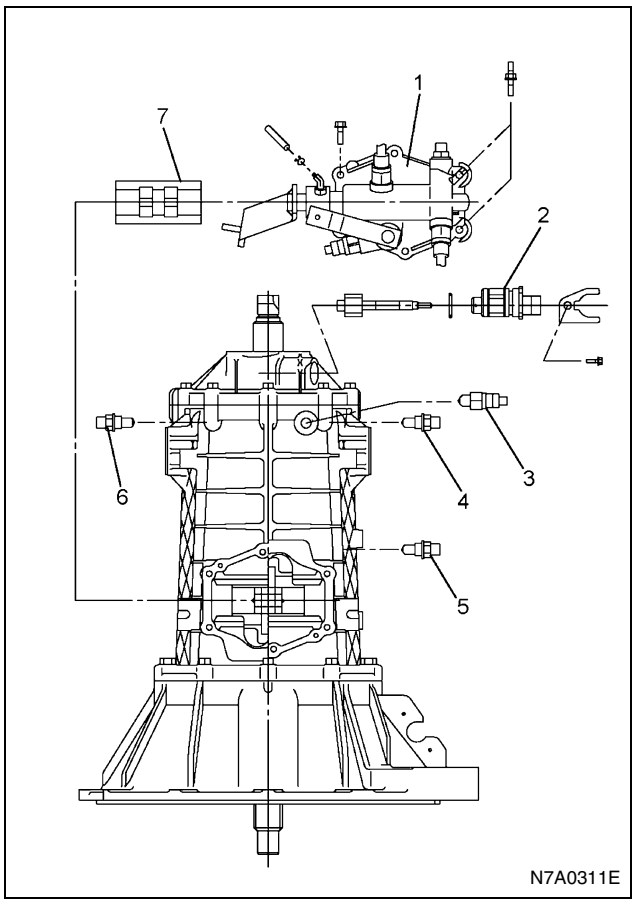
Caution:
Be careful not to damage the transmission case and the clutch housing because they are made of aluminum. Further attention should be paid to the rib because its damage weakens hardness of the case.

Do not hurt yourself when working on something heavy such as cases and gears.

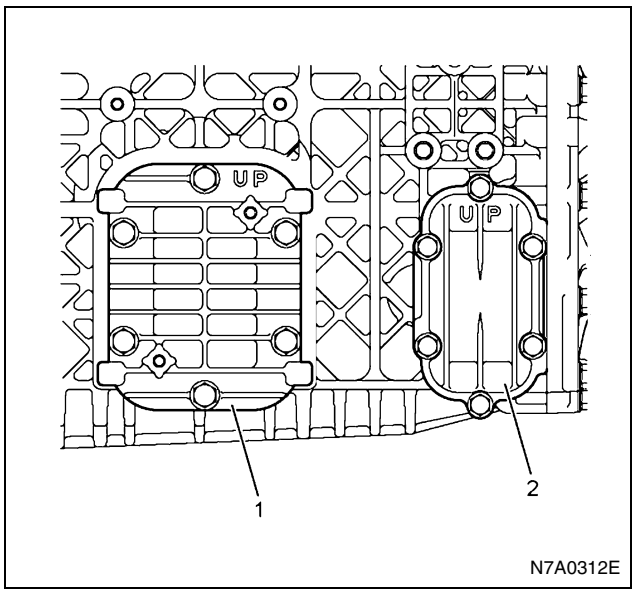
1. Remove the shift block assembly.
   - Refer to CLUTCH.
2. Remove the shift fork and the support bolt.
   - Refer to CLUTCH.
3. Remove the bolt securing the adjust hole cover and remove the parking brake drum.
   - Refer to PARKING BRAKE ASSEMBLY.
4. Raise the caulking portion (2 parts) of the coupling driver lock nut securely, and then remove the lock nut using the flange holder 5-8840-2043-0.



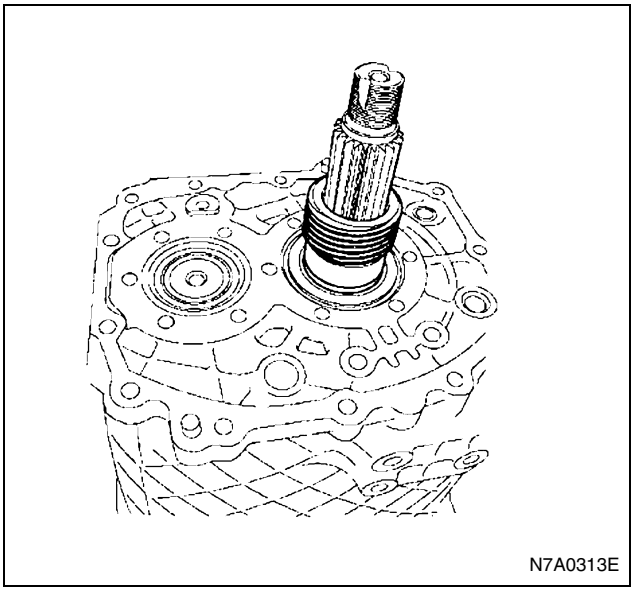
5. Remove the coupling driver and O-ring.
6. Remove the parking brake assembly.
   - Refer to PARKING BRAKE ASSEMBLY.
7. Remove the filler plug and O-ring.
8. Remove the drain plug and O-ring.
   - Drain the transmission oil. Check the amount of oil and the existence of metal particles and foreign matters while draining oil.
9. Remove the speedometer driven gear (2).
10. Remove the reverse switch (3).
11. Remove the detent assembly (4)(5)(6).
12. Remove the control box (1) and the interlock plate (7).



13. Remove the PTO cover (1).
14. Remove the reverse idle cover (2).

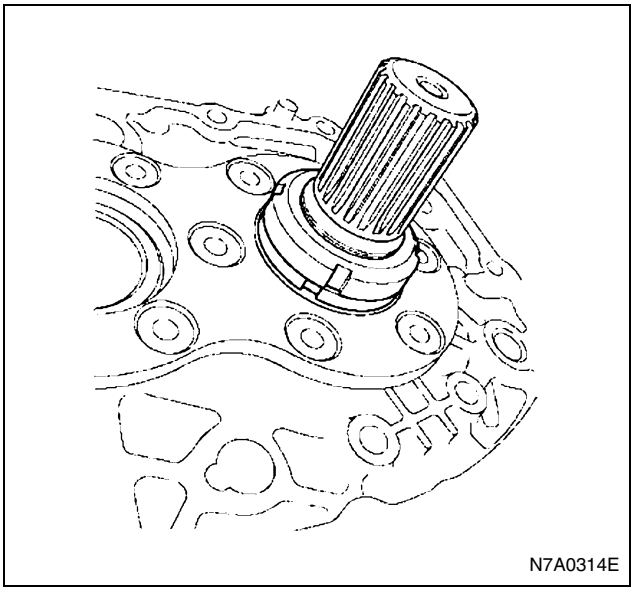


15. Remove the rear cover assembly.
16. If worn or damaged parts are found after checking the rear cover oil seal, remove the oil seal from rear cover using the flat-tip screwdriver.
17. Remove the speedometer gear and collar.



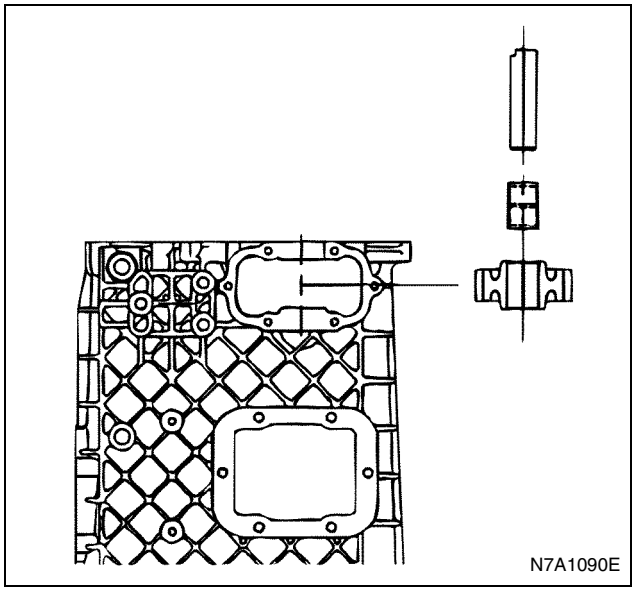
N7A0313E

18. Remove the main shaft end lock nut using the wrench 5-8840-2798-0. (4WD model)



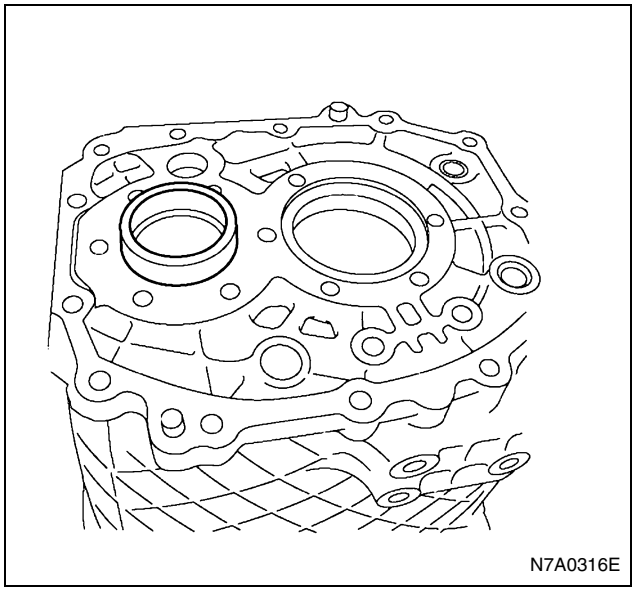
N7A0314E

19. Remove the retainer from the transmission case.
20. Pull out the reverse idle shaft, and then remove the reverse idle gear and the needle bearing.



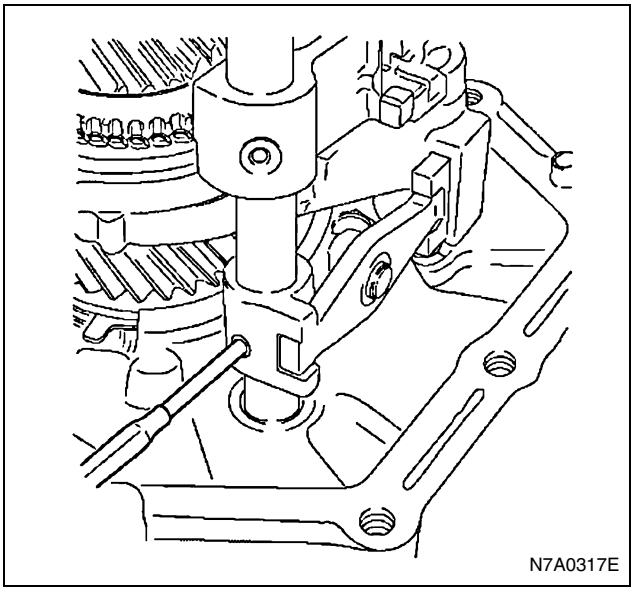
N7A1090E

21. Remove the snap ring from the main shaft rear bearing.
22. Remove the shim from the counter shaft rear bearing.
23. Remove the transmission case from the clutch housing.
24. Remove the bearing rear outer race from the transmission case.



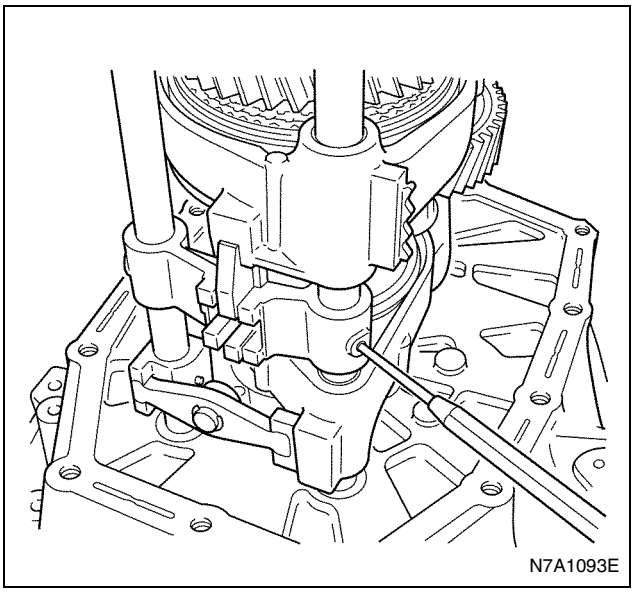
N7A0316E

25. Remove the 4th-5th shift rod, 4th-5th main shift block and 4th-5th sub shift block.
    - When driving out the spring pin, put a round pole on the opposite side of the shift rod not to damage other parts, and then remove the spring pin using the spring pin remover.



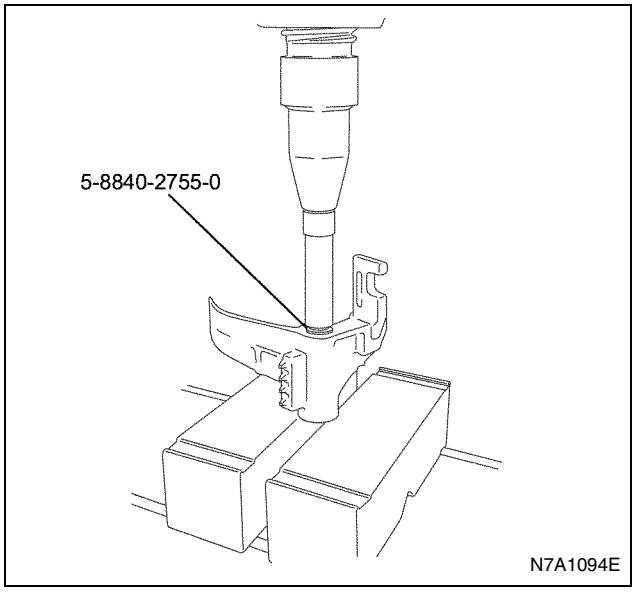
N7A0317E

26. Remove the 1st-reverse and 2nd-3rd shift rod, 1st-reverse shift arm, 2nd-3rd shift arm, 1st-reverse shift block, and 4th-5th shift arm.
    - When driving out the spring pin, put a round pole on the opposite side of the shift rod not to damage other parts, and then remove the spring pin using the spring pin remover.



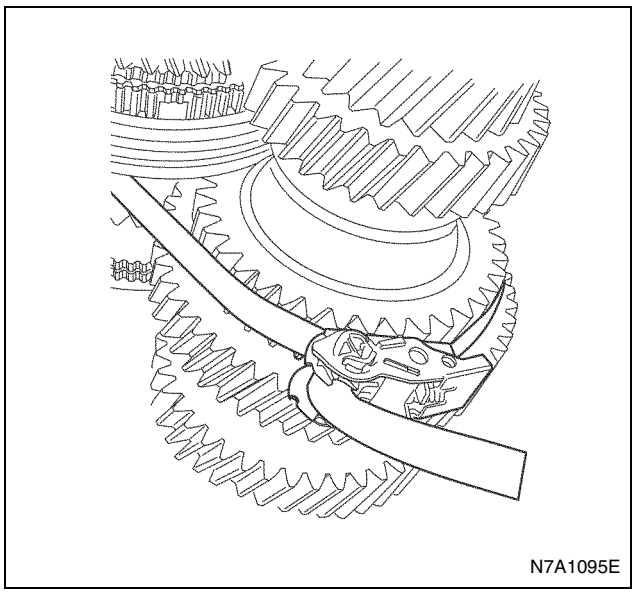
N7A1093E

27. Remove the bush from the 2nd-3rd shift arm using the remover 5-8840-2755-0.
28. Remove the bush from the 4th-5th shift arm using the remover 5-8840-2755-0.
    - Use the remover with a round pole whose length is enough to push the remover to the end.



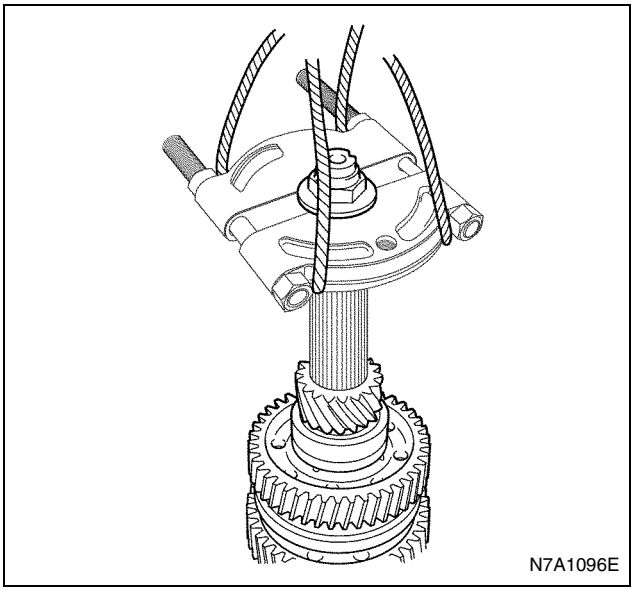
N7A1094E

29. Remove the 5th relay lever from the clutch housing.
30. Remove the magnet from the clutch housing.
31. Remove the main shaft assembly, the top gear shaft assembly and counter shaft assembly.
    a. Tie the main shaft assembly, the counter shaft assembly and the top gear shaft assembly at the two positions not to let them come apart using a lashing belt or other belts with a fixing function, and then fix them securely.

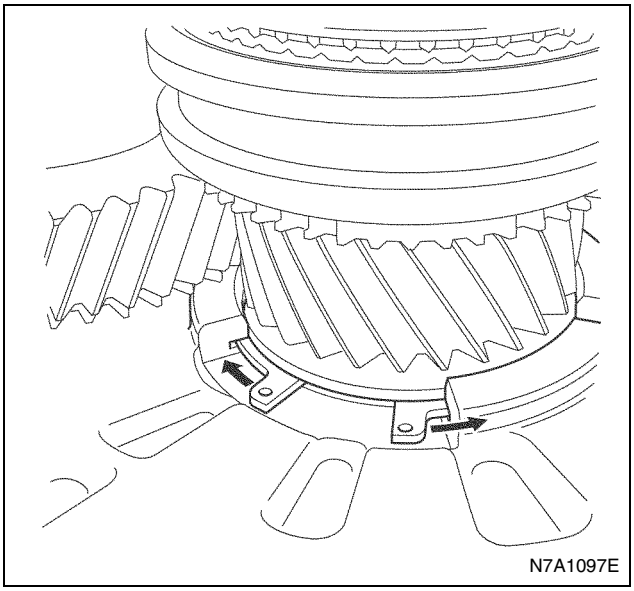


N7A1095E

    b. Install the bearing remover to the main shaft and secure it with a lock nut, hang them with a hoist and a wire, and then remove the top gear shaft assembly, the main shaft assembly, the counter shaft assembly from the clutch housing as a unit while spreading the top gear shaft bearing outer snap ring installed to the clutch housing.

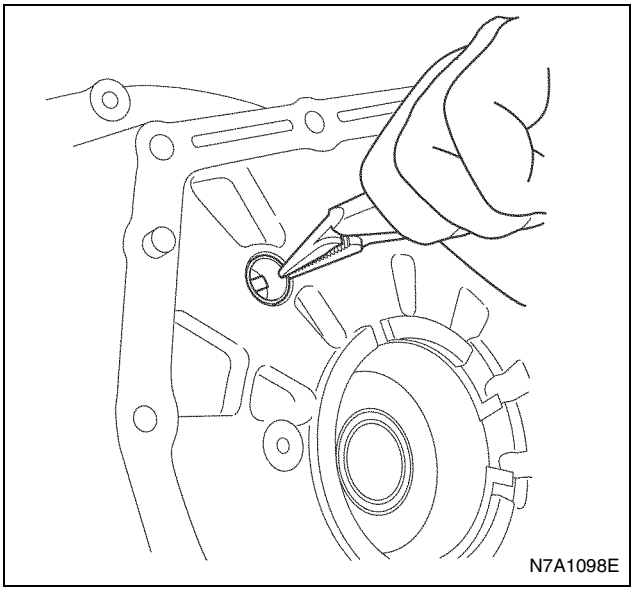


N7A1096E



N7A1097E

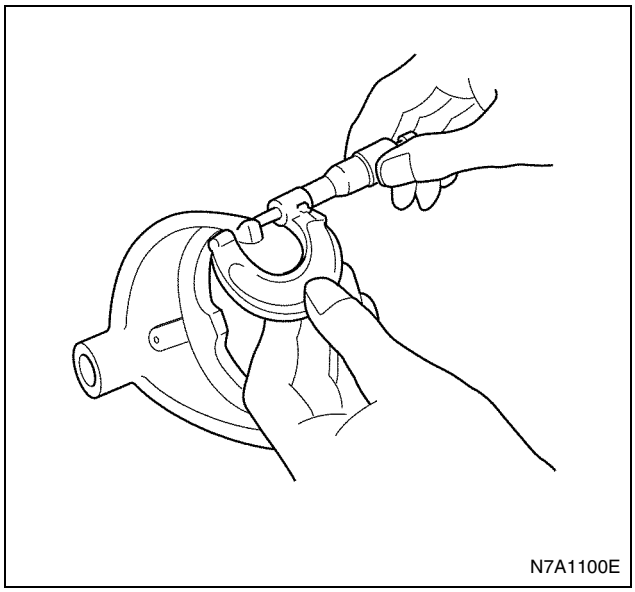
32. Check the clutch housing bush, and then remove it from the clutch housing using a pliers if it is worn or damaged.



N7A1098E

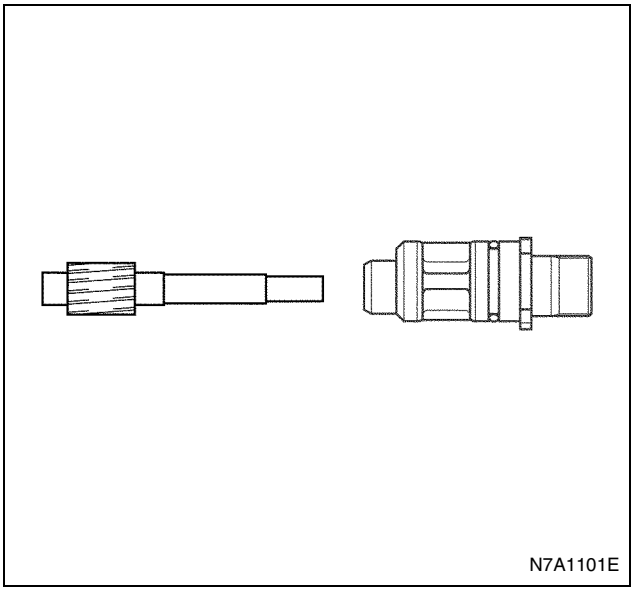
33. Check the front oil seal, and then remove it from the clutch housing using a flat-tip screwdriver if it is worn or damaged.
34. Check each part, and then correct and replace it if some worn, damaged or faulty parts are found.
    Check each part of the shift mechanism, and then correct light damage, deflection or stepped wear. Replace it when it is heavily damaged or its usage limit is over.
    - Deflection, wear and damage of the shift rod and the shift arm
    - Shift arm thickness
      – Measure the thickness of the shift arm tip using the micrometer.

Shift arm thickness, mm (in)		
	Standard	Limit
1st-reverse 3rd-2nd 5th-4th	9.60 — 9.85 (0.377 — 0.387)	9.0 (0.354)



N7A1100E

35. Check the wear of the speedometer driven gear and the driven gear bush.
    - Replace them if they are heavily worn.

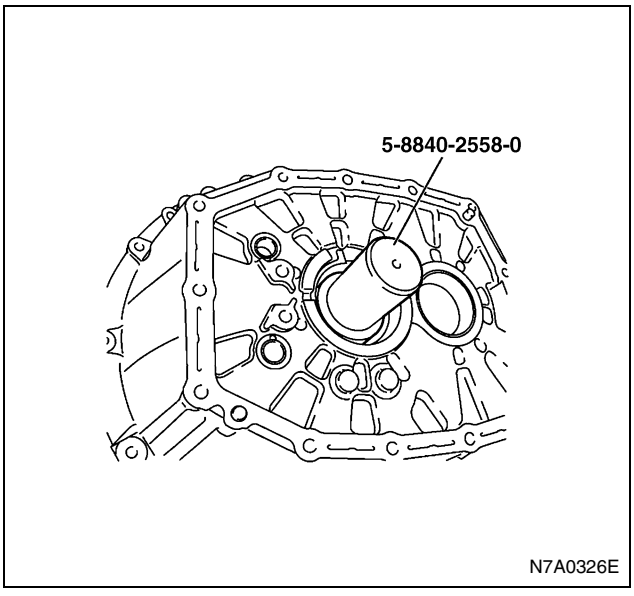


N7A1101E

Assembly

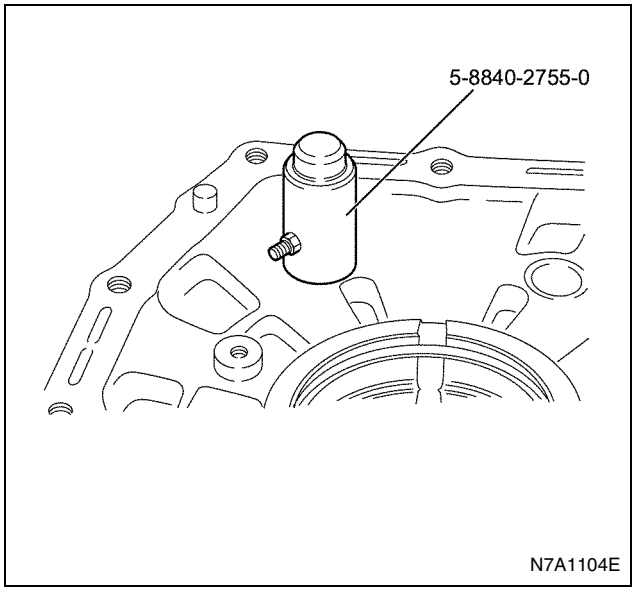
1. When finding the oil seal worn and damaged after the check and replacing it with a new one, apply engine oil 5W-30 around the oil seal, and then press in the oil seal into the clutch housing using the installer 5-8840-2558-0, or when the front PTO is equipped, using the installer 5-8840-2754-0 and the grip 5-8840-0007-0.
   - Apply Besco L2 grease on the oil seal lip portion.

Caution:
Be careful not to damage the oil seal lip portion.



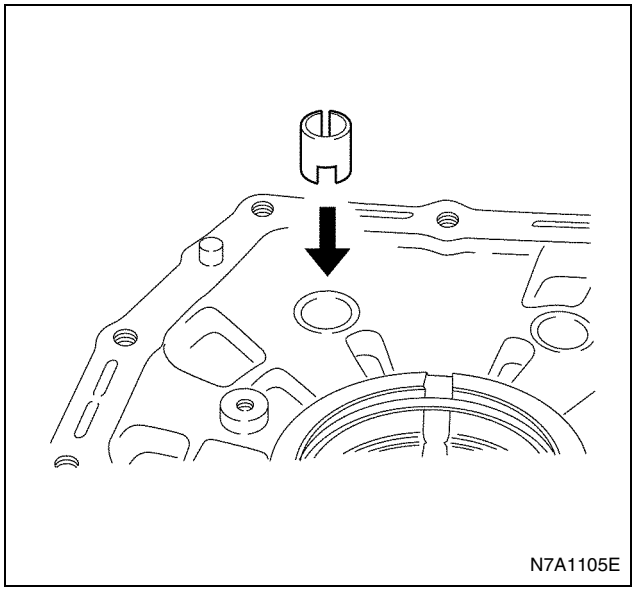
N7A0326E

2. When the clutch housing bush is replaced with a new one after checking it for wear and damage, press it in using the installer 5-8840-2755-0.
   - During installation, caulk three portions securely except older caulking portions and grooves.



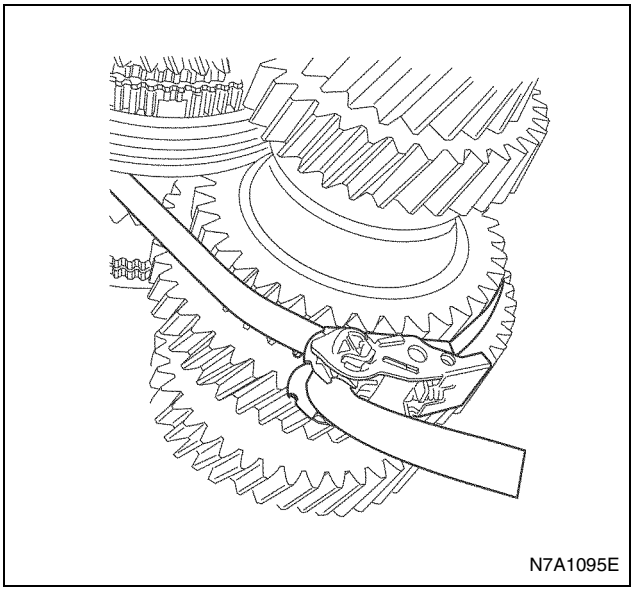
N7A1104E

   - For the bush pressing in for the second time and onwards, press in the bush facing its notched portion to the clutch housing.



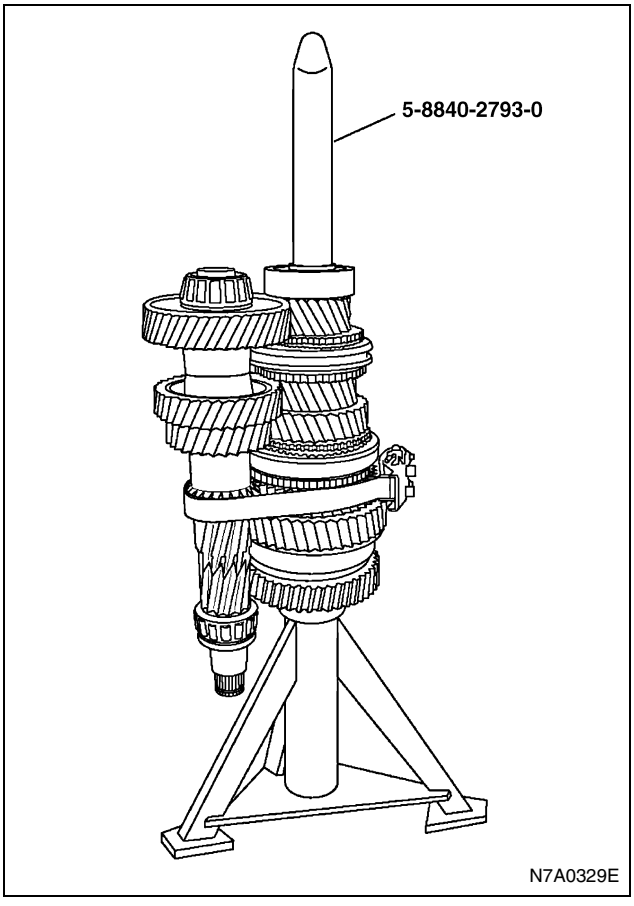
N7A1105E

3. Install the main shaft assembly, the top gear shaft assembly and the counter shaft assembly.
   a. Tie the main shaft assembly, the counter shaft assembly and the top gear shaft at the two positions not to let them come apart using a lashing belt or other belts with a fixing function, and then fix them securely. Be careful not to drop the top gear shaft while lifting up.



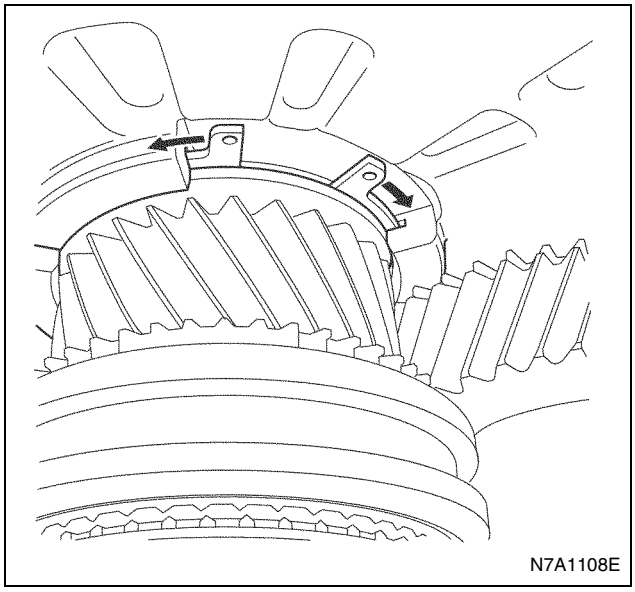
N7A1095E

b. Stick up the three of the top gear shaft assembly, the main gear shaft assembly and the counter shaft assembly on the support stand as the top gear shaft assembly is put on the top.
c. Install the oil seal protector 5-8840-2793-0 to the main shaft.



N7A0329E

d. Set the top gear shaft bearing outer snap ring to the clutch housing, spread it using a snap ring pliers, and then insert it to the clutch housing after aligning the top gear shaft, the counter shaft and the shift rod positions.



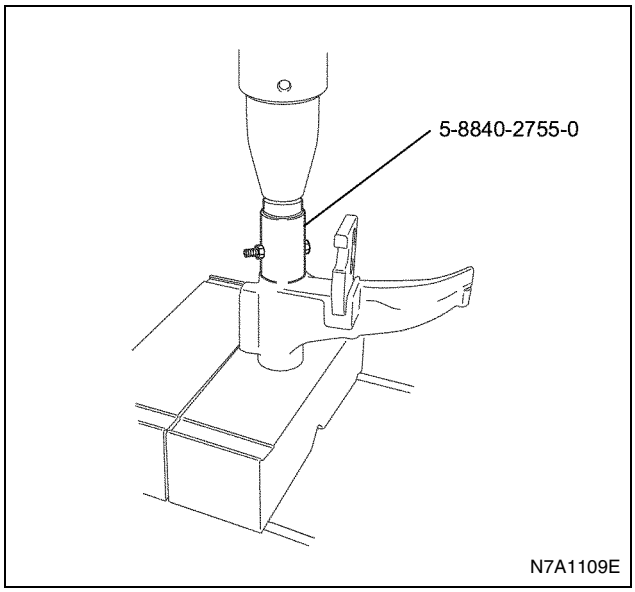
N7A1108E

Caution:
- Make sure the snap ring is installed securely.
- Work carefully not to damage the front oil seal.

4. Install the magnet to the clutch housing.
5. Install the 5th relay lever to the clutch housing.

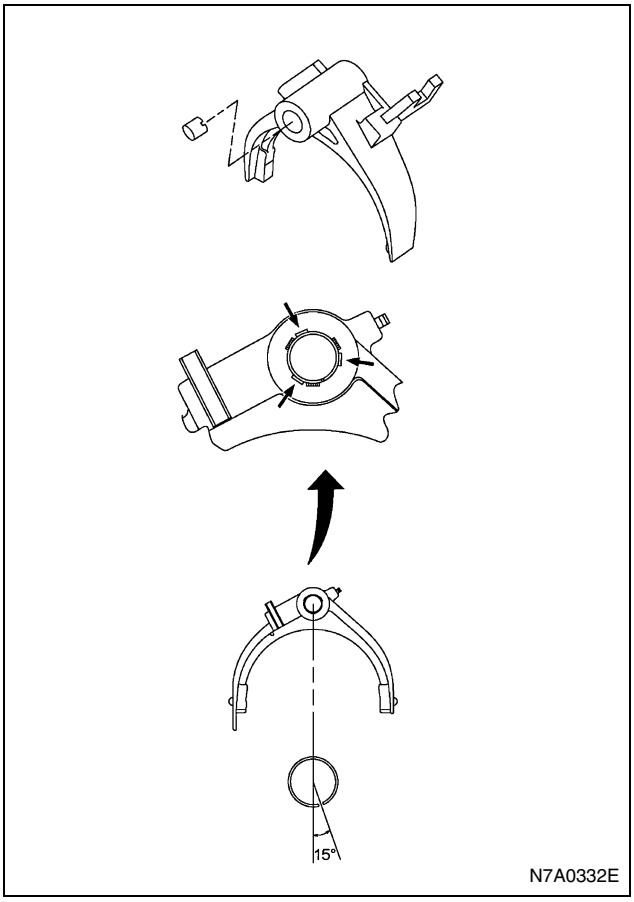
Tighten:
5th relay lever to 44 N·m (4.5 kg·m / 34 lb·ft)

6. When replacing the 4th-5th shift arm bush with a new one after checking it for wear or damage, press fit the bush using the installer 5-8840-2755-0.
7. When replacing the 2nd-3rd shift arm bush with a new one after checking it for wear or damage, press in the bush using the installer 5-8840-2755-0.

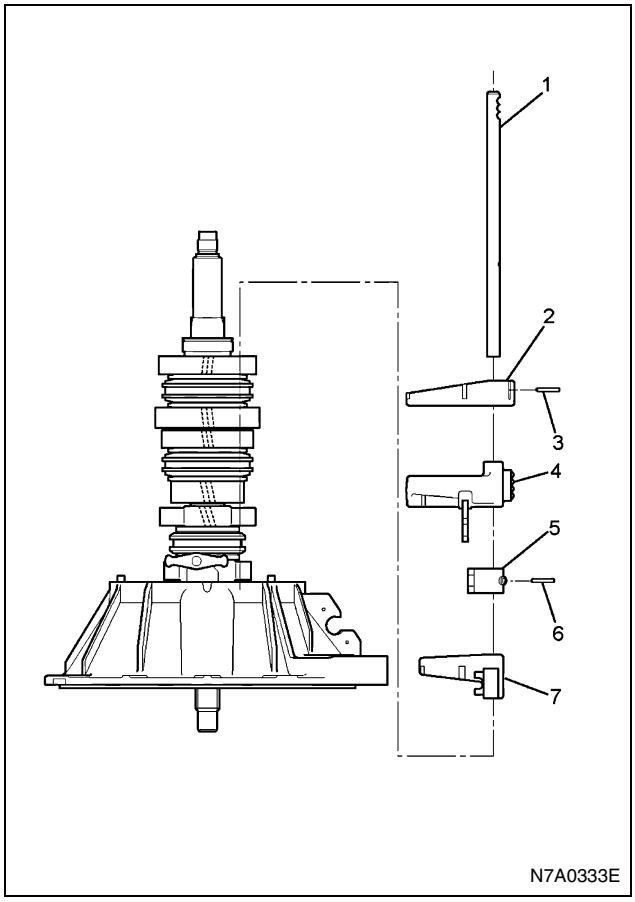


N7A1109E

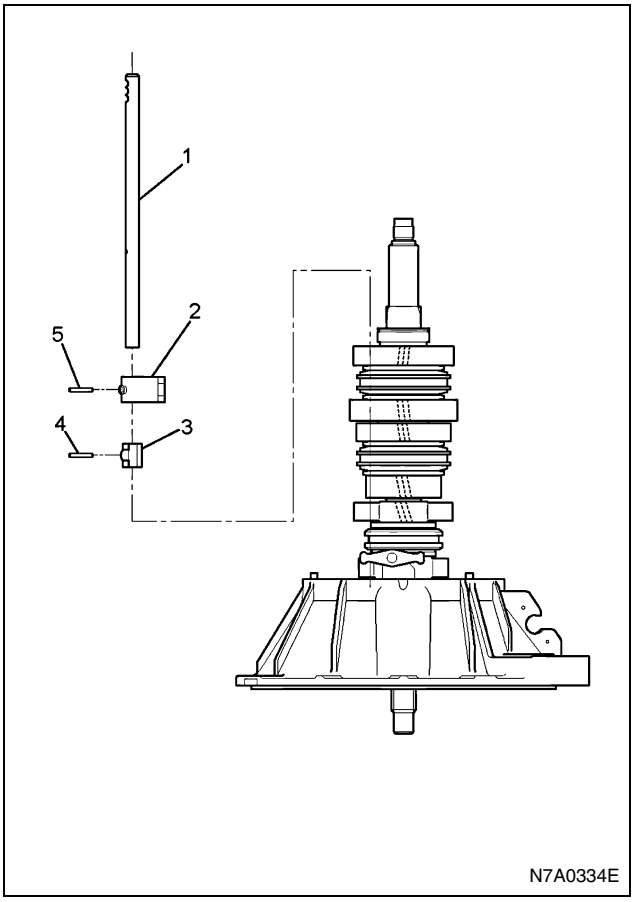
- Press it taking care of the direction and angle of the shift arm bush, caulk the three portions except the bush cut and older caulking portions.



8. Install the 4th-5th shift arm (7), the 1st-reverse shift block (5), the 2nd-3rd shift arm (4), the 1st-reverse shift arm (2), and the 1st-reverse and 2nd-3rd shift rod (1).
   - Drive the spring pin (3) and (6) using a hammer after aligning the spring pin hole.
   - When pressing in the spring pin, put a round pole on the opposite side of the shift rod not to damage other parts, and then press in the spring pin.

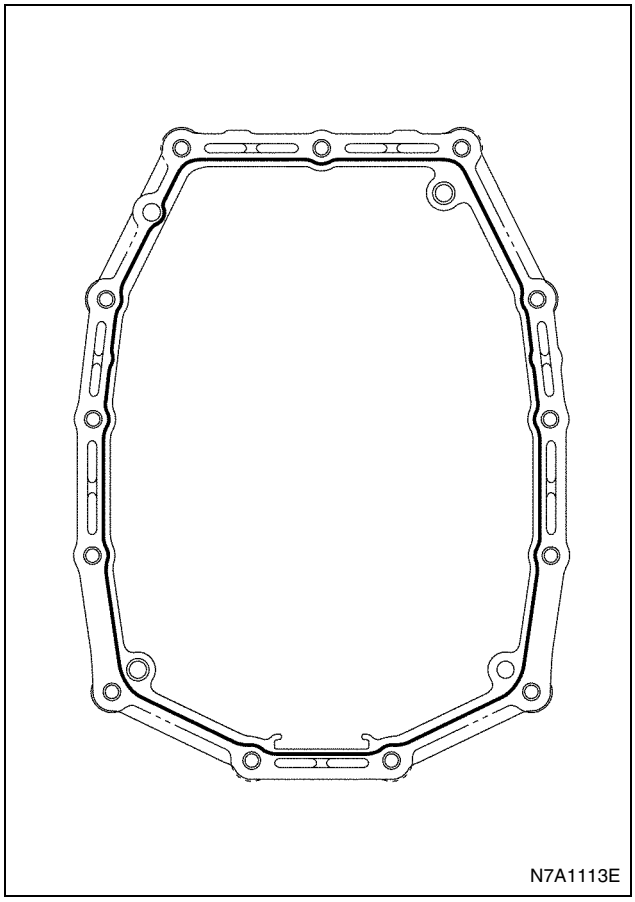


9. Install the 4th-5th sub shift block (3), 4th-5th main shift block (2), 4th-5th shift rod (1).
   - Drive in the spring pin (4) and (5) using a hammer after aligning the spring pin hole.
   - When pressing in the spring pin, put a round pole on the opposite side of the shift rod not to damage other parts, and then press in the spring pin.

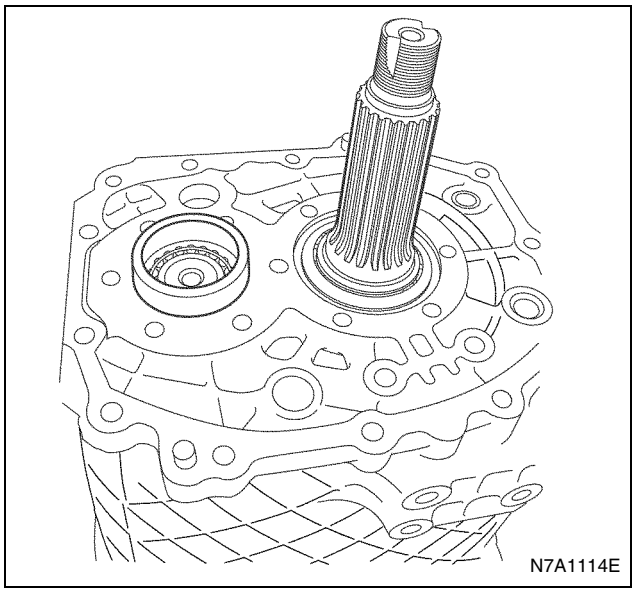


10. Apply ThreeBond 1215 to the mating surface of the transmission case and the clutch housing, and then install the clutch housing.
    - Wipe off moisture and lubricant from the mating surface, and then apply the bond continuously with a diameter of 2 mm (0.079 in) or more.

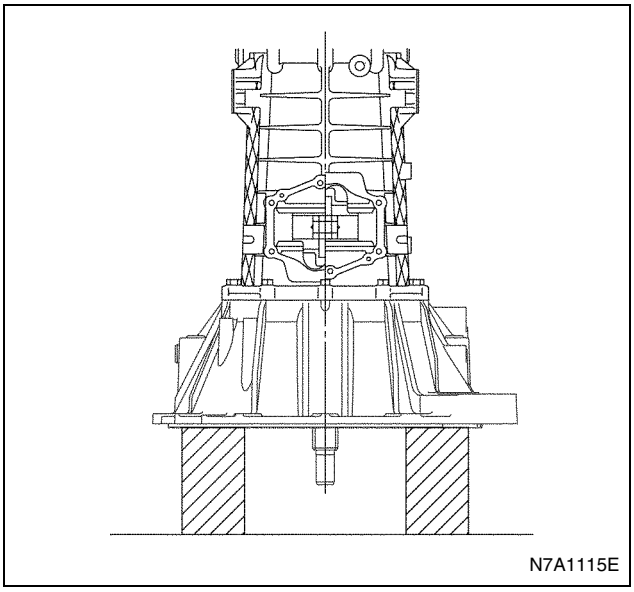
Tighten:
Clutch housing to 46 N·m (4.7 kg·m / 34 lb·ft)



11. Install the bearing rear outer race to the transmission case.



12. Install the shim to the counter shaft rear bearing.
    a. Shift the position to the neutral.
    b. Set the transmission assembly with the clutch housing faced down.



N7A1115E

c. Revolve the counter shaft more then 30 times and smooth the taper roller bearing.

d. Select the counter shim.

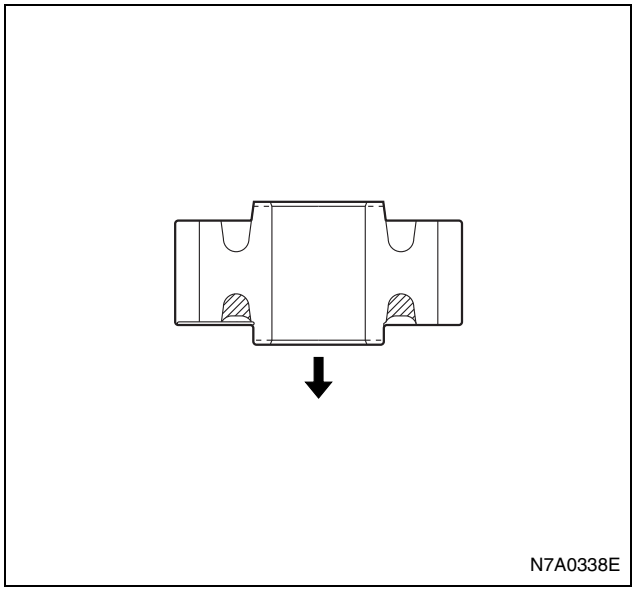
- Measure the depth at the points equally divided into three from the end surface of the transmission case to the outer ring edge surface of the counter shaft rear bearing, and then take an average of them.
- Select the shim whose thickness agrees with the list below.

Measured value, mm (in)	Thickness of applicable shim
more than — less than	
3.34 — 3.40 (0.132 — 0.133)	3.19 (0.125)
3.28 — 3.34 (0.130 — 0.131)	3.13 (0.123)
3.22 — 3.28 (0.127 — 0.129)	3.70 (0.120)
3.16 — 3.22 (0.125 — 0.126)	3.01 (0.118)
3.10 — 3.16 (0.122 — 0.124)	2.95 (0.116)
3.04 — 3.10 (0.120 — 0.122)	2.89 (0.113)
2.98 — 3.04 (0.118 — 0.119)	2.83 (0.111)
2.92 — 2.98 (0.115 — 0.117)	2.77 (0.109)
2.86 — 2.92 (0.113 — 0.114)	2.71 (0.106)
2.80 — 2.86 (0.110 — 0.112)	2.65 (0.104)
2.74 — 2.80 (0.108 — 0.110)	2.59 (0.101)
2.68 — 2.74 (0.106 — 0.107)	2.53 (0.099)
2.62 — 2.68 (0.104 — 0.105)	2.47 (0.097)
2.56 — 2.62 (0.101 — 0.103)	2.41 (0.094)
2.50 — 2.56 (0.099 — 0.100)	2.35 (0.092)
2.44 — 2.50 (0.096 — 0.098)	2.29 (0.090)
2.38 — 2.44 (0.094 — 0.096)	2.23 (0.087)
2.32 — 2.38 (0.092 — 0.093)	2.17 (0.085)
2.26 — 2.32 (0.089 — 0.091)	2.11 (0.083)

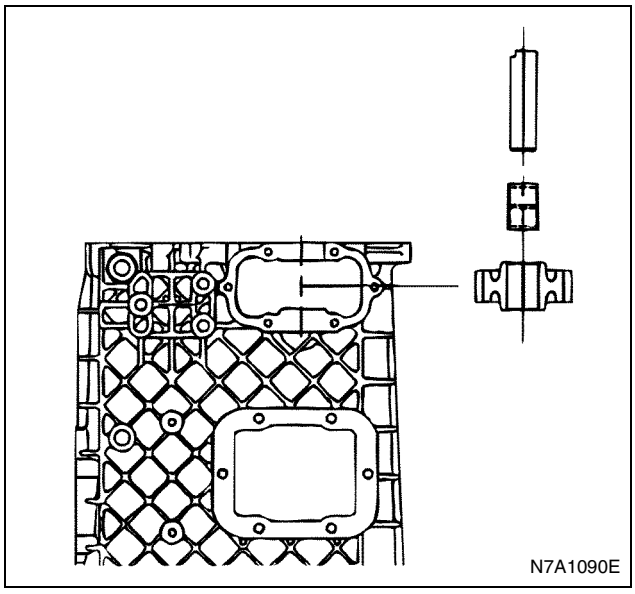
13. Install the snap ring to the main shaft rear bearing.

14. Apply engine oil 5W-30 to the needle bearing, install the reverse idle gear and needle bearing, and then insert the reverse idle shaft.

- The arrow mark shows the direction of the transmission front side.



N7A0338E



N7A1090E

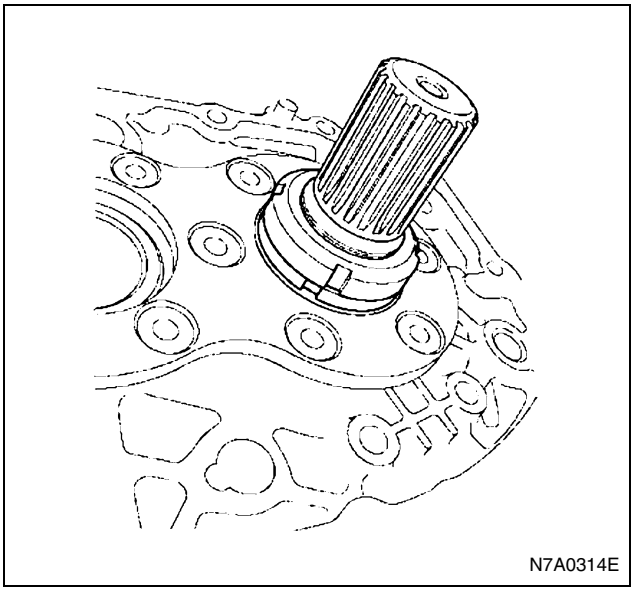
15. Install the retainer to the transmission case.

Tighten:
Retainer to 26 N·m (2.7 kg·m / 19 lb·ft)

Caution:
Clean up the sealing agent on the screw thread of the transmission case and replace all screws with new ones.

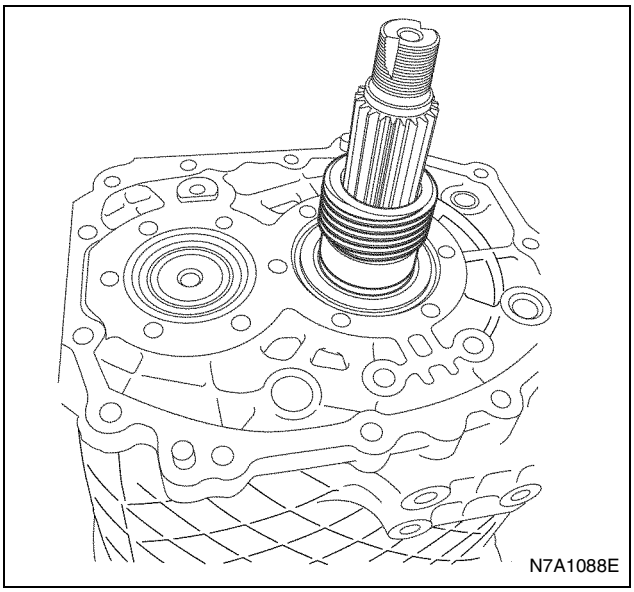
16. Fix the main shaft end lock nut using the wrench 5-8840-2798-0. (4WD model)

Tighten:
Main shaft end lock nut to 359 N·m (36.6 kg·m / 265 lb·ft)



N7A0314E

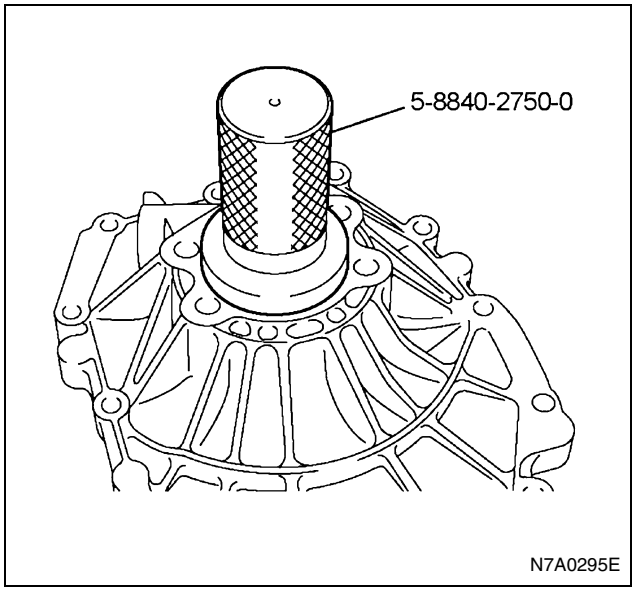
17. Install the collar and speedometer gear.



N7A1088E

18. When replacing the oil seal of the rear cover with a new one after checking it for wear or damage, apply engine oil 5W-30 around the oil seal, and then press it in to the rear cover using the installer 5-8840-2750-0.
    - Apply Besco L2 grease to the oil seal lip.

Caution:
Be careful not to damage the lip portion of the oil seal.

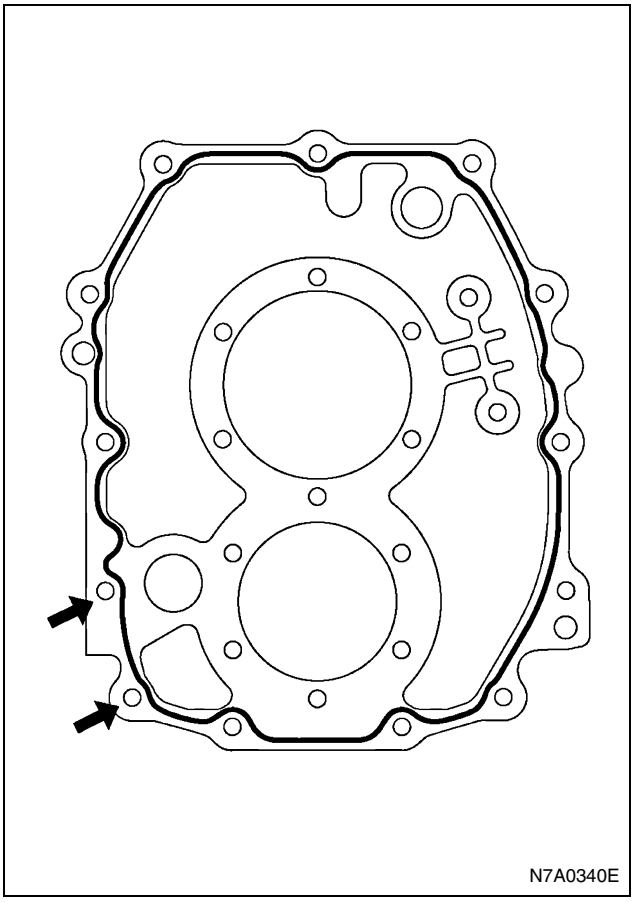


N7A0295E

19. Apply ThreeBond 1215 to the mating surface of the transmission case rear cover, and then install the rear cover.
    Wipe off moisture and lubricant from the connecting surface, and then apply the gasket continuously with a diameter of 2 mm (0.079 in) or more.

Caution:
Since the two bolts with arrow marks are installed with LOCTITE sealing agent, clean up the sealing agent remaining on the screw thread of the transmission case, and then use new bolts with LOCTITE sealing agent.

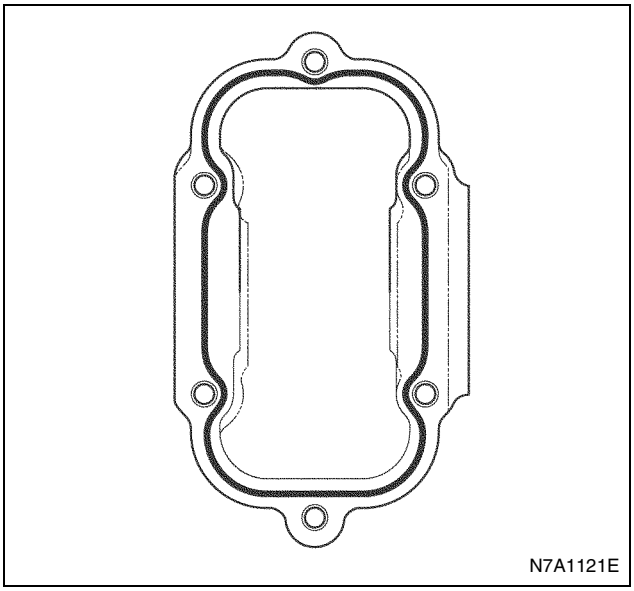
Tighten:
Rear cover to 46 N·m (4.7 kg·m / 34 lb·ft)



20. Apply ThreeBond 1215 to the mating surface of the transmission case reverse idle cover, and then install the reverse idle cover.

Tighten:
Reverse idle cover to 20 N·m (2.0 kg·m / 15 lb·ft)

- Wipe off moisture water and lubricant from the mating surface, and then apply the gasket continuously with a diameter of 2 mm (0.079 in) or more.

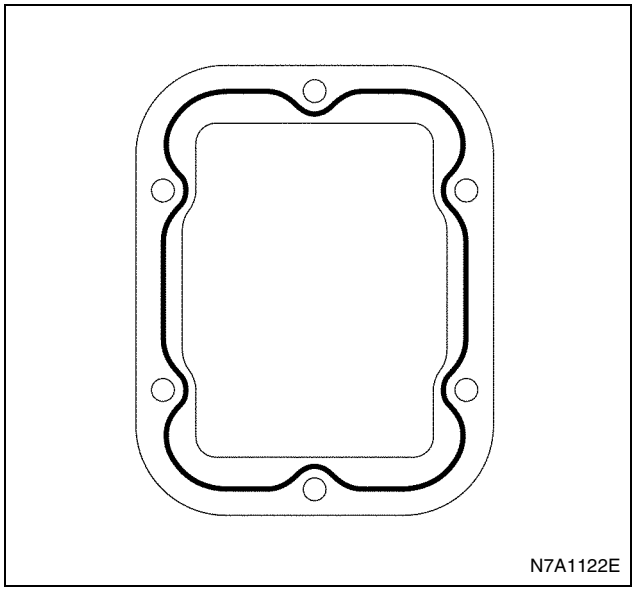


21. Apply ThreeBond 1215 to the mating surface of the transmission case front side cover, and then install the PTO cover.

- Wipe off moisture and lubricant from the mating surface, and then apply the gasket continuously with a diameter of 2 mm (0.079 in) or more.

Tighten:
PTO cover to 37 N·m (3.8 kg·m / 27 lb·ft)

Caution:
Since the bolt is installed with LOCTITE sealing agent, clean up the sealing agent remaining on the screw thread of the transmission case, and then use a new bolt with LOCTITE sealing agent.

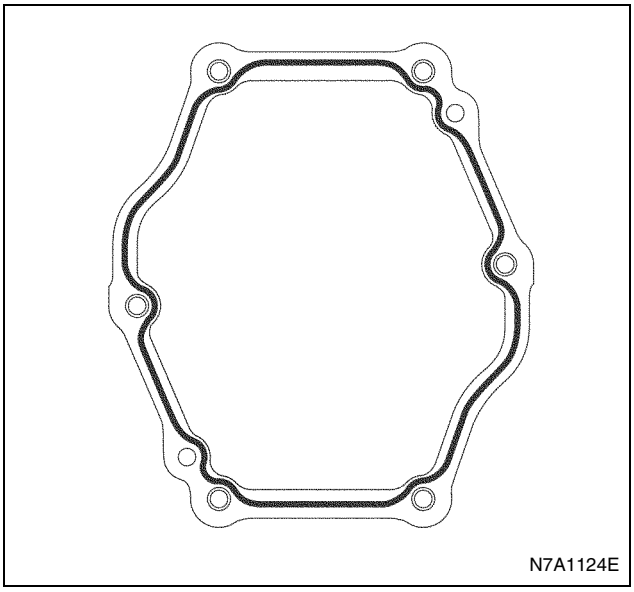


22. Shift the position to the neutral, apply ThreeBond 1215 to the mating surface of the transmission case control box, and then install the interlock plate (7) and the control box (1).

- Wipe off moisture and lubricant from the mating surface, and then apply the gasket continuously with a diameter of 2 mm (0.079 in) or more.

Tighten:
Control box (1) to 27 N·m (2.8 kg·m / 20 lb·ft)

Caution:
Since the bolt is installed with LOCTITE sealing agent, clean up the sealing agent remaining on the screw thread of the transmission case, and then use a new bolt with LOCTITE sealing agent.



23. Install the detent assembly (6) (5) (4).

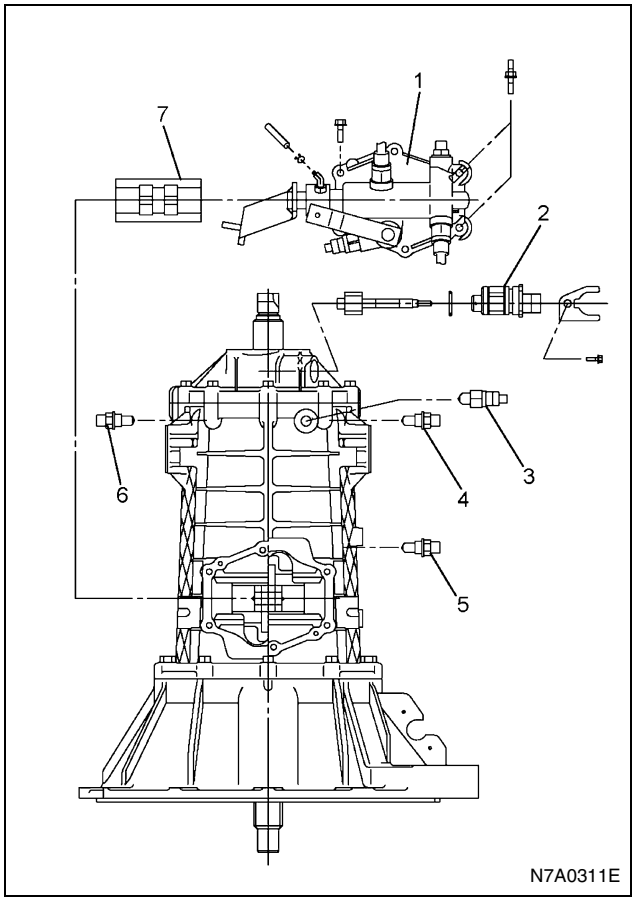
Tighten:
Detent assembly (6) (5) (4) to 27 N·m (2.8 kg·m / 20 lb·ft)

24. Apply Three Bond 1141 to the reverse switch thread portion, and then install the reverse switch (3).

Tighten:
Reverse switch (3) to 39 N·m (4.0 kg·m / 29 lb·ft)

25. Apply engine oil 5W-30 to the speedometer driven gear and the O-ring, and then install the speedometer driven gear (2).

Tighten:
Speedometer driven gear (2) to 20 N·m (2.0 kg·m / 15 lb·ft)



26. Apply engine oil 5W-30 to the O-ring, and then install the drain plug and the O-ring.

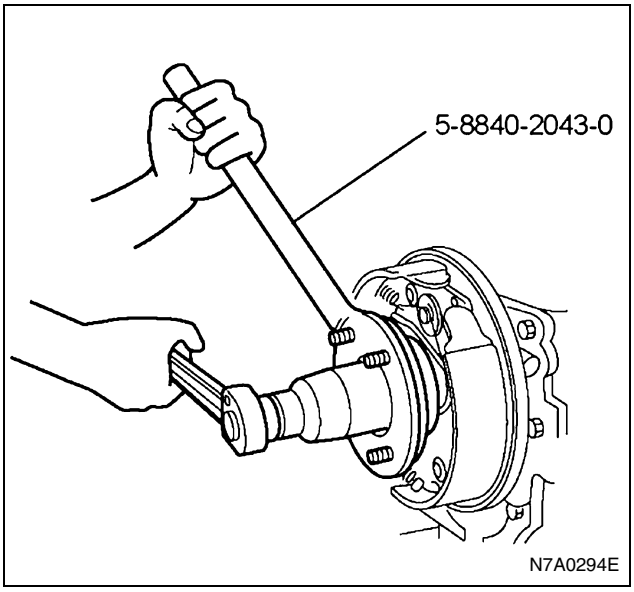
Tighten:
Drain plug to 39 N·m (4.0 kg·m / 29 lb·ft)

27. Apply engine oil 5W-30 to the O-ring, and then install the filler plug and the O-ring.

Tighten:
Filler plug to 39 N·m (4.0 kg·m / 29 lb·ft)

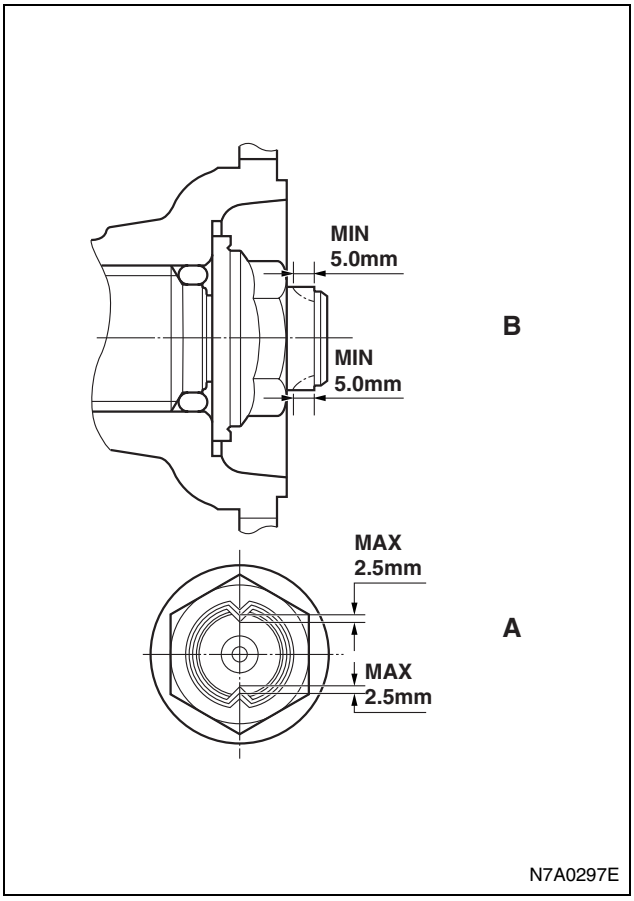
28. Install the parking brake assembly.
    - Refer to PARKING BRAKE ASSEMBLY.
29. Apply engine oil 5W-30 to the O-ring, and then install the coupling driver and the O-ring.
30. Use a new lock nut, apply engine oil 5W-30 to the seat, and then fix the lock nut using the flange holder 5-8840-2043-0.

Tighten:
Lock nut to 289 N·m (29.5 kg·m / 213 lb·ft)



- After fixing it to the specified torque, align the lip part of the nut to the V-groove of the shaft edge. Securely caulk the two parts of the nut lip using a chisel whose tip form is approx. 1 mm (0.04 in) radius by 60°, to make a length (B) of 5 mm (0.2 in) or more, and a clearance between the bottom of the shaft and the nut lip (A) of 2.5 mm (0.06 in) or less.

Caution:
If any crack is found on the caulking portions of the nut after the check, replace the lock nut and caulk it again.



31. Install the parking brake dram and the adjust hole cover securing bolt.
    - Refer to PARKING BRAKE ASSEMBLY.
32. Install the shift fork and the support bolt.
    - Refer to CLUTCH.
33. Install the shift block assembly.
    - Refer to CLUTCH.

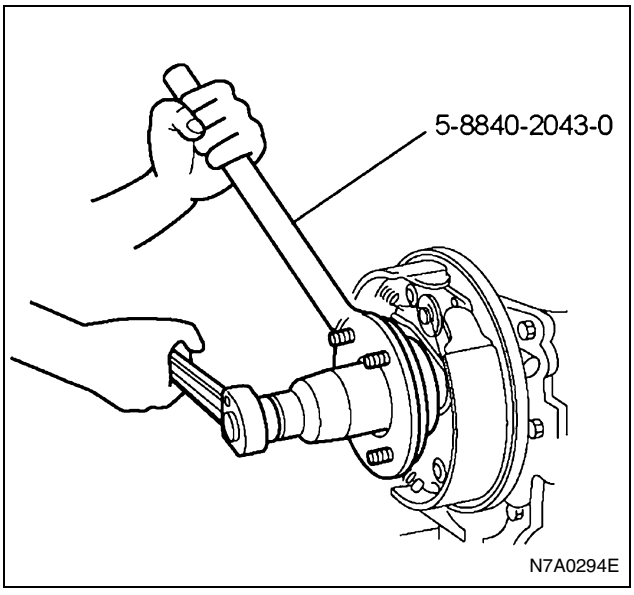
Disassembly

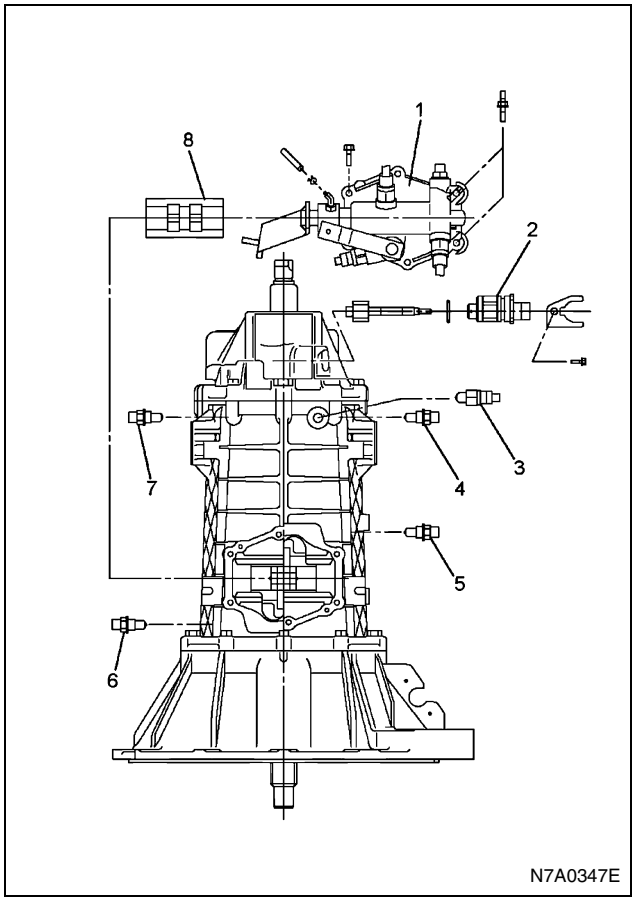
Caution:
Be careful not to damage the transmission case and the clutch housing because they are made of aluminum. Further attention should be paid to the rib because its damage weakens hardness of the case.

Do not hurt yourself when working on something heavy such as cases and gears.

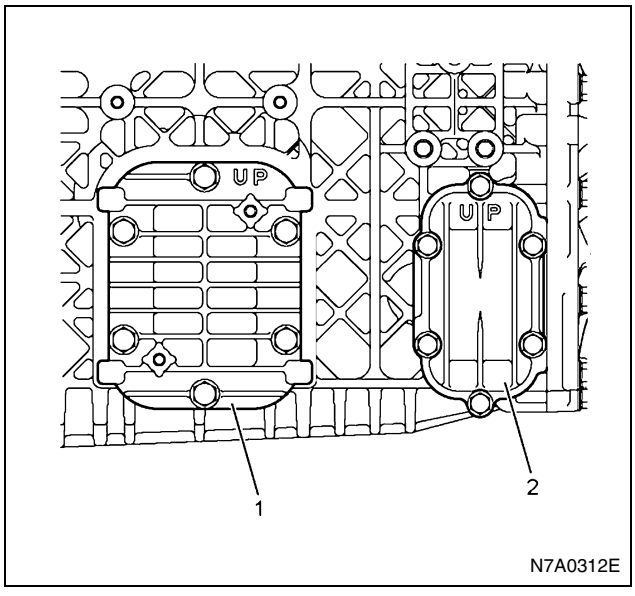
1. Remove the shift block assembly.
   - Refer to CLUTCH.
2. Remove the shift fork and the support bolt.
   - Refer to CLUTCH.
3. Remove the adjust hole cover securing bolt, and then remove the parking brake drum.
   - Refer to PARKING BRAKE ASSEMBLY.
4. Raise the caulking portions (two parts) of the coupling driver lock nut securely, and then remove the lock nut using the flange holder 5-8840-2043-0.



5. Remove the coupling driver and the O-ring.
6. Remove the parking brake assembly.
   - Refer to PARKING BRAKE ASSEMBLY.
7. Remove the filler plug and the O-ring.
8. Remove the drain plug and the O-ring.
   - Drain transmission oil. Check the amount of oil and the existence of metal particles and foreign matters while draining oil.
9. Remove the noise cover.
10. Remove the speedometer driven gear (2).
11. Remove the reverse switch (3).
12. Remove the detent assembly (4) (5) (6) (7).
13. Remove the control box (1) and the interlock plate (8).

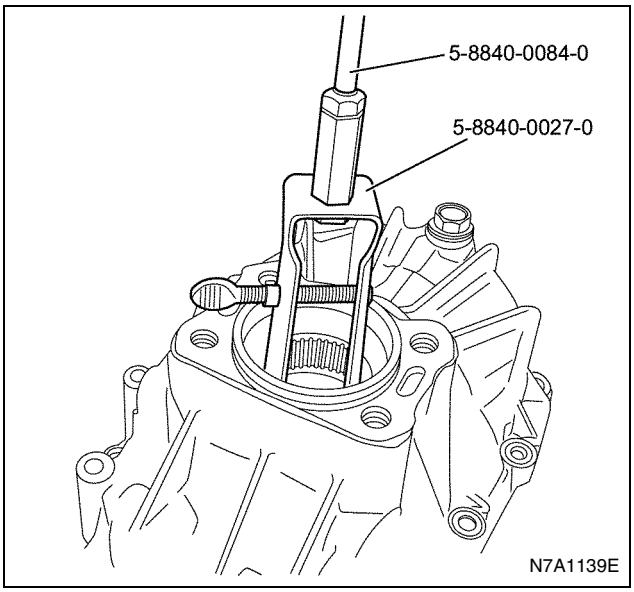


14. Remove the front side cover (1).
15. Remove the reverse idle cover (2).

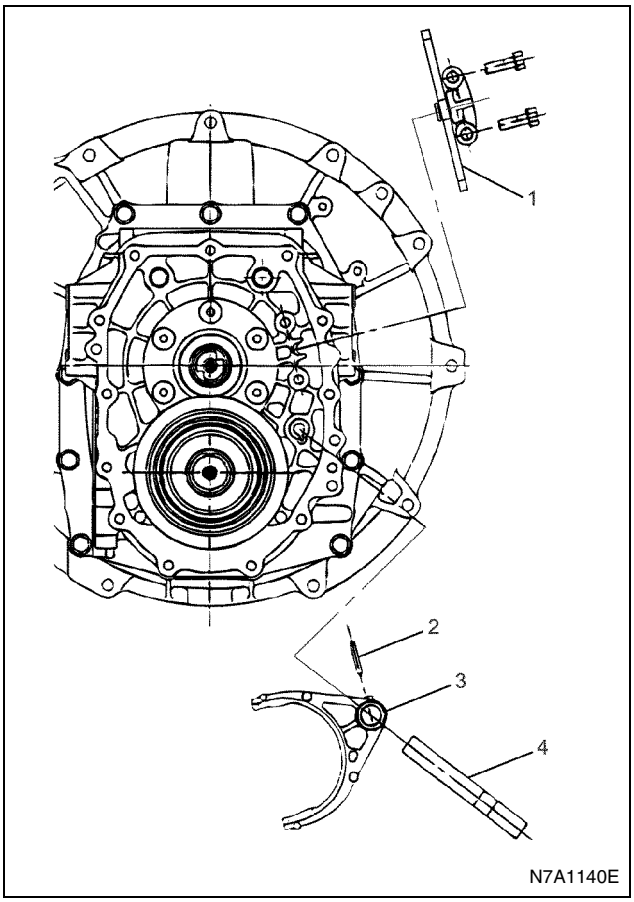


16. Remove the rear cover assembly.

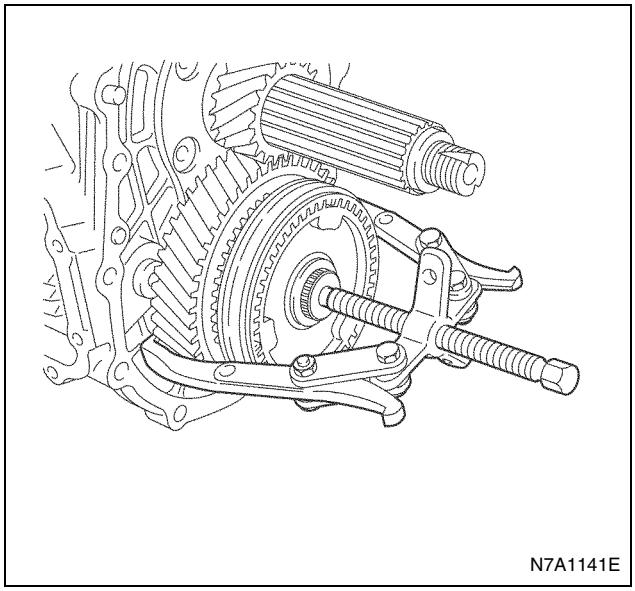
17. When worn or damaged parts are found after checking the rear cover oil seal, remove it from the rear cover using the flat-tip screwdriver.
18. Remove the needle bearing; main end from the rear cover using the remover 5-8840-0027-0 and the sliding hammer 5-8840-0084-0.



19. Remove the 6th relay lever (1).
20. Remove the 6th shift arm (3) and 6th shift rod (4).
    - Using the spring remover, drive out the spring pin (2).



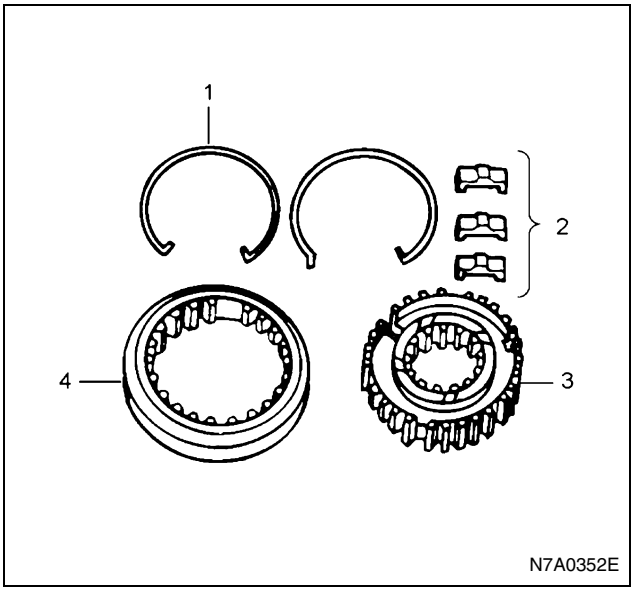
21. Using the snap ring pliers, remove the snap ring; 6th clutch hub.
22. Using the puller, remove the 6th clutch hub assembly and sleeve, the 6th block ring, the 6th gear and the needle bearing from the counter shaft.



23. Disassemble the 6th clutch hub assembly and sleeve.
    a. Remove the stopper from the clutch hub.
       - The arrow mark shows the direction of the transmission front side.

Caution:
When removing the stopper plate, replace it with a new one on installation.

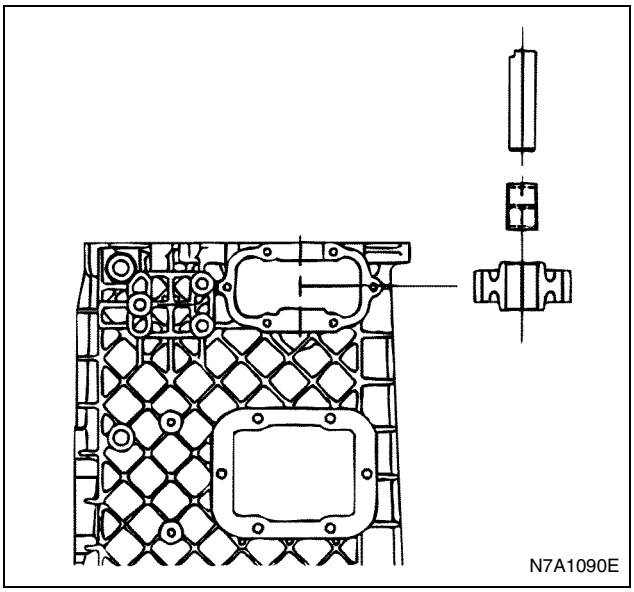
    b. Disassemble the clutch hub assembly and sleeve.



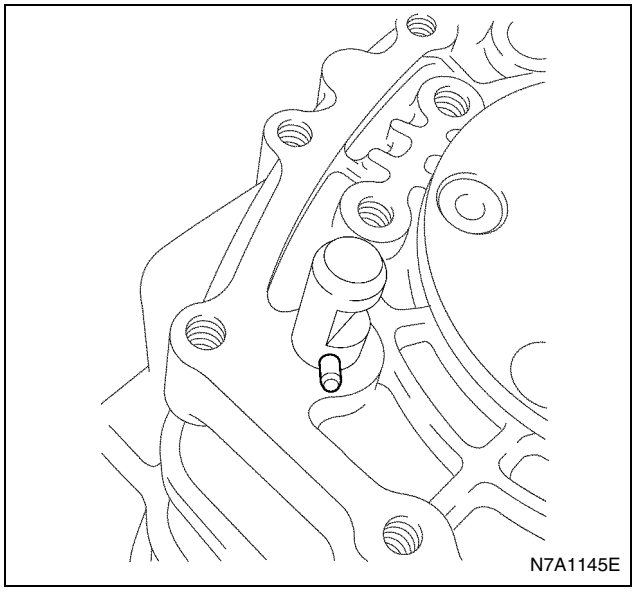
Legend

1. Spring
2. Insert
3. Clutch hub
4. Sleeve

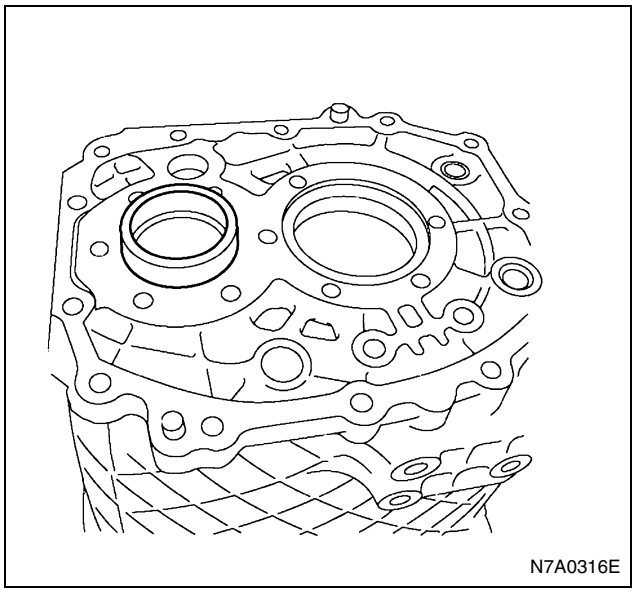
24. Remove the collar and the speedometer gear.
25. Remove the retainer from the transmission case.
26. Pull out the reverse idle shaft, and then remove the reverse idle gear and the needle bearing.



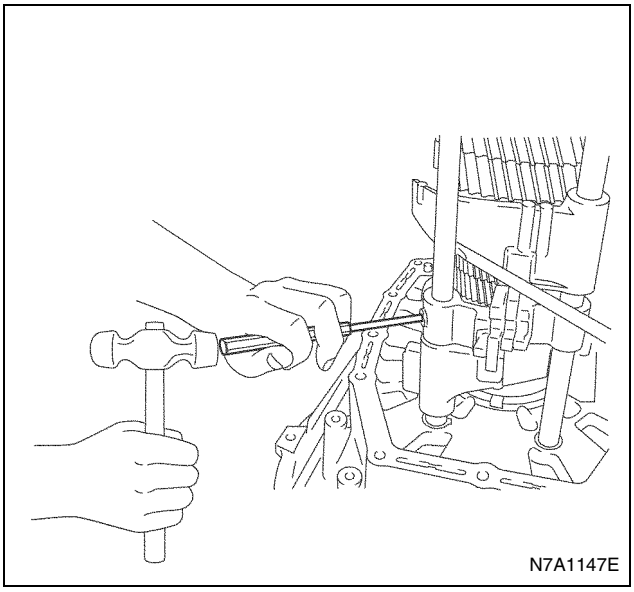
27. Remove the snap ring from the main shaft rear bearing.
28. Remove the shim from the counter shaft rear bearing.
29. Remove the spring pin; 4th-5th and 6th shift rod.



30. Remove the transmission case from the clutch housing.
31. Remove the bearing rear outer race from the transmission case.

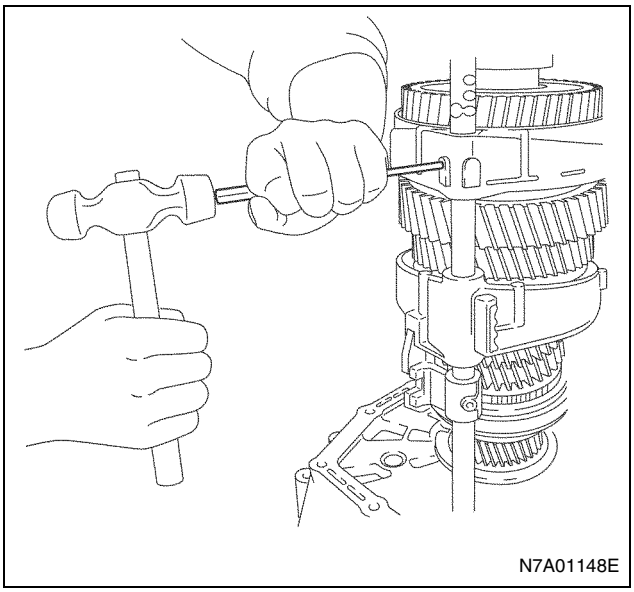


32. Remove the 4th-5th and 6th shift rod, the 1st-reverse and 6th shift block and the 4th - 5th shift arm.
    - When driving out the spring pin, put a round pole on the opposite side of the shift rod not to damage other parts, and then remove the spring pin using the spring pin remover.



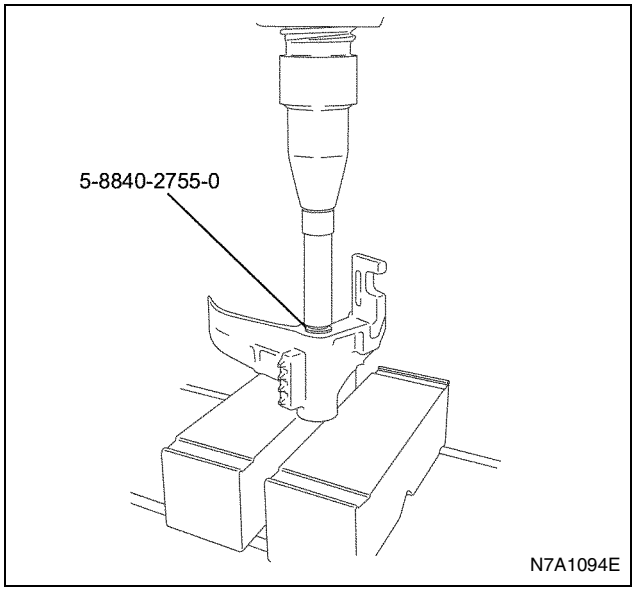
N7A1147E

33. Remove the 1st-reverse and 2nd-3rd shift rod, the 1st-reverse shift arm, the 3rd-2nd shift arm, the 1st-reverse and 6th shift block.
    - When driving out the spring pin, put a round pole on the opposite side of the shift rod not to damage other parts, and then remove the spring pin using the spring pin remover.



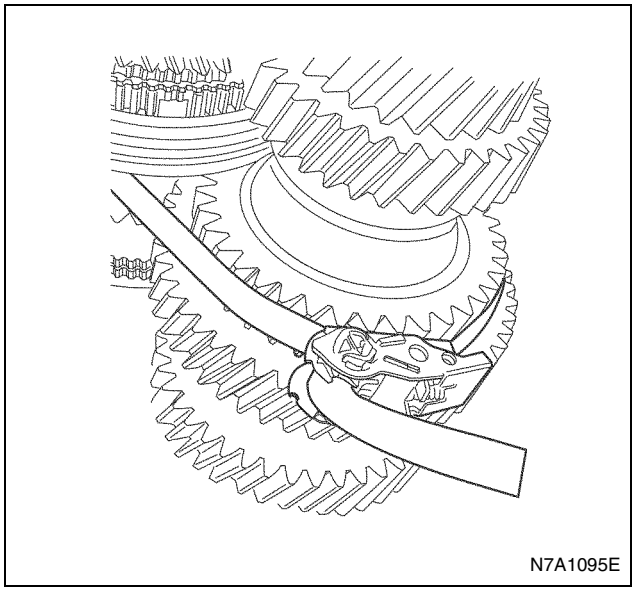
N7A01148E

34. Remove the bush from the 4th-5th shift arm using the remover 5-8840-2755-0.
35. Remove the bush from the 1st-reverse shift arm using the remover 5-8840-2755-0.
36. Remove the bush from the 3rd-2nd shift arm using the remover 5-8840-2755-0.
    - Use a round pole whose length is enough to push the remover to the end.



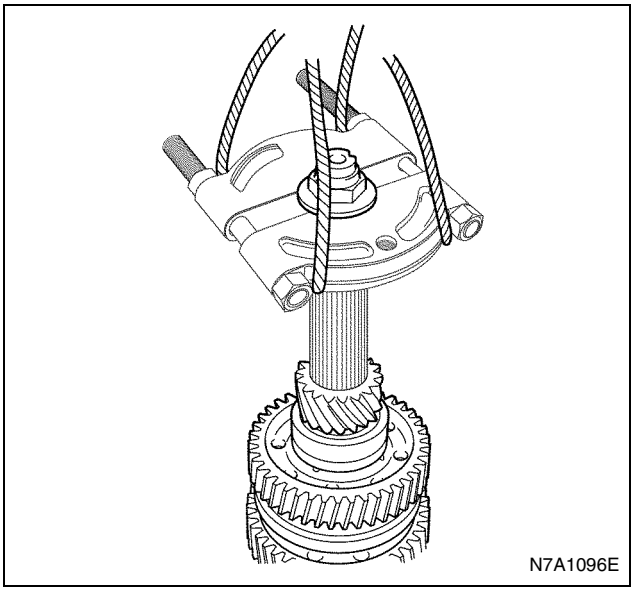
N7A1094E

37. Remove the magnet from the clutch housing.
38. Remove the mail shaft assembly, the top gear shaft assembly and the counter shaft assembly.
    a. Tie the main shaft assembly, the counter shaft assembly and the top gear shaft assembly at the two positions not to let them come apart using a lashing belt or other belts with a fixing function, and then fix them securely.

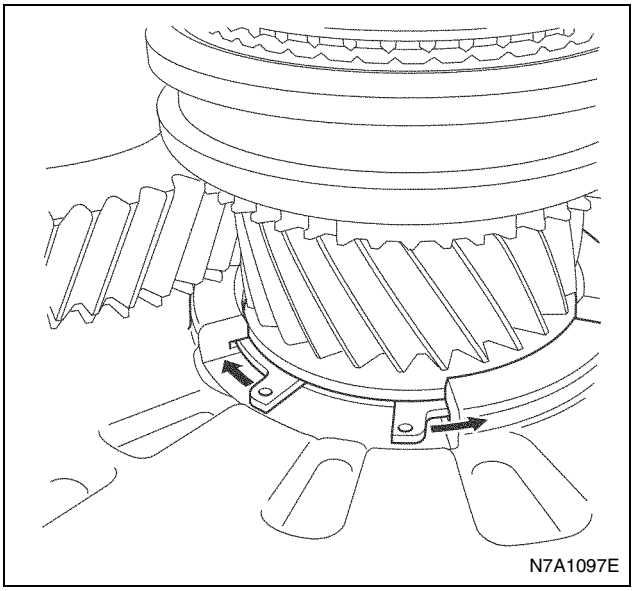


N7A1095E

    b. Install the bearing remover to the main shaft and secure it with a lock nut, hang them with a hoist and a wire, and then remove the top gear shaft assembly, the main shaft assembly, the counter shaft assembly from the clutch housing as a unit while spreading the top gear shaft bearing outer snap ring installed to the clutch housing.

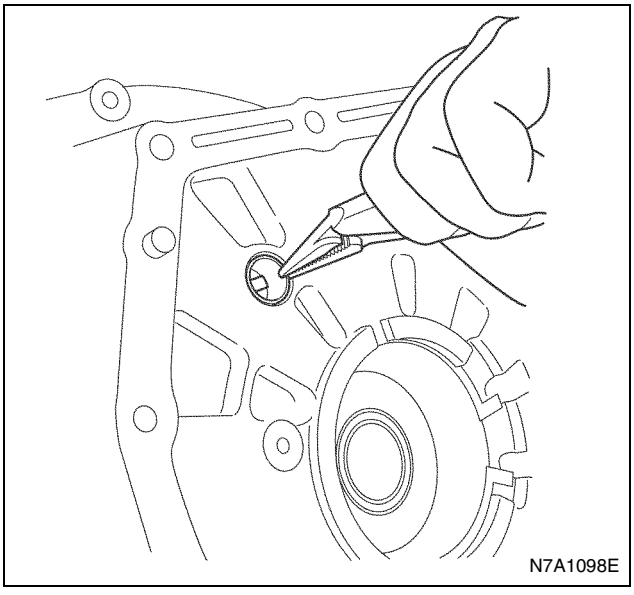


N7A1096E



N7A1097E

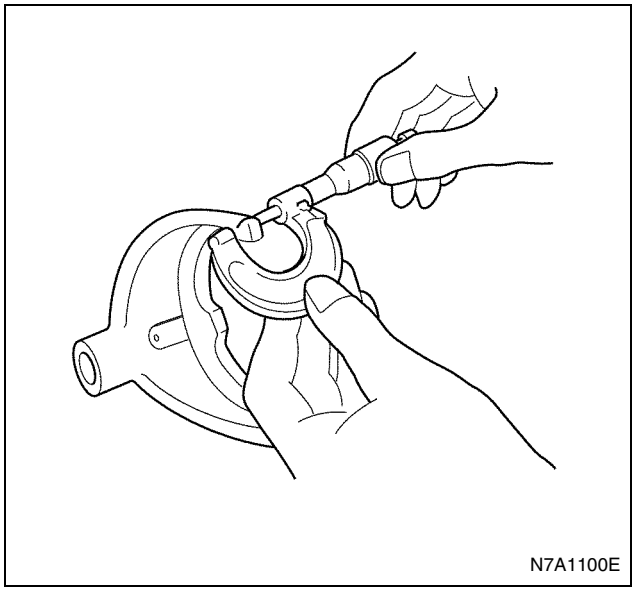
39. Check the clutch housing bush, and then remove it from the clutch housing using a pliers if it is worn or damaged.



N7A1098E

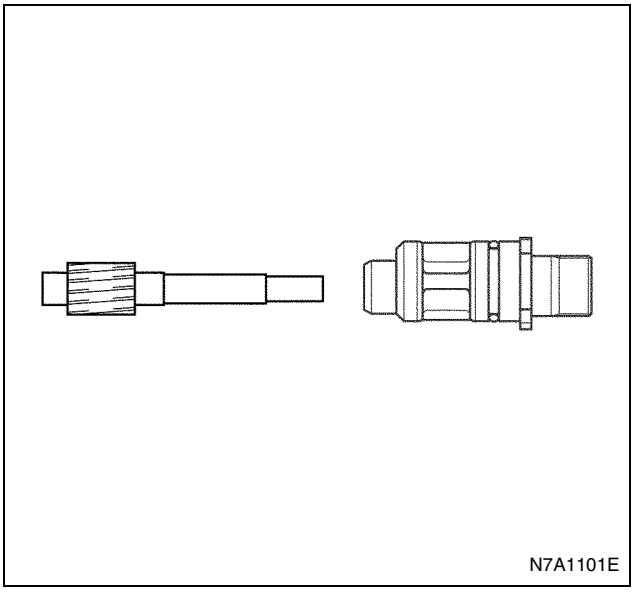
40. Check the front oil seal, and then remove it from the clutch housing using a flat-tip screwdriver if it is worn or damaged.
    Check each part, and then correct and replace it if some worn, damaged or faulty parts are found.
41. Check each part of the shift mechanism, and then correct light damage, deflection or stepped wear. Replace it when it is heavily damaged or its usage limit is over.
    - Deflection, wear and damage of the shift rod and the shift arm
    - Shift arm thickness
      – Measure the thickness of the shift arm tip using the micrometer.

Shift arm thickness, mm (in)		
	Standard	Limit
1st-reverse 3rd-2nd 5th-4th	9.60 — 9.85 (0.378 — 0.387)	9.0 (0.354)
6th	9.60 — 9.85 (0.378 — 0.387)	9.3 (0.366)



N7A1100E

42. Check whether the speedometer driven gear and the driven gear bush are worn.
    - Replace them if they are worn heavily.



N7A1101E

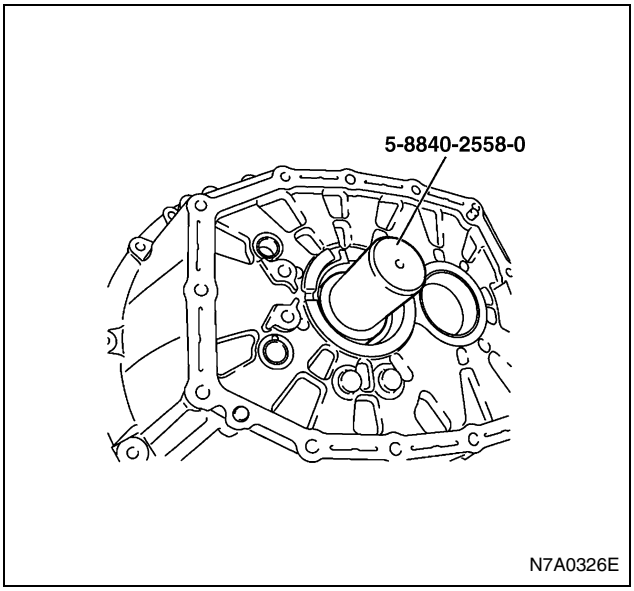
43. Measure the clearance between the insert and the block ring groove.
    - Measure the clearance using a caliper.
    - Replace the insert and the block ring if their measured values are out of the limit.

Clearance between insert and block ring, mm (in)	
	Standard
6th	3.46 — 3.76 (0.136 — 0.148)

Assembly

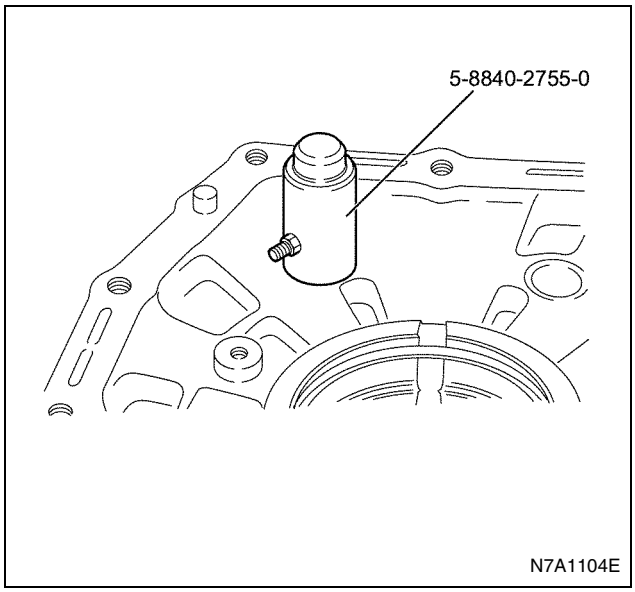
1. When finding the oil seal worn and damaged after the check and replacing it with a new one, apply engine oil 5W-30 around the oil seal, and then press in the oil seal into the clutch housing using the installer 5-8840-2558-0.
    - Apply Besco L2 grease on the oil seal lip portion.

Caution:
Be careful not to damage the oil seal lip portion.



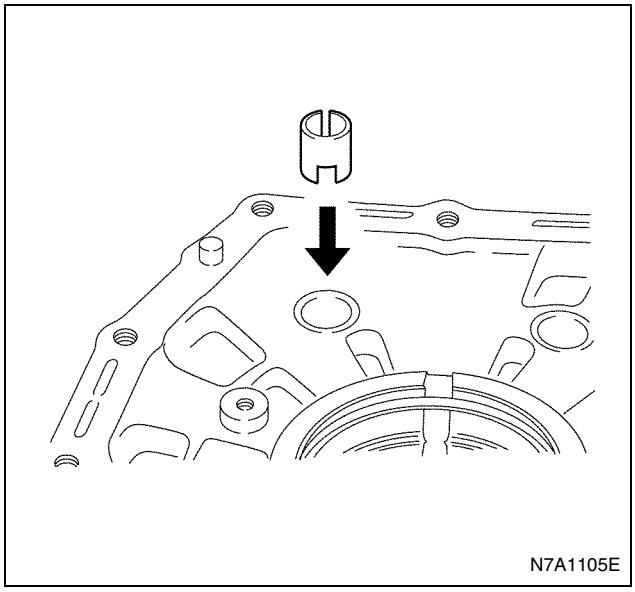
N7A0326E

2. When the clutch housing bush is replaced with a new one after checking it for wear and damage, press it in using the installer 5-8840-2755-0.



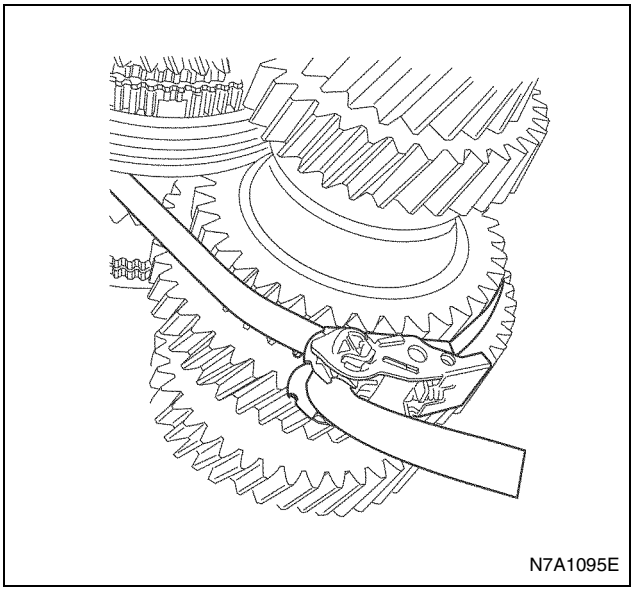
N7A1104E

- During installation, the direction of the bush and the position of the caulking should be set as indicated in the figure.
- For the bush pressing in for the second time and onwards, press in the bush facing its notched portion to the clutch housing.



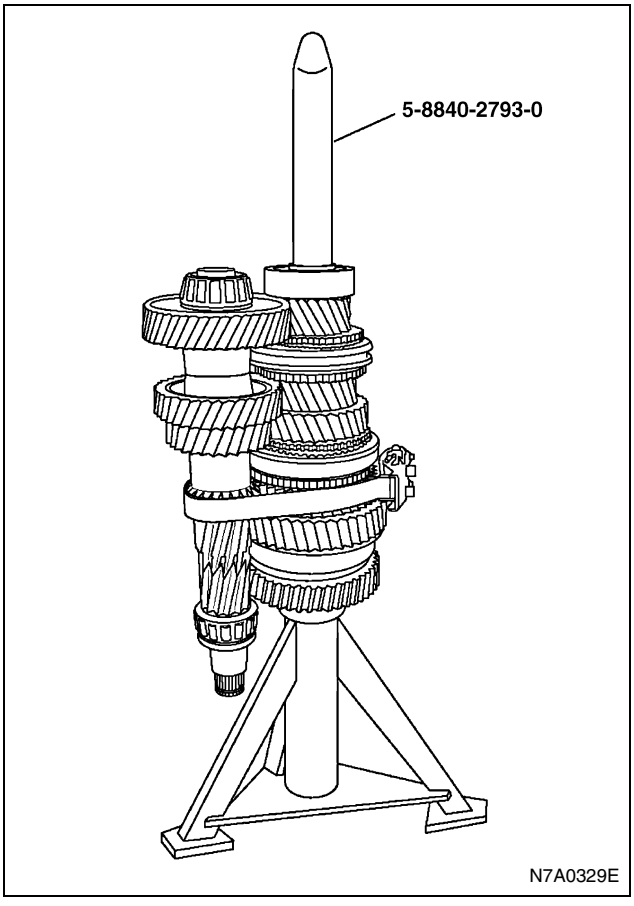
N7A1105E

3. Install the main shaft assembly, the top gear shaft assembly and the counter shaft assembly.
    a. Tie the main shaft assembly, the counter shaft assembly and the top gear shaft assembly at the two positions not to let them come apart using a lashing belt or other belts with a fixing function, and then fix them securely. Be careful not to drop the top gear shaft while lifting up.



N7A1095E

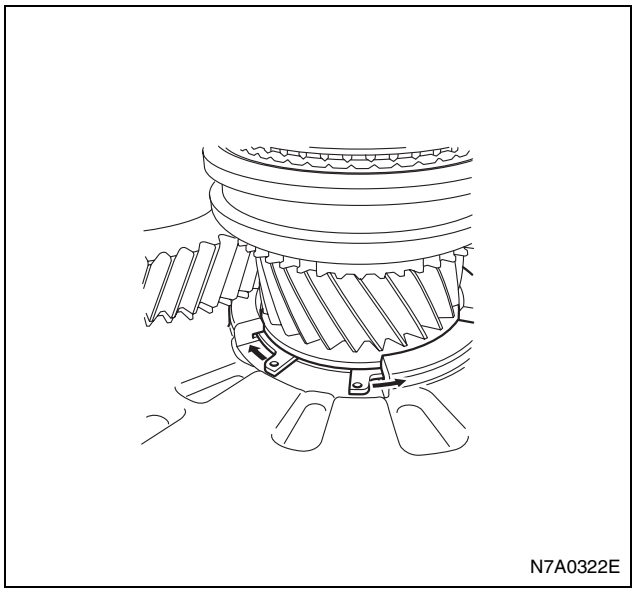
b. Stick up the three of the top gear shaft assembly, the main gear shaft assembly and the counter shaft assembly on the support stand as the top gear shaft assembly is put on the top.
c. Install the oil seal protector 5-8840-2793-0 to the main shaft.



N7A0329E

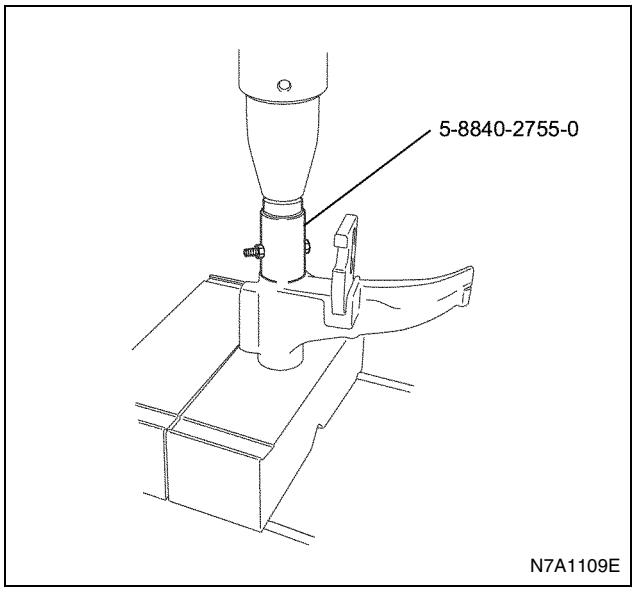
d. Set the top gear shaft bearing outer snap ring to the clutch housing, spread it using a snap ring pliers, and then insert it to the clutch housing after aligning the top gear shaft, the counter shaft and the shift rod positions.

Caution:
- Make sure the snap ring is installed securely.
- Work carefully not to damage the front oil seal.



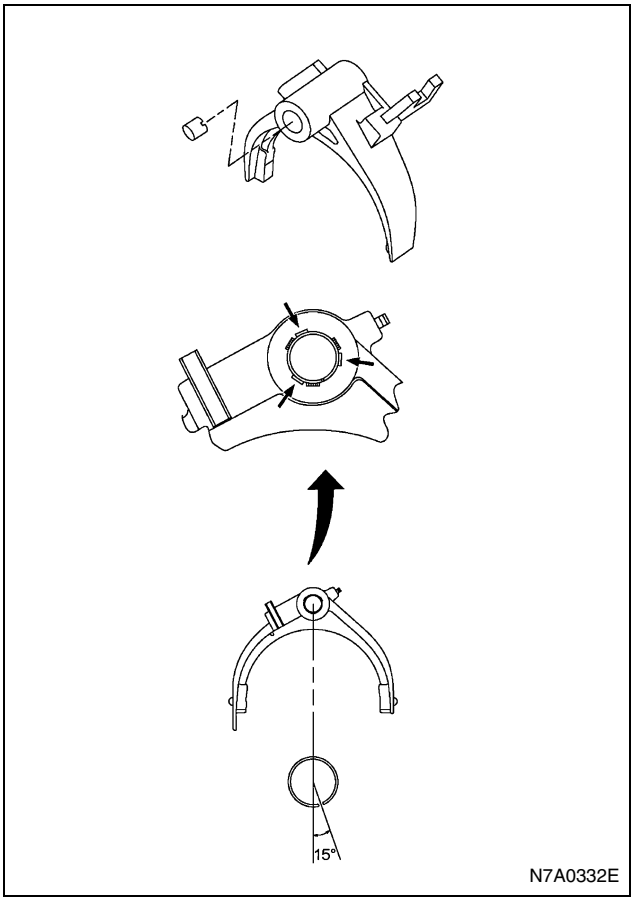
N7A0322E

4. Install the magnet to the clutch housing.
5. When replacing the 3rd-2nd shift arm bush with a new one after checking it for wear or damage, press in the bush using the installer 5-8840-2755-0.
6. When replacing the 4th-5th shift arm bush with a new one after checking it for wear or damage, press in the bush using the installer 5-8840-2755-0.
7. When replacing the 4th-5th shift arm bush with a new one after checking it for wear or damage, press in the bush using the installer 5-8840-2755-0.

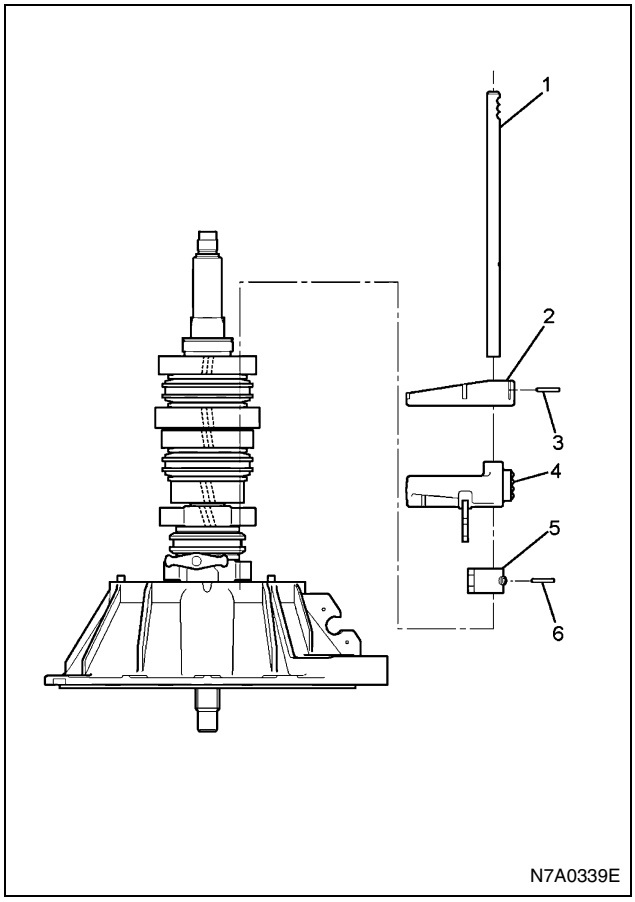


N7A1109E

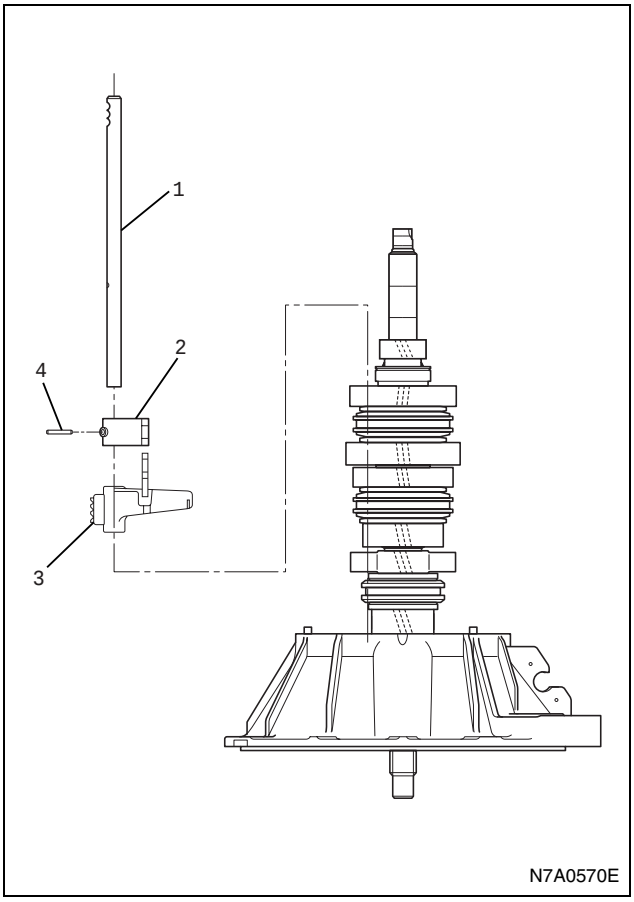
- Press it in taking care of the direction and angle of the shift arm bush, and then caulk the three portions except the bush cut and older caulking portions.



8. Install the 1st-reverse and 2nd-3rd shift rod (1) to the 1st-reverse and 6th shift block (5), the 2nd-3rd shift arm (4), the 1st-reverse shift arm (2).
   - Drive in the spring pin (3) and (6) using a hammer after aligning the spring pin hole.
   - When pressing in the spring pin, put a round pole on the opposite side of the shift rod not to damage other parts, and then press in the spring pin.

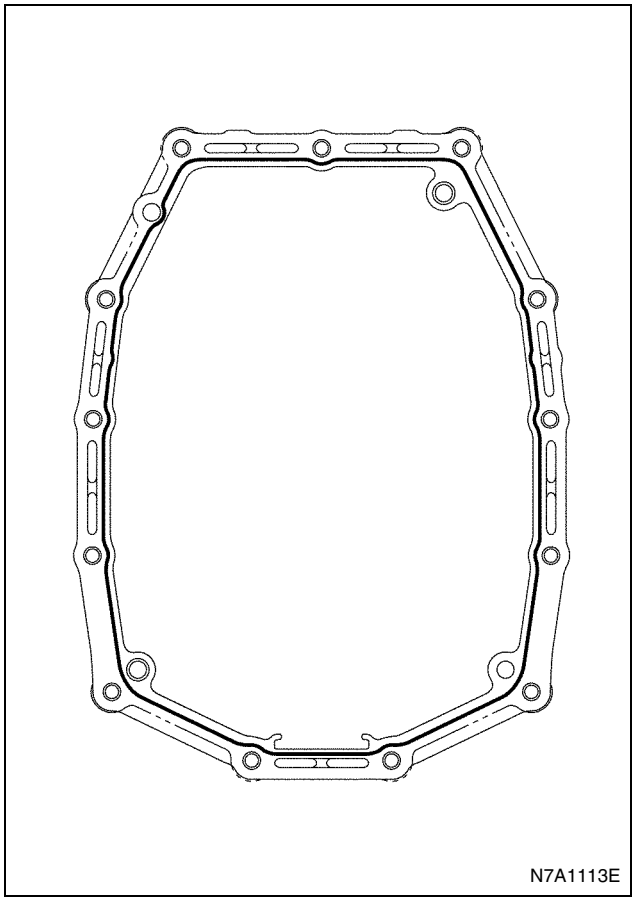


9. Install the 4th-5th and 6th shift rod (1) to the 4th-5th shift arm (3), 1st-reverse and 6th shift block (2).
   - Drive in the spring pin (4) using a hammer after aligning the spring pin hole.
   - When pressing in the spring pin, put a round pole on the opposite side of the shift rod not to damage other parts, and then press in the spring pin.



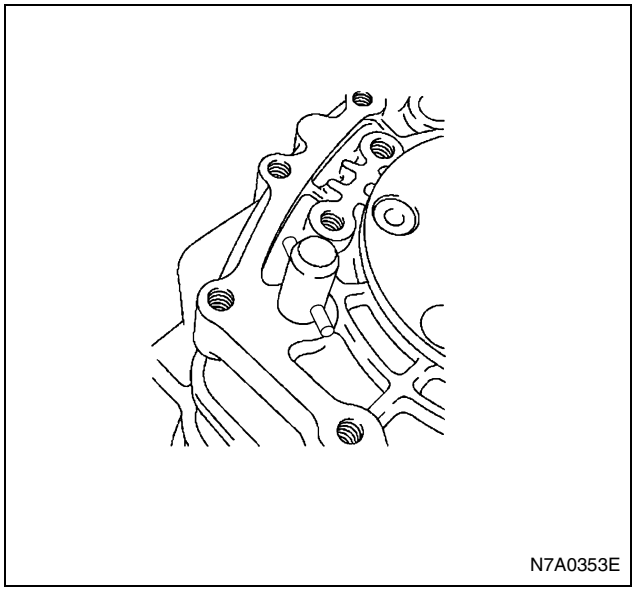
10. Apply ThreeBond 1215 to the mating surface of the transmission case and the clutch housing, and then install the clutch housing.
    - Wipe off moisture and lubricant from the mating surface, and then apply the gasket continuously with a diameter of 2 mm (0.079 in) or more.

Tighten:
Clutch housing to 46 N·m (4.7 kg·m / 34 lb·ft)

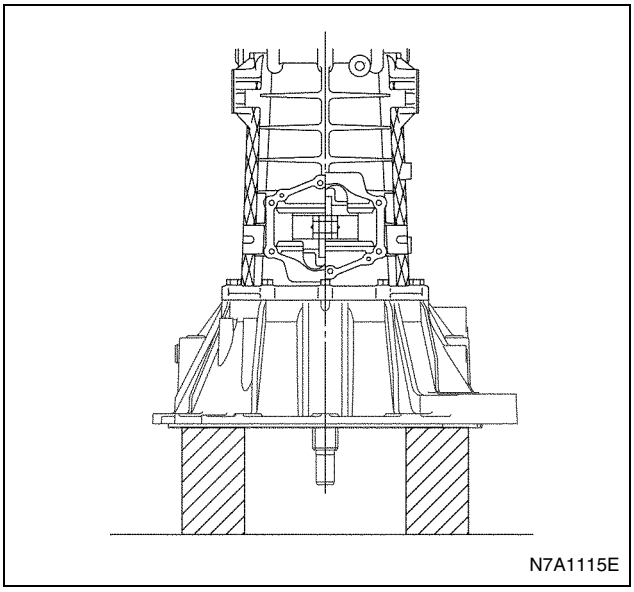


11. Install the bearing rear outer race to the transmission case.
12. Install the spring pin; 4th-5th and 6th shift rod.

Caution:
When the snap ring is deformed or damaged, replace it with a new one, and make sure it is completely installed.



13. Install the shim to the counter shaft rear bearing.
    a. Shift the position to the neutral.
    b. Set the transmission assembly with the clutch housing faced down.



N7A1115E

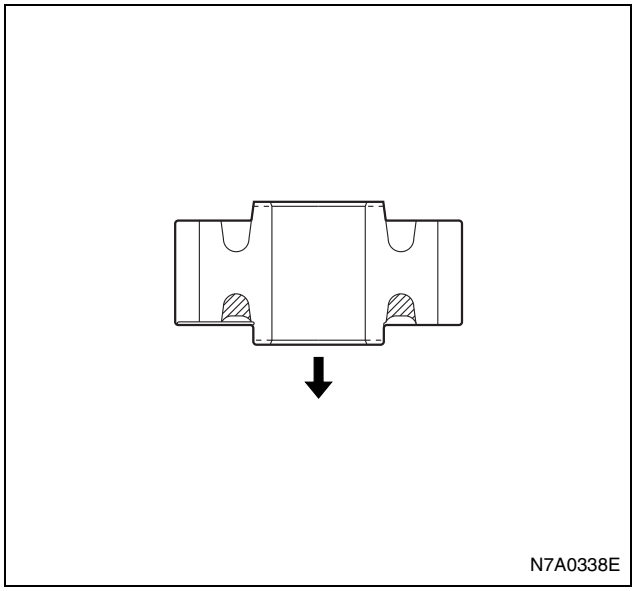
c. Revolve the counter shaft more then 30 times and smooth the taper roller bearing.

d. Select the counter shim.

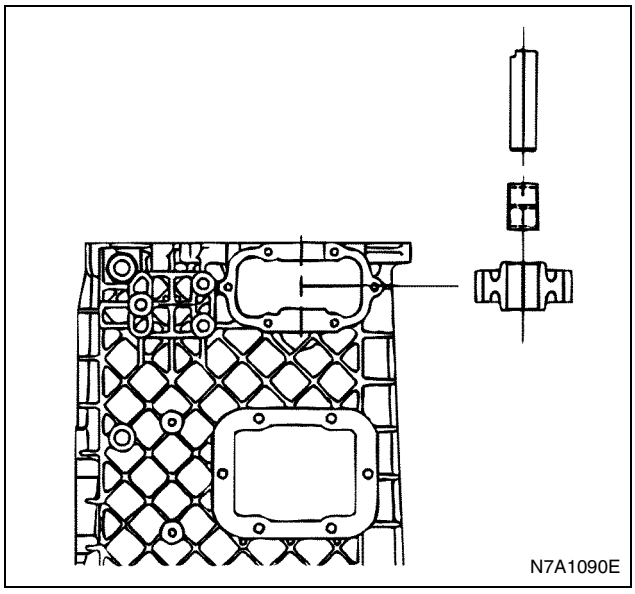
- Measure the depth at the points equally divided into three from the end surface of the transmission case to the outer ring edge surface of the counter shaft rear bearing, and then take an average of them.
- Select the shim whose thickness agrees with the list below.

Measured value, mm (in)	Thickness of applicable shim
more than — less than	
3.34 — 3.40 (0.132 — 0.133)	3.19 (0.125)
3.28 — 3.34 (0.130 — 0.131)	3.13 (0.123)
3.22 — 3.28 (0.127 — 0.129)	3.70 (0.120)
3.16 — 3.22 (0.125 — 0.126)	3.01 (0.118)
3.10 — 3.16 (0.122 — 0.124)	2.95 (0.116)
3.04 — 3.10 (0.120 — 0.122)	2.89 (0.113)
2.98 — 3.04 (0.118 — 0.119)	2.83 (0.111)
2.92 — 2.98 (0.115 — 0.117)	2.77 (0.109)
2.86 — 2.92 (0.113 — 0.114)	2.71 (0.106)
2.80 — 2.86 (0.110 — 0.112)	2.65 (0.104)
2.74 — 2.80 (0.108 — 0.110)	2.59 (0.101)
2.68 — 2.74 (0.106 — 0.107)	2.53 (0.099)
2.62 — 2.68 (0.104 — 0.105)	2.47 (0.097)
2.56 — 2.62 (0.101 — 0.103)	2.41 (0.094)
2.50 — 2.56 (0.099 — 0.100)	2.35 (0.092)
2.44 — 2.50 (0.096 — 0.098)	2.29 (0.090)
2.38 — 2.44 (0.094 — 0.096)	2.23 (0.087)
2.32 — 2.38 (0.092 — 0.093)	2.17 (0.085)
2.26 — 2.32 (0.089 — 0.091)	2.11 (0.083)

14. Install the snap ring to the main shaft rear bearing.
15. Apply engine oil 5W-30 to the needle bearing, install the reverse idle gear and needle bearing, and then insert the reverse idle shaft.
    - The arrow mark shows the direction of the transmission front side.



N7A0338E



N7A1090E

16. Install the retainer to the transmission case.

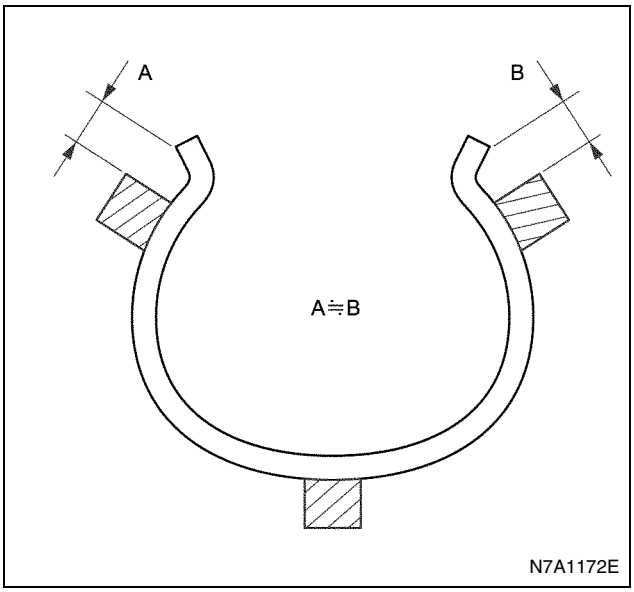
Tighten:
Retainer to 26 N·m (2.7 kg·m / 19 lb·ft)

Caution:
Clean up the sealing agent on the screw thread of the transmission case and replace all screws with new ones.

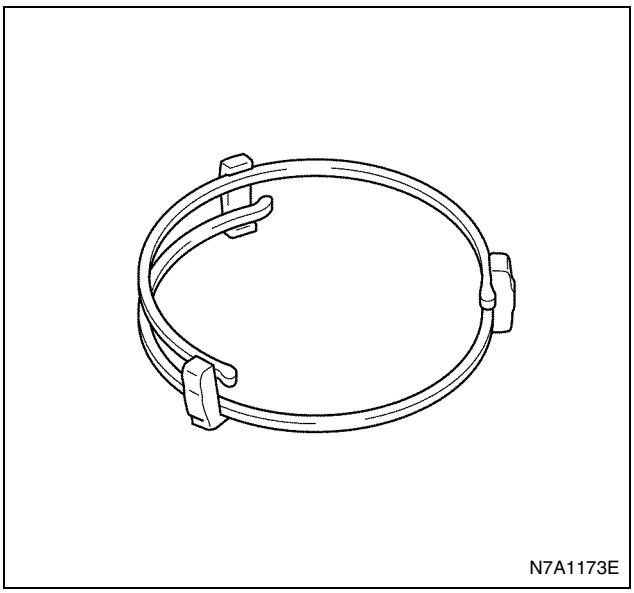
17. Install the collar and the speedometer gear.
18. Assemble the 6th clutch hub assembly (2) and the sleeve (1) following the procedure below.
    a. Assemble the insert (3) securely to the block ring insert groove.
    b. Install the insert spring (4) to the insert.

Caution:

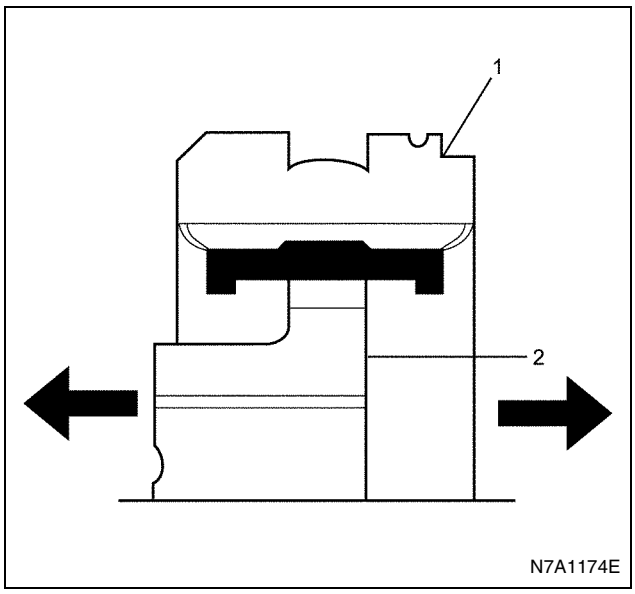
- When assembling the insert spring, equalize the length of the both edges of the spring not to adversely interfere with the inside diameter of the hub.

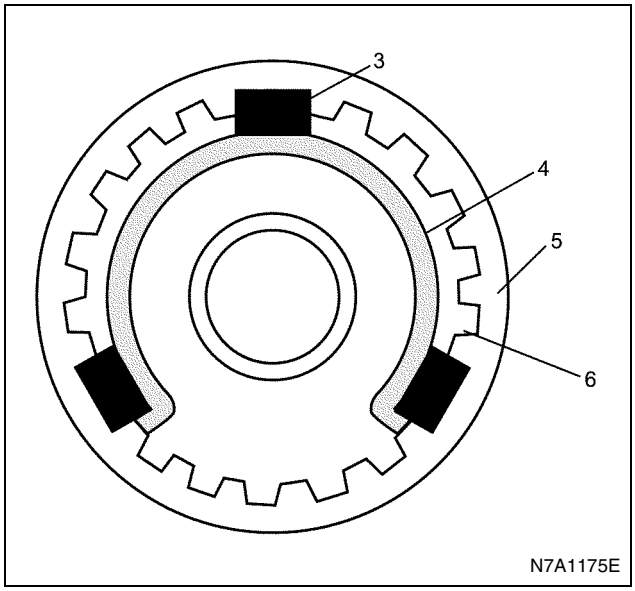


- Make sure that the open part of the insert spring assembled on the reverse side, is not aligned with the open part of the front side.



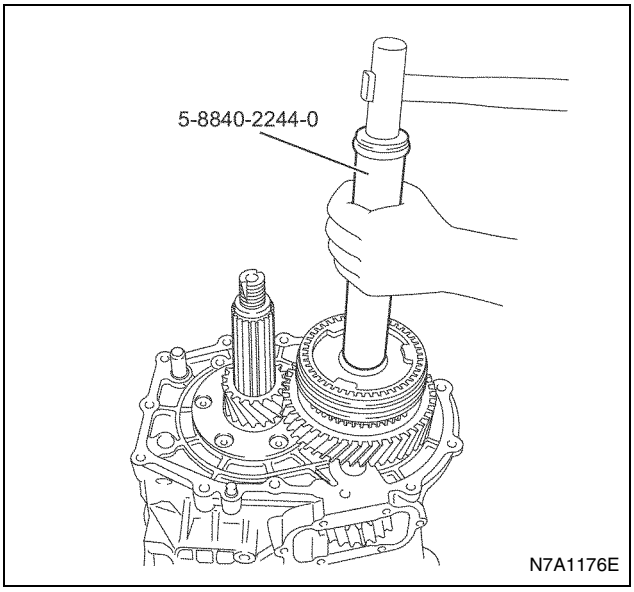
c. Make sure the clutch hub (5) and the sleeve (6) slide smoothly.





d. Install a new stopper plate to the clutch hub.

19. Apply engine oil 5W-30 to the needle bearing and the block ring bore, assemble the 6th gear, the needle bearing and the 6th block ring, align the aspect of the clutch hub block ring groove, assemble the 6th clutch hub assembly and the sleeve, and then press in them using the installer 5-8840-2244-0 and a hammer.



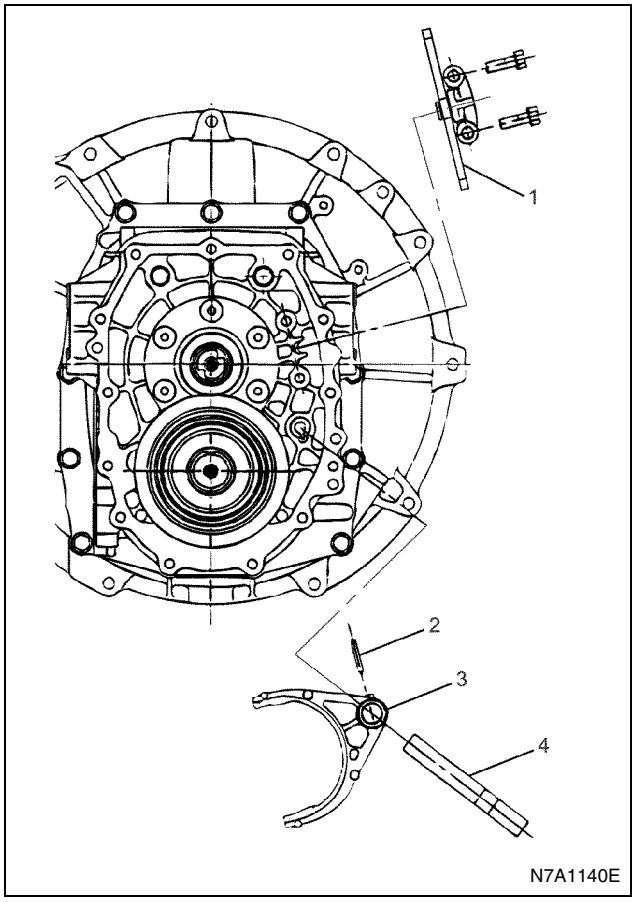
20. Using the snap ring pliers, install the snap ring and the 6th clutch hub.
    - Select the thickest snap ring of the available three.

Thickness, mm (in)	Identification Color
1.7 (0.066)	White
1.8 (0.070)	No color
1.9 (0.074)	Blue

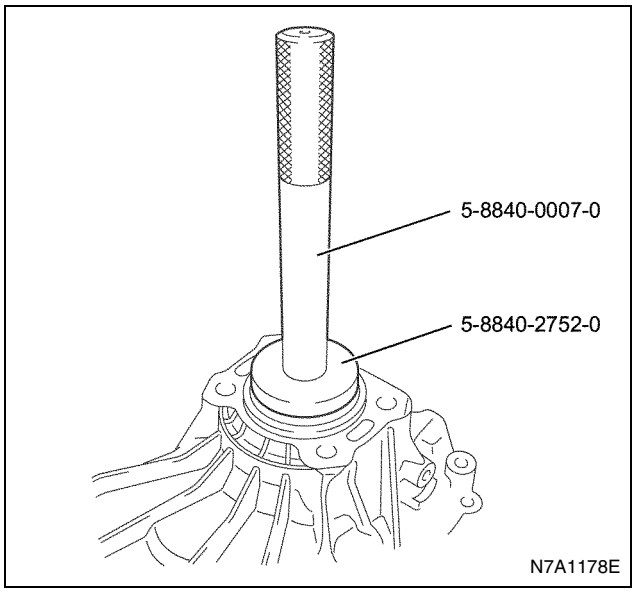
Caution:
When the snap ring is deformed or damaged on installation, replace it with a new one, and make sure it is completely installed.

21. Apply engine oil 5W-30 to the shift rod hole of the transmission case, install the 6th shift arm (3) and 6th shift rod (4), and then press in the spring pin (2) aligning its hole.
22. Install the 6th relay lever (1).

Tighten:
6th relay lever (1) to 44 N·m (4.5 kg·m / 32 lb·ft)



23. Install the needle bearing; main end.
    - Apply Besco L2 grease inside the needle bearing, and apply engine oil 5W-30 to the bearing connecting bore of the rear cover.
    - Press in the needle bearing to the rear cover from outside by turning the bearing stamped surface out and using the installer 5-8840-2752-0 and the grip 5-8840-0007-0.

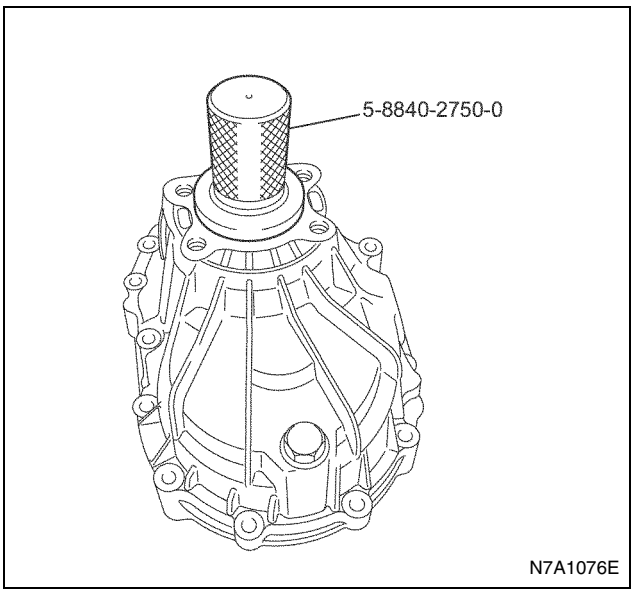


24. When replacing the rear cover oil seal with a new one after checking for wear and damage or when replacing the needle bearing, apply engine oil 5W-

30 around the oil seal, and then press in the oil seal to the rear cover using the installer 5-8840-2750-0.

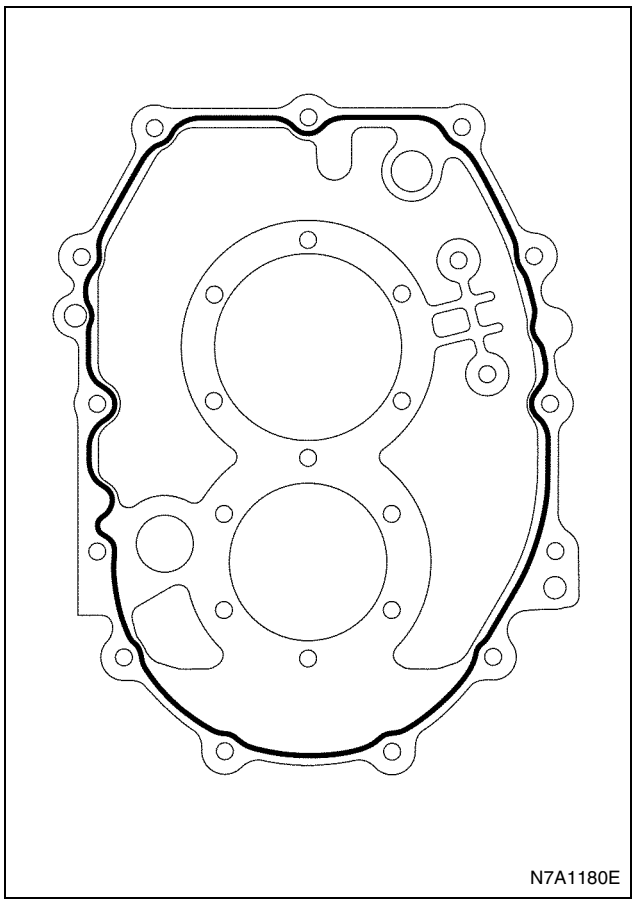
- Apply Besco L2 grease to the lip portion of the oil seal.

Caution:
Be careful not to damage the oil seal lip portion.

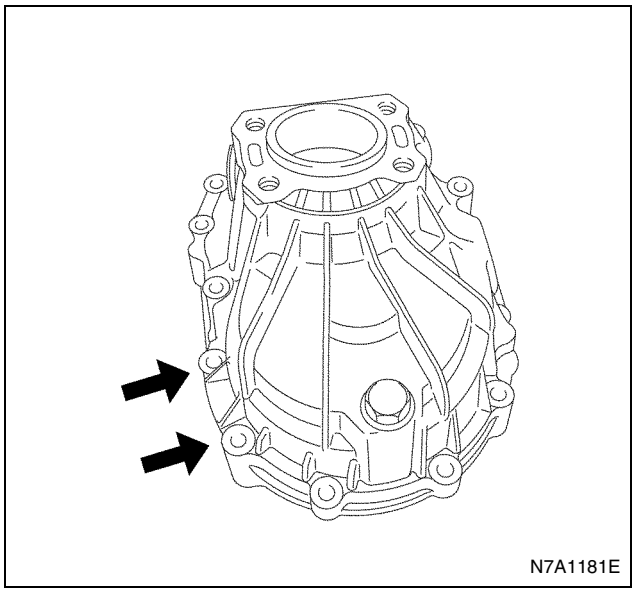


25. Apply ThreeBond 1215 to the mating surface of the transmission case rear cover, and then install the rear cover.
    - Wipe off moisture and lubricant from the connecting surface. And then apply the bond continuously with a diameter of 2 mm (0.079 in).

Tighten:
Rear cover to 46 N·m (4.7 kg·m / 34 lb·ft)

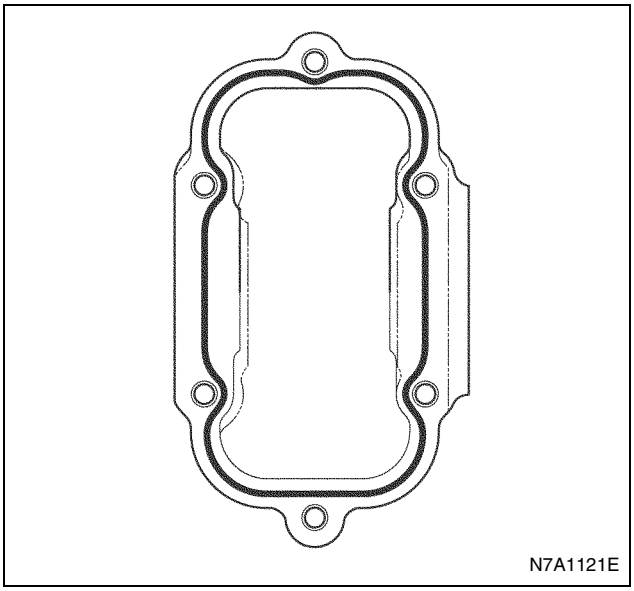


Caution:
Since the two bolts with arrow marks are installed with LOCTITE sealing agent, clean up the sealing agent remaining on the screw thread of the transmission case, and then use new bolts with LOCTITE sealing agent.



26. Apply ThreeBond 1215 to the mating surface of the transmission case reverse idle cover, and then install the reverse idle cover.
    - Wipe off moisture and lubricant from the mating surface. And then apply the bond continuously with a diameter of 2 mm (0.079 in) or more.

Tighten:
Reverse idle cover to 20 N·m (2.0 kg·m / 15 lb·ft)

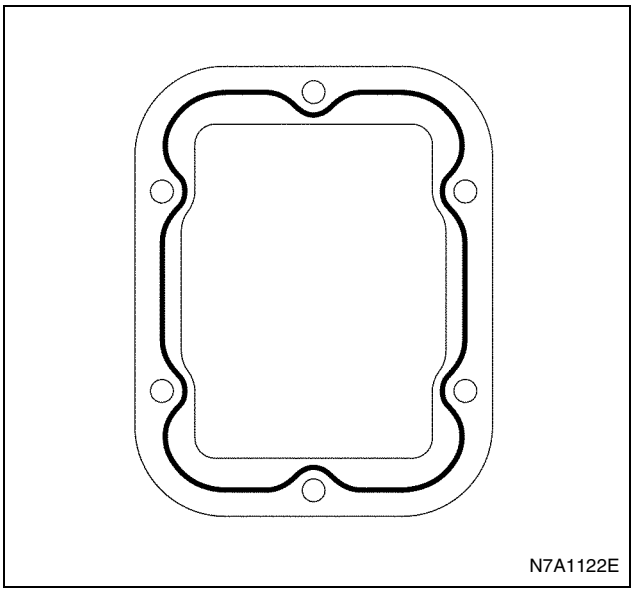


N7A1121E

27. Apply ThreeBond 1215 to the mating surface of the transmission case PTO cover, and then install the PTO cover.
    - Wipe off moisture and lubricant from the connecting surface before applying it as a more than 2 mm (0.079 in) diameter solid line.

Tighten:
PTO cover to 37 N·m (3.8 kg·m / 27 lb·ft)

Caution:
Since the bolt is installed with LOCTITE sealing agent, clean up the sealing agent remaining on the screw thread of the transmission case, and then use a new bolt with LOCTITE sealing agent.



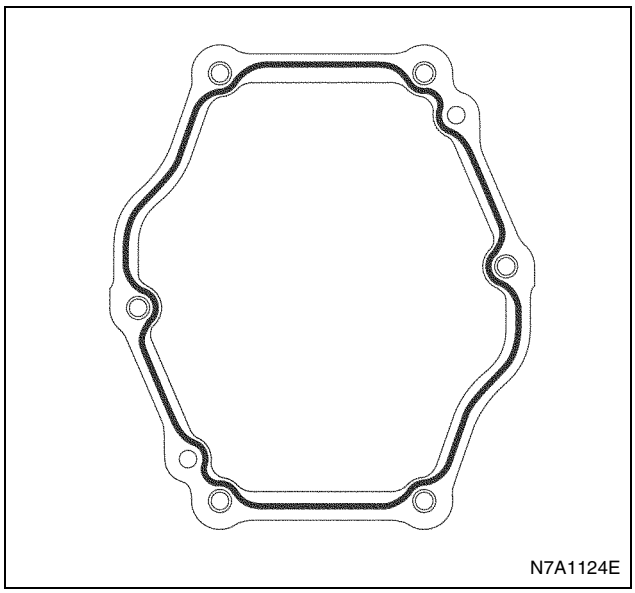
N7A1122E

28. Shift the position to the neutral, apply ThreeBond 1215 to the mating surface of the transmission case control box, and then install the interlock plate (8) and the control box (1).

Tighten:
Control box (1) to 27 N·m (2.8 kg·m / 20 lb·ft)

- Wipe off moisture and lubricant from the mating surface. And then apply the bond continuously with a diameter of 2 mm (0.079 in) or more.

Caution:
Since the bolt is installed with LOCTITE sealing agent, clean up the sealing agent remaining on the screw thread of the transmission case, and then use a new bolt with LOCTITE sealing agent.



N7A1124E

29. Install the detent assembly (7) (6) (5) (4) after cleaning up the sealing on the thread and applying the LOCTITE 242.

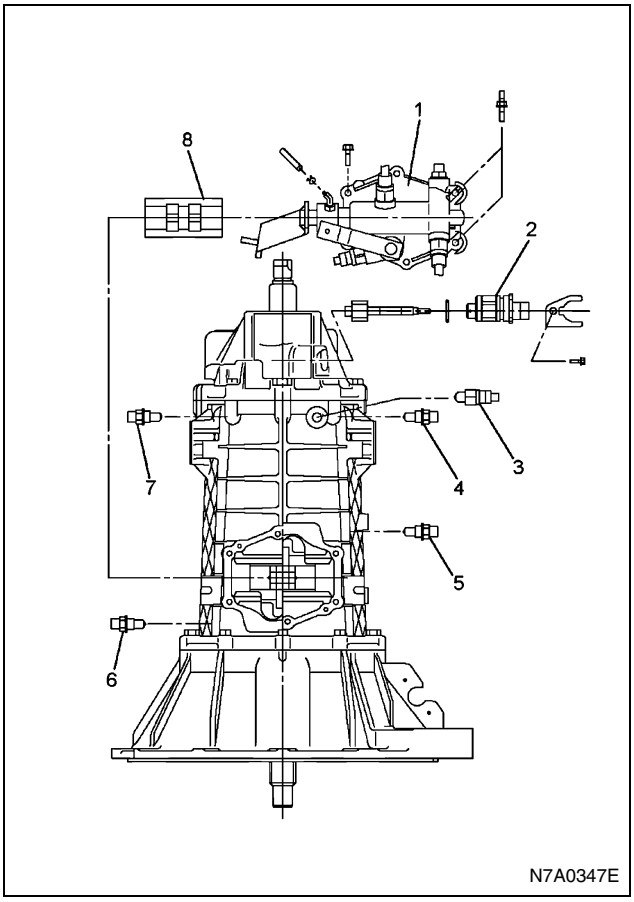
Tighten:
Detent assembly (7) (6) (5) (4) to 27 N·m (2.8 kg·m / 20 lb·ft)

30. Apply LOCTITE 242 to the reverse switch thread portion, and then install the reverse switch (3).

Tighten:
Reverse switch (3) to 39 N·m (4.0 kg·m / 29 lb·ft)

31. Apply engine oil 5W-30 to the speedometer driven gear and the O-ring, and then install the speedometer driven gear (2).

Tighten:
Speedometer driven gear (2) to 20 N·m (2.0 kg·m / 15 lb·ft)



32. Apply engine oil 5W-30 to the O-ring, and then install the drain plug and the O-ring.

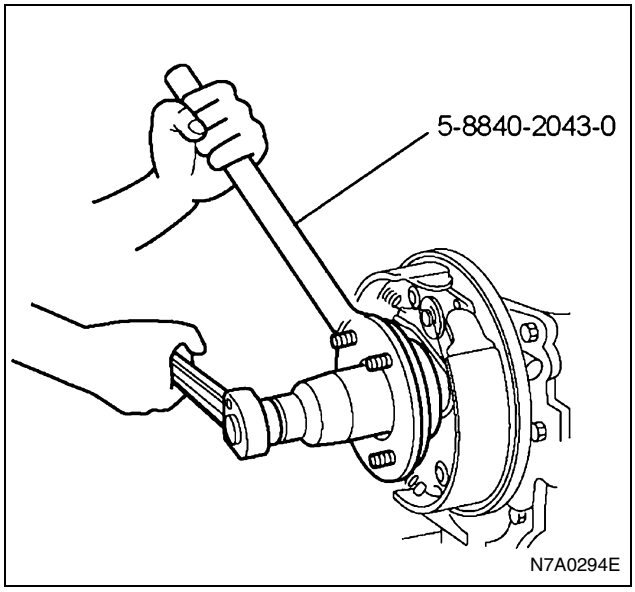
Tighten:
Drain plug to 39 N·m (4.0 kg·m / 29 lb·ft)

33. Apply engine oil 5W-30 to the O-ring, and then install the filler plug and the O-ring.

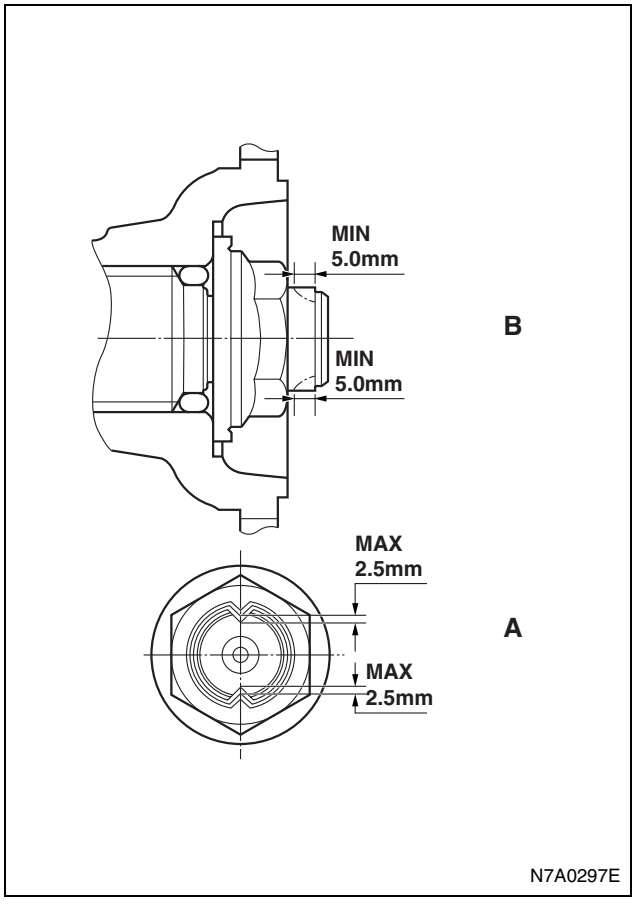
Tighten:
Filler plug to 39 N·m (4.0 kg·m / 29 lb·ft)

34. Install the parking brake assembly.
    - Refer to PARKING BRAKE ASSEMBLY.
35. Apply engine oil 5W-30 to the O-ring, and then install the coupling driver and the O-ring.
36. Use a new lock nut, apply engine oil 5W-30 to the seat, and then fix the lock nut using the flange holder 5-8840-2043-0.

Tighten:
Lock nut to 289 N·m (29.5 kg·m / 213 lb·ft)



- After fixing it to the specified torque, align the lip part of the nut to the V-groove of the shaft edge. Securely caulk the two parts of the nut lip using a chisel whose tip form is approx. 1 mm (0.04 in) radius by 60°, to make a length (B) of 5 mm (0.2 in) or more, and a clearance between the bottom of the shaft and the nut lip (A) of 2.5 mm (0.06 in) or less.



37. Install the parking brake drum and adjust hole cover fixing bolt.
    - Refer to PARKING BRAKE ASSEMBLY.

38. Install the shift fork and the support bolt.
    - Refer to CLUTCH.
39. Install the shift block assembly.
    - Refer to CLUTCH.

Fixing Torque

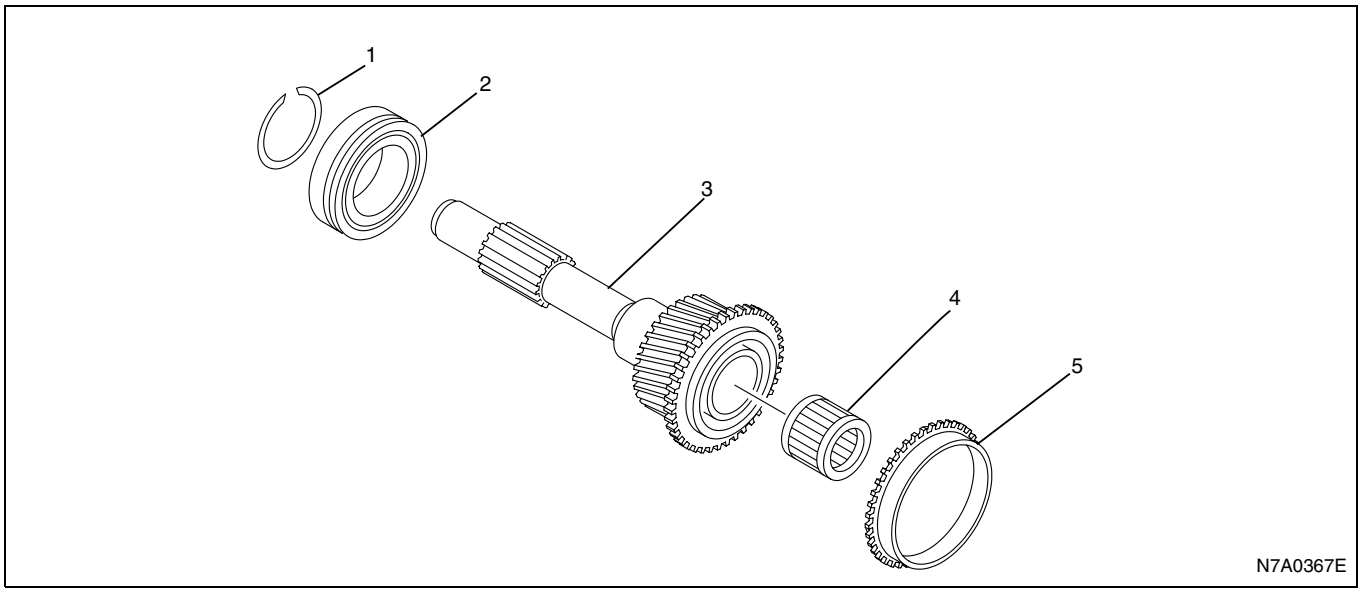
Top Gear Shaft

Components



Legend

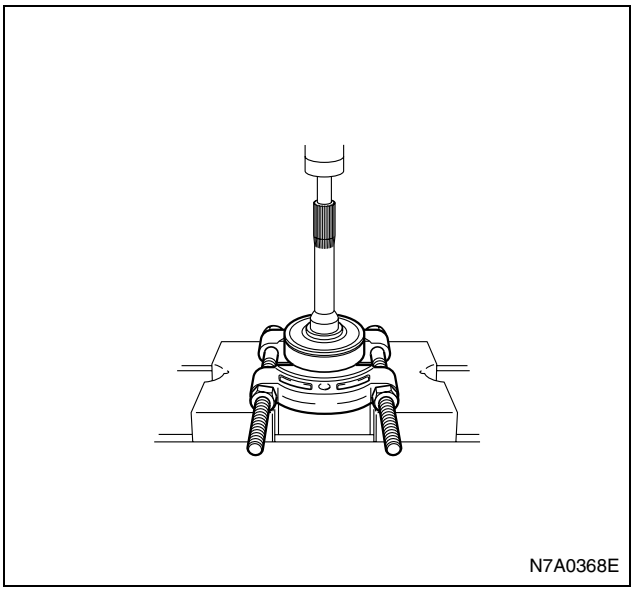
1. Snap ring
2. Bearing
3. Top gear shaft
4. Needle bearing
5. Block ring

Disassembly

1. Remove the block ring from the top gear shaft.
2. Remove the needle bearing from the top gear shaft.

Caution:
As the needle bearing is of separation type, make sure not to drop and damage the roller.

3. Remove the snap ring using snap ring pliers.
4. Remove the bearing by a press using a bearing remover.

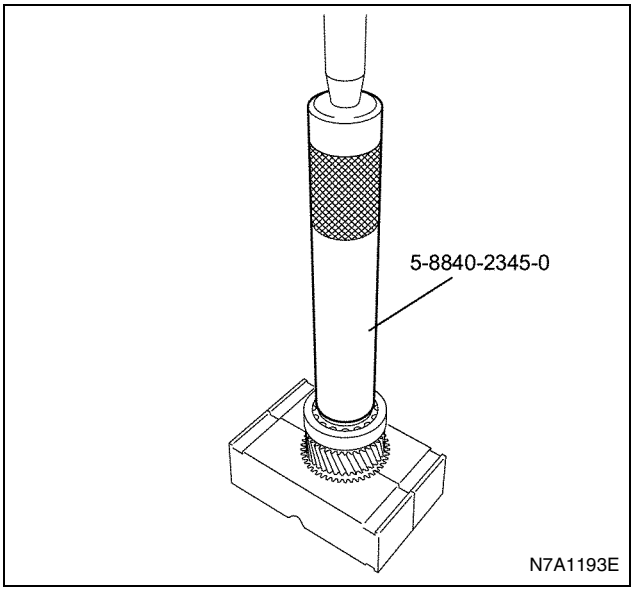


Inspect each part. If any wear, damage or other abnormality is found, repair or replace the part.

5. Inspect the gear tooth, spline part and the sliding part of the top for damage and wear. If any abnormality is found, replace them with new ones.
6. Inspect each bearing regarding the following items. If any abnormality is found, replace it with a new one.
   - Smoothness of rotation
   - Noise
   - Abnormal external appearance, including damage, rust, etc.
   - Abnormal free play in thrust direction
   - Discoloration, excessive wear and pitching of the rolling body and surface of the needle bearing

Assembly

1. Press the bearing using the installer 5-8840-2345-0.



2. Install the snap ring using snap ring pliers.
3. Install the needle bearing to the top gear shaft.
4. Apply engine oil 5W-30 sufficiently to the internal surface of the block ring, and install the block ring to the top gear shaft.

Special Tools

3. Ball
4. Block
5. Spring

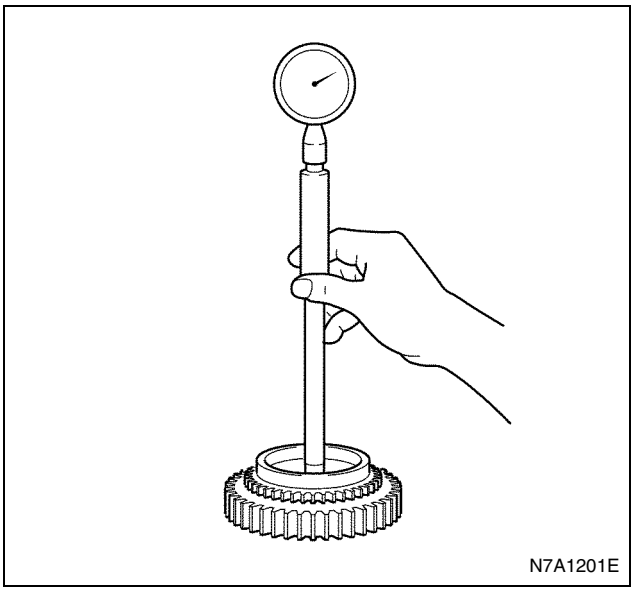
Inspect each part, and if any wear, damage and other abnormality is found, repair or replace the item.

9. Inspect each bearing with respect to the following items, and if any abnormality is found, replace the part.
   - Smoothness of rotation
   - Noise
   - Abnormal external appearance, including damage, rust, etc.

- Abnormal free play in thrust direction

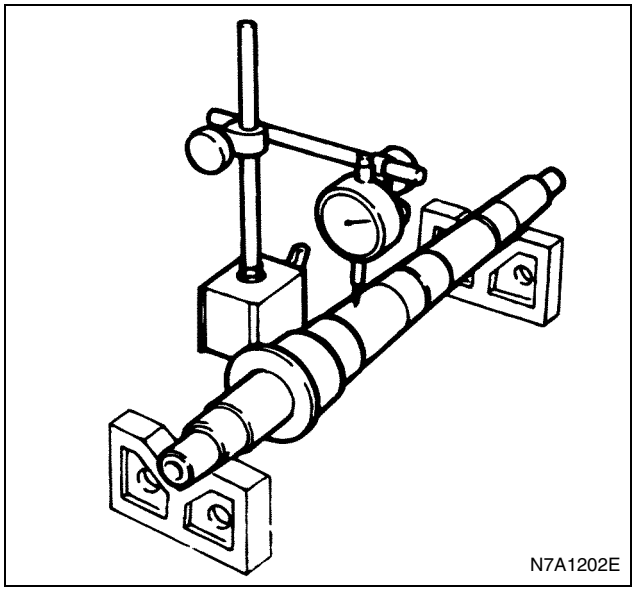
10. Inspect the internal diameter of the gear.
    - Measure the inside diameter of each gear using an inside dial gauge.
    - If the measured value exceeds the limit, replace the gear.

Gear Internal Diameter, mm (in)		
	Standard	Limit
5th gear	44.009 — 44.025 (1.732 — 1.733)	44.065 (1.734)
3rd gear	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)
2nd gear	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)
1st gear	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)
Reverse Gear	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)



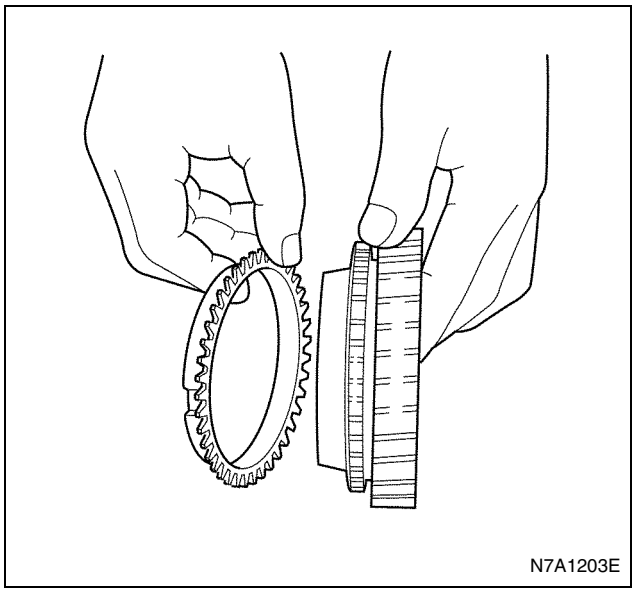
N7A1201E

11. Main shaft deflection
    - Measure the deflection of the main shaft using a dial gauge.
    - If the measured value exceeds the limit, replace the main shaft.
      Standard: 0.015 mm (0.000059 in)
      Limit: 0.1 mm (0.00393 in)



N7A1202E

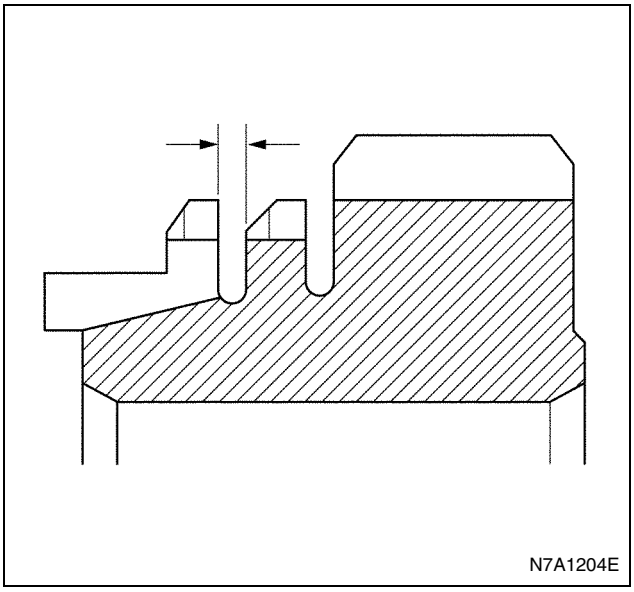
12. Inspect the synchromesh system.
    - Inspect the components, and repair light stepped wear and damage using an oil stone or a pencil grinder.



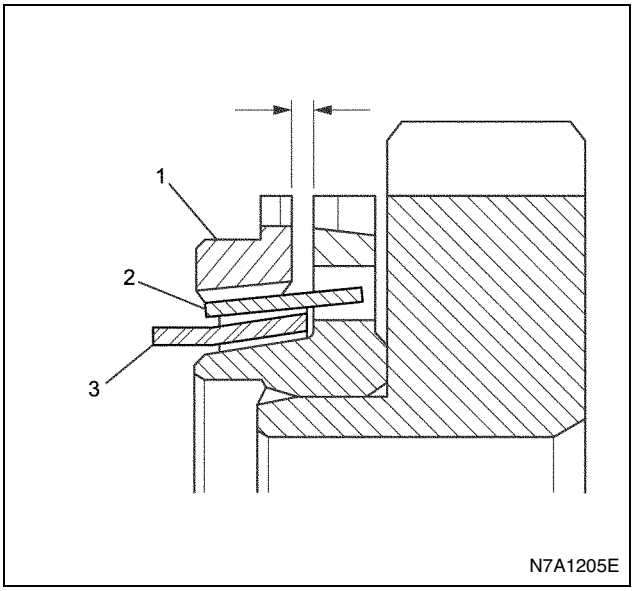
N7A1203E

13. Clearance between block ring and dog gear
    - Measure the clearance using a thickness gauge.
    - If the measured value exceeds the limit, replace the block gear.

Clearance between Block Ring and Dog Gear, mm (in)		
	Standard	Limit
4th / 5th / Reverse	1.30 — 2.60 (0.051 — 0.102)	0.5 (0.019)
2nd / 3rd	1.00 — 2.50 (0.039 — 0.098)	0.5 (0.019)
1st	1.00 — 2.50 (0.039 — 0.098)	0.5 (0.019)



N7A1204E



N7A1205E

Legend

1. Block ring

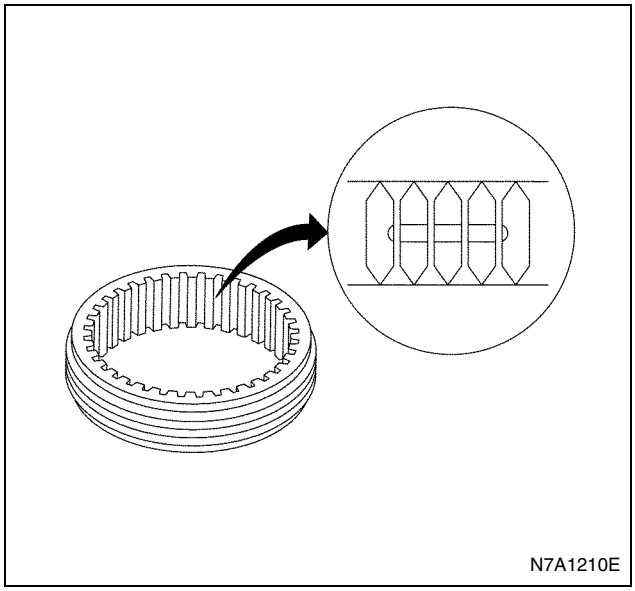
Assembly

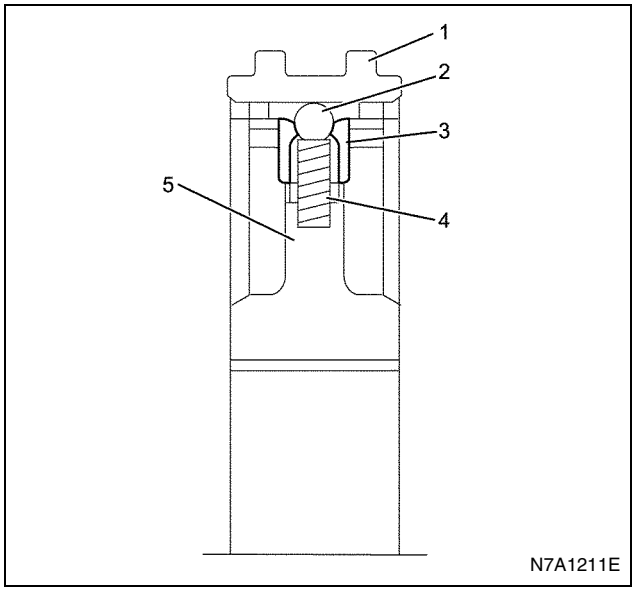
- Clean up each part.
- Set the main shaft in a vise, with the long spline part at the bottom. When setting the main shaft, make sure not to damage the grind surface.

1. Assemble the 2nd-3rd clutch hub assembly & sleeve following the procedure below.
   a. Install the block and sleeve to the clutch hub.
   b. Inside the sleeve, there are three ball grooves. Align the phase to let the ball enter the center of the ball grooves.



N7A1210E

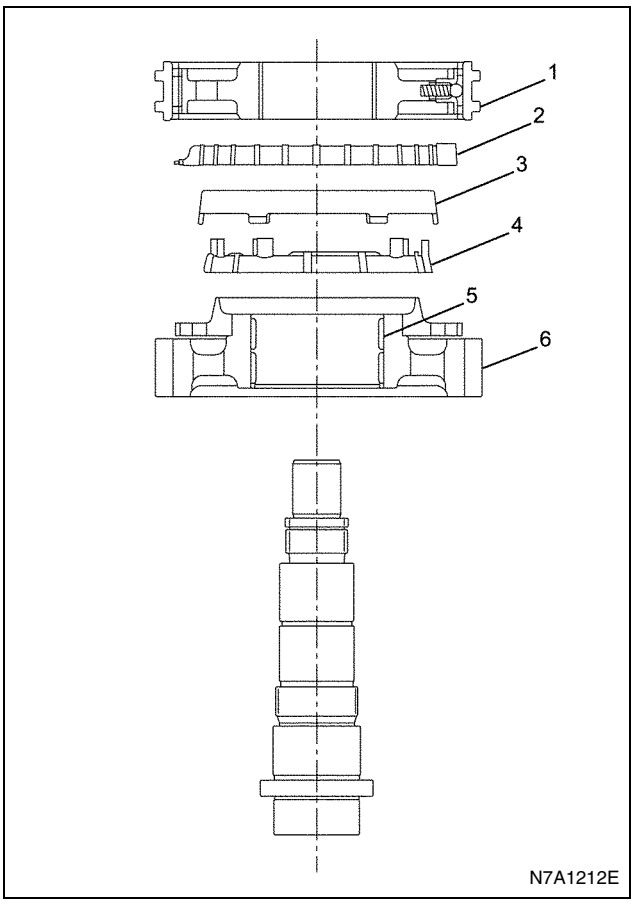
   c. Insert sleeve (1) until the clutch hub (5) slightly overlaps the block.
   d. Securely insert the sleeve until the ball enters the ball groove of the sleeve by pushing the ball (2), block (3) and spring (4).



N7A1211E

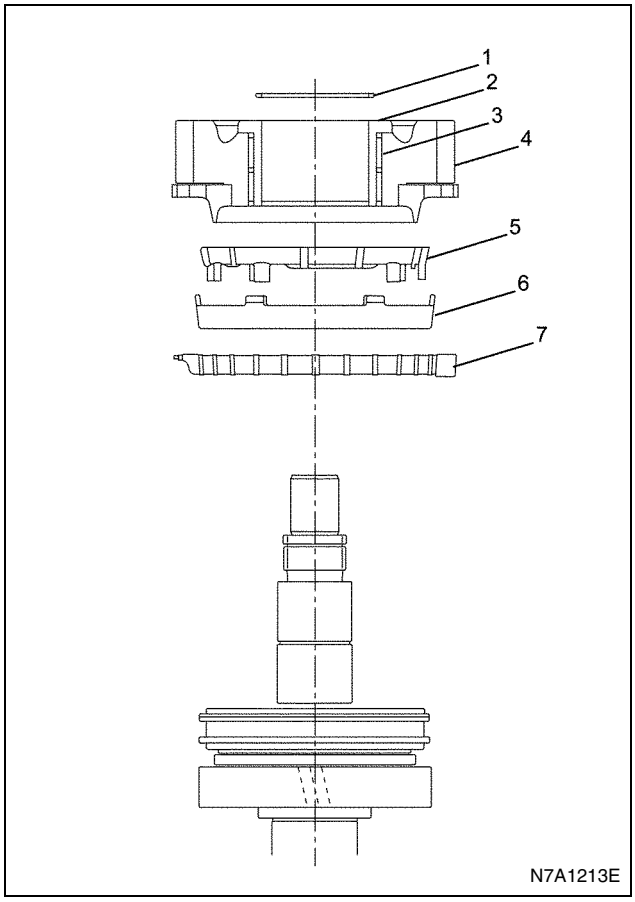
2. Apply engine oil 5W-30 to the needle bearing, 2nd gear thrust surface and synchro cone taper surface. And install the 2nd gear (6) and needle bearing (5) to the main shaft with the dog gear turned upward.

3. Install the 2nd inside ring (4), 2nd outside ring (3) and 2nd block ring (2) inserting the nail of the outside ring into the gear hole of the 2nd gear. At this time, make sure to apply engine oil 5W-30 sufficiently to the both sides of the inside ring and outside ring, and inside diameter surface of the block ring.
4. Insert the 2nd-3rd clutch hub assembly & sleeve with a press using the installer 5-8840-2345-0, setting the six nails of the inside ring to enter the six holes of the hub.



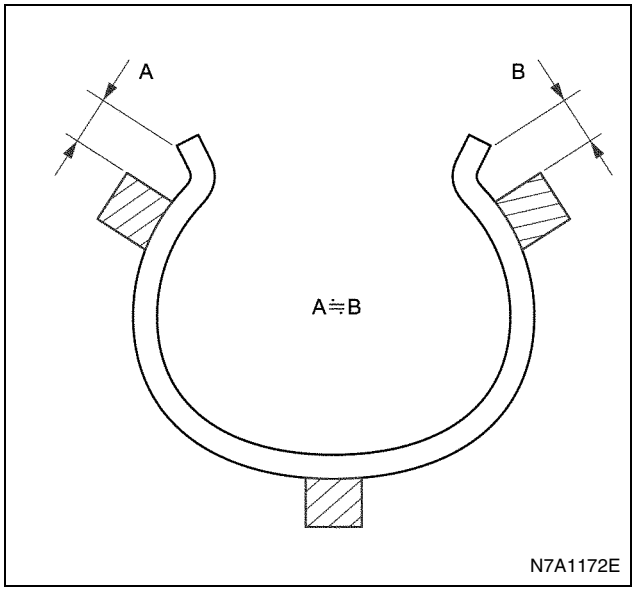
5. During installation, set the six nails of the inside ring of the 3rd block ring (7), 3rd outside ring (6) and 3rd inside ring (5) to enter the six hub holes respectively. At this time, apply engine oil 5W-30 sufficiently to the inside surface of the outside ring and the inside diameter surface of the block ring.
6. Apply engine oil 5W-30 to the needle bearing, 3rd gear thrust surface and synchro cone taper. Turn the dog gear downward, and insert the 3rd gear (4), needle bearing (3) and collar (2) with a press using the installer 5-8840-2345-0, setting the nail of the outer ring to enter the dog gear hole of the 3rd gear.
7. Install the snap ring (1) using snap ring pliers.

Caution:
Replace deformed or damaged snap rings with new ones. Check that the parts are securely installed.

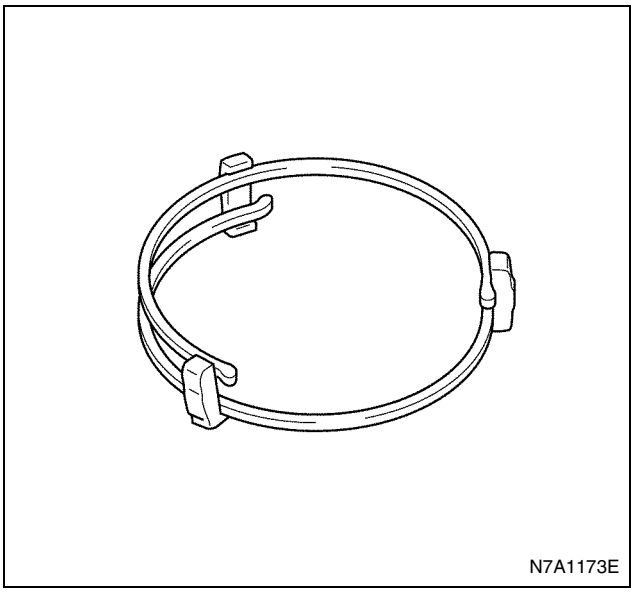


8. Assemble the 4th-5th clutch hub assembly & sleeve following the procedure below.
   a. Assemble securely the insert (2) to the insert groove of the block ring.
   b. Install the insert spring (3) to the insert.

Caution:
- When assembling the insert spring, equalize the length of the both edges of the spring not to adversely interfere with the inside diameter of the hub.

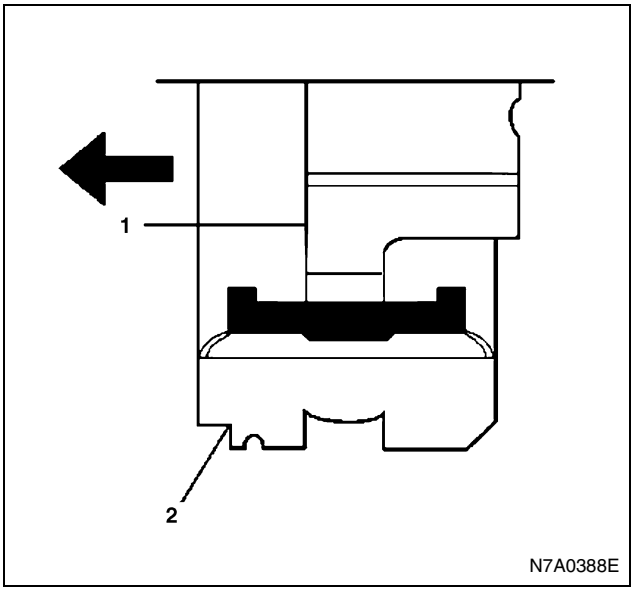


- Make sure that the open part of the insert spring assembled on the reverse side, is not aligned with the open part of the front side.

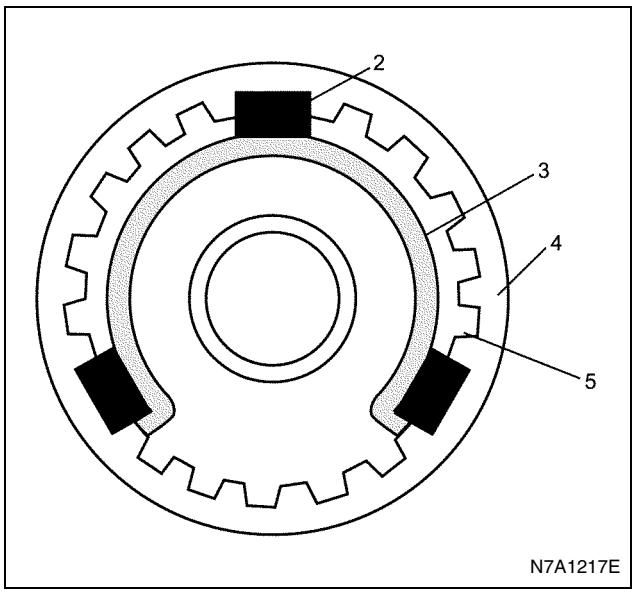


N7A1173E

c. Check that the clutch hub (5) and sleeve (4) are smoothly sliding.
   - The arrow (1) indicates the front side of the transmission.



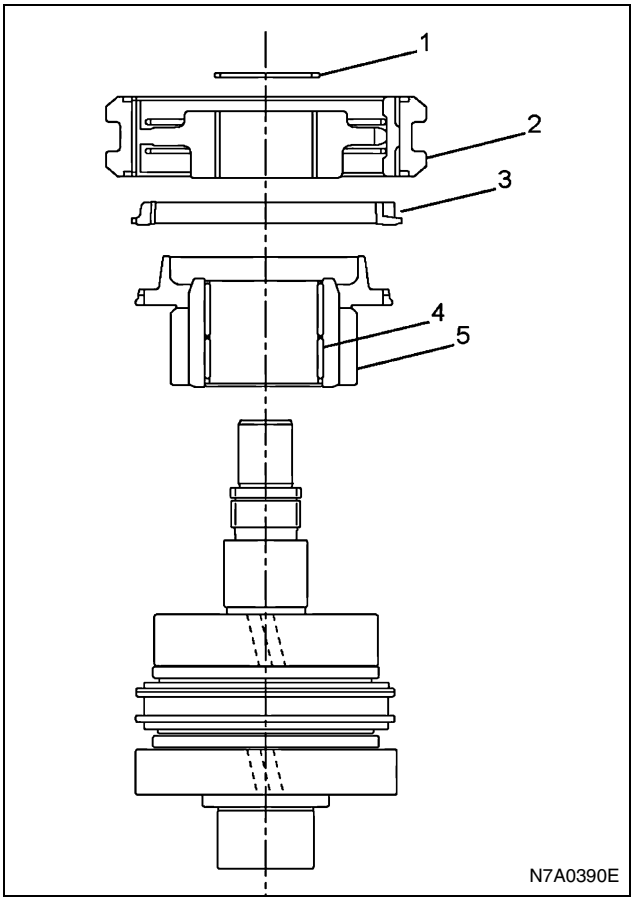
N7A0388E



N7A1217E

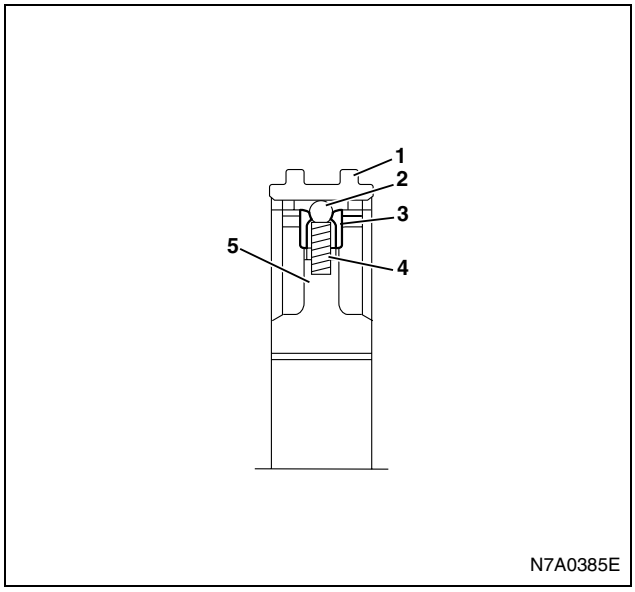
9. Apply engine oil 5W-30 sufficiently to the needle bearing, 5th gear thrust surface and synchro cone taper, and install the 5th gear (5) and needle bearing (4) with the dog gear turned upward.
10. Apply engine oil 5W-30 to the 5th block ring (3), and install.
11. Turning the surface with oil groove downward, align the 4th-5th clutch hub assembly and sleeve (2) to the groove of the 4th-5th block ring, and then insert with a press using the installer 5-8840-2345-0.
12. Install the snap ring (1) using snap ring pliers.

Caution:
Replace deformed or damaged snap rings with new ones. Check that the parts are securely installed.

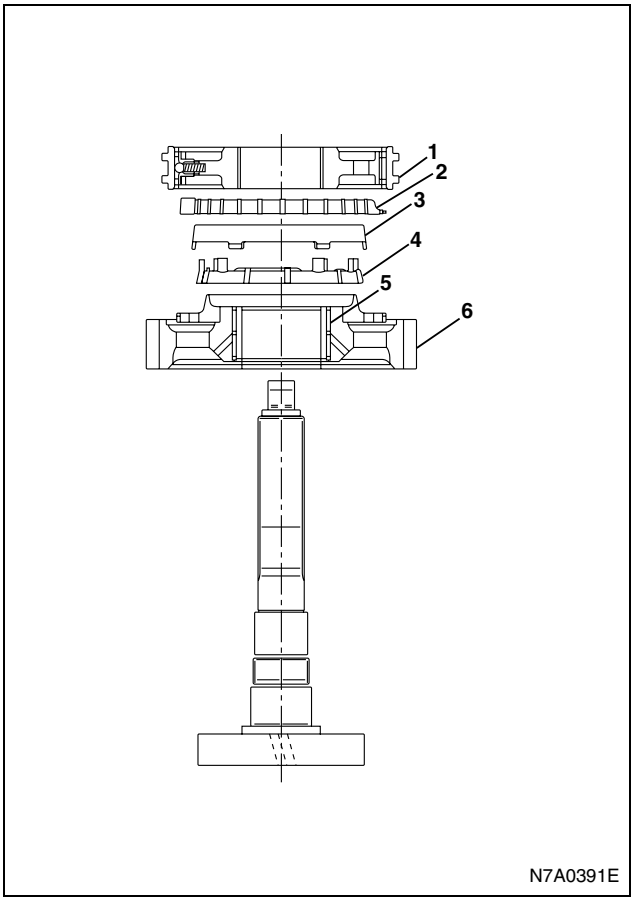


13. Assemble the 1st-reverse clutch hub assembly and sleeve following the procedure below.
    a. Install the block and spring to the clutch hub.
    b. Inside the sleeve, there are three ball grooves. Align the phase to let the ball enter the ball groove.

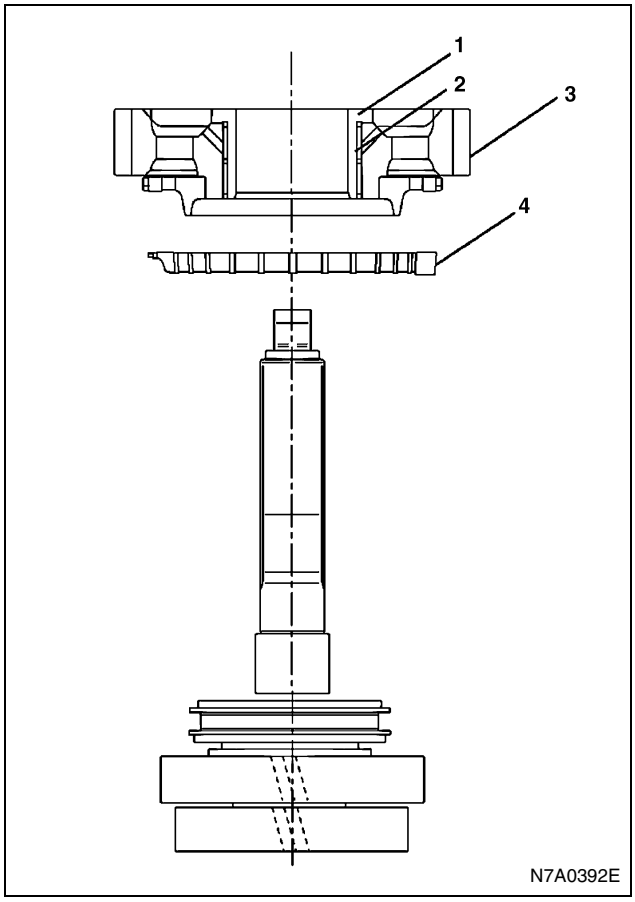
    c. Insert the sleeve (1) until the block slightly overlaps the clutch hub (5).
    d. Securely insert the sleeve until the ball enters the ball groove of the sleeve by pushing the ball (2), block (3) and spring (4).



14. Apply engine oil 5W-30 to the needle bearing, 1st gear thrust surface and synchro cone taper surface. And install the 1st gear (6) and needle bearing (5), turning the dog gear upward.
15. Assemble the 1st inside ring (4), 1st outside ring (3) and 1st block ring (2), inserting the nail of the outer ring into the dog gear hole of the 1st gear. At this time, make sure to apply engine oil 5W-30 sufficiently to the both sides of the inside ring and outside ring, and inside diameter surface of the block ring.
16. Insert the 1st-reverse clutch hub assembly & sleeve (1) with a press using the installer 5-8840-2345-0, setting the six nails of the inside ring to enter the six holes of the hub.



17. Apply engine oil 5W-30 sufficiently to the reverse block ring (4), and then align the phase of the block ring groove to the 1st-reverse clutch hub assembly and sleeve, and install.
18. Apply engine oil 5W-30 to the needle bearing, the reverse gear thrust surface and the synchro cone taper. Turning the dog gear downward, align the phase of the synchro cone phase of the reverse gear to the nail of the outer ring, and insert the reverse gear (3), needle bearing (2), and collar (1) with a press using the installer 5-8840-2345-0.



19. Install the spacer (2).
20. Insert the bearing (1) with a press using the installer 5-8840-2345-0, turning the stamped surface (4) upward and the stamped surface (3) downward.

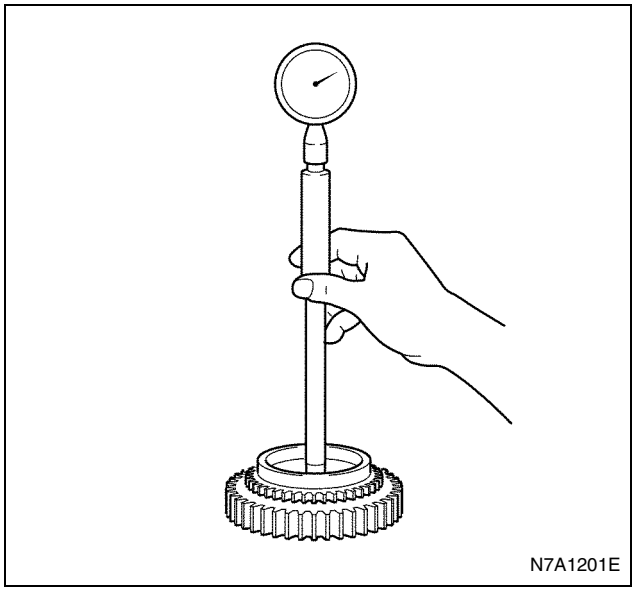
Inspect each part. If any wear, damage or other abnormality is found, repair or replace the part.

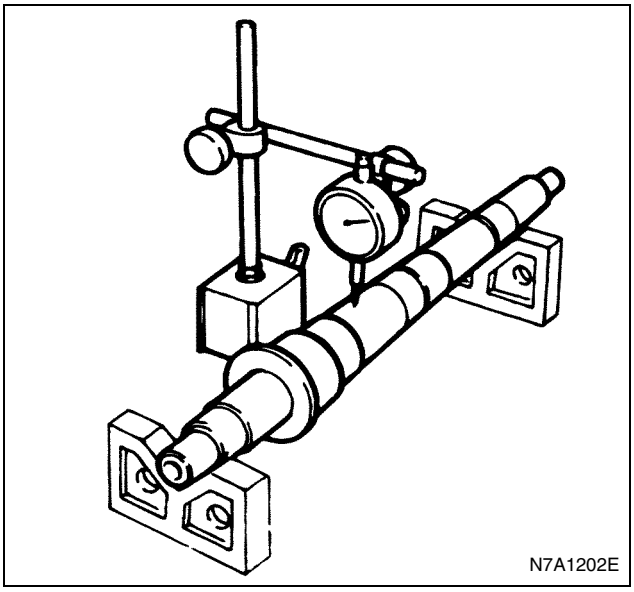
10. Inspect each bearing with respect to the following items. If any abnormality is found, replace the item.
    - Smoothness of rotation
    - Noise
    - Abnormal external appearance, including damage, rust, etc.
11. Inspect the inside diameter of the gear.
    - Measure the inside diameter of each gear using an inside dial gauge.
    - If the measured value exceeds the limit, replace the gear.

Gear Inside Diameter, mm (in)		
	Standard	Limit
6th gear	50.009 — 50.025 (1.968 — 1.969)	50.065 (1.971)
4th gear	44.009 — 44.025 (1.732 — 1.733)	44.065 (1.734)
3rd gear	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)
2nd gear	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)
1st gear	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)
Reverse Gear	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)



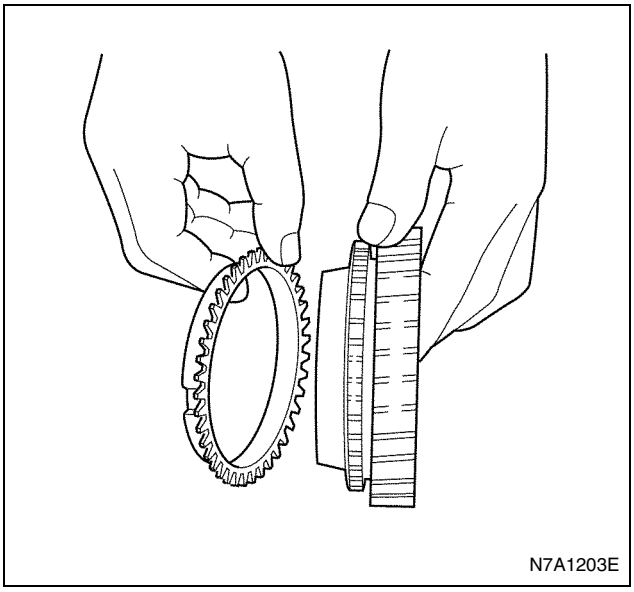
N7A1201E

12. Inspect the deflection of the main shaft.
    - Measure the deflection of the main shaft using a dial gauge.
    - If the measured value exceeds the limit, replace the main shaft.
      Standard: 0.015 mm (0.00059 in)
      Limit: 0.1 mm (0.00393 in)



N7A1202E

13. Inspect the synchromesh system.
    - Inspect the components. Repair the slight stepped wear and damage using an oil stone or a pencil grinder.



N7A1203E

14. Measure the clearance between the block ring and the dog gear using a thickness gauge.
    - If the measured value exceeds the limit, replace the block gear.

Clearance between Block Ring and Dog Gear, mm (in)		
	Standard	Limit
4th / 5th / 6th / Reverse	1.30 — 2.60 (0.051 — 0.102)	0.5 (0.019)
2nd / 3rd	1.00 — 2.50 (0.039 — 0.098)	0.5 (0.019)
1st	1.00 — 2.50 (0.039 — 0.098)	0.5 (0.019)

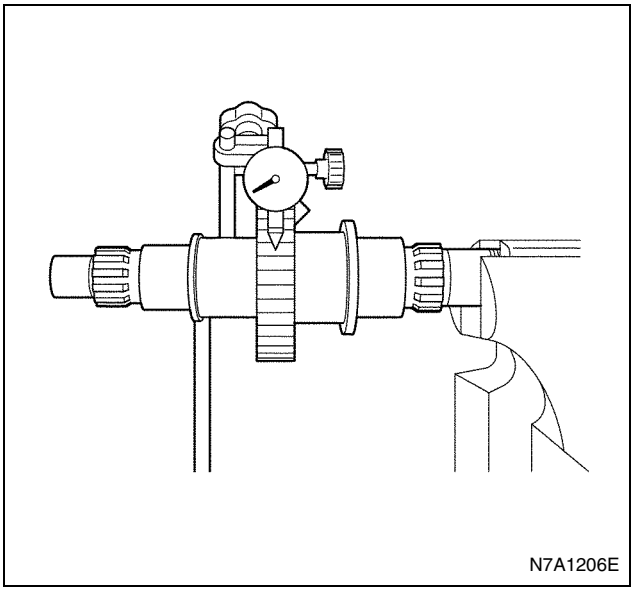
3. Inside ring

15. Inspect the sliding part, spline part, inserting part and insert groove of the clutch hub and sliding sleeve for wear and damage.
16. Measure the free play in the direction of spline rotation on the clutch hub external circumference.
    - If the measured value exceeds the limit, replace the part.

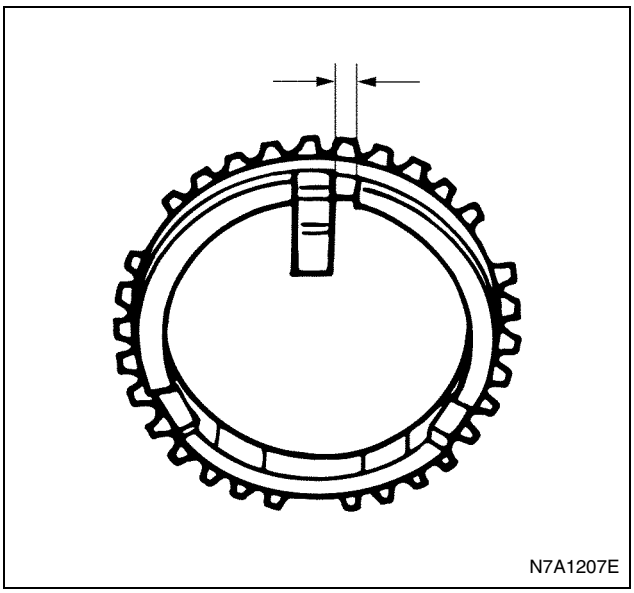
Spline Free Play, mm (in)	
Standard	Limit
0 — 0.05 (0 — 0.0019)	0.3 (0.0118)



N7A1206E

17. Measure the clearance between the insert and block ring groove using a caliper.
    - If the measured value exceeds the limit, replace the insert and block ring.

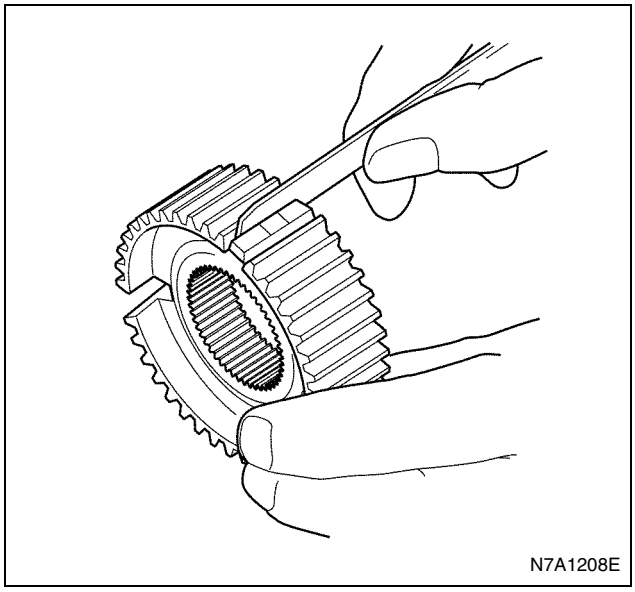
Clearance between Insert and Block Ring Groove, mm (in)	
	Standard
4th / 5th / 6th	3.46 — 3.76 (0.136 — 0.148)



N7A1207E

18. Measure the clearance between the insert and clutch hub using a thickness gauge.
    - If the measured value exceeds the limit, replace the insert and clutch hub.

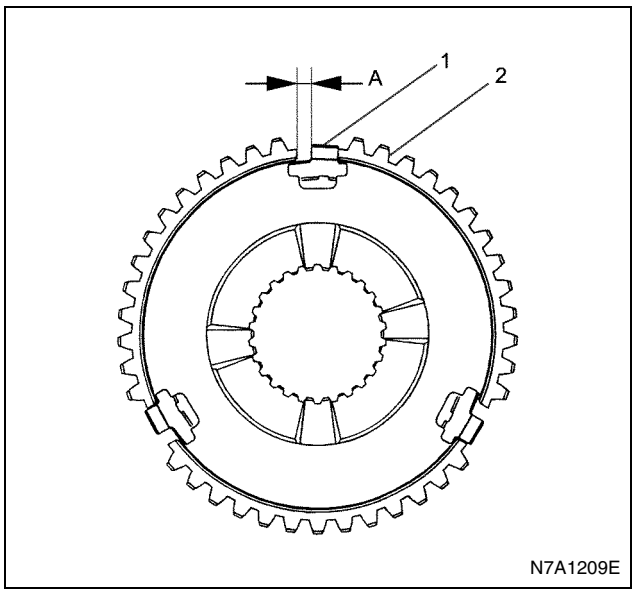
Clearance between Insert and Clutch Hub, mm (in)	
	Standard
4th / 5th / 6th	0.01 — 0.21 (0.00039 — 0.00826)



N7A1208E

19. Measure the clearance between the block ring and the clutch hub using a thickness gauge.
    - If the measured value exceeds the limit, replace the block and clutch hub.

Clearance between Block Ring and Clutch Hub, mm (in)	
	Standard
2nd / 3rd	4.30 — 4.70 (0.16929 — 0.18503)
1st / Reverse	4.30 — 4.70 (0.16929 — 0.18503)



N7A1209E

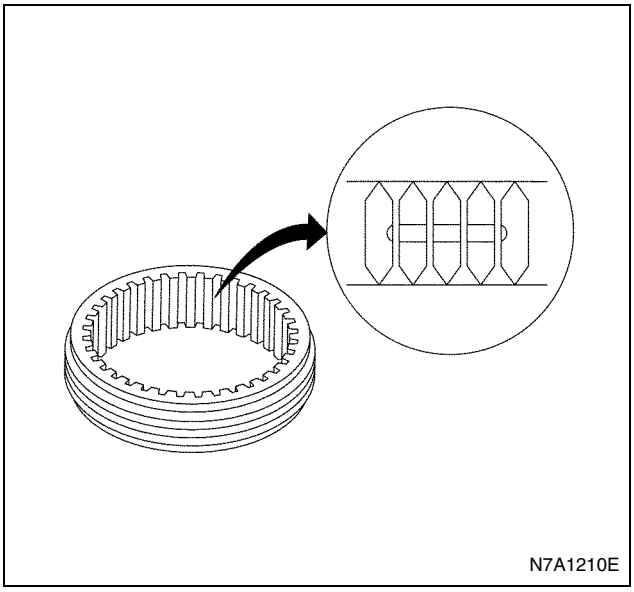
Legend
1. Block ring
2. Clutch hub

Assembly

- Clean up each part.
- Set the main shaft in a vise, with the long spline part at the bottom.

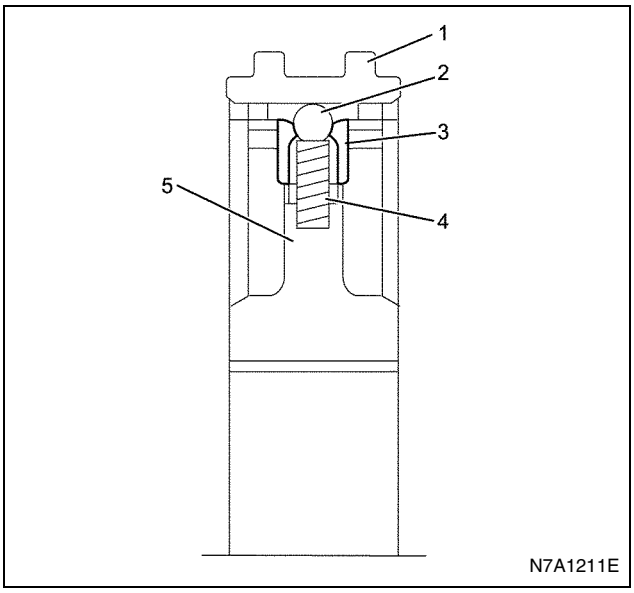
When setting the main shaft, make sure not to damage the grind surface.

1. Assemble the 2nd-3rd clutch hub assembly & sleeve following the procedure below.
   a. Install the block and sleeve to the clutch hub.
   b. Inside the sleeve, there are three ball grooves. Align the phase to let the ball enter the center of the ball grooves.



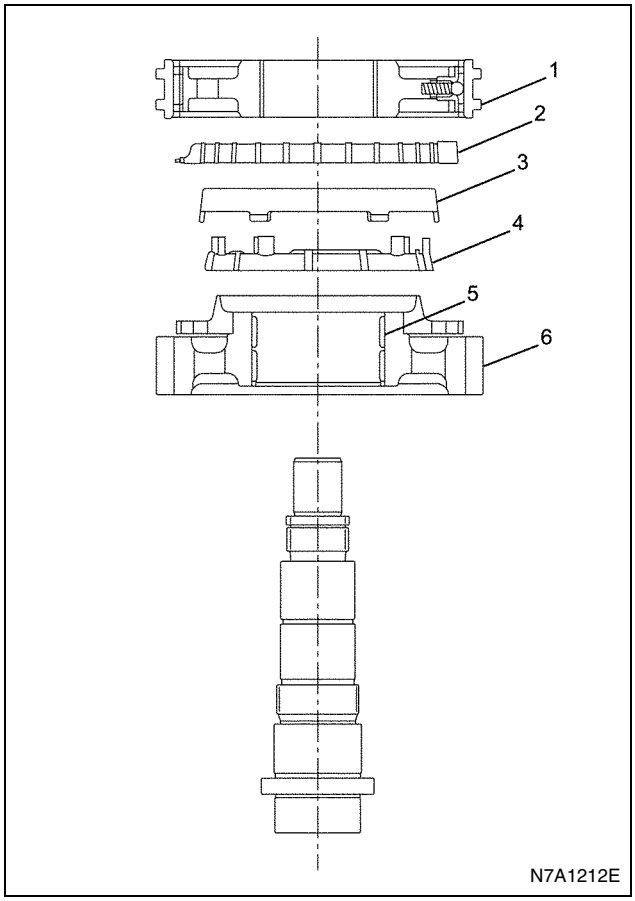
N7A1210E

   c. Insert sleeve (1) until the clutch hub (5) slightly overlaps the block.
   d. Securely insert the sleeve until the ball enters the ball groove of the sleeve by pushing the ball (2), block (3) and spring (4).



N7A1211E

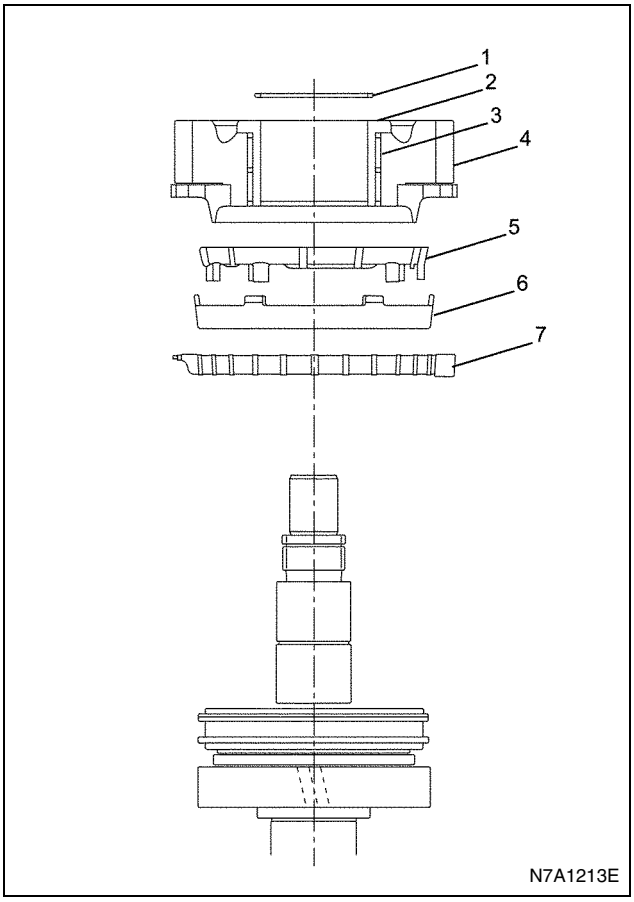
2. Apply engine oil 5W-30 to the needle bearing, 2nd gear thrust surface and synchro cone taper surface. And install the 2nd gear (6) and needle bearing (5) to the main shaft with the dog gear turned upward.
3. Install the 2nd inside ring (4), 2nd outside ring (3) and 2nd block ring (2) inserting the nail of the outside ring into the gear hole of the 2nd gear. At this time, make sure to apply engine oil 5W-30 sufficiently to the both sides of the inside ring and outside ring, and inside diameter surface of the block ring.
4. Insert the 2nd-3rd clutch hub assembly & sleeve with a press using the installer 5-8840-2345-0, setting the six nails of the inside ring to enter the six holes of the hub.



N7A1212E

5. During installation, set the six nails of the inside ring of the 3rd block ring (7), 3rd outside ring (6) and 3rd inside ring (5) to enter the six hub holes, respectively. At this time, apply engine oil 5W-30 sufficiently to the inside surface of the outside ring and the inside diameter surface of the block ring.
6. Apply engine oil 5W-30 to the needle bearing, 3rd gear thrust surface and synchro cone taper. Turn the dog gear downward, and insert the 3rd gear (4), needle bearing (3) and collar (2) using the installer 5-8840-2345-0 with a press, setting the nail of the outer ring to enter the dog gear hole of the 3rd gear.
7. Install the snap ring (1) using snap ring pliers.

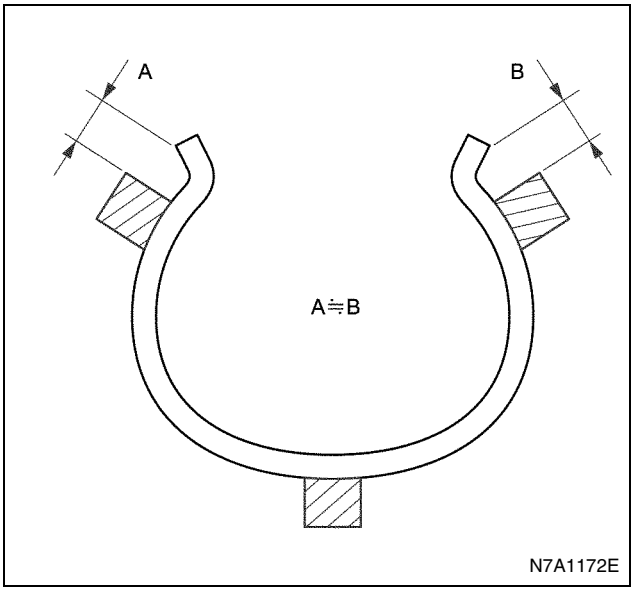
Caution:
Replace deformed or damaged snap rings with new ones. Check that the parts are securely installed.



8. Assemble the 4th-5th clutch hub assembly & sleeve following the procedure below.
   a. Assemble securely the insert (2) to the insert groove of the block ring.
   b. Install the insert spring (3) to the insert.

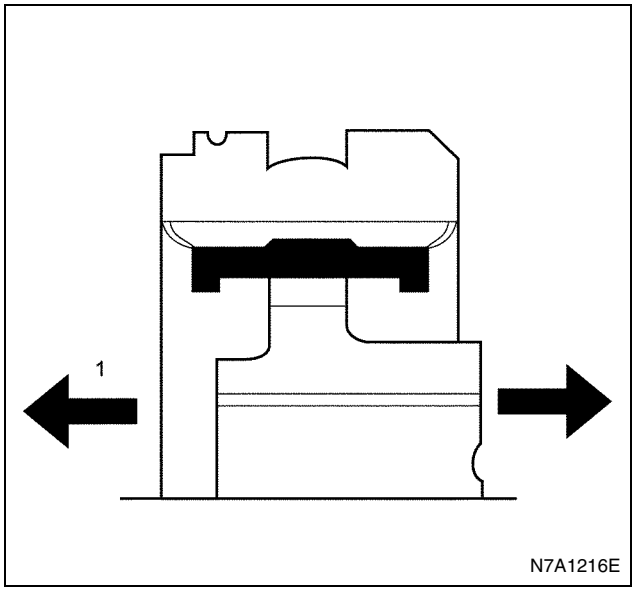
Caution:

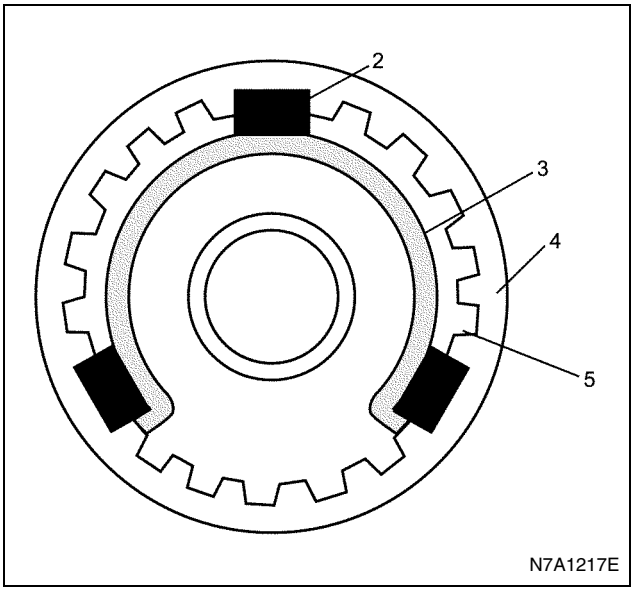
- When assembling the insert spring, equalize the length of the both edges of the spring not to adversely interfere with the inside diameter of the hub.



- Make sure that the open part of the insert spring assembled on the reverse side, is not aligned with the open part of the front side.

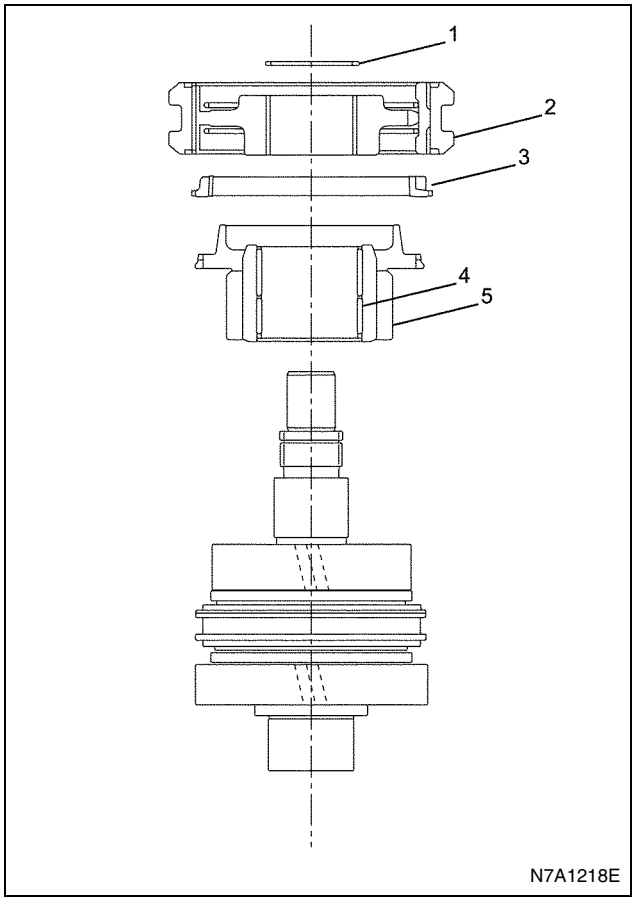
   c. Check that the clutch hub (5) and sleeve (4) are smoothly sliding.
      - The arrow (1) indicates the front side of the transmission.



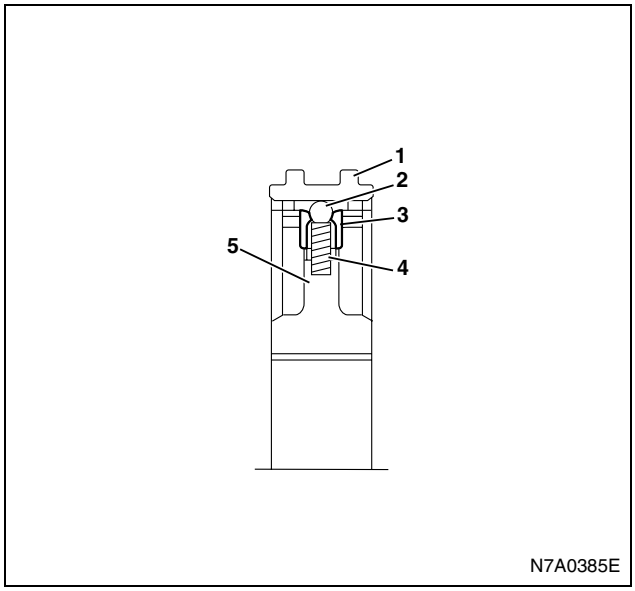


9. Apply engine oil 5W-30 sufficiently to the needle bearing, 4th gear thrust surface and synchro cone taper, and install the 4th gear (5) and needle bearing (4) with the dog gear turned upward.
10. Apply engine oil 5W-30 to the 4th block ring (3), and install.
11. Turning the surface with oil groove downward, align the 4th-5th clutch hub assembly and sleeve (2) to the groove of the 4th-5th block ring, and then insert with a press using the installer 5-8840-2345-0.
12. Install the snap ring (1) using snap ring pliers.

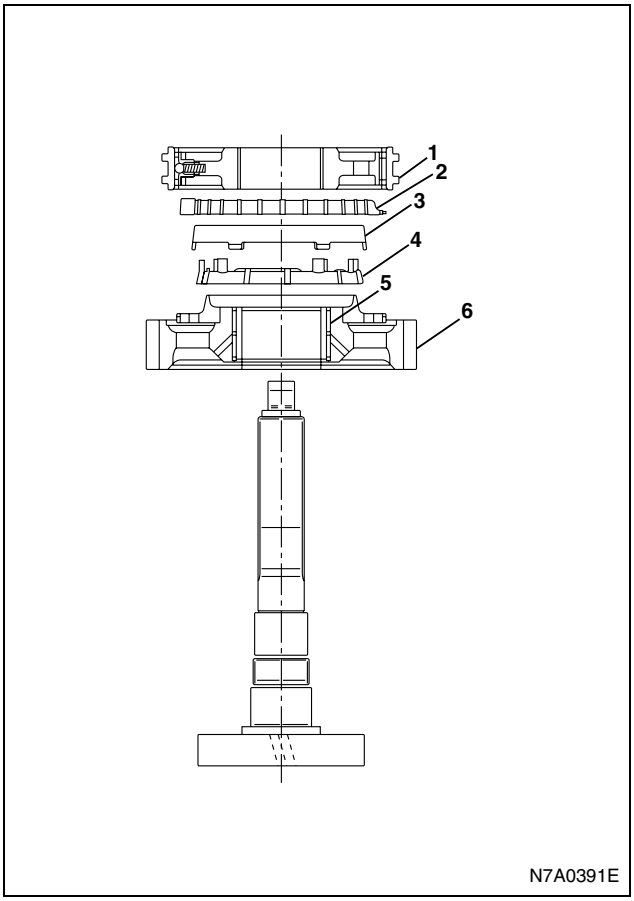
Caution:
Replace deformed or damaged snap rings with new ones. Check that the parts are securely installed.



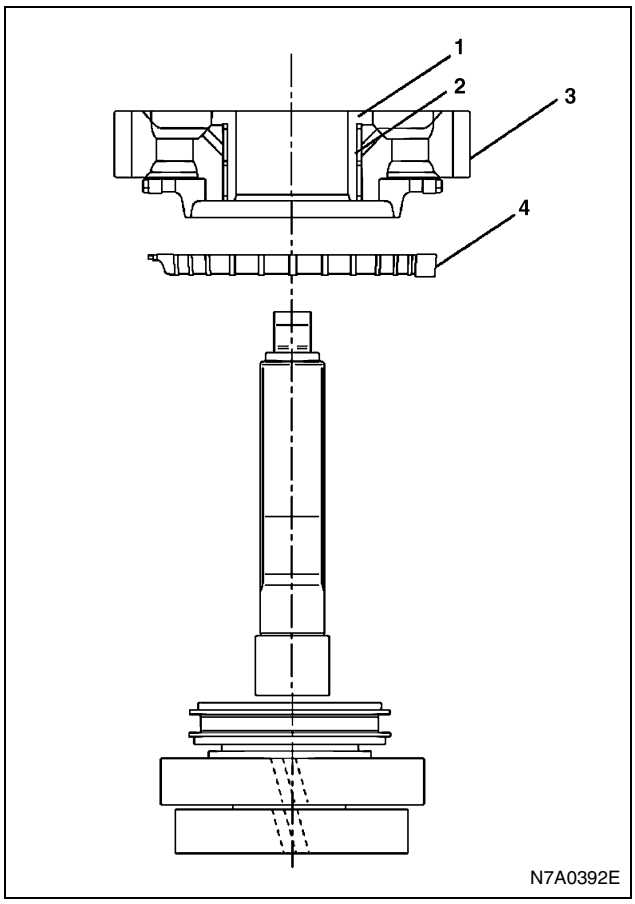
13. Assemble the 1st-reverse clutch hub assembly and sleeve following the procedure below.
    a. Install the block and spring to the clutch hub.
    b. Inside the sleeve, there are three ball grooves. Align the phase to let the ball enter the ball groove.
    c. Insert the sleeve (1) until the block slightly overlaps the clutch hub (5).
    d. Securely insert the sleeve until the ball enters the ball groove of the sleeve by pushing the ball (2), block (3) and spring (4).



14. Apply engine oil 5W-30 to the needle bearing, 1st gear thrust surface and synchro cone taper surface, and then install the 1st gear (6) and needle bearing (5), turning the dog gear upward.
15. Assemble the 1st inside ring (4), 1st outside ring (3) and 1st block ring (2), inserting the nail of the outer ring into the dog gear hole of the 1st gear. At this time, make sure to apply engine oil 5W-30 sufficiently to the both sides of the inside ring and outside ring, and inside diameter surface of the block ring.
16. Insert the 1st-reverse clutch hub assembly & sleeve (1) with a press using the installer 5-8840-2345-0, setting the six nails of the inside ring to enter the six holes of the hub.



17. Apply engine oil 5W-30 sufficiently to the reverse block ring (4), and then align the phase of the block ring groove to the 1st-reverse clutch hub assembly and sleeve, and install.
18. Apply engine oil 5W-30 to the needle bearing, the reverse gear thrust surface and the synchro cone taper. Turning the dog gear downward, align the phase of the synchro cone phase of the reverse gear to the nail of the outer ring, and then insert the reverse gear (3), needle bearing (2), and collar (1) with a press using the installer 5-8840-2345-0.



19. Install the spacer (2).
20. Insert the bearing (1) with a press using the installer 5-8840-2345-0, turning the stamped surface (4) upward and the stamped surface (3) downward.
21. Install the 6th gear.
    - Install with the convex part at the bottom.

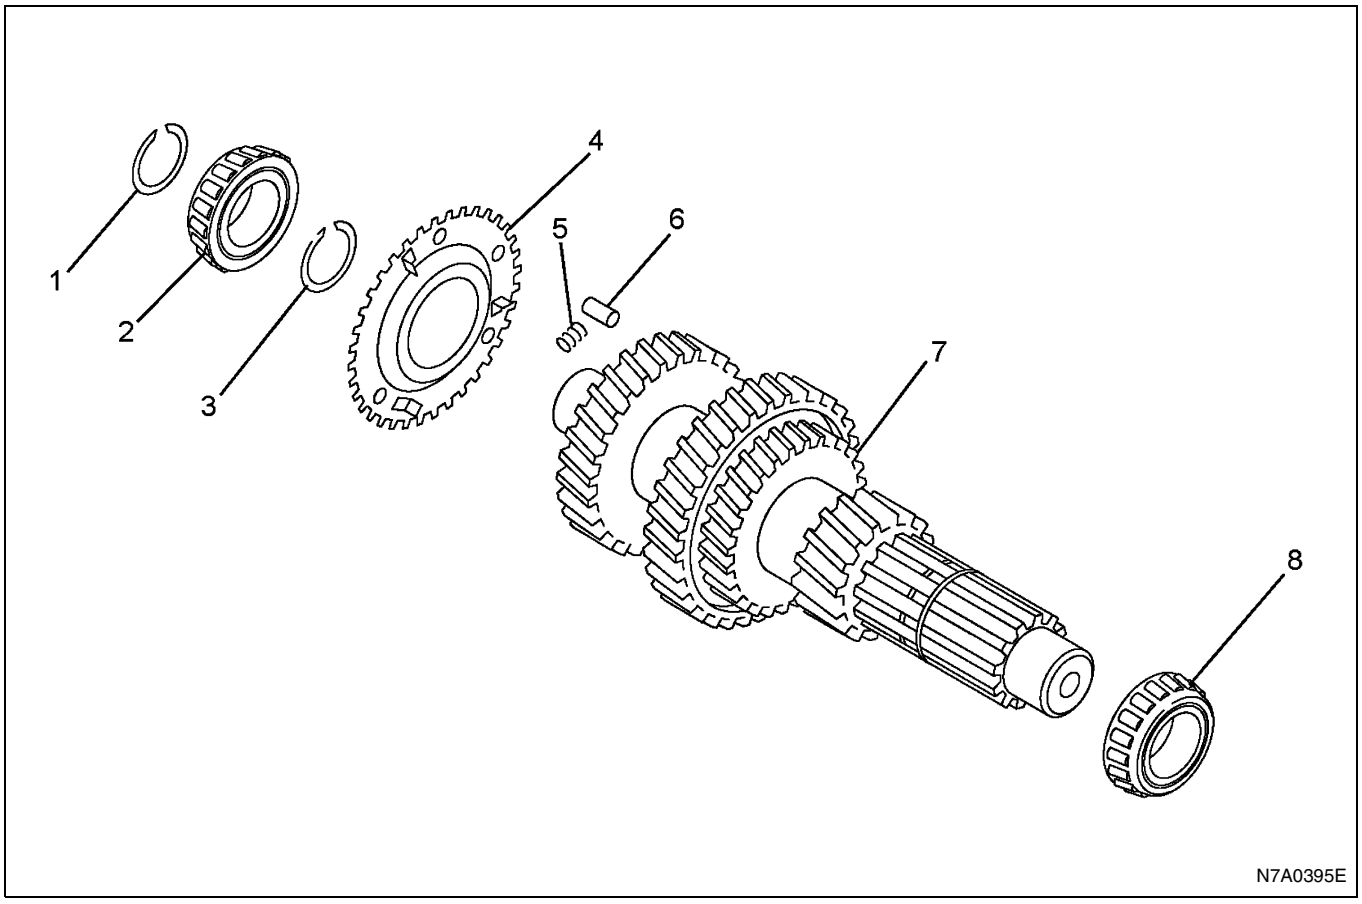
Counter Shaft (5MT)

Components

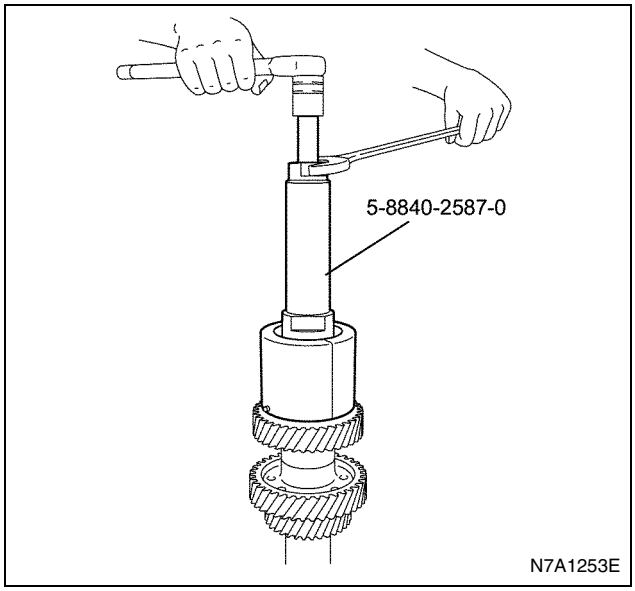


Legend

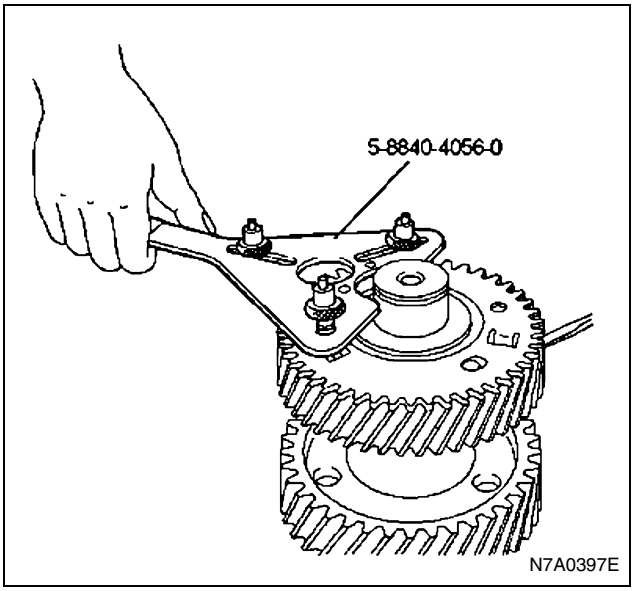
1. Snap ring
2. Bearing; Counter front
3. Snap ring
4. Anti-lash plate
5. Coil spring
6. Straight pin
7. Counter shaft assembly
8. Bearing; Counter rear

Disassembly

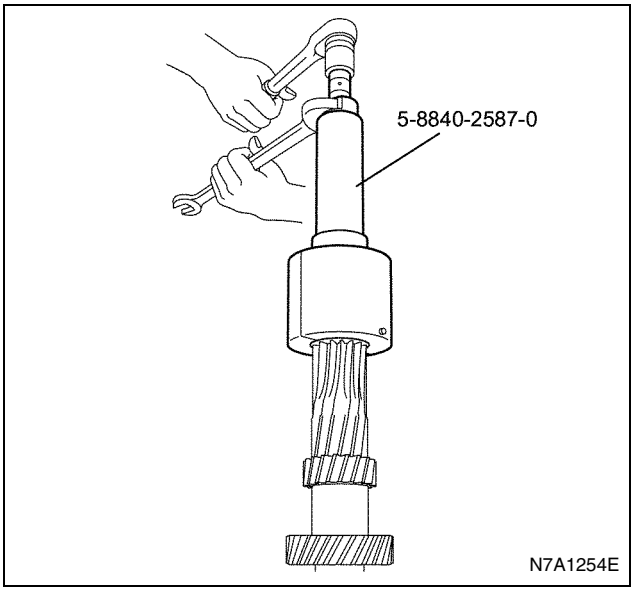
1. Remove the bearing fixing snap ring using snap ring pliers.
2. Remove the bearing; counter front using the bearing remover 5-8840-2587-0.



3. Remove the anti-lash plate fixing snap ring using snap ring pliers.
4. Remove the anti-lash plate using the flange holder 5-8840-4056-0.



5. Remove the three coil springs from the 5th gear.
6. Remove the straight pin from the 5th gear.
7. Remove the bearing; counter rear using the bearing remover 5-8840-2587-0.

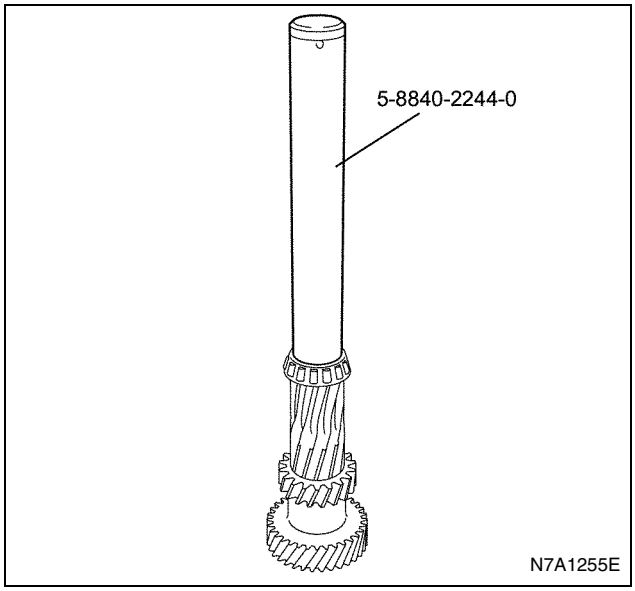


If any wear, damage or other abnormality is found on the disassembled parts, repair or replace the parts.

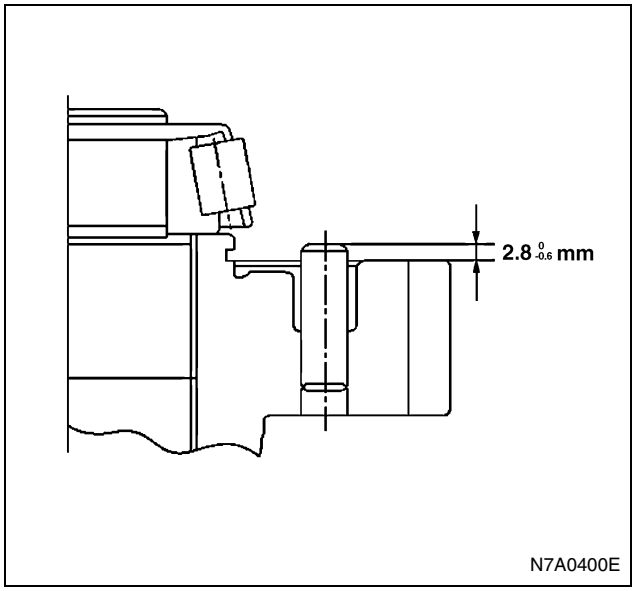
8. Inspect the surface of each gear for damage or wear. If any abnormality is found, replace the gear.
9. Inspect each bearing with respect to the following items. If any abnormality is found, replace with a new one.
   - Smoothness of rotation
   - Noise
   - Abnormal external appearance, including damage, rust, etc.
   - Abnormal free play in thrust direction

Assembly

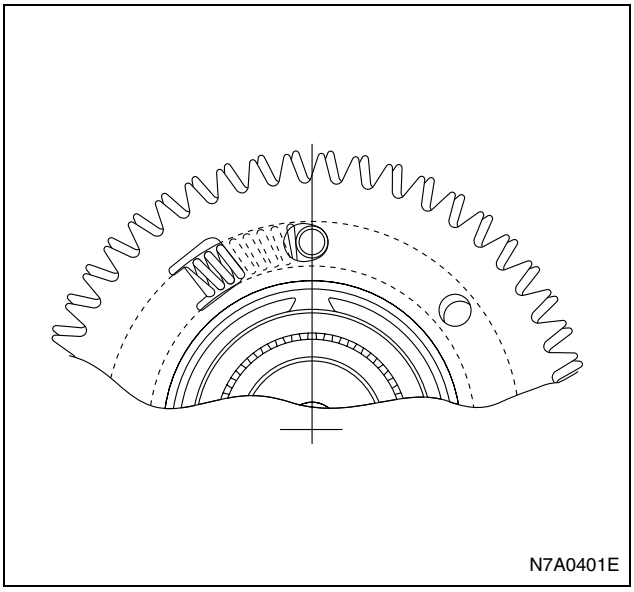
1. Insert the bearing counter rear with a press using the installer 5-8840-2244-0.



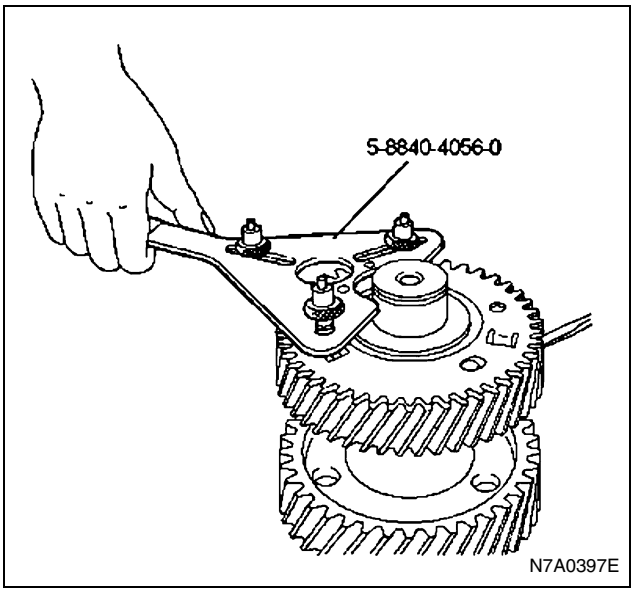
2. Install the straight pin within the range of protrusion.



3. Assemble the three coil springs to the groove on the side of the 5th gear, while these springs have to touch the left side of the pin viewing from the center of the gear.



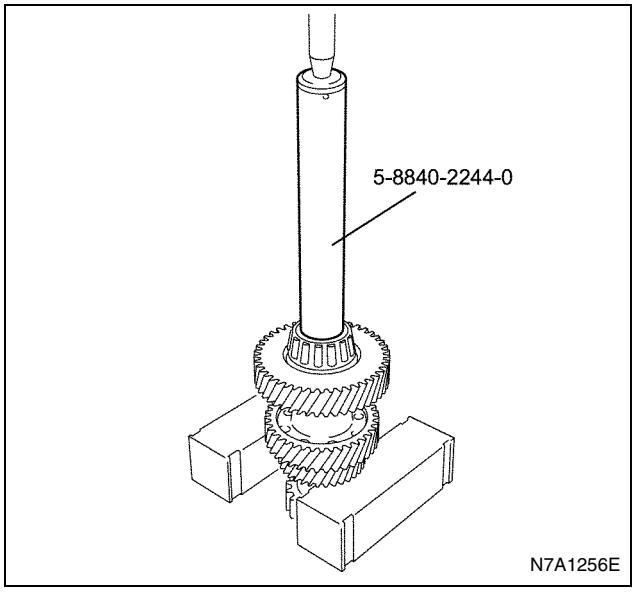
4. Set the springs between the folded protrusion of the anti-lash plate and the straight pin. Using the flange holder 5-8840-4056-0, align the set hole of the anti-lash plate with the set hole of the 5th gear, and install.



5. Install the anti-lash plate fixing snap ring using snap ring pliers.

Caution:
Replace deformed or damaged snap rings with new ones. Check that the parts are securely installed.

6. Install the bearing: counter front with a press using the installer 5-8840-2244-0.



7. Install the bearing fixing snap ring using snap ring pliers.
   - Select the thickest snap ring installable from the following three types.

Thickness, mm (in)	Color
1.9 (0.0748)	Blue
2.1 (0.0826)	Yellow
2.3 (0.0905)	Pink

Caution:
Replace deformed or damaged snap rings with new ones. Check that the parts are securely installed.

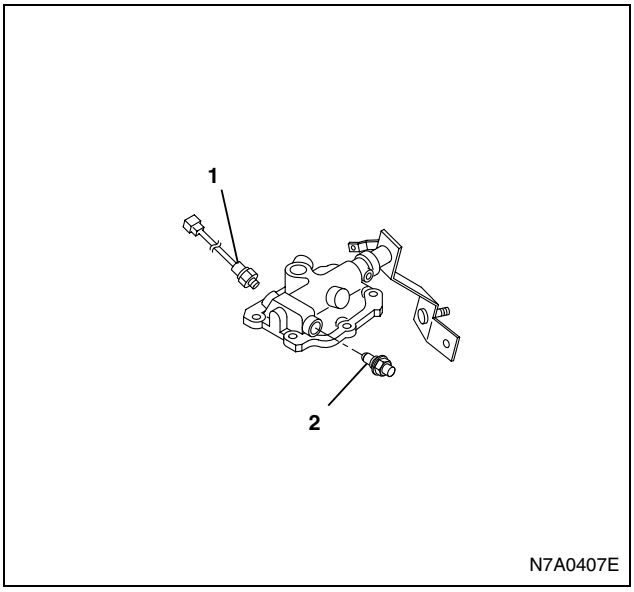
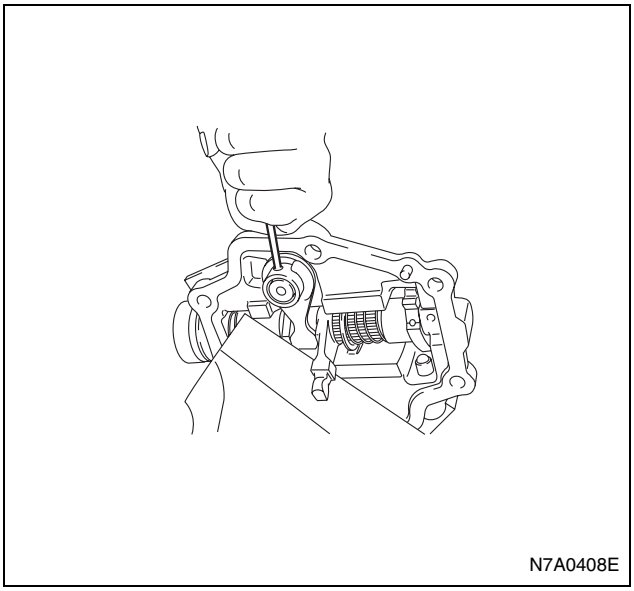
14. Spring pin; Stopper ring
15. Spring pin; Shift lever shaft
16. Neutral switch
17. Select lever shaft oil seal
18. Washer
19. Select external lever

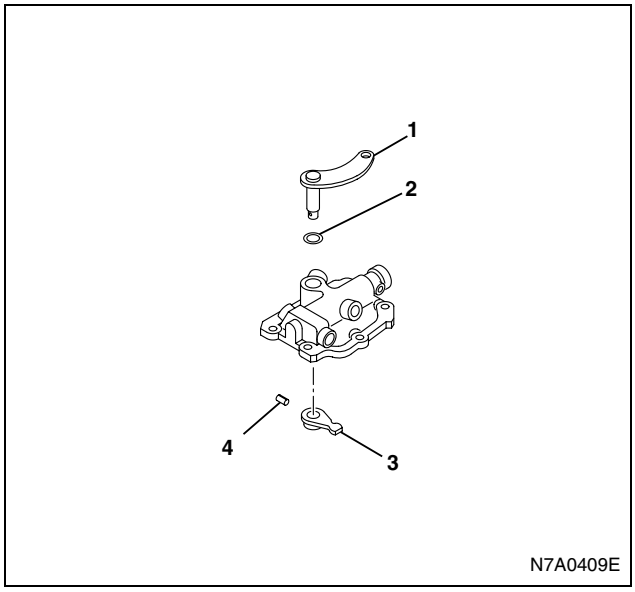
Disassembly

1. Remove the neutral switch (1) and detent (2).

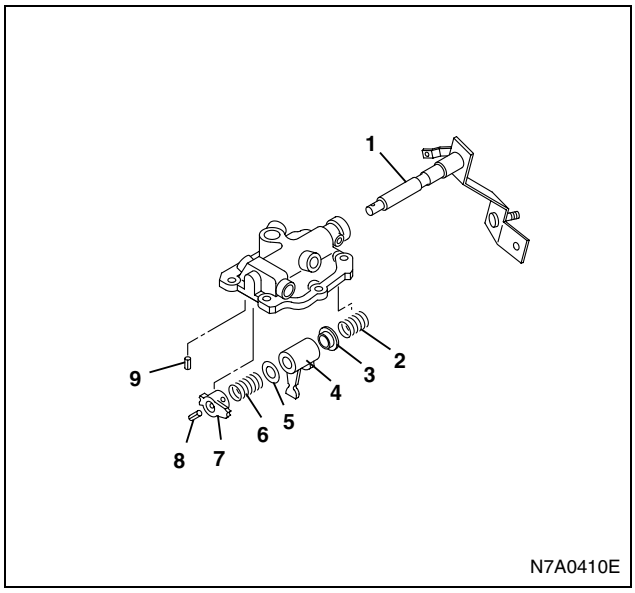


2. Remove the spring pin; select internal lever (4) using the spring pin remover, and then remove the select internal lever (3), select external lever (1) and washer (2).





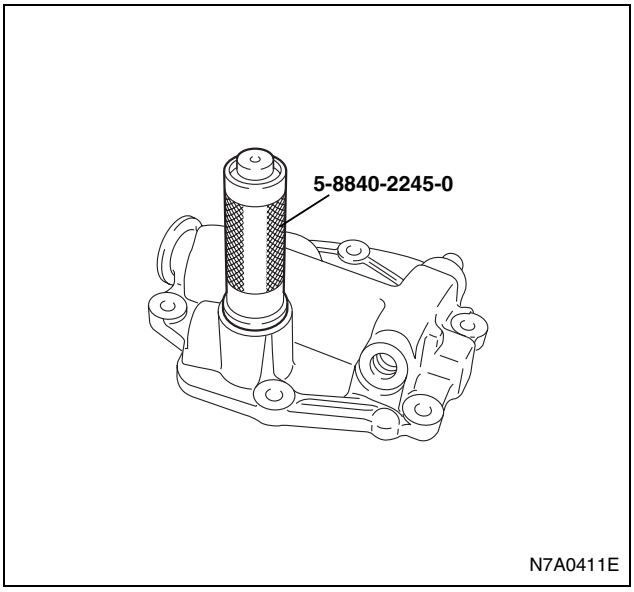
3. Remove the spring pin; stopper ring (8) and the spring pin; shift lever shaft (9).
4. Pull out the shift lever shaft (1), and remove the stopper ring (7), spring (6), spring sheet (5), shift internal lever (4), washer (3) and spring (2).



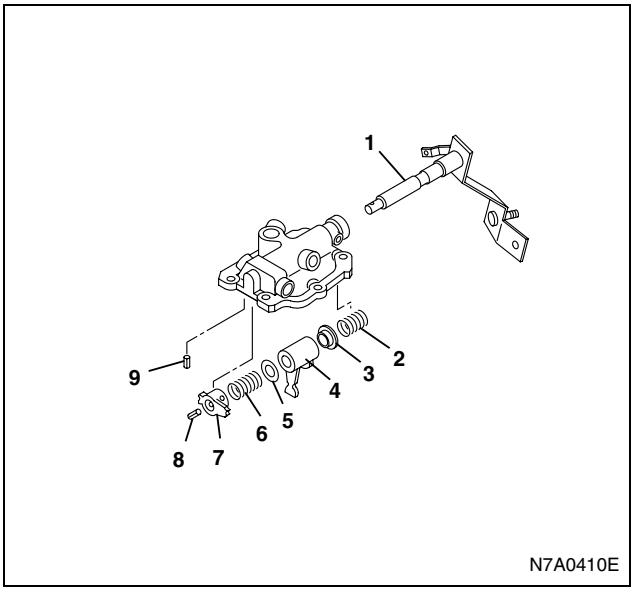
5. Pry and remove with a driver the select lever shaft oil seal and shift lever shaft oil seal from the control box.
   If any wear, damage or other abnormality is found on the disassembled parts, repair or replace them.
6. Inspect wear of the shift shaft, free play of the control box and roughness of the manipulation. If any abnormality is found, replace the part.

Assembly

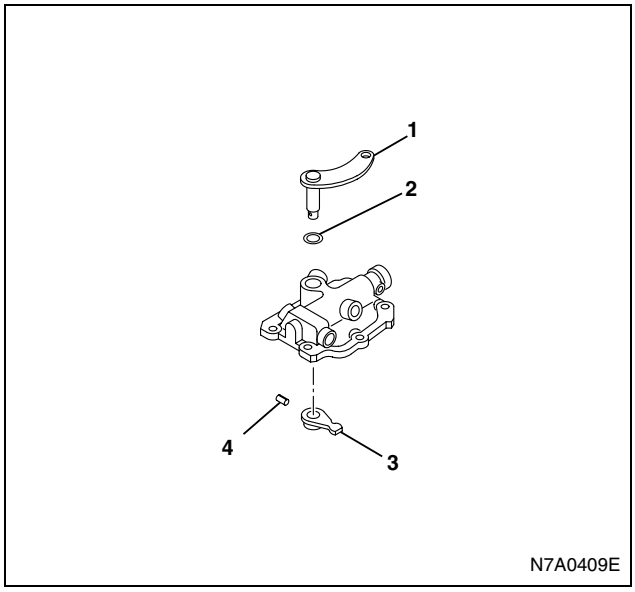
1. Using the installer 5-8840-2245-0 for the control box, install the shift lever shaft oil seal and select lever shaft oil seal.



2. Assemble the spring (2), washer (3), shift internal lever (4), spring sheet (5), spring (6) and stopper ring (7) to the control box. Insert the shift lever shaft (1). Align the pin hole of the shift lever shaft with the pin hole of the stopper ring, and then drive in a new spring pin; stopper ring (8) and spring pin; shift lever shaft (9).



3. Insert the select external lever (1) and washer (2) into the control box. Install the select internal lever (3), and then drive in a new spring pin; select internal lever (4).



4. Install the detent (2).
   - The detent contains pre-coating agent. Remove completely the seal agent on the screw of the case side before using new detent.

Tighten:
Detent (2) to 28 N·m (2.9 kg·m / 21 lb·ft)

5. Fix the neutral switch (1) to the specified torque.

Tighten:
Neutral switch (1) to 34 N·m (3.5 kg·m / 25 lb·ft)

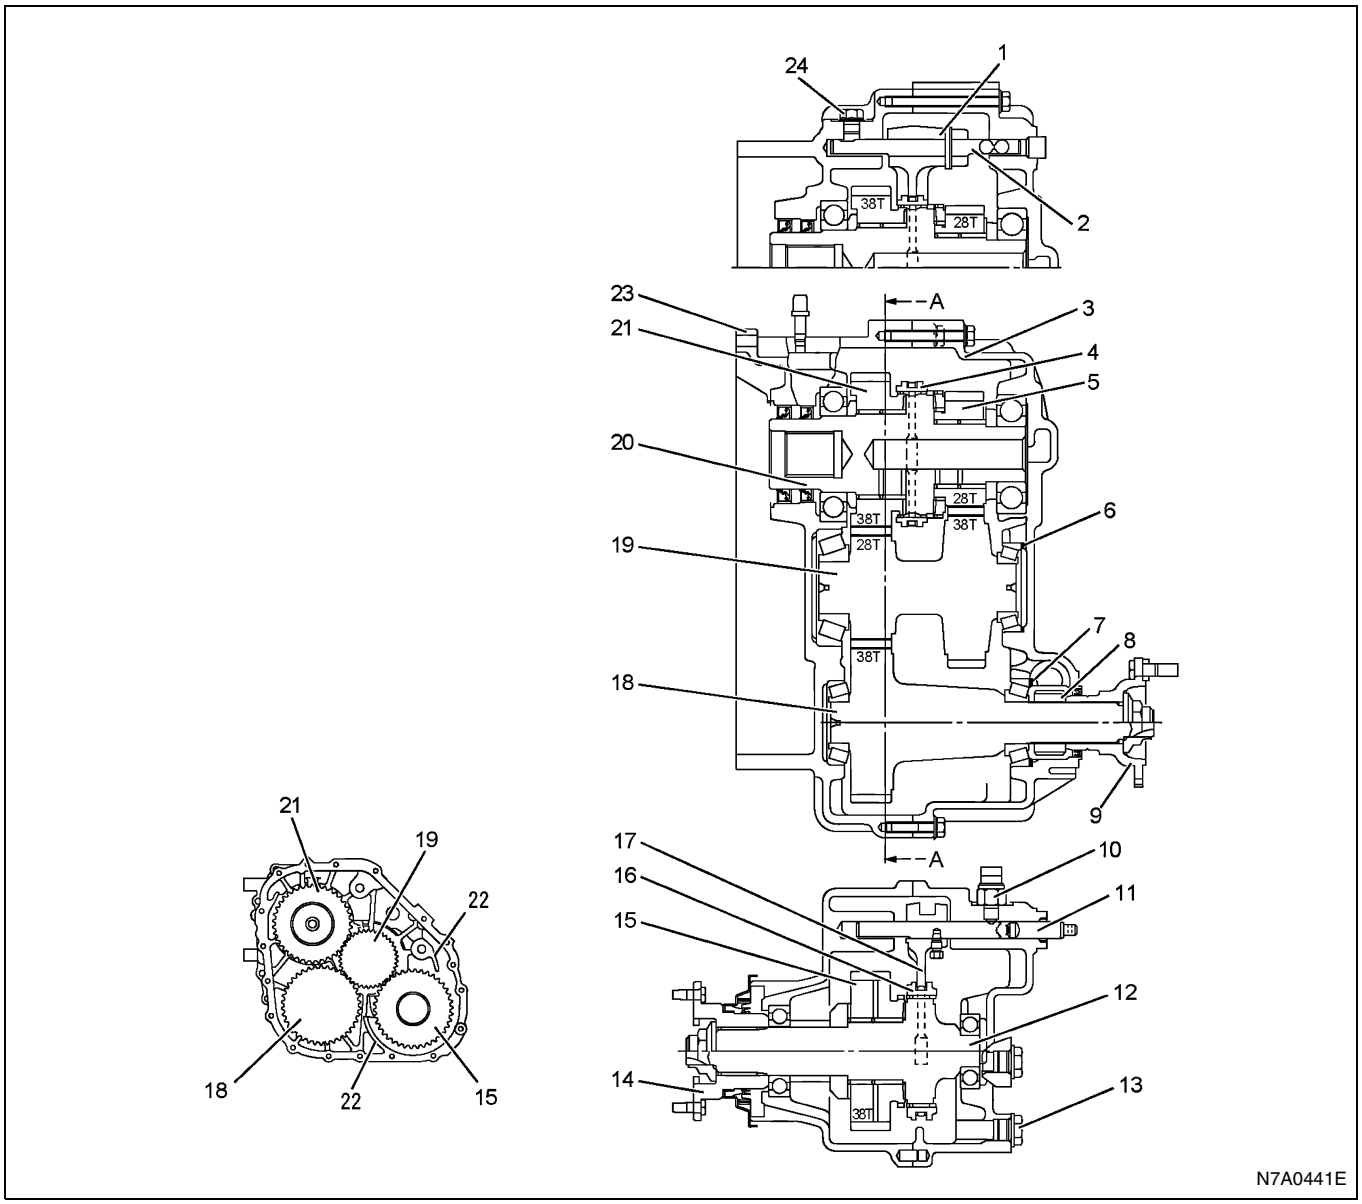
5884022450	5-8840-2245-0 / Control Box Oil Seal Installer

Transfer System (MYY Rigid Type)

Function and Operation



Legend

1. Low / high shift arm
2. Low / high shift rod
3. Transfer rear case
4. Sleeve; Low / high
5. Transfer low gear
6. Shim; Counter shaft bearing
7. Shim; Rear output shaft bearing
8. Speedometer drive gear
9. Driver coupling; Rear output
10. 2WD / 4WD sensor switch
11. 2WD / 4WD shift rod
12. Front output shaft
13. Drain plug
14. Driver coupling; Front output
15. Front output drive gear
16. Sleeve; 2WD / 4WD
17. 2WD / 4WD shift arm
18. Rear output shaft
19. Idle gear shaft
20. Input shaft
21. Transfer high gear
22. Current plate
23. Transfer front case
24. Low / high sensor switch

Specifications

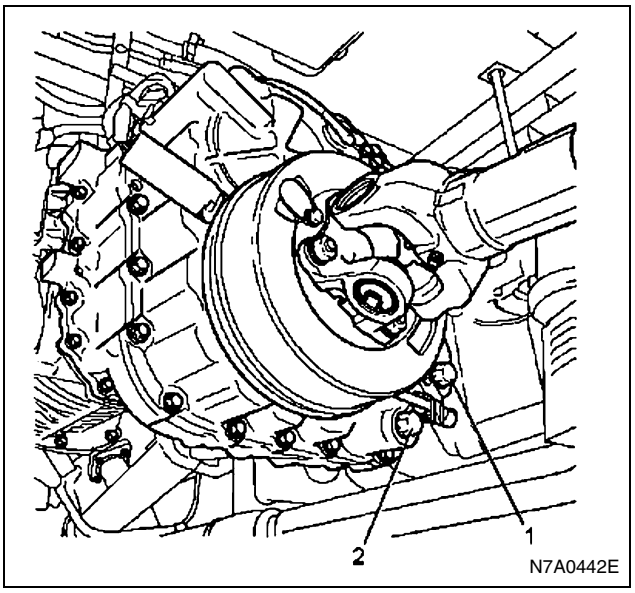
Type		2nd, helical gear type
Gear Ratio	High Range	1.000 (28/38 × 38/28)
	Low Range	1.842 (38/28 × 38/28)
Specified Oil		Besco Gear Oil Transaxle (5W-30)
Oil Capacity L (US qt/Imp qt)		1.8 (1.9 / 1.6)

Transfer Assembly (MYY Rigid Type)

Removal

Preparation

- Jack up the vehicle, and support with a rigid rack.
- Remove the drain plug, and drain the oil.



Legend

1. Filler plug
2. Drain plug

1. Remove the propeller shaft guard.
2. Remove the transfer side of the rear propeller shaft.
   - Before removing the propeller shaft, put alignment marks on the transfer flange and the propeller shaft flange yoke.
   - The removed propeller shaft must be put aside not to interfere with the operation, and fix securely with wire.
3. Disconnect the parking brake cable.
   - Remove the cable bracket (1) and slide the cover (2) in the direction indicated by an arrow.
   - Loosen the lock nut, and remove the front cable and the rear cable.

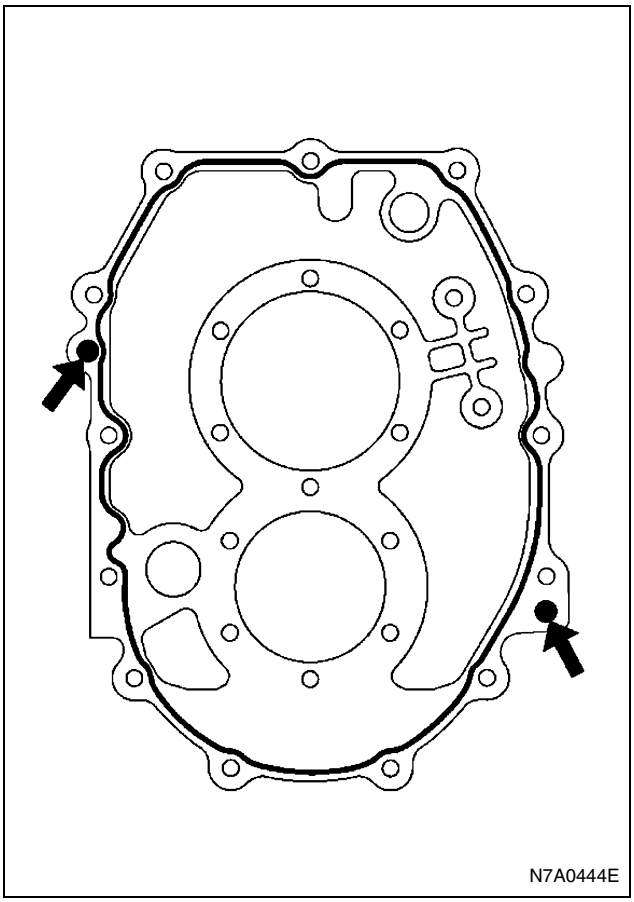
   - Remove the cable clip of the rear cable.
4. Remove the front propeller shaft.
   - Before removing the propeller shaft, put alignment marks on the transfer flange and the propeller shaft flange yoke.
5. Remove the low / high shift cable installation bracket.
6. Remove the vehicle speed sensor connector.
7. Remove the 2WD / 4WD change warning lamp switch connector.
8. Remove the 2 parts of the vacuum hose.
9. Remove the harness and nut on the transfer side.
10. Remove the transfer assembly from the transmission.
    - Set securely the transmission jack to the transfer assembly.
    - Remove 11 bolts and 2 nuts for transfer installation.
    - Remove the transfer assembly by operating the transmission jack.

Installation

Install in the reverse order of removal, observing the following items.

- Apply liquid packing (ThreeBond 1215) on the transfer mating surface of the transmission case.

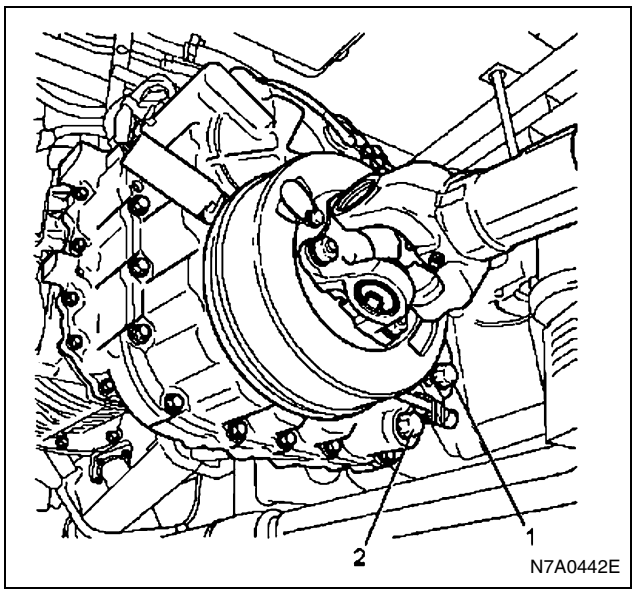
- Liquid packing (ThreeBond 1215) must be applied continuously with a diameter of 2 mm (0.079 in).
- Align the transfer assembly with the stud bolts indicated by arrows, and install it to the transmission.



- Transfer assembly to transmission assembly fixing torque

Tighten:
Transfer assembly to transmission assembly to 46 N·m (4.7 kg·m / 34 lb·ft)

- Inject gear oil into the transfer assembly.
  Product Name: Besco Gear Oil Transaxle (5W-30)
  Capacity: 1.8L (1.9 US qt / 1.6 Imp qt)



Legend
1. Filler plug
2. Drain plug

- Fixing torque of the oil filler and drain plug

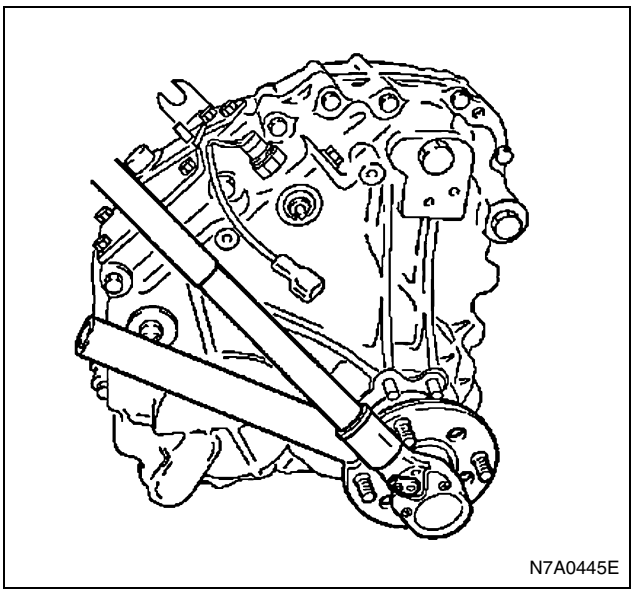
Tighten:
Oil filler and drain plug to 39 N·m (4.0 kg·m / 29 lb·ft)

Transfer (MYY Rigid Type)

Disassembly

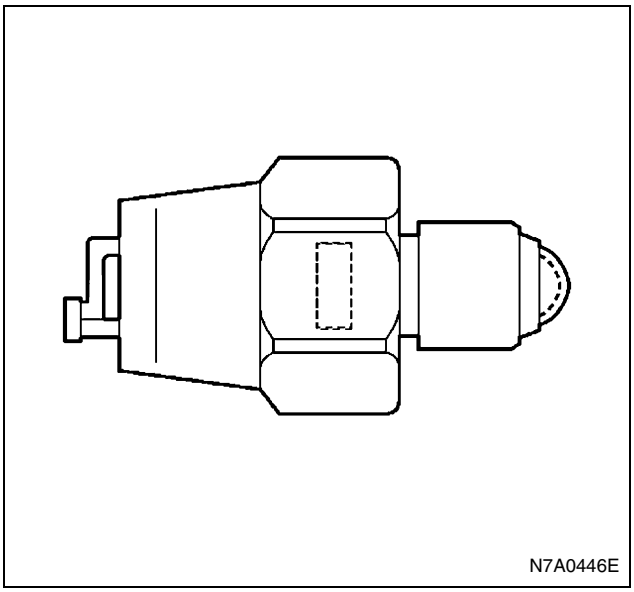
Caution:
Make sure to shift the gear to 4H before disassembling the front & rear transfer case.

1. Securely raise the caulking parts of the lock nut of the coupling driver.
2. Fix the rear coupling driver using the flange holder 5-8840-2043-0, and remove the lock nut.
3. Fix the front coupling driver using the flange holder 5-8840-0133-0, and remove the lock nut.
   - The rear coupling driver is shown in the figure below.



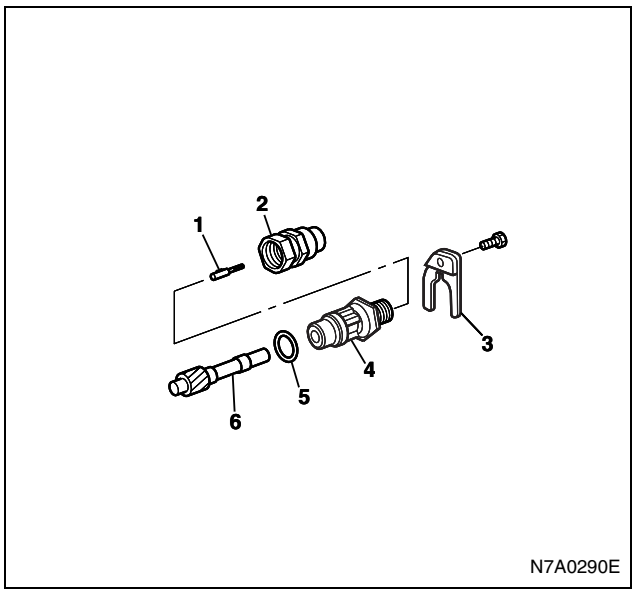
N7A0445E

4. Remove the 2WD/4WD change warning lamp switch.



N7A0446E

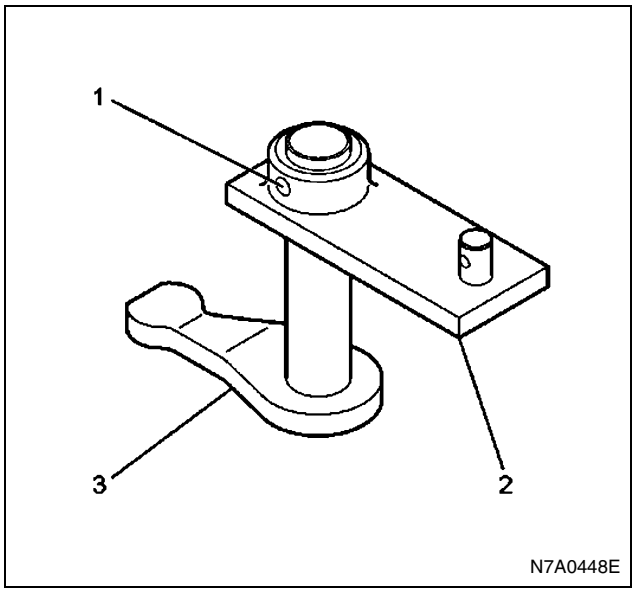
5. Remove the breather.
6. Remove the speed sensor driven gear.



N7A0290E

Legend
1. Insertion key
2. Vehicle speed sensor
3. Plate
4. Bush
5. O-ring
6. Driven gear

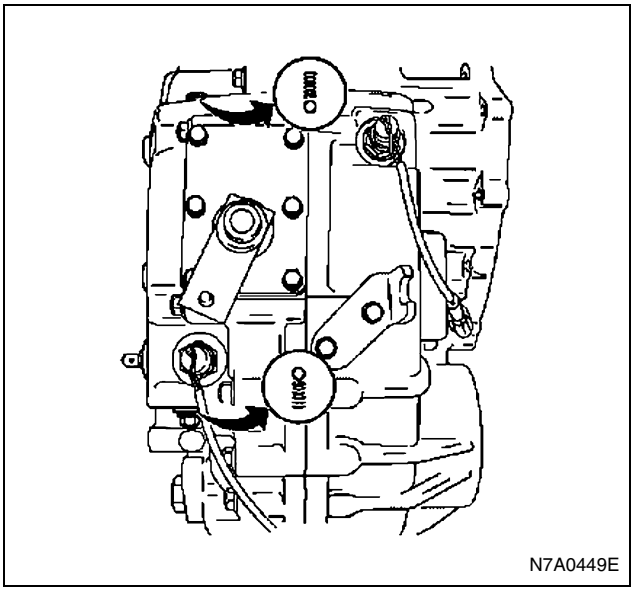
7. Remove the low / high change lever.



N7A0448E

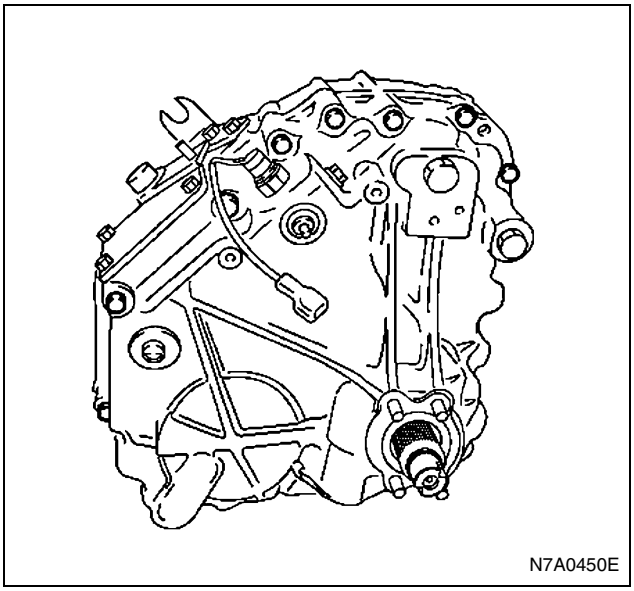
Legend
1. Spring pin
2. Select external lever
3. Select internal lever

8. Remove the control cable bracket.
9. Remove the detent ball and detent spring.
   - Two parts



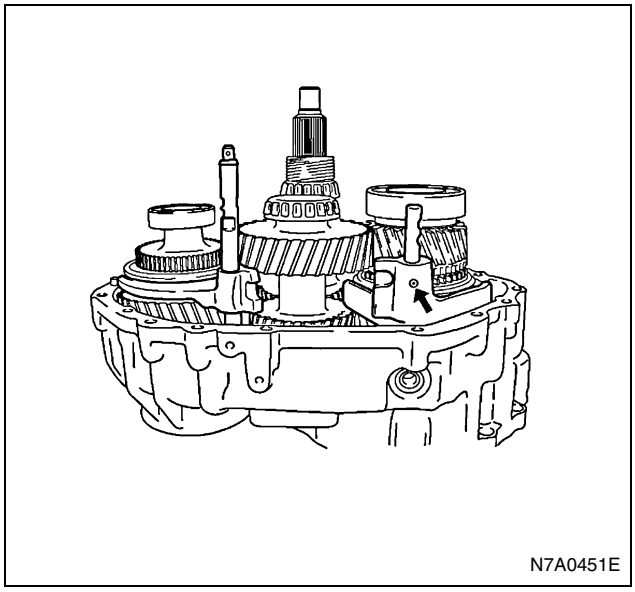
N7A0449E

10. Remove the transfer rear case.
    - Remove the 18 bolts.



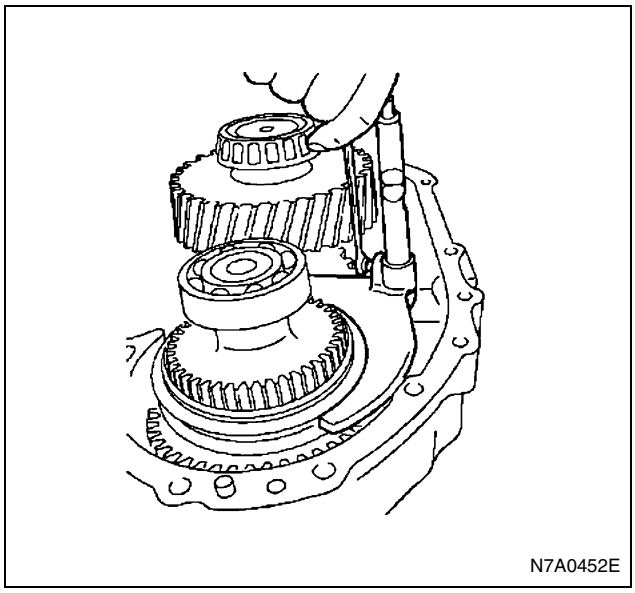
N7A0450E

11. Remove the low / high change shift arm and the shift lock.
    - Drive out the spring pin, and then remove the shift arm and the shift rod.



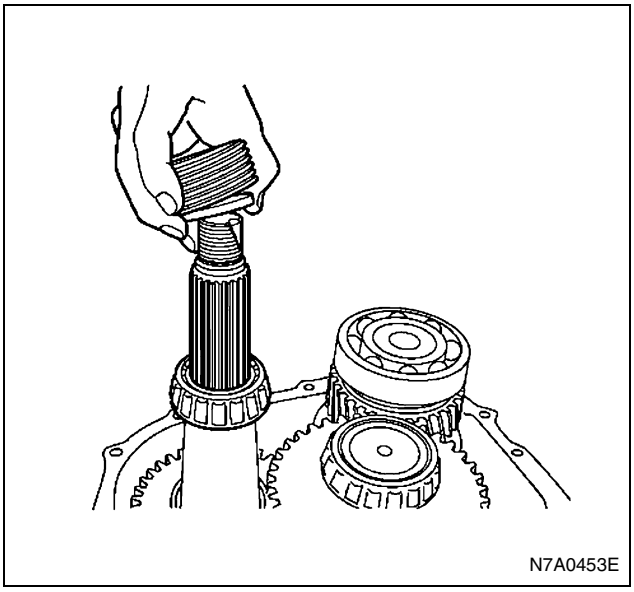
N7A0451E

12. Remove the 2WD / 4WD change shift arm and shift rod.
    - Loosen the shift arm fixing bolt, and remove the shift arm and the shift rod.

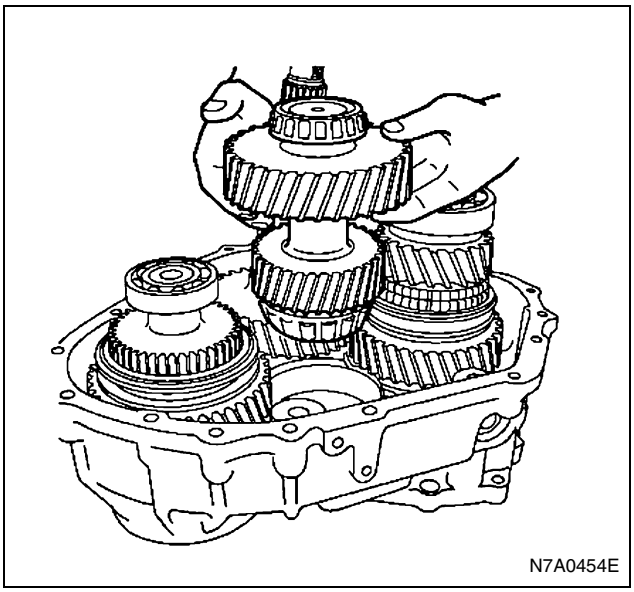


N7A0452E

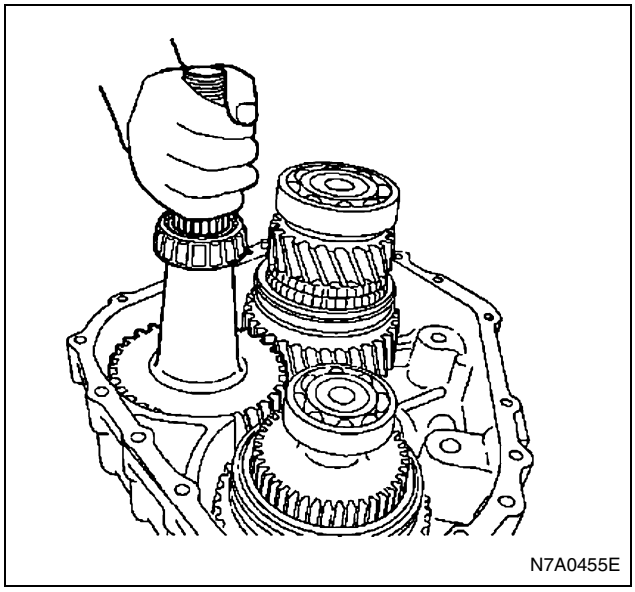
13. Remove the speedometer driven gear and the thrust washer.



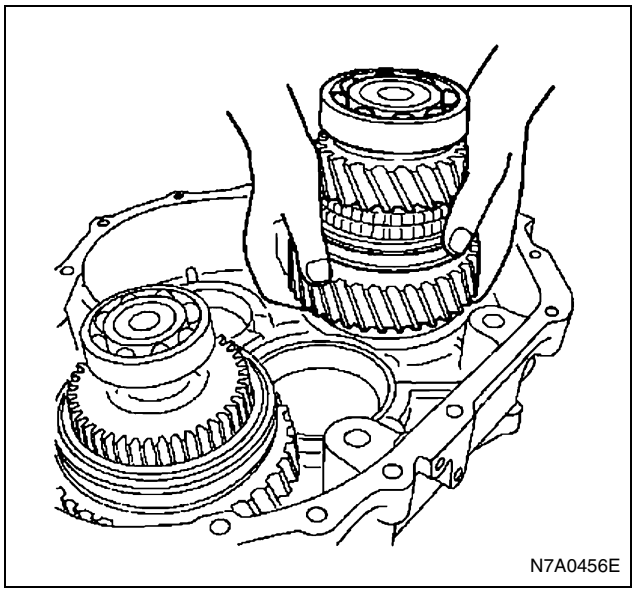
14. Remove the idle gear shaft from the transfer case.



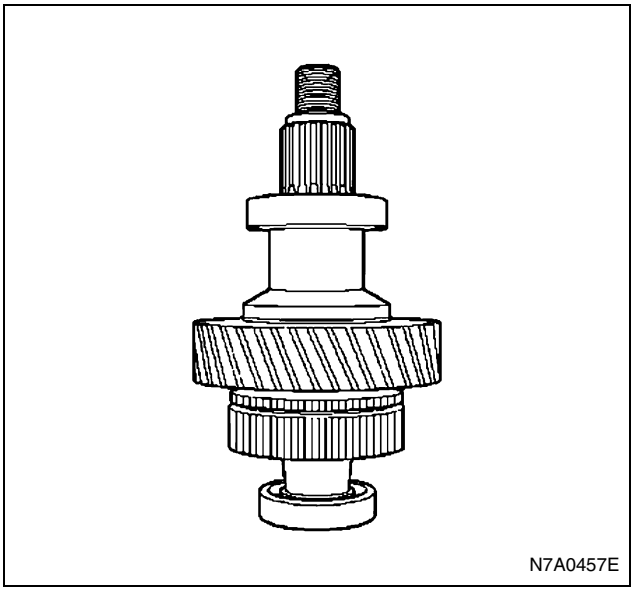
15. Remove the rear output gear shaft from the transfer case.



16. Remove the input gear shaft from the transfer case.

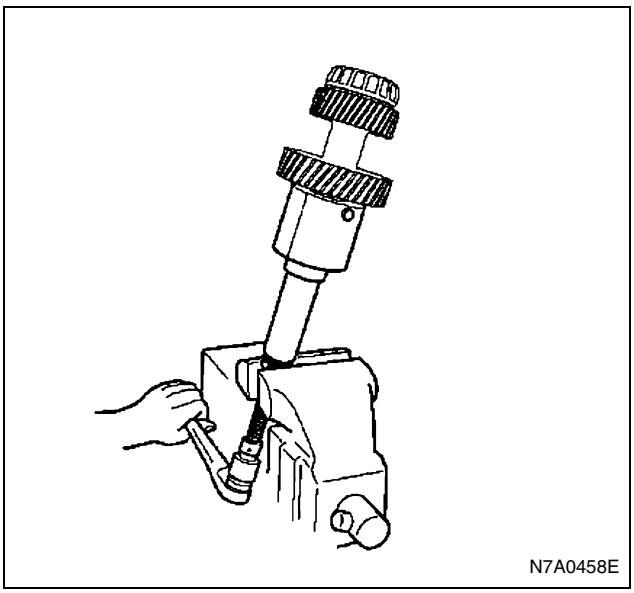


17. Remove the front output gear shaft from the transfer case.



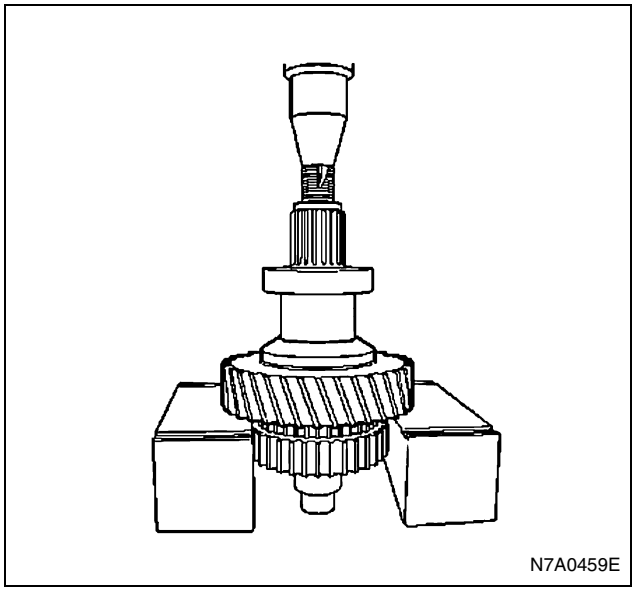
N7A0457E

18. Remove the front & rear bearing from the idle shaft.
    - Remove the front bearing using a general-purpose bearing remover.
    - Remove the rear bearing using the insert 303173 and the collet 44801 from among the parts of the bearing remover 5-8840-2587-0.



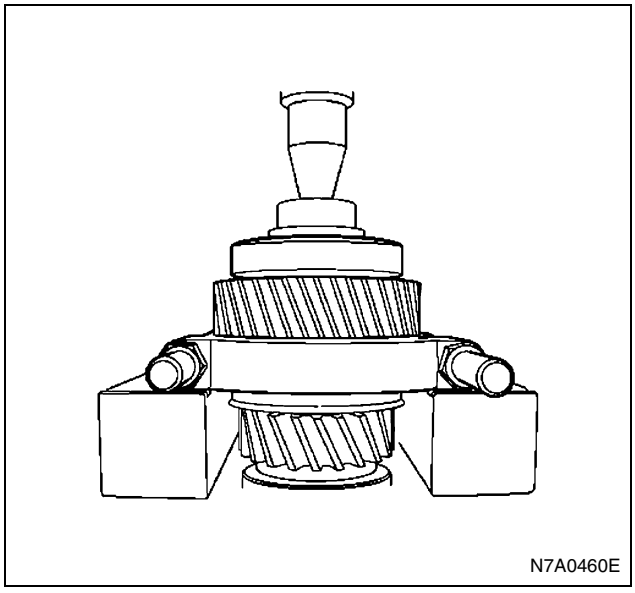
N7A0458E

19. Disassemble the front output gear shaft.
    - Before removing the ball bearing, put a mark which indicates the installation direction.
    - Remove the front & rear bearing using a general-purpose bearing remover.



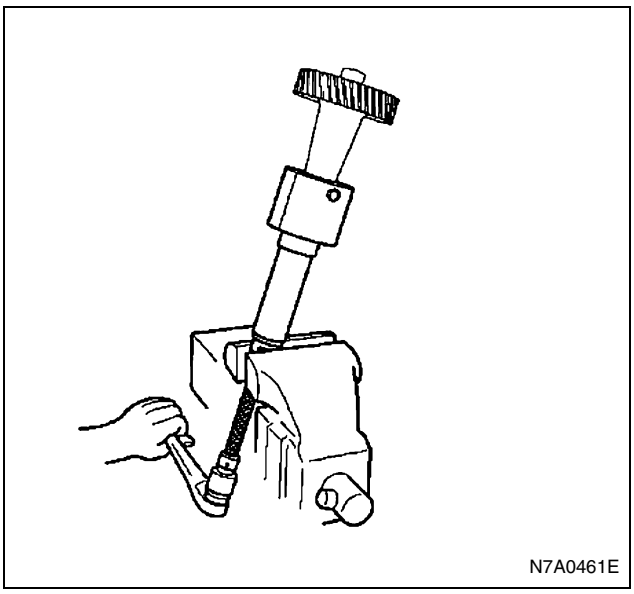
N7A0459E

    - After removing the ball bearing, remove the collar, thrust washer, front output drive gear and needle bearing.
20. Disassemble the input gear shaft.
    - Remove the front & rear bearing using a general-purpose bearing remover.



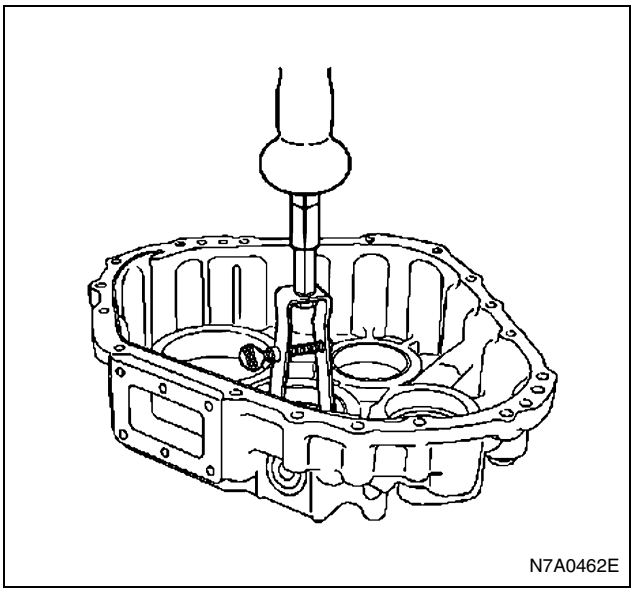
N7A0460E

    - After removing the front bearing, remove the thrust washer, transfer high gear, needle bearing and sleeve.
    - After removing the rear bearing, remove the thrust washer, transfer low gear and needle bearing.
21. Remove the front & rear bearing from the rear output gear shaft.
    - Remove using the bearing remover 5-8840-2587-0.
    - Remove using the insert 303173 and the collet 44801 from among the parts of the bearing remover.



N7A0461E

22. Remove the bearing outer race of the idle gear shaft.
    - Remove using the bearing race remover 5-8840-0027-0.

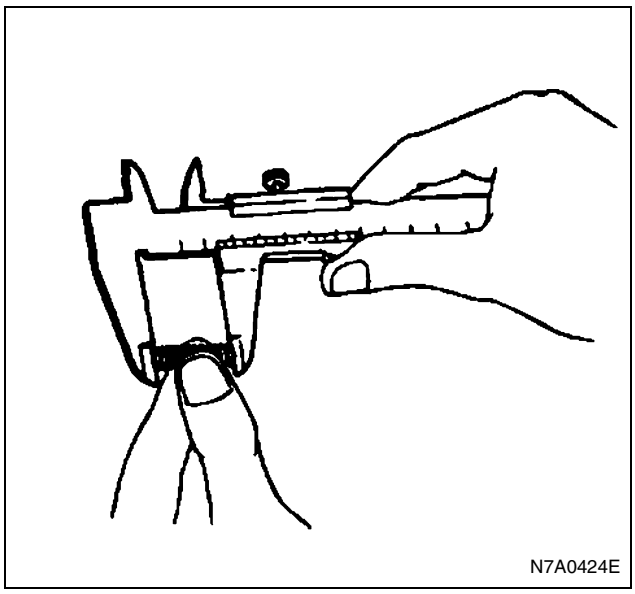


N7A0462E

Assembly

1. Clean and inspect the disassembled parts. If any abnormality including wear, damage or corrosion is found, repair or replace the part.
    - Measure the free length of the detent spring.

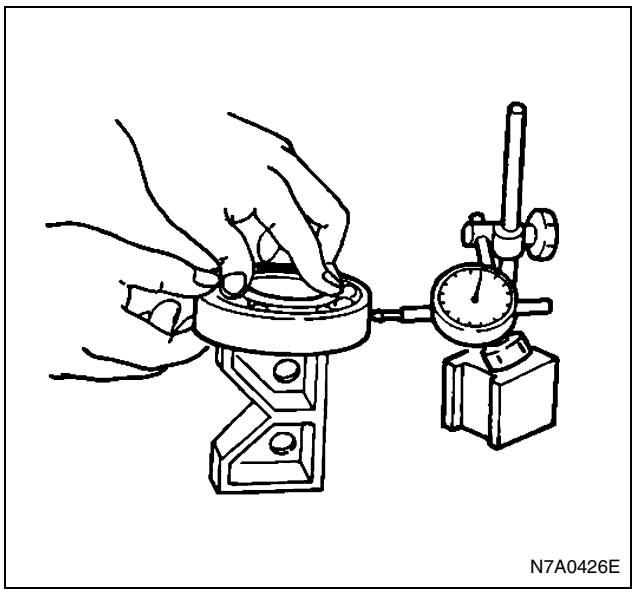
Free Length of Detent Spring
Standard: 31.6 mm (1.244 in) Limit: 30.1 mm (1.185 in)



N7A0424E

- Inspect each bearing. If any abnormality is found, replace the bearing.
  - Smoothness of rotation
  - Noise
  - Abnormal external appearance, including damage or rust
  - Abnormal free play in thrust direction
  - Discoloration, excessive wear and pitching of rotating body and rotating surface of needle bearing
- Measure the free play in the radial direction of the ball bearing.

Free play in the radial direction of the ball bearing
Limit: 0.2 mm (0.0079 in)



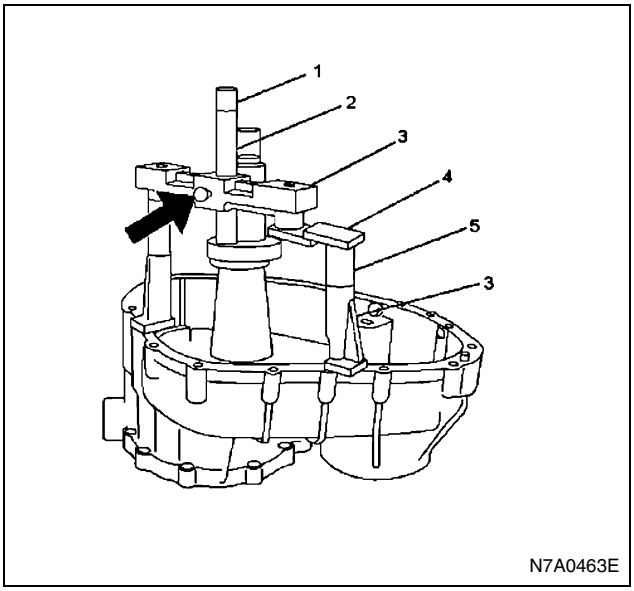
N7A0426E

- Inspect the sleeve sliding surface of the shift arm. Check that there is no excessive wear or damage.
- Inspect the gear. Repair slight stepped surface or roughness using an oil stone or pencil grinder.

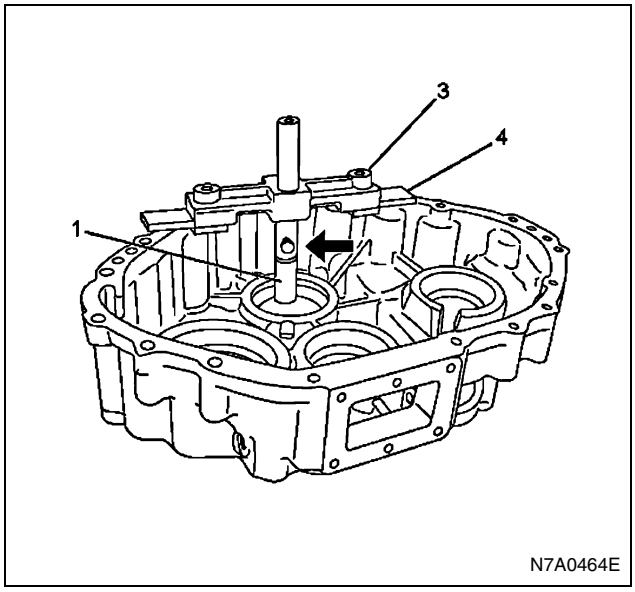
– Damage on tooth surfaces
– Excessive wear of tooth surfaces
– If excessive wear or damage is found on the tooth surfaces of the dog clutch, replace the part.

• Oil seal
– Replace the removed oil seal with a new one.

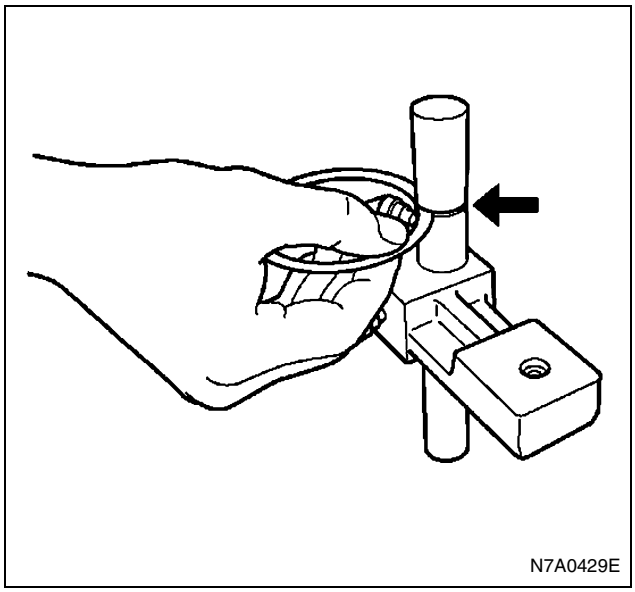
2. Bearing shim adjustment
• Adjust the thickness of the shim of the rear output shaft rear bearing, using the shim selector 5-8840-0194-0 and shim selector adaptor 5-8840-2794-0.
• Measure the thickness of the shim, using the gauge pin J-35824-8 (1), gauge cylinder J-35824-31(2), bridge assembly J-35824-1(3), extension J-35824-19(4) and spacer J-35824-30(5) included in the shim selector gauge and the shim selector set.



a. Loosen the screw, put the gauge cylinder on the rear bearing edge surface of the output shaft, and fix with the screw.
b. Remove the leg and spacer from the bridge. Install the extension (4) to the bridge to enable the bridge to connect to the rear transfer case mating surface.



c. Turn the bridge assembly upside down, and then set the bearing assembly to the installation hole surface of the output shaft rear bearing of the mating side rear transfer case.
d. Loosen the screw, put the gauge pin (1) on the bearing installation surface, and fix the screw.
e. Measure the clearance between the gauge cylinder and the gauge pin, and select the size of the shim. Adjustment to the standard end plate 0 — 0.05 mm (0 — 0.002 in) becomes possible.



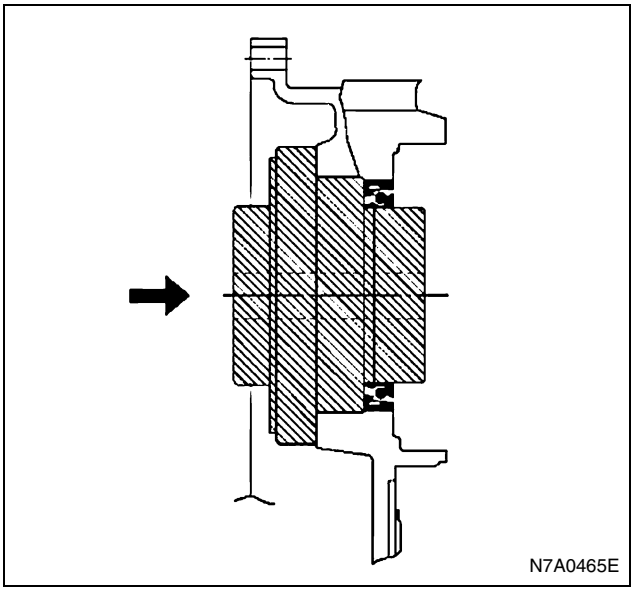
• Set the selected shim on the bearing surface of the bearing race, and press in the race.
• Adjust the shim for the bearing outer of the idle shaft in the same manner.

Shims, which can be selected, mm (in)	
Idle gear shaft	0.18 (0.0070)
Rear output gear shaft	0.25 (0.0098)
	0.30 (0.0118)
	0.35 (0.0137)
	0.40 (0.0157)
	0.50 (0.0196)

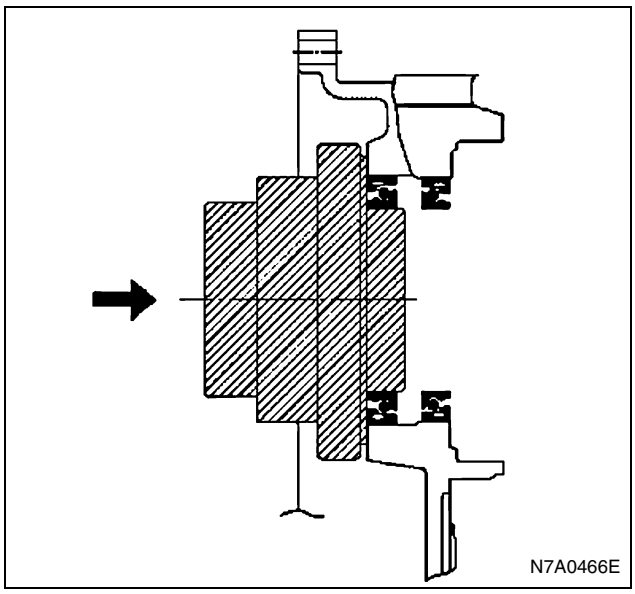
3. Install the oil seals of the rear output shaft, front output shaft and input shaft.
   - Apply engine oil on the outer circumference of a new oil seal, and apply grease (Besco L2 or equivalent) to the lip part.
   - Install the rear output oil seal using the installer 5-8840-2775-0.
   - Install the front output oil seal using the installer 5-8840-2774-0.
   - Install the input oil seal using the installer 5-8840-2776-0.

Caution:
Make sure to install the inner side and outer side of the input shaft oil seal from the transmission side.

- Installation direction of the inner side oil seal of the input shaft is indicated.

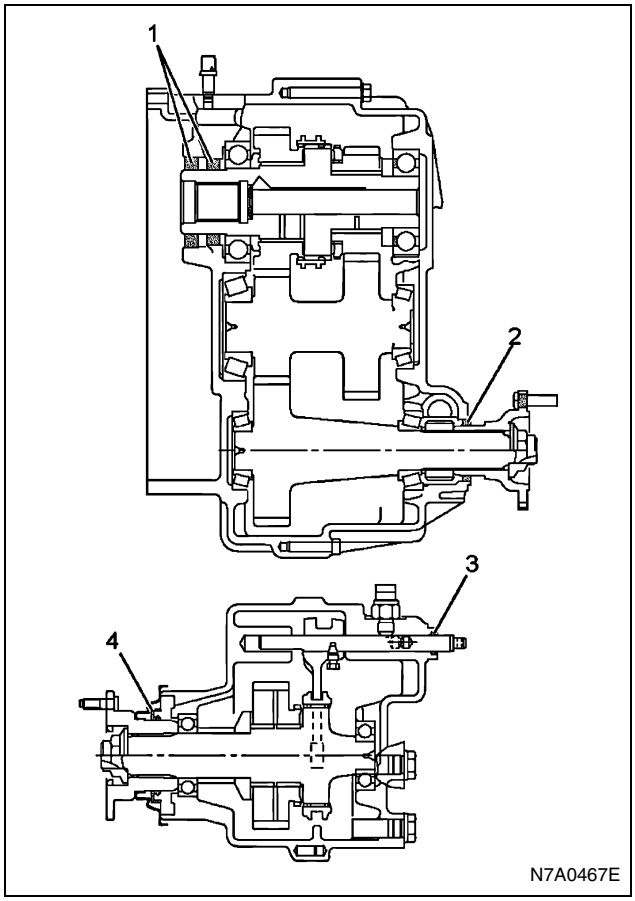


- Installation direction of the outer side oil seal of the input shaft is indicated.



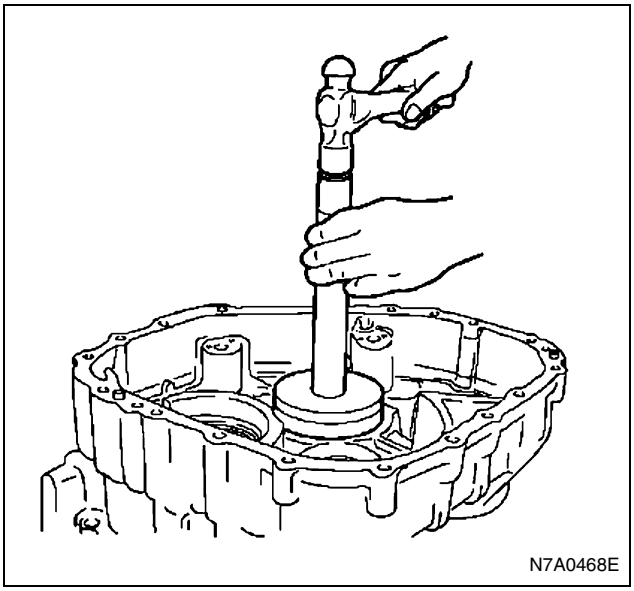
- Install the oil seal of the 2WD / 4WD change shift rod part of the rear transfer case.
- Install the front output shaft oil seal to the front transfer case.

Installation Position



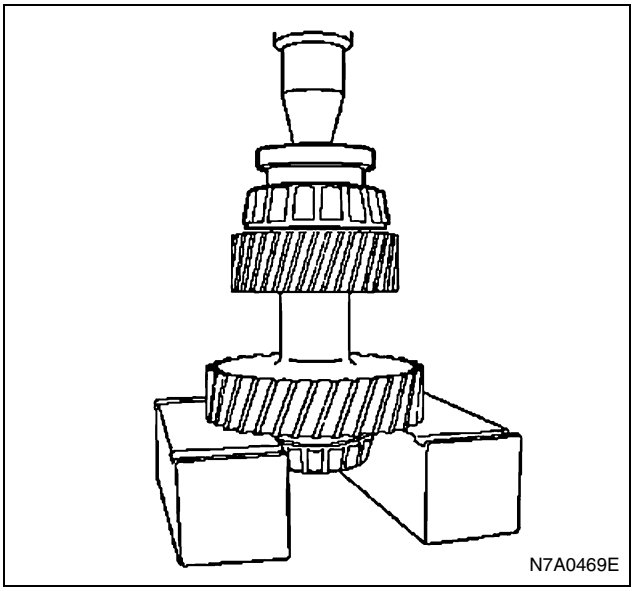
Legend
1. Input shaft oil seal
2. Rear output shaft oil seal
3. Shift rod oil seal
4. Front output shaft oil seal

4. Press in the bearing outer race of the idle gear shaft and rear output gear shaft.
   - Use the installer 5-8840-2773-0 and the grip 5-8840-0007-0 to press in the front side outer race of the idle gear shaft.
   - Use the installer 5-8840-2235-0 and the grip 5-8840-0007-0 to press in the rear side outer race of the idle gear shaft.
   - Use the installer 5-8840-2772-0 and the grip 5-8840-0007-0 to press in the front & rear side outer race of the rear output gear shaft.



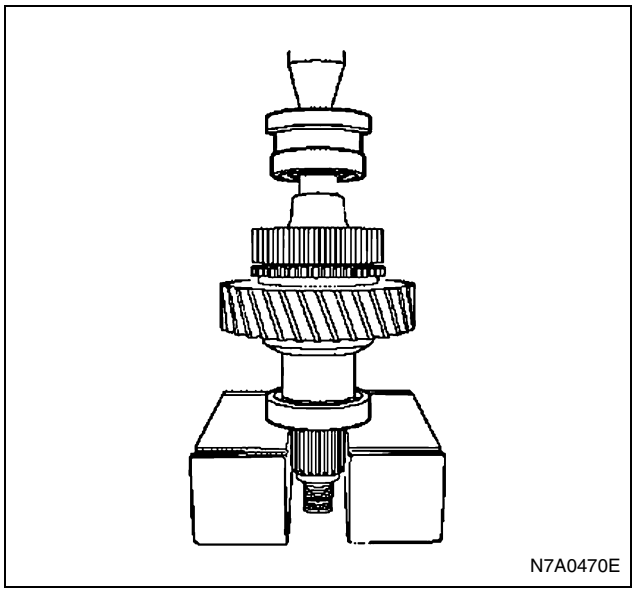
N7A0468E

5. Install the front & rear bearing inner race of the idle gear shaft.
   - Use a press machine to press in the roller bearing.



N7A0469E

6. Assemble the front output gear shaft.
   - Before installing the ball bearing, install the needle bearing, front output drive gear, thrust washer and collar.
   - Use a press machine to press in the ball bearing.



N7A0470E

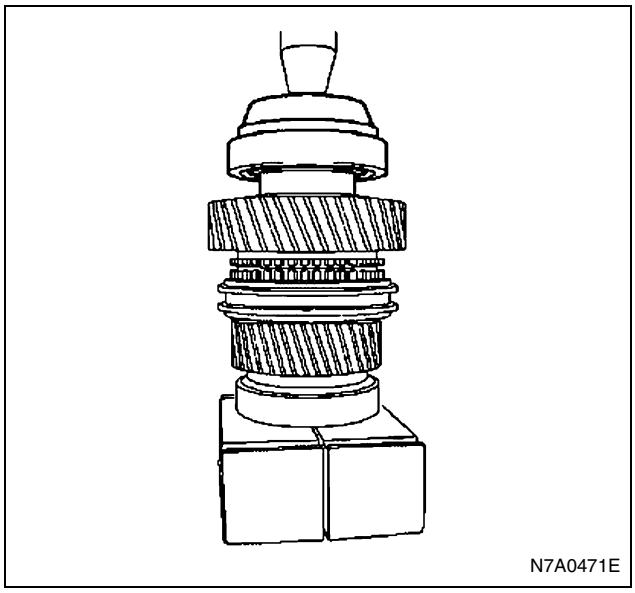
   - After installing the ball bearing, install the sleeve in accordance with the marked direction.

Caution:
Make sure to install in the correct direction.

7. Assemble the input gear shaft.
   - Before installing the front side ball bearing, install the needle bearing, transfer low gear and thrust washer.
   - Before installing the rear side ball bearing, install the sleeve, needle bearing, transfer high gear and thrust washer.

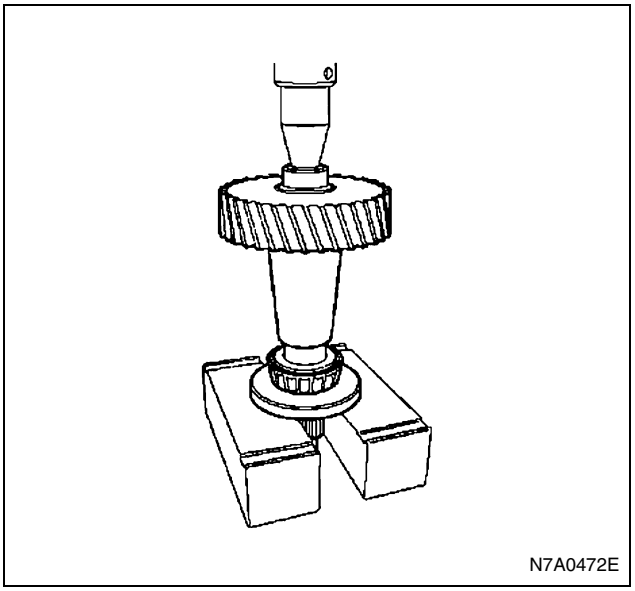
Caution:
Install the sleeve by turning the side, which has a groove along its outer circumference, toward the front side.

   - Use a press machine to press in the ball bearing.



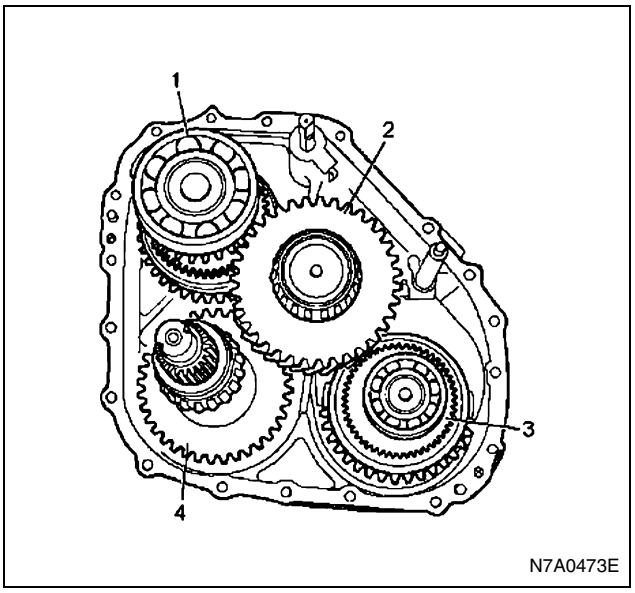
N7A0471E

8. Install the bearing of the rear output gear shaft.
   - Use a press machine to press in the ball bearing.



N7A0472E

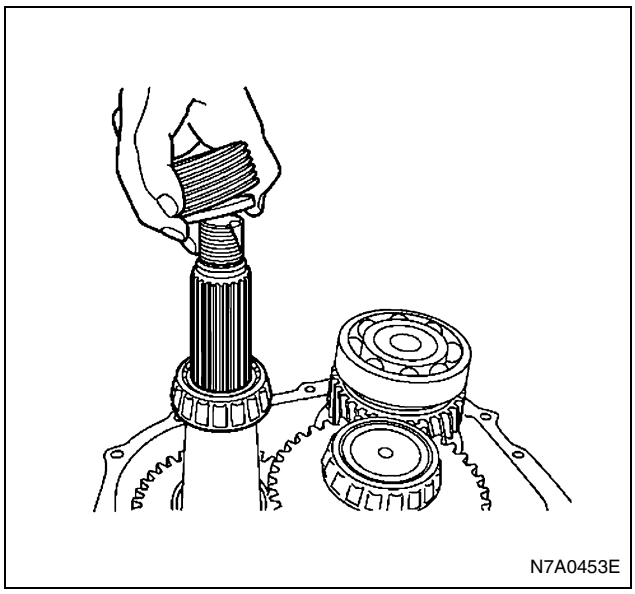
9. Install the front output gear shaft to the front transfer case.
10. Install the input gear shaft.
11. Install the rear output gear shaft.
12. Install the idle gear shaft.
    - Install in the order of 9, 10, 11 and 12.



N7A0473E

Legend
1. Input gear shaft
2. Idle gear shaft
3. Front output gear shaft
4. Rear output gear shaft

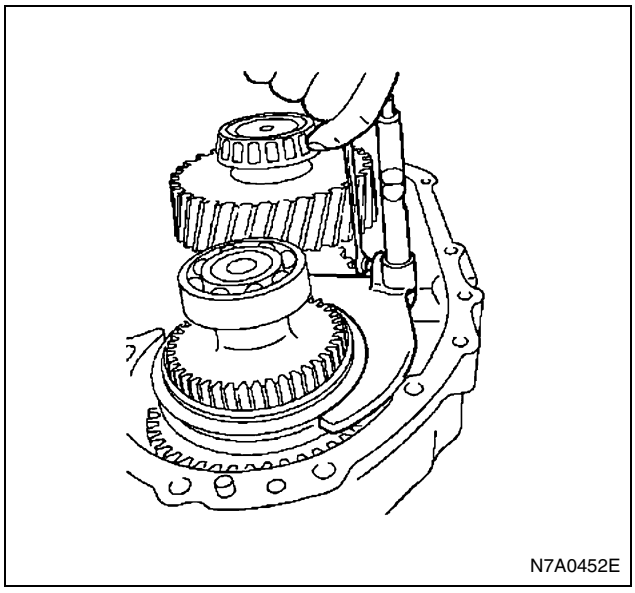
13. Install the thrust washer and speedometer drive gear.



N7A0453E

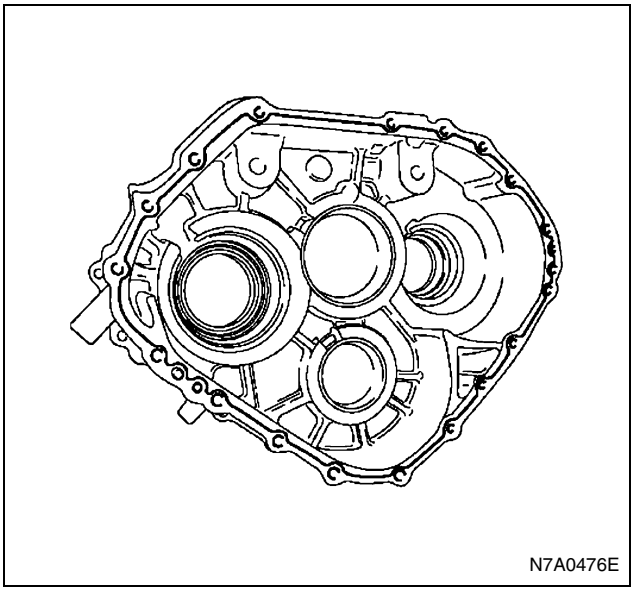
14. Install the shift arm and shift rod.
    - Use a spring pin to install the shift arm of the low / high change side.
    - Use a bolt to fix the shift arm of the 2WD / 4WD change side. Apply LOCTITE 242 to the threaded part of the bolt.

Tighten:
Shift arm and shift rod to 23 N·m (2.3 kg·m / 17 lb·ft)



N7A0452E

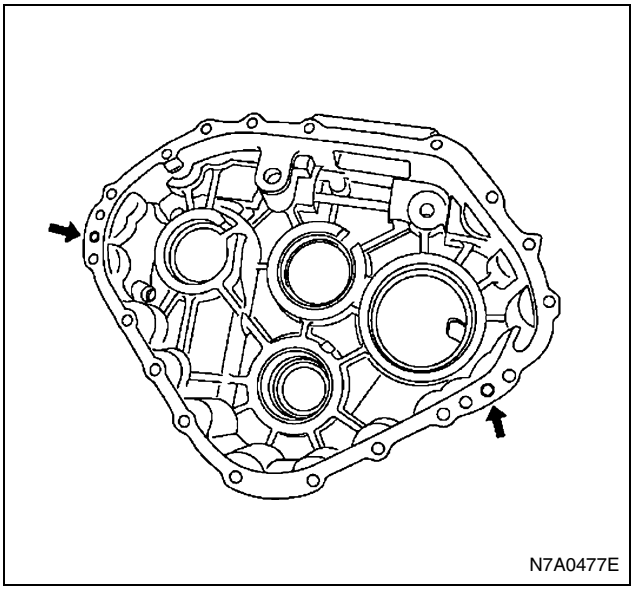
15. Install the rear transfer case.
    - Apply liquid packing (ThreeBond 1215) to the mating surface of the front transfer case. Liquid packing must be applied to the inside of the bolt hole continuously with a diameter of 2 mm (0.079 in).



N7A0476E

- Do not drop the detent shaft.
- Align with the 2 knock pins.
- Set the 18 bolts on the fixing holes, and fix them diagonally and equally.

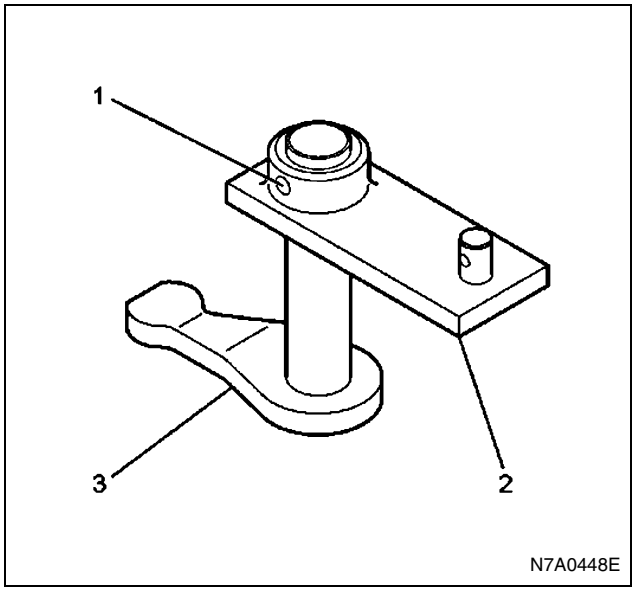
Tighten:
Transfer case to 33 N·m (3.4 kg·m / 24 lb·ft)



N7A0477E

16. Install the shift lever.
    - Check that the internal lever is securely put in the groove of the shift arm.
    - Apply liquid packing (ThreeBond 1215) to the mating surfaces of the shift cover and transfer case, and fix it with a bolt.

Tighten:
Shift lever to 17 N·m (1.7 kg·m / 13 lb·ft)



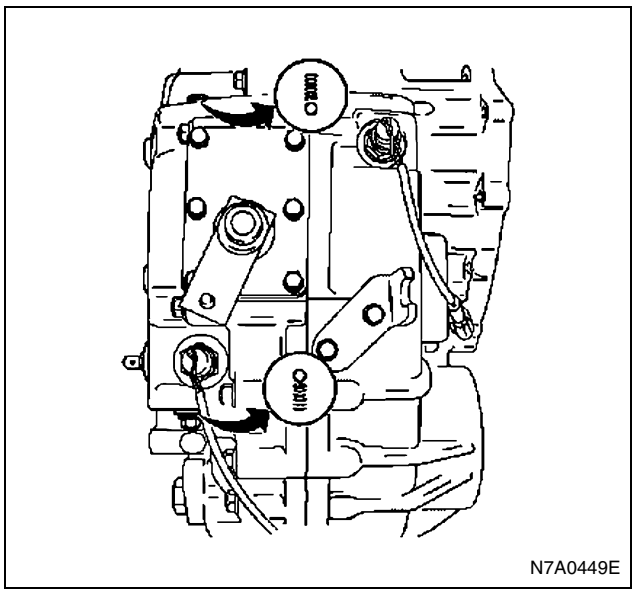
N7A0448E

Legend
1. Spring pin
2. Select external lever
3. Select internal lever

17. Install the detent balls and springs in two parts.
    - Install the detent balls and springs for 4H & 4L and 2WD & 4WD to the rear transfer case.
    - Apply liquid gasket (ThreeBond 1105) to the thread of the plug, and fix it to the specified torque.

Tighten:
Plug to 25 N·m (2.5 kg·m / 18 lb·ft)

Caution:
Do not drop the parts.



N7A0449E

18. Install the low / high shift lever cable installation bracket.

- Apply liquid gasket (ThreeBond 1215) only to the thread of the bolt, which is to be fixed through the bore hole of the case side.

Tighten:
Bolt to 17 N·m (1.7 kg·m / 13 lb·ft)

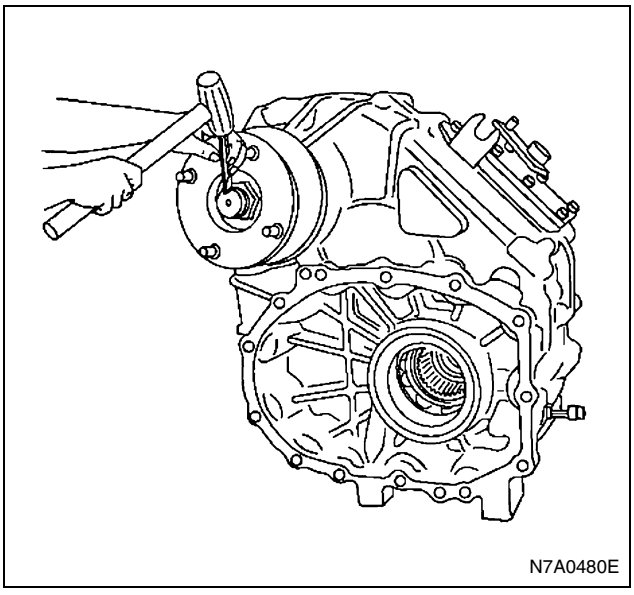
19. Install the 2WD / 4WD change warning lamp switch.
    - Apply liquid gasket (ThreeBond 1105) to the switch thread.

Tighten:
2WD / 4WD change warning lamp switch to 33 N·m (3.4 kg·m / 25 lb·ft)

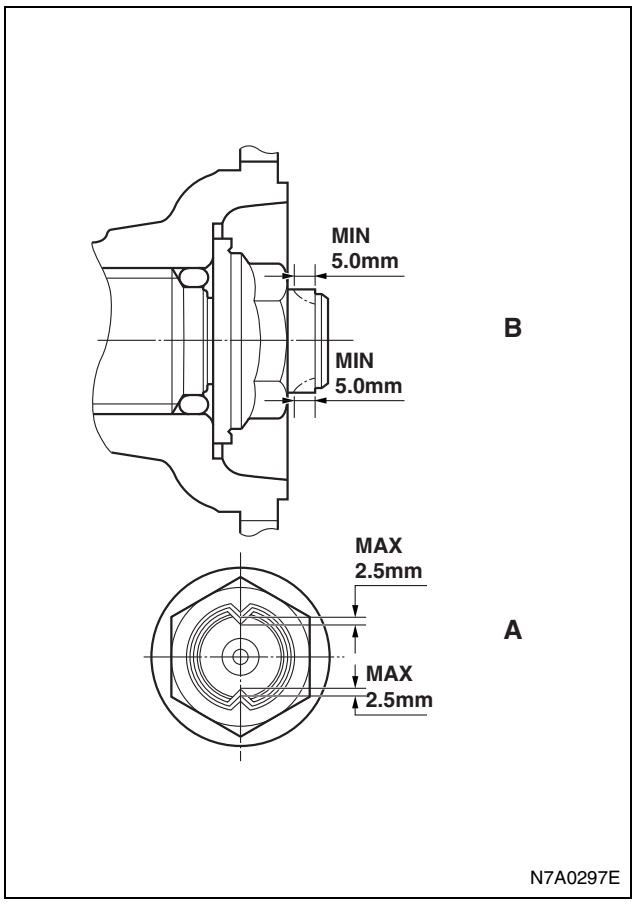
20. Install the rear & front coupling driver.
    - Use the flange holder 5-8840-0133-0 to fix the front coupling driver, and tighten it with a lock nut.
    - After installing the parking brake assembly, use the coupling driver and lock nut to install the rear output shaft.
      Tighten the lock nut by fixing the coupling driver using the flange holder 5-88470-2043-0.

Tighten:
- Parking brake to 83 N·m (8.5 kg·m / 61 lb·ft)
- Front output shaft to 290 N·m (29 kg·m / 214 lb·ft)
- Rear output shaft to 226 N·m (23 kg·m / 167 lb·ft)
    - After tightening to the specified torque, align the lip part of the nut to the V-groove of the shaft edge. Caulk the nut lip with a chisel to make a length (B) of 5 mm (0.2 in) or more, and a clearance between the bottom of the shaft and the nut lip (A) of 2.5 mm (0.06 in) or less.

Caution:
When caulking, be careful not to crack the nut.



N7A0480E



N7A0297E

21. Install the parking brake drum.
    - Tighten the adjustment hole cover fixing bolt.

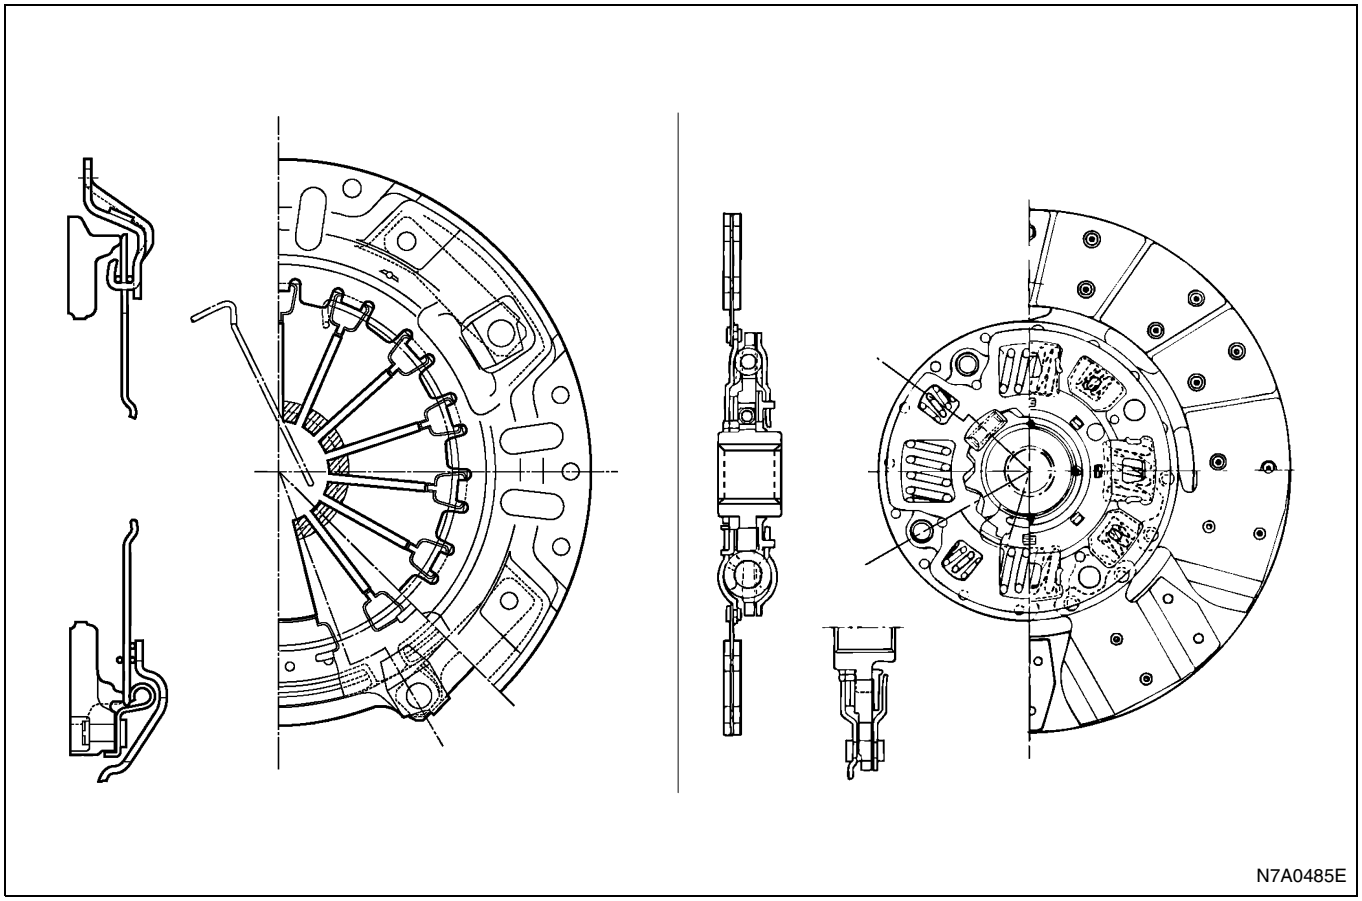
Pressure Plate Assembly and Clutch Disk Assembly



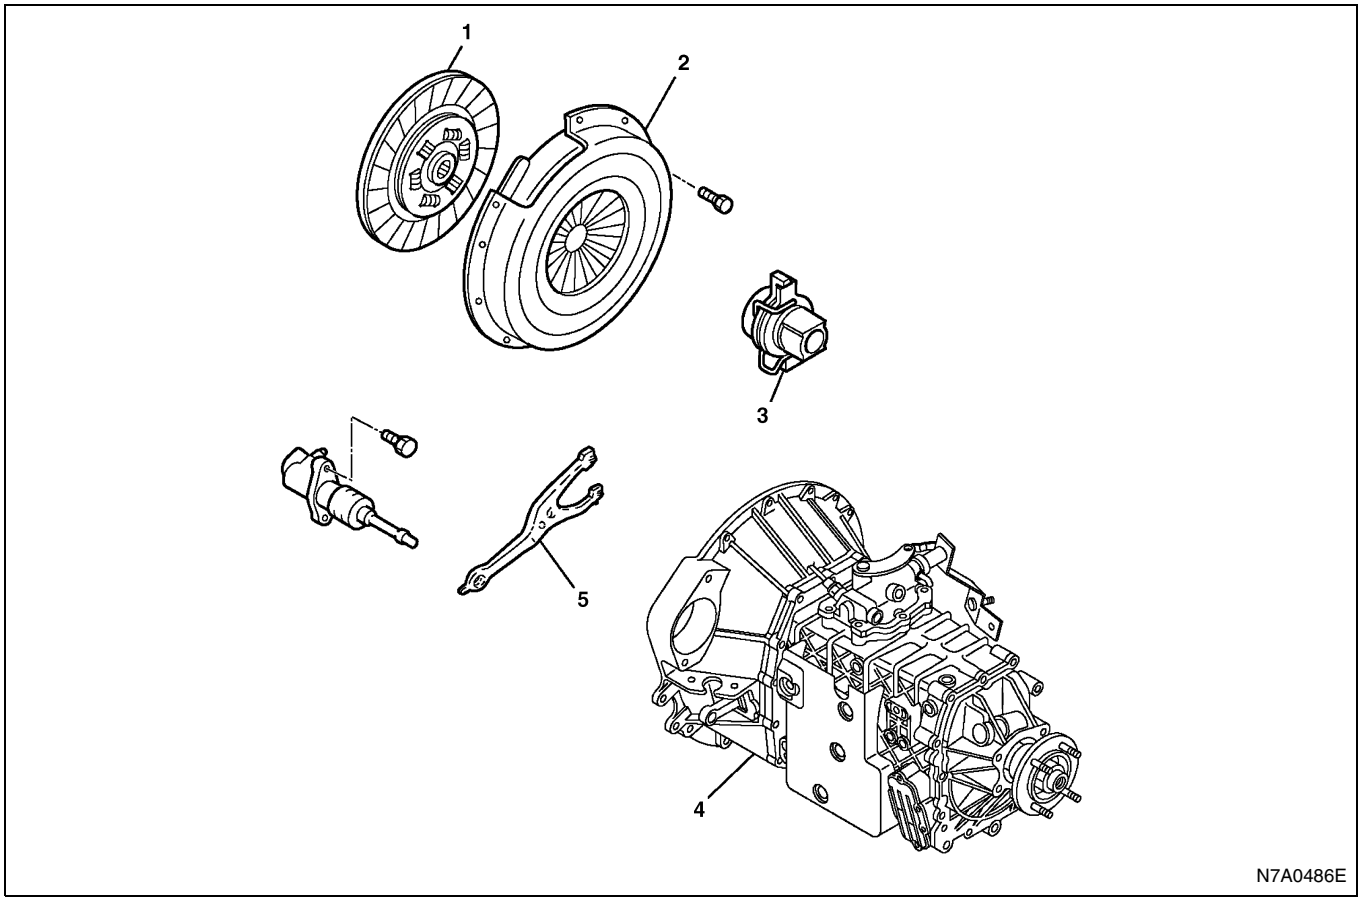
Troubleshooting

Trouble	Cause	Treatment
Dragging	Hydraulic line leakage.	Repair.
	Air in line.	Bleed air.
	Master cylinder and/or slave cylinder seals worn.	Replace seals.
	Driven plate worn or warped.	Replace.
	Diaphragm spring weak or tip of finger worn.	Replace.
	Driven plate sticking on spline.	Apply grease or replace.
	Release bearing worn or damaged.	Replace.
	Clutch pedal excessive free play.	Readjust.
Slippage	Driven plate facing worn or oil soaked.	Replace.
	Diaphragm spring weak.	Replace.
	Pressure plate and/or flywheel warped.	Repair or replace.
	Clutch pedal lack of free play.	Readjust.
Shudder (Chattering)	Engine mounting loose or broken.	Tighten or replace.
	Driven plate facing warped.	Replace.
	Driven plate surface of facing hardened.	Replace.
	Driven plate facing oil soaked.	Replace and check oil leakage.
	Driven plate damper spring weakened or broken.	Replace.
	Pressure plate and/or flywheel warped.	Repair or replace.
Noisy	Release bearing binding.	Repair or replace, apply grease.
	Release bearing worn or broken.	Replace.
	Release bearing insufficiently lubricated.	Replace.
	Driven plate damper springs weakened or broken.	Replace driven plate.
	Pilot bearing worn or broken.	Replace.
	Driven plate rivet loosened.	Replace driven plate.
	Ball stud insufficiently lubricated.	Lubricate with grease.
	Clutch pedal lack of free play.	Readjust.
	Clutch pedal shaft insufficiently lubricated.	Repair or replace.
Pedal is Hard to Push	Hydraulic line blocked or crimped.	Clean out or replace.
	Clutch booster malfunction.	Repair or replace.
	Clutch pedal shaft insufficiently lubricated.	Repair or replace.

ON-VEHICLE SERVICE

Clutch Assembly

Components

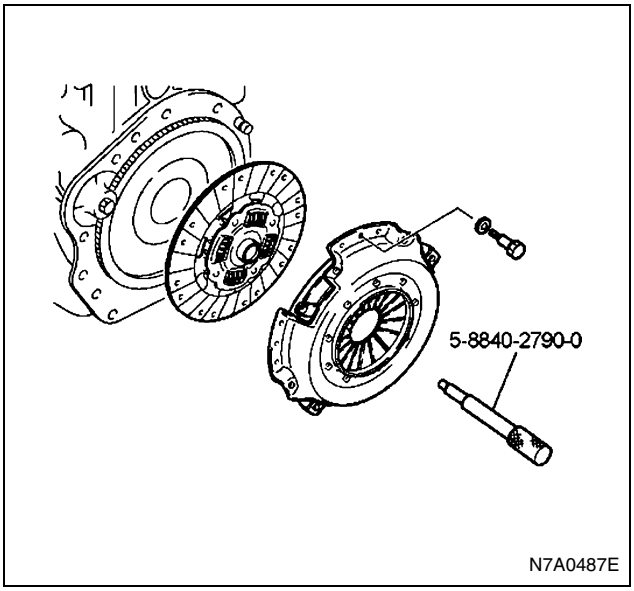


Legend

1. Driven plate assembly
2. Pressure plate assembly
3. Release bearing assembly
4. Transmission assembly
5. Shift fork

Removal

1. Remove the transmission assembly from the vehicle.
   - Refer to TRANSMISSION ASSEMBLY.
2. Remove the pressure plate assembly.
3. Remove the driven plate assembly.
   - Use pilot aligner 5-8840-2790-0 to prevent the driven plate assembly from falling.
   - Mark the flywheel and clutch cover for alignment when installing.



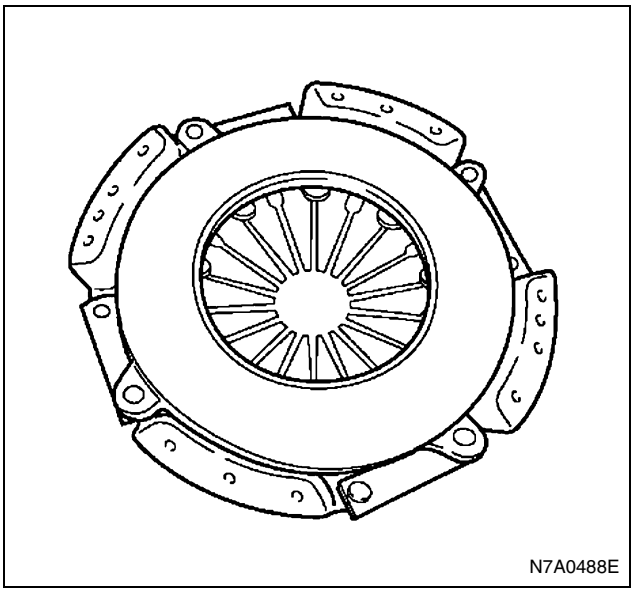
4. Remove the release bearing.
5. Remove the shift fork.

Inspection

Make the necessary adjustment, repairs, and part replacement if excessive wear or damage is found during inspection.

Pressure Plate Assembly

- Visually inspect the pressure plate friction surface for excessive wear and heat cracks. If excessive wear or deep heat cracks are present, the pressure plate assembly must be replaced.



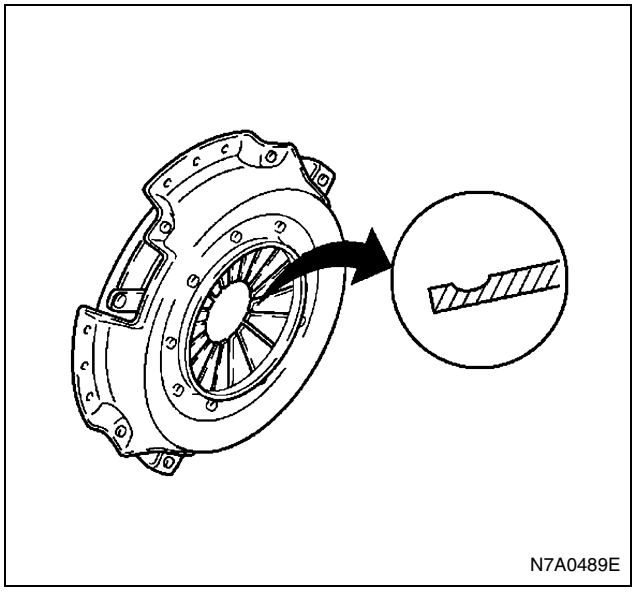
Pressure Plate Warpage

- Use a straight gauge and a filler gauge to measure the pressure plate friction surface flatness in four directions.
  If any of the measured values exceed the specified limit, the pressure plate assembly must be replaced.

Pressure Plate Warpage
Limit : 0.3 mm (0.012 in)

Clutch Cover

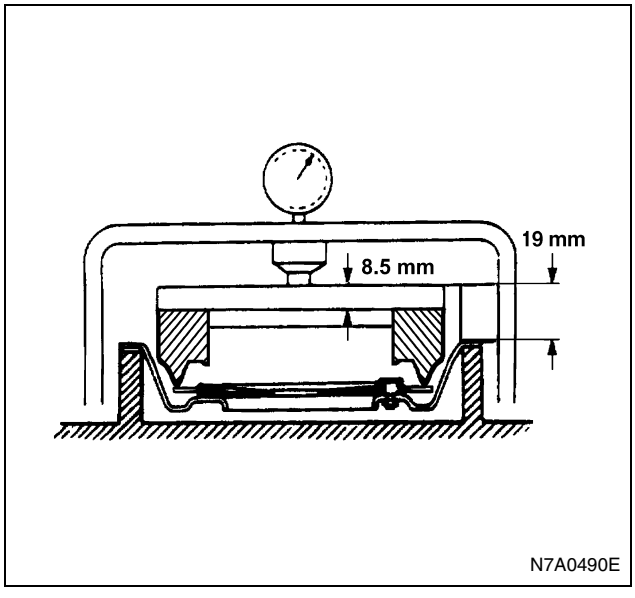
- Visually inspect the entire clutch cover for excessive wear, cracking, and other damage. The pressure plate assembly must be replaced if any of these conditions are present.



Clutch Set Force

1. Invert the pressure plate.
2. Place on the pressure plate, a new clutch disk, or a spacer of 8.5 mm (0.33 in) in place of the clutch disk.
3. Compress the pressure plate assembly until the dimension becomes 19 mm (0.748 in).
4. Note the pressure plate gauge reading.

Clutch Set Force :	
Set Force	Engine Model
8,340 N (850 kg / 1,874 lb)	4HF1, 4HG1, 4HF1-II
9,500 N (970 kg / 2,139 lb)	4HG1-T, 4HE1-TC-N, 4HK1-TC
6,200 N (633 kg / 1,396 lb)	4JH1-TC-S

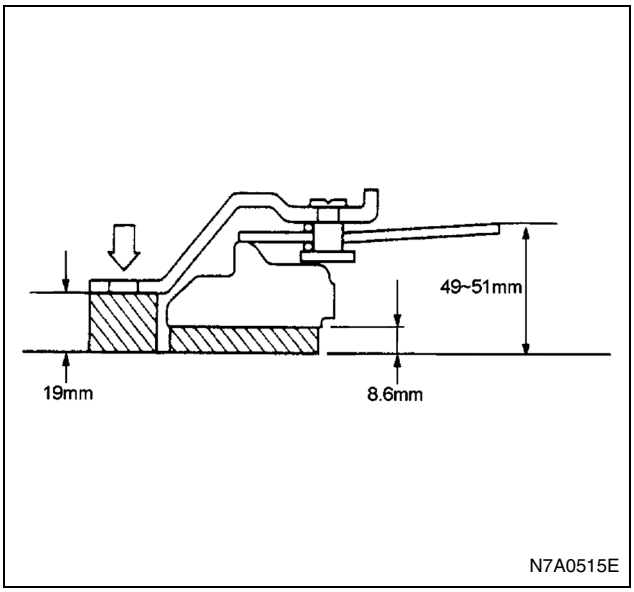


Diaphragm Spring Finger Height

1. Place a spacer of 8.5 mm (0.33 in) under the pressure plate.

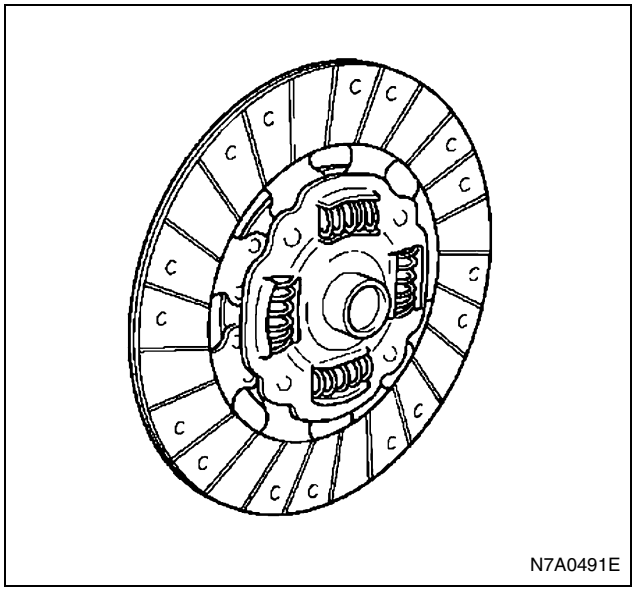
2. Compress the pressure plate assembly and the diaphragm spring until the distance “B” becomes specified. There are two ways to do this.
   a. Use a bench press to press down on the pressure plate assembly from the top.
   b. Tighten the pressure plate assembly fixing bolts.
3. Measure the distance between the base and the top of the diaphragm spring.

Spring Finger Height
Standard : 49.0 — 51.0 mm (1.929 — 2.008 in)



Driven Plate Assembly

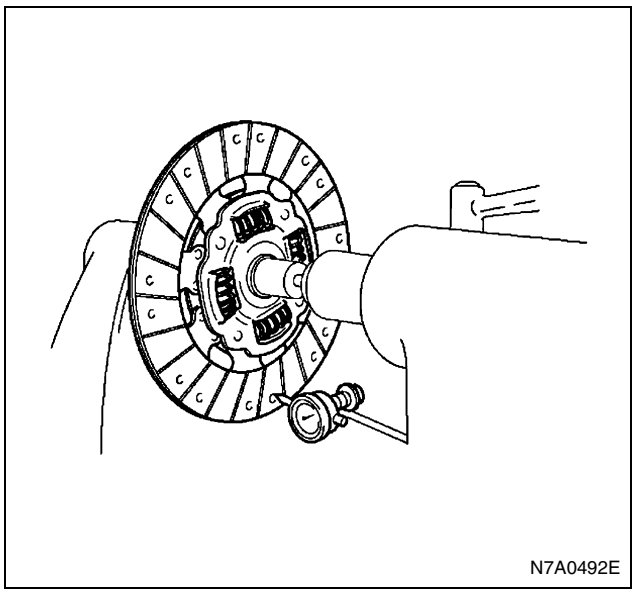
- Visually inspect the torsion spring for looseness, breakage, and weakening. If any of these conditions are found, the driven plate assembly must be replaced.
- Visually inspect the facing surfaces for cracking and excessive scorching.
- Visually inspect the facing surfaces for the presence of oil or grease. If any of these conditions are found, the facing must be cleaned or the driven plate assembly replaced.
- Check that the driven plate moves smoothly on the transmission top gear shaft spline. Minor ridges on the top gear shaft spline may be removed with an oil stone.



Driven Plate Warpage

1. Insert pilot aligner 5-8840-2790-0 into the driven plate spline hub. The pilot aligner must be held perfectly horizontal.
2. Set a dial indicator to the driven plate outside circumference.
3. Slowly turn the driven plate, and read the dial indicator.
4. If the measured value exceeds the specified limit, replace the driven plate assembly.

Driven Plate Warpage
Standard : 0.7 mm (0.028 in) or less
Limit : 1.0 mm (0.039 in)

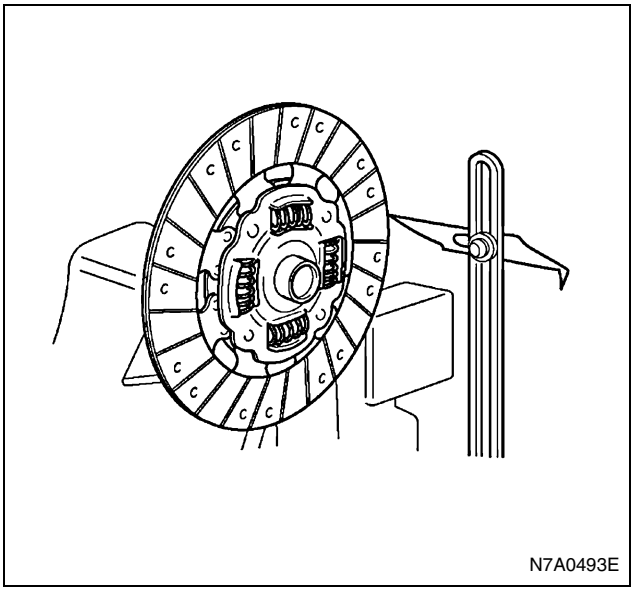


Driven Plate Spline Free Play

1. Install the driven plate to the transmission top gear shaft spline.
2. Set a surface gauge to the driven plate outside circumference.
3. Slowly turn the driven plate. Measure the spline rotation free play.

If the measured value exceeds the specified limit, replace the driven plate assembly.

Driven Plate Spline Free Play
Standard : 0.5 mm (0.020 in) or less
Limit : 1.0 mm (0.039 in)

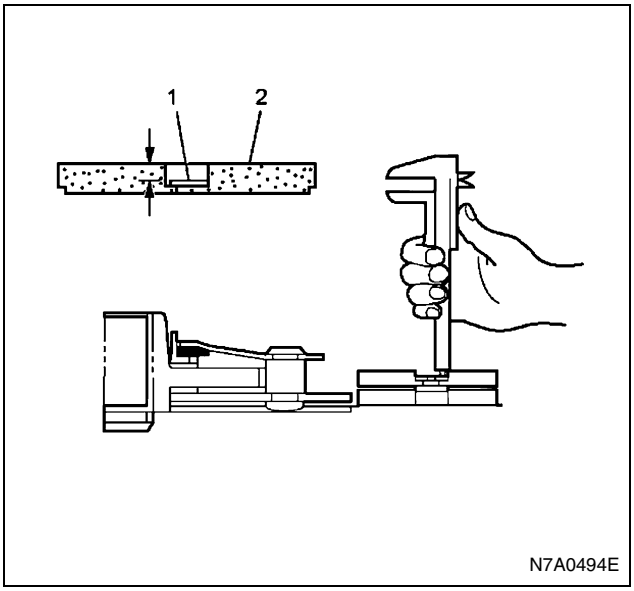


N7A0493E

Driven Plate Rivet Head Depression

- Use the depth gauge to measure the rivet head depression (1) from the facing surface (2).
- Be sure to measure the rivet head depression (1) on both sides of the driven plate (2).
- If the measured value exceeds the specified limit, replace the driven plate assembly.

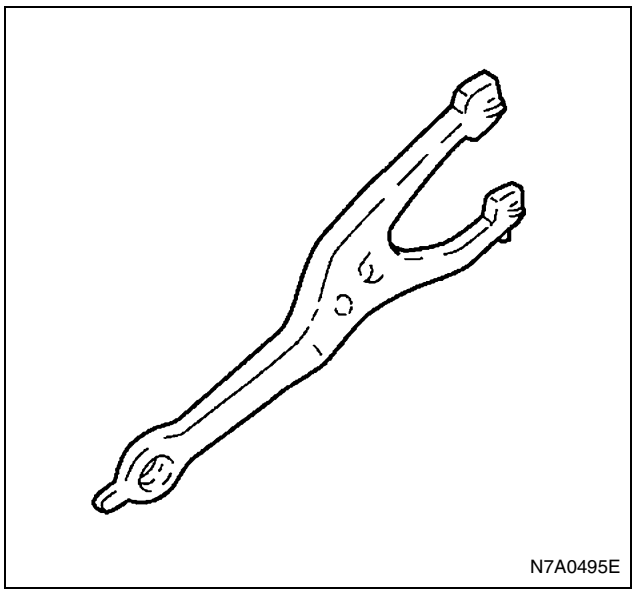
Facing Rivet Head Depression
Standard : 1.4 — 2.0 mm (0.055 — 0.078 in) (Flywheel side)
1.7 — 2.3 mm (0.067 — 0.090 in) (Transmission side)
Limit : 0.2 mm (0.008 in)



N7A0494E

Shift Fork

- Inspect the wear and damage on the release bearing and facing surface.
- Correct a slight stepped wear or surface roughness with an oil stone.
  Replace the shift fork if unrecoverable damage is found.
- Inspect the wear and damage on the surface of the support bolt.

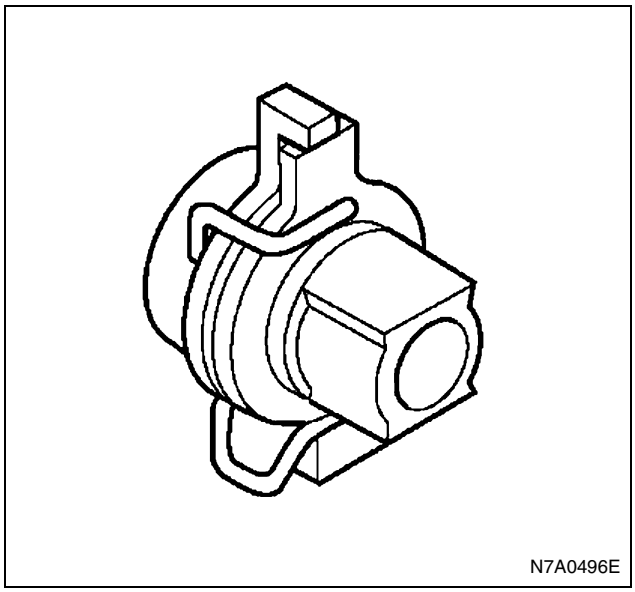


N7A0495E

Release Bearing

- Inspect the looseness, noise, damage, etc. or wear of the inside diameter. If any abnormality is found, replace the part.

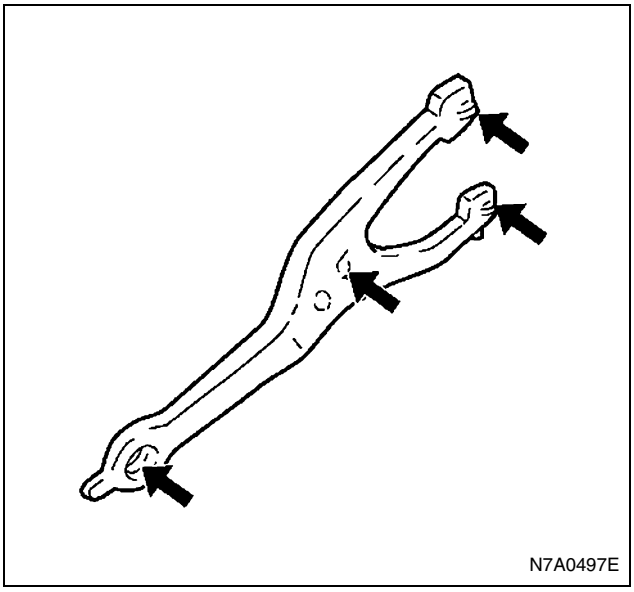
Caution:
Never wash the release bearing because this part is sealed with grease.



N7A0496E

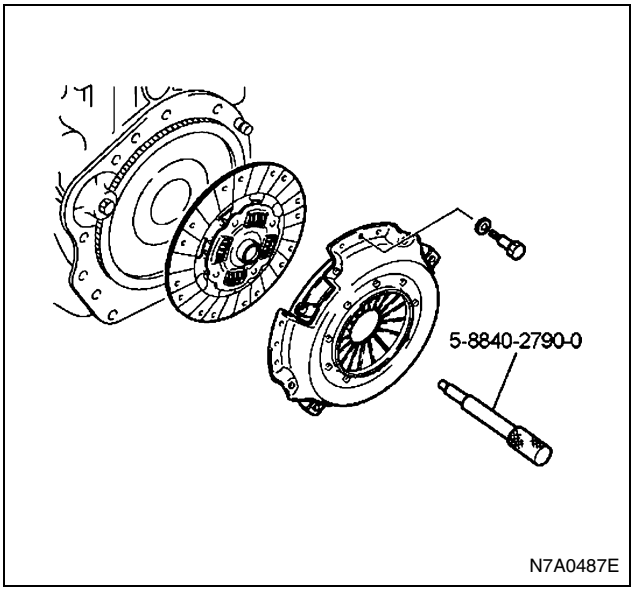
Installation

1. Install the shift fork after applying the MO-NO2 type grease to the contact surfaces of the shift fork.
2. Install the release bearing to the transmission front part.



N7A0497E

3. Install the clutch disk assembly.
4. Install the pressure plate assembly.
   - Clean the facing surfaces and pressure plate surface of the flywheel and the driven plate.
   - Install the driven plate assembly to the flywheel using pilot aligner 5-8840-2790-0.



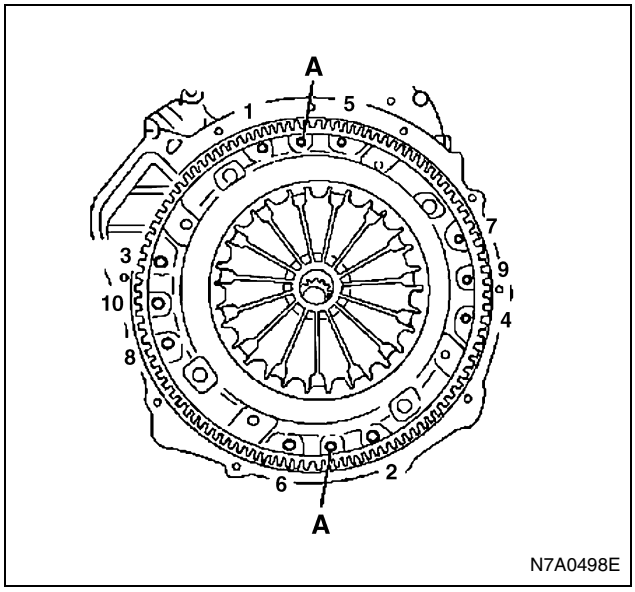
N7A0487E

   - Install the pressure plate assembly, adjusting to knock pins (A) of the flywheel. And tighten the pins slowly and equally in numerical order.

Tighten:
Pressure plate to 40 N·m (4.1 kg·m / 30 lb·ft)

   - When installing a new pressure plate assembly, make sure to remove the wiring after the tightening.

Caution:
Do not beat with hammer when removing the aligner.



N7A0498E

5. Install the transmission assembly.
   - Refer to TRANSMISSION ASSEMBLY.

Fixing Torque

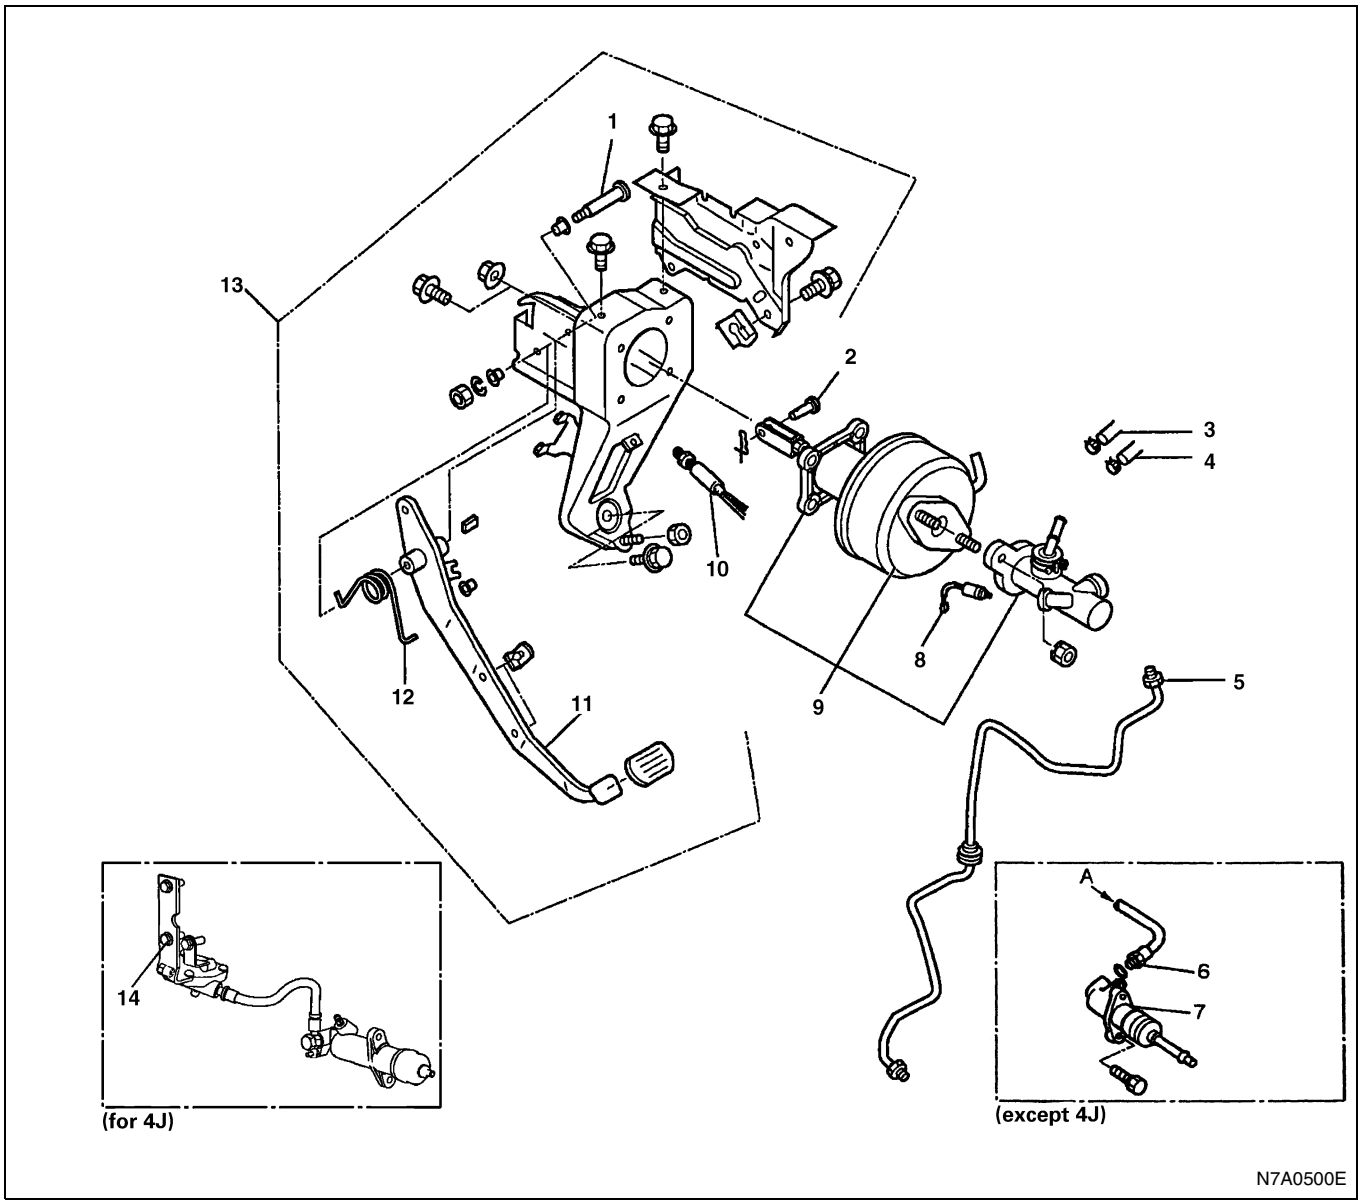
Clutch Control

Components



Legend

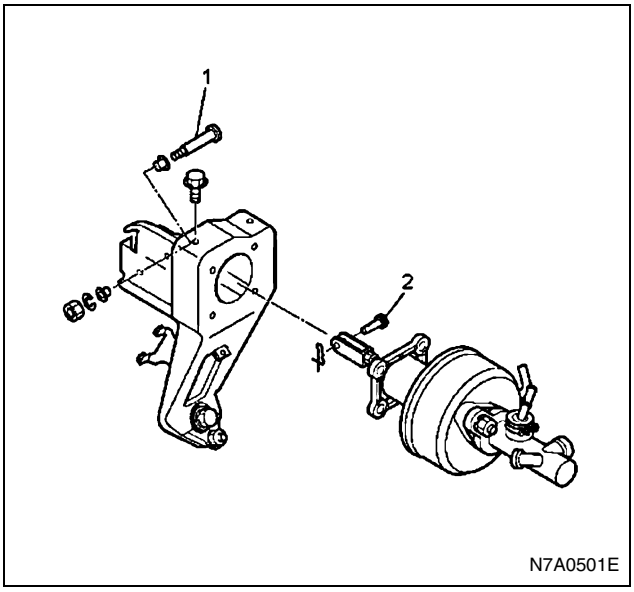
1. Pin
2. Clevis pin
3. Vacuum hose
4. Oil hose
5. Clutch pipe
6. Flexible hose
7. Slave cylinder
8. Pressure switch connector
9. Clutch booster and master cylinder assembly
10. Clutch switch
11. Clutch pedal
12. Return spring
13. Clutch pedal and bracket assembly
14. Damper cylinder

Removal

- Drain the brake fluid before removal.

Caution:
Do not let brake fluid contact painted surface. Wash it off immediately.

1. Remove the oil hose and clutch pipe.
2. Remove the vacuum hose.
3. Remove the clutch pedal and bracket assembly.
4. Remove the clutch switch.
5. Remove pin (1).
6. Remove clevis pin (2).



7. Remove the return spring.
8. Remove the clutch pedal.
9. Remove the clutch booster & spacer, and master cylinder assembly.
   - Removal of the master cylinder can be done only by removing the meter cluster.

Inspection

Make necessary adjustment, repairs, and part replacement if excessive wear or damage is found during inspection.

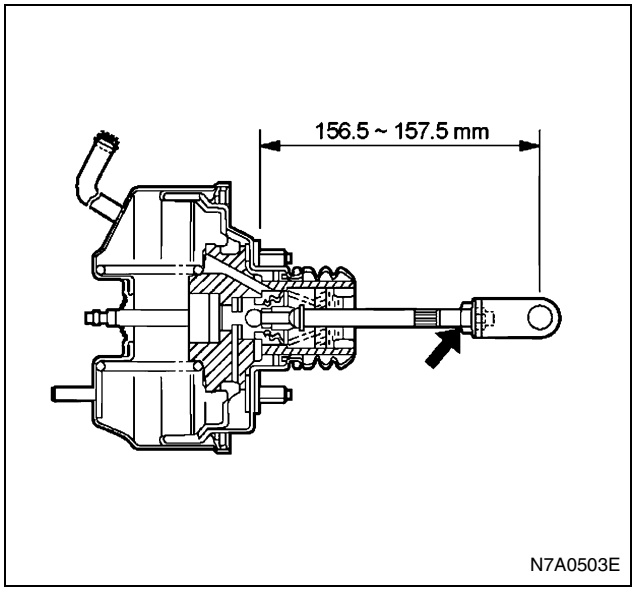
Installation

1. Install the clutch booster, spacer and master cylinder assembly.
   - Tighten the lock nut where the distance between the center of the clevis pin hole and the installation surface is 156.5 — 157.5 mm (6.161 — 6.201 in).

Tighten:
Lock nut to 26 N·m (2.6 kg·m / 19 lb·ft)

   - Install the clutch booster, spacer and master cylinder assembly to the clutch pedal bracket.

Tighten:
Nut to 13 N·m (1.3 kg·m / 10 lb·ft)

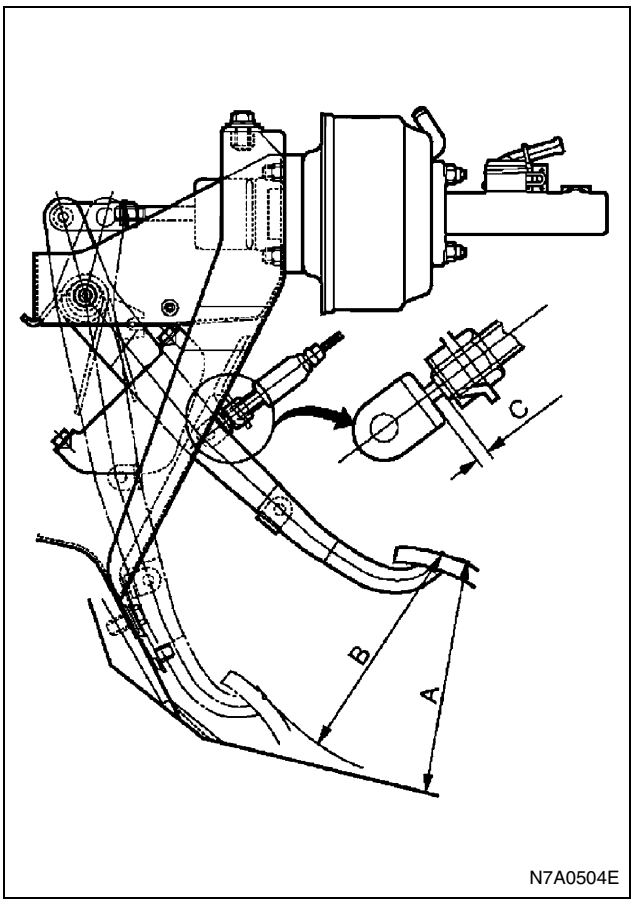


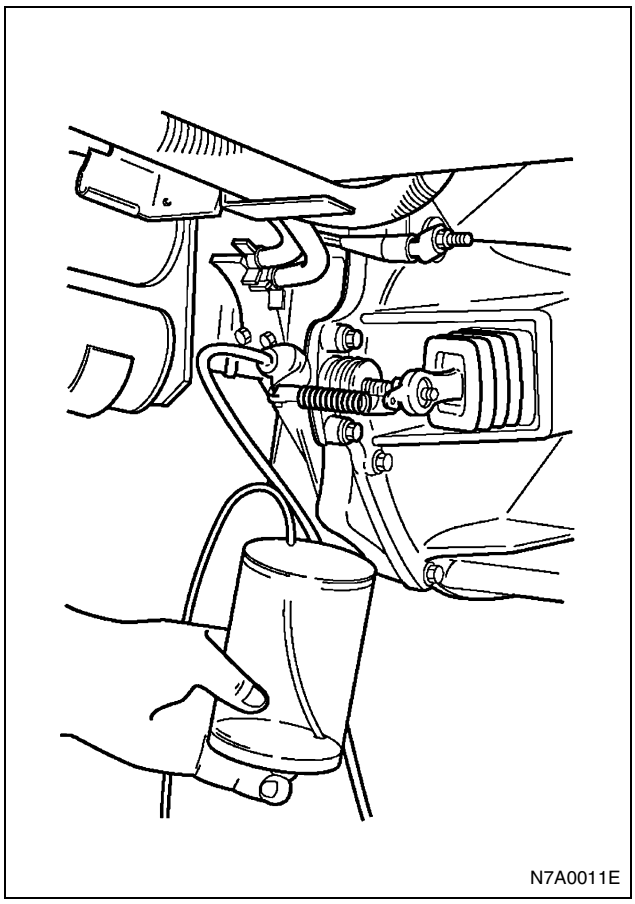
2. Install the pressure switch connector.
3. Install the clutch pedal.
4. Install the return spring.
5. Install the clevis pin.
6. Install the pin.
7. Install the clutch switch.
8. Install the clutch pedal and bracket assembly.

Tighten:
Clutch bracket bolts to 37 N·m (3.8 kg·m / 27 lb·ft)

   - The clutch pedal adjustment is not necessary if the length of the clutch booster operation rod is adjusted when installing the clutch booster.
     The length of the clutch booster operation rod:
     The distance between the installation surface and the center of the clevis pin hole is 156.5 — 157.5 mm (6.161 — 6.200 in).
   - Check the clutch pedal play.
   - Adjust the clearance between the pedal and the clutch switch bolt, to the measured value.

Clutch Pedal Height (A)
160 — 170 mm (6.299 — 6.693 in) (Reference value)
Pedal Stroke (B)
159 — 169 mm (6.260 — 6.653 in) (Reference value)
Clutch Pedal Play
15 — 25 mm (0.590 — 0.984 in) (Reference value)
Pedal and Clutch Switch
Bolt Clearance (C)
0.5 — 1.0 mm (0.020 — 0.039 in)





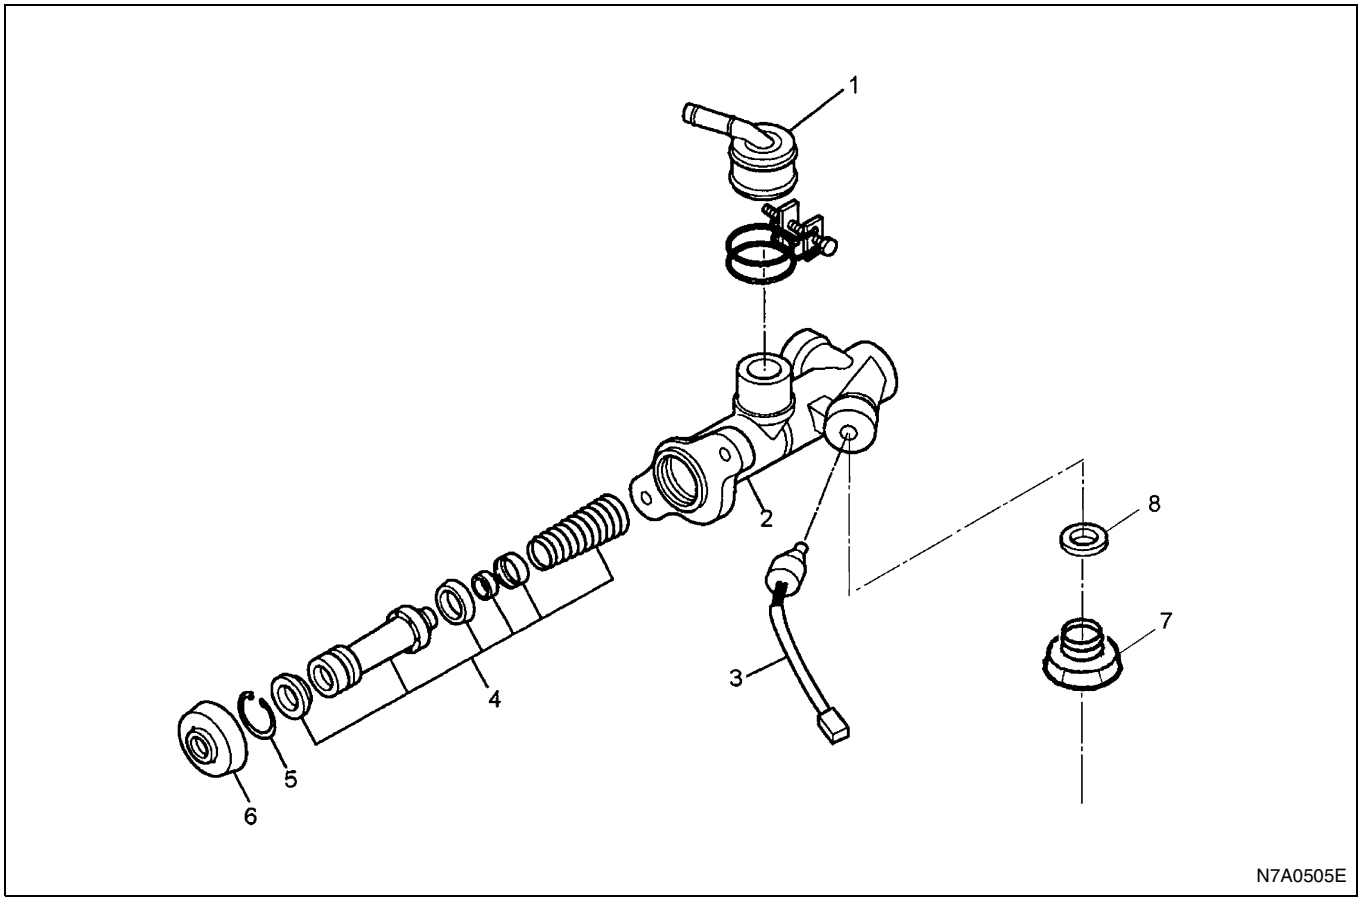
9. Install the vacuum hose.
10. Install the oil hose and clutch pipe.
    Bleeding of Slave Cylinder
    - After the installation, make sure to perform the bleeding of the slave cylinder conforming to the following procedure.

    a. Refill brake fluid to the maximum level of the reservoir.
    b. Connect a vinyl tube to the bleeder screw, and insert the other end of the vinyl tube into a transparent container.
    c. Pump the clutch pedal several times and hold it depressed.
    d. Loosen the bleeder screw on the clutch slave cylinder to bleed air in the fluid. Tightening the bleeder screw, slowly return the clutch pedal.
    e. Repeat steps (c) and (d) until the air in the fluid is completely bled.
    f. After bleeding the air, securely tighten the bleeder screw and install the bleeder cap.
    g. Refill brake fluid to the maximum level of the reservoir.

UNIT REPAIR

Master Cylinder

Components



Legend

1. Hose joint
2. Cylinder body
3. Pressure switch
4. Piston assembly
5. Snap ring
6. Dust cover
7. Damper Cylinder
8. Washer

Removal

Caution:
Press down the piston with your fingers or shop cloth to prevent it from jumping out.

1. Remove the pressure switch (3).
2. Remove the hose joint (1).
3. Remove the dust cover (6).
4. Remove the snap ring (5).
5. Remove the piston assembly (4).
6. Remove the cylinder body (2).

Inspection

Make the necessary adjustments, repairs, and parts replacements if excessive wear or damage is found during inspection.
Cylinder body

- Check the fluid return port for clogging.

Internal parts

- Replace the parts indicated in the figure with new ones.

Clearance of cylinder body and piston

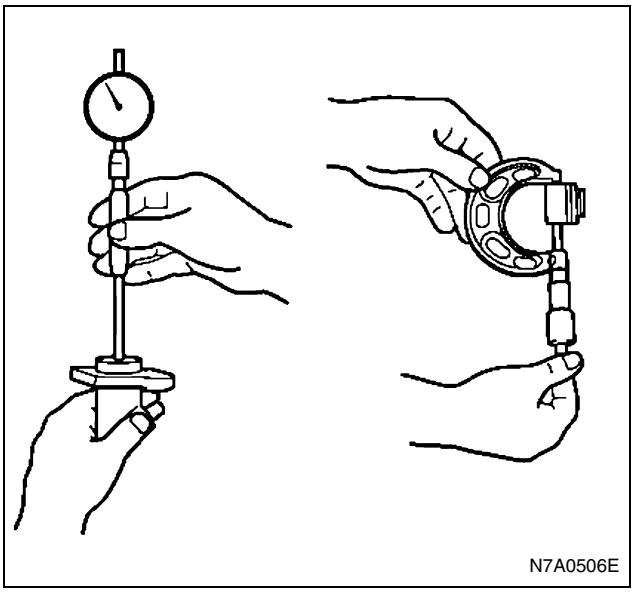
- Check the cylinder body for stepped wear, corrosion and damage, and measure the inside diameter.

Cylinder body inside diameter
Standard : Limit ϕ20.64 mm (0.8126 in)

- Check the piston for damage, rust and wear.
- Measure the clearance between the cylinder body and the piston.

Clearance between cylinder body and piston
Standard : 0.03 — 0.11 mm (0.0012 — 0.0043 in)
Limit : 0.12 mm (0.0047 in)

- If the wear limit is exceeded, replace the master cylinder assembly with a new one.



Installation

1. Cylinder body
   - Immerse the cylinder body in clean brake fluid.
2. Install the piston of the piston assembly after applying rubber grease.

Caution:
Do not damage the piston assembly when installing.

3. Install the snap ring.
4. Install the dust cover.
5. Install the hose joint.

Tighten:
Hose joint to 4.5 N·m (0.45 kg·m / 3.25 lb·ft)

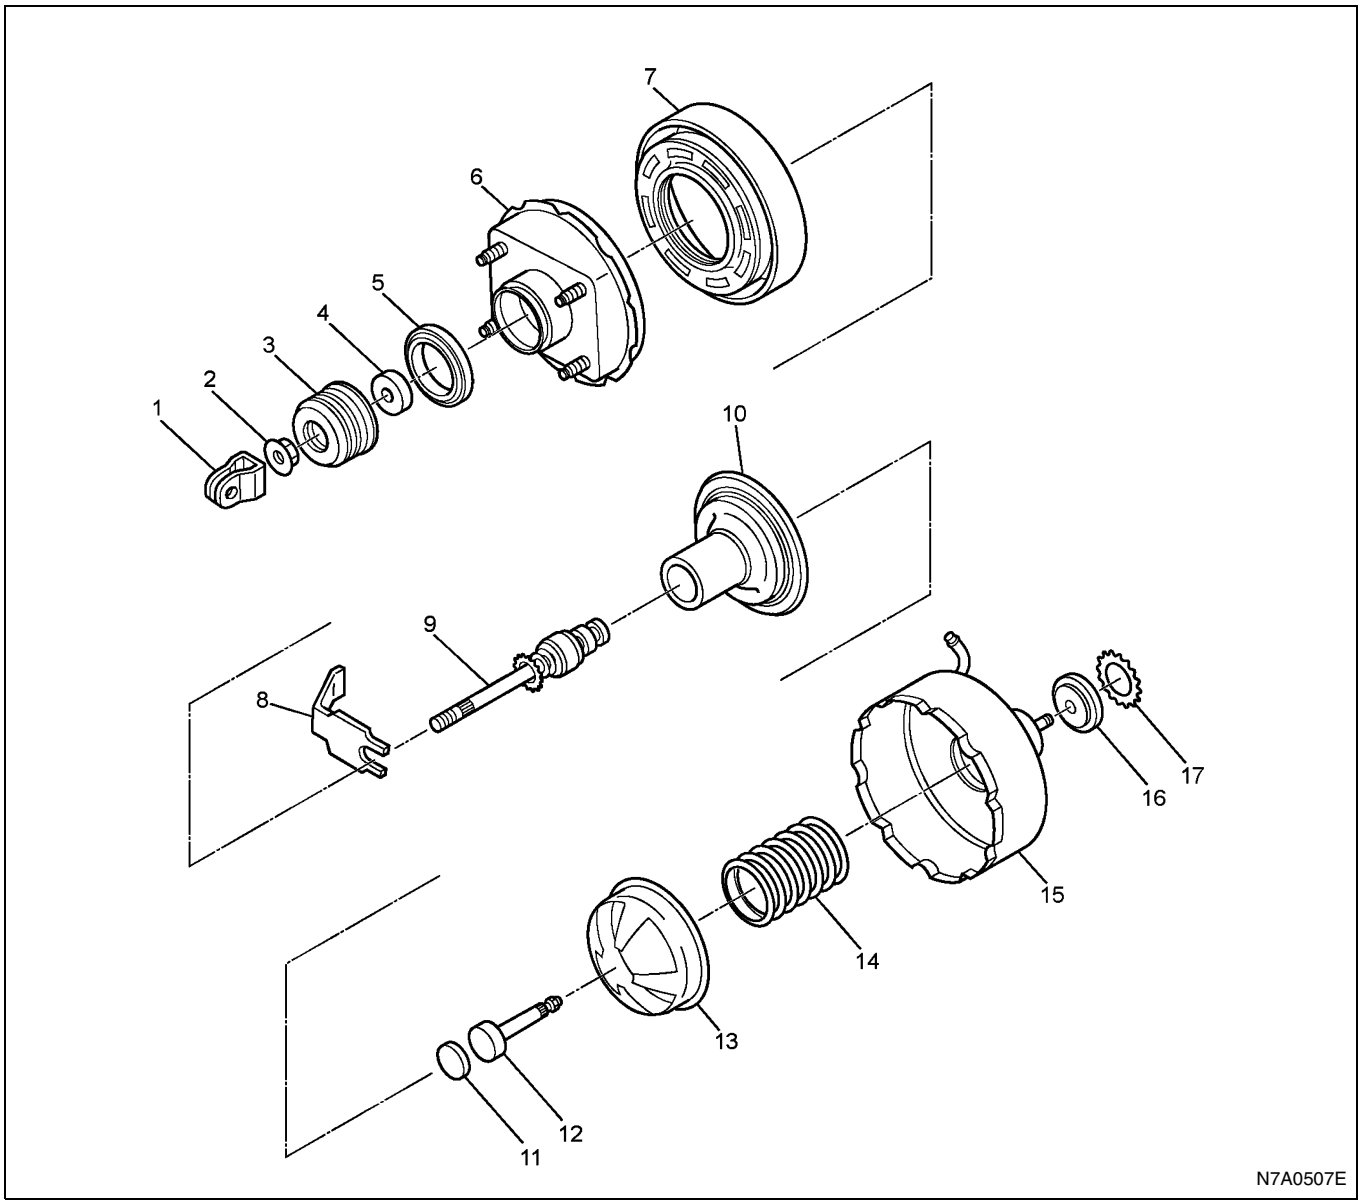
6. Install the pressure switch.
   - Apply liquid gasket to the switch screw, and install to the master cylinder.

Liquid Gasket : LOCTITE 575

Tighten:
Pressure switch to 2.5 N·m (0.25 kg·m / 1.81 lb·ft)

Clutch Booster

Components



Legend

1. Clevis master cylinder push rod
2. Nut
3. Boots
4. Separator air cleaner
5. Seal booster body No. 2
6. Body assembly booster No. 2
7. Diaphragm booster
8. Key valve stopper
9. Valve sub assembly booster air
10. Piston sub assembly booster
11. Disk reaction
12. Rod sub assembly booster piston
13. Retainer rod
14. Spring booster piston return
15. Body assembly booster No. 1
16. Seal booster body No. 1
17. Ring circular

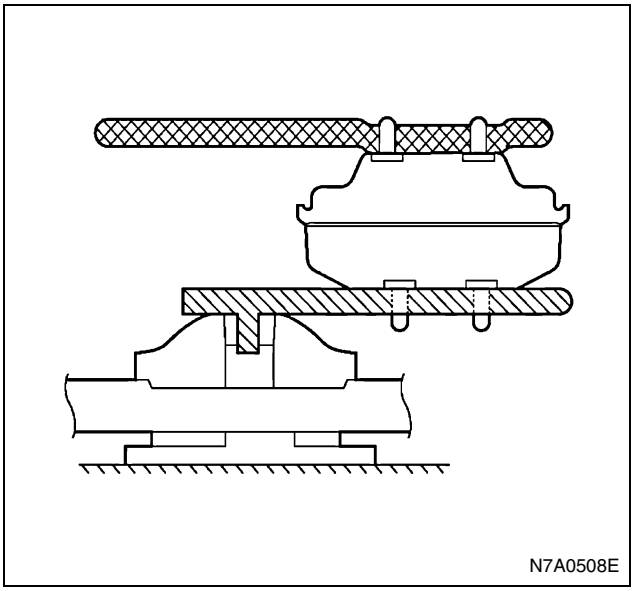
Removal

Before disassembling, mark the front shell and rear shell for alignment.

1. Remove the clevis master cylinder push rod.
2. Remove the nut.
3. Remove the boots.
4. Remove the separator air cleaner.
5. Remove the body assembly booster No. 2 (rear shell).

- Separate the rear shell from the front shell using handle 9-8523-1733-0 and support plate 5-8840-2056-0.

Caution:
Make sure to prevent the diaphragm spring from jumping out.



6. Remove the body assembly booster No. 1 (front shell).
7. Remove the spring booster piston return.
8. Remove the retainer rod.
9. Remove the rod sub assembly booster piston.
10. Remove the disk reaction.
11. Remove the diaphragm booster.
12. Remove the key valve stopper.
13. Remove the valve sub assembly booster air.
14. Remove the piston sub assembly booster.
15. Remove the link circular.
16. Remove the seal booster body No. 2.
17. Remove the seal booster body No. 1.

Inspection

Inspect the parts by washing and drying. Replace the damaged parts with new ones.

Caution:
Use trichlene or metachlene (commercial product) for metal parts, and clean alcohol for rubber and resin parts, respectively.

Installation

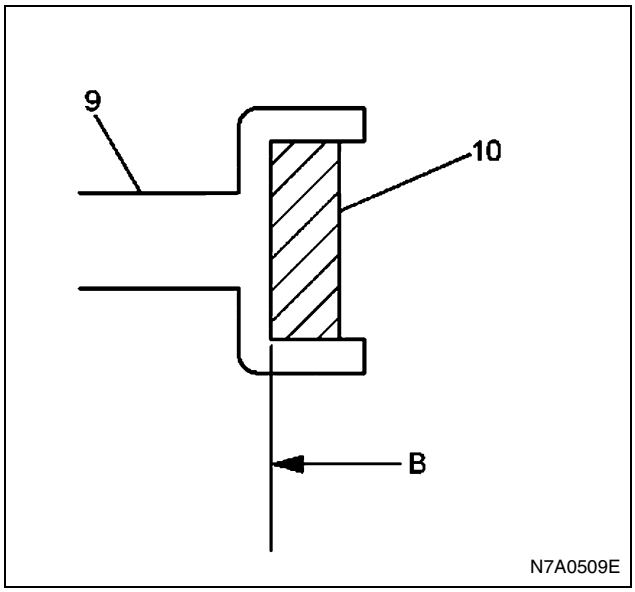
Apply silicone grease to each sliding part.

- Seal mating part and lip part of the rear shell
- Internal & external surface of the diaphragm plate, and outer circumference of the valve body
- Seal of the front shell, sliding surface of the push rod and outer circumference of the valve booster control

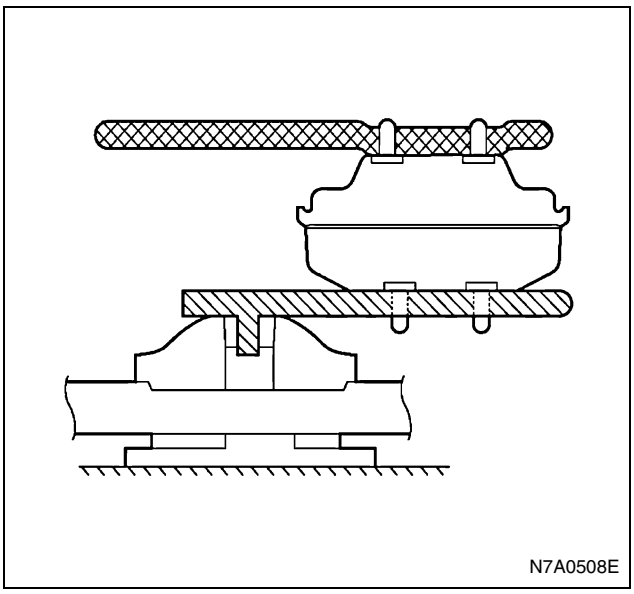
1. Install seal booster body No. 1.
2. Install body assembly booster No. 2.
3. Install the piston sub assembly booster.
4. Install the valve sub assembly booster air.
5. Install the key valve stopper.
6. Install the diaphragm booster.

Caution:
Never tear the diaphragm. Make sure that the reaction disk is securely inserted to the surface B. (Bleed the air from the outer circumference.)

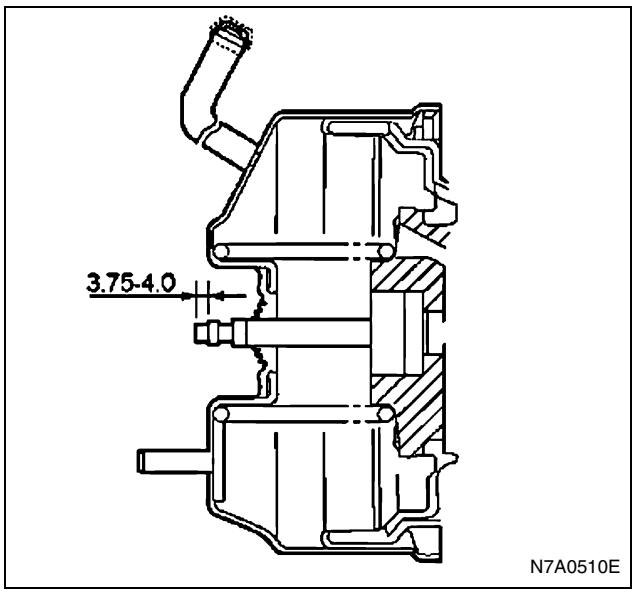
7. Install the disk reaction (10).



8. Install the rod sub assembly booster piston (9).
9. Install the retainer rod.
10. Install the spring booster piston return.
11. Install seal booster body No. 1.
12. Install the link circular.
13. Install body assembly booster No. 1 (front shell).
    - Installation has to be done using handle 9-8523-1733-0 and support plate 5-8840-2056-0.
    - When installing, the marks on the rear shell and the front shell, which were put when disassembling, has to mate with each other.



N7A0508E

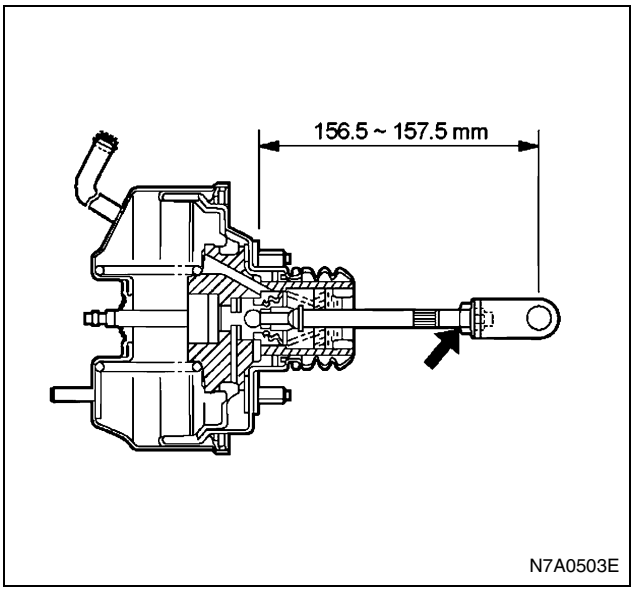


N7A0510E

14. Install the separator air cleaner.
15. Install the boots.
16. Install the nut.
17. Install and adjust the clevis master cylinder push rod.
    - Adjust the distance between the center of the pin hole of the clevis yoke and the installation surface, and tighten the lock nut.

Dimension between the center of the pin hole of the clevis yoke and the rear shell.
156.5 — 157.5 mm (6.161 — 6.201 in)

Tighten:
Lock nut to 26 N·m (2.6 kg·m / 19 lb·ft)



N7A0503E

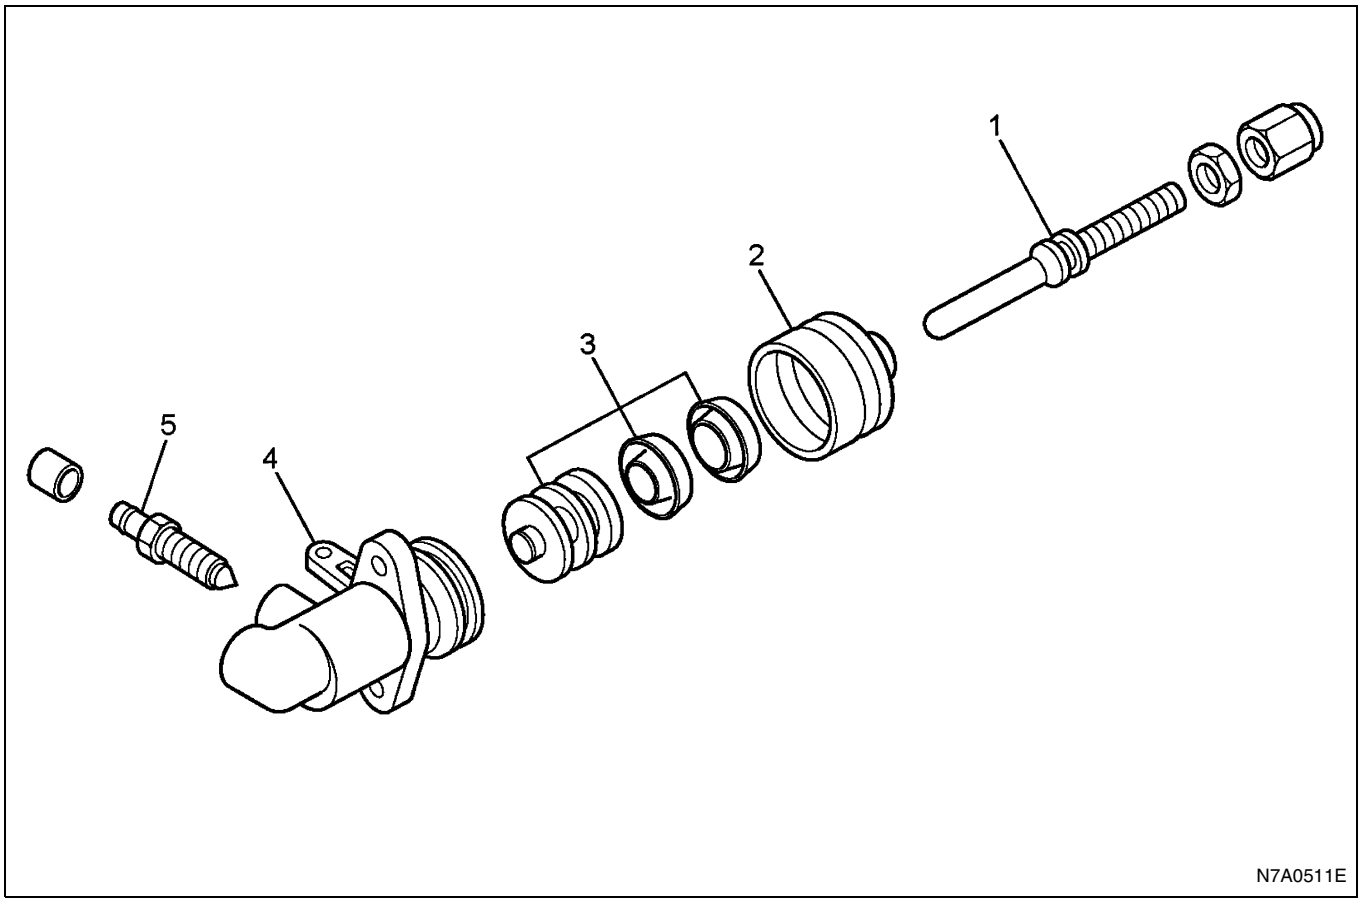
Adjustment of the rod sub assembly booster piston

- After assembling the clutch booster, adjust the length between the top of the push rod and the surface of the rear shell.

Dimension between the top of the push rod and the rear shell
3.75 — 4.0 mm (0.15 — 0.16 in)

Slave Cylinder

Components



Legend

1. Push rod
2. Boots
3. Piston assembly
4. Cylinder body
5. Bleeder screw

Removal

1. Remove the push rod (1).
2. Remove the boots (2).
3. Remove the piston assembly (3).
4. Remove the bleeder screw (5)
5. Remove the cylinder (4).

Inspection

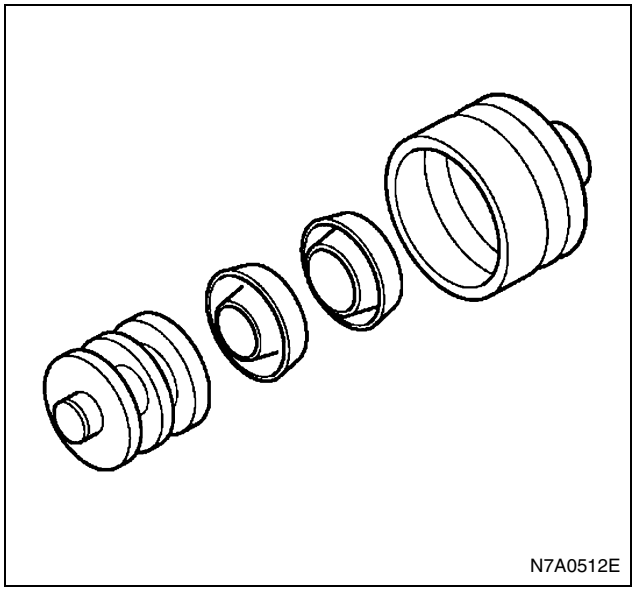
Inspect the removed parts by washing. Replace the damaged parts with new ones.

Cylinder body

- Check the fluid return port for clogging.

Internal parts

- Replace the parts indicated in the figure with new ones.



Clearance between the cylinder body and the piston

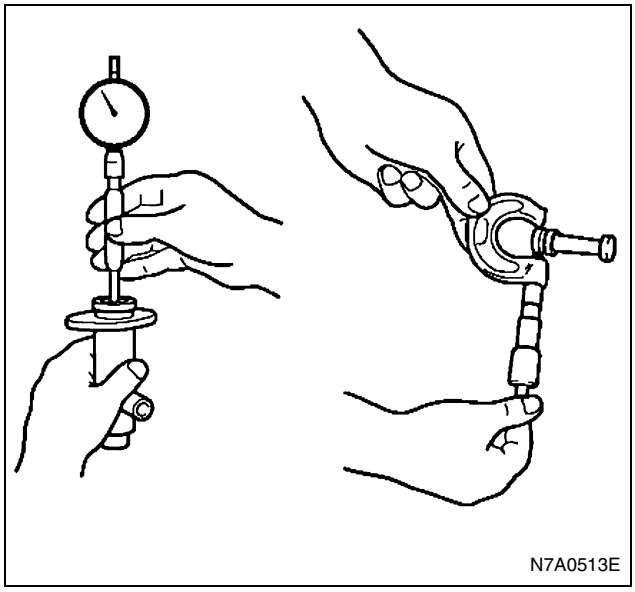
- Check the internal surface of the cylinder body for stepped wear, corrosion and damage, and measure the inside diameter.

Inside diameter of the cylinder body.
Standard inside diameter : ϕ25.4 mm (1.0 in)

- Check the piston for damage, rust and wear.
- Measure the clearance between the cylinder body and the piston.

Standard inside diameter : 0.02 — 0.10 mm (0.00078 — 0.0039 in)
Limit : 0.11 mm (0.0043 in)

- If the limit value is exceeded, replace the slave cylinder assembly.



Installation

1. Assemble the cylinder body.
2. Assemble the bleeder screw.
3. Assemble the piston assembly.
   - Before assembling, apply a thin coat of rubber grease to the piston.

Caution:
Make sure not to damage the piston assembly when assembling.

4. Assemble the boots.
5. Assemble the push rod.

Specifications

PRESSURE PLATE	Spring Shape	Diaphragm Spring	
	Outer Circumference	373 mm (14.685 in)	
	Installation Force	Set Force	Engine Model
		8,340 N (850 kg / 1,874 lb)	4HF1, 4HG1, 4HF1-II
		9,500 N (970 kg / 2,139 lb)	4HG1-T, 4HE1-TC-N, 4HK1-TC
		6,200 N (633 kg / 1,396 lb)	4JH1-TC-S

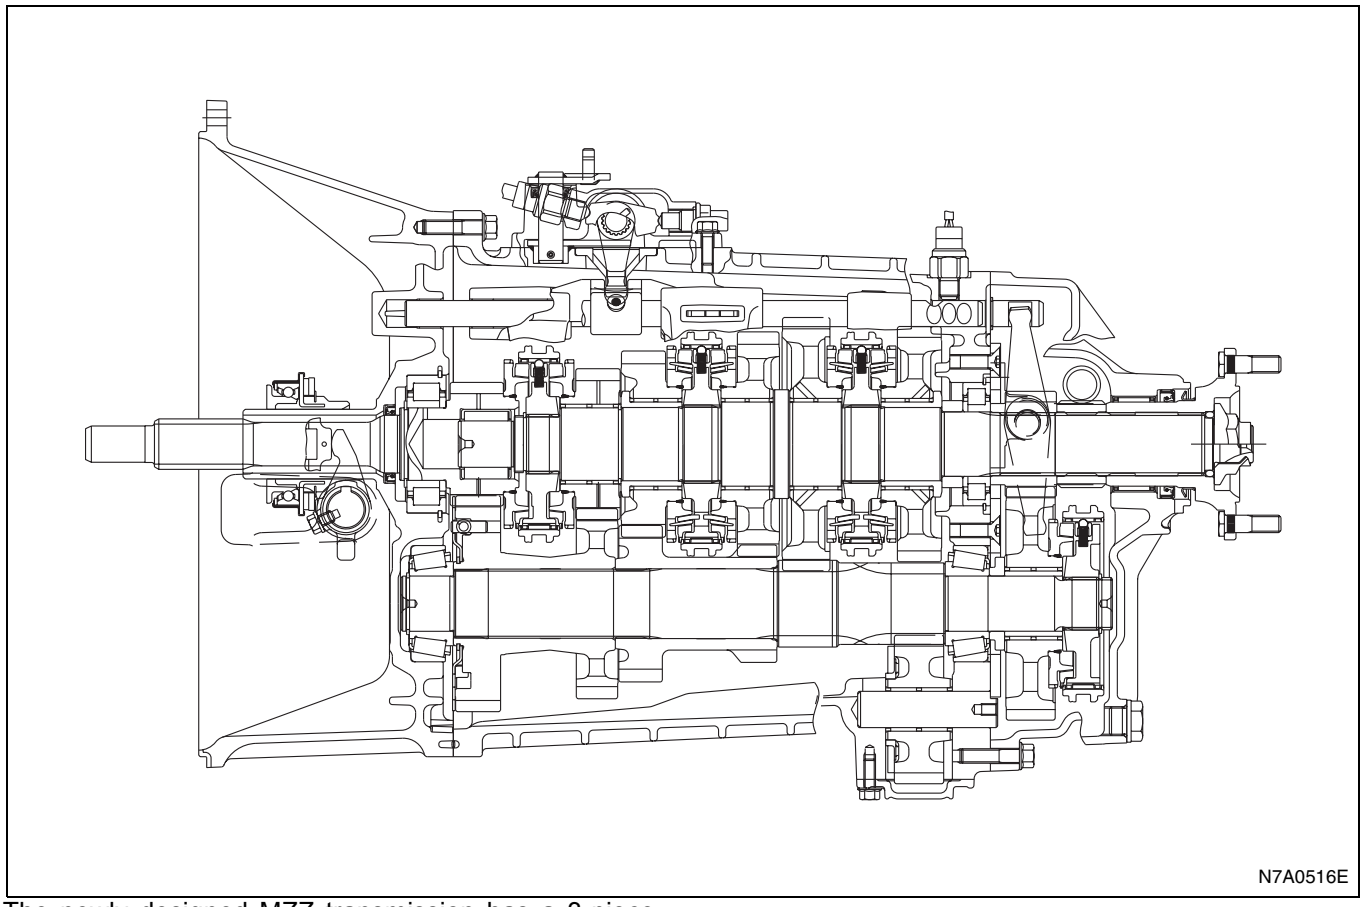
DESCRIPTION

6-speed Transmission

Notice:
When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.



The newly designed MZZ transmission has a 3-piece aluminum case to greatly reduce weight.
Taper roller bearings are used for both ends of the countershaft (front and rear).
The transmission features a twin-rod shift control.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Abnormal noise	1. Flywheel pilot bearing wear	1. Replace the bearing.
	2. Main shaft or countershaft bearing wear or other damage	2. Replace the bearing(s).
	3. Main shaft gear, countershaft gear, and/or reverse idle gear wear or other damage	3. Replace the gear(s).
	4. Main shaft spline and/or synchronizer hub spline wear	4. Replace the spline(s).
	5. Gear or bearing thrust surface scoring	5. Replace the gear(s) and/or bearing(s).
	6. Insufficient backlash between mating gears	6. Replace the gears.
Difficult shifting	1. Insufficient clutch pedal play	1. Adjust the play.
	2. Change lever contact surface wear	2. Repair or replace the change lever and apply grease.
	3. Shift block, shift rod, and/or control box contact surface wear	3. Replace the worn components.
	4. Shift arm and/or synchronizer sleeve wear	4. Replace the worn parts.
	5. Thrust washer and collar and/or gear thrust surface wear (Main shaft and countershaft thrust play)	5. Replace the worn parts.
	6. Synchronizer wear	6. Replace the synchronizer.
Gear slippage	1. Detent ball wear	1. Replace the detent ball.
	2. Shift rod and/or control box contact surface wear	2. Replace the worn components.
	3. Shift arm and/or synchronizer sleeve wear	3. Replace the worn parts.
	4. Thrust washer and collar and/or gear thrust surface wear (Main shaft and countershaft thrust play)	4. Replace the worn parts.
	5. Bearing wear or other damage	5. Replace the worn or damaged bearings.
	6. Main shaft spline and synchronizer hub spline wear	6. Replace the worn parts.
	7. Synchronizer spring weak or broken	7. Replace the spring.
Oil leakage	1. Drain plug and/or filler plug loose	1. Tighten the plug(s).
	2. Broken gasket	2. Replace the gasket.
	3. il seal wear or damage	3. Replace the oil seal.

ON-VEHICLE SERVICE

Transmission Oil Level Check

Measure

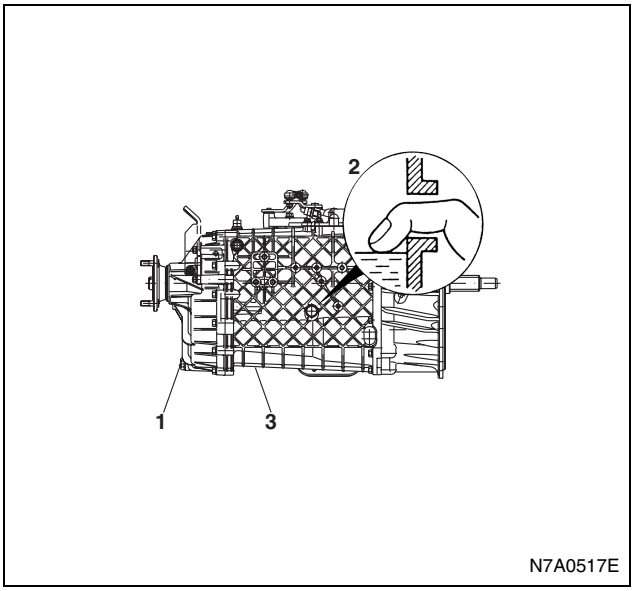
- Block the vehicle so it cannot move.
- Disconnect the ground cable from the battery negative (–) post.

1. Remove the filler plug (2) from the transmission case (3).
2. Check oil level.
   - Add lubricant to within 0 — 10 mm (0 — 0.4 in) of bottom edge of the filler hole if necessary.

Caution:
Use ENGINE OIL SAE 5W-30 for the transmission case.

3. Install the filler plug.

Tighten:
- Filler plug to 39 N·m (4 kg·m / 29 lb·ft)
- Connect the battery ground cable and remove the wheel blocks.



Legend
1. Drain plug
2. Filler plug
3. Transmission case

Changing Transmission Oil

Drain the transmission oil after driving the vehicle. The oil will drain more completely.

- Block the vehicle so it cannot move.
- Disconnect the ground cable from the battery negative (–) post.

1. Remove the drain plug (1). Provide a pan to catch oil.
2. Install the drain plug and tighten.

Tighten:
Drain plug to 39 N·m (4 kg·m / 29 lb·ft)

3. Remove the filler plug (2).
4. Fill the transmission case to level of the filler plug opening.

Caution:
Use ENGINE OIL SAE 5W-30 for the transmission case.

5. Install filler plug and tighten.

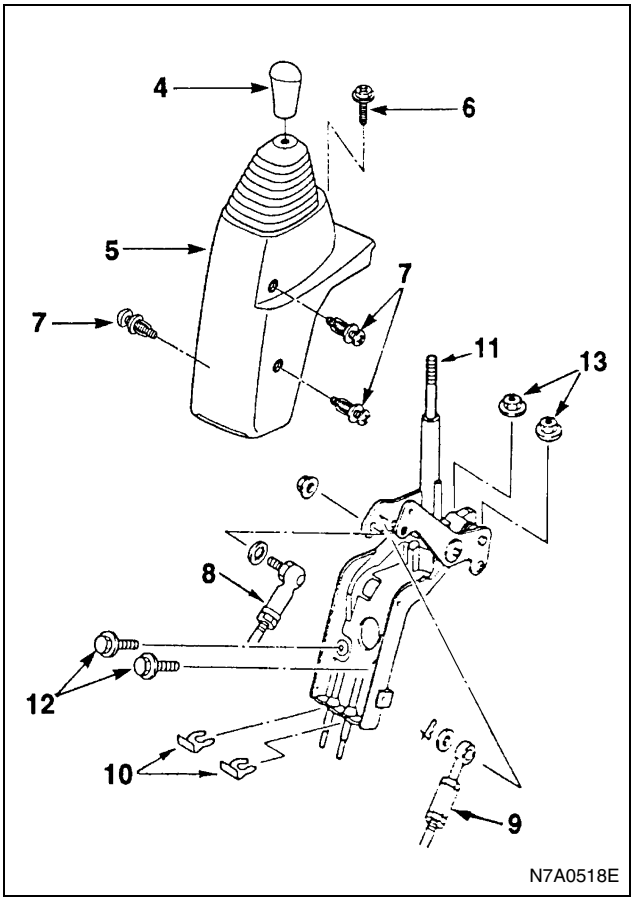
Tighten:
- Filler plug to 39 N·m (4 kg·m / 29 lb·ft)
- Connect the battery negative cable and remove the wheel blocks.

Gearshift Lever

Remove or Disconnect

- Block the vehicle so it cannot move.
- Disconnect the ground cable from the battery negative (–) post.

1. Gearshift lever knob (4).
2. Cover assembly (5).
   - Remove the fixing screw (6) and 3 clips (7).
3. Shift cable (8) and select cable (9).
   - Disconnect the cables from the gearshift lever.
   - Remove the C-clips (10) and disconnect the cables from bracket.
4. Gearshift lever assembly (11).
   - Remove 2 screws (12) and 2 nuts (13).



Legend

4. Gearshift lever knob
5. Cover assembly
6. Screw
7. Clip
8. Shift cable
9. Select cable
10. C-clip
11. Gearshift lever assembly
12. Screw
13. Nut

Install or Connect

1. Gearshift lever assembly (11).
2. Shift cable (8) and select cable (9).
   - Connect the cables to the gearshift lever.
   - Install the C-clips (10) to the bracket.

Adjust:

- When connecting the shift cable and select cable to the gearshift lever, adjust the cable. Refer to GEARSHIFT CABLE in this section.

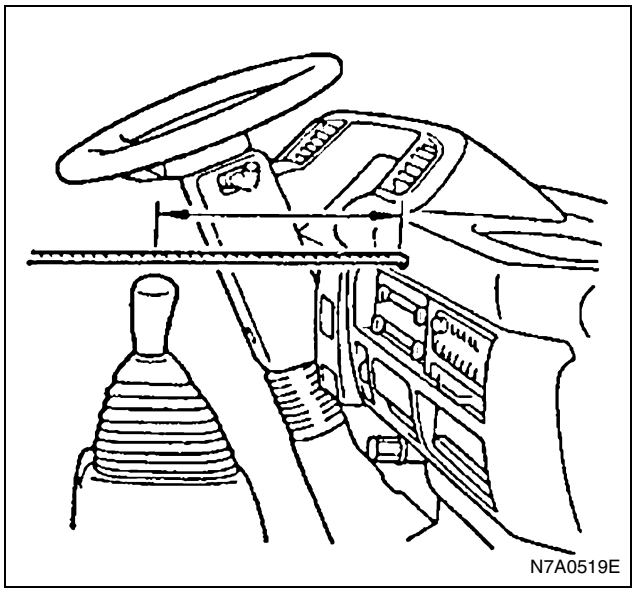
3. Cover assembly (5).
4. Gearshift lever knob (4).
   - Connect the battery negative cable and remove the wheel blocks.

Gearshift Cable

After connection of the select cable and the shift cable, confirm if shift operation is performed smoothly. If any dragging or improper stroke is present, check and adjust in accordance with the procedures shown below.

Measure

Set the transmission in the neutral position, then confirm if the dimension between the center of the shift lever play and the instrument center cluster is within the 283 ± 15 mm (11.1 ± 0.6 in). If the dimension is out of the reference value, adjust as required.



Adjust

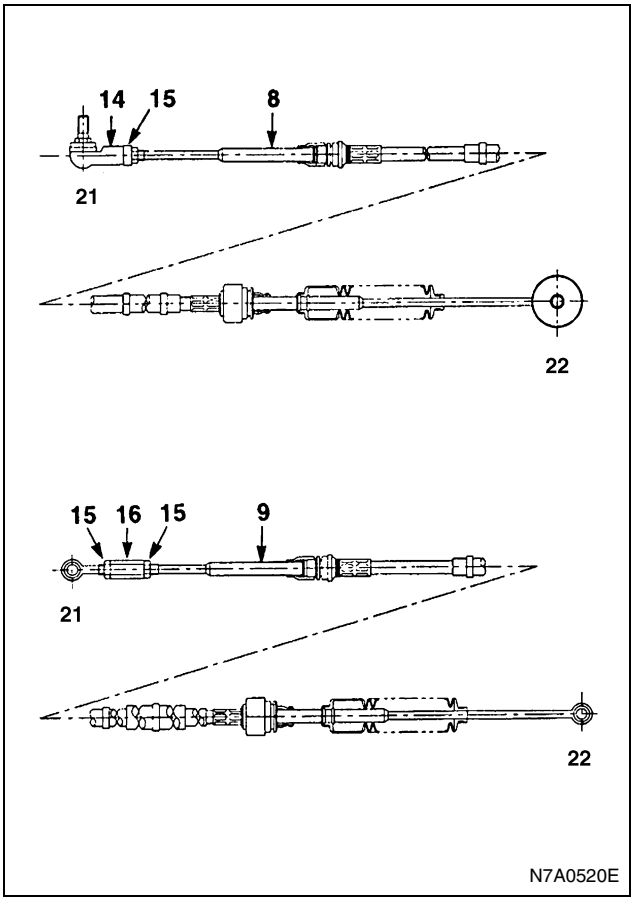
- Block the vehicle so it cannot move.
- Disconnect the ground cable from the battery negative (-) post.

1. Remove the gearshift lever knob (4).
2. Remove the cover assembly (5).
3. Disconnect the shift cable (8) and the select cable (9) on the gearshift lever side.
4. Set the transmission in the neutral position, then adjust the dimension between the center of the shift lever play and the instrument center cluster to the 283 ± 15 mm (11.1 ± 0.6 in).
5. Loosen the lock nut (15) of the shift cable (8) and the select cable (9), then turn the ball joint (14) or turnbuckle (16) as necessary for respective pins.
6. Fasten the lock nut (15) with specific torque.

Tighten:

Lock nut (15) to 6 N·m (0.6 kg·m / 52 lb·in)

7. Install the cover assembly (5).
8. Install the gearshift lever knob (4).
   - Connect the battery ground cable and remove the wheel blocks.



Legend

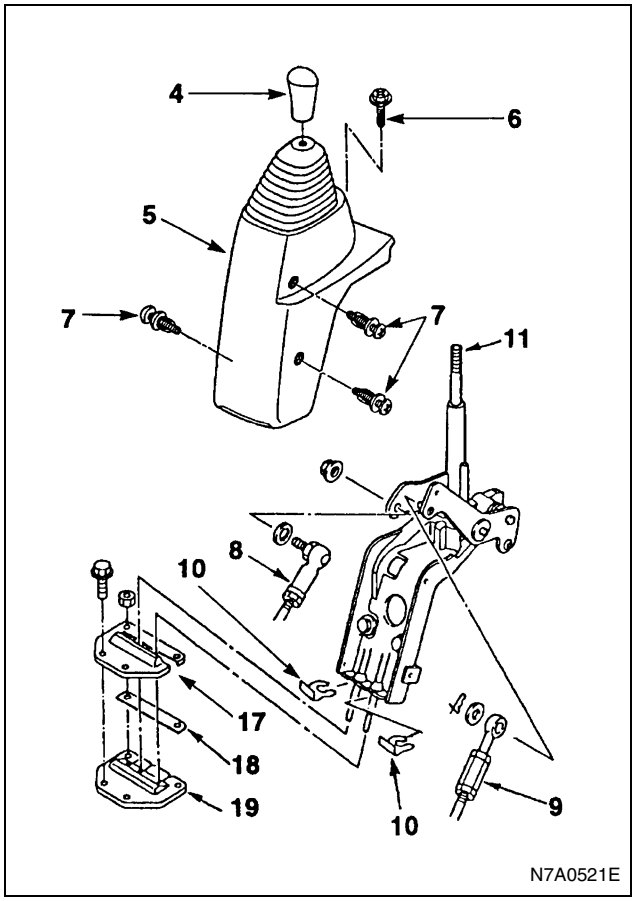
8. Shift cable
9. Select cable
14. Ball joint
15. Lock nut
16. Turnbuckle
21. Shift lever side
22. Transmission side

Remove or Disconnect

- Block the vehicle so it cannot move.
- Disconnect the ground cable from the battery negative (-) post.

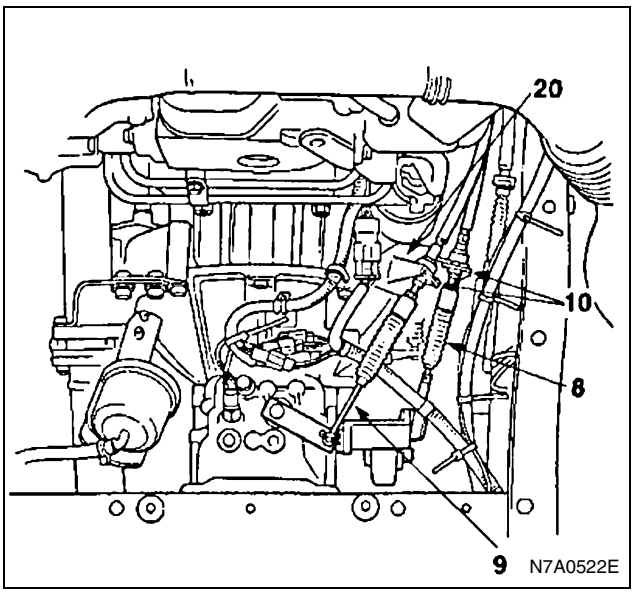
1. Gearshift lever knob (4).
2. Cover assembly (5).
3. Shift cable (8) and select cable (9).

- Disconnect the shift cable and select cable from gearshift lever.
- Remove the C-clips (10) and disconnect the cables from gearshift lever bracket.
- Remove the grommet retainer (17), grommet seal (18) and grommet (19).
- Tilt the cab.
- Disconnect the shift cable and the select cable on the transmission side.
- Remove the C-clips (10) and disconnect the shift cable and the select cable from the bracket (20).
- Remove the clips that fix the cables to the frames or brackets.
- Remove the shift and select cable assemblies.



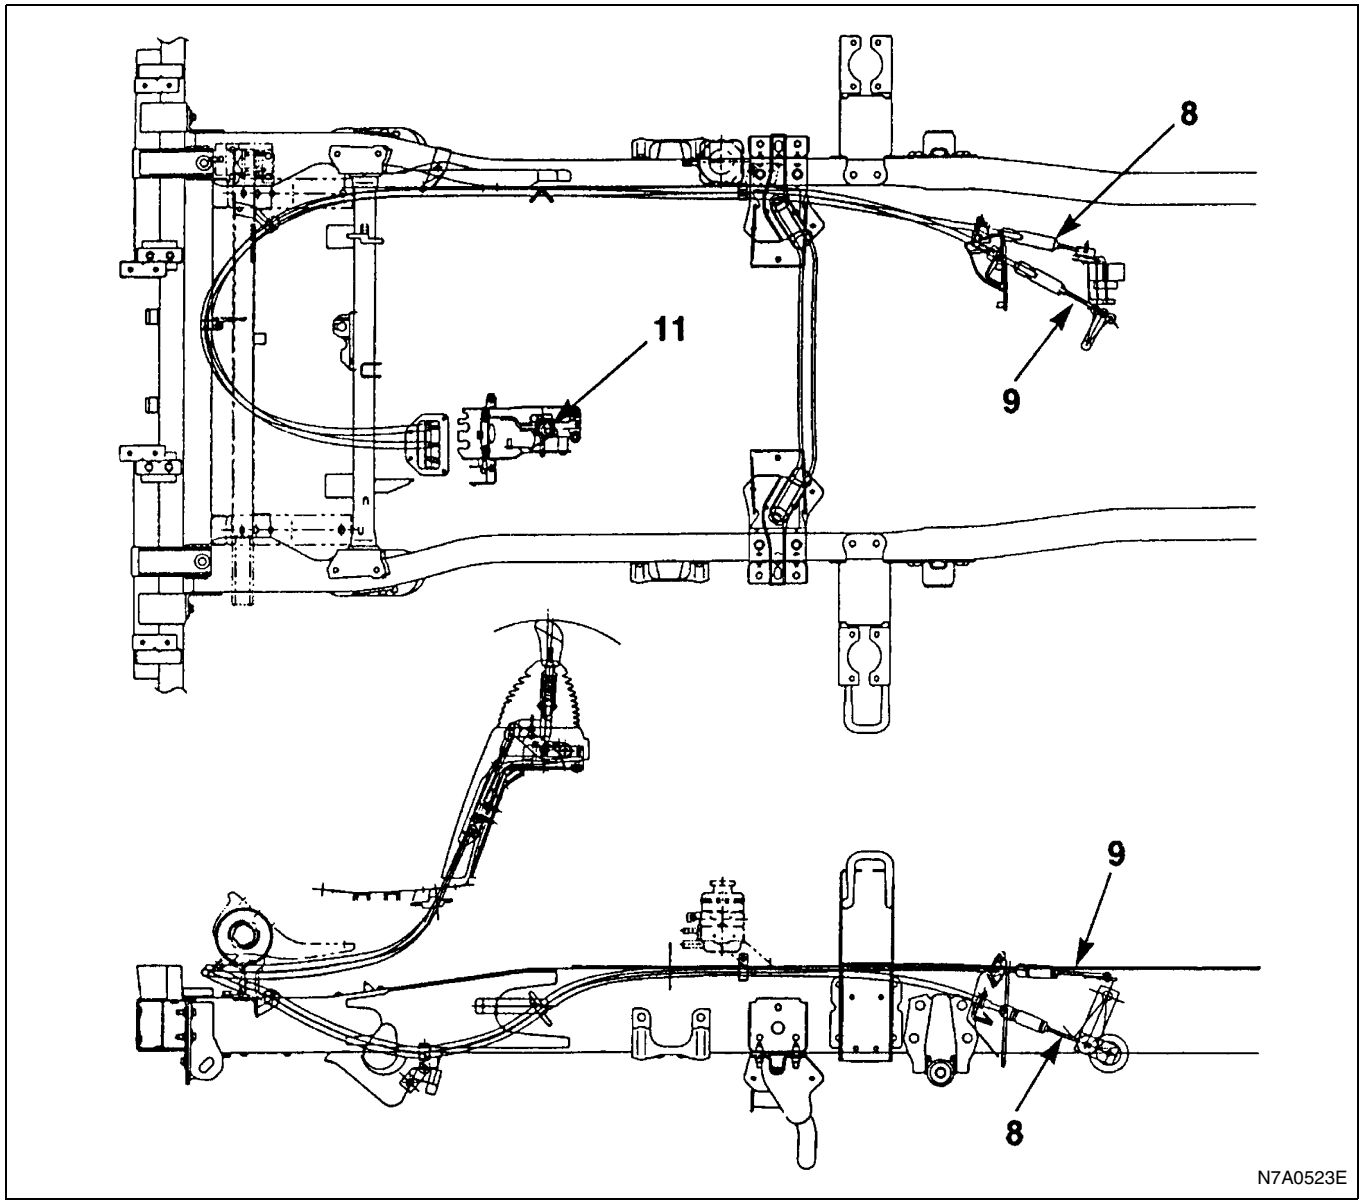
Legend

4. Gearshift lever knob
5. Cover assembly
6. Screw
7. Clip
8. Shift cable
9. Select cable
10. C-clip
11. Gearshift lever
17. Grommet retainer
18. Grommet seal
19. Grommet



Legend

8. Shift cable
9. Select cable
10. C-clip
20. Bracket



Legend

8. Shift cable
9. Select cable
11. Gearshift lever

Inspect

Check the cables for any deformation, damage or rust, and also check the sliding portion for any abnormal condition.
When there is any abnormal condition found, replace it with new one.

Install or Connect

1. Shift cable (8) and select cable(9).
   - Install temporarily the shift cable and select cable.

Important:

- Never bend the cables to radius less than 450 mm (18 in) unless it is necessary to do so for wiring purposes. And never bend the cables to radius less than 180 mm (7 in) even during wiring.
- Install the cables carefully without unnecessary twisting the cable boots.
- Fasten the cables with C-clips to the brackets on the transmission side.
- Fasten the cables with C-clips to the gearshift lever bracket.
- Fasten the cables with clips to the frames and brackets.
- Connect the cables to the transmission.
- Install the grommet (19), grommet seal (18) and grommet retainer (17).

Adjust:

- When connecting the shift cable (8) and the select cable (9) to the gearshift lever, adjust the cables. Refer to GEARSHIFT CABLE given previously in this section.

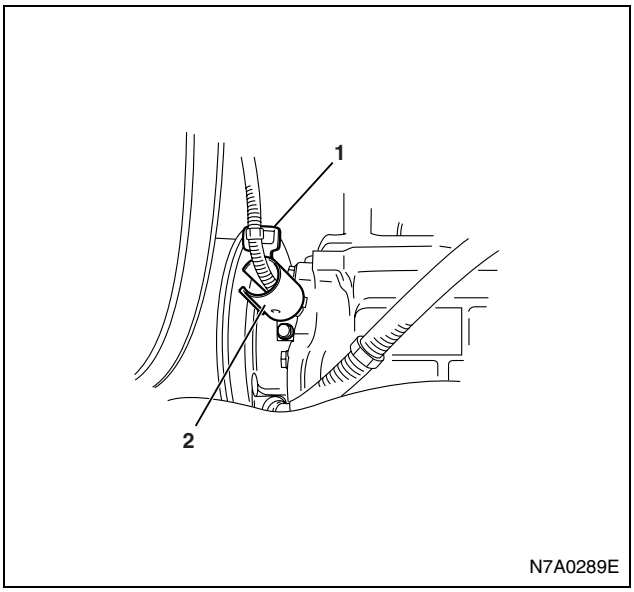
2. Cover assembly (5).
3. Gearshift lever knob (4).

- Connect the battery negative cable and remove the wheel blocks.

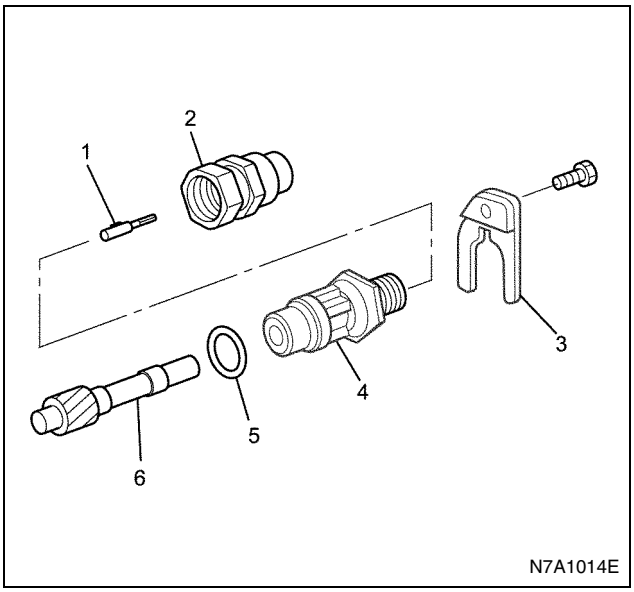
Vehicle Speed Sensor

Removal

1. Remove the clips (1) and the protector (2).
2. Remove the wiring connectors.



3. Loosen the fixing screw and remove the vehicle speed sensor (2).



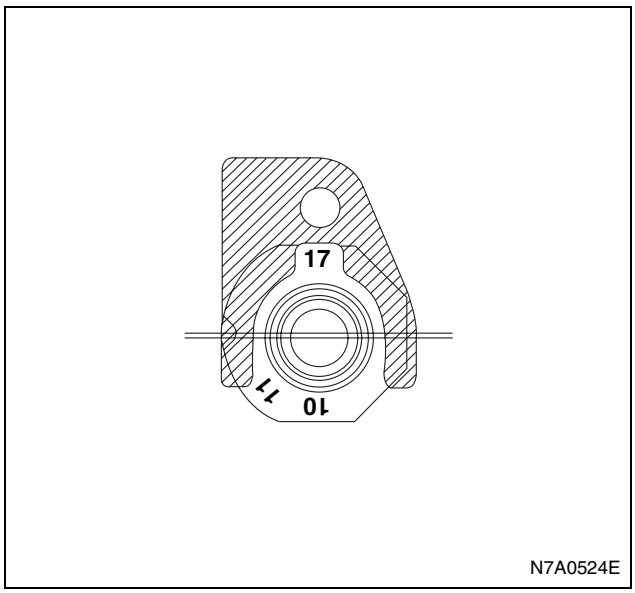
Legend

1. Sensor insert
2. Vehicle speed sensor
3. Plate
4. Bush
5. O-ring
6. Driven gear

Installation

1. Install the vehicle speed sensor and secure it with the fixing screw.

- Align the gear tooth marked 17 of the speedometer's driven gear (17 teeth) with the opening in the plate.



2. Tighten the fixing screw to the specified torque.

Tighten:
Screw to 20 N·m (2.0 kg·m / 15 lb·ft)

3. Install the sensor insert and the vehicle speed sensor. Tighten the vehicle speed sensor to the specified torque.

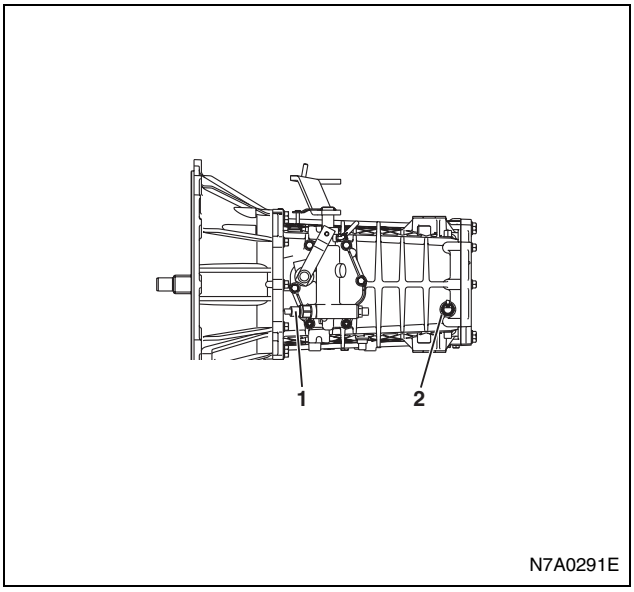
Tighten:
Vehicle speed sensor to 25 N·m (2.5 kg·m / 18 lb·ft)

4. Connect the wiring connectors.
5. Install the protector and secure it with the clips.

Reverse, Neutral and Selector Switches

Removal

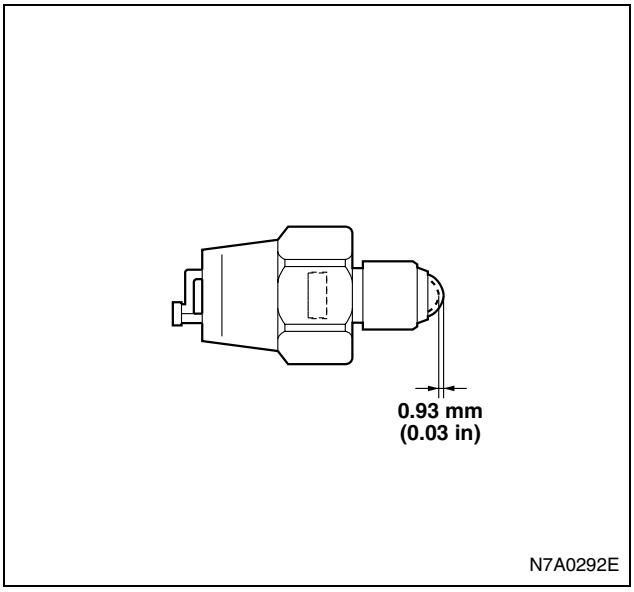
1. Remove the wiring connectors.
2. Remove the reverse switch (2). The switch has a black connector.
3. Remove the neutral switch (1). The switch has a black connector.



Inspection

1. Check for continuity between the switch terminals when the ball is pressed. If there is no continuity, the switch is bad.
2. Measure the switch travel.

Switch travel: 0.93 mm (0.03 in)



Installation

1. Apply liquid gasket (Three Bond 1141) to the threaded portion of the neutral switch.
2. Install the neutral switch. Tighten the switch to the specified torque.

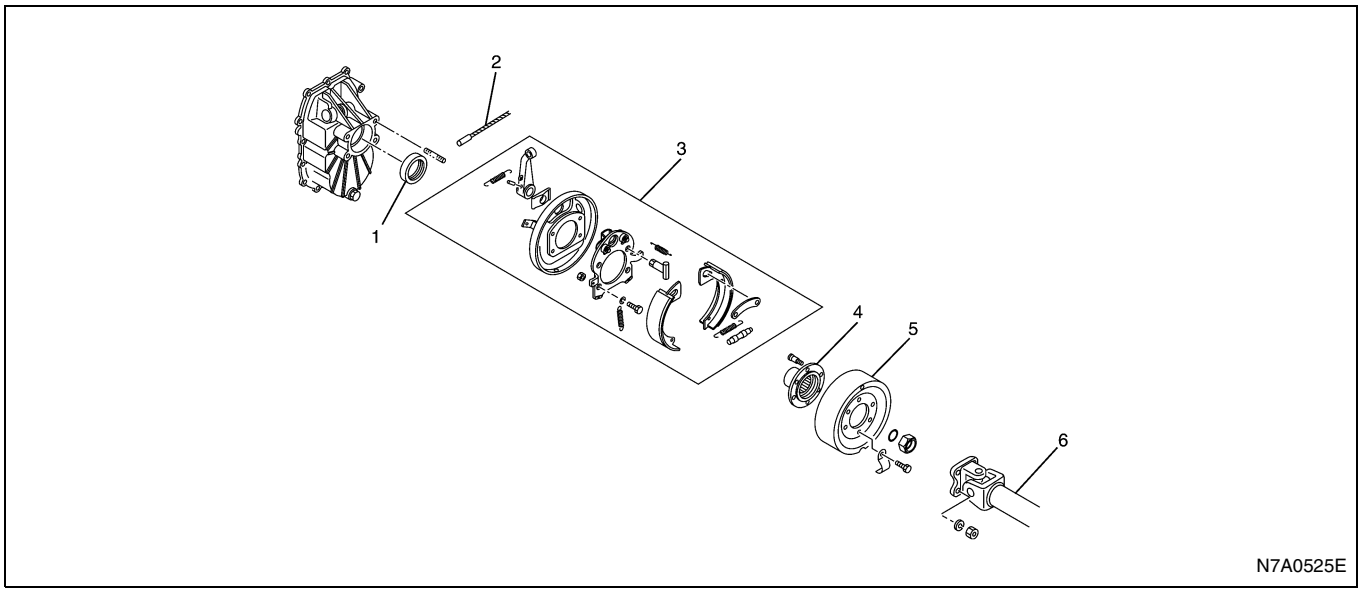
Tighten:
Switch to 34 N·m (3.5 kg·m / 25 lb·ft)

3. Apply liquid gasket (Three Bond 1141) to the threaded portion of the reverse switch.
4. Install the reverse switch. Tighten the switch to the specified torque.

Tighten:
Switch to 39 N·m (4 kg·m / 29 lb·ft)

Rear Oil Seal

Parts



Legend

1. Oil seal
2. Parking brake cable
3. Parking brake assembly
4. Coupling driver
5. Parking brake drum
6. Rear propeller shaft assembly

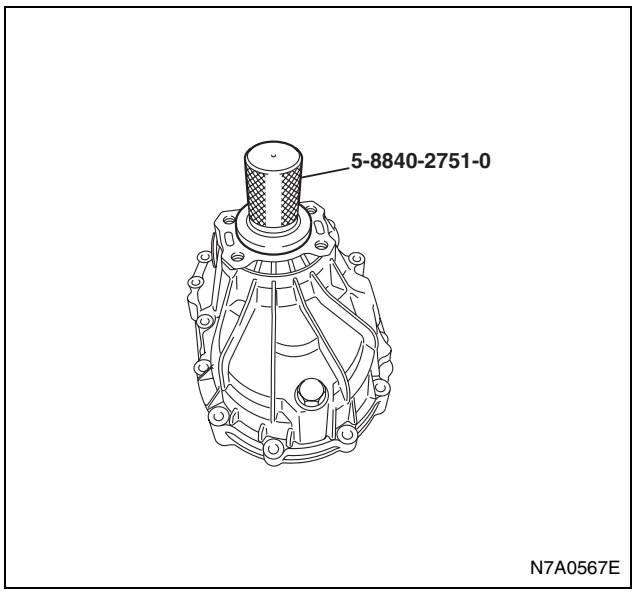
Removal

1. Remove the rear propeller shaft assembly.
   - Refer to PROPELLER SHAFT.
2. Remove the parking brake cable.
   - Refer to PARKING BRAKES.
3. Remove the parking brake drum.
   - Refer to PARKING BRAKES.
4. Use the special tool (9-8529-2101-0) to break the coupler driver lock nut caulking (2 locations) and remove the nut.
5. Remove the coupling driver together with the O-ring.
6. Remove the parking brake assembly.
   - Refer to PARKING BRAKES.
7. Use an ordinary screwdriver to remove the rear oil seal.

Installation

1. Apply engine oil (5W-30) to the new oil seal outer circumference.
2. Apply multi-purpose type grease to the lipped portion of the oil seal.
3. Use the installer (5-8840-2751-0) to press the oil seal into the rear cover.

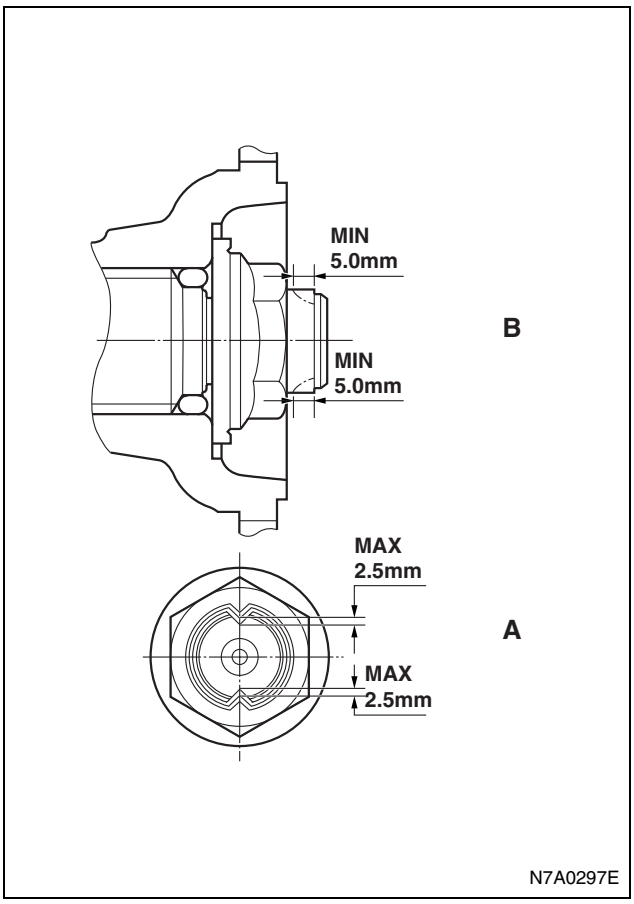
Caution:
The lipped portion of the oil seal is easily broken. Exercise care during the installation procedure.



4. Install the parking brake assembly.
   - Refer to PARKING BRAKES.
5. Apply engine oil (5W-30) to the new O-ring.
6. Install the coupling driver together with the O-ring.
7. Apply engine oil (5W-30) to the seating surface of the new lock nut.
8. Use the special tool (9-8529-2101-0) to tighten the lock nut to the specified torque.

Tighten:
Lock nut to 382 N·m (39 kg·m / 282 lb·ft)

9. Align the lip portion of the lock nut with the V-groove at the end of the shaft (length (B) must be at least 5 mm (0.2 in)). Wedge the lipped portion of the nut into the V-groove so that the gap between the nut and the bottom of the V-groove (A) is less than 2.5 mm (0.1 in).
10. Caulk the lock nut at two places.



11. Install the parking brake drum.
    - Refer to PARKING BRAKES.
12. Install the parking brake cable.
    - Refer to PARKING BRAKES.
13. Install the rear propeller shaft assembly.
    - Refer to PROPELLER SHAFT.

21. Counter shim
40. Top gear shaft assembly
41. Main shaft assembly
42. Countershaft assembly

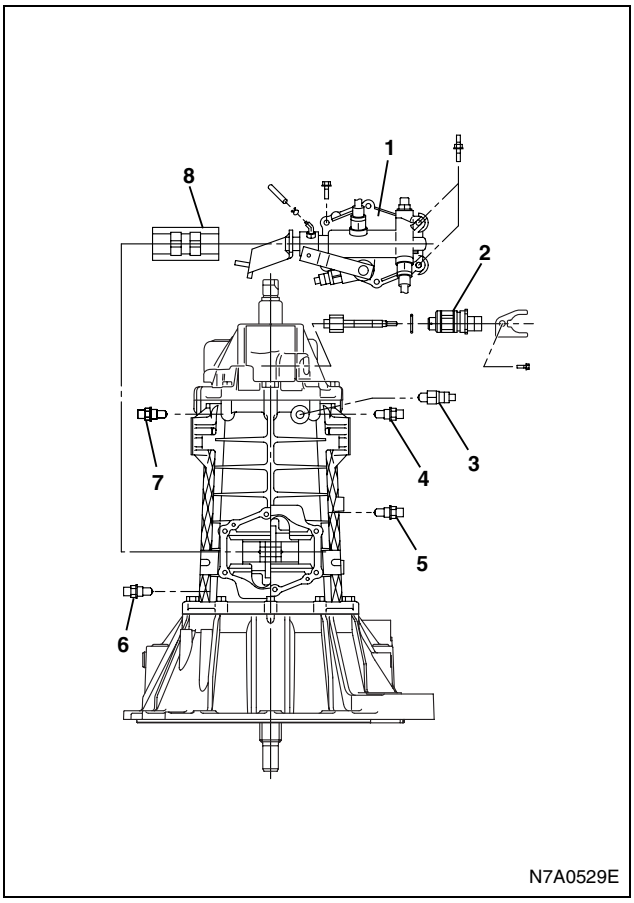
Disassembly

Caution:
The transmission case and clutch housing are made of aluminum. They are easily damaged. Exercise care during the disassembly and reassembly procedure.

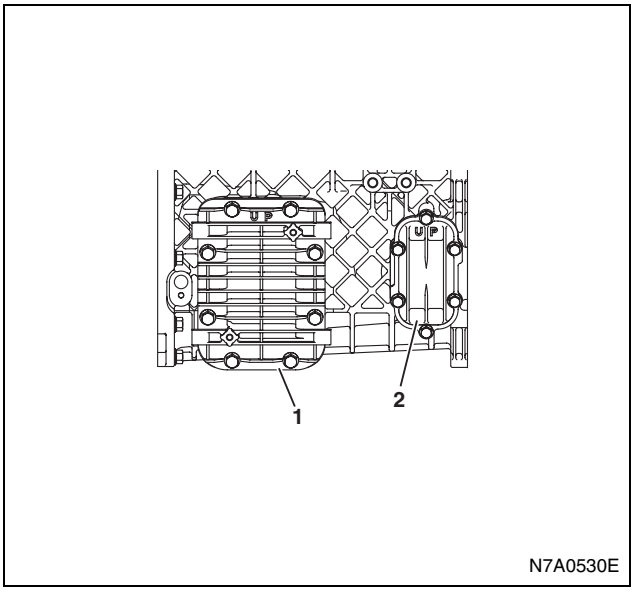
Caution:
Be especially careful not to damage the transmission case ribs. A damaged rib greatly weakens the case.

Caution:
Remember that transmission and clutch parts are heavy and must be handled with great care to avoid serious injury to yourself and others around you.

1. Remove the shift block together with the release bearing, the clutch shaft, and the shaft fork.
   - Refer to CLUTCH.
2. Remove the parking brake drum.
   - Refer to PARKING BRAKES.
3. Use the special tool (9-8529-2101-0) to break the coupler driver lock nut caulking (2 locations) and remove the nut.
4. Remove the coupling driver together with the O-ring.
5. Remove the parking brake assembly.
   - Refer to PARKING BRAKES.
6. Remove the parking brake cable bracket from the transmission case.
7. Remove the filler plug and O-ring.
8. Remove the drain plug and the O-ring.
   - Allow time for the transmission oil to drain into a suitable container. Check the oil volume. Look for metallic particles and other foreign material in the oil.
9. Remove the speedometer driven gear (2).
10. Remove the reverse switch (3).
11. Remove the 4 detent assemblies ((4), (5), (6) and (7)).
12. Remove the control box (1) together with the interlock plate (8).

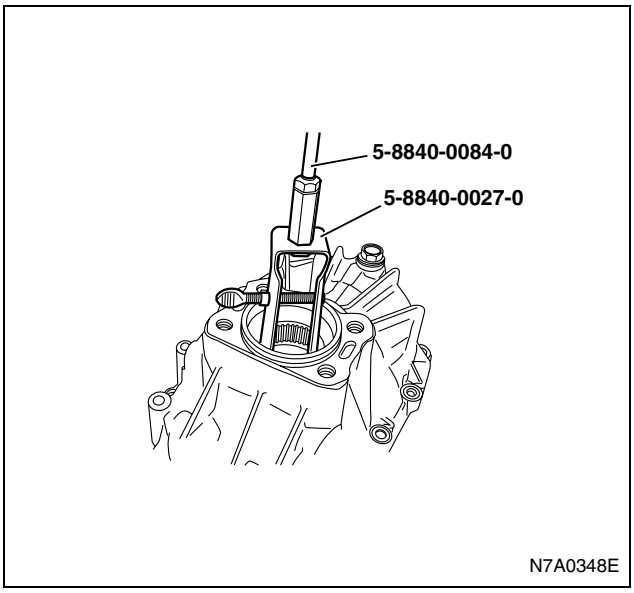


13. Remove the PTO cover (1).
14. Remove the reverse idle cover (2).

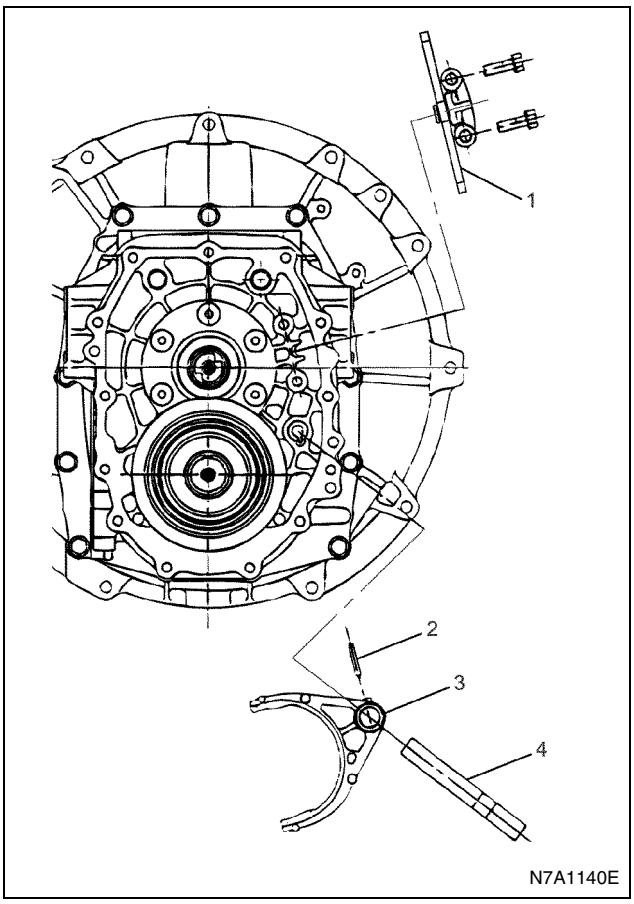


15. Remove the rear cover assembly.
16. Inspect the rear cover oil seal for wear and other damage. If wear or damage is present, the oil seal must be replaced. Use an ordinary screwdriver to remove it from the rear cover.

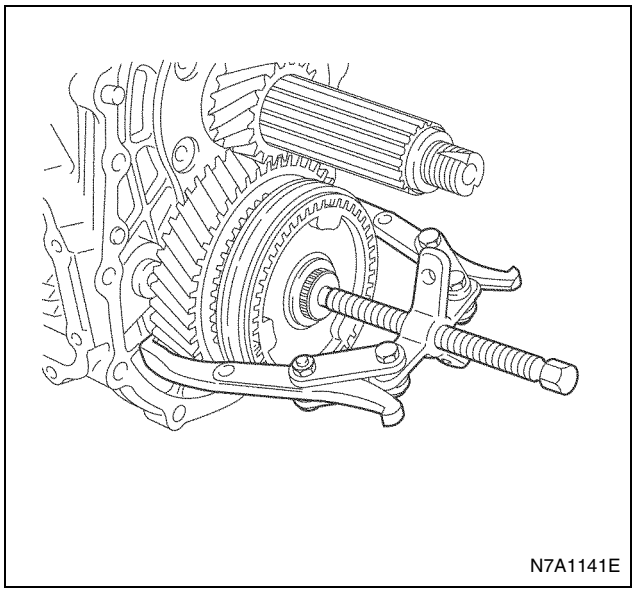
17. Use the remover (5-8840-0027-0) and the sliding hammer (5-8840-0084-0) to remove the neutral bearing (main end) from the rear cover.



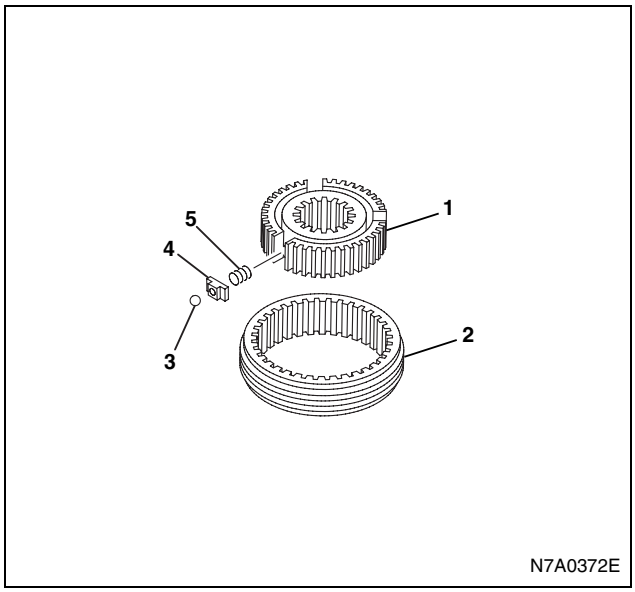
18. Remove the relay lever 6th gear (1).
19. Use a spring remover to force out the spring pins (2) from the 6th gear shift arm (3) and the 6th gear shift rod (4).
20. Remove the 6th gear shift arm and the 6th gear shift rod.



21. Use a pair of snap ring pliers to remove the snap ring from the 6th gear clutch hub.
22. Use a puller to remove the 6th gear clutch hub assembly, the sleeve, the block ring, the gear, and the needle bearing from the counter shaft.



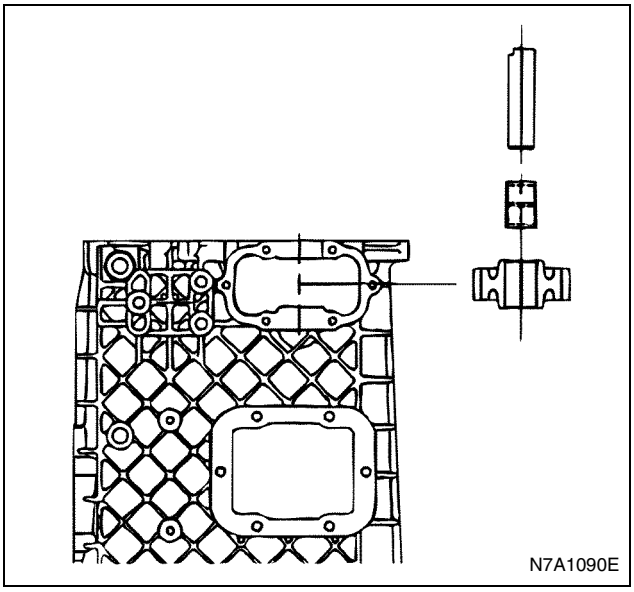
23. Disassemble the 6th gear clutch hub assembly and the sleeve.



Legend

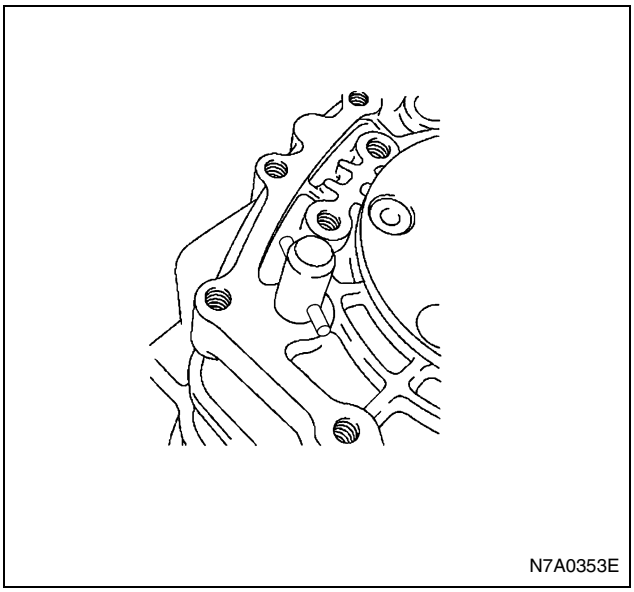
1. Clutch hub
2. Sleeve
3. Ball
4. Block
5. Spring

24. Remove the speedometer gear.
25. Remove the retainer from the transmission case.
26. Pull out the reverse idle shaft.
27. Remove the reverse idle gear together with the needle bearing.



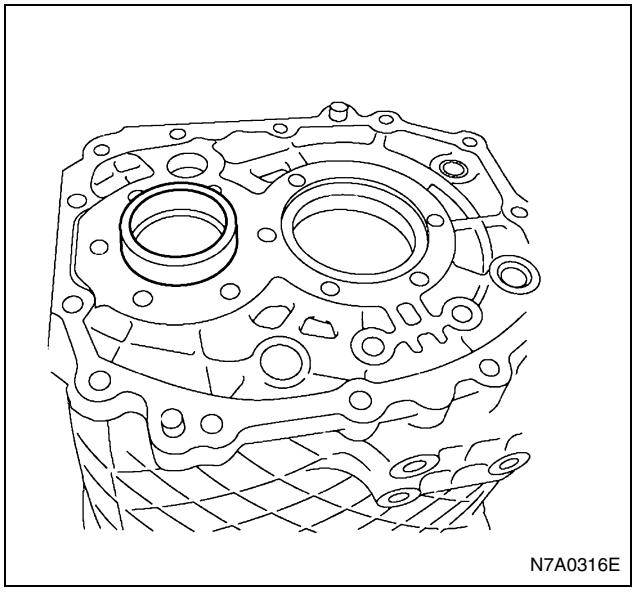
N7A1090E

28. Remove the snap ring (rear outer) from the main shaft rear bearing.
29. Remove the shim from the counter shaft rear bearing.
30. Remove the snap rings (4th / 5th and 6th shift rods).



N7A0353E

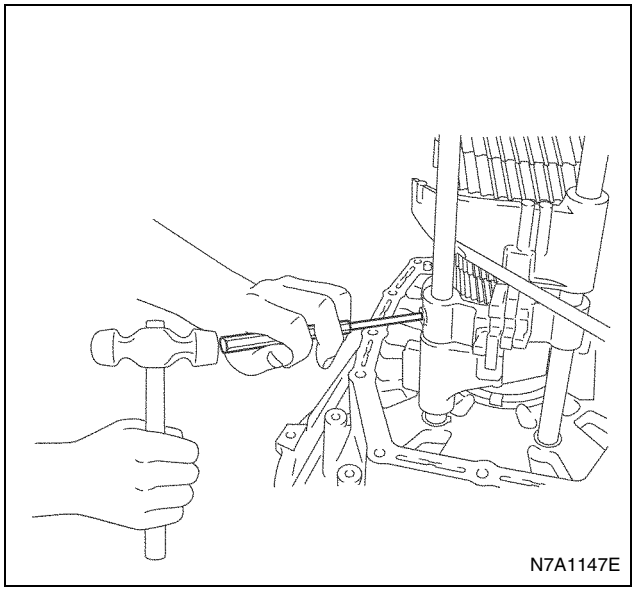
31. Remove the transmission case from the clutch housing.
32. Remove the bearing rear outer race from the transmission case.



N7A0316E

33. Use a spring pin remover to remove the spring pins from the 4th / 5th shift rod, the 1st / reverse shift block, the 6th shift block, and 4th / 5th shift arm.
34. Remove the 4th / 5th shift rod, the 1st / reverse shift block, the 6th shift block, and 4th / 5th shift arm.

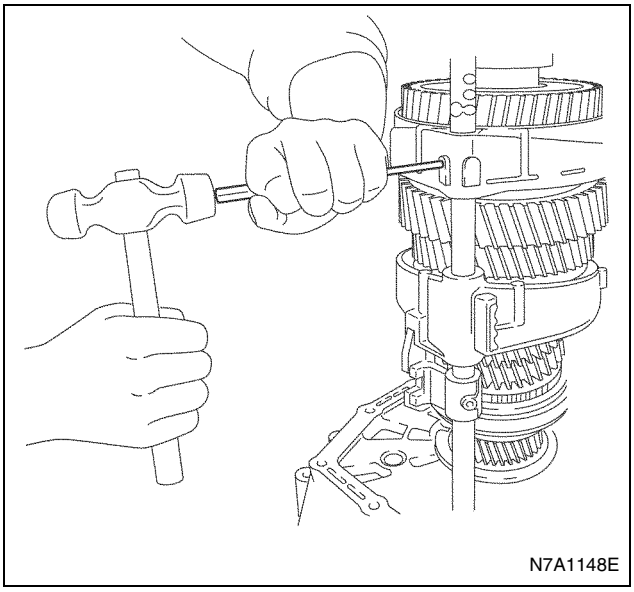
Caution:
To avoid damaging other parts, place a round shaft at the opposite end of the shift rod when removing the spring pins.



N7A1147E

35. Remove the 1st / reverse and the 2nd / 3rd shift rod, the 1st / reverse shift arm, the 2nd / 3rd shift arm, the 1st / reverse, and the 6th shift block.

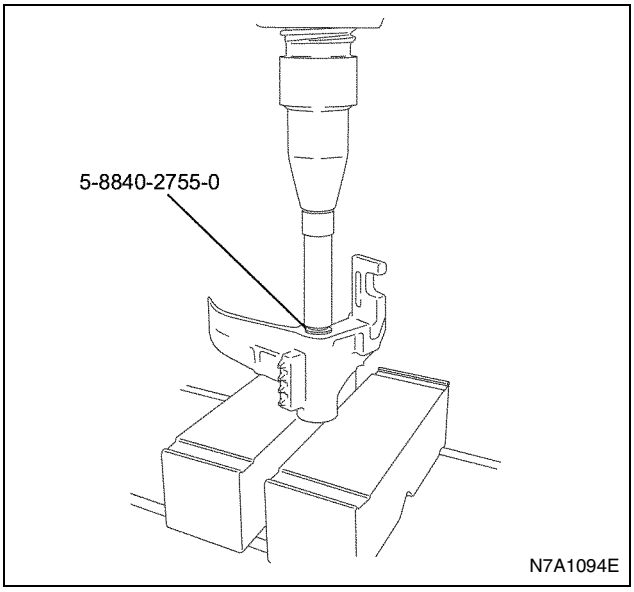
Caution:
To avoid damaging other parts, place a round shaft at the opposite end of the shift rod when removing the spring pins.



N7A1148E

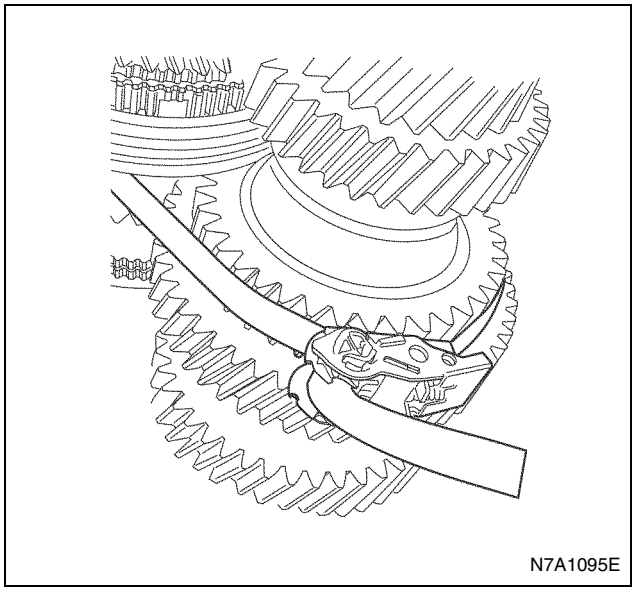
36. Use the remover (5-8840-2755-0) to remove the bush from the 4th / 5th shift arm.
37. Use the remover (5-8840-2755-0) to remove the bush from the 1st / reverse shift arm.
38. Use the remover (5-8840-2755-0) to remove the bush from the 2nd / 3rd shift arm. from the 1st / reverse shift arm.

Caution:
To avoid damaging other parts, place a round shaft at the opposite end of the shift arm (same length as the remover) when removing the bushes.



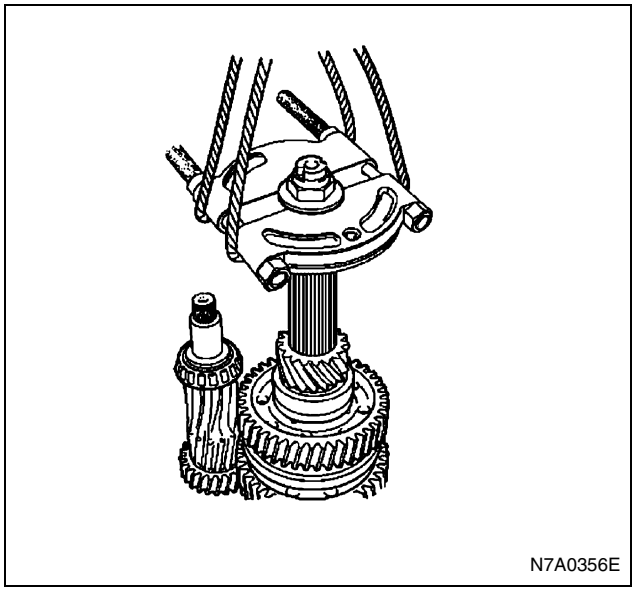
N7A1094E

39. Remove the magnet from the clutch housing.
40. Remove the main shaft assembly, upper gear shaft assembly, and the countershaft assembly.
    a. Tightly wrap belts such as lashing belts around the main shaft assembly, upper gear shaft assembly, and the countershaft assembly in two or more places to prevent the assemblies from separating.

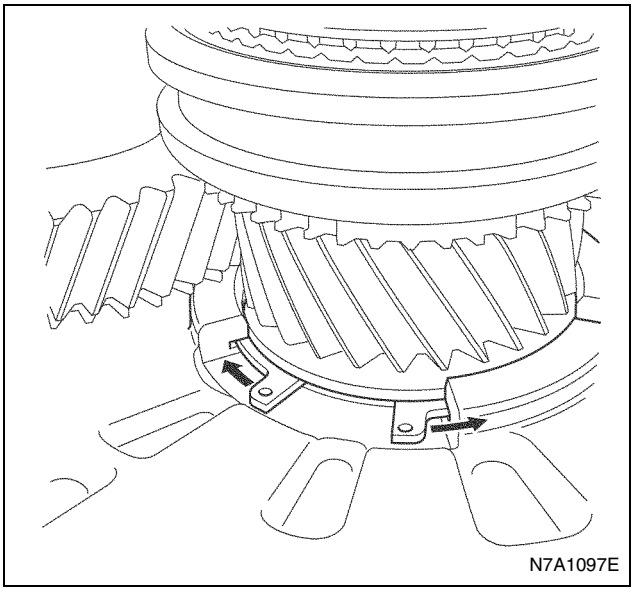


N7A1095E

    b. Secure the bearing remover to the main shaft with the lock nut, then raise it with a hoisting cable. Spread the outer snap ring of the upper gear shaft bearing, which is attached to the clutch housing, and simultaneously remove upper gear shaft assembly, main shaft assembly, and countershaft assembly from the clutch housing.

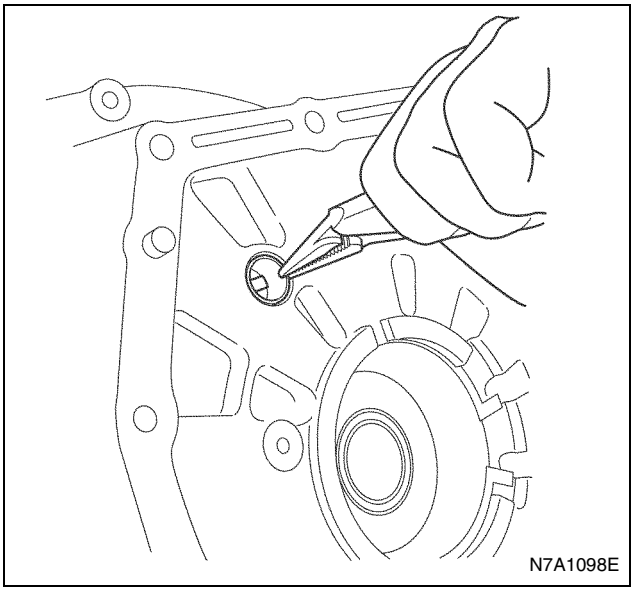


N7A0356E



N7A1097E

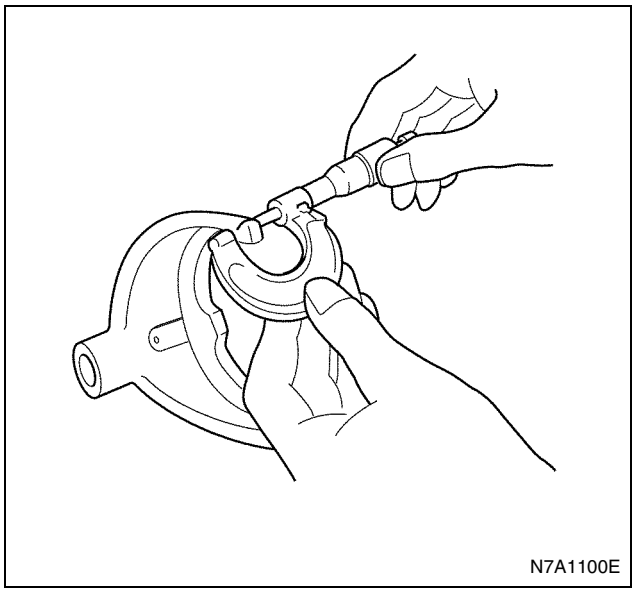
41. Inspect the clutch housing bush for wear and damage. If wear or damage is present, the bush must be replaced. Remove the old bush from the clutch housing with a pair of pliers.



N7A1098E

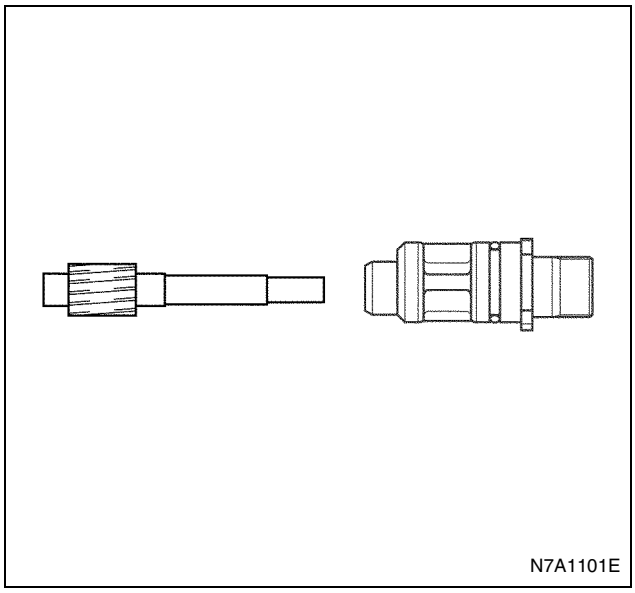
42. Inspect the front oil seal for wear and damage. If wear or damage is present, the seal must be replaced. Remove the old seal from the clutch housing with an ordinary screwdriver.
43. Inspect the other parts for wear and damage. If wear or damage is present, make the necessary repairs or replace the part(s).
44. Inspect the shift rod and the shift arm (shift mechanism) for bending, wear, and other damage. If minor wear or damage is present, make the necessary repairs. If major wear or damage is present, the part(s) must be replaced.
45. Use a micrometer to measure the shift arm end thickness. If the thickness exceeds the specified limit, the shift arm must be replaced.

Shift arm end thickness		mm (in)
Gear	Standard	Limit
1st / reverse 3rd / 2nd 5th / 4th	9.60 — 9.85 (0.378 — 0.388)	9.00 (0.354)
6th	9.60 — 9.85 (0.378 — 0.388)	9.30 (0.366)



N7A1100E

46. Inspect the speedometer driven gear and the driven gear bush for wear and other damage. Replace the driven gear and bush if significant wear is present.



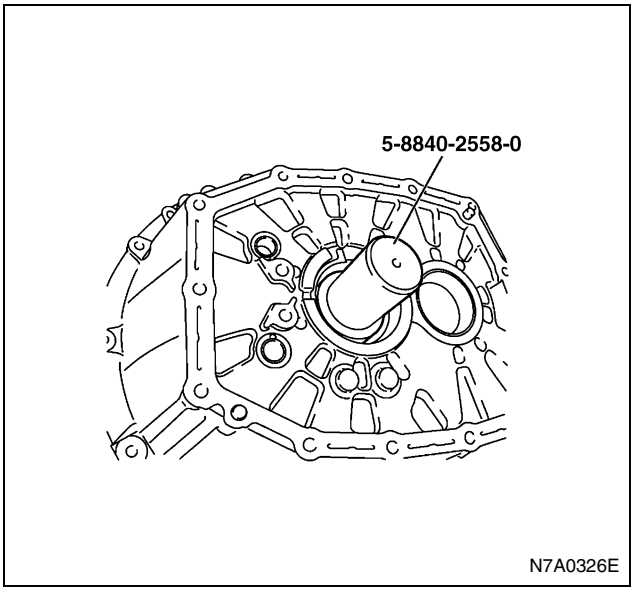
N7A1101E

Reassembly

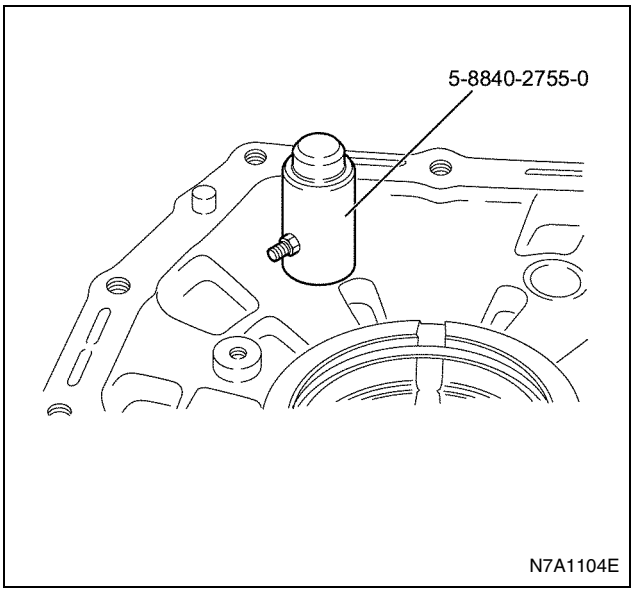
1. Inspect the oil seal for wear and damage. If damage or wear is present, the seal must be replaced.
2. Apply engine oil (5W-30) to the outside circumference of the oil seal.
3. Apply multi-purpose type grease to the lipped portion of the oil seal.

4. Use the installer (5-8840-2558-0) to press the oil seal into the clutch housing.

Caution:
The lipped portion of the oil seal is easily broken. Exercise care during the installation procedure.



5. Inspect the bearing outer race for wear and damage. If wear or damage is present, the race must be replaced.
6. Inspect the clutch housing bush for wear and damage. If wear or damage is present, the bush must be replaced.
7. Use the installer (5-8840-2755-0) to press the bush into the clutch housing. Pay close attention to the bush installation direction (refer to the illustration).

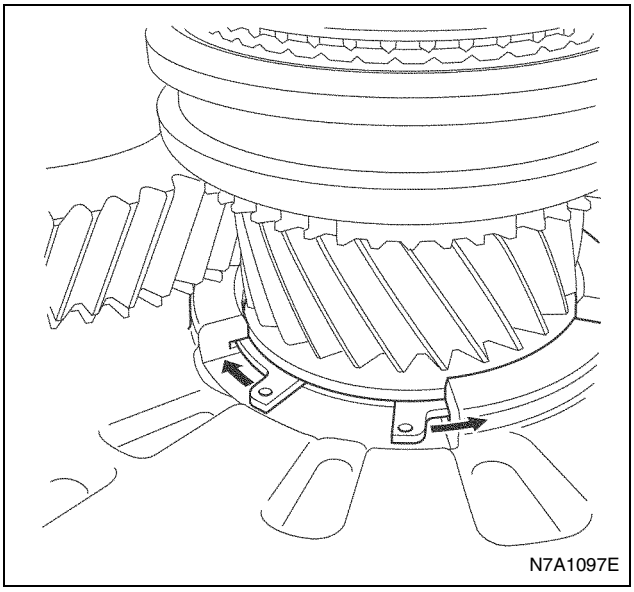


- Attach by crimping to secure at three points, but avoid the grooved area and previous crimping spots.
- Apply the second and subsequent bushing presses with the notch facing the clutch housing.

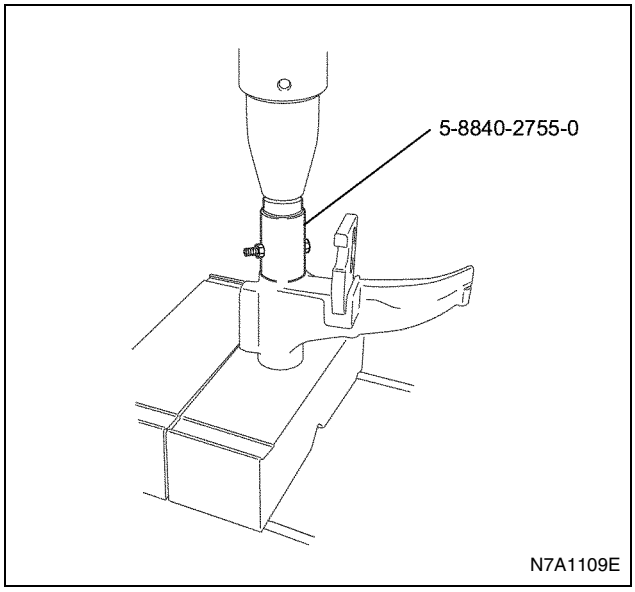
8. Attach the main shaft assembly, upper gear shaft assembly, and countershaft assembly.
   a. Tightly wrap belts such as lashing belts around the main shaft assembly, countershaft assembly, and upper gear shaft assembly at two or more places to prevent the assemblies from separating. Make sure that the upper gear shaft does not fall when the assembly is suspended.

   b. Secure the bearing remover to the main shaft with a lock nut, then raise it with a hoisting cable. Spread the outer snap ring of the upper gear shaft bearing, which is attached to the clutch housing, and simultaneously install the upper gear shaft assembly, main shaft assembly, and countershaft assembly into the clutch housing.

   c. Set the outer snap ring of the upper gear shaft bearing onto the clutch housing, spread it using snap-ring pliers, and insert the upper gear shaft bearing.



N7A1097E

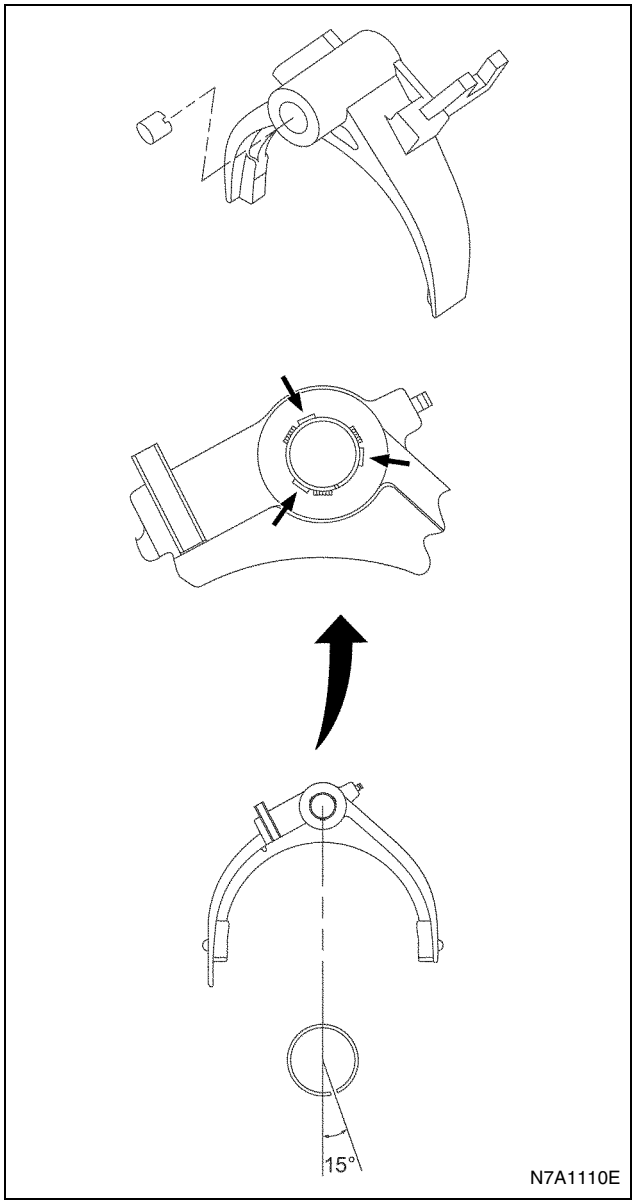


N7A1109E

Notice:

- Be sure to verify that the snap ring is properly attached.
- When suspending the shaft, maintain vertical alignment to prevent the front oil seal from being damaged, and work with care.

9. Install the magnet to the clutch housing.
10. Inspect the 3rd / 2nd shift arm bush for wear and damage. If wear or damage is present, the bush must be replaced.
11. Use the installer (5-8840-2755-0) to press the bush into the clutch housing. Pay careful attention to direction of installation and installation angle.
12. Caulk the bush at 3 locations (do not caulk near the bush grooves).
13. Inspect the 1st / reverse shift arm bush for wear and damage. If wear or damage is present, the bush must be replaced.
14. Use the installer (5-8840-2755-0) to press the bush into the clutch housing. Pay careful attention to direction of installation and installation angle.
15. Caulk the bush at 3 locations (do not caulk near the bush grooves).
16. Inspect the 4th / 5th shift arm bush for wear and damage. If wear or damage is present, the bush must be replaced.
17. Use the installer (5-8840-2755-0) to press the bush into the clutch housing.
18. Caulk the bush at 3 locations (do not caulk near the bush grooves). Pay careful attention to direction of installation and installation angle.

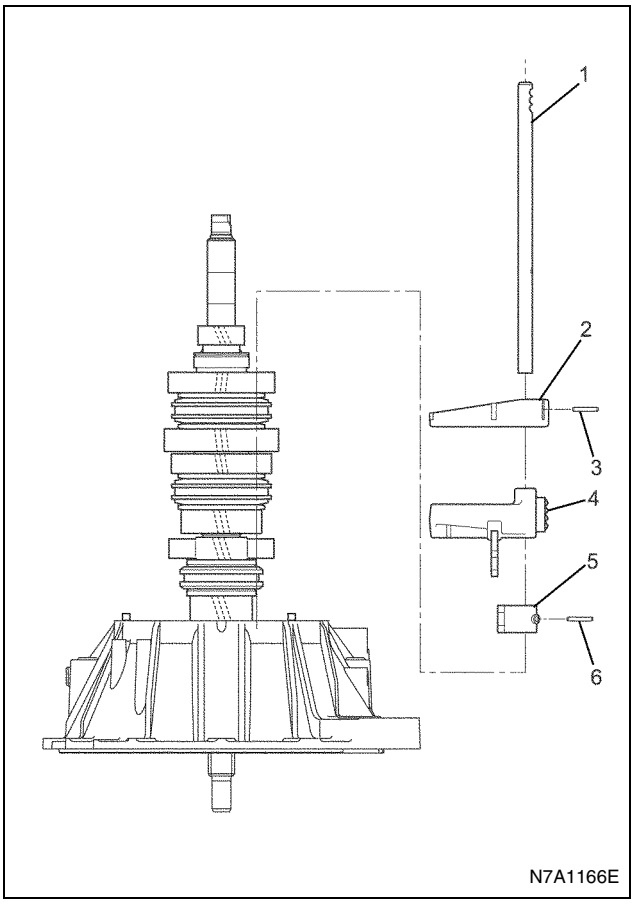


N7A1110E

19. Align the spring pin holes.

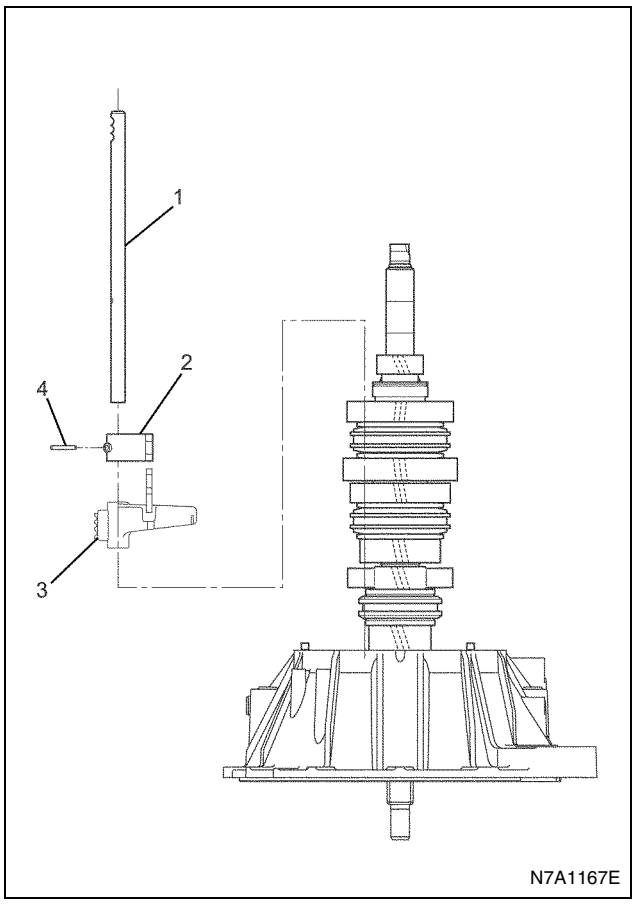
20. Install the 1st / reverse and the 2nd / 3rd shift rod (1) to the 1st / reverse and the 6th shift block (5), the 2nd / 3rd shift arm (4), and the 1st / reverse shift arm (2).
21. Use a hammer to drive the spring pins (3) (6) into the holes.

Caution:
To avoid damaging other parts, place a round shaft at the opposite end of the shift rod when installing the spring pins.



22. Align the spring pin holes.
23. Install the 4th / 5th and the 6th shift rod (1) to the 4th / 5th shift arm (3), the 1st / reverse and the 6th shift block (2).
24. Use a hammer to drive the spring pins (4) into the holes.

Caution:
To avoid damaging other parts, place a round shaft at the opposite end of the shift rod when installing the spring pins.

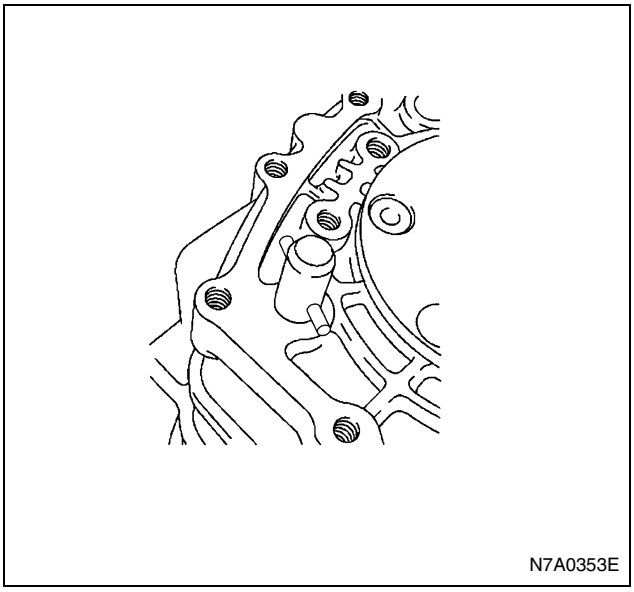


25. Apply Three Bond 1215 to the fitting surfaces of the transmission case and the clutch housing.
    - Remove moisture and oil from the fitting surface prior to application. Set the bead diameter to greater than 2 mm (0.078 in) and make it even all around.
26. Install the clutch housing to the transmission case. Tighten the bolts to the specified torque.

Tighten:
Bolts to 46 N·m (4.7 kg·m / 34 lb·ft)

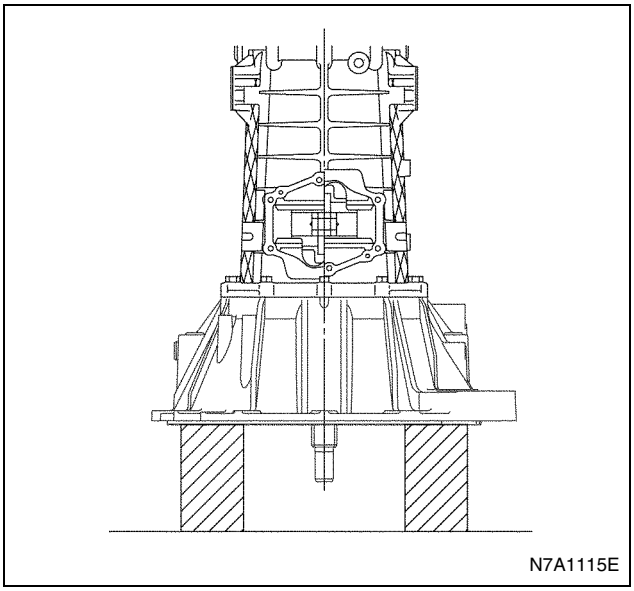
27. Install the bearing rear outer race to the transmission case.
28. Install the snap ring to the 4th / 5th and the 6th gear shift rod.

Notice:
If a snap ring is deformed or damaged, replace it with a new one and verify that it is attached properly.



N7A0353E

29. Attaching the countershim
    a. Put the gear into neutral.
    b. Set the transmission assembly with the housing at the bottom.



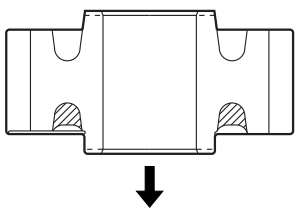
N7A1115E

    c. Break in the taper roller bearing by rotating the countershaft at least 30 times.
    d. Selecting a countershim
        • Measure the depth between the rear most surface of the transmission housing and the outer wheel surfaces of the countershaft rear bearing. Take three measurements at 120-degree intervals, and calculate the average.
        • Select the shim with the appropriate thickness from the table below.

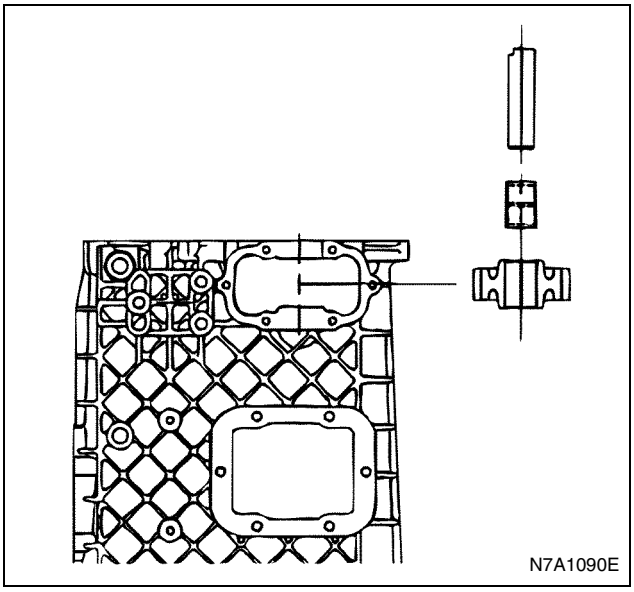
Measured depth mm (in)	Shim thickness mm (in)
2.13 — 2.19 (0.084 — 0.086)	1.98 (0.078)

Measured depth mm (in)	Shim thickness mm (in)
2.07 — 2.13 (0.081 — 0.084)	1.92 (0.076)
2.01 — 2.07 (0.079 — 0.081)	1.88 (0.074)
1.95 — 2.01 (0.077 — 0.079)	1.80 (0.071)
1.89 — 1.95 (0.074 — 0.077)	1.74 (0.069)
1.83 — 1.89 (0.072 — 0.074)	1.68 (0.066)
1.77 — 1.83 (0.070 — 0.072)	1.62 (0.064)
1.71 — 1.77 (0.067 — 0.070)	1.58 (0.062)
1.65 — 1.71 (0.065 — 0.067)	1.50 (0.059)
1.59 — 1.65 (0.063 — 0.065)	1.44 (0.057)
1.53 — 1.59 (0.060 — 0.063)	1.38 (0.054)
1.47 — 1.53 (0.058 — 0.060)	1.32 (0.052)
1.41 — 1.47 (0.056 — 0.058)	1.26 (0.050)
1.35 — 1.41 (0.053 — 0.056)	1.20 (0.047)

30. Install the snap ring (rear outer) to the main shaft rear bearing.
31. Apply engine oil (5W-30) to the needle bearing.
32. Install the reverse idle gear together with the needle bearing and the oil slinger.
33. Install the reverse idle shaft.
    • The arrow indicates the front of the transmission.



N7A0338E



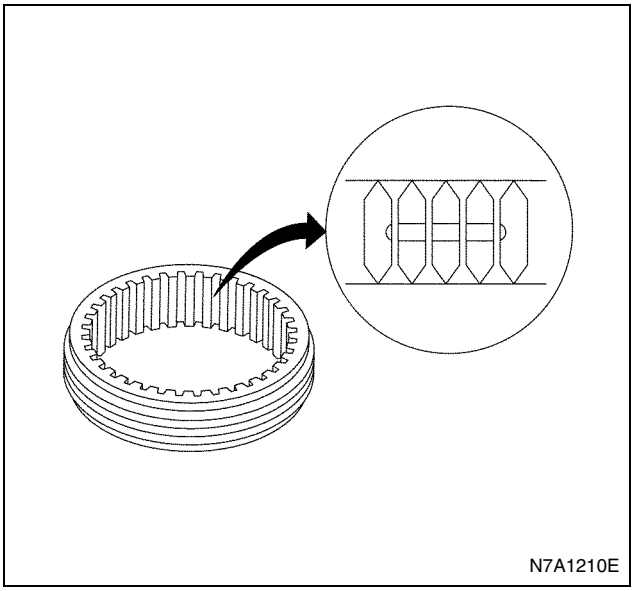
N7A1090E

34. Install the retainer to the transmission case. Tighten the bolts to the specified torque.

Tighten:
Bolts to 26 N·m (2.7 kg·m / 20 lb·ft)

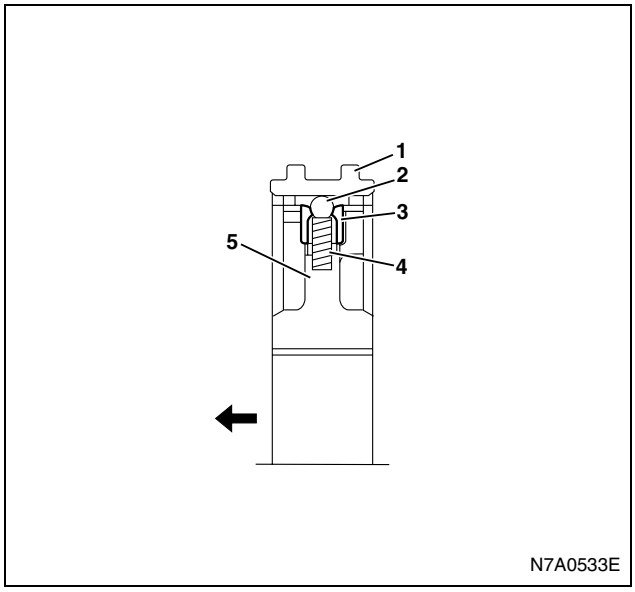
Notice:
Be sure to thoroughly remove sealing material from the screw threads of the transmission housing, and to use a set of new screws.

35. Install the speedometer gear.
36. Install the block and spring to the clutch hub.
37. Adjust the phase so that the three balls fit into the three ball grooves inside the sleeve.



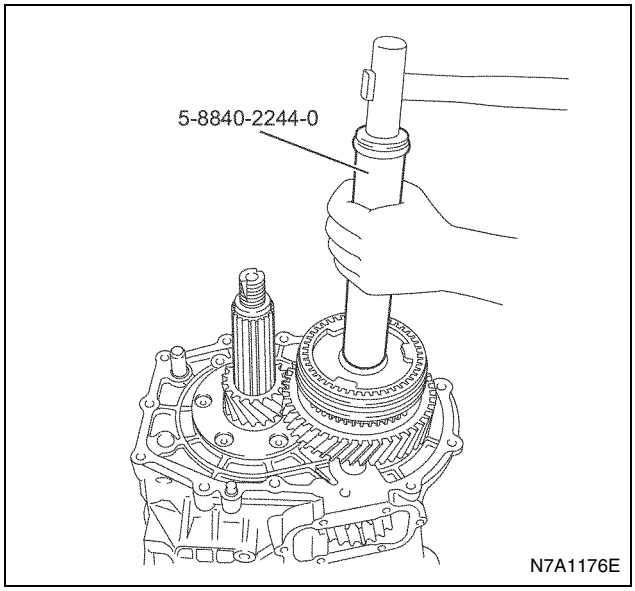
N7A1210E

38. Insert the sleeve (1) into the clutch hub (5) until resistance is felt.
39. Insert the ball (2), the block (3), and the spring (4) into the clutch hub. Be sure that the ball enters the ball groove.
    - The arrow indicates the front of the transmission.



N7A0533E

40. Apply engine oil (5W-30) to the neutral bearing and the inside of the block ring.
41. Assemble the 6th gear the needle bearing, and the 6th gear block ring.
42. Align the above assembly with the clutch hub block ring.
43. Assemble the 6th gear clutch hub assembly and the sleeve.
44. Use the installer (5-8840-2244-0) and a hammer to install the assembled parts.



N7A1176E

45. Use a pair of snap ring pliers to install the 6th gear clutch hub snap ring.
    - From the mountable snap rings, select the thickest one of the three types.

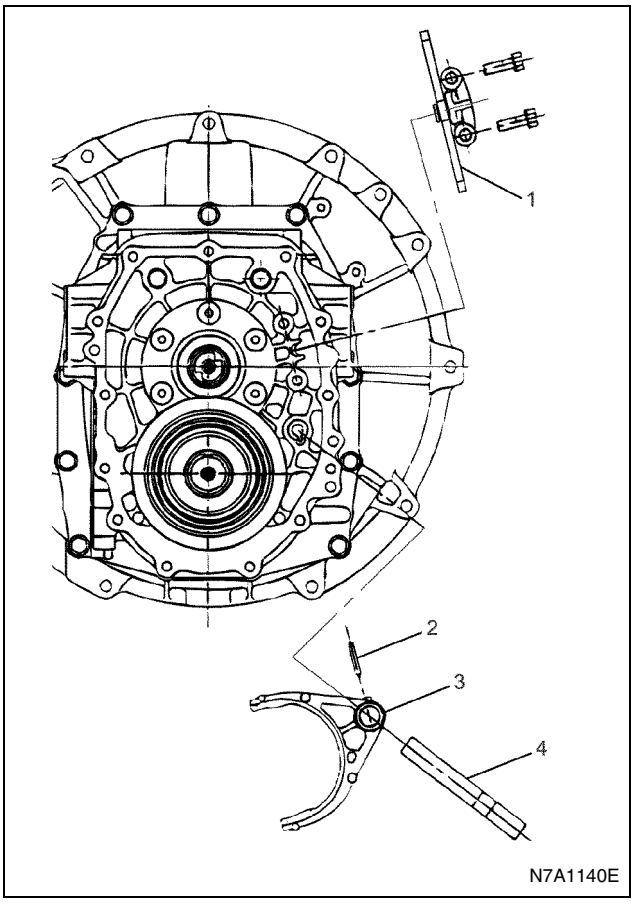
Shim thickness mm (in)	Discernment color
1.6 (0.063)	Pink
1.7 (0.067)	Light blue
1.8 (0.071)	Orange

Shim thickness mm (in)	Discernment color
1.9 (0.075)	Purple

Notice:
If a snap ring is deformed or damaged, replace it with a new one and verify that it is attached properly.

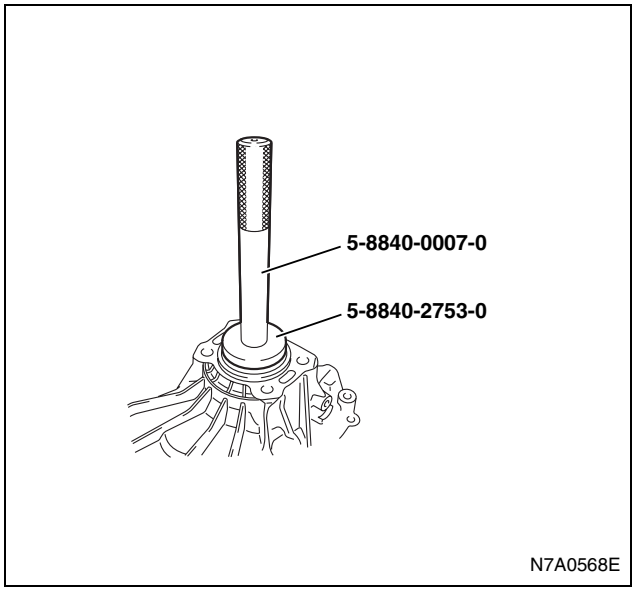
46. Apply engine oil (5W-30) to the shift rod holes in the transmission case.
47. Install the 6th gear shift arm (3) and the 6th gear shift rod (4).
48. Align the spring pin holes.
49. Insert the spring pins (2).
50. Install the relay lever 6th gear (1). Tighten the bolts to the specified torque.

Tighten:
Bolts to 44 N·m (4.5 kg·m / 34 lb·ft)

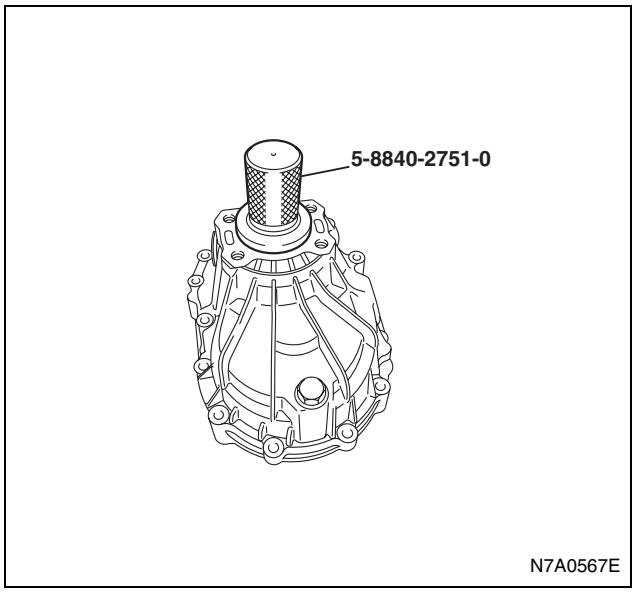


51. Apply multi-purpose type grease to the inside of the main end needle bearing.
52. Apply engine oil (5W-30) to the inside contact surfaces of the rear cover bearing.
53. Use the installer (5-8840-2753-0) and the handle (5-8840-0007-0) to press the needle bearing into the rear cover from the outside. The inscribed mark on the bearing must be facing out.

Caution:
The lipped portion of the oil seal is easily broken. Exercise care during the installation procedure.

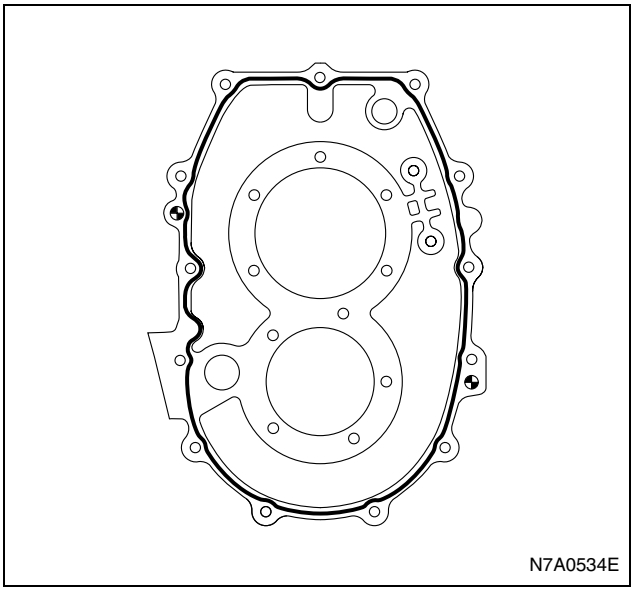


54. Inspect the rear cover oil seal for wear and damage. If wear or damage is present, the oil seal must be replaced.
55. Apply multi-purpose type grease to the lip portion of the oil seal.
56. Apply engine oil (5W-30) to the outer circumference of the oil seal.
57. Use the installer (5-8840-2751-0) to press the oil seal into the rear cover.



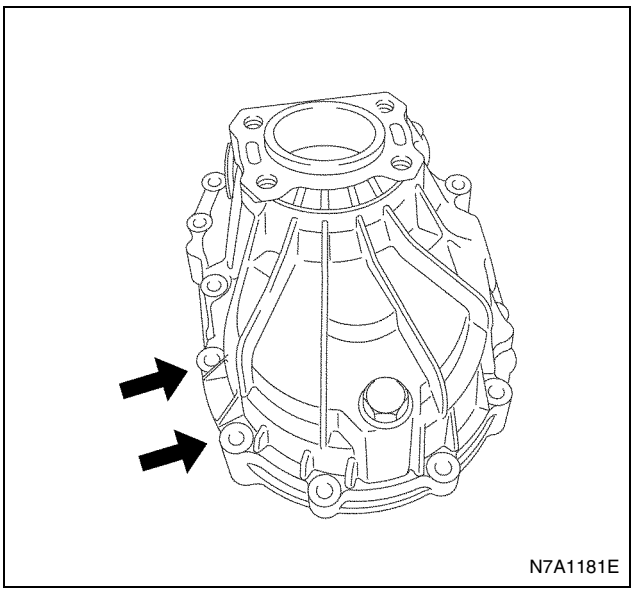
58. Apply Three Bond 1215 to the contact surfaces of the transmission case and the rear cover.
59. Install the rear cover to the transmission case. Tighten the bolts to the specified torque.
    - Remove moisture and oil from the fitting surface prior to application. Set the bead diameter to greater than 2 mm (0.078 in) and make it even all around.

Tighten:
Bolts to 46 N·m (4.7 kg·m / 34 lb·ft)



N7A0534E

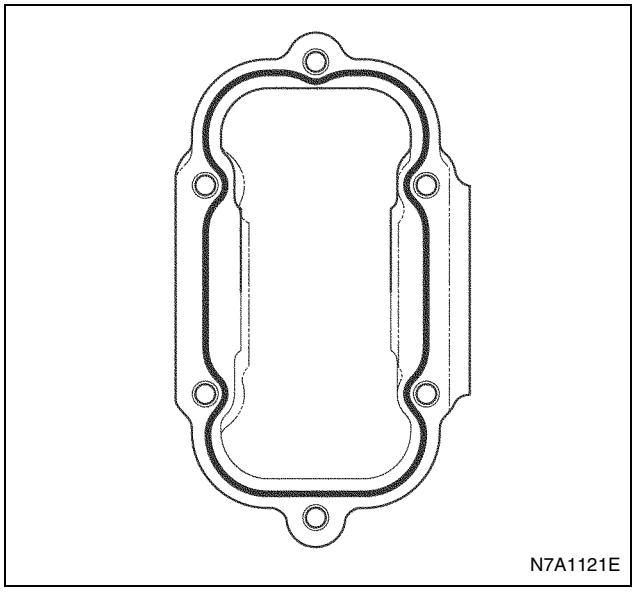
Notice:
The two bolts, indicated by the arrows, have lock-tight material applied to them. Be sure to thoroughly remove sealing material from the threads and to use new bolts with lock-tight material.



N7A1181E

60. Align the contact surfaces of the transmission case reverse gear side cover.
61. Apply Three Bond 1215 to the contact surfaces.
62. Install the reverse gear side cover. Tighten the bolts to the specified torque.

Tighten:
Bolts to 20 N·m (2.0 kg·m / 15 lb·ft)

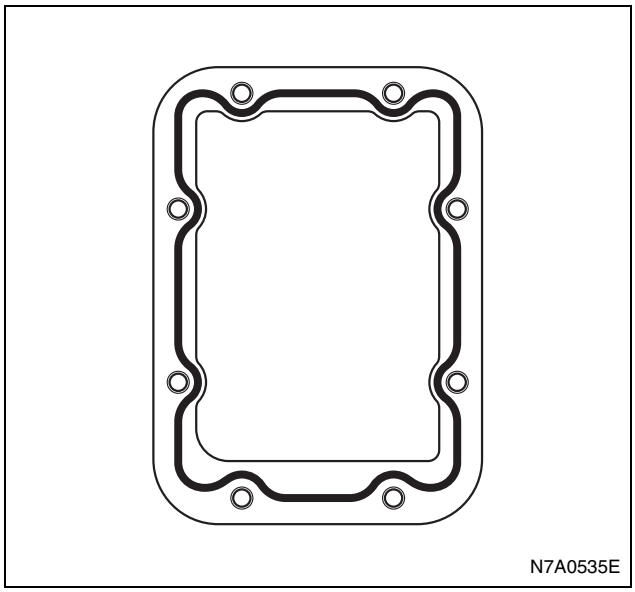


N7A1121E

63. Align the contact surfaces of the transmission case PTO cover.
64. Apply Three Bond 1215 to the contact surfaces.
65. Install the PTO cover. Tighten the bolts to the specified torque.

Tighten:
Bolts to 37 N·m (3.8 kg·m / 27 lb·ft)

Notice:
The bolts have lock-tight material applied to them. Be sure to thoroughly remove sealing material from the threads and to use new bolts with lock-tight material.



N7A0535E

66. Place the transmission in the neutral position.
67. Align the contact surfaces of the transmission case control box (1).
68. Apply Three Bond 1215 to the contact surfaces.
69. Install the interlock plate (8) and the control box. Tighten the bolts to the specified torque.

Tighten:
Bolts to 27 N·m (2.8 kg·m / 20 lb·ft)

Notice:
The bolts have lock-tight material applied to them. Be sure to thoroughly remove sealing material from the threads and to use new bolts with lock-tight material.

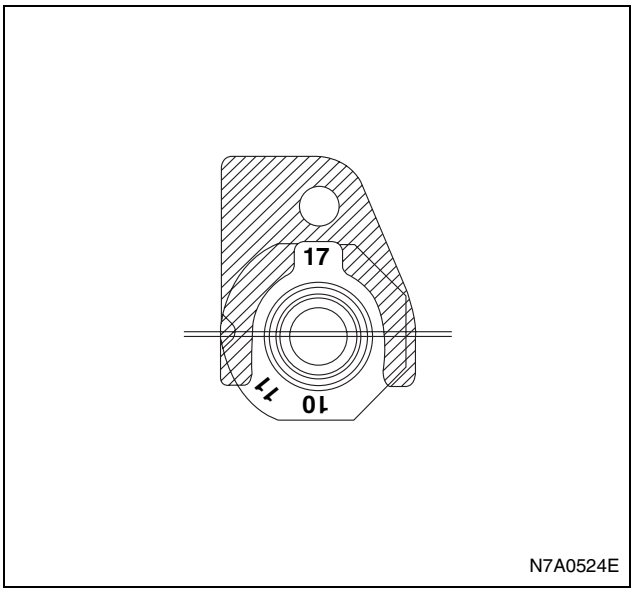
70. Install the 4 detent assemblies (7), (6), (5) and (4). Tighten the bolts to the specified torque.

Tighten:
Bolts to 27 N·m (2.8 kg·m / 20 lb·ft)

71. Apply liquid gasket (Three Bond 1141) to the threaded portion of the reverse switch.
72. Install the reverse switch (3). Tighten the bolt to the specified torque.

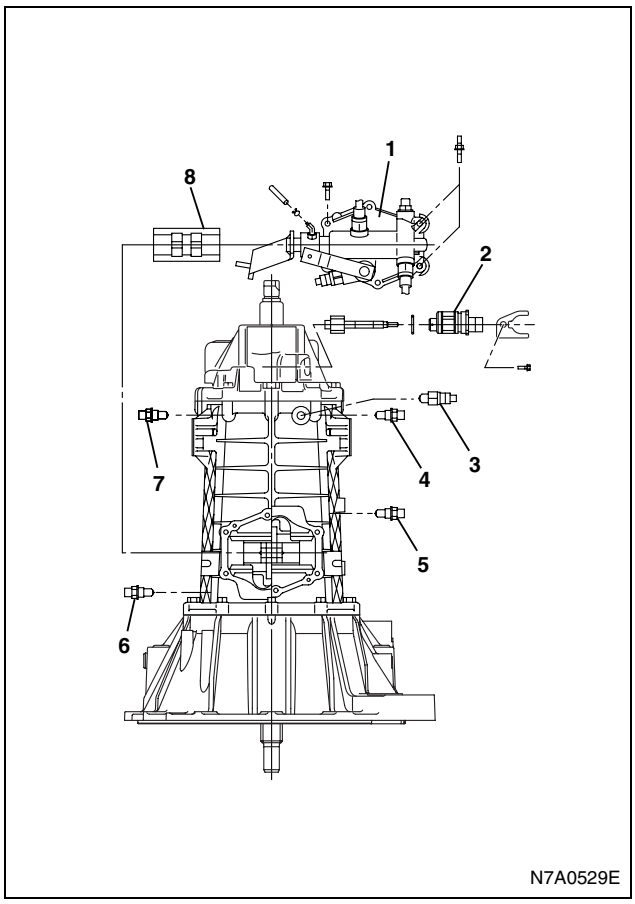
Tighten:
Bolt to 39 N·m (4 kg·m / 29 lb·ft)

73. Apply engine oil (5W-30) to the speedometer driven gear (2) and the O-ring.
    - Align the gear tooth marked 17 of the speedometer's driven gear (17 teeth) with the opening in the plate.



74. Install the driven gear together with the O-ring. Tighten the bolts to the specified torque.

Tighten:
Bolts to 20 N·m (2 kg·m / 15 lb·ft)



75. Apply engine oil (5W-30) to the drain plug and the O-ring.
76. Install the drain plug together with the O-ring. Tighten the bolts to the specified torque.

Tighten:
Bolts to 39 N·m (4 kg·m / 29 lb·ft)

77. Apply engine oil (5W-30) to the filler plug and the O-ring.
78. Install the filler plug together with the O-ring. Tighten the bolts to the specified torque.

Tighten:
Bolt to 39 N·m (4 kg·m / 29 lb·ft)

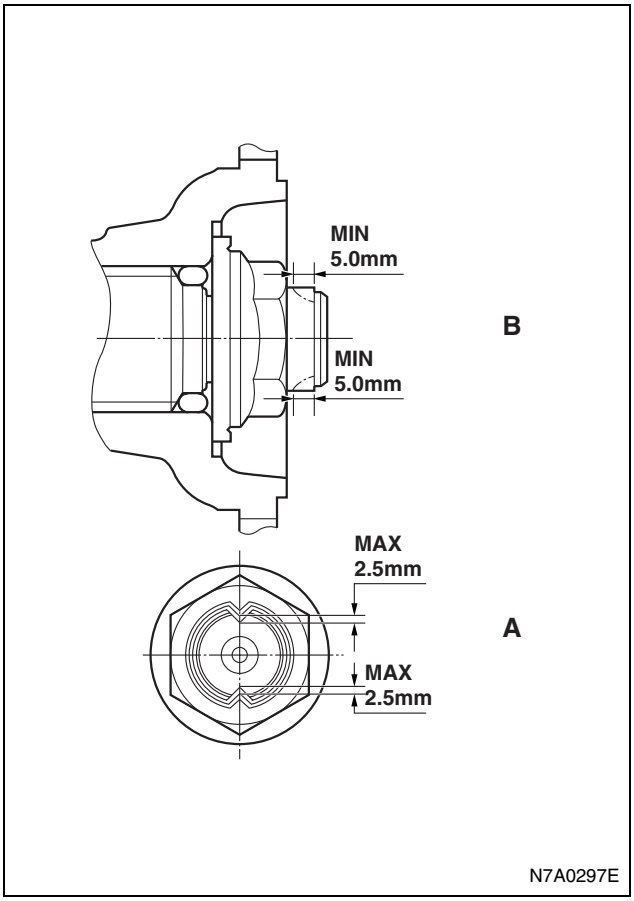
79. Install the parking brake assembly.
    - Refer to PARKING BRAKES.
80. Install the parking brake bracket to the transmission case. Tighten the bolts to the specified torque.

Tighten:
Bolts to 48 N·m (4.9 kg·m / 35 lb·ft)

81. Apply engine oil (5W-30) to the coupling driver and the O-ring.
82. Install the coupling driver together with the O-ring.
83. Apply engine oil (5W-30) to the seating surface of the new coupling driver lock nut.
84. Use the special tool (9-8529-2101-0) to tighten the lock nut to the specified torque.

Tighten:
Lock nut to 382 N·m (39 kg·m / 282 lb·ft)

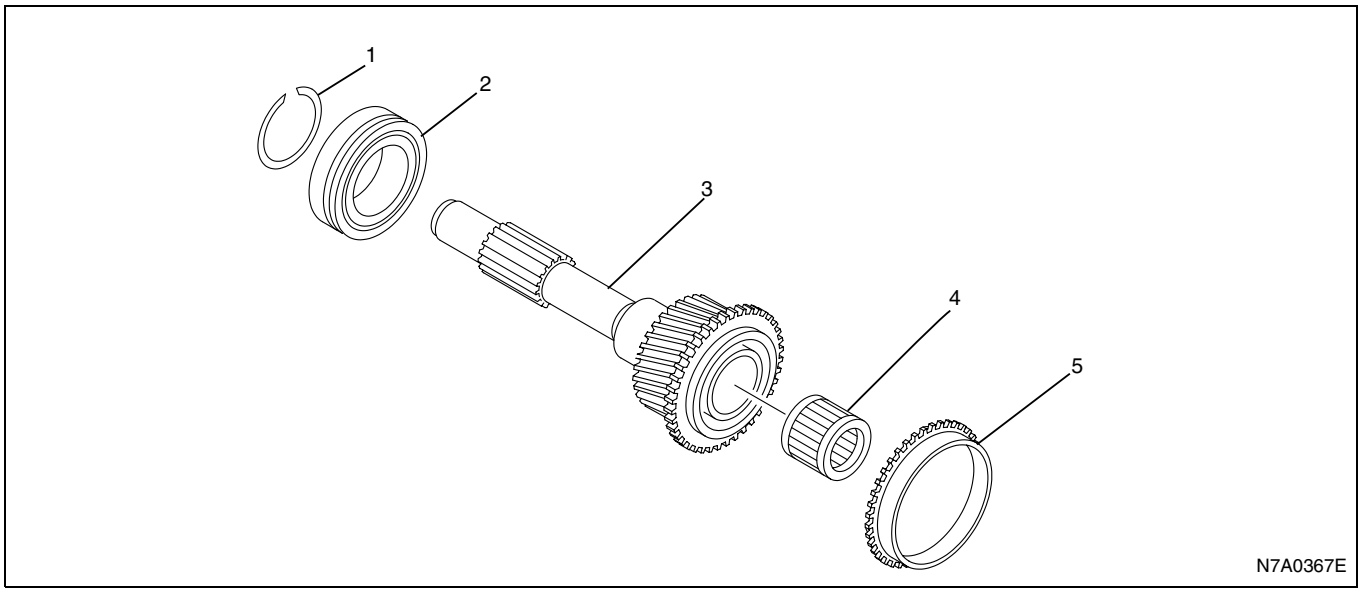
85. Align the lip portion of the lock nut with the V-groove at the end of the shaft (length (B) must be at least 5 mm (0.2 in)). Wedge the lipped portion of the nut into the V-groove so that the gap between the nut and the bottom of the V-groove (A) is less than 2.5 mm (0.1 in).
86. Caulk the lock nut at two places (caulking form: tip radius approximately 1 mm with caulking sites 60 degrees away form each other).



87. Install the parking brake drum.
    - Refer to PARKING BRAKES.
88. Install the shift block together with the release bearing, the clutch shaft, and the shift fork.
    - Refer to CLUTCH.

Top Gear Shaft

Parts



Legend

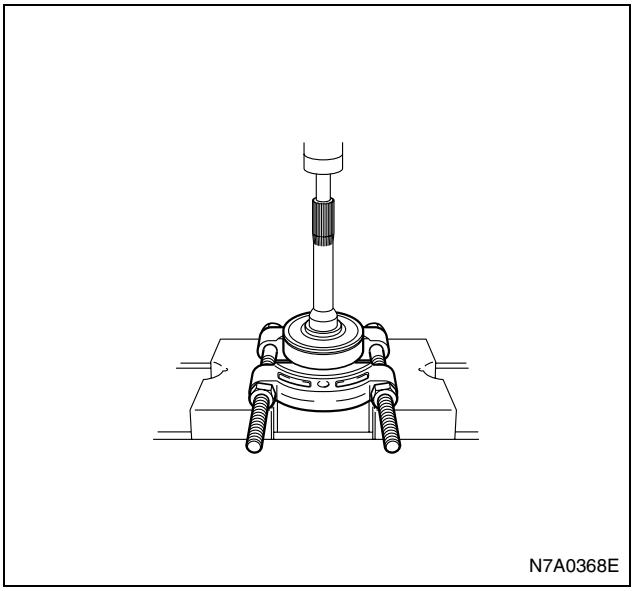
1. Snap ring
2. Bearing
3. Top gear shaft
4. Needle bearing
5. Block ring

Disassembly

1. Remove the block ring from the top gear shaft.
2. Remove the needle bearing from the top gear shaft.

Notice:
The needle bearing is of a separator type. Be careful not to drop the roller when dissembling.

3. Use a pair of snap ring pliers to remove the snap ring from the top gear shaft.
4. Use a press and a bearing remover to remove the bearing from the top gear shaft.

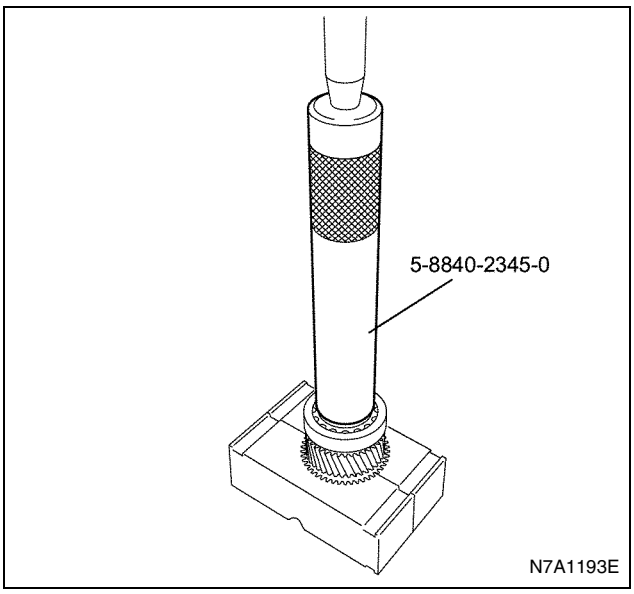


5. Inspect each of the disassembled parts for wear and damage. If wear or damage is present, make the necessary repairs or replace the part(s).
6. Inspect the gear teeth, the spline, and the end contact surfaces for wear and damage. If wear or damage is present, the part(s) must be replaced.
7. Inspect each of the bearings. The bearings must rotate smoothly and quietly. There must be no corrosion. Play in the thrust direction must be normal. Replace the bearing(s) if these conditions are not met.

8. Inspect the needle bearing rolling surface and roller for discoloration, excessive wear, and pitching. Replace the bearing if any of these conditions are present.

Reassembly

1. Use the installer (5-8840-2345-0) and a press to install the bearing to the top gear shaft.



2. Use a pair of snap ring pliers to install the snap ring to the top gear shaft.
3. Install the needle bearing to the top gear shaft.
4. Thoroughly apply 5W-30 engine oil to the inner surface of the block ring, then attach the block ring to the upper gear shaft.

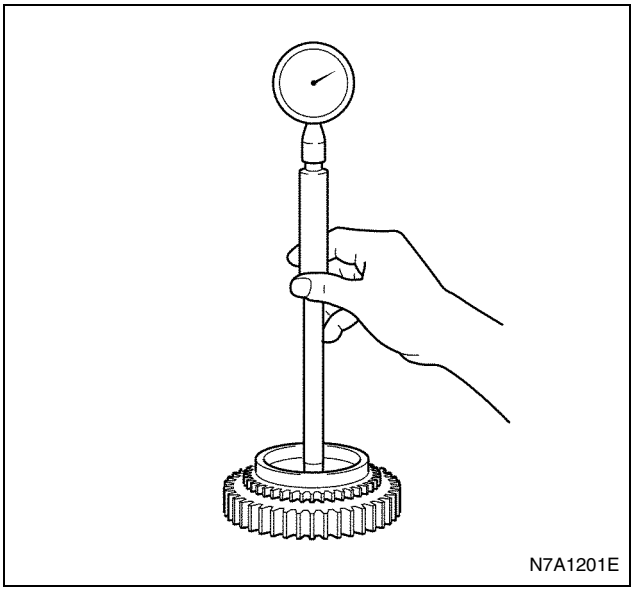
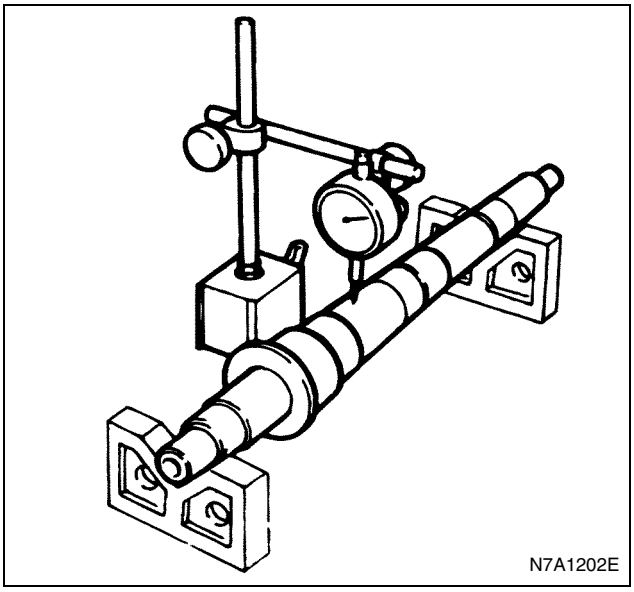
10. Inspect each of the bearings for roughness, abnormal operating noise, corrosion, internal and external damage, and excessive play (in the direction of the slide). Repair or replace the bearings as required.
11. Use an inside dial gauge to measure the inside diameter of each of the gears. If the measured diameter exceeds the specified limit, the gear must be replaced.

Gear inside diameter		mm (in)
Gear	Standard range	Limit
6th	50.009 — 50.025 (1.968 — 1.969)	50.065 (1.971)
5th	48.009 — 48.025 (1.890 — 1.890)	48.065 (1.892)
4th	55.010 — 55.029 (2.165 — 2.166)	55.069 (2.168)
3rd	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)
2nd	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)
1st	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)
Reverse	63.010 — 63.029 (2.480 — 2.481)	63.069 (2.483)

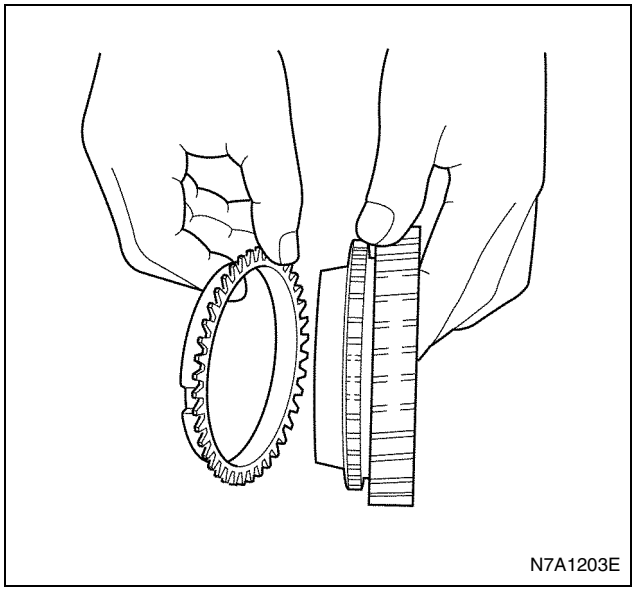


12. Use a dial gauge to measure the main shaft deflection (curvature). If the deflection exceeds the specified limit, the shaft must be replaced.

Main shaft deflection	mm (in)
Standard	Limit
0.015 (0.001)	0.1 (0.004)

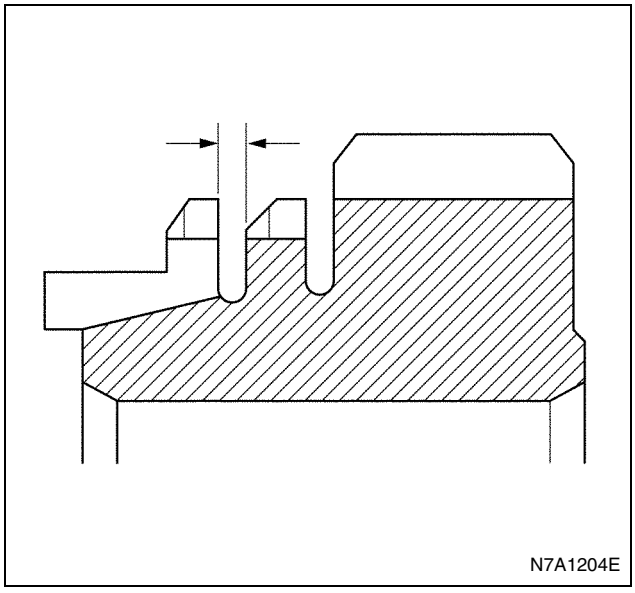


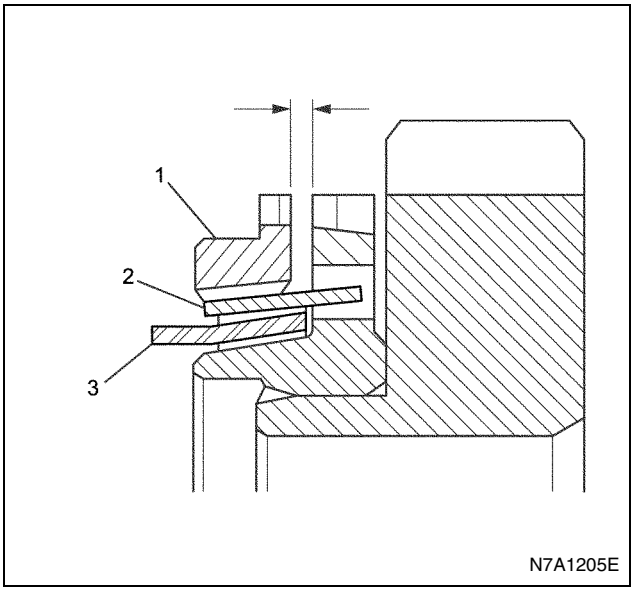
13. Inspect the synchromesh mechanism. Use an oil stone or a pencil grinder to correct light stepping and other minor imperfections.



14. Use a thickness gauge to measure the gaps between the block ring and the dog gear. If the gap exceeds the specified limit, the block ring must be replaced.

Block ring and dog gear gap		mm (in)
Gear	Standard range	Limit
4th / 5th / 6th	1.03 — 2.60 (0.04 — 0.10)	0.50 (0.02)
2nd / 3rd	1.00 — 2.50 (0.04 — 0.10)	0.50 (0.02)
1st / Reverse	1.00 — 2.50 (0.04 — 0.10)	0.50 (0.02)



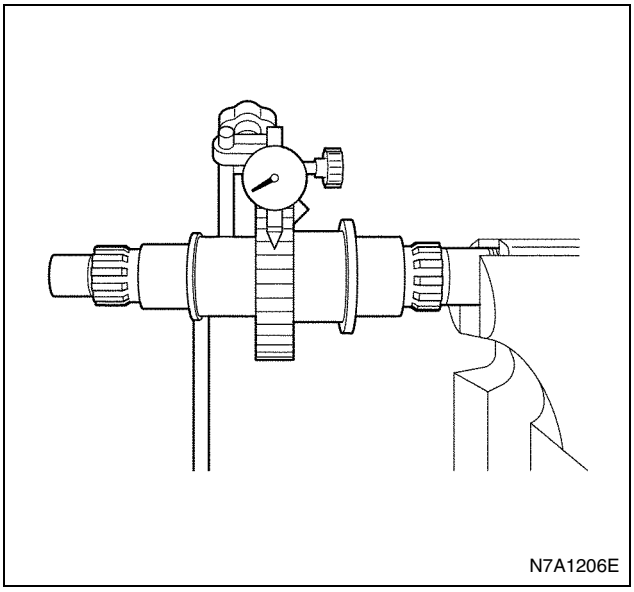


Legend

1. Block ring
2. Outside ring
3. Inside ring

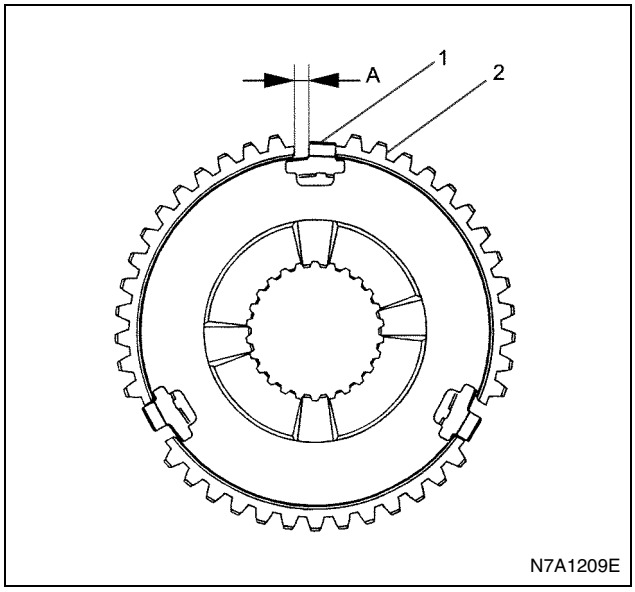
15. Inspect the clutch hub and sliding sleeve contact surfaces for wear and/or damage.
16. Inspect the spline interior and groove for wear and/or damage.
17. Measure the spline play in the direction of rotation (above the clutch hub outside circumference). If the play exceeds the specified limit, the spline must be replaced.

Spline play	mm (in)
Standard	
0 — 0.16 (0 — 0.01)	



18. Measure the gaps (A) at the clutch hub and the protrusion of the block ring using a thickness gauge.
    - If the measurements exceed the limits, replace the block and clutch hub.

Block and clutch hub gap	mm (in)
Gear	Limit
5th / 4th 6th	4.30 — 4.70 (0.17 — 0.19)
1st / Reverse 3rd / 2nd	3.30 — 3.70 (0.13 — 0.15)

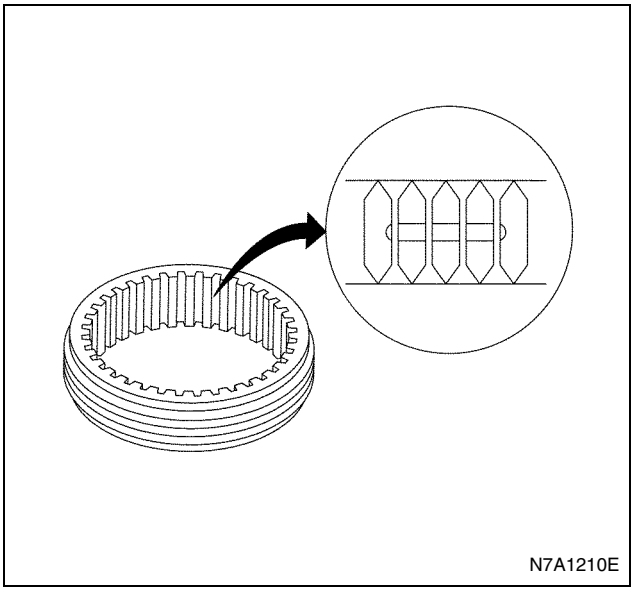


Legend

1. Block ring
2. Clutch hub

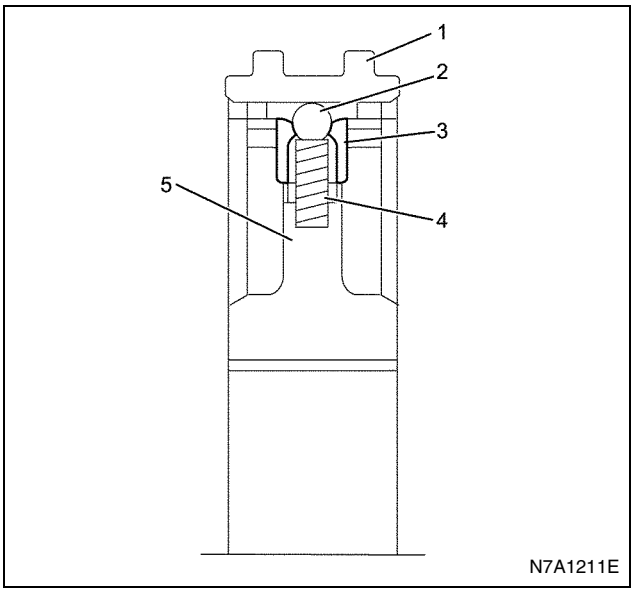
Reassembly

1. Clean all the parts.
2. Place the main shaft in a vise. The long end of the spline must be facing down.
3. Install the block and spring to the 2nd / 3rd clutch hub.
4. Insert the 3 balls into the 3 insert grooves inside the sleeve. Position the balls carefully to set the phase.



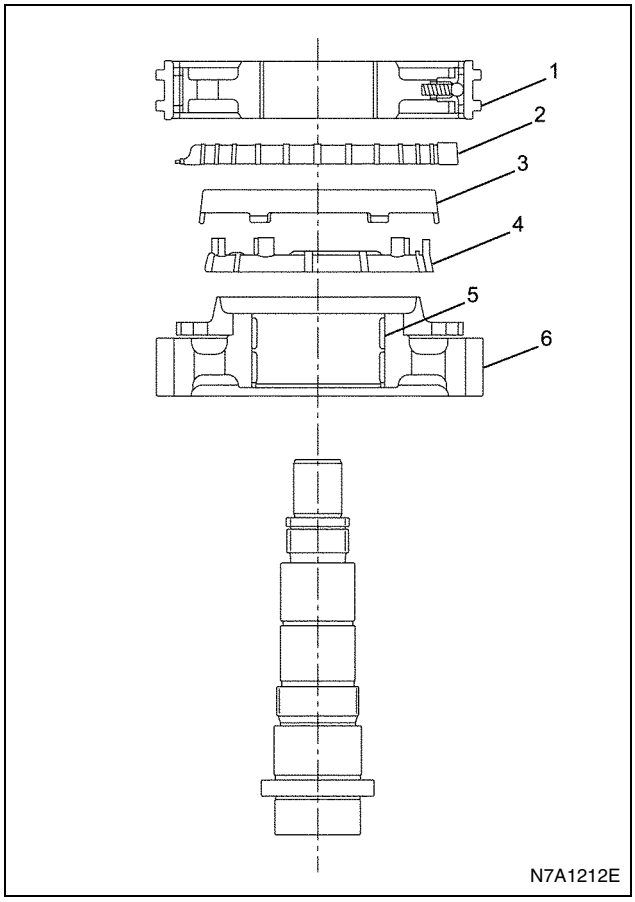
N7A1210E

5. Install the sleeve (1) to the clutch hub (5). The sleeve should press slightly against the block.
6. Press on the ball (2), the block (3), and the spring (4). Insert the sleeve into the ball groove until it touches the ball.



N7A1211E

7. Apply 5W-30 engine oil to the needle bearing, 2nd gear thrust surface, and the tapered surface of the synchronization cone. Face the dog gear upward and attach the 2nd gear (6) and needle bearing (5) to the main shaft.
8. Attach the 2nd-gear inside ring (4), 2nd-gear outside ring (3), and 2nd-gear block ring (2) so that the teeth of the outside ring mesh with those of the dog gear.
9. Insert the 6 pawls on the inside ring into the holes in the hub.
10. Use the installer (5-8840-2345-0) to press the 2nd / 3rd clutch hub assembly and sleeve (1) into place.

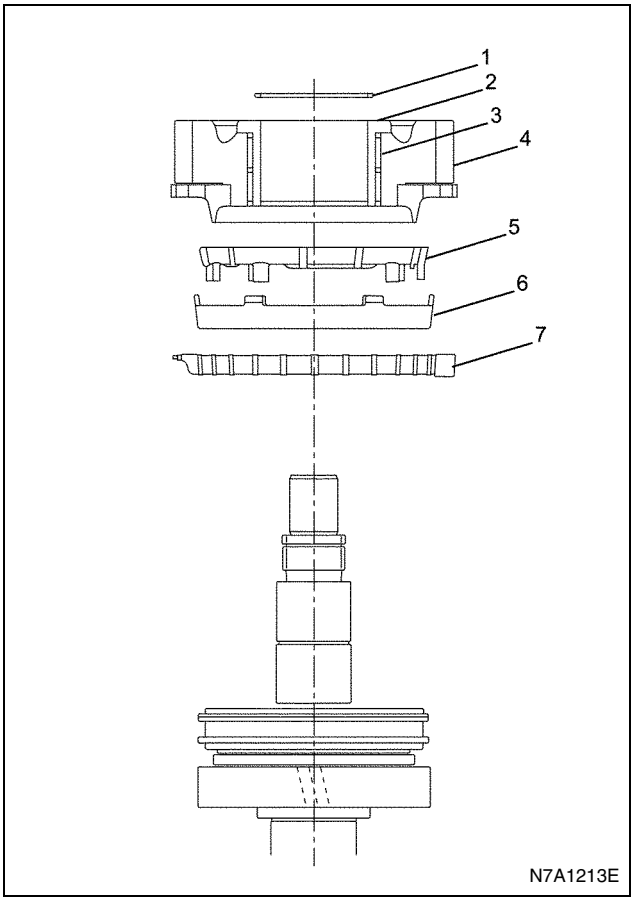


N7A1212E

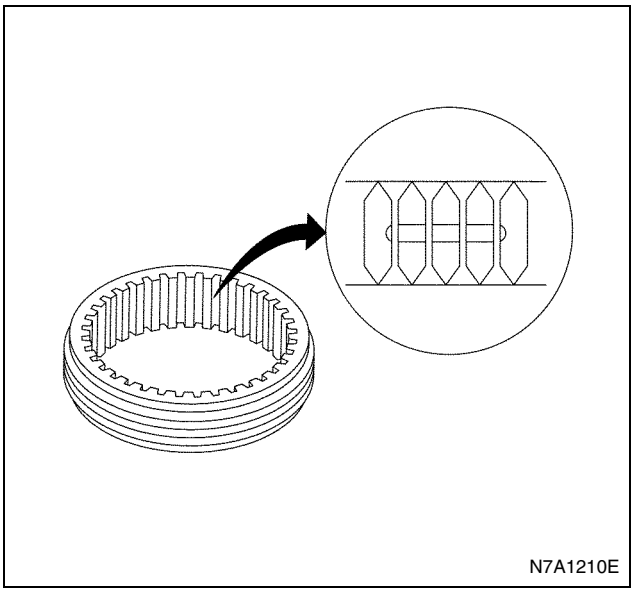
11. Attach the 3rd-gear block ring (7), 3rd-gear outside ring (6), 3rd-gear inside ring (5) so that the six teeth mesh with those of the hub. Make sure to thoroughly apply 5W-30 engine oil to both sides of the inside ring and outside ring as well as the inside surface of the block ring.
12. Apply 5W-30 engine oil to the needle bearing, 3rd-gear thrust surface, and the tapered surface of the synchronization cone. Face the dog gear downward and press-fit the 3rd gear (4), needle bearing (3), and collar (2) using the installer (5-8840-2345-0) so that the teeth of the outer ring mesh with those of the dog gear of the 3rd gear.
13. Use a pair of pliers to install the snap ring (1).

Caution:

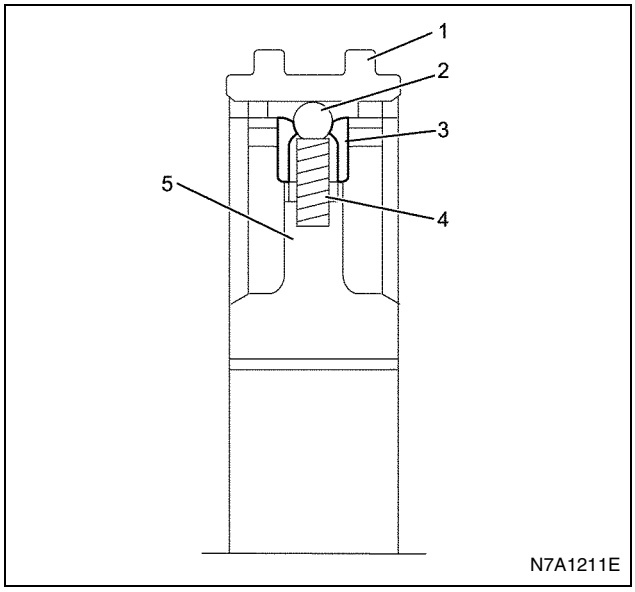
- If the snap ring is bent or otherwise damaged, it must be replaced with a new one.
- Be sure that the snap ring is completely installed to the snap ring groove.



14. Install the block and spring to the 4th / 5th clutch hub.
15. Insert the 3 balls into the 3 insert grooves inside the sleeve. Position the balls carefully to set the phase.



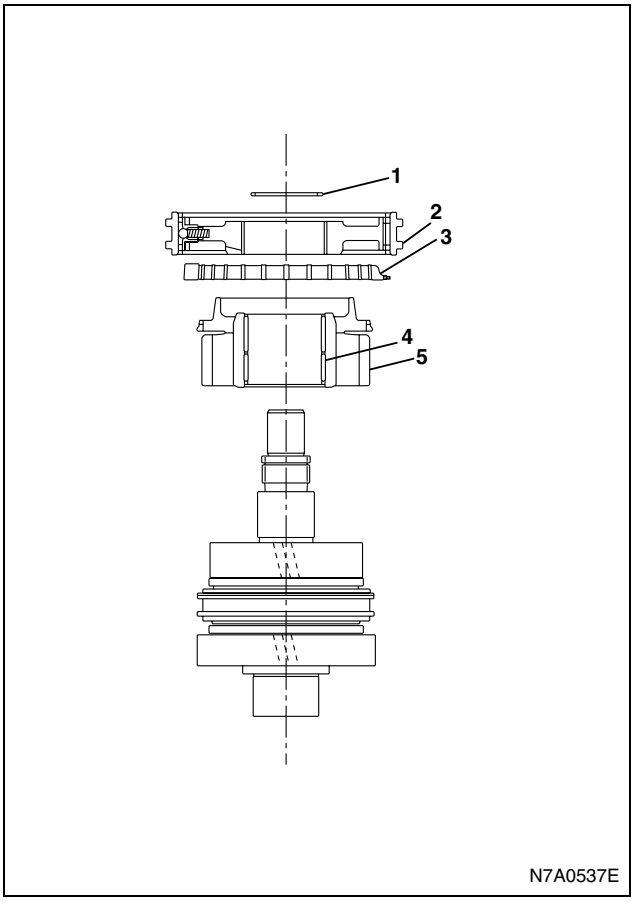
16. Install the sleeve (1) to the clutch hub (5). The sleeve should press slightly against the block.
17. Press on the ball (2), the block (3), and the spring (4). Insert the sleeve into the ball groove until it touches the ball.



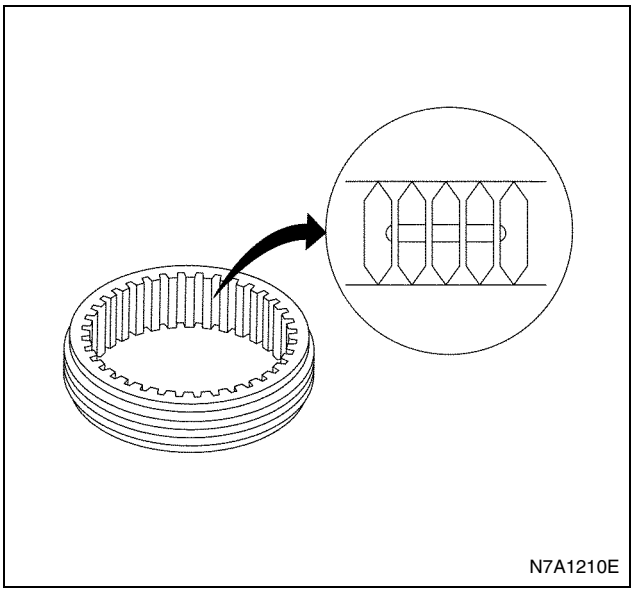
18. Apply engine oil (5W-30) to the needle bearing, the 4th gear thrust surfaces, and the synchrotron taper.
19. Install the 4th gear (5) and the needle bearing (4) to the main shaft. The dog gear must be facing up.
20. Apply engine oil (5W-30) to the 4th block ring (3).
21. Use the installer (5-8840-2345-0) to press the 4th / 5th clutch hub assembly and sleeve (2) into the groove in the 4th / 5th block ring.
22. Use a pair of pliers to install the snap ring (1).

Caution:

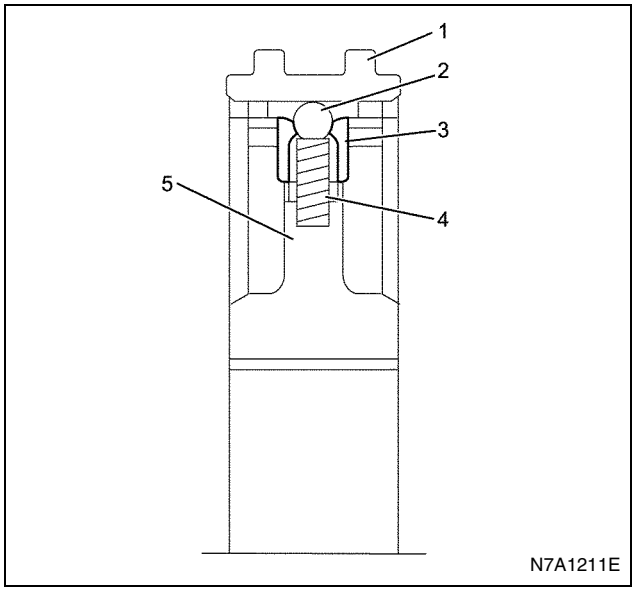
- If the snap ring is bent or otherwise damaged, it must be replaced with a new one.
- Be sure that the snap ring is completely installed to the snap ring groove.



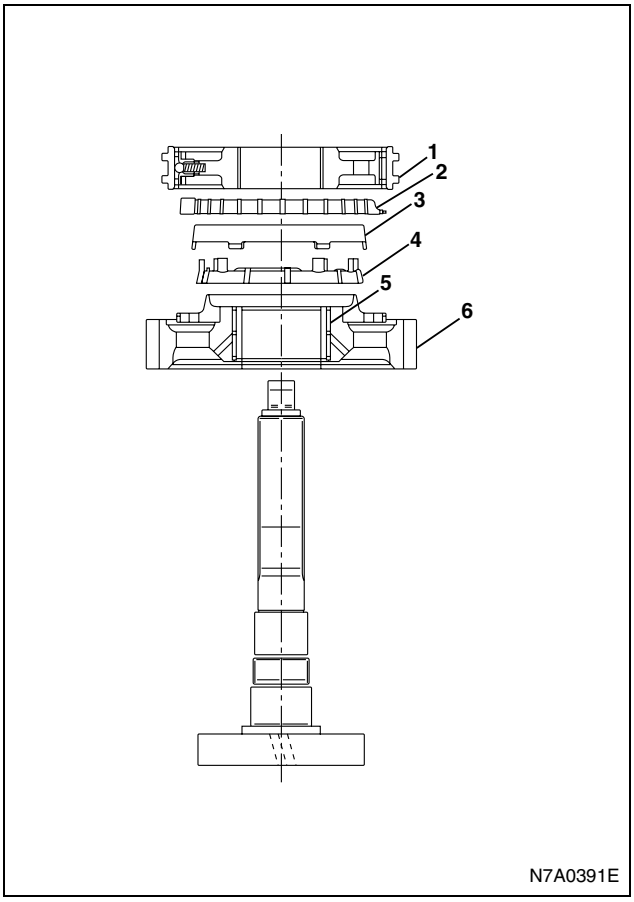
23. Install the block and spring to the 1st / reverse clutch hub.
24. Insert the 3 balls into the 3 insert grooves inside the sleeve. Position the balls carefully to set the phase.



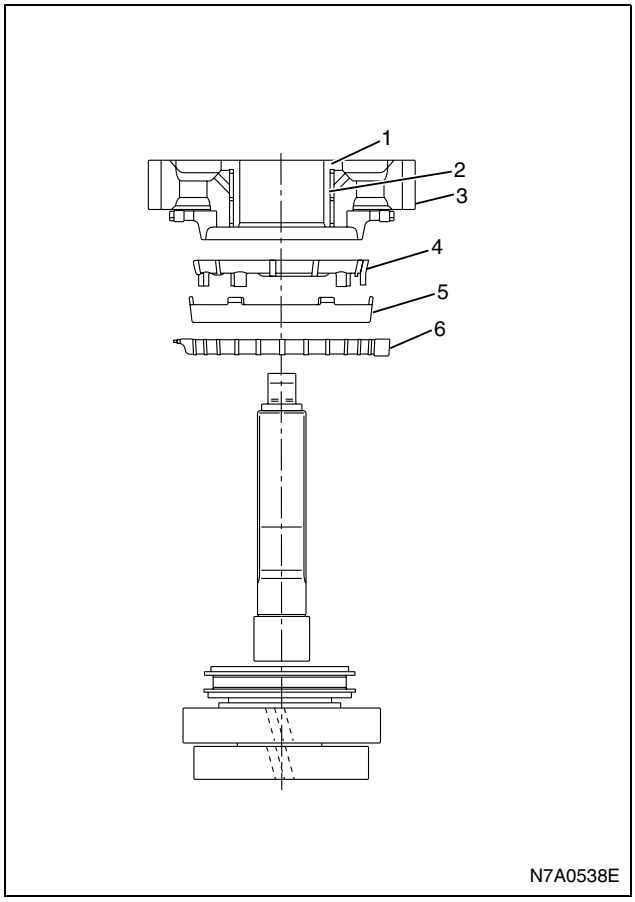
25. Install the sleeve (1) to the clutch hub (5). The sleeve should press slightly against the block.
26. Press on the ball (2), the block (3), and the spring (4). Insert the sleeve into the ball groove until it touches the ball.



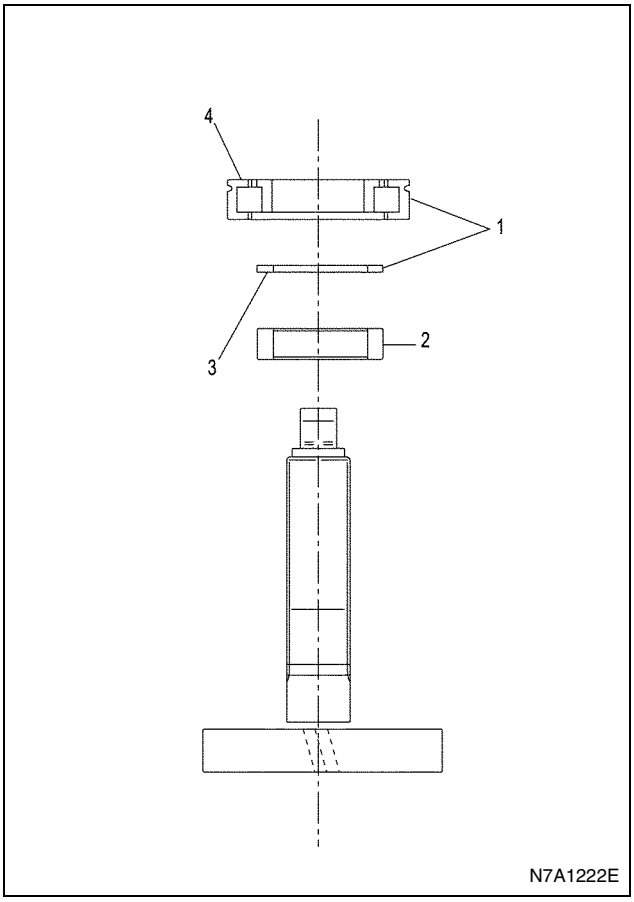
27. Apply engine oil (5W-30) to the needle bearing, the 1st gear thrust surfaces, and the synchrotron taper.
28. Install the 1st gear (6) and the needle bearing (5) to the main shaft. The dog gear must be facing up.
29. Assemble the 1st-gear inside ring (4), 1st-gear outside ring (3), and 1st-gear block ring (2) in that order. Then attach them so that the teeth of the outer ring mesh with those of the dog gear of the 1st gear. Be sure to thoroughly apply 5W-30 engine oil to both sides of the inside ring and outside ring as well as the inside surface of the block ring.
30. Insert the 6 pawls on the 1st gear inside ring into the 6 hub holes.
31. Use the installer (5-8840-2345-0) to press the 1st / reverse clutch hub assembly and sleeve (1) into place.



32. Apply engine oil (5W-30) to the reverse gear block ring (6), the reverse outside ring (5), and the reverse inside ring (4).
33. Align the block ring groove phase with the 1st / reverse clutch hub assembly and sleeve.
34. Install the block ring.
35. Apply engine oil (5W-30) to the needle bearing and the reverse gear thrust surfaces.
36. Align the reverse gear with the pawl on the outer ring to set the synchrotron phase.
37. Use the installer (5-8840-2345-0) to press the reverse gear (3), the needle bearing (2), and the collar (1) into place.



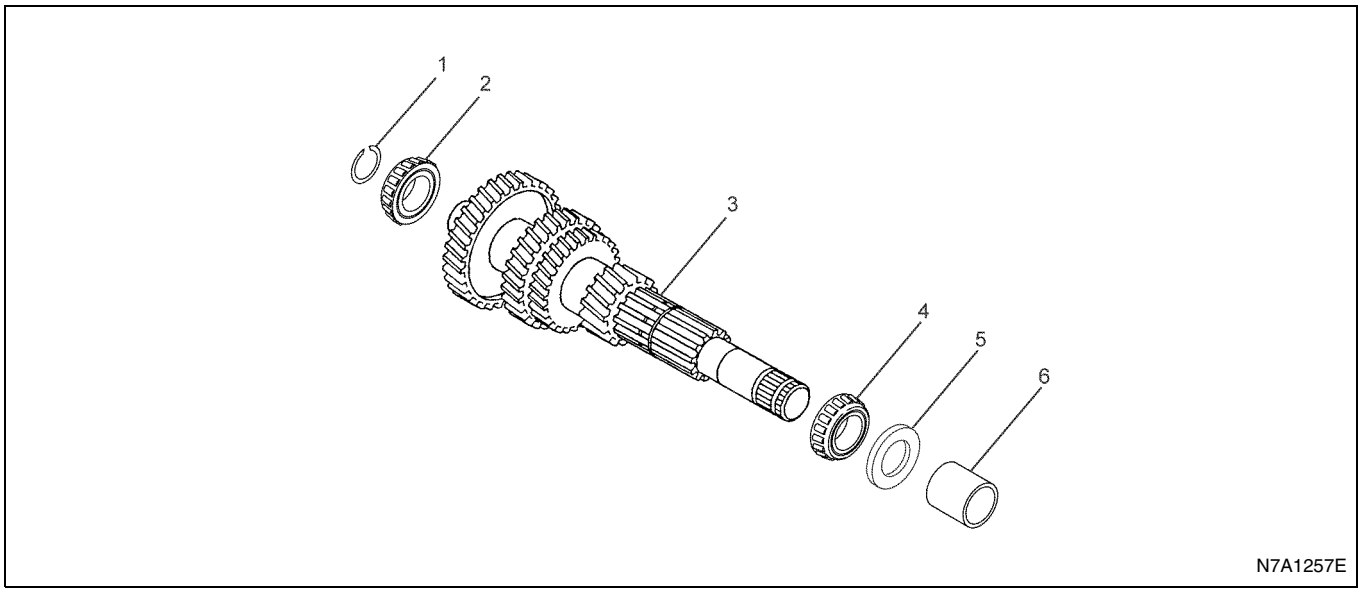
38. Install the spacer (2).
39. Use the installer (5-8840-2345-0) to press the bearing (1) into place. The bearing surface 'A' mark (4) must be facing up. The bearing surface 'B' mark (3) must be facing down.



40. Install the 6th gear. The projecting portion of the gear must be facing down.

Countershaft

Parts



Legend

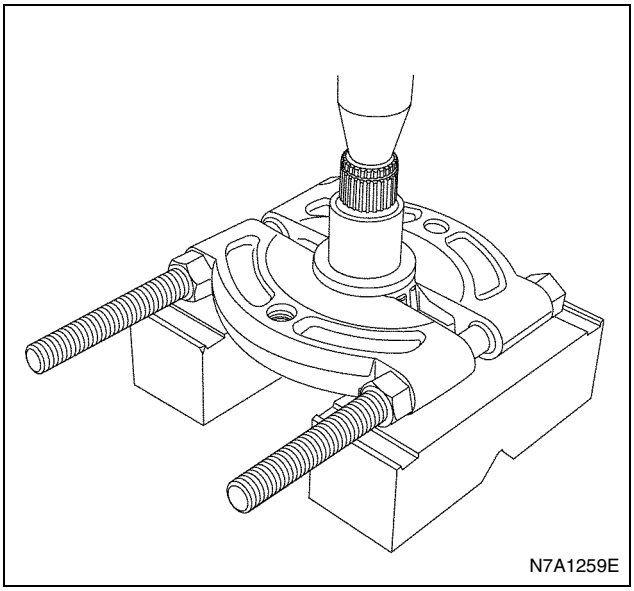
1. Snap ring
2. Bearing (Front of countershaft)
3. Countershaft assembly
4. Bearing (Back of countershaft)
5. Thrust washer
6. Collar

Disassembly

1. Use a pair of snap ring pliers to remove the snap ring holding the bearings in place.
2. Use a bearing separator or the like to remove the bearing from the front of the countershaft.

Caution:
Replace the bearing with inner race and outer race to new one.

3. Use a bearing remover and a press to remove the collar and the thrust washer.



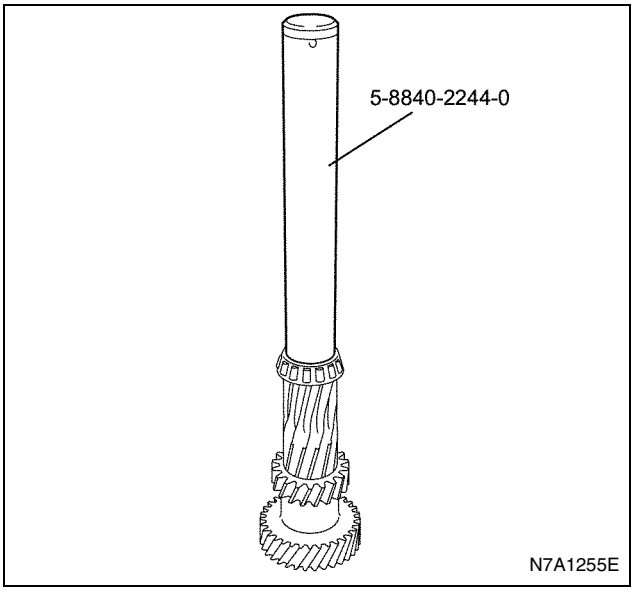
4. Use a bearing separator or the like to remove the bearing from the rear of the countershaft.

Caution:
Replace the bearing with inner race and outer race to new one.

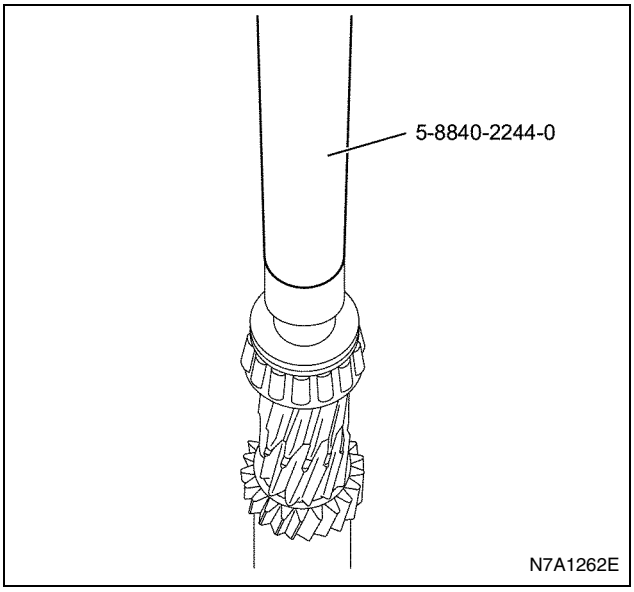
5. Inspect the disassembled parts for wear and/or other damage. Repair or replace damaged parts as required.
6. Check the cross-sectional area of each gear for significant wear and/or damage. If wear of damage is present, the gear must be replaced.
7. Inspect each of the bearings for roughness, abnormal operating noise, corrosion, internal and external damage, and excessive play (in the direction of the slide). Repair or replace the bearings as required.

Reassembly

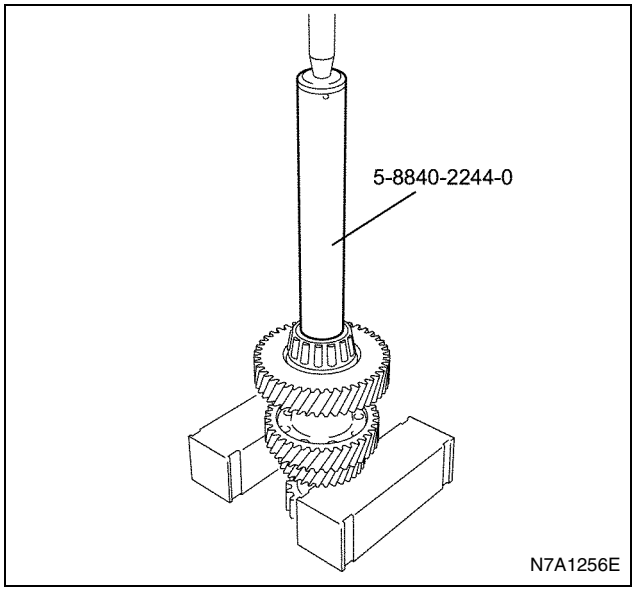
1. Use the installer (5-8840-2244-0) and a press to force the rear countershaft bearing into place.



2. Use the installer (5-8840-2244-0) and a press to force the collar and thrust washer into place.



3. Use the installer (5-8840-2244-0) and a press to force the bearing on to the front of the countershaft.

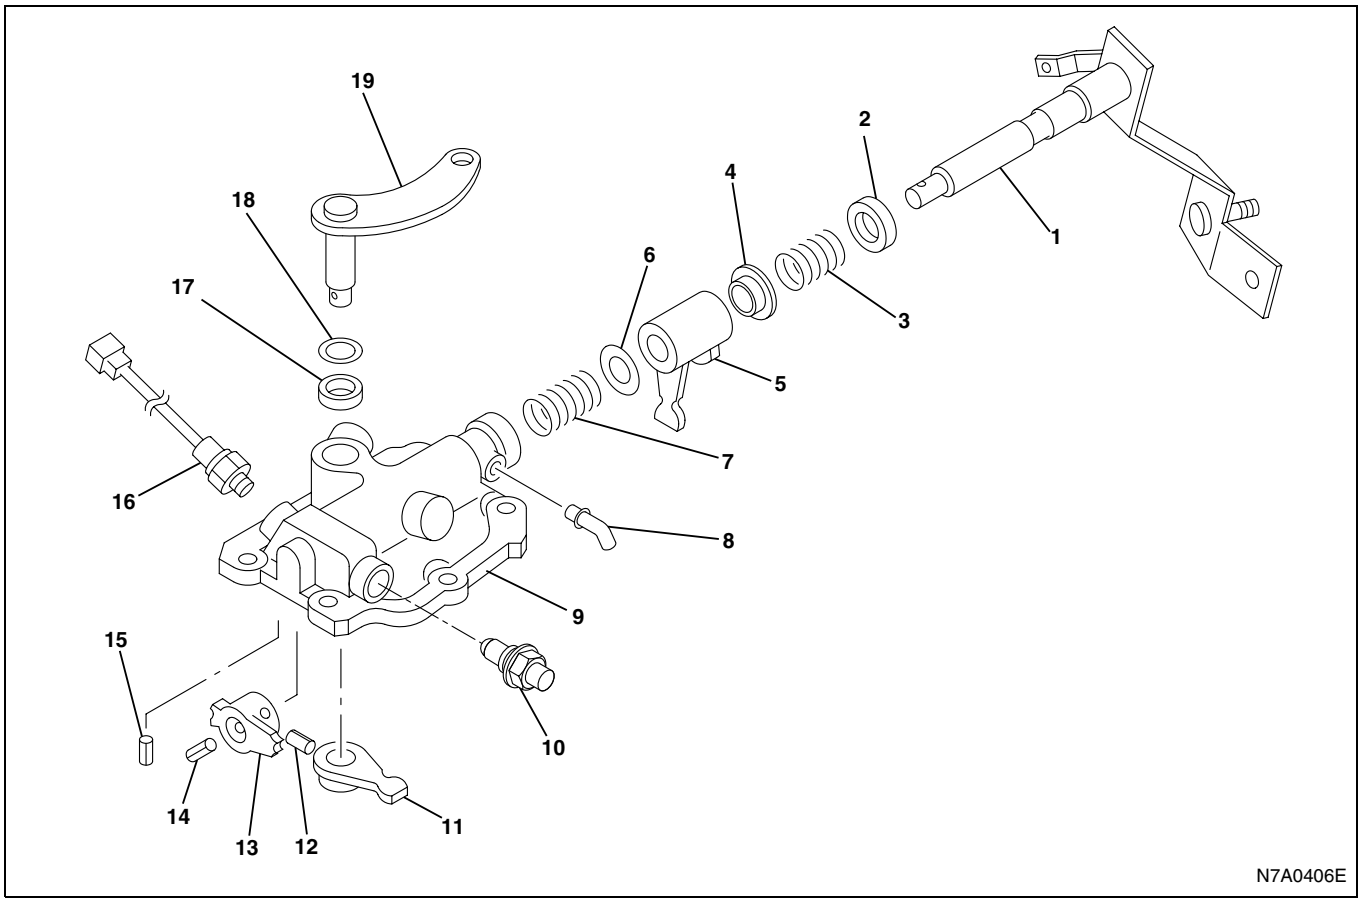


4. Use a pair of snap ring pliers to install the snap ring securing the front countershaft bearing.
   - From the mountable snap rings, select the thickest one of the three types.

Shim thickness mm (in)	Discernment color
1.9 (0.075)	Colorless
2.1 (0.083)	Yellow
2.3 (0.091)	Pink

Control Box

Parts

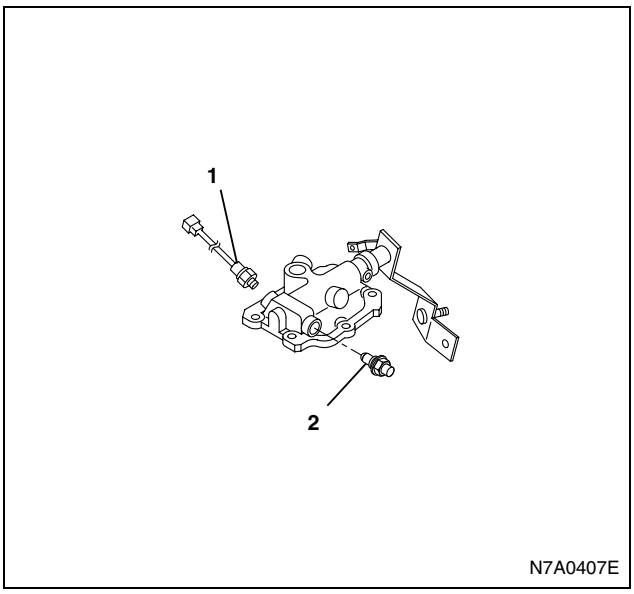


Legend

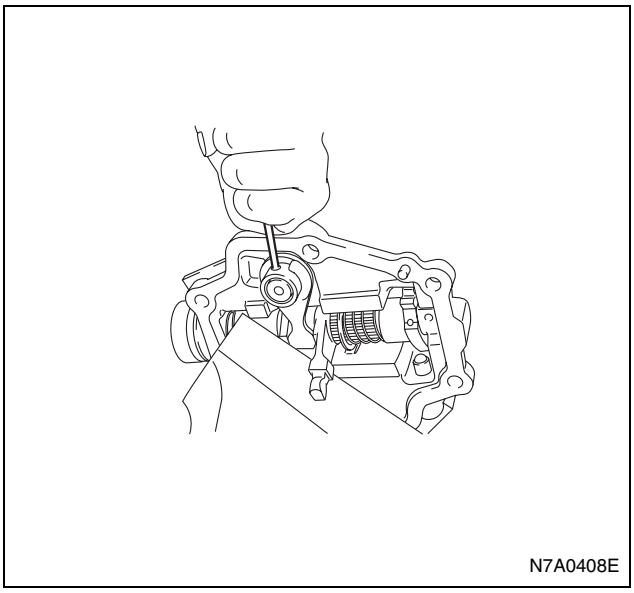
1. Shift lever shaft
2. Shift lever shaft oil seal
3. Spring
4. Washer
5. Shift internal lever
6. Spring seat
7. Spring
8. Pipe
9. Control box
10. Detent
11. Selector internal lever
12. Spring pin (Selector internal lever)
13. Stopper ring
14. Spring pin (Stopper ring)
15. Spring pin (Shift lever shaft)
16. Neutral switch
17. Selector lever shaft oil seal
18. Washer
19. Selector external lever

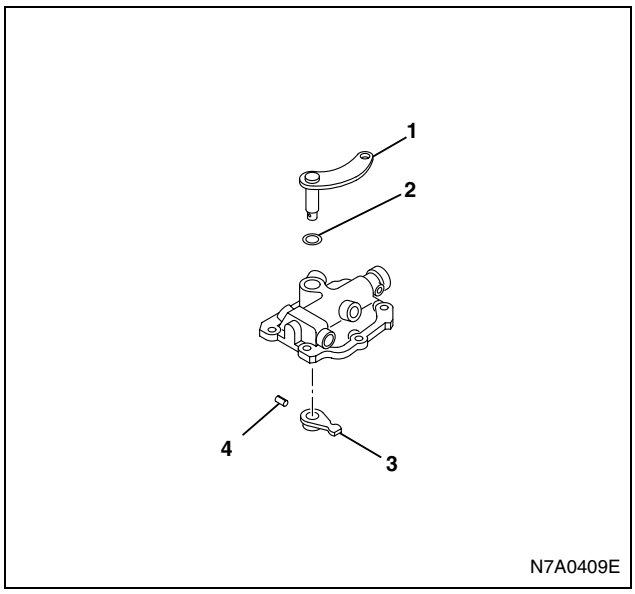
Disassembly

1. Remove the neutral switch (1), the detent (2).

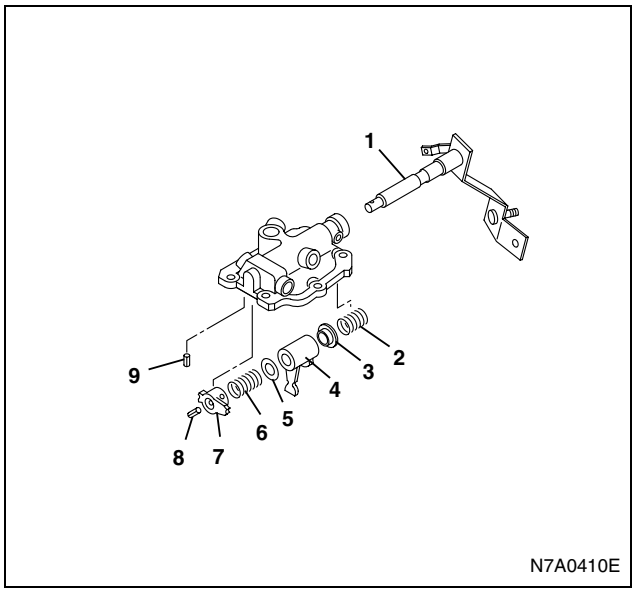


2. Use a spring pin remover to remove the selector internal bar spring pin (4).
3. Remove the selector internal lever (3), the selector external bar (1), and the washer (2).





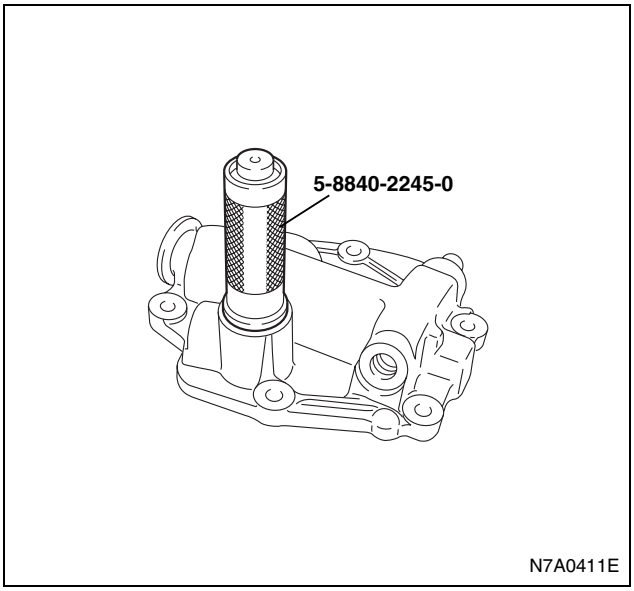
4. Use a pair of pliers to remove the stopper ring spring pin (8) and the shift lever shaft spring pin (9).
5. Pull the shift lever shaft (1) from the assembly.
6. Remove the stopper ring (7), the spring (6), the spring seat (5), the shift internal lever (4), the washer (3), and the spring (2).



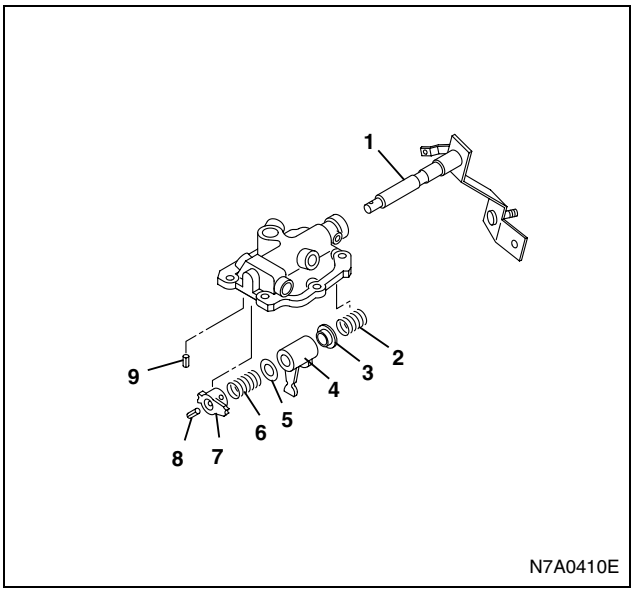
7. Use a screwdriver or similar prying tool to remove the selector lever shaft oil seal and the shift lever shaft oil seal from the control box.
8. Inspect the disassembled parts for wear and/or damage. Make the necessary repairs or replace the part as appropriate.
9. Inspect the shift lever shaft for significant wear. Replace the shaft if significant wear is present.
10. Inspect the control box for excessive play and rough or restricted movement. Replace the control box if either of these conditions is present.

Reassembly

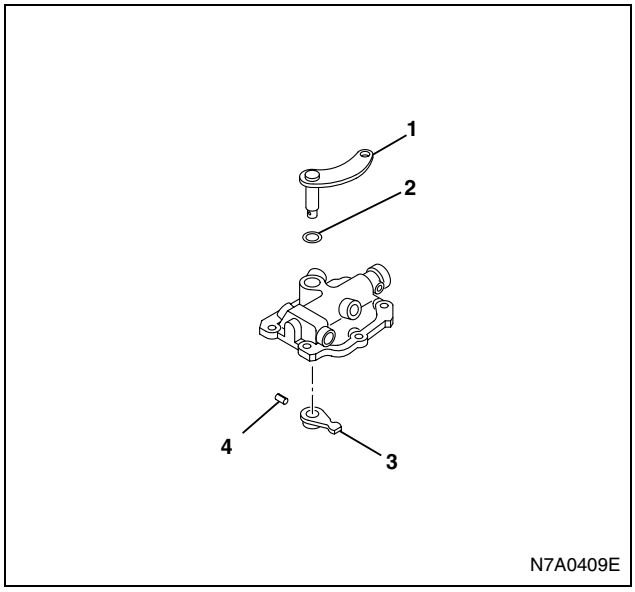
1. Use the installer (5-8840-2245-0) to install the shift lever shaft oil seal and the selector lever shaft oil seal to the control box.



2. Install the spring (2), the washer (3), the shift internal lever (4), the spring seat (5), the spring (6), and the stopper ring (7) to the control box.
3. Insert the shift lever shaft (1).
4. Align the pin holes in the shift lever shaft and the stopper ring.
5. Drive the new stopper ring spring pin (8) and the new shift lever shaft spring pin (9) into place.



6. Install the selector external lever (1) and the washer (2) to the control box.
7. Install the selector internal lever (3).
8. Drive the new selector internal lever spring pin (4) into place.



9. Install the detent (2).

Tighten:
Detent (2) to 28 N·m (2.9 kg·m / 21 lb·ft)

- Detents are precoated. Be sure to thoroughly remove sealing material around the threads of the case, and use new detents.

10. Tighten the neutral switch (1) to the specified torque.

- Thoroughly remove sealing material from the threads, apply Three Bond 1141 to them, and then assemble.

Tighten:
Neutral switch (1) to 34 N·m (3.5 kg·m / 25 lb·ft)

DESCRIPTION

Clutch System

Notice:
When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

Driving Members

The driving members of a clutch usually consist of two flat surfaces machined to a smooth finish.
One of these surfaces is usually the rear face of the engine flywheel, and the other is a comparatively heavy flat ring with one side machined. This part is known as the pressure plate. It is fitted into a steel cover, which also contains some of the operating members, and is bolted to the flywheel.

Driven Member

The driven member is a clutch disc with a splined hub which is free to slide lengthwise along the splines of the clutch shaft, but which drives the shaft through these same splines. Suitable frictional facings are attached to each side of the clutch disc by means of rivets. These facings must be heat resistant since friction produces heat.

Operating Members

The driving and driven members are held in contact by spring pressure.
The throwout (clutch release) bearing is a ballthrust bearing contained in the clutch housing, mounted on a sleeve attached to the front of the transmission case. The throwout bearing is moved by the clutch release yoke to contact the release levers and move the pressure plate to the rear, thus separating the clutch driving members from the driven member when the clutch pedal is depressed by the driver.

Clutch Controls

This system utilizes hydraulic pressure as a means of transmitting clutch pedal movement to the clutch release mechanism. The system consists of a pedal-operated master cylinder and a slave cylinder, interconnected with hydraulic lines. The clutch pedal is connected to the master cylinder push rod, and the slave cylinder push rod is connected to the clutch release fork.

DIAGNOSIS OF CLUTCH

PROBLEM	POSSIBLE CAUSE	CORRECTION
Clutch Slips	1. Binding of release levers in the pressure plate and cover assembly.	1. Replace the clutch cover assembly.
	2. Clutch release levers improperly adjusted.	2. If levers are in place, adjust free pedal.
	3. Facings loose on the clutch disc.	3. Replace the driven disc assembly.
	4. Improper clutch release bearing adjustment.	4. Adjust for proper clearance (free pedal).
	5. Binding or sticking clutch pedal assembly.	5. Repair or replace faulty parts. Check linkage for proper adjustment.
	6. Weak or broken clutch pressure springs.	6. Replace the clutch cover assembly.
	7. Burned clutch facings.	7. Replace clutch driven disc assembly and check flywheel and pressure plate friction surfaces for damage replace parts as necessary.
	8. Binding or sticking of the clutch disc hub on the transmission drive gear.	8. Lubricate splines with high temperature grease (if dry). Replace driven discs if splined hubs are worn.
	9. Release bearing binding on bearing retainer.	9. Replace release bearing or lubricate.
	10. Warped pressure plate or engine flywheel.	10. Replace defective parts. Check transmission, clutch, and engine alignment.
	11. No free pedal.	11. Adjust for free pedal, check clutch driven disc wear and replace parts as required.
Clutch Chatters During Engagement	1. Loose engine mounts.	1. Tighten engine mount bolts to specifications.
	2. Grease or oil on facings.	2. Replace driven disc assembly and repair oil leak.
	3. Slight binding in linkage during engagement.	3. Check linkage for wear or damage. Replace parts as required.
	4. Weak pressure springs.	4. Replace clutch cover assembly.
	5. Clutch release levers binding during engagement.	5. Repair or replace clutch cover assembly.
	6. Worn or broken pilot bearing.	6. Replace and lubricate pilot bearing.
	7. Rough engine idle.	7. Tune engine to manufacturer's specifications.
	8. Bent or out of plane pressure plate fingers.	8. Replace clutch cover assembly if release fingers are more than 2 mm (0.079 in) out of plane.
	9. Driven disc warped, cracked, or loose friction material.	9. Replace driven disc assembly.
	10. Pressure plate warped or hot spots.	10. Replace pressure plate or clutch cover assembly.
	11. Flywheel warpage or discoloration.	11. Replace flywheel.
	12. Flywheel housing bore and face not aligned.	12. Correct per alignment procedure.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Clutch Drags When Disengaged	1. Pedal cannot disengage clutch because of excessive free pedal travel.	1. Check pedal and linkage for wear, replace parts as required. Adjust clutch and linkage for proper free travel.
	2. Clutch release levers need adjustment.	2. Replace clutch cover assembly.
	3. High spots on clutch facings.	3. Replace driven disc assembly.
	4. Loose rivet in facings.	4. Replace driven disc assembly. Check for damaged flywheel and pressure plate, replace as necessary.
	5. Clutch disc wobbles because of broken springs in hub.	5. Replace driven disc assembly.
	6. Flange of clutch cover not in alignment with flywheel because of loose bolts or bent flange.	6. Torque bolts to specifications or replace cover assembly.
	7. Deteriorated or broken engine mounts.	7. Replace engine mountings.
	8. Worn clutch release bearing.	8. Replace release bearing and adjust clutch free pedal.
	9. Worn linkage components.	9. Check pedal and linkage for wear; replace parts as required.
	10. Clutch disc warped.	10. Replace driven disc assembly, also check flywheel for deep heat checks. Replace flywheel as necessary.
	11. Broken or loose facings.	11. Replace driven disc assembly.
	12. Misalignment of transmission.	12. Check engine mounts, wear on flywheel housing, and bolt torque.
	13. Main drive gear misaligned because of worn bearings.	13. Repair transmission if required and check flywheel pilot bearing; replace pilot bearing as required.
	14. Clutch pressure plate warped.	14. Replace clutch cover assembly; also check flywheel surface for dished out wear pattern. Replace flywheel as required.
	15. Loose flywheel housing bolts.	15. Torque bolts to specifications.
Clutch Grabs	1. Grease or oil on clutch facings.	1. Replace driven disc assembly and repair oil leak.
	2. Exposed rivet heads due to excessively worn facings or loose rivets.	2. Replace driven disc assembly and check for flywheel and pressure plate damage. Replace damaged parts.
	3. Loose engine mounts.	3. Tighten engine mount bolts to specifications.
	4. Clutch pressure springs too stiff.	4. Replace clutch cover assembly.
	5. Momentary binding in linkage while clutch is being engaged.	5. Check pedal and linkage for wear or damage. Replace parts as required.
	6. Warped pressure plate or flywheel.	6. Replace damaged parts. Check alignment.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Clutch Noisy When Engaged	1. Improper clutch release bearing adjustment.	1. Adjust clutch linkage for pedal free play.
	2. Clutch disc damper springs weak or broken.	2. Replace driven disc assembly.
	3. Linkage binds.	3. Check pedal and linkage. Replace or repair as required.
	4. Clutch release bearing binding.	4. Check for alignment and release bearing lubricant. Replace bearing as required.
	5. Loose flywheel or clutch cover bolts.	5. Torque bolts to specifications.
	6. Misalignment of transmission.	6. Check engine mountings, wear on flywheel housing, and fixing torque.
	7. Worn splines on clutch disc or transmission main drive gear.	7. Replace parts as required. Lubricate with high temperature grease.
	8. Weak or missing clutch return springs.	8. Replace clutch cover assembly.
	9. Clutch pedal assembly binding.	9. Check pedal and linkage for wear or damage. Repair or replace parts as required.
Clutch Pedal Pulsates During Engagement	1. Misalignment of transmission.	1. Check engine mountings, wear on flywheel housing, and fixing torque.
	2. Loose or improperly installed engine mounts.	2. Refer to ENGINE for proper engine mount installation.
	3. Clutch release levers not adjusted to uniform height.	3. Replace clutch cover assembly.
Clutch Rattles When Disengaged with Engine Idling	1. Wear or looseness in linkage.	1. Check linkage for wear or damage. Replace parts as required.
	2. Retractor springs on release lever weak, broken, or disconnected.	2. Replace clutch cover assembly.
	3. Loose flywheel or clutch cover bolts.	3. Torque bolts to specifications.
	4. Rough engine idle.	4. Tune engine to manufacturer's specifications.
Clutch Noisy When Disengaged	1. Pilot bearing or bushing in crankshaft worn, damaged, broken, or inadequately lubricated.	1. Replace parts as required. Lubricate with high temperature grease.
	2. Release bearing worn, dirty, damaged, broken, or inadequately lubricated.	2. Replace release bearing. Lubricate with high temperature grease.
	3. Transmission main drive gear bearing worn, dirty or lacks lubricant.	3. Repair transmission. Check for rear bearing cap oil hole for restriction clearance.

ON-VEHICLE SERVICE

Clutch System Inspection

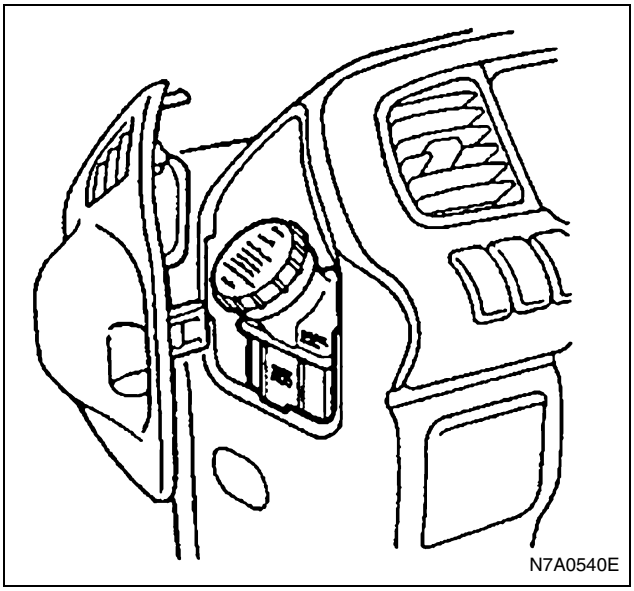
The system should be checked and serviced periodically as stated below.

- Maintain the proper level of hydraulic fluid in the master cylinder reservoir. Refer to MAINTENANCE AND LUBRICATION for recommended fluid and checking intervals.
- Inspect the entire clutch system regularly for fluid leakage. Leakage must be corrected immediately.
- Adjust the clutch linkage if necessary.
- If the clutch pedal action is springy or spongy, it is an indication that air needs to be bled from the hydraulic system.

A specified clearance in the hydraulic control linkage must exist between the end of the push rod and master cylinder piston. This clearance is measured as pedal free travel.

Before making the adjustment, make sure that the level of fluid in the master cylinder reservoir is 13 mm (0.5 in) below the top of the reservoir. The fluid system must be free of air.

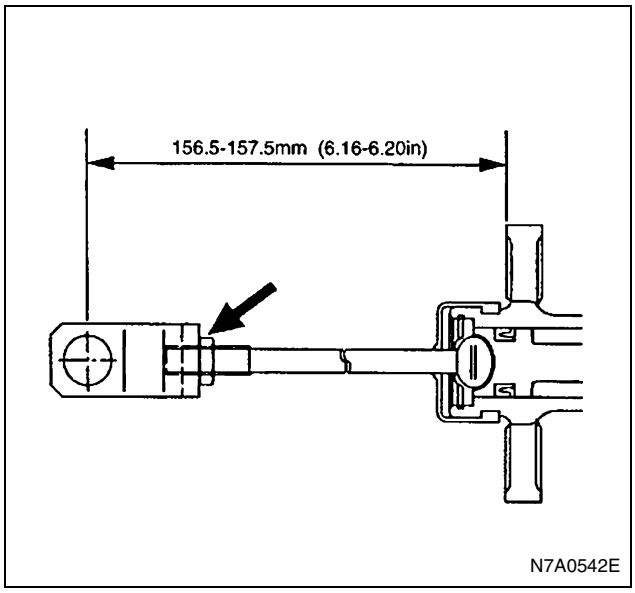
The dual brake/clutch master cylinder reservoir is in the left-upper portion of the dash panel. It can be accessed by opening the driver door.



Clutch Pedal Free Play, Height And Travel Adjustment

Adjust

1. Loosen the jam nut on the clutch switch.
2. Remove the master cylinder from the clutch pedal assembly.
3. Loosen the jam nut on the master cylinder push rod.
4. Turn the push rod until the distance from the center of clevis pin hole to mounting surface of clutch pedal bracket should be set at 156.5 — 157.5 mm (6.16 — 6.20 in).
   When fixed under this condition, there is no need to adjust the clutch pedal height and free play.



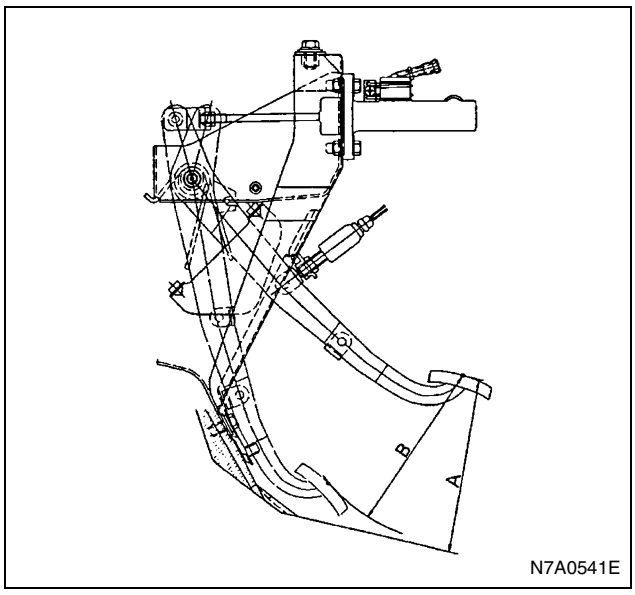
5. Install the master cylinder to the clutch pedal assembly.

Tighten:
Jam nut to 17 N·m (1.7 kg·m / 148 lb·in).

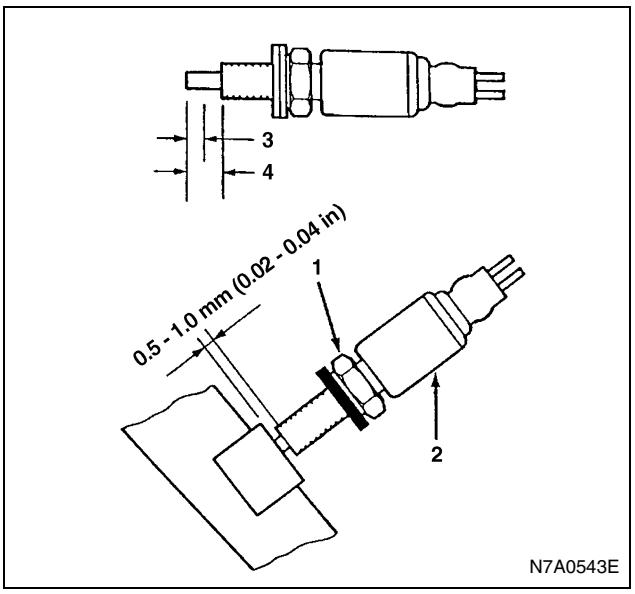
6. Install the master cylinder to the clutch pedal assembly.

Measurement

- Clutch pedal normal play is between 15 — 25 mm (0.6 — 1.0 in) (reference).
- Clutch pedal height “A” is between 160 — 170 mm (6.3 — 6.7 in) (reference).
- Clutch pedal travel “B” is between 159 — 169 mm (6.2 — 6.7 in) (reference).



7. Check clearance at the clutch switch. Turn the switch in its bracket until the clearance between the fully depressed plunger and the clutch pedal is 0.5 — 1.0 mm (0.02 — 0.04 in).



Legend

1. Jam nut
2. Clutch switch
3. OFF
4. Max. stroke

Caution:
Clutch switch must be adjusted so that when the clutch pedal is released, it closes the switch but does not completely depress the switch plunger (max stroke see figure). If the plunger is completely depressed by the pedal, switch damage may result.

8. Tighten the jam nut (1) at the clutch switch (2).

Tighten:
Jam nut to 15 N·m (1.5 kg·m / 133 lb·in).

9. Recheck the clutch switch clearance.

Bleeding The Clutch Hydraulic Circuits

If air enters the clutch circuit, it will cause the clutch to drag. It will be necessary to bleed the clutch fluid circuit if the reservoir has been emptied or the hydraulic circuit has been disassembled. To bleed the clutch circuit properly, an assistant will be needed.

Bleeding Procedure

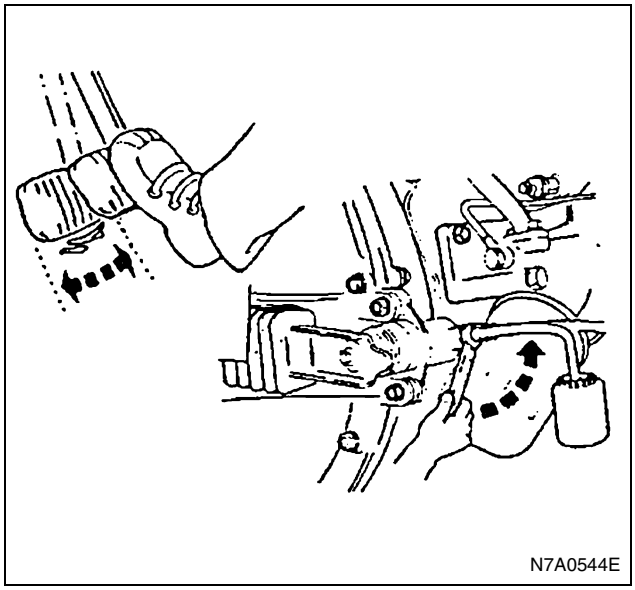
1. Check the level of the clutch fluid in the clutch reservoir and add clutch fluid if necessary.
2. Remove the rubber cap from the bleeder screw and wipe the bleeder screw clean. Connect a vinyl tube to the bleeder screw and insert the other end of the vinyl tube into a transparent container. Pump the clutch pedal repeatedly and hold the pedal in the depressed position.
3. Loosen the bleeder screw on the clutch slave cylinder to discharge clutch fluid and air bubbles into a container then tighten the bleeder screw immediately.
4. Release the clutch pedal slowly. Repeat step 3 until all air bubbles disappear from the clutch fluid being discharged into the container. During the bleeding operation, keep the clutch fluid reservoir filled to 13 mm (0.5 in) below the top of the reservoir.
5. Install the rubber cap onto the bleeder screw.

Optional Bleeding Method

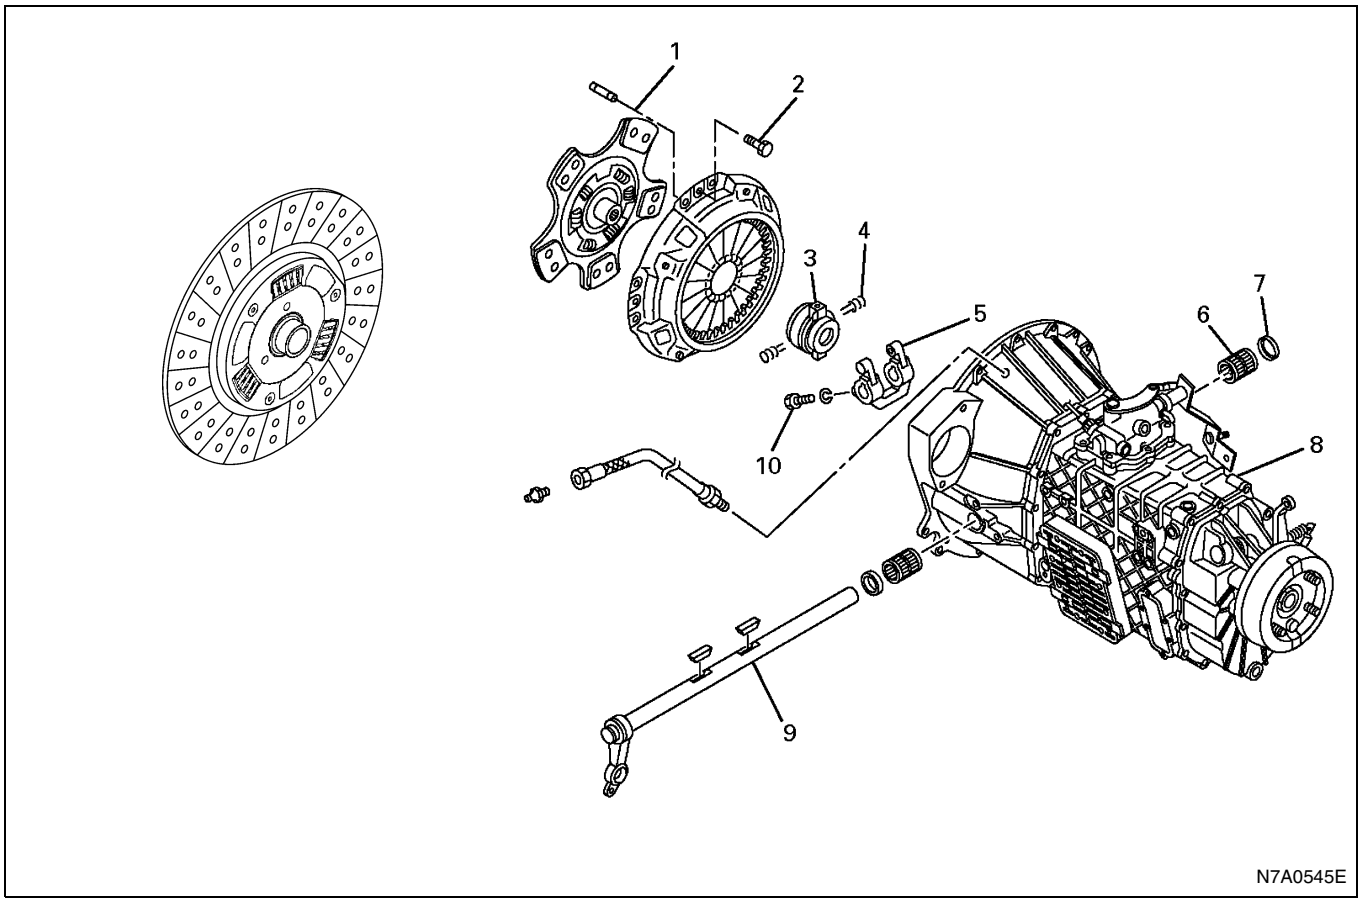
Tool Required:

J-35854 Power Bleeder Adapter or Equivalent

- Connect a power bleeding machine to the master cylinder with the use of adapter J-35854 or equivalent. Bleed until all air bubbles are out of the system and a solid pedal is obtained.



COMPONENT PARTS REPLACEMENT



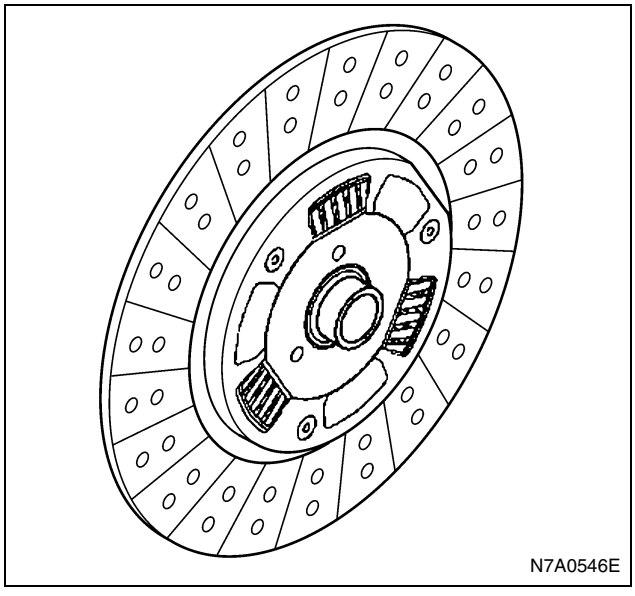
Legend

1. Clutch disc assembly
2. Pressure plate assembly
3. Shift block and release bearing
4. Return spring
5. Shift fork
6. Needle bearing
7. Dust cover
8. Transmission assembly
9. Clutch shaft
10. Set bolt

Clutch Assembly

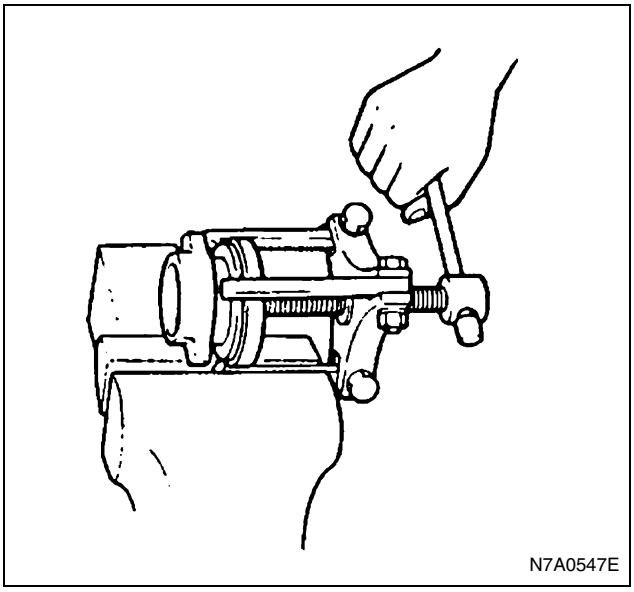
Remove or Disconnect

1. Transmission assembly.
   Refer to TRANSMISSION.
2. Pressure plate assembly.
3. Clutch disc assembly.



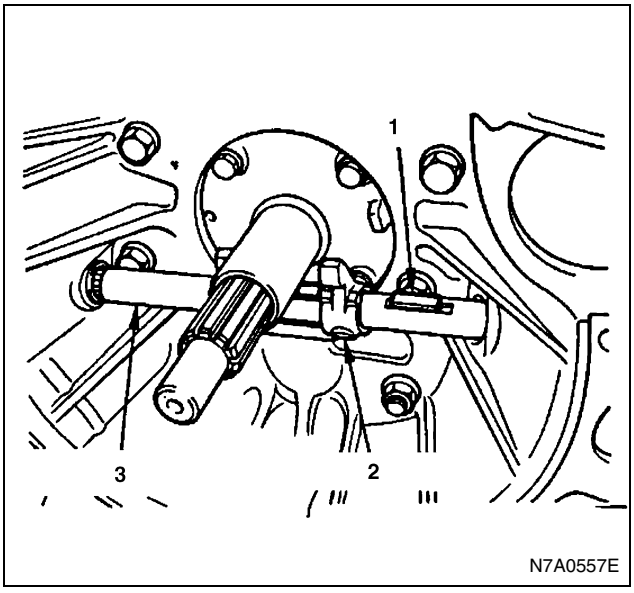
4. Return spring.

5. Shift block and release bearing.
   - Use suitable puller to remove the release bearing.



N7A0547E

6. Set bolt.
7. Clutch shaft.
   - Use a brass bar to remove the clutch shaft.
8. Shift fork.



N7A0557E

Legend

1. Key
2. Shift fork
3. Clutch shaft

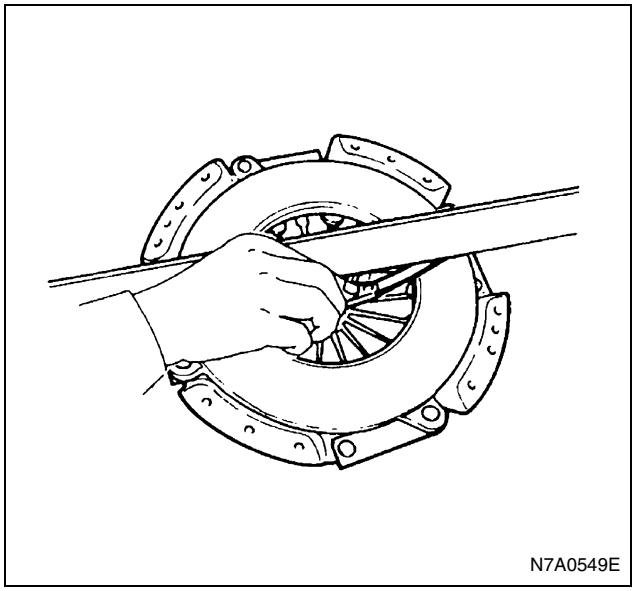
9. Dust cover.
10. Needle bearing.

Inspect

- Pressure plate cover for cracks or distortion.
- Diaphragm spring for heat distortion.
- For loose or bent rivets.
- Release bearing for roughness or noise by rotating the bearing race under light pressure.
- Shift fork for wear or damage.
- Pilot bearing on the crankshaft for roughness by rotating the bearing race under light pressure.
- Replace all parts that would effect proper operation of the clutch release assembly.
- Replace the flywheel, pressure plate assembly, or driven plate if found to be scored, burned, warped, or worn. Do not machine the flywheel or the pressure plate to eliminate these conditions.

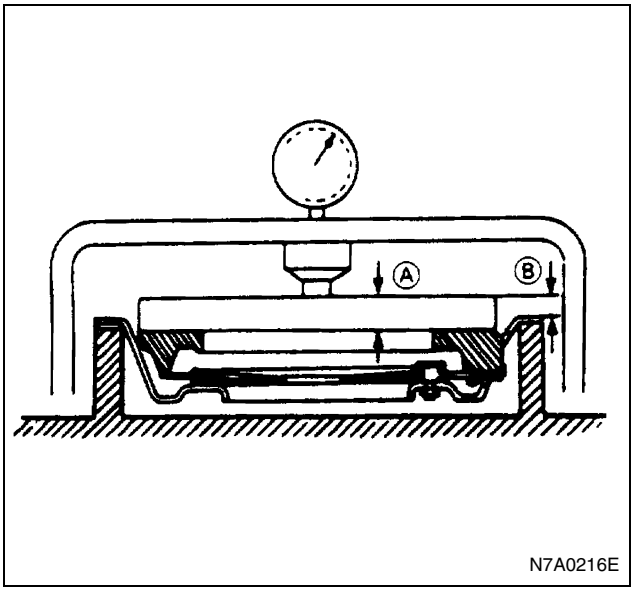
Measure

- Pressure plate wear.
  If the wear exceeds the limit 0.3 mm (0.012 in), the pressure plate assembly must be replaced.

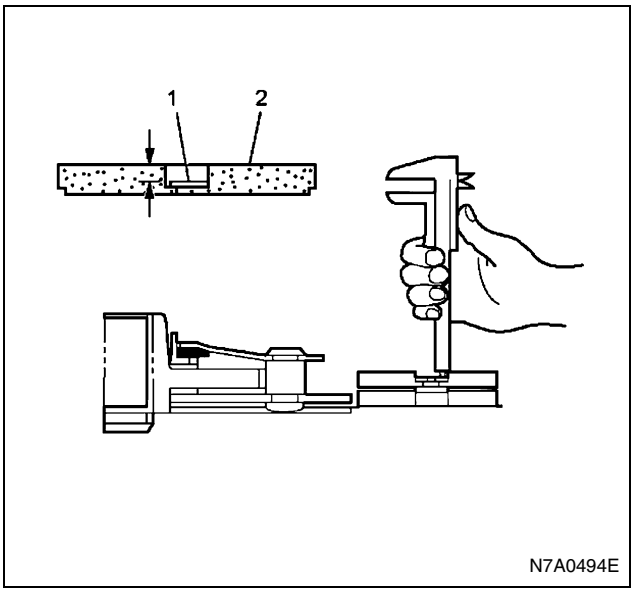


N7A0549E

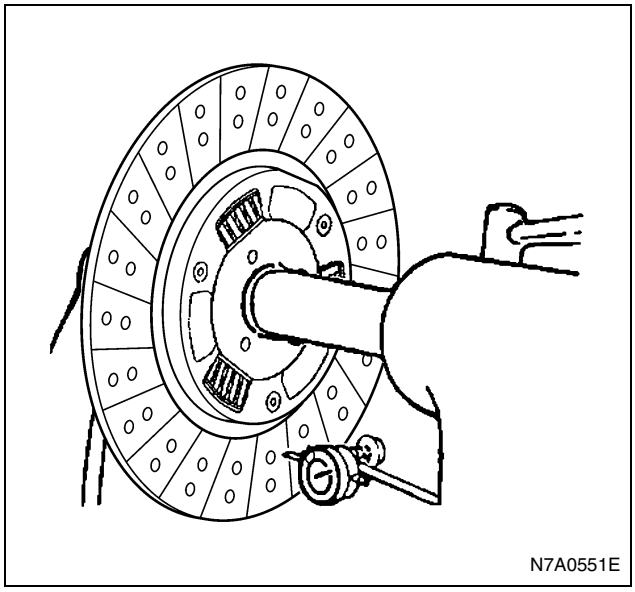
- Pressure plate clamping force. Invert the pressure plate and position an 9.2 mm (0.36 in) thick plate A over the pressure plate with hydraulic press. Then observe the load gauge reading when the dimension B becomes 19 mm (0.75 in) as indicated in the figure. Replace the pressure plate assembly if the clamping force is less than 970 kg (2,139 lb).



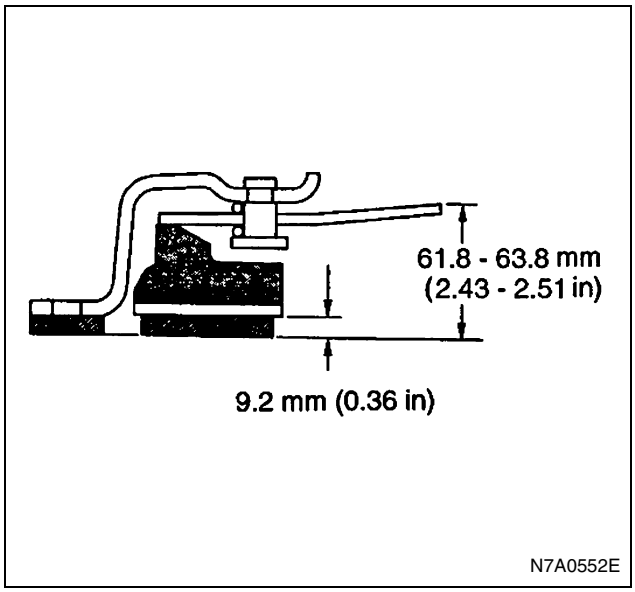
- The depression of the rivet head (1) on the driven plate (2).
  Replace the clutch disc assembly if the thickness of the friction material is less than 0.2 mm (0.008 in).



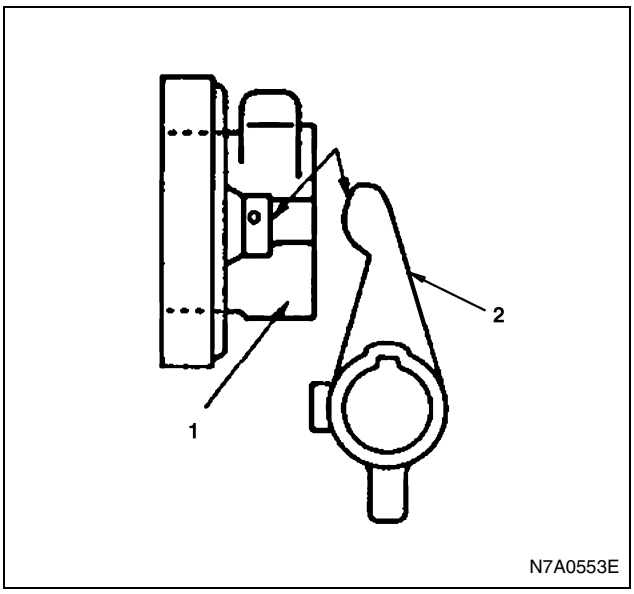
- Clutch Disc warpage.
  Limit: 0.6 mm (0.024 in).
  Clutch Size: 325 mm (12.80 in).



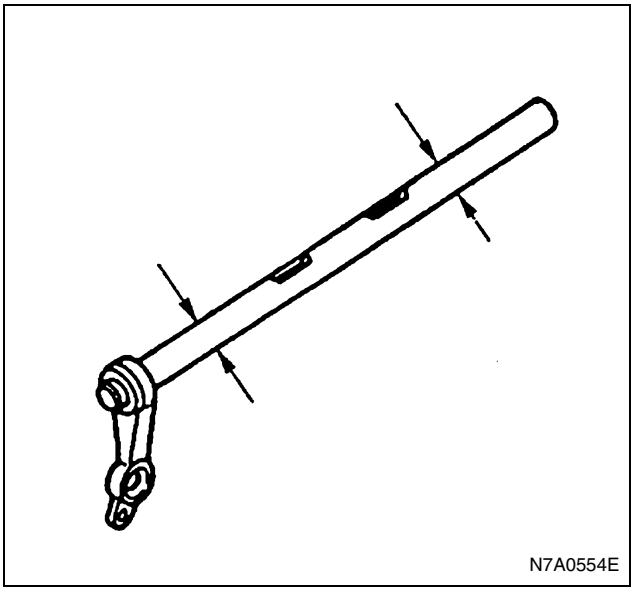
- Height of the diaphragm spring fingers. Position an 9.2 mm (0.36 in) thick plate under the pressure plate. Compress the diaphragm spring until the spring touches the table. Measure the height of the diaphragm spring fingers. They must be 61.8 — 63.8 mm (2.43 — 2.51 in) high.



- Check the surface of the shift block (1) for wear or damage.
- Check the surface of the shift fork (2) for wear or damage.

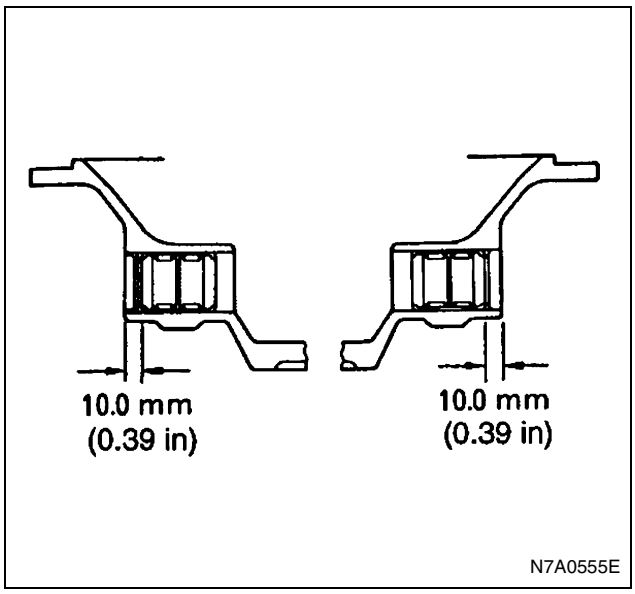


- Clutch shaft diameters as shown in the figure. If the diameter is less than 24.5 mm (0.96 in), replace the clutch shaft and needle bearing.

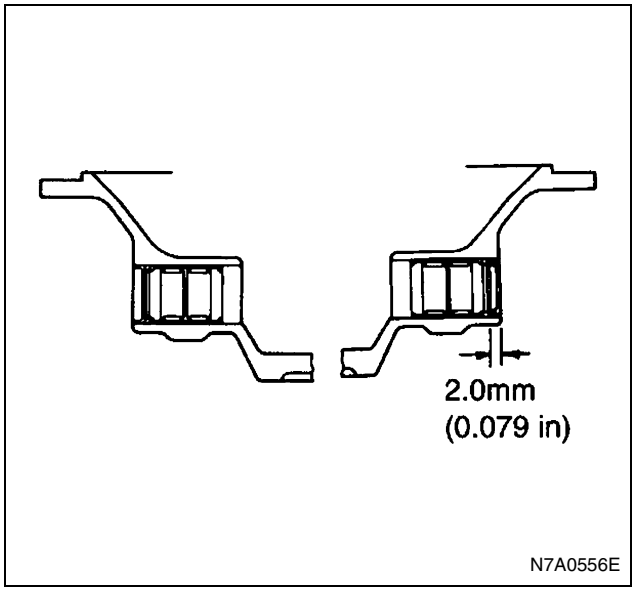


Install or connect

1. Needle bearing.
   - Use a 32 mm (1.26 in) diameter bar to drive the needle bearing from the marked side of bearing and install it specified depth as shown in illustration.

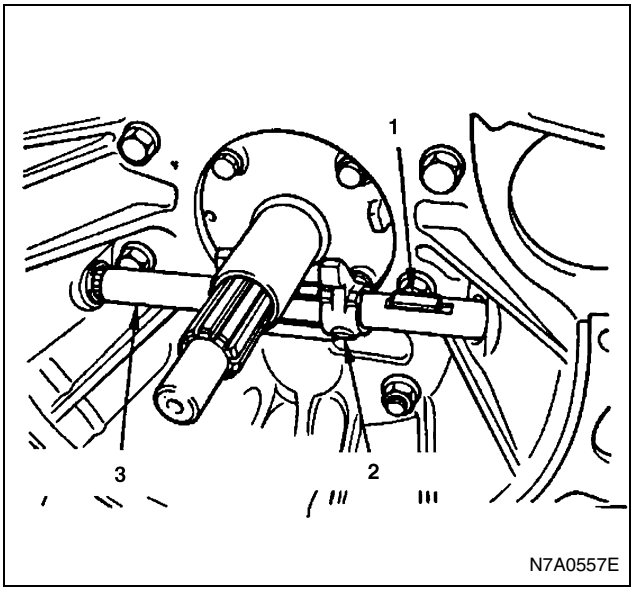


2. Dust seal.
   - Before installing the new bearing, apply MoS_2 contained type grease to the bearing surfaces and the clearance area between the bearing and the dust seal.



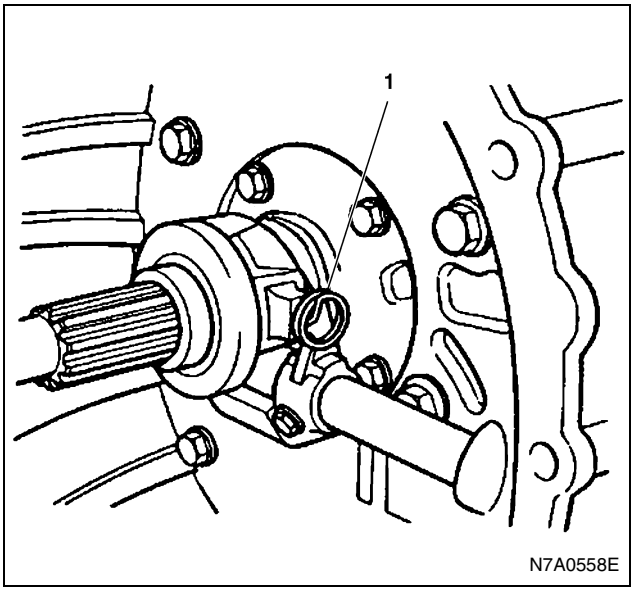
3. Shift fork.
4. Clutch shaft and key.
5. Set bolt.
   - Install the clutch shaft to the clutch housing.
   - Key and shift fork onto the clutch shaft assembly.
   - Tighten the set bolt.

Tighten:
Set bolt to 13 N·m (1.3 kg·m / 113 lb·in)

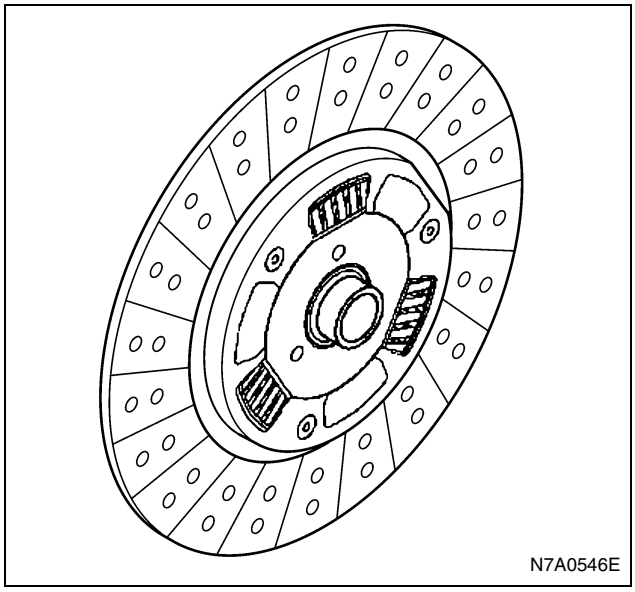


Legend
1. Key
2. Shift fork
3. Clutch shaft

6. Shift block and release bearing.
7. Return spring.
   - Apply the MoS_2 contained type grease to shift fork and shift block surfaces.
   - Install the return spring (1).

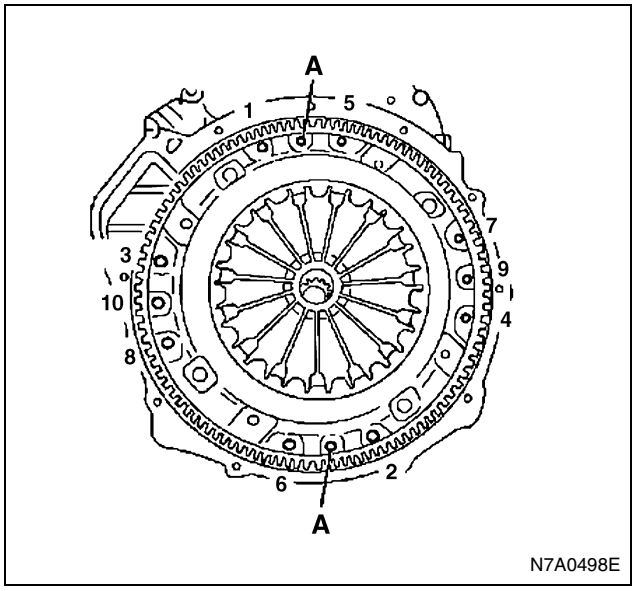


8. Clutch disc assembly.
   - Clutch pilot aligner 5-8840-2790-0 into the center of the clutch disc assembly.



9. Pressure plate assembly.
   - Install the pressure plate assembly to the flywheel. If the pressure plate was replaced to new parts, be sure to remove the ring which is installed to the diaphragm spring.

Tighten:
Pressure plate bolt to 40 N·m (4.1 kg·m / 30 lb·ft) in the sequence shown in the figure.

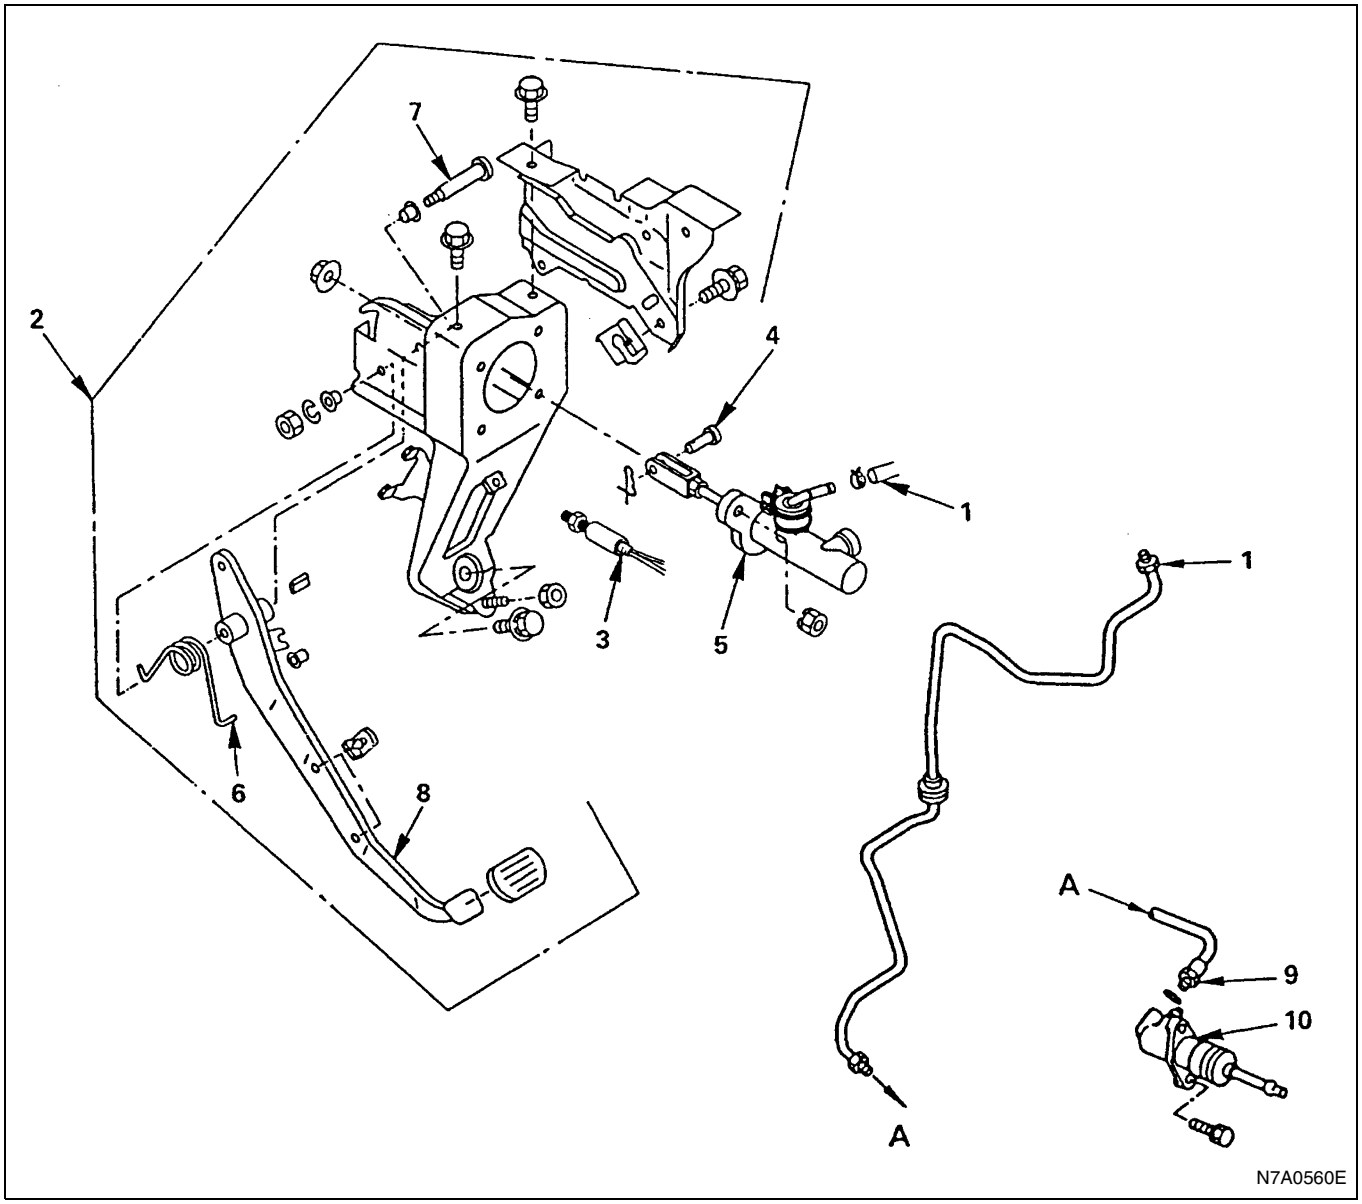


Legend
A. Dowel pin

   - Remove the pilot aligner.
10. Transmission assembly.
   - Refer to TRANSMISSION in this manual.

Clutch Controls

Clutch Control Assembly



Legend

1. Hose and pipe
2. Clutch pedal and bracket assembly
3. Clutch switch
4. Clevis pin
5. Master cylinder
6. Return spring
7. Fulcrum pin
8. Clutch pedal
9. Flexible hose
10. Slave cylinder

Remove or Disconnect

- Drain the clutch fluid from the clutch hydraulic line.

Notice:
Do not let clutch fluid remain on a painted surface. Wash it off immediately.

1. Meter cluster and meter assembly.
   - Pull out the meter cluster and disconnect harness connectors.
     Refer to INSTRUMENTAL PANEL.
2. Electric vacuum pump.
   - Remove the electric vacuum pump.
     Refer to ELECTRIC VACUUM PUMP.
3. Hose and pipe.
4. Clutch pedal and bracket assembly.
5. Clutch switch.
6. Clevis pin.
7. Master cylinder.
8. Return spring.

9. Fulcrum pin.
10. Clutch pedal.
11. Flexible hose.
12. Slave cylinder.

Inspect

- All parts for damage or wear.
- The clearance between the pedal shaft and bushings.
- Replace the clutch pedal assembly if the clearance is excessive.

Install or Connect

Notice:
For steps 1, 7 and 9 see “Notice” on page 7C-2 of this section.

1. Slave cylinder.

Tighten:
Slave cylinder bolt to 19 N·m (1.9 kg·m / 14 lb·ft).

2. Flexible hose.

Tighten:
Flexible hose tube nut to 20 N·m (2 kg·m / 14 lb·ft).

3. Clutch pedal.
4. Fulcrum pin.
5. Return spring.
6. Master cylinder.

Adjust:
- Loosen the jam nut on the master cylinder push rod.
- Adjust push rod length to 156.5 — 157.5mm (6.16 — 6.20 in), and tighten the jam nut.

Tighten:
Master cylinder jam nut to 17 N·m (1.7 kg·m / 148 lb·in).

7. Clutch switch.
8. Clutch pedal and bracket assembly.

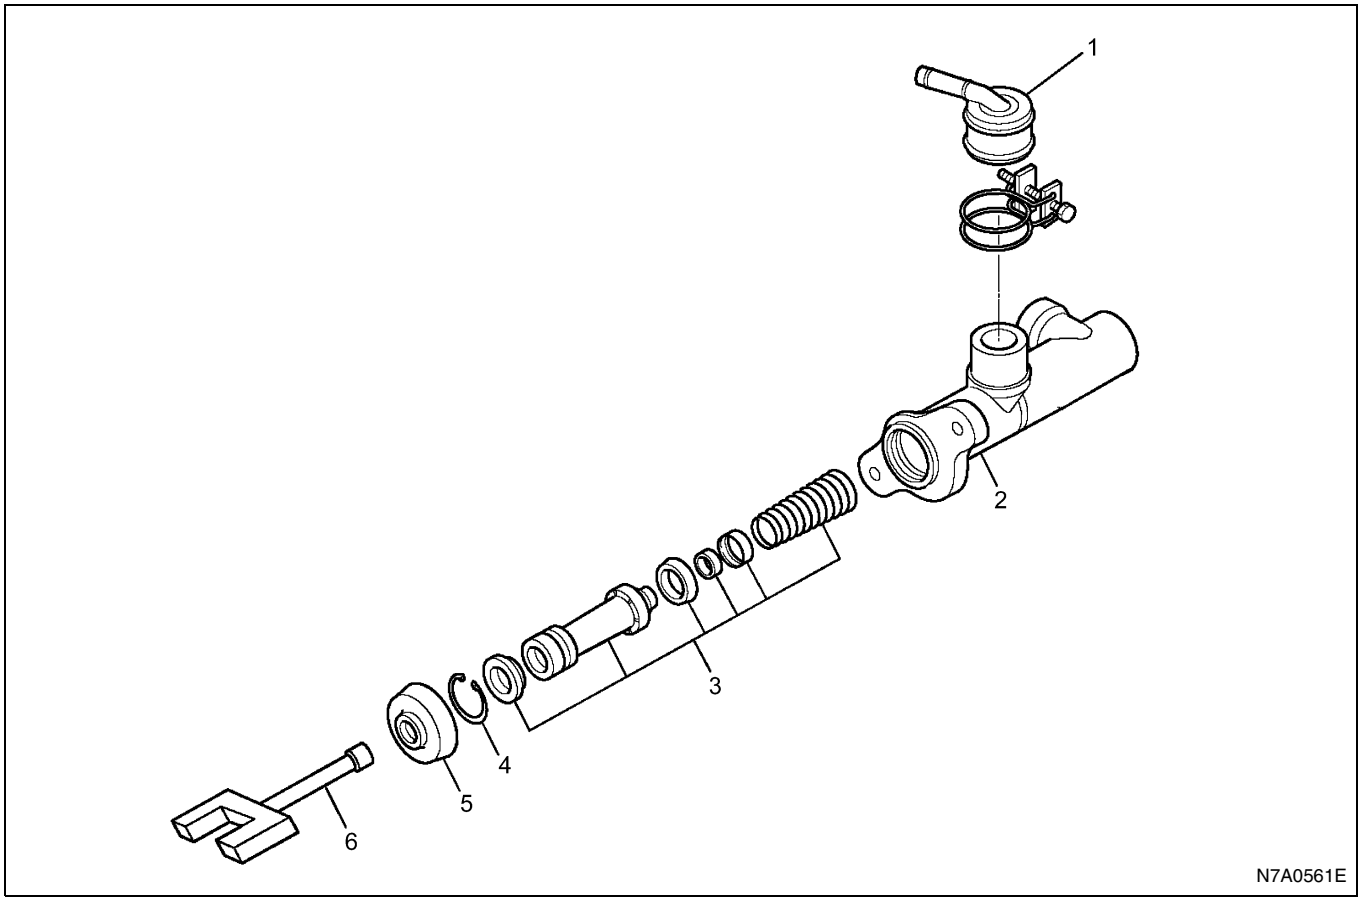
Tighten:
Clutch pedal and bracket bolt to 37 N·m (3.8 kg·m / 27 lb·ft).

9. Hose and pipe.
10. Electric vacuum pump.
    - Refer to ELECTRIC VACUUM PUMP.
11. Meter cluster and meter assembly.
    - Refer to INSTRUMENTAL PANEL.
12. Bleed the clutch hydraulic circuit. Refer to BLEEDING CLUTCH HYDRAULIC CIRCUITS previously in this section.

UNIT REPAIR

Master Cylinder

Master Cylinder Assembly



Legend

1. Hose joint
2. Cylinder body
3. Piston assembly
4. Snap ring
5. Dust cover
6. Push rod

Disassembly

1. Hose joint (1).
2. Dust cover (5).
3. Snap ring (4).
4. Piston assembly (3).
5. Cylinder body (2).

Clean

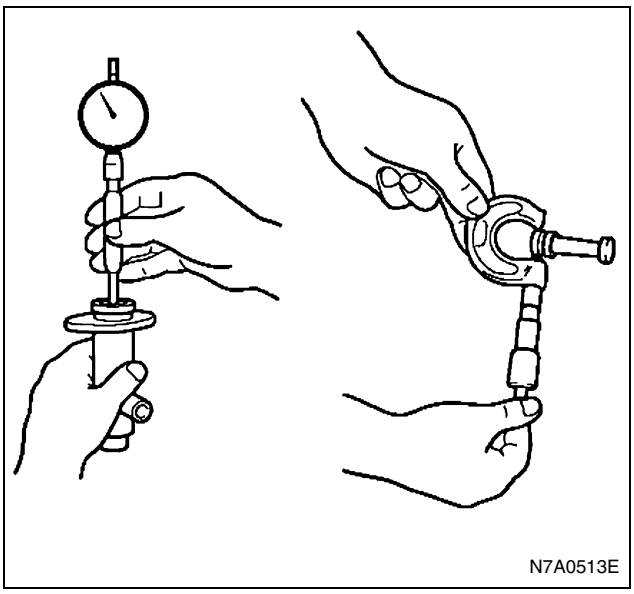
- All disassembled parts in brake fluid. Be sure to check the ports for restrictions. Use a metal wire to loosen the dirt.

Inspect

- Cylinder bore and piston for wear and rust formation.
- Spring for weakening.
- Replace any parts if wear, damage, or any other abnormal conditions are found during inspection.

Measure

- The bore inside the master cylinder body with a dial indicator. Use a micrometer to check the thickness of the piston. Replace the master cylinder body or piston if the clearance is less than 0.12 mm (0.0047 in).



N7A0513E

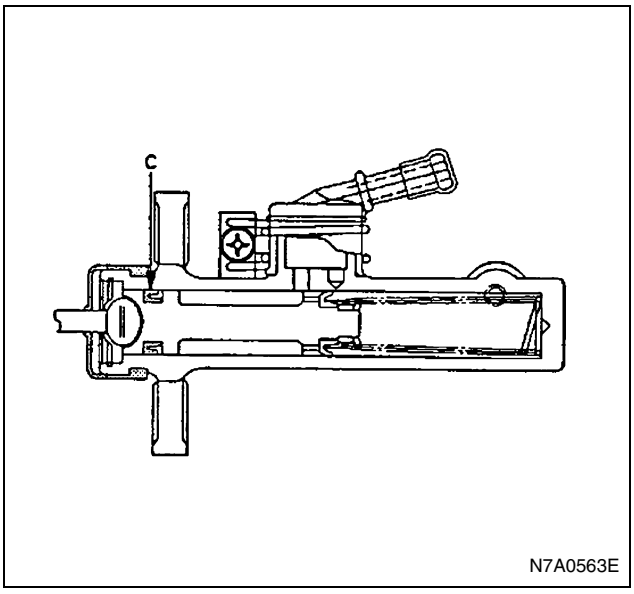
Reassembly

1. Cylinder body (2).

Important:

- Before installing the parts, apply a thin coat of brake fluid.

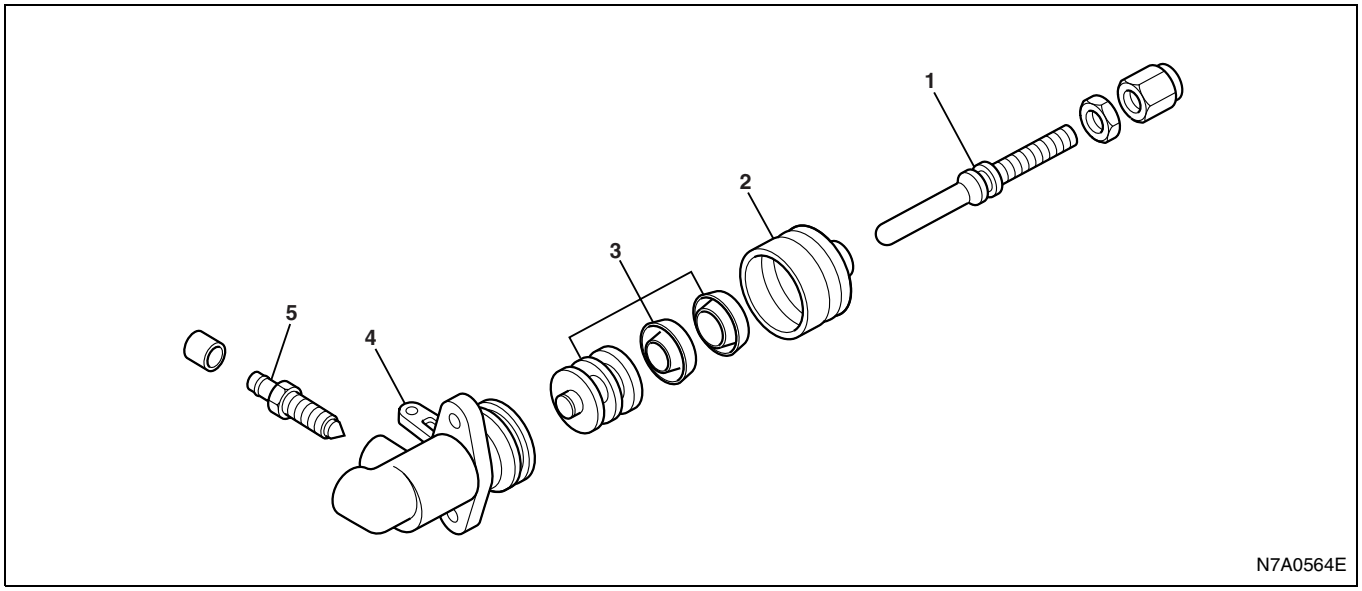
2. Piston assembly (3). Install new cup (C) in groove in piston with the lip turned toward the front of the cylinder body. Use care so as not to scratch the lipped portion of the cup.
3. Snap ring (4) to the cylinder body groove.
4. Dust cover (5).
5. Hose joint (1).



N7A0563E

Slave Cylinder

Slave Cylinder Assembly



Legend

1. Push rod
2. Boot
3. Piston assembly
4. Slave cylinder body
5. Bleeder screw and cap

Disassembly

1. Push rod (1).
2. Boot (2).
3. Piston assembly (3).
4. Slave cylinder body (4).
5. Bleeder screw and cap (5).

Clean

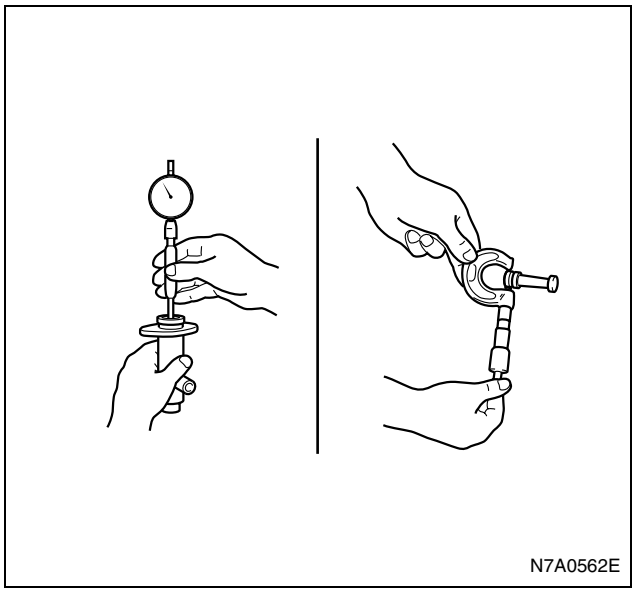
- All disassembled parts in brake fluid. Be sure to wipe excess brake fluid from the components.

Inspect

- Cylinder bore and piston for wear and rust formation.
- Spring for weakening.
- Piston cups for wear, deterioration and scratches.
- Replace any parts if wear, damage, or any other abnormal conditions are found during inspection.

Measure

- The clearance inside the slave cylinder body with a dial indicator. Use a micrometer to check the thickness of the piston. Replace the slave cylinder body or piston if the clearance is less than 0.11 mm (0.0043 in).



Reassembly

1. Slave cylinder body (4).

Notice:
See “Notice” on page 7C-2 of this section.

2. Bleeder screw and cap (5).

Tighten:
Bleeder screw to 8 N·m (0.8 kg·m / 69 lb·in).

Important:

- Before installing the parts, apply a thin coat of brake fluid.

- Be sure to install the piston cup in the piston groove with the lip turned toward the front of the cylinder body. Use care so as not to scratch the lip portion of the piston cup.

3. Piston assembly (3).
4. Boot (2).
5. Push rod (1).

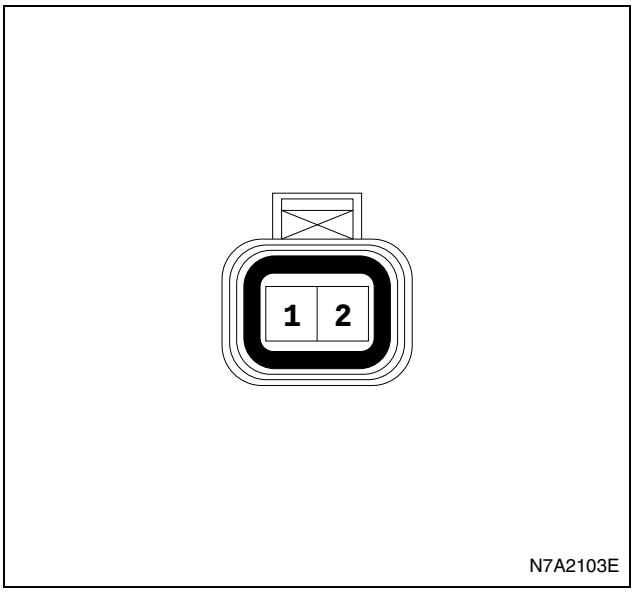
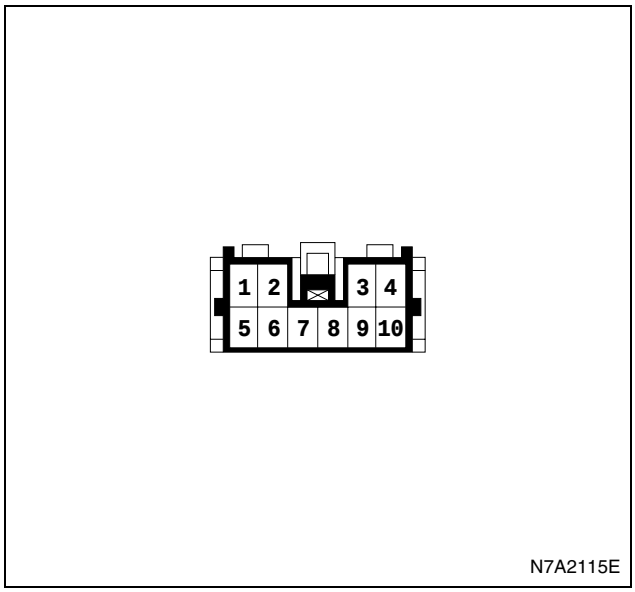
Select Solenoid



Connector No.	J-234
Connector Color	Green
Test Adapter No.	J-35616-42

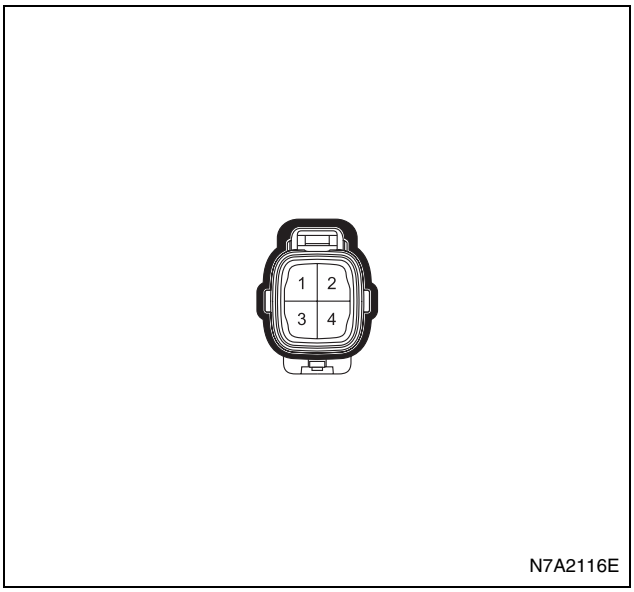
Pin	Wire Color	Pin Function
1	BLK	Select Solenoid Valve Ground
2	WHT/BLK	Select Solenoid Valve Control

Selector Lever



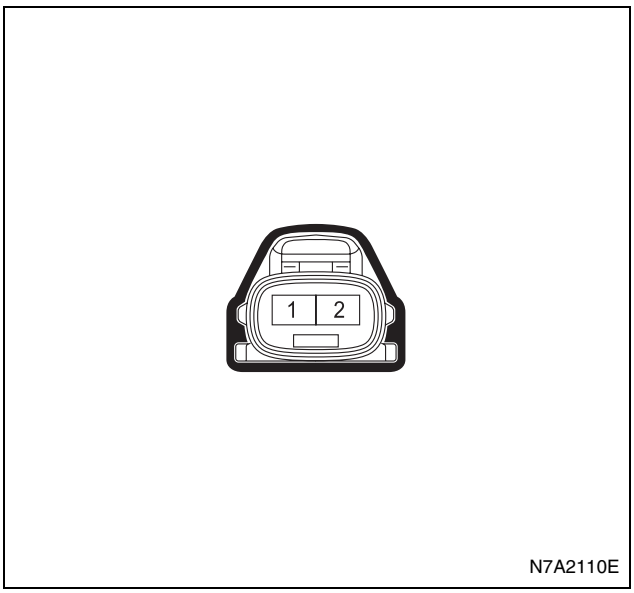
Connector No.		N-19
Connector Color		White
Test Adapter No.		J-35616-33
Pin	Wire Color	Pin Function
1	LT GRN/ RED	Illumination Lamp Voltage Feed
2	RED/BLK	Selector Lever “R” Position Switch Signal
3	YEL/RED	1st Gear Start Switch Signal
4	GRN/BLK	Selector Lever “A” Position Switch Signal
5	BLU	Economy Mode Switch Signal
6	WHT/BLK	Selector Lever “N” Position Switch Signal
7	ORN	Selector Lever “D” Position Switch Signal
8	PNK/BLK	Selector Lever “–” Position Switch Signal
9	BLK	Selector Lever Ground
10	BLU/BLK	Selector Lever “+” Position Switch Signal

Solenoid Valves & Transmission Fluid Temperature Sensor In-line Harness Connector



Connector No.		J-237
Connector Color		Gray
Test Adapter No.		J-35616-33
Pin	Wire Color	Pin Function
1	RED/YEL	Lock Up Clutch Solenoid Valve Control
2	YEL/RED	Transmission Fluid Temperature Sensor Signal
3	YEL/BLK	Gearshift Clutch Solenoid Valve Control
4	BLU/WHT	Transmission Fluid Temperature Sensor Low Reference

Turbine Speed Sensor



Connector No.		J-232
Connector Color		Gray
Test Adapter No.		J-35616-33
Pin	Wire Color	Pin Function
1	ORN/BLU	Turbine Speed Sensor Low Reference
2	WHT/BLU	Turbine Speed Sensor Signal

Diagnostic Information and Procedures

General Service Information

Non-OEM Parts

All of the on-board diagnostic (OBD) has been calibrated to run with original equipment manufacturer (OEM) parts. Accordingly, if commercially sold sensor or switch is installed, it makes a wrong diagnosis and turn on the transmission warning lamp. Aftermarket electronics, such as cellular phones, stereos, and anti-theft devices, may indicate electromagnetic interference (EMI) into the control system if they are improperly installed. This may cause a false sensor reading and turn on the transmission warning lamp.

Poor Vehicle Maintenance

The sensitivity of OBD will cause the transmission warning lamp turn on if the vehicle is not maintained properly. Restricted oil filters, fuel filters, and crankcase deposits due to lack of oil changes or improper oil viscosity can trigger actual vehicle faults that were not previously monitored prior to OBD. Poor vehicle maintenance cannot be classified as a “non-vehicle fault”, but with the sensitivity of OBD diagnostics, vehicle maintenance schedules must be more closely followed.

Visual/Physical Transmission Compartment Inspection

Perform a careful visual and physical transmission compartment inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual/physical inspection:

- Inspect all vacuum hoses for punches, cuts, disconnects, and correct routing.
- Inspect hoses that are difficult to see behind other components.
- Inspect all wires in the transmission compartment for proper connections, burned or chafed spots, pinched wires, contact with sharp edges or contact with hot exhaust manifolds or pipes.

Basic Knowledge of Tools Required

Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in an incorrect diagnosis or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge. A basic understanding of hand tools is necessary to effectively use this section of the service manual.

Transmission Warning Lamp

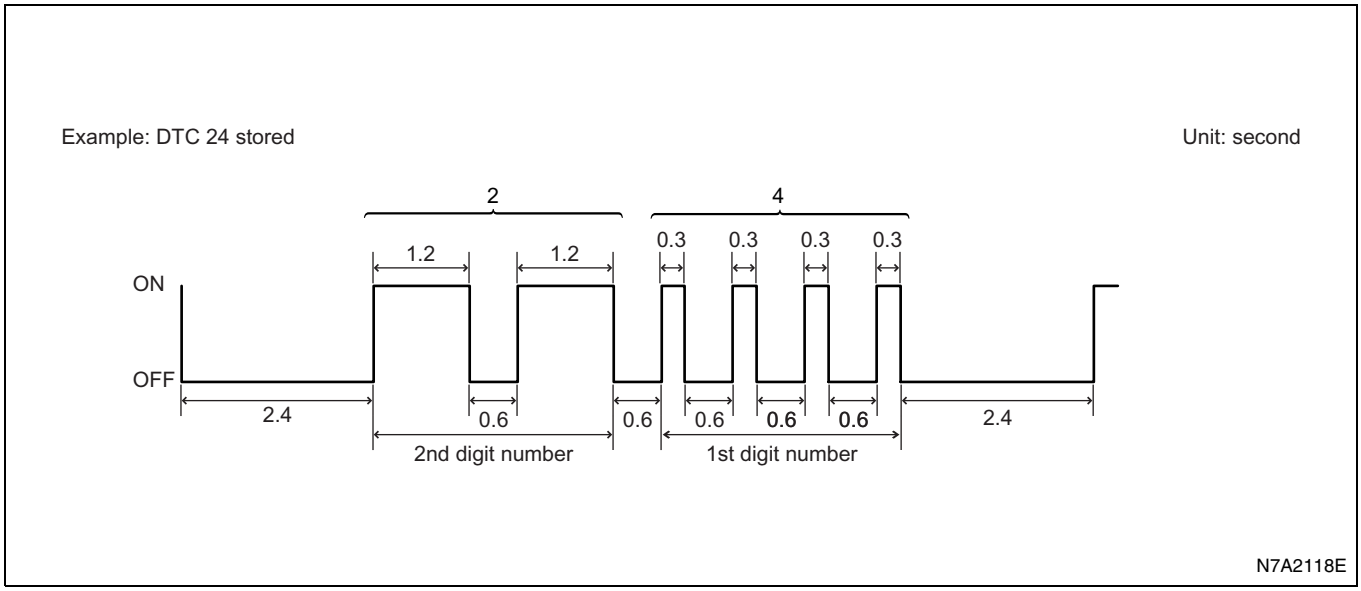
Basically, the transmission warning lamp is turned on when the transmission control module (TCM) detects a DTC that will impact the vehicle performance. When the transmission warning lamp remains “ON” while the engine is running, or when a malfunction is suspected due to a driveability problem, a Diagnostic System Check must be performed. The procedures for these checks are given in Diagnostic System Check - Transmission Controls.

Reading Flash Diagnostic Trouble Codes (DTC)

The provision for communicating with the TCM is the Data Link Connector (DLC). The DTCs stored in the TCM memory can be read either through a hand-held diagnostic scanner such as Tech 2 plugged into the DLC or by counting the number of flashes of the transmission warning lamp when the diagnostic test terminal of the DLC is grounded. The DLC terminal “11” (diagnostic request) is pulled “Low” (grounded) by jumped to DLC terminal “4”, which is a ground wire. Once terminals “11” and “4” have been connected, the ignition switch must be moved to the “ON” position, with the engine not running. The transmission warning lamp will indicate a DTC three times is a DTC is present and history. If more than one DTC has been stored in the TCM’s memory, the DTCs will be output numerical order with each DTC being displayed three times. The flash DTC display will continue as long as the DLC is shorted.

Notice:

- If DTC is present, buzzer also sounds with a lamp illumination.
- When present DTC and history DTC are mixed, present DTC is always output first, regardless of number of DTC.



Reading Diagnostic Trouble Codes (DTCs) with The Tech 2

The procedure for reading DTC(s) is used a diagnostic Tech 2. To read DTCs, use the Tech 2 “Read DTC Info As Stored By ECU”.

Clearing Diagnostic Trouble Codes (DTCs) with The Tech 2 or without Tech2

Do not clear DTCs unless directed to do so by the service information provided for each diagnostic procedure. To clear DTCs, use with the Tech 2 “Clear DTC Information”. If there is no Tech 2, clear with reset switch operation.

DTC Clear Method with Reset Switch Operation

1. Turn ON the ignition, with the engine OFF.
2. Use a jumper wire and the DLC terminal “11” (diagnostic request) is pulled “Low” (grounded) by jumped to DLC terminal “4”.
3. Press reset switch for at least 1 second and release it within 6 seconds.
4. If completed, buzzer will sound with a short beep.

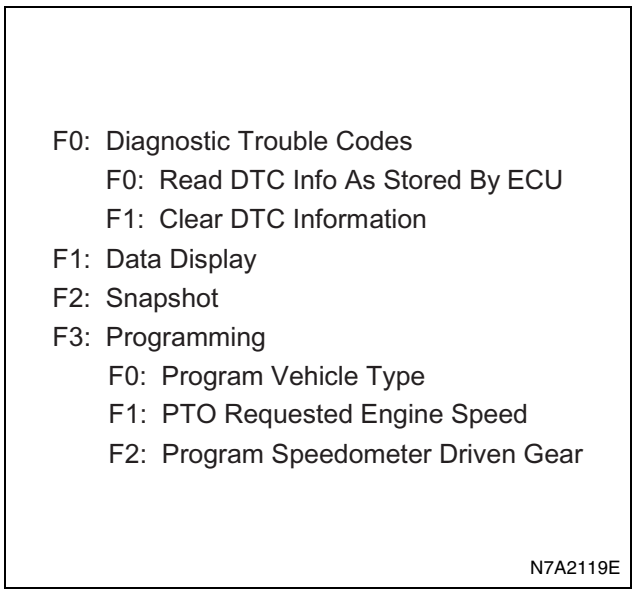
Notice:
If the buzzer does not sound, restart clear procedure from step 1.

Tech 2 Scan Tool

Isuzu recommend using Tech 2. Refer to the Tech 2 Users Guide for proper start up procedures.

Operating Procedure

1. Press Enter at start screen.
2. Select Diagnostic > appropriate vehicle identification > Transmission > Smoother.
3. The following table shows, which functions are used the available equipment versions.



F0: Diagnostic Trouble Codes

The purpose of this mode is to display stored trouble code in the TCM. When “Clear DTC Information” is selected, “Clear DTC Information”, warning screen appears. This screen informs you that by cleaning DTCs “all stored DTC information in the TCM will be erased”.

F1: Data Display

The purpose of this mode is to continuously monitor data parameters. The current actual values of all important sensors and signals, solenoid commands in the system are display through this mode.
Refer to the “Tech 2 Data List” in this section.

F2: Snapshot

“Snapshot” allow you to focus on making the condition occur, rather than trying to view all of the data in anticipation of the fault. The snapshot will collect parameter information around a trigger point that you select.
Refer to the Tech 2 user instructions for more information.

F3: Programming

The purpose of this mode is to program the vehicle information into the TCM if the vehicle specification or TCM is to be replaced.

Tech 2 Data List

Tech 2 data display items	Units	Typical Value (Key Switch ON)
Ignition Voltage	V	18V — 32V
Engine Speed	rpm	0 rpm
Turbine Speed	rpm	0 rpm
Input Shaft Speed	rpm	0 rpm
Engine and Input Shaft Speed Difference	rpm	0 rpm
Output Shaft Speed	rpm	0 rpm
Vehicle Speed	km/h / MPH	0 km/h
Accelerator Position Sensor Signal	%	0% *4
Transmission Fluid Temperature Sensor	V	Varies depending on conditions.
Transmission Fluid Temperature	°C / °F	–40 — 165 °C
Gearshift Clutch Solenoid Command	%	Varies depending on conditions.
Gearshift Clutch Output Signal	Engaged/Disengaged	Varies depending on conditions.
Lock up Clutch Solenoid Command	ON/OFF	Lockup solenoid valve active: ON
Lock up Clutch Solenoid Feedback	ON/OFF	Lockup solenoid valve active: ON
Desired Gear Select Position	V	Varies depending on conditions.
Gear Select Position Sensor	V	Varies depending on conditions.
Desired Gear Shift Position	V	Varies depending on conditions.
Gear Shift Position Sensor	V	Varies depending on conditions.
Select Solenoid Command	%	Varies depending on conditions.
1-3-5 Shift Solenoid Command	%	Varies depending on conditions.
2-4-6-R Shift Solenoid Command	%	Varies depending on conditions.
Neutral Switch	Neutral/In Gear	Neutral: Neutral
Selector Position	R/N/D/+/–/ --- /A/Don't know/Key Off/Emergency Control	Matches change lever operation (N)
Desired Gear Position	N1/N2/N3/N4/1st/2nd/ 3rd/4th/5th/6th	Varies depending on conditions.
Desired Gate Position	N1/N2/N3/N4/1st/2nd/ 3rd/4th/5th/6th	Varies depending on conditions.
Current Gear	During N1/N2/N3/N4/1st/ 2nd/3rd/4th/5th/6th/R shifting	Varies depending on conditions.
Control Phase	*1	Varies depending on conditions.
Gearshift Clutch Control Mode	*2	Varies depending on conditions.
Buzzer Mode	*3	Varies depending on conditions.
Main Relay Command	ON/OFF	ON
Main Relay Voltage Feed Circuit	ON/OFF	Battery voltage supplied to TCM: ON
Gearshift Control Box Relay Command	ON/OFF	ON
Starter Cut Relay Command	ON/OFF	Engine start prohibited: ON
Brake Pedal Switch	Applied/Released	Brake pedal depressed: Applied

Tech 2 data display items	Units	Typical Value (Key Switch ON)
Selector N Switch	ON/OFF	ON in accordance with the selector lever position.
Selector D Switch	ON/OFF	ON in accordance with the selector lever position.
Selector A Switch	ON/OFF	ON in accordance with the selector lever position.
Selector + Switch	ON/OFF	ON in accordance with the selector lever position.
Selector – Switch	ON/OFF	ON in accordance with the selector lever position.
Selector R Switch	ON/OFF	ON in accordance with the selector lever position.
Emergency Switch	ON/OFF	Emergency switch pressed: ON
Emergency N Switch	ON/OFF	Emergency shift switch position N: ON
Emergency 1st Switch	ON/OFF	Emergency switch position 1st: ON
Emergency R Switch	ON/OFF	Emergency shift switch position R: ON
1st Gear Start Switch	ON/OFF	1st gear start switch pressed: ON
Economy Switch	ON/OFF	Economy mode switch pressed: ON
Economy Lamp Command	ON/OFF	Economy mode is enabled: ON
Warning Lamp Command	ON/OFF	Key is ON, trouble is detected, etc.: ON
Buzzer Command	ON/OFF	Buzzer sounding: ON
Fast Switch	ON/OFF	FAST side of Half-clutch adjustment switch pressed: ON
Slow Switch	ON/OFF	SLOW side of Half-clutch adjustment switch pressed: ON
Reset Switch	ON/OFF	Reset switch pressed: ON
Door Switch	Open /Closed	Door open: Open
PTO Switch	ON/OFF	PTO switch pressed: ON
PTO Mode Start	Yes/No	Varies depending on conditions.
PTO Solenoid	—	—
PTO Request Engine Speed	rpm	Varies depending on conditions.
Aerial Platform Vehicle	Yes/No	Depends on vehicle condition.
Neutral Learned Shift Position	V	Varies depending on conditions.
1st Gear Learned Shift Position	V	Varies depending on conditions.
2nd Gear Learned Shift Position	V	Varies depending on conditions.
3rd Gear Learned Shift Position	V	Varies depending on conditions.
4th Gear Learned Shift Position	V	Varies depending on conditions.
5th Gear Learned Shift Position	V	Varies depending on conditions.
6th Gear Learned Shift Position	V	Varies depending on conditions.
Reverse Gear R Learned Shift Position	V	Varies depending on conditions.
N1 Learned Select Position	V	Varies depending on conditions.
N2 Learned Select Position	V	Varies depending on conditions.
N3 Learned Select Position	V	Varies depending on conditions.
N4 Learned Select Position	V	Varies depending on conditions.
N1 Learned Duty Ratio	%	Varies depending on conditions.
N2 Learned Duty Ratio	%	Varies depending on conditions.

Tech 2 data display items	Units	Typical Value (Key Switch ON)
N3 Learned Duty Ratio	%	Varies depending on conditions.
N4 Learned Duty Ratio	%	Varies depending on conditions.
Torque Learned Duty Ratio	%	Varies depending on conditions.
Half-Clutch Adjustment Duty Ratio	%	Varies depending on conditions.
Engine Type	Example: 4HK1	Varies depending on vehicle.
Engine Type Learning Status	Learned/Not Learned	Learned after learning is complete.
Transmission Type	Example: MYY	Varies depending on vehicle.
Transmission Type Learning Status	Learned/Not Learned	Learned after learning is complete.
Speedometer Driven Gear Teeth	—	10 — 17
Speedometer Driven Gear Learning Status	Learned/Not Learned	Learned
Gear Position Learning Status	Learned/Not Learned	Learned
Torque Learning Status	Learned/Not Learned	Learned

*1

Non-control	Not control being performed.
Immediate clutch disengage	Clutch immediate disengage control
Clutch slow disengage	Clutch slow disengage control
Clutch fully disengaged	Clutch fully disengaged
Full clutch engage	Clutch immediate engage control
Clutch slow engage	Clutch slow engage control
Clutch slow engage complete	Slow clutch engage control complete
Clutch full engage	Clutch fully engaged
Shift start	Shift control started.
Neutral gear	Neutral gear select control
Neutral select transition	Neutral select position transition control
Neutral select N1 transition	Neutral selection position transition to initial position
Gear in	Gear in control started.
Control stopped	Smoother system control stopped
Engine start, clutch disengaged	Clutch disengaged immediately after engine start.
Engine start, clutch engaged	Clutch engaged immediately after engine start.
PTO mode	PTO control mode
Initial learning mode	Initial learning mode
Manual learning mode	Manual learning mode
Key off	Key switch is OFF.
Torque learning clutch full disengage	Clutch is fully disengaged when torque learning.
Torque learning N2 shift	Neutral clutch position is N2 when torque learning.
Torque learning 2nd shift	Shifted to 2nd when torque learning.
Torque learning standby	Clutch engage control when torque learning
Torque learning clutch immediate disengage	Clutch immediately engaged when torque learning.
Torque learning clutch loose disengage	Clutch slowly engaged when torque learning.
Torque learning stop	Torque learning complete
N2 shift after torque learning	Neutral clutch position is N2 after torque learning.
N1 shift after torque learning	Neutral clutch position is initial position after torque learning.
Torque learning neutral shift	Gear is shifted to neutral when torque learning.

Gear learning full disengage	Clutch is fully disengaged when gear learning.
Gear learning TM learning	Gear learning (transmission type learning) performed.
Gear learning N1 learning	Gear learning (gear position) performed.
Gear learning N2 learning	Gear learning (gear position) performed.
Gear learning N3 learning	Gear learning (gear position) performed.
Gear learning N4 learning	Gear learning (gear position) performed.
Gear learning N1 standby	Standby in neutral select (N1) when gear learning.
Gear learning N2 standby	Standby in neutral select (N2) when gear learning.
Gear learning N3 standby	Standby in neutral select (N3) when gear learning.
Gear learning N4 standby	Standby in neutral select (N4) when gear learning.
Gear learning REV learning	Gear learning (gear position Rev learning) performed.
Gear learning 1st learning	Gear learning (gear position 1st learning) performed.
Gear learning 2nd learning	Gear learning (gear position 2nd learning) performed.
Gear learning 3rd learning	Gear learning (gear position 3rd learning) performed.
Gear learning 4th learning	Gear learning (gear position 4th learning) performed.
Gear learning 5th learning	Gear learning (gear position 5th learning) performed.
Gear learning 6th learning	Gear learning (gear position 6th learning) performed.
Gear learning complete	Gear position learning is complete.
Emergency control, non-control	System control stopped during non-control.
Non-control, N shift	Shift to neutral during non-control.
Non-control, 1st shift	Shift to 1st during non-control.
Non-control, Rev shift	Shift to Rev during non-control.

*2

Garage	Half-clutch control on a stopped vehicle
Engine plus	Half clutch control when engine speed is high due to input shaft speed, as when up-shifting is performed
Input shaft plus	Half clutch control when input shaft speed is high due to engine speed, as when down-shifting is performed
Synchro	Half-clutch control while running, when the engine speed and input shaft speed differential is very small.
Idle up-shift	Half-clutch control on a stopped vehicle, while idling

*3

Reset start	When the key switch is ON
Voltage drop	When battery voltage (system voltage) is low
Buzzer check	Buzzer check mode
Memory clear	When memory is cleared
Learning complete	When learning control is complete
Learning	When learning control is being performed
Self-diagnosis code output	When there is a short between DLC pins, and DTC is detected
Continuous buzzer trouble	When trouble that causes the buzzer to sound continuously is detected
Intermittent buzzer trouble	When trouble that causes the buzzer to sound on intermittently is detected
Gear in door open	When the door is open while the vehicle is in gear
Unlearned alarm	When learning is not being performed

Slip alarm	When the accelerator pedal is pressed while the parking brake is ON and the vehicle is in gear
Inclined stop alarm	When the vehicle is stopped on an incline, even though the accelerator pedal is depressed
Clutch pedal point adjustment	When torque learning (adjustment) is being performed
High-gear very low speed running	When vehicle speed is low while the gear position is very high
Overrun alarm	When the engine is over-running
Parking brake reminder	When the vehicle is running with the parking brake applied
Long-term gear in	When the vehicle is left in gear for a long time while stopped
Overrun shift prohibit	When there is an attempt to down-shift while the engine is over-running.
Underrun shift prohibit	When there is an attempt to up-shift while the engine is under-running.
N lock alarm	When the change lever position is change from N to D without pressing the brake
PTO idle up adjustment	When the idle speed is being adjusted while the PTO is active
PTO mode On	When the PTO mode is on
PTO mode Off	When the PTO mode is off
Buzzer OFF	When buzzer operation is prohibited

*4: The accelerator opening angle does not always match the operational feel of the pedal. Some difference between the two is not abnormal.

Tech 2 Data Definitions

A list of each message displayed on the Tech 2 will be explained in Transmission Controls. This information will assist in driveability problems. The displays can be viewed while the vehicle is being driven. Always perform the Diagnosis System Check - Transmission Controls first. The Diagnostic System Check will confirm proper system operation.

Ignition Voltage

This parameter displays the ignition voltage measured at the ignition feed circuit of the TCM. Voltage is applied to the TCM when the ignition switch is ON position.

Engine Speed

This parameter displays the rotational speed of the crankshaft as calculated by the engine control module (ECM) based on inputs from the crankshaft position (CKP) sensor or camshaft position (CMP) sensor. This data is sent over the CAN serial data link from the ECM to the TCM. The Tech 2 will display the engine speed in revolution per minute (RPM).

Turbine Speed

This parameter displays the rotational speed of the gearshift multi-plate clutch as calculated by the TCM based on an input from the turbine speed sensor. The Tech 2 will display the turbine speed in revolution per minute (RPM).

Input Shaft Speed

This parameter displays the rotational speed of the transmission counter shaft as calculated by the TCM based on an input from the input shaft speed sensor. The Tech 2 will display the turbine speed in revolution per minute (RPM).

Engine Speed and Input Shaft Speed Difference

This parameter display the difference of engine speed and input shaft speed (engine speed - input shaft speed) as calculated by the TCM using the signal from the input shaft speed sensor and crankshaft rotational speed that is sent over the CAN serial data link from the engine control module (ECM) to the TCM. The Tech 2 will display a low value when the gearshift clutch is engaged, and a high value when the gearshift clutch is disengaged.

Output Shaft Speed

This parameter displays the transmission output shaft speed calculated by the engine control module (ECM) using the signal from the output shaft speed sensor that is called vehicle speed sensor (VSS). This data is sent over the CAN serial data link from the ECM to the TCM. The Tech 2 will display the engine speed in revolution per minute (RPM).

Vehicle Speed

This parameter displays the vehicle speed calculated by the engine control module (ECM) using the signal from the vehicle speed sensor (VSS). This data is sent over the CAN serial data link from the ECM to the TCM. The Tech 2 will display a low value at lower vehicle speeds, and a high value at higher vehicle speeds.

Accelerator Pedal Position Sensor Signal

This parameter displays the angle of the accelerator pedal as calculated by the engine control module (ECM) using the signals from the accelerator pedal position (APP) sensors. This data is sent over the CAN serial data link from the ECM to the TCM. The APP sensor signal is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.

Transmission Fluid Temperature Sensor

This parameter displays the voltage signal sent to the TCM from the transmission fluid temperature (TFT) sensor. TFT sensor is a range of value indicating a low voltage when the temperature is high and a high voltage when the temperature is low.

Transmission Fluid Temperature

This parameter displays the temperature of the transmission fluid temperature (TFT) as calculated by the TCM using the signal from the TFT sensor. The Tech 2 will display a low temperature when the TFT sensor signal voltage is high, and a high temperature when the TFT sensor signal voltage is low.

Gearshift Clutch Solenoid Command

This parameter displays the gearshift clutch solenoid valve control duty ratio commanded by the TCM. The Tech 2 will display 0% when the gearshift clutch is controlled to engage. The Tech 2 will display a high percentage or 100% when the gearshift clutch is controlled to disengage.

Gearshift Clutch Output Signal

This parameter displays the state of the gearshift clutch output signal to the engine control module (ECM) from the TCM. The Tech 2 will display engage or disengage.

Lock Up Clutch Solenoid Command

This parameter displays the lock up clutch solenoid valve control signal commanded by the TCM. The Tech 2 will display On when the lock up clutch is controlled to engage. The Tech 2 will display Off when the lock up clutch is controlled to disengage.

Lock Up Clutch Solenoid Feedback

This parameter displays the feedback state of the lock up clutch solenoid valve control circuit. The Tech 2 will display On when the lock up clutch solenoid valve control circuit is a high voltage (commanded ON). The Tech 2 will display Off when the lock up clutch solenoid valve is a low voltage (commanded OFF).

Desired Gear Select Position

This parameter displays gear select side lever position desired by the TCM based on desired gear position.

Gear Select Position Sensor

This parameter displays the voltage signal sent to the TCM from the gear select position sensor. Gear select position sensor is a range of values indicating a low voltage when the select side lever is positioned near the N1 to a high voltage when the select side lever is positioned near the N3 or N4.

Desired Gear Shift Position

This parameter displays gear shift side lever position desired by the TCM based on desired gear position.

Gear Shift Position Sensor

This parameter displays the voltage signal sent to the TCM from the gear shift position sensor. Gear shift position sensor is a range of values indicating a low voltage when the shift side lever is positioned near the 2nd, 4th, 6th or reverse gear to a high voltage when the shift side lever is positioned near the 1st, 3rd or 5th gear. It indicates a middle voltage when the shift side lever is positioned near the neutral.

Select Solenoid Command

This parameter displays the select solenoid valve control duty ratio commanded by the TCM. The Tech 2 will display 0% when the select solenoid valve is not controlled. The Tech 2 will display any percentage when the select solenoid valve is commanded to move the select side lever.

1-3-5 Shift Solenoid Command

This parameter displays the 1-3-5 shift solenoid valve control duty ratio commanded by the TCM. The Tech 2 will display 0% when the 1-3-5 shift solenoid valve is not controlled. The Tech 2 will display any percentage when the 1-3-5 shift solenoid valve is commanded to move the shift side lever. (When engaging to 1st, 3rd and 5th gear or when disengaging from 2nd, 4th, 6th and reverse gear.)

2-4-6-R Shift Solenoid Command

This parameter displays the 2-4-6-R shift solenoid valve control duty ratio commanded by the TCM. The Tech 2 will display 0% when the 2-4-6-R shift solenoid valve is not controlled. The Tech 2 will display any percentage when the 2-4-6-R shift solenoid valve is commanded to move the shift side lever. (When engaging to 2nd, 4th, 6th and reverse gear or when disengaging from 1st, 3rd and 5th gear.)

Neutral Switch

This parameter displays the input state of the neutral switch to the TCM. The Tech 2 will display Neutral or In Gear. Neutral indicates the neutral switch is closed position (actual neutral position). In gear indicates the neutral switch is opened position (other than neutral).

Selector Position

This parameter displays the selector lever position based on the selector lever switch inputs to the TCM.

Desired Gear Position

This parameter displays the gear position commanded by the TCM based on engine speed, vehicle speed, selector lever position and other inputs.

Desired Gate Position

This parameter displays the controlled gear position is set by the TCM for shifting to the desired gear position.

Current Gear

This parameter displays the current gear position based on the gear select position sensor and gear shift position sensor inputs. N1 indicates the shift position is neutral between 1st and reverse gear. N2 indicates the shift position is neutral between 2nd and 3rd gear. N3 indicates the shift position is neutral between 4th and 5th gear. N4 indicates the shift position is neutral at 6th gear gate.

Control Phase

This parameter displays the control state of the transmission. The Tech 2 will display various control status for transmission control.

Gearshift Clutch Control Mode

This parameter displays the control state of the gearshift clutch. The Tech 2 will display various control status for gearshift clutch control.

Buzzer Mode

This parameter displays the control state of the buzzer. The Tech 2 will display various control status for buzzer control.

Main Relay Command

This parameter displays the commanded state of the main relay control circuit. On indicates the main relay control circuit is being grounded by the TCM, allowing the main relay to supply battery voltage to the TCM. Off indicates the main relay is not being commanded On by the TCM.

Main Relay Voltage Feed Circuit

This parameter displays the input state of the main relay voltage supply to the TCM. On indicates the main relay is closed and battery voltage is being supplied through the main relay.

Gearshift Control Box Relay Command

This parameter displays the commanded state of the gearshift control box relay control circuit. On indicates the gearshift control box relay control circuit is being grounded by the TCM, allowing the gearshift control box relay to supply voltage to the select and shift solenoid valves through the TCM. Off indicates the gearshift control box relay is not being commanded On by the TCM.

Starter Cut Relay Command

This parameter displays the commanded state of the starter cut relay control circuit. On indicates the starter cut relay control circuit is being grounded by the TCM, inhibiting the starter relay control circuit to connect to ground and the engine will not crank. Off indicates the starter cut relay is not being commanded On by the TCM, allowing the starter relay control circuit to connect to ground and the engine is possible to crank.

Brake Pedal Switch

This parameter displays the state of the brake pedal as determined by the TCM based on an input from the stop lamp pedal switch. This switch turns on the stop lamps when the brake pedal is depressed. The Tech 2 will display Applied when the brake pedal is depressed.

Selector N Switch

This parameter displays the state of the selector lever as determined by the TCM based on input from the selector lever switches. The Tech 2 will display On when the selector lever is positioned to N.

Selector D Switch

This parameter displays the state of the selector lever as determined by the TCM based on input from the selector lever switches. The Tech 2 will display On when the selector lever is positioned to D, A + or –.

Selector A Switch

This parameter displays the state of the selector lever as determined by the TCM based on input from the selector lever switches. The Tech 2 will display On when the selector lever is positioned to A.

Selector + Switch

This parameter displays the state of the selector lever as determined by the TCM based on input from the selector lever switches. The Tech 2 will display On when the selector lever is positioned to +.

Selector – Switch

This parameter displays the state of the selector lever as determined by the TCM based on input from the selector lever switches. The Tech 2 will display On when the selector lever is positioned to –.

Selector R Switch

This parameter displays the state of the selector lever as determined by the TCM based on input from the selector lever switches. The Tech 2 will display On when the selector lever is positioned to R.

Emergency Switch

This parameter displays the state of the emergency switch as determined by the TCM based on an input from the emergency switch. The Tech 2 will display On when the emergency switch is On, allowing the emergency mode to start.

Emergency N Switch

This parameter displays the state of the emergency shift switch as determined by the TCM based on an input from the emergency shift switch. The Tech 2 will display On when the emergency shift switch is positioned to N.

Emergency 1st Switch

This parameter displays the state of the emergency shift switch as determined by the TCM based on an input from the emergency shift switch. The Tech 2 will display On when the emergency shift switch is positioned to 1, allowing the emergency shifting to 1st gear when emergency switch is ON.

Emergency R Switch

This parameter displays the state of the emergency shift switch as determined by the TCM based on an input from the emergency shift switch. The Tech 2 will display On when the emergency shift switch is positioned to R, allowing the emergency shifting to reverse gear when emergency switch is ON.

1st Gear Start Switch

This parameter displays the state of the 1st gear start switch as determined by the TCM based on an input from the 1st gear start switch. The Tech 2 will display On when the 1st gear start switch is On.

Economy Switch

This parameter displays the state of the economy switch as determined by the TCM based on an input from the economy switch. The Tech 2 will display On when the economy switch is On, allowing the gearshift schedule to change at auto shift mode.

Economy Lamp Command

This parameter displays the commanded state of the economy indicator lamp control circuit. The ECONO indicator lamp should be On when the Tech 2 indicates the Economy Lamp Command is On. The ECONO

indicator lamp should be Off when the Tech 2 indicates the Economy Lamp Command is Off. The TCM will command the ECONO indicator lamp On approximately 3 seconds when the ignition is On with the engine Off in order to perform a bulb check.

Warning Lamp Command

This parameter displays the commanded state of the transmission warning lamp control circuit. The transmission warning lamp should be On when the Tech 2 indicates the Warning Lamp Command is On. The transmission warning lamp should be Off when the Tech 2 indicates the Warning Lamp Command is Off. The TCM will command the transmission warning lamp On approximately 3 seconds when the ignition is On with the engine Off in order to perform a bulb check.

Buzzer Command

This parameter displays the commanded state of the buzzer control circuit in the TCM. The buzzer should be sound when the Tech 2 indicates the Buzzer Command is On. The buzzer should be Off when the Tech 2 indicates the Buzzer Command is Off.

Fast Switch

This parameter displays the state of the half-clutch adjustment switch as determined by the TCM based on an input from the half-clutch adjustment switch. The Tech 2 will display On when the FAST side switch is depressed.

Slow Switch

This parameter displays the state of the half-clutch adjustment switch as determined by the TCM based on an input from the half-clutch adjustment switch. The Tech 2 will display On when the SLOW side switch is depressed.

Reset Switch

This parameter displays the state of the reset switch as determined by the TCM based on an input from the reset switch. The Tech 2 will display On when the reset switch is depressed.

Door Switch

This parameter displays the state of the door switch as determined by the TCM based on inputs from the door switches. The Tech 2 will display Open when the either of door open.

4L Switch

This parameter is not used.

PTO Switch

This parameter displays the state of the PTO switch as determined by the TCM based on an input from the PTO switch. The Tech 2 will display On when the PTO switch is depressed.

PTO Mode Start

This parameter displays the control state of the PTO mode. The Tech 2 will display Yes when the PTO mode is started.

PTO Solenoid

This parameter is not used.

PTO Request Engine Speed

This parameter displays the programmed PTO request engine speed when PTO mode is enabled. The PTO request engine speed can change by user request or PTO applications.

Aerial Platform Vehicle

This parameter is not used.

Neutral Learned Shift Position

This parameter displays the learned position at the neutral using the signal from the gear shift position sensor.

1st Gear Learned Shift Position

This parameter displays the learned position at the 1st gear using the signal from the gear shift position sensor.

2nd Gear Learned Shift Position

This parameter displays the learned position at the 2nd gear using the signal from the gear shift position sensor.

3rd Gear Learned Shift Position

This parameter displays the learned position at the 3rd gear using the signal from the gear shift position sensor.

4th Gear Learned Shift Position

This parameter displays the learned position at the 4th gear using the signal from the gear shift position sensor.

5th Gear Learned Shift Position

This parameter displays the learned position at the 5th gear using the signal from the gear shift position sensor.

6th Gear Learned Shift Position

This parameter displays the learned position at the 6th gear using the signal from the gear shift position sensor.

Reverse Gear Learned Shift Position

This parameter displays the learned position at the reverse gear using the signal from the gear shift position sensor.

N1 Learned Select Position

This parameter displays the learned position at the N1 using the signal from the gear select position sensor.

N2 Learned Select Position

This parameter displays the learned position at the N2 using the signal from the gear select position sensor.

N3 Learned Select Position

This parameter displays the learned position at the N3 using the signal from the gear select position sensor.

N4 Learned Select Position

This parameter displays the learned position at the N4 using the signal from the gear select position sensor.

N1 Learned Duty Ratio

This parameter displays the learned select solenoid valve control duty ratio at the N1.

N2 Learned Duty Ratio

This parameter displays the learned select solenoid valve control duty ratio at the N2.

N3 Learned Duty Ratio

This parameter displays the learned select solenoid valve control duty ratio at the N3.

N4 Learned Duty Ratio

This parameter displays the learned select solenoid valve control duty ratio at the N4.

Torque Learned Duty Ratio

This parameter displays the learned gearshift clutch solenoid valve control duty ratio when the half-clutch position is learned.

Half-Clutch Adjustment Duty Ratio

This parameter displays the adjustment value of the gearshift clutch solenoid valve control duty ratio when the gearshift clutch is engaged. The half-clutch adjustment switch is used to adjust the clutch engagement timing.

Engine Type

This parameter displays the programmed engine type.

Engine Type Learning Status

This parameter displays the learning state of the engine type. Not Learned indicates initialed state that is replaced to a new TCM. Learned indicates learning process is completed state.

Transmission Type

This parameter displays the programmed engine type.

Transmission Type Learning Status

This parameter displays the learning state of the transmission type. Not Learned indicates initialed state that is replaced to a new TCM. Learned indicates learning process is completed state.

Speedometer Driven Gear Teeth

This parameter displays the programmed speedometer driven gear teeth.

Speedometer Driven Gear Learning Status

This parameter displays the learning state of the speedometer driven gear teeth. Not Learned indicates initialed state that is replaced to a new TCM. Learned indicates learning process is completed state.

Gear Position Learning Status

This parameter displays the learning state of the half-clutch position. Not Learned indicates initialed state that is replaced to a new TCM. Learned indicates learning process is completed state.

Torque Learning Status

This parameter displays the learning state of the transmission gear select and shift position. Not Learned indicates initialed state that is replaced to a new TCM. Learned indicates learning process is completed state.

Transmission Contol System Check Sheet

Check list for Smoother control system Specific example Inspector's name _____

Customer's name		Model type and model year	
Driver's name		Vehicle No.	
Date vehicle brought in		Transmission type	
Registration No.		Transmission No.	
		Engine model	
		Odometer reading	km

Trouble symptom	☐ Engine does not start	☐ Engine does not crank ☐ At gear-in ☐ At neutral ☐ When emergency switch is ON
	☐ When gear is engaged while vehicle is stopped, engine stalls	☐ Idle speed is incorrect ☐ Abnormal idling ☐ High (rpm) ☐ Low (rpm) ☐ Others _____
	☐ Drivability is low	☐ Engagement/disengagement is felt at shift-up ☐ Body vibration ☐ Engine vibration ☐ Noise ☐ Large shock at gearshift ☐ Large shock at starting to move ☐ Others _____
	☐ Running not possible	☐ Immediately after starting to move ☐ When accelerator pedal is released ☐ When A/C is operated ☐ Immediately after replacing engine oil ☐ Immediately after replacing transmission oil ☐ When gear is shifted up ☐ Others _____
	☐ Gearshift	☐ Gear is shifted ☐ Gear is not shifted
	☐ Noise	☐ Gear clash ☐ Others
	☐ Accelerator pedal	☐ Blow up ☐ Slow response ☐ Rough
	☐ Engine stall	☐ Brake lamp does not come on ☐ Others _____

Trouble occurrence data		
Frequency of trouble		☐ Always ☐ Sometimes (How many times: per date/month) ☐ Once ☐ Others _____
Trouble condition	Weather	☐ Fine ☐ Cloudy ☐ Rain ☐ Snow ☐ Various/ others _____
	Ambient temperature	☐ 30℃ or more ☐ Around 20−30 ℃ ☐ Around 10−15 ℃ ☐ 0℃ or less (℃)
	Location	☐ Expressway ☐ Suburb ☐ Urban area ☐ Uphill ☐ Downhill ☐ Rough road ☐ Others _____
	Engine/ transmission temperature	☐ Cold ☐ Warming-up ☐ After warmed-up ☐ Engine coolant temperature ℃
	Operating condition	☐ When starting ☐ Immediately after starting (minutes) ☐ Idling ☐ Racing ☐ During operation ☐ At a constant speed ☐ At acceleration ☐ At deceleration ☐ A/C SW, other SW ON/OFF ☐ Others _____

Smoother warning lamp		☐ ON ☐ Sometimes comes on ☐ Not come on ☐ Not sure
DTC	Present	☐ ☐ ☐
* When was the transmission oil replaced last time? Were genuine transmission oil, filter, etc. used?		☐ When was the engine oil replaced last time? ☐ ☐
Buzzer		☐ Beeped ☐ Not beep ☐ Not sure
Lamp indication fault		☐ Economy mode ☐ Indicator display ☐ Others ☐ Not sure ☐ 1st gear start
Past trouble history		☐ (Year Month/Date) _____ ☐ (Year Month/Date)
About learning		Torque learning _____ Torque learning value _____ % Gear learning _____ Adjustment learning value _____ %
Trouble occurrence data		Phase _____ Shift mode _____ Target gear _____ Buzzer mode _____

N7A2073E

Diagnostic Starting Point - Transmission Controls

Begin the system diagnosis with Diagnostic System Check Transmission Controls. The Diagnostic System Check Transmission Controls will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and the their statuses.

The use of the Diagnostic System Check - Transmission Controls will identify the correct procedure for diagnosing the system and where the procedure is located.

Important:
Transmission Control System Check Sheet must be used to verify the customer complaint, you need to know the correct (normal) operating behavior of the system and verify that the customer complaint is a valid failure of the system.

Diagnostic System Check - Transmission Controls

Description

The Diagnostic System Check Transmission Controls is an organized approach to identifying a condition that is created by a malfunction in the electronic transmission control system. The Diagnostic System Check must be the starting point for any driveability concern. The Diagnostic System Check directs the service technician to the next logical step in order to diagnose the concern. Understanding and correctly using the diagnostic table reduces diagnostic time, and prevents the replacement of good parts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

1.Lack of communication may be because of a partial or a total malfunction of the Keyword 2000 serial data circuit. The specified procedure determines the particular condition.

5. The presence of DTCs which begin with U, indicate that some other module is not communicating.

11.If there are other modules with DTCs set, refer to the DTC list. The DTC list directs you to the appropriate diagnostic procedure. If the control module stores multiple DTCs, diagnose the DTCs in the following order.

- Component level DTCs, such as sensor DTCs, solenoid DTCs, actuator DTCs, and relay DTCs. Diagnose the multiple DTCs within this category in numerical order. Begin with the lowest numbered DTC, unless the diagnostic table directs you otherwise.

Important:

- DO NOT perform this diagnostic if there is not a driveability concern, unless another procedure directs you to this diagnostic.
- Before you proceed with diagnosis, search for applicable service bulletins.
- Unless a diagnostic procedure instructs you, DO NOT clear the DTCs.
- Ensure the battery has a full charge.
- Ensure the battery cables (+) (–) are clean and tight.
- Ensure the TCM grounds are clean, tight, and in the correct location.
- Ensure the TCM harness connectors are clean and correctly connected.
- Ensure the TCM terminals are clean and correctly mating.
- Ensure the vehicle maintenance has been done enough.
- Ensure the vehicle information data is correctly programmed and transmission gear select & shift position and half-clutch position is correctly learned.
- If there are DTC's P0718, P0726, P0909, P0915 or P0919, diagnose sensor DTCs, solenoid DTCs, actuator DTCs and relay DTCs FIRST.

Step	Action	Value(s)	Yes	No
1	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to establish communication with the listed control modules. • Engine control module (ECM) • Transmission control module (TCM) • Supplemental restraint system (SRS) control module (If so equipped) Does the Tech 2 communicate with all the listed control modules?	—	Go to Step 2	Go to Tech 2 Does Not Communicate with Keyword Device

Step	Action	Value(s)	Yes	No
2	1. Turn OFF the ignition for 30 seconds. 2. Turn OFF the emergency switch. 3. Turn ON the ignition, with the engine OFF. Does the transmission warning lamp illuminate?	—	Go to Step 3	Go to Transmission Warning Lamp Inoperative
3	Attempt to crank the engine. Does the engine crank?	—	Go to Step 4	Go to Engine Does Not Crank
4	Attempt to start the engine. Does the engine start and idle?	—	Go to Step 5	Go to Engine Cranks But Does Not Run in Engine Control Section
5	Select the DTC display function for the following control modules: • ECM • TCM • SRS control module (If so equipped) Does the Tech 2 display any DTCs?	—	Go to Step 6	Go to Step 13
6	Does the Tech 2 display DTCs which begin with a U or other control module communication fault DTCs?	—	Go to Applicable DTC	Go to Step 7
7	Does the Tech 2 display TCM DTCs P0602, P0605 or P0613?	—	Go to Applicable DTC	Go to Step 8
8	Does the Tech 2 display TCM DTCs P0885 or P0889?	—	Go to Applicable DTC	Go to Step 9
9	Does the Tech 2 display TCM DTCs P0715, P0717, P0721, P0904 or P0914?	—	Go to Applicable DTC	Go to Step 10
10	Does the Tech 2 display TCM DTCs P0740, P0742, P0902 or P0903?	—	Go to Applicable DTC	Go to Step 11
11	Does the Tech 2 display TCM DTCs P0851, P0852, P0906 or P0907?	—	Go to Applicable DTC	Go to Step 12
12	Is there any other code in any controller that has not been diagnosed?	—	Go to Applicable DTC	Go to Step 13
13	Is the customer's concern with the engine?	—	Go to Diagnostic System Check - Engine Control	Go to Step 14
14	Is the customer's concern with the SRS airbag system?	—	Go to Diagnostic System Check SRS Control	Go to Step 15
15	Drive vehicle and verify if any engine or transmission related driveability concern exist. Perform Gearshift Control System Check as necessary. Refer to Gearshift Control System Check in this section. Does an engine or transmission driveability concern exist?	—	Go to Symptoms - Engine Controls in Engine Control Section or Diagnosis based on vehicle condition for Transmission	System OK

Tech 2 Does Not Communicate with Keyword Device

Circuit Description

The engine control module (ECM), transmission control module (TCM) and supplemental restraint system (SRS) control module communicates with the Tech 2 over the Keyword 2000 serial data link. However, the ECM, TCM, electric hydraulic control module (EHCU) (ABS module) and the data recording module (DRM) communicate with each other over the controller area network (CAN) link. The CAN link is not used for communication with the Tech 2 and is shared only among each module.

Diagnostic Aids

The following conditions will cause a loss of Keyword serial data communication between the ECM, TCM and SRS control module or between the Tech 2 and any control module:

- A Keyword serial data circuit open.
- A Keyword serial data circuit shorted to ground.
- A Keyword serial data circuit shorted to voltage.
- An internal condition within a module or connector on the Keyword serial data circuit, that causes a short to voltage or ground to the Keyword serial data circuit.

Tech 2 Does Not Communicate with Keyword Device

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to communicate with the listed control modules. • Engine control module (ECM) • Transmission control module (TCM) • Supplemental restraint system (SRS) control module (If so equipped) Does the Tech 2 communicate with all the listed control modules?	—	Go to Step 3	Go to Step 7
3	Does the Tech 2 communicate with the ECM?	—	Go to Step 4	Go to Diagnostic System Check - Engine Control
4	Does the Tech 2 communicate with the TCM?	—	Go to Step 5	Go to Lost Communication with The TCM
5	Does the Tech 2 communicate with the SRS control module?	—	Go to Step 6	Go to Diagnostic System Check -SRS Control
6	Test the Keyword serial data circuit for an intermittently short to ground or intermittently short to voltage. Then, test the Keyword serial data circuit for an intermittently open (based on which control module did not communicate) at the connection in the circuit. Did you find and correct the condition?	—	Go to Step 14	System OK
7	1. Turn OFF the ignition. 2. Disconnect the ECM E-111 and J-191 harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Attempt to communicate with the TCM and SRS control module. Does the Tech 2 communicate with the TCM and SRS control module?	—	Go to Step 11	Go to Step 8

Step	Action	Value(s)	Yes	No
8	1. Turn OFF the ignition. 2. Reconnect the ECM E-111 and J-191 harness connectors. 3. Disconnect the TCM B-425, B-426, B-427 and B-428 harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the ECM and SRS control module. Does the Tech 2 communicate with the ECM and SRS control module?	—	Go to Step 12	Go to Step 9
9	1. Turn OFF the ignition. 2. Reconnect the TCM B-425, B-426, B-427 and B-428 harness connectors. 3. Disconnect the SRS B-243 control module harness connector. 4. Turn ON the ignition leaving the engine OFF. 5. Attempt to communicate with the ECM and TCM. Does the Tech 2 communicate with the ECM and TCM?	—	Go to Step 13	Go to Step 10
10	Repair the short to ground or short to voltage on the Keyword serial data circuit between the DLC and ECM, TCM and SRS control module. Did you complete the repair?	—	Go to Step 14	—
11	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement /Restore Fuel Injector ID Code Data in engine control section. Did you complete the replacement?	—	Go to Step 14	—
12	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—
13	Replace the SRS control module. Refer to Supplemental Restraint System (SRS) control module Replacement in the restraint system section. Did you complete the replacement?	—	Go to Step 14	—
14	Attempt to communicate with the ECM, TCM and SRS control module. Does the Tech 2 communicate with the ECM, TCM and SRS control module?	—	System OK	Go to Step 2

Lost Communication with The Transmission Control Module (TCM)

Circuit Description

The engine control module (ECM), transmission control module (TCM) and supplemental restraint system (SRS) control module communicates with the Tech 2 over the Keyword 2000 serial data link. However, the ECM, TCM, electric hydraulic control module (EHCU) (ABS module) and the data recording module (DRM) communicate with each other over the controller area network (CAN) link. The CAN link is not used for communication with the Tech 2 and is shared only among each module.

Lost Communication with The Transmission Control Module (TCM)

Schematic Reference: Transmission Controls Schematics
Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	Attempt to establish transmission control module (TCM) communications with the Tech 2. Does the TCM communicate with the Tech 2?	—	Go to Intermittent Conditions	Go to Step 3
3	Check the TCM B-425, B-426, B-427 and B-428 connectors for poor connections. Did you find and correct the condition?	—	Go to Step 9	Go to Step 4
4	1. Turn ON the ignition, with the engine OFF. 2. Check the NEES (IG) (10A) fuse (F-17) in the glove box fuse block. Replace and retest if open. If any fuse continues to open, check for a short to ground on each circuit fed by that fuse. 3. Turn OFF the ignition. 4. Disconnect the TCM B-426 harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Connect a test lamp to ground and check for voltage at the ignition voltage supply circuit at the ECM (pins 1 and 2 of B-426 connector). Does the test lamp illuminate?	—	Go to Step 5	Go to Step 7
5	1. Turn OFF the ignition. 2. Connect a DMM between the Keyword serial data circuit at the TCM (pin 9 of B-426 connector) and the data link connector (DLC) (pin 7 of B-79 connector). 3. Test the circuits for an open circuit or high resistance. 4. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 6
6	**Important:** An open in a ground circuit at the TCM will not cause a loss of communication. 1. Check TCM ground for corrosion and tightness. 2. Clean or tighten grounds as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 8

Step	Action	Value(s)	Yes	No
7	Repair the open in the ignition voltage circuit to the TCM. Did you complete the repair?	—	Go to Step 9	—
8	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 9	—
9	1. Turn OFF the ignition. 2. Reconnect all previously disconnected fuse or harness connector(s). 3. Turn the ignition ON with the engine OFF. 4. Attempt to establish Tech 2 communications with the ECM. Does the Tech 2 communicate with the TCM?	—	System OK	Go to Step 3

Engine Does Not Crank

Description

The Engine Does Not Crank diagnostic table is an organized approach to identifying a condition that causes an engine not crank. The diagnostic table directs the service technician to the appropriate system diagnosis. The diagnostic table assumes the following conditions are met:

- The battery is completely charged and terminals are cleaned and tight.
- Fuse and slow blow fuse are normal.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The numbers below refers to the step number on the diagnostic table.

7. This step checks whether the starter cut relay command signal from TCM is canceled by the brake pedal signal.
8. This step checks whether the starter cut relay command signal from the TCM is canceled by the parking brake signal from the ECM.
9. This step checks whether the starter cut relay command signal from the TCM is canceled by the emergency switch signal.
10. If the vehicle parked in gear, the starter cut relay command is canceled by either of brake pedal, parking brake or emergency switch input. This step retests with the gear in neutral after engine is once started.

Engine Does Not Crank

Schematic Reference: Engine Controls Schematics and Transmission Controls Schematics
Connector End View Reference: Engine Controls Connector End Views, Engine Control Module (ECM) Connector End Views, Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Chart 1 of 3

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0602, P0605, P0613, P0851, P0852, P0906, P0907 or P0914 set?	—	Go to Applicable DTC	Go to Step 3
3	Operate the selector lever while observe the Selector Position parameter with the Tech 2. Does the Selector Position parameter indicate correct position?	—	Go to Step 4	Refer to DTC P0906 and P0907
4	1. Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the parking brake • Emergency switch OFF 2. Attempt to start the engine. Does the engine crank?	—	Go to Step 5	Go to Step 6
5	Does the engine start and idle?	—	System OK	Go to Engine Cranks But Does Not Run in Engine Control Section
6	1. Turn ON the ignition, with the engine OFF. 2. Observe the Starter Cut Relay Command parameter with the Tech 2. Does the Starter Cut Relay Command parameter indicate OFF?	—	Go to Chart 3 of 3 Step 1	Go to Step 7

Step	Action	Value(s)	Yes	No
7	Put the vehicle with the following conditions: • Selector lever N position • Apply the brake pedal • Release the parking brake • Emergency switch OFF Does the Starter Cut Relay Command parameter indicate OFF?	—	Go to Step 8	Go to Chart 2 of 3 Step 1
8	Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Apply the parking brake • Emergency switch OFF Does the Starter Cut Relay Command parameter indicate OFF?	—	Go to Step 9	Go to Chart 2 of 3 Step 11
9	Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the parking brake • Emergency switch ON Does the Starter Cut Relay Command parameter indicate OFF?	—	Go to Step 10	Go to Chart 2 of 3 Step 16
10	1. Put the vehicle with the following conditions: • Selector lever N position • Apply the brake pedal or parking brake • Emergency switch OFF 2. Start the engine. If the engine cranks but does not start, go to Engine Cranks But Does Not Run in the engine control section. 3. Set the gear position in neutral. 4. Stop the engine. 5. Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the park brake • Emergency switch OFF 6. Attempt to start the engine. Does the engine crank?	—	Go to Step 5	Go to Step 11

Step	Action	Value(s)	Yes	No
11	1. Visually inspect the gear shift position sensor for the following conditions: • Physical damage • Loose or improper installation 2. Inspect the gear shift position sensor output voltage. **Notice:** The gear shift position sensor voltage shifted to a lower or a higher voltage will cause no engine crank without DTC. 3. Remove the gear shift position sensor. Refer to Gear Shift Position Sensor Replacement in this section. 4. Visually inspect the gear shift position sensor for the following conditions: • Physical damage • Loose or improper installation • Shift lever damage that connects to the gear shift position sensor shaft. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
12	1. Turn OFF the ignition. 2. Disconnect the gear shift position sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the gear shift position sensor (pins 1, 2 and 3 of J-142 connector). 4. Disconnect the TCM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each gear shift position sensor circuit at the harness connector of the TCM (pins 18, 19 and 20 of B-426 connector). 6. Test for high resistance on each gearshift position sensor circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
13	**Important:** Replacement gear shift position sensor must be relearned. Replace the gear shift position sensor. Refer to Gear Shift Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—

Step	Action	Value(s)	Yes	No
14	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2 if stored. **Important:** Transmission Gear Select & Shift Position Learning must be done if the gear shift position sensor or transmission gearshift control box is replaced, removed or repaired. 3. Turn OFF the ignition for 30 seconds. 4. Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the parking brake • Emergency switch OFF 5. Attempt to start the engine. Does the engine crank?	—	Go to Step 5	Go to Step 2

Chart 2 of 3

Step	Action	Value(s)	Yes	No
1	1. Check to ensure the brake pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 2
2	1. Turn OFF the ignition. 2. Inspect the Stop Light (10A) fuse (F-5) in the glove box fuse block. Is the Stop Light (10A) fuse (F-5) open?	—	Go to Step 3	Go to Step 4
3	Replace the Stop Light (10A) fuse (F-5). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Stop Light (10A) fuse (F-5) or replace the shorted attached component fed by the Stop Light (10A) fuse (F-5). Did you complete the repair?	—	Go to Step 25	—
4	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Connect a test lamp between the voltage feed circuit of the brake pedal switch harness (pin 1 of B-66 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 5	Go to Step 6
5	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Pedal Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the brake pedal switch harness connector between pins 1 and 2 of the B-66 connector. Does the Tech 2 indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 8	Go to Step 7

Step	Action	Value(s)	Yes	No
6	Repair the open circuit or high resistance on the voltage feed circuit between the Stop Light (10A) fuse (F-5) and the brake pedal switch (pin 1 of B-66 connector). Did you complete the repair?	—	Go to Step 25	—
7	1. Test the brake pedal switch signal circuit between the transmission control module (TCM) (pin 3 of B-428 connector) and the brake pedal switch (pin 2 of B-66 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the brake pedal switch (pins 1 and 2 of B-66 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the brake switch circuit at the harness connector of the TCM (pin 3 of B-428 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 24
10	Replace brake pedal switch. Did you complete the replacement?	—	Go to Step 25	—
11	1. Turn OFF the ignition. 2. Disconnect the parking brake switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Parking Brake Switch parameter with the Tech 2 in the engine system menu while momentarily jumping 3-amp fused jumper wire between the parking brake pedal switch harness (pin 2 of N-6 connector) and a known good ground. Does the Tech 2 indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 13	Go to Step 12
12	1. Test the parking brake switch signal circuit between the engine control module (ECM) (pin 48 of J-191 connector) and the parking brake switch (pin 2 of N-6 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 14

Step	Action	Value(s)	Yes	No
13	1. Turn OFF the ignition. 2. Disconnect the parking brake switch harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the parking brake switch (pin 2 of N-6 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 15
14	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the parking brake switch circuit at the harness connector of the ECM (pin 48 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 23
15	Replace parking brake switch. Did you complete the replacement?	—	Go to Step 25	—
16	1. Turn OFF the ignition. 2. Disconnect the emergency switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the voltage feed circuit of the emergency switch harness (pin 1 of N-17 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 17	Go to Step 18
17	1. Turn ON the ignition, with the engine OFF. 2. Observe the Emergency Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the emergency switch harness connector between pins 1 and 5 of the N-17 connector. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 20	Go to Step 19
18	Repair the open circuit or high resistance on the voltage feed circuit between the Meter (10A) fuse (F-16) in the glove box fuse block and the emergency switch (pin 1 of N-17 connector). Did you complete the repair?	—	Go to Step 25	—
19	1. Test the emergency switch signal circuit between the TCM (pin 4 of B-428 connector) and the emergency switch (pin 5 of N-17 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 21

Step	Action	Value(s)	Yes	No
20	1. Turn OFF the ignition. 2. Disconnect the emergency switch harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the emergency switch (pins 1 and 5 of N-17 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 22
21	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the emergency switch circuit at the harness connector of the TCM (pin 4 of B-428 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 24
22	Replace emergency switch. Did you complete the replacement?	—	Go to Step 25	—
23	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement /Restore Fuel Injector ID Code Data in engine control section. Did you complete the replacement?	—	Go to Step 25	—
24	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 25	—
25	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2 if stored. 3. Turn OFF the ignition for 30 seconds. 4. Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the parking brake • Emergency switch OFF 5. Attempt to start the engine. Does the engine crank?	—	Go to Chart 1 of 3 Step 5	Go to Chart 1 of 3 Step 6

Chart 3 of 3

Step	Action	Value(s)	Yes	No
1	1. Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the parking brake • Emergency switch ON 2. Attempt to start the engine. Does the engine crank?	—	Go to Step 3	Go to Step 2
2	1. Turn ON the ignition, with the engine OFF. 2. Observe the Emergency Switch parameter with the Tech 2. Does the Tech 2 indicate ON when the switch is ON and OFF when the switch is OFF?	—	Go to Step 13	Go to Step Chart 2 of 3 Step 16
3	1. Turn OFF the ignition. 2. Replace the starter cut relay with the marker lamp relay or replace with a known good relay. 3. Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the parking brake • Emergency switch OFF 4. Attempt to start the engine. Does the engine crank?	—	Go to Step 12	Go to Step 4
4	1. Turn OFF the ignition. 2. Remove the starter cut relay. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the starter cut relay (pins 1 and 4 of X-26 connector). Did you find and correct the condition?	—	Go to Step 33	Go to Step 5
5	1. Turn OFF the ignition. 2. Remove the starter cut relay. 3. Probe the ground circuit of the starter cut relay switch side (pin 1 of X-26 connector) with a test lamp that is connected to battery voltage. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 9
6	1. Probe the starter relay control circuit to the starter cut relay switch side (pin 4 of X-26 connector) with a DMM that is connected to a known good ground. 2. Make sure the emergency switch is OFF. 3. Turn Start the ignition while observing the DMM. Does the DMM voltage more than the specified value?	18.0 volts	Go to Step 7	Go to Step 10
7	1. Probe the control circuit of the starter cut relay (pin 5 of X-26 connector) with a test lamp that is connected to battery voltage. 2. Turn OFF the ignition for 30 seconds. 3. Disconnect the TCM harness connector (B-425 connector). 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 32

Step	Action	Value(s)	Yes	No
8	1. Turn OFF the ignition for 30 seconds. 2. Keep the test lamp with connected. 3. Disconnect the ECM harness connector (J-191 connector). 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 11	Go to Step 31
9	Repair the open circuit or high resistance on the ground circuit of the starter cut relay switch side between the starter cut relay (pin 1 of X-26 connector) and the chassis ground (J-9). Did you complete the repair?	—	Go to Step 33	—
10	Repair the open circuit or high resistance on the starter relay control circuit to the starter cut relay switch side between the starter relay (pin 5 of X-21 connector) and the starter cut relay (pin 4 of X-26 connector). Did you complete the repair?	—	Go to Step 33	—
11	Repair the short to ground on the starter cut relay control circuit between the TCM (pin 16 of B-425 connector) or ECM (pin 14 of J-191 connector) and the starter cut relay (pin 5 of X-26 connector). Did you complete the repair?	—	Go to Step 33	—
12	Replace the starter cut relay. Did you compete the replacement?	—	Go to Step 33	—
13	1. Turn OFF the ignition. 2. Replace the starter relay with the glow relay or replace with a known good relay. 3. Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the parking brake • Emergency switch OFF 4. Attempt to start the engine. Does the engine crank?	—	Go to Step 29	Go to Step 14
14	1. Turn OFF the ignition. 2. Remove the starter relay. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the starter relay (pins 1, 2, 4 and 5 of X-21 connector). Did you find and correct the condition?	—	Go to Step 33	Go to Step 15
15	Probe the starter relay battery voltage feed circuit (pin 2 of X-21 connector) with a test lamp that is connected to a known good ground. Does the test lamp illuminate?	—	Go to Step 16	Go to Step 23
16	1. Probe the starter relay ignition voltage feed circuit (pin 4 of X-21 connector) with a test lamp that is connected to a known ground. 2. Turn Start the ignition while observing the test lamp. Does the test lamp illuminate?	—	Go to Step 17	Go to Step 24

Step	Action	Value(s)	Yes	No
17	1. Test the starter C terminal circuit between the starter relay (pin 1 of X-21 connector) and the starter C terminal for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 33	Go to Step 18
18	1. Turn OFF the ignition. 2. Reinstall the starter relay. 3. Replace the emergency relay with the dimmer relay or replace with a known good relay. 4. Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the parking brake • Emergency switch OFF 5. Attempt to start the engine. Does the engine crank?		Go to Step 30	Go to Step 19
19	1. Turn OFF the ignition. 2. Remove the emergency relay. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the emergency relay (pins 1, 2, 3 and 5 of X-14 connector). Did you find and correct the condition?	—	Go to Step 33	Go to Step 20
20	Probe the emergency relay ground circuits (pins 2 and 5 of X-14 connector) with a test lamp that is connected to battery voltage. Does the test lamp illuminate?	—	Go to Step 21	Go to Step 25
21	1. Probe the emergency relay voltage feed circuit (pin 3 of X-21 connector) with a test lamp that is connected to a known ground. 2. Turn ON the ignition, with the engine OFF. 3. Turn ON the emergency switch. Does the test lamp illuminate?	—	Go to Step 22	Go to Step 26
22	1. Probe the starter relay control circuit to the emergency relay switch side (pin 1 of X-14 connector) with a DMM that is connected to a known good ground. 2. Turn OFF the emergency switch. 3. Turn Start the ignition while observing the DMM. Does the DMM voltage more than the specified value?	18.0 volts	Go to Step 28	Go to Step 27
23	Repair the open circuit or high resistance on the battery voltage feed circuit between the starter relay (pin 2 of X-21 connector) and the battery terminal. Check the Starter (60A) slow blow fuse (SBF-8) is first. Did you complete the repair?	—	Go to Step 33	—

Step	Action	Value(s)	Yes	No
24	Repair the open circuit or high resistance on the ignition voltage feed circuit between the starter relay (pin 4 of X-21 connector) and the starter switch (pin 4 of B-67 connector). Check the Starter (10A) fuse (F-22) is first. Did you complete the repair?	—	Go to Step 33	—
25	Repair the open circuit or high resistance on the ground circuits of the emergency relay between the emergency relay (pins 2 and 5 of X-14 connector) and the ground (B-7). Did you complete the repair?	—	Go to Step 33	—
26	Repair the open circuit or high resistance on the emergency switch voltage feed circuit between the emergency relay (pin 3 of X-14 connector) and the emergency switch (pin 5 of N-17 connector). Did you complete the repair?	—	Go to Step 33	—
27	Repair the open circuit or high resistance on the starter relay control circuit to the emergency relay switch side between the starter relay (pin 5 of X-21 connector) and the emergency relay (pin 1 of X-14 connector). Did you complete the repair?	—	Go to Step 33	—
28	Repair or replace the starter motor. Refer to starting and charging system in the engine section. Did you complete the repair?	—	Go to Step 33	—
29	Replace the starter relay. Did you complete the replacement?	—	Go to Step 33	—
30	Replace the emergency relay. Did you compete the replacement?	—	Go to Step 33	—
31	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement /Restore Fuel Injector ID Code Data in engine control section. Did you complete the replacement?	—	Go to Step 33	—
32	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 33	—

Step	Action	Value(s)	Yes	No
33	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Clear the DTCs with the Tech 2 if stored. 3. Turn OFF the ignition for 30 seconds. 4. Put the vehicle with the following conditions: • Selector lever N position • Release the brake pedal • Release the parking brake • Emergency switch OFF 5. Attempt to start the engine. Does the engine crank?	—	Go to Chart 1 of 3 Step 5	Go to Chart 1 of 3 Step 6

Diagnostic Trouble Code (DTC) List

DTC	Flash Code	W/L Status	Buzzer Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0602	—	Blinks	Intermittently ON	Control Module Not Programmed	—	• Vehicle information is not programmed.	• Vehicle information is not programmed and learned.
P0605	33	ON	Continuity ON	Control Module Internal Performance	—	Either of following condition is met: • The TCM detects a malfunction in its internal Random Access Memory (RAM). • The TCM detects a calculated checksum does not agree with the TCM internal registered checksum.	• Faulty TCM.
P0613	33	ON	Continuity ON	Control Module EEPROM Error	—	• The TCM detects a faulty learning data in the Electronically Erasable Programmable Read Only Memory (EEPROM).	• Faulty TCM.
P0710	21	ON	OFF	Transmission Fluid Temperature Sensor Circuit	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	• The TCM detects that the TFT sensor signal voltage is less than 0.1 volts (more than 165°C [329°F]) or more than 4.9 volts (less than −50°C [−58°F]).	• Sensor signal circuit is short to battery or ignition voltage or short to any 5V reference circuit, short to ground, short to the low reference circuit, open circuit or high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty TCM.
P0715	3	ON	OFF	Turbine Speed Sensor Circuit	• DTCs P0721, P0726, U0400 and U0406 are not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The engine is running. • The lock up clutch is commanded engage.	• The TCM detects that the turbine speed sensor pulses are not generated during lock up control.	• Faulty sensor installation condition. • Faulty sensor wheel (gearshift clutch case). • Sensor signal circuit is short to battery or ignition voltage, short to any 5V reference circuit, short to ground, open circuit or high resistance. • Sensor low circuit is open circuit or high resistance. • Sensor circuits short to each other. • Poor harness connector connection. • Faulty sensor. • Faulty TCM. • Electromagnetic interference and electrical noise.

DTC	Flash Code	W/L Status	Buzzer Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0717	2	ON	OFF	Input Speed Sensor Circuit	• DTCs P0715, P0718, P0721, P0726, U0400 and U0406 are not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The engine is running. • The turbine speed is more than 500 RPM. • The vehicle speed is more than 10 km/h (6 MPH). • The gearshift clutch is commanded engage.	• The TCM detects that the input shaft speed sensor pulses are not generated during vehicle running.	• Faulty sensor installation condition. • Faulty sensor wheel (counter shaft). • Sensor signal circuit is short to battery or ignition voltage, short to any 5V reference circuit, short to ground, open circuit or high resistance. • Sensor low circuit is open circuit or high resistance. • Sensor circuits short to each other. • Poor harness connector connection. • Faulty sensor. • Faulty TCM. • Electromagnetic interference and electrical noise.
P0718	17	ON	OFF	Gearshift Clutch Slip Error	• DTCs P0715 and P0717 are not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	• The TCM detects that the input shaft speed is less than the turbine speed 300 RPM or more when the gearshift clutch is commanded engage.	• Faulty ATF amount. • Faulty line pressure (low). • Faulty oil pump. • Faulty gearshift clutch. • Faulty gearshift clutch solenoid valve. • Faulty gearshift clutch oil pressure circuits. • Faulty band brake. • Faulty input shaft speed sensor.
P0721	26	ON	OFF	Output Speed Sensor Performance	• DTCs P0717, P0904, P0914 and U0100 are not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The input shaft speed is more than 1500 RPM. • The current gear is other than neutral.	• The TCM detects that the output shaft speed is less than 30 RPM during the vehicle running.	• Faulty sensor installation. • Sensor voltage feed circuit is open circuit or high resistance. • Sensor signal circuit is short to battery or ignition voltage, short to ground, open circuit or high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM. • Faulty TCM. • Electromagnetic interference and electrical noise.

DTC	Flash Code	W/L Status	Buzzer Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0726	16	ON	OFF	Lock Up Clutch Slip Error	• DTCs P0715, P0740, P0742 and U0400 are not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	• The TCM detects that the turbine speed is less than the engine speed 300 RPM or more when the lock up clutch is commanded engage.	• Faulty ATF amount. • Faulty line pressure (low). • Faulty oil pump. • Faulty fluid coupling. • Faulty lock up clutch solenoid valve. • Faulty lock up clutch oil pressure circuits. • Faulty turbine speed sensor.
P0740	67	ON	OFF	Lock Up Clutch Solenoid Circuit High Voltage	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The smoother main relay is commanded ON.	• The TCM detects a high voltage condition on the lock up clutch solenoid valve control circuit when the solenoid valve is commanded OFF.	• Solenoid valve control circuit is short to battery or ignition voltage, open circuit or high resistance. • Poor harness connector connection. • Faulty solenoid valve. • Faulty TCM.
P0742	67	ON	OFF	Lock Up Clutch Solenoid Circuit Low Voltage	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The smoother main relay is commanded ON.	• The TCM detects a low voltage condition on the lock up clutch solenoid valve control circuit when the solenoid valve is commanded ON.	• Solenoid valve control circuit is short ground. • Poor harness connector connection. • Faulty solenoid valve. • Faulty TCM.
P0851	6	OFF	OFF	Neutral Switch Circuit Low Voltage	• DTC P0914 is not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	• The TCM detects that the neutral switch signal is continuously OFF (other than neutral) when the current gear is neutral.	• Switch voltage feed circuit is open circuit or high resistance. • Switch signal circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty switch installation. • Faulty gearshift control box internal lever. • Faulty switch • Faulty gear shift position sensor. • Faulty 1-3-5 shift solenoid. • Faulty 2-4-6-R shift solenoid. • Faulty TCM.

DTC	Flash Code	W/L Status	Buzzer Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0852	7	OFF	OFF	Neutral Switch Circuit High Voltage	• DTC P0914 is not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	• The TCM detects that the neutral switch signal is continuously ON (neutral) when the current gear is other than neutral.	• Switch signal circuit is short to battery or ignition voltage. • Poor harness connector connection. • Faulty switch installation. • Faulty gearshift control box internal lever. • Faulty switch • Faulty gear shift position sensor. • Faulty 1-3-5 shift solenoid. • Faulty 2-4-6-R shift solenoid. • Faulty TCM.
P0885	38	ON	Continuity ON (Open Stuck DTC)/OFF (Close Stuck DTC)	TCM Power Relay Control Circuit	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	Open stuck DTC • The TCM detects a low voltage condition on the smoother main relay voltage feed circuit when the relay is commanded ON. Close stuck DTC • The TCM detects a high voltage condition on the smoother main relay voltage feed circuit when the relay is commanded OFF.	• Relay power feed circuit is open circuit or high resistance. • Relay control circuit is short to ground, open circuit or high resistance. • Relay voltage feed circuit is short to battery, open circuit or high resistance. • Poor harness connector connection. • Faulty relay. • Faulty TCM.
P0889	39	ON	Continuity ON (Open Stuck DTC)/OFF (Close Stuck DTC)	Gearshift Relay Control Circuit	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	Open stuck DTC • The TCM detects a low voltage condition on the 1-3-5 shift solenoid, 2-4-6-R shift solenoid and select solenoid voltage feed circuit when the gearshift control box relay is commanded ON. Close stuck DTC • The TCM detects a high voltage condition on the 1-3-5 shift solenoid, 2-4-6-R shift solenoid and select solenoid voltage feed circuit when the gearshift control box relay is commanded OFF.	• Relay power feed circuit is open circuit or high resistance. • Relay control circuit is short to ground, open circuit or high resistance. • Relay voltage feed circuit is short to battery, open circuit or high resistance. • Poor harness connector connection. • Faulty relay. • Faulty TCM.
P0902	65	ON	Intermittently ON	Clutch Actuator Circuit Low Voltage	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The smoother main relay is commanded ON.	• The TCM detects a low voltage condition on the gearshift clutch solenoid valve control circuit when the solenoid valve is commanded ON.	• Solenoid valve control circuit is short ground. • Poor harness connector connection. • Faulty solenoid valve. • Faulty TCM.

DTC	Flash Code	W/L Status	Buzzer Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0903	65	ON	Intermittently ON	Clutch Actuator Circuit High Voltage	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The smoother main relay is commanded ON.	• The TCM detects a high voltage condition on the gearshift clutch solenoid valve control circuit when the solenoid valve is commanded OFF.	• Solenoid valve control circuit is short to battery or ignition voltage, open circuit or high resistance. • Poor harness connector connection. • Faulty solenoid valve. • Faulty TCM.
P0904	58	ON	OFF	Gate Select Position Circuit	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	• The TCM detects that the gear select position sensor signal voltage is less than 0.5 volts or more than 4.5 volts.	• Sensor 5V reference circuit is short to battery or ignition voltage, short to ground, short to the low reference circuit, open circuit or high resistance. • Sensor signal circuit is short to battery or ignition voltage, short to any 5V reference circuit, short to ground, short to the low reference circuit, open circuit or high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor installation condition. • Faulty sensor. • Faulty TCM.
P0906	52	ON	OFF	Selector Lever Circuit	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	Either of following condition is met: • The TCM detects two or more selector lever N, D and R switch signal is ON (pulled to ground). • The TCM detects two or more selector lever A, + and – switch signal is ON (pulled to ground) when the selector lever N, D or R switch signal is ON (pulled to ground).	• Switch signal circuit is short to ground or short each other. • Faulty switch installation condition. • Faulty switch. • Faulty selector lever. • Faulty TCM.
P0907	51	OFF	OFF	Selector Lever Circuit	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	• The TCM detects that the selector lever N, D and R switch signals are OFF (open circuit) at the same time.	• Switch signal circuit is open circuit or high resistance. • Switch ground circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty switch installation condition. • Faulty switch. • Faulty selector lever. • Faulty TCM.

DTC	Flash Code	W/L Status	Buzzer Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0909	76	ON	OFF	Gate Select Control Error	• DTCs P0718, P0889, P0902, P0903, P0904, P0912, P0913, P0914, P0973, P0974, P0976 and P0977 are not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The gearshift control box relay is commanded ON. • The selector lever is other than N position.	• The TCM detects the gear select side lever position does not reach to a desired select position continuously when shifting to desired gear.	• Faulty gear select position sensor. • Faulty gear select position sensor installation condition. • Faulty select solenoid valve. • Faulty select solenoid valve installation condition. • Faulty gear select lever shaft. • Faulty gearshift control box. • Select lever stuck. • Incorrect vehicle information programming (transmission type).
P0912	75	ON	Intermittently ON	Select Solenoid Valve Circuit High Voltage	• DTC P0889 is not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The gearshift control box relay is commanded ON.	• The TCM detects a high voltage condition on the select solenoid valve monitor circuit when the solenoid valve is commanded OFF.	• Solenoid valve voltage feed circuit is open circuit or high resistance. • Solenoid valve control circuit is short to battery or ignition voltage, open circuit or high resistance. • Solenoid valve ground circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty solenoid valve. • Faulty TCM.
P0913	75	ON	Intermittently ON	Select Solenoid Valve Circuit Low Voltage	• DTC P0889 is not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The gearshift control box relay is commanded ON.	• The TCM detects a low voltage condition on the select solenoid valve monitor circuit when the solenoid valve is commanded ON.	• Solenoid valve control circuit is short to ground. • Faulty solenoid valve. • Faulty TCM.

DTC	Flash Code	W/L Status	Buzzer Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0914	57	ON	OFF	Gear Shift Position Circuit	• The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF.	• The TCM detects that the gear shift position sensor signal voltage is less than 0.5 volts or more than 4.5 volts.	• Sensor 5V reference circuit is short to battery or ignition voltage, short to ground, short to the low reference circuit, open circuit or high resistance. • Sensor signal circuit is short to battery or ignition voltage, short to any 5V reference circuit, short to ground, short to the low reference circuit, open circuit or high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor installation condition. • Faulty sensor. • Faulty TCM.
P0915	74	ON	OFF	Gear Shift Position Control Disengage Error	• DTCs P0718, P0889, P0902, P0903, P0904, P0912, P0913, P0914, P0973, P0974, P0976 and P0977 are not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The gearshift control box relay is commanded ON. • The selector lever is other than N position.	• The TCM detects the gear shift side lever position does not reach to a desired shift position and it keeping a previously engaged gear position continuously when shifting to desired gear. This indicates that the TCM detects gear stuck at an engaged position.	• Faulty gear shift position sensor. • Faulty gear shift position sensor installation condition. • Faulty 1-3-5 or 2-4-6-R shift solenoid valve. • Faulty 1-3-5- or 2-4-6-R shift solenoid valve installation condition. • Faulty gear shift lever shaft. • Faulty gearshift control box. • Shift lever stuck. • Faulty gearshift clutch (stuck engage). • Transmission stuck.
P0919	72	ON	OFF	Gear Shift Position Engage Error	• DTCs P0718, P0889, P0902, P0903, P0904, P0912, P0913, P0914, P0973, P0974, P0976 and P0977 are not set. • The ignition switch is ON. • The ignition voltage is more than 20 volts. • The emergency switch is OFF. • The gearshift control box relay is commanded ON. • The selector lever is other than N position.	• The TCM detects the gear shift side lever position does not reach to a desired shift position continuously when shifting to desired gear.	• Faulty gear shift position sensor. • Faulty gear shift position sensor installation condition. • Faulty 1-3-5 or 2-4-6-R shift solenoid valve. • Faulty 1-3-5- or 2-4-6-R shift solenoid valve installation condition. • Faulty gear shift lever shaft. • Faulty gearshift control box. • Shift lever stuck. • Faulty gearshift clutch (stuck engage). • Transmission stuck.

P0602

Description

The transmission control module (TCM) has the ability to set a diagnostic trouble code (DTC) if it detects that there is no vehicle information programmed.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM intermittently sounds buzzer when the diagnostic runs and fails.
- The TCM inhibits gearshift control under certain conditions.

Condition for Clearing the DTC

- The TCM blinks the transmission warning lamp when the diagnostic runs and does not fail, and turns OFF the transmission warning lamp when the initial learning is completed.
- The TCM stops the buzzer when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

Notice:

- Production and service TCM does not require software programming when it is replaced except calibration software update. This DTC indicates that a production or service TCM did not program vehicle information and learn.

DTC P0602

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	Program and learn the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the programming?	—	Go to Step 4	—
4	1. Clear the DTCs with the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0605 (Flash Code 33)

Description

This diagnostic applies to internal microprocessor integrity conditions within the transmission control module (TCM).

Condition for Setting the DTC

Either of following condition is met:

- The TCM detects a malfunction in its internal Random Access Memory (RAM).
- The TCM detects a calculated checksum does not agree with the TCM internal registered checksum.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM continuously sounds buzzer when the diagnostic runs and fails.
- The TCM inhibits transmission control.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- The TCM stops the buzzer when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

P0613 (Flash Code 33)

Description

This diagnostic applies to internal microprocessor integrity conditions within the transmission control module (TCM).

Condition for Setting the DTC

- The TCM detects a faulty learning data in the Electronically Erasable Programmable Read Only Memory (EEPROM).

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM continuously sounds buzzer when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- The TCM stops the buzzer when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

P0710 (Flash Code 21)

Circuit Description

The transmission fluid temperature (TFT) sensor is located on the oil pump assembly and soaked in the transmission fluid. The TFT sensor is a variable resistor. The TFT sensor has a signal circuit and a low reference circuit. The transmission control module (TCM) supplies 5 volts to the TFT sensor signal circuit and a ground for the TFT sensor low reference circuit. When the TFT is cold, the sensor resistance is high. When the TFT increases, the sensor resistance decreases. With high sensor resistance, the TCM detects a high voltage on the TFT sensor signal circuit. With lower sensor resistance, the TCM detects a lower voltage on the TFT sensor signal circuit. If the TCM detects an excessively low or high TFT signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the TFT sensor signal voltage is less than 0.1 volts (more than 165°C [329°F]) or more than 4.9 volts (less than −50°C [−58°F]).

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM uses a TFT substitution of 50°C (122°F) for transmission control.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the TFT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.
- If this DTC is present, harsh garage shift appears when shifted from N to D or N to R.

DTC P0710 (Flash Code 21)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Transmission Fluid Temperature (TFT) Sensor parameter with the Tech 2. **Notice:** If the TFT sensor signal voltage is more than 4.9 volts, the TFT Sensor parameter on the Tech 2 indicates a default value when the ignition has been turned ON for longer than 5 seconds. Does the TFT Sensor parameter ever exceed the specified value within 5 seconds after the ignition switch is ON?	4.9 volts	Go to Step 4	Go to Step 3
3	**Notice:** If the TFT sensor signal is less than 0.1 volts, the TFT Sensor parameter on the Tech 2 indicates a default value when the ignition has been turned ON for longer than 5 seconds. Does the TFT Sensor parameter ever fall below the specified value within 5 seconds after the ignition switch is ON?	0.1 volts	Go to Step 14	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (J-237) near the starter motor. 3. Connect a DMM between the signal circuit of the TFT sensor harness (pin 2 of J-237 female connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	5.5 volts	Go to Step 5	Go to Step 6
5	**Important:** The TFT sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the transmission control module (TCM) (pin 6 of B-427 connector) and the in-line connector (pin 2 of J-237 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
6	1. Turn OFF the ignition. 2. Connect a test lamp between the signal circuit of the TFT sensor harness (pin 2 of J-237 female connector) and a known good ground. 3. Connect a DMM between the probe of the test lamp and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 10	Go to Step 7
7	1. Turn OFF the ignition. 2. Connect a DMM across the signal circuit and low reference circuit of the TFT sensor harness (pins 2 and 4 of J-237 female connector). 3. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 11	Go to Step 8
8	1. Test the signal circuit between the TCM (pin 6 of B-427 connector) and the in-line harness connector (pin 2 of J-237 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 9
9	1. Test the low reference circuit between the TCM (pin 12 of J-237 connector) and the in-line harness connector (pin 4 of J-237 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 12
10	1. Test the signal circuit between the TCM (pin 6 of B-427 connector) and the in-line harness connector (pin 2 of J-237 connector) for a short to any 5 volts reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18

Step	Action	Value(s)	Yes	No
11	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the in-line harness connector (pins 2 and 4 of J-237 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the TFT sensor circuits at the harness connector of the TCM (pins 6 and 12 of B-427 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
13	1. Remove the harness assembly from the oil pump. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. 2. Test the signal circuit between the TFT sensor and the in-line harness connector (pin 2 of J-237 connector) for the following conditions: • An open circuit • A short to the solenoid valve circuit • High resistance 3. Test the low reference circuit between the TFT sensor and the in-line harness connector (pin 4 of J-237 connector) for an open circuit or high resistance. 4. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
14	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (J-237) near the starter motor. 3. Connect a DMM between the signal circuit of the TFT sensor harness (pin 2 of J-237 female connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 16	Go to Step 15
15	1. Test the signal circuit between the TCM (pin 6 of B-427 connector) and the in-line harness connector (pin 2 of J-237 connector) for a short to ground or short to the low reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
16	1. Test the signal circuit between the TFT sensor and the in-line harness connector (pin 2 of J-237 connector) for a short to ground or short to the low reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
17	Replace the TFT sensor. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. (TFT sensor is part of the harness assembly) Did you complete the replacement?	—	Go to Step 19	—

Step	Action	Value(s)	Yes	No
18	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 20
20	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0715 (Flash Code 3)

Circuit Description

The turbine speed sensor is located on right-hand side of the fluid coupling housing. The turbine speed sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the gearshift multi-plate clutch rotational speed that is part of the sub-hub assembly attached to the fluid coupling turbine by spline. (30 pulses per a rotation of the gearshift multi-plate clutch) If the transmission control module (TCM) detects no turbine speed sensor signal during the lock up clutch is engaged, this DTC will set.

Condition for Running the DTC

- DTCs P0721, P0726, U0400 and U0406 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The engine is running.
- The lock up clutch is commanded engage.

Condition for Setting the DTC

- The TCM detects that the turbine speed sensor pulses are not generated during lock up control.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electrical or magnetic interference may affect intermittent condition.
- Ensure the sensor is tight and the gearshift multi-plate clutch case is not damaged.
- If this DTC is present, harsh garage shift appears when shifted from N to D or N to R.

DTC P0715 (Flash Code 3)

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Place the transmission in neutral and set the parking brake. 4. Start the engine. 5. Observe the Turbine Speed parameter with the Tech 2 while accelerating the engine between idle and W.O.T. (accelerator pedal full travel). Does the Turbine Speed parameter increase in accordance with an engine speed increase?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the turbine speed sensor harness connector. 3. Connect a DMM across the turbine speed sensor terminals. 4. Measure the resistance across the turbine speed sensor. Does the turbine speed sensor resistance measure within the specified range?	1.0 - 2.5kΩ	Go to Step 4	Go to Step 16

Step	Action	Value(s)	Yes	No
4	1. Connect a DMM across the turbine speed sensor terminals (measure sensor output voltage). 2. Place the DMM on the AC volt scale. 3. Start the engine. 4. Monitor the DMM while accelerating the engine between idle and W.O.T. (accelerator pedal full travel). Does the DMM indicate an AC voltage increase in accordance with an engine speed increase?	—	Go to Step 5	Go to Step 15
5	1. Connect a DMM between the signal circuit of the turbine speed sensor harness (pin 2 of J-232 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	5.5 volts	Go to Step 9	Go to Step 6
6	Is the DMM voltage more than the specified value at Step 5?	4.5 volts	Go to Step 7	Go to Step 11
7	1. Connect a test lamp between the signal circuit of the turbine speed sensor harness (pin 2 of J-232 connector) and a known good ground. 2. Connect a DMM between the probe of the test lamp and a known good ground. 3. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 10	Go to Step 8
8	1. Connect a DMM across the signal circuit and the low reference circuit of the turbine speed sensor harness (pins 1 and 2 of J-232 connector). 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 13	Go to Step 12
9	**Important:** The turbine speed sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the transmission control module (TCM) (pin 4 of B-427 connector) and the turbine speed sensor connector (pin 2 of J-232 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
10	1. Test the signal circuit between the TCM (pin 4 of B-427 connector) and the turbine speed sensor harness connector (pin 2 of J-232 connector) for a short to any 5 volts reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17

Step	Action	Value(s)	Yes	No
11	1. Test the signal circuit between the TCM (pin 4 of B-427 connector) and the turbine speed sensor harness connector (pin 2 of J-232 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 14
12	1. Test the low reference circuit between the TCM (pin 10 of B-427 connector) and the turbine speed sensor harness connector (pin 1 of J-232 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 14
13	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the turbine speed sensor (pins 1 and 2 of J-232 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
14	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the turbine speed sensor circuits at the harness connector of the TCM (pins 4 and 10 of B-427 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
15	1. Remove the turbine speed sensor. Refer to Turbine Speed Sensor Replacement in this section. 2. Visually inspect the turbine speed sensor for the following conditions: • Physical damage • Loose or improper installation 3. The following conditions may cause this DTC to set: • Excessive air gap between the turbine speed sensor and the gearshift multi-plate clutch case • Electromagnetic interference in the turbine speed sensor circuits • Foreign material passing between the turbine speed sensor and the gearshift multi-plate clutch case Did you find and correct the condition?	—	Go to Step 18	Go to Step 16
16	Replace the turbine speed sensor. Refer to Turbine Speed Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—

Step	Action	Value(s)	Yes	No
17	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—
18	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 19
19	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0717 (Flash Code 2)

Circuit Description

The input shaft speed sensor is located on left-hand side of the transmission housing. The input shaft speed sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the counter shaft rotational speed. If the transmission control module (TCM) detects no input shaft speed sensor signal during the vehicle running, this DTC will set.

Condition for Running the DTC

- DTCs P0715, P0718, P0721, P0726, U0400 and U0406 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The engine is running.
- The turbine speed is more than 500 RPM.
- The vehicle speed is more than 10 km/h (6 MPH).
- The gearshift clutch is commanded engage.

Condition for Setting the DTC

- The TCM detects that the input shaft speed sensor pulses are not generated during vehicle running.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electrical or magnetic interference may affect intermittent condition.
- Ensure the sensor is tight and the counter shaft is not damaged.
- If this DTC is present, poor shift quality (feel) will appear.

Notice:

- If this DTC is present, the Input Shaft Speed parameter on the Tech 2 will indicate estimated value based on other inputs.

DTC P0717 (Flash Code 2)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle. 4. Let the vehicle run within the Conditions for Running the DTC. 5. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the input shaft speed sensor harness connector. 3. Connect a DMM across the input shaft speed sensor terminals. 4. Measure the resistance across the turbine speed sensor. Does the input shaft speed sensor resistance measure within the specified range?	1.5 - 3.5kΩ	Go to Step 4	Go to Step 16

Step	Action	Value(s)	Yes	No
4	1. Connect a DMM across the input shaft speed sensor terminals (measure sensor output voltage). 2. Place the DMM on the AC volt scale. 3. Lift the driving wheels or drive the vehicle. 4. Let the vehicle run with a fixed gear. 5. Monitor the DMM while accelerating the engine. Does the DMM indicate an AC voltage increase in accordance with an engine speed increase?	—	Go to Step 5	Go to Step 15
5	1. Connect a DMM between the signal circuit of the input shaft speed sensor harness (pin 2 of J-139 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	5.5 volts	Go to Step 9	Go to Step 6
6	Is the DMM voltage more than the specified value at Step 5?	4.5 volts	Go to Step 7	Go to Step 11
7	1. Connect a test lamp between the signal circuit of the input shaft speed sensor harness (pin 2 of J-139 connector) and a known good ground. 2. Connect a DMM between the probe of the test lamp and a known good ground. 3. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 10	Go to Step 8
8	1. Connect a DMM across the signal circuit and the low reference circuit of the input shaft speed sensor harness (pins 1 and 2 of J-139 connector). 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 13	Go to Step 12
9	**Important:** The input shaft speed sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the transmission control module (TCM) (pin 5 of B-427 connector) and the input shaft speed sensor connector (pin 2 of J-139 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
10	1. Test the signal circuit between the TCM (pin 5 of B-427 connector) and the input shaft speed sensor harness connector (pin 2 of J-139 connector) for a short to any 5 volts reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17

Step	Action	Value(s)	Yes	No
11	1. Test the signal circuit between the TCM (pin 5 of B-427 connector) and the input shaft speed sensor harness connector (pin 2 of J-139 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 14
12	1. Test the low reference circuit between the TCM (pin 11 of B-427 connector) and the input shaft speed sensor harness connector (pin 1 of J-139 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 14
13	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the input shaft speed sensor (pins 1 and 2 of J-139 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
14	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the input shaft speed sensor circuits at the harness connector of the TCM (pins 5 and 11 of B-427 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
15	1. Remove the input shaft speed sensor. Refer to Input Shaft Speed Sensor Replacement in this section. 2. Visually inspect the input shaft speed sensor for the following conditions: • Physical damage • Loose or improper installation 3. The following conditions may cause this DTC to set: • Excessive air gap between the input shaft speed sensor and the counter shaft • Electromagnetic interference in the input shaft speed sensor circuits • Foreign material passing between the input shaft speed sensor and the counter shaft Did you find and correct the condition?	—	Go to Step 18	Go to Step 16
16	Replace the input shaft speed sensor. Refer to Input Shaft Speed Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—

Step	Action	Value(s)	Yes	No
17	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—
18	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 19
19	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0718 (Flash Code 17)

Circuit Description

The gearshift clutch pulse width modulation (PWM) solenoid valve is located on the oil pump assembly. It controls the transmission fluid supply to the gearshift clutch control spool valve. The transmission control module (TCM) controls the gearshift clutch solenoid valve by duty cycle signal based on vehicle running condition. Since normally open type solenoid valve is used, the gearshift clutch control spool valve moves by the applied fluid pressure when the TCM turns OFF the gearshift clutch solenoid valve under the certain condition. Then the gearshift multi-plate clutch engagement pressure circuit connects with the line pressure circuit. At the same time, the gearshift multi-plate clutch is engaged. The TCM detects the actual state of the gearshift clutch solenoid valve by the slip speed of the gearshift clutch based on the turbine speed sensor signal and input shaft speed sensor signal inputs. If the TCM detects an excessively low input shaft speed in comparison to turbine speed, this DTC will set.

Condition for Running the DTC

- DTCs P0715 and P0717 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the input shaft speed is less than the turbine speed 300 RPM or more when the gearshift clutch is commanded engage.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the input shaft speed sensor is tight and the counter shaft is not damaged.
- If this DTC is present, gearshift clutch slipping feel will appear.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Inspect for correct ATF level. Refer to ATF inspection in this section. 2. Inspect for external leakage. Did you find and correct the condition?	—	Go to Step 10	Go to Step 3
3	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle. 4. Let the vehicle run within the Conditions for Running the DTC. 5. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0715, P0717, P0902 or P0903 set?	—	Go to Applicable DTC	Go to Step 4
4	Let the vehicle run while observing the Turbine Speed and Input Shaft Speed parameter with the Tech 2. Is the Input Shaft Speed parameter less than the Turbine Speed 300 RPM or more?	—	Go to Step 5	Go to Diagnostic Aids
5	Test the line pressure. Refer to line pressure test in this section. Does the line pressure within the specified value?	—	Go to Step 7	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Inspect oil strainer for clogging. Repair Instructions (Overhaul) - Oil Filter in this section. 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
7	1. Remove the input shaft speed sensor. Refer to Input Shaft Speed Sensor Replacement in this section. 2. Visually inspect the input shaft speed sensor for the following conditions: • Physical damage • Loose or improper installation 3. The following conditions may cause this DTC to set: • Excessive air gap between the input shaft speed sensor and the counter shaft • Electromagnetic interference in the input shaft speed sensor circuits • Foreign material passing between the input shaft speed sensor and the counter shaft 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	1. Remove the oil pump assembly. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. 2. Inspect the oil pump and gearshift clutch for the following conditions: • The oil pump for damage • The gearshift clutch solenoid valve for mechanically stuck or leaking • The clutch spool valve mechanically stuck or leaking • The gasket or seal leaking or worn • The band brake mechanically stuck 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
9	**Important:** Replacement gearshift clutch assembly must be learned. Replace the gearshift clutch assembly. Refer to Repair Instructions (Overhaul) - Gearshift Clutch Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run while observing the Turbine Speed and Input Shaft Speed parameter with the Tech 2. Is the Input Shaft Speed parameter less than the Turbine Speed 300 RPM or more?	—	Go to Step 2	Go to Step 11

Step	Action	Value(s)	Yes	No
11	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0721 (Flash Code 26)

Circuit Description

The output shaft speed sensor that is called vehicle speed sensor (VSS) is located on the transmission rear housing and is used by the engine control module (ECM), transmission control module (TCM) and speedometer, which generates a speed signal from the transmission output shaft. The output shaft speed sensor uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The ECM calculates the vehicle speed by the output shaft speed sensor and calculated vehicle speed sent to the TCM via a controller area network (CAN) communication bus. If the TCM detects no output shaft speed sensor signal from the ECM during the vehicle running, this DTC will set.

Condition for Running the DTC

- DTCs P0717, P0904, P0914 and U0100 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The input shaft speed is more than 1500 RPM.
- The current gear is other than neutral.

Condition for Setting the DTC

- The TCM detects that the output shaft speed is less than 30 RPM during the vehicle running.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits auto shift control.
- The TCM selects highest gear when shifted from N to D.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electrical or magnetic interference may affect intermittent condition.

Notice:

- If this DTC is present, the Output Shaft Speed and Vehicle Speed parameters on the Tech 2 will indicate estimated value based on other inputs.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC U0100, U0121 or U0406 set?	—	Go to Applicable DTC	Go to Step 3
3	1. Select the “4HK1” in the system selection menu. 2. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is the engine control module (ECM) DTC P0500 or P0501 set?	—	Go to Applicable DTC in Engine Control Section	Go to Step 4
4	1. Drive the vehicle. 2. Select the data display function of ECM. 3. Observe the Vehicle Speed parameter with the Tech 2. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Diagnostic Aids	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse (F-16) in the glove box fuse block. Is the Meter (10A) fuse (F-16) open?	—	Go to Step 6	Go to Step 7
6	Replace the Meter (10A) fuse (F-16). If the fuse continues to open, repair the short to ground on one of the circuits that fed by the Meter (10A) fuse (F-16) or replace the shorted attached component fed by the Meter (10A) fuse (F-16). Did you complete the repair?	—	Go to Step 18	—
7	1. Remove the output shaft speed sensor. Refer to Output Shaft Speed Sensor replacement in the section. 2. Visually inspect the output shaft speed sensor for the following conditions: • Physical damage • Being loose • Improper installation • For transmission output shaft teeth damage 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the output shaft speed sensor harness connector. 3. Connect a test lamp between the ignition voltage feed circuit of the output shaft speed sensor harness (pin 1 of J-32 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 11
9	1. Keep the ignition switch ON. 2. Connect a test lamp between the low reference circuit of the output shaft speed sensor harness (pins 2 of J-32 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 10	Go to Step 12
10	1. Turn ON the ignition, with the engine OFF. 2. Intermittently jump the signal circuit of the output shaft speed sensor (pin 3 of J-32 connector) with a test lamp that is connected to 12 volts (apply form a battery) while monitoring the Vehicle Speed parameter with the Tech 2. Does the Tech 2 indicate any vehicle speed when the circuit is intermittently pulled to 12 volts?	—	Go to Step 14	Go to Step 13
11	Repair the open circuit or high resistance on the output shaft speed sensor ignition voltage feed circuit between the output shaft speed sensor (pin 1 of J-32 connector) and the Meter (10A) fuse (F-16). Did you complete the repair?	—	Go to Step 18	—

Step	Action	Value(s)	Yes	No
12	Repair the open or high resistance in the output shaft speed sensor low reference circuit between the output shaft speed sensor (pin 2 of J-32 connector) and ground terminal. Did you complete the repair?	—	Go to Step 18	—
13	1. Test the output shaft speed sensor signal circuit between the engine control module (ECM) (pin 19 of J-191 connector) and the output shaft speed sensor (pin 3 of J-32 connector), then between the instrument panel cluster (IPC) (pin 17 of B-52 connector) and the output shaft speed sensor (pin 3 of J-32 connector) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
14	1. Turn OFF the ignition. 2. Disconnect the output shaft speed sensor harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the output shaft speed sensor (pin 1, 2 and 3 of J-32 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the ECM J-191 harness connector. 3. Inspect for an intermittent and for a poor connection on the output shaft speed sensor signal circuit at the harness connector of the ECM (pin 19 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
16	Replace the output shaft speed sensor. Refer to Output Shaft Speed Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—
17	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement /Restore Fuel Injector ID Code Data in engine control section. Did you complete the replacement?	—	Go to Step 18	—

Step	Action	Value(s)	Yes	No
18	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle. 5. Select the data display function of ECM. 6. Observe the Vehicle Speed parameter with the Tech 2. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Step 19	Go to Step 5
19	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0726 (Flash Code 16)

Circuit Description

The lock up clutch (ON/OFF) solenoid valve is located on the oil pump assembly. It controls the transmission fluid supply to the lock up clutch control spool valve. The transmission control module (TCM) controls the lock up solenoid valve by ON/OFF signal based on vehicle running condition. The TCM turns ON the lock up solenoid valve when the certain condition has been met. Then the lock up clutch control spool valve moves by the applied fluid pressure. The lock up engagement pressure circuit connects with the line pressure circuit, and the lock up clutch disengage pressure circuit connects to the drain circuit. The lock up clutch engagement pressure is nearly equal with the line pressure. At the same time, the lock up clutch is pressed to the fluid coupling front cover and then the fluid coupling is locked. The TCM detects the actual state of the lock up clutch solenoid valve by the slip speed of the lock up clutch based on the engine speed and turbine speed sensor signal inputs. If the TCM detects an excessively low turbine speed in comparison to engine speed, this DTC will set.

Condition for Running the DTC

- DTCs P0715, P0740, P0742 and U0400 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the turbine speed is less than the engine speed 300 RPM or more when the lock up clutch is commanded engage.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the turbine speed sensor is tight and the gearshift multi-plate clutch case is not damaged.
- If this DTC is present, lock up clutch slipping feel will appear.

P0740 (Flash Code 67)

Circuit Description

The lock up clutch (ON/OFF) solenoid valve is located on the oil pump assembly. It controls the transmission fluid supply to the lock up clutch control spool valve. The transmission control module (TCM) controls the lock up solenoid valve by ON/OFF signal based on vehicle running condition. The TCM turns ON the lock up solenoid valve when the certain condition has been met. Then the lock up clutch control spool valve moves by the applied fluid pressure. The lock up engagement pressure circuit connects with the line pressure circuit, and the lock up clutch disengage pressure circuit connects to the drain circuit. The lock up clutch engagement pressure is nearly equal with the line pressure. At the same time, the lock up clutch is pressed to the fluid coupling front cover and then the fluid coupling is locked. The TCM monitors the lock up clutch solenoid valve operating status through the feedback circuit. If the TCM detects a high voltage condition on the lock up clutch solenoid valve control circuit when the solenoid valve is commanded OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The smoother main relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a high voltage condition on the lock up clutch solenoid valve control circuit when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- If this DTC is present, deteriorated vehicle starting feel will appear.

DTC P0740 (Flash Code 67)

Schematic Reference: Transmission Controls Schematics
Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (J-237) near the starter motor. 3. Connect a DMM between the control circuit of the lock up clutch solenoid valve harness (pin 1 of J-237 female connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	18.0 volts	Go to Step 4	Go to Step 5
4	1. Connect a test lamp between the control circuit of the lock up clutch solenoid valve harness (pin 1 of J-237 female connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 7

Step	Action	Value(s)	Yes	No
5	1. Test the control circuit of the lock up clutch solenoid valve between the transmission control module (TCM) (pin 29 of B-425 connector) and the in-line harness connector (pin 1 of J-237 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 8
6	1. Test the control circuit of the lock up clutch solenoid valve between the TCM (pin 29 of B-425 connector) and the in-line harness connector (pin 1 of J-237 connector) for the following conditions: • A short to battery or ignition voltage • A short to the gearshift clutch solenoid valve control circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
7	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the in-line harness connector (pin 1 of J-237 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the lock up clutch solenoid valve circuit at the harness connector of the TCM (pin 29 of B-425 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
9	1. Remove the oil pump assembly. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. 2. Inspect for an intermittent and for a poor connection at the harness connector of the lock up clutch solenoid valve. 3. Inspect the lock up clutch solenoid valve for loose bolt. 4. Test the control circuit of the lock up clutch solenoid valve between the lock up clutch solenoid valve and the in-line harness connector (pin 1 of J-237 connector) for the following conditions: • An open circuit • A short to the gearshift clutch solenoid valve control circuit • High resistance 5. Repair the circuit(s), connection(s) or tightness as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
10	Replace the lock up clutch solenoid valve. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. Did you complete the replacement?	—	Go to Step 12	—

Step	Action	Value(s)	Yes	No
11	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 13
13	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0742 (Flash Code 67)

Circuit Description

The lock up clutch (ON/OFF) solenoid valve is located on the oil pump assembly. It controls the transmission fluid supply to the lock up clutch control spool valve. The transmission control module (TCM) controls the lock up solenoid valve by ON/OFF signal based on vehicle running condition. The TCM turns ON the lock up solenoid valve when the certain condition has been met. Then the lock up clutch control spool valve moves by the applied fluid pressure. The lock up engagement pressure circuit connects with the line pressure circuit, and the lock up clutch disengage pressure circuit connects to the drain circuit. The lock up clutch engagement pressure is nearly equal with the line pressure. At the same time, the lock up clutch is pressed to the fluid coupling front cover and then the fluid coupling is locked. The TCM monitors the lock up clutch solenoid valve operating status through the feedback circuit. If the TCM detects a low voltage condition on the lock up clutch solenoid valve control circuit when the solenoid valve is commanded ON, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The smoother main relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a low voltage condition on the lock up clutch solenoid valve control circuit when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM commands OFF the lock up clutch solenoid valve.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- If this DTC is present, lock up clutch does not engage and excessive slip feel will appear.

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle. 4. Let the vehicle run so that lock up may operate enough. 5. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (J-237) near the starter motor. 3. Connect a DMM between the control circuit of the lock up clutch solenoid valve harness (pin 1 of J-237 female connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	18.0 volts	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the control circuit of the lock up clutch solenoid valve between the transmission control module (TCM) (pin 29 of B-425 connector) and the in-line harness connector (pin 1 of J-237 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
5	1. Remove the oil pump assembly. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. 2. Test the control circuit of the lock up clutch solenoid valve between the lock up clutch solenoid valve and the in-line harness connector (pin 2 of J-237 connector) for the following conditions: • A short to ground • A short to the transmission fluid temperature (TFT) sensor low reference circuit 3. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6
6	Replace the lock up clutch solenoid valve. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. Did you complete the replacement?	—	Go to Step 8	—
7	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run so that lock up may operate enough. 6. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 9
9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0851 (Flash Code 6)

Circuit Description

The neutral switch is installed on the transmission gearshift control box. When the gear position is neutral, the switch is closed and the switch signal is provided to the transmission control module (TCM). If the TCM detects the neutral switch signal is stuck OFF (open) when the current gear is neutral based on the gear shift position sensor input.

Condition for Running the DTC

- DTC P0914 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the neutral switch signal is continuously OFF (other than neutral) when the current gear is neutral.

Action Taken When the DTC Sets

- The TCM does not illuminate the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the gear shift position sensor is tight and the sensor shaft is not damaged.

Notice:

- If this DTC is present, engine will not crank except applying the brake pedal or parking brake.

DTC P0851 (Flash Code 6)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. **Notice:** If the engine does not crank, apply the brake pedal or parking brake. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run so that all gear may engage enough. 6. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0914, P0915 or P0919 also set?	—	Go to Applicable DTC	Go to Step 3
3	Observe the Neutral Switch parameter with the Tech 2 while changing the gear between neutral and other positions. Does the Tech 2 indicate Neutral when the current gear is neutral and In Gear when other than the neutral?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the neutral switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Neutral Switch parameter with the Tech 2 while momentarily jumping across the neutral switch harness connectors between pins 1 and 2 of J-50 connector. Does the Tech 2 indicate Neutral when the circuit is jumped and In Gear when the circuit is not jumped?	—	Go to Step 8	Go to Step 5
5	1. Connect a test lamp between the ignition voltage feed circuit of the neutral switch harness (pin 2 of J-50 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 6
6	Repair the open circuit or high resistance on the voltage feed circuit between the ENG (IG) (10A) fuse (F-9) (in the glove box fuse block) and the neutral switch (pin 2 of J-50 connector). Check the ENG (IG) (10A) fuse (F-9) first. Did you complete the repair?	—	Go to Step 13	—
7	1. Test the neutral switch signal circuit between the transmission control module (TCM) (pin 10 of B-428 connector) and the neutral switch (pin 1 of J-50 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 9
8	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connectors of the neutral switch (pins 1 and 2 of J-50 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the neutral switch circuit at the harness connector of the TCM (pin 10 of B-428 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12

Step	Action	Value(s)	Yes	No
10	1. Remove the neutral switch. Refer to Neutral Switch Replacement in this section. 2. Visually inspect the neutral switch for the following conditions: • Physical damage • Loose or improper installation 3. Remove the gear shift position sensor. Refer to Gear Shift Position Sensor Replacement in this section. 4. Visually inspect the gear shift position sensor for the following conditions: • Physical damage • Loose or improper installation 5. Visually inspect the shift lever shaft to the gear shift position sensor shaft for damage. 6. Remove the transmission gearshift control box assembly from the transmission main unit. Refer to Repair Instructions (Overhaul) - Control Box in this section. 7. Visually inspect the neutral position detection lever for damage that contacts to the neutral switch. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
11	Replace the neutral switch. Refer to Neutral Switch Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. **Important:** Transmission Gear Select & Shift Position Learning must be done if the gear shift position sensor or transmission gearshift control box is replaced, removed or repaired. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the Neutral Switch parameter with the Tech 2 while changing gear between neutral and other positions. Does the Tech 2 indicate Neutral when the current gear is neutral and In Gear when other than the neutral?	—	Go to Step 14	Go to Step 2
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0852 (Flash Code 7)

Circuit Description

The neutral switch is installed on the transmission gearshift control box. When the gear position is neutral, the switch is closed and the switch signal is provided to the transmission control module (TCM). If the TCM detects the neutral switch signal is stuck ON (closed) condition when the current gear is other than neutral based on the gear shift position sensor input.

Condition for Running the DTC

- DTC P0914 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the neutral switch signal is continuously ON (neutral) when the current gear is other than neutral.

Action Taken When the DTC Sets

- The TCM does not illuminate the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the gear shift position sensor is tight and the sensor shaft is not damaged.

Notice:

- If this DTC is present, engine may not crank except applying the brake pedal or parking brake.

P0885 (Flash Code 38)

Circuit Description

The smoother main relay is energized to feed the battery voltage to the TCM through the relay switch side when the TCM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the smoother main relay is de-energized after a certain length of time passed.
If the TCM detects the smoother main relay is turned OFF when the relay is commanded ON, this DTC will set. (Open stuck DTC)
If the TCM detects the TCM has been ON when the relay is commanded OFF, this DTC will also set. (Close stuck DTC)

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

Open stuck DTC

- The TCM detects a low voltage condition on the smoother main relay voltage feed circuit when the relay is commanded ON.

Close stuck DTC

- The TCM detects a high voltage condition on the smoother main relay voltage feed circuit when the relay is commanded OFF.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM continuously sounds buzzer when the diagnostic runs and fails. (Open stuck DTC)
- The TCM inhibits gearshift control. (Open stuck DTC)
- The TCM holds gear position.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- The TCM stops the buzzer when the diagnostic runs and does not fail. (Open stuck DTC)
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Faulty or sticking smoother main relay will set this DTC.

13	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0889 (Flash Code 39)

Circuit Description

The gearshift control box relay is energized to feed a drive voltage of the each solenoid valve (1-3-5 shift solenoid, 2-4-6-R shift solenoid and select solenoid) when the transmission control module (TCM) commands ON.
If the TCM detects the gearshift control box relay is turned OFF when the relay is commanded ON, this DTC will set. (Open stuck DTC)
If the TCM detects the TCM has been ON when the relay is commanded OFF, this DTC will also set. (Close stuck DTC)

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

Open stuck DTC

- The TCM detects a low voltage condition on the 1-3-5 shift solenoid, 2-4-6-R shift solenoid and select solenoid voltage feed circuit when the gearshift control box relay is commanded ON.

Close stuck DTC

- The TCM detects a high voltage condition on the 1-3-5 shift solenoid, 2-4-6-R shift solenoid and select solenoid voltage feed circuit when the gearshift control box relay is commanded OFF.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM continuously sounds buzzer when the diagnostic runs and fails. (Open stuck DTC)
- The TCM inhibits gearshift control. (Open stuck DTC)
- The TCM holds gear position.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- The TCM stops the buzzer when the diagnostic runs and does not fail. (Open stuck DTC)
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- If this DTC is present, P0912, P0973 and P0976 may also set.
- Faulty or sticking gearshift control box relay will set this DTC.

3	1. Turn OFF the ignition. 2. Replace the gearshift control box relay with the glow relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 11
4	Does the buzzer continuously sound?	—	Go to Step 5	Go to Step 8

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Remove the gearshift control box relay. 3. Probe the battery voltage feed circuit of the gearshift control box relay (pins 3 and 4 of X-19 connector) with a test lamp that is connected to a known good ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 7
6	1. Turn OFF the ignition. 2. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the gearshift control box relay (pins 2, 3, 4 and 5 of X-19 connector). 3. Disconnect the transmission control module (TCM) harness connector. 4. Inspect for an intermittent, for a poor connection and corrosion on gearshift control box relay control circuit at the harness connector of the TCM (pin 18 of B-425 connector). 5. Test the gearshift control box relay control circuit for an open circuit or high resistance. 6. Test the each solenoid valve voltage feed circuit between the gearshift control box relay and the TCM (pins 4 and 5 of B-425, pins 5 and 6 of B-426 and pins 1 and 8 of B-418 connector) for an open circuit or high resistance. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
7	Repair the open circuit or high resistance on the battery voltage feed circuit between the NEES (60A) slow blow fuse (SBF-7) and the gearshift control box relay (pins 3 and 4 of X-19 connector) (which ever test lamp did not illuminate at Step 5). Check the NEES (60 A) slow blow fuse (SBF-7) first. Did you complete the repair?	—	Go to Step 13	—
8	1. Turn OFF the ignition. 2. Remove the gearshift control box relay. 3. Turn ON the ignition, with the engine OFF. Does the buzzer continuously sound?	—	Go to Step 9	Go to Step10
9	1. Test the control circuit of the gearshift control box relay between the TCM (pin 18 of B-425 connector) and the gearshift control box relay (pin 5 of X-19 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
10	1. Test the voltage feed circuit between the TCM (pins 4 and 5 of B-425, pins 5 and 6 of B-426 and pins 1 and 8 of B-418 connector) and the gearshift control box relay (pin 2 of X-19 connector) for a short to battery. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12

Step	Action	Value(s)	Yes	No
11	Replace the gearshift control relay. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0902 (Flash Code 65)

Circuit Description

The gearshift clutch pulse width modulation (PWM) solenoid valve is located on the oil pump assembly. It controls the transmission fluid supply to the gearshift clutch control spool valve. The transmission control module (TCM) controls the gearshift clutch solenoid valve by duty cycle signal based on vehicle running condition. Since normally open type solenoid valve is used, the gearshift clutch control spool valve moves by the applied fluid pressure when the TCM turns OFF the gearshift clutch solenoid valve under the certain condition. Then the gearshift multi-plate clutch engagement pressure circuit connects with the line pressure circuit. At the same time, the gearshift multi-plate clutch is engaged. The TCM monitors the gearshift clutch solenoid valve operating status through the feedback circuit. If the TCM detects a low voltage condition on the gearshift clutch solenoid valve control circuit when the solenoid valve is commanded ON, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The smoother main relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a low voltage condition on the gearshift clutch solenoid valve control circuit when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM intermittently sounds buzzer when the diagnostic runs and fails.
- The TCM inhibits gearshift control.
- The TCM inhibits emergency gearshift control.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- The TCM stops the buzzer when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0902 (Flash Code 65)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Place the transmission in neutral and set the parking brake. 4. Start the engine. 5. Operate the selector lever from N to D and D to N. 6. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (J-237) near the starter motor. 3. Connect a DMM between the control circuit of the gearshift clutch solenoid valve harness (pin 3 of J-237 female connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	18.0 volts	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the control circuit of the gearshift clutch solenoid valve between the transmission control module (TCM) (pin 30 of B-425 connector) and the in-line harness connector (pin 3 of J-237 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
5	1. Remove the oil pump assembly. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. 2. Test the control circuit of the gearshift clutch solenoid valve between the gearshift clutch solenoid valve and the in-line harness connector (pin 3 of J-237 connector) for the following conditions: • A short to ground • A short to the transmission fluid temperature (TFT) sensor low reference circuit 3. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6
6	**Important:** Replacement gearshift clutch solenoid valve must be learned. Replace the gearshift clutch solenoid valve. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. Did you complete the replacement?	—	Go to Step 8	—
7	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Place the transmission in neutral and set the parking brake. 5. Start the engine. 6. Operate the selector lever from N to D and D to N. 7. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 9
9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0903 (Flash Code 65)

Circuit Description

The gearshift clutch pulse width modulation (PWM) solenoid valve is located on the oil pump assembly. It controls the transmission fluid supply to the gearshift clutch control spool valve. The transmission control module (TCM) controls the gearshift clutch solenoid valve by duty cycle signal based on vehicle running condition. Since normally open type solenoid valve is used, the gearshift clutch control spool valve moves by the applied fluid pressure when the TCM turns OFF the gearshift clutch solenoid valve under the certain condition. Then the gearshift multi-plate clutch engagement pressure circuit connects with the line pressure circuit. At the same time, the gearshift multi-plate clutch is engaged. The TCM monitors the gearshift clutch solenoid valve operating status through the feedback circuit. If the TCM detects a high voltage condition on the gearshift clutch solenoid valve control circuit when the solenoid valve is commanded OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The smoother main relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a high voltage condition on the gearshift clutch solenoid valve control circuit when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM intermittently sounds buzzer when the diagnostic runs and fails.
- The TCM inhibits gearshift control and holds gear position when the diagnostic runs and fails.
- The TCM inhibits emergency gearshift control.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- The TCM stops the buzzer when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Place the transmission in neutral and set the parking brake. 4. Start the engine. 5. Operate the selector lever from N to D and D to N. 6. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (J-237) near the starter motor. 3. Connect a test lamp between the control circuit of the gearshift clutch solenoid valve harness (pin 3 of J-237 female connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 5

Step	Action	Value(s)	Yes	No
4	1. Keep the test lamp with connected. 2. Turn OFF the ignition for 30 second. 3. Start the engine while observing the test lamp. Does the test lamp blink after the engine start (note that the test lamp will blink then continuously illuminate normally)?	—	Go to Step 7	Go to Step 6
5	1. Test the control circuit of the gearshift clutch solenoid valve between the transmission control module (TCM) (pin 30 of B-425 connector) and the in-line harness connector (pin 3 of J-237 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 8
6	1. Test the control circuit of the gearshift clutch solenoid valve between the TCM (pin 30 of B-425 connector) and the in-line harness connector (pin 3 of J-237 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
7	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the in-line harness connector (pin 3 of J-237 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the gearshift clutch solenoid valve circuit at the harness connector of the TCM (pin 30 of B-425 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
9	1. Remove the oil pump assembly. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. 2. Inspect for an intermittent and for a poor connection at the harness connector of the gearshift clutch solenoid valve. 3. Inspect the gearshift clutch solenoid valve for loose bolt. 4. Test the control circuit of the gearshift clutch solenoid valve between the gearshift clutch solenoid valve and the in-line harness connector (pin 3 of J-237 connector) for the following conditions: • An open circuit • A short to the lock up clutch solenoid valve control circuit • High resistance 5. Repair the circuit(s), connection(s) or tightness as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10

Step	Action	Value(s)	Yes	No
10	**Important:** Replacement gearshift clutch solenoid valve must be learned. Replace the gearshift clutch solenoid valve. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Place the transmission in neutral and set the parking brake. 5. Start the engine. 6. Operate the selector lever from N to D and D to N. 7. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 13
13	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0904 (Flash Code 58)

Circuit Description

The gear select position sensor is used to detect the select side lever position feedback for the select solenoid valve on the transmission gearshift control box and it is installed to the transmission gearshift control box assembly. The transmission control module (TCM) uses the gear select position sensor to determine the current gear position with a combination of the gear shift position sensor. The gear select position sensor has following circuits.

- 5 volts reference circuit
- Low reference circuit
- Gear select position sensor signal circuit

The TCM supplies 5 volts to the gear select position sensor on the 5 volts reference circuit. The TCM also provides a ground on the low reference circuit. The gear select position sensor provides a signal to the TCM on the gear select position sensor signal circuit, which is relative to the position changes of the select side. The TCM monitors the gear select position sensor signal for voltages outside the normal range of the gear select position sensor. If the ECM detects an excessively low or high gear select position sensor voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the gear select position sensor signal voltage is less than 0.5 volts or more than 4.5 volts.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits auto shift control.
- The TCM permits shifting to neutral, 1st or reverse gear.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the sensor is tight, the sensor shaft and sensor lever are not damaged.

Notice:

- If this DTC is present, the Gear Select Position Sensor parameters on the Tech 2 will indicate desired value.

DTC P0904 (Flash Code 58)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. **Notice:** If the gear select position sensor signal voltage is more than 4.5 volts, the Gear Select Position Sensor parameter on the Tech 2 indicates a desired value when the ignition has been turned ON for longer than 5 seconds. Does the Gear Select Position Sensor parameter ever exceed the specified value within 5 seconds after the ignition switch is ON?	4.5 volts	Go to Step 4	Go to Step 3

Step	Action	Value(s)	Yes	No
3	**Notice:** If the gear select position sensor signal is less than 0.5 volts, the Gear Select Position Sensor parameter on the Tech 2 indicates a desired value when the ignition has been turned ON for longer than 5 seconds. Does the Gear Select Position Sensor parameter ever fall below the specified value within 5 seconds after the ignition switch is ON?	0.5 volts	Go to Step 7	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the gear select position sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Gear Select Position Sensor parameter with the Tech 2. Is the Gear Select Position Sensor parameter less than the specified value within 5 seconds after the ignition switch is ON?	0.5 volts	Go to Step 5	Go to Step 9
5	1. Turn OFF the ignition. 2. Connect a DMM between the 5 volts reference circuit of the gear select position sensor harness (pin 1 of J-223 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Is the DMM voltage less than the specified value?	5.5 volts	Go to Step 6	Go to Step 10
6	1. Turn OFF the ignition. 2. Connect a test lamp between the low reference circuit of the gear select position sensor harness (pin 3 of J-223 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 14	Go to Step 11
7	1. Turn OFF the ignition. 2. Disconnect the gear select position sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit of the gear select position sensor harness (pin 1 of J-223 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 8	Go to Step 12
8	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit of the gear select position sensor harness (pin 1 and 2 of J-223 connector). 3. Turn ON the ignition, with the engine OFF. 4. Observe the Gear Select Position Sensor parameter with the Tech 2. Is the Gear Select Position Sensor parameter more than the specified value within 5 seconds after the ignition switch is ON?	4.5 volts	Go to Step 14	Go to Step 13

Step	Action	Value(s)	Yes	No
9	**Important:** The gear select position sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the transmission control module (TCM) (pin 11 of B-426 connector) and the gear select position sensor (pin 2 of J-223 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
10	1. Test the 5 volts reference circuit between the TCM (pin 10 of B-426 connector) and the gear select position sensor (pin 1 of J-223 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
11	1. Test the low reference circuit between the TCM (pin 13 of B-426 connector) and the gear select position sensor (pin 3 of J-223 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
12	1. Test the 5 volts reference circuit between the TCM (pin 10 of B-426 connector) and the gear select position sensor (pin 1 of J-223 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
13	1. Test the signal circuit between the TCM (pin 11 of B-426 connector) and the gear select position sensor (pin 2 of J-223 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15

Step	Action	Value(s)	Yes	No
14	1. Turn OFF the ignition. 2. Disconnect the gear select position sensor harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the gear select position sensor (pins 1, 2 and 3 of J-223 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the gear select position sensor circuits at the harness connector of the TCM (pins 10, 11 and 13 of B-426 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
16	1. Remove the gear select position sensor. Refer to Gear Select Position Sensor Replacement in this section. 2. Visually inspect the gear select position sensor for the following conditions: • Physical damage • Loose or improper installation 3. Remove the transmission gearshift control box assembly from the transmission main unit. Refer to Repair Instructions (Overhaul) - Control Box in this section. 4. Visually inspect the lever for damage that connects to the gear select position sensor shaft. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
17	**Important:** Replacement gear select position sensor must be learned. Replace the gear select position sensor. Refer to Gear Select Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
18	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 20

Step	Action	Value(s)	Yes	No
20	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0906 (Flash Code 52)

Circuit Description

The selector lever switches are installed to the selector lever bracket and there are two switches. The forward and backward direction switch detects the selector lever forward and backward movement. The horizontal direction switch detects the selector lever horizontal movement. When the selector lever is positioned N, D or R, each selector lever switch is closed and the switch signal from the transmission control module (TCM) is pulled to ground. When the selector lever is positioned A, + or –, each selector lever switch and D switch are also closed and the switch signal from the TCM is pulled to ground. If the TCM detects the selector lever switch input signal is out of correlation, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

Either of following condition is met:

- The TCM detects two or more selector lever N, D and R switch signal is ON (pulled to ground).
- The TCM detects two or more selector lever A, + and – switch signal is ON (pulled to ground) when the selector lever N, D or R switch signal is ON (pulled to ground).

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits selector lever switch signal.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure each selector lever switch is tight and not damaged.

Operate the selector lever while observing the Selector N, R, D, A, + and – Switch parameter with the Tech 2. **Notice:** The Selector D Switch parameter indicates ON when the selector lever is A, + or –. Does each selector lever switch parameter display ON when it moved to its position and display OFF when it moved to other positions?	—	Go to Step 9	Go to Step 3
9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0907 (Flash Code 51)

Circuit Description

The selector lever switches are installed to the selector lever bracket and there are two switches. The forward and backward direction switch detects the selector lever forward and backward movement. The horizontal direction switch detects the selector lever horizontal movement. When the selector lever is positioned N, D or R, each selector lever switch is closed and the switch signal from the transmission control module (TCM) is pulled to ground. When the selector lever is positioned A, + or –, each selector lever switch and D switch are also closed and the switch signal from the TCM is pulled to ground. If the TCM detects the selector lever N, D and R switch input signals are OFF (open circuit) at the same time, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the selector lever N, D and R switch signals are OFF (open circuit) at the same time.

Action Taken When the DTC Sets

- The TCM does not illuminate the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure each selector lever switch is tight and not damaged.

Notice:

- Engine will not crank if the selector lever N switch signal is OFF (open circuit).

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Operate the selector lever while observing the Selector N, R, D, A, + and – Switch parameter with the Tech 2. **Notice:** The Selector D Switch parameter indicates ON when the selector lever is A, + or –. Does each selector lever switch parameter display ON when it moved to its position and display OFF when it moved to other positions?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Remove the selector lever cover. 3. Disconnect the selector lever switch harness connector. 4. Connect a DMM between the signal circuit (pins 2, 6 and 7 of N-19 connector which ever parameter reading did not display ON at Step 2) and a known good ground. 5. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	18.0 volts	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the signal circuit between the transmission control module (TCM) (pin 13 & 14 of B-427 and pin 21 of B-428 connector) and the selector lever switch (pin 2, 6 and 7 of N-19 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
5	1. Turn OFF the ignition. 2. Disconnect the selector lever switch harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the selector lever (pins 2, 6, 7 and 9 of N-19 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 6
6	1. Test the ground circuit between the selector lever switch (pin 9 of N-19 connector) and the chassis ground (B-1) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 7
7	Repair or replace the selector lever. Refer to Selector Lever Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
8	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the selector lever switch circuits at the harness connector of the TCM (pins 13 & 14 of B-427 and pin 21 of B-428 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
9	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—

Step	Action	Value(s)	Yes	No
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Operate the selector lever while observing the Selector N, R, D, A, + and – Switch parameter with the Tech 2. **Notice:** The Selector D Switch parameter indicates ON when the selector lever is A, + or –. Does each selector lever switch parameter display ON when it moved to its position and display OFF when it moved to other positions?	—	Go to Step 11	Go to Step 3
11	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0909 (Flash Code 76)

Circuit Description

The pulse width modulation (PWM) select solenoid valve is located on the gearshift control box. The transmission control module (TCM) controls the select solenoid valve by duty cycle signal based on commanded gear position. The select solenoid is only commanded ON when up-shifting. When downshifting, the force created by the return springs moves the internal select lever, but the select solenoid limits the amount of movement by generating force as required in the up-shift direction. The gear select position sensor is used to detect the select side lever position feedback for the select solenoid valve movement. The TCM uses the gear select position sensor to determine the current gear position with a combination of the gear shift position sensor. If the TCM detects the gear select side lever position does not reach to a desired select position when shifting to desired gear, this DTC will set.

Condition for Running the DTC

- DTCs P0718, P0889, P0902, P0903, P0904, P0912, P0913, P0914, P0973, P0974, P0976 and P0977 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The gearshift control box relay is commanded ON.
- The selector lever is other than N position.

Condition for Setting the DTC

- The TCM detects the gear select side lever position does not reach to a desired select position continuously when shifting to desired gear.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gearshift control.
- The TCM commands OFF the gearshift clutch solenoid valve.
- The TCM commands OFF the lock up clutch solenoid valve.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle. 4. Let the vehicle run so that all gear may engage enough. 5. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is P0902, P0903, P0904, P0912, P0913, P0914, P0973, P0974, P0976 or P0977 also set?	—	Go to Applicable DTC	Go to Step 3
3	Visually inspect the gear select position sensor and the select solenoid valve for the following conditions: • Physical damage • Loose or improper installation Did you find and correct the condition?	—	Go to Step 8	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Lift the driving wheels or drive the vehicle. 2. Let the vehicle run so that all gear may engage enough. 3. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 5	Go to Diagnostic Aids
5	If the DTC fail only when shifting from 5th to 6th with the 5th speed transmission, programmed transmission type is incorrect. Reprogram correct vehicle information and retest. Refer to Transmission Control Module (TCM) Replacement Procedure Description in this section. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6
6	1. Remove the gear select position sensor. Refer to Gear Select Position Sensor Replacement in this section. 2. Visually inspect the gear select position sensor for the following conditions: • Physical damage • Loose or improper installation 3. Inspect the gear select position sensor output voltage in order to check an open circuit, short circuit and high resistance somewhere in the operating range. 4. Remove the transmission gearshift control box assembly from the transmission main unit. Refer to Repair Instructions (Overhaul) - Control Box in this section. 5. Visually inspect the select side lever for the following conditions: • Select lever damage that connects to the gear select position sensor shaft. • Select lever damage that connects to the interlock plate and shift rods. • Select relay lever damage that connects to the select solenoid valve. • Other damage that the select lever possible stuck. 6. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
7	**Important:** Replacement select solenoid valve must be learned. Replace the select solenoid valve. Refer to Repair Instructions (Overhaul) - Gearshift Control Box in this section. Did you complete the replacement?	—	Go to Step 8	—

Step	Action	Value(s)	Yes	No
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. **Important:** Transmission Gear Select & Shift Position Learning must be done if the gear select position sensor, select solenoid valve or transmission gearshift control box is replaced, removed or repaired. 3. Turn OFF the ignition for 30 seconds. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run so that all gear may engage enough. 6. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 9
9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0912 (Flash Code 75)

Circuit Description

The pulse width modulation (PWM) select solenoid valve is located on the gearshift control box. The transmission control module (TCM) controls the select solenoid valve by duty cycle signal based on commanded gear position. The select solenoid is only commanded ON when up-shifting. When downshifting, the force created by the return springs moves the internal select lever, but the select solenoid limits the amount of movement by generating force as required in the up-shift direction. The gear select position sensor is used to detect the select side lever position feedback for the select solenoid valve movement. The TCM uses the gear select position sensor to determine the current gear position with a combination of the gear shift position sensor. If the TCM detects a high voltage condition on the select solenoid valve monitor circuit when the solenoid valve is commanded OFF, this DTC will set.

Condition for Running the DTC

- DTC P0889 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The gearshift control box relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a high voltage condition on the select solenoid valve monitor circuit when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM intermittently sounds buzzer when the diagnostic runs and fails.
- The TCM commands OFF gearshift control box relay.
- The TCM inhibits gearshift control and holds gear position when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail at next ignition cycle
- The TCM stops the buzzer when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0889 also set?	—	Go to DTC P0889	Go to Step 3
3	1. Turn OFF the ignition for 30 seconds. 2. Disconnect the select solenoid valve harness connector. 3. Connect a DMM between the control circuit of the select solenoid valve harness (pin 2 of J-234 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value until this DTC fails?	18.0 volts	Go to Step 4	Go to Step 6
4	Is the DMM voltage more than the specified value after this DTC fails?	18.0 volts	Go to Step 7	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Connect a test lamp between the ground circuit of the select solenoid valve harness (pin 1 of J-234 connector) and battery voltage. 2. Turn ON the ignition. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
6	1. Test the voltage feed circuit between the transmission control module (TCM) (pins 1 and 8 of B-428 connector) and the gearshift control box relay (pin 2 of X-19 connector) for an open circuit or high resistance. 2. Test the control circuit between the TCM (pins 16 and 22 of B-428 connector) and the select solenoid (pin 2 of J-234 connector) for an open circuit or high resistance. 3. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
7	**Important:** The select solenoid valve may be damaged if the solenoid valve control circuit is shorted to a voltage source. 1. Test the control circuit between the TCM (pins 16 and 22 of B-428 connector) and the select solenoid (pin 2 of J-234 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the ground circuit between the select solenoid (pin 1 of J-234 connector) and chassis ground (J-9) for an open circuit or high resistance. 2. Test the ground circuit between the TCM (pins 7 and 15 of B-428 connector) and chassis ground (J-9) for an open circuit or high resistance. 3. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the select solenoid valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the select solenoid valve (pins 1 and 2 of J-234 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the select solenoid valve circuits at the harness connector of the TCM (pins 1, 7, 8, 15 16 and 22 of B-428 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12

Step	Action	Value(s)	Yes	No
11	**Important:** Replacement select solenoid valve must be learned. Replace the select solenoid valve. Refer to Repair Instructions (Overhaul) - Gearshift Control Box in this section. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0913 (Flash Code 75)

Circuit Description

The pulse width modulation (PWM) select solenoid valve is located on the gearshift control box. The transmission control module (TCM) controls the select solenoid valve by duty cycle signal based on commanded gear position. The select solenoid is only commanded ON when up-shifting. When downshifting, the force created by the return springs moves the internal select lever, but the select solenoid limits the amount of movement by generating force as required in the up-shift direction. The gear select position sensor is used to detect the select side lever position feedback for the select solenoid valve movement. The TCM uses the gear select position sensor to determine the current gear position with a combination of the gear shift position sensor. If the TCM detects a low voltage condition on the select solenoid valve monitor circuit when the solenoid valve is commanded ON, this DTC will set.

Condition for Running the DTC

- DTC P0889 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The gearshift control box relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a low voltage condition on the select solenoid valve monitor circuit when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM intermittently sounds buzzer when the diagnostic runs and fails.
- The TCM commands OFF gearshift control box relay.
- The TCM inhibits gearshift control and holds gear position when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail at next ignition cycle
- The TCM stops the buzzer when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

P0914 (Flash Code 57)

Circuit Description

The gear shift position sensor is used to detect the shift side lever position feedback for the shift solenoid valves on the transmission gearshift control box and it is installed to the transmission gearshift control box assembly. The transmission control module (TCM) uses the gear shift position sensor to determine the current gear position with a combination of the gear select position sensor. The gear shift position sensor has following circuits.

- 5 volts reference circuit
- Low reference circuit
- Gear shift position sensor signal circuit

The TCM supplies 5 volts to the gear shift position sensor on the 5 volts reference circuit. The TCM also provides a ground on the low reference circuit. The gear shift position sensor provides a signal to the TCM on the gear shift position sensor signal circuit, which is relative to the position changes of the select side. The TCM monitors the gear shift position sensor signal for voltages outside the normal range of the gear shift position sensor. If the ECM detects an excessively low or high gear shift position sensor voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the gear shift position sensor signal voltage is less than 0.5 volts or more than 4.5 volts.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gearshift control and holds gear position when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the sensor is tight and the sensor shaft are not damaged.

Notice:

- If this DTC is present, engine will not crank except applying the brake pedal or parking brake.

1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle. 4. Let the vehicle run while observing the Gear Shift Position Sensor parameter with the Tech 2. Is the Gear Shift Position Sensor parameter within the specified valve?	0.6 - 4.4 volts	Go to Diagnostic Aids	Go to Step 3
3	Is the Gear Shift Position Sensor parameter less than the specified value at Step 2?	0.5 volts	Go to Step 7	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the gear shift position sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Gear Shift Position Sensor parameter with the Tech 2. Is the Gear Shift Position Sensor parameter less than the specified value?	0.5 volts	Go to Step 5	Go to Step 9
5	1. Turn OFF the ignition. 2. Connect a DMM between the 5 volts reference circuit of the gear shift position sensor harness (pin 1 of J-142 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Is the DMM voltage less than the specified value?	5.5 volts	Go to Step 6	Go to Step 10
6	1. Turn OFF the ignition. 2. Connect a test lamp between the low reference circuit of the gear shift position sensor harness (pin 3 of J-142 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 14	Go to Step 11
7	1. Turn OFF the ignition. 2. Disconnect the gear shift position sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit of the gear select position sensor harness (pin 1 of J-142 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 8	Go to Step 12
8	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit of the gear shift position sensor harness (pin 1 and 2 of J-142 connector). 3. Turn ON the ignition, with the engine OFF. 4. Observe the Gear Shift Position Sensor parameter with the Tech 2. Is the Gear Shift Position Sensor parameter more than the specified value?	4.5 volts	Go to Step 14	Go to Step 13
9	**Important:** The gear shift position sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the transmission control module (TCM) (pin 19 of B-426 connector) and the gear shift position sensor (pin 2 of J-142 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18

Step	Action	Value(s)	Yes	No
10	1. Test the 5 volts reference circuit between the TCM (pin 18 of B-426 connector) and the gear shift position sensor (pin 1 of J-142 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
11	1. Test the low reference circuit between the TCM (pin 20 of B-426 connector) and the gear shift position sensor (pin 3 of J-142 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
12	1. Test the 5 volts reference circuit between the TCM (pin 18 of B-426 connector) and the gear shift position sensor (pin 1 of J-142 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
13	1. Test the signal circuit between the TCM (pin 19 of B-426 connector) and the gear shift position sensor (pin 2 of J-142 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
14	1. Turn OFF the ignition. 2. Disconnect the gear shift position sensor harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the gear shift position sensor (pins 1, 2 and 3 of J-142 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the gear shift position sensor circuits at the harness connector of the TCM (pins 18, 19 and 20 of B-426 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18

Step	Action	Value(s)	Yes	No
16	1. Remove the gear shift position sensor. Refer to Gear Shift Position Sensor Replacement in this section. 2. Visually inspect the gear shift position sensor for the following conditions: • Physical damage • Loose or improper installation 3. Visually inspect the lever shaft for damage that connects to the gear select position sensor shaft. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
17	**Important:** Replacement gear shift position sensor must be relearned. Replace the gear shift position sensor. Refer to Gear Shift Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
18	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run. 6. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 20
20	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0915 (Flash Code 74)

Circuit Description

The pulse width modulation (PWM) 1-3-5 and 2-4-6-R shift solenoid valves are located on the gearshift control box. The transmission control module (TCM) controls each shift solenoid valves by duty cycle signal based on commanded gear position. The 1-3-5 shift solenoid is commanded ON when the commanded gear is set to 1st, 3rd and 5th gear. When disengaging from 2nd, 4th, 6th and reverse gear, the 1-3-5 shift solenoid is also commanded ON. The 2-4-6-R shift solenoid is commanded ON when the commanded gear is set to 2nd, 4th, 6th and reverse gear. When disengaging from1st, 3rd and 5th gear, the 2-4-6-R shift solenoid is also commanded ON. The gear shift position sensor is used to detect the shift side lever position feedback for the shift solenoid valves movement. The TCM uses the gear shift position sensor to determine the current gear position with a combination of the gear select position sensor. If the TCM detects the gear shift side lever position does not reach to a desired shift position and it keeping a previous gear position when shifting to desired gear, this DTC will set.

Condition for Running the DTC

- DTCs P0718, P0889, P0902, P0903, P0904, P0912, P0913, P0914, P0973, P0974, P0976 and P0977 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The gearshift control box relay is commanded ON.
- The selector lever is other than N position.

Condition for Setting the DTC

- The TCM detects the gear shift side lever position does not reach to a desired shift position and it keeping a previously engaged gear position continuously when shifting to desired gear. This indicates that the TCM detects gear stuck at an engaged position.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gearshift control.
- The TCM commands OFF the gearshift clutch solenoid valve.
- The TCM commands OFF the lock up clutch solenoid valve.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0915 (Flash Code 74)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle. 4. Let the vehicle run so that all gear may engage enough. 5. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is P0902, P0903, P0904, P0912, P0913, P0914, P0973, P0974, P0976 or P0977 also set?	—	Go to Applicable DTC	Go to Step 3
3	Visually inspect the gear shift position sensor, 1-3-5 and 2-4-6-R shift solenoid valves for the following conditions: • Physical damage • Loose or improper installation Did you find and correct the condition?	—	Go to Step 8	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Lift the driving wheels or drive the vehicle. 2. Let the vehicle run so that all gear may engage enough. 3. Monitor the DTC Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 5	Go to Diagnostic Aids
5	1. Remove the gear shift position sensor. Refer to Gear Shift Position Sensor Replacement in this section. 2. Visually inspect the gear shift position sensor for the following conditions: • Physical damage • Loose or improper installation 3. Inspect the gear shift position sensor output voltage in order to check an open circuit, short circuit and high resistance somewhere in the operating range. 4. Remove the transmission gearshift control box assembly from the transmission main unit. Refer to Repair Instructions (Overhaul) - Control Box in this section. 5. Visually inspect the shift side lever for the following conditions: • Shift lever damage that connects to the gear shift position sensor shaft. • Shift lever damage that connects to the shift solenoid valves. • Shift lever damage that connects to the interlock plate and shift rods. • Other damage that the shift lever possible stuck. 6. Inspect the transmission main unit as necessary. Refer to Repair Instructions (Overhaul) in this section. 7. Repair or replace as necessary. 8. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6
6	1. Remove the oil pump assembly. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. 2. Inspect the oil pump and gearshift clutch for the following conditions: • The gearshift clutch solenoid valve for mechanically stuck • The clutch spool valve mechanically stuck • The gearshift clutch mechanically stuck 3. Repair or replace as necessary. Did you find and correct the condition?		Go to Step 8	Go to Step 7
7	**Important:** Replacement 1-3-5 or 2-4-6-R shift solenoid valve must be relearned. Replace the 1-3-5 or 2-4-6-R shift solenoid valve. Refer to Repair Instructions (Overhaul) - Gearshift Control Box in this section. Did you complete the replacement?	—	Go to Step 8	—

Step	Action	Value(s)	Yes	No
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. **Important:** Transmission Gear Select & Shift Position Learning must be done if the gear shift position sensor, 1-3-5 shift solenoid valve, 2-4-6-R shift solenoid valve or transmission gearshift control box is replaced, removed or repaired. **Important:** Half-clutch Position Learning must be done if the gearshift clutch is replaced, removed or repaired. 3. Turn OFF the ignition for 30 seconds. 4. Lift the driving wheels or drive the vehicle. 5. Let the vehicle run so that all gear may engage enough. 6. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 9
9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0919 (Flash Code 72)

Circuit Description

The pulse width modulation (PWM) 1-3-5 and 2-4-6-R shift solenoid valves are located on the gearshift control box. The transmission control module (TCM) controls each shift solenoid valves by duty cycle signal based on commanded gear position. The 1-3-5 shift solenoid is commanded ON when the commanded gear is set to 1st, 3rd and 5th gear. When disengaging from 2nd, 4th, 6th and reverse gear, the 1-3-5 shift solenoid is also commanded ON. The 2-4-6-R shift solenoid is commanded ON when the commanded gear is set to 2nd, 4th, 6th and reverse gear. When disengaging from1st, 3rd and 5th gear, the 2-4-6-R shift solenoid is also commanded ON. The gear shift position sensor is used to detect the shift side lever position feedback for the shift solenoid valves movement. The TCM uses the gear shift position sensor to determine the current gear position with a combination of the gear select position sensor. If the TCM detects the gear shift side lever position does not reach to a desired shift position when shifting to desired gear, this DTC will set.

Condition for Running the DTC

- DTCs P0718, P0889, P0902, P0903, P0904, P0912, P0913, P0914, P0973, P0974, P0976 and P0977 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The gearshift control box relay is commanded ON.
- The selector lever is other than N position.

Condition for Setting the DTC

- The TCM detects the gear shift side lever position does not reach to a desired shift position continuously when shifting to desired gear.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gearshift control.
- The TCM commands OFF the gearshift clutch solenoid valve.
- The TCM commands OFF the lock up clutch solenoid valve.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0919 (Flash Code 72)

9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0973 (Flash Code 71)

Circuit Description

The pulse width modulation (PWM) 2-4-6-R shift solenoid valve is located on the gearshift control box. The transmission control module (TCM) controls the 2-4-6-R shift solenoid valve by duty cycle signal based on commanded gear position. The 2-4-6-R shift solenoid is commanded ON when the commanded gear is set to 2nd, 4th, 6th and reverse gear. When disengaging from1st, 3rd and 5th gear, the 2-4-6-R shift solenoid is also commanded ON. The gear shift position sensor is used to detect the shift side lever position feedback for the shift solenoid valves movement. The TCM uses the gear shift position sensor to determine the current gear position with a combination of the gear select position sensor. If the TCM detects a high voltage condition on the 2-4-6-R shift solenoid valve monitor circuit when the solenoid valve is commanded OFF, this DTC will set.

Condition for Running the DTC

- DTC P0889 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The gearshift control box relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a high voltage condition on the 2-4-6-R shift solenoid valve monitor circuit when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM intermittently sounds buzzer when the diagnostic runs and fails.
- The TCM commands OFF gearshift control box relay.
- The TCM inhibits gearshift control and holds gear position when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail at next ignition cycle
- The TCM stops the buzzer when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0973 (Flash Code 71)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0889 also set?	—	Go to DTC P0889	Go to Step 3
3	1. Turn OFF the ignition for 30 seconds. 2. Disconnect the 2-4-6-R shift solenoid valve harness connector. 3. Connect a DMM between the control circuit of the 2-4-6-R shift solenoid valve harness (pin 2 of J-236 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value until this DTC fails?	18.0 volts	Go to Step 4	Go to Step 6
4	Is the DMM voltage more than the specified value after this DTC fails?	18.0 volts	Go to Step 7	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Connect a test lamp between the ground circuit of the 2-4-6-R shift solenoid valve harness (pin 1 of J-236 connector) and battery voltage. 2. Turn ON the ignition. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
6	1. Test the voltage feed circuit between the transmission control module (TCM) (pins 5 and 6 of B-426 connector) and the gearshift control box relay (pin 2 of X-19 connector) for an open circuit or high resistance. 2. Test the control circuit between the TCM (pins 8 and 9 of B-425 connector) and the 2-4-6-R shift solenoid (pin 2 of J-236 connector) for an open circuit or high resistance. 3. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
7	**Important:** The 2-4-6-R shift solenoid valve may be damaged if the solenoid valve control circuit is shorted to a voltage source. 1. Test the control circuit between the TCM (pins 8 and 9 of B-425 connector) and the 2-4-6-R shift solenoid (pin 2 of J-236 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the ground circuit between 2-4-6-R shift solenoid (pin 1 of J-236 connector) and chassis ground (J-9) for an open circuit or high resistance. 2. Test the ground circuit between the TCM (pins 1 and 2 of B-425 connector) and chassis ground (J-9) for an open circuit or high resistance. 3. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the 2-4-6-R shift solenoid valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the 2-4-6-R shift solenoid valve (pins 1 and 2 of J-236 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the 2-4-6-R shift solenoid circuits at the harness connector of the TCM (pins 1, 2, 8 and 9 of B-425 and pins 5 and 6 of B-426 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12

Step	Action	Value(s)	Yes	No
11	**Important:** Replacement 2-4-6-R shift solenoid valve must be relearned. Replace the 2-4-6-R shift solenoid valve. Refer to Repair Instructions (Overhaul) - Gearshift Control Box in this section. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0974 (Flash Code 71)

Circuit Description

The pulse width modulation (PWM) 2-4-6-R shift solenoid valve is located on the gearshift control box. The transmission control module (TCM) controls the 2-4-6-R shift solenoid valve by duty cycle signal based on commanded gear position. The 2-4-6-R shift solenoid is commanded ON when the commanded gear is set to 2nd, 4th, 6th and reverse gear. When disengaging from1st, 3rd and 5th gear, the 2-4-6-R shift solenoid is also commanded ON. The gear shift position sensor is used to detect the shift side lever position feedback for the shift solenoid valves movement. The TCM uses the gear shift position sensor to determine the current gear position with a combination of the gear select position sensor. If the TCM detects a low voltage condition on the 2-4-6-R shift solenoid valve monitor circuit when the solenoid valve is commanded ON, this DTC will set.

Condition for Running the DTC

- DTC P0889 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The gearshift control box relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a low voltage condition on the 2-4-6-R shift solenoid valve monitor circuit when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM intermittently sounds buzzer when the diagnostic runs and fails.
- The TCM commands OFF gearshift control box relay.
- The TCM inhibits gearshift control and holds gear position when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail at next ignition cycle
- The TCM stops the buzzer when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

P0976 (Flash Code 73)

Circuit Description

The pulse width modulation (PWM) 1-3-5 shift solenoid valve is located on the gearshift control box. The transmission control module (TCM) controls the 1-3-5 shift solenoid valve by duty cycle signal based on commanded gear position. The 1-3-5 shift solenoid is commanded ON when the commanded gear is set to 1st, 3rd and 5th gear. When disengaging from 2nd, 4th, 6th and reverse gear, the 1-3-5 shift solenoid is also commanded ON. The gear shift position sensor is used to detect the shift side lever position feedback for the shift solenoid valves movement. The TCM uses the gear shift position sensor to determine the current gear position with a combination of the gear select position sensor. If the TCM detects a high voltage condition on the 1-3-5 shift solenoid valve monitor circuit when the solenoid valve is commanded OFF, this DTC will set.

Condition for Running the DTC

- DTC P0889 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The gearshift control box relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a high voltage condition on the 1-3-5 shift solenoid valve monitor circuit when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM intermittently sounds buzzer when the diagnostic runs and fails.
- The TCM commands OFF gearshift control box relay.
- The TCM inhibits gearshift control and holds gear position when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail at next ignition cycle
- The TCM stops the buzzer when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0976 (Flash Code 73)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0889 also set?	—	Go to DTC P0889	Go to Step 3
3	1. Turn OFF the ignition for 30 seconds. 2. Disconnect the 1-3-5 shift solenoid valve harness connector. 3. Connect a DMM between the control circuit of the 1-3-5 shift solenoid valve harness (pin 2 of J-235 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value until this DTC fails?	18.0 volts	Go to Step 4	Go to Step 6
4	Is the DMM voltage more than the specified value after this DTC fails?	18.0 volts	Go to Step 7	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Connect a test lamp between the ground circuit of the 1-3-5 shift solenoid valve harness (pin 1 of J-235 connector) and battery voltage. 2. Turn ON the ignition. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
6	1. Test the voltage feed circuit between the transmission control module (TCM) (pins 4 and 5 of B-425 connector) and the gearshift control box relay (pin 2 of X-19 connector) for an open circuit or high resistance. 2. Test the control circuit between the TCM (pins 21 and 31 of B-425 connector) and the 1-3-5 shift solenoid (pin 2 of J-235 connector) for an open circuit or high resistance. 3. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
7	**Important:** The 1-3-5 shift solenoid valve may be damaged if the solenoid valve control circuit is shorted to a voltage source. 1. Test the control circuit between the TCM (pins 21 and 31 of B-425 connector) and the 1-3-5 shift solenoid (pin 2 of J-235 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the ground circuit between the 1-3-5 shift solenoid (pin 1 of J-235 connector) and chassis ground (J-9) for an open circuit or high resistance. 2. Test the ground circuit between the TCM (pins 6 and 7 of B-425 connector) and chassis ground (J-9) for an open circuit or high resistance. 3. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the 1-3-5 shift solenoid valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the 1-3-5 shift solenoid valve (pins 1 and 2 of J-235 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the 1-3-5 shift solenoid circuits at the harness connector of the TCM (pins 4, 5, 6, 7, 21 and 31 of B-425 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12

Step	Action	Value(s)	Yes	No
11	**Important:** Replacement 1-3-5 shift solenoid valve must be relearned. Replace the 1-3-5 shift solenoid valve. Refer to Repair Instructions (Overhaul) - Gearshift Control Box in this section. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0977 (Flash Code 73)

Circuit Description

The pulse width modulation (PWM) 1-3-5 shift solenoid valve is located on the gearshift control box. The transmission control module (TCM) controls the 1-3-5 shift solenoid valve by duty cycle signal based on commanded gear position. The 1-3-5 shift solenoid is commanded ON when the commanded gear is set to 1st, 3rd and 5th gear. When disengaging from 2nd, 4th, 6th and reverse gear, the 1-3-5 shift solenoid is also commanded ON. The gear shift position sensor is used to detect the shift side lever position feedback for the shift solenoid valves movement. The TCM uses the gear shift position sensor to determine the current gear position with a combination of the gear select position sensor. If the TCM detects a low voltage condition on the 1-3-5 shift solenoid valve monitor circuit when the solenoid valve is commanded ON, this DTC will set.

Condition for Running the DTC

- DTC P0889 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The gearshift control box relay is commanded ON.

Condition for Setting the DTC

- The TCM detects a low voltage condition on the 1-3-5 shift solenoid valve monitor circuit when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM intermittently sounds buzzer when the diagnostic runs and fails.
- The TCM commands OFF gearshift control box relay.
- The TCM inhibits gearshift control and holds gear position when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail at next ignition cycle
- The TCM stops the buzzer when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.
- A history DTC clears with the Tech 2 or reset switch operation.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0977 (Flash Code 73)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Place the transmission in neutral and set the parking brake. 4. Start the engine. 5. Operate the selector lever from N to D and from D to N in order to energize the 1-3-5 shift solenoid valve. 6. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition for 30 seconds. 2. Disconnect the 1-3-5 shift solenoid valve harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the Tech 2. Is DTC P0976 set?	—	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the control circuit between the transmission control module (TCM) (pins 21 and 31 of B-425 connector) and the 1-3-5 shift solenoid (pin 2 of J-235 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	**Important:** Replacement 1-3-5 shift solenoid valve must be relearned. Replace the 1-3-5 shift solenoid valve. Refer to Repair Instructions (Overhaul) - Gearshift Control Box in this section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Place the transmission in neutral and set the parking brake. 5. Start the engine. 6. Operate the selector lever from N to D and from D to N in order to energize the 1-3-5 shift solenoid valve. 7. Monitor the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1901 (Flash Code 19)

Circuit Description

The half-clutch adjustment switch is used to adjust the clutch engagement timing. The clutch engages too fast/ slow when starting vehicle or the clutch engagement timing does not match with the driver preference when starting vehicle, the driver can select the timing by pressing either “FAST” or “SLOW” adjustment switch. If the TCM detects the half-clutch adjustment fast switch signal continuously “ON”, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The vehicle speed is more than 5 km/h (3 MPH)

Condition for Setting the DTC

- The TCM detects that the half-clutch adjustment fast switch signal is stuck at the ON position (high voltage).

Action Taken When the DTC Sets

- The TCM does not illuminate the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits half-clutch adjustment.

Condition for Clearing the DTC

- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1901 (Flash Code 19)

3	1. Turn OFF the ignition. 2. Disconnect the half-clutch adjustment switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Fast Switch parameter with the Tech 2. Does the Fast Switch parameter indicate OFF?	—	Go to Step 5	Go to Step 4
4	1. Test the half-clutch adjustment switch circuit between the transmission control module (TCM) (pin 2 of B-428 connector) and the half-clutch adjustment switch (pin 1 of B-106 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Replace the half-clutch adjustment switch. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—

Step	Action	Value(s)	Yes	No
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Observe the Fast Switch parameter with the Tech 2. Does the Fast Switch parameter indicate OFF?	—	Go to Step 8	Go to Step 3
8	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P1902 (Flash Code 19)

Circuit Description

The half-clutch adjustment switch is used to adjust the clutch engagement timing. The clutch engages too fast/ slow when starting vehicle or the clutch engagement timing does not match with the driver preference when starting vehicle, the driver can select the timing by pressing either “FAST” or “SLOW” adjustment switch. If the TCM detects the half-clutch adjustment slow switch signal continuously “ON”, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.
- The vehicle speed is more than 5 km/h (3 MPH)

Condition for Setting the DTC

- The TCM detects that the half-clutch adjustment slow switch signal is stuck at the ON position (high voltage).

Action Taken When the DTC Sets

- The TCM does not illuminate the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits half-clutch adjustment.

Condition for Clearing the DTC

- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

U0100, U0121 (Flash Code 42, 68)

Circuit Description

The engine control module (ECM), the transmission control module (TCM), the electric hydraulic control module (EHCU) (ABS module) and the data recording module (DRM) communicate control and diagnostic information via a controller area network (CAN) communication bus. The TCM monitors CAN operational status by expecting a constant flow of messages from the ECM, EHCU and DRM. If the TCM fails to receive an expected message from the ECM, EHCU and DRM, DTC U0100 or U0121 will set depending on what communication is lost.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

U0100

- The TCM detects that the CAN Bus OFF Status.

U0121

- The TCM detects that the CAN Bus.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails. (U0100)
- The TCM does not illuminate the transmission warning lamp when the diagnostic runs and fails. (U0121)
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail. (U0100)
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- If DTC U0100 is present, auto shift control is inhibited and poor shift quality (feel) will appear.
- If DTC U0121 is present, lock up clutch may engage/disengage during an ABS event.

Notice:

- Diagnostic charts are different depending on the specification of the vehicle.

DTC U0100, U0121 (Flash Code 42, 68)

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Chart for without ABS

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the transmission control module (TCM) Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Attempt to communicate with the engine control module (ECM) via the Engine Data table. Does the Tech 2 communicate with the ECM?	—	Go to Step 4	Go to Diagnostic System Check - Engine Controls
4	1. Turn OFF the ignition. 2. Measure the resistance across the controller area network (CAN) Low and High circuits by back probing the resistor 1 (pins 1 and 2 of B-387 connector) (resistor 1 is located near the driver's side dash panel. It is blue connector). Is the resistance within the specified value (parallel resistance of the 120Ω resister 1 and the 120Ω resistor 2 should be 60Ω)?	50 - 70Ω	Go to Step 11	Go to Step 5

Step	Action	Value(s)	Yes	No
5	Is the resistance less than the specified value at Step 4?	—	Go to Step 6	Go to Step 9
6	1. Keep the DMM with connected. 2. Disconnect the TCM harness connectors. Is the resistance within the specified value?	50 - 70Ω	Go to Step 29	Go to Step 7
7	1. Keep the DMM with connected. 2. Disconnect the engine control module (ECM) harness connectors. Is the resistance within the specified value?	50 - 70Ω	Go to Step 30	Go to Step 8
8	1. Keep the DMM with connected. 2. Disconnect the data recording module (DRM) harness connector (DRM is located behind the glove box). Is the resistance within the specified value?	50 - 70Ω	Go to Step 28	Go to Step 21
9	1. Disconnect the resistor 1 harness connector. 2. Measure the resistance of the resistor 1. Is the resistance within the specified value?	110 - 130Ω	Go to Step 10	Go to Step 26
10	1. Disconnect the resister 2 harness connector (resistor 2 is located behind the radio and above the heater unit. It is blue connector). 2. Measure the resistance of the resistor 2. Is the resistance within the specified value?	110 - 130Ω	Go to Step 22	Go to Step 27
11	1. Disconnect the resistor 1 and resistor 2 harness connector. 2. Turn ON the ignition, with the engine OFF. 3. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 4. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 - 3.7 volts	Go to Step 12	Go to Step 15
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connectors. 3. Disconnect the TCM harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 - 3.7 volts	Go to Step 13	Go to Step 18

Step	Action	Value(s)	Yes	No
13	1. Turn OFF the ignition. 2. Reconnect the TCM harness connectors. 3. Disconnect the DRM harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. Are both voltage readings within the specified value?	1.3 - 3.7 volts	Go to Step 14	Go to Step 19
14	1. Turn OFF the ignition. 2. Reconnect the ECM harness connectors. 3. Disconnect the TCM harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading Are both voltage readings within the specified value?	1.3 - 3.7 volts	Go to Diagnostic Aids	Go to Step 20
15	1. Turn OFF the ignition. 2. Disconnect the ECM harness connectors. 3. Disconnect the TCM harness connectors. 4. Disconnect the DRM harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Test the CAN Low and CAN High circuits among the resistor 1, resistor 2, ECM, TCM and DRM for a short to ground and short to voltage. Did you find and correct the condition?	—	Go to Step 31	Go to Step 16
16	1. Turn OFF the ignition. 2. Reconnect the ECM harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading Are both voltage readings within the specified value?	1.3 - 3.7 volts	Go to Step 17	Go to Step 30

Step	Action	Value(s)	Yes	No
17	1. Turn OFF the ignition. 2. Reconnect the TCM harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading Are both voltage readings within the specified value?	1.3 - 3.7 volts	Go to Step 28	Go to Step 29
18	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 — 3.7 volts in Step 12) between the DRM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 23
19	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 — 3.7 volts in Step 13) between the TCM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 24
20	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 — 3.7 volts in Step 14) between the ECM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 25
21	Repair the short circuit each other across the CAN Low and High circuits among the resistor 1, resistor 2, ECM, TCM and DRM. Did you complete the repair?	—	Go to Step 31	—
22	1. Repair the open circuit or high resistance on the CAN Low and High circuits between the resistor 1 (pins 1 and 2 of B-387 connector) and the resistor 2 (pins 1 and 2 of B-431 connector). 2. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the each resistor. Did you complete the repair?	—	Go to Step 31	—
23	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the DRM (pins 2 and 8 of B-429 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 28

Step	Action	Value(s)	Yes	No
24	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the TCM (pins 2 and 3 of B-427 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 29
25	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the ECM (pins 18 and 37 of J-191 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 31	Go to Step 30
26	Replace the resistor 1. Did you complete the replacement?	—	Go to Step 31	—
27	Replace the resistor 2. Did you complete the replacement?	—	Go to Step 31	—
28	Replace the DRM. Refer to Data Recording Module (DRM) Replacement. Did you complete the replacement?	—	Go to Step 31	—
29	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 31	—
30	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement /Restore Fuel Injector ID Code Data in engine control section. Did you complete the replacement?	—	Go to Step 31	—
31	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 32
32	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

18	1. Turn OFF the ignition. 2. Disconnect the ECM harness connectors. 3. Disconnect the TCM harness connectors. 4. Disconnect the EHCU harness connector. 5. Disconnect the DRM harness connector. 6. Turn ON the ignition, with the engine OFF. 7. Test the CAN Low and CAN High circuits among the resistor 1, resistor 2, ECM, EHCU and DRM for a short to ground and short to voltage. Did you find and correct the condition?	—	Go to Step 38	Go to Step 19
19	1. Turn OFF the ignition. 2. Keep the ECM, TCM and DRM harness connectors with disconnect. 3. Reconnect the EHCU harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 6. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading Are both voltage readings within the specified value?	1.3 - 3.7 volts	Go to Step 20	Go to Step 36
20	1. Turn OFF the ignition. 2. Reconnect the TCM harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading Are both voltage readings within the specified value?	1.3 - 3.7 volts	Go to Step 21	Go to Step 35

Step	Action	Value(s)	Yes	No
21	1. Turn OFF the ignition. 2. Reconnect the ECM harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the CAN Low circuit (pin 1 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading. 5. Connect a DMM between the CAN High circuit (pin 2 of B-387 connector) and a known good ground at the resistor 1 harness connector. Record the voltage reading Are both voltage readings within the specified value?	1.3 - 3.7 volts	Go to Step 34	Go to Step 37
22	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 — 3.7 volts in Step 16) between the DRM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 28
23	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 — 3.7 volts in Step 15) between the TCM and joint connection. 2. Repair the circuit(s) as necessary. 3. Did you find and correct the condition?	—	Go to Step 38	Go to Step 29
24	1. Test for an open or high resistance in the CAN Low or High circuit (which ever voltage reading did not read between 1.3 — 3.7 volts in Step 17) between the ECM and joint connection. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 31
25	Repair the short circuit each other across the CAN Low and High circuits among the resistor 1, TCM and EHCU. Did you complete the repair?	—	Go to Step 38	—
26	Repair the short circuit each other across the CAN Low and High circuits among the resistor 2, ECM, DRM and EHCU. Did you complete the repair?	—	Go to Step 38	—
27	1. Test the CAN Low and High circuits between the resistor 1 (pins 1 and 2 of B-387 connector) and the EHCU (pins 14 and 15 of J-177 connector) for an open circuit or high resistance. 2. Test the CAN Low and High circuits between the resistor 2 (pins 1 and 2 of B-431 connector) and the EHCU (pins 26 and 27 of J-177 connector) for an open circuit or high resistance. 3. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the each resistor. 4. Repair the circuit(s) or connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 30

Step	Action	Value(s)	Yes	No
28	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the DRM (pins 2 and 8 of B-429 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 34
29	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the TCM (pins 2 and 3 of B-427 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 35
30	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the EHCU (pins 14, 15, 26 and 27 of J-177 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 36
31	1. Inspect for an intermittent, for poor connections and corrosion on the CAN Low and High circuits at the harness connector of the ECM (pins 18 and 37 of J-191 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 38	Go to Step 37
32	Replace the resistor 1. Did you complete the replacement?	—	Go to Step 38	—
33	Replace the resistor 2. Did you complete the replacement?	—	Go to Step 38	—
34	Replace the DRM. Refer to Data Recording Module (DRM) Replacement. Did you complete the replacement?	—	Go to Step 38	—
35	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 38	—
36	Replace the EHCU. Refer to Electric Hydraulic Control Unit (EHCU Replacement in the Anti-lock Brake section. Did you complete the replacement?	—	Go to Step 38	—
37	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement /Restore Fuel Injector ID Code Data in engine control section. Did you complete the replacement?	—	Go to Step 38	—

Step	Action	Value(s)	Yes	No
38	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 39
39	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

U0400 (Flash Code 23)

Circuit Description

The engine speed signal to the transmission control module (TCM) is sent from the engine control module (ECM) via a controller area network (CAN) communication bus based on inputs from the crankshaft position (CKP) sensor and camshaft position (CMP) sensor. If the TCM detects no engine speed signal from the ECM during the engine running, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the engine speed CAN Bus messages from the ECM are not being received.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- If this DTC is present, the Engine Speed parameter on the Tech 2 will indicate the turbine speed when the current gear is neutral or lock up clutch is engaged. Other condition, it indicates a default value.

DTC U0400 (Flash Code 23)

Schematic Reference: Transmission Controls Schematics

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC U0100 or U0121 set?	—	Go to Applicable DTC	Go to Step 3
3	1. Select the “4HK1” in the system selection menu. 2. Monitor the DTC Information with the Tech 2. Is the engine control module (ECM) DTC P0335, P0336, P0340, P0341 or P1345 set?	—	Go to Applicable DTC in Engine Control Section	Go to Diagnostic Aids

U0401 (Flash Code 24)

Circuit Description

The accelerator pedal position (APP) signal to the transmission control module (TCM) is sent from the engine control module (ECM) via a controller area network (CAN) communication bus based on inputs from the APP sensor 1 and APP sensor 2. If the TCM detects no APP signal from the ECM, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the accelerator pedal position CAN Bus messages from the ECM are not being received.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits auto shift control.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- If this DTC is present, poor shift quality (feel) will appear.

DTC U0401 (Flash Code 24)

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC U0100 or U0121 set?	—	Go to Applicable DTC	Go to Step 3
3	1. Select the “4HK1” in the system selection menu. 2. Monitor the DTC Information with the Tech 2. Is the engine control module (ECM) DTC P1271, P1277, P1278, P1282 or P1283 set?	—	Go to Applicable DTC in Engine Control Section	Go to Diagnostic Aids

U0406 (Flash Code 25)

Circuit Description

The vehicle speed signal to the transmission control module (TCM) is sent from the engine control module (ECM) via a controller area network (CAN) communication bus based on input from the vehicle speed sensor (VSS). If the TCM detects no vehicle speed signal from the ECM, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 20 volts.
- The emergency switch is OFF.

Condition for Setting the DTC

- The TCM detects that the vehicle speed CAN Bus messages from the ECM are not being received.

Action Taken When the DTC Sets

- The TCM illuminates the transmission warning lamp when the diagnostic runs and fails.
- The TCM inhibits auto shift control.
- The TCM selects highest gear when shifted from N to D.
- The TCM inhibits gear select & shift position learning and half-clutch learning.

Condition for Clearing the DTC

- The TCM turns OFF the transmission warning lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- If this DTC is present, the Output Shaft Speed and Vehicle Speed parameter on the Tech 2 will indicate estimated value based on other inputs.

Transmission Warning Lamp Inoperative

Circuit Description

Ignition voltage is supplied to the transmission warning lamp via meter fuse. The transmission control module (TCM) turns the transmission warning lamp ON by grounding the lamp control circuit.

Transmission Warning Lamp Operation

The transmission warning lamp is located on the instrument panel cluster (IPC).

Transmission Warning Lamp Function

- The transmission warning lamp informs the driver that a malfunction has occurred and the vehicle should be taken in for service as soon as possible.
- The transmission warning lamp illuminates during a bulb test.
- A DTC will be stored if the transmission warning lamp is requested by the TCM.

Transmission Waning Lamp Illumination

- The transmission warning lamp illuminates for approximately 3 seconds when the ignition switch is turned ON, with the engine OFF.
- The transmission warning lamp remains illuminated if the transmission control module (TCM) detects a fault.

Transmission Warning Lamp Inoperative

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or Transmission Control Module (TCM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Verify whether the instrument panel cluster (IPC) is operational. 2. Turn OFF the ignition for 30 seconds. 3. Turn OFF the emergency switch. 4. Turn ON the ignition, with the engine OFF. Does the transmission warning lamp illuminate?	—	Go to Intermittent Conditions	Go to Step 3
3	Inspect the Meter (10 A) fuse (F-16) in the glove box fuse block that supplies ignition voltage to the transmission warning lamp. Is the fuse open?	—	Go to Step 10	Go to Step 4
4	1. Turn OFF the ignition. 2. Remove the Meter (10 A) fuse (F-16) that supplies voltage to the transmission warning lamp. 3. Disconnect the transmission control module (TCM) harness connector (B-425 connector). 4. Turn ON the ignition with the engine OFF. 5. Measure the voltage from the transmission warning lamp control circuit at the TCM (pin 11 of B-425 connector) to a known good ground. Is the voltage less than the specified value?	1 volt	Go to Step 5	Go to Step 11
5	1. Turn OFF the ignition. 2. Install the Meter (10 A) fuse (F-16) that supplies voltage to the transmission warning lamp. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the transmission warning lamp control circuit in the TCM harness connector and a known good ground. Is the transmission warning lamp illuminated?	—	Go to Step 9	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Turn ON the ignition. 2. Operate the 1st gear start switch while observing the 1st START indicator lamp in the IPC. Does the 1st START indicator lamp operate correctly?	—	Go to Step 7	Go to Step 12
7	1. Turn OFF the ignition. 2. Disconnect the IPC harness connector (B-53 connector). 3. Test the transmission warning lamp control circuit between the TCM (pin 11 of B-425 connector) and the IPC (pin 8 of B-53 connector) for an open or high resistance. 4. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 8
8	1. Test for an intermittent and for a poor connection at the IPC (pin 8 of B-53 connector). 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
9	1. Test for an intermittent and for a poor connection at the TCM harness connector (pin 11 of B-425 connector). 2. Repair the connector(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
10	Replace the Meter (10 A) fuse (F-16). If the fuse continues to open, repair the short to ground on the ignition voltage circuit or check for a shorted component. Did you complete the repair?	—	Go to Step 15	—
11	Repair the short to voltage on the transmission warning lamp control circuit. Did you complete the repair?	—	Go to Step 15	—
12	Repair the open in the transmission warning lamp ignition voltage circuit. Did you complete the repair?	—	Go to Step 15	—
13	Replace the IPC. Refer to Instrument Panel Cluster (IPC) Replacement in the Cab and Chassis Electrical section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
15	1. Remove all test equipment. 2. Connect any disconnected components or any disconnected fuse. 3. Turn ON the ignition, with the engine OFF. Does the transmission warning lamp illuminate?	—	Go to Step 16	Go to Step 2

Step	Action	Value(s)	Yes	No
16	1. Turn OFF the ignition for 30 seconds. 2. Start the engine and operate the vehicle checking for acceptable performance and driveability. 3. Observe the transmission warning lamp, the vehicle performance and the driveability. Does the vehicle operate correctly, without any transmission warning lamp illumination and without any stored DTCs?	—	System OK	Go to Diagnostic Trouble Code (DTC) List or Symptom Charts

Transmission Warning Lamp Always On

Circuit Description

Ignition voltage is supplied to the transmission warning lamp via meter fuse. The transmission control module (TCM) turns the transmission warning lamp ON by grounding the lamp control circuit.

Transmission Warning Lamp Operation

The transmission warning lamp is located on the instrument panel cluster (IPC).

Transmission Warning Lamp Function

- The transmission warning lamp informs the driver that a malfunction has occurred and the vehicle should be taken in for service as soon as possible.
- The transmission warning lamp illuminates during a bulb test.
- A DTC will be stored if the transmission warning lamp is requested by the TCM.

Transmission Waning Lamp Illumination

- The transmission warning lamp illuminates for approximately 3 seconds when the ignition switch is turned ON, with the engine OFF.
- The transmission warning lamp remains illuminated if the transmission control module (TCM) detects a fault.

Does the vehicle operate correctly, without any transmission warning lamp illumination and without any stored DTCs?	—	System OK	Go to Diagnostic Trouble Code (DTC) List or Symptom Charts

Gearshift Control System Check

Description

The pulse width modulation (PWM) select solenoid valve, 1-3-5 and 2-4-6-R shift solenoid valves are located on the gearshift control box. The transmission control module (TCM) controls each select and shift solenoid valves by duty cycle signal based on commanded gear position. The select solenoid is only commanded ON when up-shifting. When downshifting, the force created by the return springs moves the internal select lever, but the select solenoid limits the amount of movement by generating force as required in the up-shift direction. The 1-3-5 shift solenoid is commanded ON when the commanded gear is set to 1st, 3rd and 5th gear. When disengaging from 2nd, 4th, 6th and reverse gear, the 1-3-5 shift solenoid is also commanded ON. The 2-4-6-R shift solenoid is commanded ON when the commanded gear is set to 2nd, 4th, 6th and reverse gear. When disengaging from1st, 3rd and 5th gear, the 2-4-6-R shift solenoid is also commanded ON. The gear select position sensor is used to detect the select side lever position feedback for the select solenoid valve movement. The gear shift position sensor is used to detect the shift side lever position feedback for the shift solenoid valves movement. The TCM uses the gear shift position sensor to determine the current gear position with a combination of the gear select position sensor.

When the selector lever is in the N position, the transmission is in neutral. Operating the lever to the R position puts the vehicle into reverse. Operating the lever to the D position puts the vehicle into drive, and into auto shift mode. Operating the lever to the + direction from D, shifts the up-shifting. Operating it to the − direction, shifts the downshifting. This operation also switches to the manual mode. Operating the lever from the D position to the A position while in the manual mode switches to the auto mode. When the selector lever is moved to any of the A, + or − positions from the D position, it will automatically return to the D position.

The economy mode switch can be pressed during the auto mode if you want gear changes to be performed with the priority on efficient fuel consumption. The 1st gear start switch is used to control vehicle starting so that 1st gear is normally used to start vehicle. This is because the transmission is controlled to start in 2nd gear if the 1st gear start switch is not ON.

The emergency switch, which is used when the TCM or related switches or sensors fail and normal control is not possible, and the emergency shift switch are located in front of the selector lever. As these switches are only used in an emergency, they are usually protected with a cover.

The diagnostic table assumes the following conditions are met:

- The battery is completely charged and terminals are cleaned and tight.
- Fuse and slow blow fuse are normal.
- The vehicle information data is correctly programmed and transmission gear select & shift position is correctly learned.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Chart 1 of 4

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls

Step	Action	Value(s)	Yes	No
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Observe the following transmission data with the Tech 2. Reprogram correct vehicle information if incorrect. Refer to Transmission Control Module (TCM) Replacement in this section. • Engine Type • Transmission Type • Speedometer Driven Gear Teeth 5. Observe the following transmission data with the Tech 2. Relearn if indicates Not Learned. Refer to Transmission Control Module (TCM) Replacement in this section. • Engine Type Learning Status • Transmission Type Learning Status • Speedometer Driven Gear Learning Status • Gear Position Learning Status • Torque Learning Status 6. Learning procedure must be done whenever any of the relating parts are replaced, removed or repaired. Refer to Programming & Learning Guideline in this section. Did you complete the action?	—	Go to Step 3	—
3	Operate the selector lever while observe the Selector Position parameter with the Tech 2. Does the Selector Position parameter indicate correct position?	—	Go to Step 4	Refer to DTC P0906 and P0907
4	1. Inspect for correct ATF level. Refer to ATF inspection in this section. 2. Inspect for external leakage. 3. Repair or add ATF as necessary. Did you complete the action?	—	Go to Step 5	—
5	1. Lift the driving wheels or drive the vehicle. 2. Start the engine. 3. Monitor the DTC Information with the Tech 2. Are any DTC(s) set?	—	Go to Applicable DTC	Go to Step 6
6	1. Start the engine if stopped. 2. Put the vehicle with the following conditions: • Selector lever N position • 1st gear start switch OFF • Economy mode switch OFF • Emergency switch OFF • Emergency shift switch N position • PTO switch(s) and/or lever OFF 3. Operate the selector lever from N to D while applying the brake pedal. Does the gear position display in the instrument panel cluster (IPC) indicate A?	—	Go to Step 7	Go to Step 20

Step	Action	Value(s)	Yes	No
7	Does the transmission warning lamp OFF in the IPC?	—	Go to Step 8	If DTC is set, refer to applicable DTC. If no DTC, Go to Transmission Warning Lamp Always ON
8	Does the ECONO indicator lamp OFF in the IPC?	—	Go to Step 9	Go to Chart 2 of 4 Step 13
9	Does the 1st START indicator lamp OFF in the IPC?	—	Go to Step 10	Go to Chart 2 of 4 Step 28
10	Let the vehicle run while observing the Current Gear and Desired Gear Position parameter with the Tech 2. Does all forward gear automatically engage or disengage except 1st gear, and Current Gear parameter follow the Desired Gear Position parameter?	—	Go to Step 11	If DTC is set, refer to applicable DTC. If no DTC, Go to Step 19
11	1. Stop the vehicle. 2. Economy mode switch ON. 3. Let the vehicle run while observing the Current Gear and Desired Gear Position parameter with the Tech 2. Does all forward gear automatically engage or disengage except 1st gear, and the timing of up-shifting earlier than normal auto shifting?	—	Go to Step 12	Go to Chart 2 of 4 Step 1
12	1. Stop the vehicle. 2. Operate the selector lever to + and −. Slightly move the vehicle as necessary. Does the gear position display in the IPC indicate 1, 2 or 3 when the selector lever is operated?	—	Go to Step 13	If DTC is set, refer to applicable DTC. If no DTC, Go to Step 19
13	1. Stop the vehicle. 2. Operate the selector lever to A. 3. 1st gear start switch ON 4. Let the vehicle run while observing the Current Gear and Desired Gear Position parameter with the Tech 2. Does the 1st gear automatically engage whenever vehicle starting?	—	Go to Step 14	Go to Chart 2 of 4 Step 18
14	1. Stop the vehicle. 2. Operate the selector lever to R. Slightly move the vehicle as necessary. Does the reverse gear engage?	—	Go to Step 15	If DTC is set, refer to applicable DTC. If no DTC, Go to Step 19
15	1. Stop the vehicle. 2. Put the vehicle with the following conditions: • Selector lever N position • Emergency switch ON • Emergency shift switch N position Does the transmission warning lamp blink in the IPC?	—	Go to Step 16	Go to Chart 3 of 4 Step 1
16	1. Apply the brake pedal firmly. 2. Turn the emergency shift switch to 1. Does the 1st gear engage?	—	Go to Step 17	Go to Chart 3 of 4 Step 13

Step	Action	Value(s)	Yes	No
17	1. Stop the vehicle. 2. Apply the brake pedal firmly. 3. Turn the emergency shift switch to R. Does the reverse gear engage?	—	Go to Step 18	Go to Chart 3 of 4 Step 24
18	1. Stop the vehicle. 2. Put the vehicle with the following conditions: • Selector lever N position • Emergency switch OFF • Emergency shift switch N position 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. Does the gear position display in the IPC indicate N?	—	System OK	If DTC is set, refer to applicable DTC. If no DTC, Go to Step 19
19	1. Perform following checks which ever gear position did not engage or disengage. Use Tech 2 transmission data list normal reading or a known good vehicle to determine nominal values. 2. Visually inspect the gear select position sensor, gear shift position sensor, select solenoid valve, 1-3-5 shift solenoid valve, 2-4-6-R shift solenoid valve for the following conditions: • Physical damage • Loose or improper installation 3. Remove the transmission gearshift control box. Refer to Repair Instructions (Overhaul) - Control Box in this section. 4. Visually inspect the gearshift control box for the following conditions: • Internal lever damage that connects to the each position sensor. • Internal lever damage that connects to the each solenoid valve. • Shift lever damage that connects to the interlock plate and shift rods • Other damage that the shift lever possible to stuck. 5. Inspect the transmission main unit as necessary. Refer to Repair Instructions (Overhaul) in this section. 6. Remove the oil pump assembly. Refer to Repair Instructions (Overhaul) - Oil Pump in this section. 7. Inspect the oil pump assembly and gearshift clutch for the following conditions: • The gearshift clutch solenoid valve or lock up clutch solenoid valve for mechanically stuck or damage. • Each spool valve for damage. • The oil pump for damage. • ATF Internal leaking • The gearshift clutch mechanically stuck or damage. 8. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 2	—

Step	Action	Value(s)	Yes	No
20	Does the gear position display in the IPC keep to indicate N?	—	Go to Step 21	Go to Step 22
21	Does the transmission warning lamp blink in the IPC?	—	Go to Chart 3 of 4 Step 9	Go to Step Chart 4 of 4 Step 1
22	Does the gear position display in the IPC indicate any gear?	—	If DTC is set, the TCM is not allowing auto shift control. Refer to applicable DTC. If no DTC, Go to Chart 4 of 4 Step 16	Go to Chart 4 of 4 Step 12

Chart 2 of 4

Step	Action	Value(s)	Yes	No
1	1. Turn ON the ignition switch, with the engine OFF. 2. Observe the Economy Switch parameter with the Tech 2. Does the Economy Switch parameter indicate ON when the switch is ON?	—	Go to Step 2	Go to Step 3
2	Does the ECONO indicator lamp illuminate at Step 1?	—	Go to Intermittent Conditions	Go to Step 9
3	1. Turn OFF the ignition. 2. Disconnect the economy mode and 1st gear start switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Economy Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire between the economy mode switch harness (pin 6 of N-20 connector) and a known good ground. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 4	Go to Step 5
4	Observe the Economy Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the economy mode switch harness (pins 3 and 6 of N-20 connector). Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 7	Go to Step 6
5	1. Test the economy switch signal circuit between the transmission control module (TCM) (pin 13 of B-428 connector) and the economy mode switch (pin 6 of N-20 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 8
6	Repair the open circuit or high resistance on the ground circuit of the economy mode switch (pin 3 of N-20 connector) and the chassis ground (B-1). Did you complete the repair?	—	Go to Step 35	—

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. Inspect for an intermittent and for poor connections at the harness connector of the economy mode switch (pins 3 and 6 of N-20 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 32
8	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the economy mode switch signal circuit at the harness connector of the TCM (pin 13 of B-428 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 34
9	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector (B-425 connector). 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the ECONO indicator lamp control circuit of the TCM harness connector (pin 12 of B-425 connector) and a known good ground. Does the ECONO indicator lamp illuminate?	—	Go to Step 12	Go to Step 10
10	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the instrument panel cluster (IPC) (pin 7 of B-53 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 11
11	1. Test the ECONO indicator lamp control circuit between the TCM (pin 12 of B-425 connector) and the IPC (pin 7 of B-53 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 33
12	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the ECONO indicator lamp control circuit at the harness connector of the TCM (pin 12 of B-425 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 34
13	1. Turn ON the ignition switch, with the engine OFF. 2. Observe the Economy Switch parameter with the Tech 2. Does the Economy Switch parameter indicate OFF when the switch is OFF?	—	Go to Step16	Go to Step 14

Step	Action	Value(s)	Yes	No
14	1. Turn OFF the ignition. 2. Disconnect the economy mode and 1st gear start switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Economy Switch parameter with the Tech 2. Does the Economy Switch parameter indicate OFF?	—	Go to Step 32	Go to Step 15
15	1. Test the economy switch circuit between the TCM (pin 13 of B-428 connector) and the economy mode switch (pin 6 of N-20 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 34
16	1. Turn OFF the ignition. 2. Disconnect the IPC B-53 connector harness connector. 3. Connect a test lamp between the ECONO indicator lamp control circuit (pin 7 of B-53 connector) and battery voltage. 4. Turn ON the ignition, with the engine OFF. Does the test lamp continuously illuminate (test lamp blink then go out normally)?	—	Go to Step 17	Go to Step 33
17	1. Test the ECONO indicator lamp control circuit between the TCM (pin 12 of B-425 connector) and the IPC (pin 7 of B-53 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 34
18	1. Turn ON the ignition switch, with the engine OFF. 2. Observe the 1st gear start switch parameter with the Tech 2. Does the 1st gear start switch parameter indicate ON when the switch is ON?	—	Go to Step 19	Go to Step 20
19	Does the 1st START indicator lamp illuminate at Step 18?	—	Go to Intermittent Conditions	Go to Step 26
20	1. Turn OFF the ignition switch. 2. Disconnect the economy mode and 1st gear start switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the 1st Gear Start Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire between the economy switch harness (pin 4 of N-20 connector) and a known good ground. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 21	Go to Step22
21	Observe the 1st Gear Start Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the economy switch harness (pins 1 and 4 of N-20 connector). Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 24	Go to Step 23

Step	Action	Value(s)	Yes	No
22	1. Test the 1st gear start switch signal circuit between the TCM (pin 1 of B-427 connector) and the 1st gear start switch (pin 4 of N-20 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 25
23	Repair the open circuit or high resistance on the ground circuit of the 1st gear start switch (pin 1 of N-20 connector) and the chassis ground (B-1). Did you complete the repair?	—	Go to Step 35	—
24	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the 1st gear start switch (pins 1 and 4 of N-20 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 32
25	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the 1st gear start switch signal circuit at the harness connector of the TCM (pin 1 of B-427 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 34
26	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the IPC (pin 6 of B-53 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 27
27	1. Test the 1st START indicator lamp circuit between the 1st gear start switch (pin 4 of N-20 connector) and the IPC (pin 6 of B-53 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 33
28	1. Turn ON the ignition switch, with the engine OFF. 2. Observe the 1st Gear Start Switch parameter with the Tech 2. Does the 1st Gear Start Switch parameter indicate OFF when the switch is OFF?	—	Go to Step 31	Go to Step 29
29	1. Turn OFF the ignition. 2. Disconnect the economy mode and 1st gear start switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the 1st Gear Start Switch parameter with the Tech 2. Does the 1st Gear Start Switch parameter indicate OFF?	—	Go to Step 32	Go to Step 30

Step	Action	Value(s)	Yes	No
30	1. Test the 1st gear start switch circuit between the TCM (pin 1 of B-427 connector) and the 1st gear start switch (pin 4 of N-20 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 34
31	1. Test the 1st START indicator lamp circuit between the diode (pin 1 of X-32 connector) and the IPC (pin 6 of B-53 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 35	Go to Step 33
32	Replace the economy mode & 1st gear start switch. Did you complete the replacement?	—	Go to Step 35	—
33	Repair or replace the IPC. Refer to Instrument Panel Cluster (IPC) Replacement in the Cab and Chassis Electrical section. Did you complete the repair or replacement?	—	Go to Step 35	
34	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 35	—
35	Reconnect all previously disconnected fuse or harness connector(s). Is the action complete?	—	Go to Chart 1 of 4 Step 6	—

Chart 3 of 4

Step	Action	Value(s)	Yes	No
1	1. Turn ON the ignition switch, with the engine OFF. 2. Observe the Emergency Switch parameter with the Tech 2. Does the Emergency Switch parameter indicate ON when the switch is ON?	—	Go to Step 2	Go to Step 3
2	Does the transmission warning lamp blink at Step 1?	—	Go to Intermittent Conditions	Go to Transmission Warning Lamp Inoperative
3	1. Turn OFF the ignition. 2. Disconnect the emergency switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the voltage feed circuit of the emergency switch harness (pin 1 of N-17 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 5

Step	Action	Value(s)	Yes	No
4	1. Turn ON the ignition, with the engine OFF. 2. Observe the Emergency Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the emergency switch harness connector between pins 1 and 5 of the N-17 connector. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 7	Go to Step 6
5	Repair the open circuit or high resistance on the voltage feed circuit between the Meter (10A) fuse (F-16) in the glove box fuse block and the emergency switch (pin 1 of N-17 connector). Did you complete the repair?	—	Go to Step 36	—
6	1. Test the emergency switch signal circuit between the TCM (pin 4 of B-428 connector) and the emergency switch (pin 5 of N-17 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 8
7	1. Turn OFF the ignition. 2. Disconnect the emergency switch harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the emergency switch (pins 1 and 5 of N-17 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 12
8	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the emergency switch circuit at the harness connector of the TCM (pin 4 of B-428 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 35
9	1. Turn ON the ignition switch, with the engine OFF. 2. Observe the Emergency Switch parameter with the Tech 2. Does the Emergency Switch parameter indicate OFF when the switch is OFF?	—	Go to Intermittent Conditions	Go to Step 10
10	1. Turn OFF the ignition. 2. Disconnect the emergency switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Emergency Switch parameter with the Tech 2. Does the Emergency Switch parameter indicate OFF?	—	Go to Step 12	Go to Step 11

Step	Action	Value(s)	Yes	No
11	1. Test the emergency switch circuit between the TCM (pin 4 of B-428 connector) and the emergency switch (pin 5 of N-17 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 35
12	Replace emergency switch. Did you complete the replacement?	—	Go to Step 36	—
13	1. Turn ON the ignition switch, with the engine OFF. 2. Observe the Emergency 1st Switch parameter with the Tech 2. Does the Emergency 1st Switch parameter indicate ON when the switch is 1?	—	Go to Step 14	Go to Step 16
14	Does the Emergency 1st Switch parameter indicate OFF when the switch is N?	—	Go to Step 15	Go to Step 19
15	Does the Emergency N Switch parameter indicate ON when the switch is N?	—	Go to Intermittent Conditions	Go to Step 21
16	1. Turn OFF the ignition switch. 2. Disconnect the emergency shift switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Emergency 1st Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire between the emergency shift switch harness (pin 3 of N-18 connector) and a known good ground. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 17	Go to Step 18
17	Observe the Emergency 1st Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the emergency shift switch harness (pins 3 and 5 of N-18 connector). Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 29	Go to Step 33
18	1. Test the emergency 1st position switch signal circuit between the TCM (pin 14 of B-428 connector) and the emergency shift switch (pin 3 of N-18 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 30
19	1. Turn OFF the ignition. 2. Disconnect the switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Emergency 1st Switch parameter with the Tech 2. Does the Emergency 1st Switch parameter indicate OFF?	—	Go to Step 34	Go to Step 20

Step	Action	Value(s)	Yes	No
20	1. Test the emergency 1st position switch circuit between the TCM (pin 14 of B-429 connector) and the emergency shift switch (pin 3 of N-18 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 35
21	1. Turn OFF the ignition switch. 2. Disconnect the emergency shift switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Emergency N Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire between the emergency shift switch harness (pin 2 of N-18 connector) and a known good ground. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 22	Go to Step 23
22	Observe the Emergency N Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the emergency shift switch harness (pins 2 and 5 of N-18 connector). Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 29	Go to Step 33
23	1. Test the emergency N position switch signal circuit between the TCM (pin 6 of B-428 connector) and the emergency shift switch (pin 2 of N-18 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 30
24	1. Turn ON the ignition switch, with the engine OFF. 2. Observe the Emergency R Switch parameter with the Tech 2. Does the Emergency R Switch parameter indicate ON when the switch is R?	—	Go to Step 25	Go to Step 26
25	Does the Emergency R Switch parameter indicate OFF when the switch is N?	—	Go to Intermittent Conditions	Go to Step 31
26	1. Turn OFF the ignition switch. 2. Disconnect the emergency shift switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Emergency R Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire between the emergency shift switch harness (pin 1 of N-18 connector) and a known good ground. Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 27	Go to Step 28

Step	Action	Value(s)	Yes	No
27	Observe the Emergency R Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the emergency shift switch harness (pins 1 and 5 of N-18 connector). Does the Tech 2 indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 29	Go to Step 33
28	1. Test the emergency R position switch signal circuit between the TCM (pin 20 of B-428 connector) and the emergency shift switch (pin 1 of N-18 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 30
29	1. Turn OFF the ignition. Inspect for an intermittent and for poor connections at the harness connector of the emergency shift switch (pins 1, 2, 3 and 5 of N-18 connector). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 34
30	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections on the emergency shift switch signal circuit at the harness connector of the TCM (pin 6, 14 and 20 of B-428 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 35
31	1. Turn OFF the ignition. 2. Disconnect the switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Emergency R Switch parameter with the Tech 2. Does the Emergency R Switch parameter indicate OFF?	—	Go to Step 34	Go to Step 32
32	1. Test the emergency R position switch circuit between the TCM (pin 20 of B-428 connector) and the emergency shift switch (pin 1 of N-18 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 36	Go to Step 35
33	Repair the open circuit or high resistance on the ground circuit of the emergency shift switch (pin 5 of N-18 connector) and the chassis ground (B-1). Did you complete the repair?		Go to Step 36	—
34	Replace emergency shift switch. Did you complete the replacement?	—	Go to Step 36	—
35	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 36	—

Step	Action	Value(s)	Yes	No
36	Reconnect all previously disconnected fuse or harness connector(s). Is the action complete?	—	Go to Chart 1 of 4 Step 6	—

Chart 4 of 4

Step	Action	Value(s)	Yes	No
1	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Pedal Switch parameter with the Tech 2. Does the Brake Pedal Switch parameter indicate Applied when the pedal is applied and Released when the pedal is released?	—	Go to Intermittent Conditions	Go to Step 2
2	1. Check to ensure the brake pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 3
3	1. Turn OFF the ignition. 2. Inspect the Stop Light (10A) fuse (F-5) in the glove box fuse block. Is the Stop Light (10A) fuse (F-5) open?	—	Go to Step 4	Go to Step 5
4	Replace the Stop Light (10A) fuse (F-5). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Stop Light (10A) fuse (F-5) or replace the shorted attached component fed by the Stop Light (10A) fuse (F-5). Did you complete the repair?	—	Go to Step 22	—
5	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Connect a test lamp between the voltage feed circuit of the brake pedal switch harness (pin 1 of B-66 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 7
6	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Pedal Switch parameter with the Tech 2 while momentarily jumping 3-amp fused jumper wire across the brake pedal switch harness connector between pins 1 and 2 of the B-66 connector. Does the Tech 2 indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 9	Go to Step 8
7	Repair the open circuit or high resistance on the voltage feed circuit between the Stop Light (10A) fuse (F-5) and the brake pedal switch (pin 1 of B-66 connector). Did you complete the repair?	—	Go to Step 22	—

Step	Action	Value(s)	Yes	No
8	1. Test the brake pedal switch signal circuit between the transmission control module (TCM) (pin 3 of B-428 connector) and the brake pedal switch (pin 2 of B-66 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the brake pedal switch (pins 1 and 2 of B-66 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the brake switch circuit at the harness connector of the TCM (pin 3 of B-428 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21
11	Replace brake pedal switch. Did you complete the replacement?	—	Go to Step 22	—
12	1. Turn OFF the ignition. 2. Disconnect the instrument panel cluster (IPC) harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the IPC (pin 1 of B-53 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 13
13	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection on the gear position display control circuit at the harness connector of the TCM (pin 14 of B-425 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 14
14	1. Test the gear position display control circuit between the TCM (pin 14 of B-425 connector) and the IPC (pin 1 of B-53 connector) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 15

Step	Action	Value(s)	Yes	No
15	Replace the IPC. Refer to Instrument Panel Cluster (IPC) Replacement in the Cab and Chassis Electrical section. Did you complete the replacement?	—	Go to Step 22	—
16	1. Turn ON the ignition, with the engine OFF. 2. Observe the PTO Switch parameter with the Tech 2 in the ENGINE system menu. Does the PTO Switch parameter OFF when the PTO switch or lever is released?	—	Go to Intermittent Conditions	Go to Step 17
17	1. Turn OFF the ignition. 2. Disconnect the PTO switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the PTO Switch parameter with the Tech 2. Does the PTO Switch parameter OFF?	—	Go to Step 19	Go to Step 18
18	1. Test the PTO switch circuit between the ECM (pin 44 of J-191 connector) and the PTO switch or lever (pin 1 of B-84 connector) for a short to ground. 2. Repair the circuit(s) as necessary. 3. Did you find and correct the condition?	—	Go to Step 22	Go to Step 20
19	Replace the PTO switch or lever. Did you complete the replacement?	—	Go to Step 22	—
20	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement /Restore Fuel Injector ID Code Data in engine control section. Did you complete the replacement?	—	Go to Step 22	—
21	**Important:** Replacement TCM must be programmed and learned. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in this section. Did you complete the replacement?	—	Go to Step 22	—
22	Reconnect all previously disconnected fuse or harness connector(s). Is the action complete?	—	Go to Chart 1 of 4 Step 6	—

Symptoms - Transmission Controls

Symptoms - Transmission Controls

Important Preliminary Inspections Before Starting

Perform Diagnostic System Check - Transmission Controls before using the symptom tables, and verify that all of the following are true:

- The transmission control module (TCM) and transmission warning lamp are operating correctly.
- There are no diagnostic trouble codes (DTCs) stored.
- The Tech 2 data is within the normal operating range. Refer to Tech 2 Data List in this section.
- Verify the customer concern and locate the correct symptom in the table of contents. Inspect the items indicated under that symptom.

Visual and Physical Inspection

Several of the symptom procedures ask for careful visual and physical inspection. This step is extremely important. The visual and physical inspection can lead to correcting a problem without further inspections, and can save valuable time. Ensure that:

- The TCM grounds are clean, tight, and in their proper location.
- The transmission harness wiring and terminals are properly connected and are not pinched or cut.

Intermittent

Important:
Inspect for improper installation of electrical components if an intermittent condition exists. Inspect for aftermarket add-on electrical equipment devices, lights, and cellular phones. Verify that no aftermarket equipment is connected to the keyword 2000 serial data circuit. If you cannot locate an intermittent condition, a cellular phone communication signal may cause the condition.

Important:
The problem may or may not turn ON the transmission warning lamp or store a DTC.

Faulty electrical connections or wiring cause most intermittent problems. Perform a careful visual and physical inspection of the suspect connectors for the following conditions:

- Improperly mated connector halves
- Terminals that are not seated
- Terminals that are damaged or improperly formed

Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension. Remove the terminal from the connector body in order to inspect for poor terminal wire connection.
Road test the vehicle with the DMM connected to the suspected circuit. An abnormal reading that occurs when the malfunction occurs is a good indication that there is a malfunction in the circuit being monitored.

Use the Tech 2 in order to help detect intermittent conditions. Useful features of the Tech 2 include the following:

- Trigger the Snapshot feature in order to capture and store transmission parameters when the malfunction occurs. Review this stored information in order to see the specific running conditions that caused the malfunction.
- Use the Plot Function on the Tech 2 in order to plot selected data parameters. Review this stored information to aid in locating an intermittent problem. Refer to the Tech 2 Users Guide for more information.

Important:
If the intermittent condition exists as a start and then stall, test for DTCs relating to the vehicle theft deterrent system. Test for improper installation of electrical options such as lights, cellular phones, etc.

Any of the following may cause an intermittent transmission warning lamp with no stored DTC:

- The TCM grounds are loose or dirty. Refer to Transmission Controls Schematics.
- The transmission warning lamp circuit intermittently shorted to ground.
- Electrical system interference caused by a malfunctioning relay, TCM driven solenoid, or switch. The electrical component can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating.
- There are any open diodes.

Important:
The following symptom tables contain groups of possible causes for each symptom. The order of these procedures is not important. If the Tech 2 readings do not indicate the problems, then proceed in a logical order, easiest to check or most likely to cause first. In order to determine if a specific vehicle is using a particular system or component, refer to Transmission Controls Schematics for an application.

Use the following tables when diagnosing a symptom complaint:

Intermittent Conditions

Checks	Action
DEFINITION: The problem is not currently present but is indicated in DTC History. OR There is a customer complaint, but the symptom cannot currently be duplicated, if the problem is not DTC related.	
Preliminary Checks	• Refer to Symptoms - Transmission Controls before starting.
Harness/Connector	Many intermittent open or shorted circuits are affected by harness/connector movement that is caused by vibration, engine torque, bumps/rough pavement, etc. Test for this type of condition by performing the applicable procedure from the following list: • Move related connectors and wiring while monitoring the appropriate Tech 2 data. • Move related connectors and wiring with the component commanded ON, and OFF, with the Tech 2. Observe the component operation. • With the engine running, move related connectors and wiring while monitoring engine operation. If harness or connector movement affects the data displayed, component/system operation, or engine operation, inspect and repair the harness/connections as necessary. Refer to Electrical Connections or Wiring.
Electrical Connections or Wiring	Poor electrical connections, terminal tension or wiring problems cause most intermittent. To perform the following inspections: • Inspect for poor mating of the connector halves, or terminals improperly seated in the connector body. • Inspect for improperly formed or damaged terminals. Test for poor terminal tension. • Inspect for poor terminal to wire connections including terminals crimped over insulation. This requires removing the terminal from the connector body. • Inspect for corrosion/water intrusion. Pierced or damaged insulation can allow moisture to enter the wiring. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits. • Inspect for wires that are broken inside the insulation. • Inspect the harness for pinched, cut or rubbed through wiring. • Ensure that the wiring does not come in contact with hot exhaust components.
Control Module Power and Grounds Component Power and Grounds	Poor power or ground connections can cause widely varying symptoms. • Test all control module power supply circuits. Many vehicles have multiple circuits supplying power to the control module. Other components in the system may have separate power supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the power source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Ensure that the circuit can carry the current necessary to operate the component. • Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Ensure that the circuit can carry the current necessary to operate the component.

Checks	Action
Temperature Sensitivity	• An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot. • If the intermittent is related to heat, review the data for a relationship with the following: - High ambient temperatures - Underhood/engine generated heat - Circuit generated heat due to a poor connection, or high electrical load - Higher than normal load conditions, towing, etc. • If the intermittent is related to cold, review the data for the following: - Low ambient temperatures - In extremely low temperatures, ice may form in a connection or component. Test for water intrusion. - The condition only occurs on a cold start. - The condition goes away when the vehicle warms up. • Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
Electromagnetic Interference (EMI) and Electrical Noise	Some electrical components/circuits are sensitive to EMI or other types of electrical noise. Inspect for the following conditions: • A misrouted harness that is too close to high voltage/high current devices such as injection components, motors, generator etc. These components may induce electrical noise on a circuit that could interfere with normal circuit operation. • Electrical system interference caused by a malfunctioning relay, or the transmission control module (TCM) driven solenoid or switch. These conditions can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating. • Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use. • Test for any open diodes. Some relays may contain a clamping diode. • Test the generator for a bad rectifier bridge that may be allowing AC noise into the electrical system.
Duplicating Failure Conditions	• If none of the previous tests are successful, attempt to duplicate and/or capture the failure conditions. • An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the problem occurs, may help you locate the problem.
Tech 2 Snapshot	The Tech 2 can be set up to take a Snapshot of the parameters available via serial data. The Snapshot function records live data over a period of time. The recorded data can be played back and analyzed. The Tech 2 can also graph parameters singly or in combinations of parameters for comparison. The Snapshot can be triggered manually at the time the symptom is noticed, or set up in advance to trigger when a DTC sets. An abnormal value captured in the recorded data may point to a system or component that needs to be investigated further. Refer to the Tech 2 user instructions for more information on the Snapshot function.

Programming and Learning

Programming and Learning Guideline

Description

The vehicle information data must be programmed and the learning procedure must be done when the transmission control module (TCM) is replaced, sensors, actuators or internal parts are replaced or repaired. Programming with the wrong data or improper learning will cause a deterioration of the shift feeling, the poor vehicle performance and the diagnostic trouble code (DTC) to set.
Vehicle Information Programming and/or Initial Learning must be done whenever any of the following parts is replaced or specification changed. Refer to Transmission Control Module (TCM) Replacement - TCM Replacement Procedure Description in this section.

- TCM
- Transmission assembly
- Engine type
- Final gear and tire size change relating speedometer driven gear
- PTO request engine speed

Transmission Gear Select & Shift Position Learning must be done whenever any of the following parts are replaced, removed or repaired.

- 1-3-5 shift solenoid valve
- 2-4-6-R shift solenoid valve
- Select solenoid valve
- Gear shift position sensor
- Gear select position sensor
- Transmission gearshift control box
- Transmission unit internal

Half Clutch Position Learning must be done whenever any of the following parts are replaced, removed or repaired.

- Gearshift clutch assembly
- Gearshift clutch solenoid valve
- Oil pump assembly
- Clutch engagement point is shifted greatly (when difficult to adjust by the adjustment switch)

Transmission Gear Select & Shift Position Learning

1. Put the vehicle with the following conditions:
   - DTC is not present
   - Vehicle is stationary
   - Parking brake is pulled
   - Selector lever is Neutral
   - Emergency switch is OFF
   - Engine is idle speed
   - Idle up control knob to the lowest position (Full counterclockwise direction)
   - A/C switch is OFF
   - Use the Tech 2 and make sure clutch fluid temperature is 40°C (104°F) or higher
2. Depress and hold the brake pedal.

Notice:
DO NOT release the brake pedal until the transmission gear select & shift position learning is completed.

3. Press Reset switch for at least 7 seconds and release it within 17 seconds. This will enter the learning mode, which is indicated by a buzzer pattern that consists of a series of two short beeps.

Notice:
If the buzzer does not sound, restart the learning procedure from step 1.

4. With the brake pedal firmly depressed, operate the selector lever in the following sequence: N - D - N (Neutral - Drive - Neutral)
   This will change the buzzer pattern that consists of a series of two beeps, one short beep followed by one long beep. After the selector lever is operated, this buzzer pattern will continue for approximately 10 seconds and shift to each gear will be automatically performed.

Notice:
If the buzzer does not sound, operate the selector lever again.

5. Confirm that the buzzer stops.

Half Clutch Position Learning

1. Put the vehicle with the following conditions:
   - DTC is not present
   - Vehicle is stationary
   - Parking brake is pulled
   - Selector lever is Neutral
   - Emergency switch is OFF
   - Engine is warm upped
   - Engine is idle speed
   - Idle up control knob to the lowest position (Full counterclockwise direction)
   - A/C switch is OFF
   - Use the Tech 2 and make sure clutch fluid temperature is 40°C (104°F) or higher
2. Depress and hold the brake pedal.

Notice:
DO NOT release the brake pedal until the half clutch position learning is completed.

3. Press Reset switch for at least 7 seconds and release it within 17 seconds. This will enter the learning mode, which is indicated by a buzzer pattern that consists of a series of two short beeps.

Notice:
If the buzzer does not sound, restart the learning procedure from step 1.

4. With the brake pedal firmly depressed, operate the selector lever in the following sequence: N - D (Neutral - Drive)
   This will change the buzzer pattern that consists of a series of single short beeps. After the selector lever is operated, this buzzer pattern will continue for approximately 30 seconds and the clutch will be automatically engaged.

Notice:
If the buzzer does not sound, operate the selector lever again.

5. Confirm that the buzzer stops.

Repair Instructions

Transmission Control Module (TCM) Replacement

TCM Replacement Procedure Description

The following A-F steps provide an overview procedure to replace and reprogram a TCM. Each A-F step is explained further in this section.

A. Record the vehicle type information manually from the old TCM. The vehicle type information can be obtained using the Tech 2 Data Display function.
B. Replace the old TCM with the new TCM.
C. Program the latest software and calibrations into the new TCM using the Service Programming System (SPS).
D. Program the recorded vehicle information into the new TCM using the Tech 2 Programming function.
E. Perform the transmission gear position learning, half clutch learning and number of speedometer driven gear teeth learning by initial learning procedure.
F. Program the vehicle identification number (VIN). If the TCM from another vehicle is installed, VIN does not match with the vehicle. Use the SPS to change the original VIN.

A. Recording Vehicle Information

The following vehicle type information must be programmed into the TCM for correct vehicle performance.

- Engine Type
- Transmission Type
- Speedometer Driven Gear Teeth
- PTO Request Engine Speed (If so equipped)

Important:
If the communications cannot be established with the old TCM, the technician will need to follow the following ways.

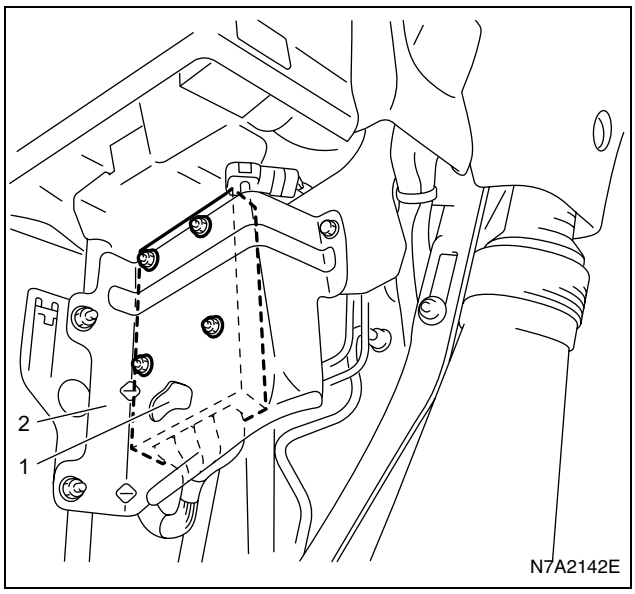
- Find out the correct engine type and transmission type from the service ID plate.
- Physically find out the correct number of speedometer driven gear teeth.
- Ask the customer which of the PTO request engine speed was previously being used.

B. Removal and Installation

Removal Procedure

Important:
Take care not to give a strong impact to the TCM.

1. Turn OFF the ignition.
2. Disconnect the negative battery cable.
3. Disconnect the TCM connectors.
4. Remove the TCM fixing nuts.
5. Remove the TCM.



Legend
1. TCM
2. TCM Cover

Installation Procedure

Important:
Do not use a fallen TCM or the TCM that received a strong impact.

1. Install the TCM on the TCM bracket.
2. Tighten the TCM fixing nuts.
3. Connect the TCM connectors.
4. Connect the negative battery cable.

C. Programming Software and Calibrations

Program latest software/calibrations if released. Refer to Service Programming System (SPS) Description and Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure) in this section.

D. Programming Vehicle Information

Use the Tech 2 to program the previously recorded vehicle information.

Notice:
If the removed TCM from another vehicle is installed with same specification, this programming is not necessary.

1. Install the Tech 2.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > appropriate vehicle identification > Smoother > Programming.
4. Select Program Vehicle Type and press Change.
5. Select previously recorded correct combination of engine type and transmission type.

6. Select PTO Request Engine Speed and press Change. (If PTO is not installed, skip to step 8.)
7. Select previously recorded correct PTO request engine speed.
8. Select Program Speedometer Driven Gear and press Change.
9. Select previously recorded correct number of speedometer driven gear teeth.
10. Select Diagnostics > appropriate vehicle identification > Smoother > Data Display. At this point, all programmed data can be verified. Compare the vehicle information programmed into the TCM with the recorded value. If the programmed vehicle information is incorrect, go back to appropriate step.

E. Initial Learning

As for initial learning, transmission gear select & shift position learning, half clutch position learning and speedometer driven gear learning will be performed at the same time.

1. Put the vehicle with the following conditions:
   - DTC is not present
   - Vehicle is stationary
   - Parking brake is pulled
   - Selector lever is Neutral
   - Emergency switch is OFF
   - Engine is warm upped
   - Engine is idle speed
   - Idle up control knob to the lowest position (Full counterclockwise direction)
   - A/C switch is OFF
   - Use the Tech 2 and make sure clutch fluid temperature is 40°C (104°F) or higher
2. Use a jumper wire and the DLC terminal “11” (diagnostic request) is pulled “Low” (grounded) by jumped to DLC terminal “4”. This will warning lamp blinks.
3. Depress and hold the brake pedal.

Notice:
DO NOT release the brake pedal until the transmission gear select & shift position learning and half clutch position learning is completed (until step 6).

4. Press Reset switch for at least 7 seconds and release it within 17 seconds. This will enter the learning mode, which is indicated by a buzzer pattern that consists of a series of two short beeps.

Notice:
If the buzzer does not sound, restart the learning procedure from step 1.

5. With the brake pedal firmly depressed, operate the selector lever in the following sequence: N - D - N (Neutral - Drive - Neutral)
   This will change the buzzer pattern that consists of a series of two beeps, one short beep followed by one long beep. After the selector lever is operated, this buzzer pattern will continue for approximately 10 seconds and shift to each gear will be automatically performed. And then, change automatically to single short beeps. This buzzer pattern will continue for approximately 30 seconds and the clutch will be automatically engaged.

Notice:
If the buzzer does not sound, operate the selector lever again.

Notice:
If the buzzer stops on the way of this step, restart the learning procedure from step 3.

6. Confirm that the buzzer stops. Remove the jumper wire from the DLC.

Notice:
If the buzzer sounds after removing the jumper wire from the DLC, restart the learning procedure from step 1.

7. Confirm that the warning lamp. The warning lamp will blink if the number of speed meter driven gear teeth leaning is not completed.

Notice:
If the TCM from another vehicle is installed, the warning lamp does not blink.

8. With the parking brake applied, the engine speed is idle, and the brake pedal is depressed, move the selector lever to D (Drive) position. Confirm that the gear position indicator is 2nd. If the gear position is not 2nd, operate the selector lever “+” or “–” to change 2nd.
9. Run the vehicle in 2nd gear at fixed vehicle speed of approximately 20km/h (12MPH) for 10 seconds.
10. Confirm that the warning lamp goes out.

Notice:
If the warning lamp does not go out, restart the learning procedure from step 8.

F. Programming VIN

If the TCM from another vehicle is installed, VIN does not match with the vehicle. Use the SPS to change the original VIN. Refer to Service Programming System (SPS) Description and Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure) in this section.

Notice:
If an updated software/calibrations is released, DO NOT program the VIN now. The VIN is programmed at previously described C. Programming Software and Calibrations SPS procedure.

Service Programming System (SPS) Description

The service programming system (SPS) allows a technician to program a control module through the data link connector (DLC). The information transfer circuit that is used at the DLC is the same serial data circuit used be the Tech 2 for retrieving diagnostic trouble codes (DTCs), displaying data, clearing DTCs etc. This procedure offers the ability to install software/ calibrations matched to a particular vehicle.
Most control modules have two types of memory. The software/calibrations reside in the flash memory. The two types of memory are listed below:

- Electrically Erasable Programmable Read Only Memory (EEPROM).
  This type of memory allows selected portions of memory to be programmed while other portions remain unchanged.
  Certain learned values reside in the EEPROM, such as:
  - The vehicle identification number (VIN)
  - The vehicle type information
  - The gear position leaning and half clutch learning
- Flash Read Only Memory-Flash Memory
  Flash memory has increased memory storage capacity. During programming, all information within this type of memory is erased, and then replaced with entirely new information.

Service Programming Methods

The two methods of programming an transmission control module (TCM) are listed below:

- Remote Programming
- Pass Thru Programming

For information on programming a TCM using one of the methods listed above, refer to Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure).

Before Programming a Control Module

Important:
DO NOT program an existing transmission control module (TCM) with the identical software/calibration package. This procedure is not a short cut to correct the driveability condition. This is an ineffective repair. A TCM should only be programmed when the following occurs:

- When a service procedure instructs you to replace the TCM. When the TCM from another vehicle is installed, VIN must be changed.
- An updated software/calibrations is released.

Ensure that the following conditions are met before programming a TCM:

- The Tech 2 PCMCIA card is programmed with the latest software.
- The TIS 2000 is installed with the latest software.
- The hardware key is plugged into the computer port.
- Vehicle system voltage:
  - There are no charging system concerns. All charging system concerns must be repaired before programming the TCM.
  - The battery voltage is greater than 24 volts but less than 30 volts. The battery must be fully charged before programming the TCM.
  - A battery charger is NOT connected to the vehicles battery. Incorrect system voltage or voltage fluctuations from a battery charger may cause programming failure or TCM damage.
  - Turn OFF or disable any system that may put a load on the vehicles battery. Turn OFF or disable systems such as:
    - Heating, ventilation, and air conditioning (HVAC) systems
    - Headlights
    - Room lights
    - Accessory equipment
- The ignition switch is in the proper position. The Tech 2 prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the programming procedure unless instructed to do so.
- All tool connections are secure:
  - The RS-232C cable
  - The connection at the DLC
  - The voltage supply circuits
- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or TCM damage may occur.
  If you are performing the Pass-Thru programming procedure using a notebook computer without the power cord, ensure that the internal battery is fully charged.

Service Programming System (SPS) (Remote Procedure)

The Remote Service Programming System (SPS) method is a three-step process that involves the following procedures:

1. Connecting the Tech 2 to the vehicle and obtaining the information from the transmission control module (TCM).
2. Connecting the Tech 2 to the terminal and downloading a new calibration file from the terminal into the Tech 2 memory.
3. Reconnecting the Tech 2 to the vehicle and uploading the new calibration file into the TCM.

Performing the Remote Procedure

1. Connect the Tech 2 to the vehicle and obtain the transmission control module (TCM) information using the following procedure:

Important:
Ensure the TCM is installed in the vehicle and the battery is fully charged before programming.

1.1. Connect the Tech 2 to the vehicle data link connector (DLC), with the engine and the Tech 2 OFF.
1.2. Turn ON the Tech 2.
1.3. Press Enter at the title screen.
1.4. Turn ON the ignition, with the engine OFF.
1.5. Select Service Programming System at the Main Menu.
1.6. Select Request Info.
1.7. If there is already stored in the Tech 2, the existing data is displayed on the screen. The Tech 2 asks user to keep existing data Keep Data or Continue to request new vehicle information from the TCM. If there is no data in the Tech 2, it will immediately start vehicle identification.
1.8. Enter the vehicle description by following the on-screen instructions based on stamped VIN or affixed VIN plate on the vehicle.
1.9. During obtaining information, the Tech 2 is receiving information from any modules at the same time. But only engine control module (ECM) information is displayed on the screen if ECM is programmable.
1.10. Turn OFF all accessories and select Continue.
1.11. Verify that the correct VIN is entered on the Tech 2. If the VIN is incorrect, write down the correct VIN.

2. Turn OFF the Tech 2.
3. Disconnect the Tech 2 from the vehicle.
4. Turn OFF the ignition.
5. Transfer the data from the terminal to the Tech 2 using the following procedure:

Important:
The TIS supports service programming with the Tech 2 scan tool only.

5.1. Connect the Tech 2 to the terminal.
5.2. Launch the TIS application at the terminal.
5.3. Select the Service Programming System at the main screen.
5.4. Highlight the following information on the Select Diagnostic Tool and Programming Process screen:
- Select Diagnostic Tool-Select Tech 2.
- Select Programming Process-Identify whether an existing TCM is being reprogrammed or a TCM is being replaced with a new one.
- Select TCM Location-Select Vehicle.

5.5. Select Next.
5.6. Verify the connections on the Preparing for Communication screen and select Next.
5.7. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen and select Next.

Important:
If the TCM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the TCM from another vehicle is installed, input correct VIN by same way.

5.8. Highlight Engine on the System Type screen and select Next, if requested.
5.9. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until Next is highlighted:
- Model
- Model Year
- Engine
- System Type
- Model Designator

5.10. Select Next.
5.11. Verify your selection on the Summary screen.

Important:
Refer to Service Bulletins before service programming is performed if the bulletins are listed along with the calibration files.

Important:
Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the TCM and reprogramming with the same download is not allowed.

5.12. Select Reprog.
5.13. The Transfer Data screen will appear until the progress bar reaches 100%.

6. Close the application and return to the TIS application selection screen after the download is complete.
7. Turn OFF the Tech 2.
8. Disconnect the Tech 2 from the terminal.
9. Transfer the data from the Tech 2 to the TCM using the following procedure:
9.1. Connect the Tech 2 to the vehicle DLC, with the engine and the Tech 2 OFF.
9.2. Turn ON the Tech 2.
9.3. Press Enter at the Title screen.
9.4. Turn ON the ignition, with the engine OFF.

9.5. Select Service Programming System.
9.6. Select the Program TCM on the Tech 2.
9.7. Follow the on-screen instructions and select Continue.
9.8. Programming in Process will appear until the progress bar reaches 100%.

Important:
Some warning lamp may turn ON or blink while programming the TCM since communication between the TCM and other modules are interrupted. Clear DTC in any module after programming.

9.9. Select Continue and exit the program after the Tech 2 displays Programming Was Successful.
10. Turn OFF the ignition.
11. Turn OFF the Tech 2.
12. Disconnect the Tech 2 from the vehicle.

Service Programming System (SPS) (Pass-Thru Procedure)

Pass-Thru programming allows the Tech 2 to remain connected to the terminal and to the vehicle throughout the programming process. The vehicle must be in close proximity to the terminal while using Pass-Thru.

Important:
The TIS supports service programming with the Tech 2 scan tool only.

1. Launch the TIS application at the terminal.
2. Select the Service Programming System at the main screen.
3. Highlight the following information on the Select Diagnostic Tool and Programming Process screen:
   - Select Diagnostic Tool-Select Pass-Thru
   - Select Programming Process-Identify whether as existing transmission control module (TCM) is being reprogrammed or a TCM is being replaced with a new one.
   - Select TCM Location-Select Vehicle.
4. Select Next.
5. Complete all vehicle data on the Preparing for Communication/Determine Vehicle screen until Next is highlighted.
6. Select Next.
7. Follow the instruction on the Preparing for Communication screen.

Important:
In order to reduce the potential for signal loss, the RS-232 cable should not be more than 25 feet long.

8. Select Next.
9. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen and select Next.

Important:
If the TCM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the TCM from another vehicle is installed, input correct VIN by same way.

10. Highlight Engine on the System Type screen and select Next, if requested.
11. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until Next is highlighted:
    - Model
    - Model Year
    - Engine
    - System Type
    - Model Designator
12. Select Next.
13. Verify your selection on the Summary screen.

Important:
Refer to Service Bulletins before service programming is performed if the bulletins are listed along with the calibration files.

Important:
Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the Tech 2 and reprogramming with the same download is not allowed.

14. Select Reprog.
15. The Transfer Data screen will appear until the progress bar reaches 100%.

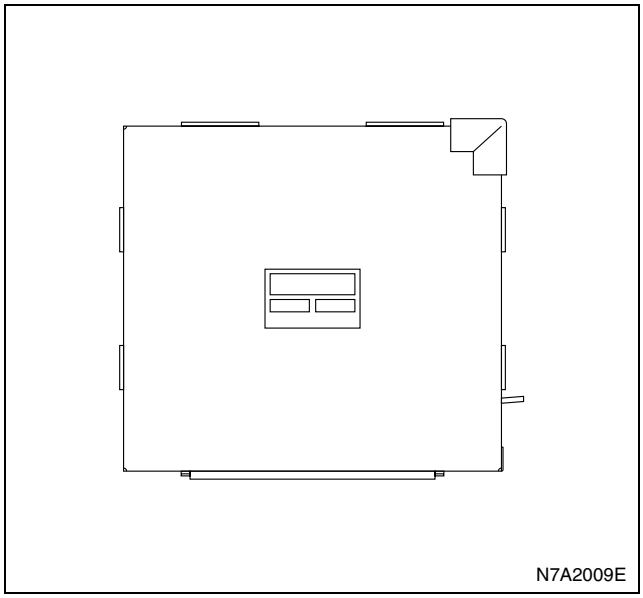
Important:
Some warning lamp may turn ON or blink while programming the TCM since communication between the TCM and other modules are interrupted. Clear DTC in any module after programming.

16. Select Close on the Programming Complete screen.
17. Turn OFF the Tech 2.
18. Disconnect the Tech 2 from the vehicle.

Description and Operation

Transmission Control Module (TCM) Description

The TCM constantly monitors the information sent from various sensors and controls the solenoid valves and other systems. The TCM controls the output circuits by controlling the ground or power supply circuit through a transistor and other devices. The TCM performs the diagnostic function of the system, detects operational problems of the system, warns the driver with a Smoother warning lamp and buzzer and memorizes DTC (diagnostic trouble codes). It also has a system backup function when trouble occurs.



N7A2009E

TCM and Components

The TCM is designed to provide outstanding driveability and fuel efficiency. The TCM monitors the transmission and other vehicle functions using operational information it obtains via various speed sensors, switches, magnetic (solenoid) valves, etc.

TCM Voltage Descriprion

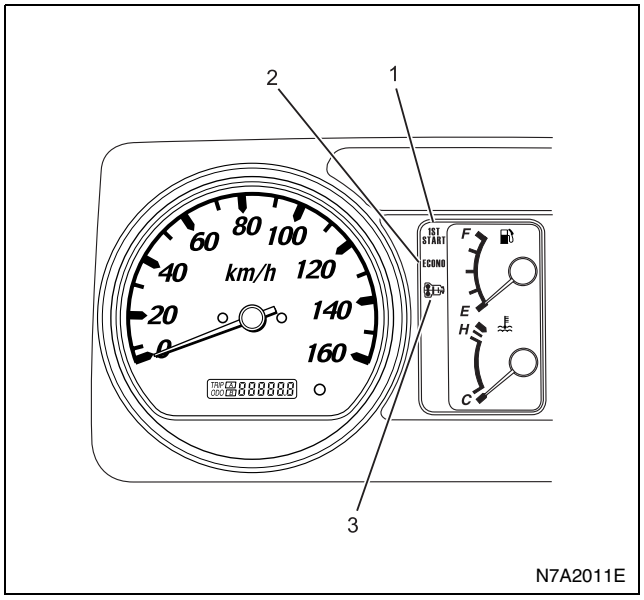
The TCM impresses reference voltage to various switches and sensors. The TCM is able to impress voltage like this because the TCM resistance value is very high, and the voltage actually applied to the circuit is low. The test light may not light, even when it is connected to the circuit. The voltmeter usually used in a service shop may not indicate a correct reading because its input impedance is too low. A digital voltmeter whose input impedance is at least 10 MΩ (e.g. 5-8840-2691-0) should be used to obtain a correct voltage reading. The input/output devices of the TCM have an analog-digital converter, a signal buffer, a counter, a special driver, etc. The TCM uses an electrical switch to control most of the components.

Important:
Replacement TCM must be programmed and learned.

Transmission Control Component Description

1st Gear Start Indicator Lamp

When the 1st gear start switch is “ON”, the lamp lights.



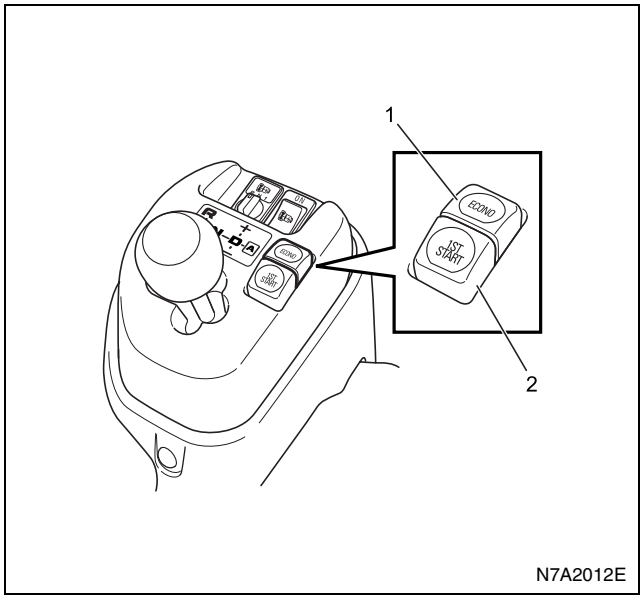
N7A2011E

Legend

1. 1st Gear Start Indicator Lamp
2. Economy Mode Indicator Lamp
3. Transmission Warning Lamp

1st Gear Start Switch

Turning on the 1st gear start switch causes the normal start gear (2nd) to change to 1st gear. This can be used when power is required due to payload and inclines.



Legend

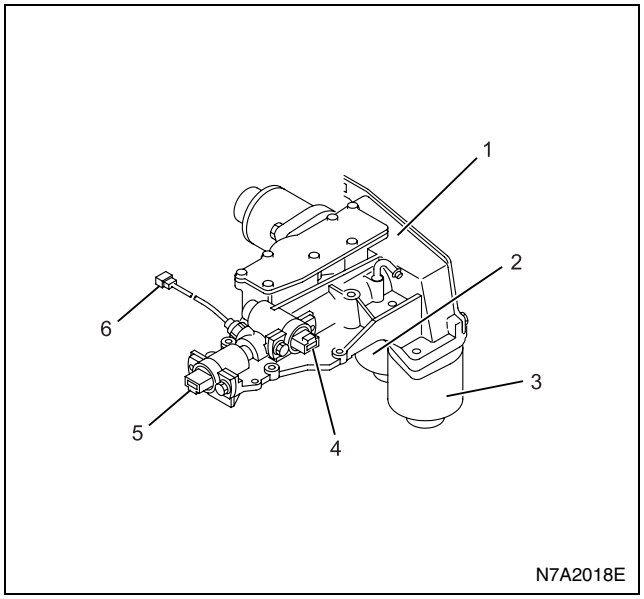
1. Economy Mode Switch
2. 1st Gear Start Switch

1-3-5 Shift Solenoid Valve

This shift solenoid valve is installed in the shift control box. The shaft inside the solenoid operates during shifting and the shift operation is performed.

2-4-6-R Shift Solenoid Valve

This shift solenoid valve is installed in the shift control box. The shaft inside the solenoid operates during shifting and the shift operation is performed.

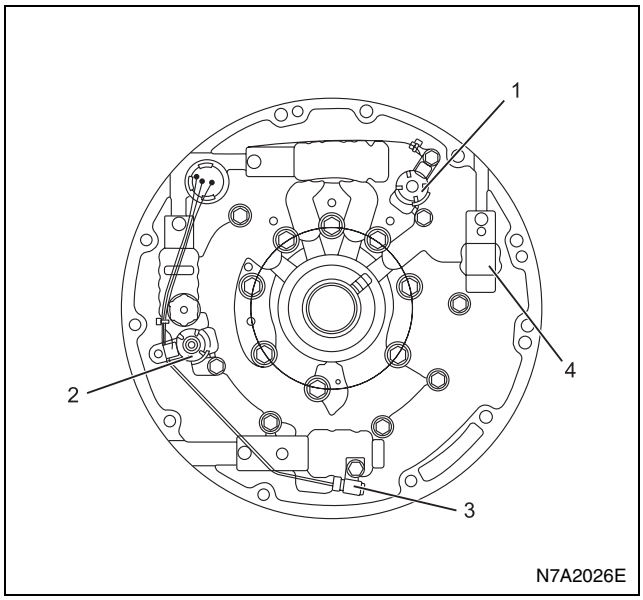


Legend

1. Gearshift Control Box
2. 1-3-5 Shift Solenoid Valve
3. 2-4-6-R Shift Solenoid Valve
4. Gear Select Positin Sensor
5. Gear Shift Position Sensor
6. Neutral Switch

Transmission Fluid Temperature (TFT) Sensor

The transmission fluid temperature (TFT) sensor is used to detect the clutch fluid temperature inside the transmission. Clutch fluid temperature is determined by detecting changes in thermistor resistance.

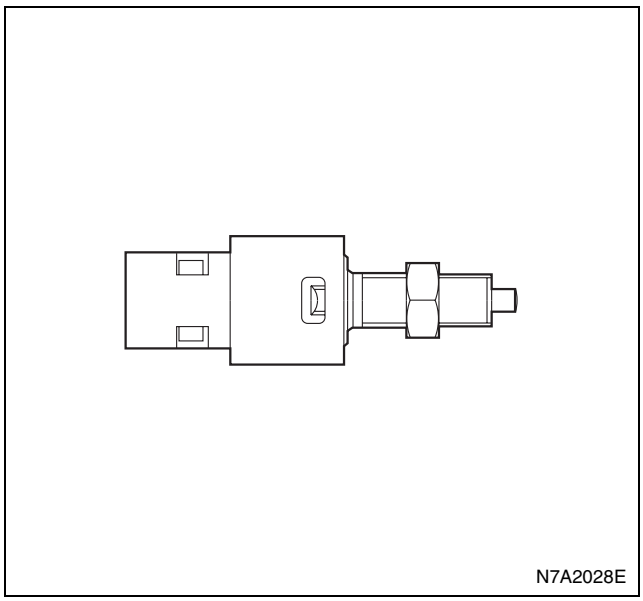


Legend

1. Lock Up Clutch Solenoid Valve
2. Gearshift Clutch Solenoid Valve
3. Transmission Fluid Temperature (TFT) Sensor
4. Bypass Valve

Brake Switch

The brake switch is used to detect brake pedal depression. The transmission control module (TCM) interprets the condition when the brake switch is on (contact closed) as the brake pedal being pressed.

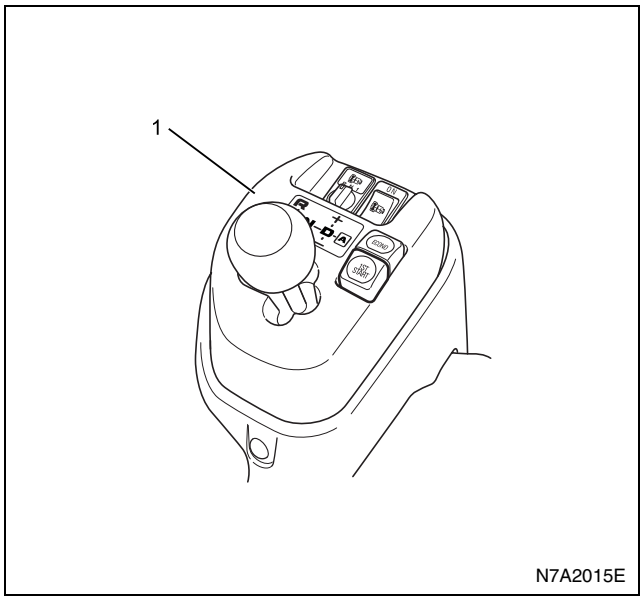


Buzzer

The buzzer sounds when trouble is detected in the Smoother system, when learning is being performed, when shift control is prohibited, etc.

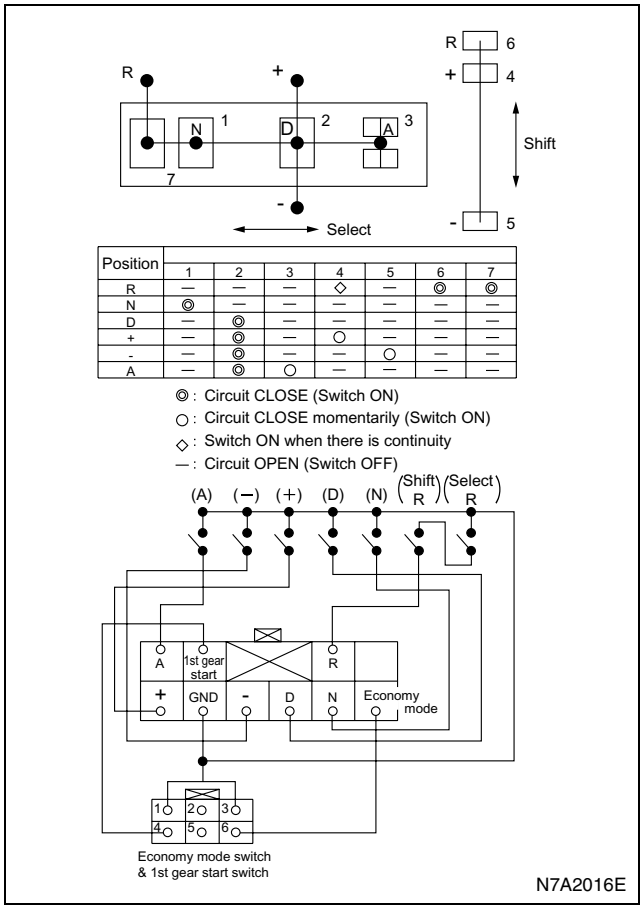
Selector Lever Unit

The selector lever unit is used during selector lever operation to communicate the lever position to the TCM, for shift control, etc. The change lever unit also has a position detection switch built in.



Legend

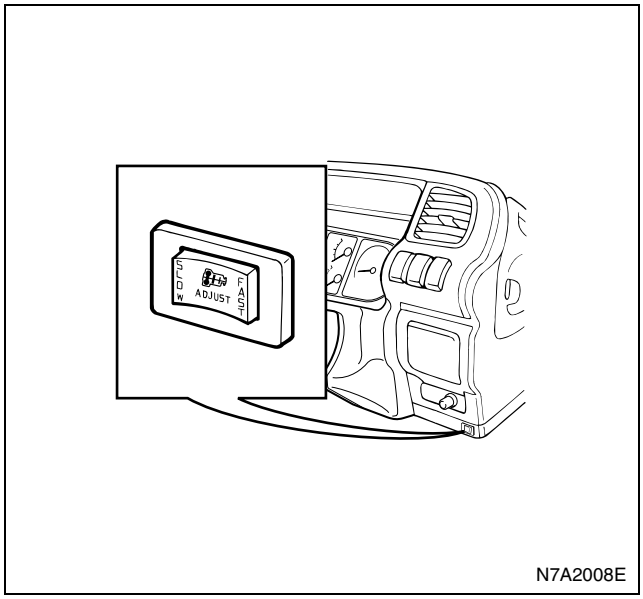
1. Selector Lever Unit



N7A2016E

Half-clutch Adjustment Switch

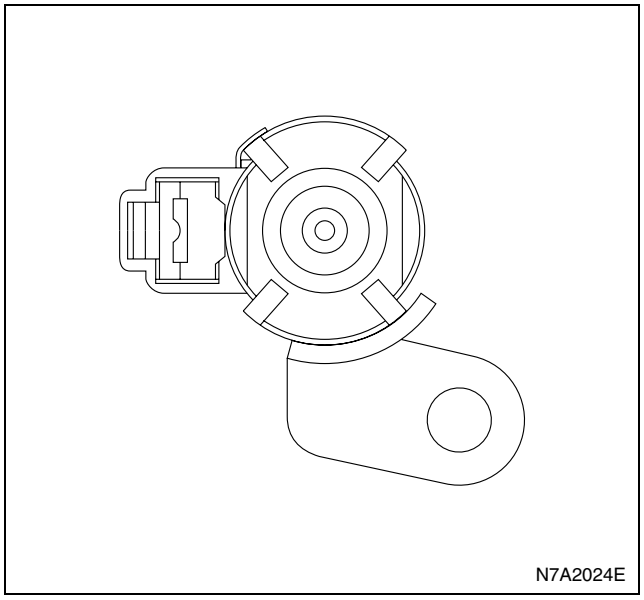
The half-clutch adjustment switch is used to adjust the half-clutch point.



N7A2008E

Geagshift clutch Solenoid Valve

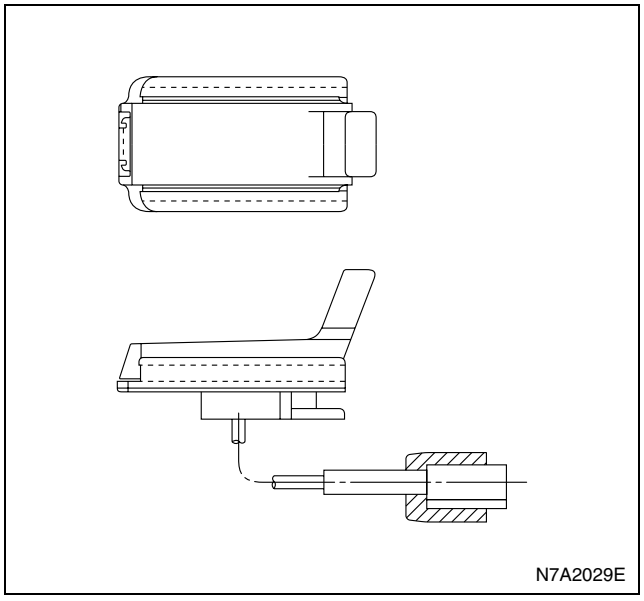
The gearshift clutch solenoid valve is installed in the oil pump. It operates during shifting, and when the gearshift clutch is engaged or disengaged.



N7A2024E

Door Switch

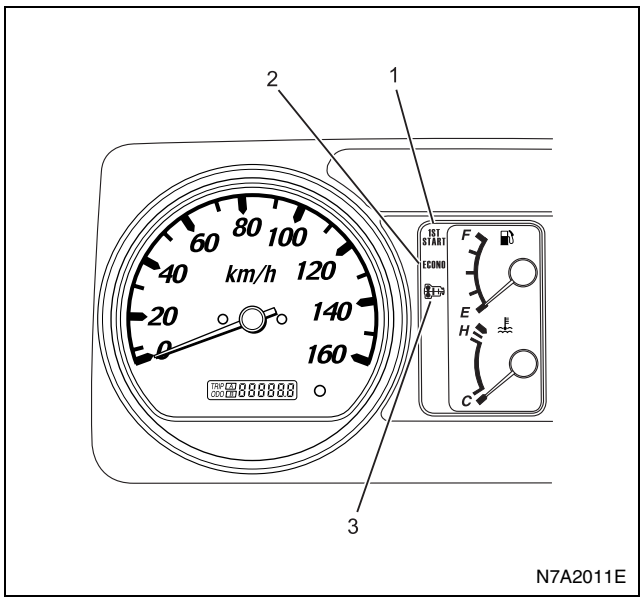
The door switch is used to detect the door open/closed condition. The transmission control module (TCM) interprets the condition when the door switch is on (contact closed) as door open.



N7A2029E

Economy Mode Indicator Lamp

When the economy mode switch is “ON” during automatic shifting, the lamp lights. The lamp is out in the normal mode.

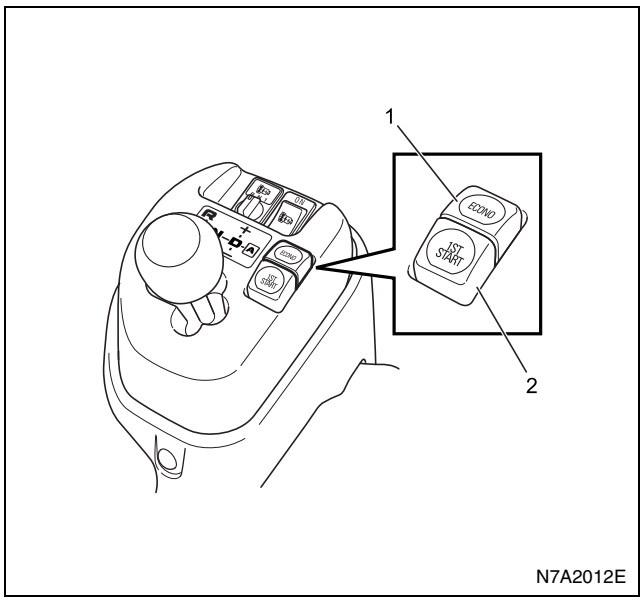


Legend

1. 1st Gear Start Indicator Lamp
2. Economy Mode Indicator Lamp
3. Transmission Warning Lamp

Economy Mode Switch

Automatic shift control characteristics are switched by the switch position. If you want to conserve fuel while running in the normal mode, press the switch to change to the economy mode. In the economy mode, the shift timing is earlier than in the normal mode.



Legend

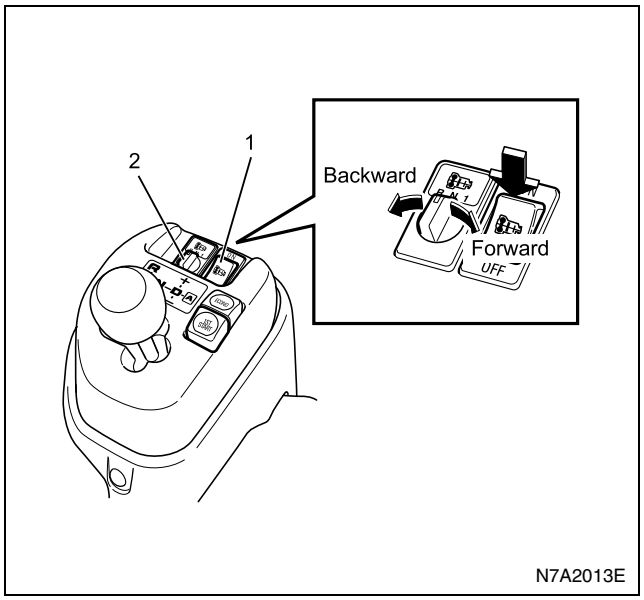
1. Economy Mode Switch
2. 1st Gear Start Switch

Emergency Shift Switch

The emergency switch is used when there is a problem with the Smoother system. When the emergency switch is ON, the emergency shift switch can be operated to shift gears to R, N, or 1.

Emergency Switch

The emergency switch is used when there is a problem with the Smoother system. Normally the emergency switch should be left in the OFF position. Turning on the emergency switch allows the engine to be started regardless of the transmission gear position, and enables the emergency shift switch.

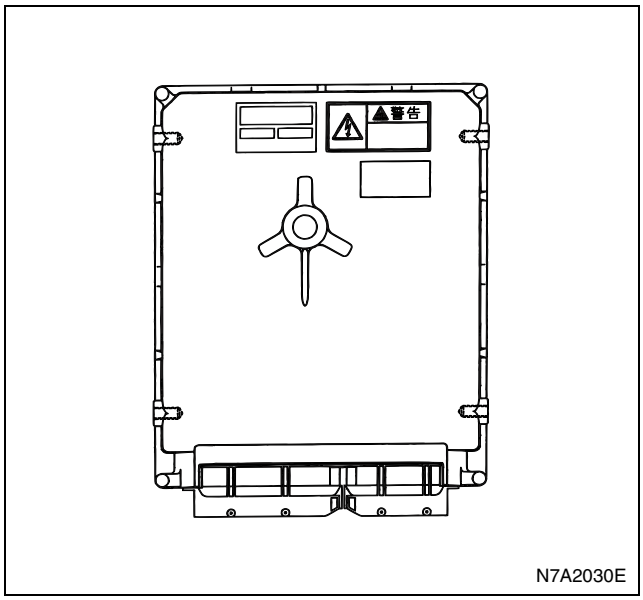


Legend

1. Emergency Switch
2. Emergency Shift Switch

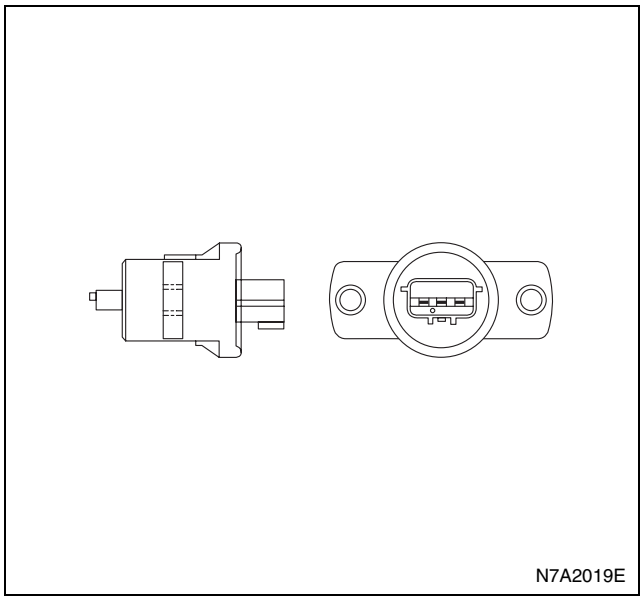
Engine Control Module (ECM)

The engine control module (ECM) uses CAN communication to send and receive engine speed, accelerator opening angle, vehicle speed, and switch signals.



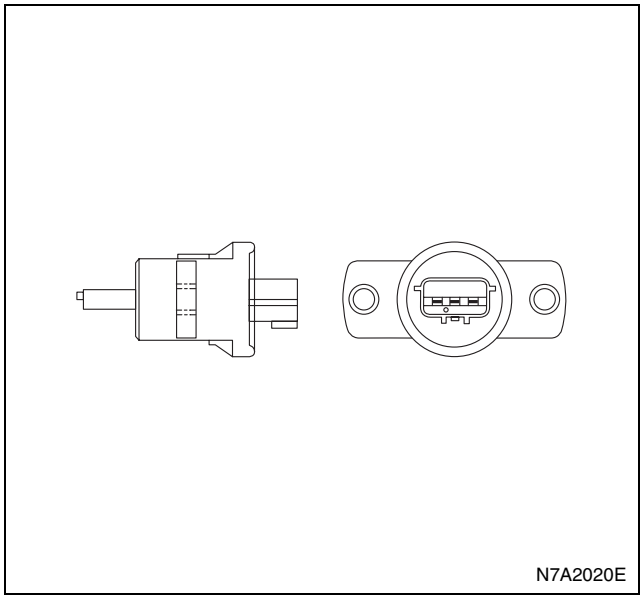
Gear Shift Position Sensor

The gear shift position sensor is the hall IC type sensor and is installed to shift control box. It detects the shift stroke amount of T/M and outputs to transmission control module (TCM).



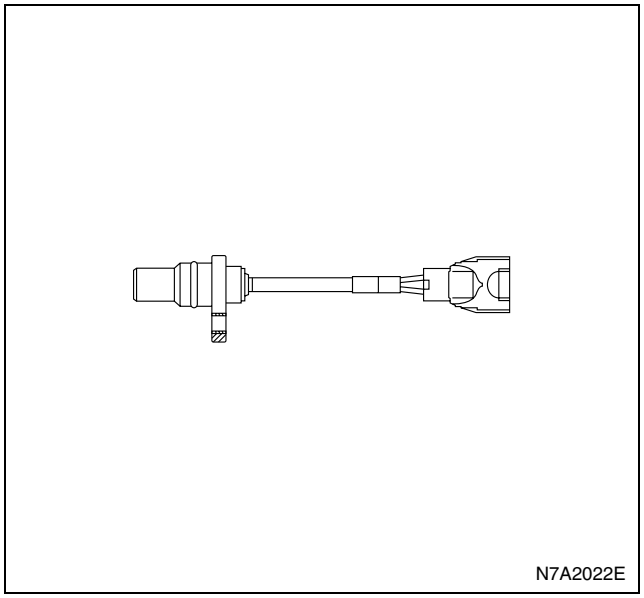
Gear Select Position Sensor

The gear select position sensor uses a hall IC type sensor to detect the shift stroke of the T/M installed in the shift control box, and outputs to the transmission control module (TCM).



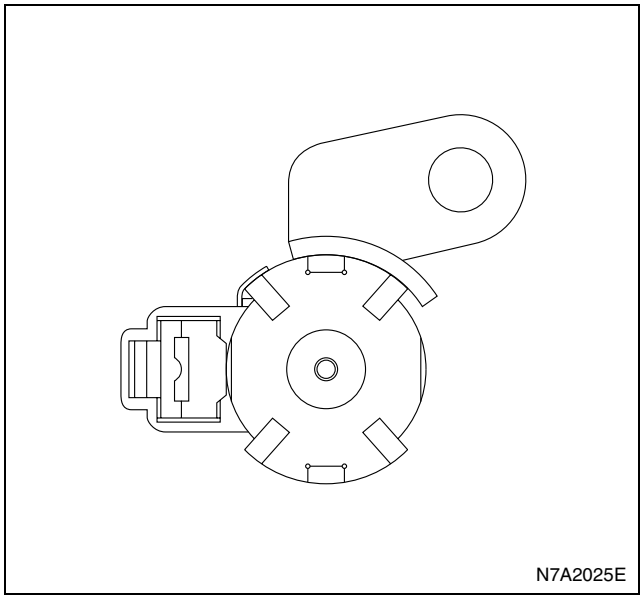
Input Shaft Speed Sensor

The input shaft speed sensor is a pickup type sensor installed in the transmission, which generates a signal when it is passed by the input shaft pulser. The input shaft speed sensor signal is used for gear shift control (lockup control, clutch control, etc.) based on signals input from the turbine speed sensor, vehicle speed sensor, etc.



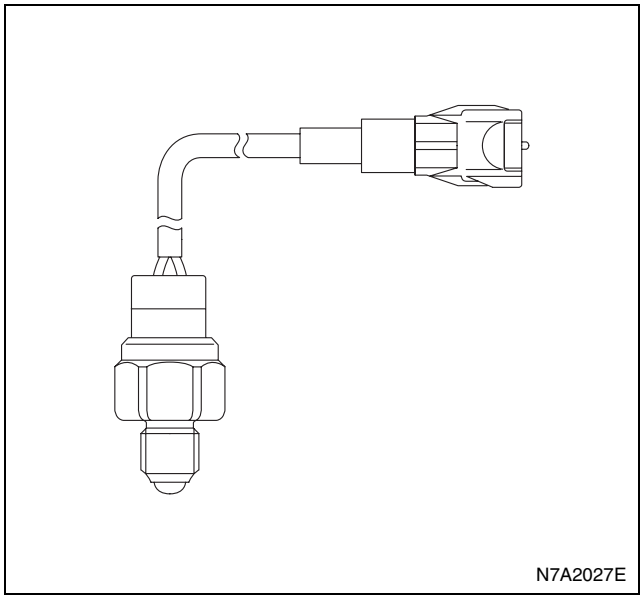
Lock up Clutch Solenoid Valve

The lock up clutch solenoid valve is installed in the oil pump. It operates in response to engine speed and fluid coupling operation.



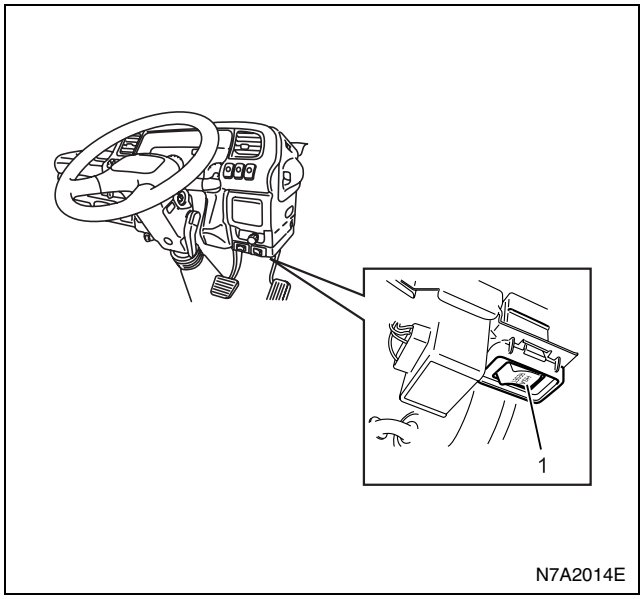
Neutral Switch

The neutral switch is installed in the gearshift control box, and it used to detect when the transmission is in neutral. The transmissin control module (TCM) interprets the condition when the neutral switch is on (contact closed) as neutral gear.



Reset Switch

The reset switch is used during transmission position learning and clutch position learning, or to clear DTC/ Smoother learning values.

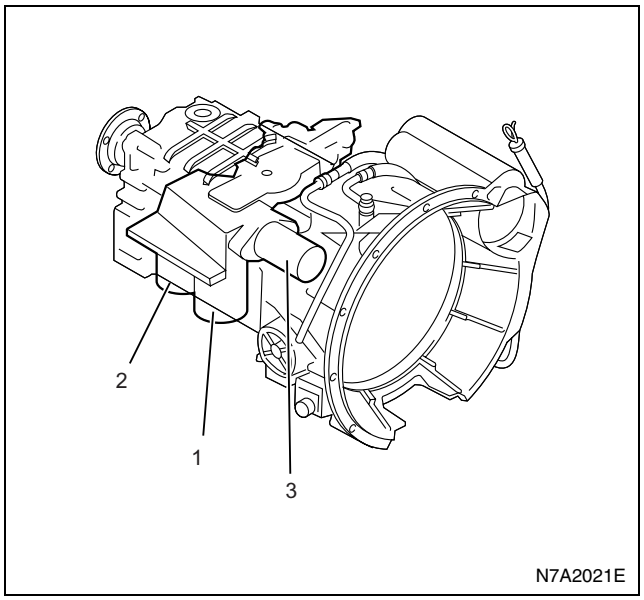


Legend

1. Reset Switch

Select Solenoid Valve

This select solenoid valve is installed in the gearshift control box. The shaft inside the solenoid operates during shifting and the select operation is performed.

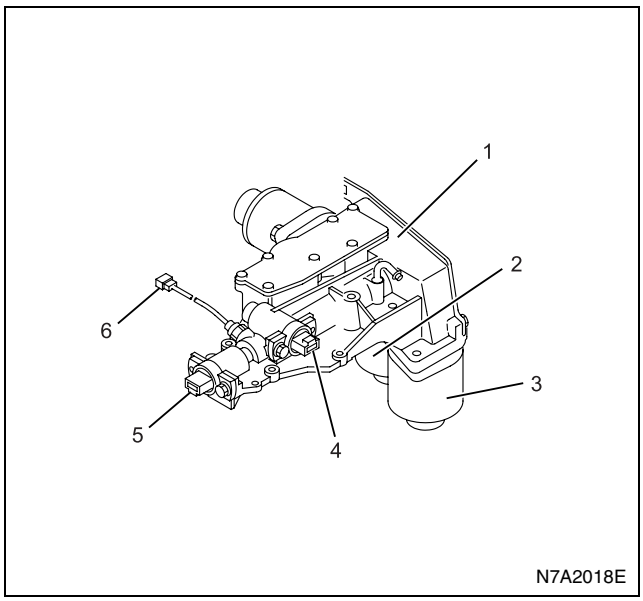


Legend

1. 1-3-5 Shift Solenoid Valve
2. 2-4-6-R Shift Solenoid Valve
3. Select Solenoid Valve

Gearshift Control Box

The gearshift control box has shift solenoids (two), a select solenoid (one), a gear shift position sensor, and a gear select position sensor, and performs shift operations (control) in accordance with signals from the transmission control module (TCM).

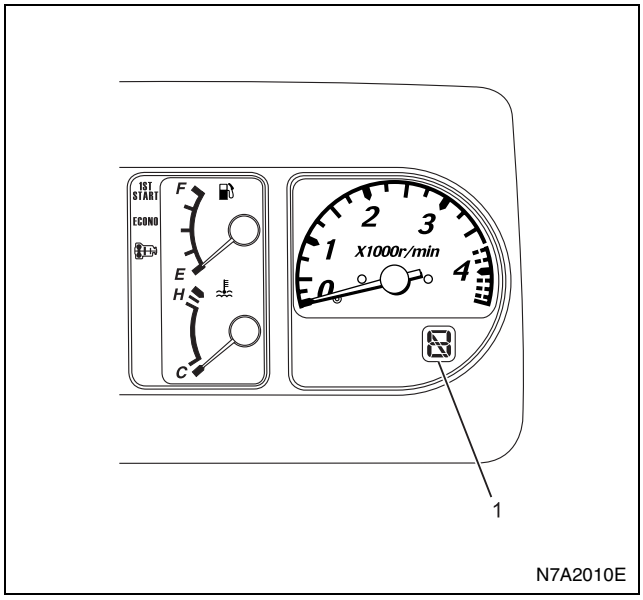


Legend

1. Gearshift Control Box
2. 1-3-5 Shift Solenoid Valve
3. 2-4-6-R Shift Solenoid Valve
4. Gear Select Positin Sensor
5. Gear Shift Position Sensor
6. Neutral Switch

Gear Position Indicator

The gear position indicator indicates the transmission gear position as detected by the TCM. The gear position indicator is installed within the instrument panel cluster (IPC).



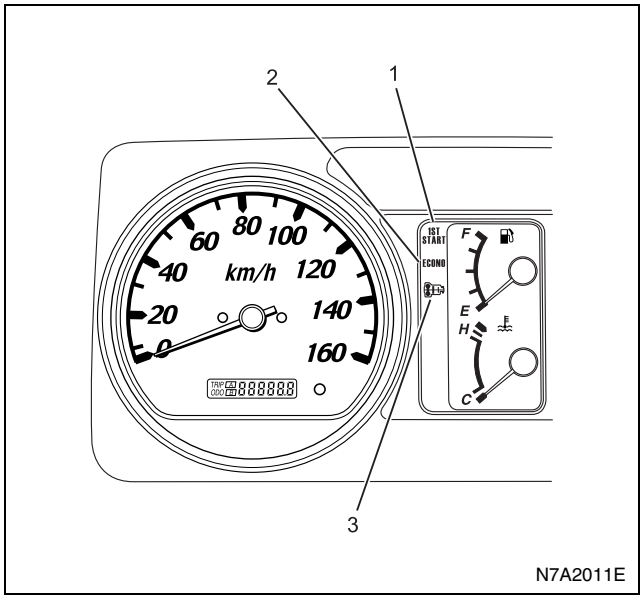
Legend

1. Gear Position Indicator

Transmission Warning Lamp

The transmission warning lamp lights or blinks when the following conditions occur.

- If trouble is detected by the system during normal running, the lamp lights or blinks.
- The warning lamp blinks when the emergency switch is on.
- If the Smoother system transmission fluid temperature rises to an abnormal level during normal running, the lamp blinks.
- The lamp blinks during learning.

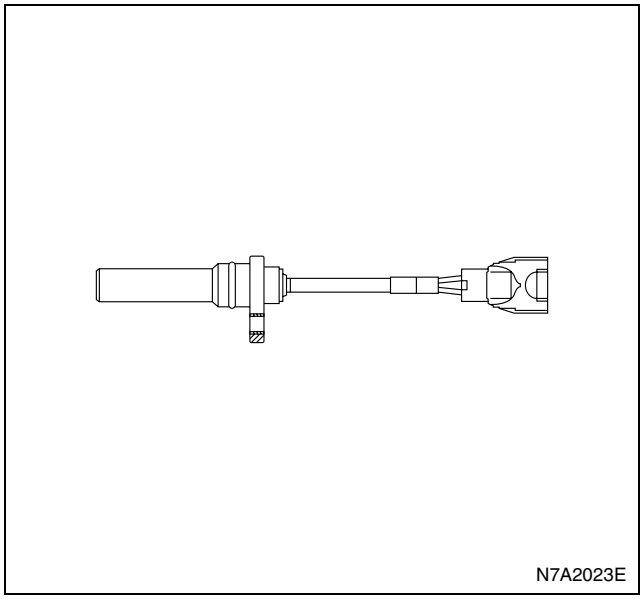


Legend

1. 1st Gear Start Indicator Lamp
2. Economy Mode Indicator Lamp
3. Transmission Warning Lamp

Turbine Speed Sensor

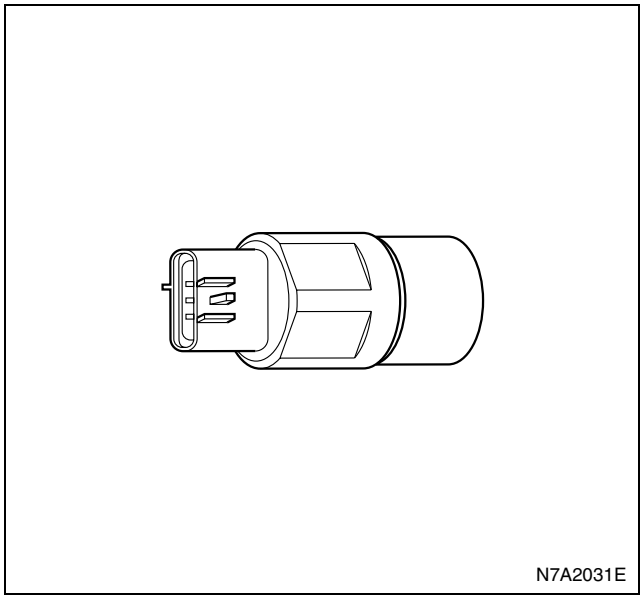
The turbine speed sensor is a pickup type sensor installed in the transmission, which generates a signal when it is passed by the turbine pulser. The turbine speed sensor signal is used for gear shift control (lockup control, clutch control, etc.) based on signals input from the input shaft speed sensor, vehicle speed sensor, etc.



N7A2023E

Vehicle Speed Sensor

The vehicle speed sensor is installed in the transmission. The vehicle speed sensor signal is obtained from the ECM using CAN communication.

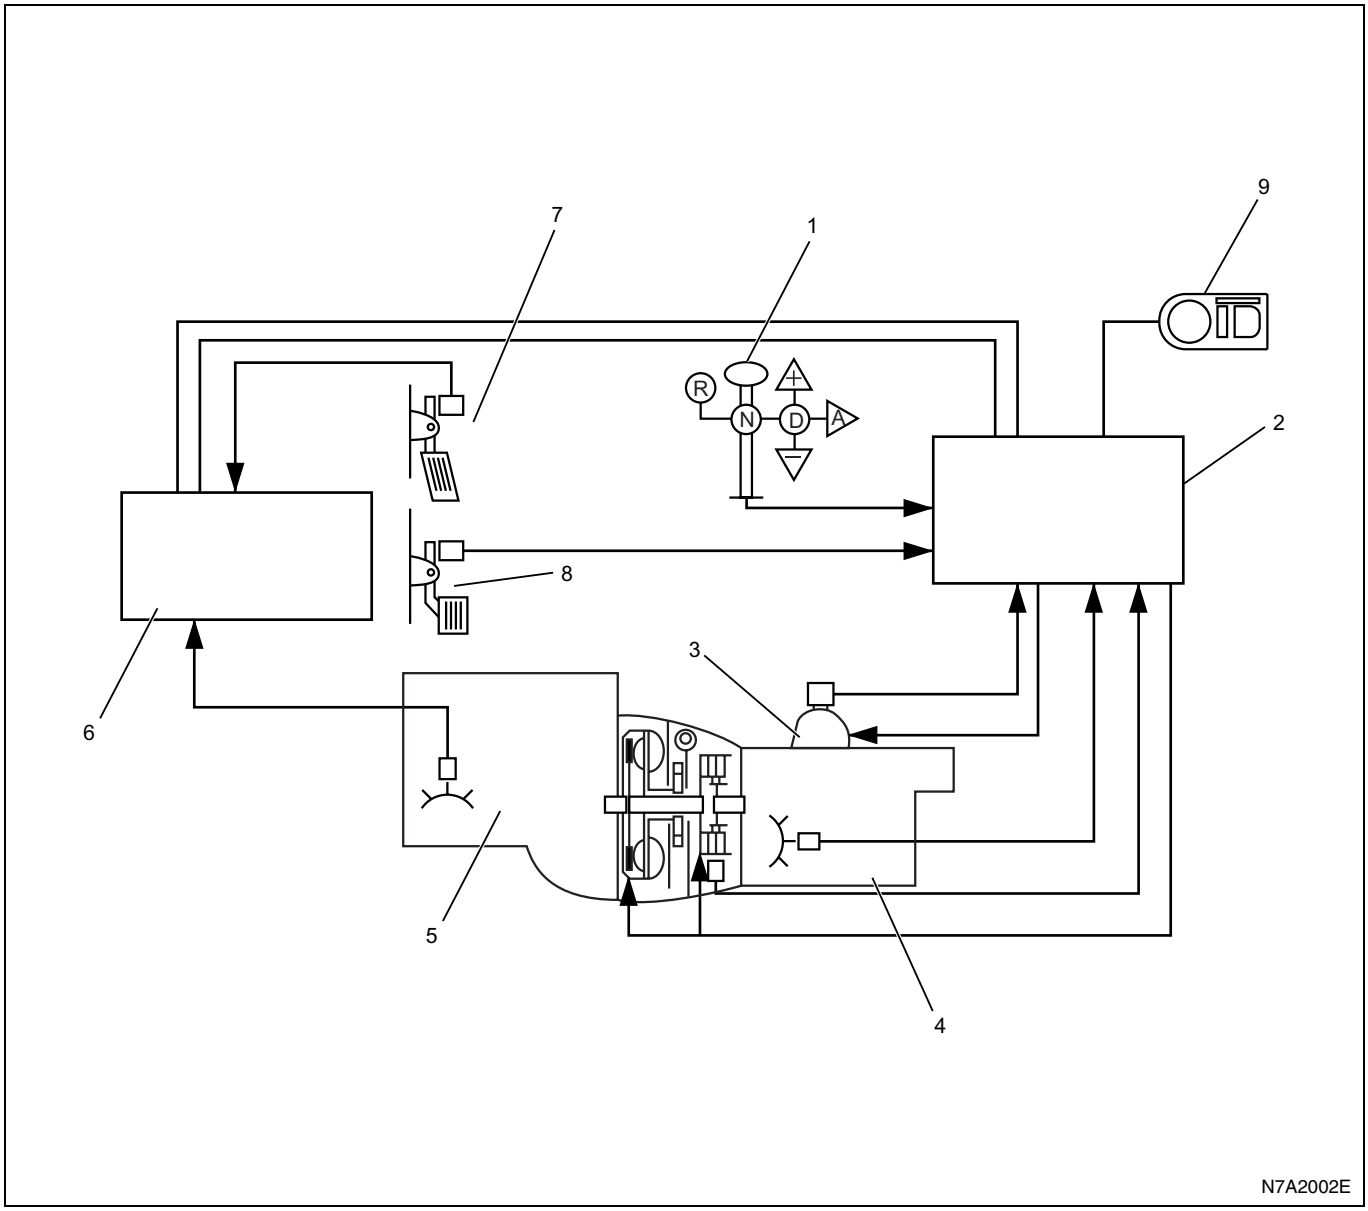


N7A2031E

Smoother System Description

Smoother System Overview

“Smoother” is the name of a new-generation drive train that provides benefits in terms of both life cycle costs (low initial cost and maintenance cost, lower fuel consumption, etc.) and easy driving. Smoother is a system that adds an automatic transmission to the existing Smoother, for even better fuel consumption and easier driving. This is accomplished by installing a solenoid system gearshift control box on the Smoother, which combines a manual transmission with fluid coupling, so all shifting is performed automatically in accordance with signals from the transmission control module (TCM). When starting moving the vehicle, depressing the brake pedal and operating the change lever as on an automatic vehicle causes a selector lever position signal to be detected by the TCM. This actuates the gearshift control box solenoid and shifts the gear into the starting position or the reverse position, and then engages the shift change clutch (gearshift). (After the shift clutch engages, creep force is generated the same as on an AT vehicle.) Releasing the foot from the brake pedal and pressing the accelerator pedal starts the vehicle moving forward. If there is an up-shift or down-shift while running, the control unit determines the vehicle status based on vehicle speed, accelerator opening angle, and other factors, and shifts to the optimal gear automatically. If the driver movers the change lever in the “+” or “–” direction, a gear change is indicated, so sequential manual shifting is also possible. (Even during sequential manual shifting, the transmission shifts to the starting position when the vehicle is stopped.)



Legend

8. Brake Signal
9. Instrument Panel Cluster (Lamps, Indicators)

About Control

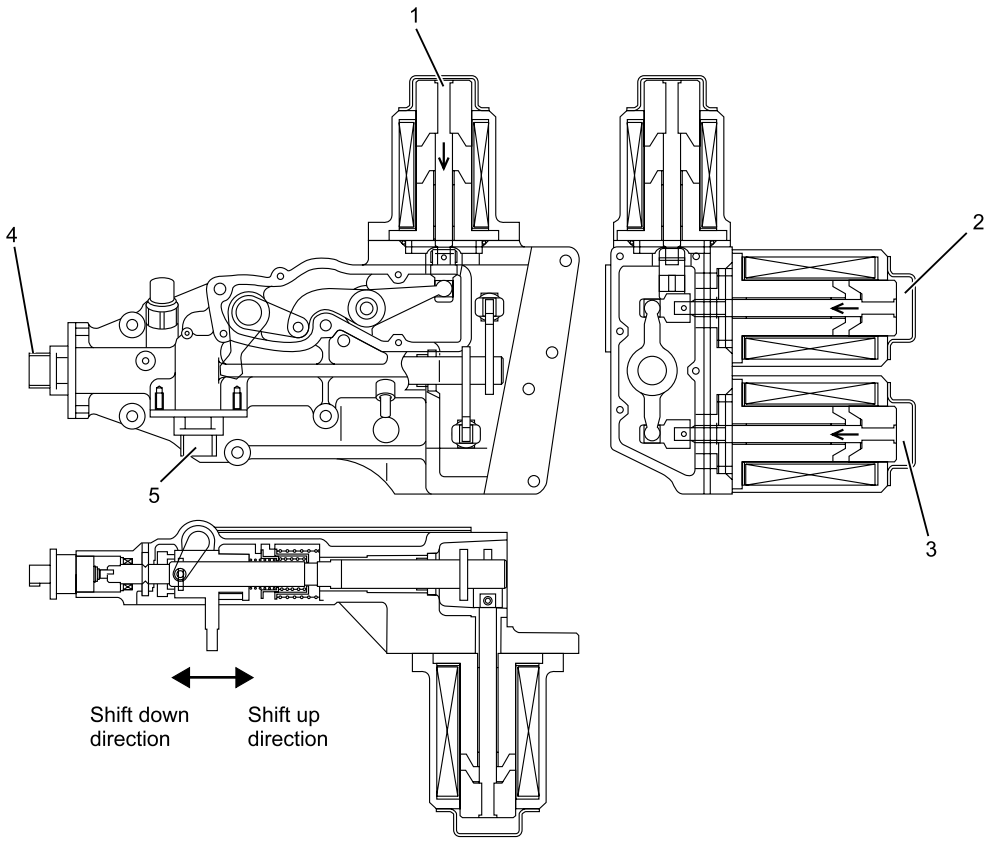
The transmission control module (TCM) has the following functions, which perform various types of control.

1. Transmission shift control
   Shift control is performed automatically as required by vehicle conditions, shift mode, 1st gear start, etc. Shift control is performed by controlling the change lever, shift control box assembly, etc. (Manual operation is also supported, and the driver's intentions are giving top priority.)
   - Shift up, shift down control
   - Shift clutch control
   - Lockup clutch control
   - Engine speed control
   - 1st gear start control
2. Running mode control
   Shift control is change automatically in accordance with the selected mode, and switches between fuel economy mode and normal mode. There are two modes: NORMAL mode and ECONO mode.

3. Starter inhibitor control
   Neutral control and other control are performed when the engine is being started.
4. PTO control
   Shift control is performed for PTO gear operation.
5. Emergency system control
   Control is performed to enable engine start and vehicle movement when system trouble is detected.
6. Inter-TCM communication
   Communication is performed with the engine control module (ECM) and other devices, and information transfer required for control is also performed.
7. Self-diagnosis function
   DTC are used to perform various tests to identify the location of trouble and communication is performed with scan tool, the DTC are confirmed, etc.
8. Information functions (indicator, lamp, buzzer control)
   Gear position indicators show the current gear position of the transmission, information lamps indicate operation of each function, and a buzzer alerts the driver to function operations, etc.
9. Half-clutch adjustment function
   The half-clutch position can be adjusted by operating a clutch adjustment switch.

Transmission Shift Control

Based on control signals from the selector lever unit, gearshift control box solenoids (shift, select) are controlled in accordance with engine speed, transmission turbine speed, input shaft speed, vehicle speed, accelerator opening angle, and other factors to perform the shift operation.

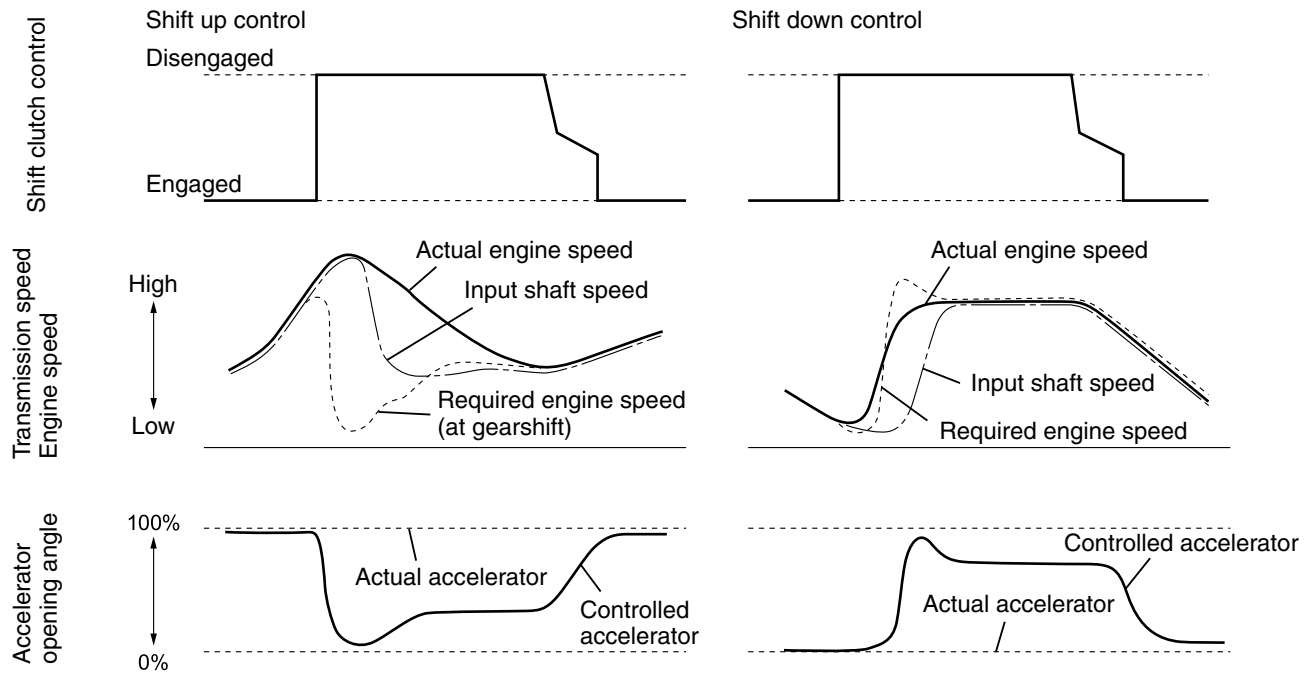


Legend

1. Select Solenoid Valve
2. 1-3-5 Shift Solenoid Valve
3. 2-4-6-R Shift Solenoid Valve
4. Gear Shift Position Sensor
5. Gear Select Position Sensor

About Shift Up, Shift Down Control

Shift up/shift down is performed when the selector lever position (mode) is “D”, and an automatic shift or selector lever operation is performed in the “+” direction or “–” direction. Basically, shift clutch control and shift control are performed based on engine speed, input shaft speed, accelerator opening angle, etc.



About Shift Clutch Control

Clutch solenoid valves are controlled so fluid pressure operates the clutch assembly piston, which operates the gearshift clutch to disengage and engage the clutch.
The clutch is disengaged while in neutral, and operates before shifting and after shift control is complete.
When ATF temperature is low (up to 20°C [68°F]), the clutch engages in order to warm up the engine.

About Lockup Clutch Control

While running at or above a preset speed, the lockup clutch engages in order to perform control that eliminates engine power transmission loss.

- Lockup clutch engagement control
  In 2nd and higher gears, the lockup clutch engages when the following conditions are satisfied: shift clutch is engaged, input shaft speed is 900 to 1500 rpm (vehicle speed depends on gear position), etc.
  In the case of Rev or 1st gear, the lockup clutch does not engage.
- Lockup clutch disengagement control
  The lockup clutch disengages when the following conditions are satisfied: input shaft speed is 900 to 1500 rpm (input shaft speed depends on gear position), etc.

About Engine Speed Control

When the clutch is released (for shifting, etc.), a request for engine speed change is sent to the engine control module (ECM), and engine blowup and deterioration of feeling (shift shock etc.) are prevented.

1st Gear Start Control

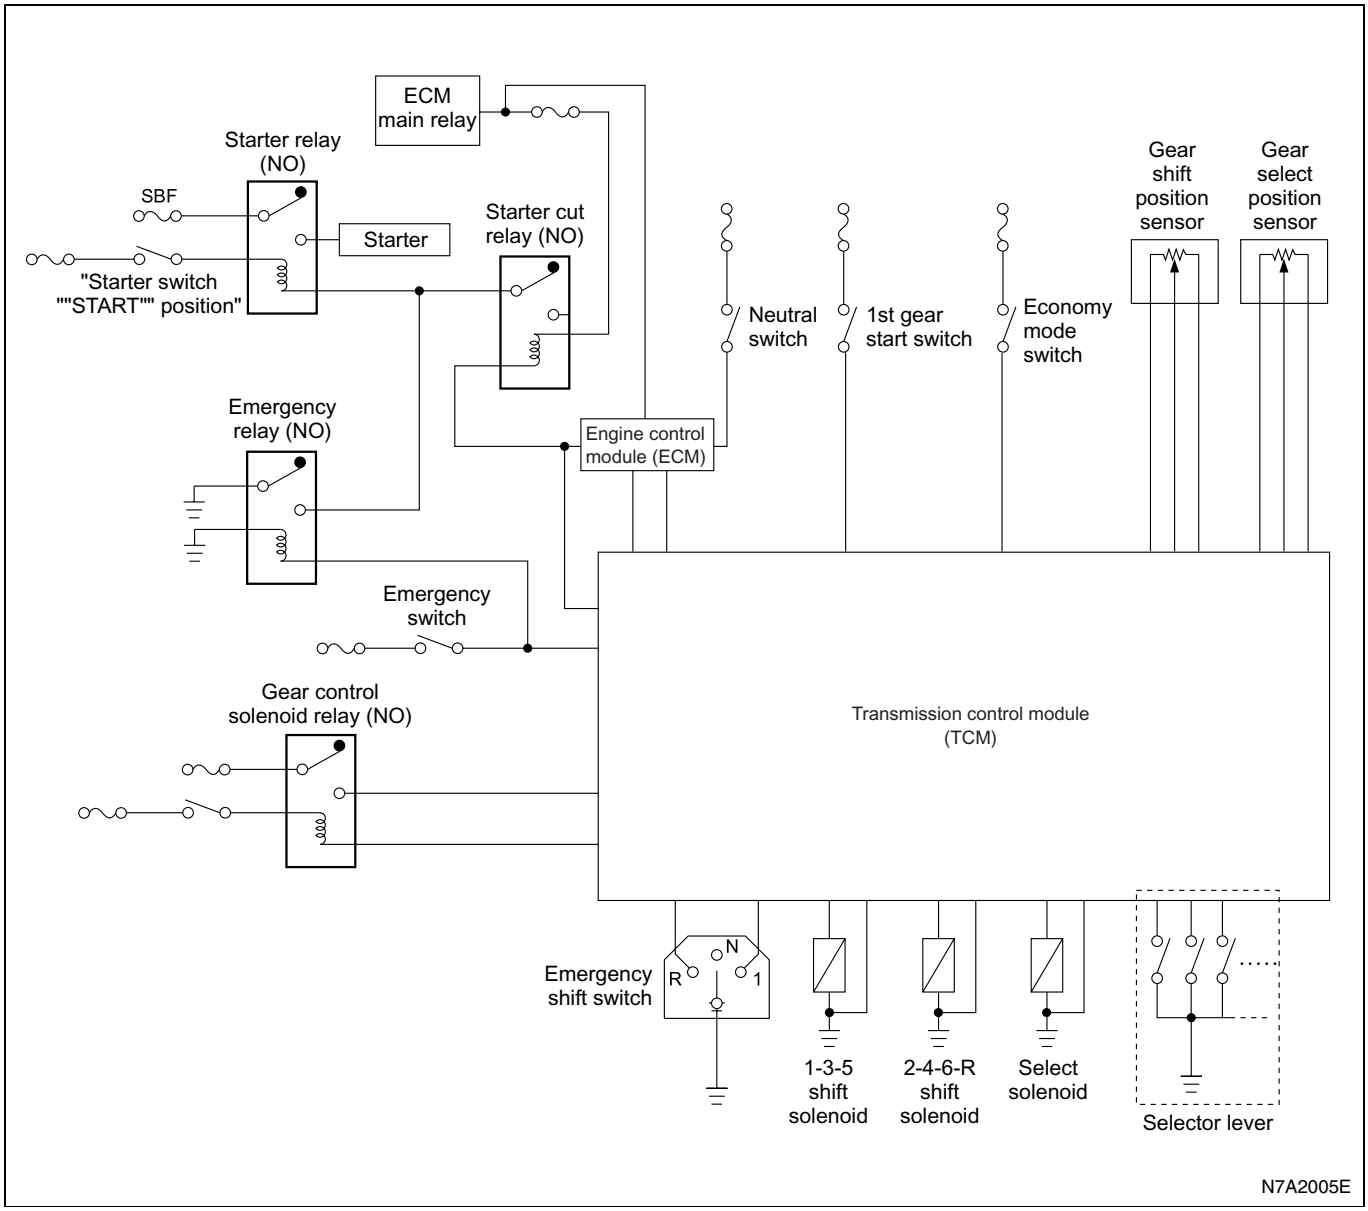
Turning on the 1st gear start switch causes the normal start gear (2nd) to change to 1st gear. This can be used when power is required due to payload and inclines.

Running Mode Control

Shift control is change automatically in accordance with the selected mode, and switches between fuel economy mode and normal mode. There are two modes: NORMAL mode and ECONO mode.

Starter Inhibitor Control

Starter inhibitor control makes it impossible to start the engine when the selector lever is in any position other than neutral.



PTO Control

PTO mode ON/OFF control is performed in accordance with the PTO switch input gear position, parking brake switch, and other inputs.

Determination of PTO control is possible

- Gear: Neutral
- Vehicle speed: Stopped
- PTO switch: ON
- Engine speed: Running (idling)
- Accelerator opening angle: OFF (idling)
- Parking brake: ON

Determination of PTO control is possible

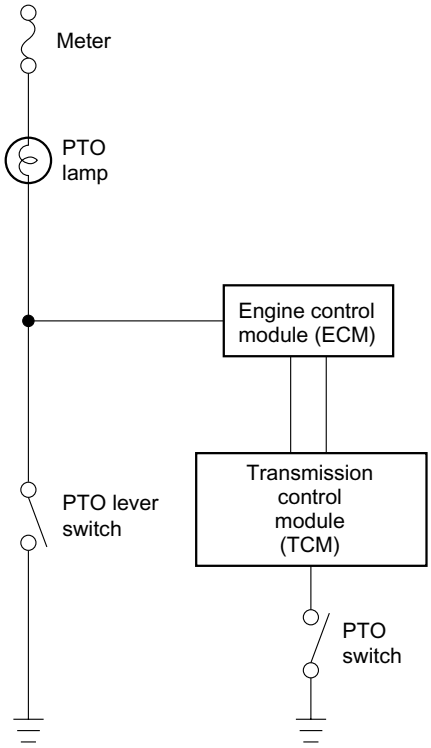
- PTO switch: OFF
- Engine stopped
- Selector lever operation during PTO operation
- In neutral, vehicle speed is greater than 20 km/h (12 MPH)
- Emergency switch: ON

Shift Control Limit

Automatic shifting prohibited while vehicle is running.

About The Starting Gear

The starting gear can be selected from among 1, 2 and Rev, and shifting from the starting gear is not possible. (The starting gear is fixed. However, shifting to neutral is possible.)

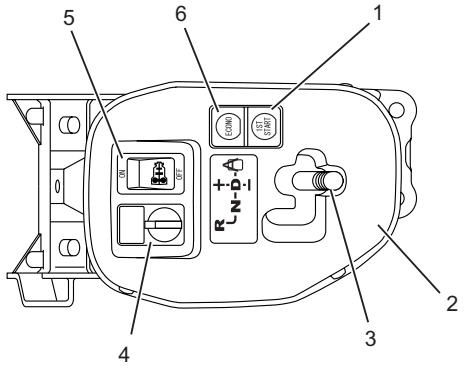


N7A2095E

Emergency System Control

Turning on the emergency switch operates the emergency relay and enables starter relay operation, which makes it possible to operate the starter. The emergency shift switch is also enabled, and switch operation can be used to shift to R, neutral, and 1st.

Notice:
Shifting with the selector lever is not possible when the emergency switch is turned on.



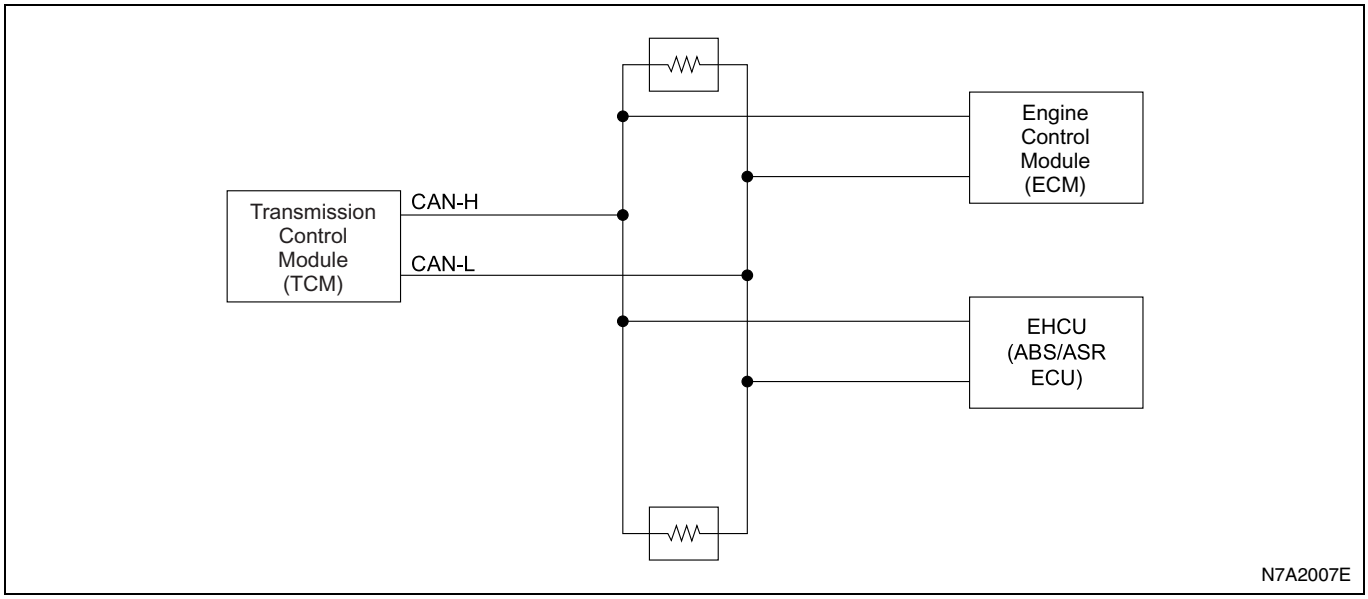
N7A2006E

Legend

1. 1st Gear Start Switch
2. Selector Lever Unit
3. Selector Lever
4. Emergency Shift Switch
5. Emergency Switch
6. Economy Mode Switch

Inter-TCM Communication

The transmission control module (TCM) communicates with the engine control module (ECM), EHCU (ABS/ASR control unit), etc., and transfers engine speed, vehicle speed, accelerator opening angle, ABS/ASR operation, and other signals. CAN communication is used for the communication system.



Half-Clutch Position Adjustment Function

The half-clutch point (gear engagement point) is adjusted by pressing the FAST side or SLOW side of the clutch adjustment switch. The procedure is: select the neutral gear, pull the parking brake, and then press “FAST” for fast clutch engagement or “SLOW” for slow engagement. Adjustment is possible to four levels on each side.

Important:

When ATF temperature is unstable, accurate learning is not possible for half-clutch position adjustment.

Perform the adjustment operation after warming up the engine sufficiently. If the half-clutch position does not feel right after adjustment, repeat half-clutch adjustment as required.

(In this case, it is not necessary to clear the current learned value. Half-clutch adjustment can be performed consecutively.)

It is easy to obtain a stable position at an ATF temperature of 40°C (104°F) or higher (directly after running), which can be checked using scan tool (Tech 2).

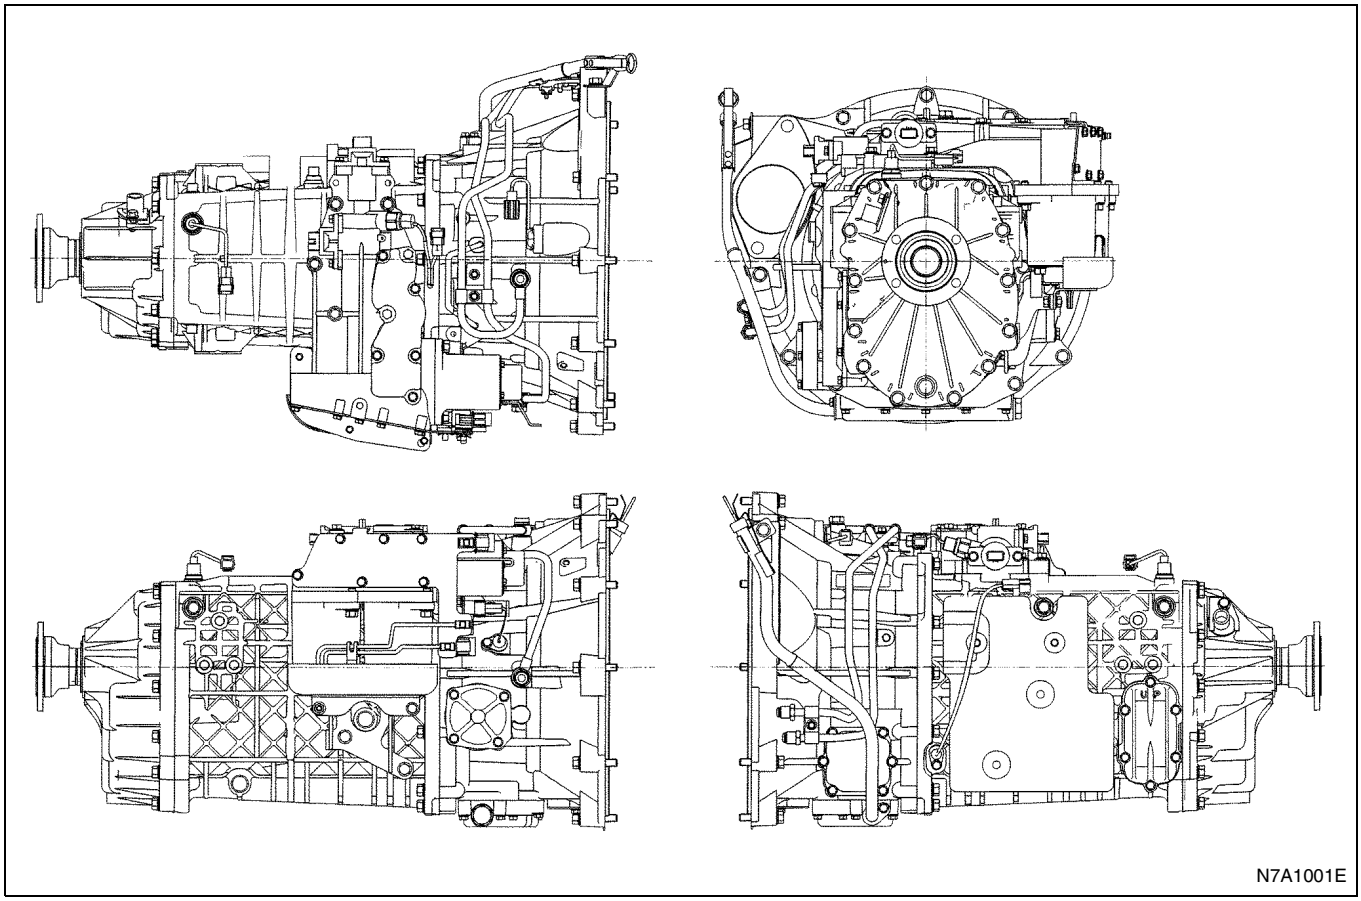
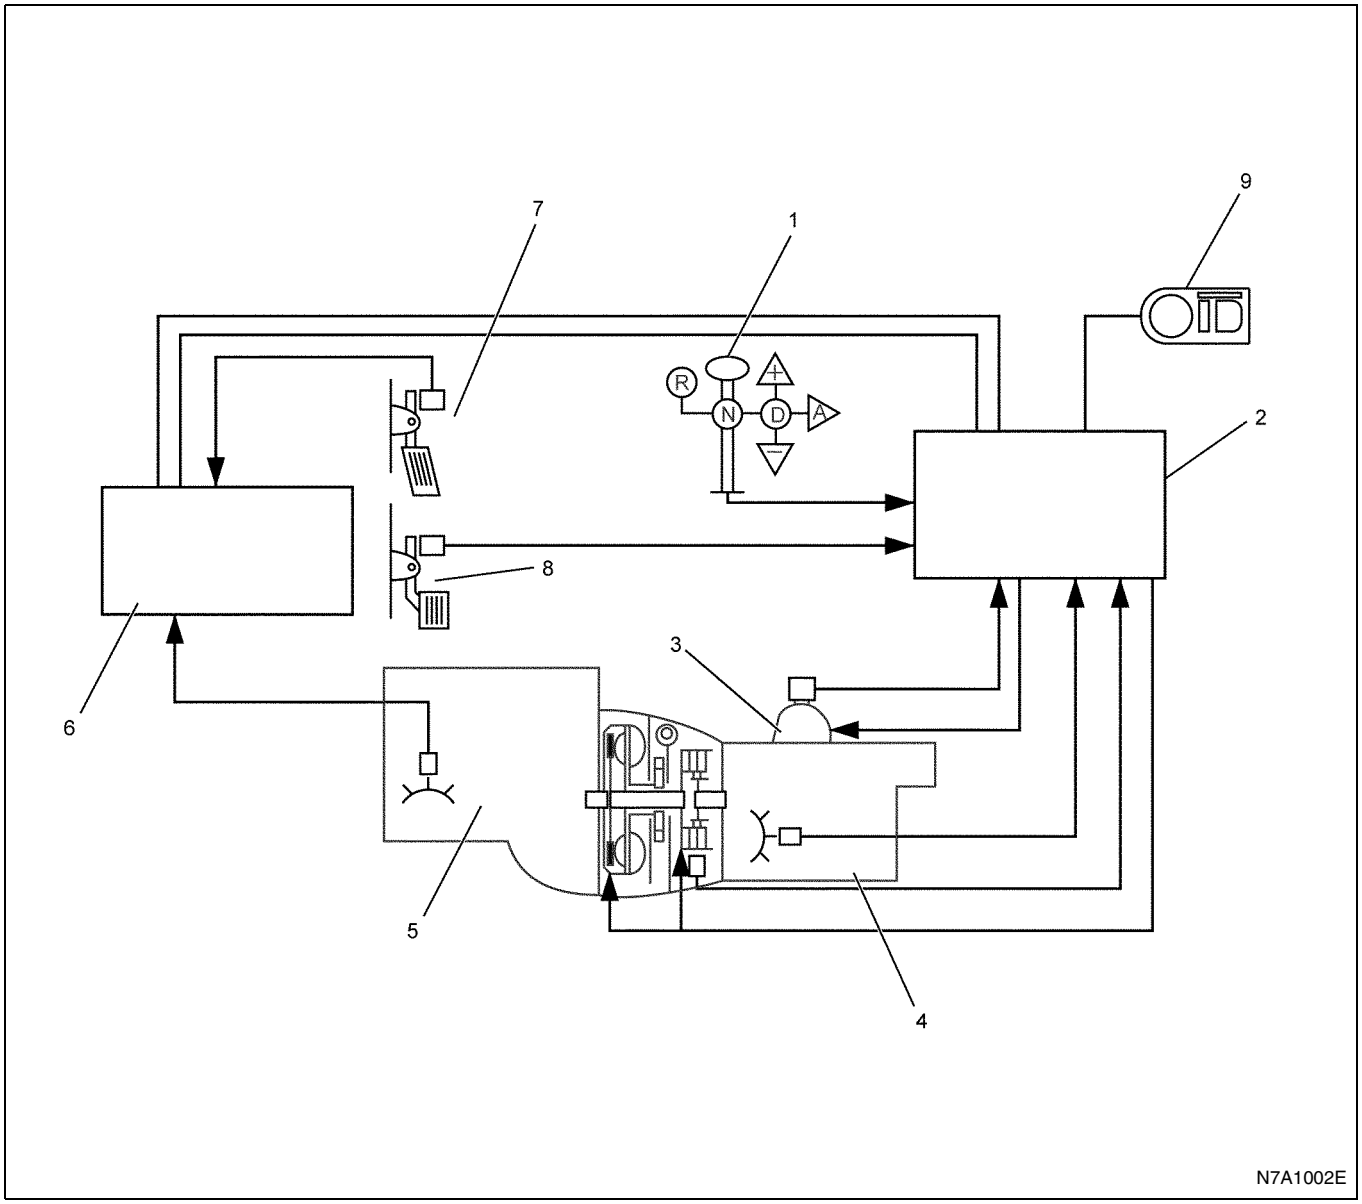
Smoother Mechanism

Description of Function and Operation

Smoother





Legend

1. Selector Lever Unit
2. Transmission Control Module (TCM)
3. Gearshift Control Box
4. Transmission
5. Engine
6. Engine Control Module (ECM)
7. Accelerator Opening Angle Signal
8. Brake Signal
9. Instrument Panel Cluster (Lamps, Indicators)

The Smoother transmission is based on the MYY type transmission, with the clutch system changed to the fluid coupling plus gearshift clutch, and the gearshift control box changed to a solenoid system. The transmission receives shift lever and accelerator operation signals and other data, and automatically engages and disengages the gearshift clutch (wet-type multi-disc clutch) and lock up clutch (inside the fluid coupling) to control gear shifting.
The following are the basic operation conditions.

1. Gearshift control box
   A new solenoid type control box enables electronic control of the gear shift/select operation. A selectable driving mode allows selection of manual mode shifting or auto shift mode (shift up and down) can be selected in accordance with the application using the + / – switch.
2. Gearshift clutch
   When shifting, the gearshift clutch releases (disengages) and gear shift control is enabled.

- Gearshift clutch release control
  The gearshift clutch is disengaged in neutral gear. However, at transmission fluid temperatures of 20°C or lower, the gearshift clutch is engaged even in neutral gear (in order to warm up the transmission).
- Gearshift clutch control engagement control
  The gearshift clutch engages after shift completion is detected (gear in determined).

3. Lock up clutch
   While running at or above a preset speed, the lock up clutch engages in order to eliminate engine power transmission loss (and increases fuel consumption).
   - Lock up clutch engagement control
     The lock up clutch disengages when the following conditions are satisfied: 2nd gear or higher, transmission speed above a prescribed value (vehicle speed depends on gear), etc. The lock up clutch does not engage in the case of reverse or 1st gear.
   - Lock up clutch control
     The lock up clutch disengages when the following conditions are satisfied: 2nd gear or higher, transmission speed below a prescribed value (vehicle speed depends on gear), etc.

MYY Transmission

There are two types of MYY transmission: MYY6P and MYY5T. The MYY transmission is designed for light weight and increased allowable input torque. New technology makes it possible to adopt aluminum cylinder case (3-piece) construction, taper roller bearings (counter shaft front and rear), a twin rod type shift control layout, and more.

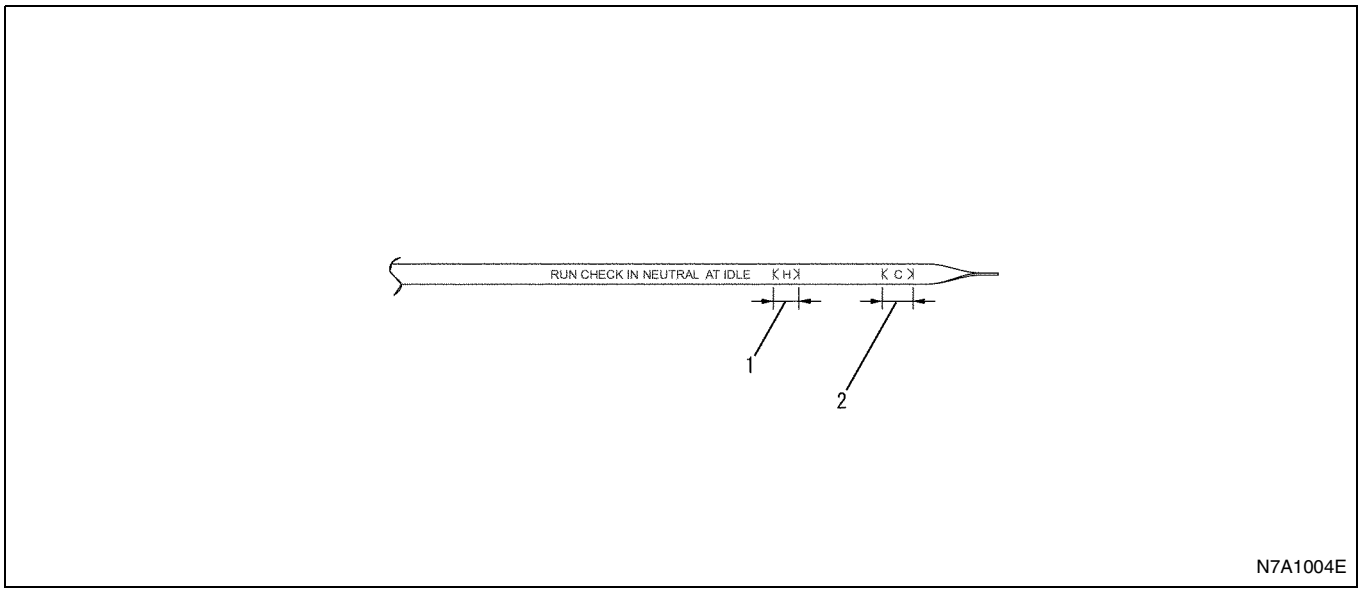
Function Check:

Transmission Fluid Level Check

Smoother

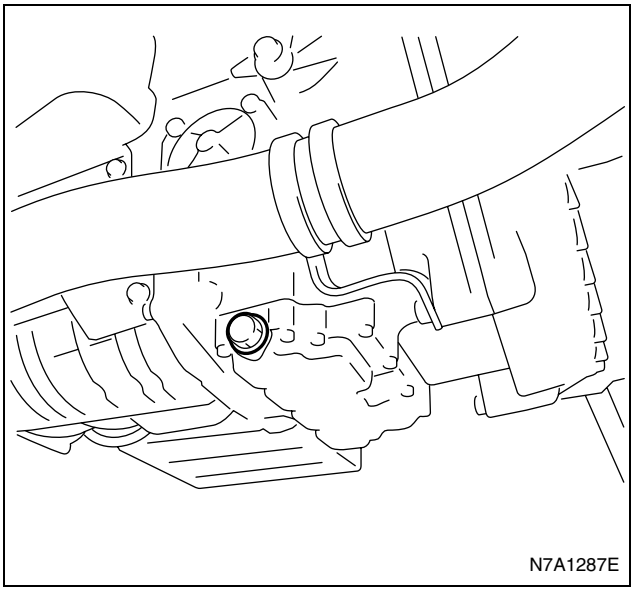


Legend

1. Oil level limit when oil temperature is 70 to 80°
2. Oil level limit when oil temperature is 20 to 30°

1. Inspection procedure
   a. Stop the vehicle on a level surface, select neutral gear, and engage the parking brake.
   b. With the engine idling, shift to 2nd gear for at least three seconds, and then return to neutral. Repeat this operation at least three times. (For the second and subsequent shifts, you can select another gear other than 2nd; also you can use gear in learning as a substitute for this.)
      It can be performed to stall the engine while gearshifts, but stop this immediately when the alarm bleeps. Even if the alarm does not bleep, finish this within five seconds. After oil temperature stabilizes, check the oil level.
   c. With the engine still idling, use the level gauge to confirm that the oil level is within the appropriate range for the oil temperature.
      If the oil level is low, replenish it with Besco ATF III through the level gauge guide tube.
2. Caution
   - Before pulling out the level gauge, clean the area around the gauge by wiping with a cloth.
   - Take care to ensure that the cloth is free of lint, dust, water, or any other foreign matter that can contaminate the oil.
   - When checking the oil level securely hook the level gauge to the clip, insert the level gauge into the guide tube, and hold it there for at least three seconds before pulling it out for reading. Insert the level gauge slowly in order to allow air to escape.
   - When inserting or pulling out the level gauge, take care to avoid letting any oil on the filler tube walls adhere to the level gauge.
   - Use the Tech 2 for an accurate reading of the oil temperature. For information about using the Tech 2, refer to “Transmission Control System Smoother.”
3. Changing transmission fluid procedure
   a. Prepare the container under drain plug for draining of transmission fluid.
   b. Pulling out the level gauge.
   c. Drain the transmission fluid by remove the drain plug and O-ring.
   d. Tighten the drain plug.
      The transmission case is made of aluminium. It is easily damaged. Be careful not to tighten a bolt too much.

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

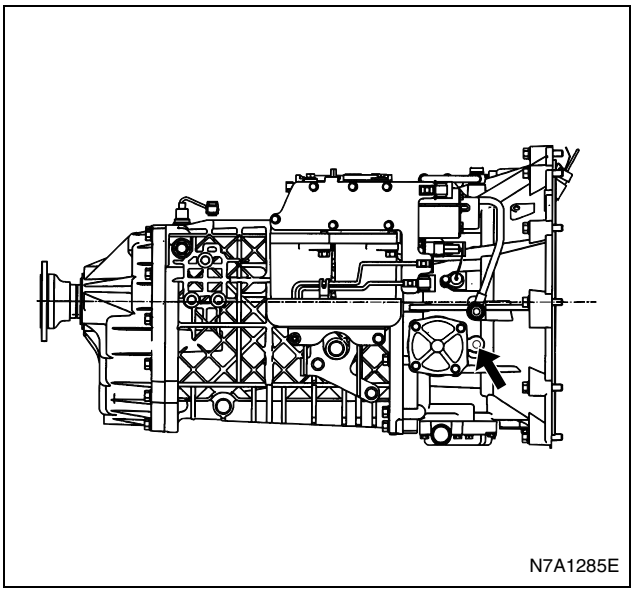


N7A1287E

e. Fill it with Besco ATF III through the level gauge guide tube.
The amount of oil is used as a guide for change. After oil change, with reference to “Inspection procedure”, make sure that it is poured to the specified level.
Transmission fluid capacity at replacement: 2.0 L (2.1 US qt / 1.8 Imp qt)

Checking Line Oil Pressure

1. Stop the engine and wait long enough for line oil pressure to drop.
2. Remove the eye bolt on the right side and remove any seal material remaining in the bolt hole.



N7A1285E

3. Attach an oil pressure gauge and then start the engine.
4. Measure the line oil pressure.
Line oil pressure reference value: 715 to 800 kPa {7.3 to 8.2 kg/cm^2}
5. Operate the shift lever and check if line oil pressure is within the prescribed values even during gear in.
6. If the line oil pressure is not within the prescribed values, check the transmission fluid level. If the level is normal, repair the transmission unit.
7. Stop the engine, wait long enough for line oil pressure to drop, and then remove the oil pressure gauge.
8. Using a new gasket, re-install the eye bolt and tighten it to its specified torque.

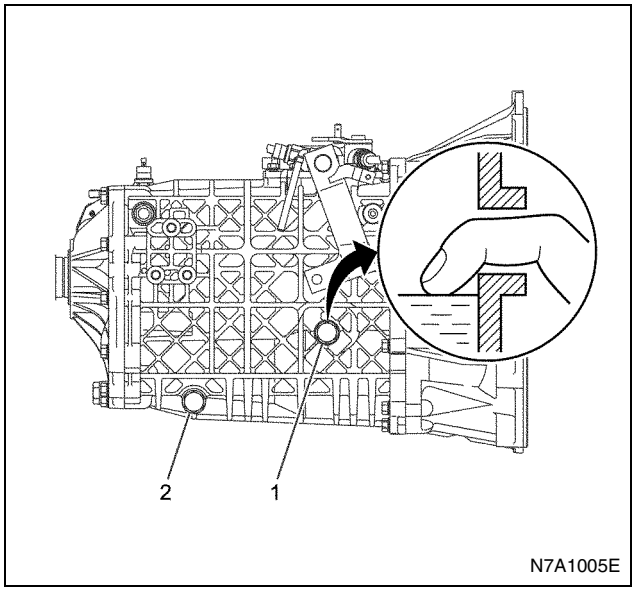
Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

Checking the Oil

1. Remove the filler plug.
2. From the filler plug hole, check that the oil is up to the bottom of the hole.
3. Replenish oil until it is within the prescribed level.
   - Oil: Besco gear oil transaxle (5W-30)
4. Tighten the filler plug to the specified torque.

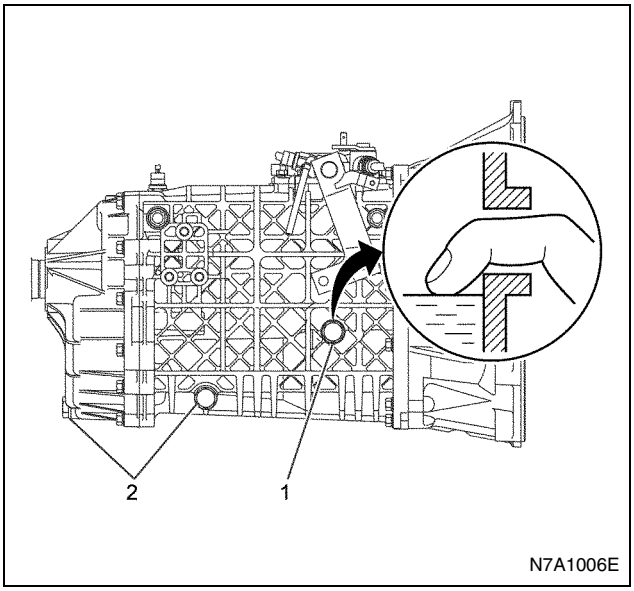
Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

MYY 5-Speed



N7A1005E

MYY 6-Speed



Legend
1. Filler Plug
2. Drain Plug

Changing Transmission Oil

1. Start the engine and allow it to run until the transmission is sufficiently warmed up.
2. Stop the engine and then remove the drain plug to drain the oil.
3. Tighten the drain plug.

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

4. Remove the filler plug.
5. Fill oil from the filler plug hole until it reaches the rim of the hole.

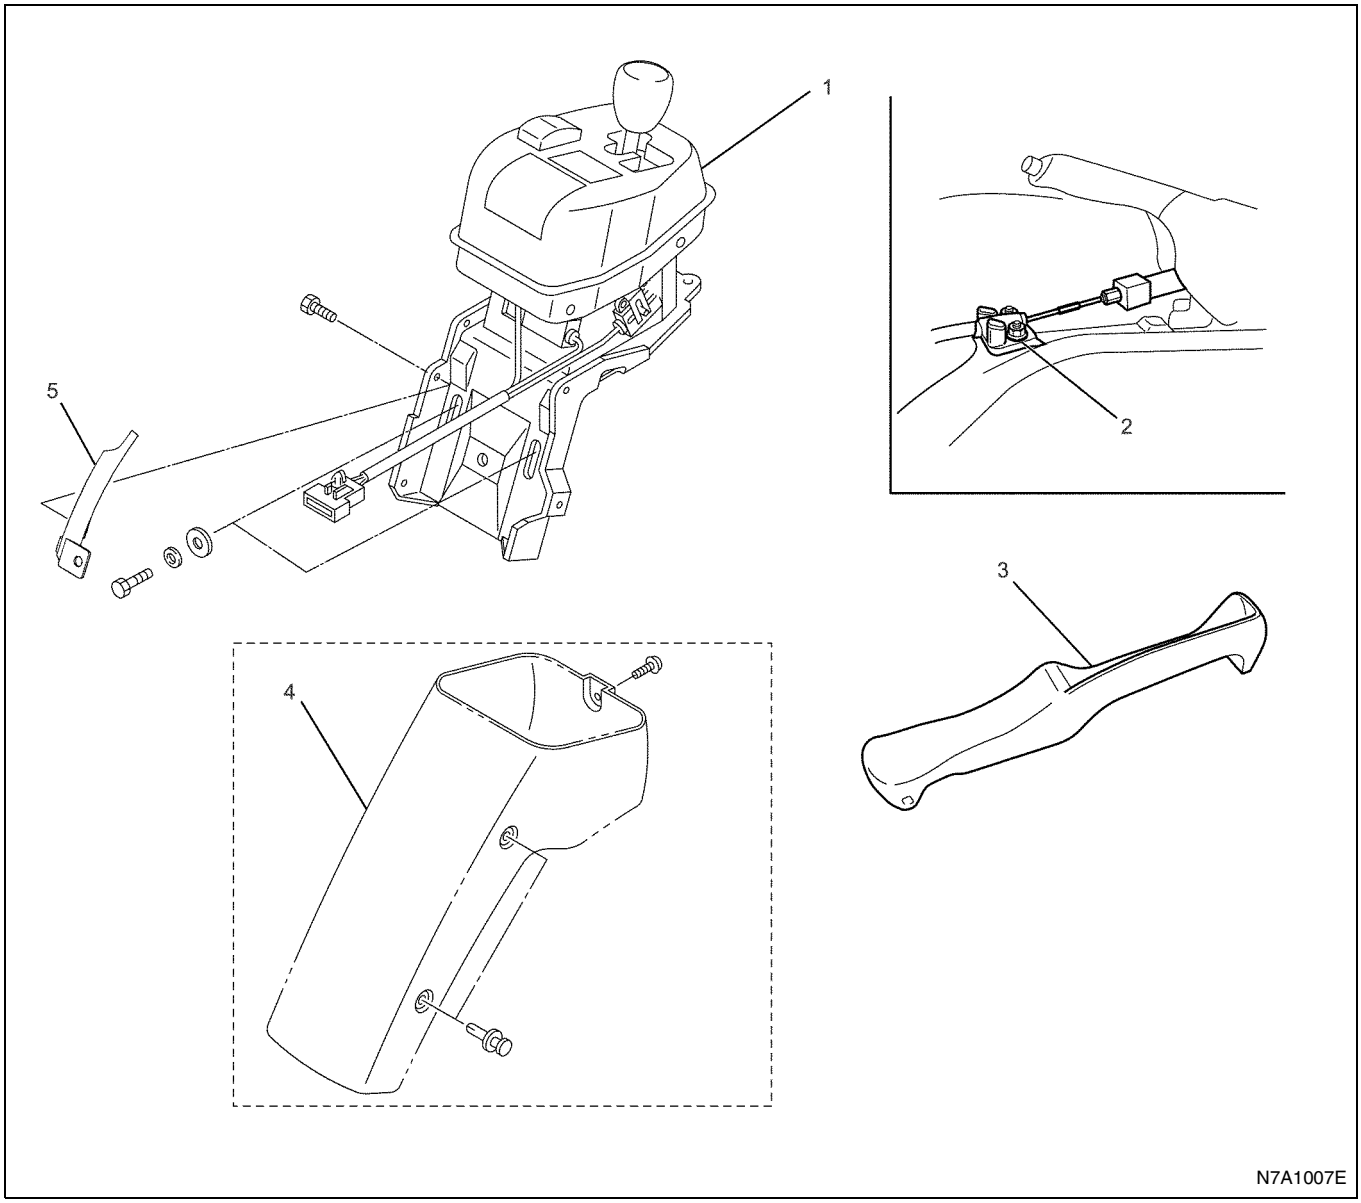
Oil Level (L)		
	MYY 5-Speed	MYY 6-Speed
Standard	2.8	3.5
With Side PTO	3.1	3.8

6. Tighten the filler plug to the specified torque.

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

Selector Lever Assembly

Components



Legend

1. Selector Lever Assembly
2. Parking Brake Cable Bracket
3. Parking Brake Cable Cover
4. Gear Control Cover
5. Parking Brake Cable Bracket

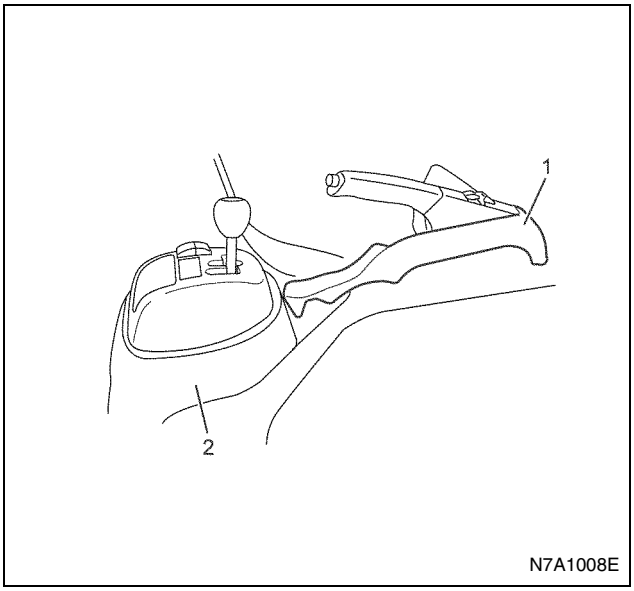
Removal

Preparation

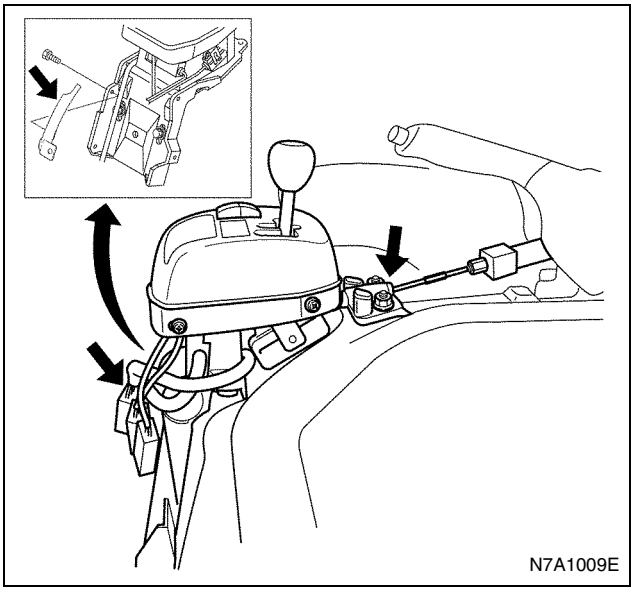
- Disconnect the battery (−) cable.

1. Remove the parking brake cable cover (1).

2. Remove the gear control cover (2).



3. Remove the two parking brake cable brackets.
4. Disconnect the harness connector.

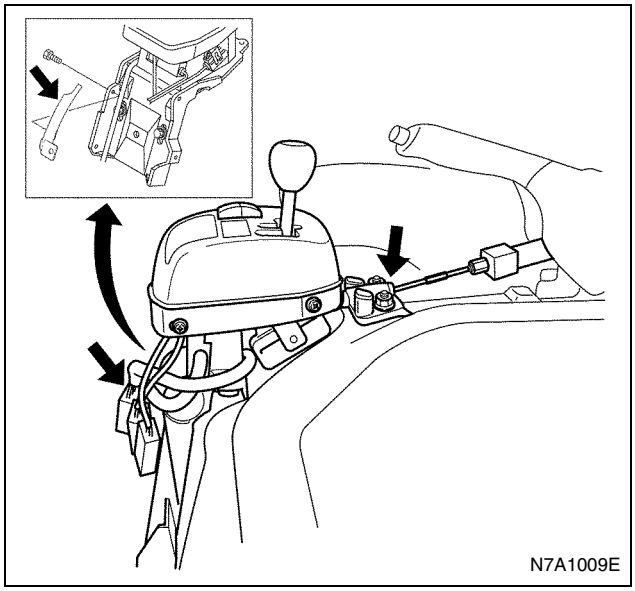


5. Remove the selector lever assembly.
   - Remove the two installation bolts and two nuts of the selector lever assembly.

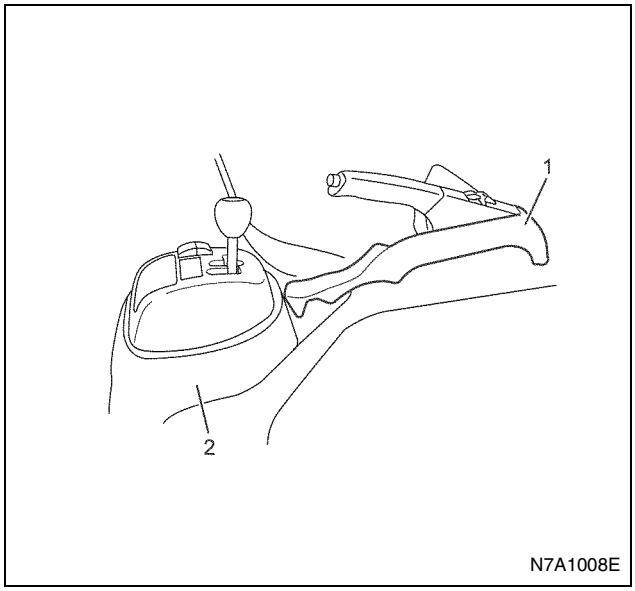
Installation

1. Install the selector lever assembly.
   - Install the two installation bolts and two nuts of the selector lever assembly.
2. Connect the harness connector.

3. Install the two parking brake cable brackets.

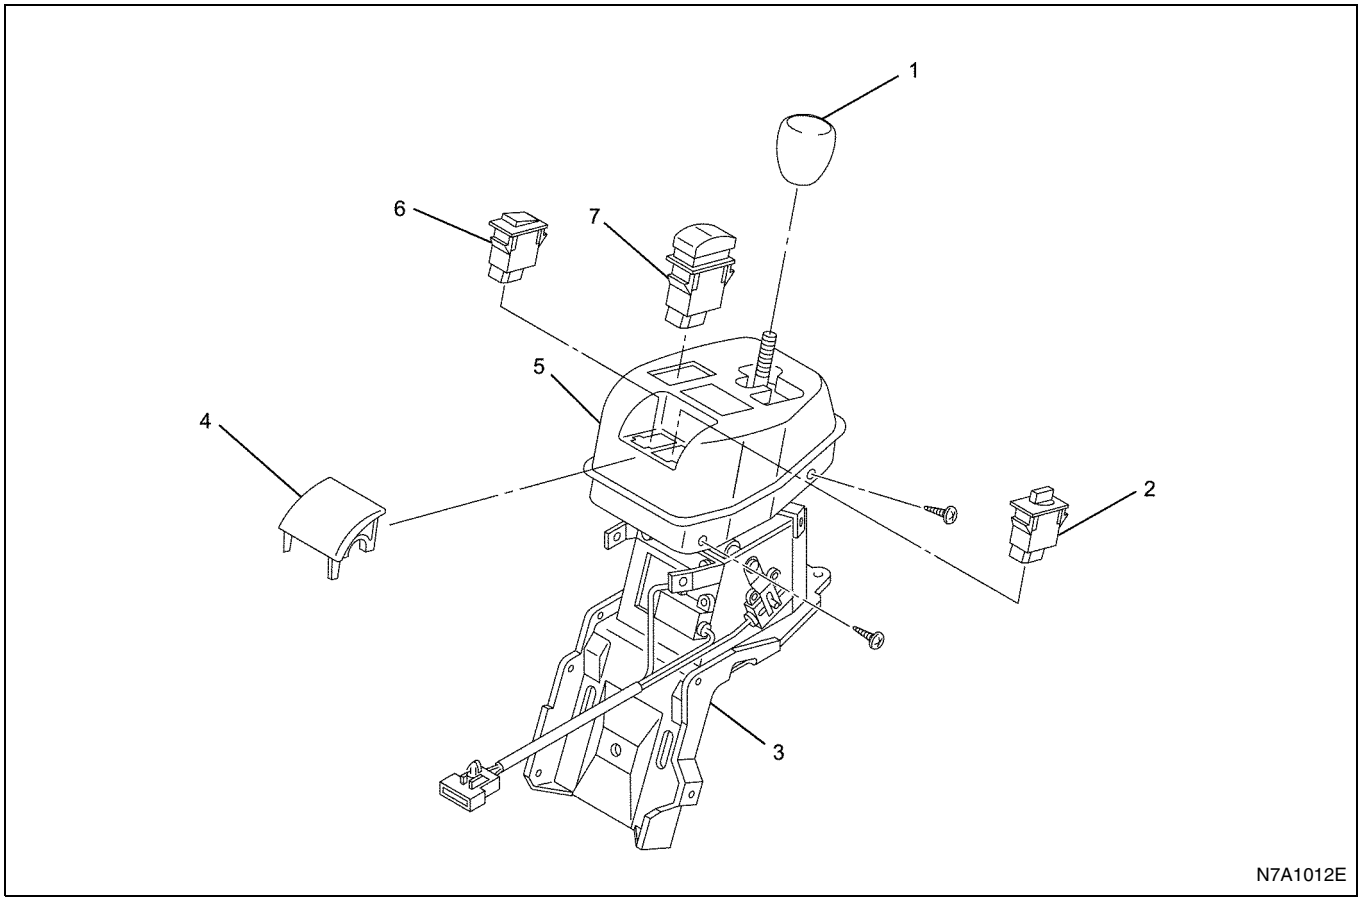


4. Install the gear control cover (2).
5. Install the parking brake cable cover (1).



Selector Lever

Components



Legend

1. Selector Lever Knob
2. Emergency Shift Switch
3. Selector Lever Assembly
4. Switch Cover
5. Selector Lever Cover
6. Emergency Switch
7. Mode Switch (Economy, 1st Gear Start)

Disassembly

1. Remove the selector lever knob.
2. Remove the selector lever cover.
   - Remove the fours screws that secure the selector lever cover in place, and remove the selector lever cover.
3. Remove the switch cover from the selector lever cover.
4. Remove the emergency shift switch, emergency switch, and mode switch from the selector lever cover.

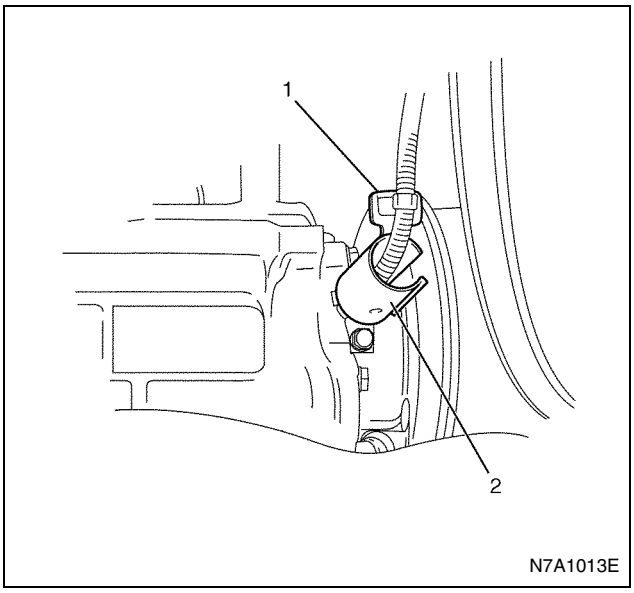
Assembly

1. Install the mode switch, emergency switch, and emergency shift switch on the selector lever cover.
2. Install the switch cover on the selector lever cover.
3. Install the selector lever cover.
   - Install the selector lever cover and secure it with the four selector lever cover screws.
4. Install the selector lever knob.

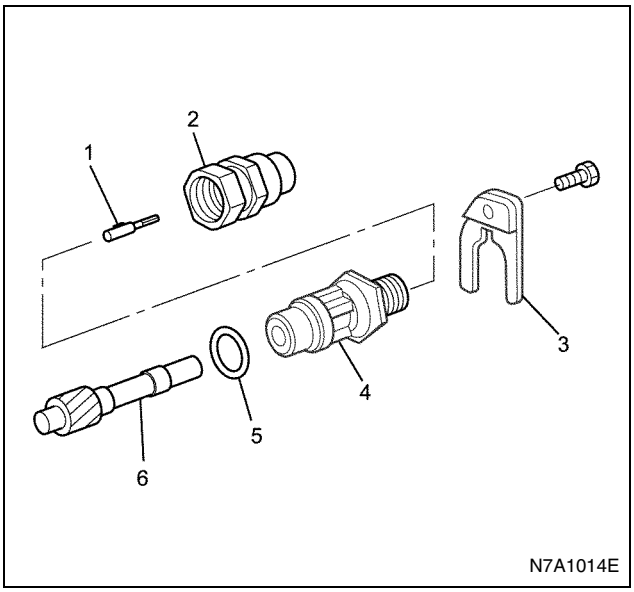
Vehicle Speed Sensor

Removal

1. Remove the clip (1) and remove the protector (2).
2. Disconnect the wire connector.



3. Remove the fixing screw and then remove the vehicle speed sensor (3).



Legend

1. Plug Sensor
2. Vehicle Speed Sensor
3. Plate
4. Bush
5. O-ring
6. Driven Gear

Installation

1. Use the fixing screw to install the vehicle speed sensor.

Fixing screw

Tighten:
20 N·m (2.0 kg·m / 14.8 lb·ft)

Bushing — Vehicle speed sensor

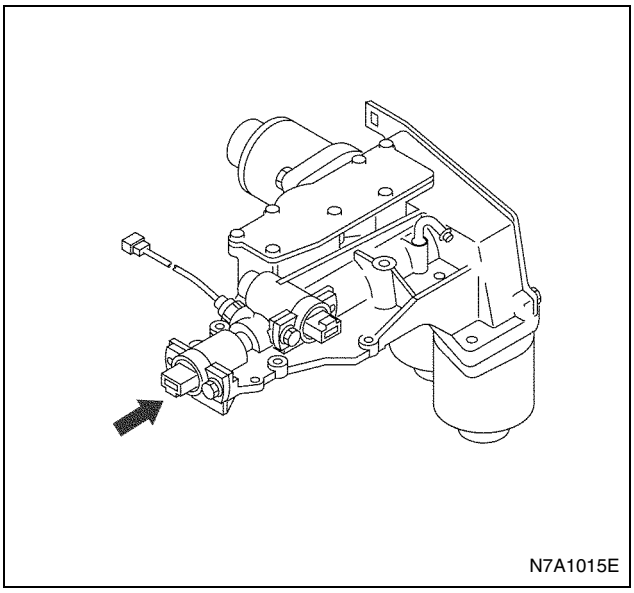
Tighten:
25 N·m (2.5 kg·m / 18.4 lb·ft)

2. Connect the wire connector.
3. Secure the protector with the clip.

Gear Shift Position Sensor

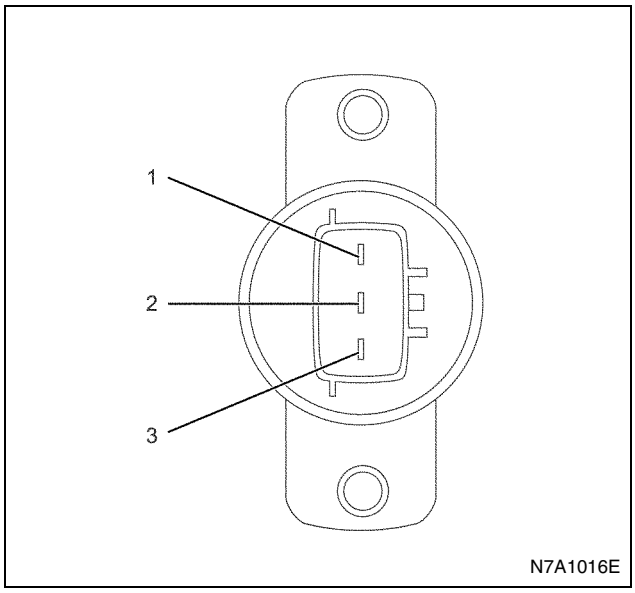
Removal

1. Connector
2. Remove the gear shift position sensor.



Inspection

Connect the gear shift position sensor terminal 3 (SFT.VCC) to 5 V and terminal 1 (SFT.GND) to ground. Record the voltage between terminals 2 (SFT.SIG) and 1 (SFT.GND) while rotating the sensor arm.
Replace if the voltage does not vary from approximately 0.1 to 4.8 V.



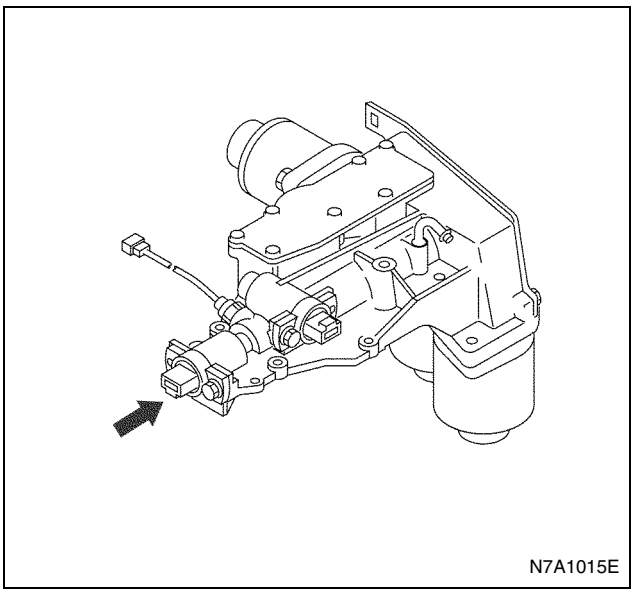
Legend

1. Gear Shift Position Sensor Terminal 1 (SFT.GND)
2. Gear Shift Position Sensor Terminal 2 (SFT.SIG)
3. Gear Shift Position Sensor Terminal 3 (SFT.VCC)

Installation

1. Apply Besco chassis grease to the sensor shaft tip and the sliding portion of the gearshift control box shaft tip groove, and install.
2. Install the gear shift position sensor.
   a. Aligning the angle of the sensor arm tip with connector part groove, carefully insert the gear shift position sensor.
   b. Install the gear shift position sensor using the bolt.

Tighten:
9 N·m (0.9 kg·m / 6.6 lb·ft)

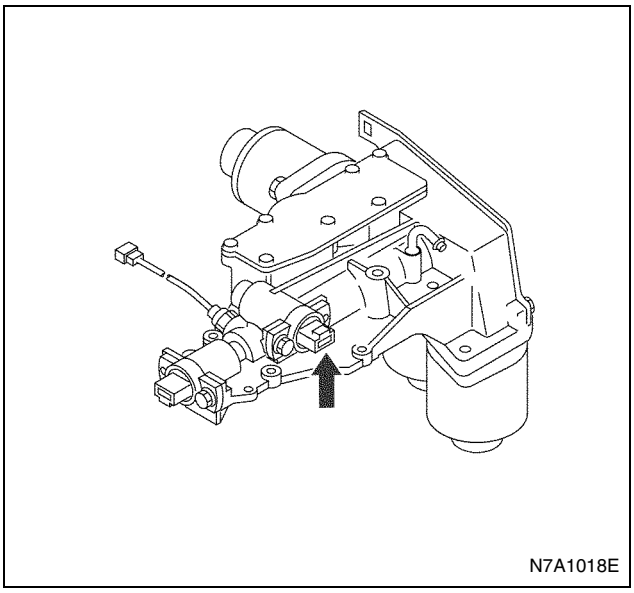


N7A1015E

Gear Select Position Sensor

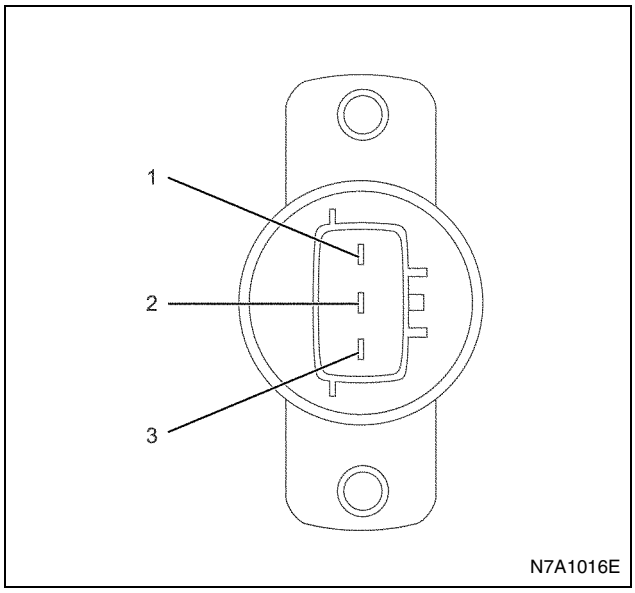
Removal

1. Connector
2. Remove the gear select position sensor.



Inspection

Connect the gear select position sensor terminal 3 (SEL.VCC) to 5 V and terminal 1 (SEL.GND) to ground. Record the voltage between terminals 2 (SEL.SIG) and 1 (SEL.GND) while rotating the sensor arm.
Replace if the voltage does not vary from approximate 0.1 to 4.8 V.



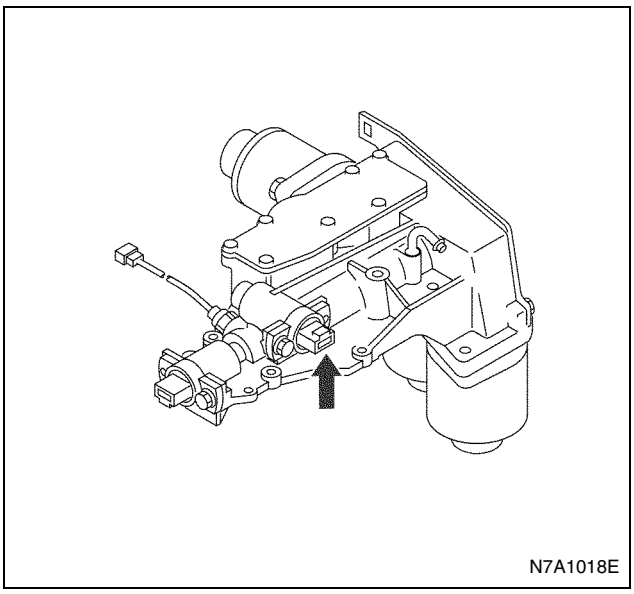
Legend

1. Gear Select Position Sensor Terminal 1 (SEL.GND)
2. Gear Select Position Sensor Terminal 2 (SEL.SIG)
3. Gear Select Position Sensor Terminal 3 (SEL.VCC)

Installation

1. Confirm there is an O-ring on the case side, apply Besco chassis grease to the sliding portion of the sensor shaft tip and install.
2. Install the gear select position sensor.
   a. Aligning the angle of the sensor arm tip with the connector part groove, carefully insert the gear select position sensor.
   b. Install the gear select position sensor using the bolt.

Tighten:
9 N·m (0.9 kg·m / 6.6 lb·ft)

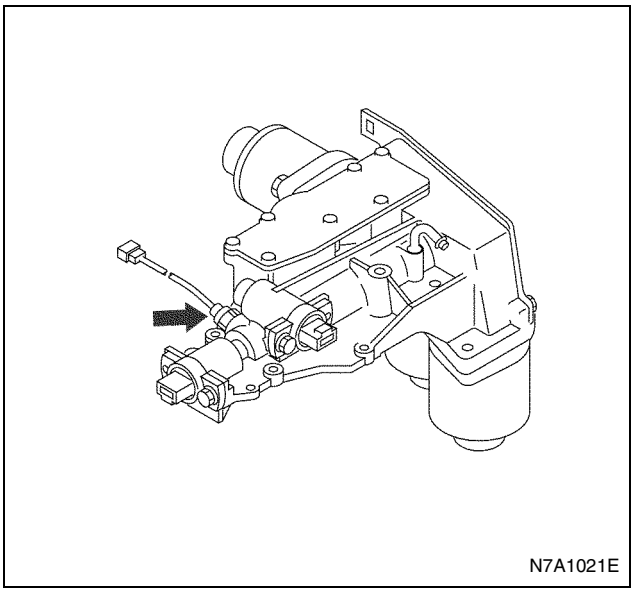


N7A1018E

Neutral Switch

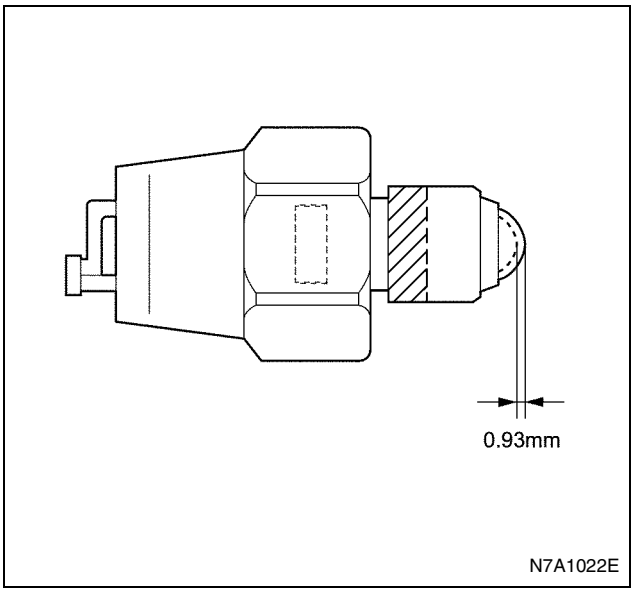
Removal

1. Connector
2. Neutral switch



Inspection

- Replace if the harness, the connector or the seal is damaged.
- Normal operation is indicated if there is continuity between switch terminals when measured as-is, and if there is no continuity between the terminals when the ball is pressed.
- The switch operation stroke is 0.93 mm.



Installation

1. Neutral switch
   - Apply Loctite 242 (or equivalent) to the threads of the switch and install.

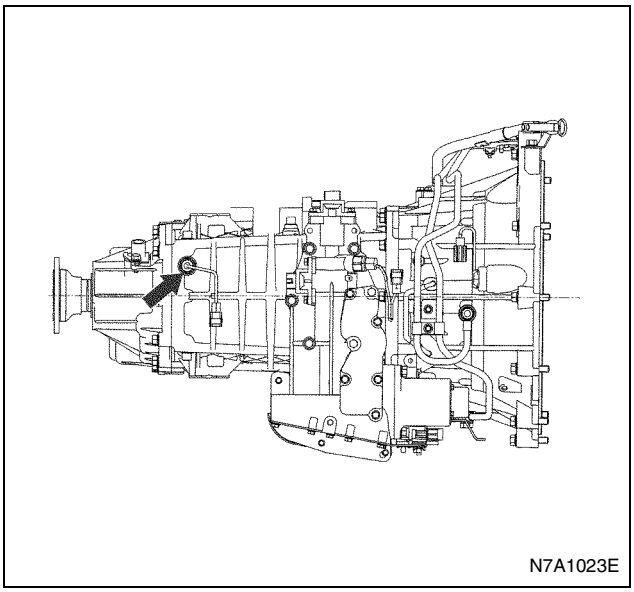
Tighten:
34 N·m (3.5 kg·m / 25.1 lb·ft)

2. Connector

Reverse Switch

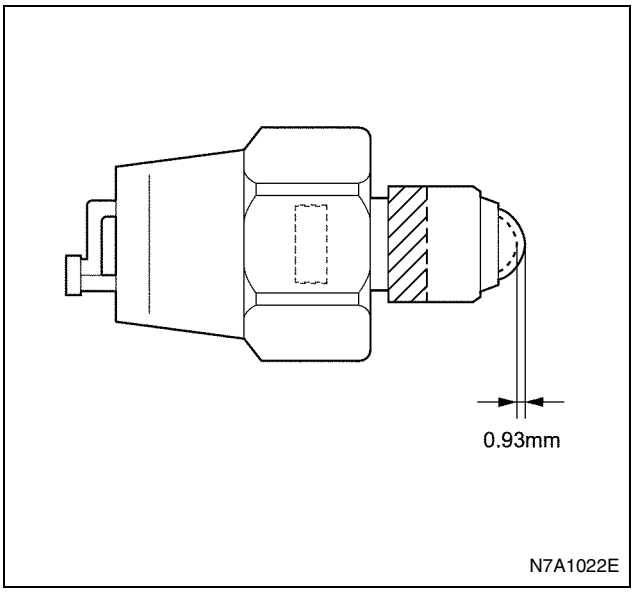
Removal

1. Connector
2. Reverse switch



Inspection

- Replace if the harness, the connector or the seal is damaged.
- Normal operation is indicated if there is continuity between switch terminals when measured as-is, and if there is no continuity between the terminals when the ball is pressed.
- The switch operation stroke is 0.93mm.



Installation

1. Reverse switch
   - Apply Loctite 242 (or equivalent) to the threads of the switch and install.

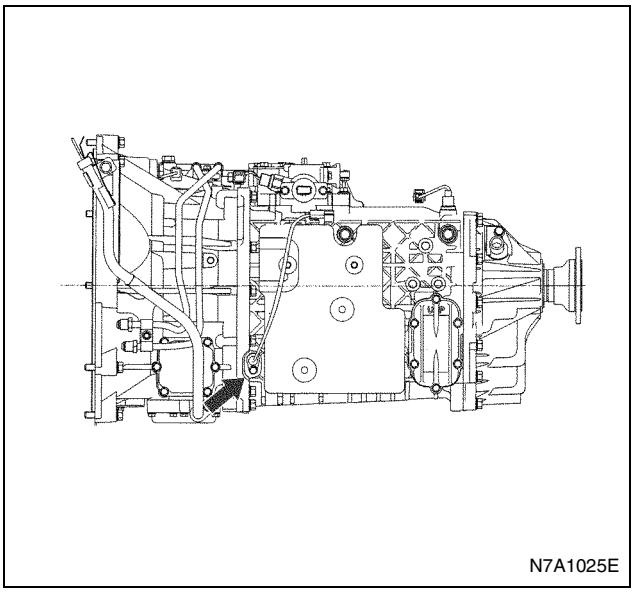
Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

2. Connector

Input Shaft Speed Sensor

Removal

1. Connector
2. Input shaft speed sensor



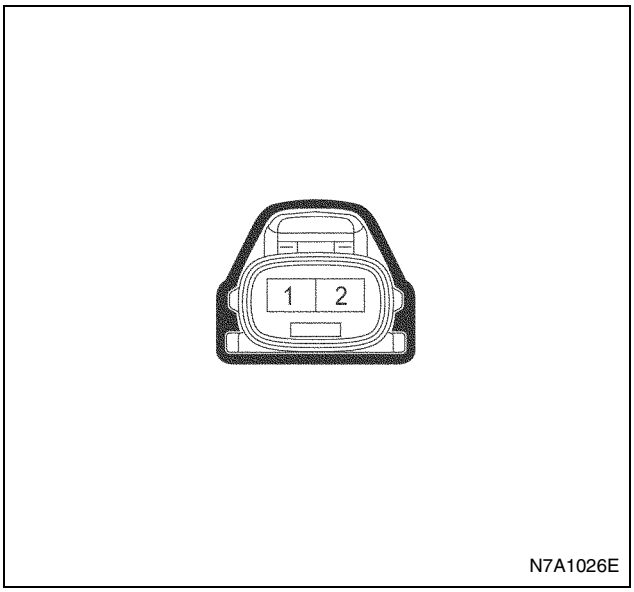
N7A1025E

Tighten:
9 N·m (0.9 kg·m / 6.6 lb·ft)

2. Connector

Inspection

- Replace if the harness, the connector or the seal is damaged.
- Measure the resistance between terminals. Replace if the resistance between 1 — 2 is not within 1.5 to 2.1 kΩ.



N7A1026E

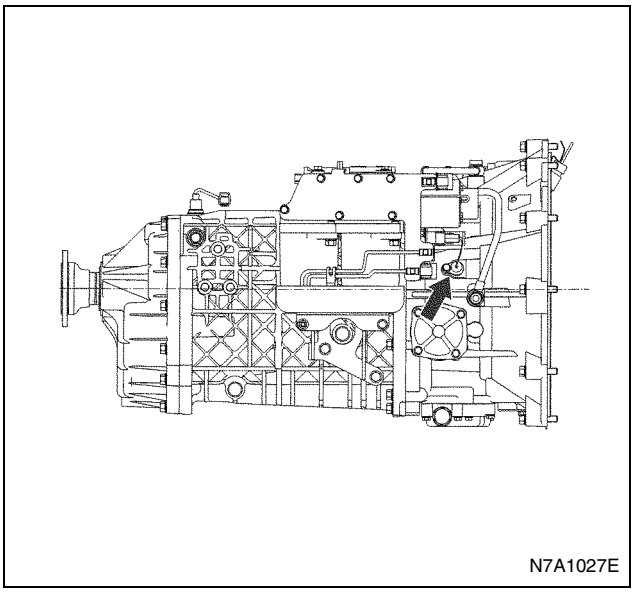
Installation

1. Input shaft speed sensor
   - Apply 5W-30 engine oil to the sensor O-ring, and install.

Turbine Speed Sensor

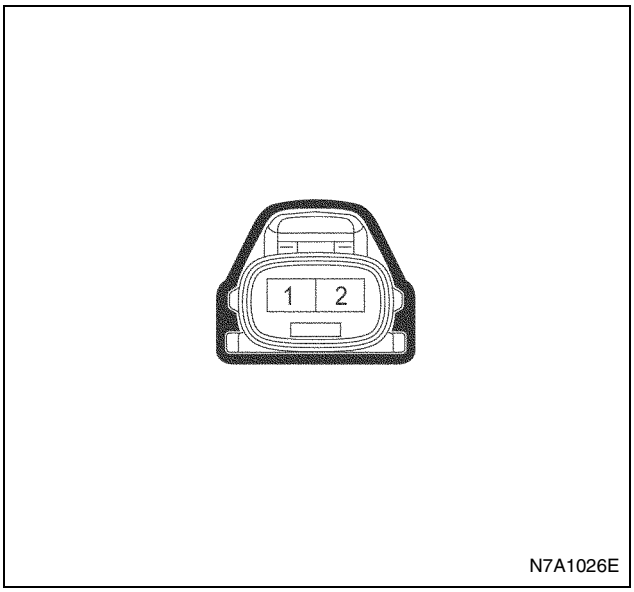
Removal

1. Connector
2. Turbine speed sensor



Inspection

- Replace if the harness, the connector or the seal is damaged.
- Measure the resistance between terminals. Replace if the resistance between 1 — 2 is not within 1.5 to 2.1 kΩ.



Installation

1. Turbine speed sensor
   - Apply oil (Besco ATF III) to the O-ring and clutch housing hole, and install.

Tighten:
9 N·m (0.9 kg·m / 6.6 lb·ft)

2. Connector

Transmission Fluid Cooler Circuit

Removal

1. Remove the Smoother oil pan drain plug and O-ring.
   - Drain the oil (Transmission fluid). When draining the oil, check the oil amount, and check for metal bits and foreign matter.
2. Disconnect the transmission fluid cooler pipe connection.
3. Remove the transmission fluid cooler pipe from the clutch housing.
4. Remove the clip, and remove the transmission fluid cooler pump.

Installation

1. Install the transmission fluid cooler pipe in the clutch housing.

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

Caution:
Use a new gasket.

2. Connect the transmission fluid cooler pipe.

Tighten:
44 N·m (4.5 kg·m / 32.5 lb·ft)

3. Install the clip on the transmission fluid cooler pipe.

Tighten:
20 N·m (2.0 kg·m / 14.8 lb·ft)

4. Install the Smoother oil pan drain plug and O-ring.

Tighten:
40 N·m (4.1 kg·m / 29.5 lb·ft)

5. Supply transmission fluid (Besco ATF III) from the oil filler tube to the Smoother.

Flushing The Transmission Fluid Cooler Circuit

Inspection

In order to prevent trouble following Smoother repair, flushing of the cooler circuit is required when any of the following conditions exist.

- When a large volume of debris comes out of the cooler circuit
- When abnormal wear is discovered while disassembling the Smoother
- When abnormal wear is discovered in the clutch facing or when impurities are discovered in the oil

Procedure

1. Disconnect the transmission fluid cooler pipe from the clutch housing and oil cooler.
2. Use cleaning solvent and pressurized air to clean the oil cooler and pipes.

Caution:
The maximum air pressure should be 197kPa {2kg/ cm^2}.

3. After using the air to dry the cleaning solvent in the oil cooler and pipes, clean with transmission fluid.
4. Connect the cooler circuit, and then fill with transmission fluid.

Tighten:
44 N·m (4.5 kg·m / 32.5 lb·ft)

5. Start the engine and check for transmission fluid leaks from the cooler circuit.
6. Check the transmission fluid level and replenish if it is low.

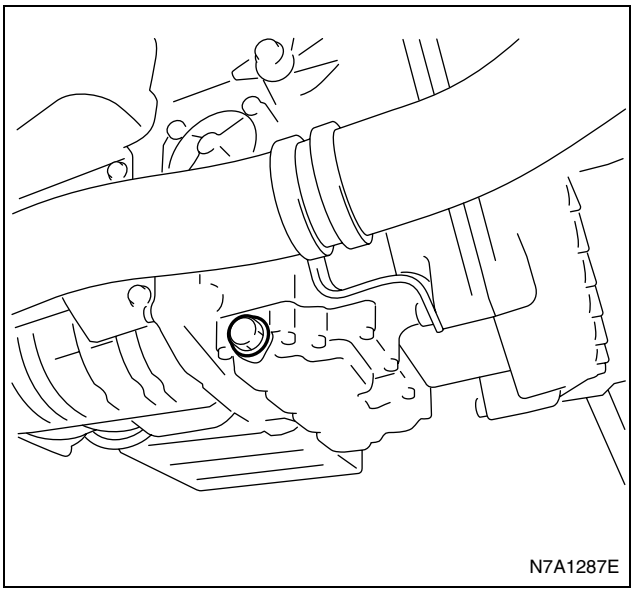
Smoother Transmission Assembly

Removal

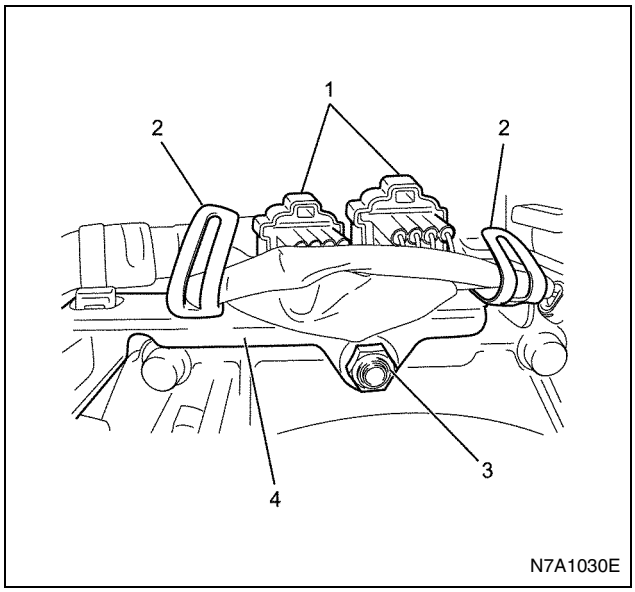
The transmission case and clutch housing are made of aluminum, to be sure to exercise sufficient care to ensure they are not damaged. A particularly high level of care is required to protect against rib damage, which can affect the strength of the case.
Also take care to avoid personal injury when working with cases and other heavy items.

- Chock the tires.
- Tilt the cab.
- Disconnect the battery (–) cable.
- Use a lifter to raise the vehicle.

1. Remove the transmission side cover and bracket.
2. Remove the Smoother oil pan drain plug and O-ring (if disassembling).
   - Drain the oil (transmission fluid). When draining the oil, check the oil amount, and check for metal bits and foreign matter.



3. Remove the transmission filler plug and O-ring (if disassembling).
4. Remove the transmission drain plug and O-ring (if disassembling).
   - Drain the transmission oil. When draining the oil, check the oil amount, and check for metal bits and foreign matter.
5. Remove the propeller shaft guard.
6. Disconnect the rear propeller shaft at the transmission, and fasten it at a point where it will not interfere with work.
   - Refer to “Rear Drive Propeller Shaft.”
7. Remove the parking brake cable.
   - Refer to “Parking Brake.”
8. Disconnect the two starter harness connectors.
9. Remove the starter ground cable.
10. Remove the upper oil filler tube.
11. Remove the starter motor assembly.
12. Disconnect the speed sensor connector.
13. Disconnect the two transmissions harness connectors from the frame harness.
    a. Remove the connector bracket nut, and remove the two transmission harness connectors from the connector bracket.
    b. Remove the two connector bracket frame harness clips and the one transmission harness clip.
    c. Disconnect the two transmissions harness connectors from the frame harness.

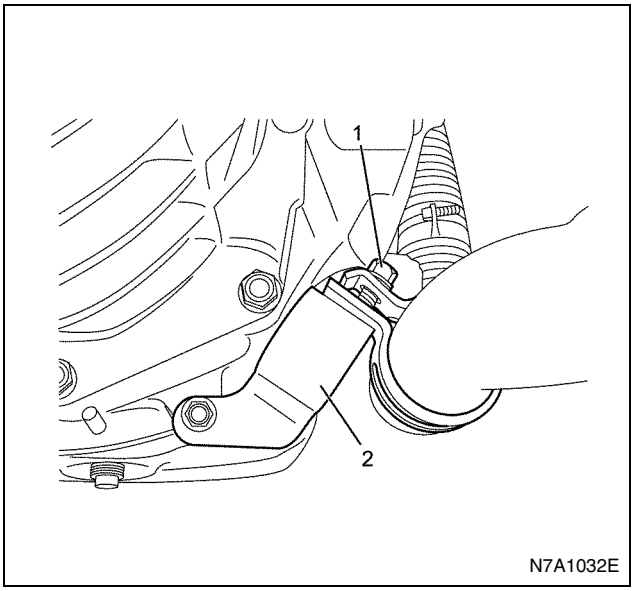


Legend

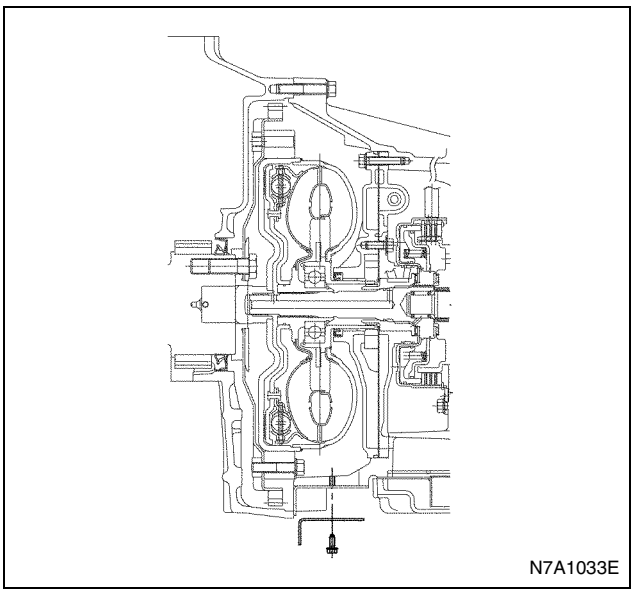
1. Transmission Harness Connector
2. Frame Harness Clips
3. Connector Bracket Nut
4. Connector Bracket

14. Remove the connector bracket.
    a. Remove the reverse switch connector from the connector bracket.
    b. Remove the frame harness clip from the connector bracket, and remove the connector bracket from the transmission.
15. Remove the battery cable clip, and disconnect the neutral switch connector.

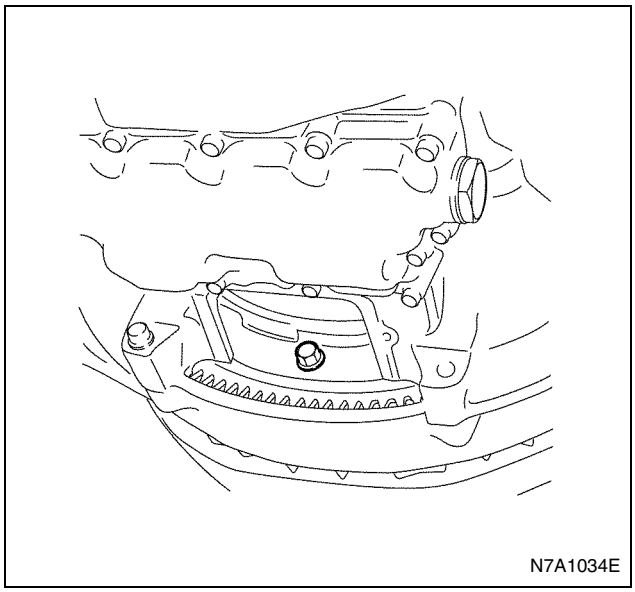
16. Remove the parking brake cable clip from the gearshift control box.
17. Remove the exhaust pipe clamp bolt (1) from the exhaust pipe bracket (2).
18. Remove the exhaust pipe bracket (2) from the clutch housing.



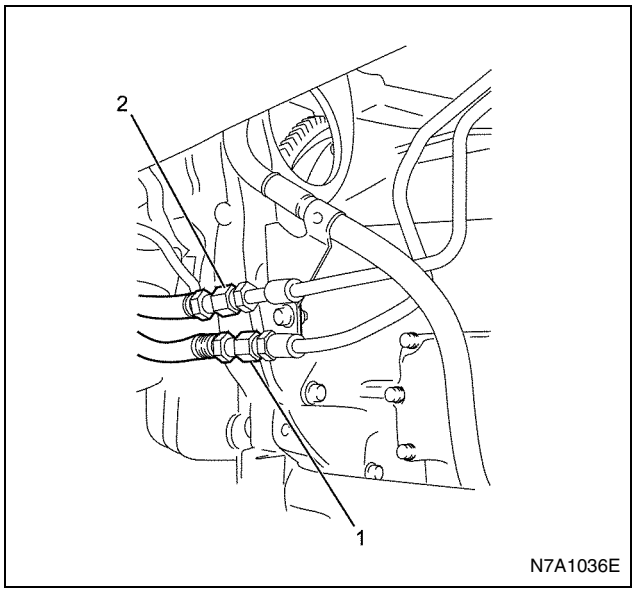
19. Remove the under cover of the work hole for the fluid coupling tightening bolt, which is located in the lower portion of the clutch housing.



20. From the hole under clutch housing rotate the flywheel as you remove the six bolts that links the flexible plate with fluid couplings.

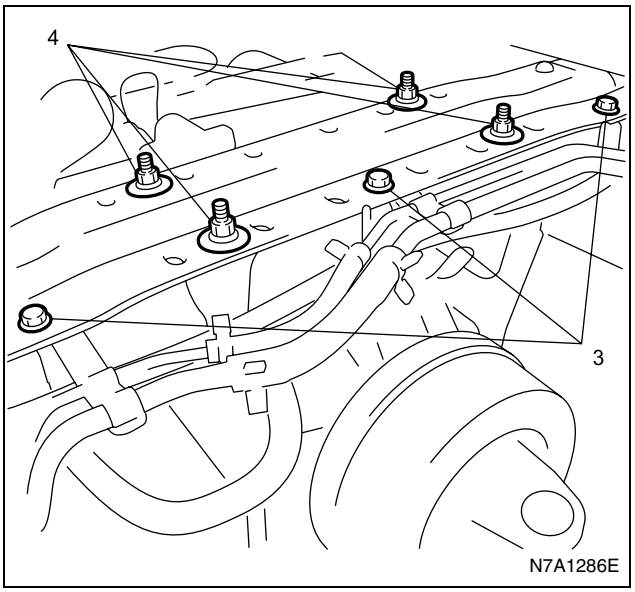


21. Disconnect the outlet (1) and inlet (2) transmission fluid cooler hose.



22. Set a transmission jack in place, and use a chain or some other means to secure the transmission.
23. Remove the three fuel pipe brackets (3) from the top of the cross member.

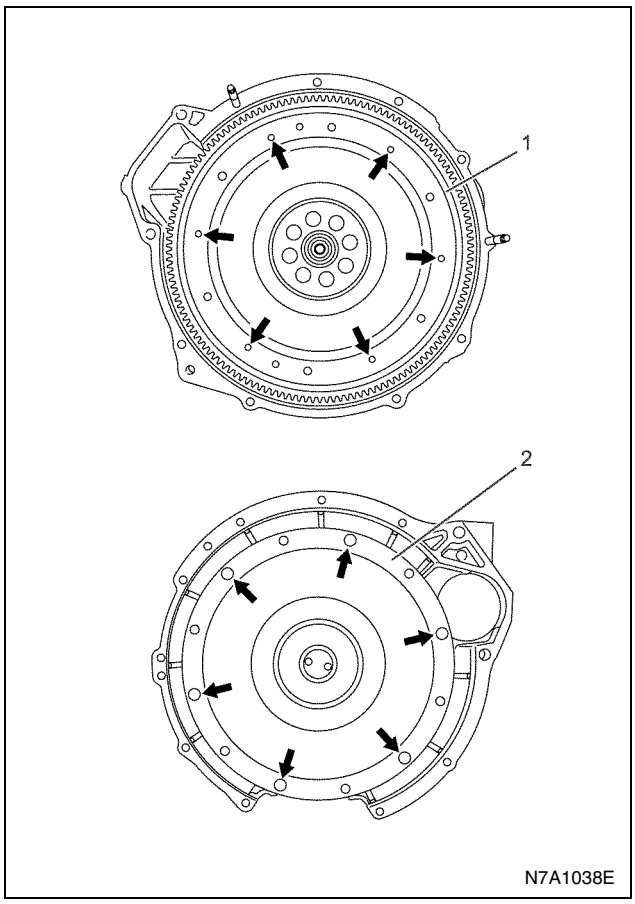
24. Remove the installation nuts (4) between the transmission mounting and the cross member.



25. Set an engine jack in place and support the engine.
26. Remove the bolt that links the transmission and engine.
27. Taking care that the fluid coupling does not fall out, pull out the Smoother transmission assembly.

Installation

1. After applying a light coating of grease around the entire circumference of the fluid coupling pilot hub, carefully operate the transmission jack to link the engine and the Smoother transmission assembly. At this time, match the phase of the engine's flexible plate (1) knock pin and the fluid coupling (2) groove.



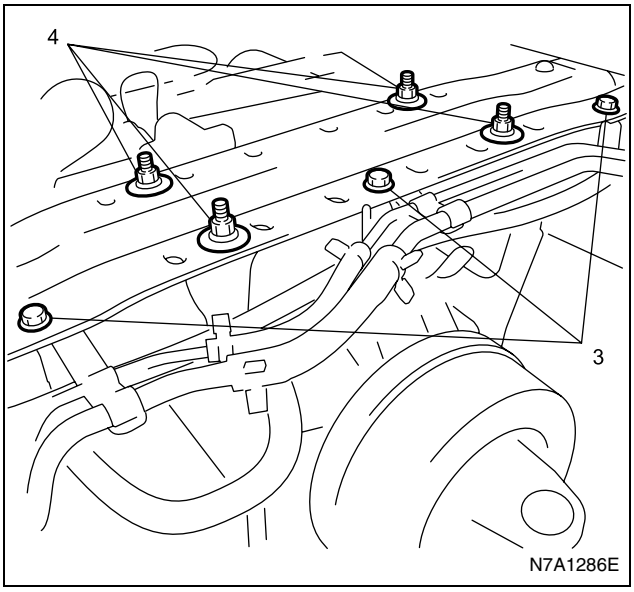
2. Tighten the engine and transmission installation bolts to their specified torque.

Tighten:
40 N·m (4.1 kg·m / 29.5 lb·ft)

3. Install the installation nuts (4) between the transmission mounting to the cross member.

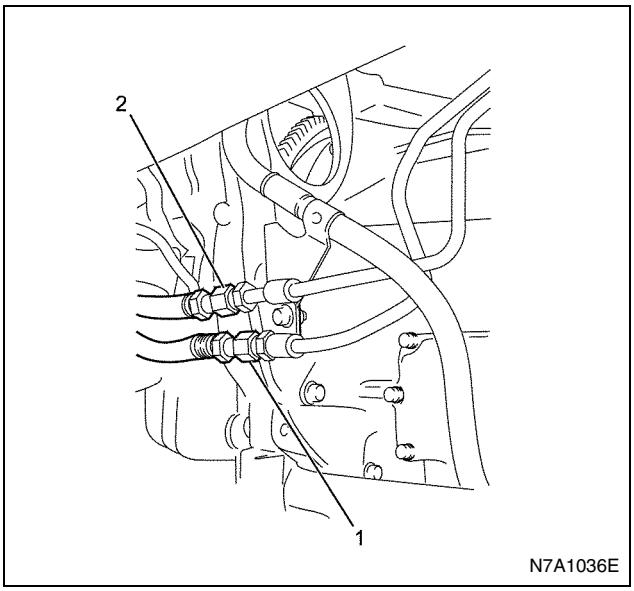
Tighten:
40 N·m (4.1 kg·m / 29.5 lb·ft)

4. Install the three fuel pipe brackets (3) on the top of the cross member to cross member.
   - Remove the transmission jack and engine jack.



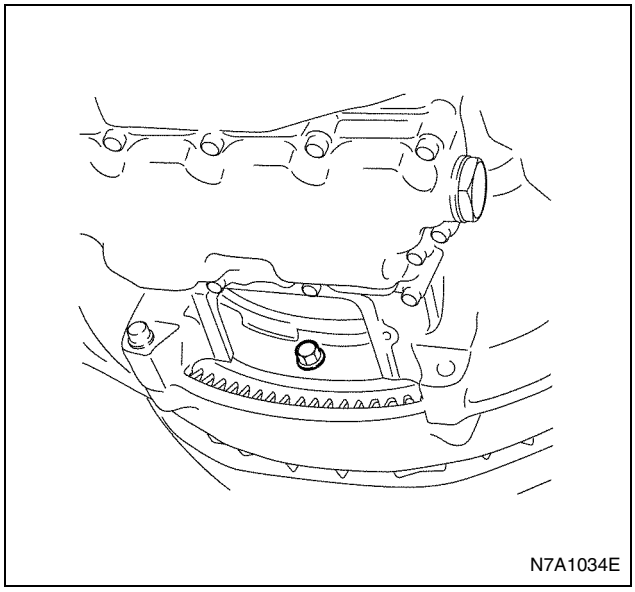
5. Connect the outlet (1) and inlet (2) transmission fluid cooler hose.

Tighten:
44 N·m (4.5 kg·m / 32.5 lb·ft)



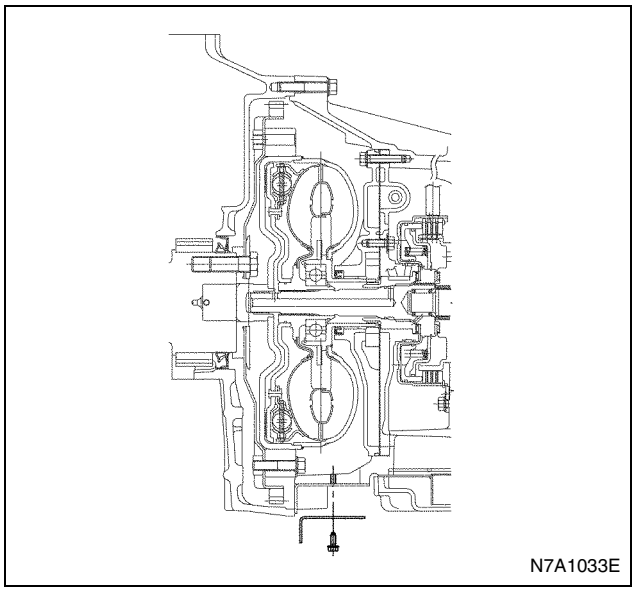
6. After temporarily assembling the six flexible plate and fluid coupling installation bolts, tighten them to their specified torque.

Tighten:
40 N·m (4.1 kg·m / 29.5 lb·ft)



7. Install the under cover of the work hole for the flexible coupling link bolt.

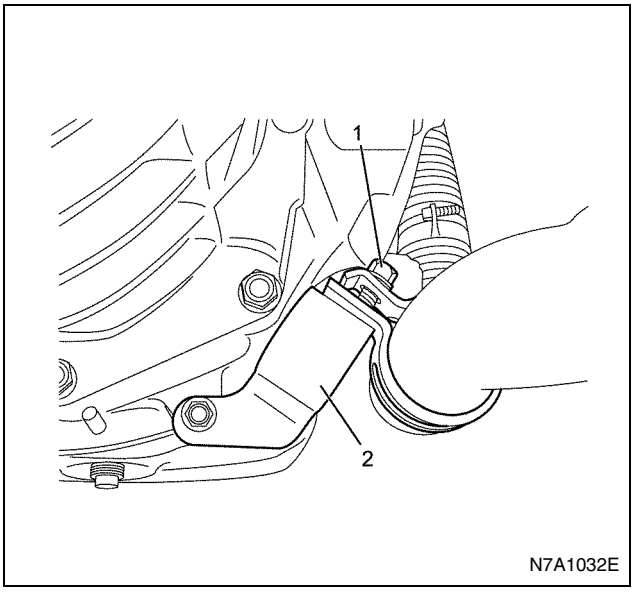
Tighten:
8 N·m (0.8 kg·m / 5.9 lb·ft)



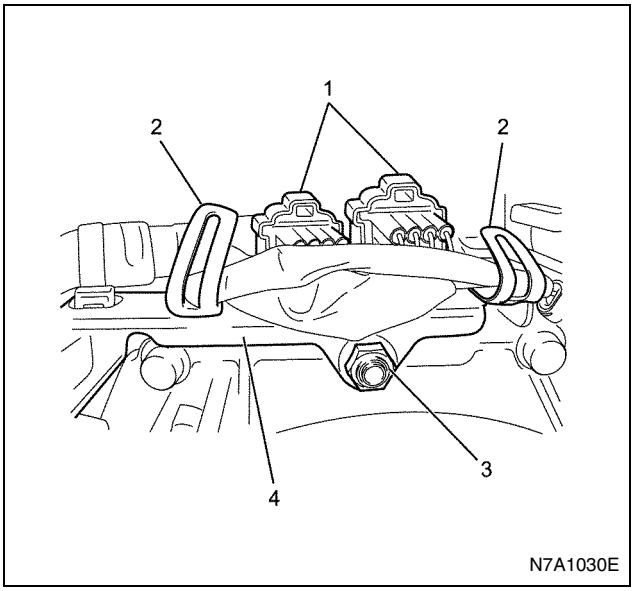
8. Install the exhaust pipe bracket (2) on the clutch housing.

Tighten:
46 N·m (4.7 kg·m / 33.9 lb·ft)

9. Install the exhaust pipe clamp bolt (1) on the exhaust pipe bracket.



10. Install the parking brake cable clip on the gearshift control box.
11. Connect the neutral switch connector, and install the battery cable clip.
12. Install the connector bracket.
    a. Install the frame harness clip on the connector bracket, and install the connector bracket on the transmission.
    b. Install the reverse switch connector on the connector bracket.
13. Connect the two transmission harness connectors to the frame harness.
    a. Connect the two transmission harness connectors to the frame harness.
    b. Install one transmission harness clip and two frame harness clips on the connector bracket.
    c. Install the transmission harness connectors at two points on the connector bracket, and install the connector bracket nut.



Legend

1. Transmission Harness Connector
2. Frame Harness Clips
3. Connector Bracket Nut
4. Connector Bracket

14. Connect the speed sensor connector.
15. Install the starter motor assembly.

Tighten:
76 N·m (7.7 kg·m / 56.1 lb·ft)

16. Install the upper oil filler tube. (Use a new O-ring.)

Tighten:
41 N·m (4.2 kg·m / 30.2 lb·ft)

17. Install the starter ground cable.

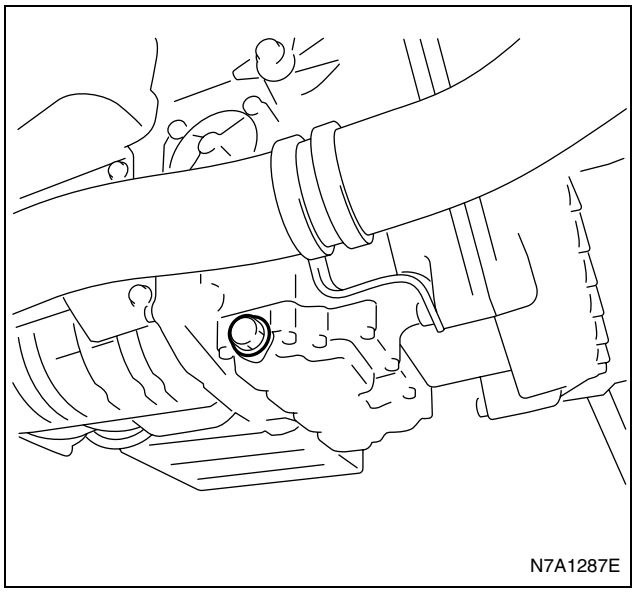
Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

18. Install the two starter harnesses.
19. Install the parking brake cable.
    - Refer to “Parking Brake.”
20. Install the rear propeller shaft.
    - Refer to “Rear Drive Propeller Shaft”.
21. Install the propeller shaft guard.
22. Apply engine oil to the O-ring, and then install the transmission drain plug and the O-ring (after disassembly).

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

23. Apply oil (Besco ATF III) to the O-ring, and then install the Smoother oil pan drain plug and the O-ring (after disassembly).

Tighten:
40 N·m (4.1 kg·m / 29.5 lb·ft)



24. Supply transmission fluid (Besco ATF III) from the oil filler tube to the Smoother (after disassembly).

25. Fill transmission oil (5W-30) from the filler hole (after disassembly).
26. Apply engine oil to the O-ring, and then install the transmission filler plug and the O-ring (after disassembly).

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

27. Install the transmission side cover and bracket.
28. Connect the battery (–) cable.
29. If you replaced switches, etc., perform gear shift position learning and half-clutch position learning.
    - For the learning procedure, refer to "Transmission Control System Smoother."
30. Start the engine and use the level gauge to check the transmission fluid level.

2. Cover
3. Gasket
4. Oil Filter
5. Upper Gasket
6. Strainer Cover
7. Lower Gasket
8. Drain Plug
9. O-ring
10. Oil Pan
11. Bolt
12. Bolt
13. Gasket Tab

Removal

1. Remove the bolt, and then remove the filler tube and O-ring.
2. Remove the bolt and remove the cover and gascket. (Removal is not required if the filter is replaced.)
3. Remove the drain plug and remove the O-ring.
4. Remove the 13 bolts, and remove the oil pan and lower gasket.
5. Remove the one bolt, and remove the strainer cover, upper gasket, and oil filter.
6. If the filter is clogged, dirty, or otherwise abnormal, replace it.
   When re-assembling, clean and then assemble.

Installation

1. Apply oil (Besco ATF III) to the bottom of the clutch housing (except the oil pan installation surface).
2. Insert the oil filter in the clutch housing, install a new upper gasket, and then use the installation bolt to install the strainer cover.

Tighten:
10 N·m (1.0 kg·m / 7.4 lb·ft)

- Position the tab of the upper gasket as shown in the illustration, and take care that the top-bottom orientation is correct.

3. Install the oil pan with a new lower gasket, and tighten with the installation bolts. Check the tightening torque twice.

Tighten:
10 N·m (1.0 kg·m / 7.4 lb·ft)

- Position the tab of the lower gasket as shown in the illustration, and take care that the top-bottom orientation is correct.

4. Apply oil (Besco ATF III) to the O-ring, assemble the drain plug, and tighten it.

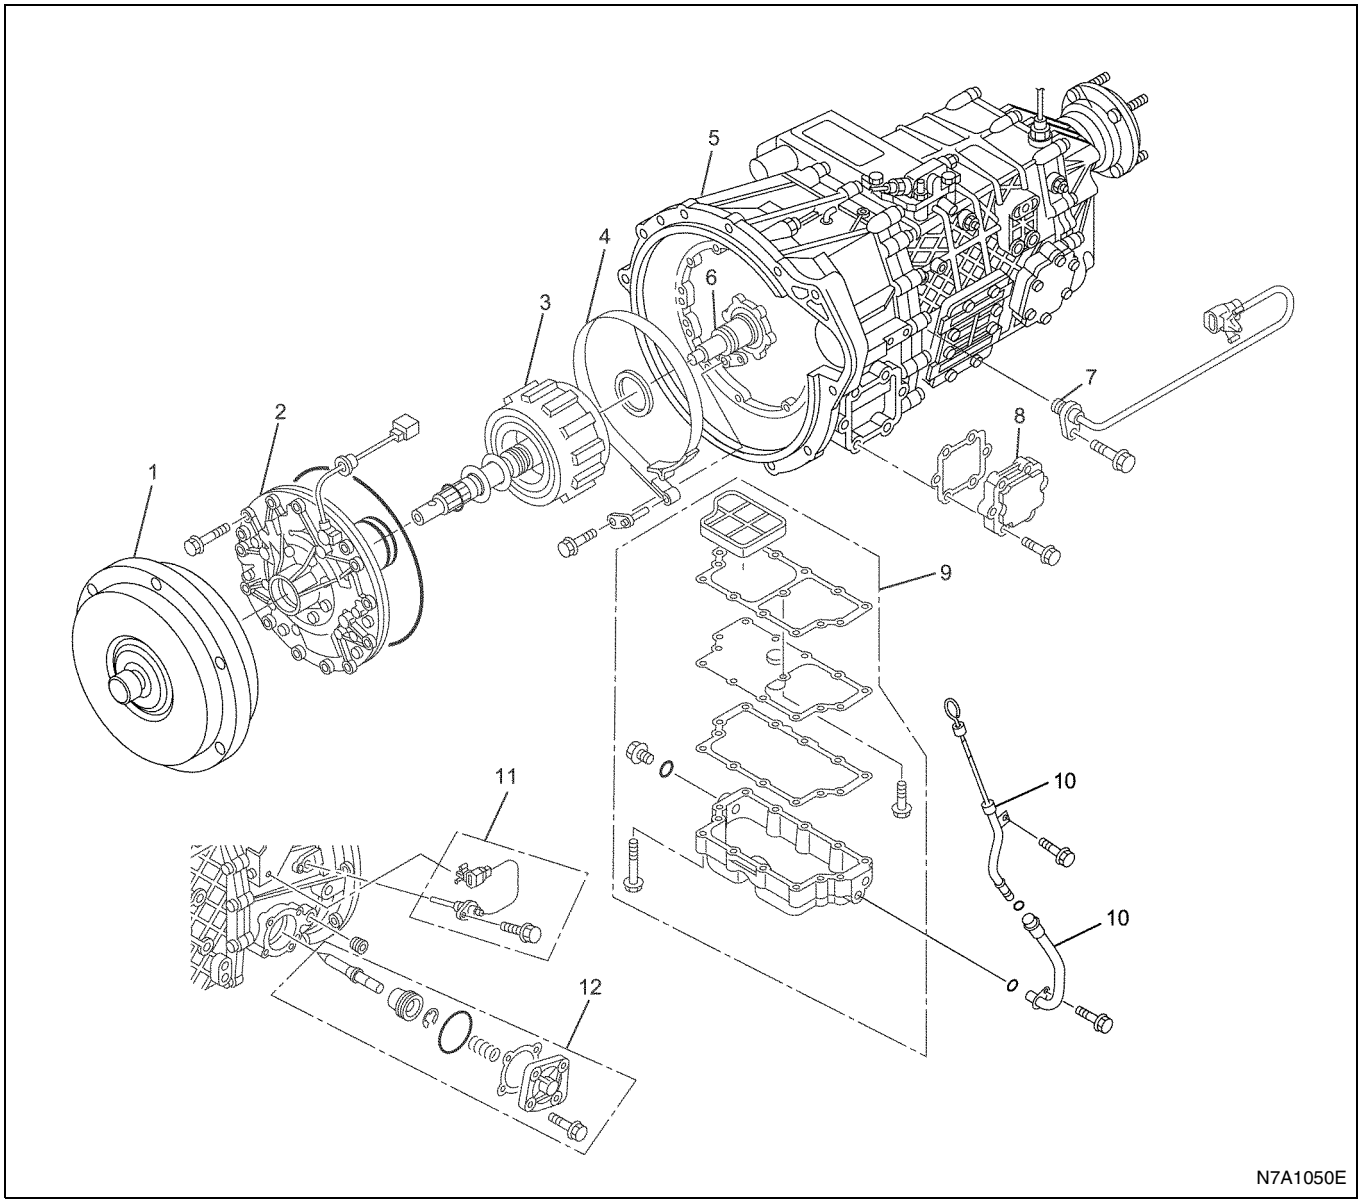
Tighten:
40 N·m (4.1 kg·m / 29.5 lb·ft)

5. Insert a new gasket, and tighten the cover with the bolt.

Tighten:
10 N·m (1.0 kg·m / 7.4 lb·ft)

Smoother

Components



Legend

1. Fluid Coupling
2. Oil Pump Assembly

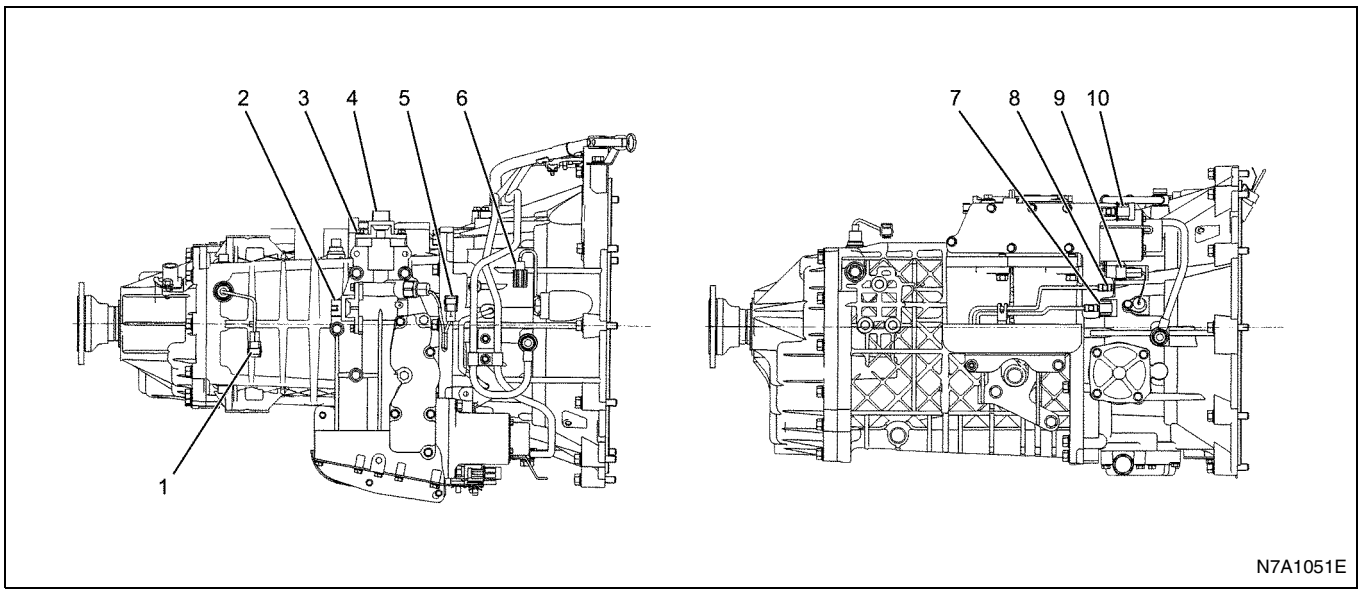
6. Top Gear Shaft
7. Input Shaft Speed Sensor
8. Cover
9. Oil Pan Assembly
10. Oil Filler Tube Assembly
11. Turbine Speed Sensor
12. Plunger and Piston Assembly

Caution:

- The interior of the Smoother does not stand up to dust, so be sure to clean all components before assembly. In addition, never use cloth rags, knit gloves, or air tools during assembly. Do not apply any paint, etc.
- In the case of disassembly, re-assemble using new O-rings, D-rings, and seal rings.

Disassembly

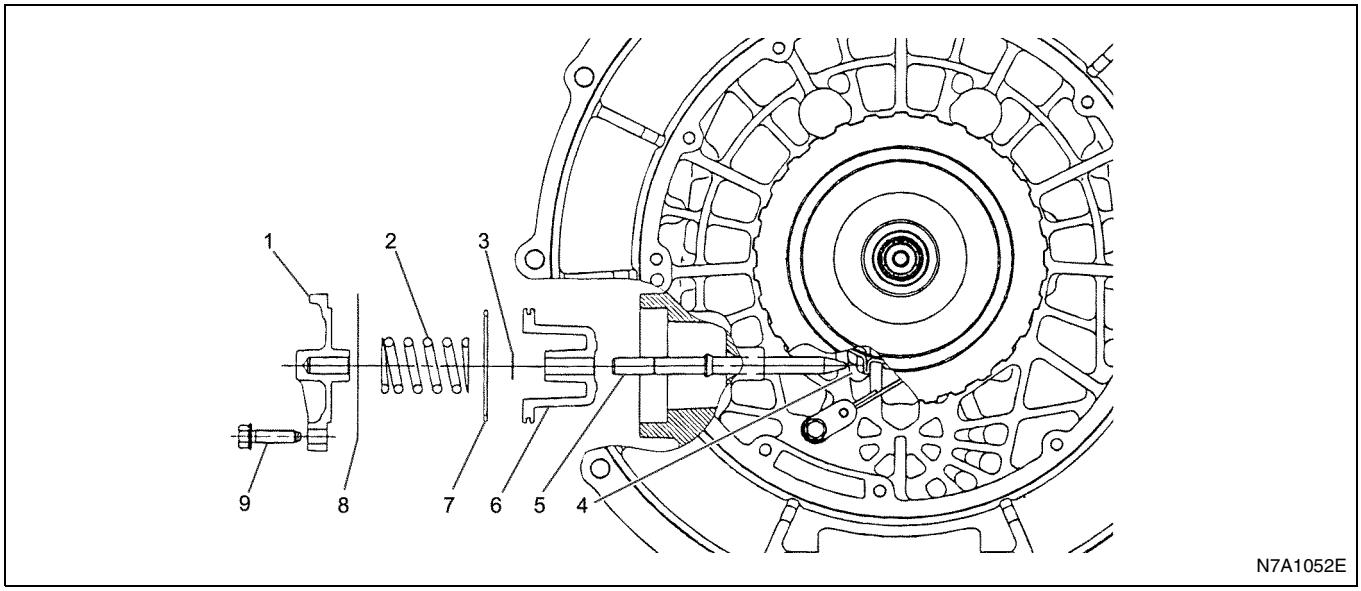
1. Remove the band clip, and disconnect the sensor connector from the transmission harness.



Legend

1. Reverse Switch
2. Gear Shift Select Sensor
3. Input Shaft Speed Sensor
4. Gear Shift Select Sensor
5. Neutral Switch
6. Solenoid & Transmission Fluid Temperature Sensor
7. 2-4-6-R Shift Solenoid
8. 1-3-5 Shift Solenoid
9. Turbine Speed Sensor
10. Select Solenoid

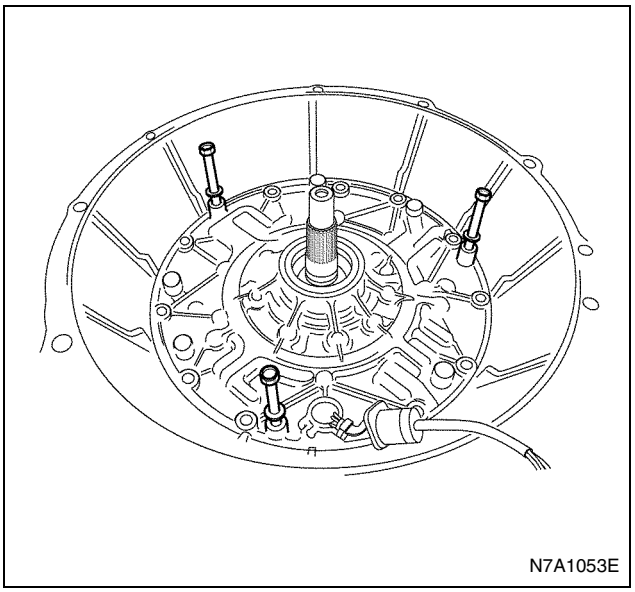
2. Drain the fluid coupling.
   - Any oil that is not drained can leak out later, so drain oil carefully.
3. To facilitate work, use a chain block, belt, or other means to secure the transmission with the front of the vehicle faced up.
4. Push in the grommet of the solenoid & transmission fluid temperature sensor harness located in the top of the clutch housing in order to put the both harness and connector inside the clutch housing.
5. Remove the bolt, and then remove the gasket, cover, spring, and piston and plunger sub assembly.
   - Tighten the four bolts equally.
6. Remove the snap ring of the piston and plunger sub assembly, and remove the piston, D-ring, and plunger.



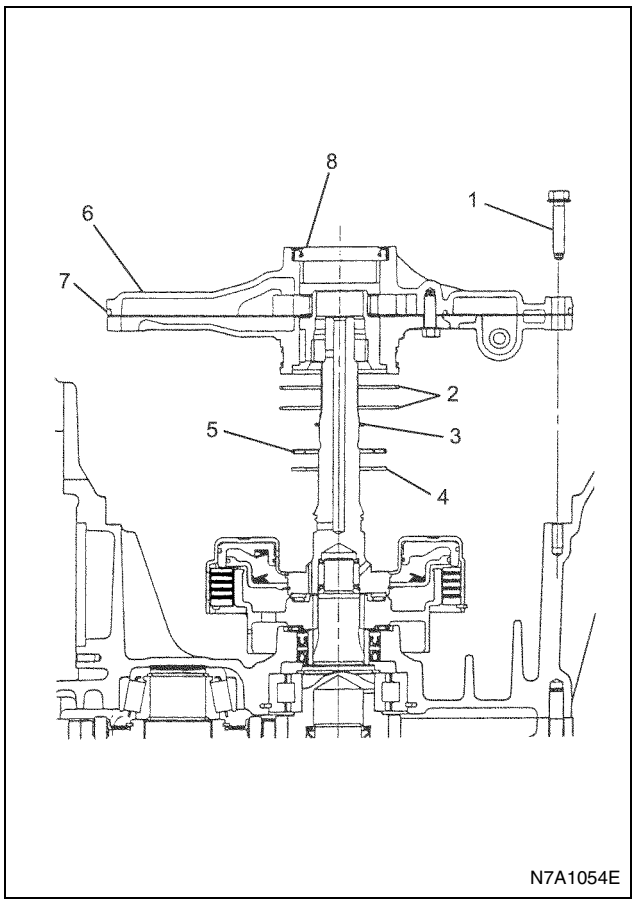
Legend

1. Cover
2. Spring
3. Snap Ring
4. Brake Band Support
5. Plunger
6. Piston
7. D-ring
8. Gasket
9. Bolt

7. Screw an M8 bolt onto the oil pump assembly work screw, and pull out the unit uniformly at three points.
   - When positioning the oil pump assembly, have the part that is towards the front of the vehicle facing downwards.



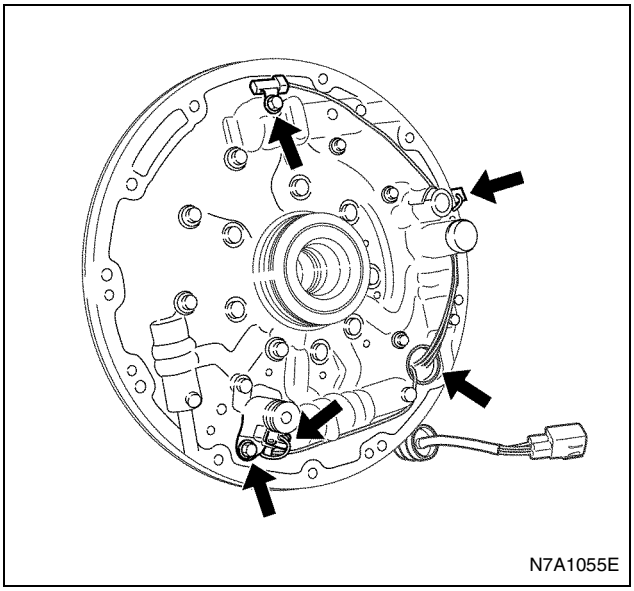
8. Remove the sealing at two points and the O-ring from the oil pump assembly.



Legend

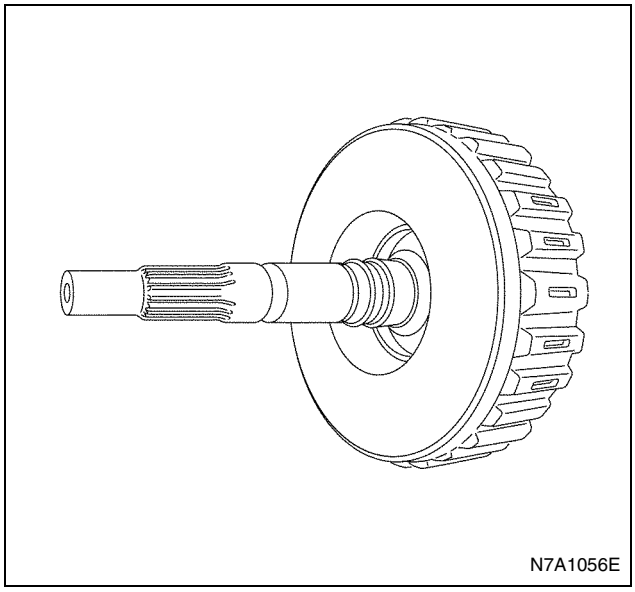
1. Bolt
2. Seal Ring
3. Seal Ring
4. Thrust Washer
5. Thrust Bearing
6. Oil Pump Assembly
7. O-ring
8. Oil Pump Oil Seal

9. Remove the thrust washer and thrust bearing. Check the thrust bearing for the following.
   - Smoothness of rotation
   - Noise
   - Damage, visible abnormality of rubber, etc.
   - Discoloration of rolling element
10. Disconnect the sealing from the clutch assembly turbine shaft
11. Remove the bolt, band clip, connector, and grommet indicated by the arrows from the oil pump assembly, and remove the solenoid and transmission fluid temperature sensor harness.

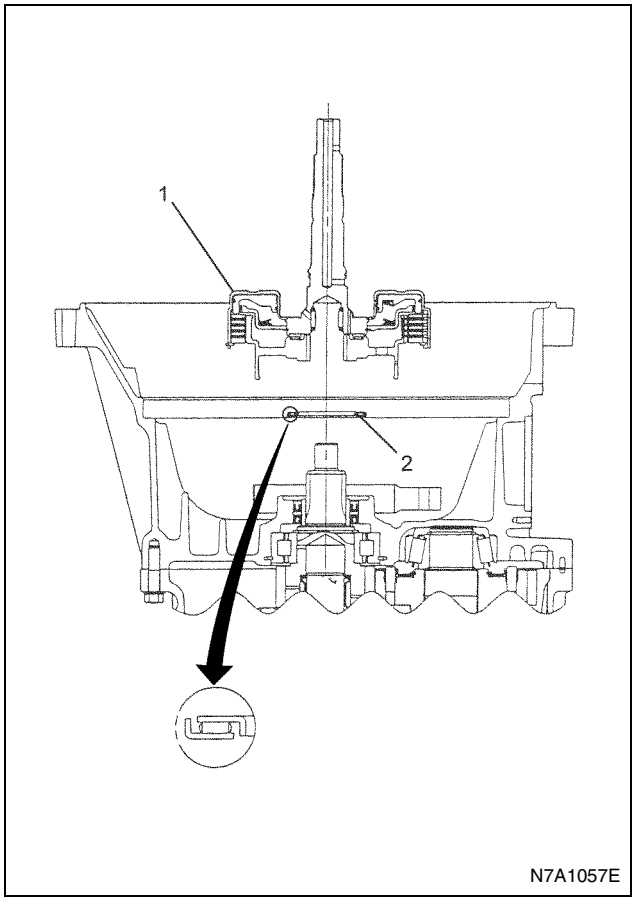


N7A1055E

12. Taking care not to damage the press-fit portion of the oil seal, remove the oil pump oil seal.
13. Remove the turbine speed sensor.
14. Remove the clutch assembly.
    - Holding the clutch hub so it is not pulled out, remove the assembly.



N7A1056E

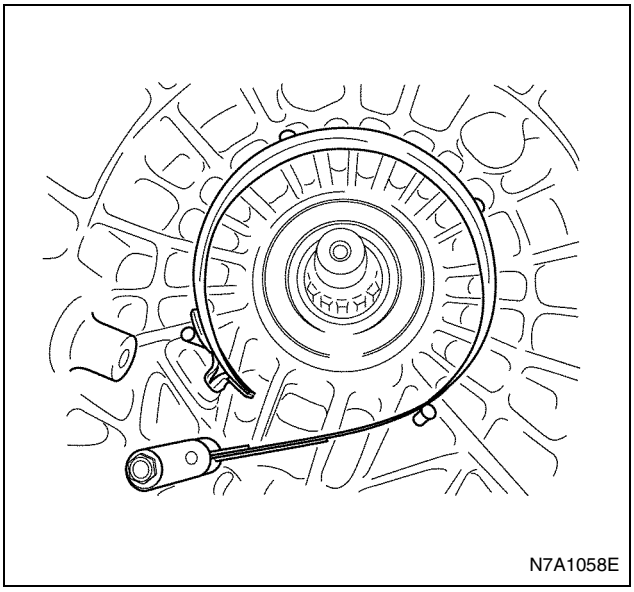


N7A1057E

Legend

1. Clutch Assembly
2. Thrust Bearing

15. Remove the bolt that holds the pin and remove the brake band.
    - If the brake band wear surface is cracked, burned, or otherwise abnormal, replace the brake band.



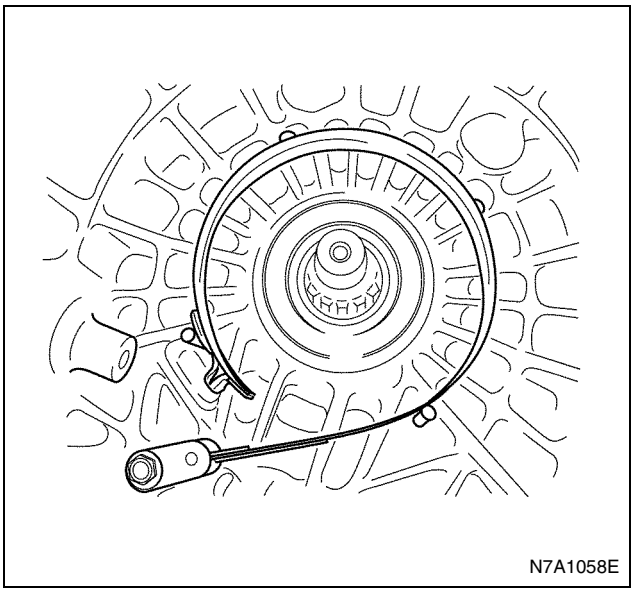
N7A1058E

16. Remove the input shaft speed sensor.

Assembly

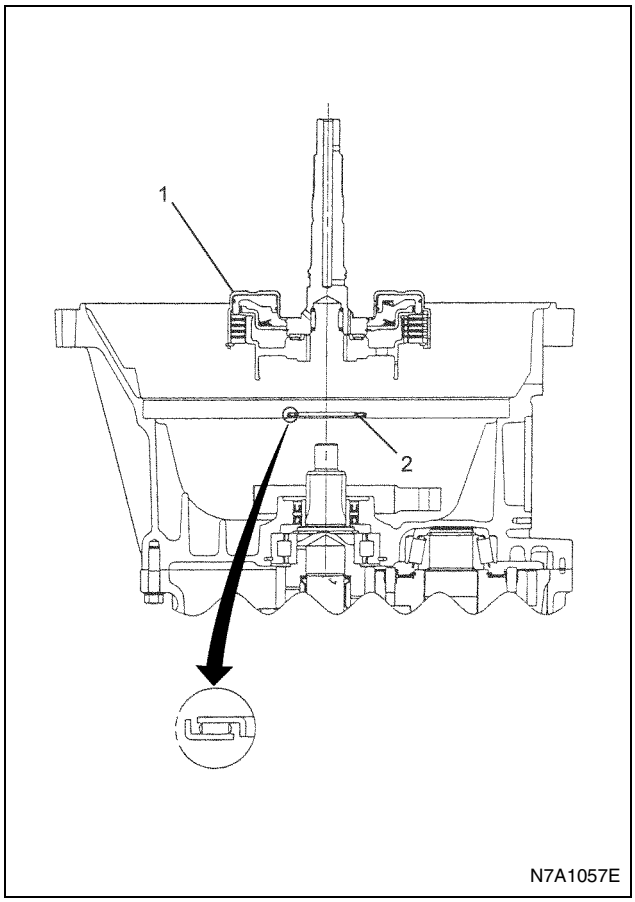
1. Set the brake band inside of the four clutch housing pins, insert the pins into the brake band, and install the bolts.

Tighten:
23 N·m (2.3 kg·m / 17 lb·ft)



N7A1058E

2. Taking care of the assembly orientation, place the thrust bearing on the clutch housing.
   - At this time, apply oil (Besco ATF III) to the clutch housing contact surface and to the thrust bearing.
3. Apply oil (Besco ATF III) to the inner circumference of the brake band and the outer circumference of the clutch hub, and then insert the clutch assembly into the shaft so that it fits inside the brake band.
   - The drum part and the hub part of the clutch assembly can be separated, so take care that they are not separated when you assemble the clutch assembly.
   - Put the transmission in neutral, and confirm that the hub can be rotated by hand.

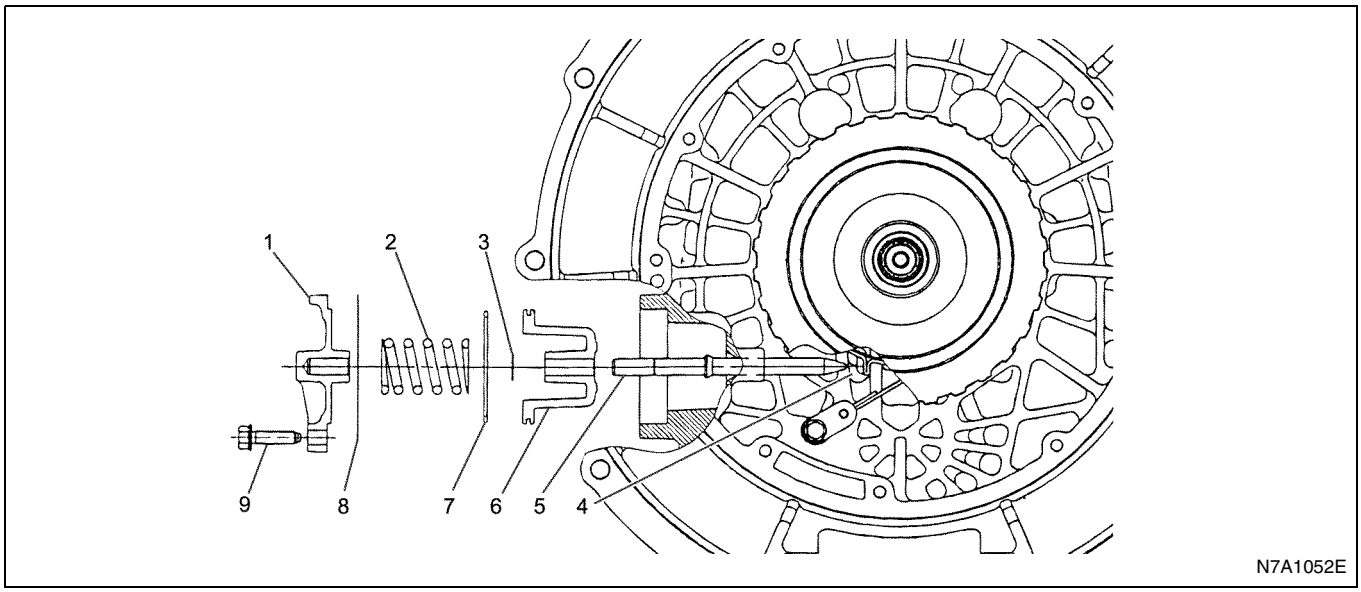


N7A1057E

Legend
1. Clutch Assembly
2. Thrust Bearing

4. Insert the plunger into the piston and secure it with the snap ring, install the D-ring, and install the piston and plunger sub assembly.

5. Apply oil (Besco ATF III) to the clutch housing hole and piston and plunger sub assembly, insert the piston and plunger sub assembly, and position the brake band so the plunger tip comes into contact with the brake band support.



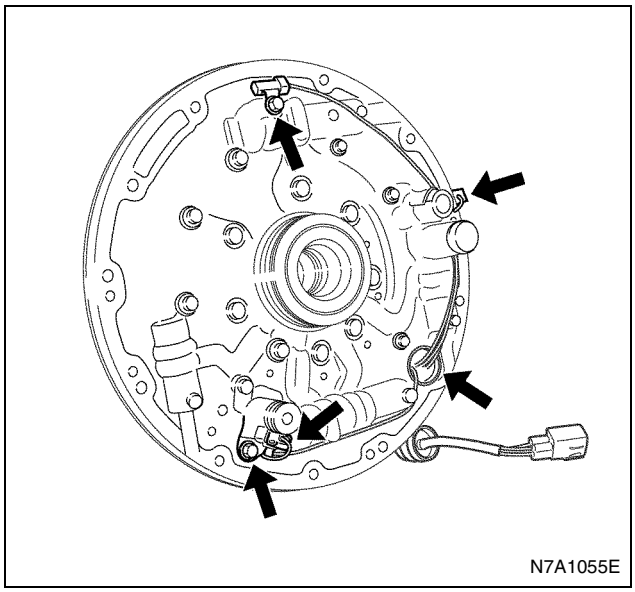
Legend

1. Cover
2. Spring
3. Snap Ring
4. Brake Band Support
5. Plunger
6. Piston
7. D-ring
8. Gasket
9. Bolt

6. Set the spring inside the piston, install a new gasket on the cover, and temporarily tighten the bolt so the spring is not compressed.
7. Apply oil (Besco ATF III) to the turbine speed sensor O-ring and clutch housing hole, and install using the bolts.

Tighten:
9 N·m (0.9 kg·m / 6.6 lb·ft)

8. Apply Besco ATF III to the outer circumference of the oil seal and to the lip, and then use an installer (9-8522-1269-0) and grip (5-8840-0007-0) to press-fit the oil seal to the oil pump assembly.
9. Secure the solenoid and transmission fluid temperature sensor harness with a bolt and new band clip, and connect the solenoid connectors.
   Pass the harness grommet through the hole and install the solenoid and transmission fluid temperature sensor harness.
   - Make sure the solenoid and transmission fluid temperature sensor harness wiring is not loose, and appears as shown in the illustration below.



10. Apply Vaseline to the outer circumference of the shaft, open the slit in the sealing, and install the sealing.
    - Take care you do not damage the sealing by opening the slit too much. After assembly, push the slit part inside.
11. Perform the procedure in step 10 to install the oil pump assembly sealing at the other two points.

12. Apply oil (Besco ATF III) to the thrust washer and thrust bearing, install them in the clutch assembly.
    - Take care to orient the thrust bearing correctly (needle down, gauge up) when assembling it, and follow the correct sequence.
13. Apply oil (Besco ATF III) to the outer circumference of the oil pump assembly O-ring, and assemble.
14. Apply oil (Besco ATF III) to the bore of the clutch housing, insert a bolt into the work screw hole, assemble the hydraulic control unit, and tighten with the bolts.
    - Take care not to damage the O-ring when aligning the clutch housing bore with the center of the hydraulic control unit.
    - Align the phase of the oil pump assembly hole and clutch housing screw hole when assembling.
    - Take care that the solenoid and transmission fluid temperature sensor harness does not become pinched between components during assembly.

Tighten:
23 N·m (2.3 kg·m / 17 lb·ft)

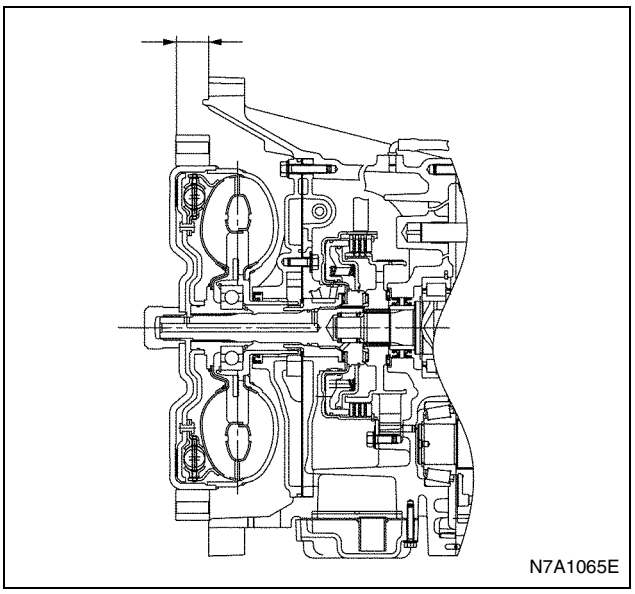
1. Bolt
2. Seal Ring
3. Seal Ring
4. Thrust Washer
5. Thrust Bearing
6. Oil Pump Assembly (Oil Control Unit)
7. O-ring
8. Oil Pump Oil Seal

15. Insert the solenoid and transmission fluid temperature sensor harness grommet into the clutch housing hole.
16. Check that the clutch assembly turbine shaft can rotate.
17. Uniformly tighten the four bolts you temporarily tightened in step 6.

Tighten:
23 N·m (2.3 kg·m / 17 lb·ft)

18. Position the Smoother so it is level and insert the fluid coupling tab so it engages wit the oil pump rotor.
    - Take care to avoid damage to the oil pump oil seal.

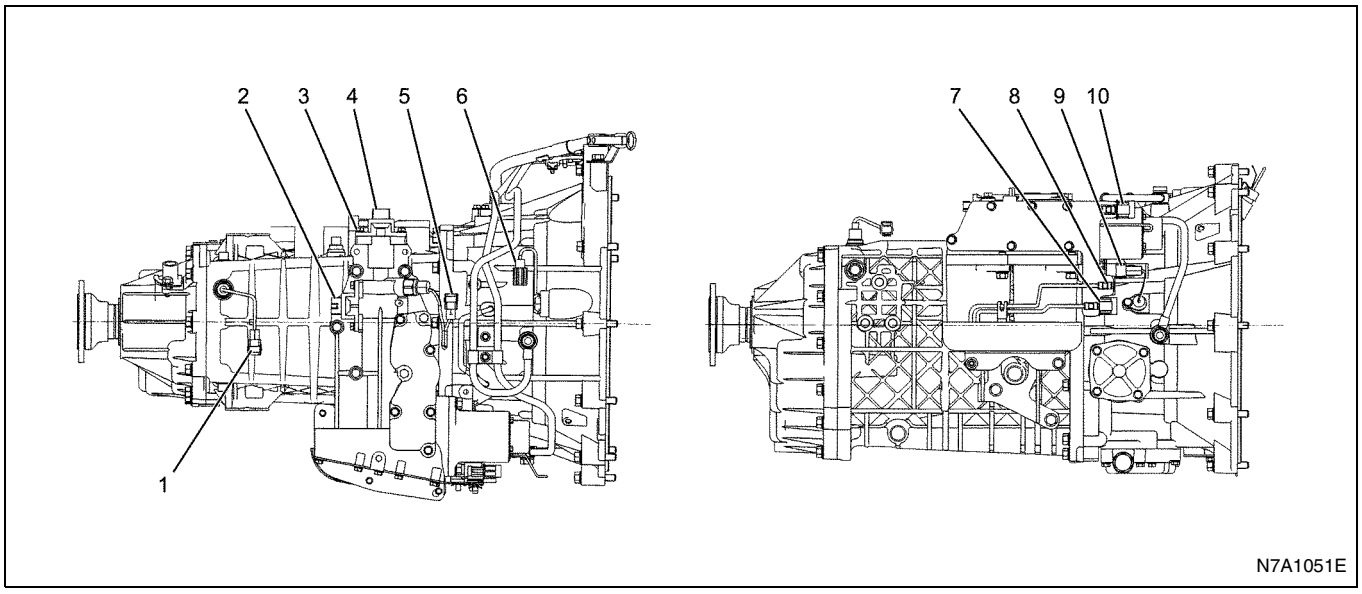
- Check to make sure that the gap between the clutch housing installation surface and the fluid coupling installation surface is no more than 31 mm.



19. Install the input shaft speed sensor.

Tighten:
9 N·m (0.9 kg·m / 6.6 lb·ft)

20. Connect the sensor harness connector to the transmission harness.
    - Install the band clip.



Legend

1. Reverse Switch

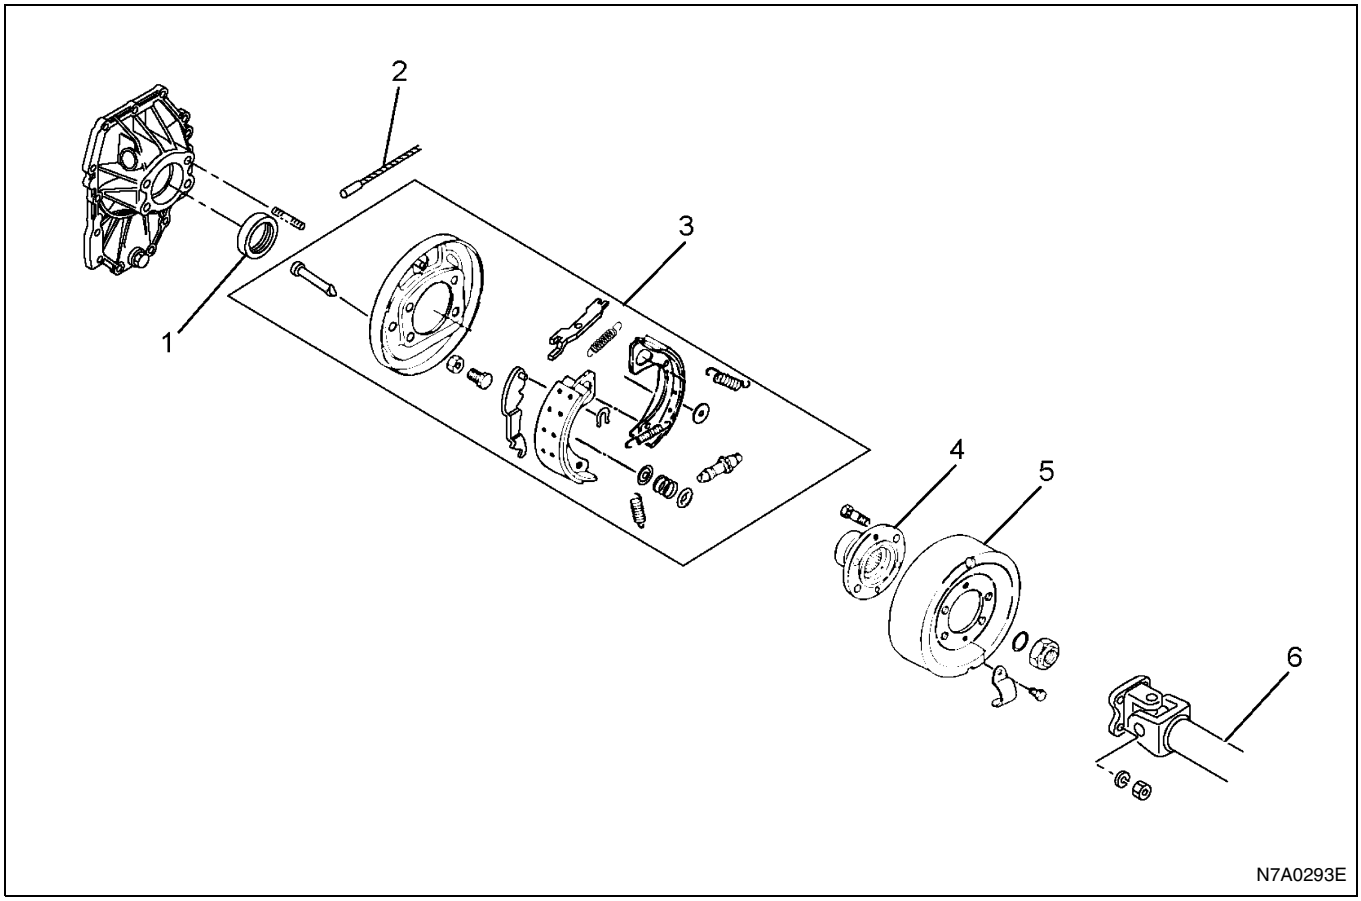
Rear Oil Seal (5-Speed)

Components

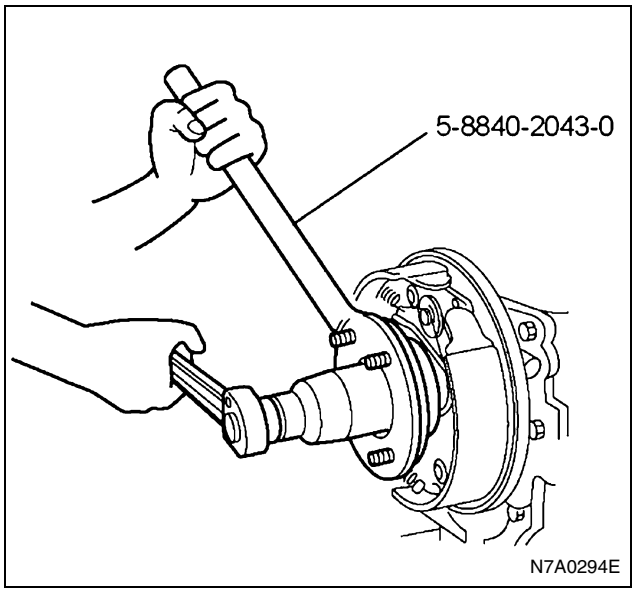


Legend

1. Oil Seal
2. Parking Brake Cable
3. Parking Brake Assembly
4. Coupling Driver
5. Parking Brake Drum
6. Rear Propeller Shaft Assembly

Removal

1. Remove the rear propeller shaft assembly.
   - Refer to “Rear Drive Propeller Shaft”.
2. Remove the parking brake cable.
   - Refer to “Parking Brake”.
3. Remove the parking brake drum.
   - Refer to “Parking Brake”.
4. Remove the coupling driver and O-ring.
   - Carefully release the caulking (two points) of the lock unit, and remove the lock nut by fixing it with the flange holder (5-8840-2043-0).



5. Remove the parking brake assembly.

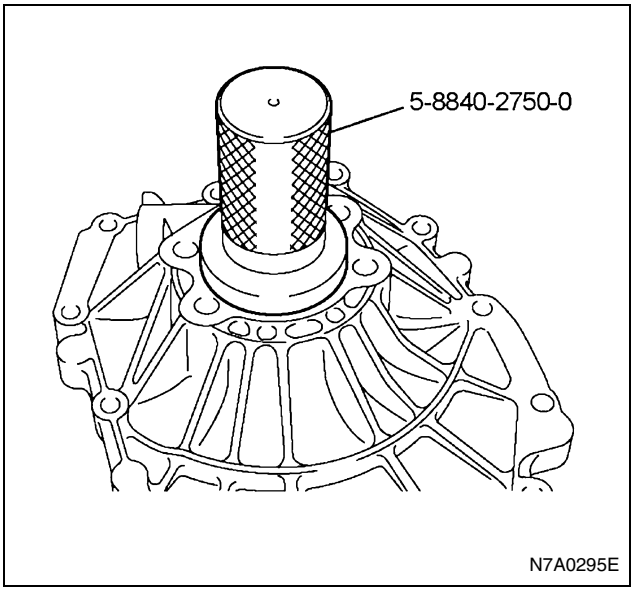
- Refer to “Parking Brake”.

6. Remove the rear oil seal.

Installation

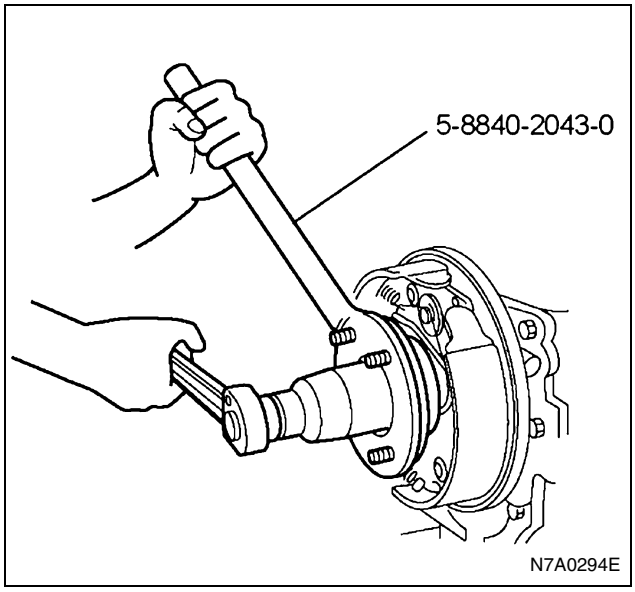
1. Apply engine oil to the outer circumference of a new oil seal, and then use the installer (5-8840-2750-0) to press-fit the oil seal to the rear cover.
   - Apply Besco L2 grease to the lip of the oil seal.

Caution:
Take care to avoid damaging the oil seal lip.



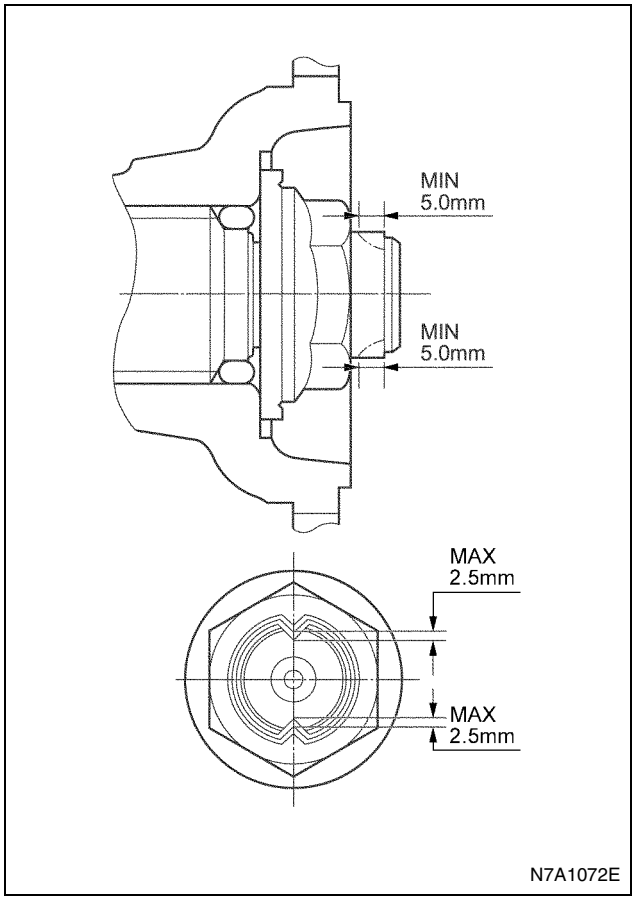
2. Install the parking brake assembly.
   - Refer to “Parking Brake.”
3. Install the coupling driver.
   a. Apply engine oil to the O-ring, and then install the coupling driver and O-ring.
   b. Using a new lock nut, use the flange holder (5-8840-2043-0) to tighten the lock nut.

Tighten:
289 N·m (29.5 kg·m / 213.2 lb·ft)



- After tightening the nut to the specified torque, align the nut lip with the V-groove of the shaft tip and caulk it (2 points) securely using a chisel (chisel tip shape: approx. 1 mm in radius × 60 degrees) so that the caulking is more than 5 mm in length and the lip gap is less than 2.5 mm.

Caution:
After caulking, check the caulking of the nut. If any cracks are discovered, replace the lock nut and re-caulk.



4. Install the parking brake drum.
   - Refer to “Parking Brake”.
5. Install the parking brake cable.
   - Refer to “Parking Brake”.
6. Install the rear propeller shaft assembly.
   - Refer to “Rear Drive Propeller Shaft”.

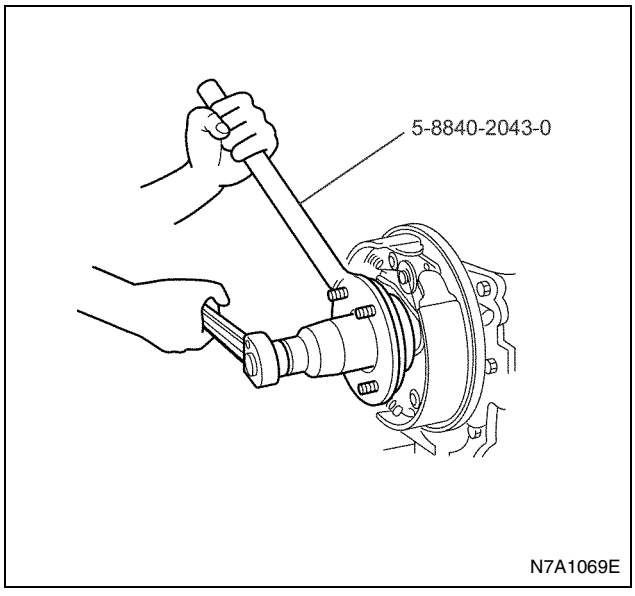
Removal

1. Remove the rear propeller shaft assembly.
   - Refer to “Propeller shaft”.
2. Remove the parking brake cable.
   - Refer to “Parking Brake”.
3. Remove the parking brake drum.
   - Refer to “Parking Brake”.
4. Remove the coupling driver and O-ring.
   - Carefully release the caulking (two points) of the lock unit, and remove the lock nut by fixing it with the flange holder (5-8840-2043-0).



5. Remove the parking brake assembly.

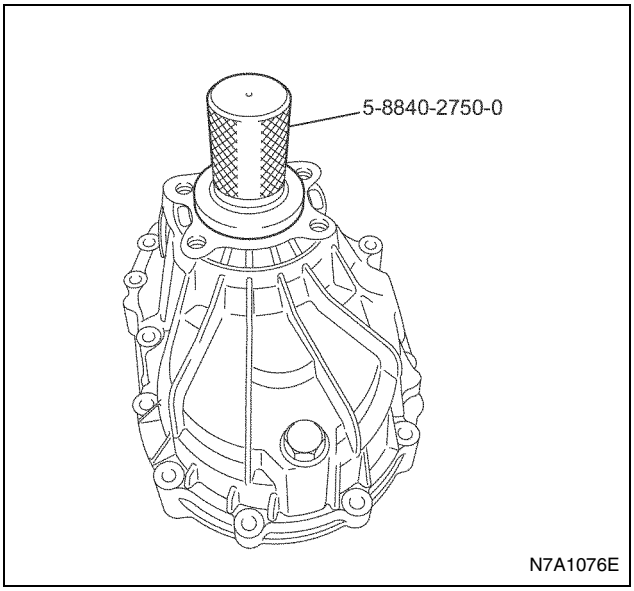
- Refer to “Parking Brake”.

6. Remove the rear oil seal.

Installation

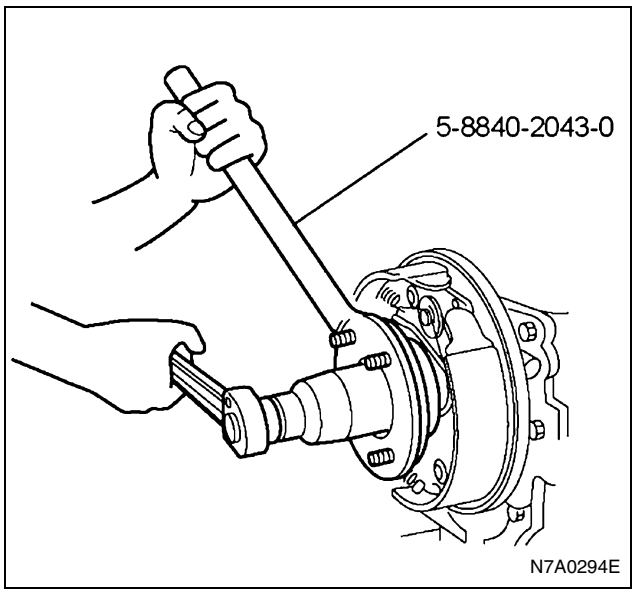
1. Apply engine oil to the outer circumference of a new seal, and then use the installer (5-8840-2750-0) to press-fit the oil seal to the rear cover.
   - Apply Besco L2 grease to the lip of the oil seal.

Caution:
Take care to avoid damaging the oil seal lip.



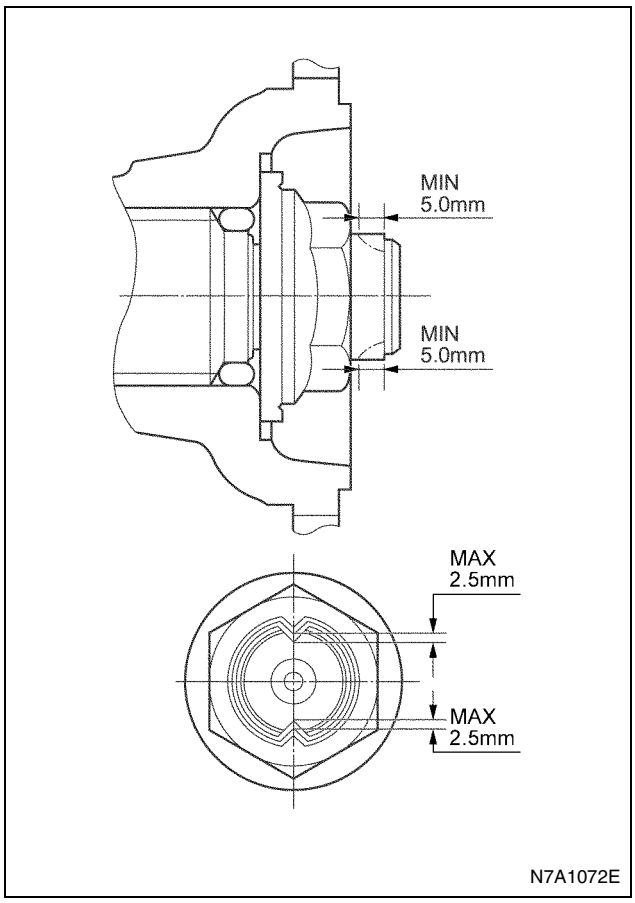
2. Install the parking brake assembly.
   - Refer to “Parking Brake”.
3. Install the coupling driver.
   a. Apply engine oil to the O-ring, and then install the coupling driver and O-ring.
   b. Using a new lock nut, use the flange holder (5-8840-2043-0) to tighten the lock nut.

Tighten:
289 N·m (29.5 kg·m / 213.2 lb·ft)



- After tightening the lock nut to the specified torque, stake it (2 points) securely using a chisel (chisel tip shape: approx. 1 mm in radius × 60 degrees) so the lock nut lip gap is aligned with the V-groove of the shaft and is at least 5 mm, and the clearance between the V-groove bottom and the nut lip is 2.5 mm or less.

Caution:
After caulking, check the caulking of the nut. If any cracks are discovered, replace the lock nut and re-caulk.



4. Install the parking brake drum.
   - Refer to “Parking Brake”.
5. Install the parking brake cable.
   - Refer to “Parking Brake”.
6. Install the rear propeller shaft assembly.
   - Refer to “Propeller shaft.”

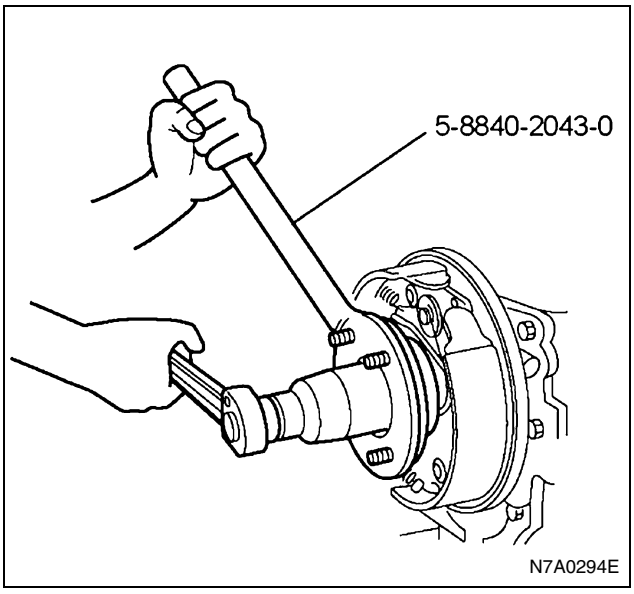
Disassembly

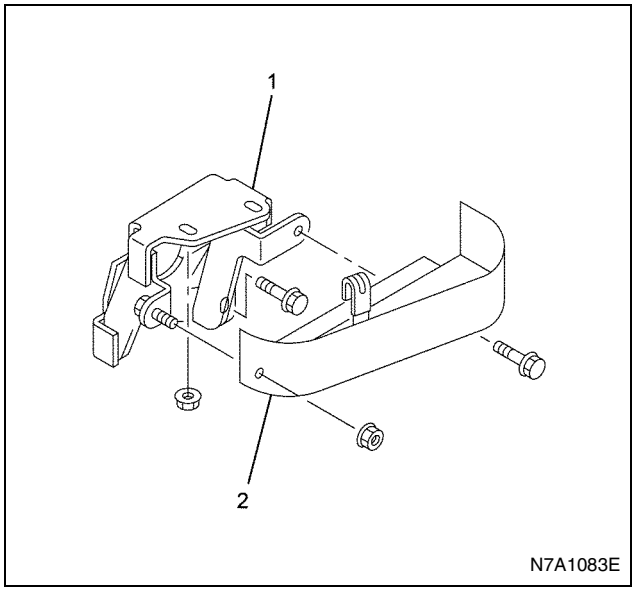
Caution:
The transmission case and clutch housing are made of aluminum, to be sure to exercise sufficient care to ensure they are not damaged. A particularly high level of care is required to protect against rib damage, which can affect the strength of the case.

Also take care to avoid personal injury when working with cases, gears, and other heavy items.

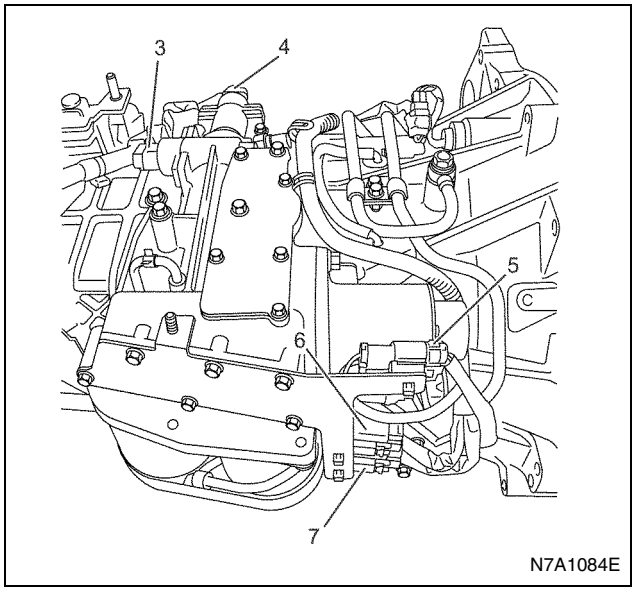
1. Remove the fixing bolt of the adjust hole cover, and remove the parking brake drum.
   - Refer to “Parking Brake.”
2. Carefully release the caulking (two points) of the coupling driver lock nut, and remove the lock nut by fixing it with the flange holder (5-8840-2043-0).



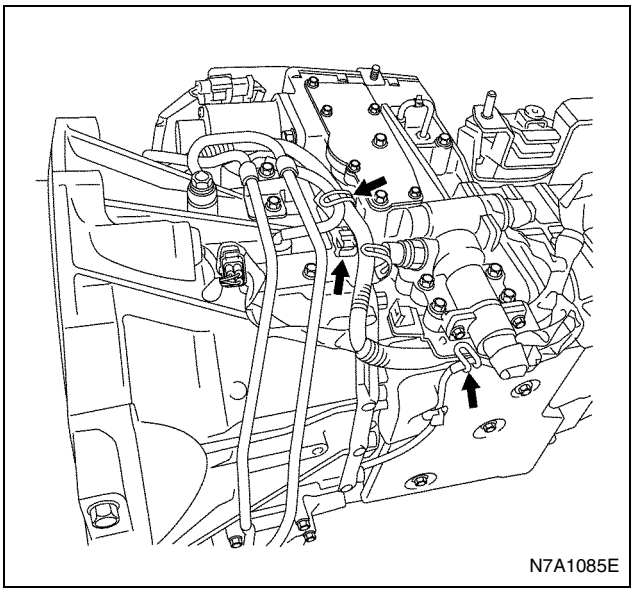
3. Remove the coupling driver and O-ring.
4. Remove the parking brake assembly.
   - Refer to “Parking Brake”.
5. Remove the filler plug and O-ring.
6. Remove the drain plug and O-ring.
   - Drain the transmission oil. When draining the oil, check the oil amount, and check for metal bits and foreign matter.
7. Remove the heat protector (2) and heat protector bracket (1).



8. Remove the gearshift control box.
   a. Disconnect the five connectors from the gearshift control box.
      - Disconnect the connectors of the select sensor (3), shift sensor (4), select solenoid (5), 2-4-6-R shift solenoid (6), and 1-3-5 shift solenoid (7).



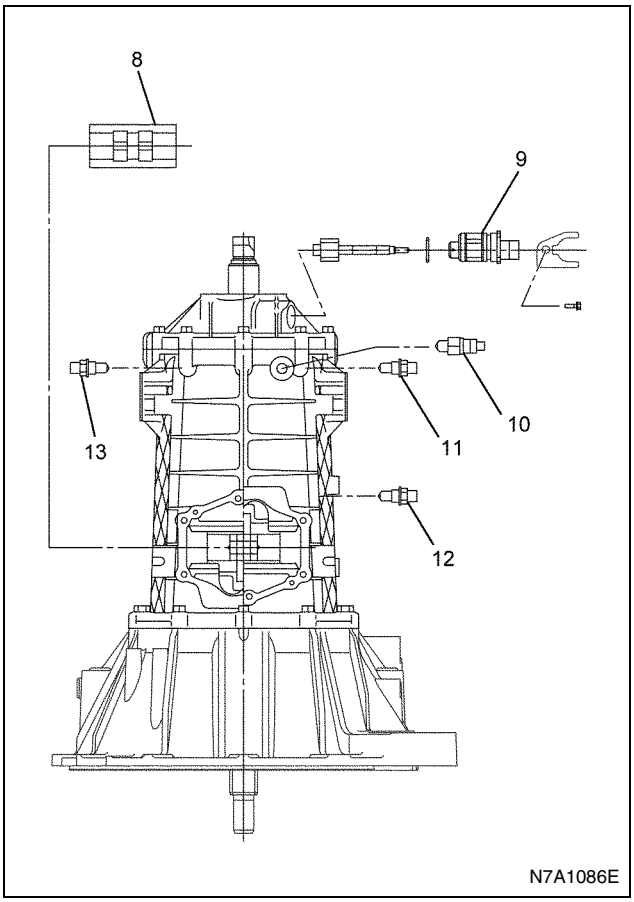
b. Remove the harness from the two clips, and remove the neutral switch connector from the bracket.



N7A1085E

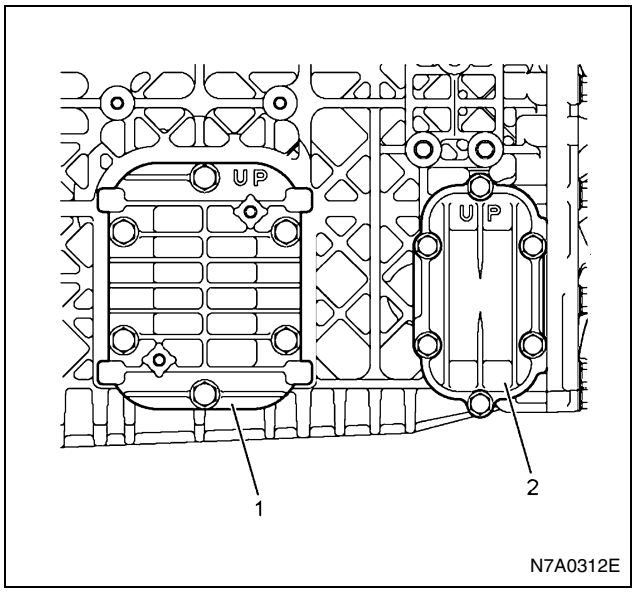
c. Remove the six bolts and the gearshift control box.

9. Remove the interlock plate (8).
10. Remove the speedometer driven gear (9).
11. Remove the reverse switch (10).
12. Remove the detent assembly (11), (12), (13).



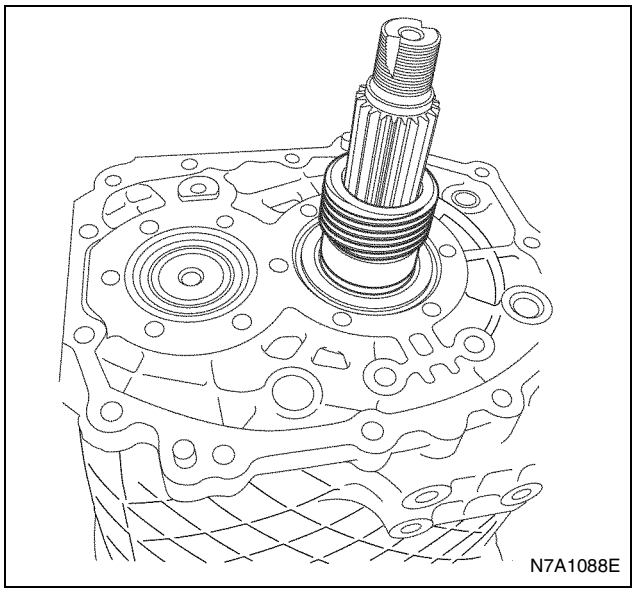
N7A1086E

13. Remove the input shaft speed sensor.
14. Remove the PTO cover (1).
15. Remove the reverse idle cover (2).



N7A0312E

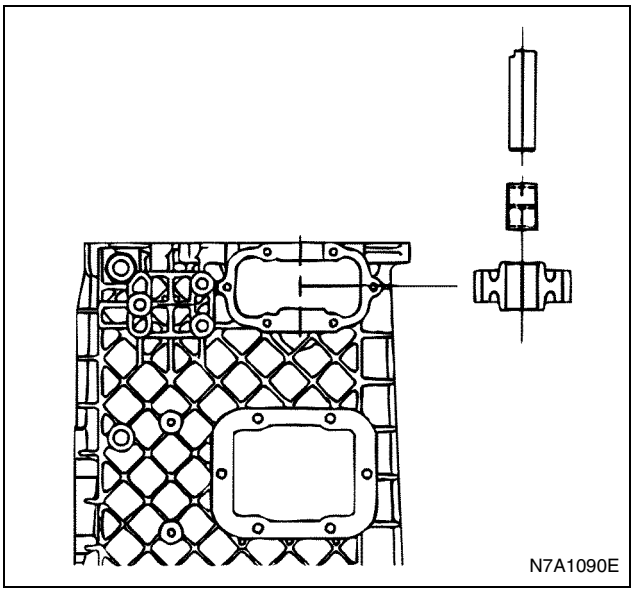
16. Remove the rear cover assembly.
17. Inspect the rear cover oil seal. If it is worn or damaged, remove it from the rear cover.
18. Remove the speedometer gear and collar.



N7A1088E

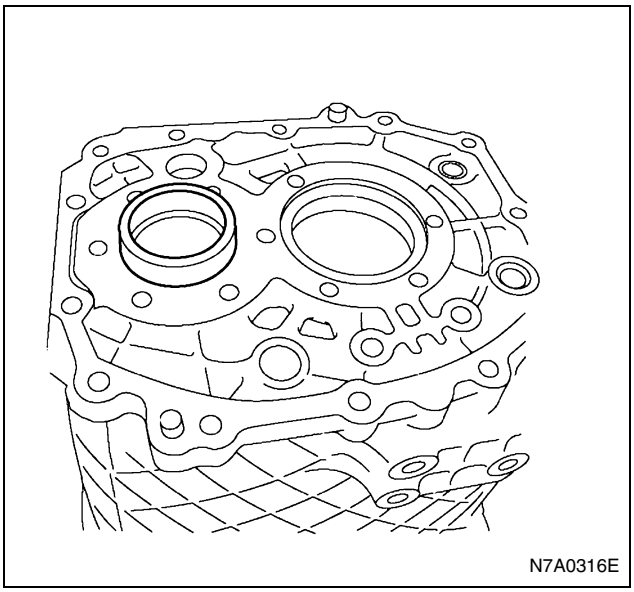
19. Remove the retainer from the transmission case.

20. Pull out the reverse idle shaft, and remove the reverse idle gear and needle bearing.



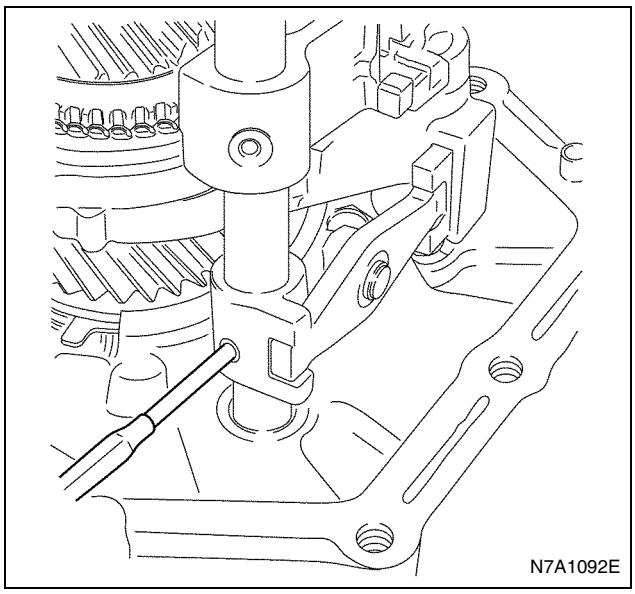
N7A1090E

21. Remove the rear outer snap ring from the main shaft rear bearing.
22. Remover the counter shim.
23. Remove the transmission case from the clutch housing.
24. Remove the bearing rear outer race from the transmission case.



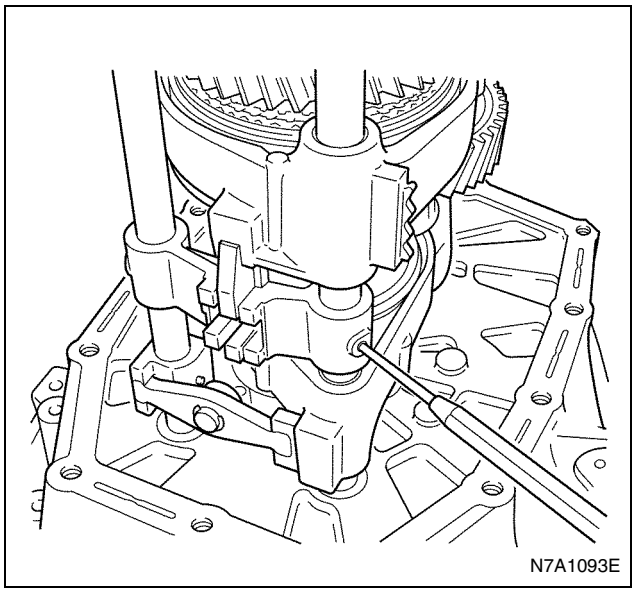
N7A0316E

25. Remove the 3rd — 4th shift rod, 4th — 5th main shift rod block and 4th — 5th gear sub shaft block.
    - When driving out the spring pin, insert a round bar on the opposite side of the shift rod, and use a spring pin remover to remove the spring pin while taking care to avoid damage to other parts.



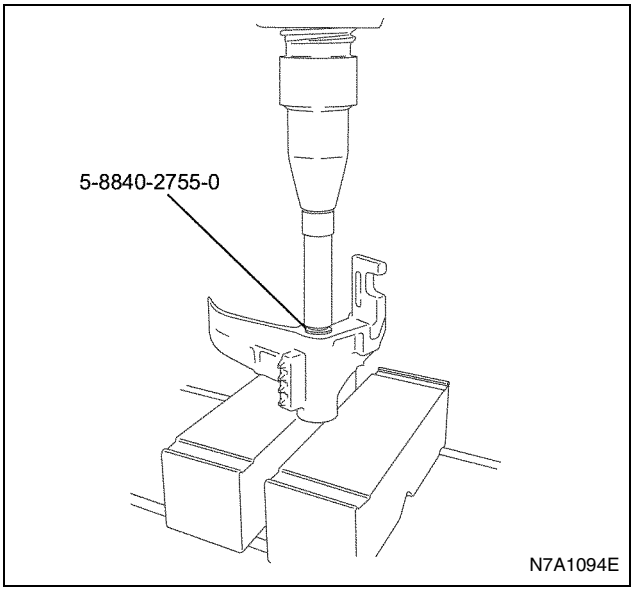
N7A1092E

26. Remove the 1st — Reverse and 2nd — 3rd shift rod, 1st — Reverse shift arm, 2nd — 3rd shift arm, 1st — Reverse shift block, 4th — 5th shift arm.
    - When driving out the spring pin, insert a round bar on the opposite side of the shift rod, and use a spring pin remover to remove the spring pin while taking care to avoid damage to other parts.



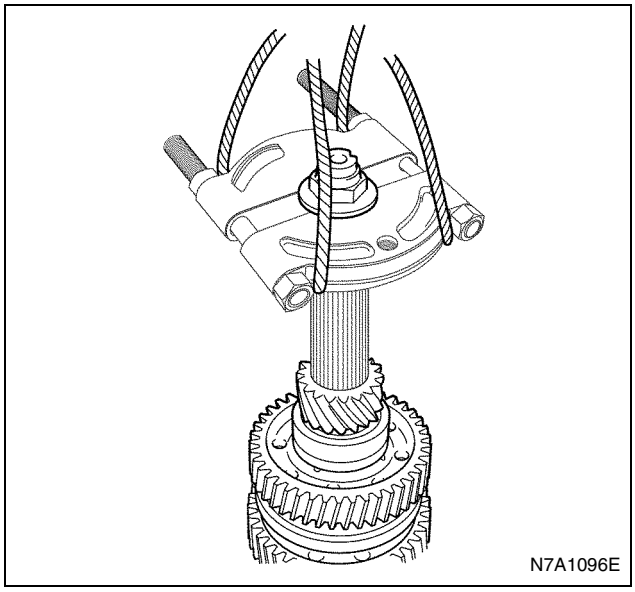
N7A1093E

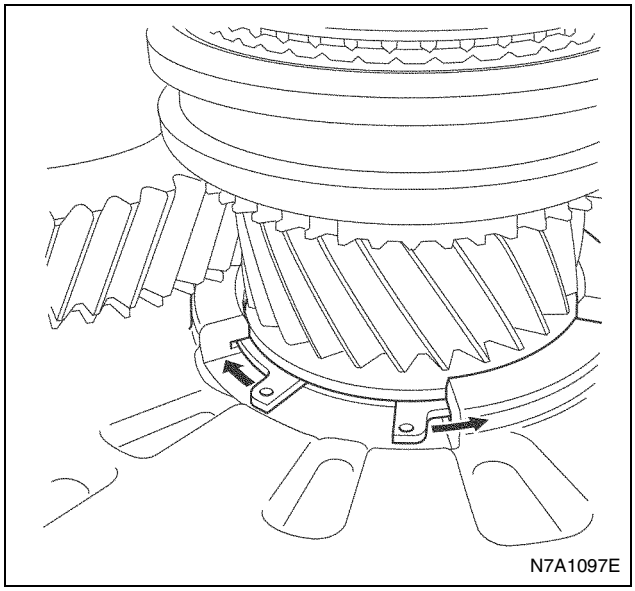
27. Use a remover (5-8840-2755-0) to remove the bushing from the 2nd — 3rd shift arm.
28. Use a remover (5-8840-2755-0) to remove the bushing from the 4th — 5th shift arm.
    - Use the remover in combination with a round bar of a length that makes it possible to push in as far as possible.



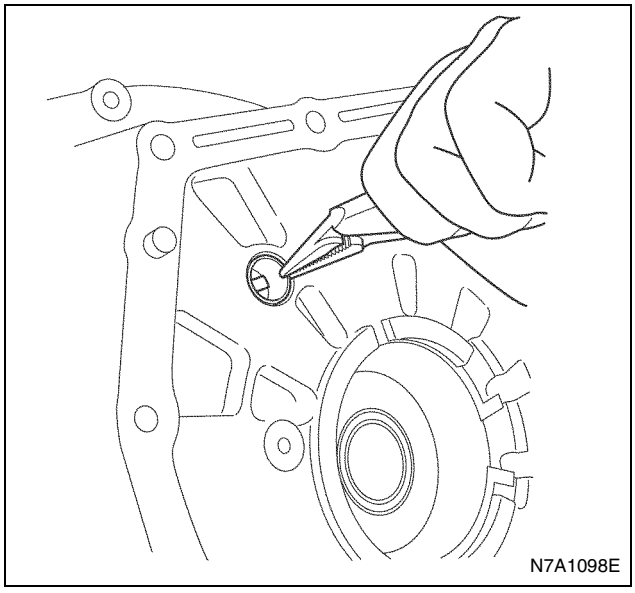
29. Remove the 5th relay lever from the clutch housing.
30. Remove the magnet case from the clutch housing.
31. Remove the main shaft assembly, top gear shaft assembly, and counter shaft assembly.
    a. Use a lashing belt or some other belt from a lashing device to bundle the main shaft assembly, counter shaft assembly, and top gear shaft assembly at two points so they cannot separate. Tighten the belt securely.

    b. Attach a bearing remover to the main shaft and secure with a lock nut, attach a wire, and raise it using a hoist. While opening the top gear shaft bearing outer snap ring attached to the clutching housing, simultaneously remove the top gear shaft assembly, main shaft assembly, and counter shaft assembly from the clutch housing.

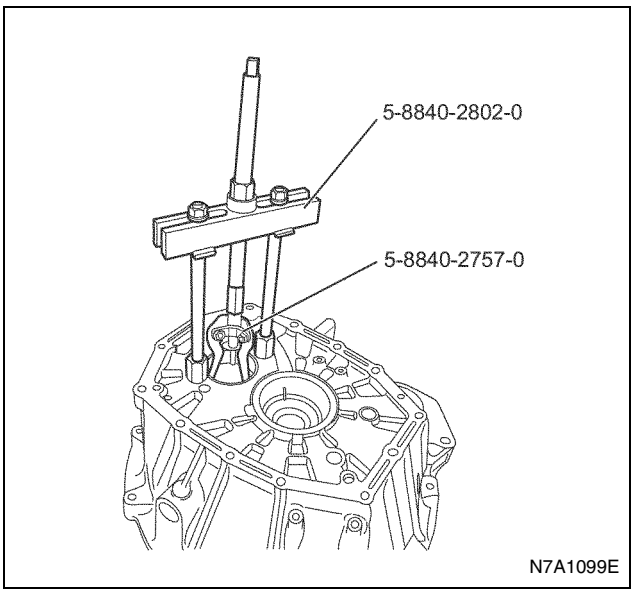




32. Inspect the clutch housing bushing. If it is worn or damaged, use pliers to remove it from the clutch housing.



33. Inspect the counter shaft front bearing. If it is worn or damaged, use a bearing remover (5-8840-2757-0) and bushing puller (5-8840-2802-0) to remove the bearing outer race from the clutch housing.

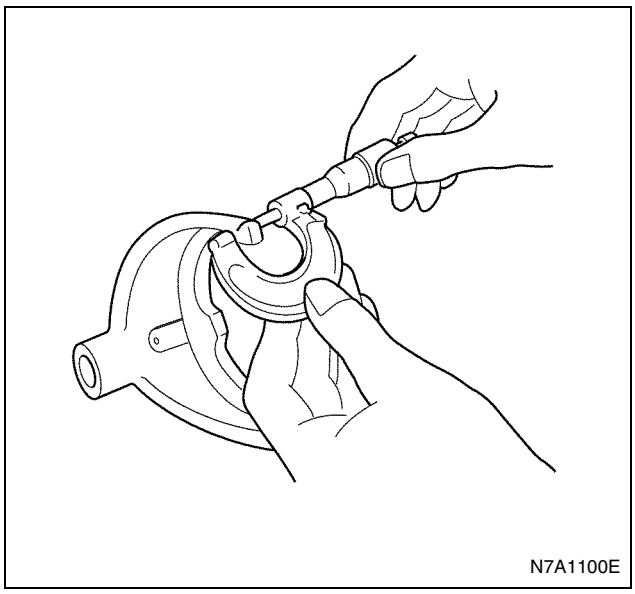


34. Inspect the front oil seal. If it is worn or damaged, remove it from the clutch housing.

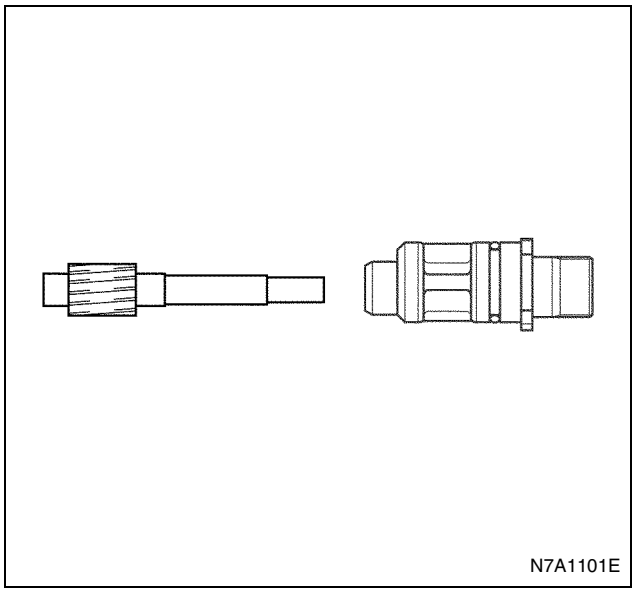
Inspect each part. Replace or repair as required if anything is worn or damaged or if any other defect is discovered.

35. Inspect each shift mechanism component. Repair any minor damage, bending, or stepped wear. Replace any component that is badly damaged or worn, and any component that exceeds the allowable limit.
    - Shift rod and shift arm bending, wear, damage
    - Shift arm thickness
      – Use a micrometer to measure the thickness of the shift arm tip.

Shift Arm Thickness (mm)		
	Specified Value	Limit
1st — Reverse 3rd — 2nd 5th — 4th	9.60 — 9.85	9.0



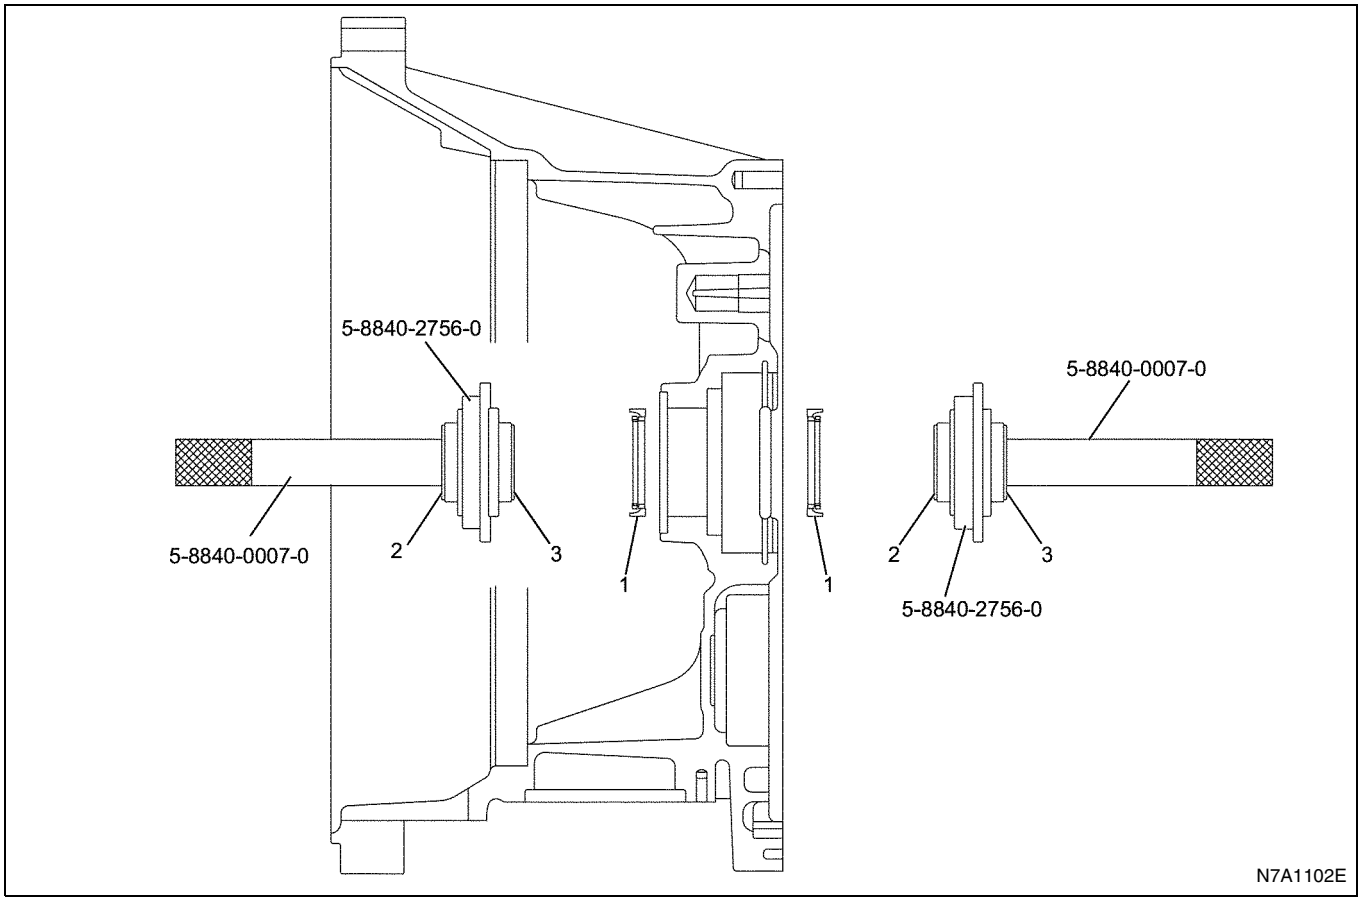
36. Inspect the speedometer driven gear and driven gear bushing for wear.
    - Replace if there is excessive wear.



Assembly

1. Inspect the oil seal. If it needs to be replaced with a new one due to wear or damage, apply engine oil or grease to the oil seal's outer circumference, and then use an installer (5-8840-2756-0) and grip (5-8840-0007-0) to press-fit it into the clutch housing as shown in the illustration, taking care that the front-back orientation of the front oil seal is correct.
    - Fill the lip of the oil seal with Besco L2 grease.

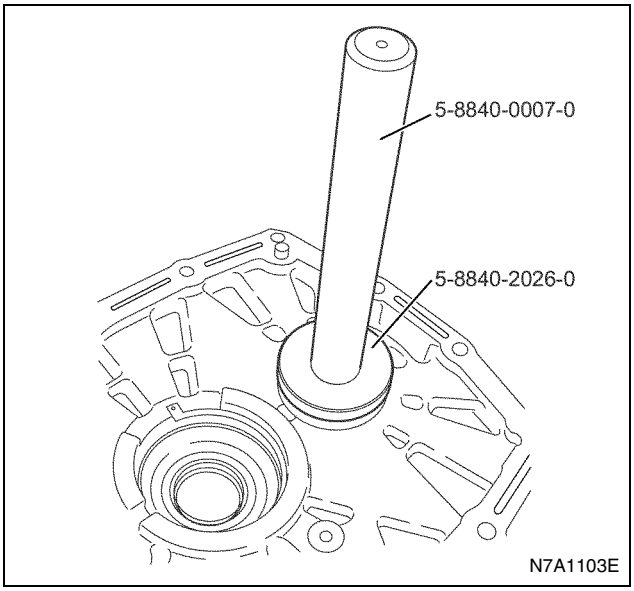
Caution:
Take care to avoid damaging the oil seal lip.



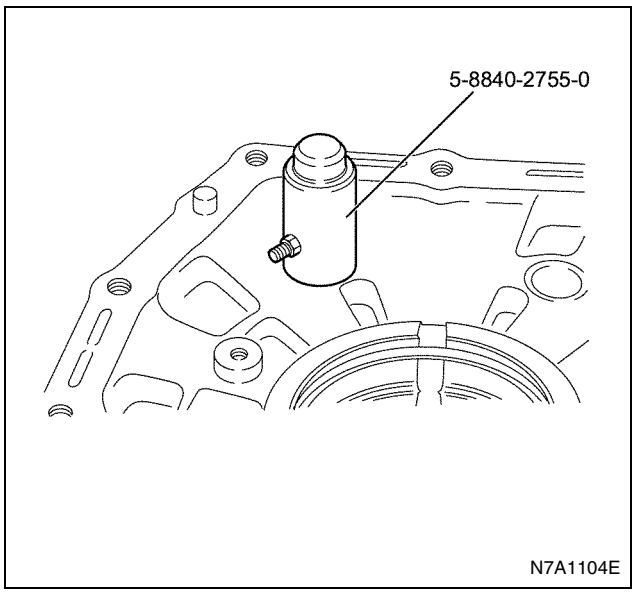
Legend

1. Front Oil Seal
2. T/M Mark
3. ENG Mark

2. Inspect the counter shaft front bearing. If it needs to be replaced with a new one due to wear or damage, use a grip (5-8840-0007-0) and installer (5-8840-2026-0) to press-fit the bearing outer race.

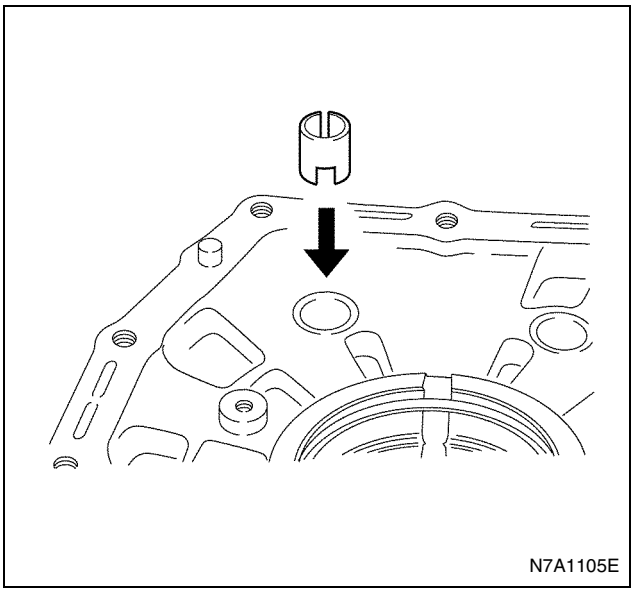


3. Inspect the clutch housing bushing. If it needs to be replaced with a new one due to wear or damage, use an installer (5-8840-2755-0) to press-fit.



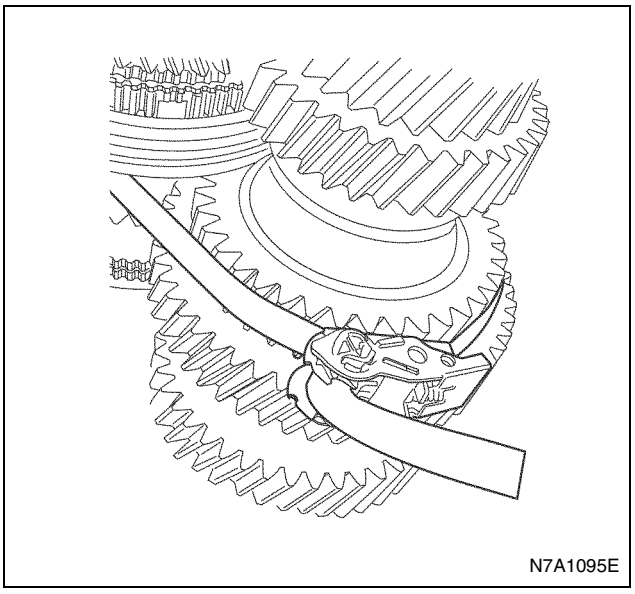
- Before installing, carefully remove all protrusions from the bore side of the old caulking.

- Before installing, securely caulk at three points, avoiding the old caulking points and grooves.
- For the second and subsequent press-fitting, the notched part should face in the direction of the clutch housing.
- After press-fitting, check that the shift rod slides smoothly.



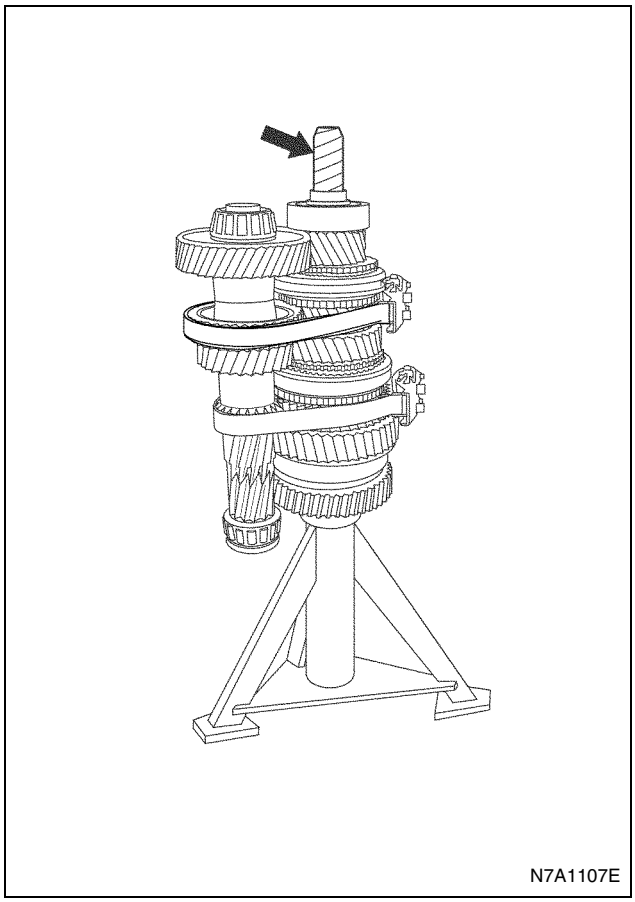
N7A1105E

4. Install the main shaft assembly, top gear shaft assembly, and counter shaft assembly.
   a. Use a lashing belt or some other belt from a lashing device to bundle the main shaft assembly, counter shaft assembly, and top gear shaft assembly at two points so they cannot separate. Tighten the belt securely. When handing the top gear shaft, take care that it does not drop.



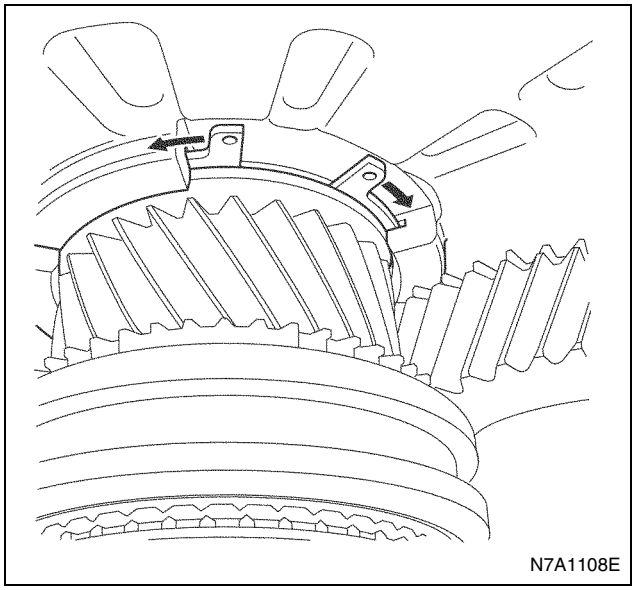
N7A1095E

   b. Stand the top gear shaft assembly, main shaft assembly, and counter shaft assembly on a support stand with the top gear shaft assembly on top.
   c. Wrap the main shaft with tape to avoid damage to the front oil seal.



N7A1107E

   d. While using snap ring pliers to open the top gear shaft bearing outer snap ring, which already has been set on the clutch housing, insert the top gear shaft, counter shaft, and shaft rod into their appropriate positions in the clutch housing.



N7A1108E

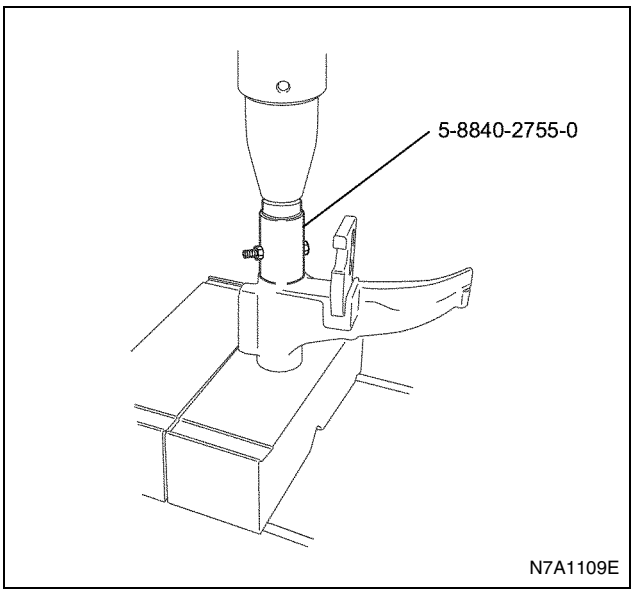
Caution:
- Confirm that the snap ring is installed properly.

- Work carefully in order to avoid damaging the front oil seal.

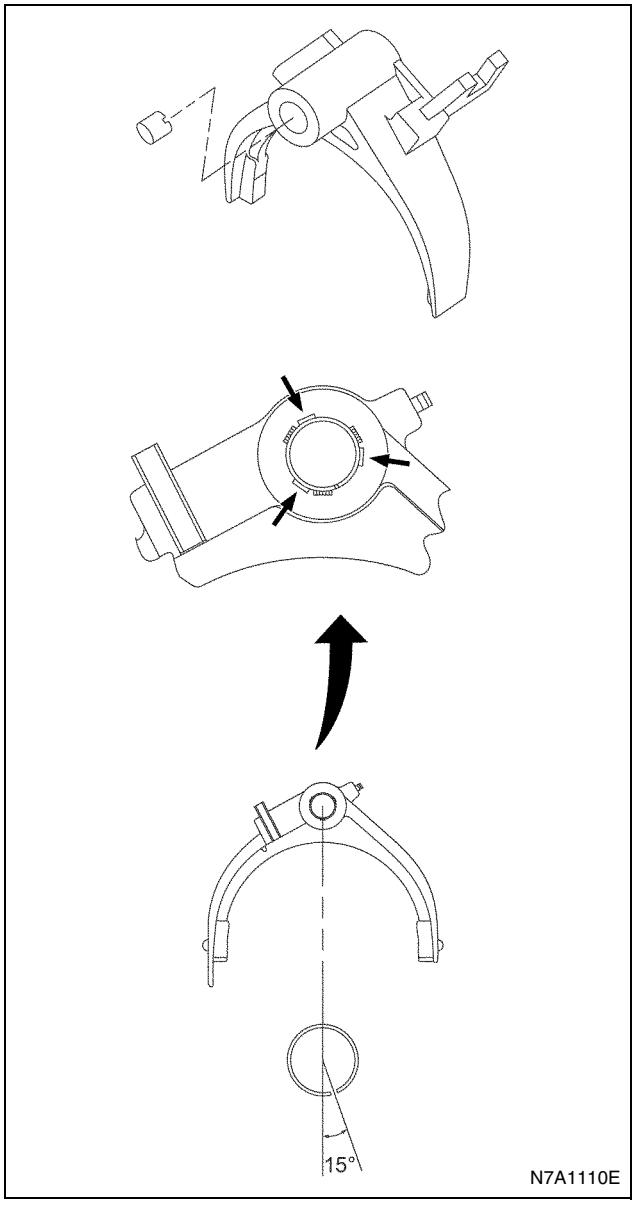
5. Install the magnet in the clutch housing.
6. Install the 5th relay lever in the clutch housing.

Tighten:
44 N·m (4.5 kg·m / 32.5 lb·ft)

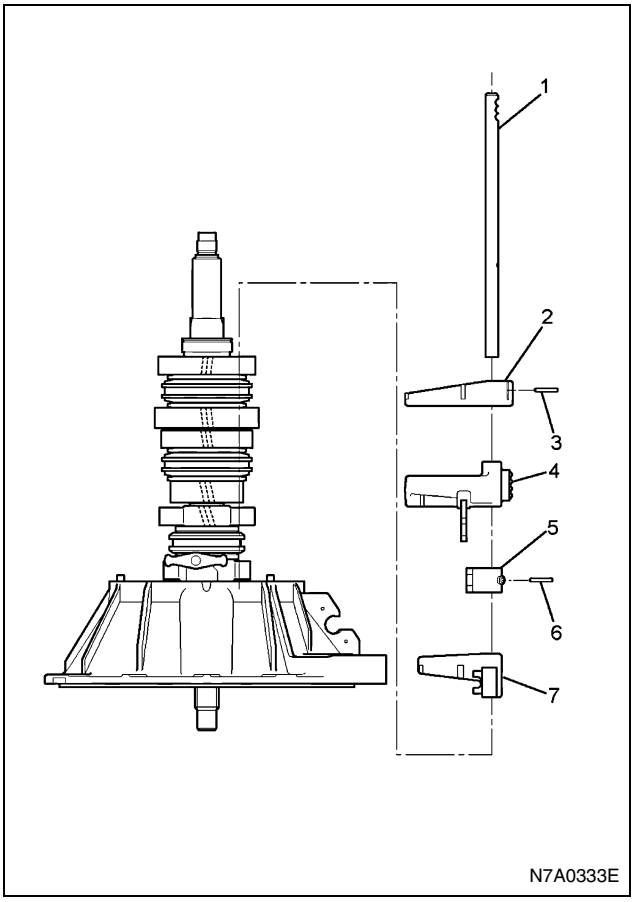
7. Inspect the 4th — 5th shift arm bushing. If it needs to be replaced with a new one due to wear or damage, use an installer (5-8840-2755-0) to press-fit with a press.
8. Inspect the 2nd — 3rd shift arm bushing. If it needs to be replaced with a new one due to wear or damage, use an installer (5-8840-2755-0) to press-fit with a press.



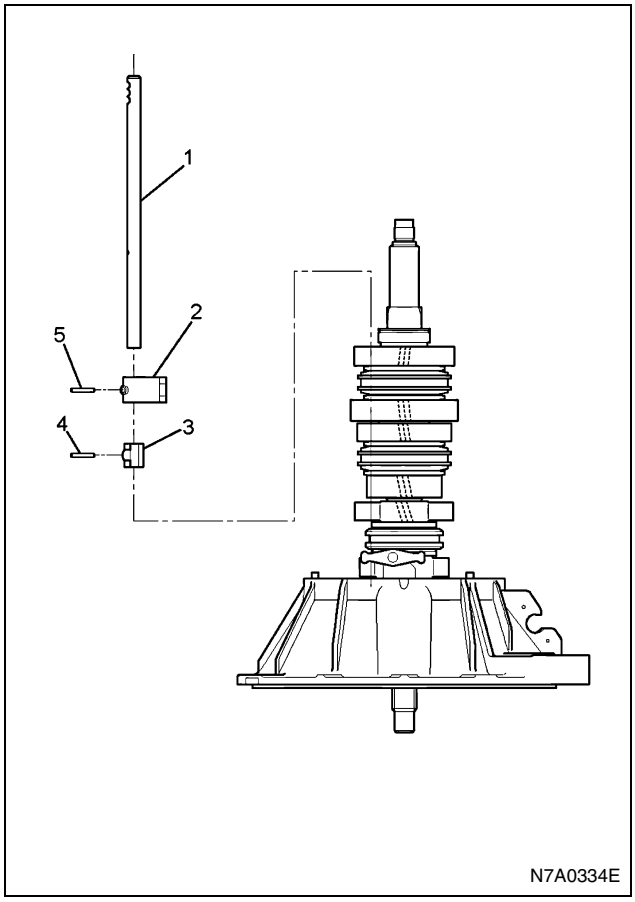
- Before installing, carefully remove all protrusions from the bore side of the old caulking.
- Press-fit the shift arm bushing taking care to use the correct orientation and angle. Caulk at three points, avoiding the bushing gap and old caulking.
- After press-fitting, check that the shift rod slides smoothly.



9. Install the 4th — 5th shift arm (7), 1st — Reverse shift block (5), 2nd — 3rd shift arm (4), 1st — Reverse shift arm (2), 1st — Reverse and 2nd — and 3rd shift rod (1).
   - Use a hammer to drive the spring pins (3), (6) into the spring pin holes.
   - When press-fitting spring pins, insert a round bar on the opposite side of the shift rod, and press-fit while taking care to avoid damage to other parts.

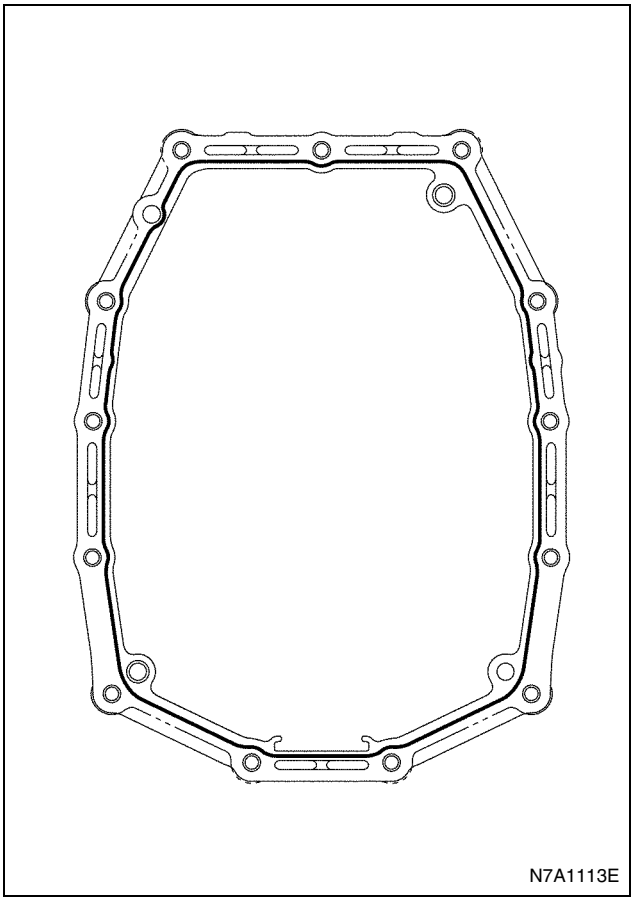


10. Install the 4th — 5th sub shift block (3), 4th — 5th main shift block (2), 3rd — 4th shift block (1).
    - Use a hammer to drive the spring pins (4), (5) into the spring pin holes.
    - When press-fitting spring pins, insert a round bar on the opposite side of the shift rod, and press-fit while taking care to avoid damage to other parts.



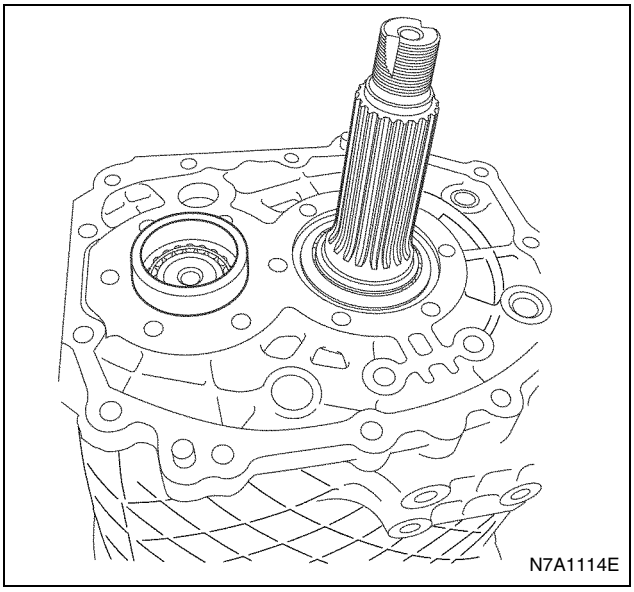
11. Apply Three Bond TB1215 to the mating surface of the transmission case and clutch housing, and install to the clutch housing.
    - Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

Tighten:
46 N·m (4.7 kg·m / 33.9 lb·ft)



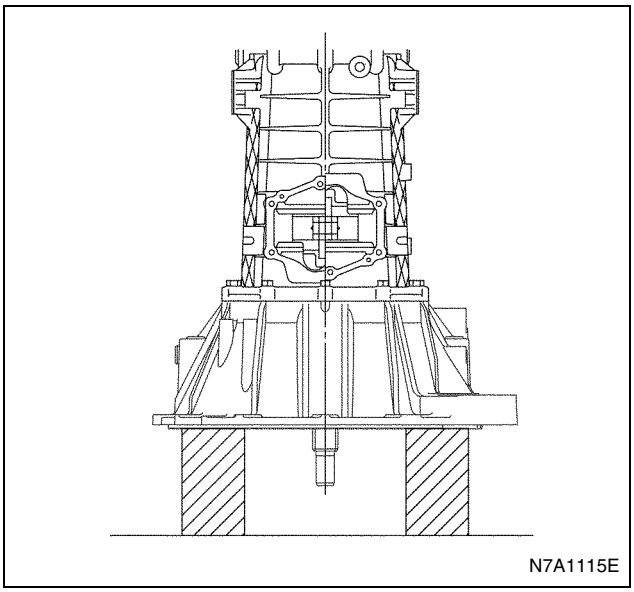
N7A1113E

12. Install the bearing rear outer race in the transmission case.



N7A1114E

13. Install counter shims.
    a. Set the gear position to neutral.
    b. Position the transmission assembly so the clutch housing is downwards.



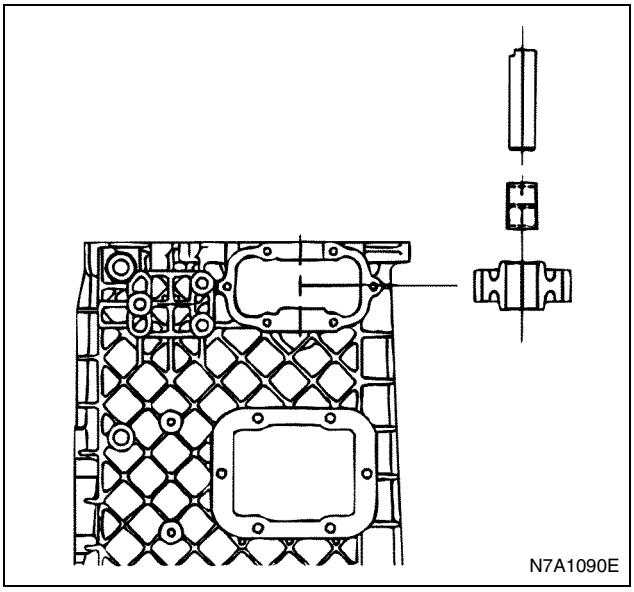
N7A1115E

    c. Rotate the counter shaft for more than 30 turns to fit the taper roller bearing in.
    d. Select the counter shim.
       - At 120-degree intervals, take measurements at three points for the depth from the transmission case back surface up to the counter shaft rear bearing outer ring surface, and then calculate the average of the measured values.
       - Use the table below to select the shim thickness to match the measured average value.

Measured Value (mm)	Shim Thickness (mm)
From — To	
3.34 — 3.40	3.19
3.28 — 3.34	3.13
3.22 — 3.28	3.07
3.16 — 3.22	3.01
3.10 — 3.16	2.95
3.04 — 3.10	2.89
2.98 — 3.04	2.83
2.92 — 2.98	2.77
2.86 — 2.92	2.71
2.80 — 2.86	2.65
2.74 — 2.80	2.59
2.68 — 2.74	2.53
2.62 — 2.68	2.47
2.56 — 2.62	2.41
2.50 — 2.56	2.35
2.44 — 2.50	2.29

Measured Value (mm)	Shim Thickness (mm)
From — To	
2.38 — 2.44	2.23
2.32 — 2.38	2.17
2.26 — 2.32	2.11

14. Install the rear outer snap ring in the main shaft rear bearing.
15. Apply engine oil to the needle bearing, install the reverse idle gear and needle bearing, and insert the reverse idle shaft.

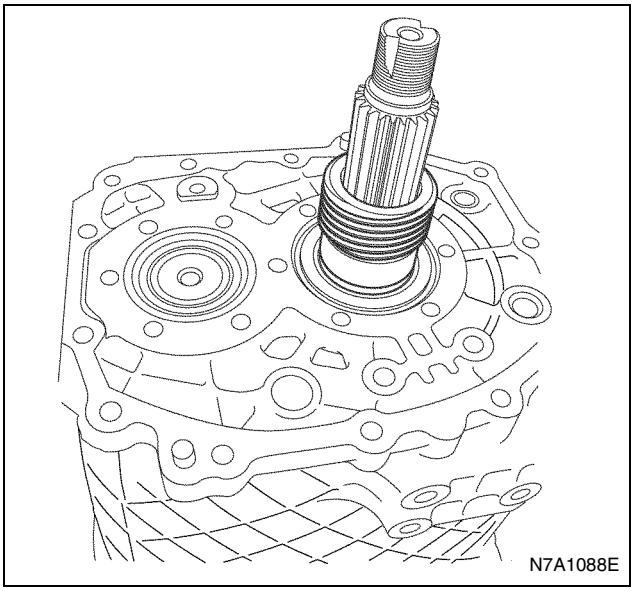


16. Install the retainer in the transmission case.

Tighten:
26N·m (2.7 kg·m / 19.2 lb·ft)

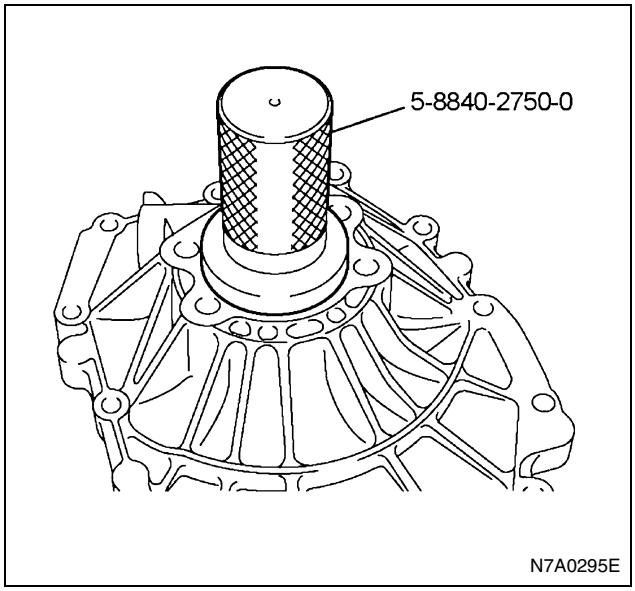
Caution:
Thoroughly remove the sealant from the threads of the transmission case, and use all new screws.

17. Install the collar and speedometer gear.



18. Inspect the rear cover oil seal. If it needs to be replaced with a new one due to wear or damage, apply engine oil to the outer circumference of the oil seal, and then use an installer (5-8840-2750-0) to press-fit it the oil seal to the rear cover.
    - Apply Besco L2 grease to the lip of the oil seal.

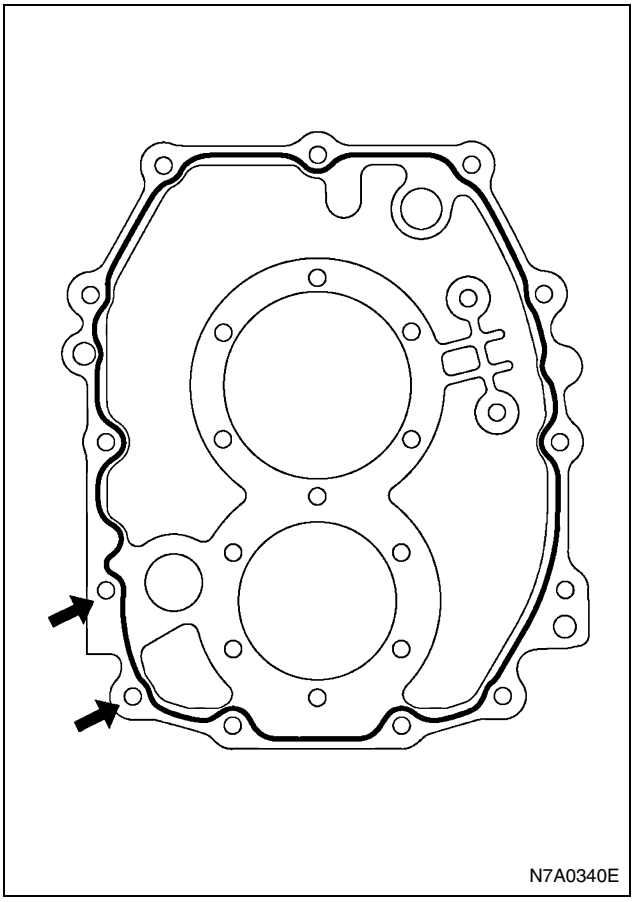
Caution:
Take care to avoid damaging the oil seal lip.



19. Apply Three Bond TB1215 to the mating surface of the transmission case rear cover, and install the rear cover.
    Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

Caution:
The bolts indicated by arrows (two points) have Loctite applied. Thoroughly remove the sealant from the transmission case threads, and use new Loctite coated bolts.

Tighten:
46 N·m (4.7 kg·m / 33.9 lb·ft)

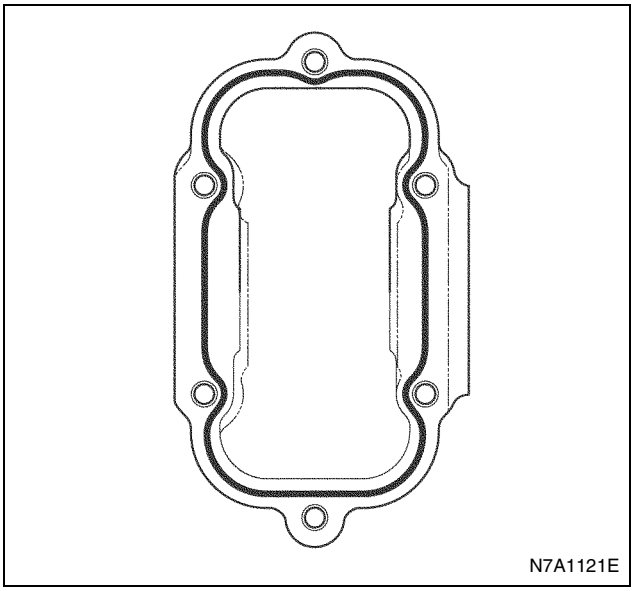


N7A0340E

20. Apply Three Bond TB1215 to the mating surface of the transmission case reverse idle cover, and install the reverse idle cover (2).

Tighten:
19 N·m (1.9 kg·m / 14 lb·ft)

- Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

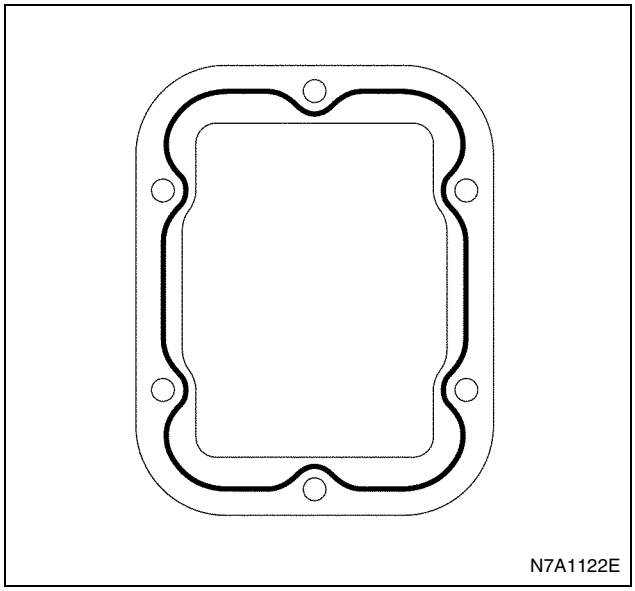


N7A1121E

21. Apply Three Bond TB1215 to the mating surface of the transmission case front side cover, and install the PTO cover (1).
    - Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

Tighten:
37 N·m (3.8 kg·m / 27.3 lb·ft)

Caution:
The bolts have Loctite applied. Thoroughly remove the sealant from the transmission case threads, and use new Loctite coated bolts.



N7A1122E

22. Apply engine oil to the input shaft speed sensor O-ring, and install the input shaft speed sensor.

Tighten:
9 N·m (0.9 kg·m / 6.6 lb·ft)

23. Thoroughly remove sealant from the threads of the detent assembly (13), (12), (11), apply Loctite 242, and install.

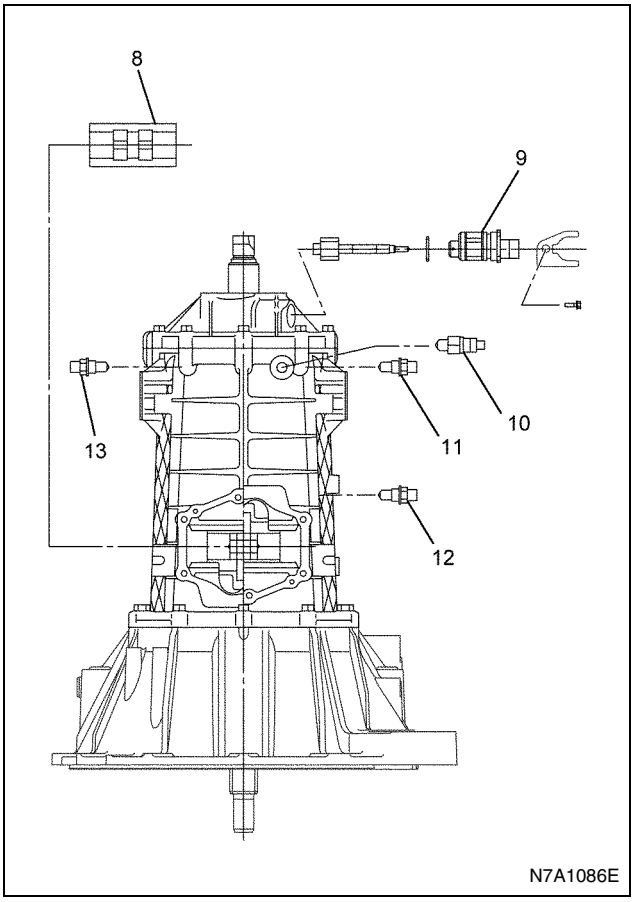
Tighten:
27 N·m (2.8 kg·m / 19.9 lb·ft)

24. Apply Loctite 242 to the reverse switch threads, and install the reverse switch (10).

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

25. Apply engine oil to the speedometer driver gear and O-ring, and then install the speedometer driven gear (9).

Tighten:
20 N·m (2.0 kg·m / 14.8 lb·ft)



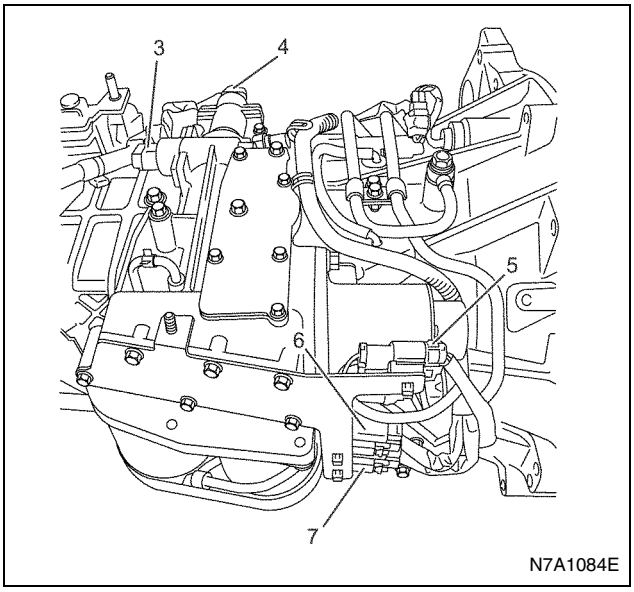
26. Install the gearshift control box.
    a. Set the gear position to neutral, apply Three Bond TB1215 to the surface, which mates with control box, of the transmission case, and install the interlock plate and gearshift control box.
        • Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

Caution:
The bolts have Loctite applied. Thoroughly remove the sealant from the transmission case threads, and use new Loctite coated bolts.

Tighten:
27 N·m (2.8 kg·m / 19.9 lb·ft)

    b. Attach the harness to the clip (two points) and install the neutral switch connector to the bracket.

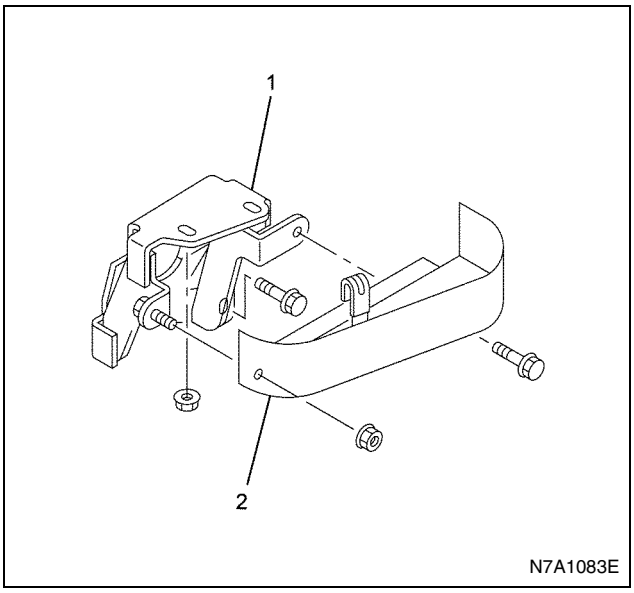
    c. Connect the five connectors to the gearshift control box.
        • Connect the connectors of the select sensor (3), shift sensor (4), select solenoid (5), 2-4-6-R shift solenoid (6), and 1-3-5 shift solenoid (7).



27. Install the heat protector bracket (1) and heat protector (2).

Tighten:

Bracket	45 N·m (4.6 kg·m / 33.2 lb·ft)
Protector	23 N·m (2.3 kg·m / 17 lb·ft)



28. Apply engine oil to the O-ring, and then install the drain plug and O-ring.

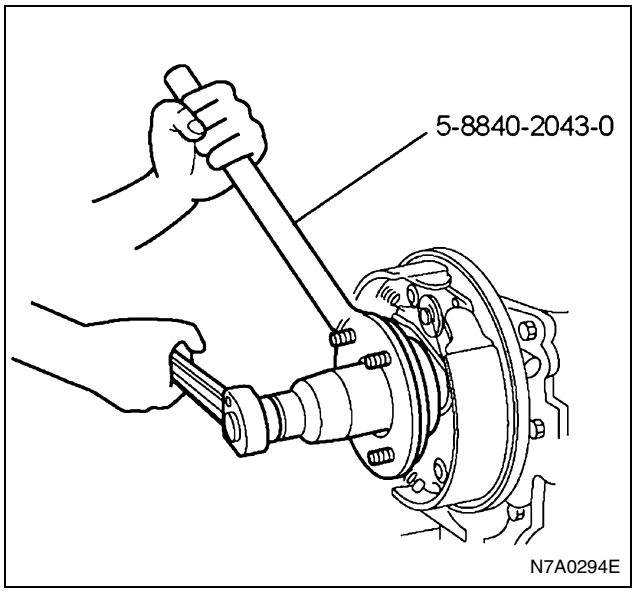
Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

29. Apply 5W-30 engine oil to the O-ring, and then install the filler plug and O-ring.

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

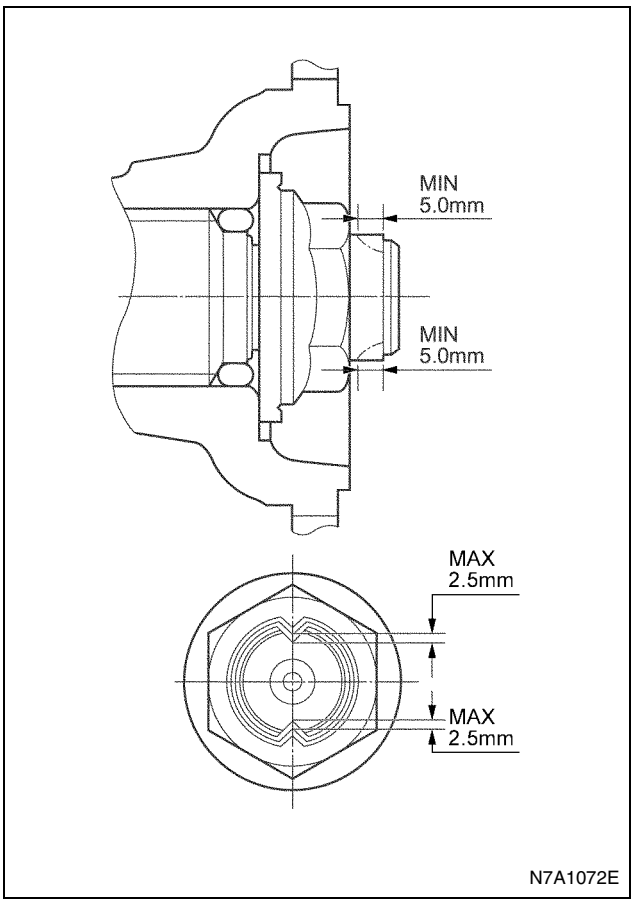
30. Install the parking brake assembly.
    - Refer to “Parking Brake”.
31. Apply engine oil to the O-ring, and then install the coupling driver and O-ring.
32. Using a new lock nut, use the flange holder (5-8840-2043-0) to tighten the lock nut.

Tighten:
289 N·m (29.5 kg·m / 213.2 lb·ft)



- After tightening the lock nut to the specified torque, stake it (2 points) securely using a chisel (chisel tip shape: approx. 1 mm in radius × 60 degrees) so the lock nut lip gap is aligned with the V-groove of the shaft and is at least 5 mm, and the clearance between the V-groove bottom and the nut lip is 2.5 mm or less.

Caution:
After caulking, check the caulking of the nut. If any cracks are discovered, replace the lock nut and re-caulk.



33. Install the parking brake drum and adjust hole cover fixing bolt.
    - Refer to “Parking Brake”.
