GENERAL DESCRIPTION

The side with an oil pump PTO integrates the PTO and the oil pump and installed in the left side of a transmission. The shift rod for switching the “ON” and “OFF” of the hydraulic circuit of the PTO is provided at the bottom of the PTO and the oil pump main unit.
The “ON” and “OFF” of the PTO uses a gear slide system and turn on and off the power by sliding the output gear. The idle gear bearing uses a needle bearing and the output shaft uses a ball bearing to ensure durability.
The oil pump section consists of the gear pump part and the hydraulic circuit switching part, and the gear pump section fixs efficiency by selecting and assembling the side plate. Further, the hydraulic circuit switching portion switches the three positions of “Up”, “Neutral”, and “Down” by the spool provided on the rod extension.
The dump control system uses a cable system.

ON-VEHICLE SERVICE

Inspection and Supply of The Hydraulic Operating Fluid

Notice:
When inspecting and supplying hydraulic operating fluid, you might have incurred danger. In that case, inspect and supply hydraulic operating fluid after having fully checked safety.

Symptoms Due to Insufficient Hydraulic Operating Fluid

The following symptoms might have occurred. In that case, inspect and supply hydraulic operating fluid because it may be insufficient.

1. The body (cargo deck) is raised only immediately.
2. The body (cargo deck) is lugged during rise.
3. While the body (cargo deck) is being raised, the oil pump portion causes a large abnormal sound (such as caterwaul or grate).
4. After the body (cargo deck) has been raised, it drops generating a knock.

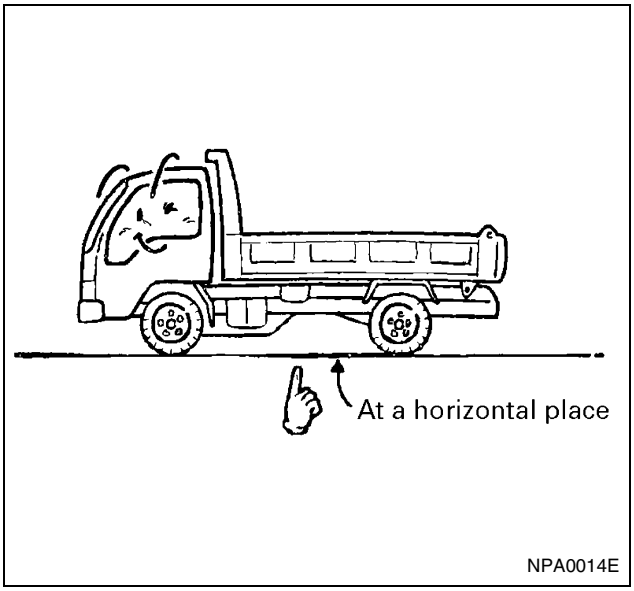
Preparing for Hydraulic Operating Fluid Supply

If there is loading, pull down the loading. Then supply hydraulic operating fluid after having safely and more carefully raised the body (cargo deck) and having firmly held the body (cargo deck) by the “safety rod” and the “safety strut” in accordance with the following “How to raise the body (cargo deck)”.

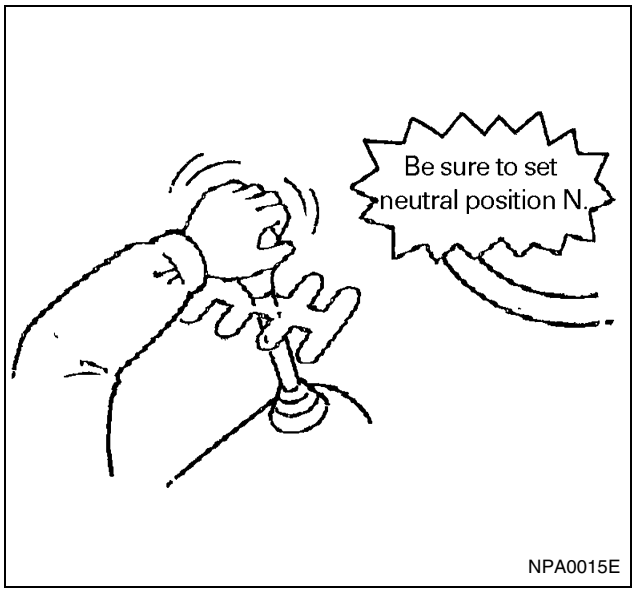
How to Raise the Body (Cargo Deck)

1. Put a truck at a horizontal place.

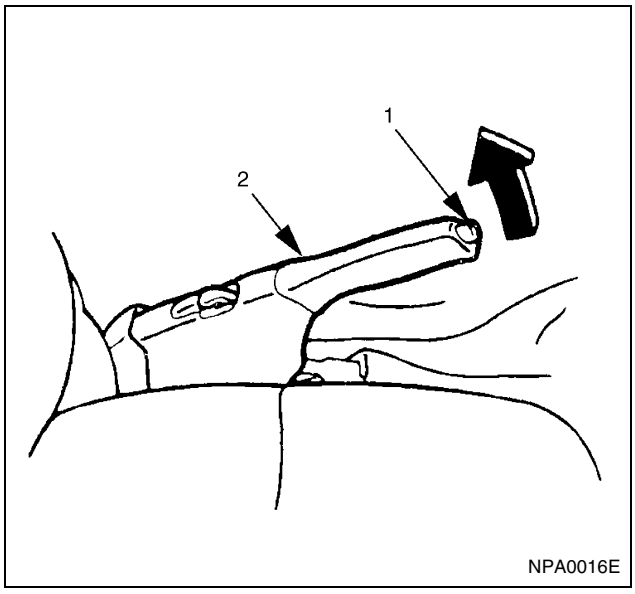
Notice:
Never raise the body (cargo deck) on tilted ground, soft ground, and unleveled ground. A truck may be inverted or warp may be generated in functional components.



2. Set the shift lever to the “Neutral” position.



3. Firmly actuate the parking brake and apply a scotch to the rear tire.

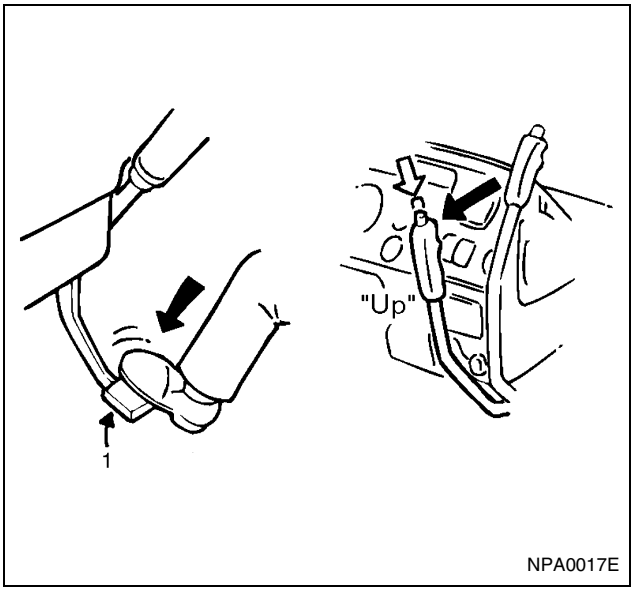


Legend
1. Release button
2. Parking brake lever

4. Start the engine and depress the clutch pedal to the floor. Push in the lock button of the dump lever and release the lock to set the “Up” position.

Notice:
Fully check that there is no person or hindrance around a truck.

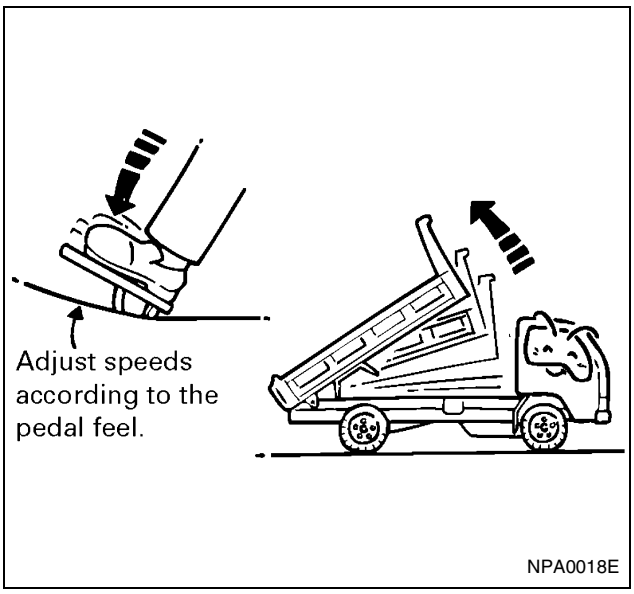
When the dump lever is operated, observe the notes of the Note label attached to the driver's seat.



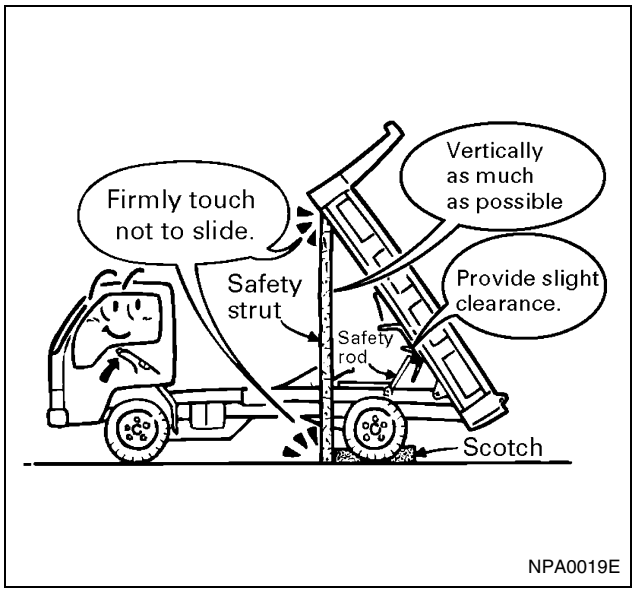
Legend
1. Clutch pedal

5. When the clutch pedal is slowly returned, the body (cargo deck) is raised.
   - Adjust raised speeds according to the pedal feel of the accelerator.
   - When raising the body (cargo deck), be sure to check the lock of the dump lever.
   - After having raised the body (cargo deck), held the body by the safety rod and the safety strut and stop the engine.

Notice:
Suddenly returning the clutch pedal is very dangerous. Use the engine at about 1,000 to 1,500 rpm, and do not perform high-speed rotation, sudden acceleration and deceleration, and unnecessary idle rotation.



Notice:
Raise the body (cargo deck) paying full attention to safety and firmly hold the body (cargo deck) by the safety rod and safety strut.



Supply Procedure of Hydraulic Operating Fluid

Notice:
Be sure to supply a specified amount (check it by the level plug) of hydraulic operating fluid using a cleaned oil supply container paying full attention so that dust or foreign matter will not be mixed in. After having supplied oil, firmly tighten each plug.

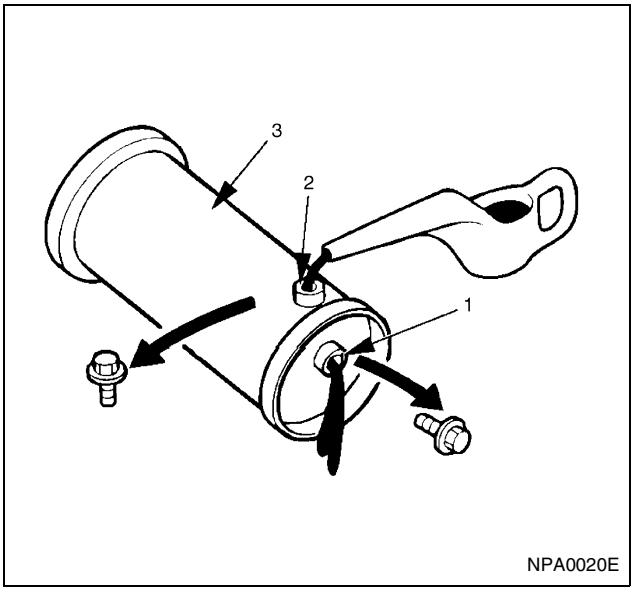
When replacing the total amount of hydraulic operating fluid, request a service network (SS store) of a body manufacturer.

1. Remove the oil supply plug and level plug of the oil tank in the engine stopped state.
2. While supplying hydraulic operating fluid from the oil filler port, supply it until the hydraulic operating fluid flows out from the level plug.
3. Remove the “Safety strut” once and raise the body (cargo deck) to the most raised position, then re-hold it by the “Safety strut and safety rod”.
4. Additionally supply hydraulic operating fluid. When the hydraulic operating fluid flows out from the level plug, install and firmly tighten the level plug and the oil filler port plug.
5. After having supplied hydraulic operating fluid, remove the “Safety strut” and store the “safety rod”. Subsequently firmly drop the body (cargo deck) and stop the engine.

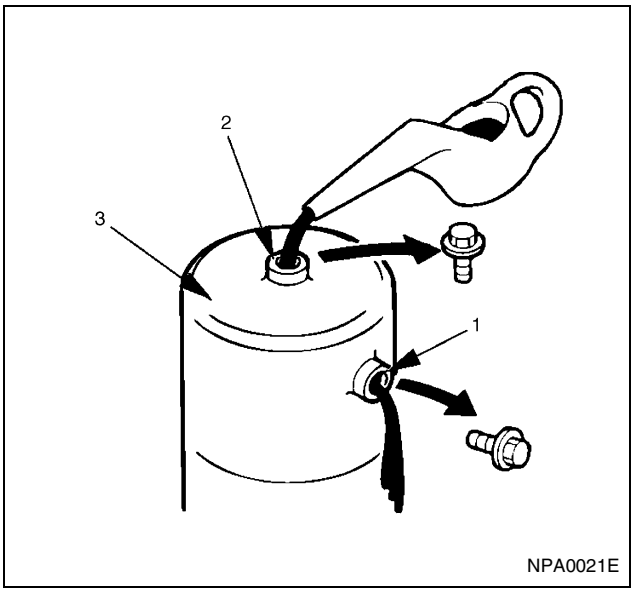
Notice:
Supply the hydraulic operating fluid used with reference to the following table.

Hydraulic Operating Fluid (Turbine Oil)

Manufactured by ShinMaywa Industries Co., Ltd.	0 to 30°C (86°F): VG32
	20°C (68°F) or more: VG56
	less than 10°C (50°F): VG22



Legend
1. Oil level
2. Oil filler port
3. Oil tank



Legend
1. Oil level
2. Oil filler port
3. Oil tank

If the Dump Rise Operation is Disabled by Itself

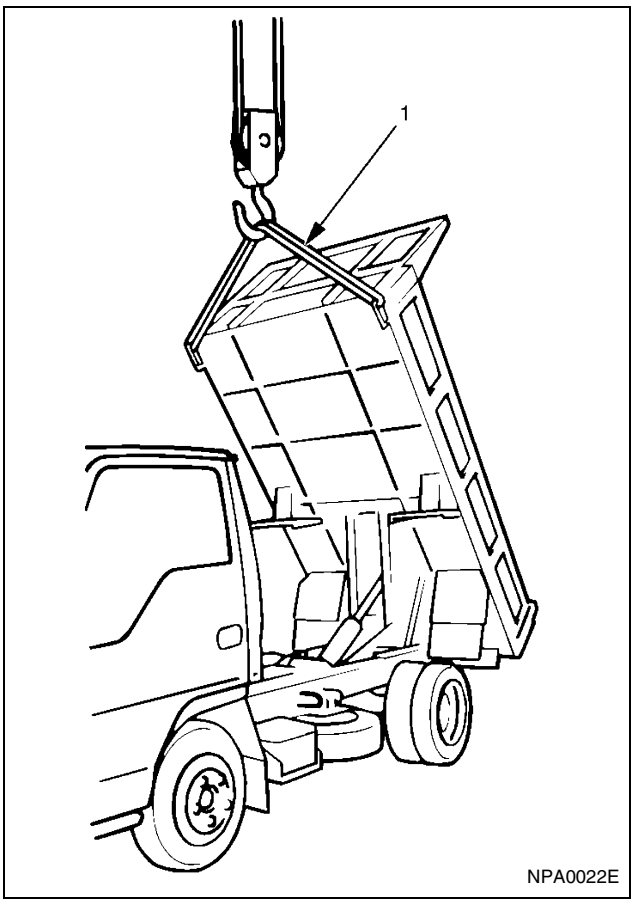
If the body (cargo deck) is kept being dropped and the “Rise” operation of the body (cargo deck) is disabled by itself, inspect the cause of rise disabled, fully identify the status, and execute maintenance and repair in accordance with the flowchart of the “Defect 1”. Dump body rise disabled” of Chapter “Troubleshooting”.
After maintenance and repair, if there is a hindrance in subsequent work advance because the “Rise” operation is disabled by itself or when the hydraulic circuit is in the following states (1) and (2) after maintenance and repair, raise the body (cargo deck), take safety measures for preventing drop, and continue the work according to the following (item of the existence of hoist or crane equipment) methods.

1. The body (cargo deck) rise is disabled due to the air mixture into the hydraulic circuit resulting from insufficient hydraulic operating fluid immediately after repair for oil pump replacement.
2. The body (cargo deck) rise is disabled due to the air mixture into the hydraulic circuit resulting from insufficient hydraulic operating fluid immediately after repair for leak of hydraulic operating fluid.

When hoist or crane equipment is provided

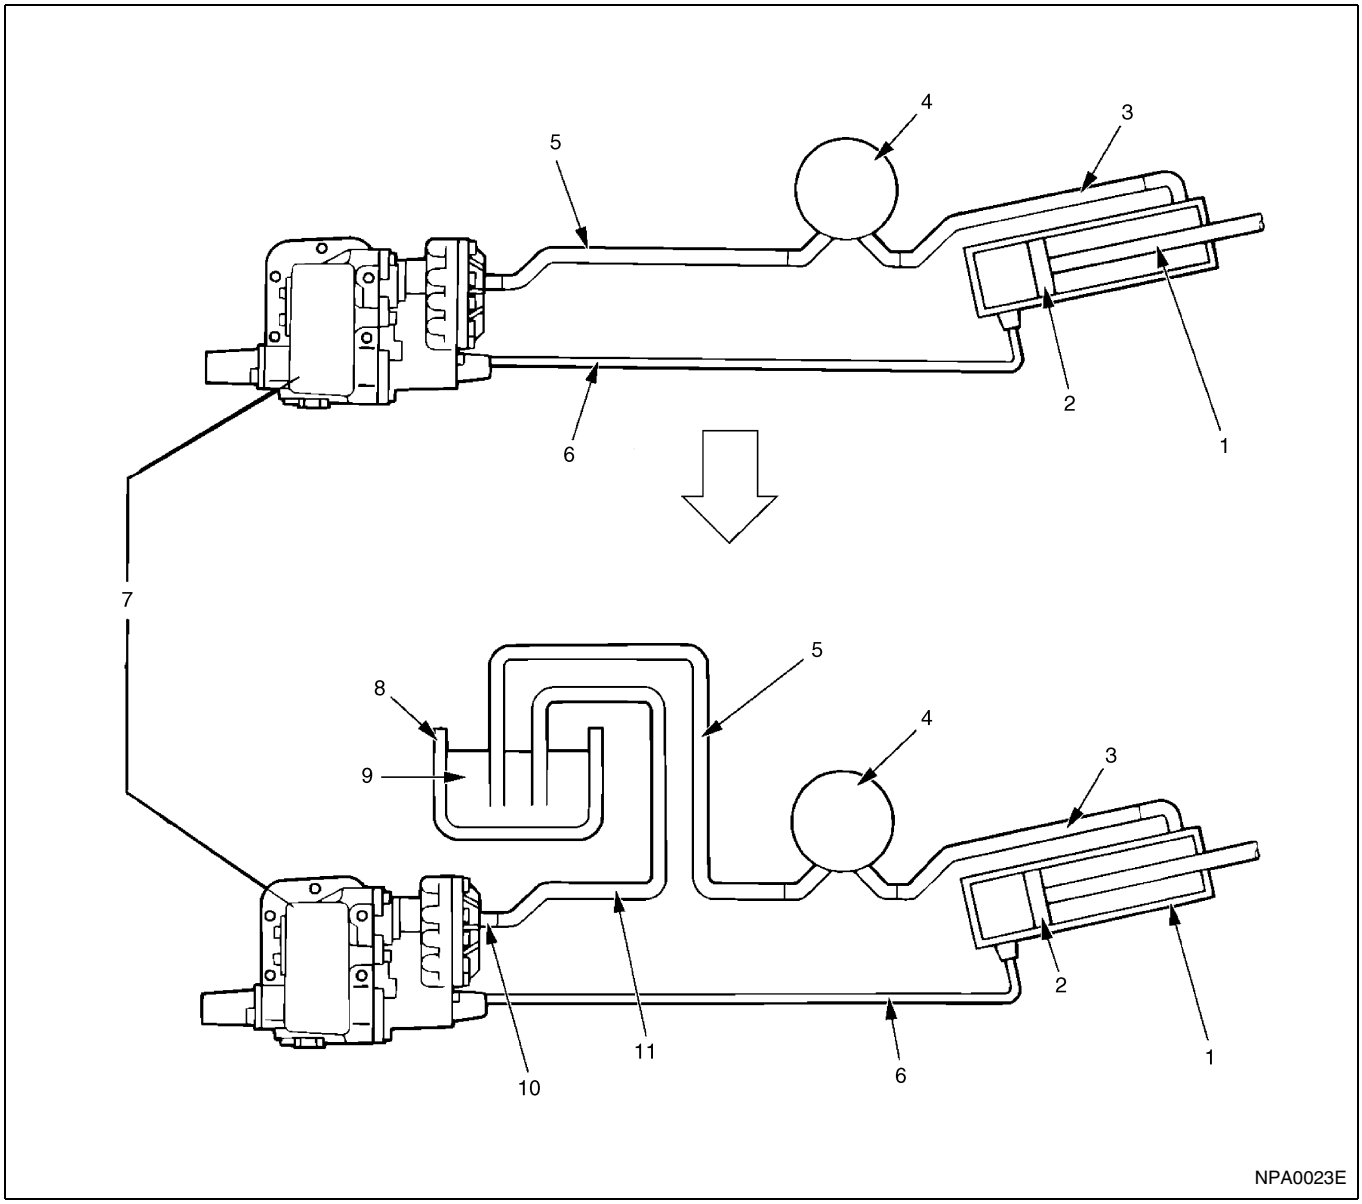
1. Firmly actuate the parking brake and apply a scotch to the rear tire.
2. Set the engine to the stopped state.
3. Set the dump lever to the “Up” position and apply a wire with ample strength to the front of the body (cargo deck).
4. Slowly hang a wire (tensile strength of 1,000 kg (9,807 N)) by a hoist or crane.
5. After having drawn up the body (cargo deck) to the most raised position, prevent the drop of the body (cargo deck) by the safety rod and the safety strut and check safety.

Notice:
For the subsequent work procedure, supply hydraulic operating fluid or perform air bleeding of the hydraulic operating fluid in accordance with each item of the text in the “Supply Procedure of Hydraulic Operating Fluid” or the “Air Bleeding Procedure of Hydraulic Operating Fluid”.



Legend
1. Wire

If neither hoist nor crane is provided
If the body (cargo deck) is kept being dropped and the “Up” operation of the dump is disabled by itself or if neither hoist nor crane is provided, raise the body (cargo deck) according to the following work procedure.



Legend

1. Hoist cylinder
2. Piston
3. Pipe
4. Oil tank
5. Low-pressure hose
6. High-pressure hose
7. PTO with oil pump
8. Hydraulic operating fluid container
9. Hydraulic operating fluid
10. Test hose joint
11. Test hose

Preparation

1. Because removal of a spare tire makes work easier according to a truck, previously check the truck.
2. Remove the intermediate fixed clip on the truck side between the oil pump and the oil tank of the low-pressure side hose and set the low-pressure hose free.
3. Prepare a cleaned hydraulic operating fluid container (a 20 L can will do), a funnel, hydraulic operating fluid, a test hose for a special tool, and a test hose joint.
4. Prepare the hydraulic operating fluid of about 10 L in the cleaned hydraulic operating fluid container.

Hydraulic Operating Fluid (Turbine Oil)

Manufactured by ShinMaywa Industries Co., Ltd.	0 to 30°C (86°F): VG32
	20°C (68°F) or more: VG56
	less than 10°C (50°F): VG22

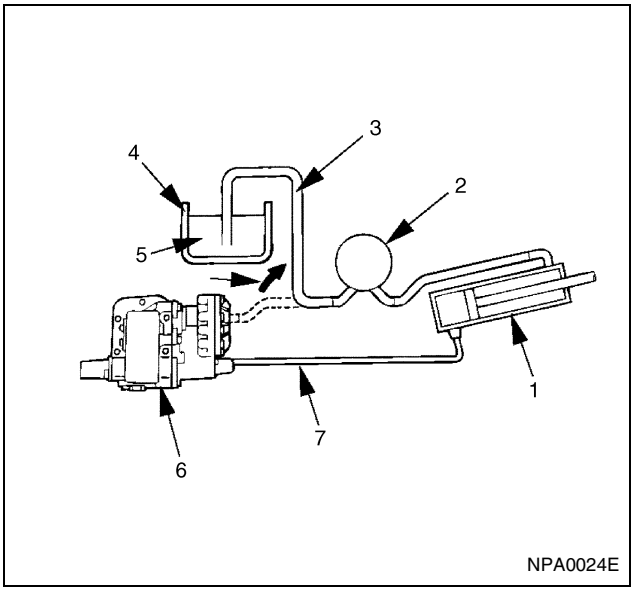
Notice:
Carefully control the prepared hydraulic operating fluid so that dust or foreign matter will not be mixed in it. Be-

sides, if the dust or foreign matter is mixed in the hydraulic operating fluid, carefully handle it because it becomes the first cause of a dump mechanism fault.

Work Procedure

1. With reference to the piping rough sketch on the preceding page, remove the low-pressure side hose of the oil pump and insert the port for removal in the prepared hydraulic operating fluid container.

Notice:
Be sure to install the hydraulic oil fluid container at a higher position than the tank pump. If it is installed at a lower position, the oil pump may be damaged because the hydraulic operating fluid applied in Item (4) flows in the hydraulic operating fluid container and air is mixed in the hose.

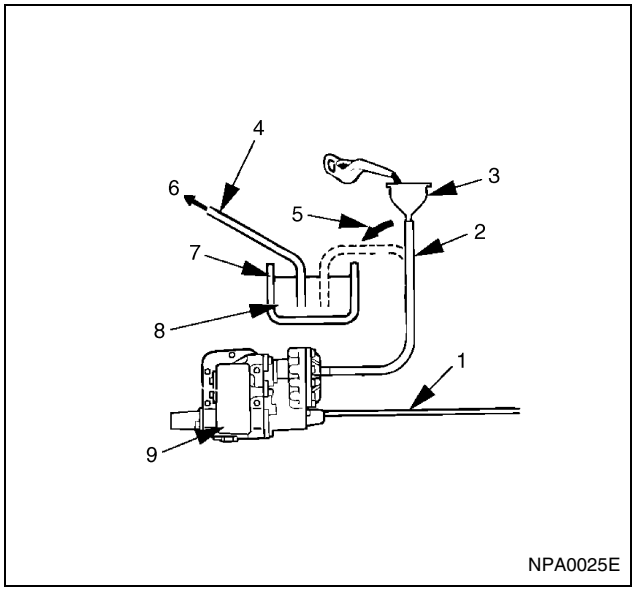


NPA0024E

Legend

1. Hoist cylinder
2. Oil tank
3. Low-pressure hose
4. Hydraulic operating fluid container
5. Hydraulic operating fluid
6. PTO with oil pump
7. High-pressure hose

Notice:
When inserting the removed low-pressure hose in the hydraulic operating fluid, remove the hose band, be sure to clean the hose port, and handle the hose so that dust or foreign matter will not be mixed in the hydraulic operating fluid.



NPA0025E

Legend

1. High-pressure hose
2. Test hose
3. Funnel
4. Low-pressure hose
5. Insert
6. To oil tank
7. Hydraulic operating fluid container
8. Hydraulic operating oil pump
9. PTO with oil pump

2. Remove the low-pressure side hose joint of the oil pump.
3. Install the test hose and connecting joint on the low-pressure side of the oil pump.
   Joint (low-pressure side): 5-8840-2439-0
   Test hose: 5-8840-2435-0
4. Use the funnel from the fluid container insertion side of the test hose to fill the hose with the hydraulic operating fluid and insert the hose port in the hydraulic operating fluid container.

Notice:
The test hose is filled with hydraulic operating fluid to minimize the mixture of air in the hydraulic circuit.

Further, fix the two hoses inserted in the fluid container not to jump out from the hydraulic operating fluid.

5. Start the engine and depress the clutch pedal in the idling state, then set the dump lever to the “Up” position.
6. When slowly releasing the clutch pedal and operating the oil pump, the body (cargo deck) starts being raised.

Notice:
At this time, check that the air mixed in the hydraulic circuit is discharged in the hydraulic operating fluid as blow holes.

7. Raise the body (cargo deck) up to the most raised position in the idling state and apply the safety rod and the safety strut to the body (cargo deck). Then prevent drop and check safety.
8. After having the body (cargo deck), stop the engine and remove the test hose installed in Item (3) from the oil pump, then release it from the fluid container.
9. Remove the test hose connecting joint from the low-pressure side of the oil pump and install the joint for connecting the original low-pressure hose.
10. Release the low-pressure side hose removed from the oil pump and soaked in the fluid container in Item (1) and install it on the low-pressure side of the oil pump as before, then firmly tighten the hose band.

Notice:
For the subsequent work procedure, supply hydraulic operating fluid or perform the air bleeding of hydraulic operating fluid in accordance with each item of the text in the "Supply Procedure of Hydraulic Operating Fluid" or the "Air Bleeding Procedure of Hydraulic Operating Fluid".

Be careful of excessive supply of hydraulic operating fluid.

If an excessive amount of hydraulic operating fluid exceeding the specified amount is supplied when supplying the hydraulic operating fluid at the rise of the body (cargo deck), the hydraulic circuit will be filled with the hydraulic operating fluid because the volume of the fluid in the oil tank is increased more than necessary at the drop of the body (cargo deck).

According, the body (cargo deck) will not be dropped from a predetermined place. If it is dropped forcibly, excessive pressure applies to the hydraulic circuit (consisting of the hose, pipe, and tank) resulting in its damage or a leak of oil.

Total Replacement of Hydraulic Operating Fluid

Request a service network (SS store) of a body manufacturer of the total replacement of hydraulic operating fluid.

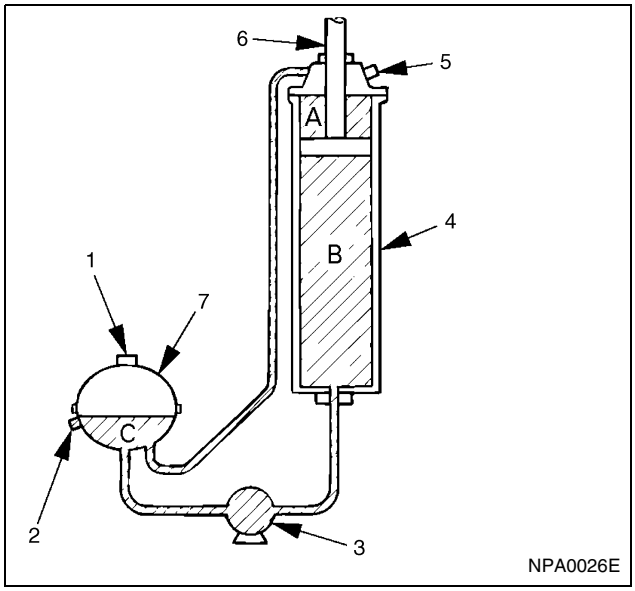
Air Bleeding Procedure of Hydraulic Operating Fluid

Notice:
Be sure to supply a specified amount of hydraulic operating fluid using a cleaned oil supply container paying full attention so that dust or foreign matter will not be mixed in. After having supplied oil, firmly tighten each plug.

[Rear Dump Truck]

<Manufactured by Shin Maywa Industries, Co., Ltd.>
Hydraulic Operating Fluid Supply

1. Raise the body (cargo deck) in accordance with the "How to raise the body (cargo deck)" described previously.
2. Remove oil filler plug (1) and level plug (2) of the oil tank and supply oil from the oil filler port until the hydraulic operating fluid flows out from level plug (1), then tighten plug (2).
3. Remove oil filler port plug (5) from the cylinder head, supply the hydraulic operating fluid to "Chamber A" so that no air will be left to fill the chamber with the fluid, and tighten oil filler port plug (5).



Legend
1. Oil filler port
2. Level plug
3. Oil pump
4. Hoist cylinder
5. Oil filler port
6. Piston rod
7. Oil tank

Air Bleeding Method

1. Raise the body (cargo deck) in accordance with the "How to raise the body (cargo deck)" described previously.
2. At the maximum rise, cylinder shaded portions "Chamber A" and "Chamber B" shown in the drawing are fully filled with hydraulic operating fluid and Section "C" is filled with the hydraulic operating fluid up to its level position.

Notice:
Supplying hydraulic operating fluid more than necessary will cause a fault.

3. First remove the oil tank oil filler port plug of (1). Then start the engine, operate the dump lever, and drop and raise the body (cargo deck) several times. Consequently, air is naturally released usually.
4. Tighten the oil tank oil filler port plug of (1).

Notice:
If the work of Item (2) is performed with plug (1) tightened, air may not be released.

Notice:
When air is mixed in hydraulic operating fluid and becomes whitely foamy, the air will not be released.

So raise the body (cargo deck) and remove plugs (1) and (5). When the hydraulic operating fluid is left alone about for 30 to 60 minutes, the air is naturally separated. Re-supply oil in accordance with the procedure of Items (2) and (3) of the “Supply Procedure of Hydraulic Operating Fluid”.

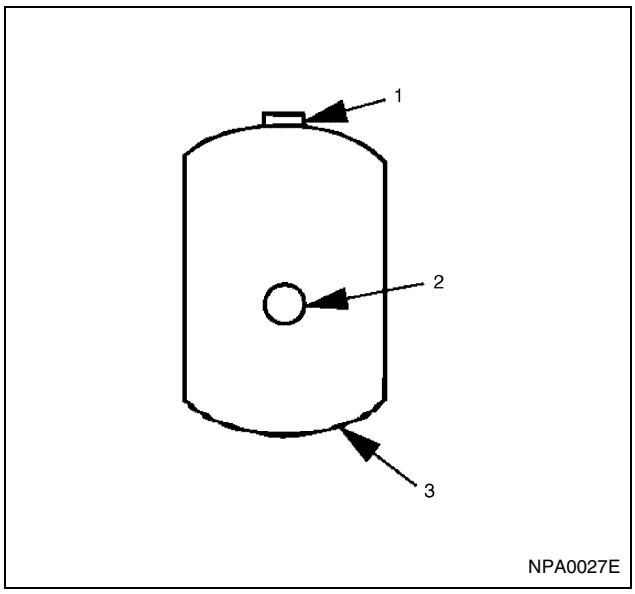
Principles Under Which Air Is Released
Between “B” and “C”
For Chamber “B” filled with hydraulic operating fluid, when the body (cargo deck) is dropped, the piston rod is dropped and the hydraulic operating fluid in “Chamber B” passes through the oil pump and is returned to the oil tank. At this time, if air is mixed in, it is discharged from “Surface C” in the oil tank as blow holes.
Between “A” and “C”
The hydraulic operating fluid pressurized and sent via the oil pump is sent from “Chamber C” to “Chamber B”. The piston cylinder is raised and the hydraulic operating oil in “Chamber A” is sent to “Chamber C”, and then the air is discharged for the same reason as between “B” and “C”.

[Three-Rotation Dump Truck]

<Manufactured by Shin Maywa Industries, Co., Ltd.]
Hydraulic Operating Fluid Supply

1. Raise the body (cargo deck) in accordance with the “How to raise the body (cargo deck)” described previously.
2. Remove oil filler plug (1) and level plug (2) of the oil tank and supply oil from the oil filler port until the hydraulic operating fluid flows out from level plug (2), then tighten plug (2).

Notice:
Supplying hydraulic operating fluid more than necessary will cause a fault.

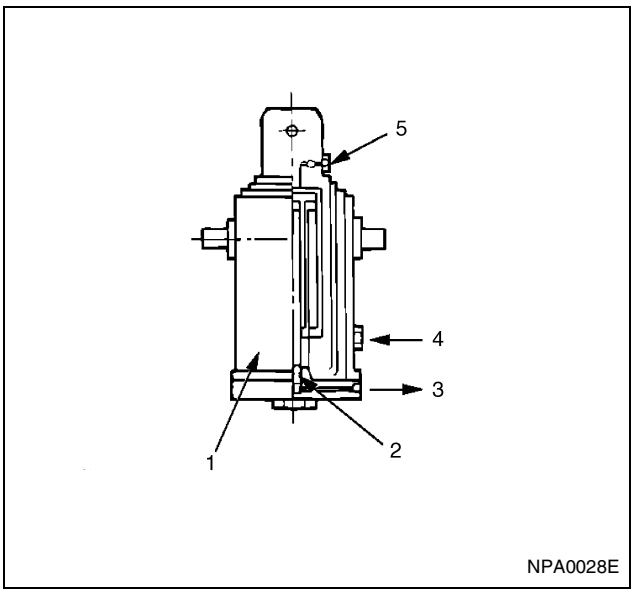


Legend
1. Oil filler port
2. Level plug
3. Oil tank

3. Set the dump lever to the “Up” position with the engine in the idling state.
4. When loosening the air bleeding plug (3) of the cylinder about once or twice, air is discharged and then hydraulic operating fluid is ejected. So quickly tighten the plug.

Notice:
When air is mixed in hydraulic operating fluid and becomes whitely foamy, the air is not released. So raise the body (cargo deck) and leave the hydraulic operating fluid alone about for one hour. The air in the hydraulic operating fluid is naturally separated and subsequently air can be released.

Even when performing air bleeding work, raise the body (cargo deck) in accordance with the “How to Raise The Body (cargo deck)” described previously.

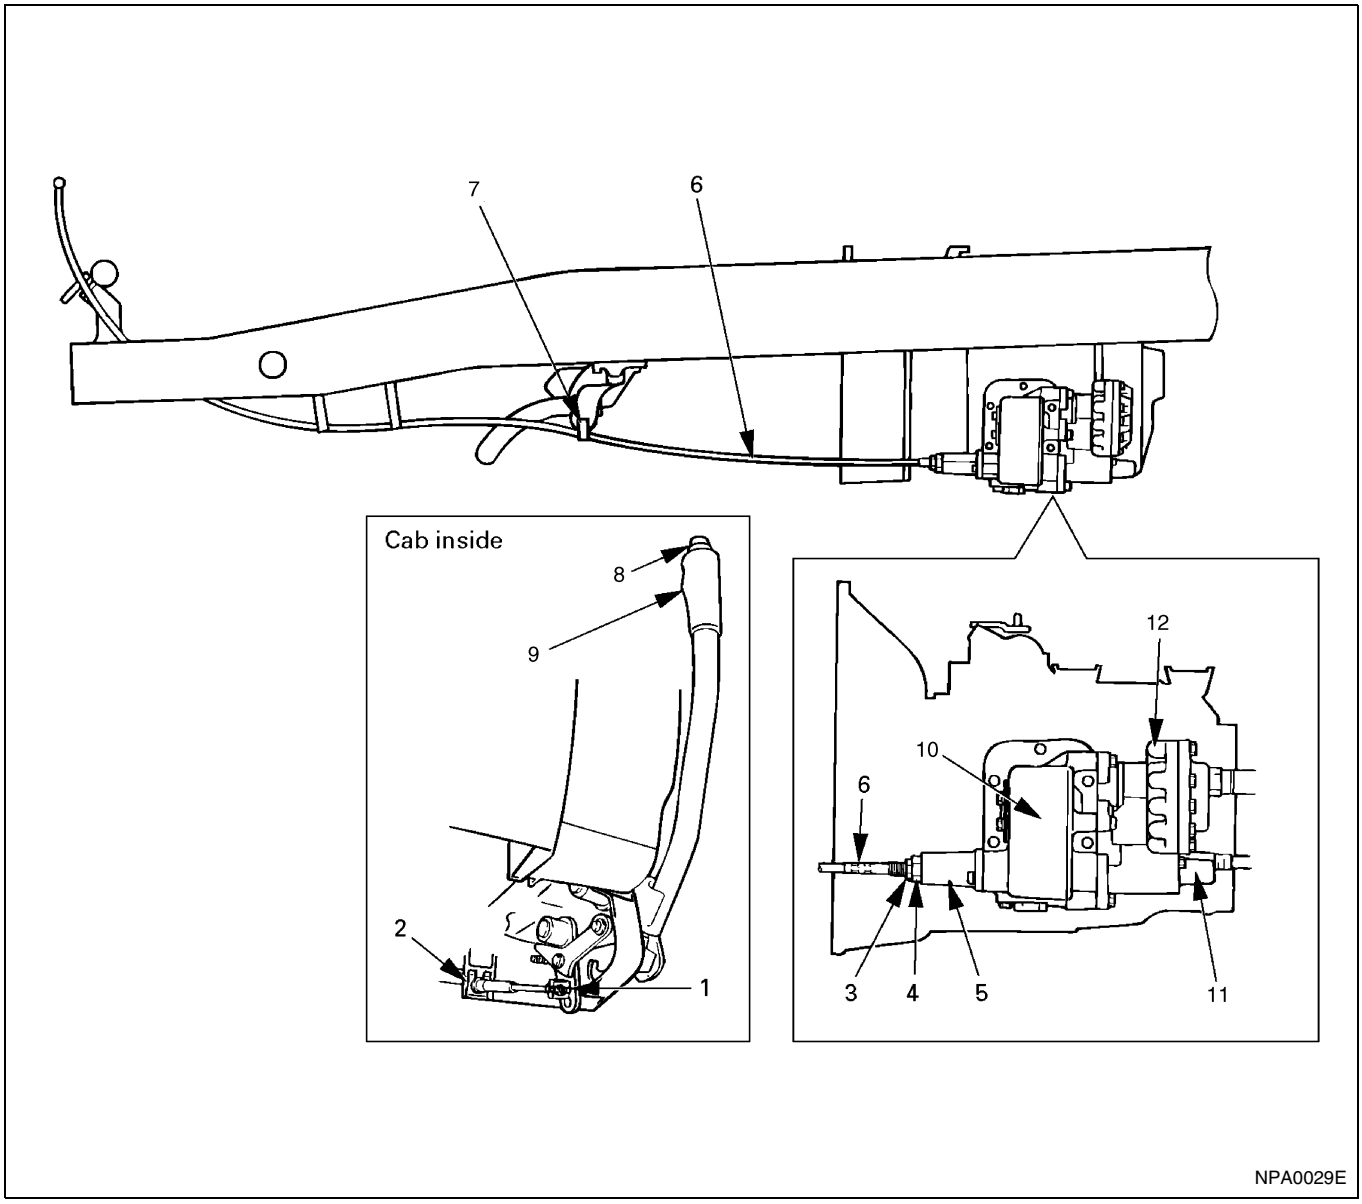


Legend

1. Cylinder main unit
2. Bypass valve
3. To oil tank
4. From oil pump (high pressure)
5. Air bleeding plug

CONTROL CABLE (FOR REAR DUMP TRUCK)

Removal and Installation



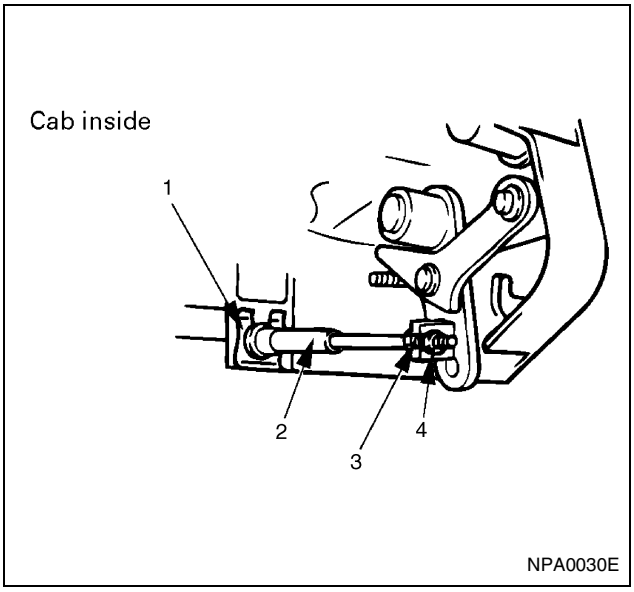
Legend

1. Lock nut (dump lever side)
2. Clip (inside cap)
3. Lock nut (PTO side)
4. Special nut
5. Cable holder
6. Control cable
7. Cable stopper clip
8. Lock button
9. Dump lever
10. PTO
11. Shift cap
12. Oil pump

Removal Steps

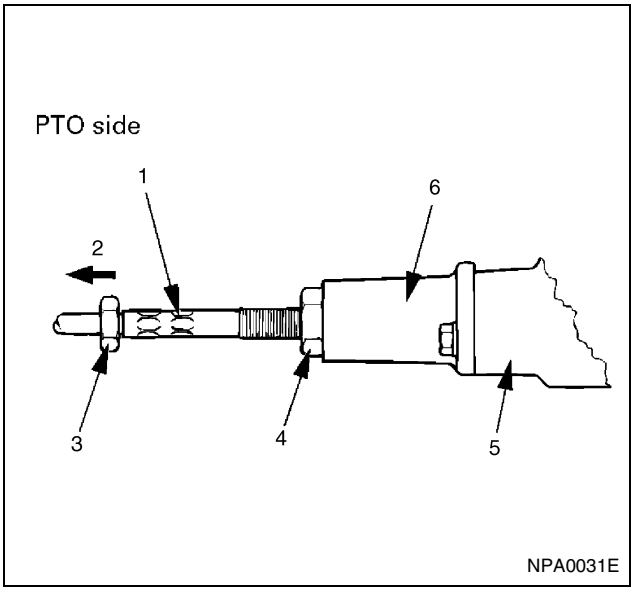
Notice:
Because a three-rotation dump truck differs in the wiring of a control cable from a rear dump truck, refer to the notes on the replacement and adjustment of the control cable for the three-rotation dump truck.

1. Lock Nut (Dump Lever Side)
   - Set the dump lever to the “Down” position and firmly lock the lever.
   - Loosen the lock nut of the control cable and remove the cable tip from the boss portion of the dump lever.
2. Clip (Inside Cab)
   - Remove the clip from the instrument panel bottom inside the cab.



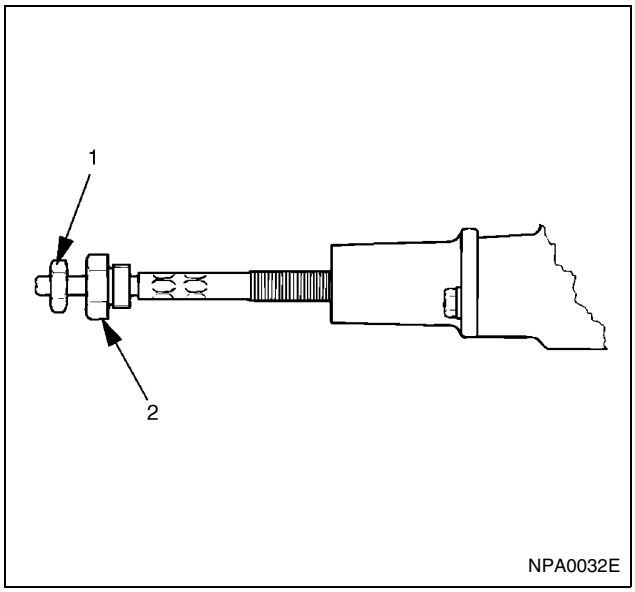
Legend
1. Clip
2. Control cable
3. Boss portion
4. Lock nut

3. Lock Nut (PTO Side)
   - Loosen the lock nut and move it toward the truck front.



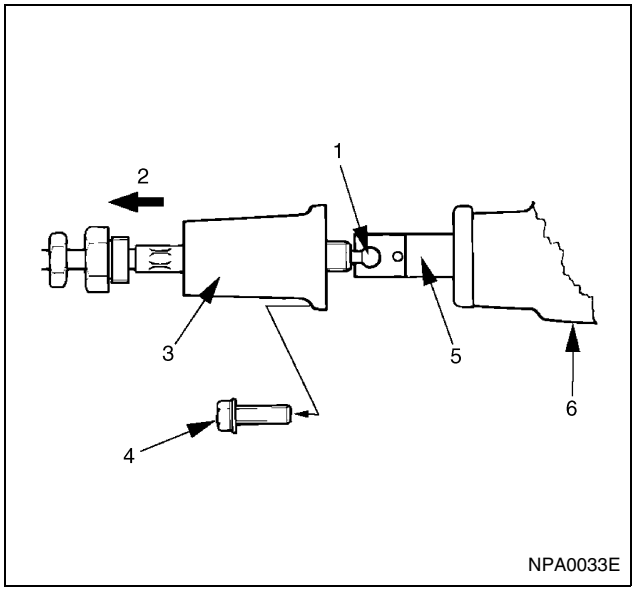
Legend
1. Control cable
2. Truck front
3. Lock nut
4. Special nut
5. PTO
6. Cable holder

4. Special Nut
   - Loosen the special nut and move it toward the truck front.



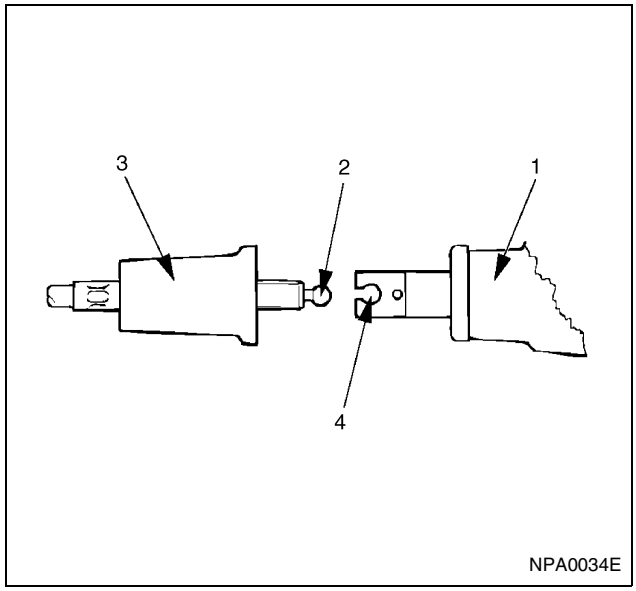
Legend
1. Lock nut
2. Special nut

5. Cable Holder
   - Remove the bolt and remove the cable holder from the PTO.
   - Move the cable holder to the truck front and provide clearance between the cable holder and PTO.



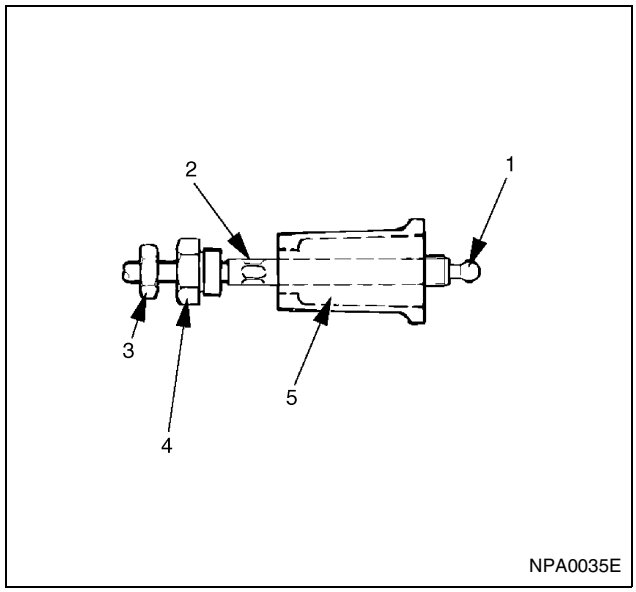
Legend
1. Rod end ball portion
2. Truck front
3. Cable holder
4. Bolt
5. Shift rod
6. PTO

6. Control Cable
   - Because the tip portion (PTO side) of the control cable is of a rod end ball type as shown in the drawing, remove the cable end portion from the cable connector groove on the PTO side sliding it along the groove.



Legend
1. PTO
2. Rod end ball portion
3. Cable holder
4. Cable connector groove

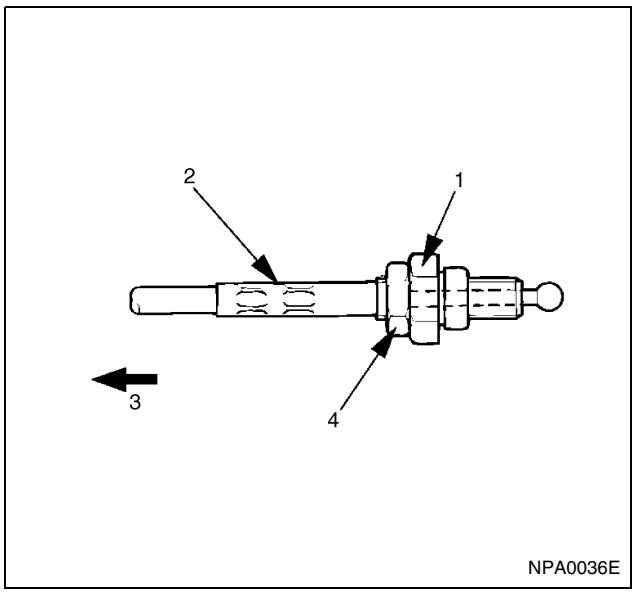
   - Remove the cable holder from the control cable.
   - Remove the control cable assembly from the truck.



Legend
1. Rod end ball portion
2. Control cable
3. Lock nut
4. Special nut
5. Cable holder

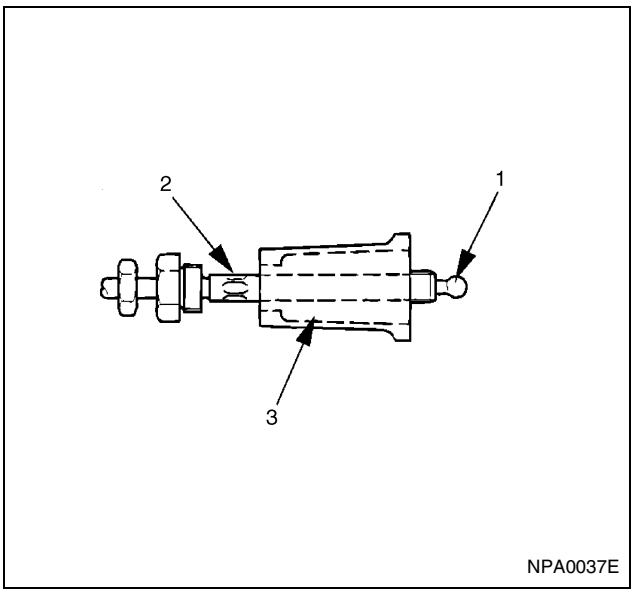
Installation Steps

1. Control Cable
   - Set the dump lever to the “Down” position and lock it.
   - Install the control cable assembly in the truck.
   - Move the lock nut (PTO side) and special nut of the cable top the truck front side.



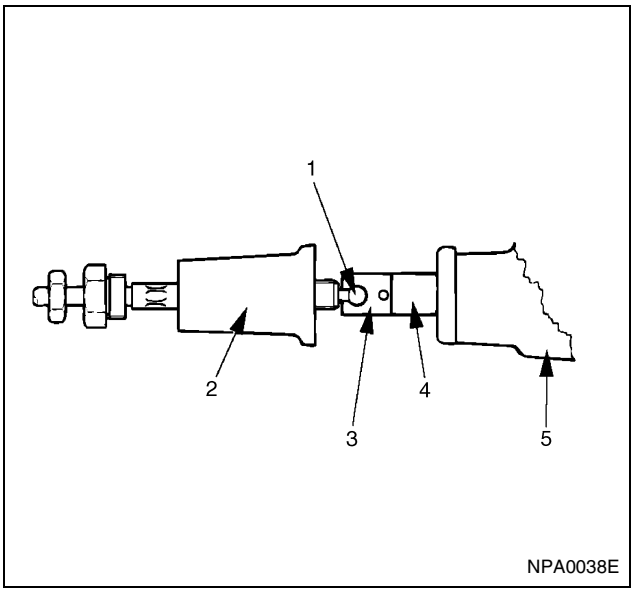
Legend
1. Special nut
2. Control cable
3. Truck front
4. Lock nut

2. Cable Holder
   - Assemble the cable holder in the control cable.



Legend
1. Rod end ball portion
2. Control cable
3. Cable holder

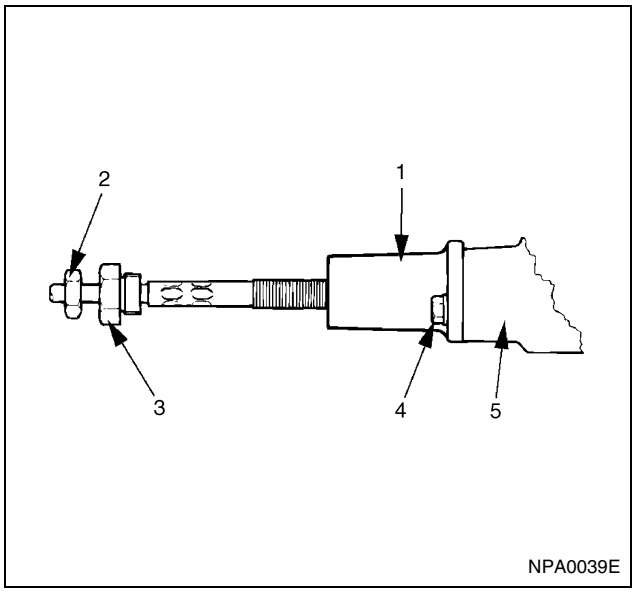
- Coat the rod end ball of the cable tip with a small amount of grease and assemble it in the groove of the control cable connector on the PTO side.



Legend
1. Rod end ball (apply a small amount of grease)
2. Cable holder
3. Cable connector
4. Shift rod
5. PTO

- Install the cable holder in the PTO and temporarily tighten the bolt.

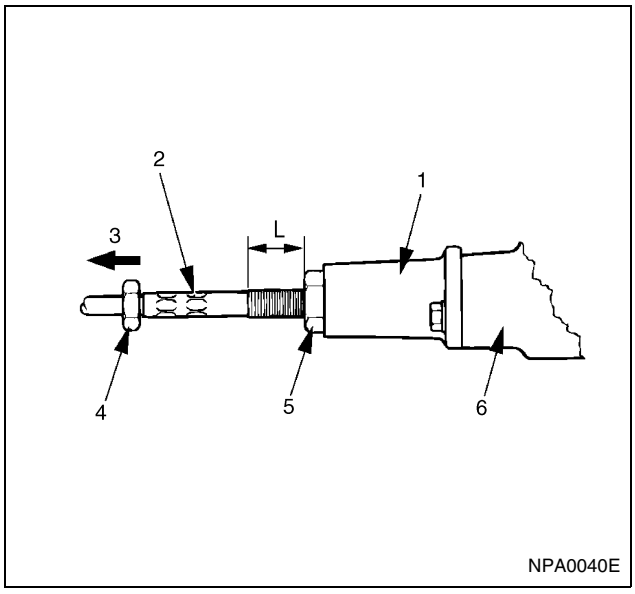
Notice:
Tighten the bolt after having adjusted it in accordance with the work procedure of the “Control Cable Adjustment”.



Legend
1. Cable holder
2. Lock nut
3. Special nut
4. Bolt
5. PTO

3. Special Nut
   - Tighten the special nut to the cable holder at a specified torque pressing down the control cable to the PTO side lightly.

Tighten:
Special nut to 147 N·m (15 kg·m / 108 lb·ft)



Legend
1. Cable holder
2. Control cable
3. Truck front
4. Lock nut
5. Special nut
6. PTO

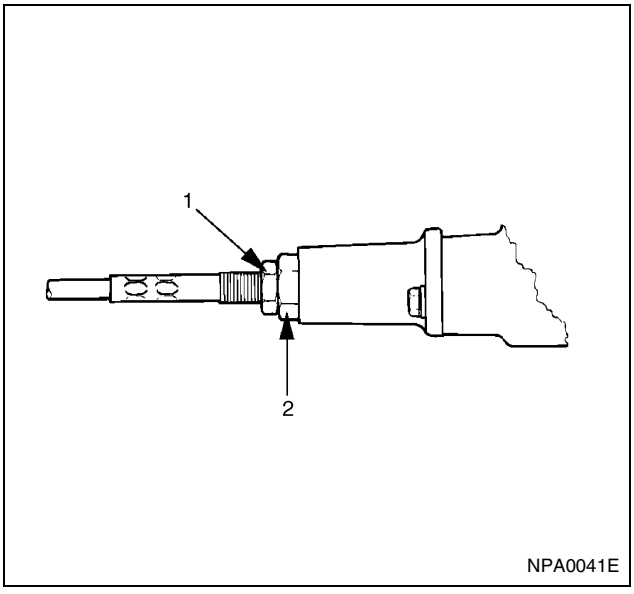
- At this time, check that the “L” dimension is 34±1 mm (1.339±0.039 inch.)
- If the “L” dimension does not satisfy the specified value, remove the cable holder from the PTO and rotate the cable holder to adjust the dimension.

Notice:
Both “clockwise rotation” and “counterclockwise rotation” indicate that the cable moves by about 0.75 mm (0.0295 inch) every time the cable holder rotates by 180 degrees.

- Re-install the cable holder on the PTO and temporarily tighten the bolt.

4. Lock Nut (PTO Side)
   - After having checked the specified value dimensions of the cable outer threaded portion, temporarily tighten the lock nut.

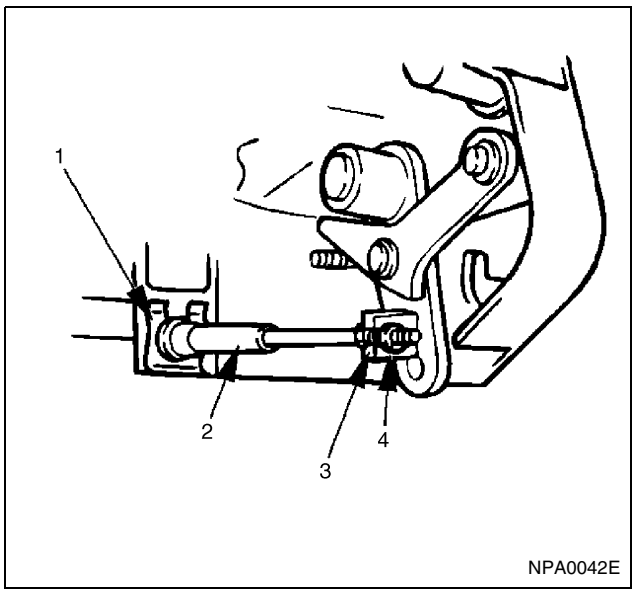
Notice:
Tighten the special nut and lock nut after having adjusted it in accordance with the work procedure of the “Control Cable Adjustment”.



Legend
1. Lock nut
2. Special nut

5. Clip (Cab Inside)
   - Draw the control cable in the instrument panel bottom inside the cab and firmly install the grommet.
   - Firmly install and fix the clip in the cable flange portion groove.
6. Lock Nut (Dump Lever Side)
   - Assemble the control cable tip in the boss portion of the dump lever and tighten the lock nut at a specified torque.

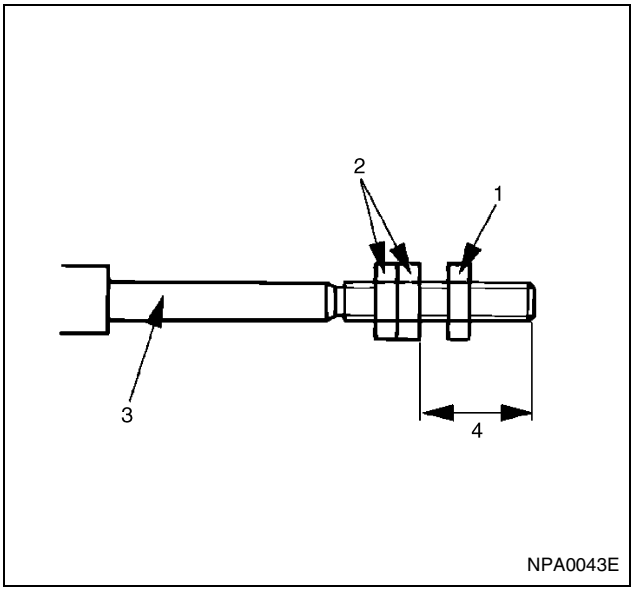
Tighten:
Lock nut to 6 N·m (0.6 kg·m / 52 lb·in)



Legend
1. Clip
2. Control cable
3. Boss portion
4. Lock nut

Notice:
If the double nut position of the control cable is not fixed, it is fixed to a reference value.

Control cable length (Reference): 18±1 mm (0.709±0.039 in)



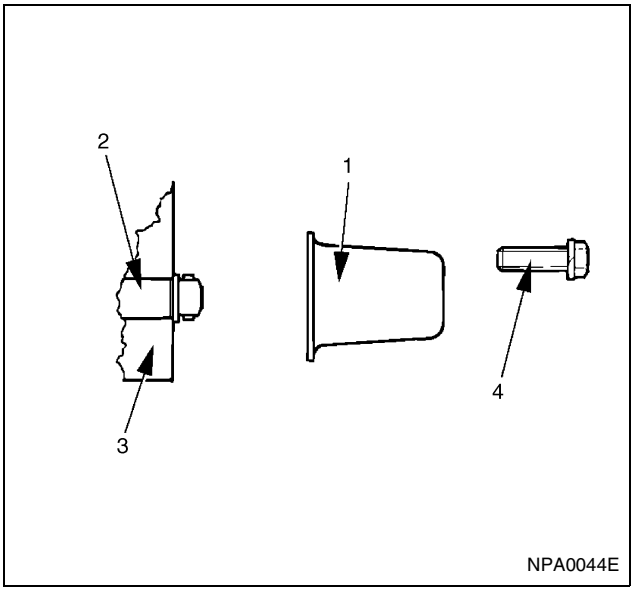
Legend
1. Lock nut
2. Double nut
3. Control cable
4. Reference valve

Control Cable Adjustment

Inspecting the Amount of Spool Extrusion

After having installed the control cable, inspect the amount of spool extrusion according to the following procedure.

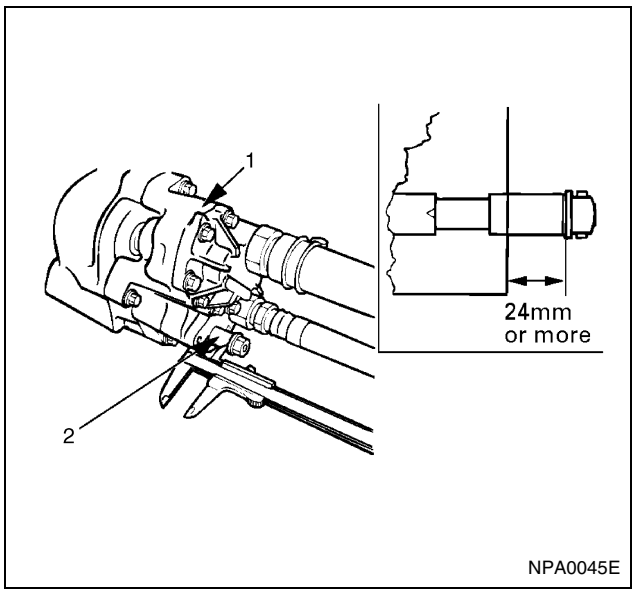
1. Remove the shift cap tightening bolt of the oil pump rear and remove the shift cap.



Legend
1. Shift cap
2. Spool
3. Oil pump rear end
4. Bolt

2. Repeat the “Up” and “Down” operations of the dump lever twice or three times and slowly set the dump lever to the “Up” position as much as possible.
3. Measure the amount of spool extrusion of the oil pump rear and check that it is a specified amount.

Amount of spool extrusion: 24 mm (0.945 in) or more

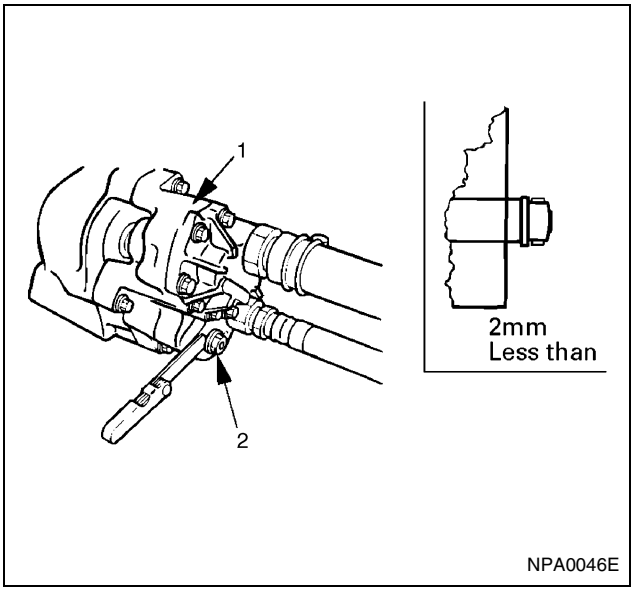


Legend
1. Oil pump
2. Spool extrusion

4. Repeat the “Up” and “Down” operations of the dump lever twice or three times and slowly set the dump lever to the “Up” position as much as possible.
5. Measure the amount of spool extrusion of the oil pump rear and check that it is a specified amount.

Amount of spool extrusion: less than 2 mm (0.0787 in)

Notice:
Both amounts of spool extrusion at “Up” and “Down” shall be within a standard value.

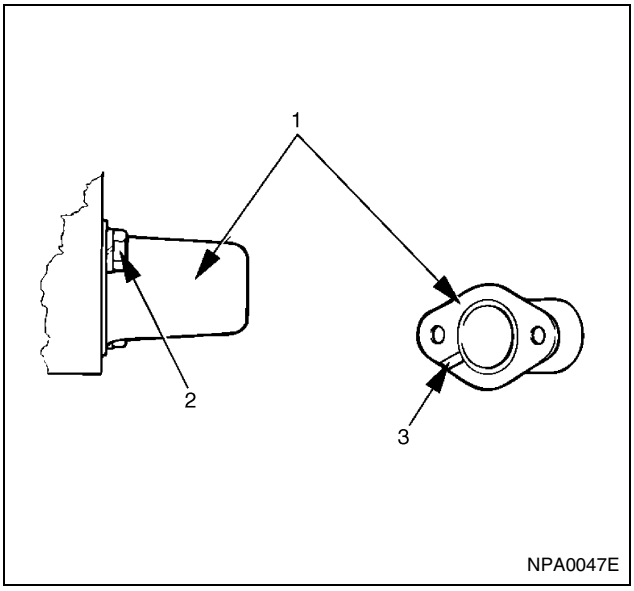


Legend
1. Oil pump
2. Spool extrusion

6. If the amount of spool extrusion is within a specified dimension, install the shift cap and tighten the bolt at a specified torque.

Tighten:
Shift cap fixing bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

Notice:
If the groove is not installed facing downward, the water intruded in the shift cap is not ejected but collected. Rusting and freezing will cause an incorrect actuation.

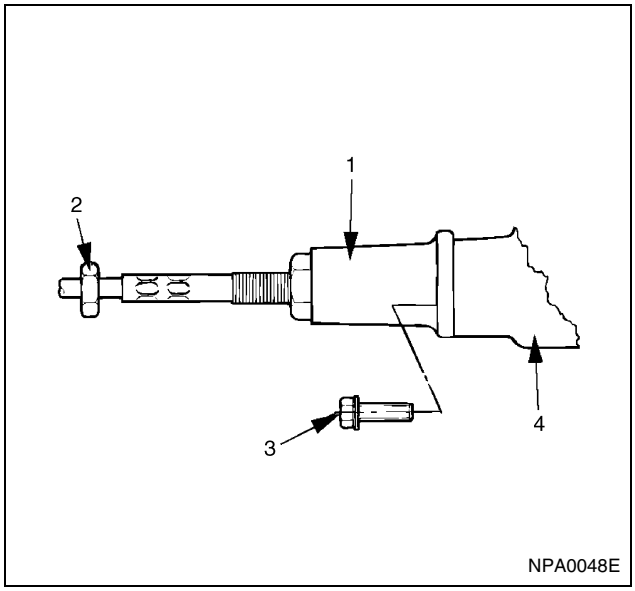


Legend
1. Shift cap
2. Bolt
3. Make groove face downward

Cable Adjustment (PTO Side)

If no specified extrusion dimensions can be obtained as a result of measuring the amount of spool extrusion described previously, adjust (PTO side) the cable so that the specified amount of spool extrusion can be obtained according to the following procedure.

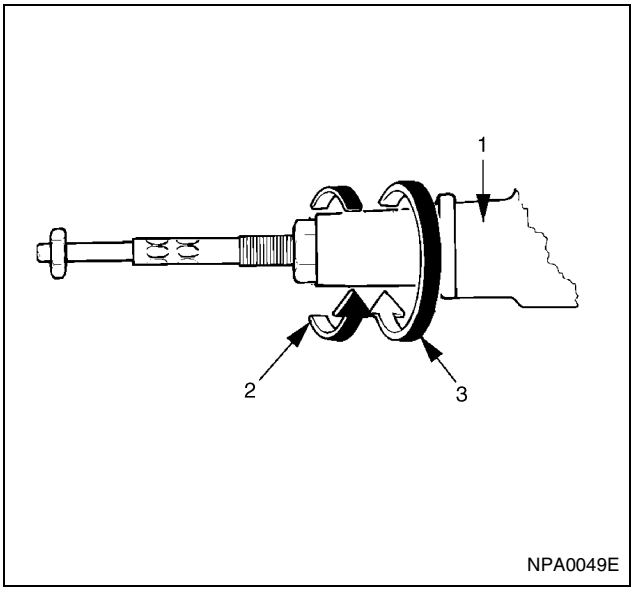
1. Loosen the lock nut of the control cable.
2. Remove the tightening bolt of the cable holder.



Legend
1. Cable holder
2. Lock nut
3. Bolt
4. PTO

3. Adjust the cable rotating the cable holder.
   - If the amount of spool extrusion is improper (insufficient) at “Dump lever Up”, rotate the cable holder toward “Counterclockwise rotation” shown by the arrow mark of the drawing.
   - If the amount of spool extrusion is improper (excessive) at “Dump lever Down”, rotate the cable holder toward “Clockwise rotation” shown by the arrow mark of the drawing.

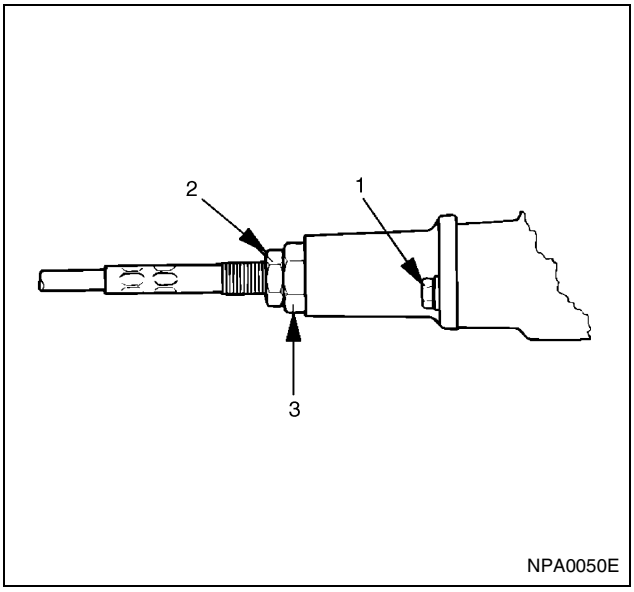
Notice:
Both “clockwise rotation” and “counterclockwise rotation” indicate that the cable moves by about 0.75 mm (0.0295 inch) every time the cable holder rotates by 180 degrees.



Legend
1. PTO
2. Counterclockwise rotation
3. Clockwise rotation

4. If the cable is adjusted in the aforementioned method and the amount of spool extrusion cannot be obtained, repeat Items (2) and (3) and adjust the cable so that the amount of spool extrusion will reach a specified extrusion dimension.
5. If a spool extrusion dimension can be obtained, tighten the cable holder tightening bolt and lock nut at a specified torque in this order.

Tighten:
- Cable holder bolt to 23 N·m (2.3 kg·m / 17 lb·ft)
- Lock nut to 21 N·m (2.1 kg·m / 15 lb·ft)



Legend
1. Bolt
2. Lock nut
3. Special nut

Operability of the dump lever, rise of the body (cargo deck), and inspection and adjustment of the rise and fall reference times

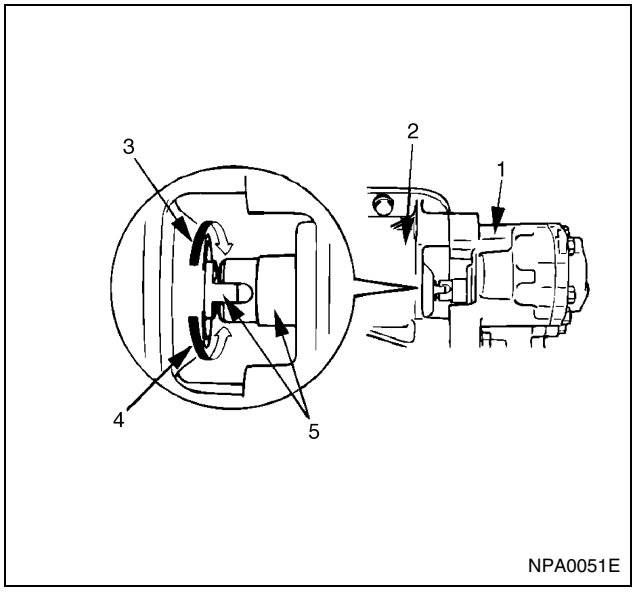
1. Check that the engine revolution per minute is 1,250 rpm and the rise and fall operations of the body (cargo deck) are performed within the following reference times.

Rise Time And Fall Time		Sec.
	Rise	Fall
Single Cab	within 20	within 20
Double Cab		within 25

2. Inspection of the dump lever control force and moderation
   - Inspect that the operation of the dump lever can lightly and smoothly be performed.

Basic Value (On the Dump Lever Knob): 10 kgf (98 N)

   - When the dump lever is in the “Up” and “Down” positions, inspect that the lock operation can be performed without a feeling of physical disorder.
3. After having repeated the “Up” and “Down” positions of the dump lever and slowly set them to the “Down” position as much as possible, inspect the shaft (driving shaft) between the PTO and oil pump.
   - Inspect that the shaft (driving shaft) rotates forward or backward.
     If the shaft slowly rotates backward, it is normal.

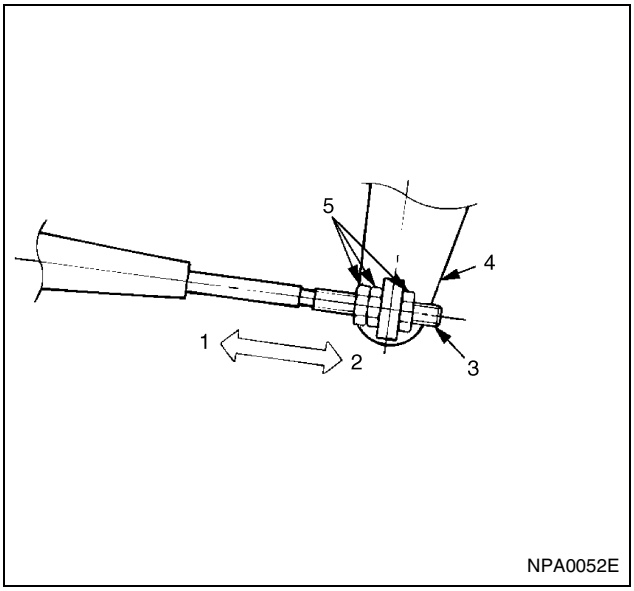


Legend
1. Oil pump
2. PTO
3. Direction of forward rotation
4. Direction of backward rotation
5. Shaft (drive shaft)

Cable Adjustment (Dump Lever Side)

If a defect is found as a result of the inspection of the aforementioned items (1) to (3), adjust the control cable in the dump lever portion inside the cab according to the following procedure.

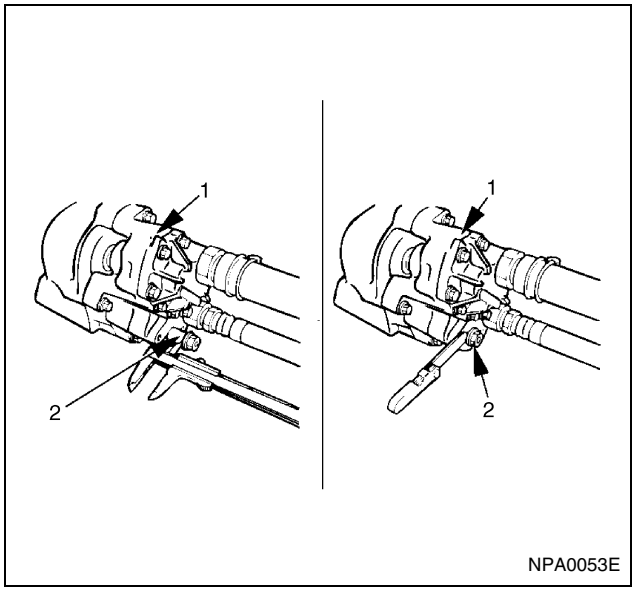
1. Set the dump lever to the “Down” position.
2. Loosen the lock nut of the control cable and adjust the cable as follows:



Legend
1. Squeeze
2. Pull out
3. Dump cable
4. Dump lever
5. Loosen

When the rise time is improper or when the shaft is inverted at “Down” time or when the dump lever is hard to lock at “Down” time, move the inner cable to Direction (1) of the drawing.
When the fall time is improper or when the dump lever is hard to lock at “Up” time or when the shaft rotates forward at “Down” time, move the inner cable to Direction (2) of the drawing.

Notice:
If the cable is adjusted on the dump lever side, be sure to re-inspect the amount of spool extrusion.



Legend
1. Oil pump
2. Spool extrusion

3. After adjustment, tighten the lock nut at a specified torque.

Tighten:
Lock nut to 6 N·m (0.6 kg·m / 52 lb·in)

Notes on Replacing and Adjusting Control Cable for Three-rotation Dump Truck

1. The control cable between the “Dump lever and selector” of the three-rotation dump truck is manufactured by ISUZU MOTORS LIMTED.
   This control cable is sent for (at replacement) in the Isuzu Motors Service Network, and because the selector need be disassembled, assembled, and adjusted, request a service network (SS store) of a body manufacturer of the replacement work.
2. The selector main unit for the three-rotation dump truck and the control cable between the “Selector and PTO (with oil pump) are manufactured by a body manufacturer.
   Request a service network (SS store) of a body manufacturer of the replacement work of the selector main unit and the aforementioned control cable.
3. First adjust the control cable at the dump lever bottom, adjust the control cable in the cable holder portion of the PTO (oil pump portion), and check that the shaft (driving shaft) of the oil pump will not rotate concurrently. Then because the adjustment of the selector main unit is necessary (only at down lever down, the ejection direction of the cargo deck can be selected. If this adjustment is improper, the cargo deck may fall off.), request a service network of a body manufacturer of the adjustment.

Control Cable Rough Layout Drawing for Three-Rotation Dump Truck

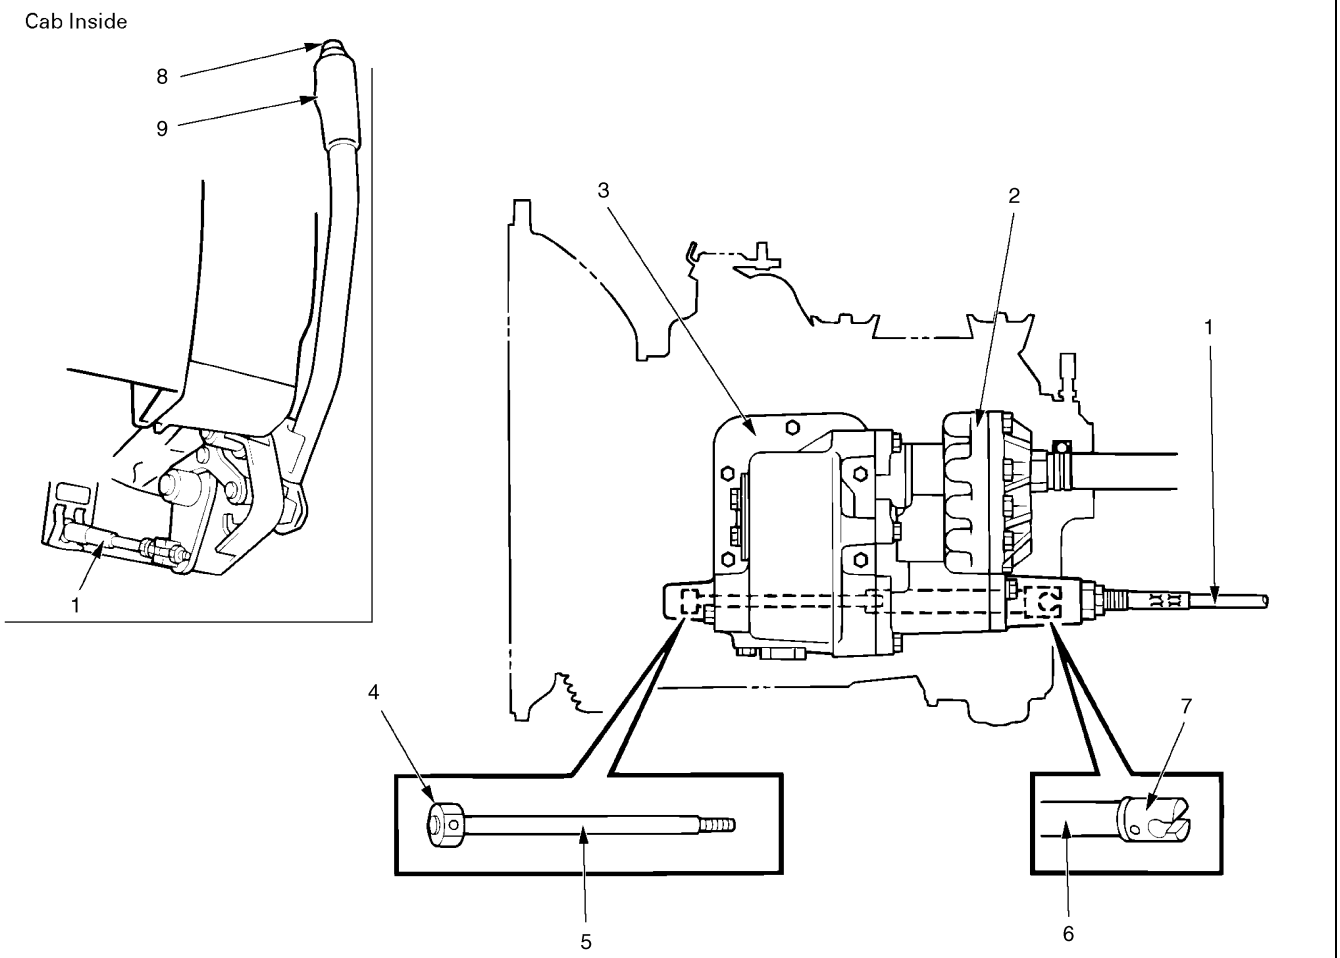
9. Isuzu control cable
10. Transmission

Control Cable Adjustment for Three-rotation Dump Truck

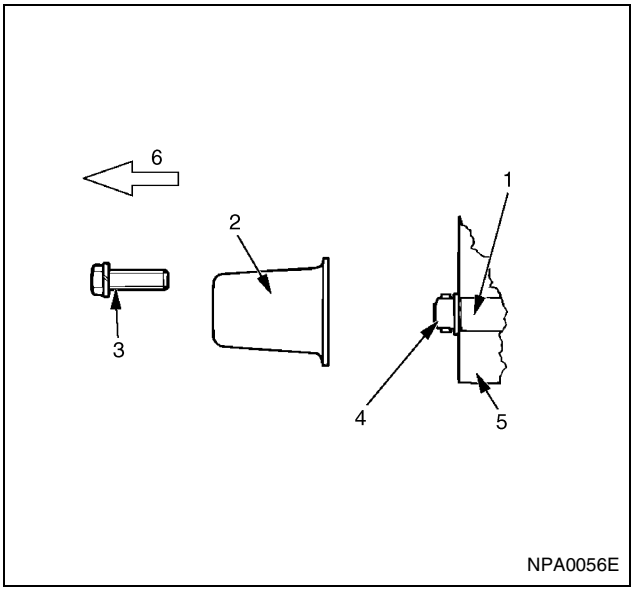


Legend

1. Control cable
2. Oil pump
3. PTO
4. Stopper adapter
5. Inner rod assembly
6. Spool
7. Cable connector
8. Lock button
9. Dump lever

Replacement

1. The control cable between the “Dump lever and selector” of the three-rotation dump truck is manufactured by Isuzu Motors Ltd. This control cable is sent for (at replacement) in the Isuzu Motors Service Network, and because the selector need be disassembled, assembled, and adjusted, request a service network (SS store) of a body manufacturer of the replacement work.
2. The selector main unit for the three-rotation dump truck and the control cable between the “Selector and PTO (with oil pump) are manufactured by a body manufacturer. Request a service network (SS store) of a body manufacturer of the replacement work of the selector main unit and the aforementioned control cable.



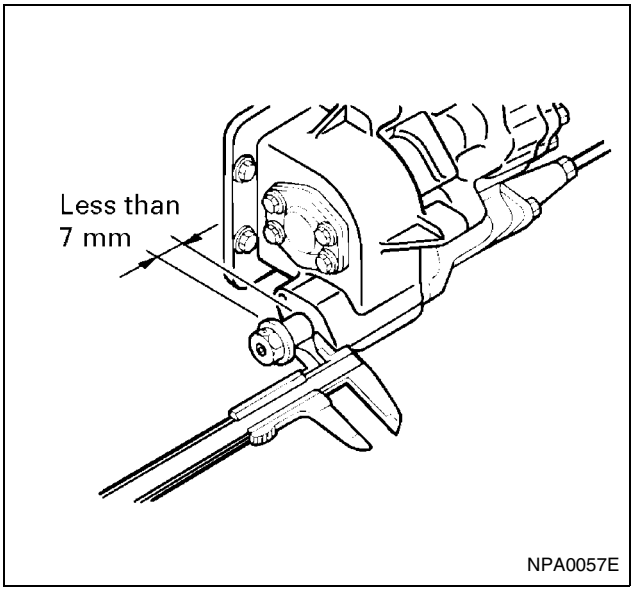
Legend

1. Inner rod
2. Shift cap
3. Bolt
4. Spool extrusion portion
5. PTO tip portion
6. Truck front

Measurement of the Amount of Spool Extrusion (PTO Tip Portion)

1. Remove the shift cap tightening bolt of the PTO tip portion and remove the shift cap.
2. Operate the dump lever twice or three times and slowly set it to the “Up” position as much as possible, then firmly lock the dump lever.
3. Measure the amount of spool extrusion at “Up” time at the PTO tip portion and check that it is a basic value.

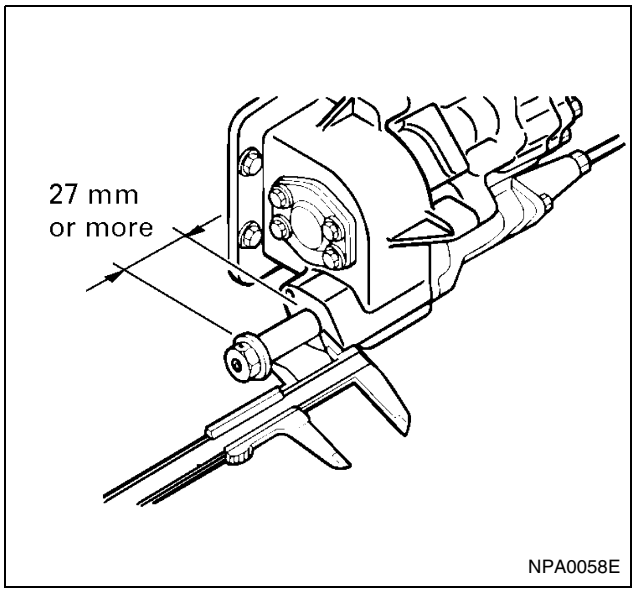
Amount of spool extrusion: less than 7 mm (0.276 in)



4. Operate the dump lever twice or three times and slowly set it to the “Down” position as much as possible, then firmly lock the dump lever.
5. Measure the amount of spool extrusion at “Down” time at the PTO tip portion and check that it is a basic value.

Amount of spool extrusion: 27 mm (1.063 in) or more

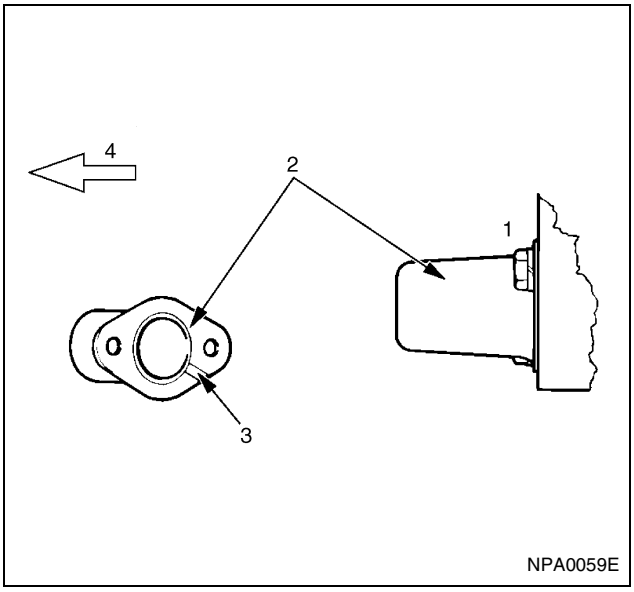
Notice:
Be sure check that both amounts of spool extrusion at “Up” and “Down” times are within basic values.



6. As a result of measurement, if the amount of spool extrusion is within a basic value, install the shift cap and tighten the bolt at a specified torque.
   - Install the shift cap so that the groove on the locating plane can locate downward.

Tighten:
Shift cap bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

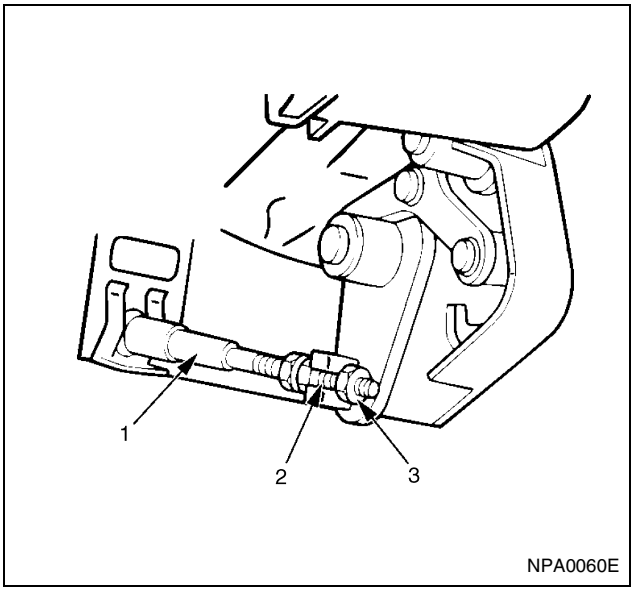
Notice:
If the groove is not installed facing downward, the water intruded in the shift cap is not ejected but collected. Rusting and freezing will cause an incorrect actuation.



Legend
1. Bolt
2. Shift cap
3. Make groove face downward
4. Truck front

Adjustment of the Amount of Spool Extrusion (Control Cable Adjustment)

Notice:
As a result of the "Measurement of The Amount of Spool Extrusion" described previously, if a specified extrusion dimension cannot be obtained, adjust the control cables on the dump lever side inside the cab and the dump lever side according to the following procedure.



Legend
1. Control cable
2. Boss portion
3. Lock nut

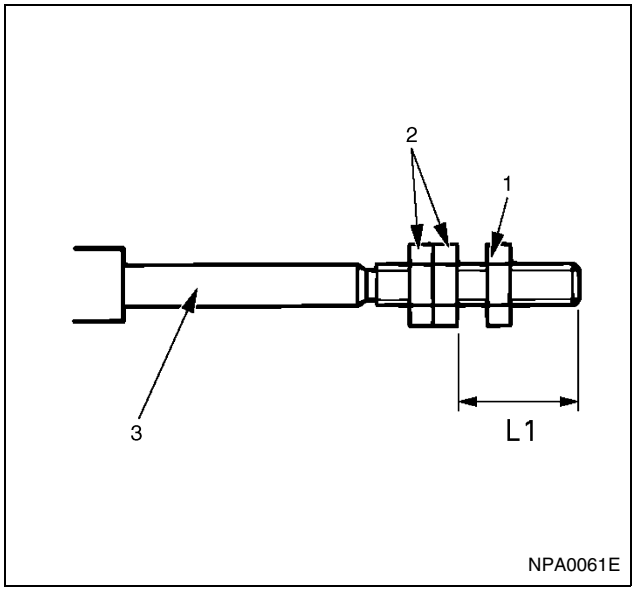
Control Cable Adjustment (Dump Lever Side Inside Cab)

1. Operate the dump lever twice or three times with the engine in the stopped state and slowly set it to the "Up" position, then firmly lock the dump lever.
2. Measure the length "L1" on the control cable tip and double nut side shown in the drawing and check that it is within the following basic value.

Length "L1": 14±1 mm (0.55±0.039 in)

3. As a result of measurement, if the length "L1" does not satisfy a basic value, loosen the lock nut and adjust the control cable so that the length "L1" will be set to a specified length "L1", then tighten the lock nut at a specified torque.

Tighten:
Lock nut to 6 N·m (0.6 kg·m / 52 lb·in)



Legend
1. Lock nut
2. Double nut
3. Control cable

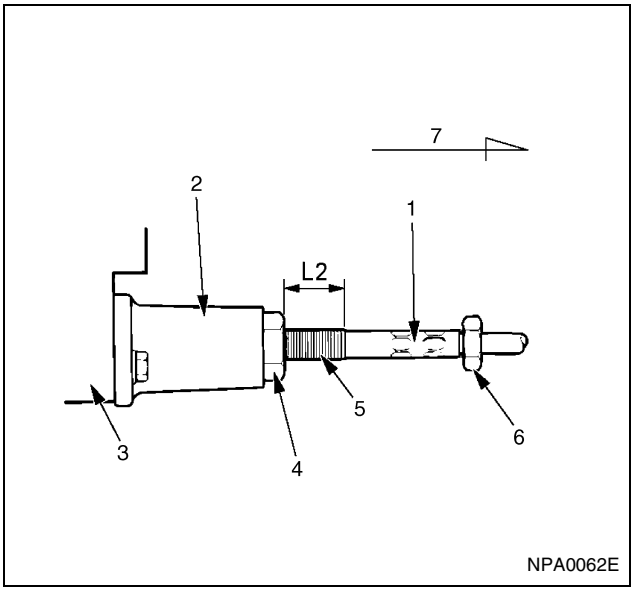
Control Cable Adjustment (Oil Pump Side)

1. Tighten the special nut in the cable holder loosening the lock nut, moving it to the truck rear, and lightly pushing the control cable against the PTO side.
2. Measure the length "L2" between the outer screw tip portion and special nut end of the control cable shown in the drawing and check that it is within a basic value.

Length "L2" (Reference): 24^{+1}_{-0} mm ($0.945^{+0.039}_{-0}$ in)

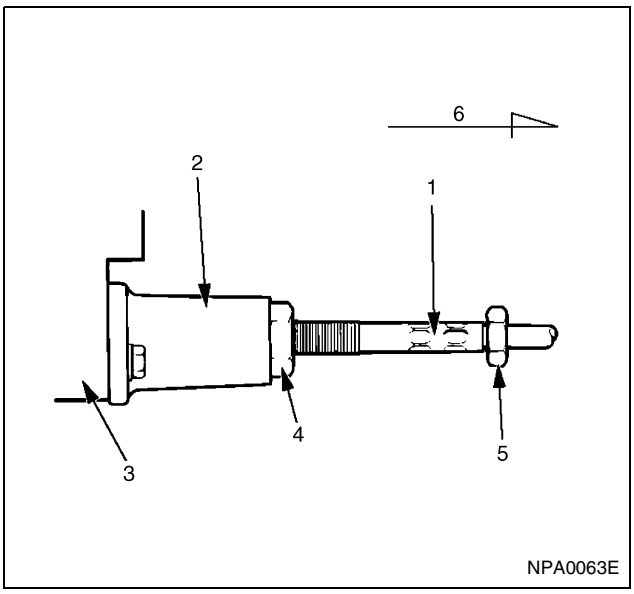
- As a result of check, if the length "L2" is satisfied, tighten the lock nut at a specified torque.

Tighten:
Lock nut to 20 N·m (2.0 kg·m / 14 lb·ft)



Legend
1. Control cable
2. Cable holder
3. Oil pump portion
4. Special nut
5. Outer threaded portion
6. Lock nut
7. Truck front

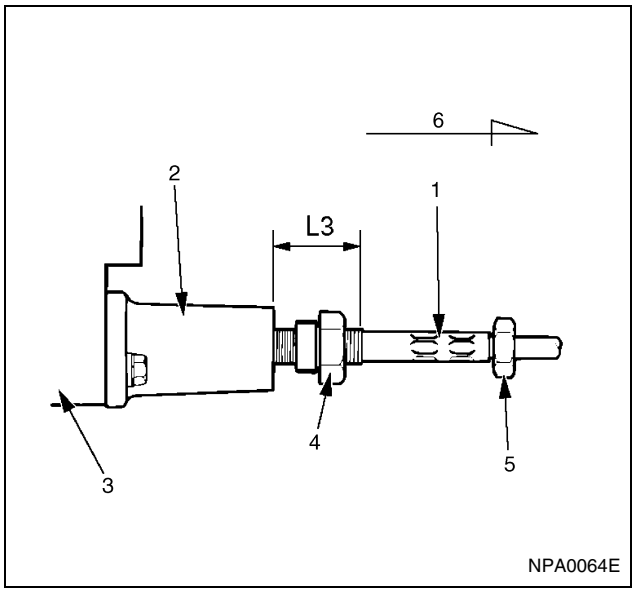
3. As a result of measurement, if the length “L2” does not satisfy a basic value, adjust the control cable according to the following procedure.



Legend
1. Control cable
2. Cable holder
3. Oil pump portion
4. Special nut
5. Lock nut
6. Truck rear

1) Loosen the special nut and move it toward the truck rear, then set the control cable free.
2) Manually holding the control cable, take in and out the cable to the front and rear. Obtain the length “L3” and temporarily tighten the special nut securing the control cable manually.

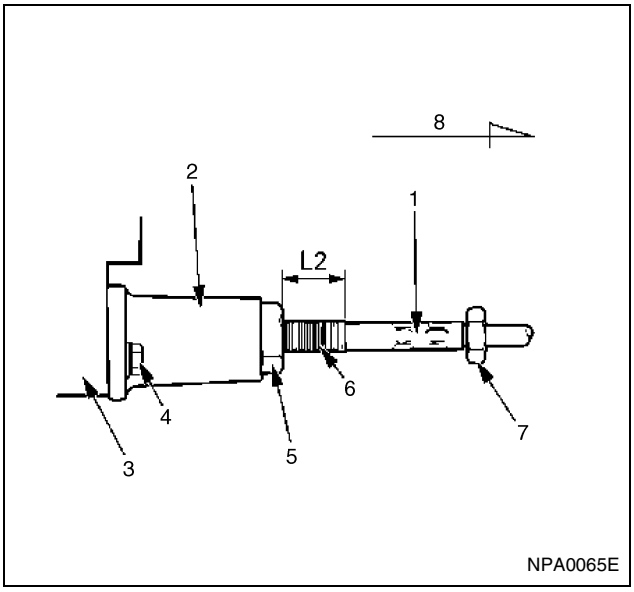
“L3” = “L2” basic value + Special Nut Thickness (10 mm)



Legend
1. Control cable
2. Cable holder
3. Oil pump portion
4. Special nut
5. Lock nut
6. Truck rear

3) Measure the length “L2” in the state of (2). If the dimension does not satisfy a basic value, repeat Items (2) and (3) and adjust so that the “L2” will be set to the basic value.
4) After having the length “L2”, tighten the special nut at a specified torque.

Tighten:
Special nut to 142 N·m (14.5 kg·m / 105 lb·ft)

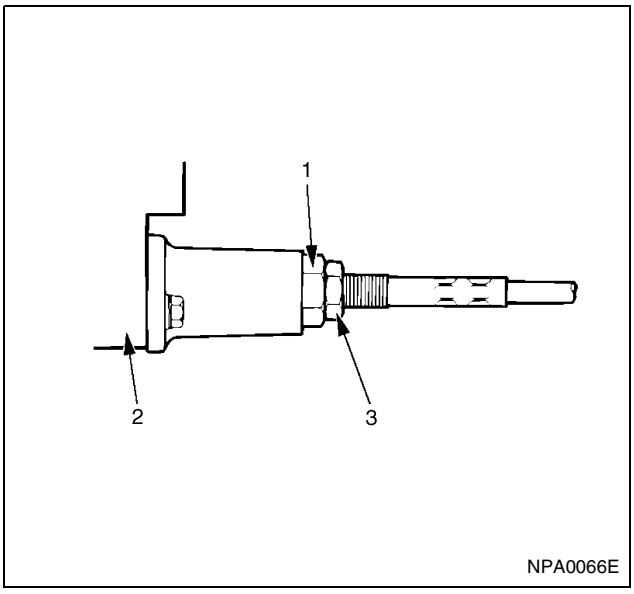


Legend

1. Control cable
2. Cable holder
3. Oil pump portion
4. Bolt
5. Special nut
6. Outer threaded portion
7. Lock nut
8. Truck rear

5) After having tightened the special nut, tighten the lock nut at a specified torque.

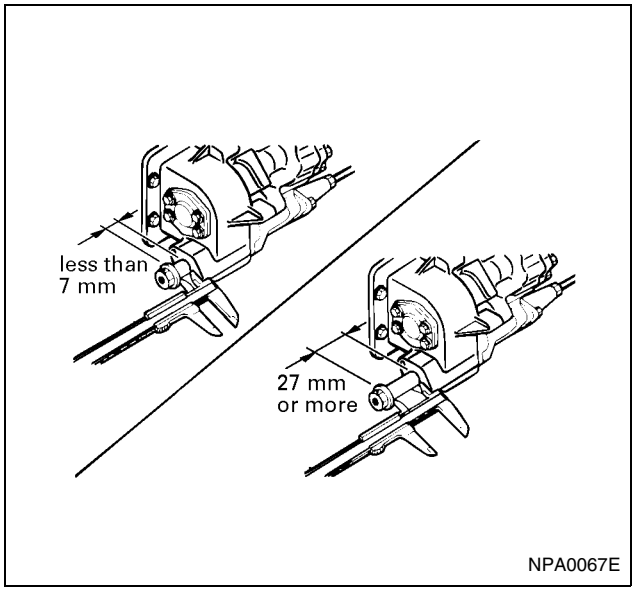
Tighten:
Lock nut to 20 N·m (2.0 kg·m / 14 lb·ft)



Legend

1. Special nut
2. Oil pump portion
3. Lock nut

4. After having adjusted the control cable, slowly operate the dump lever twice or three times and recheck the spool extrusion dimension.
(Refer to the item of Measurement of The Amount of Spool Extrusion.)

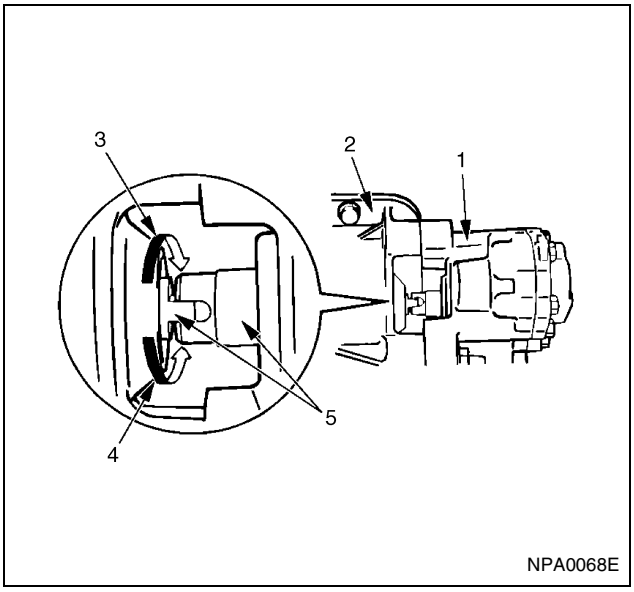


5. After having completed all measurement and adjustments, set the dump lever to the “Down” position and start the engine.

Operability of the Dump Lever, Rise of the Body (Cargo Deck), and Inspection and Adjustment of the Rise and Fall Reference Times

1. Check that the engine revolution per minute is 1,250 rpm and the rise and fall operations of the body (cargo deck) are performed within the following reference times.
Rise time = within 20 seconds
Fall time = within 20 seconds
2. Inspection of the dump lever control force and moderation
   - Inspect that the operation of the dump lever can lightly and smoothly be performed.

   Basic value = less than 10 kgf (98 N) on the dump lever knob
   - When the dump lever is in the “Up” and “Down” positions, inspect that the lock operation can be performed without a feeling of physical disorder.
3. After having repeated the “Up” and “Down” positions of the dump lever and slowly set them to the “Down” position as much as possible, inspect the shaft (driving shaft) between the PTO and oil pump.
   - Inspect that the shaft (driving shaft) rotates forward or backward.
     If the shaft slowly rotates backward, it is normal.

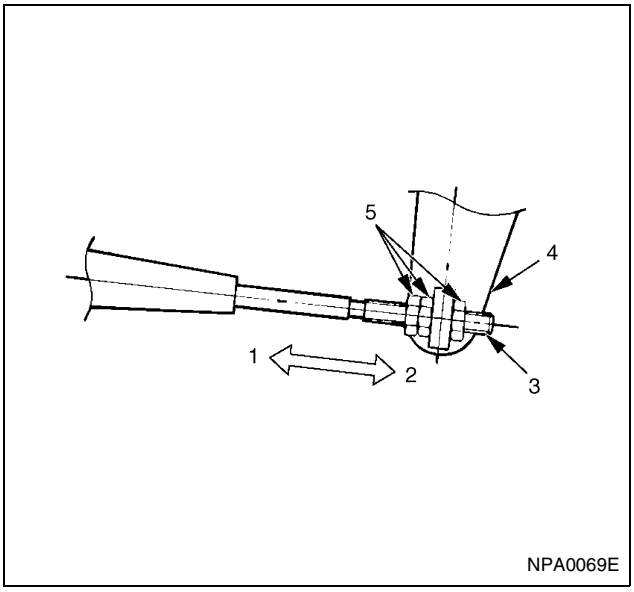


Legend

1. Oil pump
2. PTO
3. Direction of forward rotation
4. Direction of backward rotation
5. Shaft (drive shaft)

4. If a defect is found as a result of the inspection of the aforementioned items 1) to 3), adjust the control cable in the dump lever portion inside the cab according to the following procedure.
   1) Set the dump lever to the “Down” position.
   2) Loosen the lock nut of the control cable and adjust the cable as follows:

   When the rise time is improper or when the dump lever is hard to lock at “Down” time, move the inner cable to Direction (2) of the drawing on the preceding page.



Legend

1. Push in
2. Pull out
3. Dump cable
4. Dump lever
5. Loosen

When the fall time is improper or when the dump lever is hard to lock at “Up” time or when the shaft rotates forward at “Down” time, move the inner cable to Direction (1) of the drawing on the preceding page.

Notice:
If the cable is adjusted on the dump lever side, be sure to re-inspect the amount of spool extrusion.

After adjustment, tighten the lock nut at a specified torque.

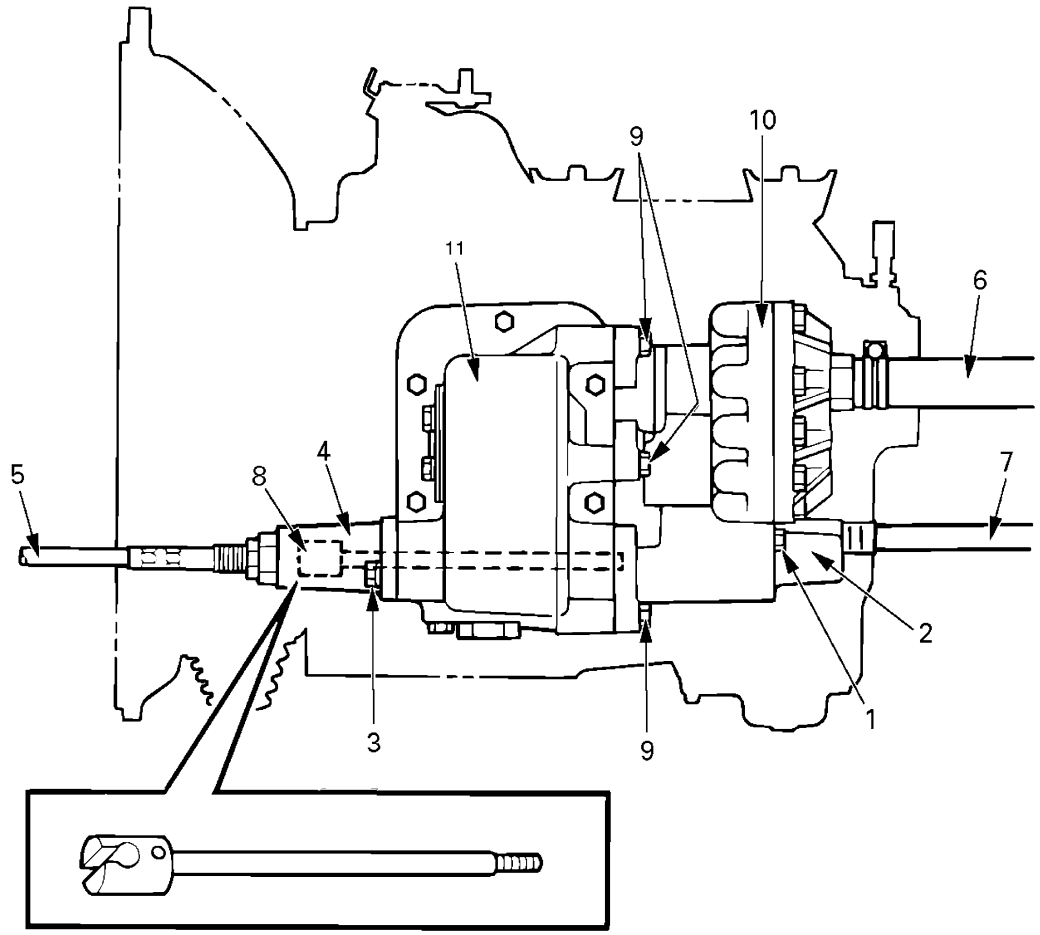
Tighten:
Lock nut to 6 N·m (0.6 kg·m / 52 lb·in)

***Selector**
The selector is adjusted so that the ejection direction of the cargo deck can be selected only at dump lever “Down”. If this adjustment is improper, the cargo deck may slide from the truck at rise. Accordingly, because the adjustment of the selector main unit is also needed after the replacement, adjustment, and inspection of the control cable, request a nearest service network (SS store) of a body builder of the adjustment.

OIL PUMP UNIT (REPLACEMENT)

Removal and Installation

This illustration is based on a rear dump truck model.



NPA0070E

Legend

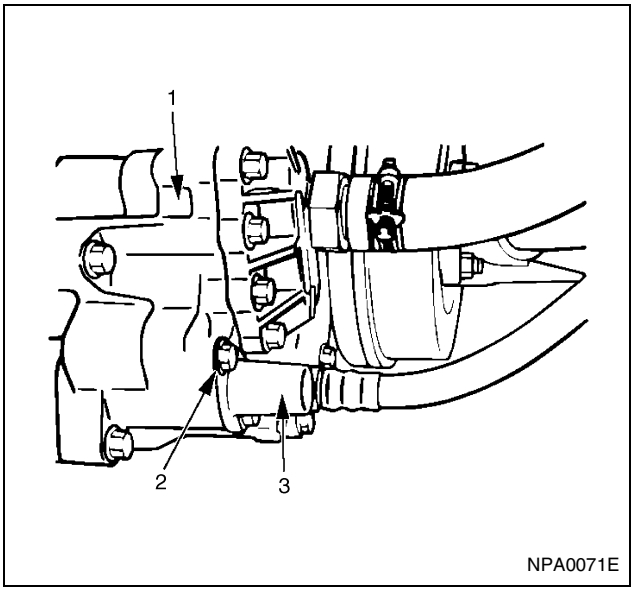
1. Bolt (shift cap)
2. Shift cap
3. Bolt (cable holder)
4. Cable holder
5. Control cable
6. Low-pressure hose
7. High-pressure hose
8. Inner rod assembly
9. Bolt (oil pump)
10. Oil pump
11. PTO

Removal Steps

Notice:
Set the dump lever inside the cab to the “Down” position and check the lever lock.

1. Bolt (Shift Cap)
2. Shift Cap

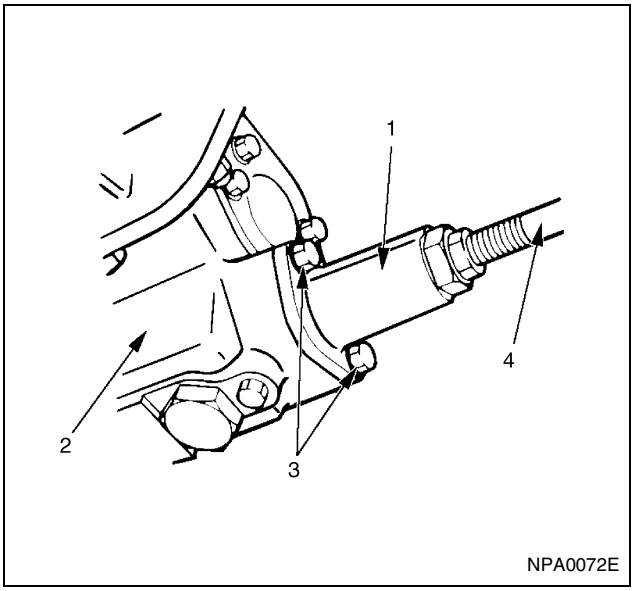
- Remove the bolt and remove the shift cap from the oil pump.



Legend
1. Oil pump
2. Bolt
3. Shift cap

3. Bolt (Cable Holder)
4. Cable Holder
5. Control Cable

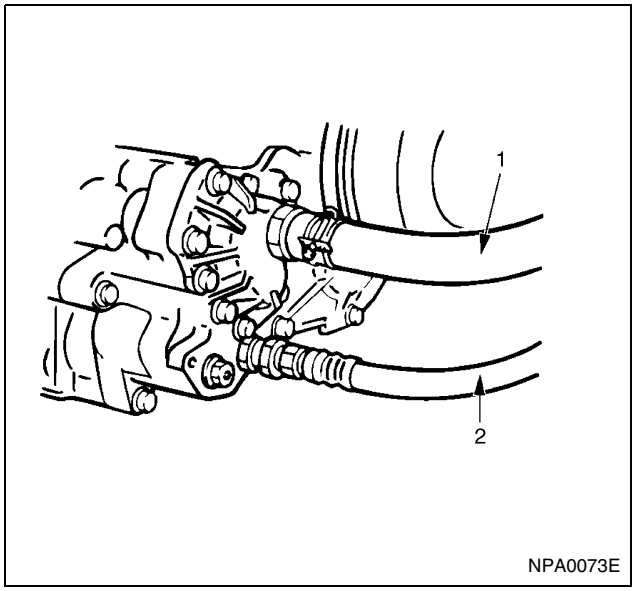
Notice:
Before removing the control cable, be sure to refer to Items 3 to 6 of “Removal” of the “Control Cable for Rear Dump Truck” described previously and perform work in accordance with the items.



Legend
1. Cable holder
2. PTO
3. Bolt
4. Control cable

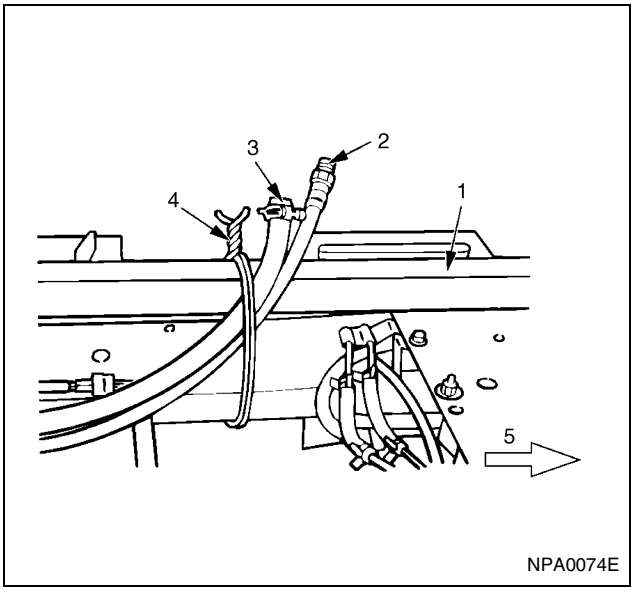
6. Low-Pressure Hose
   - Loosen the hose band and remove the hose from the oil pump.
7. High-Pressure Hose
   - Loosen the hose joint and remove the hose from the oil pump.

Notice:
For the high-pressure hose, the joint may not be removed in the oil pump fixed state according to the type of the truck and equipment. In that case, slightly loosen the joint to set the state. At the stage where the rear oil pump is removed (Item 10), remove the high-pressure hose rotating the oil pump.



Legend
1. Low-pressure hose
2. High-pressure hose

Notice:
Because hydraulic operating fluid flows out when the hose is removed, quickly make the hose port face upward and protect the hose so that dust or foreign matter will not be mixed in, then fix it to the frame with a wire.

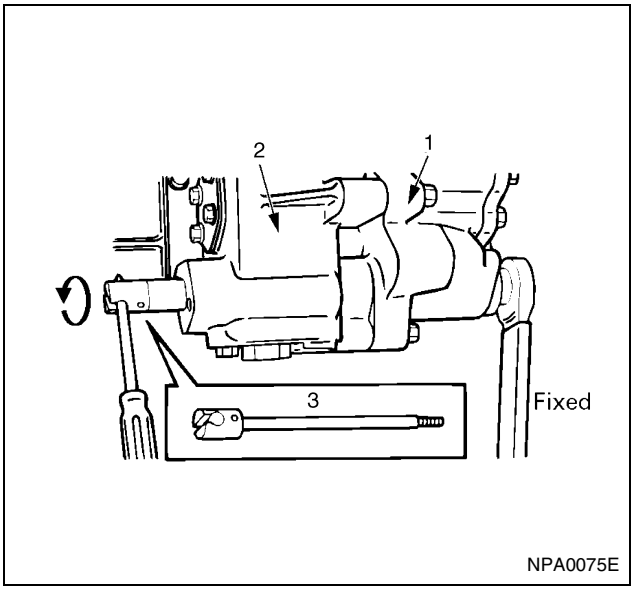


NPA0074E

Legend
1. Left frame
2. High-pressure hose
3. Low-pressure hose
4. Wire
5. Truck front

8. Inner Rod Assembly
   - To remove the inner rod assembly, as shown in the drawing, press the stopper adapter side by a wrench and insert a Phillips screwdriver (large) in the groove of the control cable connector. Then rotate it counterclockwise, loosen it, and remove it.

Notice:
Be sure to press the stopper adapter side and loosen it on the control cable connector side. (Press the stopper adapter side not to rotate the spool valve. Besides, the three-rotation dump truck is in contrast with this.)

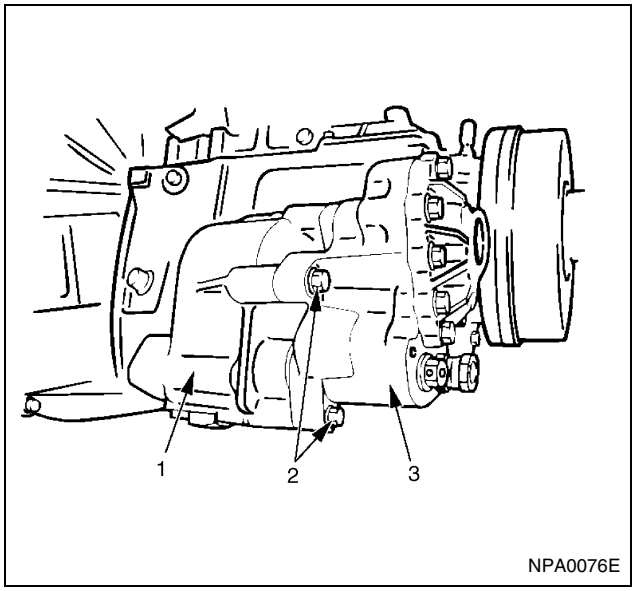


NPA0075E

Legend
1. Oil pump
2. PTO
3. Inner rod assembly

9. Bolt (Oil Pump)
10. Oil Pump
    - Remove three oil pump tightening bolts and strike them with a plastic hammer (or a wooden hammer) from the truck front side, then remove the oil pump from the PTO.
    - Remove the joint from the oil pump.

Notice:
If the high-pressure hose could not be removed in Item 7 described previously, remove the oil pump from the high-pressure hose rotating the oil pump at this time.



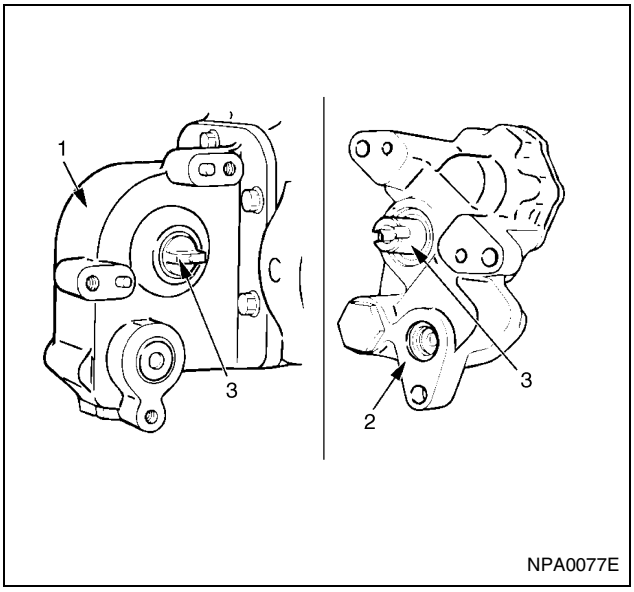
NPA0076E

Legend
1. PTO
2. Bolt
3. Oil pump

Installation Steps

1. Oil Pump
2. Bolt (Oil Pump)
   - Fully coat the oil pump shaft tip groove portion and PTO shaft tip with lithium grease (BESCO L-2 or equivalent).
   - Install the oil pump in the joint.

Notice:
If the oil pump is rotated and removed from the high-pressure hose when the oil pump is removed, install the oil pump in the high-pressure hose rotating the oil pump and slightly tighten it.

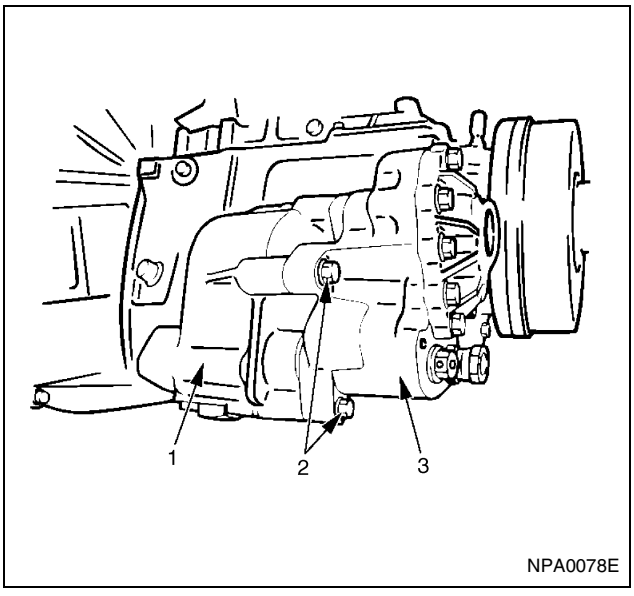


Legend
1. PTO
2. Oil pump
3. Coat shaft tip portion with grease

- Align and install the oil pump groove and the shaft width across flats of the PTO and tighten the bolt at a specified torque.

Tighten:
PTO bolt to 53 N·m (5.4 kg·m / 39 lb·ft)

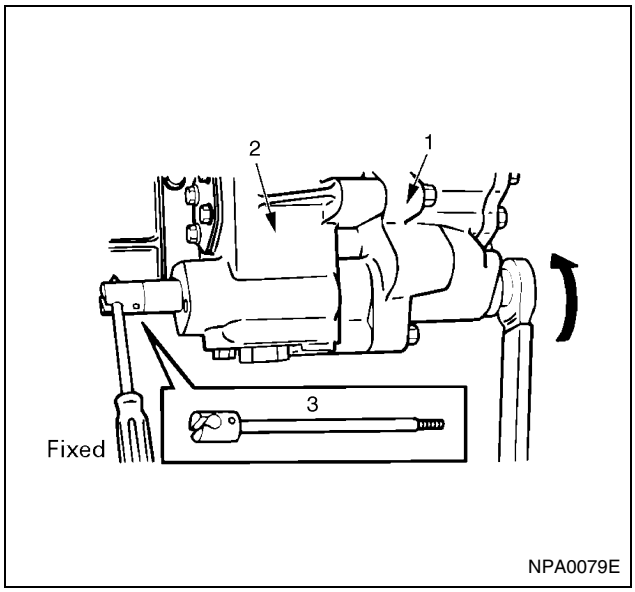
Notice:
Be fully careful so that dust or foreign matter will not be mixed in from the hose installation port of the oil pump.



Legend
1. PTO
2. Bolt
3. Oil pump

3. Inner Rod Assembly
   - Coat the threaded portion of the inner rod assembly tip with liquid gasket (LOCTITE 242 or equivalent) and insert and screw the tip from the front side of the PTO, then tighten it at a specified torque.
   - When tightening the inner rod assembly, insert a Phillips screwdriver (large) in the control cable connector groove, press it so that the spool valve will not rotate, then apply a wrench to the stopper adapter on the oil pump side to tighten it. (Besides, the three-rotation dump truck is in contrast with this.)

Tighten:
Inner rod to19 N·m (1.9 kg·m / 14 lb·ft)



Legend
1. Oil pump
2. PTO
3. Inner rod assembly

4. High-Pressure Hose
   - Install the high-pressure hose in the oil pump and firmly tighten the joint.

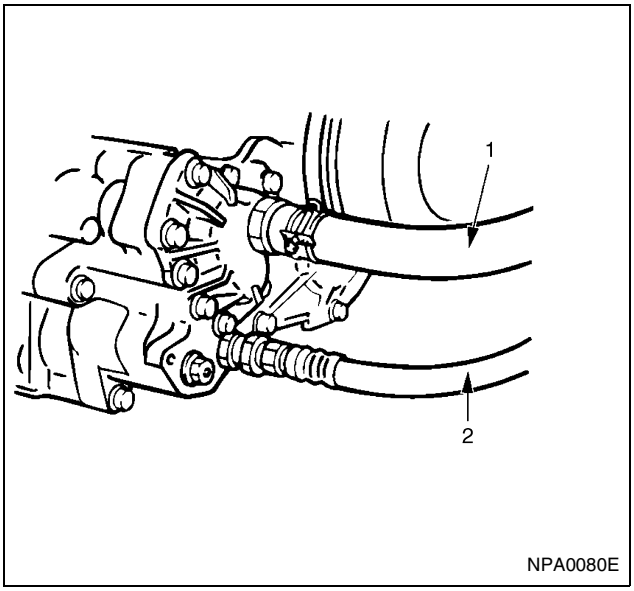
Notice:
If the oil pump is rotated and installed in the high-pressure hose in Item 10 described previously, firmly tighten the joint.

5. Low-Pressure Hose
   - Install the hose and firmly tighten the hose band.

Notice:
When installing both the high-pressure and low-pressure hoses, be fully careful so that dust or foreign matter will not be mixed in the hose port and oil pump.

Joint Torque		N·m (kg·m / lb·ft)
Item	Size	Torque
High-pressure side	PF1/2	103 (10.5 / 76)
Low-pressure side	PF3/4	147 (15 / 108)

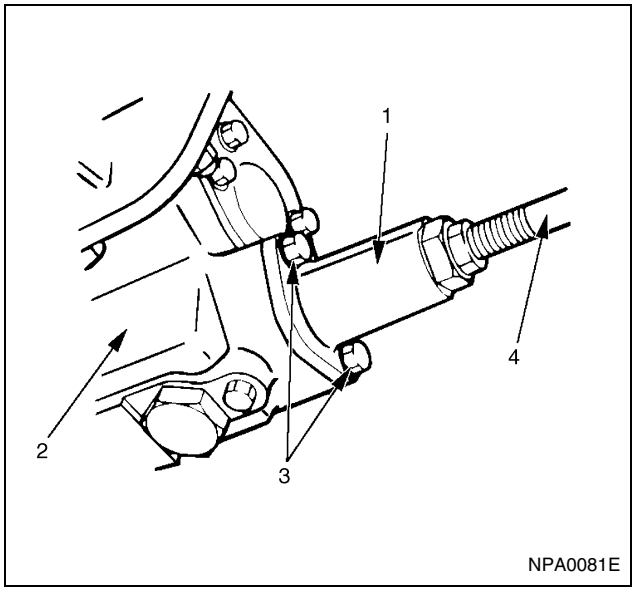
* After having tightened the joint using a recommended value, additionally tighten it if there is a leak of oil.



Legend
1. Low-pressure hose
2. High-pressure hose

6. Control Cable
7. Cable Holder
8. Bolt (Cable Holder)

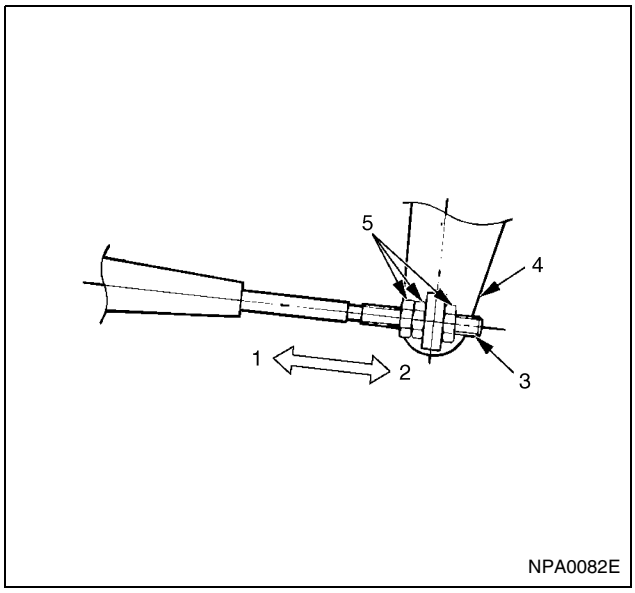
Notice:
Install the control cable and cable holder in the PTO in accordance with Items 1 to 4 of “Installation” of Removal and Installation of Control Cable for Rear Dump Truck, and after installation, inspect and adjust the spool amount in accordance with the “Amount of Spool Extrusion” described previously.



Legend
1. Cable holder
2. PTO
3. Bolt
4. Control cable

- After having adjusted the control cable and having inspected or adjusted the amount of spool extrusion, tighten the bolt and the special nut and lock nut of the control cable at a specified torque.

Tighten:
- Bolt to 24 N·m (2.4 kg·m / 17 lb·ft)
- Special nut to 206 N·m (21 kg·m / 152 lb·ft)
- Lock nut to 21 N·m (2.1 kg·m / 15 lb·ft)

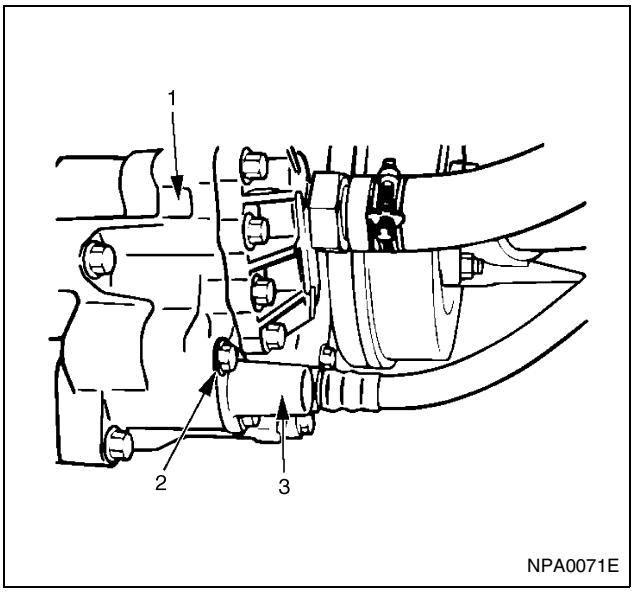


Legend
1. Push in
2. Pull out
3. Dump cable
4. Dump lever
5. Loosen

9. Shift Cap
10. Bolt (Shift Cap)
    - Install the shift cap in the oil pump making its grooved side face upward and tighten the bolt at a specified torque.

Tighten:
Shift cap bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

Notice:
If the groove is not installed facing downward, the water intruded in the shift cap is not ejected but collected. Rusting and freezing will cause an incorrect actuation.



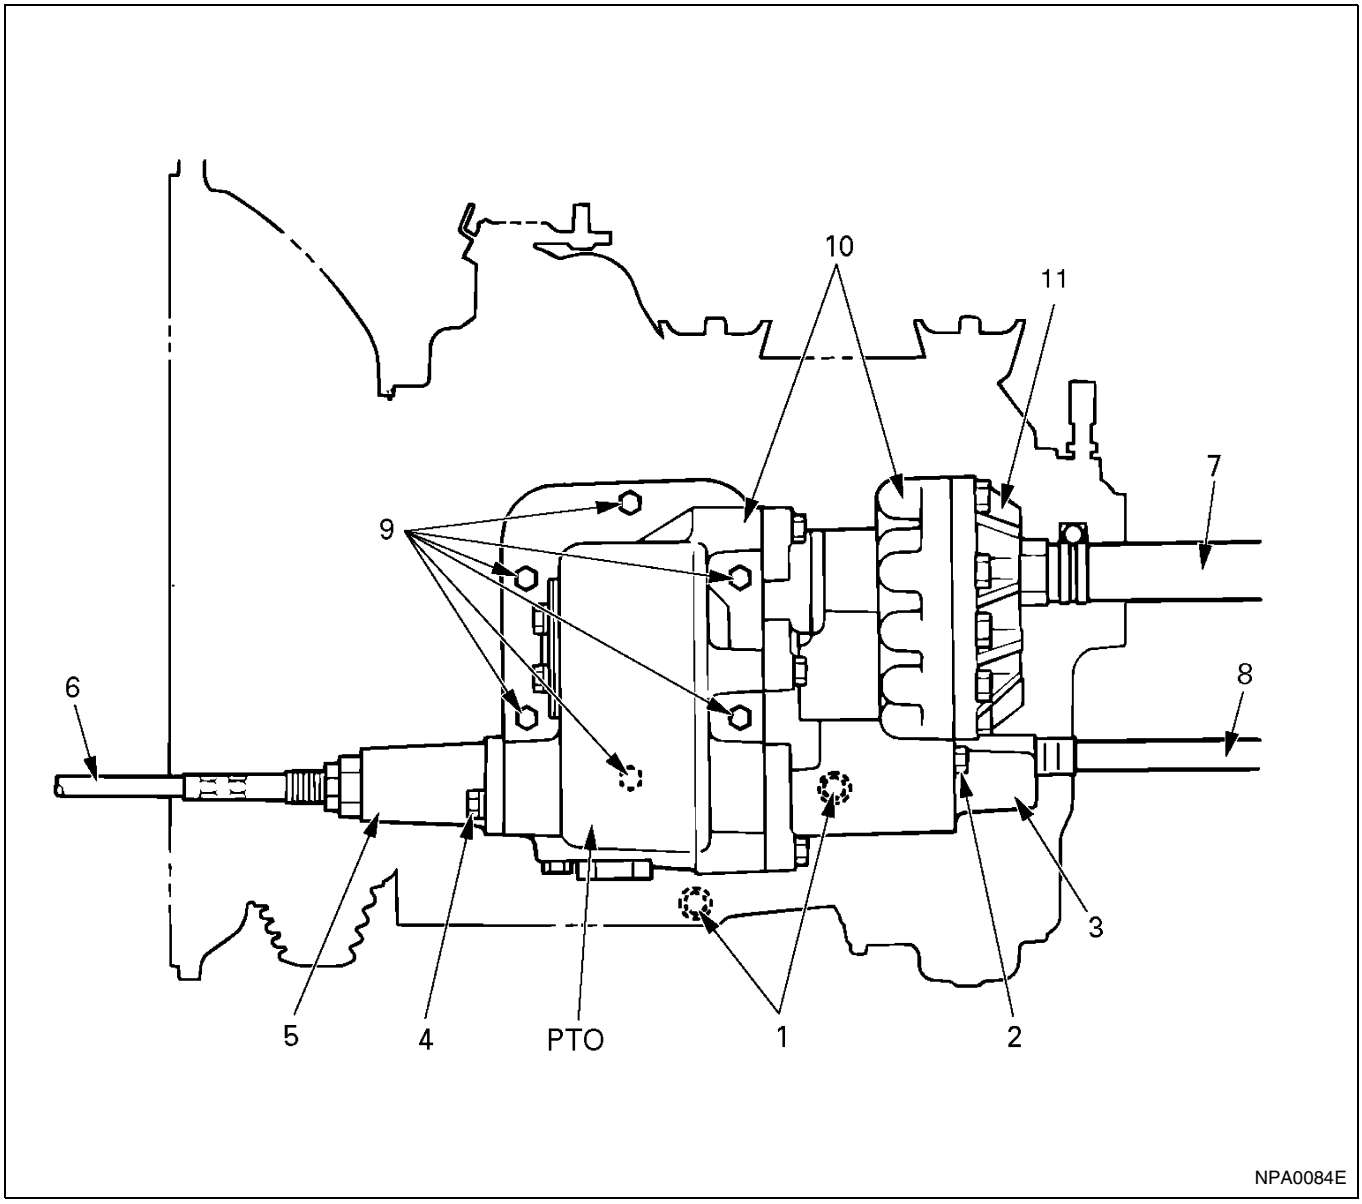
Legend
1. Oil pump
2. Bolt
3. Shift cap

Supply and Air Bleeding of Hydraulic Operating Fluid

After having installed the oil pump, supply hydraulic operating fluid and release air as requested. Supply the hydraulic operating fluid and release air in accordance with the “Inspection and Supply of The Hydraulic Operating Fluid” and the “Air Bleeding Procedure of Hydraulic Operating Fluid” described previously.

PTO (WITH OIL PUMP) ASSEMBLY

Removal and Installation



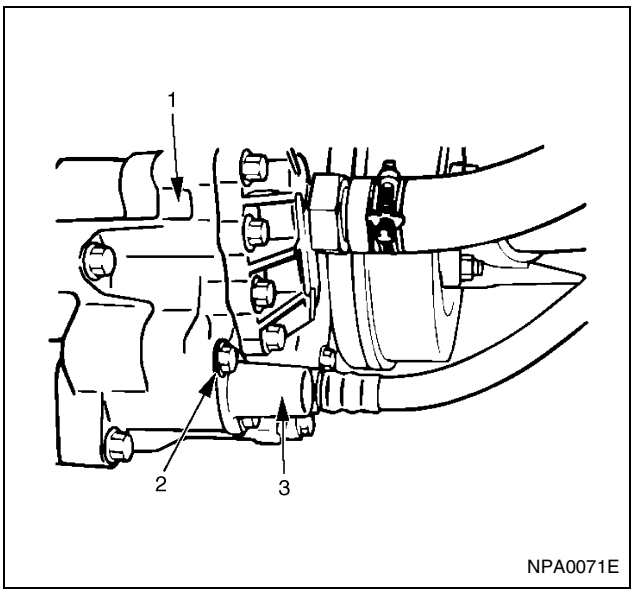
Legend

1. Drain plug, filler plug
2. Bolt (shift cap)
3. Shift cap
4. Bolt (cable holder)
5. Cable holder
6. Control cable
7. Low-pressure hose
8. High-pressure hose
9. Bolt (PTO)
10. PTO (with oil pump)
11. Oil pump

Removal Steps

Notice:
Set the dump lever inside the cab to the “Down” position and check the lever lock.

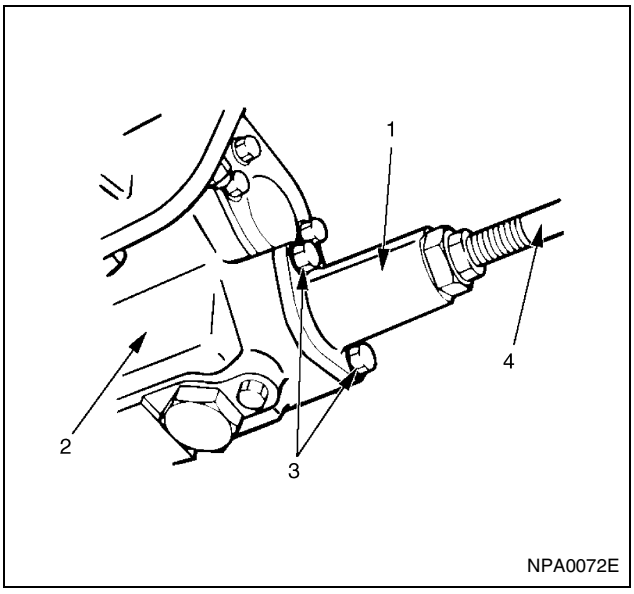
1. Drain Plug, Filler Plug
   - Remove the drain plug and filler plug of the transmission and remove the transmission oil.
2. Bolt (Shift Cap)
3. Shift Cap
   - Remove the bolt and remove the shift cap from the oil pump.



Legend
1. Oil pump
2. Bolt
3. Shift cap

4. Bolt (Cable Holder)
5. Cable Holder
6. Control Cable

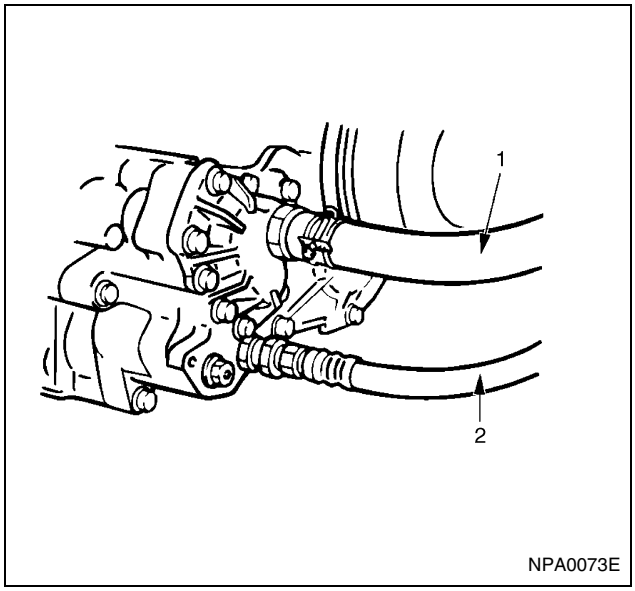
Notice:
Before removing the control cable, be sure to refer to Items 3 to 6 of “Removal” in the “Removal and Installation of Control Cable for Rear Dump Truck” in the chapter described previously and perform work in accordance with the items.



Legend
1. Cable holder
2. PTO
3. Bolt
4. Control cable

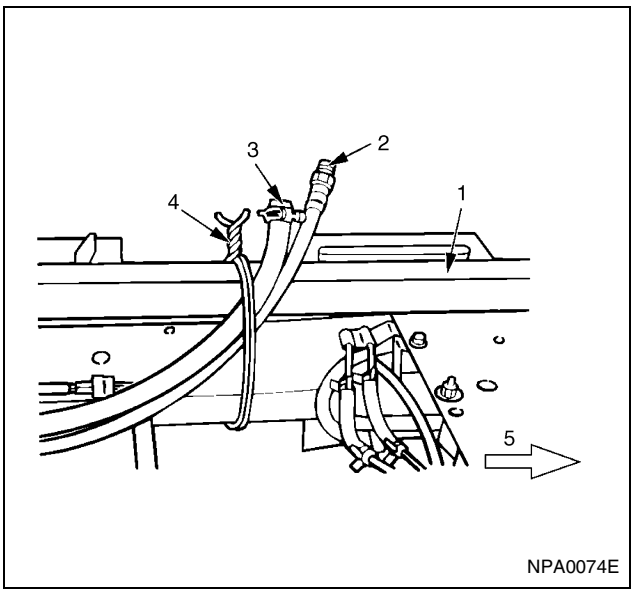
7. Low-Pressure Hose
   - Loosen the hose band and remove the hose from the oil pump.
8. High-Pressure Hose
   - Loosen the hose joint and remove the hose from the oil pump.

Notice:
For the high-pressure hose, a part of the joint may not be removed according to the type of the truck and equipment. In that case, slightly loosen the joint to set the state. At the stage where the rear PTO is removed (Item 10), remove the high-pressure hose rotating the PTO (with oil pump).



Legend
1. Low-pressure hose
2. High-pressure hose

Notice:
Because hydraulic operating fluid flows out when the hose is removed, quickly make the hose port face upward and protect the hose so that dust or foreign matter will not be mixed in, then fix it to the frame with a wire.

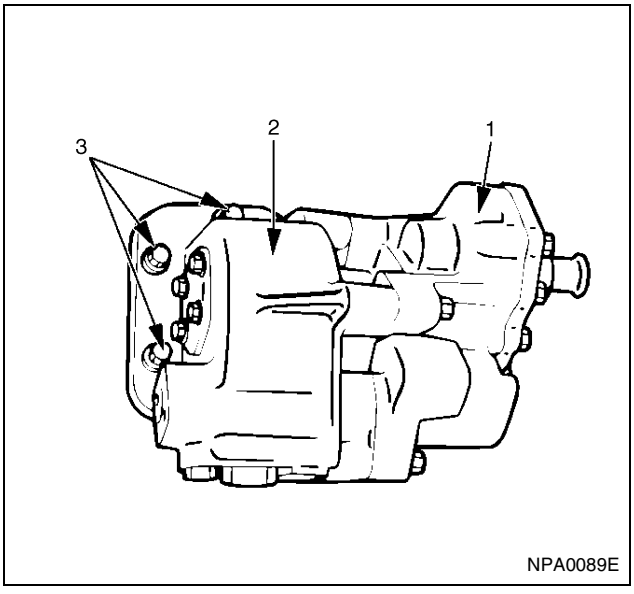


Legend
1. Left frame
2. High-pressure hose
3. Low-pressure hose
4. Wire
5. Truck front

9. Bolt (PTO)
10. PTO (with Oil Pump)
    - Remove the six tightening bolts around the PTO and remove the PTO (with oil pump) from the transmission.

Notice:
If the high-pressure hose could not be removed in Item 8 described previously, remove the PTO (with oil pump) from the high-pressure hose rotating the PTO at this time.

Besides, because this PTO (with oil pump) weighs 15 kg (147 N), be fully careful of its drop at attachment and detachment.

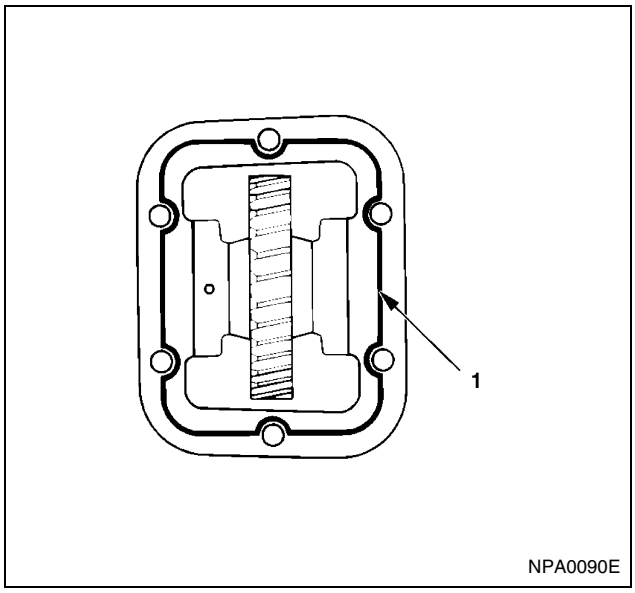


Legend
1. Oil pump
2. PTO
3. Bolt

Installation

Notice:
Before installing the PTO, cleanly remove the liquid gasket left on the PTO installation side of the transmission case and clean and degrease the transmission case by waste cloth so that oil will not adhere to it.

1. PTO (with Oil Pump)
    - After having cleaned and fully degreased the transmission installation side of the PTO, coat it with liquid gasket (LOCTITE 17430 or equivalent).

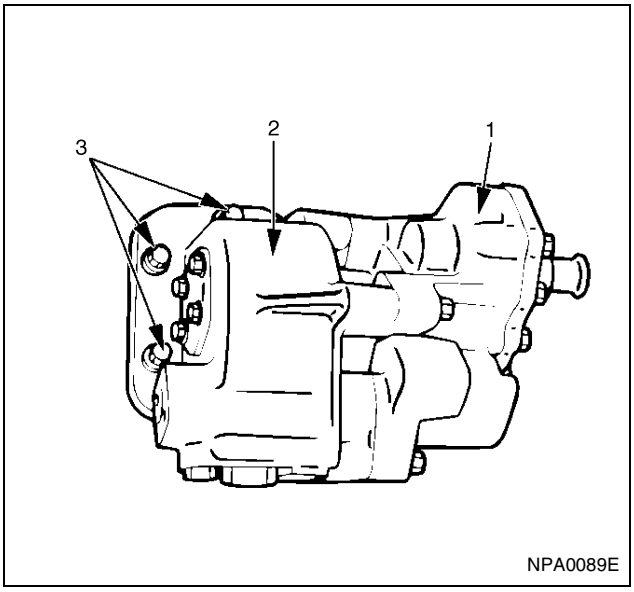


Legend
1. Apply liquid gasket

Notice:
When removing the PTO side from the high-pressure hose rotating the PTO side at PTO (with oil pump) removal, install the PTO (with oil pump) in the high-pressure hose and lightly tighten it.

2. Bolt (PTO)
    - Install the PTO (with oil pump) in the transmission and tighten the bolt at a specified torque.

Tighten:
PTO bolt to 45 N·m (4.6 kg·m / 33 lb·ft)



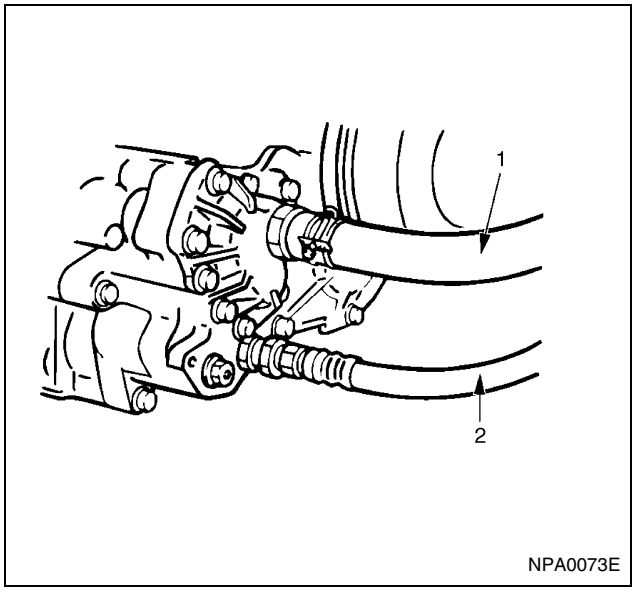
Legend
1. Oil pump
2. PTO
3. Bolt

3. High-Pressure Hose
   - Install the high-pressure hose in the oil pump and firmly tighten the joint.

Notice:
When the PTO (with oil pump) is installed in the high-pressure hose rotating the PTO in Item 10 described previously, firmly tighten the joint.

4. Low-Pressure Hose
   - Install the hose and firmly tighten the hose band.

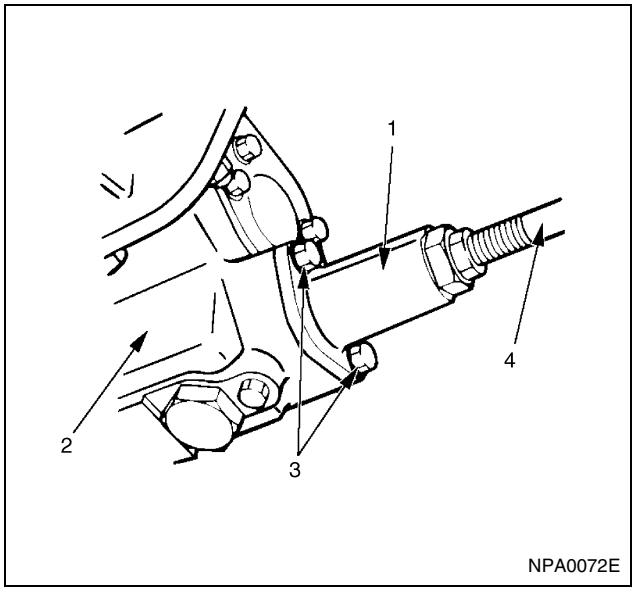
Notice:
When installing the high-pressure hose and the low-pressure hose, be fully careful so that dust or foreign matter will not be mixed in the pose port and the oil pump.



Legend
1. Low-pressure hose
2. High-pressure hose

5. Control Cable
6. Cable Holder
7. Bolt (Cable Holder)

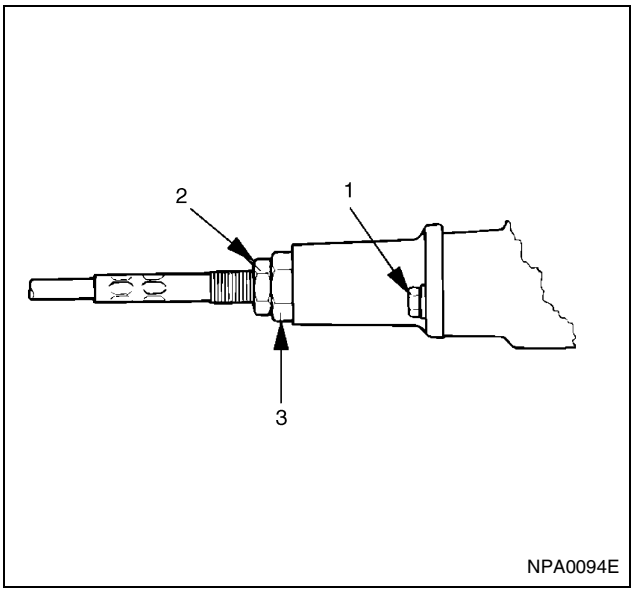
Notice:
Install the control cable and cable holder in the PTO in accordance with Items 1 to 4 of “Installation” in the “Removal and Installation of Control Cable for Rear Dump Truck”, and after installation inspect and adjust it in accordance with the “Amount of Spool Extrusion”.



Legend
1. Cable holder
2. PTO
3. Bolt
4. Control cable

- After having adjusted the control cable and having inspected or adjusted the amount of spool extrusion, tighten the bolt and the special nut and lock nut of the control cable at a specified torque.

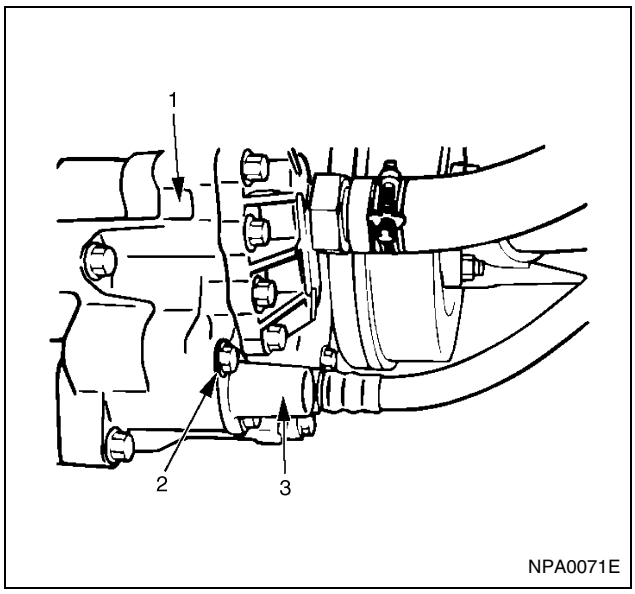
Tighten:
- Bolt to 24 N·m (2.4 kg·m / 17 lb·ft)
- Special nut to 147 N·m (15 kg·m / 108 lb·ft)
- Lock nut to 20 N·m (2.0 kg·m / 14lb·ft)



Legend
1. Bolt
2. Lock nut
3. Special nut

8. Shift Cap
9. Bolt (Shift Cap)
   - Install the shift cap in the oil pump making its grooved side face upward and tighten the bolt at a specified torque.

Tighten:
Shift cap bolt to 24 N·m (2.4 kg·m / 17 lb·ft)



Legend
1. Oil pump
2. Bolt
3. Shift cap

10. Drain Plug, Filler Plug
    - Firmly tighten the drain plug of the transmission.
    - Supply the transmission oil (BESCO gear oil transaxle (5W-30) or equivalent) until it flows out from the filler plug hole and firmly tighten the filler plug.

Amount of Oil (Reference)
5 speed: 3.2 Liters (0.85 US gal / 0.70 Imp. gal)
6 speed: 4.0 Liters (1.06 US gal / 0.88 Imp. gal)

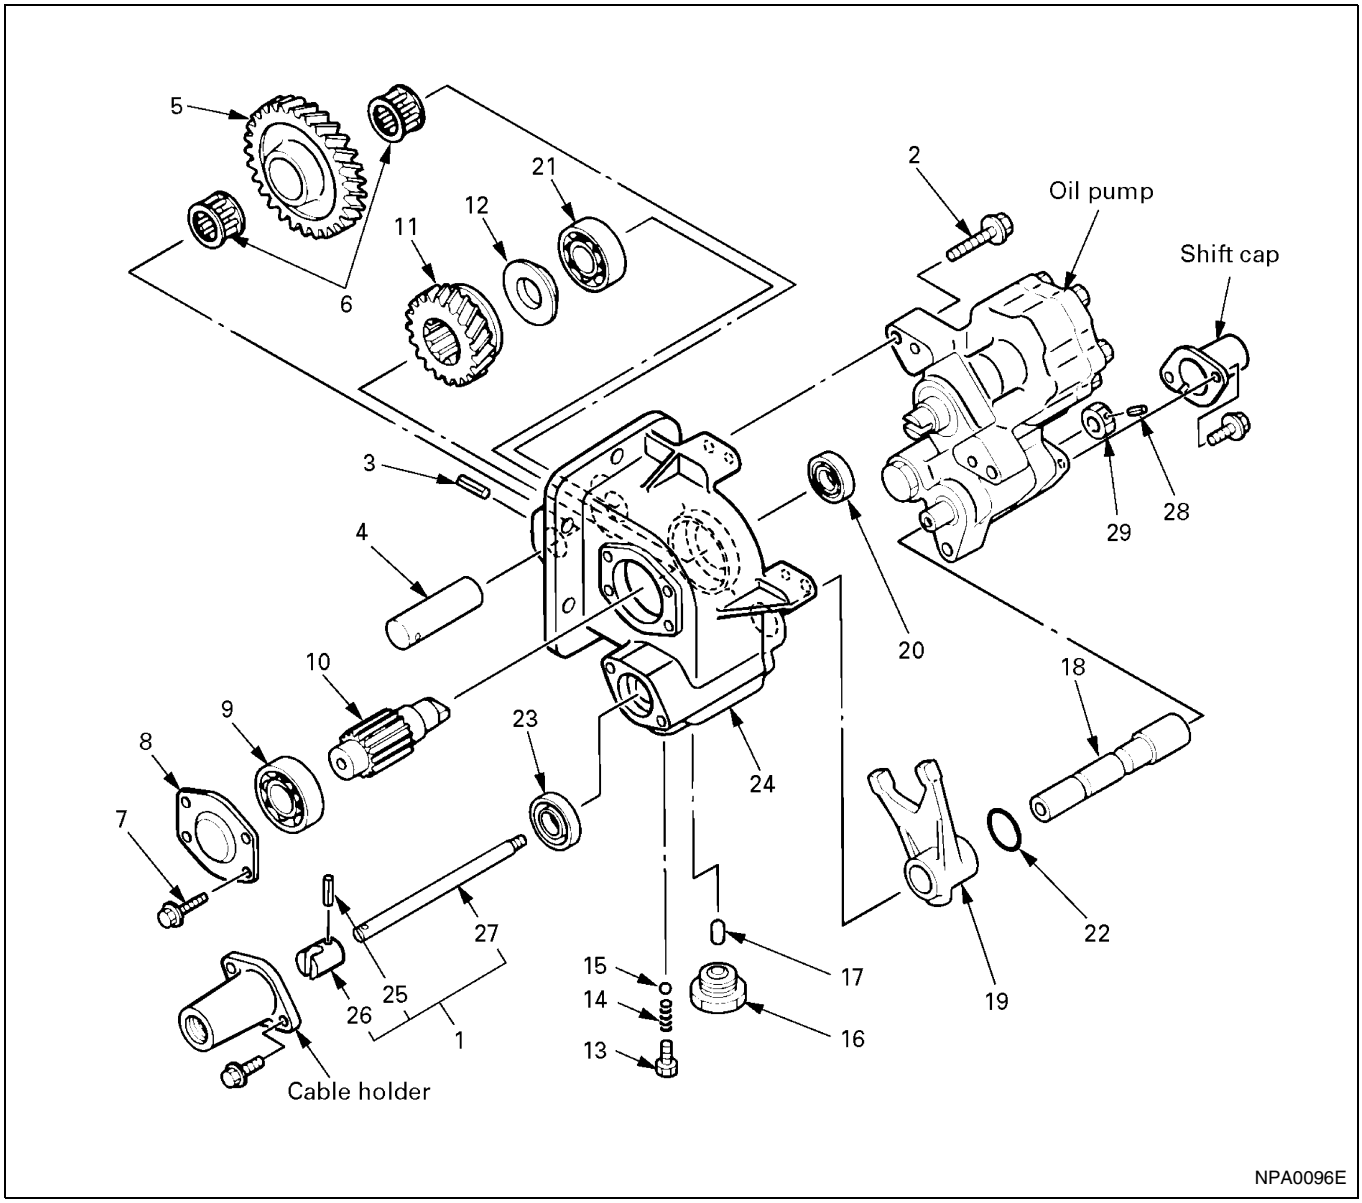
Tighten:
Drain plug and filler plug to 49 N·m (5.0 kg·m / 36 lb·ft)

Supply and Air Bleeding of Hydraulic Operating Fluid

After having installed the oil pump, supply hydraulic operating fluid and release air as requested. Supply the hydraulic operating fluid and release air in accordance with the “Inspection and Supply of The Hydraulic Operating Fluid” and the “Air Bleeding Procedure of the Hydraulic Operating Fluid” described previously.

Unit Repair

PTO Assembly



Legend

1. Inner rod assembly

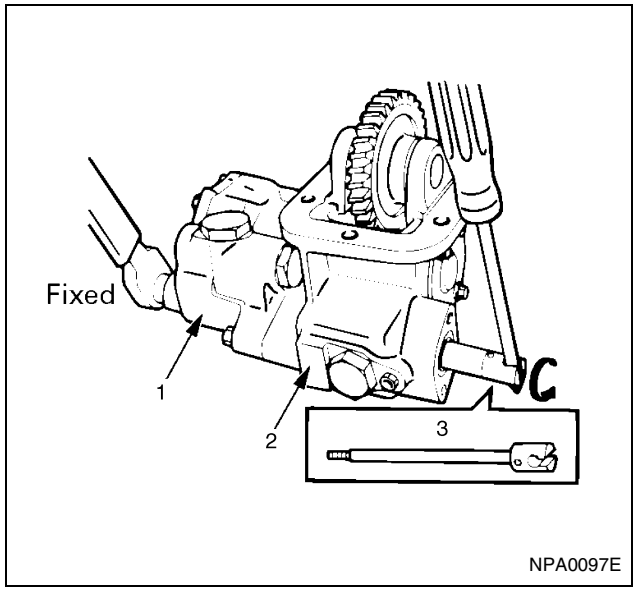
24. Gear case
25. Spring pin
26. Cable connector
27. Inner rod
28. Spring pin
29. Stopper adapter

Disassembly Steps

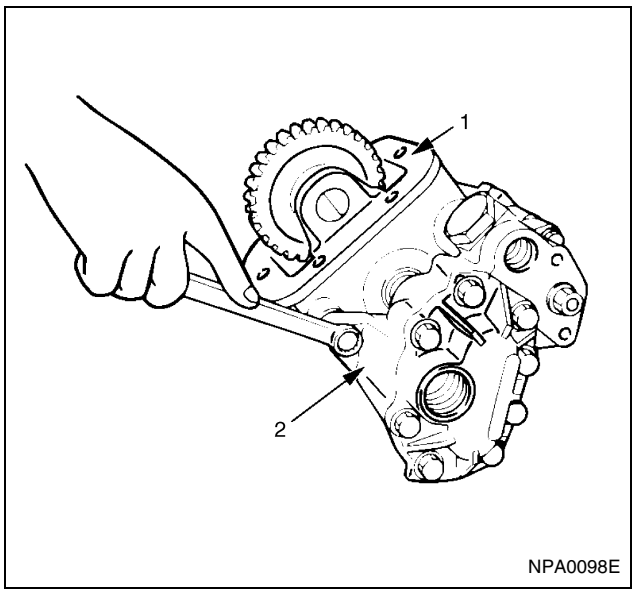
1. Inner Rod Assembly
   - Press the stopper adapter side by a wrench and insert a Phillips screwdriver (large) in the groove of the control cable connector. Then rotate it counterclockwise, loosen it, and remove it.

Notice:
Be sure to press the stopper adapter side and loosen it on the control cable connector side. (Press the stopper adapter side not to rotate the spool valve. Besides, the three-rotation dump truck is in contrast with this.)



Legend
1. Oil pump
2. PTO
3. Inner rod assembly

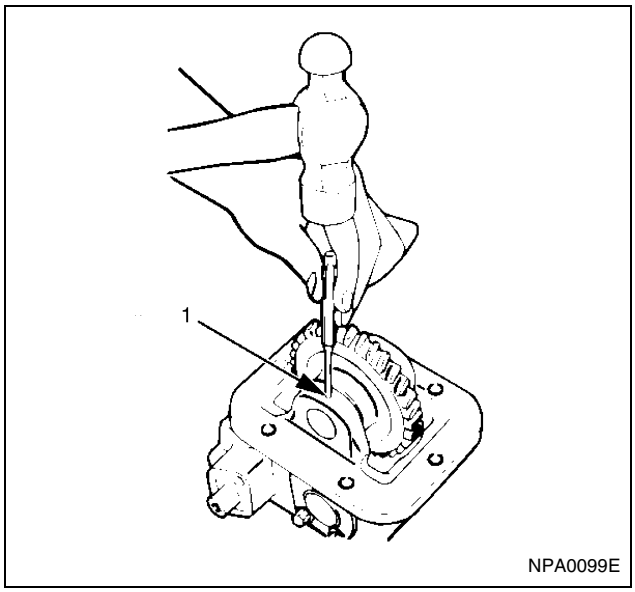
2. Bolt
   - Remove three bolts and separate the oil pump and PTO striking the oil pump by a plastic hammer (or wooden hammer).



Legend
1. PTO
2. Oil pump

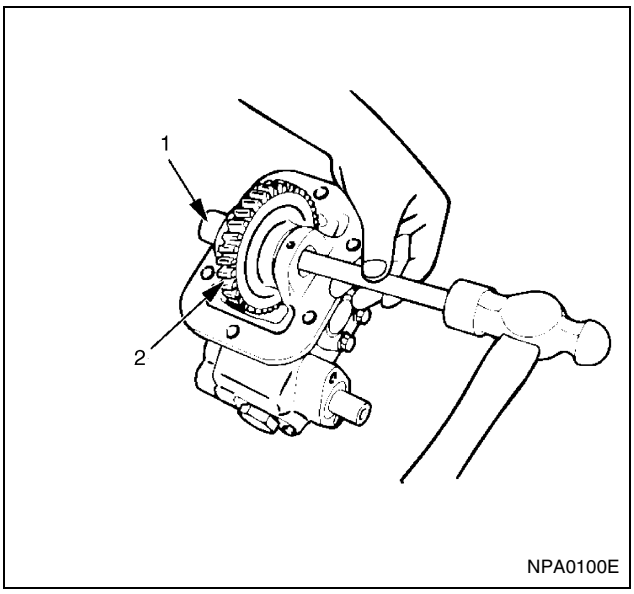
3. Spring Pin
   - Punch the spring pin in the idle gear shaft. (After having removed the idle gear shaft, punch the spring pin from the shaft.)

   Spring pin bar: 9-8529-2201-0



Legend
1. Spring pin

4. Idle Gear Shaft
5. Idle Gear
6. Needle Bearing
   - Strike and remove the idle gear shaft and remove the idle gear, then remove the needle bearing.



Legend
1. Idle gear shaft
2. Idle gear

7. Bolt
8. Case Cover
   - Remove the bolt and remove the case cover.

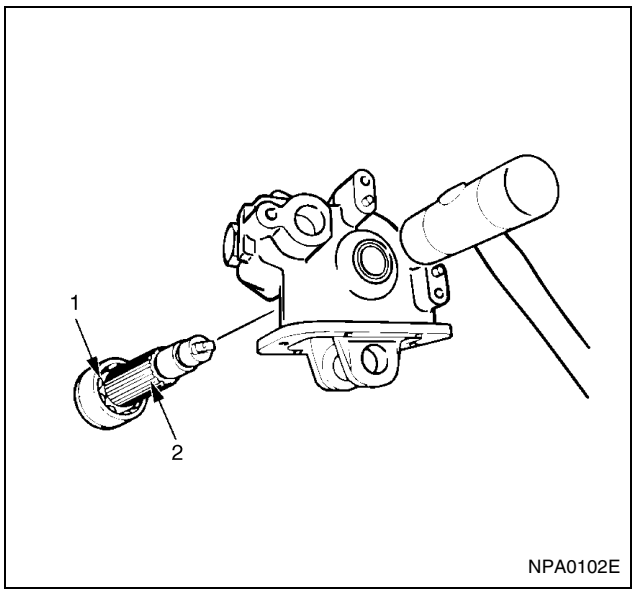
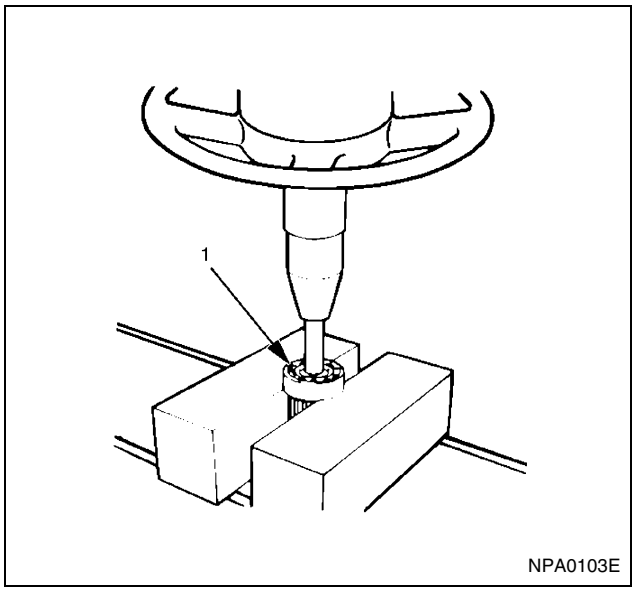
9. Front Ball Bearing
10. Output Shaft
    - Strike the end face of the output shaft from the rear side and remove the front ball bearing while it is being installed in the output shaft.



Legend
1. Front ball bearing
2. Output shaft

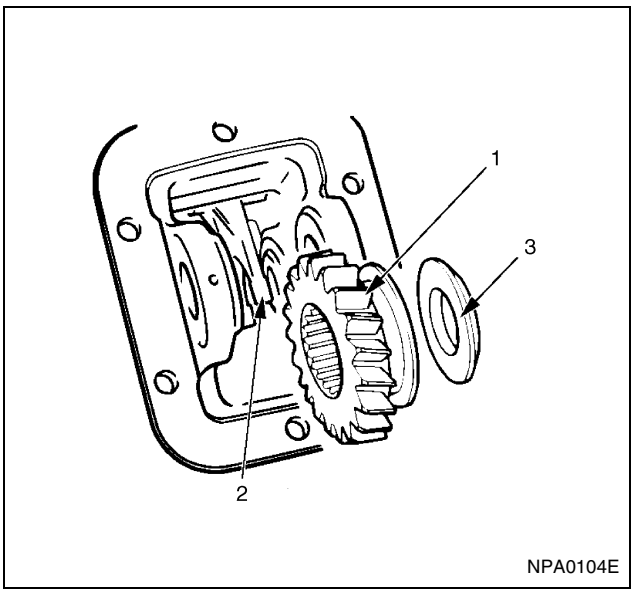
- Remove the front ball bearing from the output shaft.



Legend
1. Front ball bearing

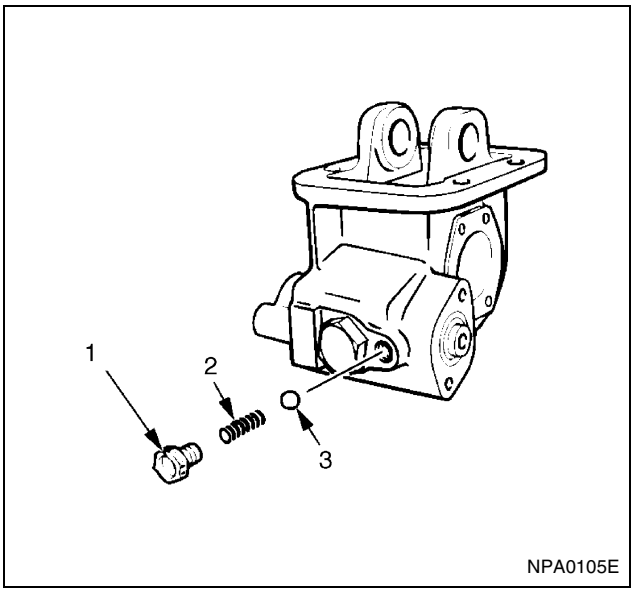
11. Output Gear
12. Thrust Collar
    - Remove the output gear and the thrust collar from the gear case.

Notice:
Check the orientation of the output gear and the thrust collar. The side in which the shift arm groove of the gear and the taper of the thrust collar exist is the rear side.



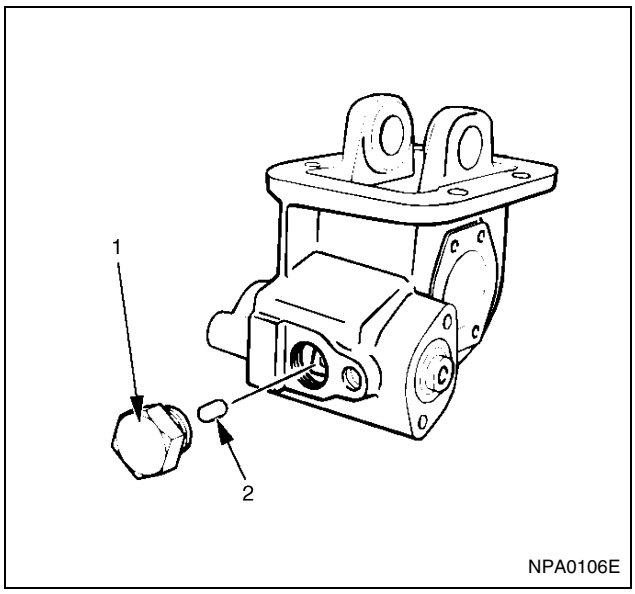
Legend
1. Output gear
2. Shift arm
3. Thrust collar

13. Spring Set Bolt
14. Spring
15. Ball
    - Remove the spring set bolt and remove the spring and ball.



Legend
1. Spring set bolt
2. Spring
3. Ball

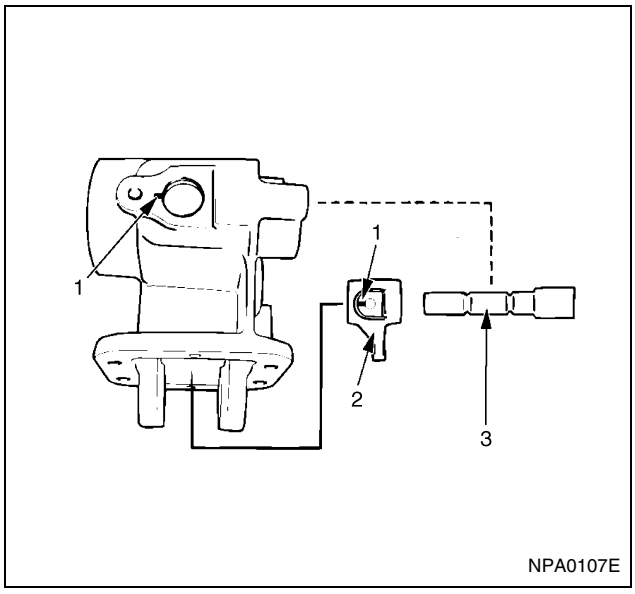
16. Interlock Plug
17. Interlock Pin
    - Remove the interlock plug and remove the interlock pin from the shift arm.



Legend
1. Interlock plug
2. Interlock pin

18. Shift Rod
19. Shift Arm
    - Pull out the shift rod to the rear side of the gear case and remove the shift arm from the inside of the gear case.

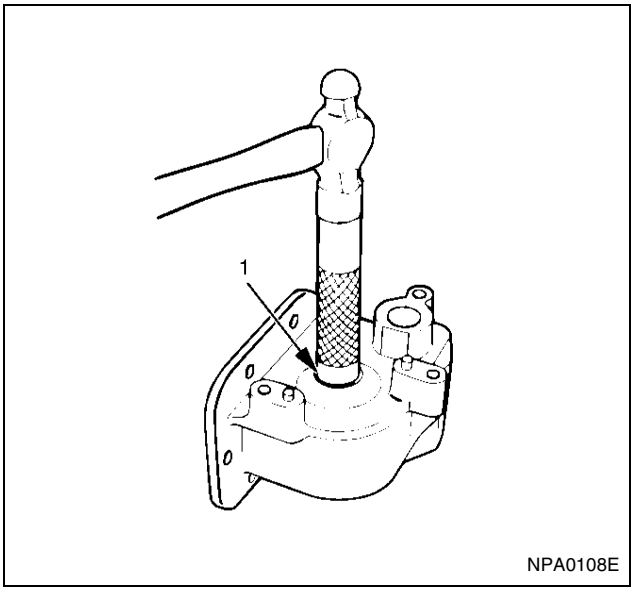
Notice:
When removing the shift arm, be sure to check the installation direction of the arm and apply the assignment mark. In that case, incorrect assembly can be prevented at subsequent assembly.



Legend
1. Alignment mark
2. Shift arm
3. Shift rod

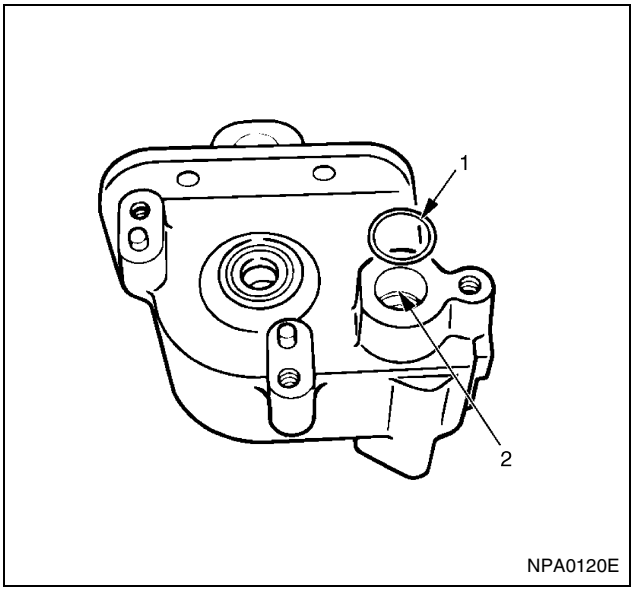
20. Oil Seal (Output Shaft Side)
21. Rear Ball Bearing
    - Pry the oil seal by a screwdriver and remove it, then strike the rear ball bearing from the rear side of the gear case and remove it.

    Bearing installer: 5-8840-2432-0



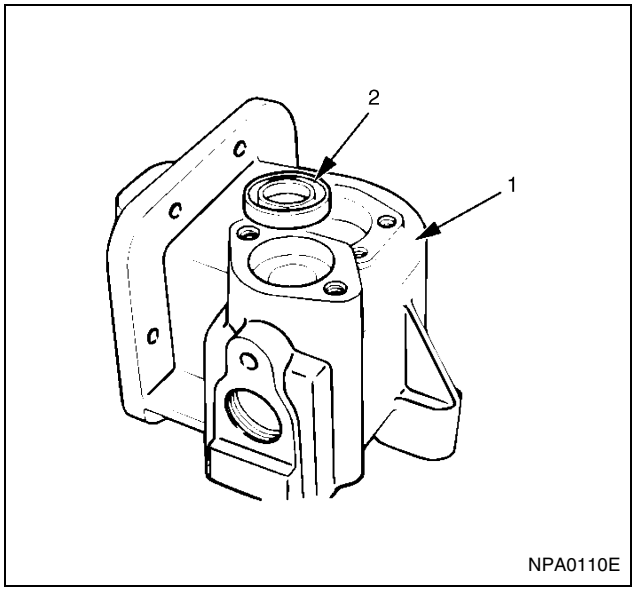
Legend
1. Rear ball bearing

22. O-Ring
    - Remove the O-ring from the shift rod hole of the gear case.



Legend
1. O-ring
2. O-ring groove

23. Oil Seal (Shift Rod Side)
    - Remove the oil seal from the gear case.
24. Gear Case



Legend
1. Rear case
2. Oil seal

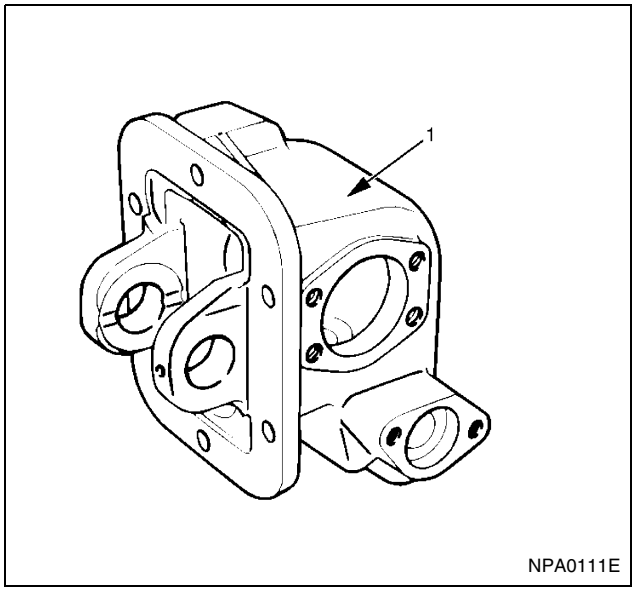
25. Spring Pin
26. Cable Connector
27. Inner Rod
28. Spring Pin
29. Stopper Adapter
    - Remove the cable connector or stopper adapter from the inner rod as requested.

Inspection and Repair

Make necessary correction or parts replacement if wear damage, or any other abnormal conditions are found through inspection.

Gear Case

- Inspect that there is a crack, a wear, or a scratch in each portion of the gear case and replace the gear case if there is a remarkable wear or scratch.

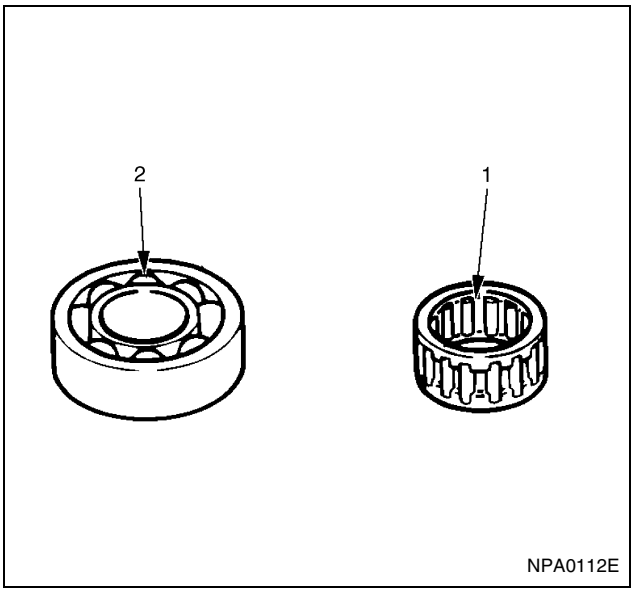


Legend
1. Gear case

Bearings

- Inspect each bearing, and replace it if the following defects are found.
  1) The rotation is not smooth.
  2) A remarkable noise is generated.
  3) There is damage or rust in the inner and outer laces.
  4) There is an abnormal play in the thrust direction.
  5) There is discoloration, remarkable wear, or hitting on the body of rotation and surface of rotation of the needle roller.

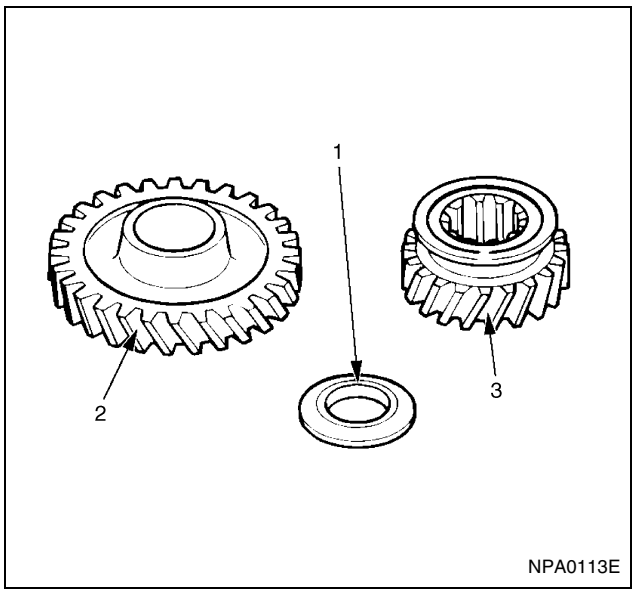
Notice:
If the ball bearing is removed, replace it by a new one.



Legend
1. Needle bearing
2. Ball bearing

Gears and Thrust Collar

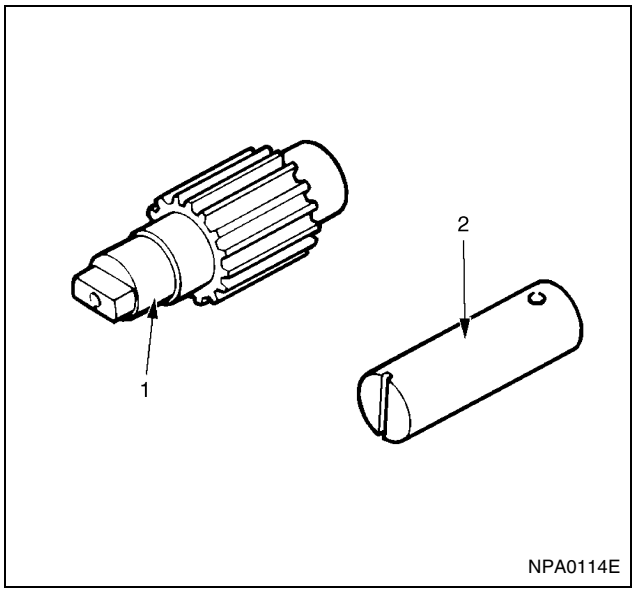
- Inspect the tooth surface of each gear and replace what has remarkable wear or damage. Further, correct lightly staged wear or a rough surface with an oil stone.
- Inspect both surfaces of the thrust collar and replace the thrust collar if there is a remarkable surface roughness or wear.



Legend
1. Thrust collar
2. Idle gear
3. Output gear

Shafts

- Inspect the damage and wear on the external surface of each shaft and the wear and damage of the spline portion and replace them if there are remarkable.



Legend
1. Output shaft
2. Idle gear shaft

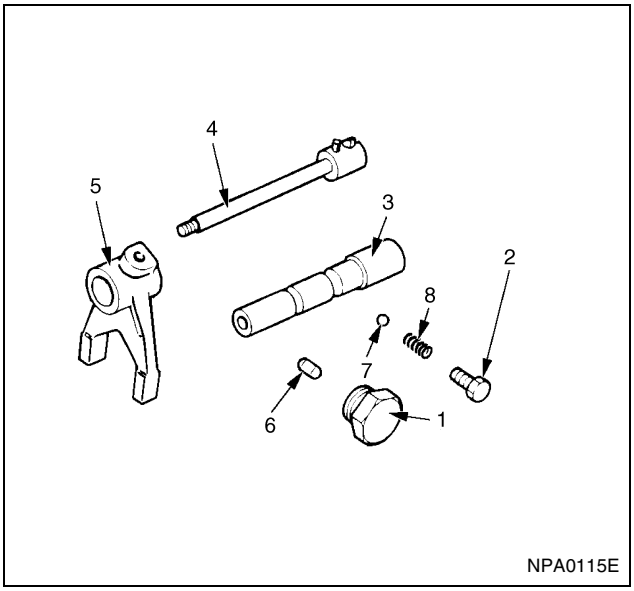
Shift Mechanism

- Inspect each portion of the shift mechanism and replace it if there is remarkable damage, deflection, or staged wear.
  1) Deflection and wear of the shift rod

2) Deformation and wear of the shift rod

Shift arm thickness
Standard: 9.0 mm (0.354 in)
Limit: 8.5 mm (0.335 in)

3) The backlash or operation between the shift rod and gear case is not smooth.
4) Wear of the ball for a detent of the shift rod and the fatigue of the spring
5) Wear of the lock pin sliding portion for the lock pin and plug
6) Deflection of the inter rod and wear of the cable connector portion

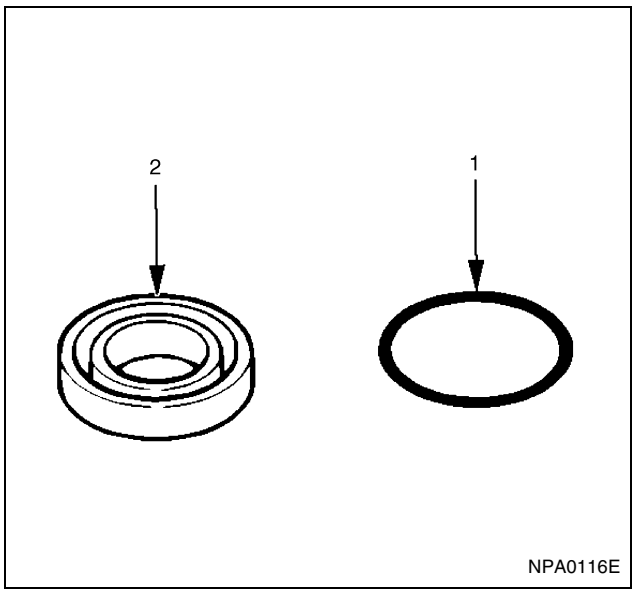


Legend
1. Interlock plug
2. Spring set bolt
3. Shift rod
4. Inner rod assembly
5. Shift arm
6. Interlock pin
7. Ball
8. Spring

Oil Seal and O-ring

- Replace the oil seal and O-ring if there is damage, wear, or aging in the lip portion of the oil seal and the O-ring.

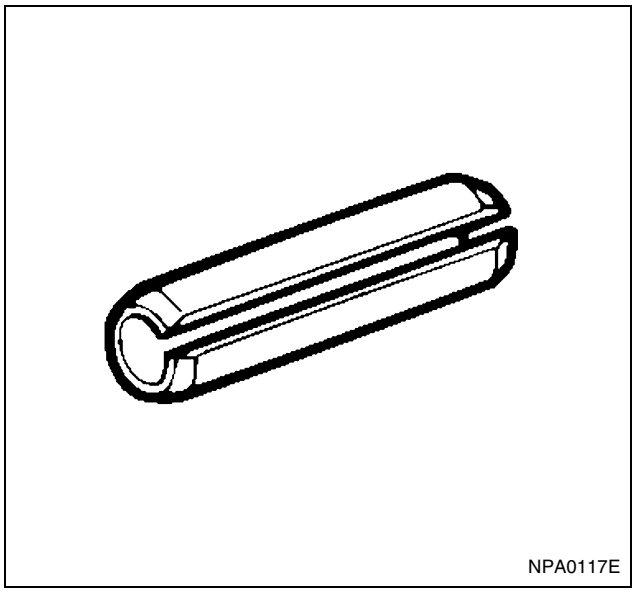
Notice:
If the PTO is disassembled, replace the oil seal and the O-ring by new ones in principle. Further, if the oil seal and the O-ring are removed, they cannot be reused.



Legend
1. O-ring
2. Oil seal

Spring Pin

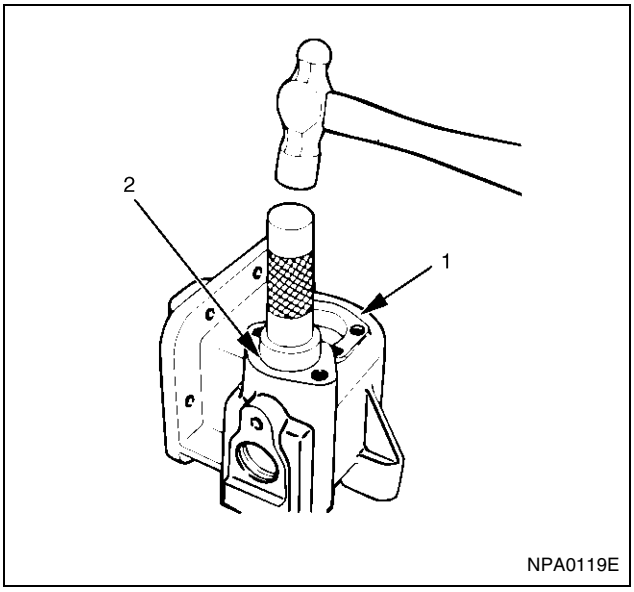
Notice:
Be sure to replace the spring pin by a new one.



Reassembly Steps

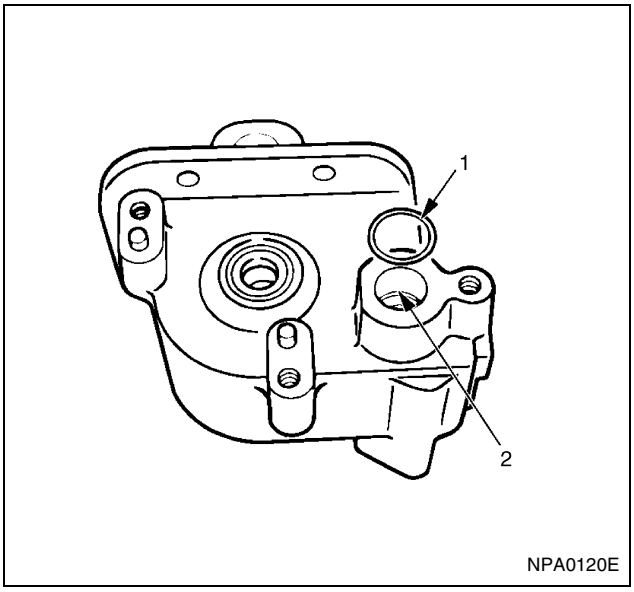
1. Gear Case
2. Oil Seal (Shift Rod Side)
   - Coat the lip portion of the oil seal with lithium grease (BESCO L-2 or equivalent), the periphery portion of the seal with liquid gasket (LOCTITE 518 or equivalent).
   - Install the lip portion of the oil seal in the shift rod side (front side) of the gear case so that the lip portion will not be damaged.

   Oil seal installer: 5-8840-2433-0



Legend
1. Gear case
2. Oil seal

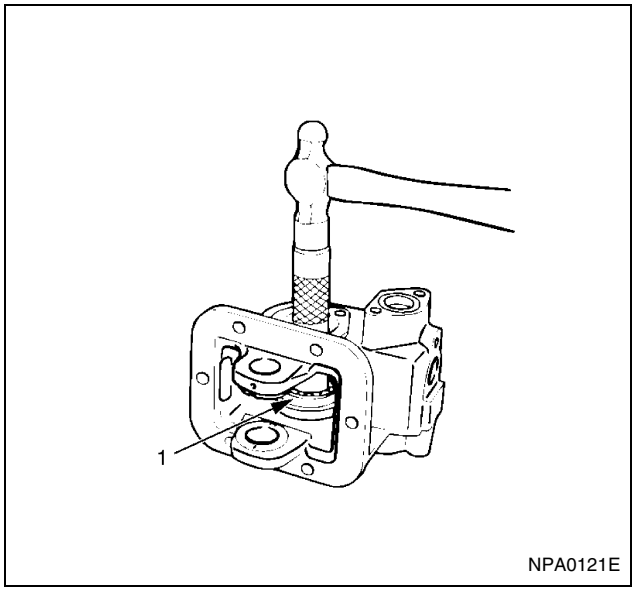
3. O-Ring
   - Thinly coat the O-ring and the O-ring groove of the gear case with lithium grease (BESCO L-2 or equivalent) and firmly assemble them in the groove so that there will be no damage and torsion.



Legend
1. O-ring
2. O-ring groove

4. Rear Ball Bearing
   - Strike and install the rear ball bearing in the gear case from the inner side of the case.

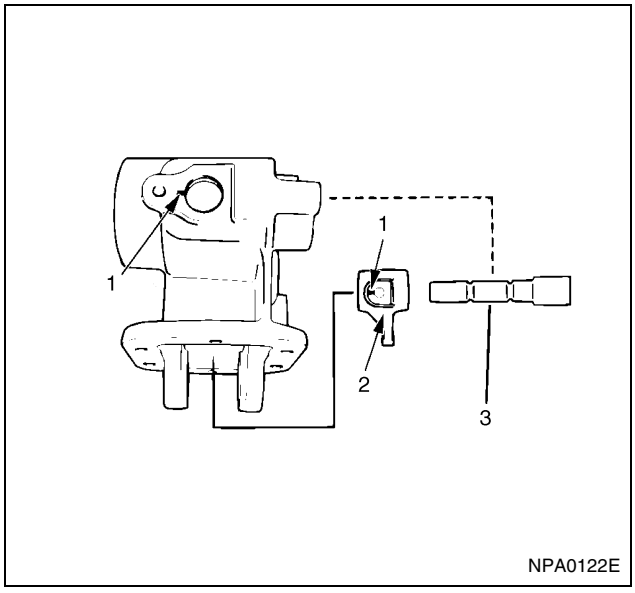
   Bearing installer: 5-8840-2432-0



Legend
1. Rear ball bearing

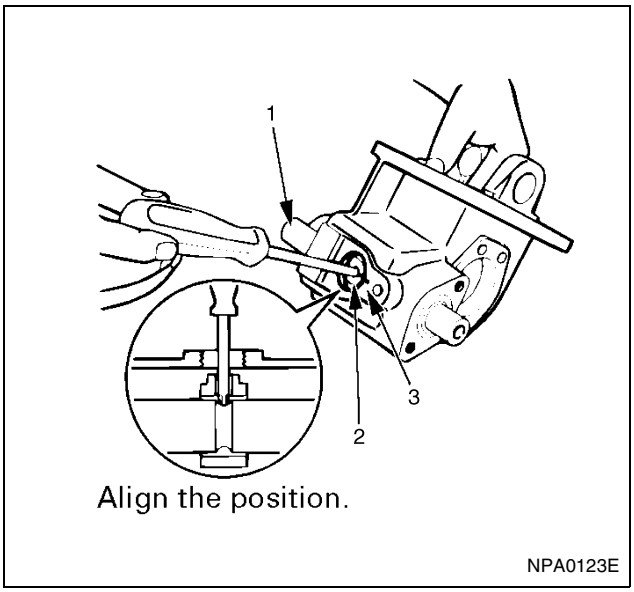
5. Shift Arm
   - Assemble the shift arm in the gear case.
6. Shift Rod
   - Thinly coat the shift rod with lithium grease (BESCO L-2 or equivalent) and insert it in the gear case, then assemble it in the shift arm.

Notice:
Align the assembly direction of the shift arm to the alignment mark at disassembly.



Legend
1. Alignment mark
2. Shift arm
3. Shift rod

- Align the position between the lock pin hole of the shift arm and the lock pin groove of the shift rod.



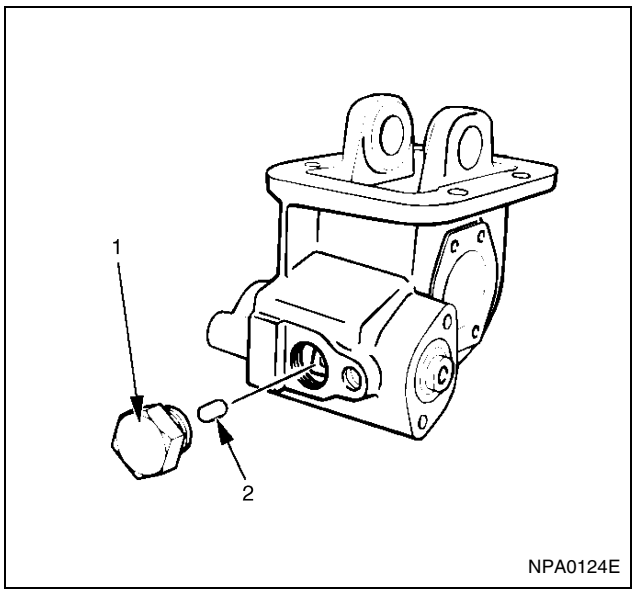
Legend
1. Shift rod
2. Shift arm
3. Alignment mark

---

7. Interlock Pin
8. Interlock Plug
   - Assemble the interlock pin in the shift arm and coat the interlock plug threaded portion with liquid gasket (LOCTITE 242 or equivalent), then tighten the interlock plug at a specified torque.

Tighten:
Interlock plug to 60 N·m (6.1 kg·m / 44 lb·ft)

Notice:
After having tightened the interlock plug, do not move the shift rod. Moving the shift rod may remove the interlock pin.

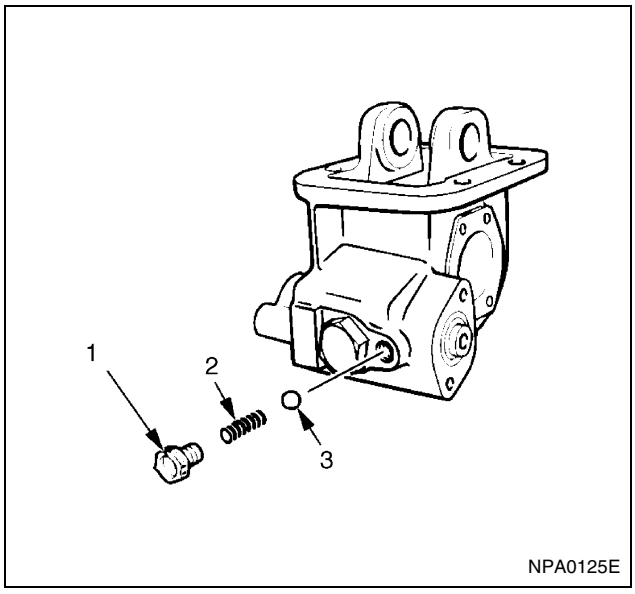


Legend
1. Interlock plug
2. Interlock pin

---

9. Ball
10. Spring
11. Spring Set Bolt
    - Assemble the ball and spring in the gear case and coat the spring set bolt threaded portion with liquid gasket (LOCTITE 242 or equivalent), then tighten the spring set bolt.

Tighten:
Set bolt to 19 N·m (1.9 kg·m / 14 lb·ft)

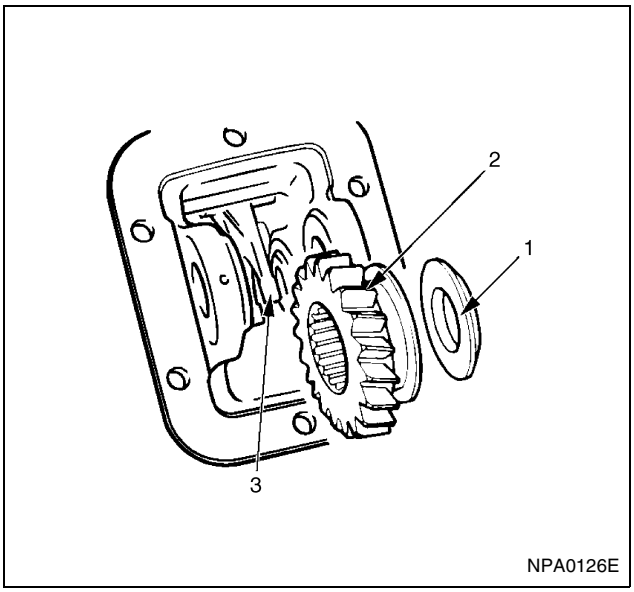


Legend
1. Spring set bolt
2. Spring
3. Ball

---

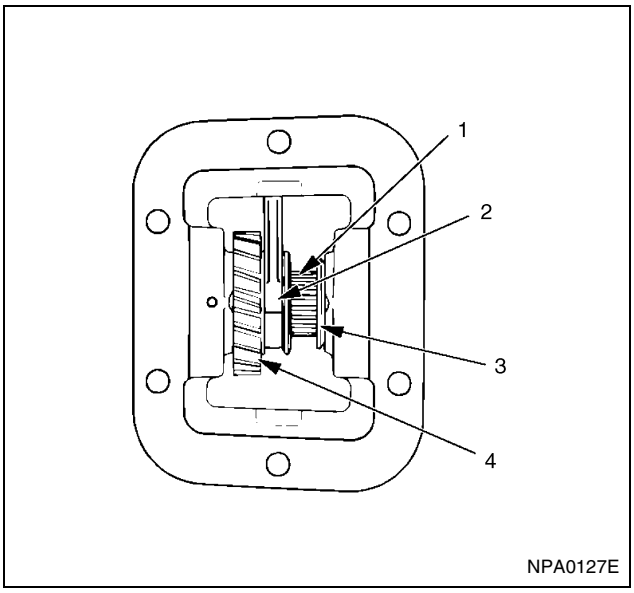
12. Output Gear

13. Thrust Collar
    - Assemble the groove (the orientation is the rear side) of the output gear in the shift arm and assemble the taper portion of the thrust collar facing the rear side.



Legend
1. Thrust collar
2. Output gear
3. Shift arm

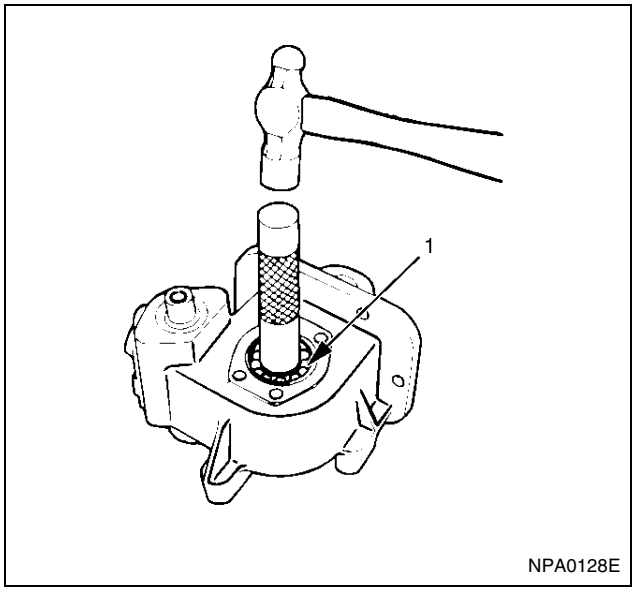
14. Output Shaft
    - Insert the output gear engaging its spline and align the output shaft tip to the inner lace of the rear bearing, then strike and install the output shaft by applying a splint to its front side head portion.



Legend
1. Output shaft
2. Shift arm
3. Thrust collar
4. Output gear

15. Front Ball Bearing
    - Align the inner lace side of the front ball bearing to the output shaft and strike and install the outer side of the bearing aligning it to the gear case.

    Bearing installer: 5-8840-2432-0

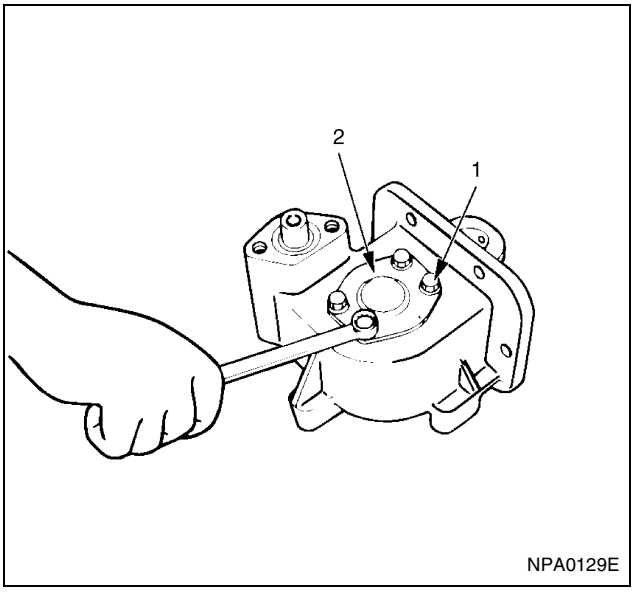


Legend
1. Front ball bearing

16. Case Cover
17. Bolt
    - Assemble the bolt by coating the match line for the gear case of the case cover with liquid gasket (LOCTITE 518 or equivalent) and the bolt threaded portion with liquid gasket (LOCTITE 242 or equivalent), then tighten the bolt at a specified torque.

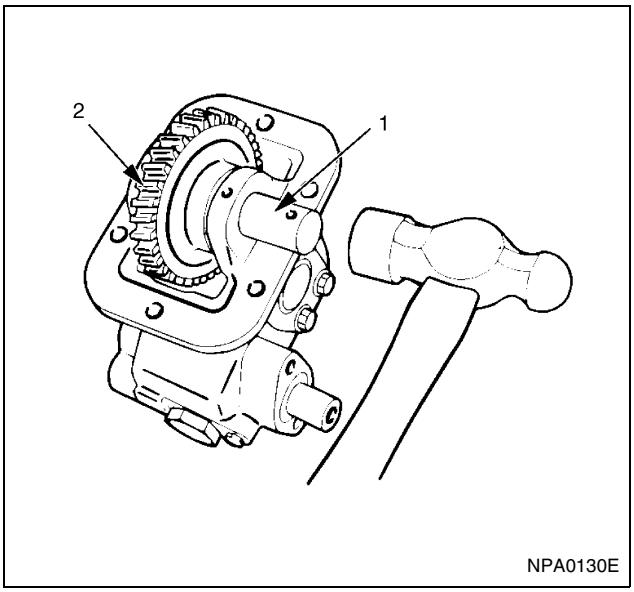
Tighten:
Case cover bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

Notice:
Cleanly remove the liquid gasket adhering to the cover installation side of the case cover and gear case and clean and fully degrease the case by waste cloth so that no oil will adhere to.



Legend
1. Bolt
2. Case cover

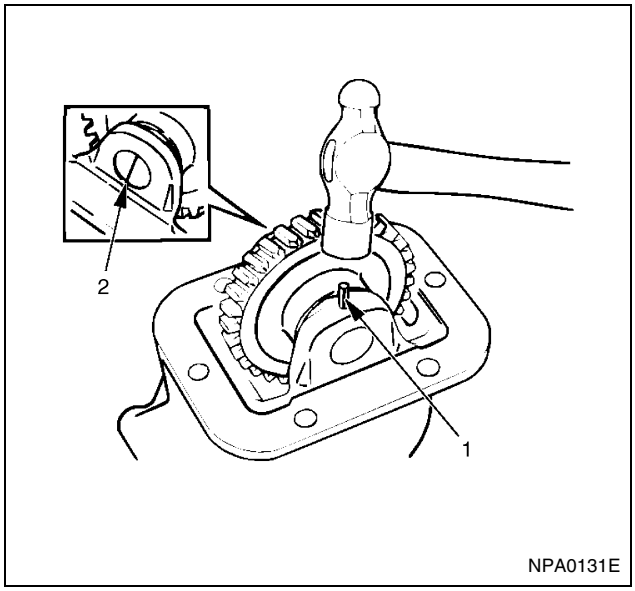
18. Needle Bearing
19. Idle Gear
    - Coat the needle bearing with assembly all amount of lithium grease (BESCO L-2 or equivalent) and assemble the needle bearing in the idle gear.
20. Idle Gear Shaft
    - Assemble the tooth round portion of the idle gear facing the front side and assemble the pin hole of the idle gear shaft facing the front side.



Legend
1. Idle gear shaft
2. Idle gear

21. Spring Pin
    - Align the spring pin hole of the gear case and the pin hole of the idle gear shaft and strike the spring pin.

Notice:
When the slit on the rear side of the idle gear shaft is set in the vertical direction, the pin hole will be aligned.

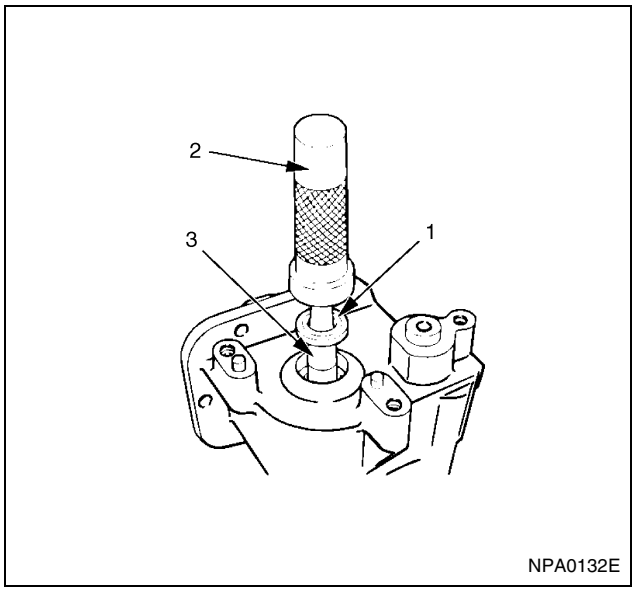


Legend
1. Spring pin
2. Slit

22. Oil Seal (Output Shaft Side)
    - Coat the oil seal lip portion with lithium grease (BESCO L-2 or equivalent) and coat the seal periphery portion with liquid gasket (LOCTITE 518 or equivalent).
    - To prevent the seal lip portion from being damaged, install it in the seal guide and press-fit it in the gear case by the oil seal installer.

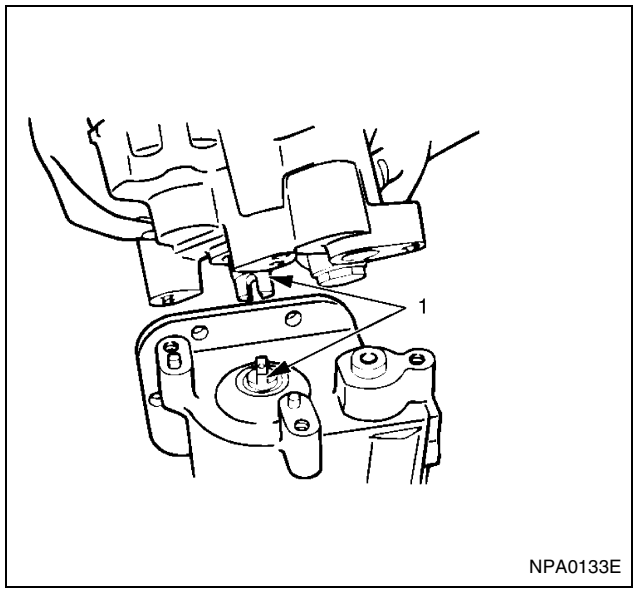
    Oil seal installer: 5-8840-2433-0

    Oil seal guide: 5-8840-2564-0



Legend
1. Oil seal
2. Oil seal installer
3. Oil seal guide

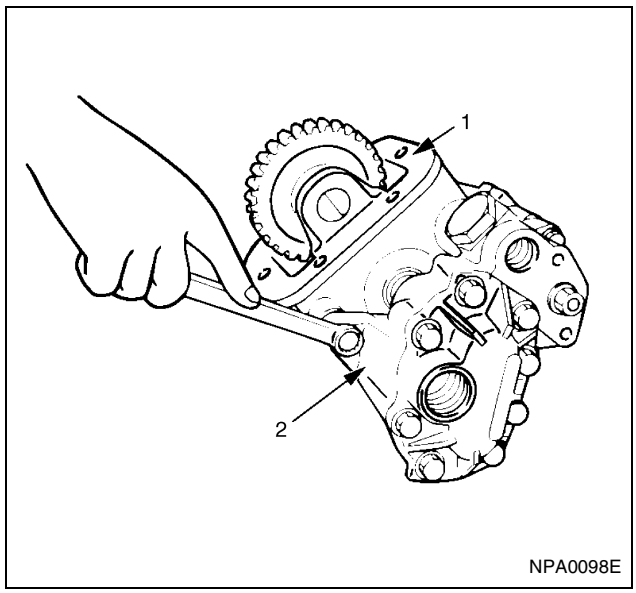
23. Bolt
    - To install the oil pump in the PTO, fully coat the shaft tip portion of the PTO and the oil pump shaft groove portion with the lithium grease (BESCO L-2 or equivalent) for rust prevention.



Legend
1. Coated with grease

    - Align and install the shaft width across flats portion on the PTO side and the shaft groove on the oil pump side and tighten the bolt at a specified torque.

Tighten:
PTO bolt to 53 N·m (5.4 kg·m / 39 lb·ft)

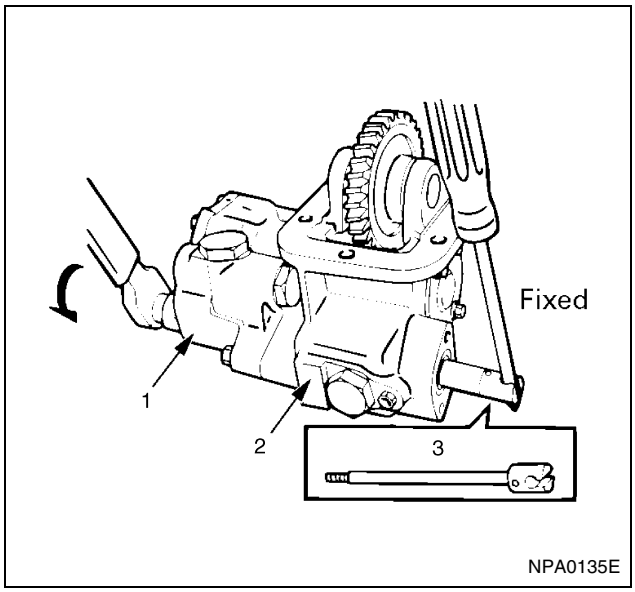


Legend
1. PTO
2. Oil pump

24. Inner rod
25. Cable connector
26. Spring pin
27. Stopper adapter
28. Spring pin
    - If the cable connector or stopper adapter is removed, install it in the inner rod.
29. Inner rod assembly
    - Coat the threaded portion of the inner rod tip with liquid gasket (LOCTITE 242 or equivalent) and insert and screw it from the front side of the PTO, and tighten the inner rod assembly at a specified torque.

Notice:
Tighten the inner rod assembly by inserting a Phillips screwdriver in the groove of the control cable connector and pressing it, then applying a wrench to the stopper adapter on the oil pump side. (The three rotation dump truck is in contrast with this.)

Tighten:
Inner rod to 19 N·m (1.9 kg·m / 14 lb·ft)

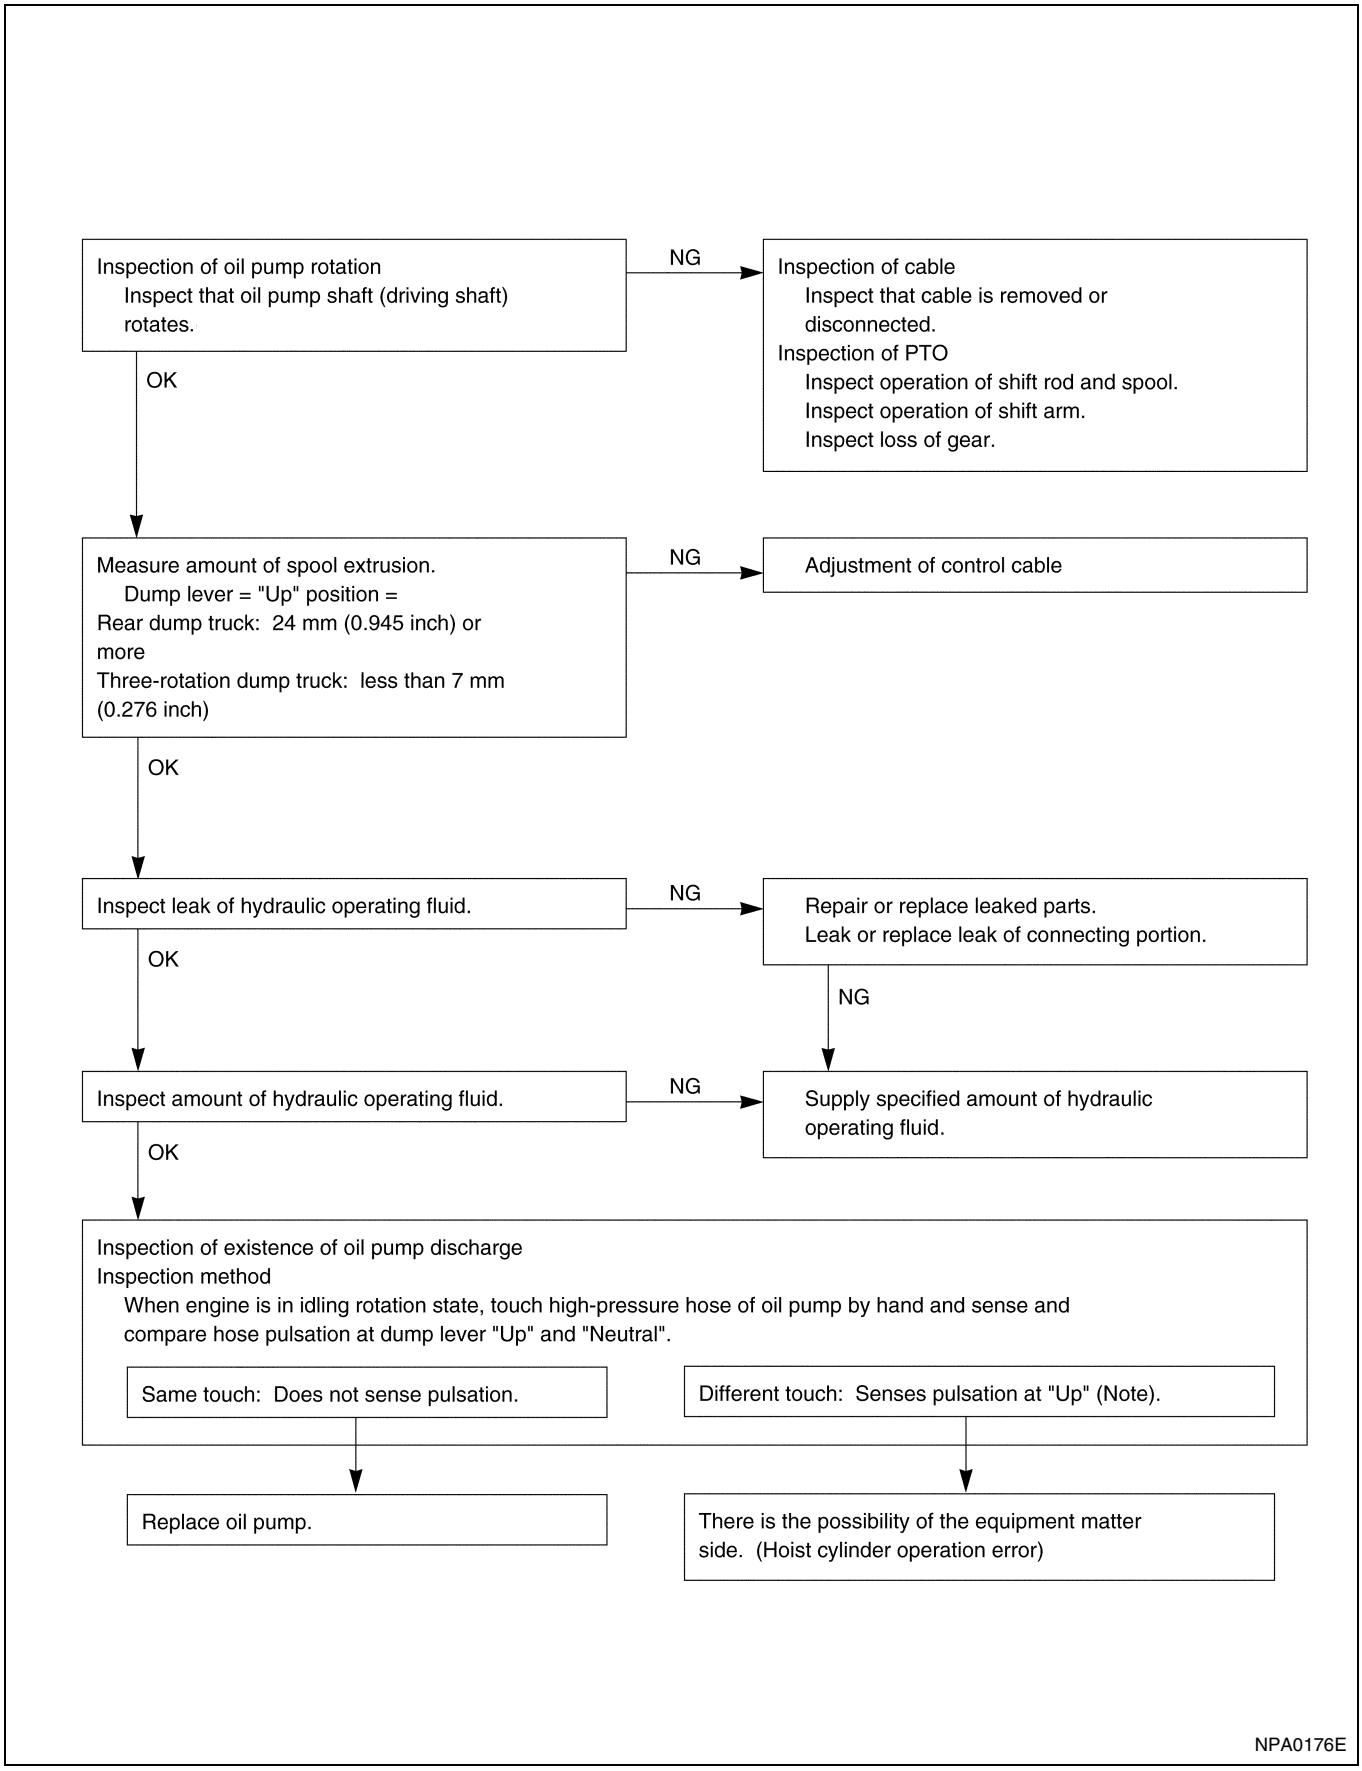


Legend
1. Oil pump
2. PTO
3. Inner rod assembly

Troubleshooting

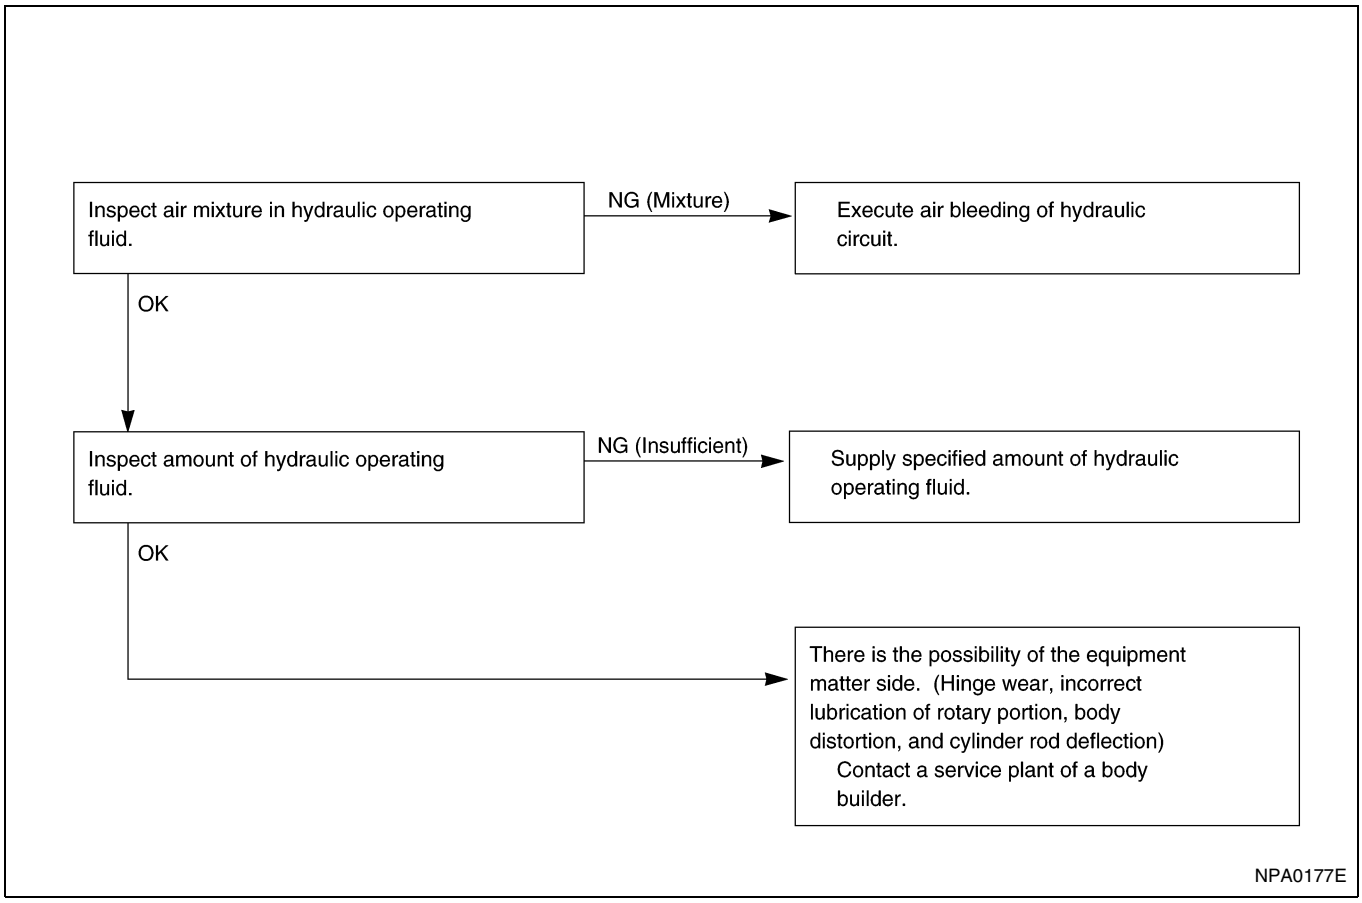
Inspection Based on Defect Symptoms

Defect 1. The Dump Body Rise is Disabled.

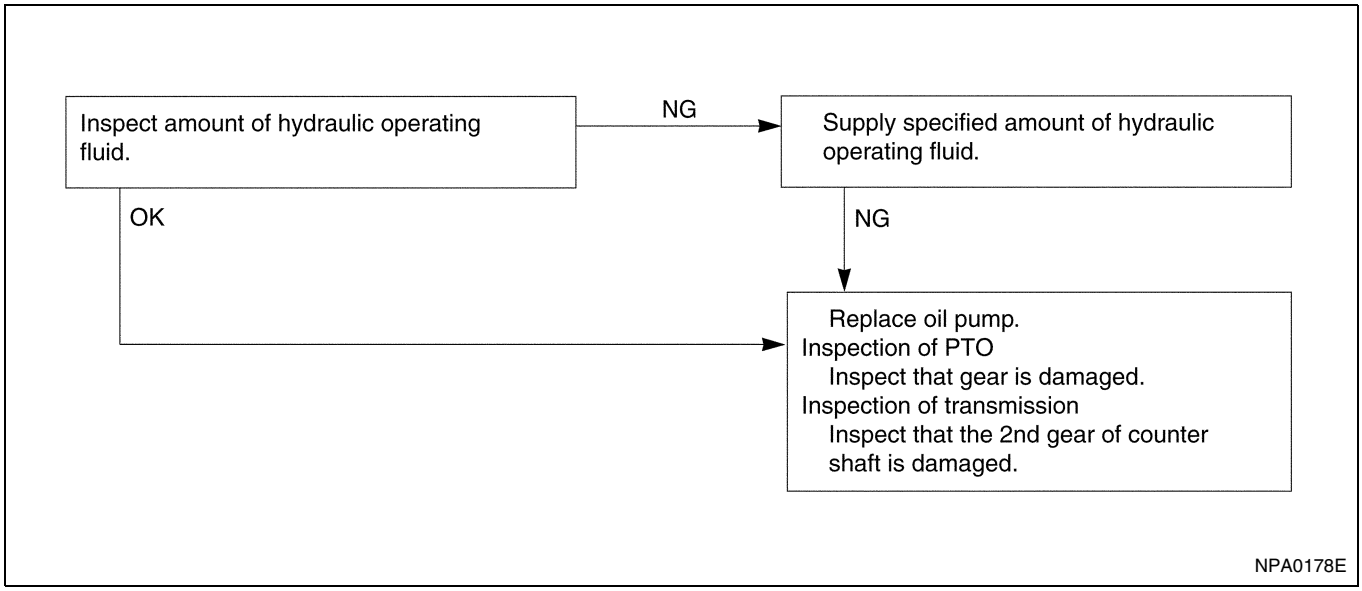


Notice:
For examination by touch on hose, be careful not to mix this pulsation with engine vibration.

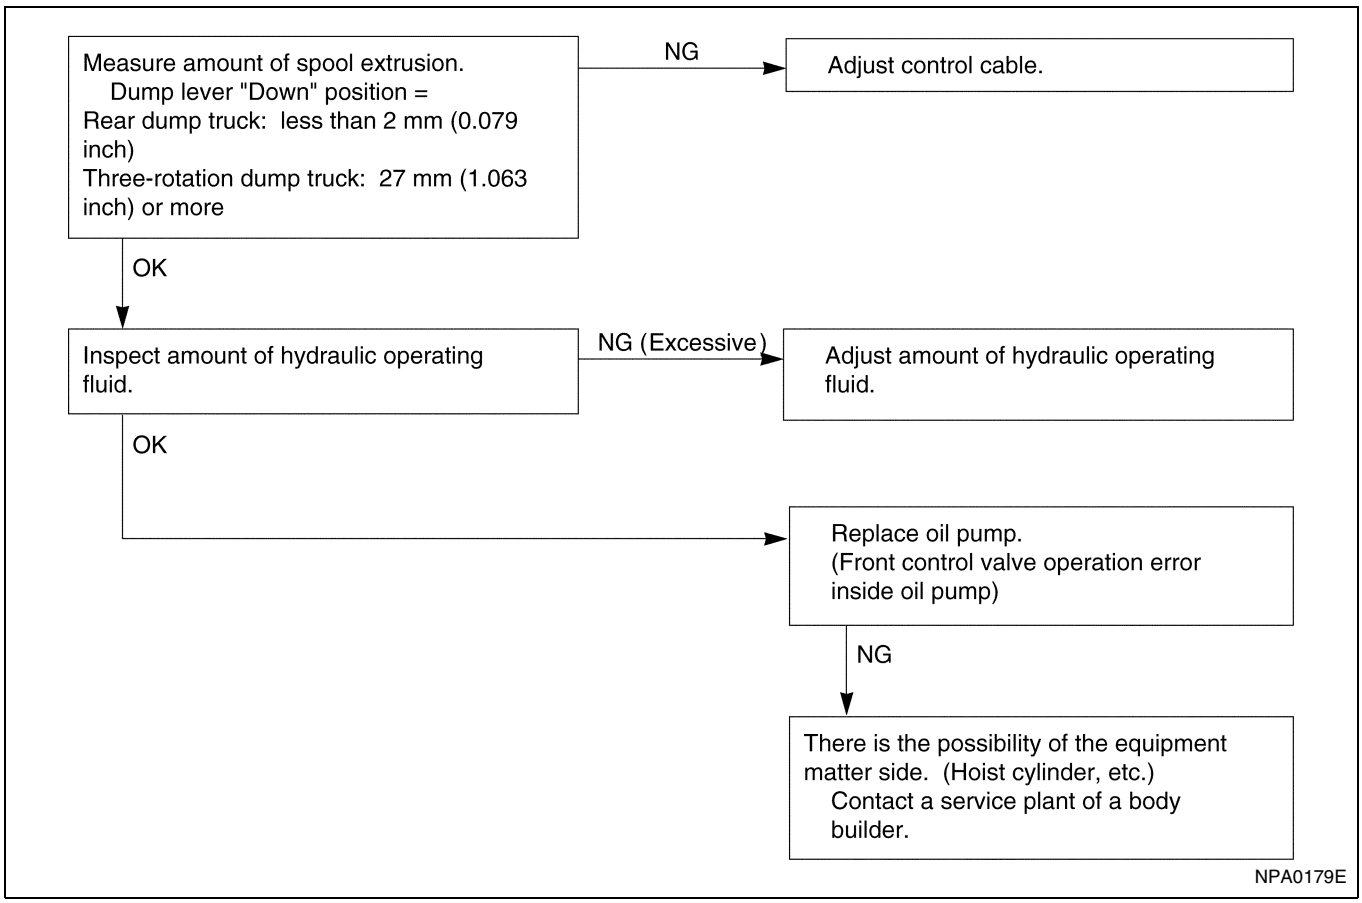
Defect 2. The Body (Cargo Deck) is Lugged During Rise.



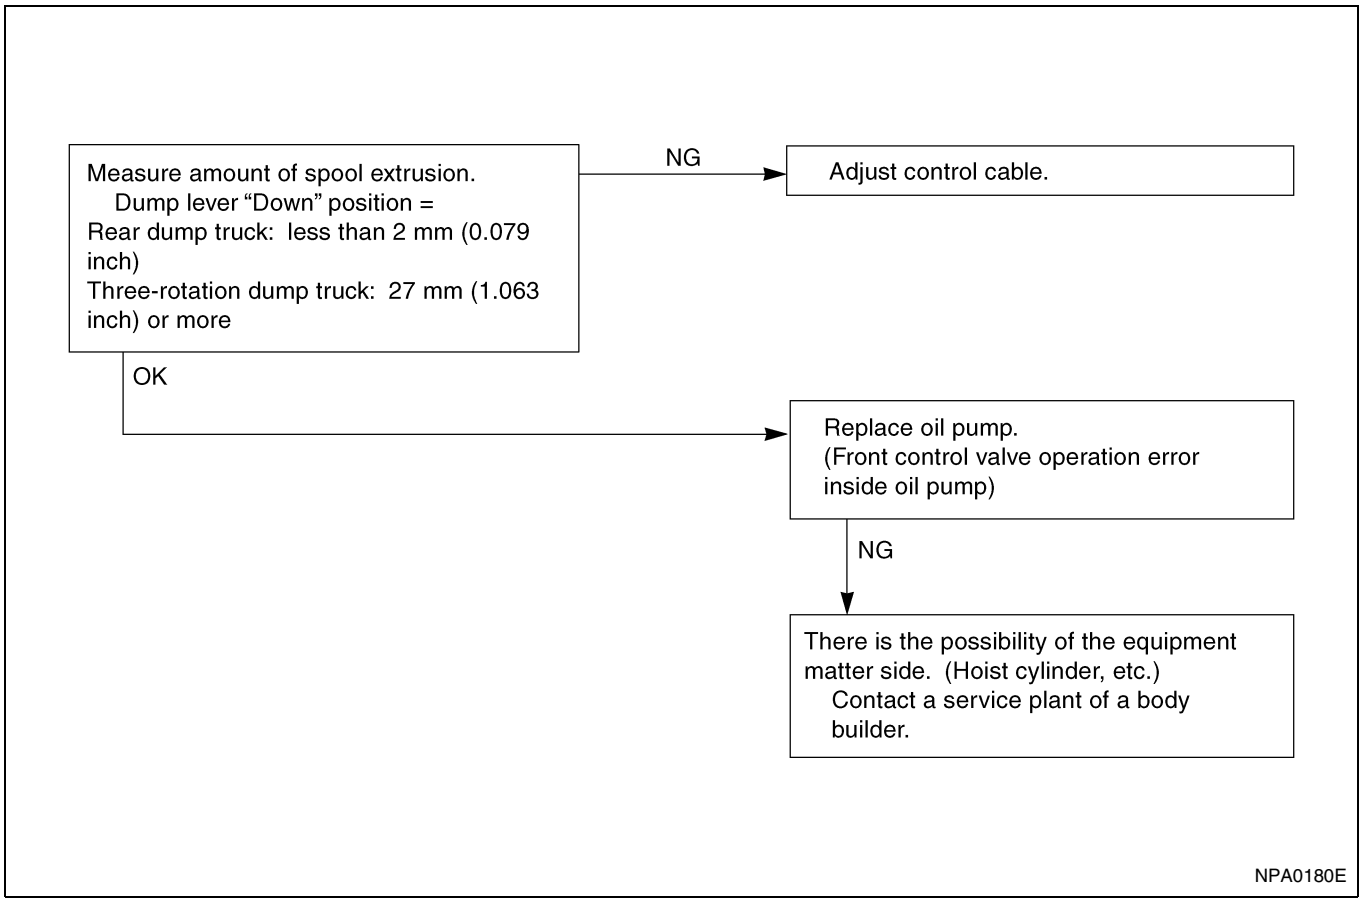
Defect 3. While the Body (Cargo Deck) is Being Raised, The Oil Pump Portion Causes a Large Abnormal Sound (Such As Caterwaul or Grate).



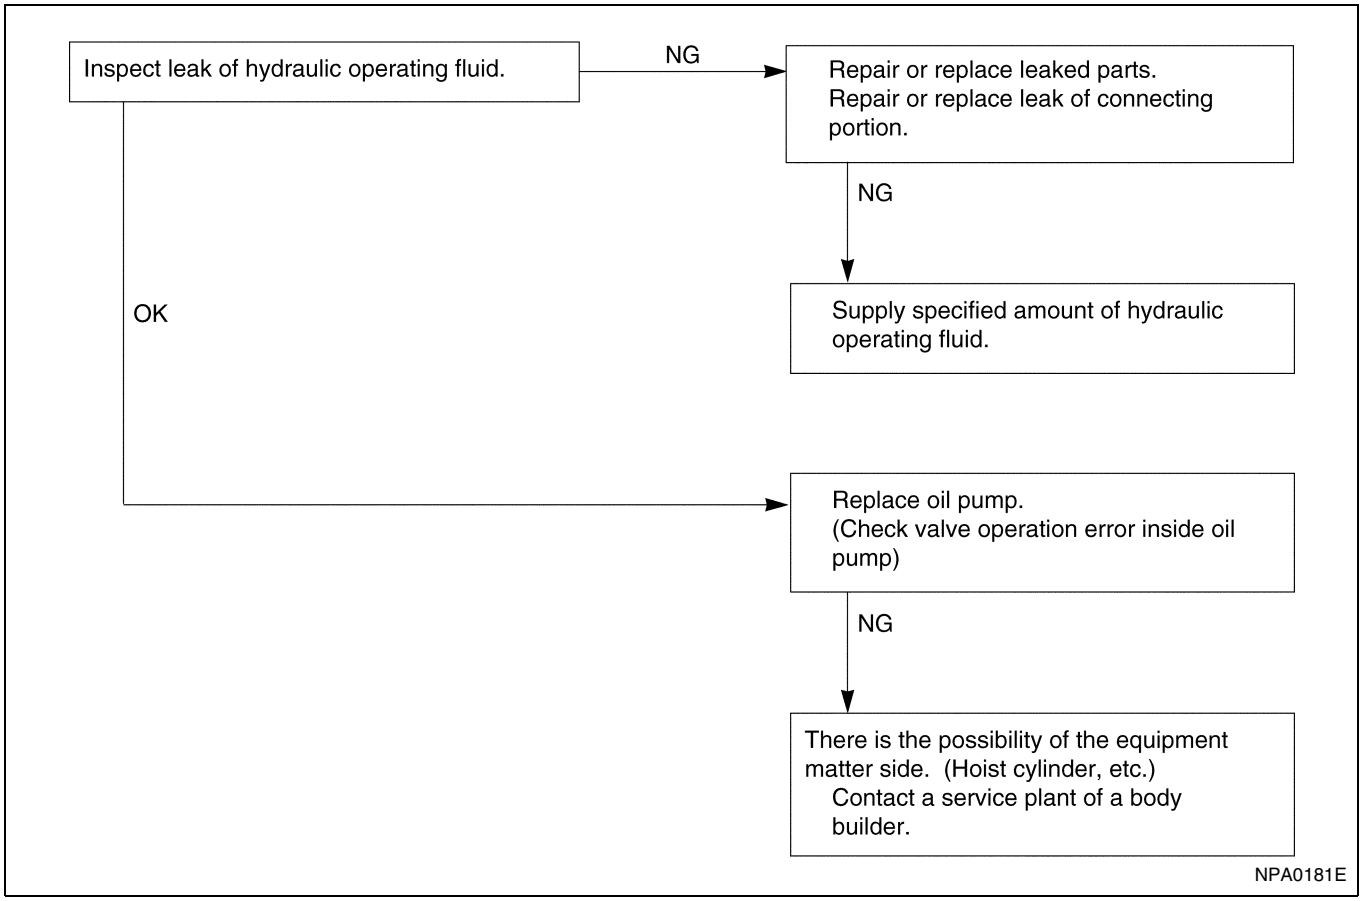
Defect 4. The Dump Body is Kept Being Raised or Does Not Drop Intermediately.



Defect 5. The Fall Speed of The Dump Body is Slow. (Basic Value: within 20 seconds for single cab, within 25 seconds for double cab (only for rear dump truck)



Defect 6. When a Load is Applied, The Dump Body Drops.



Main Data and Specifications

PTO with Oil Pump Assembly

Item	Specifications
Allowable maximum output torque N·m/rpm (kg·m/rpm)	98/1000 (10/1000)
Deceleration ratio (speed ratio for engine)	0.678
Direction of rotation (viewed from the rear of the PTO)	Clockwise rotation

Fixing Torque

This illustration is based on a rear dump truck model.

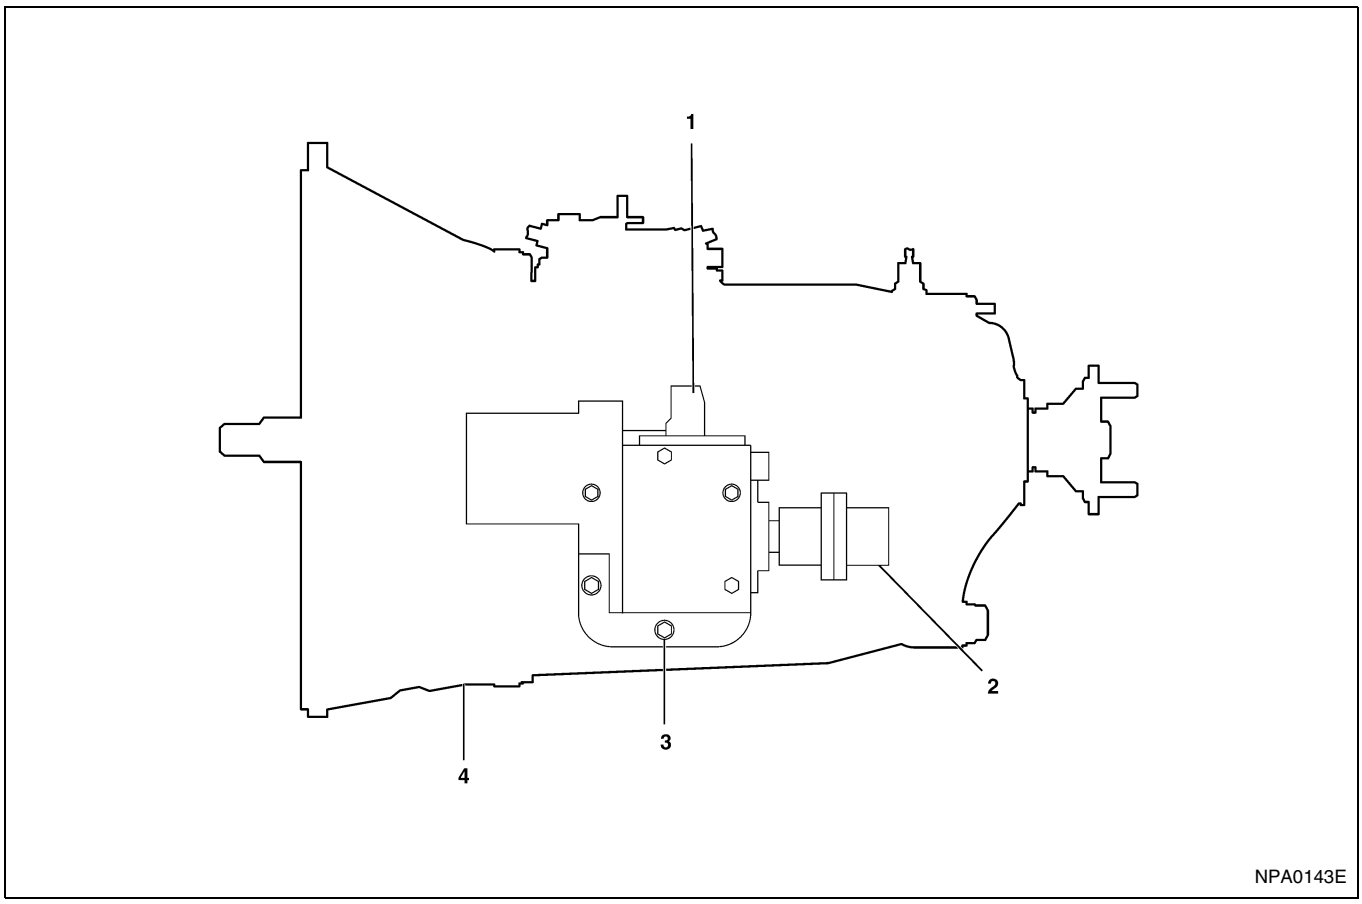
ELECTRONIC CONTROL TYPE PTO ASSEMBLY

Removal and Installation

Removal

1. PTO Output Propeller Shaft
   - Remove the propeller shaft, which is connected to equipment, at the flange portion of PTO.
   - Turn the PTO switch to ON, engage the gears, and loosen the nut which tightens the PTO output flange so that it can be rotated by hand at disassembly.
2. Battery Terminal
   - Disconnect the negative (–) terminal of battery terminal.
3. Transmission Oil
   - Remove the drain plug of the transmission to drain oil.
4. Wiring Connector
   - Disconnect the two wiring connectors.
5. PTO
   - Remove the bolts and nuts at six locations, which install the PTO to the transmission, and remove the PTO.



Legend

1. Wiring connector
2. PTO output propeller shaft
3. PTO
4. Transmission oil

Installation

1. PTO
   - Apply liquid gasket (THREE BOND TB1215 or equivalent) to the mating surface of the transmission case and PTO.
   - Install the PTO assembly to the transmission and tighten the bolts and nuts to the specified torque. (Apply LOCTITE 242 to the bolt threads.)

Tighten:
Bolt and nut to 37 N·m (3.8 kg·m / 27 lb·ft)

2. Wiring Connector
   - Connect wiring connector and secure them at the bracket portion.
3. Transmission Oil
   - Pour oil to the transmission.
     Specified oil: BESCO gear oil transaxle (5W-30)

4. Battery Terminal
   - Install the battery terminal securely and tighten it.
5. PTO Output Propeller Shaft
   - Turn the PTO to ON and tighten the tightening nut of PTO output flange to the specified torque.

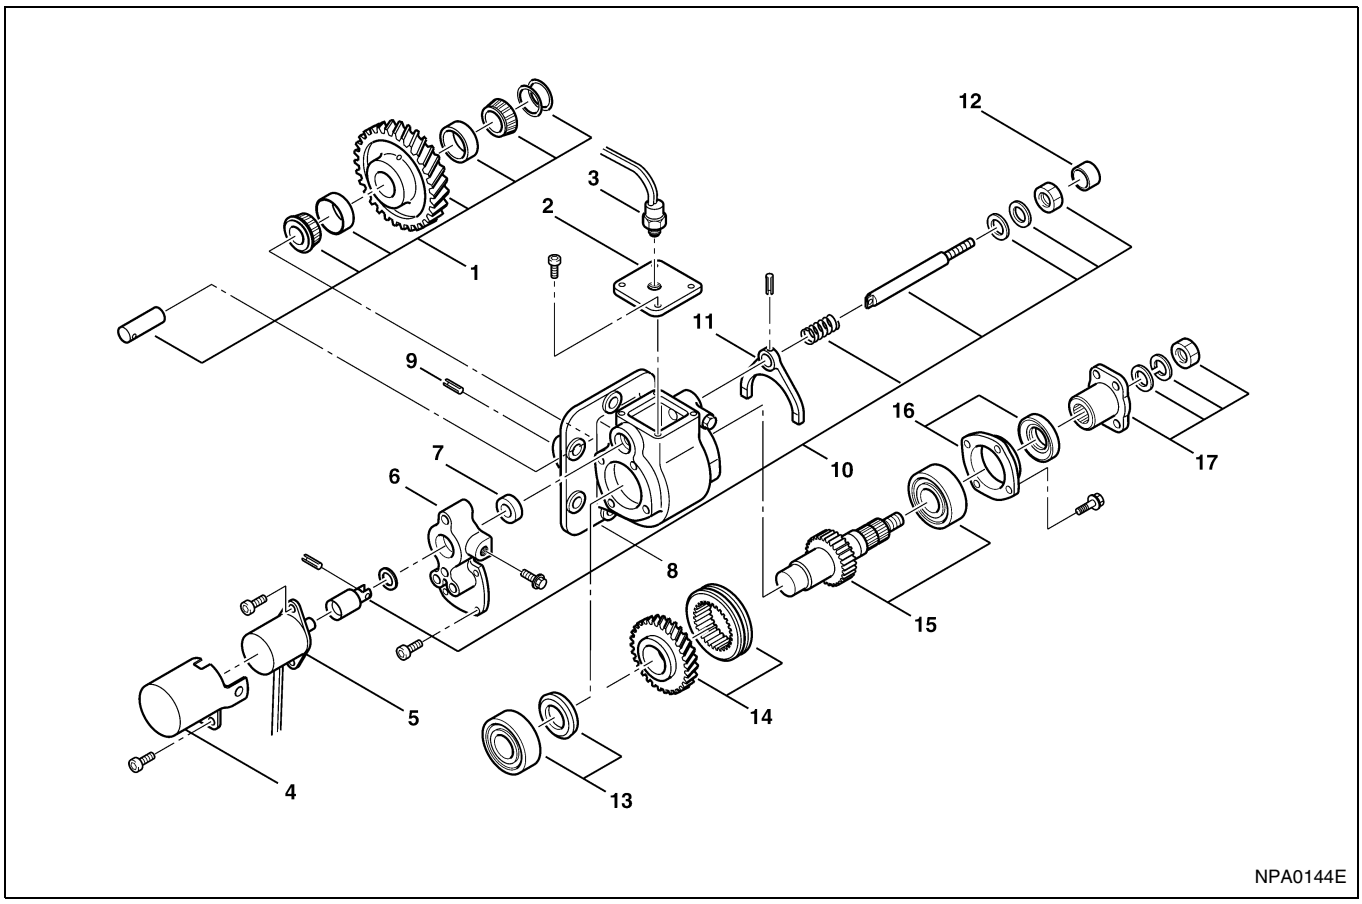
Tighten:
PTO output flange nut to 105 N·m (10.7 kg·m / 77 lb·ft)

   - Install the propeller shaft, which is connected to equipment, to the flange portion of PTO.

Tighten:
Propeller shaft to 17 N·m (1.7 kg·m / 13 lb·ft)

Unit Repair

Electronic Control Type PTO Body



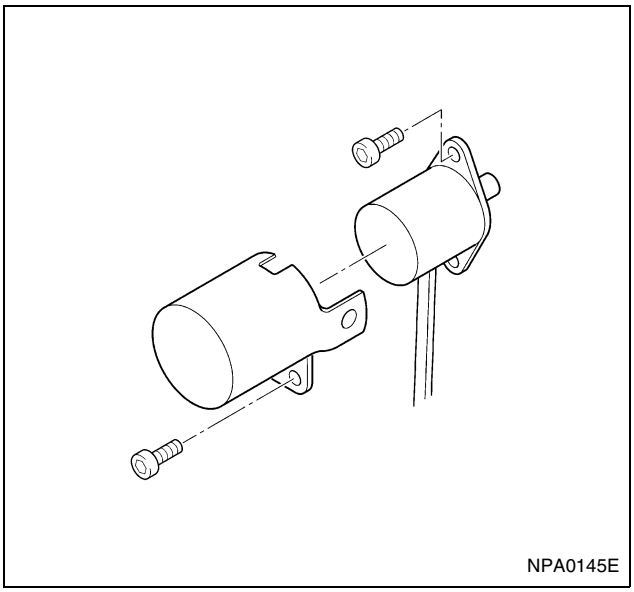
Legend

1. Idle shaft, idle gear, taper roller bearing
2. Upper cover
3. PTO switch
4. Solenoid cover
5. Solenoid assembly
6. Adapter
7. Oil seal
8. Gear case
9. Spring pin
10. Solenoid plunger, washer, shift rod, spring (plain washer, nut)
11. Shift fork
12. Plug
13. Front bearing, thrust collar
14. Gear, sleeve
15. Output shaft, rear bearing
16. Rear cover, oil seal
17. Nut, washer, flange

Disassembly

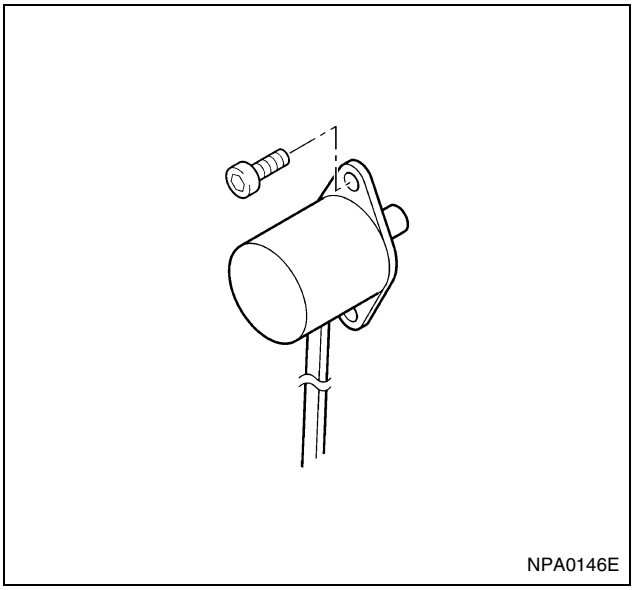
Disassembly Steps

1. Cover, Solenoid
   - Remove the three bolts and remove the cover.



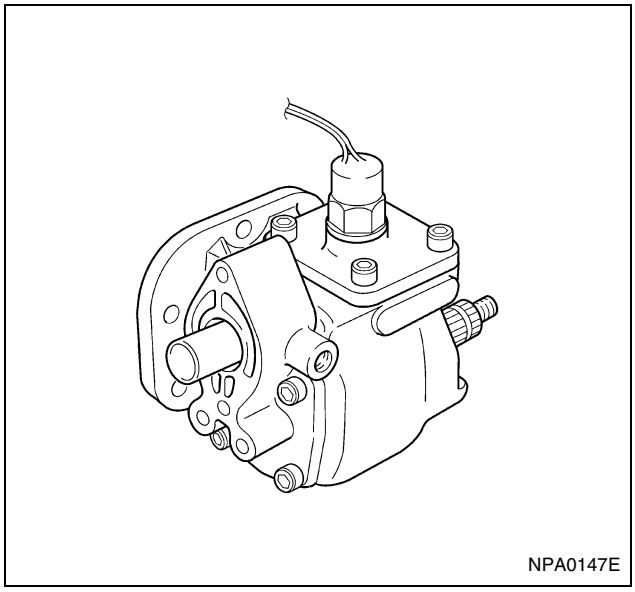
NPA0145E

2. Solenoid
   - Disconnect the harness connector and remove the two bolts. Remove the solenoid.



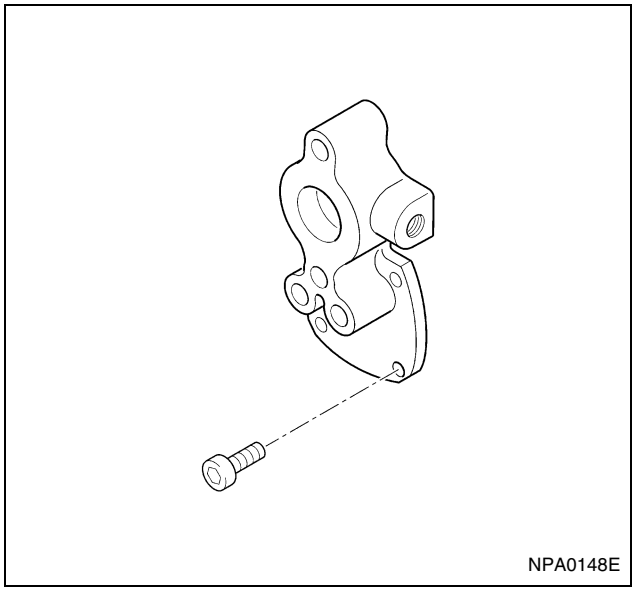
NPA0146E

3. PTO Switch
4. Upper Cover
   - Remove the four bolts and remove the upper cover.



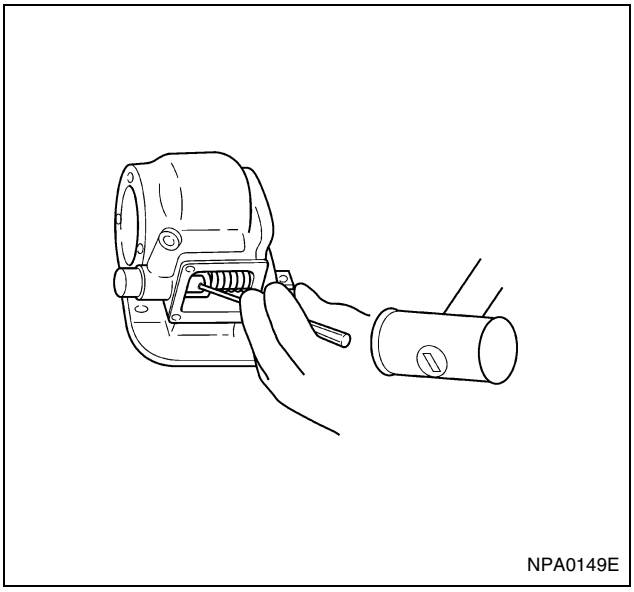
NPA0147E

5. Adapter
   - Remove the four bolts and remove the adapter.



NPA0148E

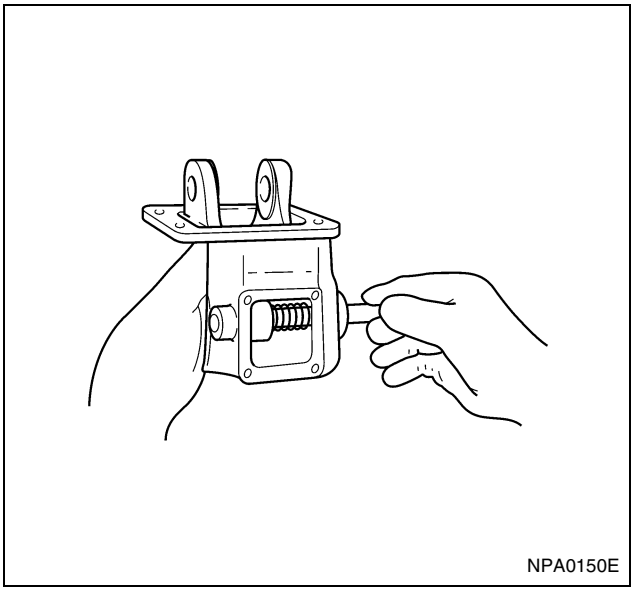
6. Spring Pin
   - Punch out the spring pin of shift fork.



NPA0149E

7. Shift Rod, Shift Fork, Spring Pin, Solenoid, Plunger, Washer
   - Pull out the shift rod and remove the shift fork and spring washer.
8. Oil Seal
9. Plug

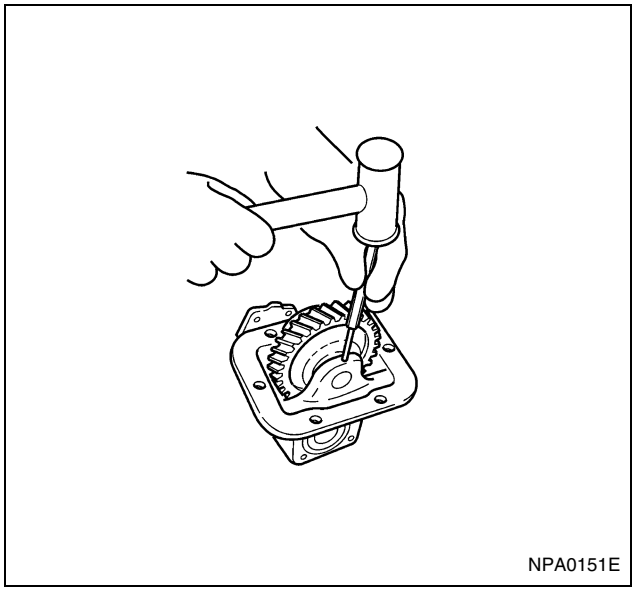
Caution:
If the plug and oil seal are not faulty, removal of them is not necessary.



NPA0150E

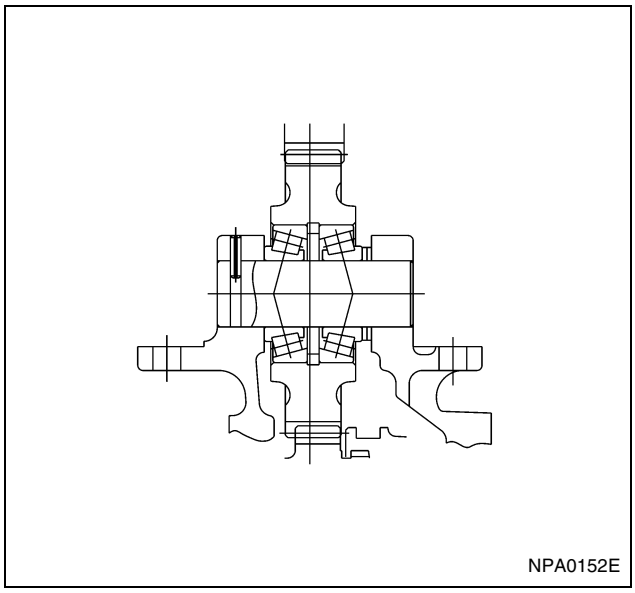
10. Spring Pin
    - Punch the spring pin into the idle gear shaft. (After removing the idle gear shaft, pull the spring pin out from the shaft.)

Special Tool
Spring pin remover; 9-8529-2201-0



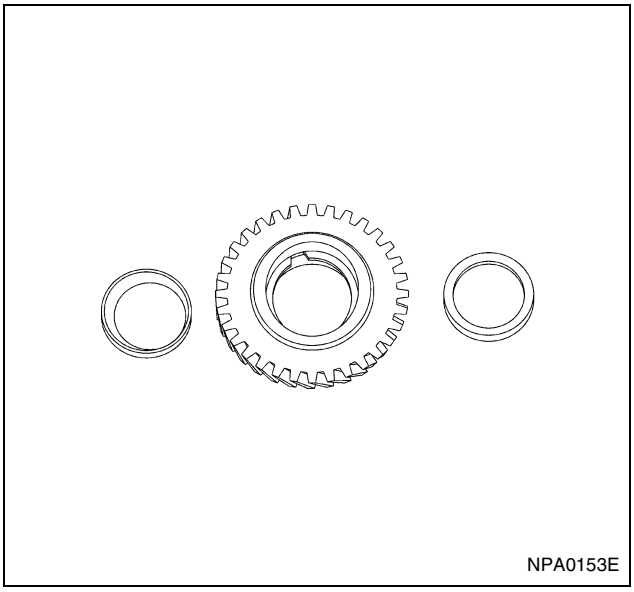
NPA0151E

11. Idle Gear, Taper Roller Bearing, Shim, Shaft
    - Pull out the idle gear shaft and remove the idle gear (with snap ring), the taper roller bearings (two) and the shim.



NPA0152E

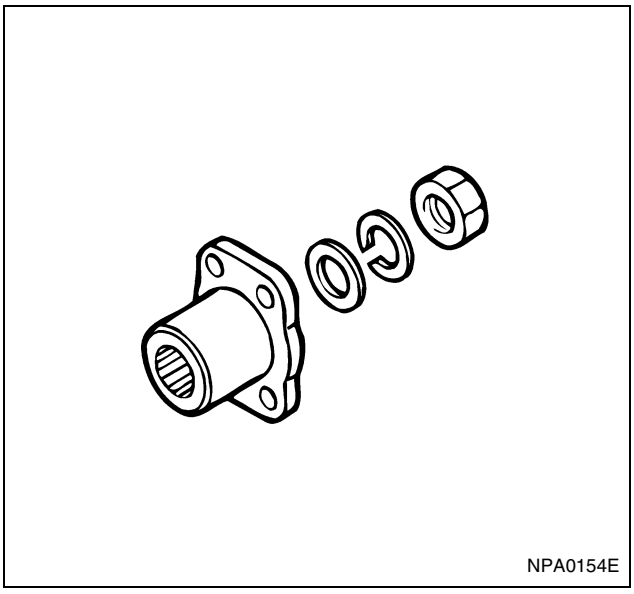
- If replacing the taper roller bearing, pull out the taper roller bearing outer races (two) from the idle gear using a brass stick and a hammer. (Do not remove the snap ring.)



NPA0153E

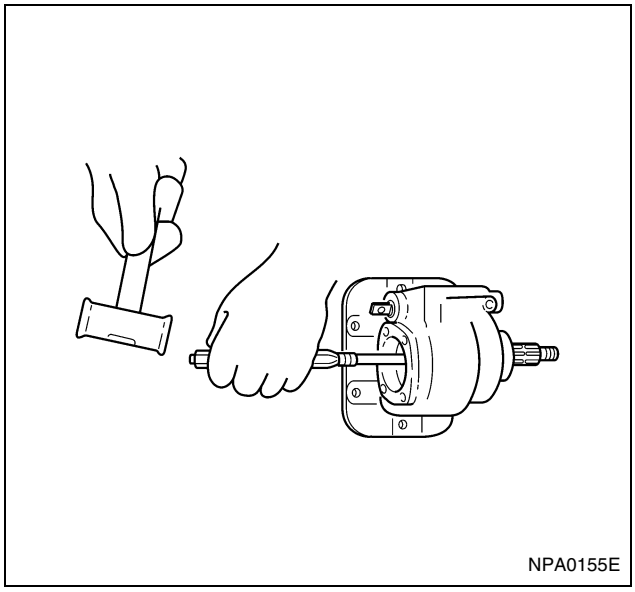
12. Nut, Washer, Flange
    - Remove the tightening nut of output flange and remove the spring washer and flange.
13. Rear Cover, Oil Seal
    - Remove the rear cover (with oil seal).
    - Remove the oil seal from the rear cover.

Caution:
If the oil seal is not faulty, removal of it is not necessary.



NPA0154E

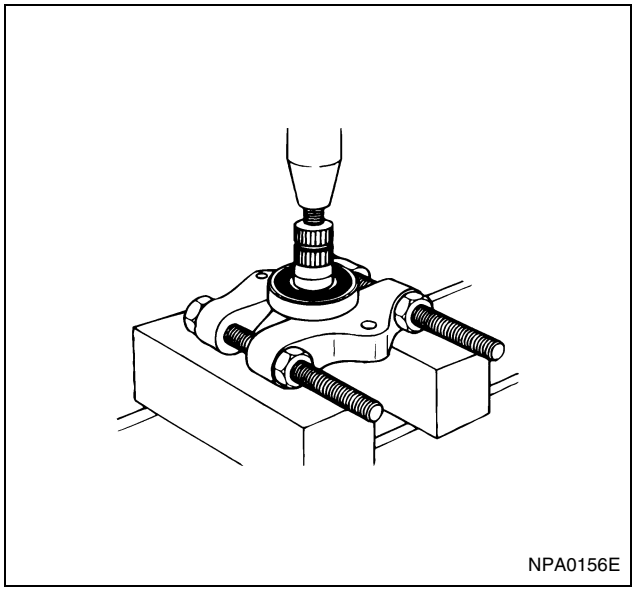
14. Output Shaft, Rear Bearing, Gear, Sleeve
15. Front Bearing, Thrust Collar
    - Tap the output shaft axis from the front side, and remove the front bearing, output gear, thrust collar and sleeve. Then pull out the output shaft and rear bearing from the gear case as a unit.
    - Remove the output gear (with bushing), sleeve, thrust collar and front bearing from the inside of gear case.



NPA0155E

    - Remove the rear bearing from the output shaft.

Special tool
Bearing remover; 5-8840-0015-0

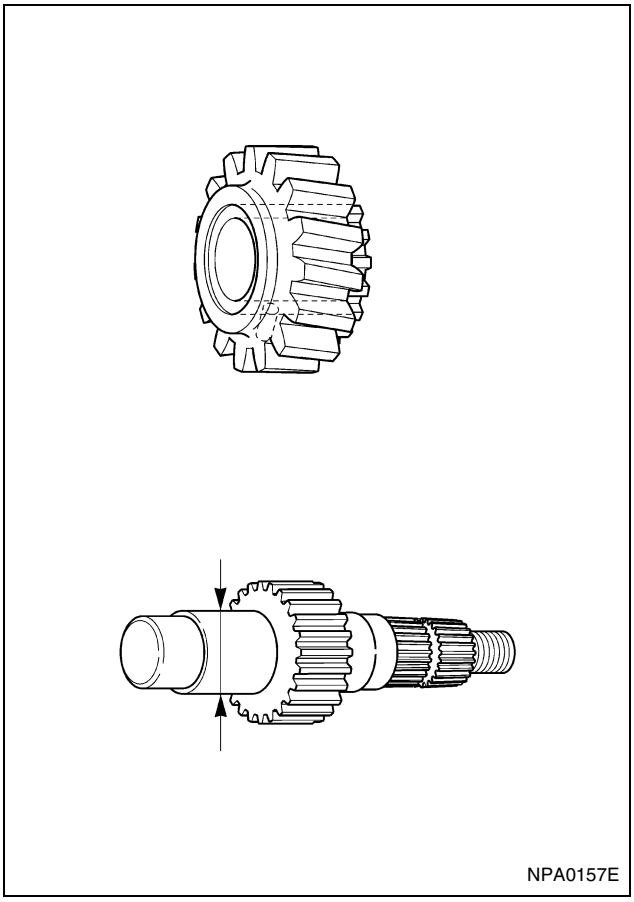


NPA0156E

Assembly

- Make sure that each part has been washed. Especially, remove metal particles or cleaning solvent at the bottom of gear case.
- Right before assembly, apply engine oil to the sliding portion and the fitting portion of each part.
- Bearings
  – Check each bearing. Replace it if there is one of the following faults.
    - Its rotation is not smooth.
    - Extreme noise occurs.
    - There is extreme damage or rust.
    - There is abnormal play in the thrust direction.

  - There is discoloration, extreme wear or pitching on the rolling body and rolling surface of the needle bearing or taper roller.
  - There is extreme backlash in the output shaft and the bearing (front and rear)
    Service limit; 0.2 mm (0.008 in)
- Gears
  – Check each gear. Replace it if there is extreme fault. For minor stepped wear or rough surface, repair it using oil stone or pencil grinder.
    - Breakage, damage or wear on the cross-section
    - Wear on idle gear and shaft
      Replace the idle gear (with snap ring), the needle bearing or the taper roller bearing if there is extreme wear.
    - Gap between output shaft and output gear (with bushing)
      Service limit; 0.2 mm (0.008 in)
      Replace the output gear (with bushing) if its gap exceeds the service limit.
- Idle and output shaft
  – Check for the damage or wear on the outside surfaces of idle shaft and output shaft, wear or damage on the spline portion, bent shaft, etc. Replace it if the fault is extreme.



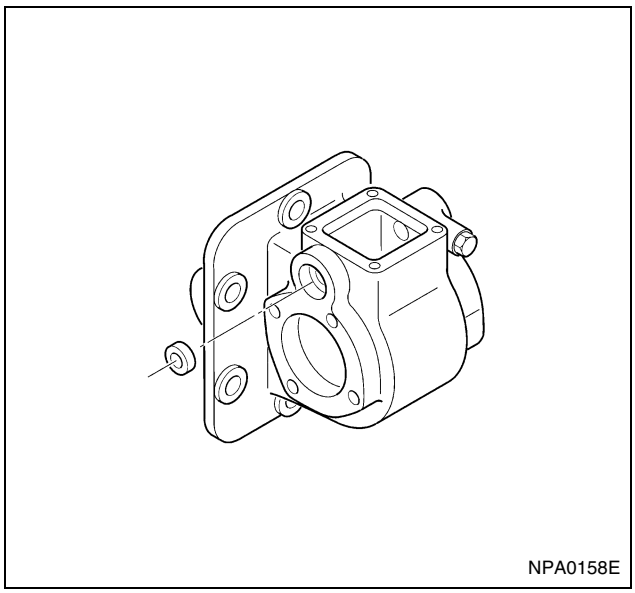
NPA0157E

- Shift mechanism
  – Check each part of shift mechanism for damage, bent, stepped wear, etc. and replace it if the fault is extreme.
    - Bent or wear of shift rod
    - Deformation or wear of shift arm
      Thickness of shift arm
      Specification; 9 mm (0.354 in)
      Service limit; 8 mm (0.315 in)
    - Backlash or rough movement of shift rod and gear case
- Oil seal
  – Replace the output shaft or shift rod if its contact surface is damaged or deteriorated.
  – Do not reuse the removed oil seal.
- Clutch
  – For minor stepped wear or damage, repair it using oil stone or pencil grinder. Replace it if there is extreme fault.
- For assembly direction of parts, refer to cross-section diagram.

Assembly

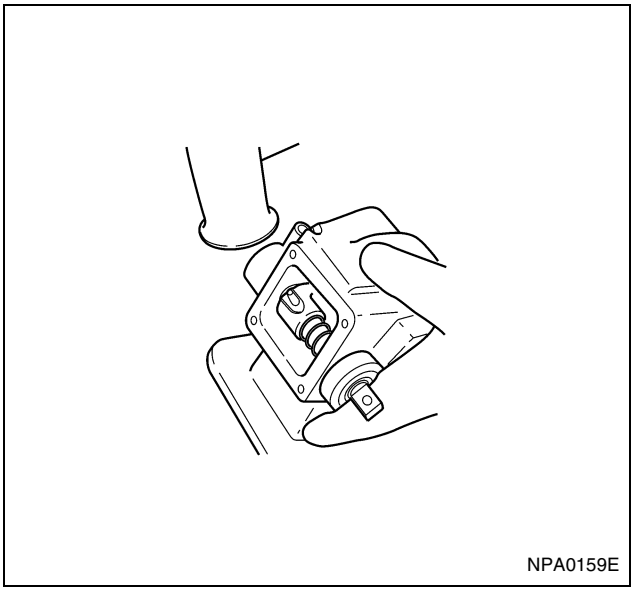
1. Gear Case
2. Oil Seal
   - Apply liquid gasket (THREE BOND 1141E) to the circumference of oil seal and grease (BESCO L2 or equivalent) to the lip, and punch it into gear case slot portion (front side).

Special tool
Oil seal installer; 5-8840-2065-0



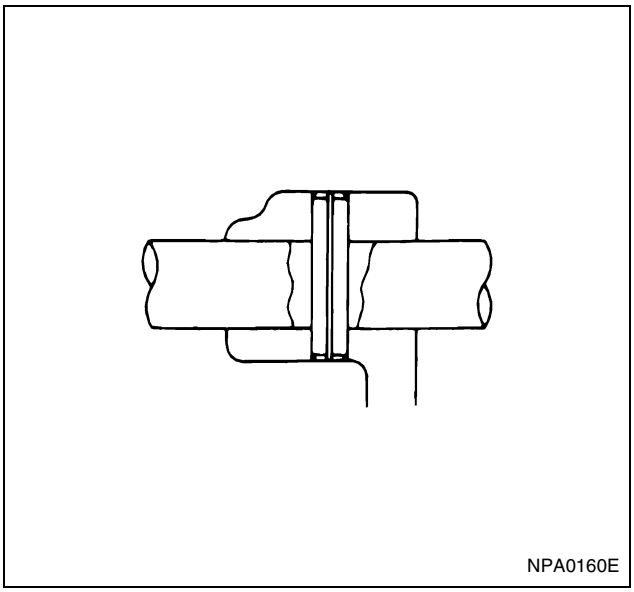
NPA0158E

3. Shift Rod, Shift Fork, Spring, Washer
   - Put the spring and the shift fork into gear case and pass the shift rod through them.



NPA0159E

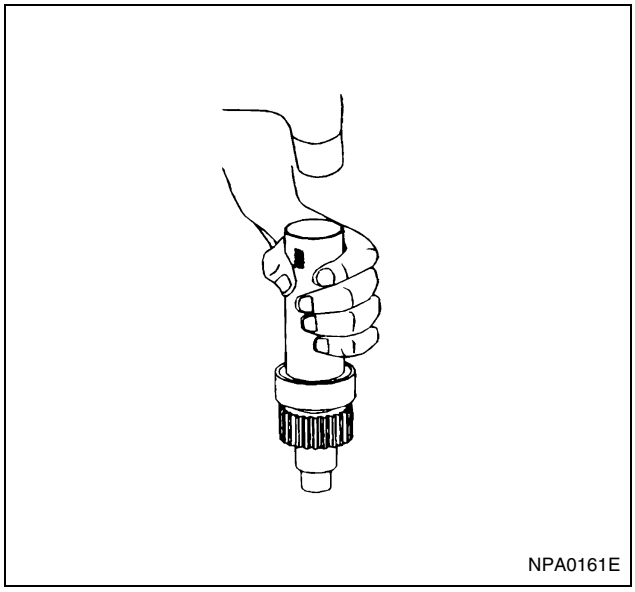
4. Spring Pin
   - Punch the spring pin so that the pin is flush with the shift fork.



NPA0160E

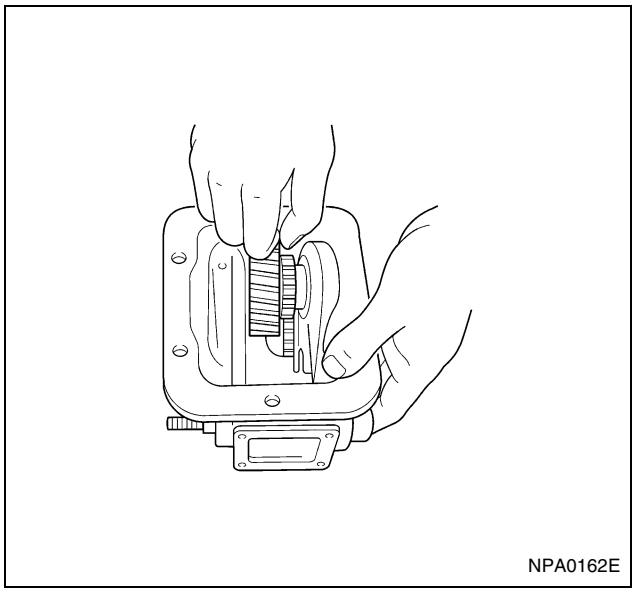
5. Output Shaft, Rear Bearing
   - Press-fit the rear bearing into output shaft.

Special tool
Bearing installer; 5-8840-2066-0



NPA0161E

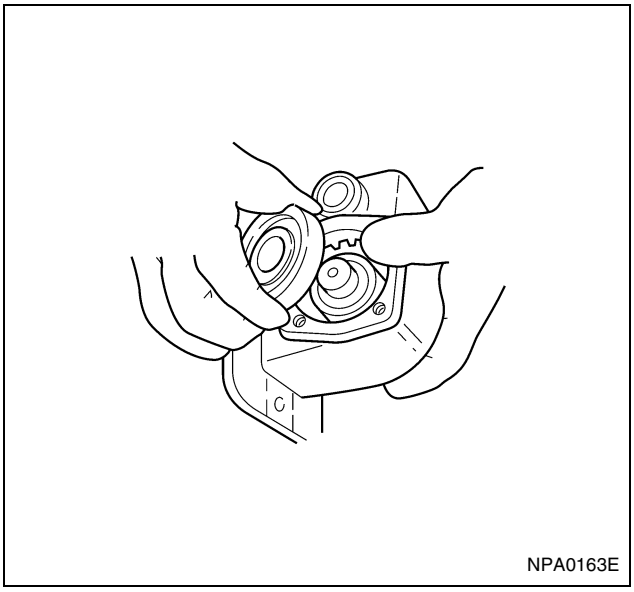
6. Output Gear (with Bushing), Sleeve
   - Insert the shift fork into the sleeve groove in the gear case and assemble the output shaft (with rear bearing) to the sleeve and output gear.



NPA0162E

7. Thrust Collar, Front Bearing
   - Install the thrust collar to the front side of output shaft and press-fit the front bearing.

Special tool
Bearing installer; 5-8840-2066-0



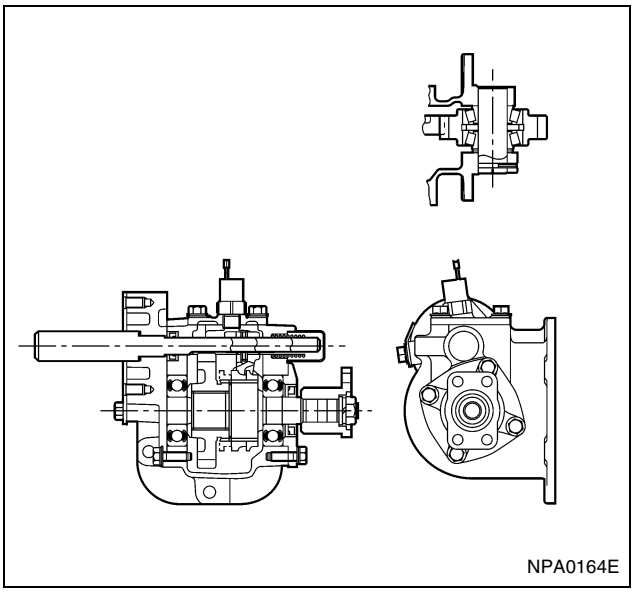
NPA0163E

8. Adapter, Solenoid
   - Apply liquid gasket (THREE BOND TB1215) to the mounting surfaces of adapter and solenoid. Let the cores of solenoid in-low portion and case slot portion of adapter come out. Assemble the bolt. Apply LOCTITE 242 to the bolt.

Caution:
Be careful not to damage the oil seal when the cores come out.

Tighten:
Bolt to 25 N·m (2.5 kg·m / 18 lb·ft)

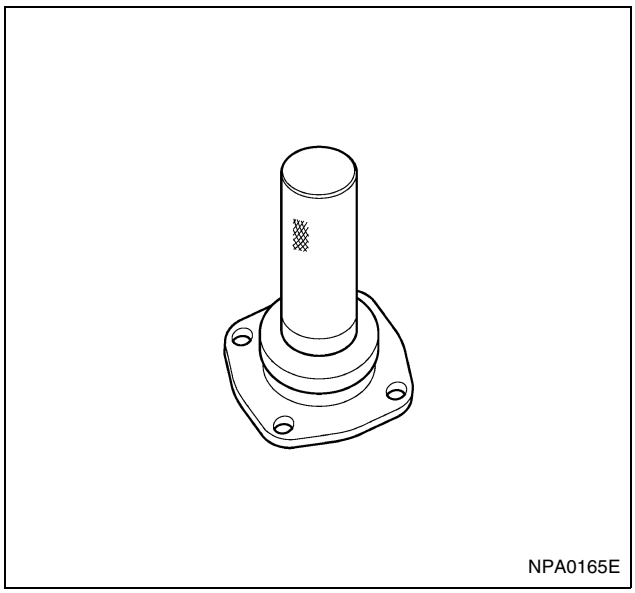
Special tool
Setting tool; 5-8840-2452-1



NPA0164E

9. Rear Cover, Oil Seal
   - Fill with grease (BESCO L2 or equivalent) of approx. 3 g to the lip of oil seal and apply liquid gasket (THREE BOND 1141E) to the circumference and assemble it to the rear cover.

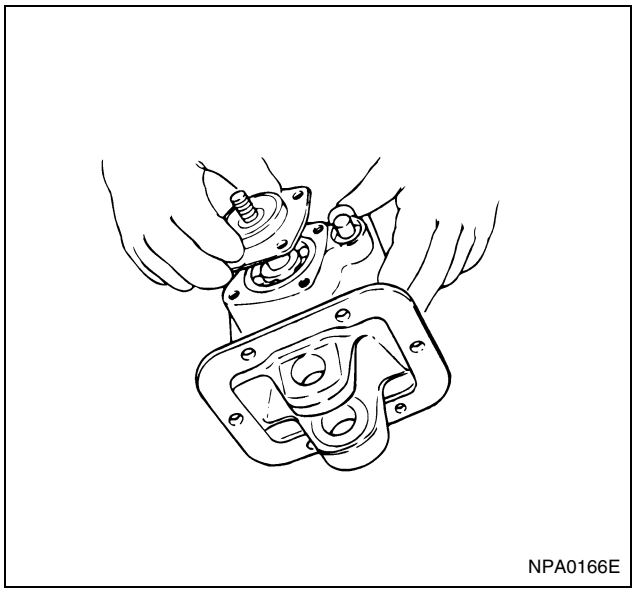
Special tool
Oil seal installer; 5-8840-2064-0



NPA0165E

   - Apply liquid gasket (THREE BOND TB1215) to the mounting surface of rear cover and LOCTITE 242 to the bolt threads, and assemble it.

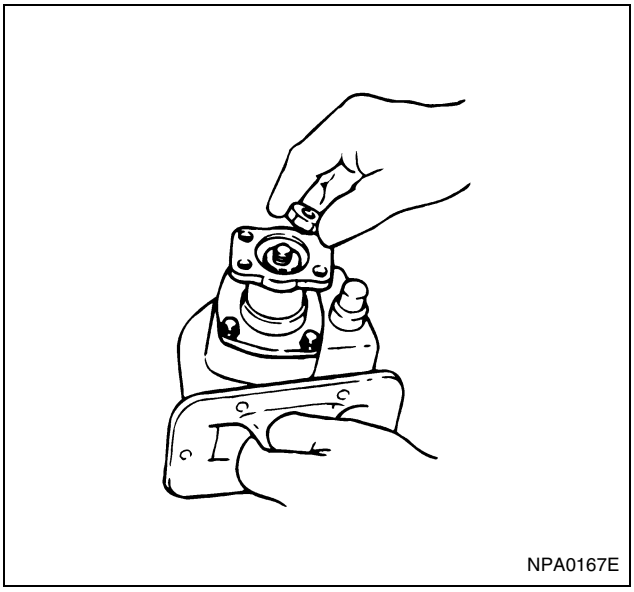
Tighten:
Bolt to 25 N·m (2.5 kg·m / 18 lb·ft)



NPA0166E

10. Flange, Washer, Nut
    - Assemble the flange to output shaft.
    - Install the plain washer and spring washer, and temporarily tighten the nut. After installing the PTO to the transmission, tighten it to the specified torque.

Tighten:
Nut to 105 N·m (10.7 kg·m / 77 lb·ft)

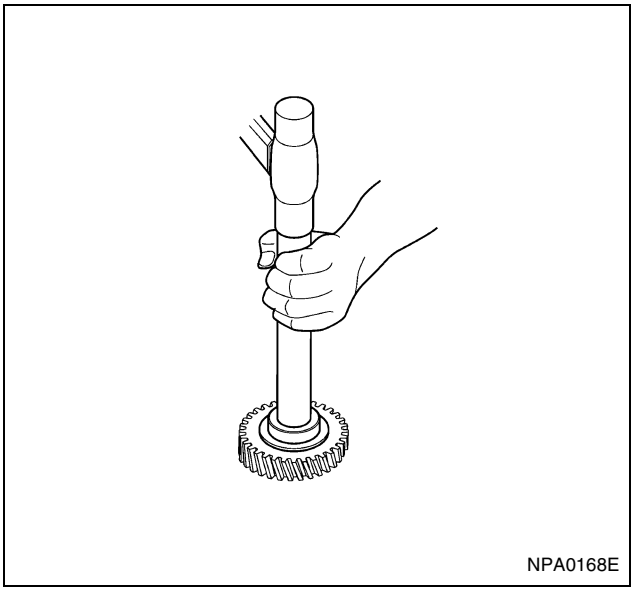


NPA0167E

11. Idle Gear, Taper Roller Bearing, Shim, Shaft
    - To replace the taper roller bearing, punch out the taper roller bearing outer races (two) from the both sides of idle gear.

Special tool
Bearing installer; 5-8522-0035-0
Grip; 5-8840-0007-0

- Install the idle gear taper roller bearings (two) and shim.

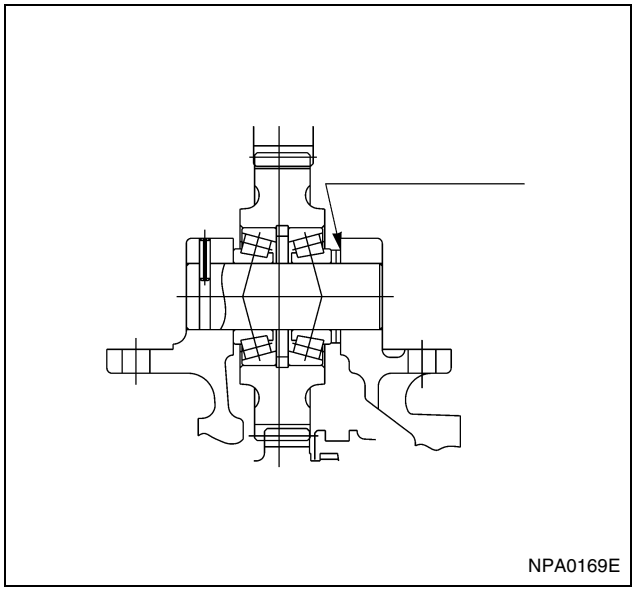


NPA0168E

- Select the shim so that the gap shown in the illustration is specification, insert the shim between the back side taper roller bearing and the gear case, and install the idle shaft.

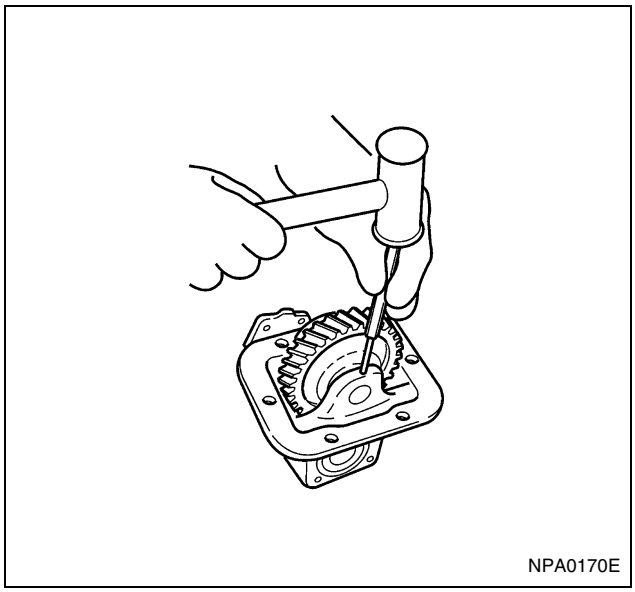
Gap specification between shim and case = Less than 0.08 mm (0.003 in)

Shim thickness to be selected	mm (in)
1.50 (0.059)	1.70 (0.067)
1.60 (0.063)	1.80 (0.071)
1.65 (0.065)	1.85 (0.073)



NPA0169E

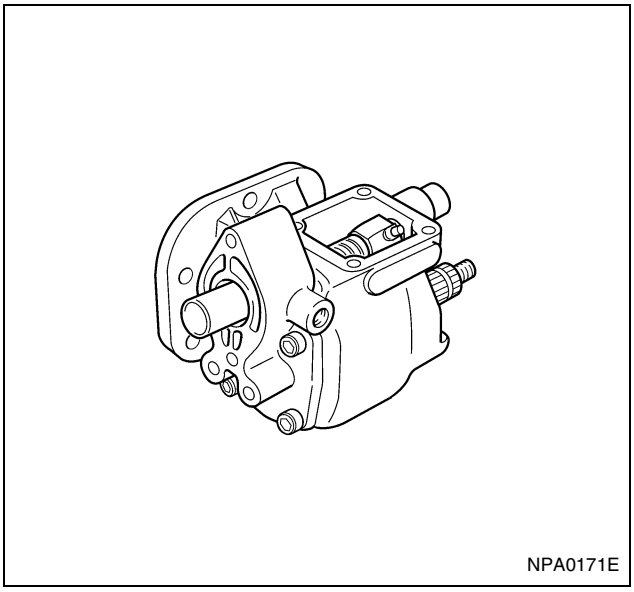
12. Spring Pin
    - Punch the spring pin so that it is flush with the gear case.



NPA0170E

13. Upper Cover
    - Apply THREE BOND TB1215 to the mounting surface and LOCTITE 242 to the bolt threads, and assemble it to the case.

Tighten:
Bolt to 25 N·m (2.5 kg·m / 18 lb·ft)



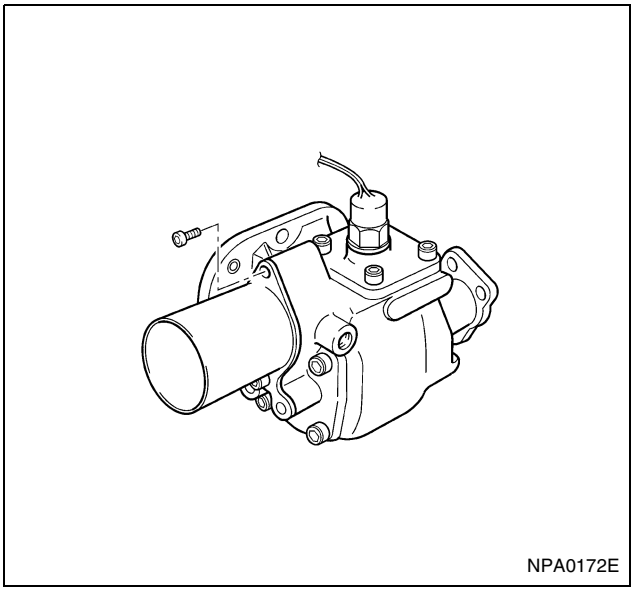
NPA0171E

14. PTO Switch
    - Apply LOCTITE 242 to the threads and assemble it.

Tighten:
PTO switch to 44 N·m (4.5 kg·m / 32 lb·ft)

15. Solenoid Assembly
    - Apply LOCTITE 242 to the bolt threads and assemble it.

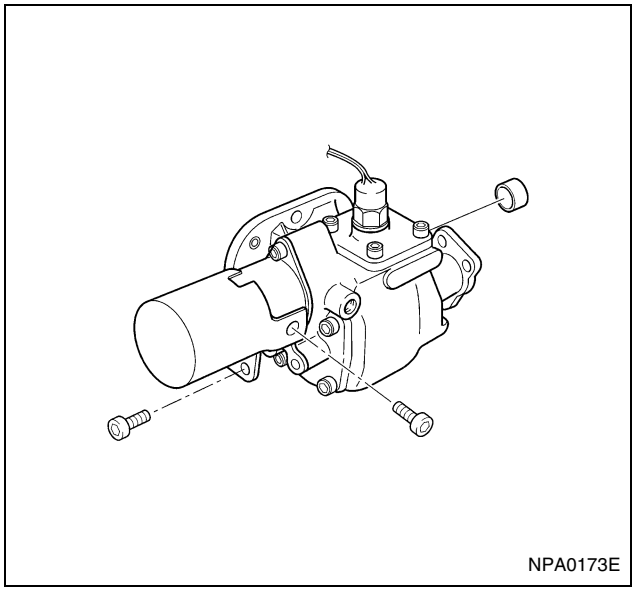
Tighten:
Bolt to 25 N·m (2.5 kg·m / 18 lb·ft)



NPA0172E

16. Cover Solenoid Plug
    - Apply LOCTITE 242 to the bolt threads of cover and solenoid and assemble them.

Tighten:
Bolt to 25 N·m (2.5 kg·m / 18 lb·ft)

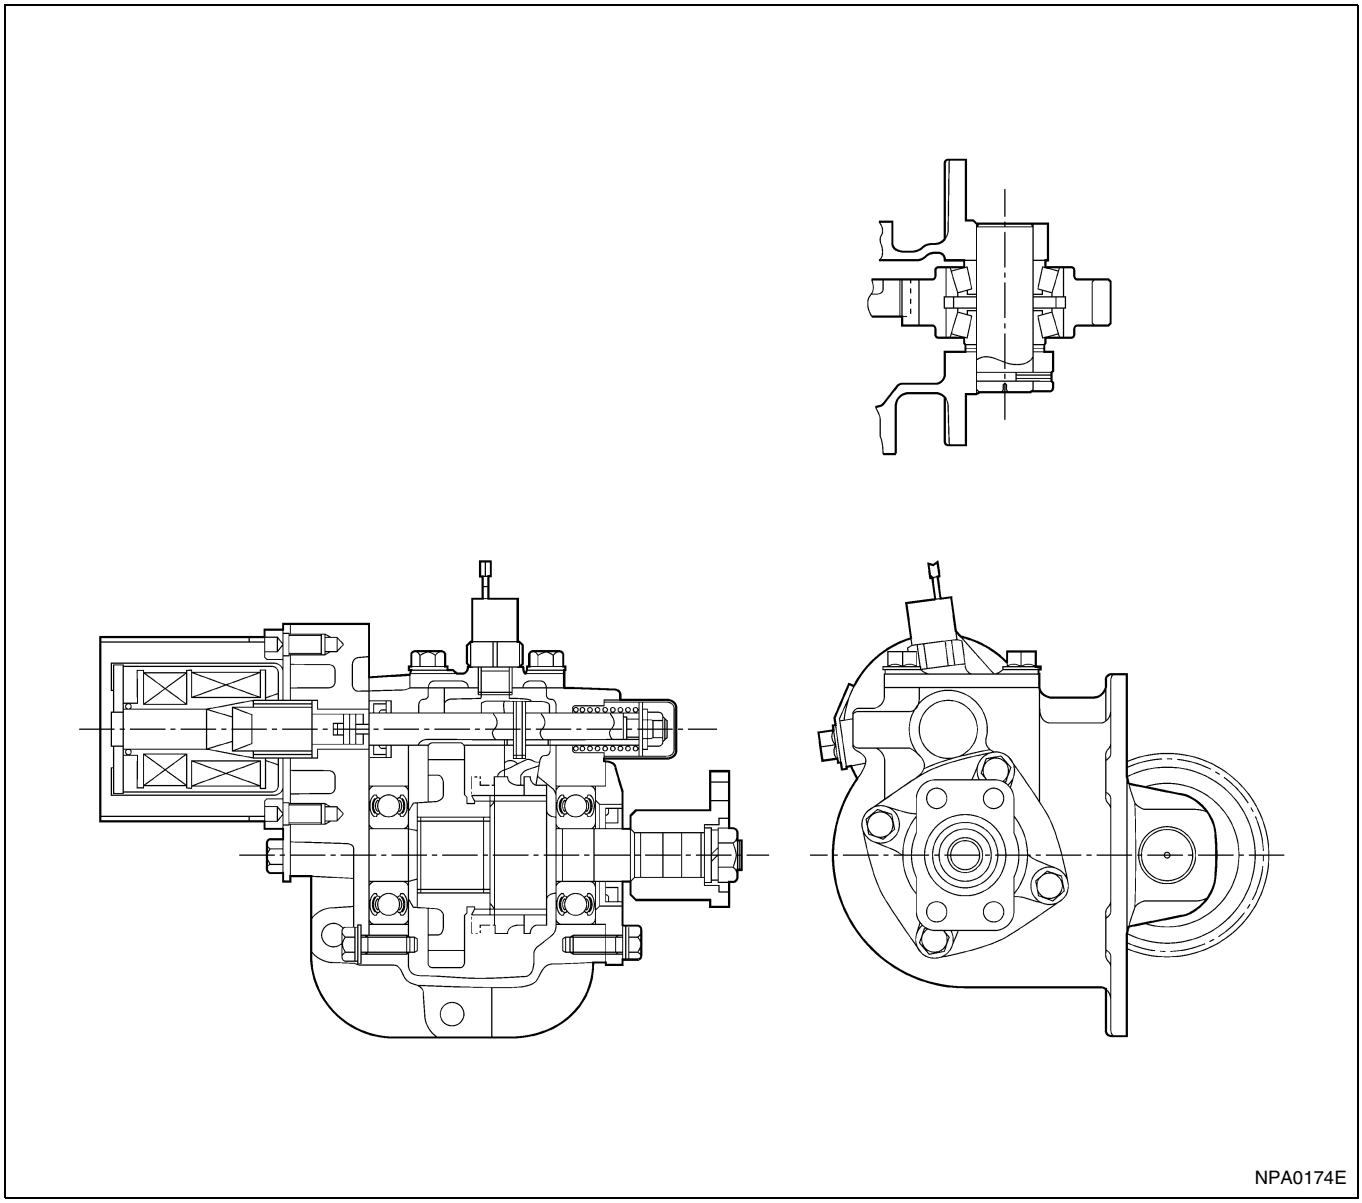


NPA0173E

Description of function and operation

The electronic control type side PTO of MYY transmission is installed on the left side of transmission.
The gear of PTO is engaged at all times. The solenoid shifts the sleeve on output axis by the shift rod and shift arm to transmit or cut the power to the gear. The gear is the helical type as well as transmission and has a silent effect.
To maintain durability, the idle gear bearing uses the taper roller bearing, and the output axis uses the ball bearing.

Cross-section diagram



Main Data and Specifications

Electronic control type PTO

Item	Specifications
Allowance output torque N·m/rpm (kg·m/rpm)	196/1000 (20/1000)

Application Procedure 0A-9
RECOMMENDED THREAD LOCKING AGENT . 0A-10

GENERAL REPAIR INSTRUCTIONS

General Repair Instructions

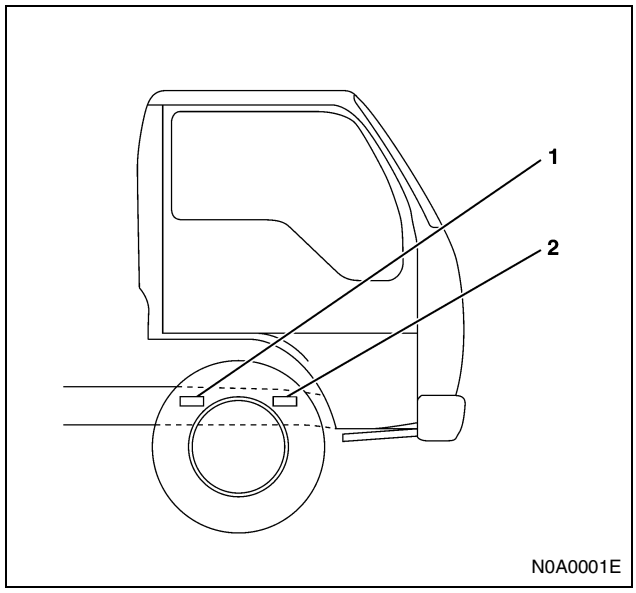
1. Park the vehicle on level ground and chock the front or rear wheels before lifting the vehicle.
2. Use covers on the vehicle body, seats, and floor to prevent damage and/or contaminations.
3. Disconnect the grounding cable from the battery before performing service operations. This will prevent cable damage or burning due to shortcircuiting.
4. Raise the vehicle with a jack set against the axle or the frame.
5. Support the vehicle on chassis stands.
6. Handle brake fluid and engine coolant with great care.
   Spilling these liquids on painted surfaces will damage the paint.
7. The use of the proper tool(s) and special tool(s) where specified is essential to efficient, reliable, and safe service operations.
8. Always use genuine ISUZU replacement parts.
9. Discard used cotter pins, gasket, O-rings, oil seals, lock washers, and self-locking nuts at disassembly.
   Normal function of these parts cannot be guaranteed if they are reused.
10. Keep the disassembled parts neatly in groups.
    This will facilitate smooth and correct reassembly.
11. Keep fixing nuts and bolts separate.
    Fixing nuts and bolts vary in hardness and design according to installation positions.
12. Clean all parts before inspection or reassembly.
13. Clean the oil ports and other openings with compressed air to make certain that they are free of dirt and obstructions.
14. Lubricate the rotating and sliding faces of all moving parts with oil or grease before installation.
15. Use the recommended liquid gasket to prevent leakage.
16. Be sure to tighten bolts and nuts to the specified torque, using a properly maintained torque wrench.
17. When service operation is completed, make a final check to be sure service has been done properly and problem has been corrected.
18. When removing or replacing parts that require refrigerant to the discharged from the Air conditioning system, be sure to use the ACR4 or equivalent to recover and recycle Refrigerant-134a, to promote the movement for the protection of the ozone layer covering the earth.
19. To assure safety, always slowly release air pressure from the air tanks before disconnecting pipes, hoses or other parts from any unit under pressure.

IDENTIFICATION

Chassis Number:

It is stamped on the front right-hand side face of the chassis side member.

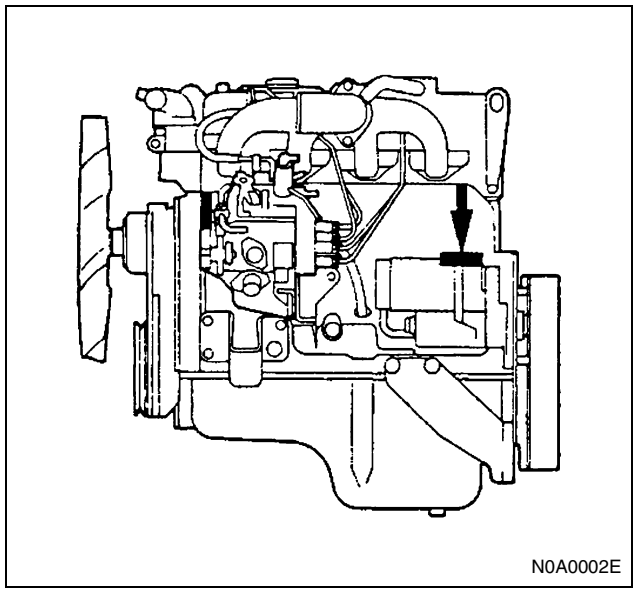
1. NKR models with independent front suspension
2. NHR, NKR, NPR, NQR and NPS models with rigid axle front suspension



Engine Number:

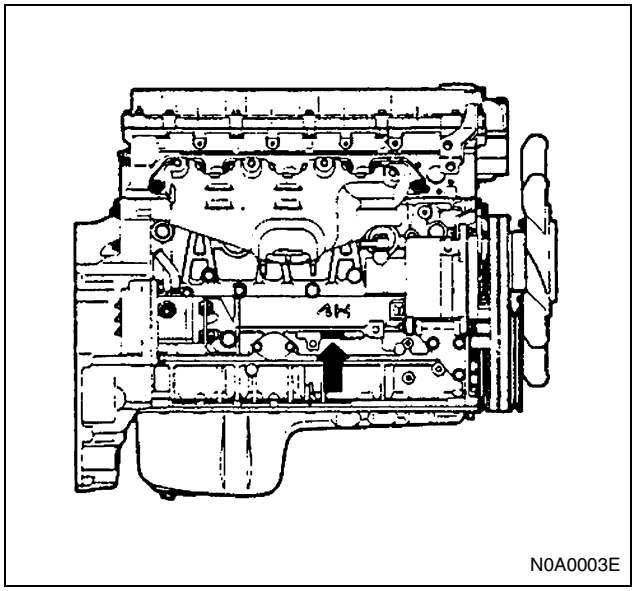
4J Series Engine

The engine number is stamped on the left side rear of the cylinder body.



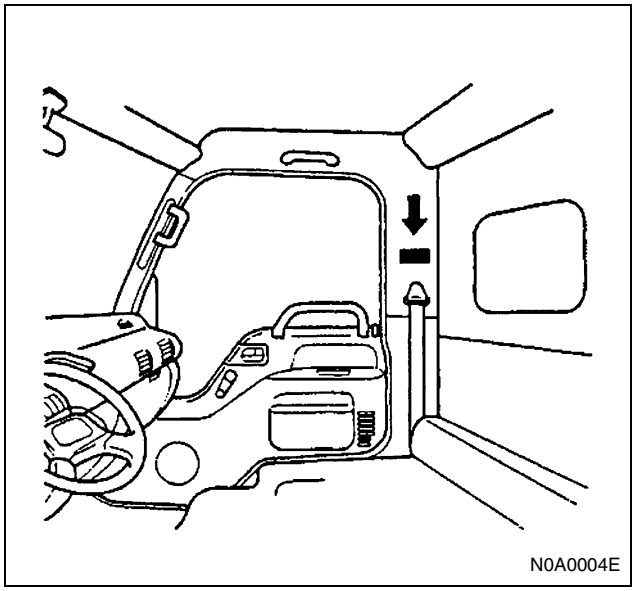
4H Series Engine

The engine number is stamped on the right side of the cylinder body.



Vehicle Identification Plate

The vehicle identification plate is attached to the interior side of the cab side panel on the right side.



LIFTING INSTRUCTION

Lifting Instruction

If it is necessary to use a lifting device other than the original equipment jack, see illustration for acceptable lifting points.
Lifting should only be done at the positions indicated to prevent possible damage to the vehicle.

Caution:
Failure to observe the acceptable lift points may result in unsatisfactory vehicle performance or a durability failure which may result in loss of control of the vehicle.

Garage Jack and Safety Stand

Lifting Point and Supportable Point Location

TORQUE SPECIFICATIONS

Standard Bolts

The torque values given in the following table should be applied where a particular torque is not specified.

N·m (kg·m / lb·ft)
N·m [kg·cm / lb·in]

Bolt Diameter × Pitch (mm)	Strength Class	4.8	8.8		9.8
			Refined	Non-Refined	
	Bolt Identification				
		No mark			M6×1.0	6 [60 / 52]		7 [75 / 69]		—
M8×1.25	13 [130 / 113]		18 [180 / 156]		24 [240 / 208]
M10×1.25	27 (2.8 / 20)		37 (3.8 / 27)		50 (5.1 / 37)
M12×1.25	61 (6.3 / 45)		76 (7.7 / 56)		95 (9.7 / 70)
M14×1.5	96 (9.8 / 71)		117 (11.9 / 86)		142 (14.5 / 105)
M16×1.5	130 (13.3 / 96)		170 (14.3 / 125)		200 (20.4 / 148)
M18×1.5	188 (19.2 / 139)		244 (24.9 / 180)		287 (29.3 / 212)
M20×1.5	258 (26.3 / 190)		337 (34.4 / 249)		396 (40.4 / 292)
M22×1.5	332 (33.9 / 245)		454 (46.3 / 335)		530 (54.1 / 391)
M24×2.0	449 (45.8 / 331)		538 (54.9 / 397)		692 (70.6 / 511)
*M10×1.5	26 (2.7 / 20)		36 (3.7 / 27)		48 (4.9 / 35)
*M12×1.5	57 (2.8 / 42)		71 (7.2 / 52)		89 (9.1 / 66)
*M14×2.0	89 (9.1 / 66)		110 (11.2 / 81)		133 (13.6 / 98)
*M16×2.0	124 (12.7 / 92)		162 (16.5 / 119)		191 (19.5 / 141)

N0A0023E

The asterisk * indicates that the bolts are used for female-threaded parts that are made of soft materials such as casting, etc.

Flare Nuts

N·m (kg·m / lb·ft)

Pipe diameter mm (in)	Torque	Pipe diameter mm (in)	Torque
4.76 (0.187)	16 (1.6 / 12)	10.00 (0.94)	54 (5.5 / 40)
6.35 (0.250)	26 (2.7 / 20)	12.00 (0.472)	88 (9.0 / 65)
8.00 (0.315)	44 (4.5 / 33)	15.00 (0.591)	106 (10.8 / 78)

RECOMMENDED LIQUID GASKET

Recommended Liquid Gasket

TYPE	BRAND NAME	MANUFACTURER	APPLICATION PARTS (EXAMPLE)
RTV*	ThreeBond 1207B	ThreeBond	Engine Oil Seal Retainer
Silicon	ThreeBond 1207C	ThreeBond	Engine Oil Pan
	ThreeBond 1215	ThreeBond	Timing Gear Case
	ThreeBond 1216	ThreeBond	Cylinder Head Cover
	ThreeBond 1281	ThreeBond	Fuel Pump
Water Base	ThreeBond 1141E	ThreeBond	Rear Axle
Solvent	ThreeBond 1104	ThreeBond	etc.
	BelcoBond 4	Isuzu	
	BelcoBond 401	Isuzu	
	BelcoBond 402	Isuzu	
Anaerobic	LOCTITE 515	LOCTITE	Engine Oil Seal Retainer
	LOCTITE 518	LOCTITE	Water Pump
			Transaxle
			etc.

*RTV: Room Temperature Vulcanizer

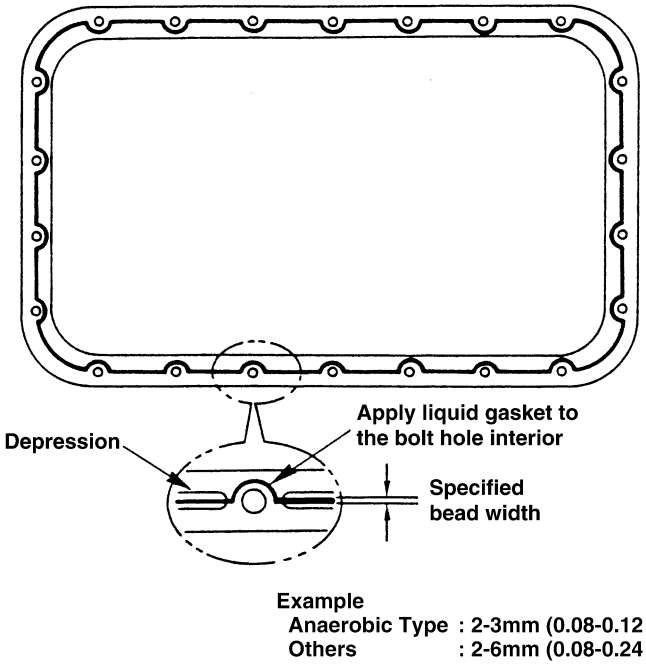
Notice:

1. It is very important that the liquid gaskets listed above or their exact equivalent be used on the vehicle.
2. LOCTITE 515 and LOCTITE 518 harden upon contact with a metal surface.
   Do not apply LOCTITE 515 or LOCTITE 518 between two metal surfaces having a clearance of greater than 0.25 mm (0.001 in). Poor adhesion will result.
3. Be careful to use the specified amount of liquid gasket.
   Follow the manufacturer’s instructions at all times.

Application Procedure

mm (in)

SCREW HOLE	DEPRESSION	JUDGE-MENT
1~3 (0.04~0.12)		OK
1~3 (0.04~0.12)	More than 2(0.08)	OK
		NG



N0A0014E

1. Completely remove lubricant and moisture from the connecting surfaces. The surfaces must be perfectly dry.
2. Apply specified bead width of liquid gasket to one of the connecting surfaces.

Notice:
When the application procedures are specified in this manual, follow them.

RECOMMENDED THREAD LOCKING AGENT

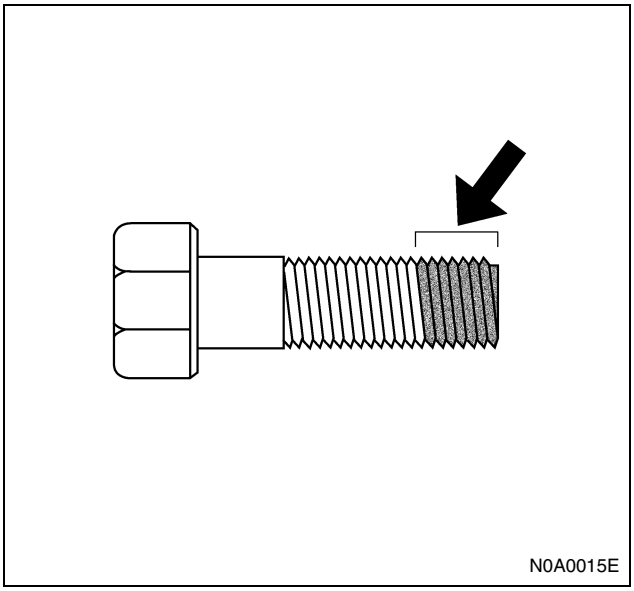
Notice:
When the application procedures are specified in this manual, follow them.

LOCTITE

TYPE	COLOR
LOCTITE 242	Blue
LOCTITE 262	Red
LOCTITE 271	Red

Application Steps

1. Completely remove all lubricant and moisture from the bolts and the female threaded surfaces of the parts to be joined.
   The surfaces must be perfectly dry.
2. Apply LOCTITE to the bolts.
   Apply LOCTITE to at least 1/3 of the bolt's threaded area.



3. Tighten the bolts to the specified torque.

Notice:
After tightening, be sure to keep the bolts free from vibration and torque for at least an hour until LOCTITE hardens.

MAINTENANCE SCHEDULE

When performing the checks on the following items, regular inspection items should also be checked.

Abbreviations

I :Inspect, clean and correct or replace as necessary
A : Adjust
R : Replace or change
T : Tighten to specified torque
L : Lubricate
[V] : Variation (optional on some models).
[OPT] : Optional equipment.
[SA] : For Smoother model only.
*Marks: Under severe driving conditions, more frequent maintenance is required. Refer to “Maintenance schedule under severe driving conditions”.

Maintenance Schedule: 4JH1-TC Engine Model (Engine Oil that Meets or Exceeds ACEA B3 Specification)

SERVICE INTERVAL: (Use odometer reading or months Whichever comes first)								
	× 1,000 km	20	40	60	80	100	120	
	× 1,000 mile	12	24	36	48	60	72	
ENGINE								
*Engine oil		R	R	R	R	R	R	Or every 9 months

(I): Inspect and correct or replace as necessary (A): Adjust (R): Replace or change (T): Tighten to specified torque (L): Lubricate

Maintenance Schedule under Severe Driving Conditions

Severe driving conditions
A : Repeated short trips
B : Driving on rough roads
C : Driving on dusty roads
D : Driving in extremely cold weather and/or on salted roads

Item	Interval	Condition				
		A	B	C	D	A+D
Engine oil	Change every 5,000 km (3,000 miles)			❍		❍
Engine oil filter	Replace every 5,000 km (3,000 miles)			❍		❍
Air cleaner element	Replace every 20,000 km (12,000 miles)			❍		
Exhaust pipes and mountings for looseness or damage	Inspect every 10,000 km (6,000 miles)	❍	❍		❍	
Manual transmission oil and differential gear oil	Change every 20,000 km (12,000 miles)		❍			
[SA] Smoother clutch fluid	Change every 20,000 km (12,000 miles)		❍			
Universal joints and sliding sleeve grease	Lubricate every 10,000 km (6,000 miles)		❍			
Kingpins	Lubricate every 5,000 km (3,000 miles)			❍	❍	
Steering system for looseness or damage	Inspect every 5,000 km (3,000 miles)		❍			
Brake linings and drums for wear	Inspect every 5,000 km (3,000 miles)	❍	❍	❍		
Disc brake pads and discs for wear	Inspect every 5,000 km (3,000 miles)	❍	❍	❍		

RECOMMENDED FLUIDS, LUBRICANTS AND DIESEL FUELS

Recommended Fluids, Lubricants and Diesel Fuels

In order to obtain maximum performance and longest service life from ISUZU vehicles, it is very important to select and use correctly best lubricants and diesel fuels.
When lubricating, be sure to use ISUZU genuine lubricants or recommended lubricants listed below, according to the maintenance schedule for each vehicle model.
The lubrication intervals in the maintenance schedule and the coverage and period of new vehicle warranty are based on the use of ISUZU genuine lubricants or recommended lubricants as given in the chart which will serve as a guide for selecting lubricants of proper brand name.

LUBRICATION	MAKER	BRAND/TYPE	GRADE		
			API	ACEA	JASO
Diesel engine crankcase	**ISUZU GENUINE**	**BESCO MULTI-Z TYPE CF-4 (10W-30)**	**CF-4**		
	ISUZU GENUINE	**BESCO S-3 (10W, 20W, 30, 40)**	**CD**		
	Caltex/Chevron	Delo CXJ (15W-40/20W-50/40)	CF		DH-1

GENERAL REPAIR INSTRUCTIONS

General Repair Instructions

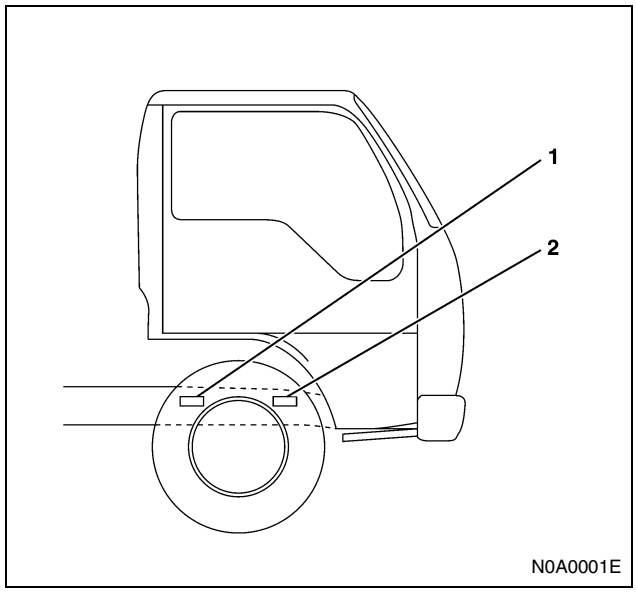
1. Park the vehicle on level ground and chock the front or rear wheels before lifting the vehicle.
2. Use covers on the vehicle body, seats, and floor to prevent damage and/or contaminations.
3. Disconnect the grounding cable from the battery before performing service operations. This will prevent cable damage or burning due to shortcircuiting.
4. Raise the vehicle with a jack set against the axle or the frame.
5. Support the vehicle on chassis stands.
6. Handle brake fluid and engine coolant with great care.
   Spilling these liquids on painted surfaces will damage the paint.
7. The use of the proper tool(s) and special tool(s) where specified is essential to efficient, reliable, and safe service operations.
8. Always use genuine ISUZU replacement parts.
9. Discard used cotter pins, gasket, O-rings, oil seals, lock washers, and self-locking nuts at disassembly.
   Normal function of these parts cannot be guaranteed if they are reused.
10. Keep the disassembled parts neatly in groups.
    This will facilitate smooth and correct reassembly.
11. Keep fixing nuts and bolts separate.
    Fixing nuts and bolts vary in hardness and design according to installation positions.
12. Clean all parts before inspection or reassembly.
13. Clean the oil ports and other openings with compressed air to make certain that they are free of dirt and obstructions.
14. Lubricate the rotating and sliding faces of all moving parts with oil or grease before installation.
15. Use the recommended liquid gasket to prevent leakage.
16. Be sure to tighten bolts and nuts to the specified torque, using a properly maintained torque wrench.
17. When service operation is completed, make a final check to be sure service has been done properly and problem has been corrected.
18. When removing or replacing parts that require refrigerant to the discharged from the Air conditioning system, be sure to use the ACR4 or equivalent to recover and recycle Refrigerant-134a, to promote the movement for the protection of the ozone layer covering the earth.
19. To assure safety, always slowly release air pressure from the air tanks before disconnecting pipes, hoses or other parts from any unit under pressure.

IDENTIFICATION

Chassis Number:

It is stamped on the front right-hand side face of the chassis side member.

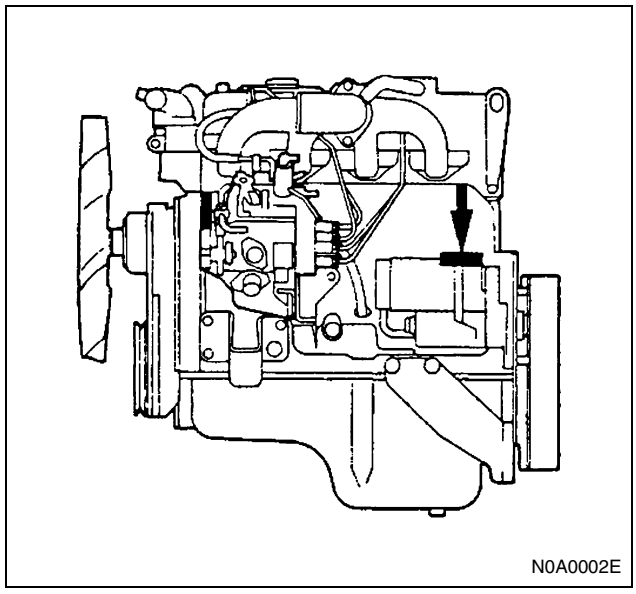
1. NKR models with independent front suspension
2. NHR, NKR, NPR, NQR and NPS models with rigid axle front suspension



Engine Number:

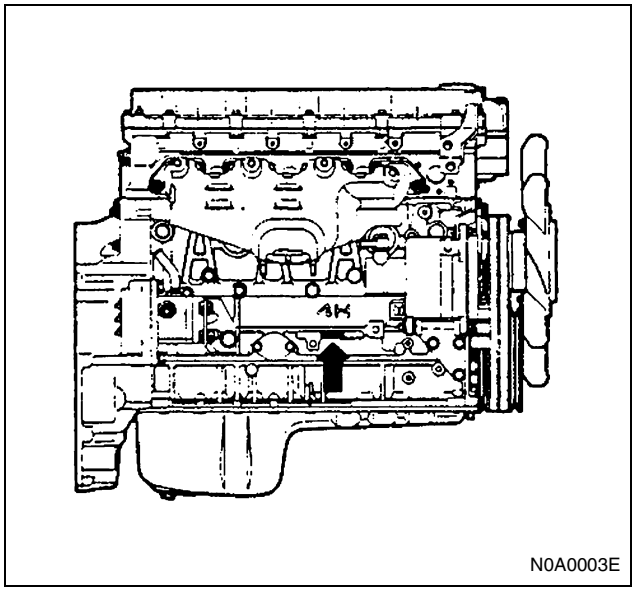
4J Series Engine

The engine number is stamped on the left side rear of the cylinder body.



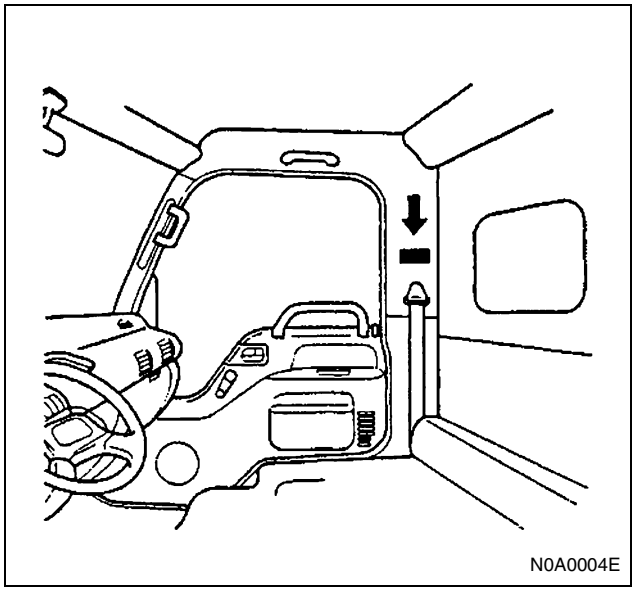
4H Series Engine

The engine number is stamped on the right side of the cylinder body.



Vehicle Identification Plate

The vehicle identification plate is attached to the interior side of the cab side panel on the right side.



LIFTING INSTRUCTION

Lifting Instruction

If it is necessary to use a lifting device other than the original equipment jack, see illustration for acceptable lifting points.
Lifting should only be done at the positions indicated to prevent possible damage to the vehicle.

Caution:
Failure to observe the acceptable lift points may result in unsatisfactory vehicle performance or a durability failure which may result in loss of control of the vehicle.

TORQUE SPECIFICATIONS

Standard Bolts

The torque values given in the following table should be applied where a particular torque is not specified.

N·m (kg·m / lb·ft)
N·m [kg·cm / lb·in]

Bolt Diameter × Pitch (mm)	Strength Class	4.8	8.8		9.8
			Refined	Non-Refined	
	Bolt Identification				
		No mark			M6×1.0	6 [60 / 52]		7 [75 / 69]		—
M8×1.25	13 [130 / 113]		18 [180 / 156]		24 [240 / 208]
M10×1.25	27 (2.8 / 20)		37 (3.8 / 27)		50 (5.1 / 37)
M12×1.25	61 (6.3 / 45)		76 (7.7 / 56)		95 (9.7 / 70)
M14×1.5	96 (9.8 / 71)		117 (11.9 / 86)		142 (14.5 / 105)
M16×1.5	130 (13.3 / 96)		170 (14.3 / 125)		200 (20.4 / 148)
M18×1.5	188 (19.2 / 139)		244 (24.9 / 180)		287 (29.3 / 212)
M20×1.5	258 (26.3 / 190)		337 (34.4 / 249)		396 (40.4 / 292)
M22×1.5	332 (33.9 / 245)		454 (46.3 / 335)		530 (54.1 / 391)
M24×2.0	449 (45.8 / 331)		538 (54.9 / 397)		692 (70.6 / 511)
*M10×1.5	26 (2.7 / 20)		36 (3.7 / 27)		48 (4.9 / 35)
*M12×1.5	57 (2.8 / 42)		71 (7.2 / 52)		89 (9.1 / 66)
*M14×2.0	89 (9.1 / 66)		110 (11.2 / 81)		133 (13.6 / 98)
*M16×2.0	124 (12.7 / 92)		162 (16.5 / 119)		191 (19.5 / 141)

N0A0023E

The asterisk * indicates that the bolts are used for female-threaded parts that are made of soft materials such as casting, etc.

Flare Nuts

N·m (kg·m / lb·ft)

Pipe diameter mm (in)	Torque	Pipe diameter mm (in)	Torque
4.76 (0.187)	16 (1.6 / 12)	10.00 (0.94)	54 (5.5 / 40)
6.35 (0.250)	26 (2.7 / 20)	12.00 (0.472)	88 (9.0 / 65)
8.00 (0.315)	44 (4.5 / 33)	15.00 (0.591)	106 (10.8 / 78)

RECOMMENDED LIQUID GASKET

Recommended Liquid Gasket

TYPE	BRAND NAME	MANUFACTURER	APPLICATION PARTS (EXAMPLE)
RTV*	ThreeBond 1207B	ThreeBond	Engine Oil Seal Retainer
Silicon	ThreeBond 1207C	ThreeBond	Engine Oil Pan
	ThreeBond 1215	ThreeBond	Timing Gear Case
	ThreeBond 1216	ThreeBond	Cylinder Head Cover
	ThreeBond 1281	ThreeBond	Fuel Pump
Water Base	ThreeBond 1141E	ThreeBond	Rear Axle
Solvent	ThreeBond 1104	ThreeBond	etc.
	BelcoBond 4	Isuzu	
	BelcoBond 401	Isuzu	
	BelcoBond 402	Isuzu	
Anaerobic	LOCTITE 515	LOCTITE	Engine Oil Seal Retainer
	LOCTITE 518	LOCTITE	Water Pump
			Transaxle
			etc.

*RTV: Room Temperature Vulcanizer

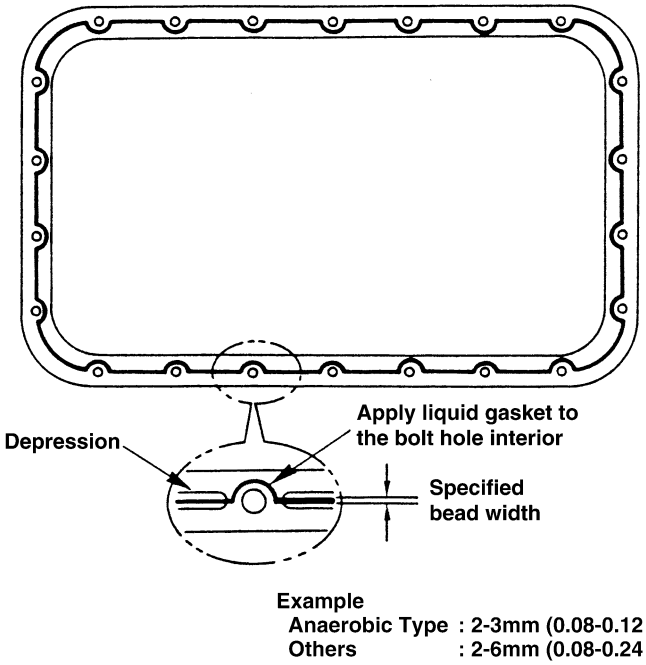
Notice:

1. It is very important that the liquid gaskets listed above or their exact equivalent be used on the vehicle.
2. LOCTITE 515 and LOCTITE 518 harden upon contact with a metal surface.
   Do not apply LOCTITE 515 or LOCTITE 518 between two metal surfaces having a clearance of greater than 0.25 mm (0.001 in). Poor adhesion will result.
3. Be careful to use the specified amount of liquid gasket.
   Follow the manufacturer’s instructions at all times.

Application Procedure

mm (in)

SCREW HOLE	DEPRESSION	JUDGE-MENT
1~3 (0.04~0.12)		OK
1~3 (0.04~0.12)	More than 2(0.08)	OK
		NG



N0A0014E

1. Completely remove lubricant and moisture from the connecting surfaces. The surfaces must be perfectly dry.
2. Apply specified bead width of liquid gasket to one of the connecting surfaces.

Notice:
When the application procedures are specified in this manual, follow them.

RECOMMENDED THREAD LOCKING AGENT

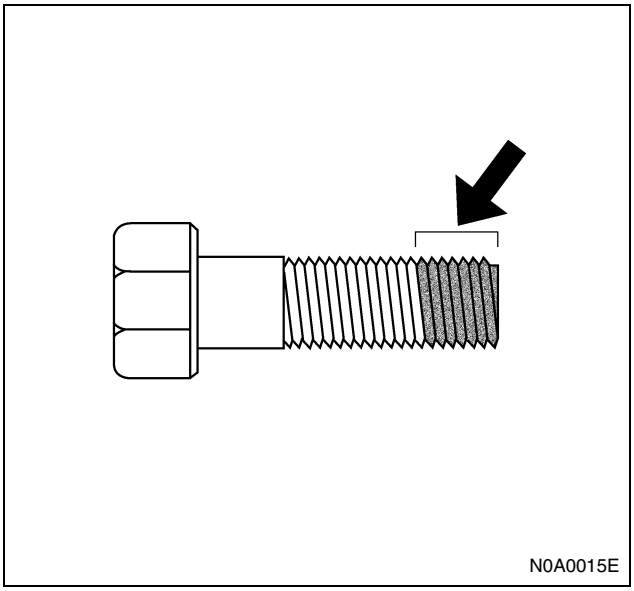
Notice:
When the application procedures are specified in this manual, follow them.

LOCTITE

TYPE	COLOR
LOCTITE 242	Blue
LOCTITE 262	Red
LOCTITE 271	Red

Application Steps

1. Completely remove all lubricant and moisture from the bolts and the female threaded surfaces of the parts to be joined.
   The surfaces must be perfectly dry.
2. Apply LOCTITE to the bolts.
   Apply LOCTITE to at least 1/3 of the bolt's threaded area.



3. Tighten the bolts to the specified torque.

Notice:
After tightening, be sure to keep the bolts free from vibration and torque for at least an hour until LOCTITE hardens.

NKR77 (Front Independent Suspension) Model (For Europe) 0B-47

MAINTENANCE SCHEDULE

For General Export

When performing the checks on the following items, regular inspection items should also be checked.

Abbreviations

I : Inspect, clean and correct or replace as necessary
A : Adjust
R : Replace or change
T : Tighten to specified torque
L : Lubricate
[V] : Variation (optional on some models).
[OPT] : Optional equipment.
[4JG] : For 4JG2 engine model.
[4JH] : For 4JH1-TC engine model.
[4J] : For 4J engine models.
[4HF1-2] : For 4HF1-2 engine model.
[4HK1-TC] : For 4HK1-TC engine model.
[4H] : For 4H engine model.
[MT] : For manual transmission model only.
[SA] : For Smoother model only.
*Marks: Under severe driving conditions, more frequent maintenance is required. Refer to “Maintenance schedule under severe driving conditions”.

Maintenance Schedule

Use odometer reading or months whichever comes first

SERVICE INTERVAL:	× 1,000 km	1	5	10	15	20	25	30	35	40	45	50	55	60	65	70	75	80	85	90	95	100

Maintenance Schedule under Severe Driving Conditions

Severe driving conditions
A : Repeated short trips
B : Driving on rough roads
C : Driving on dusty roads
D : Driving extremely cold weather and/or on salted roads

Item	Interval	Condition				
		A	B	C	D	A+D
[4JB] [4JG] Engine oil	Change every 2,500 km (1,500 miles)			❍		❍
[4H] Engine oil	Change every 5,000 km (3,000 miles)			❍		❍
[4JB] [4JG] [4H] Engine oil filter	Replace every 5,000 km (3,000 miles)			❍		❍
Exhaust pipes and mounting	Inspect every 10,000 km (6,000 miles)	❍	❍		❍	
Air cleaner element	Replace every 20,000 km (12,000 miles)			❍		
Steering system for looseness or damage	Inspect every 5,000 km (3,000 miles)		❍			
Universal joints and sliding sleeve grease	Lubricate every 10,000 km (6,000 miles)		❍			
Manual transmission and differential gear oil	Change every 20,000 km (12,000 miles)		❍			
[SA] Smoother clutch fluid	Change every 20,000 km (12,000 miles)		❍			
Brake lining and drum for wear	Inspect every 10,000 km (6,000 miles)	❍	❍	❍		
Disc brake pads and discs for wear	Inspect every 5,000 km (3,000 miles)	❍	❍	❍		
[4JH] Engine oil	Change every 7,500 km (4,500 miles)			❍		❍

Item	Interval	Condition				
		A	B	C	D	A+D
[4JH] Engine oil filter	Replace every 7,500 km (4,500 miles)			❍		❍
[4JH] Air cleaner element	Replace every 10,000 km (6,000 miles)			❍		

For Australia and Taiwan

When performing the checks on the following items, regular inspection items should also be checked.

Abbreviations

I :Inspect, clean and correct or replace as necessary
A : Adjust
R : Replace or change
T : Tighten to specified torque
L : Lubricate
[V] : Variation (optional on some models).
[OPT] : Optional equipment.
[SA] : For Smoother model only.
*Marks: Under severe driving conditions, more frequent maintenance is required. Refer to “Maintenance schedule under severe driving conditions”.

Maintenance Schedule: 4JH1-TC Engine Model (ACEA B2 Specification Engine Oil)

SERVICE INTERVAL: (Use odometer reading or months Whichever comes first)												
	× 1,000 km	10	20	30	40	50	60	70	80	90	100

CLUTCH												
Clutch fluid		I	I	I	R	I	I	I	R	I	I	or every 24 months
Clutch pedal travel and free play		I	I	I	I	I	I	I	I	I	I	or every 6 months
TRANSMISSION												
*Manual transmission oil		I	I	I	R	I	I	I	R	I	I	or every 24 months
Gear control mechanism for looseness		—	—	—	I	—	—	—	I	—	—	or every 24 months
Gear control cables		—	A	—	A	—	A	—	A	—	A	or every 12 months
PROPELLER SHAFT												
*Universal joints and sliding sleeve grease		—	L	—	L	—	L	—	L	—	L	or every 12 months

SERVICE INTERVAL: (Use odometer reading or months Whichever comes first)												
	× 1,000 km	10	20	30	40	50	60	70	80	90	100	
	× 1,000 mile	6	12	18	24	30	36	42	48	54	60	
Loose connections		I	I	I	I	I	I	I	I	I	I	or every 6 months
Splines for excessive wear		—	—	—	I	—	—	—	I	—	—	or every 24months
Bearings and related parts for looseness		—	—	—	I	—	—	—	I	—	—	or every 24 months
Center bearing		—	L	—	L	—	L	—	L	—	L	or every 12 months
REAR AXLE												
*Differential gear oil		I	I	I	R	I	I	I	R	I	I	or every 24 months
FRONT AXLE												
*Kingpins		L	L	L	L	L	L	L	L	L	L	or every 6 months
STEERING												
Power steering system oil leakage		I	I	I	I	I	I	I	I	I	I	or every 6 months
Power steering system for looseness or damage		I	I	I	I	I	I	I	I	I	I	or every 6 months
Power steering fluid		—	—	—	R	—	—	—	R	—	—	or every 24 months
Power steering hoses		—	—	—	—	—	—	—	R	—	—	or every 48 months
Fitting of knuckles and front axle for looseness		I	I	I	I	I	I	I	I	I	I	or every 6 months
Steering mechanism for looseness or damage		—	—	—	I	—	—	—	I	—	—	or every 24 months
Ball joints for damage (Independent suspension model only)		I	I	I	I	I	I	I	I	I	I	or every 6 months
Ball joints for excessive play (Independent suspension model only)		I	I	I	I	I	I	I	I	I	I	or every 6 months
Relay lever shaft for excessive play (Independent suspension model only)		I	I	I	I	I	I	I	I	I	I	or every 6 months
Steering wheel play		I	I	I	I	I	I	I	I	I	I	or every 6 months
Steering function		I	I	I	I	I	I	I	I	I	I	or every 6 months
Wheel alignment		—	—	—	I	—	—	—	I	—	—	or every 24 months
SERVICE BRAKES												
Brake fluid		I	I	I	R	I	I	I	R	I	I	or every 24 months
Brake system for fluid leakage		I	I	I	I	I	I	I	I	I	I	or every 6 months
*Brake linings and drums for wear		I	I	I	I	I	I	I	I	I	I	or every 6 months
*Disc brake pads and discs for wear		I	I	I	I	I	I	I	I	I	I	or every 6 months
Brake pedal travel and free play		I	I	I	I	I	I	I	I	I	I	or every 6 months
Pipes and hoses for loose connections or damage		I	I	I	I	I	I	I	I	I	I	or every 6 months

SERVICE INTERVAL: (Use odometer reading or months Whichever comes first)	× 1,000 km	10	20	30	40	50	60	70	80	90	100	
	× 1,000 mile	6	12	18	24	30	36	42	48	54	60	
PARKING BRAKE												
Parking brake cables		I	I	I	I	I	I	I	I	I	I	or every 6 months
Parking brake function		I	I	I	I	I	I	I	I	I	I	or every 6 months
Parking brake lever travel		I	I	I	I	I	I	I	I	I	I	or every 6 months
Linings for wear		—	—	—	I	—	—	—	I	—	—	or every 24 months
Drum for wear or damage		—	—	—	I	—	—	—	I	—	—	or every 24 months
Ratchet for wear or damage		—	—	—	I	—	—	—	I	—	—	or every 24 months
SUSPENSION												
Spring leaves for damage		I	I	I	I	I	I	I	I	I	I	or every 6 months
Torsion bar spring (Independent suspension model only)		I	I	I	I	I	I	I	I	I	I	or every 6 months
Ball joint boots for damage (Independent suspension model only)		I	I	I	I	I	I	I	I	I	I	or every 6 months
Ball joints for excessive play (Independent suspension model only)		—	—	—	I	—	—	—	I	—	—	or every 24 months
Mounts for looseness or damage		I	I	I	I	I	I	I	I	I	I	or every 6 months
Shock absorbers for oil leakage		I	I	I	I	I	I	I	I	I	I	or every 6 months
Shock absorbers mount for looseness		I	I	I	I	I	I	I	I	I	I	or every 6 months
Upper links (Independent suspension model only)		L	L	L	L	L	L	L	L	L	L	or every 6 months
WHEELS												
Wheel pins and nuts		—	T	—	T	—	T	—	T	—	T	or every 12 months
Wheel discs for damage		—	I	—	I	—	I	—	I	—	I	or every 12 months
Hub bearings grease		—	—	—	R	—	—	—	R	—	—	or every 24 months
Tire pressures and damage		I	I	I	I	I	I	I	I	I	I	or every 6 months
ELECTRICAL EQUIPMENT												
Specific gravity of battery electrolyte		I	I	I	I	I	I	I	I	I	I	or every 6 months
OTHERS												
Lights, horn, windshield, wiper and washers		I	I	I	I	I	I	I	I	I	I	or every 6 months
Bolts and nuts on chassis and body		—	—	—	I	—	—	—	I	—	—	or every 24 months

(I): Inspect and correct or replace as necessary (A): Adjust (R): Replace or change (T): Tighten to specified torque (L): Lubricate

Power steering hoses		—	—	—	—	—	—	—	R	or every 56 months
Fitting of knuckles and front axle for looseness		I	I	I	I	I	I	I	I	or every 7 months
Steering mechanism for looseness or damage		—	—	—	I	—	—	—	I	or every 28 months
Steering wheel play		I	I	I	I	I	I	I	I	or every 7 months
Steering function		I	I	I	I	I	I	I	I	or every 7 months
Wheel alignment		—	—	—	I	—	—	—	I	or every 28 months
SERVICE BRAKES										
Brake fluid		I	I	I	R	I	I	I	R	or every 28 months
[V] Hydro booster fluid (ATF)		I	I	I	R	I	I	I	R	or every 28 months
Brake system for fluid leakage		I	I	I	I	I	I	I	I	or every 7 months
*Brake linings and drums for wear		I	I	I	I	I	I	I	I	or every 7 months
*Disc brake pads and discs for wear		I	I	I	I	I	I	I	I	or every 7 months
Brake pedal travel and free play		I	I	I	I	I	I	I	I	or every 7 months
Pipes and hoses for loose connections or damage		I	I	I	I	I	I	I	I	or every 7 months
PARKING BRAKE										
Parking brake cables		I	I	I	I	I	I	I	I	or every 7 months

SERVICE INTERVAL: (Use odometer reading or months Whichever comes first)	km	11250	22500	33750	45000	56250	67500	78750	90000	
	mile	7000	14000	21000	28000	35000	42000	49000	56000	
Parking brake function		I	I	I	I	I	I	I	I	or every 7 months
Parking brake lever travel		I	I	I	I	I	I	I	I	or every 7 months
Linings for wear		—	—	—	I	—	—	—	I	or every 28 months
Drum for wear or damage		—	—	—	I	—	—	—	I	or every 28 months
Ratchet for wear or damage		—	—	—	I	—	—	—	I	or every 28 months
SUSPENSION										
Spring leaves for damage		I	I	I	I	I	I	I	I	or every 7 months
Mounts for looseness or damage		I	I	I	I	I	I	I	I	or every 7 months
Shock absorbers for oil leakage		I	I	I	I	I	I	I	I	or every 7 months
Shock absorbers mount for looseness		I	I	I	I	I	I	I	I	or every 7 months
WHEELS										
Wheel pins and nuts		T	T	T	T	T	T	T	T	or every 7 months
Wheel discs for damage		I	I	I	I	I	I	I	I	or every 7 months
Hub bearings grease		—	—	—	R	—	—	—	R	or every 28 months
Tire pressures and damage		I	I	I	I	I	I	I	I	or every 7 months
ELECTRICAL EQUIPMENT										
Specific gravity of battery electrolyte		I	I	I	I	I	I	I	I	or every 7 months
OTHERS										
Lights, horn, windshield, wiper and washers		I	I	I	I	I	I	I	I	or every 7 months
Bolts and nuts on chassis and body		—	—	—	I	—	—	—	I	or every 28 months

(I): Inspect and correct or replace as necessary (A): Adjust (R): Replace or change (T): Tighten to specified torque (L): Lubricate

Maintenance Schedule under Severe Driving Conditions

Severe driving conditions
A : Repeated short trips
B : Driving on rough roads
C : Driving on dusty roads
D : Driving in extremely cold weather and/or on salted roads

Item	Interval	Condition				
		A	B	C	D	A+D
Engine oil	Change every 5,000 km (3,000 miles)			❍		❍
Engine oil filter	Replace every 5,000 km (3,000 miles)			❍		❍
Air cleaner element	Replace every 20,000 km (12,000 miles)			❍		
Exhaust pipes and mountings for looseness or damage	Inspect every 10,000 km (6,000 miles)	❍	❍		❍	
Manual transmission oil and differential gear oil	Change every 20,000 km (12,000 miles)		❍			
[SA] Smoother clutch fluid	Change every 20,000 km (12,000 miles)		❍			
Universal joints and sliding sleeve grease	Lubricate every 10,000 km (6,000 miles)		❍			
Kingpins	Lubricate every 5,000 km (3,000 miles)			❍	❍	
Steering system for looseness or damage	Inspect every 5,000 km (3,000 miles)		❍			
Brake linings and drums for wear	Inspect every 5,000 km (3,000 miles)	❍	❍	❍		
Disc brake pads and discs for wear	Inspect every 5,000 km (3,000 miles)	❍	❍	❍		

For Europe

When performing the checks on the following items, regular inspection items should also be checked.

Abbreviations

I :Inspect, clean and correct or replace as necessary
A : Adjust
R : Replace or change
T : Tighten to specified torque
L : Lubricate
[V] : Variation (optional on some models).
[OPT] : Optional equipment.
[SA] : For Smoother model only.
*Marks: Under severe driving conditions, more frequent maintenance is required. Refer to “Maintenance schedule under severe driving conditions”.

Maintenance Schedule: 4JH1-TC Engine Model (Engine Oil that Meets or Exceeds ACEA B3 Specification)

SERVICE INTERVAL: (Use odometer reading or months Whichever comes first)	× 1,000 km	20	40	60	80	100	120	
	× 1,000 mile	12	24	36	48	60	72	
ENGINE								
*Engine oil		R	R	R	R	R	R	Or every 9 months
*Engine oil filter		R	R	R	R	R	R	Or every 9 months
Fuel filter		R	R	R	R	R	R	Or every 18 months
*Air cleaner element		I	I	R	I	I	R	Or every 36 months
Idling speed and acceleration		—	I	—	I	—	I	Or every 18 months
Valve clearances		—	—	A	—	—	A	Or every 36 months
Fuel tank cap and fuel pipes for loose connections or damage		—	—	I	—	—	I	Or every 36 months
Drive belt tension and damage		I	I	I	I	I	I	Or every 9 months
Radiator coolant		—	—	R	—	—	R	Or every 36 months
*Exhaust pipes and mountings for looseness or damage		—	I	—	I	—	I	Or every 18 months
Cooling system for water leakage		—	I	—	I	—	I	Or every 18 months
Engine operation condition		I	I	I	I	I	I	Or every 9 months
CLUTCH								
Clutch fluid		I	I	R	I	I	R	Or every 24 months
Clutch pedal travel and free play		I	I	I	I	I	I	Or every 6 months
TRANSMISSION								
*Manual transmission oil		I	I	R	I	I	R	Or every 24 months
Gear control mechanism for looseness		—	—	I	—	—	I	Or every 24 months
Gear control cables		—	A	—	A	—	A	Or every 12 months
PROPELLER SHAFT								
*Universal joints and sliding sleeve grease		L	L	L	L	L	L	Or every 12 months

SERVICE INTERVAL: (Use odometer reading or months Whichever comes first)	× 1,000 km	20	40	60	80	100	120	
	× 1,000 mile	12	24	36	48	60	72	
Loose connections		I	I	I	I	I	I	Or every 6 months
Splines for excessive wear		—	—	I	—	—	I	Or every 24 months
Bearings and related parts for looseness		—	—	I	—	—	I	Or every 24 months
Center bearing		L	L	L	L	L	L	Or every 12 months
REAR AXLE								
*Differential gear oil		I	I	R	I	I	R	Or every 24 months
FRONT AXLE								
*Kingpins		L	L	L	L	L	L	Or every 9 months
STEERING								
Power steering system oil leakage		I	I	I	I	I	I	Or every 9 months

Disc brake pads and discs for wear	Inspect every 5,000 km (3,000 miles)	❍	❍	❍		

RECOMMENDED FLUIDS, LUBRICANTS AND DIESEL FUELS

Recommended Fluids, Lubricants and Diesel Fuels

In order to obtain maximum performance and longest service life from ISUZU vehicles, it is very important to select and use correctly best lubricants and diesel fuels.
When lubricating, be sure to use ISUZU genuine lubricants or recommended lubricants listed below, according to the maintenance schedule for each vehicle model.
The lubrication intervals in the maintenance schedule and the coverage and period of new vehicle warranty are based on the use of ISUZU genuine lubricants or recommended lubricants as given in the chart which will serve as a guide for selecting lubricants of proper brand name.

LUBRICATION	MAKER	BRAND/TYPE	GRADE		
			API	ACEA	JASO
Diesel engine crankcase	**ISUZU GENUINE**	**BESCO MULTI-Z TYPE CF-4 (10W-30)**	**CF-4**

TROUBLESHOOTING

Heating Cycle Troubleshooting

TROUBLE	POSSIBLE CAUSE	CORRECTION
No heating or Insufficient heating.	1. Blower motor does not run, or runs improperly. 2. Engine coolant temperature is low. 3. Insufficient engine coolant. 4. Circulation volume of engine coolant is insufficient. 5. Heater core clogged or collapsed. 6. The heater core is not provided with air sent from the blower motor. 7. Duct connections defective or unsealing.	• Refer to “Fan Switch Troubleshooting”. • Check the engine coolant temperature after warming up the engine and check the thermostat. Replace as necessary. • Add engine coolant as required. • Check if the water hose to the heater core is clogged, collapsed or twisted. Repair or replace as necessary. • Check water pump function. Repair or replace as necessary. • Clean or replace as necessary. • Repair the temperature control link unit or mode doors. • Repair or adjust the control cables. • Repair or replace as necessary.
Control knob moves but mode door does not operate.	1. Cable attaching clip is not correct. 2. Link unit of heater unit or blower assembly defective.	• Repair. • Repair.
The mode door cannot be set to the mode selected.	1. Link unit of heater unit or blower assembly defective. 2. Control cable is not adjusted.	• Repair. • Adjust.

Fan Switch Troubleshooting

Current flows to the blower motor through the heater & A/C relay X-12 to activate the rotation of the blower motor by turning “ON” the fan switch.
Blower motor speed is controlled in stages by the resistor, by operating the switch from “LOW” to “HIGH.”

Air Conditioning Cycle Troubleshooting

TROUBLE	POSSIBLE CAUSE	CORRECTION
No cooling or insufficient cooling	1. Magnetic clutch does not run	• Refer to “MAGNETIC CLUTCH TROUBLESHOOTING”
	2. Compressor is not rotating property	
	• Drive belt loosened or broken	• Adjust the drive belt to the specified tension or replace the drive belt
	• Magnetic clutch face is not clean and slips	• Clean the magnetic clutch face or replace
	• Incorrect clearance between magnetic drive plate and pulley	• Adjust the clearance (Refer to Section 1D “COMPRESSOR OVERHAUL”)
	• Compressor oil leaks from shaft seal or shell	• Replace the compressor
	• Compressor seized	• Replace the compressor
	3. Insufficient or excessive charge of refrigerant	• Discharge and recover refrigerant. Recharge to specified amount.
	4. Leaks in the refrigerant system	• Check refrigerant system for leaks and repair as necessary. Discharge and recover refrigerant. Recharge to specified amount.
	5. Condenser clogged or insufficient radiation	• Clean the condenser or replace as necessary
		• Check radiator or condenser fan function
	6. Temperature control link unit of the heater unit defective	• Repair the link unit
	7. Unsteady operation due to foreign substance in expansion valve	• Replace the expansion valve
	8. Poor operation of electronic thermostat	• Check electronic thermostat and replace as necessary
Insufficient velocity of cooling air	1. Evaporator clogged or frosted	• Check evaporator core and replace or clean the core
	2. Air leaking from cooling unit or air duct	• Check evaporator and duct connection, then repair as necessary
	3. Blower motor does not rotate properly	• Refer to “FAN SWITCH TROUBLESHOOTING”

* For the execution of the charging and discharging operation in the table above, refer to the “RECOVERY, RECYCLING, EVACUATION AND CHARGING” in section 1B.

Checking Refrigerant System with Manifold Gauge

Conditions;

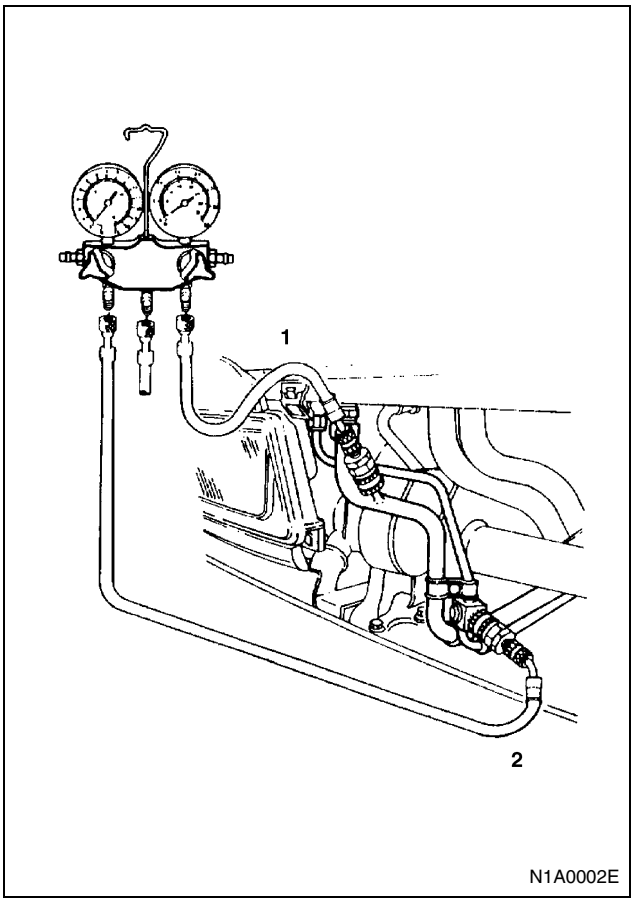
- Ambient temperature at approx. 30 — 35°C (86 — 95°F)
- Run the engine at 1,500 rpm
- A/C switch is “ON”
- Run the blower motor at “4” (high) position
- Temperature control lever sets at “MAX COLD”
- Air source selector lever at “CIRC”
- Open then the all doors and engine hood

Normal pressures kPa (kg·cm^2/PSI)

- Low-pressure side: Approx. 127 — 245 (1.3 — 2.5/ 18 — 36)
- High-pressure side: Approx. 1373 — 1667 (14 — 17/199 — 242)

Connect the manifold gauge

Low-pressure hose (LOW) - Suction side (1)
High-pressure hose (HI) - Discharge side (2)



Legend

1. Low side
2. High side

Caution:

Vehicles that use Refrigerant-134a (R-134a) is used in the air conditioning system, be sure to use manifold gauges, charging hoses and other air conditioning service tools for R-134a when checking the refrigerant system. (Refer to “ON VEHICLE SERVICE” for Precautions for R-134a Air Conditioning System in section 1B.)

RESULT	SYMPTOM	TROUBLE CAUSE	CORRECTION
Discharge (High) pressure gauge abnormally high	Reduced or no air flow through the condenser	• Condenser clogged or dirty • Radiator (condenser) fan does not operate properly	• Clean • Check cooling fan operation
	No bubbles in sight glass when condenser is cooled by water (Insufficient cooling)	• Excessive refrigerant in system	• Check sight glass. (See “Reading Sight Glass”) • Discharge and recover refrigerant. Recharge to specified amount
	After stopping air conditioning, pressure drops approx. 196 kPa (2.0 kg·cm^2/28 PSI) quickly	• Air in system	• Evacuate and charge refrigerant system
Discharge (High) pressure gauge abnormally low	Insufficient cooling and excessive bubbles in the sight glass	• Insufficient refrigerant in system	• Check sight glass. (See “Reading Sight Glass”) • Check for leaks • Discharge and recover refrigerant. Recharge to specified amount
	Low pressure gauge indicates vacuum	• Clogged or defective expansion valve	• Replace the expansion valve
	Frost or dew on refrigerant line before and after receiver/ drier or expansion valve, and low pressure gauge indicates vacuum	• Restriction caused by debris or moisture in receiver/ drier	• Check system for restriction and replace receiver/drier
	After turning off air conditioning, high and low pressure gauge balanced quickly	• Compressor seal defective • Poor compression due to defective compressor gasket	• Replace or repair compressor
Suction (Low) pressure gauge abnormally high	Low pressure gauge is lowered after condenser is cooled by water	• Excessive refrigerant in system	• Discharge and recover refrigerant Recharge to specified amount
	Low pressure hose temperature around the compressor refrigerant line connector is lower than around evaporator	• Unsatisfactory valve operation due to defective temperature sensor of expansion valve • Expansion valve opens too long	• Replace the expansion valve
	After turning off air conditioning, high and low pressure gauge is balanced quickly	• Compressor gasket is defective	• Replace
	Air conditioning turns off before passenger compartment is sufficiently cool	• Electronic thermostat defective	• Check the electronic thermostat and replace as necessary

* For the charging and discharging operations in the table above, refer to “RECOVERY, RECYCLING, EVACUATION AND CHARGING” in section 1B.

RESULT	SYMPTOM	TROUBLE CAUSE	CORRECTION
Suction (Low) pressure abnormally low	Condenser is not hot and excessive bubble in sight glass	• Insufficient refrigerant	• Check sight glass. (See “Reading Sight Glass”) • Check for leaks • Discharge and recover refrigerant. Recharge to specified amount
	Frost on the expansion valve inlet line	• Expansion valve clogged	• Replace the expansion valve
	A distinct difference in temperature between the inlet and outlet refrigerant lines of the receiver/drier	• Receiver/drier clogged	• Replace the receiver/drier
	Expansion valve outlet refrigerant line is not cold and low-pressure gauge indicates vacuum	• The temperature sensor of the expansion valve is defective, and the valve cannot regulate the correct flow of the refrigerant	• Replace the expansion valve
	Discharge temperature is low and air flow from vents is restricted	• Frozen evaporator core fins	• Check electronic thermostat and replace as necessary
	Low-pressure gauge reading is low, or a vacuum reading may be shown	• Clogged or blocked refrigerant line	• Replace refrigerant line
Suction (Low) and Discharge (High) pressure abnormally high	No bubbles in sight glass after condenser is cooled by water (Insufficient cooling)	• Excessive refrigerant in system	• Check sight glass. (See “Reading Sight Glass”) • Discharge and recover refrigerant. Recharge to specified amount
	Reduce air flow through condenser	• Condenser clogged • Radiator (condenser) fan does not rotate properly	• Clean • Check cooling fan operation
	Suction (Low) pressure hose is not cold	• Air in system	• Evacuate and charge refrigerant
Suction (Low) and Discharge (High) pressure abnormally low	Insufficient cooling and excessive bubbles in the sight glass	• Insufficient refrigerant in system	• Check sight glass. (See “Reading Sight Glass”) • Check for leaks • Discharge and recover refrigerant. Recharge to specified amount

Magnetic Clutch Troubleshooting

The air conditioning is made up of the evaporator, condenser, electronic thermostat, A/C switch, fan switch and relays.

The air conditioning starts its operation when both the A/C switch and the fan switch are turned on and the magnetic clutch gets engaged through the A/C thermo relay while the engine is running. And it stops when either A/C switch or fan switch is turned off.

In addition to these switches, the air conditioning is also stopped by turning off the magnetic clutch temporarily under the predetermined condition when the abnormal refrigerant pressure is sensed by pressure switch, or when the air temperature is sensed by electronic thermostat that prevents the evaporator core from freezing.

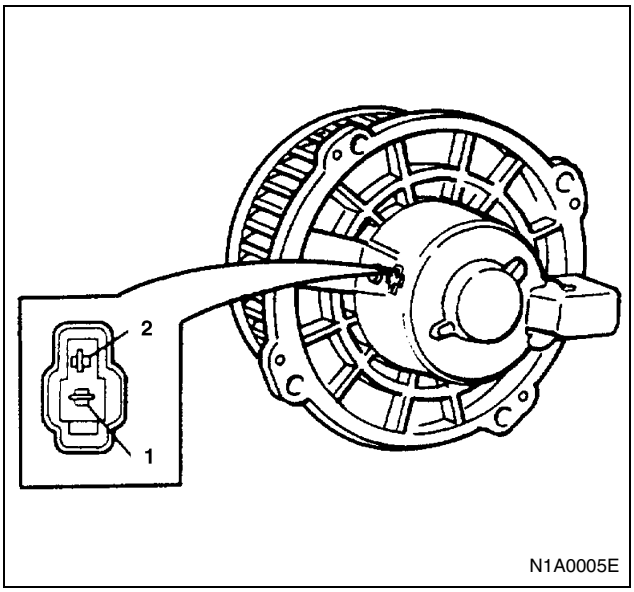
Compressor Troubleshooting

ITEM	TROUBLE	POSSIBLE CAUSE	CORRECTION
1	Noise from compressor	1. Defective Piston 2. Defective bearing 3. Defective shaft	Replace cylinder and shaft assembly Replace cylinder and shaft assembly Replace cylinder and shaft assembly
2	Noise from magnetic clutch face	1. Defective bearing 2. Defective clutch 3. Clearance between drive plate and pulley is not standard	Replace magnetic clutch Replace magnetic clutch Adjust the clearance or replace magnetic clutch
3	Insufficient cooling	1. Defective gasket 2. Defective reed valve 3. Defective suction valve	Replace gasket Replace valve plate Replace suction valve
4	Not rotating	1. Defective piston 2. Defective shaft 3. Rotating parts seized due to insufficient oil	Replace cylinder and shaft assembly Replace cylinder and shaft assembly Replace compressor
5	Oil and/or gas leakage	1. Defective seal 2. Defective O-ring	Replace shaft seal Replace

Individual Inspection

Blower Motor

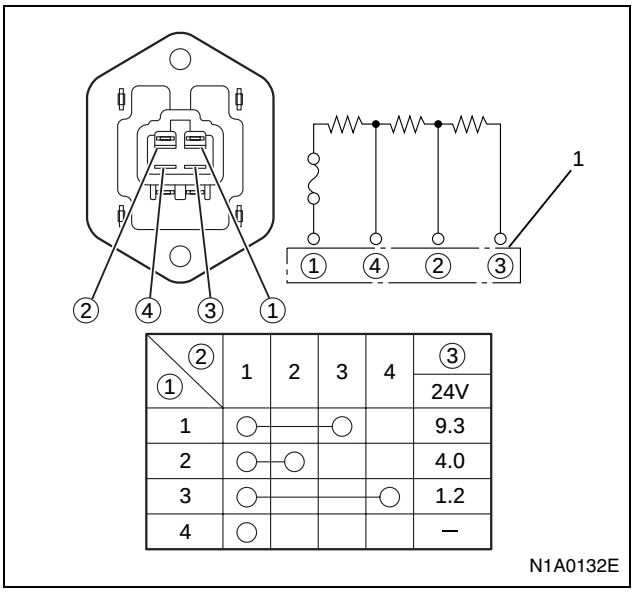
1. Disconnect the blower motor connector from the blower motor.
2. Connect the battery positive terminal to the No. 1 (No. 2; RHD) terminal of the blower motor and negative to the No. 2 (No. 1, RHD).
3. Be sure to check to see if the blower motor operates correctly.



Resistor

1. Disconnect resistor connector.
2. Check for continuity and resistance between the terminals of the resistor.

Except Taiwan

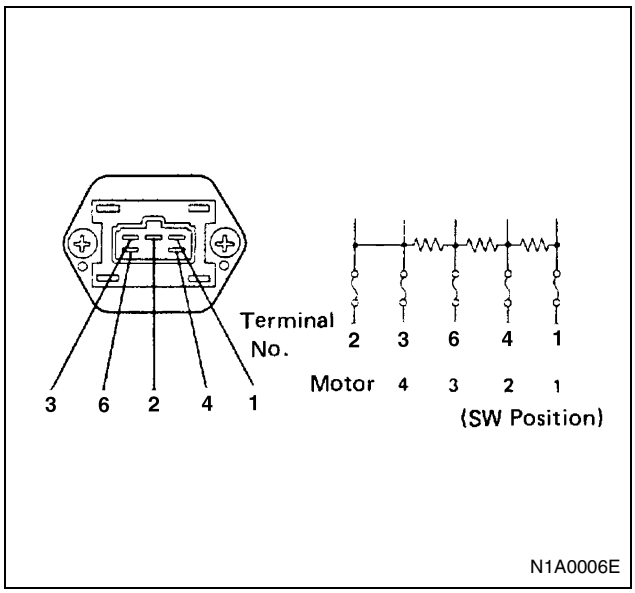


② / ①	1	2	3	4	③ 24V
1	○		○		9.3
2	○	○			4.0
3	○			○	1.2
4	○				–

Legend

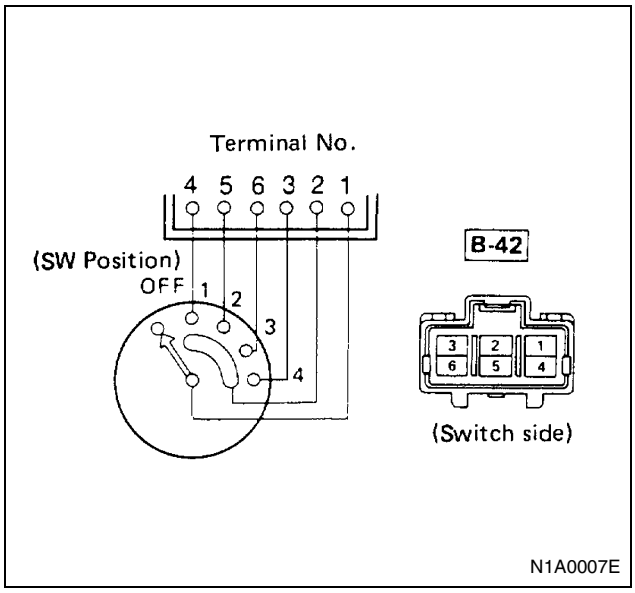
1. SW position
2. Terminal No.
3. Resistance value

For Taiwan



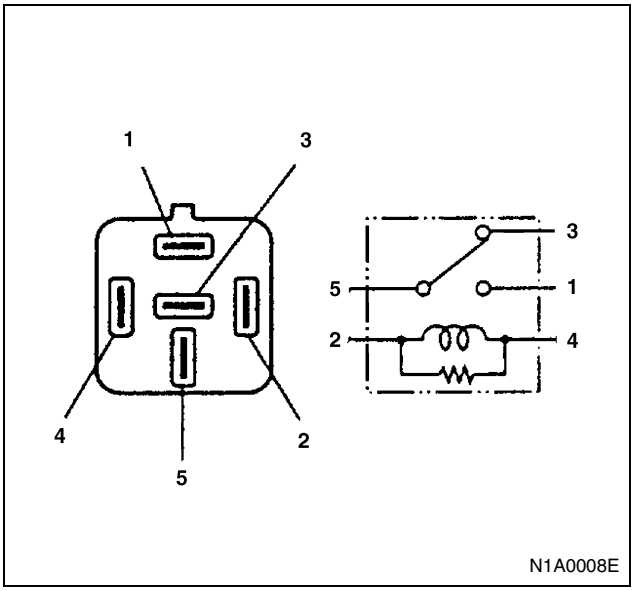
Fan Switch

Check for continuity between fan switch and A/C switch side connector terminals.



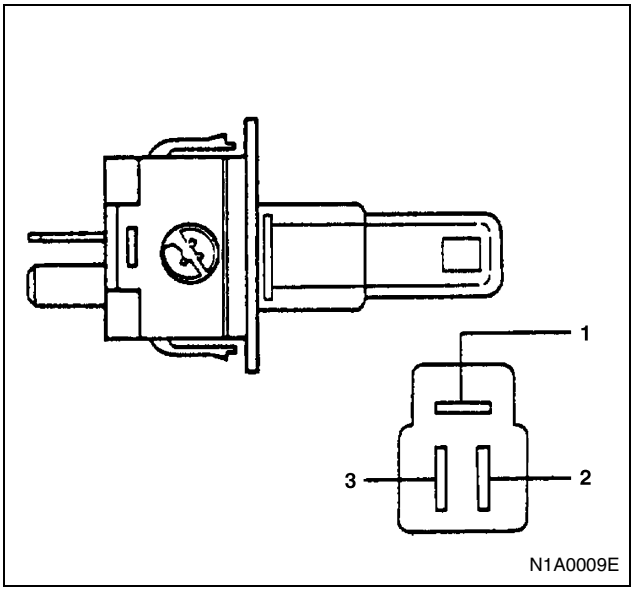
Heater & A/C and A/C Thermo Relay

Check for continuity between relay side connector terminal.
3 — 5 --- Continuity
1 — 5 --- No Continuity
When battery voltage is applied between 2 — 4
3 — 5 --- No Continuity
1 — 5 --- Continuity



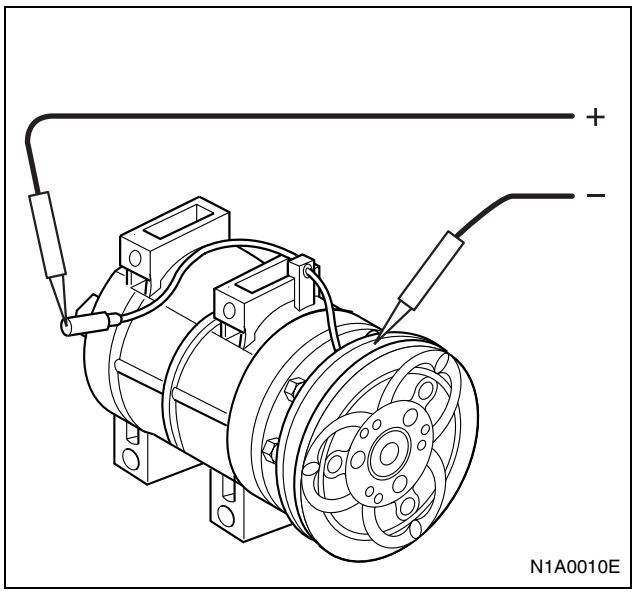
A/C Switch

Check for continuity between A/C switch side connector terminals.



Magnetic Clutch

1. Disconnect the magnetic clutch harness connectors.
2. Apply battery voltage to the clutch side connector terminal, check to see if the magnetic clutch is attracted to the pulley.

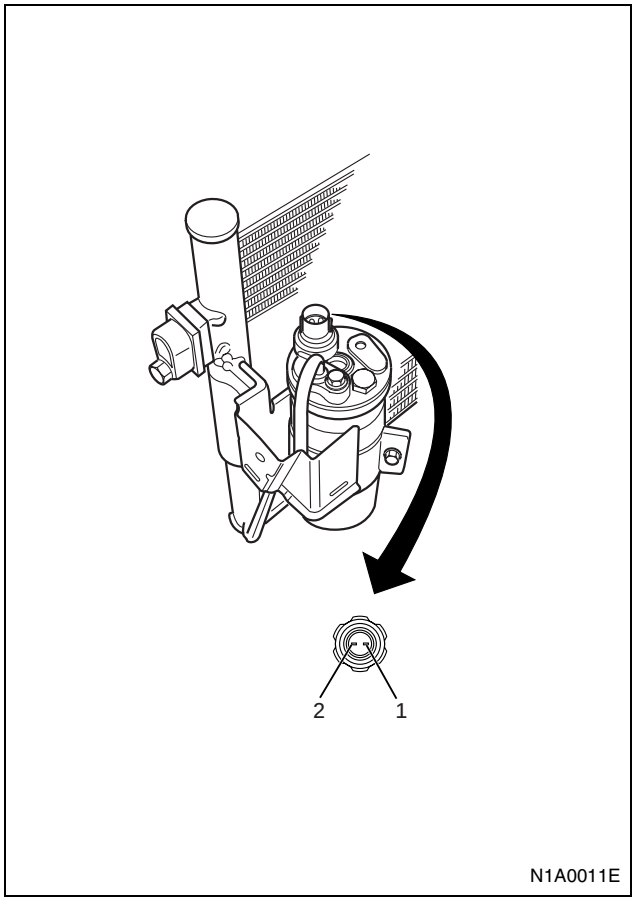


Pressure Switch

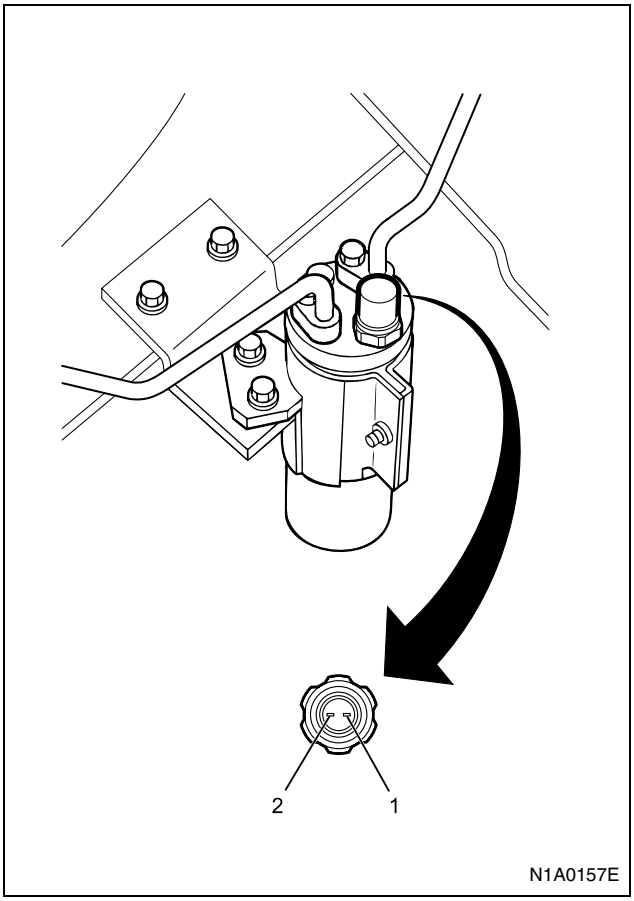
Disconnect the connector and check for continuity between pressure switch side connector terminal.

Terminal No.	Control	Continuity
1 — 2	Magnetic Clutch	Continuity

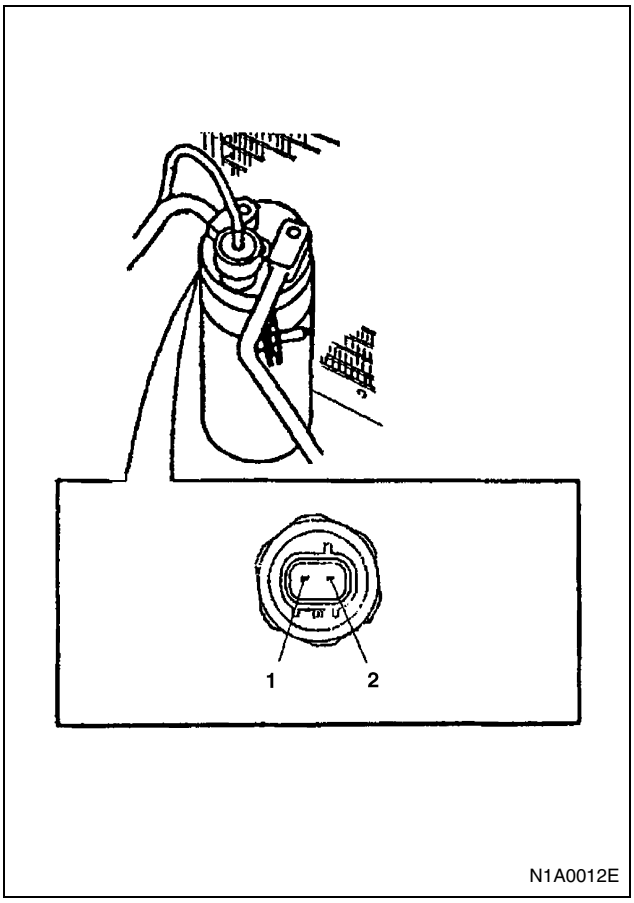
For GCC



For Australia



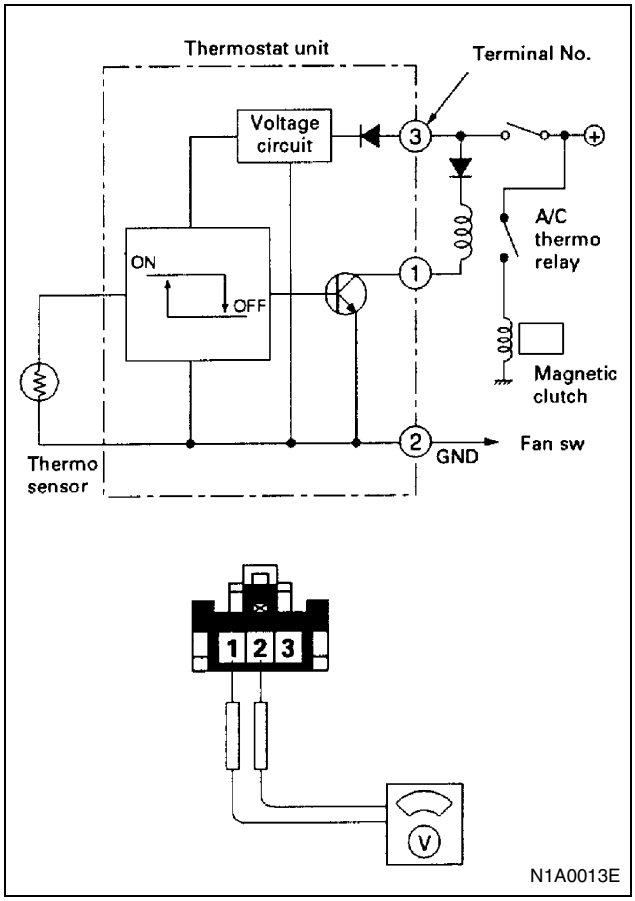
For Taiwan



Electronic Thermostat

1. With the air select lever set to “VENT” and the air source select lever to “CIRC”, start the air conditioning.
2. While shifting the temperature control lever from “FULL COOL” through the “FULL HOT”, check to see if the magnetic clutch turns on and off.
   (*Note that the time required to reach the “OFF” point depends on the warm or cold air at 3.5 ± 0.5°C at the electronic thermostat thermo sensor).
3. While the magnetic clutch is turning “ON” and “OFF”, measure the voltage between chassis side connector terminal No. 1 and No. 2.

Terminal No.	Magnetic Clutch	Voltage
1 — 2	ON	0 V
	OFF	Battery voltage



MAIN DATA AND SPECIFICATIONS

HEATER UNIT		
Temperature control		Reheat mix system

HEATING AND AIR CONDITIONING

SECTION 1A
HEATING AND VENTILATION

Caution:
When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used.

Fasteners that are not reused, and those requiring thread locking compound, will be called out. The correct torque values must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

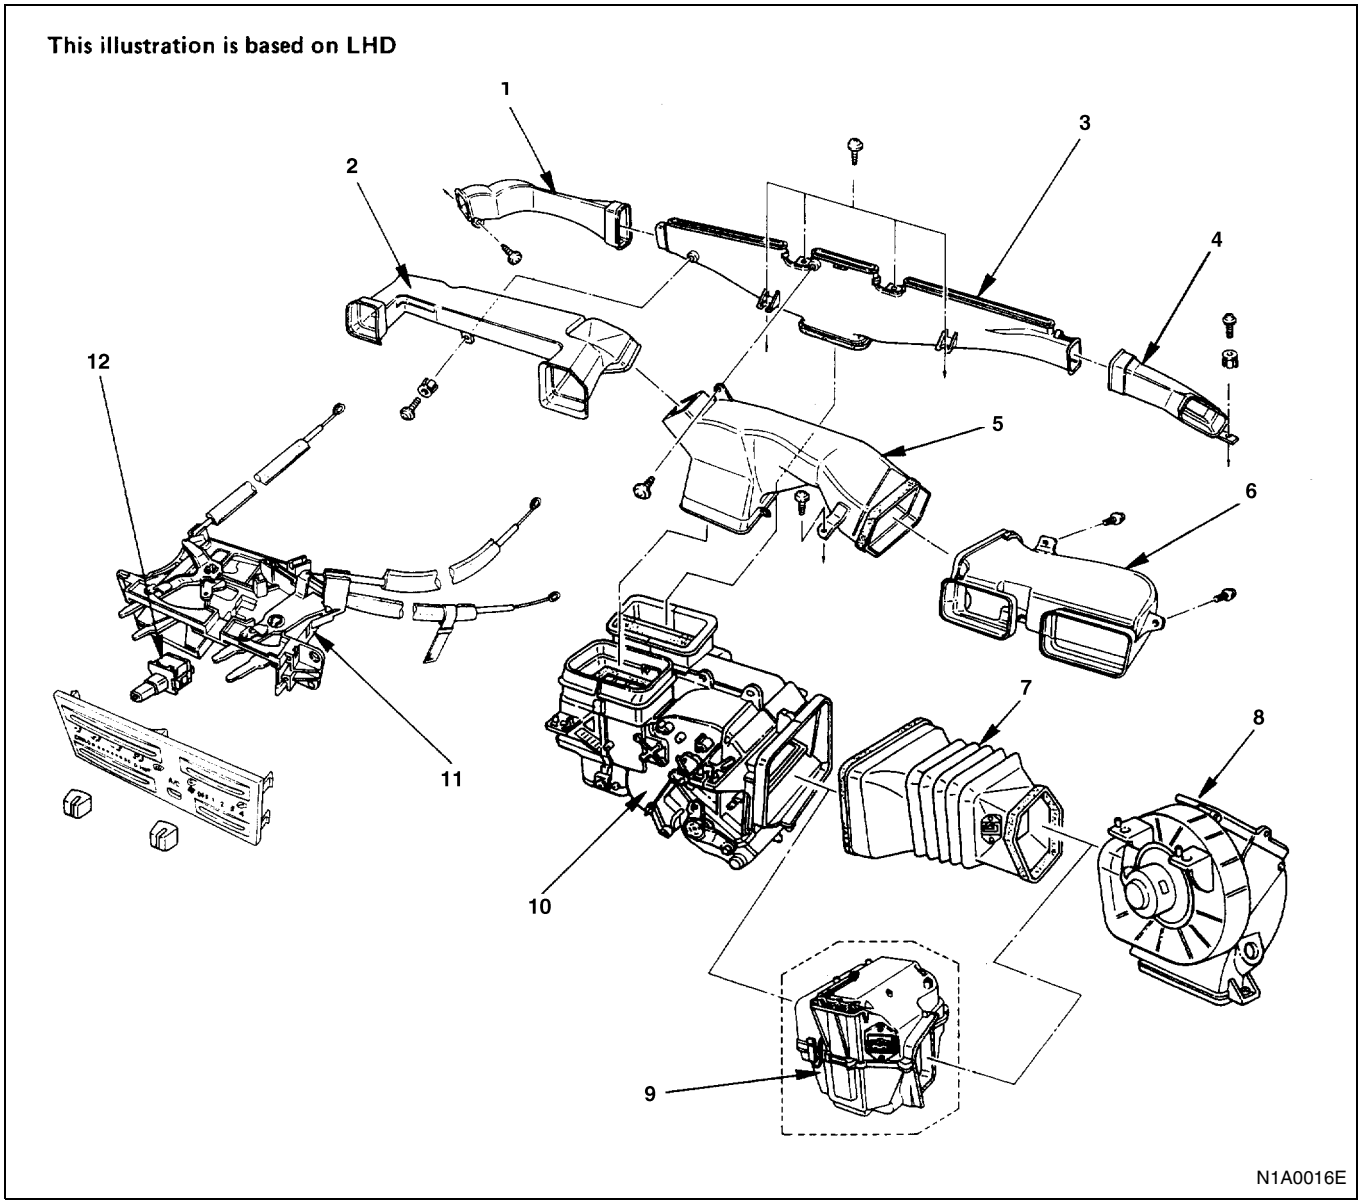
GENERAL DESCRIPTION

Heater

When the engine warming up, the warmed engine coolant is sent out into the heater core. The heater system supplies warm air into the passenger compartment to warm it up.
Outside air is circulated through the heater core of the heater unit and then back into the passenger compartment. By controlling the mixture of outside air and heater core air, the most comfortable passenger compartment temperature can be selected and maintained.
The temperature of warm air sent to the passenger compartment is controlled by the temperature control lever. This lever acts to open and close the air mix door, thus controlling the amount of air passed through the heater core.
The air select lever, with its different modes, also allows you to select and maintain the most comfortable passenger compartment temperature.
The air source select lever is used to select either “FRESH” for the introduction of the outside air, or “CIRC” for the circulation of the inside air. When the lever is set to “FRESH”, the outside air is always taken into the passenger compartment.
When setting the lever to “CIRC” position, the circulation of air is restricted only to the inside air with no introduction of the outside air and the air in the passenger compartment gets warm quickened. However, the lever is normally set to “FRESH” to prevent the windshield from clouding.

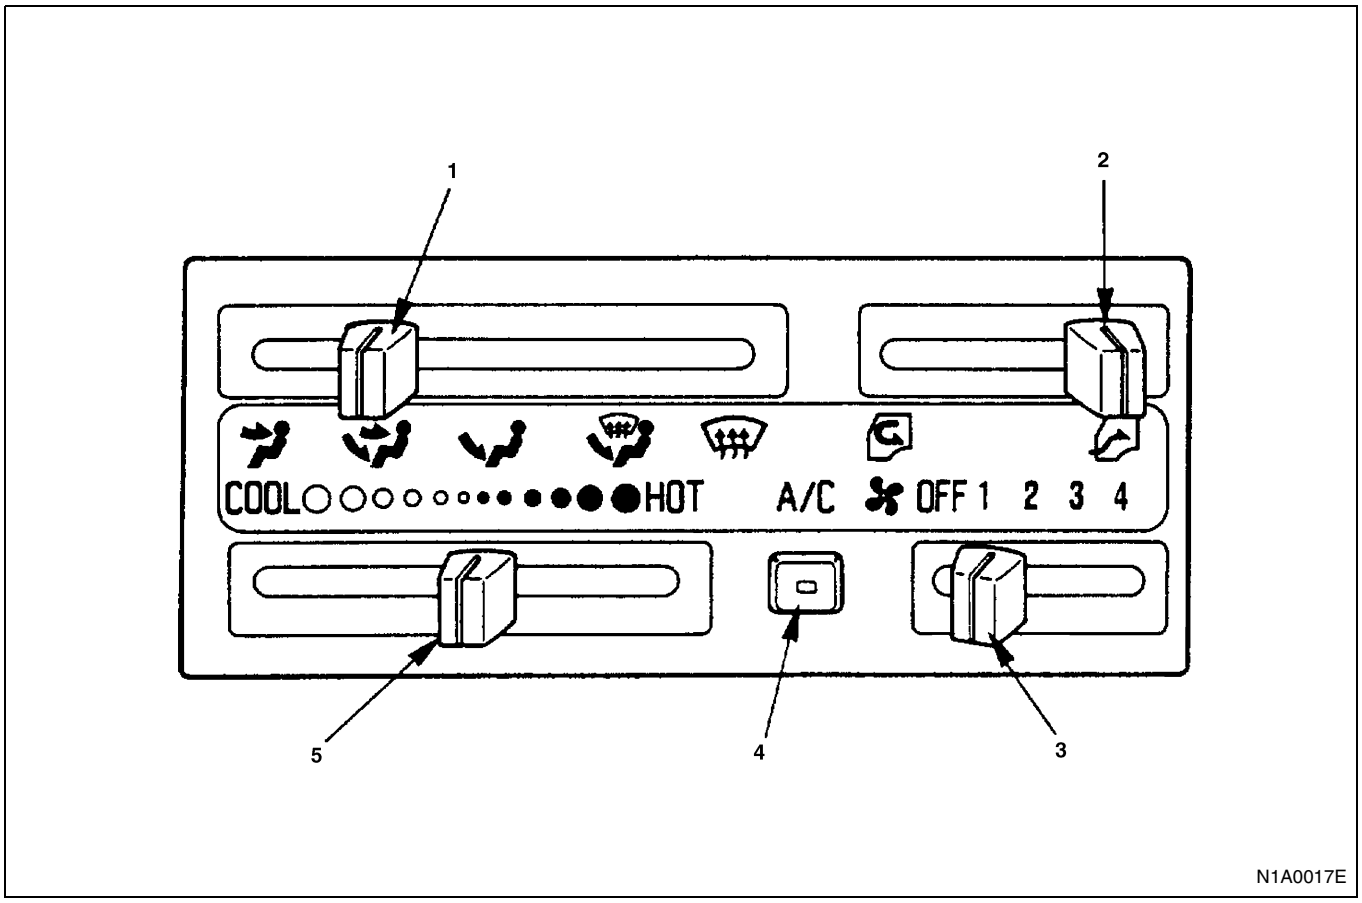


Legend

1. Side defroster nozzle (LH)
2. Ventilation duct (LH)
3. Defroster nozzle
4. Side defroster nozzle (RH)
5. Ventilation duct (Center)
6. Ventilation duct (RH)
7. Duct
8. Blower assembly
9. Evaporator assembly (W/A/C)
10. Heater unit
11. Control lever assembly
12. A/C switch

Control Lever Assembly

The vehicle has cable-control-type to control by cable the mode and temperature of the heater unit and the mode door for the air source of the blower assembly.
The fan control is used to control the amount of air sent out by the resistor at four levels from “LOW” to “HIGH”.

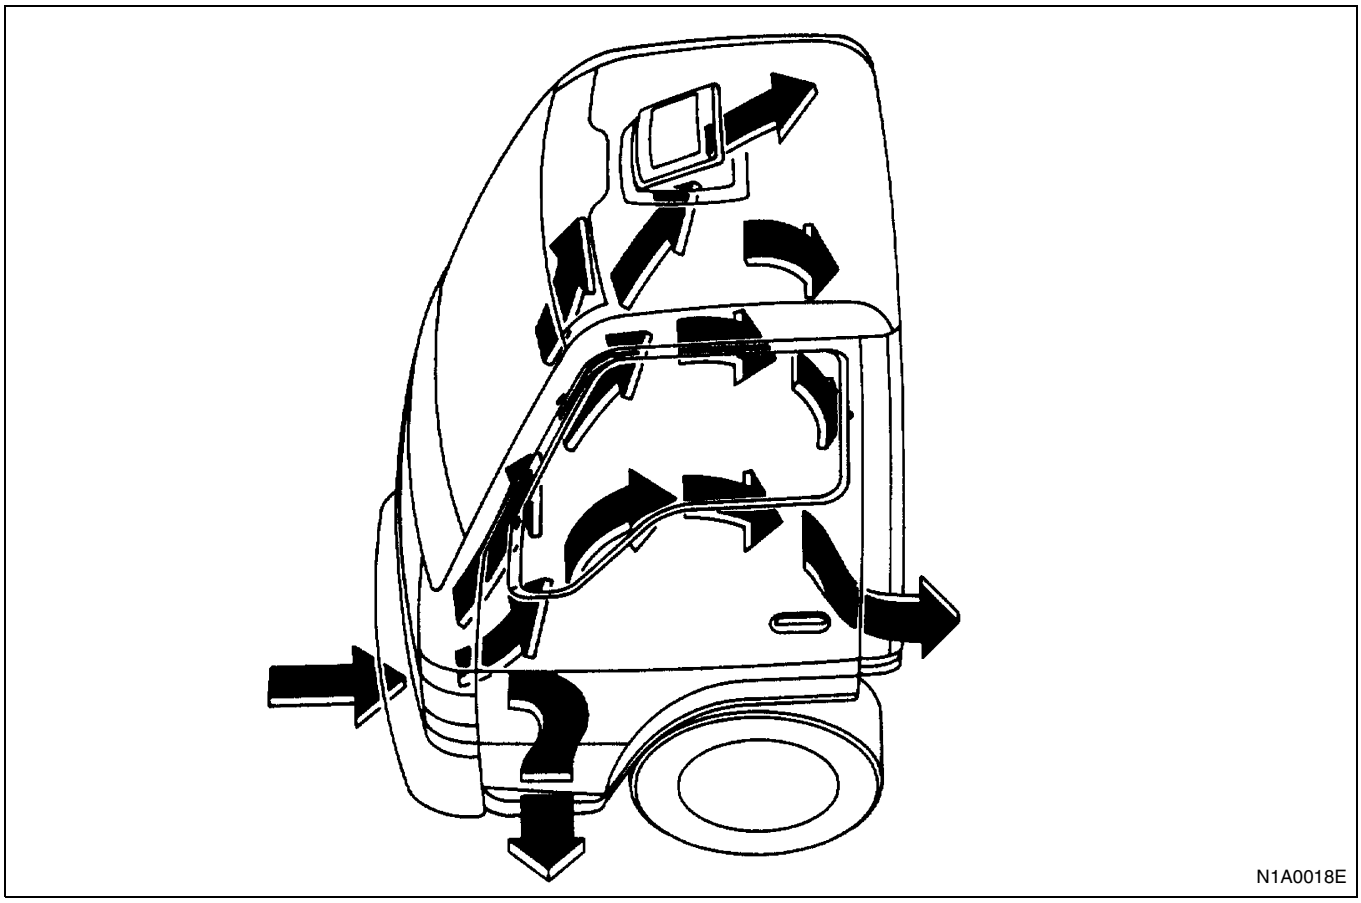


Legend

1. Air select lever
2. Air source select lever
3. Fan switch lever
4. A/C switch (W/A/C)
5. Temperature control lever

Ventilation

Set “AIR SOURCE SELECT LEVER” to “FRESH” position and turn on the blower fan. Heating can be done in this lever position, sending in fresh air from outside.
The blower fan also serves to deliver fresh outside air to the vehicle interior to assure adequate ventilation.



Air Select Lever

The air selector lever allows you to direct heated air into the passenger compartment through different outlets.

1. **Vent** - In this position, air is discharged from the upper air outlet. Air quantity is controlled by the fan control knob.
2. **Bi-Level** - In this position, air flow is divided between the upper air outlets and the foot air outlets, with warmer air delivered to the floor outlets than the air delivered to the upper air outlets.
3. **Foot** - In this position, air flow is delivered to the foot only.
4. **Def/Foot** - In this position, air flow is delivered to the foot, while sending approx, 30% of total amount of air to the windshield.
5. **Defrost** - In this position, most of the air is delivered to the windshield and a small amount is delivered to the side windows.

Air Source Select Lever

The intake of outside air and the circulation of inside air are controlled by sliding this lever left or right.
Moving the air source select lever to the “CIRC” position provides quickest heat delivery by closing the blower assembly mode door. In this position, outside air is not delivered to the passenger compartment.

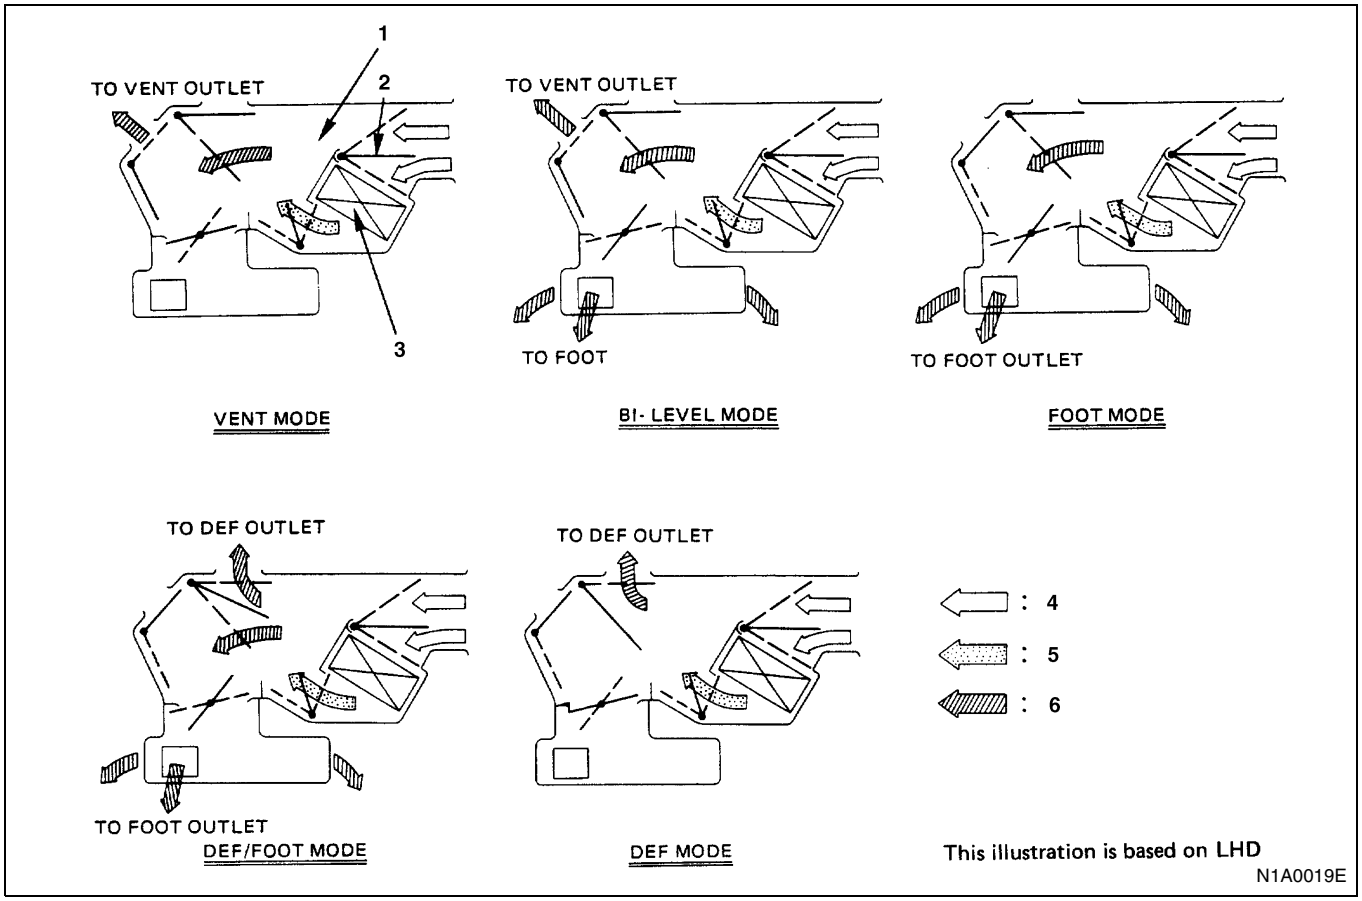
Fan Switch Lever

This lever controls the blower motor speed to regulate the amount of air delivered to the defrost, foot, and ventilation ducts:

1. Low
2. Medium Low
3. Medium High
4. High

Temperature Control Lever

When the temperature control lever is in the “COLD” position, the air mix door closes to block the flow of air to the heater core.
When the temperature control lever is in the “HOT” position, the air mix door opens to allow air to pass through the heater core and heat the passenger compartment.
Placing the lever in an intermediate position will cause a lesser or greater amount of air to reach the heater core. In this mode the passenger compartment temperature can be regulated.

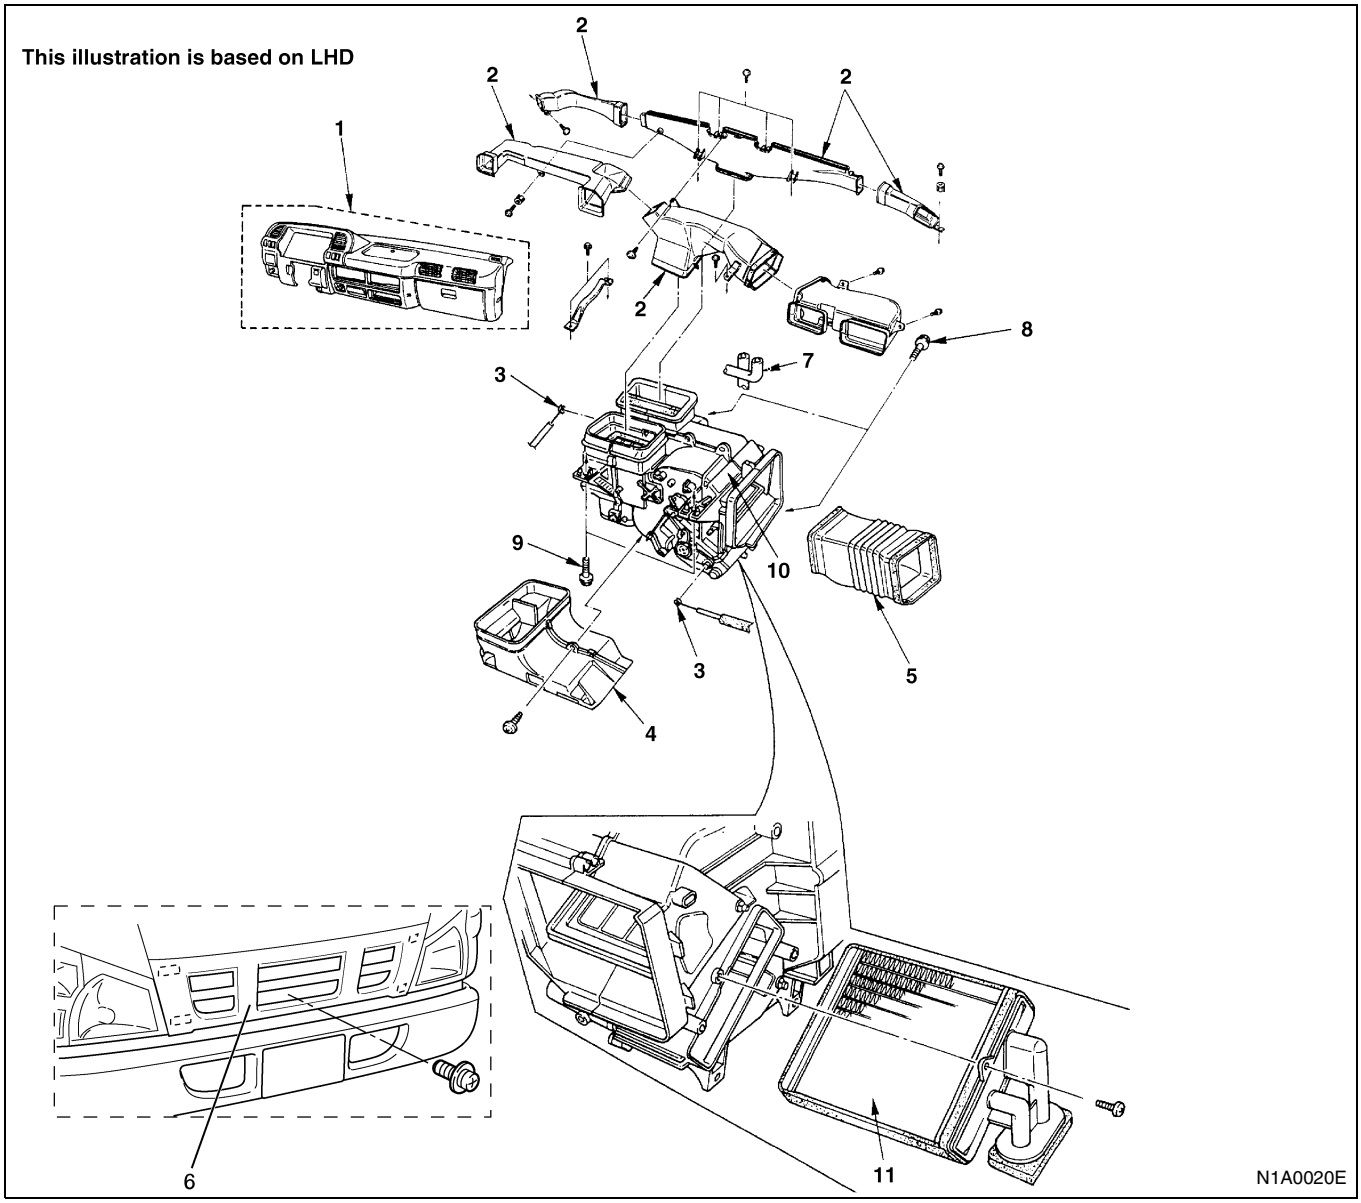


Legend

1. Heater unit
2. Air mix door
3. Heater core
4. Cold air
5. Hot air
6. Temperature controlled air

ON-VEHICLE SERVICE

Heater Unit/Heater Core



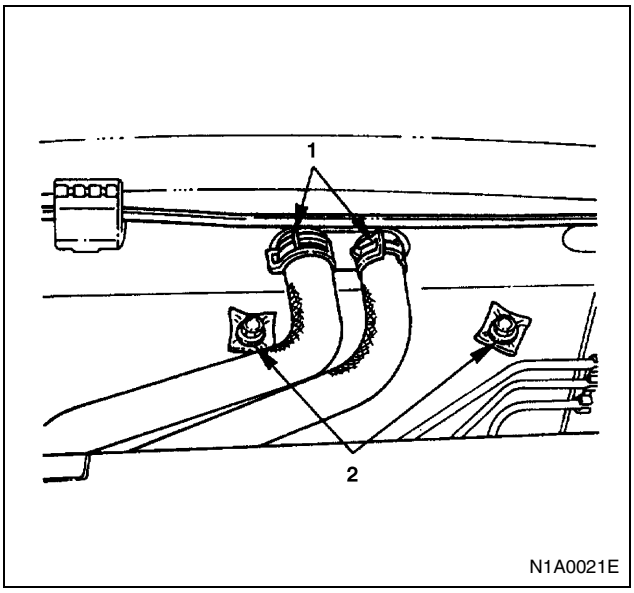
Legend

1. Instrument panel assembly
2. Defroster nozzle and ventilation duct
3. Heater control cable
4. Foot duct
5. Duct (NPR only)
6. Front grille
7. Water hose
8. Bolt (Panel - Heater unit)
9. Bolt (Heater unit - Reinforce)
10. Heater unit
11. Heater core

Removal

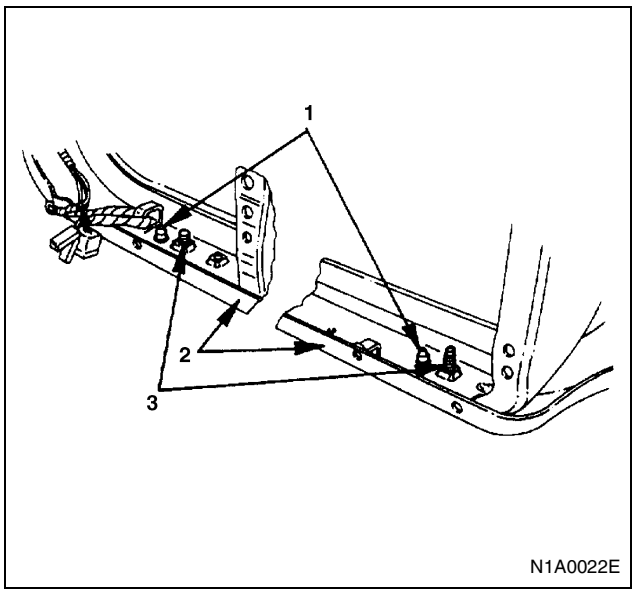
Preparation:
Disconnect the battery ground cable.

1. Instrument Panel Assembly
   Refer to Section 2 “CAB AND FRAME” for Instrument Panel Assembly removal procedure.
2. Defroster Nozzle and Ventilation Duct
   Refer to “DEFROSTER NOZZLE / VENTILATION DUCT” removal procedure in this section.
3. Heater Control Cable
   Disconnect the cables from the heater unit.
4. Foot Duct
5. Duct (NPR only)
6. Front Grille
7. Water Hose
   - Loosen the water hose clips and disconnect the water hoses from the heater unit.
   - Put caps to the openings of the heater unit and the water hoses to prevent a lot of engine coolant from spilling out of them.
8. Bolt (Panel - Heater Unit)



Legend
1. Water hose clip
2. Bolt

9. Bolt (Heater Unit - Reinforce)
10. Heater Unit
    - Drop the heater unit positioning pins from the reinforce, and remove the heater unit while sliding the engaged section between the evaporator and the heater unit.



Legend
1. Pin
2. Reinforce
3. Fixing bolt (Heater unit - Reinforce)

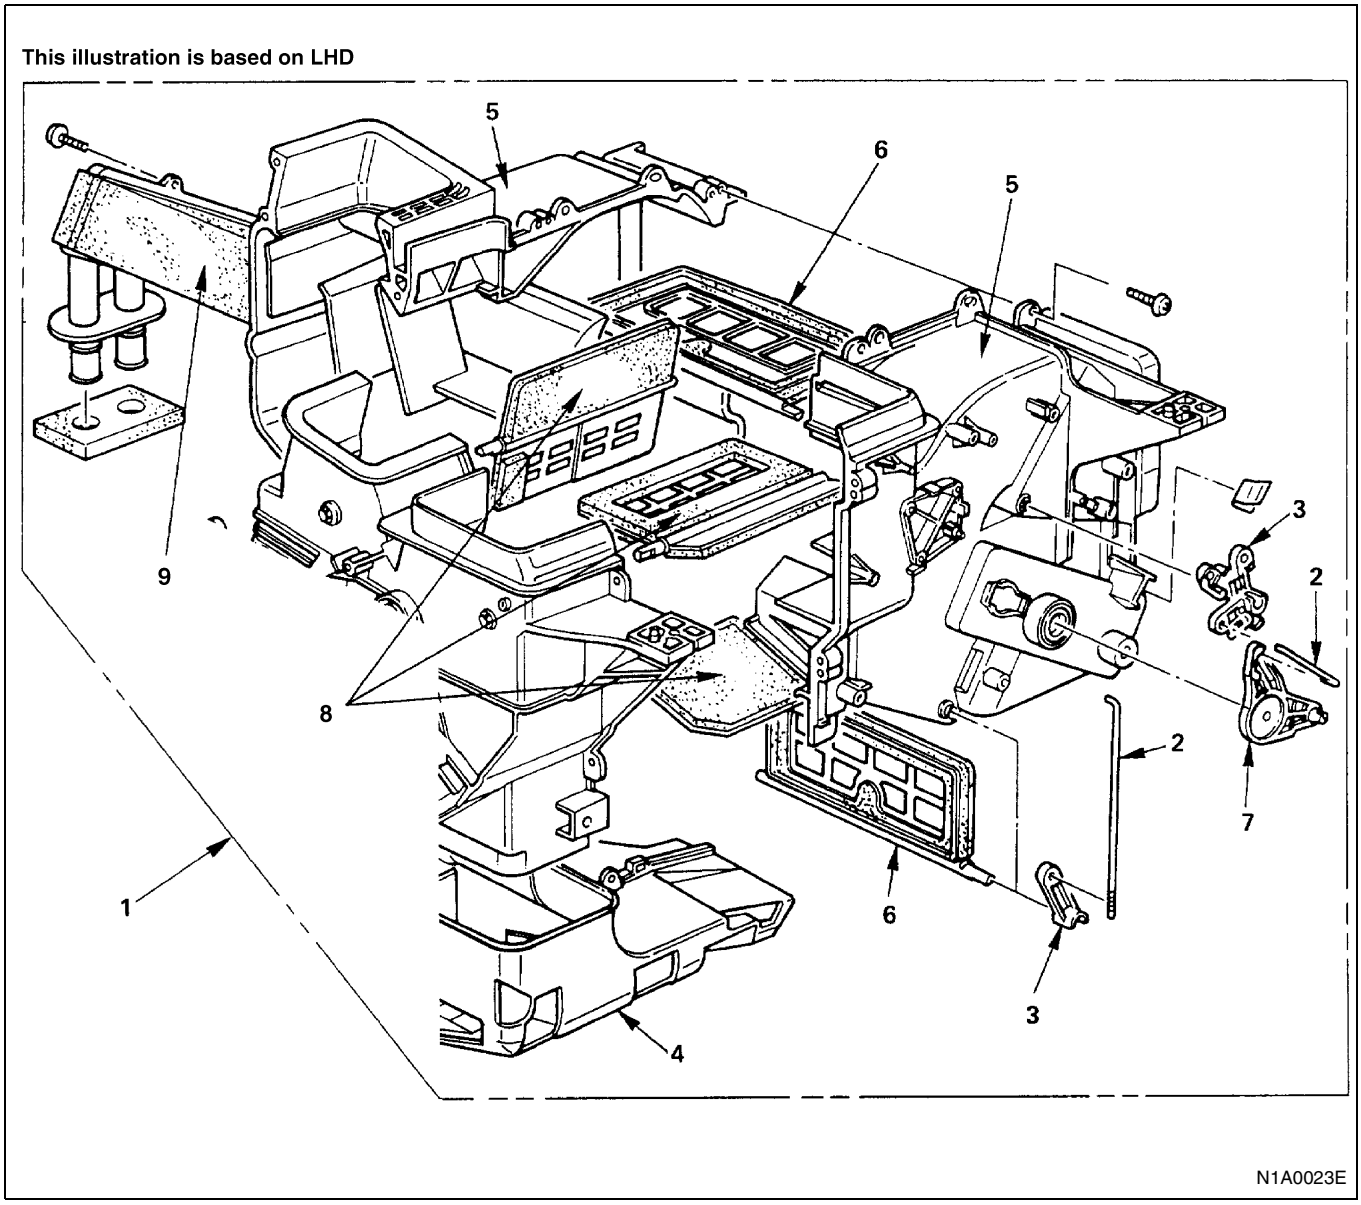
11. Heater Core

Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Adjust the heater control cable.
   Refer to “CONTROL LEVER ASSEMBLY” installation procedure in this section.
2. When installing the heater unit, defroster nozzles and ventilation ducts, be sure that proper seal is made, without any gap between them.
3. Check the engine coolant level. When the level is below the specified amount, replenish engine coolant to the proper level.

Heater Temperature Control Link Unit/Air Mix Door



Legend

1. Heater unit
2. Rod
3. Door lever
4. Foot duct
5. Upper case
6. Air mix door
7. Mix sub lever
8. Mode door
9. Heater core

Removal

Preparation:

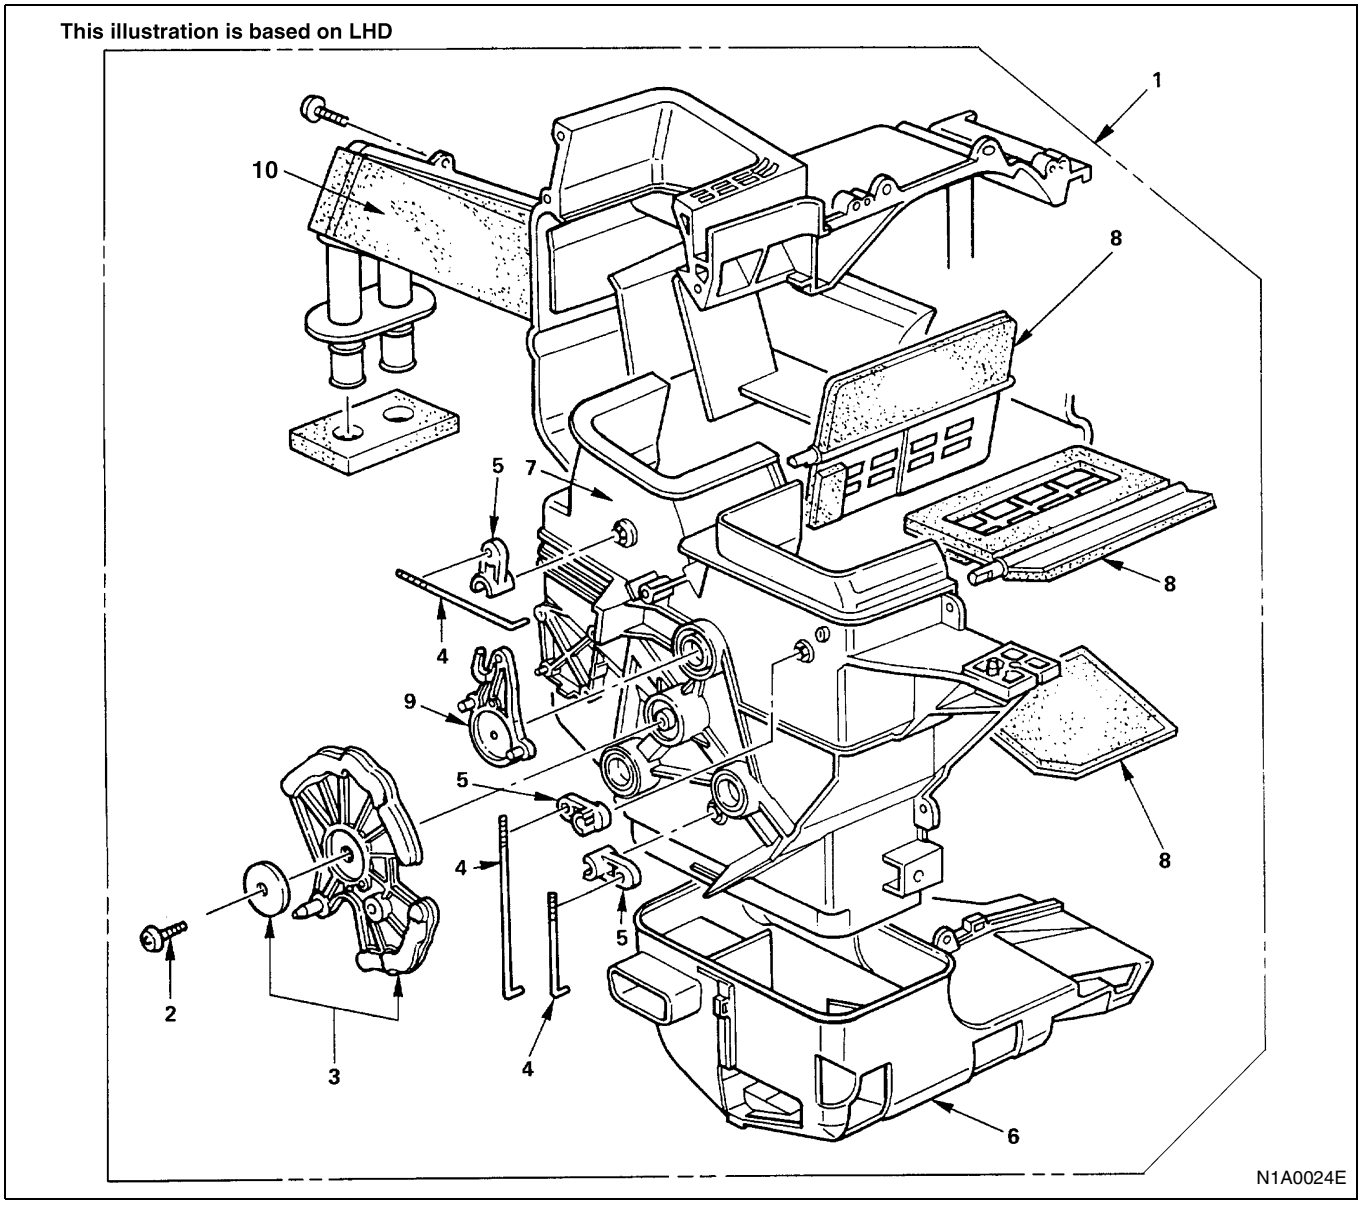
Disconnect the battery ground cable.

1. Heater Unit
   Refer to “HEATER UNIT” removal procedure in this section.
2. Rod
3. Door Lever
   Pull out the door lever while raising up the catch of the door lever.
4. Foot Duct
5. Upper Case
   Separate two halves of the upper case.
6. Air Mix Door
7. Mix Sub Lever
   Press the tab of the sub lever inward, and take out the sub lever.

Installation

To install, follow the removal steps in the reverse order.

Heater Mode Control Link Unit/Mode Door



Legend

1. Heater unit
2. Screw
3. Washer and mode main lever
4. Rod
5. Door lever
6. Foot duct
7. Upper case
8. Mode door
9. Mode sub lever
10. Heater core

Removal

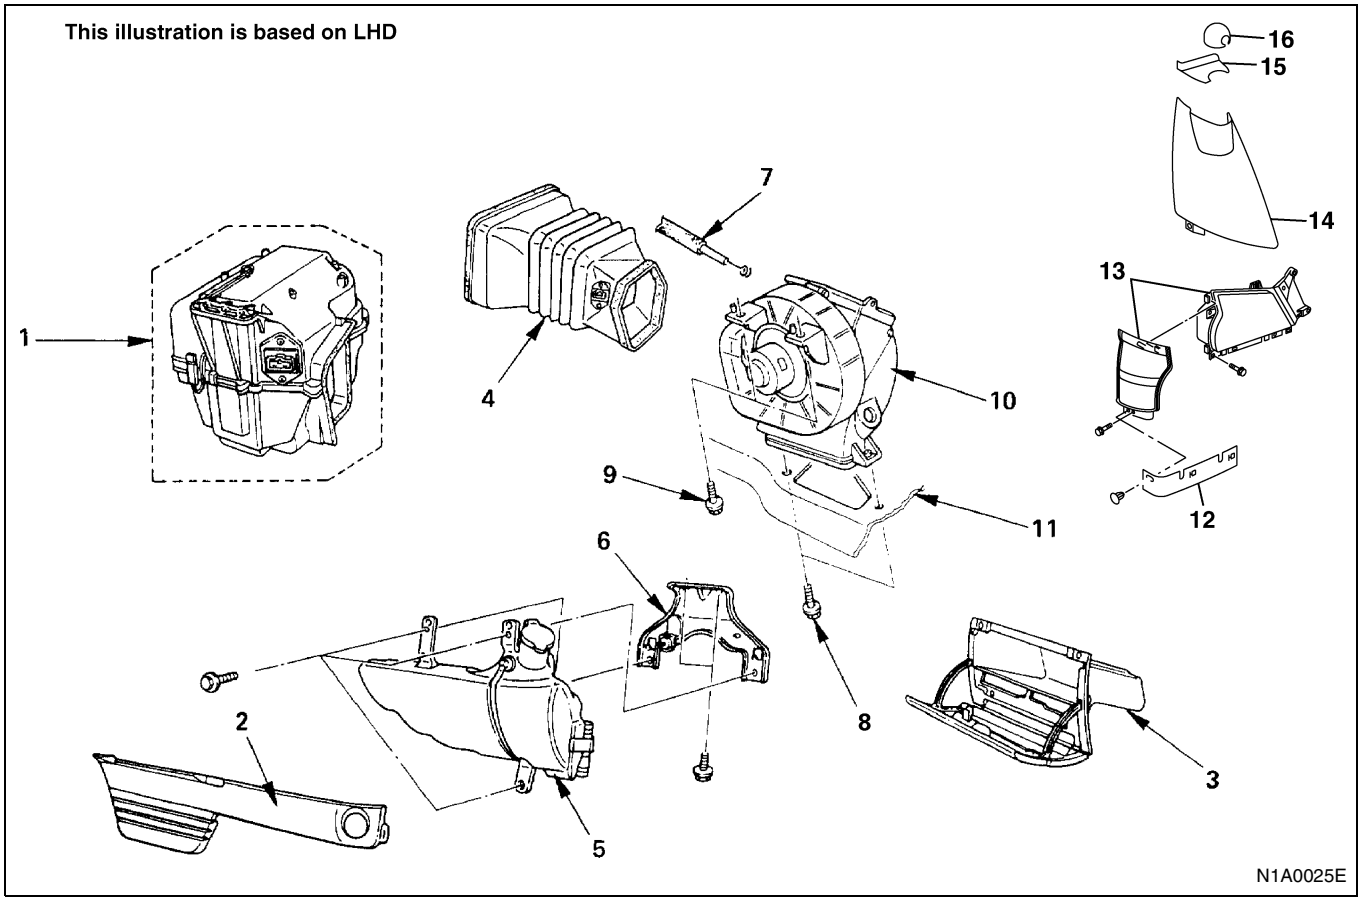
Preparation:
Disconnect the battery ground cable.

1. Heater Unit
   Refer to “HEATER UNIT” removal procedure in this section.
2. Screw
3. Washer and Mode Main Lever
4. Rod
5. Door Lever
   Pull out the door lever while raising up the catch of the door lever.
6. Foot Duct
7. Upper Case
8. Mode Door
9. Mode Sub Lever
   Press the tab of the sub lever inward, and take out the sub lever.

Installation

To install, follow the removal steps in the reverse order.

Blower Assembly



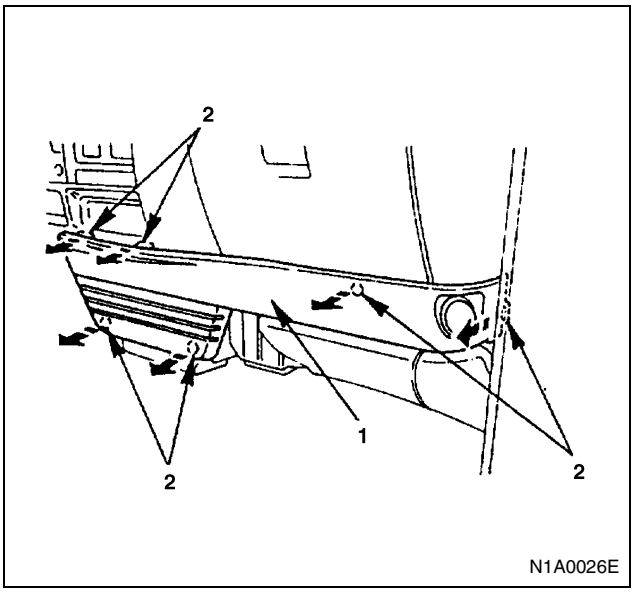
Legend

1. Evaporator assembly (A/C only)
2. Under cover (Without A/C)
3. Glove box (Without A/C)
4. Duct (Without A/C)
5. Washer tank (Without A/C)
6. Washer tank bracket
7. Blower control cable
8. Bolt (Panel-Blower assembly)
9. Bolt (Blower assembly - Reinforce)
10. Blower assembly
11. Floor panel
12. Headlight grill cover
13. Headlight assembly and combination light (RH)
14. Front side panel
15. Outside mirror cover
16. Mirror stay cap

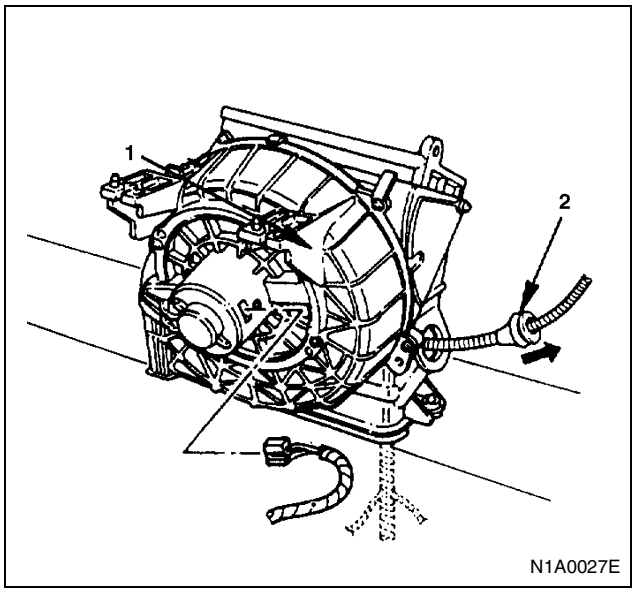
Removal

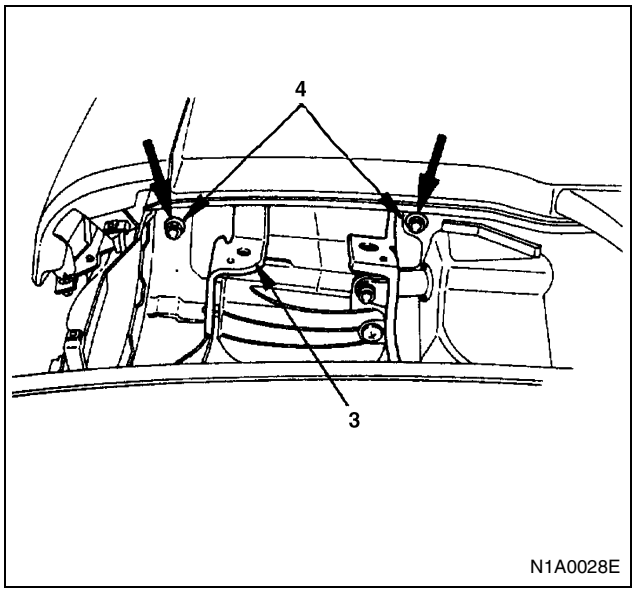
Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant (A/C only).

1. Glove Box (Without A/C)
   Open the glove box and remove the fixing screws.
2. Under Cover (Without A/C)
   While pulling the under cover (1) with care, remove the clips (2) on the backside of the cover.



3. Washer Tank (Without A/C)
   Remove the washer tank fixing three bolts (Upper: two, Lower: one) and disconnect the connector.
4. Washer Tank Bracket
   Disconnect the harness connection connector and remove the fixing bolts.
5. Blower Control Cable
   Disconnect the blower control cable from the blower assembly.
6. Evaporator Assembly
   Refer to Section 1B “AIR CONDITIONING” for Evaporator Assembly removal procedure.
7. Duct (Without A/C)
8. Mirror Stay Cap
   Spread the stay fixing part by fingers to remove the mirror stay cap. Be careful not to break the two inside claws.
9. Outside Mirror Cover
   Insert a screwdriver to the front ends of cover to remove the outside mirror cover.
10. Front Side Panel
    Remove five clips and a bolt.
11. Headlight Grill Cover
    Remove the headlight grill cover from the claw part of headlight assembly at first, and then remove a clip.
12. Headlight Assembly and Combination Light (RH)
    - Refer to Section 8 “CAB AND CHASSIS ELECTRICAL” for Headlight removal procedure.
    - Remove the ground point bolts of headlight bracket (RH) (3) and right frame (front).
    - Remove the grommet (2) provided at the lower right side of the blower assembly (1), and pull in the harness to the room through the blower hole.
13. Bolt (Panel - Blower Assembly)

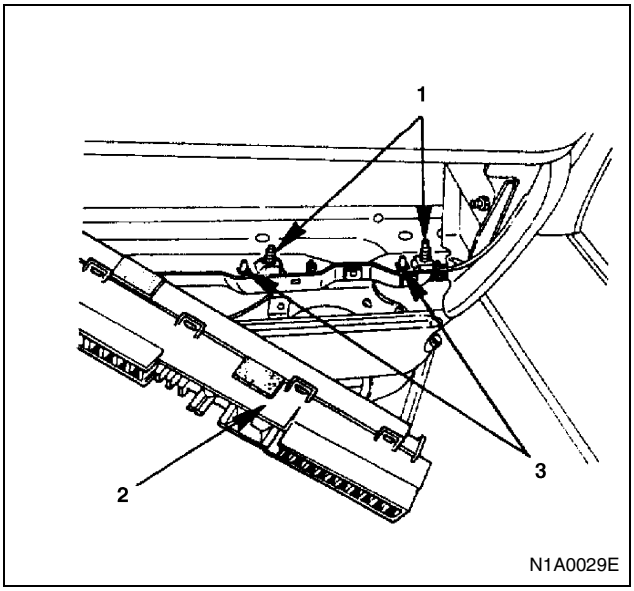




Legend

3. Headlight bracket (RH)
4. Bolt (Panel-Blower assembly)

14. Bolt (Blower Assembly - Reinforce)



Legend

1. Bolt (Blower assembly - Reinforce)
2. Fuse box
3. Pin

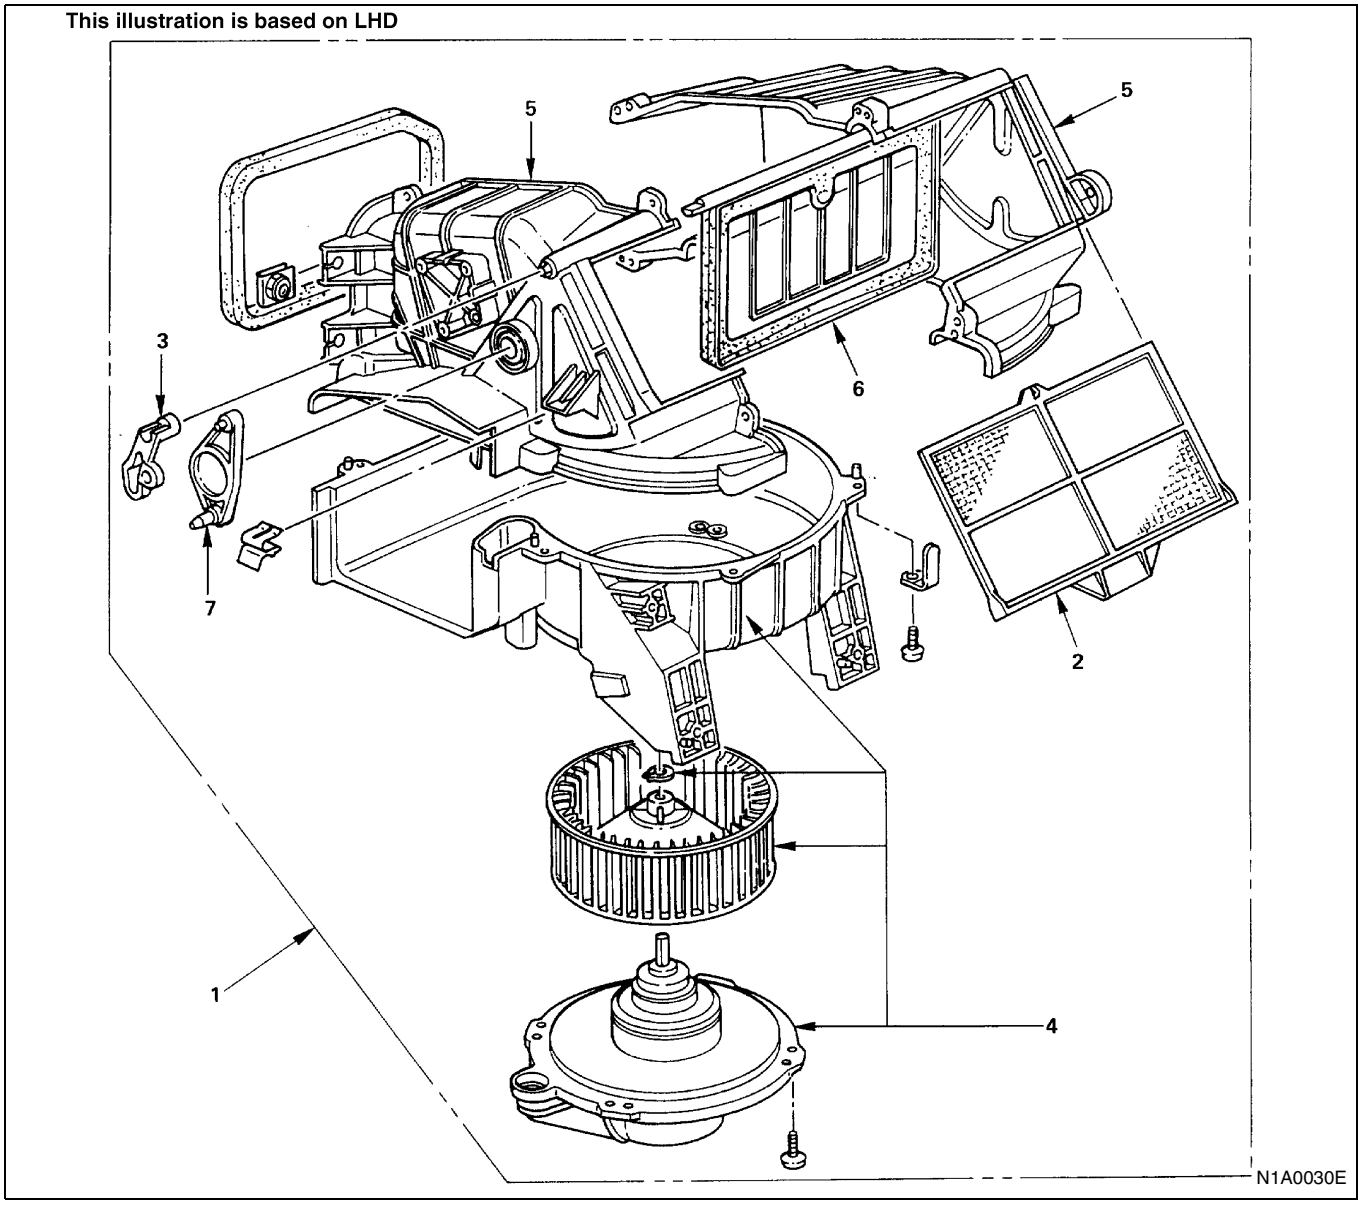
15. Blower Assembly
    - Remove the blower fixing bolts.
    - Drop the blower positioning pins from the reinforce to remove them.

Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Adjust the blower control cable.
   Refer to “CONTROL LEVER ASSEMBLY” installation procedure in this section.

Blower Link Unit/Mode Door



Legend

1. Blower assembly
2. Blower filter
3. Door lever
4. Lower case
5. Upper case
6. Mode door
7. Mode sub lever

Removal

Preparation:

Disconnect the battery ground cable.

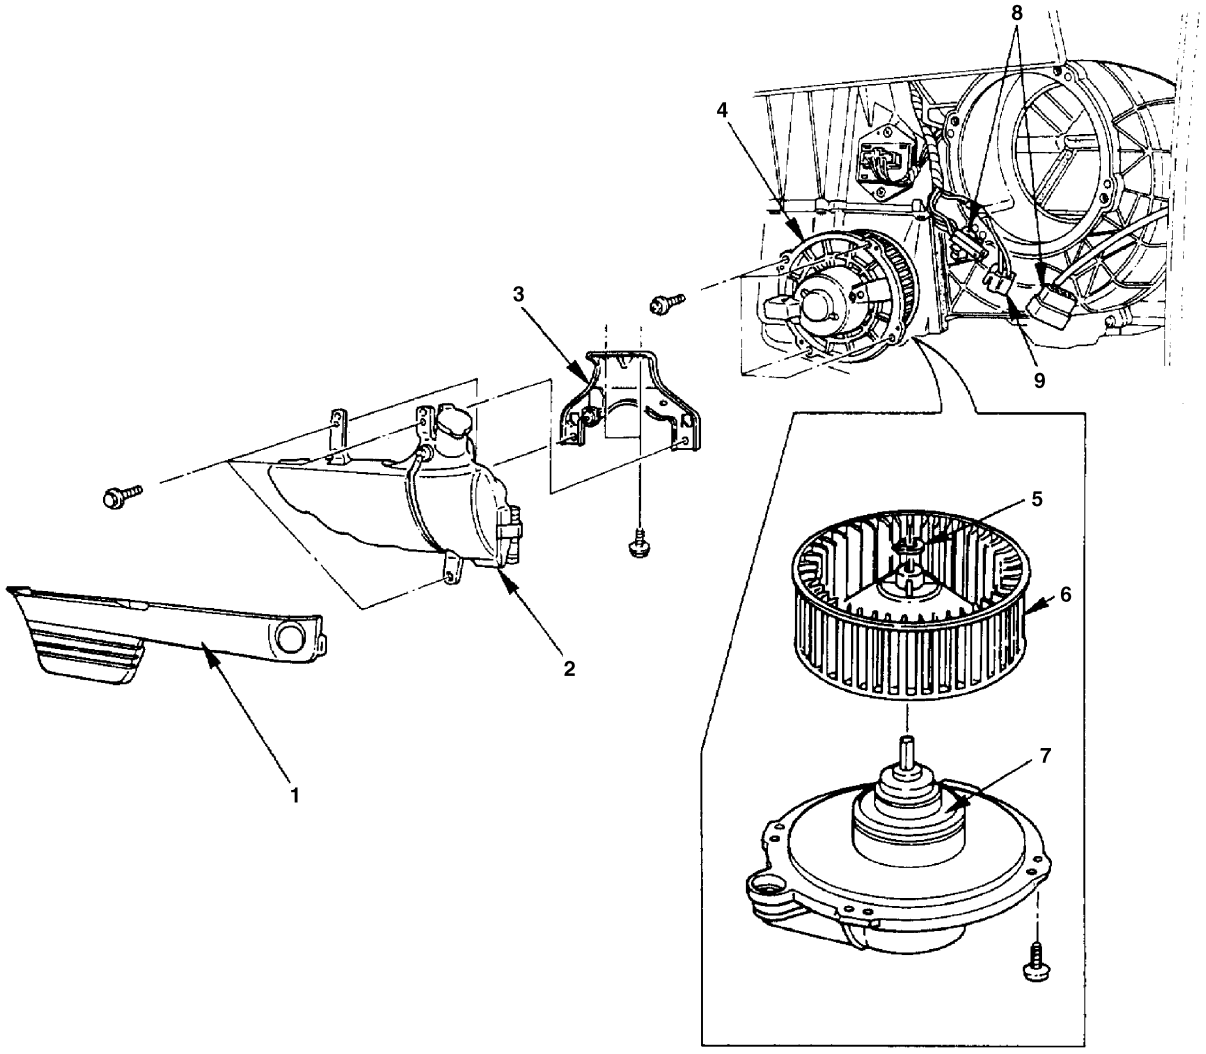
1. Blower Assembly
   Refer to “BLOWER ASSEMBLY” removal procedure in this section.
2. Blower Filter
3. Door Lever
   Pull out the door lever while raising up the catch of the door lever.
4. Lower Case
5. Upper Case
   Separate two halves of the upper case.
6. Mode Door
7. Mode Sub Lever
   Press the tab of the sub lever inward, and take out the sub lever.

Installation

To install, follow the removal steps in the reverse order.

Blower Motor

This illustration is based on LHD



N1A0031E

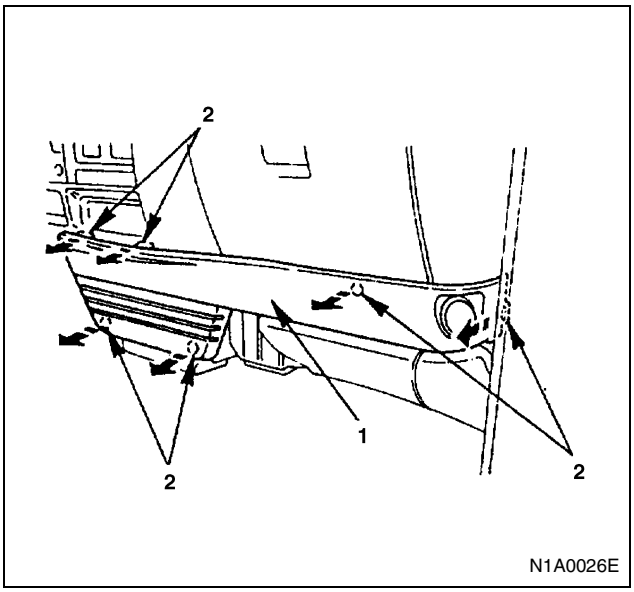
Legend

1. Under cover
2. Washer tank
3. Washer tank bracket
4. Blower motor assembly
5. Clip
6. Fan
7. Blower motor
8. Harness connection connector
9. Blower motor connector

Removal

Preparation:
Disconnect the battery ground cable.

1. Under Cover
   While pulling the under cover (1) with care, remove the clips (2) on the back side of the cover.

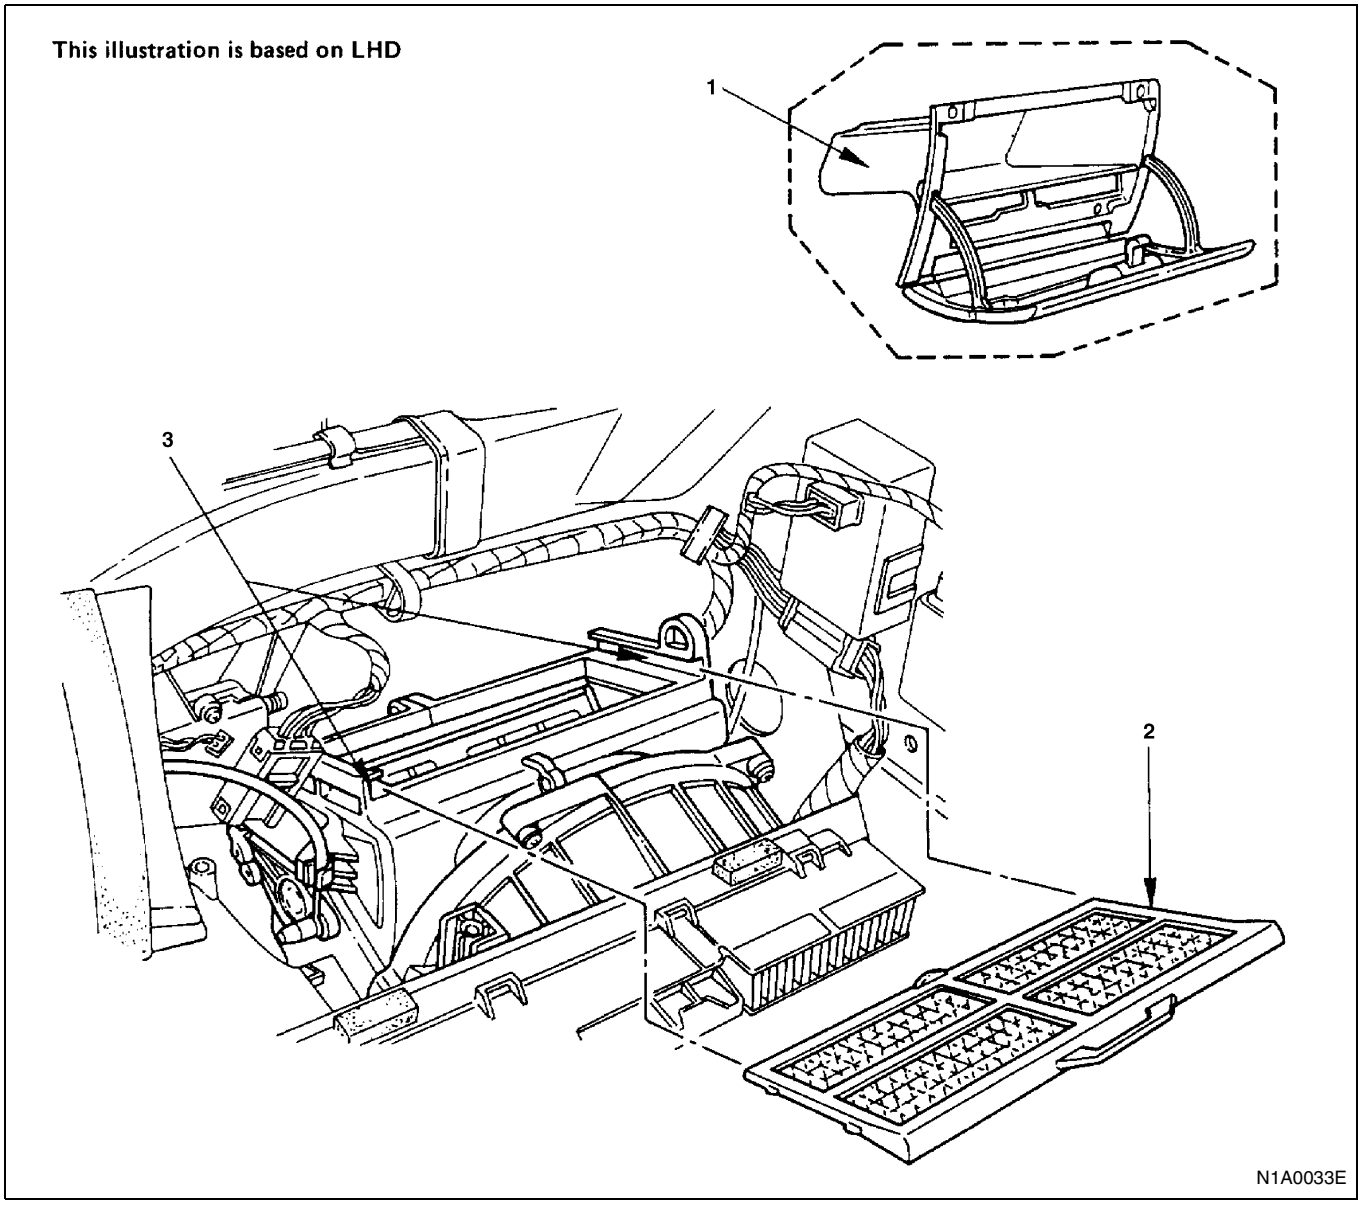


2. Washer Tank
   Remove the washer tank fixing three bolts (Upper: two, Lower: one) and disconnect the connector.
3. Washer Tank Bracket
   Disconnect the harness connection connector and remove the fixing bolts.
4. Blower Motor Assembly
   Disconnect the motor connector.
5. Clip
6. Fan
7. Blower Motor

Installation

To install, follow the removal steps in the reverse order.

Blower Filter



Legend

1. Glove box
2. Blower filter
3. Slit

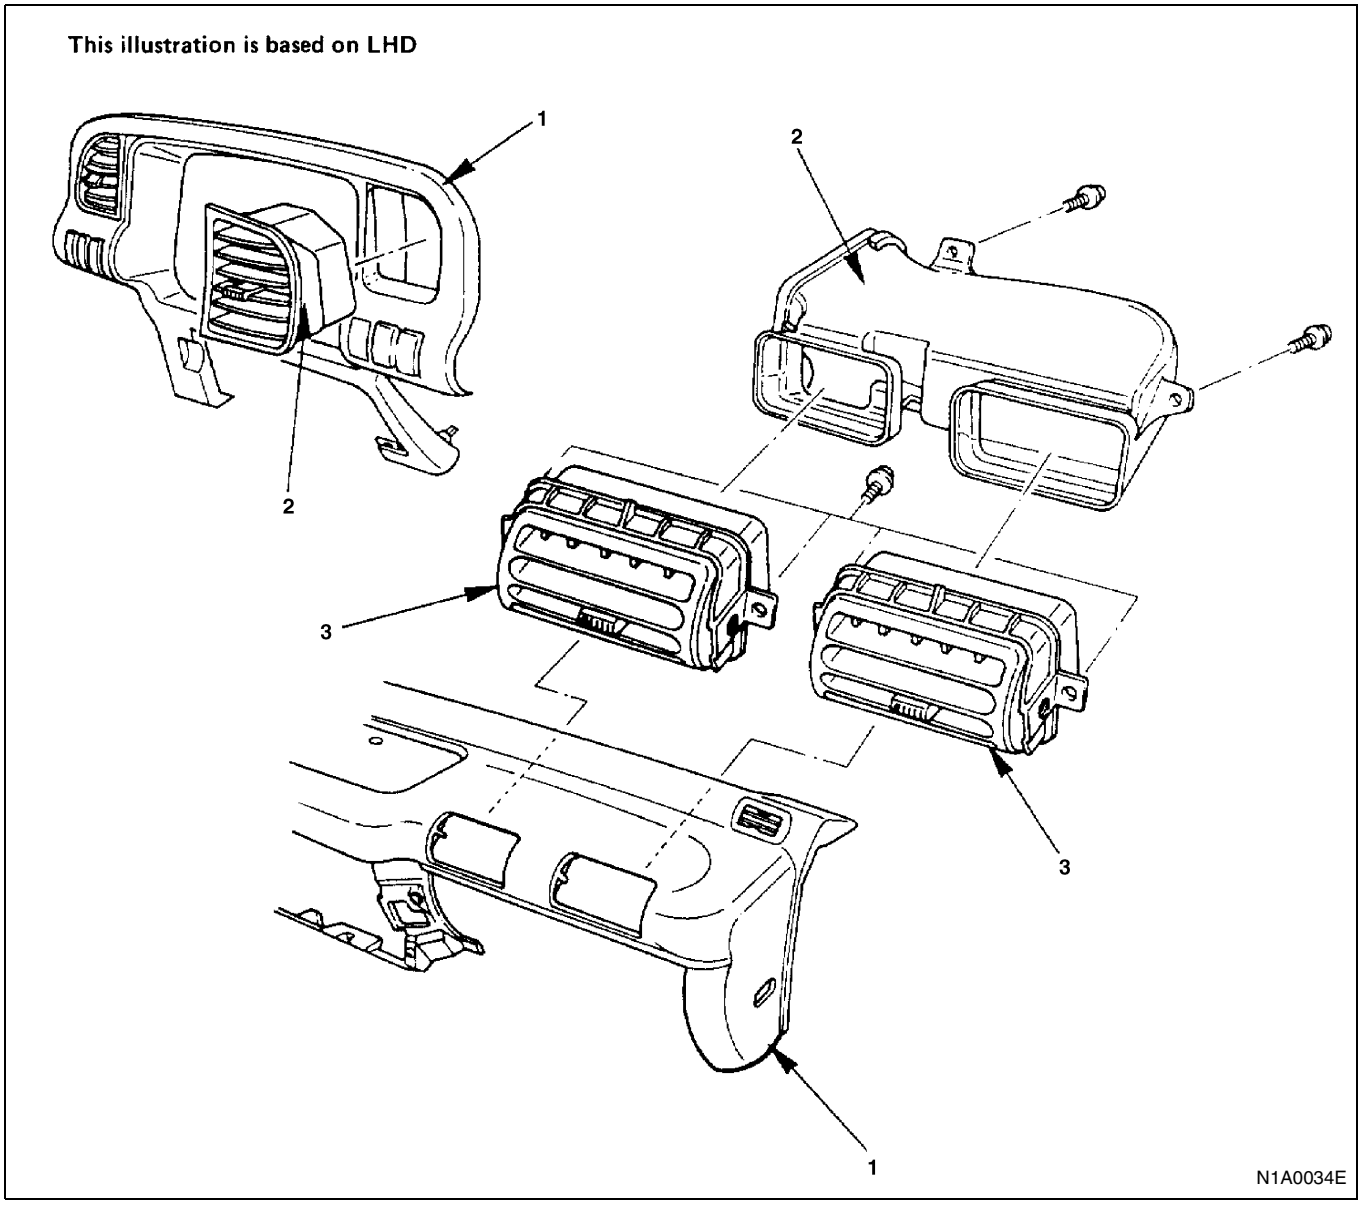
Removal

1. Glove Box
   Open the glove box and remove the fixing screws.
2. Blower Filter
   Pull out the blower filter from the blower upper slit.

Installation

To install, follow the removal steps in the reverse order.

Ventilation Grille



Legend

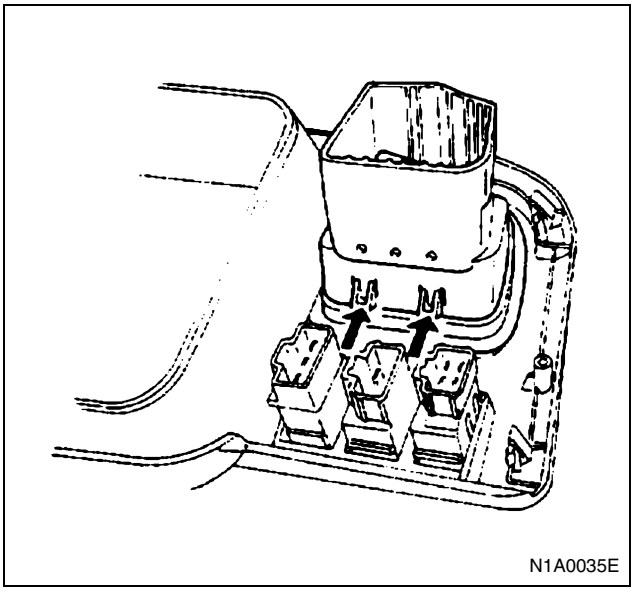
[Driver Side]
1. Meter cluster
2. Ventilation grille

[Passenger Side]
1. Instrument panel assembly
2. Ventilation duct
3. Ventilation grille

Removal

Preparation:
Disconnect the battery ground cable.
[Driver Side]

1. Meter Cluster
   Refer to Section 2 “CAB AND FRAME” for Meter Cluster removal procedure.
2. Ventilation Grille
   Push the catches of the grille on the backside of the cluster to the inside, and remove the ventilation grille.



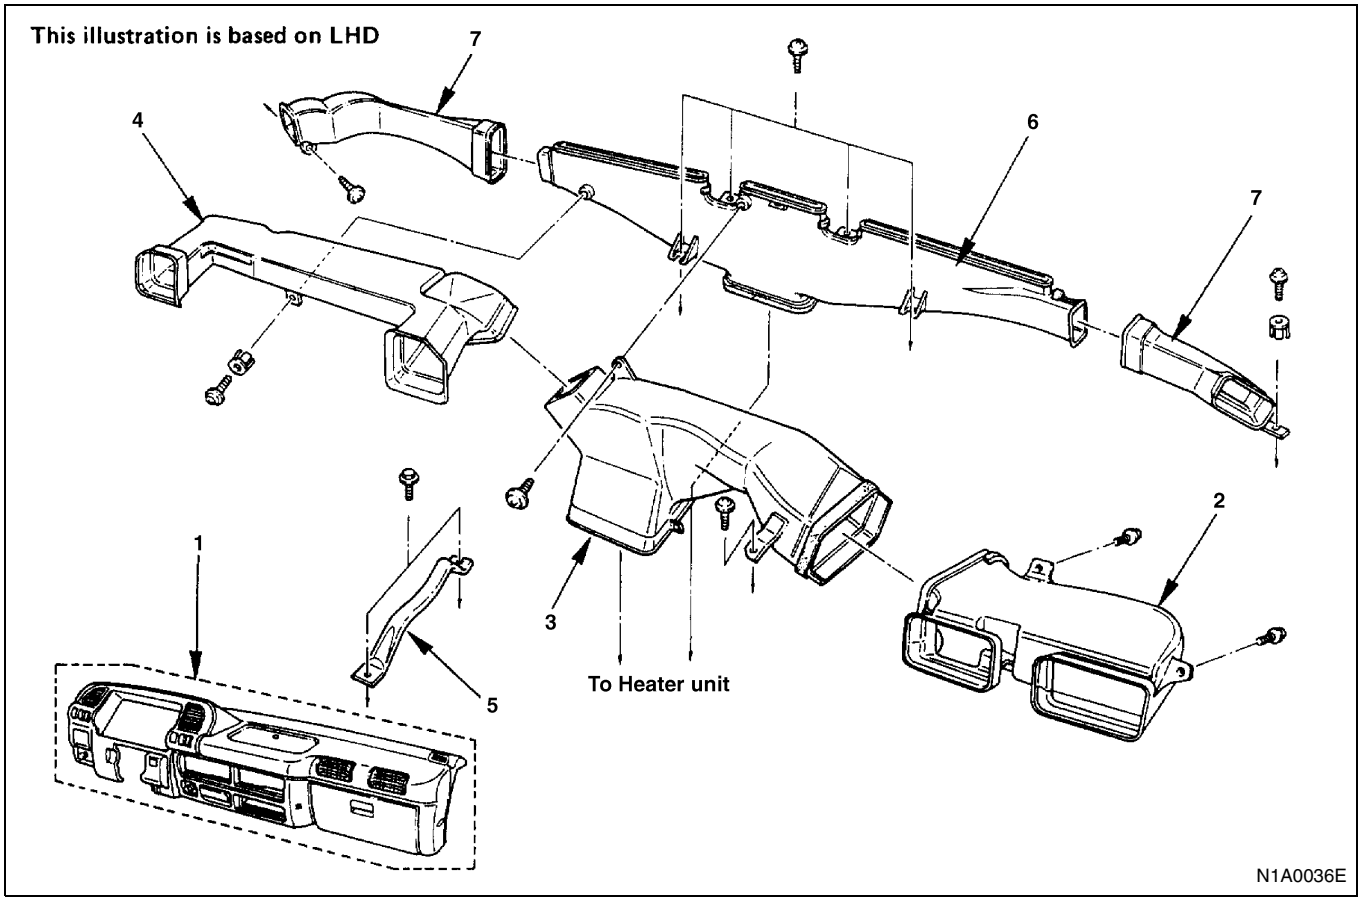
[Passenger Side]

1. Instrument Panel Assembly
   Refer to Section 2 “CAB AND FRAME” for Instrument Panel removal procedure.
2. Ventilation Duct
3. Ventilation Grille

Installation

To install, follow the removal steps in the reverse order.

Defroster Nozzle/Ventilation Duct



Legend

1. Instrument panel assembly
2. Ventilation duct (RH)
3. Ventilation duct (CTR)
4. Ventilation duct (LH)
5. Reinforcement stay
6. Defroster nozzle (It is not installed on the vehicle with forged air ventilation as an optional equipment.)
7. Side defroster nozzle (It is not installed on the vehicle with forged air ventilation as an optional equipment.)

Removal

Preparation:

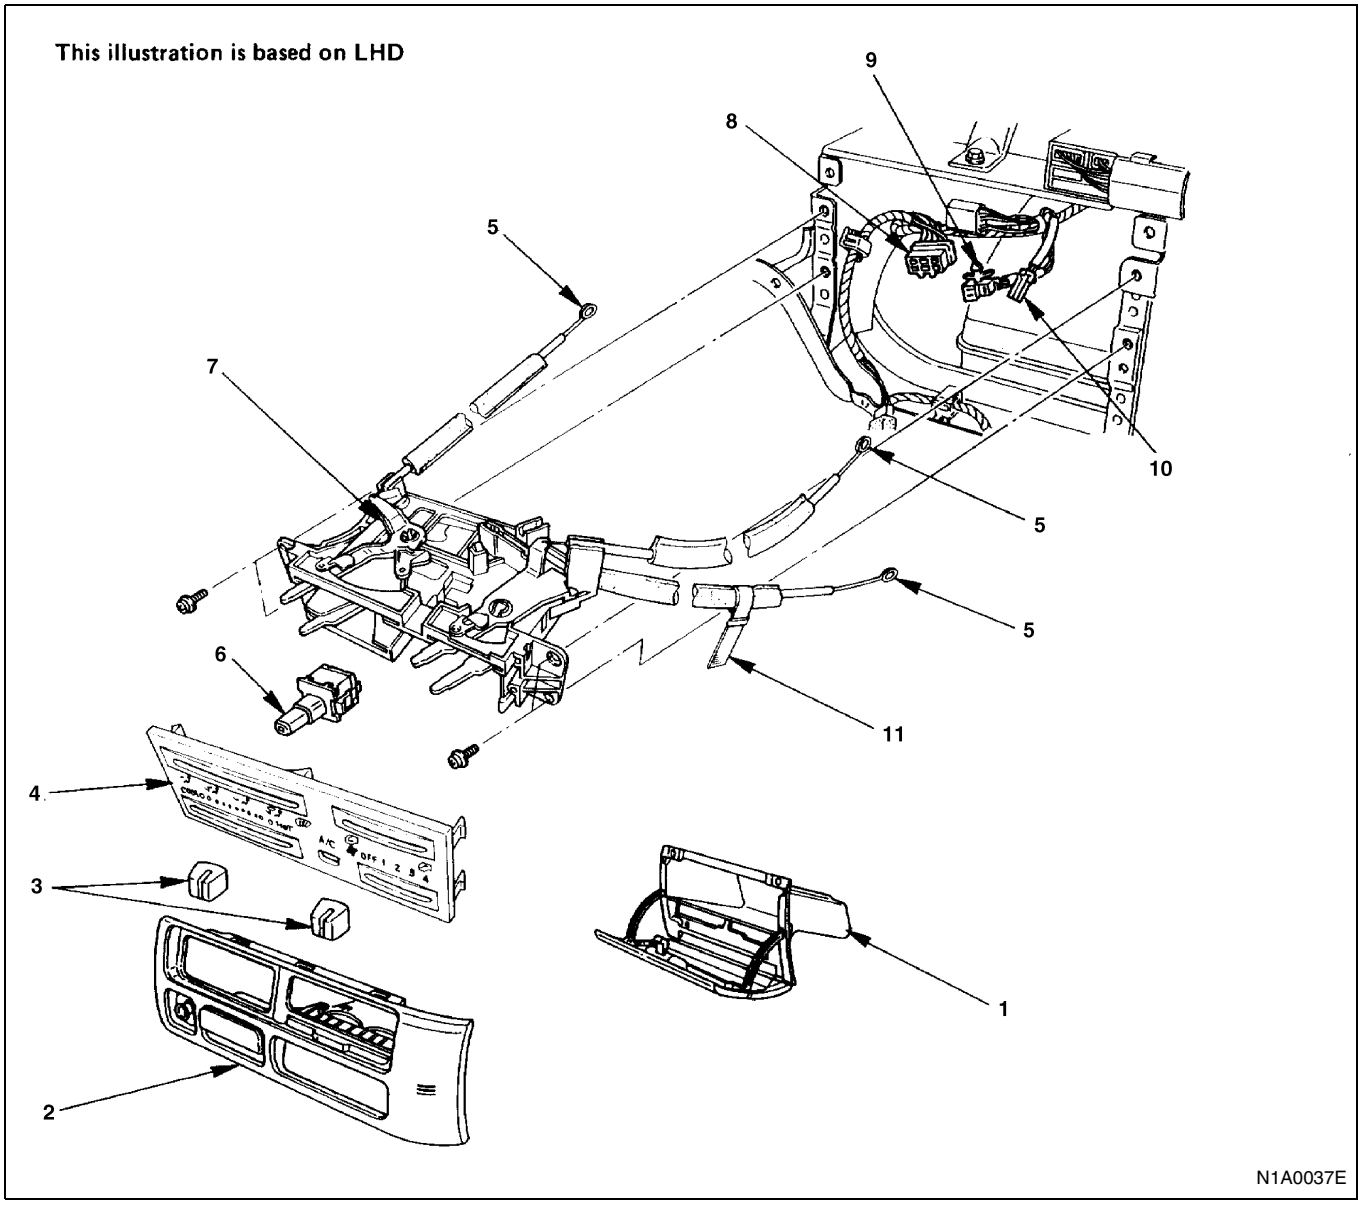
Disconnect the battery ground cable.

1. Instrument Panel Assembly
   Refer to Section 2 “CAB AND FRAME” for Instrument Panel removal procedure.
2. Ventilation Duct (RH)
3. Ventilation Duct (CTR)
4. Ventilation Duct (LH)
5. Reinforcement Stay
6. Defroster Nozzle
7. Side Defroster Nozzle

Installation

To install, follow the removal steps in the reverse order.

Control Lever Assembly



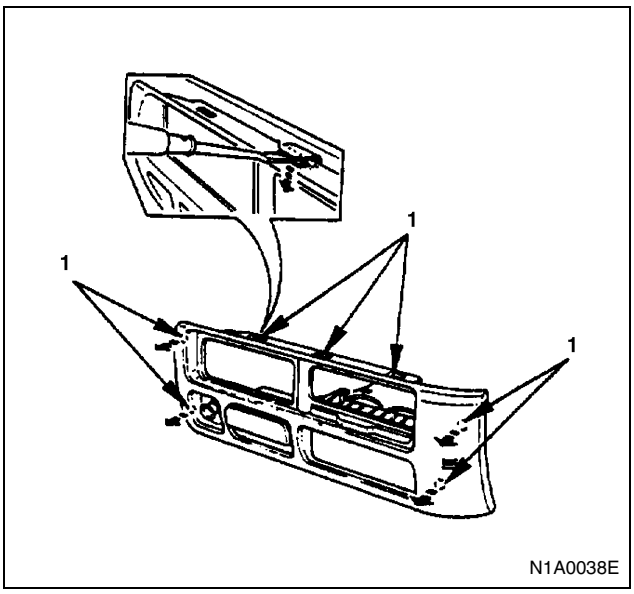
Legend

1. Glove box
2. Center cluster
3. Knob
4. Control panel bezel
5. Control cable
6. A/C switch (A/C only)
7. Control lever assembly
8. Fan switch connector
9. A/C switch connector
10. Illumination bulb connector
11. Clip

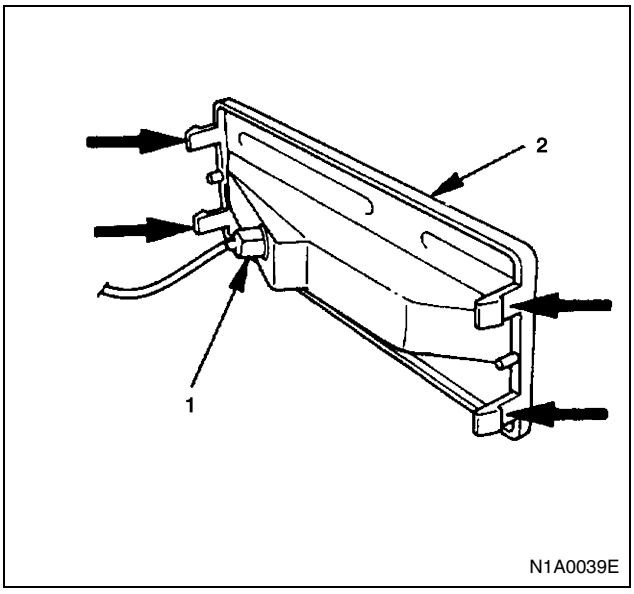
Removal

Preparation:
Disconnect the battery ground cable.

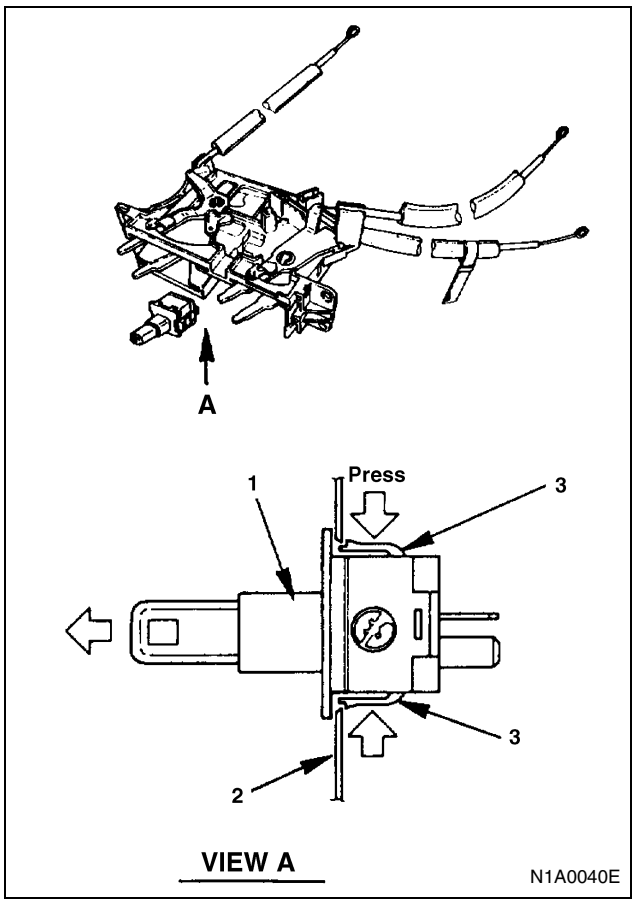
1. Glove Box
   Open the glove box and remove the fixing screws.
2. Center Cluster
   - While pulling the cluster with care, remove the upper and the back side clips (1) of the cluster.
   - Disconnect the cigar lighter and illumination connectors.



3. Knob
4. Control Panel Bezel
   Push the four catches at both sides of the bezel to the inside, and remove the illumination bulb (1) from the bezel (2).



5. Control Cable
   Disconnect the control cables from the heater and blower units.
6. A/C Switch
   Push the catches at both sides of the A/C switch to the inside, and remove the A/C switch by pulling it out.



Legend
1. A/C switch
2. Control lever
3. Catch

7. Control Lever Assembly
   - Remove the lever fixing bolts and pull the lever assembly out.
   - Disconnect the A/C switch connector clip and fan switch connector from the lever assembly.
   - Remove the control cable fixing clip.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. Adjust the control cables.
   Air source control cable
   1) Slide the control lever to the left (“CIRC” position).
   2) Connect the control cable at the “CIRC” position of the link unit of blower assembly and fix it with the clip.

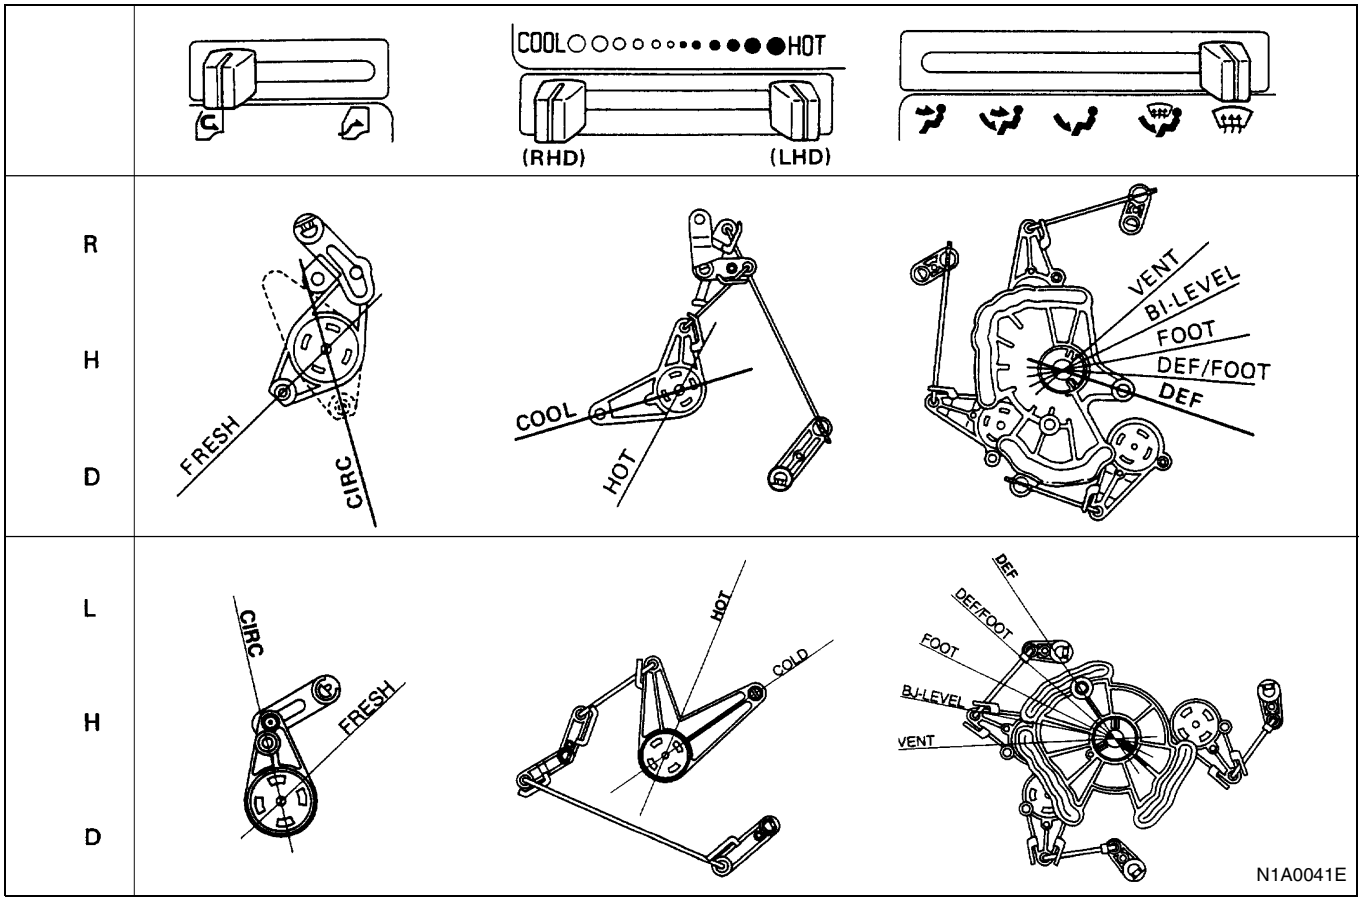
   Temperature control cable
   1) Slide the control lever to the left/right (“MAX COLD”/“MAX HOT” position).

2) Connect the control cable at the “COLD”/“HOT” position of the temperature control link of the heater unit and fix it with the clip.

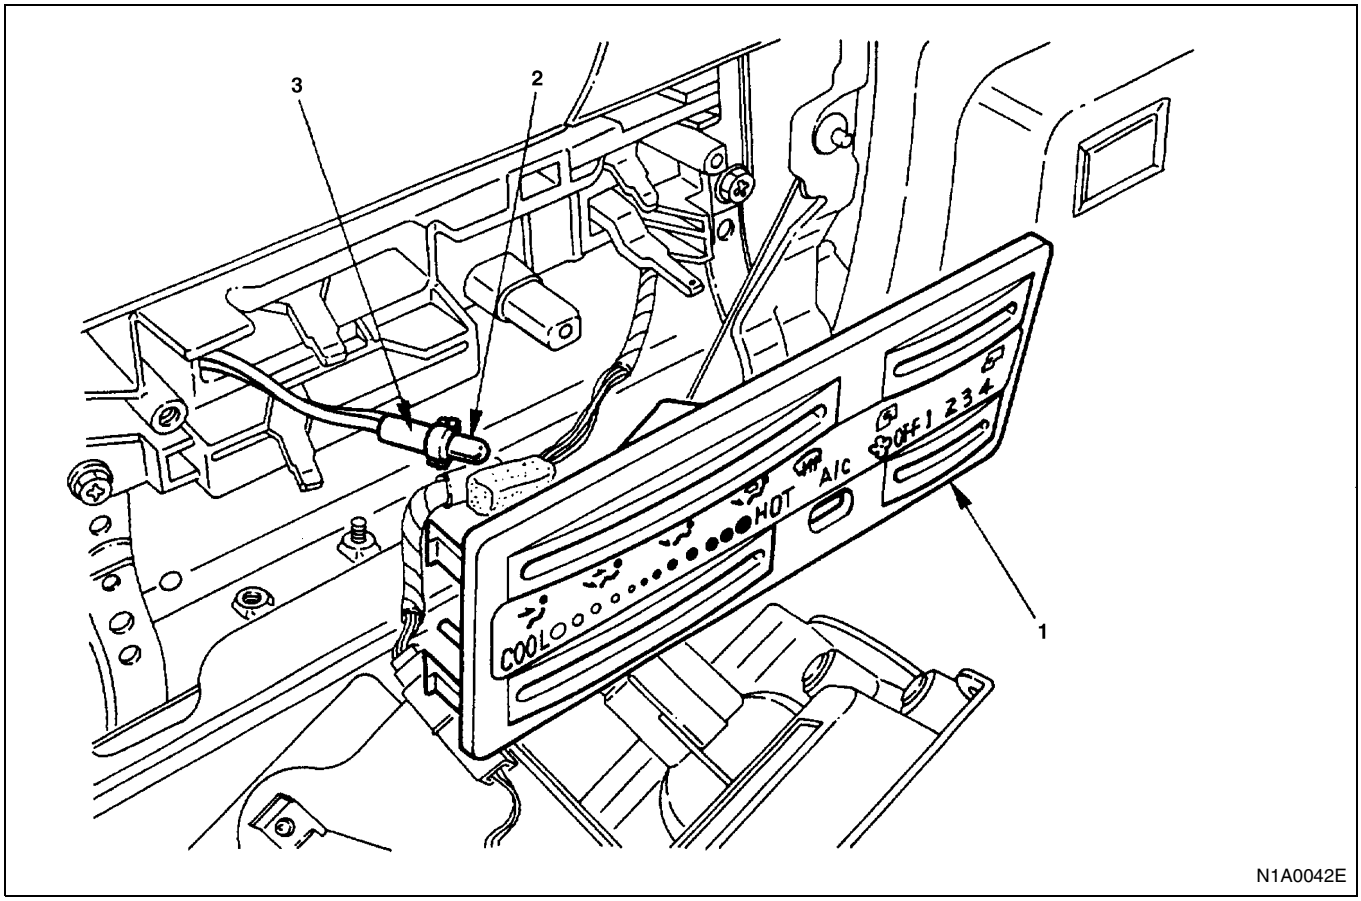
Air select control cable

1) Slide the control lever to the right (“DEFROST” position).
2) Connect the control cable at the “DEFROST” position of the mode control link of the heater unit and fix it with the clip.

2. Check control cable operation.



Control Panel Illumination Bulb



Legend

1. Control panel bezel
2. Control panel illumination bulb
3. Socket

Removal

Preparation:

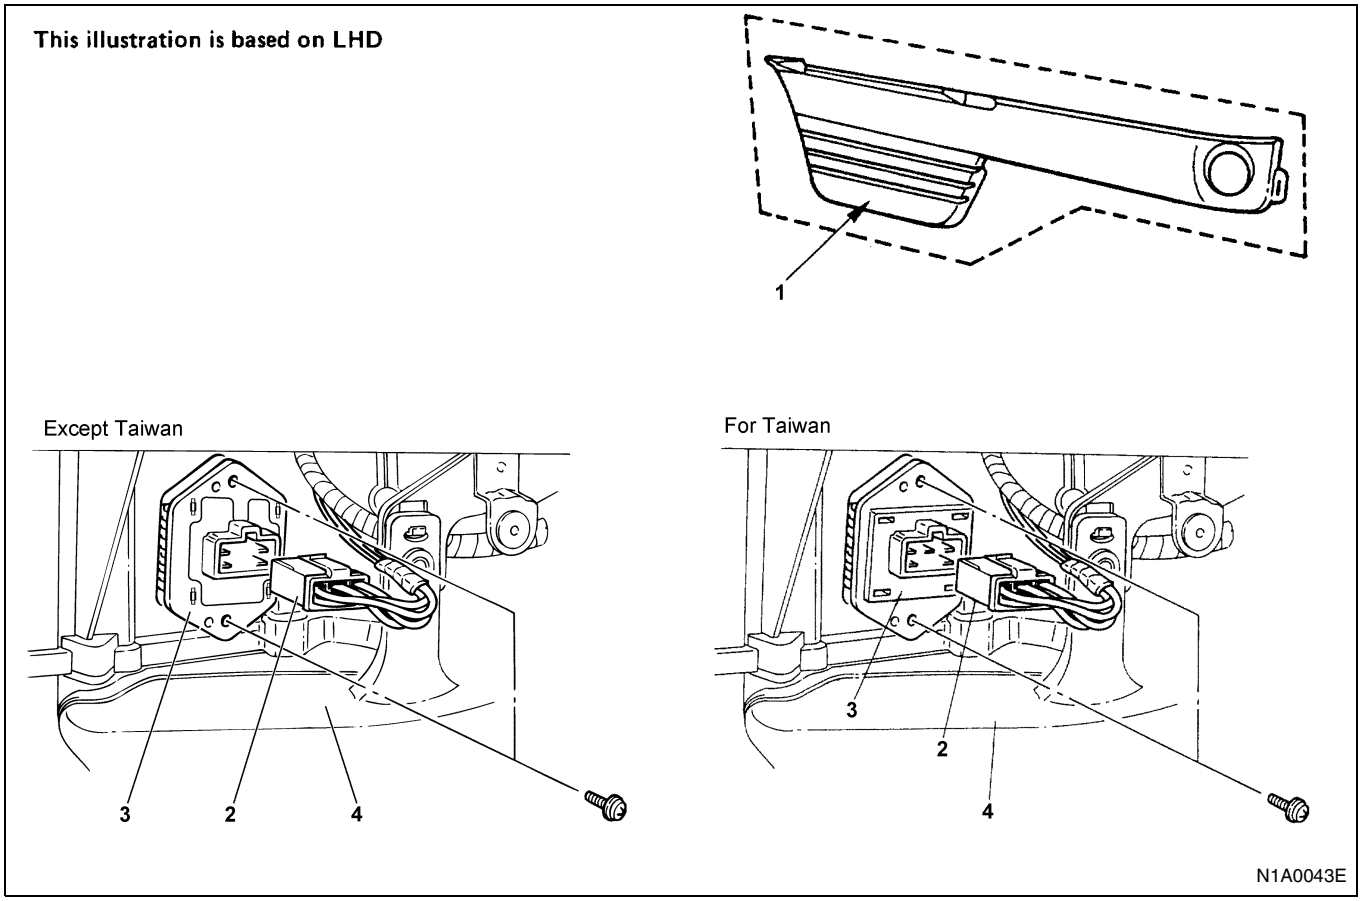
Disconnect the battery ground cable.

1. Control Panel Bezel
   Refer to “CONTROL LEVER ASSEMBLY” removal procedure.
2. Control Panel Illumination Bulb
   Pull the bulb from the bulb socket.

Installation

To install, follow the removal steps in the reverse order.

Resistor



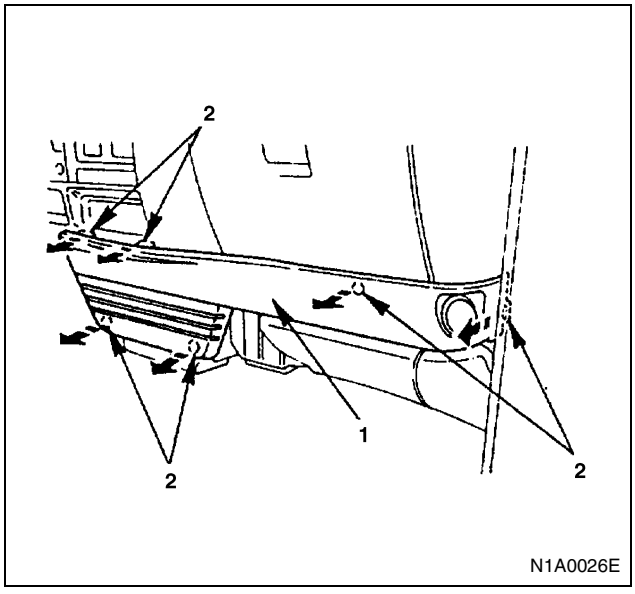
Legend

1. Under cover
2. Resistor connector
3. Resistor
4. Washer tank

Removal

Preparation:
Disconnect the battery ground cable.

1. Under Cover
   While pulling the under cover (1) with care, remove the clips (2) on the backside of the cover.



2. Resistor Connector
3. Resistor

Installation

To install, follow the removal steps in the reverse order.

HEATING AND AIR CONDITIONING

SECTION 1B
AIR CONDITIONING

Caution:
When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used.

Fasteners that are not reused, and those requiring thread locking compound, will be called out. The correct torque values must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

GENERAL DESCRIPTION

Caution:
This Vehicle is equipped with Refrigerant-134a (R-134a) air conditioning system.

R-134a and A-12 systems require different types of lubricating oil. Components designed solely for use with one refrigerant and oil type must never be interchanged with components designed solely for use with another refrigerant and oil type. Refer to “ON-VEHICLE SERVICE” for Precautions for R-134a Air Conditioning system in this section.

The refrigeration cycle includes the following four processes as the refrigerant changes repeatedly from liquid to gas and back to liquid while circulating.

Evaporation

The refrigerant is changed from a liquid to a gas inside the evaporator. The refrigerant mist that enters the evaporator vaporizes readily. The liquid refrigerant removes the required quantity of heat (latent heat of vaporization) from the air around the evaporator core cooling fins and rapidly vaporizes.
Removing the heat cools the air, which is then radiated from the fins and lowers the temperature of the air inside the vehicle.
The refrigerant liquid sent from the expansion valve and the vaporized refrigerant gas are both present inside the evaporator and the liquid is converted to gas.
With this change from liquid to gas, the pressure inside the evaporator must be kept low enough for vaporization to occur at a lower temperature.
Because of that, the vaporized refrigerant is sucked into the compressor.

Compression

The refrigerant is compressed by the compressor until it is easily liquefied at normal temperature.
The vaporized refrigerant in the evaporator is sucked into the compressor. This action maintains the refrigerant inside the evaporator at a low pressure so that it can easily vaporize, even at low temperatures close to 0°C (32°F).
Also, the refrigerant sucked into the compressor is compressed inside the cylinder to increase the pressure and temperature to values such that the refrigerant can easily liquefy at normal ambient temperatures.

Condensation

The refrigerant inside the condenser is cooled by the outside air and changes from gas to liquid.
The high temperature, high pressure gas coming from the compressor is cooled and liquefied by the condenser with outside air and accumulated in the receiver/drier. The heat radiated to the outside air by the high temperature, high pressure gas in the compressor is called heat of condensation. This is the total quantity of heat (heat of vaporization) the refrigerant removes from the vehicle interior via the evaporator and the work (calculated as the quantity of heat) performed for compression.

Expansion

The expansion valve lowers the pressure of the refrigerant liquid so that it can easily vaporize.
The process of lowering the pressure to encourage vaporization before the liquefied refrigerant is sent to the evaporator is called expansion. In addition, the expansion valve controls the flow rate of the refrigerant liquid while decreasing the pressure.
That is, the quantity of refrigerant liquid vaporized inside the evaporator is determined by the quantity of heat which must be removed at a prescribed vaporization temperature. It is important that the quantity of refrigerant be controlled to exactly the right value.

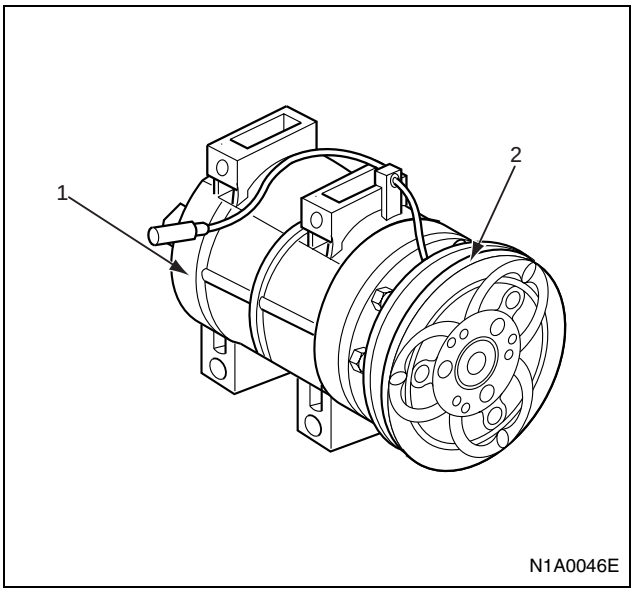
Compressor

The compressor performs two main functions:
It compresses low-pressure and low-temperature refrigerant vapor from the evaporator into high-pressure and high-temperature refrigerant vapor to the condenser. And it pumps refrigerant and refrigerant oil through the A/C system.
This vehicle is equipped with a swash plate type compressor (DKS-15 D Type, DKS-13 CH Type for Taiwan only).
Swash plate compressors have a swash (slanted) plate mounted on the shaft. When the shaft turns, the rotation of the swash plate is converted to reciprocating piston motion which sucks in and compresses the refrigerant gas.
Shaft seal (Lip type) is installed between the valve plate and shaft a cylinder head to prevent refrigerant gas leaks. A specified amount of compressor oil is contained in the oil pan.

This oil is supplied to the cylinders, bearings, etc., by an oil pump which is connected to the swash plate shaft.
With some compressors the differential between the intake pressure and discharge pressure generated while the compressor is operating is used for lubrication instead of an oil pump.
The specified amount of compressor oil is 180cc (5.0 Imp fl oz).
The oil used in the R-134a system compressor differs from that used in R-12 systems.
Also, compressor oil to be used varies according to the compressor model. Be sure to avoid mixing two or more different types of oil.
If the wrong oil is used, lubrication will be poor and the compressor will seize or malfunction.
(Refer to "ON-VEHICLE SERVICE" for Precautions for R-134a Air Conditioning System in this section)
The magnetic clutch connector is a waterproof type.

Magnetic Clutch

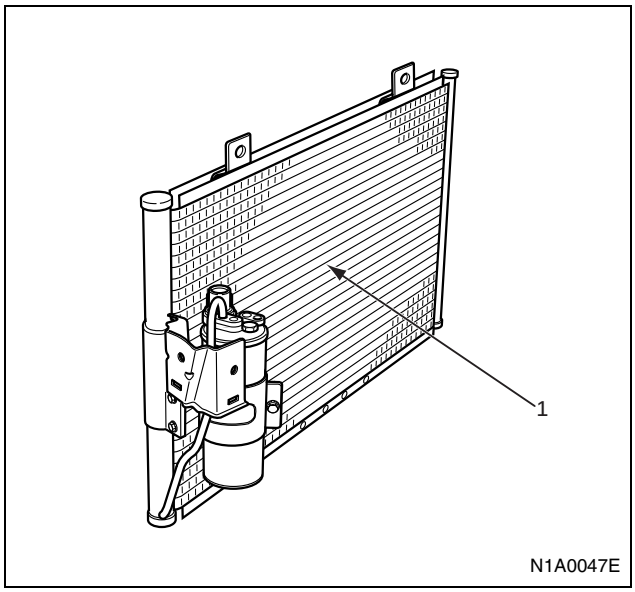
The compressor (1) is driven by the drive belt from the crank pulley of the engine. If the compressor is activated each time the engine is started, this causes too much load to the engine. The magnetic clutch (2) transmits the power from the engine to the compressor and activates it when the air conditioning is "ON". Also, it cuts off the power from the engine to the compressor when the air conditioning is "OFF". (Magnetic clutch repair procedure can be found in Section 1D)



Condenser

The condenser assembly in front of the radiator, which carry the refrigerant and cooling fins to provide rapid transfer of heat.
Also, it functions to cool and liquefy the high-pressure and high-temperature vapor sent from the compressor by the radiator fan or outside air.

A condenser (1) may malfunction in two ways: it may leak, or it may be restricted. A condenser restriction will result in excessive compressor discharge pressure. If a partial restriction is present, the refrigerant expands after passing through the restriction.
Thus, ice or frost may from immediately after the restriction. If air flow through the condenser or radiator is blocked, high discharge pressures will result. During normal condenser operation, the refrigerant outlet line will be slightly cooler than the inlet line.
The vehicle is equipped with the condenser of the parallel flow type condenser. A larger thermal transmission area on the inner surface of the tube allows the radiant heat to increase and the ventilation resistance to decrease.



Receiver/Drier

The receiver/drier performs four functions;

- As the quantity of refrigerant circulated varies depending on the refrigeration cycle conditions, sufficient refrigerant is stored for the refrigeration cycle to operate smoothly in accordance with fluctuations in the quantity circulated.
- The liquefied refrigerant from the condenser is mixed with refrigerant gas containing air bubbles. If refrigerant containing air bubbles is sent to the expansion valve, the cooling capacity will decrease considerably. Therefore, the liquid and air bubbles are separated and only the liquid is sent to the expansion valve.
- The receiver/drier utilizes a filter and dryer to remove the dirt and water mixed in the cycling refrigerant.

A receiver/drier may fail due to a restriction inside the body of the unit. A restriction at the inlet to the receiver/drier will cause high pressures.
Outlet restrictions will be indicated by low pressure and little or no cooling. An excessively cold receiver/drier outlet may indicate a restriction.

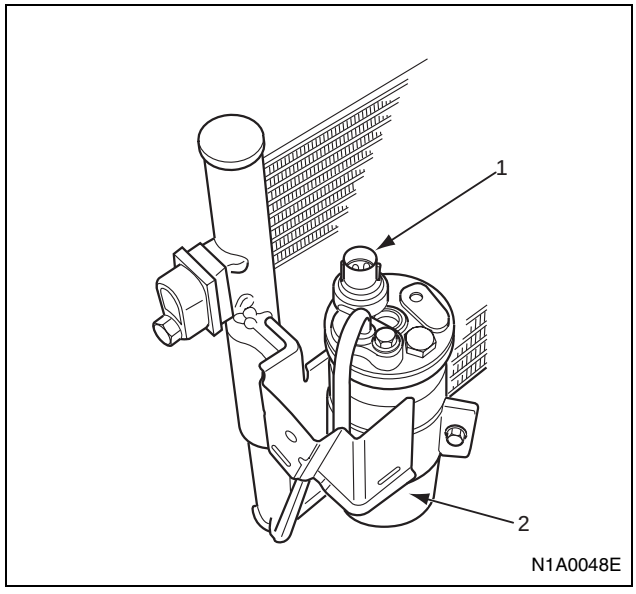
The receiver/drier of this vehicle is made of aluminum with a smaller tank. It has 250cc (7.1 Imp fl oz) refrigerant capacity.

Dual Pressure Switch (for GCC and Taiwan)

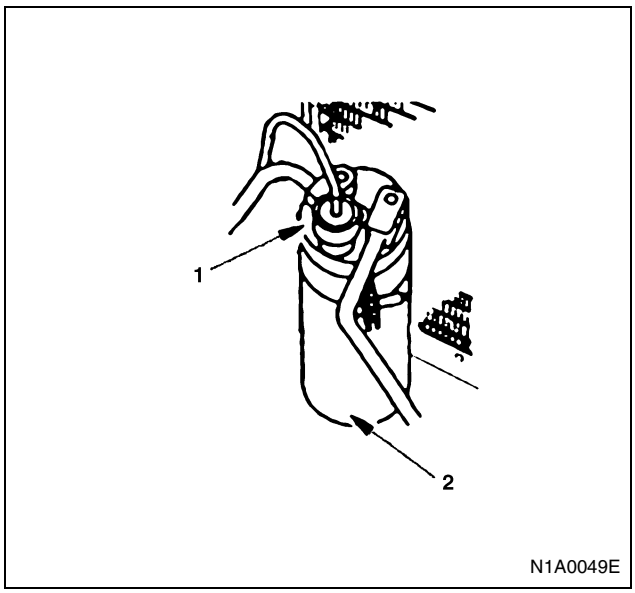
The dual pressure switch (1) is installed on the upper part the receiver/drier (2), to defect excessively high pressure (high pressure switch) and prevent compressor seizure due to the refrigerant leaking (low pressure switch), switching the compressor “ON” or “OFF” as required.
The pressure switch connector is water proof type.
R-134a refrigerant pressure characteristics differ from those of R-12. Thus, the dual pressure switch operation for R-134a systems has been changed from R-12.

- Low-pressure control (for GCC) kPa (kg/cm^2 / PSI)
  Compressor
  – ON: 206±30 (2.1±0.3 / 30±4)
  – OFF: 177±25 (1.8±0.2 / 26±3)
- High-pressure control (for GCC)
  Compressor
  – ON: 2,350±200 (24.0±2.0 / 341±29)
  – OFF: 2,940±200 (30.0±2.0 / 426±29)
- Low-pressure control (for Taiwan)
  Compressor
  – ON: 221±20 (2.25±0.2 / 32±3)
  – OFF: 196±20 (2.0±0.2 / 28±3)
- High-pressure control (for Taiwan)
  Compressor
  – ON: 2,350±200 (24.0±2.0 / 341±29)
  – OFF: 2,940±200 (30.0±2.0 / 426±29)

For GCC



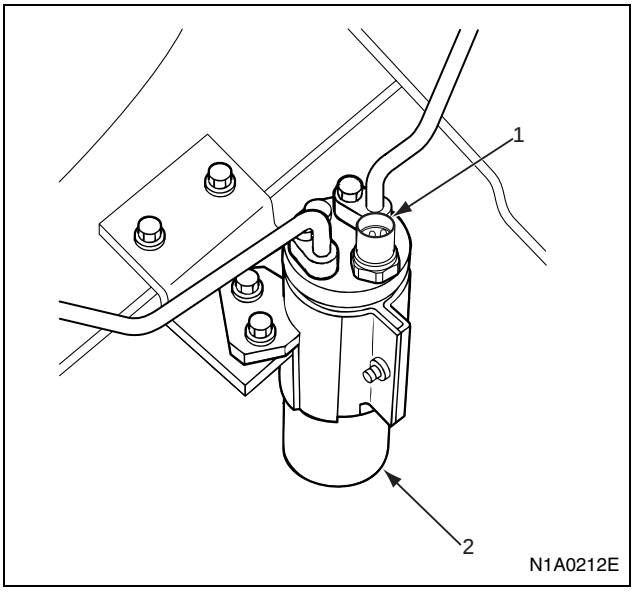
For Taiwan



Triple Pressure Switch (for Australia)

The triple pressure switch (1) is installed on the upper part of the receiver/drier (2). This switch is constructed with a unitized type of two switches. One of them is a low and high pressure switch (Dual pressure switch) to switch “ON” or “OFF” the magnetic clutch as a result of irregularly high-pressure or low-pressure of the refrigerant. The other one is a medium pressure switch (Cycling switch) to switch “ON” or “OFF” the condenser fan by sensing the condenser high side pressure.

- Low-pressure control kPa (kg/cm^2 / PSI)
  Compressor
  – ON: 206±30 (2.1±0.3 / 30±4)
  – OFF: 177±25 (1.8±0.2 / 26±3)
- Medium-pressure control
  Condenser fan
  – ON: 1,470±100 (15±1.0 / 213±14)
  – OFF: 1,079±120 (11±1.2 / 156±17)
- High-pressure control
  Compressor
  – ON: 2,350±200 (24.0±2.0 / 341±29)
  – OFF: 2,940±200 (30.0±2.0 / 426±29)



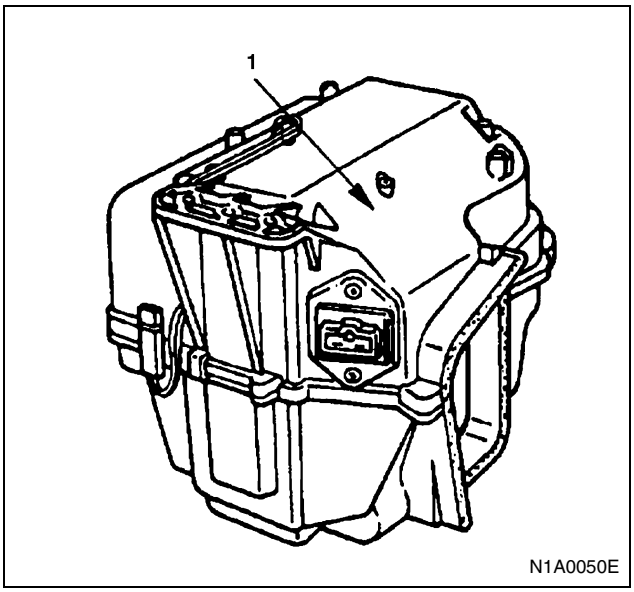
Evaporator

The evaporator (1) cools and dehumidifies the air before the air enters the vehicle. High-pressure liquid refrigerant flows through the expansion valve into the low-pressure area of the evaporator.The heat in the air passing through the evaporator core is lost to the cooler surface of the core, thereby cooling the air.

As heat is lost between the air and the evaporator core surface, moisture in the vehicle condenses on the outside surface of the evaporator core and is drained off as water.

When the evaporator malfunctions, the trouble will show up as inadequate supply of cool air. The causes is typically a partially plugged core due to dirt, or a malfunctioning blower motor.

The evaporator core with a laminate louver fin is a single-sided tank type where only one tank is provided under the core.



Expansion Valve

This expansion valve is external pressure type and it is installed at the evaporator intake port.

The expansion valve converts the high pressure liquid refrigerant sent from the receiver/drier to a low pressure liquid refrigerant by forcing it through a tiny port before sending it to the evaporator.

This type of expansion valve consists of a temperature sensor, diaphragm, ball valve, ball seat, spring adjustment screw, etc.

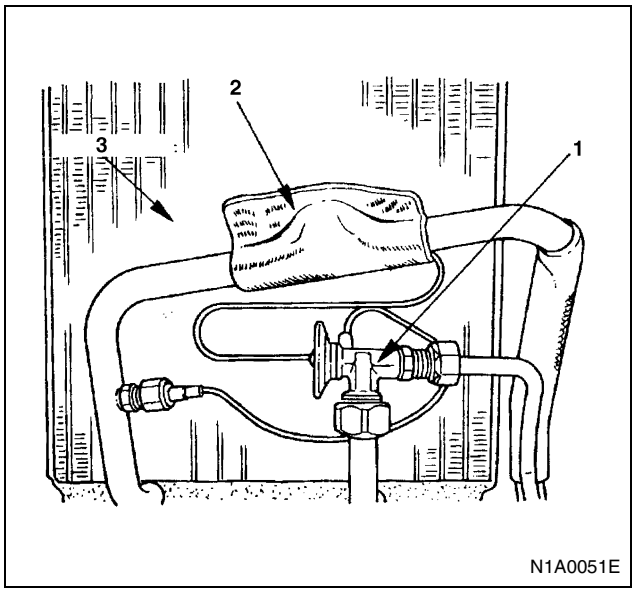
The temperature sensor contacts the evaporator outlet pipe, and converts changes in temperature to pressure. It then transmits these to the top chamber of the diaphragm.

The refrigerant pressure is transmitted to the diaphragms bottom chamber through the external equalizing pressure tube.

The ball valve is connected to the diaphragm. The opening angle of the expansion valve is determined by the force acting on the diaphragm and the spring pressure.

The expansion valve regulates the flow rate of the refrigerant. Accordingly, when a malfunction occurs to this expansion valve, both discharge and suction pressures get low, resulting in insufficient cooling capacity of the evaporator.

For R-134a air conditioning, the expansion valve calibration has been changed from R-12 to match the R-134a characteristics.

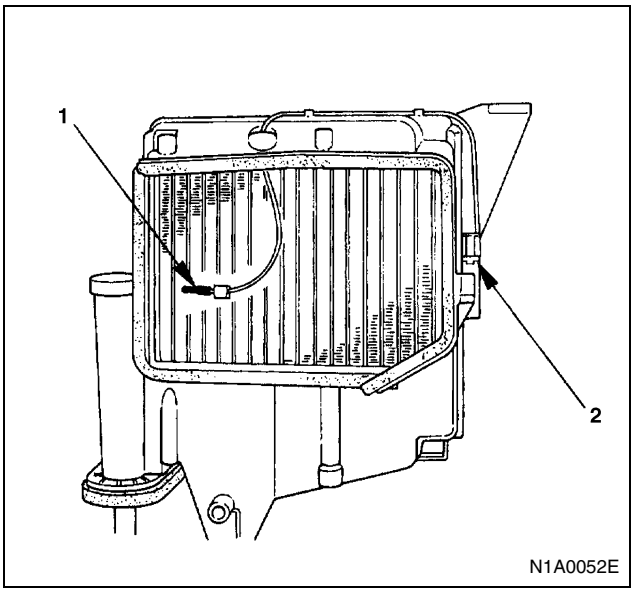


Legend

1. Expansion valve
2. Insulator
3. Evaporator core

Electronic Thermostat

The thermostat consists of the thermosensor (1) and thermostat unit (2) which functions electrically to reduce the noises being generated while the system is in operation.
The electronic thermosensor is mounted at the evaporator core outlet and senses the temperature of the cool air from the evaporator, Temperature signals are input to the thermostat unit. This information is compared by the thermo unit and the results in output to operate the A/C thermo relay and turn the magnetic clutch “ON” or “OFF” to prevent evaporator freeze-up.
A characteristic of the sensor is that the resistance decreases as the temperature increases and the resistance increases as the temperature decreases.

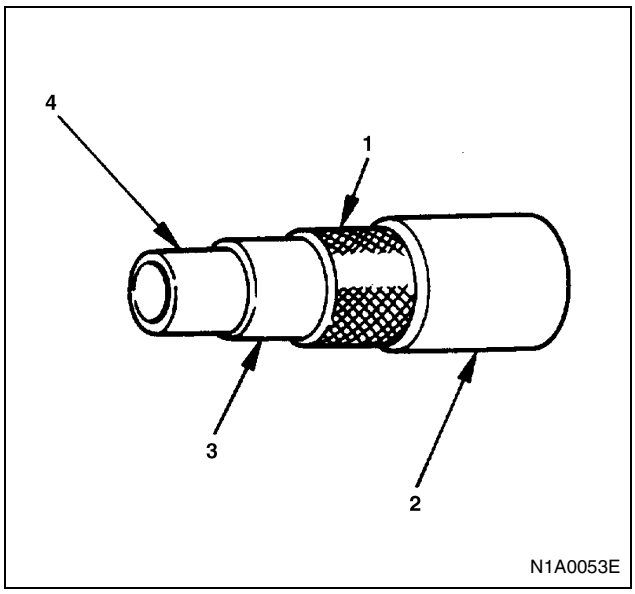


Refrigerant Line

Restrictions in the refrigerant line will be indicated by:

1. Suction line; A restricted suction line will cause low suction pressure at the compressor, low discharge pressure and little or not cooling.
2. Discharge line; A restriction in the discharge line generally will cause the discharge line to leak.
3. Liquid line; A liquid line restriction will be evidenced by low discharge and suction pressure and insufficient cooling.

Refrigerant flexible hoses that have a low permeability to refrigerant and moisture are used.
These low permeability hoses have a special nylon layer on the inside.



Legend

1. Reinforcement layer (Polyester)
2. External rubber layer
3. Internal rubber layer
4. Resin layer (Nylon)

Service Charge Valves

R-134a service charge valve shapes is different from the charge valves used in the R-12 system. The charging hoses have a quick-joint type fitting, to reduce refrigerant loss during removal and installation. This type of valve also eliminates the possibility of cross charging R-12 and R-134a systems when using approved service equipment.

ON-VEHICLE SERVICE

Precautions for Refrigerant -134a (R-134a) Air Conditioning System

This vehicle is equipped with Refrigerant-134a (R-134a) air conditioning system.
R-134a and R-12 systems require different types of lubricating oil. Components designed solely for use with one refrigerant and oil type must never be interchanged with components designed solely for use with another refrigerant and oil type.

R-134a Refrigerant:

- R-134a differs entirely from R-12 in its composition and, therefore, the two should never be mixed. Always charge the specified amount of R-134a.
- The pressure characteristics of R-134a differ from those of R-12. The low pressure is lower, and the high pressure is higher.

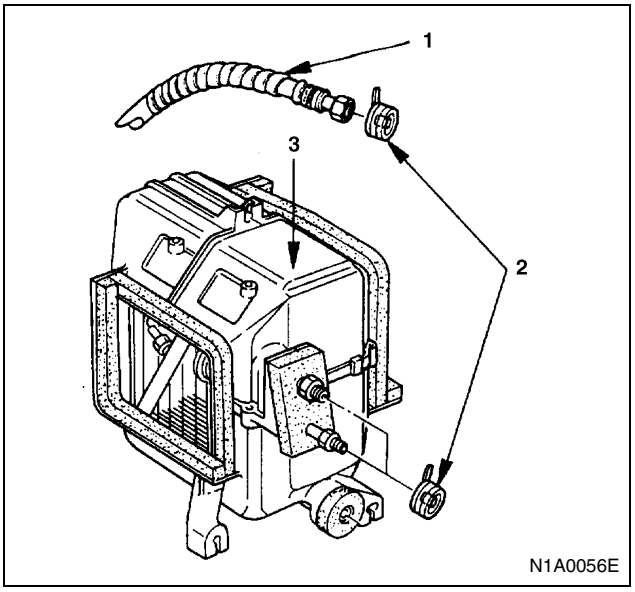
R-134a Compressor oil:

- The R-134a system requires a synthetic (PAG) compressor oil whereas the R-12 system requires a mineral compressor oil. The two oils must never be mixed.
- Compressor (PAG) oil varies according to compressor model. Be sure to use oil specified for the model of compressor.

Oil Specification

ZXL-100PG (ISUZU PART No. 8-97101-338-0)

- The PAG compressor oil for the R-134a system tends to absorb moisture more quickly than mineral oil. When air conditioning parts are removed for servicing, all the open ends of parts and components must be sealed with caps to keep out contaminants.
- The PAG compressor oil must be stored in metal containers, not in plastic containers.

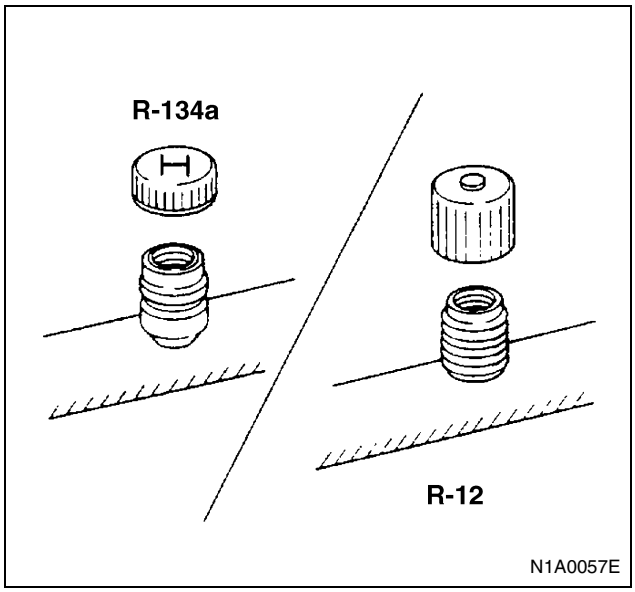


Legend

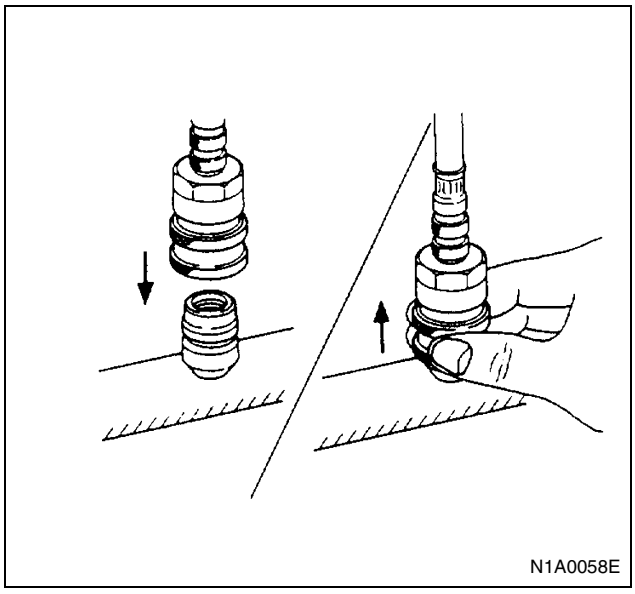
1. Refrigerant line
2. Cap
3. Evaporator

Service charge valve:

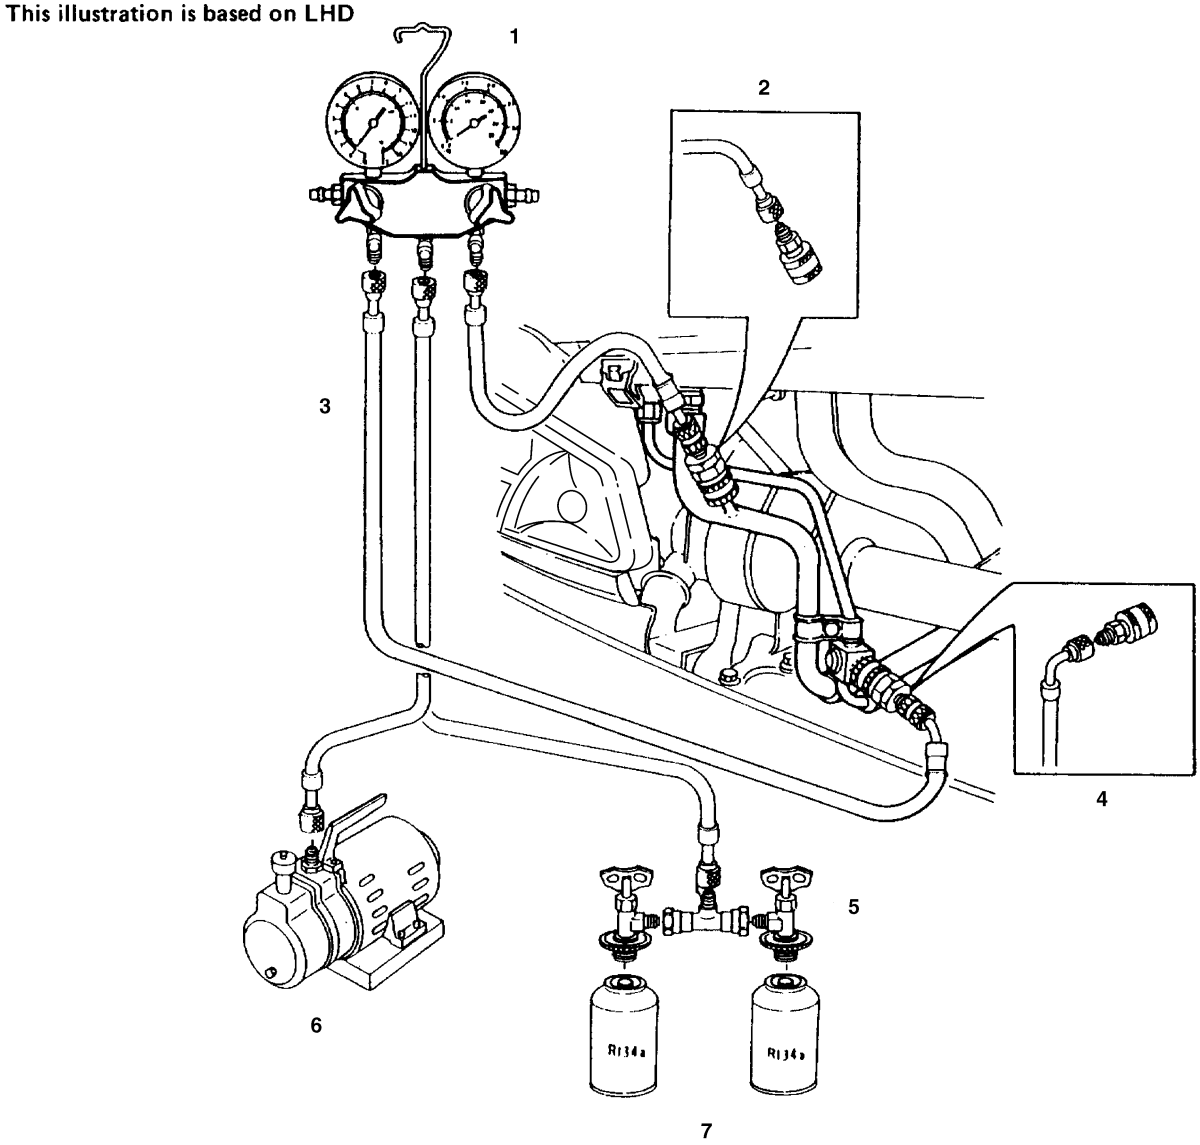
- The diameter of the service charge valve for the R-134a system is made larger than that for the R-12 system to prevent cross-contamination. In addition, the screw-in type joint of the R-12 system is replaced with a quick joint type in the R-134a system.



- To prevent refrigerant from escaping during installation and removal of charging hoses from the service charge valves, quick-joint type fittings are used.
  Connection: Push on firmly until locked (a “click” will be heard).
  Removal: Hold the grip-ring and pull to remove.



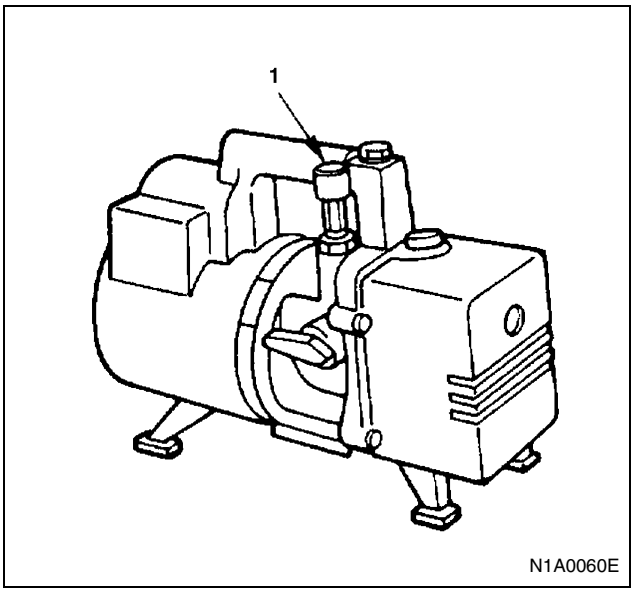
- Air conditioning manifold gauges, charging hoses and other service tools designed exclusively for the R-134a system must be used with this vehicle.



Legend

1. Manifold gauge
2. Quick joint (Low side)
3. Charging hose
4. Quick joint (High side)
5. Charge valve handle
6. Vacuum pump
7. Service container

- Do not use the same vacuum pump for evacuating the R-134a and R-12 systems interchangeably (The vacuum pump hose fitting is a M10X1.5).
- R-134a vacuum pumps must have a positive shut-off valve.



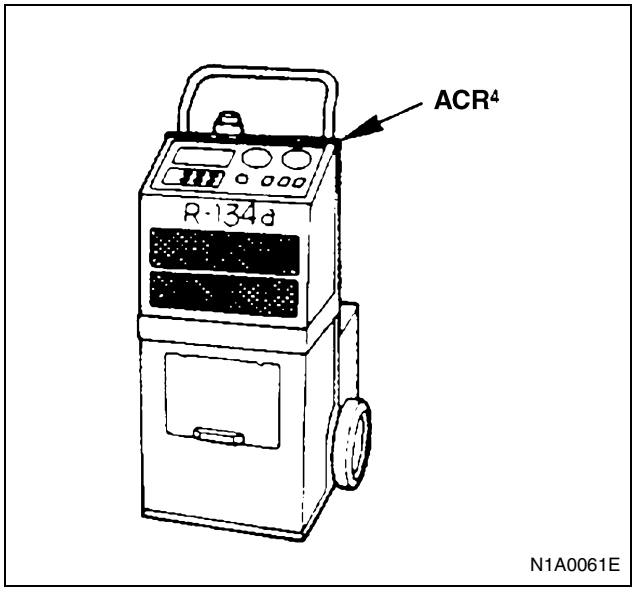
Legend

1. M10 × 1.5 (Hose fitting)

Caution:
Never use the same vacuum pump for both R-134a and R-12 systems, as cross contamination of compressor oil may occur.

Refrigerant Recovery, Recycling and Charging

- Avoid releasing the R-134a into the atmosphere. Use the ACR^4 (R-134a Refrigerant Recovery/ Recycling/ Recharging/ System) or equivalent to recover and recycle R-134a. Note that the ACR^4 (or equivalent) is not interchangeable between the R 134a and R-12 systems.
  ACR^4 (115V 60Hz): 5-8840-0629-0 (J-39500-A)
  ACR^4 (220-240V 50/60Hz): 5-8840-0630-0 (J-39500-220A)
  ACR^4 (220-240V 50/60Hz Australian model): 5-8840-0631-0 (J-39500-220ANZ)



Refrigerant Leak Inspection

- The flame type gas leak detector for the R-12 system cannot be used with the R-134a system.
- The electric leak detector for the R-12 cannot be used with the R-134a system as the R-134a particles are far smaller than the R-12 molecules and, therefore, may not be always detected. Use leak detectors designed exclusively for the R-134a system.

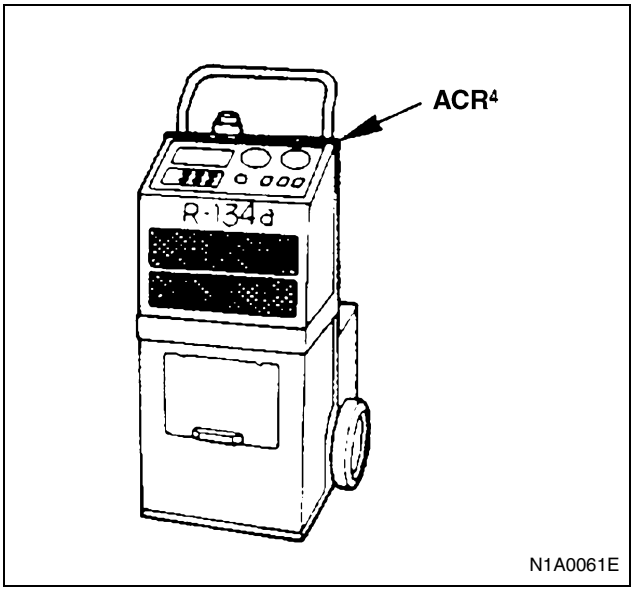
Precautions for Replacement or Repair of R-134a Air Conditioning Parts

There are certain procedure, practices and precautions that should be followed when servicing air conditioning systems:

- Keep your work area clean.
- Always wear safety goggle and protective gloves when working on refrigerant systems.
- Beware of the danger of carbon monoxide fumes caused by running the engine.
- Beware of discharged refrigerant in enclosed or improperly ventilated garages.
- Always disconnect the negative battery cable and discharge and recover the refrigerant whenever repairing the air conditioning system.
- When discharging and recovering the refrigerant, do not allow refrigerant to discharge too fast; it will draw compressor oil out of the system.
- Keep moisture and contaminants out of the system. When disconnecting or removing any lines or parts, use plugs or caps to close the fittings immediately.
  Never remove the caps or plugs until the lines or parts are reconnected or installed.
- When disconnecting or reconnecting the lines, use two wrenches to support the line fitting, to prevent from twisting or other damage.

- Always install new O-rings whenever a connection is disassembled.
- Before connecting any hoses or lines, apply new specified compressor oil to the O-rings.
- When removing and replacing any parts which require discharging the refrigerant circuit, the operations described in this Section must be performed in the following sequence:

1. Using the ACR^4 (R-134a Refrigerant Recovery/ Recycling/ Recharging/ System) or equivalent to thoroughly discharge and recover the refrigerant.
   ACR^4 (115V 60Hz): 5-8840-0629-0 (J-39500-A)
   ACR^4 (220-240V 50/60Hz): 5-8840-0630-0 (J-39500-220A)
   ACR^4 (220-240V 50/60Hz Australian model): 5-8840-06311-0 (J-39500-220ANZ)

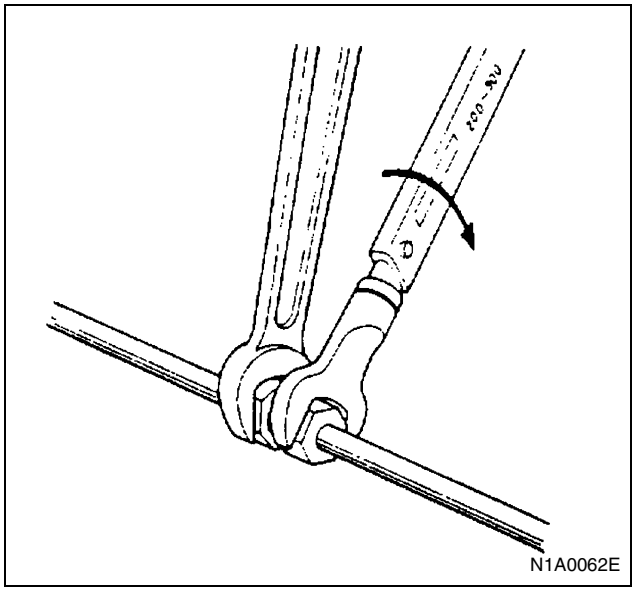


2. Remove and replace the defective part.
3. After evacuation, charge the air conditioning system and check for leaks.

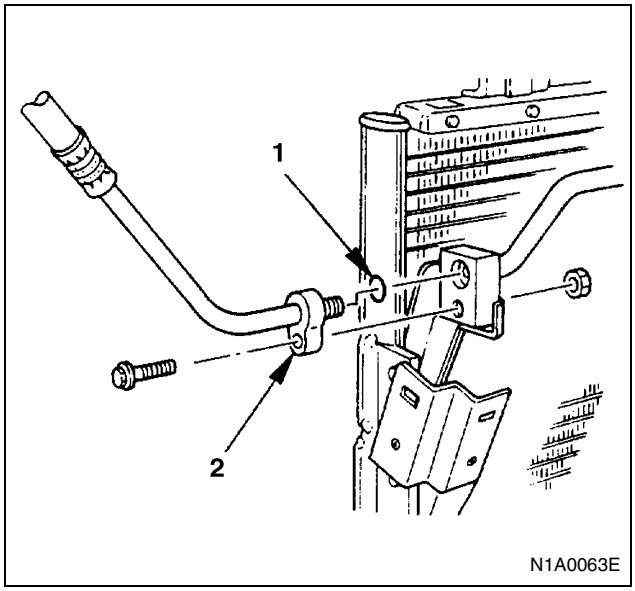
Repair of Refrigerant Leaks

Refrigerant Line Connections

Install new O-rings, if required. When disconnecting or connecting lines, use two wrenches to prevent the connecting portion from twisting or becoming damaged.



When connecting the refrigerant line at the block joint, securely insert the projecting portion of the joint portion into the connecting hole on the unit side and secure with a bolt.

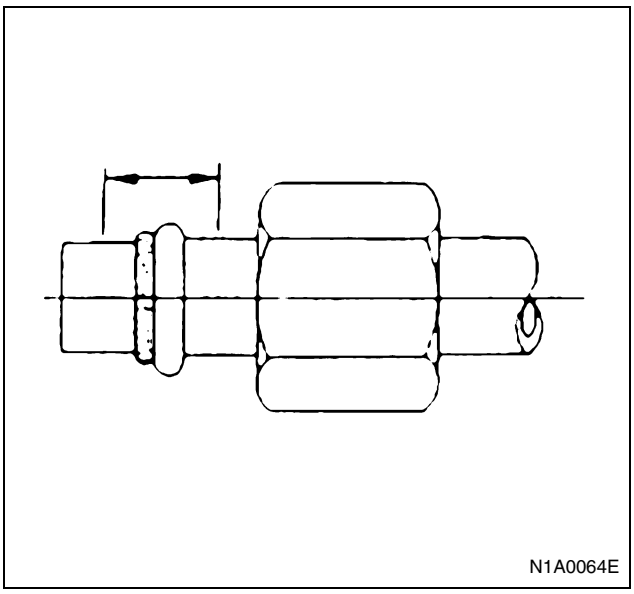


Legend

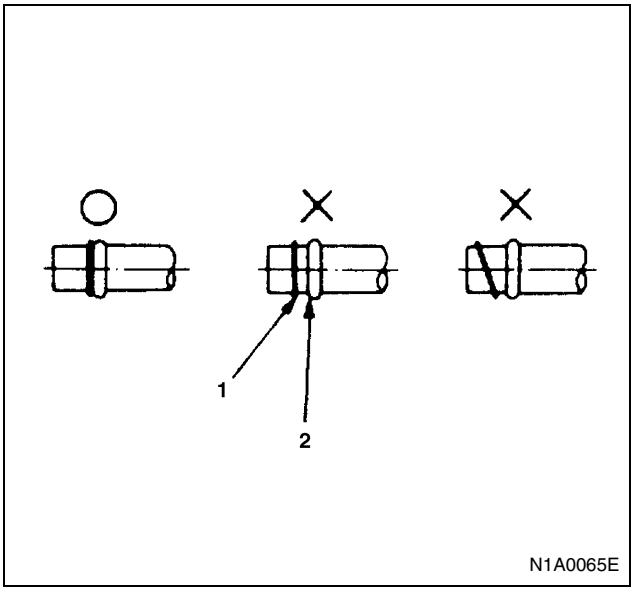
1. O-ring
2. Block joint

Apply specified compressor oil to the O-rings prior to connecting.

Caution:
Compressor (PAG) oil to be used varies according to compressor model. Be sure to apply specified oil for the model of compressor.

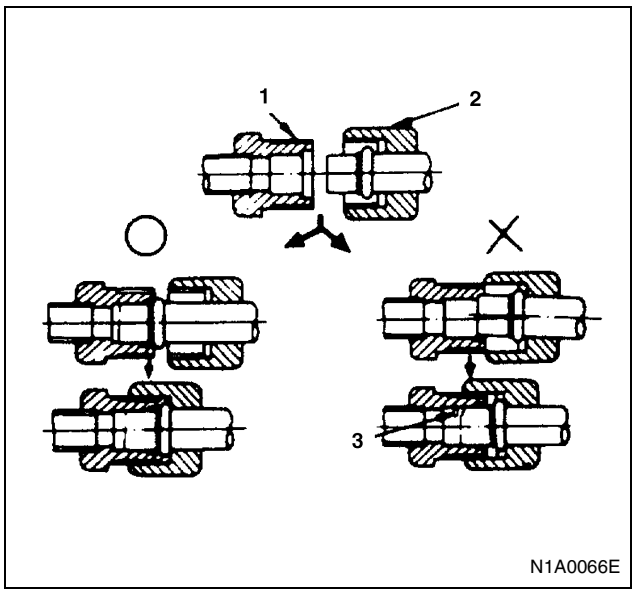


O-rings must be closely aligned with raised portion of refrigerant line.



Legend
1. O-ring
2. Raised portion

Insert nut into union. First tighten nut by hand as much as possible. Then, tighten nut to specified torque. (Refer to “SERVICE INFORMATION” for Fixing Torque in section 00)



Legend
1. Union
2. Nut
3. Damage

Leak at Refrigerant Line Connections

1. Check the torque on the refrigerant line fitting and, if too loose, tighten to the specified torque.
   - Use two wrenches to prevent twisting and damage to the Line.
   - Do not over tighten.
2. Perform a leak test on the refrigerant line fitting.
3. If the leak is still present, discharge and recover the refrigerant from the system.
4. Replace the O-rings.
   - O-rings cannot be reused. Always replace with new ones.
   - Be sure to apply specified compressor oil to the new O-rings.
5. Retighten the refrigerant line fitting to the specified torque.
   - Use two wrenches to prevent twisting and damage to the line.
6. Evacuate, charge and retest the system.

Leak in The Hose

If the compressor inlet or outlet hose is leaking, the entire hose must be replaced. Refrigerant hose must not be cut or spliced for repair.

1. Locate the leak.
2. Discharge and recover the refrigerant.
3. Remove the hose assembly.
   - Cap the open connections at once.
4. Connect the new hose assembly.
   - Use two wrenches to prevent twisting or damage to the hose fitting.

- Tighten the hose fitting to the specified torque.

5. Evacuate, charge and test the system.

Compression Leaks

If leaks are located around the compressor shaft seal or shell, replace or repair the compressor.

Recovery, Recycling, Evacuation and Charging

Handling Refrigerant-134a
Air conditioning systems contain R-134a.
This is a chemical mixture which requires special handling procedures to avoid personal injury.

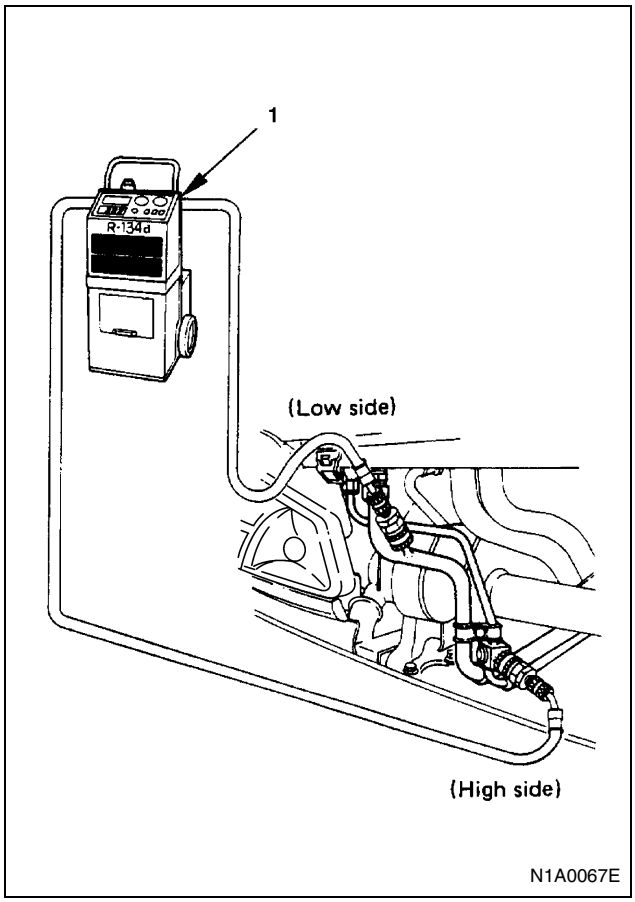
- Always wear safety goggles and protective gloves.
- Always work in a well-ventilated area. Do not weld or steam clean on or near any vehicle-installed air conditioning lines or components.
- If R-134a should come in contact with any part of the body, flush the exposed area with cold water and immediately seek medical help.
- If it is necessary to transport or carry any container of R-134a in a vehicle, do not carry it in the passenger compartment.
- If it is necessary to fill a small R-134a container from a large one, never fill the container completely. Space should always be allowed above the liquid for expansion.
- R-134a and R-12 should never be mixed as their compositions are not the same.
- R-134a PAG oil tends to absorb moisture more quickly than R-12 mineral oil and, therefore, should be handled more carefully.
- Keep R-134a containers stored below 40°C (100°F).

WARNING:

- **SHOULD R-134a CONTACT YOUR EYE(S), CONSULT A DOCTOR IMMEDIATELY.**
- **DO NOT RUB THE AFFECTED EYE(S). INSTEAD, SPLASH QUANTITIES OF FRESH COLD WATER OVER THE AFFECTED AREA TO GRADUALLY RAISE THE TEMPERATURE OF THE REFRIGERANT ABOVE THE FREEZING POINT.**
- **OBTAIN PROPER MEDICAL TREATMENT AS SOON AS POSSIBLE. SHOULD THE R-134a TOUCH THE SKIN, THE INJURY MUST BE TREATED THE SAME AS SKIN WHICH HAS BEEN FROSTBITTEN OR FROZEN.**

Refrigerant Recovery

The refrigerant must be discharged and recovered by using ACR^4 (R-134a Refrigerant Recovery/ Recycling/ Recharging/ System) (1) or equivalent before removing or mounting air conditioning parts.
ACR^4 (115V 60Hz): 5-8840-0629-0 (J-39500-A)
ACR^4 (220-240V 50/60Hz): 5-8840-0630-0 (J-39500-220A)
ACR^4 (220-240V 50/60Hz Australian model): 5-88410-0631-0 (J-39500-220ANZ)



1. Connect the high and low charging hoses of the ACR^4 (or equivalent) as shown.
2. Recover the refrigerant by following the ACR^4 Manufacture's Instructions.
3. When a part is removed, put a cap or a plug on the connecting portion so that dust, dirt or moisture cannot get into it.

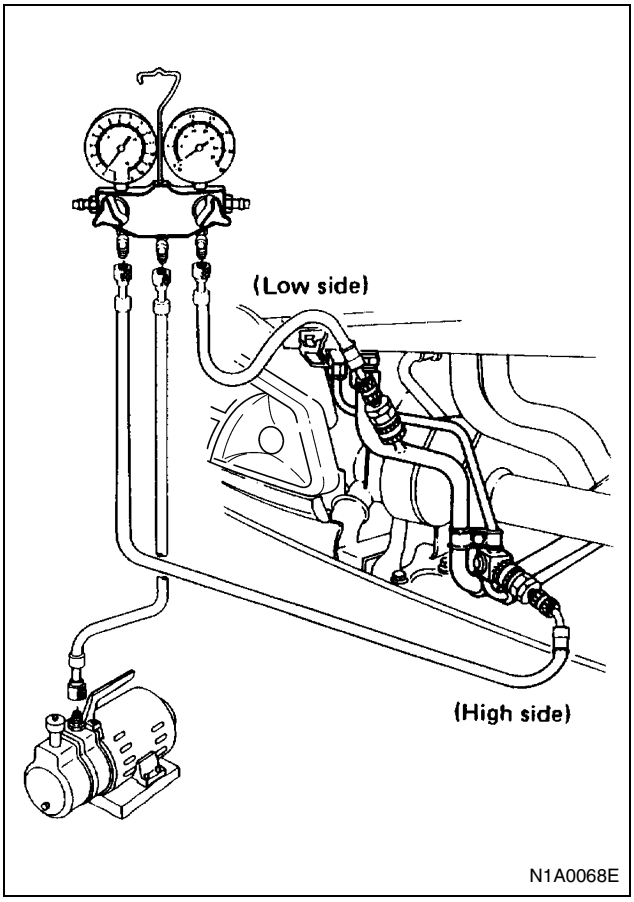
Refrigerant Recycling

Recycle the refrigerant recovered by ACR^4 or equivalent.
For the details of the actual operation, follow the steps in the ACR^4 Manufacture's Instructions.
ACR^4 (115V 60Hz): 5-8840-0629-0 (J-39500-A)
ACR^4 (220-240V 50/60Hz): 5-8840-0630-0 (J-39500-220A)
ACR^4 (220-240V 50/60Hz Australian model): 5-8840-0631-0 (J-39500-220ANZ)

Evacuation of The Refrigerant System

Notice:
Explained below is a method using a vacuum pump. Refer to ACR^4 (or equivalent) manufacture's instructions when evacuating the system with ACR^4 (or equivalent).

Air and moisture in the refrigerant will cause problems in the air conditioning system.
Therefore, before charging the refrigerant, be sure to evacuate air and moisture thoroughly from the system.



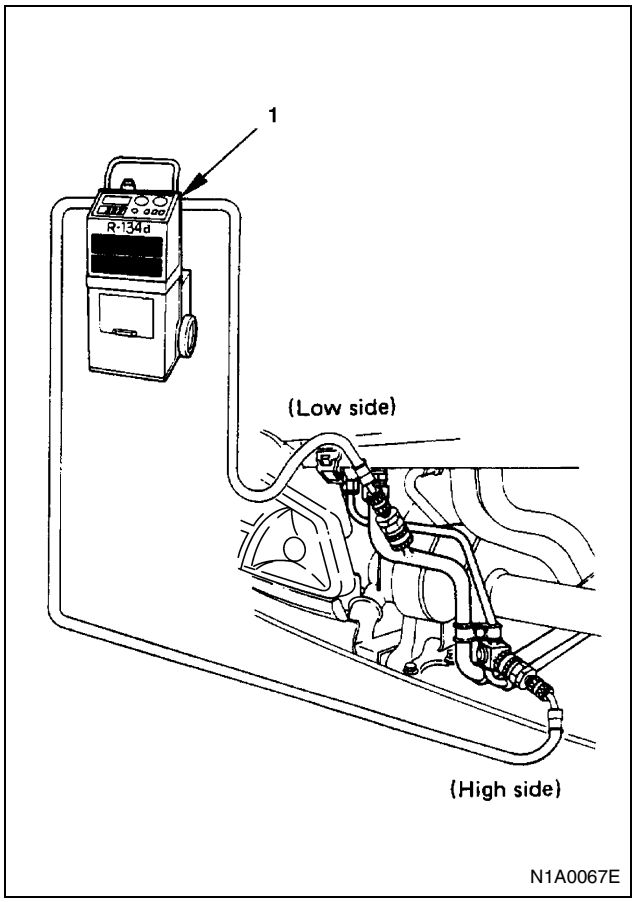
1. Connect the gauge manifold.
   - High-pressure valve (HI) — Discharge-side
   - Low-pressure valve (LOW) — Suction-side
2. Discharge and recover the refrigerant.
3. Connect the center hose of the gauge manifold set to the vacuum pump inlet.
4. Operate the vacuum pump, open shutoff valve and then open both hand valves.
5. When the low-pressure gauge indicates approx. 750 mmHg (30 inHg), continue the evacuation for 5 minutes or more.
6. Close both hand valves and stop the vacuum pump.
7. Check to ensure that the pressure does not change after 10 minutes or more.
   - If the pressure changes, check the system for leaks.
   - If leaks occur, retighten the refrigerant line connections and repeat the evacuation steps.
8. If no leaks are found, again operate the vacuum pump for 20 minutes or more. After confirming that the gauge manifold pressure is at 750 mmHg(30 inHg), close both hand valves.
9. Close positive shutoff valve.
   Stop the vacuum pump and disconnect the center hose from the vacuum pump.

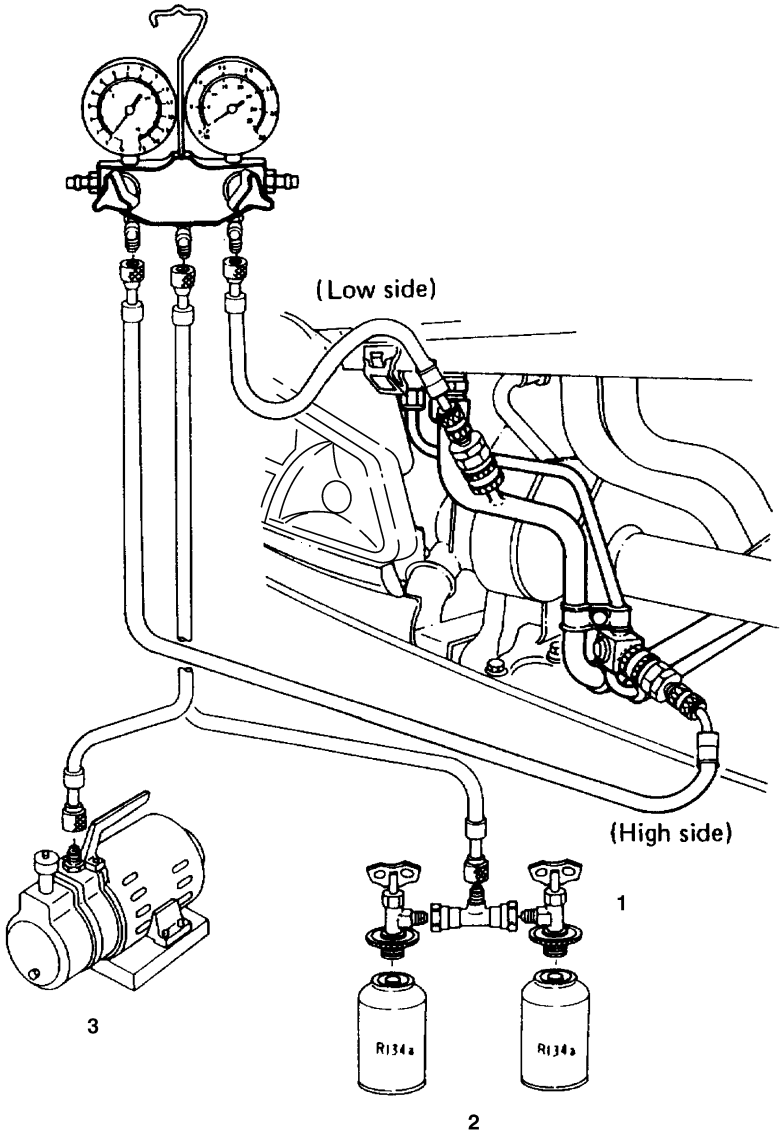
Charging The Refrigerant System

There are various methods of charging refrigerant into the air conditioning system.
These include using ACR^4 (R-134a Refrigerant Recovery/ Recycling/ Recharging/ System) or equivalent and direct charging with a manifold gauge charging station.
ACR^4 (115V 60Hz): 5-8840-0629-0 (J-39500-A)
ACR^4 (220-240V 50/60Hz): 5-8840-0630-0 (J-39500-220A)
ACR^4 (220-240V 50/60Hz Australian model): 5-8840-0631-0 (J-39500-220ANZ)

Charging procedure

- ACR^4 (or equivalent) method
  For the charging of refrigerant recovery by ACR^4 (1), follow the manufacture's instruction.





N1A0070E

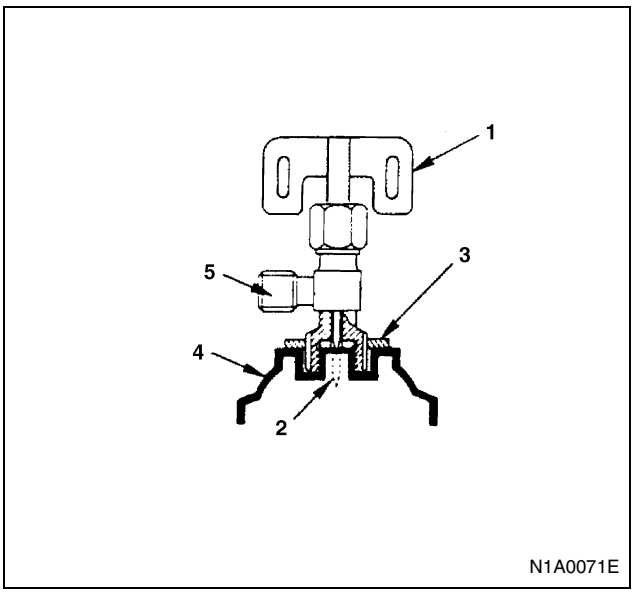
Legend

1. Charge valve handle
2. Service container
3. Vacuum pump

- Direct charging with a manifold gauge charging station method
  Handling the charging valve handle when installing refrigerant container.

1. Before attaching the charge valve to the refrigerant container, turn the charge valve handle (1) counterclockwise until the needle (2) is fully retracted.
2. Turn the plate nut (3) counterclockwise until it reaches its highest position relative to the charge valve.
3. Install the charge valve onto the refrigerant container (4).
4. Turn the plate nut clockwise and connect the center hose of the manifold gauge to the charge valve (5).
5. Tighten the plate nut sufficiently by hand. Then turn the charge valve handle clockwise to lower the needle and bore a hole in the refrigerant container.
6. Turn the charge valve handle counterclockwise to raise the needle. The refrigerant in the refrigerant container is charged into the air conditioning system by the operation of the manifold gauge.

- Be absolutely sure not to reuse the emptied refrigerant container.



1. Make sure the evacuation process is correctly completed.
2. Connect the center-hose of the manifold gauge to the refrigerant container.
   - Turn the charge valve handle counterclockwise to purge the charging line and purge any air existing in the center-hose of the manifold gauge.
3. Open the low-pressure hand valve and charge the refrigerant about 200 g (0.44 lbs.).
   - Make sure the high-pressure hand valve is closed.
   - Avoid charging the refrigerant by turning the refrigerant container upside down.
4. Close the low-pressure hand valve of the manifold gauge.
   - Check to ensure that the degree of pressure does not charge.
5. Check the refrigerant leaks by using a R-134a leak detector.
   - If a leak occurs, repair the leak connection, and start all over again from the first step of evacuation.
6. If no leaks are found, open the low-pressure hand valve of the manifold gauge. Then continue charging refrigerant to the system.
   - When charging the system becomes difficult:
     1) Run the engine at 1,300 — 1,500 rpm and open the all vehicle doors.
     2) A/C switch is “ON”.
     3) Set the fan control knob (fan switch) to its highest position.

WARNING:
BE ABSOLUTELY SURE NOT TO OPEN THE HIGH-PRESSURE HAND VALVE. SHOULD THE HIGH-PRESSURE HAND VALVE BE OPENED, THE HIGH-PRESSURE REFRIGERANT GAS WOULD FLOW BACKWARD, AND THIS MAY CAUSE THE REFRIGERANT CONTAINER TO BURST.

7. When the refrigerant container is emptied, use the following procedure to replace it with a new refrigerant container.
   1) Close the low pressure hand valve.
   2) Raise the needle upward and remove the charge valve.
   3) Reinstall the charge valve to the new refrigerant container.
   4) Purge any air existing in the center hose of the manifold gauge.
8. Charge the system to the specified amount and then close the low-pressure hand valve.

Refrigerant Amount	g (lbs.)
450 (0.99) GCC, 600 (1.32) Australia & Taiwan	

   - A fully charged system is indicated by the sight glass on the receiver/drier being free of any bubbles (Refer to “Reading Sight Glass”).
   - Check the high and low pressure value of the manifold gauge.
   - Check for refrigerant leaks by using a R-134a leak detector.
     Immediately after charging refrigerant, both high and low pressures are slightly high and to the left of the gauge, but they settle down to the guide pressure valves as shown below:
   - Ambient temperature; 30 — 35°C (86 — 95°F)
   - Guide pressure
     High-pressure side;
     Approx. 1373 — 1667 kPa (14 — 17 kg/cm^2 / 199 — 242 PSI)
     Low-pressure side;
     Approx. 127 — 245 kPa (1.3 — 2.5 kg/cm^2 / 18 — 36 PSI)
9. Close the low pressure hand valve and charge valve of the refrigerant container.
10. Stop the air conditioning and the engine.
11. Disconnect the high and low pressure hoses from the manifold gauge fittings.

Reading Sight Glass

High and low pressure pipe temperature	The high pressure pipe is hot and the low pressure pipe is cold. There is a distinct difference in temperature between them.	The high pressure pipe is warm and the low pressure pipe is cool. There is no great difference in temperature between them.	There is little difference in temperature between the high pressure pipe and the low pressure pipe.	The high pressure pipe is hot and the low pressure pipe is slightly warm. There is a difference in temperature between them.
Sight glass condition	Almost transparent. A flow of bubbles can be seen, but they disappear when the throttle is opened.  N1A0072E	A flow of bubbles always can be seen. It appears sometimes transparent, and sometimes frothy.  N1A0073E	Something like fog faintly can be seen.  N1A0074E	Even at idle with the fan at “HI” (with the window fully open), the bubbles cannot be seen.  N1A0075E
Air conditioner cycle condition	OK	NG (Not enough refrigerant)	NG (Almost no refrigerant)	NG (Too much refrigerant)

The sight glass provides accurate diagnosis only under the following conditions.
If the vehicle can be tested under these conditions, check the sight glass appearance and compare to the chart.

- Engine speed 1,500 RPM
- A/C switch “ON”
- Blower fan operating at highest speed
- Air source selector lever at “RECIRC”
- Temperature control knob at coldest position
- Ambient temperature below 35°C (95°F) and humidity below 70%

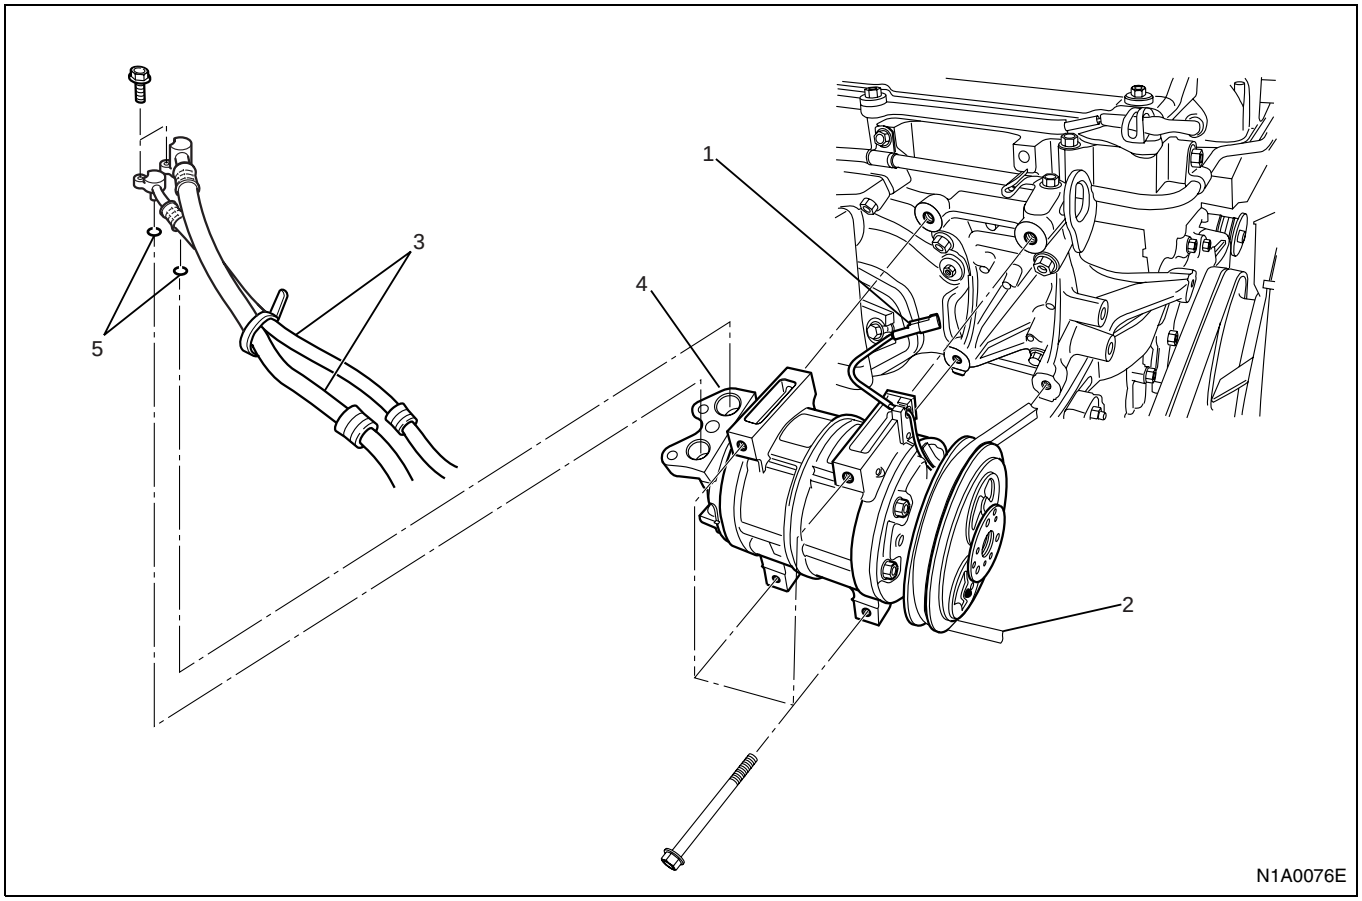
Notice:
If the vehicle cannot be moved to a testing location that meets these specifications, then the sight glass cannot be used for diagnosis. You must discharge and recover the refrigerant, then recharge the system with the specified amount of refrigerant. Then continue checking the system performance.

- High side pressure less than 1667 kPa (17 kg·cm^2 / 242 PSI)

Notice:
If the high side pressure is greater than stated, the sight glass cannot be used for diagnosis. You must discharge and recover the refrigerant, then recharge the system with the specified amount of refrigerant.

Then continue checking system performance.

Compressor



Legend

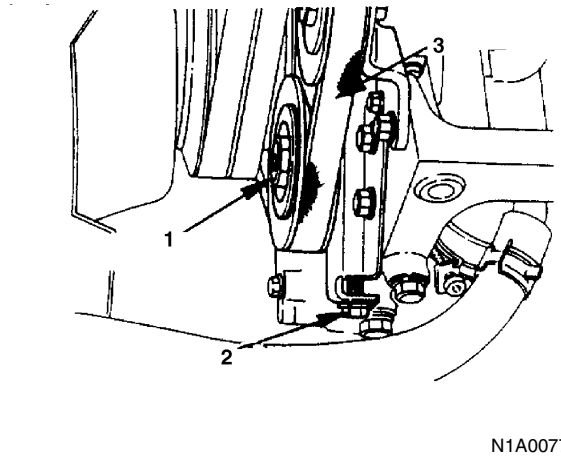
1. Magnetic clutch harness connector
2. Drive belt
3. Refrigerant line
4. Compressor
5. O-ring

Removal

Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant.

1. Magnetic clutch harness connector
2. Drive Belt
   Loosen the tension pulley center nut (1) and tension adjustment bolt (2), then remove the drive belt (3).

This illustration is based in 4HF1 engine



3. Refrigerant line
   When removing the line connector, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
4. Compressor

Installation

1. Compressor
   Tighten the compressor fixing bolts to the specified torque.

Tighten:
Compressor Bolt to 19 N·m (1.9 kg·m/14 lb·ft).

2. Refrigerant Line
   - Tighten the refrigerant line fixing bolt to the specified torque.

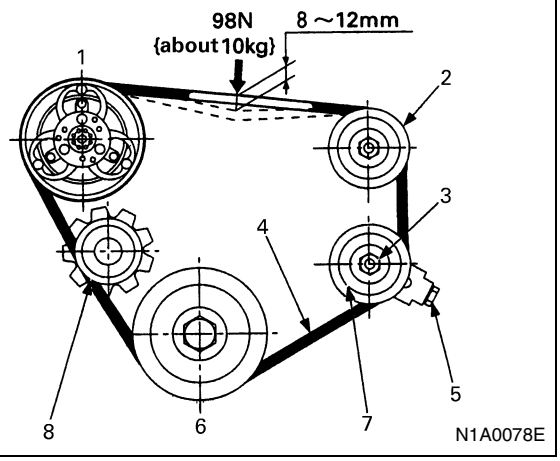
Tighten:
Refrigerant Line Bolt to 27 N·m (2.8 kg·m/20 lb·ft).

- O-ring cannot be reused. Always replace with new ones.
- Be sure to apply new specified compressor oil to the O-rings when connecting refrigerant lines.

3. Drive Belt
   Push the drive belt with the force of 10 kg (22 lbs) and adjust the drive belt tension by tightening idle pulley tension adjustment bolt, until the 8 — 12 mm (0.31 — 0.47 in) deflection of the belt is obtained. Then tighten the pulley center nut.

Tighten:
Idle Pulley Center nut to 39 N·m (4.0 kg·m/29 lb·ft).

This illustration is based in 4HF1 engine



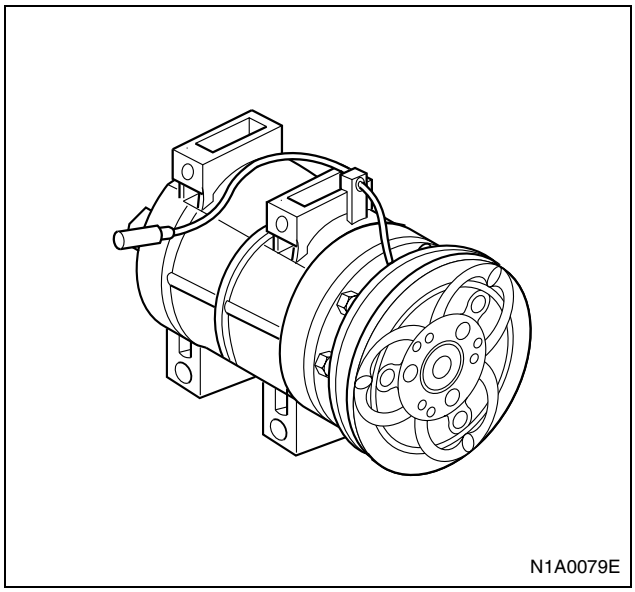
Legend

1. A/C compressor
2. Pulley
3. Center nut
4. Drive belt
5. Adjustment bolt
6. Crank pulley
7. Tension pulley
8. Generator

4. Magnetic Clutch Harness Connector

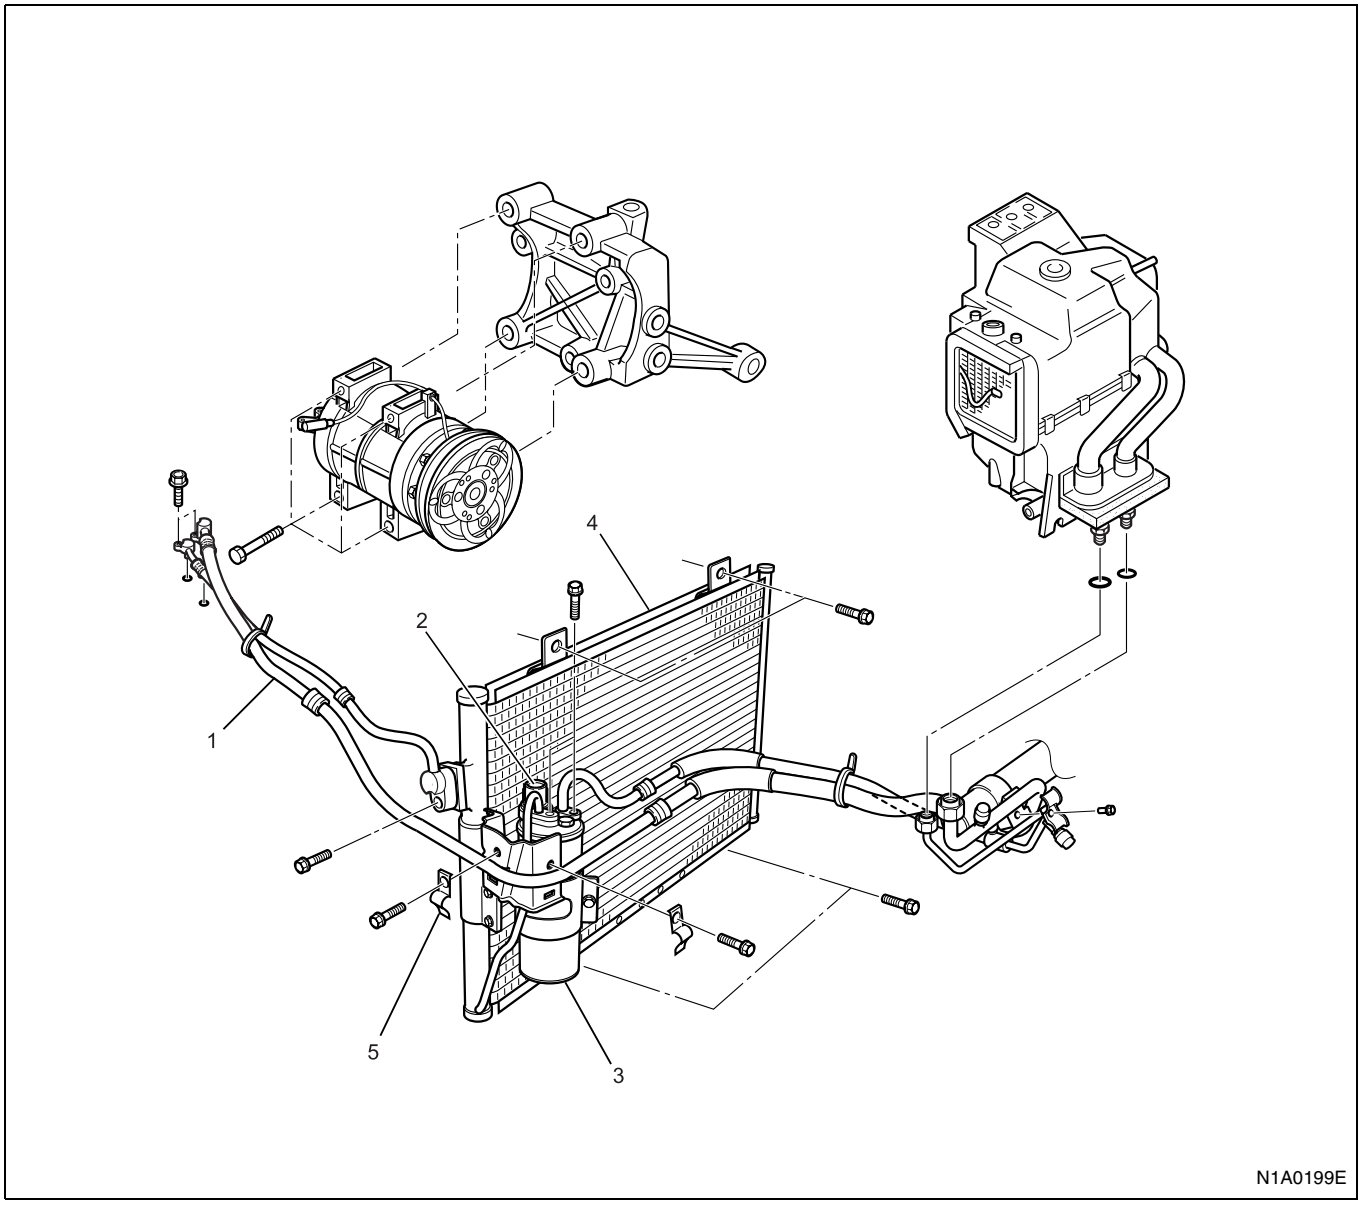
New Compressor Installation

The new compressor is filled with 180cc (5.0 Imp fl oz) of compressor oil and nitrogen gas. When mounting the compressor on the vehicle, perform the following steps;



1. Gently release nitrogen gas from the rear head of the new compressor.
   - Take care not to let the compressor oil flow out.
   - Inspect O-rings and replace if necessary.
2. Turn the compressor several times by hand and release the compressor oil in the cylinder.
3. When installing on a new system, the compressor should be installed as it is. When installing on a used system, the compressor should be installed after adjusting the amount of compressor oil. (Refer to Section 1D “COMPRESSOR OVERHAUL” for General Information.)

Condenser Assembly (Except 4HK1-TC Engine Model For Australia)



Legend

1. Refrigerant line
2. Pressure switch
3. Receiver / drier
4. Condenser assembly
5. Refrigerant line fixing clamp

Removal

Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant.

1. Pressure switch connector
2. Refrigerant line fixing clamp
3. Refrigerant Line
   - Use a back up wrench when disconnecting and re-connecting the refrigerant lines.
   - When removing the line, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
4. Condenser assembly
   - Remove the radiator stay before condenser (GCC).

Installation

1. Condenser Assembly
   - If installing a new condenser, be sure to add 30cc (0.8 Imp fl oz) of new specified compressor oil to a new one.
   - Tighten the condenser bolt to the specified torque.
2. Refrigerant Line
   - Tighten the inlet line to the specified torque.

Tighten:
Inlet line to 15 N·m (1.5 kg·m/11 lb·ft)

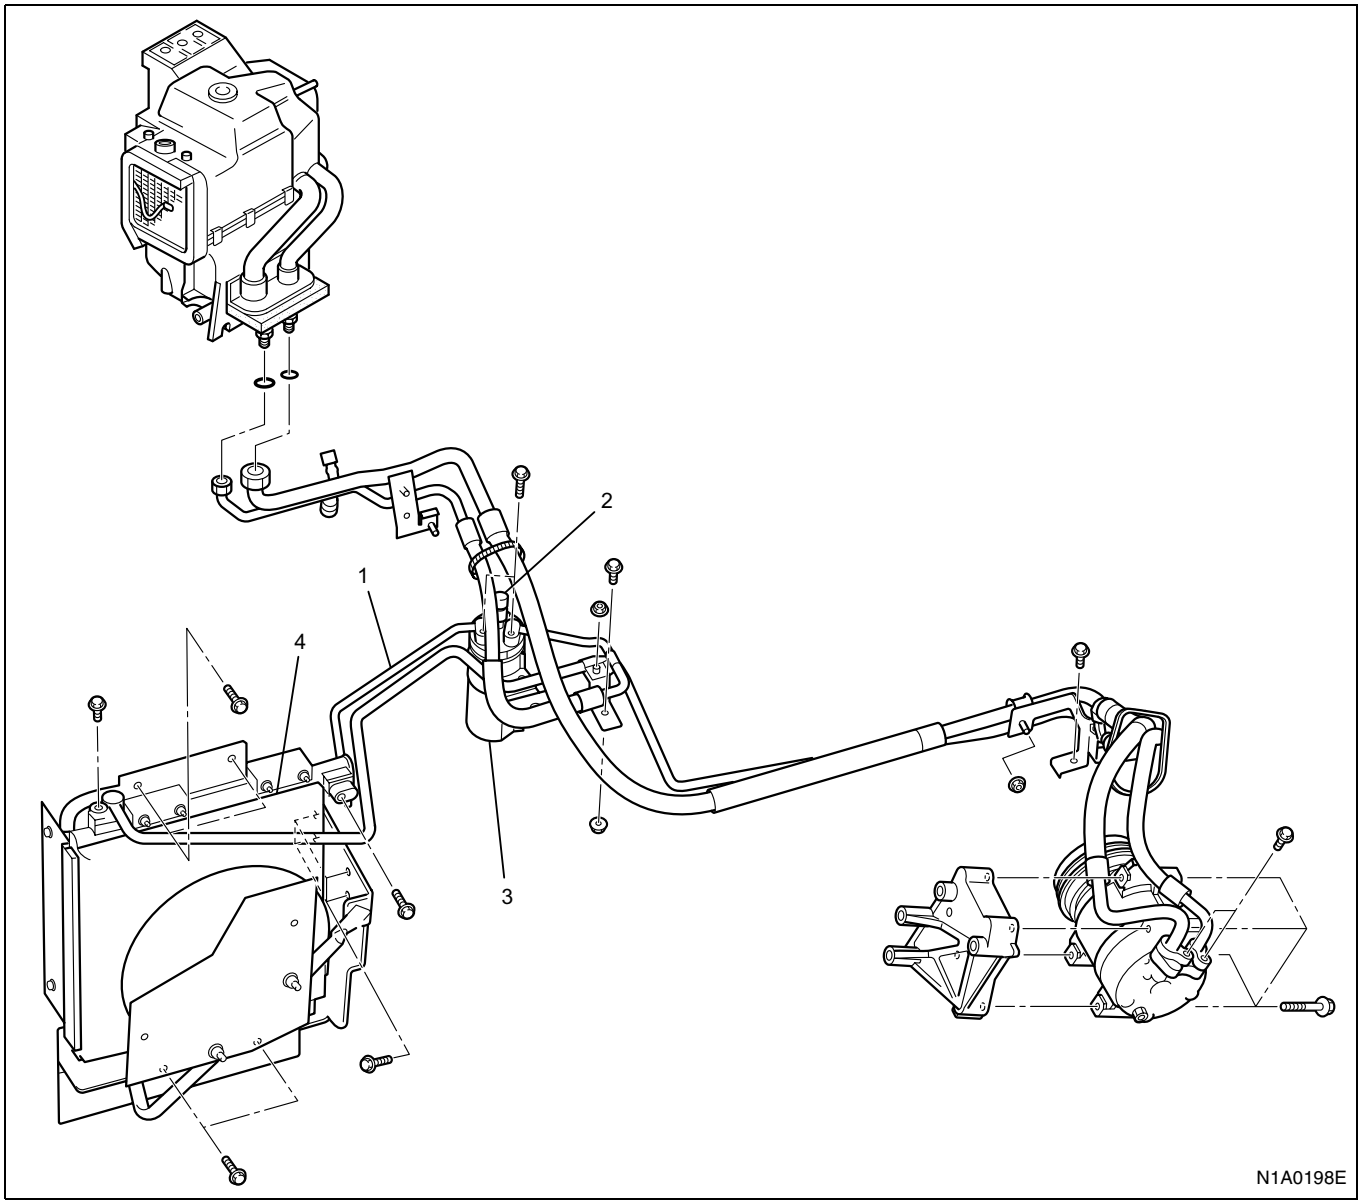
- Tighten the outlet line to the specified torque.

Tighten:
Outlet line to 6 N·m (0.6 kg·m/4 lb·ft)

- O-rings cannot be reused. Always replace with new ones.
- Be sure to apply new specified compressor oil to the O-rings when connecting refrigerant line.

3. Refrigerant Line Fixing Clamp
4. Pressure Switch Connector

Condenser Assembly (4HK1-TC Engine Model For Australia)



Legend

1. Refrigerant line
2. Pressure switch
3. Receiver / drier
4. Condenser assembly

Removal

Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant.

1. Refrigerant Line
   - Use a back up wrench when disconnecting and re-connecting the refrigerant lines.
   - When removing the line, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
2. Condenser assembly

Installation

1. Condenser Assembly
   - If installing a new condenser, be sure to add 30cc (0.8 Imp fl oz) of new specified compressor oil to a new one.
   - Tighten the condenser bolt to the specified torque.
2. Refrigerant Line
   - Tighten the inlet line to the specified torque.

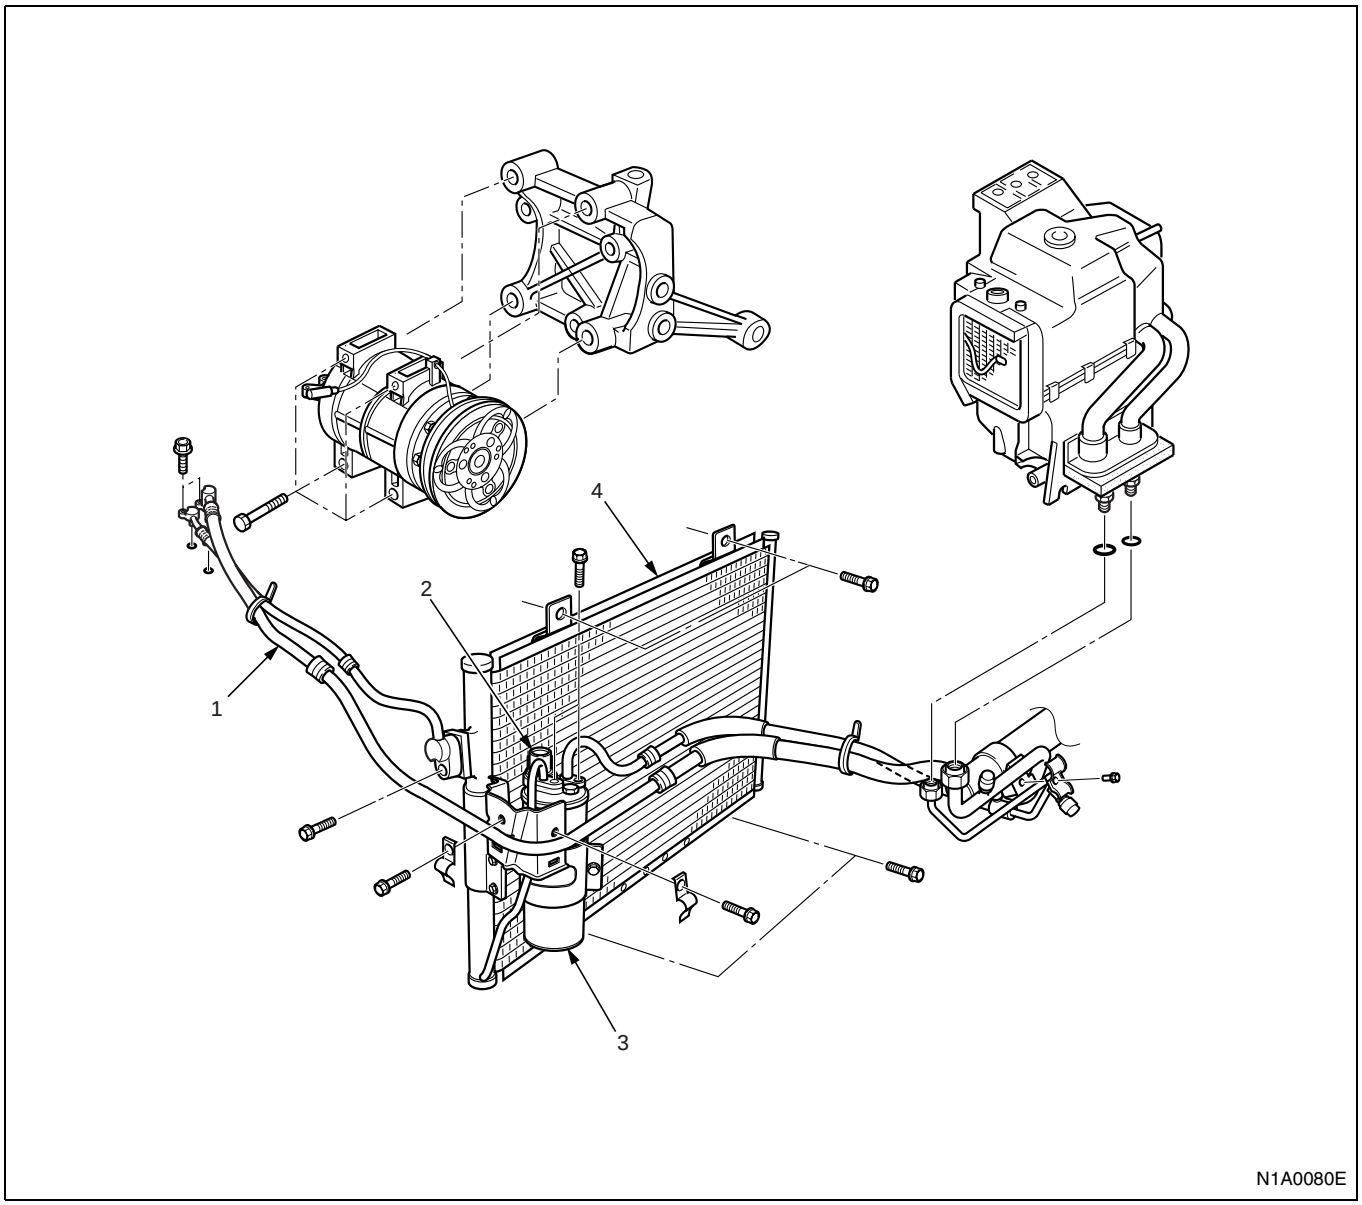
Tighten:
Inlet line to 15 N·m (1.5 kg·m/11 lb·ft)

- Tighten the outlet line to the specified torque.

Tighten:
Outlet line to 6 N·m (0.6 kg·m/4 lb·ft)

- O-rings cannot be reused. Always replace with new ones.
- Be sure to apply new specified compressor oil to the O-rings when connecting refrigerant line.

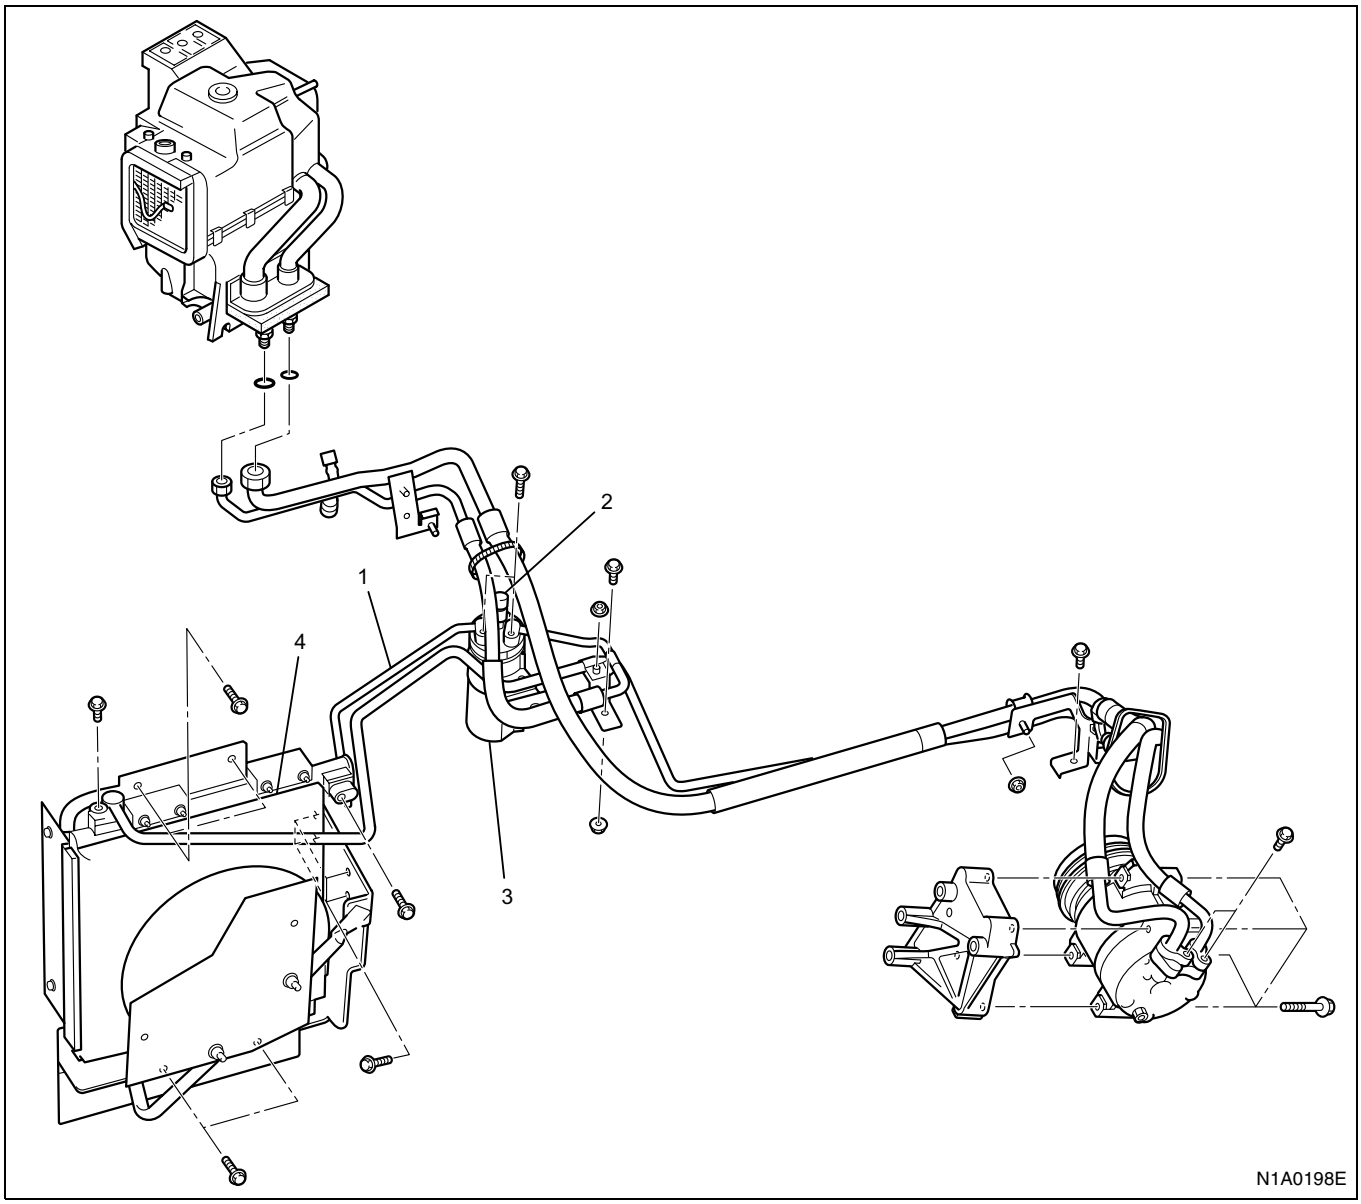
Receiver / Drier (Except 4HK1-TC Engine Model For Australia)



Legend

1. Refrigerant line
2. Pressure switch
3. Receiver / drier
4. Condenser assembly

Receiver / Drier (4HK1-TC Engine Model For Australia)



Legend

1. Refrigerant line
2. Pressure switch
3. Receiver / drier
4. Condenser assembly

Removal

Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant.

1. Pressure Switch Connector
2. Refrigerant line
   - Use a back up wrench when disconnecting and reconnecting the refrigerant line.
   - When removing the line connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
3. Receiver / Drier
   - Loosen the fixing bolt and carefully pull out the receiver/drier.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

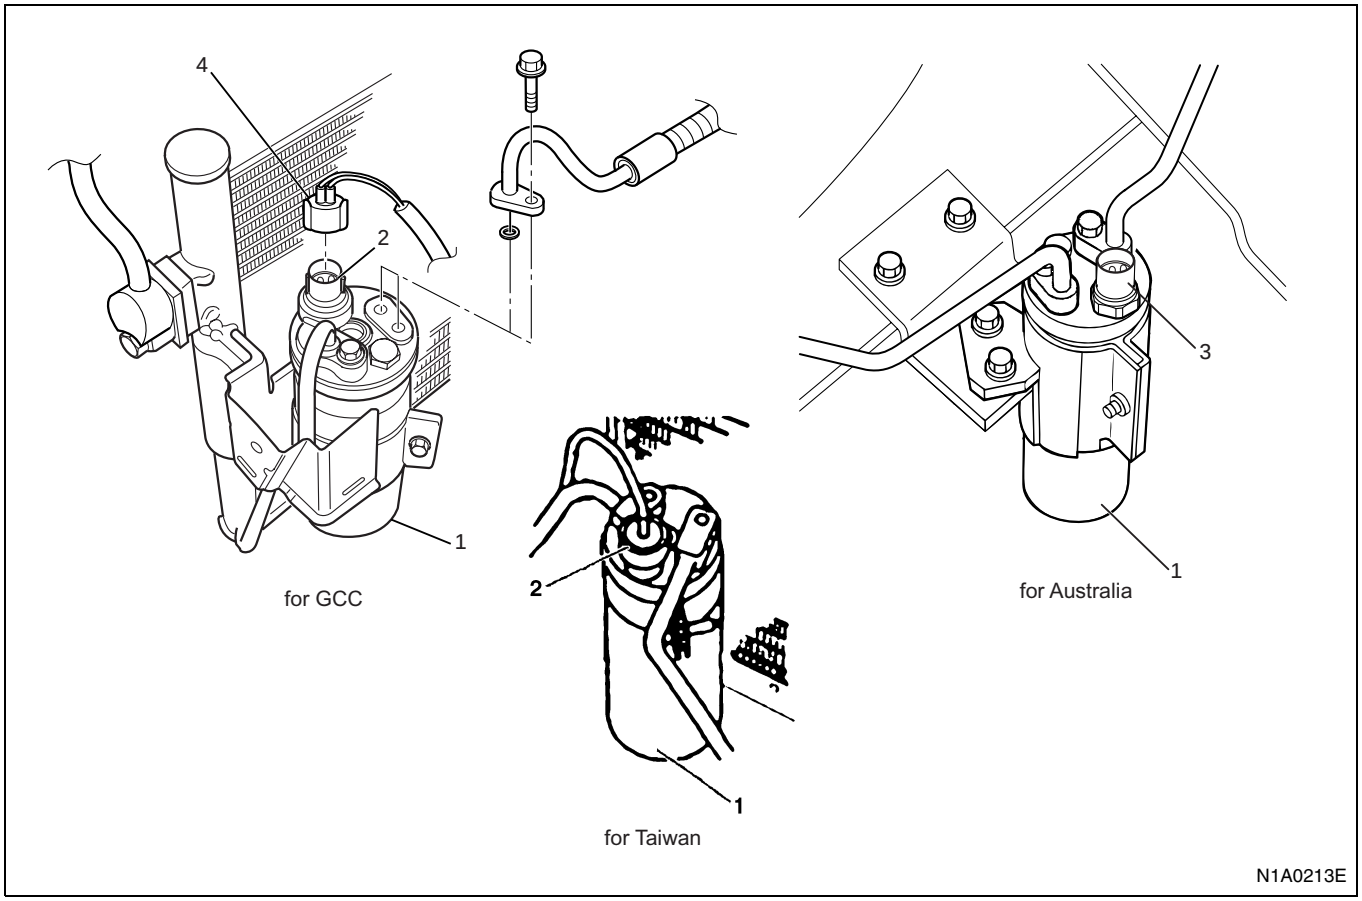
1. If installing a new receiver/drier, be sure to add 30 cc (0.8 Imp fl oz) of new specified compressor oil to a new one.
2. Put the receiver/drier in the bracket, and connect with the refrigerant line. Check that no excessive force is imposed on the line. Fasten the fixing bolt to the receiver/drier.

3. Tighten the line to the specified torque.

Tighten:
Refrigerant Line to 6 N·m (0.6 kg·m/4 lb·ft)

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new specified compressor oil to the O-rings when connecting refrigerant line.

Pressure Switch



Legend

1. Receiver / drier
2. Dual pressure switch
3. Triple pressure switch
4. Pressure switch connector

Removal

Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant.

1. Pressure Switch Connector
2. Pressure Switch
   - Turn the pressure switch counterlockwise to remove it.
   - When removing the switch connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.

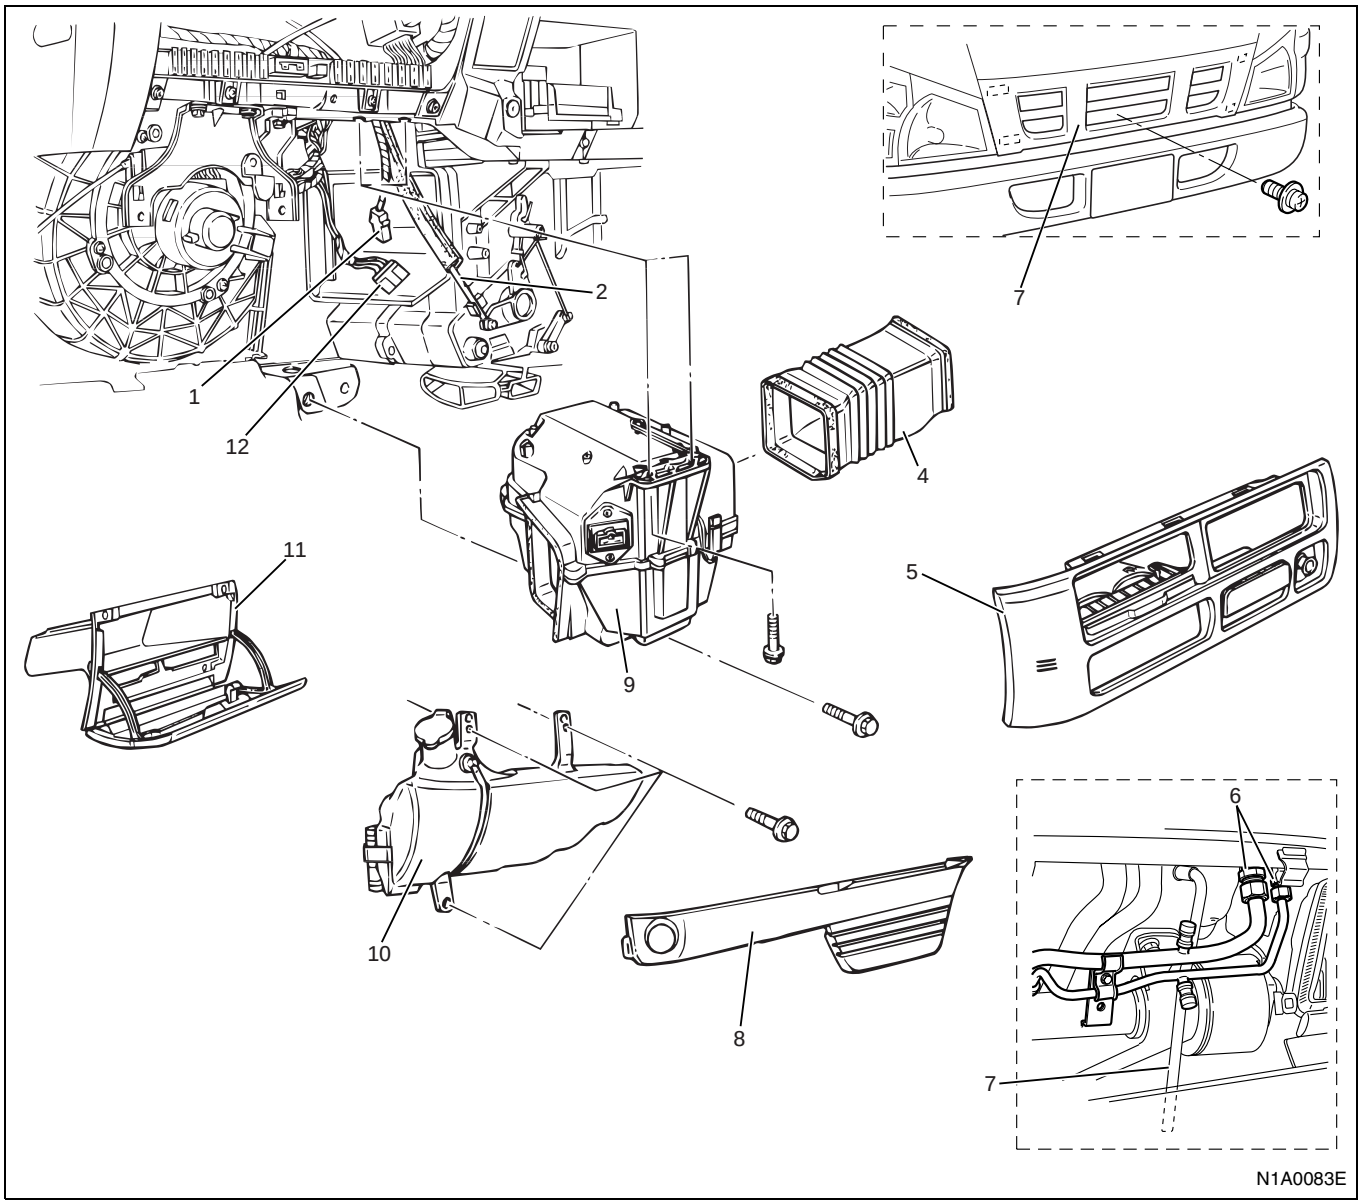
Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. O-ring cannot be reused. Always replace with a new one.
2. Be sure to apply new specified compressor oil to the O-ring when connecting pressure switch.
3. Tighten the pressure switch to the specified torque.

Tighten:
Pressure switch to 10 N·m (1.0 kg·m/7.4 lb·ft)

Evaporator Assembly



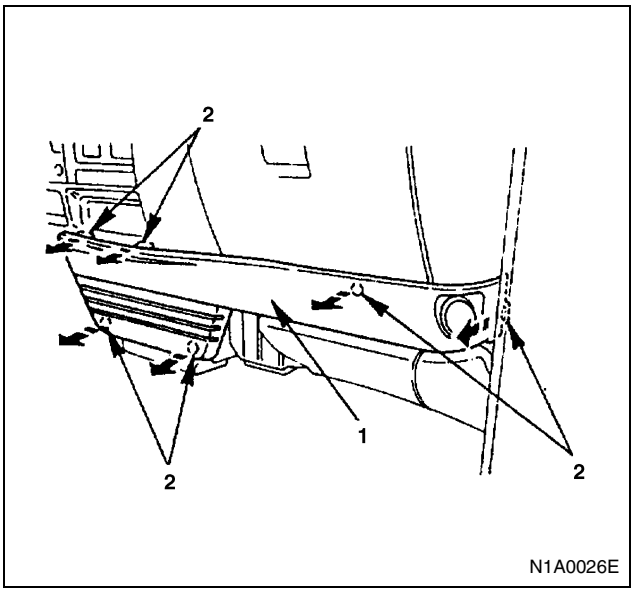
Legend

1. Electronic thermostat connector
2. Temperature control cable
3. Front grille
4. Duct (NPR only)
5. Center cluster
6. Refrigerant line
7. Drain hose
8. Under cover
9. Evaporator assembly
10. Washer tank
11. Glove box
12. Resistor connector

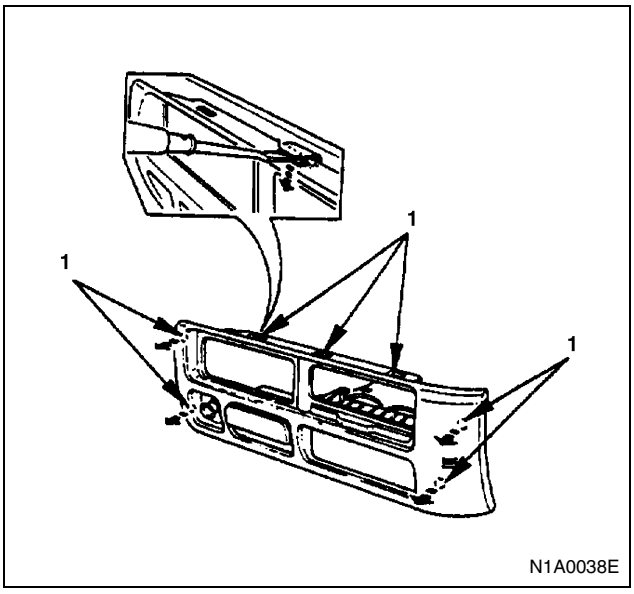
Removal

Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant.

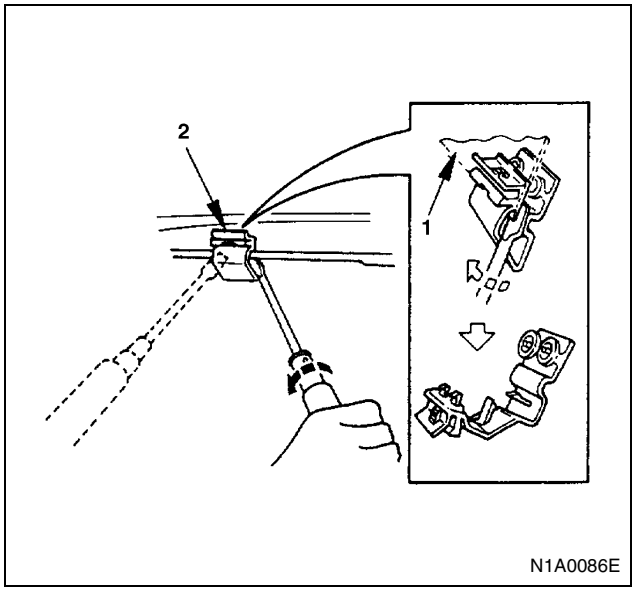
1. Glove Box
   Open the glove box and remove the fixing screws.
2. Under Cover
   While pulling the under cover (1) with care, remove the clips (2) on the back side of the cover.



3. Washer Tank
   - Remove the washer tank fixing three bolts (Upper: two, Lower: one) and disconnect the connector.
   - Do not disconnect the washer tank tube.
4. Center Cluster
   - While pulling the cluster with care, remove the upper and back side clips (1) of the cluster.
   - Disconnect the cigar lighter and illumination connectors.

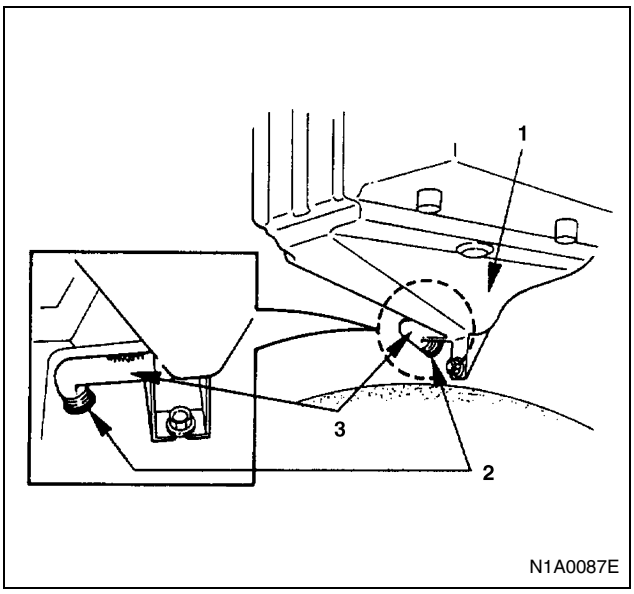


5. Temperature Control Cable
   Disconnect the temperature control cable of the control lever assembly from the heater unit.
6. Duct (NPR only)
7. Front Grille
   After removing the grille, remove the grille fixing clip (RH).



Legend
1. Panel
2. Clip

8. Refrigerant Line
   - Use a back up wrench when disconnecting and reconnecting the refrigerant line.
   - When removing the refrigerant line connected part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.
9. Evaporator Assembly
   - Disconnect the resistor and thermostat connectors.
   - Disconnect the drain hose.



Legend
1. Evaporator
2. Grommet
3. Drain hose

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. To install a new evaporator assembly, add 50cc (1.4 lmp fl oz) of new specified compressor oil to a new core.
2. Tighten the refrigerant outlet line to the specified torque.

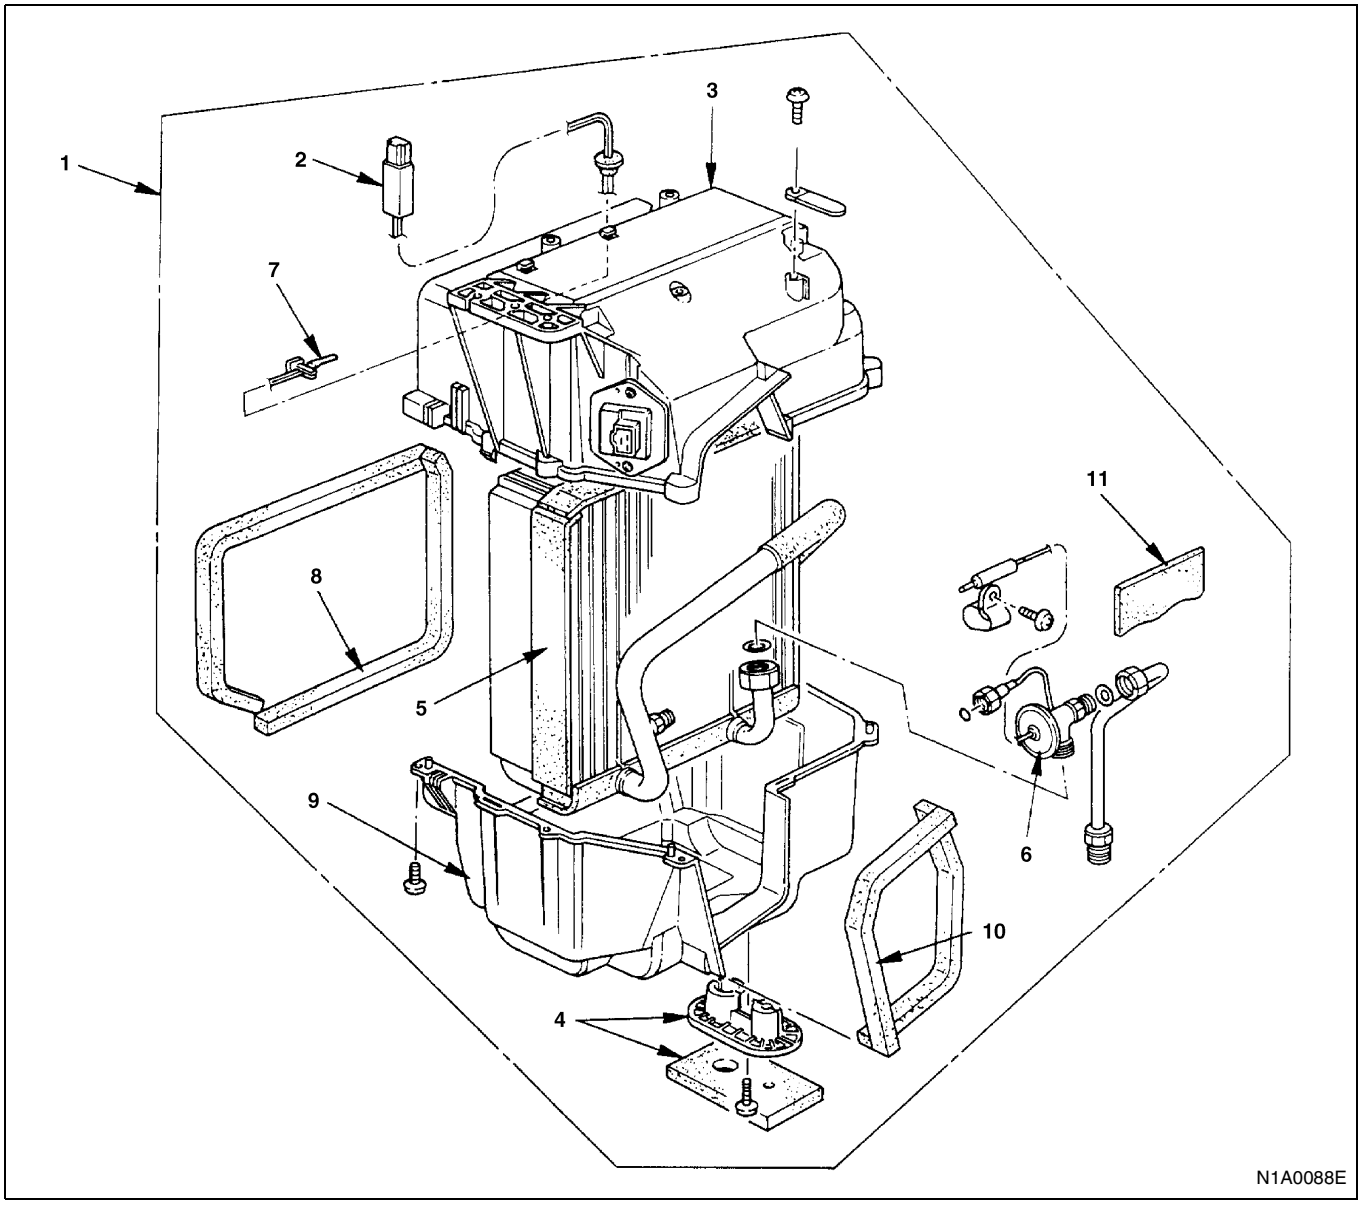
Tighten:
Outlet line to 28 N·m (2.8 kg·m/21 lb·ft)

3. Tighten the refrigerant inlet line to the specified torque.

Tighten:
Inlet line to 15 N·m (1.5 kg·m/11 lb·ft)

4. O-rings cannot be reused. Always replace with new ones.
5. Be sure to apply new specified compressor oil to the O-rings when connecting lines.

Evaporator Core / Expansion Valve (LHD Model)



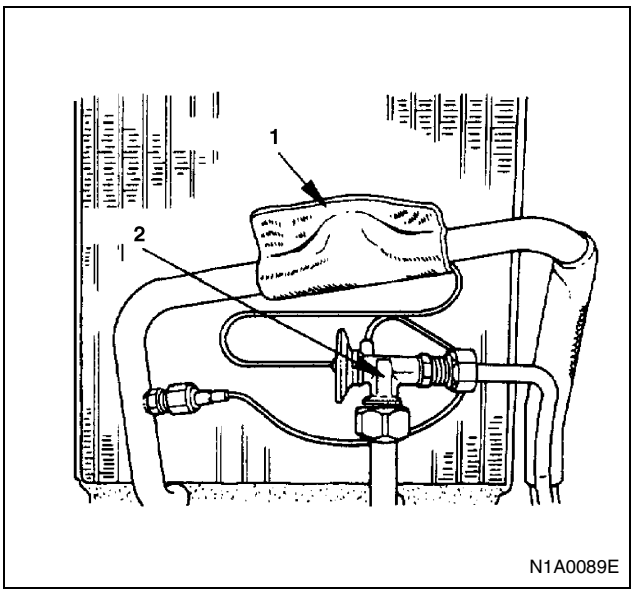
Legend

1. Evaporator assembly
2. Electronic thermostat
3. Upper case
4. Insulator and under cover
5. Evaporator core
6. Expansion valve
7. Thermo sensor
8. Lining
9. Lower case
10. Lining
11. Insulator

Removal

Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant.

1. Evaporator Assembly
   Refer to "EVAPORATOR ASSEMBLY" removal procedure in this section.
2. Electronic Thermostat
   - Remove the sensor fixing clip.
   - Pull out the grommet from the upper case to remove the thermostat.
3. Upper Case
   - Separate the upper and lower case.
   - Slit the case parting face with a knife since the lining is separated.
4. Insulator and Under Cover
5. Evaporator Core
   Pull up the core from the lower case.
6. Expansion Valve
   - Tear off the insulator (1) carefully.
   - Remove the sensor fixing clip.
   - Use a back up wrench when disconnecting all refrigerant pipes, and remove the expansion valve (2).

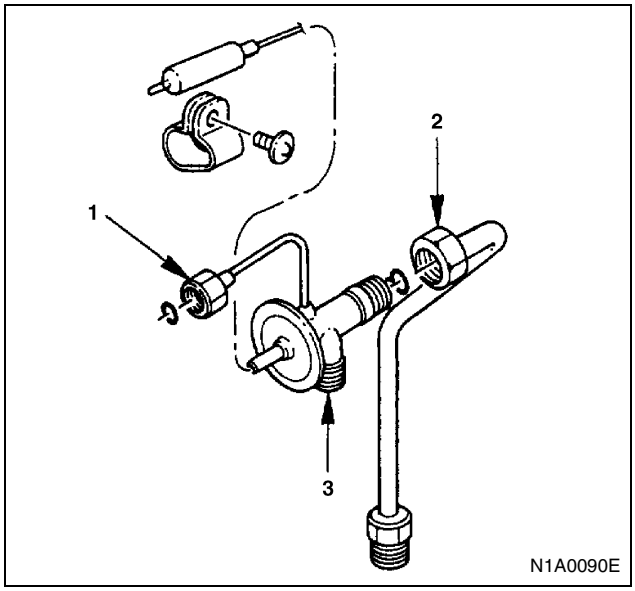


Installation

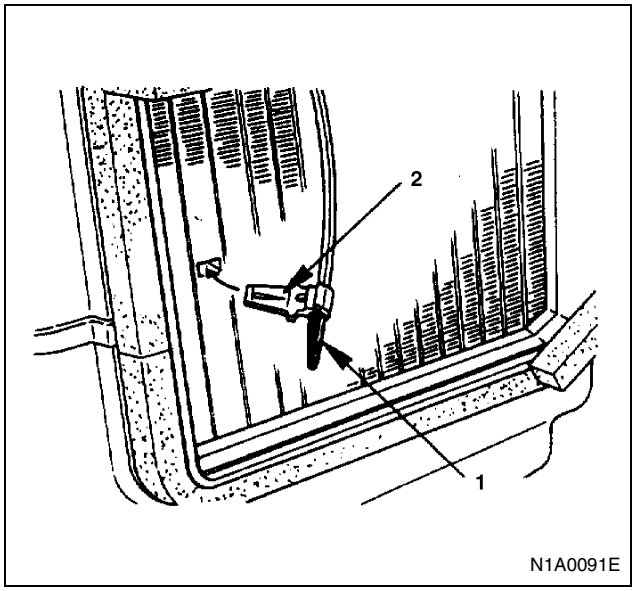
To install, follow the removal steps in the reverse order, noting the following points:

1. O-rings cannot be reused. Always replace new ones.
2. Be sure to apply new specified compressor oil to the O-rings when connecting lines.
3. Be sure to install the expansion valve sensor and the insulator on the place where it was before.
4. To install a new evaporator core, add 50cc (1.4 Imp. fl oz) of new specified compressor oil to a new core and install the thermostat sensor to the evaporator core specified position with the clip where it was before.
5. Tighten the refrigerant lines to the specified torque.

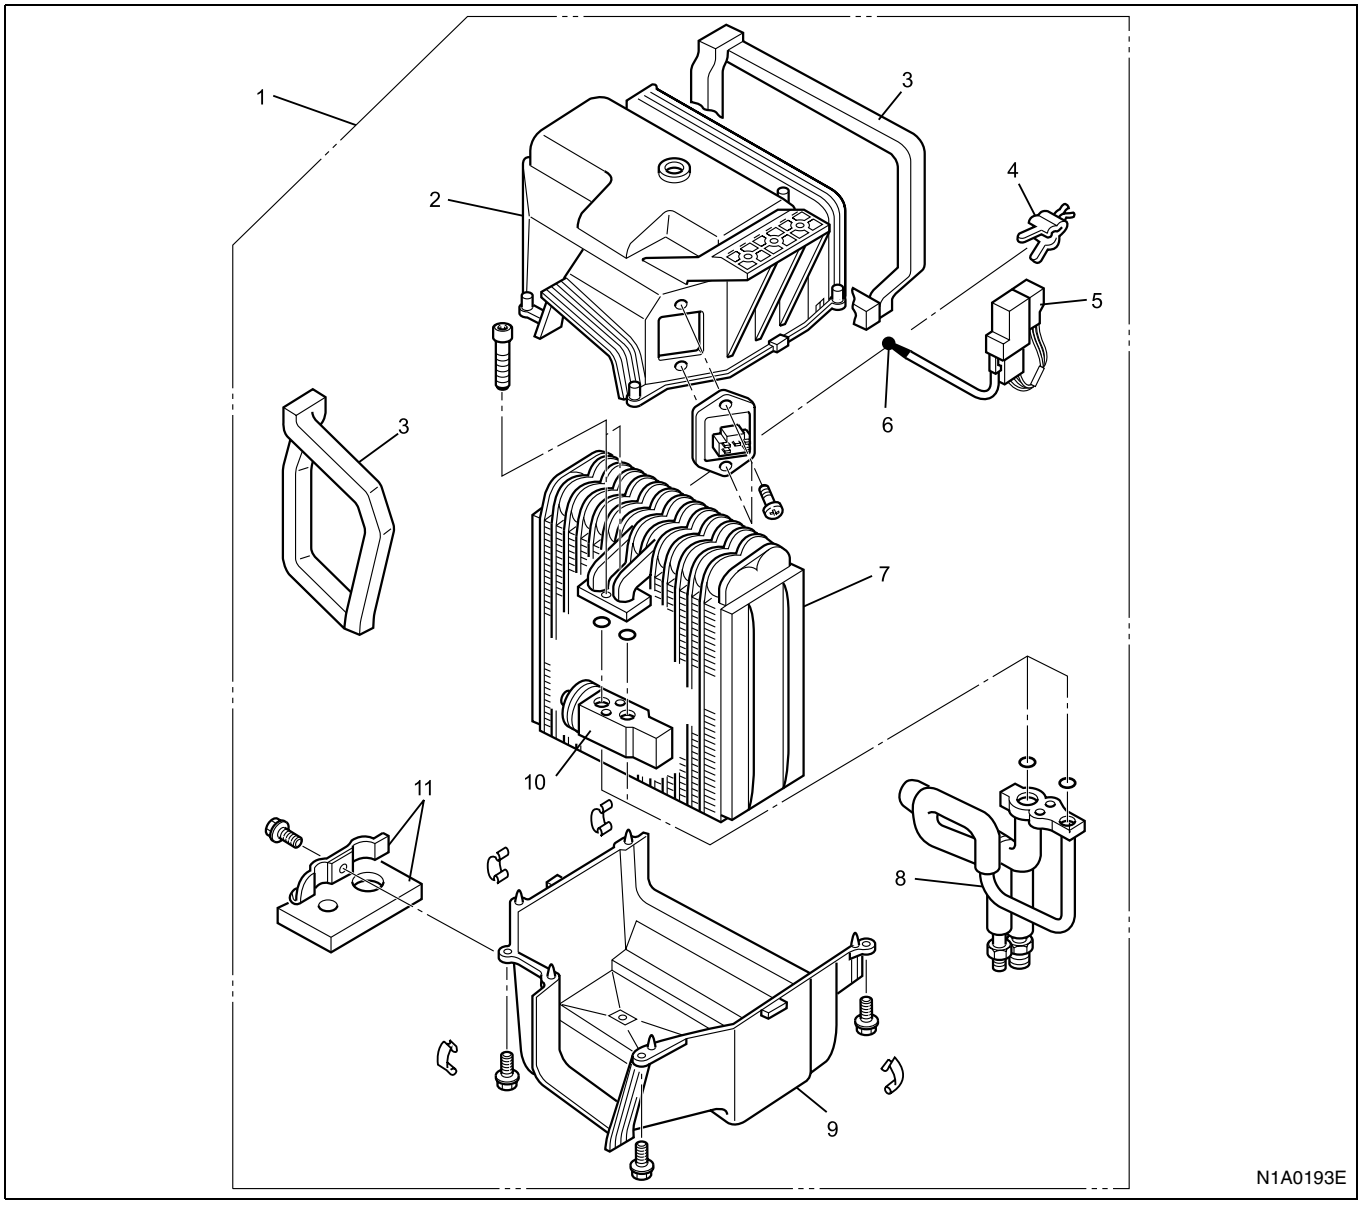
Tighten:
- Refrigerant line 1 to 10 N·m (1.0 kg·m/7 lb·ft)
- Refrigerant line 2 to 15 N·m (1.5 kg·m/11 lb·ft)
- Refrigerant line 3 to 20 N·m (2.0 kg·m/14 lb·ft)



6. Apply an adhesive to parting face of lining when assembling evaporator assembly.
7. The thermostat sensor (1) is installed on the core with the clip (2) and it must not interfere with the core.



Evaporator Core / Expansion Valve (RHD Model)



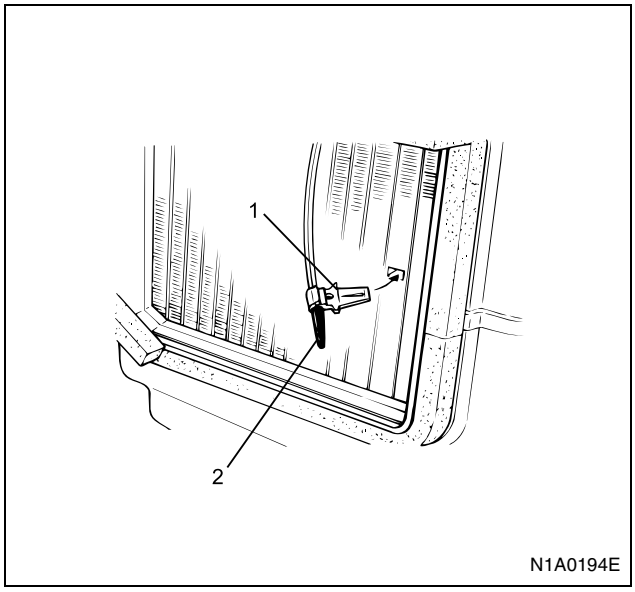
Legend

1. Evaporator assembly
2. Upper case
3. Lining
4. Clip
5. Amplifier & Thermistor
6. Thermo sensor
7. Evaporator core
8. Pipe assembly
9. Lower case
10. Expansion valve
11. Insulator and cover

Removal

Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant.

1. Evaporator Assembly
   Refer to “EVAPORATOR ASSEMBLY” removal procedure in this section.
2. Amplifier & Thermistor
   - Remove the sensor fixing clip.
   - Pull out the grommet from the upper case to remove the thermostat.
3. Upper Case
   - Separate the upper and lower case.
   - Slit the case parting face with a knife since the lining is separated.
4. Insulator and Cover
5. Evaporator Core
   Pull up the core from the lower case.
6. Expansion Valve
   Take off two installation bolts and subsequently remove pipe assembly and expansion valve sequentially.



Installation

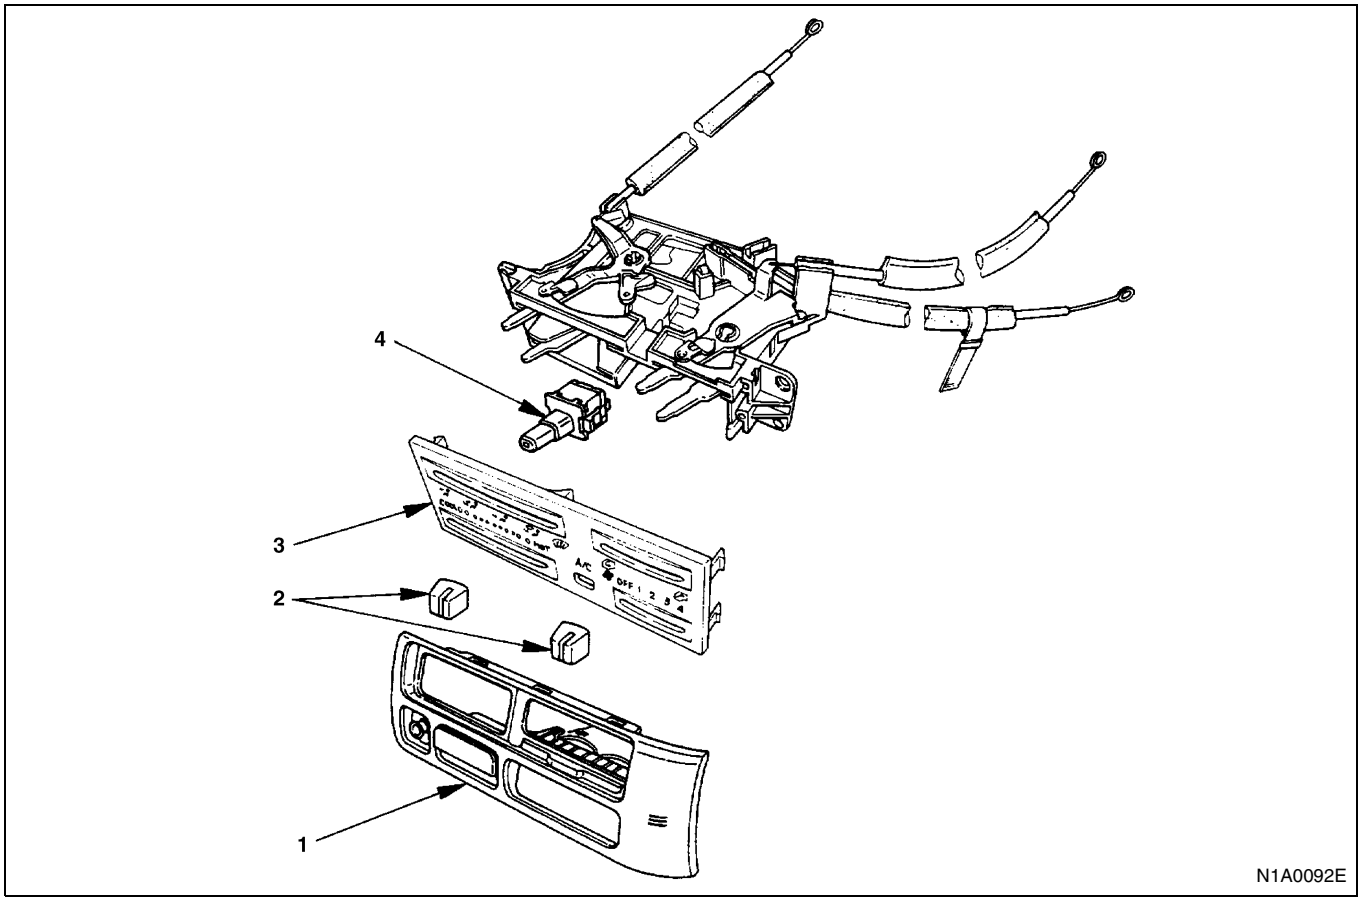
To install, follow the removal steps in the reverse order, noting the following points:

1. Tighten the expansion valve to the specified torque.

Tighten:
Installation bolts to 5 N·m (0.5 kg·m/3.7 lb·ft)

2. O-rings cannot be reused. Always replace new ones.
3. Be sure to apply new specified compressor oil to the O-rings when connecting lines.
4. To install a new evaporator core, add 50cc (1.4 Imp. fl oz) of new specified compressor oil to a new core.
5. Apply an adhesive to parting face of lining when assembling evaporator assembly.
6. Install the amplifier & thermistor sensor (2) surely to the evaporator core specified position with the clip (1) where it was before.

A/C Switch



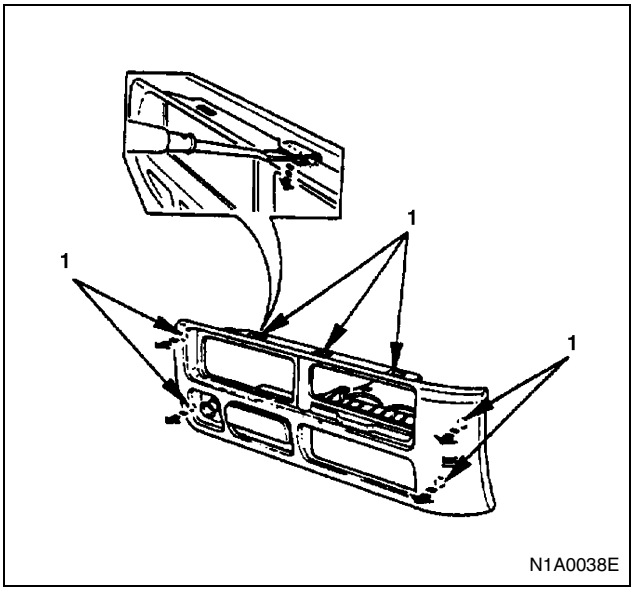
Legend

1. Center cluster
2. Knob
3. Control panel bezel
4. A/C switch

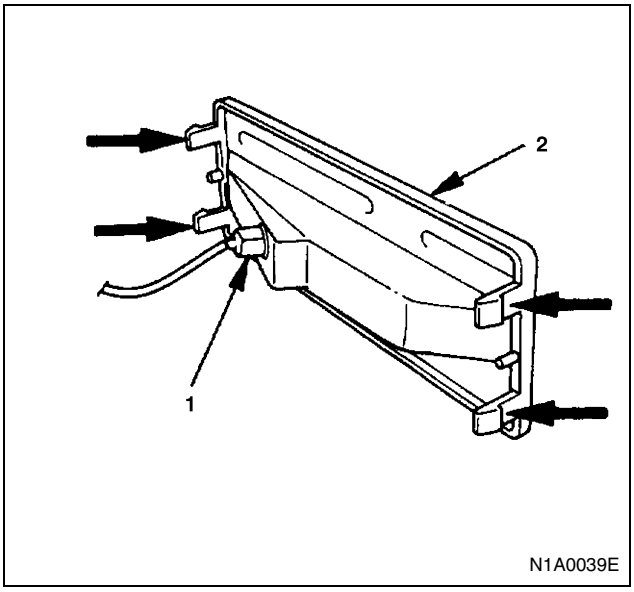
Removal

Preparation:
Disconnect the battery ground cable.

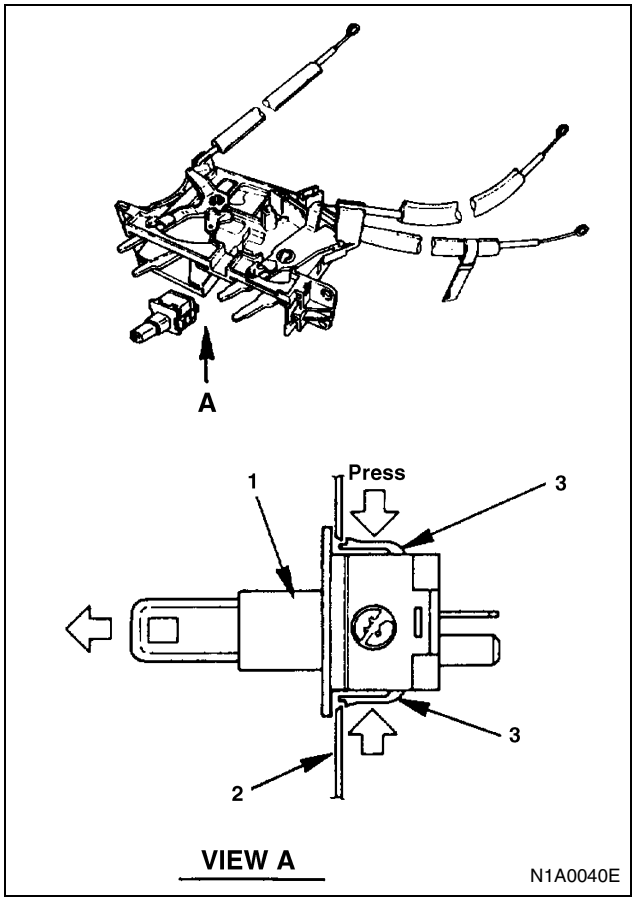
1. Center Cluster
   - While pulling the cluster with care, remove the upper and backside clips (1) of the cluster.
   - Disconnect the cigar lighter and illumination connectors.



2. Knob
3. Control Panel Bezel
   Push the four catches at both sides of the bezel to the inside, and remove the illumination bulb (1) from the bezel (2).



4. A/C Switch
   Push the catches at both sides of the A/C switch to the inside, and remove the switch by pulling it out.



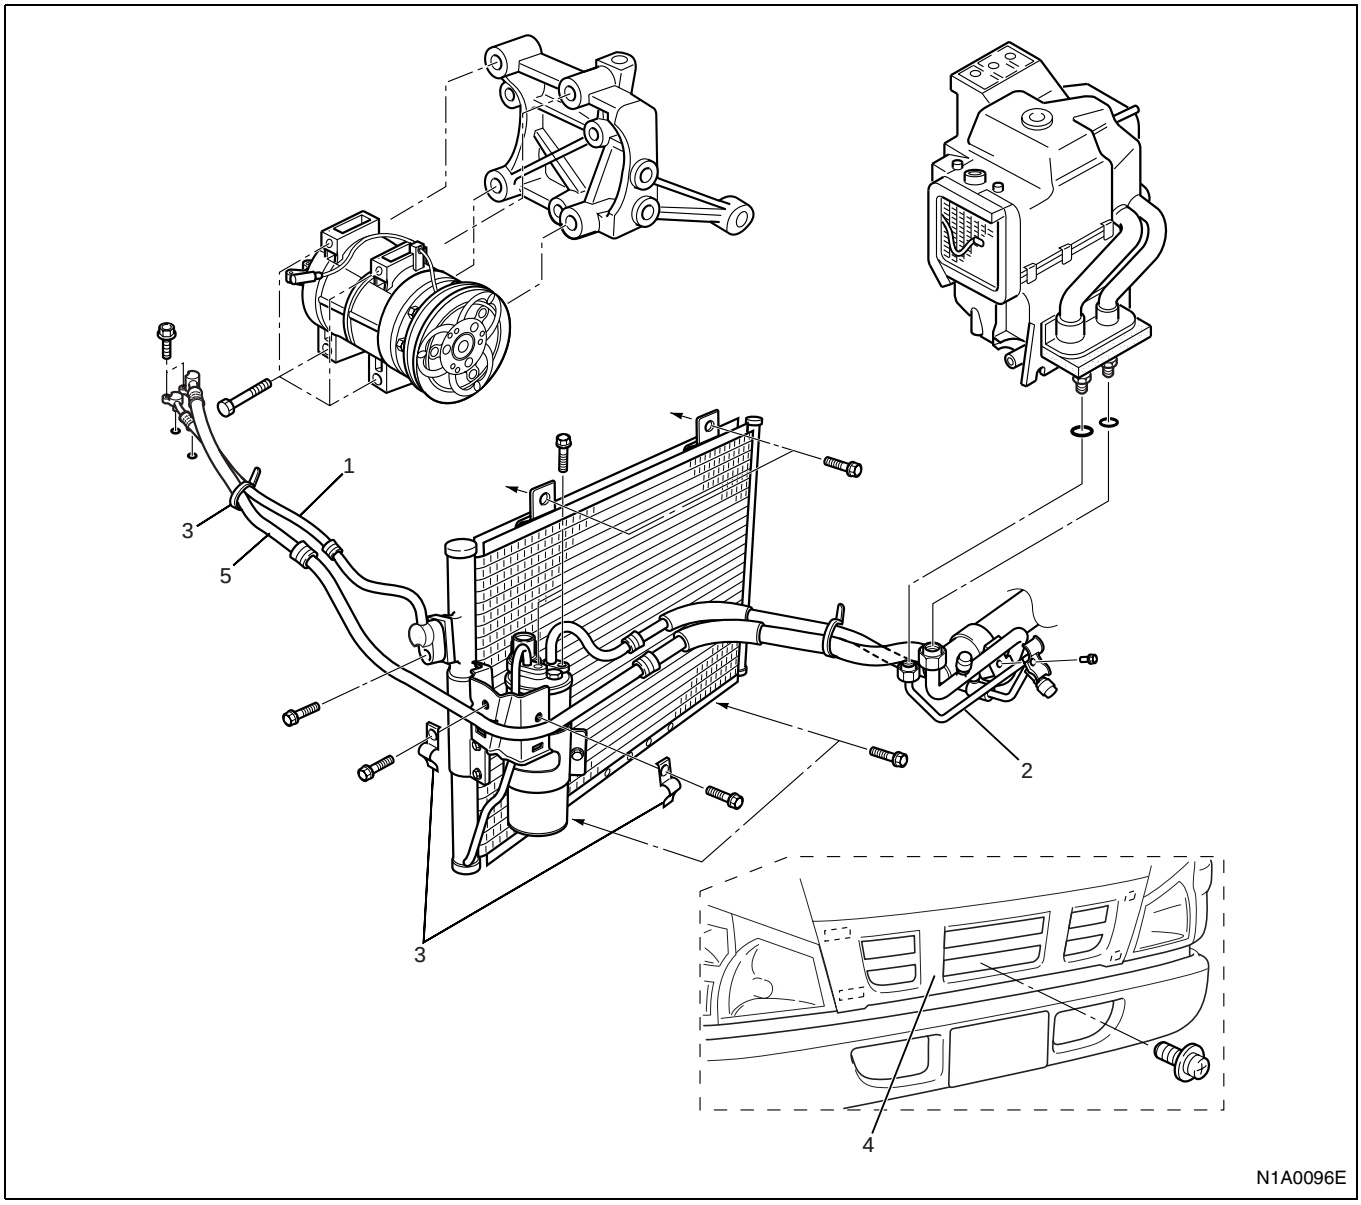
Legend

1. A/C switch
2. Control lever
3. Catch

Installation

To install, follow the removal steps in the reverse order.

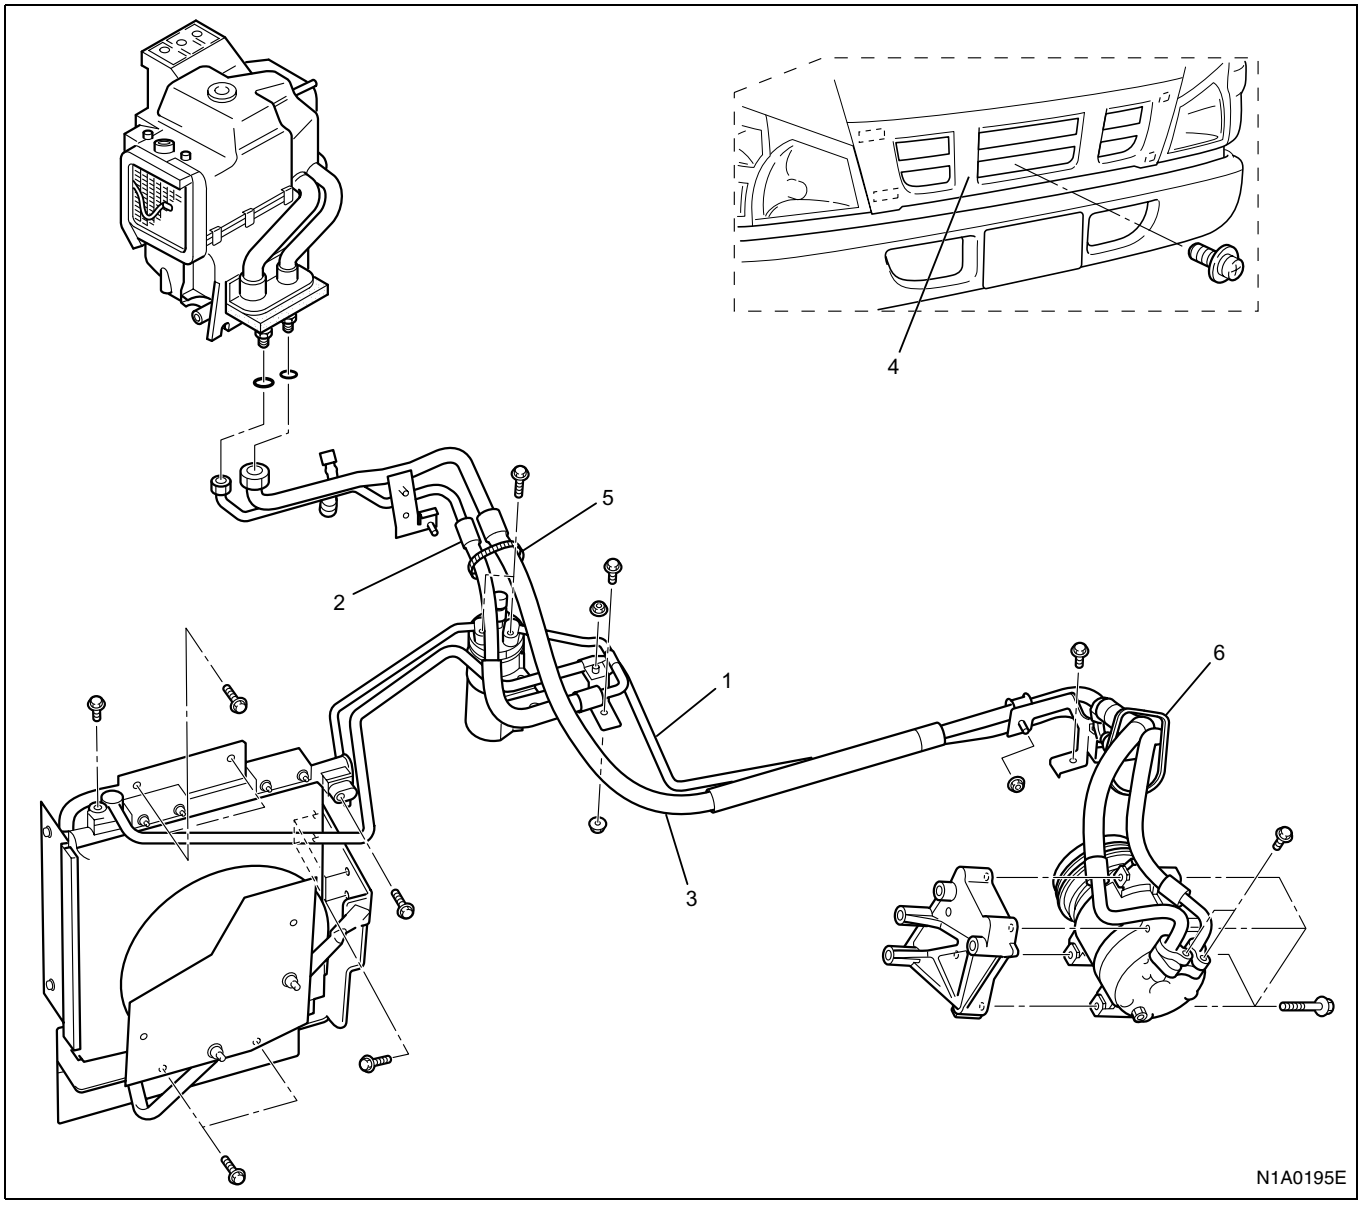
Refrigerant Line (Except 4HK1-TC Engine Model For Australia)



Legend

1. Refrigerant line (Compressor — Condenser)
2. Refrigerant line (Receiver / Drier — Evaporator)
3. Clamp / Clip
4. Front grille
5. Refrigerant line (Compressor — Evaporator)

Refrigerant Line (4HK1-TC Engine Model For Australia)



Legend

1. Refrigerant line (Compressor — Condenser)
2. Refrigerant line (Receiver / Drier — Evaporator)
3. Refrigerant line (Compressor — Evaporator)
4. Front grille
5. Band clip
6. Band clip

Removal

Preparation:
Disconnect the battery ground cable.
Discharge and recover refrigerant.

1. Front grille
2. Clamp / Clip (Except 4HK1-TC Engine Model For Australia)
3. Band clip (4HK1-TC Engine Model For Australia)
4. Refrigerant line (Compressor — Condenser)
5. Refrigerant line (Compressor — Evaporator)
6. Refrigerant line (Receiver / Drier — Evaporator)

- Use a back-up wrench when disconnecting and re-connecting the refrigerant lines.
- When removing the refrigerant line connecting part, the connecting part should immediately be plugged or capped to prevent foreign matter from being mixed into the line.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

1. O-rings cannot be reused. Always replace new ones.
2. Be sure to apply new specified compressor oil to the O-rings when connecting refrigerant lines.
3. If installing a new refrigerant line, be sure to add 10 cc (0.3 lmp fl oz) of new specified compressor oil to a new one.
4. Tighten the refrigerant line to the specified torque. (Refer to “SERVICE INFORMATION” for FIXING TORQUE in section 00.)

HEATING AND AIR CONDITIONING

SECTION 1D1

COMPRESSOR OVERHAUL EXCEPT TAIWAN

Caution:
When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used.

Fasteners that are not reused, and those requiring thread locking compound, will be called out. The correct torque values must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

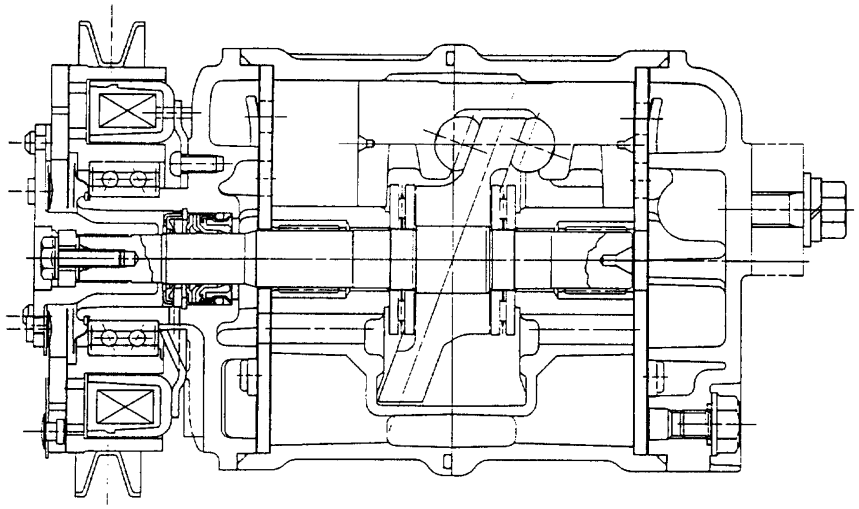
GENERAL DESCRIPTION 1D1-2
GENERAL INFORMATION.....1D1-3
Compressor Oil.....1D1-3
SERVICE PROCEDURES.....1D1-5
Compressor Overhaul 1D1-5

GENERAL DESCRIPTION



N1A0097E

When servicing the compressor, keep dirt or foreign material from getting on or into the compressor parts and system. Clean tools and a clean work area are important for proper service. The compressor connections and the outside of the compressor should be cleaned before any "On-Vehicle" repair, or before removal of the compressor. The parts must be kept clean at all times and any parts to be reassembled should be cleaned with Trichloroethane, naphtha, kerosene, or equivalent solvent, and dried with dry air. Use only lint free cloths to wipe parts.
The operations described below are based on bench overhaul with compressor removed from the car, except as noted. They have been prepared in order of accessibility of the components. When the compressor is removed from the car for servicing, the oil remaining in the compressor should be discarded and new refrigerant oil added to the compressor.
Magnetic clutch assembly repair procedures require that the system be discharged of refrigerant. (Refer to Section 1B for "REFRIGERANT RECOVERY".)
Compressor malfunction will appear in one of four ways: noise, seizure, leakage or low discharge pressure. Resonant compressor noises are not cause for alarm; however, irregular noise or rattles may indicate broken parts or excessive clearances due to wear. To check seizure, de-energize the magnetic clutch and check to see if the drive plate can be rotated. If rotation is impossible, the compressor is seized. Low discharge pressure may be due to a faulty internal seal of the compressor, or a restriction in the compressor. Low discharge pressure may also be due to an insufficient refrigerant charge or a restriction elsewhere in the system. These possibilities should be checked prior to servicing the compressor. If the compressor is inoperative, but is not seized, check to see if current is being supplied to the magnetic clutch coil terminals.
This vehicle is provided with a swash plate type compressor.
Swash plate compressors have a swash (slanted) plate mounted on the shaft. When the shaft turns, the rotation of the swash plate is converted to reciprocating piston motion which sucks in and compresses the refrigerant gas.
Shaft seal (Lip type) is installed between the valve plate and shaft a cylinder head to prevent refrigerant gas leaks. A specified amount of compressor oil is contained in the oil pan.
This oil is supplied to the cylinders, bearings, etc., by an oil pump which is connected to the swash plate shaft.
With some compressors the differential between the intake pressure and discharge pressure generated while the compressor is operating is used for lubrication instead of an oil pump.
Three pistons are arranged at 120 degree intervals around the center of the swash plate shaft. These pistons are connected to the ends of the swash plate through balls.
The rotation of the swash plate causes reciprocating movement of the piston inside the cylinders, with each piston operating as two cylinders. Because of that, the compressor operates as though it has 6 cylinders.
The specified amount of the compressors oil is 180 cc (5.0 Imp fl oz).
The oil used in the R-134a system compressor differs from that used in R-12 systems.
Also, compressor oil to be used varies according to the compressor model. Be sure to avoid mixing two or more different types of oil.
If the wrong oil is used, lubrication will be poor and the compressor will seize or malfunction.
(Refer to Section 1B "ON-VEHICLE SERVICE" for Precautions for R-134a Air Conditioning System in this manual.)

GENERAL INFORMATION

Compressor Oil

Oil specification

- The R-134a system requires a synthetic (PAG) compressor oil whereas the R-12 system requires a mineral compressor oil.
  The two oils must never be mixed.
- Compressor (PAG) oil varies according to compressor model. Be sure to use oil specified for the model of compressor.

Specified Compressor Oil
ZXL-100PG (ISUZU PART NO. 8-97101-338-0)

Handling of oil

- The oil should be free from moisture, dust, metal powder, etc.
- Do not mix with other oil.
- The water content in the oil increases when exposed to the air. After use, seal oil from air immediately.
  (R-134a PAG Compressor Oil absorbs moisture very easily than R-12.)
- The compressor oil must be stored in steel containers, not in plastic containers.

Compressor oil check

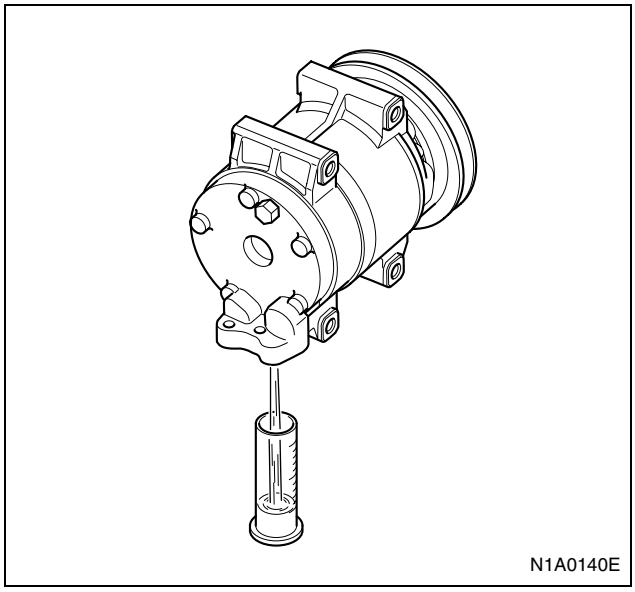
The oil used to lubricate the compressor is circulating with the refrigerant.
Whenever replacing any component of the system or a large amount of gas leakage occurs, add oil to maintain the original amount of oil.

Oil Capacity

Capacity total in system	180 cc (5.0 Imp fl oz)
Compressor (Service parts) charging amount	180 cc (5.0 Imp fl oz)

Checking and Adjusting for Used Compressor

1. Perform Oil return operation.
   (Refer to “Oil Return Operation” in this section.)
2. Discharge refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil with a measuring cylinder.



4. If the amount of oil drained is much less than 90 cc (2.5 Imp fl oz), some refrigerant may have leaked out. Conduct leak tests on connections of each system, and if necessary, repair or replace faulty parts.
5. Check the compressor oil for contamination.
   (Refer to “Contamination of Compressor Oil” in this section.)
6. Adjust oil level following the procedure below.

Collected Amount	Charging Amount
more than 120 cc (3.4 Imp fl oz)	same as collected amount
less than 120 cc (3.4 Imp fl oz)	120 cc (3.4 Imp fl oz)

7. Install the compressor, then evacuate, charge and perform oil return operation.
8. Check system operation.

When it is impossible to perform oil return operation, the compressor oil should be checked in the following order:

1. Discharge refrigerant and remove the compressor.
2. Drain the compressor oil and measure the extracted oil with a measuring cylinder.
3. Check the oil for contamination.
4. If more than 120 cc (3.4 Imp fl oz) of oil is extracted from the compressor, supply same amount of oil to the compressor to be installed.
   If the amount of oil extracted is less than 120 cc (3.4 Imp fl oz), recheck the compressor oil in the following order:
5. Supply 120 cc (3.4 Imp fl oz) of oil to the compressor and install it on to the vehicle.
6. Perform oil return operation.

Checking and Adjusting for Compressor Replacement

180 cc (5.0 Imp fl oz) of oil is charged in compressor (service parts). So it is necessary to drain the proper amount of oil from the new compressor.

1. Perform oil return operation.
2. Discharge refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil.
4. Check the compressor oil for contamination.
5. Adjust oil level as required.

Amount of oil drained from used compressor	Draining amount of oil from new compressor
less than 180 cc (3.4 Imp fl oz)	Same as drained amount
more than 180 cc (3.4 Imp fl oz)	180 cc (3.4 Imp fl oz)

6. Evacuate, charge and perform oil return operation.
7. Check system operation.

Contamination of compressor oil

Unlike engine oil, no cleaning agent is added to the compressor oil. Even if the compressor runs for a long period of time (approximately 1 season), the oil never becomes contaminated as long as there is nothing wrong with the compressor or its method of use.

Inspect the extracted oil for any of the following conditions:

- The capacity of the oil has increased.
- The oil has changed color to red.
- Foreign substances, metal powder, etc., are present in the oil.

If any of these conditions exists, compressor oil is contaminated. Whenever contaminated compressor oil is discovered, the receiver/drier must be replaced.

Oil return operation

There is close affinity between the oil and the refrigerant. During normal operation, part of the oil recirculates with the refrigerant in the system.

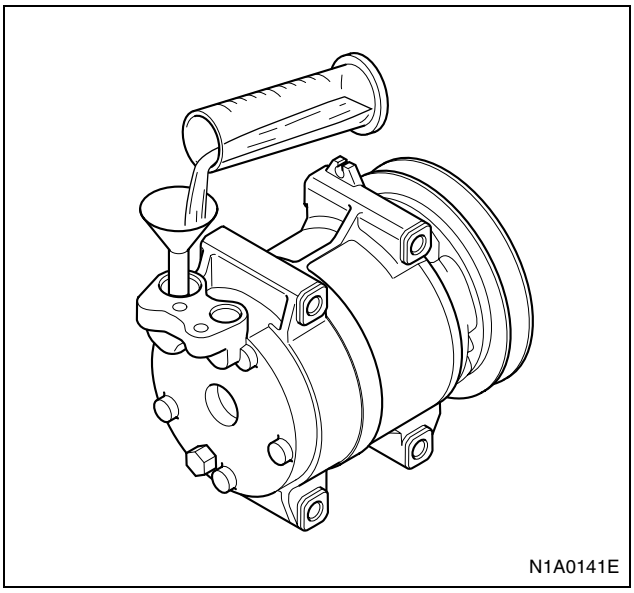
When checking the amount of oil in the system, or replacing any component of the system, the compressor must be run in advance for oil return operation. The procedure is as follows:

1. Open the all doors and engine hood.
2. Start the engine and A/C switch is “ON”. Set the fan control knob at its highest position.
3. Run the compressor for more than 20 minutes between 800 and 1,000 rpm in order to operate the system.
4. Stop the engine.

Replacement of component parts

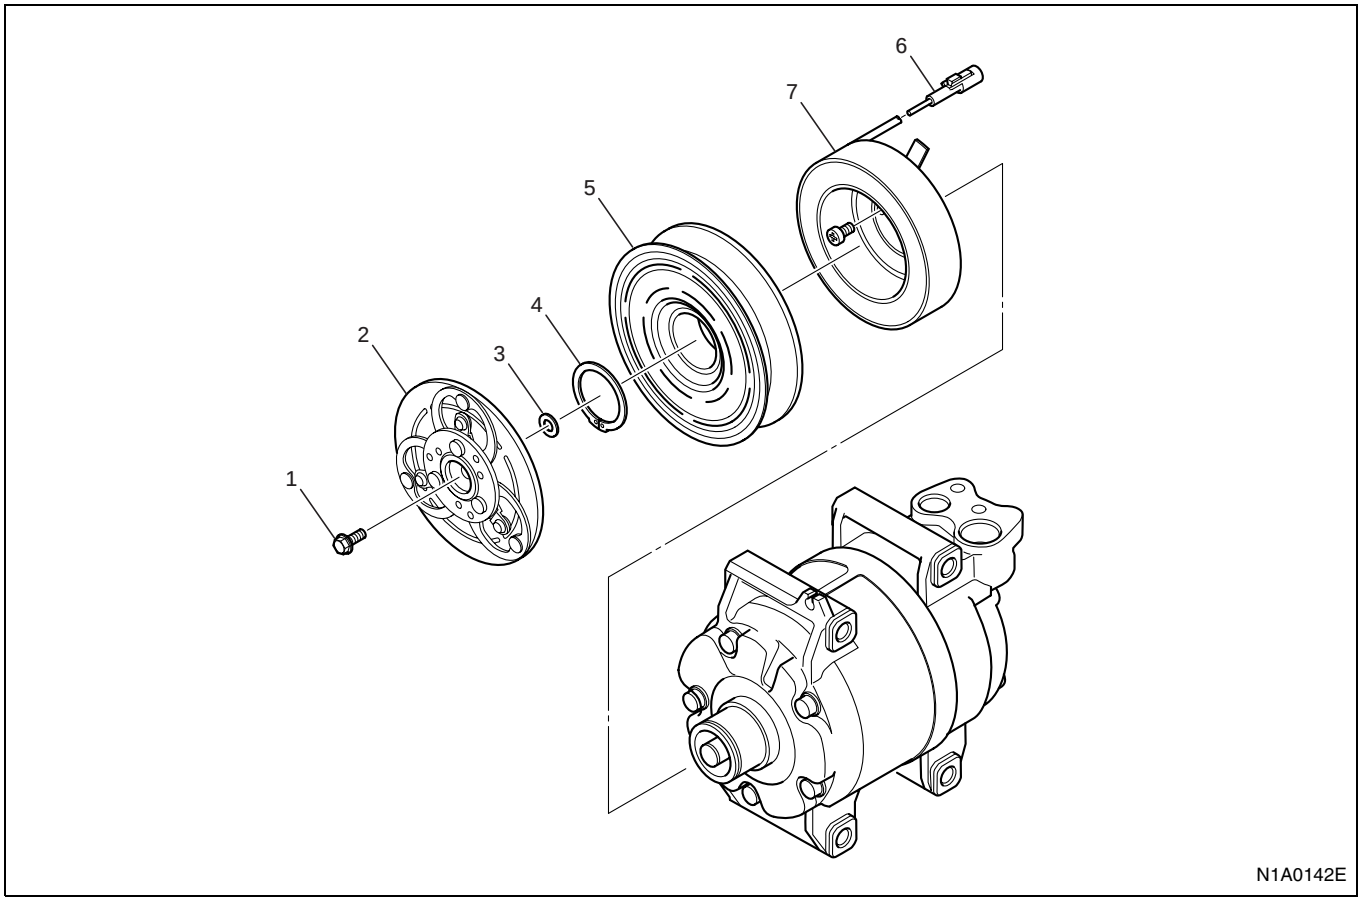
When replacing system component parts, supply the following amount of oil to the component parts to be installed.

Component parts to be installed	Amount of oil
Evaporator	50 cc (1.4 Imp fl oz)
Condenser	30 cc (0.8 Imp fl oz)
Receiver/drier	30 cc (0.8 Imp fl oz)
Refrigerant line (One piece)	10 cc (0.3 Imp fl oz)



SERVICE PROCEDURES

Compressor Overhaul

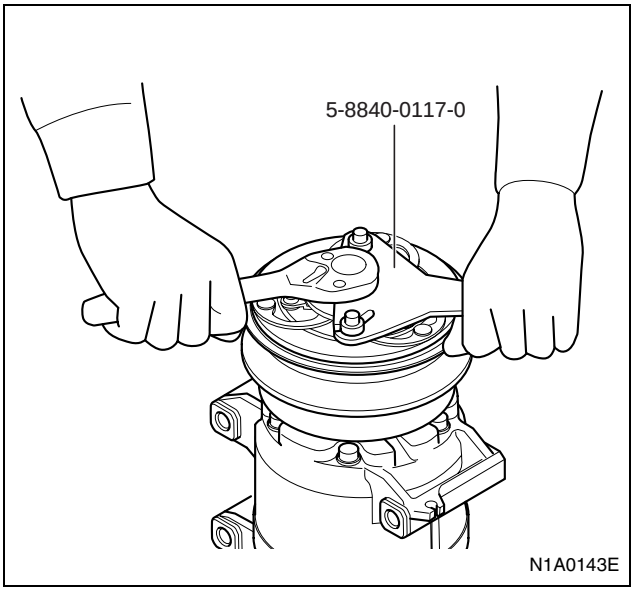


Legend

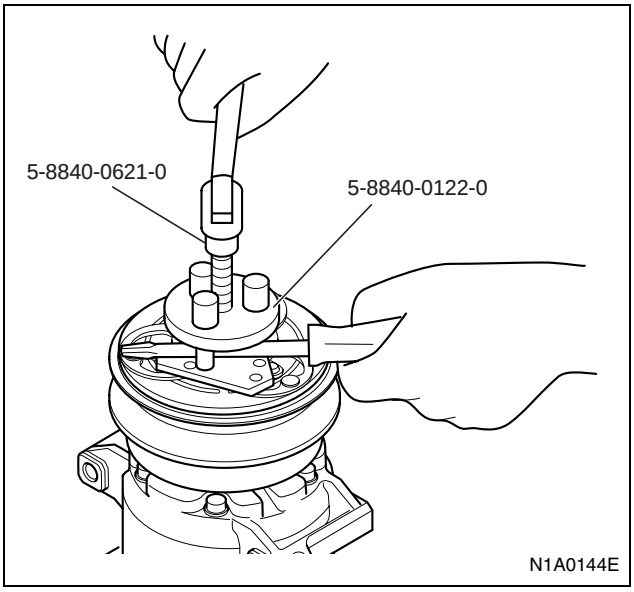
1. Drive plate bolt
2. Drive plate
3. Shim(s)
4. Snap ring
5. Pulley assembly
6. Lead wire connector
7. Field coil

Disassembly

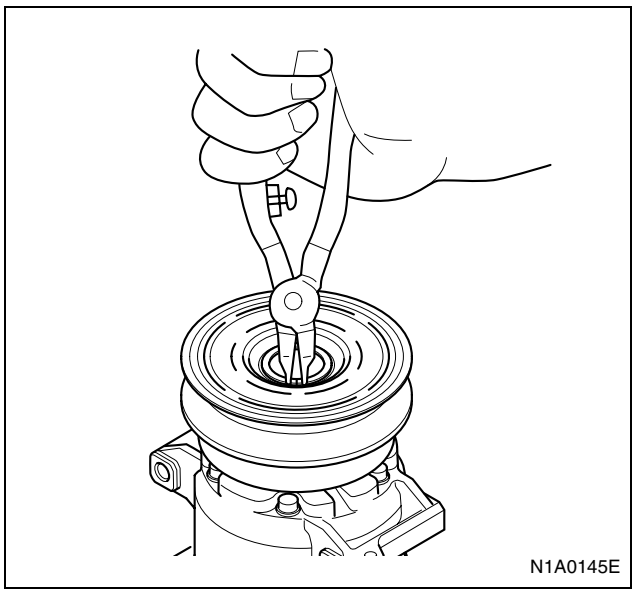
1. Drive Plate Bolt
   Using drive plate holder to prevent the drive plate from rotating, then remove the bolt.
   Drive Plate Holder: 5-8840-0117-0 (J-33939)



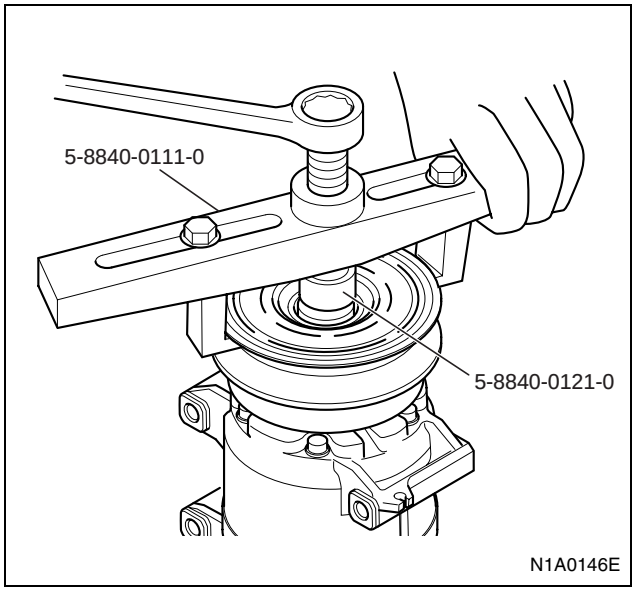
2. Drive Plate
   Using drive plate puller and forcing screw to remove the drive plate.
   Drive Plate Puller: 5-8840-0122-0 (J-33944-A)
   Forcing Screw: 5-8840-0621-0 (J-33944-4)
   If the frictional surface shows signs of damage due to excessive heat, the drive plate and pulley should be replaced.



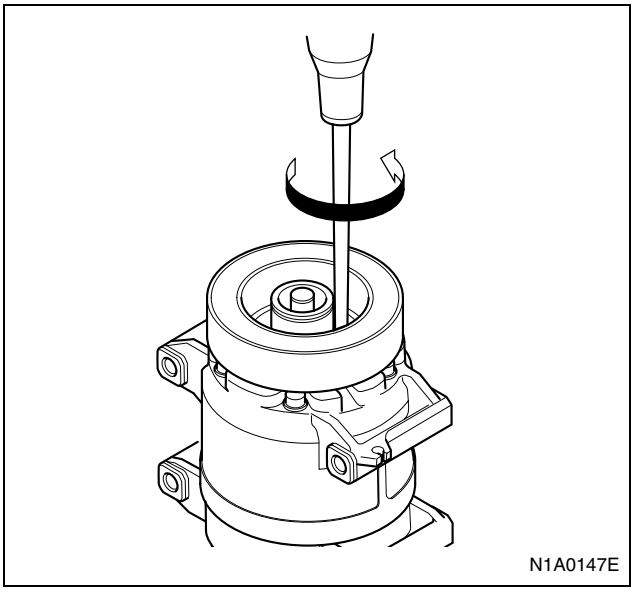
3. Shim(s)
4. Snap Ring
5. Cover (If so equipped)
   Using snap ring pliers to remove the snap ring.



6. Pulley Assembly
   Using pulley puller pilot and pulley puller to remove the pulley assembly.
   Pulley Puller Pilot: 5-8840-0121-0 (J-33943)
   Pulley Puller: 5-8840-0111-0 (J-8433)
   Check the appearance of the pulley assembly. If the frictional surface of the pulley shows signs of excessive grooving due to slippage, both the pulley and drive plate should be replaced. The frictional surfaces of the pulley assembly should be cleaned with a suitable solvent before reinstallation.



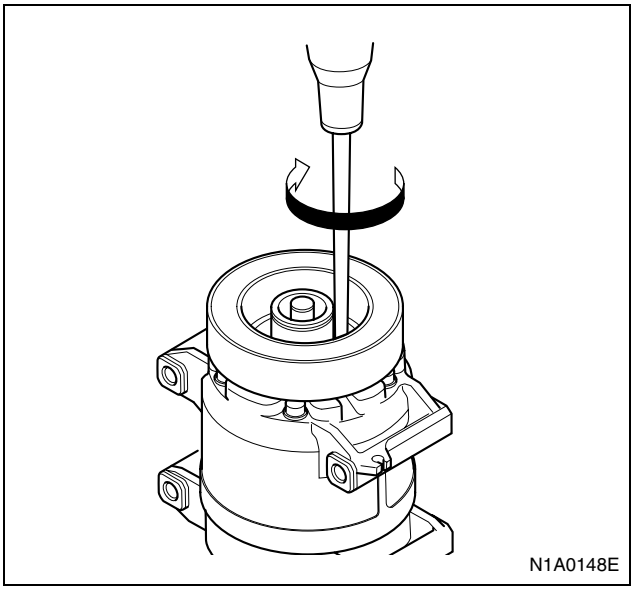
7. Lead Wire Connector
   Remove the lead wire from lead wire fixing bush.
8. Field Coil
   Loosen three screws and remove the field coil with lead wire.
   Check coil for loose connector or cracked insulation.



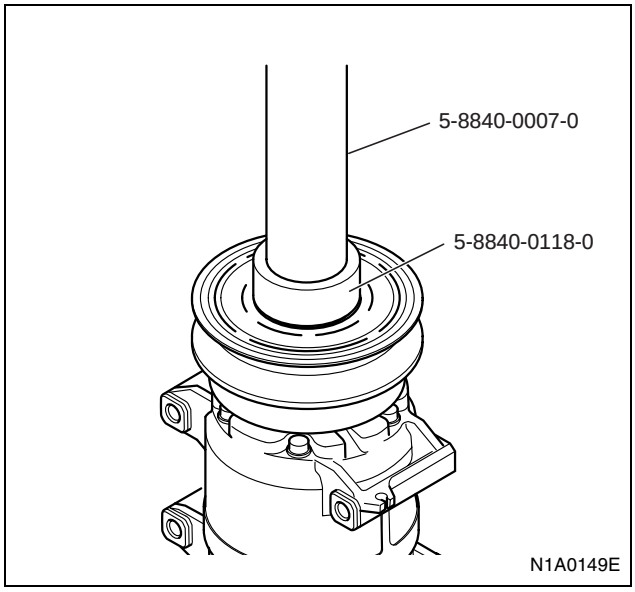
Reassembly

1. Field Coil
2. Lead Wire Connector
   Install the field coil to the compressor.
   Lead wire must be facing up.
   Tighten the field coil fixing screws to the specified torque.

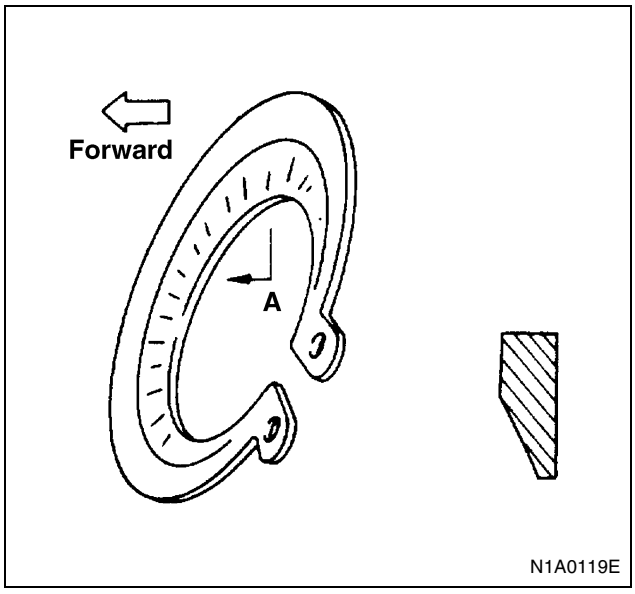
Tighten:
Field coil screw to 5 N·m (0.5 kg·m / 44 lb·ft)



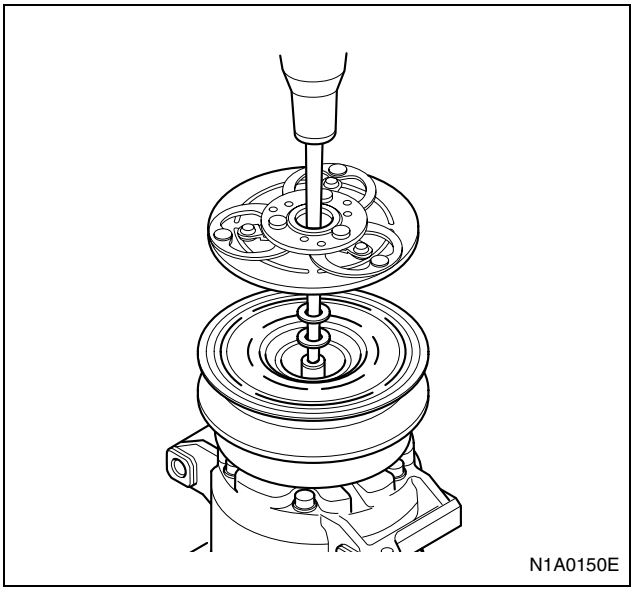
3. Pulley Assembly
   Using pulley installer and drive handle to install the pulley assembly.
   Pulley Installer: 5-8840-0118-0 (J-33940)
   Drive Handle: 5-8840-0007-0 (J-8092)



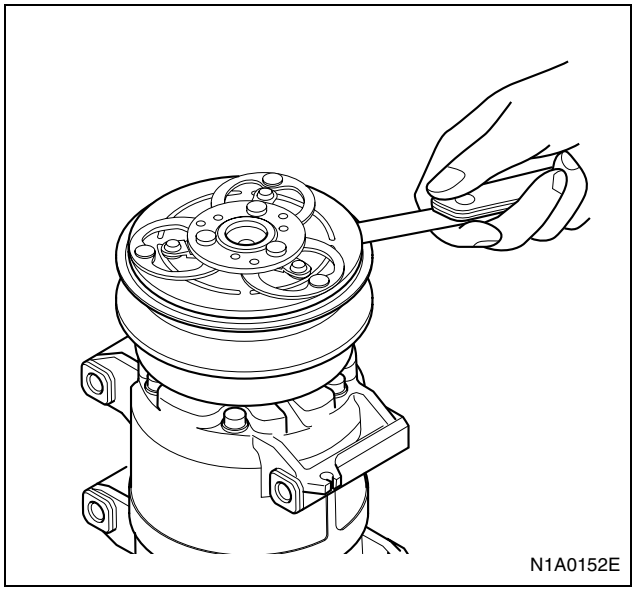
4. Cover (If so equipped)
5. Snap Ring
   Install the snap ring with the inside indented portion facing out.



6. Shim(s)
7. Drive Plate
   Install the drive plate to the compressor drive shaft together with the original shim(s).
   Press the drive plate by hand.



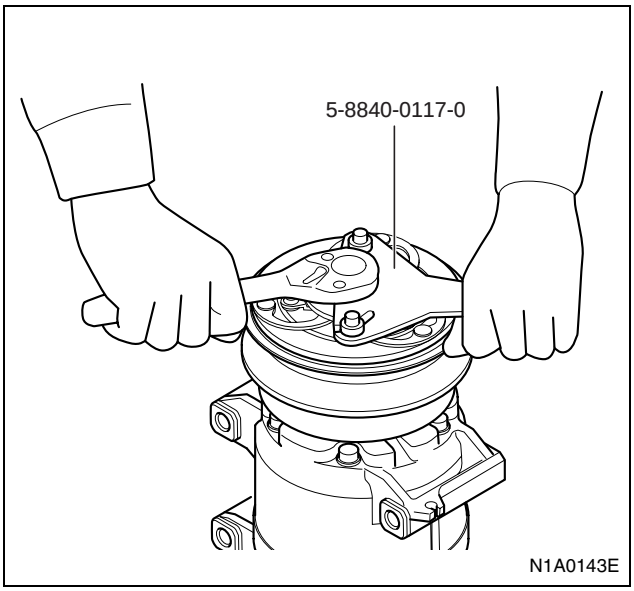
N1A0150E



N1A0152E

8. Drive Plate Bolt
   Using drive plate holder to prevent the drive plate from rotating.
   Drive Plate Holder: 5-8840-0117-0 (J-33939)
   Tighten the bolt to the specified torque.

Tighten:
Drive plate bolt to 15 N·m (0.5 kg·m / 11 lb·ft)



N1A0143E

After tightening the bolt, check to be sure the pulley rotates smoothly.

Check to be sure that the clutch clearance is between 0.3 — 0.6 mm (0.01 — 0.02 in).

If necessary, install adjusting shim(s).

Adjusting shims are available in the following thickness.

Thickness	0.1 mm (0.0039 in)
	0.3 mm (0.0118 in)
	0.5 mm (0.0197 in)

HEATING AND AIR CONDITIONING

SECTION 1D2

COMPRESSOR OVERHAUL FOR TAIWAN

Caution:
When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used.

Fasteners that are not reused, and those requiring thread locking compound, will be called out. The correct torque values must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

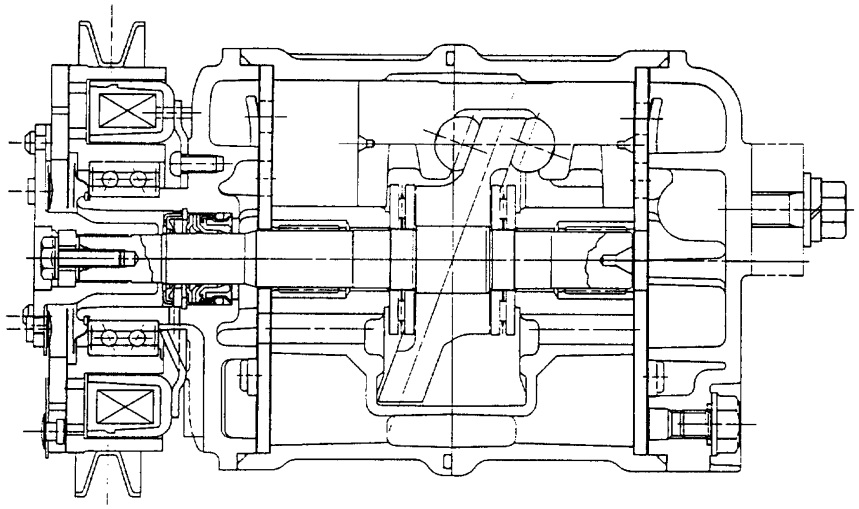
GENERAL DESCRIPTION 1D2-2
GENERAL INFORMATION.....1D2-3
Compressor Oil.....1D2-3
SERVICE PROCEDURES.....1D2-5
Compressor Overhaul 1D2-5

GENERAL DESCRIPTION



N1A0097E

When servicing the compressor, keep dirt or foreign material from getting on or into the compressor parts and system. Clean tools and a clean work area are important for proper service. The compressor connections and the outside of the compressor should be cleaned before any "On-Vehicle" repair, or before removal of the compressor. The parts must be kept clean at all times and any parts to be reassembled should be cleaned with Trichloroethane, naphtha, kerosene, or equivalent solvent, and dried with dry air. Use only lint free cloths to wipe parts.
The operations described below are based on bench overhaul with compressor removed from the car, except as noted. They have been prepared in order of accessibility of the components. When the compressor is removed from the car for servicing, the oil remaining in the compressor should be discarded and new refrigerant oil added to the compressor.
Magnetic clutch assembly repair procedures require that the system be discharged of refrigerant. (Refer to Section 1B for "REFRIGERANT RECOVERY".)
Compressor malfunction will appear in one of four ways: noise, seizure, leakage or low discharge pressure. Resonant compressor noises are not cause for alarm; however, irregular noise or rattles may indicate broken parts or excessive clearances due to wear. To check seizure, de-energize the magnetic clutch and check to see if the drive plate can be rotated. If rotation is impossible, the compressor is seized. Low discharge pressure may be due to a faulty internal seal of the compressor, or a restriction in the compressor. Low discharge pressure may also be due to an insufficient refrigerant charge or a restriction elsewhere in the system. These possibilities should be checked prior to servicing the compressor. If the compressor is inoperative, but is not seized, check to see if current is being supplied to the magnetic clutch coil terminals.
This vehicle is provided with a swash plate type compressor.
Swash plate compressors have a swash (slanted) plate mounted on the shaft. When the shaft turns, the rotation of the swash plate is converted to reciprocating piston motion which sucks in and compresses the refrigerant gas.
Shaft seal (Lip type) is installed between the valve plate and shaft a cylinder head to prevent refrigerant gas leaks. A specified amount of compressor oil is contained in the oil pan.
This oil is supplied to the cylinders, bearings, etc., by an oil pump which is connected to the swash plate shaft.
With some compressors the differential between the intake pressure and discharge pressure generated while the compressor is operating is used for lubrication instead of an oil pump.
Three pistons are arranged at 120 degree intervals around the center of the swash plate shaft. These pistons are connected to the ends of the swash plate through balls.
The rotation of the swash plate causes reciprocating movement of the piston inside the cylinders, with each piston operating as two cylinders. Because of that, the compressor operates as though it has 6 cylinders.
The specified amount of the compressors oil is 180 cc (5.0 Imp fl oz).
The oil used in the R-134a system compressor differs from that used in R-12 systems.
Also, compressor oil to be used varies according to the compressor model. Be sure to avoid mixing two or more different types of oil.
If the wrong oil is used, lubrication will be poor and the compressor will seize or malfunction.
(Refer to Section 1B "ON-VEHICLE SERVICE" for Precautions for R-134a Air Conditioning System in this manual.)

GENERAL INFORMATION

Compressor Oil

Oil specification

- The R-134a system requires a synthetic (PAG) compressor oil whereas the R-12 system requires a mineral compressor oil.
  The two oils must never be mixed.
- Compressor (PAG) oil varies according to compressor model. Be sure to use oil specified for the model of compressor.

Specified Compressor Oil
ZXL-100PG (ISUZU PART NO. 8-97101-338-0)

Handling of oil

- The oil should be free from moisture, dust, metal powder, etc.
- Do not mix with other oil.
- The water content in the oil increases when exposed to the air. After use, seal oil from air immediately.
  (R-134a PAG Compressor Oil absorbs moisture very easily than R-12.)
- The compressor oil must be stored in steel containers, not in plastic containers.

Compressor oil check

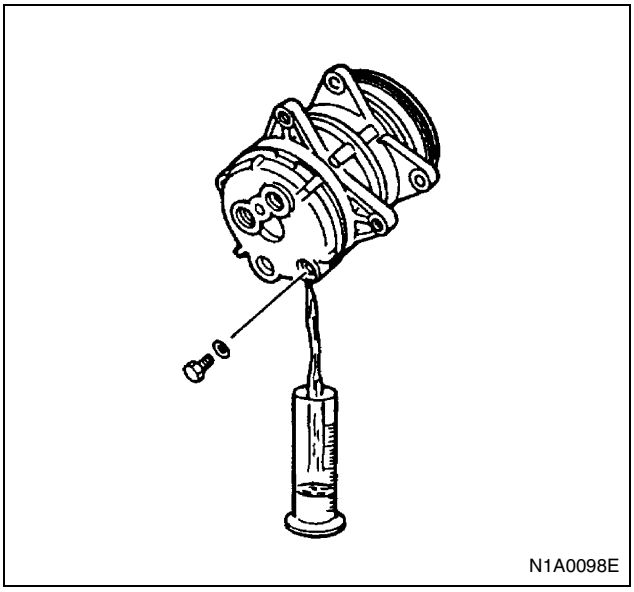
The oil used to lubricate the compressor is circulating with the refrigerant.
Whenever replacing any component of the system or a large amount of gas leakage occurs, add oil to maintain the original amount of oil.

Oil Capacity

Capacity total in system	180 cc (5.0 Imp fl oz)
Compressor (Service parts) charging amount	180 cc (5.0 Imp fl oz)

Checking and Adjusting for Used Compressor

1. Perform Oil return operation.
   (Refer to “Oil Return Operation” in this section.)
2. Discharge refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil with a measuring cylinder.



N1A0098E

4. If the amount of oil drained is much less than 90 cc (2.5 Imp fl oz), some refrigerant may have leaked out. Conduct leak tests on connections of each system, and if necessary, repair or replace faulty parts.
5. Check the compressor oil for contamination.
   (Refer to “Contamination of Compressor Oil” in this section.)
6. Adjust oil level following the procedure below.

Collected Amount	Charging Amount
more than 120 cc (3.4 Imp fl oz)	same as collected amount
less than 120 cc (3.4 Imp fl oz)	120 cc (3.4 Imp fl oz)

7. Install the compressor, then evacuate, charge and perform oil return operation.
8. Check system operation.

When it is impossible to perform oil return operation, the compressor oil should be checked in the following order:

1. Discharge refrigerant and remove the compressor.
2. Drain the compressor oil and measure the extracted oil with a measuring cylinder.
3. Check the oil for contamination.
4. If more than 120 cc (3.4 Imp fl oz) of oil is extracted from the compressor, supply same amount of oil to the compressor to be installed.
   If the amount of oil extracted is less than 120 cc (3.4 Imp fl oz), recheck the compressor oil in the following order:
5. Supply 120 cc (3.4 Imp fl oz) of oil to the compressor and install it on to the vehicle.
6. Perform oil return operation.

Checking and Adjusting for Compressor Replacement

180 cc (5.0 Imp fl oz) of oil is charged in compressor (service parts). So it is necessary to drain the proper amount of oil from the new compressor.

1. Perform oil return operation.
2. Discharge refrigerant and remove the compressor.
3. Drain the compressor oil and measure the extracted oil.
4. Check the compressor oil for contamination.
5. Adjust oil level as required.

Amount of oil drained from used compressor	Draining amount of oil from new compressor
less than 180 cc (3.4 Imp fl oz)	Same as drained amount
more than 180 cc (3.4 Imp fl oz)	180 cc (3.4 Imp fl oz)

6. Evacuate, charge and perform oil return operation.
7. Check system operation.

Contamination of compressor oil

Unlike engine oil, no cleaning agent is added to the compressor oil. Even if the compressor runs for a long period of time (approximately 1 season), the oil never becomes contaminated as long as there is nothing wrong with the compressor or its method of use.

Inspect the extracted oil for any of the following conditions:

- The capacity of the oil has increased.
- The oil has changed color to red.
- Foreign substances, metal powder, etc., are present in the oil.

If any of these conditions exists, compressor oil is contaminated. Whenever contaminated compressor oil is discovered, the receiver/drier must be replaced.

Oil return operation

There is close affinity between the oil and the refrigerant. During normal operation, part of the oil recirculates with the refrigerant in the system.

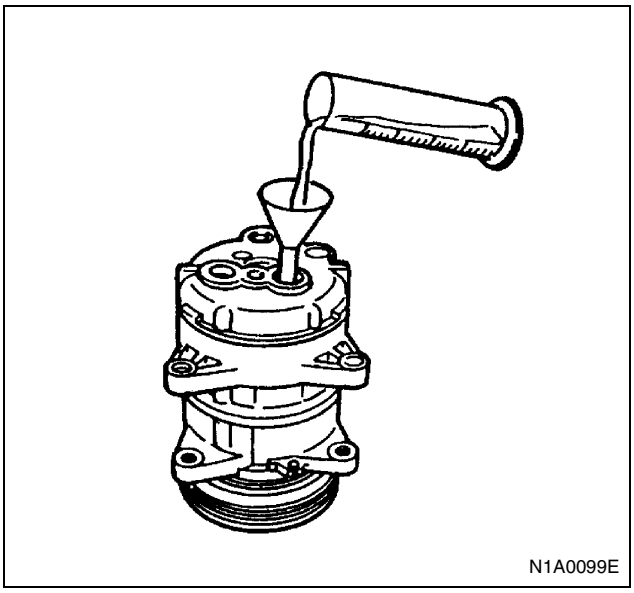
When checking the amount of oil in the system, or replacing any component of the system, the compressor must be run in advance for oil return operation. The procedure is as follows:

1. Open the all doors and engine hood.
2. Start the engine and A/C switch is “ON”. Set the fan control knob at its highest position.
3. Run the compressor for more than 20 minutes between 800 and 1,000 rpm in order to operate the system.
4. Stop the engine.

Replacement of component parts

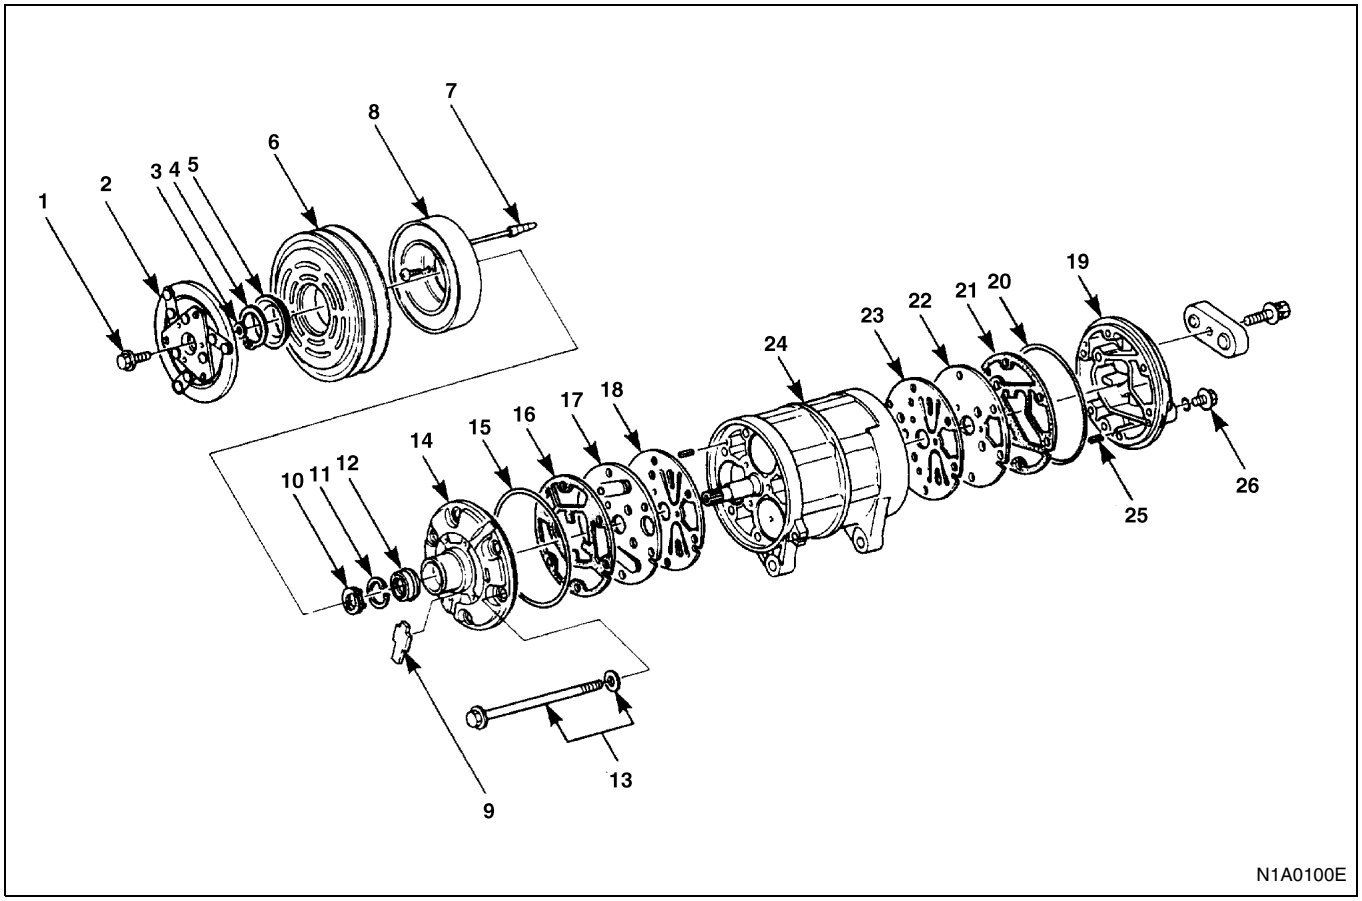
When replacing system component parts, supply the following amount of oil to the component parts to be installed.

Component parts to be installed	Amount of oil
Evaporator	50 cc (1.4 Imp fl oz)
Condenser	30 cc (0.8 Imp fl oz)
Receiver/drier	30 cc (0.8 Imp fl oz)
Refrigerant line (One piece)	10 cc (0.3 Imp fl oz)



SERVICE PROCEDURES

Compressor Overhaul



Legend

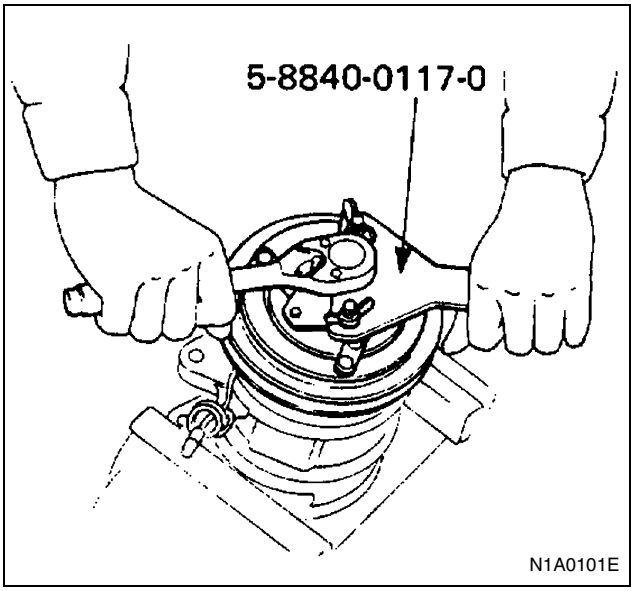
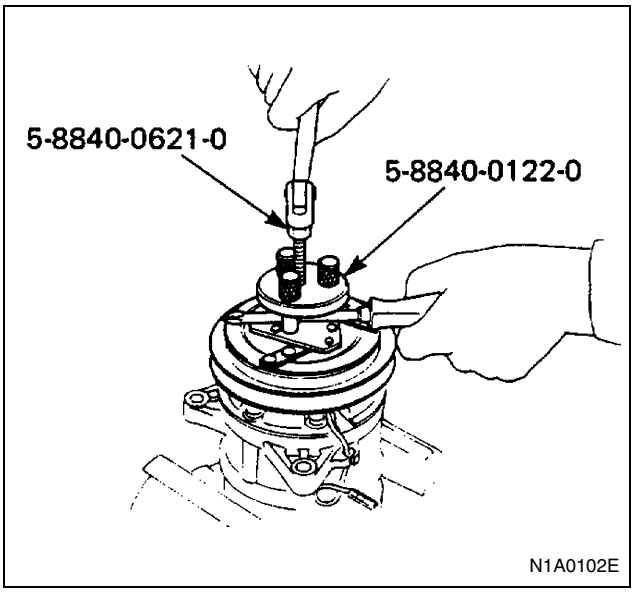
24. Cylinder and shaft assembly
25. Key
26. Oil drain plug

Disassembly

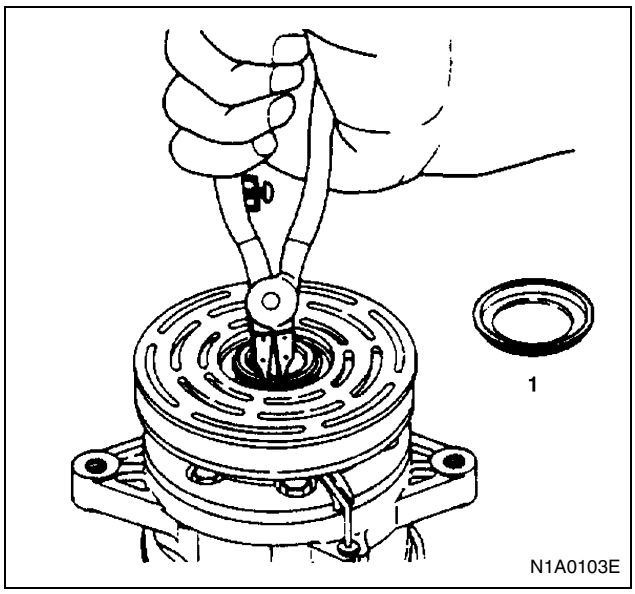
1. Drive Plate Bolt
   Using drive plate holder to prevent the drive plate from rotating, then remove the bolt.
   Drive Plate Holder: 5-8840-0117-0 (J-33939)



2. Drive Plate
   Using drive plate puller and forcing screw to remove the drive plate.
   Drive Plate Puller: 5-8840-0122-0 (J-33944-A)
   Forcing Screw: 5-8840-0621-0 (J-33944-4)
   If the frictional surface shows signs of damage due to excessive heat, the drive plate and pulley should be replaced.

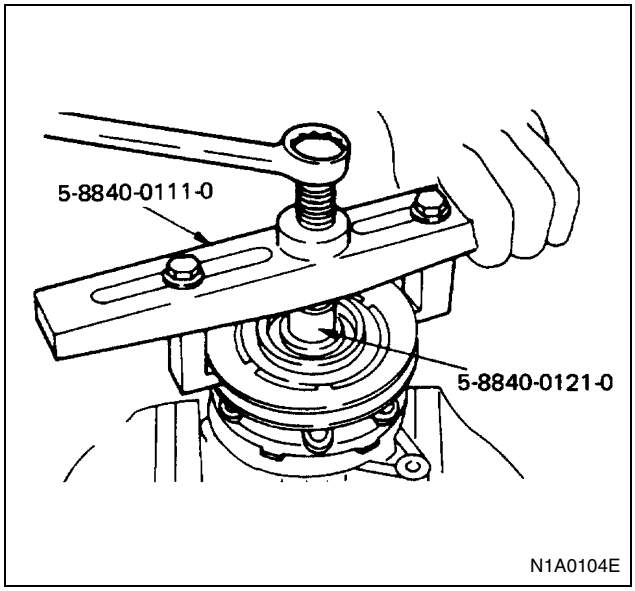


3. Shim(s)
4. Snap Ring
5. Cover (If so equipped)
   Using snap ring pliers to remove the snap ring.



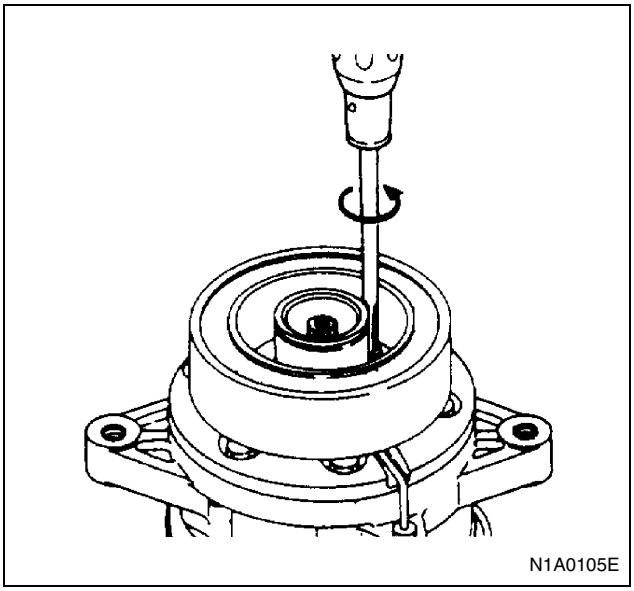
Legend
1. Cover

6. Pulley Assembly
   Using pulley puller pilot and pulley puller to remove the pulley assembly.
   Pulley Puller Pilot: 5-8840-0121-0 (J-33943)
   Pulley Puller: 5-8840-0111-0 (J-8433)
   Check the appearance of the pulley assembly. If the frictional surface of the pulley shows signs of excessive grooving due to slippage, both the pulley and drive plate should be replaced. The frictional surfaces of the pulley assembly should be cleaned with a suitable solvent before reinstallation.

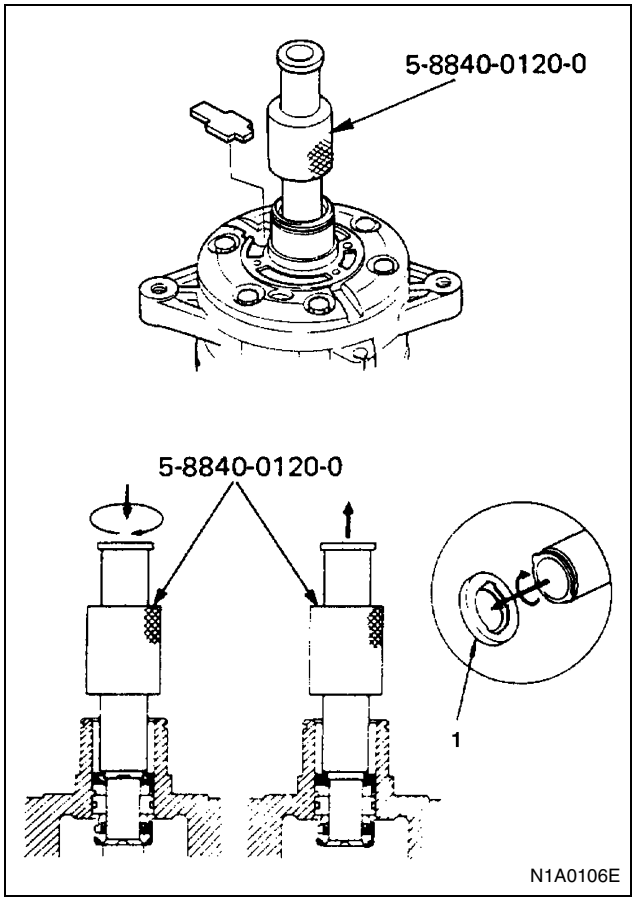


7. Lead Wire Connector
   Remove the lead wire from lead wire fixing bush.

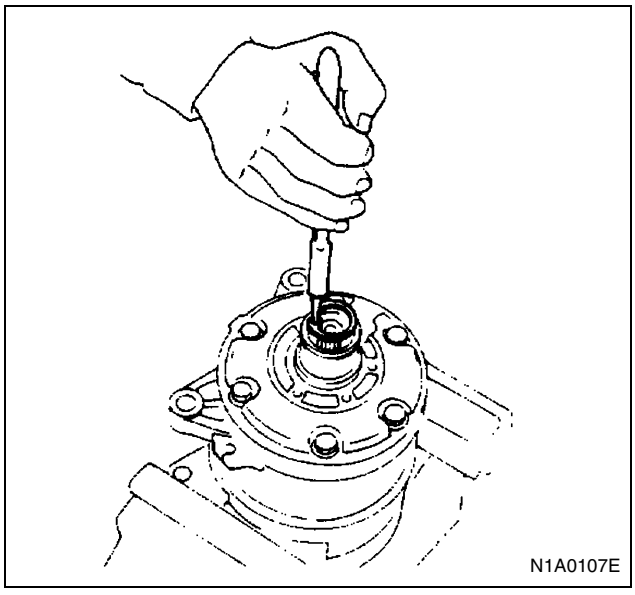
8. Field Coil
   Loosen three screws and remove the field coil with lead wire.
   Check coil for loose connector or cracked insulation.



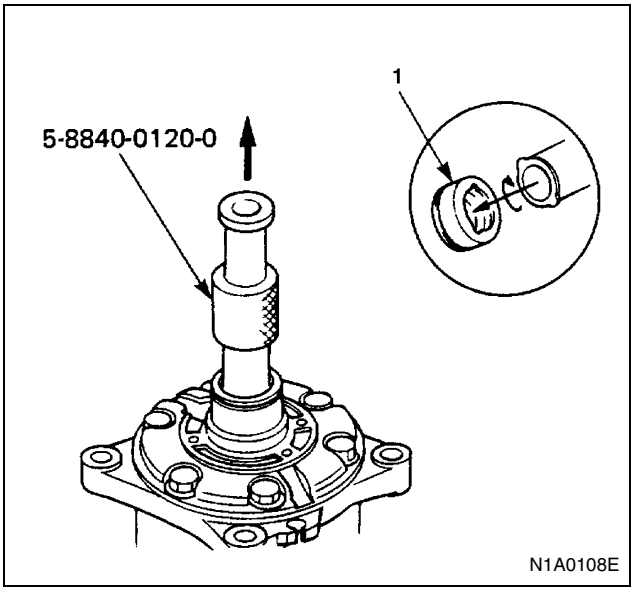
9. Felt (If so equipped)
10. Shaft Seal Cover (If so equipped)
    Using shaft seal remover to remove the shaft seal cover (1).
    Engage the remover hook with the shaft seal cover groove and slowly draw the shaft seal cover out.
    Shaft Seal Remover: 5-8840-0120-0 (J-33942)



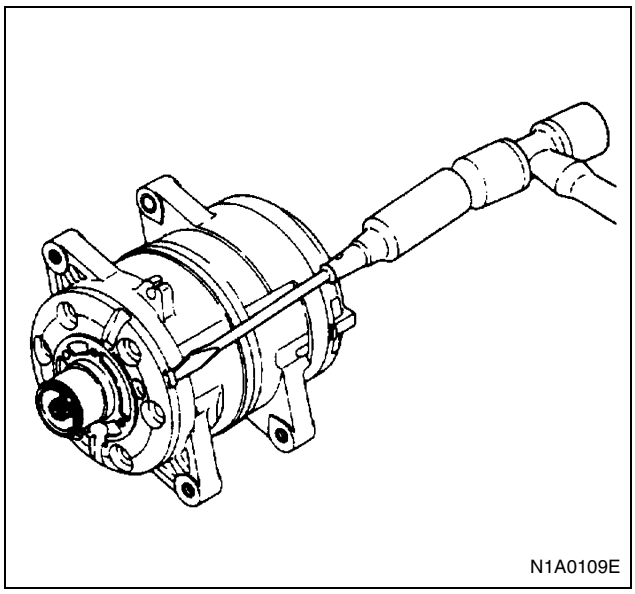
11. Snap Ring
    Using snap ring pliers to remove the snap ring.



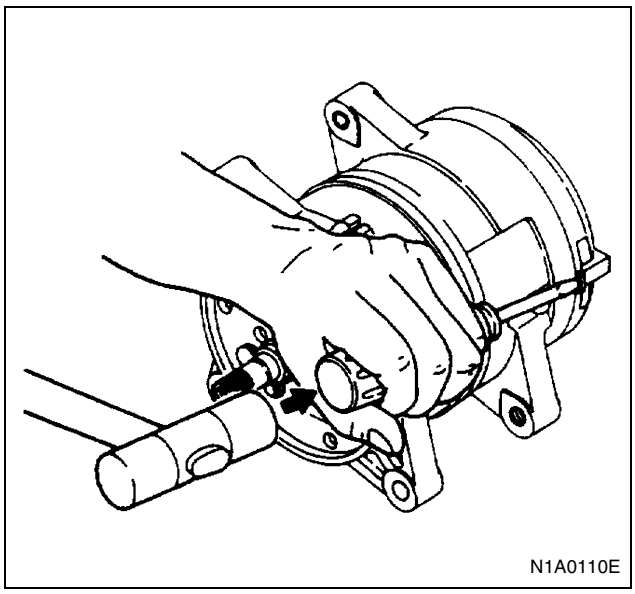
12. Shaft Seal Assembly
    Using shaft seal remover to remove the shaft seal assembly.
    Engage the remover hook with the shaft seal assembly groove and slowly draw the shaft seal assembly out.
    Shaft Seal Remover: 5-8840-0120-0 (J-33942)
    The shaft seal (1) is precision-machined and its critical parts are finished to extremely close tolerances. The assembly must be handled with great care, it slips face demanding particularly careful handling.
    The shaft seal can not be reused. Install a new shaft seal at reassembly.
    Take care not to scratch or otherwise damage the shaft seal face.
    Keep the shaft seal free from lint and dirt.



13. Through Bolt with Gasket
14. Front Cylinder Head
15. O-ring
    Alternately tap the projections on the circumference of the front cylinder head with a screwdriver and a plastic hammer to remove the front cylinder head.



16. Gasket
17. Front Valve Plate
18. Front Suction Valve
    Check the front valve plate for scratching and bending.
    Check the front valve plate and the front cylinder head for nicks and burrs on the sealing surface.
    Buff or replace the valve plate and cylinder head if nicks and burrs are present.
    Check that the front valve plate passage is free from obstructions.
    Check the front valve plate and the cylinder head for cracks.
    Replace the valve plate and cylinder head if cracks are present.
19. Rear Cylinder Head
20. O-ring
    Alternately tap the projections on the circumference of the rear cylinder head with a screwdriver and a plastic hammer to remove the rear cylinder head.



21. Gasket
22. Rear Valve Plate
23. Rear Suction Valve
24. Cylinder and shaft assembly
    Check the rear valve plate for scratching and bending.

    Check the rear valve plate and the rear cylinder head for nicks and burrs on the sealing surface.

    Buff or replace the valve plate and cylinder head if nicks and burrs are present.

    Check that the rear valve plate passage is free from obstructions.

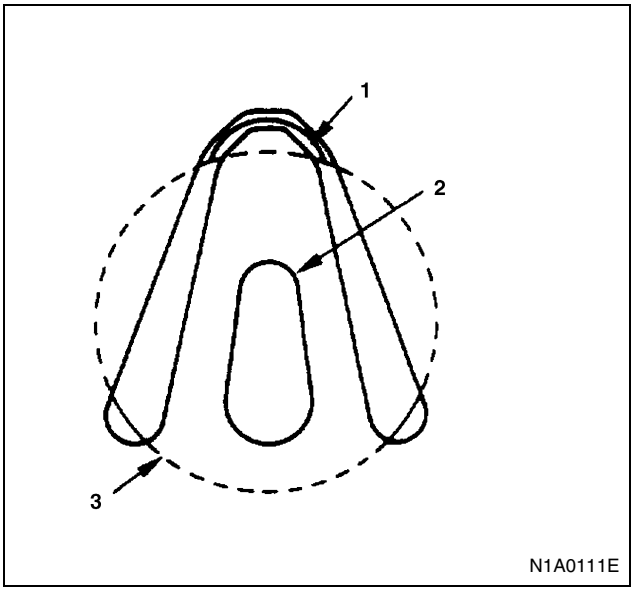
    Check the rear valve plate and the cylinder head for cracks.

    Replace the valve plate and cylinder head if cracks are present.

Reassembly

1. Cylinder and Shaft Assembly
   Clamp the cylinder shaft assembly in a vise. The rear side of the cylinder shaft assembly must be facing up.
2. Rear Suction Valve
   Apply a coat of new compressor oil to the new suction valve.

   Install the suction valve by aligning it with the spring pin and the cylinder valve relief grooves.



Legend

1. Escape groove
2. Suction valve
3. Piston

3. Rear Valve Plate
   Apply a coat of new compressor oil to the new valve plate.

   Install the valve plate to the suction valve by aligning it with the spring pin.

Notice:
Do not mix up the front and rear valve plates.

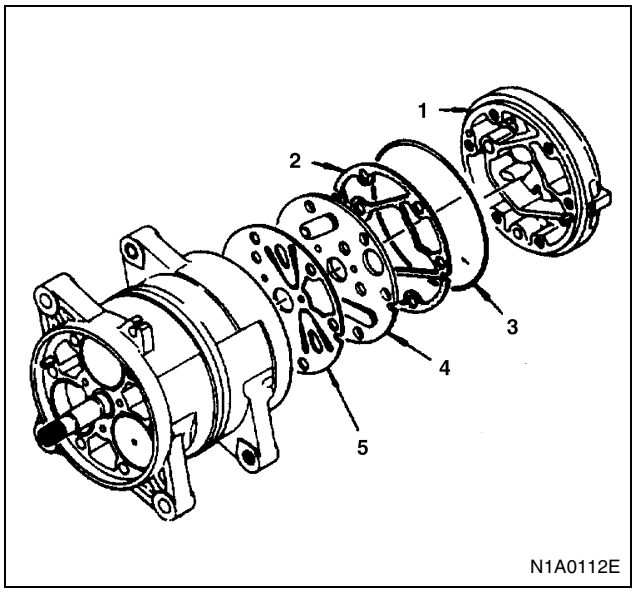
4. Gasket
   Apply a coat of new compressor oil to the new gasket.

   Install the gasket to the valve plate.
5. O-ring
6. Rear Cylinder Head
   Apply a coat of new compressor oil to the new O-ring.

   Install the O-ring to the rear cylinder head.

   Install the rear cylinder head.

   Tap the rear cylinder head into place with a plastic hammer.



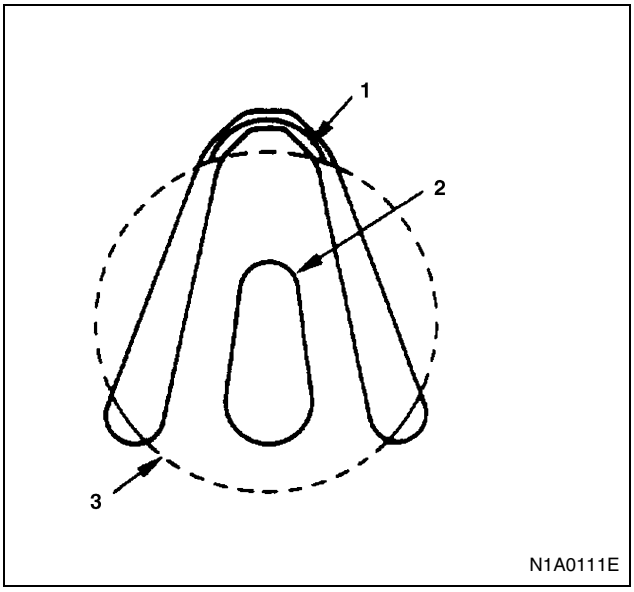
Legend

1. Rear cylinder head
2. Gasket
3. O-ring
4. Valve plate
5. Suction valve

7. Front Suction Valve
   Set the cylinder shaft assembly with the front side facing up.

   Apply a coat of new compressor oil to the new suction valve.

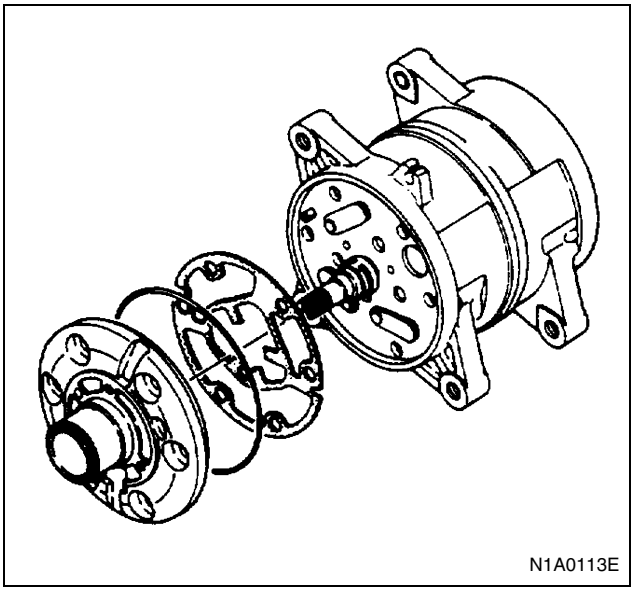
   Install the suction valve by aligning it with the spring pin and the cylinder valve relief grooves.



Legend
1. Escape groove
2. Suction valve
3. Piston

8. Front Valve Plate
   Apply a coat of new compressor oil to the new valve plate.
   Install the valve plate to the suction valve by aligning it with the spring pin.

Notice:
Do not mix up the front and rear valve plates.



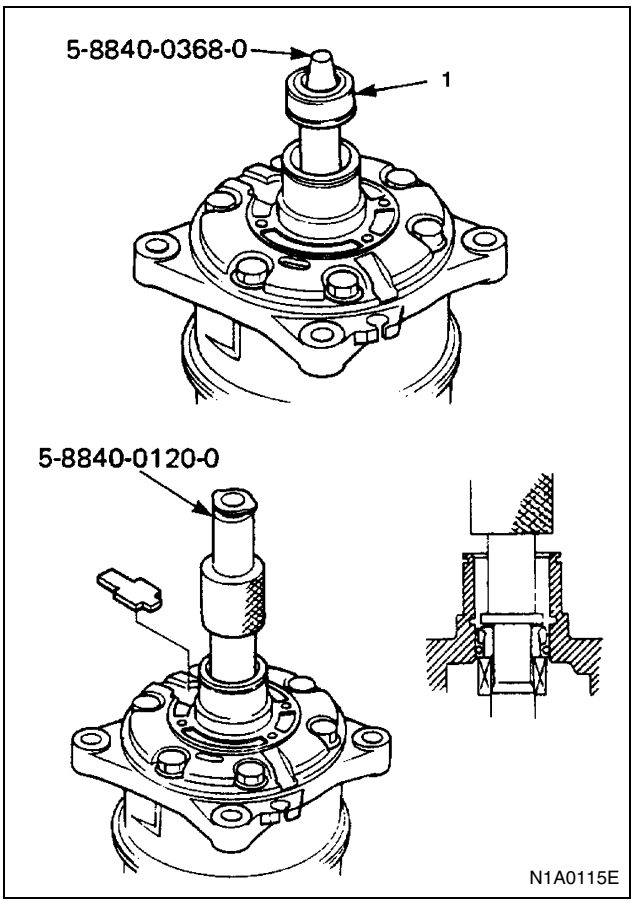
9. Gasket
   Apply new compressor oil to the new gasket.
   Install the gasket to the valve plate by aligning it with the spring pin.
10. O-ring
11. Front Cylinder Head
    Apply a coat of new compressor oil to the new O-ring.
    Install the O-ring to the front cylinder head.
    Install the front cylinder head.
    Tap the front cylinder head into place with a plastic hammer.

Notice:
When installing the cylinder head, be careful that the end of the drive shaft does not damage the shaft seal assembly surface in the cylinder head.

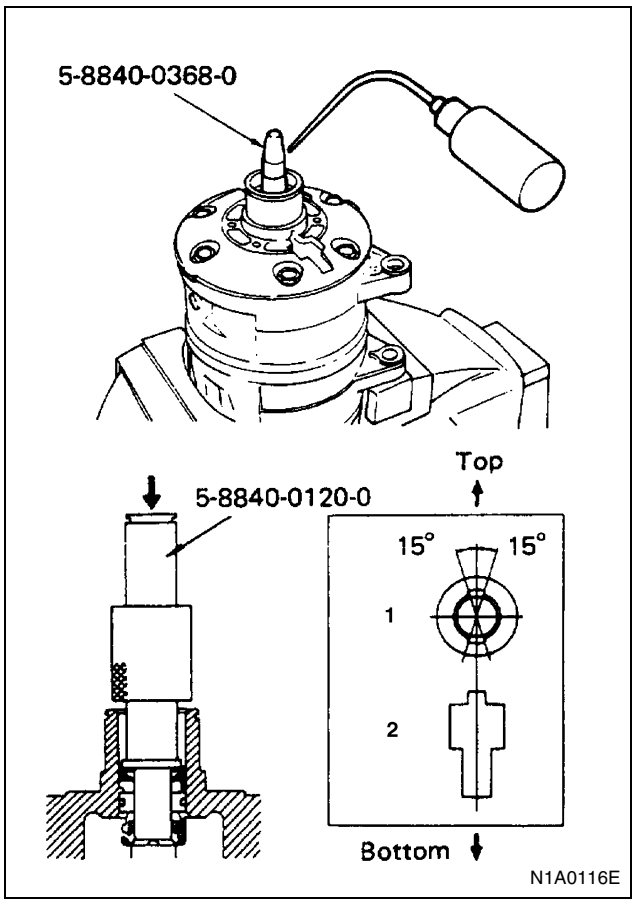
12. Through Bolt with Gasket
    Gaskets cannot reused. Always replace new ones.
    Tighten the bolts to the specified torque a little at a time in the sequence shown in the illustration.

Tighten:
Through bolt to 22 N·m (2.2 kg·m / 16 lb·ft)

    Rotate the compressor drive shaft two or three times to make sure that it moves smoothly.
13. Shaft Seal Assembly
    Clean the sealing portion of the compressor and shaft seal (1).
    Install the shaft seal guide onto the end of the drive shaft.
    Shaft Seal Guide: 5-8840-0368-0 (J-34614)
    Apply new compressor oil to the shaft seal guide.
    Install the shaft seal onto the compressor drive shaft head by using shaft seal installer.
    Shaft Seal Installer: 5-8840-0120-0 (J-33942)



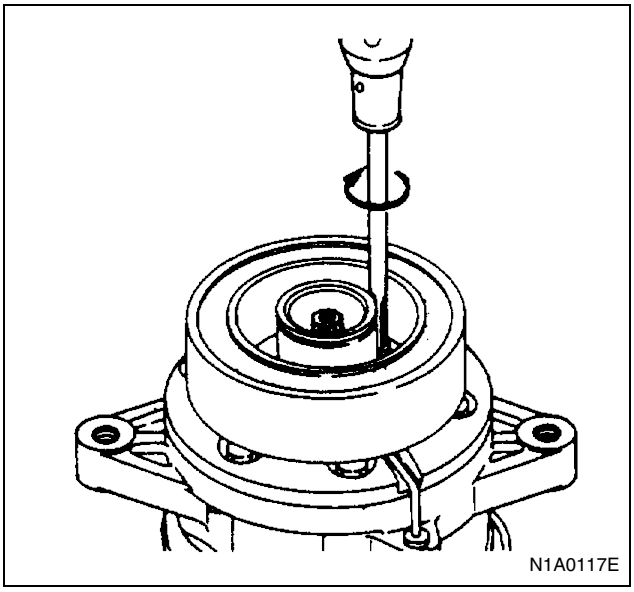
14. Snap Ring
    Using snap ring pliers to install the snap ring.
15. Shaft Seal Cover (If so equipped)
16. Felt (If so equipped)
    Clean the sealing portion of the compressor and shaft seal cover.
    Install the shaft seal guide onto the end of the drive shaft.
    Shaft Seal Guide: 5-8840-0368-0 (J-34614)
    Apply new compressor oil to the shaft seal guide.
    Install the shaft seal cover onto the drive shaft by using shaft seal installer.
    The installation position of the shaft seal cover is shown in the illustration.
    Shaft Seal Installer: 5-8840-0120-0 (J-33942)



Legend
1. Shaft seal cover
2. Felt

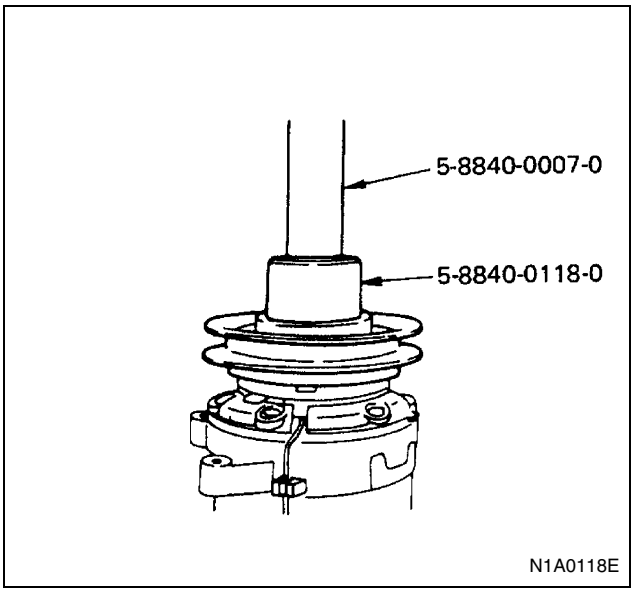
17. Field Coil
18. Lead Wire Connector
    Install the field coil to the compressor.
    Lead wire must be facing up.
    Tighten the field coil fixing screws to the specified torque.

Tighten:
Field coil screw to 5 N·m (0.5 kg·m / 44 lb·ft)



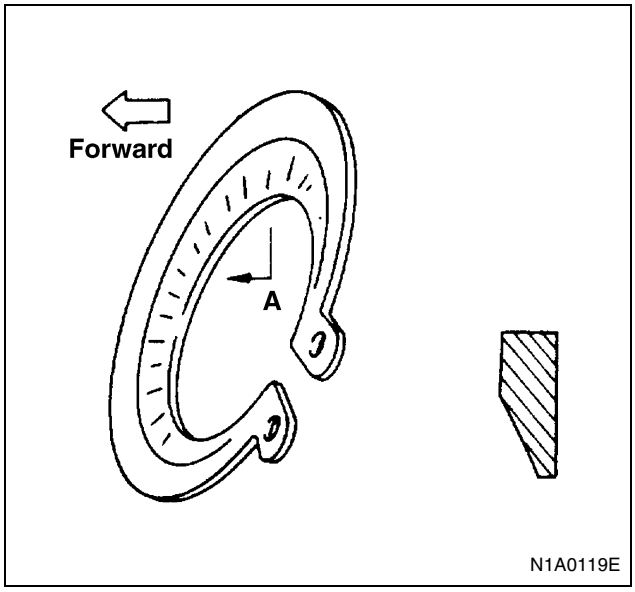
N1A0117E

19. Pulley Assembly
    Using pulley installer and drive handle to install the pulley assembly.
    Pulley Installer: 5-8840-0118-0 (J-33940)
    Drive Handle: 5-8840-0007-0 (J-8092)



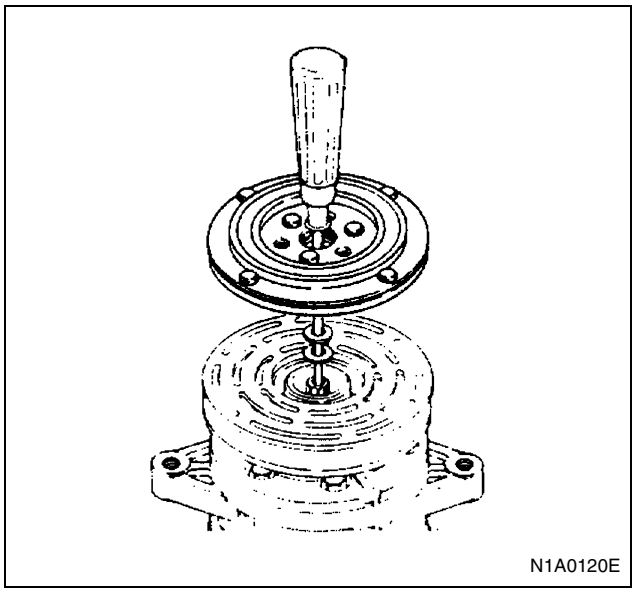
N1A0118E

20. Cover (If so equipped)
21. Snap Ring
    Install the snap ring with the inside indented portion facing out.



N1A0119E

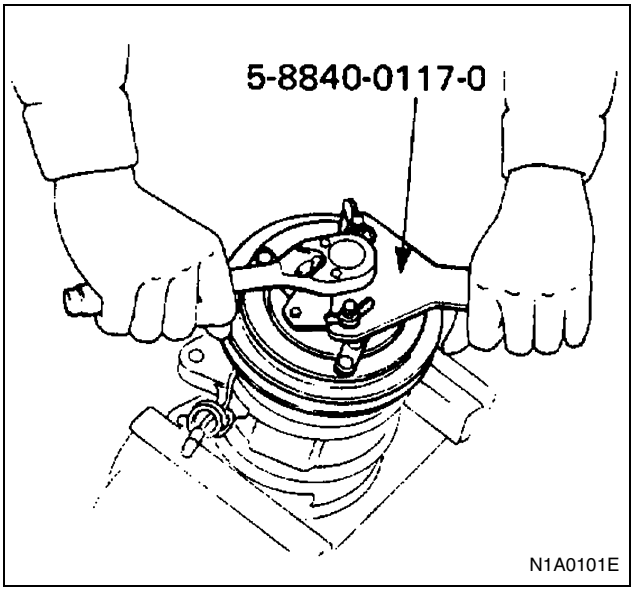
22. Shim(s)
23. Drive Plate
    Install the drive plate to the compressor drive shaft together with the original shim(s).
    Press the drive plate by hand.



N1A0120E

24. Drive Plate Bolt
    Using drive plate holder to prevent the drive plate from rotating.
    Drive Plate Holder: 5-8840-0117-0 (J-33939)
    Tighten the bolt to the specified torque.

Tighten:
Drive plate bolt to 15 N·m (0.5 kg·m / 11 lb·ft)



After tightening the bolt, check to be sure the pulley rotates smoothly.

Check to be sure that the clutch clearance is between 0.3 — 0.6 mm (0.01 — 0.02 in).

If necessary, install adjusting shim(s).

Adjusting shims are available in the following thickness.

Thickness	0.1 mm (0.0039 in)
	0.3 mm (0.0118 in)
	0.5 mm (0.0197 in)

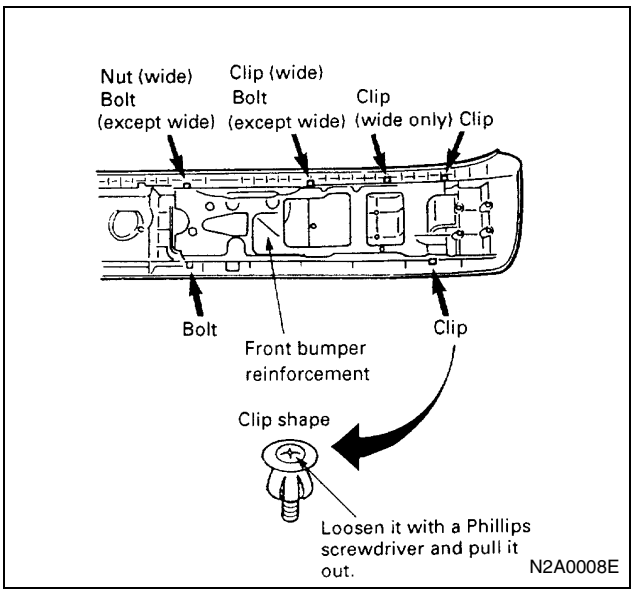
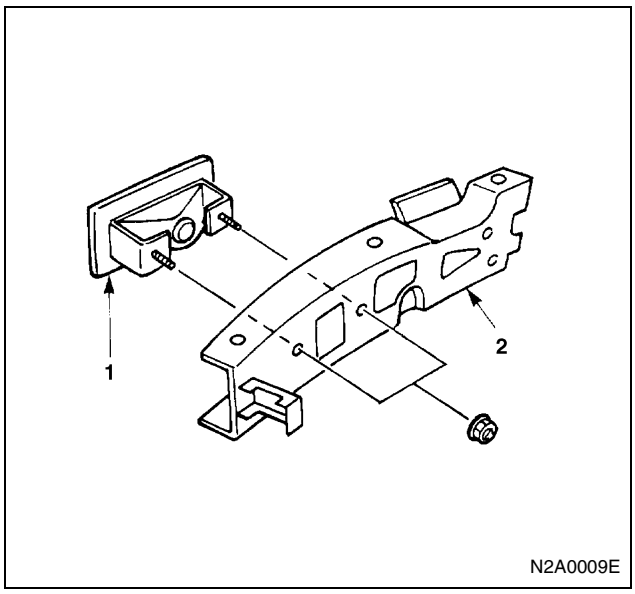
Removal

1. Air guide fixing bolts
   - Remove the rear-side bolts/washers fixing the air guide.
2. Front bumper assembly
   - Remove the two fixing bolts on each side of the left and right front bumper assembly.
     And disconnect fog lamp harness connection.
3. Front bumper reinforcement
   - Loosen the fixing nuts and bolts, and clips and pull them out.

	(1)	(2)	(3)	(4)	(5)
Wide Cab	Nut	Clip	Clip	Clip	Bolt
Others than Wide	Bolt	Bolt	—	Clip	Bolt





4. Fog lamp assembly
   - Remove the fixing nuts and pull out the fog lamp (1) to forward from reinforcement (2).

Installation

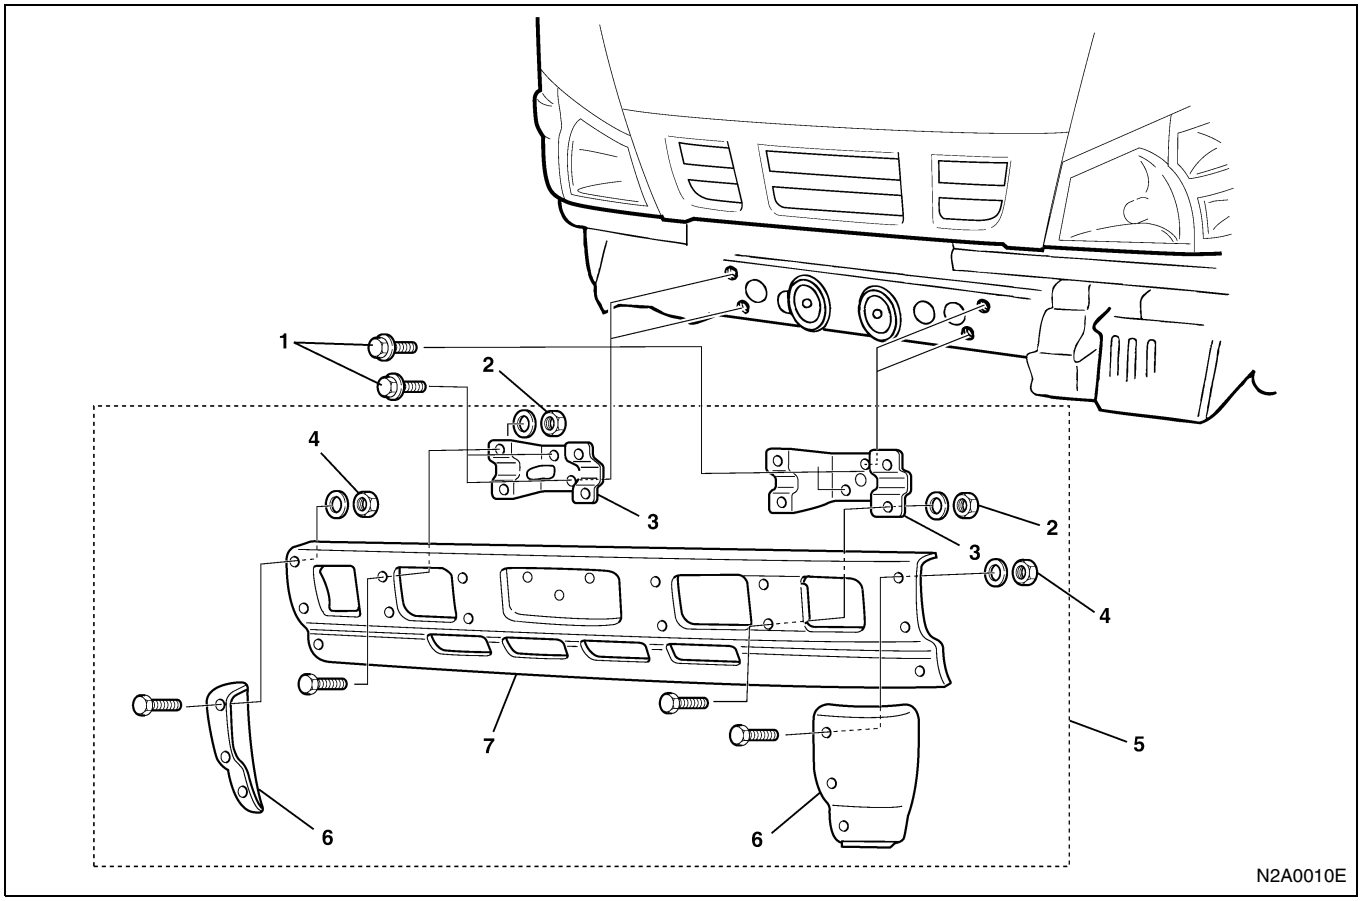
For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the front bumper assembly fixing bolts to the specified tightening torque.

Tighten:
40 N·m (4.1 kg·m/29.5 lb·ft)

2. Adjust the installation position referring to “Basic sizes for installation of the front bumper”.

Front Bumper (NPS Rigid Axle Model)



Legend

1. Bolt A
2. Nut C
3. Front bumper back bar
4. Nut B
5. Front bumper assembly
6. Front side bumper
7. Front center bumper

Removal

1. Front bumper assembly
   - Remove the 2 fixing bolts A on each side of the left and right front bumper assembly.
2. Front side bumper
   - Remove the 3 fixing bolts/nuts B on each side to remove front side bumper from front center bumper.
3. Front bumper back bar
   - Remove the 4 fixing bolt/nut C on each side.

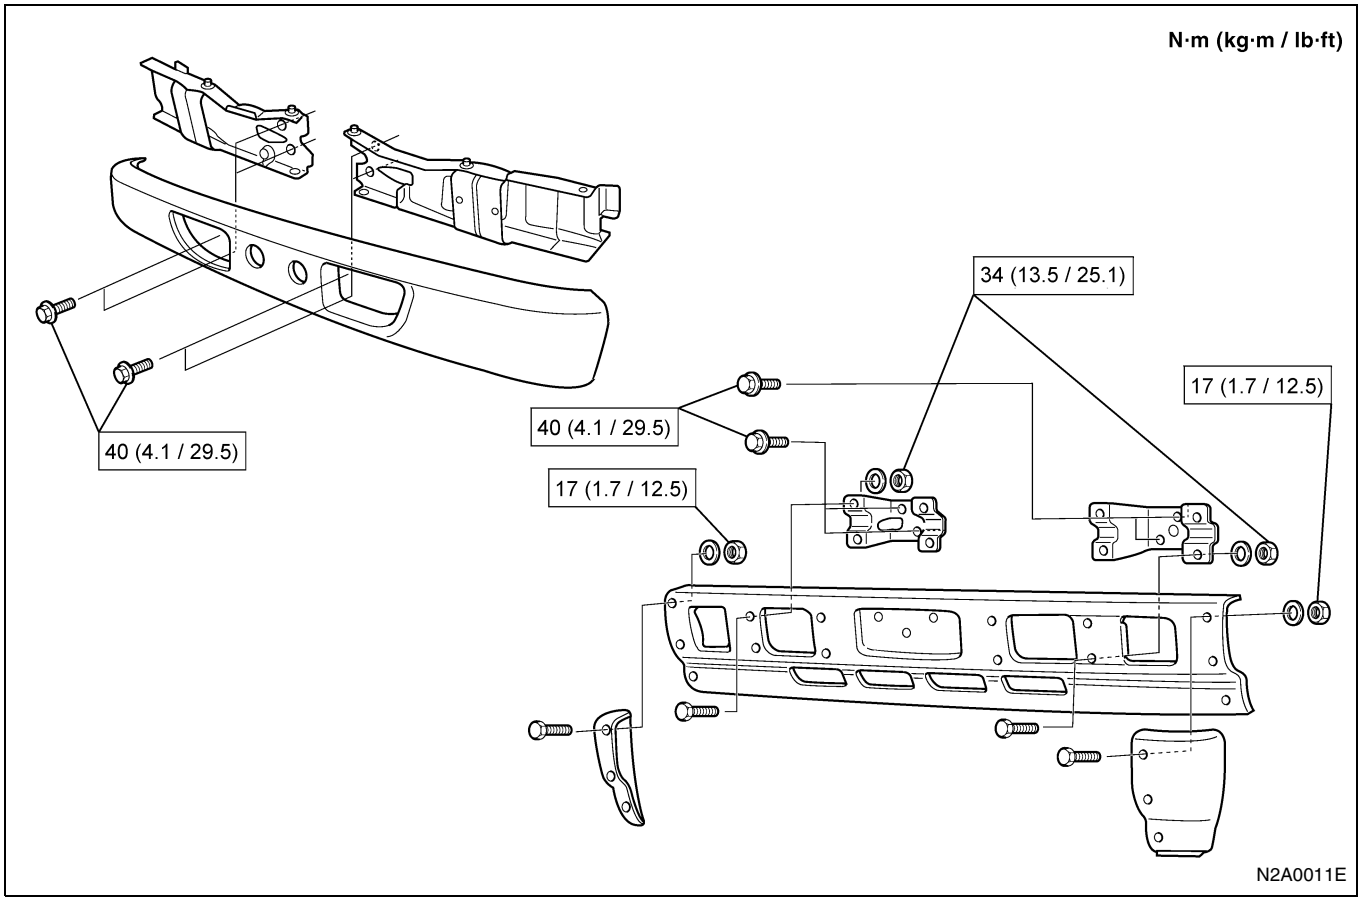
Installation

For installation, reverse the removal procedure taking the following points into consideration.
Tighten each fixing bolts/nuts to the specified tightening torque.

Tighten:

- Bolt A (M10 × 1.25) to 40 N·m (4.1 kg·m/29.5 lb·ft)
- Nut B (M8 × 1.25) to 17 N·m (1.7 kg·m/12.5 lb·ft)
- Nut C (M10 × 1.25) to 34 N·m (3.5 kg·m/25.1 lb·ft)

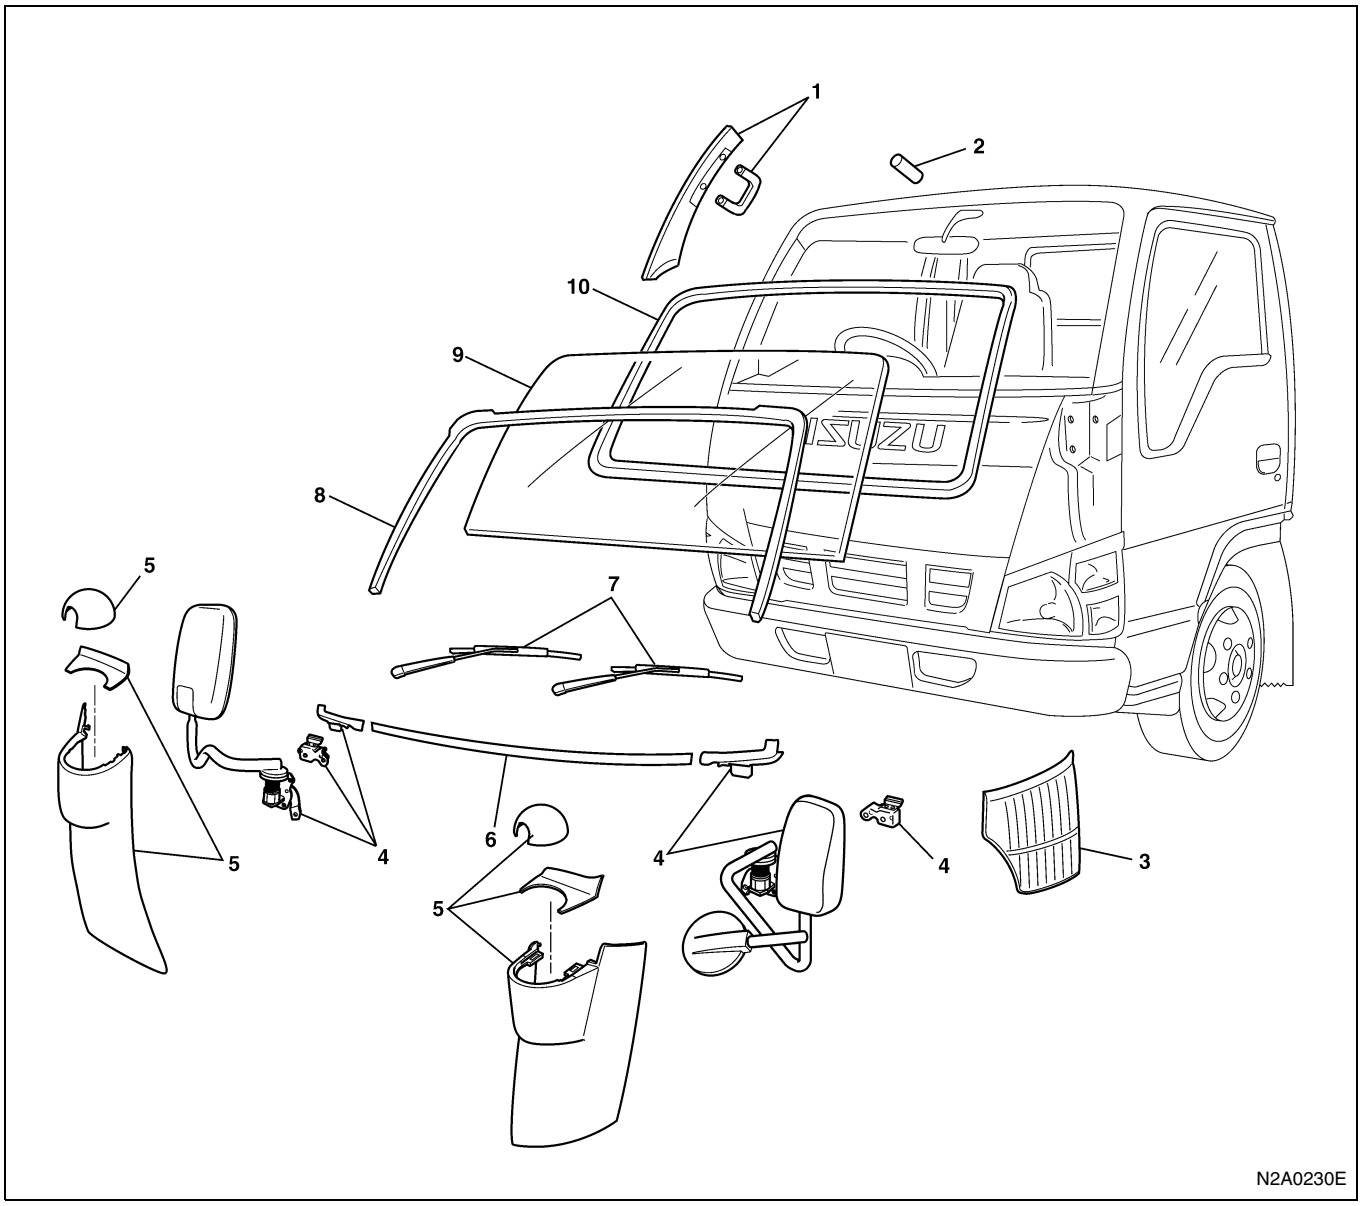
Fixing Torque



GLASS

Front Window Glass

Component

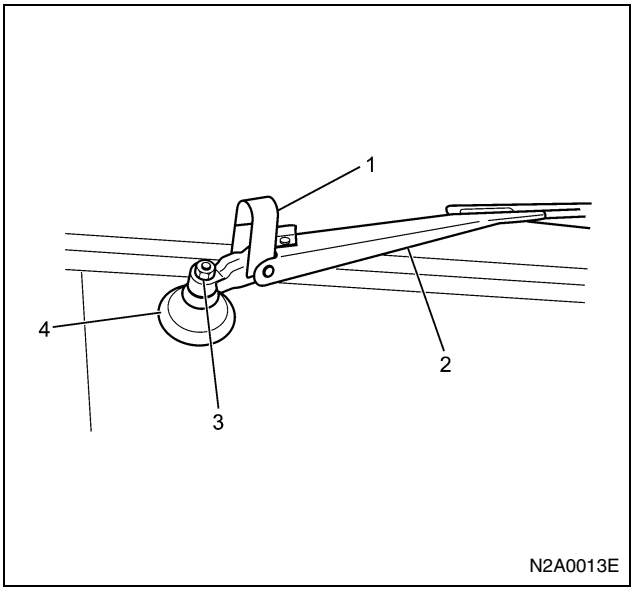


Legend

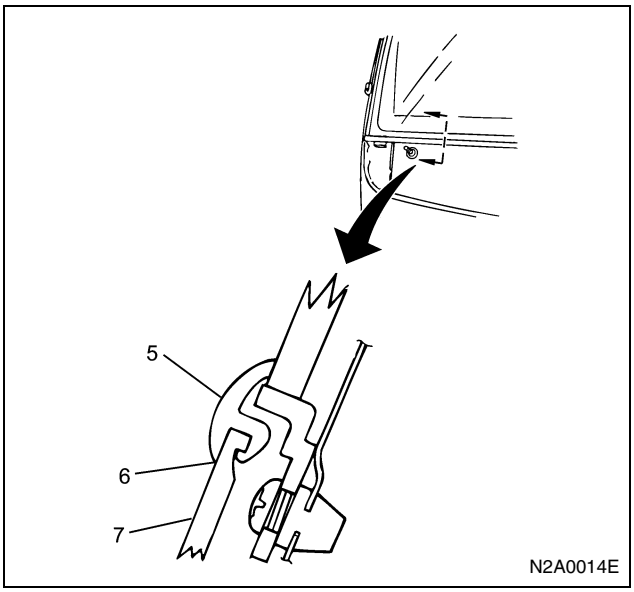
1. Front pillar grip/trim cover
2. Room mirror stopper rubber
3. Clearance lamp
4. Outside mirror assembly/outside mirror attachment/molding
5. Outside mirror stay cap/front panel side/sub cover
6. Ornament grille/upper molding
7. Front wiper arm
8. Front window molding
9. Front window glass
10. Front window glass finisher

Removal

1. Front wiper arm (2)
   - Open the cover (1) and remove the fixing nut (3).



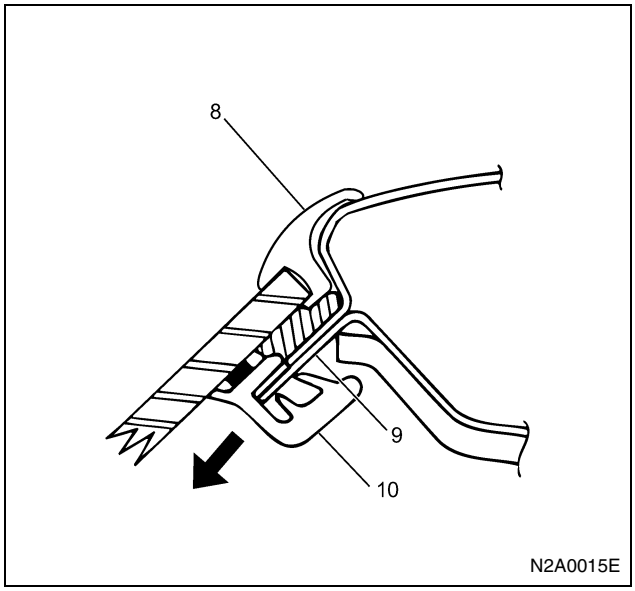
2. Clearance lamp
   - Refer to “Lighting System”.
3. Outside mirror stay cap/front panel side/sub cover
4. Outside mirror assembly/outside mirror attachment/molding
   - Refer to “Outside Mirror Assembly” in this Section.
5. Ornament grille upper molding (5)
   - Remove the lower part (6) of upper molding from ornament grille (7) with a bladed screwdriver.



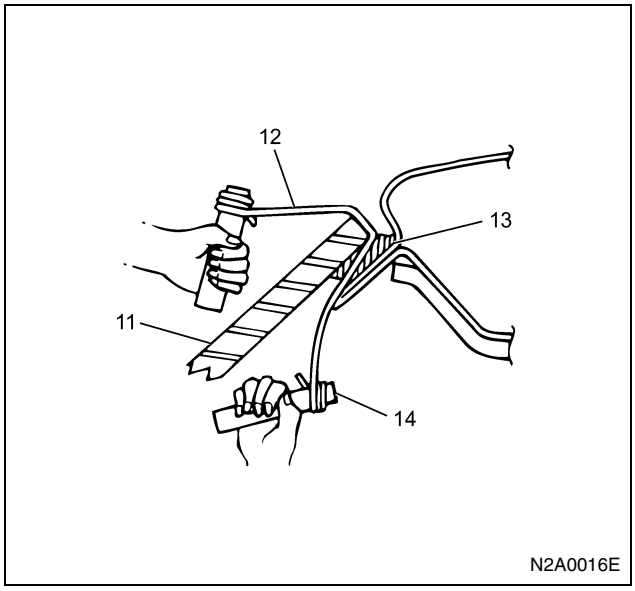
6. Front window molding (8)
   - Remove it according to the same procedure as step 3. Don’t reuse it.

Caution:
If the painted surface is scratched, this causes rust.

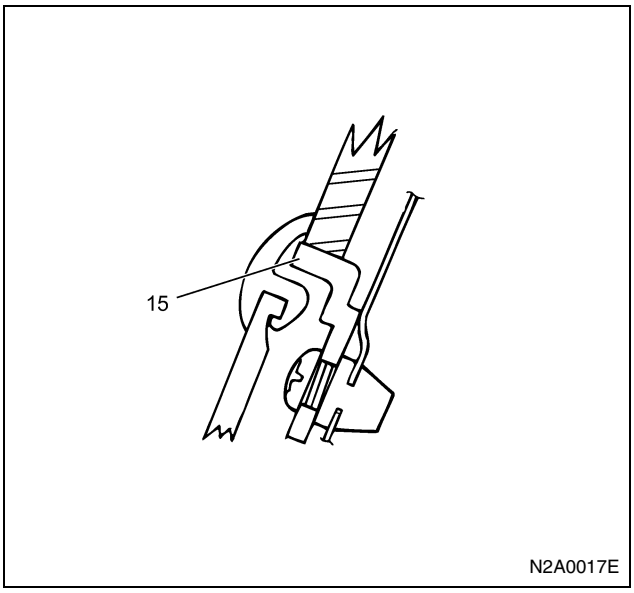
7. Room mirror stopper rubber
8. Front pillar grip/trim cover
   - Refer to “Front Side Trim Cover” in Interior & Exterior Trim Section.
9. Front window finisher (10)
   - Pull it from body flange.
   - Don’t reuse it.



10. Front window glass (11)
    - Pass the piano wire (12) of ϕ0.5 mm or so to the room inside through the adhesive part (13) of front window glass. Bind both ends of this piano wire on the wooden piece (14) etc., and cut the adhering part in the whole periphery of the glass moving it back and forth inside and outside the room. Remove the glass.



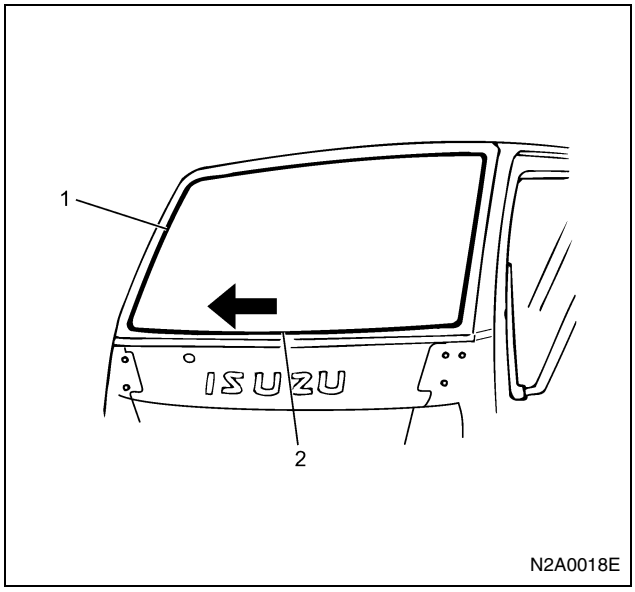
Caution:
Completely remove the adhesive remaining on the body flange and perform cleaning. If there is any convex or concave portion, this causes imperfect contact when installing the glass, leading to cracks or water leakage. To reuse the removed glass, perform the same treatment on the adhering surface of the glass side as well as the flange side. When the glass is an adhesion type, take care not to damage the glass stopper which must be reused. If the painted surface of the body flange is scratched, this will cause rust. Accordingly, repair it completely.



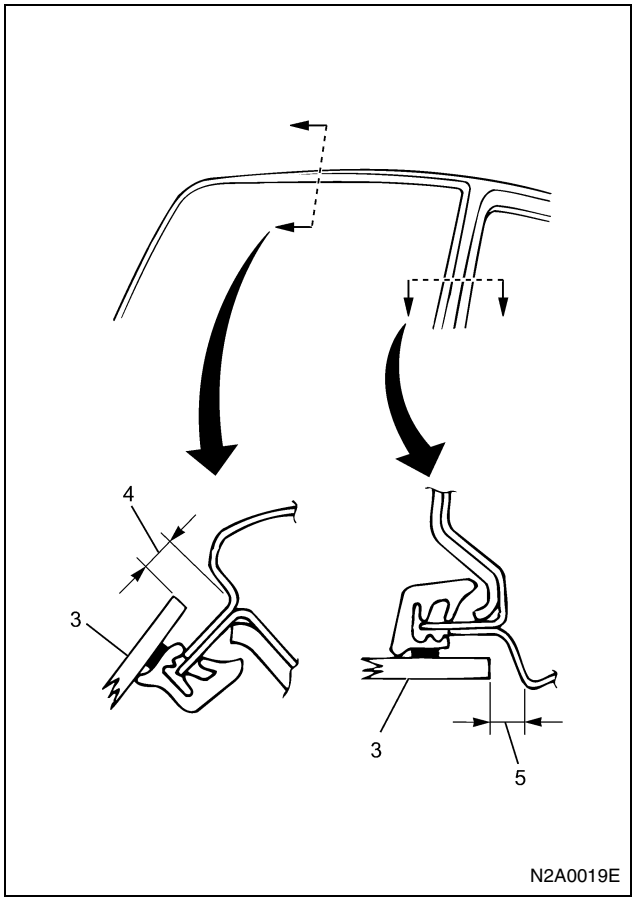
Installation

Preparation

- Be sure to perform the position alignment check of the front window glass before installation.
- Be sure to use a new front glass finisher (1). Set the deposit (2) in the central lower part. Insert the flange sequentially from the deposit. After setting, proceed to the next step without peeling off the exfoliate paper of two-sided adhesive tape.



- Temporarily set the front window glass (3), perform positioning marking so that the left/right clearance (5) may be uniform. Next, when the top clearance (4) is equal to the left/right clearance, proceed to the installation step. At this time, If the clearance must be adjusted, remove the ornament grille and adjust the glass stopper.
- Refer to “Ornament Grille” in Interior & Exterior Trim Section for removal of ornament grille.



1. Front window glass finisher (1)
   - Be sure to use a new one.
   - Apply the primer to the whole periphery of body side.

Caution:
Check that there remains no adhesive on the flange surface to which the primer is to be applied. If the primer is applied on the residual adhesive, the contact of the adhesive for glass to be applied later may be imperfect, resulting in cracks or water leakage. After applying the primer, keep the status for 3 minutes or more.

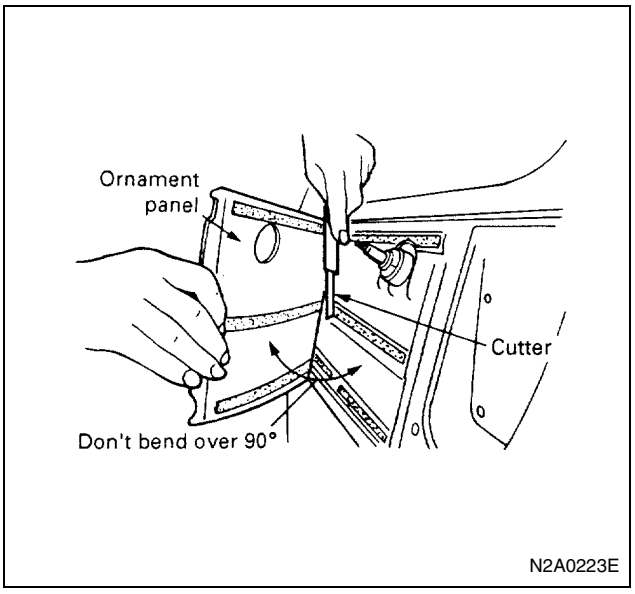
Primer: PRIMER RC-50E for painting manufactured by The Yokohama Rubber Co., Ltd. or equivalent

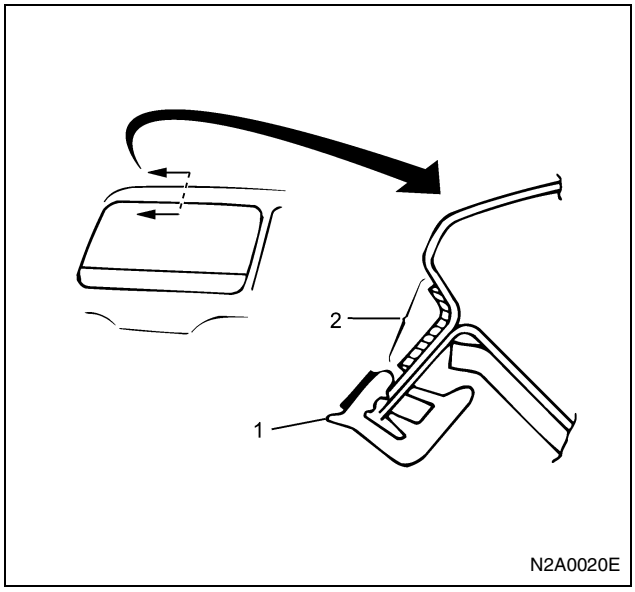
Mounting/Dismounting Procedure for Ornament Panel

- First, remove the washer nozzle (refer to Section 8 “Electrical Equipment Workshop Manual”), cut off the two-sided adhesive tape fixing the ornament panel with a cutter and remove it from the front panel. At this time, don’t bend the ornament panel over 90°. Take care not to scratch the painted surface of the body panel. If it is scratched, repair it completely to prevent rust. When installing the ornament panel, completely remove the two-sided adhesive tape remaining on the ornament panel side and install the ornament panel with a new two-sided adhesive tape.

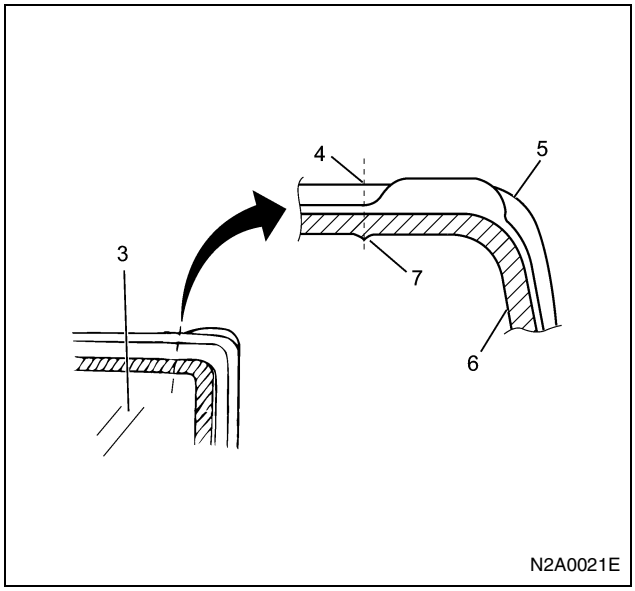
Caution:
After removing the washer nozzle, take care not to drop the washer tube to the inside of the front panel.

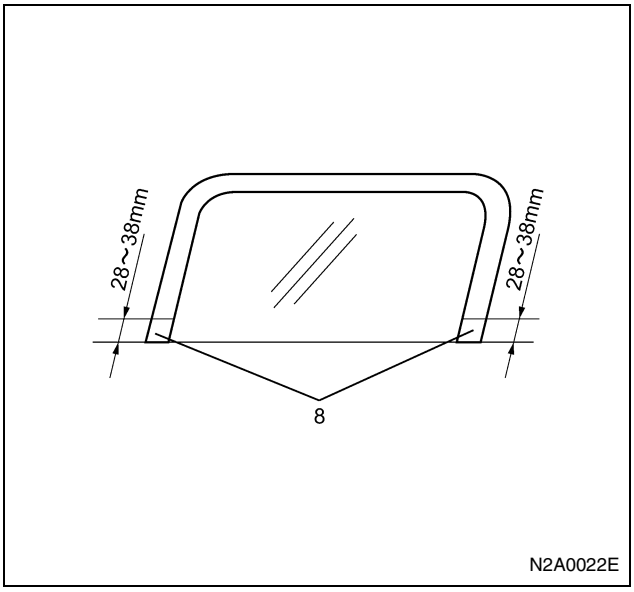
After removing the ornament panel, connect the nozzle to the tube and fix it.





2. Front window molding (5)
   - Align the paint marking part of the back side of molding with the alignment mark (7) on the glass ceramic painting part (6), insert the upper ends (left and right) and fix the both sides. Be sure to use a new one.
   - The margin (8) of molding should be equal at both ends.





3. Front window glass (9)
   - Apply the primer (10) to the outer periphery on the room side of the glass. Apply it over 20 mm from the end.

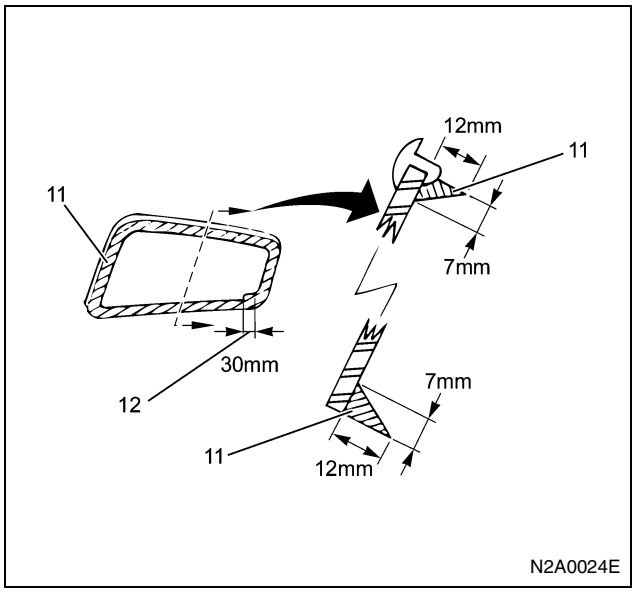
Caution:
Before reusing the glass, completely remove the residual adhesive and perform cleaning. If the primer is applied on the residual adhesive, the contact of the adhesive for glass to be applied later may be imperfect, resulting in cracks or water leakage. After applying the primer, keep the status for 3 minutes or more.

Primer: PRIMER MS-80 for both sides of glass manufactured by The Yokohama Rubber Co., Ltd. or equivalent

   - After keeping the status for 3 minutes or more after primer application, apply the adhesive. Apply it to the whole outer periphery and make a 30 mm lap allowance.

Adhesive: ADHESIVE WS-90F for glass manufactured by The Yokohama Rubber Co., Ltd. or equivalent

Caution:
Install the glass on the cab within 5 minutes after applying the adhesive. At this time, peel off the exfoliate paper of the two-sided adhesive tape of front window glass finisher and set the glass by pressing accurately at the installation position determined in the positioning procedure described on the previous step. Harden the adhesive at temperature of 20 to 30°C for 24 hours. Press the periphery by using a gummed tape as an auxiliary means. Imperfect press fitting will cause water leakage.



4. Front pillar grip/trim cover
   - For the grip, be sure to use the specified bolt.
   - Be sure to use a new two-sided adhesive tape for the trim cover.

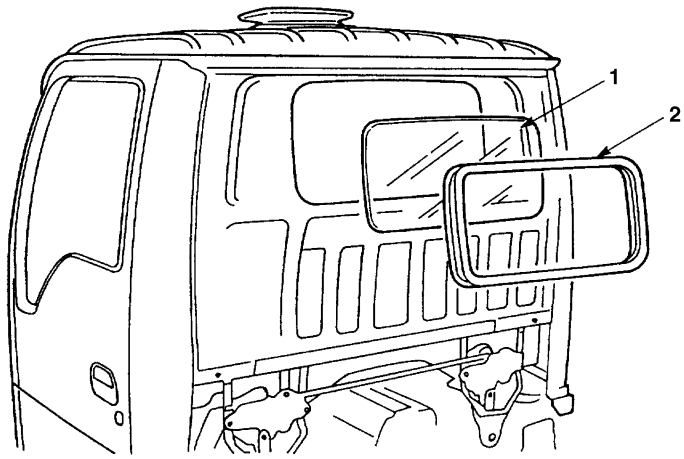
Caution:
Take care not to push the glass from the inside of the room at installation.

5. Ornament panel upper molding
6. Outside mirror assembly/outside mirror attachment/molding
   - Be sure to use a new two-sided tape for molding.
7. Outside mirror stay cap/front panel side/sub cover
8. Clearance lamp
   - Refer to “Outside Mirror Assembly” in this Section.
9. Front wiper arm
10. Room mirror stopper rubber
    - Install this rubber after adhesive for the front window glass becomes completely hard.

Precautions after installation

- As described before, fix the periphery by using a gummed tape as an auxiliary means in the period of 24 hours when the adhesive for the front window glass is hardened.
- After installation, avoid driving within 24 hours.
- Within 24 hours after installation, open or close the doors with the side window glass or roof ventilation open. When the door must be opened or closed inevitably in the closed status, open it slowly without giving any vibration or shock to it.
- Make a water leakage test.

Backlight Glass (Single Cab Model)



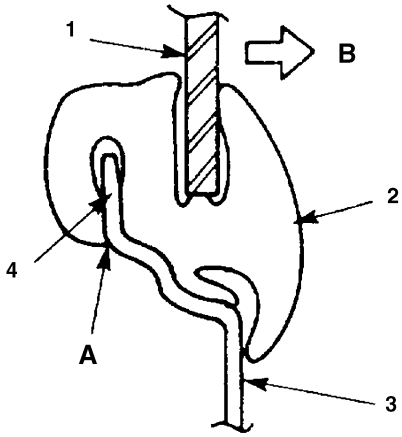
N2A0025E

Legend

1. Backlight glass
2. Backlight glass weather strip

Removal

1. Backlight glass
   - Pry off the top edge of the backlight glass and the weather strips on the both angles from the position (A) and remove them from the body flange. Push out the backlight glass toward (B).
2. Backlight glass weather strip
   - Remove the weather strip from the backlight glass.



N2A0026E

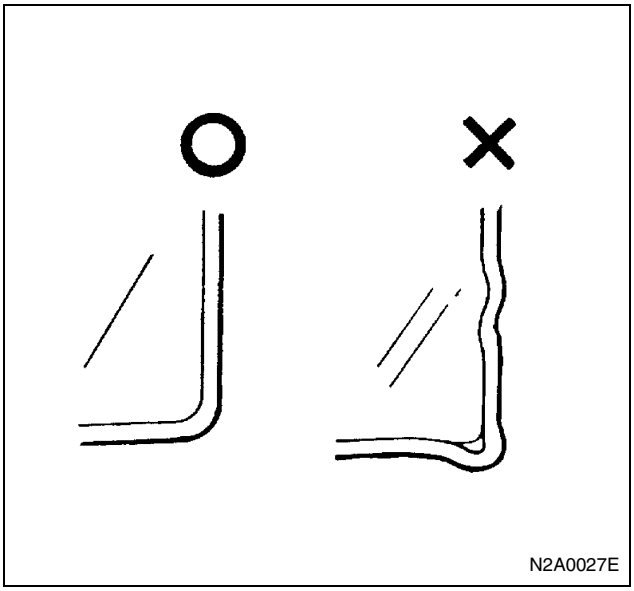
Legend

1. Backlight glass
2. Backlight glass weather strip
3. Back panel
4. Flange

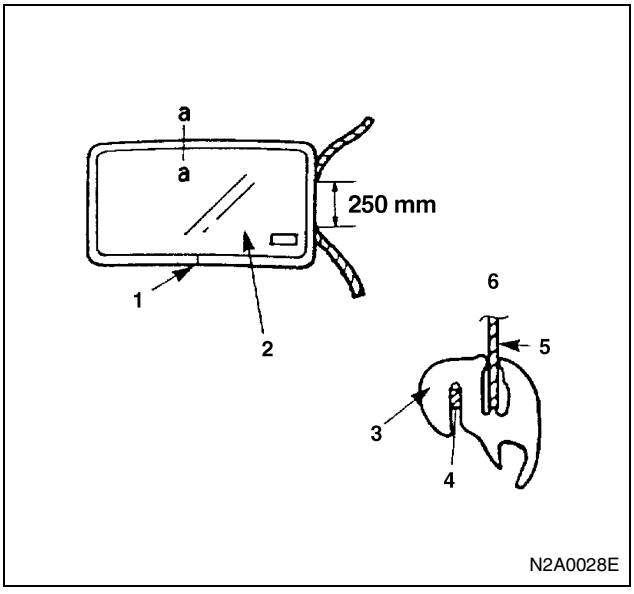
Installation

1. Backlight glass weather strip
   - Fit the backlight glass weather strip into the backlight glass. At this time, turn the deposit of the weather strip downward.

Caution:
Bring each portion into close contact without any float or corrugation.

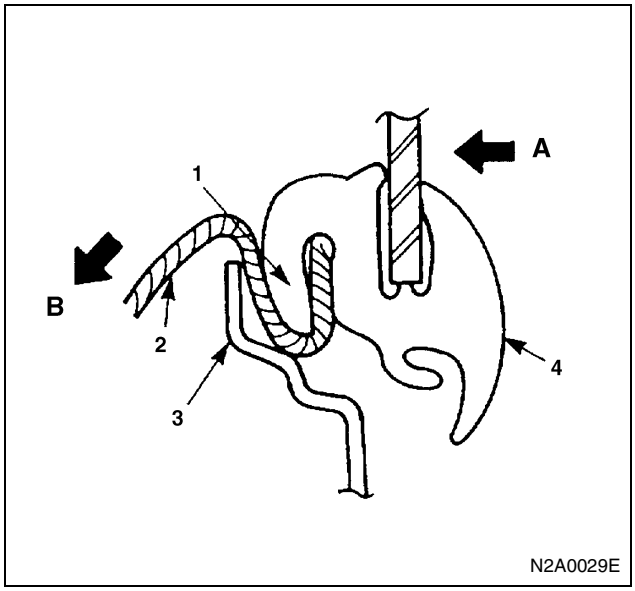


2. Backlight glass
   - Set the string for installing the window shield of ϕ5 — 6 mm into the portion (A) of the backlight glass weather strip installed on the backlight glass.
     Cause the string to go round and cross it about 250 mm in the center on the left of the backlight glass.



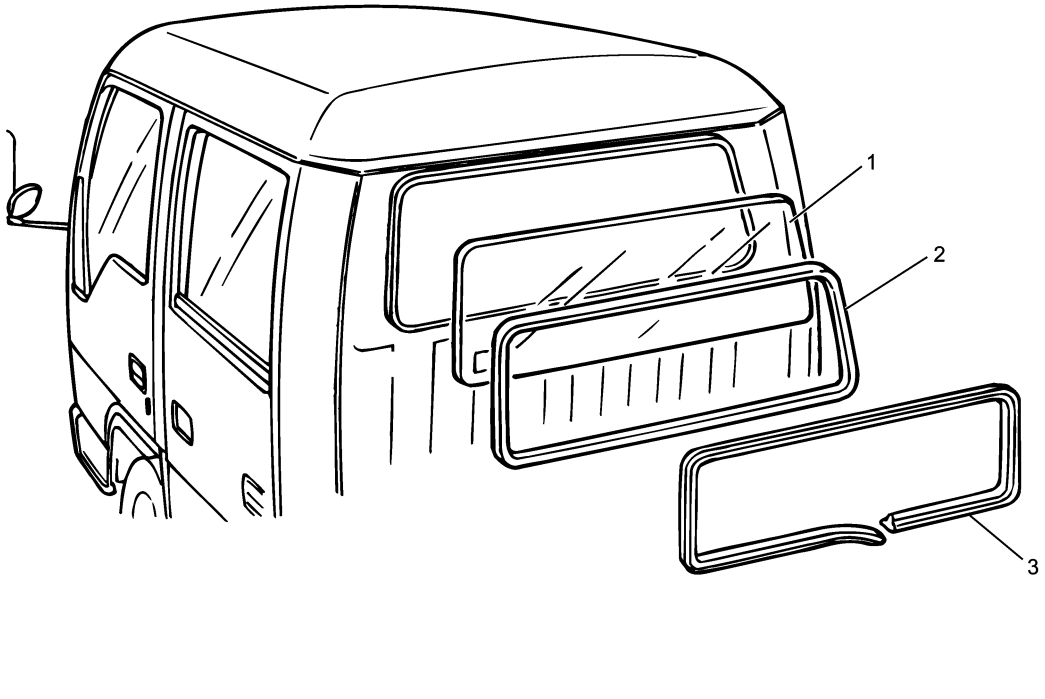
Legend
1. Deposit
2. Backlight glass
3. Backlight glass weather strip
4. String
5. Backlight glass
6. Section a — a

   - Adjust the backlight glass to the body position. Pushing down the backlight glass from the direction (A), pull the string toward (B) and fit the lip into the flange. To make the contact between the weather strip and body flange better, strike a glass position of about 150 mm from the outside weather strip equally with a hammer.



Legend
1. Lip
2. String
3. Flange
4. Weather strip

Backlight Glass (Crew Cab Model)



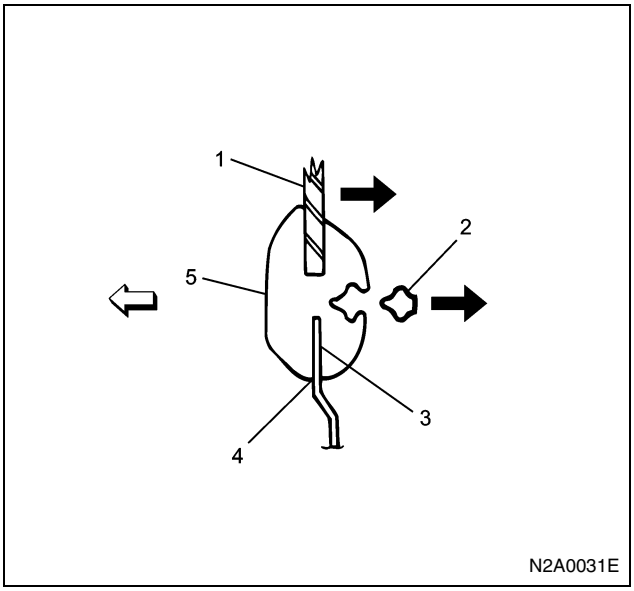
N2A0030E

Legend

1. Backlight glass
2. Backlight glass weather strip
3. Wedge rubber

Removal

1. Wedge Rubber (2)
   - Draw out the wedge rubber from the bottom end of the backlight glass weather strip.
2. Backlight glass (1)
   - Pry off the weather strip (5) at the top edge and both angles of the backlight glass from the position (4) and remove it from the body flange (3). Push out the backlight glass toward B.



N2A0031E

3. Backlight glass weather strip
   - Remove the weather strip from the backlight glass.

Installation

1. Backlight glass weather strip
   - Fit the backlight weather strip into the backlight glass. At this time, turn the deposit (8) of the weather strip to the right side of the vehicle.

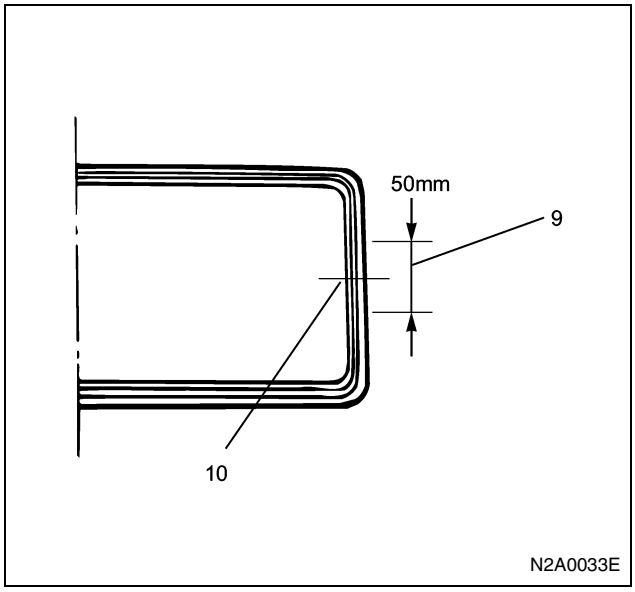
Caution:
Bring each portion into close contact without any float or corrugation.

2. Backlight glass (6)
   - Set a ϕ5 to 6 mm string for installing the window shield into the portion (7) of the backlight weather strip installed on the backlight glass by means of a metal tube of about 8 mm.
     Adjusting the center of the glass to that of the body, push down the glass with force from the outside and pull the string toward the center of the glass from the inside.
     Thus, set the lip into the body flange in succession.

   - After installing the backlight glass, fill the portion (10) in the range of 50 mm up and down (9) of the deposit of the weather strip with sealant.

     Sealant: CS3061D

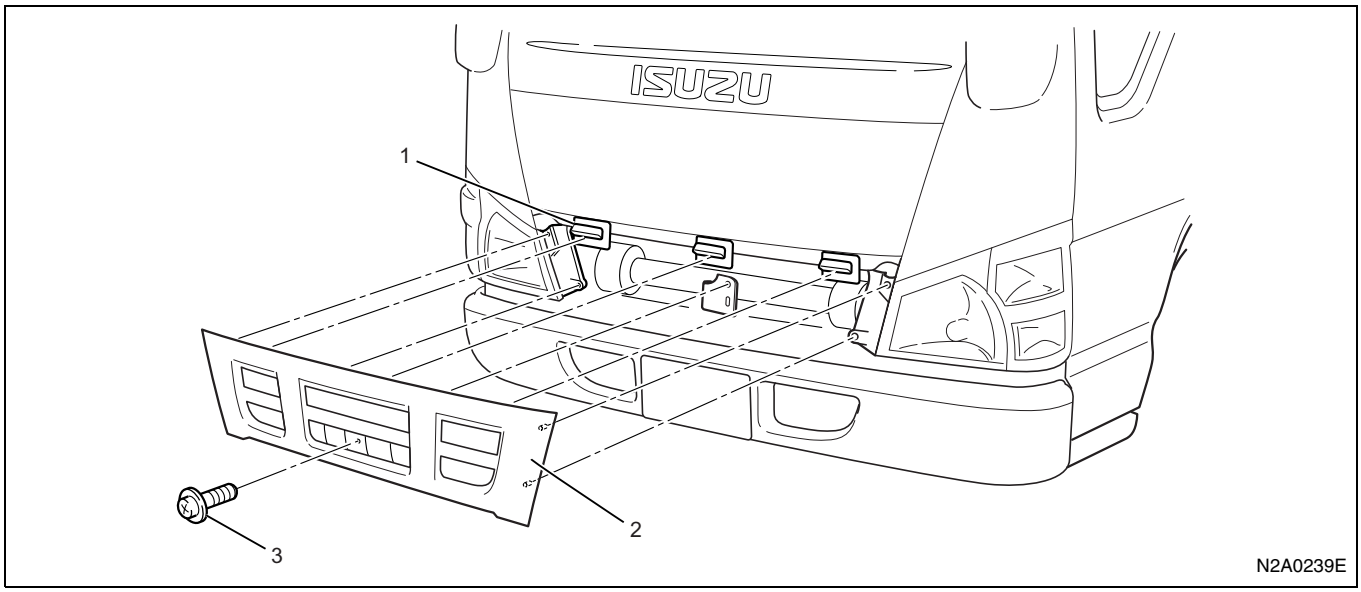
Caution:
Fill the portion B in the specified range with sealant securely. Completely remove overflowed sealant.



3. Wedge rubber
   - Fit the wedge rubber securely into the bottom end of the backlight glass weather strip.

FRONT GRILLE

Component

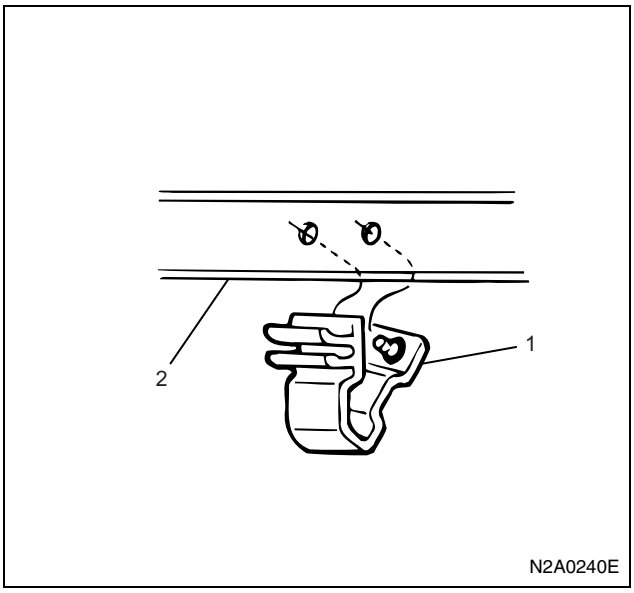


Legend

1. Clip
2. Front grille
3. Bolt

Removal

1. Remove the front grille.
   - Remove the front grille by pulling the fixing screw at the center, the three (narrow cab) or four (wide cab) clips which install cab panel, and the four clips which install headlamp.
2. Remove the fixing clip (1).
   - Open the clip (1) to remove it from cab panel (2).



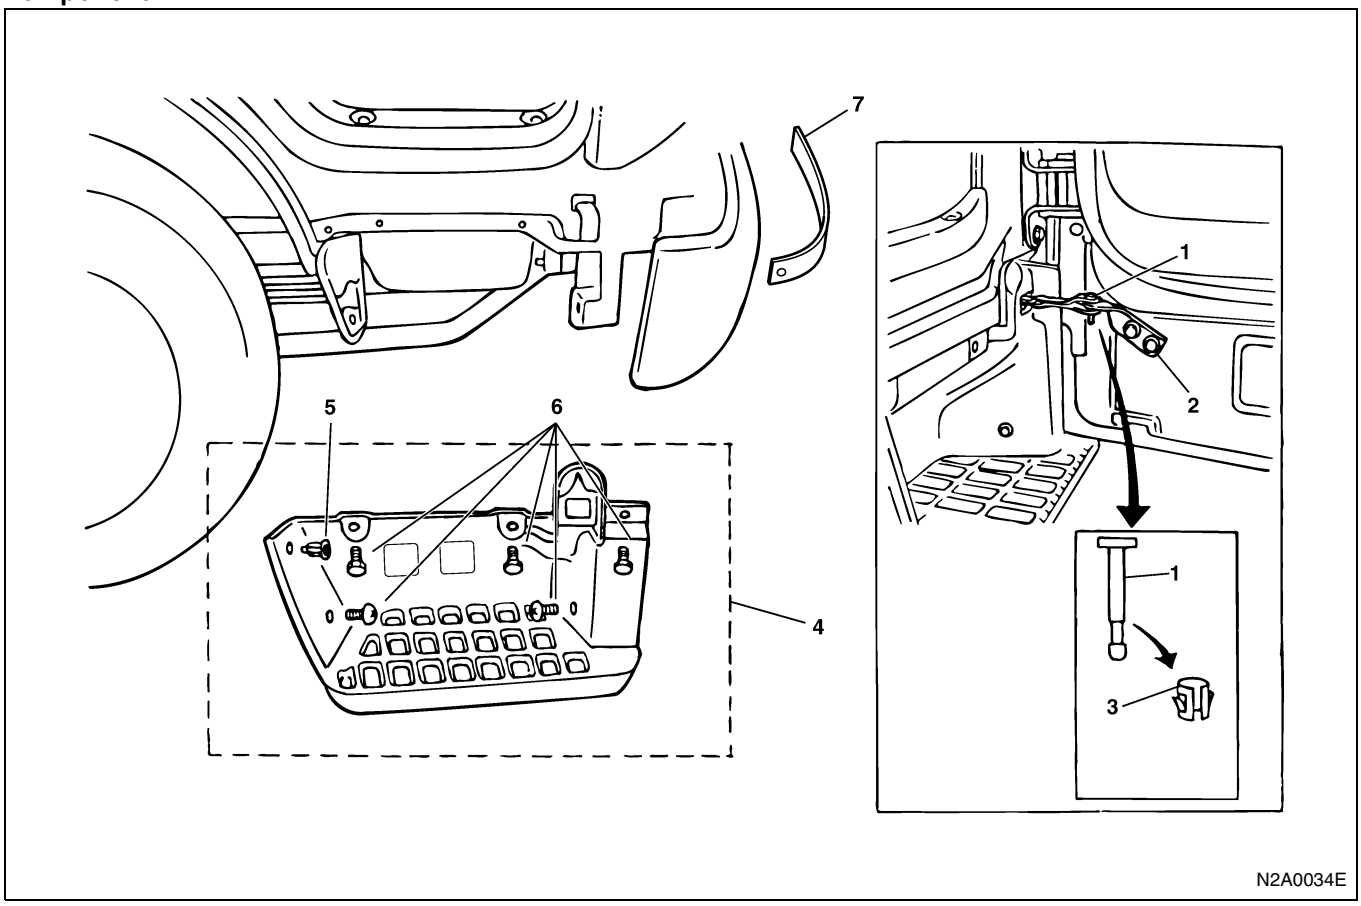
Installation

Install in the reverse order of removal.

STEP

Front Step (Except NPS Front Rigid Suspension Model)

Component



Legend

1. Front door check arm pin
2. Check arm bracket
3. Clip
4. Front step assembly
5. Clip
6. Bolt
7. Headlamp lower cover

Removal

1. Headlamp lower cover
   - Pull the mating part of clip to remove it.
2. Front combination lamp
3. Front door check arm pin
   - Expand the notch on the tip of pin to remove, and tap the pin from the bottom with a plastic hammer.
4. Check arm bracket
   - Remove the 2 mounting bolts on the door side.
5. Front step assembly
   - Remove the 3 mounting bolts, 2 screws and a clip.

Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the mounting bolt of front step assembly to the specified torque.

Tighten:
Mounting bolt to 15 N·m (1.5 kg·m/11.1 lb·ft)

2. Tighten the mounting bolt of check arm bracket to the specified torque.

Tighten:
Mounting bolt to 25 N·m (2.5 kg·m/18.4 lb·ft)

3. Make sure that the clip gets caught the tip of check arm pin securely.

Legend

1. Headlamp lower cover
2. Front door check arm pin
3. Clip
4. Lower step plate assembly
5. Lower step rod
6. Front step assembly
7. Step plate

Removal

1. Lower step plate
   - Remove the 5 mounting bolts.
2. Lower step rod
   - Remove the 2 mounting nuts.
3. Headlamp lower cover
   - Pull the mating part of clip to remove it.
4. Front combination lamp
5. Front door check arm pin
   - Expand the notch on the tip of pin to remove, and tap the pin from the bottom with a plastic hammer.
6. Front step assembly
   - Remove the 3 mounting bolts, 2 screws and a clip.
7. Step plate
   - Remove 5 mounting bolts.

Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the mounting bolts and nuts to the specified tightening torque.

Tighten:

Mounting bolts and nuts to 15 N·m (1.5 kg·m/11.1 lb·ft)

2. Make sure that the clip gets caught the tip of check arm pin securely.

2. Rear step

Removal

1. Fixing bolts
   - Remove the 4 fixing bolts.
2. Rear step

Installation

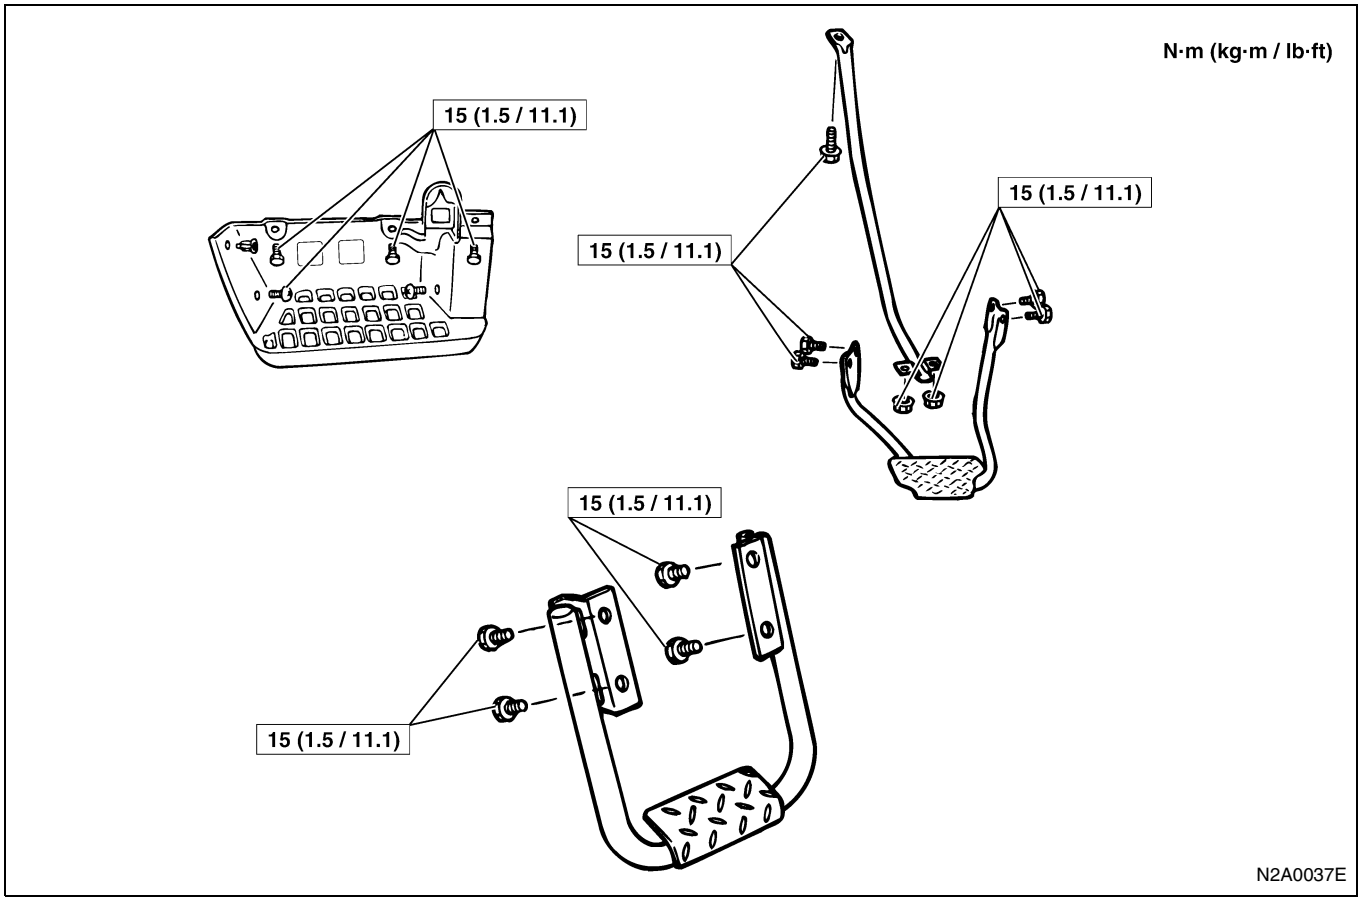
For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the fixing bolts to the specified torque.

Tighten:

Fixing bolt to 15 N·m (1.5 kg·m/11.1 lb·ft)

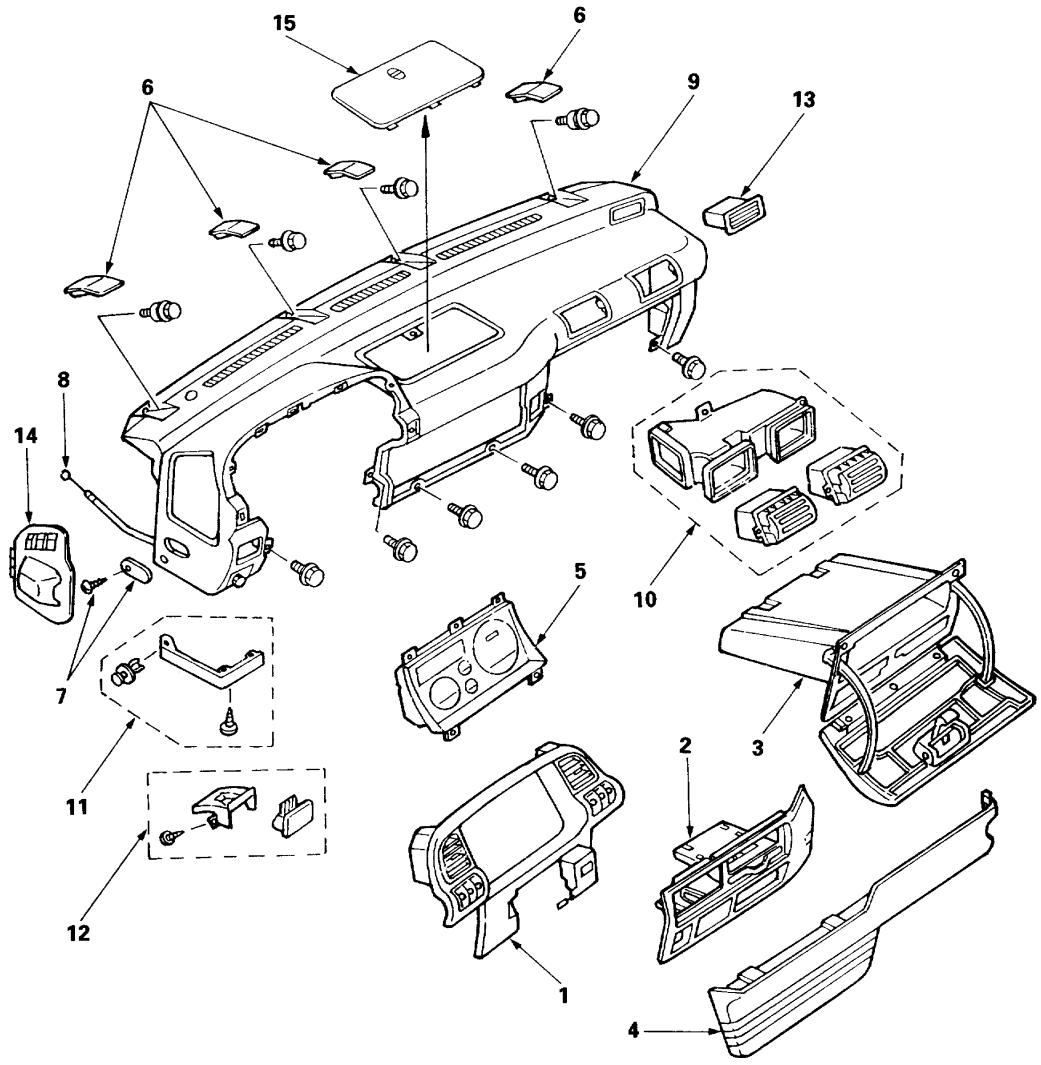
Fixing Torque



INSTRUMENT PANEL

Instrument Panel Assembly

This illustration is based on LHD.



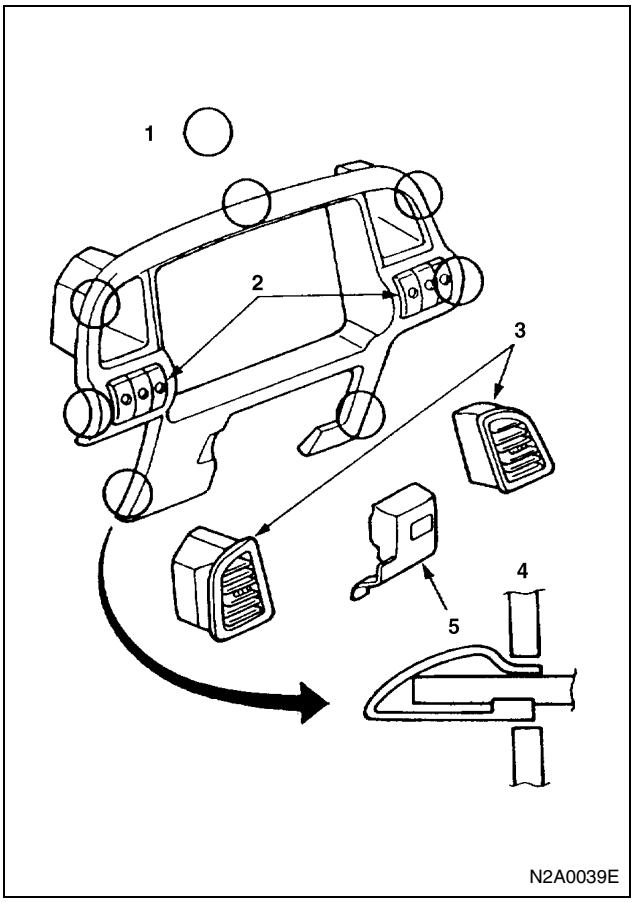
N2A0038E

Legend

1. Meter cluster
2. Center cluster
3. Glove box
4. Under cover
5. Meter assembly
6. Front cover
7. Instrument side grommet
8. Idling control cable
9. Instrument panel assembly
10. Vent duct
11. Instrument panel extension
12. Ashtray (driver's seat side)
13. Side defroster nozzle
14. Fluid tank cover
15. Relay lid

Removal

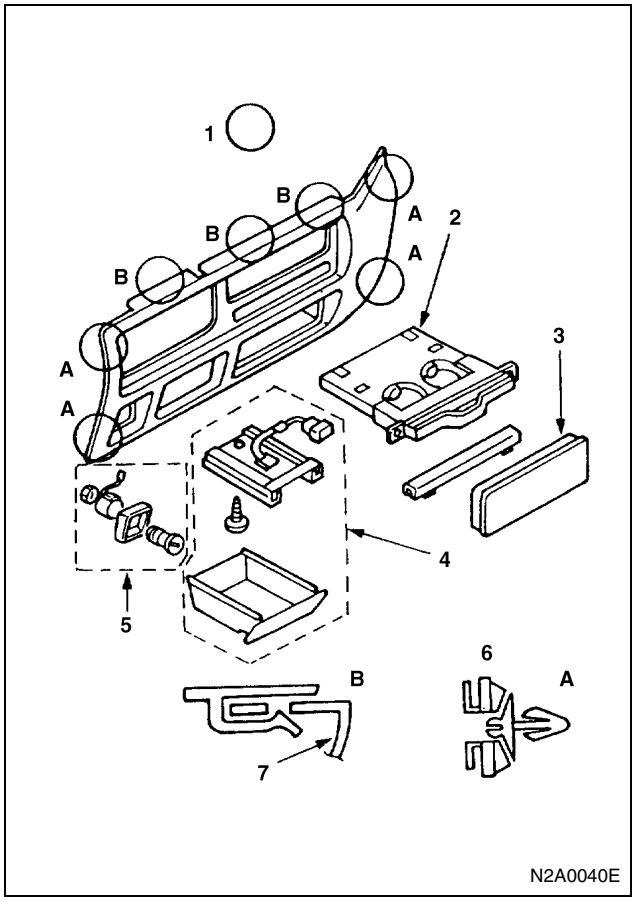
1. Meter cluster
   - Pull the main unit toward you and remove the clips at 7 positions. Remove each switch connector. When switches are mounted on the switch cover, remove the connectors.
   - Remove the vent grille, switch cover and each switch from the cluster proper.



Legend
1. Clip position
2. Switch
3. Vent grill
4. Clip section
5. Switch cover

2. Center cluster
   - Pull the main unit toward you and remove the clips A at 4 positions, clips B at 3 positions, cigar lighter power source and ashtray lighting connector. When an auto air conditioner is mounted, remove the room sensor.
   - Remove the drink holder, control unit cover (or glove compartment), ashtray and cigar lighter from the center cluster proper.

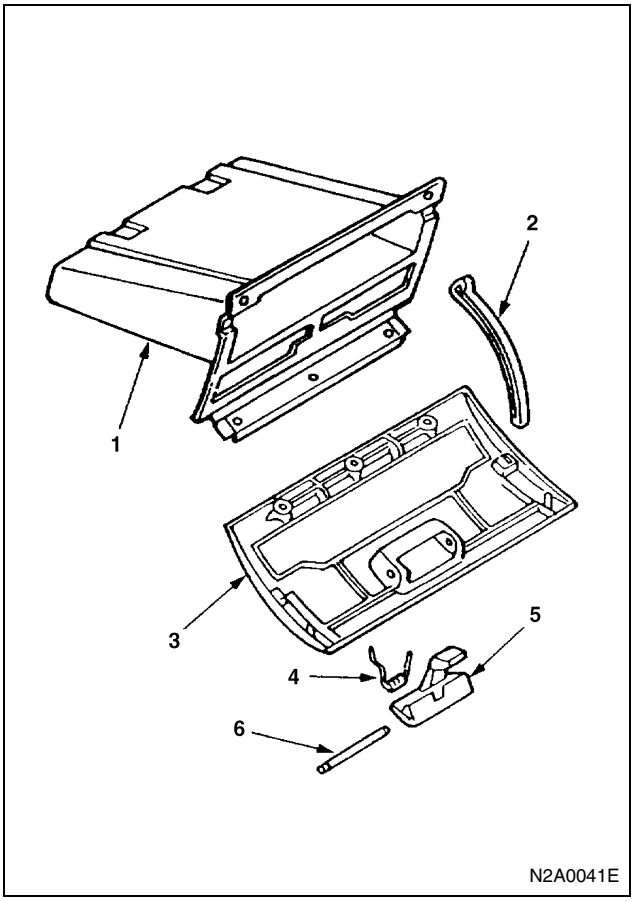
Caution:
Remove the clips B with a bladed screwdriver.



Legend
1. Clip position
2. Drink holder
3. Control unit cover
4. Ashtray
5. Cigar lighter
6. Clip section
7. Center cluster

3. Glove box
   - Open the lid and remove the 4 mounting screws.
     Then, remove the main unit.
   - Remove the left and right stays, remove the 3 mounting screws, and remove the lid.
   - Pull out the pin from the lid and remove the spring and lever.

Caution:
The Instrument panel assembly of this item can be removed without disassembling each of the parts of above items 1 — 3.

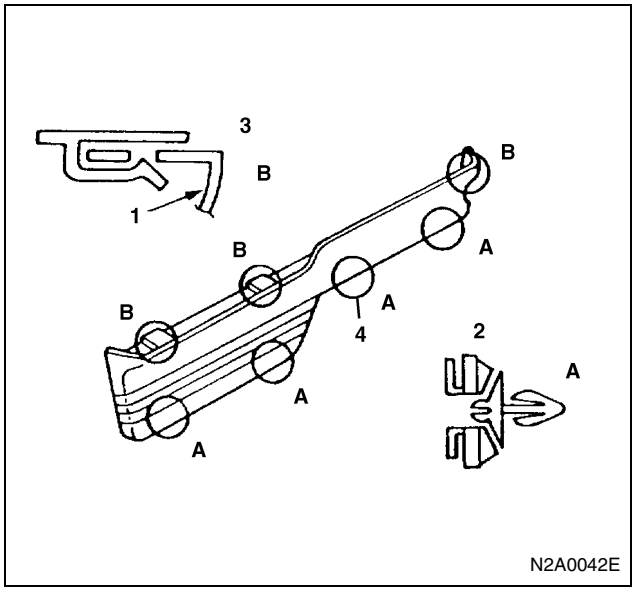


Legend

1. Glove box
2. Stay
3. Glove box lid
4. Spring
5. Lever
6. Pin

4. Under cover
   - Pull the main unit toward you and remove the clips A at 3 positions (4 positions for the wide cab) and clips B at 3 positions. First remove the clips B.

Caution:
The above parts of 1 to 4 can be removed in any order, or each of them can be removed independently.

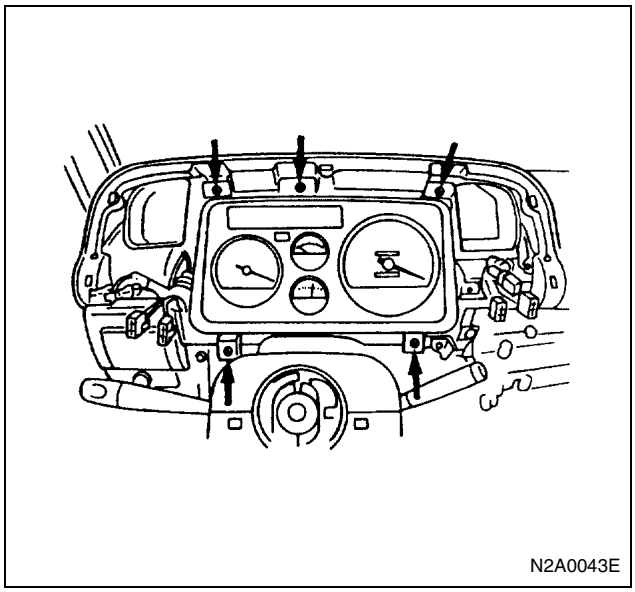


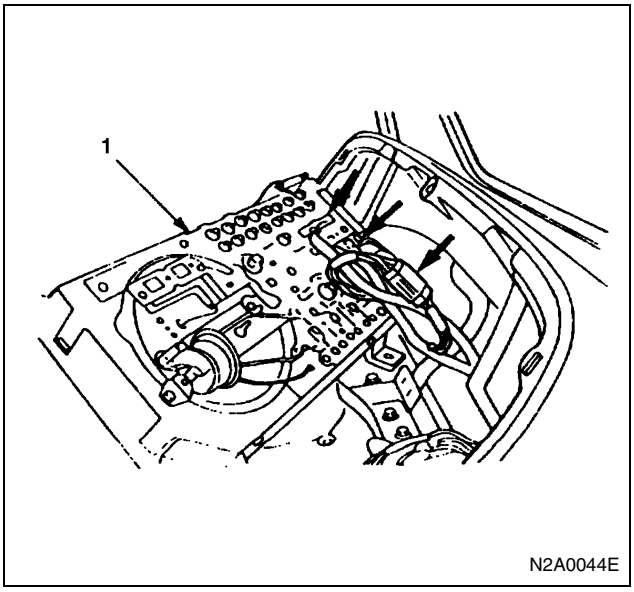
Legend

1. Center cluster
2. Clip section A
3. Clip section B
4. NPR only

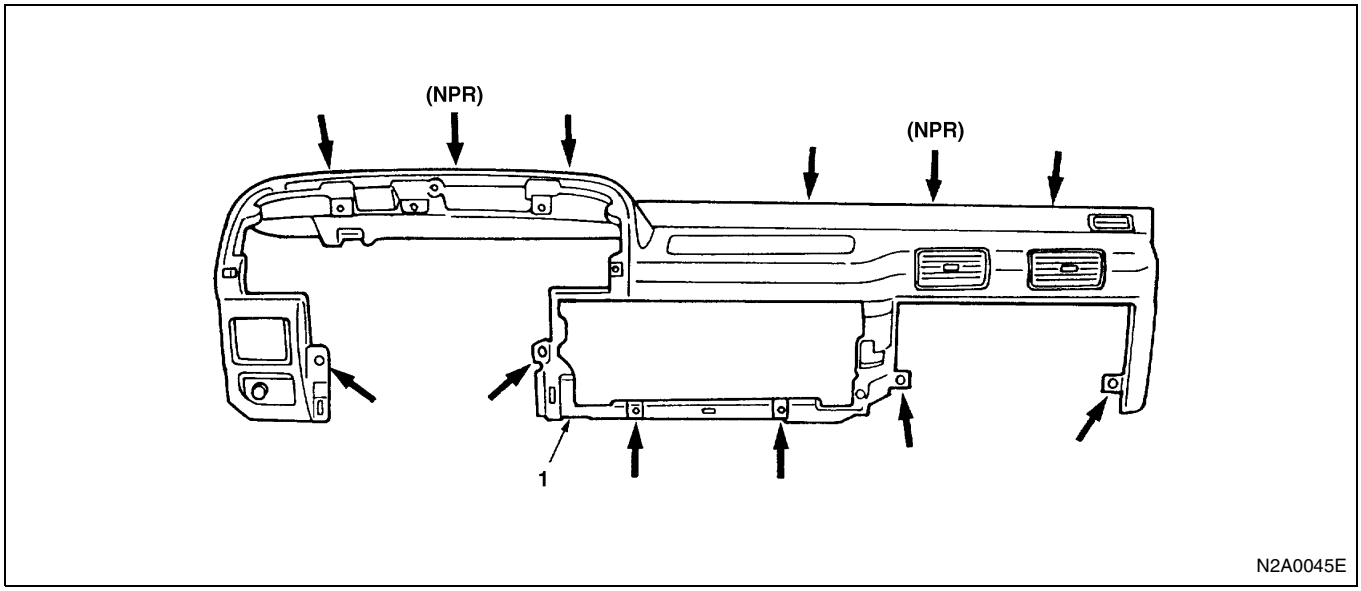
5. Meter assembly
   - Remove the 5 mounting screws.
   - Remove the connector.

Caution:
To remove only the meter assembly (1), it can be attained by removing the meter cluster.





6. Front cover
7. Instrument side grommet
   - Remove the screws and pull out the instrument side grommet.
8. Idling control cable
   - Remove the clip on the accelerator pedal side.
9. Instrument Panel assembly
   - Remove the 10 mounting bolts (Wide cab=12 bolts). When the vehicle is provided with an auto air conditioner, remove the solar radiation sensor connector and harness clips from the duct and push the instrument panel assembly (1) from the rear side.



10. Vent duct
    - Remove the mounting screws.
11. Instrument panel extension
    - Remove the mounting screws and clips.
12. Ashtray (driver's seat side)
    - Pull out the main unit and remove the tray mounting screws.
13. Side defroster nozzle
    - Push out the side defroster nozzle from the rear side of the instrument panel assembly.
14. Fluid tank cover
    - Pull out the fluid tank cover.
15. Relay lid

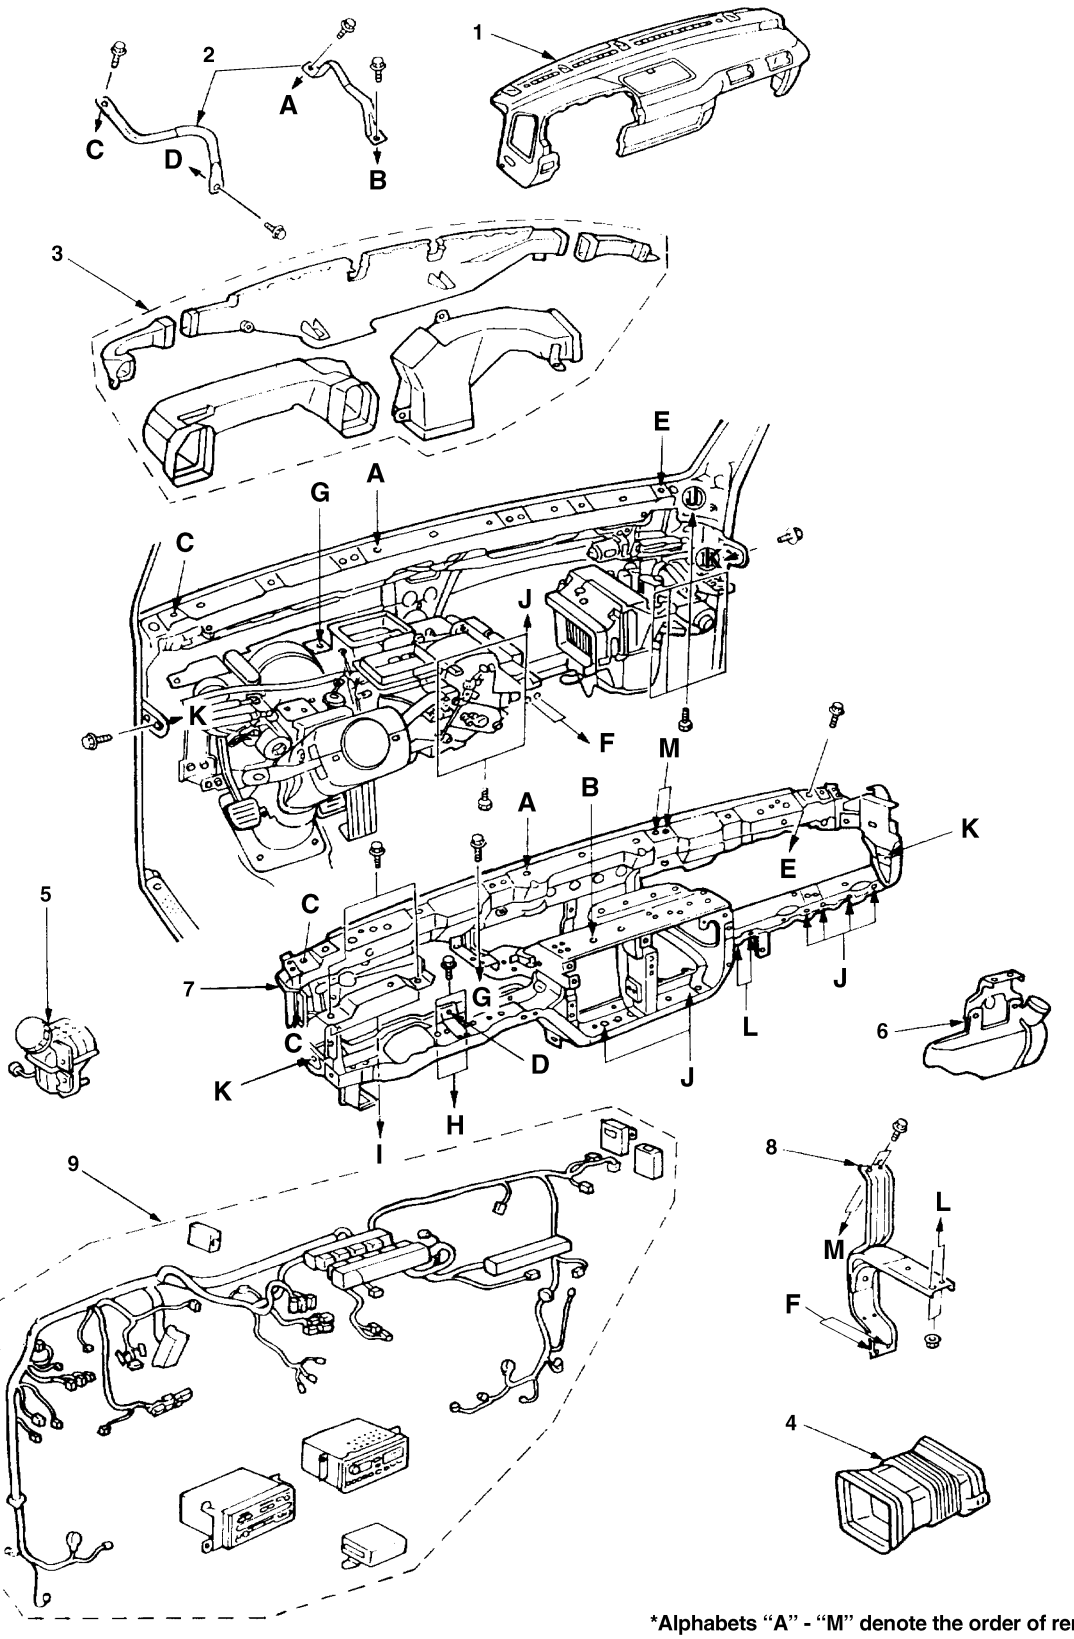
Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. After installing each connector, check the operation of each equipment.

Instrument Reinforcement Assembly

This illustration is based on LHD.



*Alphabets "A" - "M" denote the order of removing bolts.

N2A0046E

Legend

1. Instrument panel assembly
2. Instrument center/side stay
3. Defroster nozzle/ventilation duct
4. Intermediate duct (wide cab model)
5. Brake/clutch fluid reserve tank
6. Washer tank/bracket
7. Instrument reinforcement assembly
8. Instrument support bracket (wide cab model)
9. Body harness/controller/radio

Removal

1. Instrument panel assembly
   - Refer to “Instrument panel assembly” in this Section.
2. Instrument center/side stay
   - Remove the mounting bolts A — D.
3. Defroster nozzle/ventilation duct
   - Refer to “Heater/Air Conditioner Workshop Manual”.
4. Intermediate duct (wide cab model)
5. Brake/clutch fluid reserve tank
   - Remove the level switch connector and remove the 4 nuts.
   - Extract the fluid and remove each tube.

Caution:
Don’t apply the brake/clutch fluid to the resign portions and painted portions in any case.

6. Washer tank/bracket
   - Remove the washer motor connector and washer tube and remove the two bolts fixing the bracket and the one bolt in the lower part of the tank.
7. Instrument reinforcement assembly
   - Remove all the connectors of electrical equipments.
   - Remove the mounting bolts E — K.
   - When the vehicle is provided with a manual air conditioner, remove each control cable. For removal, refer to “Heater/Air conditioner Workshop Manual”.
8. Instrument support bracket (wide cab model)
   - Remove the bolts L and M and remove the instrument support bracket from the instrument reinforcement assembly.
9. Body harness/controller/radio
   - Remove the body harness/controller/radio from the instrument reinforcement assembly. Refer to “Electrical Equipment Workshop Manual” and “Heater/Air Conditioner Workshop Manual”.

Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten each bolt to the specified tightening torque.

Tighten:

- G: Clutch pedal bracket upper bolt to 37 N·m (3.8 kg·m/27 lb·ft)
- H: Steering column bracket bolt to 20 N·m (2.1 kg·m/14 lb·ft)
- I: Brake pedal bracket upper bolt to 42 N·m (4.3 kg·m/32 lb·ft)

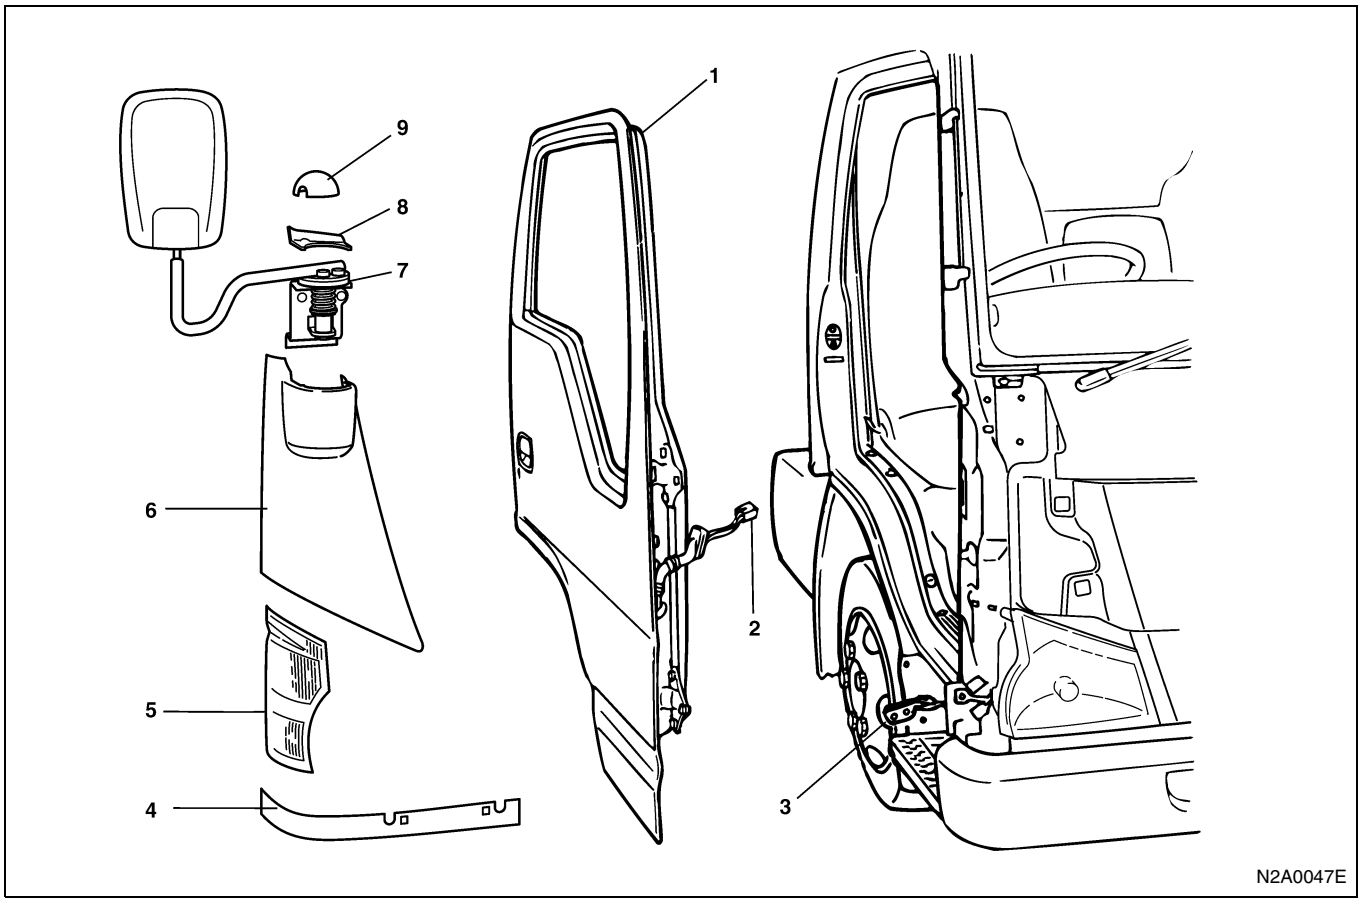
Tighten the other bolts and nuts to the standard torque.

2. Perform air bleeding for the brake and clutch.

DOOR

Front Door Assembly

Component

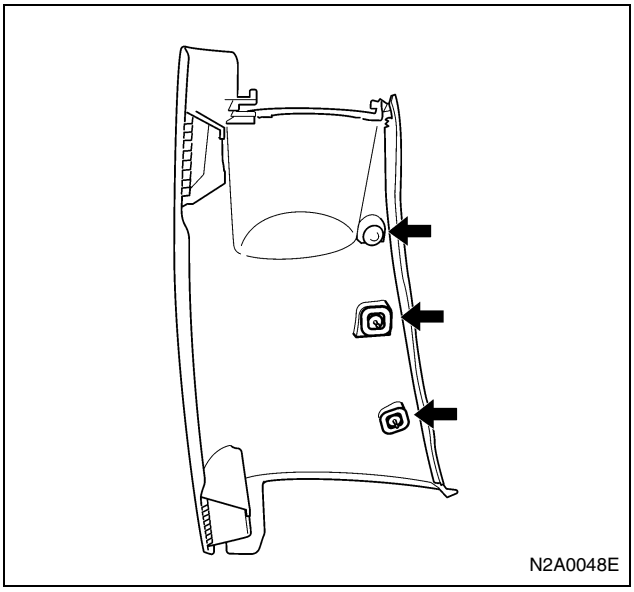


Legend

1. Front door assembly
2. Door harness connector
3. Door check arm
4. Headlamp lower cover
5. Front combination lamp
6. Front panel side
7. Outside mirror
8. Outside mirror sub cover
9. Outside mirror stay cap

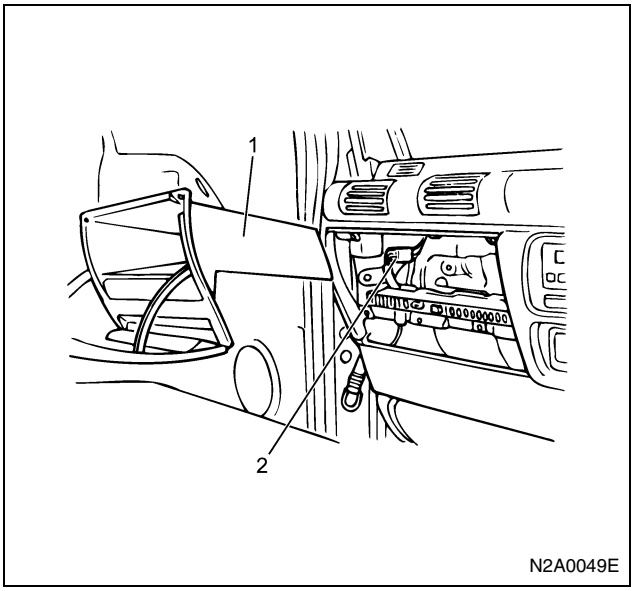
Removal

1. Disconnect the battery ground cable.
2. Headlamp grille
   - Pull out the head lamp grille toward you.
3. Front combination lamp
   - Remove the mounting screw and disconnect the connector.
4. Front panel side
   - Remove the bolt.
   - Be careful the 3 clips shown in the figure when removing the front panel side.



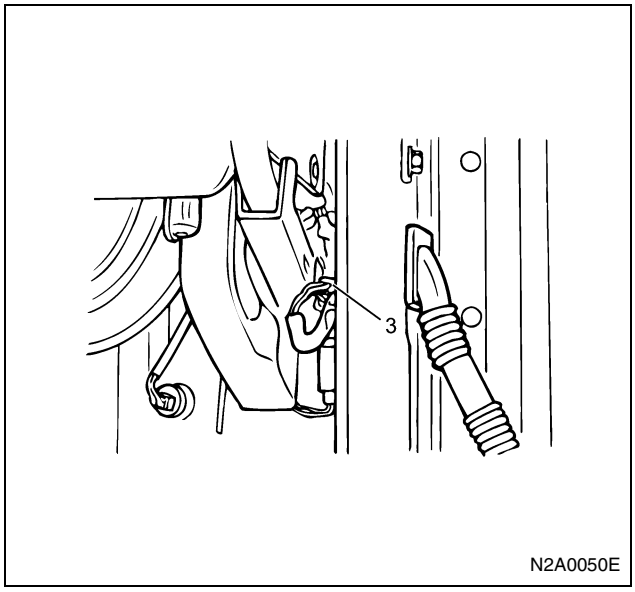
N2A0048E

5. Outside mirror/molding
   - Refer to “Outside Mirror Assembly” in this Section.
6. Disconnect the door harness connector (2).
   - To remove the door on the assistant’s seat side, remove the glove box (1) and disconnect the connector.



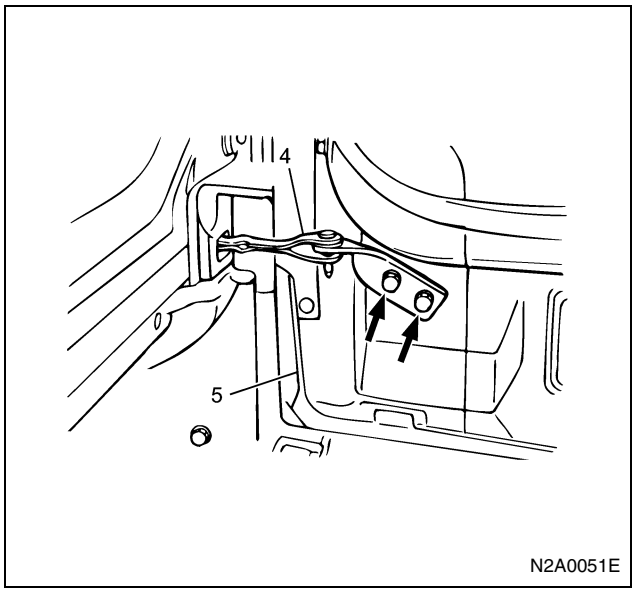
N2A0049E

   - To remove the door on the driver’s seat side, disconnect the connector (3) from the bottom side of the instrument panel.



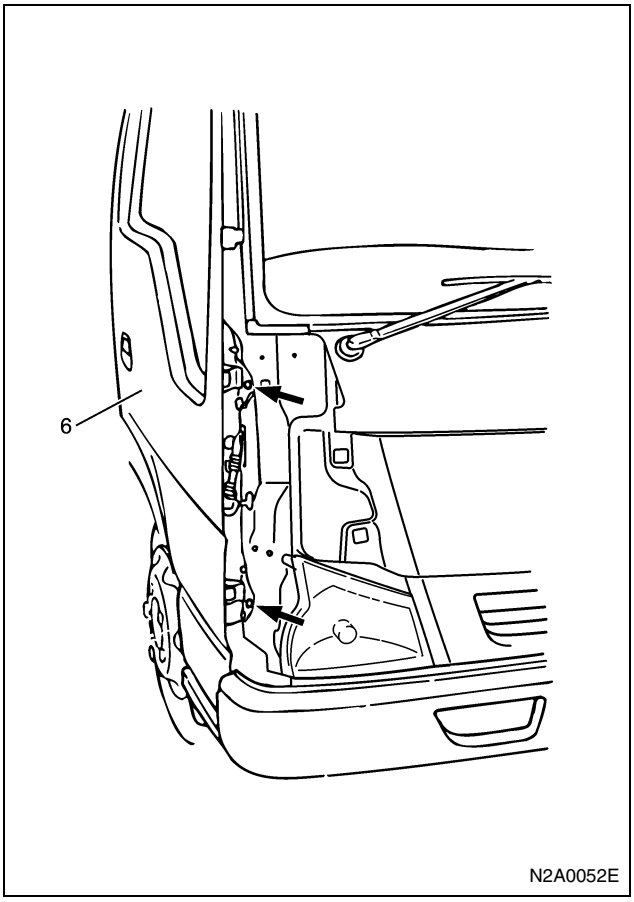
N2A0050E

7. Door check arm (4)
   - Remove the 2 mounting bolts on the door side (5).



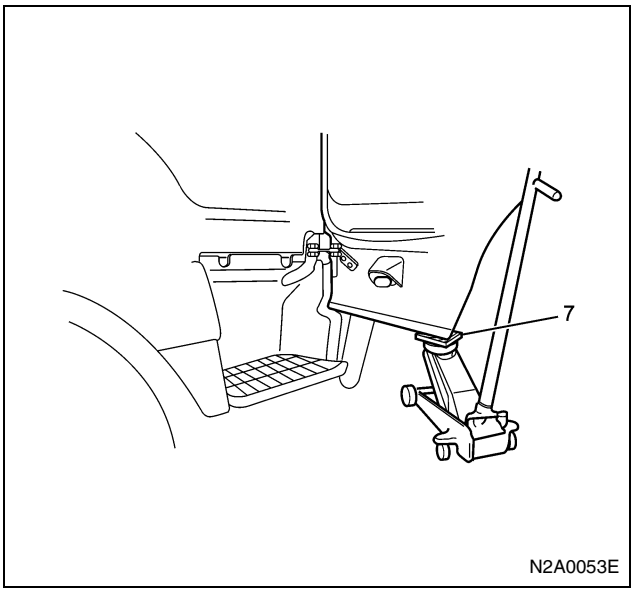
N2A0051E

8. Front door assembly (6)
   - Remove the one mounting bolt for each hinge on the front side while the door is closed.
   - Put mark on the hinge beforehand.

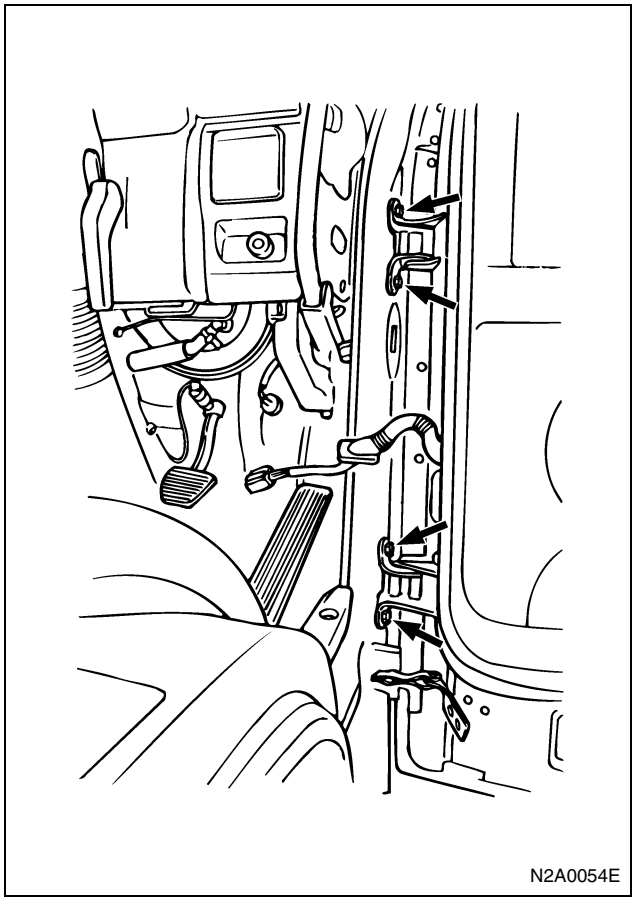


- Open the door and support it with garage jack etc.

Caution:
To prevent scratches, support it with a waste cloth or wooden piece (7).



- Remove the 2 mounting bolts for each hinge on the rear side while the door is open.



Installation

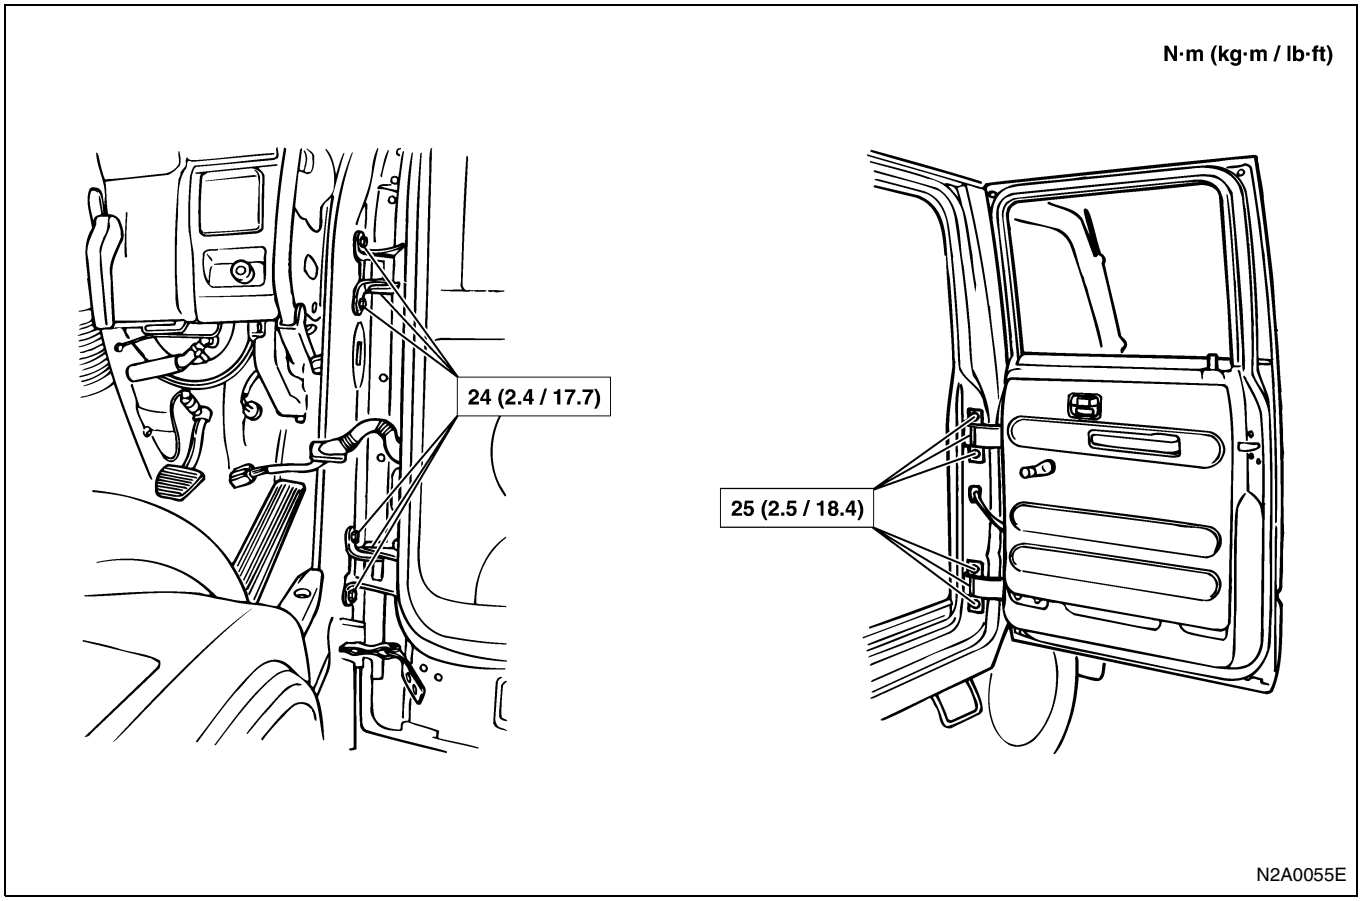
For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the mounting bolts to the specified torque.

Tighten:
Mounting bolt to 24 N·m (2.4 kg·m/17.7 lb·ft)

2. Adjust the door installation position referring to “Body Panel Assembly” in Body Panel Section.

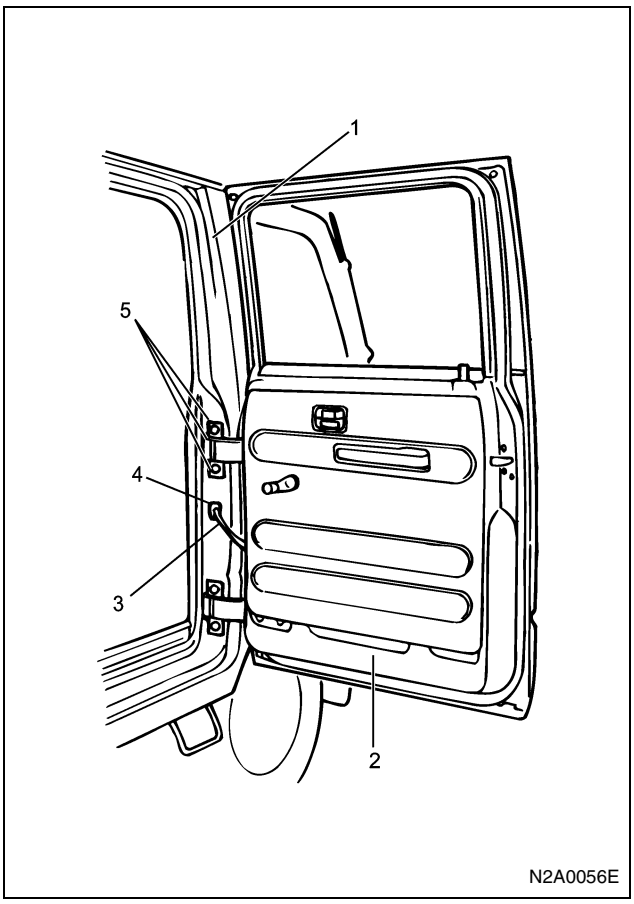
Fixing Torque



Rear Door Assembly

Removal

1. Rear door harness connector (4)
   - Remove the harness grommet (3) and disconnect the connector inside center pillar (1).
2. Rear door assembly mounting bolt (5)
   - Support the rear door assembly and remove the 3 bolts on each hinge. (Put mark on the hinge beforehand.)
3. Rear door assembly (2)



Installation

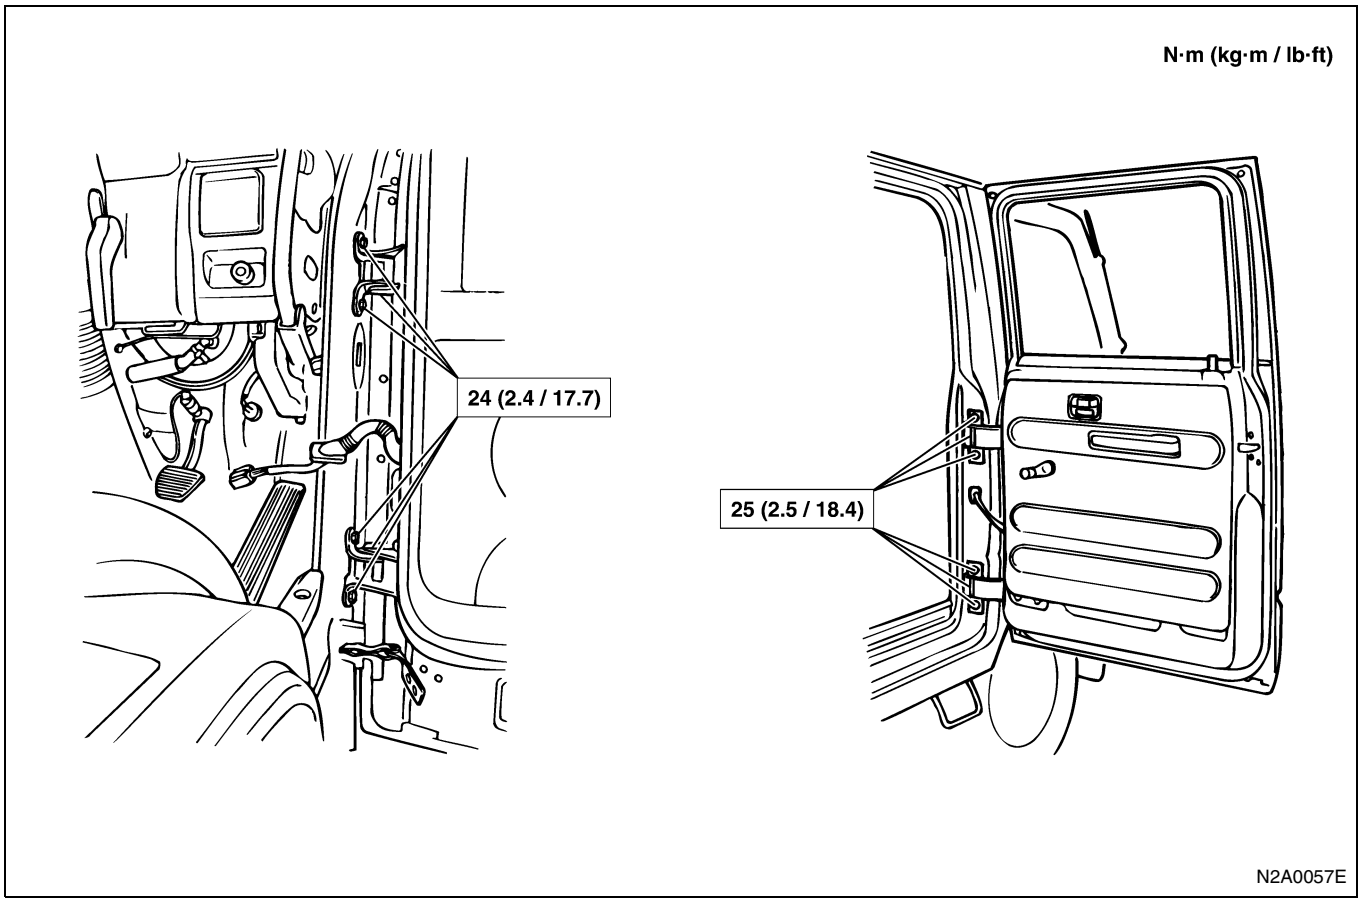
For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the rear door assembly mounting bolts to the specified torque.

Tighten:

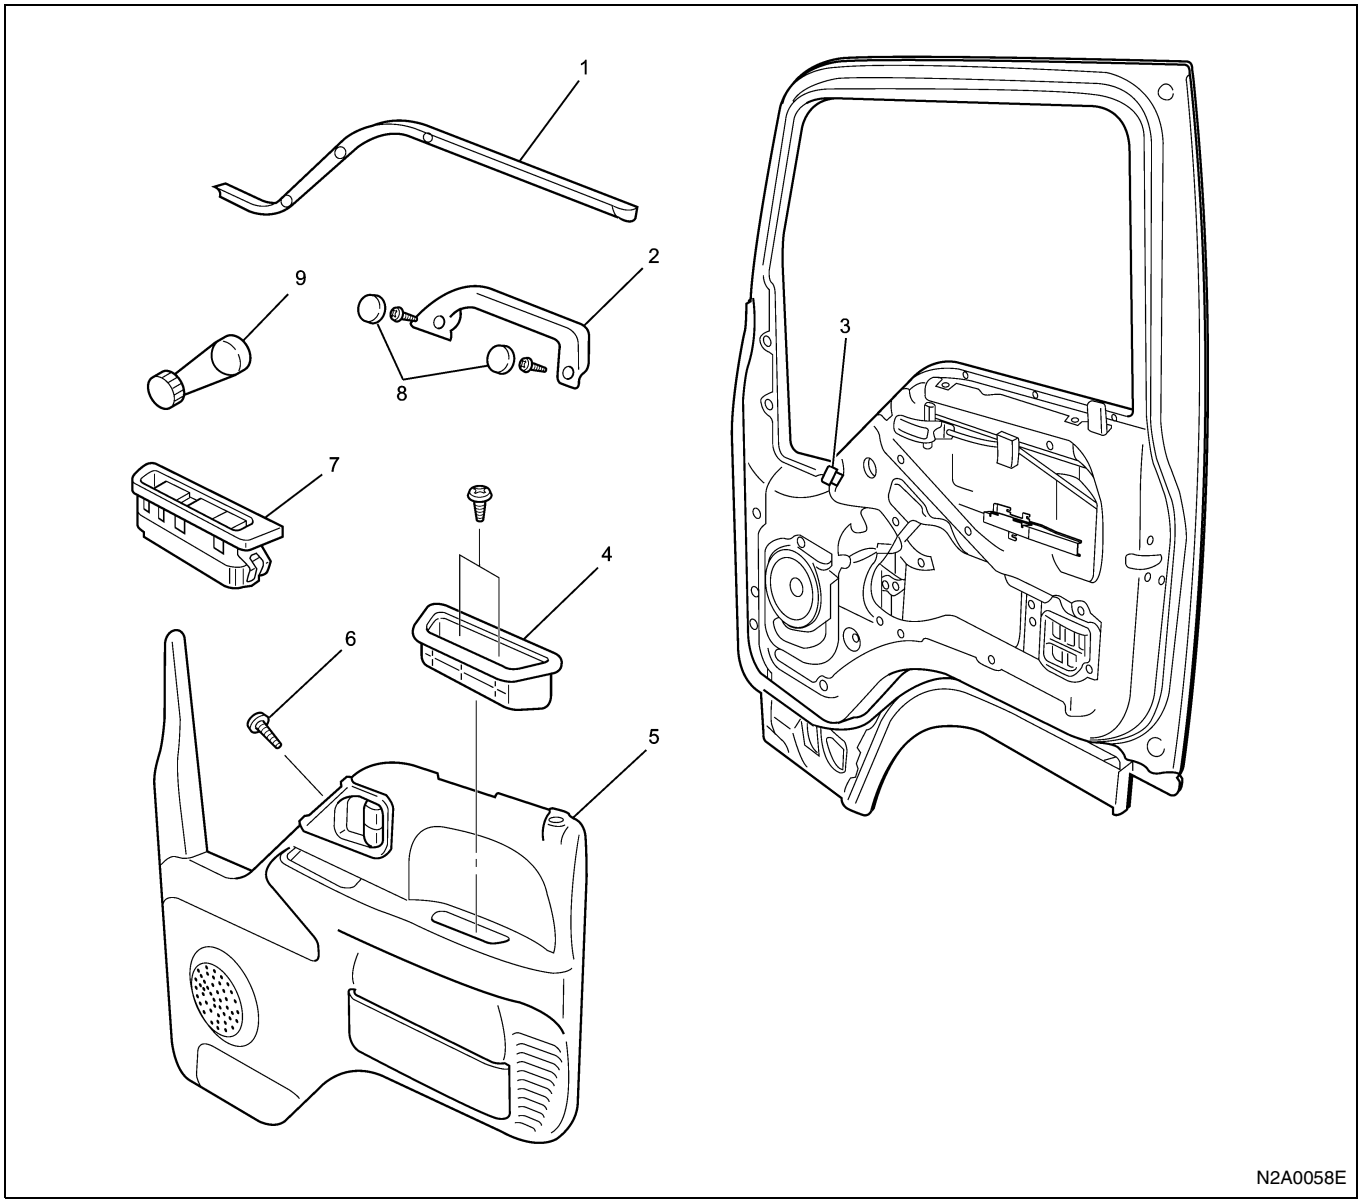
Rear door assembly mounting bolt to 25 N·m (2.5 kg·m/ 18.4 lb·ft)

Fixing Torque



Front Door Trim Pad

Component

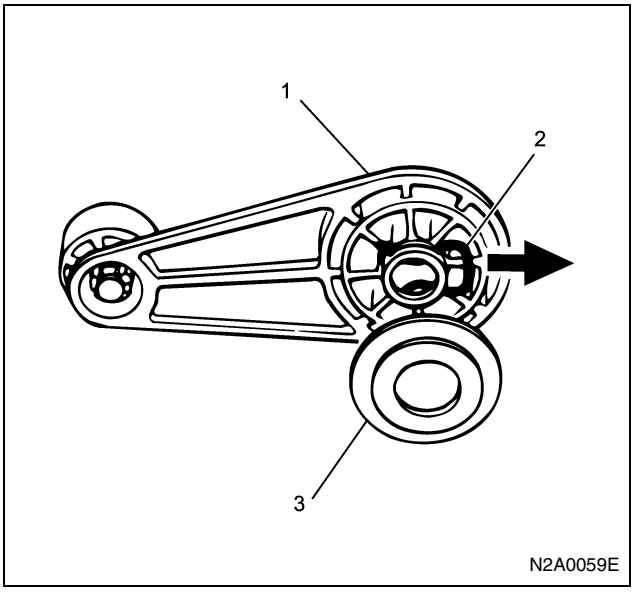


Legend

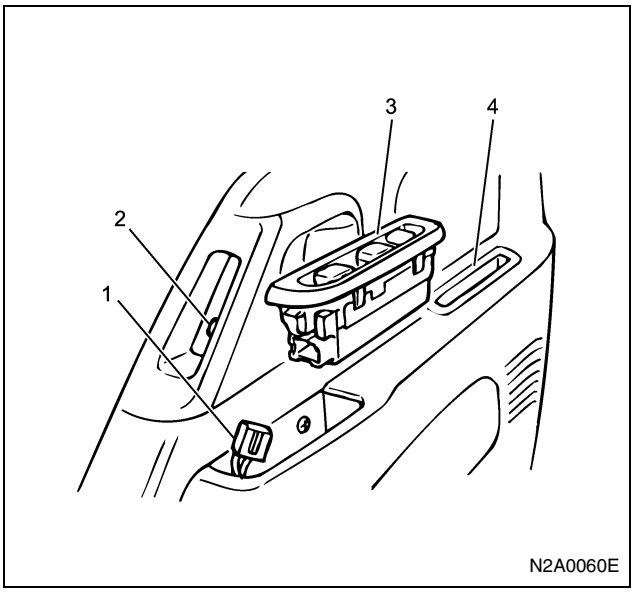
1. Inner waist seal
2. Guard bar (High cab model, wide cab model)
3. Power window switch connector
4. Door pull case
5. Front door trim pad
6. Screw
7. Power window switch
8. Grommet
9. Window regulator handle (if equipped)

Removal

1. Disconnect the battery ground cable.
2. Guard bar (high cab model, wide cab model)
   - Open the grommet and remove the 2 screws.
3. Inner waist seal
   - Remove the clips one by one with a bladed screwdriver. Note that excessive force will cause deformation. Be careful not scratch the pillar with their edge while removing.
4. Window regulator handle (1). (if equipped)
   - Pull the fixing pin (2) to remove the washer (3) and body.

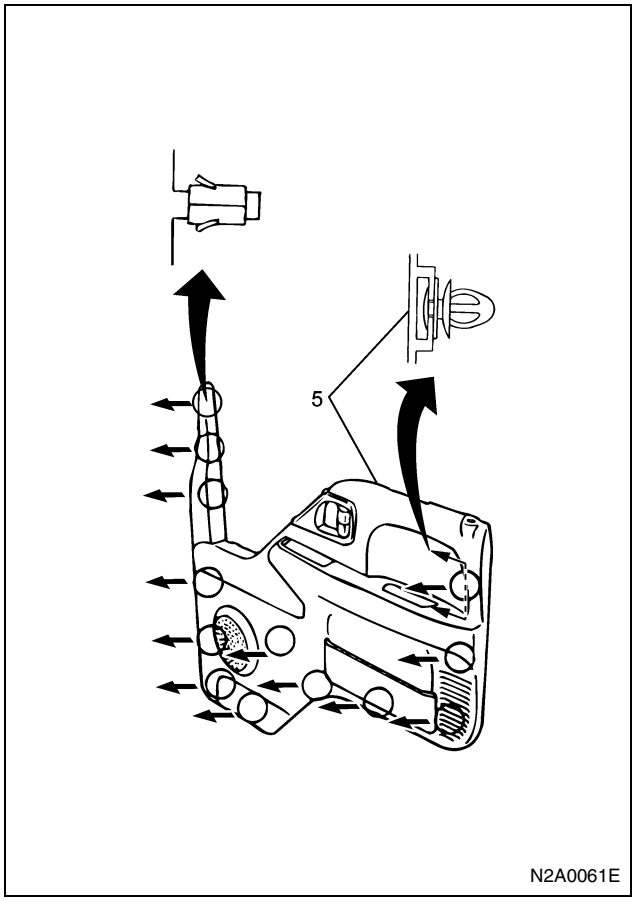


5. Power window switch (3)
   - Pull out the switch from the door trim pad and disconnect the connector (1).
6. Screw (2)
7. Door pull case (4)
   - Remove the 2 mounting screws.



Caution:
The above parts 3 to 5 can be removed in any order or each of them can be removed independently.

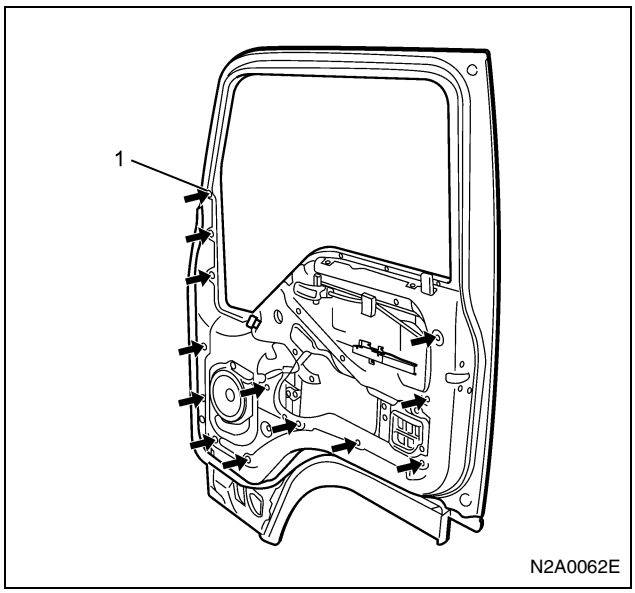
8. Front door trim pad (5)
   - Remove the clips at 13 positions.



Installation

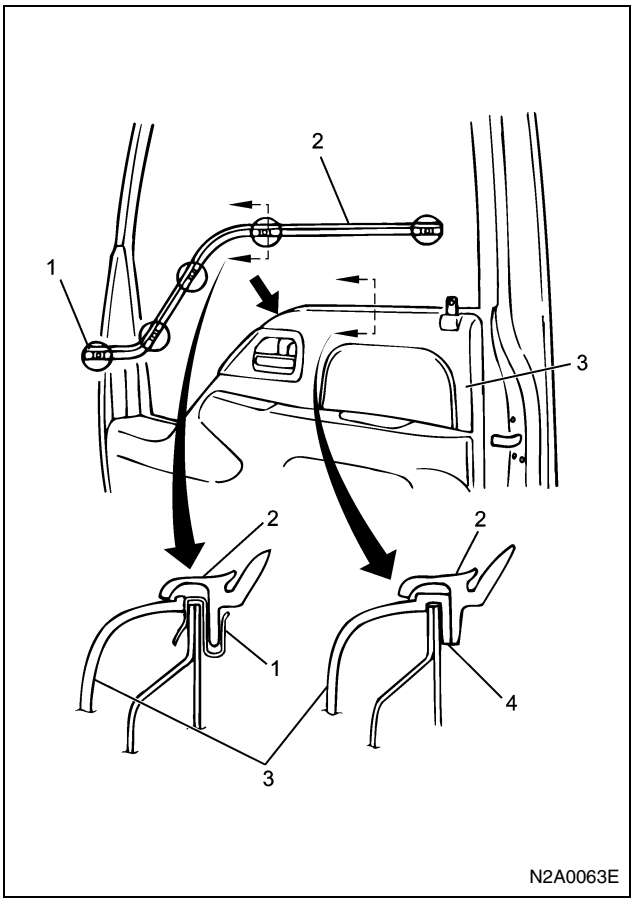
For installation, reverse the removal procedure taking the following points into consideration.

1. Adjust the trim pad clip to the mounting hole (1) on the door panel side and install the trim pad so as to prevent any float, skewness or door harness bite.



2. To install the inner waist seal (2), align the front end so that the seal hang over the 4 claws (4) of upper part of the trim pad (3) and insert the clips in sequence starting from the front end clip (1). Note that applying force in transverse direction will cause deformation.

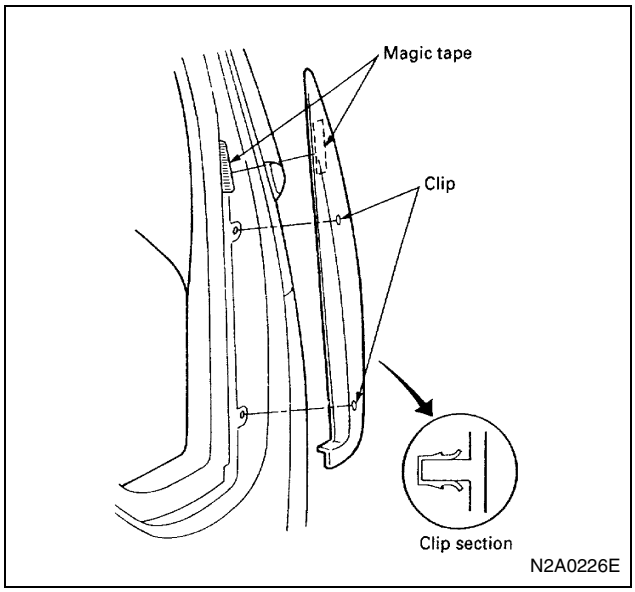
Caution:
Be extremely careful that the painted surface of pillar bottom part may be scratched by the cored bar of the both ends of inner waist seal during removal. If it get damaged, touch up it with appropriate color to prevent rust.



Front Pillar Garnish

Removal

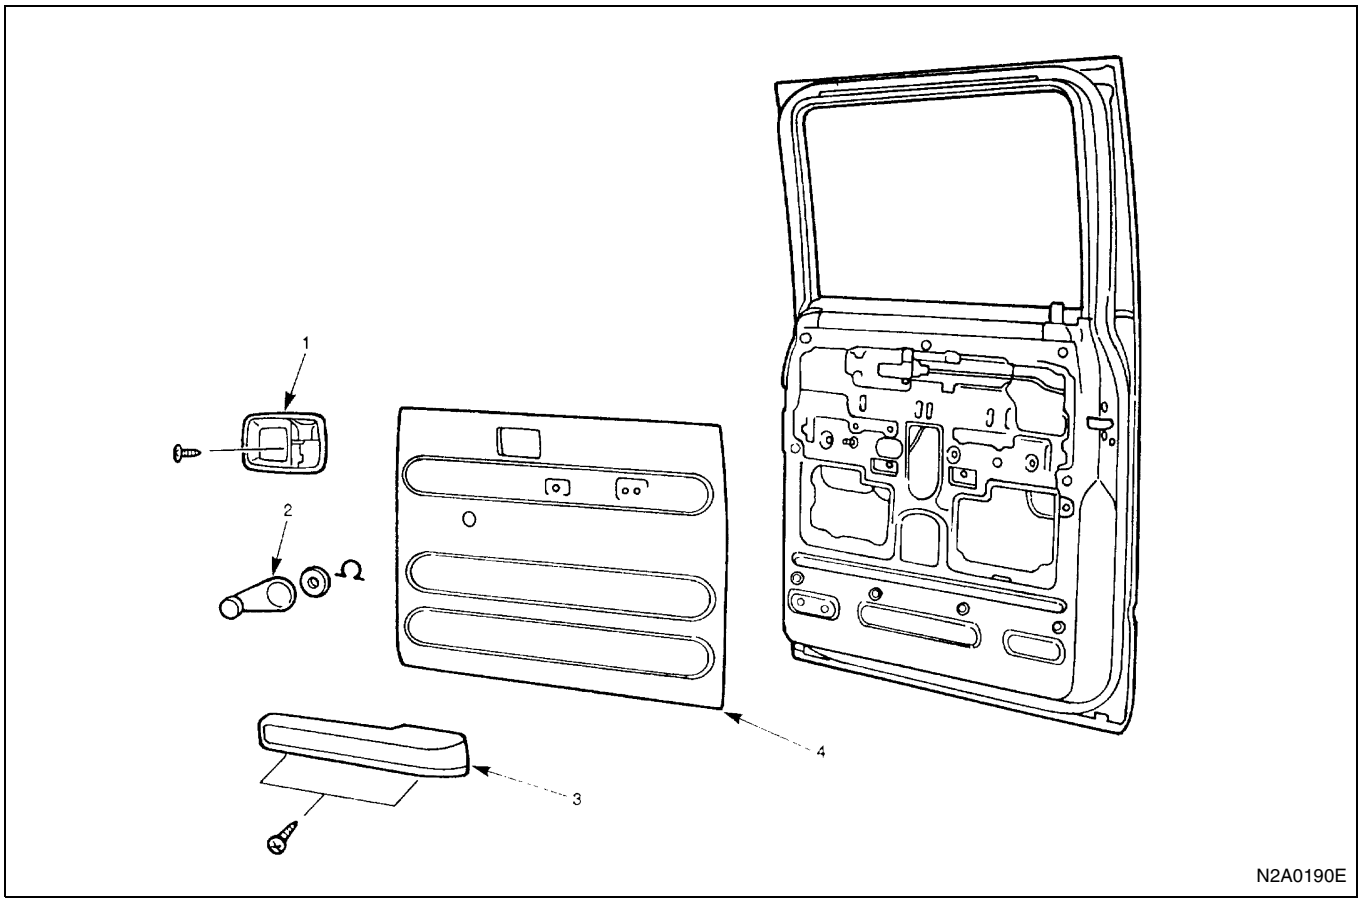
1. Front pillar garnish
   Peel off the magic tape and pull it toward you. Pull out the clips at 2 positions.



Installation

For installation, reverse the removal procedure.

Rear Door Trim Pad

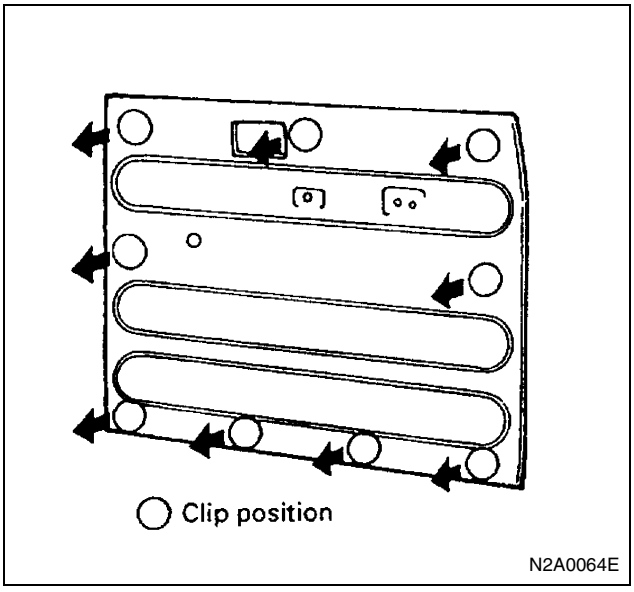


Legend

1. Inside lever bezel
2. Window regulator handle
3. Arm rest assembly
4. Rear door trim pad

Removal

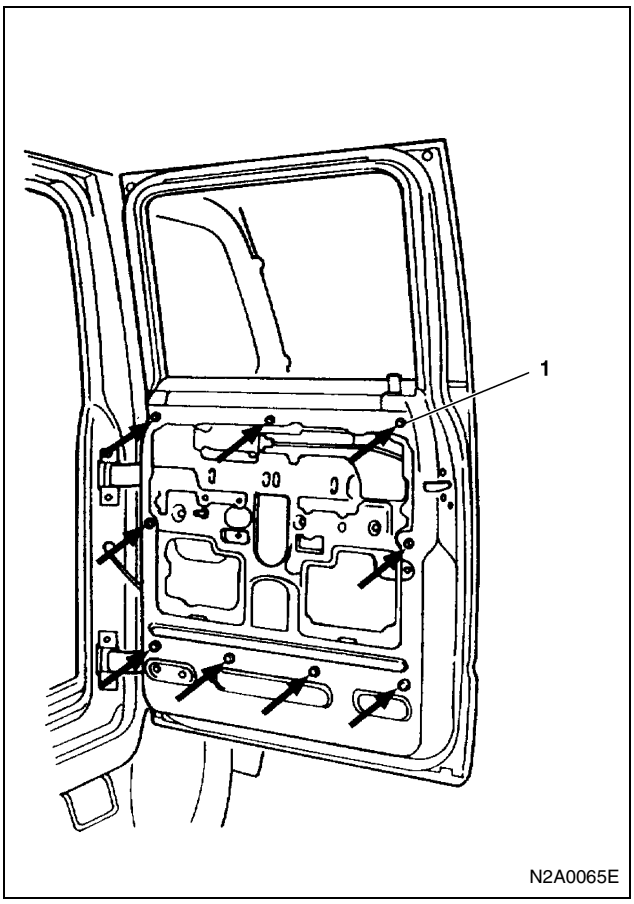
1. Inside lever bezel
   - Remove the mounting screws and draw out the bezel forward by pulling the inside lever.
2. Window regulator handle
   - Draw out the hook and dismount the handle.
3. Arm rest assembly
   - Remove the 2 mounting screws.
4. Rear door trim pad
   - Remove the clip fitting at 9 positions.



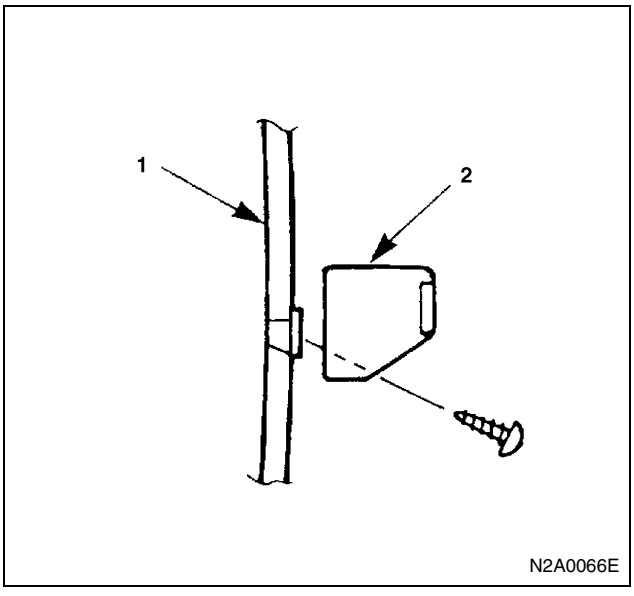
Installation

For installation, reverse the removal procedure taking the following points into consideration.

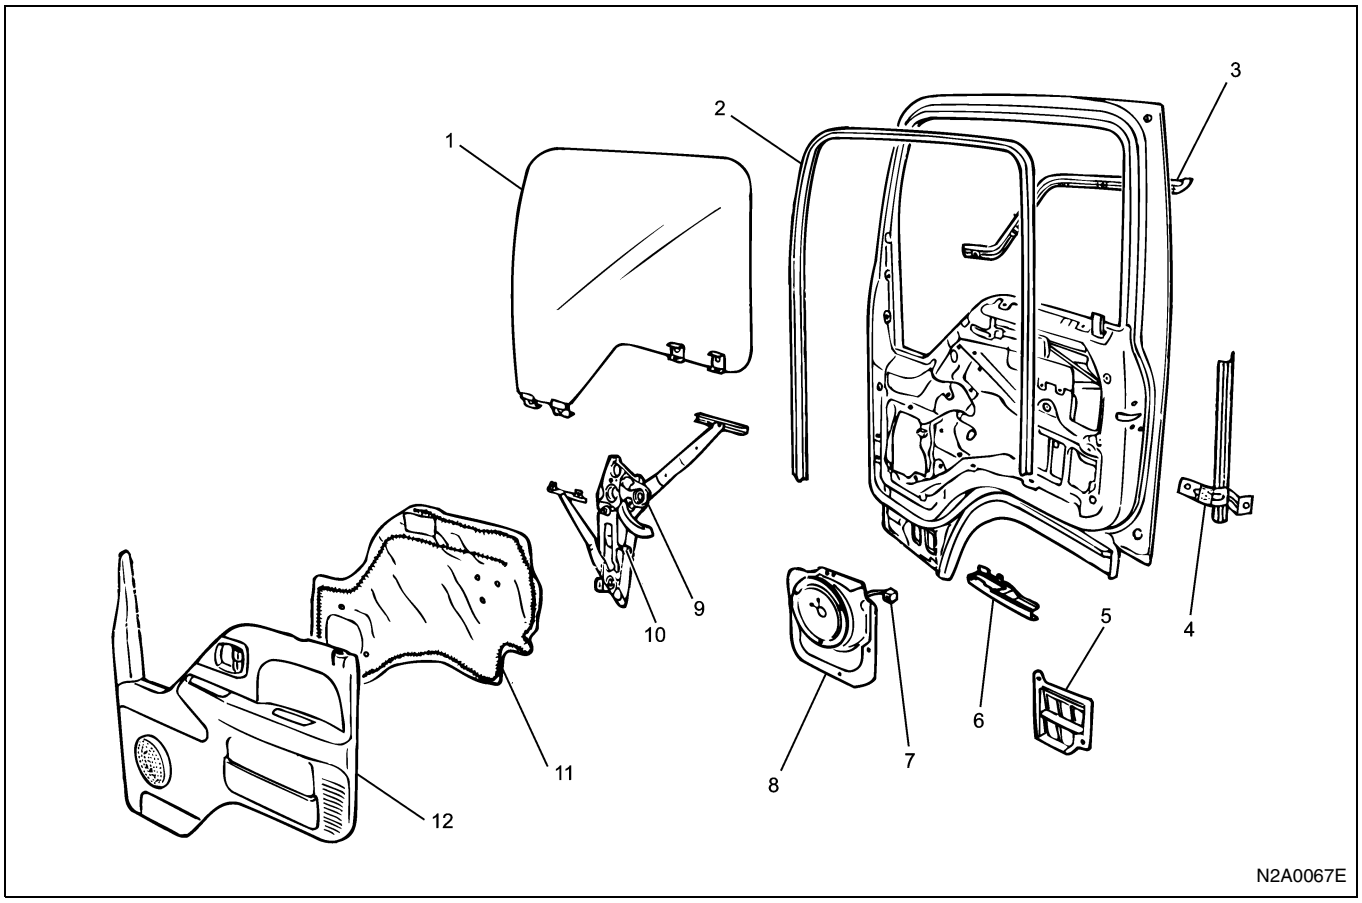
1. Install the rear door trim pad by adjusting the trim pad grip to the mounting hole (1) on the door panel side so that any float, skewness, harness bite may not exist.



2. Take care not mistake the tightening direction for the arm rest assembly (2) mounting screws.



Door Window Glass, Regulator and Glass Run

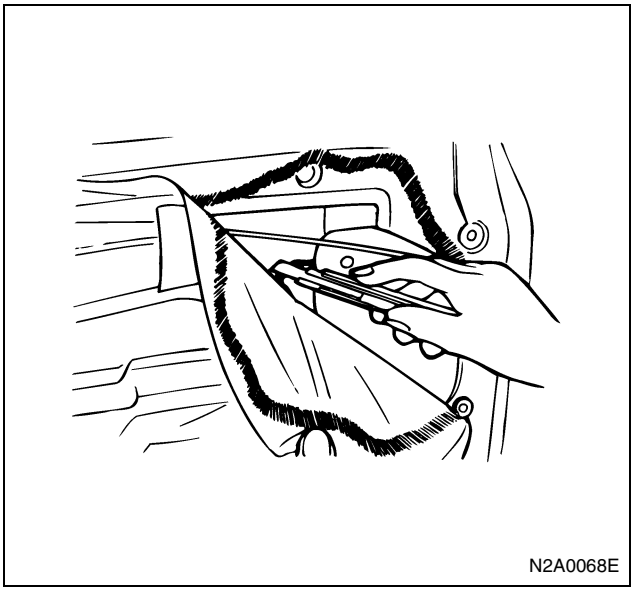


Legend

1. Glass
2. Glass run
3. Outer waist seal
4. Glass run rear channel
5. Door-out one way valve
6. Door pull case bracket
7. Speaker connector
8. Speaker
9. Window regulator
10. Power window motor connector
11. Water-proof sheet
12. Front door trim pad

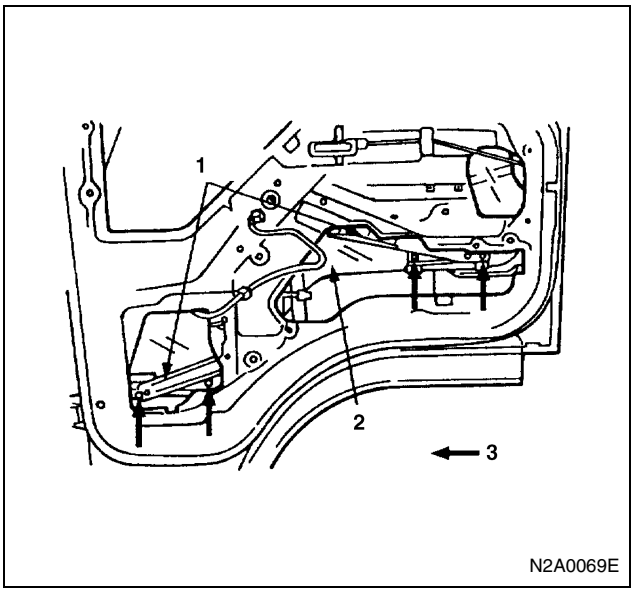
Removal

1. Front door trim pad
   - Refer to “Front door trim pad” in this Section.
2. Speaker
   - Remove the 3 screws and 1 clip and disconnect the connector.
3. Door pull case bracket
4. Door-out one-way valve
5. Water-proof sheet
   - Peel off the water-proof sheet carefully with a cutter or knife. Take care not to damage it when peeling it off.



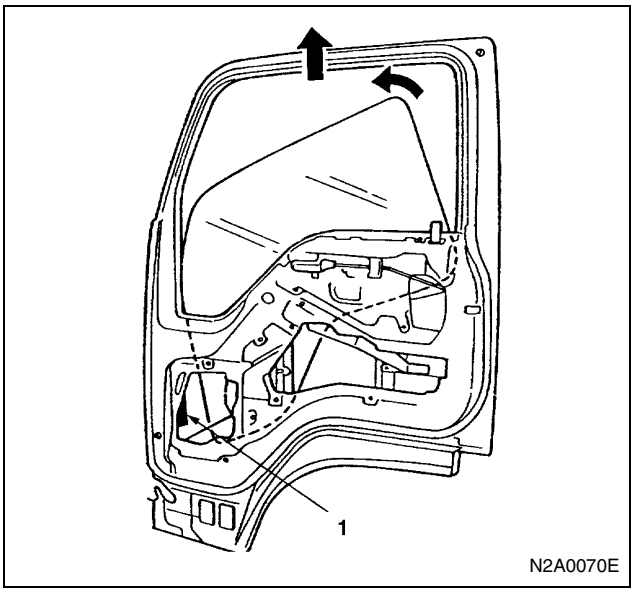
6. Outer waist seal

7. Glass
   - Lower the glass to a position where the mounting screw can be seen, and remove the 4 screws.



Legend
1. Window regulator
2. Glass
3. Screw

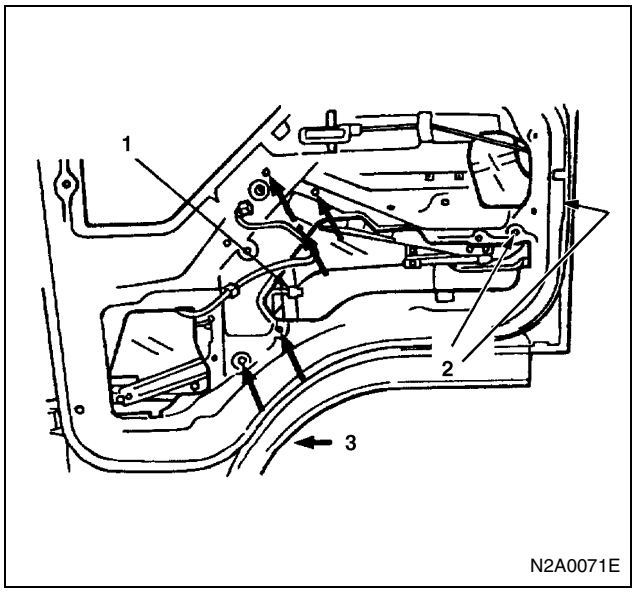
   - Lower the front side of the glass. After the front side of the glass comes off from the glass run, pull up the rear side of the glass.



Legend
1. Glass run

8. Window regulator
   - Disconnect the harness connector of the power window motor and remove the 5 mounting screws.

9. Glass run
   - Pull out the glass run from the door frame groove.
10. Glass run rear channel
   - Pull out the 2 mounting screws.

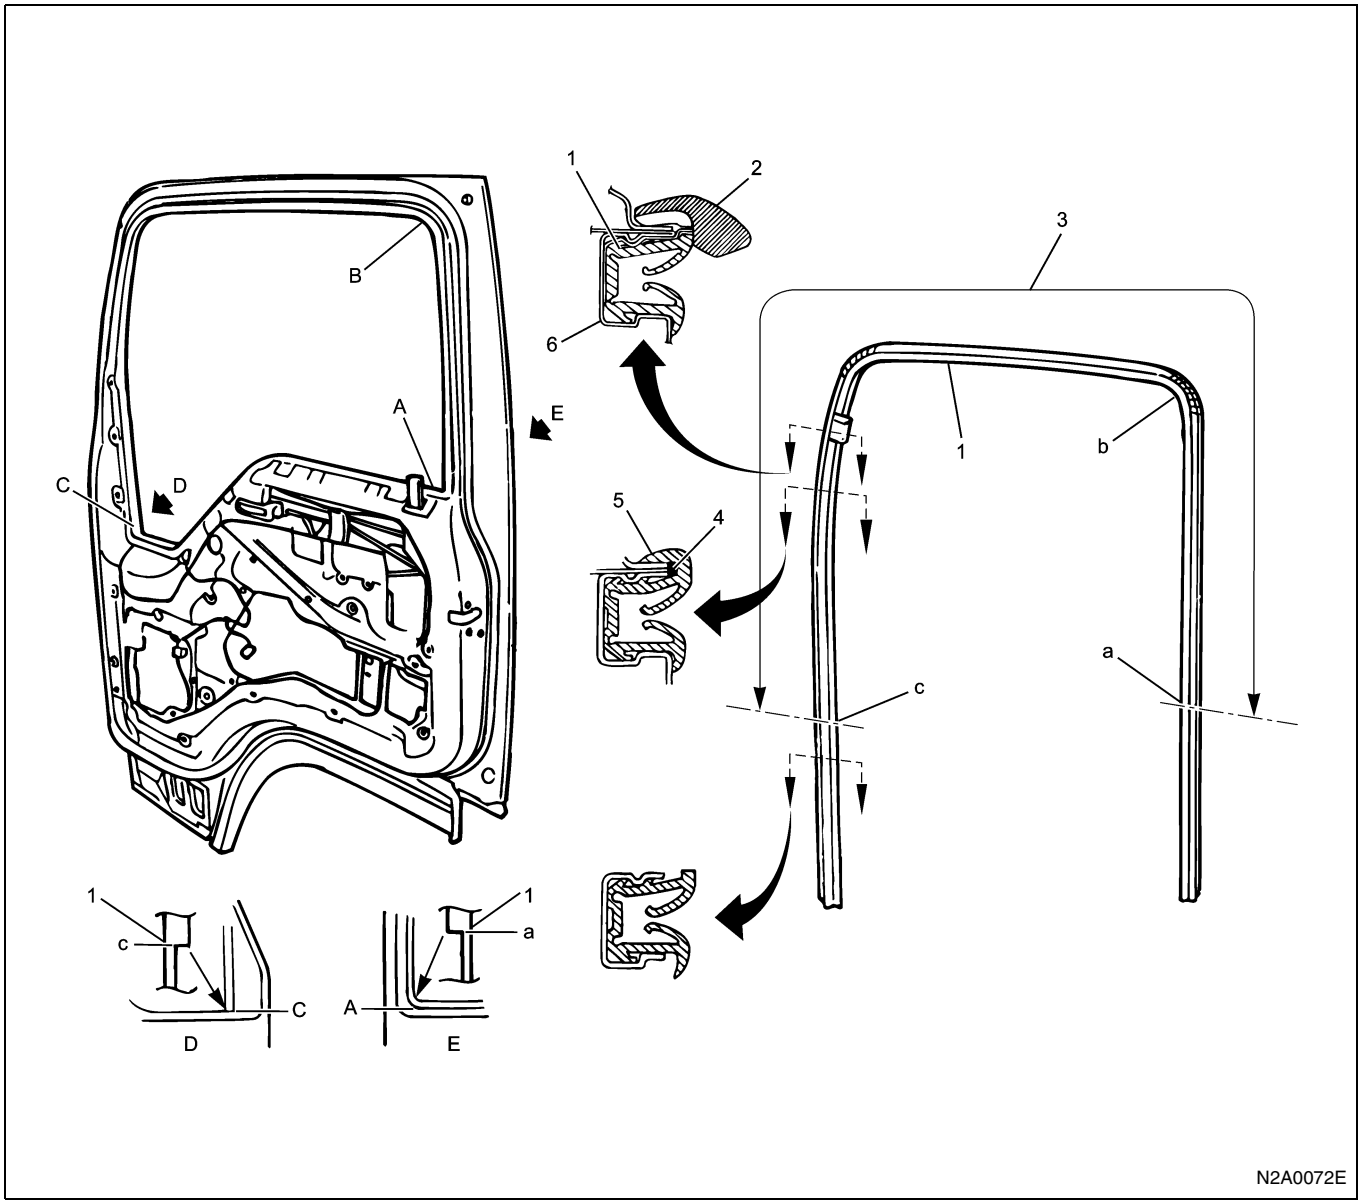


Legend
1. Power window motor connector
2. Glass run rear channel mounting screw
3. Mounting screw position

Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Align the notch a of the glass run lip with the door outer waist line A. Align the glass run slit b with the door B and fit the glass run between A and B. Next, align the notch c of the glass run lip with the door outer waist line C and fit the glass run between B and C. Fit the glass run in the channel within the door. (Refer to the illustration shown on the next.)



Legend

1. Glass run
2. Glass guide
3. Sealant application range
4. Sealant
5. Lip
6. Channel within the door

- Fit the glass run with the lip toward the outside of the vehicle.

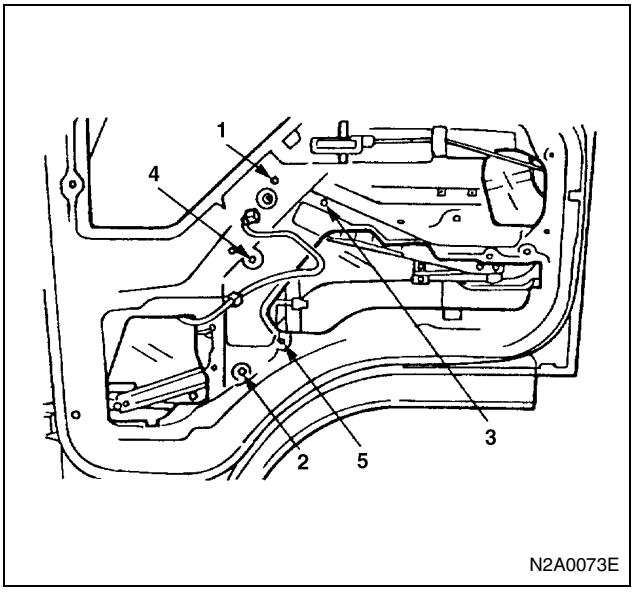
2. While the front side of the glass is lowered, insert the glass into the door panel. First, insert the rear side of the glass into the glass run, then insert the front side into the glass run. Raise the front side gradually along the glass run.

Caution:
When reusing the glass run, apply the sealant to the range shown in the figure.

Sealant: CEMEDINE 366DX or equivalent

3. Temporarily tighten the window regulator mounting screw (3) (basic hole) and tighten (1) to (5) firmly. Lastly, tighten (3) (basic hole) firmly.

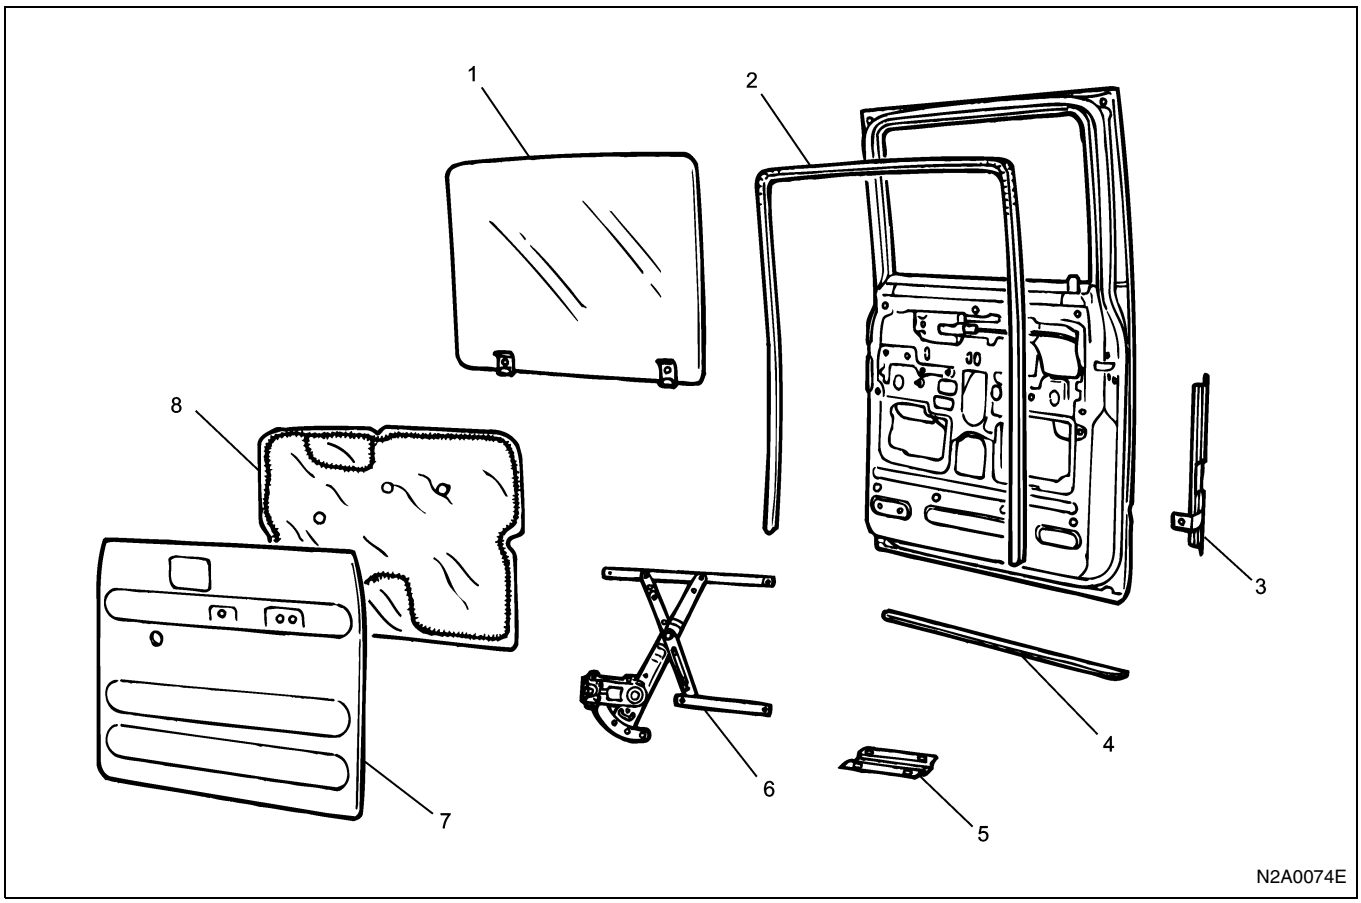
Tighten:
Window regulator mounting screw to 6 N·m (0.6 kg·m/4 lb·ft) — 7.8 N·m (0.8 kg·m/6 lb·ft)



4. Glue the water-proof sheet with an IIR tape securely.
   Check the water-proof sheet for breakage.

Rear Window Glass and Regulator

Component

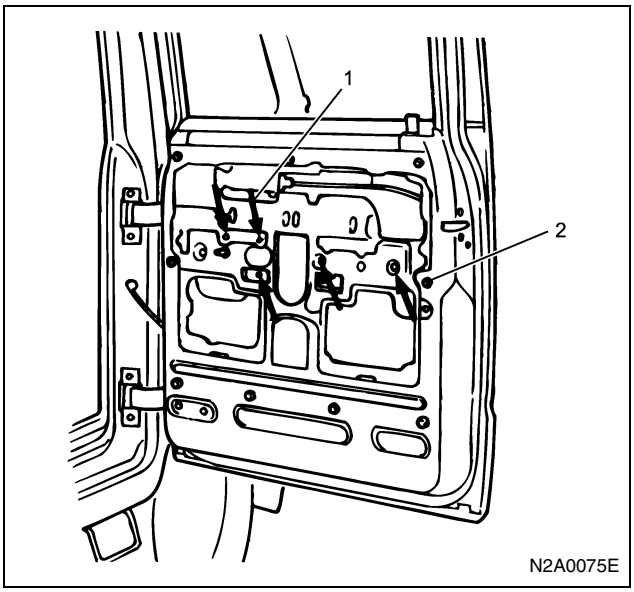


Legend

1. Rear door glass
2. Glass run
3. Glass run rear channel
4. Rear door glass plug
5. Door bottom bracket
6. Window regulator
7. Rear door trim pad
8. Water-proof sheet

Removal

1. Rear door trim pad
   - Refer to “Rear Door Trim Pad” in Interior & Exterior Trim Section.
2. Water-proof sheet
   - Peel off it carefully with a cutter or knife. Take care not to damage it when peeling it off.
3. Bottom bracket
   - Remove the 4 screws.
4. Rear door glass plug
5. Rear door glass
   - Lower the glass to a position of working holes where the mounting screws can be seen, remove the 2 screws and pull out them through the working holes in the bottom of door.
6. Window regulator
   - Remove the 5 mounting screws (1) and pull out them through the working holes.
7. Glass run
   - Pull out the glass run from the channel.
8. Glass run rear channel
   - Remove the mounting screw (2) and pull it out.



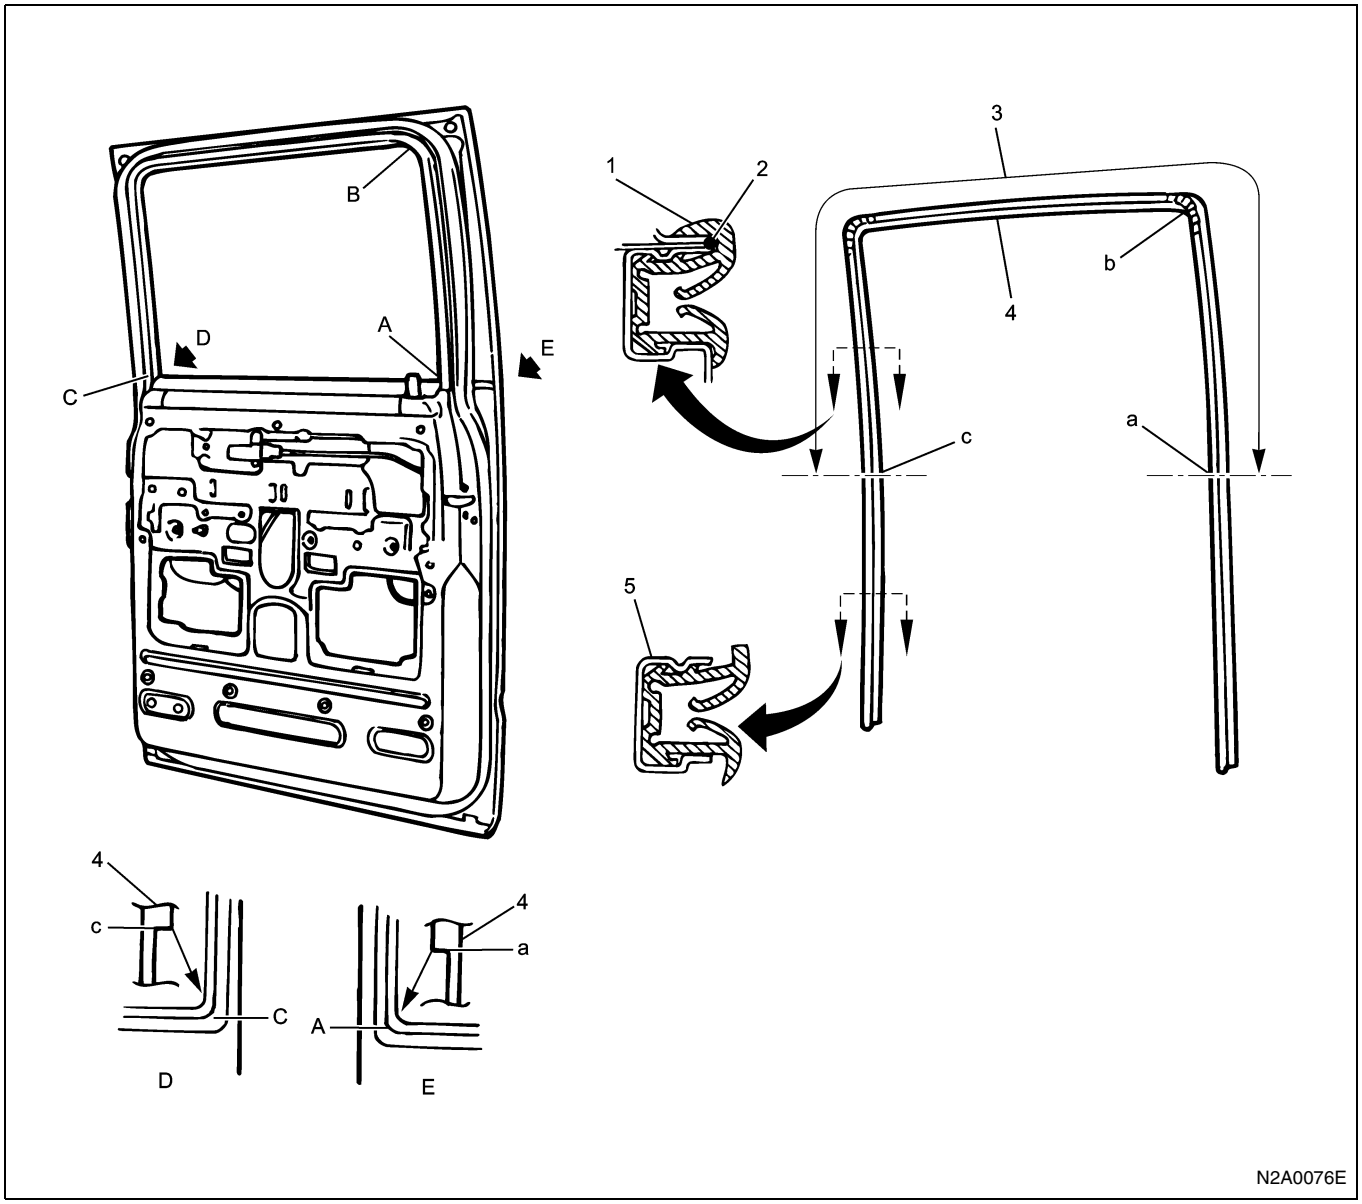
Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Align the notch (a) of the glass run lip (4) with the door outer waist line (A). Align the glass run slit (b) with the door (B) and fit the glass run between A and B. Next, align the notch (c) of the glass run lip with the door outer waist line (C) and fit the glass run between B and C. Fit the glass run in the channel (5) within the panel with the lip (1) toward the outside of the vehicle.

Caution:
When reusing the glass run, apply the sealant to the range shown in the figure.

Sealant: CEMEDINE 366DX or equivalent



Legend

1. Lip
2. Sealant application range
3. Sealant
4. Glass run
5. Channel within panel

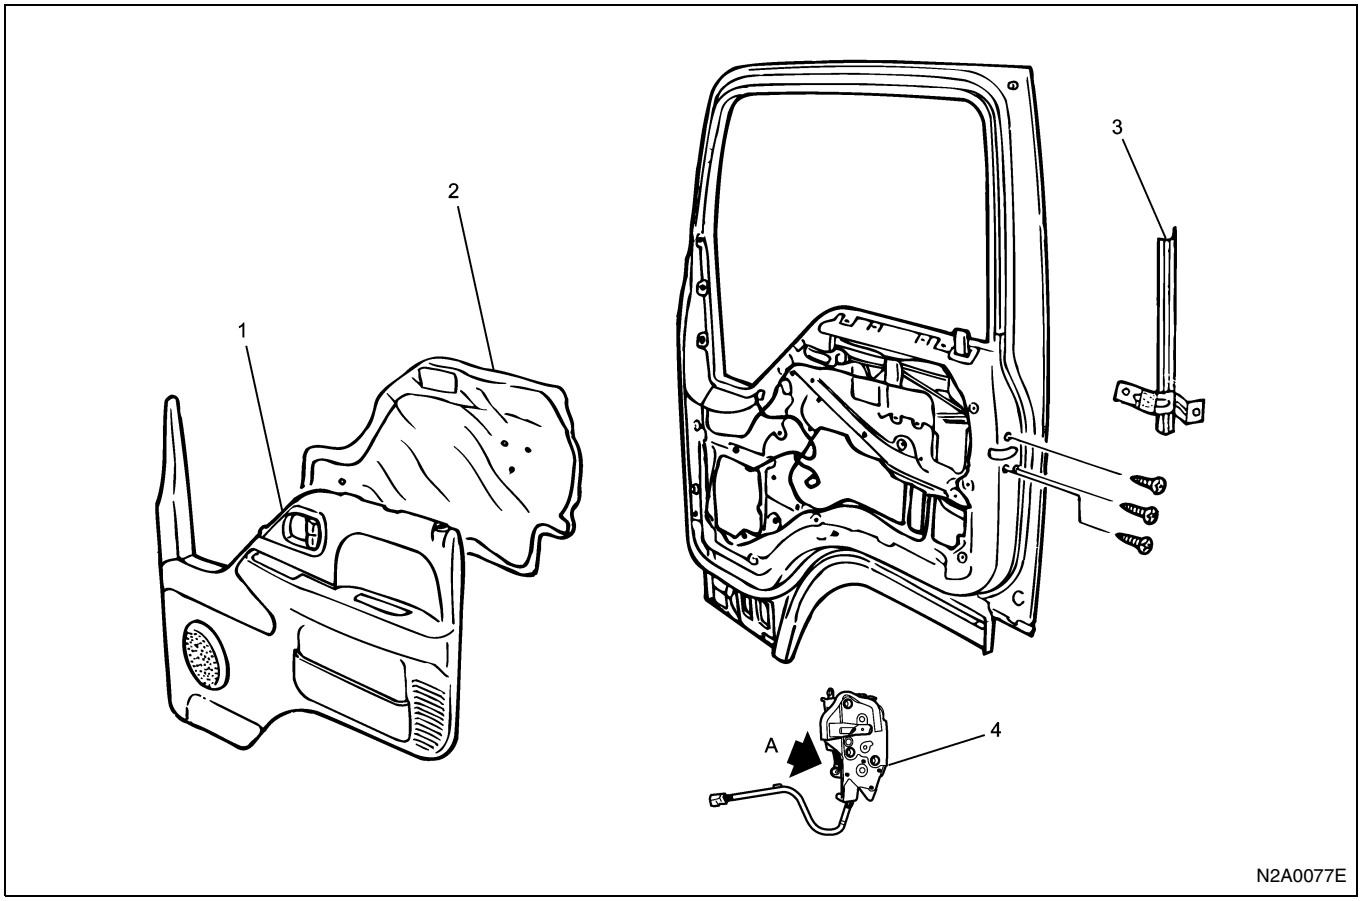
2. Insert the window regulator through the working hole to tighten the 5 mounting screws to the specified torque.

Tighten:

Window regulator mounting screw to 7 N·m (0.7 kg·m/ 5.2 lb·ft)

3. Glue the water-proof sheet with butyl tape securely. Check it for breakage.

Door Lock Assembly



Legend

1. Door trim pad
2. Water-proof sheet
3. Glass run rear channel
4. Door lock assembly

Removal

1. Door trim pad
2. Water-proof sheet
   - Refer to “Window regulator” in this Section.
3. Glass run rear channel
   - Pull out the 2 mounting screws.
4. Door lock assembly
   - Disconnect each link and remove the 3 mounting screws.

Installation

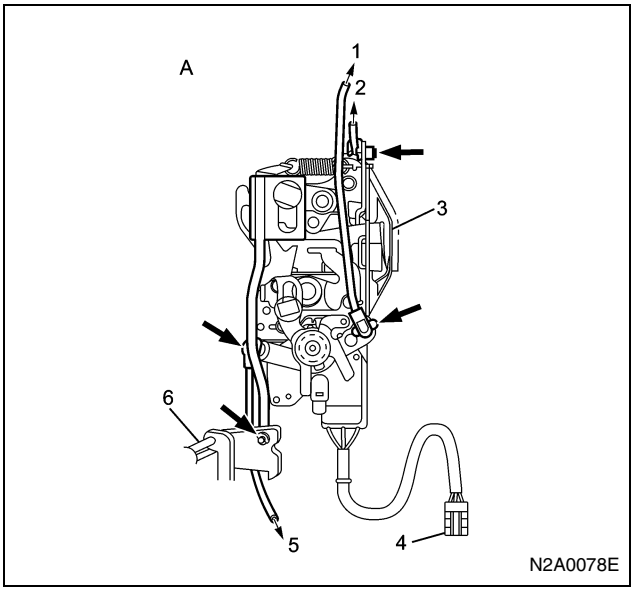
For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the door lock assembly to the specified torque.

Tighten:

- 15 N·m (1.5 kg·m/11.1 lb·ft)

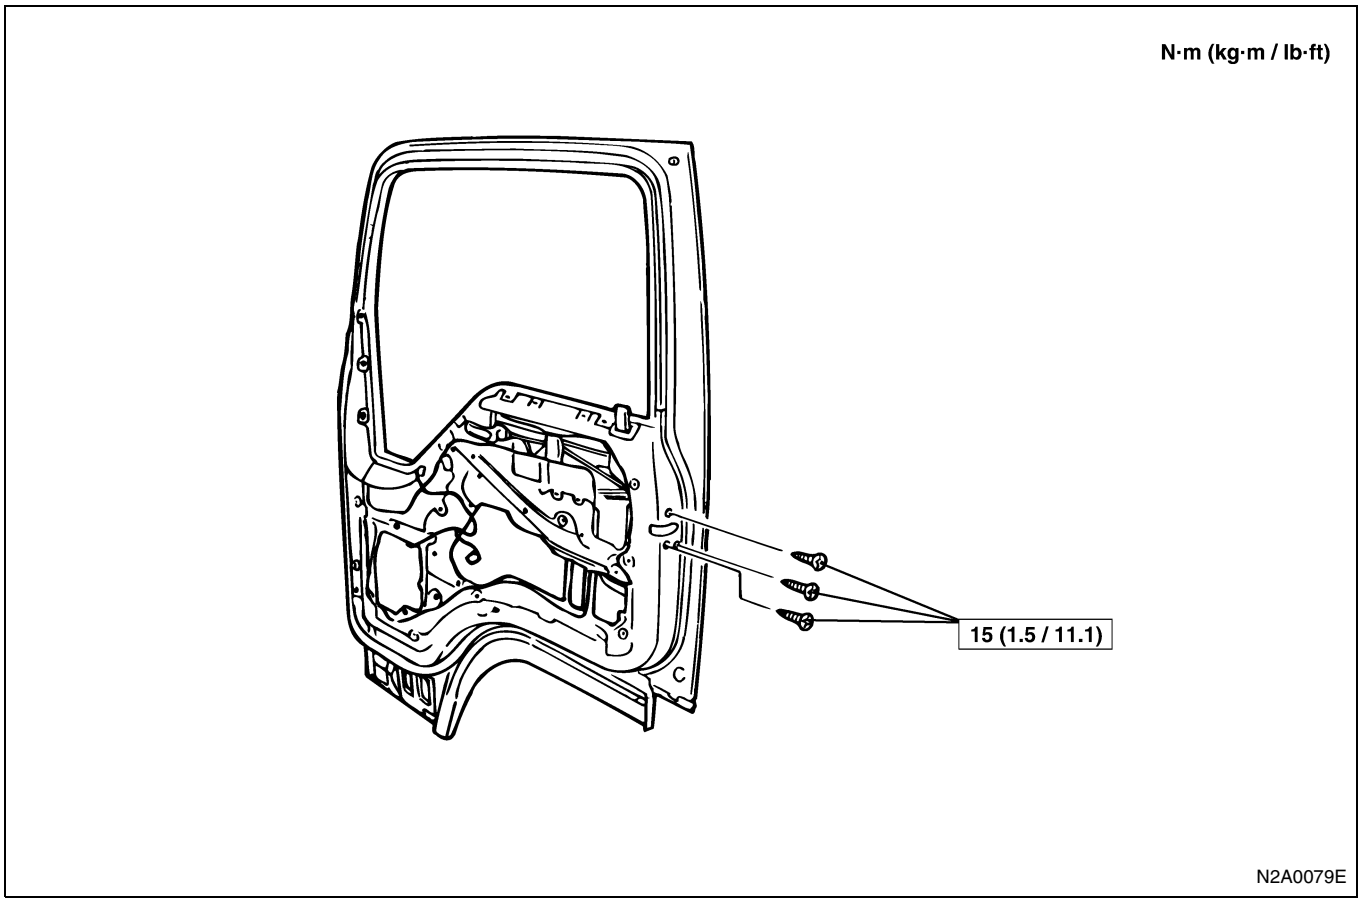
2. After installation, check the operation.



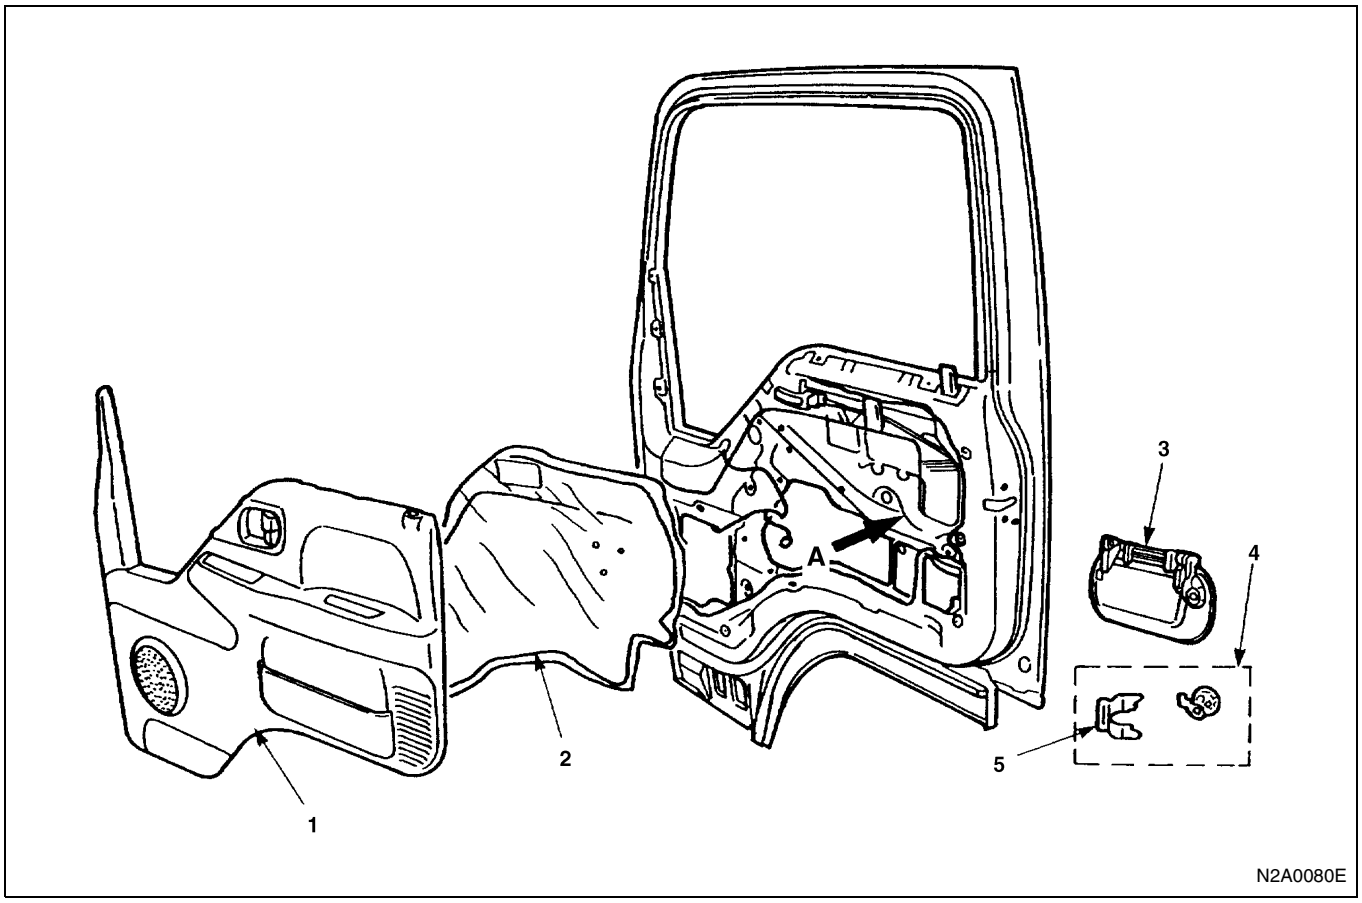
Legend

1. Door inside lock knob
2. Door inside handle
3. Door lock assembly
4. Door lock switch connector
5. Door lock cylinder
6. Door outside handle

Fixing Torque



Door Outside Handle and Door Lock Cylinder

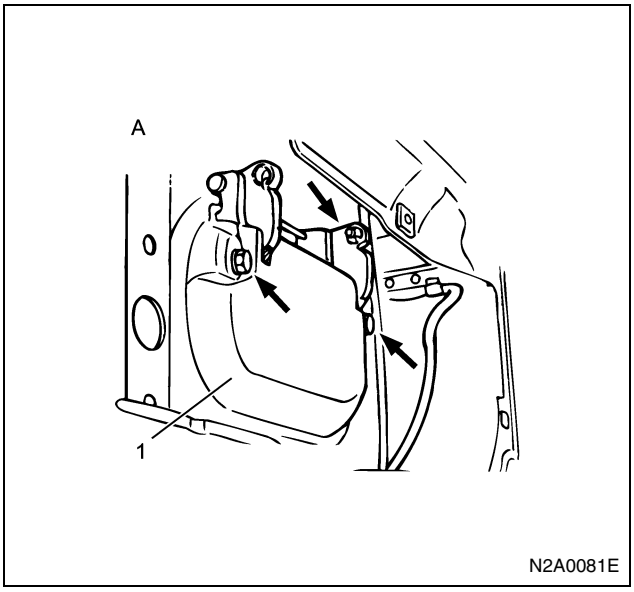


Legend

1. Door trim pad
2. Water-proof sheet
3. Door outside handle
4. Door lock cylinder
5. Clip

Removal

1. Door trim pad
2. Water-proof sheet
   - Refer to “Window regulator” in this Section.
3. Door outside handle (1)
   - Disconnect the link and remove the 2 mounting bolts.



4. Door lock cylinder
   - Disconnect the link and pull out the clip.

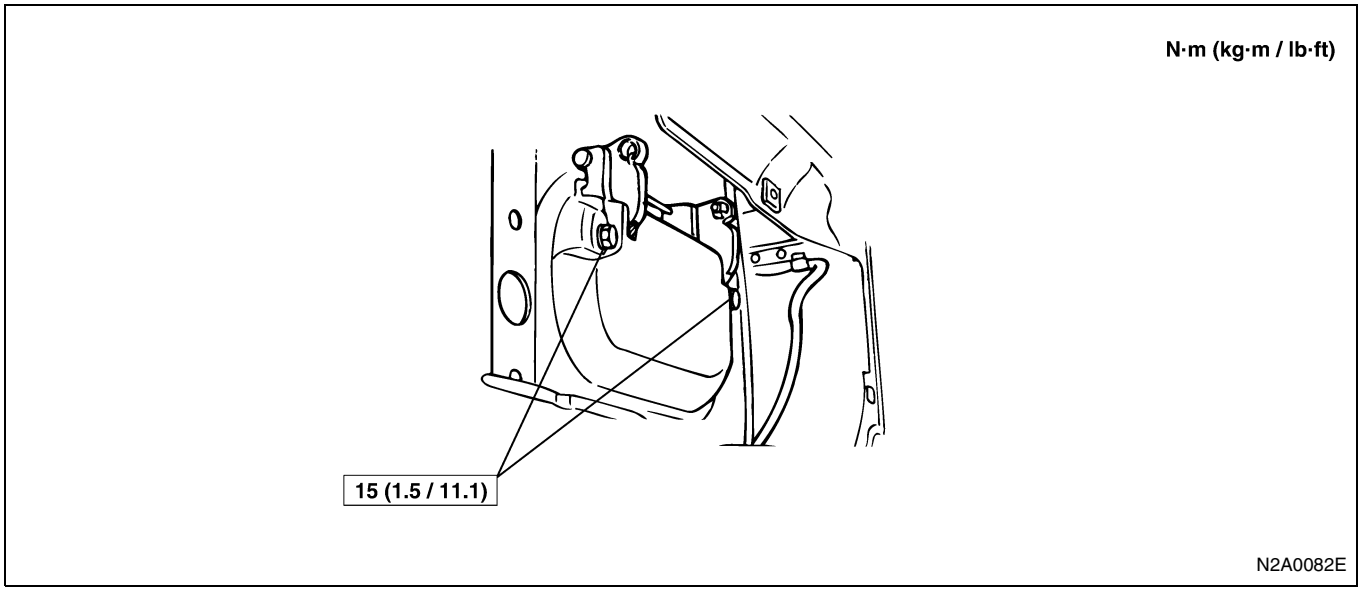
Installation

For installation, reverse the removal procedure taking the following point into consideration.

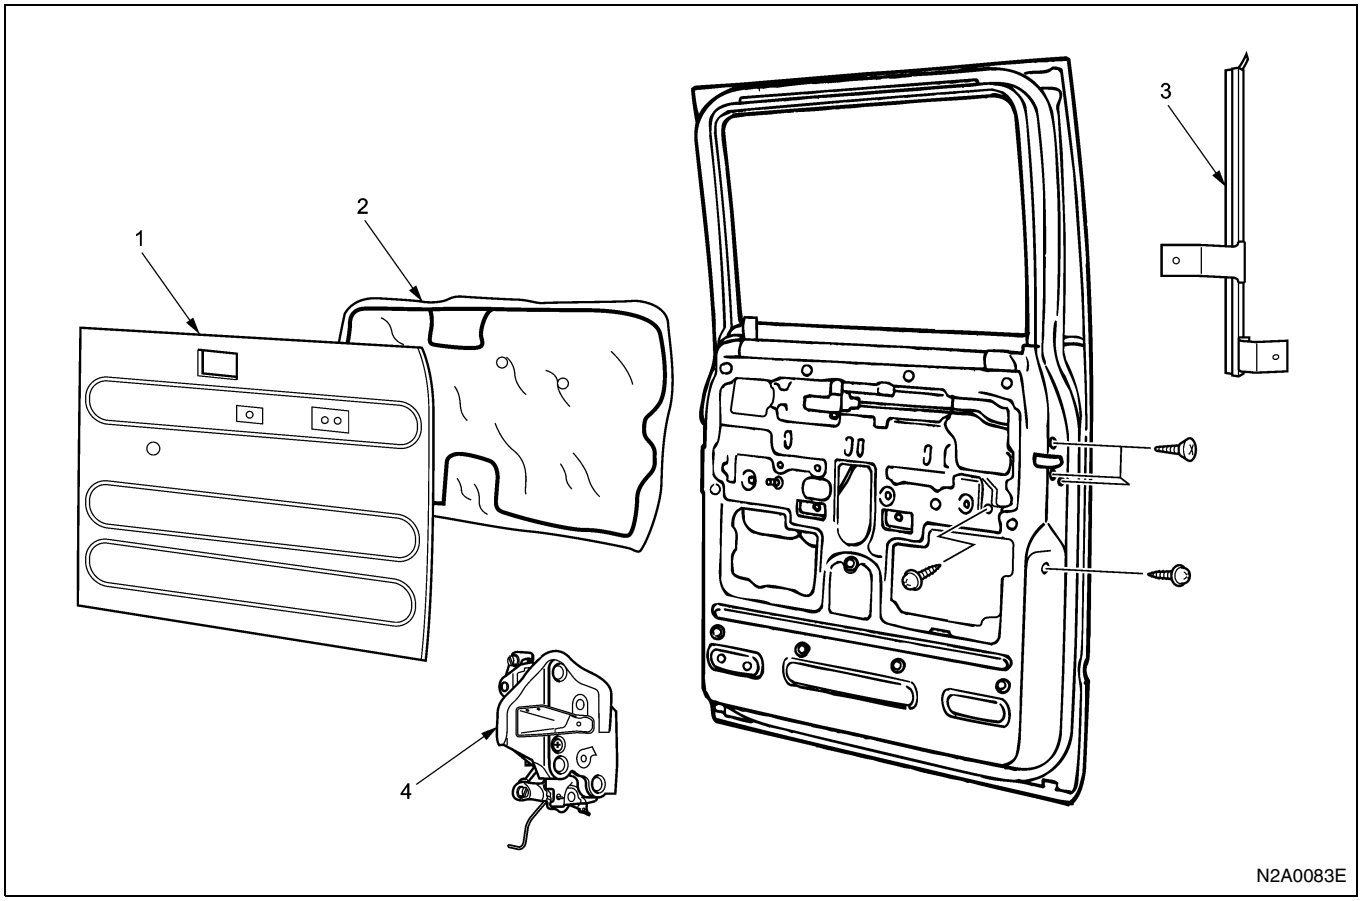
1. Tighten the door outside handle mounting bolts to the specified tightening torque.

Tighten:
15 N·m (1.5 kg·m/11.1 lb·ft)

Fixing Torque



Rear Door Lock Mechanism

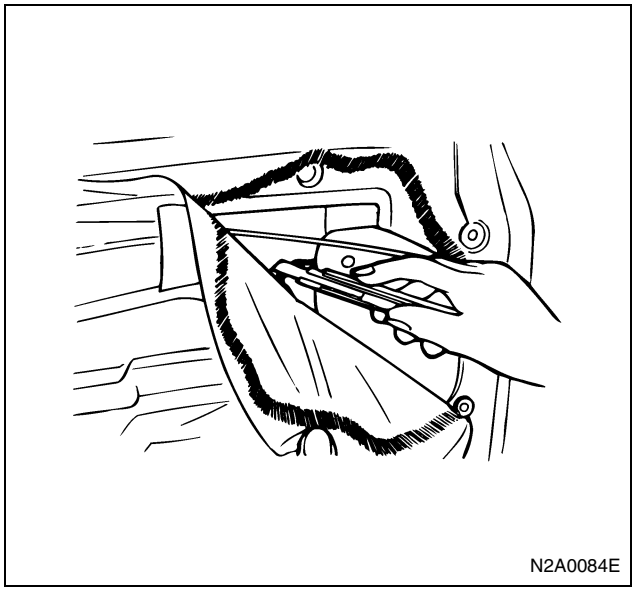


Legend

1. Rear door trim panel
2. Water-proof sheet
3. Glass run rear channel
4. Lock mechanism

Removal

1. Remove the Rear door trim panel.
   - Refer to “Rear door trim panel” in this section.
2. Peel off the water-proof sheet carefully with a cutter or knife. Take care not to damage it when peeling it off and remove the water-proof sheet.



3. Remove the 2 mounting screws and pull the rear channel out and remove the glass run rear channel.
4. Remove the 3 mounting screws and disconnect the locking links and remove the lock mechanism.

Installation

To install, follow the removal steps in the reverse order, noting the following points:

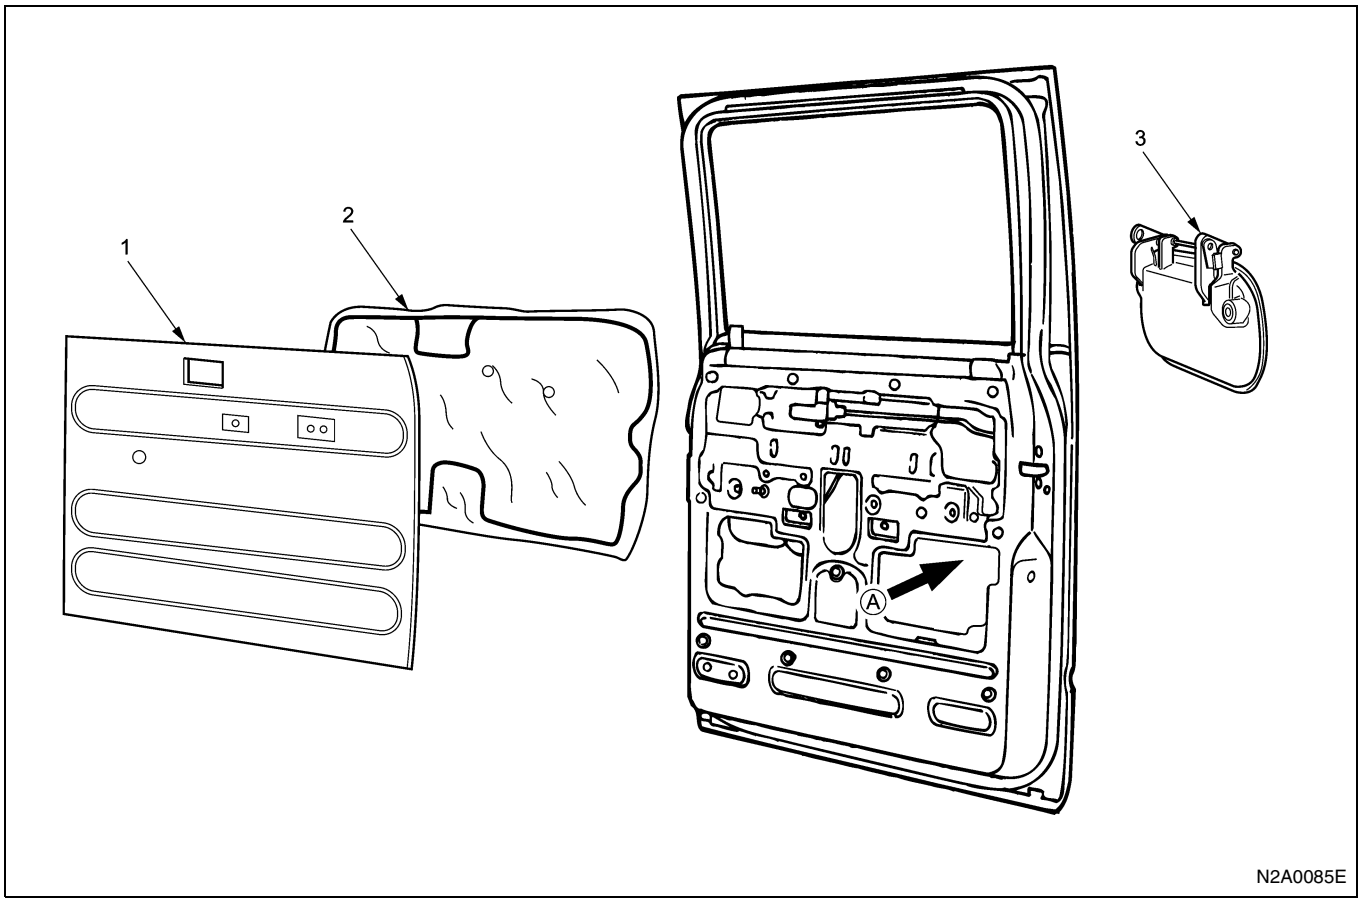
1. Tighten the mounting screw to the specified torque.

Tighten:

- Rear door lock mechanism mounting screws to 6 N·m (61.1 kg·cm/52 lb·in)

2. After installation, check the operation.

Rear Door Outside Door Release Handle

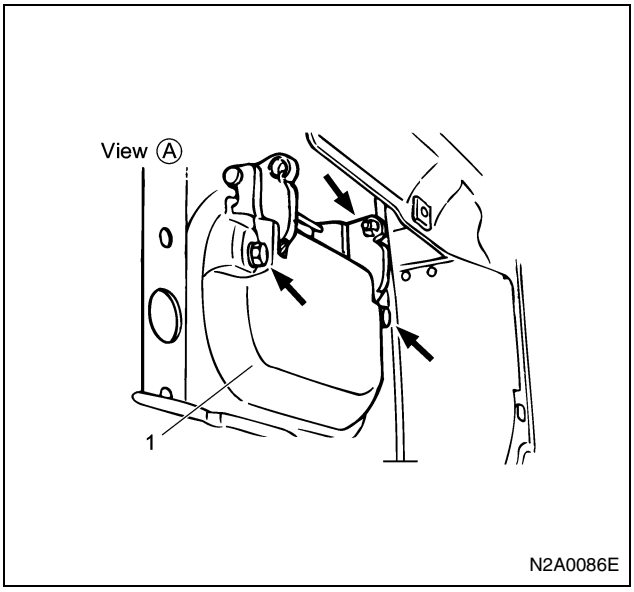


Legend

1. Rear door trim panel
2. Water-proof sheet
3. Outside door release handle

Removal

1. Remove the rear door trim panel.
   - Refer to “Rear door trim panel” in this section.
2. Remove the water-proof sheet.
   - Refer to “Rear door lock mechanism” in this section.
3. Disconnect the link and remove the 2 mounting bolts and remove the Outside door release handle.



Legend

1. Outside door release handle

Installation

To install, follow the removal steps in the reverse order, noting the following point:

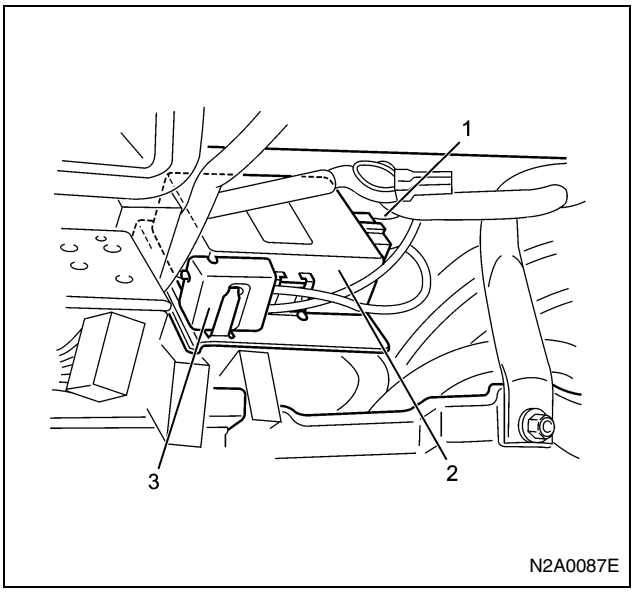
1. Tighten the mounting bolt to the specified torque.

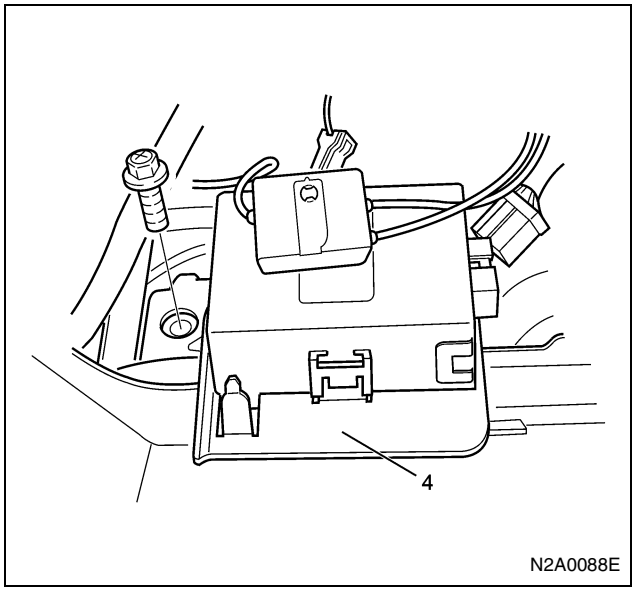
Tighten:

- Outside door release handle mounting bolts to 13 N·m (132.6 kg·cm/113 lb·in) — 18 N·m (1.8 kg·m/13 lb·ft)

Keyless Entry Control Unit

Removal





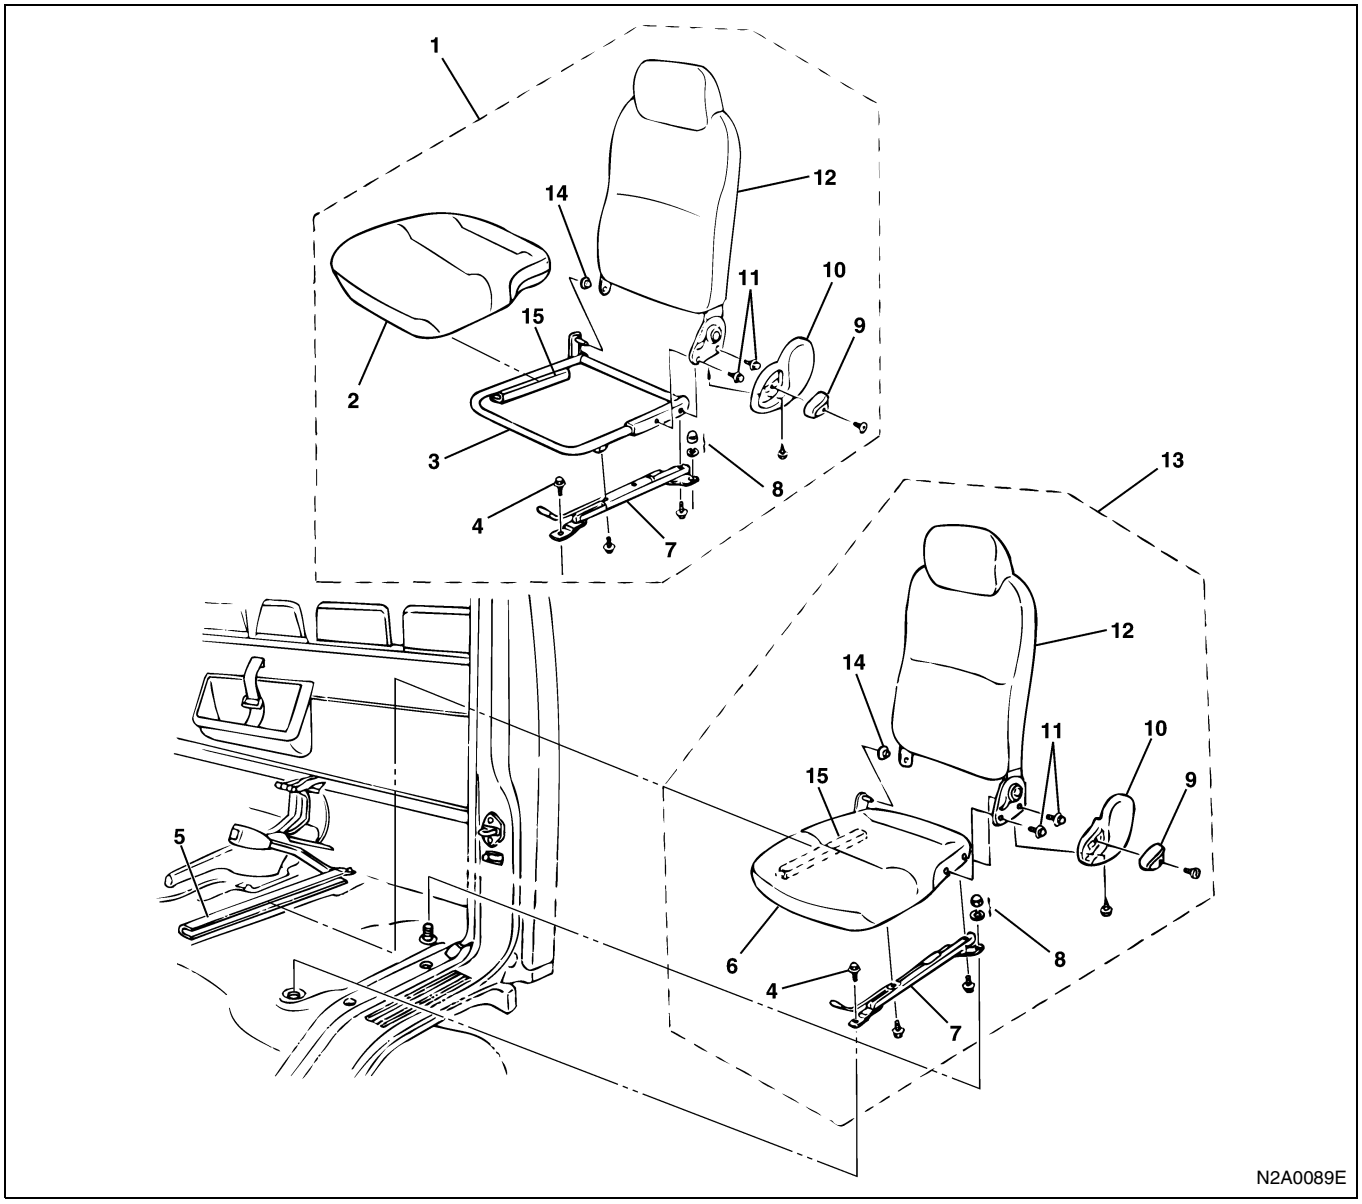
1. Meter cluster
   - Refer to “Meter Assembly” in Meter Section.
2. Tail/stop lamp malfunction warning relay
   - Release the claw to remove it together with bracket.
   - Disconnect the connector (1).
   - Remove the distributor (3) from bracket.
   - Remove the mounting screw and remove the control unit (2) together with bracket (4).
3. Register the ID code.
   - Refer to “Keyless Entry” in Wiring Diagram Section.
4. Check whether the keyless entry system operates properly.

Installation

For installation, reverse the removal procedure taking the following points into consideration.

SEAT

Driver Side (Except LHD Wide Cab Model)



Legend

1. Seat assembly (Non-tilt cab model)
2. Seat cushion assembly (Removable type)
3. Seat cushion frame
4. Seat bolt
5. Seat rail (Cab side)
6. Seat cushion assembly
7. Seat adjuster assembly
8. Cap nut
9. Reclining lever
10. Reclining cover
11. Reclining adjuster assembly mounting bolt
12. Seat back assembly
13. Seat assembly (Tilt-cab model)
14. Bushing
15. Seat rail (Seat frame side)

Removal

1. Cap nut
   - Slide the seat forward and remove the cap nut.
2. Seat bolt
   - Slide the seat backward and remove the seat bolt.
3. Seat assembly
4. Reclining lever
   - Remove the one screw.

5. Reclining cover
   - Remove the one screw.
6. Reclining adjuster assembly
   - Remove the fixing bolt.
7. Seat cushion assembly (Non-tilt cab model only)
8. Seat back assembly
9. Seat adjuster
   - Remove the 2 bolts.

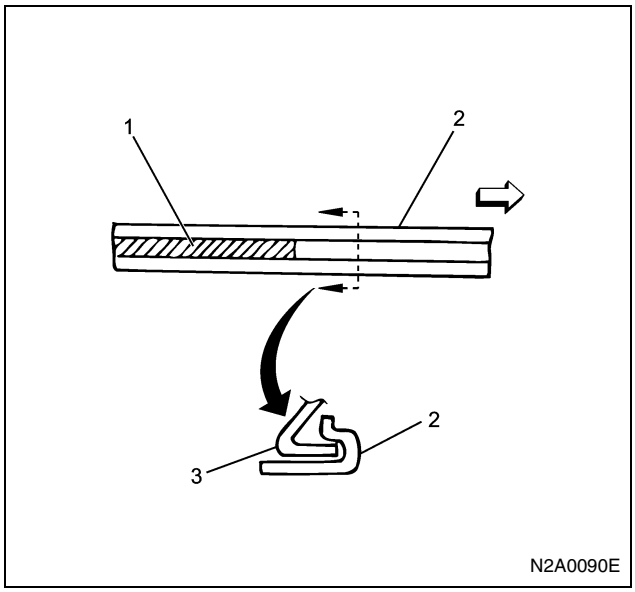
Installation

For installation, reverse the removal procedure taking the following point into consideration.

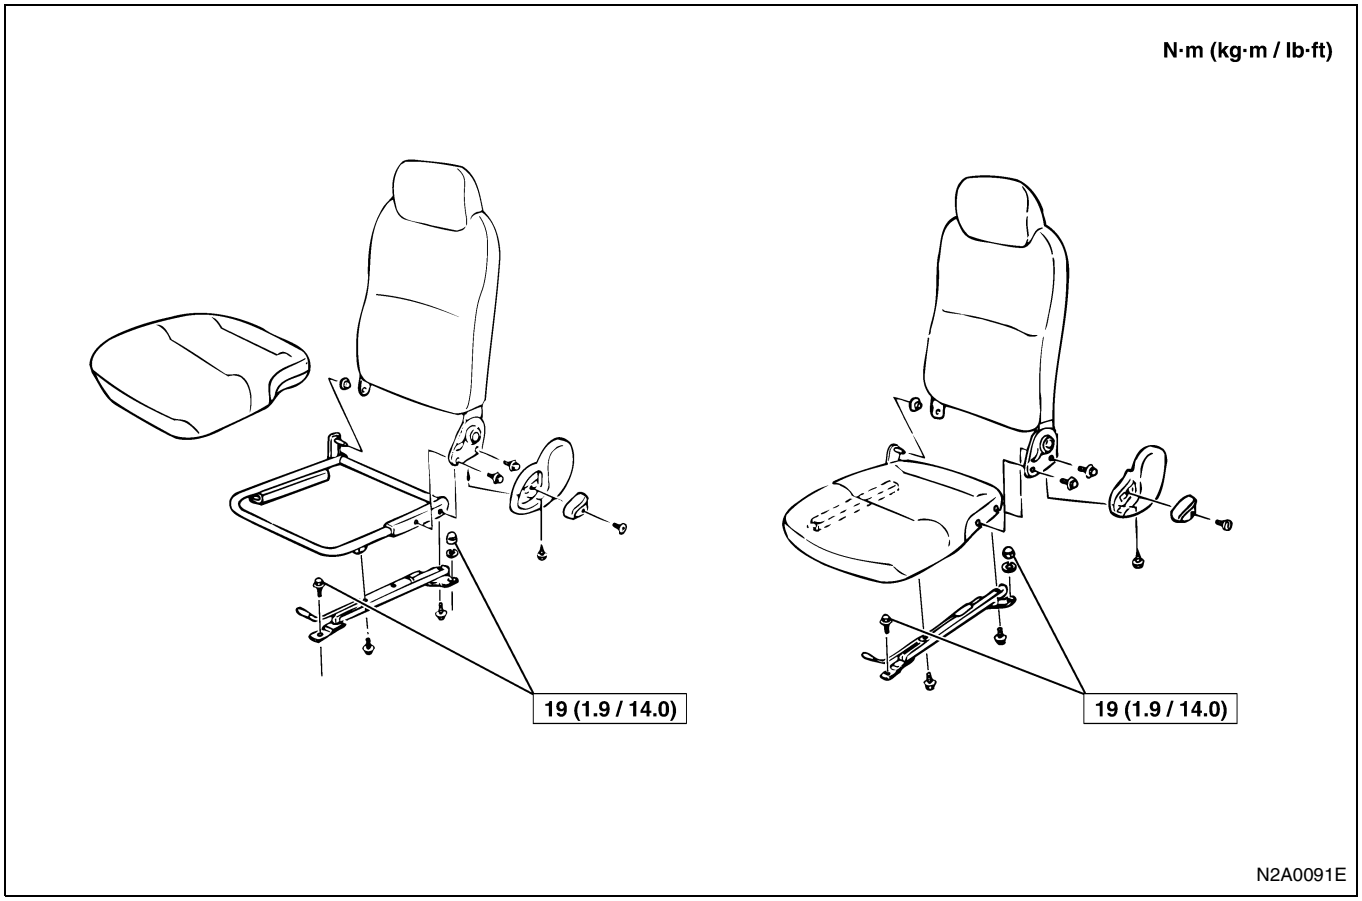
1. Before installing the seat assembly, apply grease (1) to the backward half of the cab-side seat rail (2) and set the claw on the seat frame side (3).
   After that, tighten the cap nut (with lock), plain washer and seat bolt (with Loctite) securely.

Tighten:
19 N·m (1.9 kg·m/14.0 lb·ft)

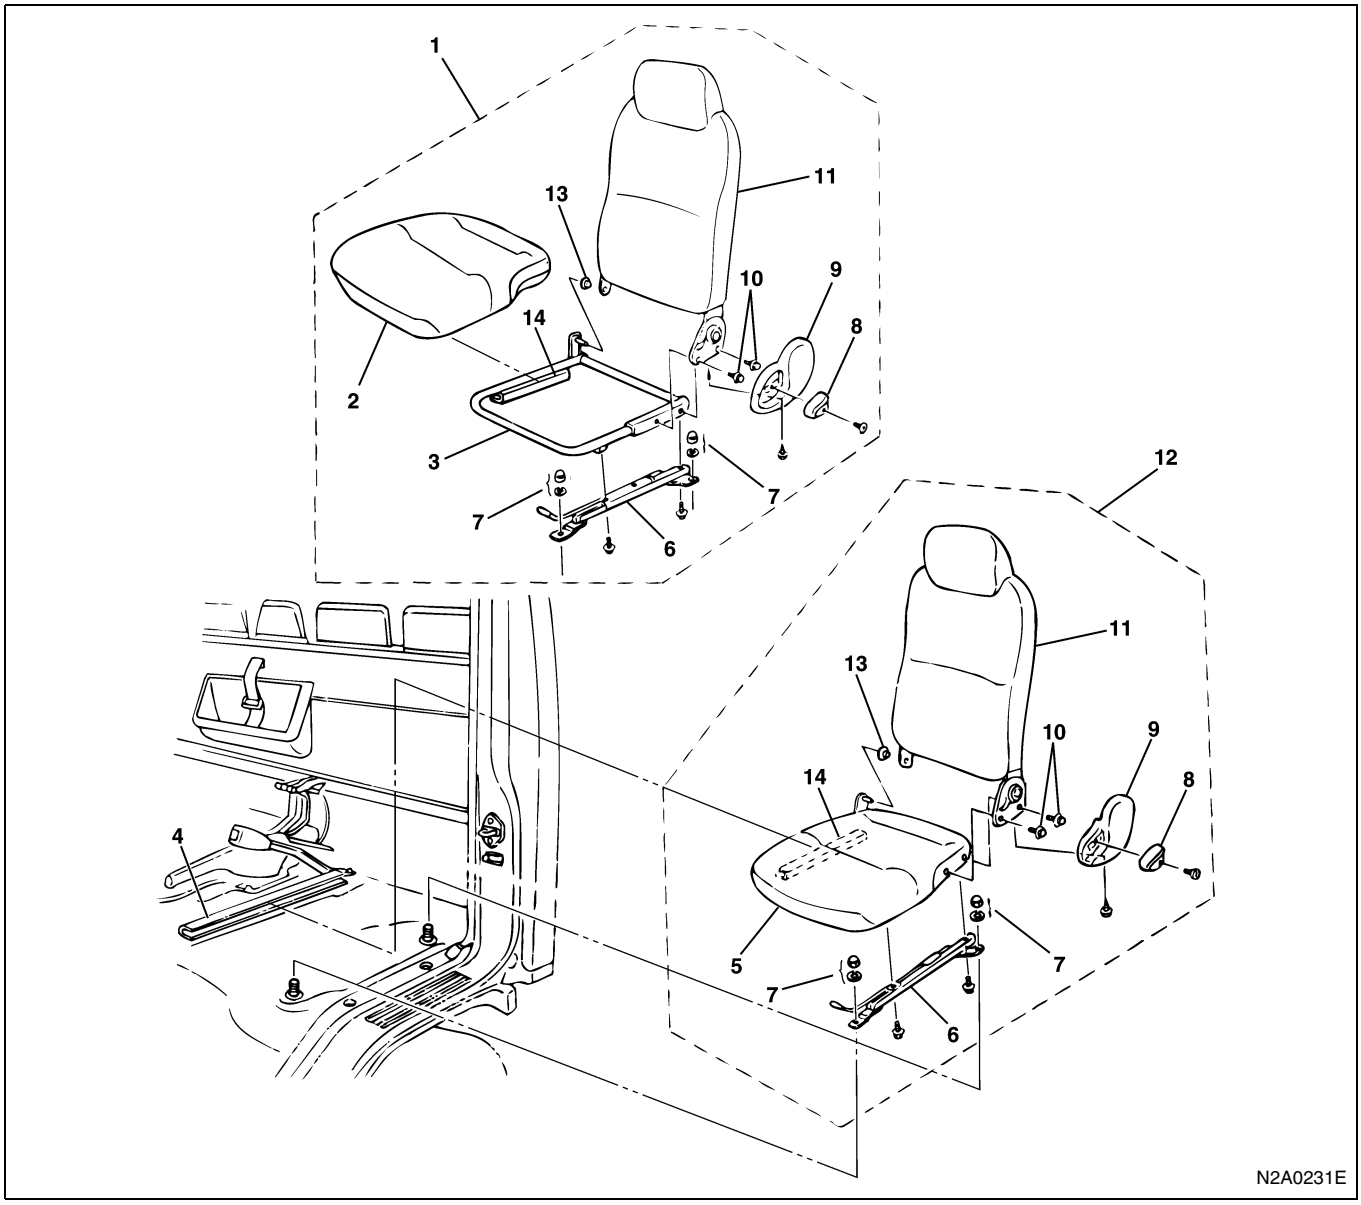
Grease: MITSUBISHI MULTI-PURPOSE No.2 or equivalent



Fixing Torque



Driver Side (LHD Wide Cab Model)



Legend

1. Seat assembly (Non-tilt cab model)
2. Seat cushion assembly (Removable type)
3. Seat cushion frame
4. Seat rail (Cab side)
5. Seat cushion assembly
6. Seat adjuster assembly
7. Cap nut and washer
8. Reclining lever
9. Reclining cover
10. Reclining adjuster assembly mounting bolt
11. Seat back assembly
12. Seat assembly (Tilt-cab model)
13. Bushing
14. Seat rail (Seat frame side)

Removal

1. Cap nut
   - Slide the seat forward and remove the cap nut of the rear side.
   - Slide the seat backward and remove the cap nut of the front side.
2. Seat assembly
3. Reclining lever
   - Remove the one screw.
4. Reclining cover
   - Remove the one screw.
5. Reclining adjuster assembly
   - Remove the fixing bolt.
6. Seat cushion assembly (Non-tilt cab model only)
7. Seat back assembly

8. Seat adjuster
   - Remove the 2 bolts.

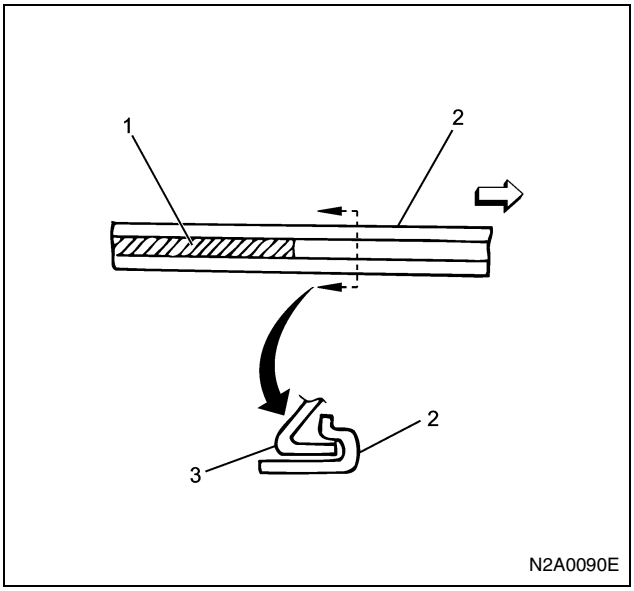
Installation

For installation, reverse the removal procedure taking the following point into consideration.

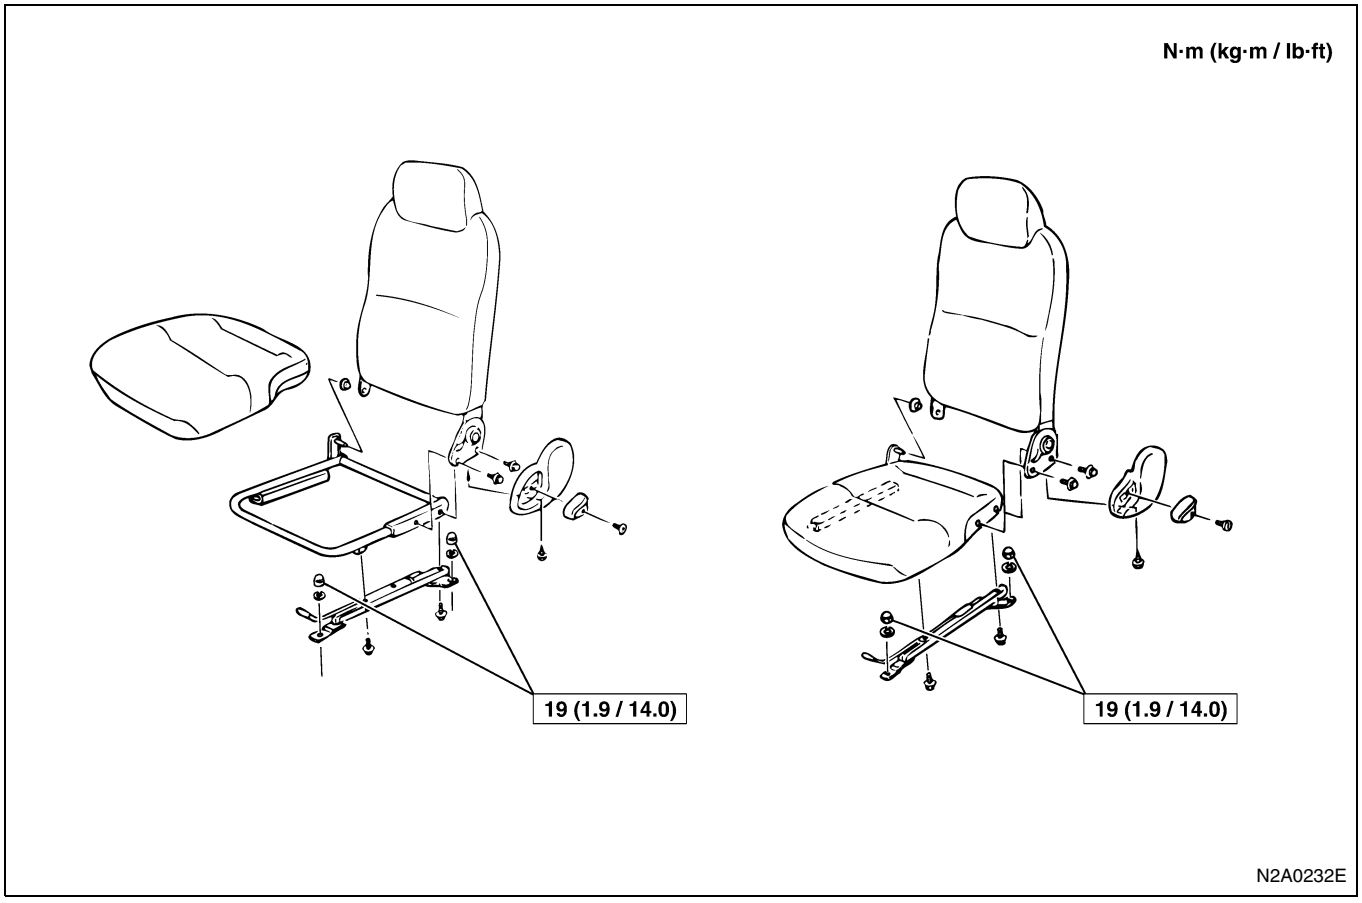
1. Before installing the seat assembly, apply grease (1) to the backward half of the cab-side seat rail (2) and set the claw on the seat frame side (3). After that, tighten the cap nuts (with lock) and plain washers securely.

Tighten:
19 N·m (1.9 kg·m/14.0 lb·ft)

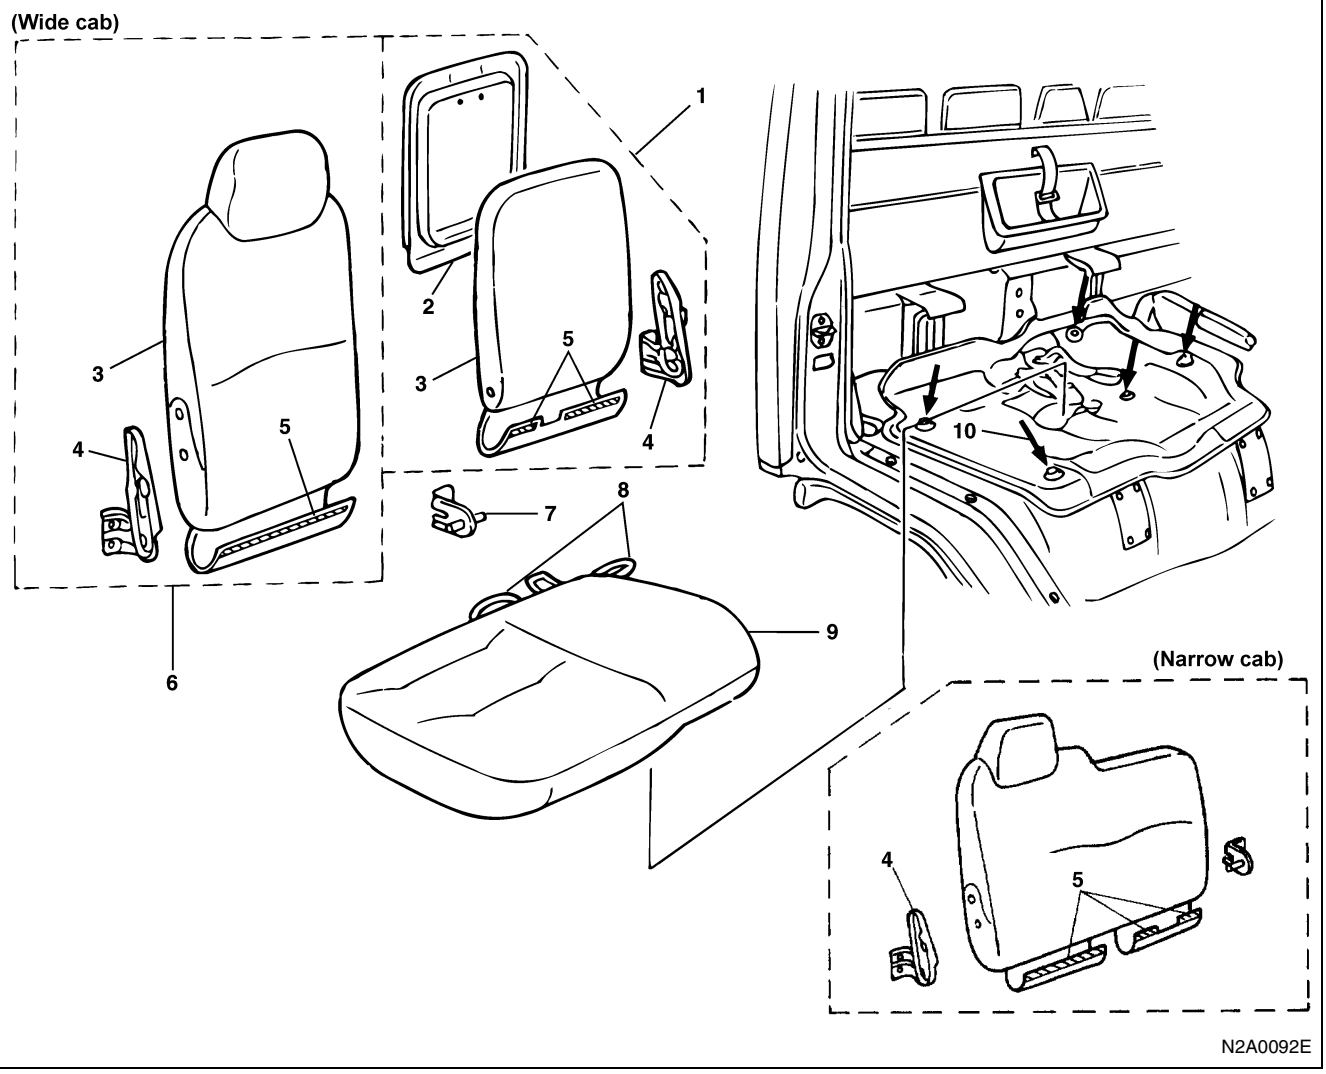
Grease: MITSUBISHI MULTI-PURPOSE No.2 or equivalent



Fixing Torque



Center and Passenger Side



Legend

1. Center seat back assembly (if equipped)
2. Seat back tray
3. Seat back
4. Hinge assembly
5. Magic fastener
6. Passenger seat back assembly
7. Hinge bracket
8. Seat belt band
9. Seat cushion assembly
10. Clip positions (five)

Removal

1. Seat cushion assembly
   - Raise the cushion and remove the clips and peel off the magic fasteners at 5 positions and pull out the seat belt from the band.
2. Center seat back assembly (Wide cab model)
   - Remove the 2 hinge fixing bolts.
   - Remove the 2 fixing bolts and remove the hinge assembly.
   - Remove the fixing screw and remove the seat back tray.
3. Passenger seat back assembly
   - Remove the 2 hinge fixing bolts.
   - Remove the 2 fixing bolts and remove the hinge assembly.
4. Hinge bracket
   - Remove 2 fixing bolts.

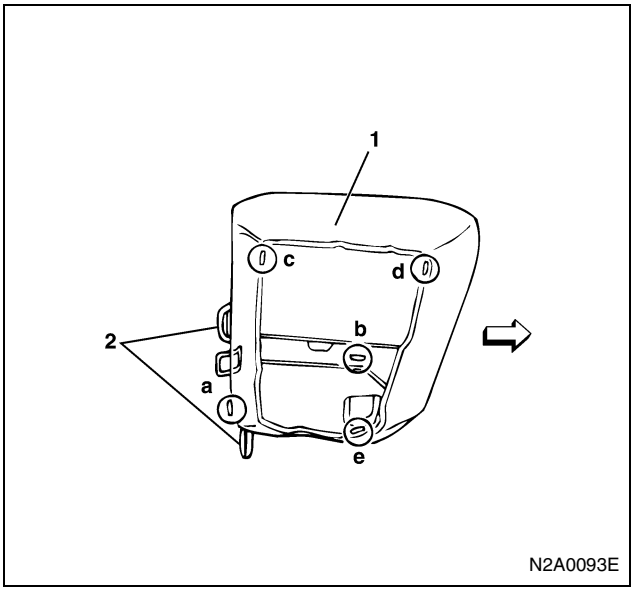
Installation

For installation, reverse the removal procedure taking the following point into consideration.

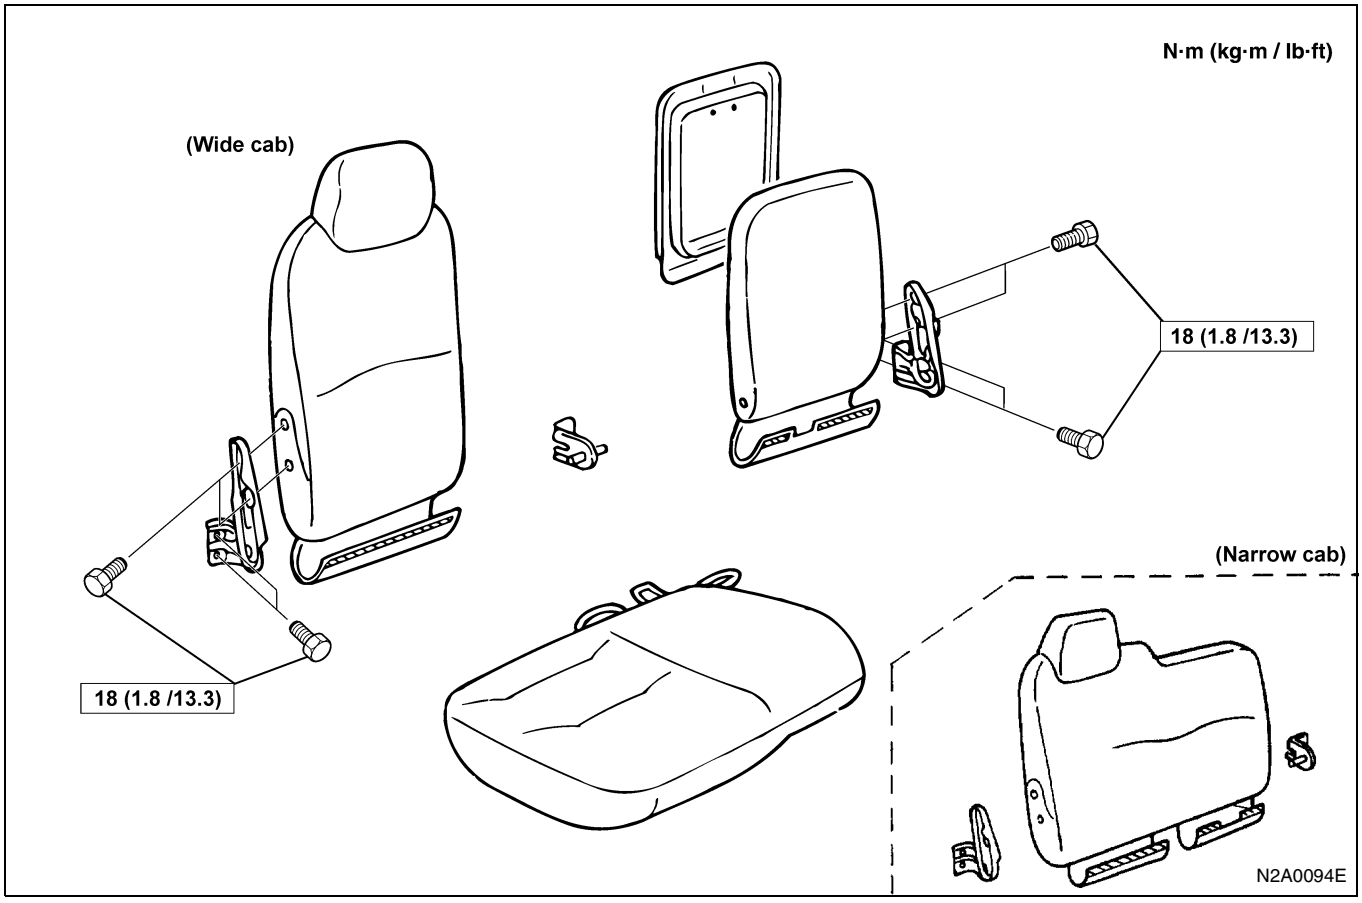
1. Tighten each hinge of the seat back with the specified bolts (with Loctite) securely.

Tighten:
18 N·m (1.8 kg·m/13.3 lb·ft)

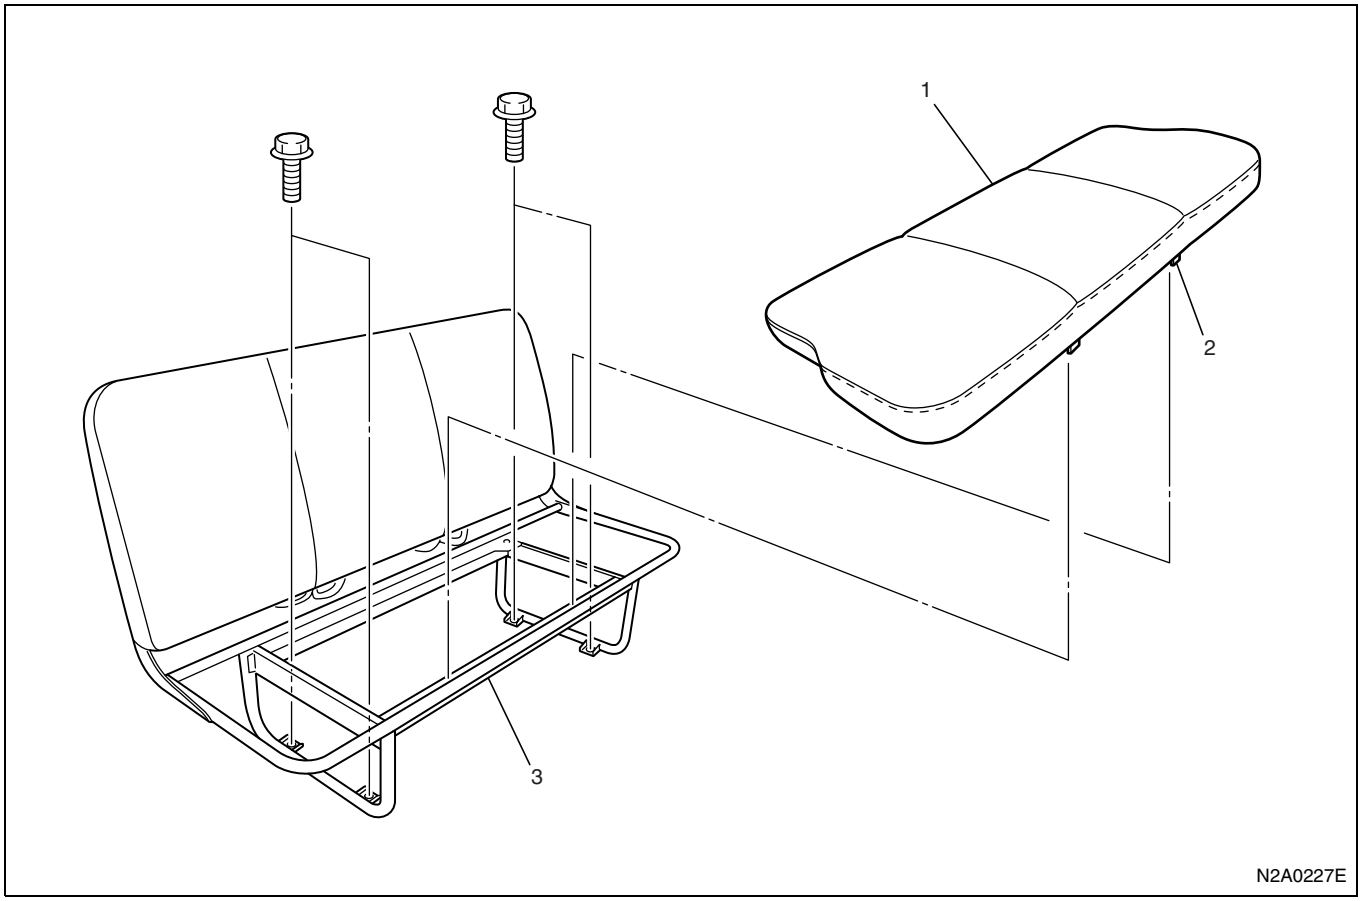
2. Check the direction of seat cushion fixing clip and set its mate clip on the engine cover.
3. Pass the seat belt through the seat cushion band (2).
4. Install the seat cushion (1) in the following order:
   a → b → c → d → e



Fixing Torque



Rear Seat (NKR)



Legend

1. Rear Seat Cushion
2. Clip
3. Rear Seat Frame

Removal

1. Pull the seat cushion at the three clip positions from the seat frame and remove the rear seat cushion.
2. Remove the 4 bolts and remove the rear seat frame.

Installation

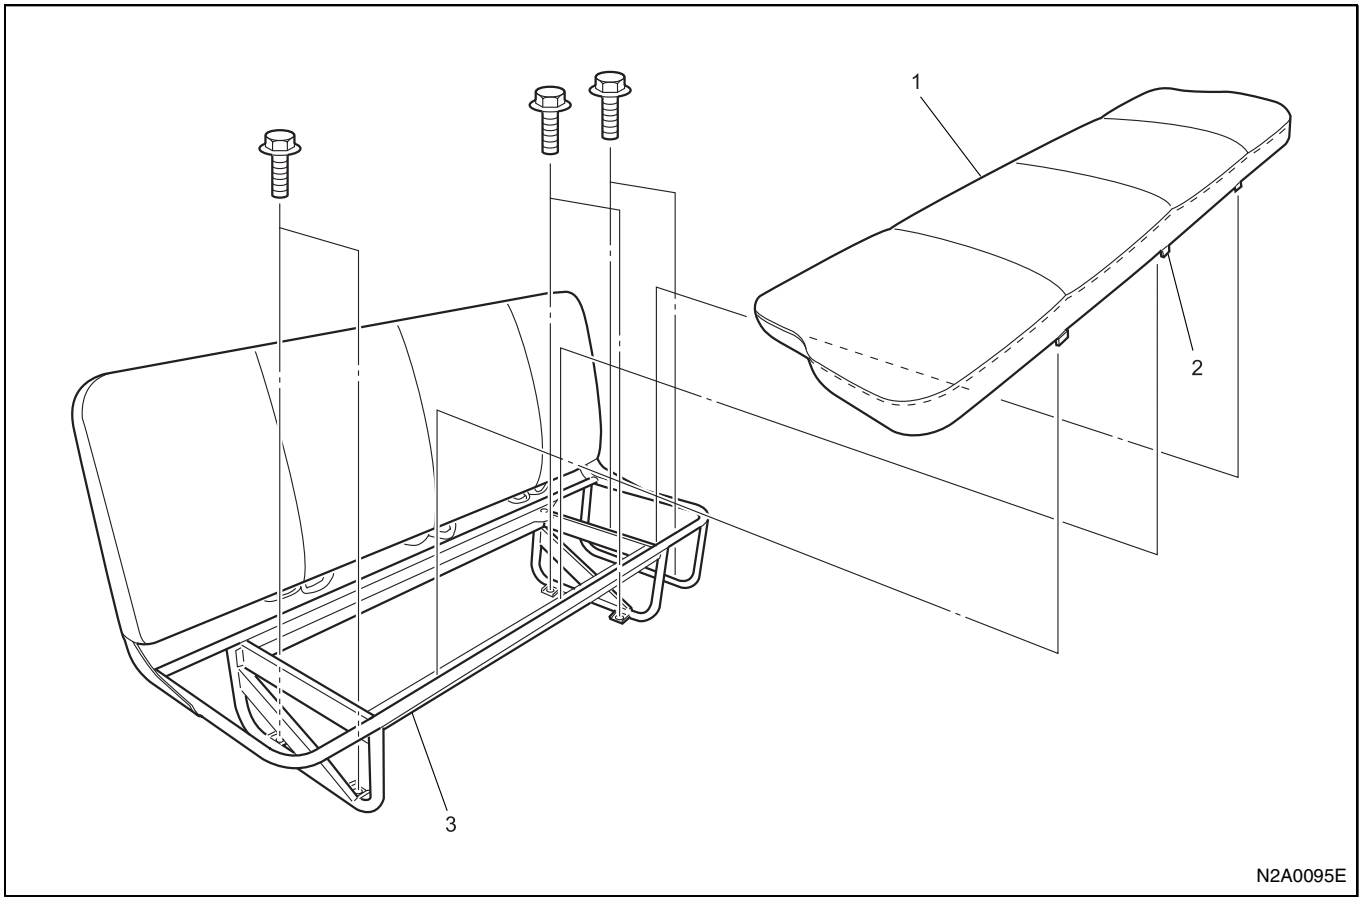
To install, follow removal steps in the reverse order, noting the following point.

1. Tighten the rear seat frame mounting bolts to the specified torque.

Tighten:

Rear seat frame bolts to 13 N·m (1.3 kg·m/9.6 lb·ft)

Rear Seat (NPR, NQR)



Legend

1. Rear Seat Cushion
2. Clip
3. Rear Seat Frame

Removal

1. Pull the seat cushion at the three clip positions from the seat frame and remove the rear seat cushion.
2. Remove the 6 bolts and remove the rear seat frame.

Installation

To install, follow removal steps in the reverse order, noting the following point.

1. Tighten the rear seat frame mounting bolts to the specified torque.

Tighten:

Rear seat frame bolts to 13 N·m (1.3 kg·m/9.6 lb·ft)

Fixing Torque

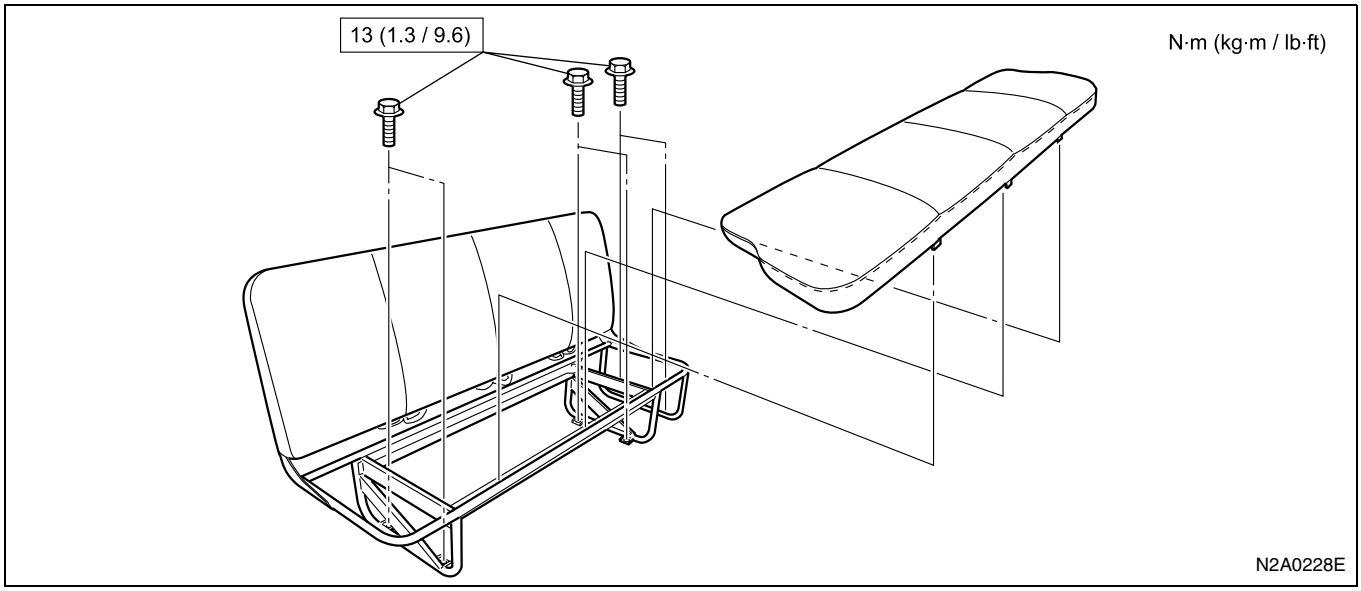
NPR, NQR



INTERIOR TRIM

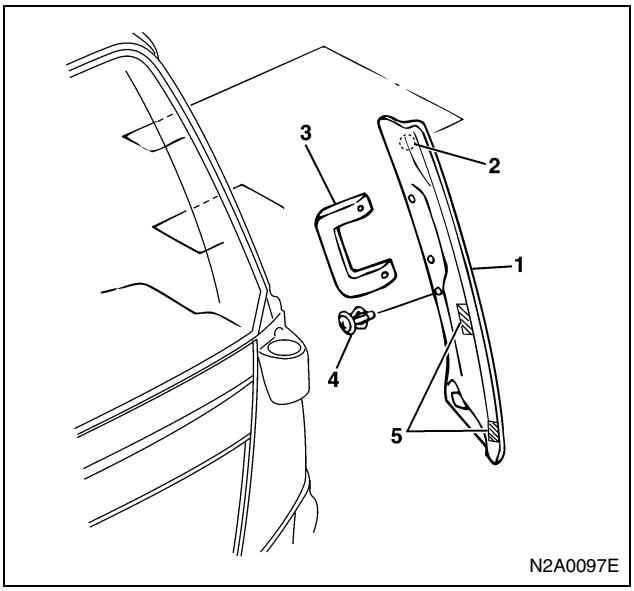
Front Pillar Trim Cover

Removal

1. Front grip (3)
   - Remove the 2 mounting screws.

Caution:
These screws are coated with Loctite. When removing them, take care not to damage their heads.

2. Front pillar trim cover (1)
   - Remove the one clip at the position (2) and peel off the two-sided adhesive tape at the position (5) shown in the figure.
     For the high cab or wide cab, remove the clip (4).

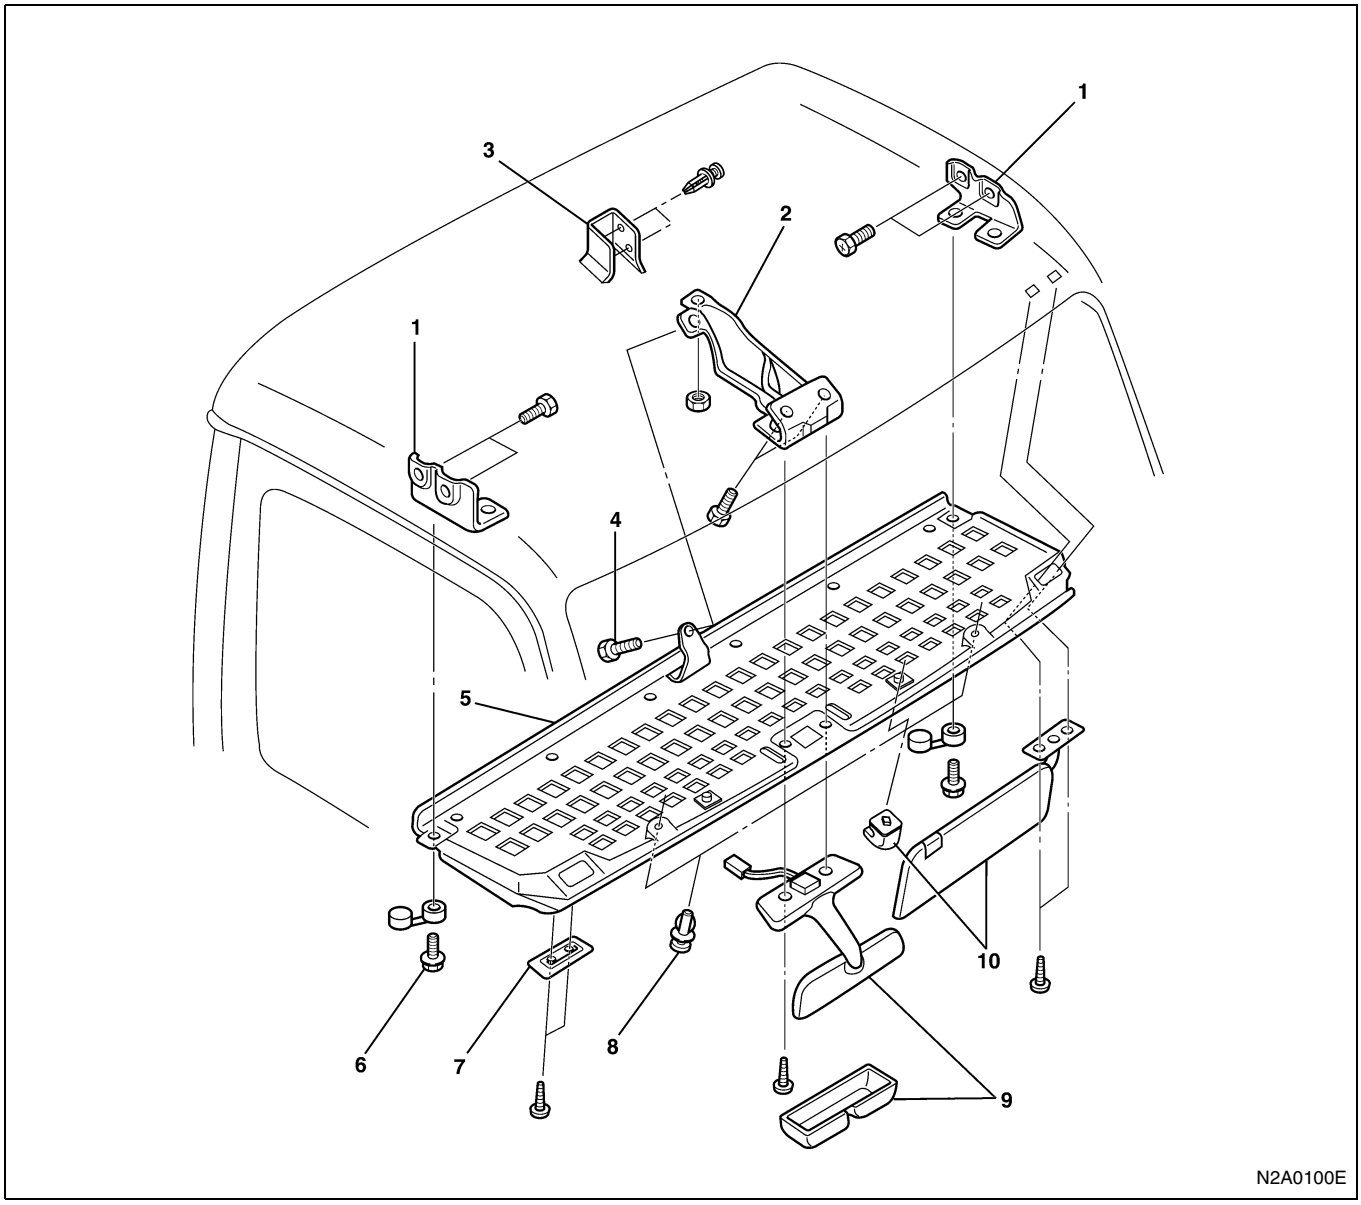


Installation

For installation, reverse the removal procedure taking the following point into consideration.

- Use a new two-sided adhesive tape and stick it securely by press at installation.

Header Shelf



Legend

1. Side bracket
2. Center bracket
3. Bracket cover (without roof ventilation)
4. Screw
5. Header shelf assembly
6. Screw
7. Grommet
8. Clip
9. Room lamp/mirror
10. Sun visor/holder

Removal

1. Battery ground cable
2. Room lamp/mirror
   - Remove the lens and remove 2 mounting screws and connector.
3. Sun visor/grommet
   - Remove the 2 mounting screws. For a custom vehicle, a sun visor is mounted on each of the left and right sides.
4. Mounting screw
   - Slide the left-hand 1 screws and right-hand 1 screws and the roof ventilator cover backward, then pull them out. Remove the one screw in the center of the rear side.
5. Header shelf assembly
6. Center bracket
   - Remove the 2 mounting screws and 1 nut. (With roof ventilation)
   - Remove the 2 clips. (Without roof ventilation)
7. Side bracket

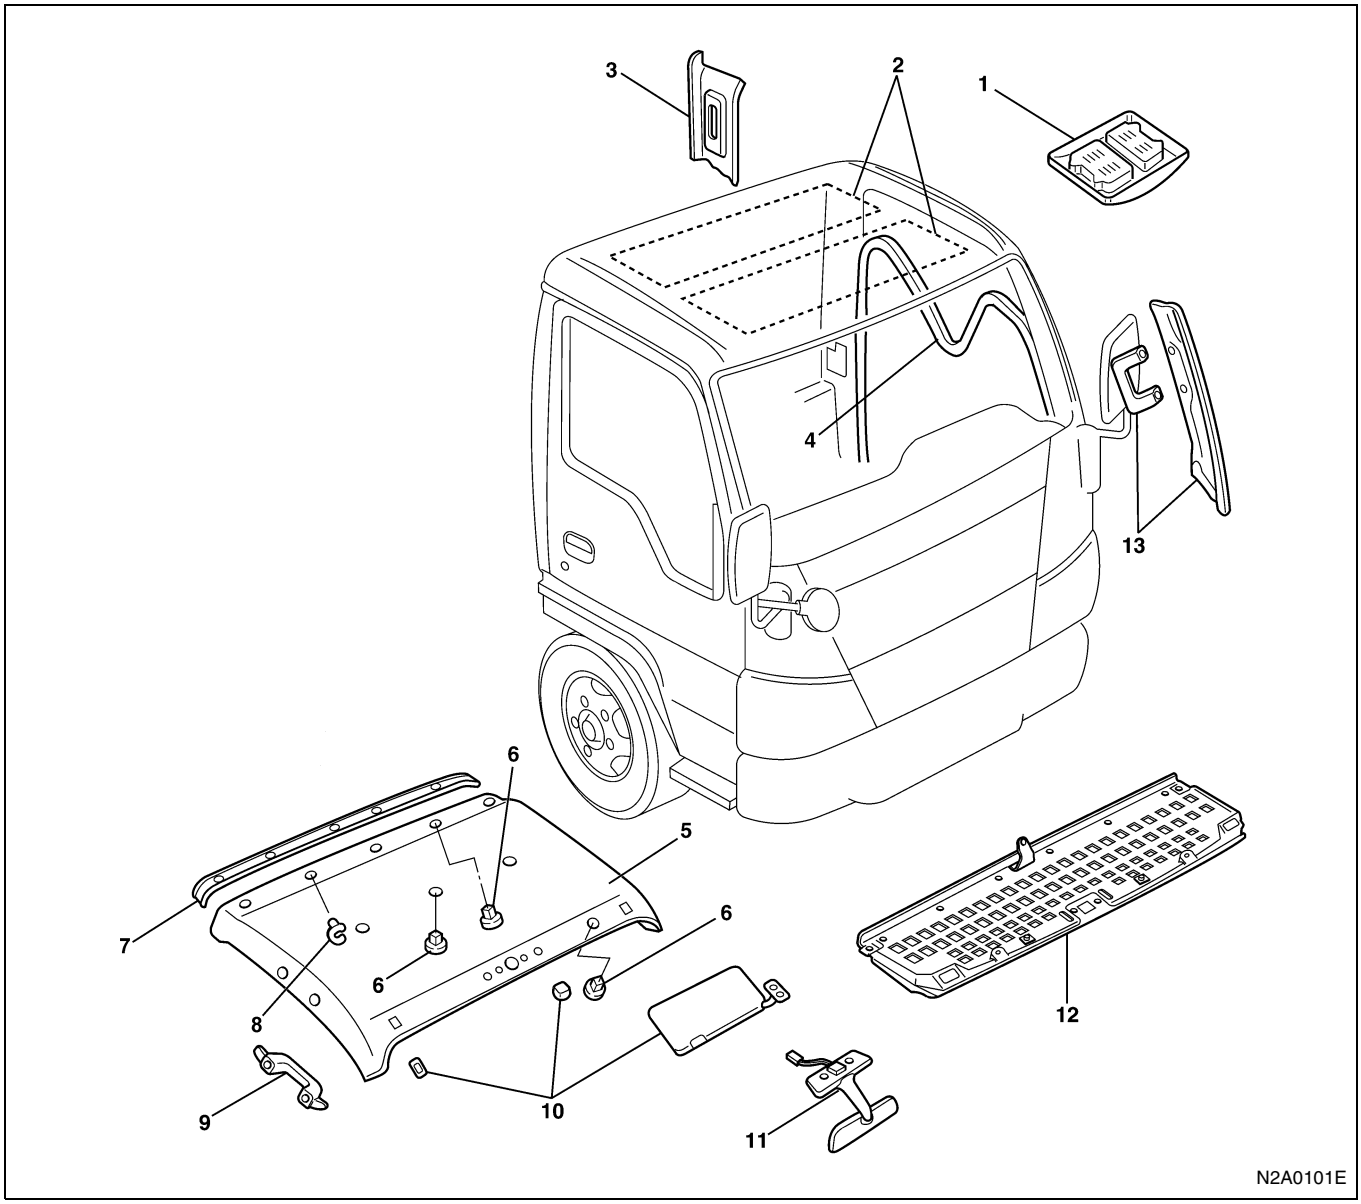
- Remove the 2 mounting screws each.

Installation

For installation, reverse the removal procedure.

Head Lining (Single Cab Model)

Component



Legend

1. Roof ventilator grille (High cab, wide cab; Option equipment)
2. Insulator
3. Rear pillar upper trim cover (Option equipment)
4. Body side finisher (Option equipment)
5. Head lining (Option equipment)
6. Clip
7. Rear retainer/clip (High cab, wide cab option equipment)
8. Coat hanger
9. Assist grip
10. Sun visor/holder/grommet (Standard cab)
11. Room lamp/mirror (Standard cab)
12. Header shelf (High cab, wide cab except limited model)
13. Front grip/front pillar trim cover

Removal

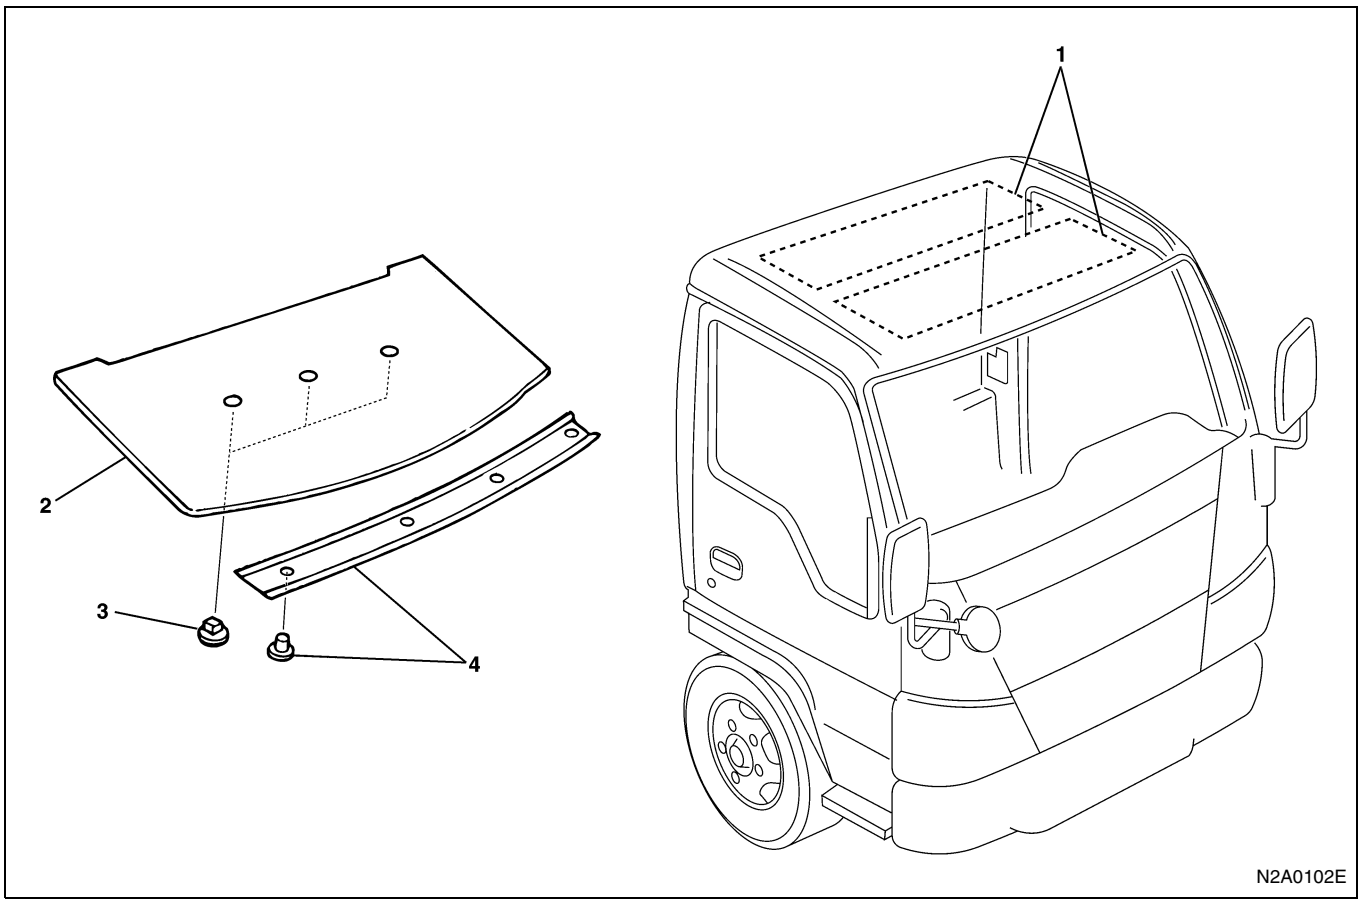
1. Disconnect the battery ground cable.
2. Sun visor/holder/grommet (Standard cab)
   - Remove the 2 mounting screws to remove the sun visor.
   - Pull the sun visor holder while rotating it 45°.
   - Pry the sun visor grommet with a bladed screwdriver.
3. Room lamp/mirror (Standard cab)
   - Pry the room lamp lens with a bladed screwdriver, and remove the 2 mounting screws of room mirror to disconnect the connector.
4. Header shelf (High cab, wide cab except limited model)
   - Refer to “Header Shelf” in this Section.
5. Assist grip
   - Open the covers at 2 positions and remove the mounting screws.
6. Coat hanger
   - Turn it 45° for removal.
7. Fluorescent (Option equipment)
   - Refer to “Fluorescent Working with Room Lamp” in Repair Manual for electrical equipment.
8. Roof ventilator grille (High cab/wide cap; option equipment)
   - Refer to “Roof Ventilator” in this Section.
9. Front grip/front pillar trim cover
   - Refer to “Front Pillar Trim Cover” in this Section.
10. Rear upper trim cover
    - Refer to “Rear Side Trim Cover” in this Section.
11. Clip
    - Standard cab; Top: 3 positions, Rear: 2 positions
    - High cab, wide cab; Top: 3 positions, Front: 4 positions (High cab), 5 positions (Wide cab), Rear 3 positions
12. Rear retainer/clip (High cab, wide cab)
    - Remove the clip to remove the retainer.
13. Body side finisher (upper)
    - Pull only the upper side from panel flange.
14. Head lining
15. Insulator

Installation

For installation, reverse the removal procedure.

Head Lining (B Pack Model)

Component



Legend

1. Insulator
2. Head lining
3. Clip
4. Retainer/clip

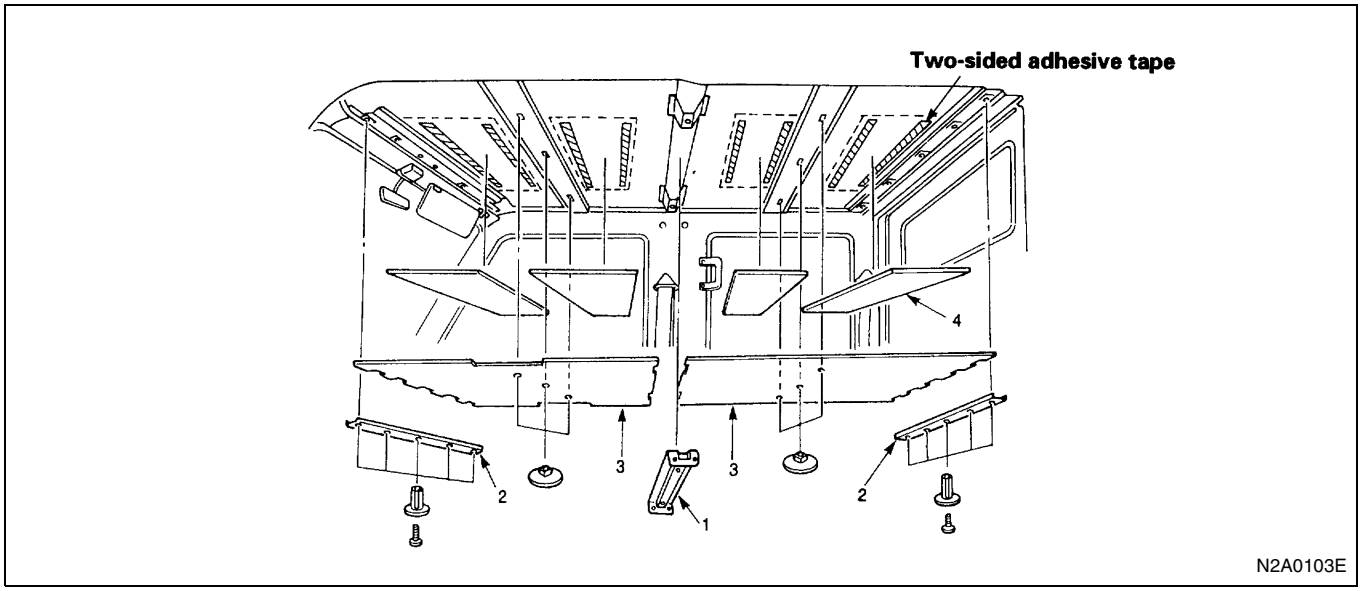
Removal

1. Retainer/clip
   - Remove the clip to remove the retainer.
2. Clip
3. Head lining
4. Insulator

Installation

For installation, reverse the removal procedure.

Head Lining (Crew Cab Model)



Legend

1. Roof reinforcement
2. Retainer
3. Head lining
4. Insulator

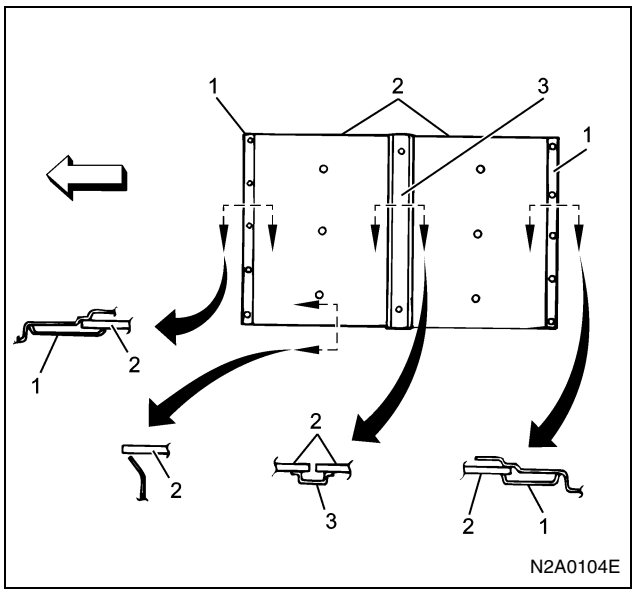
Removal

1. Roof reinforcement
   - Remove the 3 left fixing bolts and 3 right fixing bolts.
2. Retainer
   - Remove the 5 front clips and 5 back clips.
3. Head lining
   - Remove the 5 front clips and 5 back clips.
4. Insulator

Installation

For installation, reverse the removal procedure.

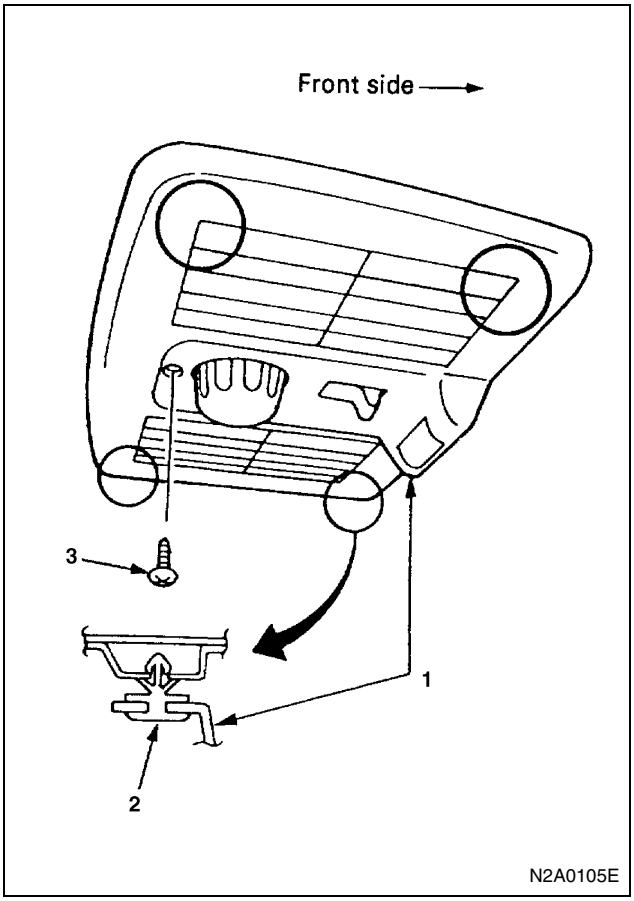
1. When installing the insulator, be sure to use a new two-sided adhesive tape.
2. Install the head lining (2) by nipping it with the front and back retainers (1) and the central reinforcement (3).



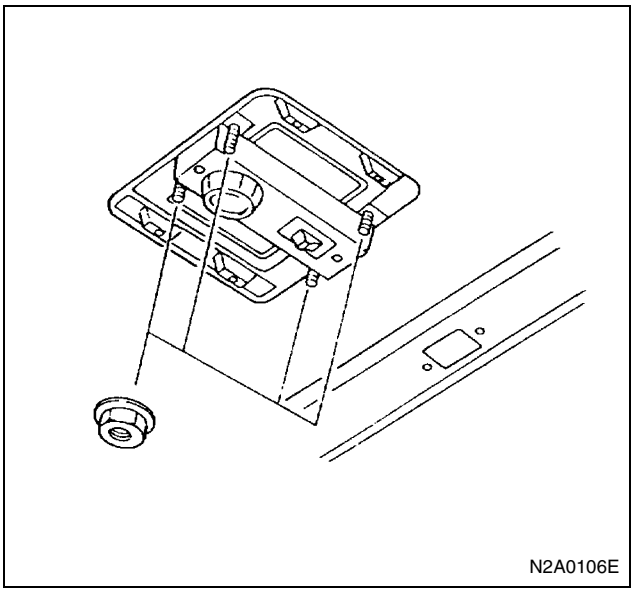
Roof Ventilator

Removal

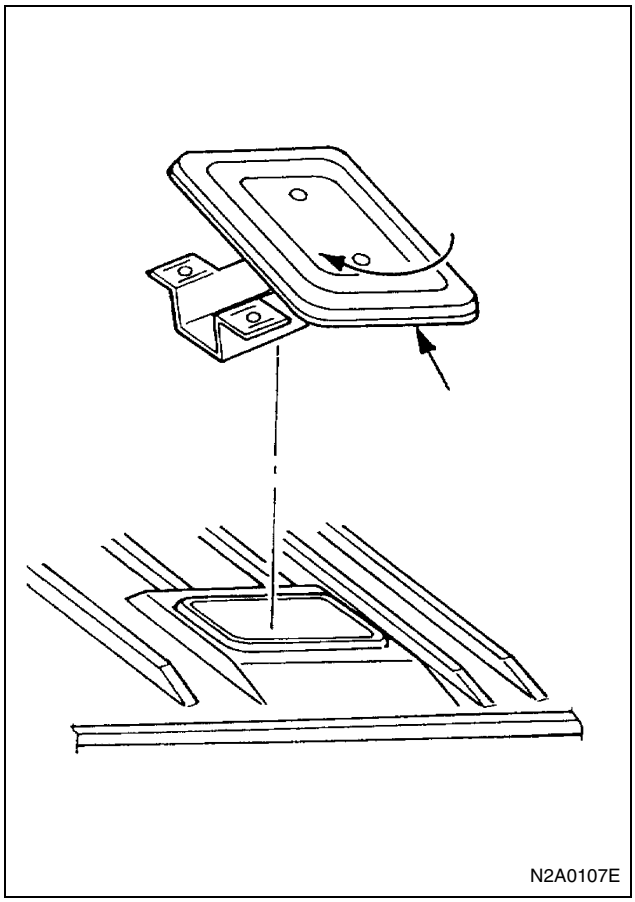
1. Roof ventilator grille (1)
   - Remove the one mounting screw (3) and pull out the clips (2) at 4 positions.



2. Roof ventilator mounting nut
   - Remove the nuts at 4 positions.



3. Roof ventilator assembly
   - Align the main unit with the inlet side and remove it from the stud. Turn it 90° and pull it out.



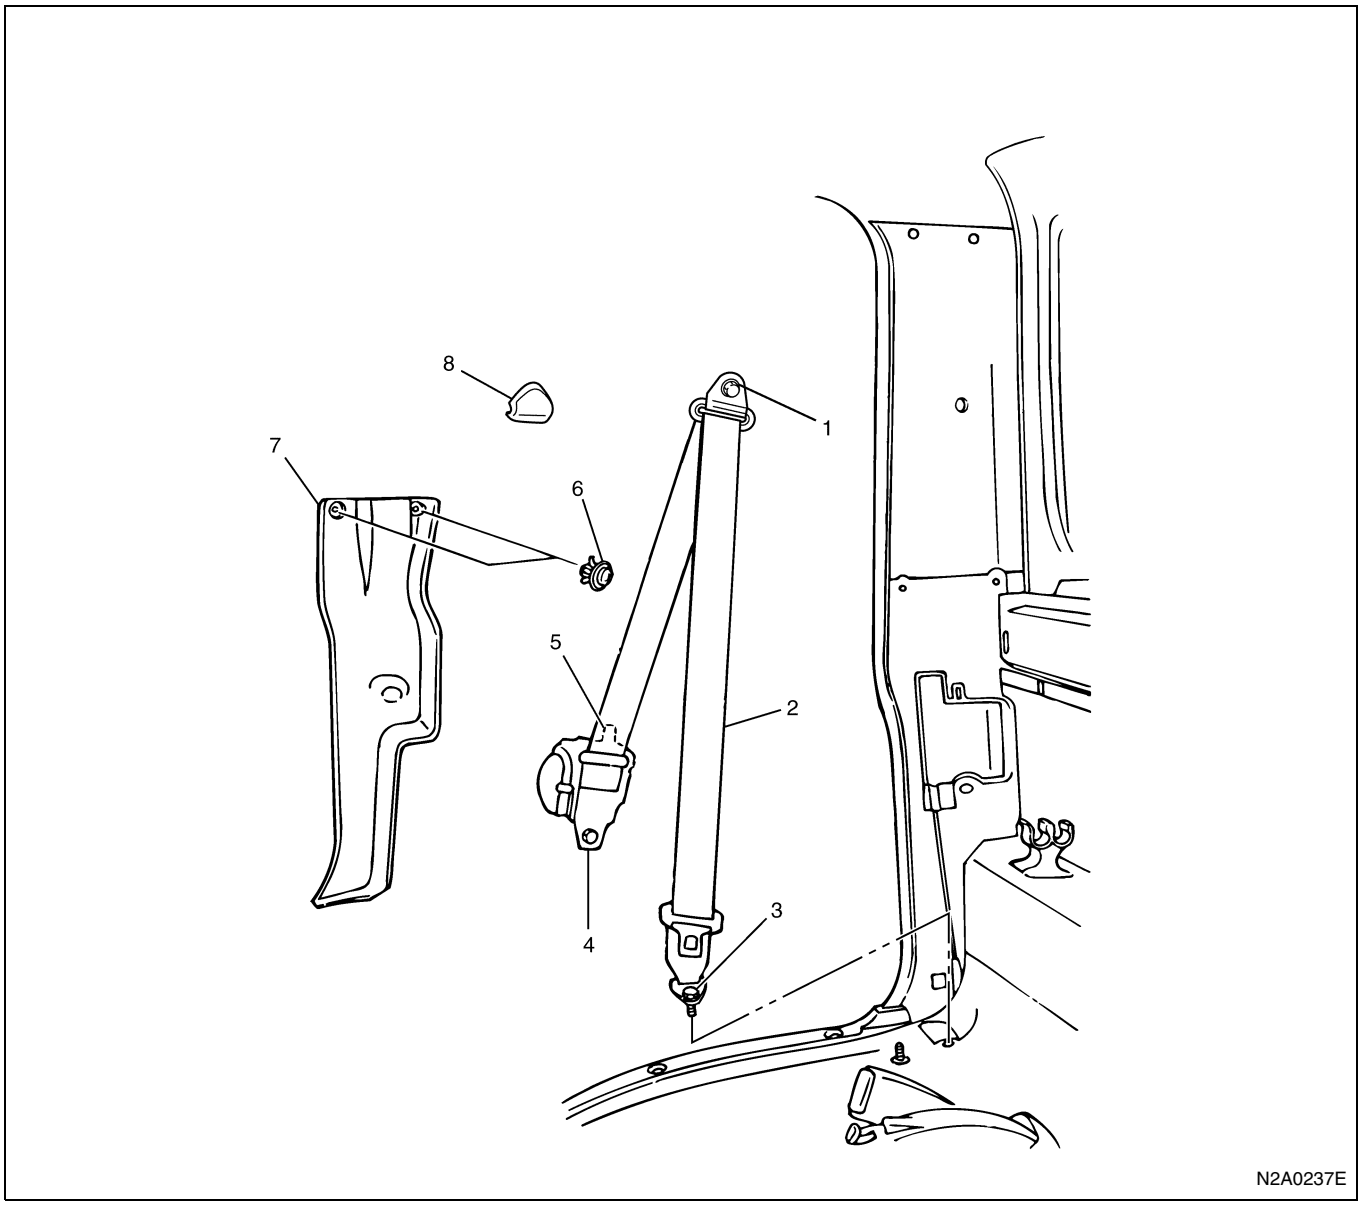
Installation

For installation, reverse the removal procedure.

SEAT BELT

Tongue Side Seat Belt (Single Cab Model)

Component



Legend

1. Seat belt upper anchor bolt
2. Tongue side seat belt assembly
3. Seat belt lower anchor bolt
4. Retractor bolt
5. Bracket
6. Clip
7. Rear piller lower trim cover
8. Through anchor cover

Removal

1. Seat belt lower anchor bolt
2. Rear pillar lower trim cover
3. Through anchor cover
4. Seat belt upper anchor bolt
5. Retractor fixing bolt
   - Remove the bolt and pull out the upper bracket of the retractor from the panel.

Installation

For installation, reverse the removal procedure taking the following points into consideration.

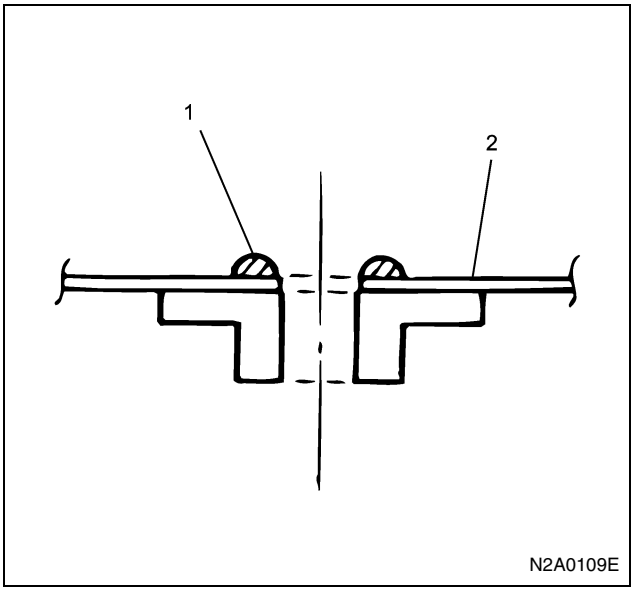
1. Tighten the seat belt upper anchor bolt to the specified torque.

Tighten:

Anchor bolt to 44 N·m (4.5 kg·m/32.5 lb·ft)

2. Apply the sealant (1) around the seat belt lower anchor bolt mounting hole on the floor part (2).

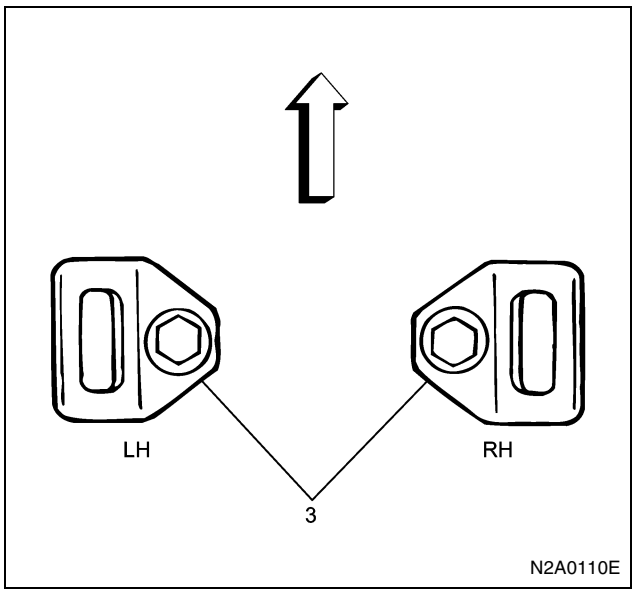
Sealant: TOKIWA CHEMICAL INDUSTRY 770GA or equivalent



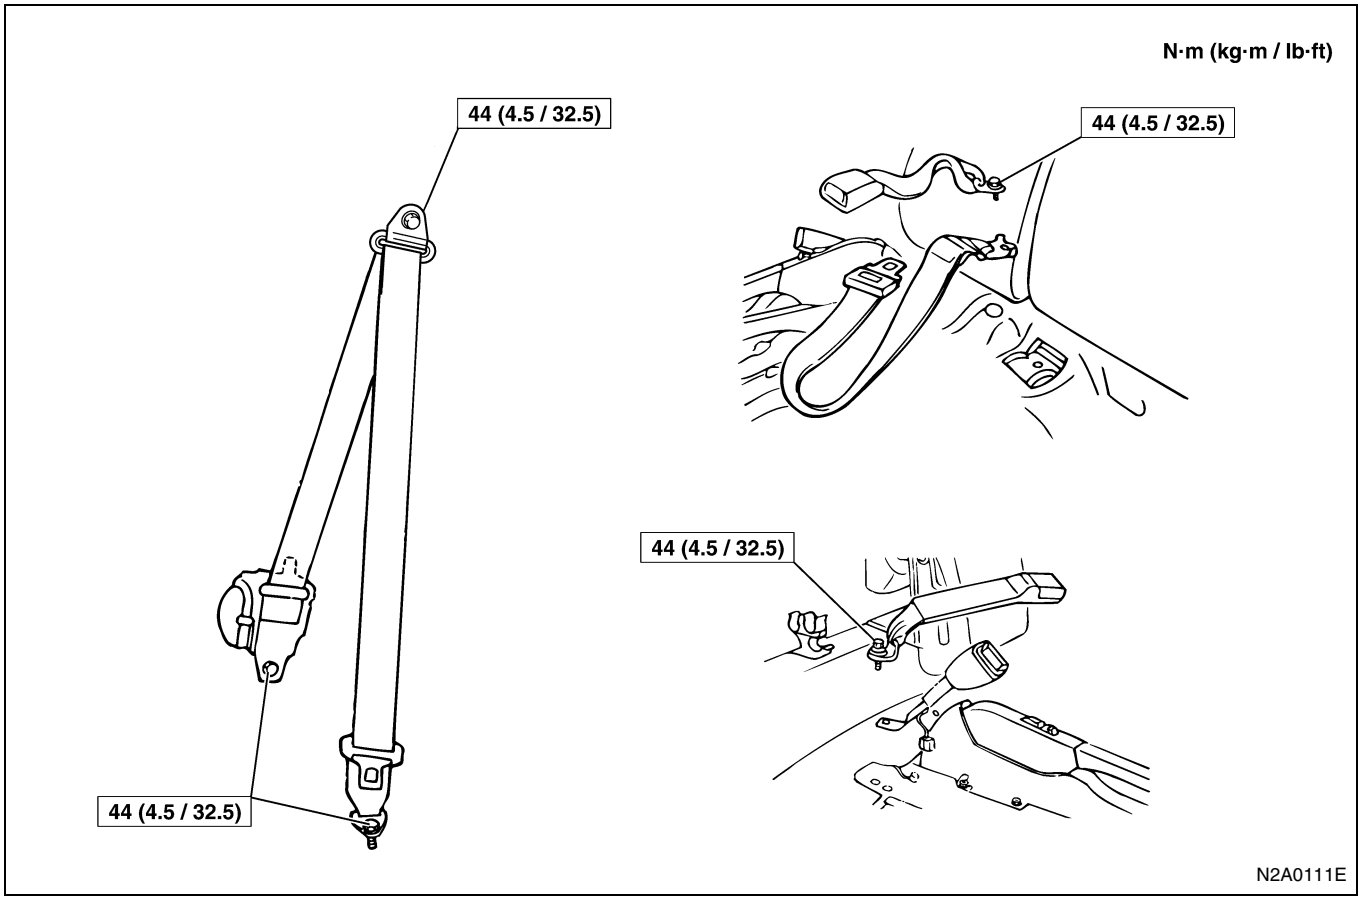
3. Install the seat belt lower anchor (3) in the specified direction, and tighten it to the specified torque.

Tighten:
Anchor bolt to 44 N·m (4.5 kg·m/32.5 lb·ft)

Caution:
Install the seat belt lower anchor so that it may not run on the anchor detent bead.

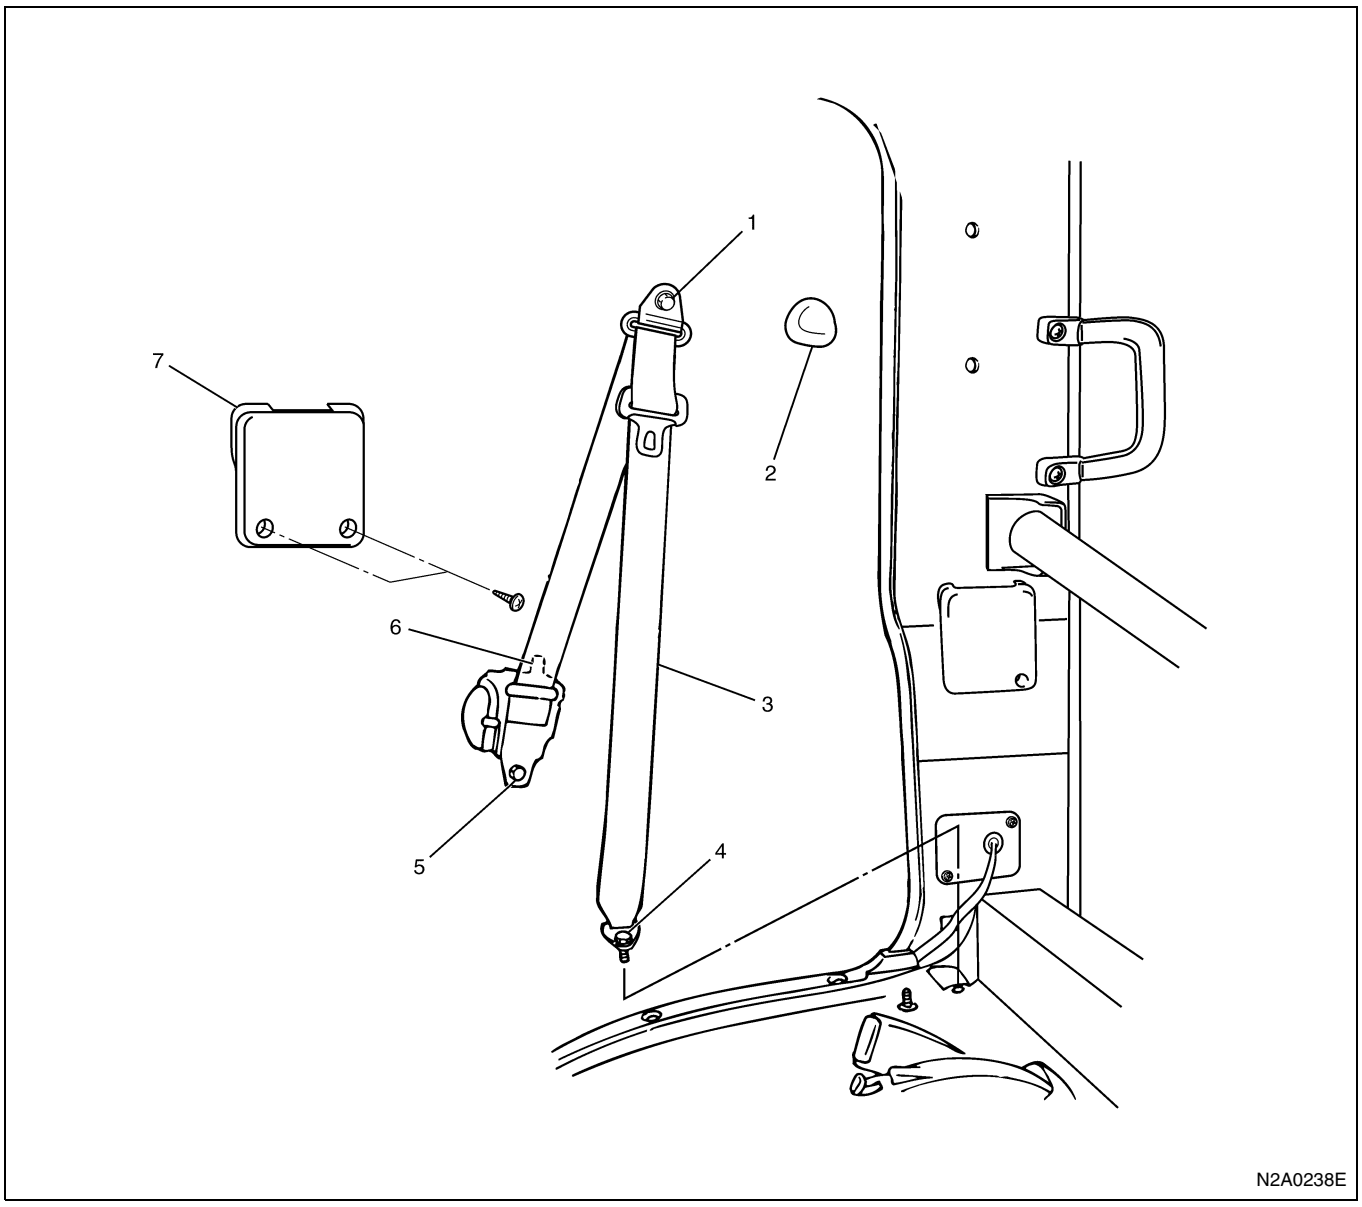


Fixing Torque



Tongue Side Seat Belt (Crew Cab Model)

Component



Legend

1. Seat belt upper anchor bolt
2. Through anchor cover
3. Tongue side seat belt assembly
4. Seat belt lower anchor bolt
5. Retractor fixing bolt
6. Bracket
7. Retractor cover

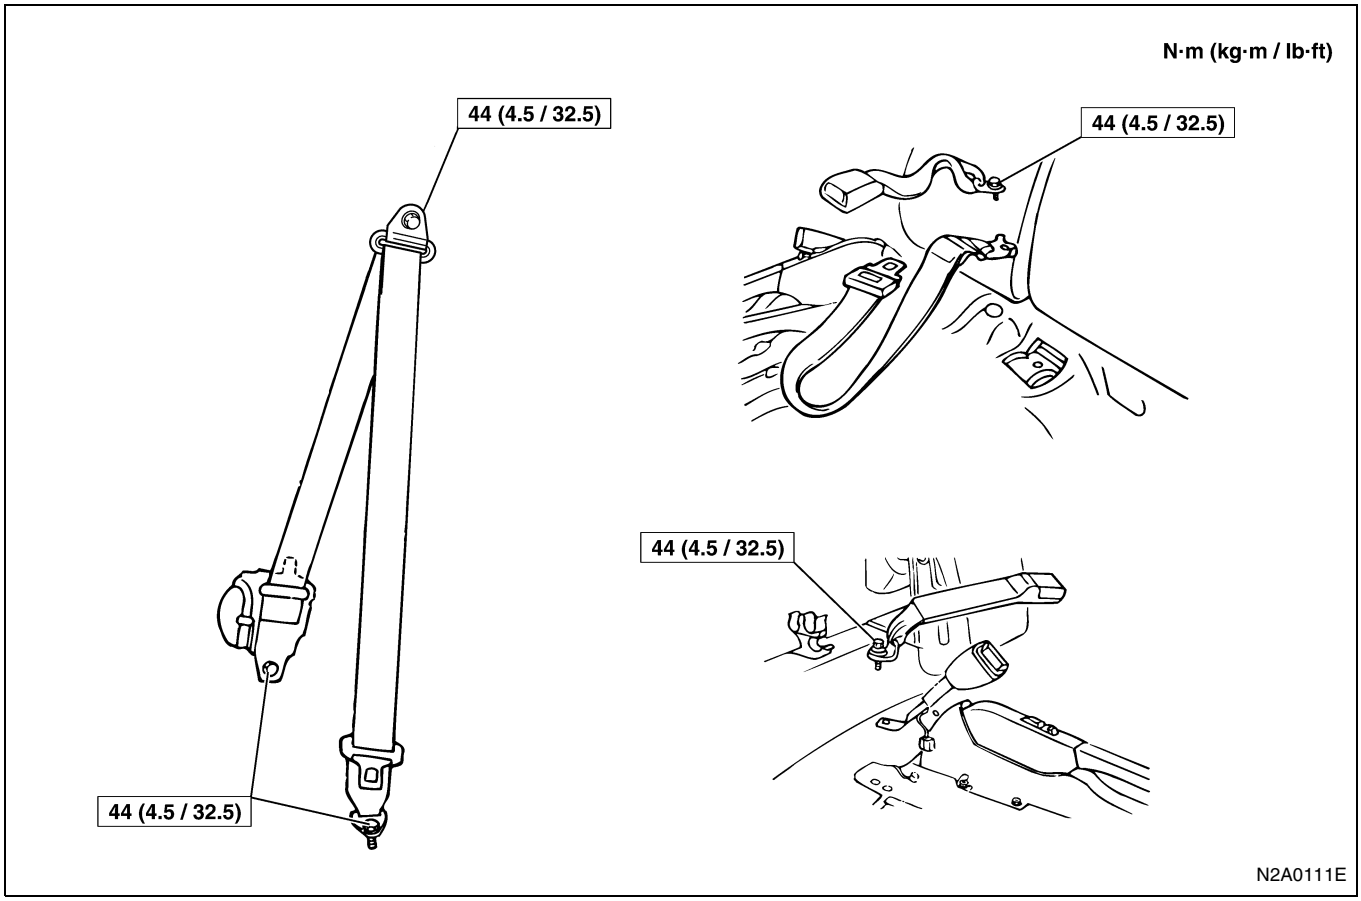
Removal

1. Seat belt lower anchor bolt
2. Retractor cover
   - Remove the 2 fixing screws.
3. Through anchor cover
4. Seat belt upper anchor bolt
5. Retractor fixing bolt
   - Remove the bolt and pull the retractor upper bracket from panel to remove.
6. Adjuster cover

Installation

For installation, refer to “Tongue Side Seat Belt (Single Cab Model)” in this section, and reverse the removal procedure.

Fixing Torque

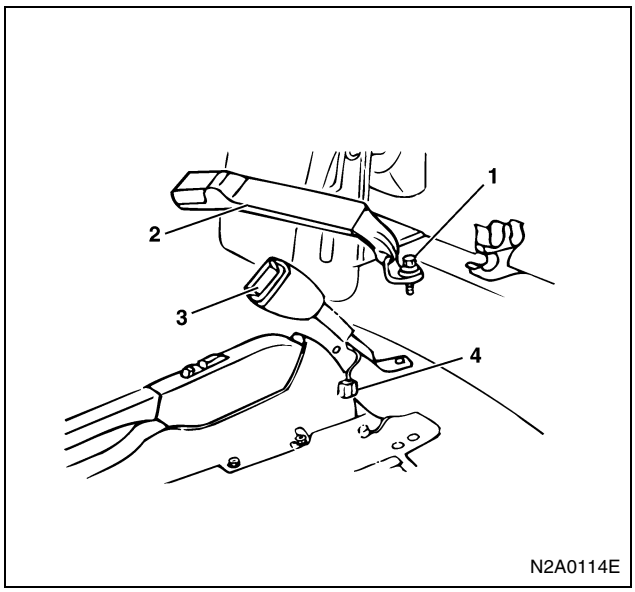


Front Center and Driver's Side Seat Belt Buckle

Removal

1. Disconnect the battery ground cable.
2. Fixing bolt (1)
3. Center seat belt buckle (2)
4. Disconnect the seat belt warning connector (4).
5. Driver's side seat belt buckle (3)

Caution:
For wide cab model, perform the steps 1 and 2 (Center), or the steps 1, 3 and 4 (Driver's side).

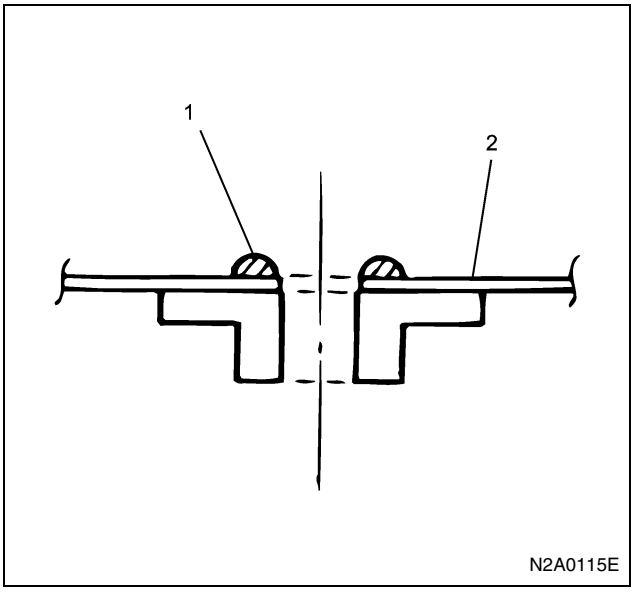


Installation

For installation, reverse the removal procedure taking the following points into consideration.

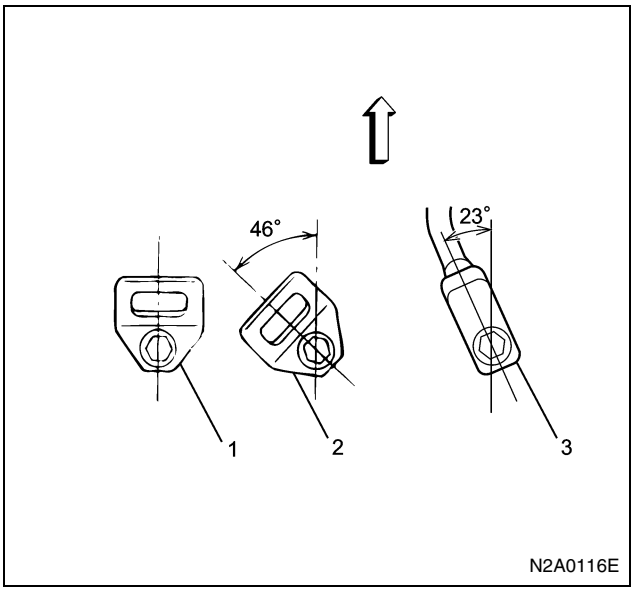
1. Apply the sealant (1) around the fixing bolt mounting hole on the floor part (2).

Sealant: TOKIWA CHEMICAL INDUSTRY 770GA or equivalent



2. Install the anchor in the specified direction, and tighten it to the specified torque.

Tighten:
Fixing bolt to 44 N·m (4.5 kg·m/32.5 lb·ft)

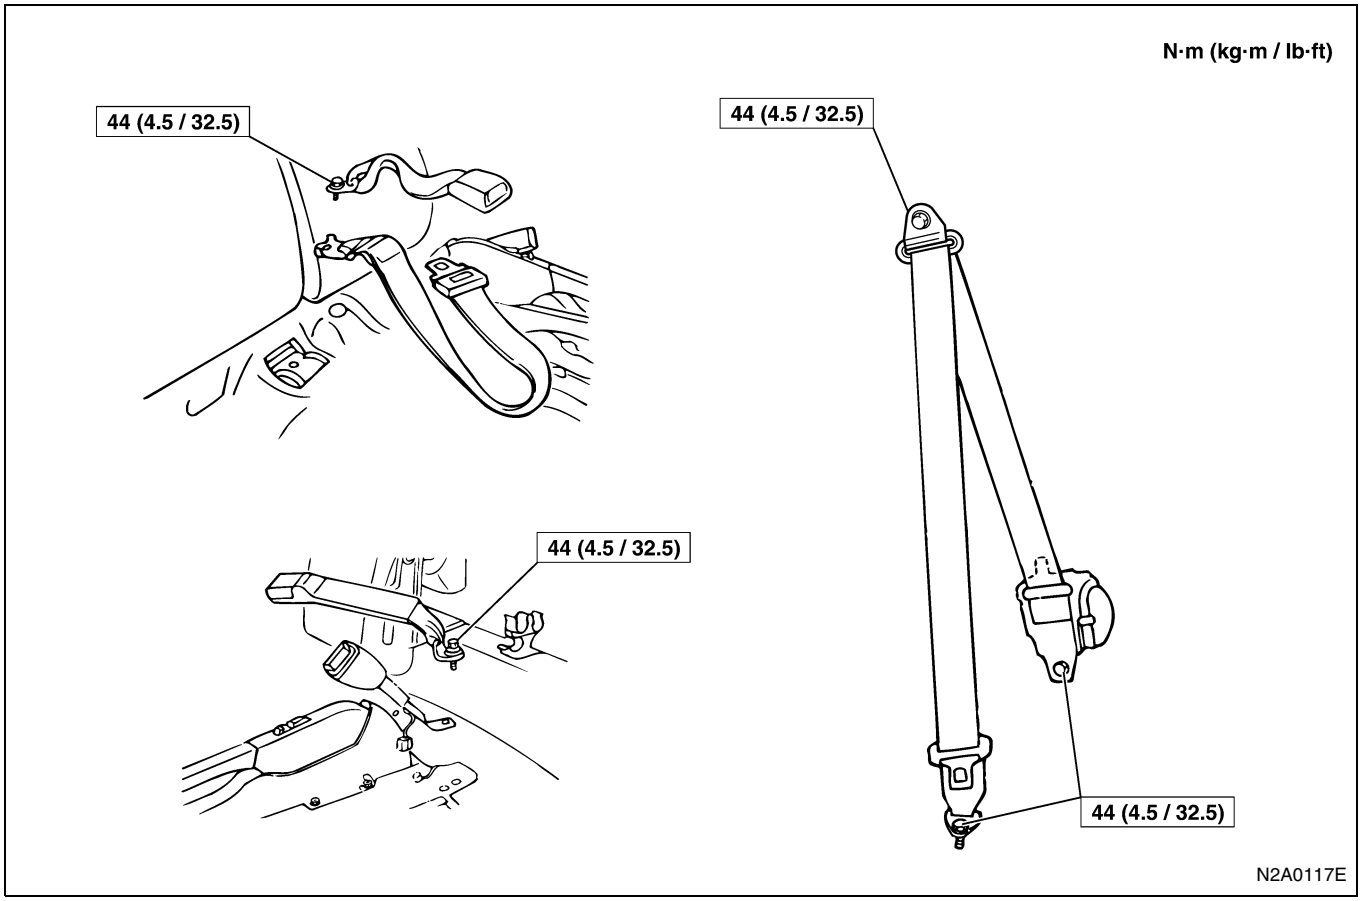


Legend
1. Center seat belt buckle (Wide cab model)
2. Center seat belt buckle (Except wide cab model)
3. Driver's side seat belt buckle

3. Pass the center seat belt buckle through the band on the end of seat cushion.

Caution:
Install the anchor so that it may not run on the anchor detent bead.

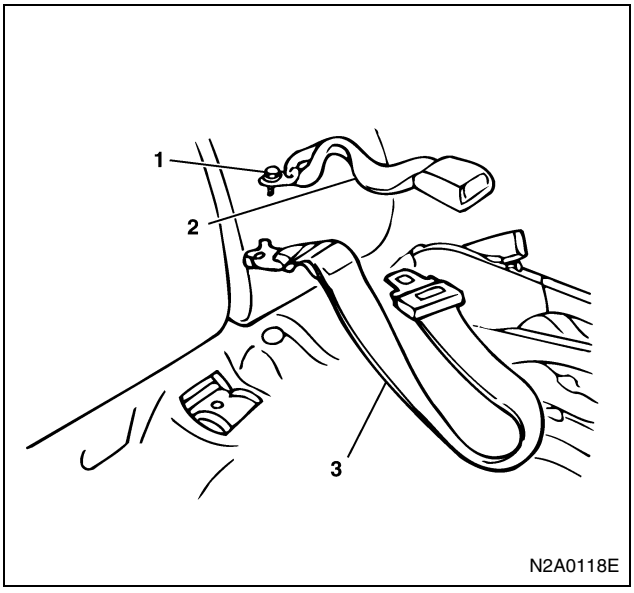
Fixing Torque



Front Center Seat Belt and Assistant's side Seat Belt Buckle

Removal

1. Assistant's seat cushion (three-passenger vehicle)
   - Refer to "Center and Passenger Side" in Seat Section of Cab Repair Manual.
2. Fixing bolt (1)
3. Passenger side seat belt buckle (2)
4. Center seat belt (3)



Installation

For installation, reverse the removal procedure taking the following points into consideration.

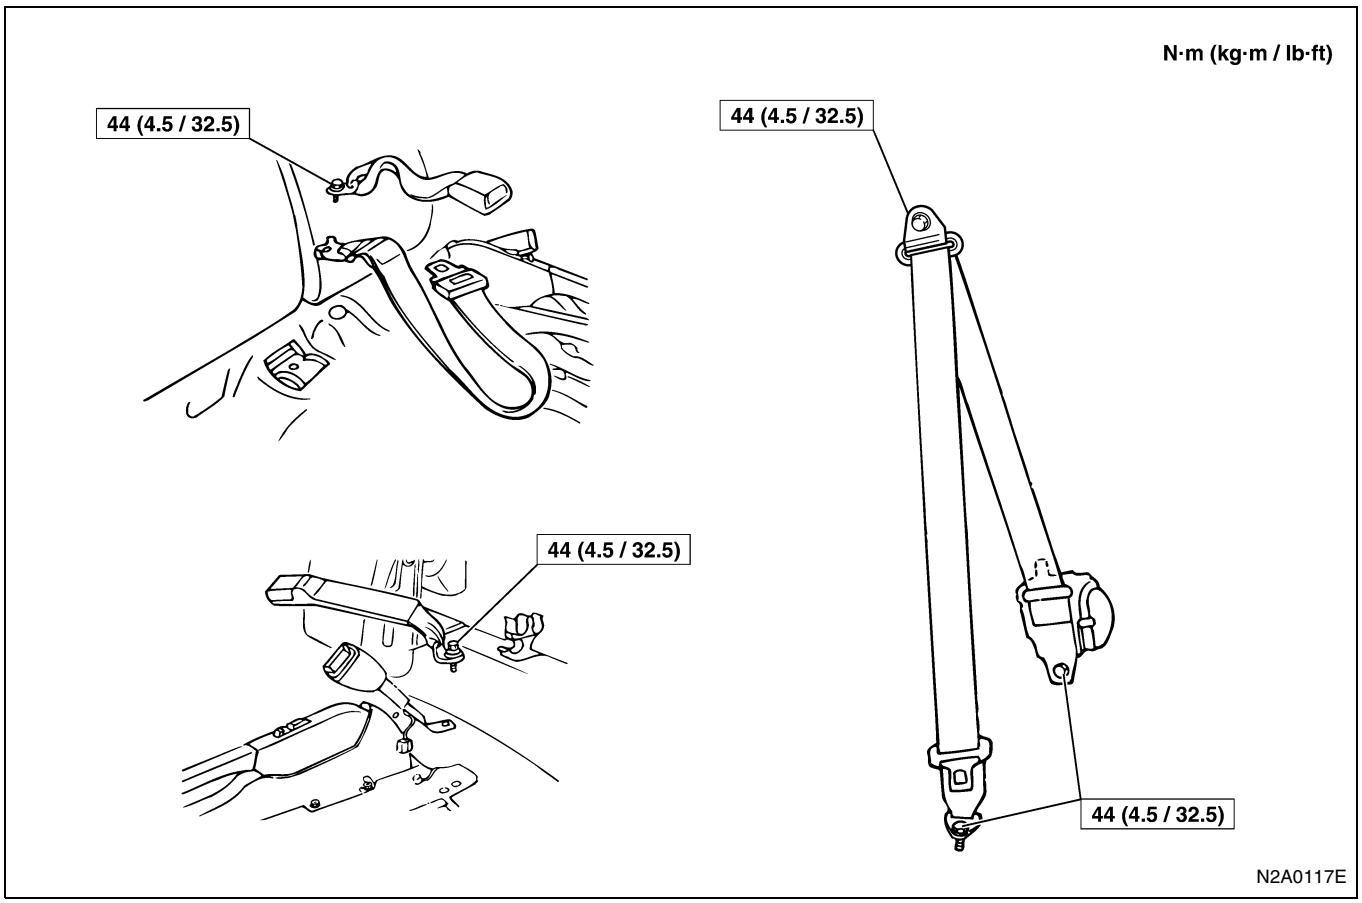
1. Apply the sealant (1) around the fixing bolt mounting hole.

Sealant: TOKIWA CHEMICAL INDUSTRY 770GA or equivalent

2. Install the anchor parallel to the traveling direction of vehicle.
3. Tighten the fixing bolts to the specified torque.

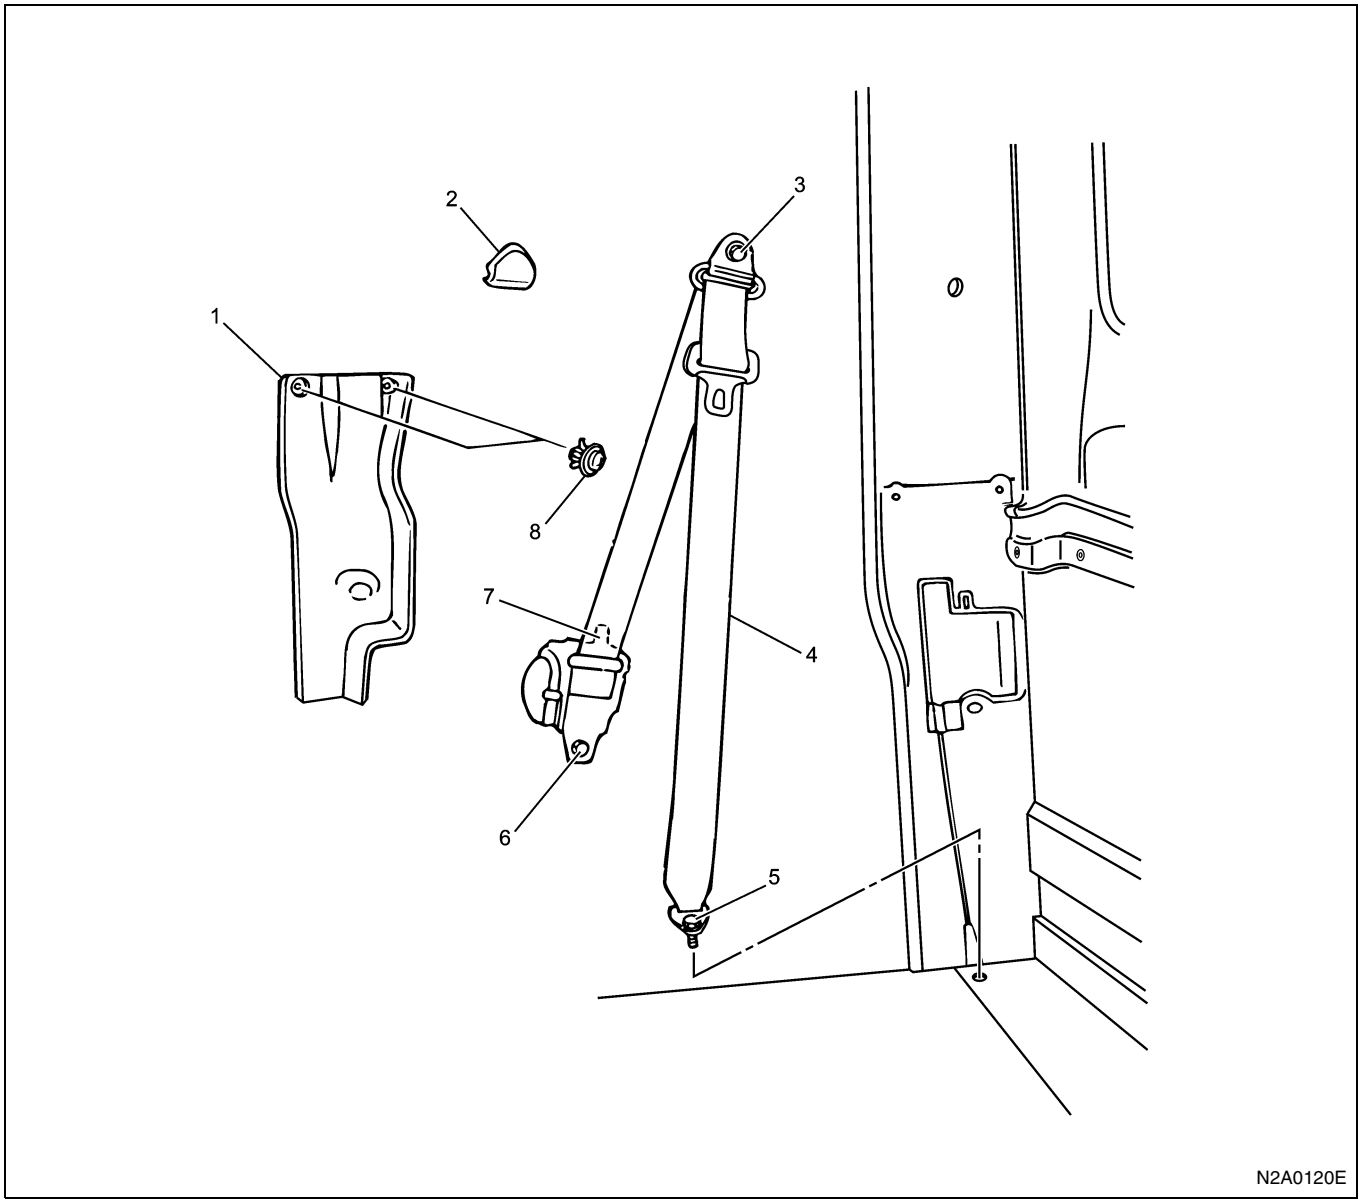
Tighten:
Fixing bolt to 44 N·m (4.5 kg·m/32.5 lb·ft)

Fixing Torque



Rear Seat Belt (Crew Cab Model)

Component



Legend

1. Rear pillar lower trim cover
2. Through anchor cover
3. Seat belt upper anchor bolt
4. Rear seat belt assembly
5. Seat belt lower anchor bolt
6. Retractor fixing bolt
7. Bracket
8. Clip

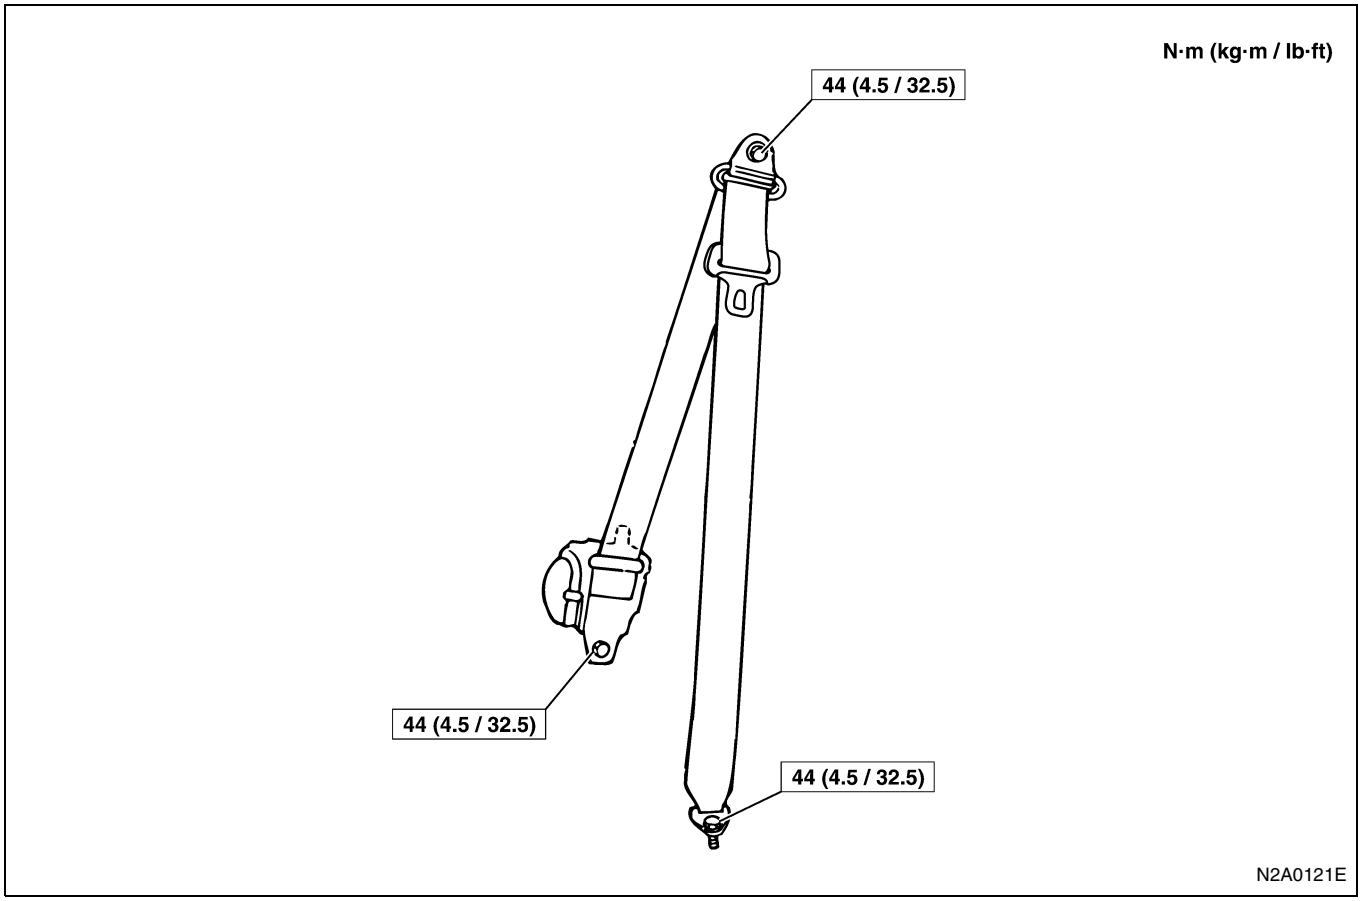
Removal

1. Seat belt lower anchor bolt
2. Rear pillar lower trim cover
   - Remove the 2 clips and pull it upward.
3. Through anchor cover
4. Seat belt upper anchor bolt
5. Retractor fixing bolt
   - Remove the bolt, and pull the retractor upper bracket from panel to remove it.

Installation

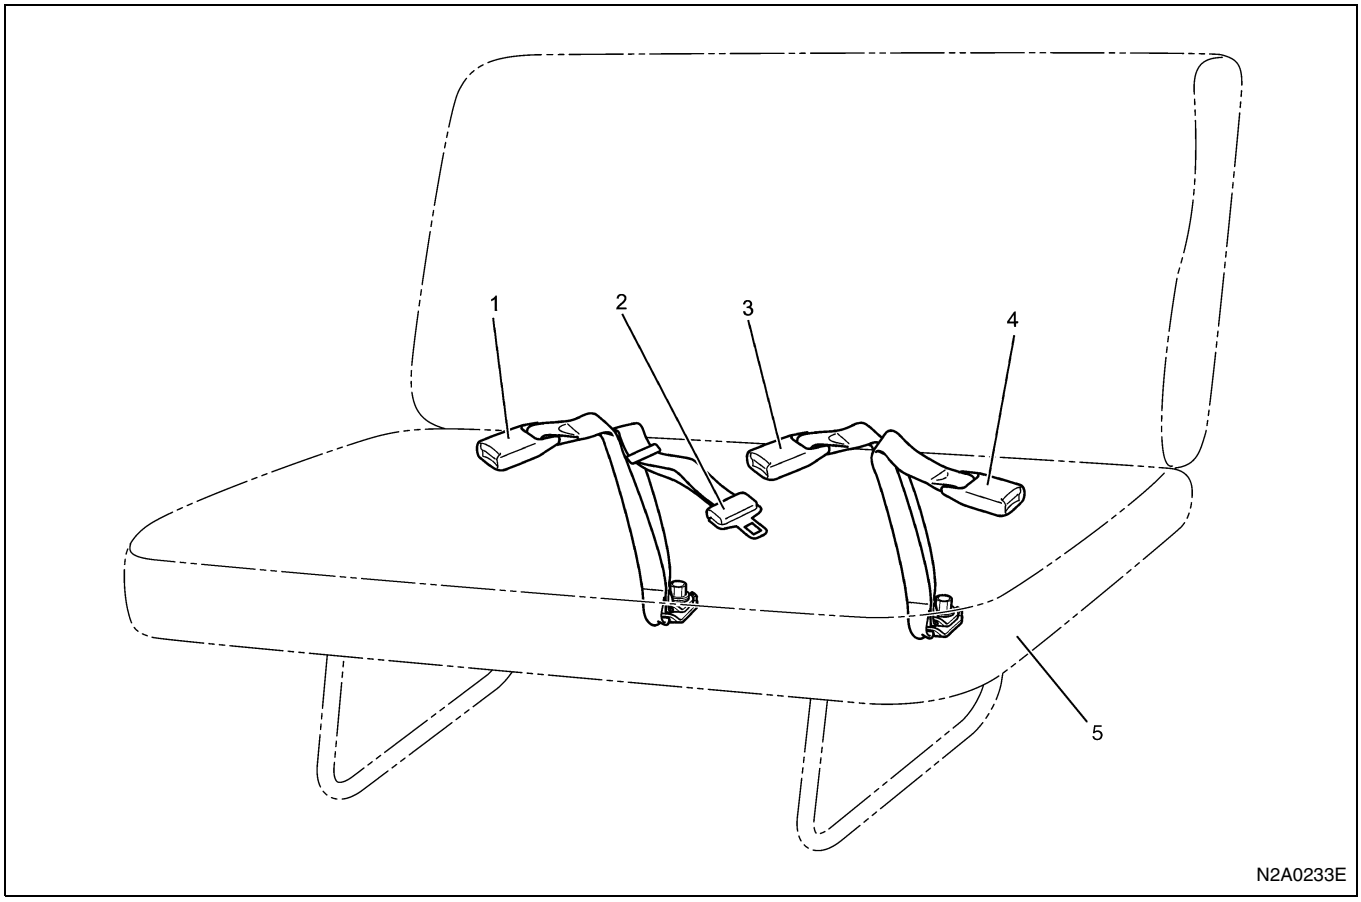
For installation, refer to “Tongue Side Seat Belt (Single Cab Model)” in this Section, and reverse the removal procedure.

Fixing Torque



Rear Seat Belt Buckle and Rear Center Seat Belt/Buckle (Narrow Cab Model)

Component



Legend

1. Rear seat belt buckle (RH)
2. Rear center seat belt
3. Rear center belt buckle
4. Rear seat belt buckle (LH)
5. Rear seat cushion

Removal

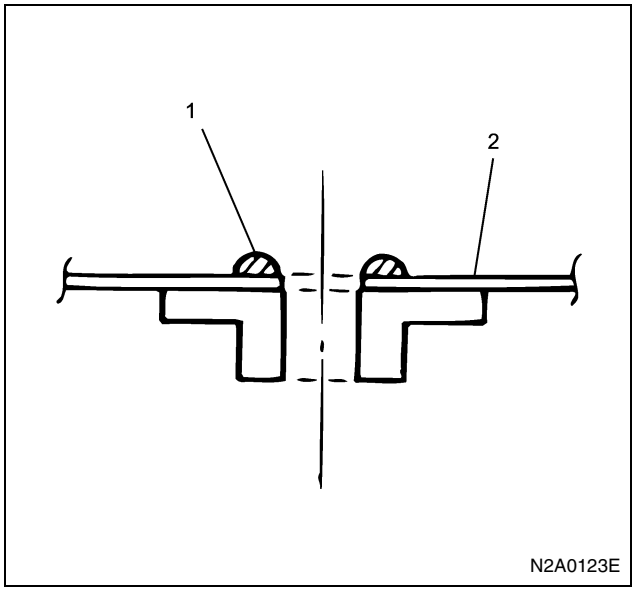
1. Fold the rear seat cushion.
   - Pull out each seat belt buckle and seat belt from the interval of the seat cushion and release the lock lever of rear seat cushion stay to fold it.
2. Fixing bolt of each seat belt

Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Apply the sealant (1) around the fixing bolt mounting hole on the floor part (2).

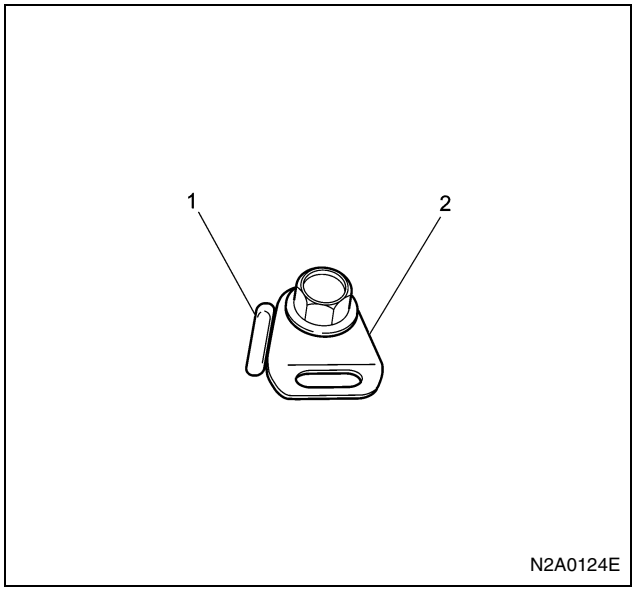
   Sealant: TOKIWA CHEMICAL INDUSTRY 770GA or equivalent



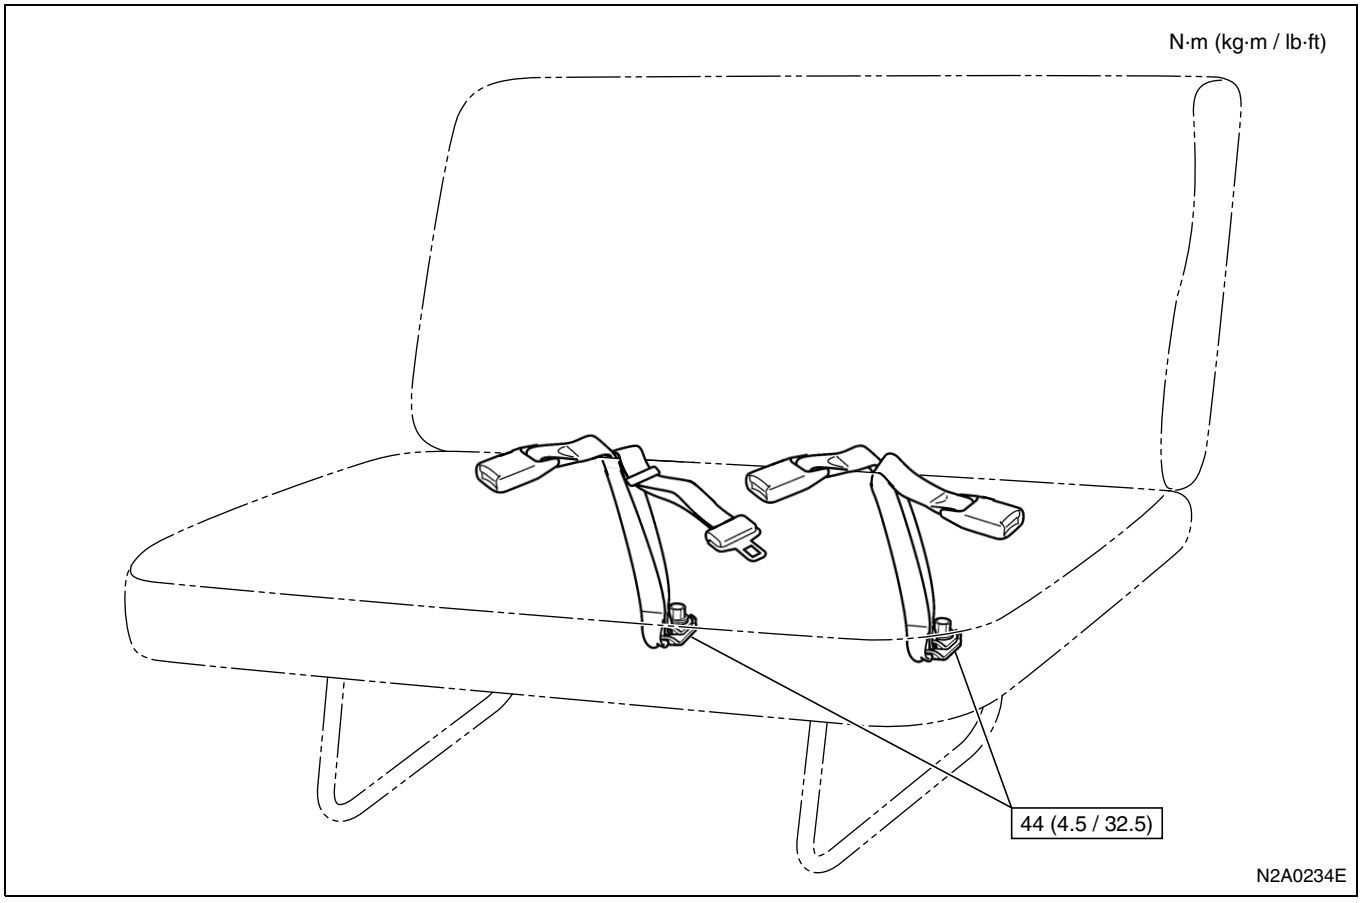
2. Install the anchor parallel to the traveling direction of vehicle.
3. Tighten the fixing bolts to the specified torque.

Tighten:
Fixing bolts to 44 N·m (4.5 kg·m/32.5 lb·ft)

Caution:
Install the anchor bracket (2) so that it may not run on the anchor detent bead (1).

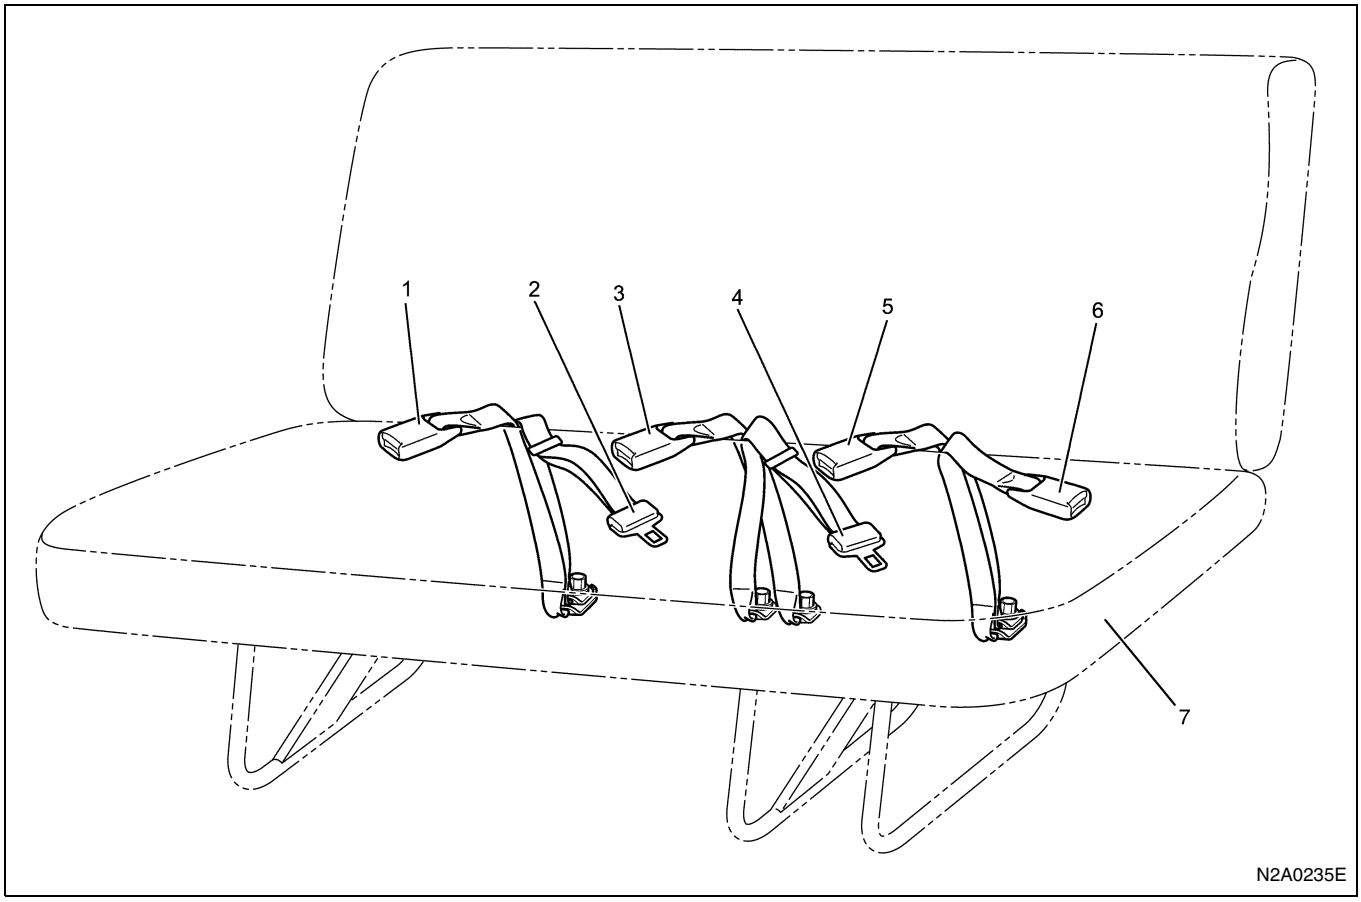


Fixing Torque



Rear Seat Belt Buckle and Rear Center Seat Belt/Buckle (Wide Cab Model)

Component



Legend

1. Rear seat belt buckle (RH)
2. Rear center seat belt (RH)
3. Rear center seat belt buckle (RH)
4. Rear center seat belt (LH)
5. Rear center seat belt buckle (LH)
6. Rear seat belt buckle (LH)
7. Rear seat cushion

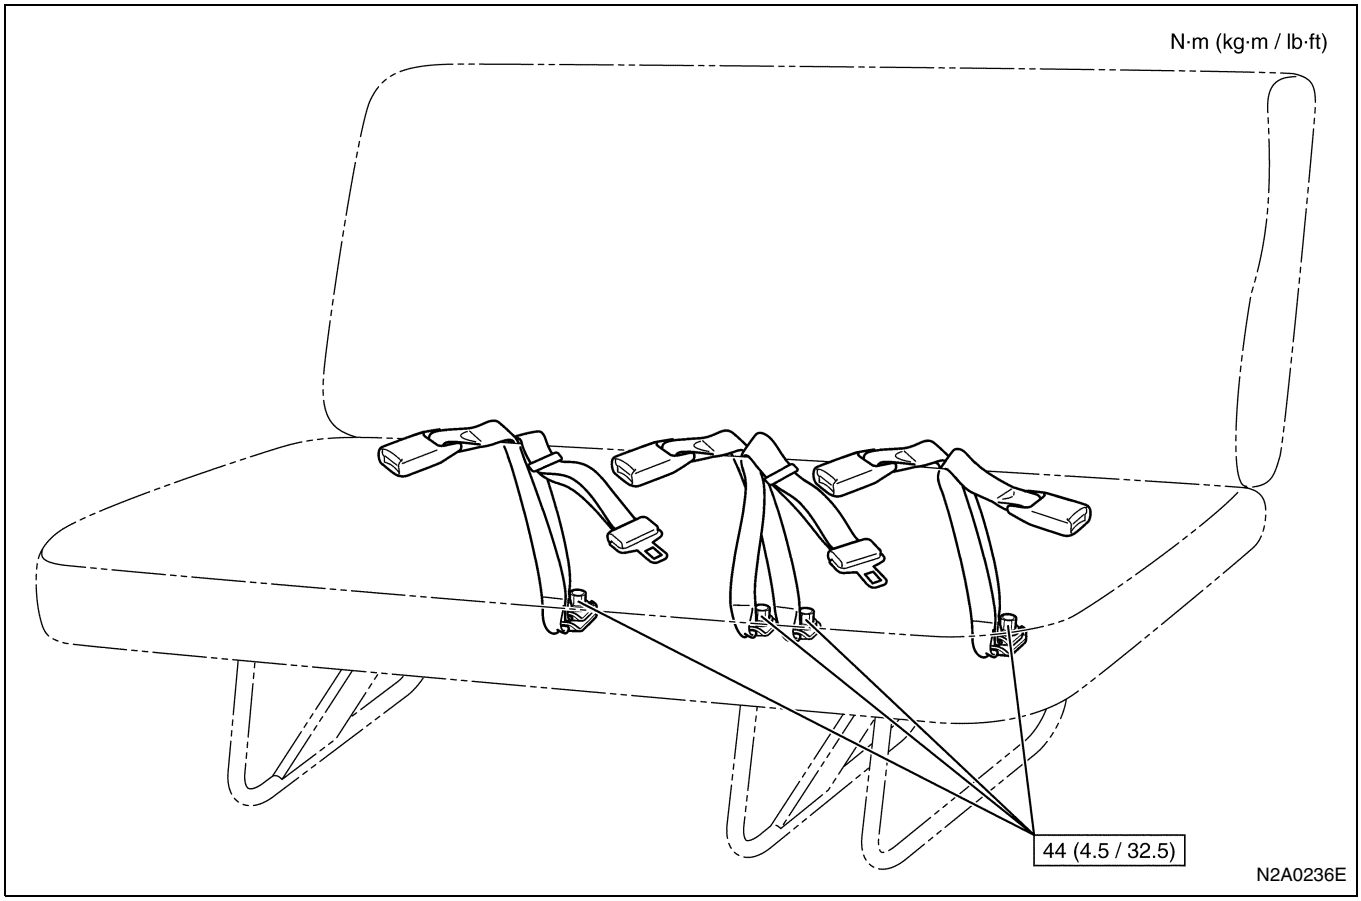
Removal

Refer to “Rear Seat Belt Buckle and Rear Center Seat Belt/Buckle (Narrow Cab Model)” in this section for removal.

Installation

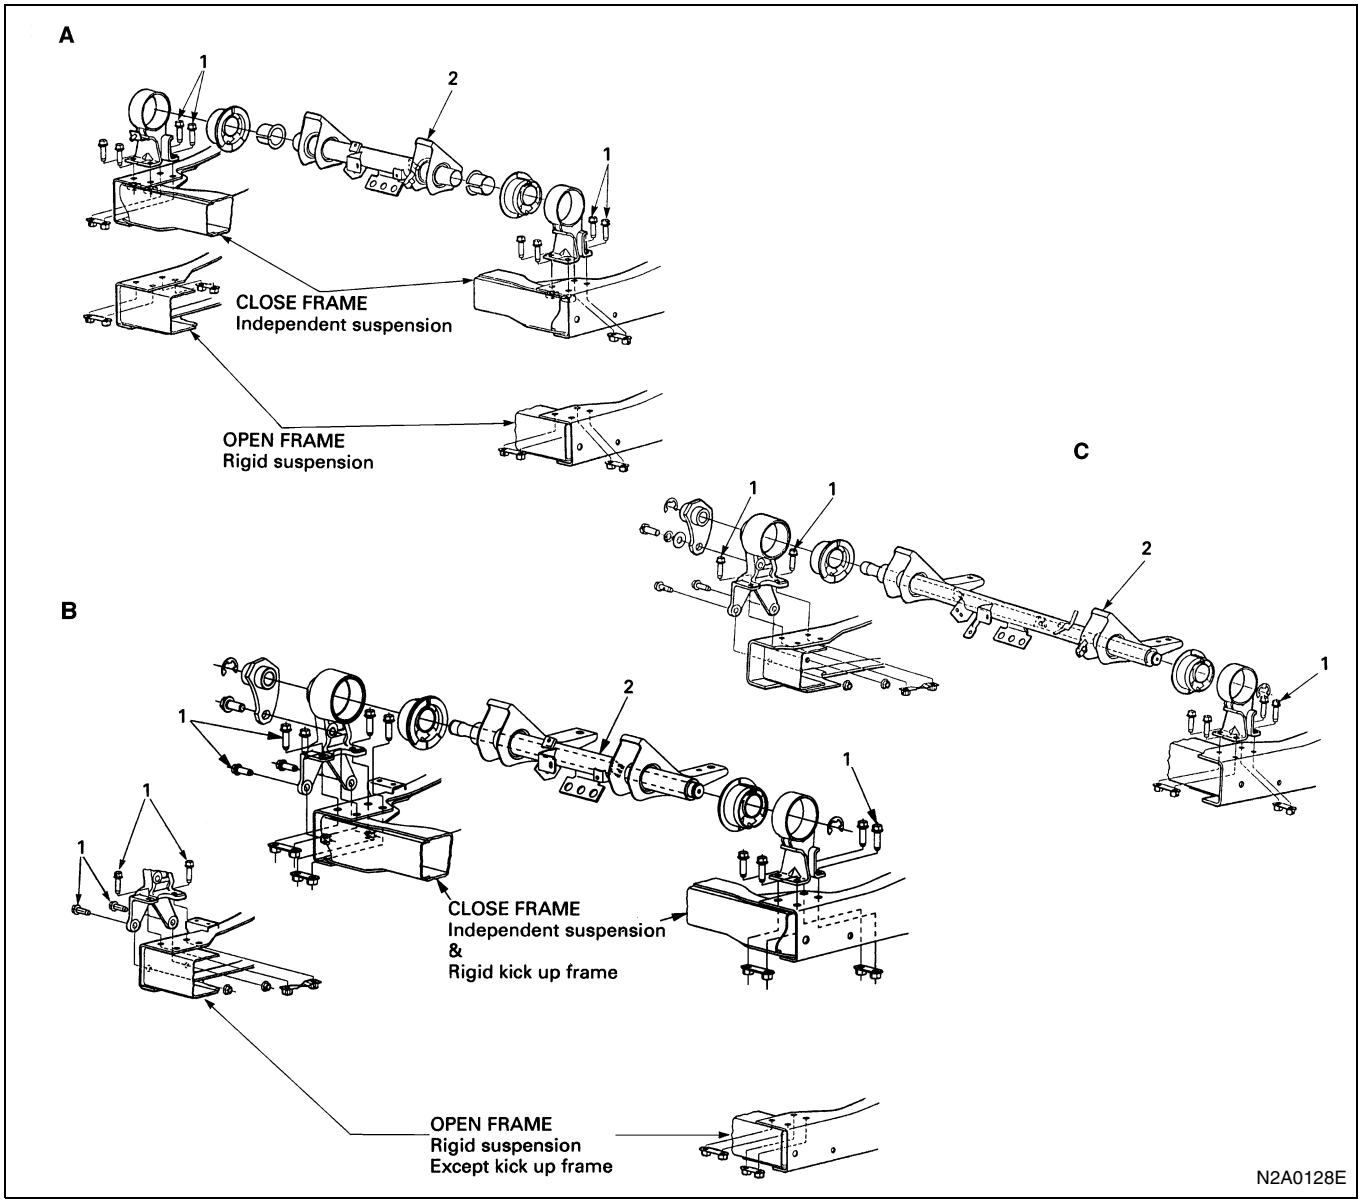
Refer to “Rear Seat Belt Buckle and Rear Center Seat Belt/Buckle (Narrow Cab Model)” in this section for installation.

Fixing Torque



CAB MOUNTING

Front Mounting



Legend

A. Non-tilt cab
B. Tilt cab (wide)
C. Tilt cab (narrow)
1. Cab mounting bracket fixing bolt
2. Cab mounting lever assembly

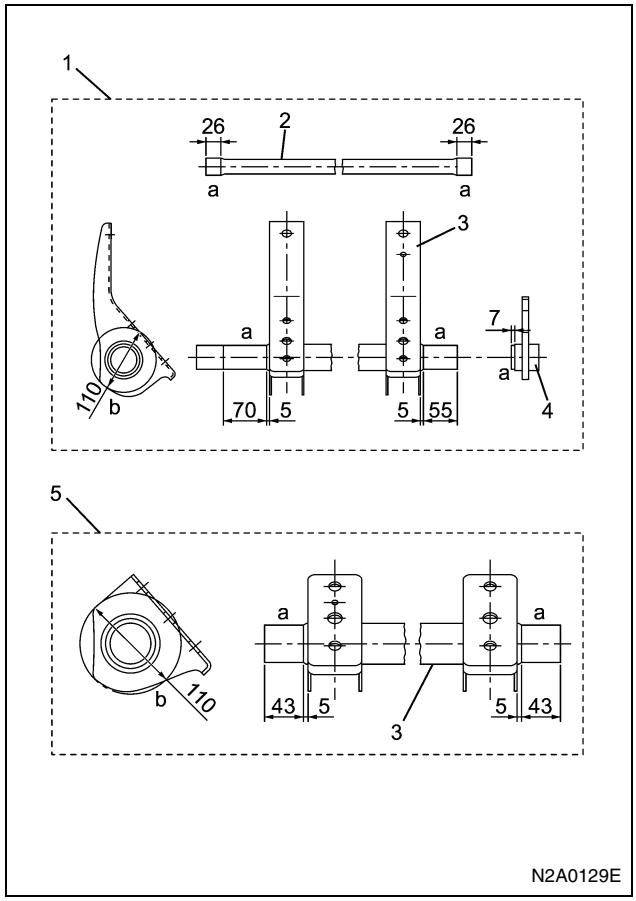
Removal

1. Cab assembly
   - Refer to “Removal and Installation of Cab Assembly” in this Section.
2. Anchor bolt (Tilt cab model)
   - Loosen the anchor bolt, remove the adjusting bolt, and then remove the anchor bolt.
3. Front cab mounting bracket
   - For RH side, remove the 4 fixing bolts. The nut side is classified into 2 types, weld and plate, depending on models.
   - For LH side, remove the 2 fixing bolts from the upper and 2 fixing bolts from the side. The nut side is classified into 2 types, weld and plate, depending on models, similarly to RH side.
4. Anchor arm
   - Remove the snap ring in the end of torsion bar.
5. Cab mounting lever assembly

Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Apply grease to the designated locations.
   a. BESCO L-2 applied area
   b. BESCO rubber grease application range
   • Apply it to the outer side of the body with mounting rubber.



N2A0129E

Legend

1. Tilt cab model
2. Torsion bar
3. Cab mounting lever assembly
4. Anchor arm
5. Non-tilt cab model

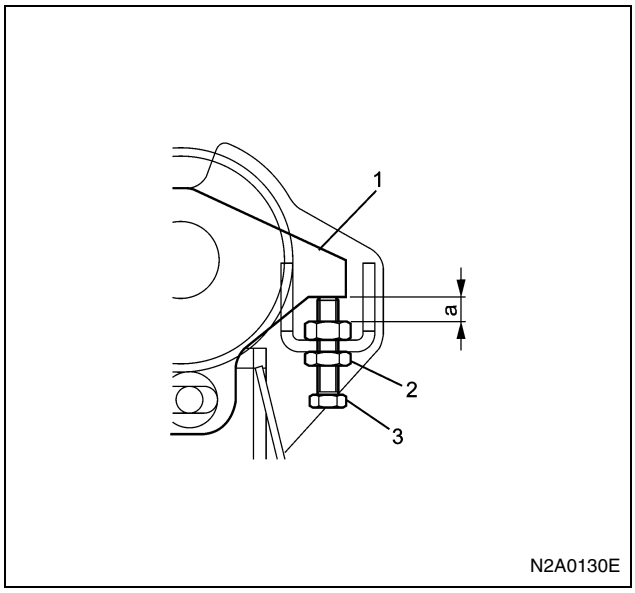
2. Tighten the fixing bolt of cab mounting bracket to the specified torque.

Tighten:
Fixing bolt to 117±11.8 N·m (11.9±1.2 kg·m/86.3±8.7 lb·ft)

3. When installing anchor arm, align the match mark (I mark) with the missing tooth of the torsion bar.
4. Adjust the amount of projection for anchor arm assembly (1) with adjusting bolt (3), and fix with the lock nut (2). (Tilt cab model)

The following dimensions are guide values.
When adjustment of operating force is necessary, refer to “7. Operating Force Adjustment”.

Dimension	Bolt projection amount mm (in)	Model type	Remarks
a	18±2.5 (0.7±0.1)	NKR slide door, NPS	Adjustment dimension
	13.5±2.5 (0.5±0.1)	Except above	



N2A0130E

5. Tighten the lock nut to the specified torque.

Tighten:
Lock nut to 76 N·m (7.7 kg·m/56.1 lb·ft)

6. Tighten the anchor arm anchor bolt to the specified torque.

Tighten:
Anchor arm anchor bolt to 95 N·m (9.7 kg·m/70.1 lb·ft)

7. Cab tilt operating force adjustment
   • Perform the following procedure when the cab equips heavy items such as roof rack, or any other occasion which require cab tilt operating force adjustment.
   a. Tilt-up the cab.

Caution:
Never perform adjustment with the cab tilt-down, since the torsion bar torque is applied to the adjusting bolt and nut of the anchor arm.

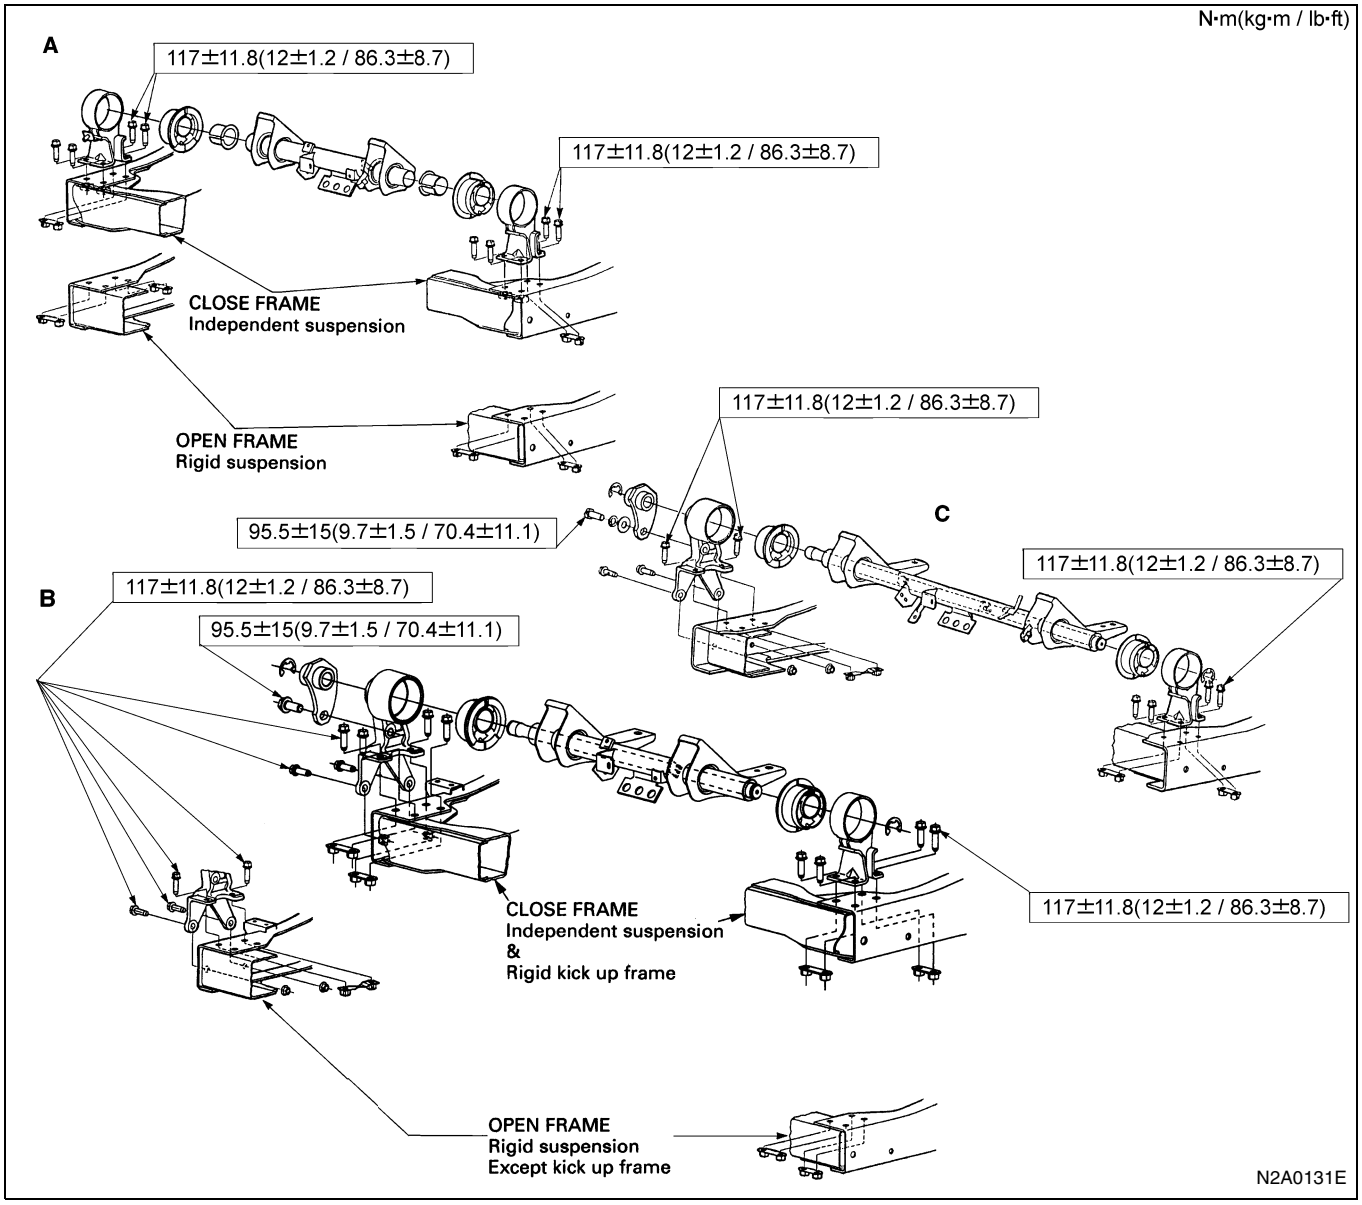
   b. Loosen the anchor bolt to the degree that allows you to turn it by hand.
   c. Turn the adjusting bolt to adjust the operating force.
      • Clockwise direction: Reduces cab tilt operating force.
      • Counterclockwise direction: Increase cab tilt operating force.

Notice:
One turn of the bolt changes ±4kg of cab tilt operating force.

d. Check that the adjusting bolt tip contacts the anchor arm side face.
e. Tighten the anchor bolt and lock nut to the specified torque.
f. Tilt-up or down the cab to make sure that the operating force is well-balanced. Repeat the steps (a) to (f) until the above condition is satisfactory.

Notice:
Specification for adjustment bolt projection amount is described in “4. Projection amount adjustment”.

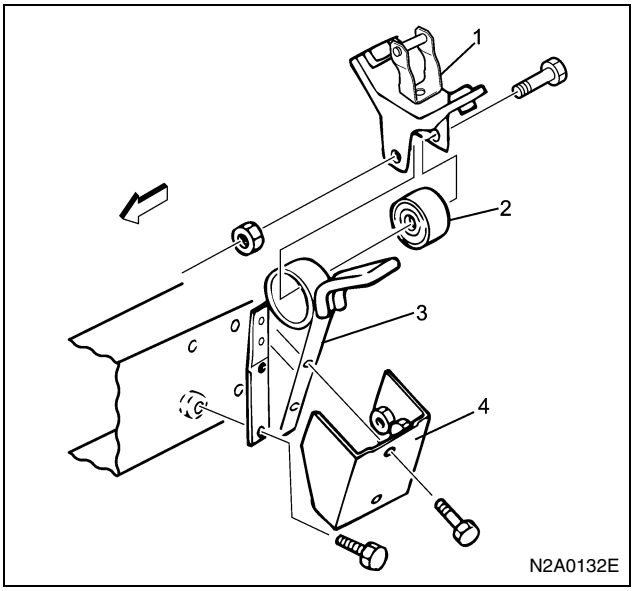
Fixing Torque



Rear Mounting (Model with Rubber Bushing except Wide Cab Model)

Removal

1. Tilt-up the cab.
2. Cab rear mounting bracket (1)
   - Remove the bolt and nut.
3. Cab mounting bracket (3)
   - Remove the cover (4) and remove the installing bolts. (Independent: 5 bolts, Rigid: 4 bolts)
4. Rubber bushing assembly (2)



Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the cab mounting bracket to the specified torque.

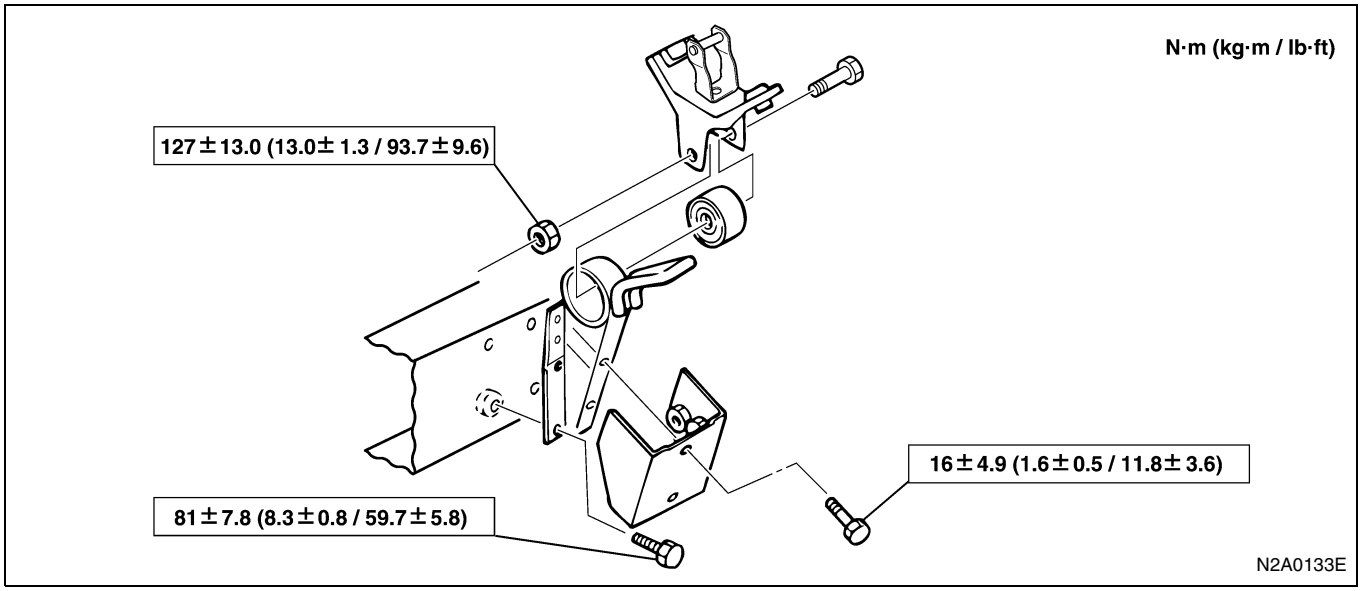
Tighten:
Cab mounting bracket to 81±7.8 N·m (8.3±0.8 kg·m/ 59.7±5.8 lb·ft)

2. Tighten the cab rear mounting bracket to the specified torque.

Tighten:
Cab rear mounting bracket to 127±13 N·m (13.0±1.3 kg·m/93.7±9.6 lb·ft)

3. Set the tilt of cab rear mounting bracket to ±2°or less.

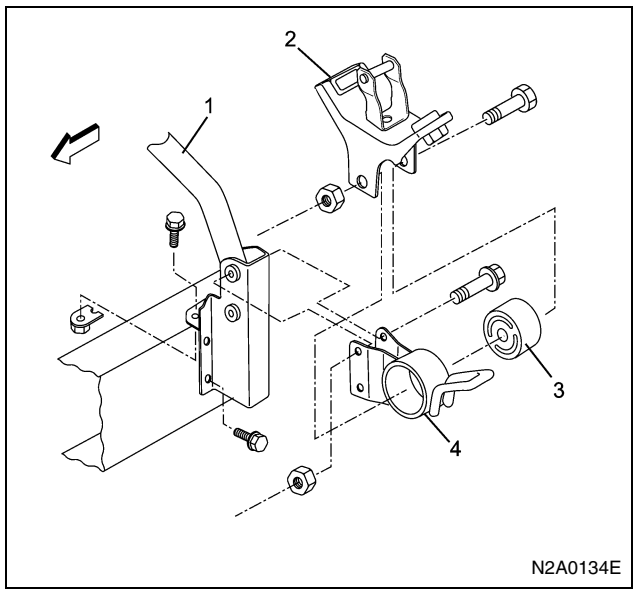
Fixing Torque



Rear Mounting (Wide Cab Model)

Removal

1. Tilt-up the cab.
2. Cab rear mounting bracket (2)
   - Remove the bolt and nut.
3. Cab mounting bracket (4)
   - Remove 2 pairs of bolts and nuts.
4. Rubber bushing assembly (3)
5. Cab back crossmember (1)
   - Remove the fixing bolt and nut.



Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the cab back crossmember.

Tighten:
Cab back crossmember to 81 N·m (8.3 kg·m/59.7 lb·ft)

2. Tighten the cab mounting bracket to the specified torque.

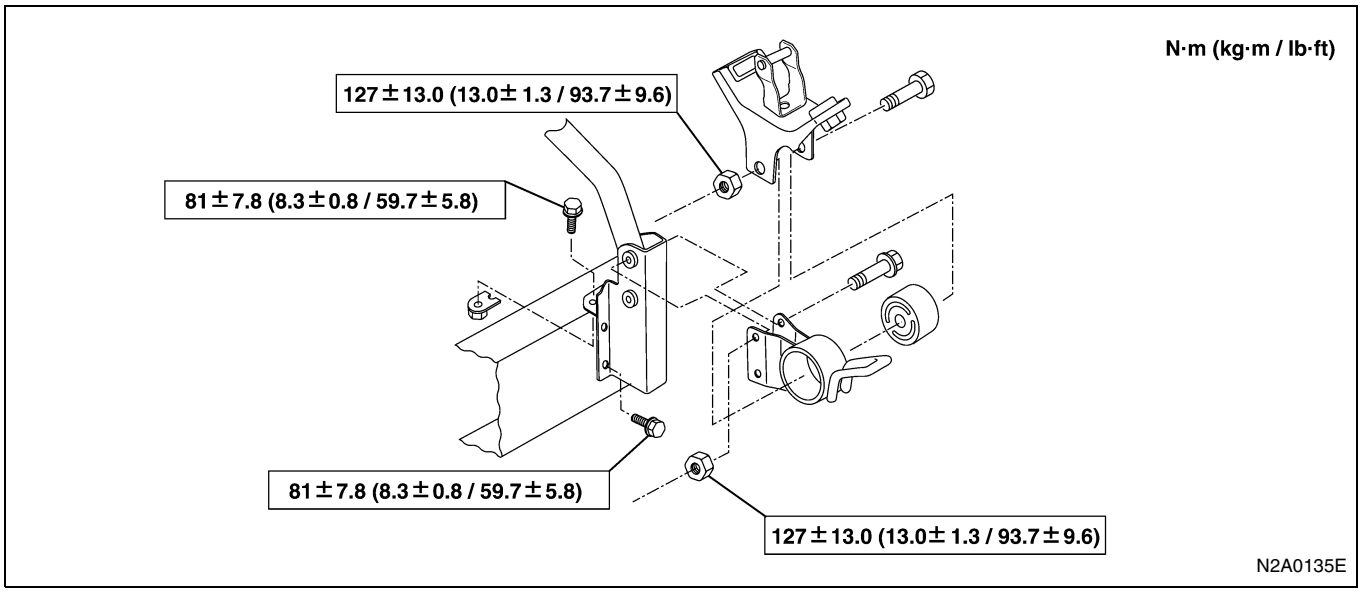
Tighten:
Cab mounting bracket to 127 N·m (13.0 kg·m/93.7 lb·ft)

3. Tighten the cab rear mounting bracket to the specified torque.

Tighten:
Cab rear mounting bracket to 127 N·m (13.0 kg·m/93.7 lb·ft)

4. Set the tilt of cab rear mounting bracket to ±2°or less.

Fixing Torque

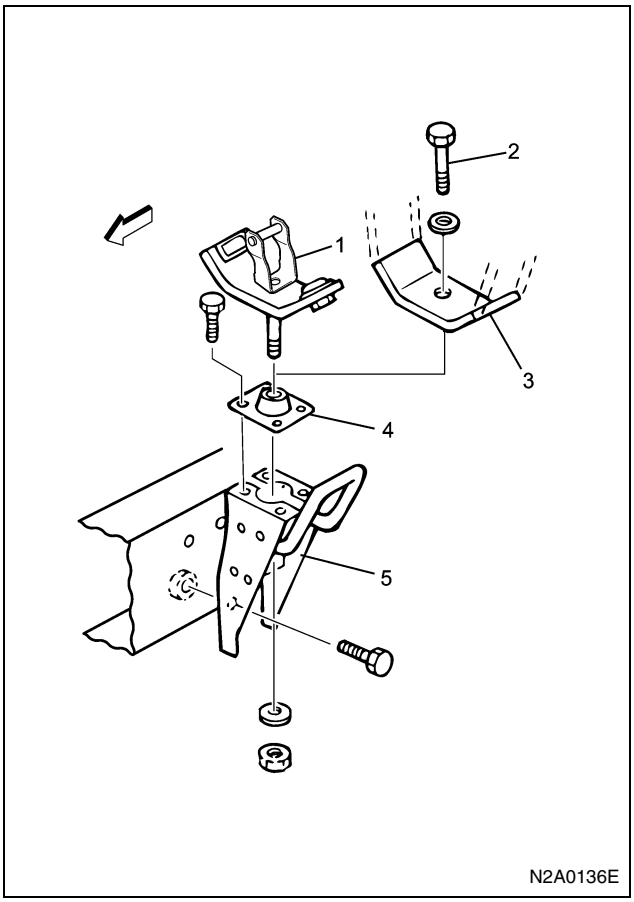


Rear Mounting (Model without Rubber Bushing)

Removal

1. For a tilt vehicle, tilt-up the cab.
2. Cab rear mounting bracket (1) (Tilt cab model)
   - Remove the nut and pull it up.

   Cab mounting rear bolt (Non-tilt cab model)
   - Remove the bolt (2) from the cab side bracket (3).
3. mounting rubber (4)
   - Remove the 4 bolts.
4. Cab mounting bracket (5)
   - Remove the bolts. (Independent: 5 bolts, Rigid: 4 bolts)



Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Tighten the cab mounting bracket to the specified torque.

Tighten:
Cab mounting bracket to 81±7.8 N·m (8.3±0.8 kg·m/59.7±5.8 lb·ft)

2. Tighten the mounting rubber to the specified torque.

Tighten:
Mounting rubber to 50±5.9 N·m (5.1±0.6 kg·m/36.9±4.4 lb·ft)

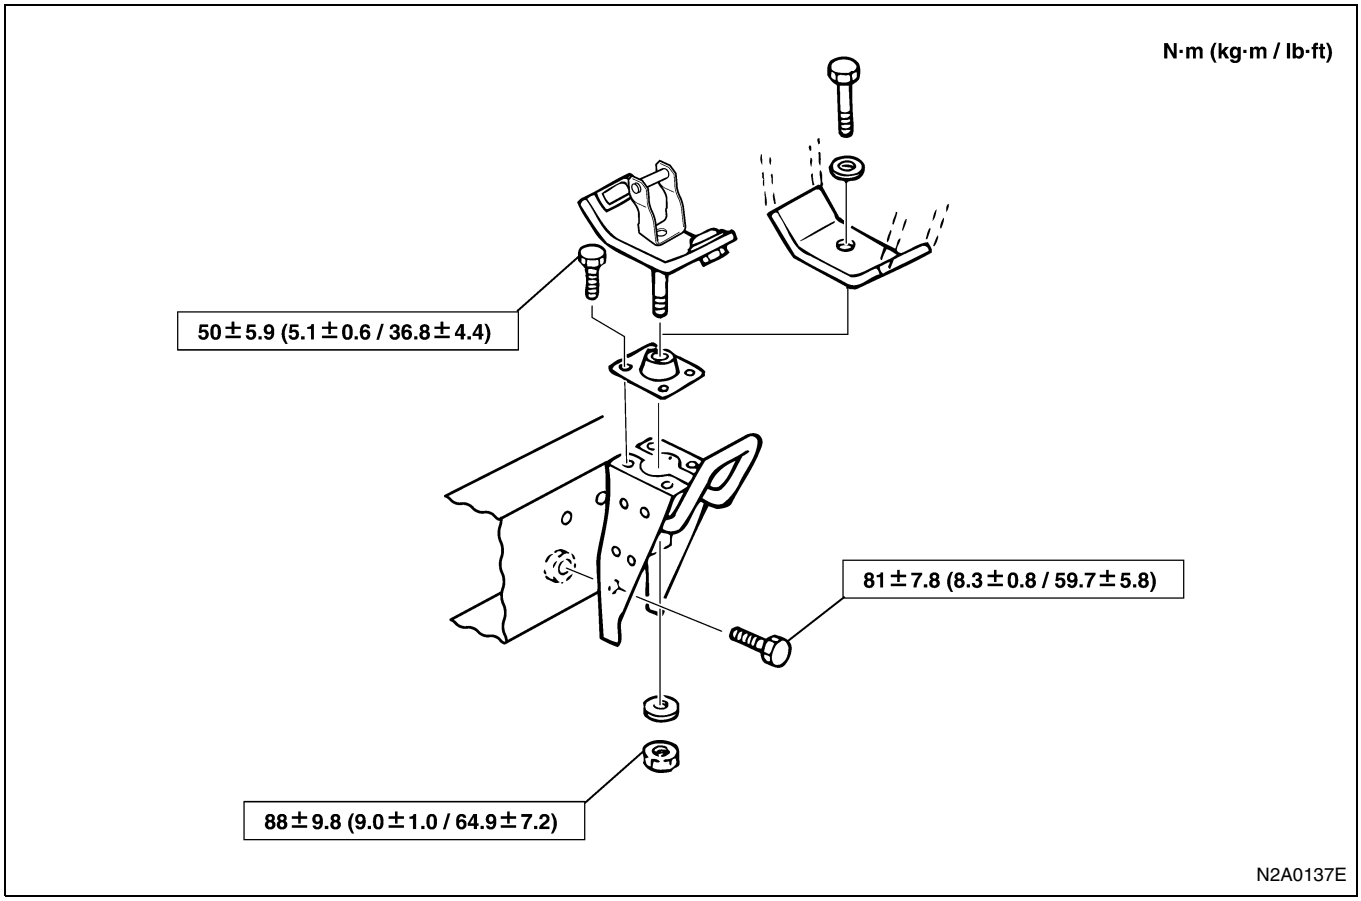
3. Tighten the cab rear mounting bracket to the specified torque. (Tilt cab model)

Tighten:
Cab rear mounting bracket to 88±9.8 N·m (9.0±1.0 kg·m/64.9±7.2 lb·ft)

4. Tighten the cab rear mounting bolt to the specified torque. (Non-tilt cab model)

Tighten:
Cab rear mounting bolt to 88 N·m (9.0 kg·m/64.9 lb·ft)

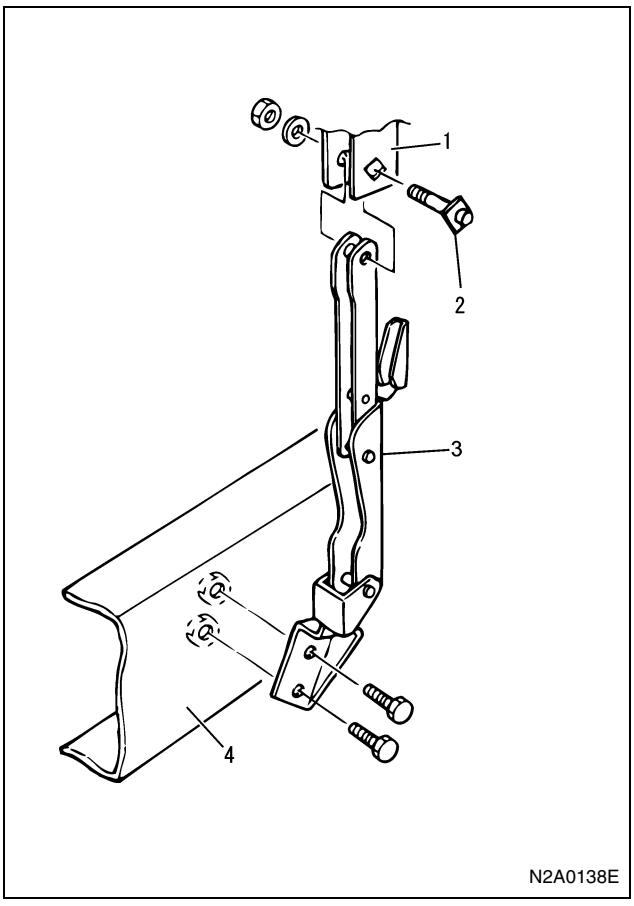
Fixing Torque



Cab Stay

Removal

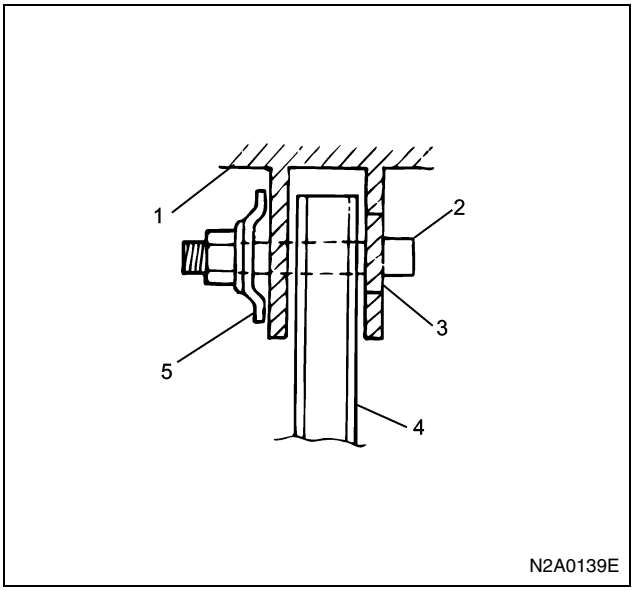
1. Cab stay pin
   - Remove the pin (2), nut, and washer from cab side bracket (1).
2. Cab stay (3)
   - Remove the 2 fixing bolts from frame side (4).



Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. When installing the cab stay (4) to the cab side bracket (1), completely fit the cab stay pin (2) to the bracket square hole (3).
2. Assemble the washer (5) convex to face the nut side.



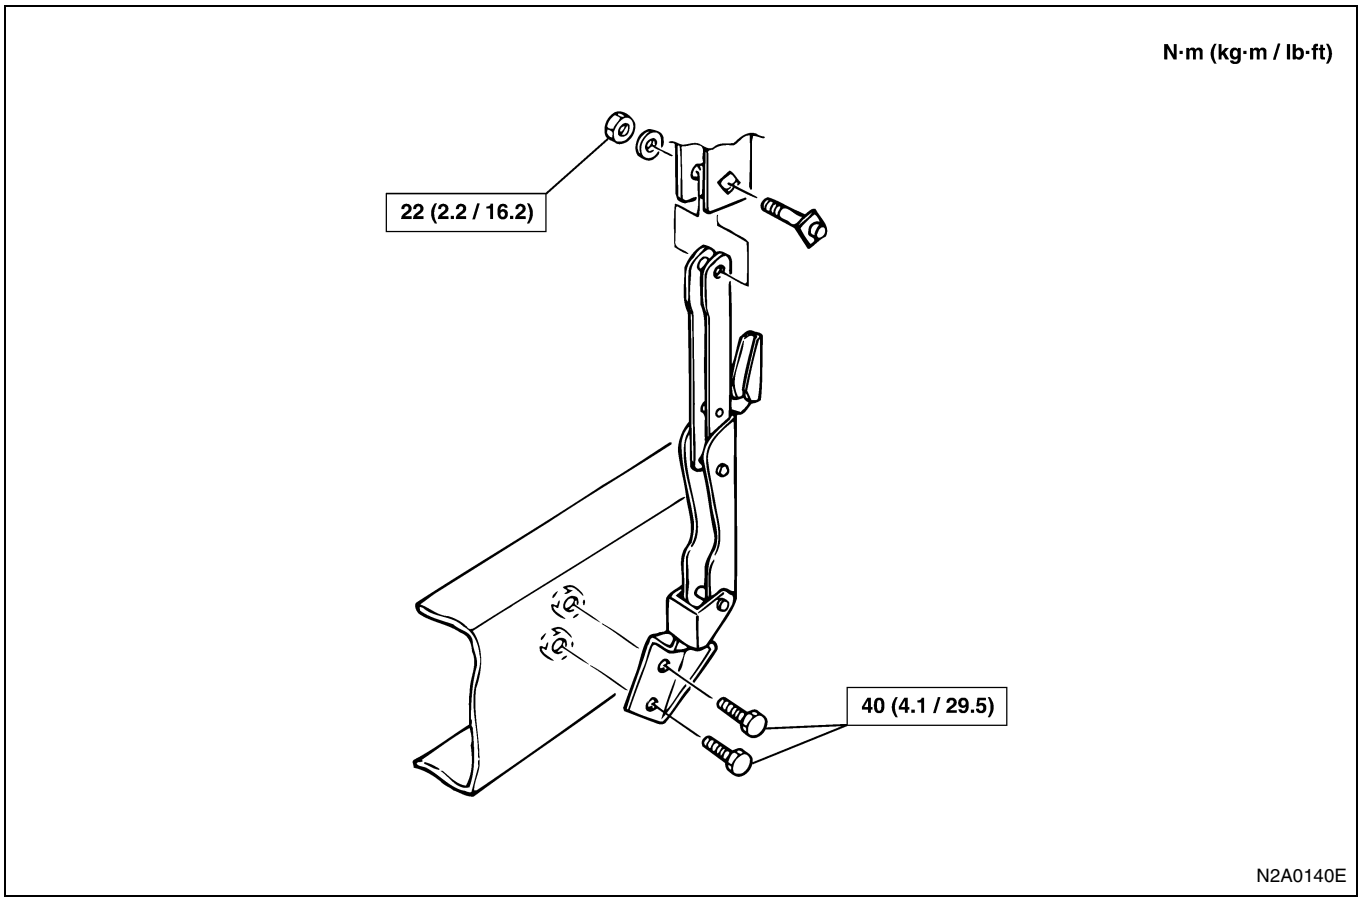
3. Tighten the cab stay pin fixing nut to the specified torque.

Tighten:
Cab stay pin fixing nut to 22 N·m (2.2 kg·m/16.2 lb·ft)

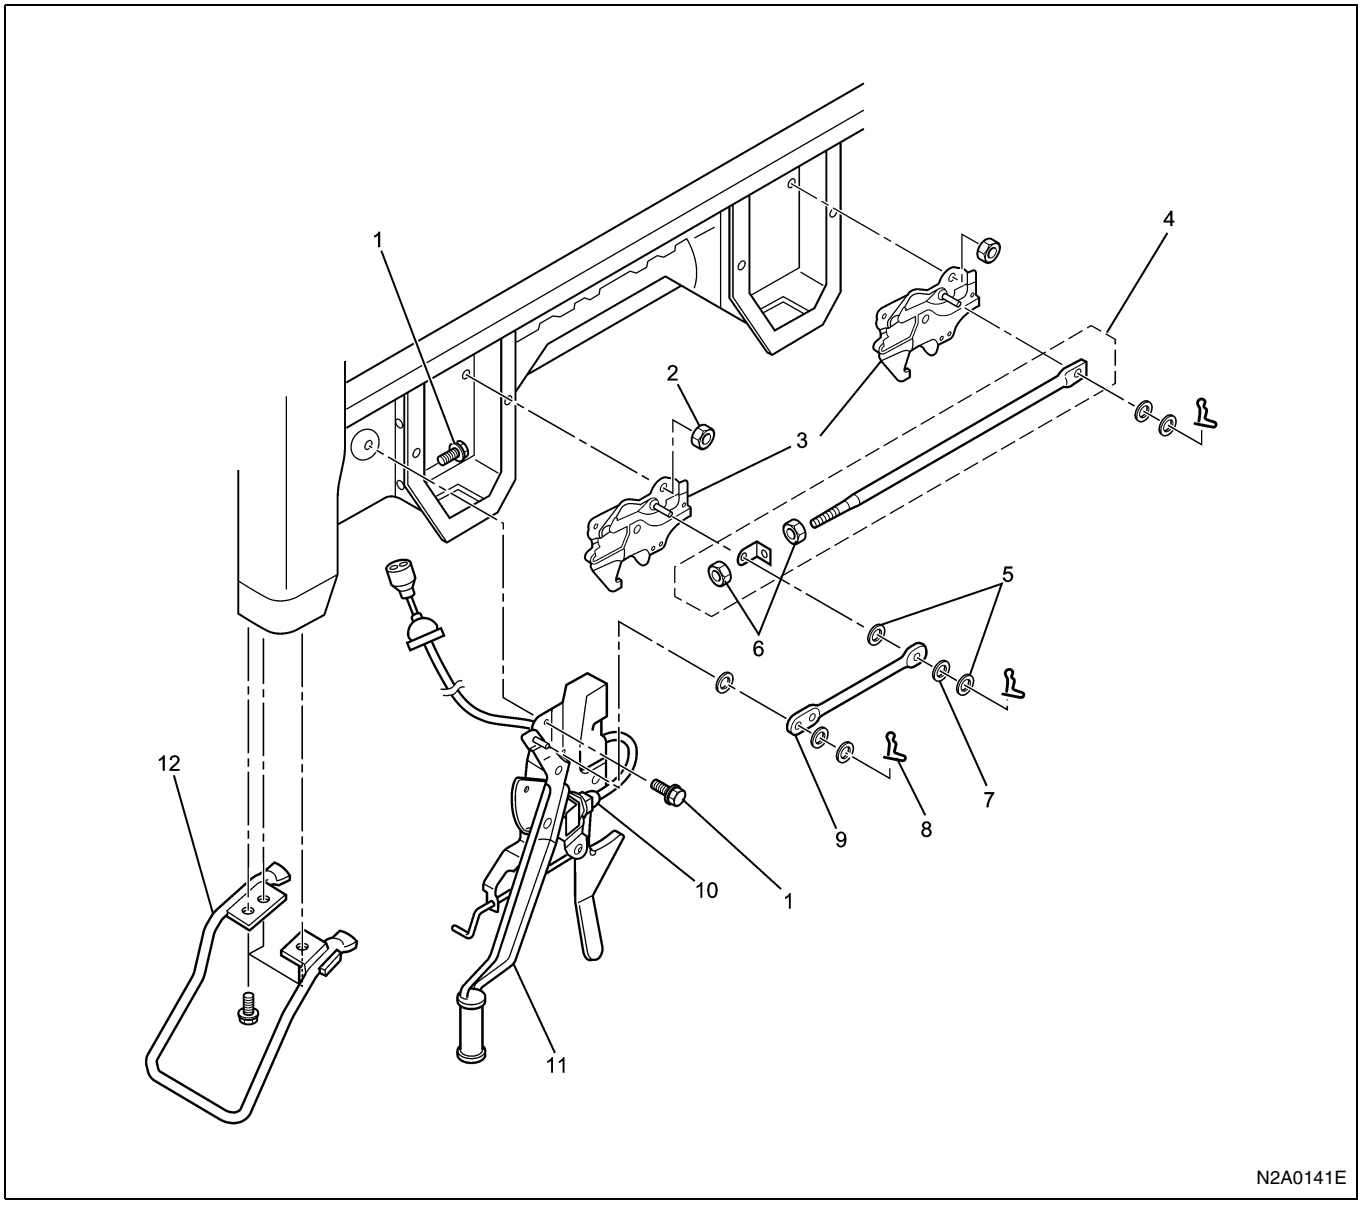
4. Tighten the cab stay frame side fixing bolt to the specified torque.

Tighten:
Cab stay frame side fixing bolt to 40 N·m (4.1 kg·m/29.5 lb·ft)

Fixing Torque



Cab Lock Assembly



Legend

1. Cab lock control unit fixing bolt
2. Cab lock assembly fixing nut
3. Cab lock assembly
4. Hook rod assembly
5. Washer
6. Adjust nut
7. Wave washer
8. Snap pin
9. Hand lever hook rod
10. Cab tilt switch
11. Cab control unit assembly
12. Tilt handle assembly

Removal

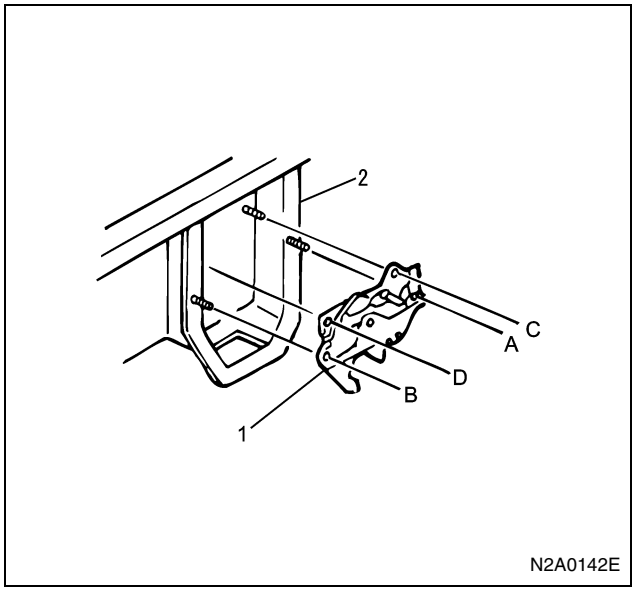
1. Disconnect the battery cable.
2. Hand lever hook rod
   - Pull out the snap pins and remove the washers and wave washers.
3. Hook rod assembly
4. Cab lock assembly
   - Remove the 4 fixing nuts.
5. Cab lock control unit assembly
   - Remove the 3 fixing bolts, and disconnect the harness connector of cab tilt switch.
6. Tilt handle assembly
   - Remove the 3 tilt handle fixing bolts.

Installation

For installation, reverse the removal procedure taking the following points into consideration.

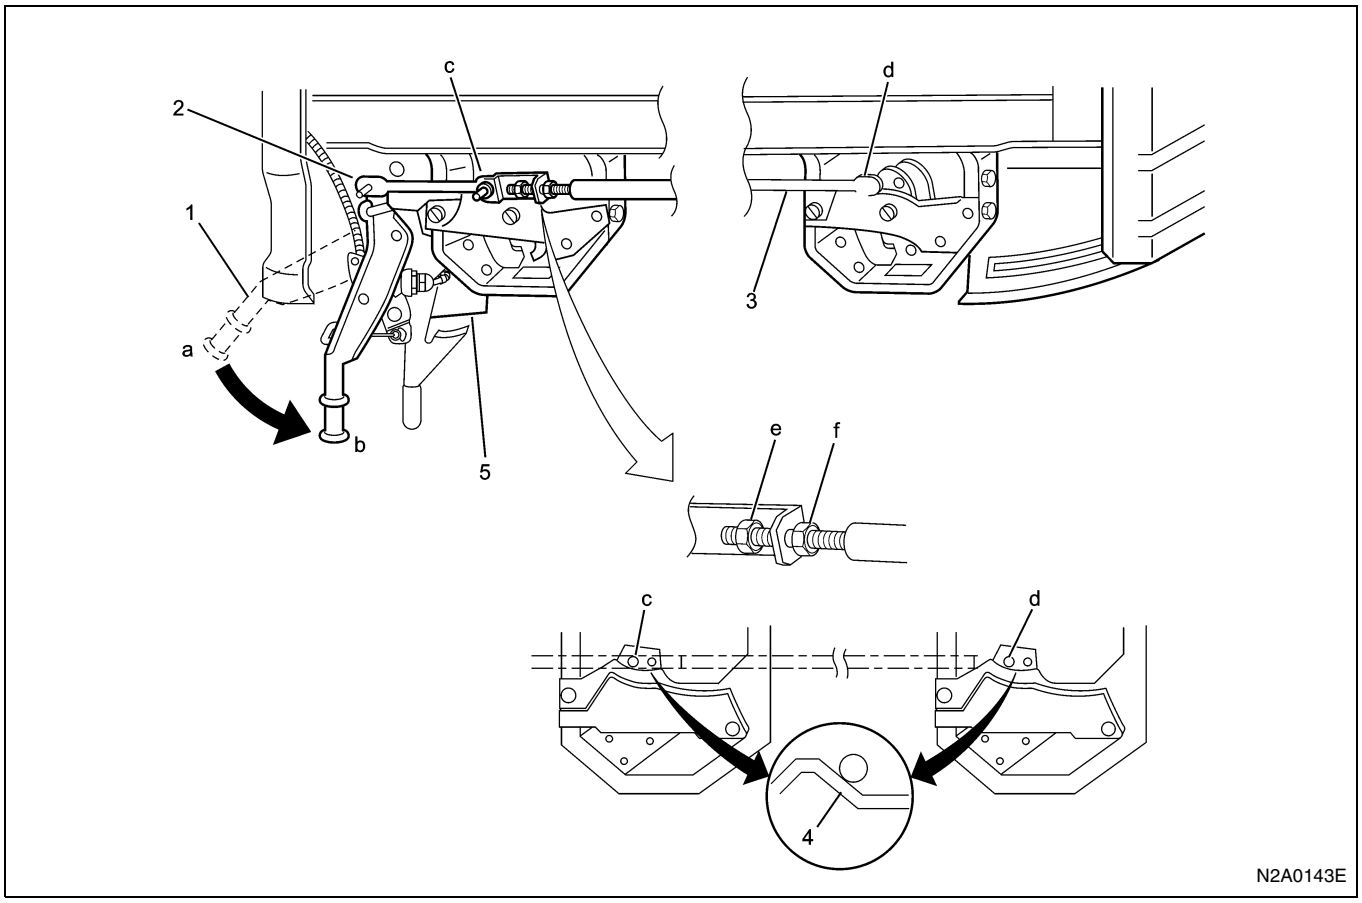
1. When installing cab lock assembly (1) to the rear mounting (2), install the LH and RH cab lock assembly, and tighten the nuts in the following sequence. First, temporarily tighten A, then tighten B to D to the specified torque, and lastly tighten A firmly.

Tighten:
Nut to 19 N·m (1.9 kg·m/14.0 lb·ft)

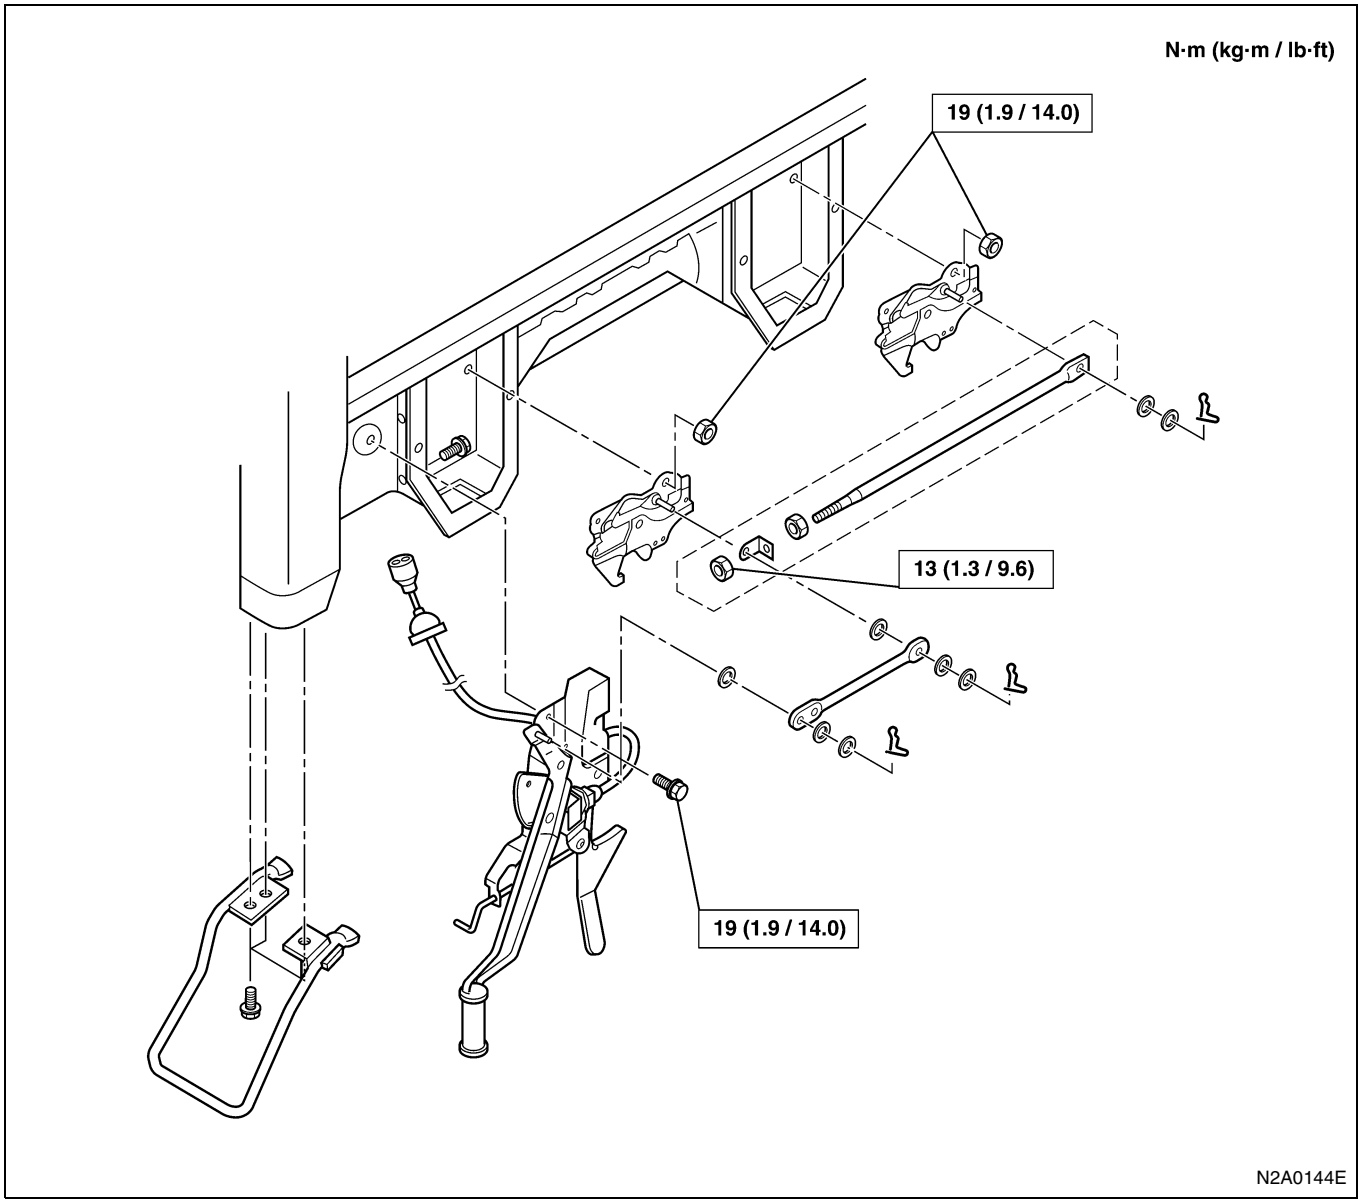


2. Install the hook rod assembly (3) and handle lever hook rod (2) and adjust.
   - Move the control lever (1) “a” to “b”. While holding “c” attached to the bracket (4), adjust the lock nut “e” and “f”. And then tighten to the specified torque so that both “c” and “d” contact to the bracket.

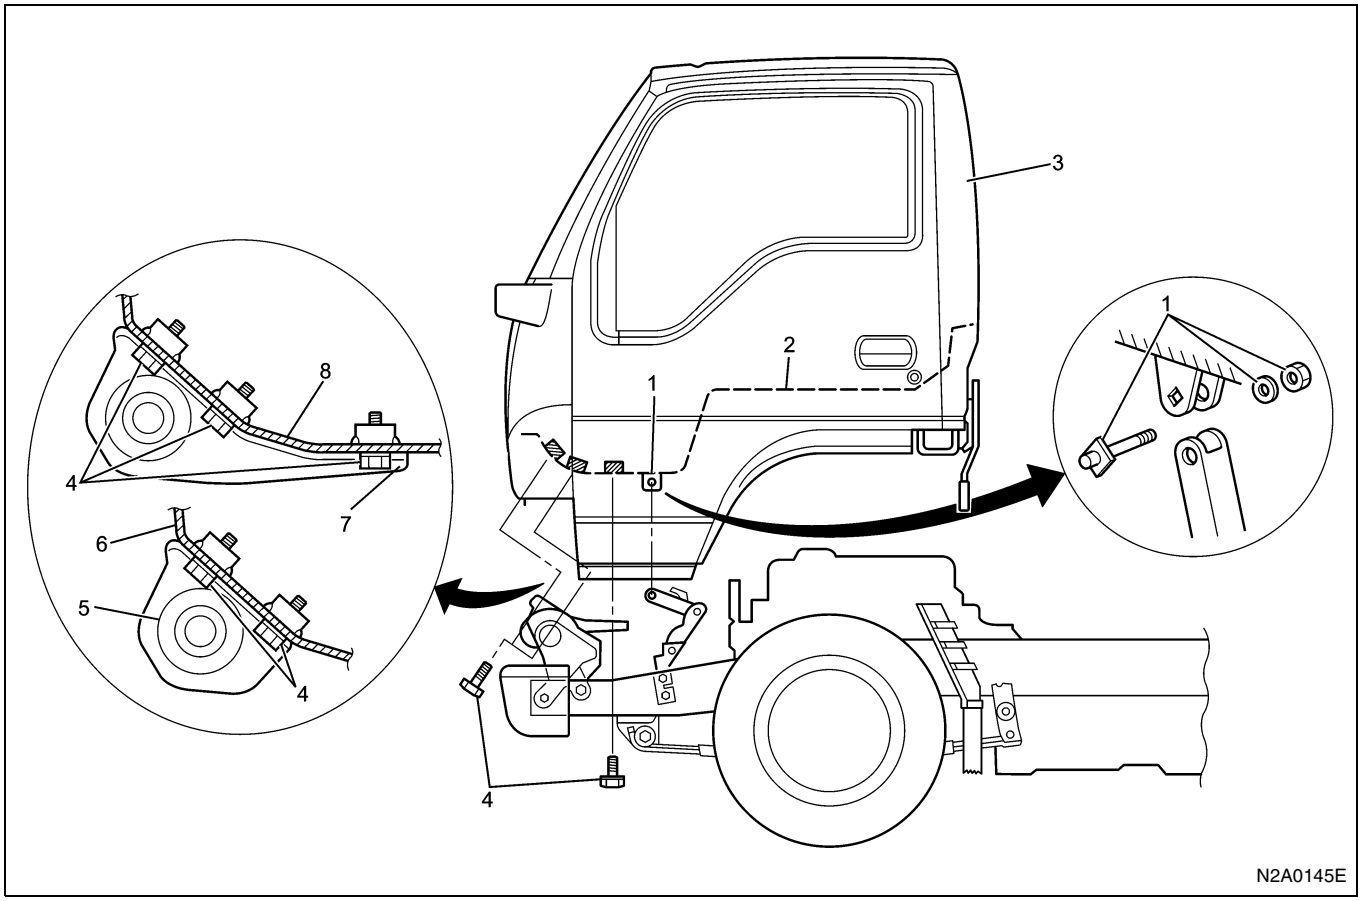
Tighten:
Lock nut to 13 N·m (1.3 kg·m/9.6 lb·ft)



Fixing Torque



Removal and Installation of Cab Assembly



Legend

1. Cab stay pin/nut (Tilt cab model)
2. Floor
3. Cab assembly
4. Cab fixing bolt
5. Frame side mounting lever (Non-tilt cab model)
6. Cab side front mounting rail (Non-tilt cab model)
7. Frame side front mounting lever (Tilt cab model)
8. Cab side front mounting rail (Tilt cab model)

Removal

Preparations

- Before removal or installation of the cab assembly, remove the following connections. The removal order is free. However, perform each step surely referring to each workshop manual.

1. Heater hose/air conditioner piping
   - Refer to “Heater and Ventilator” and “Air Conditioner”.
2. Accelerator control cable
   - Refer to “Fuel System” in Section 6C. Perform the work surely according to the procedure fit for the mounted engine.
3. Brake fluid piping
   - Refer to “Hydraulic Brake”.
4. Hydraulic clutch piping
   - Refer to “Clutch”.
5. Gear control cable
   - Refer to “Gear Control Cable”. Perform the work surely according to the procedure fit for the mounted engine.
6. Parking brake control cable
   - Refer to “Parking Brake”.
7. Steering linkage
   - Refer to “Steering Linkage”.
8. Harness connector/frame earth bolt
   - Refer to “Electrical Equipment”.
9. PTO control cable
   - Refer to “Power take-off (PTO)”. Perform the work surely according to the procedure fit for each type of PTO.
   - After disconnecting all the above connections, tilt the cab for a tilt cab vehicle or remove the rear mounting connection for a non-tilt vehicle. For removal of the rear mounting, refer to “Cab mounting” in this Section.
10. Cab stay pin and nut (tilt cab vehicle)
11. Cab mounting bolt
12. Cab assembly

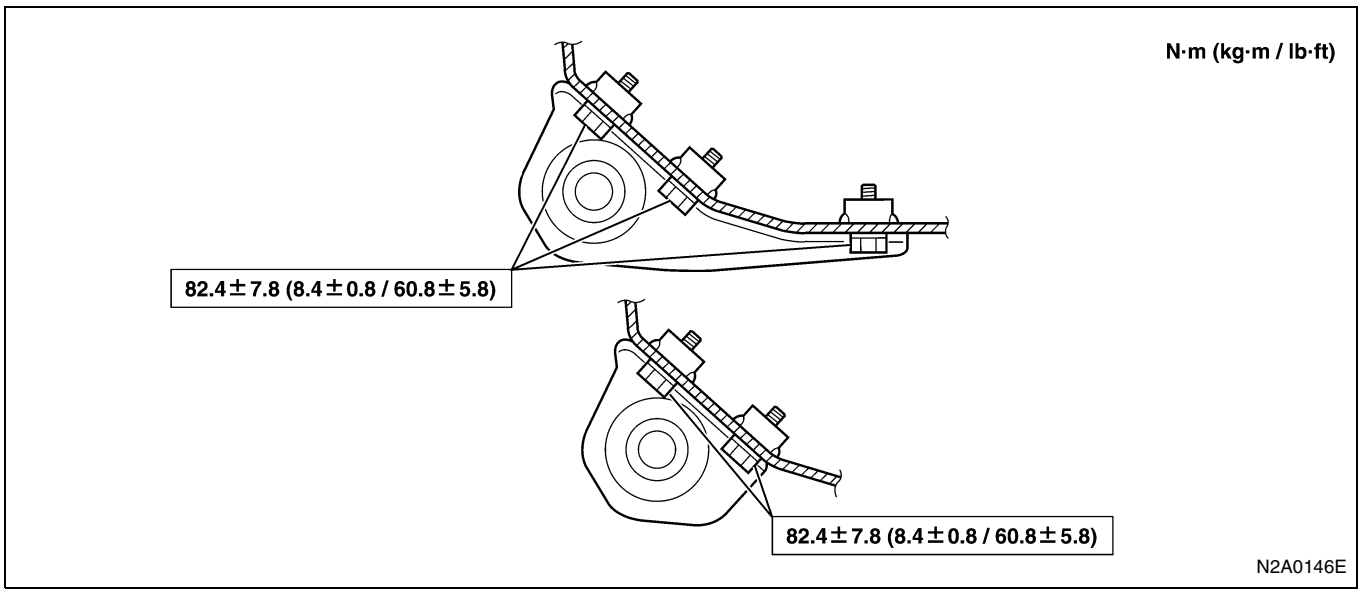
Installation

For installation, reverse the removal procedure taking the following point into consideration.

- Tighten the cab mounting bolt to the specified torque.

Tighten:
82.4±7.8 N·m (8.4±0.8 kg·m/60.8±5.8 lb·ft)

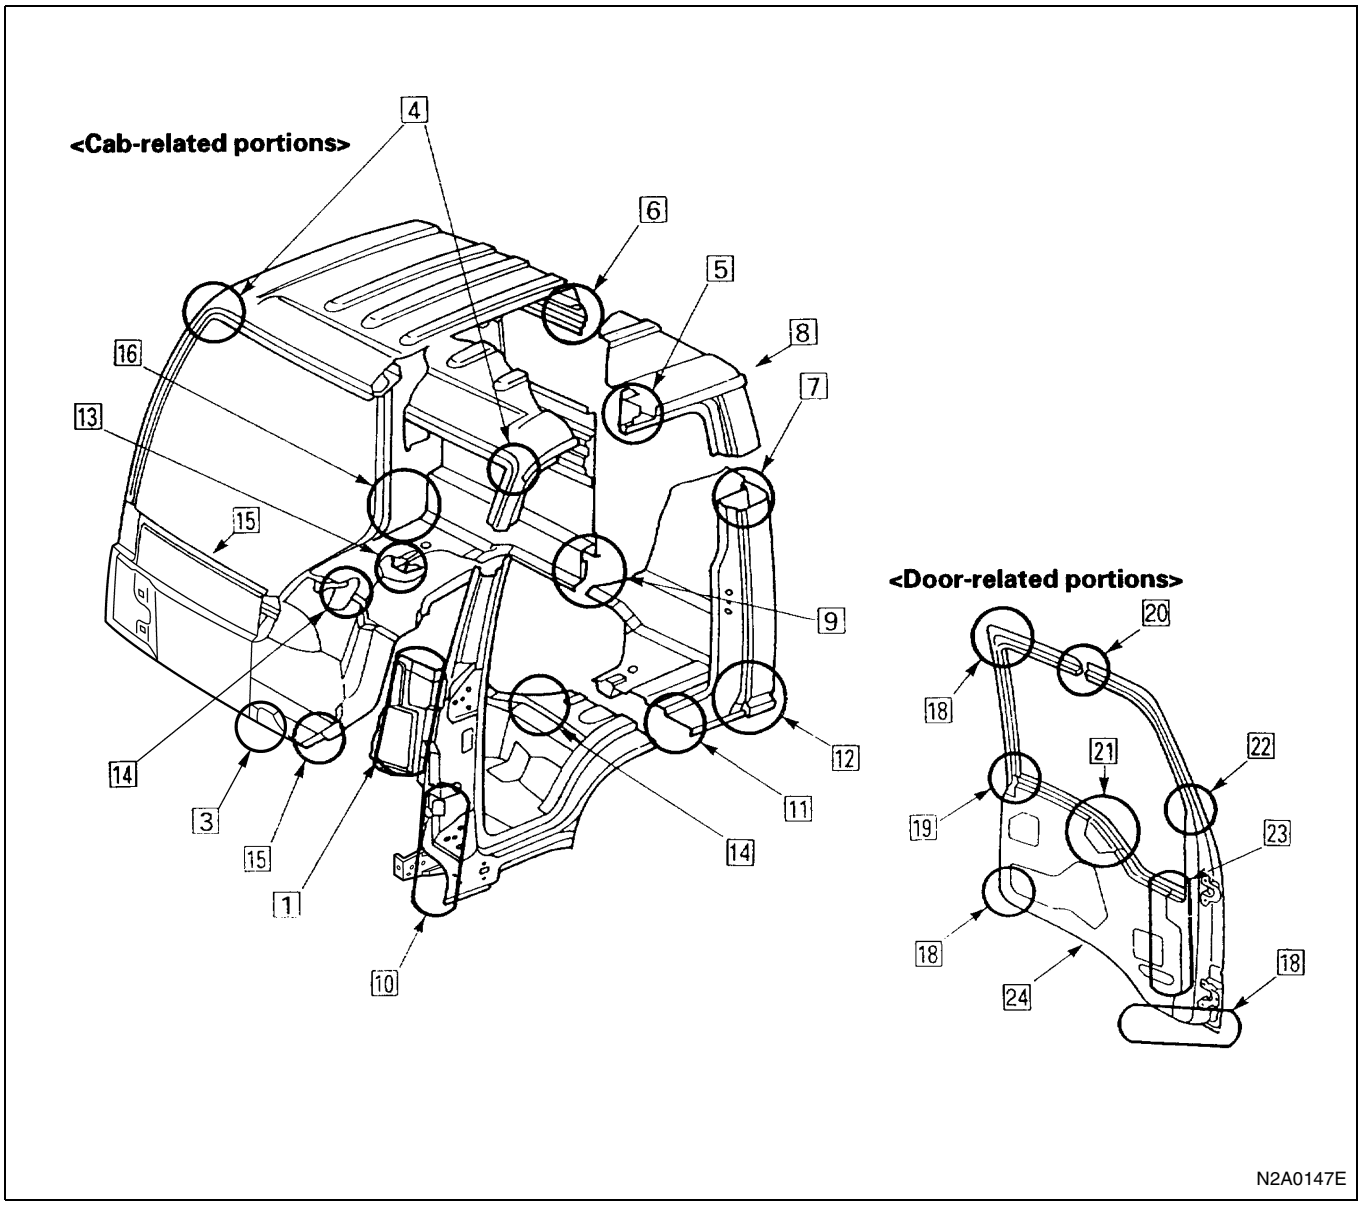
Fixing Torque



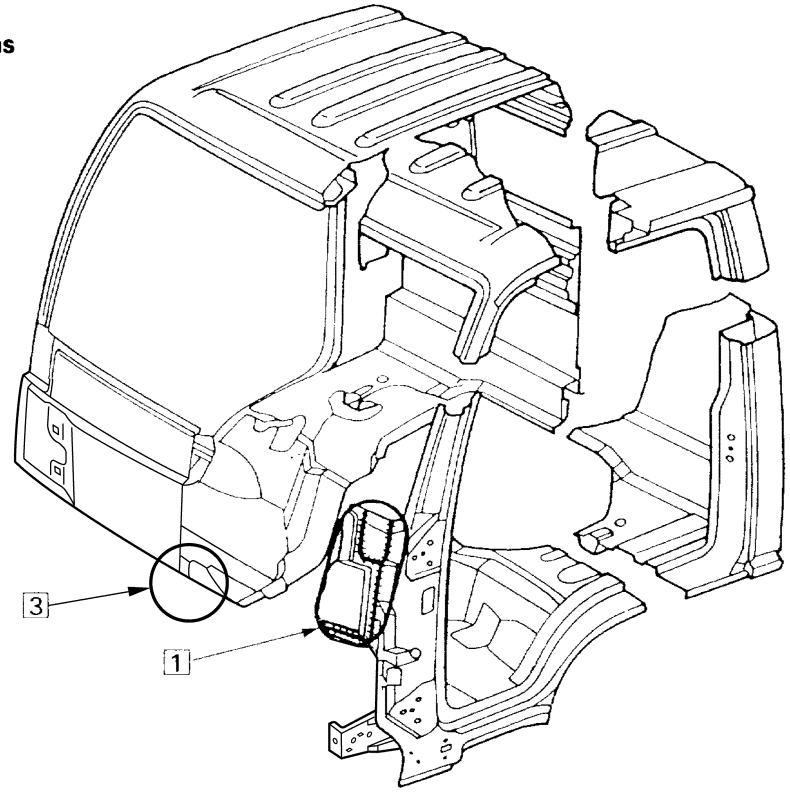
BODY PANEL SEALING (SINGLE CAB MODEL)

This paragraph describes body panel sealing. The sealing procedure described in this text should be performed as follows.

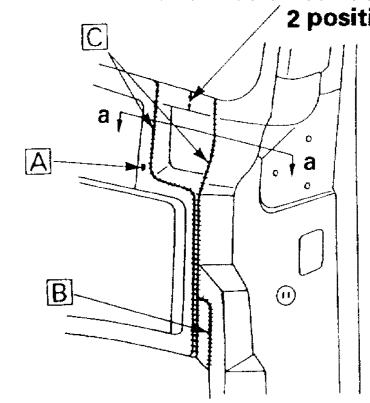
Purpose	1	Anti-rust	2	Air-water tightness	3	Sound insulation
External finish	A	Specially important	B	Important	C	Common
Sealing range						
Vehicle model	N	Narrow cab	W	Wide cab		

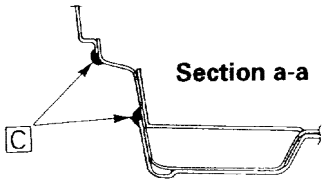


Front-related portions



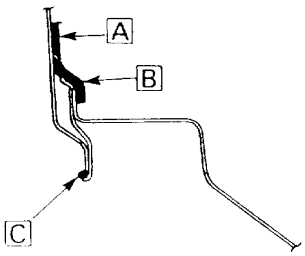
1





A: Center front panel location hole ø12 (l = 38) x 2
B: Hinge lower reinforcement + side panel junction l = 75 x 2
C: Center front panel + hinge reinforcement junction
Side panel + hinge reinforcement junction
l = 800 x 2 ①,②-Ⓒ
※ The indicated portion should be smoothed.

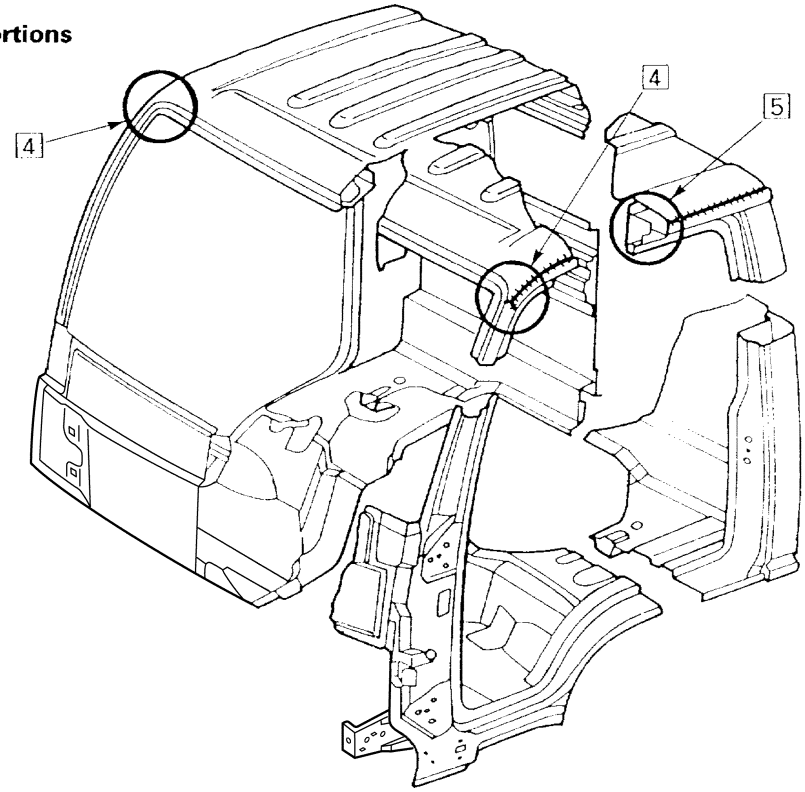
3



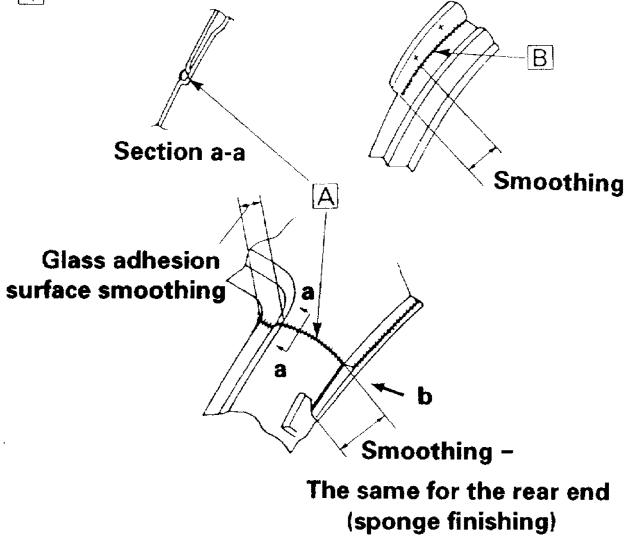
A: Center floor panel to front mounting rail Extension + front floor panel melting sheet sticking
B: Front mounting extension + front mounting rail junction Sealing ②-Ⓒ
C: Center front panel + front mounting extension junction Sealing ①,②-Ⓒ

N2A0148E

Roof-related portions



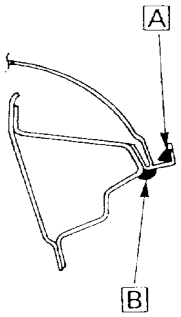
4



A: **Side panel + roof panel + side drip junction**
l = 120 x 2 ①-Ⓐ
※Perform finishing without any corrugation or curvature.
The indicated portion should be smoothed.

B: **Side panel + side drip junction**
①,②-Ⓐ
l = 1040 x 2
※The indicated portion should be smoothed.

5

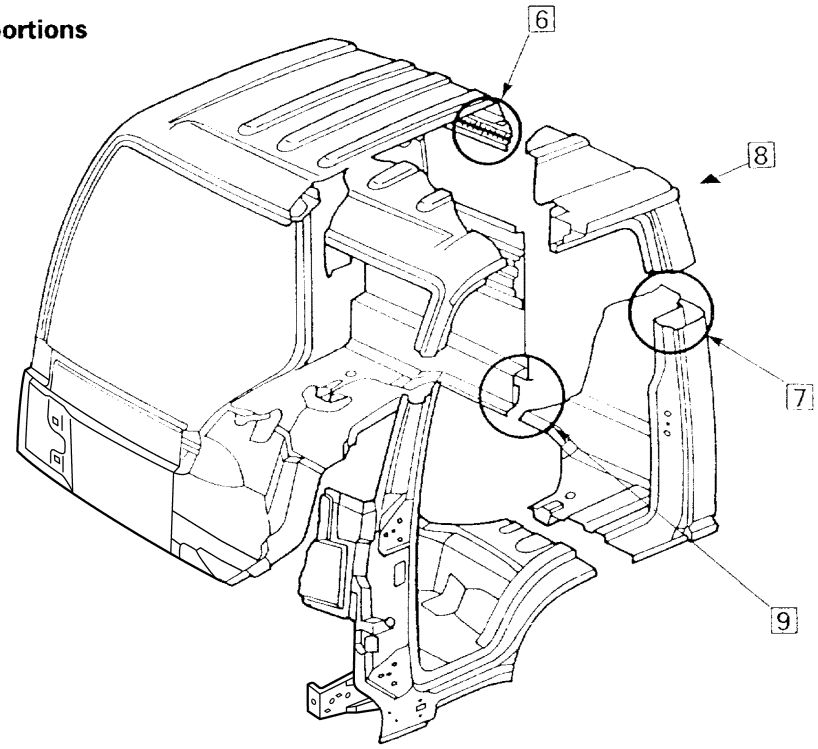


A: **Roof panel + side drip junction**
①,②-Ⓒ
l = 1000 x 2
※No break should be found on sealing.

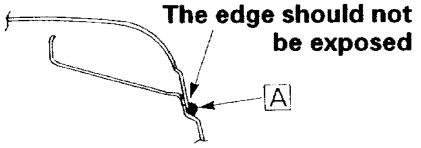
B: **Refer to 4-B**

N2A0149E

Back panel-related portions

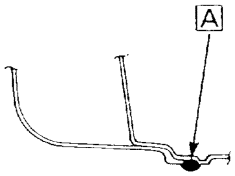


6



A: Roof panel + back panel junction
Narrow cab l = 1300 ①,②-Ⓐ
Wide cab l = 1720

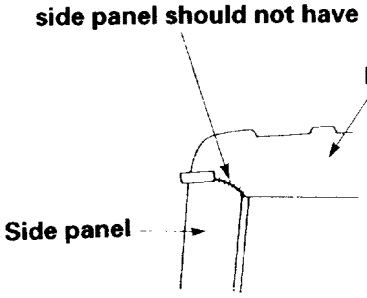
7



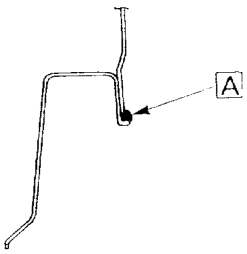
A: Side panel + back panel junction
①,②-Ⓐ
l = 845 x 2
※Uniformity is required without any corrugation.

8

The junction between the roof panel and side panel should not have any exposed edge.



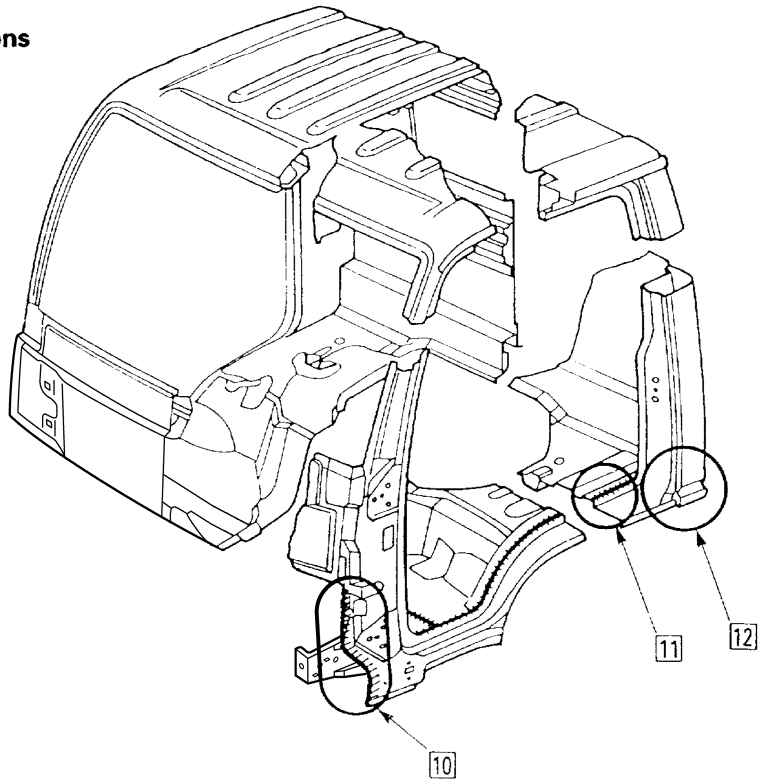
9



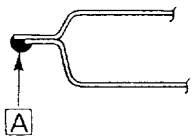
A: Back panel + rear mounting rail junction
Narrow cab l = 1320
Wide cab l = 1700
※Uniformity should be required without any corrugation.

N2A0150E

Side panel-related portions

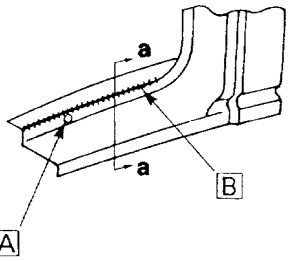


10

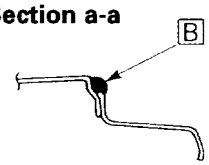


A: Side panel + hinge lower reinforcement junction
l = 300 x 2 ②-Ⓒ

11

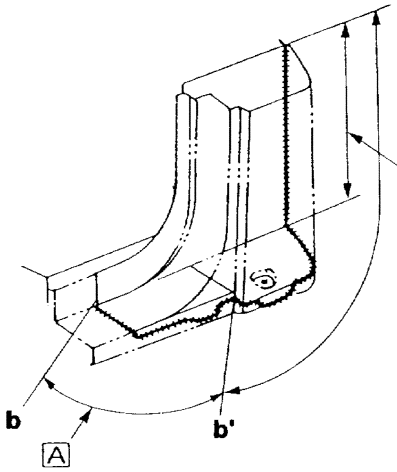


Section a-a



A: Side panel location hole periphery
ø8 (l = 25) x 2 ①-Ⓒ
※Don't block up the hole.
B: Side panel + floor panel junction
l = 1000 x 2 ②-Ⓒ

12

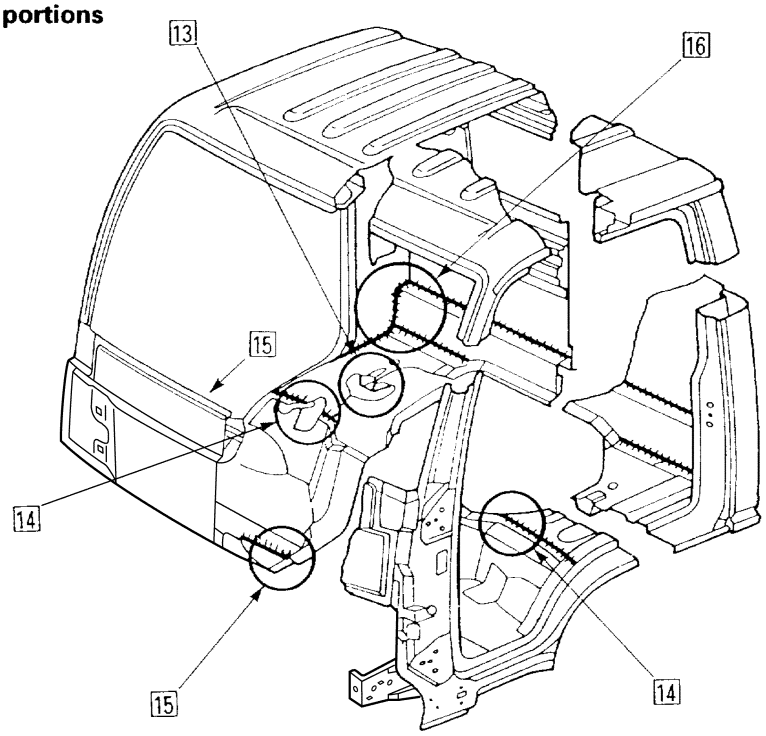


A: Side panel + rear pillar lower closing junction
l = 280 x 2 ①,②,③-Ⓒ
※Completely fill up the clearance between b and b'.

This section should not have any exposed edge.

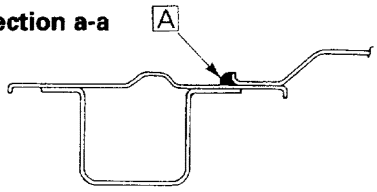
N2A0151E

Floor panel-related portions



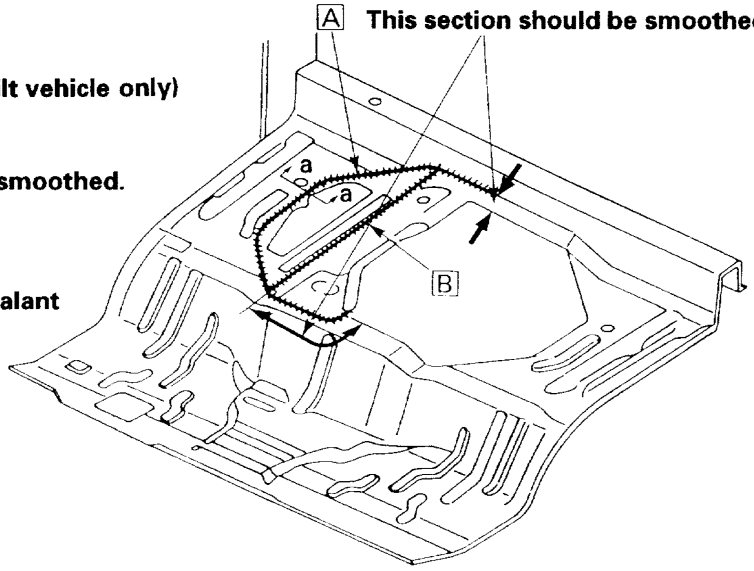
13

Section a-a



A: Support cover + floor panel + rear mounting rail junction periphery (tilt vehicle only)
Narrow cab l = 1580 ②-Ⓒ
Wide cab l = 1760
※The indicated portion should be smoothed.

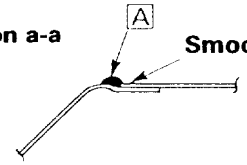
B: Support cover + engine lever reinforcement junction
l = 720 ②-Ⓒ
※Perform finishing without any sealant break or clearance.



N2A0152E

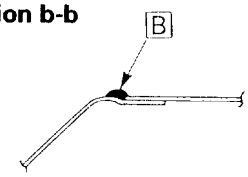
14

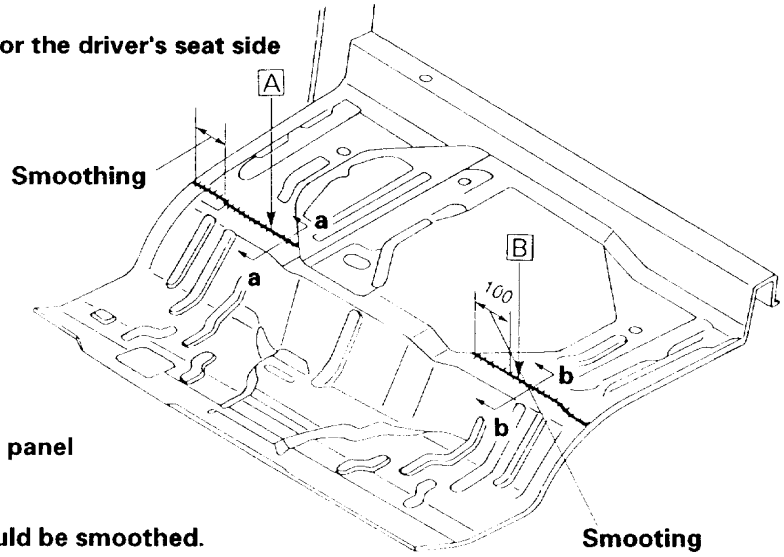
Section a-a



Smoothing for the driver's seat side

Section b-b

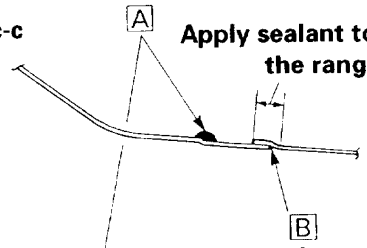




A, B: Front floor panel + rear floor panel junction
l = 400
※The indicated portion should be smoothed.

15

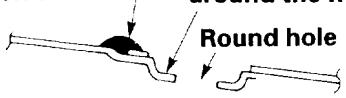
Section c-c

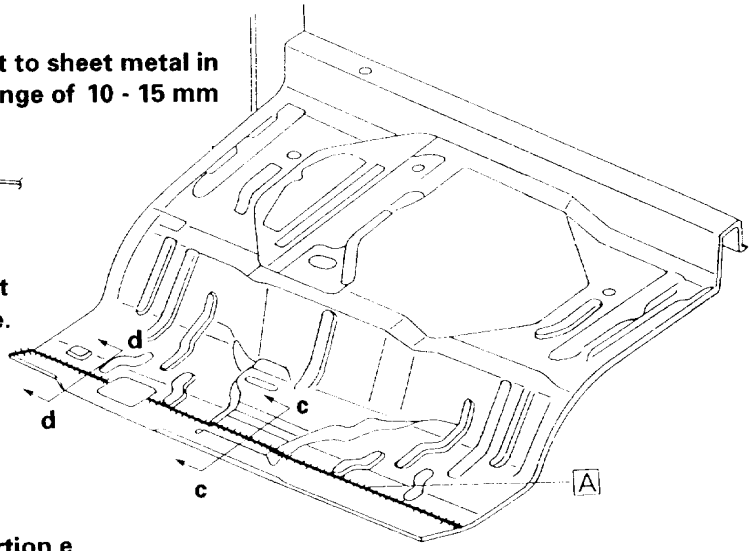


Apply sealant to sheet metal in the range of 10 - 15 mm

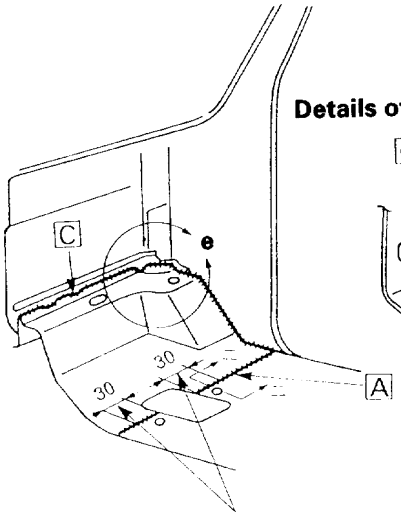
Don't apply sealant around the hole.

Section d-d



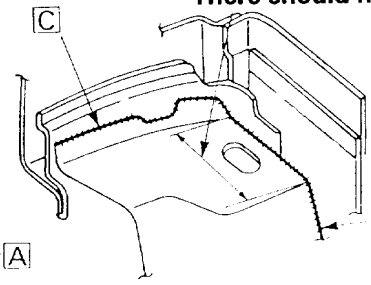


Details of portion e



Perform brushing in the width of 30 mm without touching the grommet hole.

There should not be any swell around the hole.



A: Front mounting rail + front floor panel junction
Narrow cab l = 1330
Wide cab l = 1620 ②-Ⓒ
※The indicated portion should be smoothed.

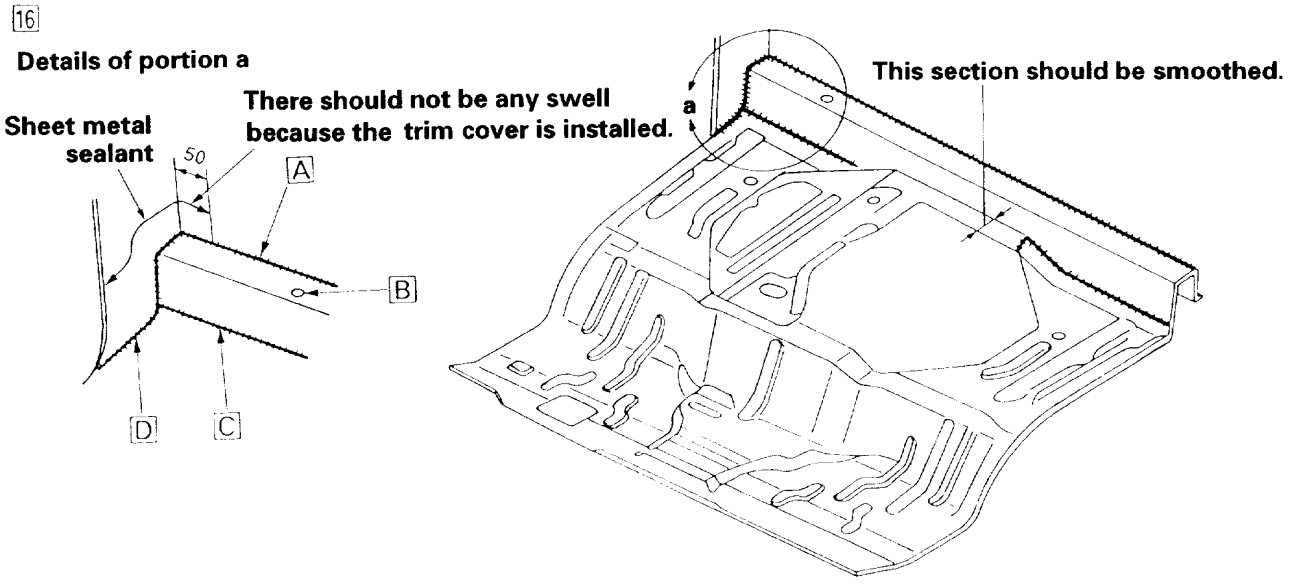
D B: Front floor panel end
Apply sheet metal sealant.
10 - 15 mm

C: Front mounting rail + front mounting rail extension junction
Narrow cab l = 1450
Wide cab l = 1750 ②-Ⓒ

D: Front pillar lower closing + front mounting + front floor panel junction
l = 370 x 2 ②-Ⓒ
※Apply sheet metal sealant without touching the grommet hole.

N2A0153E

16



A: Rear mounting rail + back panel junction
Narrow cab l = 1320 ①,②-Ⓒ
※The indicated portion should be smoothed.
Perform finishing without any clearance between both ends.

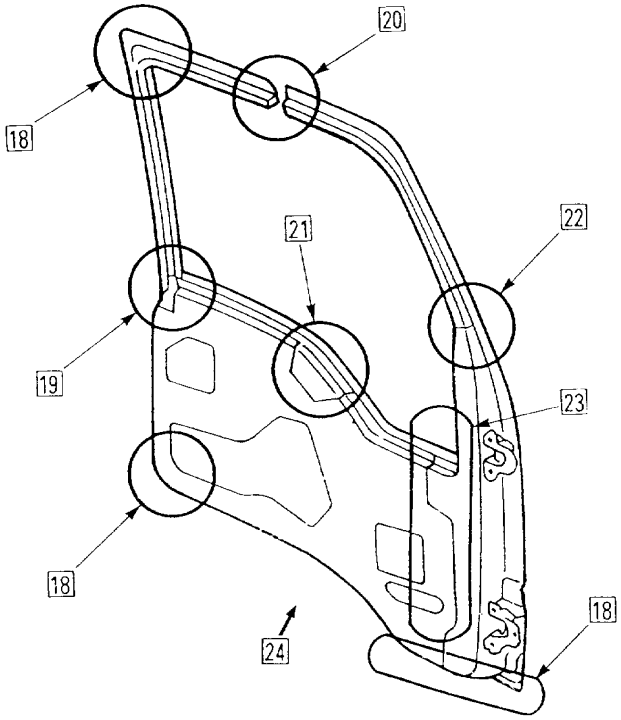
B: Rear mounting rail location hole
ø20 (l = 63) x 2 ②-Ⓒ

C: Rear floor panel + rear mounting rail junction
l = 460 x 2 ②-Ⓒ
※The indicated portion should be smoothed,

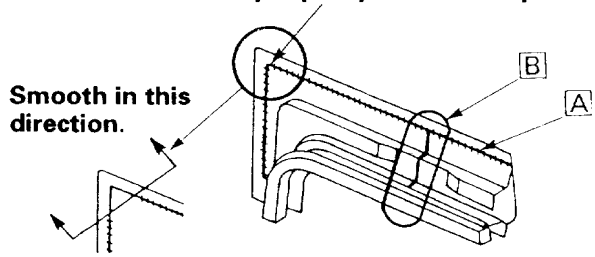
D: Rear pillar lower closing + rear floor panel + rear mounting rail junction
l = 590 x 2 ②-Ⓒ
※Sheet metal sealant

N2A0154E

Door-related portions

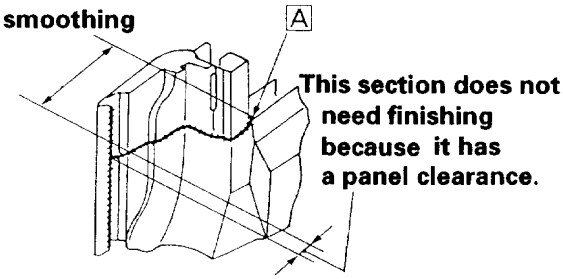


18

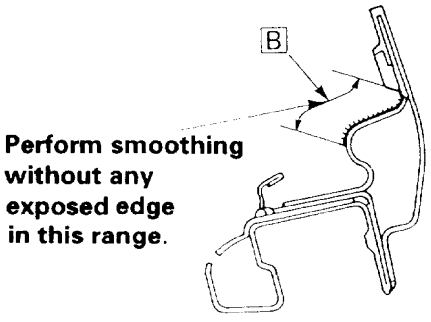


A: Door outer panel + door inner panel junction
l = 4970 x 2 ①,②-Ⓐ
※The indicated portion should be smoothed.

19

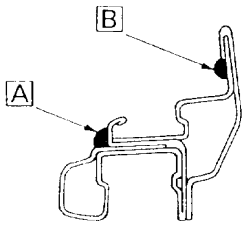


A: Door outer panel + door sash junction
l = 120 x 2 ①,②-Ⓐ
※Be careful about finishing.



B: Door sash rear + door sash front junction
①-Ⓐ
※The indicated portion should be smoothed.

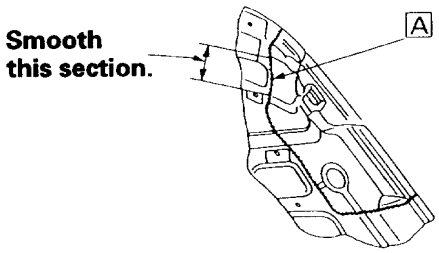
20



A: Door sash junction
①-Ⓒ
B: Refer to 18-A

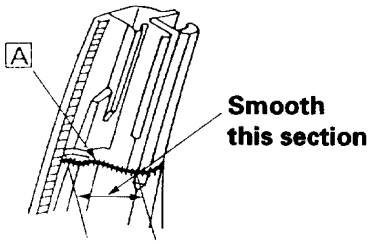
N2A0155E

21



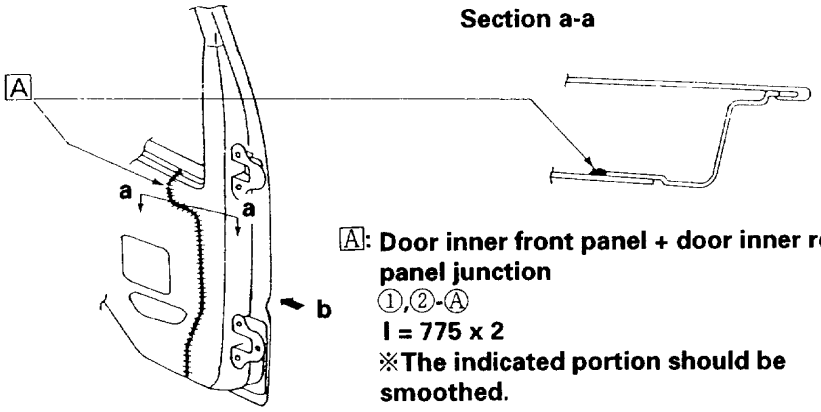
A: Door inner panel + door pull handle reinforcement junction
l = 400 x 2 ②-Ⓒ
※The indicated portion should be smoothed.

22



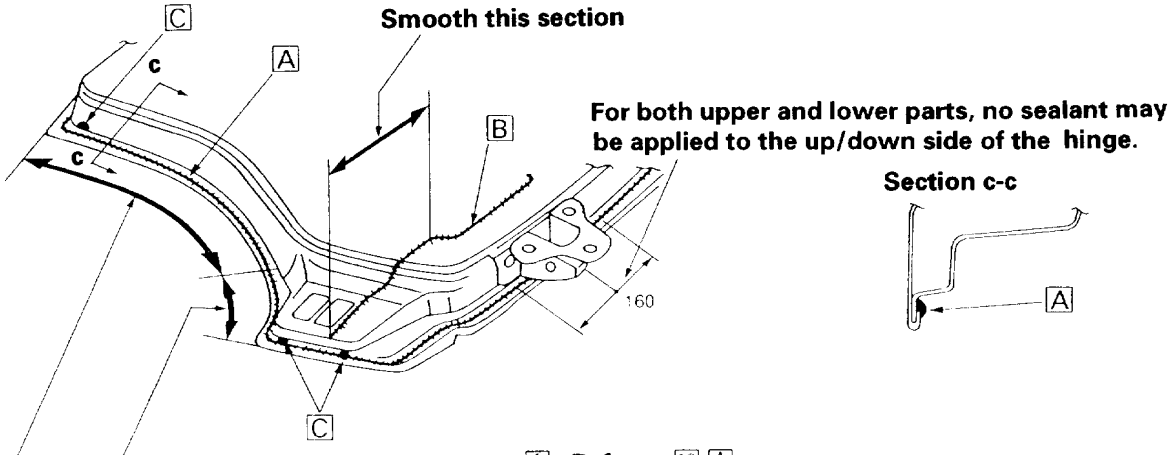
A: Door inner panel + door frame ASM junction
①,②-Ⓐ
※The indicated portion should be smoothed.

23



A: Door inner front panel + door inner rear panel junction
①,②-Ⓐ
l = 775 x 2
※The indicated portion should be smoothed.

24



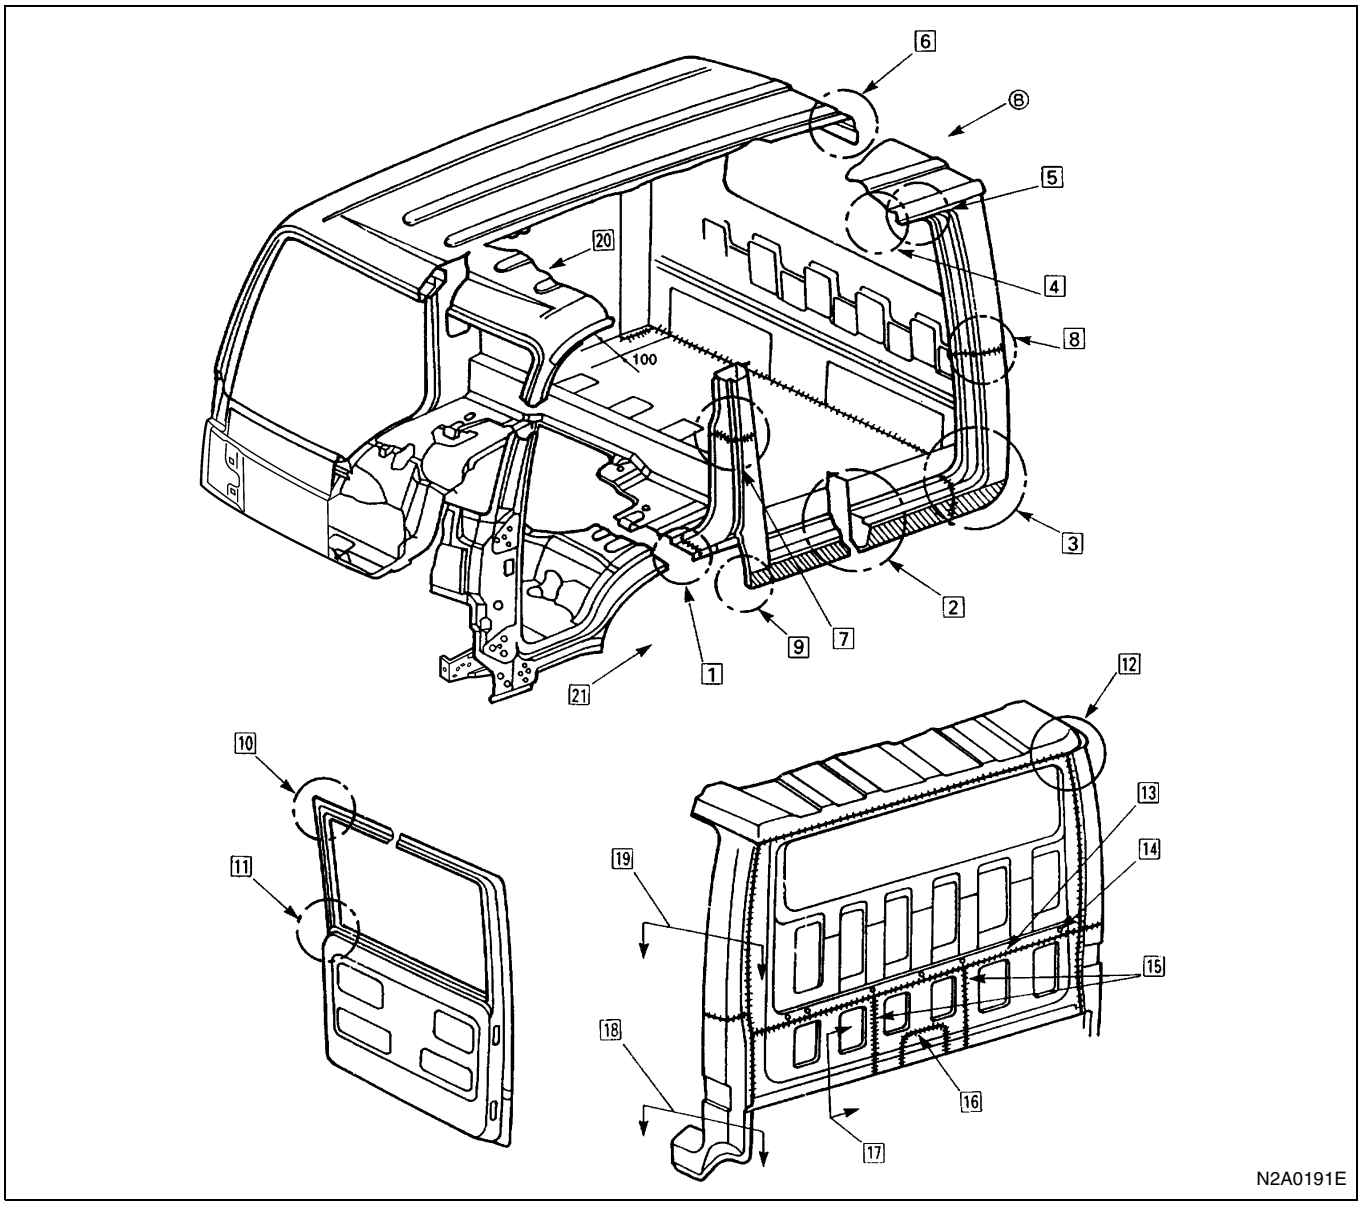
A: Refer to 18-A.
B: Refer to 23-A.
C: Door outer panel + door inner panel junction drain hole
l = 30 x 3 positions x 2

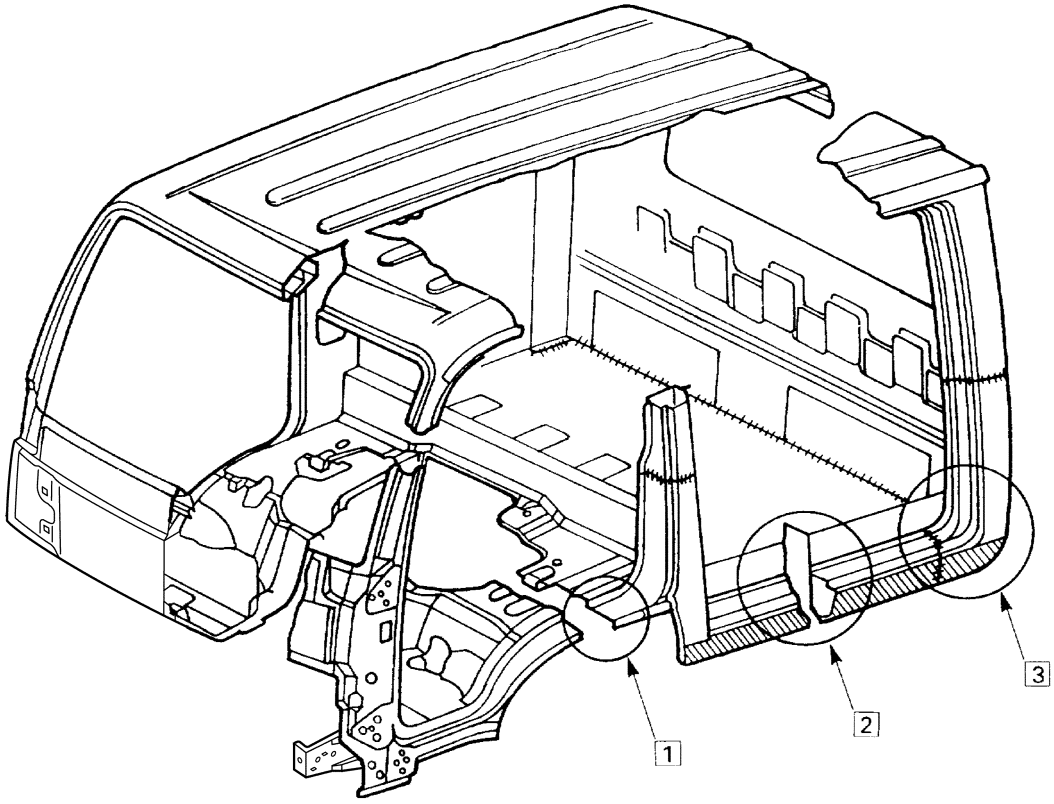
N2A0156E

BODY PANEL SEALING (CREW CAB MODEL)

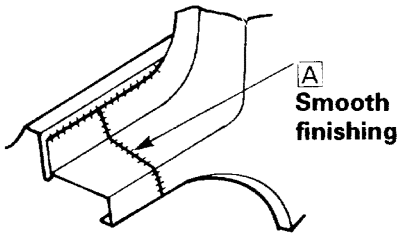
This Chapter describes the sealing procedure for body panel.
The sealing procedure described in the text should conform to the following.

Purpose	1	Rust prevention	2	Air-tightness and water-tightness	3	Sound insulation
External finish	A	Specially important	B	Important	C	Common
Sealing range						



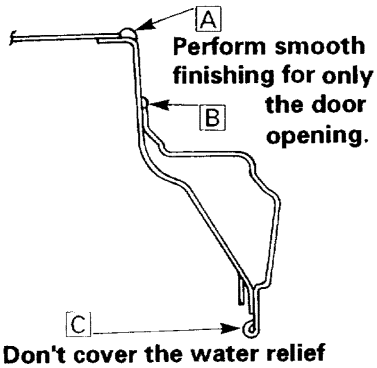


1



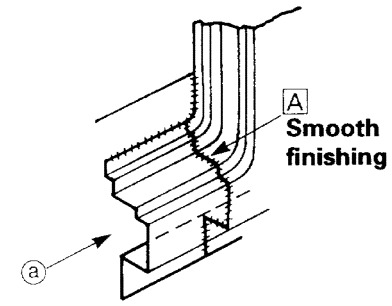
A: Floor panel + Side panel + Center pillar fitting.
①-B
※Perform smooth finishing.

2

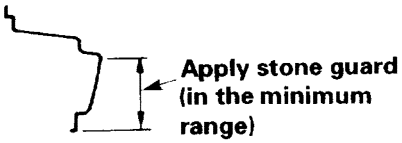


A: Rear floor panel + Floor side panel fitting
①, ②-B
※Perform smooth finishing for the door opening.
B: Outer sill + Floor side panel fitting
①
D: Outer sill + Floor side panel fitting
①-C
※Don't cover the water relief hole.

3

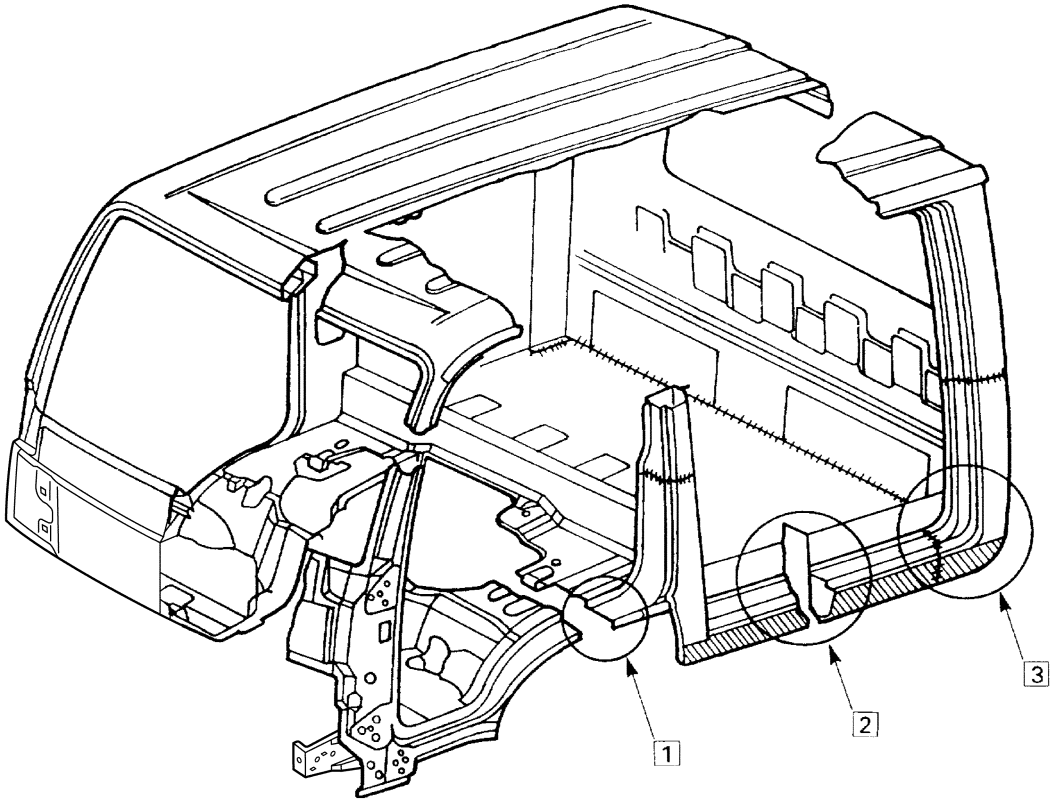


View ⓐ

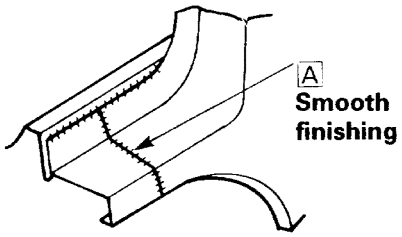


A: Rear pillar + Outer sill fitting
①-B
※Perform smooth finishing.

N2A0192E

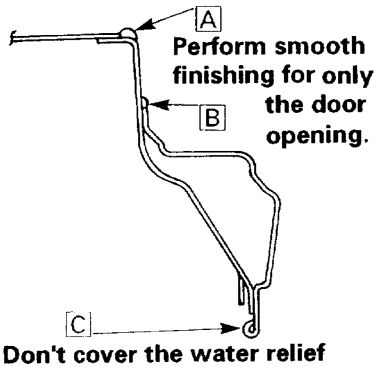


1



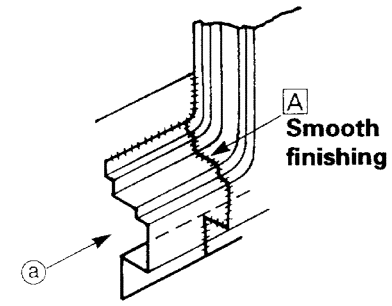
A: Floor panel + Side panel + Center pillar fitting.
①-B
※Perform smooth finishing.

2

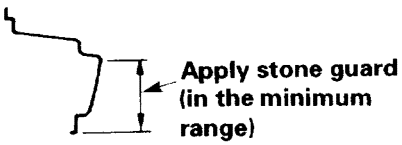


A: Rear floor panel + Floor side panel fitting
①, ②-B
※Perform smooth finishing for the door opening.
B: Outer sill + Floor side panel fitting
①
D: Outer sill + Floor side panel fitting
①-C
※Don't cover the water relief hole.

3

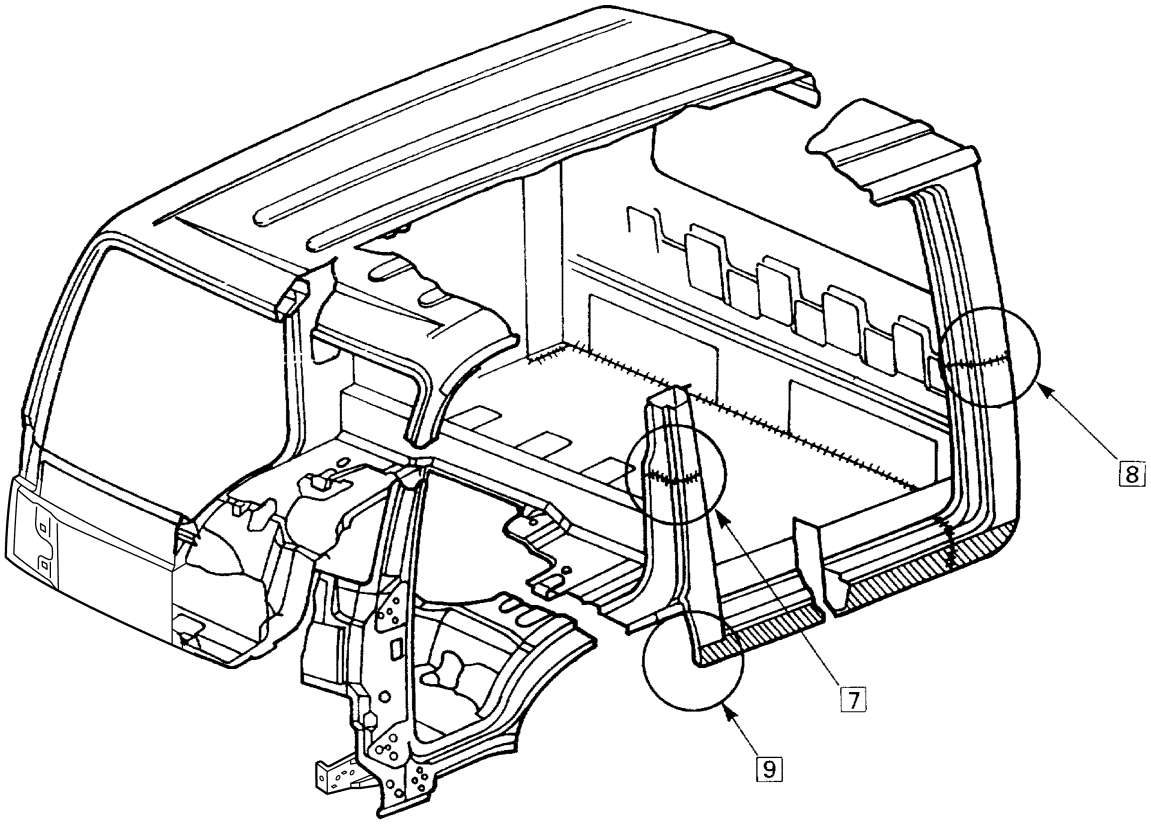


View ⓐ

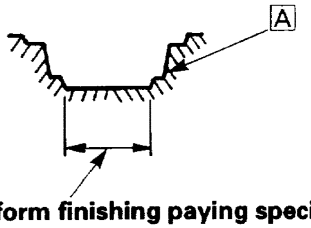


A: Rear pillar + Outer sill fitting
①-B
※Perform smooth finishing.

N2A0193E



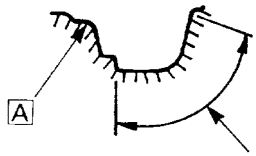
7



Perform finishing paying special attention to this section.

A: Center pillar upper + Center pillar lower fitting
①, ②-A
※The indicated range is the most important in respect of external finishing.

8

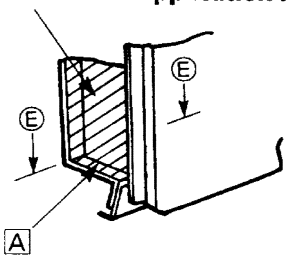


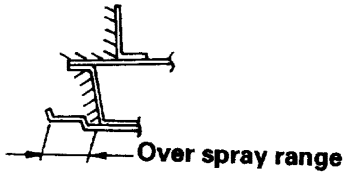
Perform finishing paying special attention to this section.

A: Rear pillar upper + Rear pillar lower fitting
①, ②-A
※The indicated range is the most important in respect of external finishing.

9

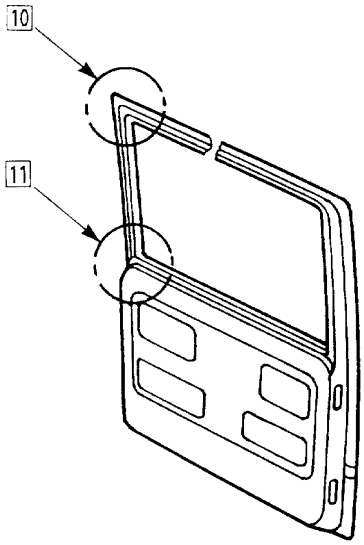
Under coat application range



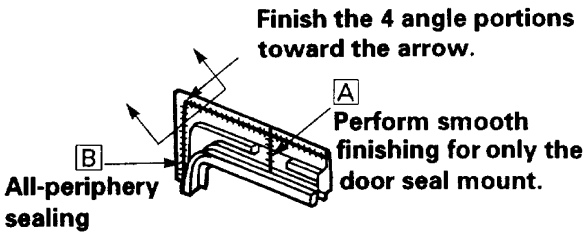


A: Rear door hinge + Floor side panel + Center pillar lower fitting
①, ②-B

N2A0194E



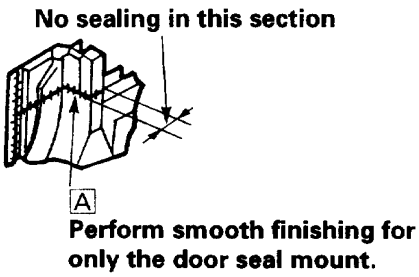
10



A: Door sash extension front + Door sash extension rear fitting
①-A
※Perform smooth finishing for only the door seal mount.

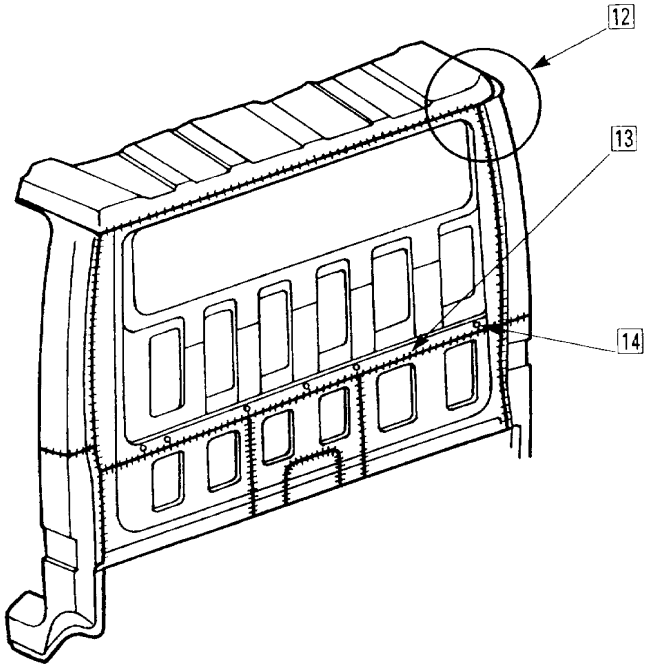
B: Door outer panel + Door inner panel fitting
①-A
※Perform sealing for all the periphery of the door. Finish the 4 angle portions toward the indicated arrow.

11

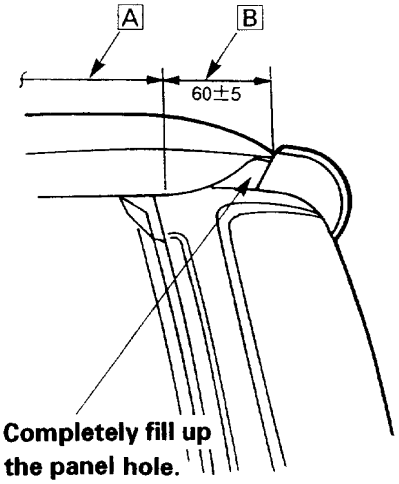


A: Door sash extension + Door inner panel fitting
①-A
※Perform smooth finishing for the door seal mount.

N2A0195E

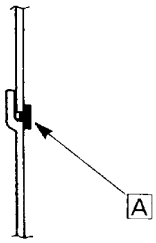


12



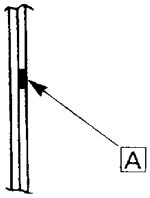
A: Roof panel + Back panel fitting
①, ②-C
B: Roof panel + Back panel fitting
①, ②-B
※Perform smooth finishing for the section from the end to a 60 ±5 mm position and completely fill up the panel hole.

13



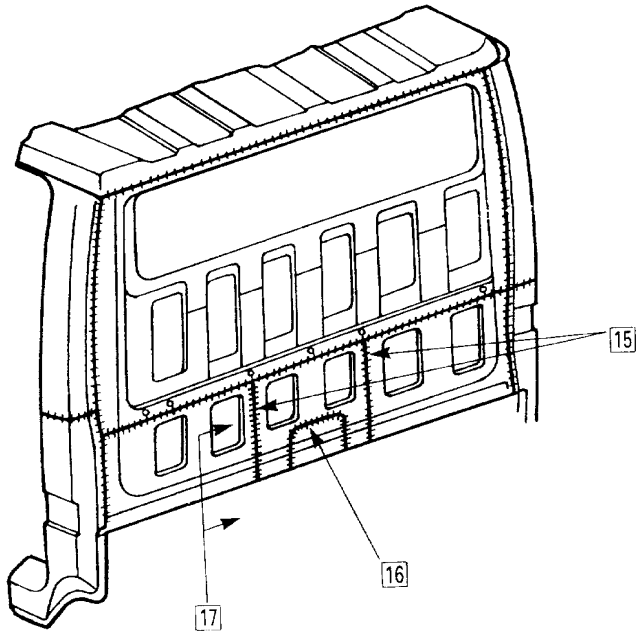
A: Back panel + Back panel lower fitting
①, ②-C
※Perform smooth finishing for the section from the end to a 5 ±3 mm position and don't expose the panel edge.

14



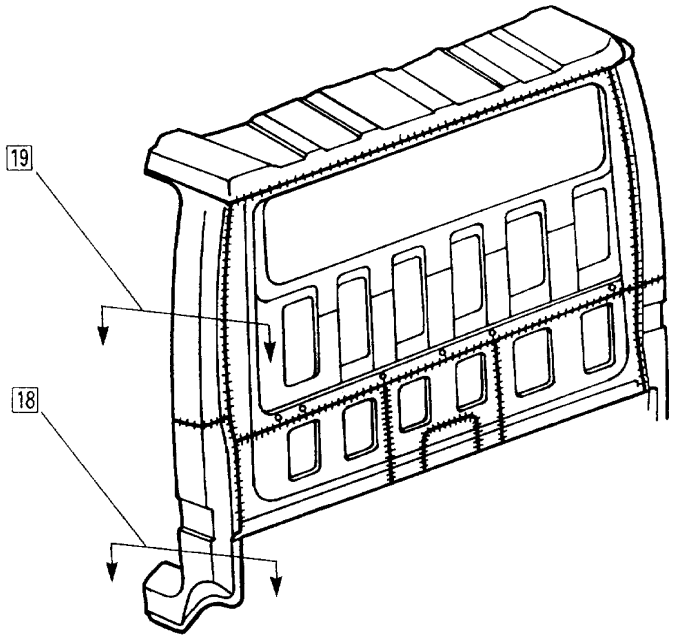
A: All the periphery of the back panel hole
①, ②-B

N2A0196E

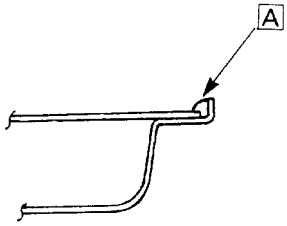


15 (Wide cab only)	16 (Fire engine only)	17
		A: back panel lower side + Back panel center fitting **①, ②-C** **※Don't expose the panel edge.**	**A: Back panel lower + P.T.O. cover fitting** **①-C** **※Fill up the panel angle securely with care because of its large gap.**	**A: Back panel lower + Rear floor panel bolster fitting** **②-B** **B: Back panel + Rear bolster fitting** **①-C**

N2A0197E



18



A: **Front side panel + Rear pillar fitting**
①, ②-**B**
Refer to 2-C.

TROUBLE SHOOTING

Steering System

PROBLEM	POSSIBLE CAUSE	CORRECTION
Objectionable “Hiss”	Noisy relief valve. There is some noise in all power steering systems. One of the most common is a hissing sound most evident at standstill parking. Hiss is a high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results from high velocity fluid passing valve orifice edges. There is no relationship between this noise and performance of the steering. “Hiss” may be expected when the steering wheel is at end of travel of when slowly turning at stand still.	Do not replace the valve unless “hiss” is extremely objectionable. A replacement valve will also exhibit slight noise and is not always a cure.
Rattle or Chuckle Noise in the Steering Gear	1. Gear housing loose on frame. 2. Steering linkage looseness. 3. Pressure house touching other parts of the truck. 4. Loose pitman shaft over center adjustment. A slight rattle may occur on turns because of increased clearance off the “high point.” This is normal and clearance must not be reduced below specified limits to eliminate this slight rattle. 5. Loose pitman arm.	1. Check gear mounting. Torque the bolts to specifications. 2. Check linkage pivot points for wear. Replace if necessary. 3. Adjust the hose position. Do not bend tubing by hand. 4. Adjust. 5. Torque the pitman arm nut.
Groan Noise in the Steering Pump	1. Low oil level. 2. Air in the oil. Poor pressure house connection.	1. Fill the reservoir to the proper level. 2. Torque the connector. Bleed the system.
Rattle or Knock Noise in the Steering Pump	Loose pump gear nut.	Torque the nut.
Rattle Noise in the Steering Pump	1. Vanes not installed properly. 2. Vanes sticking in the rotor slots.	1. Install properly. 2. Repair or replace.
Switch Noise in the Steering Pump	Defective flow control valve.	Replace or repair.
Whine Noise in the Steering Pump	Pump shaft bearing scored.	Replace the housing and shaft. Flush and bleed the system.
Growl Noise in the Steering Pump	Excessive back pressure in houses or the steering gear caused by restriction.	Locate the restriction and correct. Replace the part if necessary.
Growl Noise in the Steering Pump (Particularly Noticeable at Standstill Parking)	1. Scored pressure plates, thrust plate or rotor. 2. Extreme wear of the cam ring.	1. Replace the parts and flush the system. 2. Replace the parts.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Excessive Play or Looseness in the Steering System (Steering Wanders)	1. Front wheel bearing loosely adjustment.	1. Adjust the bearing or replace with new parts as necessary.
	2. Worn coupling or steering shaft joints.	2. Replace.
	3. Worn steering linkage ball joints.	3. Replace steering linkage.
	4. Worn upper or lower ball joints.	4. Replace ball joints.
	5. Steering wheel loose on the shaft, loose pitman arm, tie rods, steering arms, or steering linkage ball studs.	5. Torque the fastener.
	6. Steering gear worm bearing loosely adjusted.	6. Adjust the preload.
	7. Excessive pitman shaft to ball nut lash in the steering gear.	7. Adjust the preload.
	8. Toe-in out of adjustment or worn drag link or tie rod sockets.	8. Replace the tie rod ends if worn, adjust to correct the toe-in, and inspect the steering arm and tie rod for bent condition.
	9. Steering system out of alignment.	9. Align caster, camber, and toe-in. Inspect spring components for condition and wear. Repair or replace as required.
	10. Tires badly worn, edge of the tires are rounded off.	10. Install new tires, and check alignment; abnormal tire wear indicates improper alignment.
	11. Lack of lubrication in the linkage and kingpins.	11. Lubricate. Free up any components which are frozen and will not take lubrication.
	12. Air in the system.	12. Add oil to the pump reservoir and bleed the system. Check hose connectors for proper torque.
	13. Steering gear mounting loose.	13. Tighten attaching bolts to the specified torque.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Vibration and Shimmy	1. Seal damage and leakage resulting in loss of lubricant, corrosion and excessive wear.	1. Replace damaged parts as necessary.
	2. Tires, wheels, or brake drums out of balance.	2. Balance the tires and wheels, preferably with an on-vehicle type balancer, as this method balances the entire wheel and drum assembly.
	3. Bent wheel or out of bound tire. Wheel nuts torqued unevenly.	3. Replace the wheel and remount the tire, or replace the assembly.
	4. Loose steering linkage components.	4. Adjust, torque, and repair the linkage as necessary.
	5. Worn steering linkage ball joints.	5. Replace steering linkage.
	6. Worn upper or lower end ball joints.	6. Replace ball joints.
	7. Wheel loose on the hub.	7. Inspect the wheel bolt holes for damage, and replace the wheel or torque the nuts.
	8. Drive line universal joints rough or defective. This condition may be confused with steering vibration.	8. Repair the drive line.
	9. Engine misses or is out of balance, this may also be confused with steering shimmy.	9. Correct the miss in the engine, or repair the out of balance condition, clutch, pressure plate, or harmonic balancer, etc.
	10. Faulty shock absorbers.	10. Replace the shock absorbers.
Hard Steering or Excessive Effort Required at Steering Wheel	1. Low or uneven tire pressure.	1. Inflate to specified pressures.
	2. Steering linkage kingpins or ball joints need lubrications.	2. Lubricate, and free up kingpins or ball joints. Make certain all fittings take lubricant properly.
	3. Tight or frozen intermediate rod, tie rod or idler socket.	3. Lubricate or replace as necessary.
	4. Steering gear to column misalignment.	4. Align the column.
	5. Steering gear adjust too tightly.	5. Adjust preload.
	6. Front wheel alignment incorrect.	6. Check alignment and correct as necessary.
	7. Steering gear adjusted too tight.	7. Adjust the steering gear.
	8. Frozen or tight shaft bearings.	8. Replace the bearings.
	9. Lower the U-joint flange rubbing against the adjuster.	9. Loosen the bolt, assemble and torque properly.
	10. Tight or binding conditions in steering column.	10. Adjust the steering column.
	11. Power cylinder rod nicked or marred.	11. Replace the cylinder.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Pump Inoperative, Poor, or No Assist (Hard Steering)	1. Low oil level. 2. Air in the oil. 3. Defective hoses or steering gear. 4. Flow control valve stuck. 5. Loose nut in end of flow control valve. 6. Pressure plate not flat against ring. 7. Extreme wear of pump ring. 8. Scored pressure plate, thrust plate. 9. Vanes not installed properly. 10. Vanes sticking in rotor slots. 11. Faulty flow control valve assembly.	1. Fill the reservoir to the proper level. 2. Locate the source of the air leak and correct it. 3. Repair or replace. 4. Repair or replace. 5. Torque nut. 6. Repair or replace. 7. Repair or replace. 8. Repair or replace. 9. Repair or replace. 10. Repair or replace. 11. Repair or replace.
Moment Increase in Effort when Turning Wheel Fast to Right or Left	1. Low oil level in pump. 2. High internal leakage in hydraulic pump. 3. High internal leakage in steering gear.	1. Add power steering fluid as required. 2. Check the pump pressure. (See the pump pressure test.) 3. Repair
Steering Wheel Surges or Jerks when Turning with Engine Running Especially During Parking	1. Low oil level. 2. Insufficient pump pressure. 3. Defective gear relief valve. 4. Sticky flow control valve.	1. Fill as required. 2. Check the pump pressure. (See the pump pressure test.) Replace relief valve if defective. 3. Replace the gear relief valve. 4. Repair or replace.
Steering Pulls to Left or Right	1. Camber incorrectly adjusted. Steering will generally pull to the side of the axle having the greatest positive camber. 2. Low air pressure in the right or left tire. Steering will pull to the side having the air pressure. 3. Axle loose and shifted at the spring U-bolts. 4. Rear axle loose at the spring U-bolt. If shifted axle is shifted at one side, it will cause the steering to pull. 5. Unbalanced steering gear valve. If this is the cause, steering effort will be very light in the direction of the lead and heavy in the opposite direction.	1. Adjust camber. 2. Inflate the tire to the correct pressure, check for air leak and repair as required. 3. Align the axle, and torque the U-bolt nuts. Inspect for damaged parts. Replace if required. 4. Align the rear axle and replace the defective parts, if any. Torque the U-bolt. 5. Replace the valve.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Poor Return of the Steering Wheel	1. Lack of lubrication in the linkage.	1. Lubricate the linkage.
	2. Steering gear to column misalignment.	2. Align the steering column.
	3. Tires not properly inflated.	3. Inflate to the specified pressure.
	4. Improper front wheel alignment.	4. Check and adjust as necessary.
	5. Steering linkage binding.	5. Replace the pivots.
	6. Steering wheel rubbing against the directional signal housing. (Turn the steering wheel and listen for internal rubbing in the column.)	6. Adjust the steering jacket.
	7. Tight steering shaft bearings.	7. Replace the bearings.
	8. Sticky or plugged valve spool.	8. Repair or replace valve.
	9. Steering gear out of adjustment.	9. Check adjustment. Adjust as required.
	10. Tight kingpin bushings.	10. Lubricate or replace as required.
	11. Lower U-joint flange rubbing against the steering gear adjust plug.	11. Loosen the pinch bolt and assemble it properly.
	12. Upper or lower end ball joint blinding.	12. Replace ball joints.
Snapping or Chucking in the Steering Column or Wheel	1. Loose steering gear at the frame.	1. Torque the mounting bolts.
	2. Worn steering shaft universal joints.	2. Replace and repair the joints as necessary.
	3. Worn steering linkage components. The effect of these components will telescope through the steering system and be felt in the steering wheel.	3. Adjust, torque, and repair the components.
	4. Steering gear incorrectly adjusted.	4. Adjust steering gear.
Excessive Road Shock	1. Tire air pressure too high.	1. Deflate to the correct pressure.
	2. Wheel bearings adjusted too loose.	2. Adjust the bearings.
	3. Camber adjustment incorrect.	3. Adjust the camber.
	4. Weak or broken front spring.	4. Replace the spring.
	5. Defective shock absorbers.	5. Replace the shock absorbers.
	6. Loose suspension components.	6. Inspect, adjust or repair, and replace as necessary.

Front and Rear Suspension

PROBLEM	POSSIBLE CAUSE	CORRECTION
Spring Noise	1. Loose U-bolts.	1. Tight to recommended torque.
	2. Loose or worn eye bushings.	2. Replace eye bushings.
	3. Lack of lubrication.	3. Lubricate as required.
	4. Defective shock absorber.	4. Replace shock absorber.
Spring Sag or Bottom	1. Inoperative shock absorber.	1. Replace shock absorbers.
	2. Broken spring leaf.	2. Replace leaf or spring assembly.
	3. Severe operation or overloading.	3. Check load capacity rating.
Spring Breakage	1. Loose U-bolts.	1. Tighten to recommended torque.
	2. Normal fatigue.	2. Replace springs.
	3. Overloading.	3. Do not overload vehicle.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Excessive Road Shock	1. Tire air pressure too high. 2. Wheel bearings adjusted too loose. 3. Camber adjustment incorrect (Negative camber contributes to road shock). 4. Weak or broken spring. 5. Defective shock absorbers. 6. Loose suspension components.	1. Deflate to correct pressure. 2. Adjust bearings. 3. Adjust camber. 4. Replace spring. 5. Replace shock absorbers. 6. Inspect, adjust or repair and replace as necessary.

Wheels

PROBLEM	POSSIBLE CAUSE	CORRECTION
Wheel Hop (Vehicle Vibration and Rough Steering)	**Wheels** 1. Rocks and debris wedged between dual disc wheels. 2. Out-of- balance tire and/or hub and drum/rotor assembly. 3. Improper positioning of the side rings split. **Vehicle** Loose or worn driveline or suspension.	1. Remove rocks and debris. 2. Determine the out-of-balance component and balance or replace. 3. Reassemble with ring split opposite (180 degrees) the valve opening to improve balance. Identify location of vibration carefully as it may be transmitted through the frame making a rear end vibration appear to come from the front. Then repair or replace loose or worn parts. (Refer to PROPELLER SHAFT [SEC. 4A] for vehicle vibration.)
Stripped Threads	Excessive clamp load.	Replace studs — follow proper torque procedure.
Rust Streaks from Stud Holes Correction	Loose cap nuts.	Check complete assembly, replace damaged parts and follow proper torque procedure.

Tires

PROBLEM	POSSIBLE CAUSE	CORRECTION
Wobble (Vehicle Vibration and Rough Steering)	**Wheels** 1. Bent or distorted disc from overloading or improper handling. 2. Loose mountings, damaged studs, cap nuts, enlarged stud holes, worn or broken hub face, or foreign material on mounting surfaces. 3. Improper positioning of the side rings split. **Vehicle** 1. Improper alignment. 2. Loose, worn or broken suspension parts.	1. Replace wheel. 2. Replace worn or damaged parts. Clean mounting surfaces. 3. Reassemble with ring split opposite (180 degrees) the valve opening to improve balance. 1. Have vehicle aligned. 2. Repair or replace.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Cracked or Broken Wheel Discs (Cracks Develop in the Wheel Disc from Handhole to Rim, or from Handhole to Stud)	Metal fatigue resulting from overloading.	Replace wheel. Check position of wheel on vehicle for working load specifications.
Damaged Stud Holes (Stud Holes Become Worn, Elongated or Deformed, Metal Builds up Around Stud Hole Edges, Cracks Develop from Stud Hole to Stud Hole)	Loose wheel mounting.	Replace wheel and check for: • Installation of correct studs and nuts. • Cracked or broken studs — replace. • Worn hub face — replace. • Broken or cracked hub barrel — replace. • Clean mounting surfaces and retorque cap nuts periodically. • Rust streaks fanning out from stud holes indicate that the cap nuts are or have been loose.
Damaged Stud Threads	Sliding wheel across studs during assembly	Replace stud following proper wheel installation.
Loose Drum	Improper drum bolt.	Replace with proper length bolt.
Loose Inner Wheel	1. Excessive stud standout from mounting face of hub allowing wheel nut to bottom out. 2. Improper torque.	1. Replace with proper length bolt. 2. Use recommended torque procedure.
Broken Wheel Studs	1. Loose cap nuts. 2. Overloading.	1. Replace stud and follow proper torque procedure. 2. Replace stud.
Tire Slippage on Rim	1. Improper storage or operating conditions. 2. Poor maintenance. 3. Rust, corrosion on bead seating. 4. Loss of pressure.	1. Correct as required. 2. Follow proper maintenance procedures. 3. Correct as required. 4. Follow proper maintenance procedures.
Tire Mounting Difficulties	1. Mismatch tire and rim sizes. 2. Defective or mismatched rings for rim use. 3. Overinflation of tires. 4. Corrosion and dirt.	1. Correct as required. 2. Correct as required. 3. Follow recommended tire pressure. 4. Correct as required.
Tires Show Excessive Wear on Edges of Tread	1. Underinflated tires. 2. Vehicle overloading. 3. High speed cornering. 4. Incorrect toe-in setting.	1. Properly inflate to recommended pressure. 2. Correct as required. 3. Correct as required. 4. Set to correct specifications.
Tires Show Excessive Wear in Center of Tread	Tire overinflated.	Properly inflate to recommended pressure.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Excessive Tire Wear	1. Improper tire pressure. 2. Incorrect tire/wheel usage. 3. Defective shock absorbers. 4. Front end out of alignment. 5. Loose, worn or damaged steering linkage, joints, suspension components, bushing and ball joints.	1. Properly inflate to recommended pressure. 2. Install correct tire/wheel combination. 3. Repair or replace. 4. Align front end. 5. Inspect, repair or replace as required.
Dual Tires Rubbing	Insufficient wheel spacing.	Check tire and wheel sizes.

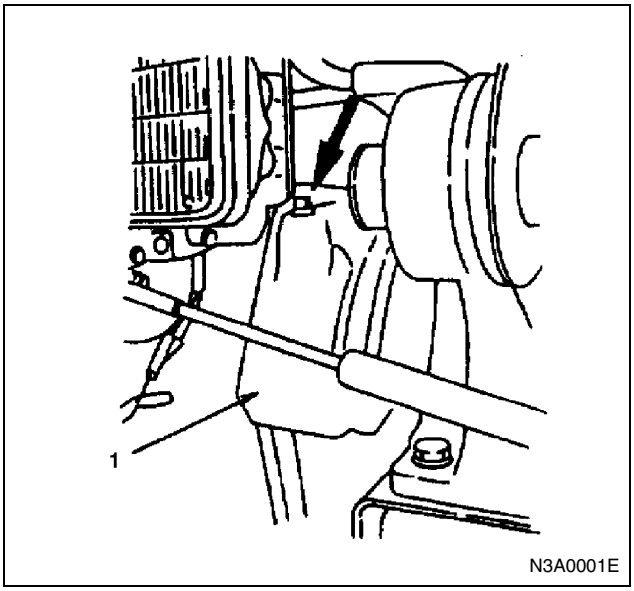
SERVICING

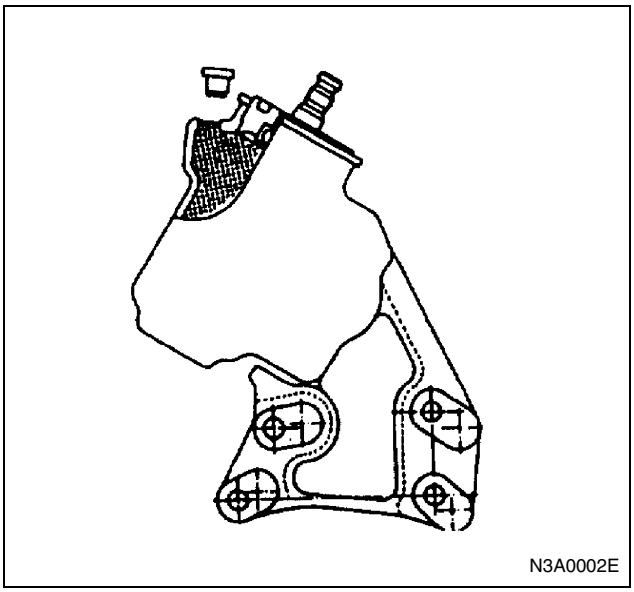
Steering System

Manual Steering Gear Oil

1. Remove the filler plug on the steering unit (1).



2. Fill the gear box to the level of filler plug with specified gear oil through the filler hole.
3. Install and tighten the filler plug.



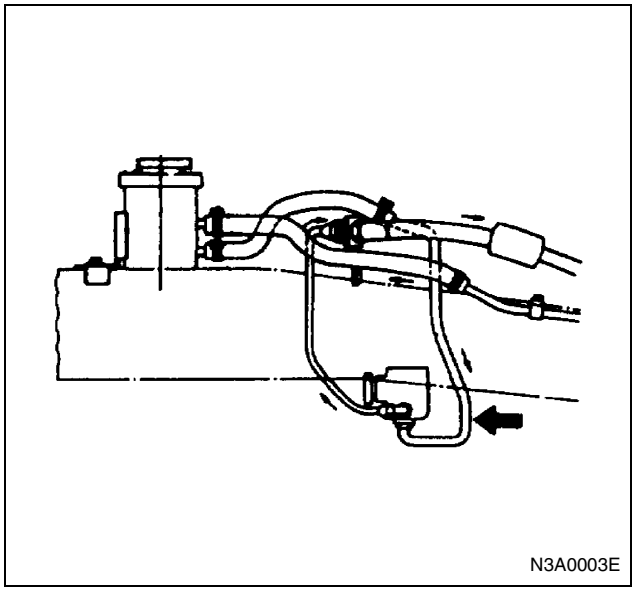
Power Steering Fluid

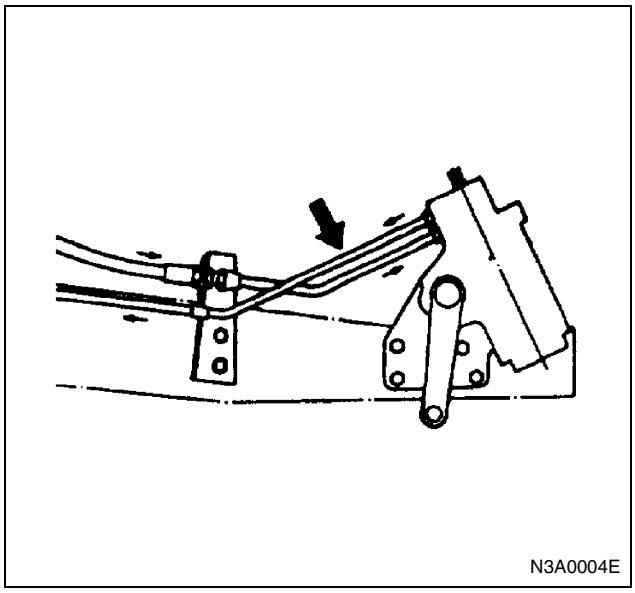
Draining

1. Jack up the front wheels until they are clear of the ground.
2. Disconnect the fluid pipes between the steering unit and fluid reservoir, and the fluid hose between the pump and the fluid reservoir.
3. When draining is completed, remove remaining fluid within hydraulic system by turning the steering wheel to stop in both directions several times.

Hose Replacement

Replace the power steering hoses at intervals of fluid change.





Refilling

1. Connect the fluid lines securely and fill the fluid reservoir with specified automatic transmission fluid.
2. When the fluid reservoir is filled to specified level, allow 2 or 3 minutes. While refilling, keep fluid reservoir replenished as necessary to prevent air from entering the hydraulic system.
3. Lower the front wheels to the ground. Start and let the engine idle for a few minutes.
   Recheck the fluid level and replenish if necessary.

Steering Wheel Free Play

Inspection

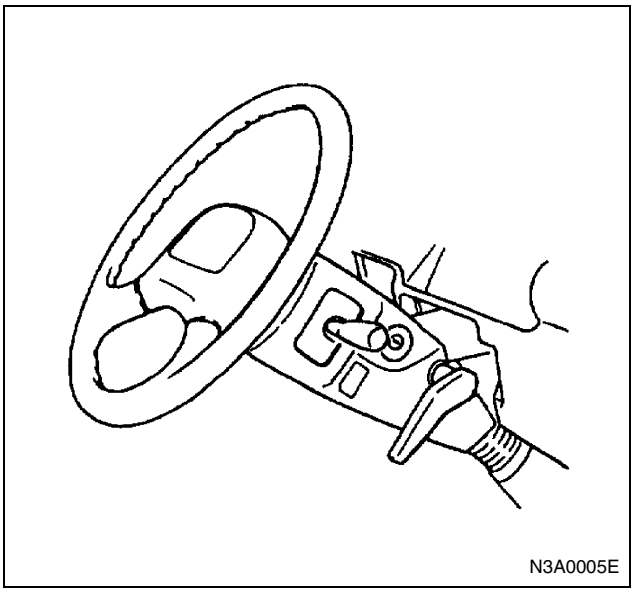
1. Check the amount of the steering wheel play by turning the wheel in both directions until the tires

begin to move with the front wheels properly in the straight ahead position.

Notice:
If the vehicle is equipped with a power steering unit, the wheel free play should be checked with the engine running.

Steering Wheel Free Play
Manual Steering: 10 — 30 mm (0.4 — 1.2 in)
Power Steering: 10 — 50 mm (0.4 — 2.0 in)

2. Also check the steering wheel for play and looseness in mount by moving it back and forth and sideways. While driving, check for hardsteering, shimmy and tendency of steering to pull to one side.

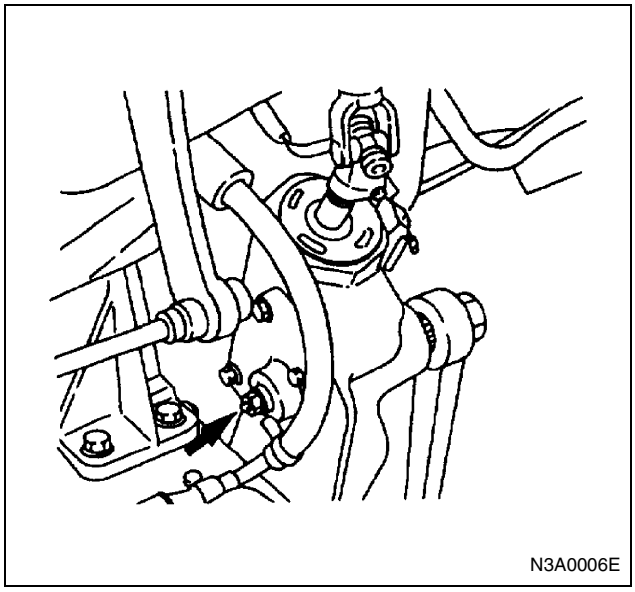


N3A0005E

Adjustment

1. Align the front wheels properly in the straight ahead position.
2. Loosen the lock nut on the adjusting screw of the steering unit.
3. Turn the adjust screw clockwise to decrease free play or counter-clockwise to increase.
4. After check of specified free play, tighten the lock nut to specified torque.

Tighten:
- Lock nut to
  Manual Steering: 25 N·m (2.5 kg·m / 18 lb·ft)
  Power Steering: 69 N·m (7.0 kg·m / 51 lb·ft)



N3A0006E

Power Steering Fluid Pressure

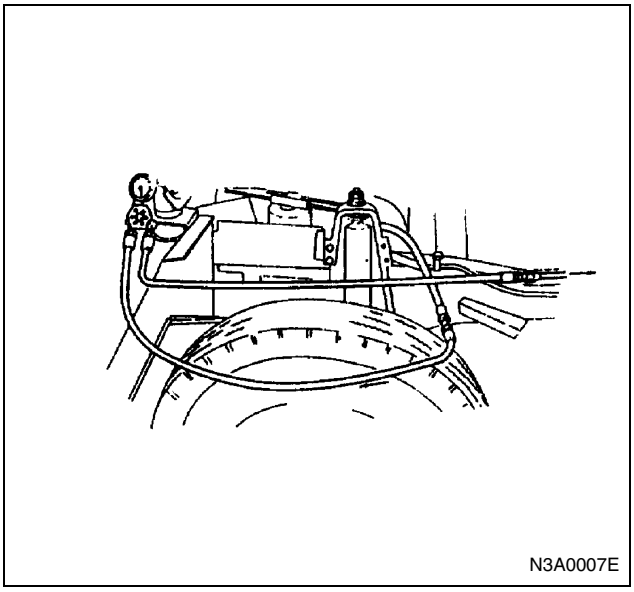
Preparation

1. Install the power steering fluid pressure gauge between the pump and steering unit as figure.
   Gauge: 5-8840-0162-0
2. Start and let the engine idle until oil temperature reaches 50 — 60°C (122 — 140°F).
3. Take measurement of the pressure gauge when the steering wheel is turned clockwise or counterclockwise to lock.

Standard Pressure (at idle speed)
- NQR without HBB: 11,275 kPa (115 kg/cm^2/1,635 psi)
- NPR/NPS/NQR with HBB: 10,787 kPa (110 kg/cm^2/1,563 psi)
- except Above Models: 10,297 kPa (105 kg/cm^2/1,439 psi)

Excess pressure means pump trouble.
Less pressure means steering unit trouble.

Notice:
This test should be done within ten seconds.



N3A0007E

Steering Function

Check the following items.

- Steering wheel shake
- Steering shimmy
- Hard steering
- Turning radius
- Steering wheel return
- Steering pull to one side

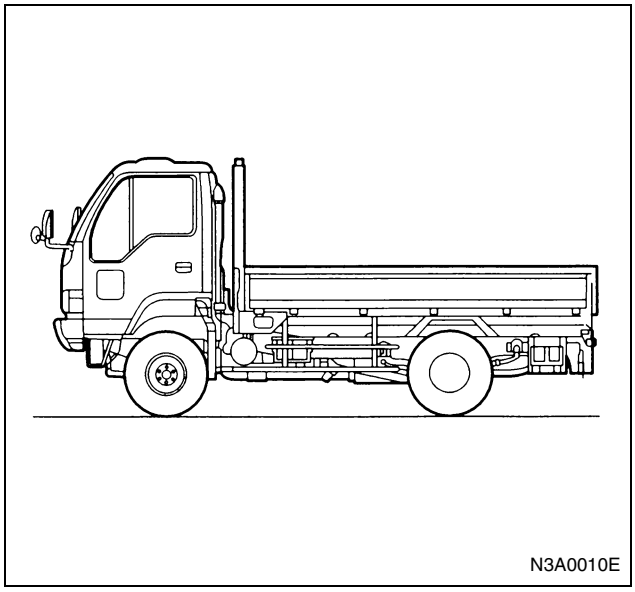
Inspection of Wheel Alignment

The points listed below must be checked prior to inspection front wheel alignment.

- Tire pressure and abnormal wear
- Front hub bearing for axial play
- Ball joint on steering linkage for play
- Operation of shock absorbers
- Tightness of suspension parts
- King pin bearings for play

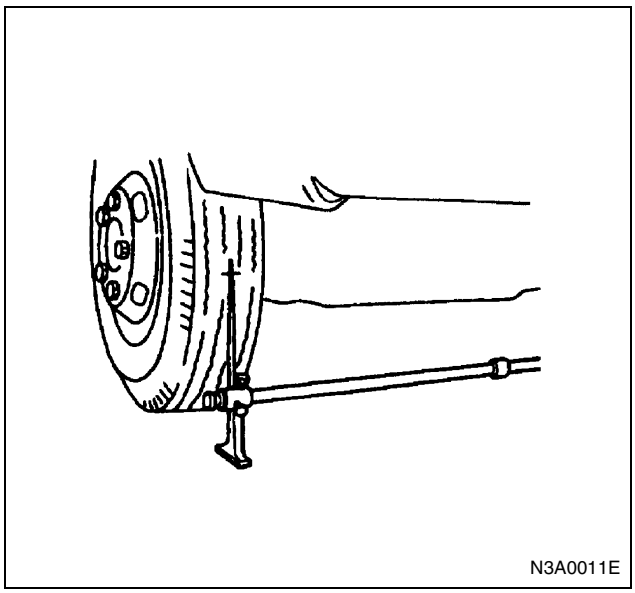
Toe-In

Measurement should be taken with the vehicle on a surface plate.
If a surface plate is not available, toe-in should be checked with the vehicle parked on a level floor.



N3A0010E

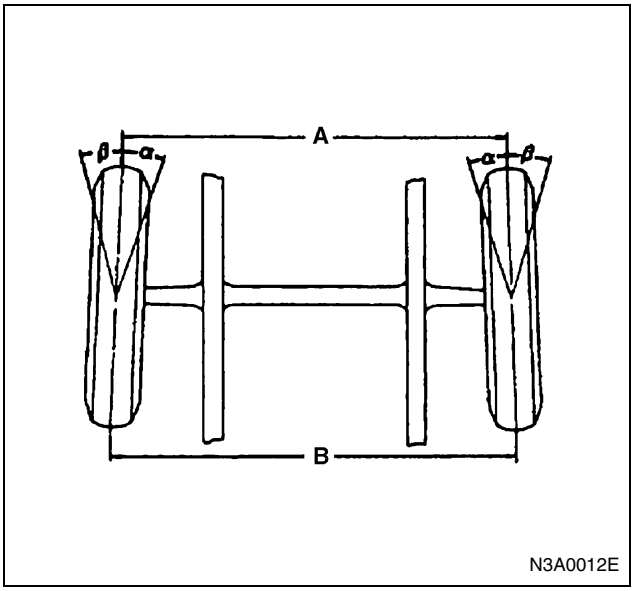
1. Set front wheels to its straight ahead position.
2. Align the toe-in gauge with center height of each wheels at front end.
3. Apply center marks to each wheel, then take measurement of distance A between the center marks on each wheel.
4. Move slowly the vehicle rearward until center marks get its rear end position.
5. Take measurement of distance B between the center marks at rear end.



N3A0011E

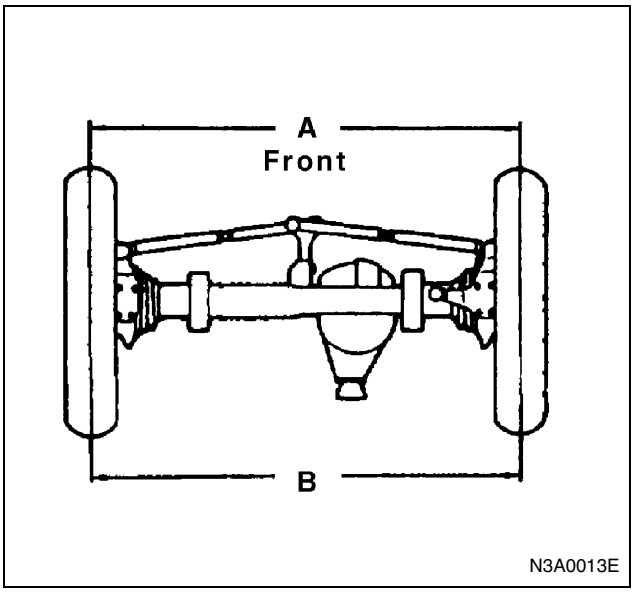
Toe-in can be calculated with next formula.
Toe-in = B − A
Toe-in
−2 — 2 mm (−0.08 — 0.08 in)

• Rigid Suspension



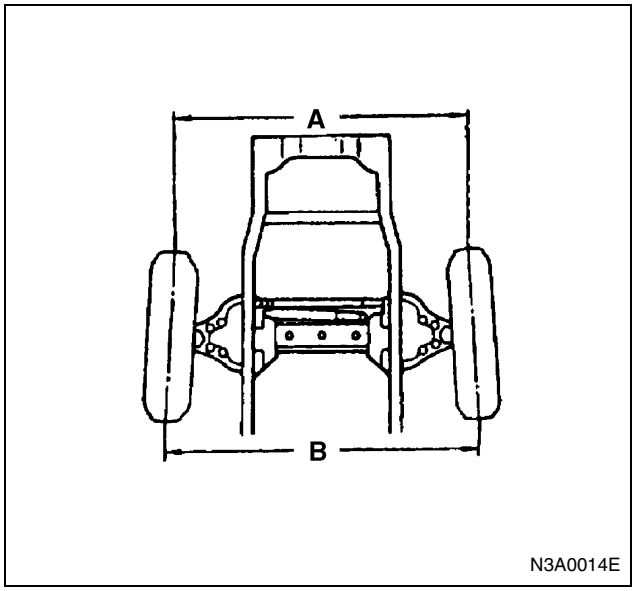
N3A0012E

• NPS



N3A0013E

• Wishbone Suspension



N3A0014E

Adjustment

1. Loosen the lock nuts on the tie rod or outer truck rod ends.
2. Adjust length of the tie rod by turning the connecting rod on outer truck rod.
3. Tighten the lock nuts to specified torque.

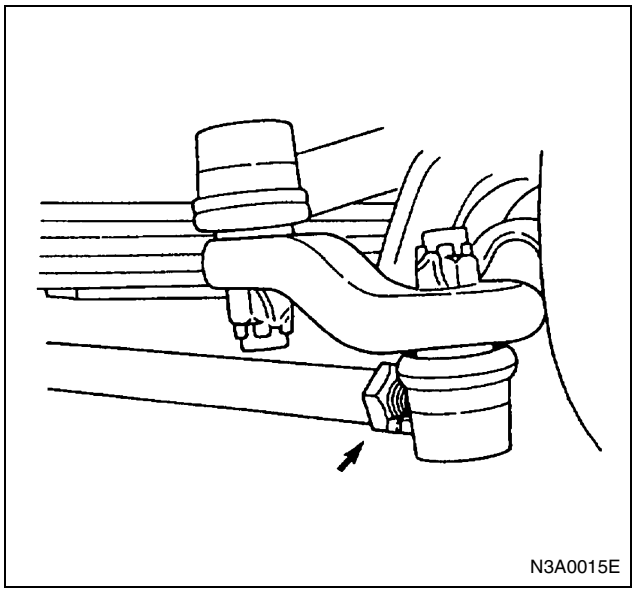
Tighten:

• Lock nut to

Rigid Suspension, NPS: 113 N·m (11.5 kg·m / 183 lb·ft)

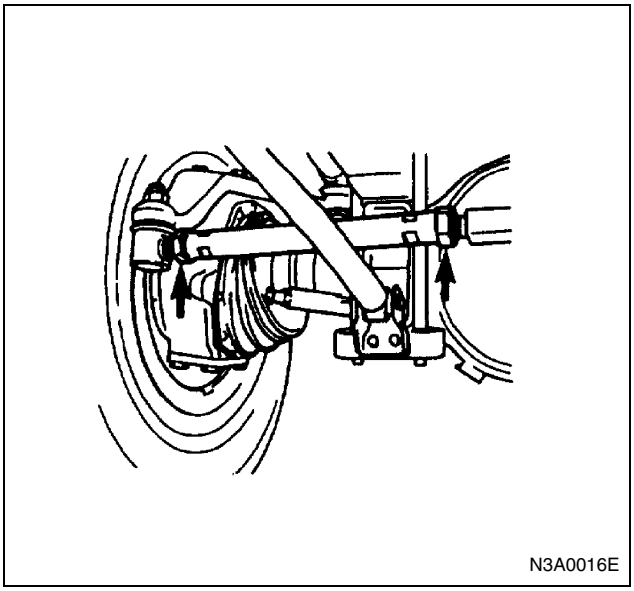
Wishbone Suspension: 167 N·m (17.0 kg·m / 123 lb·ft)

• Rigid Suspension

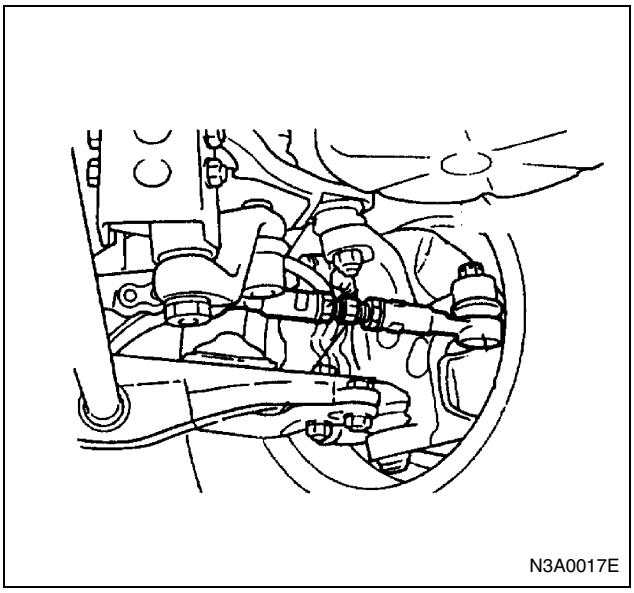


N3A0015E

- NPS



- Wishbone Suspension

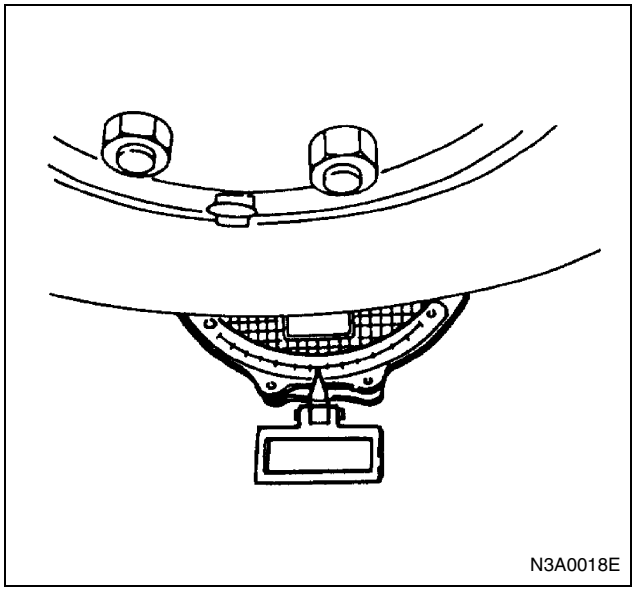


Turning Radius

1. Position a suitable piece of wood equivalent in thickness to the turning radius gauge under each rear wheel.
2. Position each front wheel on a turning radius gauge by aligning the tire center line with the center of the turning radius gauge.
3. Turn the steering wheel clockwise or counterclockwise until the front wheels are locked.

Notice:
Turn the steering wheel with the brake pedal depressed using brake pedal pusher.

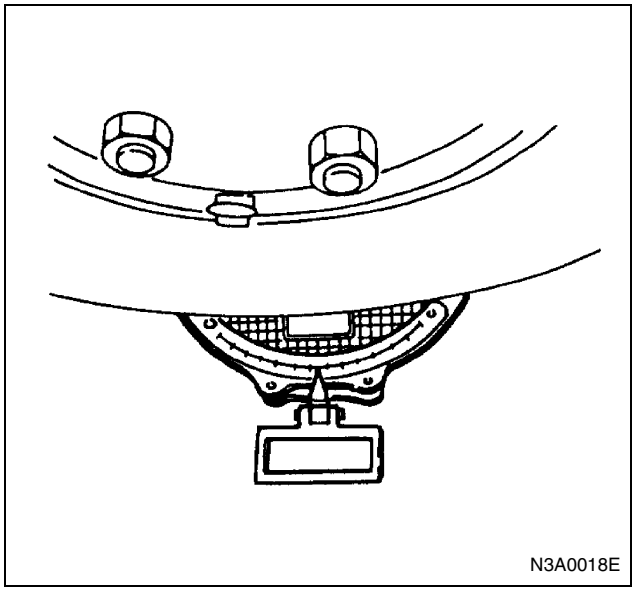
Reading of the turning radius gauge directly indicates the steering angle.



Steering Angle

Wishbone Suspension Model		(deg.)
Vehicle Model	Outer	Inner
NKR (7.00-15 Tire)	35.0	38.0

Rigid Suspension Model		(deg.)
Vehicle Model	Outer	Inner
NHR	33.0	37.5
NKR (7.00-15 Tire)	29.5	38.5
NKR (7.00-16 Tire)	27.9	35.5
NPR (7.00-16 Tire)	35.0	47.5
NPR, NQR (7.50-16 Tire)	32.7	42.5
NQR (8.25-16 Tire)	30.0	36.5
NPS	29.8	37.5



Adjustment

1. Loosen the lock nuts on the steering knuckle or the axle case.
2. Adjust projecting height of the stopper bolts.
3. Tighten the lock nuts to specified torque.

Tighten:

- Stopper bolt to
  Rigid suspension: 186 N·m (19.0 kg·m / 137 lb·ft)
  NPS: 49 N·m (5.1 kg·m / 36 lb·ft)
  Wishbone suspension: 82 N·m (8.4 kg·m / 61 lb·ft)

N3A0022E

Camber Angle

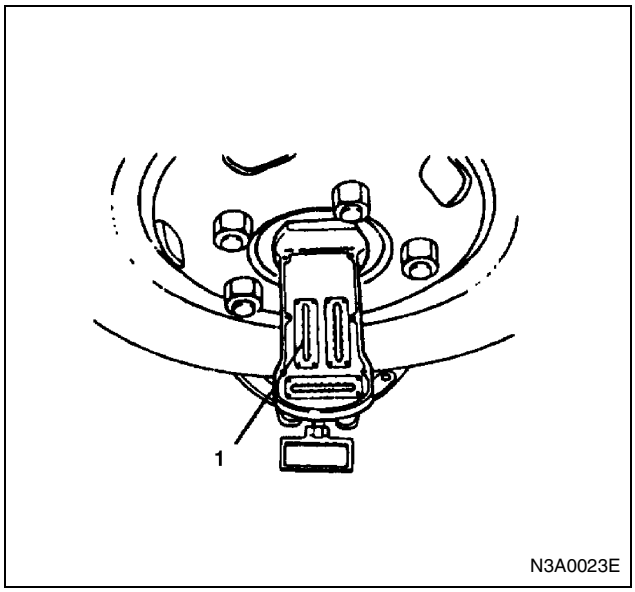
All Model except NPS

Toe-in can be checked on the gauge simultaneously.

1. When inspection of turning radius is completed, calibrate the scale of the turning radius gauge to zero.
2. Remove the front hub cap.
   Install camber, caster and king pin inclination gauge on end of the knuckle spindle horizontally.

Notice:

When removing hub cap, take care so as not to cause damage to gauge fitting face at end of the spindle. If end of the spindle has been scratched or damaged, correct before setting the gauge.



N3A0023E

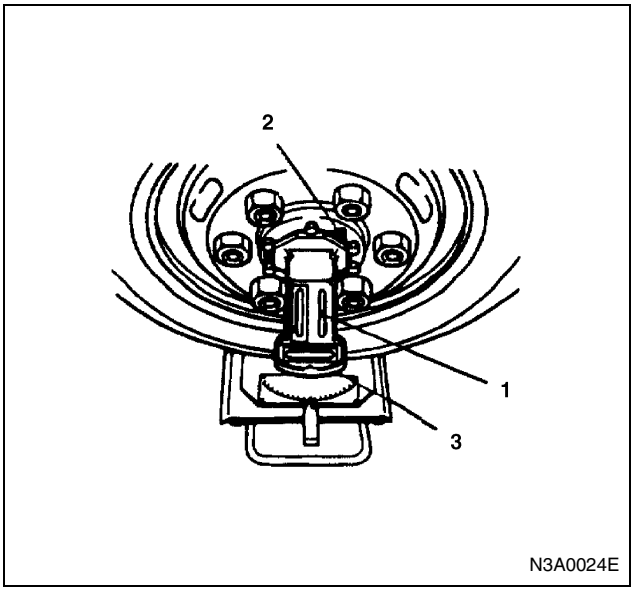
Legend

1. Camber angle

NPS

Remove the free wheel hub lock cover assembly, then install gauge adapter on end of the knuckle spindle. Install camber, caster and king pin inclination gauge on end of gauge adapter.

Gauge Adapter: 5-8840-2188-0



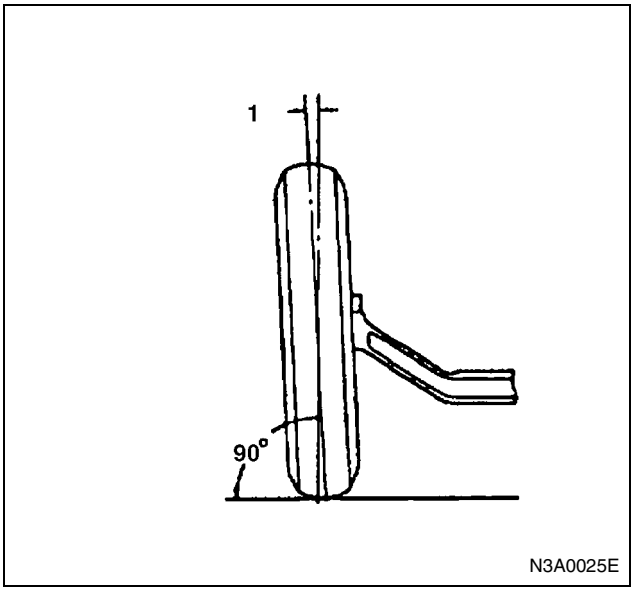
Legend

1. Camber angle
2. Gauge adapter
3. Wheel alignment tester

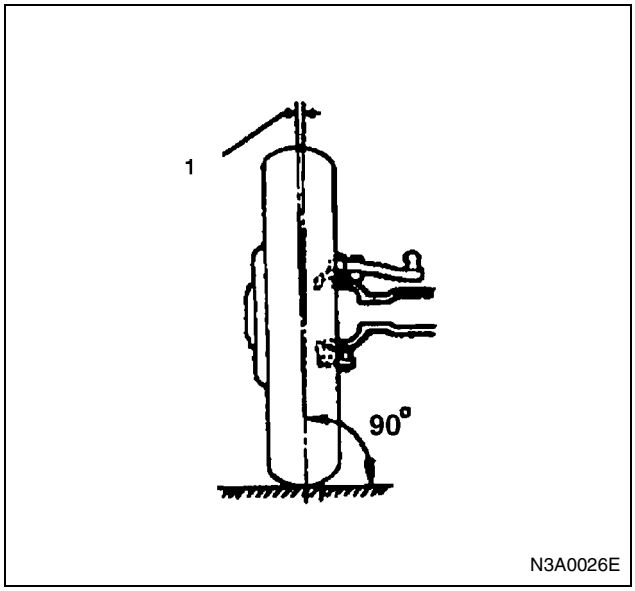
3. Reading of the camber scale directly indicates the camber angle (1).

Camber Angle	(deg.)
NHR Rigid Suspension	1°15′±45′
Rigid Suspension (except NHR)	0°15′±45′
Wishbone Suspension, NPS	0°15′±45′

- NHR, NKR, NPR and NQR



- NPS

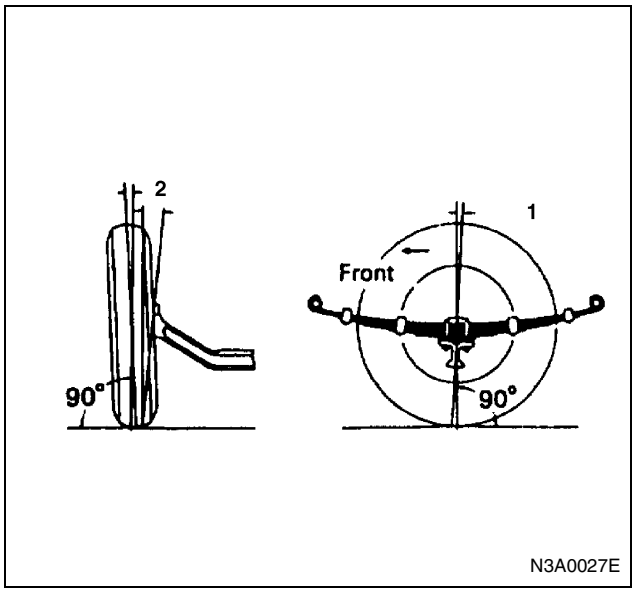


Caster Angle and King Pin Inclination

The caster angle and king pin inclination can be checked on the gauge simultaneously.

1. When inspection of camber angle is completed, calibrate the scale of the turning radius gauge to zero and turn the steering wheel clockwise (counterclockwise for checking caster angle (1) and king pin inclination (2) on the left side front wheel) until the front wheels are steered 20 degrees from the straight-ahead position.

- Rigid Suspension



- NPS

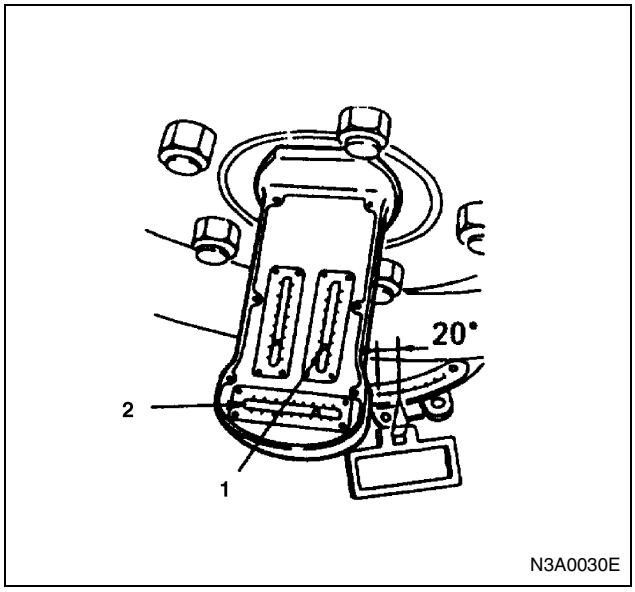
Notice:
Turn the steering wheel with the brake pedal depressed using brake pedal pusher.

2. When the front wheels are turned 20 degrees, calibrate the caster and king pin scales to zero turning the camber, caster and king pin gauge adjuster.

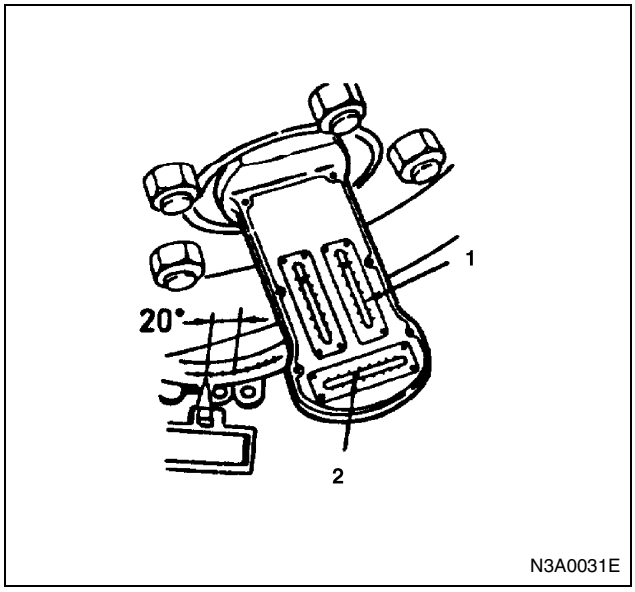


N3A0030E

Legend
1. Caster angle
2. King pin inclination

3. Turn the steering wheel in the opposite direction until the front wheels are steered 20 degrees in the opposite direction. Reading of the caster and king pin scales directly indicates the caster and king pin inclination angles being checked.

Caster Angle and King Pin Inclination (deg.)		
	Caster Angle	King Pin Inclination
NHR	1°30′±1°	7°15′
NKR Rigid Suspension	3°00′±1°	12°00′
NPR, NQR	2°45′±1°	12°00′
Wishbone Suspension	1°00′±1°	9°45′±30′
NPS	2°00′±1°	7°15′



N3A0031E

Legend

1. Caster angle
2. King pin inclination

Adjustment

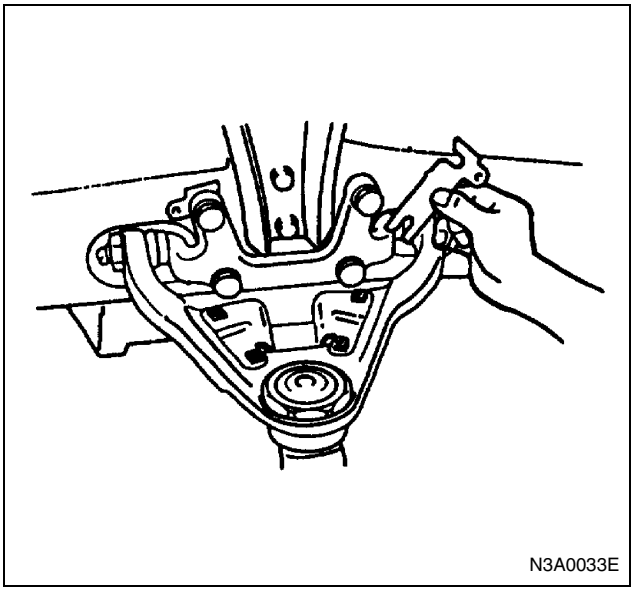
Rigid Suspension

The camber, caster and king pin inclination are built into front end and are not adjustable. If the camber, caster or king pin inclination is found to be out of alignment, check to locate the cause of trouble against the listing below and replace the parts necessary.

- Front springs for weakening
- Front I-beam (axle case) for distortion
- Bushing in king pin, King pin bearings for wear or determination

Wishbone Suspension

1. Set the jack under the cross member of the suspension and then raise the lower link with the jack and retain the jack with applied in the place.
2. Remove the shock absorber.
3. Attach the fulcrum pin and loosen the bolts to the degree that it will not fall a part to adjust the camber angle using the shims.



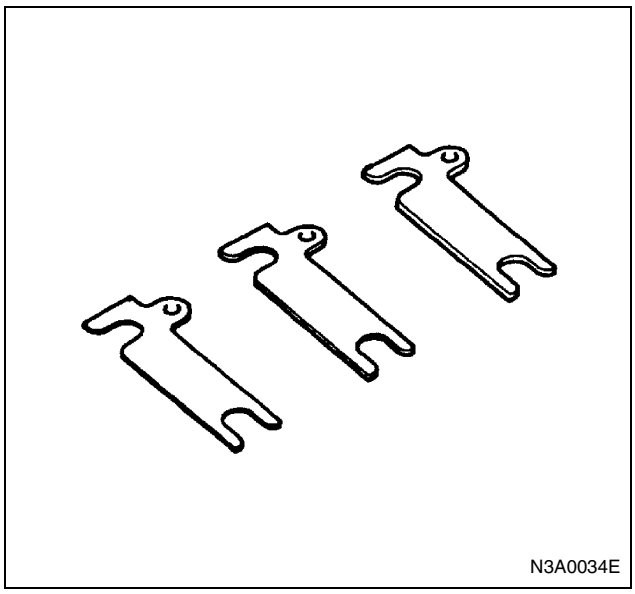
N3A0033E

Camber Angle

If the number of shims are evenly increased both at fore and aft, the camber angle becomes acute, while if decreased, the angle becomes obtuse.

Caster Angle

When the caster angle is obtuse, increase the number of shims at the fore side, while the angle is acute, increase the number of shims at the aft side.



N3A0034E

Thickness of Shims Available

0.8 mm (0.031 in), 1.6 mm (0.063 in), 3.2 mm (0.126 in)

Conditions Where The Shims are Used

Numbers of Shims: 4 or less

Thickness: 9.6 mm (0.378 in) or less

Difference of Thickness (between Front and Rear): 4.8 mm (0.189 in) or less

In case the shim has already reached at the limitation in its number or its thickness, decrease the number of shims at the aft side to adjust the obtuse caster angle, while decrease the number at the fore side to adjust the acute caster angle.

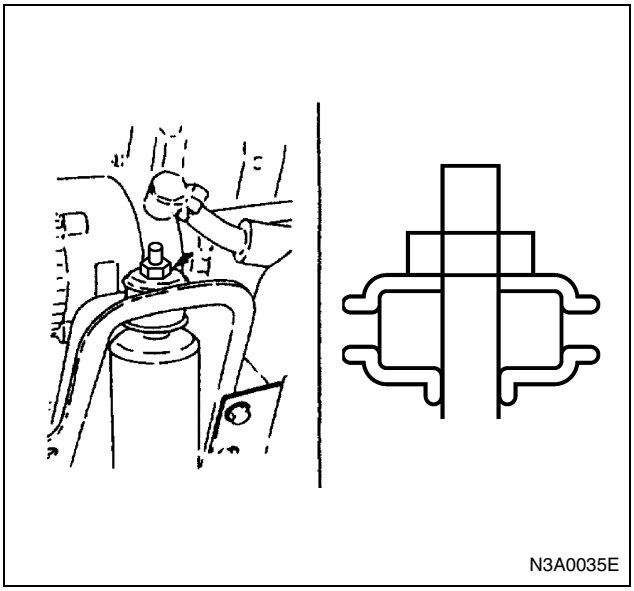
Notice:

Since the number of shims needed for caster angle adjustment varies depending on the conditions of the car, perform the adjustment procedures which are the most suitable for the car conditions.

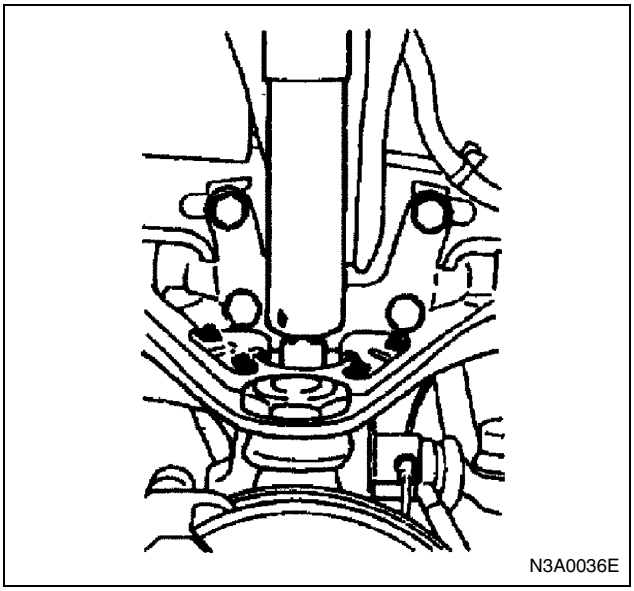
4. Tighten the mounting bolts of the front shock absorber.

Tighten:

- Shock absorber bolt and nut to
  Upper: 21 N·m (2.1 kg·m / 16 lb·ft)
  Lower: 103 N·m (10.5 kg·m / 76 lb·ft)



N3A0035E



N3A0036E

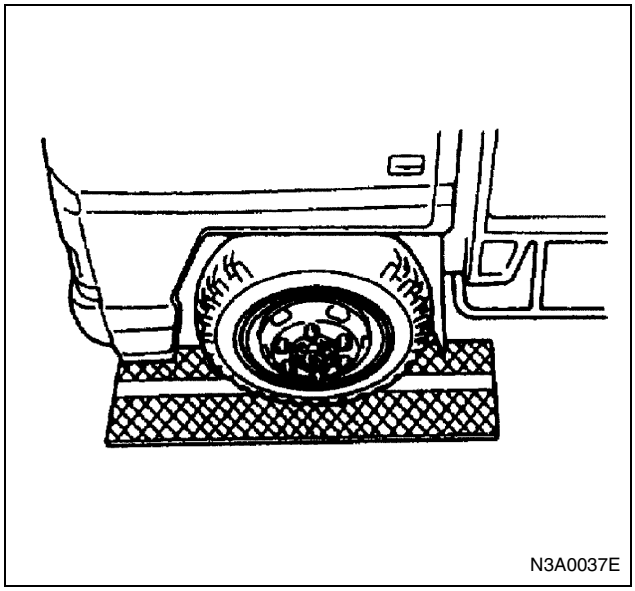
Measurement of Side Slippage

When inspection and adjustments of toe-in, camber, caster and king pin inclination are completed, check for side slippage using a side slip tester.

Roll the wheels over the side slip tester as slowly as possible and take reading on the tester, If the amount of side slippage is in excess of 5 mm per 1 m, recheck the wheel alignment.

Side Slippage

Limit: 5.0 (0.197) Per 1m



N3A0037E

Front and Rear Suspension

Suspension Function

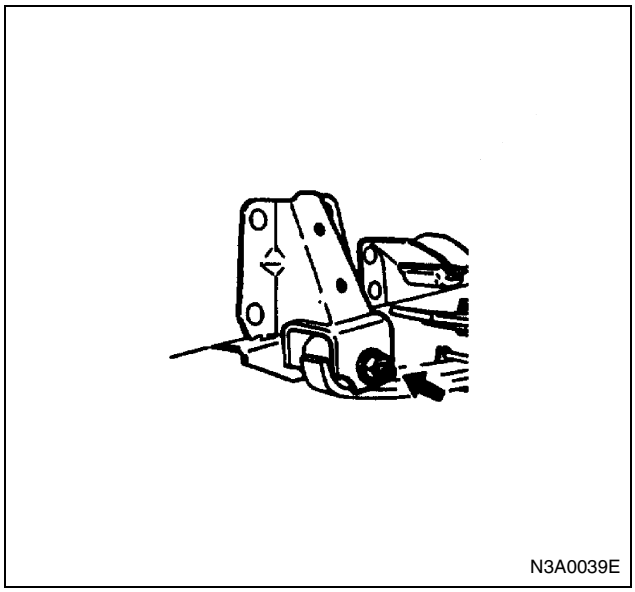
Check the following items.

- Leaf spring breakage
- Body inclination
- Reduction of ground clearance

Lubrication

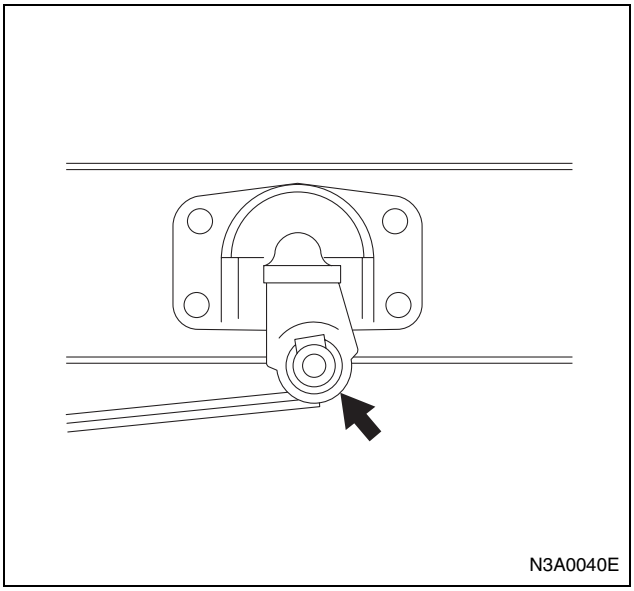
Lubricate the following points with multi- purpose type grease.

- Spring Pin (NPS only)



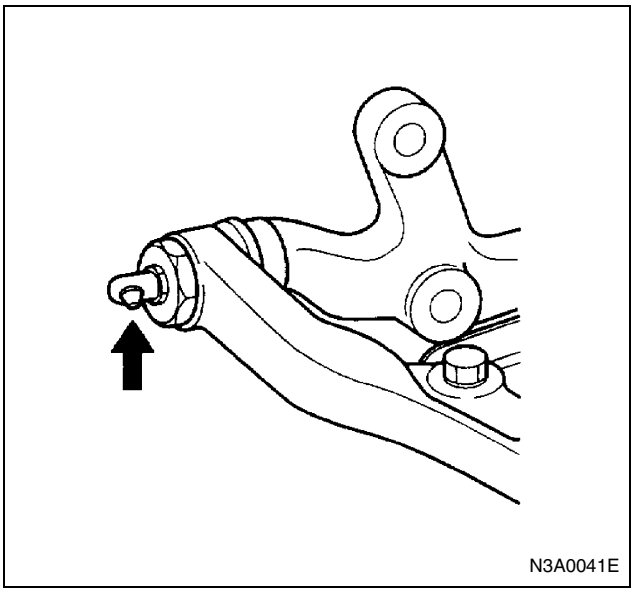
N3A0039E

- Shackle Pin (NPS only)

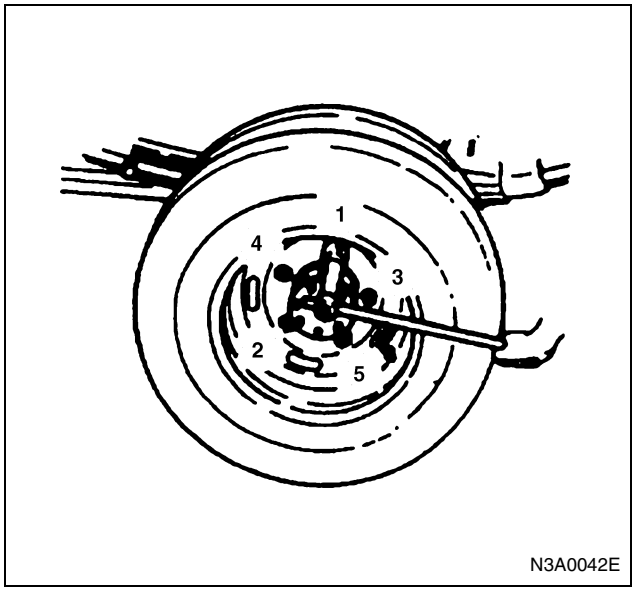


N3A0040E

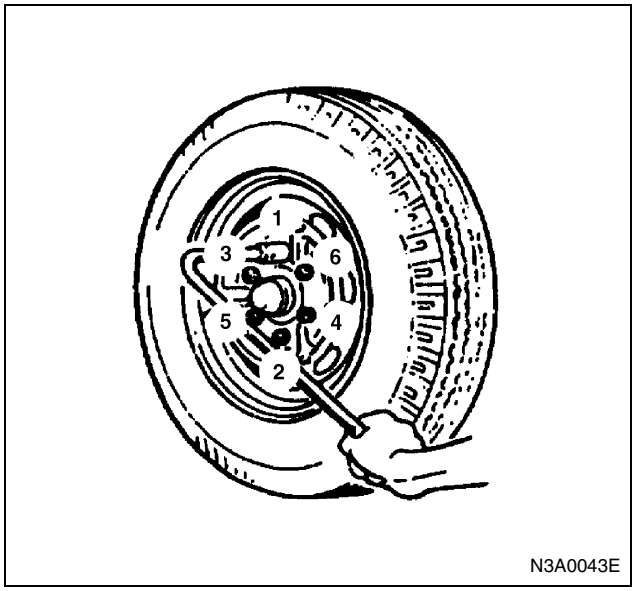
- Upper Arm (for Wishbone Suspension)



N3A0041E



N3A0042E



N3A0043E

Wheel and Tires

Wheel Nut Retightening

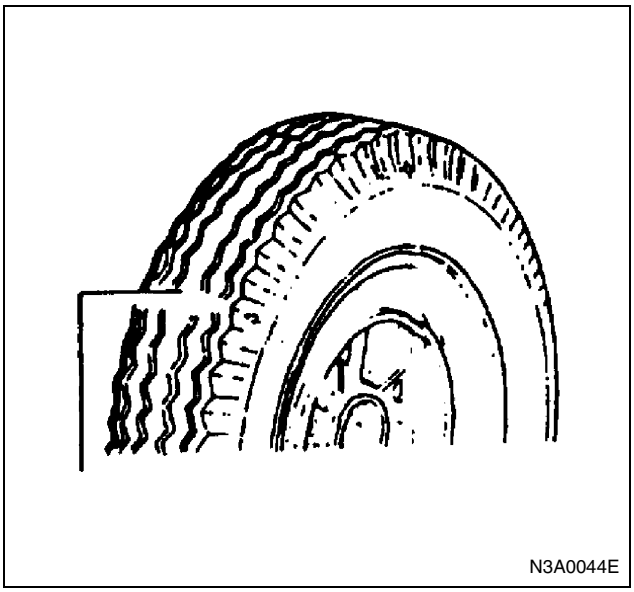
Retighten the wheel nuts to specified torque in sequence as shown in the figure.

Tighten:

- Front wheel nut to
  NHR / NKR single tire, NKR flat low: 167 N·m (17 kg·m / 123 lb·ft)
  Except above models: 441 N·m (45 kg·m / 325 lb·ft)
- Rear wheel nut to
  NHR / NKR single tire: 167 N·m (17 kg·m / 123 lb·ft)
  NHR dual tire, NKR flat low: 294 N·m (30 kg·m / 217 lb·ft)
  Except above models: 441 N·m (45 kg·m / 325 lb·ft)

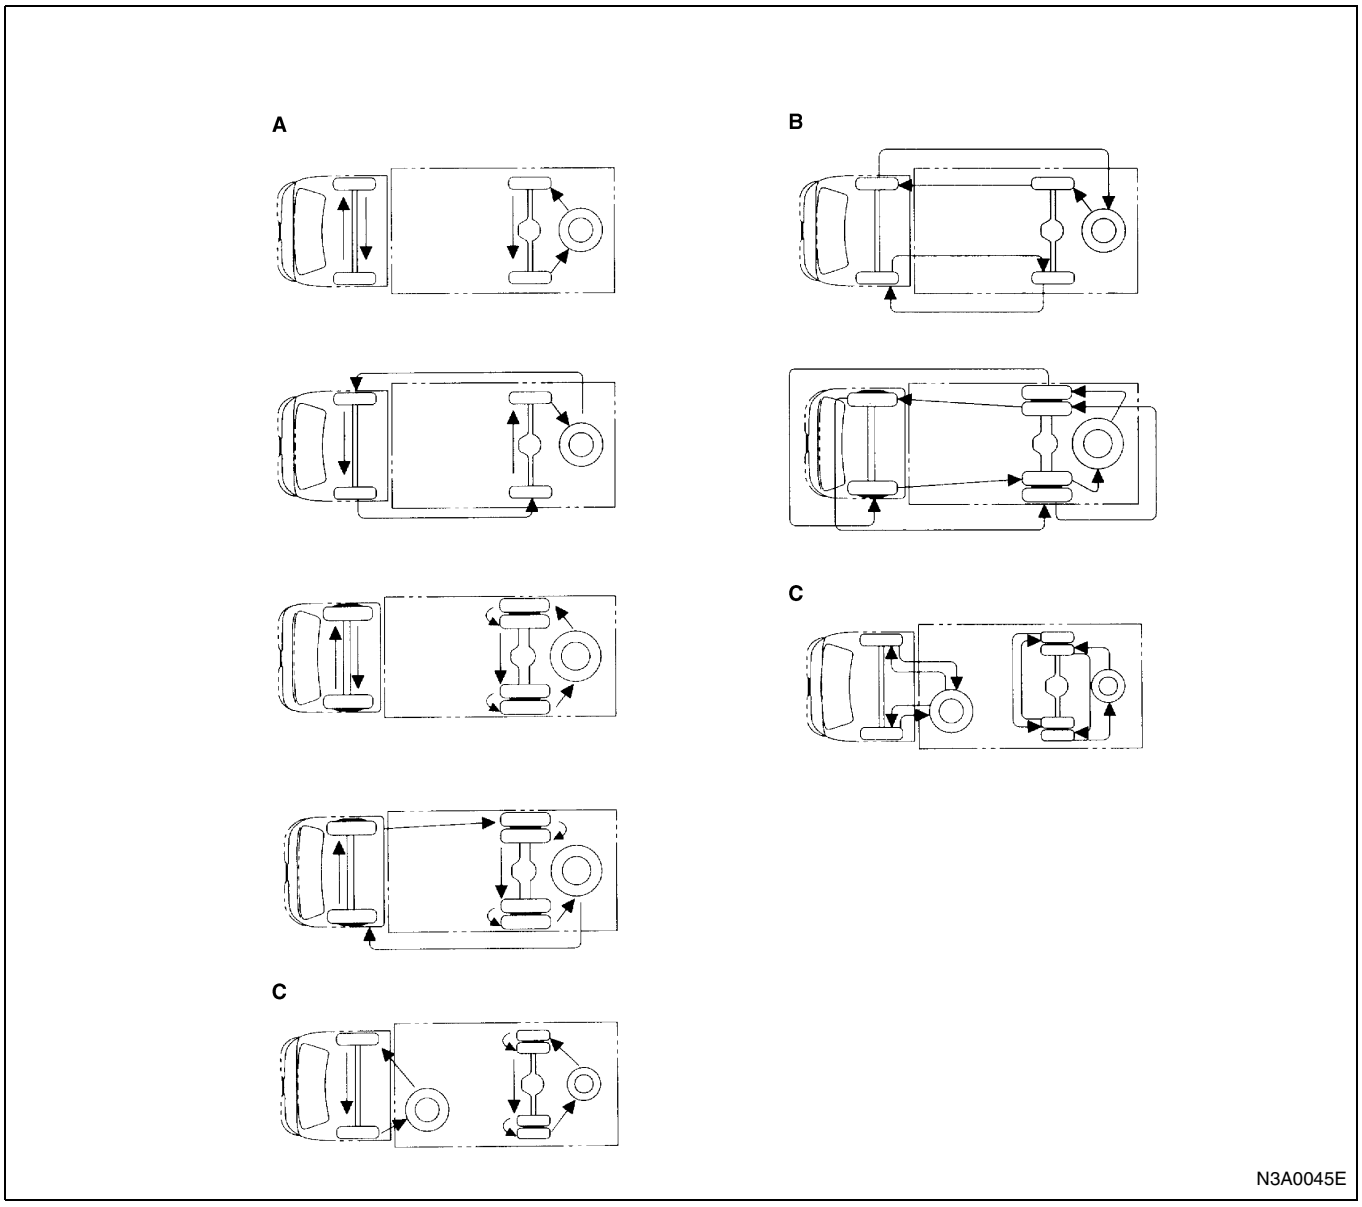
Tread Wear Indicators

The original equipment tires have built-in tread wear indicators to show when tires need replacement.
These indicators may appear as wide bands. When the indicators appear in two or more grooves at three locations, tire replacement is recommended.



Tire Rotation

To allow the tires to wear evenly and to prolong their life, exchange the front and rear tire locations as shown in the figure.

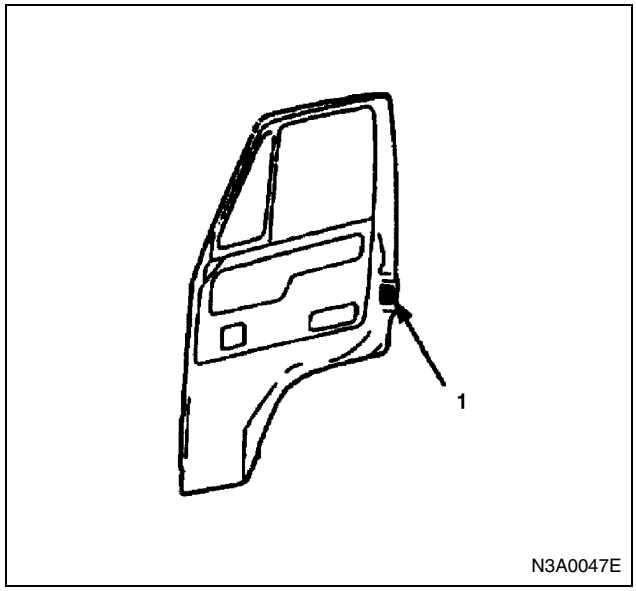


Legend

A. For bias tires
B. For radial tires
C. Flat low (Small dual tire)

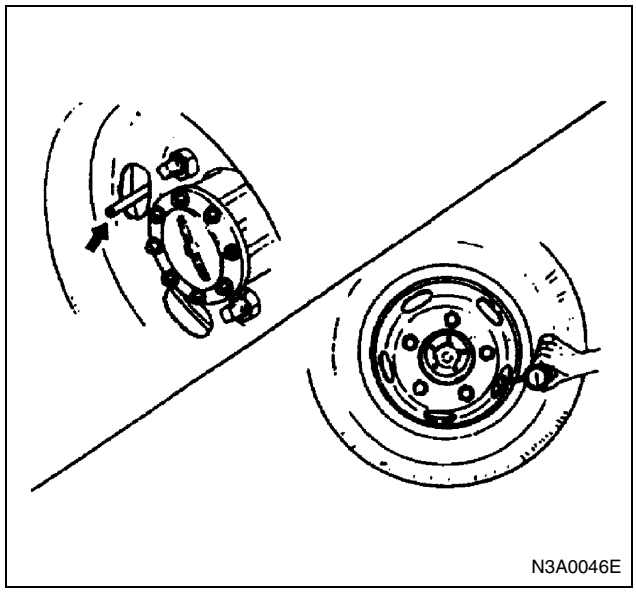
Tire Inflation Pressure

Tire pressure, in cold condition (after vehicle has set for three hours or more, or driven less than one mile), should be checked monthly or before any extended trip. Tire pressure increases approx. 15% when the tires become hot during driving. The pressure specification is shown on the label as figure.



Legend

1. Tire air pressure plate (The position of LHD vehicle is opposite)



For tire size and tire inflation pressure, refer to “Tires”.

FRONT END ALIGNMENT

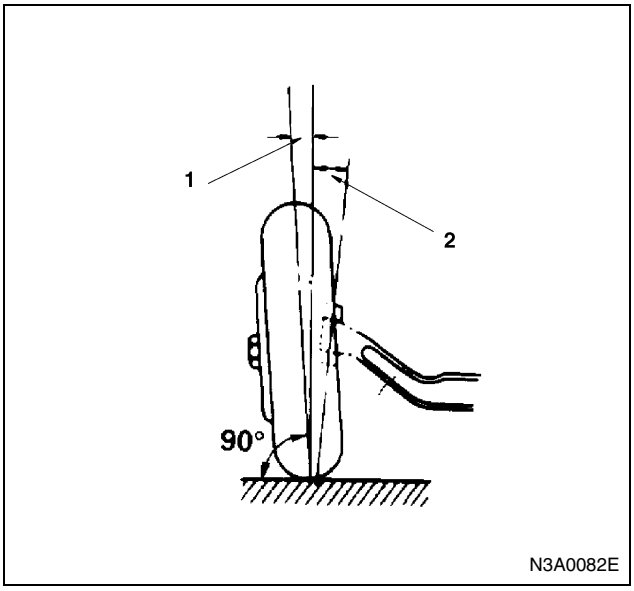
Contents

GENERAL DESCRIPTION 3A-2
Camber Angle 3A-2
Caster Angle 3A-2
Toe-In 3A-2
ON-VEHICLE SERVICE 3A-3
Toe-in 3A-3
Turning Radius 3A-5
Camber Angle 3A-6
Caster Angle and King Pin Inclination 3A-7
Trim Height (Wishbone Suspension Only) 3A-10

GENERAL DESCRIPTION

Camber Angle

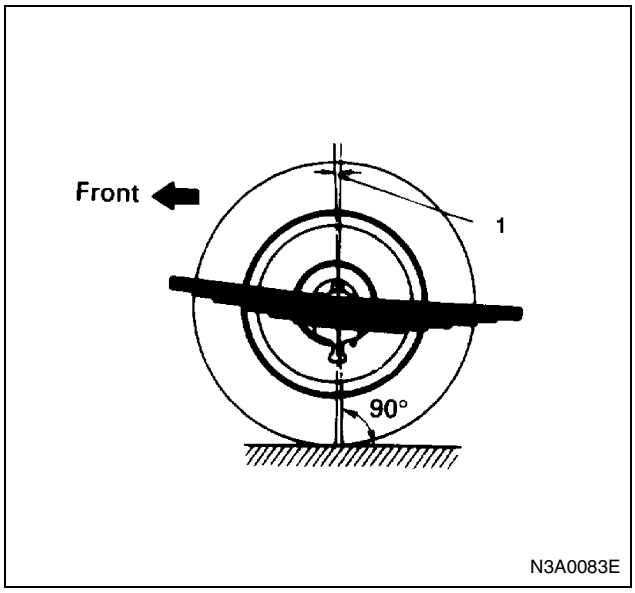
The reason why the camber is so important in wheel alignment is that it affects greatly the tire wear and characteristics. The front wheels of most cars lean slightly either inward or outward when seen from the front. This tilt of the wheel is called the camber. When the center line of the tire is completely vertical to the road, the tire has “zero camber”. In the positive camber, the wheels incline outward at the tops while in the negative camber they incline inward at the tops. Excessive positive camber causes the outer edge of tire to excessively wear. On the other hand, excessive negative camber causes the inner edge of tire to wear.
Improper wheel camber setting will not only cause the tires’ excessive wear, but also the tire will tend to move in the direction of the wheel which has a larger camber angle affecting the car’s straight traveling ability. When measuring the camber, it is indicated by the angle.



Legend
1. Camber angle
2. Kingpin inclination

Caster Angle

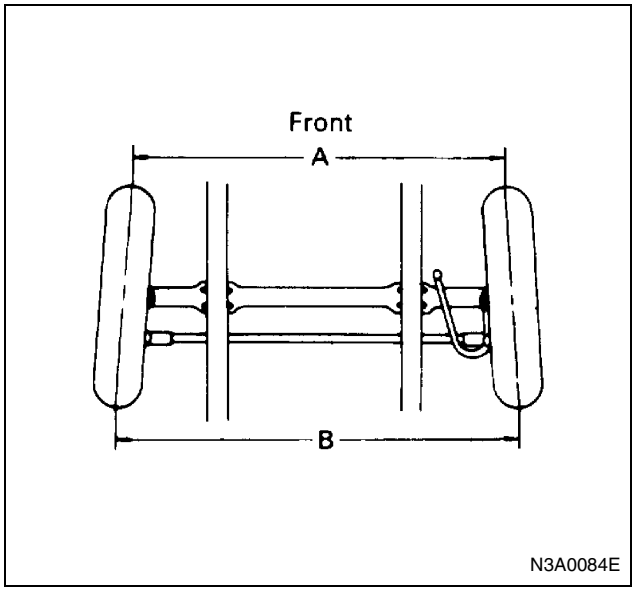
Caster is the angle between the rearward inclination of king pin axis and a vertical center line of the wheel when the car is seen from its side. Like camber, it is also indicated by the angle. Caster angle affects greatly the straight traveling ability of the car, steering wheel maneuverability, self alignment effort and the returning ability of the car to the straight ahead position.



Legend
1. Caster angle

Toe-In

When seen from the top of the car, the front edges of the front wheels are slightly closer each other. The amount of this slight inward turning is called toe-in and usually expressed by millimeter.
The toe-in can be calculated with next formula.
Toe-in = B – A



ON-VEHICLE SERVICE

Inspection

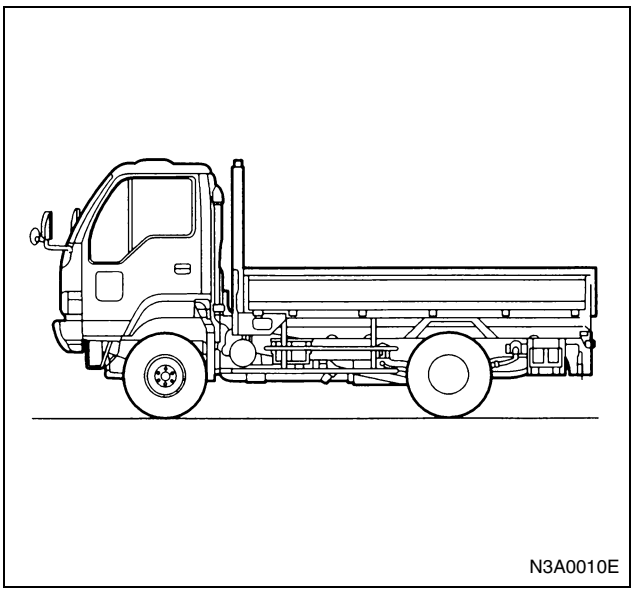
The points listed below must be checked prior to inspection front wheel alignment.

- Tire pressure and abnormal wear
- Front hub bearing for axial play
- Ball joint on steering linkage for play
- Operation of shock absorbers
- Tightness of suspension parts
- King pin bearings for play

Toe-in

Inspection

Measurement should be taken with the vehicle on a surface plate.
If a surface plate is not available, toe-in should be checked with the vehicle parked on a level floor.



N3A0010E

1. Set front wheels to its straight ahead position.
2. Align the toe-in gauge with center height of each wheels at front end.
3. Apply center marks to each wheel, then take measurement of distance A between the center marks on each wheel.
4. Move the vehicle slowly rearward until center marks get its rear end position.
5. Take measurement of distance B between the center marks at rear end.

The toe-in can be calculated with next formula.
Toe-in = B − A
Toe-in
−2 — 2 mm (−0.08 — 0.08 in)

Adjustment

1. Loosen the lock nuts on the tie rod or outer truck rod ends.
2. Adjust length of the tie rod by turning the connecting rod on outer truck rod.
3. Tighten the lock nuts to specified torque.

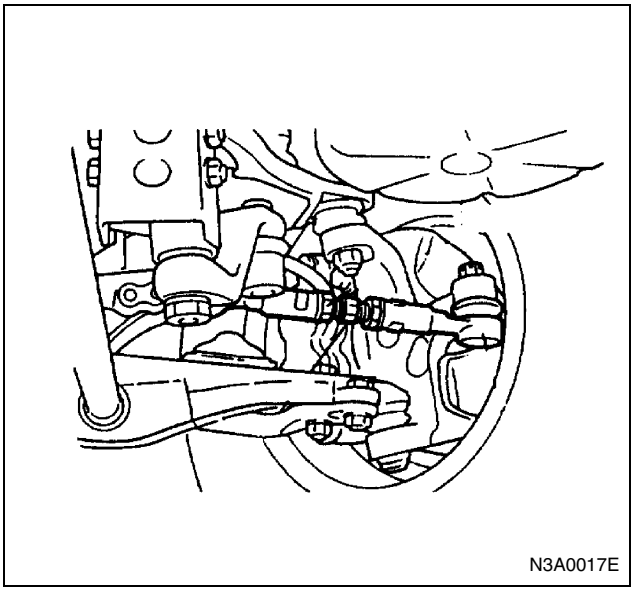
Tighten:

• Lock nut to

Rigid suspension, NPS: 113 N·m (11.5 kg·m / 183 lb·ft)

Wishbone suspension: 167 N·m (17.0 kg·m / 123 lb·ft)

• Wishbone Suspension

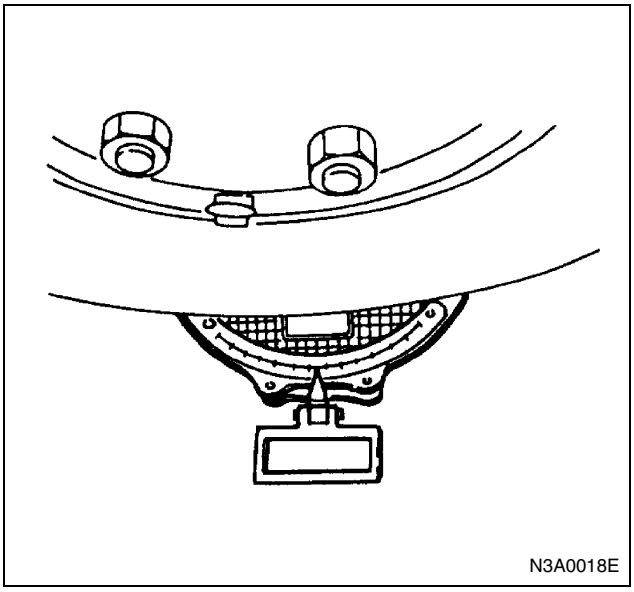


Turning Radius

Inspection

1. Position a suitable piece of wood equivalent in thickness to the turning radius gauge under each rear wheel.
2. Position each front wheel on a turning radius gauge by aligning the tire center line with the center of the turning radius gauge.
3. Turn the steering wheel clockwise or counterclockwise until the front wheels are locked.

Notice:
Turning the steering wheel with the brake pedal depressed using brake pedal pusher.



Reading of the turning radius gauge directly indicates the steering angle.

Steering Angle

Wishbone Suspension Model		(deg.)
Vehicle Model	Outer	Inner
NKR (7.00-15 Tire)	35.0	38.0

Rigid Suspension Model		(deg.)

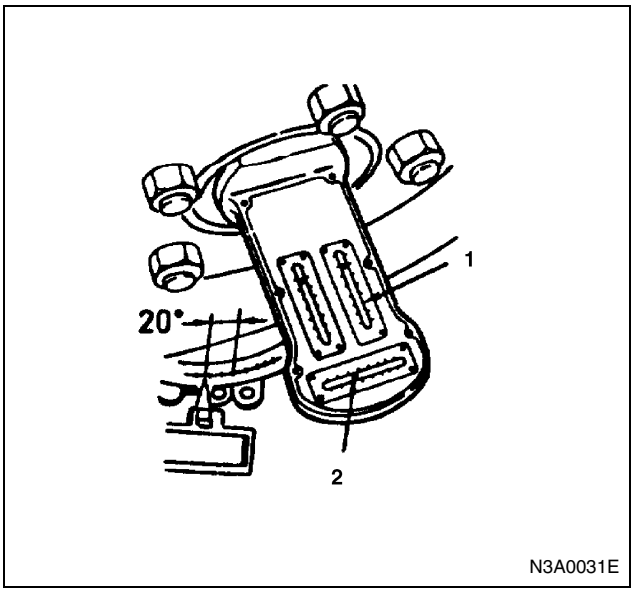
NKR Rigid Suspension	3°00′±1°	12°00′
NPR, NQR	2°45′±1°	12°00′
Wishbone Suspension	1°00′±1°	9°45′±30′
NPS	2°00′±1°	7°15′



Legend
1. Caster angle
2. King pin inclination

Adjustment

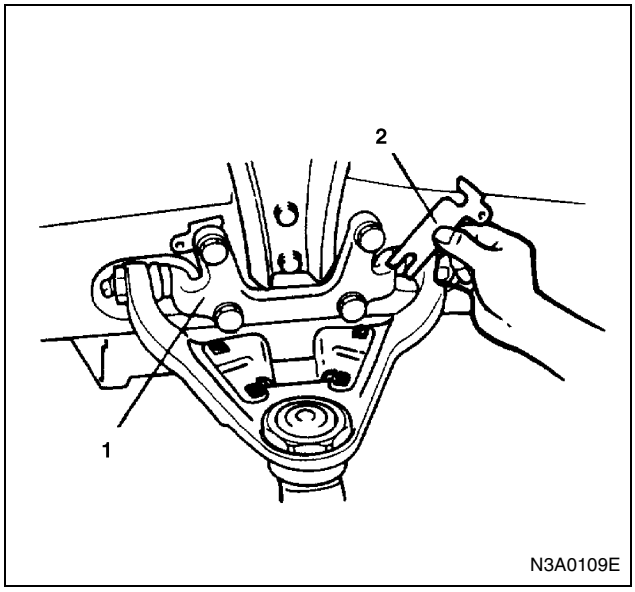
Rigid Suspension

The camber, caster and king pin inclination are built into front end and are not adjustable. If the camber, caster or king pin inclination is found to be out of alignment, check to locate the cause of trouble against the listing below and replace the parts necessary.

- Front springs for weakening
- Front I-beam (axle case) for distortion
- Bushing in king pin, King pin bearings for wear or determination

Wishbone Suspension

1. Set the jack under the cross member of the suspension and then raise the lower link with the jack and retain the jack with applied in the place.
2. Remove the shock absorber.
3. Attach the fulcrum pin (1) and loosen the bolts to the degree that it will not fall a part to adjust the camber angle using the shims (2).

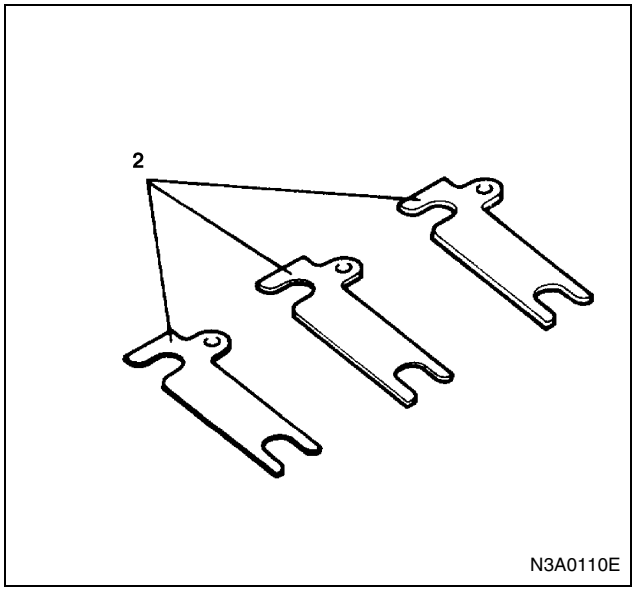


Camber Angle

If the number of shims (2) are evenly increased both at fore and aft, the camber angle becomes acute, while if decreased, the angle becomes obtuse.

Caster Angle

When the caster angle is obtuse, increase the number of shims (2) at the fore side, while the angle is acute, increase the number of shims (2) at the aft side.



Thickness of Shims Available

0.8 mm (0.031 in), 1.6 mm (0.063 in), 3.2 mm (0.126 in)

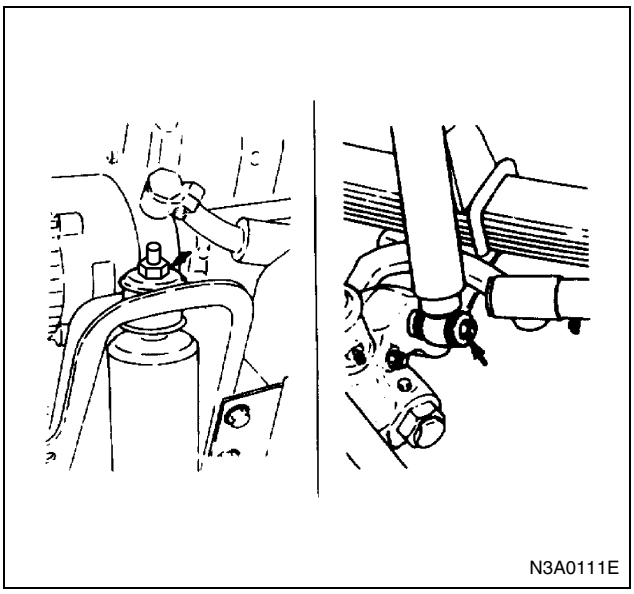
Conditions Where The Shims are Used

Number of Shims: 4 or less
Thickness: 9.6 mm (0.378 in) or less
Difference of Thickness (between Front and Rear): 4.8 mm (0.189 in) or less
In case the shim has already reached at the limitation in its number or its thickness, decrease the number of shims at the aft side to adjust the obtuse caster angle, while decrease the number at the fore side to adjust the acute caster angle.

Notice:
Since the number of shims needed for caster angle adjustment varies depending on the conditions of the car, perform the adjustment procedures which are the most suitable for the car conditions.

4. Tighten the mounting bolts of the front shock absorber.

Tighten:
- Shock absorber bolt and nut to
  Upper: 21 N·m (2.1 kg·m / 16 lb·ft)
  Lower: 103 N·m (10.5 kg·m / 76 lb·ft)



N3A0111E

Trim Height (Wishbone Suspension Only)

Adjustment

Adjust the trim height by means of adjusting bolt on the height control arms.

Caution:
When adjusting front end alignment, be sure to begin with trim height as trim height adjustment may change other adjusted alignments.

1. Check and adjust the tire inflation pressures.
2. Park the vehicle on a level ground and move the front of the vehicle up and down several times to settle the suspension.
3. Make necessary adjustment with the adjusting bolt on the height control arms.

Trim Height
101.4±5 mm (3.992±0.197 in)

Tandem Hydraulic Pump

A tandem hydraulic pump has two independent hydraulic pumps inside one casing. Its main parts can be classified into the following three.

- hydraulic pump (vane type)
- flow control valve
- pressure relief valve

The following is a description of the functions and operation of the main parts.

Hydraulic pump

Functions

The heart of the system, namely the part that supplies hydraulic pressure, which operates the hydro boost and the P/S. The hydraulic pump is installed directly to the engine and is driven by gears. It smoothly adapts itself to severe conditions of use, including a wide range of rotation speeds, changes in the temperature at which it is used, and frequent changes in load pressure, and it is able to fully perform its functions.

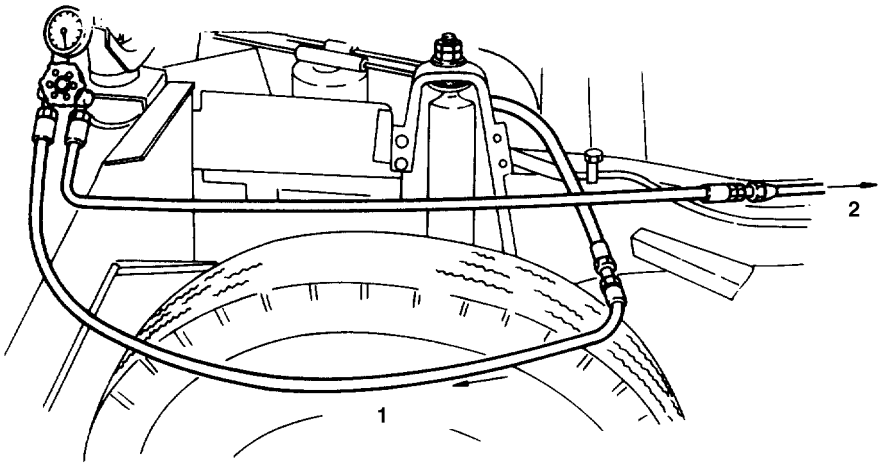
Operation

Its drive is transmitted by gears from the engine to the drive shaft of the oil pump, and it turns a rotor that is fitted into the spline part of the drive shaft. When the rotor rotates, the ten vanes built into the rotor groove fly out by centrifugal force, are pressed against the inside surface of the cam ring, and rotate along the inside surface so that the pump operates.

Suction and discharge of the hydraulic oil is done by a pressure plate and side plate attached to both ends of the cartridge.
Suction openings and discharge openings are provided in two locations each in symmetrical positions with respect to the axis of rotation, and because the load on the bearings due to the discharge pressure is balanced, a tandem oil pump is also called a balanced hydraulic pump.
Because it has a double pump effect per rotation, this pump provides large discharge flow in proportion to the space it occupies. Also, some of the hydraulic oil that is discharged is led to the base of the vanes and ensures the quality of the seal between the vane tips and the cam, and even if the vanes and cam rings become a little worn, the seal is hardly affected at all (with respect to discharge, oil tightness).

ON-VEHICLE SERVICE

Power Steering System



N3A0118E

Legend

1. From oil pump
2. To steering unit

Preparation

- Inspect the fluid reservoir for proper fluid level.
- Inspect the pump belt for proper tension.

System Test Procedure

1. Place a container under the pump to catch the fluid when disconnecting or connecting the hoses.
2. With the engine NOT running, install the power steering fluid pressure gauge unit between the power steering unit and discharge side of oil pump. The gauge must be between the stop valve and oil pump.

   Gauge kit: 5-8840-0162-1
3. Check the fluid level. Fill the reservoir with Dexron®-III to "Full" mark. Check the connections at gauge kit for leakage.
4. Fully open the stop valve, and bleed the system. Refer to "Power Steering System Bleeding" of this section.
5. Start the engine and being idled, and raise oil temperature to 50 — 60°C (122 — 144°F). Check the fluid level again. Fill the reservoir with Dexron®-III to "Full" mark if required.
6. Hold the steering wheel in the forward position. Fully close the stop valve, and record the highest value of fluid pressure.

Caution:
Do not continue this test. It should be done within 10 seconds, because otherwise oil temperature would rise to excess to cause trouble.

Standard Operating Pressure

- NQR without HBB: 11,278 kPa (115 kg/cm^2/1,635 psi)
- NPR/NPS/NQR, with HBB: 10,787 kPa (110 kg/cm^2/1,563 psi)
- except Above Models: 10,297 kPa (105 kg/cm^2/1,493 psi)

HBB: Hydraulic Booster Brake

- If the pressure recorded is within specified range, the steering system is functioning within its specifications.
- If the pressure recorded is higher than specified range, oil pump relief valve is defective.
- If the pressure recorded is lower than specified range, oil pump or relief valve is defective.

7. Fully open the stop valve and keep engine idled. Turn and hold steering wheel to full left lock, and record the highest value of fluid pressure.

   Turn and hold steering wheel to full right lock, and record the highest value of fluid pressure.

Caution:
Do not continue this test. It should be done within 5 seconds.

Standard Operating Pressure

- NQR without HBB: 11,278 kPa (115 kg/cm^2/1,635 psi)
- NPR/NPS/NQR, with HBB: 10,787 kPa (110 kg/cm^2/1,563 psi)

- except Above Models: 10,297 kPa (105 kg/cm^2/ 1,493 psi)

HBB: Hydraulic Booster Brake

- If the pressure recorded is within specified range, the steering system is functioning within its specifications.
- If the pressure recorded is lower than specified range, steering unit is leaking internally and must be disassembled and repaired.

Power Steering System Bleeding

1. Raise the front wheels with a jack. (It is recommended that a turn-table should be placed under right hand and left hand side front wheels at this time.)
2. Replenish the fluid tank with ATF Dexron®-III, and repeat the full steering (turning to the extreme ends of the steering) in both right hand side and left hand side directions quietly with the engine stopped.

Caution:
Under this condition, the air trapped in the fluid piping will be released from the fluid tank to the atmosphere in the form of large air bubbles.

3. Whenever the fluid level in tank is lowered, replenish the tank with ATF Dexron®-III in the amount equivalent to the consumption.

Caution:
Pay extra care over the fluid level so that fluid will not run out.

4. Start the engine and repeat the full steering several times quietly with the engine kept idling.

Caution:
The time needed for full steering should be less than five minutes. (Prolonged full steering of more than five seconds will cause the fluid temperature to raise significantly.)

5. Lower the front wheels and turn the steering wheel in both left hand and right hand sides several times with the engine run. If no abnormal noise can be heard at this time, air might be completely released.

Caution:
If the abnormal noise (creaky, “zi-zi” sound etc.) can be heard in the piping after the step No. 5 has been completed, the air is still trapped in the piping and air release has not been completed.

In this case, continue repetition of steering wheel turn in the both directions of left hand and right hand sides until the fluid temperature is increased up to around 50 — 80°C (122 — 176°F). When the temperature reaches this degree, stop the engine and leave the engine for about five minutes. (Within five minutes, air bubbles can be collected.) Start the engine again and repeat the full steering several times.

6. After air release has been completed, check the fluid level in the tank and also confirm that the joints have no fluid leak.

Tighten:

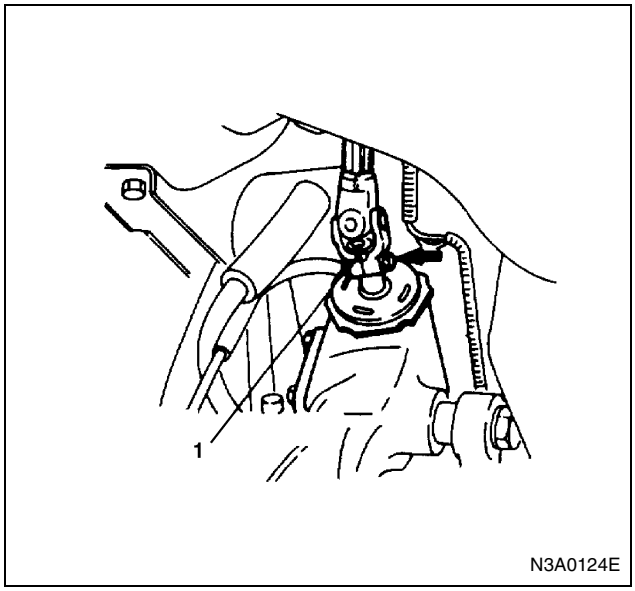
- Nut and bolt to 103 N·m (10.5 kg·m / 76 lb·ft)

5. Universal Joint
   Install the parts by aligning setting marks (1) applied at removal.

Tighten:

- Universal joint bolt to
  M8 bolt: 25 N·m (2.5 kg·m / 18 lb·ft)



6. Drag Link
7. Nut
8. Cotter Pin
   1) Install the drag link to the pitman arm and the knuckle arm.
   2) Tighten nuts to specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Tighten:
- Nut to 167 N·m (17 kg·m / 123 lb·ft)
  - Connect the oil pipe. Tighten flare nuts to specified torque.

Tighten:
- Flare nut to 44 N·m (4.5 kg·m / 33 lb·ft)

9. Install the bumper assembly. (for Non-Tilt Cab Model)

Tighten:
- Bumper bolt to 40 N·m (4.1 kg·m / 30 lb·ft)

10. Install the under panel. (for Non-Tilt Cab Model)
11. Install the head light assembly, front grille and front combination light assembly. (for Non-Tilt Cab Model) Refer to “Headlight Replacement”.

Notice:
After installation, adjust head light aiming. Refer to “Cab and Chassis Electrical”. (Non-Tilt Cab Model)

Power Steering Pump

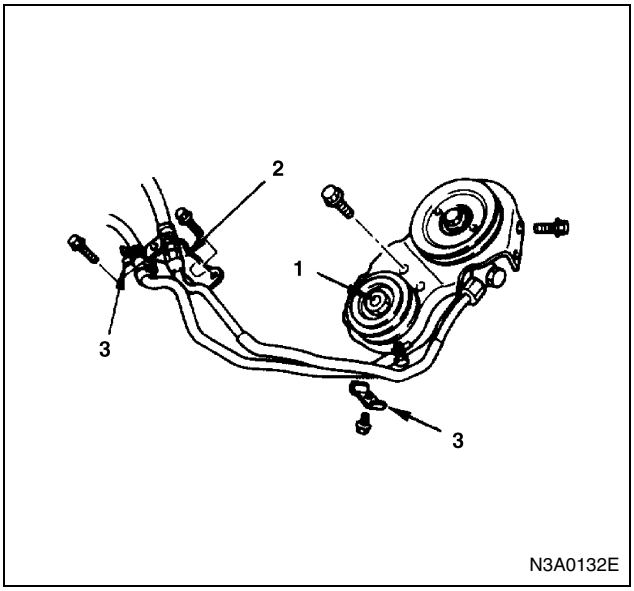
Preparation

- Drain the fluid through the pipe which is connected to the return board for the power steering pump.
- Disconnect the fluid piping.

Removal

4J Series Engine

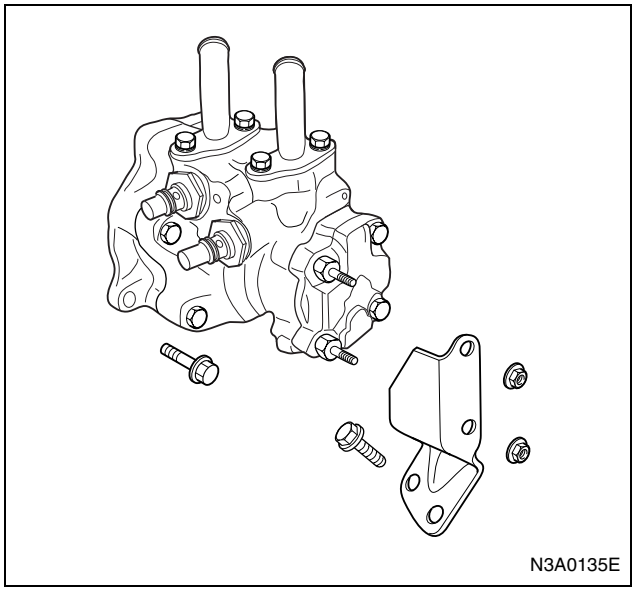
- Loosen the idler pulley locking nuts (1) for the power steering pump.
- Loosen the adjusting bolts for the drive belt and remove the drive belt.
- Remove the pipe brackets (2) and clips (3) on the alternator side.
- Remove the pump mounting brackets.



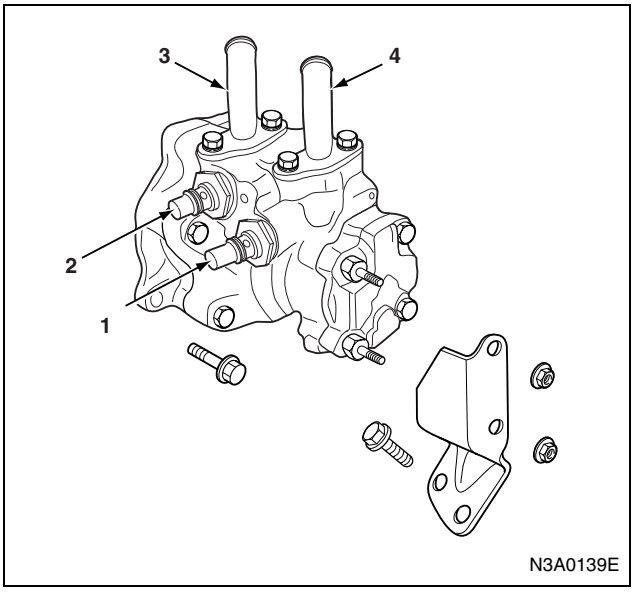
4HE1 Engine

- Block the vehicle wheels and apply the parking brake.
- Disconnect the battery ground cable.

1. Disconnect air intake hose at turbocharger side.
2. Raise the vehicle and remove front exhaust pipe with exhaust brake.
   - Remove bolts at manifold, silencer and support bracket.
3. Place a container under the hydraulic pump assembly to catch fluid when disconnecting hoses. Clean the surfaces around fittings before removing them.

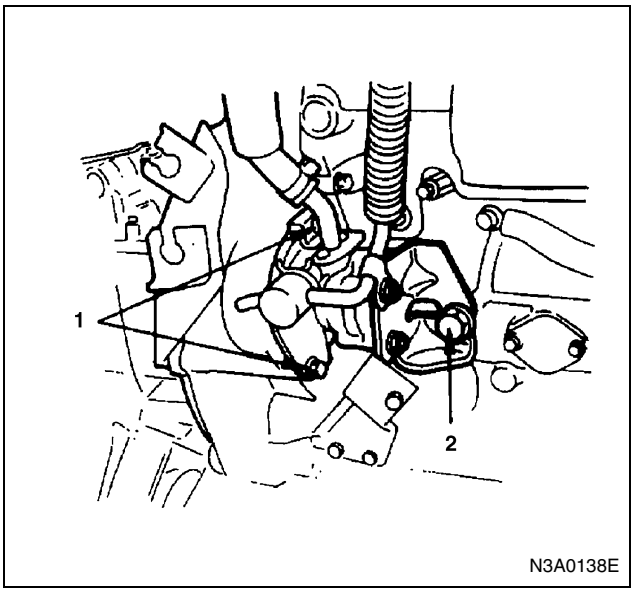


4. Remove power steering outlet flexible hose (1) and nut.
5. Remove hydraulic booster outlet pipe (2) nut.
6. Remove two clips for hydraulic booster lines on the flywheel housing.
7. Remove clip for hydraulic booster lines on the left side member.
8. Hydraulic booster inlet hose (3).
9. Power steering inlet hose (4).
10. Remove hydraulic booster pipe from the pump.
11. Remove hydraulic pump assembly with bracket and O-ring.



4HF1 Engine

- Loosen three fixing bolts for power steering pump (Two on the flywheel side (1) and one on the cylinder body side (2)) and remove them.



Installation

4J Series Engine

Tighten:

- Bolt and nut to

  Pump and bracket assembly: 19 N·m (1.9 kg·m / 14 lb·ft)

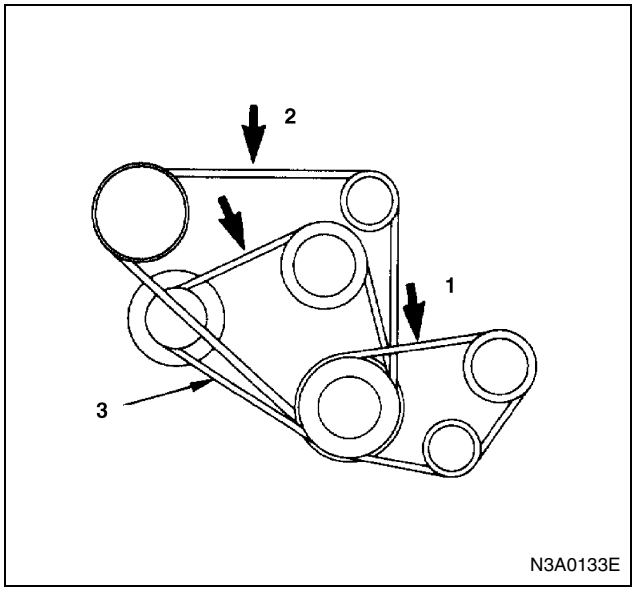
  Oil pipe bracket: 19 N·m (1.9 kg·m / 14 lb·ft)

  Clip bolt: 10 N·m (1.0 kg·m / 87 lb·in)

- Install the drive belt for the power steering pump and adjust the belt tension. Press the middle of the belt with a 98N (10kg) weight to measure the deflection of the belt.

Belt Deflection

8 — 12 mm (0.315 — 0.472 in)

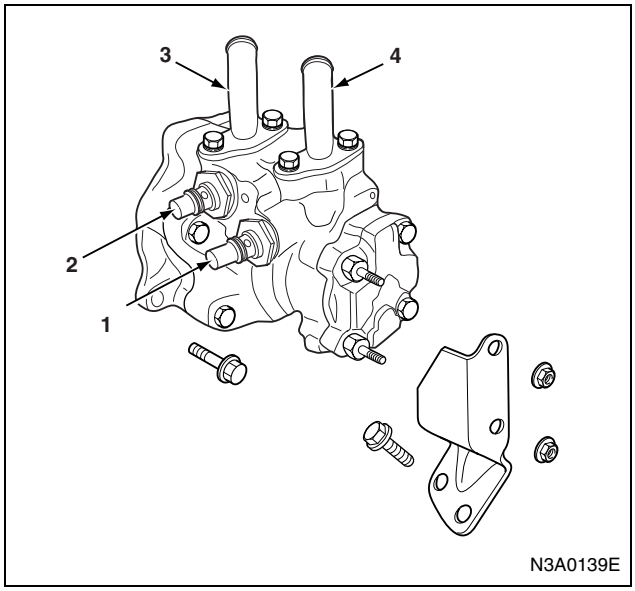


Legend

1. Power steering pump drive belt
2. A/C compressor drive belt
3. A/C generator cooling fan drive belt

4HE1 Engine

1. Attach new O-ring and install hydraulic pump assembly to the engine.



2. Install booster outlet pipe (2) and nut.

Tighten:

- Nut to 23.5 N·m (2.4 kg·m / 17 lb·ft)

3. Install power steering outlet flexible hose (1) and nut.

Tighten:

- Nut to 23.5 N·m (2.4 kg·m / 17 lb·ft)

4. Connect hydraulic booster inlet hose (3).
5. Connect power steering inlet hose (4).
6. Install clips for hydraulic booster lines.
7. Connect air intake hose.

8. Install exhaust pipe with exhaust brake.
9. Fill the power steering and hydraulic booster systems with DEXRON®-III.
   Bleed the power steering system as outlined in this section.
   Bleed the hydraulic booster system. Refer to “Hydraulic Booster Line Bleeding” in Section 5.

4HF1 Engine

- Attach new O-rings and tighten them to the specified torque.

Tighten:

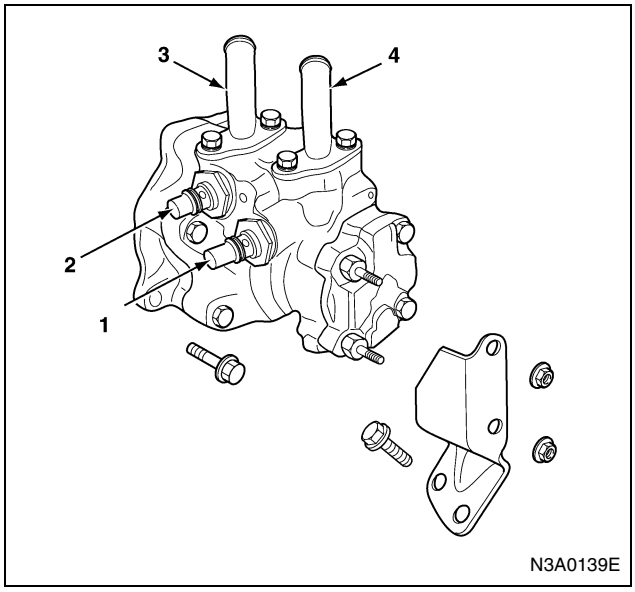
- Power steering pump bolt to
  Flywheel side: 43 N·m (4.4 kg·m / 32 lb·ft)
  Cylinder body side: 44 N·m (4.5 kg·m / 33 lb·ft)

Tandem Hydraulic Pump

Removal

- Block the vehicle wheels and apply the parking brake.
- Disconnect the battery ground cable.

1. Disconnect air intake hose at turbocharger side.
2. Raise the vehicle and remove front exhaust pipe with exhaust brake.
   - Remove bolts at manifold, silencer and support bracket.
3. Place a container under the hydraulic pump assembly to catch fluid when disconnecting hoses. Clean the surfaces around fittings before removing them.
4. Remove power steering outlet flexible hose (1) and nut.
5. Remove hydraulic booster outlet pipe nut.
6. Remove clips for hydraulic booster lines on the flywheel housing.
7. Remove clip for hydraulic booster lines on the left sidemember.
8. Hydraulic booster inlet hose (3).
9. Power steering inlet hose (4).
10. Remove hydraulic booster outlet pipe (2) from the pump.
11. Remove hydraulic pump assembly with bracket and O-ring.



Installation

1. Attach new O-ring and install hydraulic pump assembly to the engine.
2. Install booster outlet pipe (2) and nut.

Tighten:

- Bolt and nut to 23.5 N·m (2.4 kg·m / 17 lb·ft)

3. Install power steering outlet flexible hose (1) and nut.

Tighten:

- Bolt and nut to 23.5 N·m (2.4 kg·m / 17 lb·ft)
  - Put the cap on the eye joint and clamp the cap with the fastener.

4. Connect hydraulic booster inlet hose (3).
5. Connect power steering inlet hose (4).
6. Install clips for hydraulic booster lines.
7. Connect air intake hose.
8. Install exhaust pipe with exhaust brake.
9. Fill the power steering and hydraulic booster systems with ATF DEXRON®-III.
   Bleed the power steering system as outlined in this section.
   Bleed the hydraulic booster system. Refer to “Hydraulic Booster Line Bleeding” in Section 5.

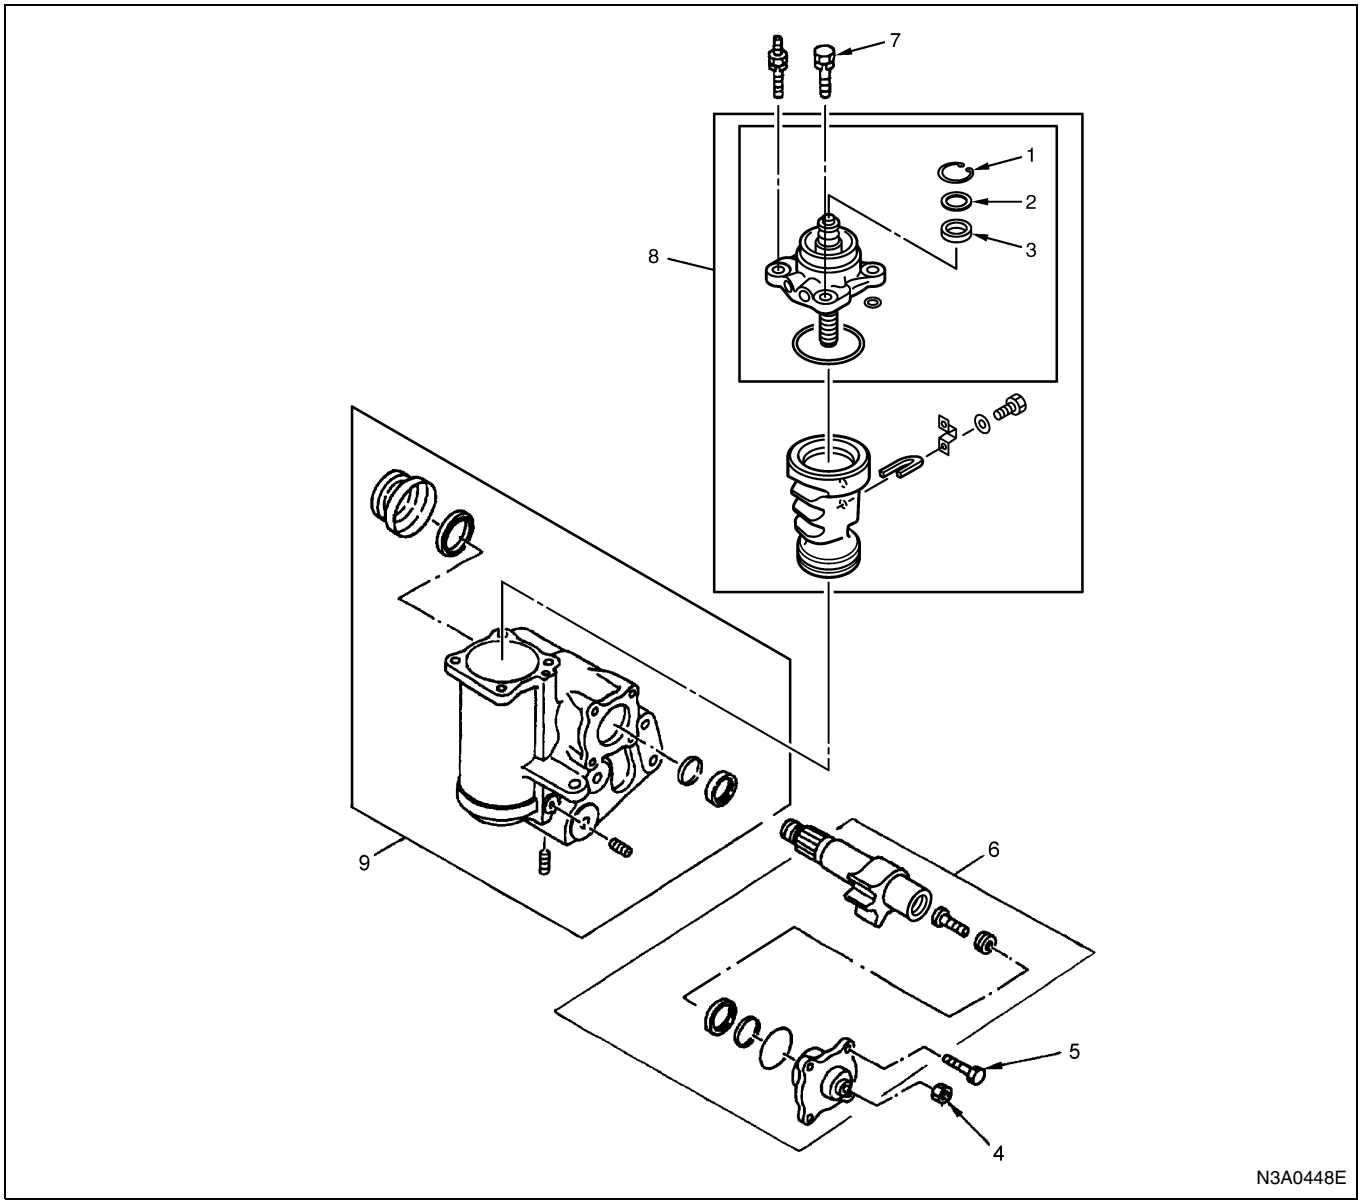
UNIT REPAIR

Power Steering Unit

Illustrations of this section are based on RHD model.
Illustrations for LHD model are symmetrically opposite.

Power Steering Unit



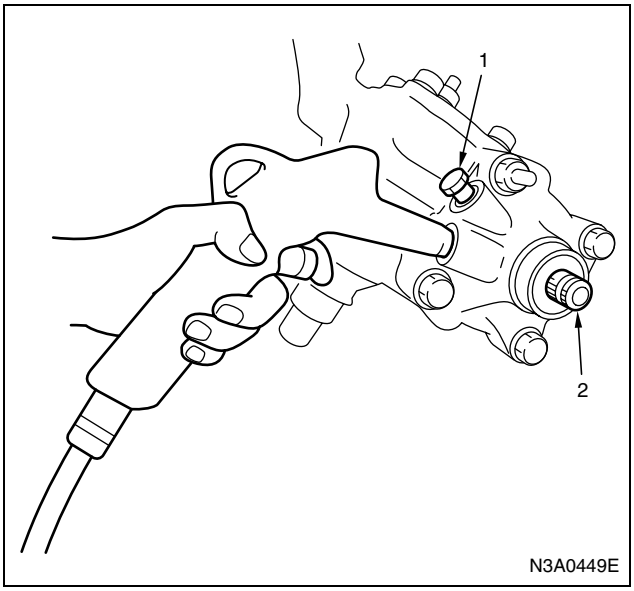
Legend

1. Retaining ring
2. Dust seal
3. Oil seal
4. Lock nut
5. Bolt
6. Sector shaft assembly and side cover assembly
7. Bolt
8. Valve housing and worm shaft assembly
9. Body assembly

Disassembly

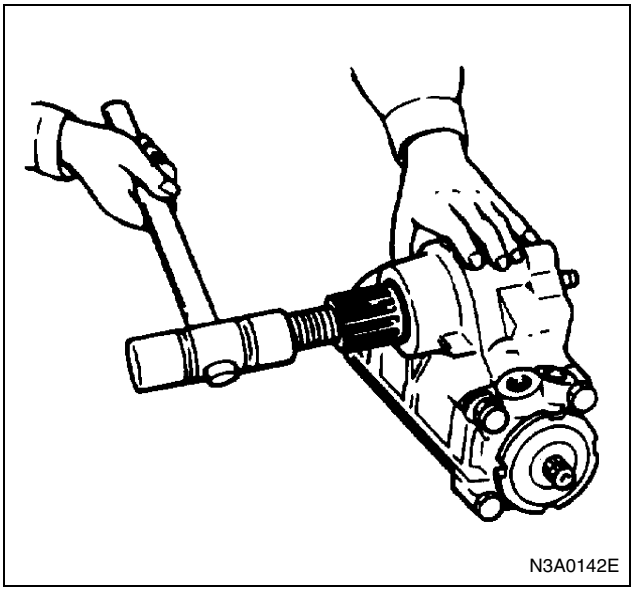
1. Retaining ring
2. Dust seal
3. Oil seal
   - Clean around the stub shaft.
   - Plug the hose hole on the inlet side.
   - Blow air through the hole on the outlet side to remove the oil seal.

Caution:
- Be careful because the oil seal may suddenly fly out due to air pressure.
- Take care not to damage the pipe seating area in port.

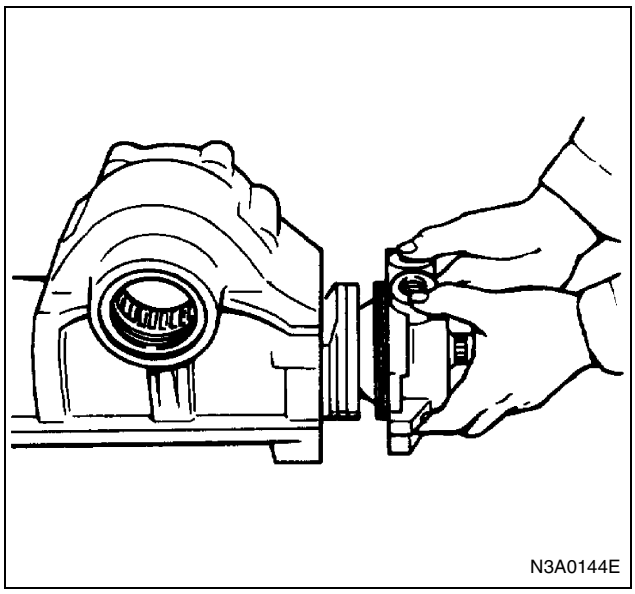


Legend
1. Plug
2. Stub shaft

4. Lock Nut
5. Bolt
6. Sector Shaft Assembly and Side Cover Assembly
   When removing, take care so as not to cause damage to the serrations, threads and oil seal.



7. Bolt
8. Valve Housing and worm shaft Assembly
   Remove piston with valve housing.
   Always keep ball-nut assembly in a horizontal position and avoid holding it vertically.



9. Body Assembly

Inspection and Repair

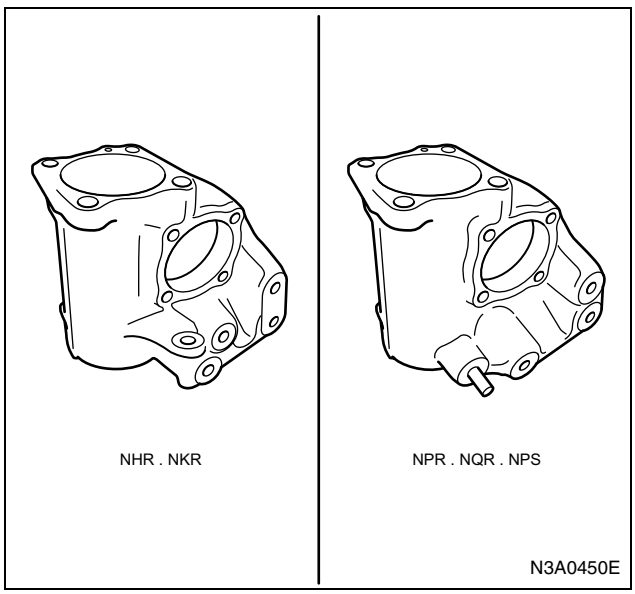
Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Visual Check

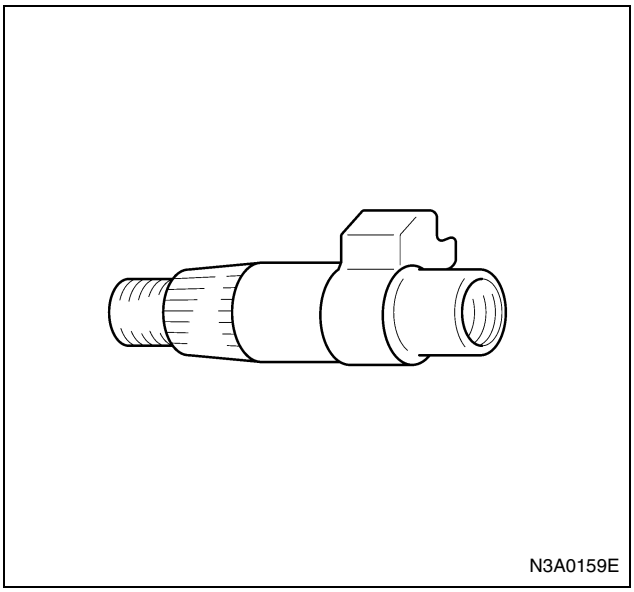
Inspect the following parts for wear, damage or other abnormal conditions.
- Gear box
- Sector shaft
- Needle roller bearing
- Piston and worm shaft
- Oil seal, Dust cover, Y-gasket, O-ring and seal ring

Gear Box

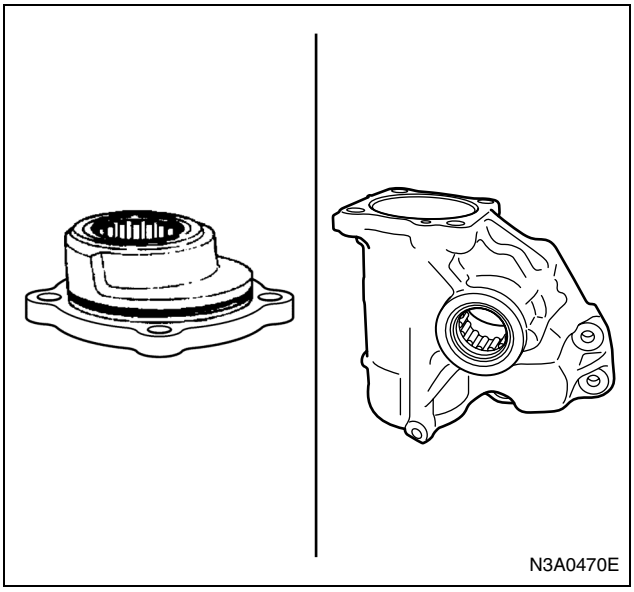
Check the body for cracks, and body inner surface and piston sliding surface for scratches.



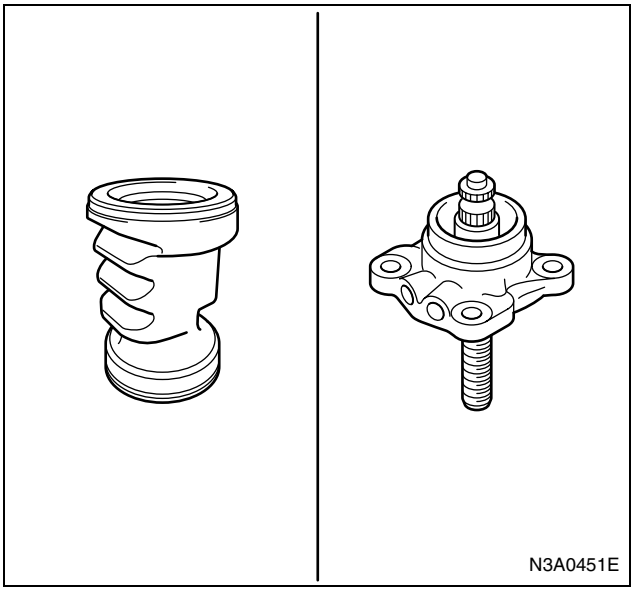
Sector Shaft
If the shaft is worn, twisted, scratched or partially worn, replace it with a new one.



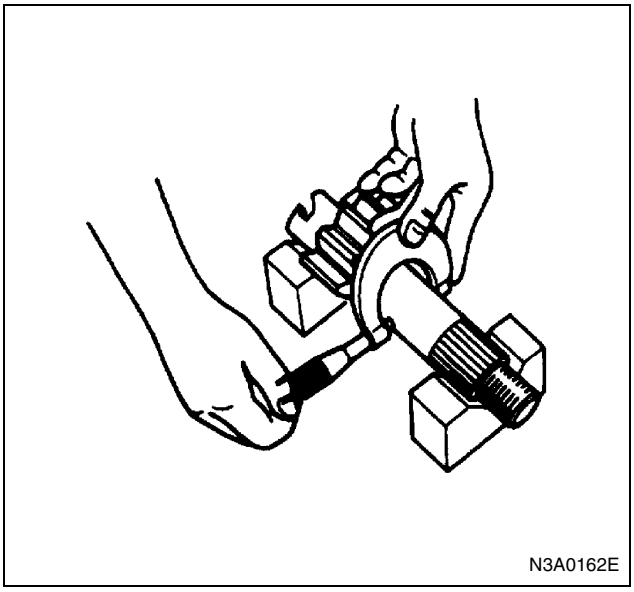
Bearing
If the bearing race surface is worn, scratched or seized, replace it with a new assembly.



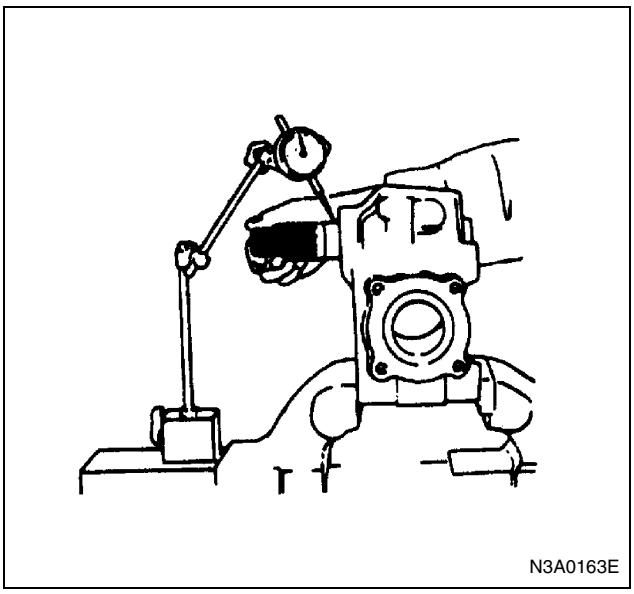
Piston and Worm Shaft
If the piston surface is remarkable worn or play is excessive, replace with a new assembly.



Measurement of Sector Shaft Outside Diameter
Standard: 39.975 mm (1.574 in)
Limit: 39.925 mm (1.572 in)

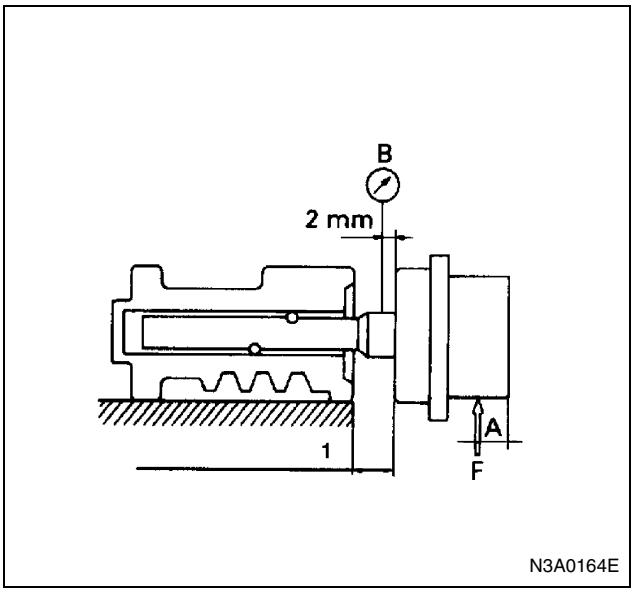


Measurement of Play between Sector Shaft and Needle Roller Bearing
Limit: 0.12 mm (0.0047 in)



N3A0163E

Valve Housing Assembly
Measure the end play of the ball screw in the axial direction.
A: 16 mm (0.6299 in)
F: 39 N (4 kg/11 lb)
B (end play): 0.5 mm (0.0197 in) or less



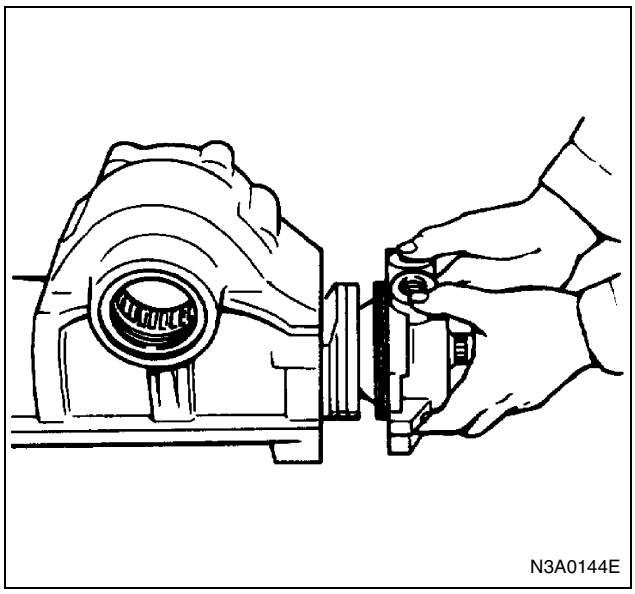
N3A0164E

Legend
1. Neutral position

Reassembly

1. Body Assembly
2. Valve Housing Assembly

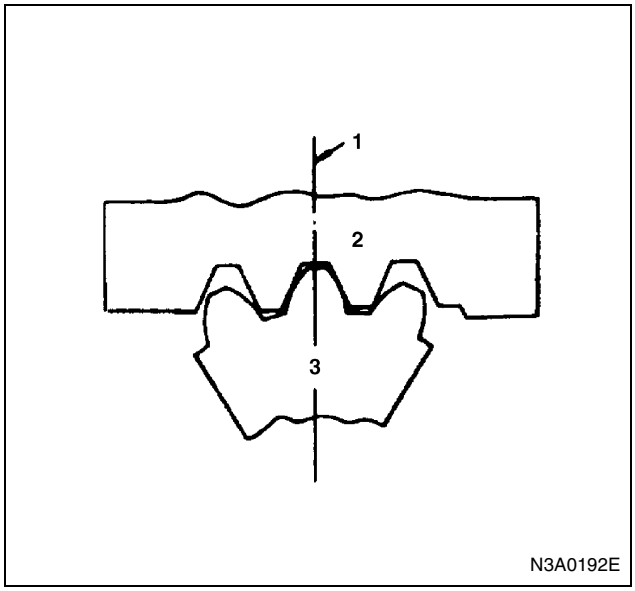
Tighten:
- Valve housing and worm shaft assembly bolt to
  NHR, NKR: 59 N·m (6.0 kg·m / 43 lb·ft)
  NPR, NQR, NPS: 103 N·m (10.5 kg·m / 76 lb·ft)
  Install the parts with the valve side turned to front and worm gear of piston toward the sector gear. Apply liquid to the valve housing contact surface.



N3A0144E

3. Bolt
4. Sector Shaft Assembly and Side Cover Assembly
5. Bolt

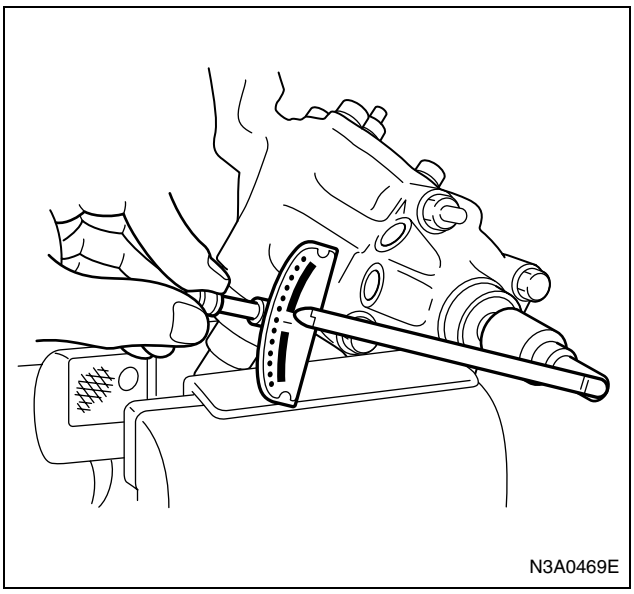
Tighten:
- Side cover bolt to 59 N·m (6.0 kg·m / 43 lb·ft)
  Align the center tooth (1) of piston (ball nut (2)) with that of the sector shaft (3).



N3A0192E

6. Lock Nut
   1) Install drop arm.
   2) Hold the sector shaft in a straight ahead position.
   3) With the adjuster screw, adjust the preload to specification.

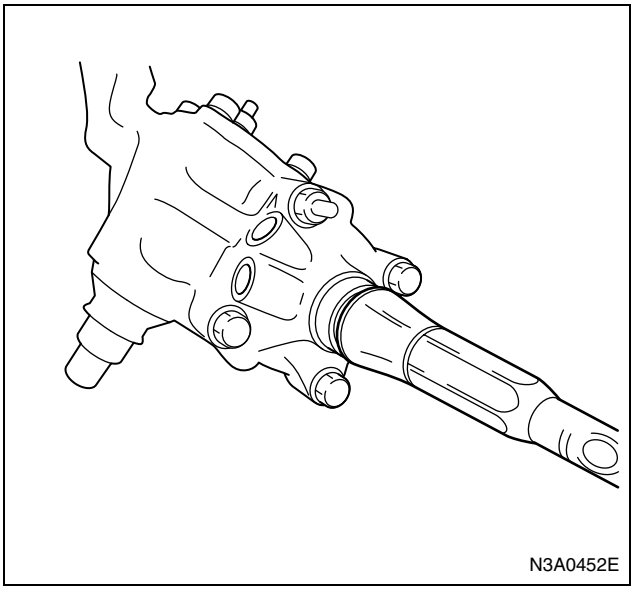
Preload Between Sector Shaft and Ball Nut
1.3 N·m (0.13 kg·m/1 lb·ft) or less



4) Apply liquid gasket to the lock nut. Adhesive liquid gasket (JIS K6820 Category 1), HERME SEAL 101Y, THREE BOND 1102 or equivalent
5) Tighten the lock nut.

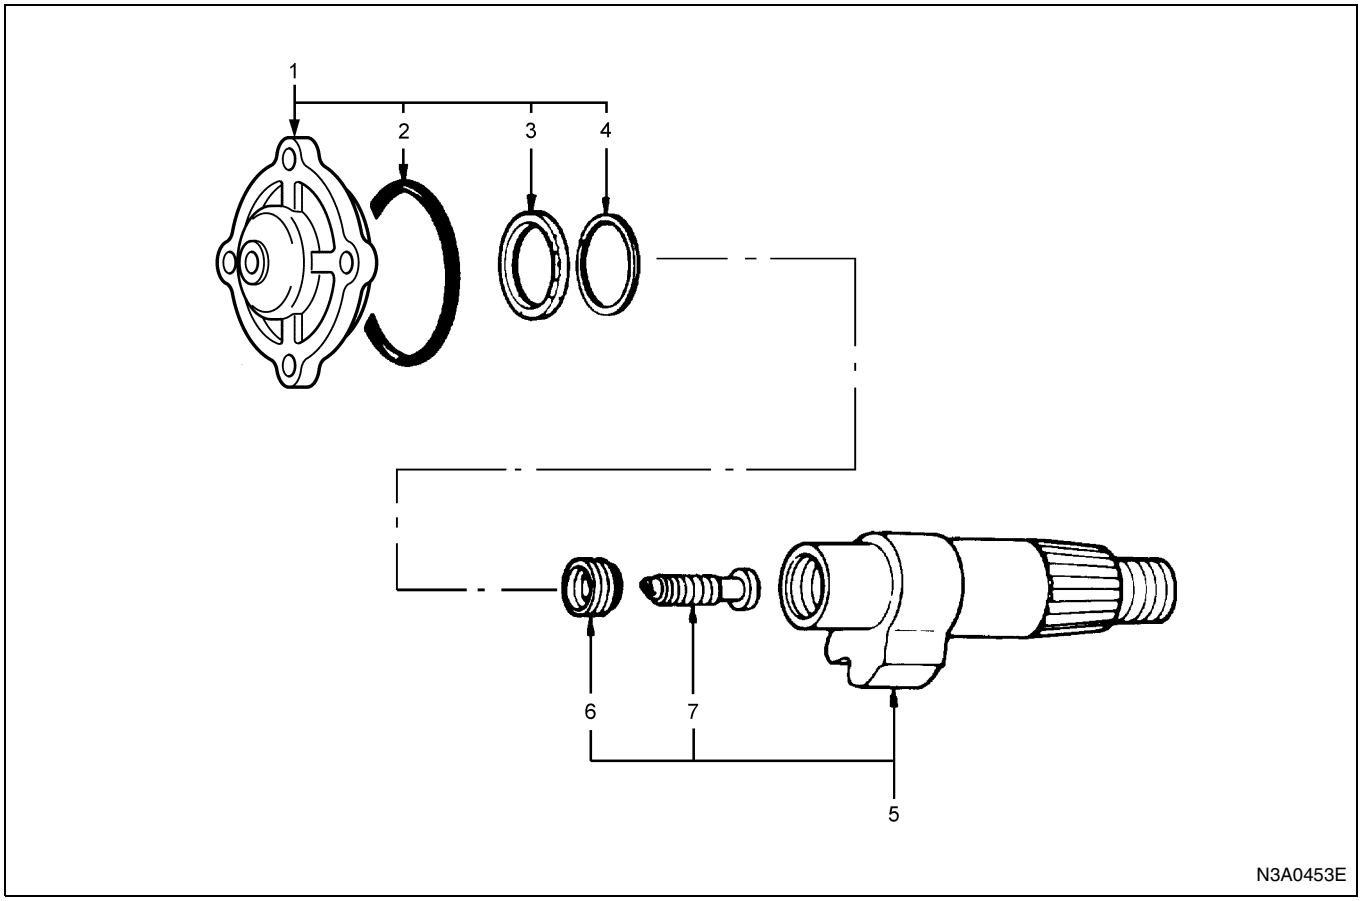
Tighten:
- Lock nut to 69 N·m (7.0 kg·m / 51 lb·ft)

7. Oil seal
   - Use new one.
   - Apply a thin coat of power steering fluid to the lip, and check the installation direction.
     Installer: 5-8522-0026-0



8. Dust seal
   - Face the dust lip side outward.
9. Retaining ring
   - Face the surface with chamfered periphery toward the oil seal side.
   - Use new one.

Side Cover and Sector Shaft Assembly



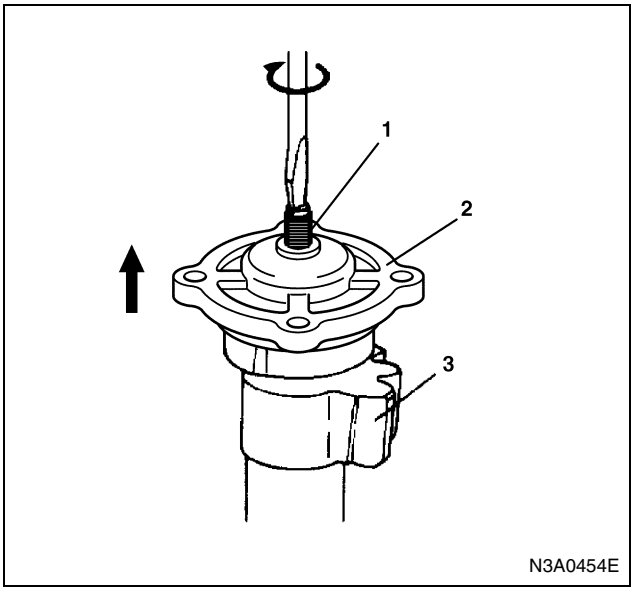
Legend

1. Side cover assembly
2. O-ring
3. Back up ring
4. Y-gasket
5. Sector shaft assembly
6. Retainer
7. Adjuster screw

Disassembly

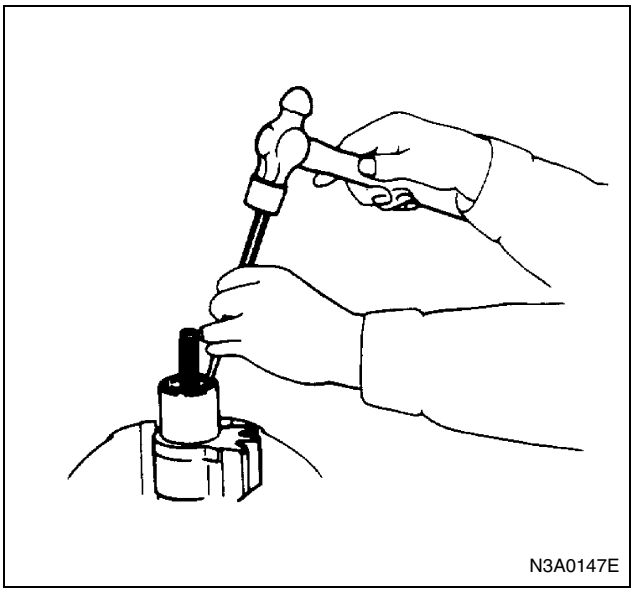
If the sector shaft is going to be fixed on the bench vice during disassembly, be sure to protect the sector shaft with cloth or other soft material.

1. Side Cover
   Gradually turn the adjuster screw (1) clockwise, and the side cover assembly will be lifted. Thus, you can separate the side cover assembly (2) from the sector shaft assembly (3).



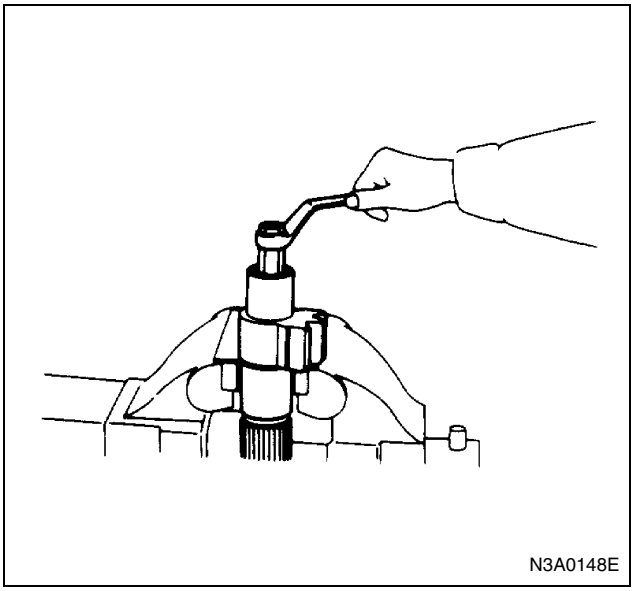
2. O-ring
3. Back Up Ring

4. Y-Gasket
   Using needle, scriber or equivalent.
5. Sector Shaft Assembly
   Unless otherwise a problem, it is not necessary to disassembly.
6. Retainer
   1) Raise the two lips of the retainer.



N3A0147E

   2) Using retaining bar.



N3A0148E

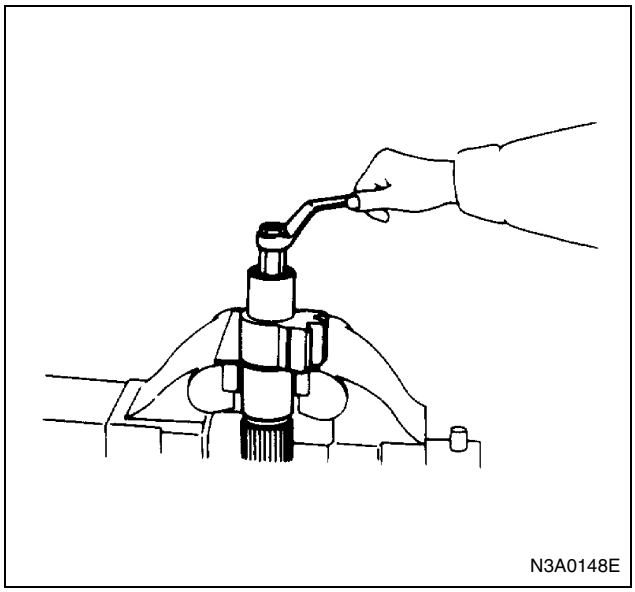
7. Adjuster Screw

Inspection and Repair

Refer to “Power Steering Unit” in this section.

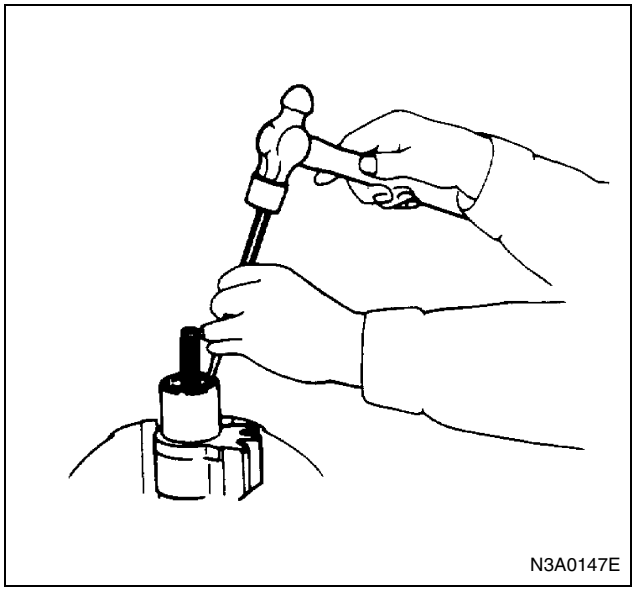
Reassembly

1. Adjuster Screw
2. Retainer
   Discard used retainer and install a new one.
   Install and fully tighten the retainer and back off 180 degrees.
   Retighten to a torque of 39 N (4 kg /44 lb) and back off 20 degrees. Check that the adjuster screw turns smoothly.



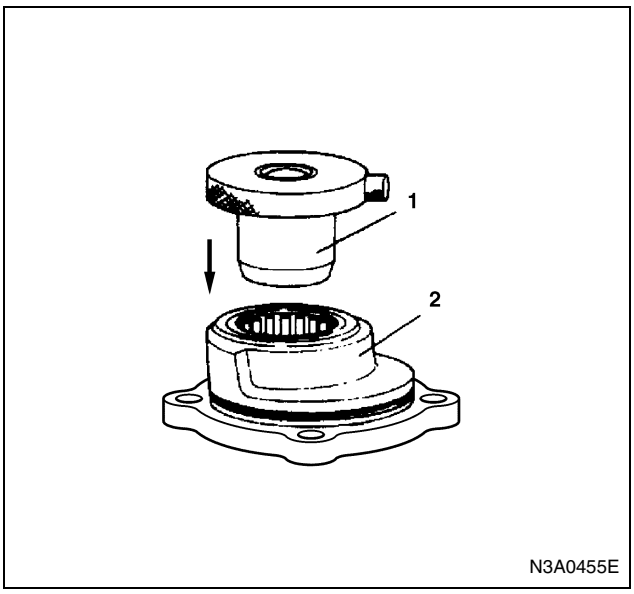
N3A0148E

   Caulk the retainer in position.



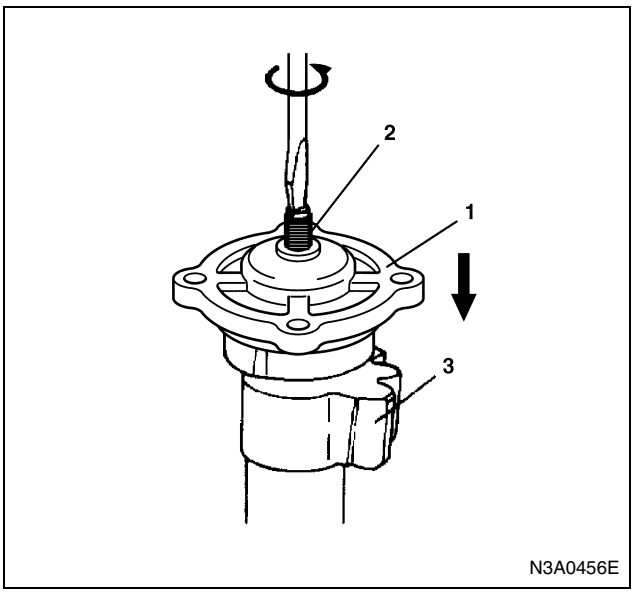
N3A0147E

3. Sector Shaft Assembly
4. Y-Gasket
   Install the gasket so that its lip faces to the bearing.
   If the lip is deformed, correct.
   Apply grease to Y-gasket.
5. Back Up Ring
   When the back up ring is installed, use installer for alignment.

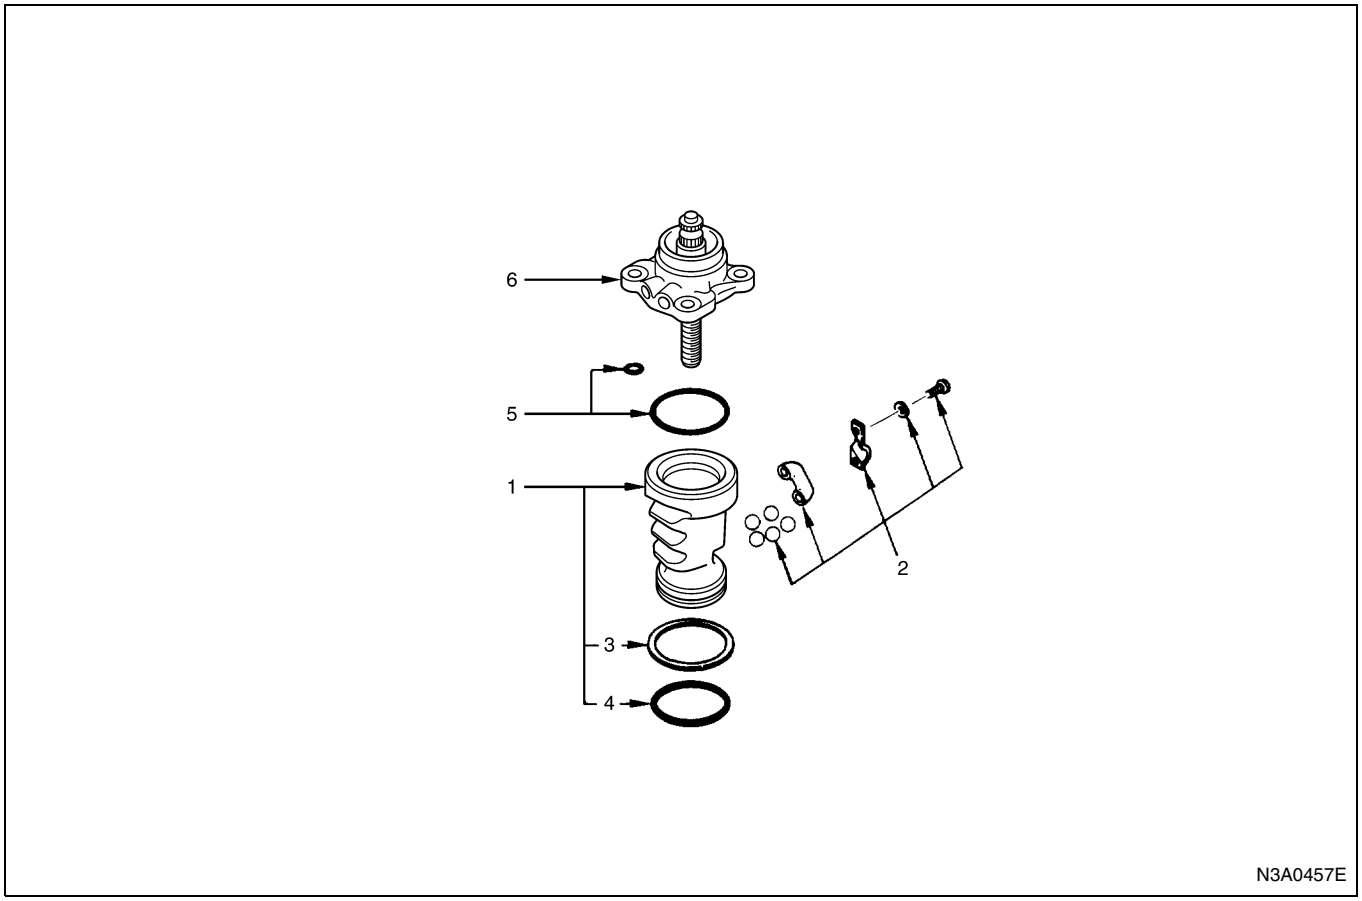


Legend
1. Installer
2. Side cover

6. O-ring
7. Side Cover Assembly
   Mate the screw hole at the center of the side cover (1) with the adjuster screw (2) on the sector shaft assembly (3), and fix the side cover assembly to the sector shaft assembly by turning the adjuster screw counterclockwise.



Valve Housing Assembly



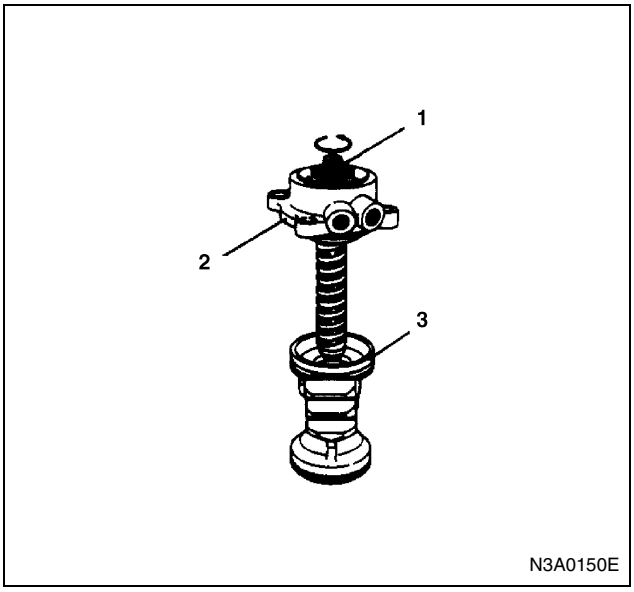
Legend

1. Piston assembly
2. Ball, tube, tube grip, screw and washer
3. Seal ring
4. O-ring
5. O-ring
6. Valve housing and worm shaft assembly

Disassembly

1. Piston Assembly
   Hold the housing with the piston end facing downward, and turn the stub shaft counterclockwise. Then, the worn shaft can be removed from the piston.

Caution:
The steel ball put in the ball race for the piston and worm shaft will drop inside of the piston. Be careful not to let the piston fall down.



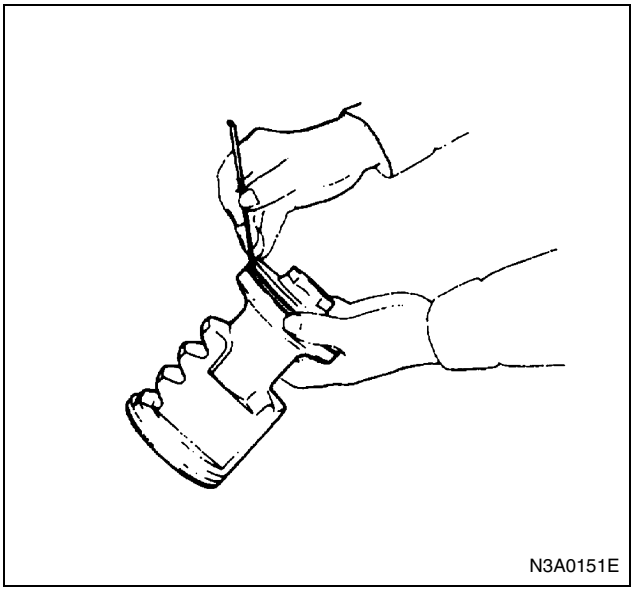
Legend

1. Stub shaft
2. Valve housing
3. Piston

2. Ball, Tube, Tube Grip, Screw and Washer
   Be careful not to lose the ball when remove the ball tube.

Number of Balls: 28

3. Seal Ring



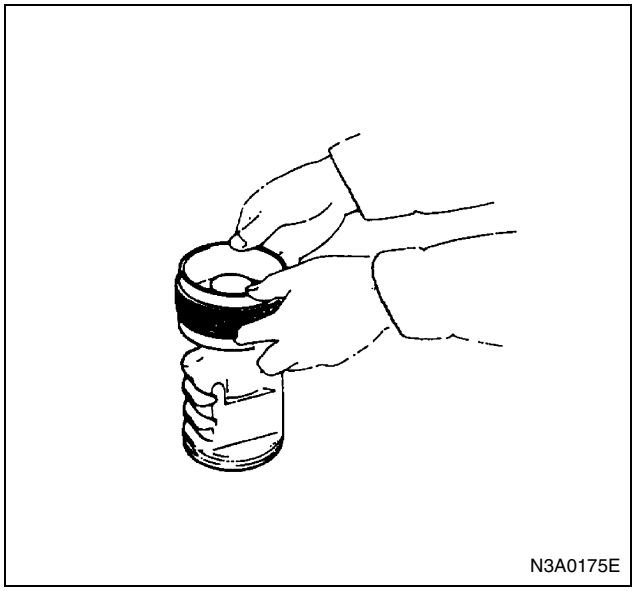
4. O-ring
5. O-ring
   Using needle, scriber or equivalent.
6. Valve housing and worm shaft assembly.

Inspection and Repair

Refer to “Power Steering Unit” in this section.

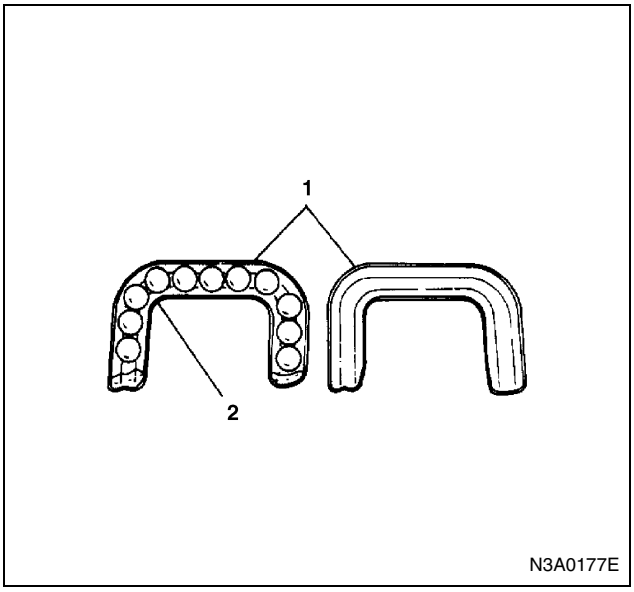
Reassembly

1. Valve housing and worm shaft assembly
2. O-ring
3. O-ring
4. Seal Ring
   When the O-ring and seal ring are installed, use installer for alignment.



5. Piston Assembly
6. Ball, Tube, Tube Grip, Screw and Washer
   1) Put the valve housing assembly (1) horizontally. Insert the ball (2) into the ball tube hole in the piston (3) while rotating the stub shaft (4). Thus, the ball can be easily mounted.

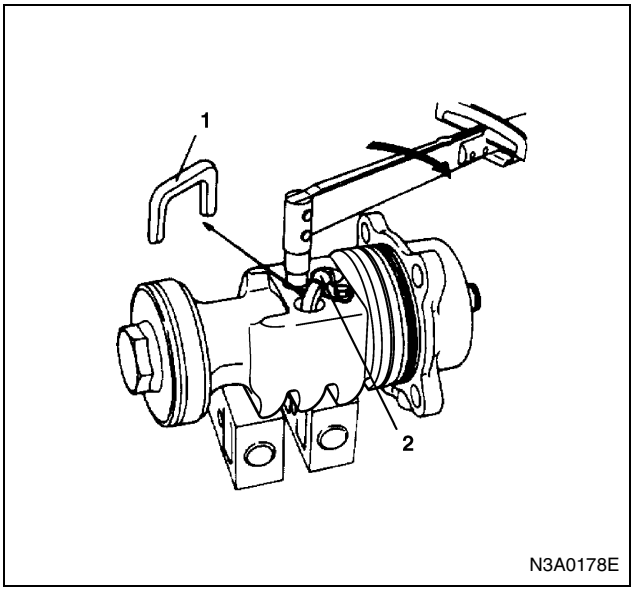
   2) Apply a sufficient amount of grease to the inner surface of the tube (1). Put and paste the balls (2) to the inner surface of the tube. Then, put the other ball tube onto the tube to which grease has been applied and the balls have been pasted.



3) Then, tighten the screw.

Tighten:

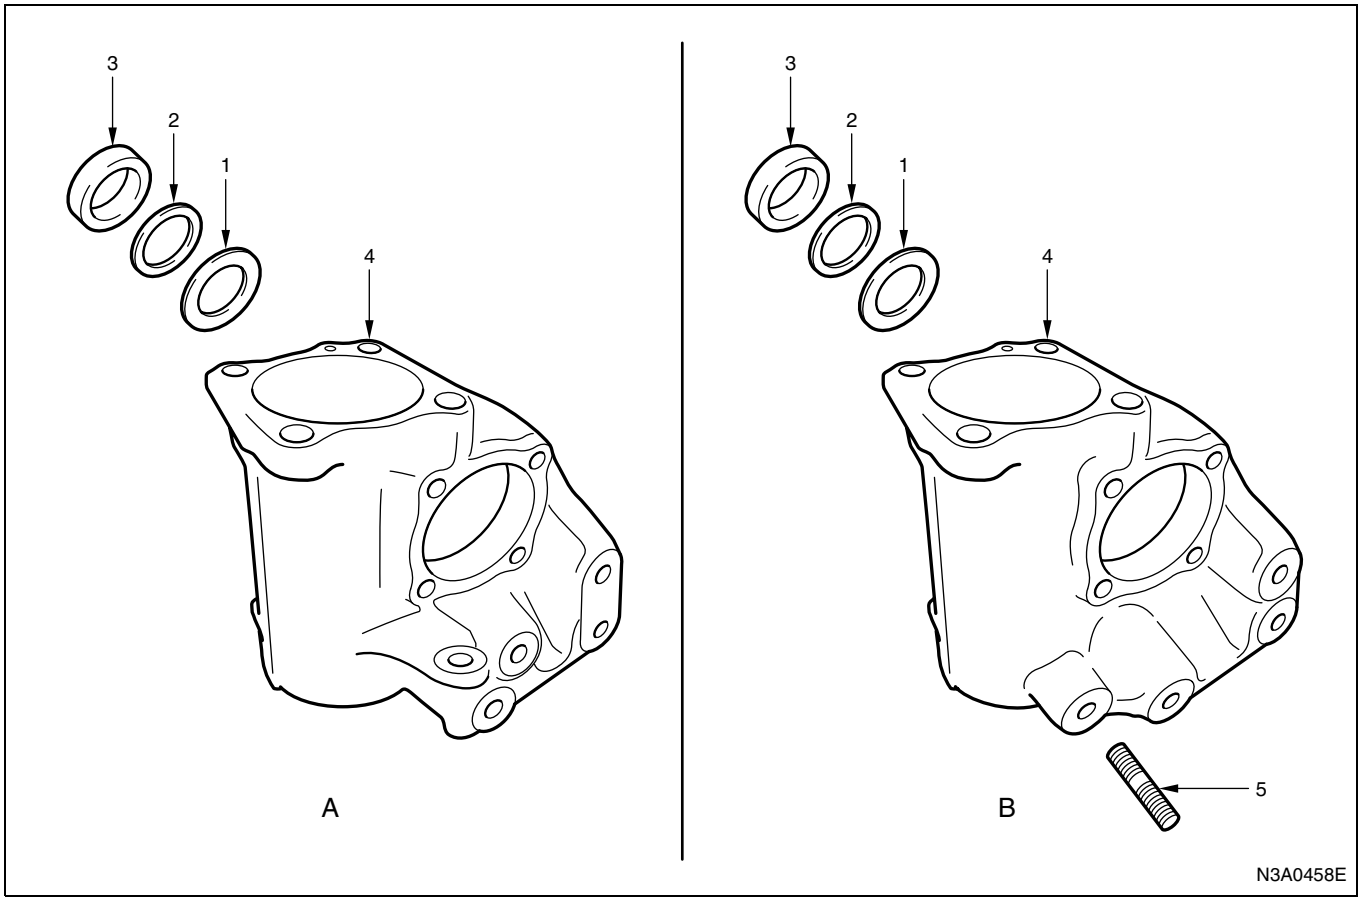
- Tube screw to 5 N·m (0.5 kg·m / 43 lb·in)



Legend

1. Tube
2. Tube grip

Body Assembly



Legend

A. NHR, NKR
B. NPR, NQR, NPS
1. Y-gasket
2. Back up ring
3. Oil seal
4. Body
5. Stud

Disassembly

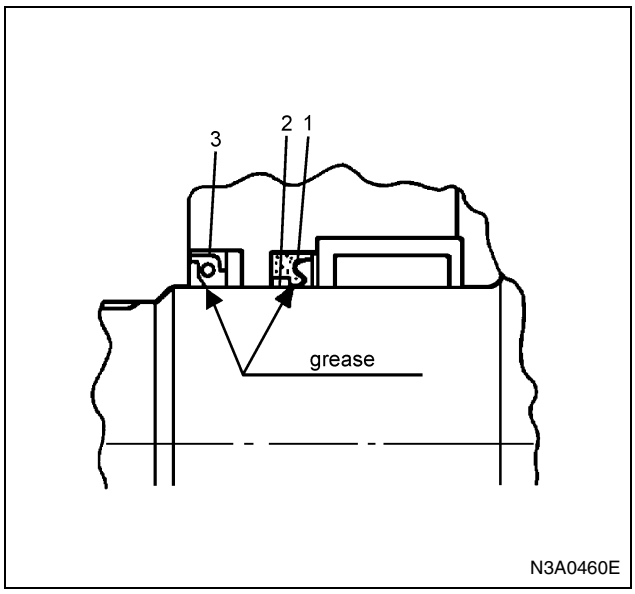
1. Y-gasket
2. Back Up Ring
3. Oil Seal
4. Body
5. Stud

Inspection and Repair

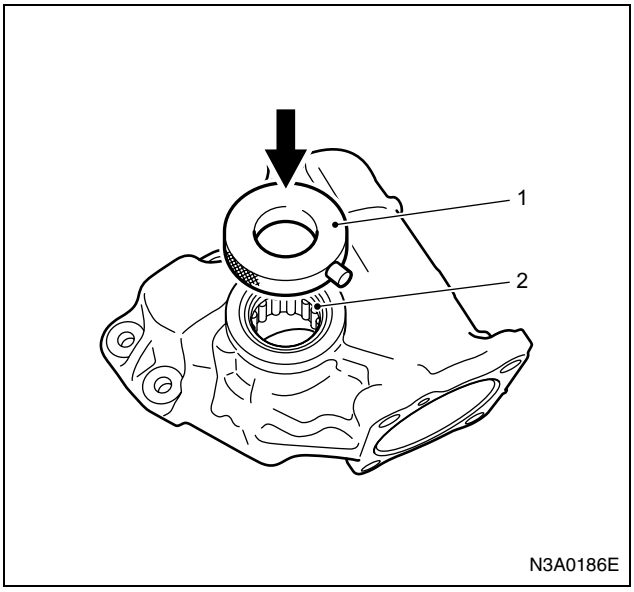
Refer to “Power Steering Unit” in this section (3B1-15).

Reassembly

Note the direction of installation.
Apply grease to these parts.

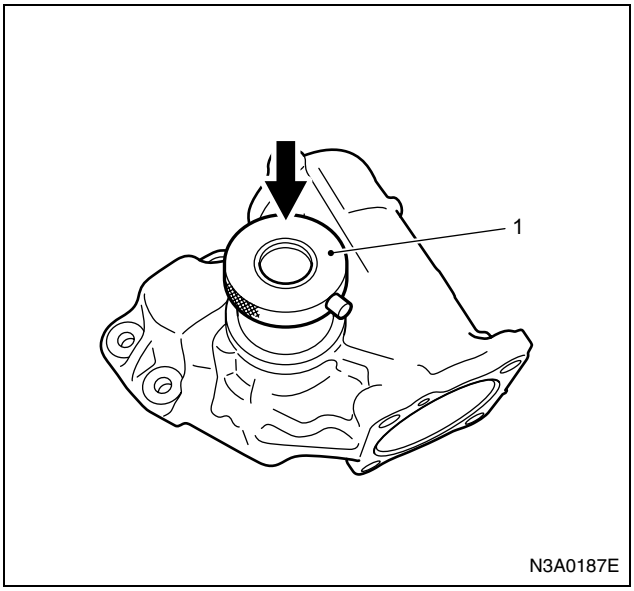


1. Body
2. Oil Seal
   Using installer.



Legend
1. Installer
2. Oil seal

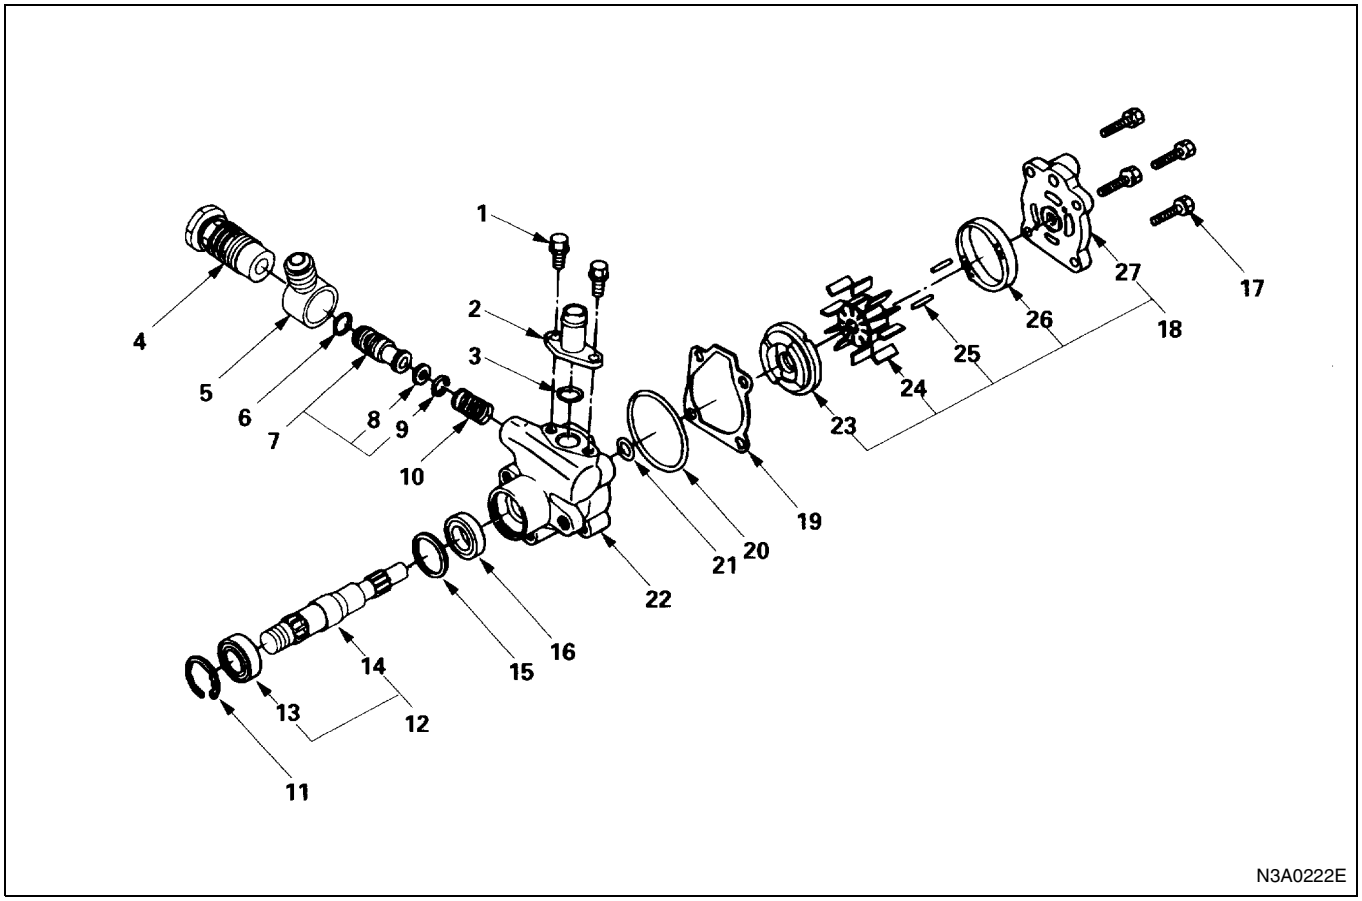
3. Y-gasket
4. Back Up Ring
   When the back up ring is installed, use installer (1) for alignment.



5. Stud

Tighten:
- Stud to 40 N·m (4.1 kg·m / 29.5 lb·ft)

Power Steering Pump (4J Series Engine)



Legend

1. Bolt
2. Pipe, suction
3. O-ring
4. Connector
5. Connector
6. O-ring
7. Valve
8. Retaining ring
9. Filter
10. Spring

20. O-ring
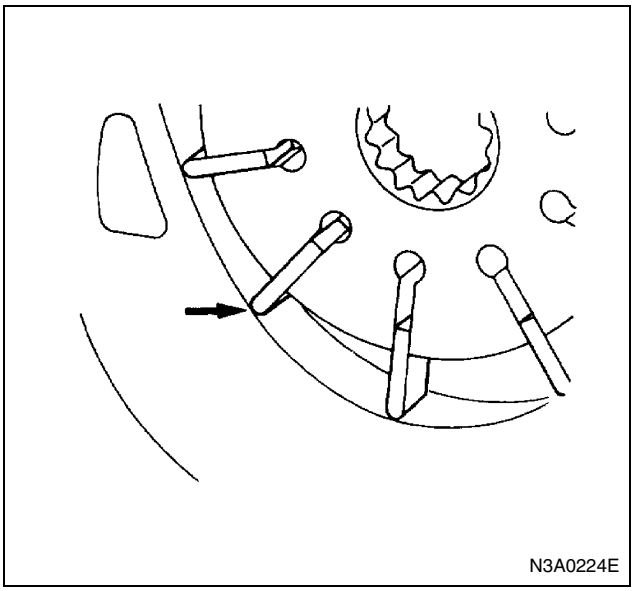
21. Front Housing
22. Pressure Plate
23. Rotor and Vane
24. Cam
25. Pin
26. Rear Housing

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Reassembly

1. Rear Housing
2. Pin
3. Cam
4. Rotor and Vane
   Install the vane with curved face in contact with the inner wall of the cam.



5. Pressure Plate

Caution:
When install pressure plate, be careful not to damage its inner surface. Damaged pressure plate may cause poor pump performance, pump seizure or oil leakage.

6. Front Housing
7. O-ring
   Be sure to discard used parts, and always use new parts for installation.
8. O-ring
   Be sure to discard used parts, and always use new parts for installation.
9. Gasket
   Be sure to discard used parts, and always use new parts for installation.
10. Rear Housing Assembly and Pump Cartridge
11. Bolt

Tighten:
- Rear housing bolt to 54 N·m (5.5 kg·m / 40 lb·ft)

12. Oil Seal
    Be sure to discard used parts, and always use new parts for installation.

Caution:
When install pressure plate, be careful not to damage its inner surface. Damaged pressure plate may cause poor pump performance, pump seizure or oil leakage.

13. Retaining Ring
14. Shaft
15. Bearing
16. Shaft Assembly
17. Retaining Ring

35. Oil Seal
36. Pump Housing
    - Use a brass drift to remove the oil seal from the pump housing.
37. Snap Ring
    - Use a mallet to remove the shaft assembly from the front body.
38. Ball Bearing
39. Shaft
    - A press and rod will be necessary to remove the ball bearing from the shaft.
40. Retainer Ring
41. Oil Seal
42. Front Body
    - Use a brass drift to remove the oil seal from the front body.

Clean

- All parts in a suitable solvent and blow dry with compressed air. Be sure to use clean solvent to clean internal parts.

Inspection

- Cartridge assembly

– Vane tips of cartridge assembly for wear.
– Vanes for scoring or wear.
– Inner surface of the ring for scoring, wear, damage, etc.
– Fit of the vanes in the rotor. The vanes must fit property in the rotor slots, without sticking or excessive play. Also check for burrs in the rotor slots, and excessive wear at the thrust faces.
– If heavy wear is present, or if parts are damaged, replace the entire cartridge assembly.

• Side place for wear at the thrust faces.

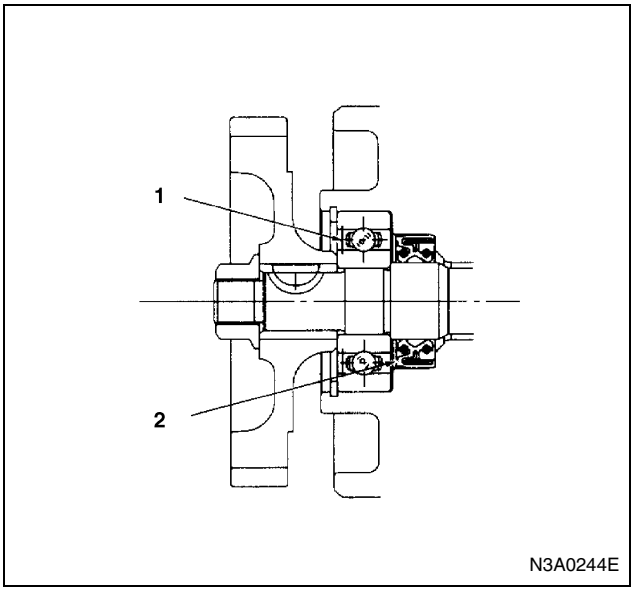
Replace if excessive wear is evident.

• Ball bearing. If the bearing is rough or loose, replace it.
• Seal contact area of the shaft. If fretting or roughness is present, replace the shaft.
• Gear for rough or chipped teeth.
• Flow control valve assembly for scoring or burrs. Also, inspect the flow control valve bore in the pump housing for burrs.

If heavy damage is present, replace pump housing assembly together with valves.

Reassembly

1. Oil Seal
2. Front Body
   • Oil seal into the front body using a proper size rod and press or hammer.
3. Shaft
4. Ball Bearing
   • Press the shaft, into the ball bearing as illustration.



Legend

1. Shield plate
2. Stamping

5. Retaining Ring
   • Place the retaining ring in the front body and install the shaft assembly into the front body using a press or hammer.
6. Snap Ring
   • Snap ring into front body.
7. Oil Seal
8. Pump Housing
   • Oil seal into pump housing using a proper size rod and press or hammer.

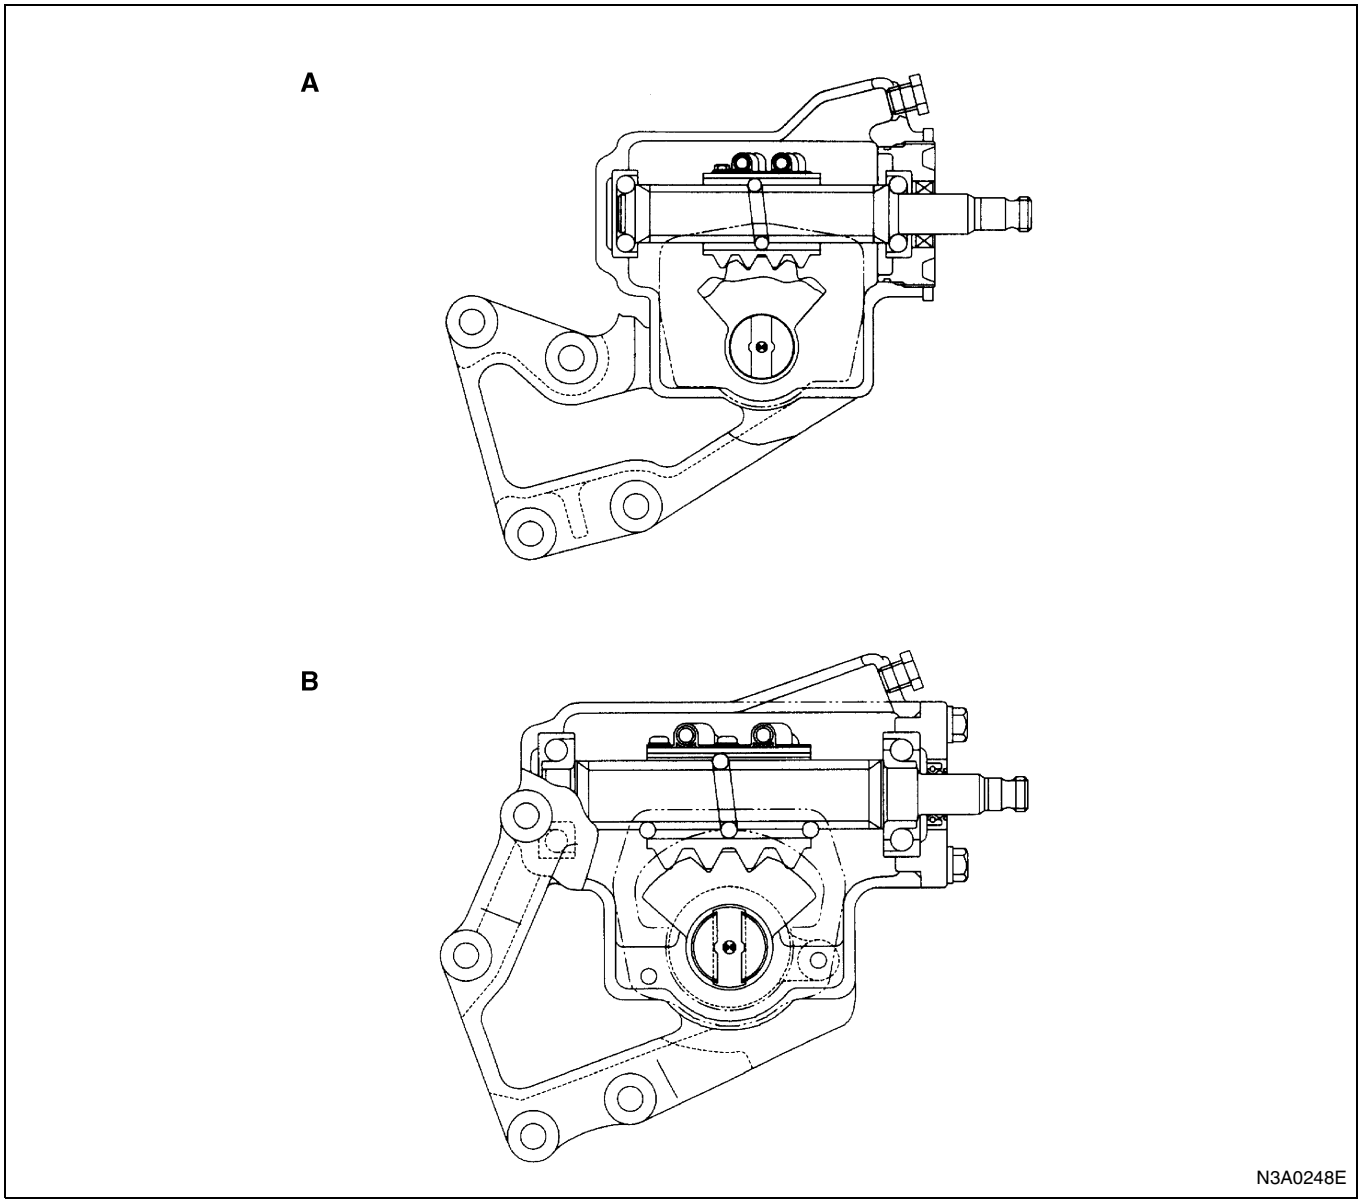
Manual Steering Unit (NPR, NQR) 3B2-12

GENERAL DESCRIPTION

Manual Steering Unit



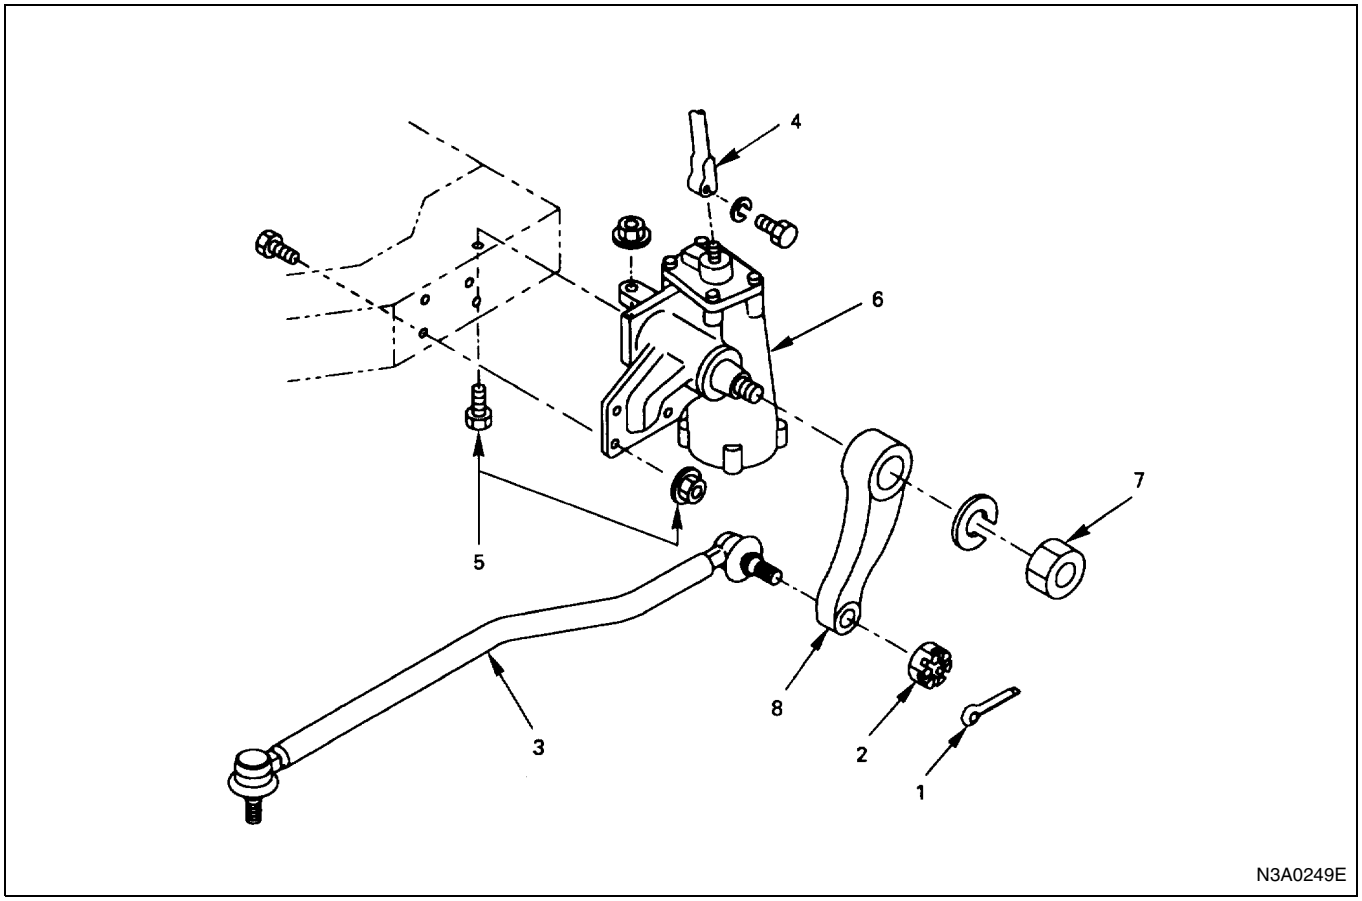
Legend

A. NHR, NKR

B. NPR, NQR

ON-VEHICLE SERVICE

Manual Steering Unit Replacement

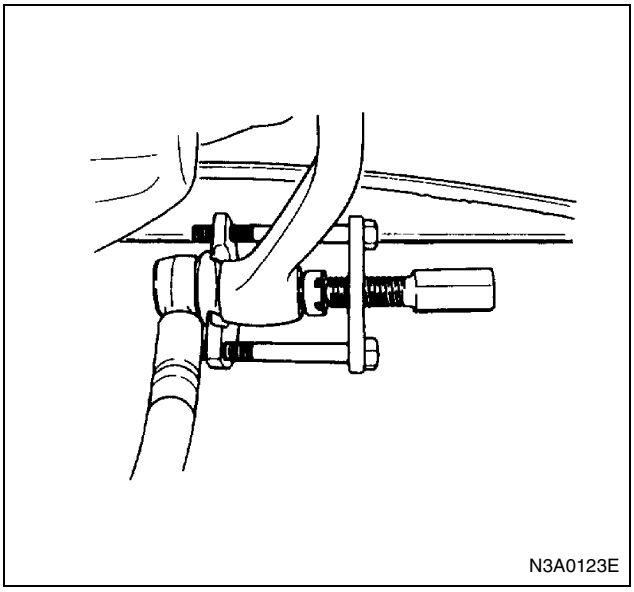


Legend

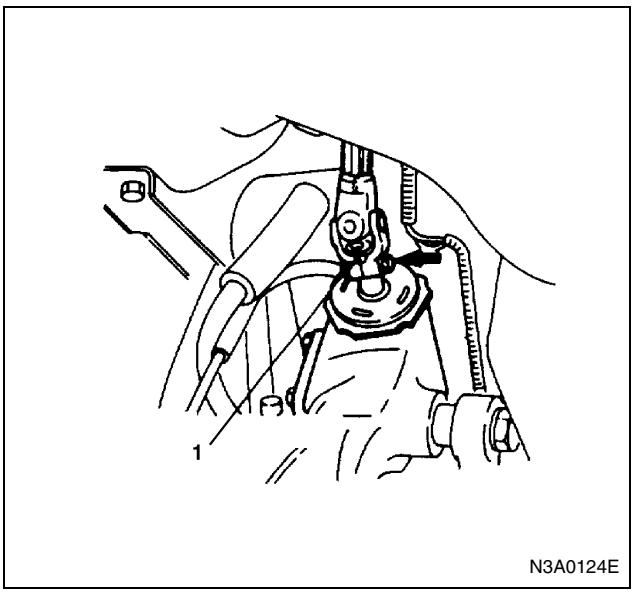
1. Cotter pin
2. Nut
3. Drag link
4. Universal joint
5. Unit fixing nut and bolt
6. Steering unit
7. Pitman arm fixing nut
8. Pitman arm

Removal

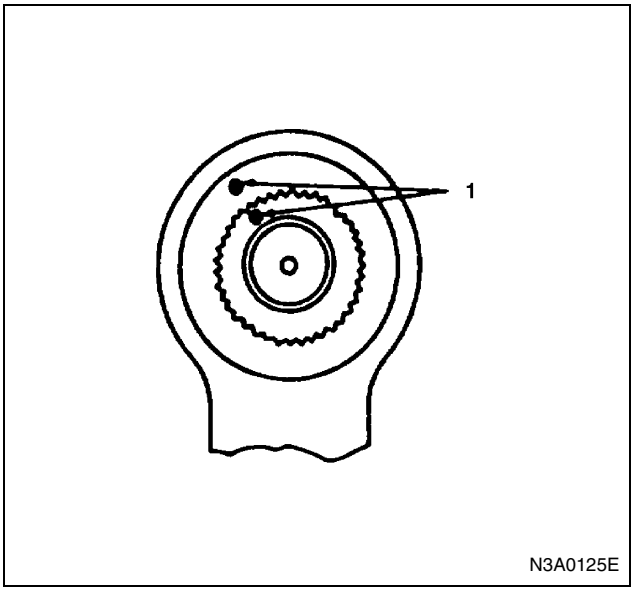
1. Remove the head light assembly. (for Non-Tilt Cab Model, driverside only)
   Refer to “Headlight Replacement”.
2. Remove the under panel. (Non-Tilt Cab Model)
3. Remove the front bumper assembly. (Non-Tilt Cab Model)
4. Cotter Pin
5. Nut
6. Drag Link
   Disconnect the drag link at the knuckle arm and the pitman arm.
   Remover: 5-8840-2017-0



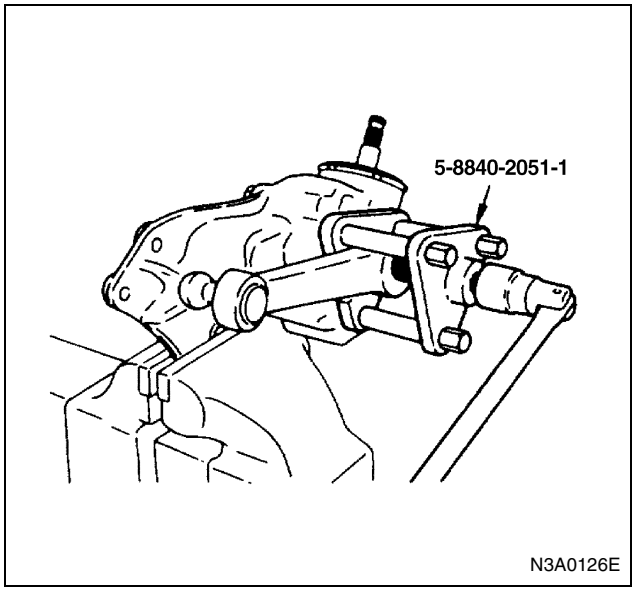
7. Universal Joint
   Apply a setting mark (1) across the yoke and worm shaft in unit to ensure reassembly of the parts in the original position.



8. Unit Fixing Nut and Bolt
9. Steering Unit
10. Pitman Arm Fixing Nut
11. Pitman Arm
    1) Apply a setting mark (1) across the pitman arm and worm shaft.

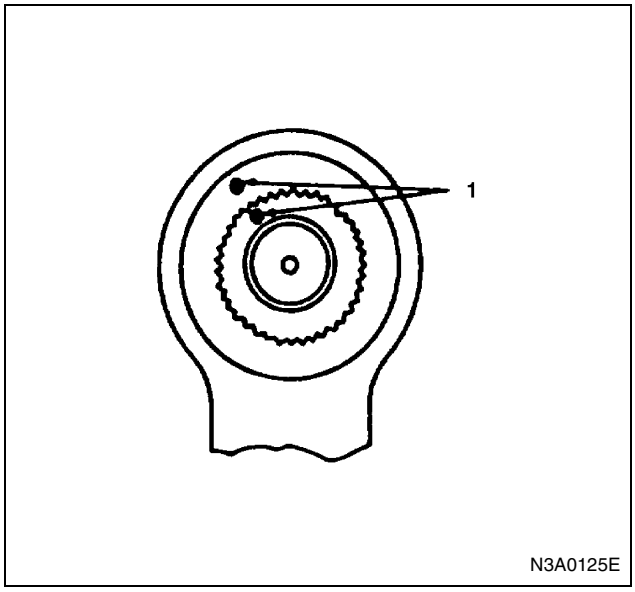


Puller: 5-8840-2051-1



Installation

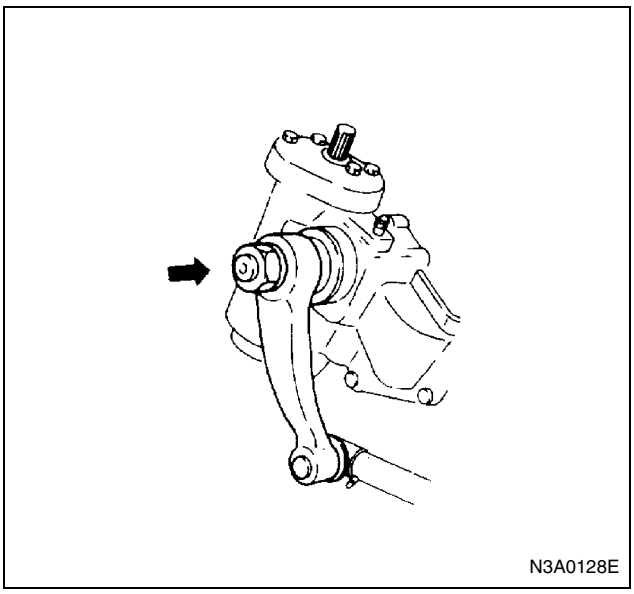
1. Pitman Arm
   Align the setting mark (1) applied at removal.



2. Pitman Arm Fixing Nut

Tighten:

- Nut to
  NHR, NKR: 216 N·m (22 kg·m/159 lb·ft)
  NPR, NQR: 294 N·m (30 kg·m/217 lb·ft)



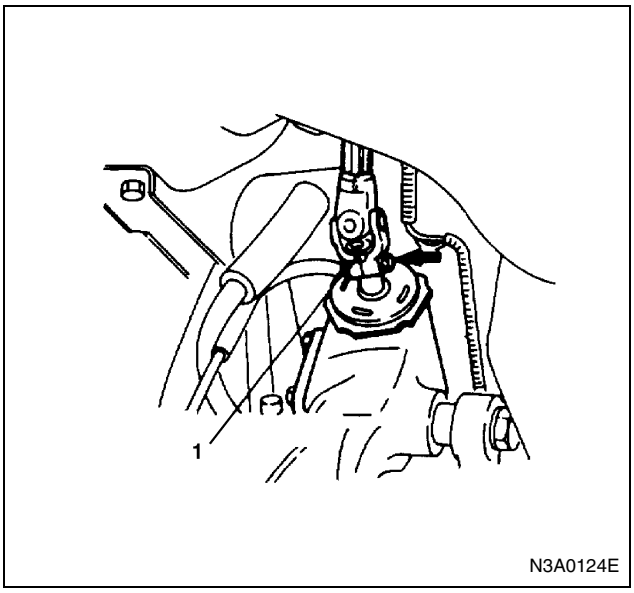
N3A0128E

3. Steering Unit
4. Unit Fixing Nut and Bolt

Tighten:
Nut and bolt to 103 N·m (10.5 kg·m/76 lb·ft)

5. Universal Joint
   Install the parts by aligning setting marks (1) applied at removal.

Tighten:
- Universal joint bolt to
  M8 bolt: 25 N·m (2.5 kg·m/18 lb·ft)



N3A0124E

6. Drag Link
7. Nut
8. Cotter Pin
   1) Install the drag link to the pitman arm and the knuckle arm.
   2) Tighten nuts to specified torque, with just enough additional torque to align cotter pin holes.
      Install new cotter pin.

Tighten:
- Nut to 167 N·m (17 kg·m/123 lb·ft)

9. Install the bumper assembly. (Non-Tilt Cab Model)

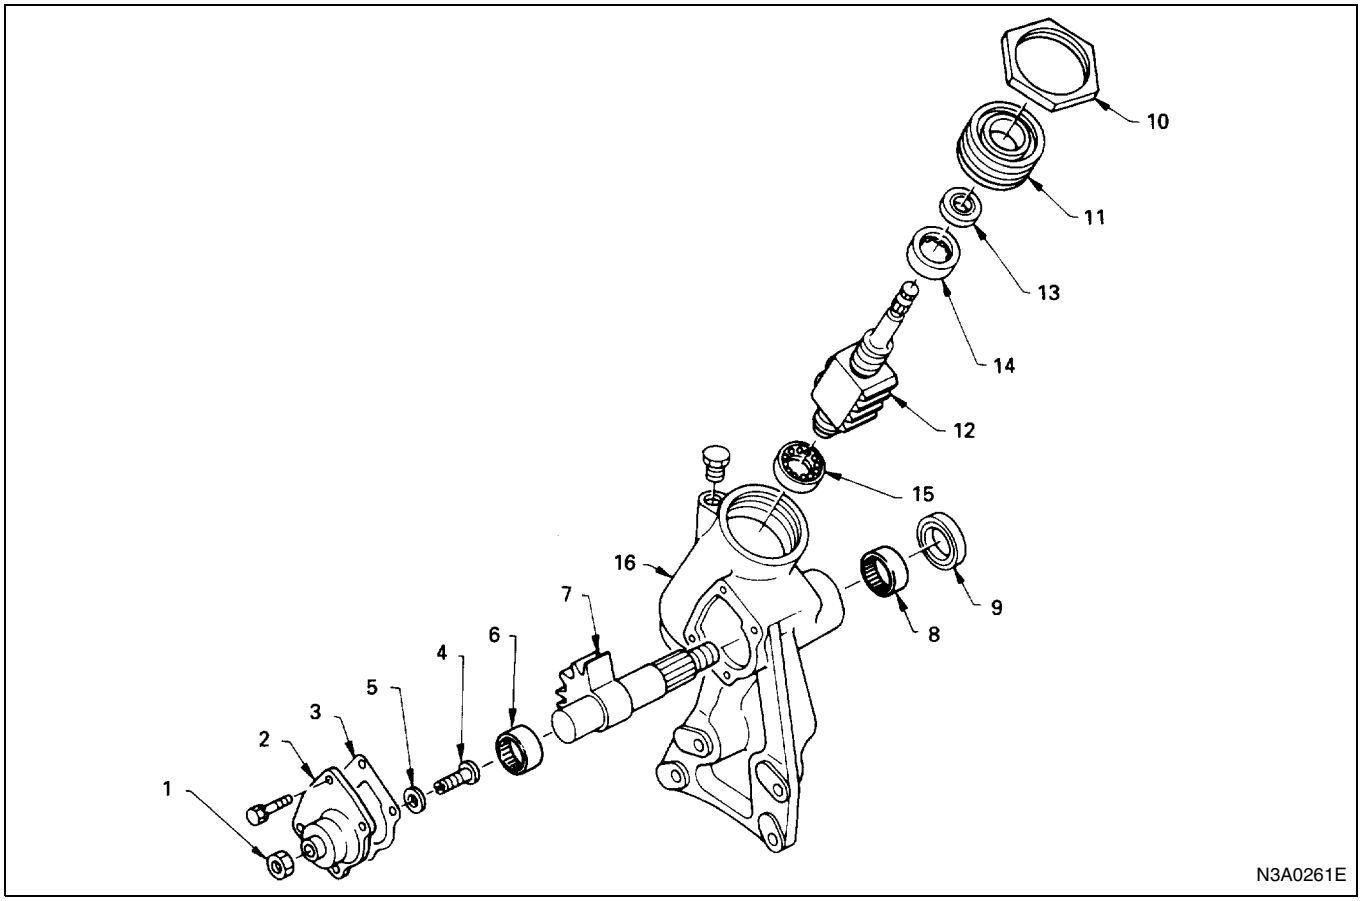
Tighten:
- Bumper bolt to 40 N·m (4.1 kg·m /30 lb·ft)

10. Install the under panel. (Non-Tilt Cab Model)
11. Install the head light assembly, front grille and front combination light assembly. (for Non-Tilt Cab Model)
    Refer to “Headlight Replacement”.

Notice:
After installation, adjust head light aiming. Refer to “Cab and Chassis Electrical” in Section 8. (Non-Tilt Cab Model)

UNIT REPAIR

Manual Steering Unit (NHR, NKR)

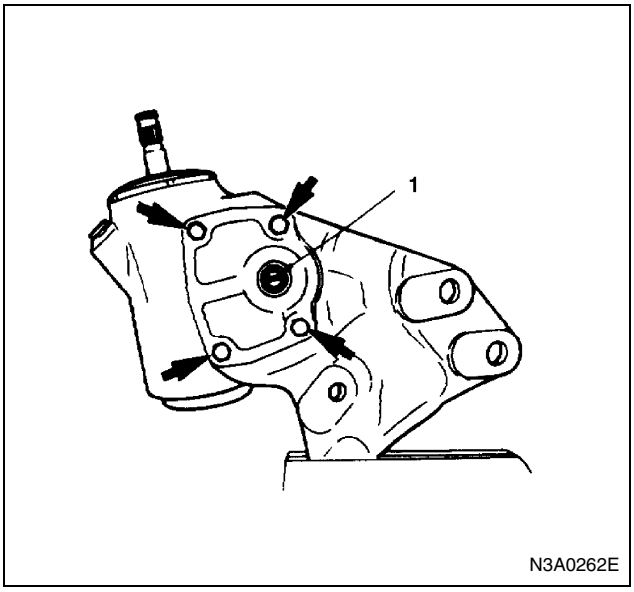


Legend

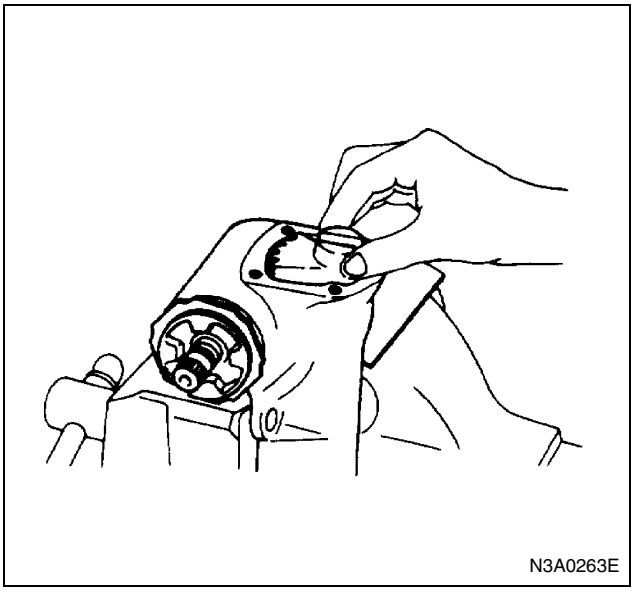
1. Lock nut
2. Side cover
3. Gasket
4. Adjuster screw
5. Adjuster shim
6. Needle bearing
7. Sector shaft
8. Needle bearing
9. Oil seal
10. Lock nut
11. End cover
12. Ball nut and worm shaft
13. Oil seal
14. Bearing
15. Bearing
16. Gear box

Disassembly

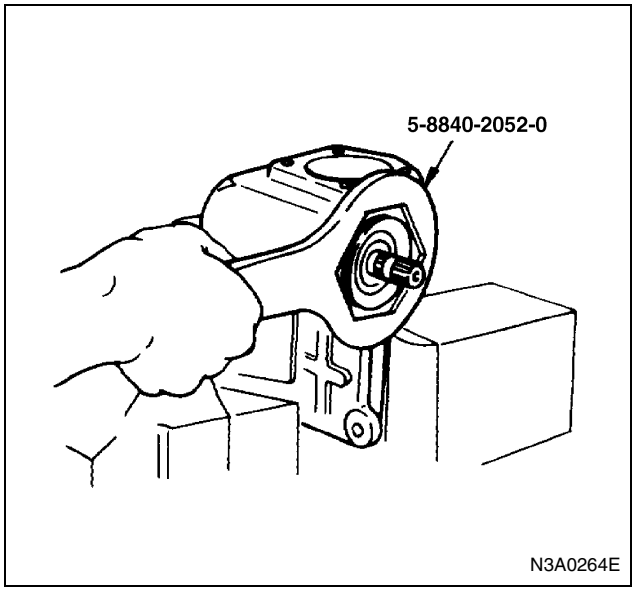
1. Lock Nut
2. Side Cover
   1) Turn the adjuster screw (1) counterclockwise slightly, then remove the side cover fixing bolt. (Arrowed in the illustration.)
   2) Turn the adjuster screw clockwise with the side cover held from turning.



3. Gasket
4. Adjuster Screw
5. Adjuster Shim
6. Needle Bearing
7. Sector Shaft
   When removing, be careful not to damage the serrations, threads and oil seal.

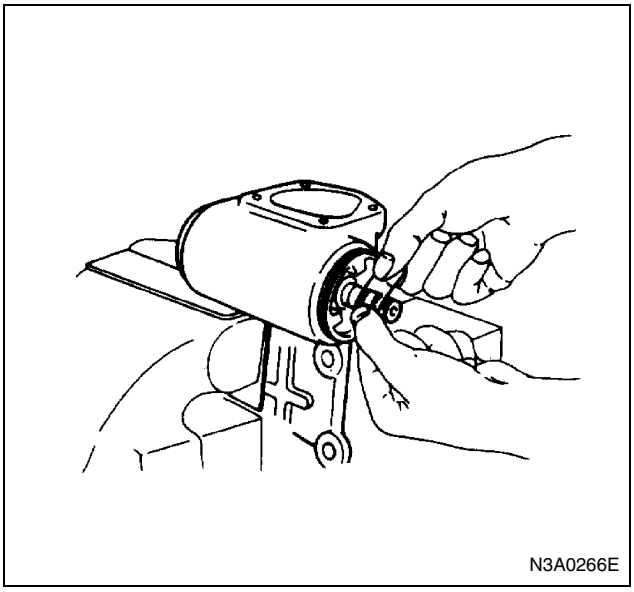


8. Needle Bearing
9. Oil Seal
10. Lock Nut
    Steering Lock Nut Wrench : 5-8840-2052-0



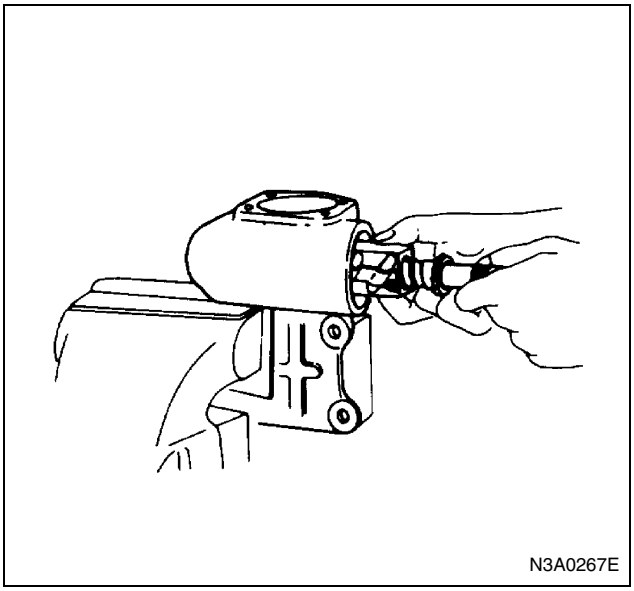
11. End Cover
    1) Wrench : 5-8840-2053-0

    2) When removing, be careful not to damage the oil seal.
       Taping the splines will provide some protection.



N3A0266E

12. Ball Nut and Worm Shaft
    Always keep ball nut assembly in a horizontal position and avoid holding it vertically, or ball nut will slide out.



N3A0267E

13. Oil Seal
14. Bearing
15. Bearing
16. Gear Box

Inspection and Repair

Make necessary correction or parts replacement if wear damage, or any other abnormal conditions are found through inspection.

Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

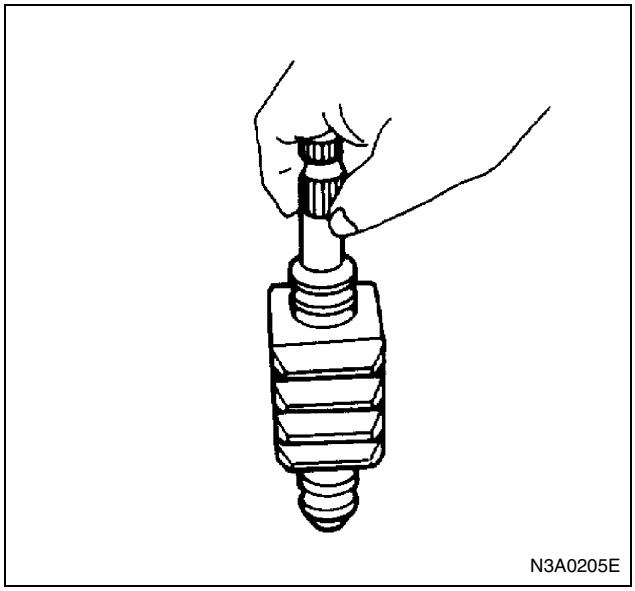
- Bearing
- Sector shaft
- Ball nut and worm shaft

Ball Nut Rotation

Hold the worm shaft vertically and see if the ball nut lowers with turning motion smoothly. If lowering of the ball nut with its own weight is unsmooth, check the worm shaft for bending and ball-groove for burrs, dents and presence of foreign matter.

Notice:

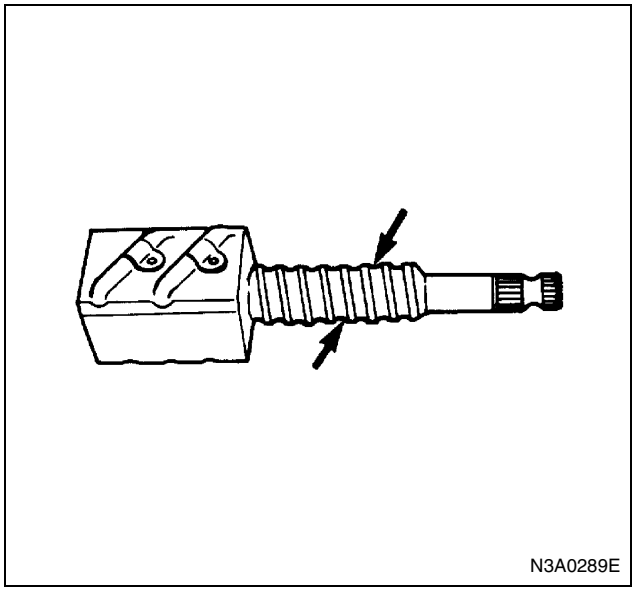
When making a test on the ball nut assembly, exercise care so as not to strike ball nut against end of worm shaft, or damage to the ball tubes will result.



N3A0205E

If any of the parts in the ball nut and worm shaft assembly is found to be defective, the entire parts should be replaced using a new worm shaft assembly.

As these parts are of selective combination and are sealed to prohibit disassembly, the faulty parts should not be replaced individually.

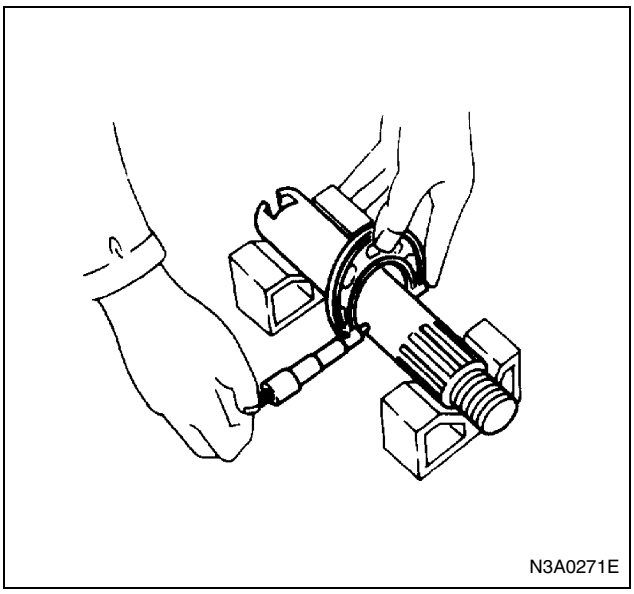


N3A0289E

Sector Shaft Outside Diameter

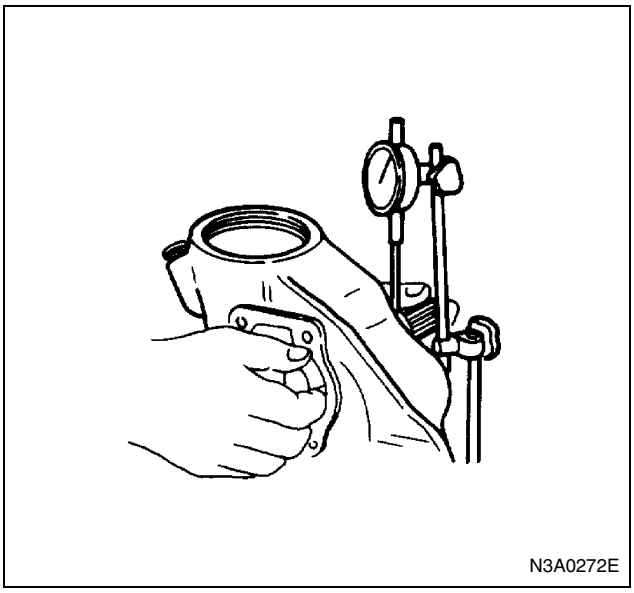
Standard : 34.925 mm (1.375 in)

Limit : 34.825 mm (1.371 in)



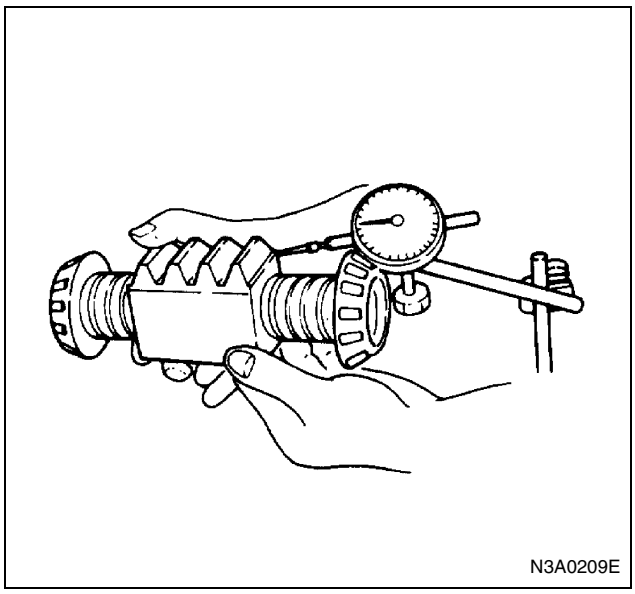
N3A0271E

Sector Shaft and Needle Bearing Play
Limit : 0.2 mm (0.008 in)



N3A0272E

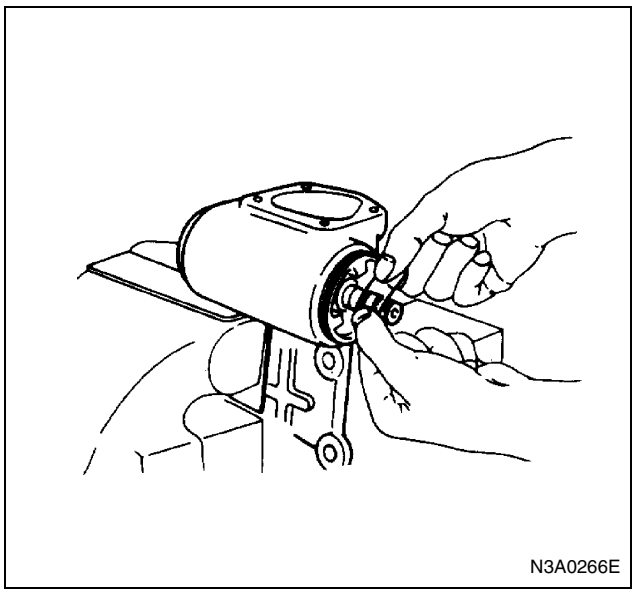
Ball Nut Axial Play
Limit : 0.1 mm (0.004 in)



N3A0209E

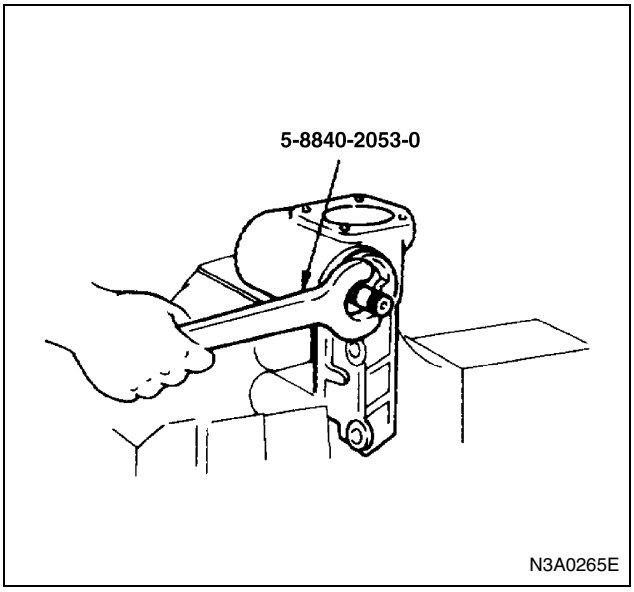
Reassembly

1. Gear Box
2. Bearing
3. Bearing
4. Oil seal
5. Ball Nut and Worm Shaft
6. End Cover
   1) When installing, be careful not to damage the oil seal.
      Taping the splines will provide some protection.

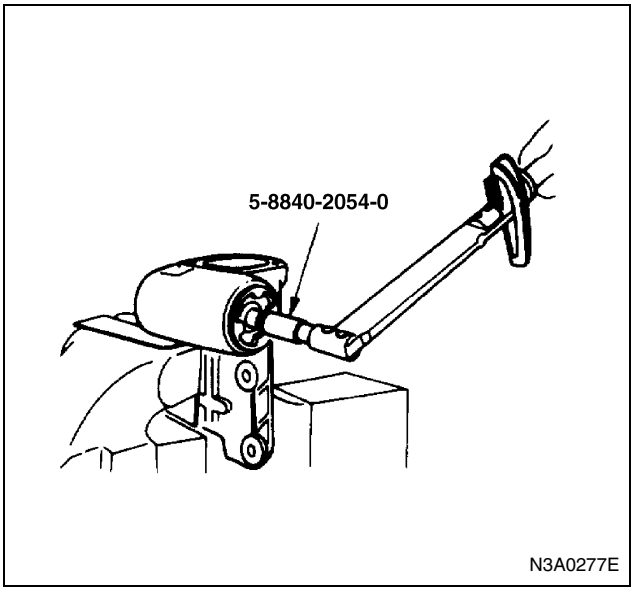


N3A0266E

   2) Adjust the starting torque of steering input shaft by turning the end cover with a special tool.
      Wrench : 5-8840-2053-0

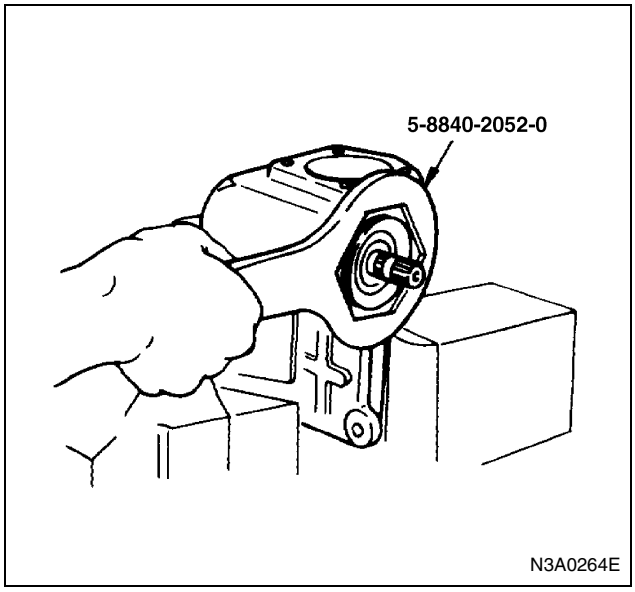


Starting Torque
0.34 — 0.64 N·m (0.035 — 0.065 kg·m/0.25 — 0.47 lb·ft)
Steering Shaft Driver : 5-8840-2054-0

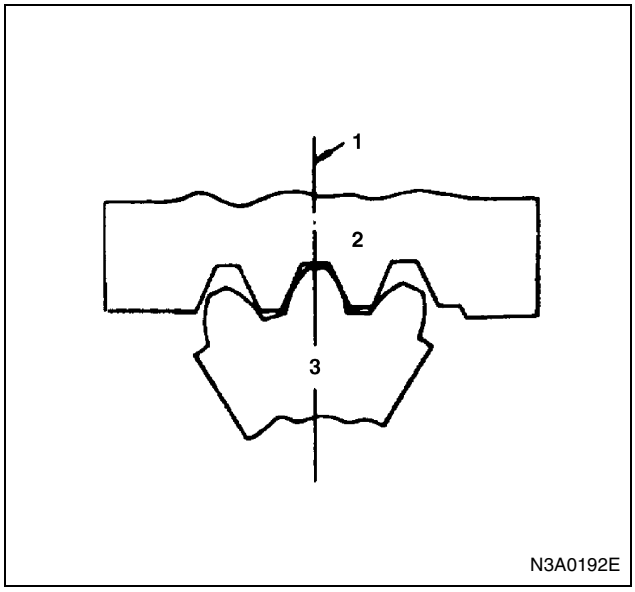


7. Lock Nut
   Steering Lock Nut Wrench : 5-8840-2052-0

Tighten:
- Lock Nut to 177 N·m (18 kg·m/30 lb·ft)

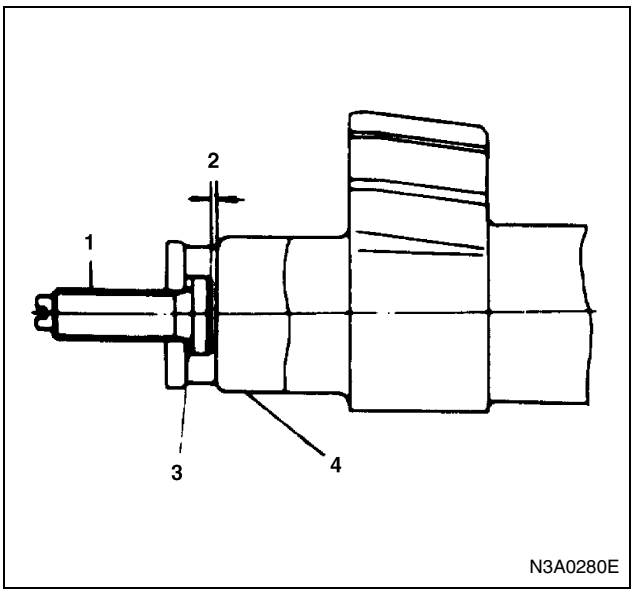


8. Sector Shaft
   Align the center tooth (1) of ball nut (2) with the center tooth (1) of the sector shaft (3).



9. Needle Bearing
10. Oil Seal
11. Needle Bearing
12. Adjuster Shim
13. Adjuster Screw
    Adjust the clearance and check that the adjuster screw slides freely.

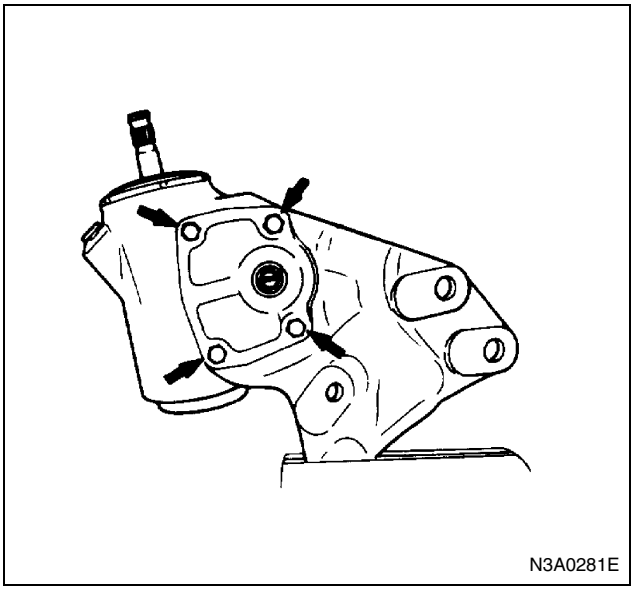
Clearance
0.1 mm (0.0039 in)
Adjust Shims Available
1.53 mm (0.060 in), 1.56 mm (0.061 in), 1.59 mm (0.063 in), 1.62 mm (0.064 in), 1.65 mm (0.065 in)



Legend
1. Adjuster screw
2. Clearance
3. Shim
4. Sector shaft

14. Gasket
15. Side Cover

Tighten:
- Side cover bolt to 44 N·m (4.5 kg·m/33 lb·ft)



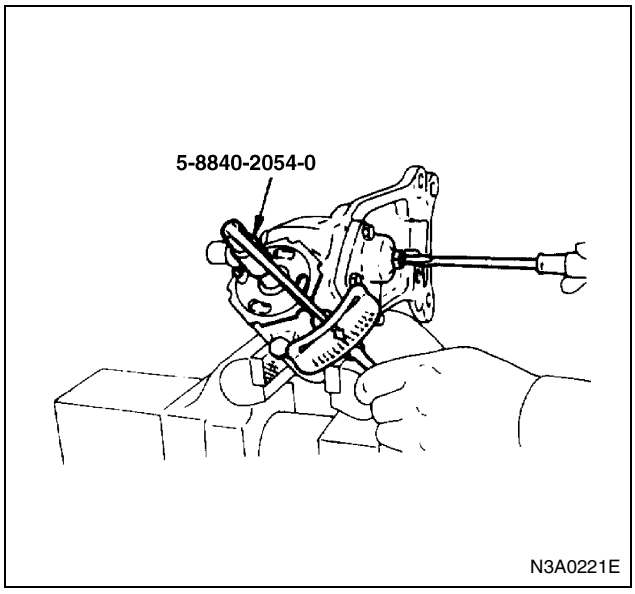
16. Lock Nut
    Adjust the backlash between the sector gear and ball nut.
    1) Install the pitman arm.
    2) Set the sector shaft in a straight ahead position.
    3) With the adjuster screw, adjust the backlash to the specification.

Backlash (at End of Pitman Arm)
0.2 mm (0.0079 in) or less

    4) Lock adjuster screw with lock nut.

Tighten:
- Lock Nut to 25 N·m (2.5 kg·m/18 lb·ft)
    5) Inspect the starting torque of the steering input shaft.

Starting Torque
0.54 — 1.03 N·m (0.055 — 0.105 kg·m/0.40 — 0.76 lb·ft)
Steering Shaft Driver : 5-8840-2054-0



Manual Steering Unit (NPR, NQR)

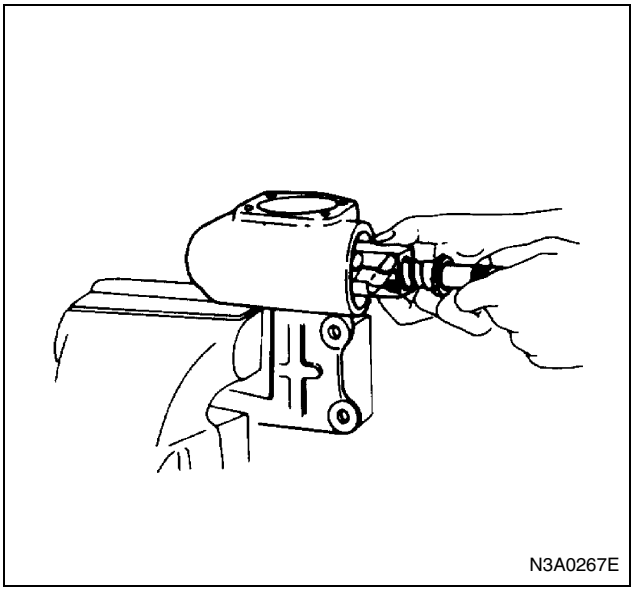
12. Ball Nut and Worm Shaft
    Always keep ball nut assembly in a horizontal position and avoid holding it vertically, or ball nut will slide out.



N3A0267E

Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Visual Checks

Inspect the following parts for wear, damage or other abnormal conditions.

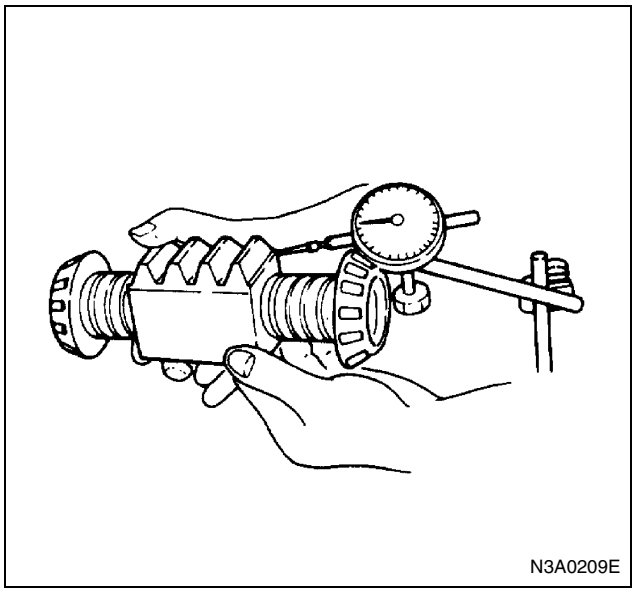
- Bearing
- Sector shaft
- Ball nut and worm shaft

Ball Nut Rotation

Hold the worm shaft vertically and see if the ball nut lowers with turning motion smoothly. If lowering of the ball nut with its own weight is unsmooth, check the worm shaft for bending and ball-groove for burrs, dents and presence of foreign matter.

Notice:

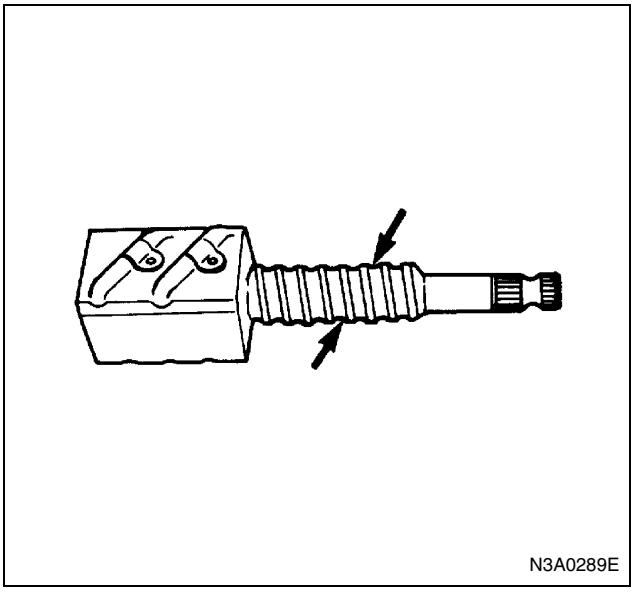
When making a test on the ball nut assembly, exercise care so as not to strike ball nut against end of worm shaft, or damage to the ball tubes will result.



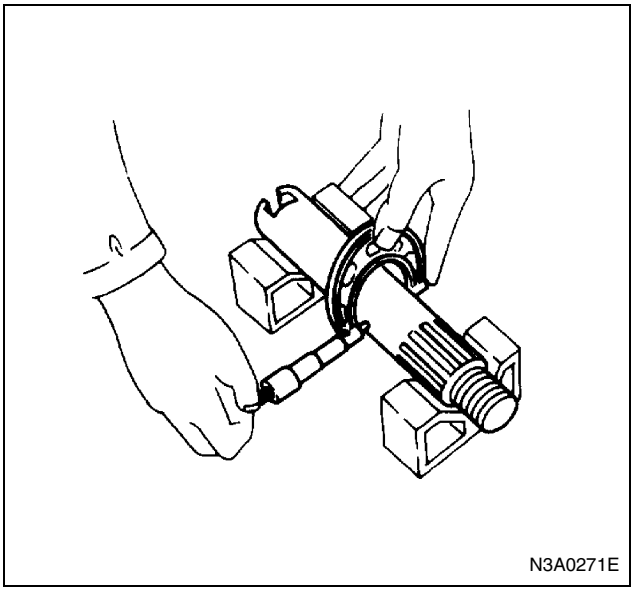
N3A0209E

If any of the parts in the ball nut and worm shaft assembly is found to be defective, the entire parts should be replaced using a new worm shaft assembly.

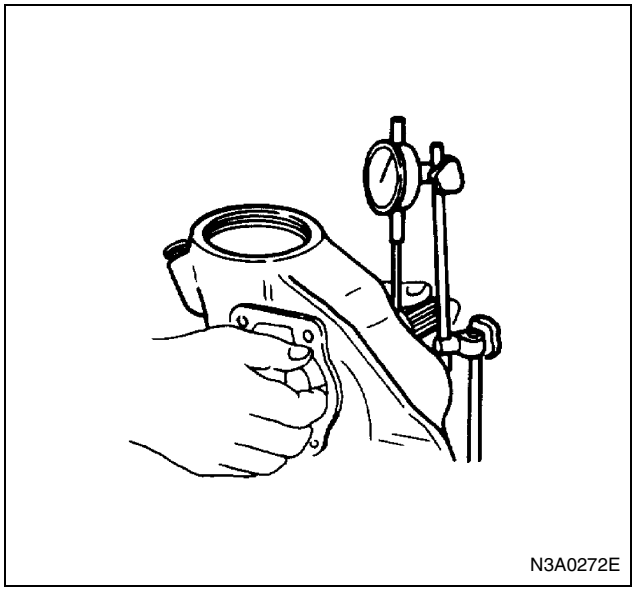
As these parts are of selective combination and are sealed to prohibit disassembly, the faulty parts should not be replaced individually.



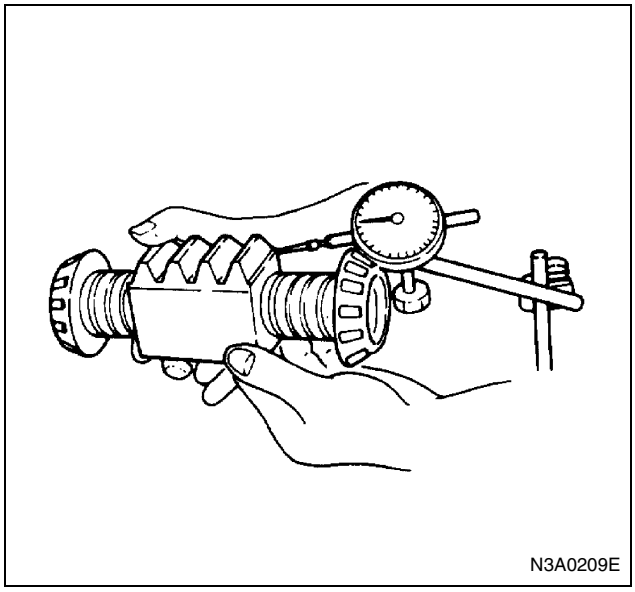
Sector Shaft Outside Diameter
Standard : 38.1 mm (1.50 in)
Limit : 38.0 mm (1.496 in)



Sector Shaft and Needle Bearing Play
Limit : 0.2 mm (0.008 in)



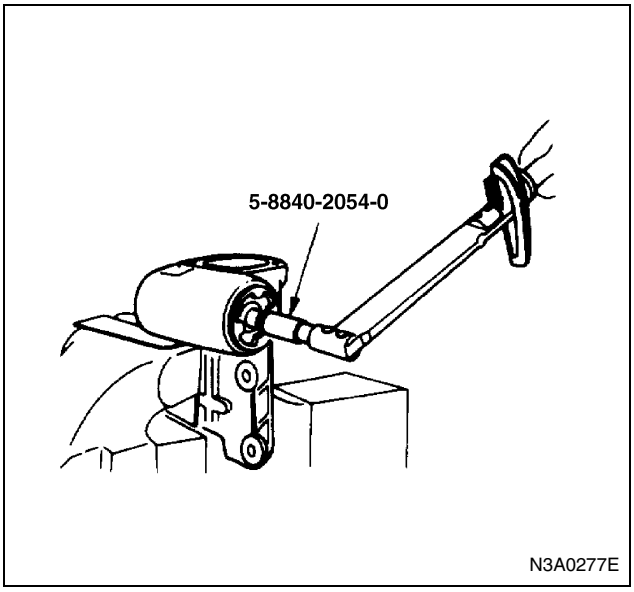
Ball Nut Axial Play
Limit : 0.1 mm (0.004 in)



Reassembly

1. Gear box
2. Bearing
3. Bearing
4. Ball Nut and Worm Shaft
5. Adjuster Shim
   1) Adjust the starting torque of input shaft by varying shim thickness.
      Steering Shaft Driver : 5-8840-2054-0

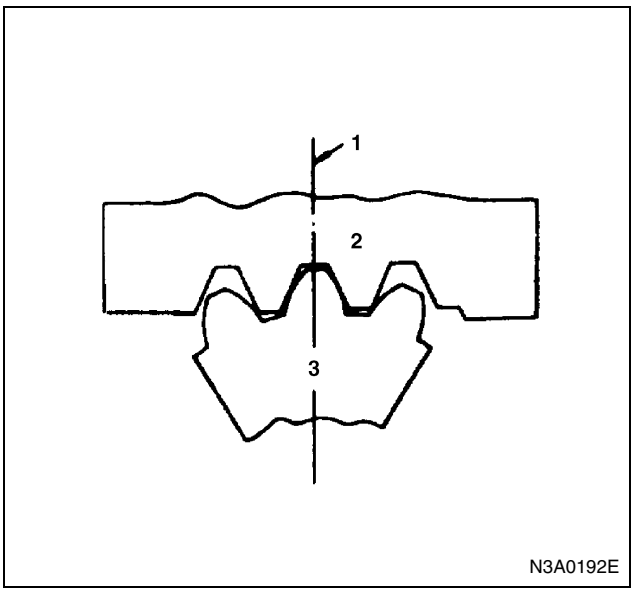
Starting Torque
0.29 — 0.69 N·m (0.030 — 0.070 kg·m/0.22 — 0.51 lb·ft)
Adjust Shims Available
0.01 mm (0.0004 in), 0.02 mm (0.0008 in), 0.05 mm (0.0020 in), 0.07 mm (0.0028 in), 0.08 mm (0.0031 in)



6. End Cover

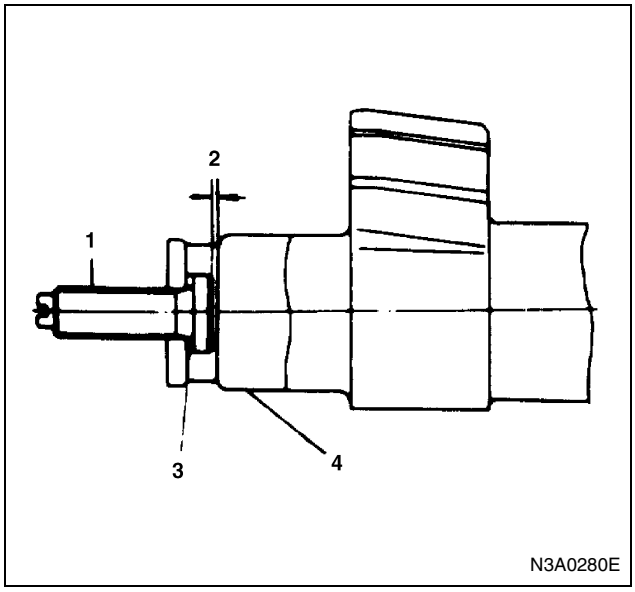
Tighten:
- Fixing bolt to 44 N·m (4.5 kg·m/33 lb·ft)

7. Oil Seal
8. Sector Shaft
   Align the center tooth (1) of ball nut (2) with that of the sector shaft (3).



9. Sector Shaft
10. Needle Bearing
11. Adjuster Shim
12. Adjuster Screw
    Adjust the clearance and check that the adjuster screw slides freely.

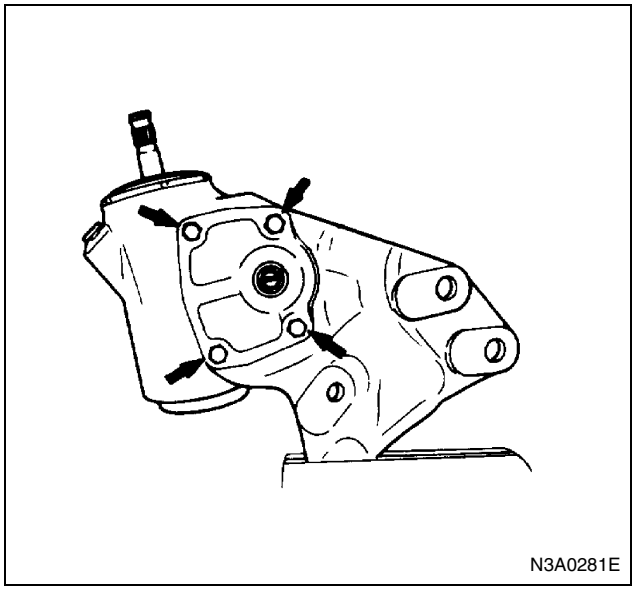
Clearance
0.1 mm (0.0039 in)
Adjust Shims Available
1.53 mm (0.060 in), 1.56 mm (0.061 in), 1.59 mm (0.063 in), 1.62 mm (0.064 in), 1.65 mm (0.065 in)



Legend
1. Adjuster screw
2. Clearance
3. Shim
4. Sector shaft

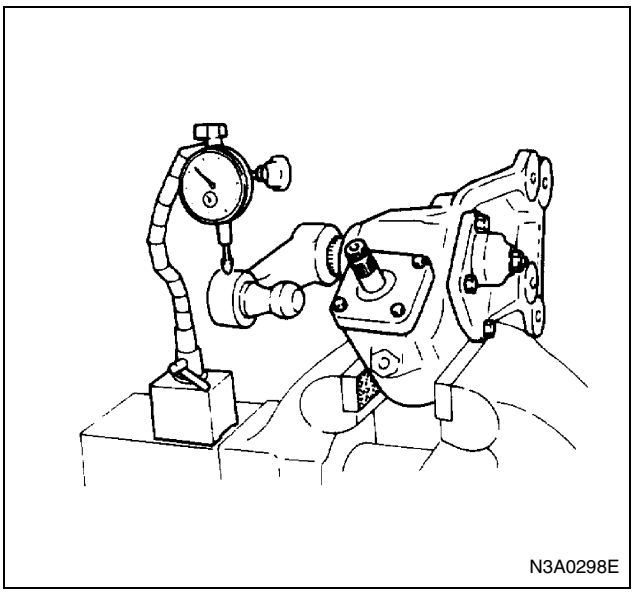
13. Gasket
14. Side Cover

Tighten:
- Side cover bolt to 44 N·m (4.5 kg·m/33 lb·ft)



15. Lock Nut
    Adjust the backlash between the sector gear and ball nut.
    1) Install the pitman arm.
    2) Set the sector shaft in a straight ahead position.
    3) With the adjuster screw, adjust the backlash to the specification.

Backlash (at End of Pitman Arm)
0.5 mm (0.0197 in) or less



4) Lock adjuster screw with lock nut.

Tighten:

- Lock nut to 25 N·m (2.5 kg·m/ 1.8 lb·ft)

5) Inspect the starting torque of the input shaft.

Starting Torque

0.98 N·m (0.1 kg·m/0.72 lb·ft) or less

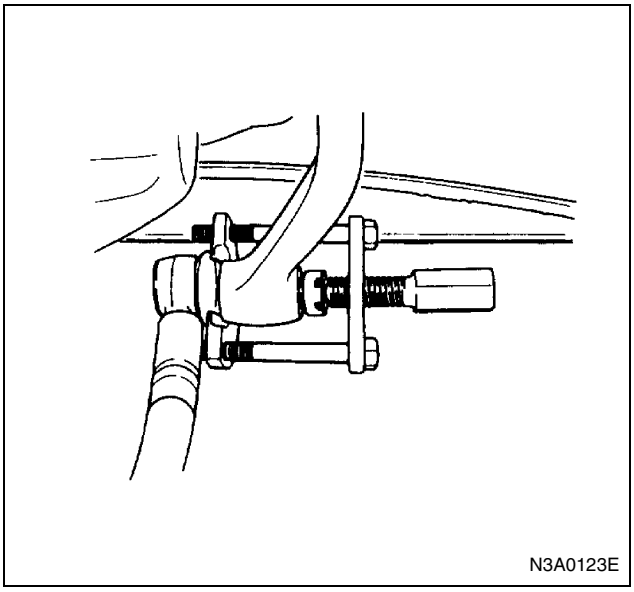
Removal

1. Cotter Pin
2. Nut
3. Cotter Pin
4. Nut
5. Drag Link
   Remove the drag link using a special tool.
   Remover: 5-8840-2017-0

Caution:
Be careful not to damage the ball joint boot.



Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion, bending, deteriorations or any other abnormal conditions are found through inspection.
Check the following parts.

- Ball joint (Boot, screws and tapered surface)

Installation

1. Drag Link
2. Nut
3. Cotter Pin
4. Nut
5. Cotter Pin
   Tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes.
   Install new cotter pin.

Tighten:

- Drag link nut to 167 N·m (17 kg·m / 123 lb·ft)

Tie Rod Replacement (2WD Rigid Suspension)

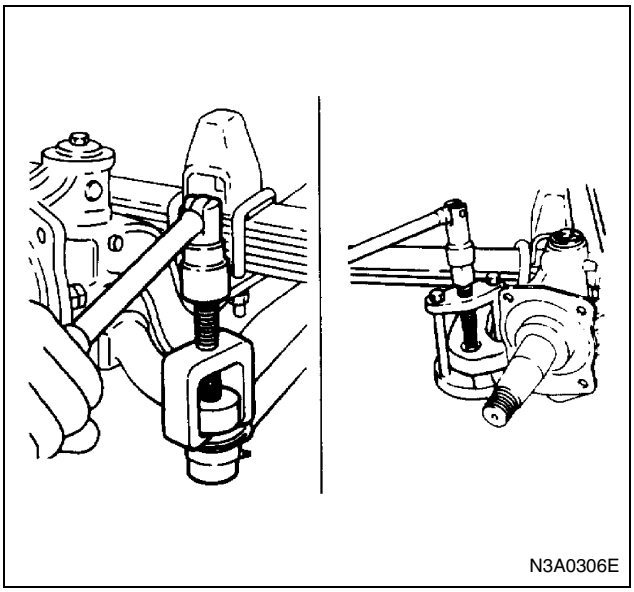
   Remover
   Driver side: 5-8840-2017-0
   Assistant side: 5-8840-2018-0



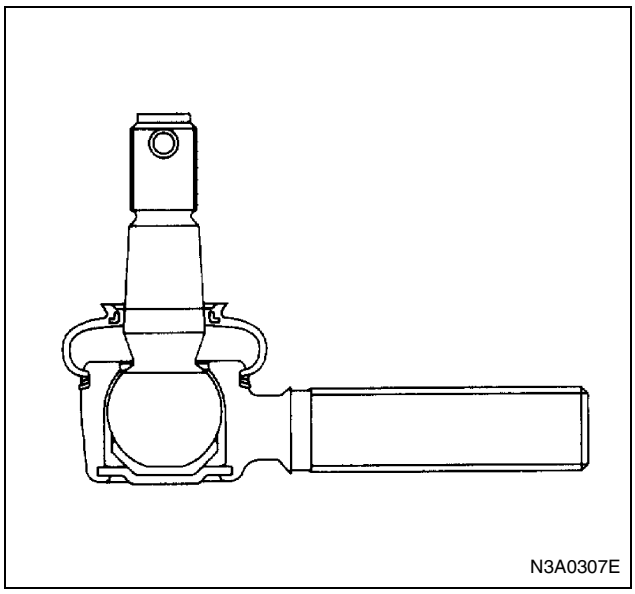
6. Tie Rod End

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, or any other abnormal conditions are found through inspection.

Tie Rod End

Inspect the ball joint taper fitting part for contact condition or abnormal wear.
Inspect the boot for damage or grease leak. Move the ball joint to confirm its normal movement.
If abnormal condition is found, replace the assembly because it cannot be disassembled.



Tie Rod

Inspect the tie rod tube for bending or damaged threads. If abnormal condition is found, replace the assembly or correct if bending is small.

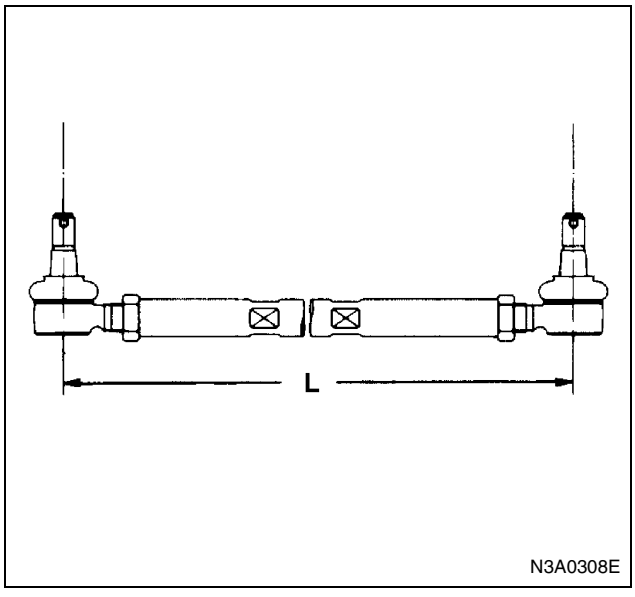
Installation

1. Tie Rod End
2. Tie Rod Assembly
   1) Install the tie rod end to the tie rod.
   2) Adjust length of tie rod by turning the connecting rod.

Tie Rod Length (L)

NHR: 1153.5 mm (45.413 in)
NKR: 1160.5 mm (45.925 in)
NPR, NQR: 1446.5 (56.949 in)

   3) After adjustment of length, temporarily tighten the tie rod end lock nut.



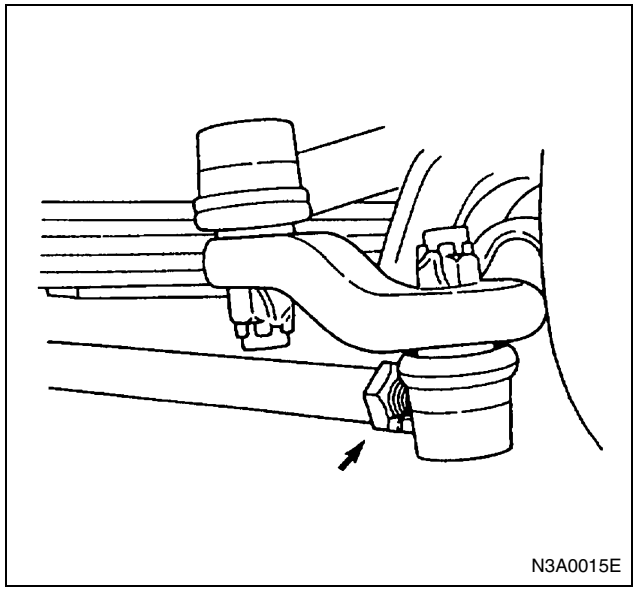
3. Nut
4. Cotter Pin
5. Nut

6. Cotter Pin
   1) Tighten the nut to specified torque, with just enough additional torque to align cotter pin hole.
      Install new cotter pin.

Tighten:
- Tie rod nut to 108 N·m (11 kg·m / 80 lb·ft)

   2) Adjust the front end alignment after installation. Refer to “Front end alignment”.
   3) Tighten tie rod end lock nuts to specified torque after adjustment of front end alignment.

Tighten:
- Lock nut to 113 N·m (11.5 kg·m / 83 lb·ft)



Tie Rod Replacement (NPS)

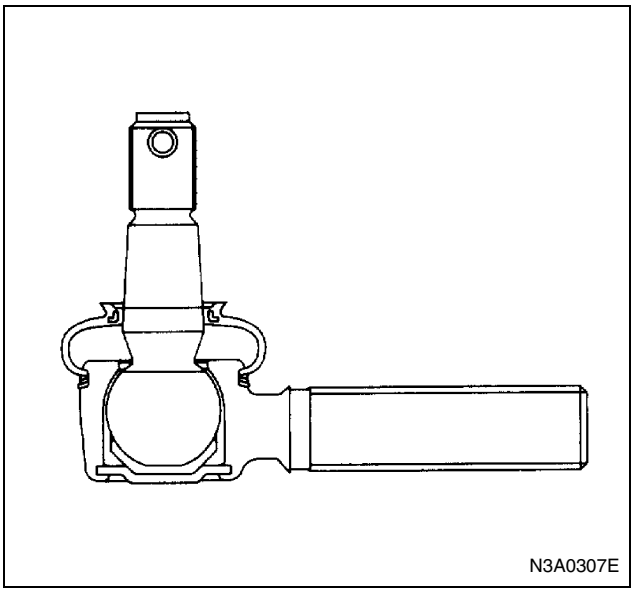
8. Relay Lever
9. Tie Rod End
10. Lock Nut
11. Tie Rod Tube
12. Lock Nut
13. Tie Rod

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, or any other abnormal conditions are found through inspection.

Tie Rod End

- Inspect the ball joint taper fitting part for contact condition or abnormal wear.
- Inspect the boot for damage or grease leak.
- Move the ball joint to confirm its normal movement.
- If abnormal condition is found, replace the assembly because it cannot be disassembled.



N3A0307E

Tie Rod

Inspect the tie rod tube for bending or damaged threads. If abnormal condition is found, replace the assembly or correct if bending is small.

Relay Lever

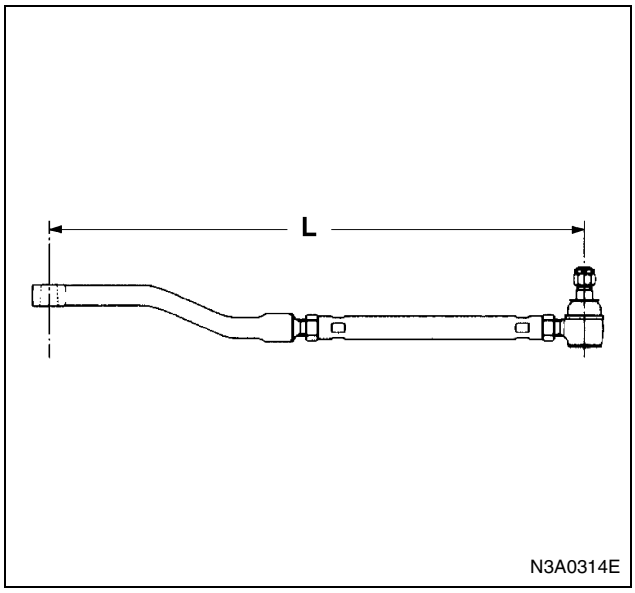
Inspect the relay lever bushing. If bushing is defective, replace the relay lever assembly.

Installation

1. Tie Rod
2. Lock Nut
3. Tie Rod Tube
4. Lock Nut
5. Tie Rod End
   1) Install all parts and adjust tie rod length (L).

Tie Rod Length (L)

781 mm (30.748 in)

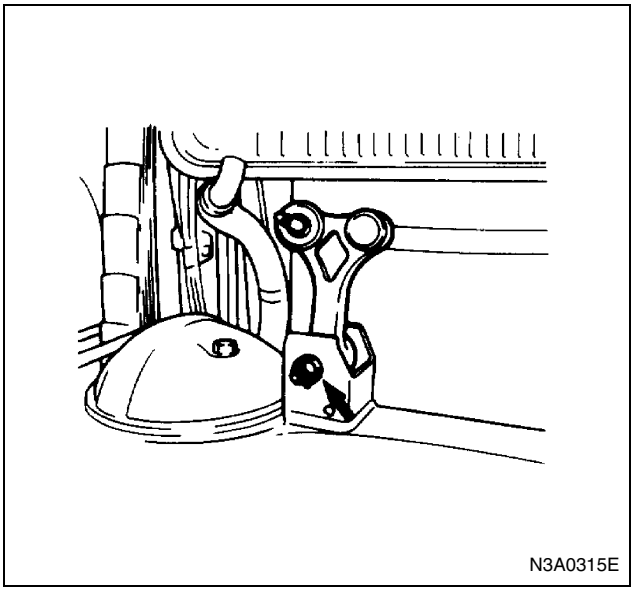


N3A0314E

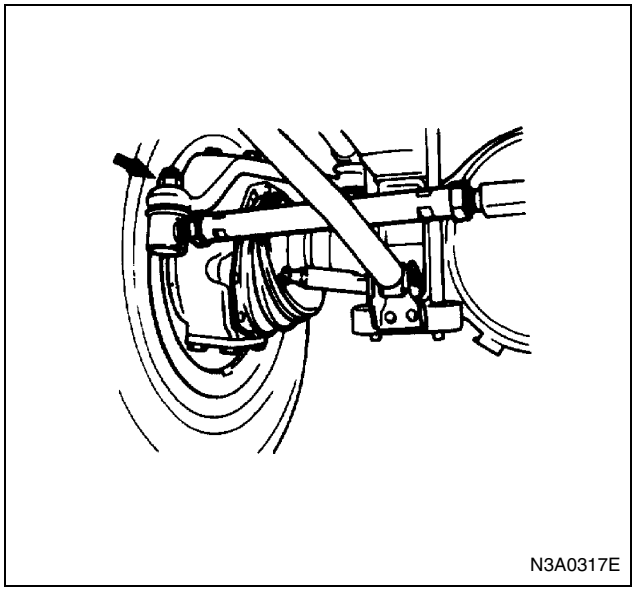
   2) After adjustment, tighten lock nuts temporarily.
6. Relay Lever
7. Bolt, Nut, Washer and Cotter Pin
   1) Install the relay lever to the bracket.
   2) Tighten the nut to specified torque, with just enough additional torque to align cotter pin hole.
   3) Install new cotter pin.

Tighten:

- Relay lever nut to 147 N·m (15 kg·m / 108 lb·ft)



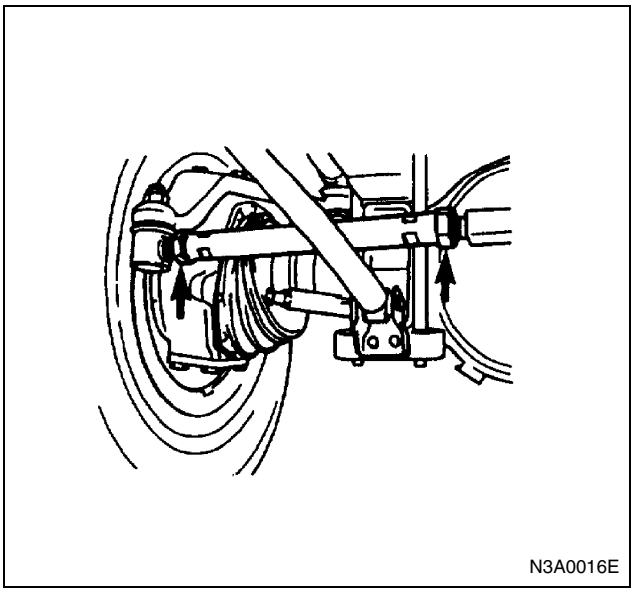
N3A0315E



N3A0317E

8. Tie Rod Assembly
9. Nut and Cotter Pin
10. Nut and Cotter Pin
11. Tie Rod Assembly
12. Nut and Cotter Pin
13. Nut and Cotter Pin
    1) Tighten tie rod end nut to specified torque, with just enough additional torque to align cotter pin hole.
       Install new cotter pin.

Tighten:
- Tie rod end nut to 186 N·m (19 kg·m / 137 lb·ft)

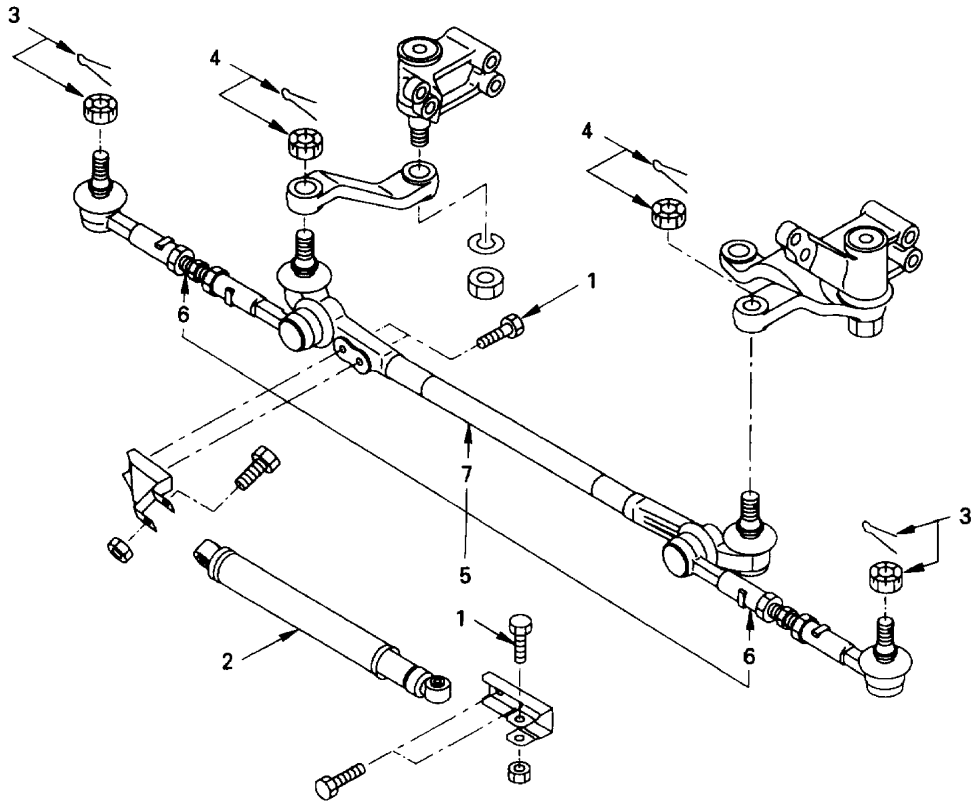


N3A0016E

    2) Adjust the front end alignment after installation. Refer to “Front end alignment”.
    3) After adjustment, tighten the lock nuts to specified torque.

Tighten:
- Lock nut to 113 N·m (11.5 kg·m / 83 lb·ft)

Steering Link Replacement (Wishbone Suspension)



Legend

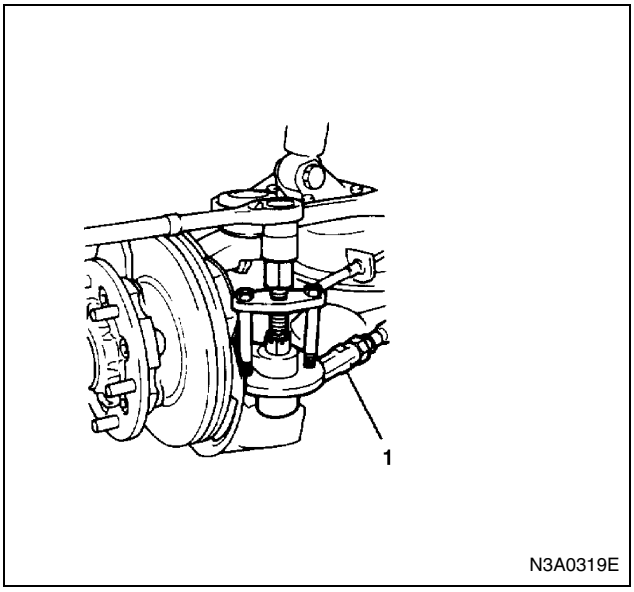
1. Bolt
2. Steering damper
3. Nut and cotter pin
4. Nut and cotter pin
5. Steering link assembly
6. Outer track rod
7. Center track rod

Removal

Preparation

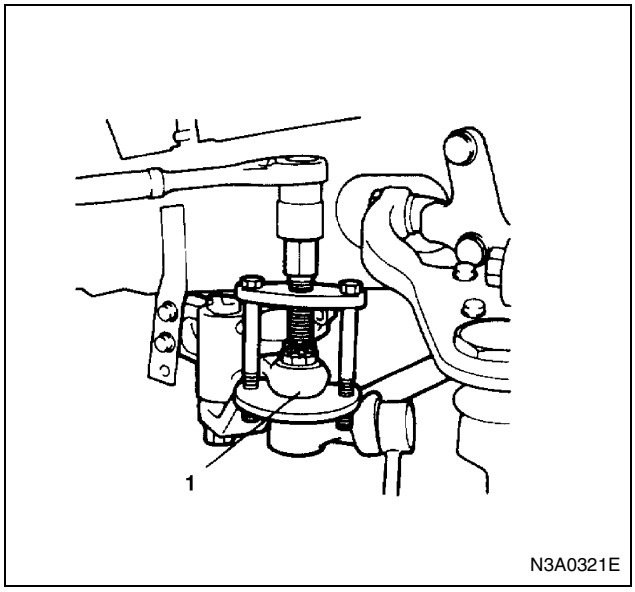
Raise the vehicle and support the frame with suitable safety stands.

1. Bolt
2. Steering Damper
3. Nut and Cotter Pin
   Disconnect outer track rods (1) from knuckle.
   Remover: 5-8840-2017-0

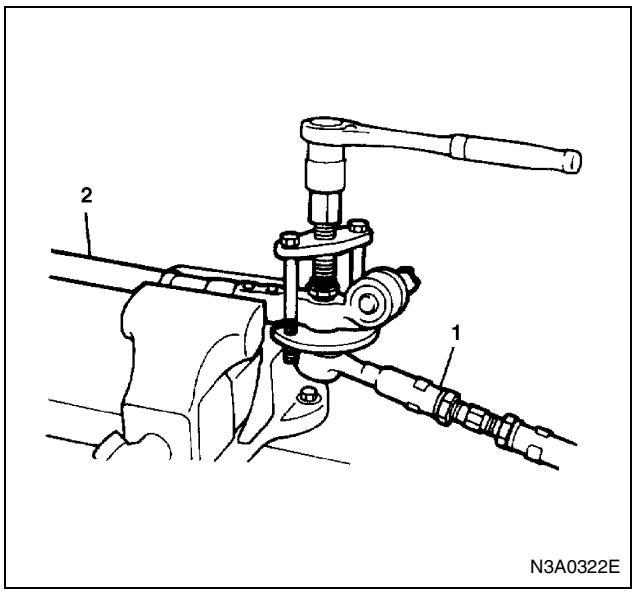


4. Nut and Cotter Pin
   1) Disconnect center track rod (1) from relay lever (2).
      Remover: 5-8840-2017-0

   2) Disconnect center track rod from idler arm (1).
      Remover: 5-8840-2017-0



5. Steering Link Assembly
6. Outer Track Rod
7. Center Track Rod
   Disconnect outer track rods (1) from center track rod (2).
   Remover: 5-8840-2017-0



Inspection

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Outer Track Rod End

- Inspect the ball joint taper fitting part for contact condition or abnormal wear.
- Inspect the boot for damage or grease leak.
- Move the ball joint to confirm its normal movement. If abnormal condition is found, replace the rod end assembly because it cannot be disassembled.

Center Track Rod

- Inspect the center track rod for bending or any other abnormal conditions.

- Inspect the ball joint taper fitting part for contact condition or abnormal wear.
- Inspect the boot for damage or grease leak.
- Move the ball joint to confirm its normal movement. If abnormal condition is found, replace the center track rod assembly because it cannot be disassembled.

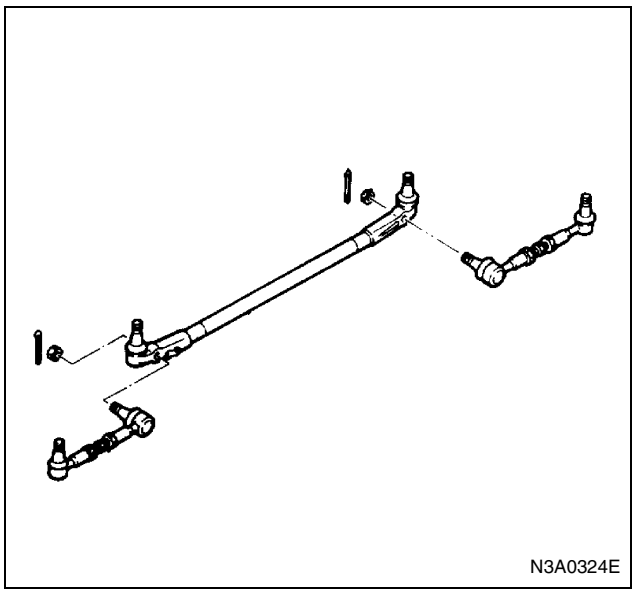
Installation

1. Center Track Rod
2. Outer Track Rod
   1) Adjust outer track rod length (L) to specified length.

Rod Length (L)
323.5 mm (12.736 in)

   2) After adjustment, tighten track rod end lock nut temporarily.
   3) Install outer track rods to the center track rod. Tighten nuts to specified torque, with just enough additional torque to align cotter pin hole.
      Install new cotter pin.

Tighten:
- Outer track rod nut to 108 N·m (11 kg·m / 80 lb·ft)



3. Steering Link Assembly
4. Nut and Cotter Pin
5. Nut and Cotter Pin
   1) Connect center track rod ends to the idler arm and relay lever.
   2) Connect outer track rod ends to knuckle.
   3) Tighten nuts to specified torque, with just enough additional torque to align cotter pin hole.
      Install new cotter pin.

Tighten:
- Center track rod end nut to 167 N·m (17 kg·m / 123 lb·ft)
- Outer track rod end nut to 108 N·m (11 kg·m / 80 lb·ft)
   4) Adjust the front end alignment after installation. Refer to “Front end alignment” in Section 3A.
   5) Tighten outer track rod end lock nuts to specified torque after adjustment of front end alignment.

Tighten:
- Lock nut to 167 N·m (17 kg·m / 123 lb·ft)

6. Steering Damper
7. Bolt

Tighten:
- Steering damper bolt to 50 N·m (5.1 kg·m / 37 lb·ft)

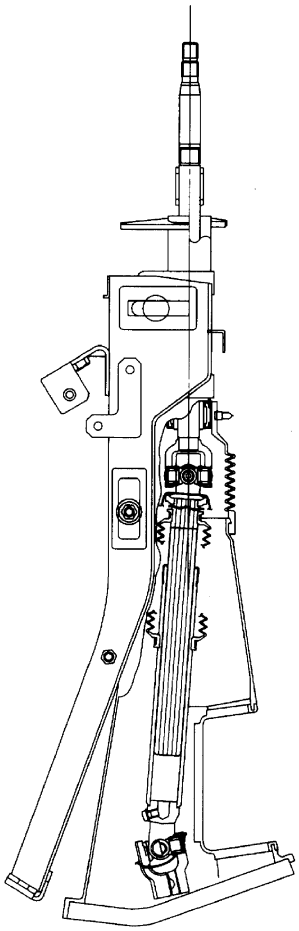
GENERAL DESCRIPTION 3B4-2
ON-VEHICLE SERVICE 3B4-3
Steering Wheel, Shaft and Column 3B4-3

GENERAL DESCRIPTION

This illustration is based on tilt and telescopic control type.

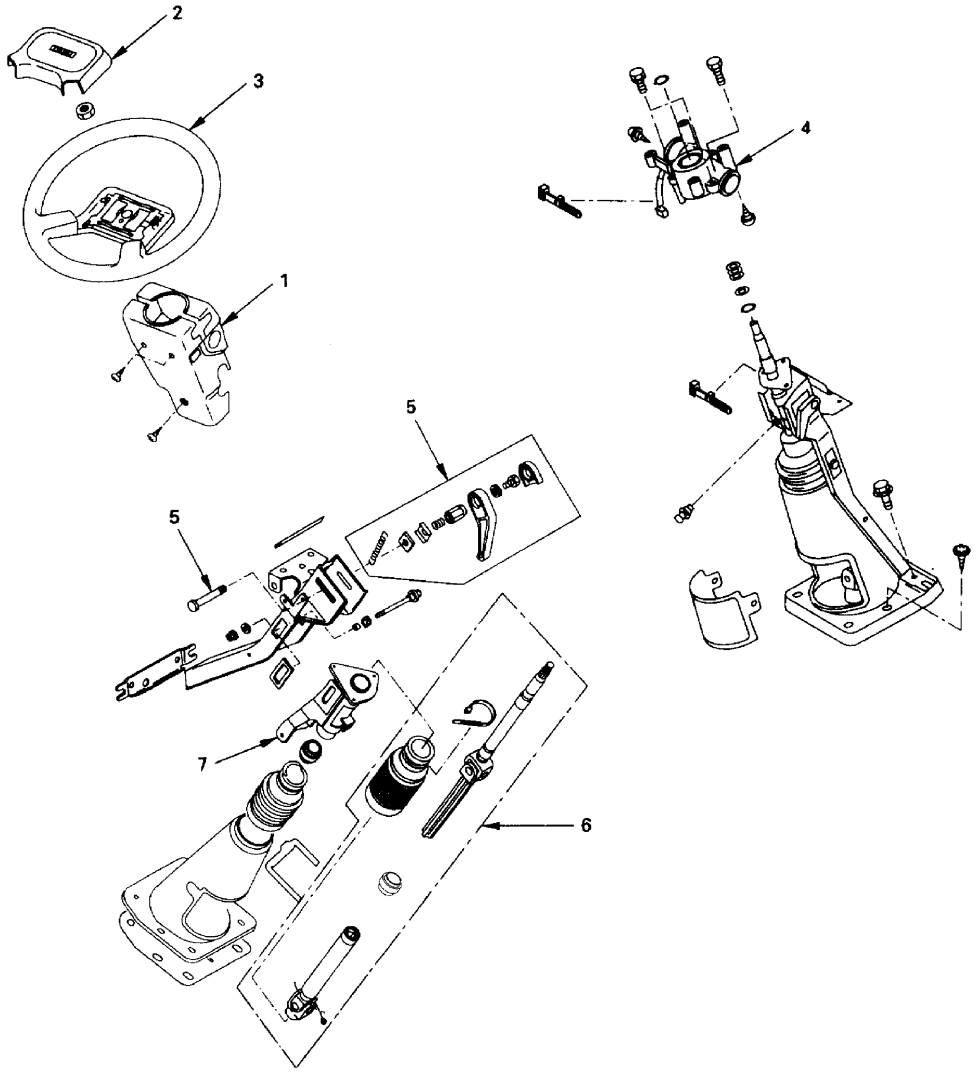


N3A0325E

ON-VEHICLE SERVICE

Steering Wheel, Shaft and Column

This illustration is based on tilt and telescopic control type.



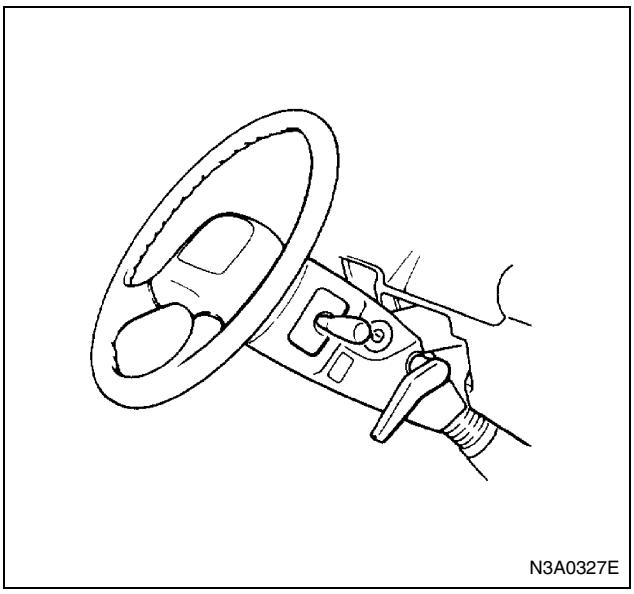
N3A0465E

Legend

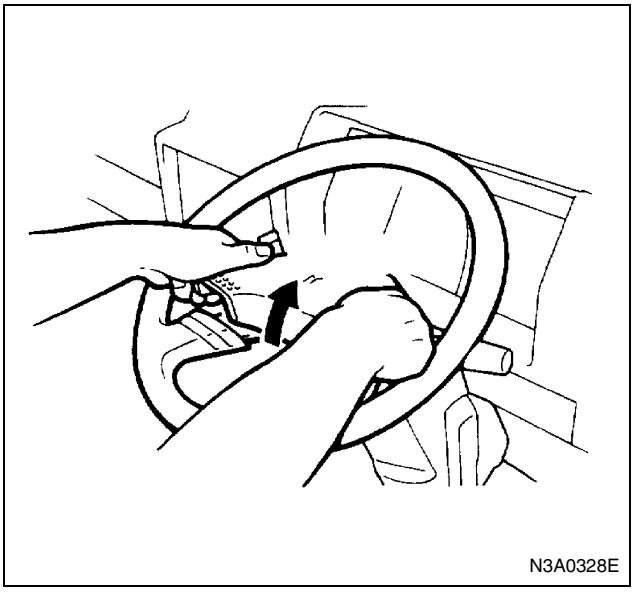
1. Steering cowl
2. Horn button
3. Steering wheel
4. Starter switch and key cylinder assembly
5. Tilt control (or support bolt)
6. Steering shaft assembly
7. Steering column

Removal

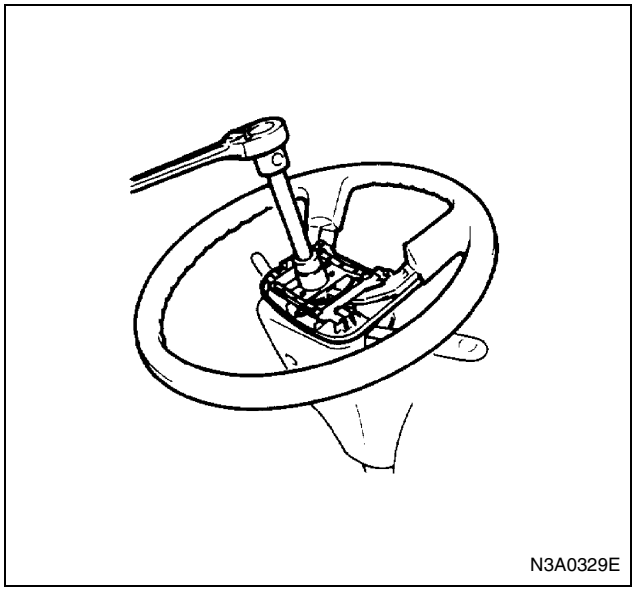
1. Steering Cowl



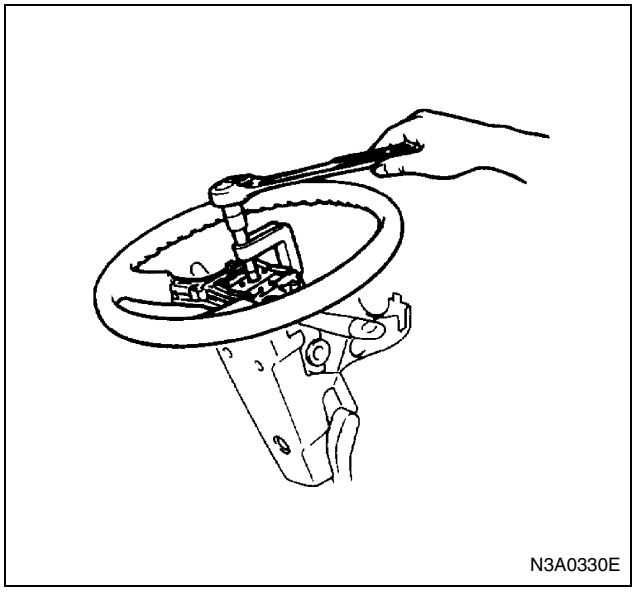
2. Horn Button



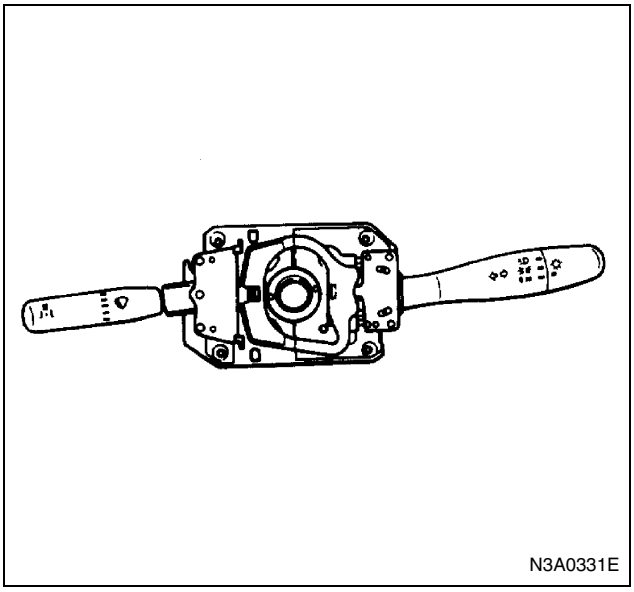
3. Steering Wheel
   - Remove the locking nuts for the steering wheel.



- Remove the steering wheel using the special tool.
  Remover: 5-8840-2215-0

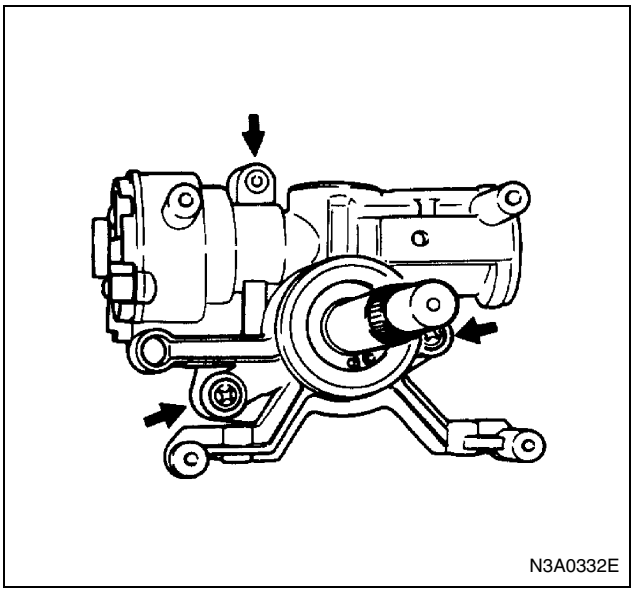


- Take out the combination switch.



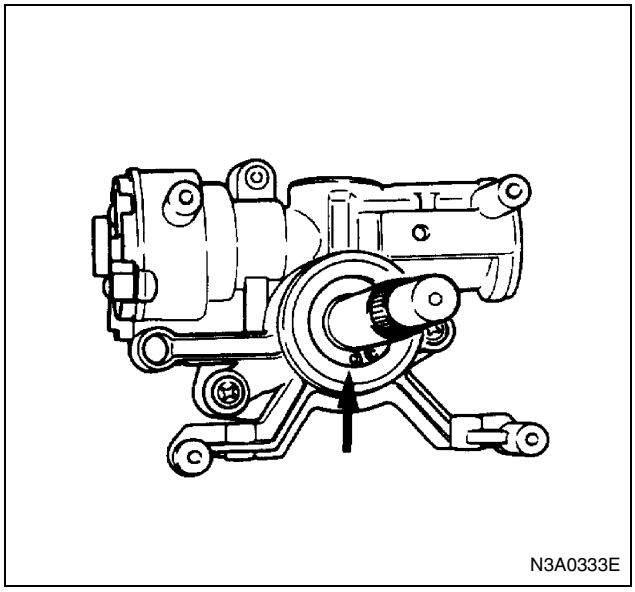
N3A0331E

4. Starter Switch and Key Cylinder Assembly
   - Cut the steering lock with a hack-saw to loosen the screws.



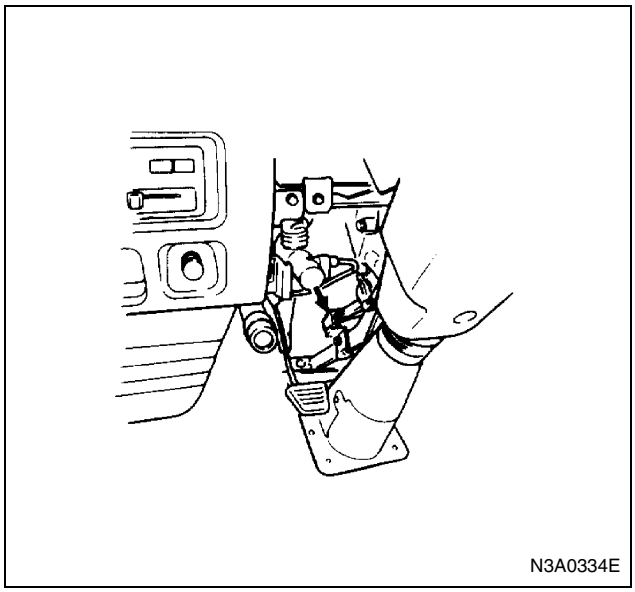
N3A0332E

- Remove the snap rings and remove the steering lock assembly.



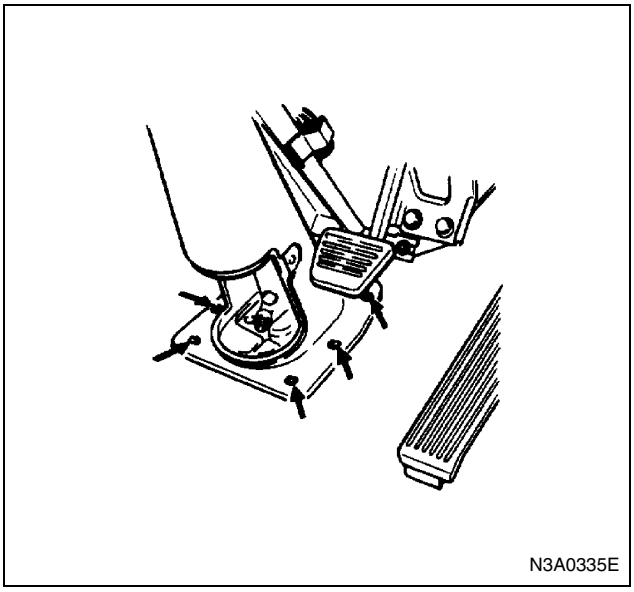
N3A0333E

- Remove the harness connectors.



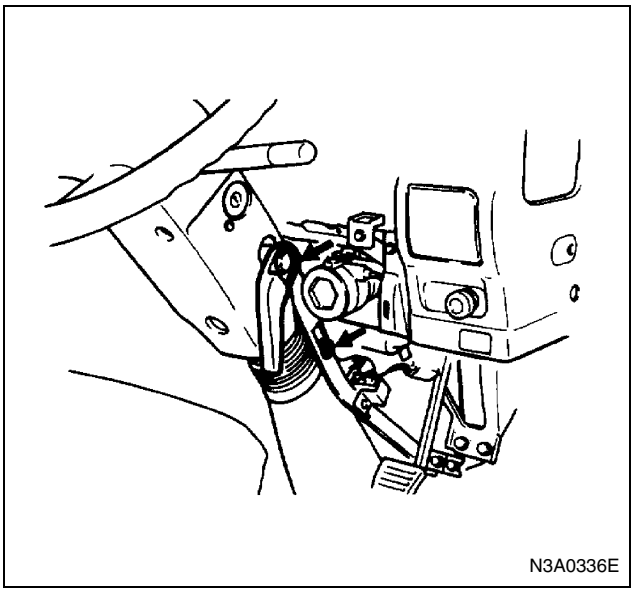
N3A0334E

- Remove the inspection window in the boots to describe a mating mark on the steering shaft and the yoke of universal joint.



N3A0335E

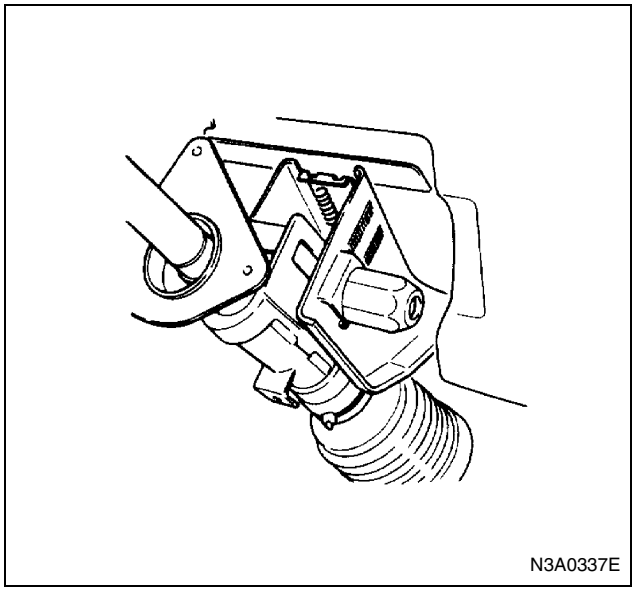
5. Tilt control
   - Remove the tilt control and the support brackets retaining bolts for the steering wheel column.



N3A0336E

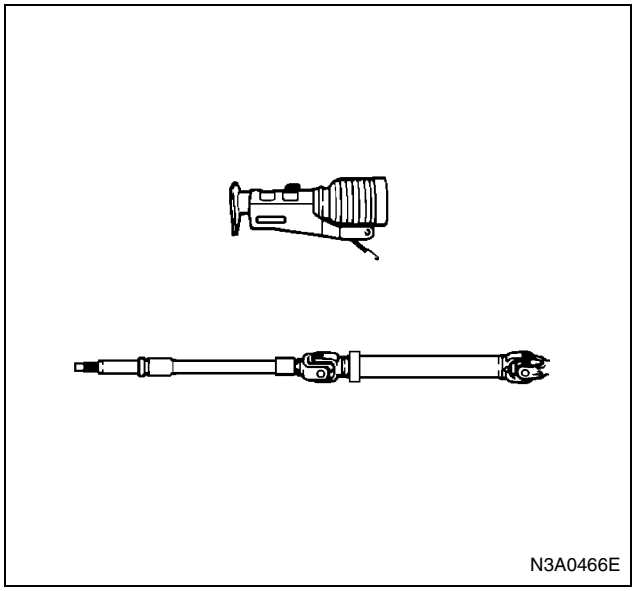
for Tilt Steering

- Remove the tilt spring.



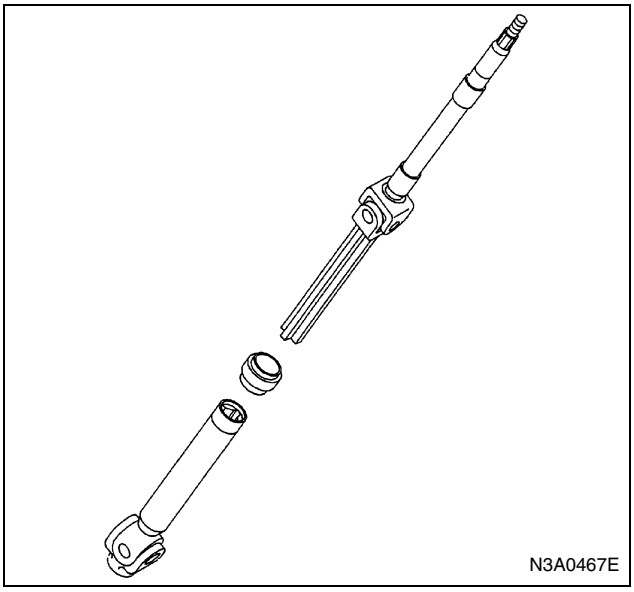
N3A0337E

6. Steering Shaft
   - Pull the steering shaft out of the column.



N3A0466E

- Describe a mating mark on the spline shaft and steering shaft and dismantle them.



7. Steering Column

Inspection and Repair

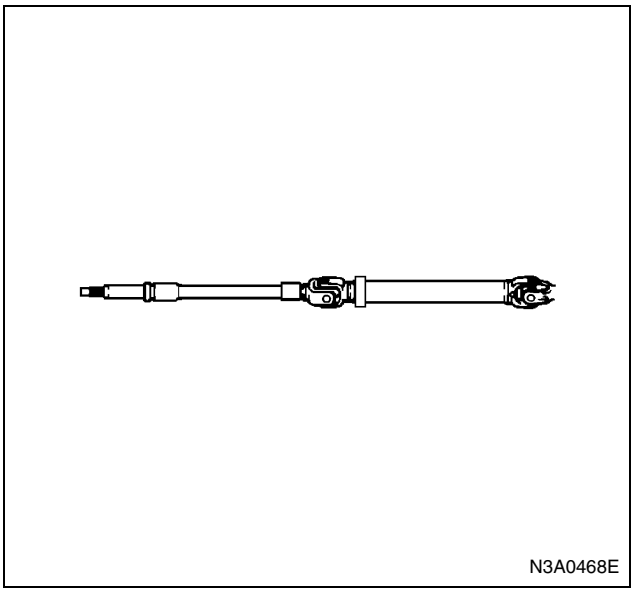
Clean up the dismantled components to perform inspection over each component.

Steering Shaft

- Inspect the bend.
- Inspect the universal joint.
  Check the yoke for crack and deformation.
  Chattering in the joint pairing.

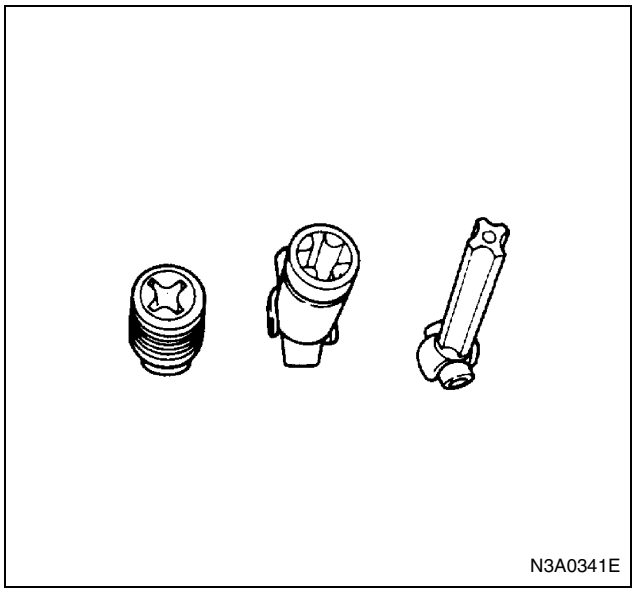
Caution:
The universal joint is non-repairable type.

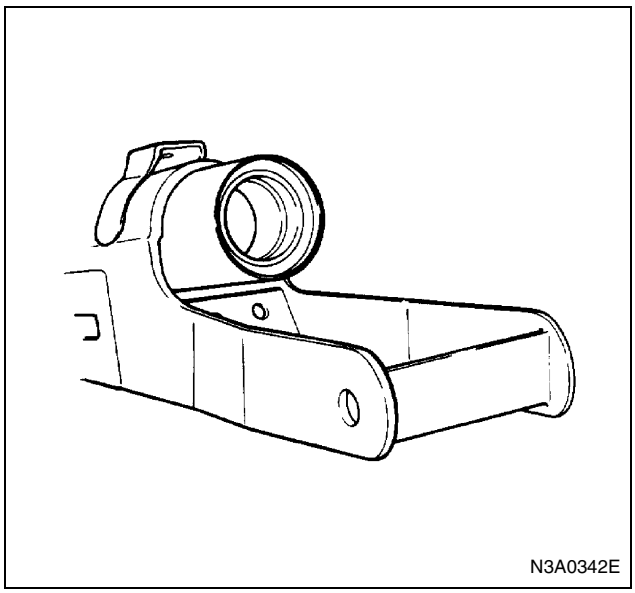
- Inspect the spline shaft.
  Significant chattering in the turning direction of steering shaft
  Chattering in the joints
  Fracture and deterioration in the boots



Steering Column

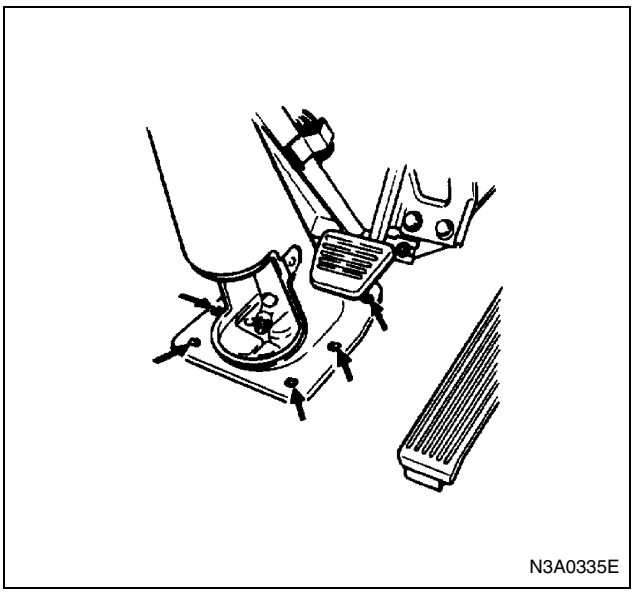
- Check to see if there is no significant deformation in the steering column.
- Check the boots for fracture and deterioration.
- Check the bushing for wear and deformation.





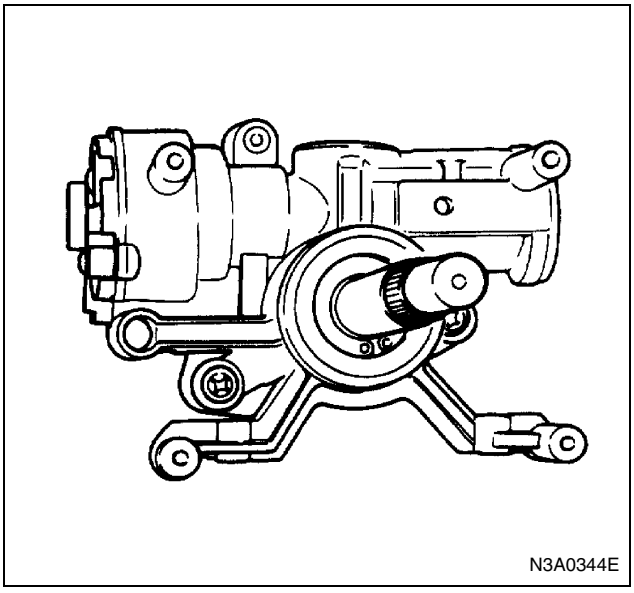
Installation

1. Steering Column
2. Steering Shaft
   - Assemble the steering shaft referring to the mating mark described at the time of dismantling and install the shaft.
   - Install the steering shaft to the steering unit referring to the mating mark described at the time of dismanting.



N3A0335E

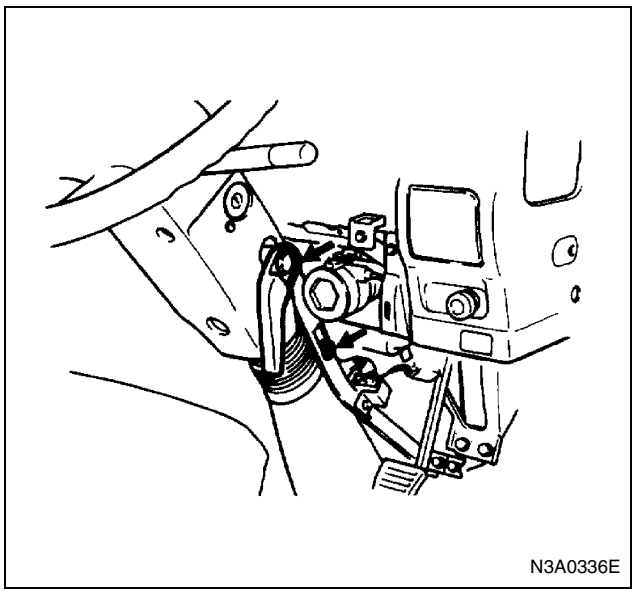
3. Starter Switch and Key Cylinder Assembly
   - Install the steering lock assembly and insert the snap ring positively.
   - Use new screws.



N3A0344E

4. Tilt Control (or Support Bolt)
   - Tighten the retaining nuts for the lower steering column support brackets to the specified torque.
   - Tighten the nuts outside the tilt control to the specified torque to install the lever, and tighten the lever retaining bolts to the specified torque.

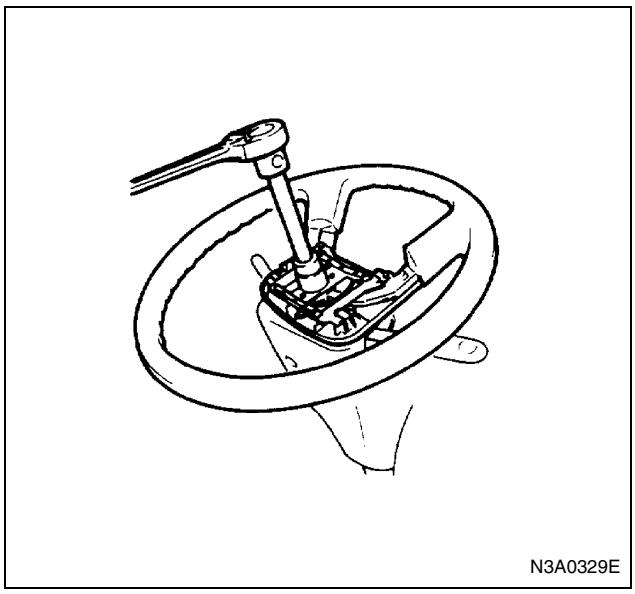
Tighten:
- Lower support bolt and nut to 14 N·m (1.4 kg·m/122 lb·ft)
- Tilt control bolt and nut to
  Bolt : 45 N·m (4.5 kg·m/33 lb·ft)
  Nut : 16 N·m (1.6 kg·m/12 lb·ft)
  Nut (Non-tilt) : 20 N·m (2.0 kg·m/14 lb·ft)



N3A0336E

5. Steering Wheel
   - Install the combination switch.
   - Install the steering wheel and tighten the nuts to the specified torque.

Tighten:
- Steering wheel nut to 50 N·m (5 kg·m/36 lb·ft)



N3A0329E

6. Horn Button
7. Steering Cowl
   - Hook up the harness connectors and install the steering cowl.

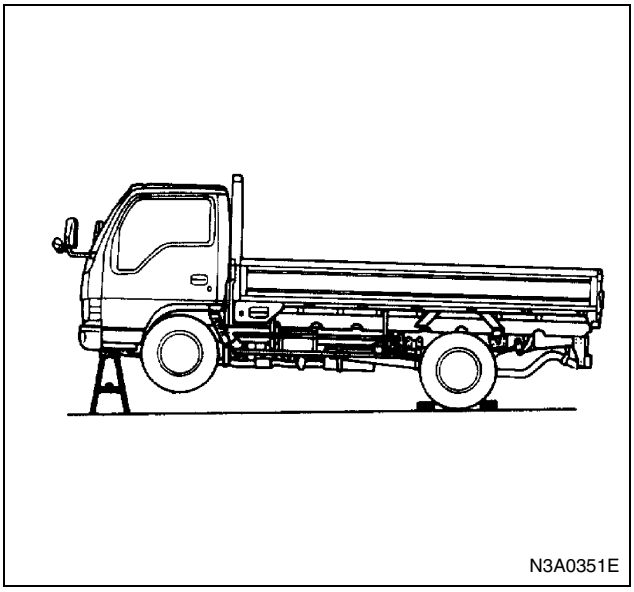
6. Rubber bushing
7. Shackle pin, nut and washer
8. Shackle
9. Rubber bushing
10. Leaf spring

Removal

Preparation

Make the following preparation before removing the leaf spring.

1. Brace the rear wheels.
2. Jack up the front axle until the front wheels are lifted off the ground and position safety stand under the chassis frame.
   Refer to “Lifting Instruction” in Section 0A for acceptable lifting point and supportable point location.

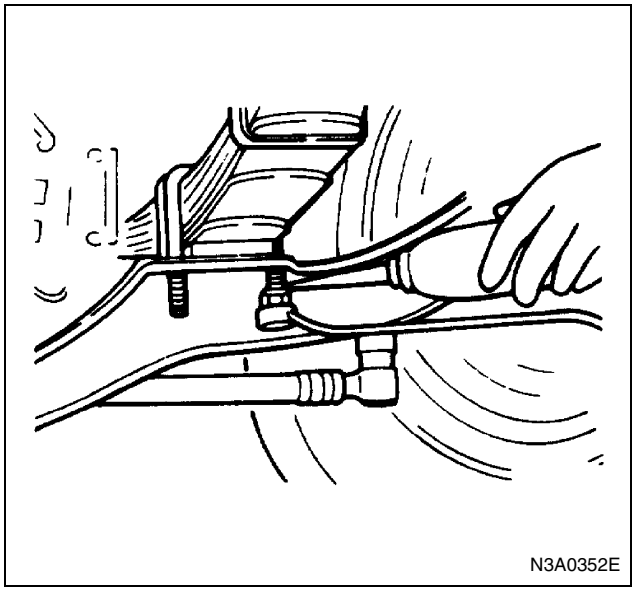


N3A0351E

3. Position a garage jack under the front axle.
4. For the vehicle model with a stabilizer, remove the mounting portion on the axle side of the stabilizer in advance before removing the leaf spring. (Refer to the removal procedure of the stabilizer.)

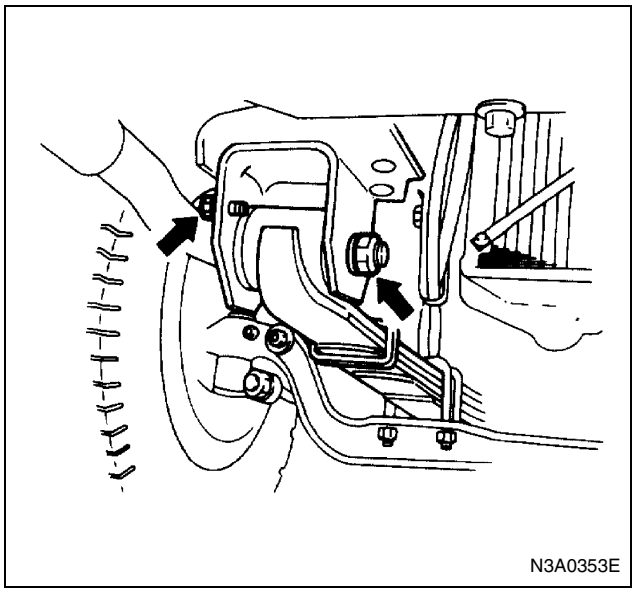
NHR and NKR

1. Shock Absorber
2. U-bolt and Nut
3. Helper Rubber
   If the U-bolts are heavily rusted, apply a generous amount of oil to the threads before loosening them to prevent seizure.



N3A0352E

4. Spring Pin, Nut and Washer
5. Bolt
6. Rubber Bushing
   Take out the rubber bushings after removal of the spring pin.



N3A0353E

7. Shackle Pin, Nut and Washer
8. Shackle
9. Rubber Bushing
   Take out the rubber bushings after removal of the shackle.
10. Leaf Spring
    Lower the garage jack slowly and remove the front spring assembly. When removing the front spring assembly, exercise care not to cause damage to the brake flexible hoses and drag link. Also, exercise care not to cause the spring to come down.

NPR, NQR and NPS

1. Shock Absorber
2. U-bolt and Nut
   Refer to page NHR and NKR.

3. Helper Rubber
4. Spring Pin, Nut and Washer
   Drive out the spring pin with a hammer using a brass bar after removal of the spring pin nut.
5. Shackle Pin, Nut and Washer
6. Shackle
   Drive out the shackle pin with a hammer using a brass bar after removal of the shackle pin nut.
7. Rubber Bushing
8. Leaf Spring
   Refer to NHR and NKR.

Inspection and Repair

Make the necessary adjustments, repairs and part replacements if excessive wear or damage is discovered during inspection.

Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

- Leaf spring assembly
- Clip
- Center bolt
- U-bolt
- Spring pin
- Shackle pin
- Helper rubber
- Rubber bushing

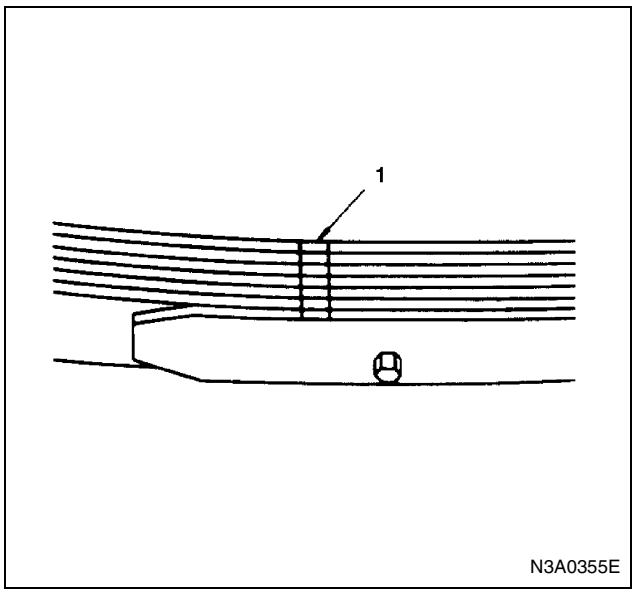
Shock Absorber

1. Inspect for extreme oil leakage.
   Slight oil leakage is allowed.
2. Inspect for temperature after running.
   Unchanged temperature indicates deteriorated function.
3. Inspect if large resistance is felt when the shock absorber is expanded and contracted by holding either end, or if play is eliminated after several times of expansion and contraction.
   The function has deteriorated if the above condition is not observed.
4. Inspect the bushing for wear or deterioration.
   Replace if abnormality is found.

Leaf Spring Assembly Replacement

- Apply a setting mark (1) across the springs before disassembling the leaf spring assembly.
- Apply grease to both faces of each leaf spring at reassembly.
- Use a bench press for disassembly and reassembly.
- Discard center bolt and install a new one.

When replacing the leaf spring assembly, use the leaf spring with the same camber represented by “+, -, I” on both right and left sides.

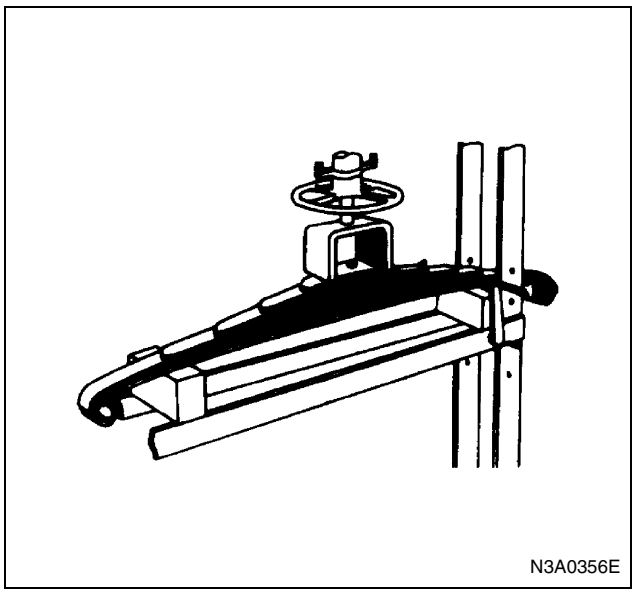


Center Bolt

Tighten the center bolt nut to the specified torque.

Tighten:

- Center bolt to 39 N·m (4 kg·m/29 lb·ft)

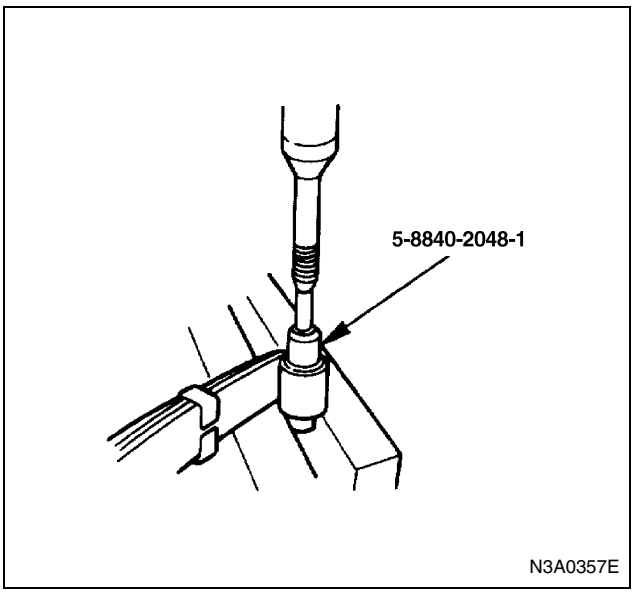


Bushing Replacement

When replacing bushing, drive out the bushing using a bench press.

Leaf Spring Rubber Bush Remover & Installer:
5-8840-2048-1

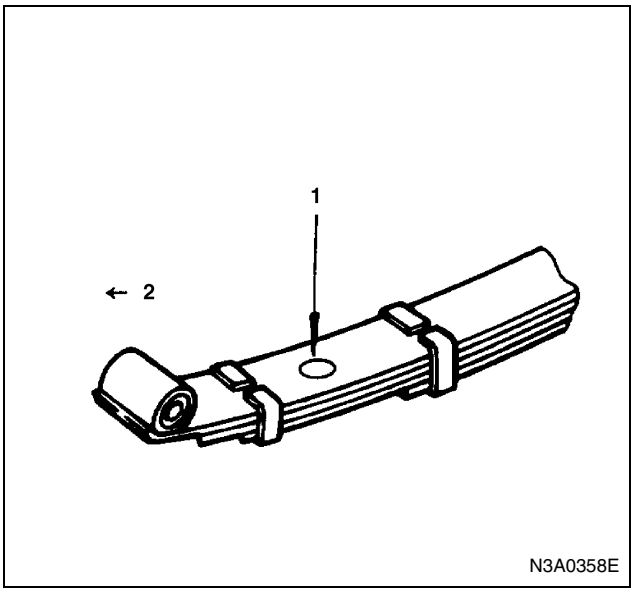
Leaf Spring Metal Bush Remover & Installer:
5-8840-2049-1



Installation

NHR and NKR

1. Leaf Spring
   Install the leaf spring assembly with the camber mark (1) turned to front side (2) on the front axle.



2. Helper Rubber
3. U-Bolt and Nut
   Position the U-bolts and helper rubber on the leaf spring assemblies and jack up the front axle.
   When tightening the nuts, apply oil as necessary to prevent damaging the threads.

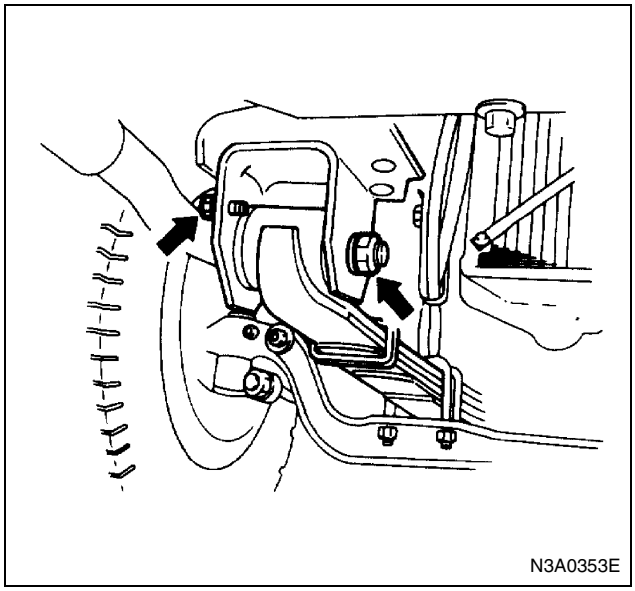
Tighten:

- U-bolt nut to 127 N·m (13 kg·m/94 lb·ft)

4. Rubber Bushing
5. Spring Pin, Nut and Washer
6. Bolt
   Finger tighten first, and tighten to specified torque after lowering the vehicle to ground.

Tighten:

- Spring pin bolt and nut to
  Bolt: 27 N·m (2.8 kg·m/20 lb·ft)
  Nut: 177 N·m (18 kg·m/130 lb·ft)



7. Rubber Bushing
8. Shackle
9. Shackle Pin, Nut and Washer
   Finger tighten first, and tighten to specified torque after lowering the vehicle to ground.

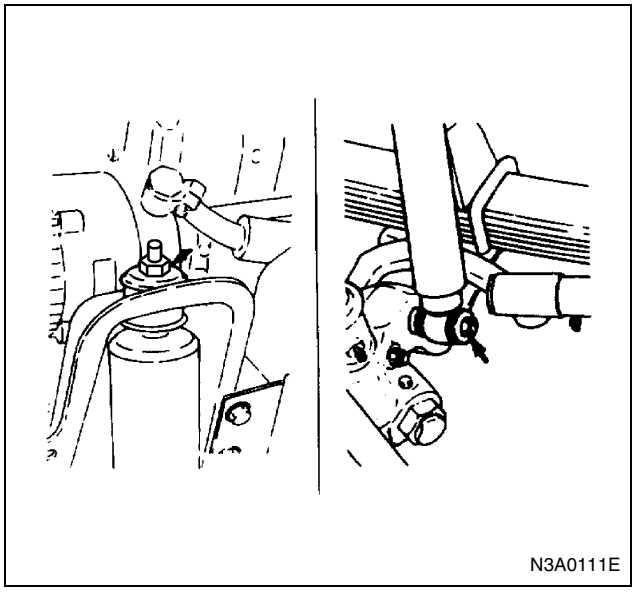
Tighten:

- Shackle pin nut to 137 N·m (14 kg·m /101 lb·ft)

10. Shock Absorber

Tighten:

- Shock absorber nut to
  Upper nut: 21 N·m (2.1 kg·m/16 lb·ft)
  Lower nut: 61 N·m (6.2 kg·m/45 lb·ft)



NPR, NQR and NPS

1. Leaf Spring
   Refer to NHR and NKR.
2. Helper Rubber
3. U-Bolt and Nut

Tighten:

- U-bolt nut to
  NPR, NPS: 127 N·m (13 kg·m/94 lb·ft)
  NQR: 196 N·m (20 kg·m/145 lb·ft)

4. Spring Pin, Nut and Washer
   Refer to NHR and NKR.

Tighten:

- Shackle pin nut to 202 N·m (20.6 kg·m/149 lb·ft)

5. Rubber Bushing
6. Shackle
7. Shackle Pin, Nut and Washer
   Refer to NHR and NKR.

Tighten:

- Shackle pin nut to 202 N·m (20.6 kg·m/149 lb·ft)

8. Shock Absorber

Tighten:

- Shock absorber nut to
  Upper nut: 21 N·m (2.1 kg·m/16 lb·ft)
  Lower nut: 95 N·m (9.7 kg·m/70 lb·ft)

Removal

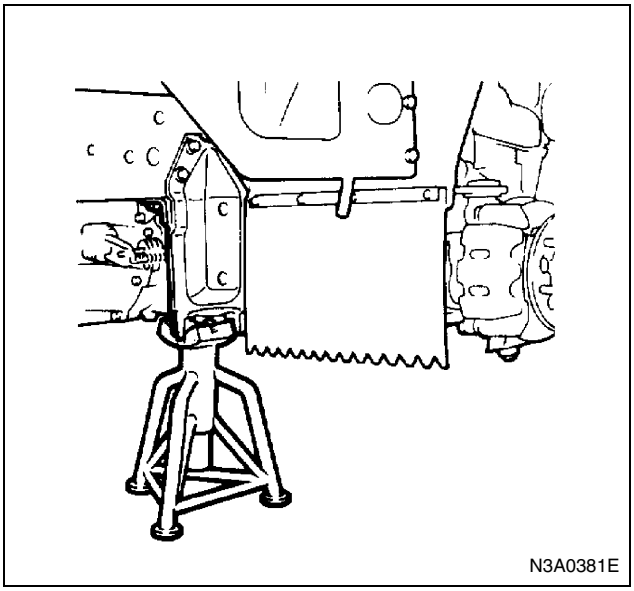
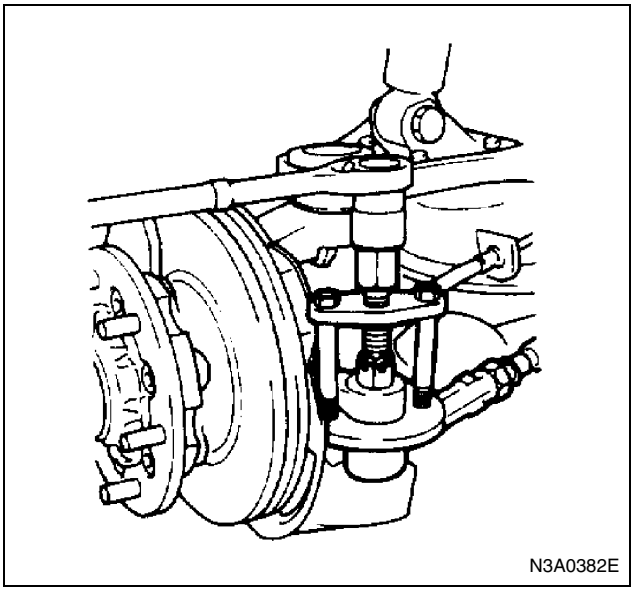
Preparations

- Raise the vehicle and support the jack up point with suitable safety stands. Refer to “Lifting Instruction” in Section 0A.
- Remove front tire and wheels. Refer to “Wheels and Tires” in Section 3E.
- Remove brake caliper assembly. Refer to “Hydraulic Brakes” in Section 5A.
- Remove hub and rotor assembly. Refer to “Front Axle” in Section 4C.



N3A0381E

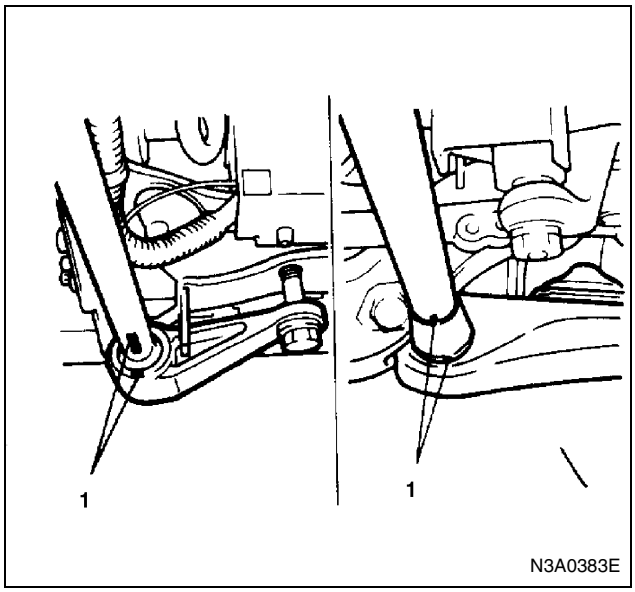
- Disconnect the outer track rod ball joint from the knuckle.
  Remover: 5-8840-2017-0



N3A0382E

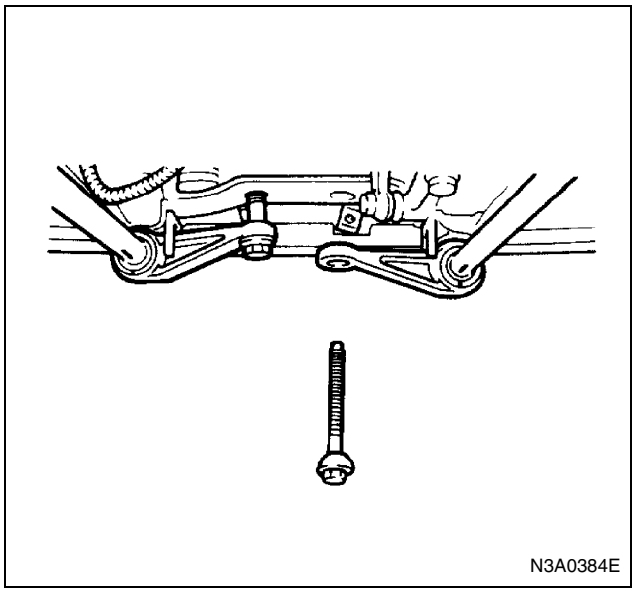
1. Adjusting Bolt
2. Height Control Arm
3. End Piece
4. Torsion Bar

- Apply setting marks (1) to torsion bar, height control arm and lower link to ensure installation of the parts in their original position.



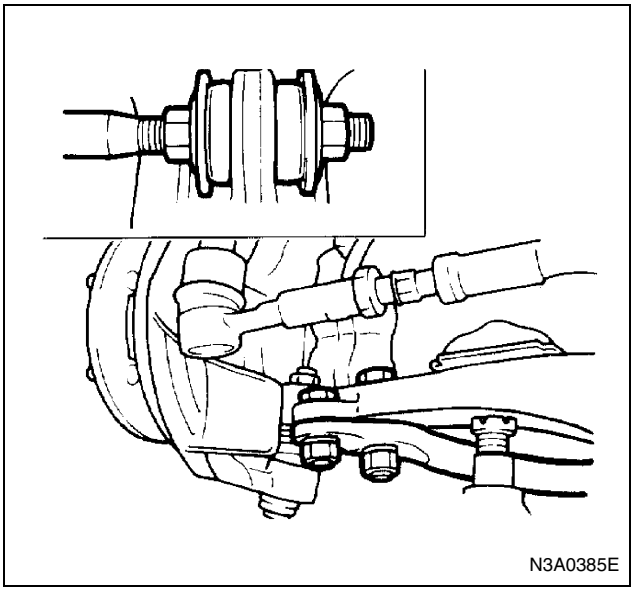
N3A0383E

Apply setting marks to adjusting bolt threads to ensure installation of the parts in their original position.



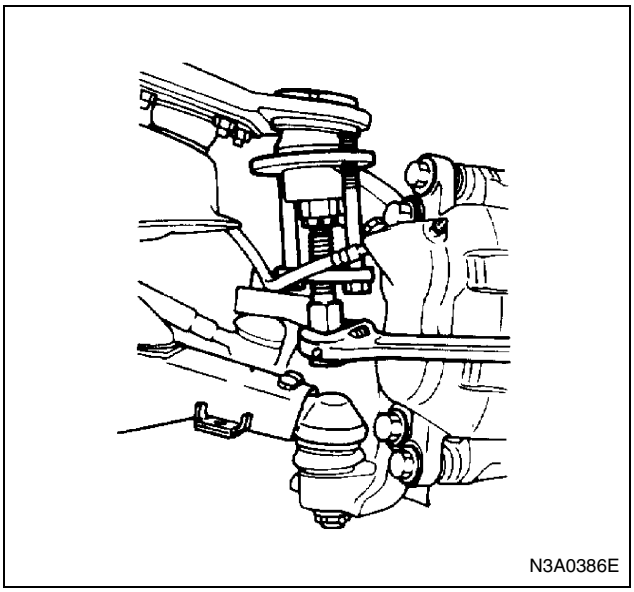
N3A0384E

5. Strut Bar Assembly
   - Raise and support the lower link with a jack.
   - Loosen the rear side nut, and remove the nut, washer and rubber bushing.
   - Loosen two fixing bolts of lower link side and remove the strut bar to front side.



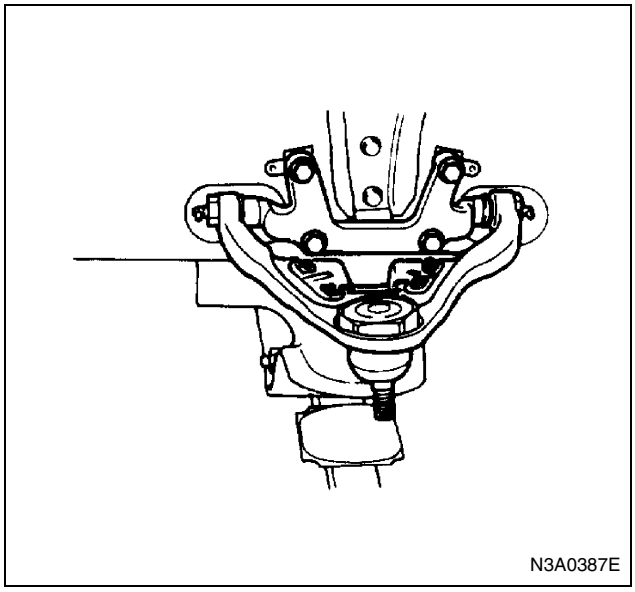
N3A0385E

6. Shock Absorber
7. Upper Link Assembly
8. Adjusting Shim
   Disconnect upper link joint ball at the knuckle.
   Remover: 5-8840-2017-0



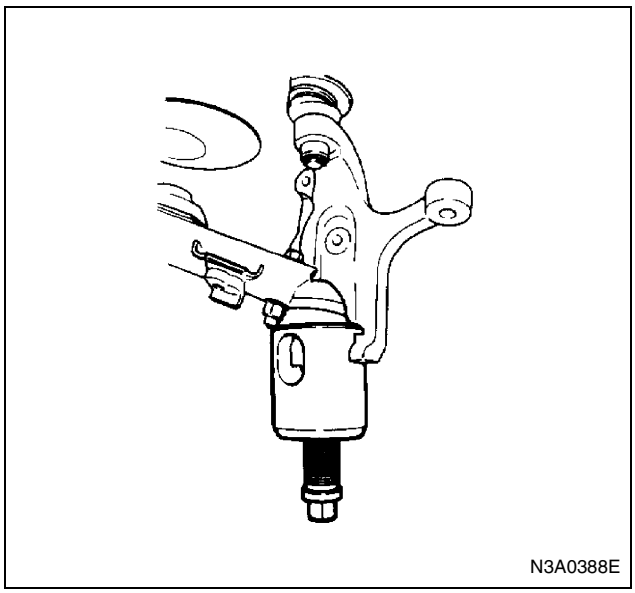
N3A0386E

- Remove the fulcrum pin fixing bolt.
- Note the thickness and number of shims.



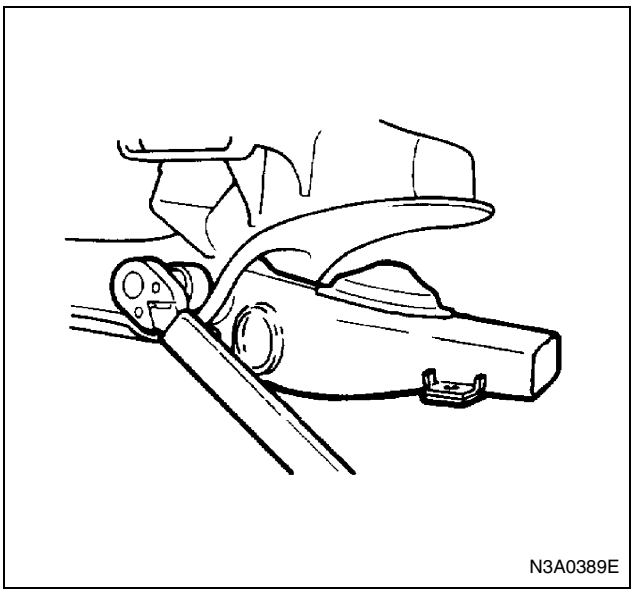
N3A0387E

9. Knuckle
   - Disconnect the lower link ball joint at the knuckle.
     Remover: 5-8840-2366-0
   - Remove two fixing bolts and the ball joint from lower link.



N3A0388E

10. Lower Link



N3A0389E

Inspection and Repair

Make necessary correction or parts replacements if excessive wear, damage, corrosion or any other abnormal condition are found through inspection.

Visual Check

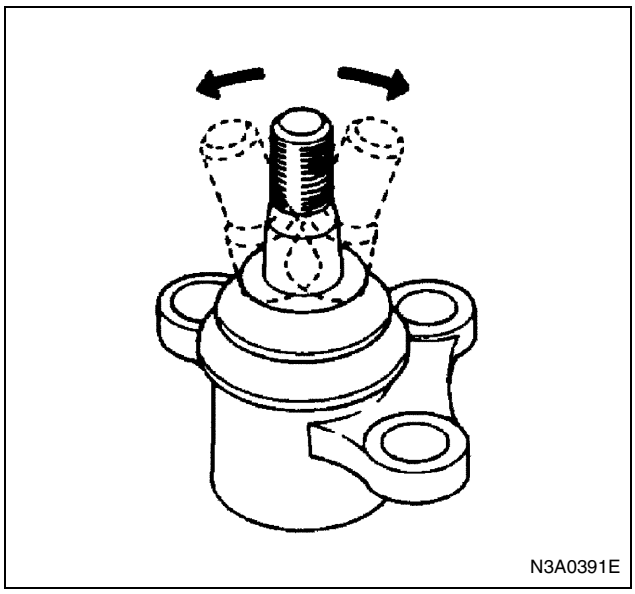
Inspect the following parts for excessive wear, damage, bending, oil leak or any other abnormal conditions.

- Torsion Bar
- End Piece
- Height Control Arm
- Rubber Bushings
- Strut Bar
- Shock Absorber

Ball Joint

- Inspect the ball joint boot for damage or grease leak.
- Move the ball joint to confirm its normal movement.
- Inspect screw / taper area of ball for flaws.

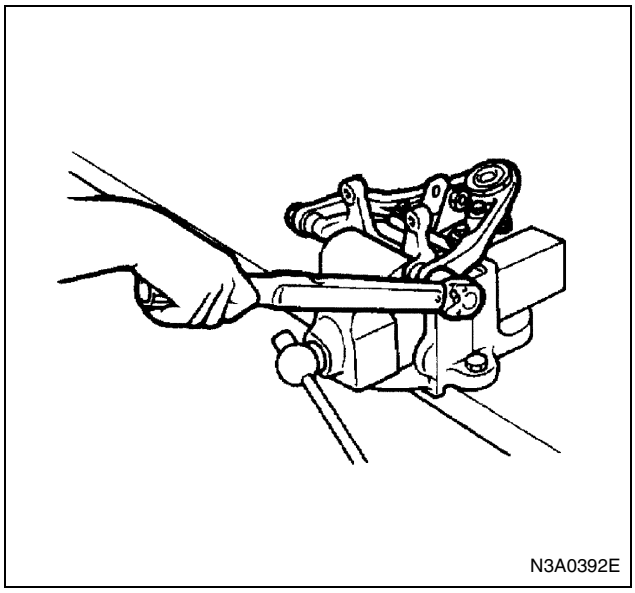
If any defects are found by the above inspections, replace the ball joint with new one.



N3A0391E

Upper Ball Joint Replacement

- Remove the ball joint fixing nut (Hex. 63mm).
- Remove the ball joint from the upper link using a special tool.
  Remover: 5-8840-2364-0

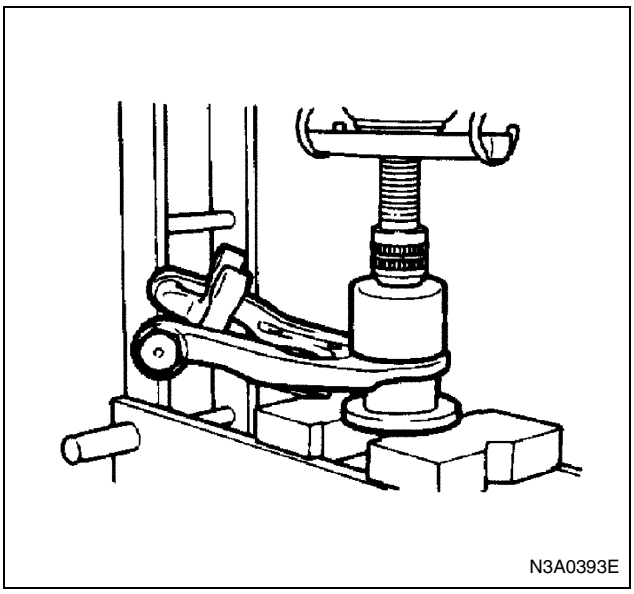


N3A0392E

- Install the ball joint to the upper link using a bench press and special tool.
  Installer: 5-8840-2365-0
- Tighten nut to specified torque.

Tighten:

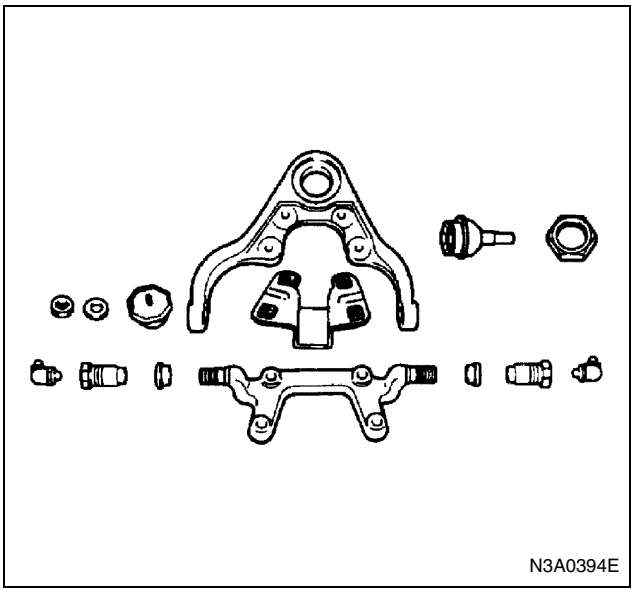
- Joint ball nut to 206 N·m (21.0 kg·m/152 lb·ft)



N3A0393E

Upper Link Assembly

- Disassemble the upper link assembly.
- Inspect the following parts as shown in the figure for wear, damage, bending or any other abnormal conditions.

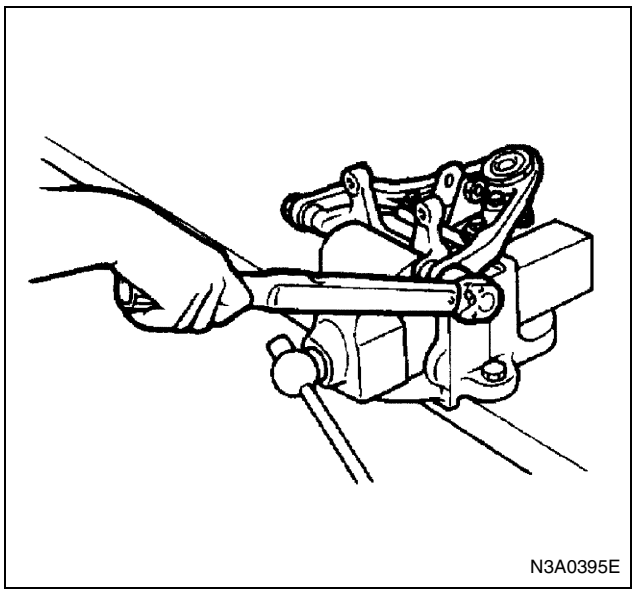


N3A0394E

- Reassemble the upper link assembly.
- Apply multi-purpose with MoS_2 grease to the fulcrum pin threads.
- Fill multi-purpose with MoS_2 grease to bushings.
- Install the fulcrum pin to the upper link and tighten bushings to specified torque.

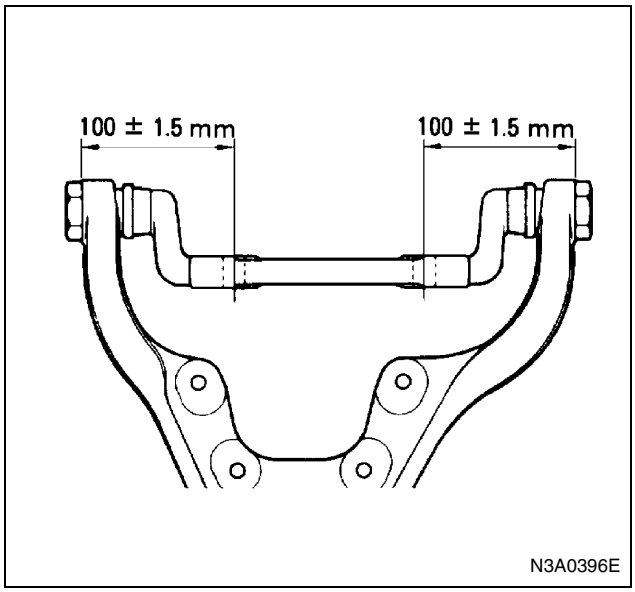
Tighten:

- Bushing to 294 N·m (30 kg·m/217 lb·ft)



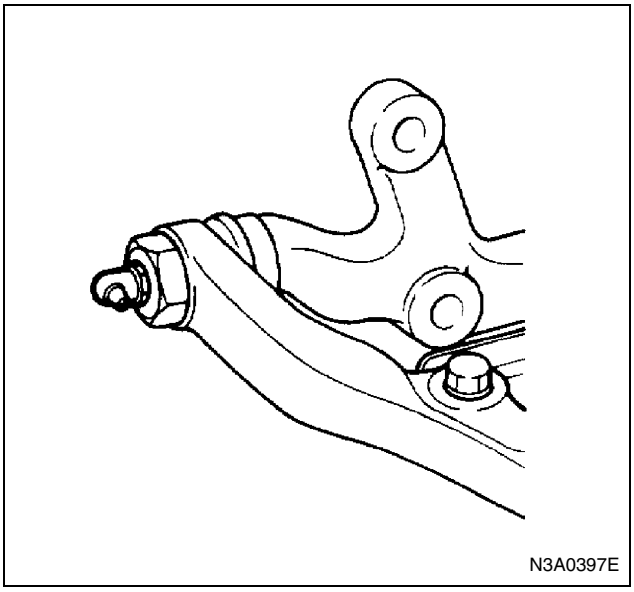
N3A0395E

- Adjust the fulcrum pin as shown in the figure.



N3A0396E

- Install grease fitting to upper link in parallel with upper link.



N3A0397E

Lower Link Bushing Replacement

- Remove the lower link bushing using a bench press and special tool.
  Remover: 5-8840-2367-0
- Inspect the bushing for wear, damage or any other abnormal condition.
- Install the bushing to the lower link from vehicle forward direction.
  Installer: 5-8840-2367-0

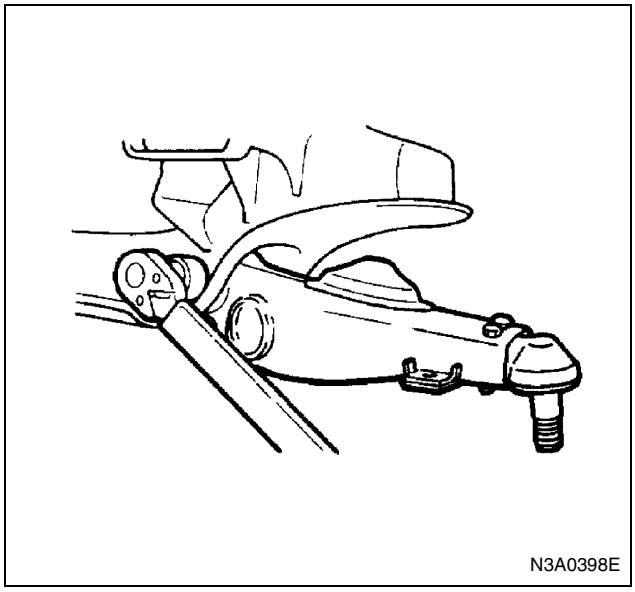
Installation

1. Lower Link
   - Install the lower link fixing bolt from the vehicle forward direction and set the bolt head to the bolt stopper completely.
   - Tighten the nut temporarily.

Notice:
Tighten nuts to specified torque after following steps;

- Park the vehicle on a level ground.
- Move the front of the vehicle up and down several times to settle the suspension.

Tighten:
- Lower link nut to 579 N·m (59.0 kg·m/427 lb·ft)



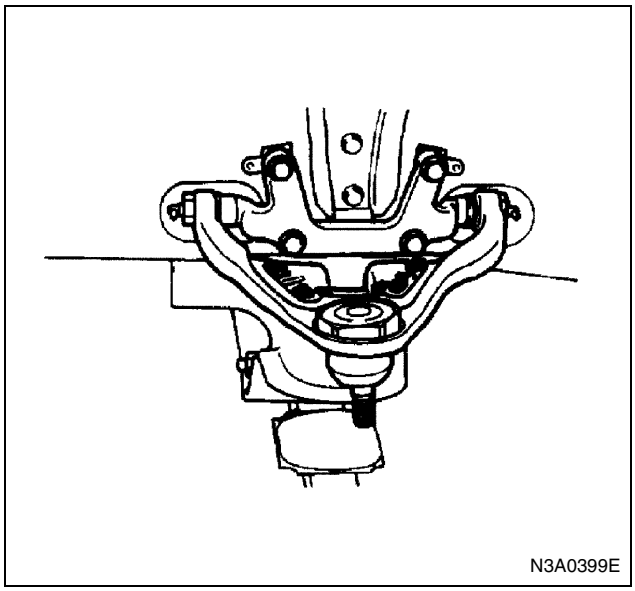
N3A0398E

2. Shim
3. Upper Link Assembly
   - Install the shims and upper link assembly.
   - Tighten the fixing bolts to the specified torque.

Thickness of Shims Available
0.8 mm (0.031 in), 1.6 mm (0.063 in), 3.2 mm (0.126 in)

Tighten:
- Upper link bolt to 152 N·m (15.5 kg·m/112 lb·ft)

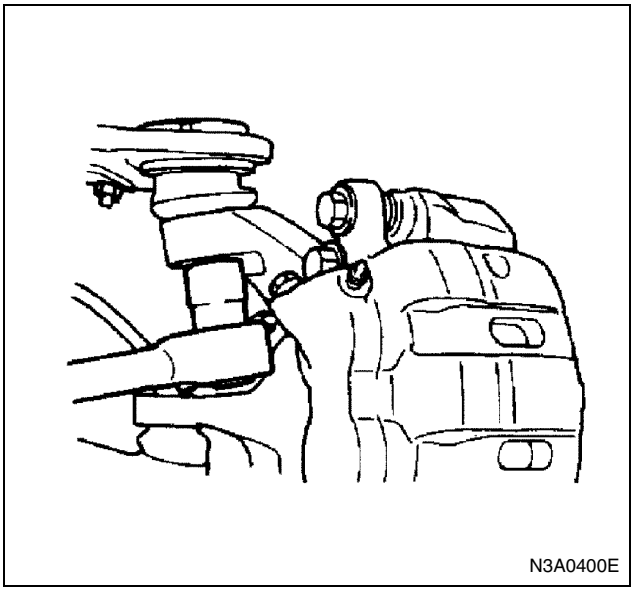
  For adjustment of camber and caster angle, refer to “Front End Alignment” in Section 3A.



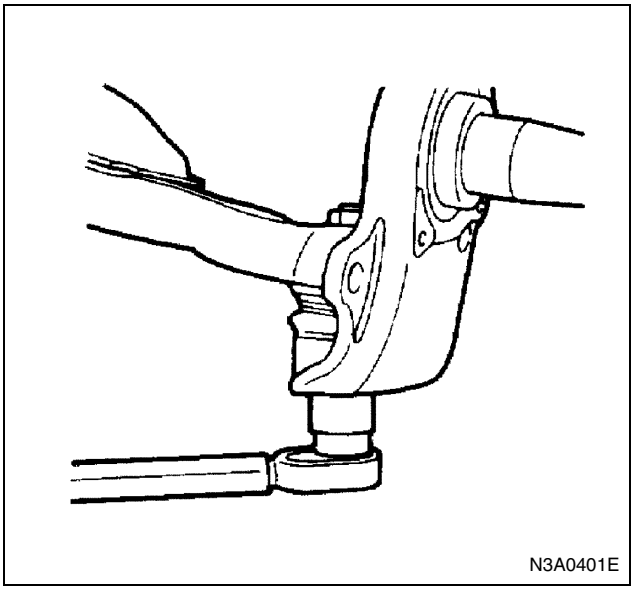
N3A0399E

4. Knuckle
   - Connect the upper ball joint, lower ball joint to the knuckle.
   - Tighten the fixing nuts temporarily.
   - After installation of tie rod end and strut bar assembly, tighten fixing nuts to specified torque, with just enough additional torque to align cotter pin holes.
     Install new cotter pin.

Tighten:
- Ball joint nut to
  Upper: 205 N·m (20.9 kg·m/151 lb·ft)
  Lower: 377 N·m (38.4 kg·m/278 lb·ft)



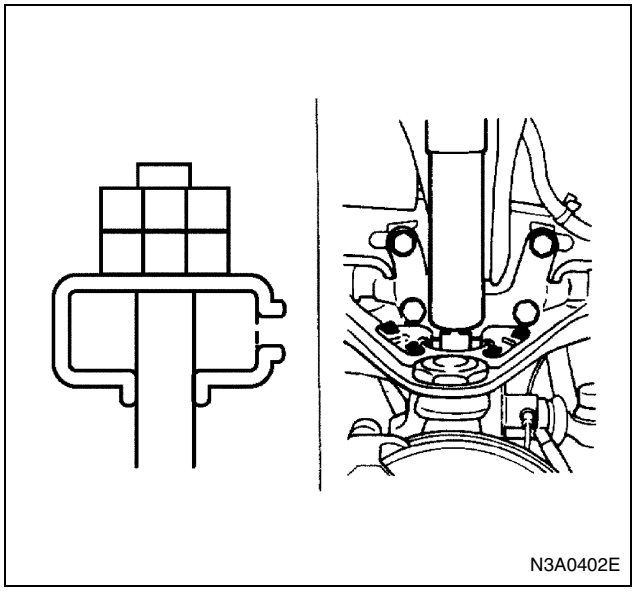
N3A0400E



N3A0401E

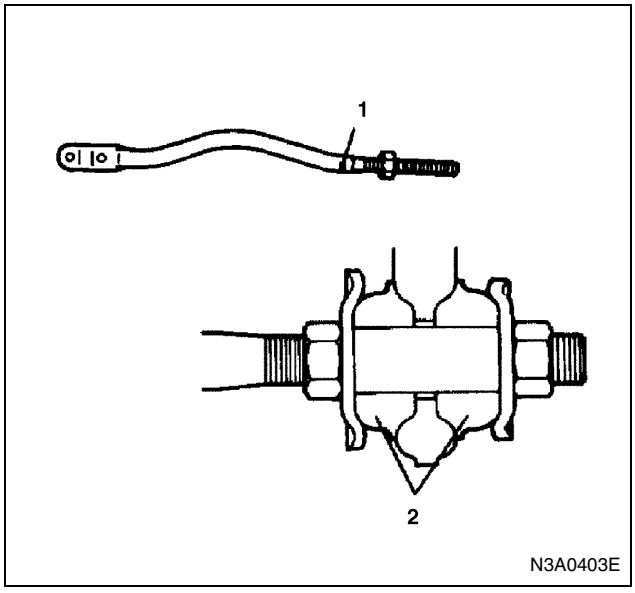
5. Shock Absorber Assembly

Tighten:
- Shock absorber bolt and nut to
  Double nut (upper): 40 N·m (4.1 kg·m/30 lb·ft)
  Double nut (lower): 21 N·m (2.1 kg·m/16 lb·ft)
  Lower: 103 N·m (10.5 kg·m/76 lb·ft)



N3A0402E

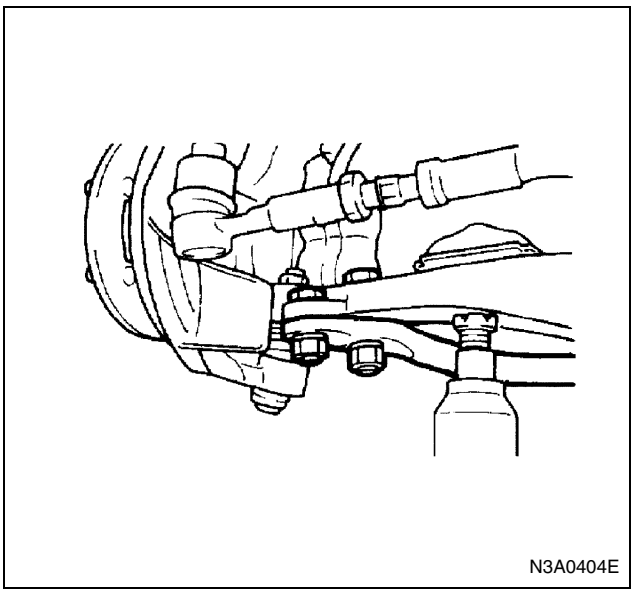
6. Strut Bar Assembly
   - Install the strut bar assembly.
   - White paint (1) is aligned to right side strut bar. Be careful not to install to the opposite side.
   - Apply a thin coat of rubber grease to inside of the rubber bushing (2).
   - Tighten the rear side fixing nuts temporarily.



N3A0403E

   - Tighten the lower link side fixing bolts to specified torque.

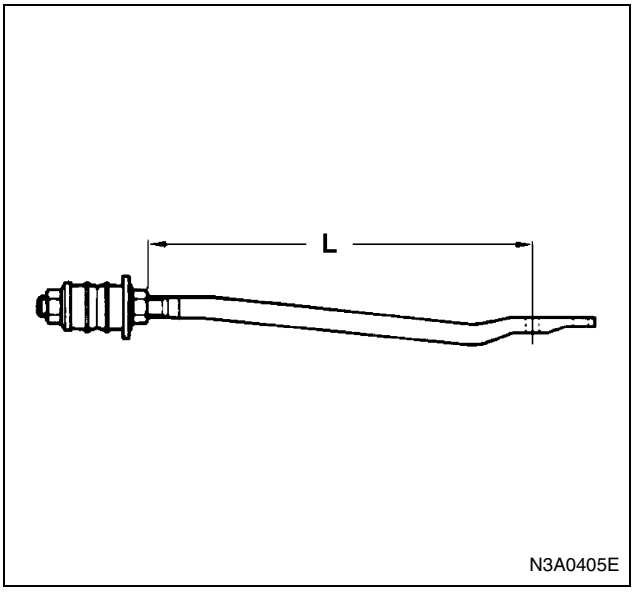
Tighten:
- Strut bar bolt and nut to 219 N·m (22.3 kg·m/161 lb·ft)



N3A0404E

- Adjust the strut bar length (L) after installation.

Strut Bar Length (L)
485.0 mm (19.095 in)

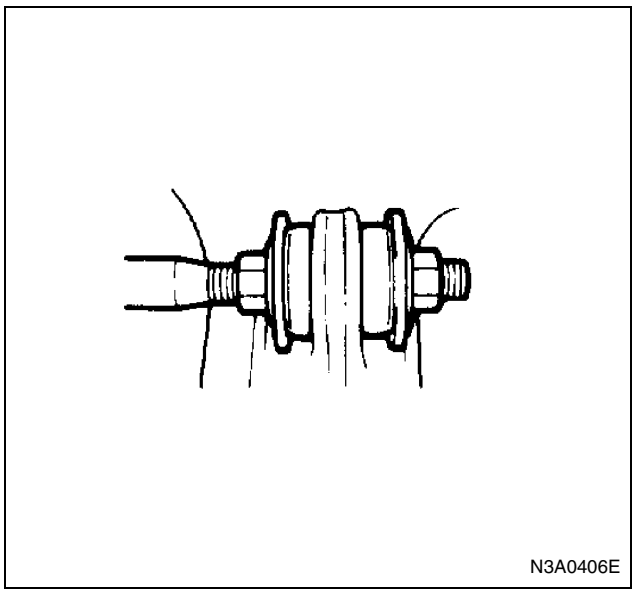


N3A0405E

Notice:
Tighten nuts to specified torque after following steps;

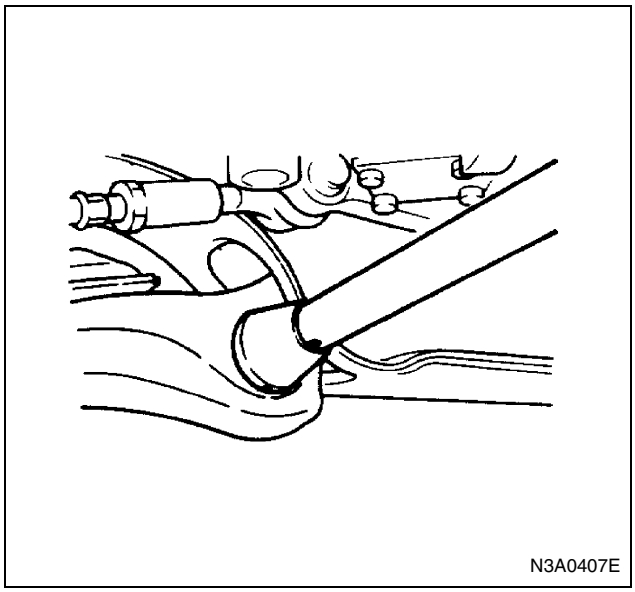
- Park the vehicle on a level ground.
- Move the front of the vehicle up and down several times to settle the suspension.

Tighten:
- Strut bar nut to 235 N·m (24 kg·m/174 lb·ft)



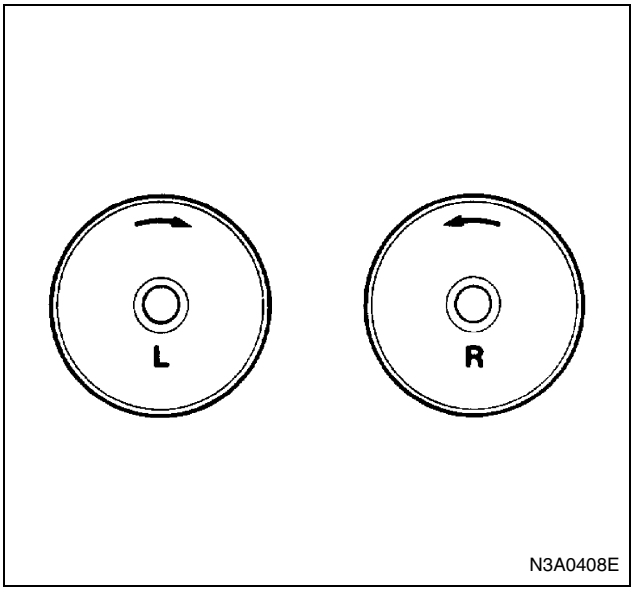
N3A0406E

7. Torsion Bar
8. End Piece
9. Height Control Arm
10. Adjusting Bolt
    - Apply chassis type grease to serrated portions of torsion bar, lower arms, threaded portion of end piece.
    - Make sure the bars are on their correct respective sides.



N3A0407E

- Align the setting marks applied at removal.



- Tighten adjusting bolts to the original portion temporarily.
- Install the outer track rod end to the knuckle. Tighten nuts to specified torque, with just enough additional torque to align cotter pin holes.
  Install new cotter pin.

Tighten:
- Tie rod end nut to 108 N·m (11 kg·m/80 lb·ft)
  - Park the vehicle on a level ground.
  - Move the front of the vehicle up and down several times to settle the suspension.
  - Tighten temporarily tightening bolts and nuts to specified torque.
  - Install the hub and rotor assembly. Refer to “Front Axle”.
  - Install the brake caliper assembly. Refer to “Hydraulic Brakes”.

Tighten:
- Brake caliper bolt to 219 N·m (22.3 kg·m/161 lb·ft)
  - Install front wheel and tire assembly. Refer to “Wheels and Tires” in Section 3E.
  - Adjust the trim height.

Notice:
Adjust the front end alignment. Refer to “Front End Alignment”.

Bleed brakes. Refer to “Brake Bleeding”.

Adjustment of Trim Height
Adjust the trim height by means of adjusting bolt on the height control arms.

Caution:
When adjusting front end alignment, be sure to begin with trim height as trim height adjustment may change other adjusted alignments.

1. Check and adjust the tire inflation pressures.
2. Park the vehicle on a level ground and move the front of the vehicle up and down several times to settle the suspension.
3. Make necessary adjustment with the adjusting bolt on the height control arms.

Trim Height
101.4±5 mm (3.992±0.197 in)

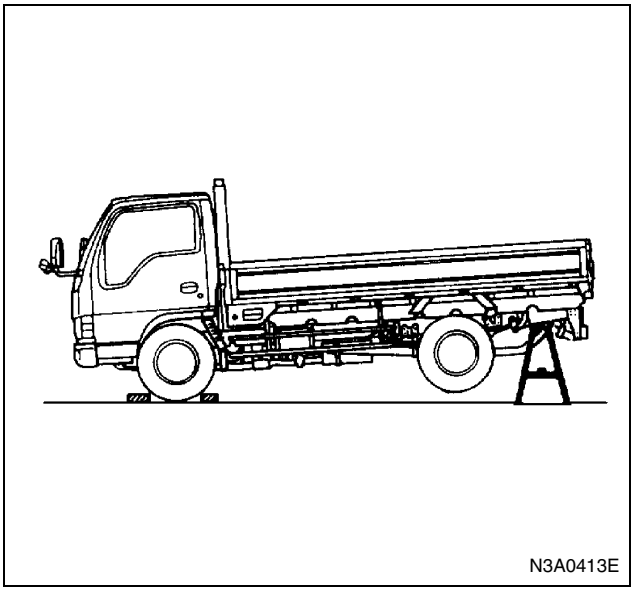
5. Spring pin, nut and washer
6. Leaf spring

Removal

Preparation

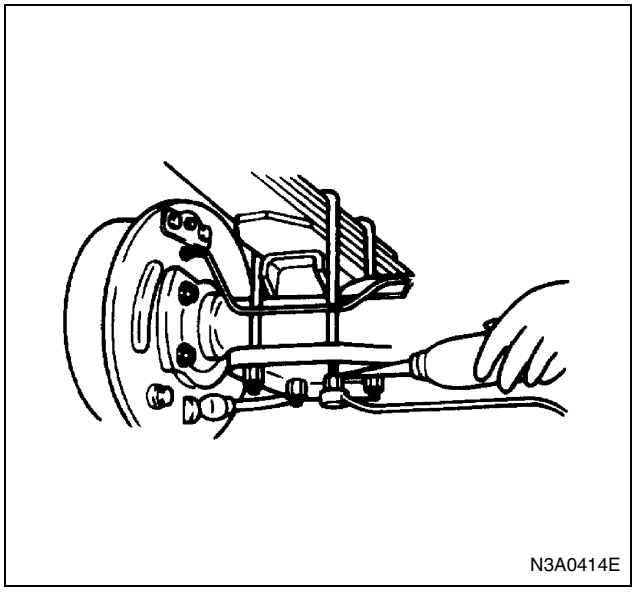
Make the following preparation before removing the leaf spring.

1) Brace the front wheels.
2) Jack up the rear axle until the rear wheels are lifted off the ground and position safety stand under the chassis frame.
   Refer to “Lifting Instruction” in Section 0A for acceptable lifting point and supportable point location.

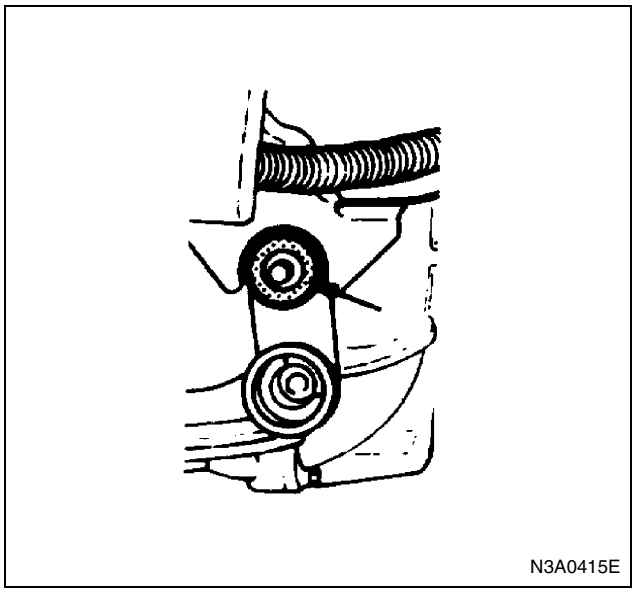


3) Position a garage jack under the rear axle.
4) For the vehicle model with a stabilizer, remove the mounting portion on the axle side of the stabilizer in advance before removing the leaf spring. (Refer to the removal procedure of the stabilizer.)

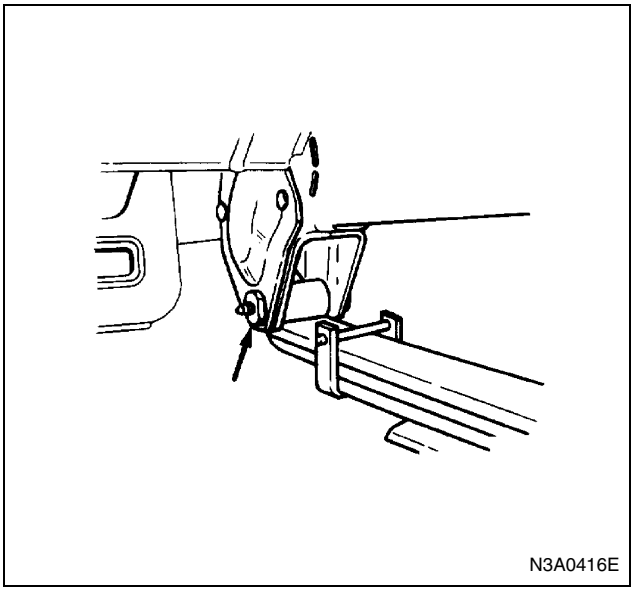
1. Shock Absorber
2. U-bolt, Nut and Washer
   If the U-bolt are heavily rusted, apply a generous amount of oil to the threads before loosening them to prevent seizure.



3. Shackle Pin, Nut and Washer
4. Shackle
   Take out the rubber bushings after removal of the shackle.



5. Spring Pin, Nut and Washer
   Drive out the shackle pin with a hammer using a brass bar after removal of the shackle pin nut.



N3A0416E

6. Leaf Spring
   Lower the garage jack slowly and remove the rear spring assembly. When removing the rear spring assembly, exercise care not to cause damage to the brake flexible hoses. Also, exercise care not to cause the spring to come down.

Installation and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

- Leaf spring assembly
- Clip
- Center bolt
- U-bolt
- Spring pin
- Shackle pin
- Shock absorber
- Helper rubber
- Rubber bushing
- Sub spring stopper rubber
- Helper rubber seat

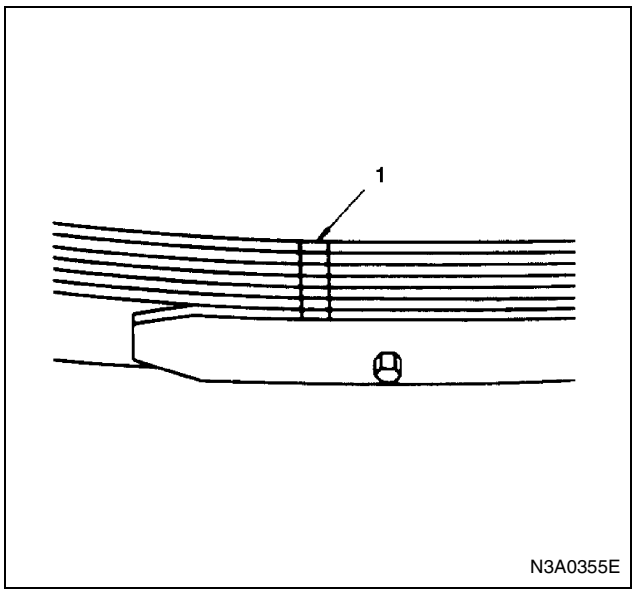
Shock Absorber

1. Inspect for extreme oil leakage. Slight oil leakage is allowed.
2. Inspect for temperature after running. Unchanged temperature indicates deteriorated function.
3. Inspect if large resistance is felt when the shock absorber is expanded and contracted by holding either end, or if play is eliminated after several times of expansion and contraction. The function has deteriorated if the above condition is not observed.
4. Inspect the bushing for wear or deterioration. Replace if abnormality is found.

Leaf Spring Assembly Replacement

- Apply a setting mark (1) across the springs before disassembling the leaf spring assembly.
- Apply grease to both faces of each leaf spring at reassembly.
- Use a bench press for disassembly and reassembly.
- Discard removed center bolt and install a new one.

When replacing the leaf spring assembly, use the leaf spring with the same camber represented by "+, –, ❍" on both right and left sides.



N3A0355E

Center Bolt

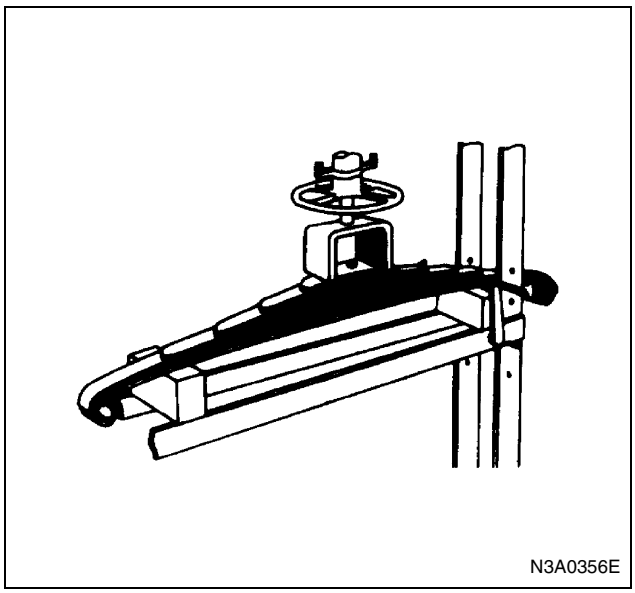
Tighten:

- Center bolt to 39 N·m (4 kg·m/29 lb·ft)

Clip Bolt

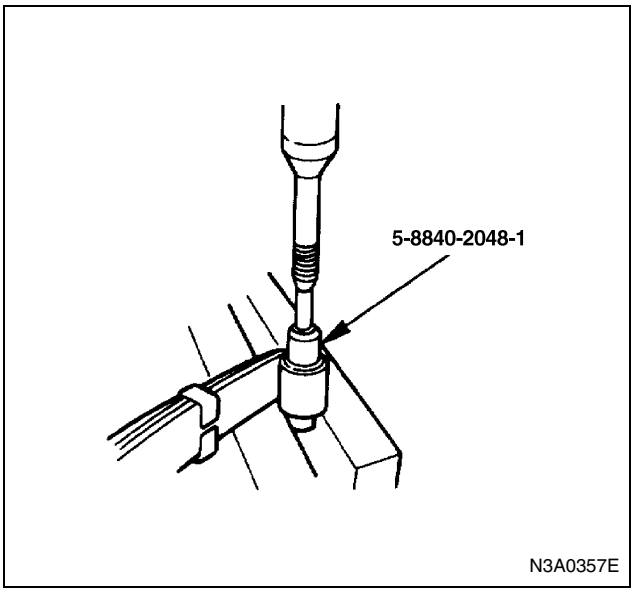
Tighten:

- Clip bolt to 20 N·m (2 kg·m/14 lb·ft)

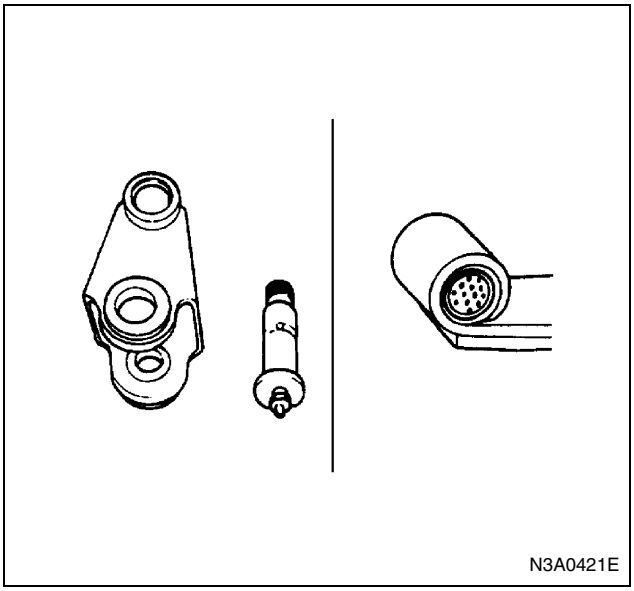


N3A0356E

Bushing Replacement
When replacing bushing, drive out the bushing using a bench press.
Leaf Spring Rubber Bush Remover & Installer: 5-8840-2048-1
Leaf Spring Metal Bush Remover & Installer: 5-8840-2049-1

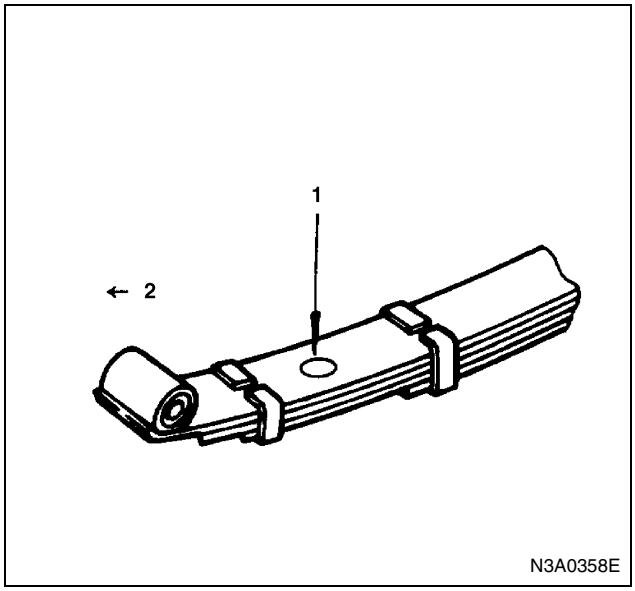


Measurement of Outer Diameter of Spring Pin
Standard: 25 mm (0.98 in)
Limit: 24.7 mm (0.97 in)
Clearance between Shackle Pin and Bushing
Standard: 0.1 mm (0.0039 in)
Limit: 0.5 mm (0.019 in)



Installation

1. Leaf Spring
   Install the leaf spring assembly with the camber mark (1) turned to front side (2) on the rear axle.



2. U-bolt, Nut and Washer
   Position the U-bolts and clamp on the leaf spring assemblies and jack up the rear axle.
   When tightening the nuts, apply oil as necessary to prevent damaging the threads.

Tighten:
- U-bolt nut to
  NQR: 284 N·m (29 kg·m/210 lb·ft)

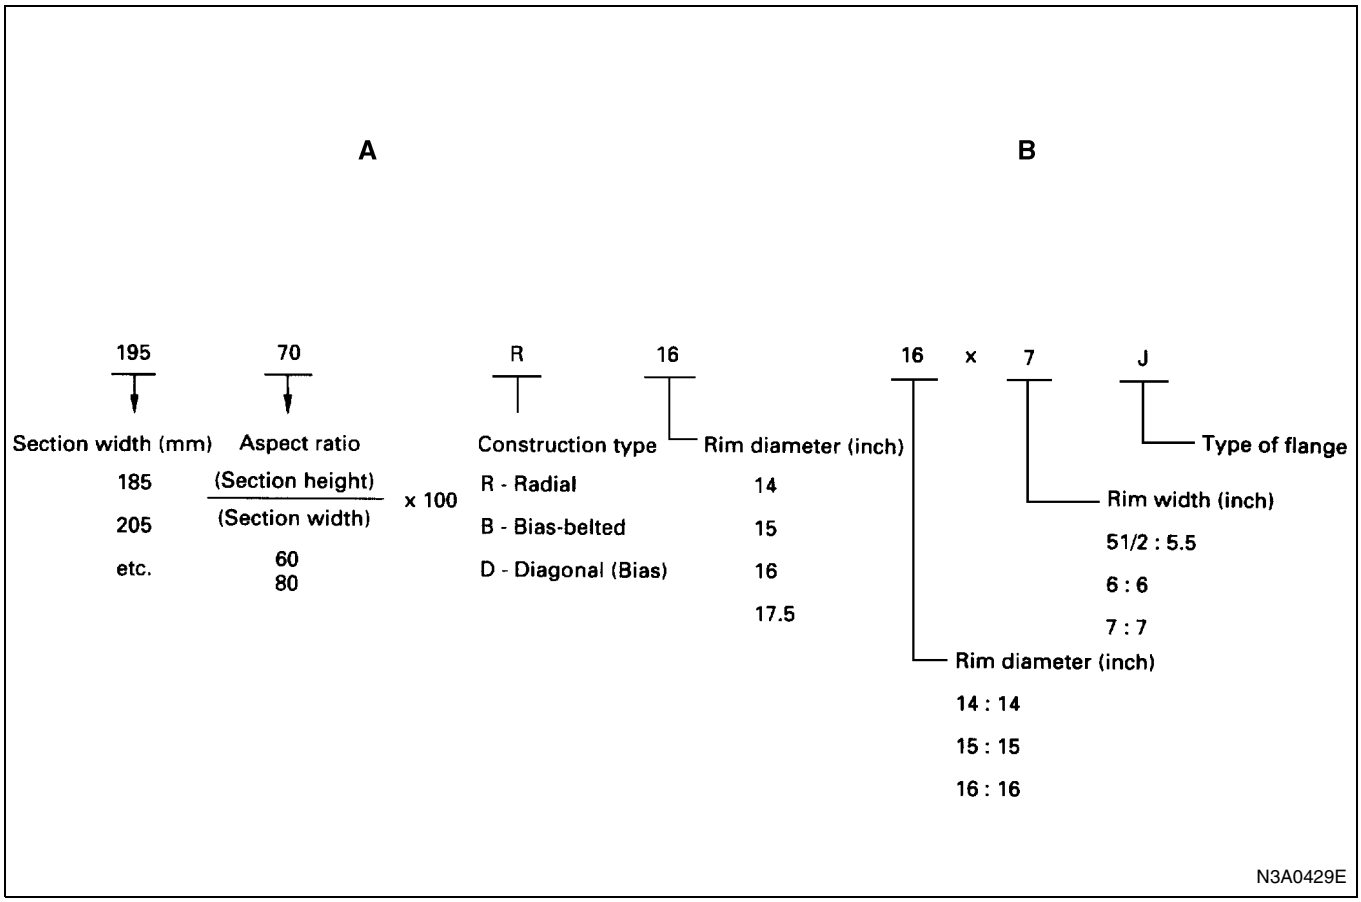
Balancing Wheel and Tire 3E-10

GENERAL DESCRIPTION



Legend

A. Metric tire size format

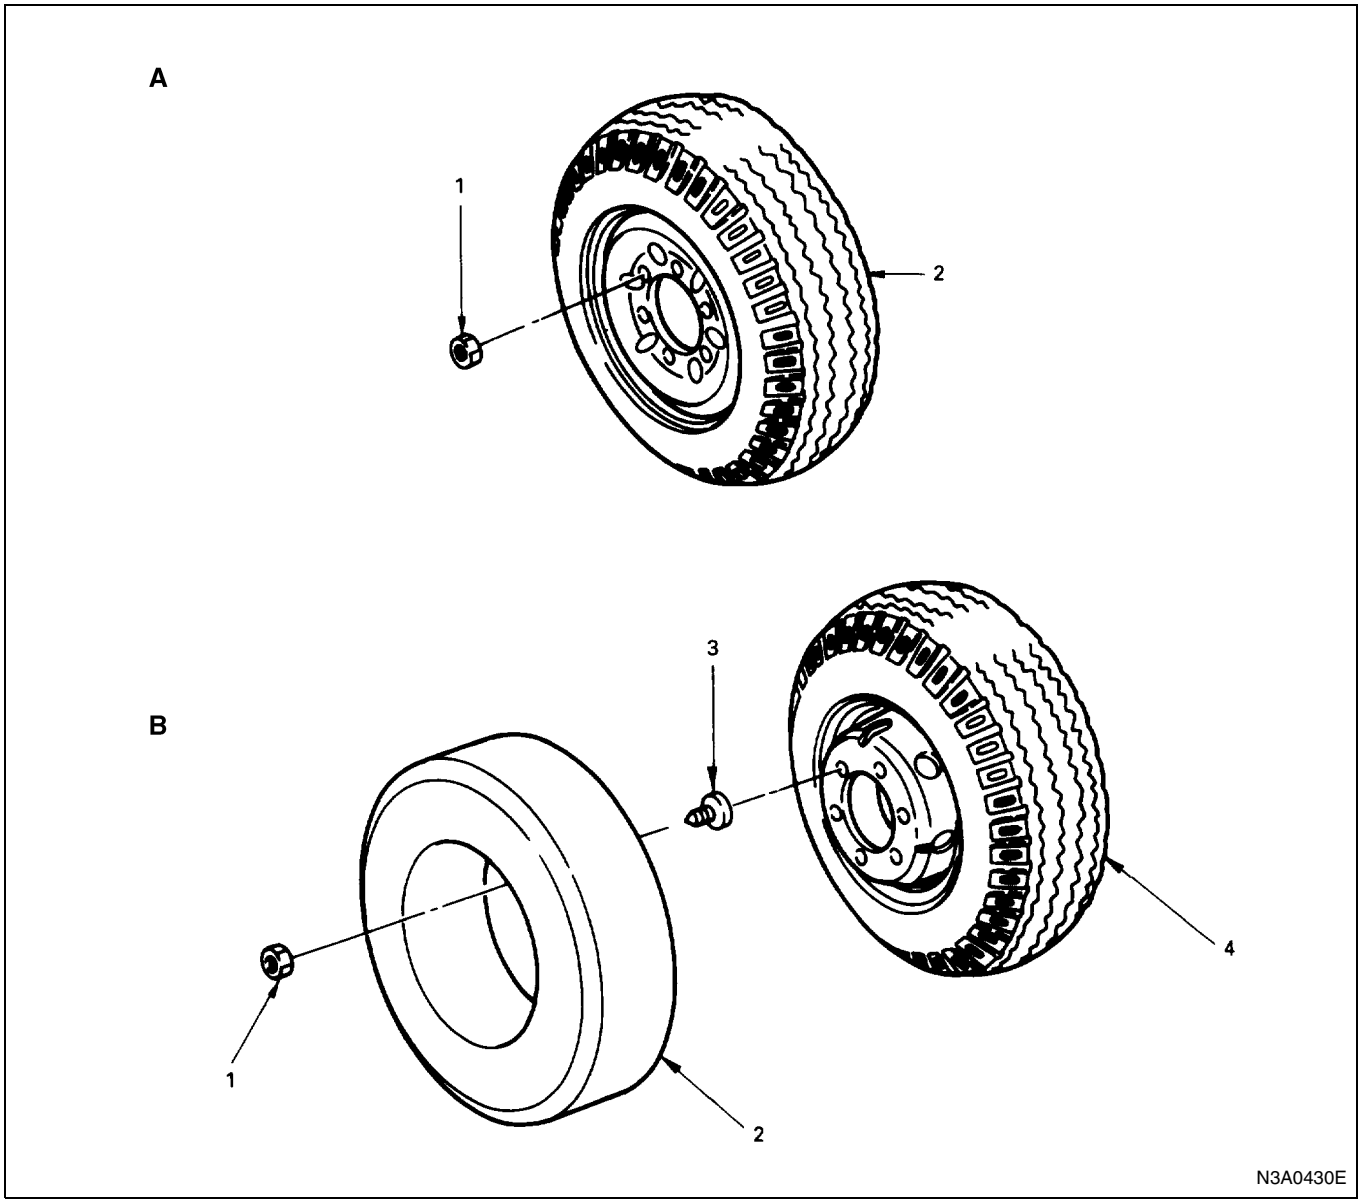
B. Rim size format

Replaced wheels or tires must be equivalent to the original one in load capacity, specified dimension and mounting configuration. Improper size or type may affect bearing life, brake performance, speedometer/ odometer calibration, vehicle ground clearance and tire clearance to the body and chassis.

All models are equipped with metric sized steel belted radial tires. Correction of tire pressures and driving habits have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase premature and uneven wear.

ON-VEHICLE SERVICE

Wheel and Tire Assembly



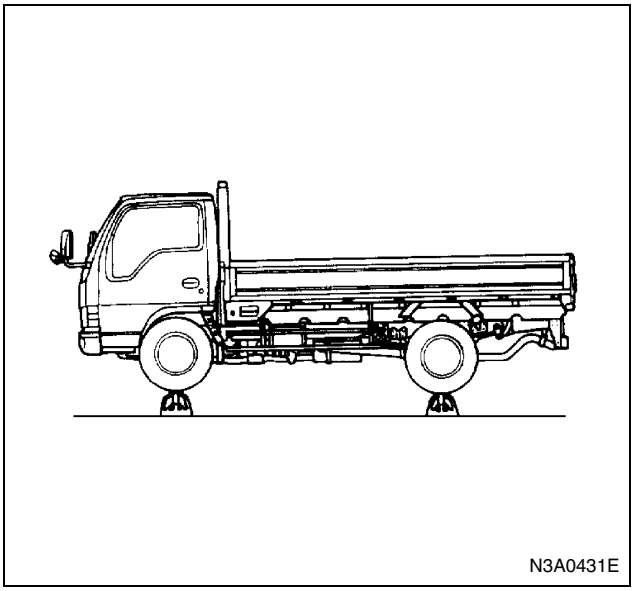
Legend

A. Front tire, Rear single tire
B. Rear dual tire
1. Wheel nut (outer)
2. Wheel and tire assembly (front or outer)
3. Wheel nut (inner)
4. Wheel and tire assembly (inner)

Removal

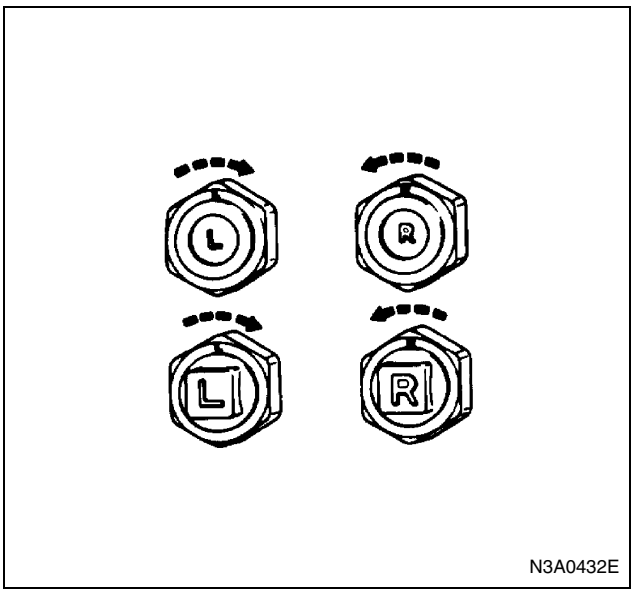
Preparations

- Raise the vehicle and support jack up point with suitable safety stands. Refer to “Lifting Instruction” in Section 0A.



N3A0431E

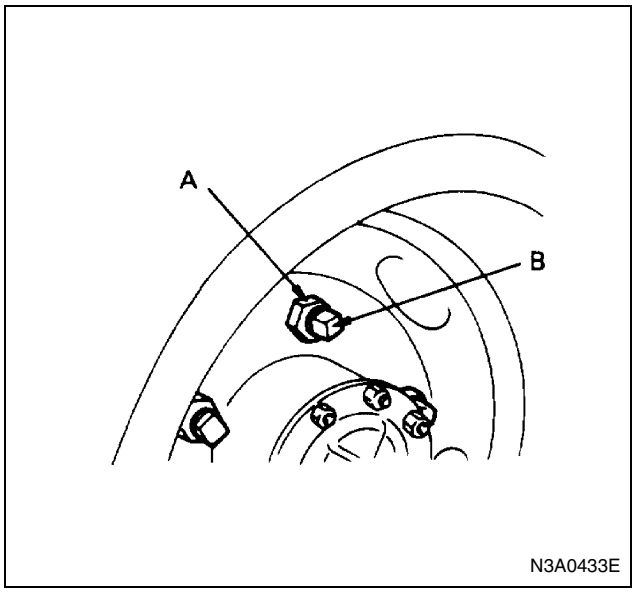
1. Wheel Nut (Outer)
2. Wheel and Tire Assembly (Front or Outer)
3. Wheel Nut (Inner)
4. Wheel and Tire Assembly (Inner)
   Loosen the wheel nuts with the wheel nut wrench.
   The wheel nuts on the right side wheels have right-hand threads and the wheel nuts on the left side wheels have left-hand threads.



N3A0432E

To change the inner wheel on either side of the rear of the vehicle:

1) Completely loosen the six-sided outer wheel nut (A) with the wheel wrench.
2) Using the opposite side of the wheel wrench, unscrew the four-sided inner wheel nut (B) approximately one full turn.
3) Repeat this procedure with the remaining outer and inner wheel nuts.



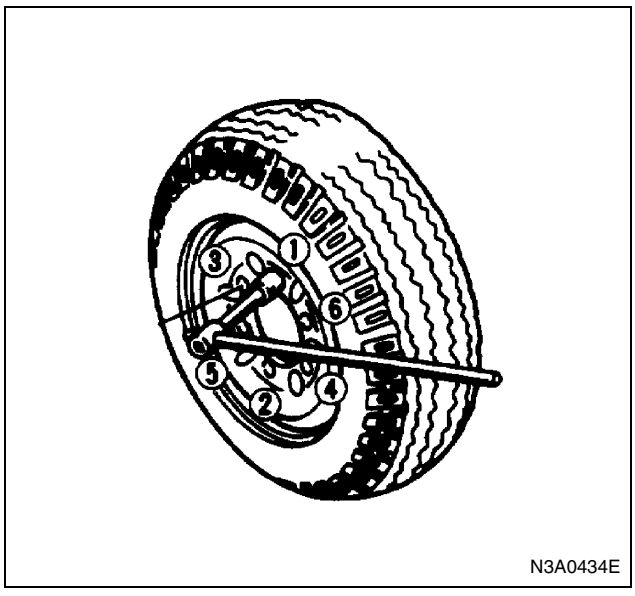
N3A0433E

Installation

1. Wheel and Tire Assembly (Inner)
2. Wheel Nut (Inner)
3. Wheel and Tire Assembly (Front or Outer)
4. Wheel Nut (Outer)
   Tighten wheel nuts in numerical sequence.

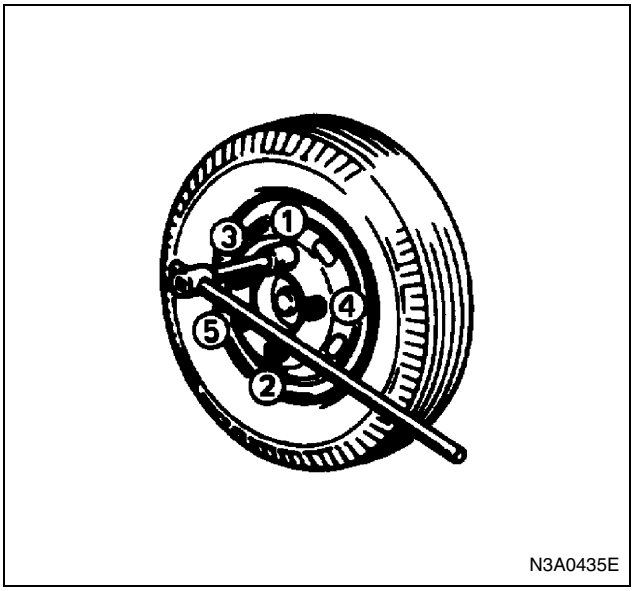
Tighten:

- Front wheel nut to
  NHR, NKR Single tire, NKR Flat low: 167 N·m (17 kg·m/123 lb·ft)
  Except above models: 441 N·m (45 kg·m/325 lb·ft)
- Rear wheel nut to
  NHR, NKR Single tire: 167 N·m (17 kg·m/123 lb·ft)
  NHR Dual tire, NKR Flat low: 294 N·m (30 kg·m/217 lb·ft)
  Except above models: 441 N·m (45 kg·m/325 lb·ft)
  - 6 studs

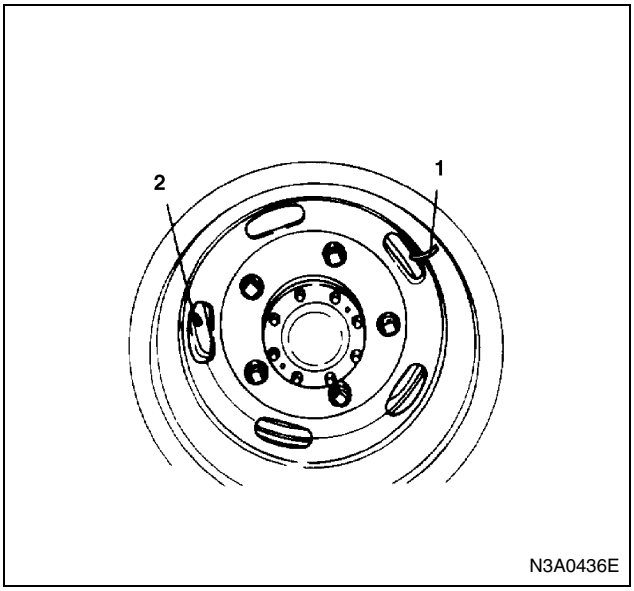


N3A0434E

- 5 studs



Notice:
When installing the rear wheels, take care so that the dual tires' valves (1) (2) are dislocated or that the inner valve (2) will not be hidden.



UNIT REPAIR

Tires

Replacement

When replacement is necessary, the original metric tire size should be used. Most metric tire sizes do not have exact corresponding alphanumeric tire sizes. It is recommended that new tires be installed in pairs on the same axle, if necessary to replace only one tire, it should be paired with tire having the most tread, to equalize braking traction.

Caution:
Do not mix different types of tires such as radial, bias and bias-belted tires except in emergencies, because car handling may be seriously affected and may result in loss of control.

Tire Dismounting

Remove valve cap on valve stem and deflate the air.
Then use a tire changing machine to mount or dismount tires. Follow the equipment manufacturer's instruction. Do not use hand tools or tire lever alone to change tires as they may damage the tire beads or wheel rim.

Tire Mounting

Rim bead seats should be cleaned with a wire brush or coarse steel wool to remove lubricants and light rust. Before mounting a tire, the bead area should be well lubricated with an approved tire lubricant.
After mounting, inflate the tire to 196kPa (2 kg/cm^2, 28 psi) so that beads are completely seated. Inflate the air to specified pressure and install valve cap to the stem.

WARNING:
NEVER STAND OVER TIRE WHEN INFLATING. BEAD MAY BREAK WHEN BEAD SNAPS OVER RIM'S SAFETY HUMP AND CAUSE SERIOUS PERSONAL INJURY.

NEVER EXCEED SPECIFIED PRESSURE WHEN INFLATING. IF SPECIFIED PRESSURE WILL NOT SEAT BEADS, DEFLATE, RE-LUBRICATE AND RE-INFLATE.

OVER INFLATION MAY CAUSE THE BEAD TO BREAK AND CAUSE SERIOUS PERSONAL INJURY.

Tire Repair

There are many different materials on the market used to repair tires.
Manufacturers have published detailed instructions on how and when to repair tires. These instructions can be obtained from the tire manufacturer if they are not included with the repair kit.

Tire Size and Tire Inflation Pressure

	Tire size		Tire inflation pressure kPa (kg/cm^2, psi)

Wheels

Replacement

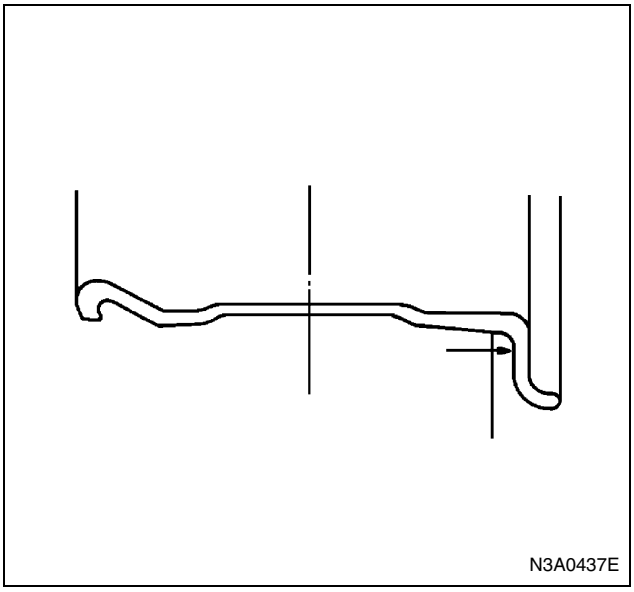
Damaged wheels and wheels with excessive run-out must be replaced.

Wheel Run-out at Rim

1.5 mm (0.059 in) or less

Caution:

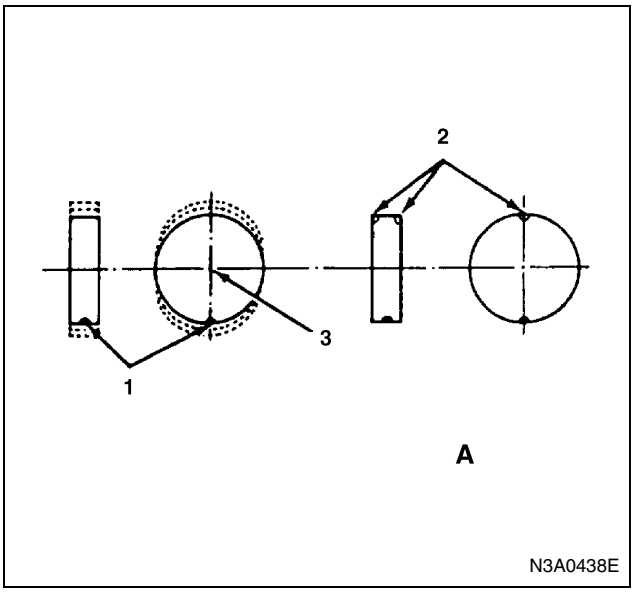
Wheel repairs that use welding, heating or preening are not permitted. Replace wheel lug nuts if they are bent, dented, have excessive lateral or radial run-out, leak air through welds, have elongated bolt holes, will not stay tight, or if they are heavily rusted.



N3A0437E

General Balance Procedure

Deposits of mud, etc. must be cleaned from the inside of the rim.
The tire should be inspected for the following: match mount paint marks, bent rims, bulges, irregular tire wear, proper wheel size and inflation pressure. Then balance according to the equipment manufacturer's recommendations.
There are two types of wheel and tire balance.
Static balance is the equal distribution of weight around the wheel.
Assemblies that are statically unbalanced cause a bouncing action called tramp. This condition will eventually cause uneven tire wear.

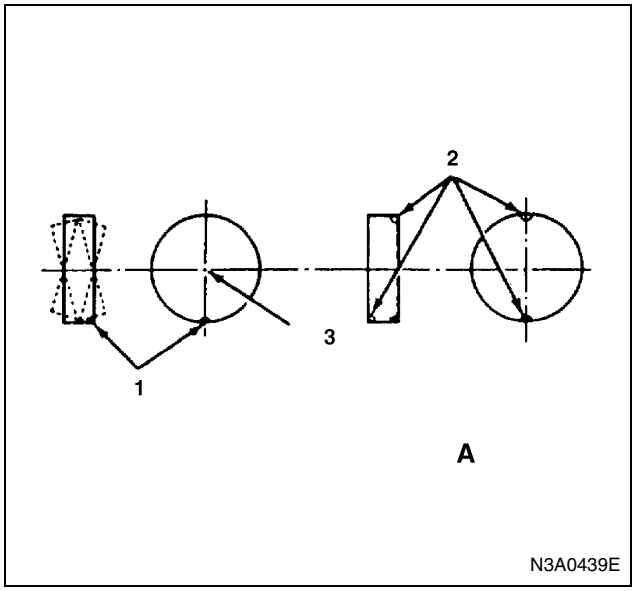


N3A0438E

Legend

A. Corrective weights
1. Heavy spot wheel tramp
2. Add balance weights here
3. Center line of spindle

Dynamic balance is the equal distribution of weight on each side of the wheel center-line, so when the tire spins, there is no tendency for the assembly to move from side to side. Assemblies that are dynamically unbalanced may cause shimmy.



N3A0439E

Legend

A. Corrective weights
1. Heavy spot wheel shimmy
2. Add balance weights here
3. Center line of spindle

WARNING:
STONES SHOULD BE REMOVED FROM THE TREAD TO AVOID OPERATOR INJURY DURING SPIN BALANCING AND TO OBTAIN A GOOD BALANCE.

Balancing Wheel and Tire

On-Vehicle Balancing

On-Vehicle balancing methods vary with equipment and tool manufacturers. Be sure to follow each manufacturer's instructions during balancing operation.

Off-Vehicle Balancing

Most electronic off-vehicle balancers are more accurate than the on-vehicle spin balancers. They are easy to use and give a dynamic balance. Although they do not correct for drum or disc unbalance (as on vehicle spin balancing does), they are very accurate.

NOTICE

Before using this Workshop Manual to assist you in performing vehicle service and maintenance operations, it is recommended that you carefully read and thoroughly understand the information contained in Section-0A under the headings "GENERAL REPAIR INSTRUCTIONS" and "HOW TO USE THIS MANUAL".

All material contained in this Manual is based on latest product information available at the time of publication.
All rights are reserved to make changes at any time without prior notice.

Applicable Model:

N-Series

This manual is applicable to 2005 year model.

THIS MANUAL INCLUDES THE FOLLOWING SECTIONS:

SECTION No.	CONTENTS
00	SERVICE INFORMATION
3A	FRONT END ALIGNMENT
3B1	POWER STEERING
3B2	MANUAL STEERING
3B3	STEERING LINKAGE
3B4	STEERING COLUMN
3C	FRONT SUSPENSION
3D	REAR SUSPENSION
3E	WHEELS AND TIRES

TROUBLESHOOTING

Propeller Shaft

PROBLEM	POSSIBLE CAUSE	CORRECTION
Noises from Propeller Shaft	1. Worn spline yoke. 2. Worn or stuck spider bearing. 3. Worn center bearing.	1. Replace the spline yoke. 2. Replace the center bearing. 3. Replace the center bearing.
Vibration from Propeller Shaft	1. Incorrect shaft run-out. 2. Out of shaft balance. 3. Stuck spline yoke.	1. Replace the propeller shaft. 2. Adjust the shaft balance. 3. Replace the spline yoke.

Rear Axle and Front Driving Axle

PROBLEM	POSSIBLE CAUSE	CORRECTION
Oil Leak at Front Axle or Rear Axle	1. Worn or defective oil seal. 2. Axle housing cracked.	1. Replace the oil seal. 2. Repair or replace.
Oil Leak at Pinion Shaft	1. Too much gear oil. 2. Oil seal worn or defective. 3. Pinion flange loose or damaged.	1. Correct the oil level. 2. Replace the oil seal. 3. Tighten or replace.
Noises in Front Axle or Rear Axle	1. Insufficient gear oil. 2. Wrong or poor grade gear oil. 3. Drive pinion to ring gear backlash incorrect. 4. Worn or chipped ring gear, pinion gear or side gear. 5. Pinion shaft bearing worn. 6. Wheel bearing worn. 7. Differential bearing loose or worn.	1. Replenish the gear oil. 2. Replace the gear oil. 3. Adjust the backlash. 4. Replace the ring gear, pinion gear or side gear 5. Replace the pinion shaft bearing. 6. Replace the wheel bearing. 7. Tighten or replace.

MAIN DATA AND SPECIFICATIONS

Propeller Shaft

		NHR55, 69	NKR55	NKR66, 71, 77 NPR66, 70, 71, 77 NQR66, 71, NPS71	NQR70, 75 NPR75 NPS75
Bearing retention method		Inside snap ring		Outside snap ring	
Spider length	mm (in)	69 (2.72)		85 (3.35) 95 (3.74) <for Taiwan, Australia and GCC>	96 (3.780)
Spider outside dia.	mm (in)	18.46 (0.73)		21.94 (0.86)	23.02 (0.9065)
Tube-outside dia. diameter × thickness	mm (in)	68.9 × 2.0 (2.71 × 0.08)		82.6 × 2.3 (3.25 × 0.09)	90 × 3.2 (3.54 × 0.13)
Flange bolt size		M10		M12	M12
Flange bolt P.C.D.	mm (in)	85 (3.35)		100 (3.94)	110 (4.33)

Rear Axle

		Vehicle series			
		NHR55, 69		NKR55, 69 (For general export; Turkey, Chile)	
		Single	Dual Small	Single	Dual Small (For Turkey)
Rear axle type		Banjo semi-floating	Banjo full floating		
Gear type		Hypoid			
Number of differential pinion		4			
Ring gear pitch diameter	mm (in)	244 (9.6)			
Amount of hub grease (each wheel)	g (oz)	80 (2.8)	285 (10.1)	280 (9.9)	285 (10.1)
Oil capacity	lit (US/Imp qt)	2.7 (2.9/2.4)			

	Vehicle series

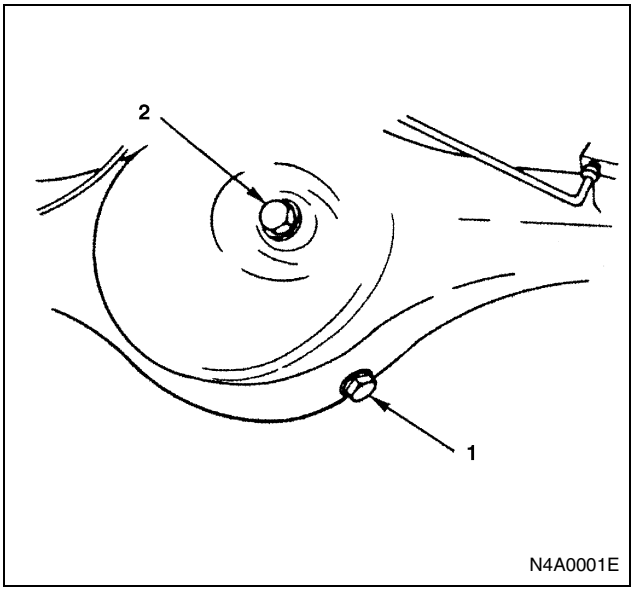
FREE WHEEL HUB							
Clearance between the Free Wheeling Hub Body and the Snap Ring	mm (in)	0-0.5 (0-0.02)			—		

SERVICING

Change The Rear Differential Gear Oil

1. Remove the drain plug (1) and filler plug (2) and, drain the gear oil.



2. Tighten the drain plug to specified torque.

Tighten:
Drain plug to 78 N·m (8.0 kg·m / 57 lb·ft)

3. Fill the rear axle case with hypoid gear lubricant, to just below the filler hole.

Rear Axle Case Oil Capacity	L (US/Imp qt)
244 mm Diff.	2.7 (2.9/2.4)
292 mm Diff.	3.0 (3.2/2.6)
320 mm Diff.	(A) 3.4 (3.6/3.0) / (B) 4.3 (4.5/3.8) / (C) 5.2 (5.5/4.6)

A: Except Straight Frame model
B: For Straight Frame model
C: For Straight Frame model, Colombia

Notice:
Limited Slip Differential (LSD)-Friction Type Model:

Use GL-5 LSD gear lubricant together with LSD Lubricant Additive (ISUZU part No. 8-01052-358-0, GM part No. #1052358) or equivalent.

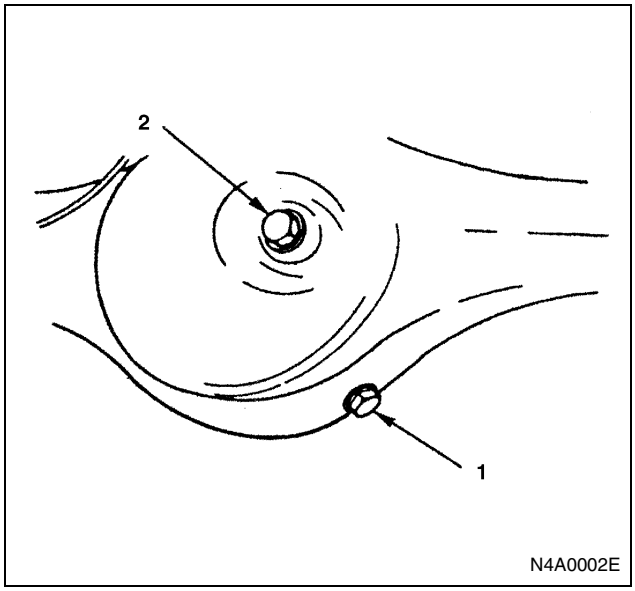
Quantity
LSD Lubricant additive, 4 oz (112 g)

4. Tighten the filler plug to specified torque.

Tighten:
Filler plug to 78 N·m (8.0 kg·m / 57 lb·ft)

Change The Front Differential Gear Oil

1. Remove the drain plug (1) and filler plug (2), and drain the gear oil.



2. Tighten the drain plug to specified torque.

Tighten:
Drain plug to 83 N·m (8.5 kg·m / 61 lb·ft)

3. Fill the front axle case with hypoid gear lubricant, to just below the filler hole.

Front axle case oil capacity, 2.7 Liters (2.9 US / 2.4 Imp·qt)

4. Tighten the filler plug to specified torque.

Tighten:
Filler plug to 83 N·m (8.5 kg·m / 61 lb·ft)

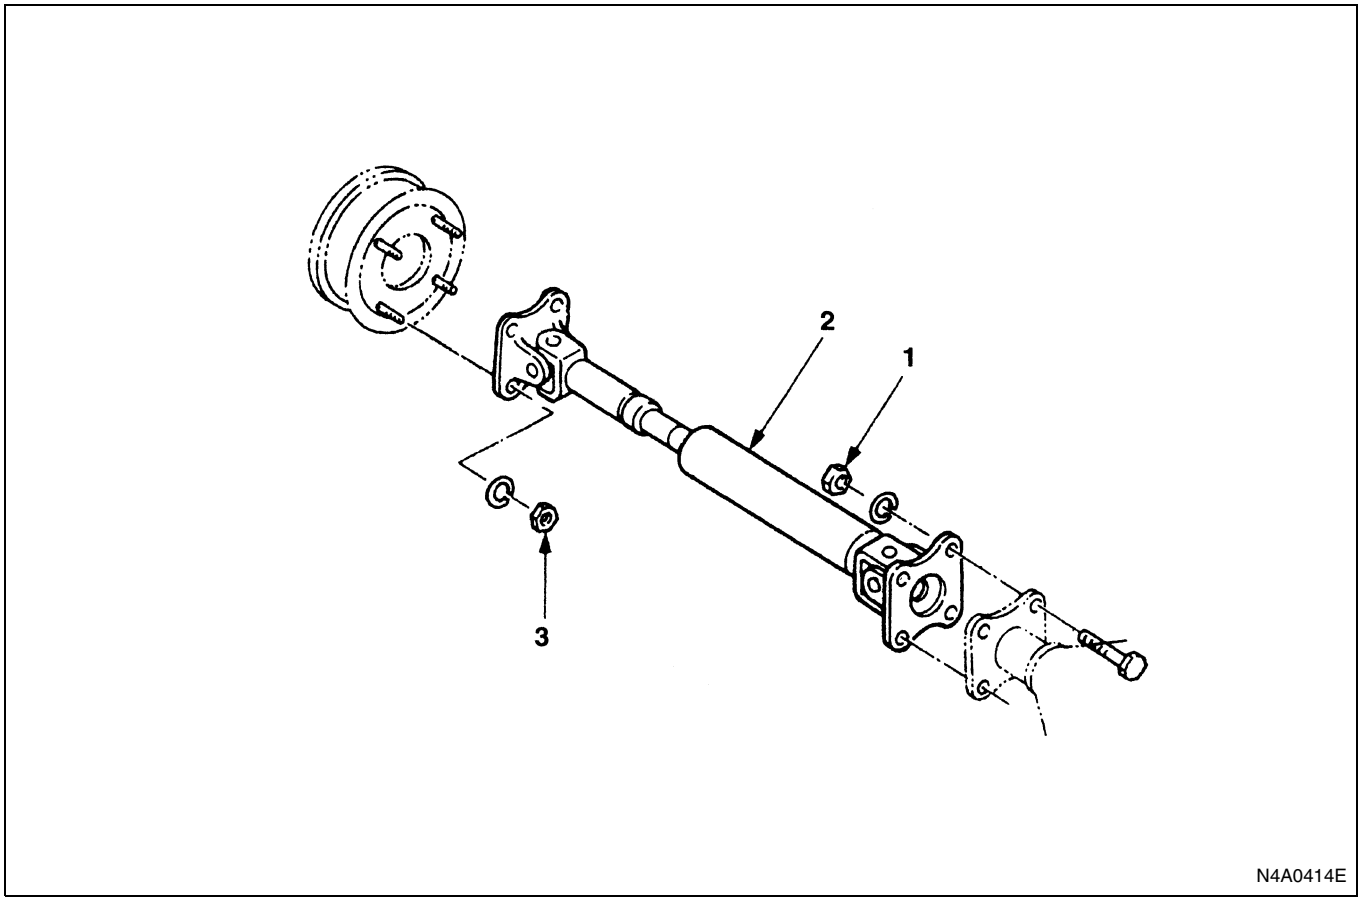
Rear Drive Propeller Shaft (Short Wheel Base Models)



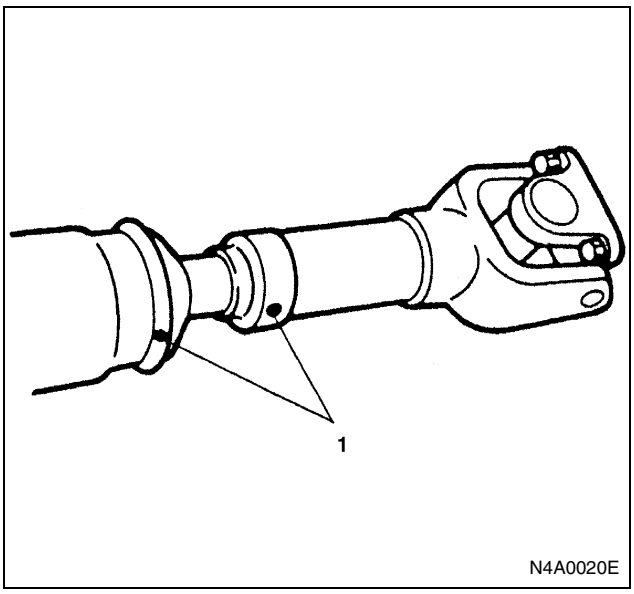
Legend

1. Differential side nut
2. Propeller shaft assembly
3. Transmission side nut

Removal

Preparation:

- Since the propeller shaft assembly is carefully balanced, a setting mark (1) should be applied to the joints (1st propeller shaft and parking brake drum, 1st propeller shaft and 2nd propeller shaft, 2nd propeller shaft and final drive flange), before removal in to original position.



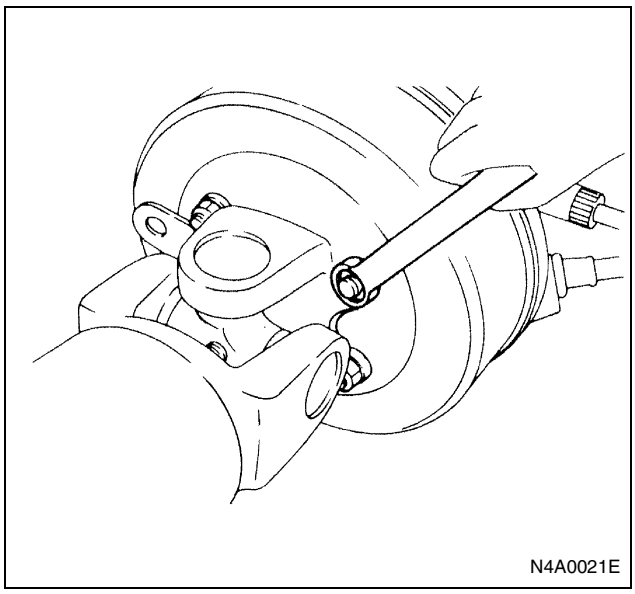
1. Differential Side Nut
2. Center Bearing Side Nut
3. 2nd Propeller Shaft
4. Transmission Side Nut
5. Center Bearing Bracket
6. 1st Propeller Shaft

Installation

1. 1st Propeller Shaft
2. Center Bearing Bracket
3. Transmission Side Nut

Tighten:
Transmission side nut to

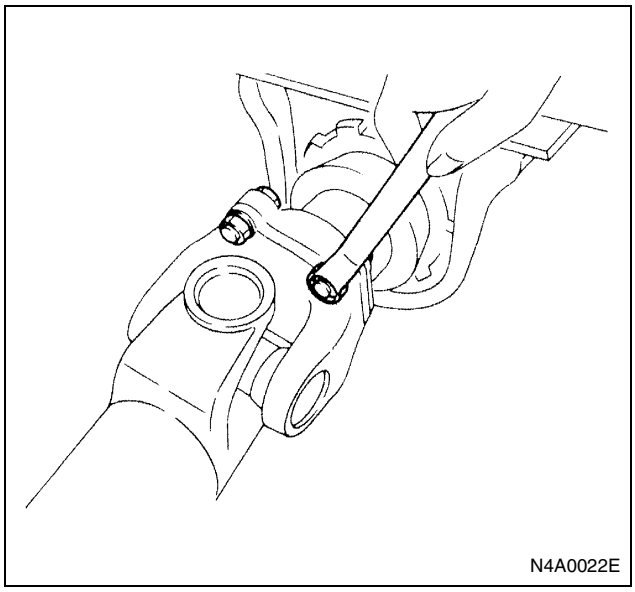
- M10: 63 N·m (6.4 kg·m / 46 lb·ft)
- M12: 103 N·m (10.5 kg·m / 76 lb·ft)



4. 2nd Propeller Shaft

Tighten:
Center bearing side nut to

- M10: 63 N·m (6.4 kg·m / 46 lb·ft)
- M12: 103 N·m (10.5 kg·m / 76 lb·ft)



5. Center Bearing Side Nut

Tighten:
Center bearing bracket bolt to 40 N·m (4.1 kg·m / 30 lb·ft)

6. Differential Side Nut

Tighten:
Differential side nut to
- M10: 63 N·m (6.4 kg·m / 46 lb·ft)
- M12: 103 N·m (10.5 kg·m / 76 lb·ft)

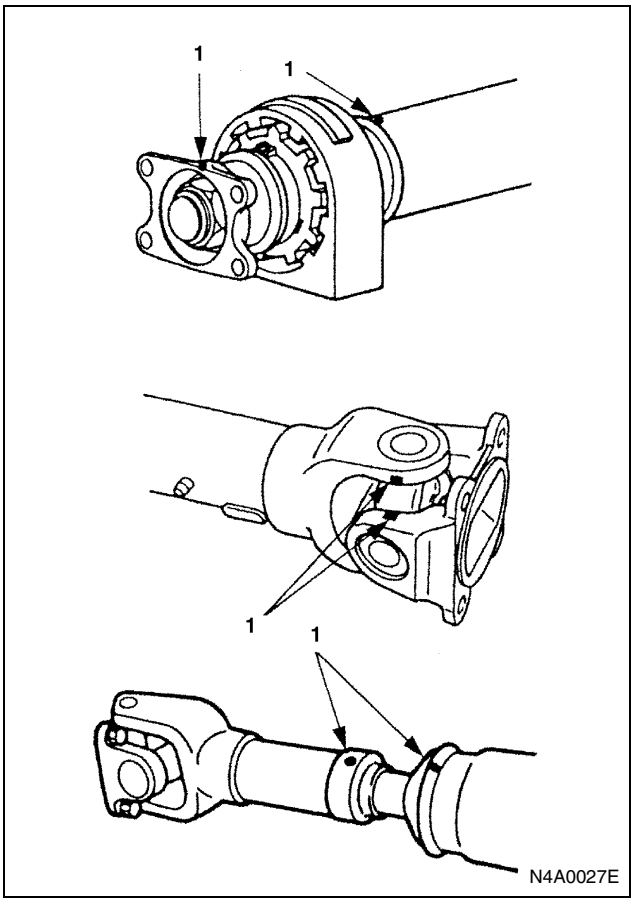
1. Grease fitting
2. Snap ring
3. Needle roller bearing
4. Spider
5. Flange yoke

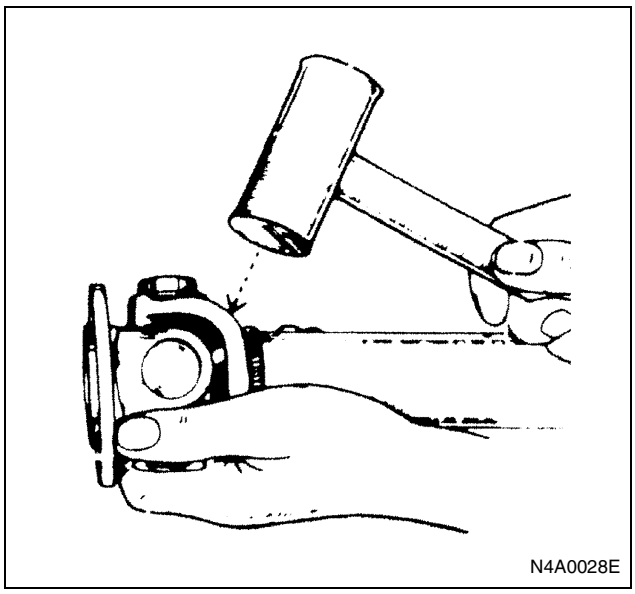
Disassembly

Preparation:
Since the propeller shaft assembly is carefully balanced, a setting mark (1) should be applied to the joints, before disassembly.



1. Grease Fitting
2. Snap Ring
3. Needle Roller Bearing

Tap out the bearing by applying a shock to the shoulder of the yoke, using a copper hammer.
Remove the needle roller bearings remaining in position by tapping lightly on the spider.
Remove the remaining bearings in the similar manner.



4. Spider
5. Flange Yoke

Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Visual Check

Inspect following parts for wear, damage or other abnormal conditions.

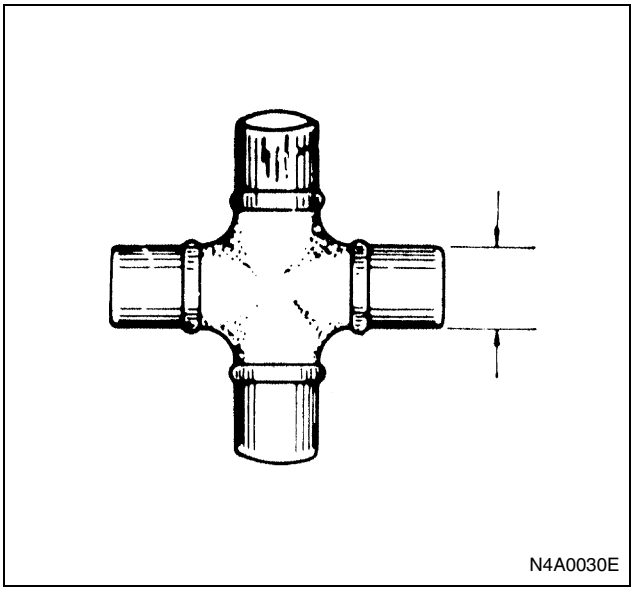
Notice:
When any part of the journal assembly requires replacement, be sure to replace the entire assembly.

- Spider
- Needle roller bearing
- Yoke
- Flange
- Center bearing
- Cushioning rubber
- Bracket

Outside Diameter of Spider Pins

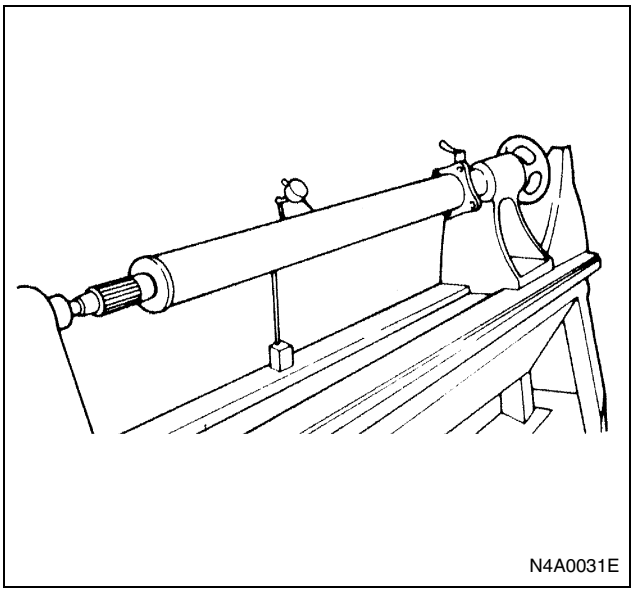
mm (in.)

	Standard	Limit
NHR, NKR55	18.46 (0.73)	18.36 (0.72)
NKR 66,71,77 NPR 66, 70,77 NQR66, 71,NPS 71	21.94 (0.86)	21.84 (0.8598)
NQR70, 75 NPR75 NPS75	24.00 (0.945)	23.9 (0.941)



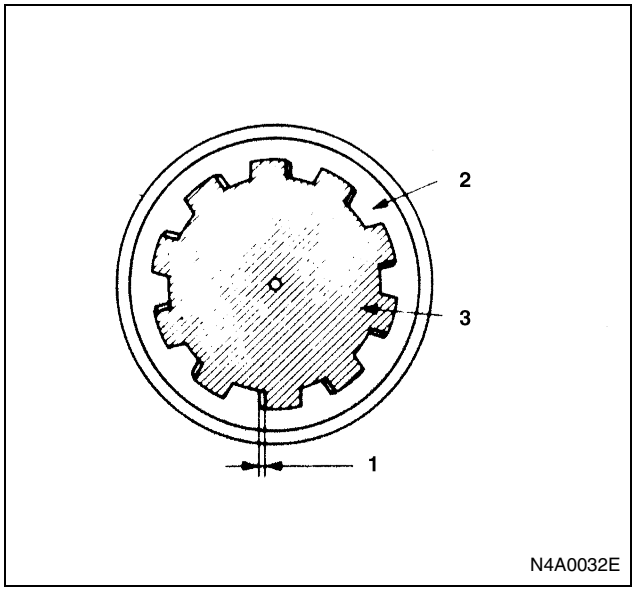
N4A0030E

Propeller Shaft Run-Out
Support the propeller shaft at its ends and check for run-out by holding the probe of a dial indicator agains the center part of the shaft.
If the amount of run-out it beyond the standard value for assembly, correct with a bench press or replace with a new one.
Standard: 0.5 mm (0.02 in) or less
Limit: 1.0 mm (0.039 in)



N4A0031E

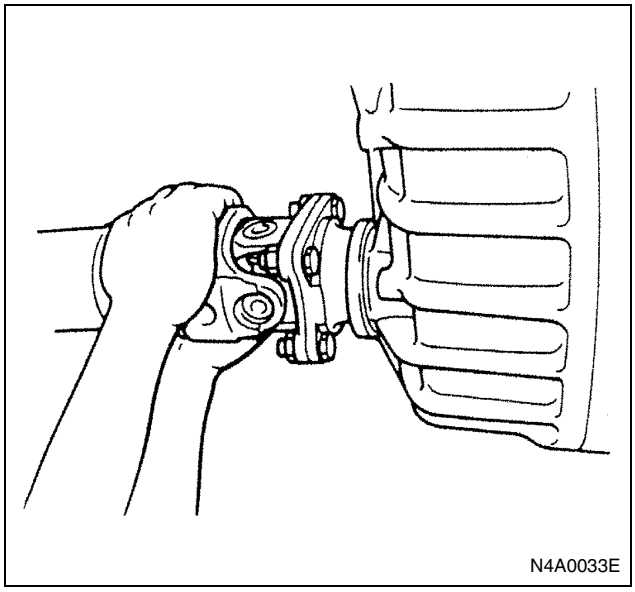
Play in Splines in Normal Direction of Rotation
Check the amount of play (1) in the sleeve yoke (2) and propeller shaft (3) splines in direction of rotation using a pointed feeler gauge.
Standard: 0.1 mm (0.0039 in)
Limit: 0.3 mm (0.012 in)



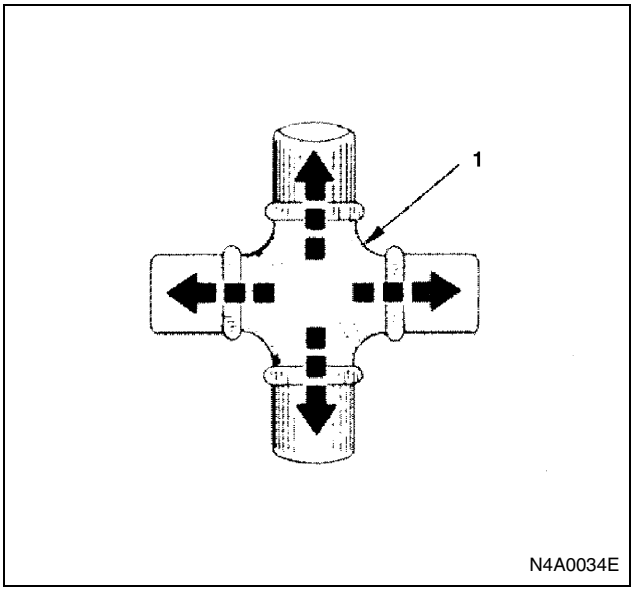
N4A0032E

Checking of Play of Double Cardan Joint (Front Propeller Shaft Only)

1. Check the double cardan joint for play in the direction of the spider (1) shaft. When there is an excessive play found, replace it as a propeller shaft assembly.

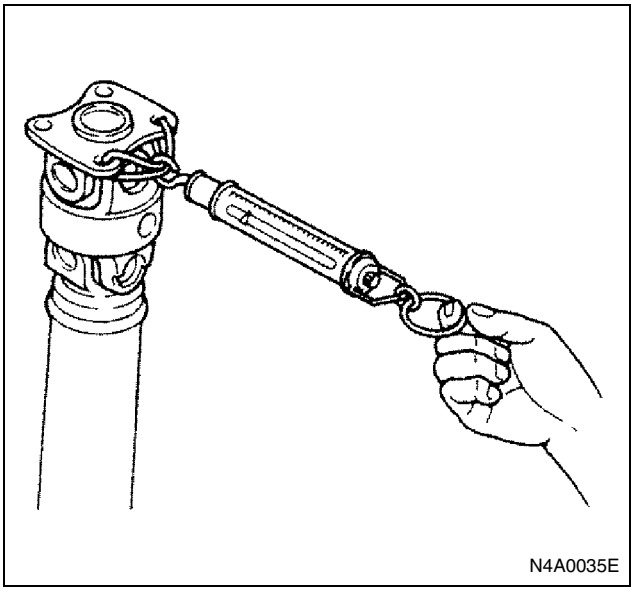


N4A0033E



Preload Checking of The Double Cardan Joint (Front Propeller Shaft Only)

1) As shown in the illustration, tie a wire firmly by passing it through the bolt holes which are in the same direction with the flange yoke shaft.



2) Hook a spring balance at the center of the wire, and pull the spring balance in the direction of a right angle.
3) Measure the value and check if the reading of the spring balance is within the specified value at the moment when the flange starts to move.

Preload, 52 N (5.3 kg / 11.7 lb)

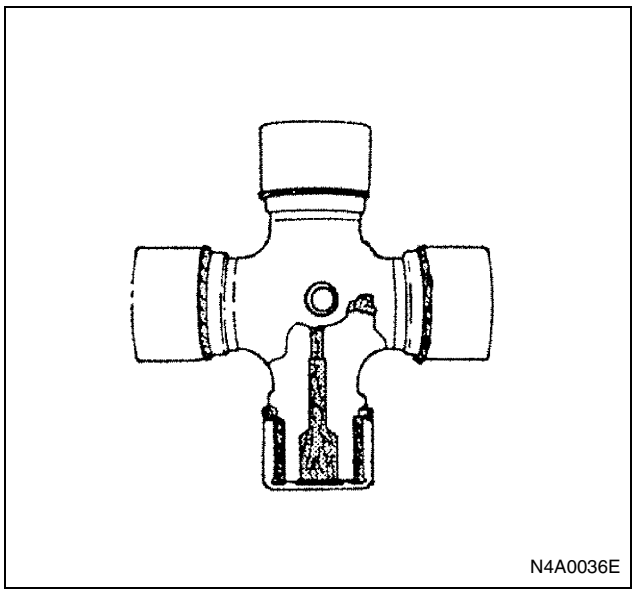
Lubrication

Universal Joints

Universal joints are drilled and provided with a lubrication fitting through which the lubricant travels to all four bearing caps, direct to the needle bearing.

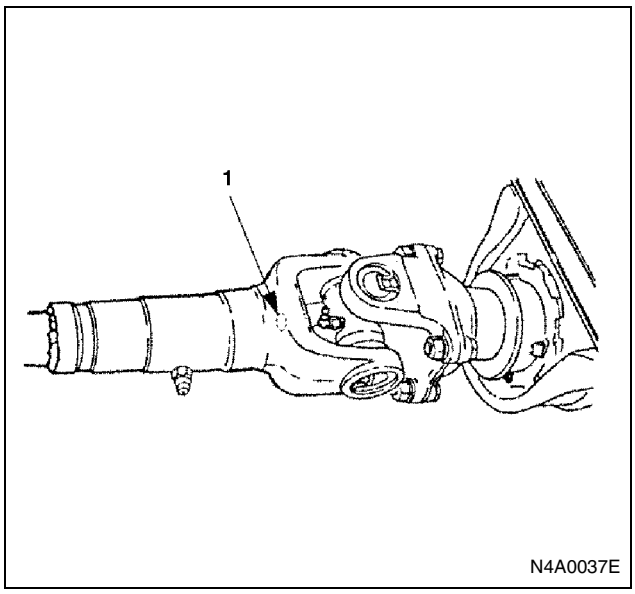
Needle bearings are protected against lubricant leakage and the entrance of foreign matter by seals.

1) Lubricate with a chassis lubricant.
2) When greasing the joint, a flow of grease at all four trunnion seals must be visible to ensure lubrication of the U-joint. If grease does not appear at all four trunnion seals, the universal joint should be rotated while applying lubricant under pressure to relieve any air lock inside the joint which would prevent lubricant from reaching the bearing area.



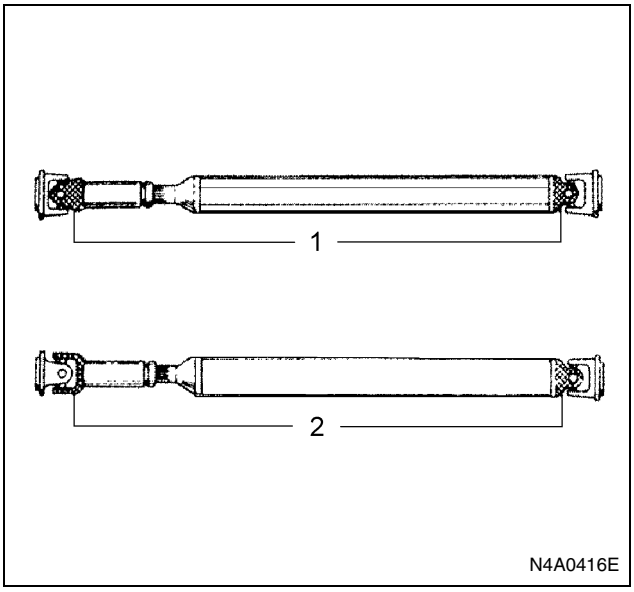
Sliding Spline Sections

Apply grease gun pressure to the lubrication fitting until lubricant appears at the pressure relief hole (1) as shown in the figure. Now cover the pressure relief hole with your finger and continue to apply pressure until grease appears at the sleeve yoke seal as shown in the figure.



Reassembly

1. Flange Yoke
   The flange yoke at end of the propeller shaft should be in alignment with the spline yoke as illustrated.
   The direction of the flange yoke at each end of the propeller shafts (setting mark) are in alignment.



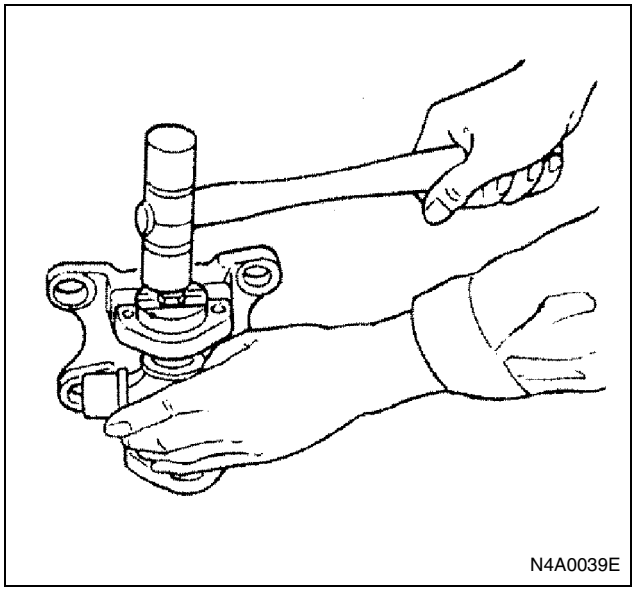
Legend
1. Correct
2. Incorrect

2. Spider
3. Needle Roller Bearing
   Apply MoS_2 grease to lip of the oil seal and needle roller bearing.

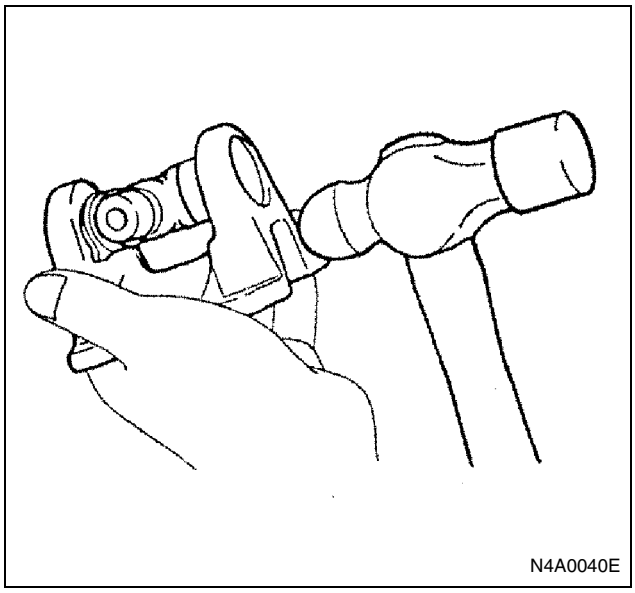
Notice:
Excessive greasing could make the bearing difficult to install or make accurate data unobtainable for the selection of the right snap ring.

Assemble the spider to the flange yoke. Using the spider as a guide, install the needle roller bearing into the hole in the arm of the flange yoke by press or tapping with a soft-faced hammer.

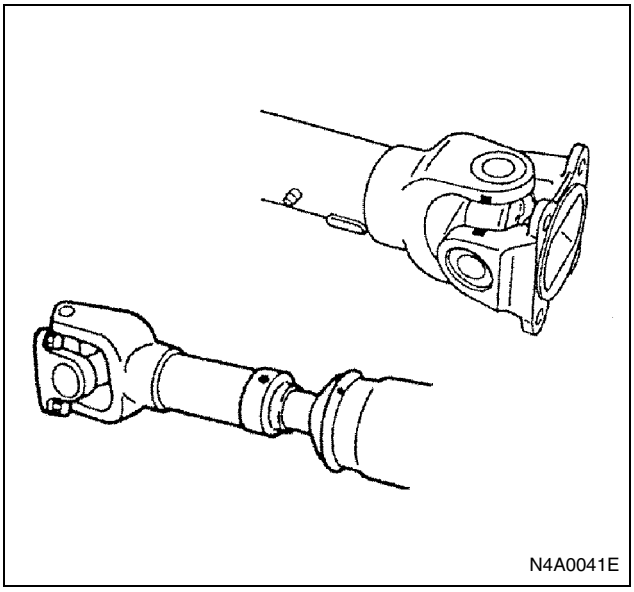
Caution:
- The needle roller bearing cannot be installed smoothly if is set at an incorrect angle with the flange.
- Excessive hammering will damage the needle roller bearing.



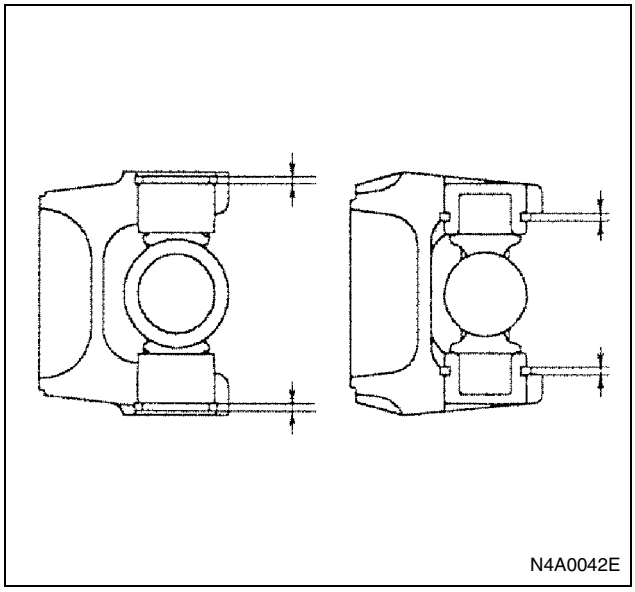
Eliminate the clearance between snap ring and bearing by striking the yoke with a hammer.



Align setting marks and join the yokes.



N4A0041E



N4A0042E

4. Snap Ring

Discard used snap ring and install new one.
When the bearing is fitted into position, select and install the snap ring of suitable thickness so that the end play of the spider pin is held within 0.1 mm.

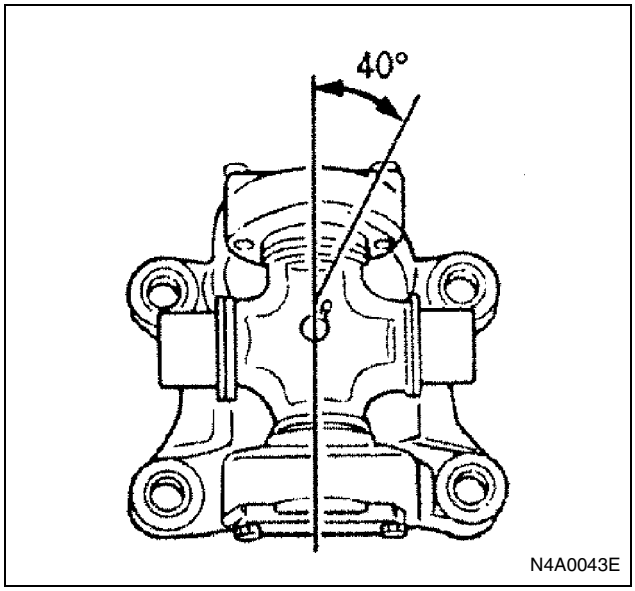
Thickness of Snap Ring Available mm (in.)	
NHR, NKR55	
Snap ring thickness	Identification color
1.5 (0.059)	Blue
1.53 (0.060)	White
1.59 (0.063)	Yellow
1.62 (0.064)	Green
1.68 (0.066)	Not colored

NKR 66, 71, 77, NPR 66, 70, 77, NQR66, 71, NPS 71	
Snap ring thickness	Identification color
1.95 (0.077)	Blue
2.00 (0.079)	White
2.05 (0.081)	Yellow or Not colored

Notice:
Be sure to use snap rings of the same thickness on both sides.

5. Grease Fitting

Install the grease fitting at an angle of approximately 40 degrees to the spider. The parts should be so installed that all grease fittings are pointed upward.



N4A0043E

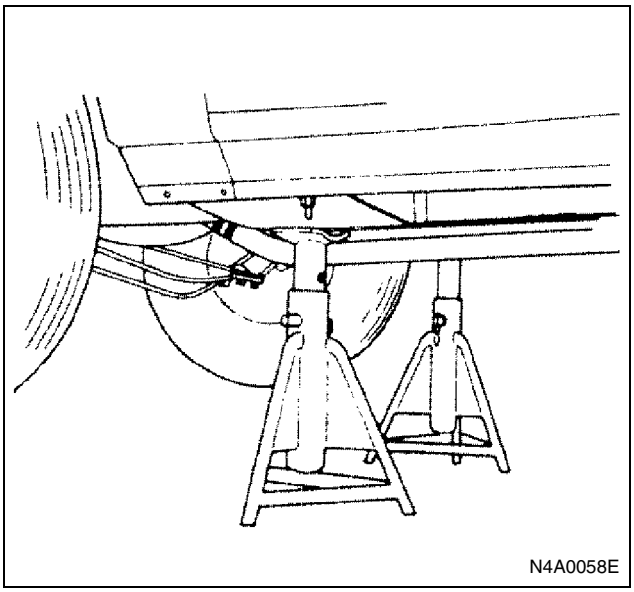
4. Shim
5. Axle case oil seal
6. O-ring
7. Bearing lock nut and washer
8. Bearing holder
9. Bearing
10. Oil seal

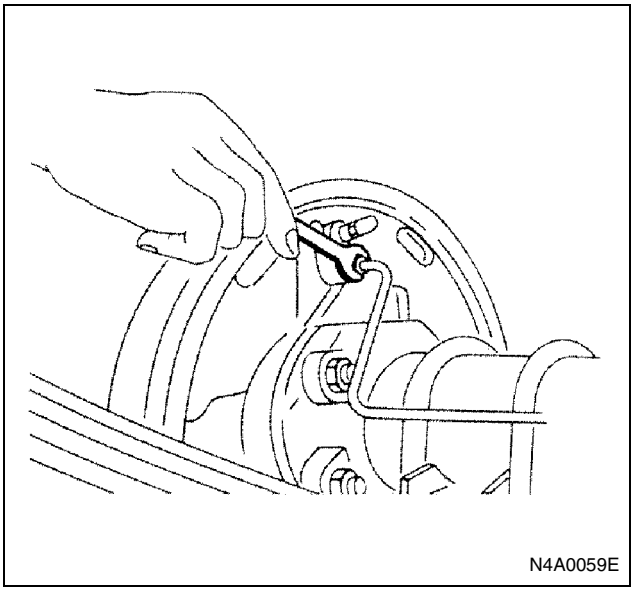
Removal

Preparation:
Raise vehicle to working level.
Support the axle assembly with a suitable jack and chassis stands.



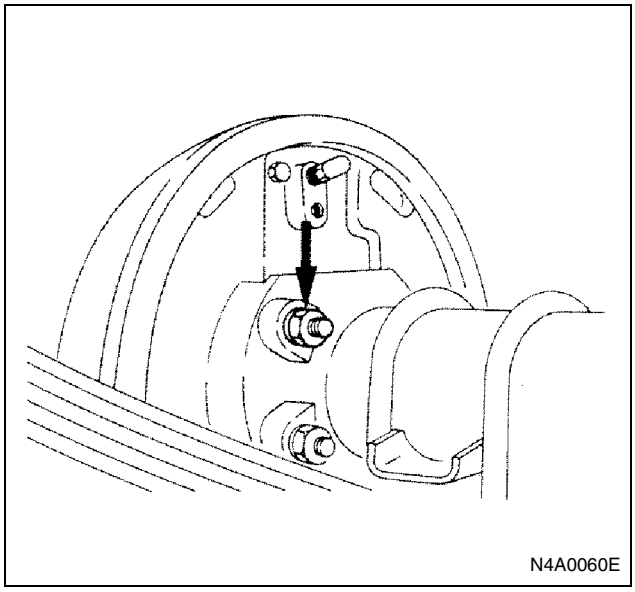
N4A0058E

1. Wheel and Tire
2. Brake Drum
   Before disassembly of axle shaft assembly, disconnect the following parts.
   Disconnect the brake pipe from brake wheel cylinder on the back plate.



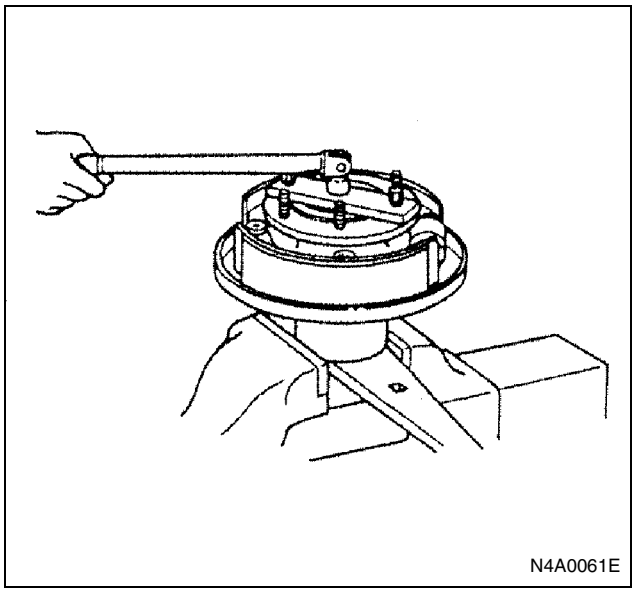
N4A0059E

3. Axle Shaft with Brake Assembly
   Remove four nuts from the bearing holder fixing-bolts.



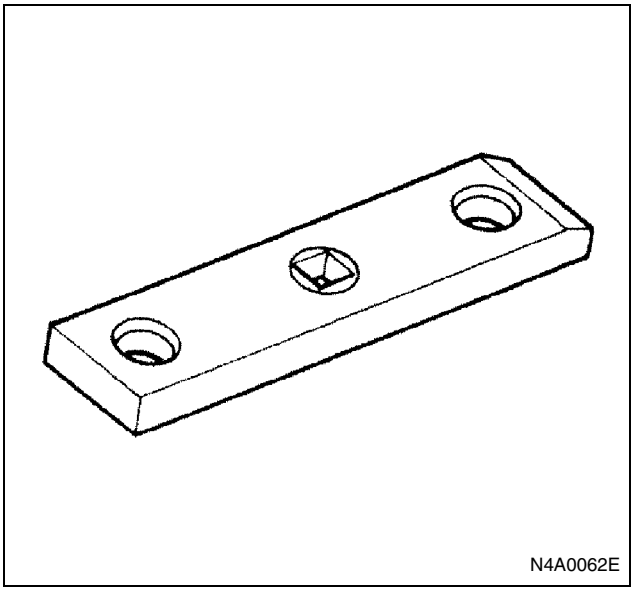
N4A0060E

4. Shim
5. Axle Case Oil Seal
6. O-ring
7. Bearing Lock Nut and Washer
   1) Flatten the locking portion on the lock nut.
   2) Clamp special tool; wrench into vise, and mount axle shaft into wrench.
      Wrench: 5-8840-2329-0
   3) Install special tool onto flange studs, lock into position with two wheel nuts, and turn axle shaft loose from lock nut.
      Remover: 5-8840-2003-0



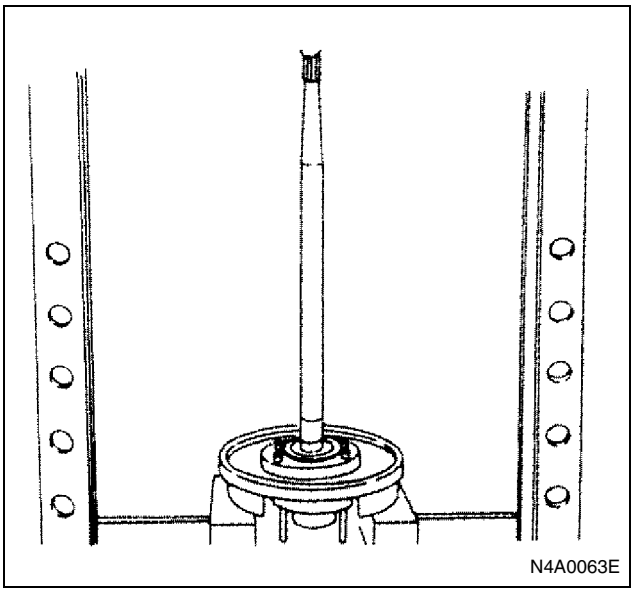
N4A0061E

Notice:
Because of the high torque on the locknut, it is sometimes advantageous to have an assistant when performing this operation.

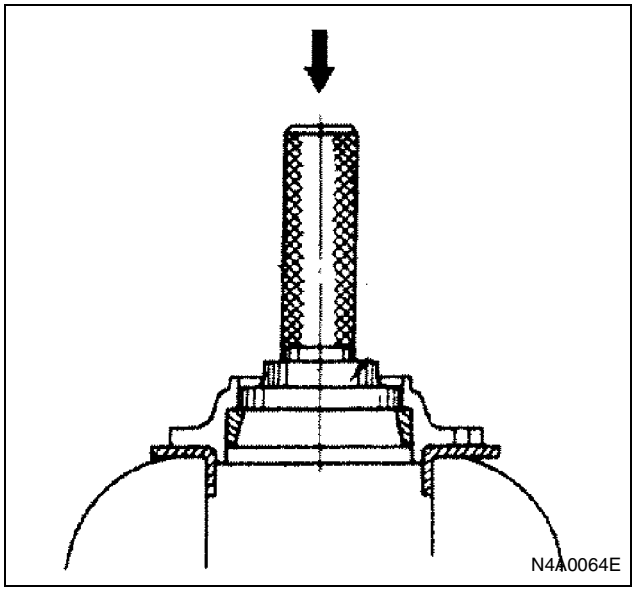


8. Bearing Holder
   Remove the bearing holder and bearing from the axle shaft by means of a press.

Notice:
Only a slight amount of pressure from the press is required to loosen bearing from the shaft. Be sure to support the backing plate solidly, and to hold onto the axle shaft to prevent it from falling to the floor.



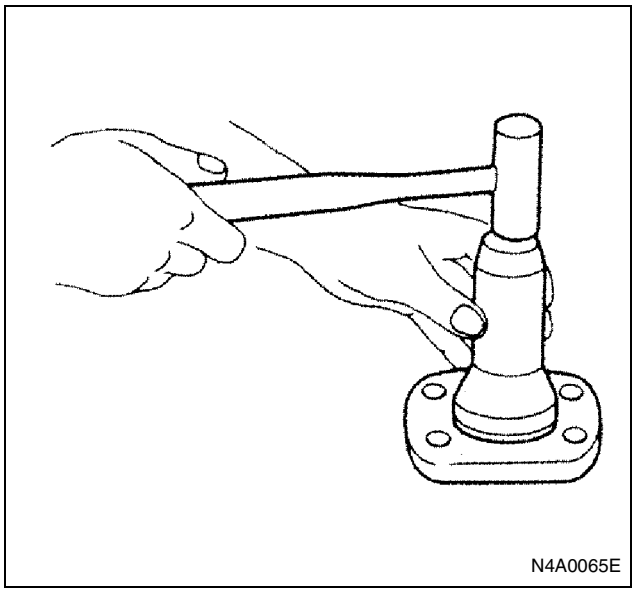
9. Bearing
   Drive out the bearing outer race using a special tool.
   Remover: 9-8521-1772-0
   Grip: 9-8522-1148-0



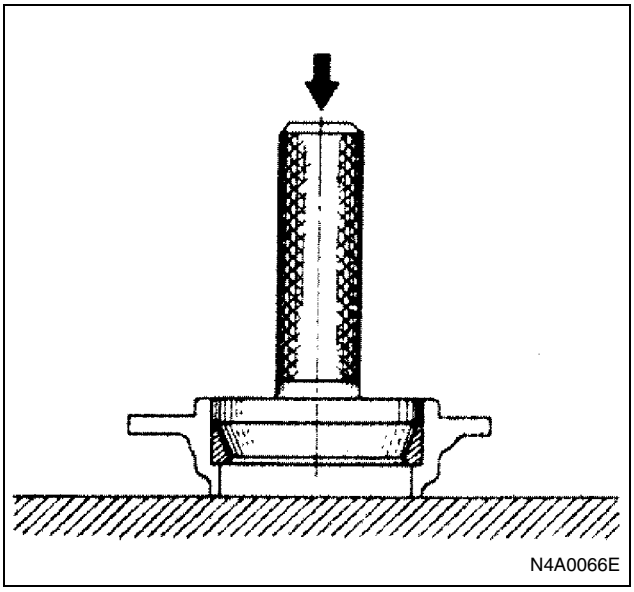
10. Oil Seal

Installation

1. Oil Seal
   Installer: 9-8522-1269-0

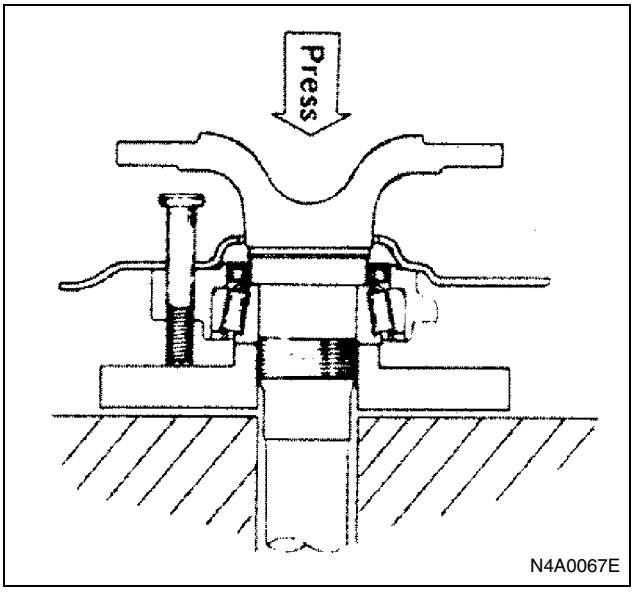


2. Bearing
   Installer: 9-8522-1268-0
   Grip: 9-8522-1148-0
   Apply generous amount of grease to the bearing inner race.



N4A0066E

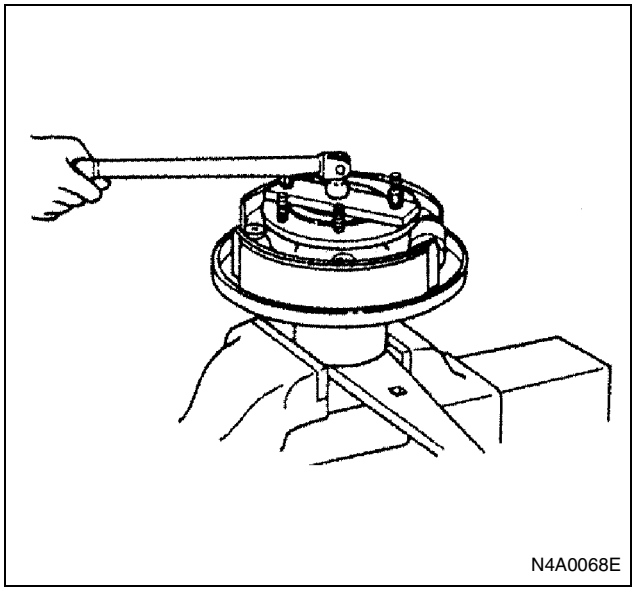
3. Bearing Holder
   1) Insert four through-bolts into back plate.
   2) Install bearing holder to back plate.
   3) Install the above parts onto the axle shaft.
   4) Install bearing over axle shaft and press into bearing holder.
      Installer: 9-8522-1271-0



N4A0067E

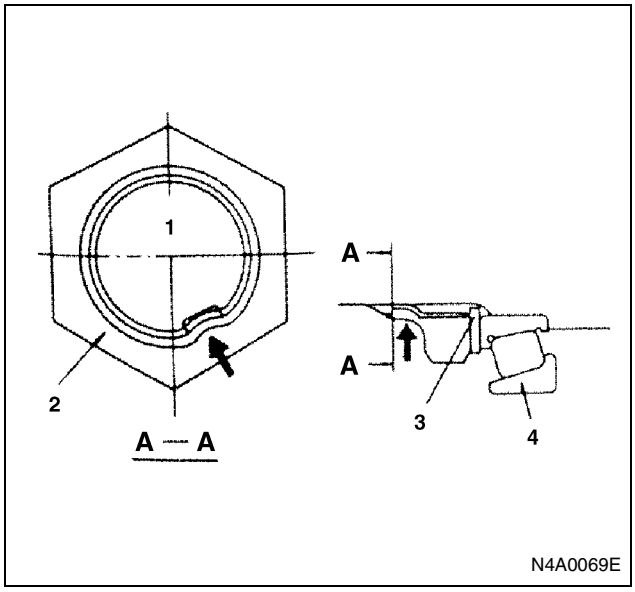
4. Bearing Lock Nut and Washer
   1) Install the washer with the washer tab inserted to the groove on the axle shaft.
   2) Discard used bearing lock nut and install a new one into the position by using a vise and special tools.
      Installer: 5-8840-2003-0
      Wrench: 5-8840-2329-0

Tighten:
Bearing lock nut to 260 N·m (26.5 kg·m / 192 lb·ft)



N4A0068E

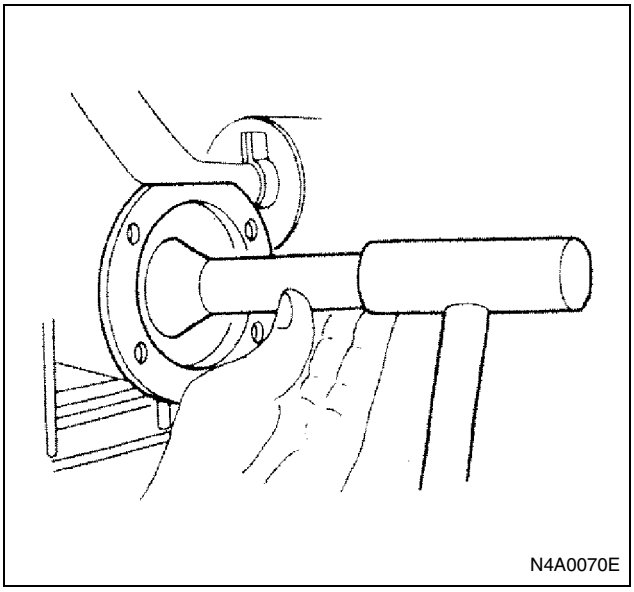
   3) Stake the bearing lock nut at groove portion on the axle shaft.



N4A0069E

Legend
1. Axle shaft
2. Nut
3. Bearing lock nut
4. Bearing

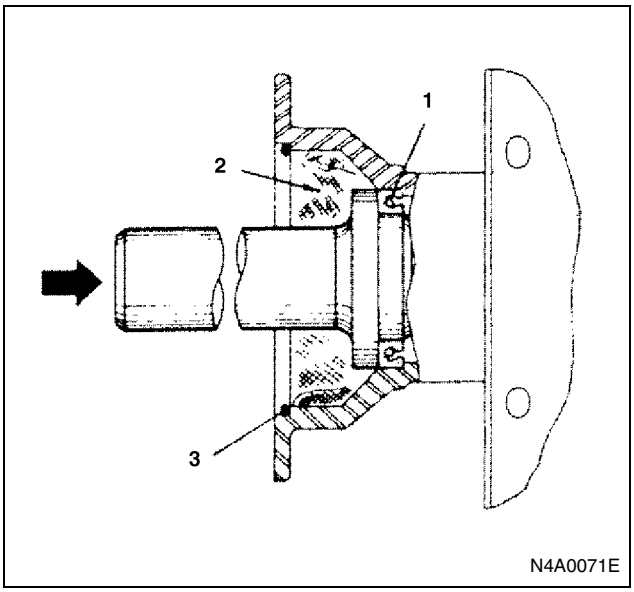
5. O-Ring
6. Oil seal; Axle Case
   1) Installer: 9-8522-1272-0



N4A0070E

2) Apply measured amount of good quality grease to the inner face of the rear axle case.

Type of grease: Wheel bearing grease of Multipurpose type grease
Amount of grease required: 80 g (2.8 oz)

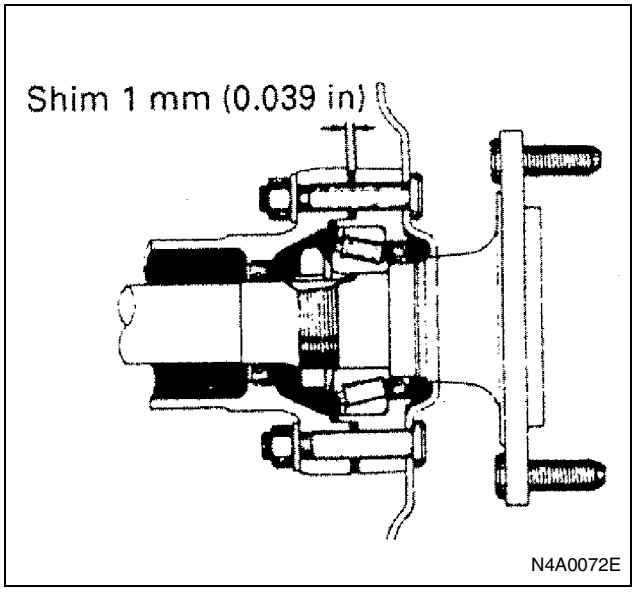


N4A0071E

Legend
1. Oil seal
2. Grease
3. O-ring

7. Shim
   Install the axle shaft assembly to the axle case with a 1 mm (0.039 in) thick shim fitted in position between the bearing holder and axle case flange. Install and tighten the bolts evenly in progression.

Tighten:
Bearing holder nut to 74 N·m (7.5 kg·m / 54 lb·ft)



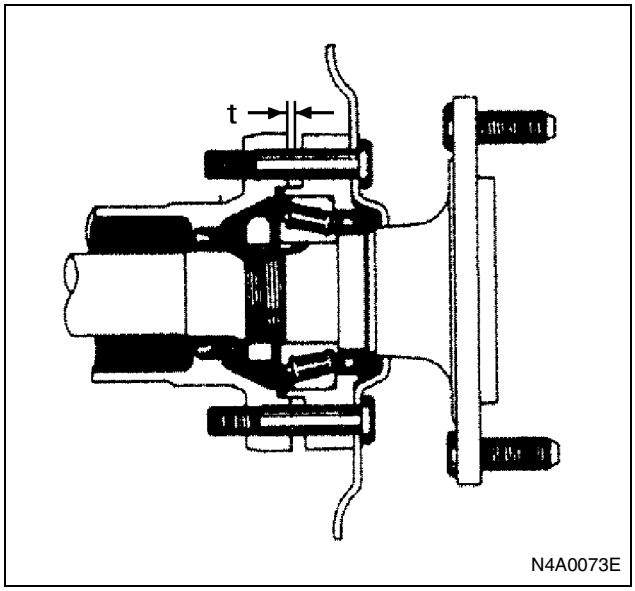
N4A0072E

Install the axle shaft assembly on the opposite side and push it in until it is fitted against the differential thrust block.

Then, measure the clearance (t) between the bearing holder and axle case flange and determine the thickness of the shim to be installed by the following formula:

Measured clearance (t) + 0.3 mm (0.012 in.) = thickness of shim to be installed.

Thickness of shims available, 0.05, 0.076, 0.13, 0.5, 1.0 mm (0.002, 0.003, 0.005, 0.02, 0.04 in)



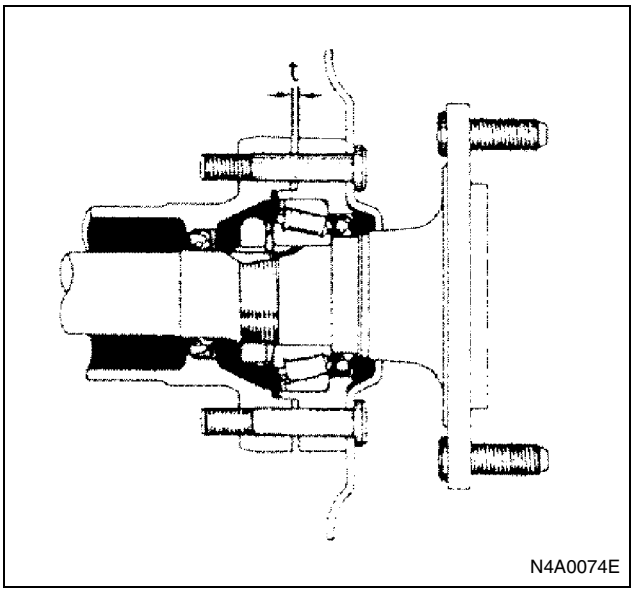
N4A0073E

8. Axle Shaft with Brake Assembly

Tighten:
Bearing holder nut to 74 N·m (7.5 kg·m / 54 lb·ft)

- Connect the brake pipes to wheel cylinder.
- Brake air bleeding, refer to servicing to Section 5 “Brake”.

Notice:
To install the axle shaft assembly, follow the reassembly procedure outline under the Section 5 “Brake”.



9. Brake Drum
10. Wheel and Tire

Tighten:
Wheel nut to 167 N·m (17 kg·m / 123 lb·ft)

Rear Hub and Brake Drum (NKR Model; Full Floating)

Single Tire

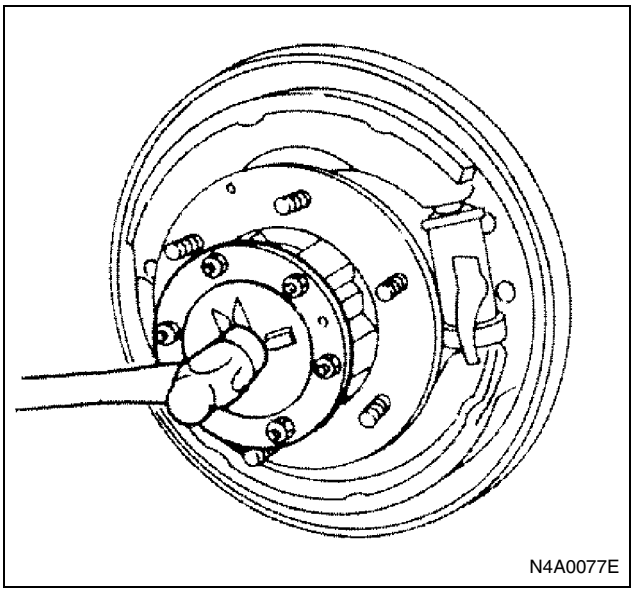
10. Inner bearing
11. Hub

Removal

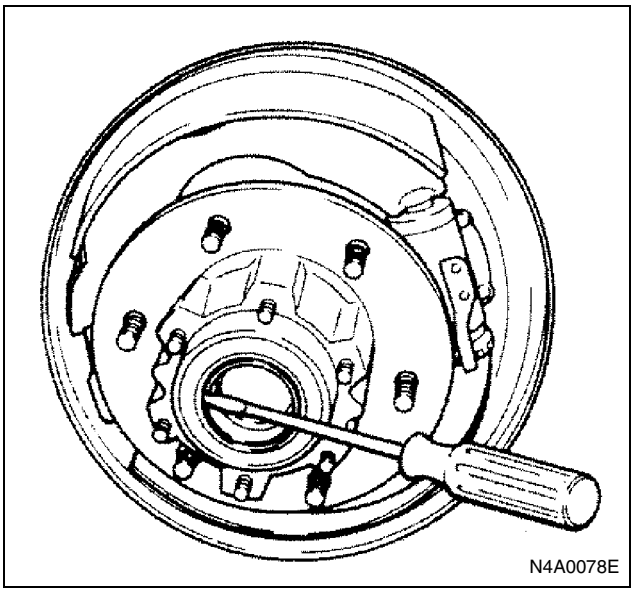
Preparation:
Jack up and support the vehicle on stands.

1. Wheel and Tire
2. Brake Drum
3. Axle Shaft
   Remove the collar by tapping on the upper face of the axle shaft with a hammer, then remove the axle shaft.



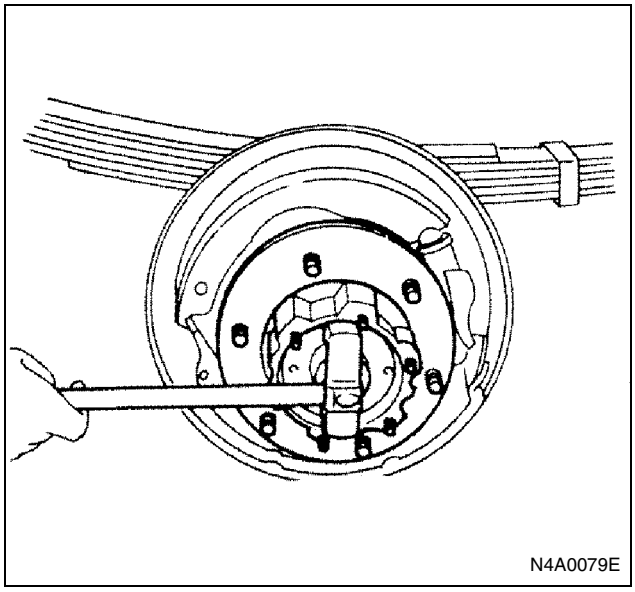
N4A0077E

4. Outer Oil Seal
   Take out the hub outer oil seal using a screwdriver.



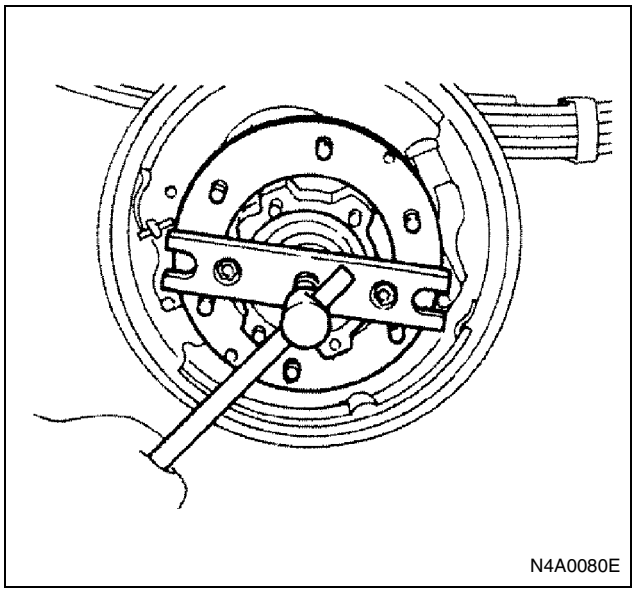
N4A0078E

5. Lock Washer
6. Bearing Lock Nut
   Wrench: 9-8522-1188-0



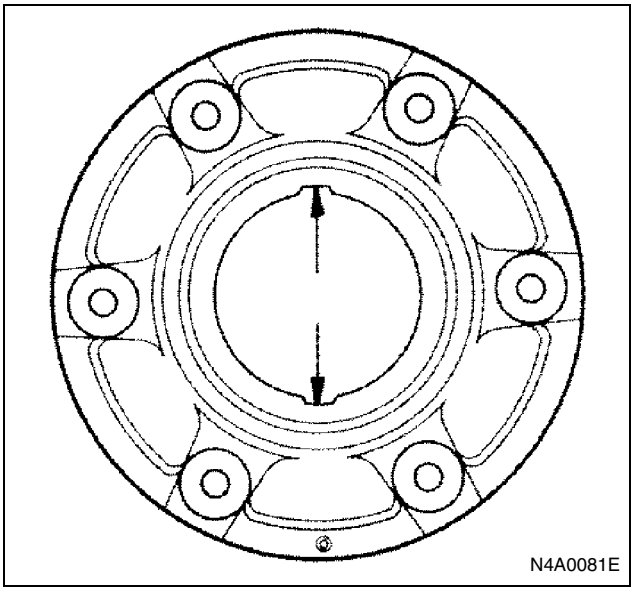
N4A0079E

7. Hub Assembly
   Remover: 9-8521-0116-0
   If the hub inner bearing and the hub inner oil seal remain on the axle tube, remove the hub inner bearing using a special tool.
   Remover: 9-8521-0092-0



N4A0080E

8. Outer Bearing
9. Inner Oil Seal
10. Inner Bearing
    Drive out the hub inner bearing outer race together with the hub inner bearing inner race and the hub inner oil seal by using a proper bar through two notches.



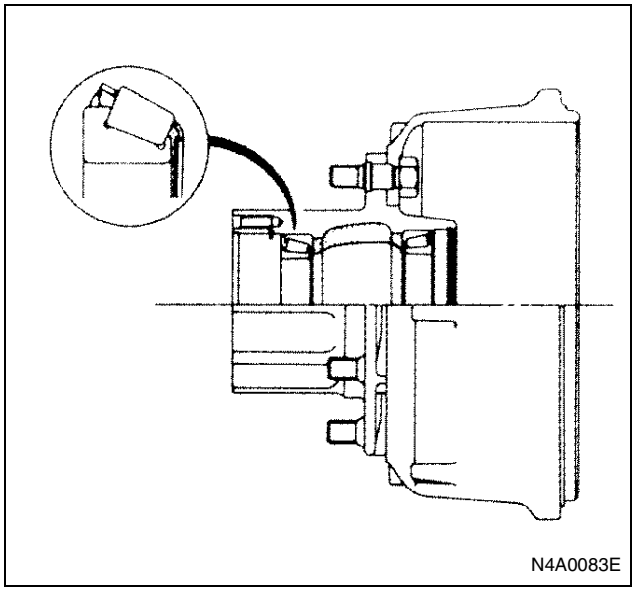
11. Hub

Installation

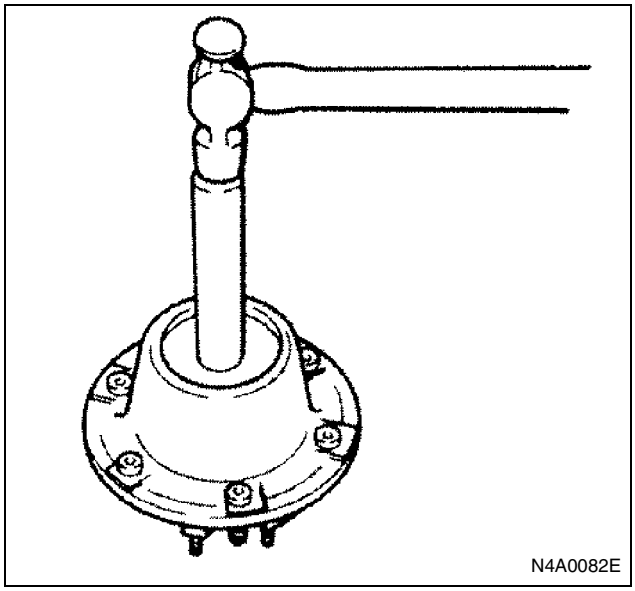
1. Hub
2. Inner Bearing
   Install the bearing outer race.
   Installer: 9-8522-1194-0
   Grip: 9-8522-1148-0
   If removed outer bearing outer race, install the bearing outer race.
   Installer: 9-8522-1195-0
   Grip: 9-8522-1148-0

   Apply specified grease into the bearing and grease well in the hub.

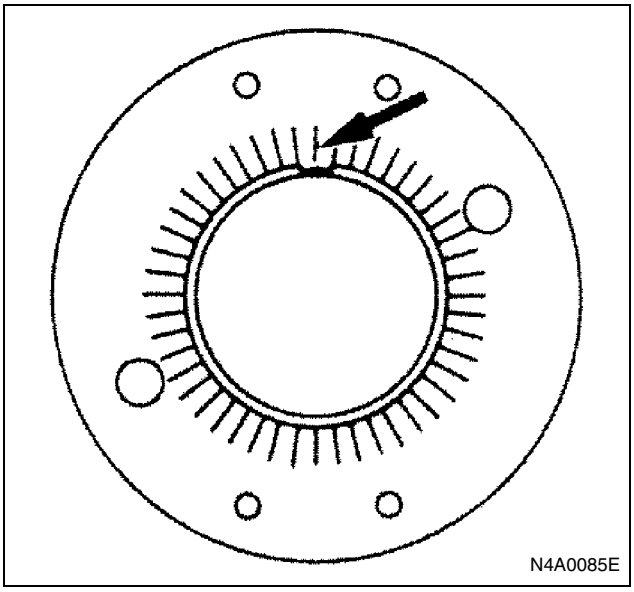
Amount of grease: 280 g (9.8 oz)



3. Inner Oil Seal
   Installer: 9-8522-1607-0
   Grip: 9-8522-1608-0



4. Outer Bearing
5. Hub Assembly
6. Bearing Lock Nut
   1) Install the bearing nut, so that its side with notched line is turned outward.
      The forty eight (48) slits are provided on the bearing nut, to ensure locking and easy maintenance.

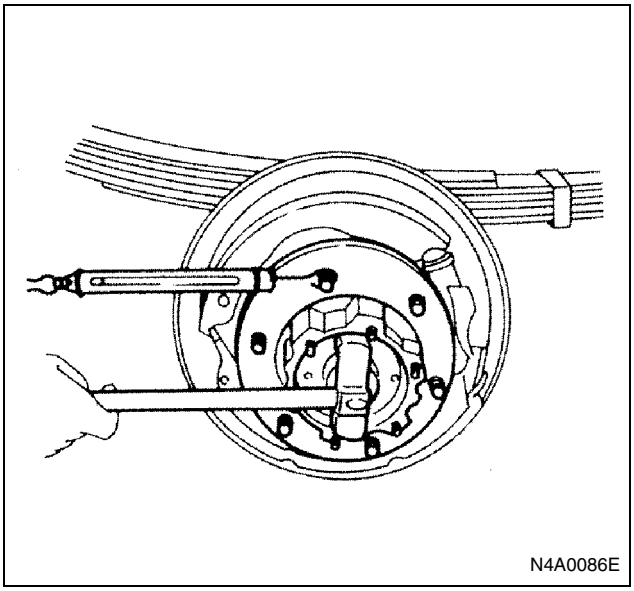


2) Align notched line on the bearing nut with the center of groove in the axle case, so that two threaded holes in the bearing nut line up with two holes in the lock washer.
Wrench: 9-8522-1188-0

3) Adjustment of wheel bearing preload.

Bearing preload (at wheel pin), 42 — 52 N (4.3 — 5.3 kg / 9.5 —11.7 lb)

4) While the wheel bearing pre-load is adjusted, if the notched line on the bearing nut is not aligned with the groove on the axle case, adjust to turn the lock nut clockwise to align.



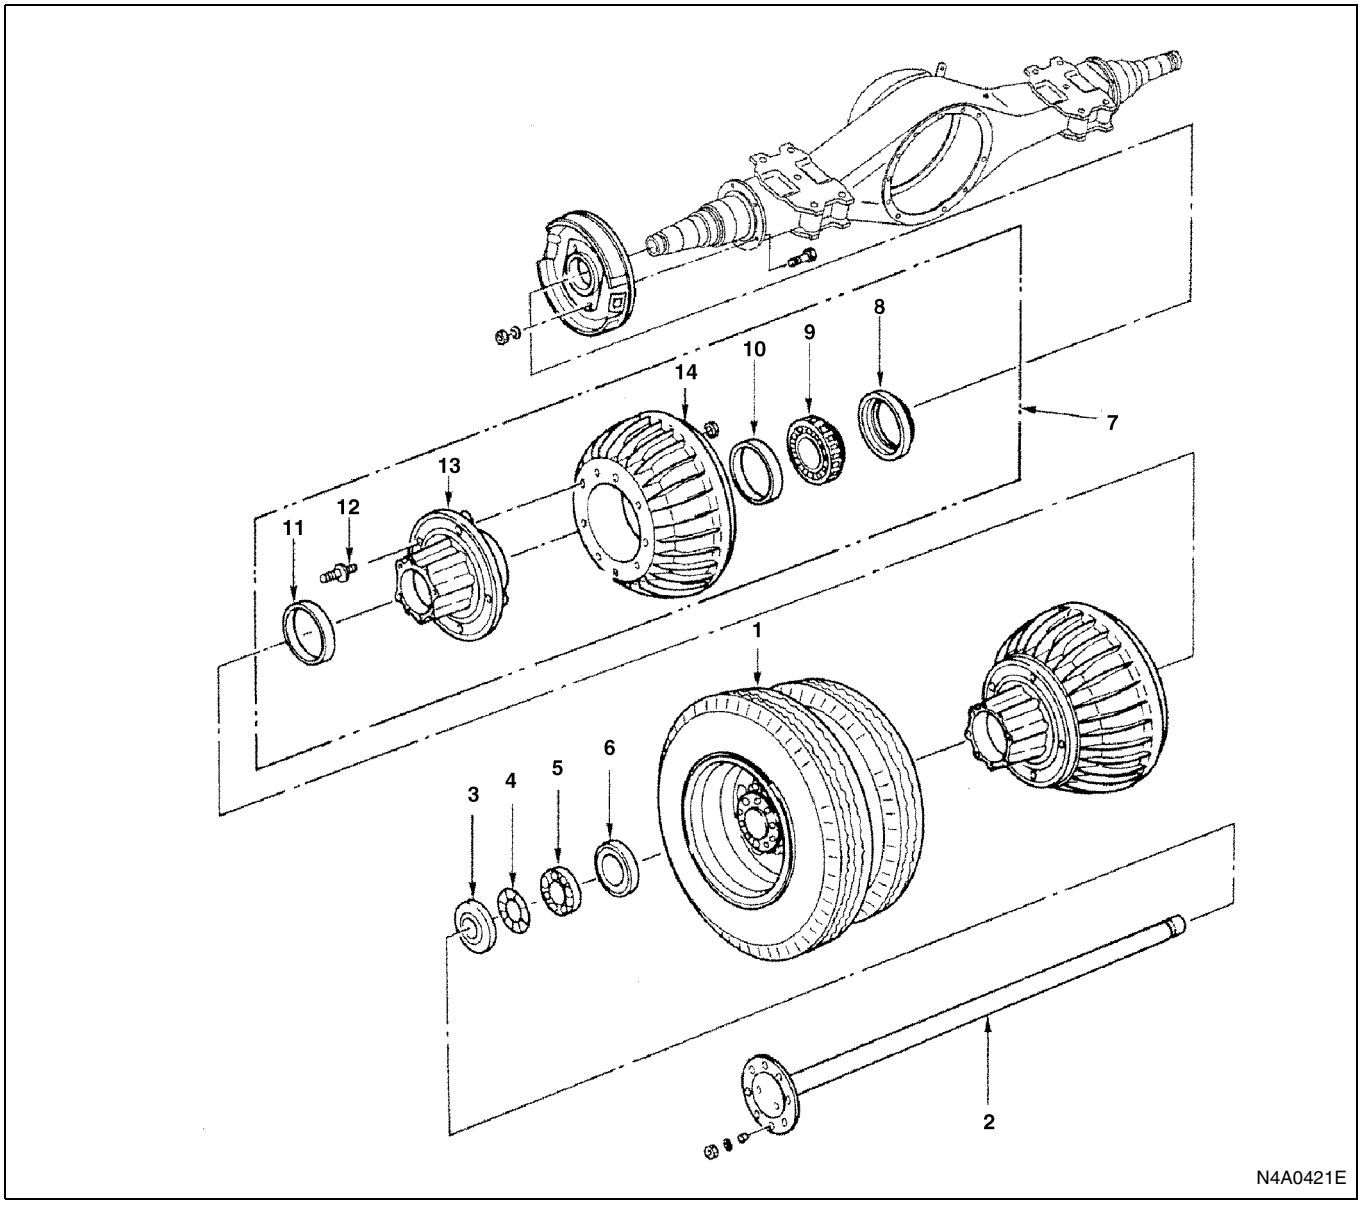
7. Lock Washer
   Install lock washer and fix it to the bearing nut by the lock bolt. The lug of lock washer should be inserted to the groove on the axle case.
8. Outer Oil Seal
9. Axle Shaft

Tighten:
Axle shaft nut to 46 N·m (4.7 kg·m / 34 lb·ft)

10. Brake Drum
11. Wheel and Tire

Tighten:
Wheel nut to 167 N·m (17 kg·m / 123 lb·ft)

Rear Hub and Brake Drum (NHR, NKR, NQR, NPS Models; Full Floating)



Legend

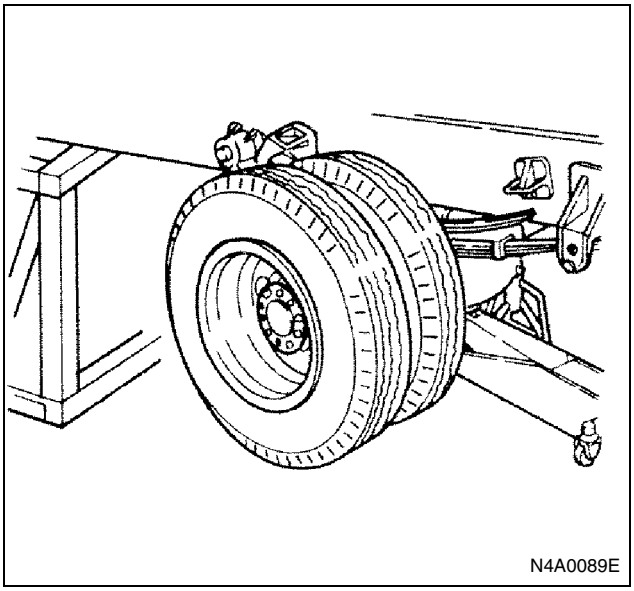
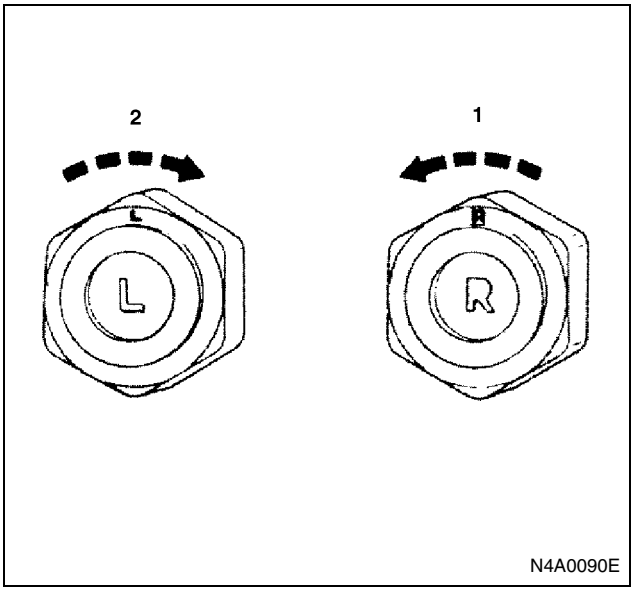
Removal

Preparation:
Jack up and support the vehicle on stands.



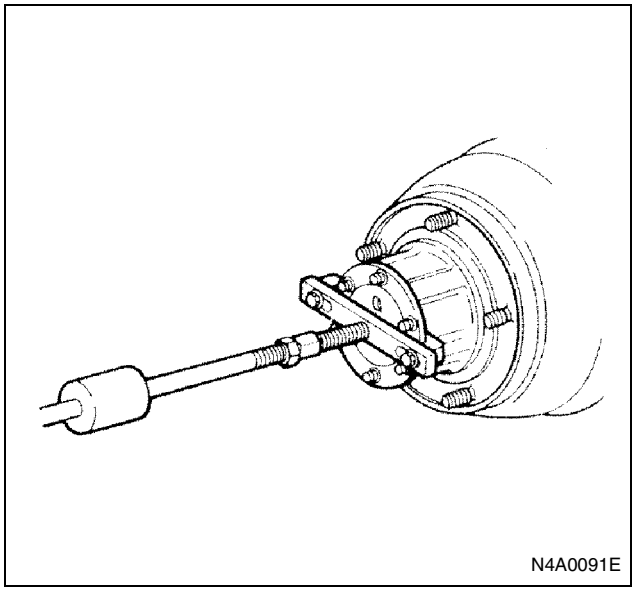
N4A0089E

1. Wheel and Tire
   Right side wheel nut (1) have right hand threads and left side wheel nut (2) have left hand threads.



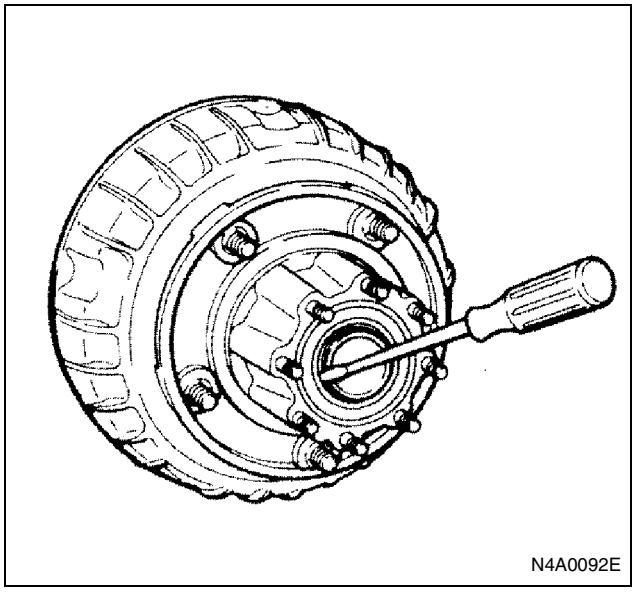
N4A0090E

2. Axle Shaft
   Use the axle shaft remover and the sliding hammer to remove the axle shaft.
   Axle Shaft Remover: 5-8840-2027-0
   Sliding Hammer: 5-8840-0084-0



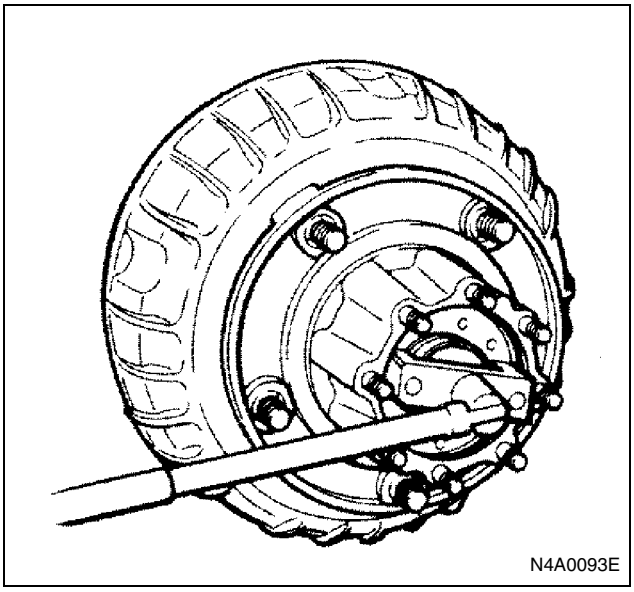
N4A0091E

3. Outer Oil Seal
   Use a pry bar to pry the oil seal from the axle case.



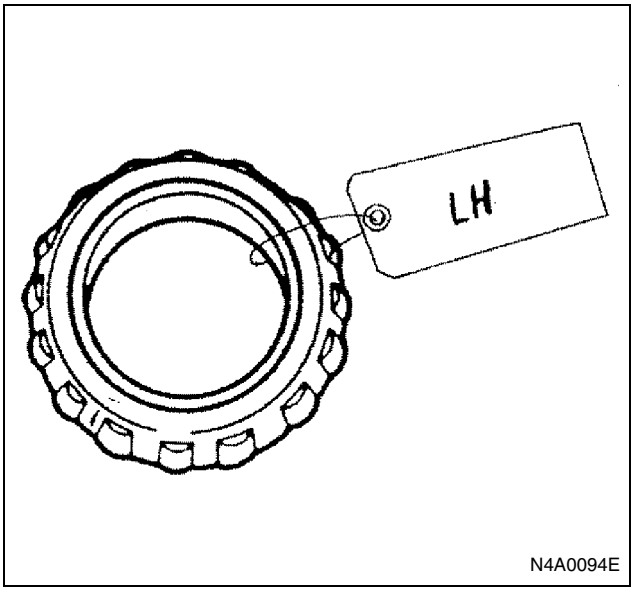
N4A0092E

4. Lock Washer
5. Bearing Lock Nut
   Use the lock nut remover to remove the lock nut.
   Lock Nut Remover:
   9-8522-1188-0 (For lock bolt P.C.D. 70 mm (2.8 in.))
   9-8522-1606-0 (For lock bolt P.C.D. 74 mm (2.9 in.))



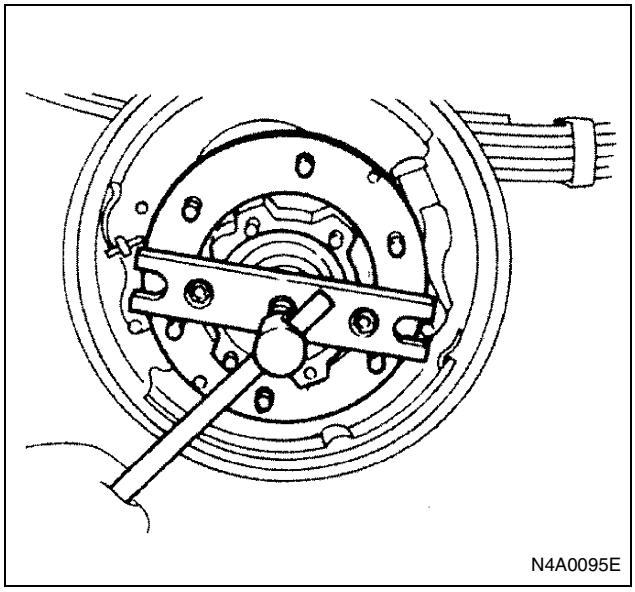
N4A0093E

6. Outer Bearing
   If the bearings are to be reinstalled, tag each bearing with the fitting position from which it was removed.



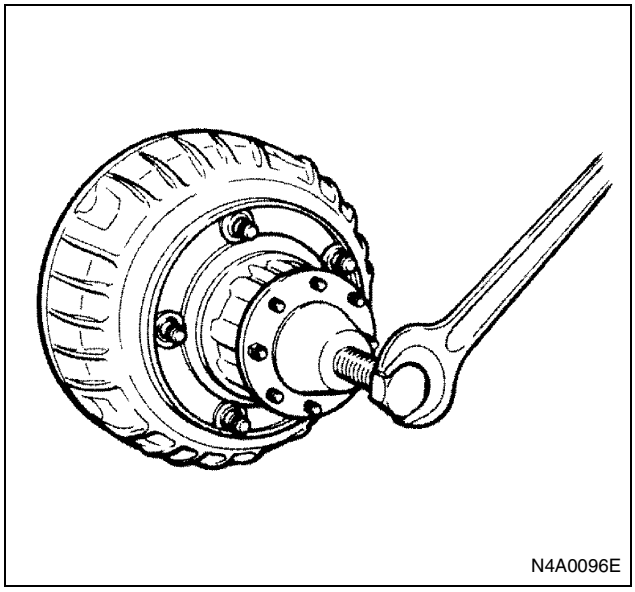
N4A0094E

7. Hub and Brake Drum
   Use the rear hub remover to remove the hub and the brake drum.
   Rear Hub Remover:
   9-8521-0116-0 (For NHR, NKR Flat Low)



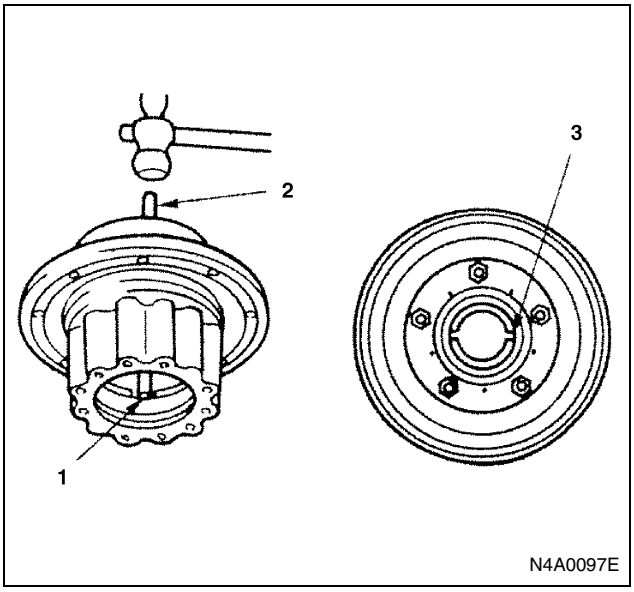
N4A0095E

   Rear Hub Remover:
   9-8521-2501-0 (For except NHR, NKR Flat Low)



N4A0096E

8. Inner Oil Seal
9. Inner Bearing
10. Inner Bearing Outer Race
11. Outer Bearing Outer Race
    Use a hammer and a brass bar (2) to drive the outer races (3) from the hub (1) at the two points shown in the illustration.



12. Wheel Pin
    1) Set the rear hub with brake drum (1) to the wheel with tire (2) previously removed from the vehicle.
       Turn the wheel pin nuts (3) counterclockwise to loosen them.
    2) The pin nuts are loosened counterclockwise on both sides of the vehicle.

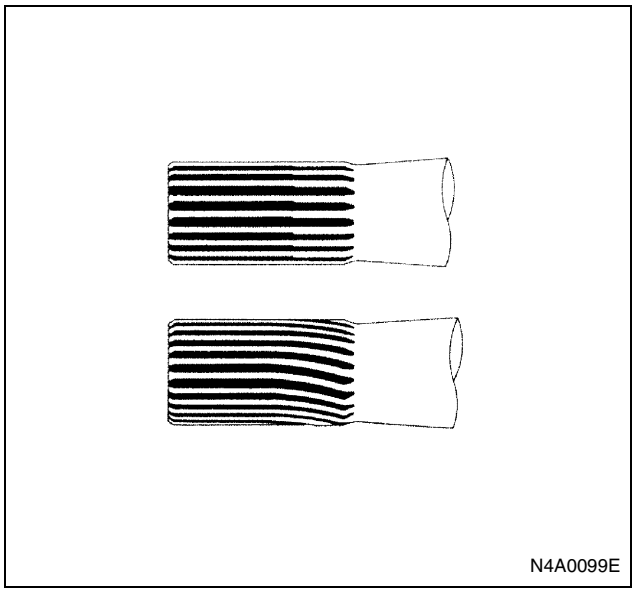
    3) Remove the brake drum from the rear hub.
    4) Discard the wheel pins and nuts.
       The wheel pins and nuts cannot be reused.
13. Hub
14. Brake Drum

Inspection and Repair

Make necessary adjustments, repairs, and part replacement if excessive wear or damage is discovered during inspection.

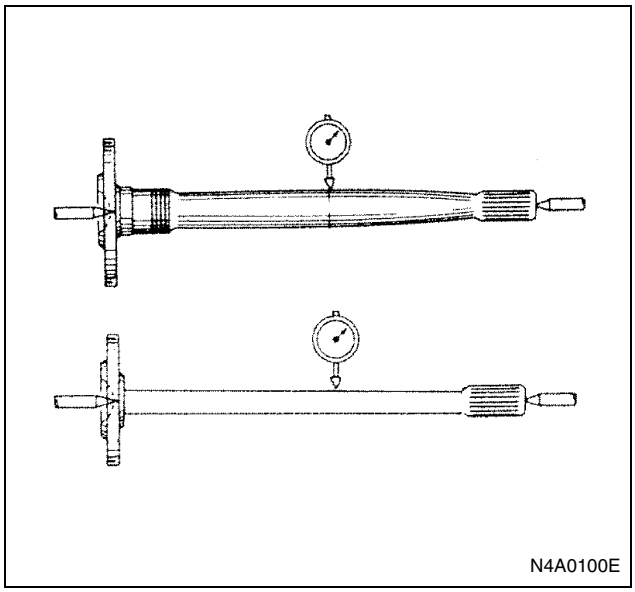
Axle Shaft Spline

Inspect the spline for wear, damage or other abnormal conditions.



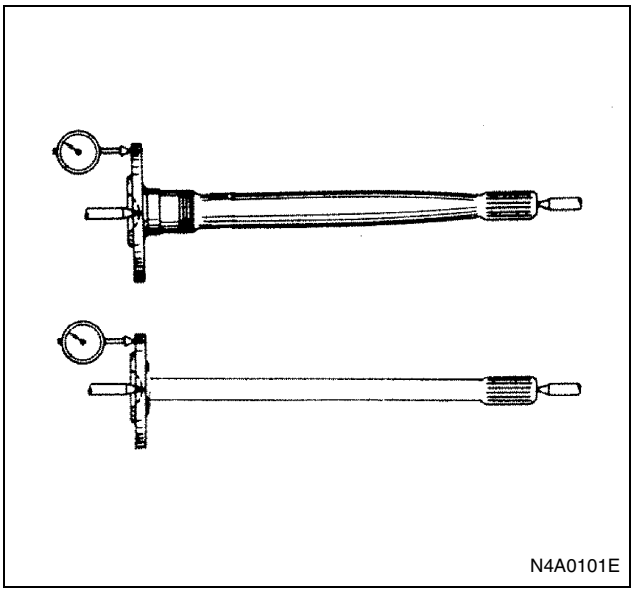
Axle Shaft Run-Out

Limit, 1 mm (0.039 in)



Axle Shaft Flange Run-Out

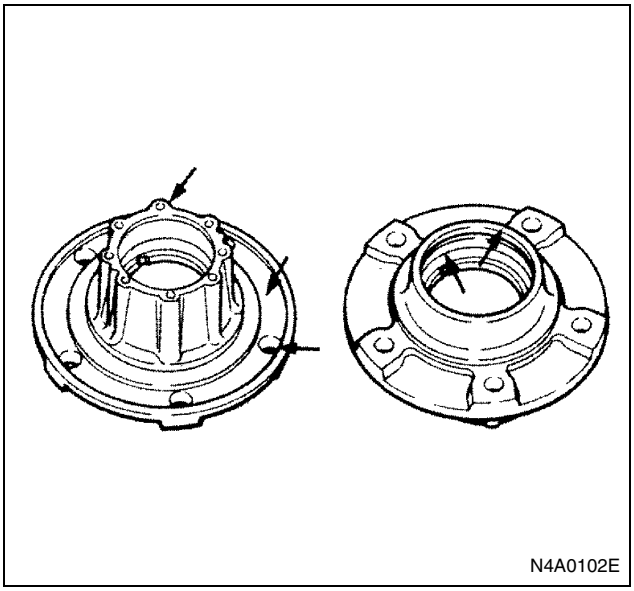
Limit, 0.15 mm (0.00591 in)



Hub

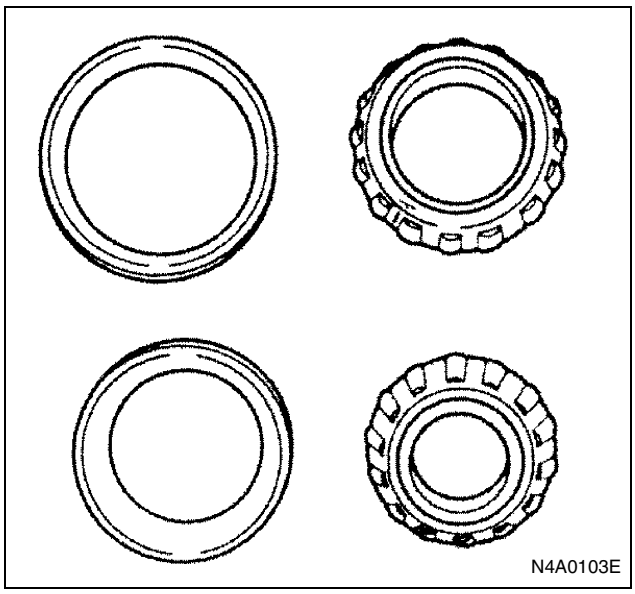
Inspect the oil seal and bearing fitting faces for excessive wear and damage.

Inspect the wheel pin threads and stud bolt threads for excessive damage and cracks.



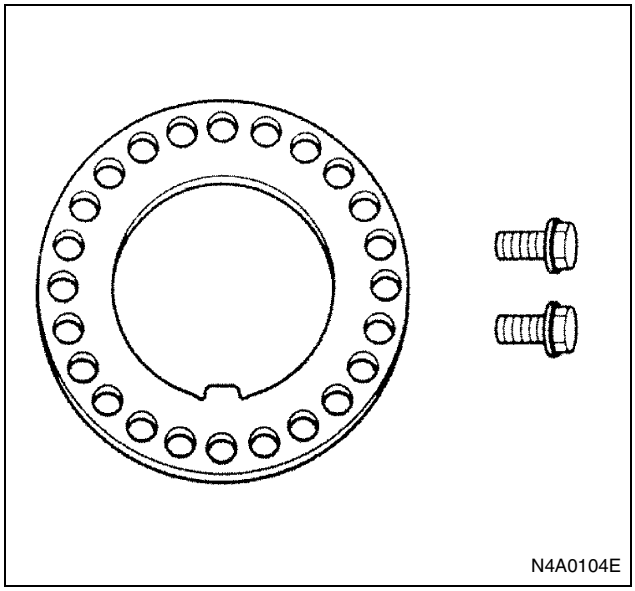
Bearing

Inspect the bearing for excessive wear, abnormal noise, rough rotation, and freezing.



Lock Washer

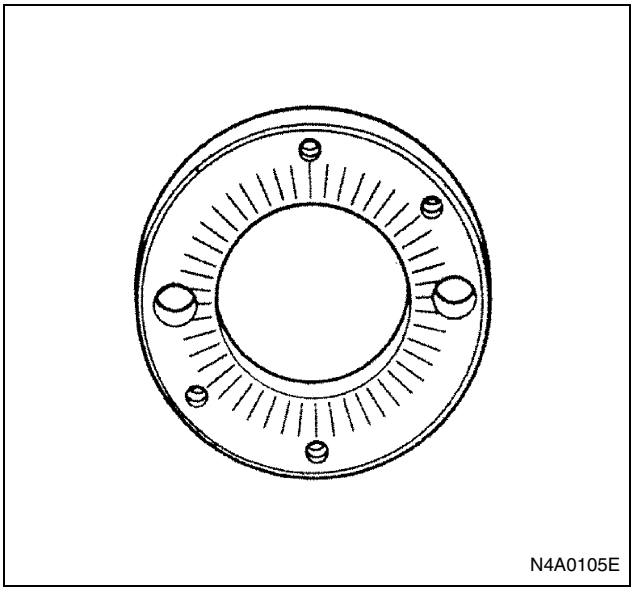
Inspect the lock washer for excessive wear, cracks, warpage, and other damage.



Bearing Lock Nut

Inspect the bearing lock nut threads and contact surfaces for excessive wear, warpage, and other damage.

Light damage to the contact surfaces can be repaired with an oil stone or a piece of fine sandpaper.

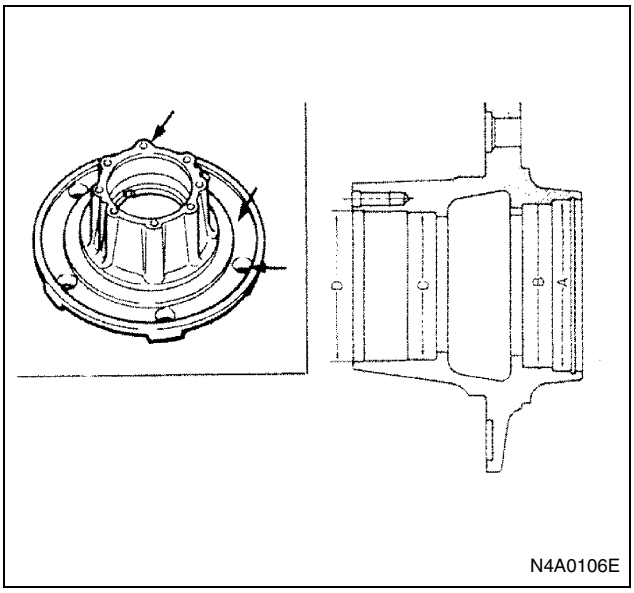


N4A0105E

Installation

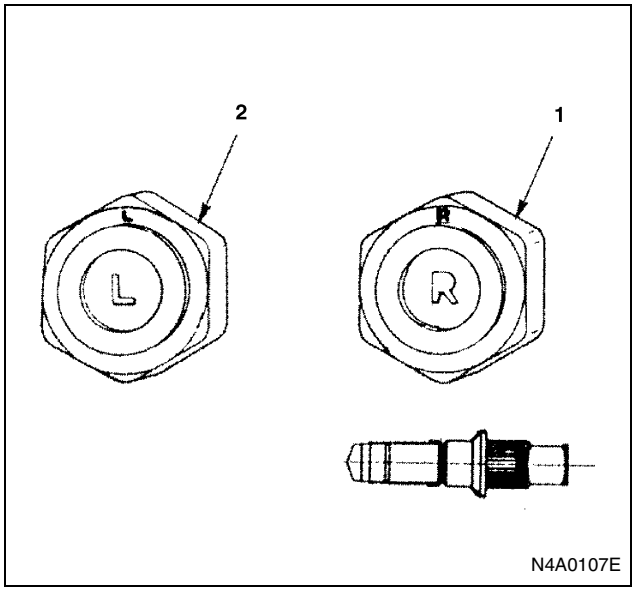
1. Brake Drum
2. Hub
   1) Clean the hub inside and outside surfaces.
   2) Apply bearing grease to the hub cavity.

Hub bearing grease amount, 285 g (10.1 oz)



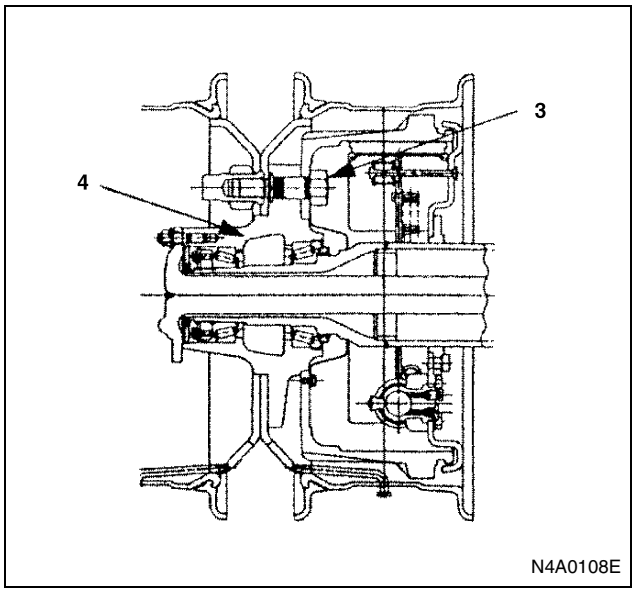
N4A0106E

3. Wheel Pin
   1) Right side hub wheel pins (1) have right hand threads and left side hub wheel pins (2) have left hand threads.



N4A0107E

   2) Install the wheel pins (3) to the hub (4).
   Note the installation direction shown in the illustration.
   Tap the wheel pin into the hub with a hammer.



N4A0108E

   3) Wheel Pin Nut Torque

Brake drum diameter 228 mm: 206 N·m (21 kg·m / 152 lb·ft)

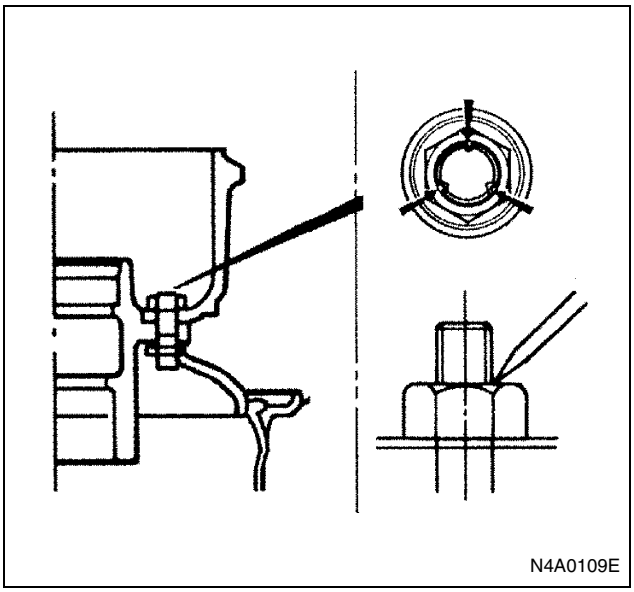
(WHLPIN M18)	Brake lining width 75 mm / 100 mm	343 (35/253)

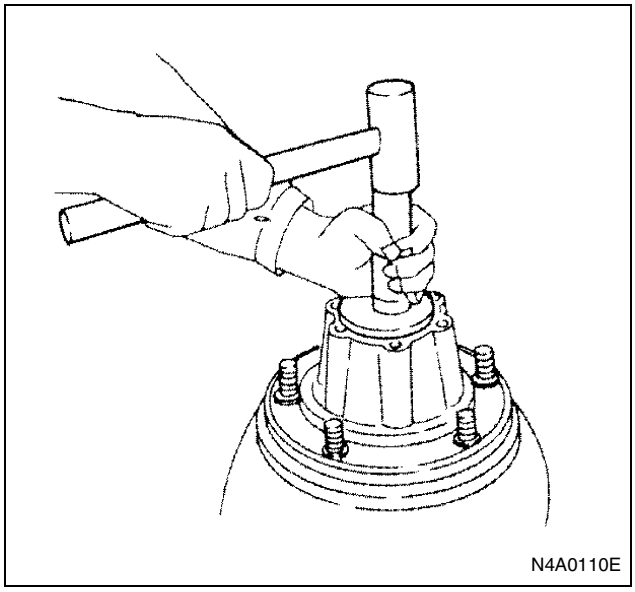
		N·m (kg·m/lb·ft)
(WHLPIN M20)	Brake lining width 100 mm / 120 mm	392 (40/289)

4) Caulk three portions of each wheel nut to prevent them from loosening.



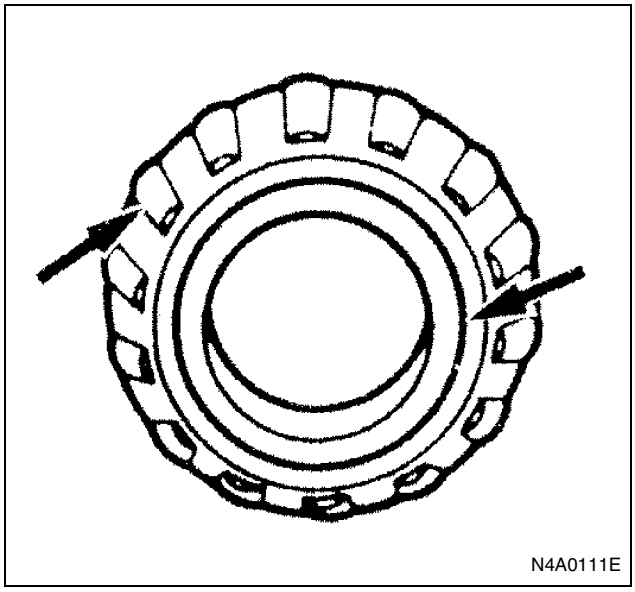
N4A0109E

4. Outer Bearing Outer Race
5. Inner Bearing Outer Race
   Use the bearing outer race installer and the drive handle to install the outer race to the hub.
   Outer Bearing Outer Race Installer:
   9-8522-1195-0
   (Outer race outside diameter 92 mm (3.6 in.))
   9-8522-1610-0
   (Outer race outside diameter 97.6 mm (3.8 in.))
   Drive Handle:
   9-8522-1608-0
   Inner Bearing Outer Race Installer:
   9-8522-1194-0
   (Outer race outside diameter 101.6 mm (4 in.))
   9-8522-1609-0
   (Outer race outside diameter 108 mm (4.3 in.))
   5-8840-2426-0
   (Outer race outside diameter 120 mm (4.72 in.))
   Drive Handle:
   9-8522-1148-0



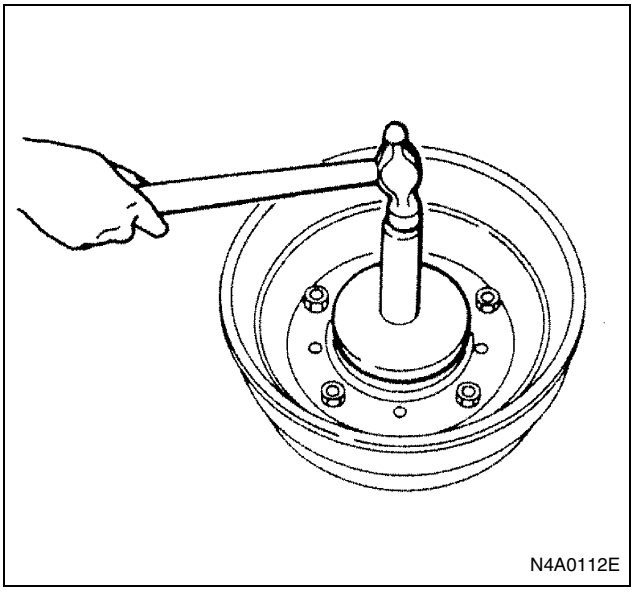
N4A0110E

6. Inner Bearing
   Apply an ample coat of bearing grease between the inner race and the roller cage.



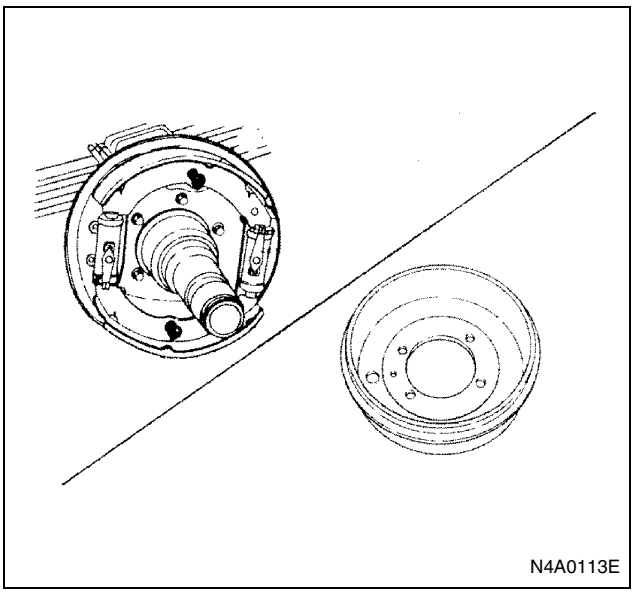
N4A0111E

7. Inner Oil Seal
   1) Apply grease to the oil seal lip inner and outer circumferences.
   2) Use the oil seal installer and the drive handle to install the oil seal to the hub.
      Oil Seal Installer:
      9-8522-1607-0 (Except NQR70)
      Oil Seal Installer:
      5-8840-2427-0 (NQR70)
      Drive Handle:
      9-8522-1608-0



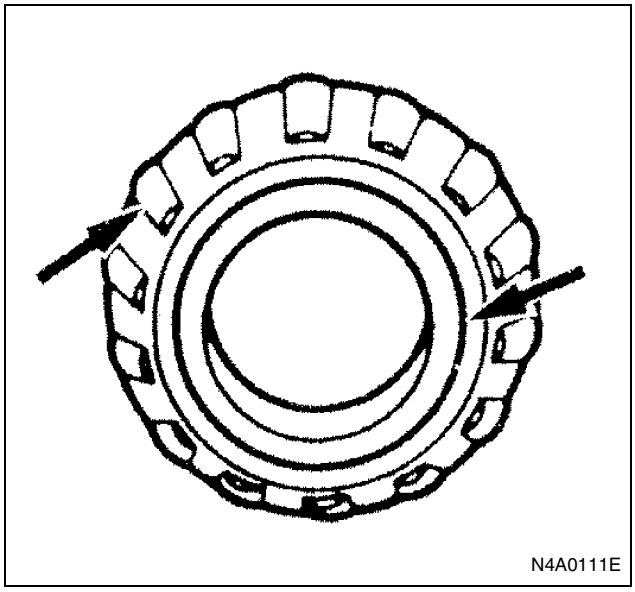
N4A0112E

8. Hub and Brake Drum
   1) Wipe away any oil or other foreign material from the brake linings and the brake drum inside surfaces.
   2) Clean the rear axle case tip.
   3) Install the hub assembly to the rear axle case.



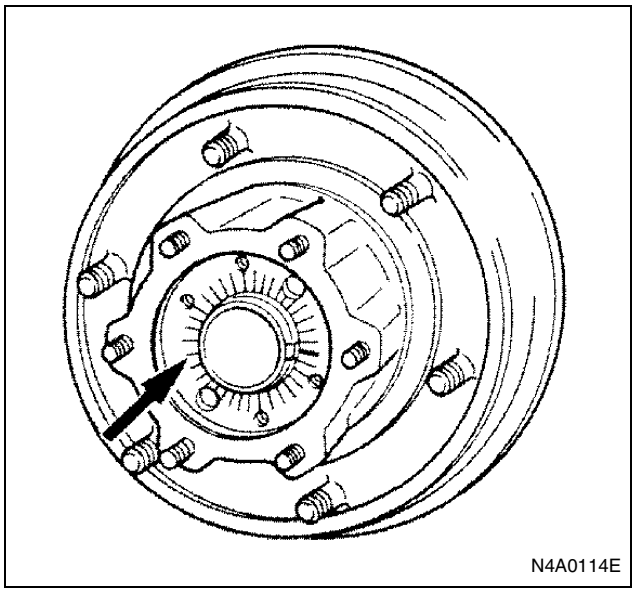
N4A0113E

9. Outer Bearing
   Apply an ample coat of bearing grease between the inner race and the roller cage.



N4A0111E

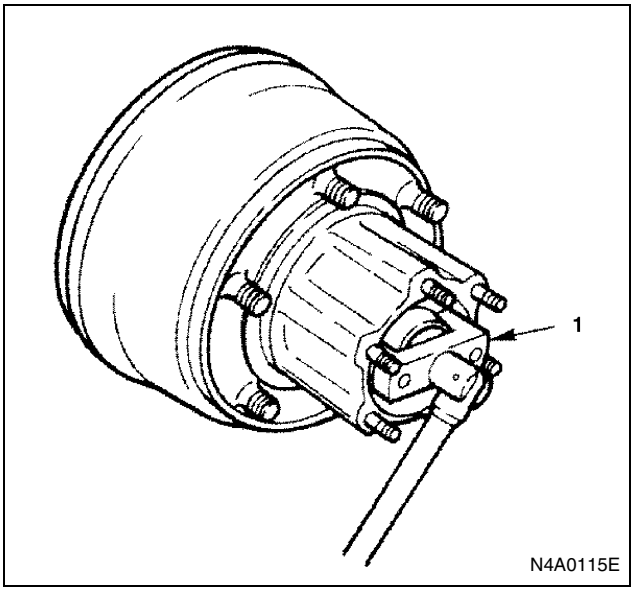
10. Bearing Lock Nut
    Install the lock nut with the notched line facing out.



N4A0114E

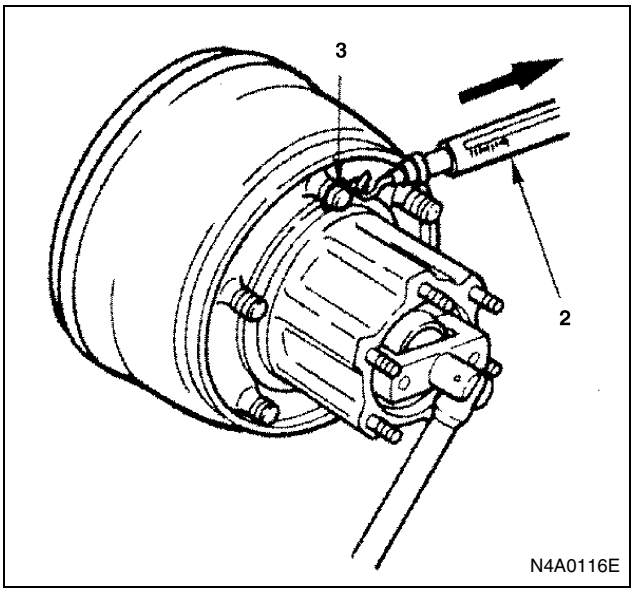
Hub Bearing Preload Measuring Method

1) Turn the hub to the left and right several times to establish bearing conformity.
2) Use the bearing nut wrench (1) to tighten the bearing nut until the hub can not be manually rotated.
   Bearing Nut Wrench:
   9-8522-1188-0 (For lock bolt P.C.D. 70 mm (2.8 in.))
   9-8522-1606-0 (For lock bolt P.C.D. 74 mm (2.9 in.))



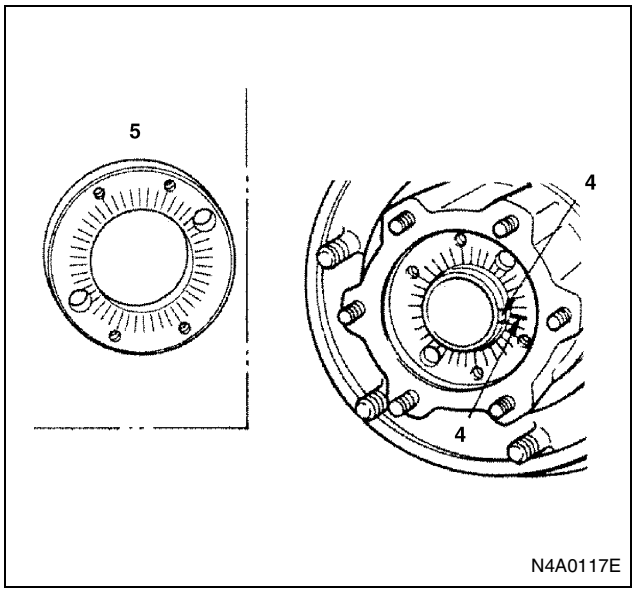
3) Loosen the bearing nut until hub rotates easily.
4) Set the spring balancer (2) to the wheel pin (3) in the position shown in the illustration.
5) Measure the hub bearing preload by carefully pulling on the spring balancer and noting the indicator reading.

Hub Bearing Preload (At Wheel Pin)	N (kg/lb)
P.C.D.139.7	61.1 — 75.6 (6.2 — 7.7/13.7 — 17)
P.C.D.170	50.2 — 62.2 (5.1 — 6.3/11.2 — 13.9)
P.C.D.184.15	46.3 — 57.4 (4.7 — 5.9/10.4 — 13)
P.C.D.203.2	42 — 52 (4.3 — 5.3/ 9.5 — 11.7)
P.C.D.222.25	38 — 48.0 (3.9 — 4.9/ 8.6 — 10.8)



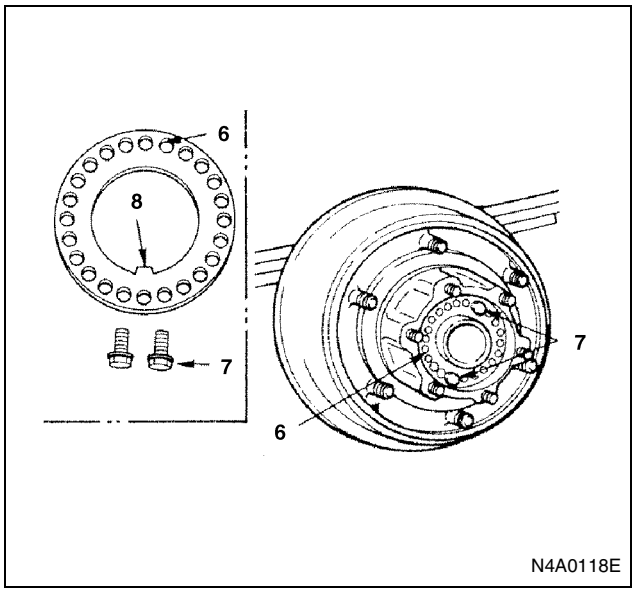
6) Rotate the hub several times to the right and left.
7) Measure the bearing preload a second time.
8) Align the axle case groove with the closest bearing nut slit.

Notice:
If it is difficult to align the axle case and bearing nut, slightly tighten the bearing nut.

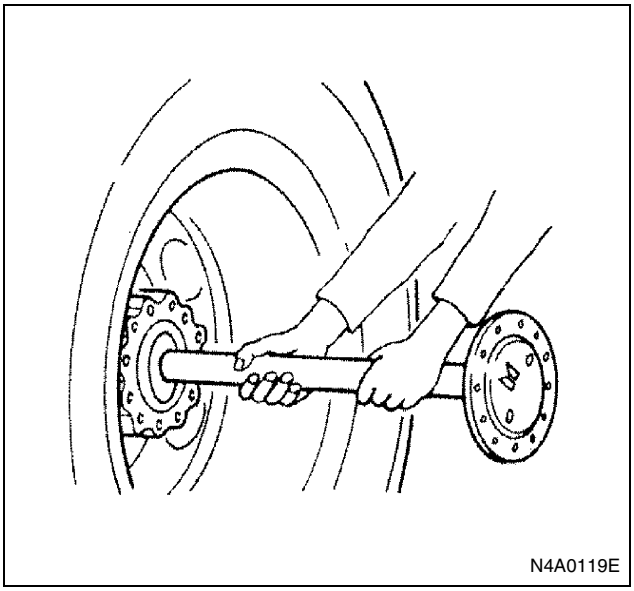


Legend
4. Bearing nut slit
5. Lock nut

11. Lock Washer
    1) Install the lock washer (6) with the lock washer tabs inserted to the axle case grooves.
    2) Install the lock bolts (7) to prevent the bearing nut from loosening.
    3) Check that the lock washer tabs (8) are inserted to the axle case grooves.



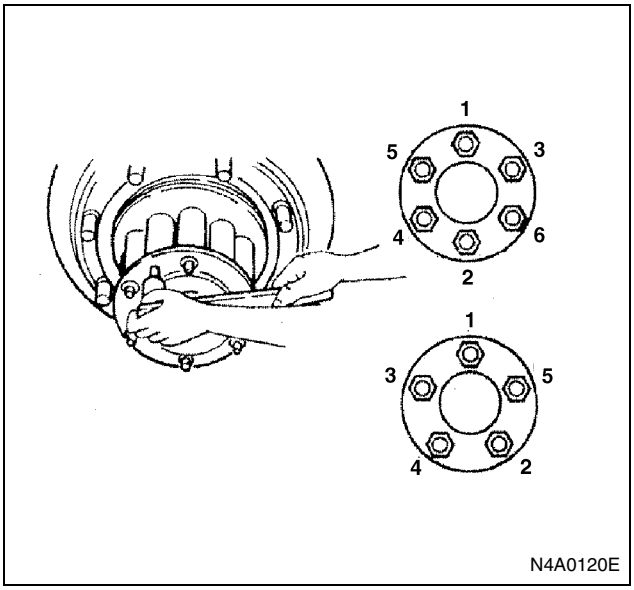
12. Outer Oil Seal
    Apply grease to the oil seal lip inner and outer circumferences.
13. Axle Shaft
    1) Clean the axle shaft.
    2) Apply gear oil to the axle shaft spline.
    3) Insert the axle shaft into the axle case.
       Take care not to damage the oil seal.



N4A0119E

    4) Tighten the axle shaft nuts to the specified torque a little at a time in the numerical order shown in the illustration.

Tighten:
Axel shaft nut to 46 N·m (4.7 kg·m / 34 lb·ft)

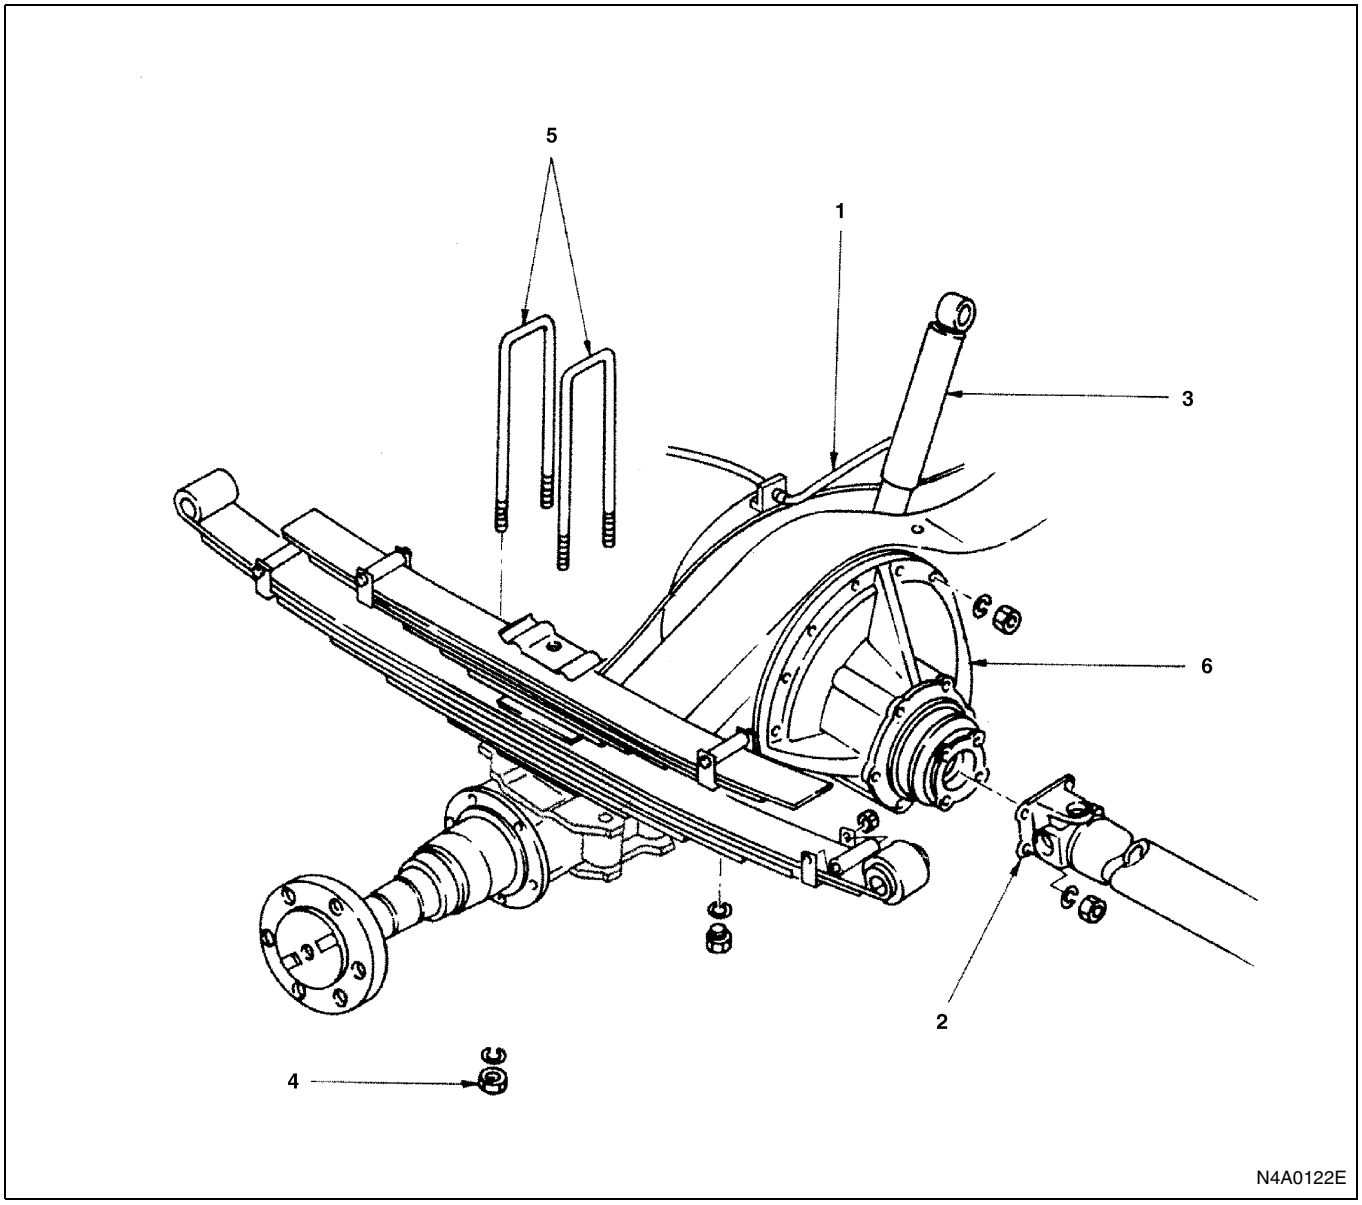


N4A0120E

14. Wheel and Tire

Tighten:
Wheel nut to
- NHR Dual Tire, NKR NPR Flat low: 343 N·m (35 kg·m / 253 lb·ft)
- Except above models: 490 N·m (50 kg·m / 361 lb·ft)
- NHR, NKR, S/Tire: 167 N·m (17 kg·m / 123 lb·ft)

Rear Axle Assembly



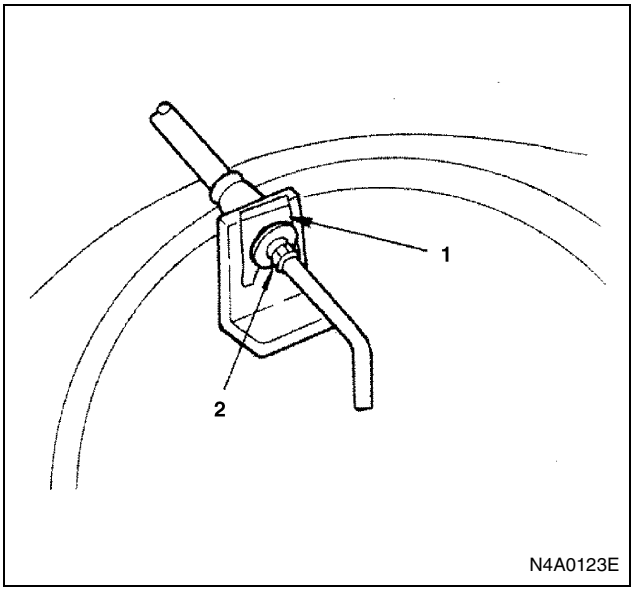
Legend

1. Rear flexible hose
2. Rear propeller shaft
3. Rear shock absorber
4. Nut and washer
5. U-bolt
6. Rear axle assembly

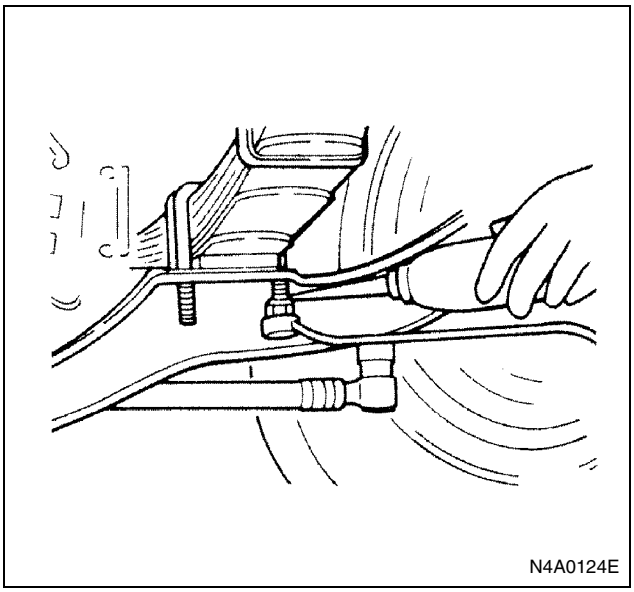
Removal

Preparation:
Jack up and support the vehicle on stands.

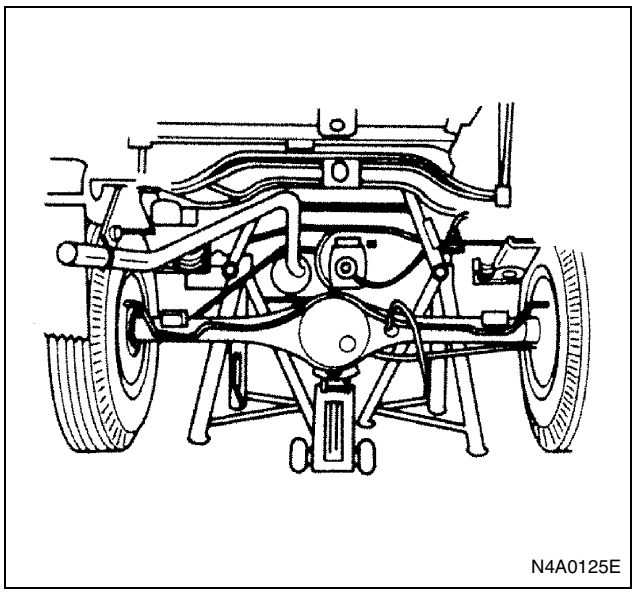
1. Rear Flexible Hose
   Loosen the nut (1), then ply off a clip (2).



2. Rear Propeller Shaft
3. Rear Shock Absorber
   Remove the shock absorber lower end.
4. Nut and Washer
   If the U-bolt are heavily rusted, apply a generous amount of oil to the threads when turning them loose the prevent seizure.



5. U-bolt
6. Rear Axle Assembly
   Move to the rear axle side.

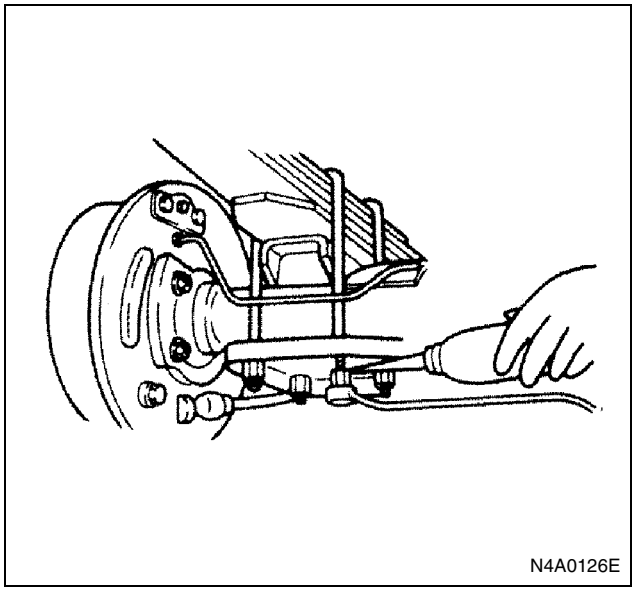


Installation

1. Rear Axle Assembly
2. U-bolt
3. Nut and Washer
   When tightening the nuts apply oil as necessary to prevent damaging the threads.

Tighten:
U-bolt nut

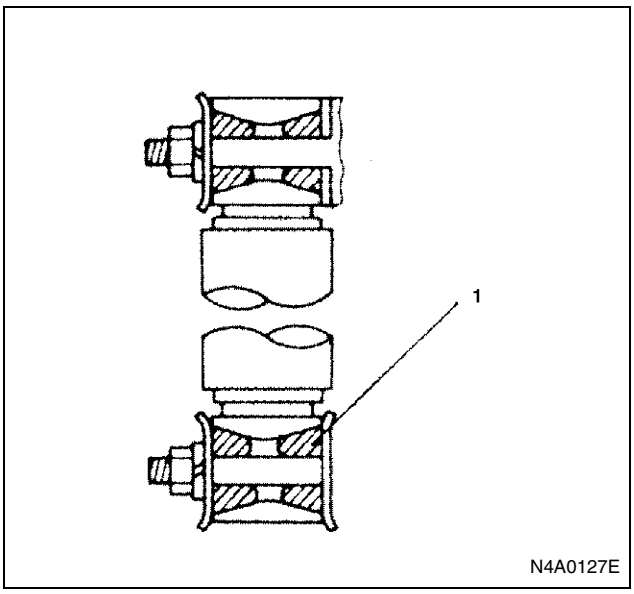
- NQR: 294 N·m (30 kg·m / 217 lb·ft)
- Except NQR: 177 N·m (18 kg·m / 130 lb·ft)



4. Rear Shock Absorber
   Refer to the drawing for parts installation.

Tighten:
Shock absorber lower nut

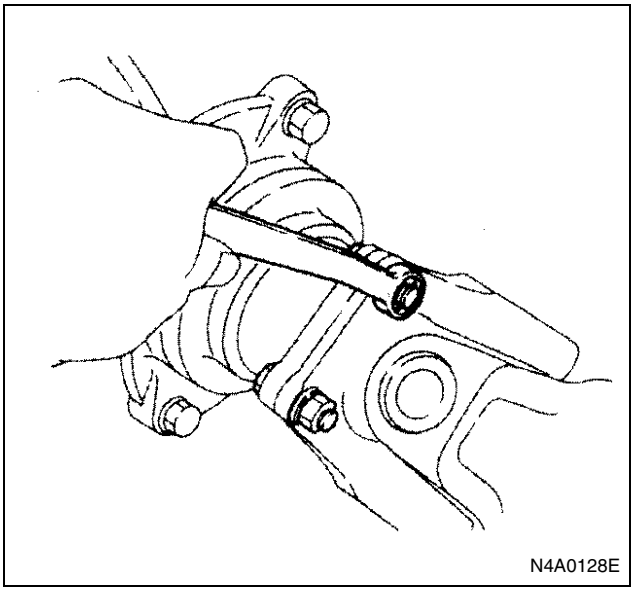
- NHR, NKR single tire: 61 N·m (6.2 kg·m /45 lb·ft)
- NKR dual tire: 95 N·m (9.7 kg·m / 70 lb·ft)
- NPR, NQR, NPS: 40 N·m (4.1 kg·m / 30 lb·ft)



Legend
1. Rubber bushing

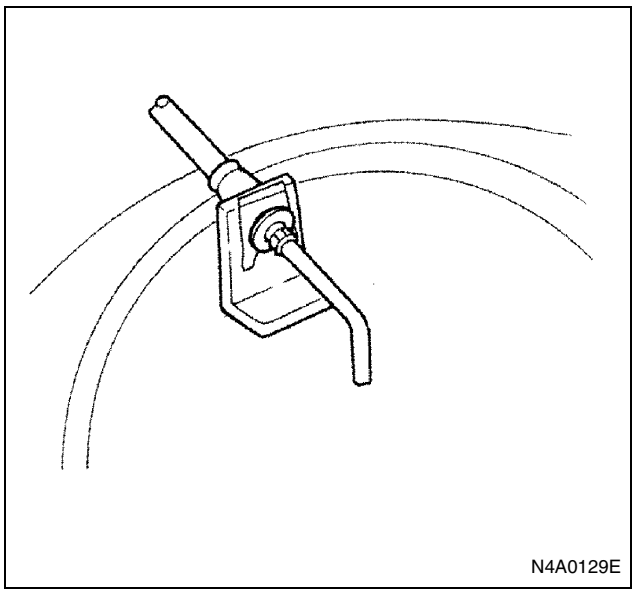
5. Rear Propeller Shaft
   Connect the propeller shaft assembly after tightening U-bolt nuts.

Tighten:
Propeller shaft nut
- M10: 63 N·m (6.4 kg·m / 46 lb·ft)
- M12: 103 N·m (10.5 kg·m / 76 lb·ft)



6. Rear Flexible Hose
   To install, follow the disassemble procedure in reverse order.

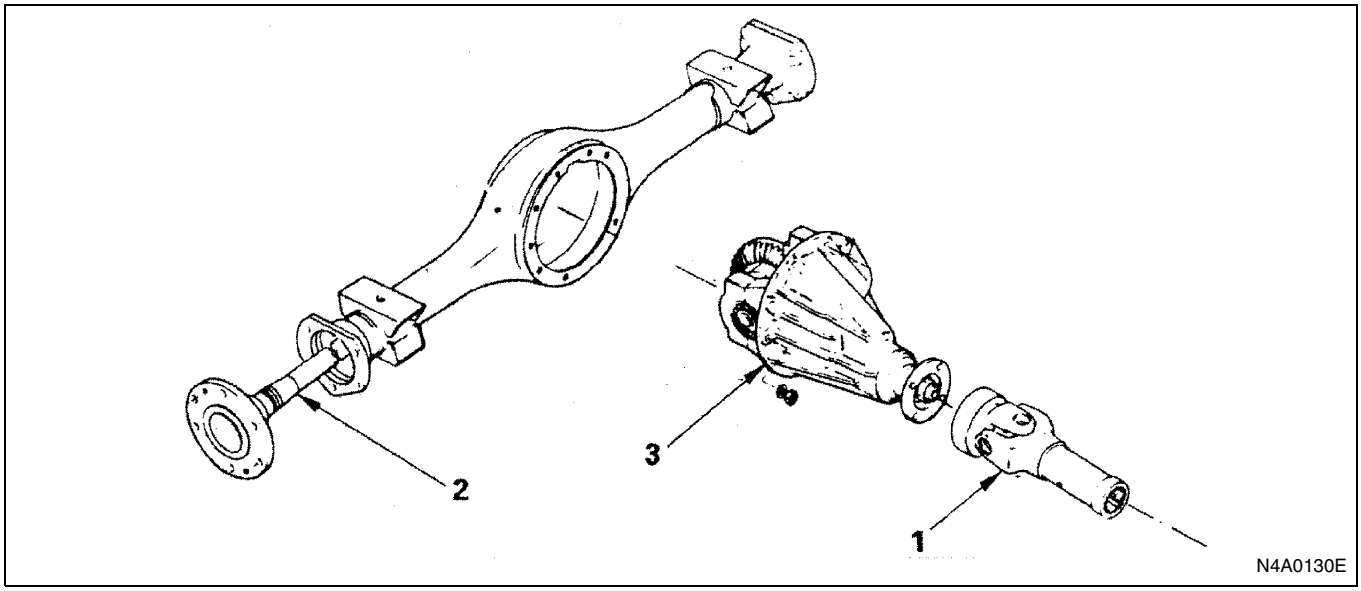
Tighten:
Flare nut to 16 N·m (1.6 kg·m / 12 lb·ft)



Perform bleeding operation after installation of the brake flexible hoses.

Refer to Section 5 “Service information” for brake oil air bleeding procedure.

Differential Assembly (NHR Single Tire Model; Semi-Floating)



Legend

1. Propeller shaft
2. Axle shaft with brake assembly
3. Differential assembly

Removal

Preparation:

- Raise vehicle to working level.
- Support the axle assembly with suitable jack and chassis stand.
- Drain the oil from the axle case.

1. Propeller Shaft
2. Axle Shaft with Brake Assembly
   To remove the axle shaft assembly, follow the removal procedure outlined under “Rear Hub and Brake Drum” after finding the axle assembly is semi-floating rear axle.
3. Differential Assembly

Installation

1. Differential Assembly
   Apply liquid gasket (BELCO BOND NO. 4 or equivalent) to the jointing faces of the axle case and carrier.

Tighten:
Differential carrier bolt and nut to

- Bolt: 64 N·m (6.5 kg·m / 47 lb·ft)
- Nut: 64 N·m (6.5 kg·m / 47 lb·ft)

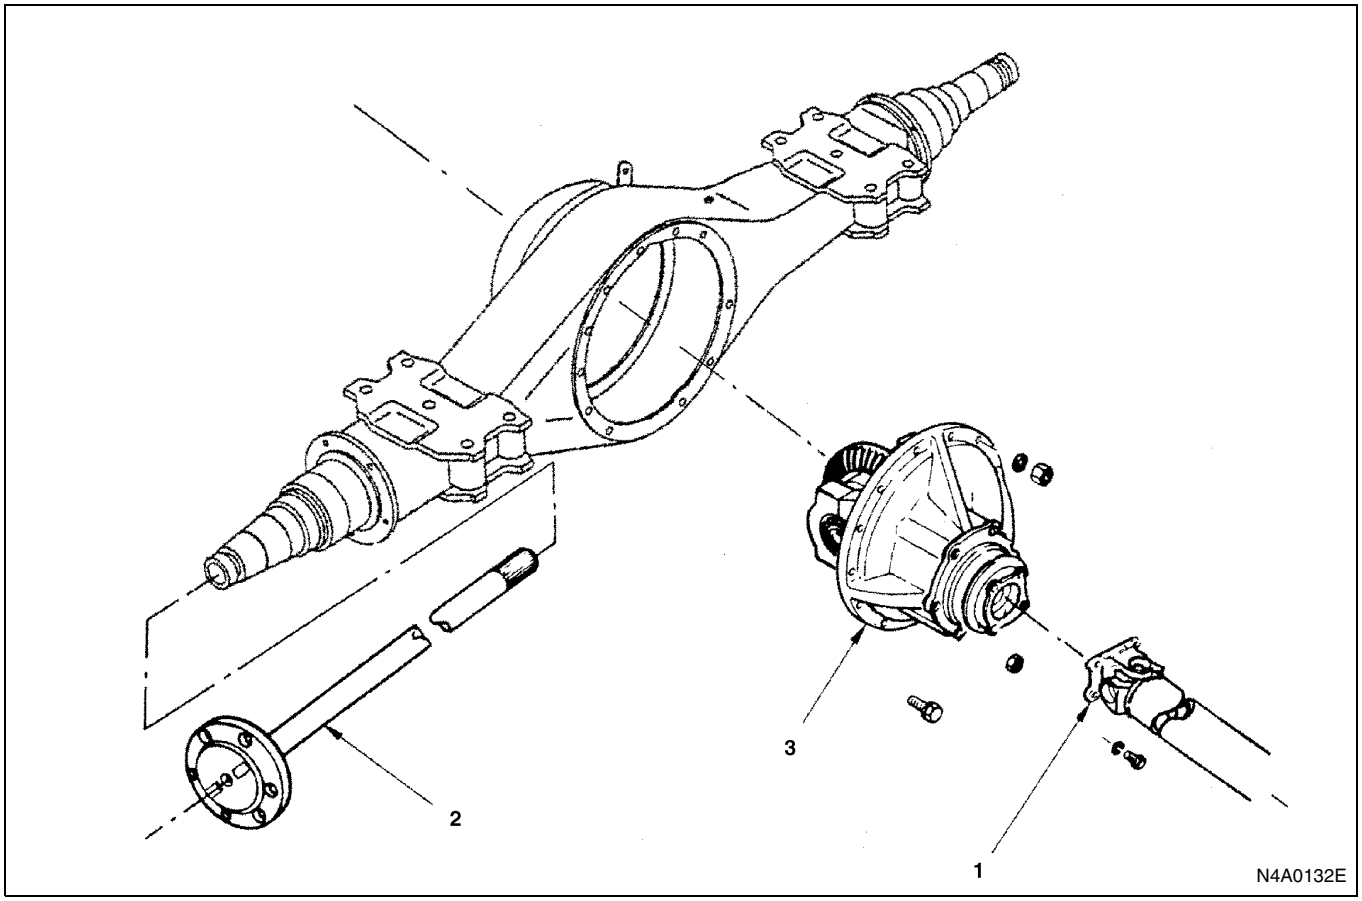
2. Axle Shaft with Brake Assembly
   To install the axle shaft assembly, follow the installation procedure outlined under “Rear Hub and Brake Drum” after finding the axle assembly is semi-floating rear axle.

Tighten:
Bearing holder nut to: 74 N·m (7.5 kg·m / 54 lb·ft)

3. Propeller Shaft

Tighten:
Propeller shaft nut torque: 63 N·m (6.4 kg·m / 46 lb·ft)

Differential Assembly (NKR Single Tire and All Dual Tire Models; Full Floating)



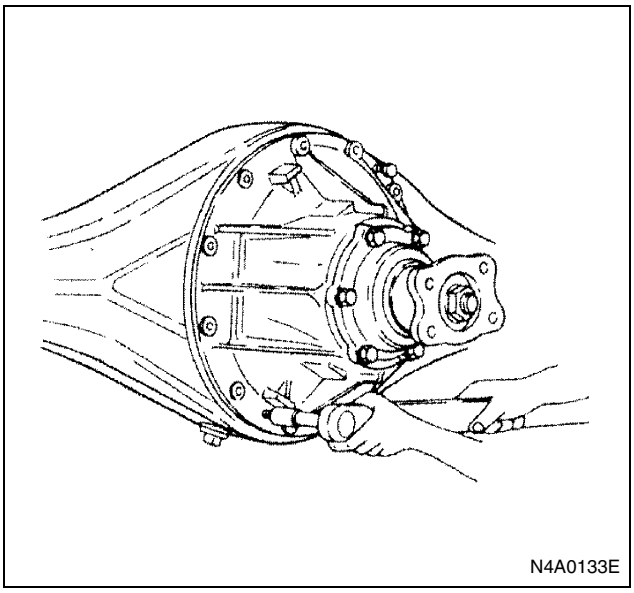
Legend

1. Propeller shaft
2. Axle shaft
3. Differential assembly

Removal

Preparation:
Drain the oil from the axle case.

1. Propeller Shaft
2. Axle Shaft
3. Differential Assembly
   To remove, turn push bolt into threaded holes in the differential carrier, so that differential assembly is lifted off the position.



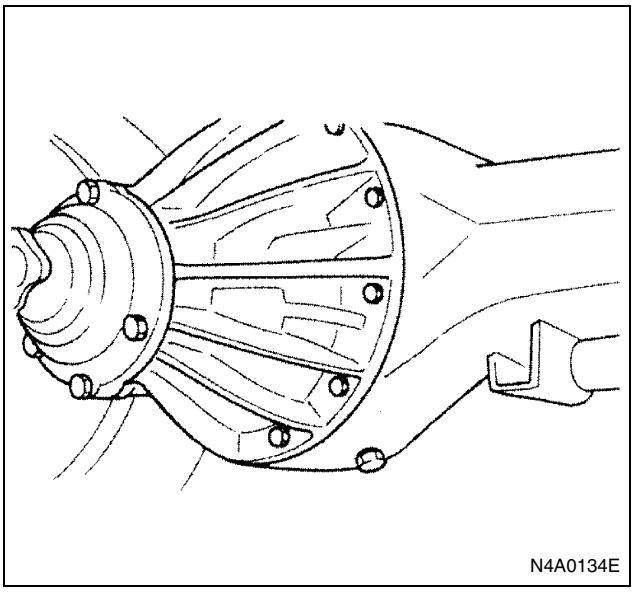
N4A0133E

Installation

1. Differential Assembly
   Apply liquid gasket (BELCO BOND No. 4 or equivalent) to the joining faces of the axle case and carrier.

Tighten:
Differential carrier bolt and nut to

- 244 — 320 mm differential: 64 N·m (6.5 kg·m / 47 lb·ft)



N4A0134E

2. Axle Shaft

Tighten:
Axle shaft nut to 46 N·m (4.7 kg·m / 34 lb·ft)

3. Propeller Shaft

Tighten:
Propeller shaft nut to

- M10: 62.7 N·m (6.4 kg·m / 46 lb·ft)
- M12: 103 N·m (10.5 kg·m / 76 lb·ft)

UNIT REPAIR

244 mm Rear Differential

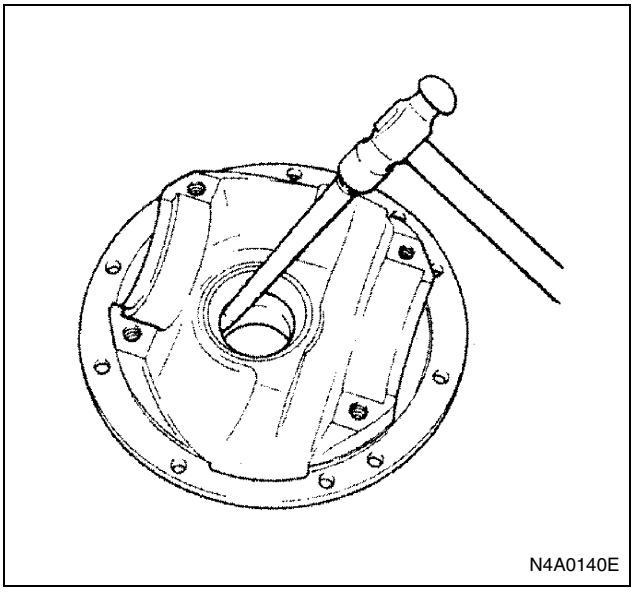
16. Outer Bearing Inner Race
17. Outer Bearing Outer Race
    Drive out the inner bearing outer race or the outer bearing outer race together with the outer bearing inner race and oil seal by using a proper bar through two notches.



N4A0140E

Reassembly

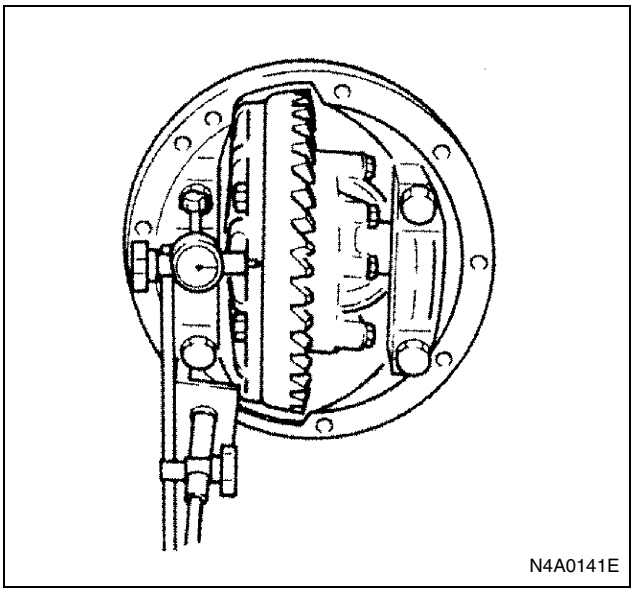
Measurement of ring gear run-out

Install dummy bearing into the differential assembly, then install these parts in the differential carrier.
Install and tighten the bearing cap.
Dummy bearing: 9-8522-1137-0

Tighten:

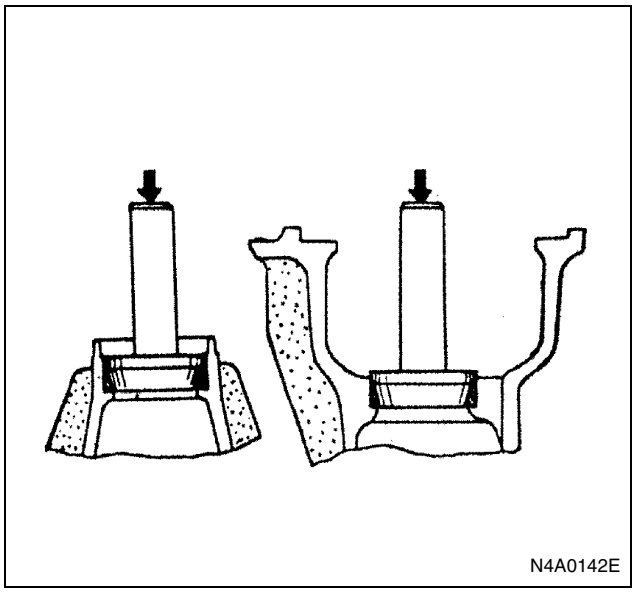
Bearing cap bolt to 108 N·m (11.0 kg·m / 80 lb·ft)

Ring gear run-out,
Standard: 0.05 mm (0.002 in)
Limit: 0.2 mm (0.008 in)



N4A0141E

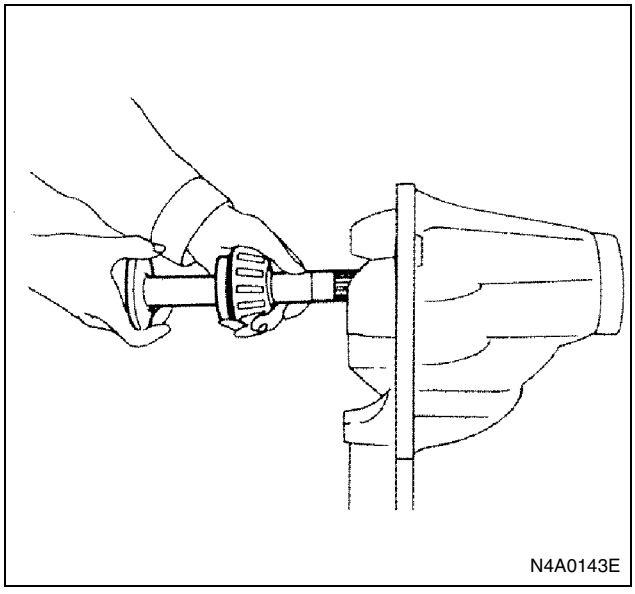
1. Outer Bearing Outer Race
2. Pinion Depth Adjusting Shim
3. Inner Bearing Outer Races
   Adjustment of drive pinion engagement depth.
   Install the inner and outer bearing outer races without shims into the differential carrier using a bench press.
   Installer (inner): 9-8522-1196-0
   (Outer): 9-8522-1197-0
   Grip: 9-8522-1148-0



N4A0142E

Assemble the inner bearing inner race to the dummy pinion shaft, then install these parts into the carrier.

Dummy Pinion Shaft: 9-8522-1603-0

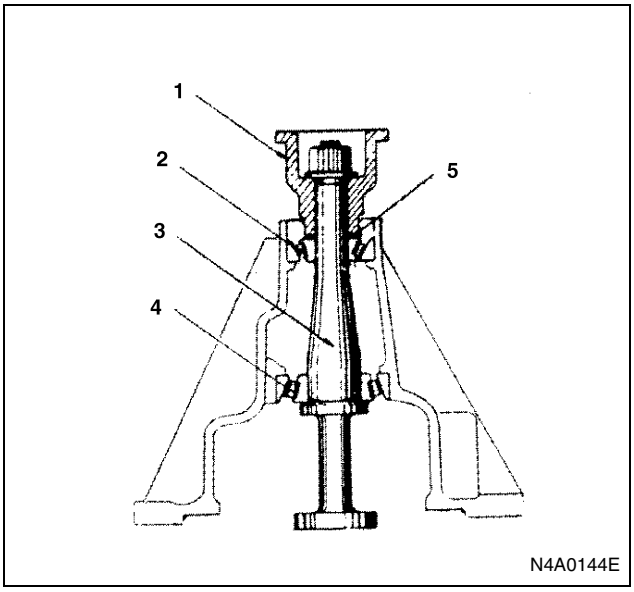


N4A0143E

Install the outer bearing inner race, flange, washer and dummy nut.

Lubricate the bearing before tighten the dummy nut.

Dummy Nut: 9-8522-1624-0



Legend

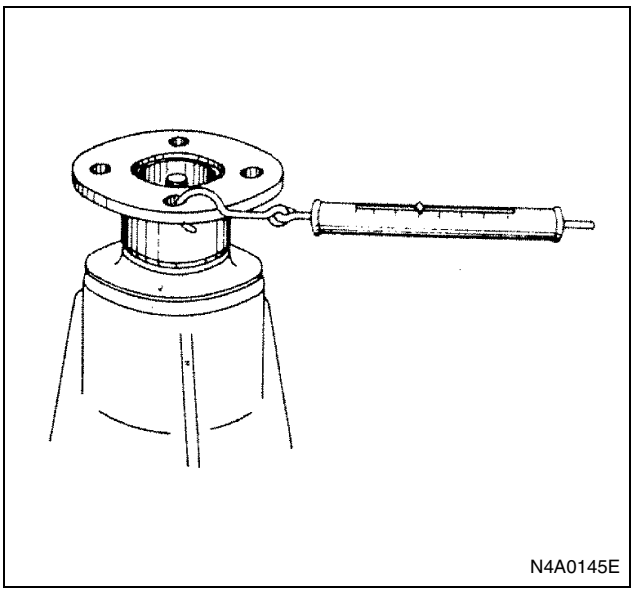
1. Coupling driver
2. Outer bearing
3. Dummy pinion shaft
4. Inner bearing
5. Shim

Tighten the dummy nut until specified preload are required to rotate the bearing.

Bearing preload
New bearing: 16 — 29 N (1.6 — 3.0 kg / 3.5 — 6.6 lb)
Used bearing: 8 — 14.5 N (0.8 — 1.5 kg / 1.8 — 3.3 lb)

Tighten:
Starting to

- New bearing: 0.69 — 1.27 N·m (7.0 — 13.0 kg·cm / 6.1 — 11.3 lb·in)
- Used bearing: 0.35 — 0.64 N·m (3.5 — 6.5 kg·cm / 3.1 — 5.7 lb·in)

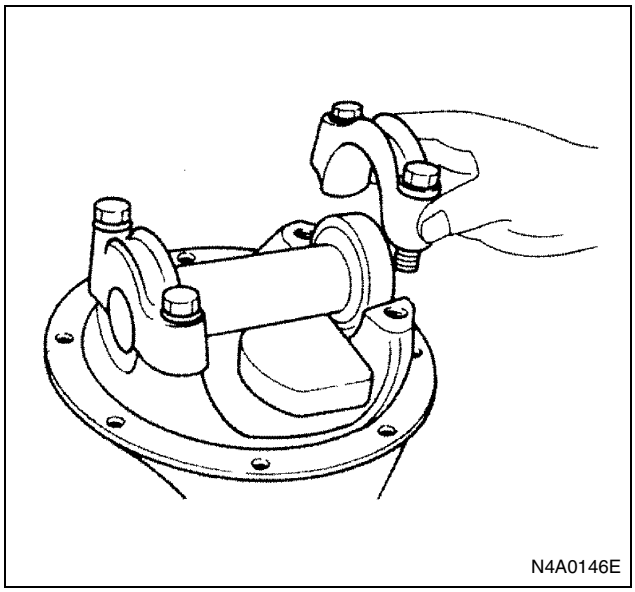


Install dummy bearing on dummy shaft and install these parts into the carrier. Install and tighten the bearing cap.

Dummy Shaft: 9-8522-1138-0

Dummy Bearing: 8-8522-1137-0

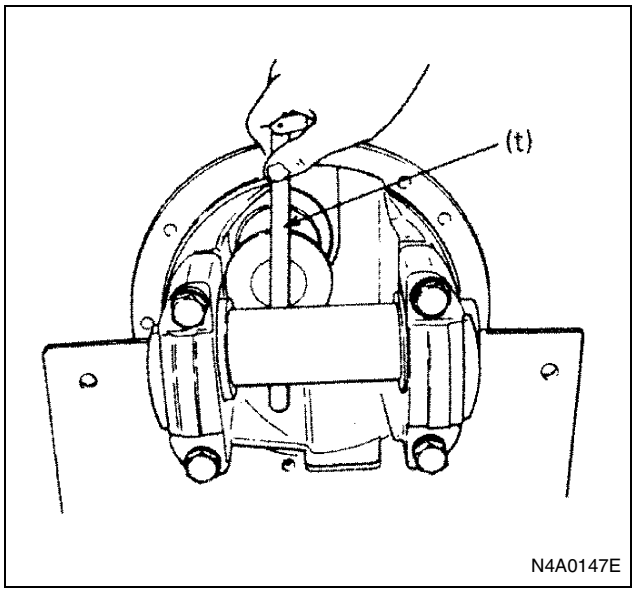
Tighten:
Bearing cap bolt to 108 N·m (11.0 kg·m / 80 lb·ft)



Measure the clearance (t) with a feeler gauge.

The clearance (t) is equal to the shim in thickness.

Thickness of shim available, 2.12, 2.16 ... 2.52, 2.56 mm (0.083, 0.085 ... 0.099, 0.100 in)

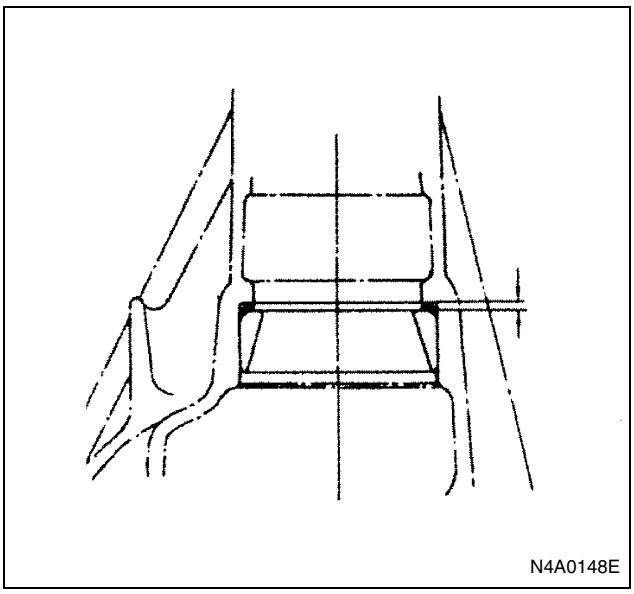


Remove dummy pinion, dummy shaft, dummy bearing and inner bearing outer race.

Install pinion depth adjusting shim of specified thickness in position between the inner bearing outer race and the carrier, then install the inner bearing outer race.

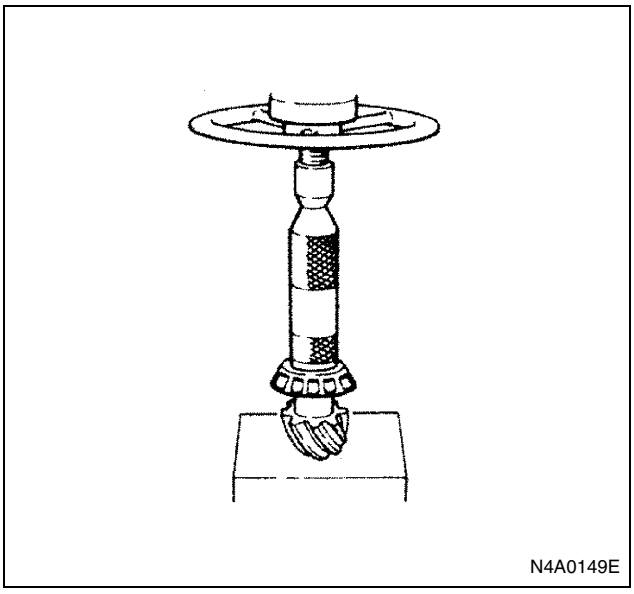
Installer: 9-8522-1196-0

Grip: 9-8522-1148-0



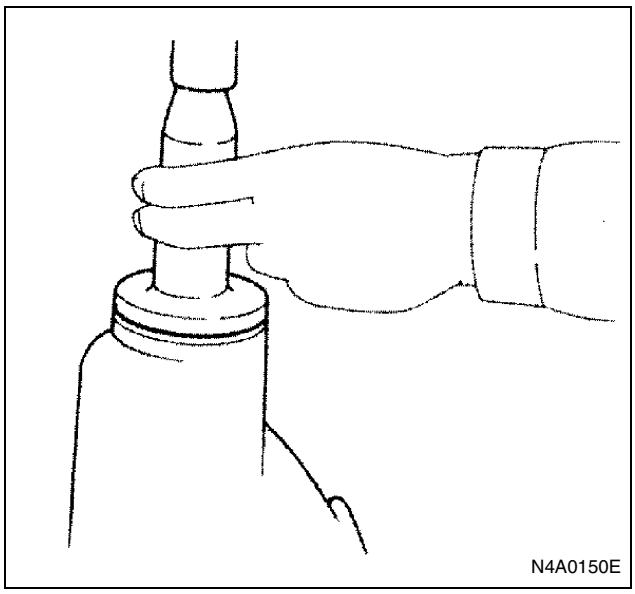
N4A0148E

4. Inner Bearing Inner Race
   Installer: 9-8522-0018-0
   Apply gear oil to the pinion shaft before installing final drive pinion assembly into carrier.



N4A0149E

5. Outer Bearing Inner Race
6. Oil seal
   Installer: 5-8840-2047-0



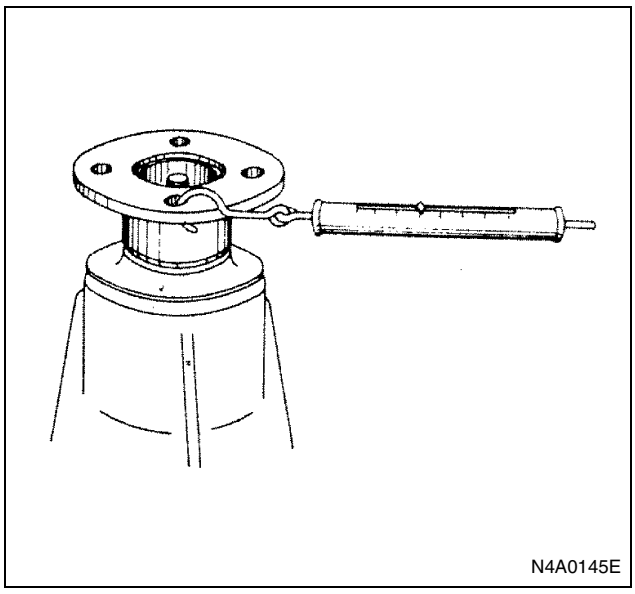
N4A0150E

7. Drive Pinion
8. Collapsible Spacer (NHR model)
   Discard used collapsible spacer and install a new one.
9. Distance Piece (NKR model)
10. Bearing Preload Adjusting Shim (NKR model)
    Use a dummy nut until specified bearing preload is obtained.

Bearing preload
New bearing: 16 — 29 N (1.6 — 3.0 kg / 3.5 — 6.6 lb)
Used bearing: 8 — 14.5 N (0.8 — 1.5 kg / 1.8 — 3.3 lb)

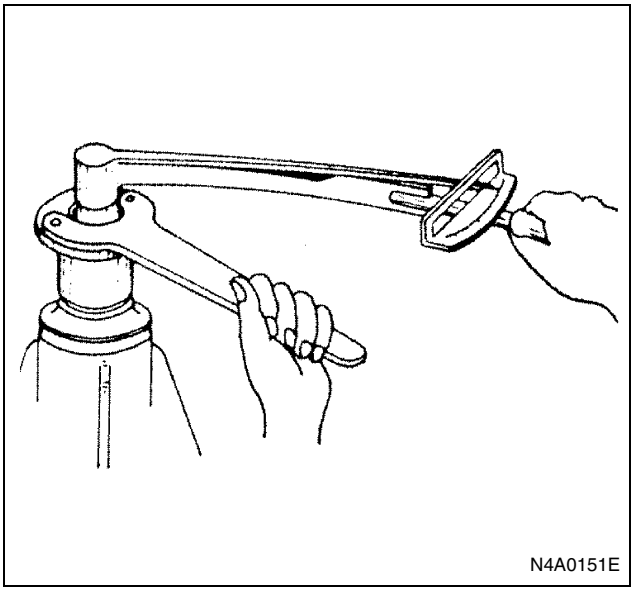
Tighten:
Starting to

- New bearing: 0.69 — 1.27 N·m (7.0 — 13.0 kg·cm / 6.1 — 11.3 lb·in)



N4A0145E

Tighten:
Dummy nut to 270 N·m (27.5 kg·m / 199 lb·ft)



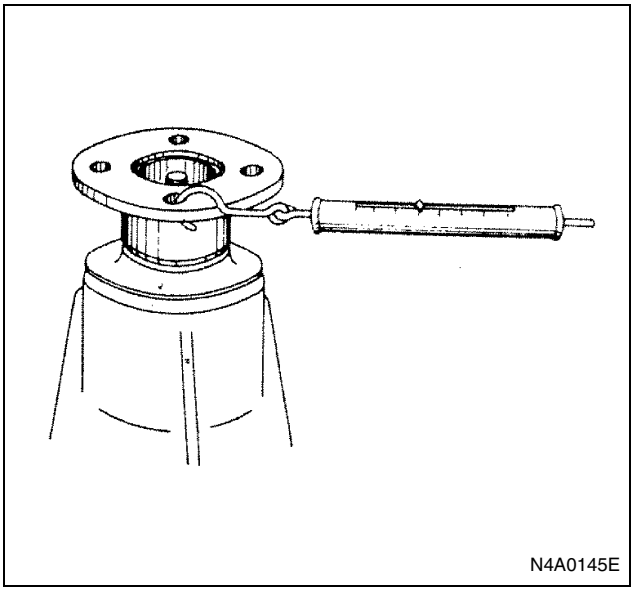
N4A0151E

Thickness of shim available, 1.53, 1.56 ... 2.07, 2.10 mm (0.060, 0.061 ... 0.081, 0.082 in)

11. Flange
12. Flange Nut
    (NHR only for collapsible spacer)
    1) Tighten the flange nut to a torque of 245 N·m (25 kg·m/181 lb·ft).
    2) Make an adjustment by tightening the flange nut until specified bearing pre-load is obtained.

Bearing preload
New bearing: 16 — 29 N (1.6 — 3.0 kg / 3.5 — 6.6 lb)
Used bearing: 8 — 14.5 N (0.8 — 1.5 kg / 1.8 — 3.3 lb)

Tighten:
Starting to
- New bearing: 0.69 — 1.27 N·m (7.0 — 13.0 kg·cm / 6.1 — 11.3 lb·in)
- Used bearing: 0.35 — 0.64 N·m (3.5 — 6.5 kg·cm / 3.1 — 5.7 lb·in)



N4A0145E

    3) The flange nut should be within the specified range when specified bearing preload is obtained.

Tighten:
Flange nut to 245 — 294 N·m (25 — 30 kg·m / 181 — 217 lb·ft)

Discard used flange nut and install new one.

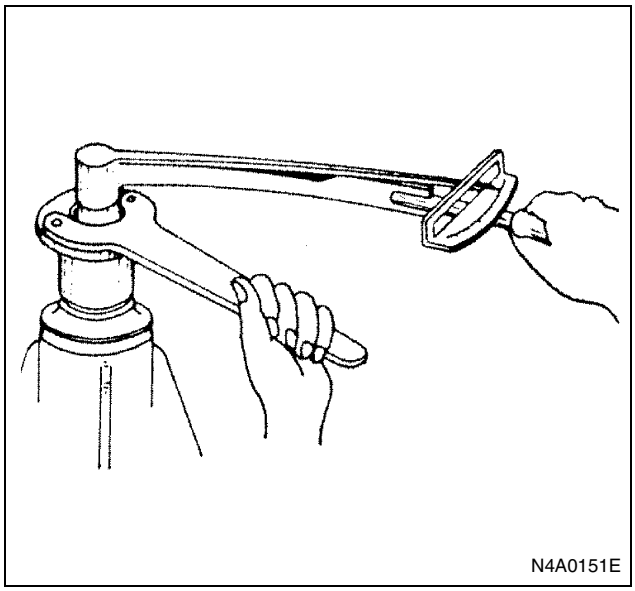
(NKR only for distance piece)

Once specified bearing preload is obtained by dummy nut, remove dummy nut and replace with flange nut.

Tighten the flange nut until specified bearing preload and nut torque.

Using special tool, stake the flange nut at two points.

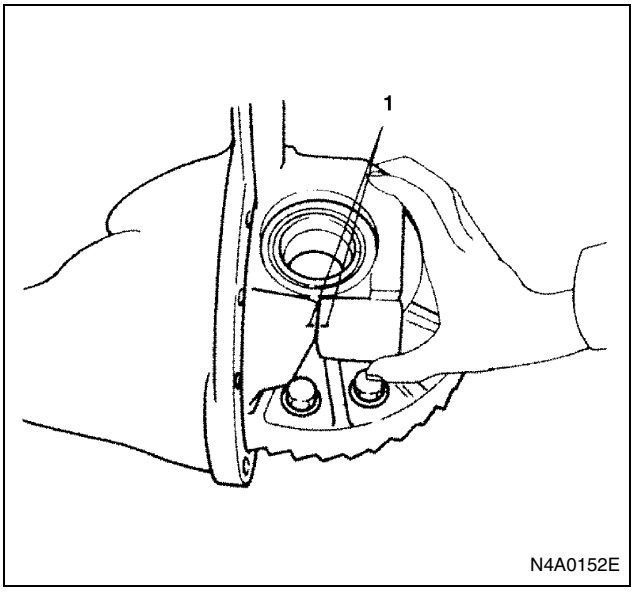
Punch: 5-8840-2293-0



N4A0151E

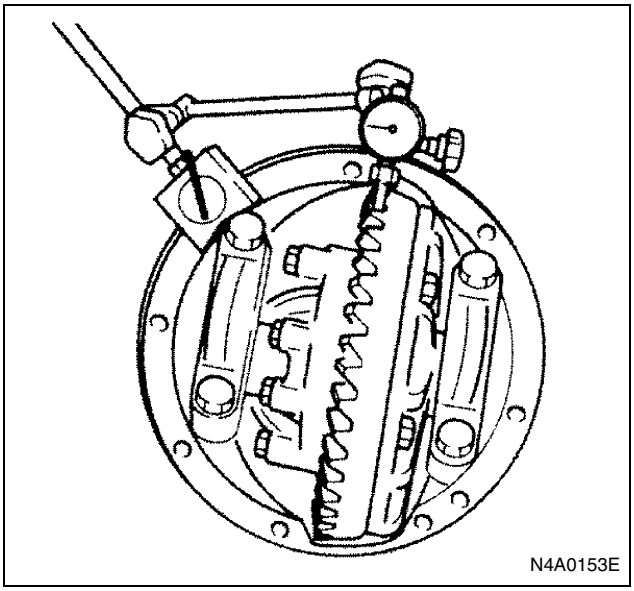
13. Backlash and Preload Adjusting Shim
    1) Adjustment of Backlash
    - Install dummy bearing in the differential cage assembly, then install differential cage assembly and ring gear into the differential carrier. Install the bearing caps after checking to make certain setting marks (1) applied at disassembly are in alignment.

Tighten:
Bearing cap bolt to 108 N·m (11.0 kg·m /80 lb·ft)

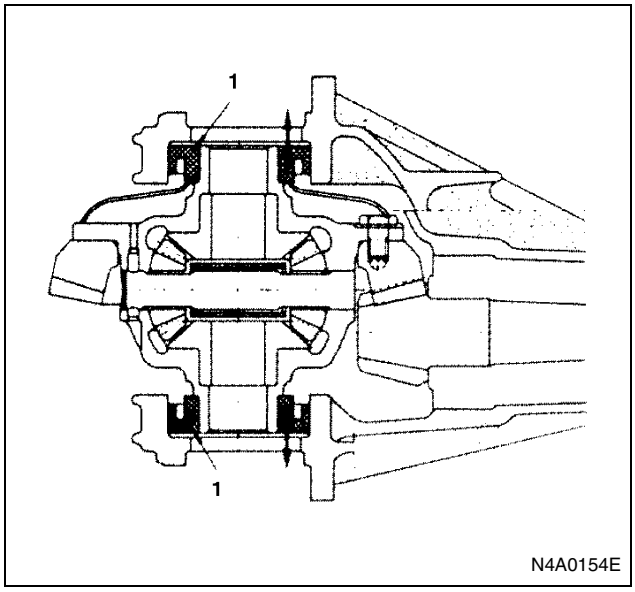


- Set the dial indicator and measure the backlash between the drive pinion and ring gear at the foot portion of the ring gear.

Backlash, 0.15 — 0.20 mm (0.006 — 0.008 in)

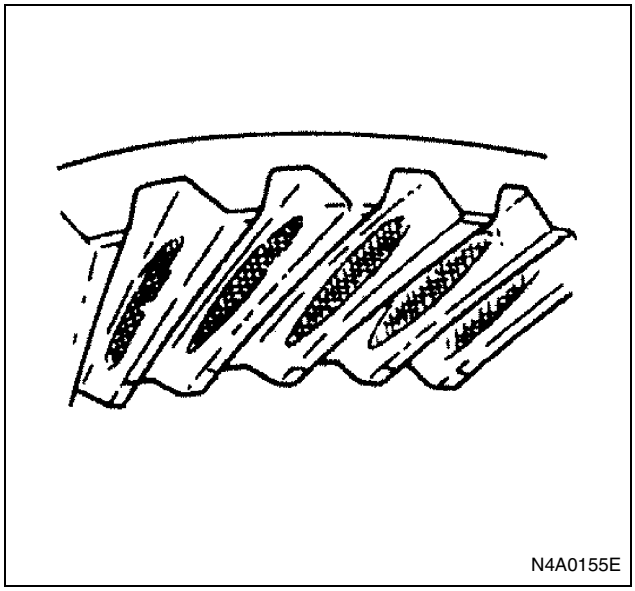


- To adjust backlash, loosen bearing cap bolts slightly and move the dummy bearing (1) as necessary.
  A clearance should not be provided between dummy bearing and bearing fitting face of the differential cage.



2) Inspection of drive pinion and ring gear tooth contact.

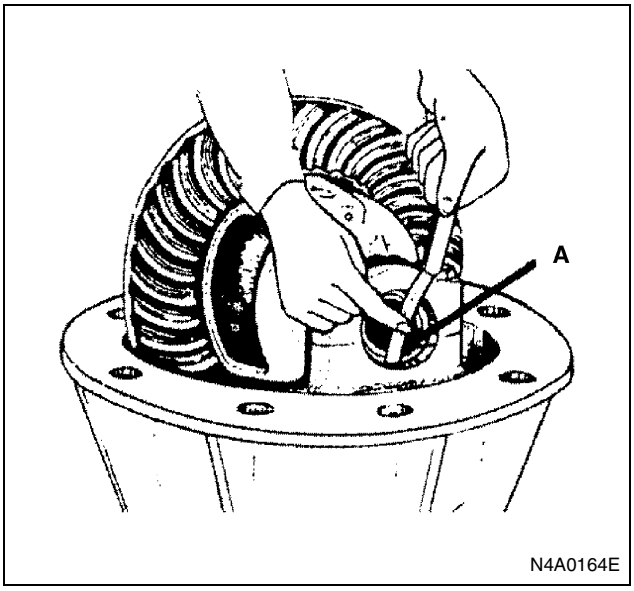
- Apply a thin coat of red check to faces of the 7 — 8 teeth of the ring gear.
- Check the impression of contact (Right contact) obtained on the ring gear teeth and make necessary adjustment as described below if the contact is abnormal.



TOOTH CONTACT	CASE	ADJUSTMENT PROCEDURE
 N4A0156E	Drive pinion is too far away from ring gear.	1. Move the drive pinion in toward the ring gear by decreasing the thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear away from the drive pinion.  N4A0160E
 N4A0157E	Drive pinion is too close to the ring gear.	1. Move the drive pinion away from the ring gear by increasing thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear in toward the drive pinion. N4A0161E
 N4A0158E	Ring gear is too close to the drive pinion.	1. Move the drive pinion in toward the ring gear by decreasing thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear away from the drive pinion. N4A0162E
 N4A0159E	Ring gear is too for away from drive pinion.	1. Move the drive pinion away from the ring gear by increasing thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear in toward the drive pinion. N4A0163E

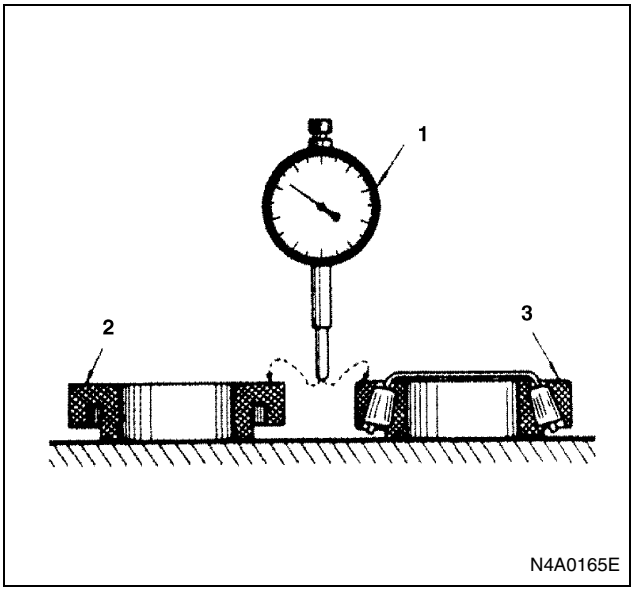
3) Selection of Preload Adjusting Shim

- Measure the clearance (A) between the differential carrier and right and left side (dummy) bearings by using a feeler gauge.
  Carefully note the relationship between the values obtained through measurement at each side and dummy bearings.



N4A0164E

- Measure the thickness of dummy bearing and side bearing.
  Comparison should be made between the thicknesses of dummy bearing and side bearing installed in the same position.



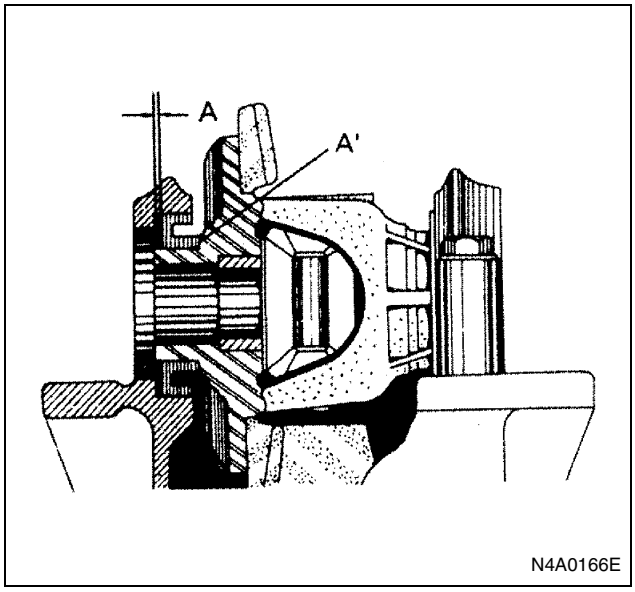
Legend
1. Dial gauge
2. Dummy bearing
3. Side bearing

When side bearing is thinner:
A+(dummy bearing thickness–side bearing thickness)=(X)
When side bearing is thicker:
A–(side bearing thickness–dummy bearing thickness)=(X)

- (X)+0.025=Shim thickness
  Allowance for bearing preload at one side=0.025

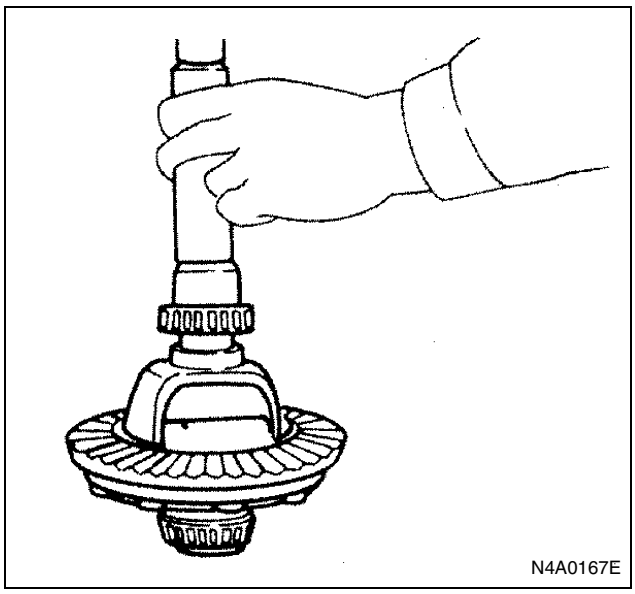
Example of calculation	mm (in.)
Measured Clearance A:	+0.85 (+0.033)
Suppose that the side bearing is thicker [thinner] than dummy bearing by 0.05 mm	–0.05 (–0.002) [+0.05 (+0.002)]
An allowance for bearing preload:	+0.025 (+0.0009)
Thickness of shims to be installed:	0.825 (0.032) [0.925 (0.036)]

Thickness of shim available, 0.25, 0.30, 0.35, 0.5 mm (0.009, 0.012, 0.014, 0.019 in)



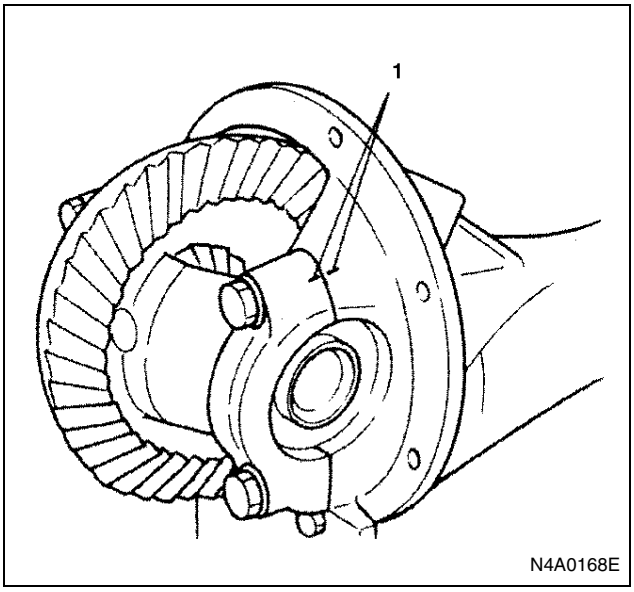
Legend
A. Measured clearance
A′. Shim installed position

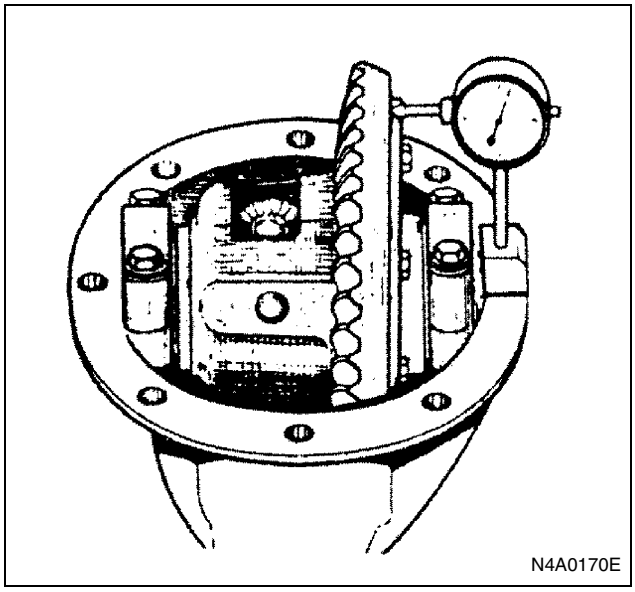
14. Side Bearing Inner Race
    Installer: 5-8840-2050-0
    Grip: 9-8522-1608-0



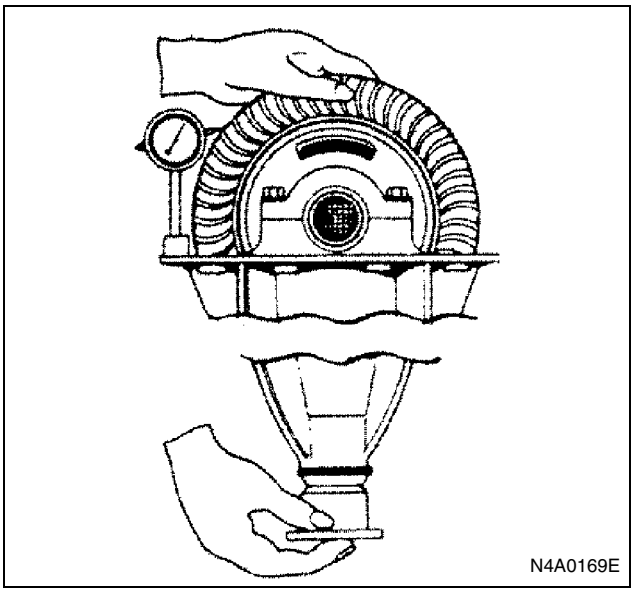
15. Differential Cage Assembly
16. Side Bearing Outer Race
17. Bearing Cap
    1) Install bearing caps by aligning setting marks (1) applied at disassembly.

Tighten:
Bearing cap bolt to 108 N·m (11.0 kg·m /80 lb·ft)





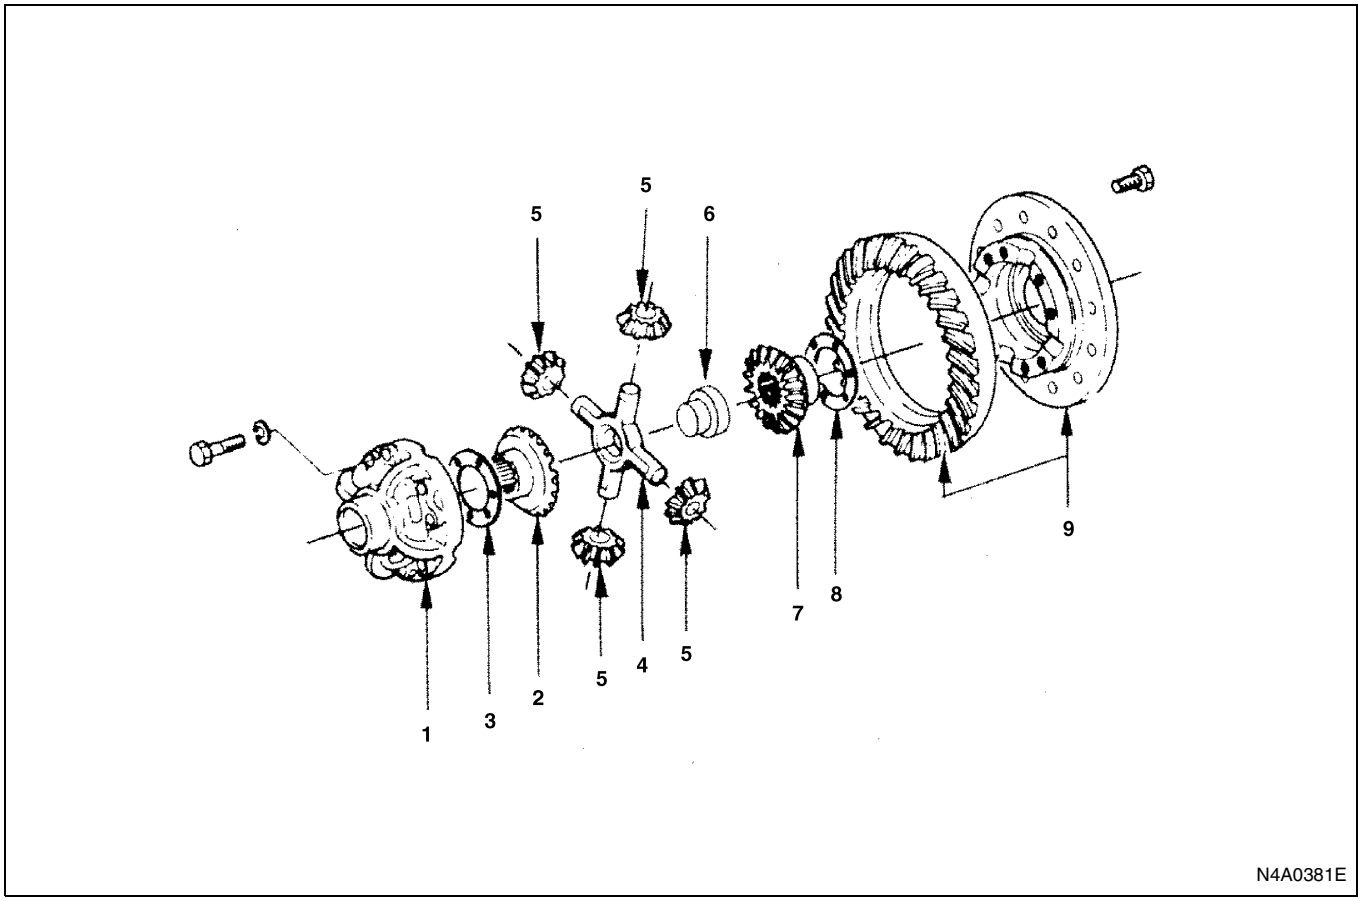
2) Recheck the backlash. If measurement indicates that the backlash deviates from the specified range, make an adjustment by shifting the position of shims in use without varying the total thickness.



Recheck the ring gear for run-out at the rear face. If the amount of run-out is excessive, repeat the disassembly and reassembly steps.

Ring gear run-out,
Standard: 0.05 mm (0.002 in)
Limit: 0.2 mm (0.008 in)

Differential Cage Assembly



Legend

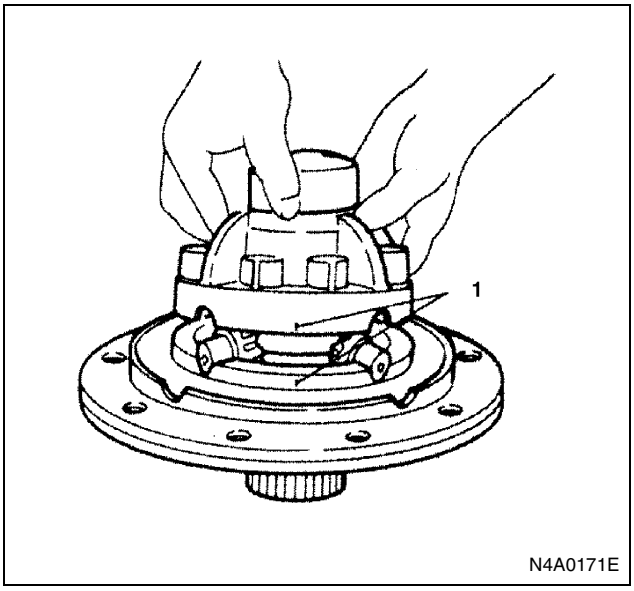
   Apply a setting mark (1) to the differential cage assembly.
2. Side Gear
3. Thrust Washer
4. Spider
5. Differential Pinion Gear
6. Thrust Piece
7. Side Gear
8. Thrust Washer
9. Differential Cage A and Ring Gear



Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

- Gear
- Bearing
- Oil seal
- Differential cage
- Drive pinion cage
- Parts organizing limited slip differential assembly

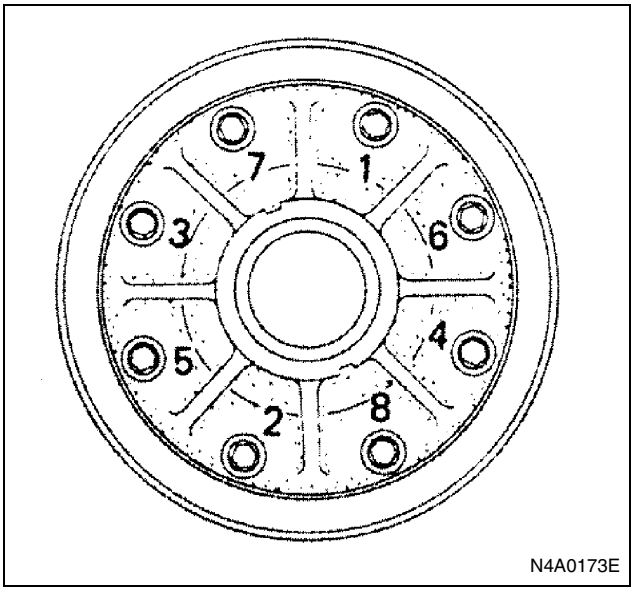
Ring Gear Replacement

The ring gear should always be replaced with drive pinion as a set.

When installing ring gear, apply stud lock to the threaded holes and bolts after treatment of the bolts with primer N.

Tighten:

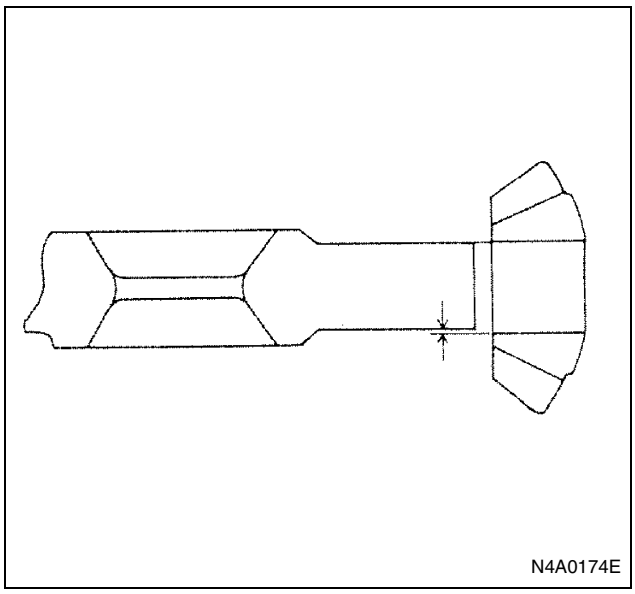
Ring gear bolt to 127 N·m (13.0 kg·m / 94 lb·ft)



Clearance between Differential Pinion and Spider

Standard: 0.07 — 0.13 mm (0.003 — 0.005 in)

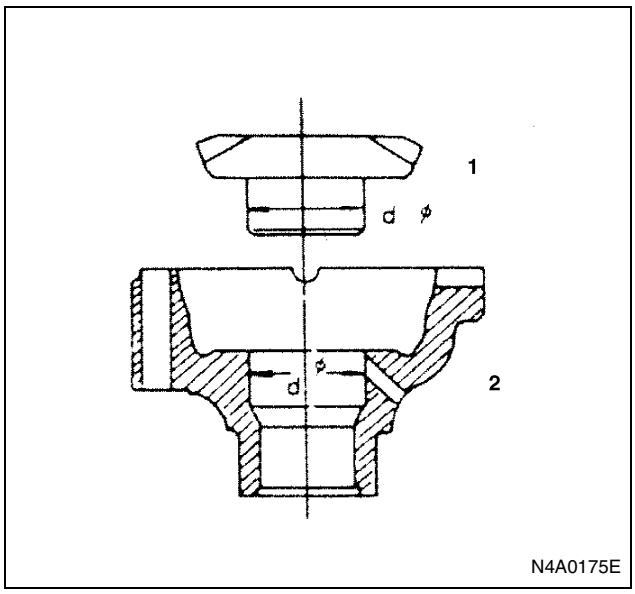
Limit: 0.2 mm (0.008 in)



Clearance between Side Gear and Differential Cage

Standard: 0.05 — 0.11 mm (0.002 — 0.004 in)

Limit: 0.25 mm (0.01 in)



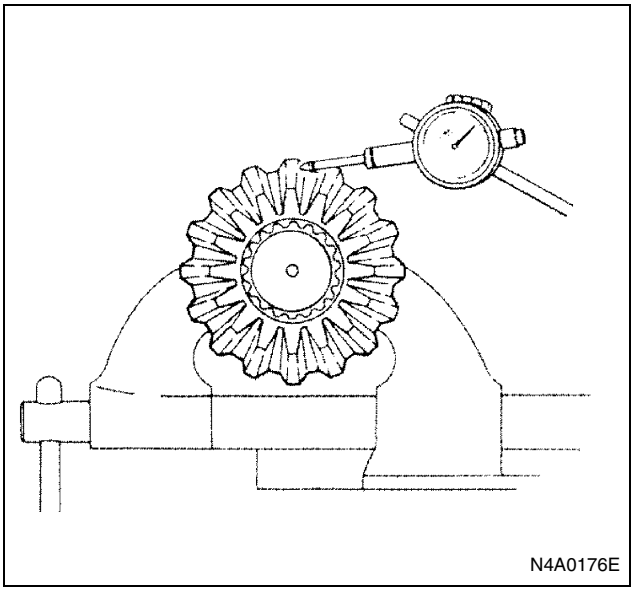
Legend

1. Side gear
2. Differential cage

Play in Splines between Side Gear and Axle Shaft

Standard: 0.02 — 0.12 mm (0.0008 — 0.005 in)

Limit: 0.25 mm (0.01 in)

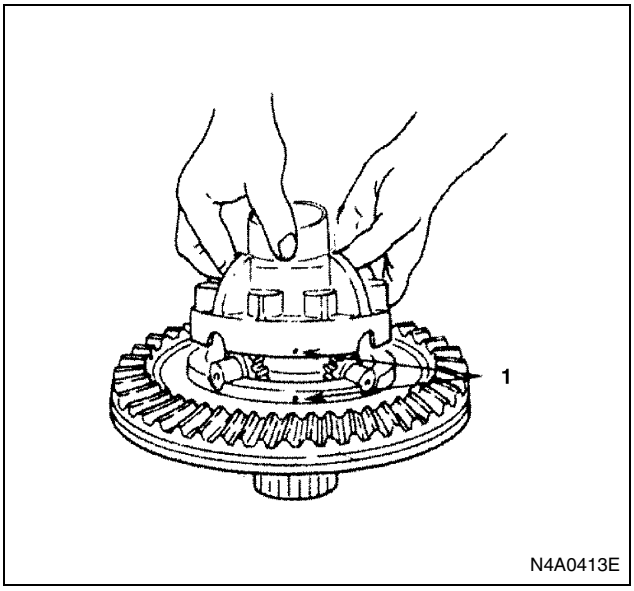


N4A0176E

Reassembly

1. Differential Cage A and Ring Gear
2. Thrust Washer
3. Side Gear
4. Thrust Piece
5. Differential Pinion Gear
6. Spider
7. Thrust Washer
8. Side Gear
9. Differential Cage B
   1) Apply oil to the threaded portion of the bolts before installation.
   2) Fasten the differential cages A and B so that the setting marks (1) are correctly aligned.

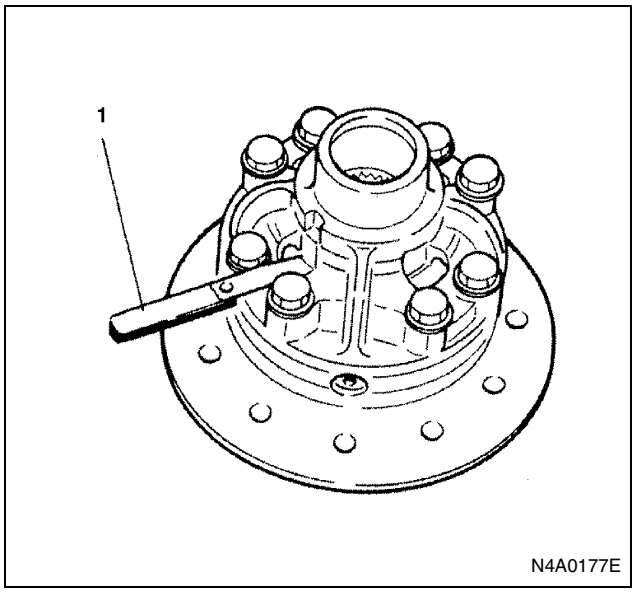
Tighten:
Differential cage bolt to 78 N·m (8.0 kg·m / 58 lb·ft)



N4A0413E

3) Measure the clearance between the back face of the side gear and the differential cage B by inserting a feeler gauge (1) through the hole on the cage B.

Clearance, 0.13 — 0.18 mm (0.005 — 0.007 in)



N4A0177E

When the clearance exceed a limit, replace the thrust washer or side gear.

7. Shim
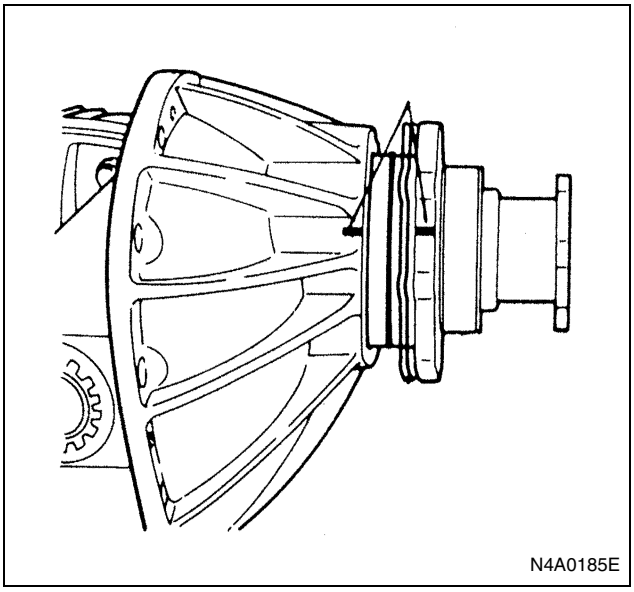
8. Drive Pinion Cage Assembly
   Install the shim removed and pinion aligning the oil hole or setting mark applied on removal.

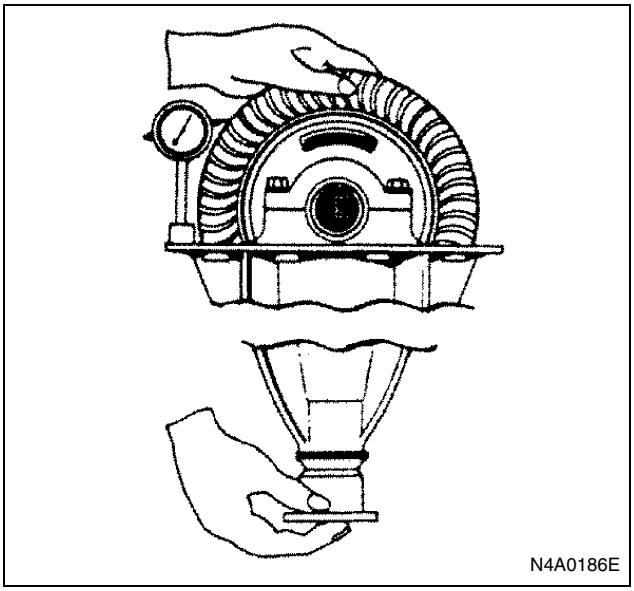
Tighten:
Drive pinion cage bolt to

- 292 mm differential: M12 bolt to 69 N·m (7.0 kg·m / 51 lb·ft), M14 bolt to 78 N·m (8.0 kg·m / 58 lb·ft)
- 320 mm differential: 72 N·m (7.3 kg·m / 53 lb·ft)



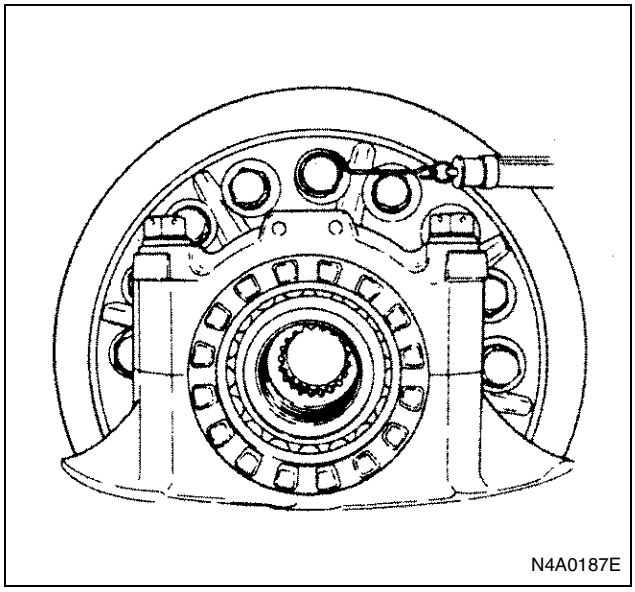
N4A0185E

Backlash between Drive Pinion and Ring Gear
Backlash,
292 mm differential: 0.18 — 0.23 mm (0.007 — 0.009 in)
320 mm differential: 0.19 — 0.29 mm (0.007 — 0.011 in)



N4A0186E

Bearing preload,
N.S.K. bearing: 5.7 — 13.0 N (0.58 — 1.33 kg / 1.3 — 2.9 lb)
Koyo bearing 11.5 — 17.9 N (1.17 — 1.83 kg /2.6 — 4.0 lb)

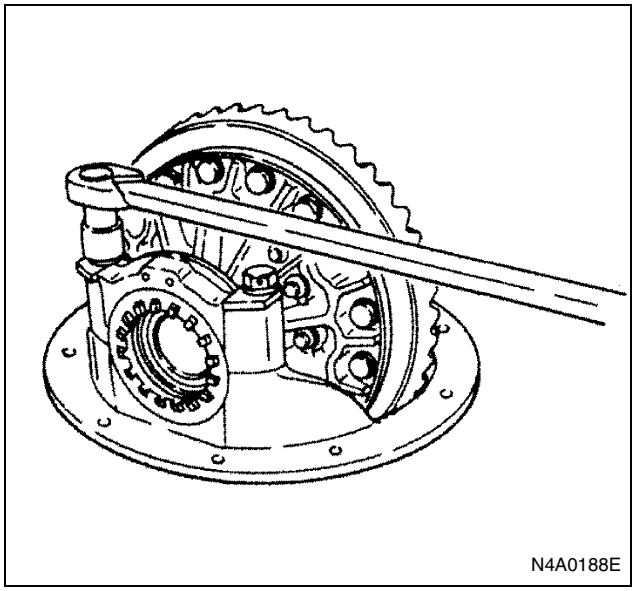


N4A0187E

Side Bearing Preload Adjustment
Thread the adjust nut on the ring gear side into 2 notches to give a proper bearing preload when correct backlash and tooth contact are obtained.
Fully tighten the bearing cap bolts.

Tighten:
Bearing cap bolt to
- 292 mm differential: 108 N·m (11 kg·m / 80 lb·ft)
- 320 mm differential: 157 N·m (16 kg·m / 116 lb·ft)

Recheck the backlash after tightening the bearing cap bolts.

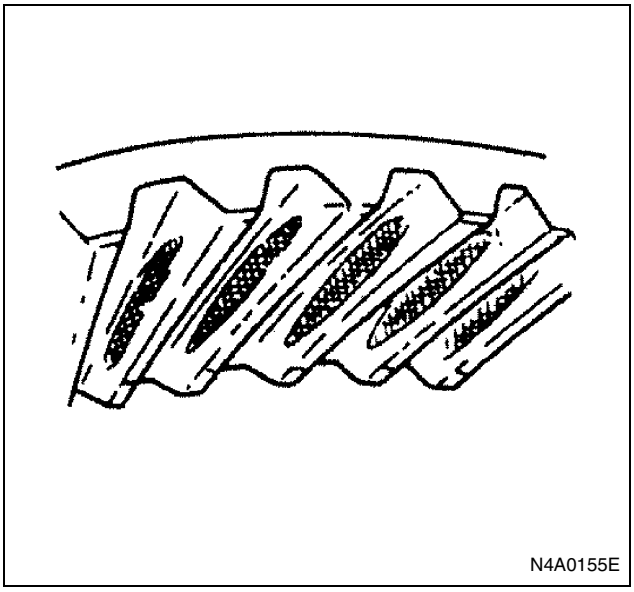


N4A0188E

Inspection of Drive Pinion and Ring Gear Tooth Contact

- Apply a thin coat of red check to the faces of the 7 — 8 teeth of the ring gear.
- Check the impression of contact (Right contact) obtained on the ring gear teeth and make necessary adjustment as described below if the contact is abnormal.

Adjusting shims available,
0.10, 0.12, 0.14, 0.16, 0.18, 0.20 mm (0.004, 0.0047, 0.0055, 0.0063, 0.0071, 0.0079 in)



N4A0155E

TOOTH CONTACT	CASE	ADJUSTMENT PROCEDURE
 N4A0156E	Drive pinion is too far away from ring gear.	1. Move the drive pinion in toward the ring gear by decreasing the thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear away from the drive pinion. N4A0160E
 N4A0157E	Drive pinion is too close to the ring gear.	1. Move the drive pinion away from the ring gear by increasing thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear in toward the drive pinion. N4A0161E
 N4A0158E	Ring gear is too close to the drive pinion.	1. Move the drive pinion in toward the ring gear by decreasing thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear away from the drive pinion. N4A0162E
 N4A0159E	Ring gear is too for away from drive pinion.	1. Move the drive pinion away from the ring gear by increasing thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear in toward the drive pinion. N4A0163E

9. Lock Plate

Tighten:
Lock plate bolt to
- 292 mm differential: 29 N·m (3.0 kg·m / 22 lb·ft)
- 320 mm differential: 13 N·m (1.3 kg·m / 9 lb·ft)

The lock plates are available in 2 different kinds to permit gradual adjustment by 1/2 notch of the adjust nut.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

- Gear
- Bearing
- Oil seal
- Differential cage
- Drive pinion

Ring Gear Replacement

The ring gear should always be replaced together with the drive pinion as a matched set.

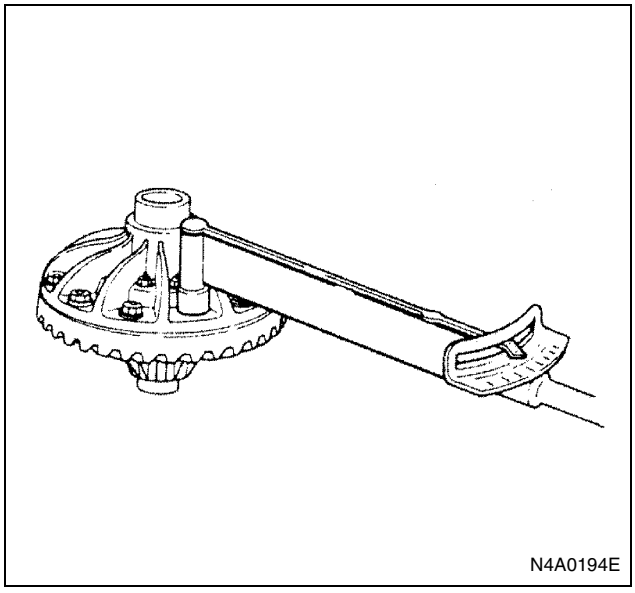
When installing ring gear, apply stud lock to the thread holes and bolts after treatment of the bolts with primer N.

Ring gear bolt wrench;
5-8840-2830-0 (for 292 mm differential)

Tighten:

Ring gear bolt to

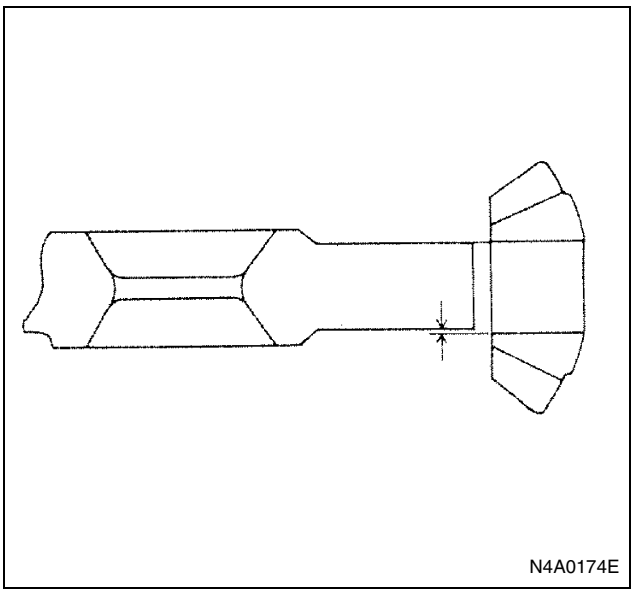
- 292 mm differential: M12 bolt (E12) to 127 N·m (13 kg·m / 94 lb·ft), M14 bolt to 181 N·m (18.5 kg·m / 133 lb·ft)
- 320 mm differential: 333 N·m (34 kg·m / 246 lb·ft)



N4A0194E

Clearance between Spider and Differential Pinion

- 292 mm differential
  Standard: 0.07 — 0.13 mm (0.003 — 0.005 in)
  Limit: 0.2 mm (0.008 in)
- 320 mm differential
  Standard: 0.05 — 0.13 mm (0.002 — 0.005 in)
  Limit: 0.2 mm (0.008 in)



N4A0174E

Clearance between Side Gear and Differential Cage

- 292 mm differential
  Standard: 0.05 — 0.11 mm (0.002 — 0.004 in)
  Limit: 0.25 mm (0.01 in)
- 320 mm differential
  Standard: 0.13 — 0.20 mm (0.005 — 0.008 in)
  Limit: 0.25 mm (0.01 in)

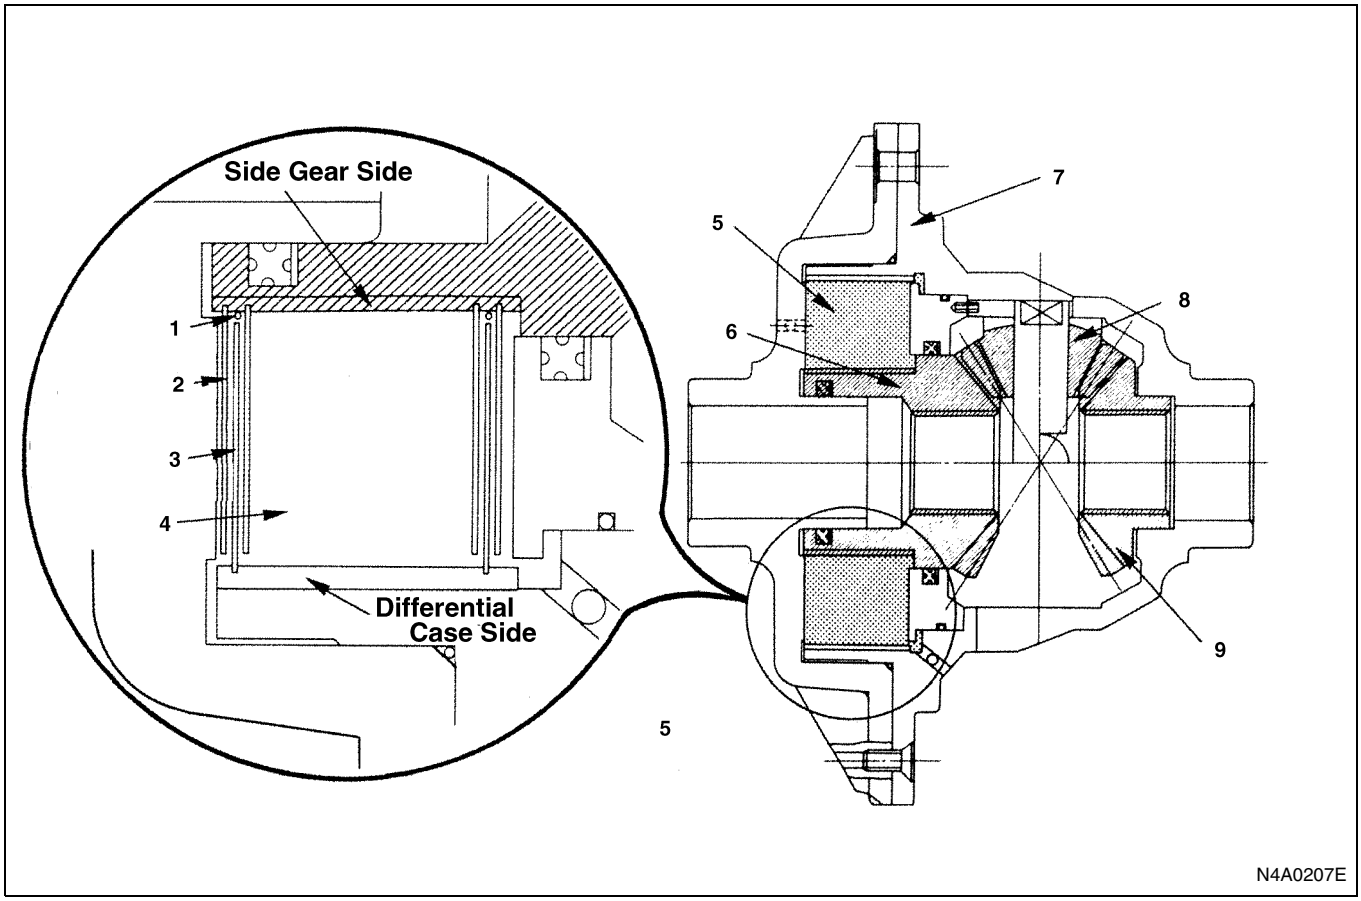
Punch: 5-8840-2293-0

Limited Slip Differential (LSD); Viscous Type

Function (NPS Model Only) <Except Taiwan, Australia and GCC>



N4A0207E

Legend

1. Spacer ring
2. Inner plates (20 plate in all)
3. Outer plates (19 plate in all)
4. Silicon oil
5. Viscous coupling
6. Side gear (LH)
7. Differential case
8. Spider pinion
9. Side gear (RH)

The viscous-type limited slip differential is of the structure filled with viscous (high viscosity silicone oil) between the outer plates connected to the differential case and the inner plates connected to the side gear on the left side. While driving, the difference in the number of revolutions between the right and left wheels causes the difference in the number of revolutions also between the differential case and the side gear on the left side. This difference in the number of revolutions results in shearing of silicone oil to generate viscous torque between the plates.
When either one of the wheels is caught up in muddy or snow melting road and starts racing while driving, the operation of the viscous torque mentioned above makes it facilitate to drive the vehicle by providing a driving force to the other wheel on the road where the road condition is better.

Caution:
The LSD assembly cannot be disassembled. When there occurs anything abnormal with the LSD assembly, replace it as an assembly. (Please note that when the silicone oil which has been sealed inside drains out while in disassembly, the LSD assembly will fail to display its intrinsic performance.)

Performance Check (Except Taiwan, Australia and GCC)
Check the performance by following the procedure given below.

1. Set the transmission gearshift lever to the neutral position.
2. Lift up the rear axle.
3. Rotate with a gathered momentum either one of the wheels on the rear axle in the forward direction.

When the wheel on the opposite side rotates in the forward direction while in the operation of (3) above, it is considered that the performance of viscous coupling functions normally, and otherwise, that the viscous coupling has a lowered performance.

WARNING:
WHEN EITHER ONE OF THE REAR WHEELS IS LIFTED UP AND A DRIVING FORCE IS APPLIED TO THE REAR AXLE, THE VEHICLE IS IN DANGER OF STARTING ABRUPTLY. BE SURE NOT TO APPLY A DRIVING FORCE TO THE REAR AXLE IN THIS CONDITION.

For detailed information of disassembling, assembling, checking and servicing of parts other than the LSD assembly, refer to “292 MM DIFFERENTIAL”.

Rear Axle Shaft (Except 2003 year model)

Notice:
For vehicles provided with the LSD assembly, the length of the rear axle shafts is different from each other on the right and left sides. Be careful not to confuse one with another when replacing the rear axle shaft.

L (in the illustration)

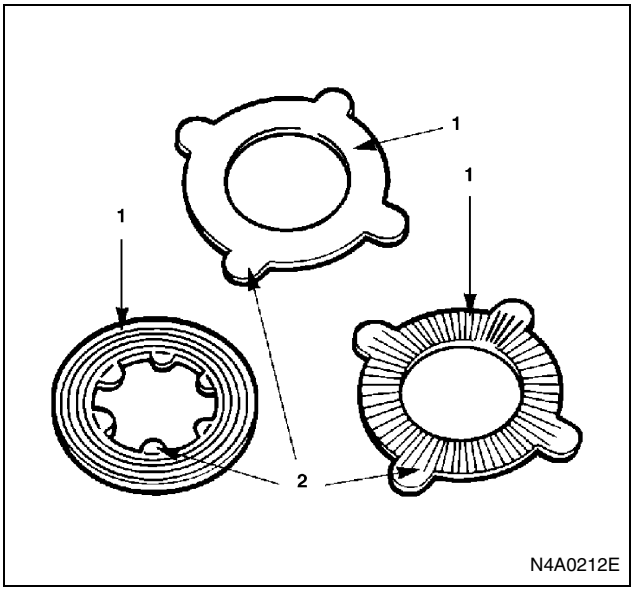
Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition is found through inspection.

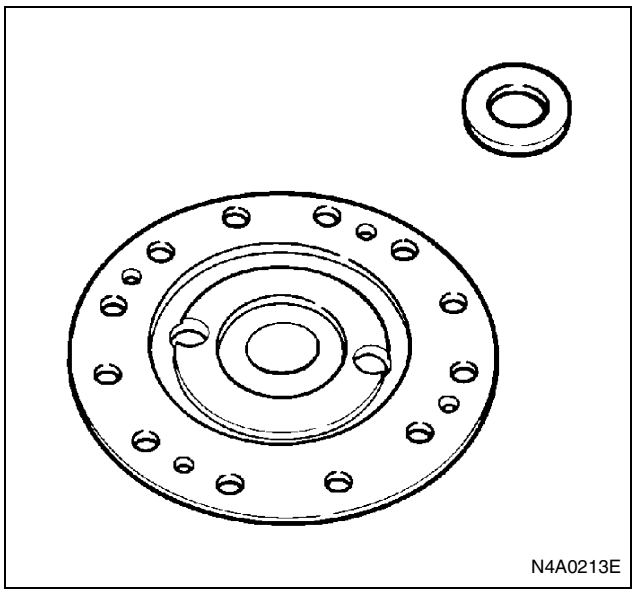
Visual Check

Check the following parts for wear, damage, noise or any other abnormal conditions.

- Friction disc, friction plate and spring disc.
  1) Sliding surfaces
  2) Projections

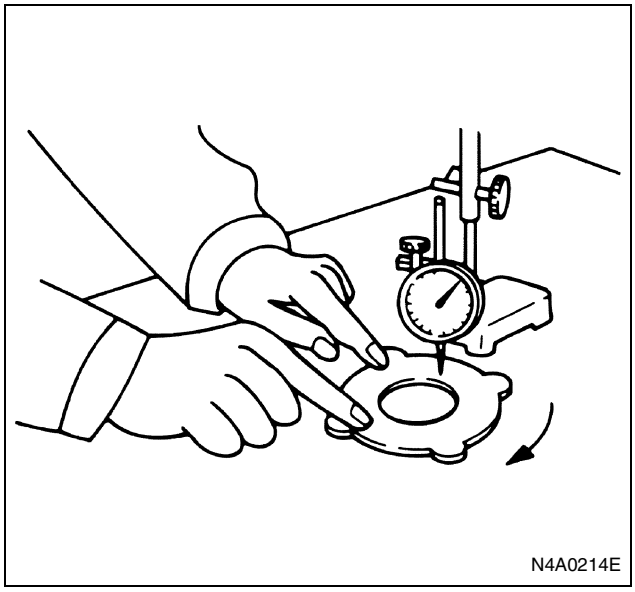


- Differential cage
  Inner groove of the differential cages. Repair light nicks and burrs using an oil stone.



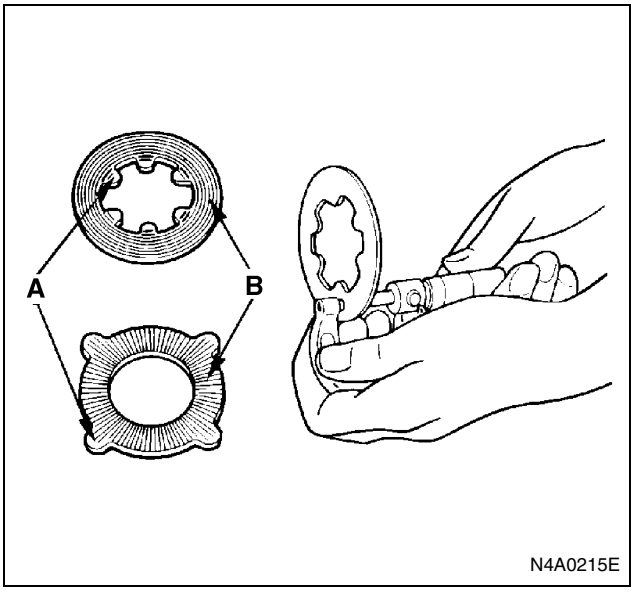
Deformation of the Friction Disc & Plate

Deformation of the friction disc & plate: 0.2 mm (0.008 in)



Wear of the Friction Plate & Disc

Wear of the friction plate & disc: 0.1 mm (0.004 in)
Remarks:
A = Inner or outer projections
B = Sliding surface subject to abrasion

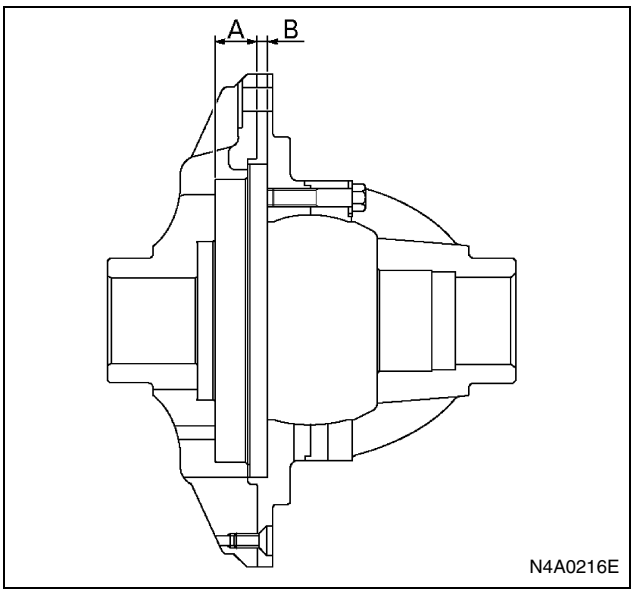


Reassembly

Clearance adjustment

1) Measuring the depth of the differential cages.

Depth of the differential cage,
Standard (A): 23.0 mm (0.9 in)
Standard (B): 5.8 mm (0.23 in)



2) Measuring the Combined thickness of the spring disc (C), friction disc (D) and friction plate (E).
3) Select and install the appropriate spacer (F) to create the specified clearance.
Clearance = (A+B) − (C+D+E+F)

Clearance,
Standard: 2.4 — 2.7 mm (0.094 — 0.106 in)
Thickness of spacer available: 2.85, 3.0, 3.15, 3.3, 3.45, 3.6, 3.75 mm

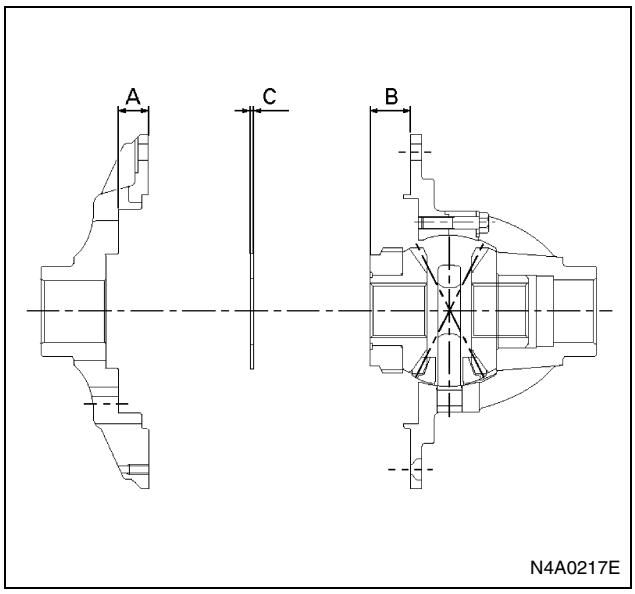
Notice:
When assembling the parts, apply recommended gear oil sufficiently to each of the parts, especially, to the contact surfaces and sliding surface.

Recommended oil:
Gear oil 5 LSD (limited slip differential) or equivalent

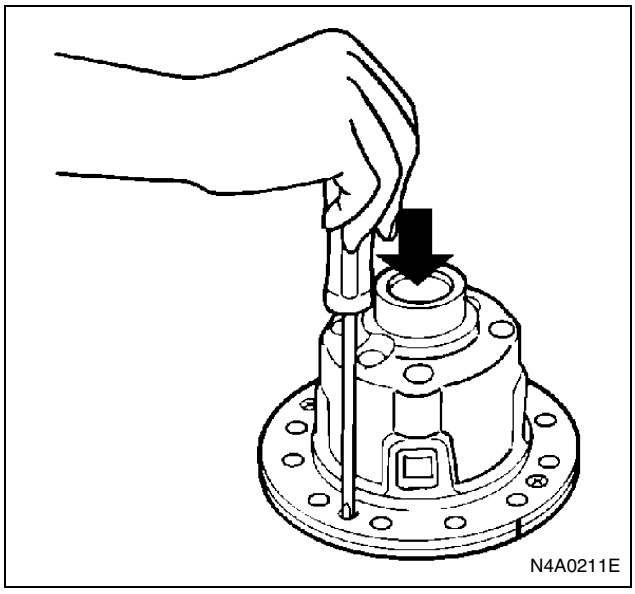
1. Differential Cage A
2. Thrust Washer
   Measure the clearance the back face of the side gear and the differential cage A.

Clearance=A−B−C,
Standard: 0−0.235 mm (0−0.09 in)
C: Thrust washer thickness

Thickness of thrust washer available: 1.3, 1.4, 1.5, 1.6 mm

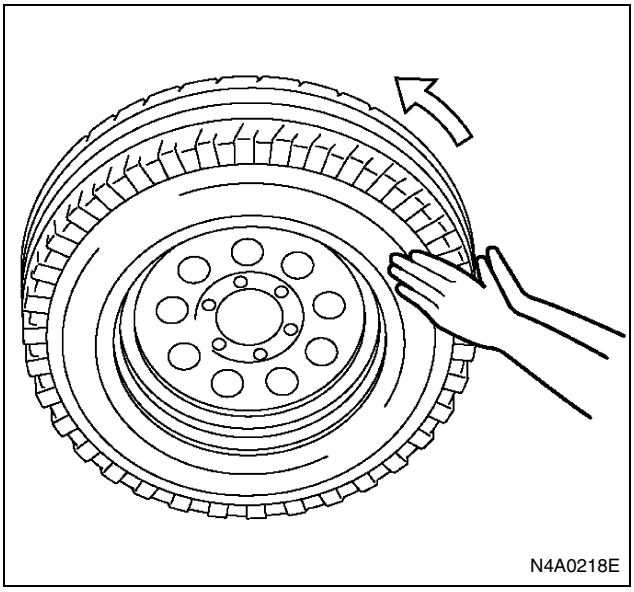


3. Friction plate and Friction Disc
4. Spring Disc
5. Spacer
6. Differential Cage B
7. Screw
   Matching the guide marks of the differential cages.
   Press the differential cage B and hold it.
   Tighten the screws evenly in the diagonal order.



Inspection (After installation to the vehicle)
Check parking brake function.

1) Make sure the vehicle is empty.
2) Set the parking brake.
3) Jack up the rear of the vehicle.
4) Check that the rear wheels do not turn when force is applied to them.



N4A0218E

Road test
Drive the vehicle on the open road. Check that the limited slip differential operates when the vehicle is drive in a circular pattern and during cornering.

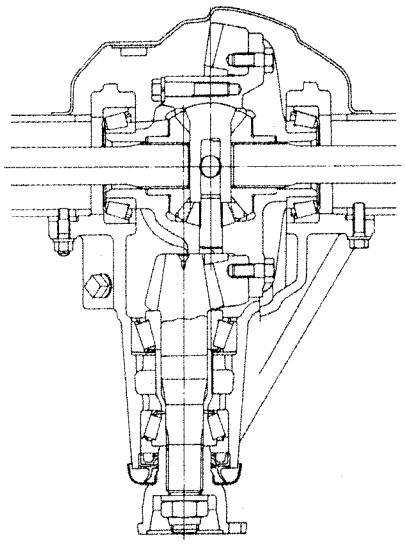
11. Front axle hub outer bearing
12. Free wheel hub
13. Front axle hub
14. Front hub oil seal
15. Spindle

The front axle is full floating axle tube type with Birfield joints. The front axle supports the weight of the front of the vehicle and transfers it to the front tires. It also functions as a part of the steering system. The front axle is also designed to transmit the driving force to the front wheels in the four wheels drive mode.

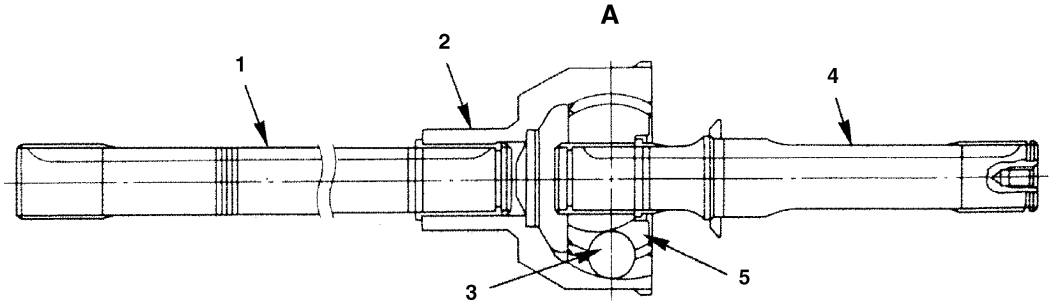
Front Final Drive (244mm (9.6 in.) Size)



N4A0229E

The differential system employs a hypoid gearing which is higher in strength and durability and quieter in operation than the spiral bevel gears to lower the center of gravity of the vehicle thereby improving running stability. The differential gear box which includes the side gears and pinion gears is mounted to the differential carrier via the two (2) taper roller bearings. The final drive gear reduces and changes axial rotary force (drive power) of transfer output to rectangular direction, and also it distributes the power to the drive wheels.

Front Drive Shaft (Birfield Joint)



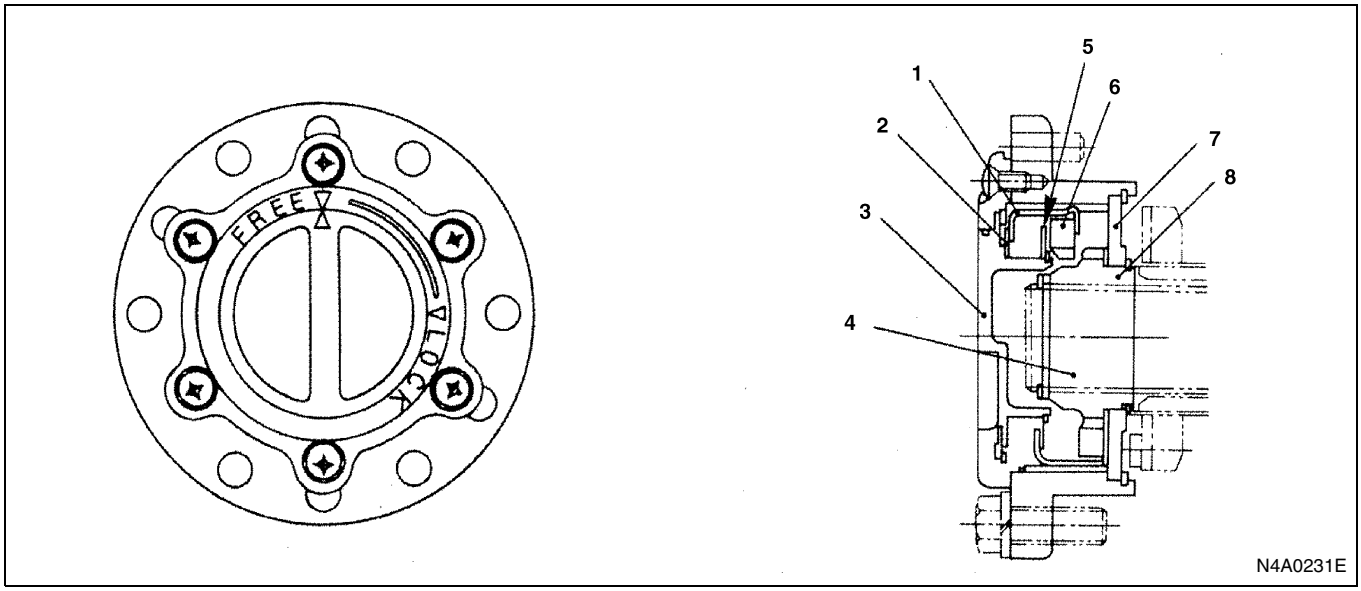
N4A0230E

Legend

A. Birfield section
1. Outer shaft
2. Outer ring
3. Ball
4. Inner shaft
5. Inner ring

The drive power from the reduction and differential is transmitted from the outer drive shaft to the outer ring of Birfield joint to its ball to its inner ring to the inner drive shaft finally to drive the tire. When the vehicle is steered the balls automatically move according to the steering angle thereby operating as a complete constant velocity joint.

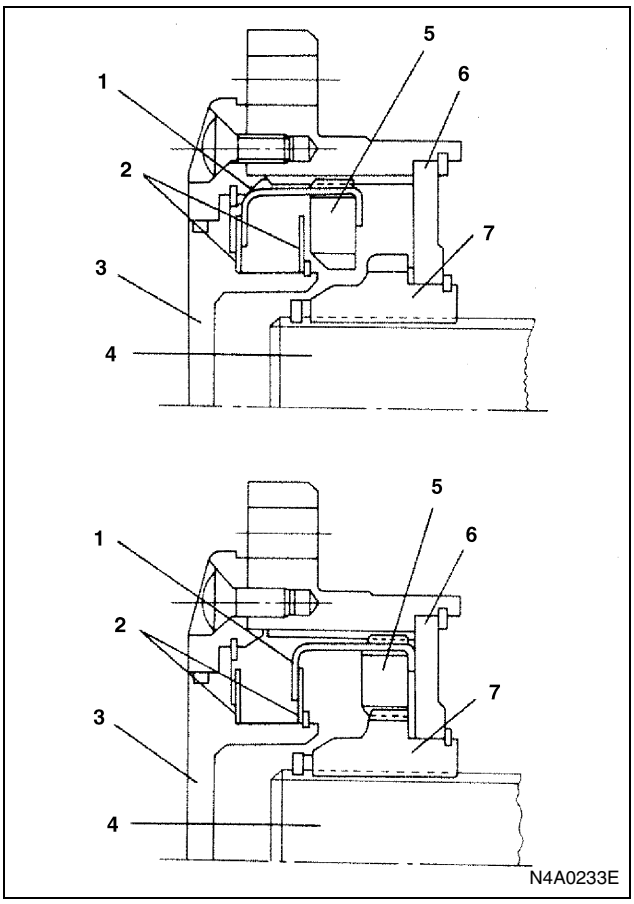
Free Wheel Hub (Manual Type)



Legend

1. Retainer
2. Lock spring
3. Handle
4. Drive shaft
5. Lock spring
6. Hub lock clutch
7. Hub lock ring
8. Hub lock inner

The free wheel hub, a hub lock device installed on the hub, transmits engine torque to the front wheels by engaging the dog clutch in the 4-wheel drive mode, or disengages the dog clutch in the 2-wheel drive mode to make free the front wheel drive system, so that it can improve fuel economy and reduce noise.
Engagement or disengagement of dog clutch is done by handle operation.



Legend

1. Retainer
2. Lock spring
3. Handle
4. Drive shaft
5. Hub lock clutch
6. Hub lock ring
7. Hub lock inner

[Operational Description]

(FREE status)

As the handle is rotated in the FREE direction, a lock spring assembled in the handle also rotates. Since the retainer lug moves along the slant face of lock spring, the hub lock clutch calked to the retainer is disengaged from lock inner, resulting in free status. If, however, the hub lock clutch is not disengaged from lock inner due to spline resistance, the lock spring is compressed to store spring force. Upon elimination of spline resistance, the hub lock clutch is disengaged by means of spring force.

(LOCK status)

As the handle is rotated in the LOCK direction, the retainer lug moves along the slant face of lock spring, and the hub lock clutch is engaged with lock inner, resulting in lock status. If, however, phase between hub lock clutch and lock inner is not coincident, the lock spring is compressed to store spring force. Upon coincidence of phase, the hub lock clutch is engaged by means of spring force.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

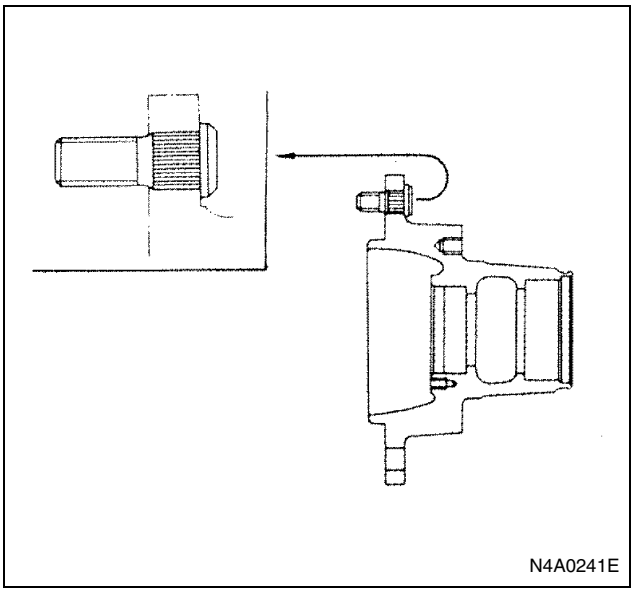
Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

- Hub
- Hub bearing, oil seal
- Knuckle spindle
- Brake
- Brake shoe, lining etc.

(NHR, NKR MODELS)

Check bolt for looseness.



N4A0241E

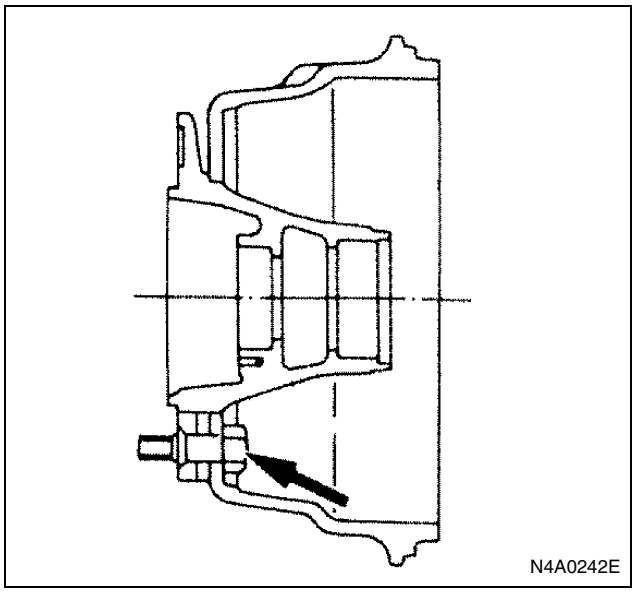
Installation

1. Hub
2. Brake Drum
   Tighten the brake drum wheel nuts to the specified torque.

Tighten:

Wheel nut to

- Brake lining width 75 mm: 343 N·m (35 kg·m / 253 lb·ft)
- Brake lining width 100 mm: 392 N·m (40 kg·m / 289 lb·ft)



N4A0242E

When replacement of hub or drum is completed, stake 3 portions of each wheel pin nut.

This illustration is based on 5 studs.

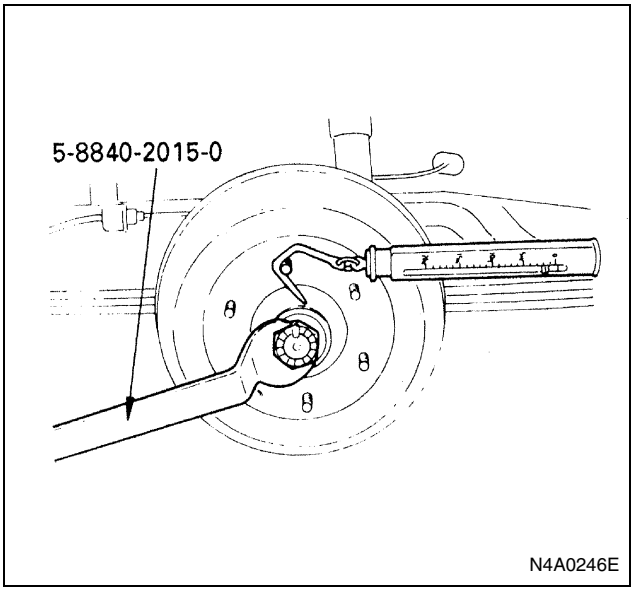
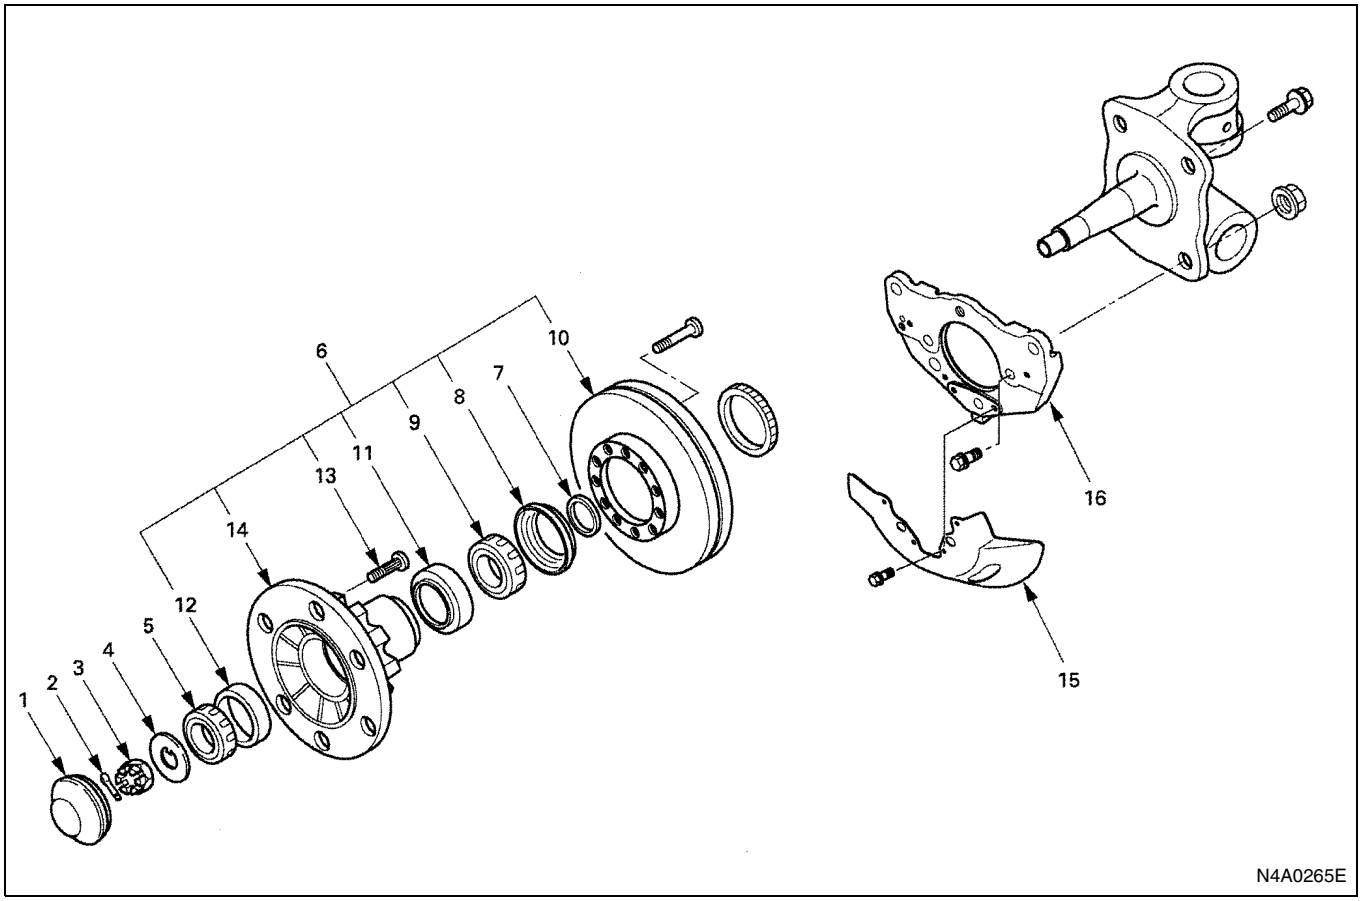
Hub Nut Wrench: 5-8840-2015-0

In case of misalignment of locking hole, align in direction of retightening.



12. Hub Cap
13. Wheel and Tire

Front Hub and Disc (4 × 2 Model, 293 & 310mm Disc)



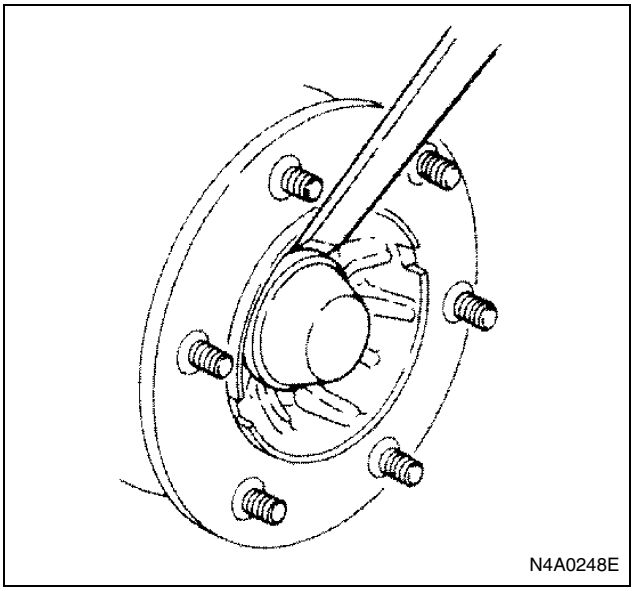
Legend

1. Hub cap
2. Cotter pin
3. Nut
4. Washer
5. Outer bearing
6. Hub and disc assembly
7. Spacer
8. Oil seal
9. Inner bearing
10. Disc
11. Inner bearing race
12. Outer bearing race
13. Stud
14. Hub
15. Dust shield
16. Adapter

Removal

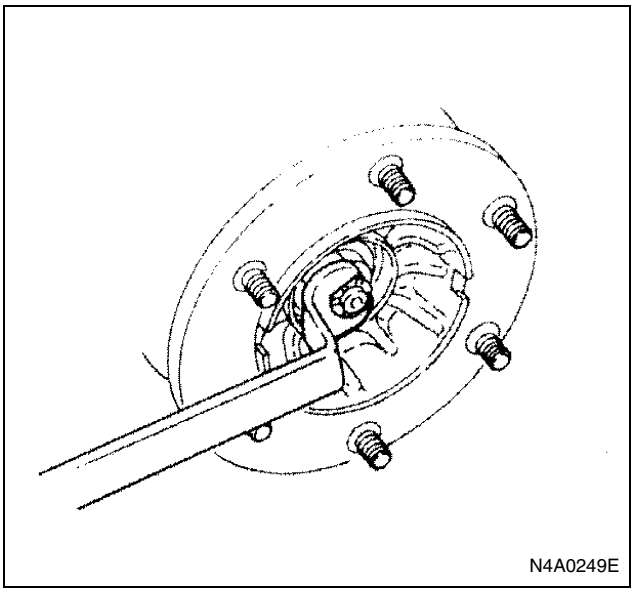
Preparation:
Jack up and support the vehicle on stands.

1. Hub cap
   Use a lever to pry the hub cap from the hub.



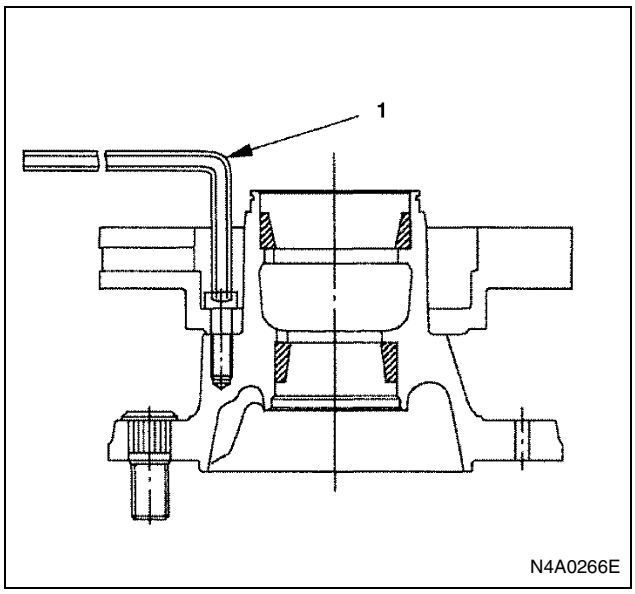
N4A0248E

2. Cotter Pin
3. Nut
   Use a wrench to remove the nut.



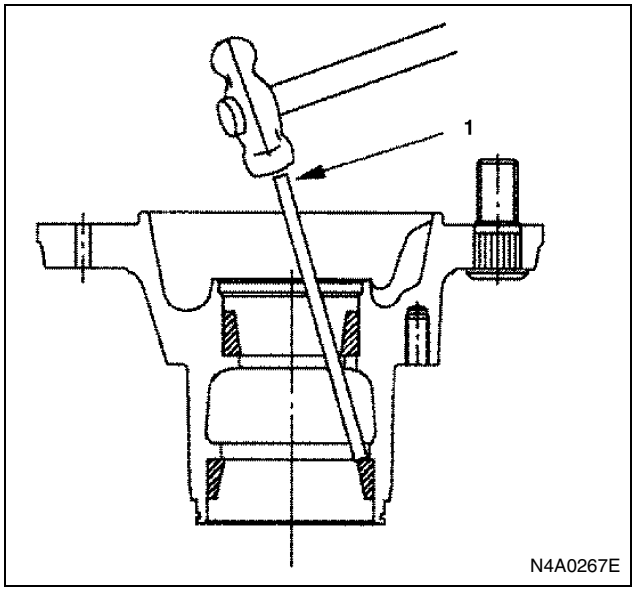
N4A0249E

4. Washer
5. Outer Bearing
6. Hub and Disc Assembly
   1) Turn the caliper assembly up and around the guide pin.
   2) Remove the hub and disc assembly from the knuckle.
7. Spacer
8. Oil Seal
9. Inner Bearing
10. Disc
    1) Use an inner hex wrench (1) to loosen the disc fixing bolts.
    2) Remove the disc from the hub.



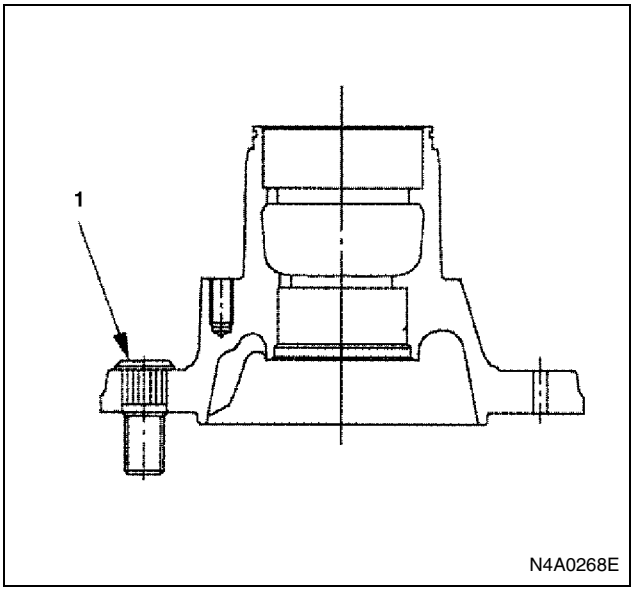
N4A0266E

11. Inner Bearing Race
12. Outer Bearing Race
    Use a hammer and a brass bar (1) to remove the inner race and the outer race from the hub.



N4A0267E

13. Stud
    Place hub on a suitable work surface and remove the studs (1) by using a hammer.



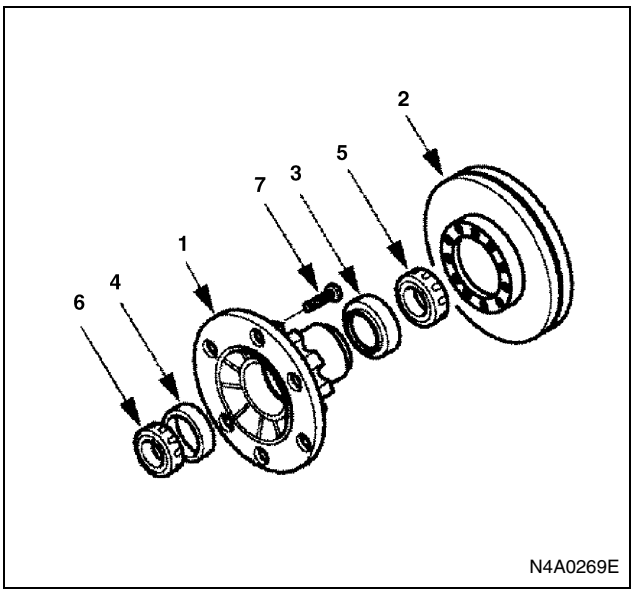
14. Hub
15. Dust Shield
16. Adapter

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Visual Inspection

Inspect the following parts for cracking, deformation, and corrosion.

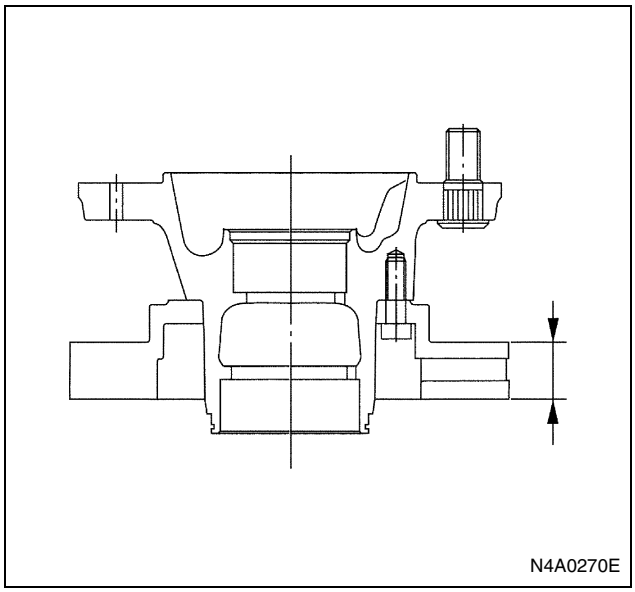


Legend

1. Hub
2. Disc
3. Inner bearing race
4. Outer bearing race
5. Inner bearing
6. Outer bearing
7. Wheel pins

Disc

Use a vernier caliper to measure the disc thickness.
If the measured value is less than the specified limit, the disc must be replaced.
Disc thickness,
Standard: 42.0 mm (1.654 in)
Limit: 39.0 mm (1.535 in)



Installation

1. Adapter

Tighten:

Adapter fixing bolt to 162 N·m (16.5 kg·m / 119 lb·ft)

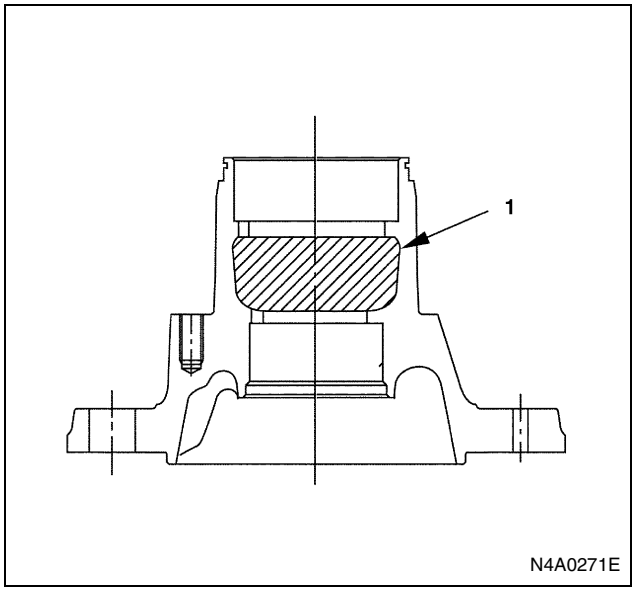
2. Dust Shield

Tighten:

Dust shield fixing to 13 N·m (1.3 kg·m / 113 lb·ft)

3. Hub
   Apply the specified amount of the approved grease to the hub cavity (1).

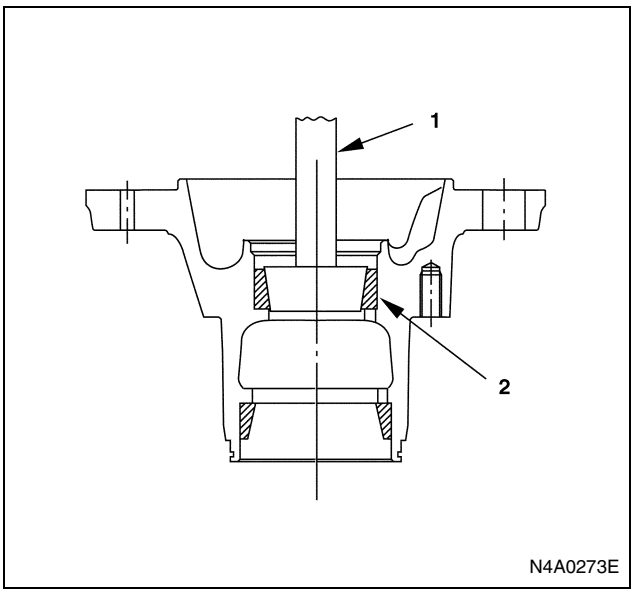
Grease amount: 160 g (5.6 oz)



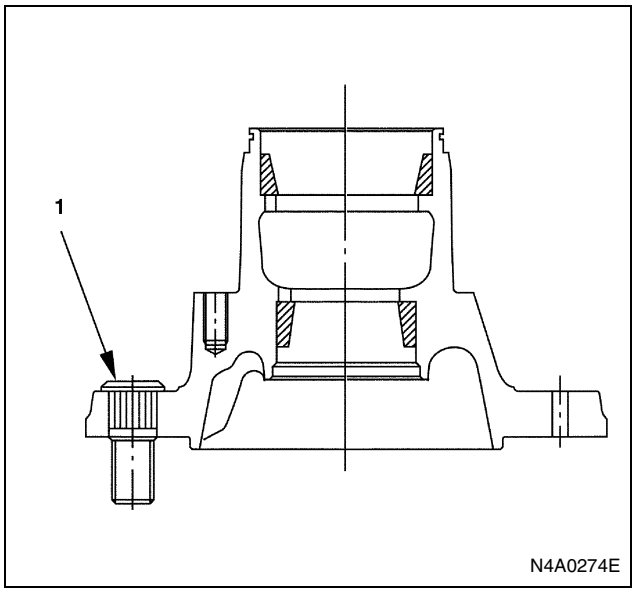
4. Inner Bearing Race

5. Inner Bearing
6. Oil Seal
   1) Use a hammer and the installer (1) to install the inner bearing race (2) to the hub.
      Be sure that the race is completely seated in the hub.
      Installer: 5-8840-2235-0

   2) Apply grease to the inner bearing.
   3) Install the inner bearing to the hub.
   4) Use a plastic hammer to carefully tap the oil seal into place.
      The oil seal surfaces must be flat.
      Use a new oil seal.
7. Outer Bearing Race
   Use a hammer and the installer (1) to install the outer bearing race (2) to the hub.
   Be sure that the race is completely seated in the hub.
   Installer: 5-8840-2026-0

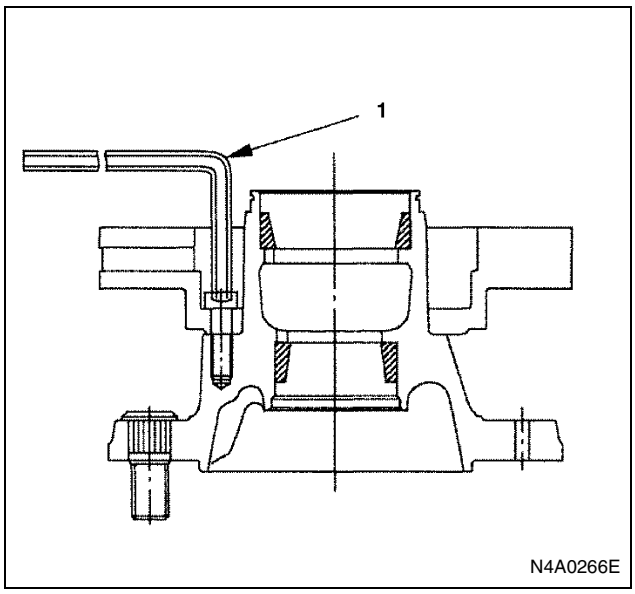


8. Stud
   Insert a stud (1) using a hammer.

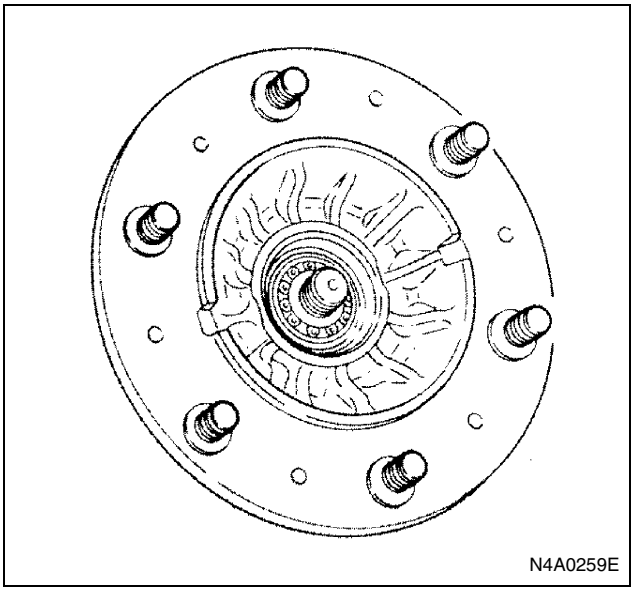


9. Disc
   1) Install the disc to the hub.
   2) Use an inner hex wrench (1) to tighten the disc bolts to the specified torque.

Tighten:
Disc bolt to 103 N·m (10.5 kg·m / 76 lb·ft)

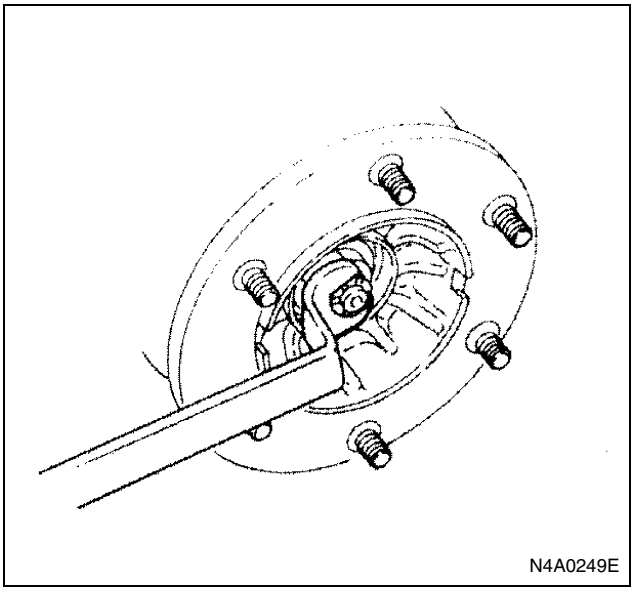


10. Spacer
11. Hub and Disc Assembly
12. Outer Bearing
    1) Turn the caliper assembly up and around the guide pin.
    2) Install the spacer and the hub and disc assembly to the knuckle.
    3) Apply grease to the outer bearing.
    4) Install the bearing to the hub.



N4A0259E

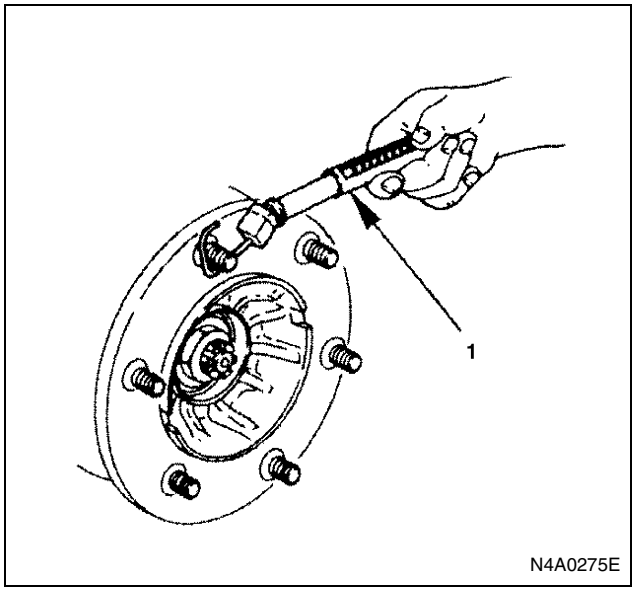
13. Washer
14. Nut
15. Cotter Pin
    1) Install the washer to the hub.
    2) Tighten the nut until you are unable to manually rotate the hub and disc assembly.



N4A0249E

    3) Loosen the nut.
    4) Attach a spring balancer (1) to one wheel pin. Gradually retighten the nut until the hub and disc assembly bearing is adjusted to the specified preload.

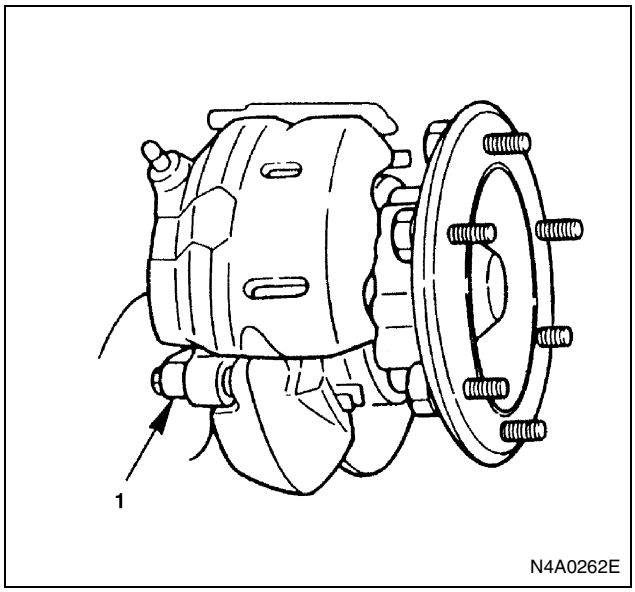
Hub bearing preload,
New Hub bearing: 17 — 31 N (1.7 — 3.2 kg / 3.7 — 7.1 lb)
Reused Hub bearing: 14 — 28 N (1.4 — 2.9 kg / 3.1 — 6.4 lb)



N4A0275E

    5) Align the nut slot with the knuckle cotter pin hole.
       If necessary, slightly tighten the nut to align the slot and the hole.
    6) Insert the cotter pin to the slot and hole.
    7) Bend back the cotter pin to lock the nut.
    8) Return the caliper assembly to its original position.
    9) Tighten the lock pin bolt (1) to the specified torque.
       Use a new cotter pin.

Tighten:
Lock pin bolt to137 N·m (14 kg·m / 101 lb·ft)



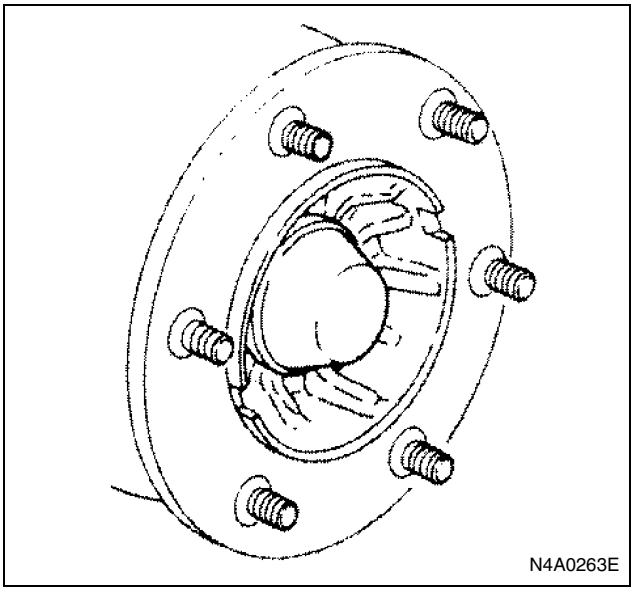
N4A0262E

16. Hub Cap
    1) Apply LOCTITE or liquid gasket to the engagement part with hub.
    2) If severe deformation is found, replace with a new one.

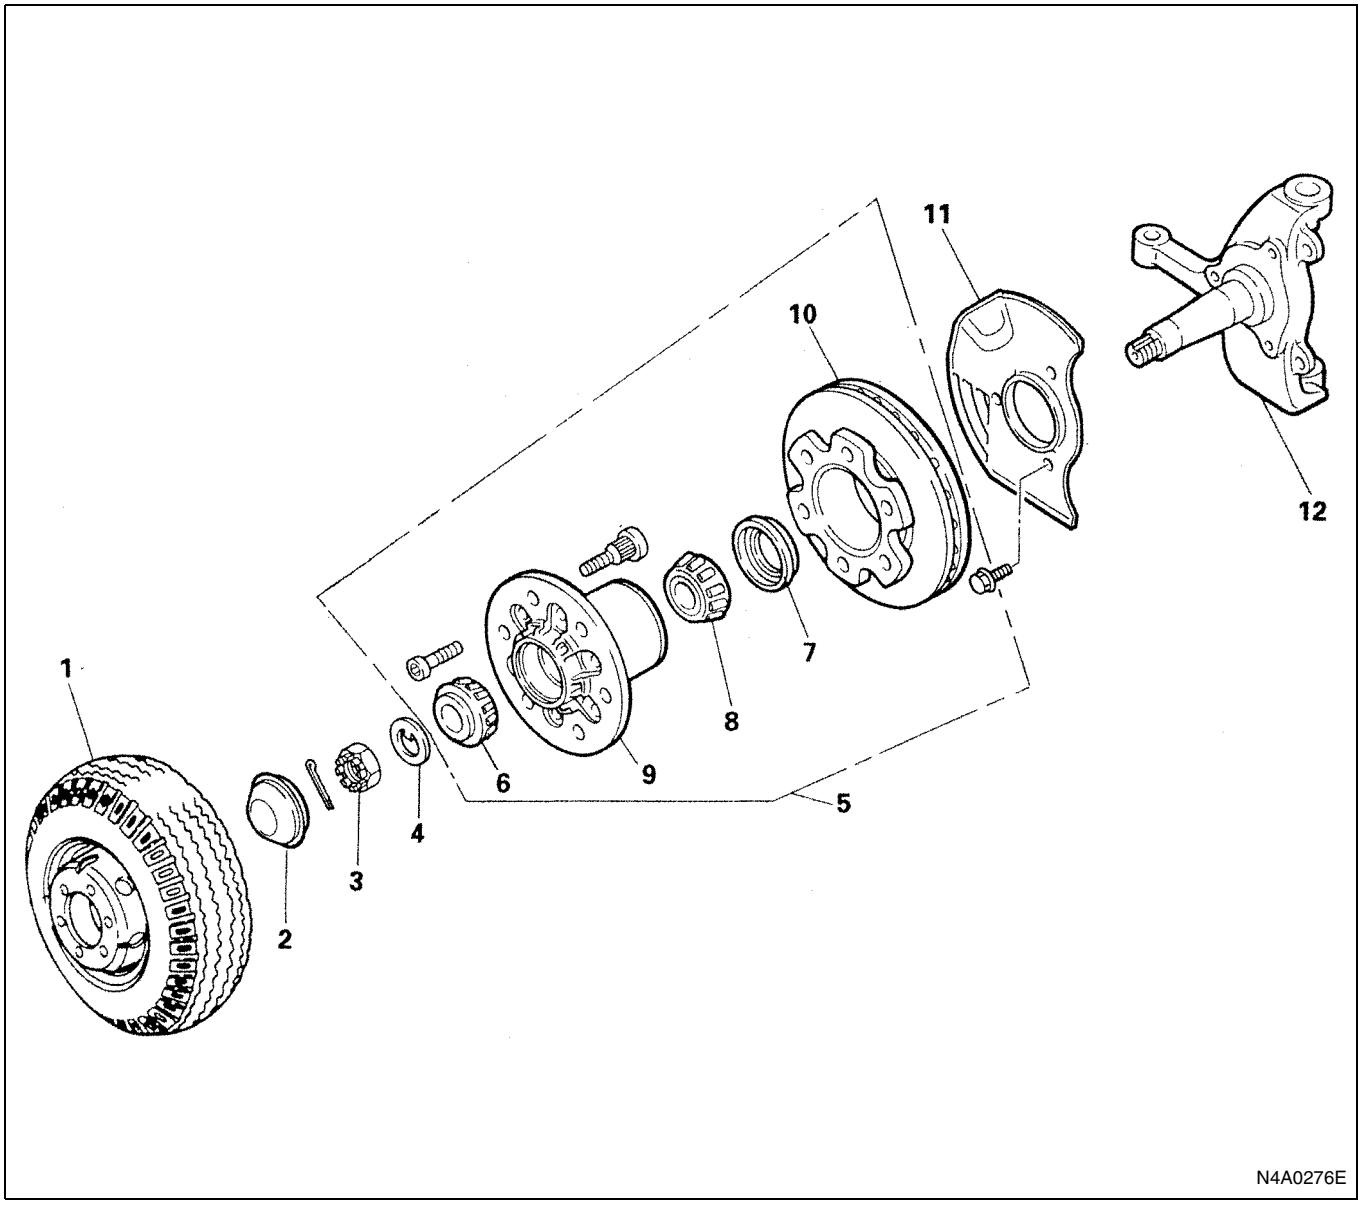
3) Apply the specified amount of the approved grease to the hub cap.

Grease amount: 40 g (1.4 oz)

4) Use a plastic hammer to install the hub cap to the hub.



Front Hub, Disc and Knuckle (4 × 2, Independent Suspension Model)



Legend

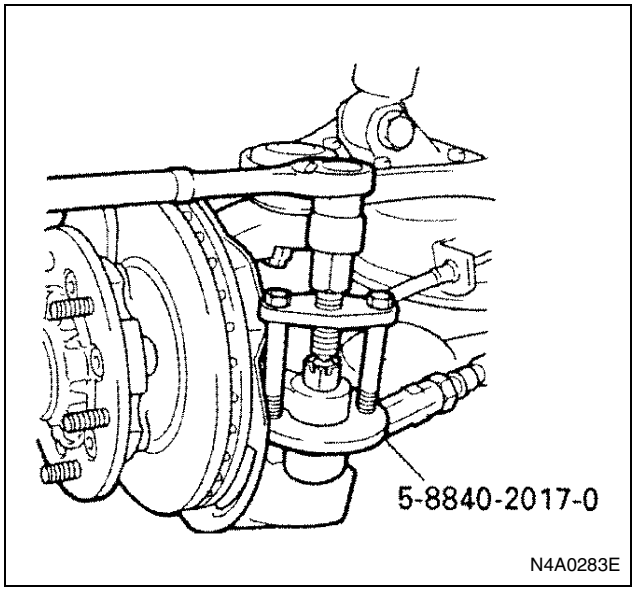
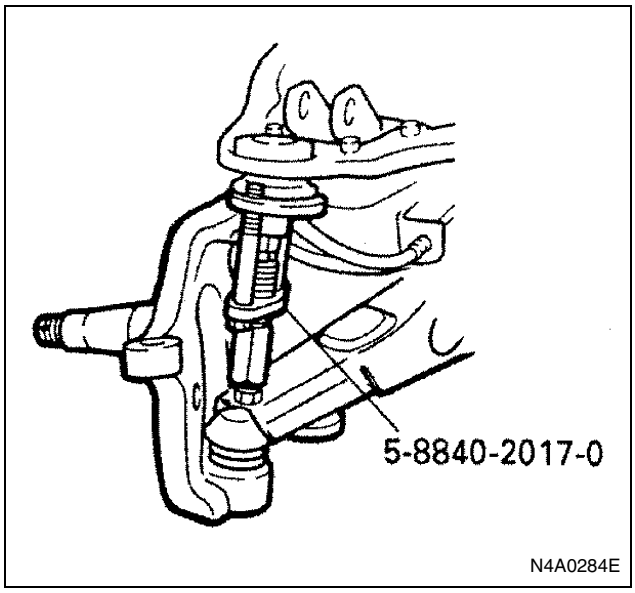
1. Bolt
2. Hub
3. Disc

12. Knuckle
    - Disconnect the tie rod end joint and upper link end joint from the knuckle.
      Tie Rod End Remover: 5-8840-2017-0



N4A0283E

- Remove the two bolts fixing the lower link end and remove the knuckle together with the lower link end.
- Remove the lower link end from the knuckle.



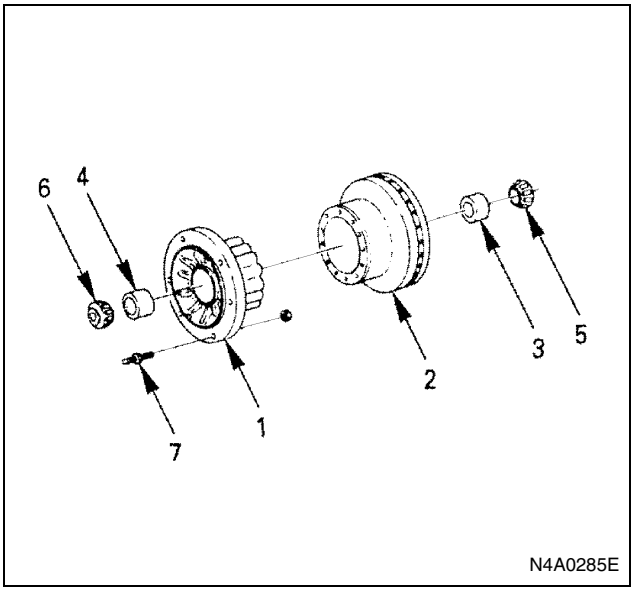
N4A0284E

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Visual Inspection

Inspect the following parts for cracking, deformation, and corrosion.

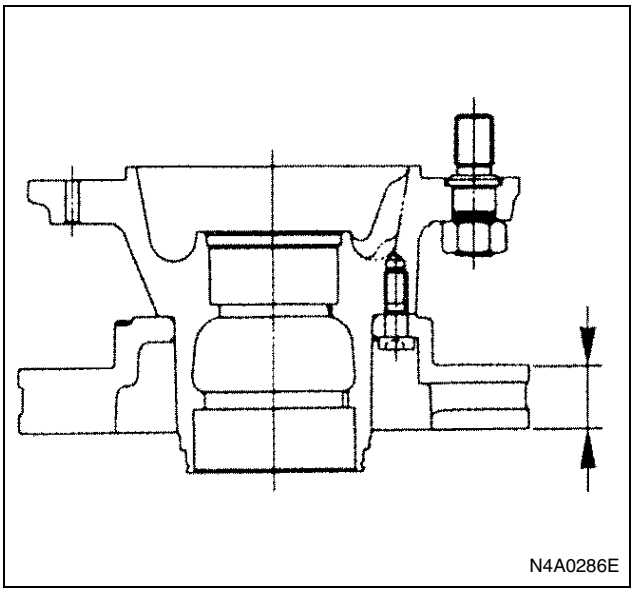


Legend

1. Hub
2. Disc
3. Inner race
4. Outer race
5. Inner bearing
6. Outer bearing
7. Wheel pins

Disc

Use a vernier caliper to measure the disc thickness.
If the measured value is less than the specified limit, the disc must be replaced.
Disc thickness,
Standard: 35.0 mm (1.38 in)
Limit: 33.5 mm (1.32 in)



Installation

1. Knuckle

Tighten:

- Lower link joint nut to 377 N·m (38.4 kg·m / 278 lb·ft)
- Lower link end bolt to 219 N·m (22.3 kg·m / 161 lb·ft)
- Upper link joint nut to 205 N·m (20.9 kg·m / 151 lb·ft)
- Tie rod joint nut to 108 N·m (11 kg·m / 80 lb·ft)
    - Discard used cotter pin and install new one.

2. Back Plate

Tighten:

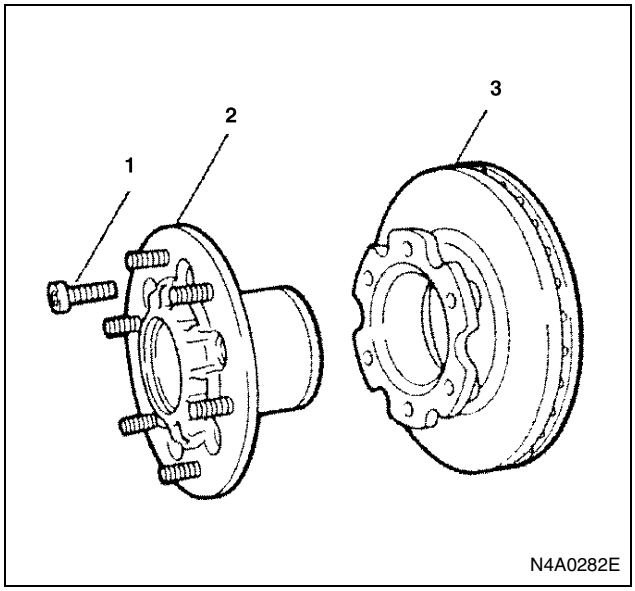
Back plate bolt to 13 N·m (1.3 kg·m / 113 lb·ft)

3. Disc
4. Hub

Tighten:

Disc bolt to

- M14: 155 N·m (15.8 kg·m / 114 lb·ft)
- M16: 219 N·m (22.3 kg·m / 163 lb·ft)

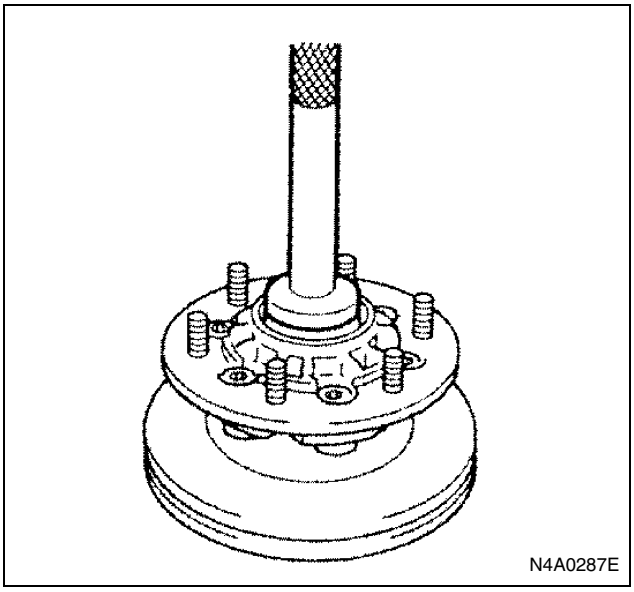


Legend

1. Bolt
2. Hub
3. Disc

Be sure that the race is completely seated in the hub.

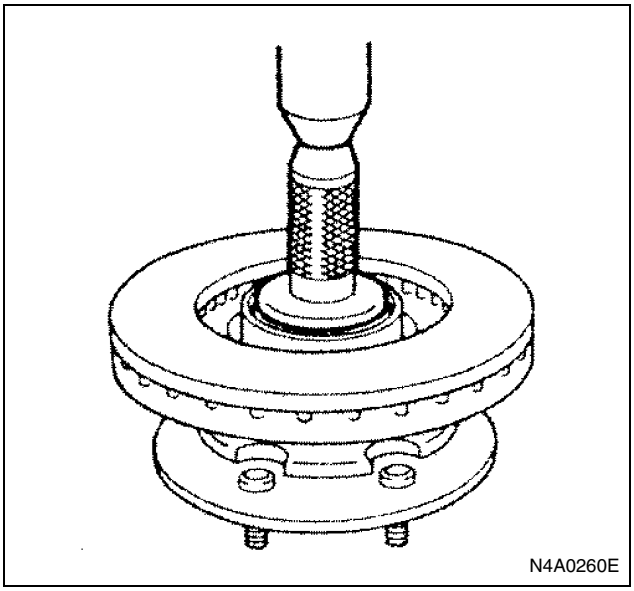
Outer Bearing Outer Race Installer: 5-8840-2026-0



N4A0287E

Be sure that the race is completely seated in the hub.

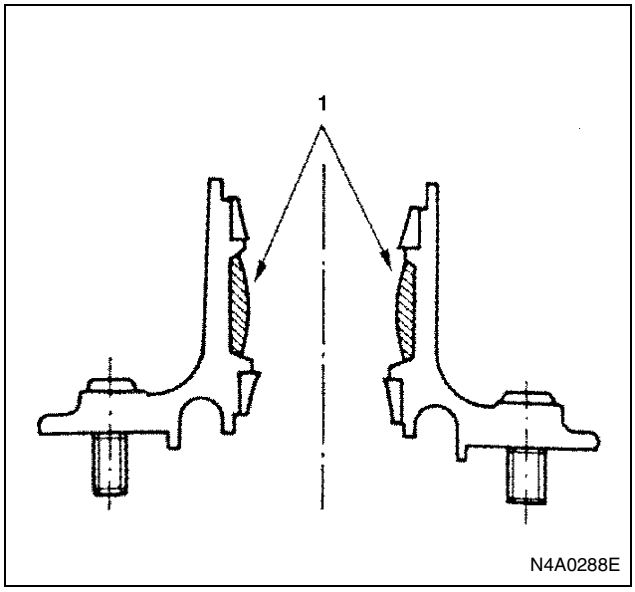
Inner Bearing Outer Race Installer: 5-8840-2235-0



N4A0260E

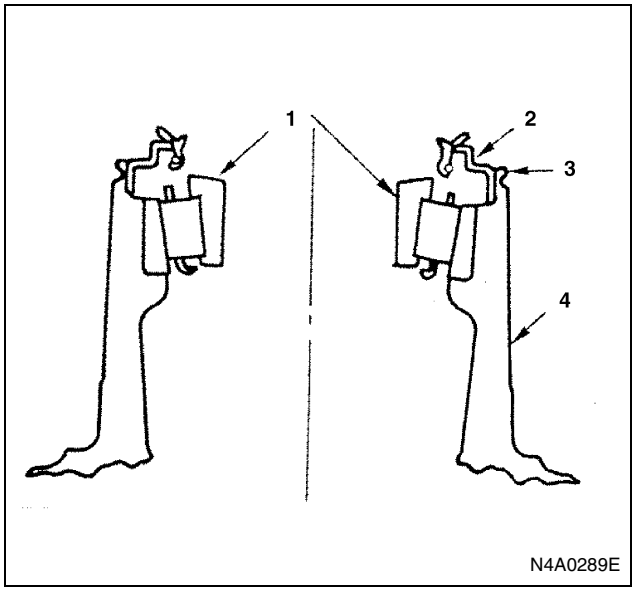
Apply the specified amount of the multipurpose type grease (1) to the hub cavity.

Grease amount: 96 g (3.4 oz)



N4A0288E

5. Inner Bearing
   Apply grease (multipurpose type) to the inner bearing.
6. Oil Seal
   Use a hammer and installer to install the oil seal. The oil seal surfaces must be flat.
   Use a new oil seal.
   Oil Seal Installer: 5-8840-2235-0



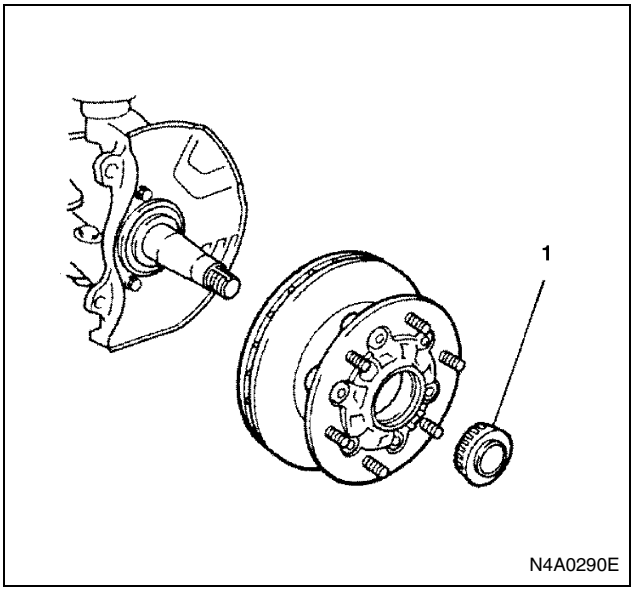
N4A0289E

Legend

1. Inner bearing
2. Oil seal
3. Flat
4. Hub

7. Outer Bearing
8. Hub and Disc Assembly
   1) Install the hub and disc assembly to the knuckle.
   2) Apply grease (multipurpose type) to the outer bearing (1).

3) Install the bearing to the hub.



9. Thrust Washer
10. Hub Nut
    1) Install the thrust washer (1) and hub nut (2).

    2) Tighten the nut until you are unable to manually rotate the hub and disc assembly.
    3) Loosen the nut.
    4) Attach a spring balancer to one wheel pin. Gradually retighten the nut until the hub and disc assembly bearing is adjusted to the specified preload.

Hub bearing preload,
NHR new bearing: 14 — 28 N (1.4 — 2.9 kg·m / 3 — 6 lb·ft)
NKR new bearing: 12 — 26 N (1.2 — 2.7 kg·m / 3 — 6 lb·ft)
NHR · NKR reused bearing: 7 — 22 N (0.7 — 2.2 kg·m / 2 — 5 lb·ft)

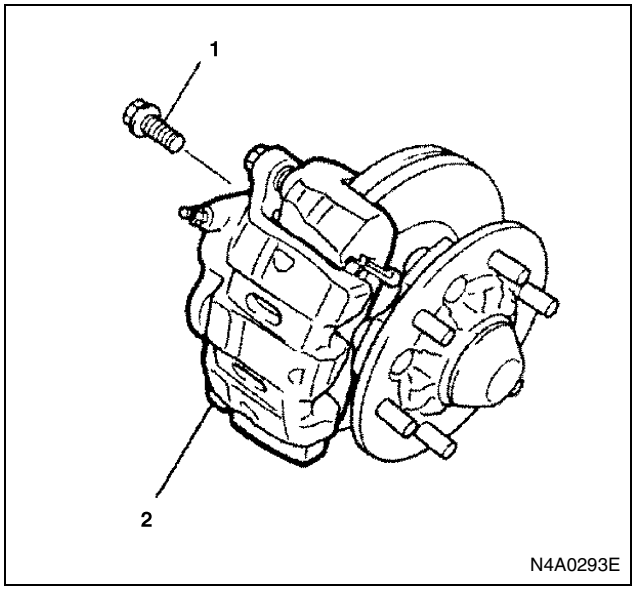
    5) Align the nut slot with the knuckle cotter pin hole.
       If necessary, slightly tighten the nut to align the slot and the hole.
    6) Discard used cotter pin and install new cotter pin.

11. Hub Cap
    1) Apply LOCTITE or liquid gasket to the engagement part with hub.
    2) If severe deformation is found, replace with a new one.
    3) Apply the specified amount of the approved grease (Multipurpose type) to the hub cap.

Grease amount: 40 g (1.4 oz)

    4) Install the disc brake caliper assembly to the knuckle.

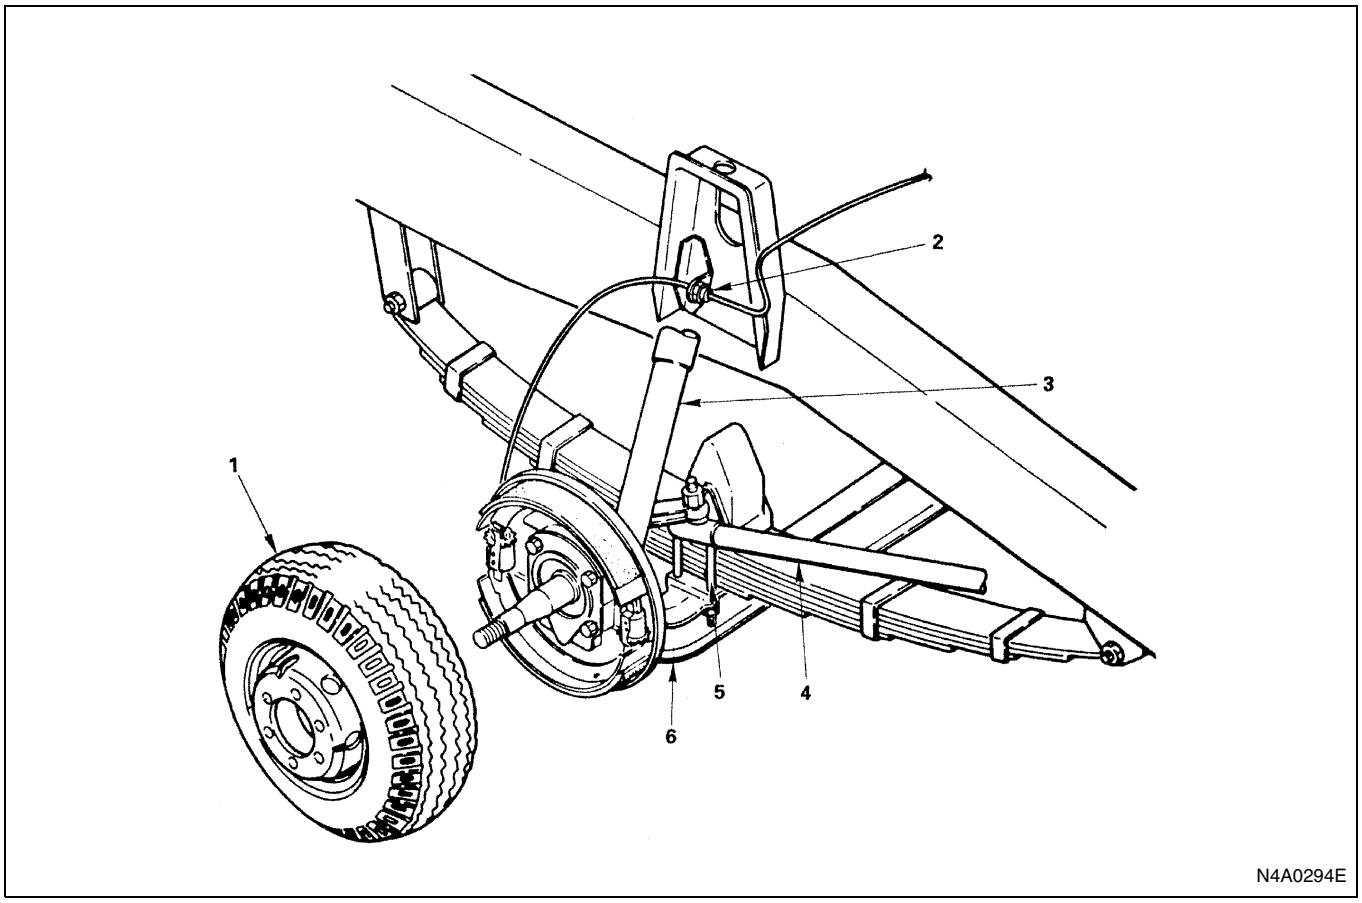
Tighten:
Disc brake caliper bolt to 219 N·m (22.3 kg·m / 161 lb·ft)



Legend
1. Bolt
2. Disc brake caliper assembly

12. Wheel and Tire

Front Axle Assembly (4 × 2 Model)

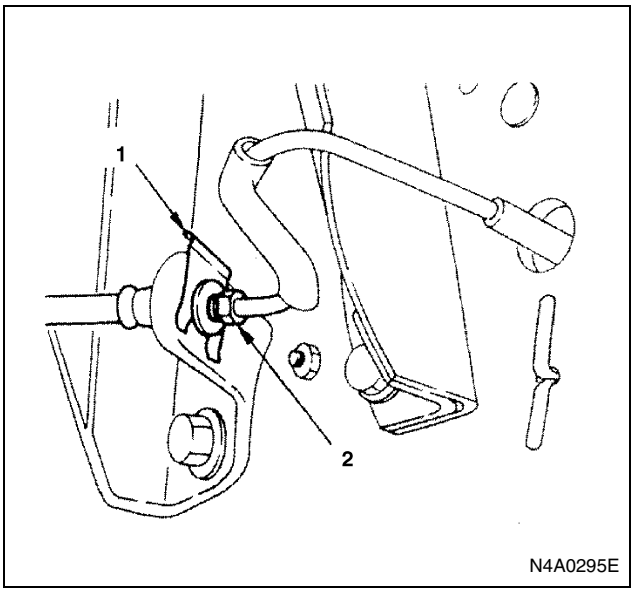


Legend
1. Wheel and tire
2. Brake flexible hose
3. Shock absorber
4. Drag link
5. U-bolt
6. Front axle assembly

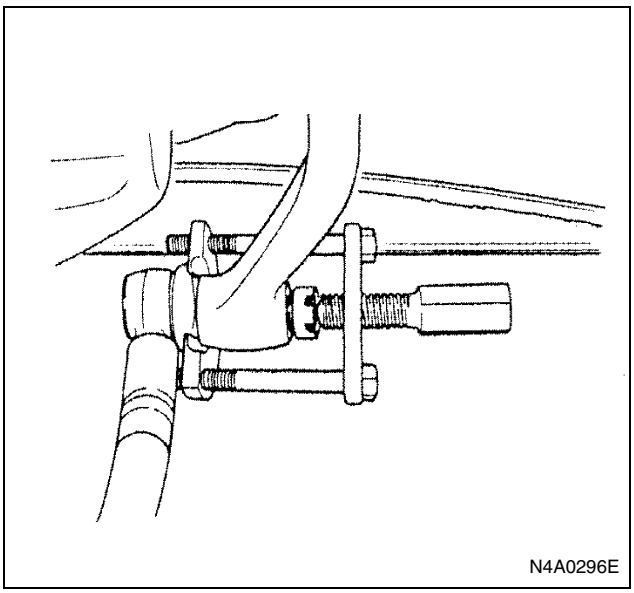
Removal

Preparation:
Jack up and support the vehicle on stands.

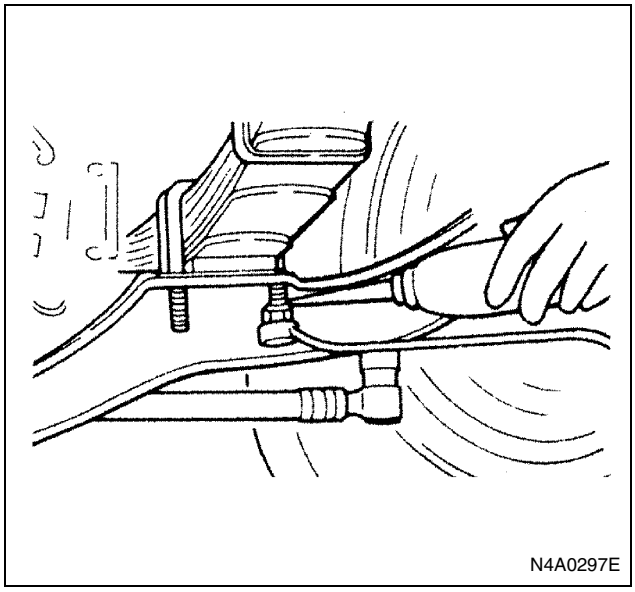
1. Wheel and Tire
2. Brake Flexible Hoses
   Loosen the nut (2), then pry off a clip (1).



3. Shock Absorber
4. Drag Link
   Disconnect the drag link, using a special tool.
   Remover: 5-8840-2017-0



5. U-Bolt
   Loosen the U-bolts after setting jack against the front axle. If the U-bolts are heavily rusted, apply a generous amount of oil to the threads before loosening them to prevent seizure.



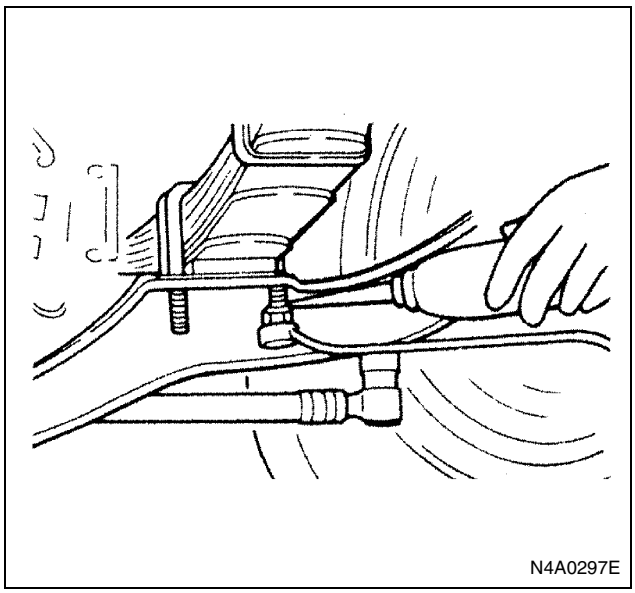
6. Front Axle Assembly

Installation

1. Front Axle Assembly
2. U-bolt and Nut
   Position the U-bolts and helper rubber on the leaf spring assemblies and jack up the front axle. When tightening the nuts, apply oil as necessary to prevent damaging the threads.

Tighten:
U-bolt nut to

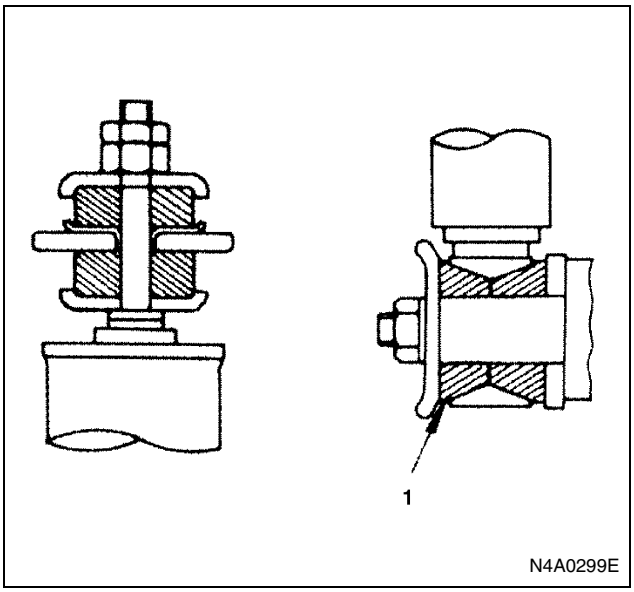
- NQR: 196 N·m (20 kg·m / 145 lb·ft)
- NHR, NKR, NPR: 127 N·m (13 kg·m / 94 lb·ft)



3. Drag Link
   Tighten drag link nut to specified torque, with just enough additional torque to align cotter pin holes.
   Install new cotter pin.

Tighten:
Drag link nut to 167 N·m (17 kg·m / 123 lb·ft)

4. Shock Absorber
   Refer to illustration for installation of shock absorber, nut, washer and rubber bushing (1).



5. Brake Flexible Hose
   Set first the wheels in the straight going position, then attach the flexible hose to the bracket without torsion using a (1).
   Connect the pipe, then tighten the nut (2) to the specified torque.

Tighten:
Brake flexible hose to 16 N·m (1.6 kg·m / 12 lb·ft)

   Perform bleeding operation after installation of the brake flexible hoses.
   Refer to Section 5 “Service information” for brake fluid air bleeding procedure.
   Also inspect wheel alignment after completion of front axle removal and installation.
6. Wheel and Tire

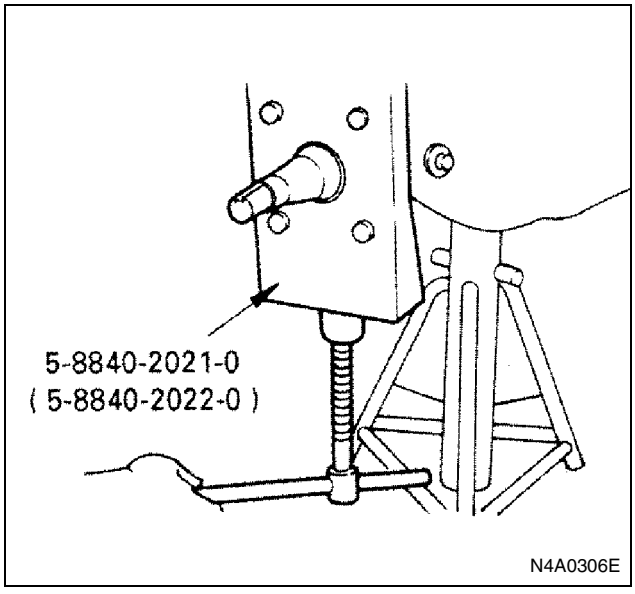
    NKR, NPR 5-8840-2022-0
    NQR 5-8840-2022-0



12. Knuckle
13. Shim
14. Thrust Bearing
15. I-Beam

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Visual Check

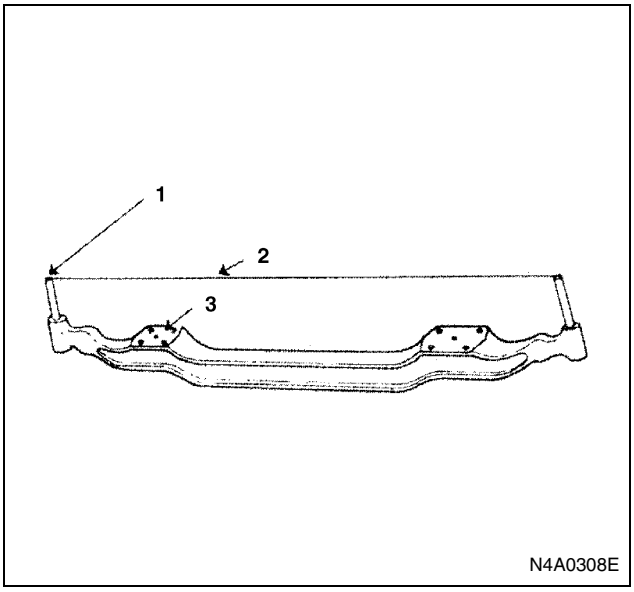
Inspect the following parts for wear, damage or other abnormal conditions.

- I-beam
- Knuckle

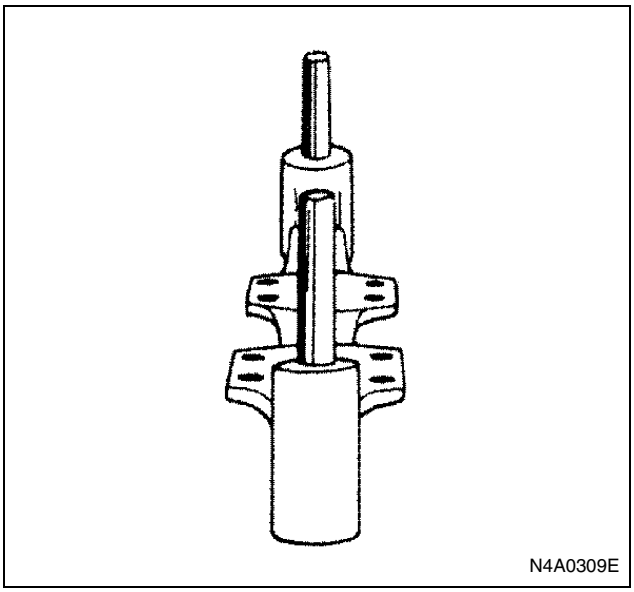
- Knuckle arm, tie rod arm
- Tie rod, tie rod end
- King pin, bushing, thrust bearing and shims
- Joint ball
- Front hub, bearing and oil seal
- Brake drum
- Brake shoe, lining etc.

I-Beam (when removed from the vehicle)

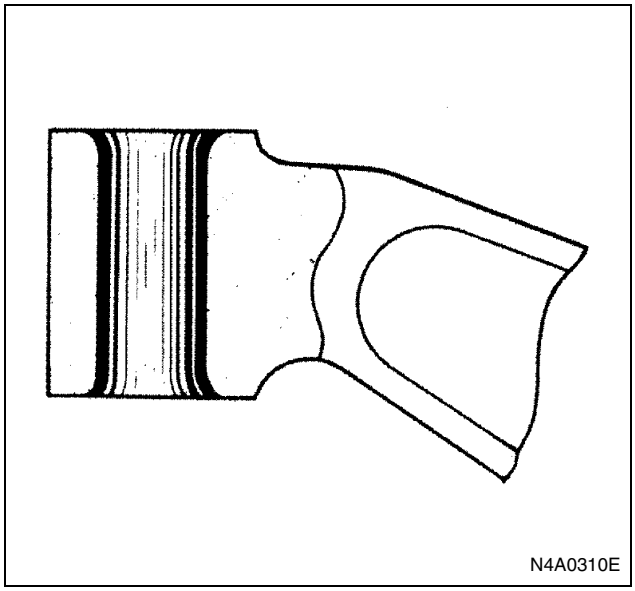
1. Fit the king pin or test bar (1) into the king pin hole.
2. Stretch a cord (2) across the centers of king pin or test bars.
3. Check to see if the cord is in line with the centers of the center bolt holes (3) in the spring seat when looked down from above the cord.



4. Also check to see if the king pins or test bar are in good parallel alignment as viewed from the side.

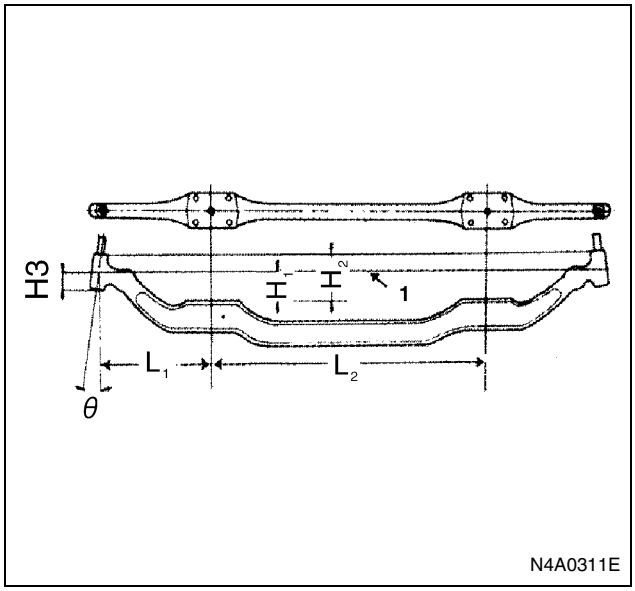


5. Check to see if the king pin holes is worn.



6. Stretch a cord (1) and check the following dimensions.

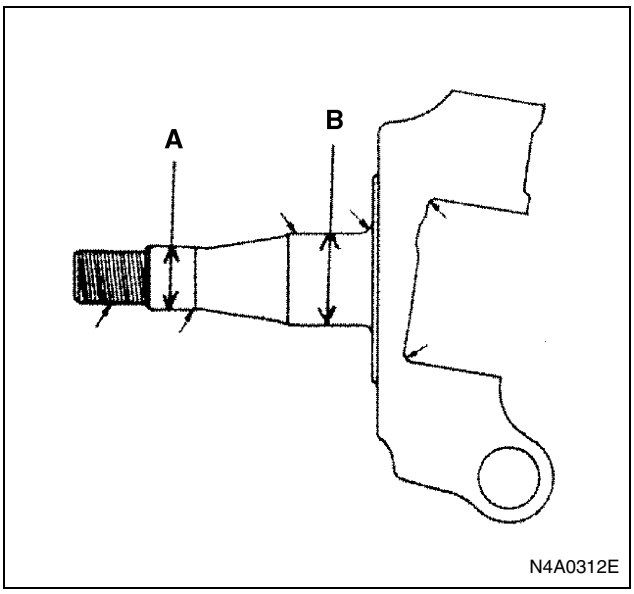
'05 model						mm (in)
	θ	H1	H2	H3	L1	L2
NHR	12°	97 (3.8)	135.3 (5.3)	25.2 (0.99)	260 (10.2)	690 (27.2)
NKR		97 (3.8)	134.4 (5.3)		260 (10.2)	690 (27.2)
NPR		83 (3.3)	120.4 (4.7)		315 (12.4)	860 (33.9)
NQR		83 (3.3)	120.4 (4.7)		315 (12.4)	860 (33.9)



Cracks in Knuckles

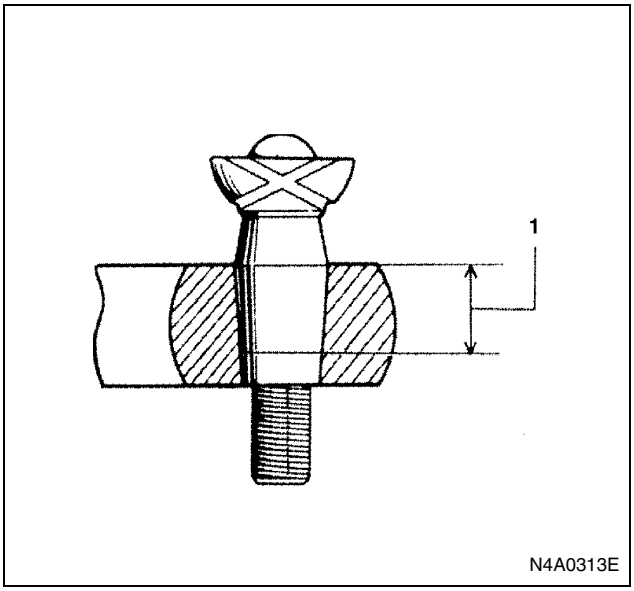
Check the knuckles for cracks or damage paying a particular attention to the areas indicated by arrows.
Use a magnetic flaw detector or red check.

- NHR
  A: 30 mm (1.19 in)
  B: 40 mm (1.57 in)
- NKR, NPR, NQR
  A: 35 mm (1.38 in)
  B: 50 mm (1.97 in)



Knuckle Arm and Tie Rod Arm

Check tapered portion of the knuckle arms and tie-rod arms for abnormal contact in the following manner.:
Apply a thin coat of red check evenly to the tapered portion of the shaft and insert the shaft into the tapered hole. Remove the shaft and check impression of contact obtained on the shaft.
Correction or parts replacement is necessary if the contact is uneven or if contact area is smaller than 3/4 of the entire length of the shaft.

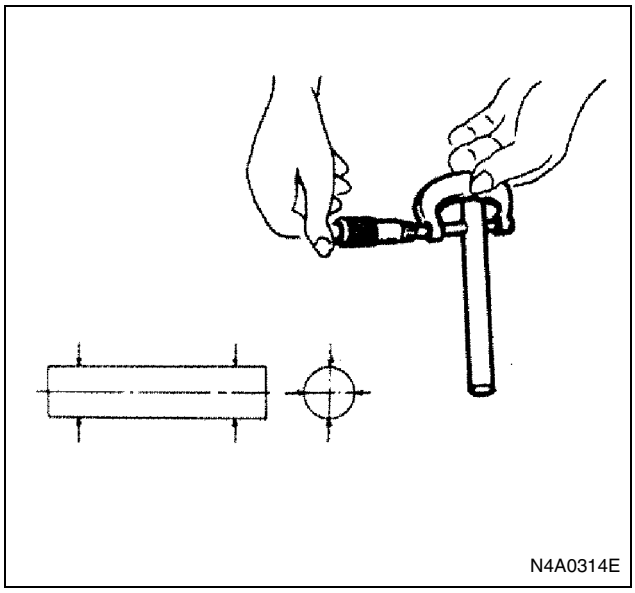


Legend

1. Contact are is longer than 3/4 of the entire length of the shaft.

King Pin Diameter

- NHR
  A: 25.0 mm (0.984 in)
  B: 24.9 mm (0.980 in)
- NKR, NPR, NQR
  A: 30.0 mm (1.181 in)
  B: 29.9 mm (1.177 in)

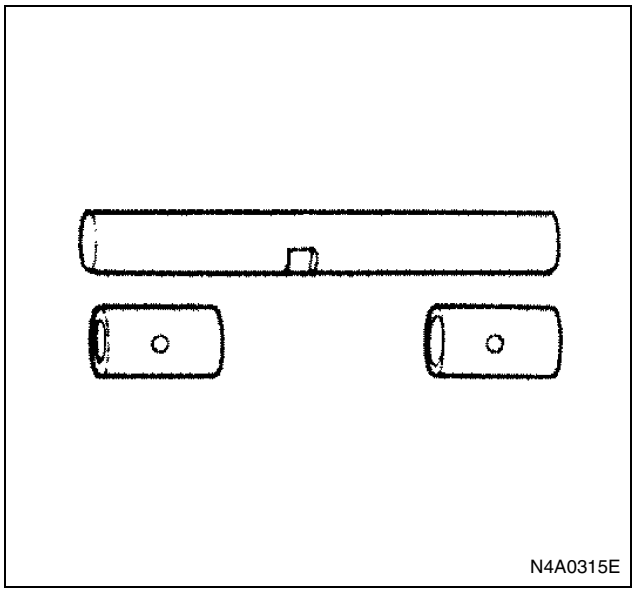


Clearance between King Pin and Bushing

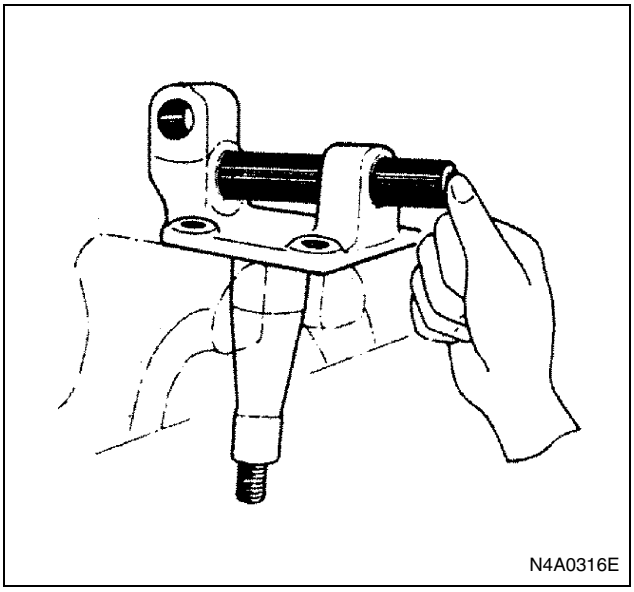
Standard: 0.06 mm (0.0024 in)
Limit: 0.15 mm (0.0059 in)

Notice:

Install the king pin bushing by aligning its grease hole with grease fitting hole in the knuckle.

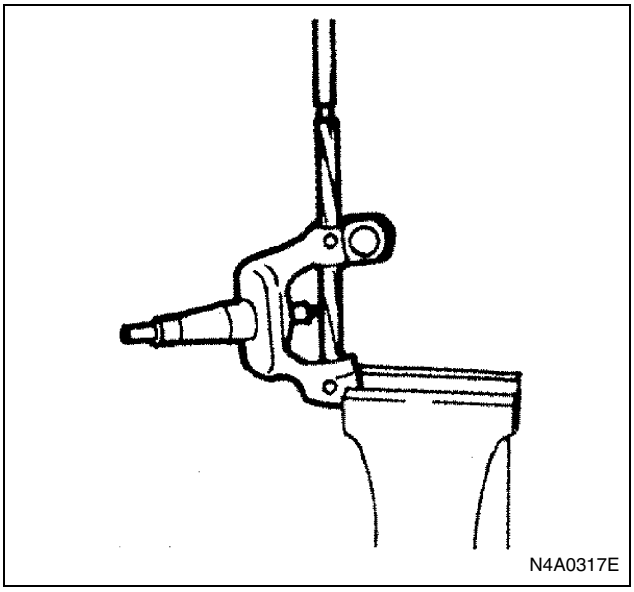


Fit of king pin into the king pin bushing can be checked in the following manner.
Clamp the knuckle with king pin bushings in a vise and insert the king pin into the bushings. Check for radial play by moving the king pin in direction at a right angle to its axis, then move the king pin endwise with finger.



N4A0316E

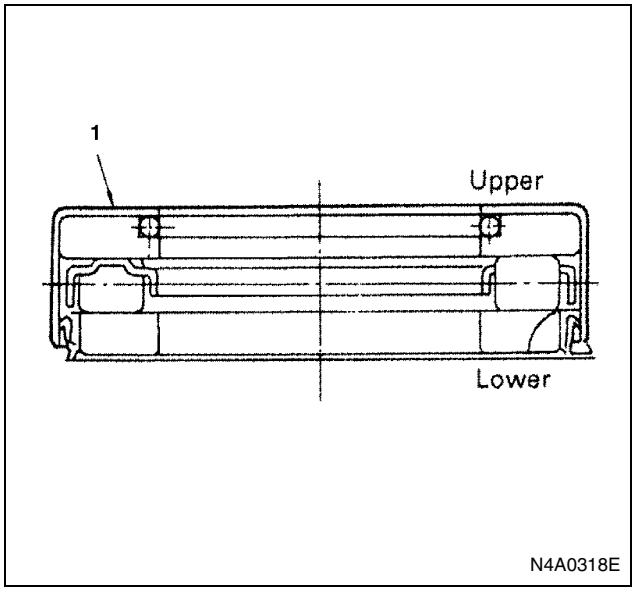
If fitting of king pin into the bushing is too tight, carefully cut inner face of the bushing with a reamer, so that upper and lower holes in the knuckle are well centered.



N4A0317E

Installation

1. I-Beam
2. Knuckle
3. Thrust Bearing
   1) Apply grease.
   2) Turn the bearing case-side upward.



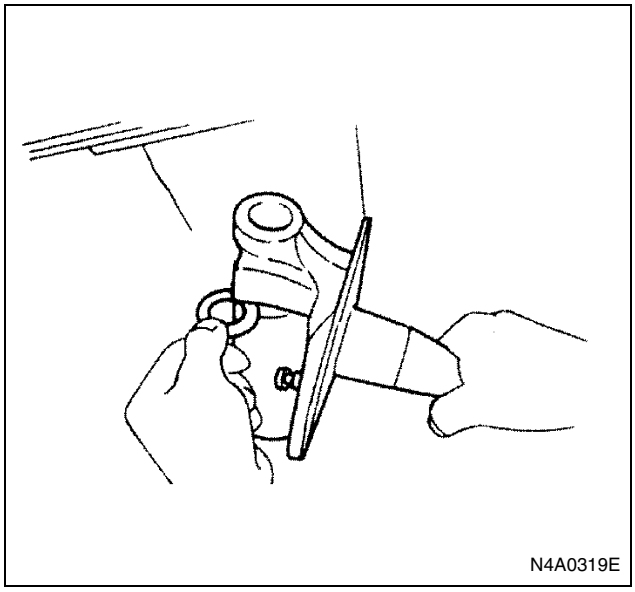
N4A0318E

Legend

1. Case

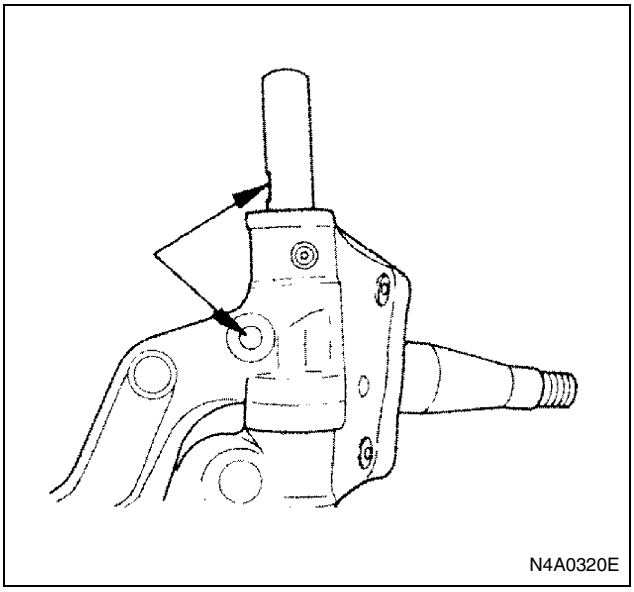
4. Shim
   Check the clearance between the knuckle and front axle.

Standard: 0 — 0.10 mm (0 — 0.004 in)
Limit: 0.20 mm (0.0079 in)
Shim available thickness, 0.50, 0.55, 0.60, 0.65, 0.70, 0.80, 0.90 mm (0.019, 0.022, 0.024, 0.026, 0.028, 0.031, 0.035 in)



N4A0319E

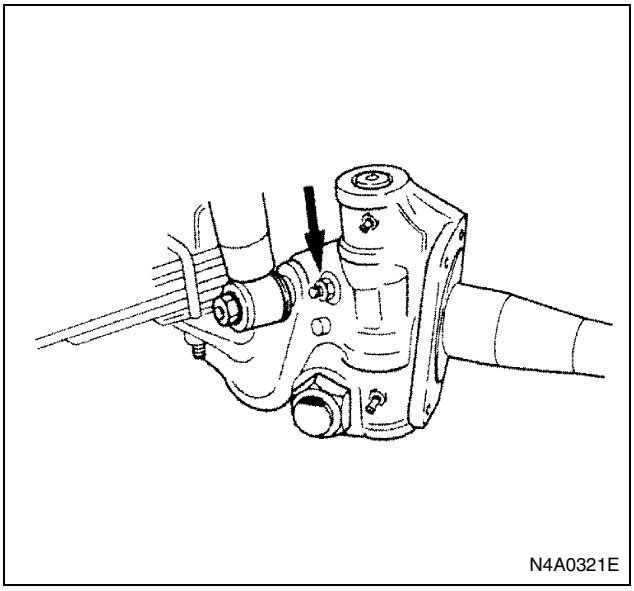
5. King Pin
   1) Apply grease.
   2) Align the key groove with the key bolt hole in the front axle.
   3) After installing the king pin, check that the knuckle turns smoothly.



N4A0320E

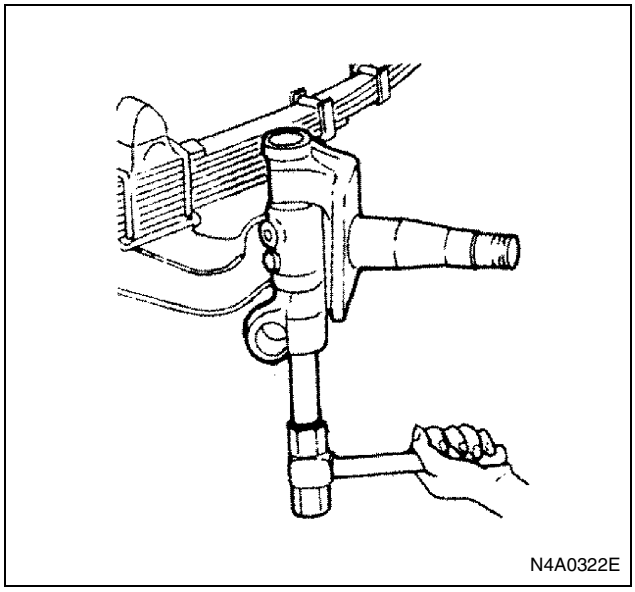
6. Key Bolt

Tighten:
Key bolt to 32 N·m (3.3 kg·m / 24 lb·ft)



N4A0321E

7. King Pin Cover
8. Plate Plug
   Drive the plate plug upward into position with an appropriate bar fitted against the lower end.

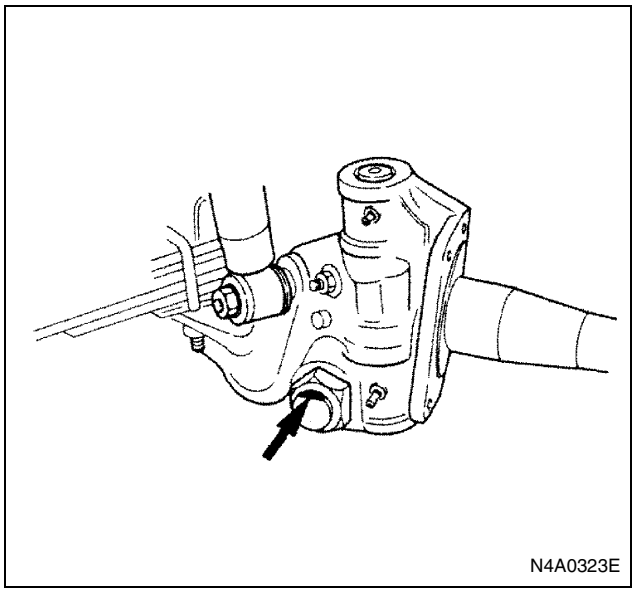


N4A0322E

9. Tie Rod Arm
10. Knuckle Arm

Tighten:
Knuckle arm nut to 441 N·m (45 kg·m / 325 lb·ft)

After tightening, stake nut.
Use a new nut.

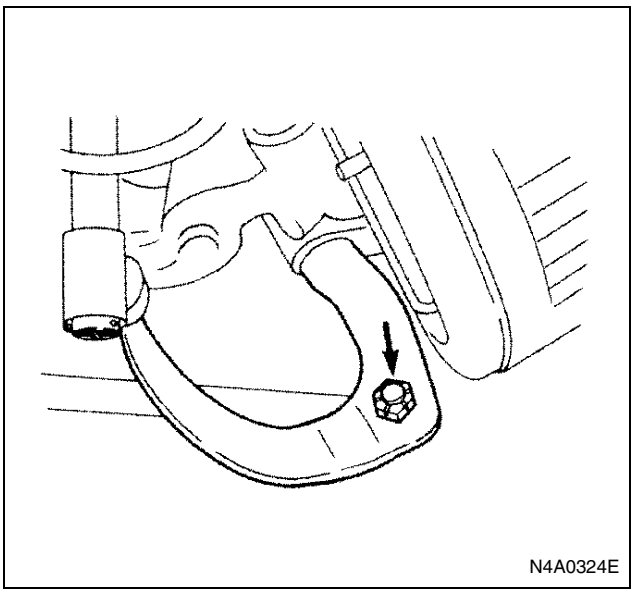


N4A0323E

11. Tie Rod Assembly
    Use a new nut.

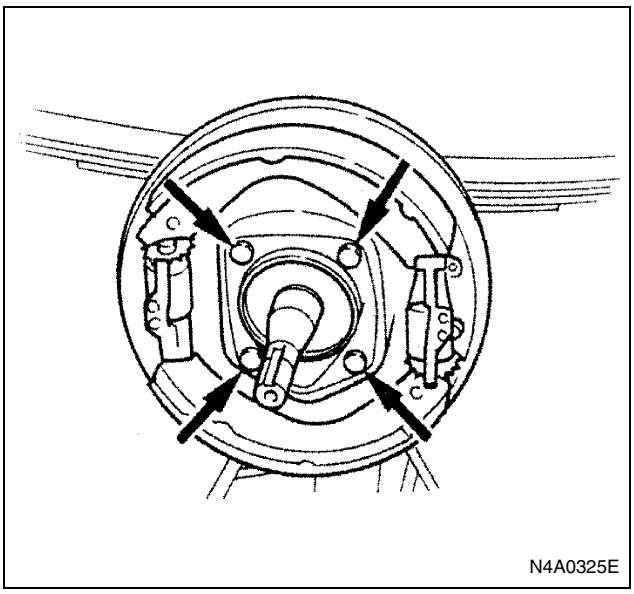
Tighten:
Tie rod end nut to 186 N·m (19 kg·m / 137 lb·ft)

Be sure to install a new cotter pin. If the hole and the slot are not aligned, turn in the direction of tightening to align them.



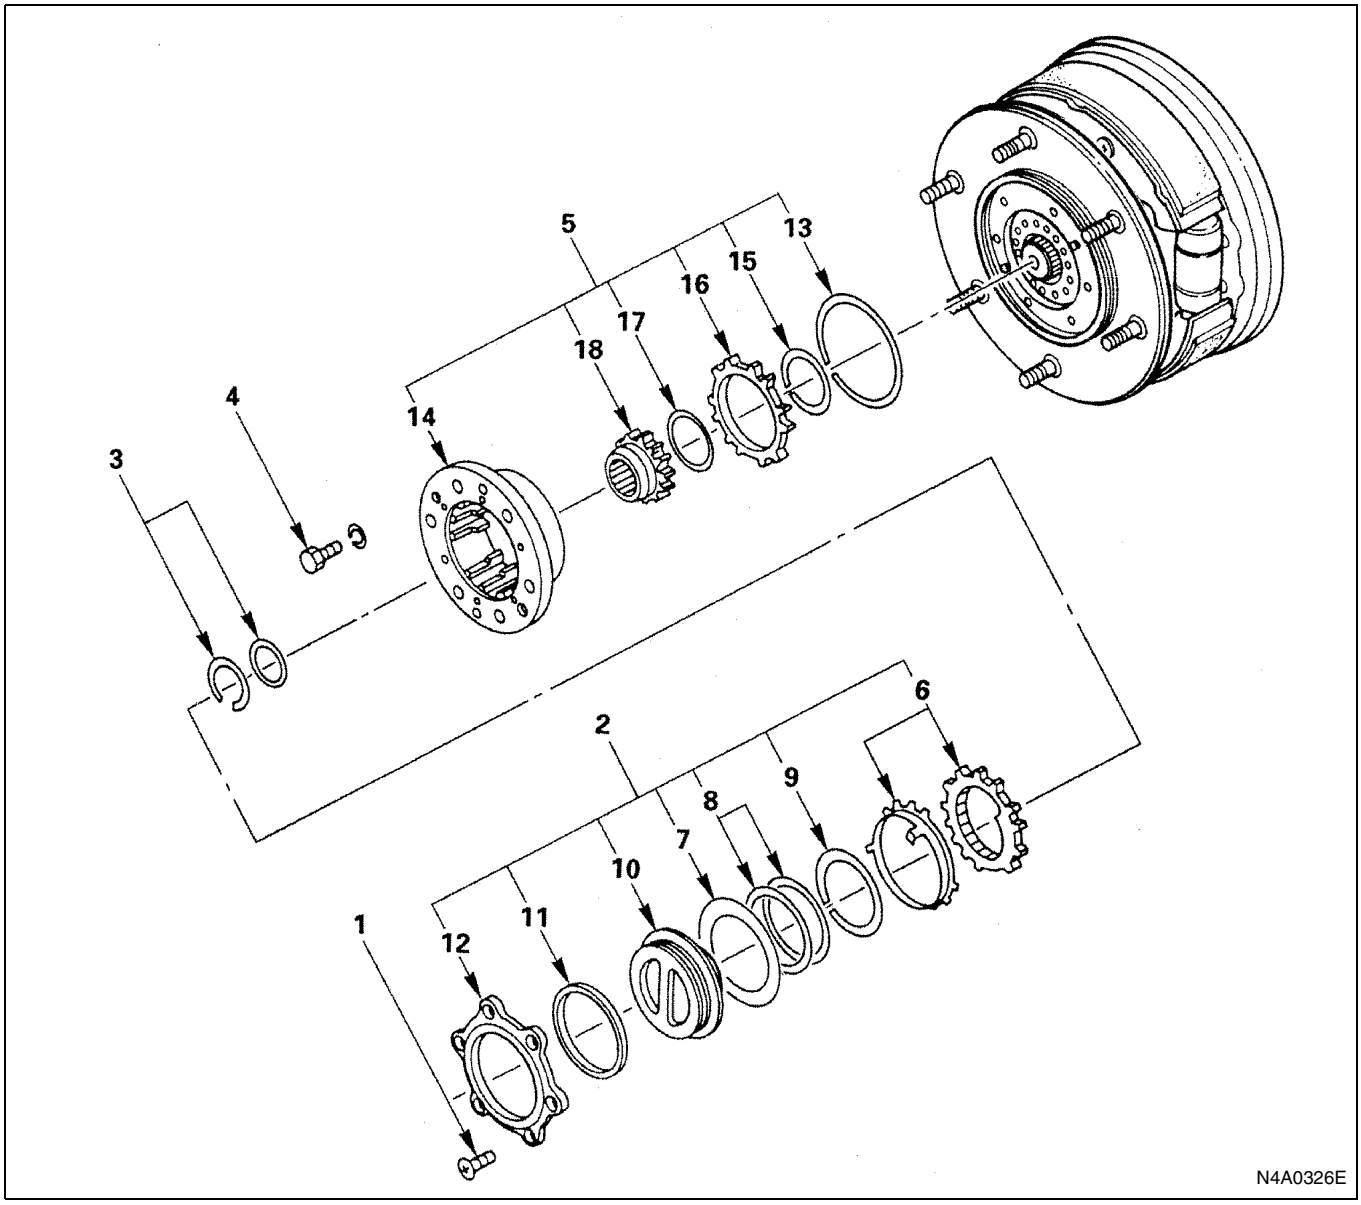
12. Wheel Brake Assembly
13. Cover

Tighten:
Wheel brake bolt to 69 N·m (7 kg·m / 51 lb·ft)



14. Hub with Brake Drum
15. Wheel and Tire

Free Wheel Hub (Manual Locking Hub) (4 × 4 Model)

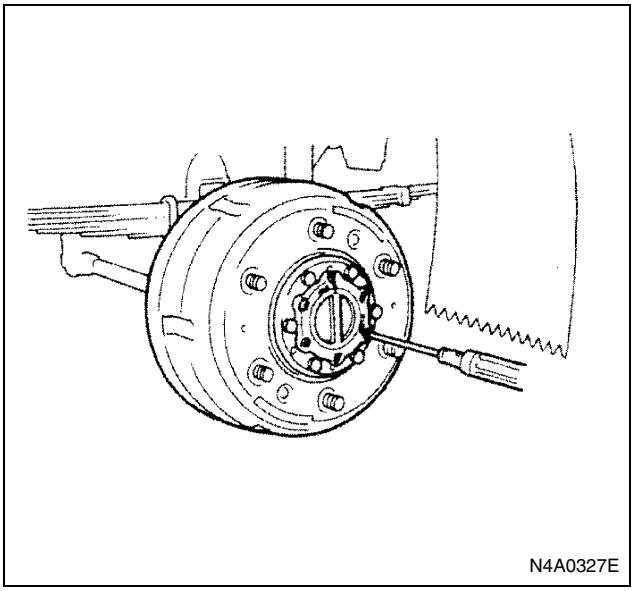


Legend

1. Screw
2. Cover assembly
3. Snap ring and shim
4. Bolt
5. Body assembly
6. Clutch assembly
7. Inner snap ring
8. Tension spring
9. Inner snap ring
10. Handle
11. Ring
12. Cover
13. Inner snap ring
14. Body
15. Outer snap ring
16. Ring
17. Spacer
18. Inner hub lock

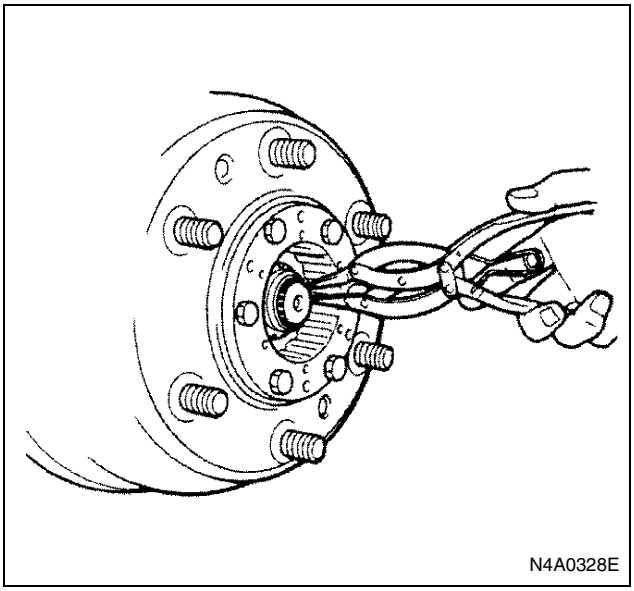
Removal

1. Screw
2. Cover Assembly
   Set handle into “FREE” position and then remove cover assembly.
   (During removal, take care not to damage the flange on rear side of cover. Remove wheel (tire) as necessary.)



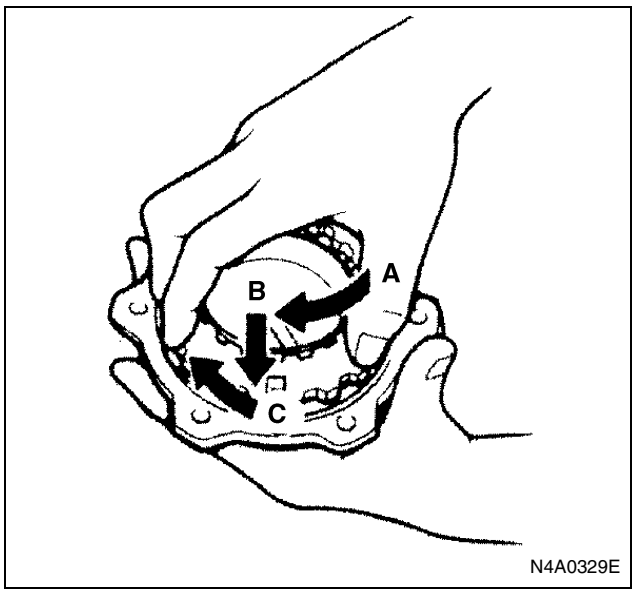
N4A0327E

3. Snap Ring and Shim
   Confirm the quantity of shims.



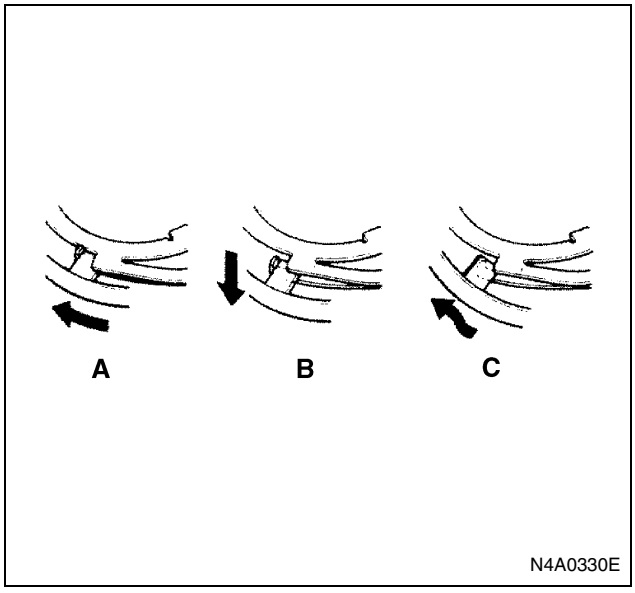
N4A0328E

4. Bolt
5. Body Assembly
   Remove the body assembly using a push bolt (M10 × 1.5).
   During removal, do not damage the flange of body by hitting with a screwdriver or the like.
6. Clutch Assembly
   1) With the handle in FREE position, hold the cover and rotate fully the clutch assembly clockwise as shown (A).
      At this time, the lug of clutch retainer gets stuck by the L-shaped part at the edge of tension spring (0 it is pinched by double parts of tension spring).



N4A0329E

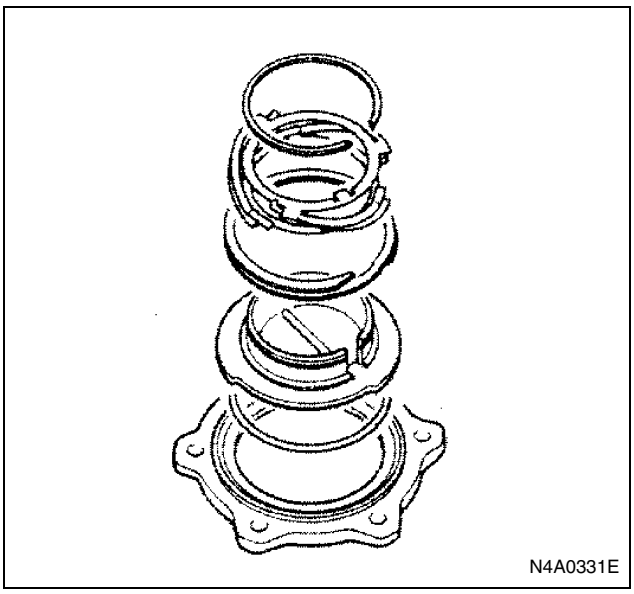
   2) Under the condition of 1) above, rotate further the clutch assembly clockwise while pushing it (B).
      Consequently, the clutch retainer lug is freed from the L-shaped part at the edge of tension spring (C).
      Do not try to further disassemble the clutch assembly.



N4A0330E

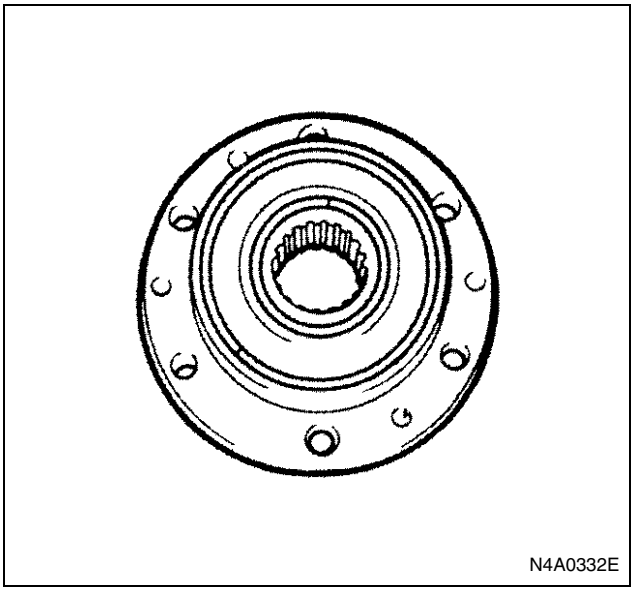
7. Inner Snap Ring
8. Tension Spring
   Remove the snap ring and then remove the tension spring from the cover.
9. Inner Snap Ring
10. Handle
    Remove the inner snap ring and then remove the handle from the cover.

11. Ring
    Remove the ring from the handle.
12. Cover



N4A0331E

13. Inner Snap Ring



N4A0332E

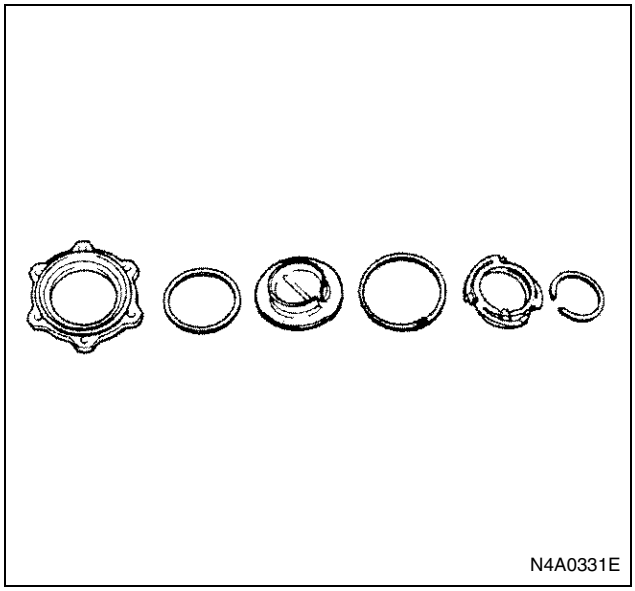
14. Body
    Remove the inner snap ring from the back of body.
15. Outer Snap Ring
16. Ring
    Remove the outer snap ring that joints inner and ring, so that they are separated.
17. Spacer
18. Inner Hub Lock

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Cover Assembly

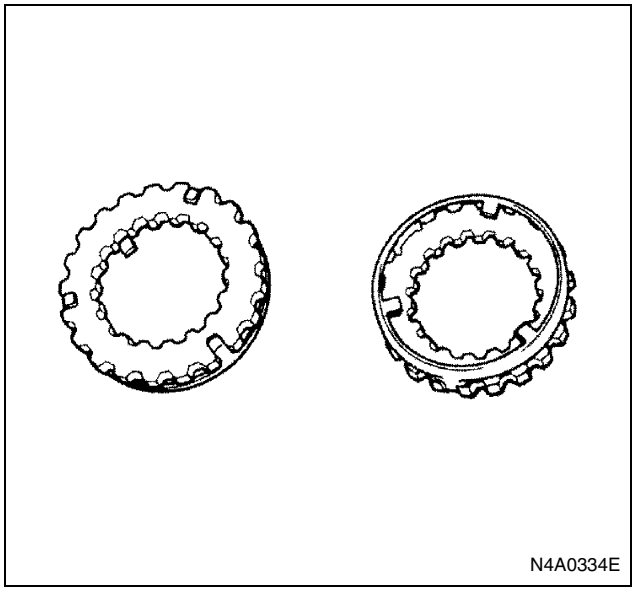
1. Inspect the cover and handle for presence of crack or damage particularly in a sliding part.
2. Inspect the inner snap ring of cover for local wear in the mounting groove.
3. Inspect the tension spring for wear, damage or break.



N4A0331E

Clutch Assembly

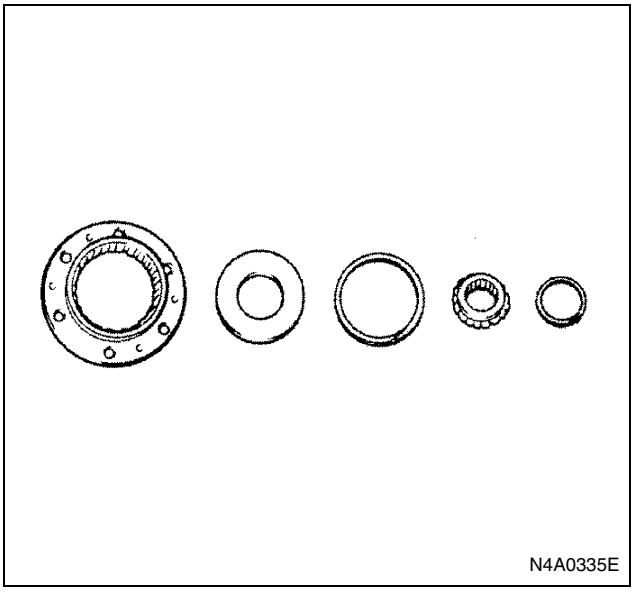
1. Inspect the retainer of clutch assembly for play in the calked parts (3 places).
   Re-calk if the axial play exceeds 0.1 mm.
2. Inspect the clutch teeth for crack, wear or damage, and also the retainer lug for break or wear. Replace the assembly if clutch or retainer is defective.



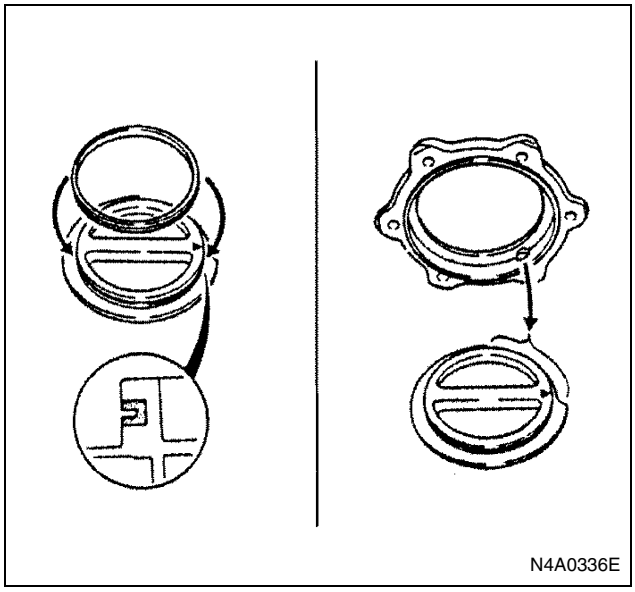
N4A0334E

Body Assembly

1. Inspect the body, ring, inner snap ring, outer snap ring and inner hub lock for crack, wear or damage particularly in the teeth.
2. Inspect the inner snap ring mounting groove of the hub lock body and the outer snap ring mounting groove of the hub lock inner for an uneven wear.



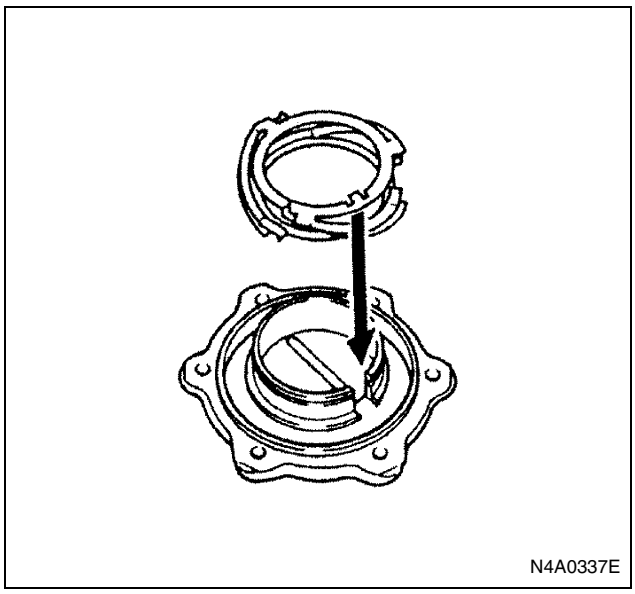
N4A0335E



N4A0336E

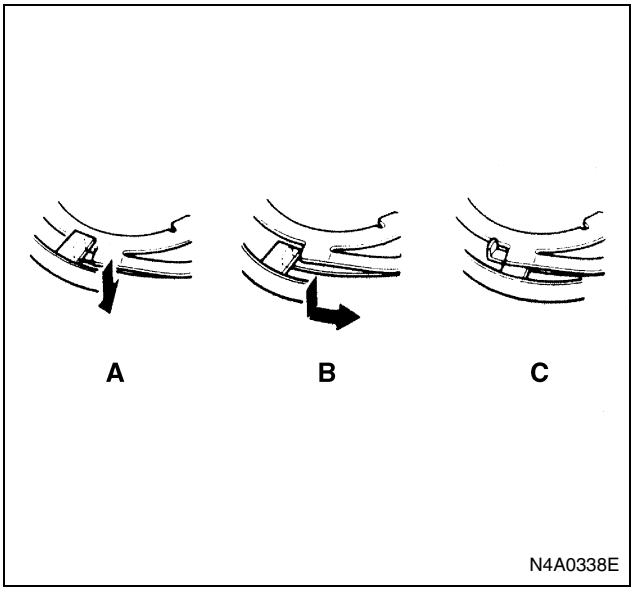
Installation

1. Inner Hub Lock
2. Spacer
3. Ring
4. Outer Snap Ring
   Apply grease (Multipurpose type) to each part of inner hub lock and install it to the hub lock ring (flange should face rear side), then fix it with outer snap ring.
5. Body
6. Inner Snap Ring
   1) Install the inner hub lock to hub lock ring, then to the body, and fix them with inner snap ring.
   2) Make sure that the inner hub lock and outer snap rings are installed properly.
7. Cover
8. Ring
   Apply grease (Multipurpose type) to the ring and install the ring to the handle.
   Make sure that the ring is free from torsion.
9. Handle
10. Inner Snap Ring
    1) Install the handle to the cover, and fix with inner snap ring.
    2) Make sure that the inner snap ring is installed properly.
11. Tension Spring
    1) Apply grease (Multipurpose type) to the tension spring.
    2) Insert the tension spring into the cover assembly with the nail of spring engaged with the groove.
       There is no discrimination such as face or back in the tension spring.



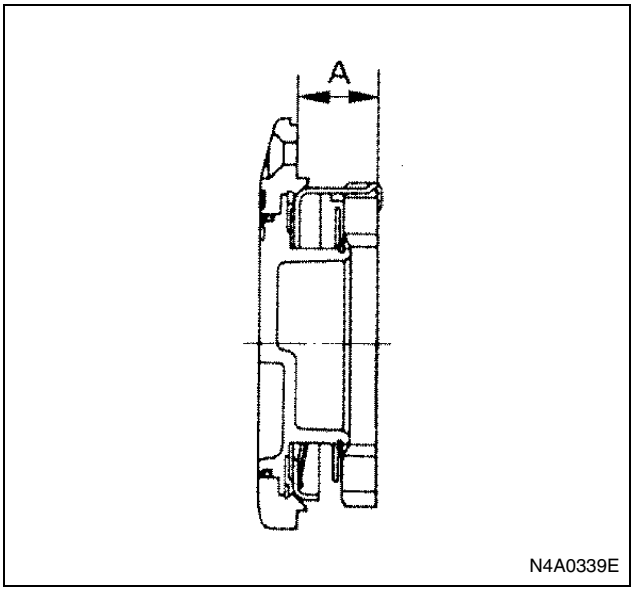
N4A0337E

12. Inner Snap Ring
    Fix the tension spring with inner snap ring.
13. Clutch Assembly
    1) With the retainer lugs met with L-shaped parts (3 places) at the edge of tension spring (A), push and rotate spirally the retainer (B) so that it is pinched by springs (C).



2) The clutch must be in retract status when the handle is set in FREE position.
3) Install the clutch assembly to the cover, and measure the dimension “A” to confirm that it satisfies the standard.

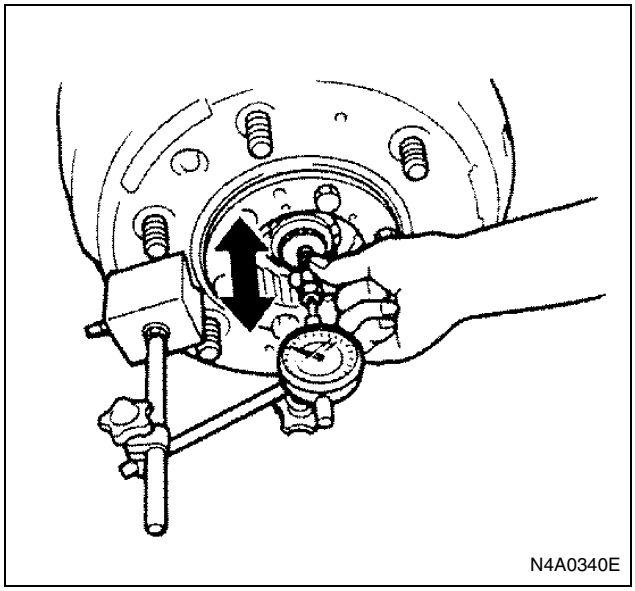
FREE status: 22.4 — 23.7 mm (0.88 — 0.93 in)
LOCK status: 32.6 — 33.9 mm (1.28 — 1.33 in)



14. Body Assembly
    1) Apply grease (Multipurpose type) to the teeth of hub lock body assembly.
    2) Apply adhesive (LOCTITE 515 or equivalent) to the flange surface of the body assembly.
15. Bolt
    Apply adhesive (LOCTITE 242 or equivalent) to the threads of body assembly fixing bolts, and tighten them to the specified torque.

Tighten:
Body assembly bolt to 98 N·m (10 kg·m / 72 lb·ft)

Measurement of axial play of front drive shaft
After installation of body assembly, measure axial play of front drive shaft. If it is out of the standard range, adjust with shims listed below.
Standard play: 0 — 0.5 mm (0 — 0.020 in)
Kind of shims, 1.0, 0.5, 0.3 mm (0.039, 0.020, 0.012 in)



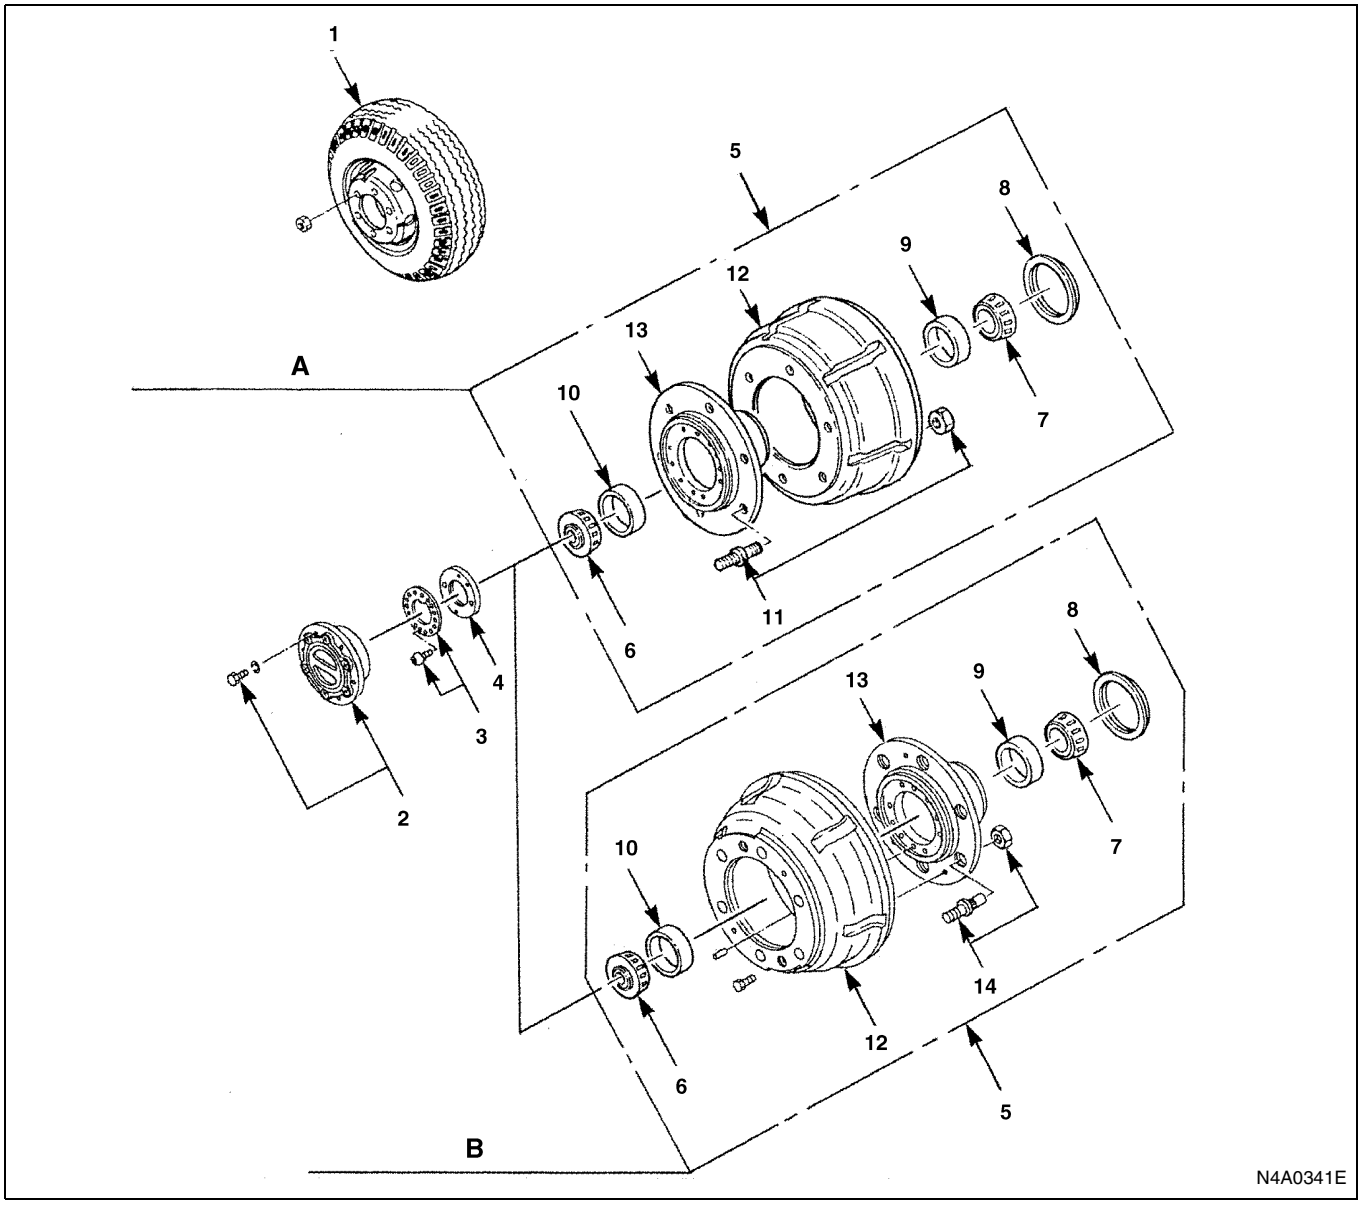
16. Snap Ring and Shim
    Install the snap ring properly.
17. Cover Assembly
    Apply adhesive (Three Bond 1215 or equivalent) to the flange surface of the cover assembly.
18. Screw
    With the handle in FREE position (clutch is disengaged), adjust three grooves of body and tighten the screws to the specified torque after applying adhesive (LOCTITE 242 or equivalent) to the threads.

Tighten:
Screws to 6 N·m (0.6 kg·m / 52 lb·ft)

<Inspection of free wheel hub locking operation>
1. With the handle in FREE position, rotate the front drive shaft. Normal if no load is applied.
2. With the handle in LOCK position, rotate the front drive shaft. Normal if load is applied.
   - Reference value
     Load of front drive shaft: 3 N·m (0.3 kg·m / 26 lb·ft)
3. Return the handle from LOCK to FREE position, rotate the front drive shaft. Normal if no load is applied.

<Inspection of hub lock handle operating force>
The handle should be operated smooth and be moderate in functioning when it is operated two or three times.
[Reference] Handle operating force:10 kg·cm or less at 10°C or above 100 kg·cm or less at –30°C.

Front Hub and Brake Drum (4 × 4 Model)



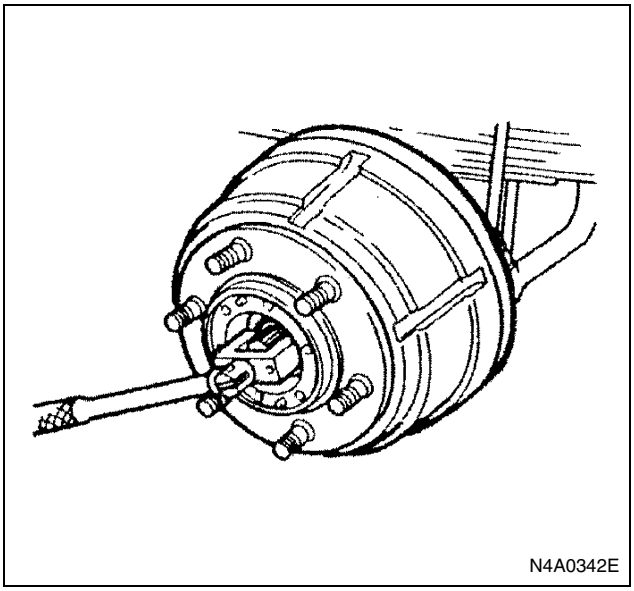
Legend

A. Inside drum fixing type
B. Outside drum fixing type
1. Wheel and tire
2. Front locking hub set
3. Front hub bearing lock washer
4. Front hub bearing lock nut
5. Front hub and brake drum assembly
6. Front axle hub outer bearing
7. Front axle hub inner bearing
8. Front hub oil seal
9. Front axle hub inner bearing outer race
10. Front axle hub outer bearing outer race
11. Front wheel pin and nut (Inside drum fixing type)
12. Brake drum
13. Front axle hub
14. Front wheel pin and nut (Outside drum fixing type)

Removal

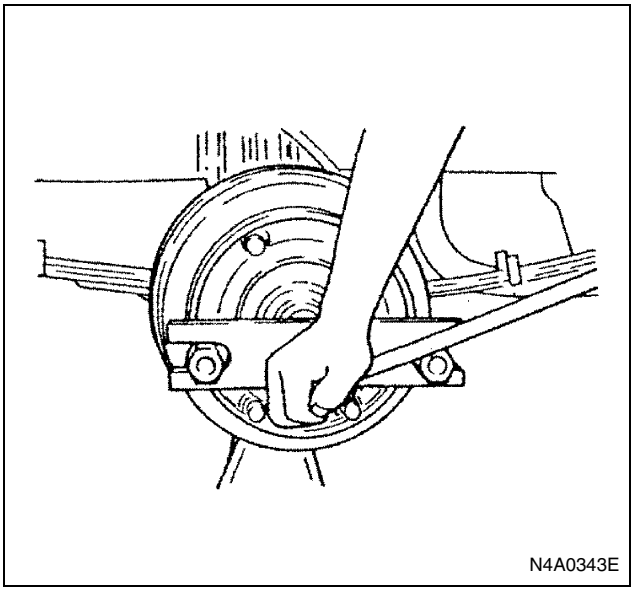
Preparation:
Jack up and support the vehicle on stands.

1. Wheel and Tire
2. Front Locking Hub Set
   Refer to “FREE WHEEL HUB” previously in this section.
3. Front Hub Bearing Lock Washer
4. Front Hub Bearing Lock Nut
   Front Hub Bearing Lock Nut Wrench:
   5-8840-2182-0



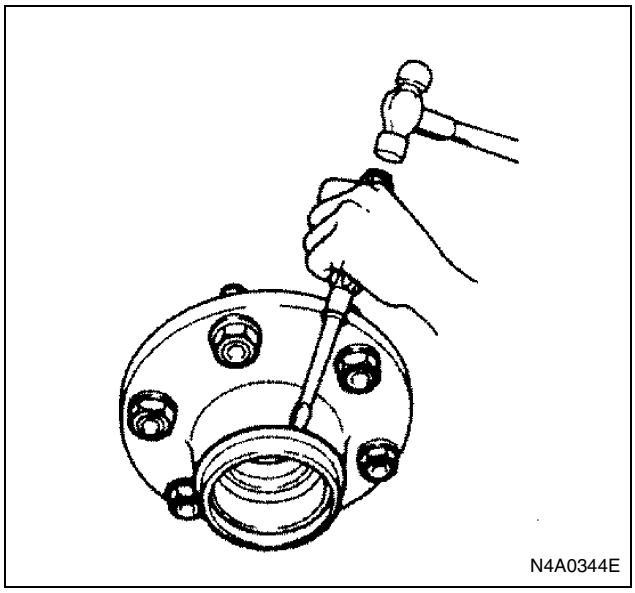
N4A0342E

5. Front Hub and Brake Drum Assembly
   Hub Remover: 9-8521-0187-0



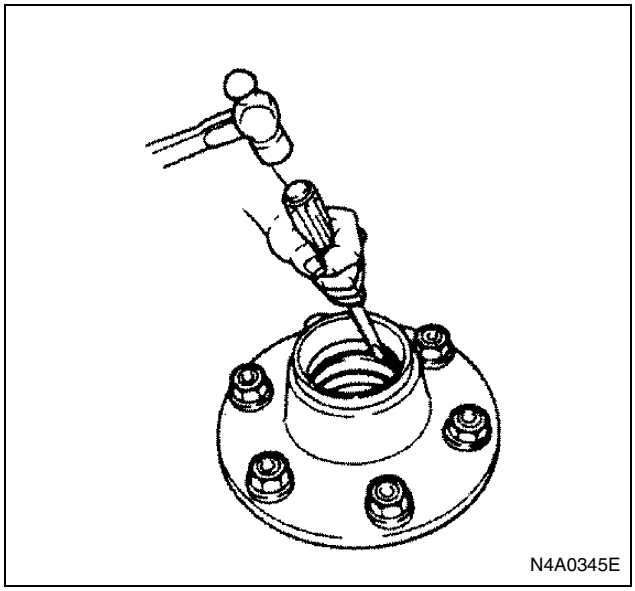
N4A0343E

6. Front Axle Hub Outer Bearing
7. Front Axle Hub Inner Bearing
   If the inner bearing is left on the spindle side, gouge from left and right with a screwdriver, and if floating up, pull to remove it.
8. Front Hub Oil Seal
   When removing the oil seal, hit the outer flange of oil seal. The oil seal must not be reused.



N4A0344E

9. Front Axle Hub Inner Bearing Outer Race



N4A0345E

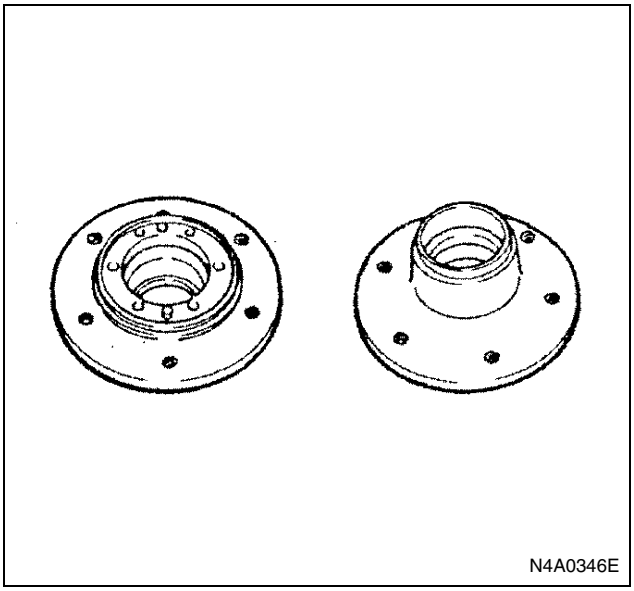
10. Front Axle Hub Outer Bearing Outer Race
    Remove the outer race by driving out race from the hub with a brass drift inserted behind race in notches in the hub.
11. Front Wheel Pin and Nut (Inside Drum Fixing Type)
    Remove nuts and hit with hammer, or use a press to remove wheel pin.
    Remove the wheel pin as necessary.
12. Brake Drum
13. Front Axle Hub
14. Front Wheel Pin and Nut (Outside Drum Fixing Type)
    Remove nuts and hit with hammer, or use a press to remove wheel pin.
    Remove the wheel pin as necessary.

Inspection and Repair

Make necessary adjustments, repairs, and part replacement if excessive wear or damage is discovered during inspection.

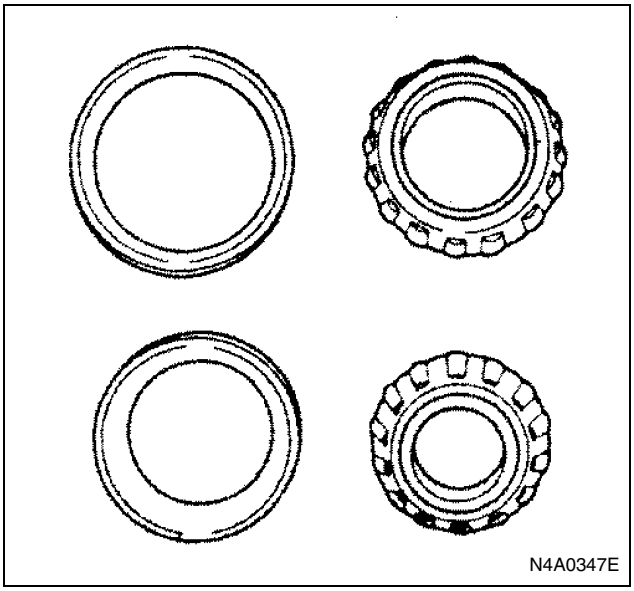
Front Axle Hub

1. Inspect the inner surface of front axle hub.
   Inspect the fitting portions of front axle hub bearing outer race and hub lock body assembly for crack, damage or wear.
2. Inspect the outer surface of front axle hub.
   Inspect the flange and oil seal fitting portion for crack, deformation or damage.



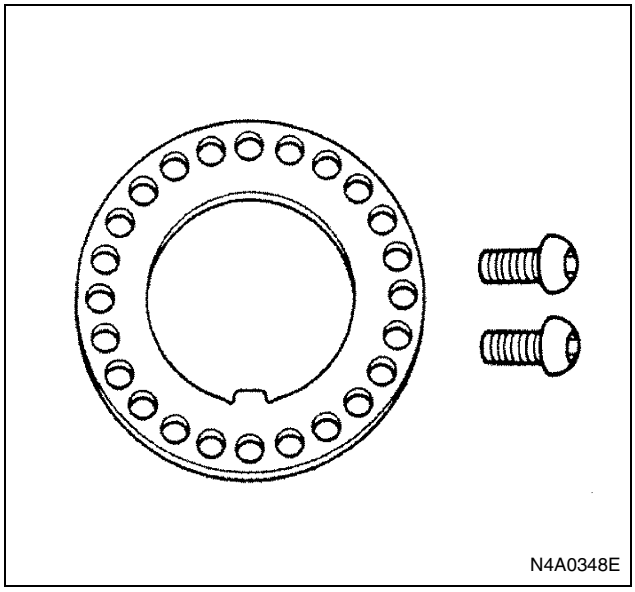
Bearing

Inspect the bearing for excessive wear, abnormal noise, rough rotation, and seizure



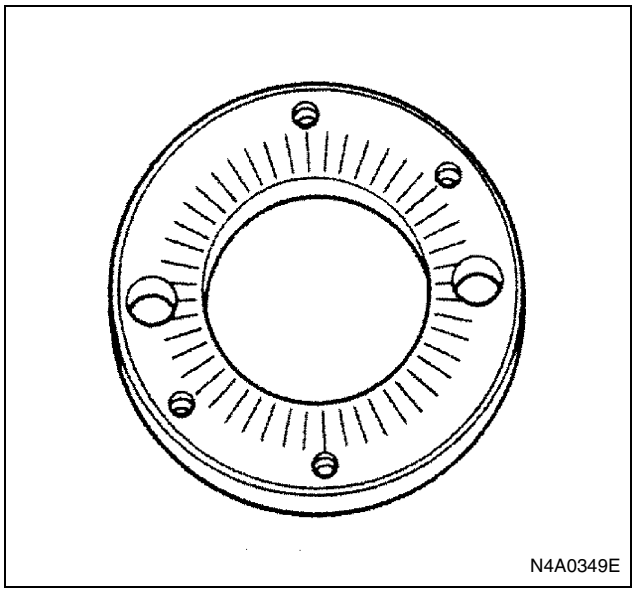
Front Hub Bearing Lock Washer

Inspect the lock washer for wear, deformation or crack, and also the lug for break.



Front Hub Bearing Lock Nut

Inspect the bearing lock nut threads and contact surfaces for excessive wear, warpage, and other damage. Light damage to the contact surfaces can be repaired with an oil stone or a piece of fine sandpaper.

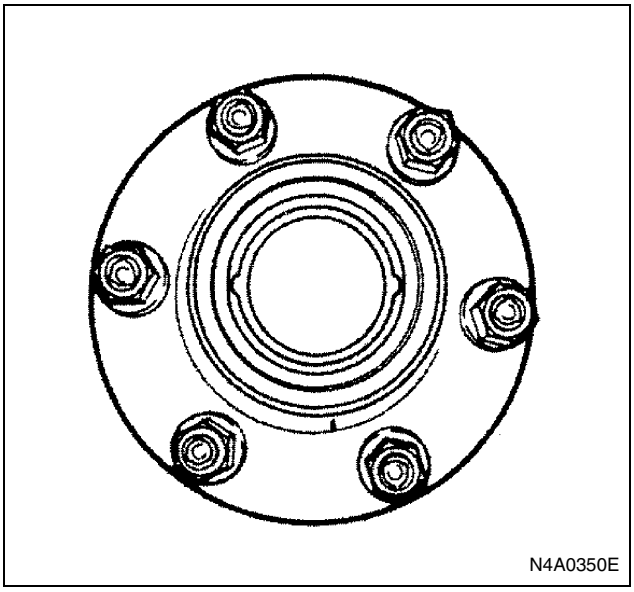


Installation

1. Front Wheel Pin and Nut (Outside Drum Fixing Type)
   If a wheel pin is replaced or removed, tighten the nut to the specified torque and calk the nut at three places per pin.

Tighten:

Front wheel pin nut to 392 N·m (40 kg·m / 289 lb·ft)



N4A0350E

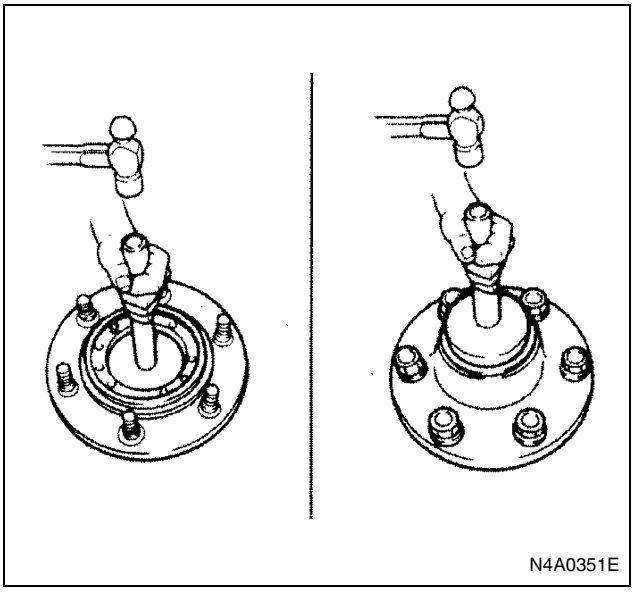
2. Front Axle Hub
3. Brake Drum
   On the model with outside drum fixing type, tighten the brake drum bolts to the specified torque.

Tighten:
Brake drum bolt to 13 N·m (1.3 kg·m / 113 lb·in)

4. Front Wheel Pin and Nut (Inside Drum Fixing Type)
   Tighten the nut to the specified torque and calk the nut at three places per pin.

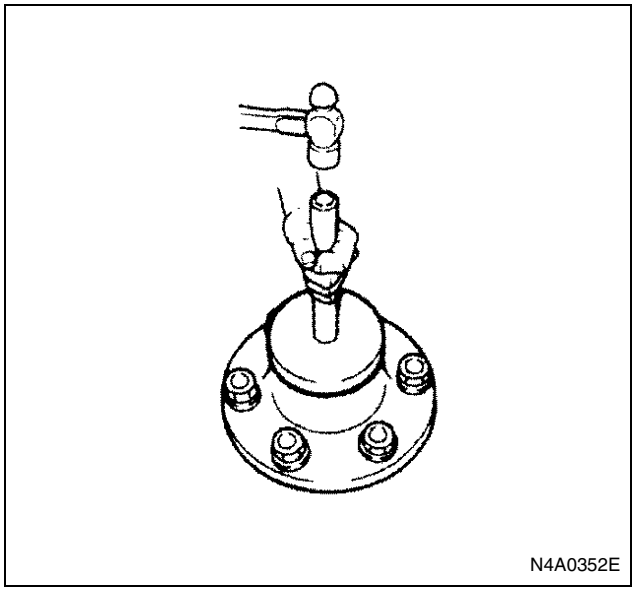
Tighten:
Front wheel pin nut to 392 N·m (40 kg·m / 289 lb·ft)

5. Front Axle Hub Outer Bearing Outer Race
6. Front Axle Hub Inner Bearing Outer Race
   Use the bearing outer race installer to install the outer race to the hub.
   Inner Bearing Outer Race Installer:
   5-8840-2184-0
   Outer Bearing Outer Race Installer:
   5-8840-2183-0



N4A0351E

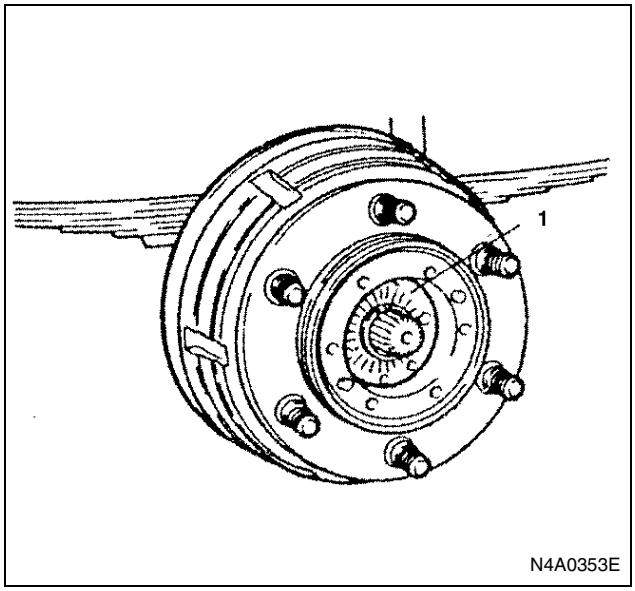
7. Front Hub Oil Seal
   1) Apply grease (Multipurpose type) to the oil seal lip inner circumferences.
   2) Use the oil seal installer to install the oil seal to the hub.
      Oil Seal Installer: 5-8840-2187-0
      During installation of oil seal, do not press or hit it other than outer flange of seal.



N4A0352E

Apply the specified amount of the approved grease to the hub cavity, the outer bearing and the inner bearing.
Grease amount: 200 g (7.1 oz) per each side

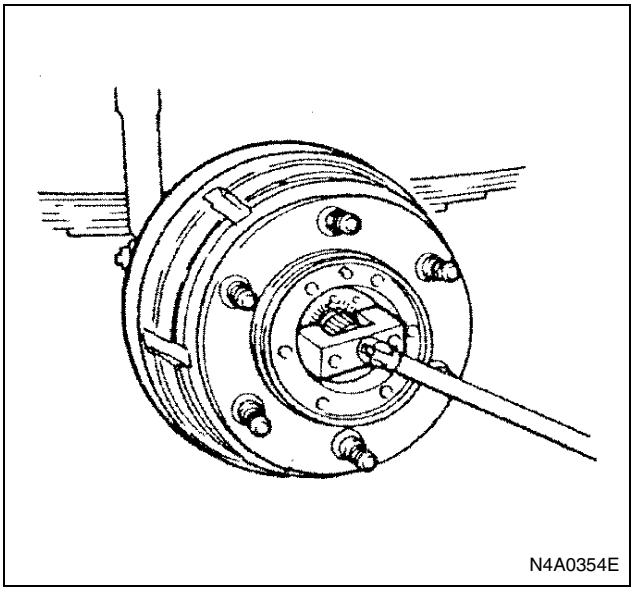
8. Front Axle Hub Inner Bearing
   Install the inner bearing to the spindle.
9. Front Axle Hub Outer Bearing
   Install the outer bearing to the front hub assembly.
10. Front Hub and Brake Drum Assembly
11. Front Hub Bearing Lock Nut
    Install the hub bearing lock nut with (1) slits facing outside, and tighten provisionally.



N4A0353E

<Adjustment of Hub Bearing Preload>

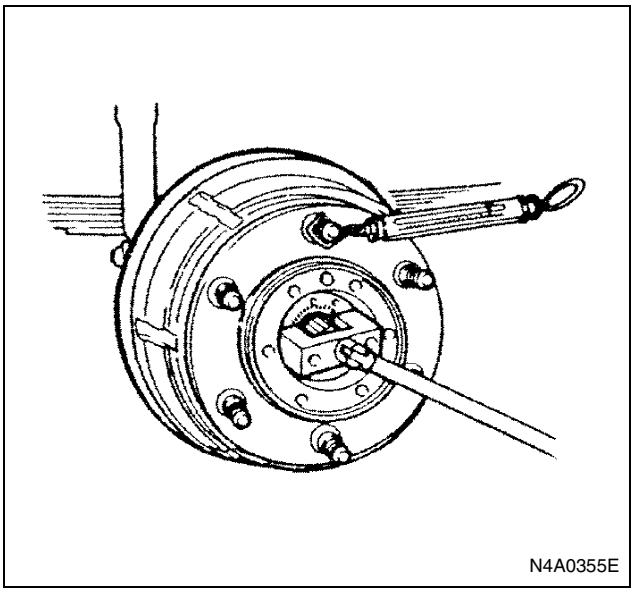
1) Turn the hub to the left and right several times to establish bearing conformity.
2) Use the bearing nut wrench to tighten the bearing nut until the hub can not be manually rotated.
   Bearing Nut Wrench:5-8840-2182-0
3) Loosen the bearing nut until hub rotates easily.



N4A0354E

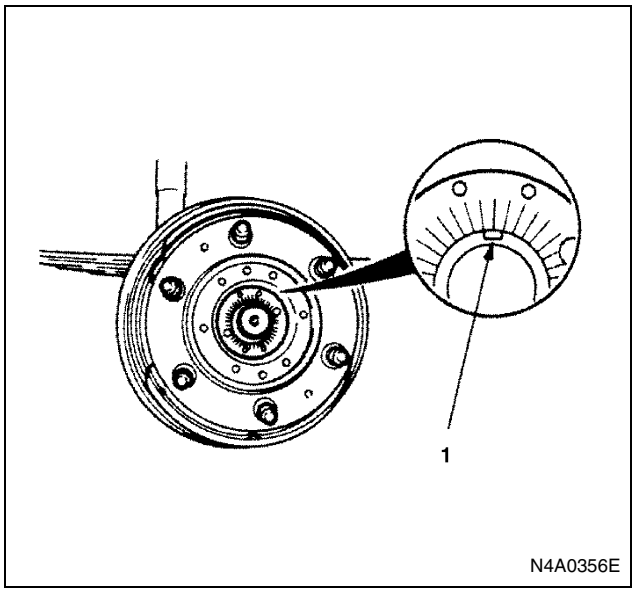
4) Set the spring balancer to the wheel pin in the position shown in the illustration.
   Gradually retighten the nut until the hub bearing is adjusted to the specified preload.

Hub bearing preload,
New Hub bearing: 17 — 31 N·m (1.7 — 3.2 kg·m / 3.7 — 7.1 lb·ft)
Reused Hub bearing: 14 — 28 N·m (1.4 — 2.9 kg·m / 3.1 — 6.4 lb·ft)



N4A0355E

5) Rotate the hub several times to the right and left.
   Measure the bearing preload a second time.
6) Align the axle case groove (1) with the closest bearing nut slit.



N4A0356E

Notice:
If it is difficult to align the axle case and bearing nut, slightly tighten the bearing nut.

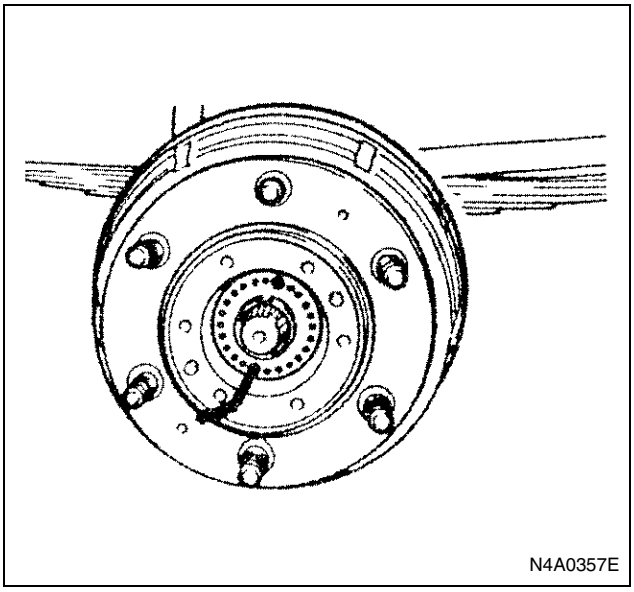
12. Front Hub Bearing Lock Washer
    Engage the lug of lock washer with a notch in the spindle.

    Apply adhesive (LOCTITE 242 or equivalent) to the threads of lock washer bolt, and tighten the hub bearing lock nut with lock washer.

Tighten:
Lock washer bolt to 10 N·m (1.0 kg·m / 87 lb·in)

In order to ensure locking, equally spaced 48 slits are scribed on the hub bearing lock nut. The tapped holes in hub bearing lock nut will meet either hole in lock washer (two holes provided at symmetric position) if a slit of hub bearing lock nut is aligned with the notch center at the threads of spindle end.

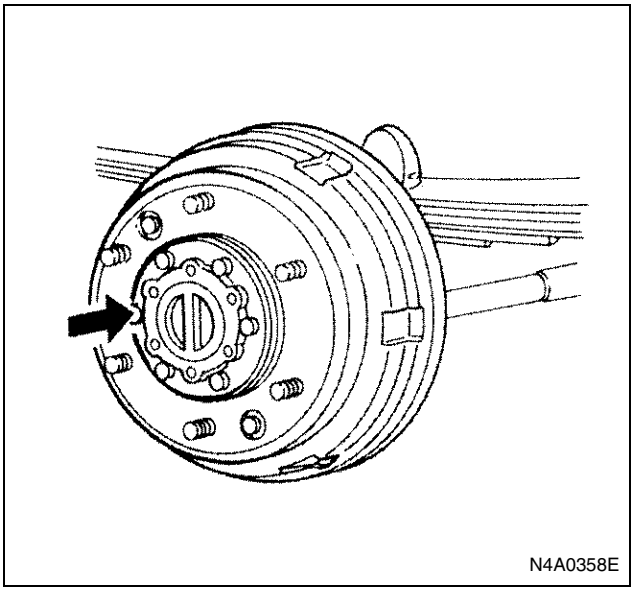
Under this condition, tightening the bolts fix surely the hub bearing lock nut.



N4A0357E

13. Front Locking Hub Set
    Refer to “FREE WHEEL HUB” previously in this section.

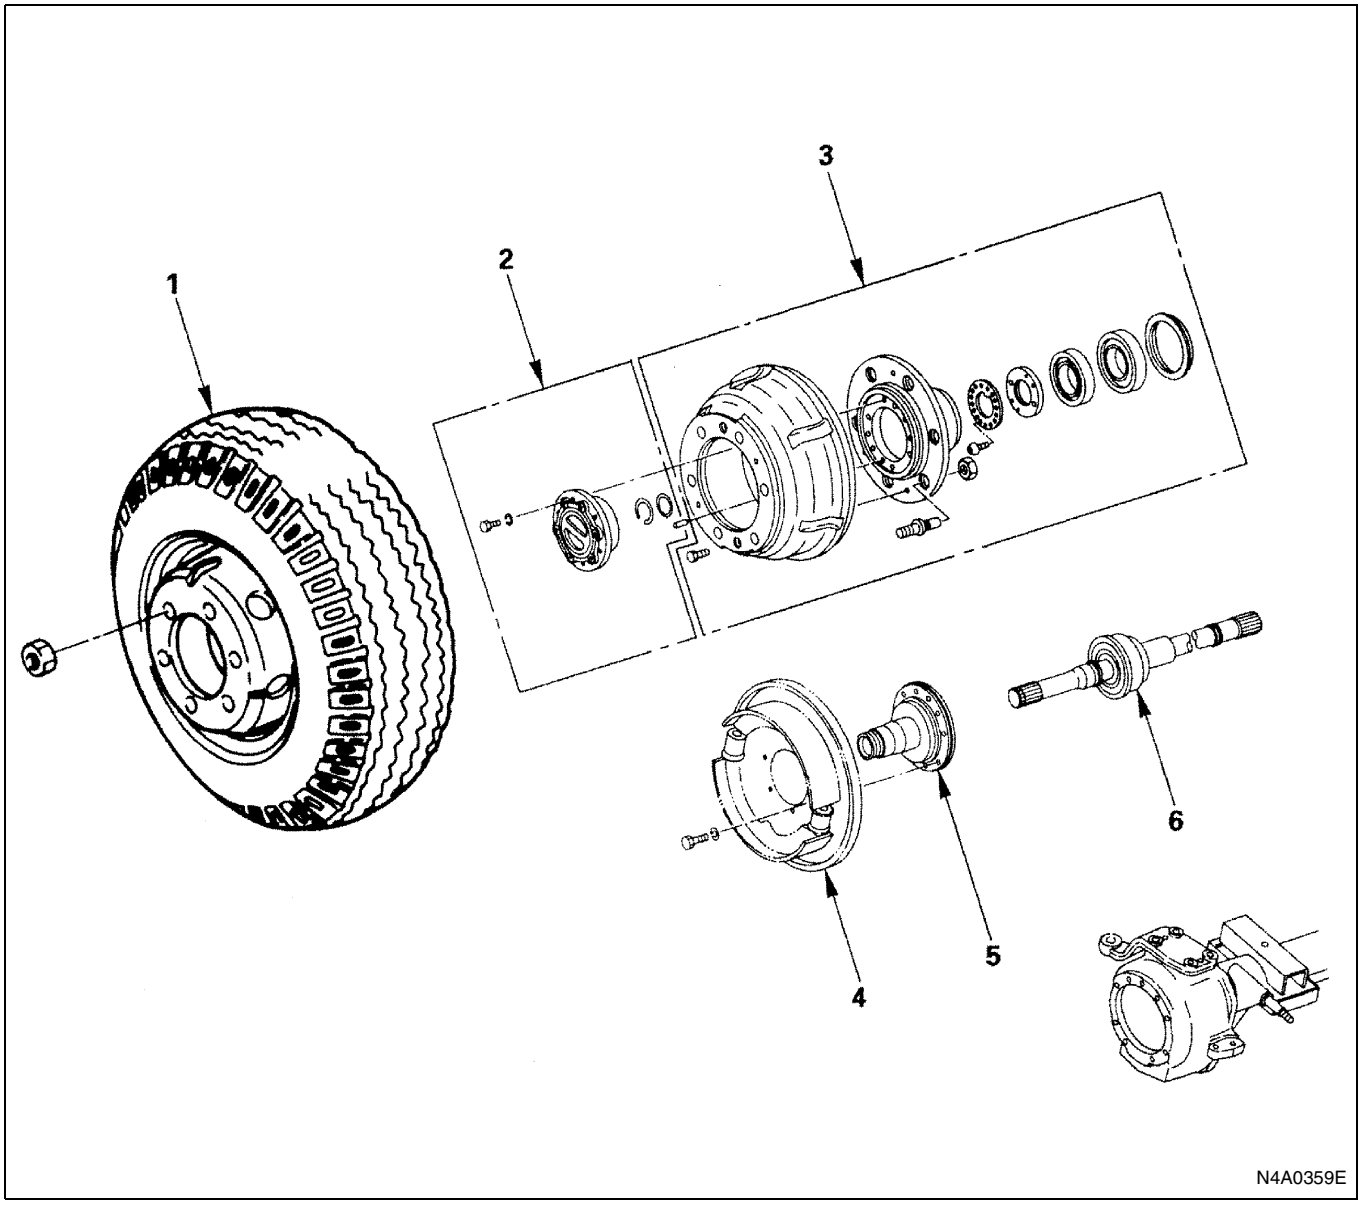
Tighten:
Front locking hub set bolt to 98 N·m (10.0 kg·m / 72 lb·ft)



N4A0358E

14. Wheel and Tire

Spindle and Drive Shaft (4 × 4 Model)



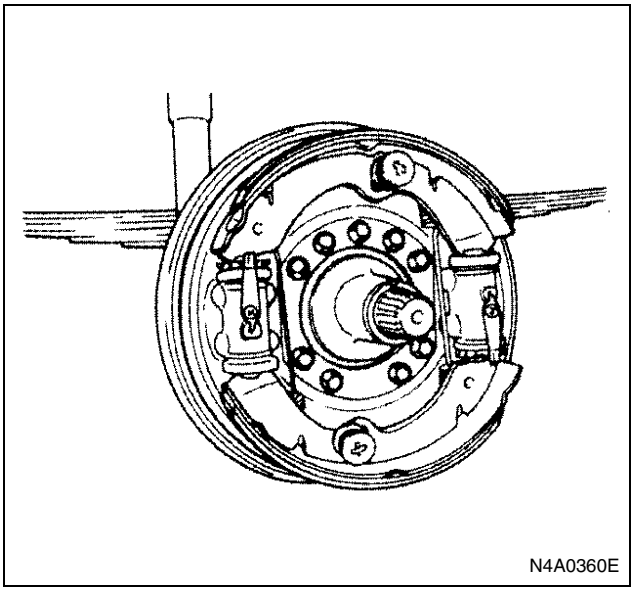
Legend

1. Wheel and tire
2. Front locking hub set
3. Front axle hub, brake drum and related parts
4. Front brake assembly
5. Spindle
6. Front drive shaft assembly

Removal

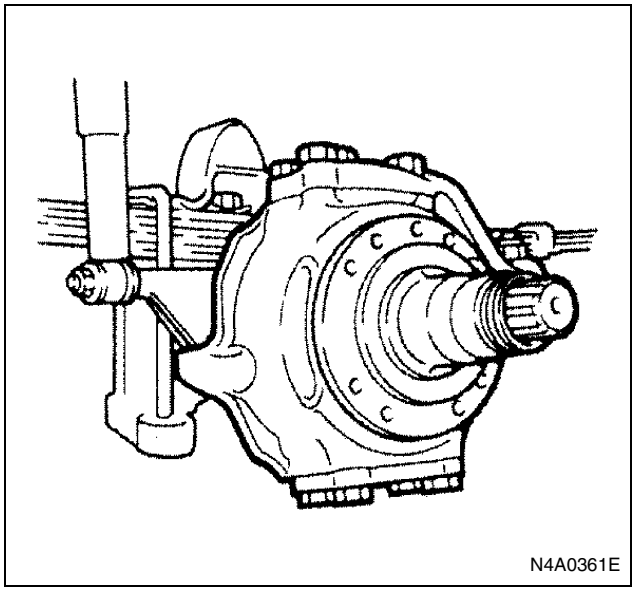
Preparation:
Jack up and support the vehicle on stands.

1. Wheel and Tire
2. Front Locking Hub Set
   Refer to “FREE WHEEL HUB” previously in this section.
3. Front Axle Hub, Brake Drum and Related Parts
   Refer to “FRONT HUB and BRAKE DRUM (4 × 4 Model)” previously in this section.
4. Front Brake Assembly
   1) Remove fixing bolts and front oil shield cover, then the brake assembly.
      The front oil shield cover, spindle and back plate are tightened together.
   2) Using a wire, sling the brake assembly to the frame to hold. At this time, take care not to damage or bend the brake hose.



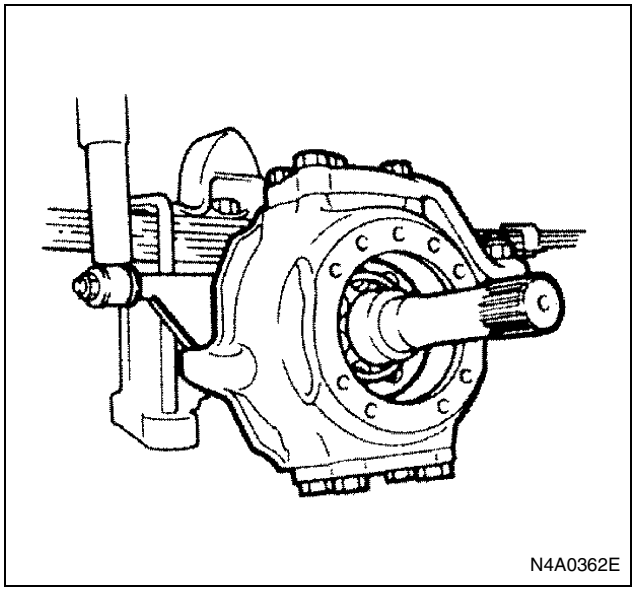
N4A0360E

5. Spindle
   Hitting lightly the spindle end with a wood or plastic hammer, remove the spindle from knuckle.
   Do not use an iron hammer. Special care should be taken to protect the threads at the spindle end from damage.



N4A0361E

6. Front Drive Shaft Assembly
   Pull and remove the front drive shaft to your side.



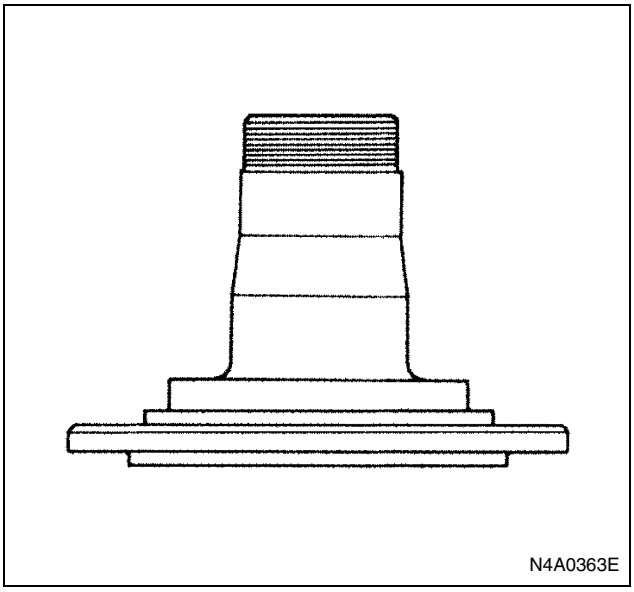
N4A0362E

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

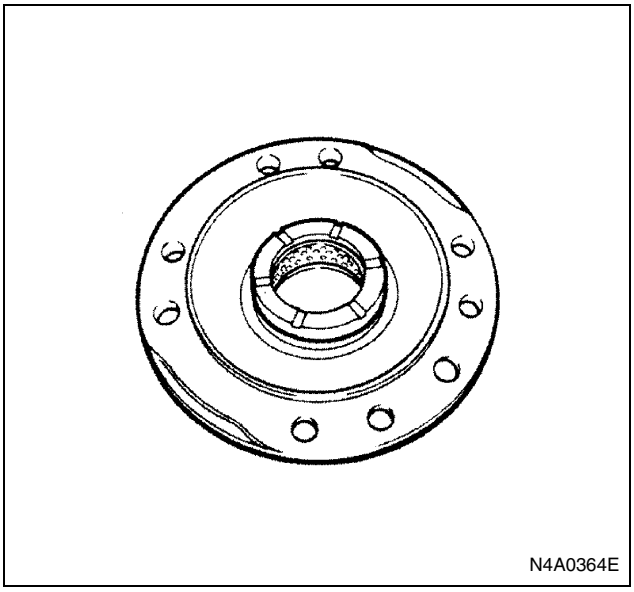
Spindle

1. Inspect the whole of the spindle for crack, wear or damage.
   Replace the spindle if any abnormal condition is noticeable.
   Use a visible dye-penetrant flaw detection method or a magnetic flaw detector.



N4A0363E

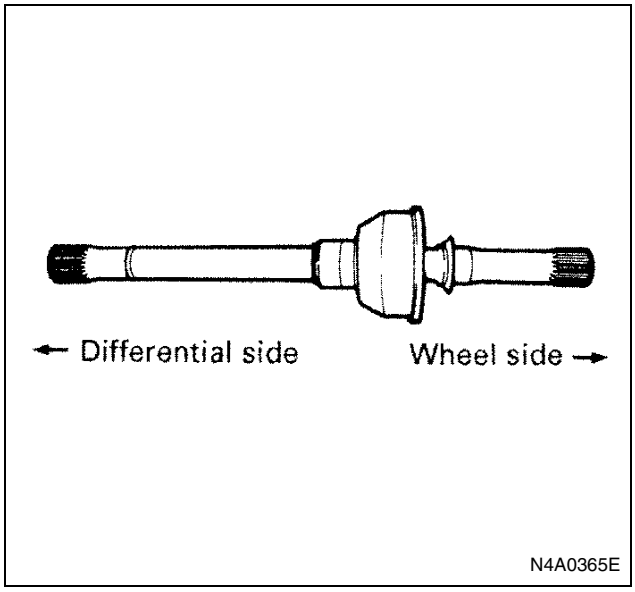
2. Inspect the front axle shaft thrust washer or bushing for wear and damage.



N4A0364E

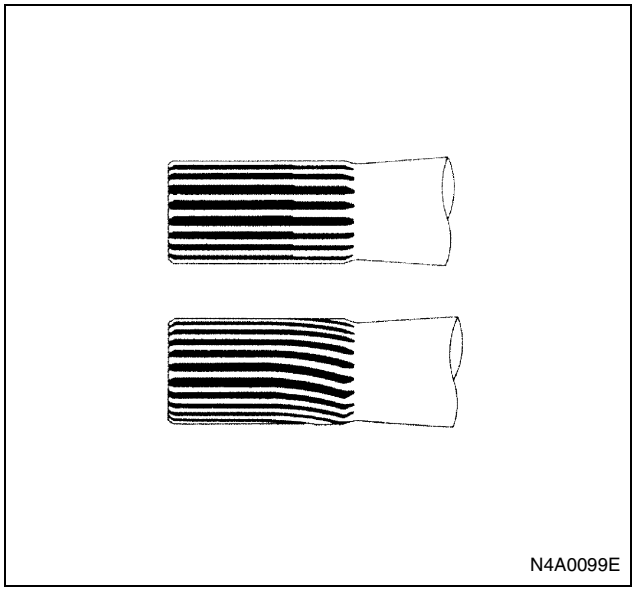
Front Drive Shaft Assembly

1. Inspect the front drive shaft for bending or distortion.



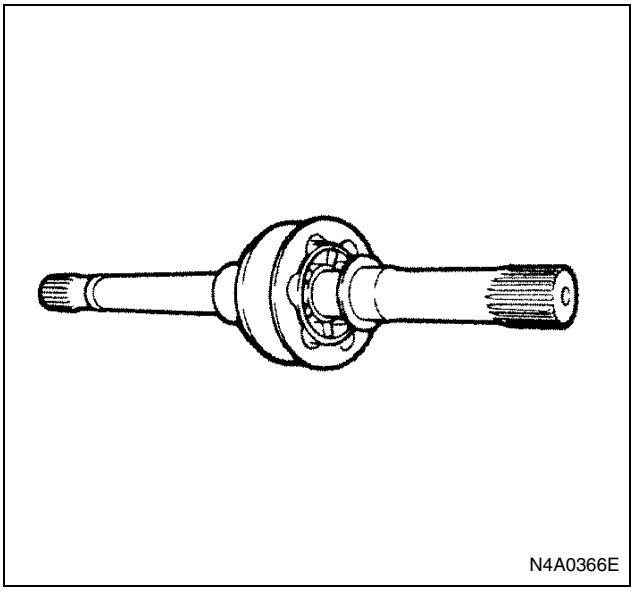
N4A0365E

2. Inspect the front drive shaft spline for wear or distortion.
   Replace the front drive shaft assembly if wear or distortion is found.



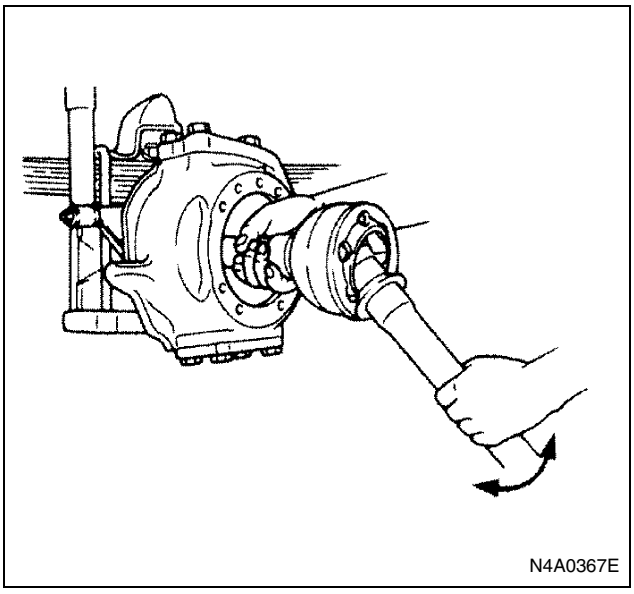
N4A0099E

3. Inspect the stopper contact face (on the spindle's side) for wear or damage.



N4A0366E

4. Moving the front drive shaft joint as shown, inspect for smooth operation or presence of excessive play.
   Replace the front drive shaft assembly if it does not move smoothly or there is excessive play.



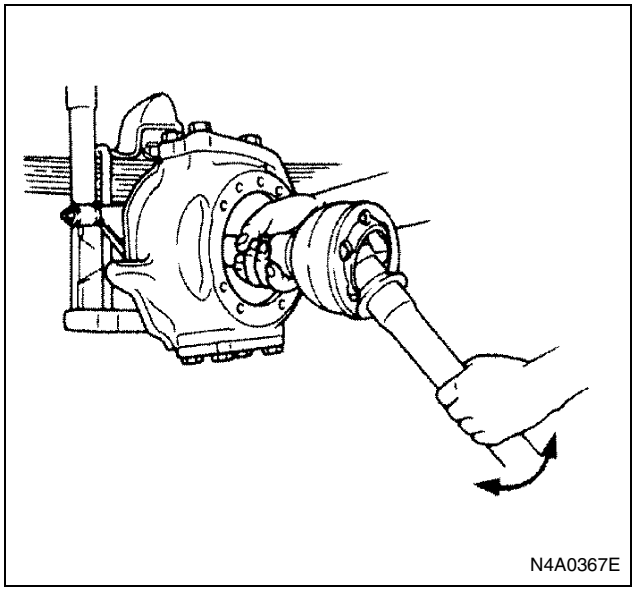
N4A0367E

Installation

1. Front Drive Shaft Assembly
   1) Apply the MoS2 contained type grease into the universal joint.

Grease amount: 94 — 106 g (3.3 — 3.7 oz)

   2) Install the front drive shaft assembly into the front axle case.
      During installation, take care not to damage the oil seal lip on the front axle case side.
      To install, bend the front drive shaft as shown, and moving the shaft a little to the left or right, push it into the spline on the differential side gear.



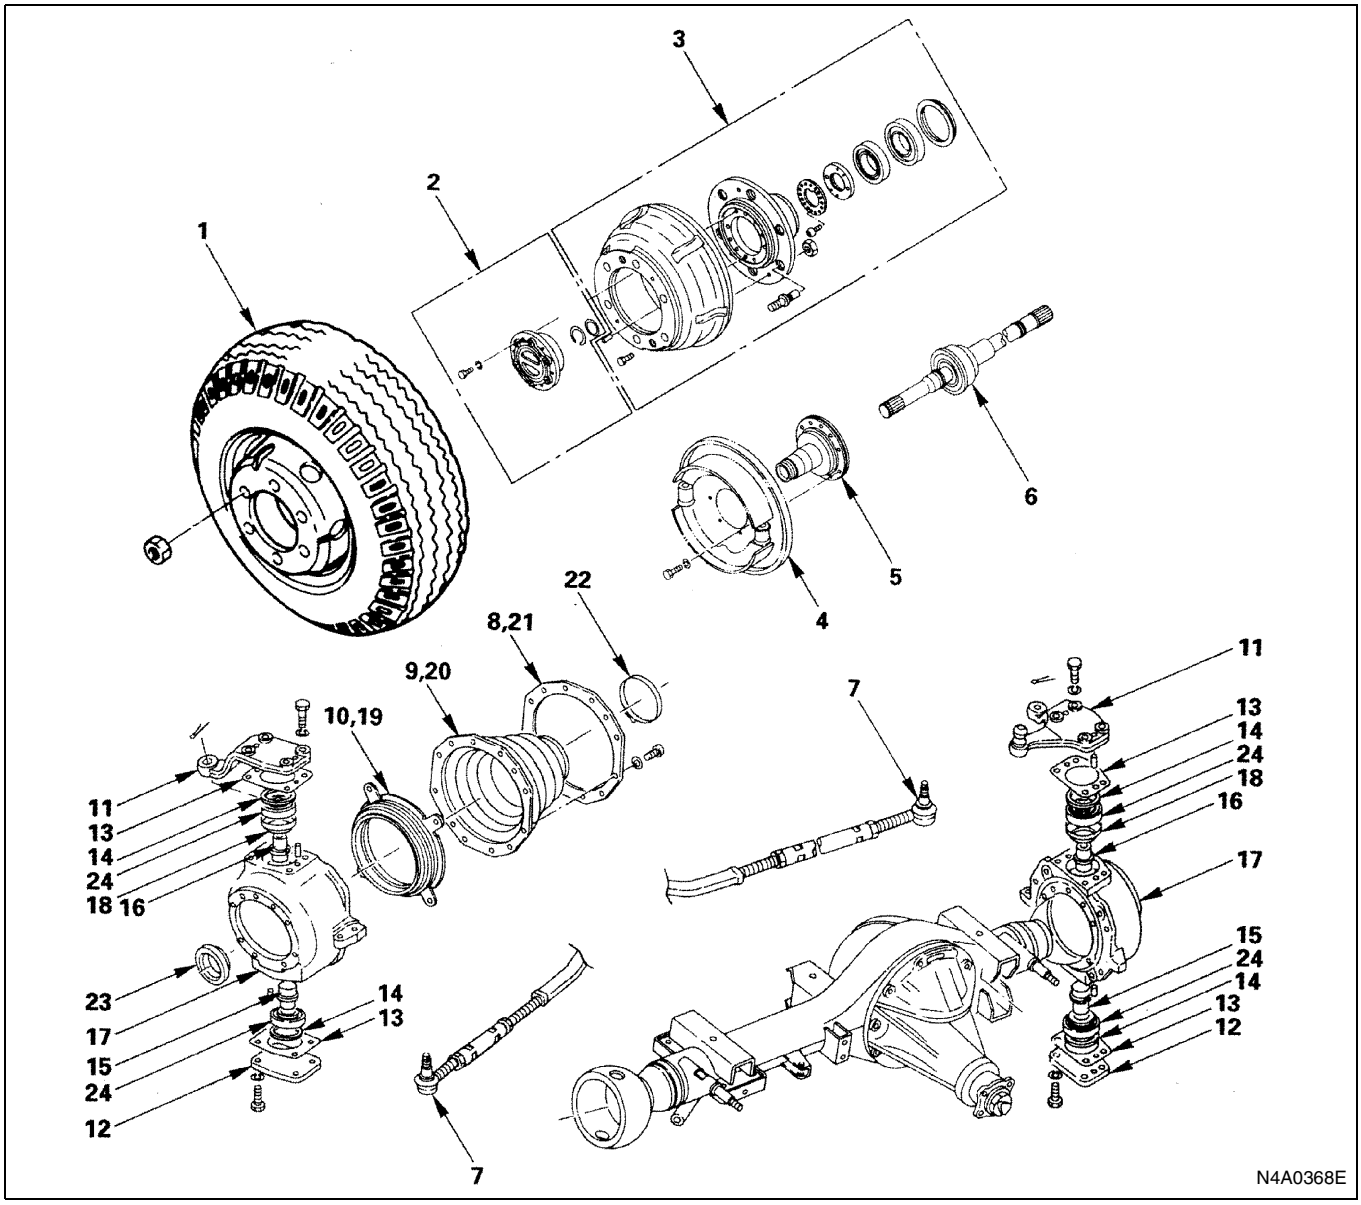
N4A0367E

2. Spindle
   1) Apply MoS2 contained type grease to the surfaces of the thrust washer and bushing of spindle.
   2) Apply adhesive (LOCTITE 515 or equivalent) to the spindle flange, and install the spindle to the knuckle. At this time, a bolt hole of the spindle should be met with that of knuckle.
3. Front Brake Assembly
   1) Install the front oil shield cover with a cut in outer surface facing inside.
   2) Apply adhesive (LOCTITE 242 or equivalent) to the threads of fixing bolts and tighten them to the specified torque.

Tighten:
Front brake assembly fixing bolt to 98 N·m (10 kg·m / 72 lb·ft)

4. Front Axle Hub, Brake Drum and Related Parts
   Refer to “FRONT HUB and BRAKE DRUM (4 × 4 Model)” previously in this section.
5. Front Locking Hub Set
   Refer to “FREE WHEEL HUB” previously in this section.
6. Wheel and Tire

Knuckle and King Pin (4 × 4 Model)



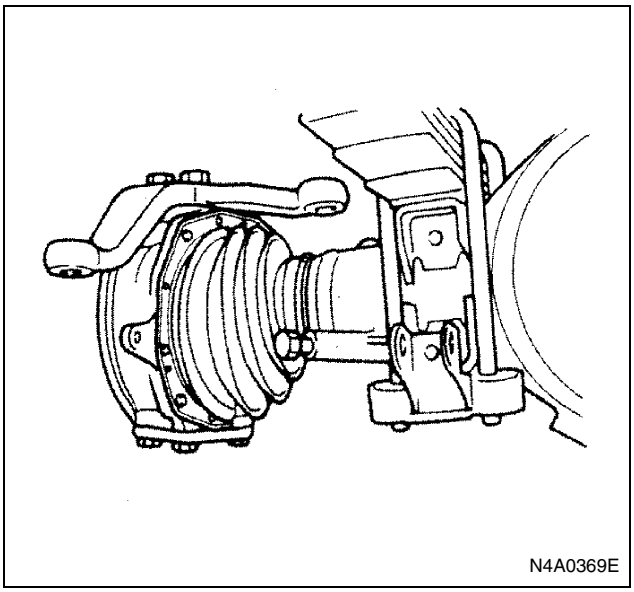
Legend

1. Wheel and tire
2. Front locking hub set
3. Front axle hub, brake drum and relative parts
4. Front brake assembly
5. Spindle
6. Front drive shaft assembly
7. Tie rod end
8. Front axle tube end boot holder
9. Front axle tube end boot
10. Knuckle oil seal
11. Knuckle arm and tie rod arm
12. King pin cover
13. King pin bearing shim
14. Bearing distance collar
15. Front axle lower king pin
16. Front axle upper king pin
17. Front axle knuckle
18. King pin receiver
19. Knuckle oil seal
20. Front axle tube end boot
21. Front axle tube end boot holder
22. Front axle tube end boot band
23. Front axle shaft oil seal
24. King pin bearing

Removal

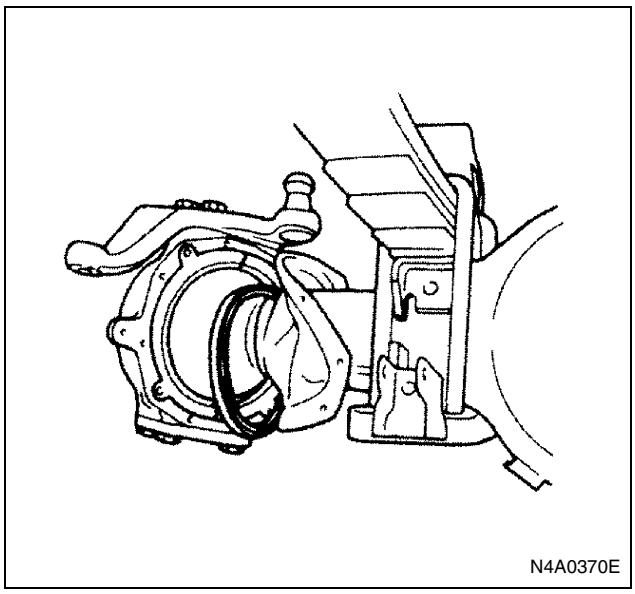
Preparation:
Jack up and support the vehicle on the stands.

1. Wheel and Tire
2. Front Locking Hub Set
   Refer to “FREE WHEEL HUB” previously in this section.
3. Front Axle Hub, Brake Drum and Relative Parts
   Refer to “FRONT HUB and BRAKE DRUM (4 × 4 Model)” previously in this section.
4. Front Brake Assembly
5. Spindle
6. Front Drive Shaft Assembly
7. Tie Rod End
8. Front Axle Tube End Boot Holder
   Remove the front axle tube end boot holder at the back of knuckle. (The front axle tube end boot holder is divided into two pieces in horizontal directions.)
9. Front Axle Tube End Boot
   Remove the front axle tube end boot fixing bolts, and peel and shift the boot toward the differential.



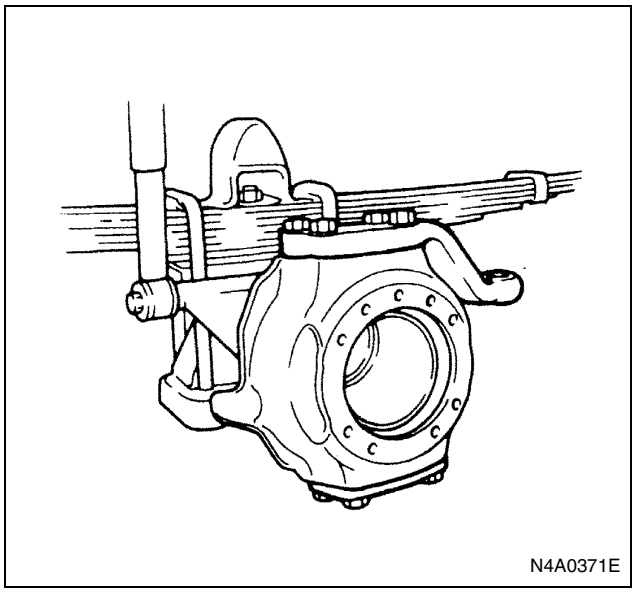
N4A0369E

10. Knuckle Oil Seal
    1) Remove the outer side of oil seal holder. (The oil seal holder outer is divided into two pieces in vertical direction.)
    2) Shift the oil seal toward the front axle tube end boot (on Differential side).
    3) Remove the inner side of oil seal holder. (The oil seal holder inner is divided into two pieces in horizontal direction.)



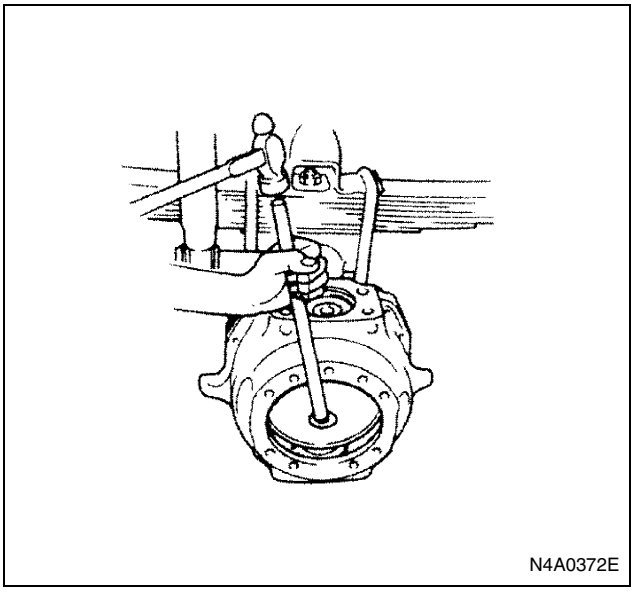
N4A0370E

11. Knuckle Arm and Tie Rod Arm
12. King Pin Cover
13. King Pin Bearing Shim
    Confirm the quantity of shims and components when removing the knuckle arm, tie rod arm and king pin cover.



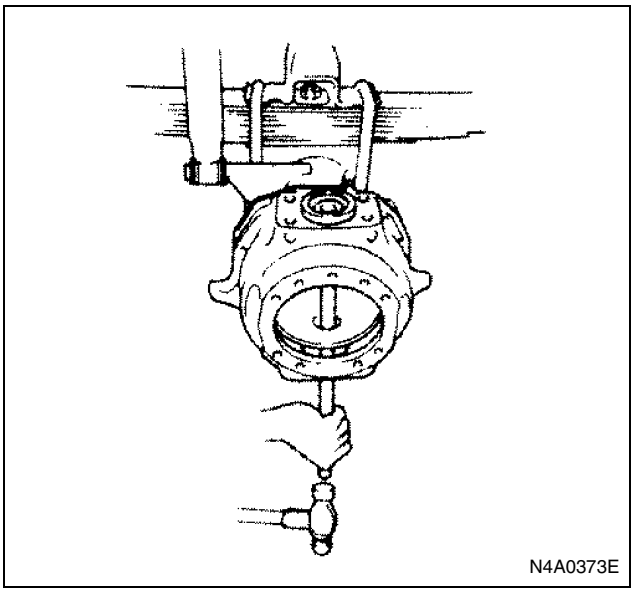
N4A0371E

14. Bearing Distance Collar
15. Front Axle Lower King Pin
    Attach a bar to the center recess of king pin from tube end (spherical part) of front axle case, and hit with a hammer to remove the king pin downward.



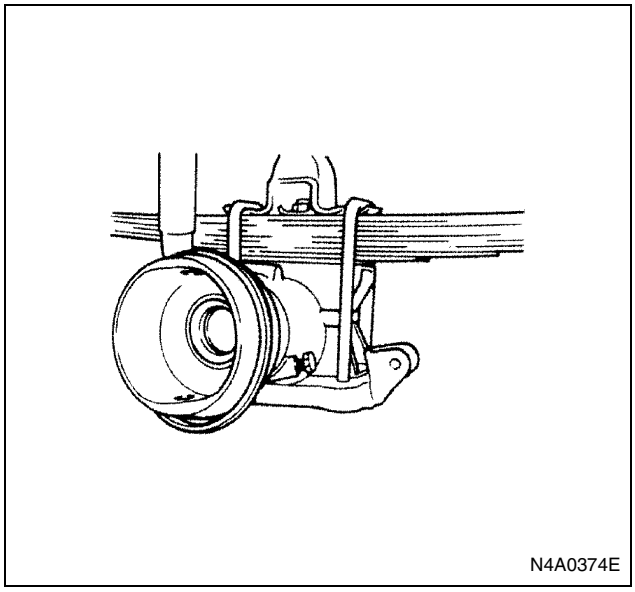
N4A0372E

16. Front Axle Upper King Pin
17. Front Axle Knuckle
    1) From under the knuckle, hit a bar attached to the upper king pin to remove the outer race of king pin bearing first.
    2) At this time, support the knuckle with both hands and raise it to remove to your side.
    3) Again hit the king pin to remove.



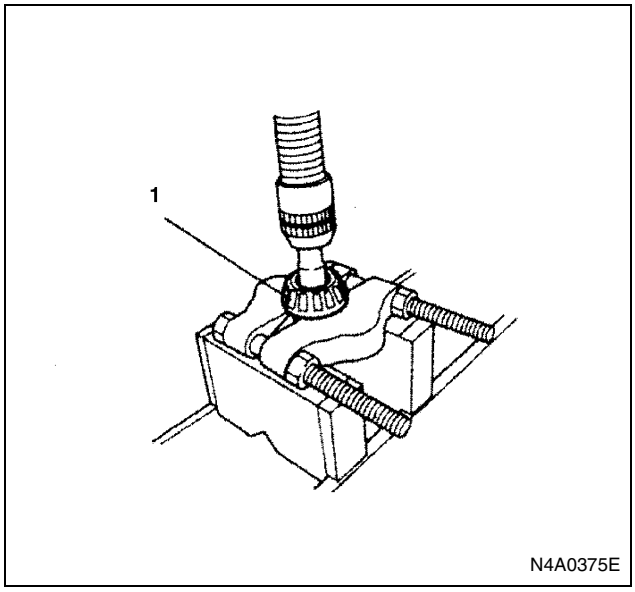
N4A0373E

18. King Pin Receiver
19. Knuckle Oil Seal
    Remove the oil seal from the front axle case.
    At this time, make sure the direction of oil seal.



N4A0374E

20. Front Axle Tube End Boot
21. Front Axle Tube End Boot Holder
22. Front Axle Tube End Boot Band
    Loosen and remove the tube end boot band.
    Avoid frequent removal of tube end boot band except when it is to be replaced or removal is necessary for servicing.
23. Front Axle Shaft Oil Seal
    The oil seal must not be reused.
24. King Pin Bearing
    Remove the bearing with a press.
    Some components are different between upper and lower king pin bearings (1), and do not confuse them.



N4A0375E

Inspection and Repair

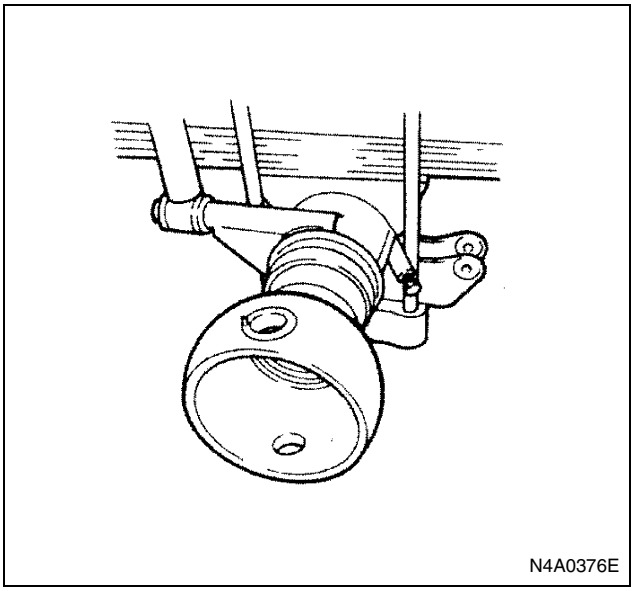
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Front Axle Tube End

Inspect the front axle case tube end sphere for crack, wear, damage or rust. Slight rust of sphere should be polished with a sand paper.

To check the tube end sphere for crack, use a red-check or a magnetic flaw detector.

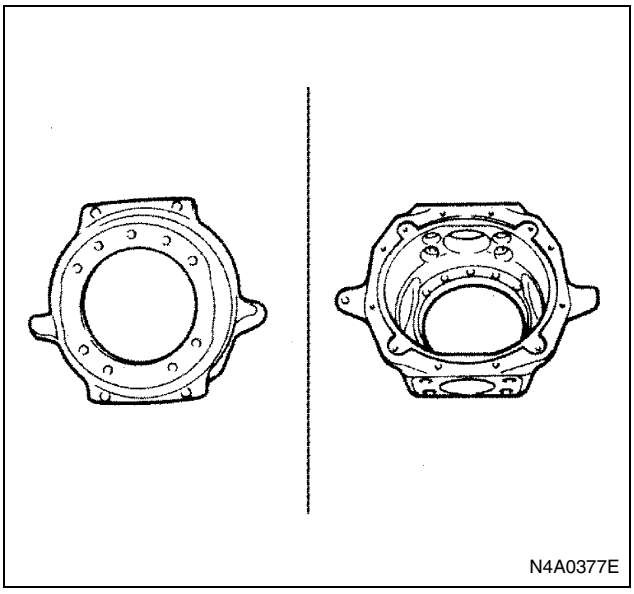
If a crack is found, replace the front axle case assembly.



Front Axle Knuckle

Inspect the whole of the knuckle for cracks, wear or damage using a magnetic flaw detector or red-check.

Replace the knuckle if any abnormal condition is noticeable.



King Pin

Inspect the king pin for cracks.

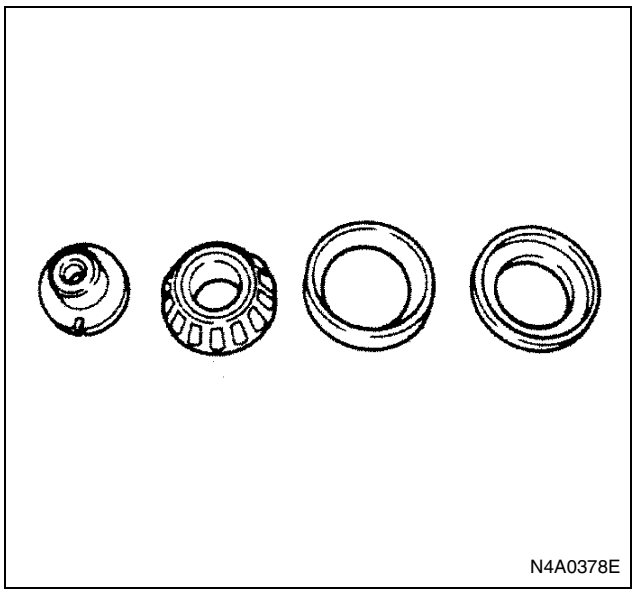
Use a magnetic flaw detector or red-check.

Replace king pin, if any cracks are found.

King Pin Bearing

Inspect the bearing for wear, seizure, damage and rough rotation.

Replace any flawed or damaged bearing.



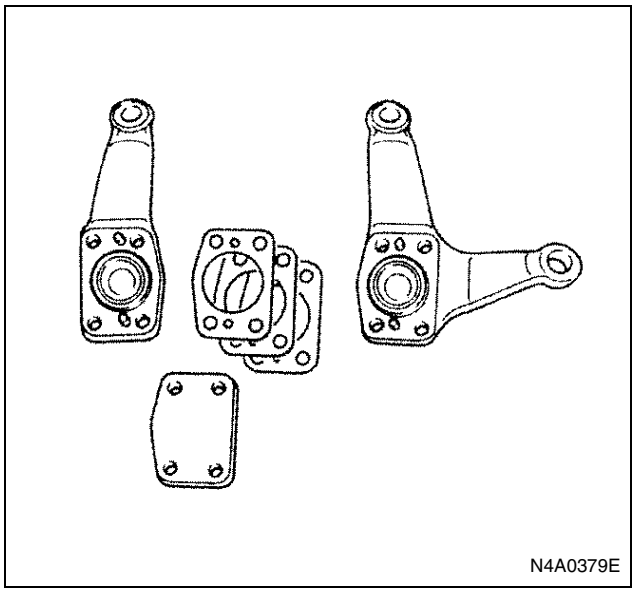
Knuckle Arm
Tie Rod Arm
King Pin Cover

Inspect the knuckle arm, tie rod arm and king pin cover for cracks, damage or wear.

Replace the these parts if any abnormal condition is noticeable.

To check the arm for crack, use a visible dye-penetrant flaw detection method or a magnetic flaw detector.

Replace the arm if a crack is found.

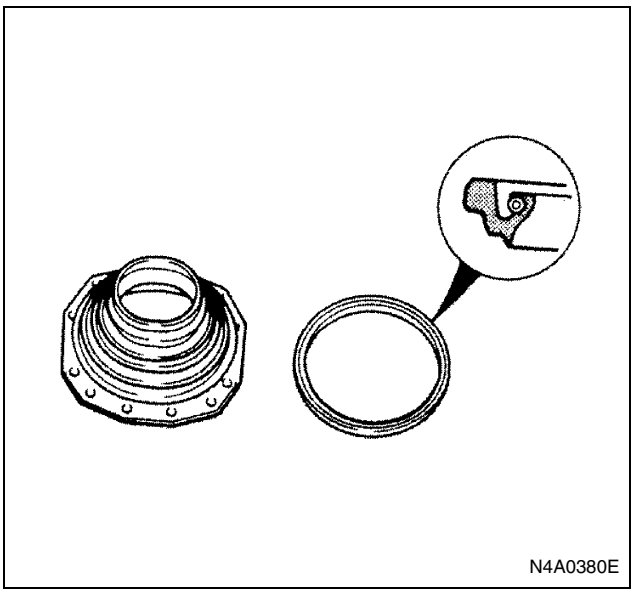


Front Axle Tube End Boot

Inspect the front axle tube end boot and replace if broken. It should be replaced if even one hole or crack is found.

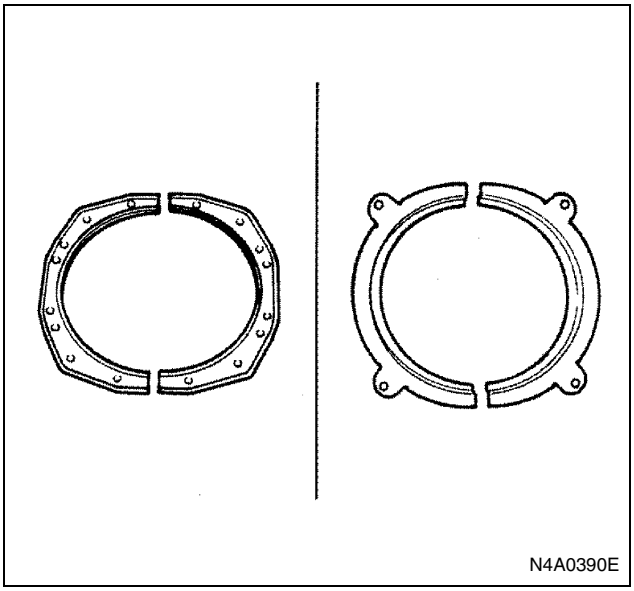
Oil Seal

Inspect the oil seal, and replace it if its lip is damaged, worn or hardened.



N4A0380E

Front Axle Tube End Boot Holder, Oil Seal Holder
Inspect the oil seal holder and front axle tube end boot holder, and replace if excessive deformation or rust is found.

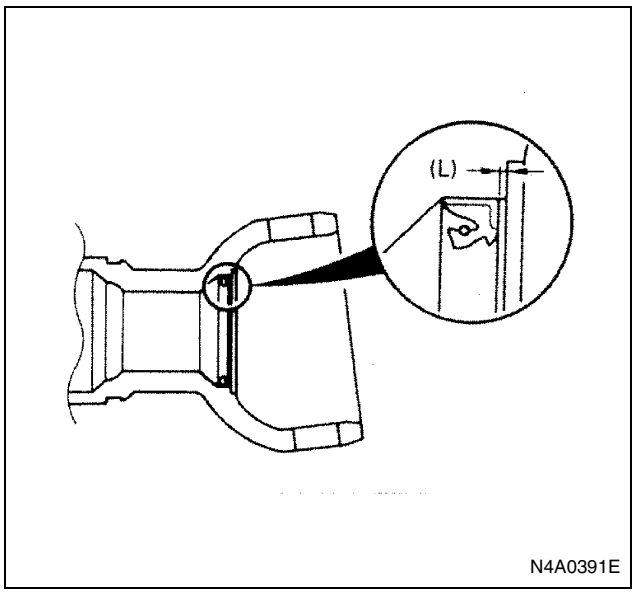


N4A0390E

Installation

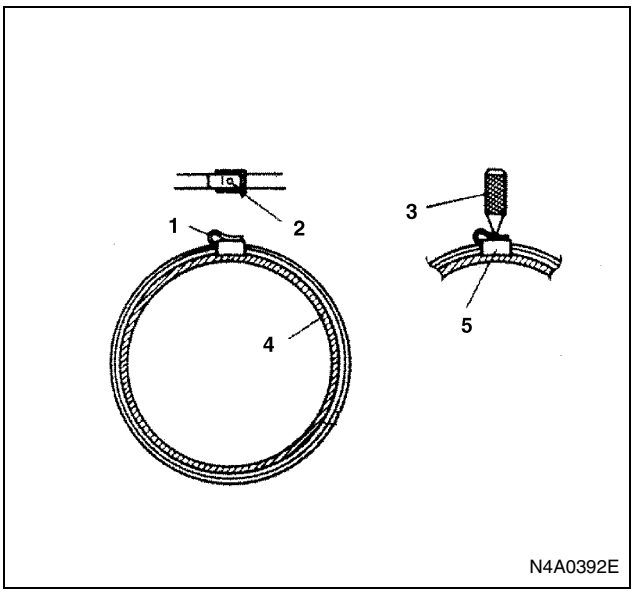
1. Front Axle Shaft Oil Seal
   1) Drive in the oil seal to the dimension as shown. Take care not to damage the oil seal lip.
   2) Apply grease (Multipurpose type) to the oil seal lip.

Oil seal drive in depth (L): 0 — 0.5 mm (0 — 0.020 in)



N4A0391E

2. Front Axle Tube End Boot Holder
3. Front Axle Tube End Boot
   1) Apply gear oil GL-5 grade (SAE90) to the entire surface of front axle tube end sphere.
   2) Warm the front axle tube end boot to 70 — 80°C with hot water.
   3) Reverse the front axle tube end boot, and install into the front axle case. During this work, do not touch the front axle tube end boot by bear hand because it is too hot.
   4) After installation in the front axle case, remove the moisture immediately.
   5) Return the front axle tube end boot to original form, and insert the leading end of boot into the front axle tube end boot groove of the front axle case.
4. Knuckle Oil Seal
5. Front Axle Tube End Boot Band
   1) Fix the boot with front axle tube end boot band. Wind the front axle tube end boot band twice and tighten it up to eliminate looseness.
   2) Then, calk the center of fitting on the front axle tube end boot band with a punch.
   3) Turn back the front axle tube end boot band at the fitting, and again calk the center of front axle tube end boot band.
   4) Cut the front axle tube end boot band at the end face of fitting.



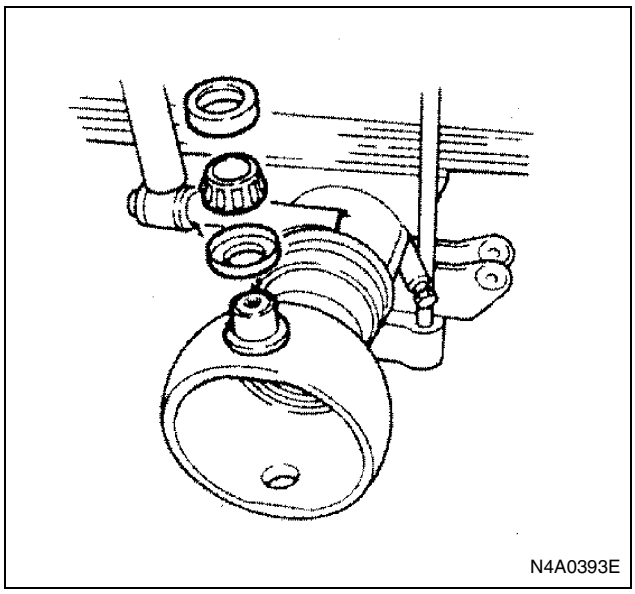
Legend

1. Bend
2. Calking point
3. Punch
4. Front axle tube end boot
5. Fitting

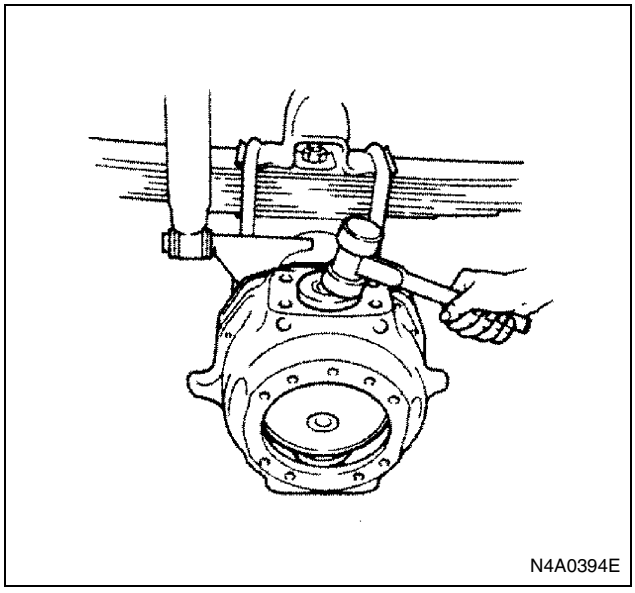
Install the oil seal to the front axle. (Apply Multipurpose type grease, to the entire surface of oil seal, and install it with care not to damage the oil seal lip.

In installing the oil seal, position the spring side on the differential side.)

6. Front Axle Upper King Pin
7. Front Axle Lower King Pin
   1) Seal multi-purpose grease NLGI No.2 in the king pin bearing.
   2) Install only the king pins (both upper and lower) in the front axle case.
   3) Align the locking groove of the king pin with the locking pin on the front axle tube end surface, and then drive in the king pin.



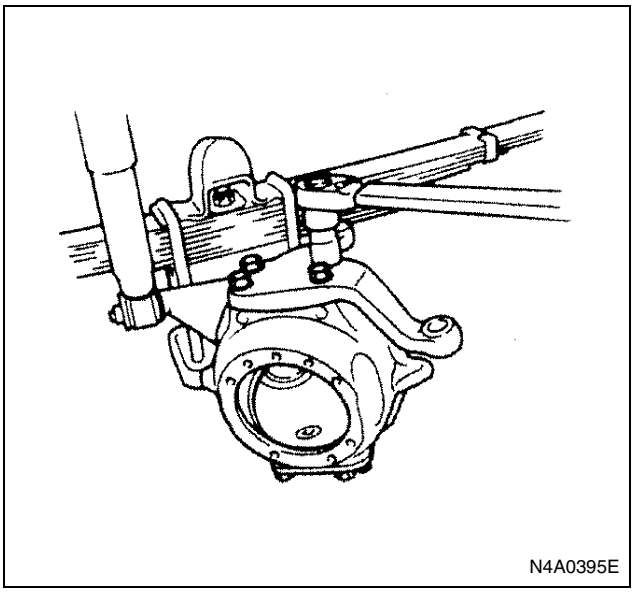
8. King Pin Receiver
9. King Pin Bearing
   Install the king pin bearing to the king pin. For the upper side, install the receiver, king pin bearing in this order.
10. Front Axle Knuckle
    1) Install the knuckle to the front axle. (Holding the knuckle with both hands, align the upper hole of knuckle to the upper king pin bearing and lower it slowly while passing the lower king pin bearing.)
    2) Install upper and lower king pin bearing outer races. (Fit the king pin bearing outer race completely with the knuckle, and hit lightly the outer race until it gets stuck.)



11. Bearing Distance Collar
12. King Pin Bearing Shim
13. King Pin Cover
14. Knuckle Arm and Tie Rod Arm

1) Install the knuckle arm (or tie rod arm) and the king pin cover. (Install the distance collar and shim in this order. Then, install knuckle arm (or tie rod arm) and the king pin cover and fix provisionally with bolts. Use the number of shims that were removed previously, and tighten the bolts lightly. At this time, do not apply LOCTITE to the shims, arms and king pin cover yet.
2) Tighten the bolts on knuckle arm (or tie rod arm) and king pin cover to the specified torque while turning the knuckle to the left and right several times to run-in the king pin bearing.

Tighten:
Knuckle arm, tie rod arm and king pin cover bolt to147 N·m (15 kg·m / 108 lb·ft)



N4A0395E

<Adjustment of Front Axle Knuckle Preload>

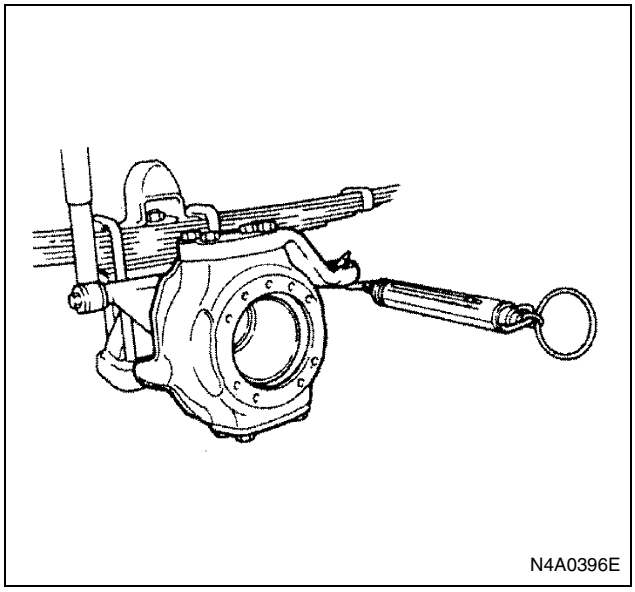
1) Hook a spring balance to the edge of knuckle arm (or tie rod arm), and pull it in tangential direction to check if the spring balance reading at the start of movement is within the standard range.
(Measure preload in tangential direction.)

Front axle knuckle preload, 3.1 — 5.5 N (6.8 — 12.1 kg / 30.4 — 53.9 lb)

2) If it does not satisfy the standard, adjust with shims.

Shim thickness available: 0.3 mm (0.01 in)

3) After adjustment, measure the preload again.



N4A0396E

<Tighten completely the knuckle arm (or tie rod arm) and king pin cover>

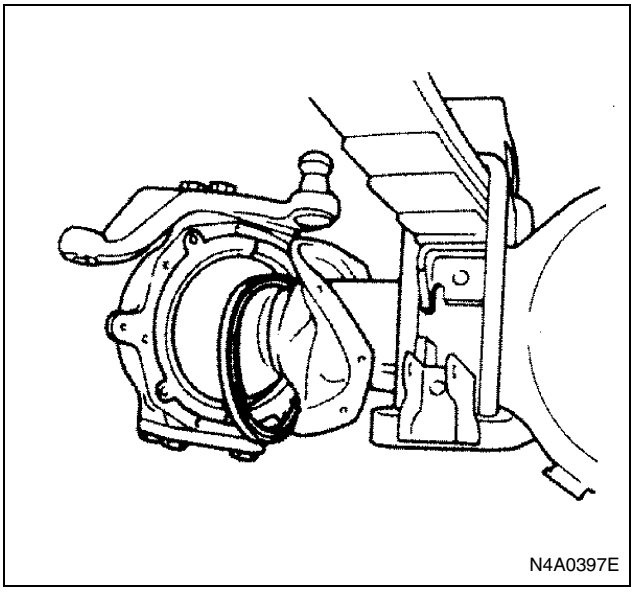
1) Remove each arm and king pin cover once, and apply adhesive (LOCTITE 515 or equivalent) to the shims, each arm and king pin cover evenly.
2) Tighten fixing bolts to the specified torque.

Tighten:
Knuckle arm, tie rod arm and king pin cover bolt to147 N·m (15 kg·m / 108 lb·ft)

3) Reconfirm the preload.
If it is out of standard, readjust by repeating the above steps.

15. Knuckle Oil Seal
    1) Install the inner oil seal holder to the knuckle.
    Install the inner oil seal holder in longitudinal direction.
    2) Install the oil seal, then the outer oil seal holder.
    Install the outer oil seal holder in vertical direction (a mating face should be shifted 90° against the inner holder).
16. Front Axle Tube End Boot
17. Front Axle Tube End Boot Holder
    Install the front axle tube end boot, and tighten bolts to the specified torque via the front axle tube end boot holder.
    Install the front axle tube end boot holder in longitudinal direction.

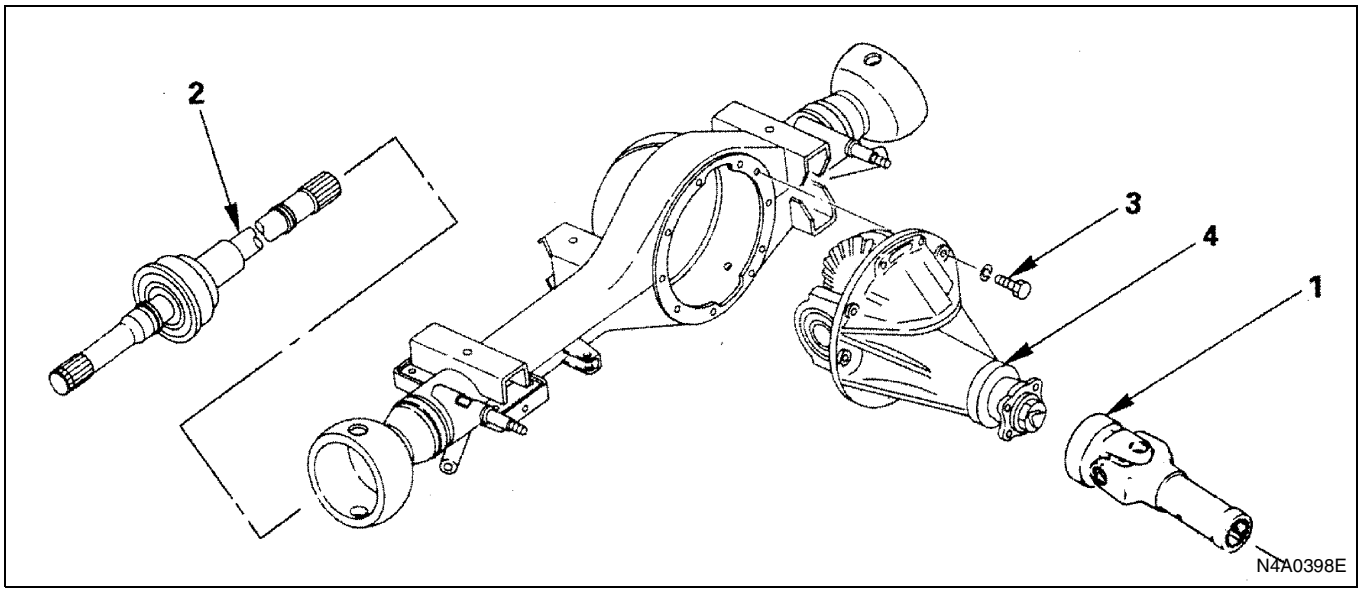
Tighten:
Front axle tube end boot holder bolt to 6 N·m (0.6 kg·m / 52 lb·ft)



N4A0397E

18. Tie Rod End
19. Front Drive Shaft Assembly
20. Spindle
21. Front Brake Assembly
22. Front Axle Hub, Brake Drum and Relative Parts
    Refer to “FRONT HUB and BRAKE DRUM (4 × 4 Model)” previously in this section.
23. Front Locking Hub Set
    Refer to “FREE WHEEL HUB” previously in this section.
24. Wheel and Tire

Front Differential Assembly (4 × 4 Model)



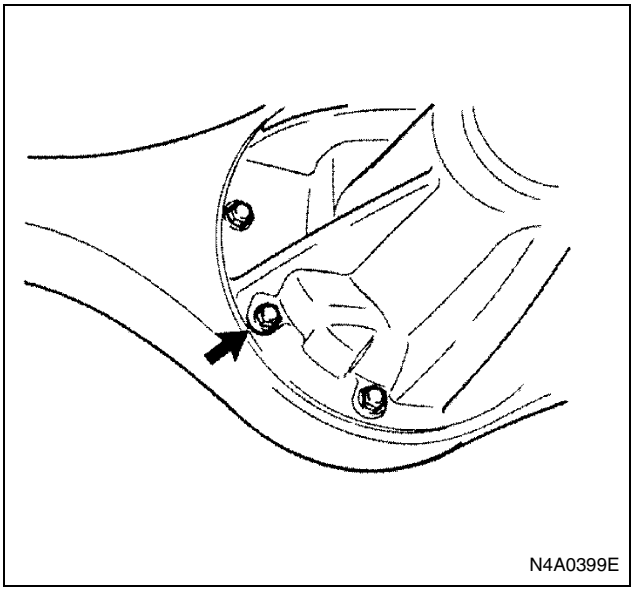
Legend

1. Propeller shaft assembly
2. Front drive shaft assembly
3. Front axle case bolt
4. Front differential assembly

Removal

Support the front axle with a suitable jack and chassis stands.
Drain the front axle case by removing the drain plug on the lower part of the front axle case.

1. Propeller Shaft Assembly
   Remove the propeller shaft assembly.
2. Front Drive Shaft Assembly
   Refer to “Spindle and Drive Shaft” previously in this section.
3. Front Axle Case Bolt
   Put jack under the center of front axle then remove the front axle case bolts.
4. Front Differential Assembly
   Remove the front differential assembly from the front axle case.



Installation

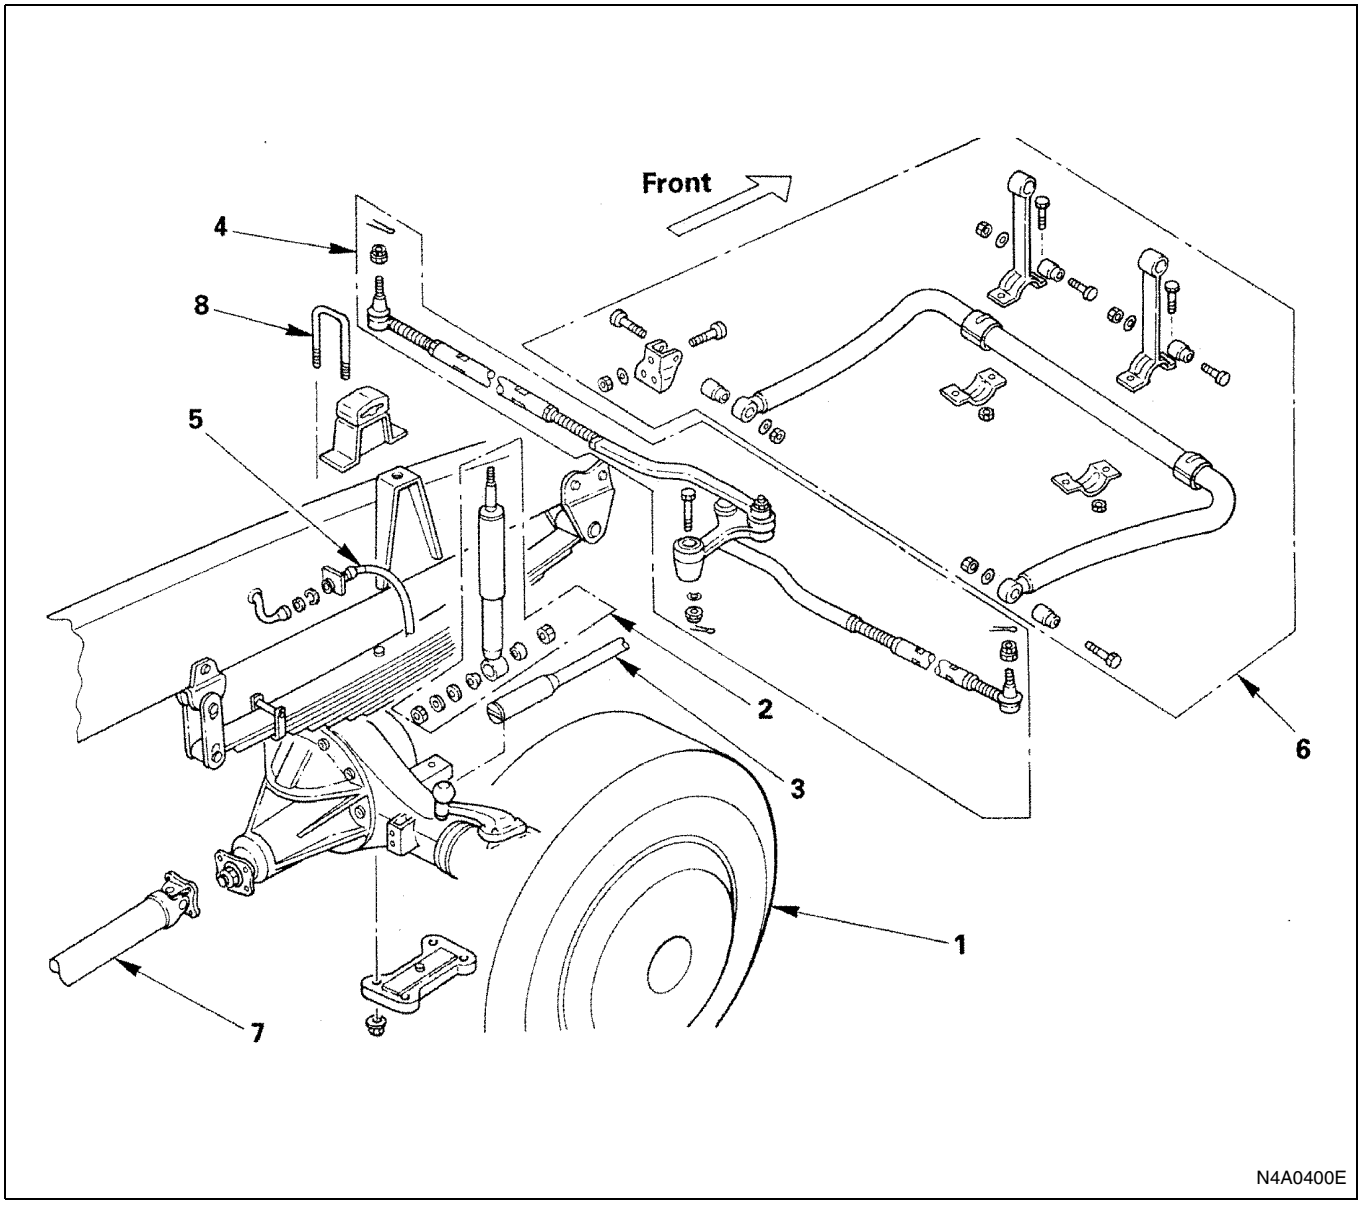
1. Front Differential Assembly
   Clean the faces of the front axle case and the final drive carrier.
   Apply the recommended liquid gasket (Three Bond 1215 or its equivalent) to the sealing side of the front axle case and the final drive carrier.
2. Front Axle Case Bolt
   Attach the front final drive assembly to the front axle case and tighten the bolts.

Tighten:
Front axle case bolt to 67 N·m (6.8 kg·m / 49 lb·ft)

3. Front Drive Shaft Assembly
4. Propeller Shaft Assembly
   Fill the axle case with hypoid gear lubricant to just below the filler hole.

Lubricant capacity, 2.7 liter (2.9 US qt / 2.4 Imp qt)

Front Axle Assembly (4 × 4 Model)



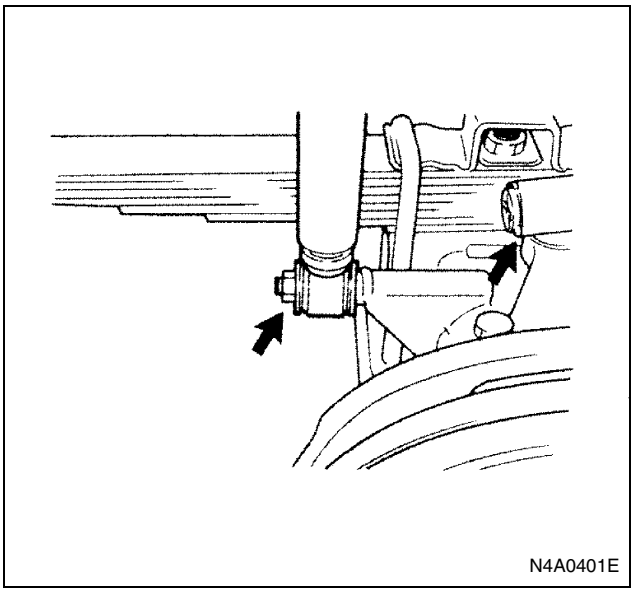
Legend

1. Wheel and tire
2. Shock absorber
3. Drag link
4. Tie rod assembly
5. Brake flexible hose
6. Stabilizer assembly
7. Front propeller shaft
8. Leaf spring U-bolt

Removal

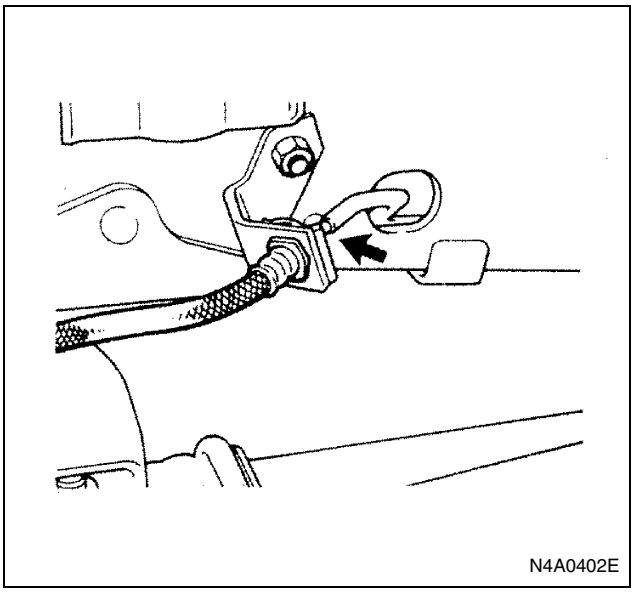
Preparation:
Jack up and support the vehicle on stands.

1. Wheel and Tire
2. Shock Absorber
   Remove lower side of shock absorber.



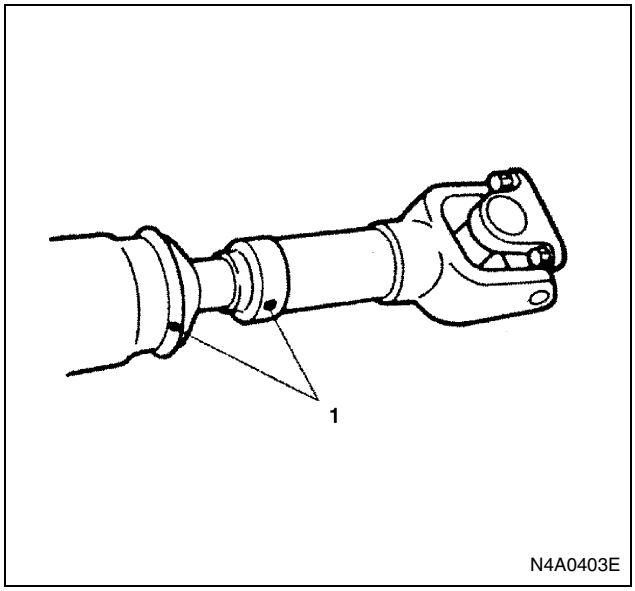
N4A0401E

3. Drag Link
   Remove the drag link (on the knuckle arm side).
4. Tie Rod Assembly
   Remove the tie rod assembly (with relay lever attached). Refer to STEERING LINKAGE (4 × 4 Model) in section 3B.
5. Brake Flexible Hose
   Remove a clip on the brake hose bracket.
   After the hose is disconnected, prevent brake fluid running out and invasion of foreign matters.



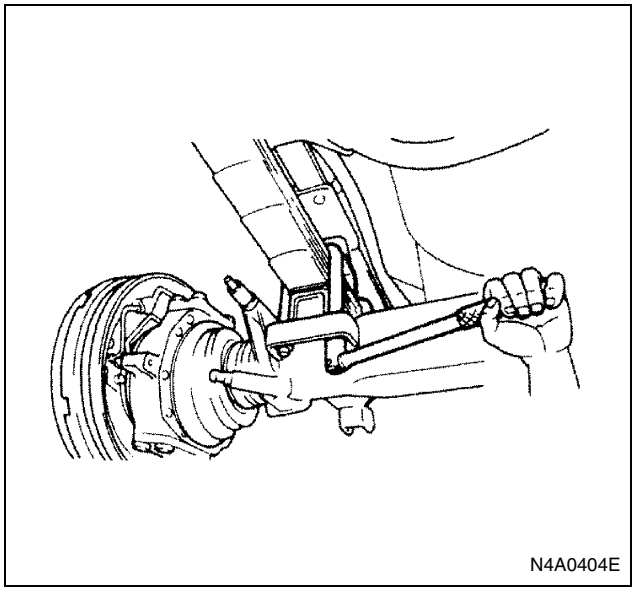
N4A0402E

6. Stabilizer Assembly
   Refer to STABILIZER in section 3C.
7. Front Propeller Shaft
   Draw setting marks (1) on the front and rear flanges.
   Also, draw setting marks as shown if the propeller shaft is removed at the spline yoke.



N4A0403E

8. Leaf Spring U-Bolt
   1) Put jack under the center part of front axle then remove the U-bolts.
   2) Lower the front axle assembly and roll out toward the front of vehicle.
      Use care so as not to cause damage to brake hose, back plate and front axle tube end boot.



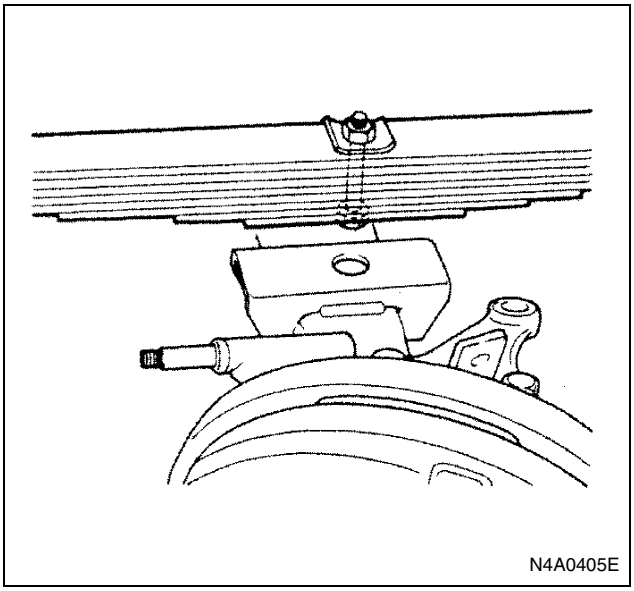
N4A0404E

9. Front Axle Assembly

Installation

1. Front Axle Assembly
2. Leaf Spring U-Bolt
   Align a hole in the center of spring seat in the front axle case with the center bolt of leaf spring, and tighten the leaf spring U-bolt.

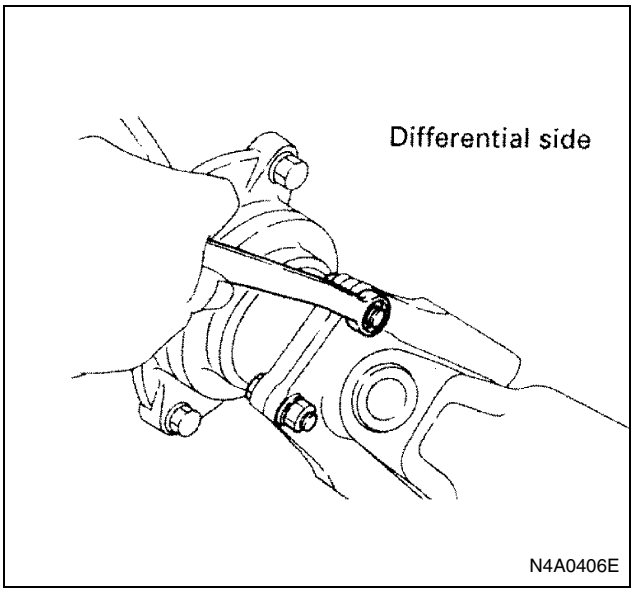
Tighten:
U-bolt nut to 126 N·m (12.9 kg·m / 93 lb·ft)



N4A0405E

3. Front Propeller Shaft

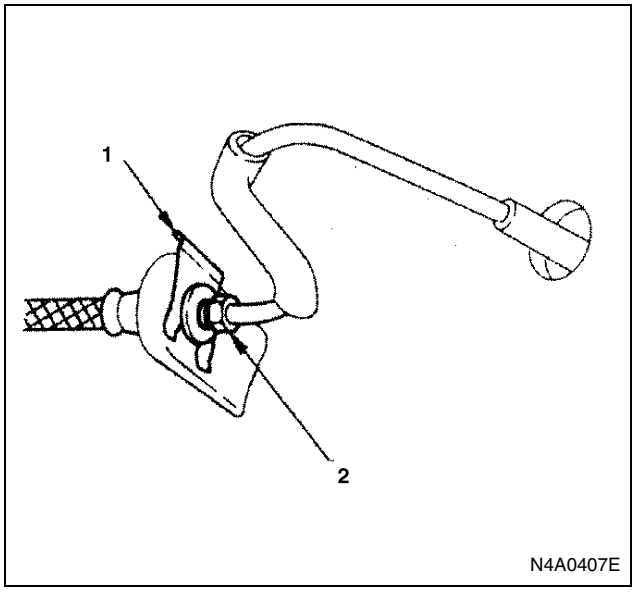
Tighten:
Front propeller shaft bolt to 103 N·m (10.5 kg·m / 76 lb·ft)



N4A0406E

4. Stabilizer Assembly
   1) Refer to STABILIZER.
5. Brake Flexible Hose
   Set first the wheels in the straight going position, then attach the flexible hose to the bracket without torsion using a clip (1).
   Connect the pipe, then tighten the nut (2) to the specified torque.

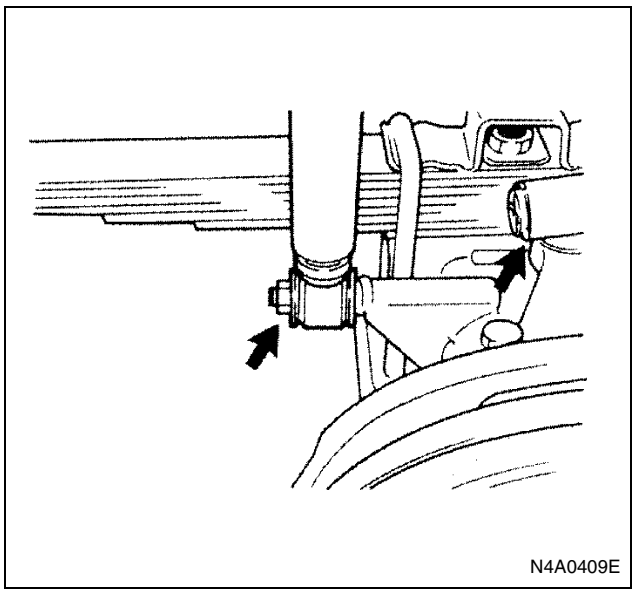
Tighten:
Brake flexible nut to 16 N·m (1.6 kg·m / 12 lb·ft)



N4A0407E

   Perform bleeding operation after installation of the brake flexible hoses.
   Refer to “Service information” for brake fluid air bleeding procedure.
6. Tie Rod Assembly
   Refer to STEERING LINKAGE (4 × 4 Model).
7. Drag Link
   Refer to STEERING LINKAGE (4 × 4 Model).
8. Shock Absorber

Tighten:
Shock absorber under side nut to 95 N·m (9.7 kg·m / 70 lb·ft)



N4A0409E

9. Wheel and Tire

Tighten:
Wheel nut to 441 N·m (45 kg·m / 325 lb·ft)

6 studs

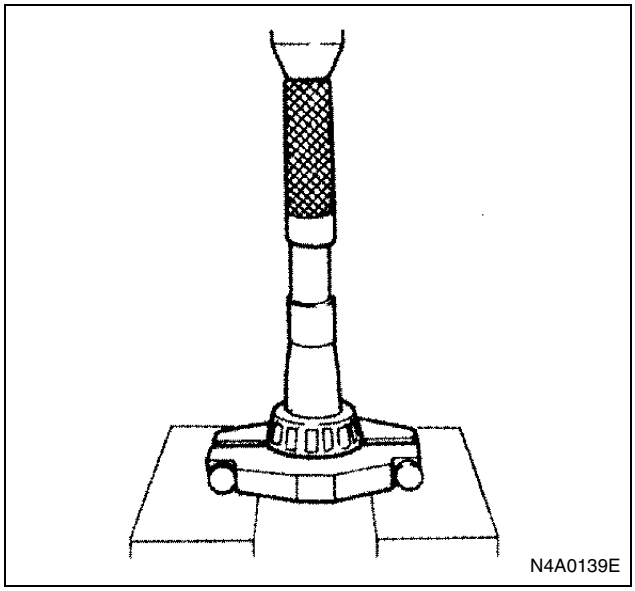
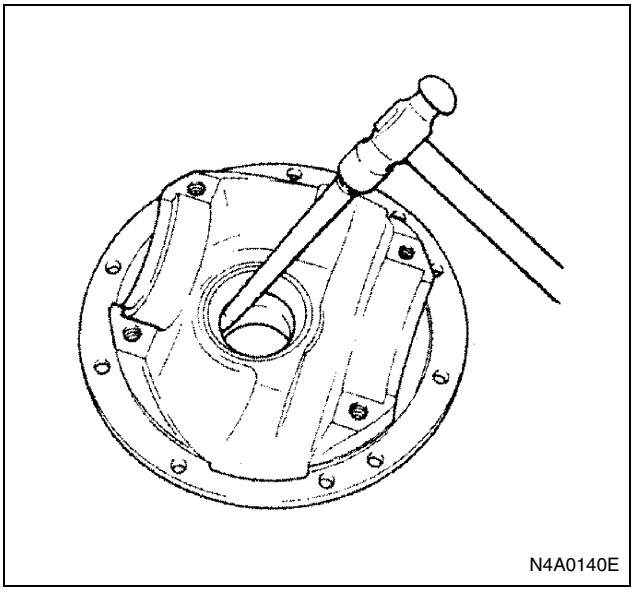
11. Inner Bearing Inner Race
    Remover: 5-8840-0015-0



12. Inner Bearing Outer Race
13. Pinion Depth Adjusting Shim
14. Oil Seal
15. Outer Bearing Inner Race
16. Outer Bearing Outer Race
    Drive out the inner bearing outer race or the outer bearing outer race together with the outer bearing inner race and oil seal by using a proper bar through two notches.



N4A0140E

REASSEMBLY

Measurement of ring gear run-out.

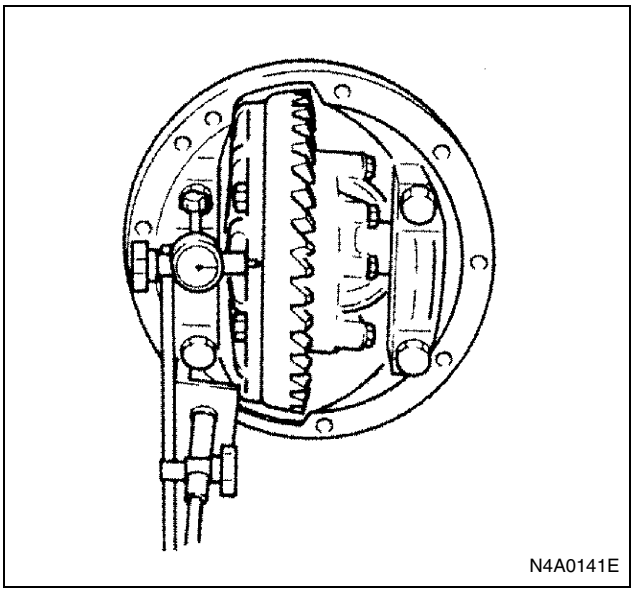
Install dummy bearing into the differential assembly, then install these parts in the differential carrier. Install and tighten the bearing cap.

Dummy bearing: 9-8522-1137-0

Tighten:

Bearing cap bolt to 108 N·m (11.0 kg·m / 80 lb·ft)

Ring gear run-out,
Standard: 0.05 mm (0.002 in)
Limit: 0.2 mm (0.008 in)



N4A0141E

1. Outer Bearing Outer Race
2. Pinion Depth Adjusting Shim
3. Inner Bearing Outer Races

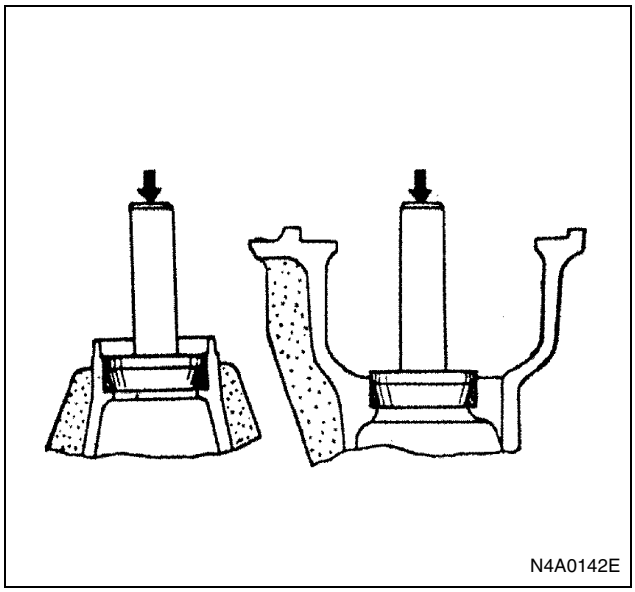
   Adjustment of drive pinion engagement depth.

   Install the inner and outer bearing outer races without shims into the differential carrier using a bench press.

   Installer (Inner): 9-8522-1196-0

   (Outer): 9-8522-1197-0

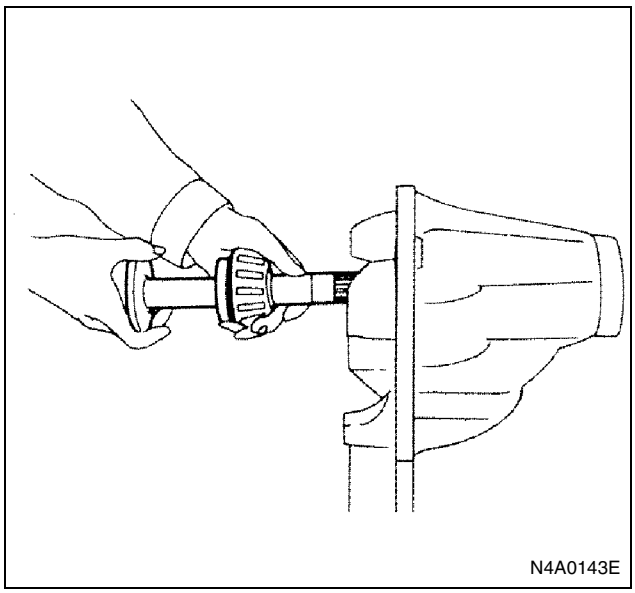
   Grip: 9-8522-1148-0



N4A0142E

Assemble the inner bearing inner race to the dummy pinion shaft, then install these parts into the carrier.

Dummy Pinion Shaft: 9-8522-1603-0

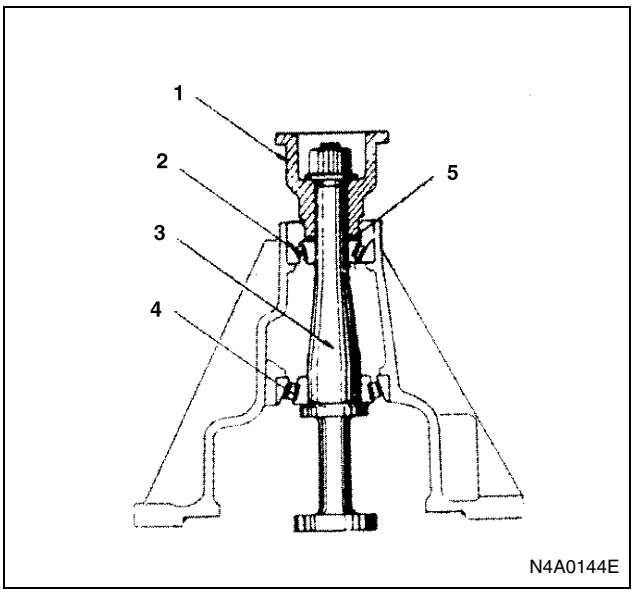


N4A0143E

Install the outer bearing inner race flange, washer and dummy nut.

Lubricate the bearing before tighten the dummy nut.

Dummy Nut: 9-8522-1624-0



Legend

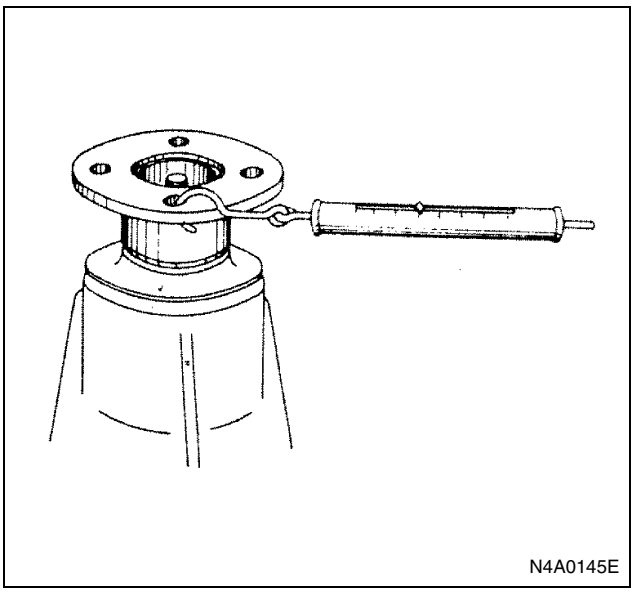
1. Coupling driver
2. Outer bearing
3. Dummy pinion shaft
4. Inner bearing
5. Shim

Tighten the dummy nut until specified preload are required to rotate the bearing.

Bearing preload,
New bearing: 16 — 29 N (1.6 — 3.0 kg / 3.5 — 6.6 lb)
Used bearing: 8 — 14.5 N (0.8 — 1.5 kg / 1.8 — 3.3 lb)

Tighten:
Bearing starting to

- New bearing: 0.69 — 1.27 N·m (7.0 — 13.0 kg·cm / 6.1 — 11.3 lb·in)
- Used bearing: 0.35 — 0.64 N·m (3.5 — 6.5 kg·cm / 3.1 — 5.7 lb·in)

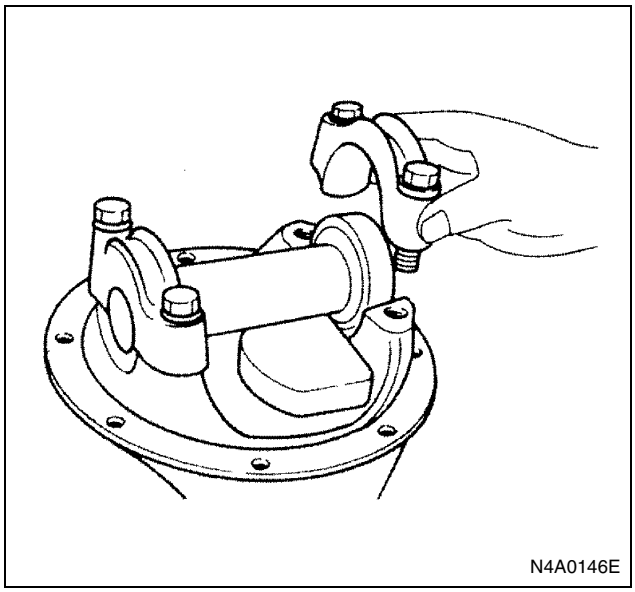


Install dummy bearing on dummy shaft and install these parts into the carrier. Install and tighten the bearing cap.

Dummy Shaft: 9-8522-1138-0

Dummy Bearing: 9-8522-1137-0

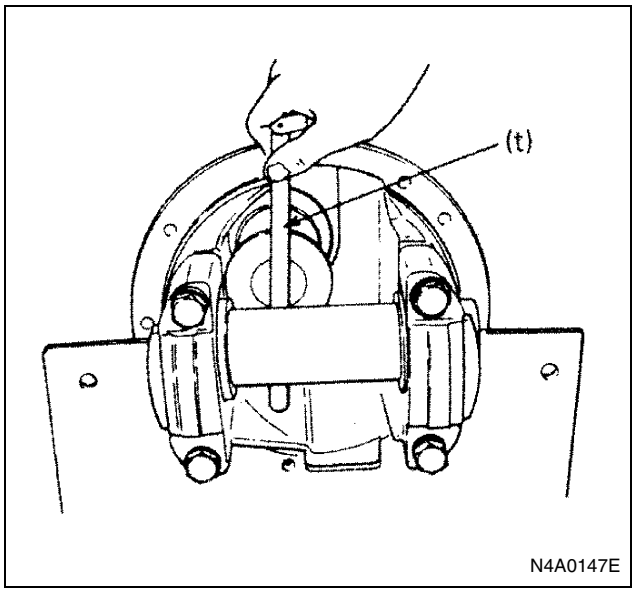
Tighten:
Bearing cap bolt to 108 N·m (11.0 kg·m / 80 lb·ft)



Measure the clearance (t) with a feeler gauge.

The clearance (t) is equal to the shim in thickness.

Thickness of shim available: 2.12, 2.16 ... 2.52, 2.56 mm (0.083, 0.085 ... 0.099, 0.100 in)

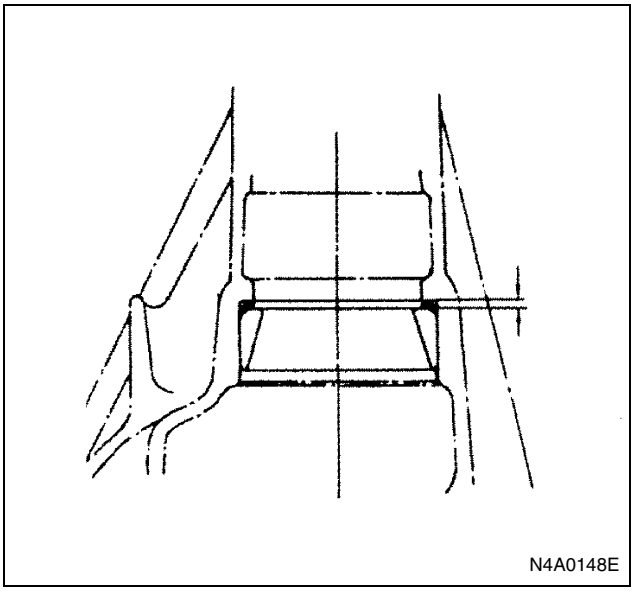


Remove dummy pinion, dummy shaft, dummy bearing and inner bearing outer race.

Install pinion depth adjusting shim of specified thickness in position between the inner bearing outer race and the carrier, then install the inner bearing outer race.

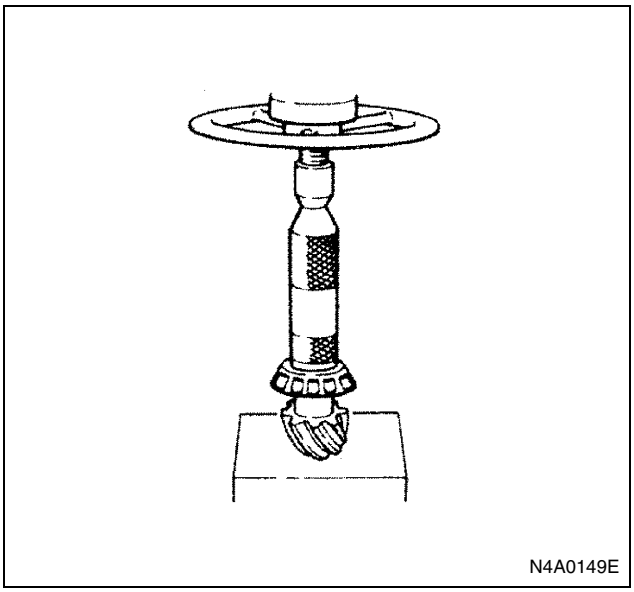
Installer: 9-8522-1196-0

Grip: 9-8522-1148-0



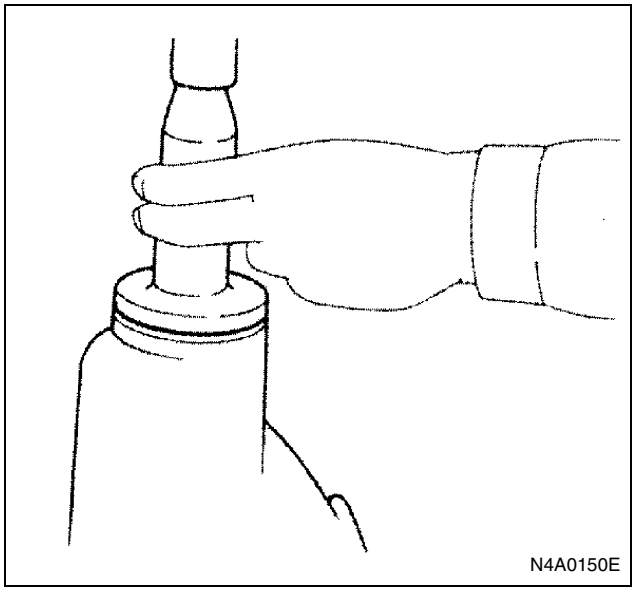
N4A0148E

4. Inner Bearing Inner Race
   Installer: 9-8522-0018-0
   Apply gear oil to the pinion shaft before installing final drive pinion assembly into carrier.



N4A0149E

5. Outer Bearing Inner Race
6. Oil Seal
   Installer: 5-8840-2047-0



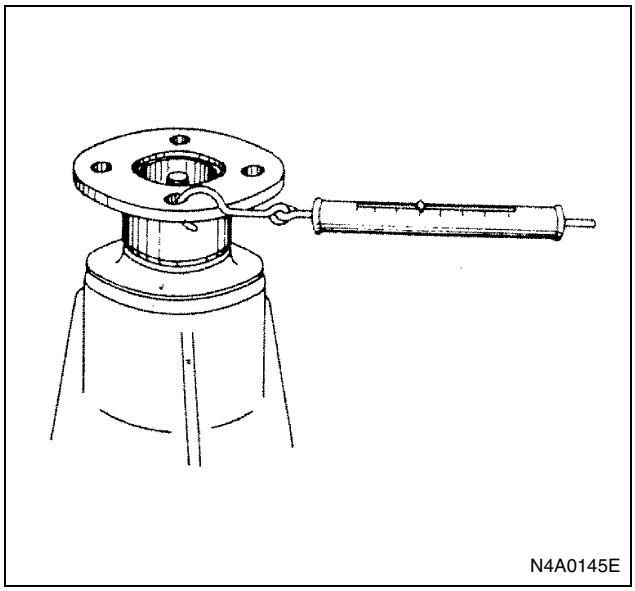
N4A0150E

7. Drive Pinion
8. Distance Piece (NKR model)
9. Bearing Preload Adjusting Shim
   Use a dummy nut until specified bearing preload is obtained.

Bearing preload,
New bearing: 16 — 29 N (1.6 — 3.0 kg / 3.5 — 6.6 lb)
Used bearing: 8 — 14.5 N (0.8 — 1.5 kg / 1.8 — 3.3 lb)

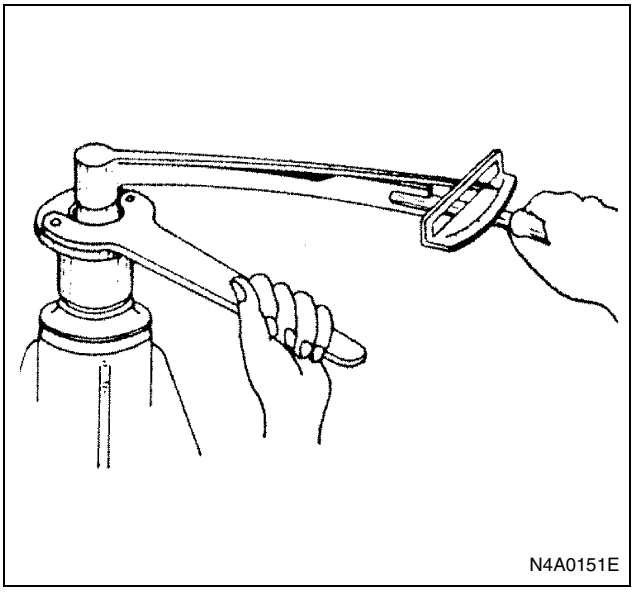
Tighten:
Bearing starting to

- New bearing: 0.69 — 1.27 N·m (7.0 — 13.0 kg·cm / 6.1 — 11.3 lb·in)
- Used bearing: 0.35 — 0.64 N·m (3.5 — 6.5 kg·cm / 3.1 — 5.7 lb·in)



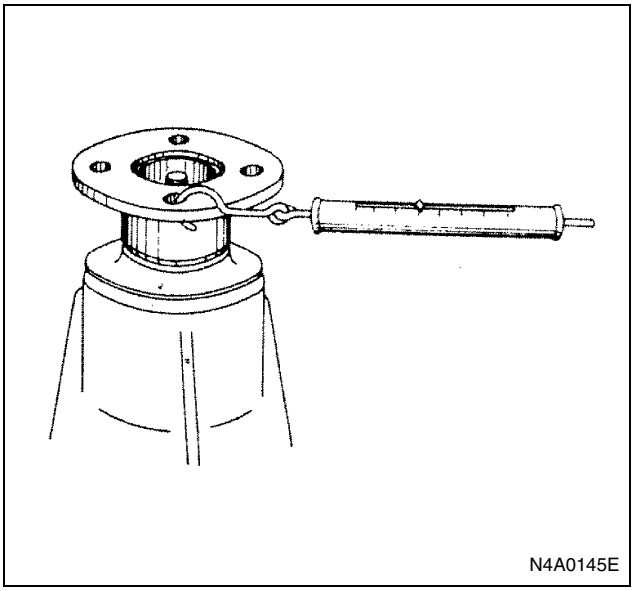
N4A0145E

Tighten:
Dummy nut to 270 N·m (27.5 kg·m / 199 lb·ft)

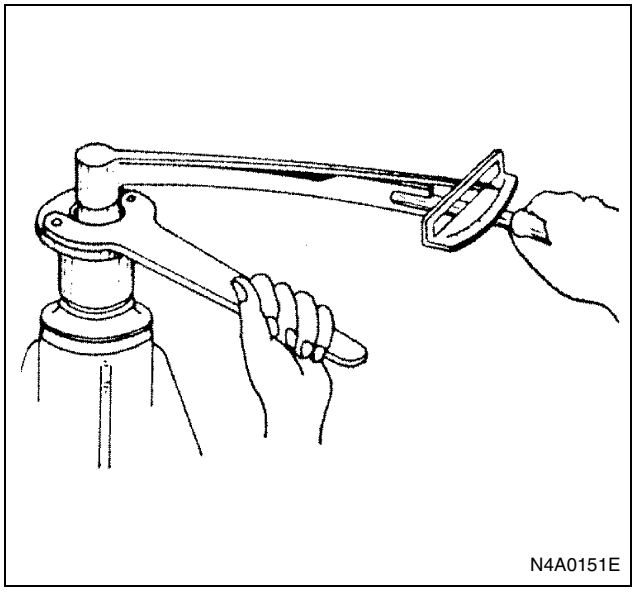


Thickness of shim available: 1.53, 1.56 ... 2.07, 2.10 mm (0.060, 0.061 ... 0.081, 0.082 in)

10. Flange
11. Flange Nut
    Once specified bearing preload is obtained by dummy nut, remove dummy nut and replace with flange nut.
    Tighten the flange nut until specified bearing preload and nut torque.
    Using special tool, stake the flange nut at two points.
    Punch: 5-8840-2293-0

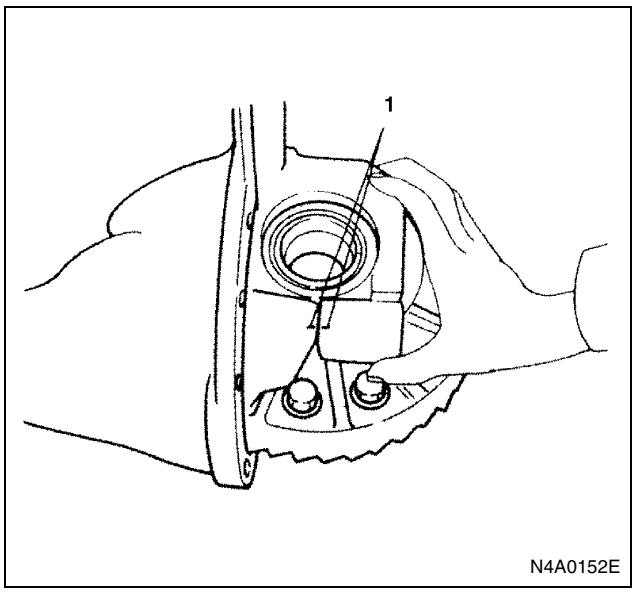


12. Backlash and Preload Adjusting Shim
    1) Adjustment of Backlash
    • Install dummy bearing in the differential cage assembly, then install differential cage assembly and ring gear into the differential carrier.



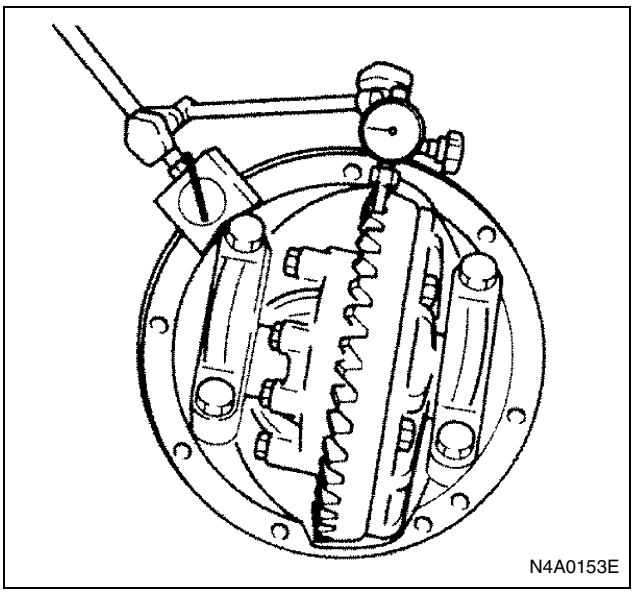
Install the bearing caps after checking to make certain setting marks (1) applied at disassembly are in alignment.

Tighten:
Bearing cap bolt to 108 N·m (11.0 kg·m / 80 lb·ft)

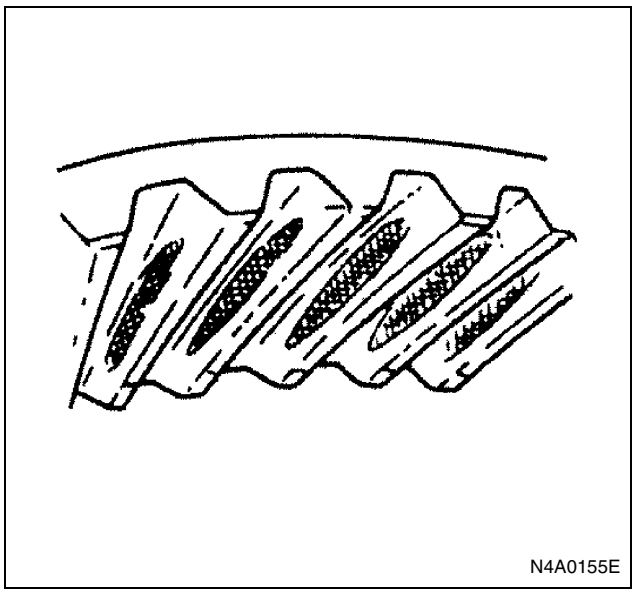


• Set the dial indicator and measure the backlash between the drive pinion and ring gear at the foot portion of the ring gear.

Backlash: 0.15 — 0.20 mm (0.006 — 0.008 in)

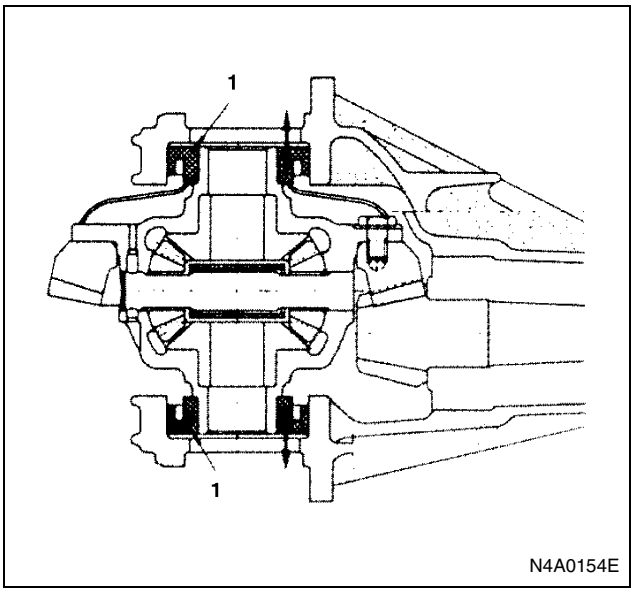


N4A0153E



N4A0155E

- To adjust backlash, loosen bearing cap bolts slightly and move the dummy bearing (1) as necessary.
  A clearance should not be provided between dummy bearing and bearing fitting face of the differential cage.



N4A0154E

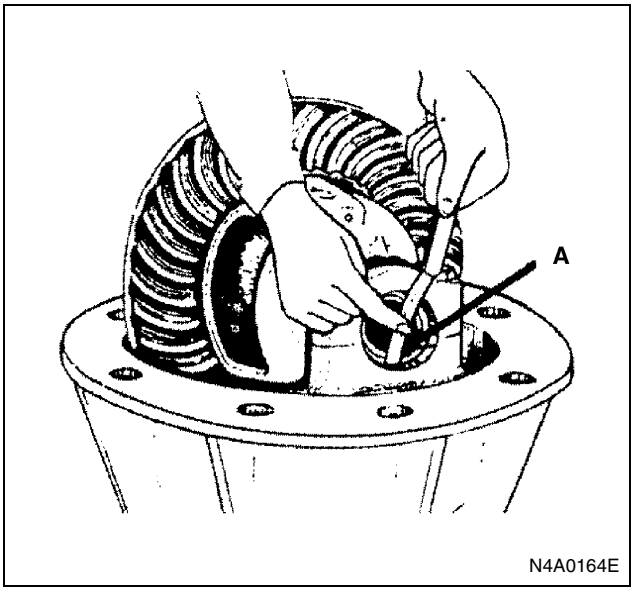
2) Inspection of drive pinion and ring gear tooth contact.

- Apply a thin coat of red check to faces of the 7 — 8 teeth of the ring gear.
- Check the impression of contact obtained on the ring gear teeth and make necessary adjustment as described below if the contact is abnormal.

TOOTH CONTACT	CASE	ADJUSTMENT PROCEDURE
 N4A0156E	Drive pinion is too far away from ring gear.	1. Move the drive pinion in toward the ring gear by decreasing the thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear away from the drive pinion. N4A0160E
 N4A0157E	Drive pinion is too close to the ring gear.	1. Move the drive pinion away from the ring gear by increasing thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear in toward the drive pinion. N4A0161E
 N4A0158E	Ring gear is too close to the drive pinion.	1. Move the drive pinion in toward the ring gear by decreasing thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear away from the drive pinion. N4A0162E
 N4A0159E	Ring gear is too far away from drive pinion.	1. Move the drive pinion away from the ring gear by increasing thickness of pinion depth adjusting shims. 2. Adjust the backlash by moving ring gear in toward the drive pinion. N4A0163E

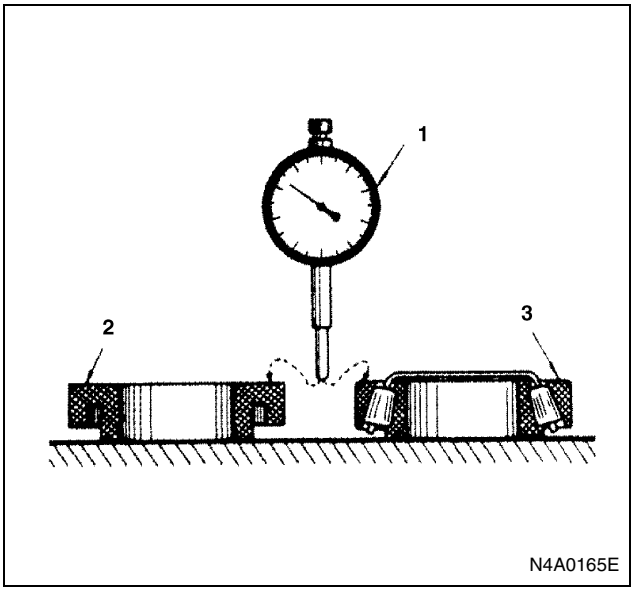
3) Selection of Preload Adjusting Shim

- Measure the clearance between the differential carrier and right and left side (dummy) bearings by using a feeler gauge.
  Carefully note the relationship between the values obtained through measurement at each side and dummy bearings.



N4A0164E

- Measure the thickness of dummy bearing and side bearing.
  Comparison should be made between the thicknesses of dummy bearing and side bearing installed in the same position.



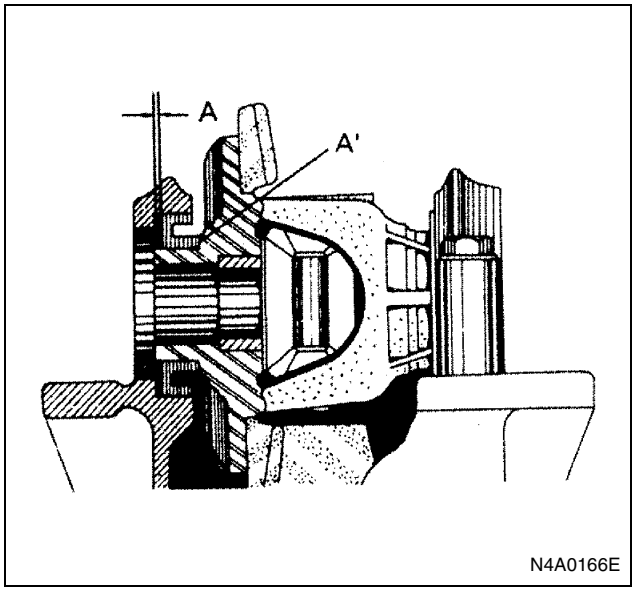
Legend
1. Dial gauge
2. Dummy bearing
3. Side bearing

When side bearing is thinner:
A + (dummy bearing thickness − side bearing thickness) = (X)
When side bearing is thicker:
A − (side bearing thickness − dummy bearing thickness) = (X)

- (X) + 0.025 = Shim thickness
  Allowance for bearing preload at one side = 0.025
- Example of calculation

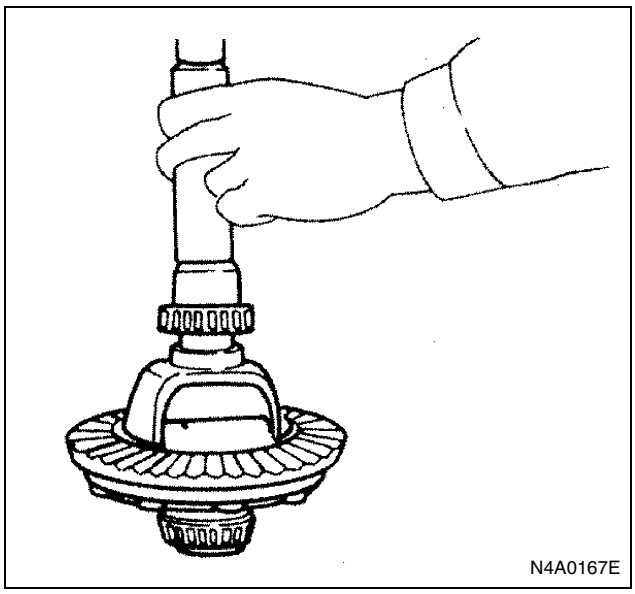
	mm (in.)
Measured Clearance A:	+0.85 (+0.033)
Suppose that the side bearing is thicker [thinner] than dummy bearing by 0.05 mm	−0.05 (−0.002) [+0.05 (+0.002)]
An allowance for bearing preload:	+0.025 (+0.0009)
Thickness of shims to be installed:	0.825 (0.032) [0.925 (0.036)]

Thickness of shim available: 0.25, 0.30, 0.35, 0.5 mm (0.009, 0.012, 0.014, 0.019 in)



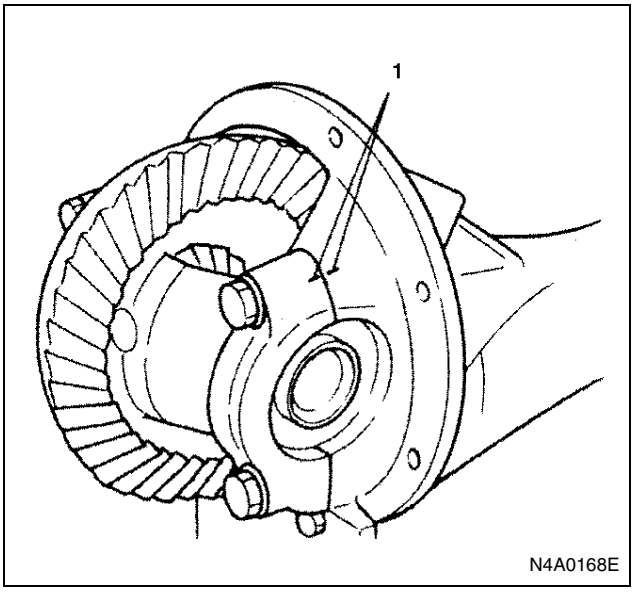
Legend
A. Measured clearance
A′. Shim installed position

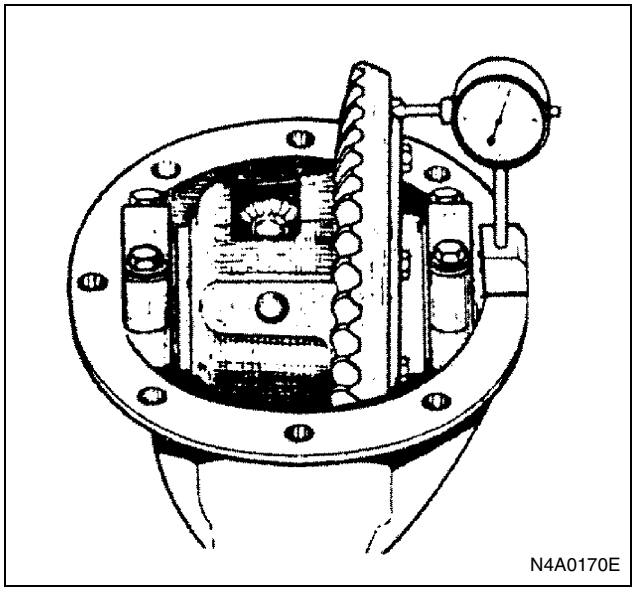
13. Side Bearing Inner Race
    Installer: 5-8840-2050-0
    Grip: 9-8522-1608-0



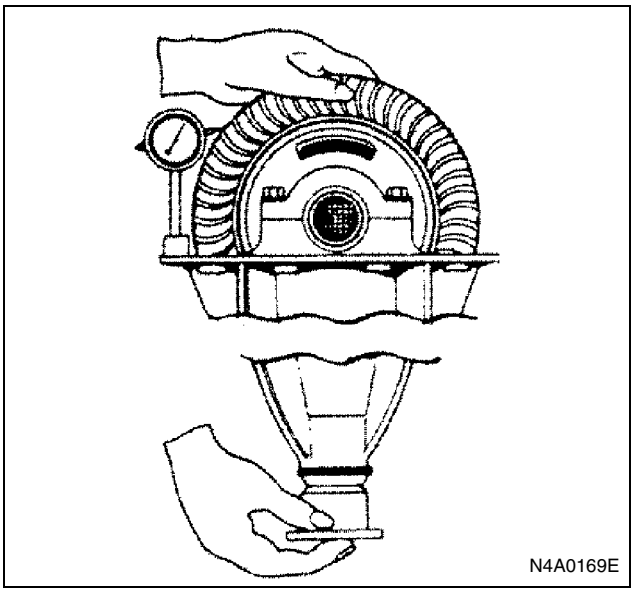
14. Differential Cage Assembly and Ring Gear
15. Side Bearing Outer Race
16. Bearing Cap
    1) Install bearing caps by aligning setting marks (1) applied at disassembly.

Tighten:
Bearing cap bolt to 108 N·m (11.0 kg·m / 80 lb·ft)





2) Recheck the backlash. If measurement indicates that the backlash deviates from the specified range, make an adjustment by shifting the position of shims in use without varying the total thickness.

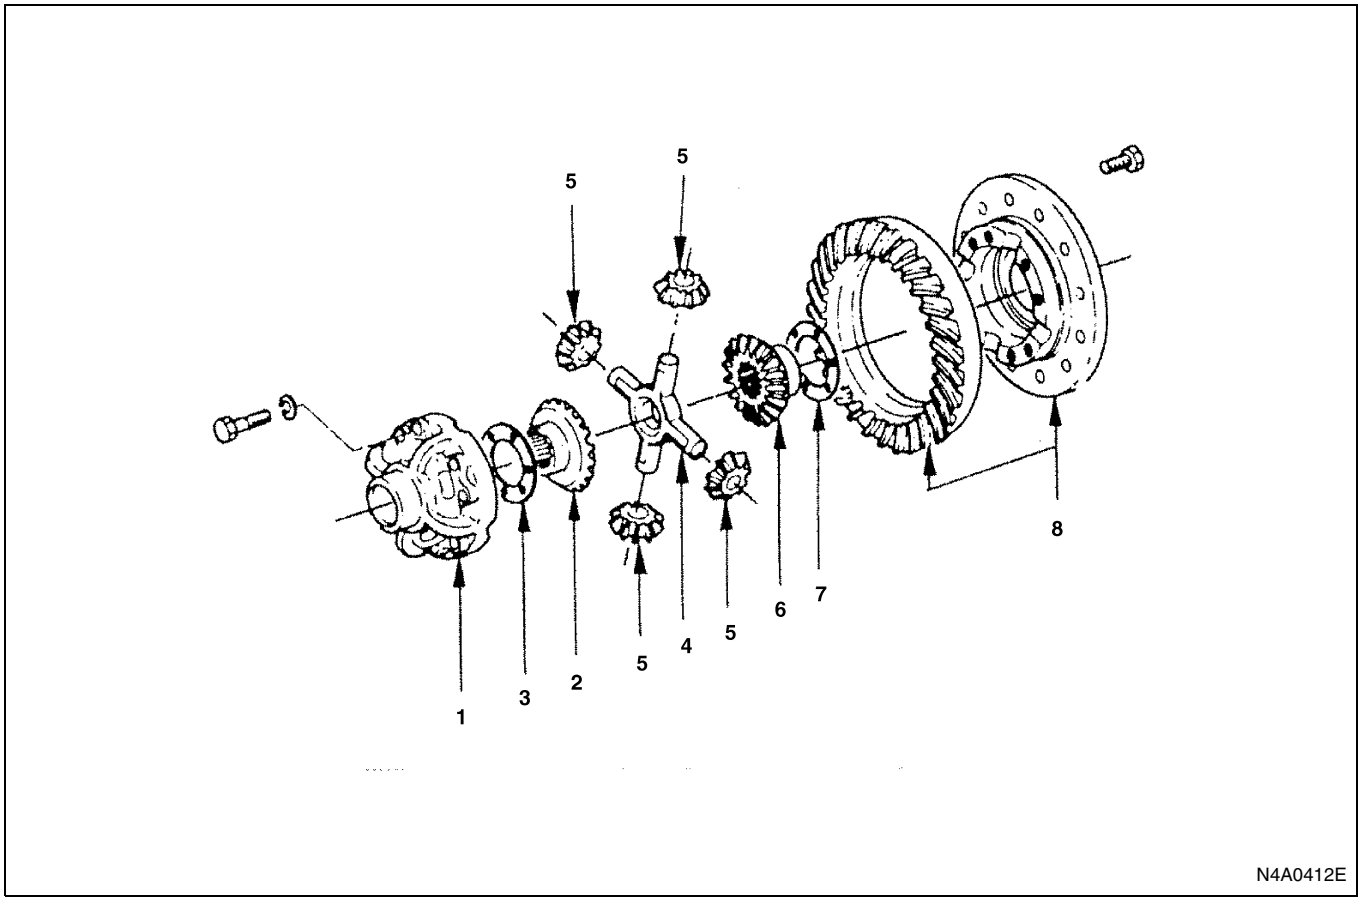


Recheck the ring gear for run-out at the rear face.

If the amount of run-out is excessive, repeat the disassembly and reassembly steps.

Ring gear run-out,
Standard: 0.05 mm (0.002 in)
Limit: 0.2 mm (0.008 in)

Differential Cage Assembly

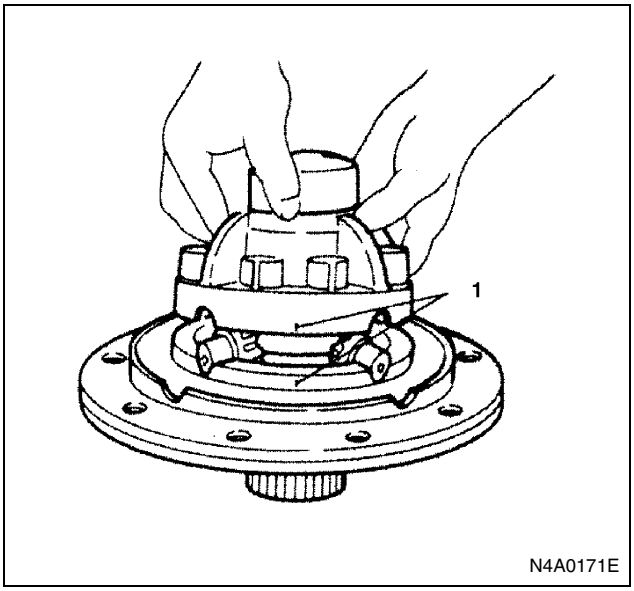


Legend

1. Differential cage B
2. Side gear
3. Thrust washer
4. Spider
5. Differential pinion
6. Side gear
7. Thrust washer
8. Differential cage A and ring gear

Disassembly

1. Differential Cage B
   Apply a setting mark (1) to the differential cage assembly.



2. Side Gear
3. Thrust Washer
4. Spider
5. Differential Pinion
6. Side Gear
7. Thrust Washer
8. Differential Cage A and Ring Gear

Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

- Gear
- Bearing
- Oil seal
- Differential cage
- Drive pinion cage
- Parts organizing limited slip differential assembly

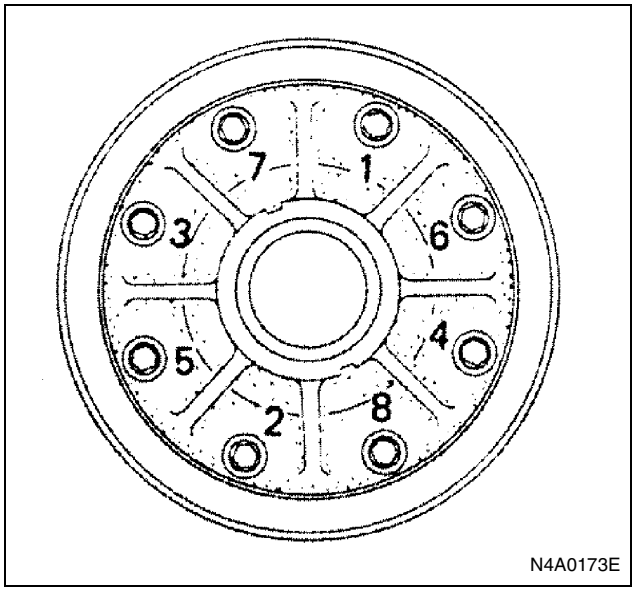
Ring Gear Replacement

The ring gear should always be replaced with drive pinion as a set.

When installing ring gear, apply stud lock to the threaded holes and bolts after treatment of the bolts with primer N.

Tighten:

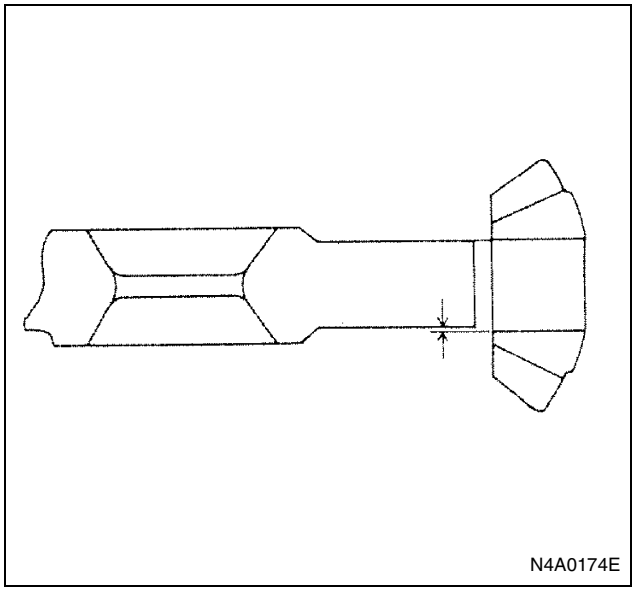
Ring gear bolt to 127 N·m (13.0 kg·m / 94 lb·ft)



Clearance between Differential Pinion and Spider

Standard: 0.07 — 0.13 mm (0.003 — 0.005 in)

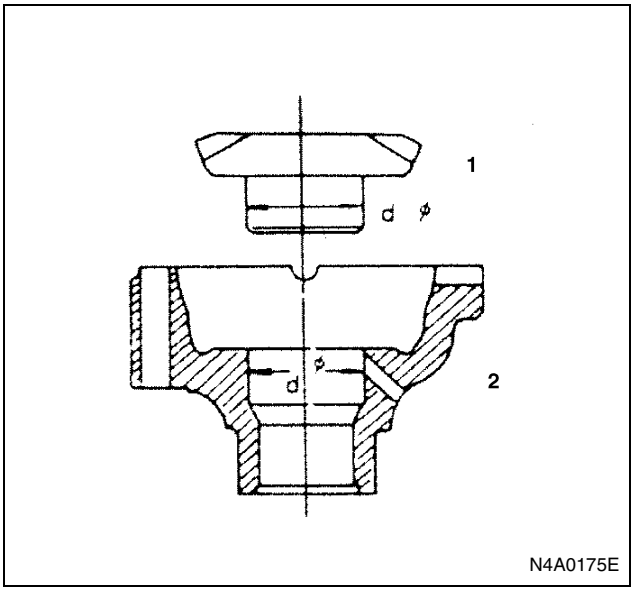
Limit: 0.2 mm (0.008 in)



Clearance between Side Gear and Differential Cage

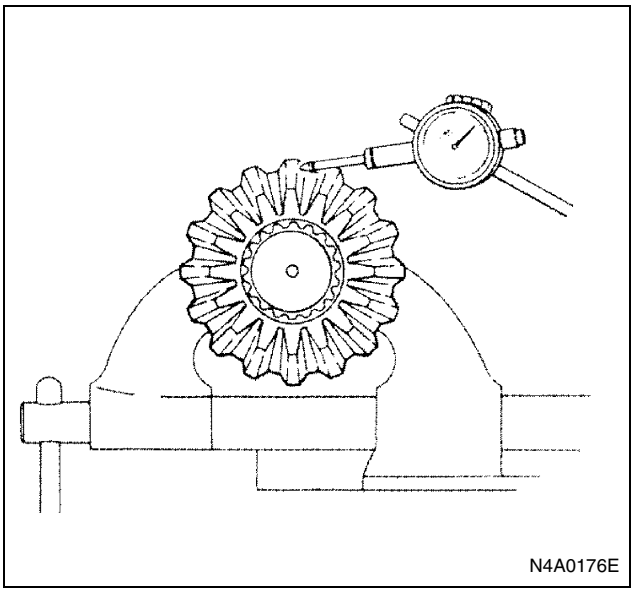
Standard: 0.05 — 0.11 mm (0.002 — 0.004 in)

Limit: 0.25 mm (0.01 in)



Legend
1. Side gear
2. Differential cage

Play in Splines between Side Gear and Axle Shaft
Standard: 0.02 — 0.12 mm (0.0008 — 0.005 in)
Limit: 0.25 mm (0.01 in)



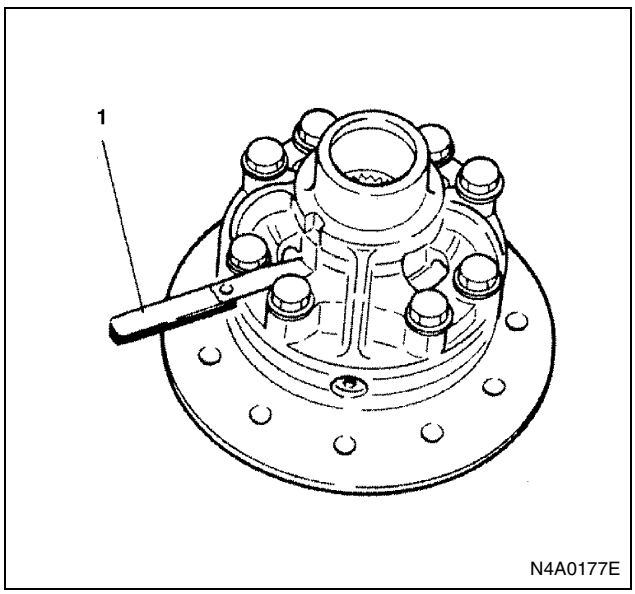
Reassembly

1. Differential Cage A and Ring Gear
2. Thrust Washer
3. Side Gear
4. Differential Pinion
5. Spider
6. Thrust Washer
7. Side Gear
8. Differential Cage B
   1) Apply oil to the threaded portion of the bolts before installation.
   2) Fasten the differential cages A and B so that the setting marks (1) are correctly aligned.

Tighten:
Differential cage bolt to 78 N·m (8.0 kg·m / 58 lb·ft)

   3) Measure the clearance between the back face of the side gear and the differential cage B by inserting a feeler gauge (1) through the hole on the cage B.

Clearance: 0.13 — 0.18 mm (0.005 — 0.007 in)



When the clearance exceed a limit, replace the thrust washer or side gear.

TROUBLESHOOTING

Brake System

PROBLEM	POSSIBLE CAUSE	CORRECTION
No Brakes	1. Restricted tubing or hose. 2. Brakes out of adjustment. 3. No fluid.	1. Replace defective parts. 2. Adjust. 3. Fill the reservoir with brake fluid.
Insufficient Brakes	1. Pedal improperly adjusted. 2. Worn linings/pads or drum/discs. 3. Plugged, crimped, restricted lines or hoses.	1. Adjust. 2. Replace as necessary. 3. Repair or replace.
Slow Brake Application	1. Pedal binding. 2. Wheel cylinder piston sticking. 3. Restriction in the lines. 4. Worn linings/pads or drums/discs.	1. Lubricate pivot pin, clean-check for foreign objects. 2. Repair the wheel cylinder. 3. Remove the restriction or replace the line. 4. Replace as necessary.
Uneven Braking (Front or Rear Brakes not Working)	1. Damaged hydraulic lines. 2. No brake fluid at the master cylinder. 3. Safety valve not opened.	1. Repair or replace. 2. Check for plugged, kinked or damaged hose to the reservoir. 3. Correct.
Wet Weather: Brakes Grab or won't Hold	1. Linings too sensitive to water. 2. Dirty brakes. 3. Bent mounting plate - opening. 4. Scored drums/discs.	1. Replace in axle sets. 2. Clean out. 3. Replace. 4. Machine in pairs. Replace if necessary.
Brakes Squeak	1. Mounting plate bent or shoes twisted. 2. Metallic particles or dust imbedded in the lining. 3. Lining rivets loose or lining not held tightly against the shoe at the ends. 4. Drums distorted tampered, or not Square. 5. Incorrect lining/pad. 6. Mixed size linings. 7. Weak or broken return spring. 8. Loose wheel bearings. 9. Loose mounting plate, drum, wheel cylinder. 10. Linings/pads located wrong on the shoes. 11. Linings/pads worn out. 12. Lining glazed. 13. Cracked or threaded drums/discs.	1. Replace damaged parts. 2. Replace the linings/pads in axle sets. 3. Replace the rivets and/or tighten the lining by riveting. 4. Machine or replace drums/discs. 5. Replace the linings/pads in axle sets. 6. Use all standard or oversize linings in a brake. 7. Replace the return spring. 8. Tighten to the proper setting. 9. Tighten. 10. Install the linings correctly. 11. Reline the brakes. 12. Replace. 13. Replace in axle pairs.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Brakes Chatter	1. Incorrect lining/pad to drum/disc clearance.	1. Adjust to specification.
	2. Loose mounting plate.	2. Tighten securely.
	3. Grease, fluid, road dust on the lining pad.	3. Clean or reline.
	4. Weak or broken return spring.	4. Replace the return spring.
	5. Loose wheel bearings.	5. Readjust.
	6. Drums out-of-round.	6. Machine the drums in axle sets.
	7. Discs warped.	7. Machine the discs in axle sets.
	8. Cocked or distorted shoes.	8. Straighten or replace.
	9. Distorted, tapered, or barrel- shaped drums.	9. Machine drums in pairs. Replace if necessary.
	10. Incorrect lining/pad material.	10. Reline with correct linings/pads.
	11. Linings/pads worn out.	11. Reline the brake.
	12. Lining loose on the shoes.	12. Rerivet the linings to the shoes. Replace if necessary. Check for damaged or distorted shoes.
	13. Foreign material imbedded in the linings/pads.	13. Replace the linings/pads in axle sets.
	14. Cracked or threaded drums/discs.	14. Replace in axle pairs.
Shoe Click	1. Return spring weak.	1. Replace the spring.
	2. Shoe bent.	2. Straighten or replace.
Noise and Chatter Squealing, clicking, or scraping sound upon brake application	1. Bent, damaged or incorrect shoes.	1. Replace with the correct shoes and lining. Always replace in axle sets.
	2. Worn out lining/pad.	2. Replace the shoes and lining/pad in axle sets.
	3. Foreign material embedded in the lining/pad.	3. Replace the shoes and lining/pad in axle sets.
	4. Broken shoe return spring.	4. Replace the return spring.
	5. Cracked or threaded drums/discs (lathe marks).	5. Replace the drums/discs in axle sets.
Pulls to One Side	1. Grease or fluid soaked lining/pad.	1. Replace in axle sets.
	2. Loose wheel bearings, loose (or distorted) mounting plate on the rear or front axle or loose spring bolts.	2. Adjust the wheel bearing, tighten (or replace) the mounting plate to the axle and tighten the spring bolts.
	3. Linings/pads not of the recommended kind.	3. Install recommended linings/pads. Install the shoes correctly.
	4. Tires not properly or evenly inflated or unequal wear of tread. Different tread non-skid design.	4. Inflate the tires to recommended pressures. Rearrange the tires so that a pair of non-skid tread surfaces of similar design and equal wear will be installed on the front wheels, and an other pair with like tread will be installed on the rear wheels.
	5. Water, mud, etc., in the brakes.	5. Remove any foreign material from all of the brake parts and inside of the drums.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Pulls to One Side (Cont.)	6. Wheel cylinder sticking.	6. Repair or replace the wheel cylinder.
	7. Weak or broken shoe return spring.	7. Check the spring-replace distorted, open coiled, or cracked spring.
	8. Out-of-round drums or different sized drums on the same axle.	8. Refinish or replace the drums in axle pairs.
	9. Brake dragging.	9. Check for loose lining. Adjust. (Refer to “Dragging Brakes”.)
	10. Weak chassis springs, loose U-bolts, loose steering gear, etc.	10. Replace the spring, tighten the U-bolts, adjust the steering gear, etc.
	11. Loose steering.	11. Repair and adjust.
	12. Unequal camber.	12. Adjust to specifications.
	13. Restricted brake line or hose.	13. Check for soft hose or damaged lines. Replace as necessary.
	14. Wheel cylinder size different on opposite sides.	14. Replace with correct cylinders.
	15. Loose kingpin.	15. Replace the kingpins or bushing.
	16. Distorted, damaged, or scored drum/ disc.	16. Refinish the drums/discs in axle pairs. Replace if necessary.
	17. Front end alignment.	17. Align the front end.
	18. Excessively worn lining/pad.	18. Replace in axle sets.
	19. Uneven adjustment of brake lining clearance.	19. Adjust the brake lining clearance in all wheels.
	20. Water/wet linings.	20. Apply the brakes a few times while moving at a slow speed to dry the linings.
One Wheel Locks	1. Gummy lining/pad.	1. Replace in axle sets.
	2. Tire tread slick.	2. Match up tire treads from side to side.
	3. Brake adjustment not correct.	3. Adjust the brakes.
	4. Restricted brake line or hoses.	4. Check for soft hoses or damaged lines. Replace as necessary.
	5. Incorrect lings/pads.	5. Replace. Linings/pads must be the same on the axle.
	6. Grease or fluid soaked lining/pads.	6. Replace in axle sets.
	7. Foreign material in the brakes.	7. Remove the material.
Light Pedal Pressure Brakes too Severe (Grabby Brakes)	1. Brake adjustment not correct.	1. Adjust the brakes.
	2. Loose mounting plate on the front axle.	2. Tighten the plates.
	3. A small amount of grease or fluid on the lining/pad.	3. Replace the linings/pads.
	4. Incorrect lining/pad.	4. Install factory specified linings/pads.
	5. Wheel bearings loose.	5. Adjust the wheel bearings.
	6. Lining loose on the shoe.	6. Replace the lining or the shoe and lining.
	7. Excessive dust and dirt in the drum.	7. Clean and sand the drums and linings.
	8. Out-of-round drum.	8. Turn the drums in pairs or replace.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Low Pedal or Pedal Goes to Floor	1. Excessive clearance between the linings and drum.	1. Adjust the brakes.
	2. Pedal stop not adjusted, or missing.	2. Adjust or install the pedal stop.
	3. Weak brake hose.	3. Replace with new hose.
	4. Leaking wheel cylinder.	4. Clean and rebuild.
	5. Air in the hydraulic system.	5. Bleed the hydraulic system.
	6. Improper brake fluid (low boiling point).	6. Flush the system and refill with recommended brake fluid.
	7. Low fluid level.	7. Fill the reservoir with brake fluid; check for leaks and bleed system.
	8. Bent or distorted brake shoes.	8. Replace in axle sets.
	9. Leaks at hydraulic line connections.	9. Check for hydraulic leaks and repair.
Slow Brake Release	1. Foot pedal binding.	1. Lubricate the pivot pin; clean-check for foreign objects.
	2. Restriction in the line.	2. Remove the restriction or replace line.
	3. Weak shoe return spring.	3. Replace the spring.
Poor Assist or Loss of Assit	1. Low brake fluid level.	1. Fill the reservoir to the proper level. Bleed the system.
	2. Air in the hydraulic system.	2. Locate the source of the air leak and repair. Bleed the system.
	3. Weak brake hose.	3. Replace.
	4. Loss of vacuum.	4. Inspect for vacuum leaks or malfunctioning pump. Repair or replace as necessary.
	5. No brake fluid at the master cylinder.	5. Check for plugged, kinked, or damaged hose to the reservoir.
Brake Fade	1. Incorrect lining/pad.	1. Replace with recommended lining/pad.
	2. Poor lining/pad contact.	2. Grind the lining/pad to the proper radius; adjust.
	3. Thin drum.	3. Replace the drum.
	4. Dragging brakes.	4. Adjust.
	5. All conditions listed under “Pulls to One Side”.	5. All corrections listed under “Pulls to One Side”.
All Brakes Drag when Adjustment is Known to be Correct	1. Pedal does not return to stop.	1. Lubricate the pedal linkage; adjust the pedal.
	2. Improper fluid.	2. Replace rubber parts and fill with the recommended brake fluid.
	3. Use of incorrect rubber parts.	3. Install the proper parts.

PROBLEM	POSSIBLE CAUSE	CORRECTION
One Wheel Drags	1. Weak or broken shoe return spring.	1. Replace the return spring.
	2. Brake shoe to drum clearance too small.	2. Adjust to specification.
	3. Loose wheel bearings.	3. Adjust or replace the wheel bearings.
	4. Wheel cylinder piston cups swollen and distorted or piston stuck.	4. Rebuild the cylinders. Flush the hydraulic system and fill with recommended fluid.
	5. Pistons sticking in the wheel cylinder.	5. Clean or replace the pistons; clean the cylinder bore.
	6. Drum out-of-round.	6. Machine the drum.
	7. Disc warped.	7. Machine the disc.
	8. Restricted brake line or hose.	8. Check for soft hoses or damaged lines. Replace as necessary.
	9. Distorted shoe.	9. Replace.
	10. Defective lining/pad.	10. Replace with the recommended lining/pad.
	11. Loose or bent mounting plate.	11. Tighten the fasteners; replace the plate.
	12. Loose calipers.	12. Tighten the fasteners.
Dragging Brakes	1. Improper fluid.	1. Flush the hydraulic system and fill with recommended brake fluid, and replace rubber components.
	2. Brake pedal adjustment incorrect.	2. Adjust the pedal.
	3. Incorrect shoe return spring.	3. Replace the shoe return spring.
	4. Brake pedal linkage interference or binding.	4. Free the linkage and lubricate.
	5. Incorrect lining/pad.	5. Replace the linings/pads.
	6. All conditions listed under “One Wheel Drags”.	6. All corrections under “One Wheel Drags”.

Hydraulic Booster

PROBLEM	POSSIBLE CAUSE	CORRECTION
Large force pressing on the brake pedal (boosting insufficient)	1. Booster operation insufficient • Large internal leakage • Sticking of the spool valve • Insufficient sliding around the input and output rods	• With the engine on, press the brake pedal repeatedly, and confirm the presence of manual operation. With regard to manual operation, turn the engine off, and judge whether the pedal is as stiff and its play is as small as when the pedal is pressed repeatedly ten times or more. • When there is manual operation, the hydro boost assembly is replaced.
Brake dragging	1. Bad dimensions of the booster • The amount of protrusion of the output rod is large	• Confirm whether the amount of protrusion of the output rod (the distance from surface of the master cylinder attachment flange to the end of the rod) is no greater than 18.2 mm (0.717 in). • If the above dimension is outside the range, replace the hydro boost assembly.
	2. Bad pedal circumference attachment dimensions • Clevis position dimension is large	• Confirm whether the clevis position dimension (the distance from surface of the vehicle attachment flange to the center of the clevis center) is in the range 109 $\pm$ 1 mm (4.29 $\pm$ 0.04 in). • If the above dimension is outside the range, loosen the lock nut and adjust the clevis position dimension to be inside the above range. After making this adjustment, be sure to securely tighten the lock nut and to do a stop light switch reconfirmation.
	3. Booster return is bad • Input-output rod circumference sticks • Bad spool valve operation	• With the engine on, repeatedly press the brake pedal and confirm the pedal return state. • If the pedal does not return, replace the hydro boost assembly as necessary.
Oil leakage	1. Hydro boost assembly external leakage • Leakage from the seal material	• If the oil leakage is caused by looseness in the piping connections, retighten the connections. • If there is oil leakage from the connections of the accumulator, replace the affected seals of the connections with new seals. • If there is any oil leakage from parts other than the above that are included in the hydro boost assembly, replace the hydro boost assembly or the repair setting parts (accumulator).

PROBLEM	POSSIBLE CAUSE	CORRECTION
Bad brake operation (lack of smoothness in operation)	1. Poor operation of the booster • Input-output rod circumference sticks • Bad spool valve operation	• With the engine on, repeatedly press the brake pedal and confirm the pedal operation state. • If there is sticking or some other abnormality in the pedal operation, replace the hydro boost assembly as necessary.
Abnormal brake noise (when pressing the pedal)	1. Air in the hydraulic booster lines	• With the engine running, check the amount of hydraulic fluid remaining in the reserve tank for the hydraulic booster. • If low, add fluid (Besco ATF III) and bleed to remove air as necessary before starting the engine. Operate the pump and repeatedly step on the pedal to confirm the gear noise (caused by cavitation).
	2. Water in the hydraulic fluid	• Check the color of the hydraulic fluid in the reserve tank for the hydraulic booster (normal: purple, abnormal: milky white). • If the hydraulic fluid is milky white, change the fluid (Besco ATF III) and bleed to remove air as necessary before starting the engine. Operate the pump and strongly press the pedal until reaching full boost range to confirm the gear noise (caused by cavitation). The length of time to keep the pedal pressed all the way down is no more than five seconds.
No pedal boosting effect immediately after turning the engine off	1. Faulty charge valve • Gas leaking from the accumulator • Leakage inside the charge valve	• Keep the engine running for more than 10 seconds. Turn off the engine, and within 60 seconds, step on the pedal once to confirm boosting effect. Boosting effect means the same pedal effort if the engine was running. • If boosting effect does not exist, either the hydraulic booster assembly or the accumulator may need to be replaced.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Warning buzzer continuously sounds	1. Faulty hydraulic booster assembly • Faulty pressure switch • Leakage inside the charge valve	• Confirm that the electric devices (pressure switch, relay, buzzer, etc.) are working correctly. • If all are working correctly, pump the brake pedal at least 10 times after turning the engine off to reduce pressure in the hydraulic booster. Start the engine, and release the parking brake. Check to see if the alarm stops within ten seconds (if it does, the electrical devices are working properly). • When testing the electrical devices, always keep your foot on the brake pedal with just enough pressure to prevent the vehicle from moving. If the alarm does not stop, the hydraulic booster assembly may have to be replaced.
Charge operation remains in effect	1. Bad charge valve operation • Bad valve switching operation	• Turn the engine on, and without pressing the brake pedal, check whether any charging sound continues, such as the sound of the fluid. • If it continues and will not stop, replace the hydro boost assembly as necessary.

Notice:

- When the brake pedal is operated after the engine is turned off and the oil pump stops, during a few operations a fluid sound due to the flow of high-pressure oil or a sound of movement by the charge spool may be produced, but this sound is not abnormal; it merely indicates that boosting by the accumulator (accumulator operation) is proceeding normally.
  Also, a similar fluid sound is produced during quick operation of the brake pedal even if the engine is on, but this too is normal.
- If the pressure of the oil in the accumulator drops with operation of the brake pedal after the engine is turned off or when the engine has been off for a long time, then immediately after the engine is turned on, fluid sound during charge valve operation or switching sound when charging ends will be produced, but this sound is not abnormal; it merely indicates that the accumulator is being normally charged.
  Also, a similar charging operation sometimes occurs and sound is sometimes produced when the pressure inside the accumulator drops even when the engine is on and charging has ended, due to such causes as rapid operation of the brake pedal, internal leakage that is too slight to affect brake performance, or a change in temperature; this too is normal.
- When the brake pedal is pressed strongly as far as the booster full load region while the engine is on, sometimes sound is produced by the flow of hydraulic oil discharged from the oil pump, but this is not abnormal. Also, pressing the pedal in as far as this booster full load region can cause a significant increase in the oil temperature inside the oil pump and can lead to a failure, so keep the pedal pressed for no longer than 5 seconds.

Brake Lining

PROBLEM	POSSIBLE CAUSE	CORRECTION
Poor Contact at the Center of Shoe	1. Bell-mouthed drum. 2. Distorted mounting plate. 3. Bent brake shoe. 4. Undersize linings. 5. Loose wheel bearing.	1-5. Repair or replace as required.
Unequal Wear on the Shoes in the Same Brake	1. Brake linings not a balanced set. 2. Sticking wheel cylinder piston.	1-2. Repair or replace as required.
Material at the Center of the Shoe Excessively Thin	1. Undersize linings. 2. Oversize drum.	1-2. Repair or replace as required.
Lining Tapered across the Width	1. Bell-mouthed drum. 2. Bent shoe. 3. Distorted mounting plate.	1-3. Repair or replace as required.
Lining Worn at One End	Bent mounting plate.	Repair or replace as required.
Linings Glazed	1. Grease on lining. 2. Wrong type lining for service involved.	1-2. Repair or replace as required.
Rivets Tear Loose	1. Improper set rivet. 2. Improper setting of the rivet. 3. Enlarged rivet holes in the shoe.	1-3. Repair or replace as required.
Unequal Wear Opposite Brakes, Same Axle	1. Weak shoe return spring. 2. Obstructed hydraulic line. 3. Stuck wheel cylinder piston. 4. Brake drum surface in poor condition. 5. Loose wheel bearing.	1-5. Repair or replace as required.
Linings at Scored	1. Scored drum. 2. Abrasive material between the lining and drum.	1-2. Repair or replace as required.
Cracks at Rivet Holes	1. Wrong type rivets. 2. Rivets not properly set. 3. Dirt or rust on the shoe table. 4. Wrong size lining.	1-4. Repair or replace as required.
Elongation of the Rivet Holes	1. Loose rivets. 2. Wrong size rivets.	1-2. Repair or replace as required.
Wear on the Edge of the Lining	1. Wrong width lining. 2. Holes improperly drilled. 3. Loose wheel bearing. 4. Bent shoe.	1-4. Repair or replace as required.
Groove on the Edge of the Lining	1. Lining too wide. 2. Worn drum.	1-2. Repair or replace as required.

Brake Drum

PROBLEM	POSSIBLE CAUSE	CORRECTION
Brake Drum Heat Checked in Spots	1. Out-of-round brake drum. 2. Eccentric mounting of the drum. 3. Loose wheel bearing.	1-3. Repair or replace as required.
Drum Uniformly Heat Checked	1. Improper friction materials. 2. Overworked brake. 3. Driver abuse.	1-3. Repair or replace as required.
Excessive Scoring of the Drum	1. Improper friction materials. 2. Overworked brake. 3. Abrasive material between the lining and drum. 4. Soft drum. 5. Bent or warped shoe.	1-5. Repair or replace as required.
Excessive Drum Cracks	1. Drive abuse. 2. Weak drum. 3. Wrong friction material. 4. Overworked brake.	1-4. Repair or replace as required.

Exhaust Brake

PROBLEM	POSSIBLE CAUSE	CORRECTION
Exhaust Brake does not Operate	1. Blown fuse. 2. Improperly adjusted or faulty accelerator or clutch switches. 3. Poor connections or corroded terminals at switches or control valve. 4. Improperly adjusted or seized exhaust brake valve. 5. Vacuum lines kinked, restricted, or plugged with ice. 6. Seized vacuum chamber. 7. Valve linkage broken. 8. Chamber or control valve jammed with ice. 9. Faulty control valve. Valve should open when approximate battery(s) voltage is applied to terminals. 10. Faulty vacuum chamber. 11. Broken wire in wiring harness.	1. Replace. 2. Adjust or replace. 3. Clean or replace. 4. Adjust, or repair. 5. Repair. 6. Repair. 7. Repair. 8. Melt ice and drain lines of water. 9. Replace. 10. Replace. 11. Repair.
Exhaust Brake SIow to Operate	1. Tighten exhaust brake valve or linkage. 2. Improperly adjusted accelerator or clutch switches.	1. Free up and lubricate. 2. Adjust.

PROBLEM	POSSIBLE CAUSE	CORRECTION
Weak Braking Action	1. Improperly adjusted or tight exhaust brake valve. 2. Tight linkage. 3. Vacuum lines kinked or partially plugged with ice. 4. Leaking fittings at vacuum lines. 5. Leaky vacuum chamber.	1. Free up and/or adjust. Lubricate as needed. 2. Free up and lubricate. 3. Repair. 4. Tighten. 5. Replace.
Exhaust Brake will not Shut Off (Exhaust Brake Control Switch “Off”)	1. Seized exhaust brake valve or linkage. 2. Control valve or chamber jammed with ice. 3. Short in wiring harness (approximate battery(s) voltage) at control solenoid regardless of control switch position. 4. Faulty control switch.	1. Free up and lubricate. 2. Melt ice and drain lines. 3. Repair. 4. Replace.
Exhaust Brake “On” Continuously when Exhaust Brake Control Switch is “On” (not Controlled by Clutch or Accelerator Switches)	1. Improperly adjusted clutch or accelerator switches. 2. Switches improperly wired. 3. Short in wiring harness.	1. Adjust. 2. Check wiring against wiring diagram. Repair as needed. 3. Repair.
Engine Overheats or Loses Power	1. Engine brake valve stuck partially closed. 2. Engine brake valve adjusted so that it is partially closed.	1. Free up and lubricate or replace. 2. Adjust.

Parking Brakes

Insufficient Braking Force

PROBLEM	POSSIBLE CAUSE	CORRECTION
Brake lining and drum clearance	Clearance between the brake lining and the brake drum excessive	Adjust the brake lining and the brake drum clearance.
Brake lining	Brake lining worn out	Replace the brake lining.
Camshaft	Camshaft worn out	Replace the camshaft.
Control wire	Control wire stretched	Adjust the control wire length or replace the control wire.

SERVICING

Service Brakes

Wheel Brake Adjustment

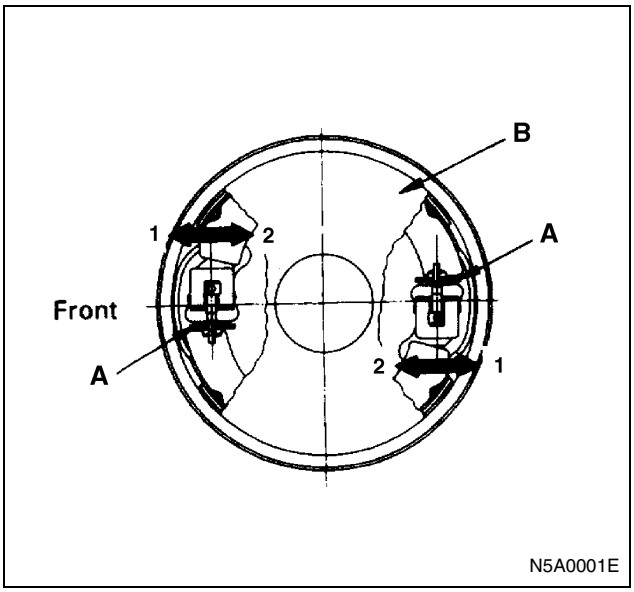
Brake Lining Clearance Adjustment (2L and D2L)

Without auto-adjuster type

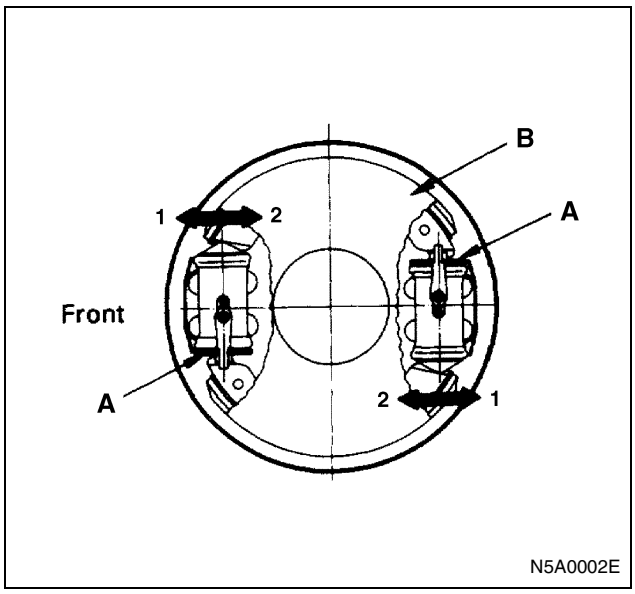
1. Chock the wheels not being adjusted.
2. Jack up the axle until the wheels can be turned freely.
3. Manually shake the wheel to check for excessive play.
4. Remove the grommet fitted to one of the brake drum cover adjuster holes.
5. Insert a screwdriver into the adjuster hole. Manually rotate the wheel while turning the adjuster (A) in the direction of the arrow (1) until resistance is felt at the wheel.
6. Back off the adjuster (A) in the direction of the arrow (2) the specified number of notches.

Specified Notches	
Front Rear	5-6

2L



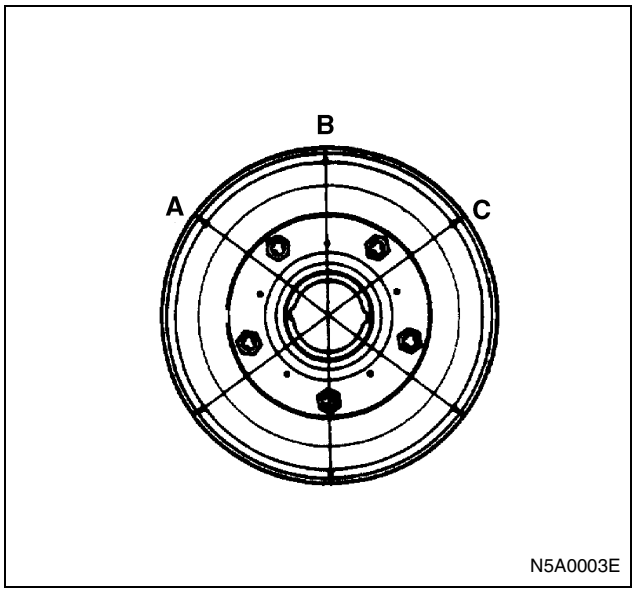
D2L



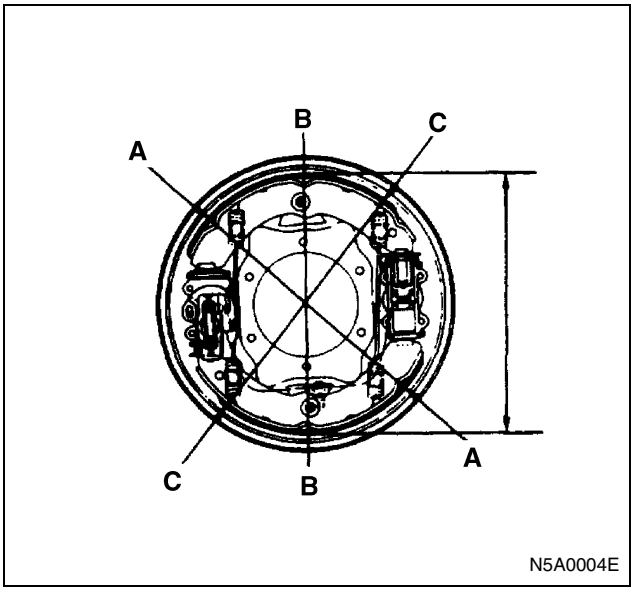
7. Install the grommet to the adjuster hole.
8. Repeat Steps 4 through 7 on the other wheels.
9. Lower the vehicle to the ground.

With auto-adjuster type

1. Measure the internal diameter of the brake drum.
   - Take measurement of the distance at (A), (B) and (C) points.



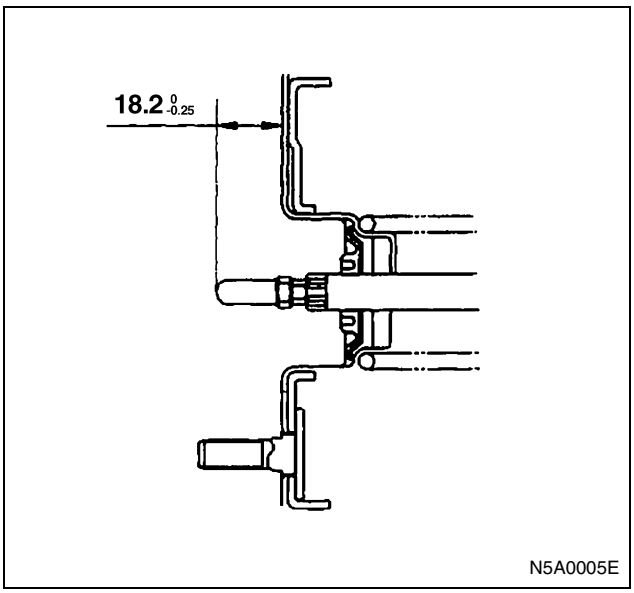
2. Measure the external diameter of the brake shoe.
   - Take measurement of the distance at (A), (B) and (C) points.



3. Turn the adjuster gear so that the difference between the internal diameter of the brake drum and the external diameter of the brake shoe becomes 0.6 mm (0.024 in).
4. Step on the brake hard while turning the brake drum in the forward direction, or while driving forward.

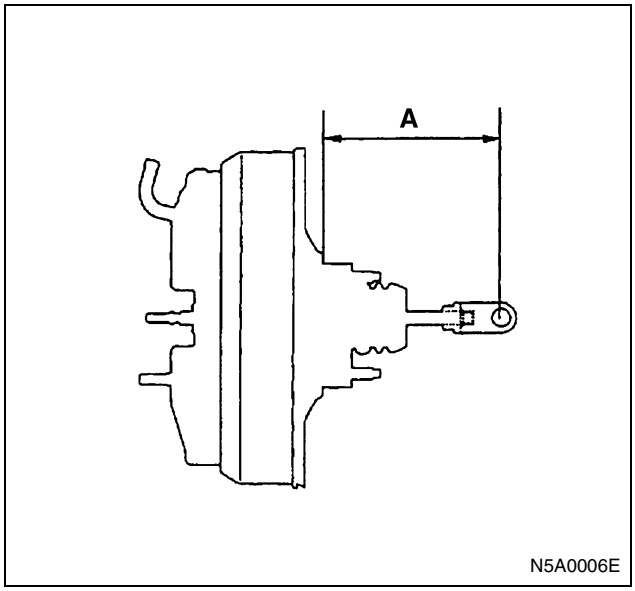
Brake Pedal Adjustment

Brake Pedal Height and Free Play Adjustment
Vacuum Booster (Master Vac) Type:
The height of push rod should be adjusted so that the distance from its master cylinder mounting surface to end measures 18.2 mm (0.717 in).



For push rod length adjustment, the distance from the center of crevis pin hole to brake pedal bracket mounting surface should be set at 109 mm (4.291 in); without spacer, 129 mm (5.079 in); with spacer.
When fixed under this condition, there is no need to adjust the height of brake pedal from floor and free play.

Notice:
- As vacuum booster (Master Vac) is undetachable type, it should be replaced as an assembly if it does not work well.
- Be sure to adjust the stop light switch.



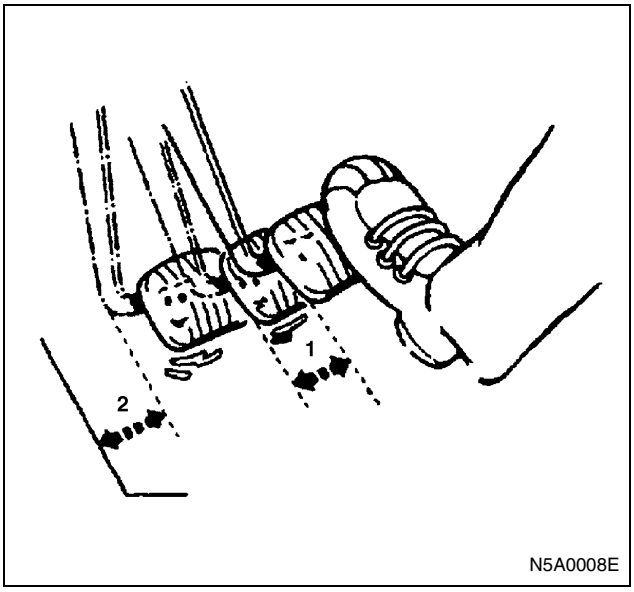
Brake Pedal Free Play and Allowance
Standard value
1. Free play: 4 to 7 mm (0.16 to 0.28 in)
   24 to 29 mm (0.94 to 1.14 in) for HBB type

2. Allowance			mm (in)
NHR	Front Drum Brake		50 (1.97)
NKR	Front Disc Brake Model		40 (1.57)
	Front Drum Brake Model	Less than GVM 6.5 ton	60 (2.36)
		GVM 6.5 ton	40 (1.57)
NPR NQR	Front Disc Brake Model		40 (1.57)
	Front Drum Brake Model	Less than GVM 6.5 ton	60 (2.36)
		GVM 6.5 ton or more	40 (1.57)
NPS	Front Drum Brake		40 (1.57)

(When depressed with force of the 490 N (50 kg / 110 lbs).)

NPR, NQR (HBB type)	Front Disc Brake Model	35 (1.38)
	Front Drum Brake Model	45 (1.77)

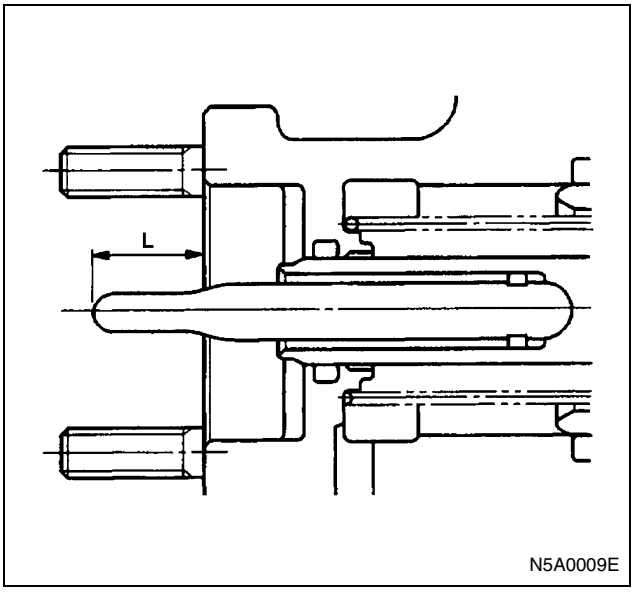
(When depressed with force of the 294 N (30 kg / 66 lbs).)



Hydraulic Booster Type

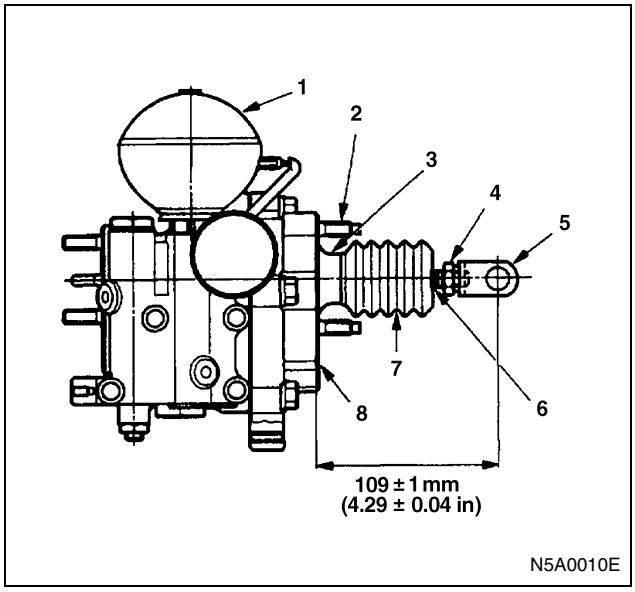
Push Rod Length

- Use a scale to measure the push rod length (push rod to flange face clearance).
  Push Rod Length "L" to 17.95 — 18.2 mm (0.707 — 0.717 in).
  If the push rod length is not equal to the specification, the hydraulic booster assembly must be replaced.



Operating Rod Length

1. Loosen the jam nut at the stop light switch.
2. Loosen the jam nut on the hydraulic booster operating rod.
3. Turn the operating rod until the distance from the center of clevis pin hole to mounting surface of the brake pedal bracket should be set at 109 ± 1 mm (4.29 ± 0.04 in).
   When fixed under this condition, there is no need to adjust the brake pedal height and free play.



Legend

1. Accumulator
2. Stud bolt
3. Cover boss
4. Lock nut
5. Clevis
6. Operating rod
7. Guard
8. Flange

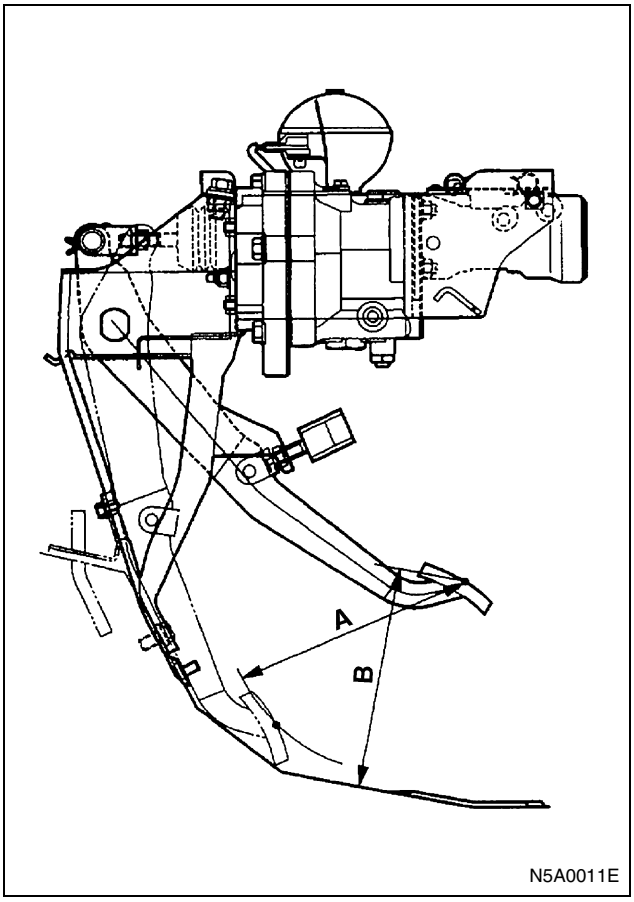
4. Tighten the operating rod jam nut.

Tighten:
Jam nut to 20 N·m (2.0 kg·m / 14 lb·ft)

5. Stop light switch so that the end of the switch threaded portion contacts the brake pedal, then back off the switch 1/2 turn.

Tighten:
Stop light switch locknut to 20 N·m (2.0 kg·m / 14 lb·ft)

6. Check light pedal operation to be sure that it is operating properly.
   - Measure the brake pedal free play, after reducing the pressure of the hydraulic oil in the accumulator by pedal operations at least 10 times with engine off.
     Brake pedal normal play is between 21 — 24 mm (0.83 — 0.94 in).
   - Pressing the brake pedal with a force of 294 N (30 kg / 66 lb) with the engine on, the clearance between the brake pedal and floor panel is more than 35 mm (1.4 in).
   - Brake pedal height "B" is 167 mm (6.58 in) (reference).
   - Brake pedal travel "A" is between 180 ± 5 mm (7.09 ± 0.2 in) (reference).



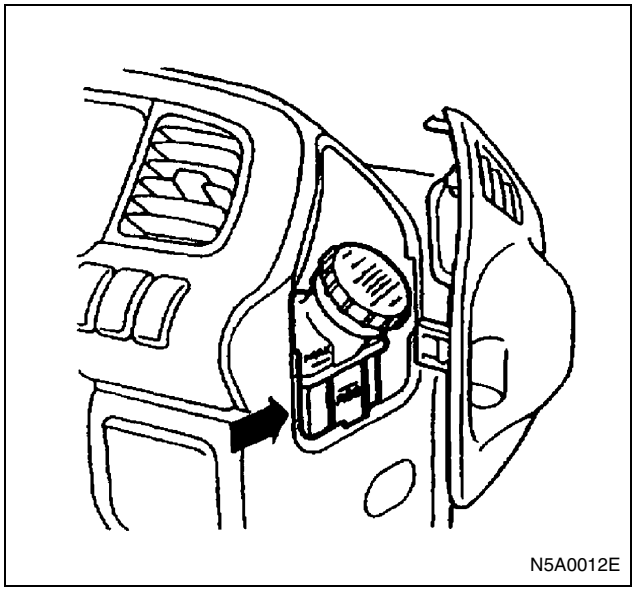
Legend

A. Pedal travel
(Reference).....180 ± 5 mm (7.09 ± 0.2 in)
B. Pedal height
(Reference).....167 mm (6.58 in)

Brake Bleeding

Brake Bleeding Precautions

Air in the brake hydraulic circuit will result in dangerous reduced braking efficiency.
The brake hydraulic circuit must be bled whenever the vehicle has been operated with the reservoir brake fluid level at an excessively low level or any time the brake pipes have been disconnected in the course of brake servicing.
The brake bleeding procedure requires the cooperative action of two men.



Brake Bleeding Procedure

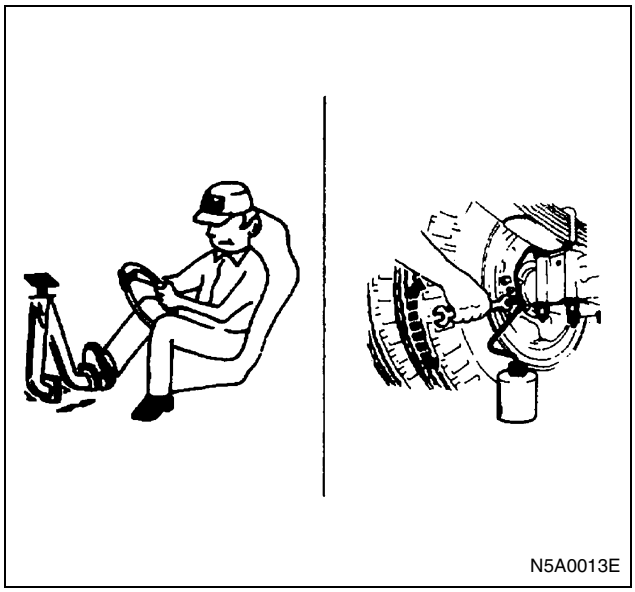
Bleed the brake hydraulic circuit in the following sequence.

LHD

Left-hand rear wheel (vehicle equipped with ABS) → Right-hand rear wheel → DSPV or LSPV → (If so equipped) → Right-hand front wheel → Left-hand front wheel

RHD

Left-hand rear wheel (vehicle equipped with ABS) → Right-hand rear wheel → DSPV or LSPV (If so equipped) → Left-hand front wheel → Right-hand front wheel



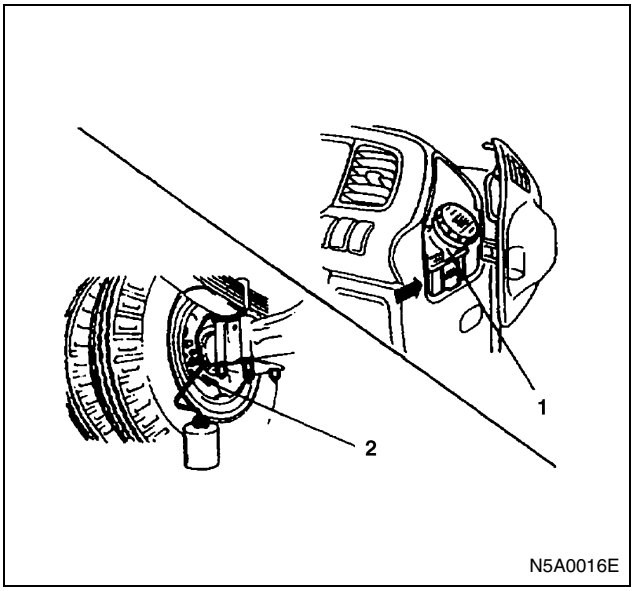
1. Check to make sure that the service area is well ventilated.
   Apply the parking brake firmly. Start the engine and allow it to run until the vacuum pressure rises sufficiently.

Notice:

Brake booster (master-vac) will be adversely effected if bleeding operation is performed without running engine.

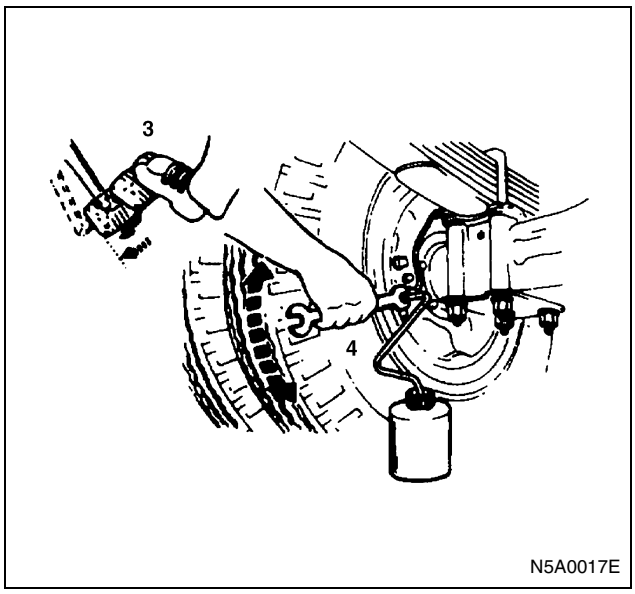
If the vehicle is equipped with ABS, be sure to remove the ABS fuse (60 A) from the fuse box before beginning the air bleeding procedure. If this is not done, air is not bled completely from ABS unit, so that ABS unit will be broken. (Be sure to install the ABS fuse (60 A) in specified position when the air bleeding procedure is completed.)

2. Fill the brake fluid reservoir (1) up to the “MAX” level with clean brake fluid.
   It may be necessary to replenish the brake fluid reservoir several times during the bleeding procedure to maintain the required level of brake fluid.

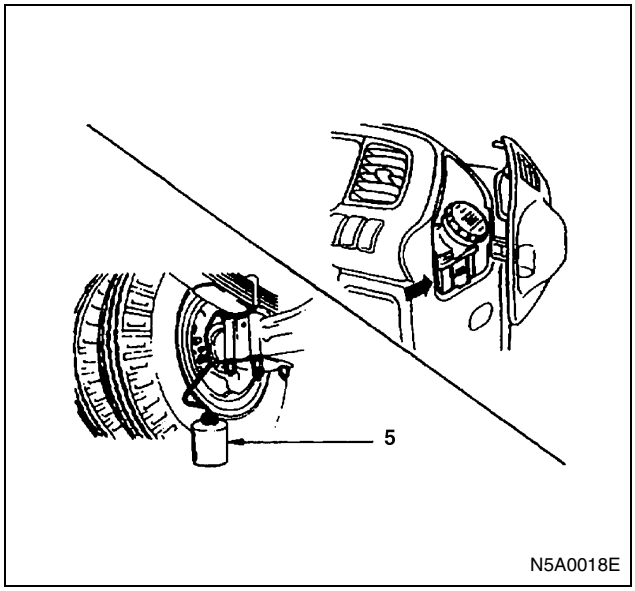


Notice:
Pour the brake fluid carefully so as not to produce air bubbles.

3. Remove the right hand rear wheel cylinder (left hand rear wheel cylinder if ABS is equipped) bleeder screw rubber cap and wipe it clean.
4. Connect one end of a vinyl tube (2) to the bleeder screw.
5. Insert the other end of the vinyl tube into a transparent container approximately 1/3 full of brake fluid.
6. Depress the brake pedal (3) slowly 3 times and hold it depressed.



7. Loosen the bleeder screw (4) approximately 1/2 of a turn.
   This will release the brake fluid with air bubbles into the transparent container (5).



8. When the brake fluid being released into the transparent container is completely free of air bubbles, retighten the bleeder screw (4).
9. Slowly release the brake pedal.
10. Replace the bleeder screw rubber cap.

Notice:
In order to bleed the air completely from the brake line, repeat the above procedures.

Bleeding of the brake fluid circuit should be performed for front wheel 10 times or more, for rear wheel 15 times or more.

11. Repeat Steps 3 through 10 for each bleeder screws as mentioned before.
12. After the air bleeding procedure is finished in all wheels, depress the brake pedal, and verify wheth-

er there is no abnormality in operation of the brake system.

13. After the air bleeding procedure for individual wheel is completed, inspect the fluid level of the reservoir tank. If it is insufficient, replenish brake fluid. Do not overfill above “MAX” level.
14. Stop the engine.

Hydraulic Booster Line Bleeding

Bleeding Precautions

After removing the hydro boost assembly or piping and making repairs, do not run the vehicle until you perform the below-described air bleeding and then verify that everything is normal, including hydro boost boosting and accumulator operation.

Bleeding Procedure

1. Attach the hydro boost and the master cylinder to the vehicle and connect the piping.
2. Fill the hydro boost reservoir with hydraulic oil between its minimum and maximum range.
3. Turn the engine on for about 5 seconds.
4. Then turn the engine off and check the quantity of hydraulic oil in the reservoir.
5. If the hydraulic oil is below the minimum, pour in more hydraulic oil so that it is in the range from minimum to maximum.
6. Repeat the above steps 2 — 5 until there is no foaming or change in the level of the hydraulic oil in the reservoir. But if the hydraulic oil foams during the above steps, let it stand for a while, wait for the foam to dissipate, then continue the work.
7. With the engine on, repeatedly press the brake pedal slowly about five times.
8. Then turn the engine off and check the quantity of hydraulic oil in the reservoir. If the hydraulic oil is below the minimum, once again pour in more hydraulic oil so that it is in the range from minimum to maximum.
9. Leaving the engine off, repeatedly press the brake pedal at least ten times.
10. Verify that there is no foam or change in the level of the hydraulic oil in the reservoir. If any foam remains, let it stand for a while, wait for the foam to dissipate, then repeat the above steps 7 — 9.
11. If it is necessary at this time to bleed out the air from the brake fluid pressure system, such as the master cylinder or the wheel cylinder, be sure to first complete step 10 above and make sure that the engine is on.
12. With the engine on, strongly press the brake pedal as far as the booster full load region slowly and repeatedly about 30 times (for 1 — 3 seconds each time). When doing so, do not keep the pedal at the full load region (no longer than 1 second).
13. Then turn the engine off and repeatedly press the brake pedal at least 10 times.
14. Check the state of the hydraulic oil in the reservoir, and if there is no foaming or change in the level of the oil, the operation of bleeding the air out is considered completed. If any foam remains, let it stand for a while, wait for the foam to dissipate, then repeat the above steps 12 — 13.

Notice:

Precautions when bleeding the air from the brake fluid pressure system

When doing air bleeding of the brake fluid pressure system, such as the master cylinder or wheel cylinder, verify that the air has been bled out of the hydro boost, and make sure that the engine is on.

Be aware that if air bleeding of the brake fluid system is to be done with the engine off, air bleeding cannot be done.

If air bleeding of the brake fluid pressure system is to be done at the same time as air bleeding of the hydro boost, do so when the operation of the above hydro boost air bleeding method 10 has been completed.

Supply Parts Replacement

1. The hydro boost is a precision part that operates with high-pressure hydraulic oil. Never remove any parts from the hydro boost except replacement parts.
   Trouble may occur if a part other than a replacement part is removed and a non-matching part is included or the assembly is bad. For example, misoperation may occur and the brake becomes ineffective, or a bad seal may allow high-temperature hydraulic oil under high pressure to spatter and cause a burn.
2. The hydraulic oil to be used for the hydro boost is ATF DEXRON® III. Using any other hydraulic oil could adversely affect the rubber parts and cause poor operation or oil leakage.
   In particular, the hydraulic oil for the hydro boost is quite different from the brake fluid that is used in the master cylinder.

   Be careful that hydro boost parts do not come into contact with the brake fluid for the master cylinder, and that master cylinder parts do not come into contact with the hydraulic oil for the hydro boost.

   Any mixing together of the hydraulic oil for the hydro boost and the brake fluid for the master cylinder could cause degradation such as the swelling of rubber parts, brake failure due to oil leakage or bad operation, or a serious mishap such as a vehicle fire caused by brake friction.
3. Operation of the pump while the engine is on will cause the hydro boost hydraulic oil to get hot. In particular, frequent repeated operation of the brake will sometimes increase the temperature of the hydraulic oil in the hydro boost assembly to 100°C (212°F) or more. Be careful in handling.
   When performing work such as removing the hydro boost assembly from the vehicle, before starting

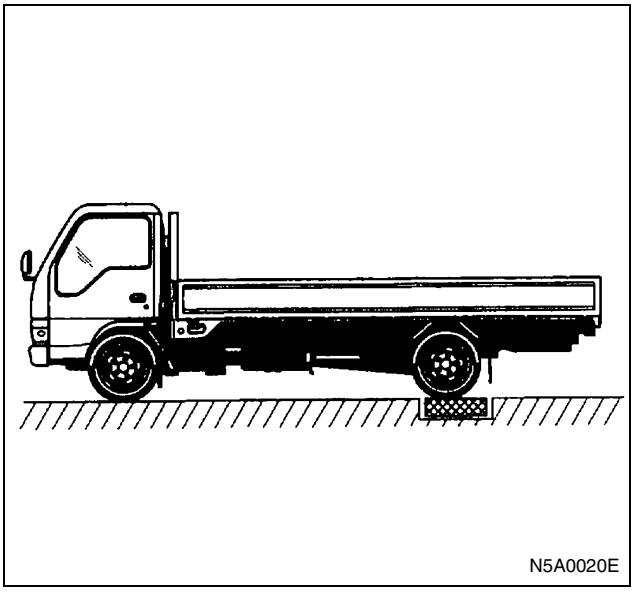
the work, first turn the engine off, wait 30 minutes, and verify that the temperature has cooled off.

4. Even when a long time passes after the engine is turned off, the high-pressure hydraulic oil in the accumulator of the hydro boost remains stored under pressure.
   Before removing the hydro boost assembly or piping, be sure to repeatedly press the brake pedal at least ten times with the engine off, and make sure the pressure of the hydraulic oil in the accumulator has been reduced to atmospheric pressure before doing the work.
   In particular, when removing the replacement-part accumulator from the hydro boost assembly, the hydraulic oil may spatter if it remains stored under high pressure inside the accumulator, so be careful of this.

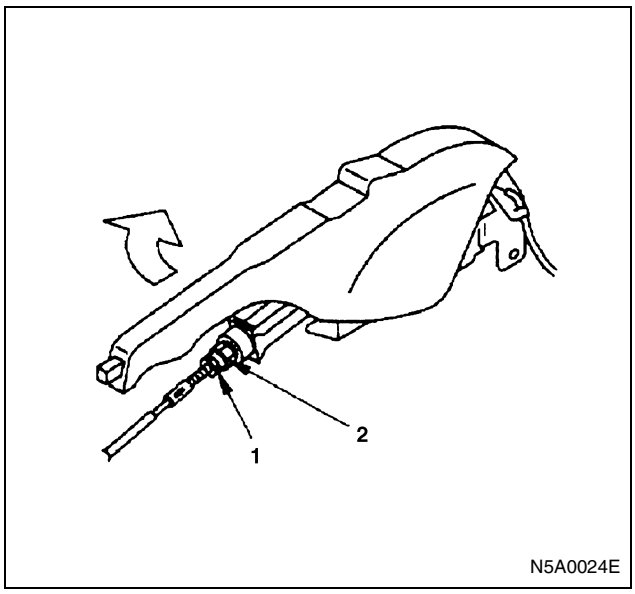
Parking Brake

Parking Brake Adjustment

Before beginning to adjust the parking brake, park the vehicle on a level surface, chock all of the wheels, and place the parking brake lever in the released (off) position.
Then loosen the parking brake control wire lock nut (1), and turn the adjuster (2) to completely loosen the parking brake control wire.



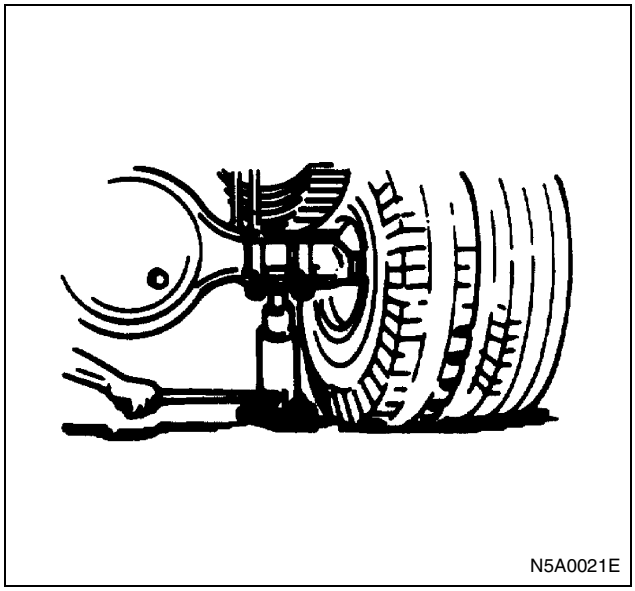
N5A0020E



N5A0024E

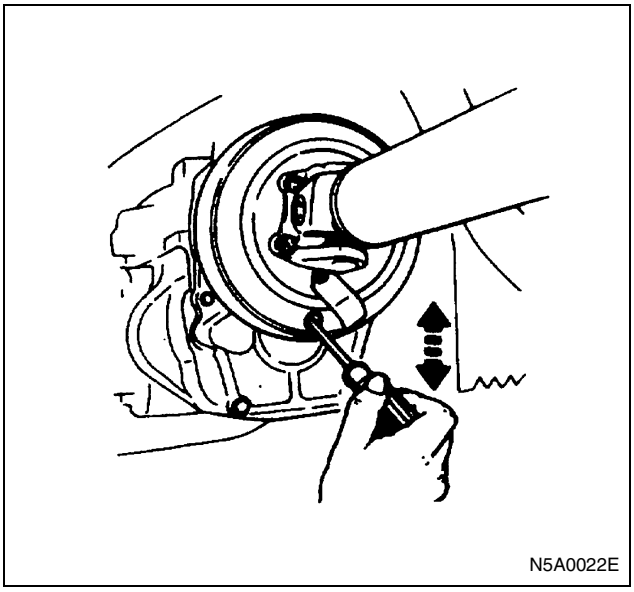
Parking Brake Lining Clearance Adjustment

1. Jack up the rear axle until the wheels can be turned freely.



N5A0021E

2. Remove one of the two check hole covers from the parking brake drum.
3. Rotate the brake drum to align the check hole with the adjusting screw.
4. Move the camshaft lever from side to side several times to center the brake shoes.
5. Insert a screwdriver into the check hole and rotate the adjusting screw by pushing it upward.
   Continue doing this until the brake shoes begin to drag on the drum.



N5A0022E

6. Back off the adjusting screw the specified number of notches.

Adjusting Screw Notches and Clearance		
Brake Type mm (in)	Notches	Clearance mm (in)
178 (7.008), 190 (7.480)	30	0.75 (0.029)

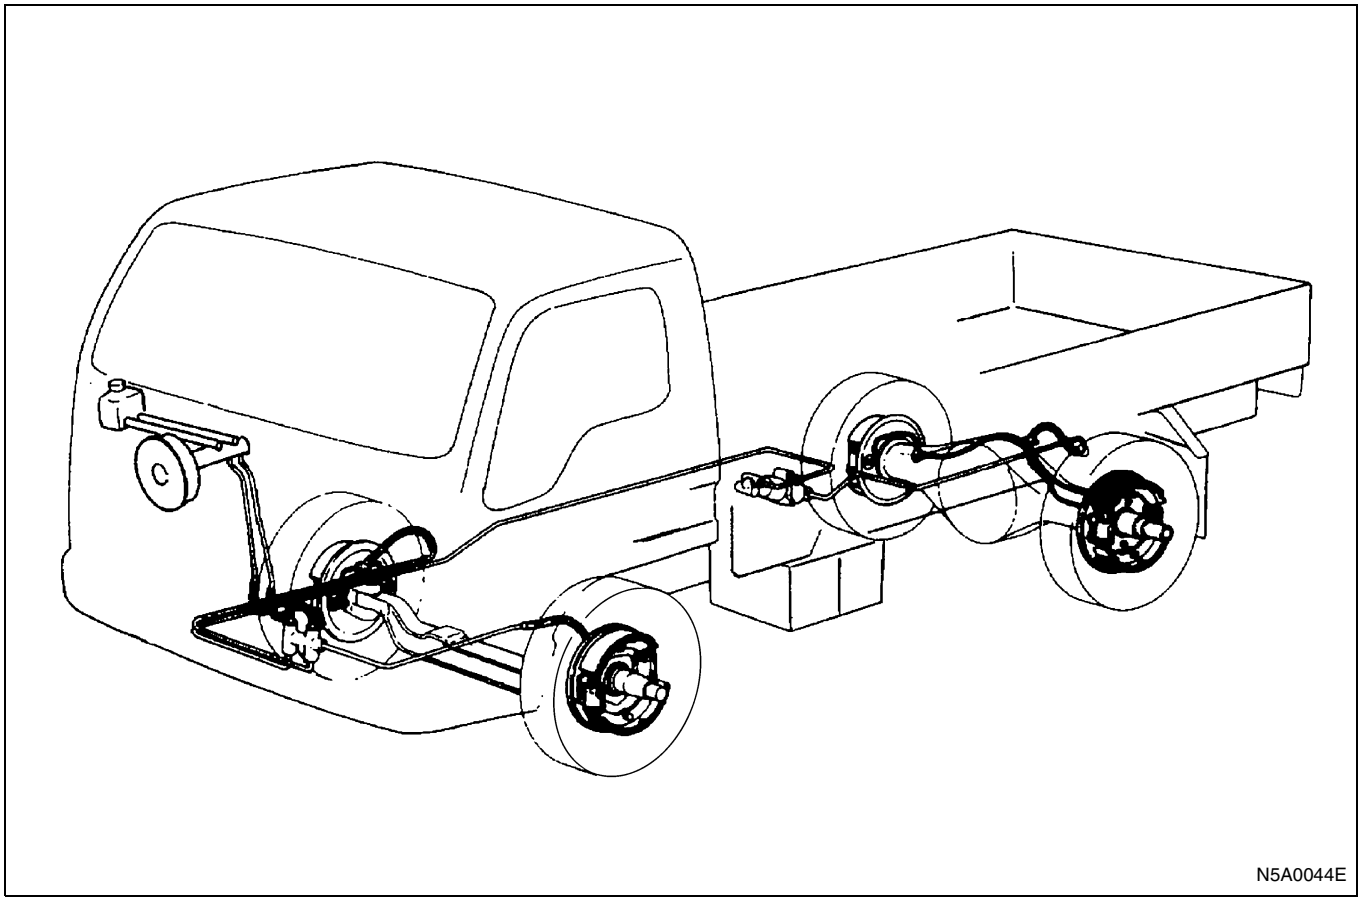
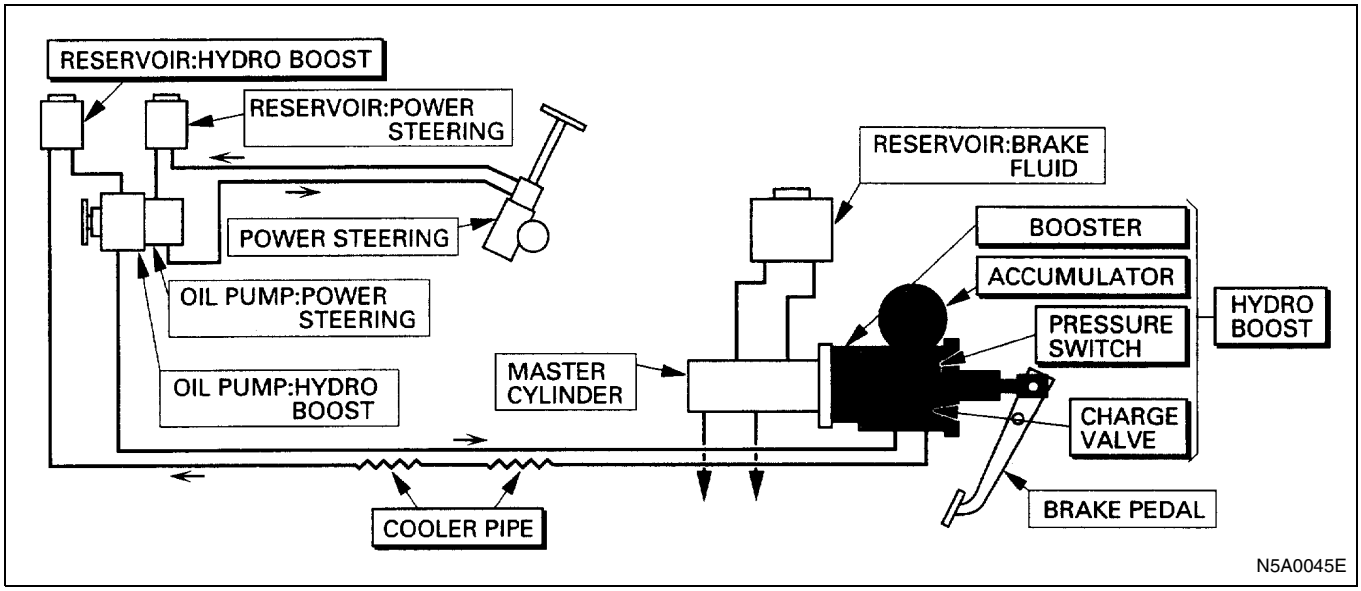
GENERAL DESCRIPTION

Hydraulic Brake System



The brake system has dual hydraulic circuit with vacuum booster (Master-vac).
The master cylinders and the wheel cylinders at the front and rear of the vehicle are connected by steel piping and flexible hoses.
The vacuum booster is connected to the vacuum pump through the vacuum tank. This provides the most effective vacuum assist.

Hydraulic Booster Brake system



The hydro boost system, which functions as a brake force boosting device that allows the brake to be operated with less force than otherwise, includes the hydro boost, which has the booster, accumulator, charge valve, and pressure switch in an integrated structure, a reservoir, and a cooler pipe.

Functions of the Main Constituent Parts

Booster:
Controls the hydraulic oil ejected from the oil pump and amplifies the force on the pedal.
Accumulator:
Accumulates the hydraulic oil under pressure for the boosting operation after the pump stops.
Charge valve:
Performs switching operation and feeds the hydraulic oil to the accumulator when the accumulator oil pressure declines.
Pressure switch:
Detects that the accumulator oil pressure has declined to the warning set pressure and operates the warning buzzer.
Oil pump:
Is driven by the engine rotation and feeds the hydraulic oil to the hydro boost through the piping.
Reservoir:
The pump stores the hydraulic oil for doing suction and expulsion.
Cooler pipe:
Located before the radiator, facilitates heat radiation of the hydraulic oil in the system piping, and inhibits an increase in the temperature of the oil.

Other units relating to this system include, as shown in the figure, the power steering, the pump and reservoir for the power steering, the master cylinder, which receives the output of the hydro boost and activates the brake, the reservoir for the master cylinder, and the brake pedal that activates the booster.
The master cylinder is integrally bolted to the booster of the hydro boost. The pump for the power steering is integrated as a tandem pump that shares the hydro boost pump and the drive unit. But as systems, the hydro boost and the power steering are independent of each other, and their reservoirs are separate as well.

Booster Assembly

The hydraulic booster is a device that applies force to the master cylinder when the brake pedal is applied. The fluid flowing through the booster head is controlled by brake pedal movement.
The hydraulic booster cylinder rod attaches to a piston that connects with the spool valve. This assembly moves when brake pedal pressure is applied. The spool valve restricts fluid flow and builds pressure on one side of the piston. The pressure overcomes the return spring and moves the piston to a balanced position. As the piston moves, it pushes the cylinder rod and applies pressure to the master cylinder.
A relief valve inside the pump limits the pressure to 11,770 kPa (120 kg/cm^2 / 1707 psi). This pressure level provides good braking without damaging the brake pipes or hoses. When actuated, the relief valve allows fluid to bypass the piston.

Fluid and Fluid Handling

This system uses no special fluids. However, care must be taken to use the correct fluids. The master cylinder and brake system uses brake fluid, while the hydraulic brake booster pump uses power steering fluid.

Substandard or Contaminated Fluid

Notice:
Hydraulic brake systems use two distinct and incompatible fluids. Power steering fluid is used in the hydraulic booster brake system. Brake fluid is used in the master cylinder and brake pipes to the wheels. Be extremely careful when selecting brake system fluids or seal damage can result. Refer to Section 0B MAINTENANCE AND LUBRICATION to select the correct fluid.

Notice:
Do not reuse brake system fluids. Do not mix power steering fluid with brake fluid. Swelling and deterioration of rubber parts can result from fluid contamination. This can lead to reduced brake performance and the eventual loss of braking capability.

Contaminated fluid causes swelling and deterioration of rubber parts that can lead to reduced brake performance and the eventual loss of braking capability. Check the condition of the fluid at regular intervals and note any unusual consistency, color, and signs of contaminants in the fluid. Do not reuse brake system fluids. Always discard used fluids. Do not mix power steering fluid with hydraulic brake fluid. If contamination occurs, flush the hydraulic booster system with clean power steering fluid.
Booster components bench servicing should be done in a clean work area separated from the brake servicing area. Wash hands before changing between brake or booster work areas. Do not use the same containers for fluids.

Flushing the Hydraulic Booster System

Flushing is required when dirt, sludge, or water is found in the system. Flushing involves running clean fluid through the system until the draining fluid appears the same as clean fluid.
Contaminated fluid in the booster system can cause rubber parts to deteriorate.
The hydraulic booster system should be cleaned and flushed when the hydraulic pump is replaced.
Metal shavings from a worn hydraulic pump often contaminate the system. Pipes and hoses should be removed and blown clean of all metal shavings.

The dual two leading shoe type brake eliminates the problem of weaker braking force on reverse stops common to two leading shoe type brakes while maintaining the many advantages of this type of brake.
This combination of two leading shoes provides nearly equal braking force. This prevents an uneven load distribution on the wheel hub bearings.
This type of brakes is widely used on the rear wheels of many vehicles.

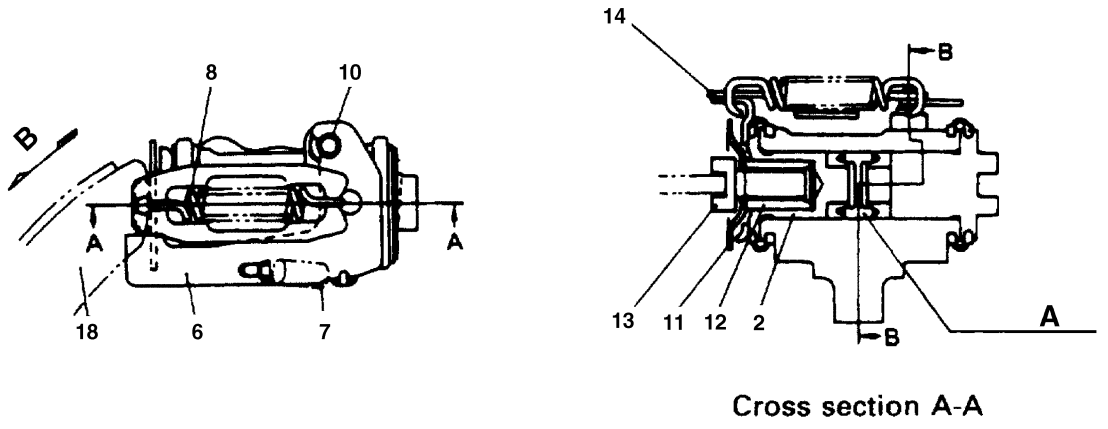
Operation of Auto-adjuster



Legend

A. Oil chamber

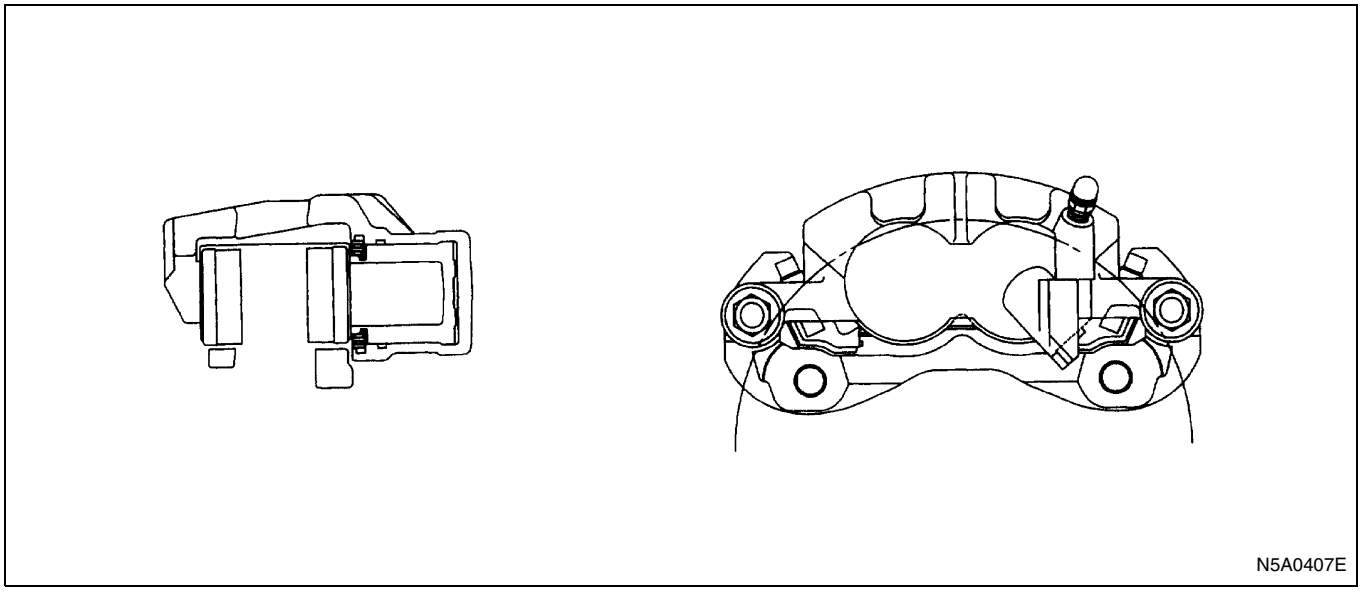
B. Rotational direction of the drum (forward)

The entire auto-adjust mechanism is incorporated into the wheel cylinder assembly, and the adjust operation is carried out only when in the forward movement.
The operation of the auto-adjuster is as follows:

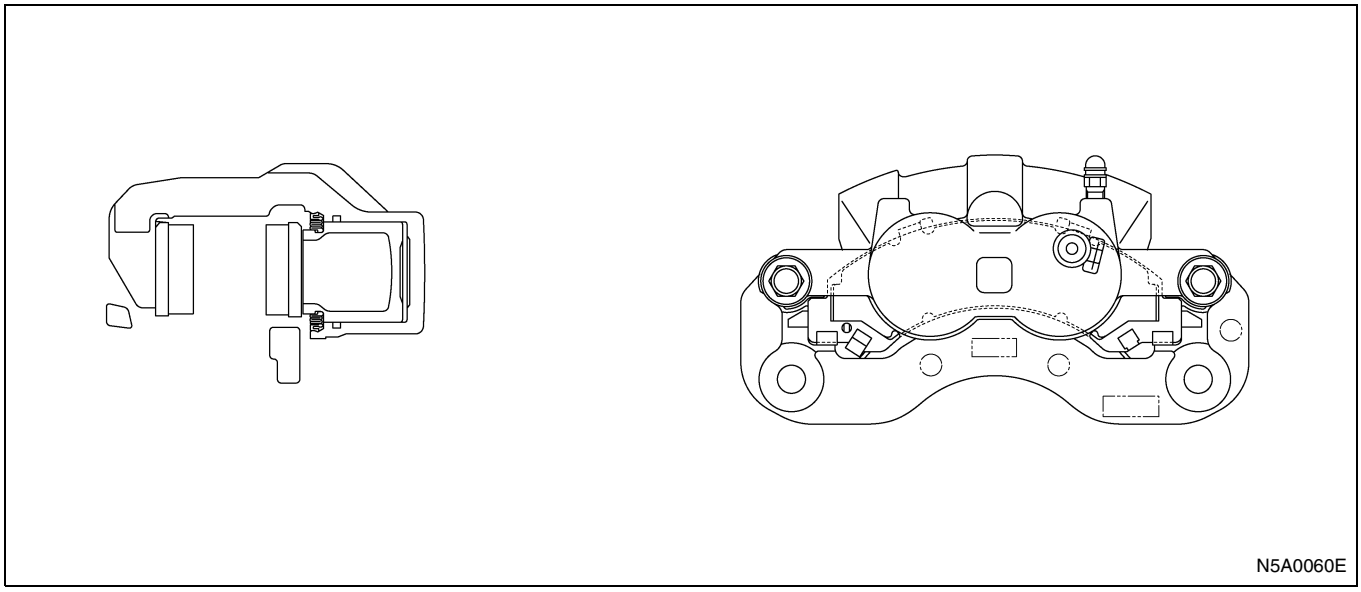
- When fluid pressure is applied to the oil chamber (A), the piston, which is resistant to the over-travel spring installed between the bracket (14) and the adjust lever (6), is forced out to the brake shoe (18) side. (The piston and bracket are welded into a monolithic construction.)
- When force delivered by the over-travel spring (18) is intensified as the piston (2) moves, the balance maintained with the lever return spring (7) installed between the adjust lever (6) and lever pin (10) is destroyed, and the adjust lever (6) with the lever pin (10) as a pivot, rotates the adjust gear (11) in the rotational direction.
- When the shoe clearance (clearance between the brake shoe and the brake drum) gets to the specified value, the adjust lever (6) adjusts the shoe clearance by driving one gear tooth or more of the adjust gear (11) in the rotational direction through the force of the over-travel spring (8).
- When the brake shoe (18) comes into contact with the brake drum, the frictional force generated between the adjust screw (13) and the adjust nut (12) gets larger, and the adjust gear (11) cannot be rotated by the force of the over-travel spring (8). (The adjust gear and the adjust nut are welded into a monolithic construction.) That is, the automatic adjustment of the shoe clearance is carried out until the brake shoe comes in touch with brake drum. However, over adjust can be avoided since this automatic adjustment will not be performed for the increased amount of the piston shift caused by the deformation of the drum and shoe after their contact.
- When the fluid pressure is released from the oil chamber (A), the force by which the lever return spring (7) rotates the adjust gear (6) adversely gets weaker than the frictional force generated between the adjust screw (13) and the adjust nut (12),therefore, the adjust lever (6) slides on the adjust gear (11) to get back to its former state before operation and this operation is completed with the adjust gear (11) left in the state in the rotational direction into which its has been driven.

Front Disc Brake

Independent Suspension Models



Leaf Spring Suspension Models (Rigid Axle Type)



The disc brake assembly consists of a caliper, piston, disc, pad assembly and support bracket.
The caliper assembly has two bores and is mounted to the support bracket with 2 mounting bolts. The support bracket allows the caliper to move laterally against the disc. The caliper is a one-piece casting with the inboard side containing the piston bore. A square cut rubber seal is located in a groove in the piston bore which provides the hydraulic seal between the piston and the cylinder wall.

Load Sensing Proportioning Valve (LSPV)

7. Support assembly
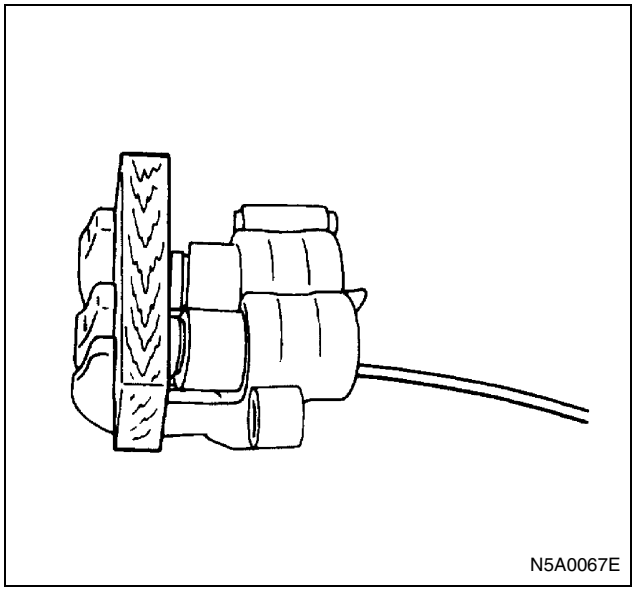
   - Remove the hub and disc before removing the support assembly.
8. Wind guide
   - Remove the hub and disc before removing the wind guide.
9. Adapter

Disassembly

1. Place a piece of wood across the body assembly to prevent piston damage.
2. Apply approximately 196 kPa (2.0 kg/cm^2 / 28.4 psi) of compressed air to the body assembly oil port to remove the pistons.

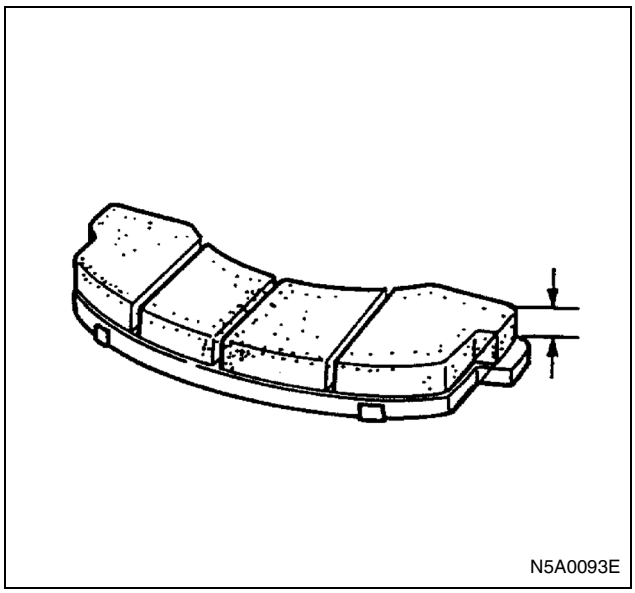


Inspection

1. All parts for wear distortion or other conditions and replace as needed.
2. Inner and outer pads.
   - Use a vernier caliper to measure the inner pad and outer pad thickness.

Pad Thickness	mm (in)
Standard	Limit
13 (0.51)	1 (0.04)

   - If the measured value is less than the specified limit, the pads must be replaced with the repair pad kit.

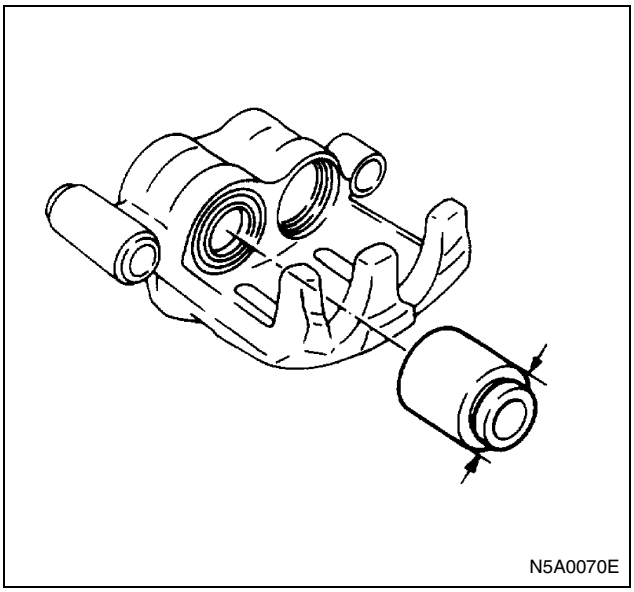


3. Piston and Cylinder Clearance.
   - Use a micrometer to measure the piston diameter.
   - Use an inside dial indicator to measure the cylinder bore.

- Calculate the piston and cylinder bore clearance.

Piston and cylinder bore clearance mm (in)	
Standard	Limit
0.08 — 0.18 (0.003 — 0.007)	0.23 (0.009)

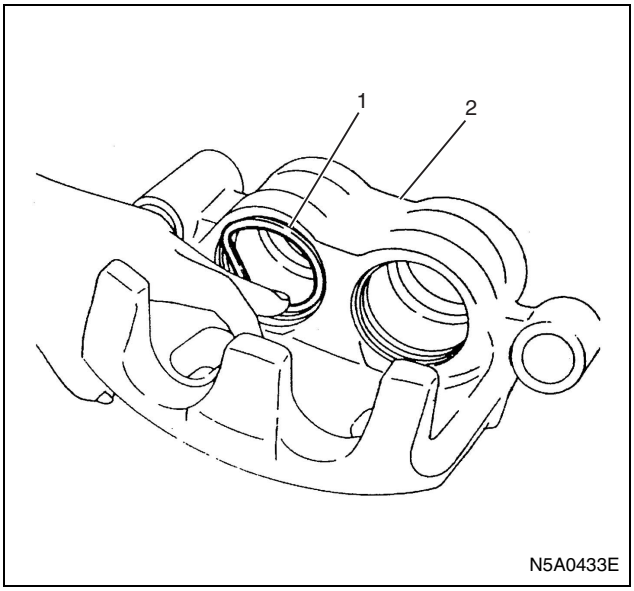
- If the clearance exceeds the specified limit, the piston and/or the body assembly must be replaced along with the repair seal kit.



N5A0070E

Reassembly

1. Piston Seal
   - Be sure to use a new seal ring.
   - Apply rubber grease to the piston seal. The rubber grease is included in the seal kit.
   - Install the piston seal to the cylinder bore groove.



N5A0433E

Legend
1. Piston Seal
2. Body Assembly

2. Piston and Piston Boot
   - Apply brake oil to the piston outer circumference.
   - Use a hand vise to install the pistons to the cylinder.
   - Apply special grease to the piston.
     This will prevent cylinder and piston corrosion.
   - Use a new piston boot.
     Do not confuse the front and rear sides of the boot.
     Carefully press the insert portion of the boot into the cylinder body groove. Be sure that the insertion depth is uniform.
   - Install the piston boot inner lip to the piston groove.
     Handle the piston boot carefully.

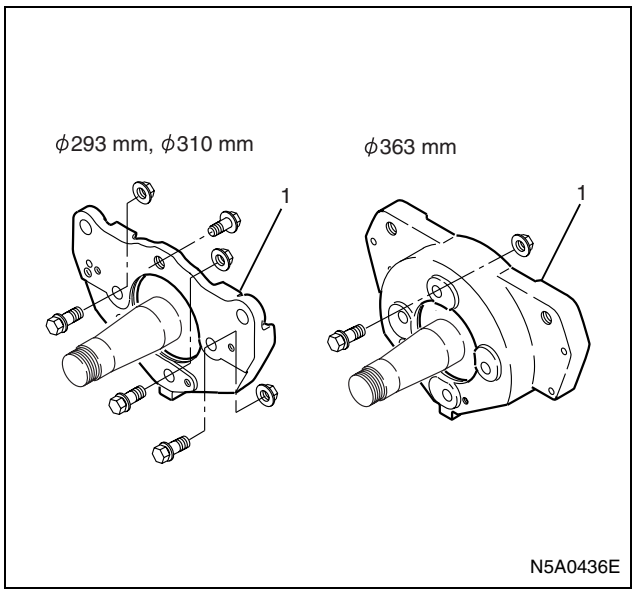
4. Boot Insert Portion

Installation

1. Adapter
   - Install the adapter to the knuckle.
   - Tighten the fixing bolts and nuts to the specified torque.

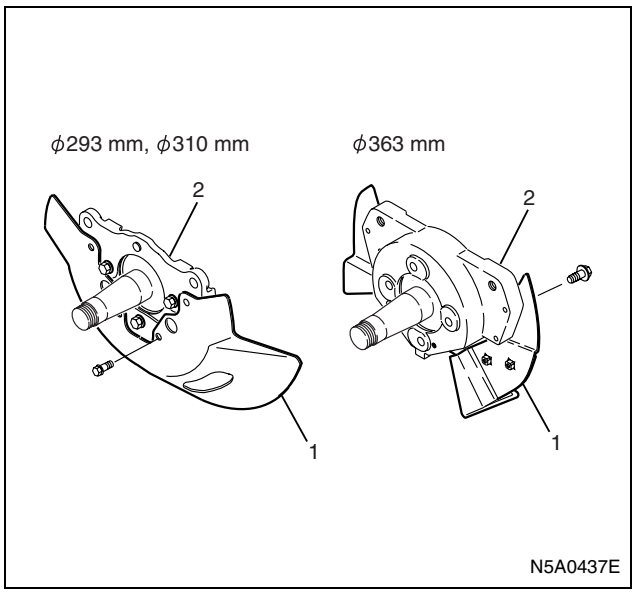
Tighten:
Fixing bolts and nuts to 162 N·m (16.5 kg·m / 119 lb·ft).



Legend
1. Adapter

2. Wind Guide
   - Tighten the fixing bolts to the specified torque.

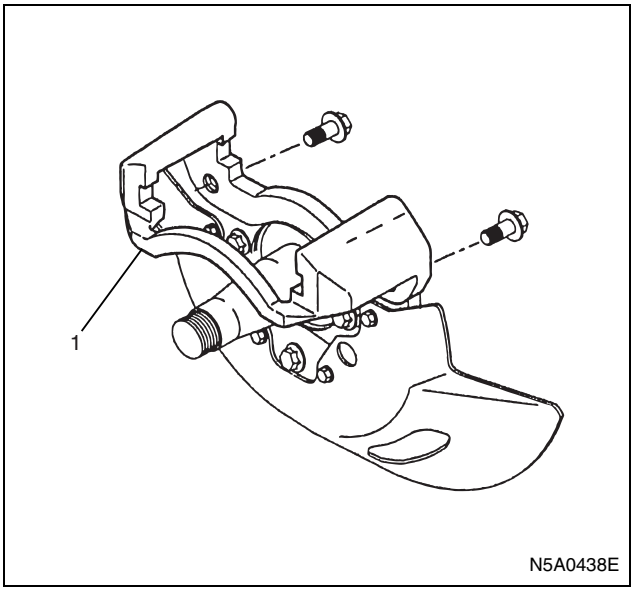
Tighten:
Fixing bolts to 13 N·m (1.3 kg·m / 113 lb·in).



Legend
1. Wind Guide
2. Adapter

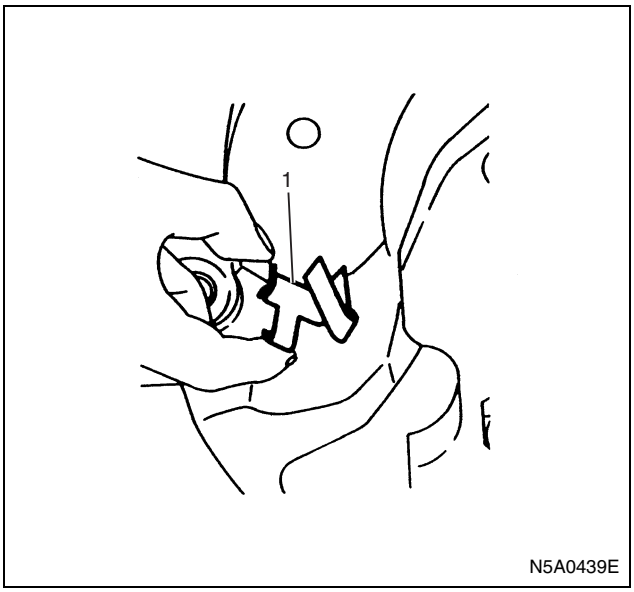
3. Support Assembly
   - Tighten the fixing bolts to the specified torque.

Tighten:
Fixing nuts to 221 N·m (22.5 kg·m / 163 lb·ft).



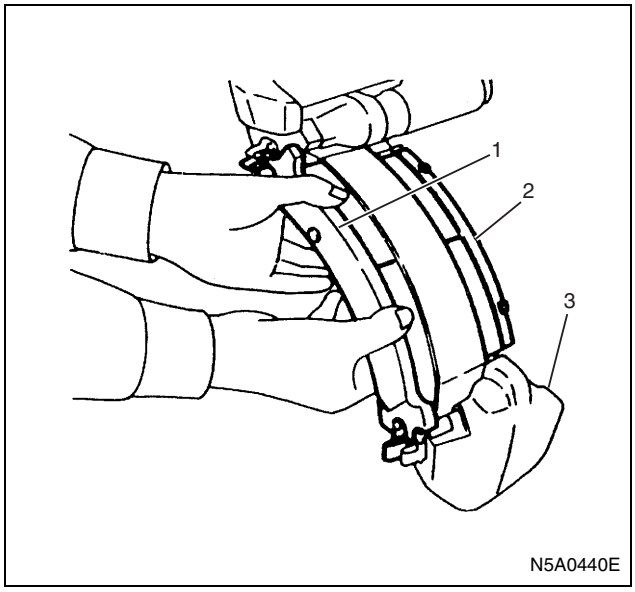
Legend
1. Support Assembly

4. Pad Clips
   - Be sure that the clips are completely installed to the support assembly.



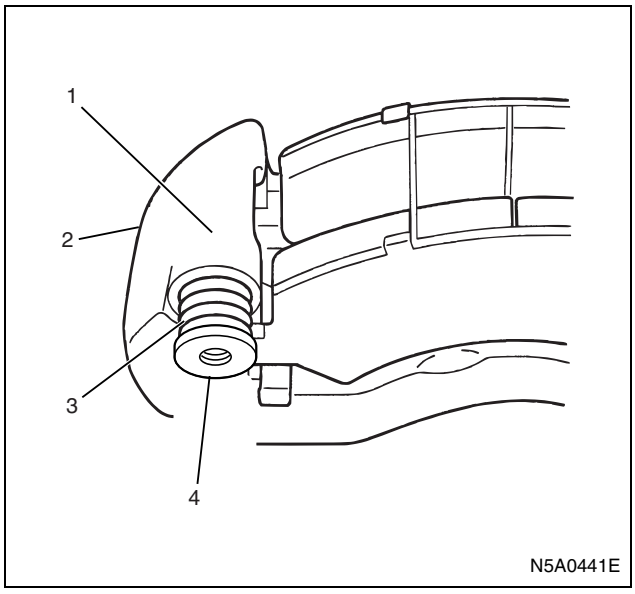
Legend
1. Pad Clip

5. Pads
   - Install the inner pad and the outer pad to the support assembly.



Legend
1. Outer Pad (WEAR INDICATOR....ø310 / ø363)
2. Inner Pad (WEAR INDICATOR....ø293)
3. Support Assembly

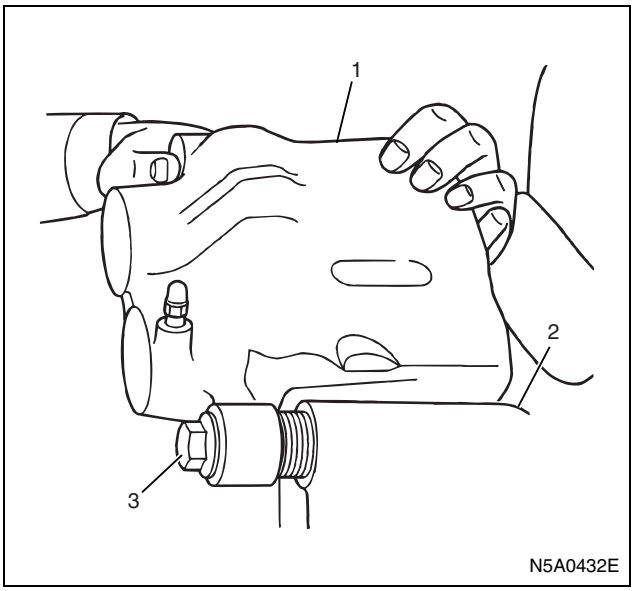
6. Pin Boot
   - Under normal conditions, there is no need to remove the pin boot.
   - Apply approximately 1g (0.035 oz) of special grease to the pin boot bore and pin boss bore of support.
     This will prevent pin corrosion.
     The special grease is included in the seal kit.
   - Install the pin boot to the support assembly.
   - Check that the pin boot is securely inserted to the groove.



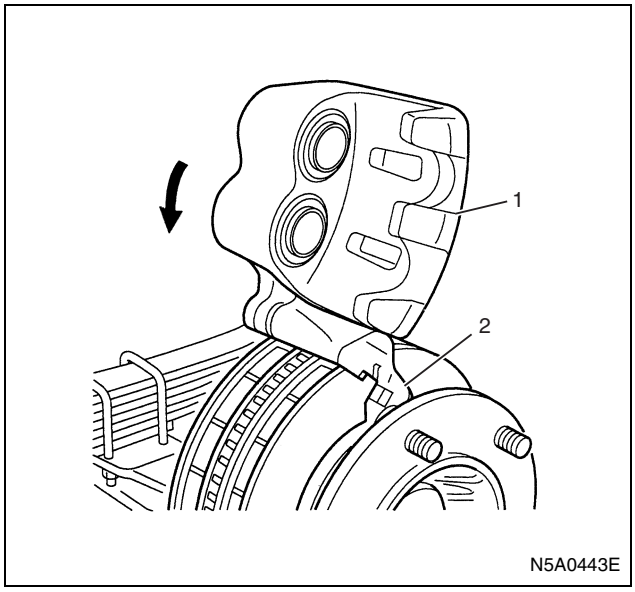
Legend
1. Pin Boss of Support
2. Support Assembly
3. Pin Boot
4. Pin

7. Caliper Assembly and Bolt (Lock pin side)
   - Install the caliper assembly to the support assembly guide pin from the inside.
   - Return the caliper assembly to its original position.
   - Tighten the bolt (lock pin side) to the specified torque.

Tighten:
Bolt (Lock pin side) to 125 N·m (12.7 kg·m / 92 lb·ft).



Legend
1. Caliper Assembly
2. Support Assembly
3. Pin Bolt



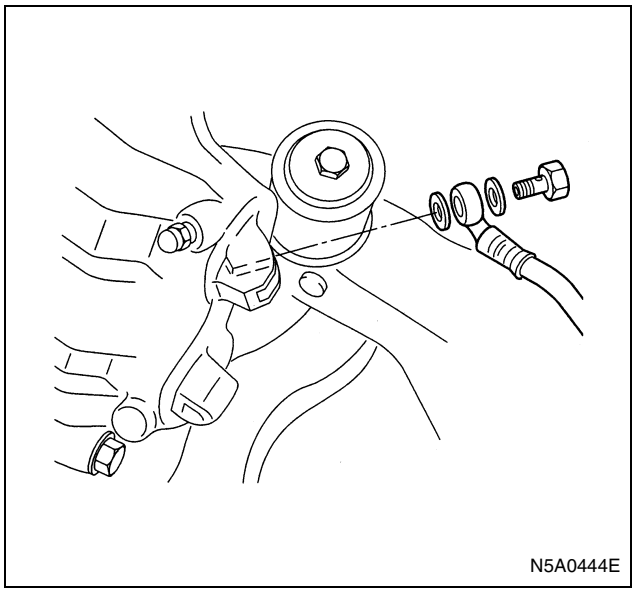
Legend
1. Caliper Assembly
2. Support Assembly

8. Flexible Hose
   - Tighten the flexible hose bolt to the specified torque.

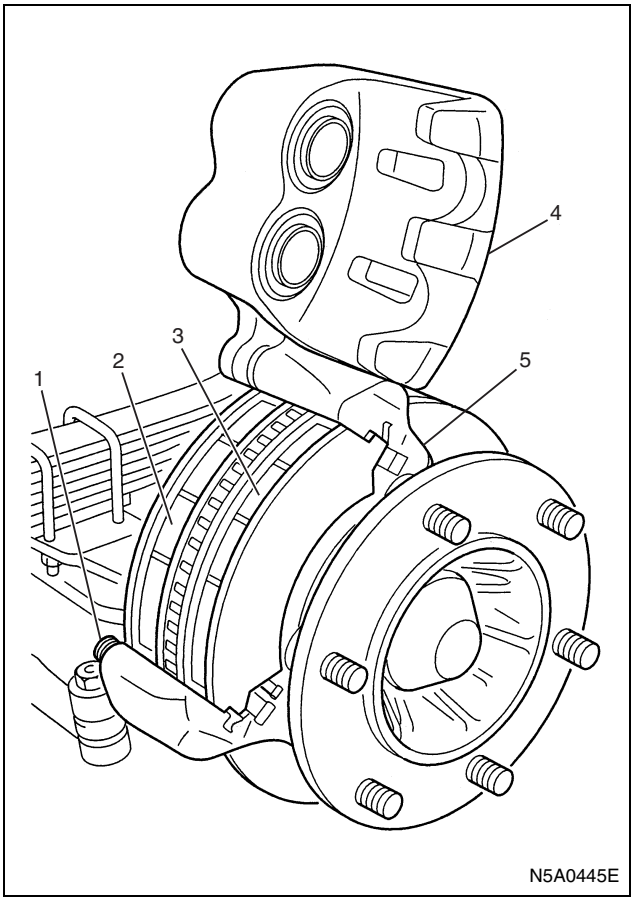
Tighten:
Hose bolt to 34 N·m (3.5 kg·m / 25 lb·ft).

Air Bleeding

Refer to “Brake Bleeding” in Section 00 of section.



Front Disc Brake Pad



Legend

1. Lock Pin
2. Inner Pad
3. Outer Pad
4. Caliper Assembly
5. Support Assembly

Removal

Notice:

- Block vehicle wheels and apply the parking brake.
- Rise the axle to clear the tire from the ground.

  Position jack stands under vehicle.
- Remove the wheel.

1. Loosen and remove the lock pin bolt from the lower side of the caliper.
2. Turn the caliper assembly up and wire it to the frame firmly so that the hose is not stretched.

Notice:

- Do not disconnect the brake hose.

3. Remove the pad assembly with clips.
4. Conduct disc wear check, and resurface or replace it as required.
5. When removing brake disc, slide caliper assembly inside of the vehicle, and take out brake disc from support assembly.

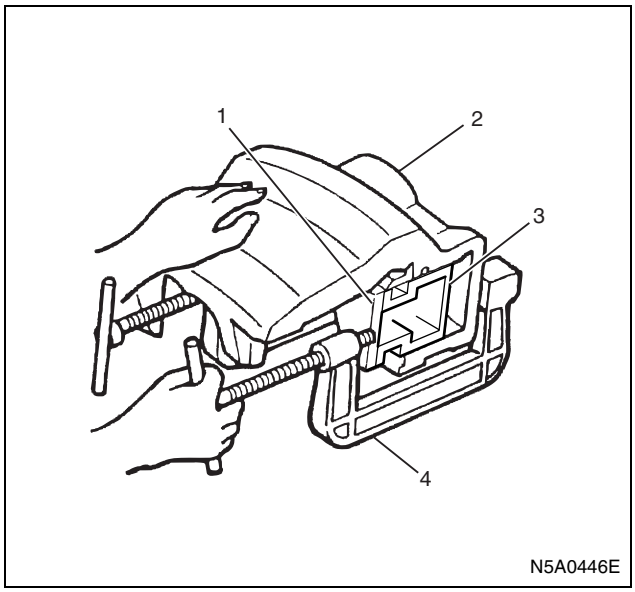
   Take care not to wipe the special grease from guide pin, and prevent from sticking dust or any foreign material to guide pin.
6. Refer to Section 4C FRONT AXLE and Section 3C FRONT SUSPENSION for disc wear check and replacement procedures.

Installation

1. Keep the rotor face away from the brake oil or grease.
2. Use a hand vise to push the piston backward until it reaches the cylinder bottom, as the piston was pushed forward by the distance where the pad worn.

Notice:

- When using a hand vise, push the piston at its center.



Legend

1. Steel Plate
2. Caliper Assembly
3. Piston
4. Hand Vise

3. Remove hand vise and install the new pads along with new clips.

Notice:

- Be careful not to assemble the inner and outer pad reversely.

4. Install the bolt (Lock pin side) into the lock pin by turning the caliper carefully so that the piston boot and pin boot may not be wedged.
   After assembling the caliper assembly, make sure that the piston boot and pin boot fitted correctly, and not damaged.

10. Piston
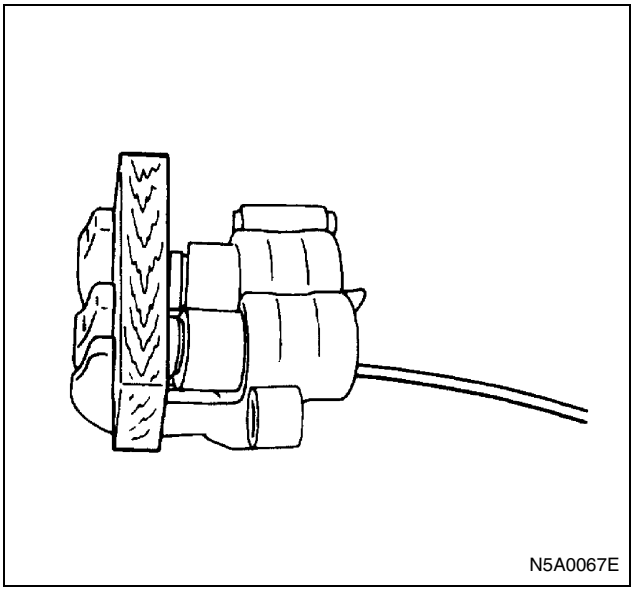
    1) Place a piece of wood across the body assembly to prevent piston damage.
    2) Apply approximately 196 kPa (2 kg/cm^2 / 28.4 psi) of compressed air to the body assembly oil port to remove the pistons.



11. Piston Seal

Inspection and Repair

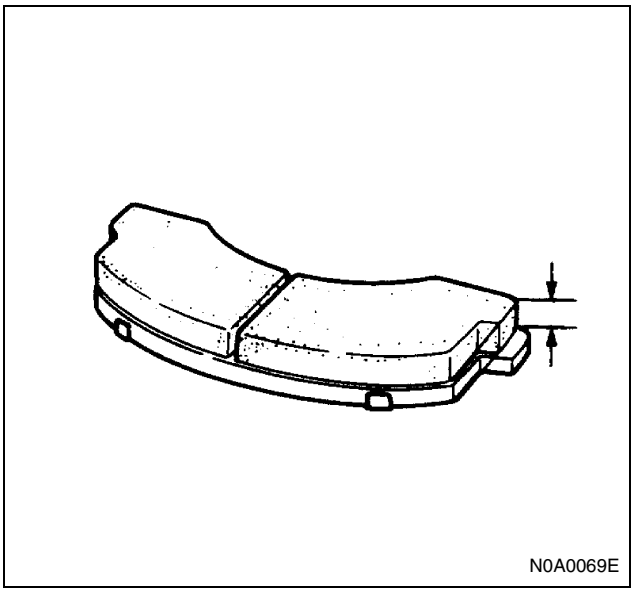
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Pad

Use a vernier caliper to measure the pad thickness.

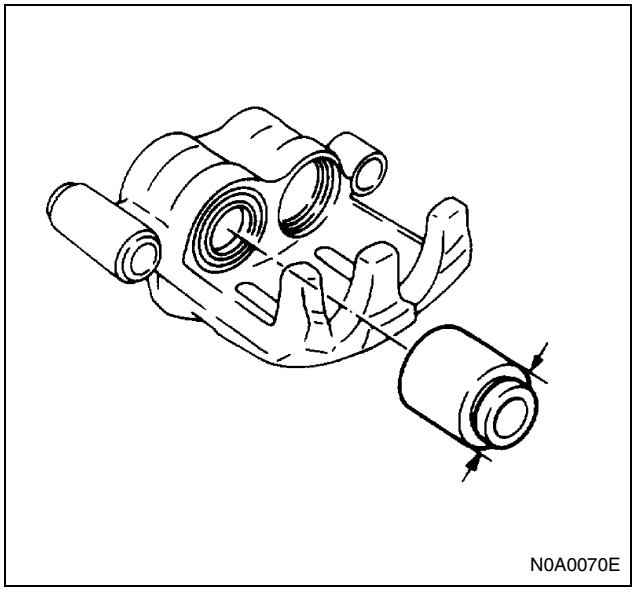
Pad Thickness	mm (in)
Standard	Limit
14 (0.551)	1 (0.039)

If the measured value is less than the specified limit, the pads must be replaced with the repair pad kit.



Piston and Cylinder Clearance

1. Use a micrometer to measure the piston diameter.



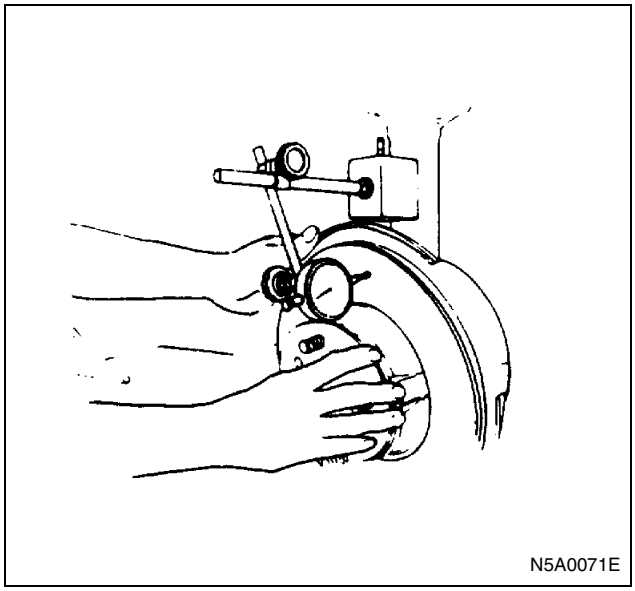
2. Use an inside dial indicator to measure the cylinder bore.
3. Calculate the piston and cylinder clearance.

Piston and cylinder Clearance	mm (in)
Standard	Limit
0.08 — 0.18 (0.0031 — 0.0071)	0.23 (0.0091)

If the clearance exceeds the specified limit, the piston and/or the body assembly must be replaced along with the repair seal kit.

Lateral Runout

1. Adjust the wheel bearing correctly.
   Refer to Section 4C FRONT AXLE.
2. Attach a dial indicator to some portion of the suspension so that the stem contacts the disc face about 29 mm (1.14 in) from the disc edge.



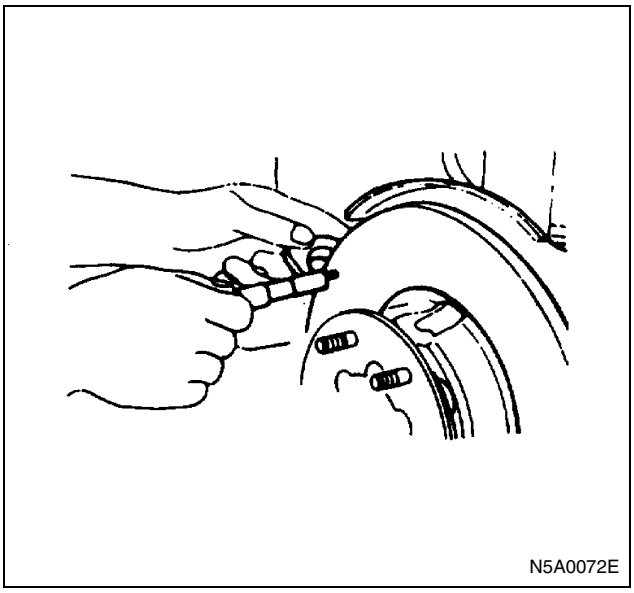
3. Move the disc one complete rotation.
   The lateral runout should not exceed 0.13 mm (0.005 in).

Maximum runout mm (in)	0.13 (0.005)

Parallelism and thickness
Parallelism is the measurement of the thickness of the disc at four or more points around the circumference of the disc. All measurement must be made at 29 mm (1.14 in) from the edge of the disc.
The disc thickness must not vary more than 0.010 mm (0.0004 in) from the point to point.

Maximum parallelism mm (in)	0.02 (0.0008)

Disc Thickness	mm (in)
Standard	Limit
35.0 (1.378)	32.0 (1.260)



N5A0072E

Installation

1. Piston Seal
   1) Apply rubber grease to the piston seal.
      The rubber grease is included in the seal kit.
   2) Install the piston seal to the cylinder bore groove.

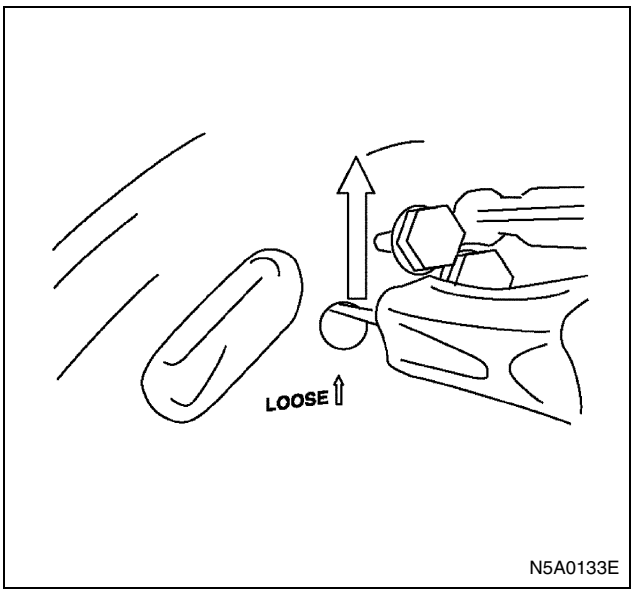
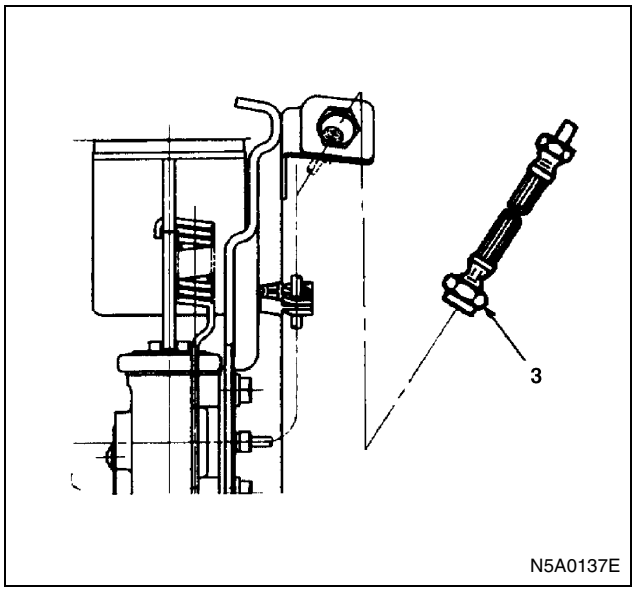
5. Turn the adjuster gear to the marked arrow “LOOSE” on the backing plate.



6. Shoe Holding Spring, Cup and Pin
7. Brake Shoe and Return Spring
8. Brake flexible Hose and Pipe
   1) Place a tray beneath the flexible hose to receive the brake fluid.
   2) Loosen the union nut (1).

   3) Remove the clip (2) and loosen the hose end (3) from the pipe to remove the flexible hose.

Notice:
Take care not to twist the piping and the flexible hose.



9. Wheel Cylinder Assembly
10. Back Plate and Oil Shield Cover
    Store all of the removed parts in a clean part tray.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

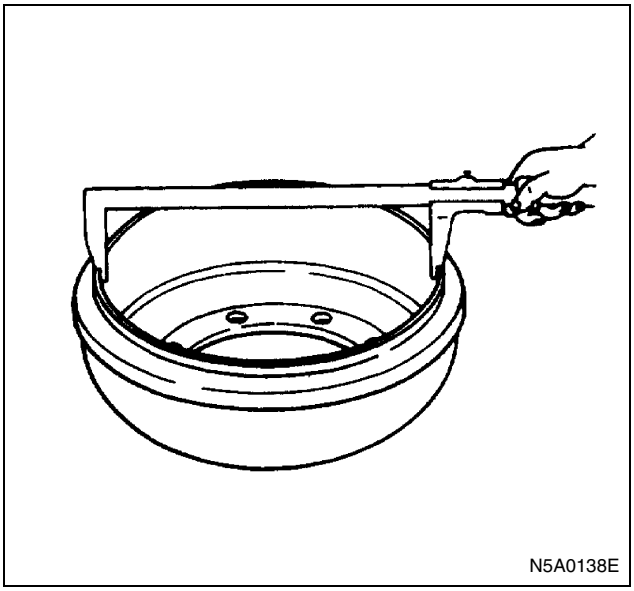
Brake Drum Inside Diameter

Visually inspect the brake drum for excessive wear and scoring.

If the brake drum is scored or worn, lathed to the specified limit.

Use a vernier caliper to measure the brake drum inside diameter.

Brake Drum Inside Diameter		mm (in)
Drum size	Standard	Limit
279.4 300.0 320.0	279.4 (11.00) 300.0 (11.81) 320.0 (12.60)	281.0 (11.06) 301.5 (11.87) 321.5 (12.66)
Out of round: • Limit: 0.13 mm (0.005 in)		



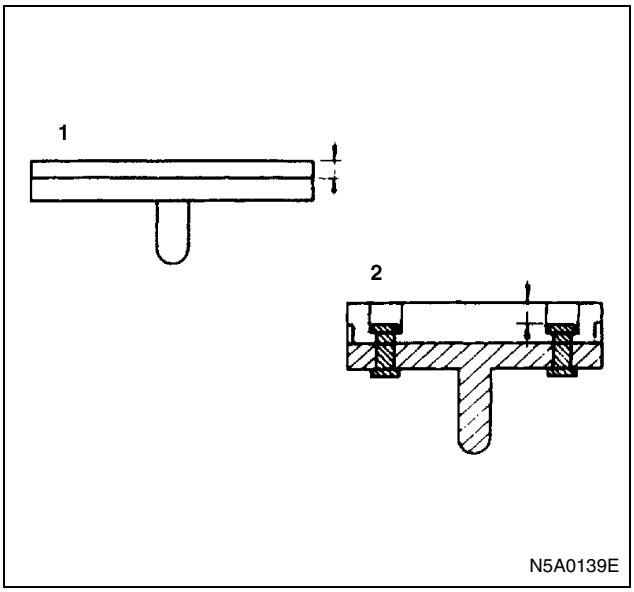
N5A0138E

Brake Lining Thickness Measurement

Use a vernier caliper to measure the brake lining thickness or the rivet depth.

If the measured value is less than the specified limit, the brake shoe assembly and/or the lining must be replaced.

Brake Lining Thickness or Rivet Depth	mm (in)
Limit	1.0 (0.039)



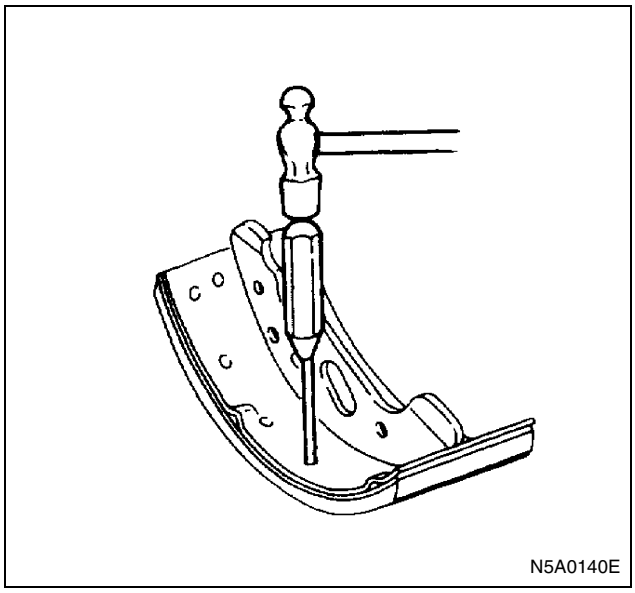
N5A0139E

Legend

1. Adhesion type
2. Riveted type

Brake Lining Removal (Riveted Type Only)

1. Remove the rivet caulking portions with a hammer and chisel.
2. Remove the rivets with a hammer and punch.

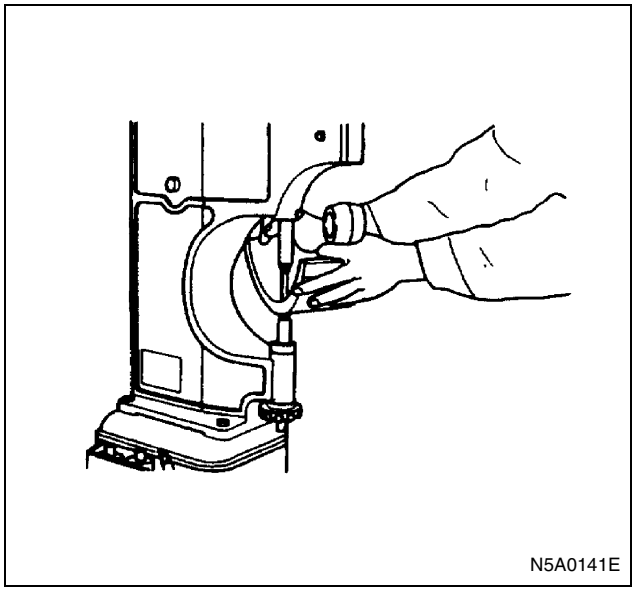


N5A0140E

3. Inspect the brake shoe for cracking.

Brake Lining Installation (Riveted Type Only)

1. Install the brake lining the rivets to the brake shoe.
2. Place the brake shoe assembly in the air hydraulic riveter.
3. Use the air hydraulic riveter to set and caulk each of the rivets.



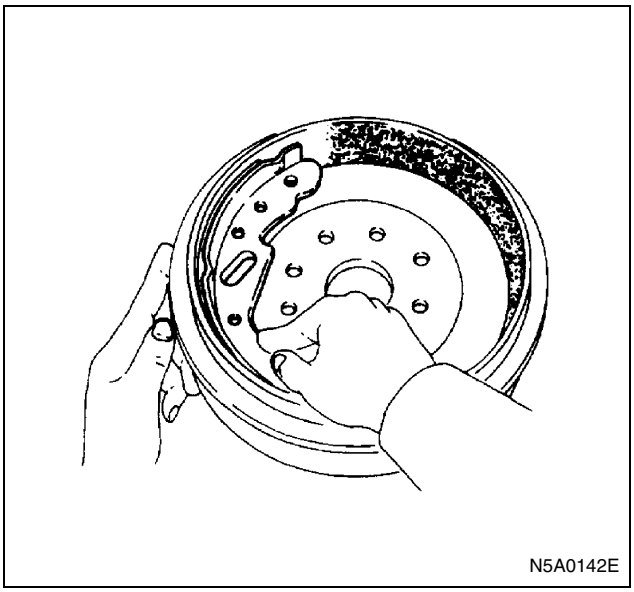
N5A0141E

4. Start riveting at the center of lining and work towards the ends.

Brake Lining and Drum Contact

1. Apply chalk powder to the entire inside brake drum surface.

2. Place the brake shoe assembly in the inside brake drum.
3. Move the brake shoe assembly around the inside brake drum.
   Check for uniform contact between the brake lining and the brake drum.



N5A0142E

4. Correct any areas having poor contact with sandpaper.
5. Repeat Steps 1 through 4 until the contact between the brake lining and the brake drum is perfect.

Installation

1. Back Plate and Oil Shield cover
   Tighten the back plate and oil shield cover bolts to the specified torque.

Tighten:
Back plate and oil shield cover bolts to

NPS model: 98 N·m (10.0 kg·m / 72 lb·ft)

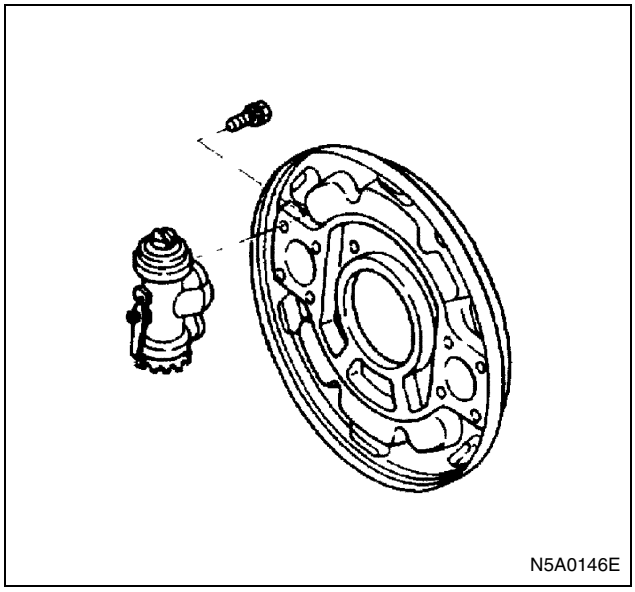
320.0 (12.60)	100 (3.94)	74 (7.5/54)
320.0 (12.60)	120 (4.72)	94 (9.6/69)

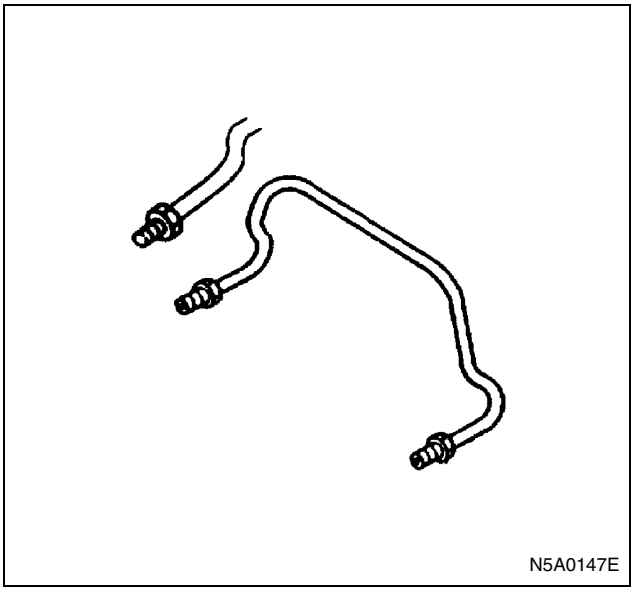


N5A0146E

3. Brake Flexible Hose and Pipe
   Tighten the brake pipe flare nuts to the specified torque.

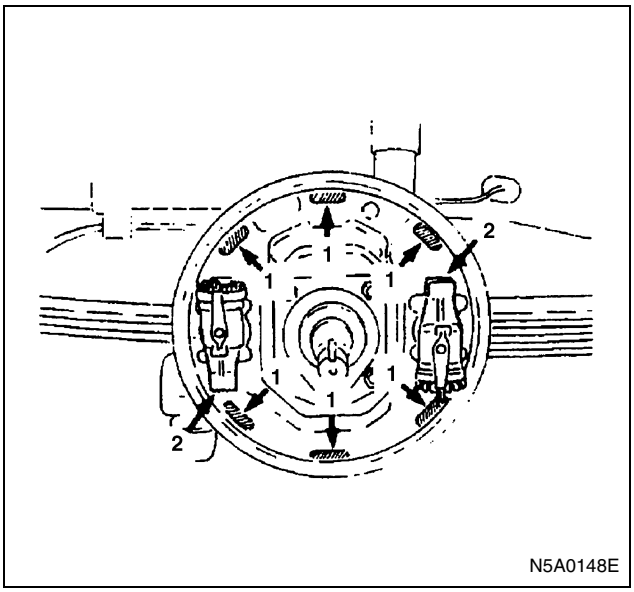
Tighten:
Brake pipe flare nuts to 16 N·m (1.6 kg·m / 12 lb·ft)

Notice:
Take care not to twist the piping and the flexible hose.



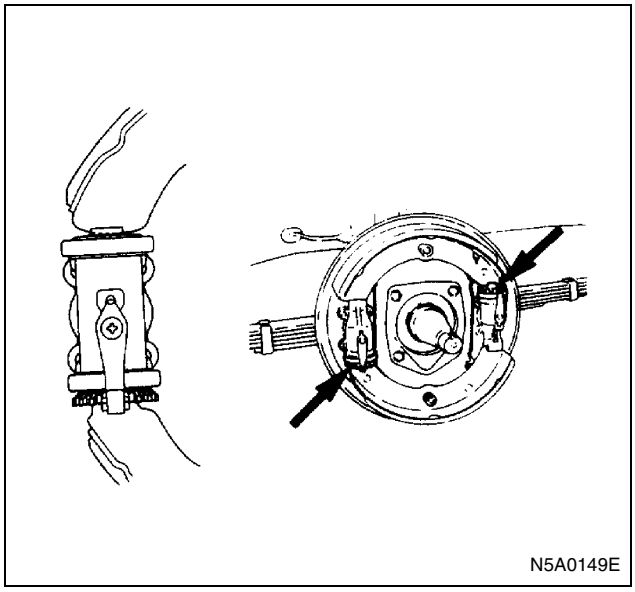
N5A0147E

4. Brake Shoe and Return Spring (Two Leading Type)
   1) Before setting the brake shoes, apply a thin coat of molybdenum disulfide grease to the back plate portions (1) contacting the brake shoe edge as shown in the illustrations.
   2) Apply a coat of molybdenum disulfide grease to the wheel cylinder parts contacting the shoe (2).



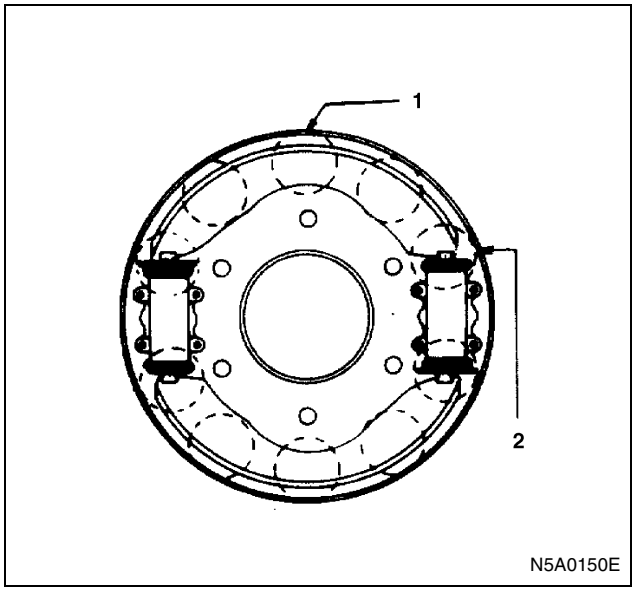
N5A0148E

   3) Set the brake shoe assembly to the cylinder adjusting screw at the brake shoe small angle end.
      Do not install it at the round end to the adjusting screw.



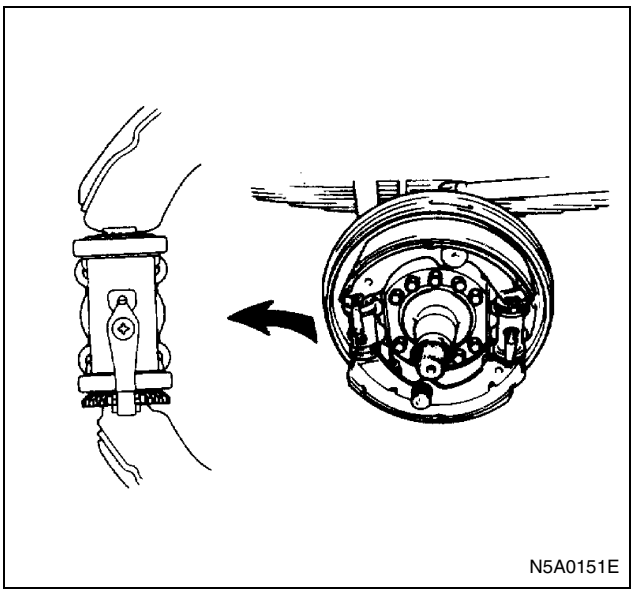
N5A0149E

   4) Install the brake shoes and the return springs to the wheel cylinders.
      Keep the lining surface clean.
5. Brake Shoe and Return Spring (Dual Two Leading Type)
   1) Before setting the brake shoes, apply a thin coat of molybdenum disulfide grease to the back plate portions (1) contacting the brake shoe edge as shown in the illustrations.
   2) Apply a coat of molybdenum disulfide grease to the wheel cylinder parts contacting the brake shoe (2).



N5A0150E

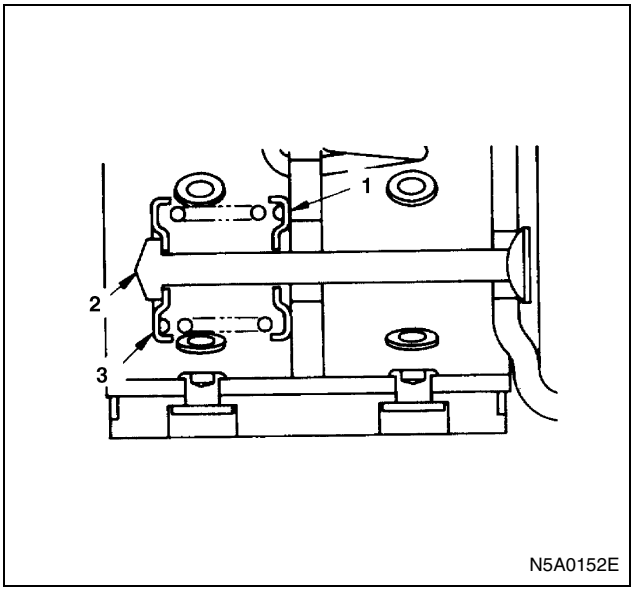
   3) Set the brake shoe assembly to the cylinder adjusting screw at the brake shoe small angle end.
      Do not install it at the round end to the adjusting screw.



N5A0151E

4) Install the brake shoes and the return springs to the wheel cylinders.
Keep the brake lining clean.

6. Shoe Holding Spring, Cup and Pin
   1) Before installing the holding pin, apply a coat of molybdenum disulfide grease to the holding cup seating faces (1) contacting the brake shoe.



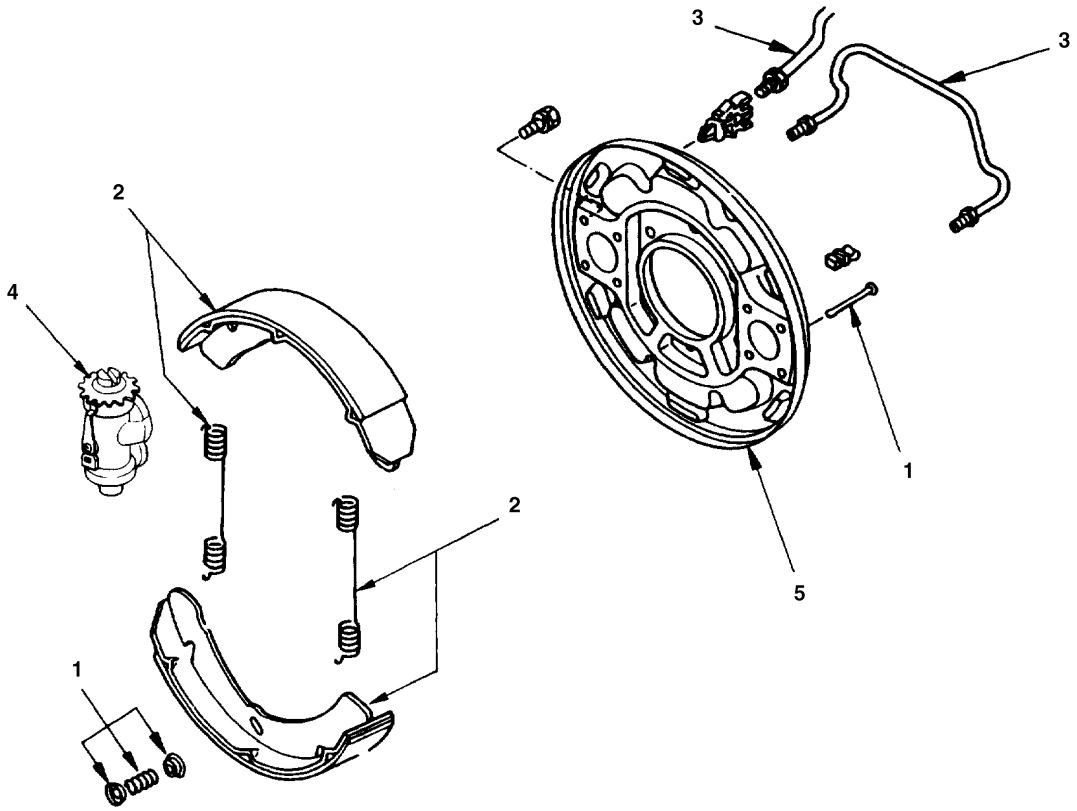
N5A0152E

   2) After installation of the pins, cups and the springs, make sure the pin (2) seats to the cup (3) properly.

After assembly, adjust the lining clearance and air bleeding the brake, referring to “SERVING” in Section 00 of this section.

Rear Drum Brake Assembly (Except Drum Inside Diameter 370 mm)

These removal steps are based on the without auto-adjuster type brake.



N5A0153E

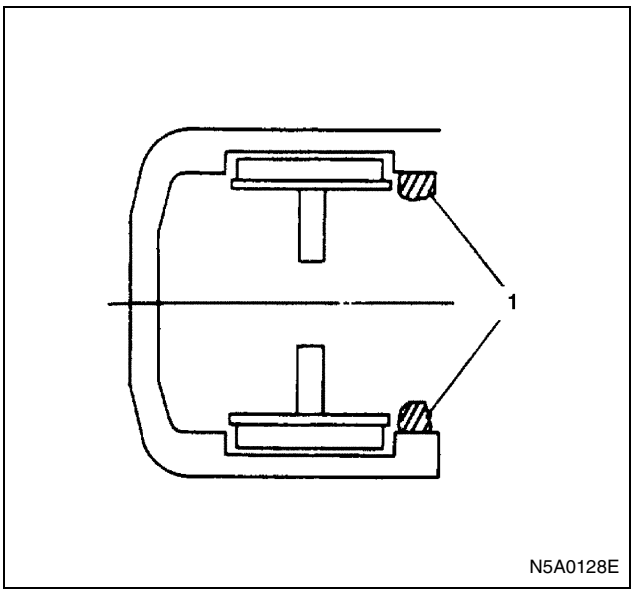
Removal

1. Shoe Holding Spring, Cup and Pin
2. Brake Shoe Return Spring
3. Brake Pipe
4. Wheel Cylinder Assembly
5. Back Plate

   Store all of the removed parts in a clean part tray.

With Auto-adjuster

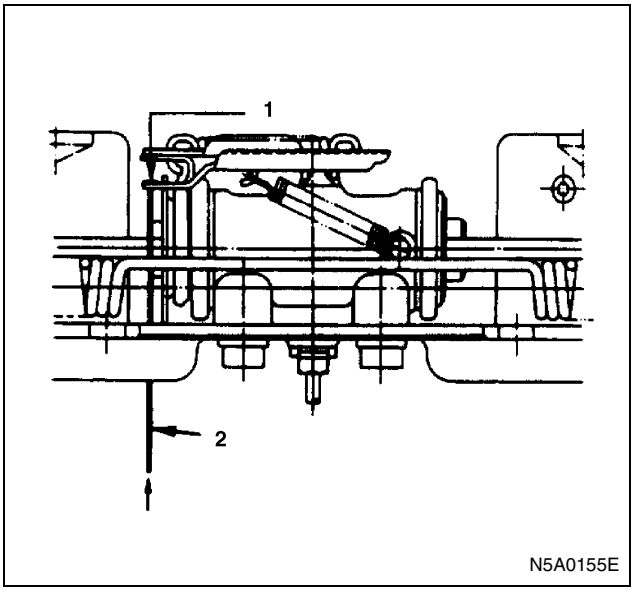
If the brake drum has step wear or the brake drum edge is corroded, it will be difficult to remove the brake drum. The following procedure will make brake drum removal easier.



Legend
1. Corroded portion

Drum Inside Diameter 260 mm

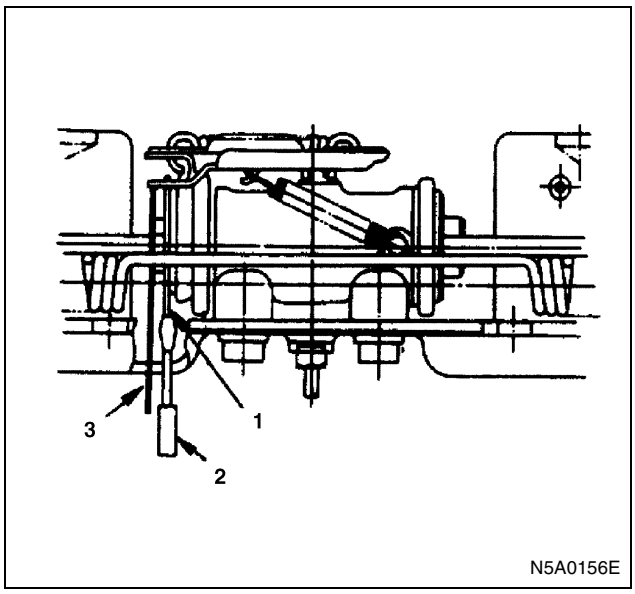
1. Remove the rubber covers from the brake lining clearance adjusting hole and auto-adjuster lever release hole.
2. Push up the auto-adjuster lever with a long drift or a suitable rod.
   (Outside diameter: 4 mm (0.15 in) length: 80 mm (3.1 in))



Legend
1. Auto-adjuster lever
2. Rod

3. Hold the auto-adjuster lever stationary.
   Use a screwdriver to rotate adjusters at back of the brake to provide clearance between lining and drum.

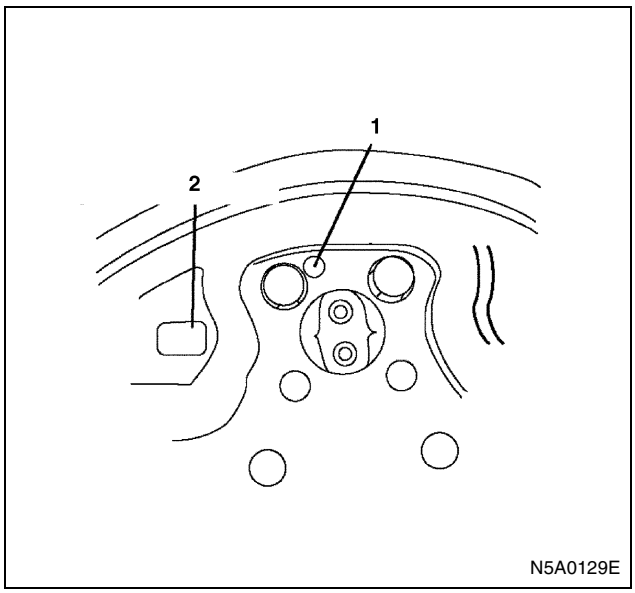
Notice:
Be sure to push up the auto-adjuster lever (Step 2).
Failure to do so will result in damage to the teeth of the auto-adjuster lever.
Take care not to damage the rubber boot with the bar or the screwdriver.



Legend
1. Adjuster
2. Screw driver
3. Rod

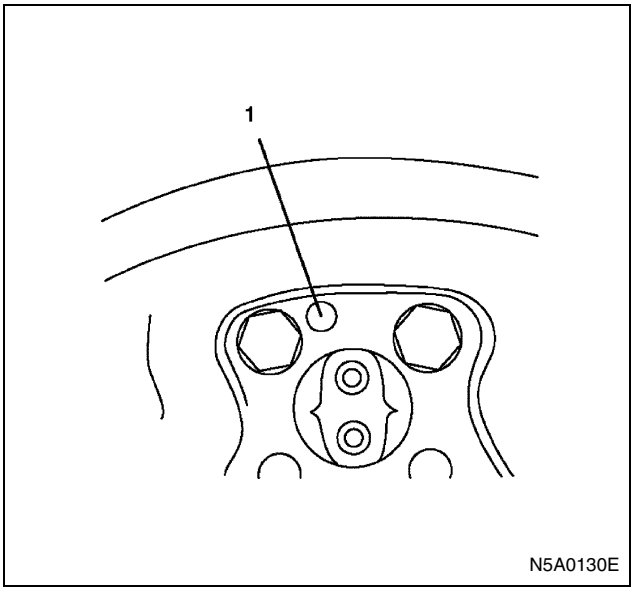
Drum Inside Diameter 320 mm

1. Remove the rubber cover from the brake lining clearance adjusting hole and auto-adjuster lever release hole.
2. Remove the adjust hole cover and adjuster lever release hole cover.

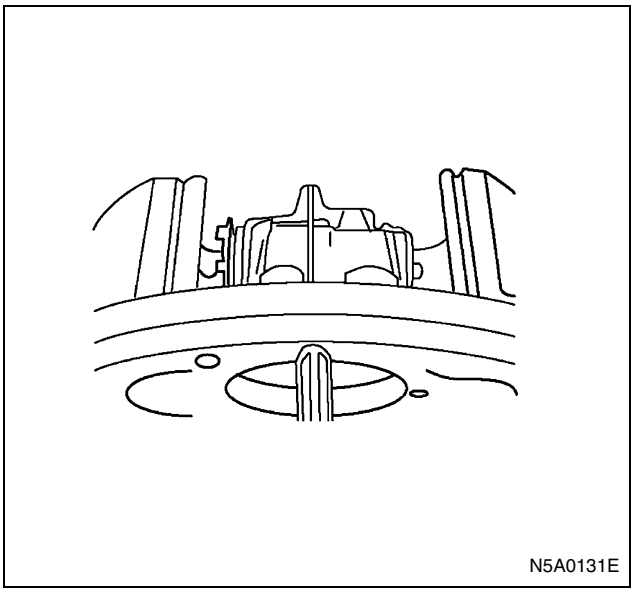


Legend
1. Adjuster lever release hole cover
2. Adjuster hole cover

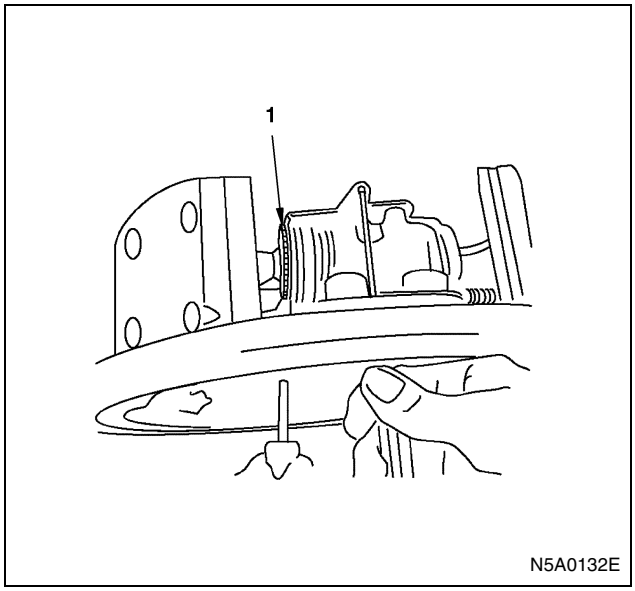
3. Using ϕ5 mm Phillips screwdriver put it into the adjuster lever release hole and then push up the adjuster lever.



Legend
1. Adjuster lever release hole

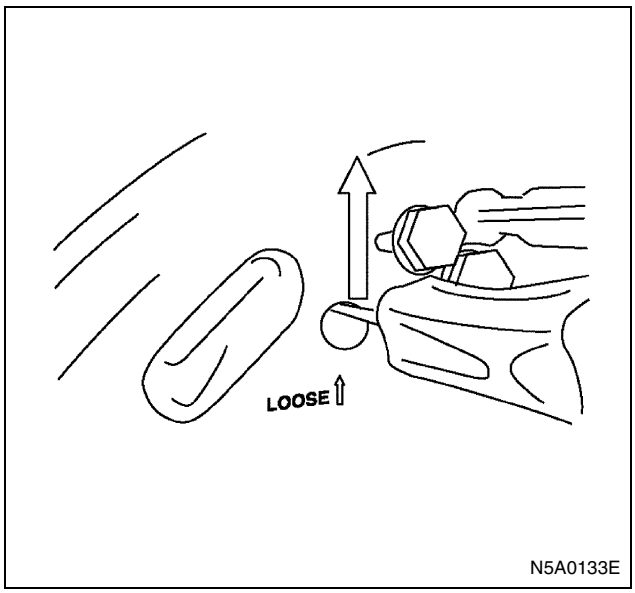


4. Put the flathead screwdriver into the adjuster hole while push up the adjuster lever.



Legend
1. Adjuster gear

5. Turn the adjuster gear to the marked arrow “LOOSE” on the backing plate.

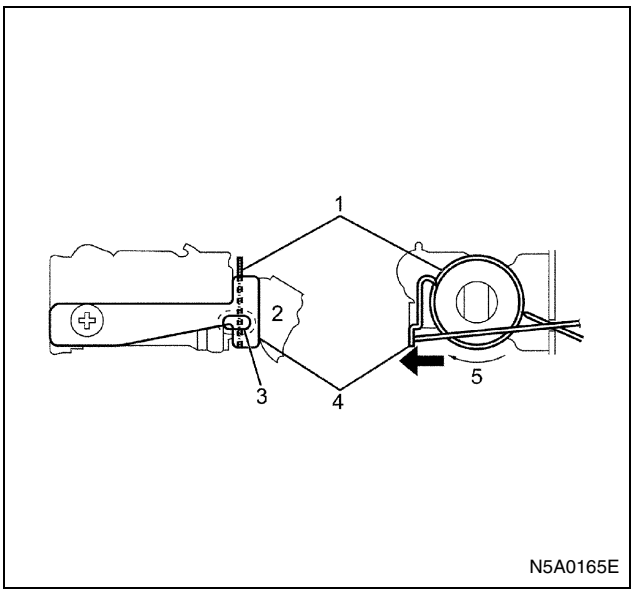


Drum Inside Diameter 240 mm

1. Remove the rubber cover from the brake lining clearance adjusting hole/auto-adjuster lever release hole in the back plate.
2. Insert a thin, suitable rod in the hole, and push up the auto-adjuster lever (4).
3. With the auto-adjuster lever (4) pushed up, insert a keystone tip screwdriver in the adjusting hole, and turn the adjuster gear (1) to increase the gap between the gear and the brake shoe (the outside diameter of the shoe will decrease).

Notice:
Do not fail to push up the auto-adjuster lever before turning the gear. Failure to do so will result in damage to the teeth of the gear because it is locked with the lever.

Exercise care not to damage the boot of the wheel cylinder and other parts when turning the gear and pushing up the lever.



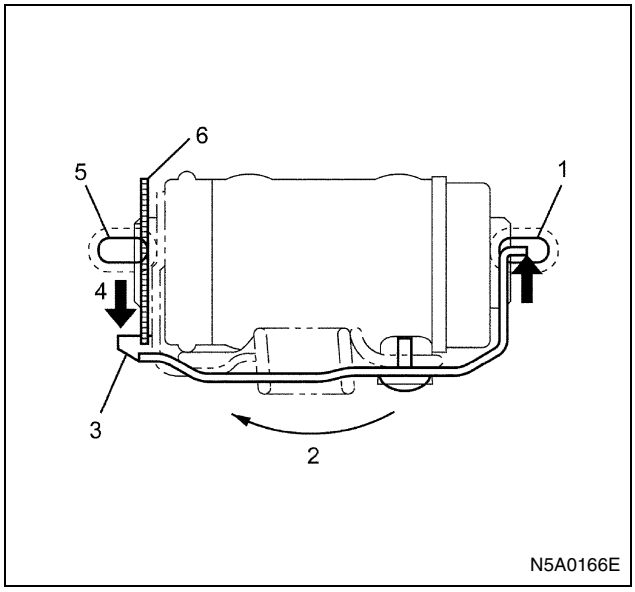
Legend
1. Adjuster gear
2. Brake shoe
3. Plug hole
4. Auto-adjuster lever
5. Loosening direction

Drum Inside Diameter 290 mm

1. Remove the rubber cover from the brake lining clearance adjusting hole/auto-adjuster lever release hole in the back plate.
2. Insert a thin, suitable rod in the auto-adjuster lever release hole, and push the end of the auto-adjuster lever (3) in the direction of the arrow (4).
3. With the auto-adjuster lever (3) pushed up, insert a keystone tip screwdriver in the adjusting hole, and turn the adjuster gear (6) to increase the gap between the gear and the brake shoe (the outside diameter of the shoe will decrease).

Notice:
Do not fail to push up the auto-adjuster lever before turning the gear. Failure to do so will result in damage to the teeth of the gear because it is locked with the lever.

Exercise care not to damage the boot of the wheel cylinder and other parts when turning the gear and pushing up the lever.



Legend
1. Plug hole
2. Rotating direction of tire (forward)
3. Auto-adjuster lever
4. Loosening direction
5. Plug hole
6. Adjuster gear

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

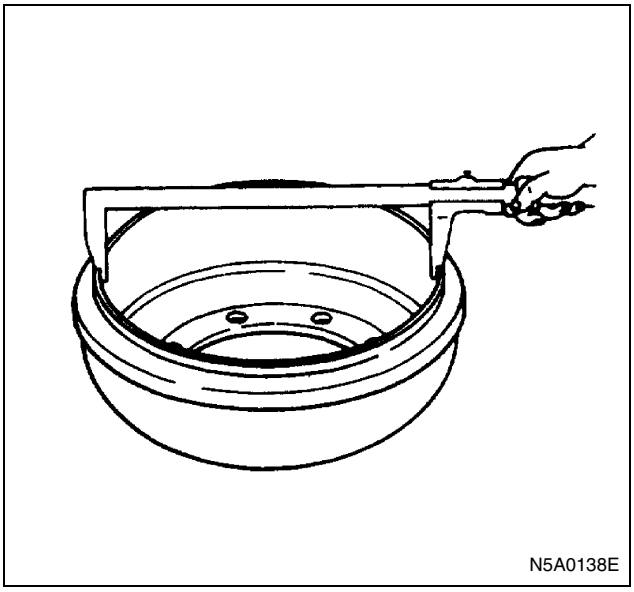
Brake Drum Inside Diameter

Visually inspect the brake drum for excessive wear and scoring.

If the brake drum is scored or worn, lathed to the specified limit.

Use a vernier caliper to measure the brake drum inside diameter.

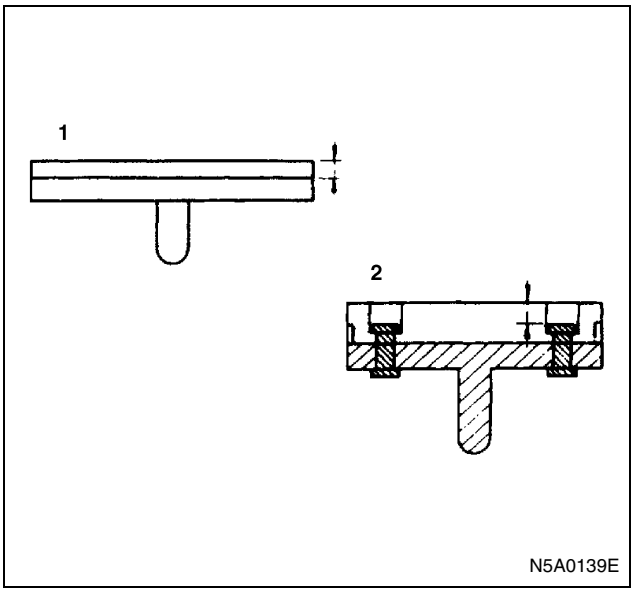
Brake Drum Inside Diameter		mm (in)
Drum size	Standard	Limit
228.6	228.6 (9.00)	230.0 (9.06)
240	240.0 (9.45)	241.5 (9.51)
260	260.0 (10.24)	261.5 (10.30)
279.4	279.4 (11.00)	281.0 (11.06)
290	290.0 (11.42)	291.5 (11.48)
300	300.0 (11.81)	301.5 (11.87)
320	320.0 (12.60)	321.5 (12.66)
Out of round • Limit: 0.13 mm (0.005 in)		



N5A0138E

Brake Lining Thickness Measurement
Use a vernier caliper to measure the brake lining thickness or the rivet depth.
If the measured value is less than the specified limit, the brake shoe assembly and/or the lining must be replaced.

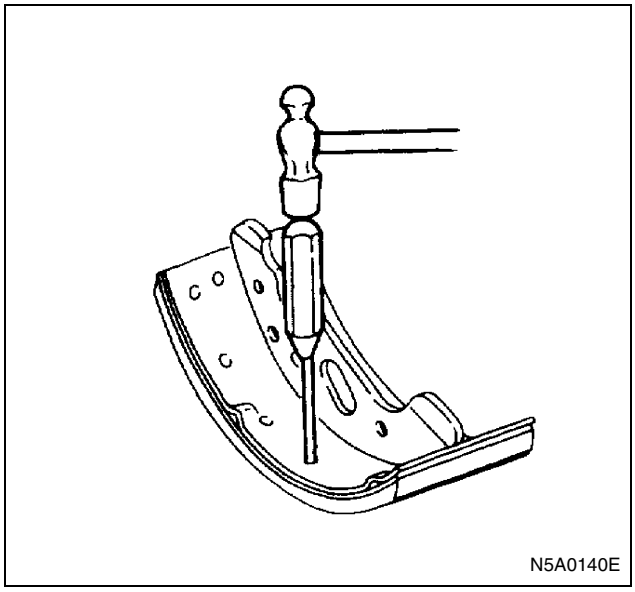
Brake Lining Thickness or Rivet Depth	mm (in)
Limit	1.0 (0.039)



N5A0139E

Legend
1. Adhesion type
2. Riveted type

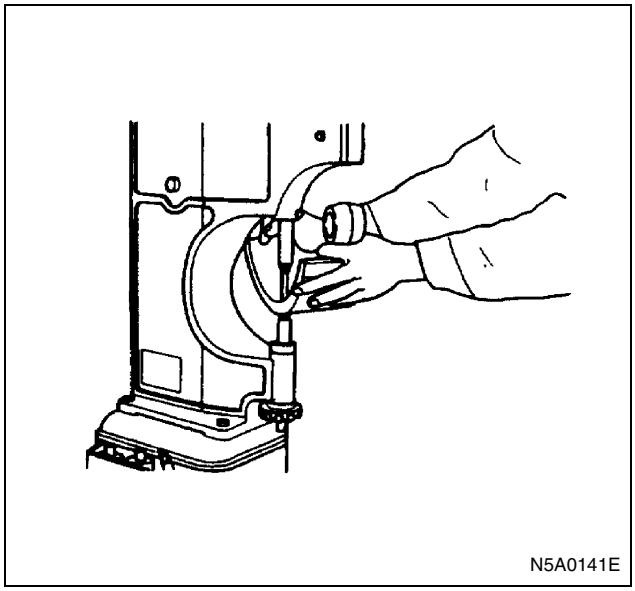
Brake Lining Removal (Riveted Type Only)
1. Remove the rivet caulking portions with a hammer and chisel.
2. Remove the rivets with a hammer and punch.



N5A0140E

3. Inspect the brake shoe for cracking.

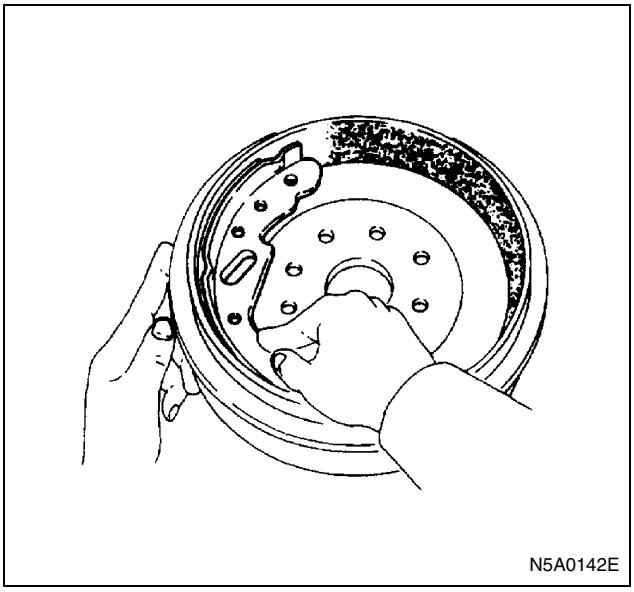
Brake Lining Installation (Riveted Type Only)
1. Install the brake lining and the rivets to the brake shoe.
2. Place the brake shoe assembly in the air hydraulic riveter.
3. Use the air hydraulic riveter to set and caulk each of the rivets.



N5A0141E

4. Start riveting at the center of lining and work towards the ends.

Brake Lining and Drum Contact
1. Apply chalk powder to the entire inside brake drum surface.
2. Place the brake shoe assembly in the inside brake drum.
3. Move the brake shoe assembly around the inside brake drum.
   Check for uniform contact between the brake lining and the brake drum.



N5A0142E

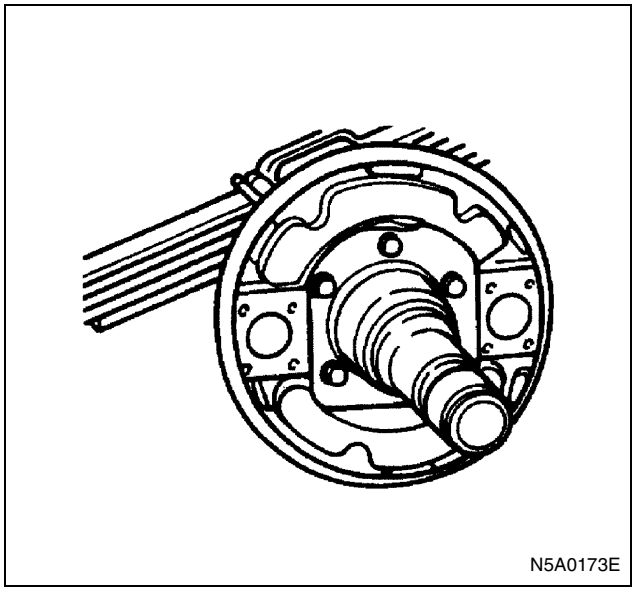
4. Correct any areas having poor contact with sandpaper.
5. Repeat Steps 1 through 4 until the contact between the brake lining and the brake drum is perfect.

Installation

1. Back Plate
   Tighten the back plate bolts to the specified torque.

Back Plate Bolt Torque		N·m (kg·m/lb·ft)
Drum Inside Dia. mm (in)	Lining Width mm (in)	—
228.6 (9.00)	75 (2.95)	108 (11.0/80)
240.0 (9.45)	60 (2.36)	108 (11.0/80)
260.0 (10.24)	90 (3.54)	108 (11.0/80)
279.4 (11.00)	60 (2.36)	74 (7.5/54)
290.0 (11.42)	75 (2.95)	108 (11.0/80)
300.0 (11.81)	75 (2.95)	* 44 (4.5/33)
		** 108 (11.0/80)
320.0 (12.60)	75 (2.95)	108 (11.0/80)
	100 (3.94)	108 (11.0/80)
	120 (4.72)	157 (16.0/116)

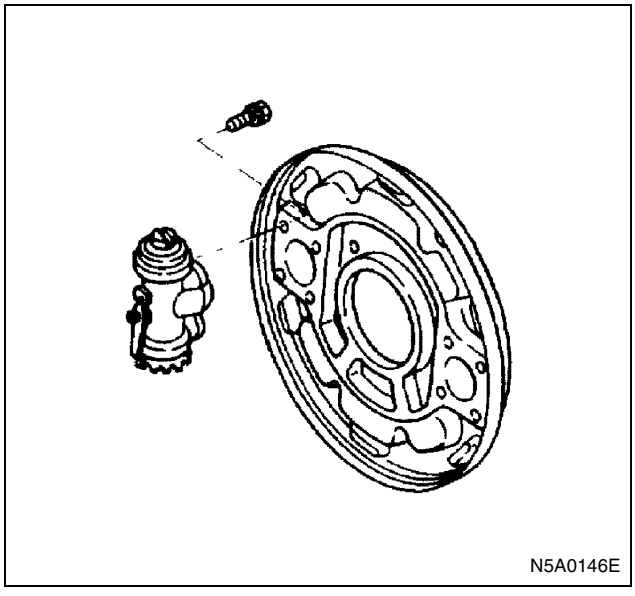
* Single Tire models
** Dual Tire models



N5A0173E

2. Wheel Cylinder Assembly
   Tighten the wheel cylinder assembly bolts to the specified torque.

Wheel Cylinder Assembly Bolt Torque		N·m (kg·m/lb·ft)
Drum Inside Dia. mm (in)	Lining Width mm (in)	—
228.6 (9.00)	75 (2.95)	34 (3.5/25)
240.0 (9.45)	60 (2.36)	25 (2.5/18)
260.0 (10.24)	90 (3.54)	43 (4.4/32)
279.4 (11.00)	60 (2.36)	27 (2.8/20)
290.0 (11.42)	75 (2.95)	25 (2.5/18)
300.0 (11.81)	75 (2.95)	34 (3.5/25)
320.0 (12.60)	75 (2.95)	43 (4.4/32)
	100 (3.94)	74 (7.5/55)
	120 (4.72)	94 (9.6/69)

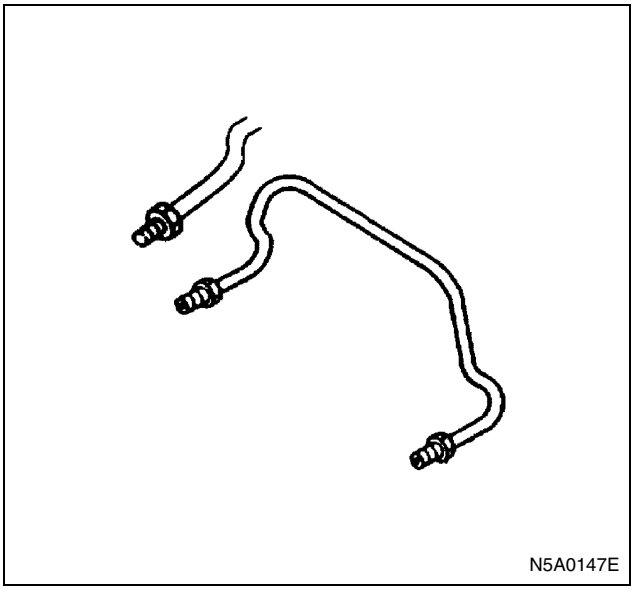


N5A0146E

3. Brake Pipe
   Tighten the brake pipe flare nuts to the specified torque.

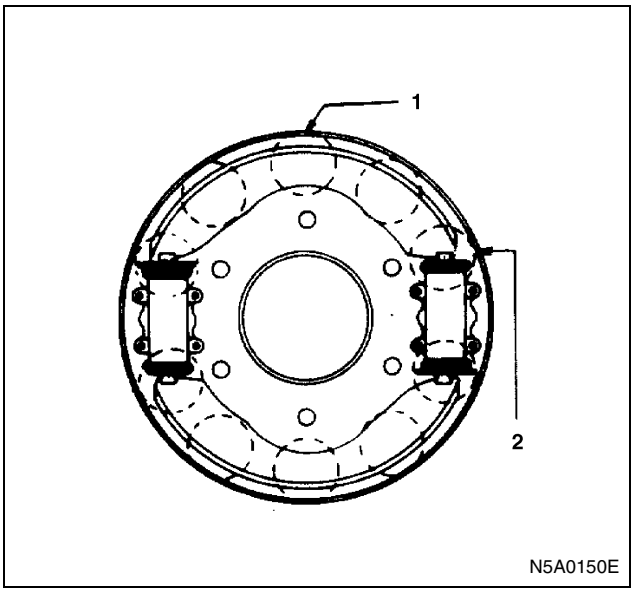
Tighten:
Brake pipe flare nuts to 16 N·m (1.6 kg·m / 12 lb·ft)

Notice:
Take care not to twist the piping.



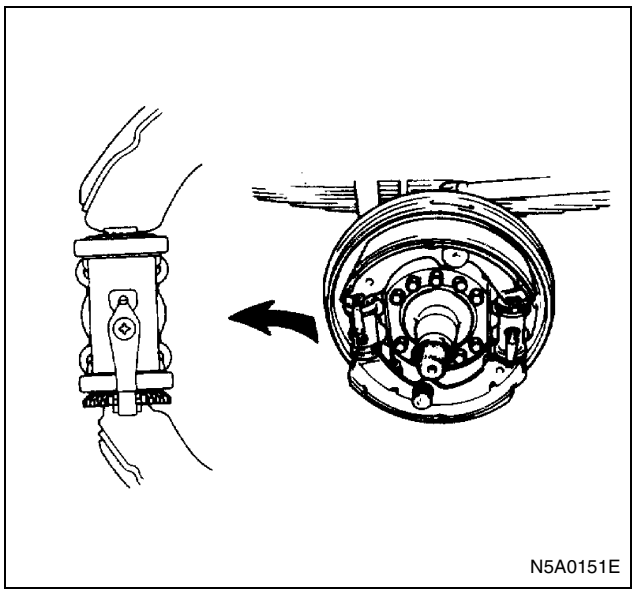
N5A0147E

4. Brake Shoe and Return Spring
   1) Before setting the brake shoes, apply a thin coat of molybdenum disulfide grease to the back plate portions (1) contacting the brake shoe edge as shown in the illustrations.
   2) Apply a coat of molybdenum disulfide grease to the wheel cylinder parts contacting the brake shoe (2).



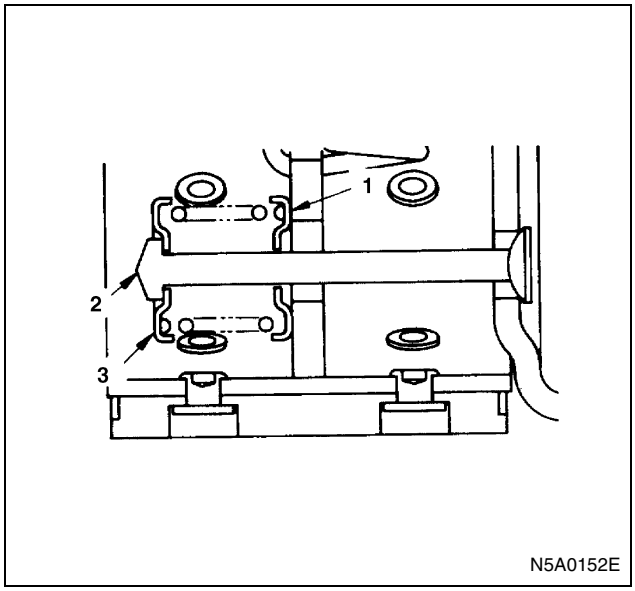
N5A0150E

   3) Set the brake shoe assembly to the cylinder adjusting screw at the brake shoe small angle end.
      Do not install it at the round end.



N5A0151E

   4) Install the brake shoes and the return springs to the wheel cylinders.
      Keep the brake lining clean.
5. Shoe Holding Spring, Cup and Pin
   1) Before installing the holding pin.
      Apply a coat of molybdenum disulfide grease to the holding cup seating faces (1) contacting the brake shoe.
   2) After installation of the pins, cups and the springs, make sure the pin (2) seats to the cup (3) properly.



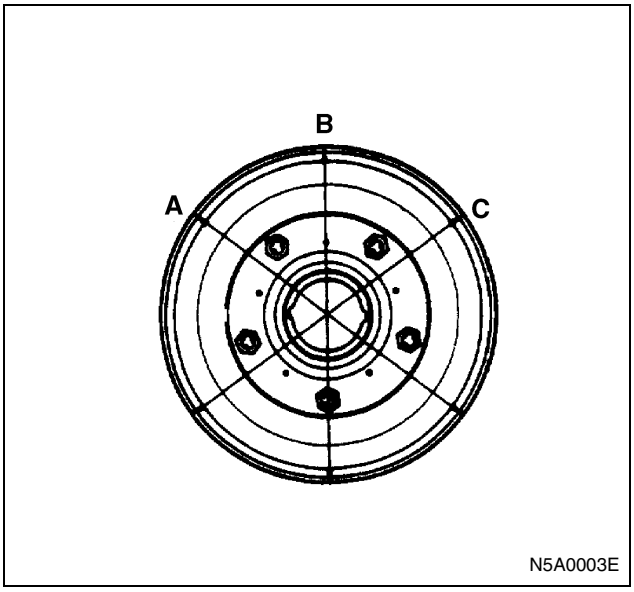
N5A0152E

6. After installation of brake drum, be sure to perform the preload adjustment of hub bearing.
7. Bleed the air from brake.

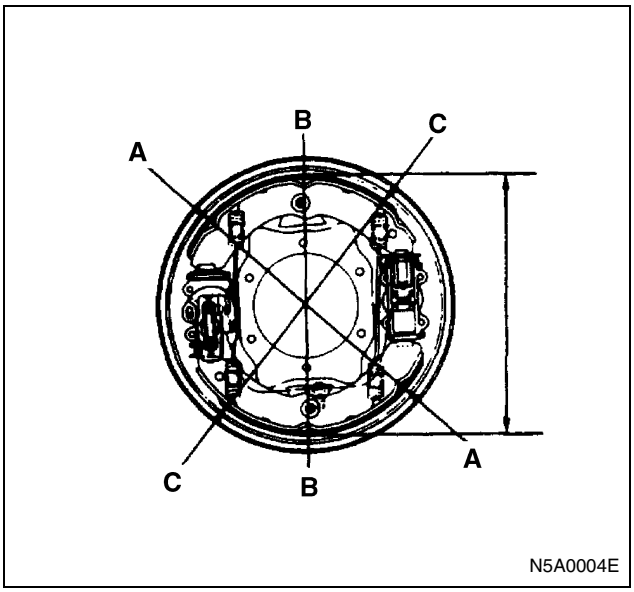
With Auto-adjuster

For the drum brake with auto-adjuster, perform the following procedure before Step 6 and 7.

1. Measure the internal diameter of the brake drum.
   - Take measurement of the distance at (A), (B) and (C) points.



2. Measure the external diameter of the brake shoe.
   - Take measurement of the distance at (A), (B) and (C) points.



3. Turn the adjuster gear so that the difference between the internal diameter of the brake drum and the internal diameter of the brake shoe becomes 0.6 mm (0.024 in).
4. Install the brake drum.

Adjustment

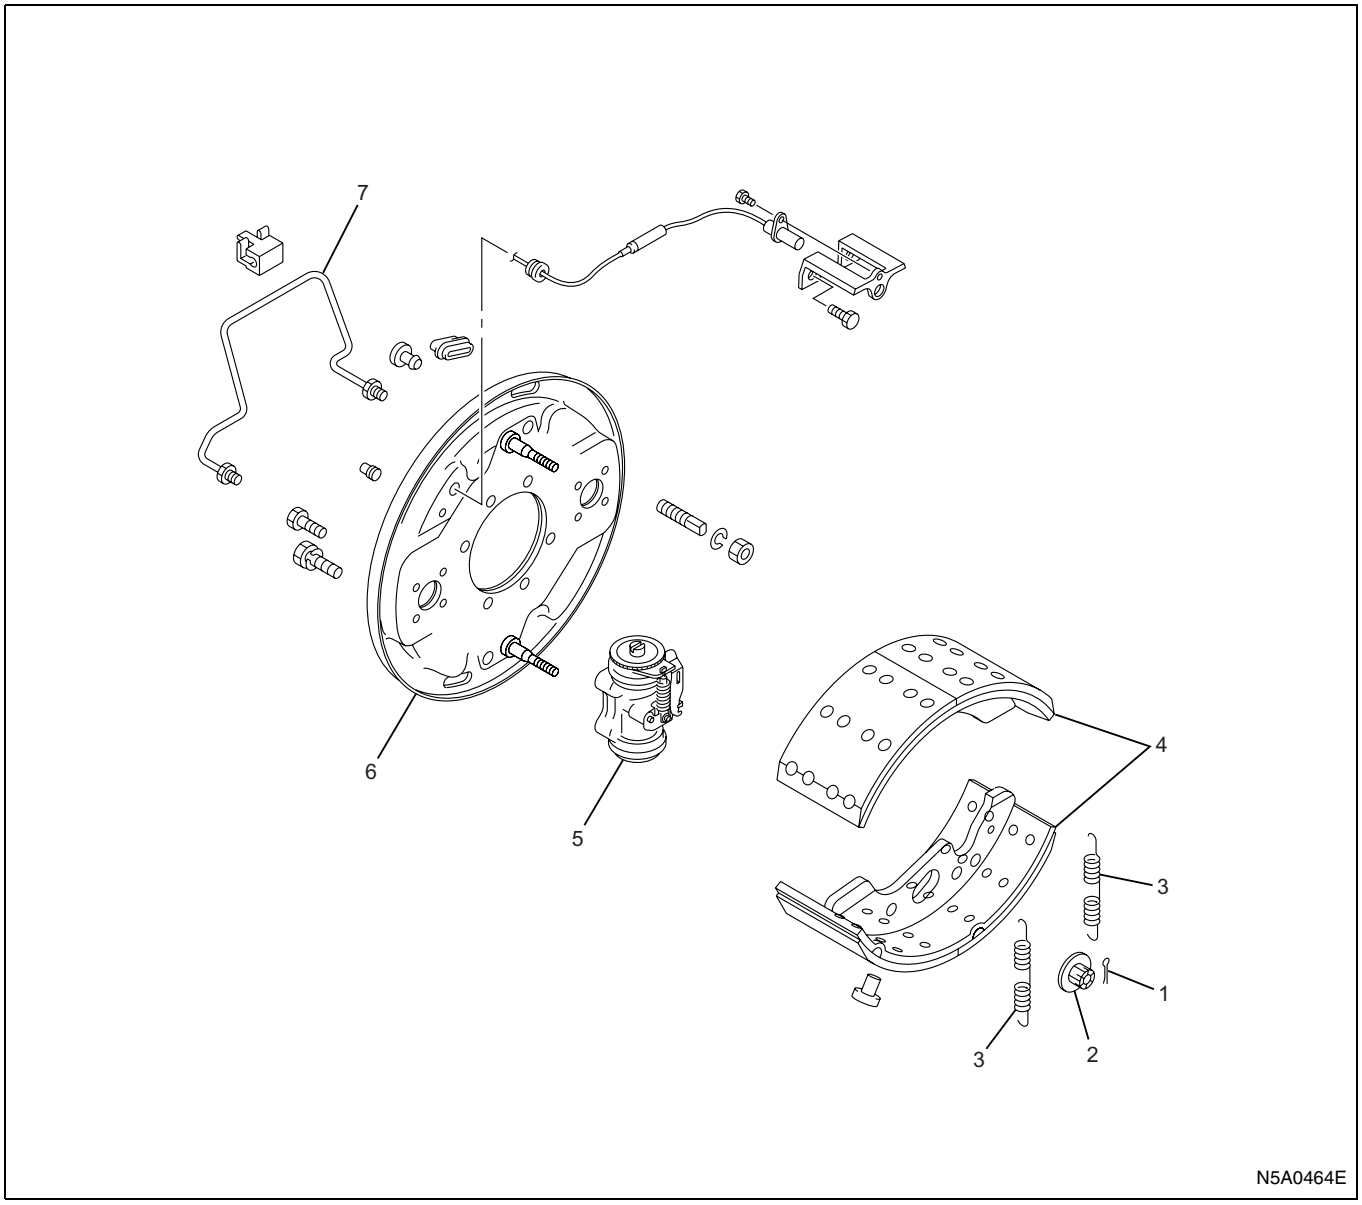
Without Auto-adjuster

Turn the adjuster until the brake drum stops rotating. Depress the brake pedal several times and turn the adjuster furthermore. When the brake drum stops rotating completely, turn the adjuster back for 5 to 6 notches.

With Auto-adjuster

Strongly depress the brake pedal several times while rotating the brake drum in the direction of moving forward or driving the vehicle forward. This adjusts the brake drum clearance automatically.

Rear Drum Brake Assembly (Drum Inside Diameter 370 mm)



Legend

1. Cotter pin
2. Shoe hold nut
3. Brake shoe return spring
4. Brake shoe assembly
5. Wheel cylinder assembly
6. Back plate
7. Brake pipe

Removal

- Block vehicle wheels and apply the parking brake.
- Raise the axle to clear the tire from the ground. Position jack stands under vehicle.

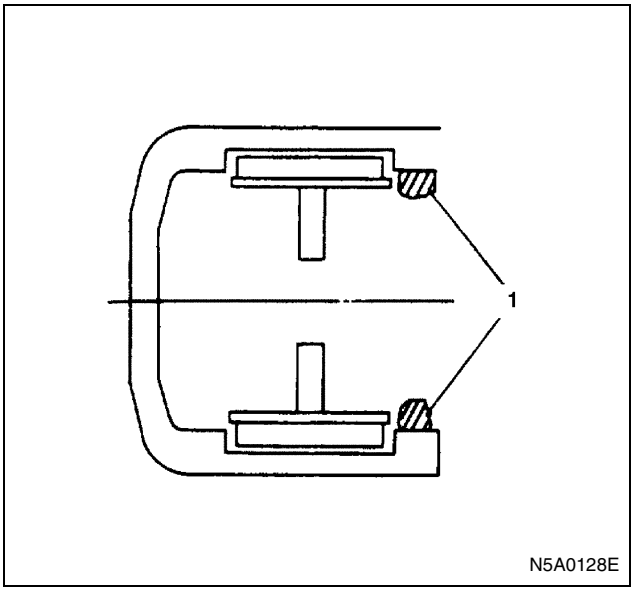
1. Wheel and tire assembly and brake drum and hub assembly.
   - Refer to Section 3E WHEELS AND TIRES.
   - Refer to Section 4C FRONT AXLE and Section 3C FRONT SUSPENSION.
   - Refer to Section 4B REAR AXLE.
2. Holder nuts.
3. Shoe return springs using a return spring plier. Return spring plier: 9-8522-0026-0
4. Shoe and lining assemblies.
5. Brake pipes.

Notice:
The brake pipes to the wheel cylinders must be removed before the wheel cylinders can be removed.

6. Brake hose.
7. Back plate.
8. Wheel cylinders.

Drum Inside Diameter 370.0 mm (14.57 in)

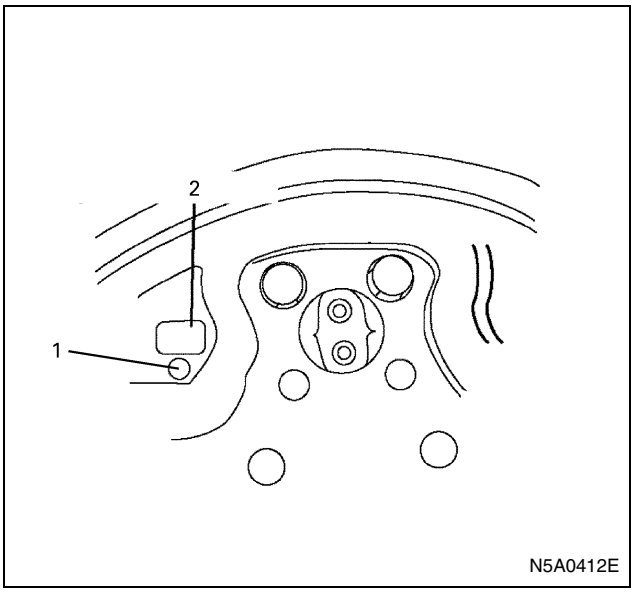
If the brake drum has step wear or the brake drum edge is corroded, it will be difficult to remove the brake drum. The following procedure will make brake drum removal easier.



Legend

1. Corroded portion

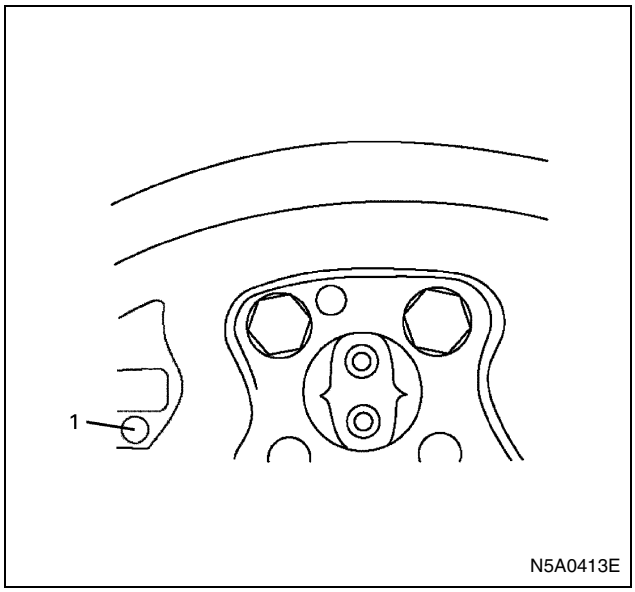
1. Remove the rubber cover from the brake lining clearance adjusting hole and auto-adjuster lever release hole.
2. Remove the adjust hole cover and adjuster lever release hole cover.



Legend

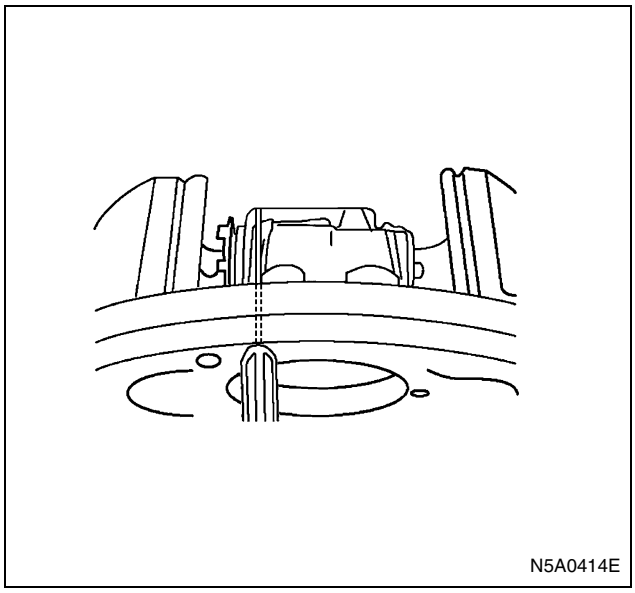
1. Adjuster lever release hole cover
2. Adjuster hole cover

3. Using ϕ5 mm Phillips screwdriver put it into the adjuster lever release hole and then push up the adjuster lever.

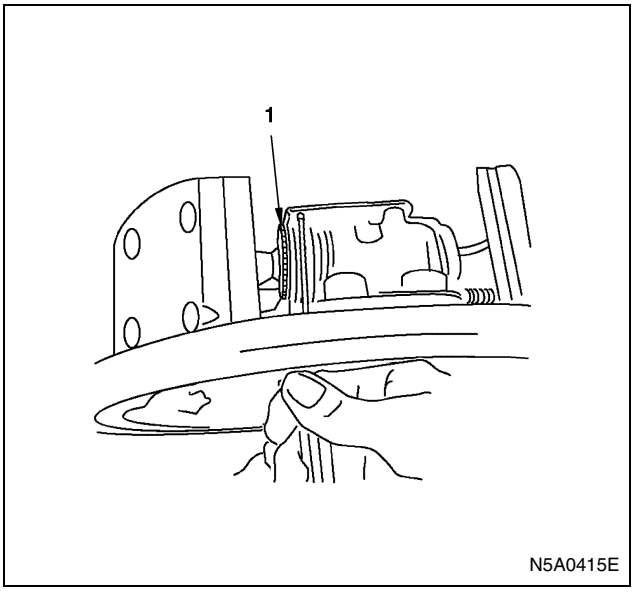


Legend

1. Adjuster lever release hole



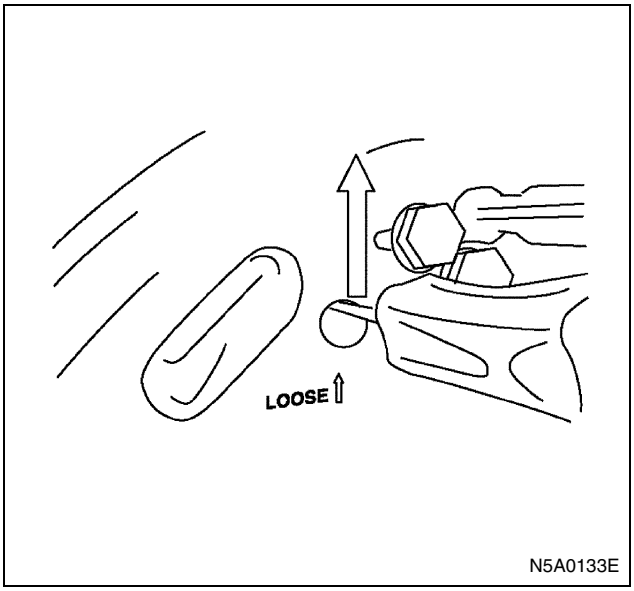
4. Put the flathead screwdriver into the adjuster hole while push up the adjuster lever.



Legend

1. Adjuster gear

5. Turn the adjuster gear to the marked arrow “LOOSE” on the backing plate.

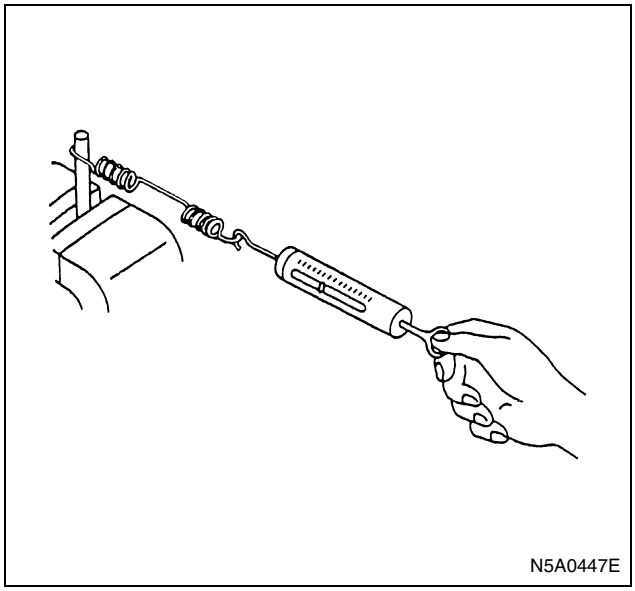


Inspection

- All components for wear or damage. Replace as necessary.

Measurement

Set the return spring as it is installed, and measure the tension.



- Return spring tension.

Free Length mm (in)	209.3 (8.24)
Set Length mm (in)	226 (8.90)
Set Load N (kg/lb)	292.2 — 357 (29.8 — 36.4 / 65.7 — 80.2)

Installation

1. Wheel cylinder assemblies.

Tighten:
Wheel cylinder mounting bolts to 120 N·m (12.2 kg·m / 89 lb·ft)

2. Back Plate.

Tighten:
Mounting plate bolts to 157 N·m (16.0 kg·m / 116 lb·ft)

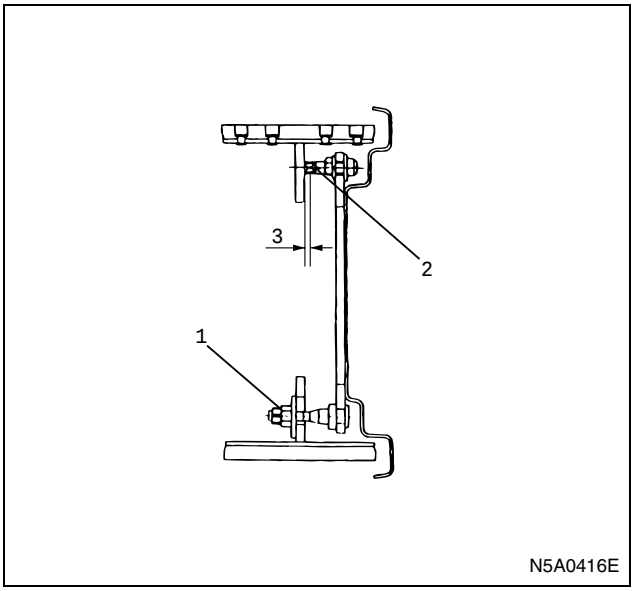
3. Brake pipes and hoses.

Tighten:
Brake pipe nuts to 15 N·m (1.5 kg·m / 11 lb·ft)

4. Shoe and lining assemblies.
5. Shoe return spring using a return spring plier.
   Return spring plier: 9-8522-0026-0
6. Holder nuts.
   - Brake holder nut clearance.
     – Turn nut (1) clockwise until shoe comes into contact with the bolts (2).
     – Turn nut (1) counterclockwise 1/3 turn. Back off the nut until the hole in the holding pin lines up with the nearest slot in the nut within 1/6 turn, and install split pin.
     – Check to see if clearance between bolt and shoe in 0.3 — 0.5 mm (0.012 — 0.020 in). If

clearance is not specified, it should be readjusted.

Caution:
Do not loosen the nuts on the shoe hold bolts during the operation.



Legend
1. Nut
2. Bolt
3. Clearance 0.3 — 0.5 mm (0.012 — 0.020 in)

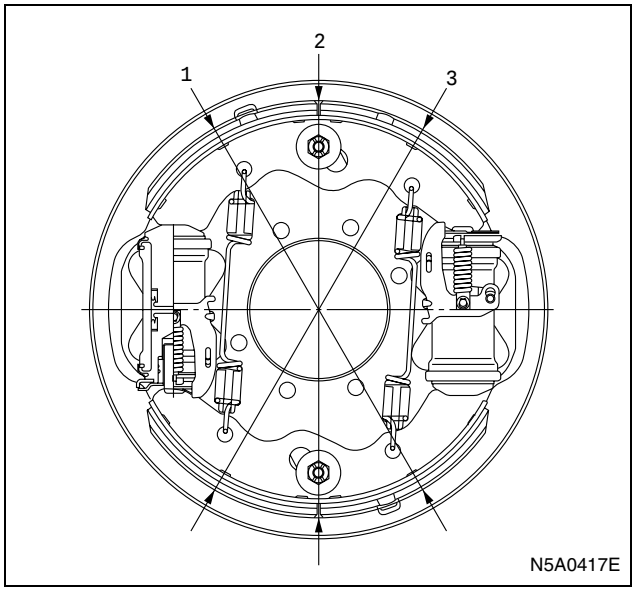
7. Cotter pin.
   Use a new cotter pin. Be sure to bend back the legs of the pin.
8. Hub and drum assembly and wheel and tire assembly. Adjust wheel bearings.
   - Refer to Section 3E WHEELS AND TIRES.
   - Refer to Section 4C FRONT AXLE and Section 3C FRONT SUSPENSION.
   - Refer to Section 4B REAR AXLE.

Adjustment

1. After reassembling the brake assembly, adjust the brake lining external diameter to 369.3 — 369.8 mm (14.54 — 14.56 in) by turning the wheel cylinder adjuster gear.
   If the measurement at 1, 2 and 3 point are within the range of specified value, brake drum can be installed easily.

Notice:
Be sure to push up the auto-adjuster lever. Failure to do so will result in damage to the teeth of auto-adjuster-gear.

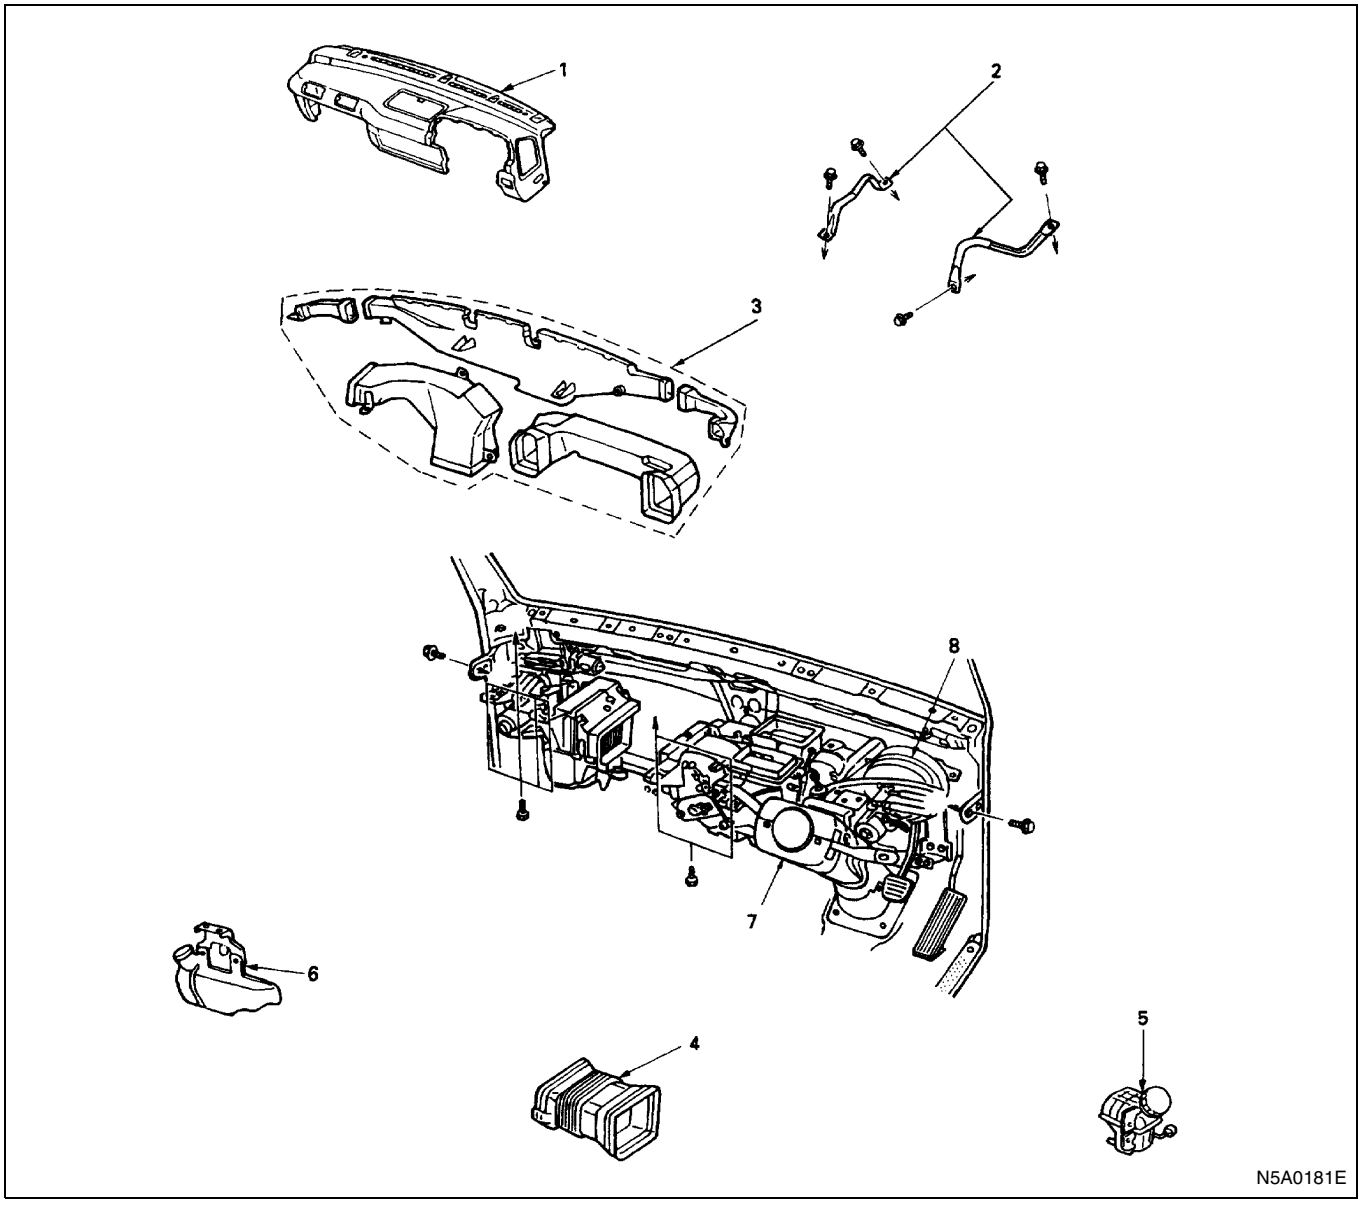
Take care not to damage the rubber boot with the screw driver.



2. Install the brake drum.
3. Rotate the brake drum and depress the brake pedal as far as possible.

Brake Pedal and Control

Brake Vacuum Booster and Brake Pedal Assembly

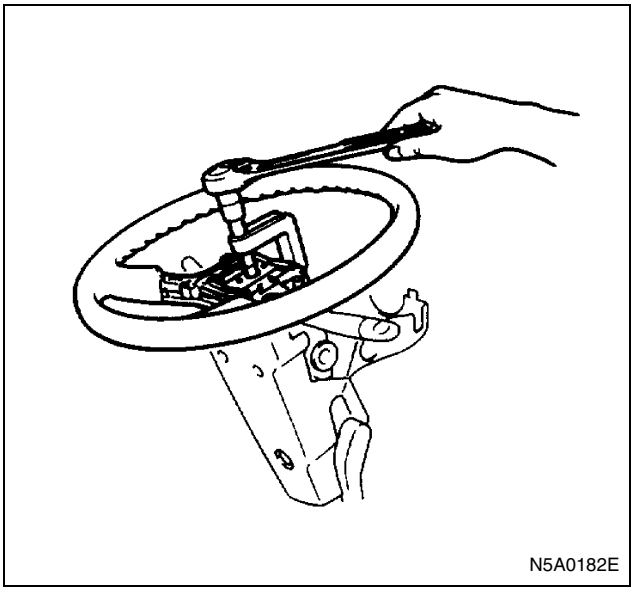


Legend

1. Instrument panel
2. Stay
3. Defroster nozzle and vent duct
4. Center duct (NPR model only)
5. Brake and clutch fluid reservoir
6. Windshield washer tank
7. Steering cowl assembly
8. Vacuum booster and brake pedal assembly

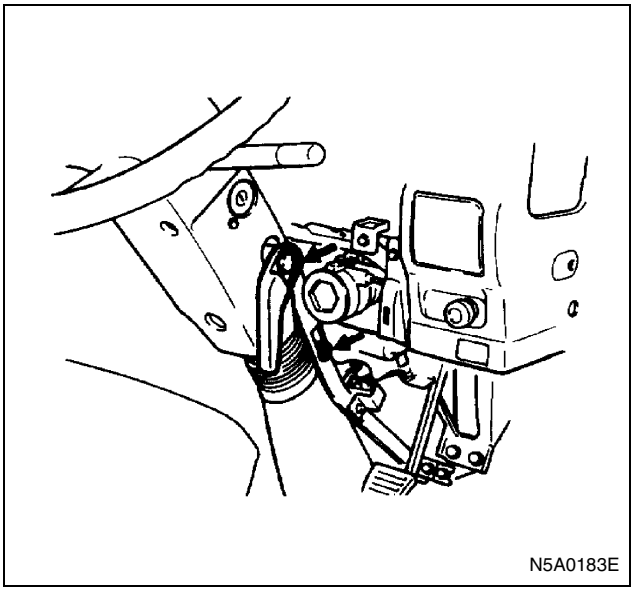
Removal

1. Instrument Panel
2. Stay
3. Defroster Nozzle and Vent Duct
4. Center Duct (NPR model only)
5. Brake and Clutch Fluid Reservoir
6. Windshield Washer Tank
   For the removal procedure for above, refer to Section 2 CAB AND FRAME.
7. Steering Cowl Assembly
   Wheel remover: 5-8840-2215-0



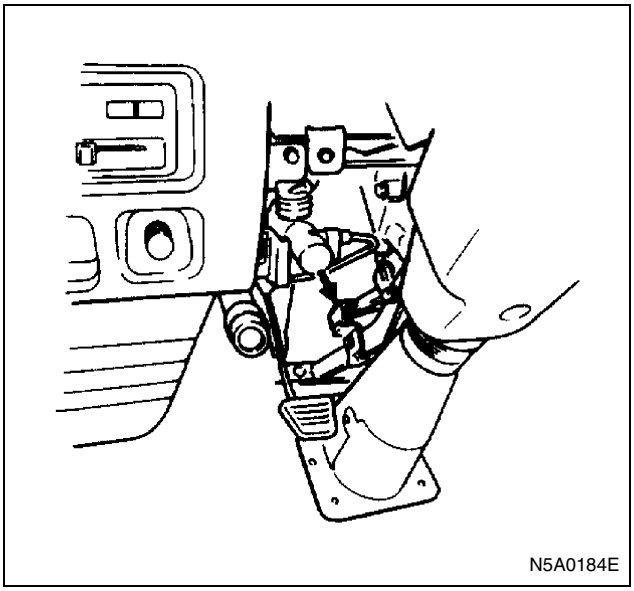
N5A0182E

Remove the tilt lever and steering cowl.



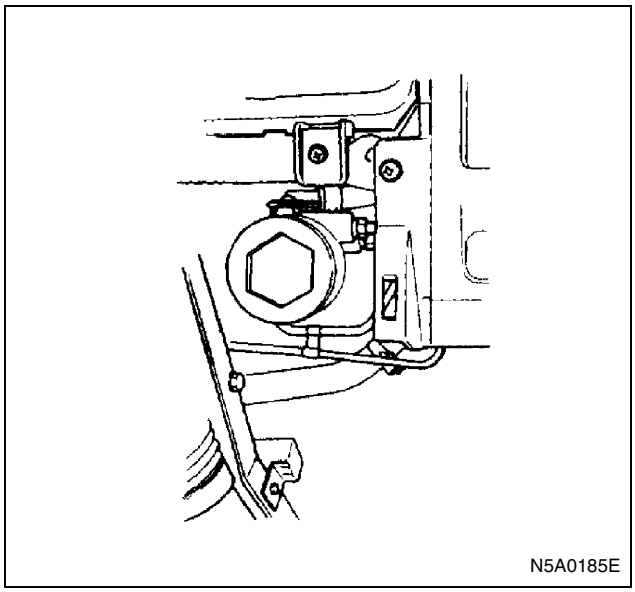
N5A0183E

Disconnect the wire harness connectors.



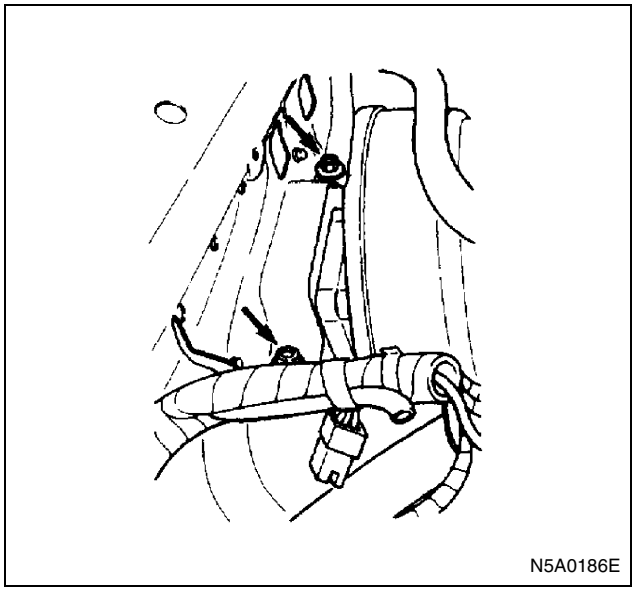
N5A0184E

8. Vacuum Booster and Brake Pedal Assembly
   1) Disconnect the brake pipes and hoses.

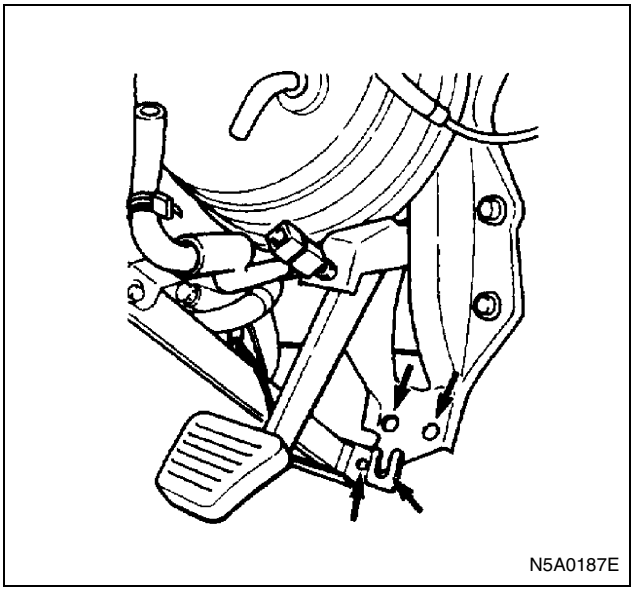


N5A0185E

   2) Plug or cover the brake rubber hoses, pipes and the master cylinder brake fluid ports to prevent brake fluid spillage.
      If brake fluid spillage occurs, wipe it up immediately.
   3) Remove the brake pedal bracket fixing bolts and vacuum booster and brake pedal assembly.

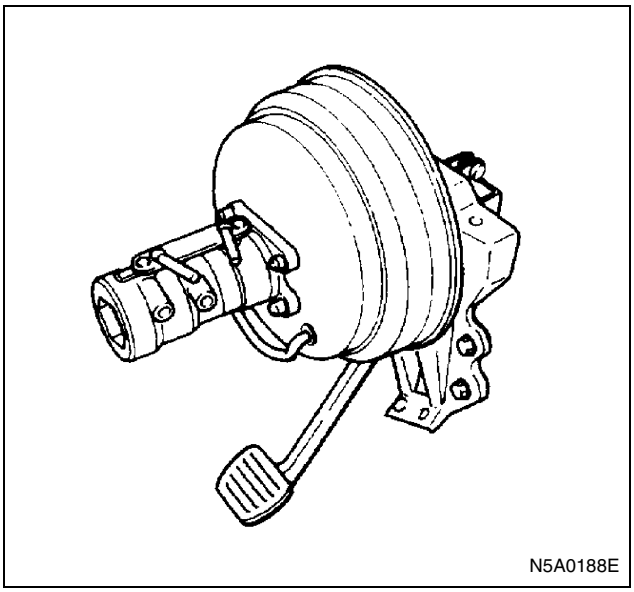


N5A0186E



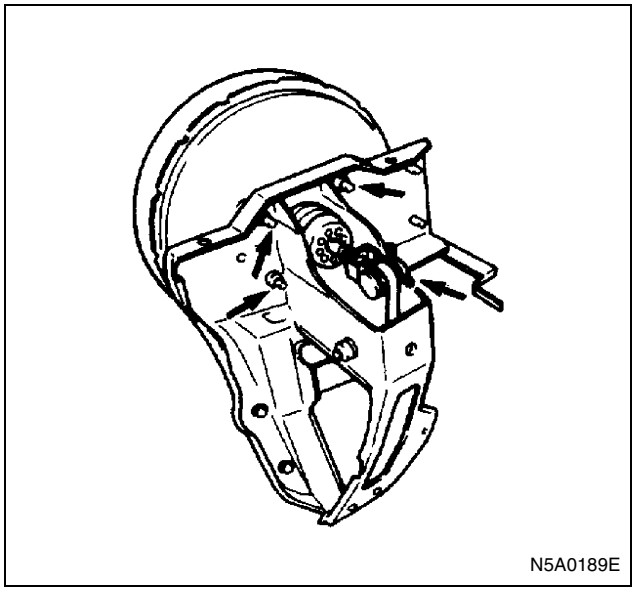
N5A0187E

4) Remove the brake pedal and master cylinder.



N5A0188E

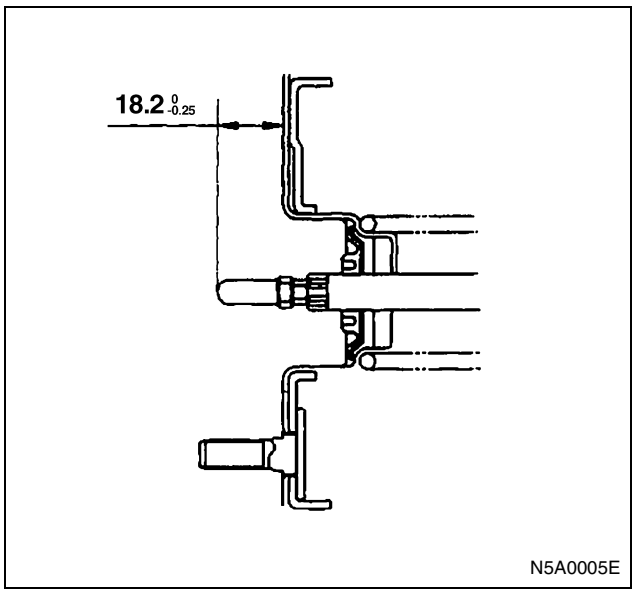
5) Remove the vacuum booster assembly from brake pedal assembly.



N5A0189E

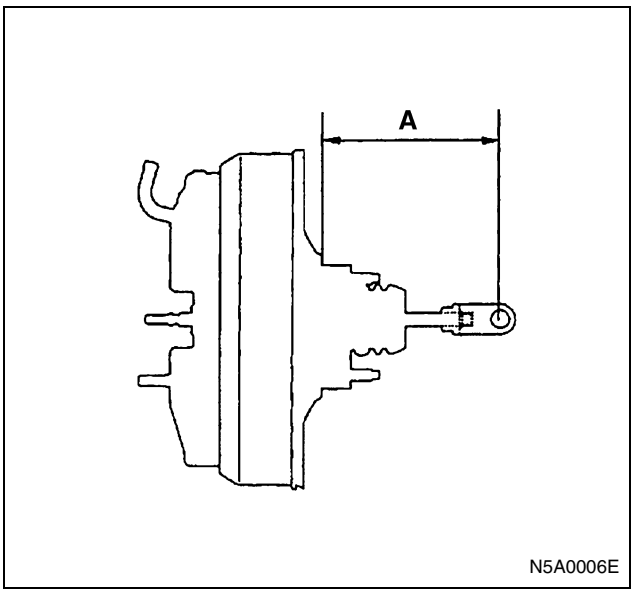
Installation

1. Vacuum Booster and Brake Pedal Assembly
   1) Vacuum booster cannot be overhauled. If it is found faulty, replace its assembly with a new one.
   2) Make necessary adjustment, so that distance between end of push rod and flange face is adjusted to 18.2 mm (0.717 in) in condition of vacuum applying.



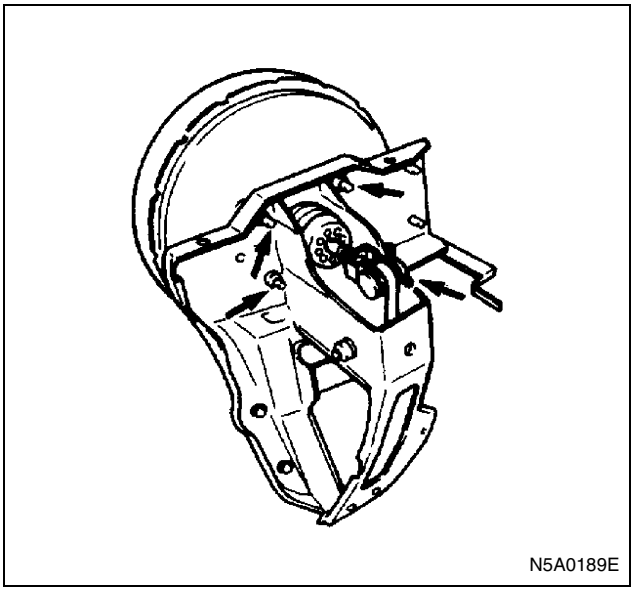
N5A0005E

   3) Push rod length (A) is measured from the center of the clevis pin hole to the mounting surface of the brake pedal bracket. Adjusted to 109 mm (4.291 in); without spacer, 129 mm (5.079 in); with spacer and tighten the lock nut. When fixed under this condition, there is no need to adjust the height of brake pedal from floor and free play.



4) Install the vacuum booster to brake pedal assembly.

- Adjust the clearance between the tip of threaded portion of the stop light switch and the pedal arm to 0.5 — 1.0 mm (0.02 — 0.04 in).

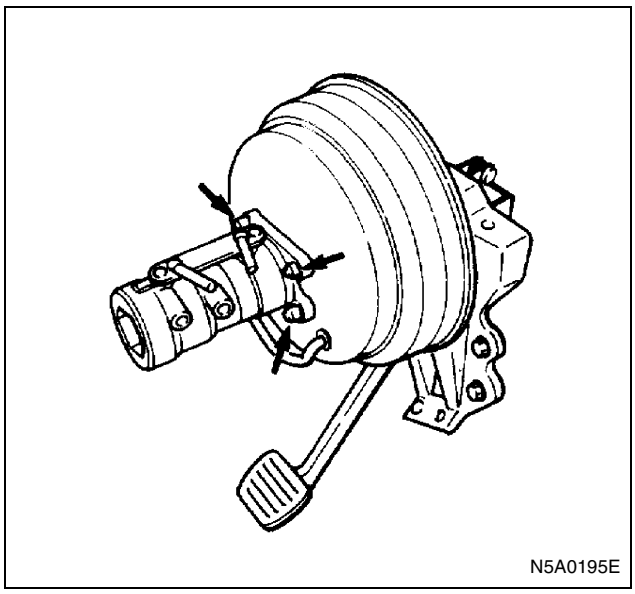


5) Tighten the vacuum booster bolts to the specified torque.

Tighten:
Vacuum booster bolts to 14 N·m (1.4 kg·m / 122 lb·in)

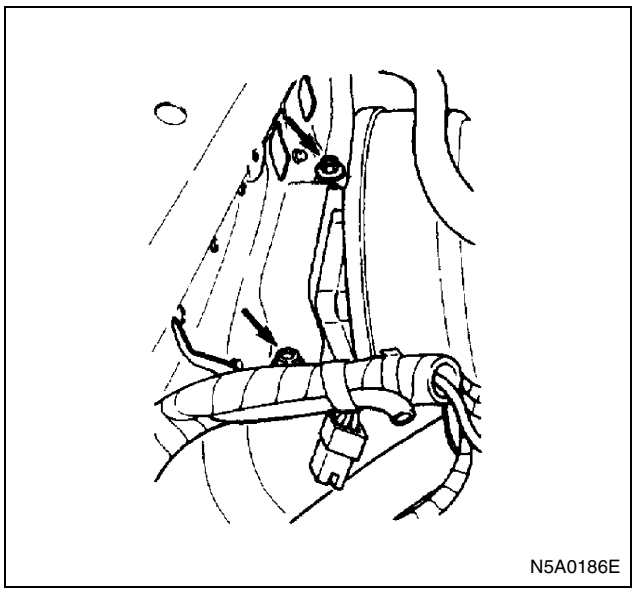
6) Install the master cylinder assembly to vacuum booster or brake pedal assembly.
7) Tighten the master cylinder nut to the specified torque.

Tighten:
Master cylinder nut to 14 N·m (1.4 kg·m / 122 lb·in)

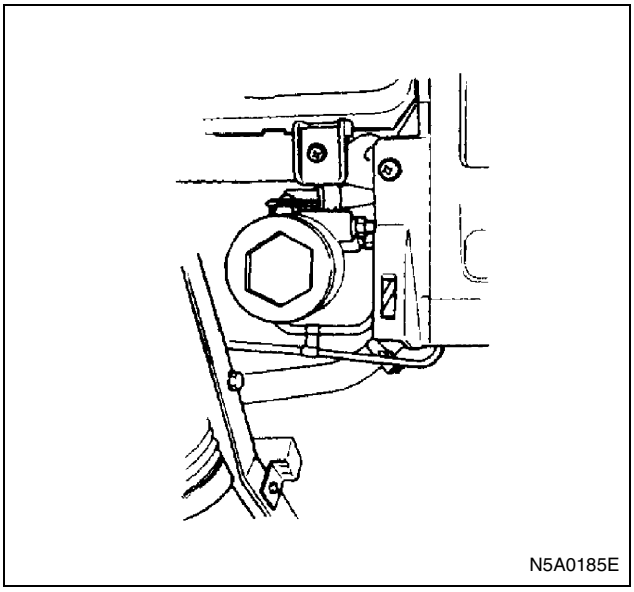


8) Install the vacuum booster and brake pedal assembly.

Tighten:
Vacuum booster and brake pedal assembly bolts to 42 N·m (4.3 kg·m / 32 lb·ft)



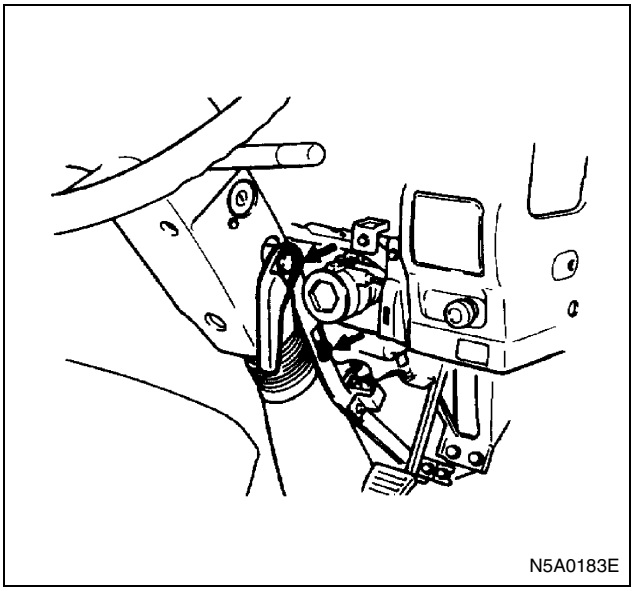
9) Connect the brake hoses and pipes.



N5A0185E

2. Steering Cowl Assembly
   1) Connect the wire harness connectors.
   2) Install the steering cowl.

Tighten:
Steering cowl bolt to 14 N·m (1.4 kg·m / 122 lb·in)



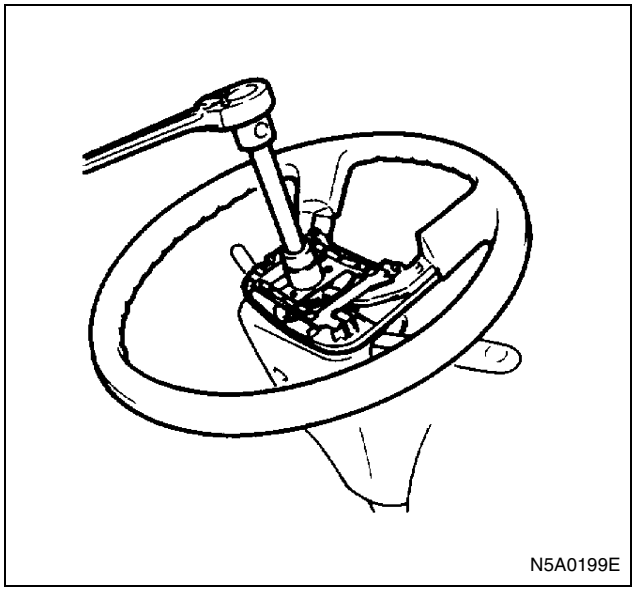
N5A0183E

   3) Install the tilt lever.

Tighten:
Tilt lever bolt to 45 N·m (4.6 kg·m / 33 lb·ft)

   4) Install the steering wheel.

Tighten:
Steering wheel nut to 49 N·m (5.0 kg·m / 36 lb·ft)

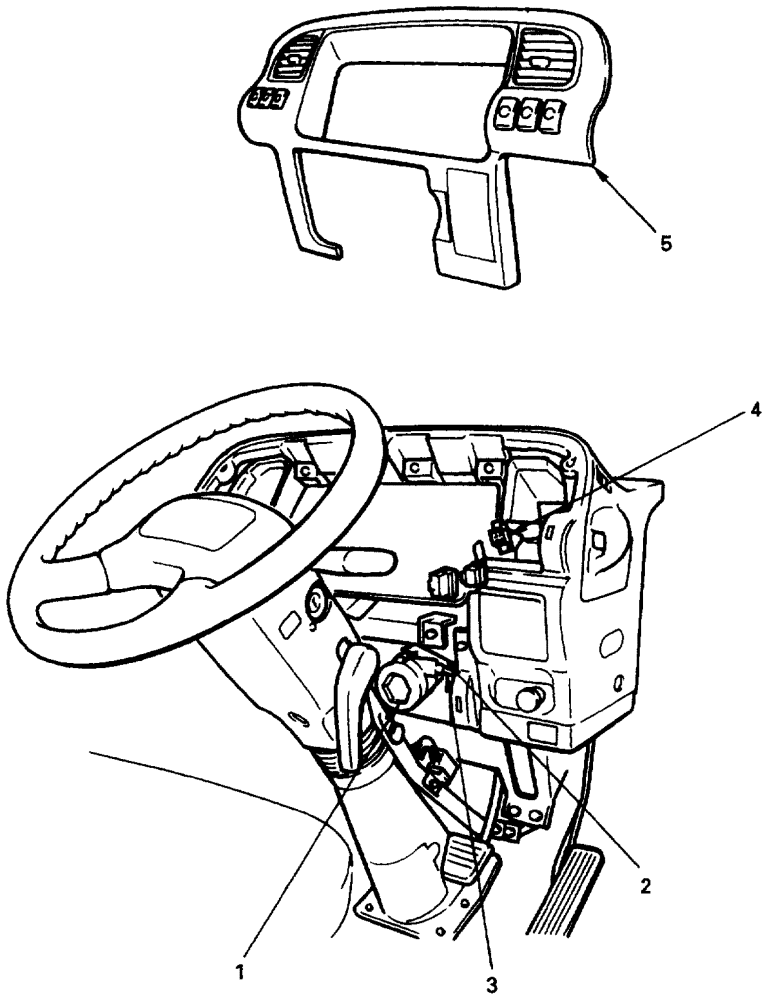


N5A0199E

3. Windshield Washer Tank
4. Brake and Clutch Fluid Reservoir
5. Center Duct (NPR model only)
6. Defroster Nozzle and Vent Duct
7. Stay
8. Instrument Panel
   For the installation procedure for above, refer to Section 2 CAB AND FRAME.

Master Cylinder Assembly

This illustration is based on RHD.



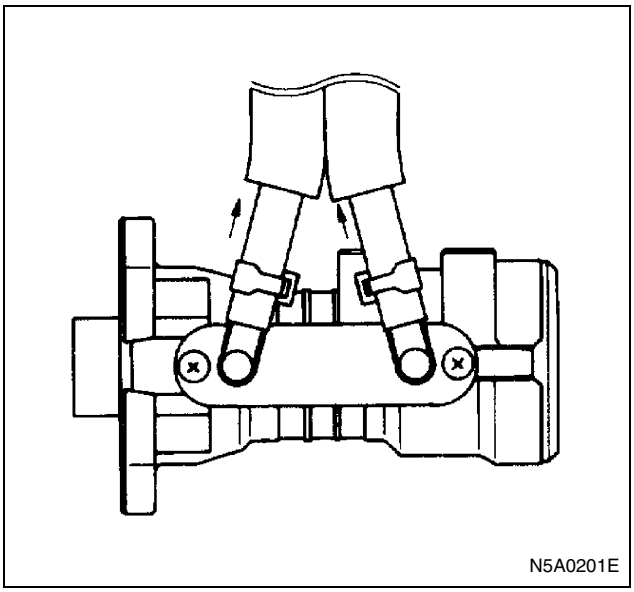
N5A0200E

Legend

1. Meter cluster
2. Switch connector
3. Brake pipe
4. Brake hose
5. Master cylinder

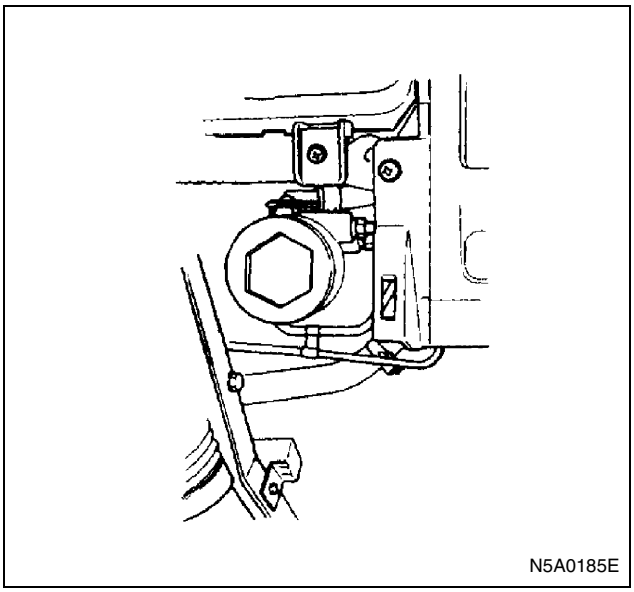
Removal

1. Meter Cluster
2. Switch connector
   For the removal procedure for above, refer to Section 2 CAB AND FRAME.
3. Brake Pipe



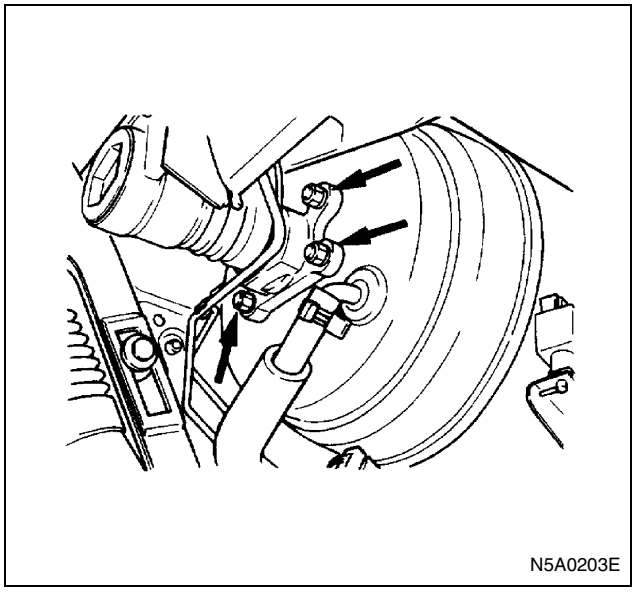
N5A0201E

4. Brake Hose
   1) Disconnect the brake pipes and hoses.
   2) Plug or cover the brake rubber hoses, pipes and the master cylinder brake fluid ports to prevent brake fluid spillage.
      If brake fluid spillage occurs, wipe it up immediately.



N5A0185E

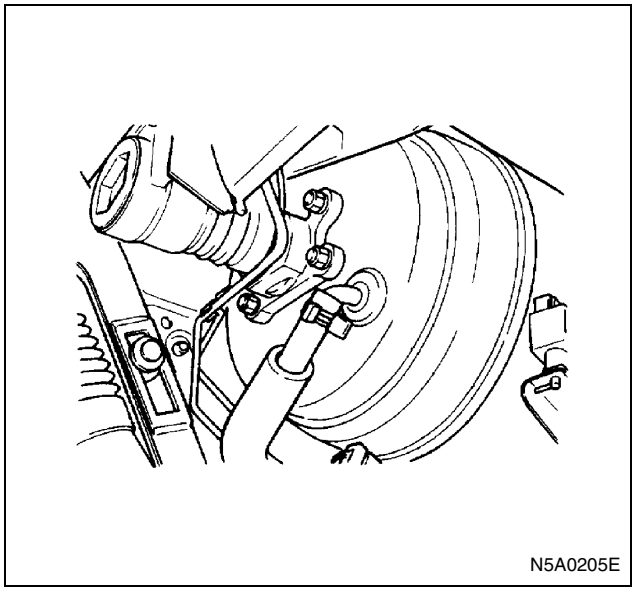
5. Master Cylinder



N5A0203E

Installation

1. Master Cylinder
   1) Install the master cylinder assembly to the vacuum booster or brake pedal assembly.



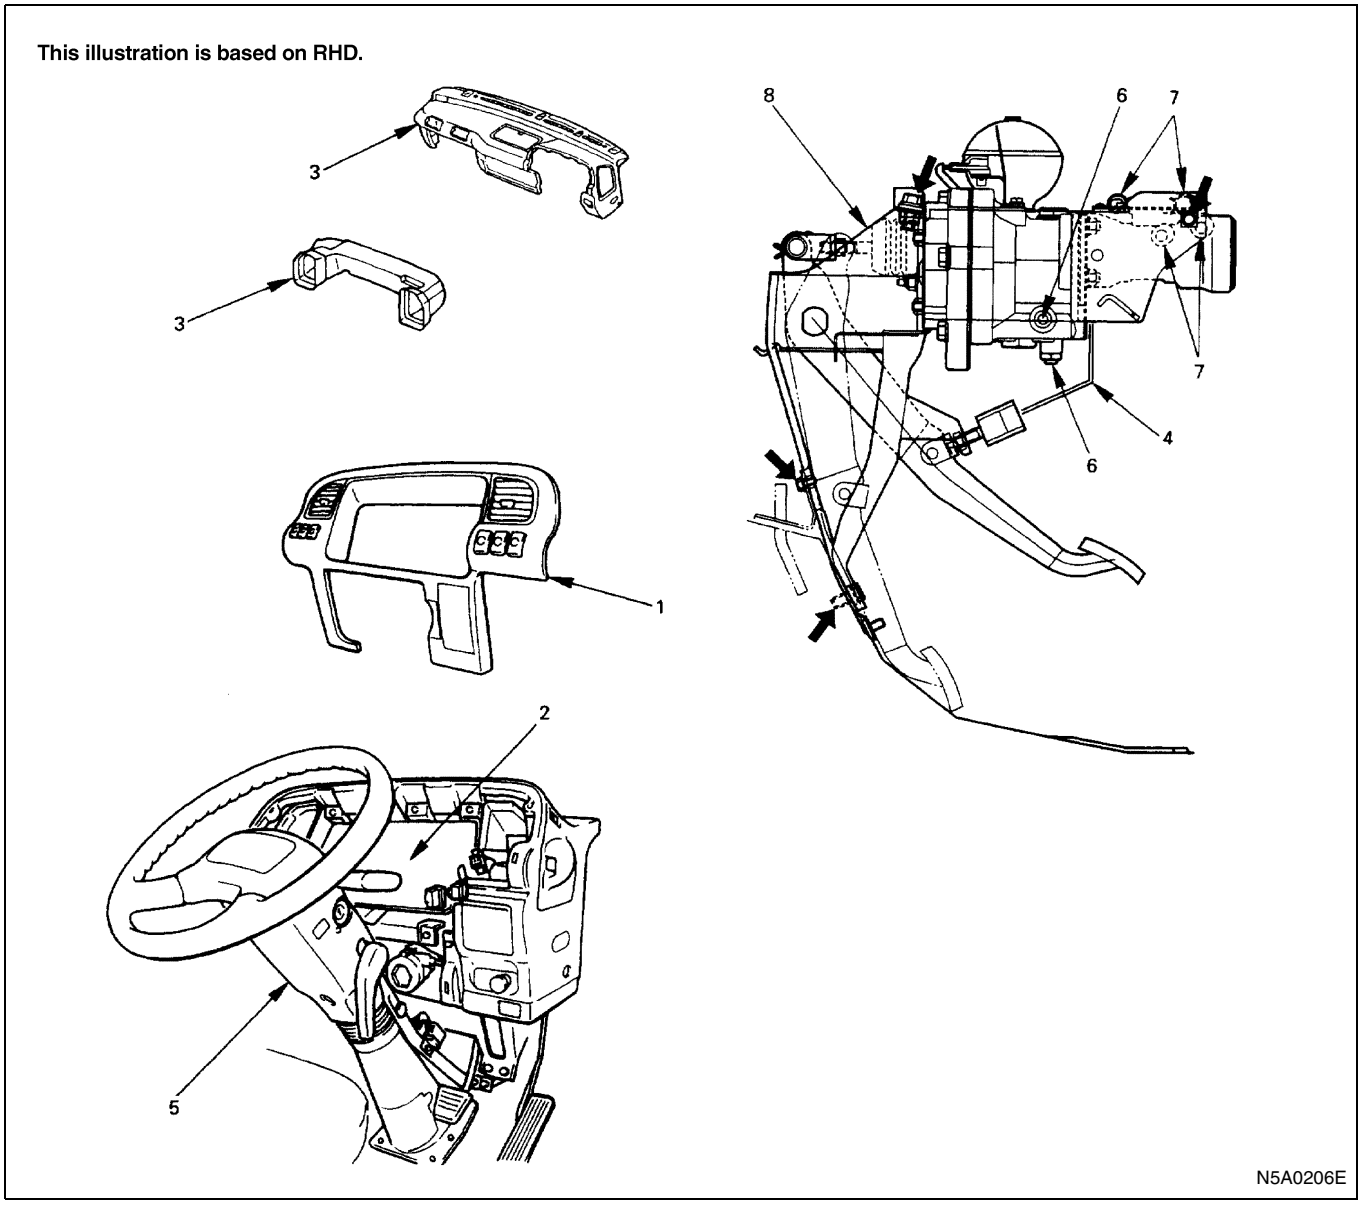
N5A0205E

   2) Tighten the nuts to the specified torque.

Tighten:
Master cylinder assembly nuts to 14 N·m (1.4 kg·m / 122 lb·in)

2. Brake Hose
3. Brake Pipe
4. Switch Connector
5. Meter Cluster

Hydraulic Booster and Brake Pedal Assembly



Legend

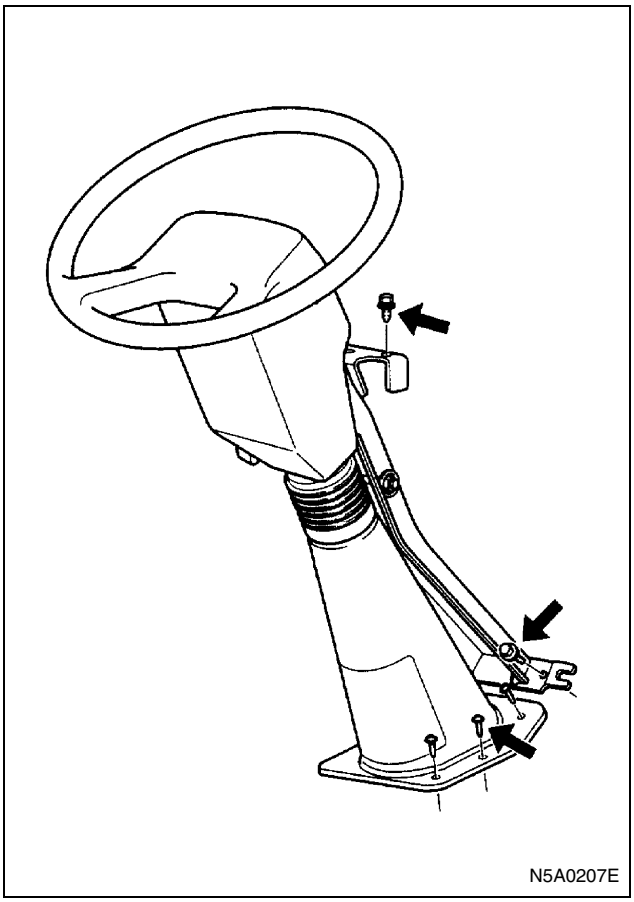
1. Meter cluster
2. Meter
3. Instrument panel and duct
4. Heat protector
5. Steering wheel and column assembly
6. ATF pipe
7. Brake pipe and hose
8. Brake pedal assembly with master cylinder and hydraulic booster

Removal

- Block the vehicle wheels and apply the parking brake.
- Disconnect the battery ground cable.
- By brake pedal operation with the engine off, reduce the pressure of the hydraulic oil in the accumulator, and after confirming that the temperature of the hydro boost assembly has been reduced, remove the hydro boost assembly from the vehicle.

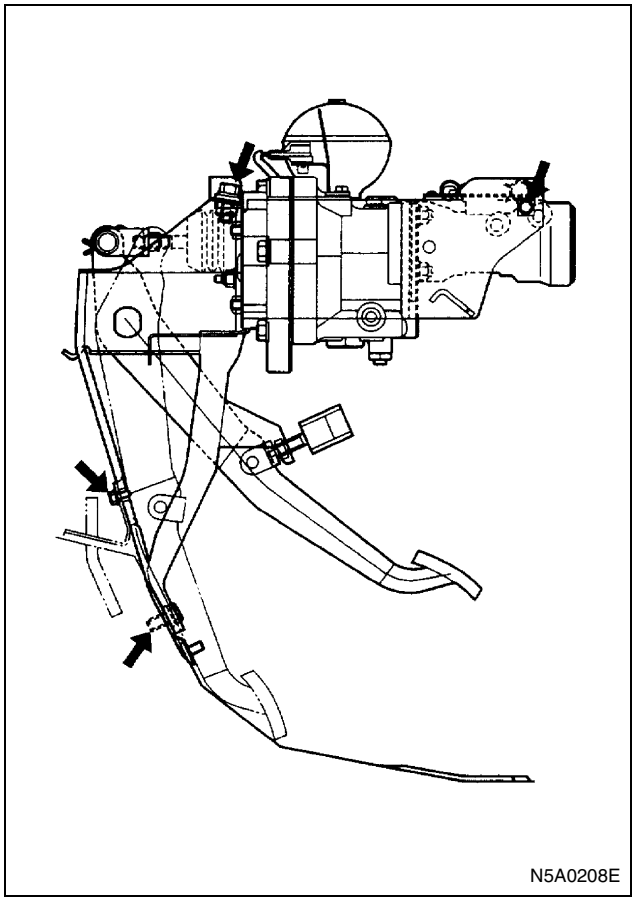
1. Remove meter cluster.
2. Remove meter assembly and harness connector.
3. Remove instrument panel assembly and ventilation duct.
4. Remove heat protector under the hydraulic booster.
5. Steering wheel and column assembly.
   - Remove inspection window and mark steering worm shaft and U-joint yoke.
     Remove key bolt and nut.
   - Remove screws: boots to floor.

- Remove bolts and nuts: support bracket to floor.
- Remove bolts: steering column bracket to instrument reinforcement assembly.
- Remove bolts: steering column bracket to brake pedal bracket.



N5A0207E

6. ATF pipe: inlet and outlet.
   - Disconnect pipes from the booster.
7. Brake pipe and hose: front and rear.
   - Disconnect pipes and hoses from the brake master cylinder.
8. Brake pedal assembly with master cylinder and hydraulic booster.
   - Remove accelerator pedal bracket.
   - Remove brake pedal assembly mounting bolts.
   - Remove radiator grille and disconnect ATF inlet pipe from flexible hose in front of the radiator.
     Remove ATF inlet pipe.
   - Remove brake pedal assembly.



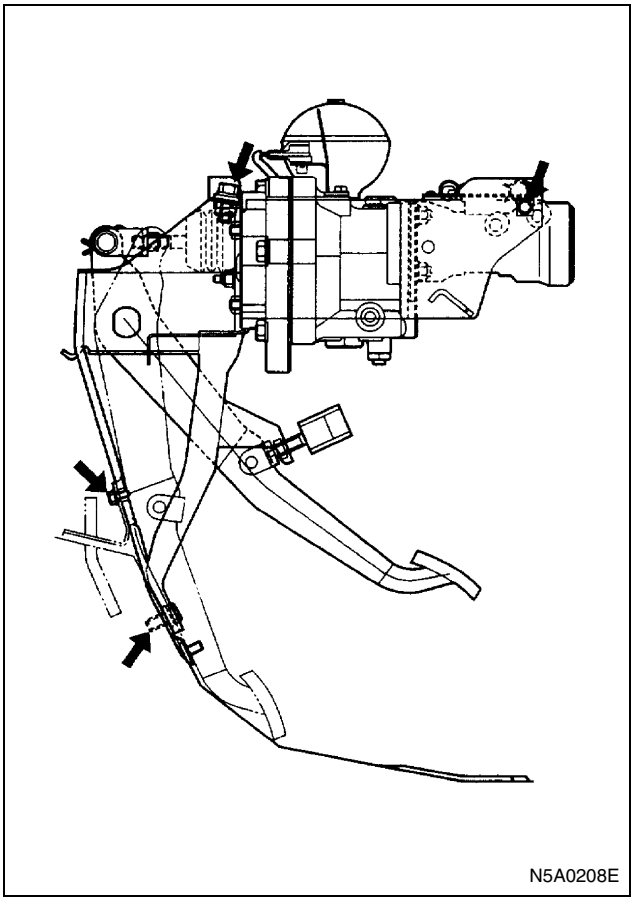
N5A0208E

Installation

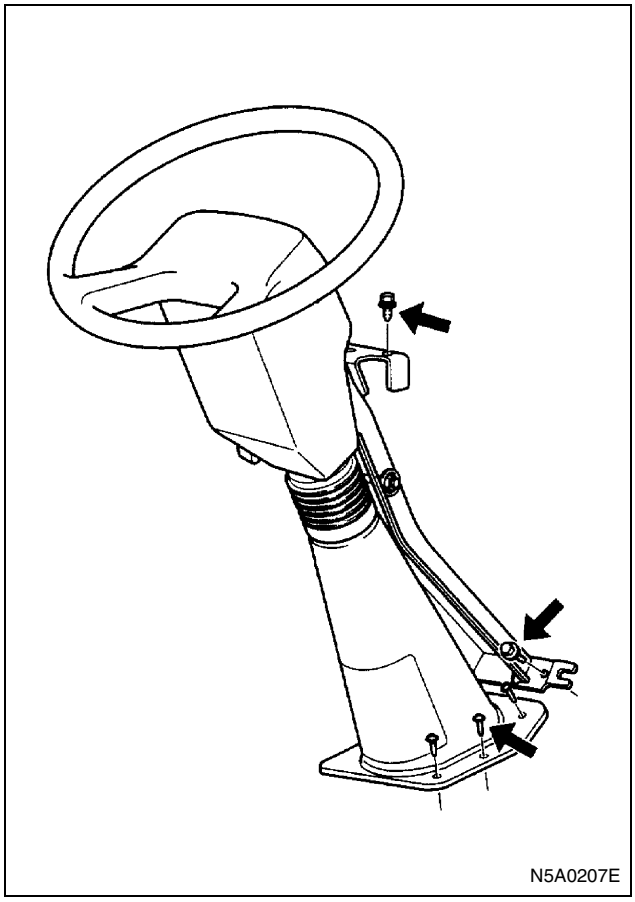
1. Brake Pedal Assembly with Master Cylinder and Hydraulic Booster
   - Set ATF inlet pipe and install brake pedal assembly.

Tighten:
M10 mounting bolts to 42 N·m (4.3 kg·m / 32 lb·ft)

- Connect ATF inlet pipe with flexible hose.
- Install accelerator pedal bracket.
- Install radiator grille.



N5A0208E



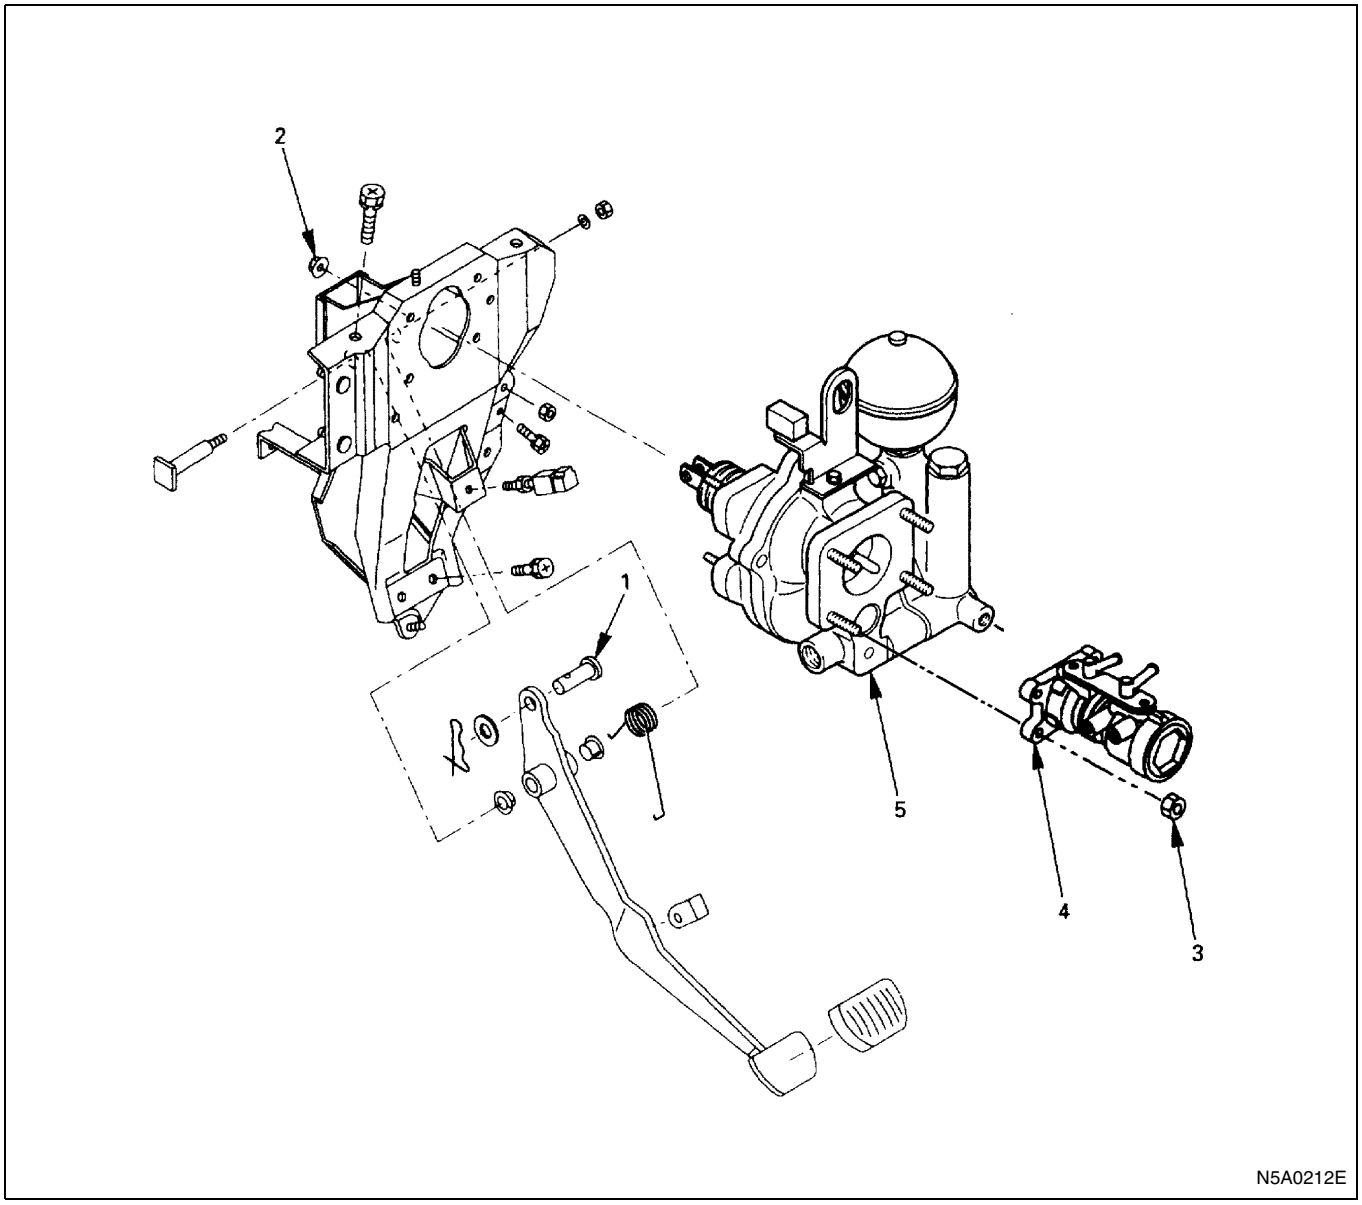
N5A0207E

2. ATF Pipe
   - Install ATF pipes to hydraulic booster.
3. Brake Pipe and Hose
   - Install master cylinder hydraulic lines to master cylinder.
4. Steering Wheel and Column Assembly
   - Set steering wheel and column assembly.
   - Install mounting bolts, nuts and screws to body.
   - Install key bolt and nut.

Tighten:
Key bolt to 38 N·m (3.9 kg·m / 28 lb·ft)

   - Install inspection window.
5. Heat Protector
   - Install hydraulic booster heat protector.
6. Instrument Panel and Duct
   - Install ventilation duct and instrument panel assembly.
7. Meter
   - Install meter assembly and harness connector.
8. Meter Cluster
   - Install meter cluster.
9. Battery ground cable.
10. After attaching it to the vehicle, always replenish with new hydraulic oil (Besco ATF III), and completely release the air from the hydro boost.
11. Bleed brake lines.
12. Release the parking brake and remove the wheel blocks.

Hydraulic Booster

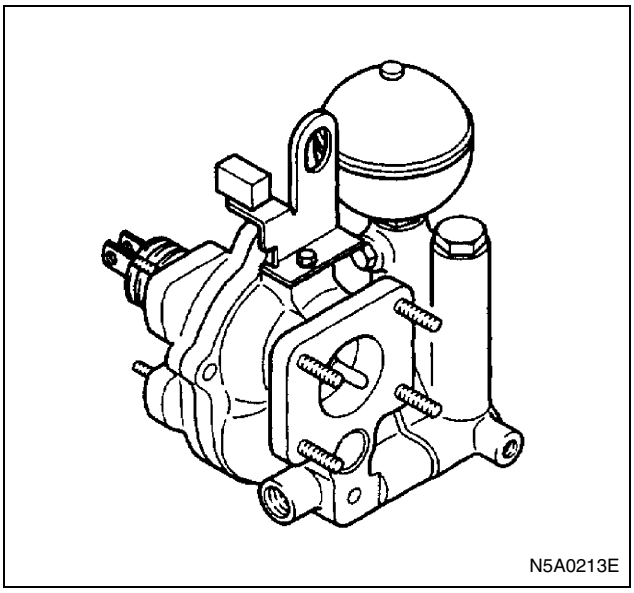


Legend

1. Clevis pin
2. Hydraulic booster nut
3. Master cylinder nut
4. Master cylinder
5. Hydraulic booster

Removal

1. Clevis Pin
2. Hydraulic Booster Nut
   - Four hydraulic booster mounting nuts at pedal bracket.
   - Remove master cylinder with hydraulic booster.
3. Mastcr Cylinder Nut
   - Four nuts retaining master cylinder to hydraulic booster.
4. Master Cylinder
5. Hydraulic Booster



Installation

1. Hydraulic Booster
2. Master Cylinder Assembly
3. Master Cylinder Nut

Tighten:
Master cylinder nut to 14 N·m (1.4 kg·m / 122 lb·in)

4. Hydraulic Booster Nut
   - Four hydraulic booster mounting nuts to pedal bracket.

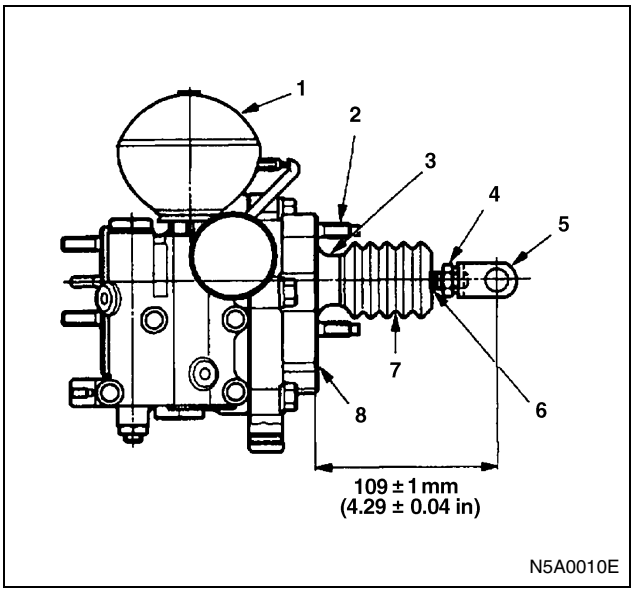
Tighten:
Hydraulic booster nut to 14 N·m (1.4 kg·m / 122 lb·in)

5. Clevis Pin
   - Connect hydraulic booster clevis to brake pedal and install clevis pin.

Accumulator and O-ring Replacement

Removal

- Block the vehicle and apply the parking brake.
- Disconnect the battery ground cable.
- Reduce the pressure of the hydraulic oil in the accumulator by brake pedal operation with the engine off, and after confirming that the temperature of the hydro boost assembly has been reduced, remove the hydro boost assembly from the vehicle.
  1) Remove meter cluster.
  2) Remove meter assembly and harness connector.
  3) Remove ventilation duct.
  4) Using an oil filter wrench, remove accumulator and O-ring.



Legend

1. Accumulator
2. Stud bolt
3. Cover boss
4. Lock nut
5. Clevis
6. Operating rod
7. Guard
8. Flange

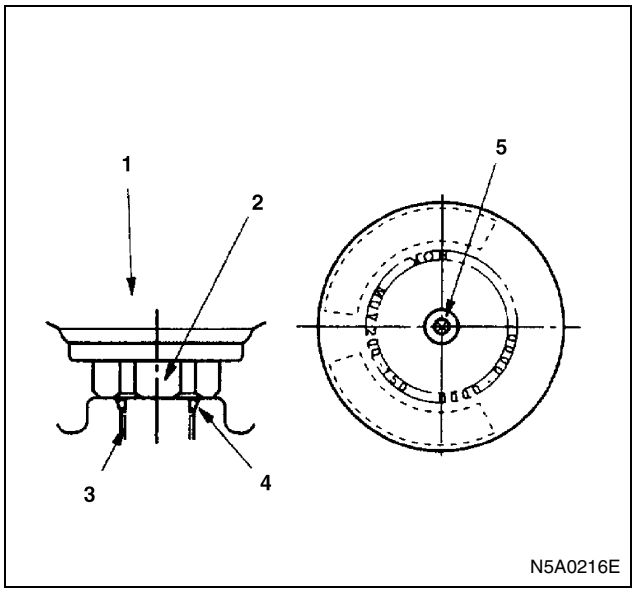
Installation

1. Verify that there is no foreign matter adhering to the screw part of the accumulator or to the attachment part on the booster side.
2. Put an O-ring coated with new hydraulic oil (ATF DEXRON®-III) into the screw part of the accumulator, being careful not to damage it.
   Always use a new O-ring.
3. Using an oil filter wrench, hold the accumulator shell fixed, and tighten it via the wrench to the specified torque.

Tighten:
Accumulator to 29 N·m (3.0 kg·m / 22 lb·ft)

4. Install ventilation duct.
5. Connect harness connector and install meter assembly.
6. Install meter cluster.
7. Connect the battery ground cable.
8. After attaching it to the vehicle, always replenish with new hydraulic oil (ATF DEXRON®-III), and completely release the air from the hydro boost.
9. Release the parking brake and remove the wheel blocks.

Notice:
How to dispose of the accumulator
To dispose of the accumulator, drill a hole in the position shown in the diagram according to the indications printed on the accumulator, completely release the nitrogen gas scaled inside the accumulator, then dispose of the accumulator.
Concerning disposal with the hydro boost assembly as well, dispose of it after first letting out all the nitrogen gas inside the accumulator, by the above method.



Legend

1. Accumulator
2. HEX25
3. Thread
4. O-ring
5. Drilling point for gas releasing

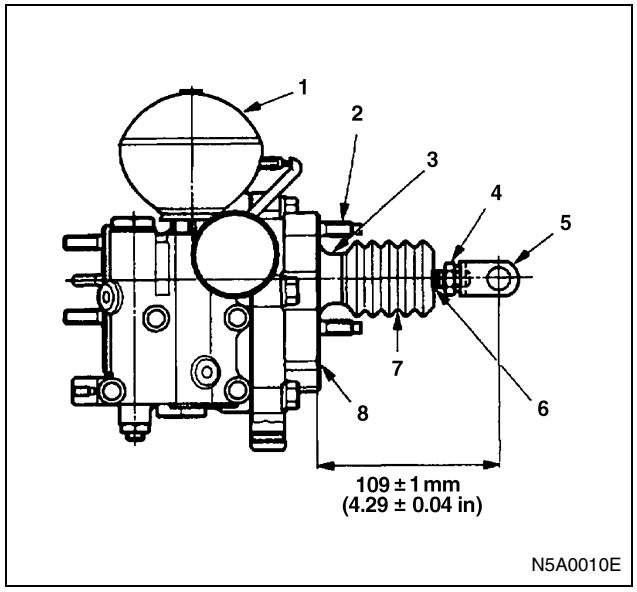
Clevis and Lock Nut Replacement

Removal

1. Remove hydraulic booster assembly.
   Refer to “Removal” of Hydraulic Booster in this section.
2. Secure the hydro boost assembly to the jig using the four stud bolts on the surface of the flange for attachment to the vehicle.
3. Being careful not to exert any off-center load on the operating rod, loosen the lock nut and remove the clevis and lock nut.

Installation

1. Screw the lock nut and then the clevis onto the operating rod.



Legend

1. Accumulator
2. Stud bolt
3. Cover boss
4. Lock nut
5. Clevis
6. Operating rod
7. Guard
8. Flange

2. Adjust so that the booster clevis position dimension (the distance to the center of the clevis hole from the surface of the flange for attachment to the vehicle) is 109 ± 1 mm (4.29 ± 0.04 in), and tighten the lock nut with the prescribed torque.
   When tightening the lock nut, be careful not to deform the clevis.

Tighten:
Lock nut to 20 N·m (2.0 kg·m / 14 lb·ft)

3. Attach the hydro boost assembly to the vehicle. Refer to “Installation” of Hydraulic Booster in this section.

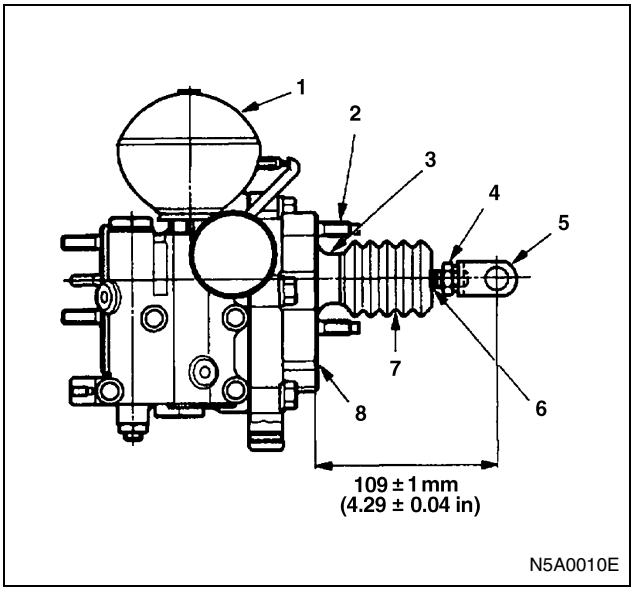
Guard Replacement

Removal

1. Remove hydraulic booster assembly.
   Refer to “Removal” of Hydraulic Booster in this section.
2. Secure the hydro boost assembly to the jig using the four stud bolts on the surface of the flange for attachment to the vehicle.
3. Being careful not to exert any off-center load on the operating rod, loosen the lock nut and remove the clevis and lock nut.
4. Remove the guard from the cover boss anchoring groove and from the operating rod anchoring groove, and pull it out.

Installation

1. With a dry cloth, clean well the cover boss anchoring groove and the operating rod anchoring groove, and verify that no foreign matter is present.
2. Insert from the large diameter hole side of the guard end-face into the operating rod outside diameter part, assemble the small diameter hole part of the guard end-face into the anchoring groove of the operating rod, then assemble the large diameter hole part securely into the anchoring groove of the boss of the cover.
3. Screw the lock nut and then the clevis onto the operating rod.



Legend

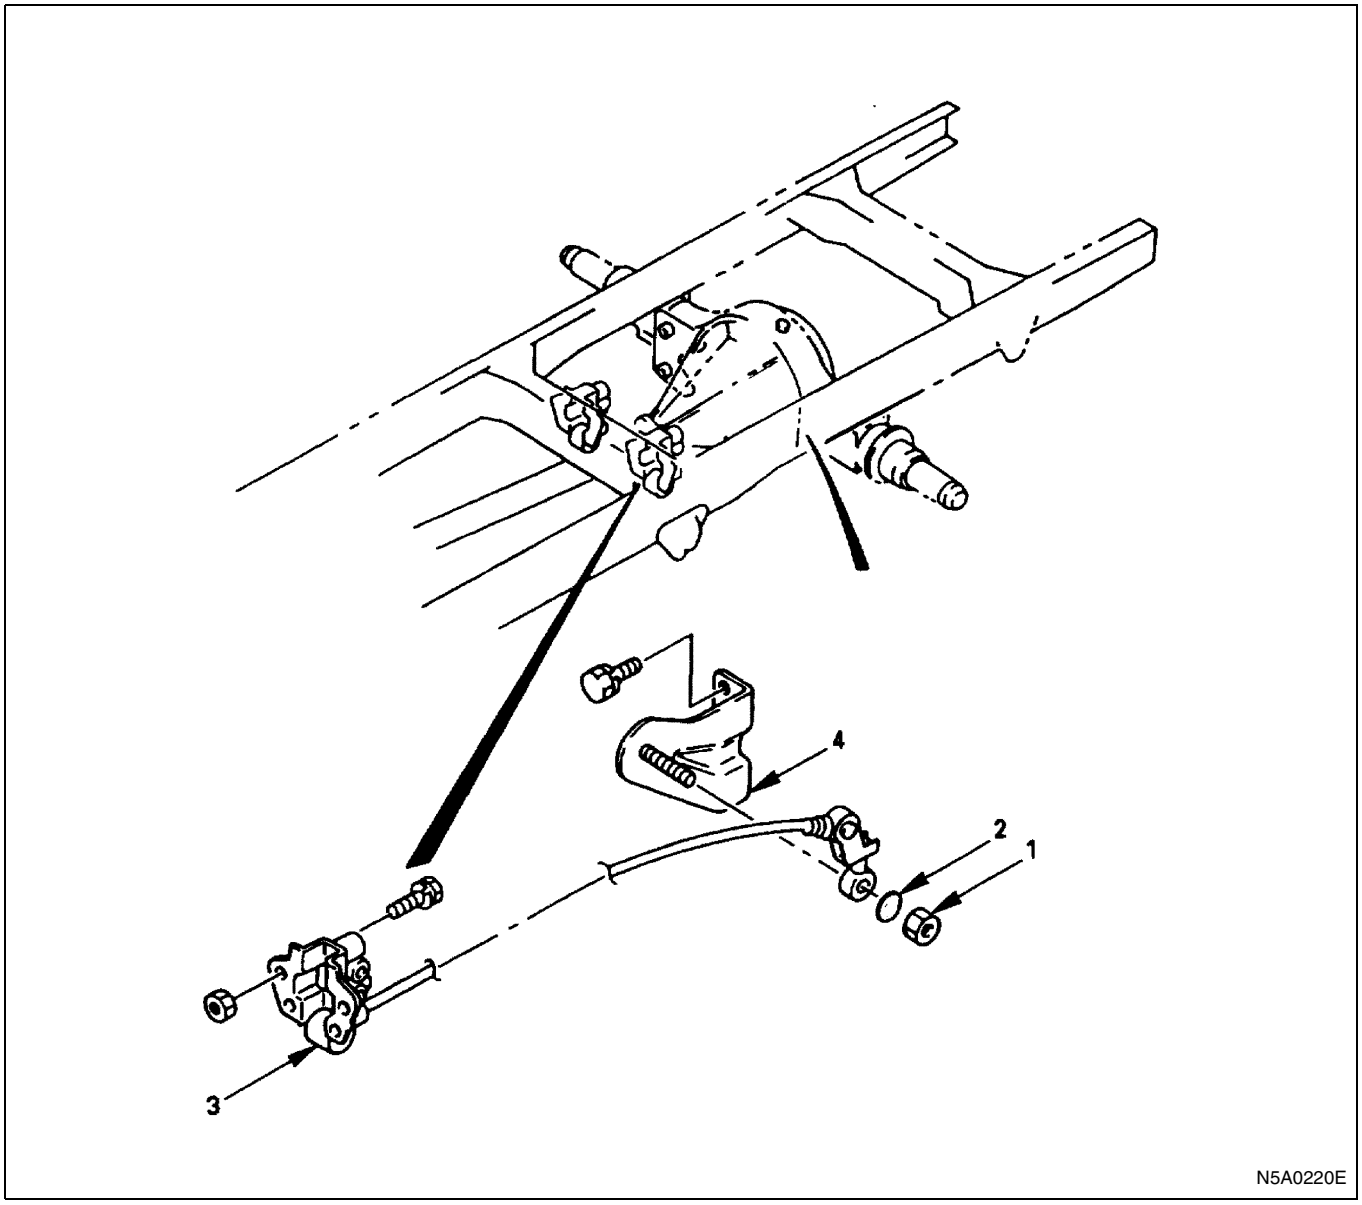
1. Accumulator
2. Stud bolt
3. Cover boss
4. Lock nut
5. Clevis
6. Operating rod
7. Guard
8. Flange

4. Adjust so that the booster clevis position dimension (the distance to the center of the clevis hole from the surface of the flange for attachment to the vehicle) is 109±1 mm (4.29 ± 0.04 in), and tighten the lock nut with the prescribed torque. When tightening the lock nut, be careful not to deform the clevis.

Tighten:
Lock nut to 20 N·m (2.0 kg·m / 14 lb·ft)

5. Attach the hydro boost assembly to the vehicle. Refer to “Installation” of Hydraulic Booster in this section.

Load Sensing Proportioning Valve



Legend

1. Nut
2. Washer
3. Load sensing proportioning valve
4. Bracket

Removal

1. Nut
2. Washer
3. Load sensing Proportioning Valve
4. Bracket

Installation

To install, follow the removal steps in the reverse order.

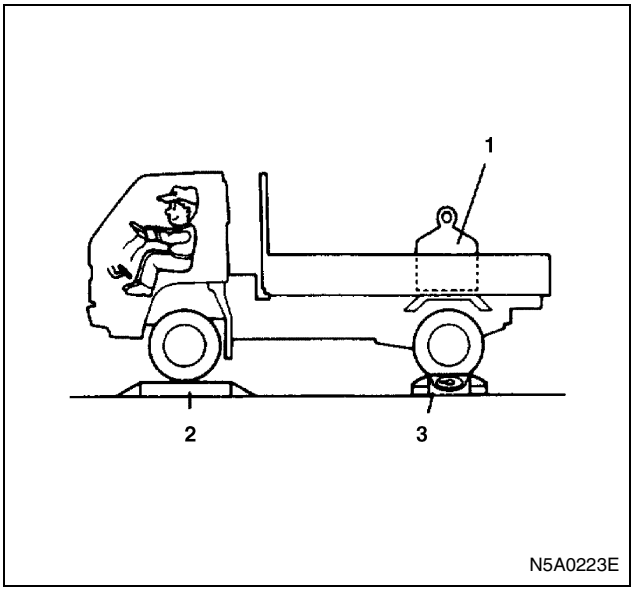
Adjustment

1. Fluid Pressure Measurement
   1) Rear axle weight adjustment

With an axle weight meter, adjust the rear axle weight with a person sitting in the driver's seat and a weight loaded in the rear body.

	N (kg/lb)
Adjustment value	(A)

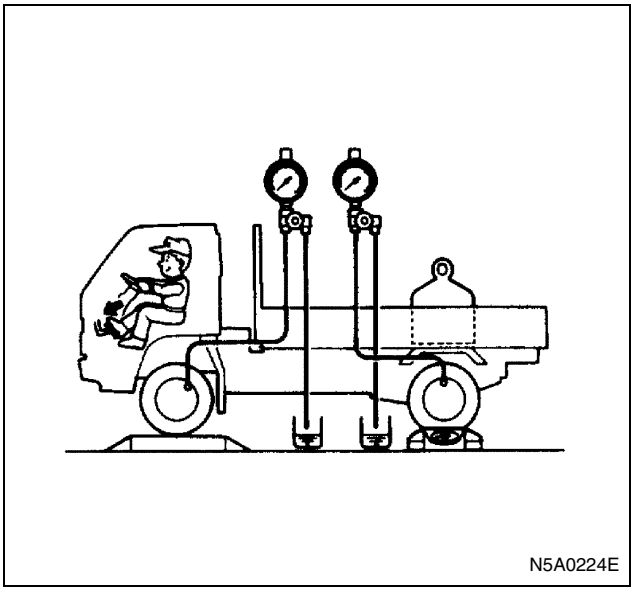
For (A), refer to the adjustment standard table.



Legend
1. Weight
2. Platform (which is the same height as the axle weight meter)
3. Axle weight meter

2) Installation of a fluid pressure gauge
Remove the air bleeder of the left hand wheel front and rear brakes. Bleed air out of the fluid pressure gauge with the measurement hose of the fluid pressure gauge installed.

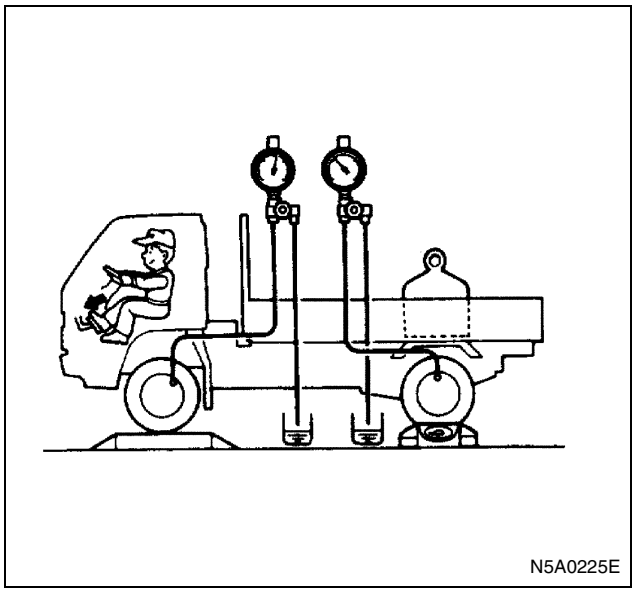
Pressure Tester: Brake oil (Fluid pressure gauge) 5-8840-2190-0



3) Rear wheel cylinder fluid pressure measurement
Step on the brake pedal until the fluid pressure of the front wheel cylinder gets to 7845 kPa (80 kg/cm^2 / 1138 psi), and check the rear wheel cylinder fluid pressure. (Read the value of the front wheel cylinder fluid pressure 2 seconds after the measurement. When measuring the L.S.V fluid pressure, keep the brake pedal pressed down without stepping it down twice or releasing it.)

Rear Wheel Cylinder Fluid Pressure	kPa (kg/cm^2/ psi)
Standard	(B)

For (B), refer to the adjustment standard table.

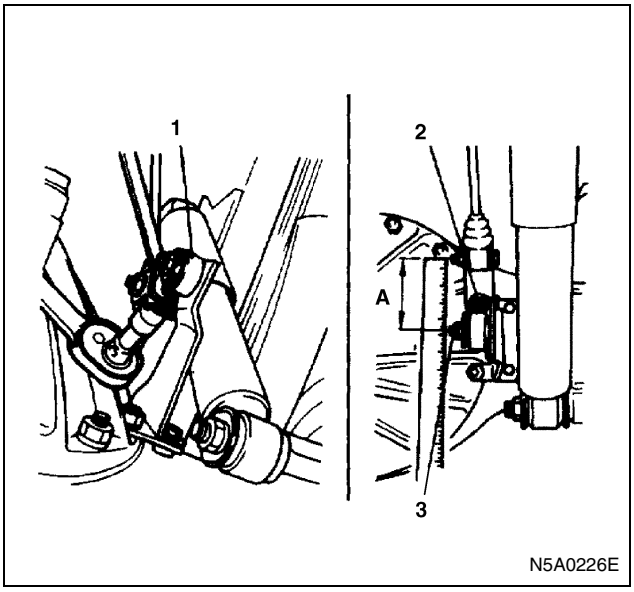


2. Oil Pressure Adjustment
1) L.S.V spring shackle adjustment
Loosen the adjust nut of the L.S.V spring shackle, and adjust the length of the L.S.V spring shackle.
When the oil pressure is insufficient, turn the adjust nut clockwise to extend the span “A”. When the oil pressure is too high, turn the adjust nut counterclockwise to reduce the span “A”.

	mm (in)
Item	Span adjusted
Standard of span “A”	78 (3.07)
Range adjustable	72 — 84 (2.83 — 3.31)

After adjustment, tighten the lock nut securely and install the cotter pin.

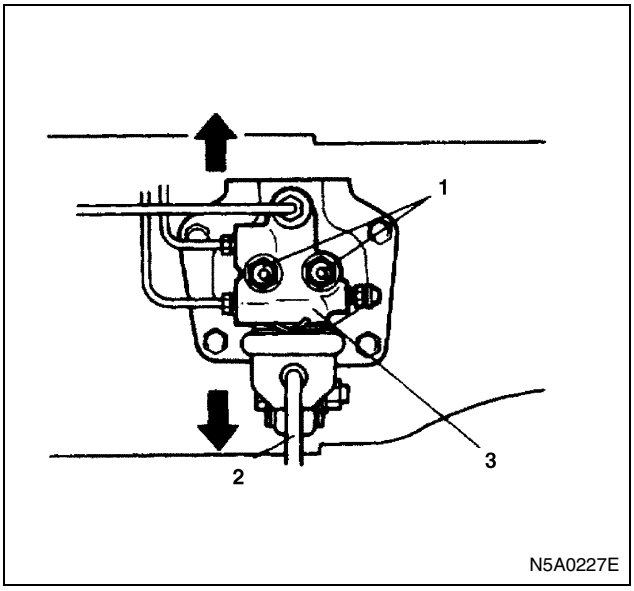
Tighten:
Lock nut to Max. 10 N·m (1.0 kg·m / 87 lb·in)



Legend
1. L.S.V spring shackle
2. Adjust nut
3. Lock nut

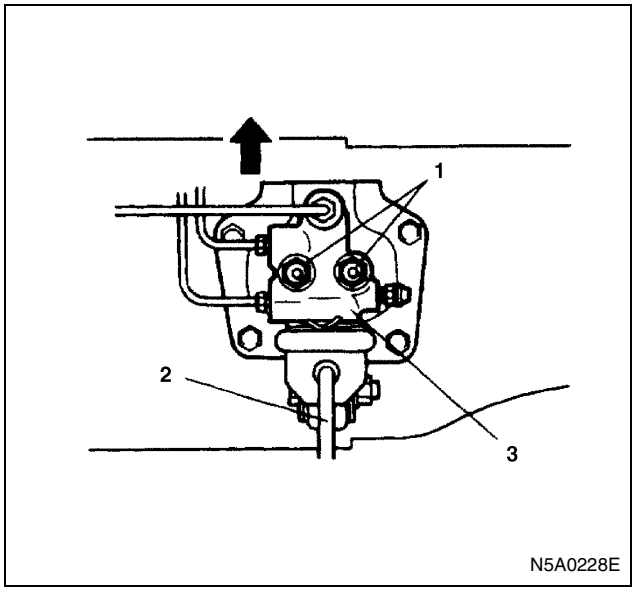
2) L.S.V adjustment
When the adjustment cannot be done with the L.S.V spring shackle, loosen the L.S.V adjust nut (2 pcs.) and adjust the oil pressure to the standard value by sliding the L.S.V up and down. After the L.S.V adjustment, readjust the length of the L.S.V spring shackle.

Tighten:
L.S.V adjust nut to 13 N·m (1.3 kg·m / 113 lb·in)



Legend
1. L.S.V adjust nut
2. L.S.V spring
3. L.S.V

3. Unit Inspection of L.S.V
1) Loosen the L.S.V adjust nut (2 pcs.). And then lift the L.S.V up fully and tighten it up tentatively so that the L.S.V spring will not move.

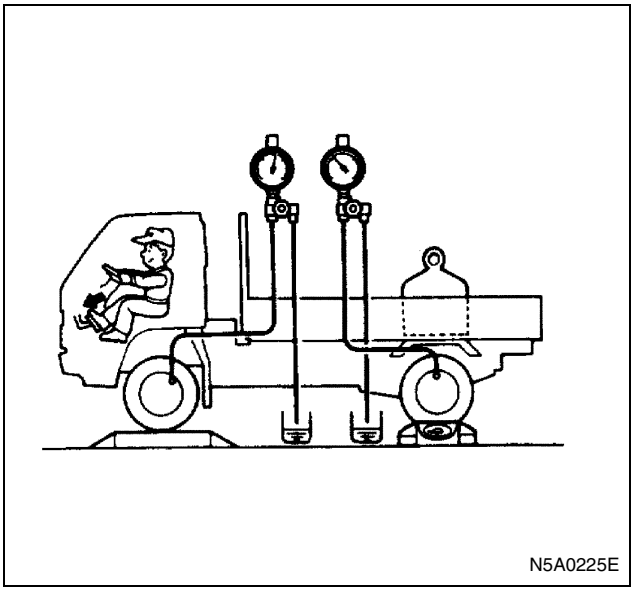


Legend
1. L.S.V adjust nut
2. L.S.V spring
3. L.S.V

2) Under the same conditions as 1) above, check the rear wheel cylinder fluid pressure.

Standard	
Master cylinder fluid pressure kPa (kg/cm^2/psi)	Rear fluid pressure kPa (kg/cm^2/psi)
2942 (30 / 427)	(C)
7845 (80 / 1138)	(D)

For (C) and (D), refer to the adjustment standard table.



Adjustment Standard Table

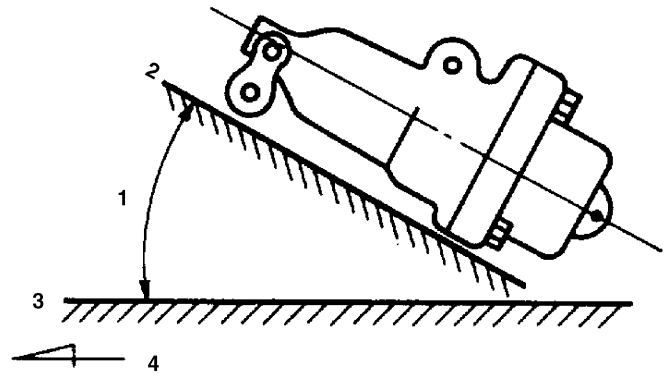
Deceleration Sensing Proportioning Valve

DSPV Mounting Angle



N5A0230E

Legend

1. Mounting angle
2. Mounting surface
3. Ground surface
4. Front

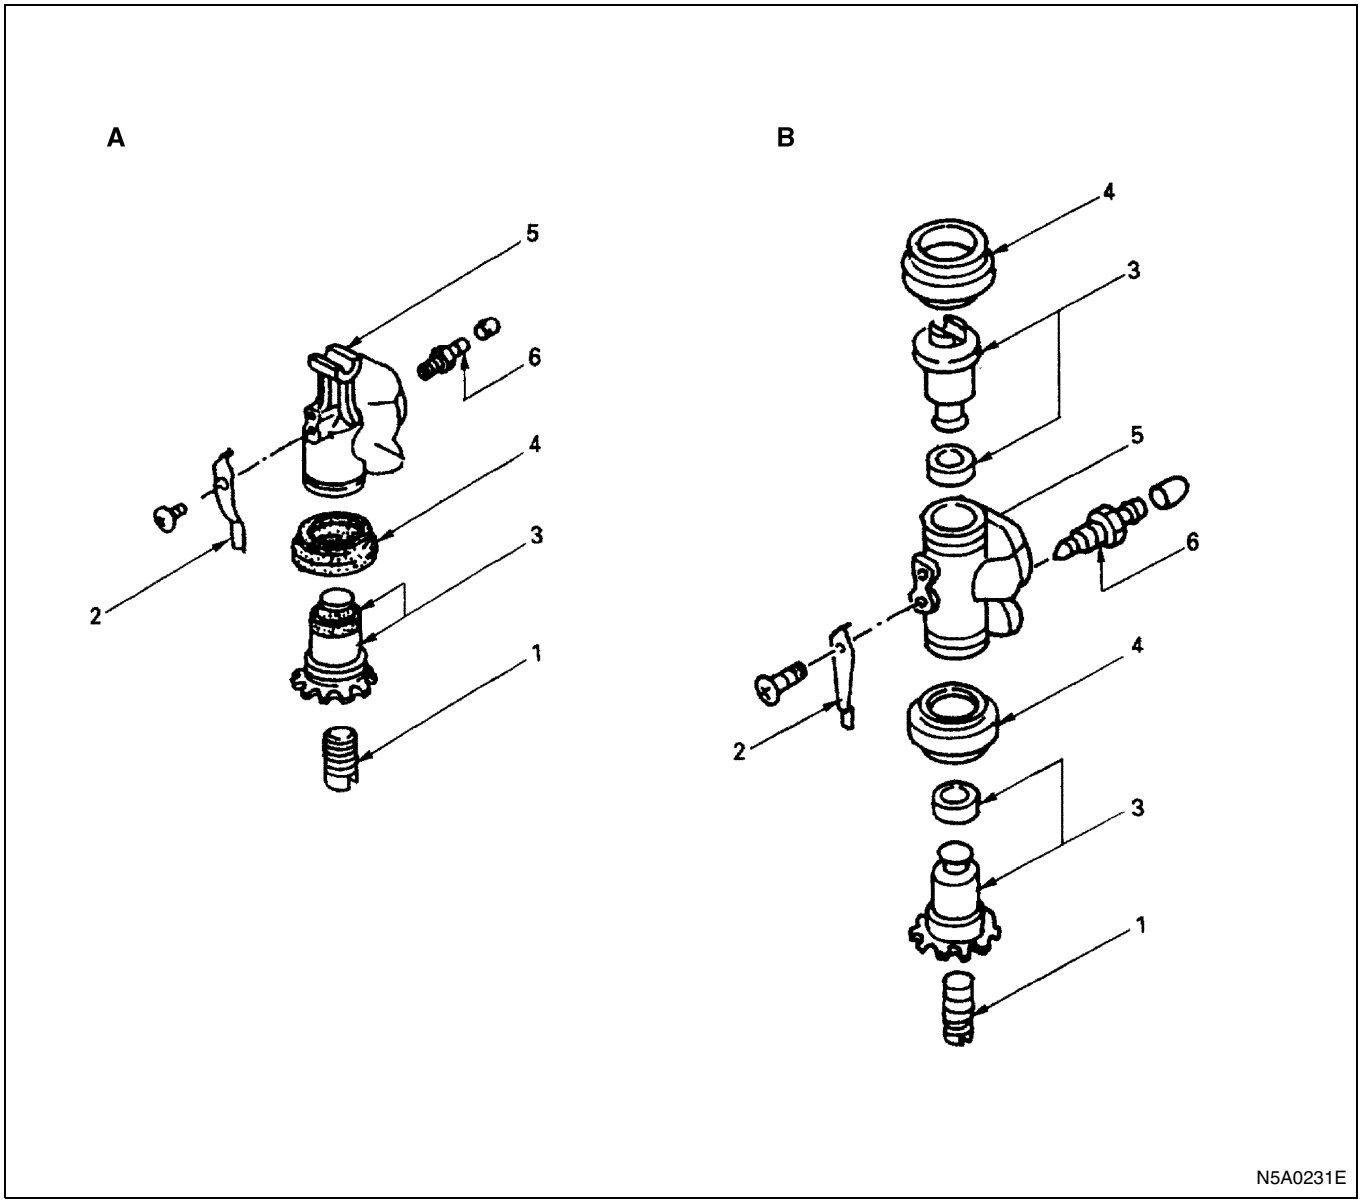
Models	Mounting Angle
NHR	12°00′±45′
NKR	12°30′±45′

Conduct the following inspections, and if any abnormality is found, replace.

Condition	Procedure	Judgement
As installed in the vehicle	Measure braking force to make sure of normality.	If no braking force, adherence of ball (deceleration sensing) to seal is suspected.
	Bleed air also from the DSPV side of breather.	If no brake fluid does not come out, the same trouble as above is suspected.
	Check fluid leakage.	No problem, if there is no leak.
	Check mounting angle. (Refer to the table.)	If installed at an abnormal angle, though rare, specified braking force is unobtainable or DSPV does not work.
As not installed in the vehicle	Incline DSPV back and forth to see if the ball moves insides.	No problem, if a ball sound is heard from within.

UNIT REPAIR

Wheel Cylinder Assembly (without Auto-adjuster)



Legend

A. 2L type
B. D2L type

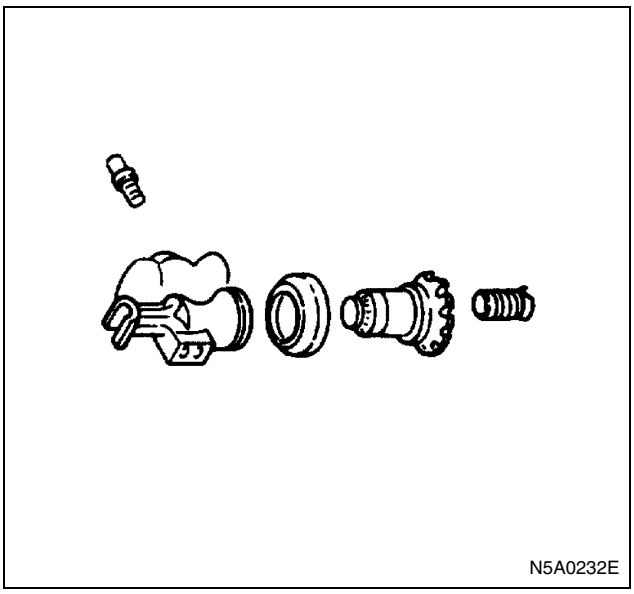
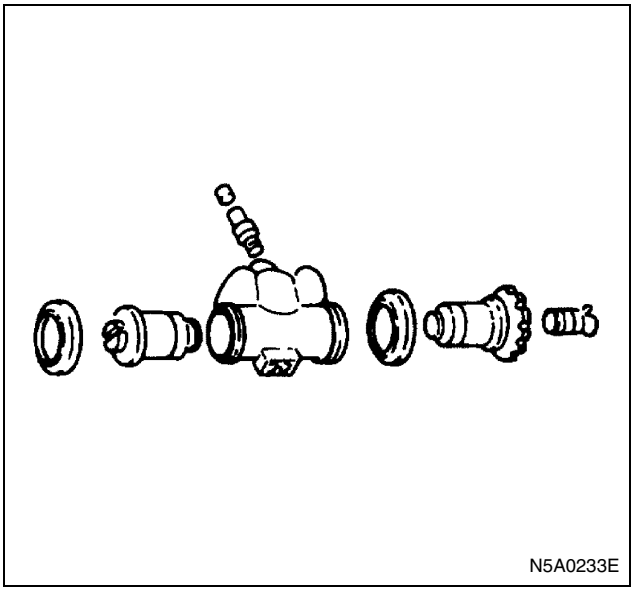
6. Bleeder screw

Disassembly

2L Type



D2L Type



1. Adjusting Screw
2. Lock Plate
3. Piston and cup Assembly
4. Boot
5. Wheel Cylinder Body
6. Bleeder Screw

Store all of the removed parts in a clean part tray.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

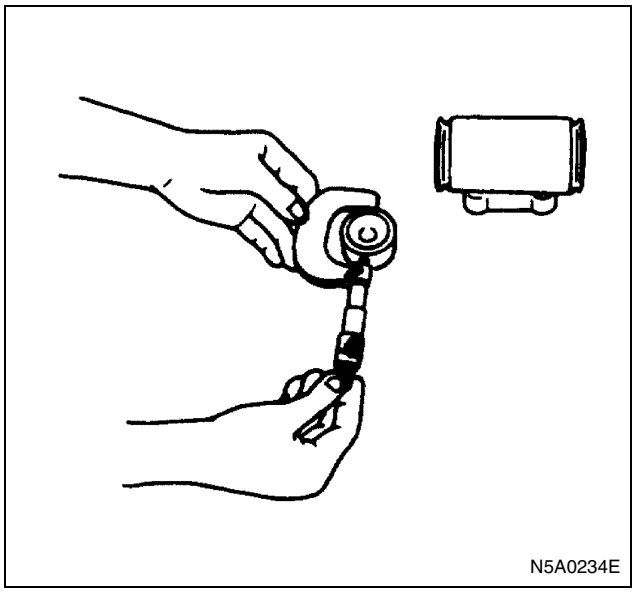
Wheel Cylinder Assembly

Wheel Cylinder and Piston Clearance

1. Use a micrometer to measure the piston diameter.
2. Use an inside dial indicator to measure the cylinder bore.
3. Calculate the clearance between the wheel cylinder and the piston.
   If the clearance exceeds the specified limit, the piston and/or wheel cylinder body must be replaced.

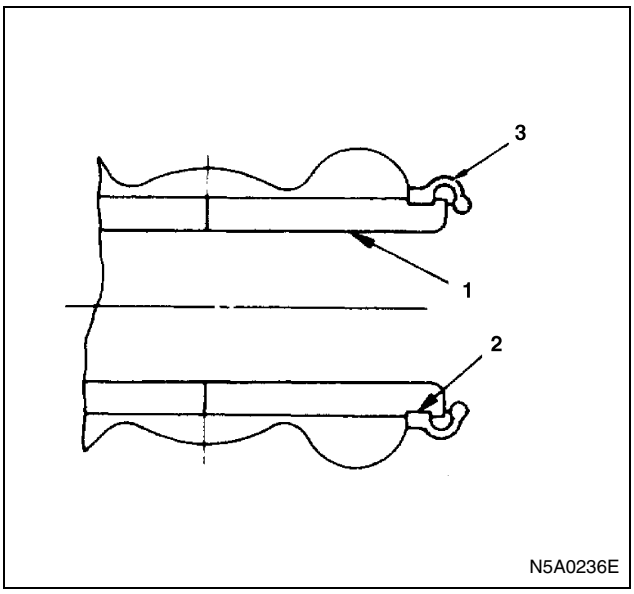
Wheel Cylinder and Piston Clearance mm (in)	
Wheel Cylinder size	Limit
22.22 (0.875) 25.40 (1.000) 28.57 (1.125) 30.16 (1.188) 33.33 (1.312) 34.93 (1.375)	0.15 (0.006)

When the wheel cylinder disassembled, the repair kit (piston cup and boot) must be replaced.



Reassembly

1. Bleeder Screw
2. Wheel Cylinder Body
   1) Apply a coat of rubber grease to the cylinder body bore (1) and the grooves for the boots (2).
   2) Fit the boot edge securely into the mating groove of the cylinder body.



Legend
1. Cylinder body bore
2. Groove
3. Boot

3. Boot
4. Piston Assembly
   1) Apply a coat of rubber grease to the piston cups and the pistons.
      Be sure to lubricate the entire cylinder body bore with the rubber grease.
   2) Install the piston assembly to the cylinder.

Notice:
After installation of the piston assembly into the cylinder body bore, fit the boot edge securely into the mating groove of the piston.

Make sure that the two boot edges firmly sealed into the grooves.

Be careful not to damage the piston cups and the boots.

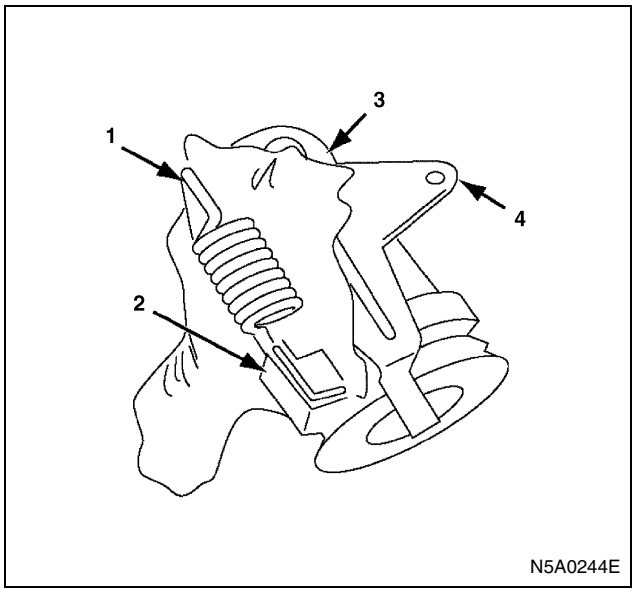
Disassembly of piston on adjust side (Drum inside diameter 300, 320 mm)

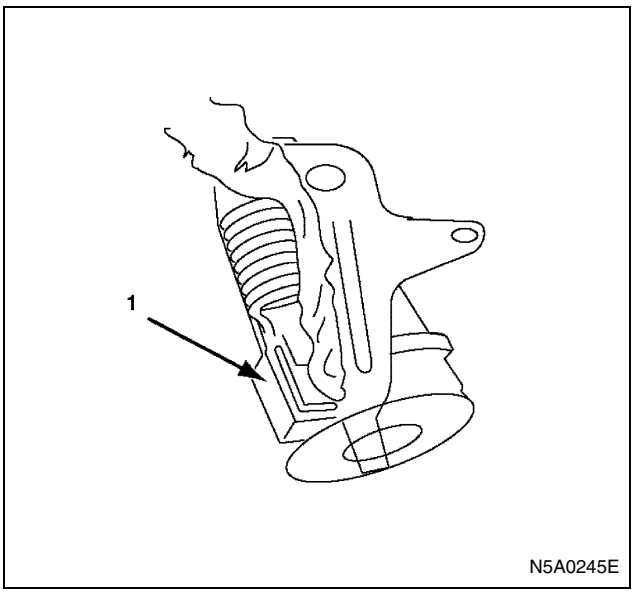
1. Fit the waste cloth between the lever and spring not to damage each parts.



Legend

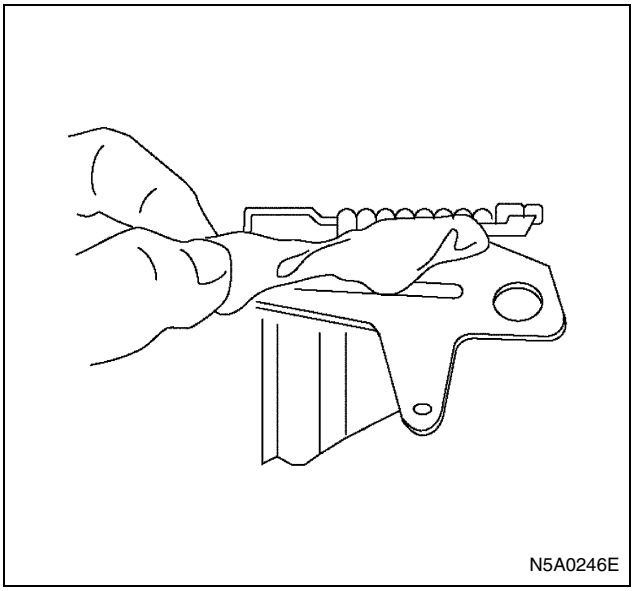
1. Spring
2. Bracket
3. Lever fixing bolt
4. Lever

2. Disassemble the lever fixing bolt.
3. Remove the piston assembly to hold the lever to fit the bracket.



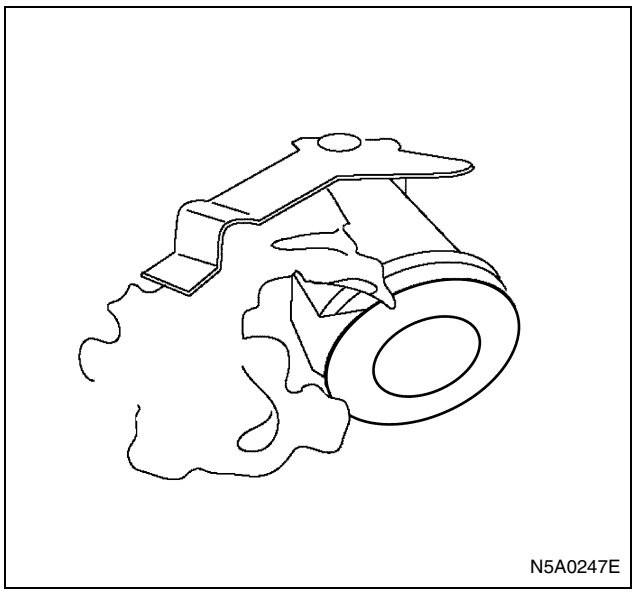
Legend

1. Attach the lever to the bracket

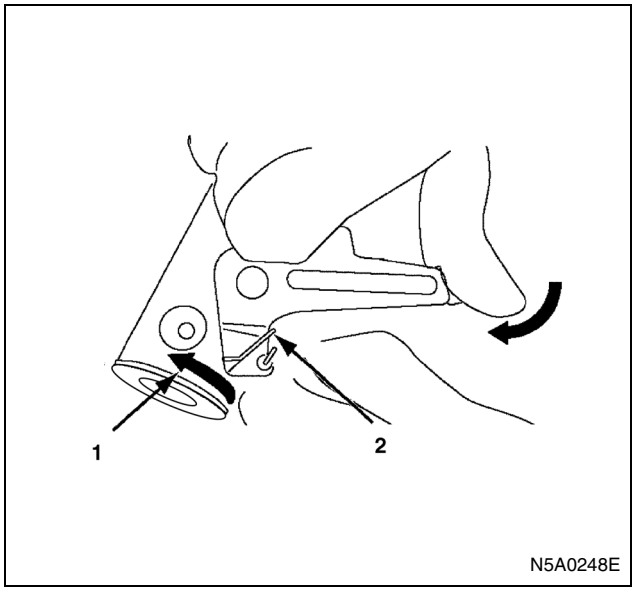


Disassembly of lever spring

1. Fit the waste cloth between the lever and spring not to damage each parts.



2. After running the lever up on the bracket, turn the lever to the direction at the connecting point of lever and spring.



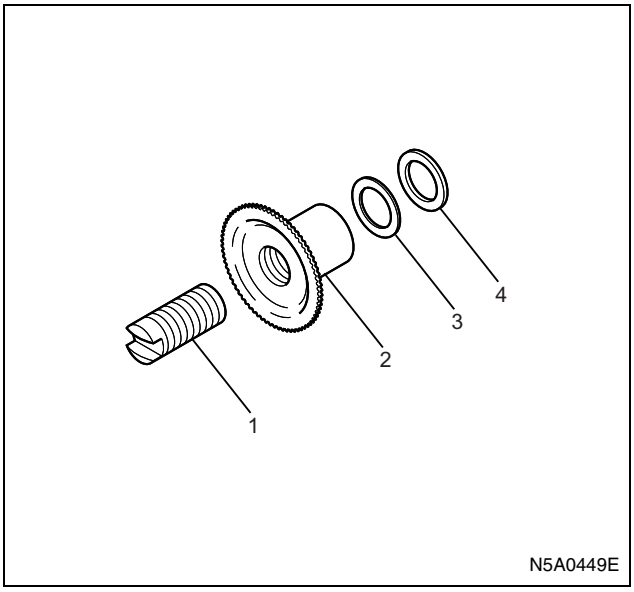
Legend

1. Reassemble the lever from the direction
2. Connecting point of lever and spring

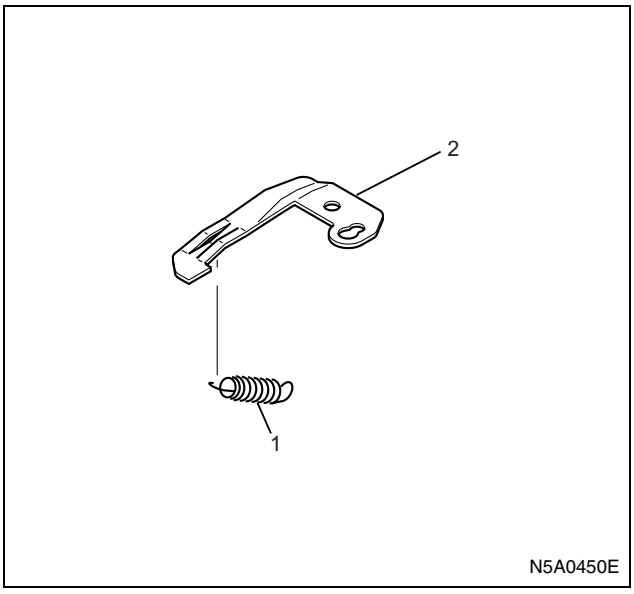
3. Disassemble the lever from the bracket.

Drum inside diameter 370 mm

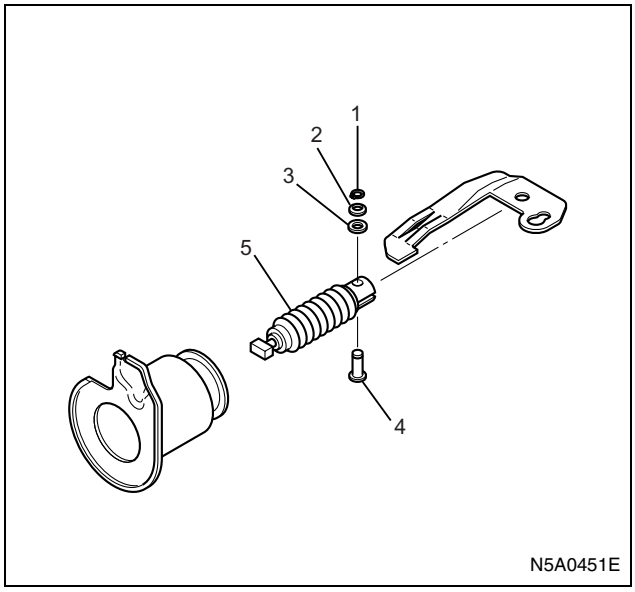
1. Remove the adjusting screw (1).
2. Remove the adjuster gear and nut assembly (2).
3. Remove the washer (SUS) (3).
4. Remove the washer (OIL LESS) (4).



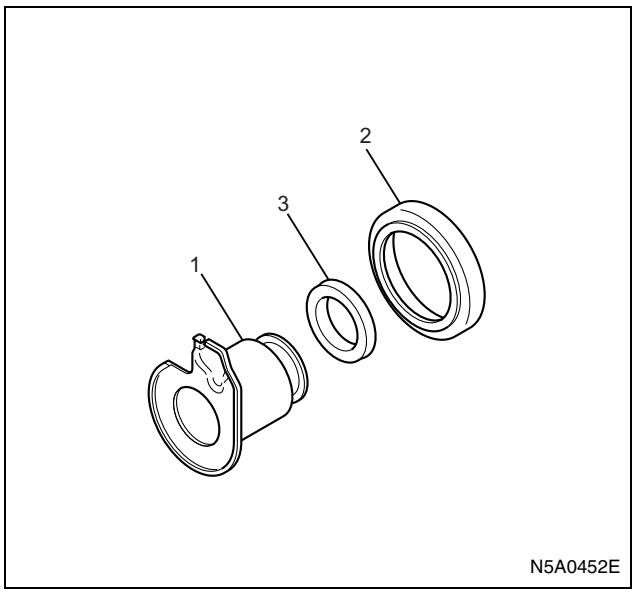
5. Remove the return spring (1).
   Remove the spring from lever side and cylinder side.
6. Remove the lever (2).



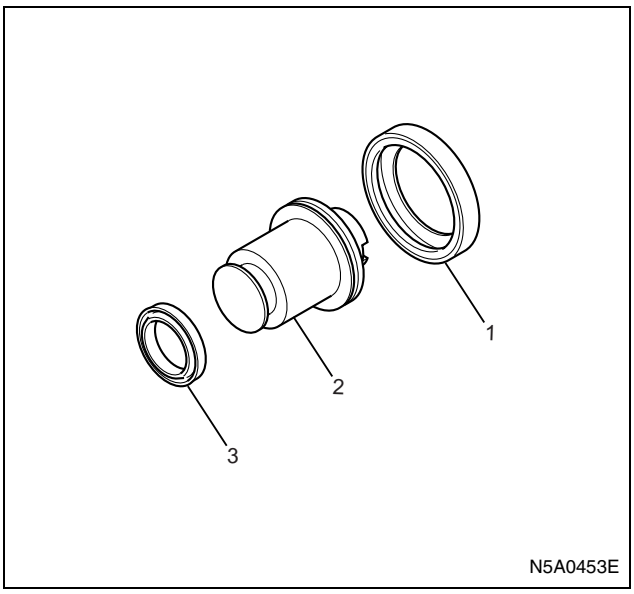
7. Remove the snap ring (1).
8. Remove the wave washer (2).
9. Remove the washer (3).
10. Remove the pin (4).
11. Remove the spring assembly (5).
    Pull out the pin from lever and separate the spring.
    For piston side, remove it from flange groove of piston.



12. Remove the piston (1).
    Remove the boot from cylinder and pull out the piston.
13. Remove the boot (2).
14. Remove the piston cup (3).
15. Remove the cylinder assembly.



16. Remove the boot (1).
17. Remove the piston (2).
18. Remove the piston cup (3).



19. Remove the bleeder.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

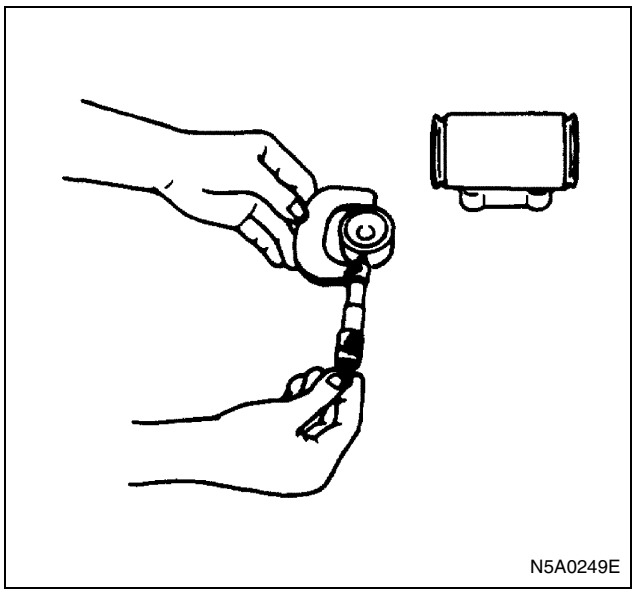
Wheel cylinder assembly

Wheel Cylinder and Piston Clearance

1. Use a micrometer to measure the piston diameter.
2. Use an inside dial indicator to measure the cylinder bore.
3. Calculate the clearance between the wheel cylinder and the piston.
   If the clearance exceeds the specified limit, the piston and/or wheel cylinder body must be replaced.

Wheel Cylinder and Piston Clearance mm (in)	
Wheel Cylinder size	Limit
28.6 (1.125) 30.2 (1.188) 25.4 (1.000) 33.3 (1.313)	0.15 (0.006)

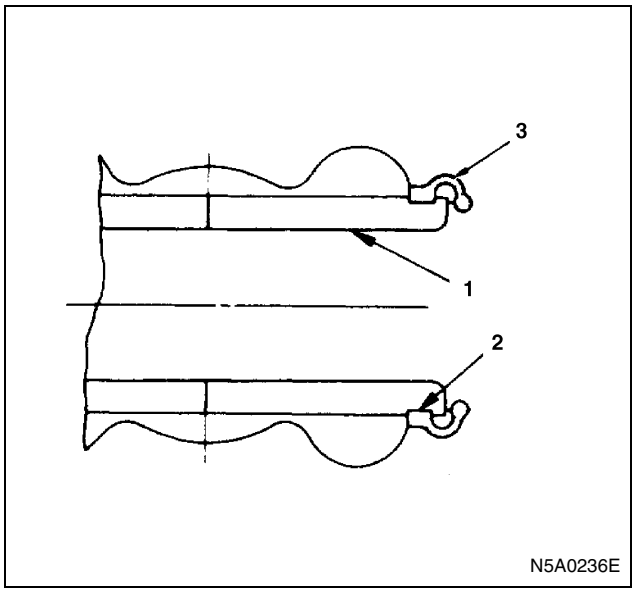
When the wheel cylinder disassembled, the repair kit (piston cup and boot) must be replaced.



Reassembly

Drum Inside Diameter 260 mm

1. Bleeder Screw
2. Wheel Cylinder Body
   1) Apply a coat of rubber grease to the cylinder body bore (1) and the grooves for the boots (2).



Legend

1. Cylinder body bore

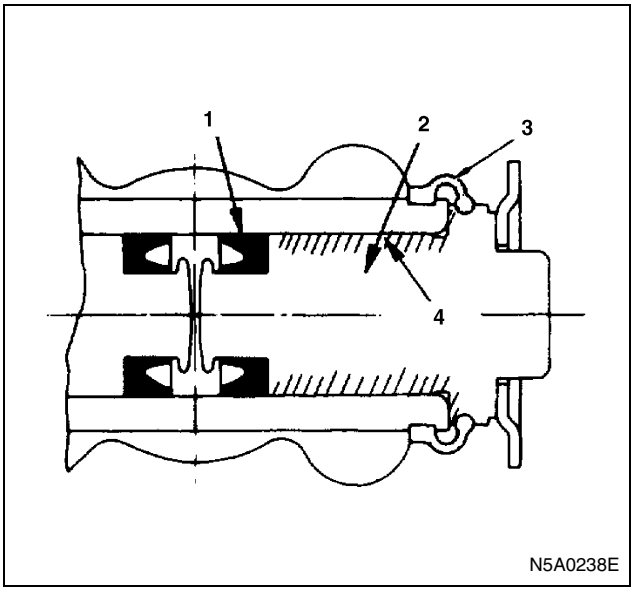
3. Boot

   2) Fit the boot edge securely into the mating groove of the cylinder body.
3. Boot
4. Piston Assembly



Legend

1. Piston cup
2. Piston
3. Boot
4. Grease

1) Apply a coat of rubber grease to the piston cups and the pistons.
   Be sure to lubricate the entire cylinder body bore with the rubber grease.
2) Install the piston assembly to the cylinder.

Notice:

After installation of the piston assembly into the cylinder body bore, fit the boot edge securely into the mating groove of the piston.

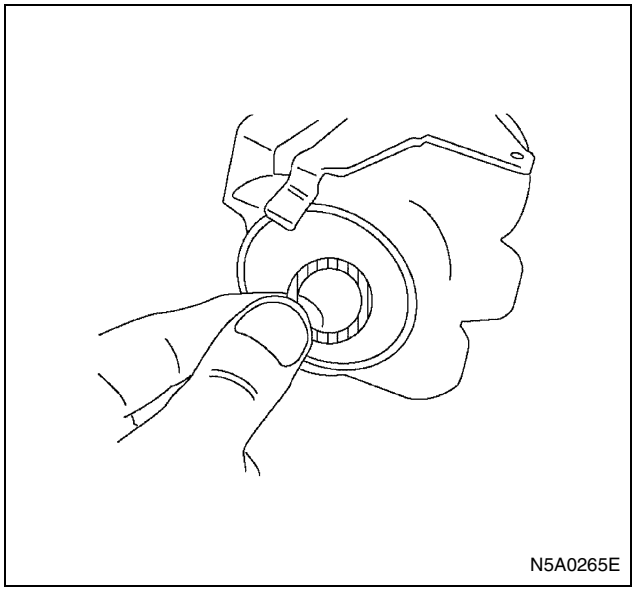
Make sure that the two boot edges firmly sealed into the grooves.

Be careful not to damage the piston cups and the boots.

5. Adjuster Gear
6. Adjusting Screw
   Apply a coat of molybdenum disulfide grease to the adjusting screw slit and threads.

Plain washer

Make sure to assemble the plain washer of coating side to the adjust side.

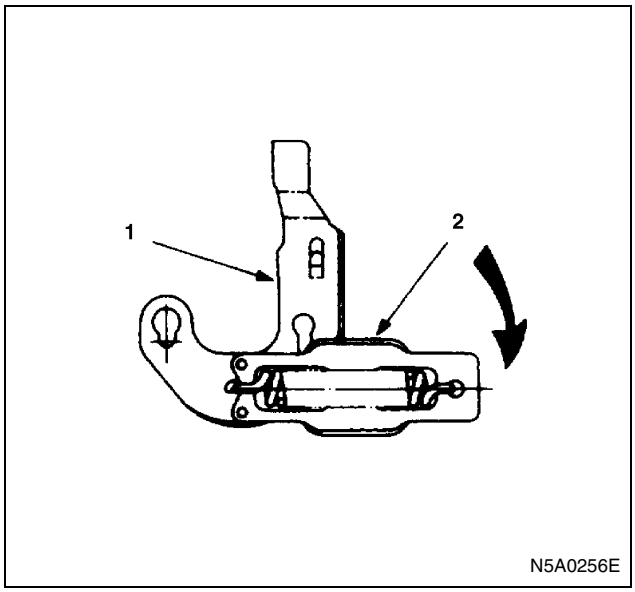


Assemble the plain washer with the copper-colored surface facing inward and the coating (black) surface facing outward.

Notice:

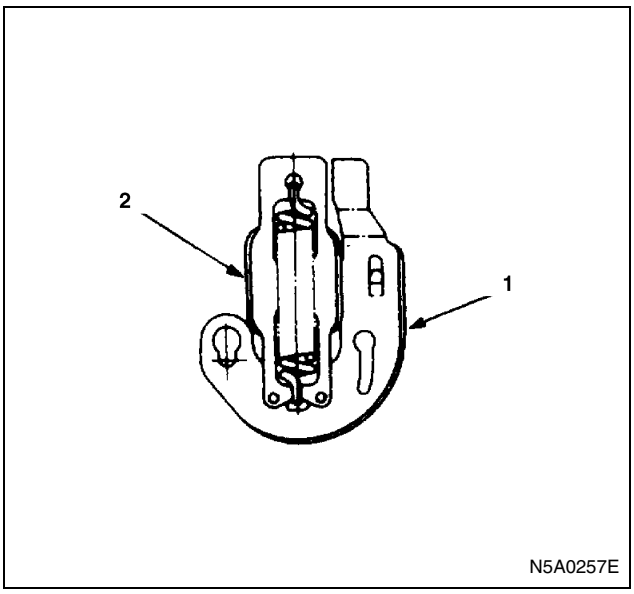
Failure to assemble the plain washer or assembling it inside out causes auto adjuster not to operate properly. Be sure to assemble it correctly.

7. Adjuster Lever
8. Fitting
9. Overtravel Spring



Legend

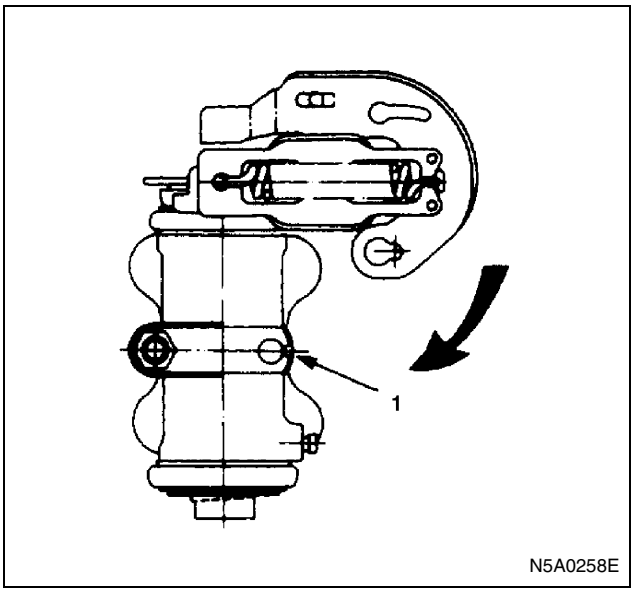
1. Adjuster lever
2. Overtravel spring



Legend
1. Adjuster lever
2. Overtravel spring

1) Hook one end of the overtravel spring to the adjuster lever hole as shown in the illustration.
2) Hook the other end of the overtravel spring to the fitting slot.
3) Turn the overtravel spring 90 degrees counterclockwise as shown in the illustrations.

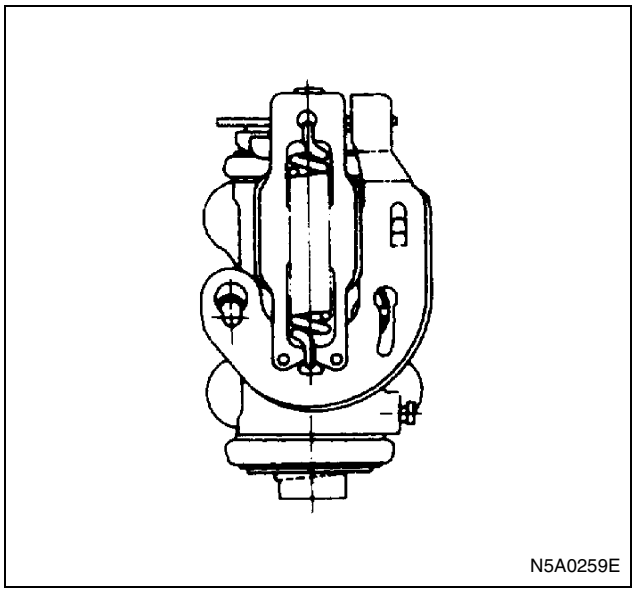
(Wheel Cylinder Body)



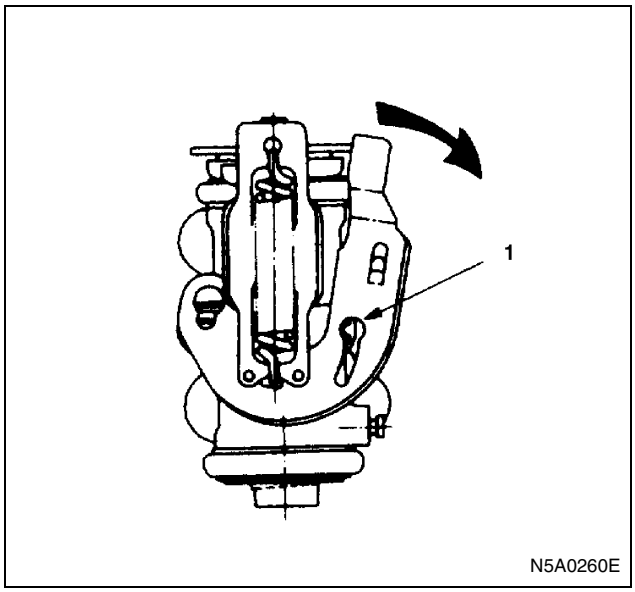
Legend
1. Wheel cylinder

Install the adjuster lever and the overtravel spring to the wheel cylinder body.

1) Hook the overtravel spring fitting slot side to the wheel cylinder body bracket hole.
2) Turn the adjuster lever and the overtravel spring 90 degrees clockwise as shown in the illustration.

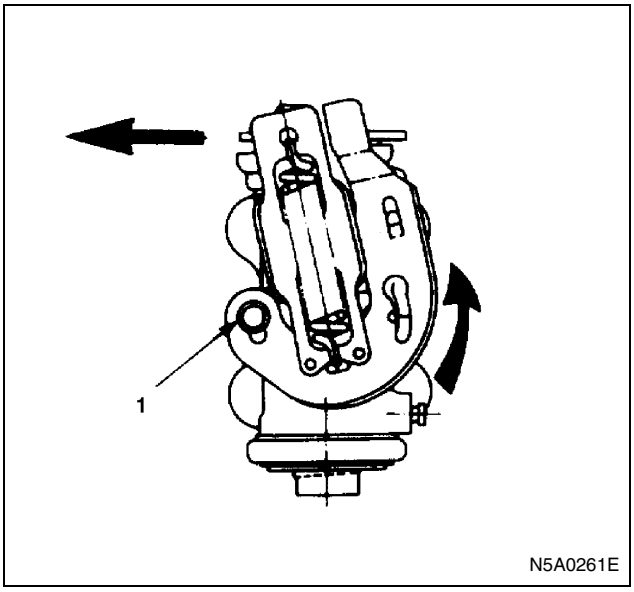


3) Turn the adjuster lever slightly clockwise to attach the adjuster lever hole to the wheel cylinder body hook.



Legend
1. Cylinder body hook

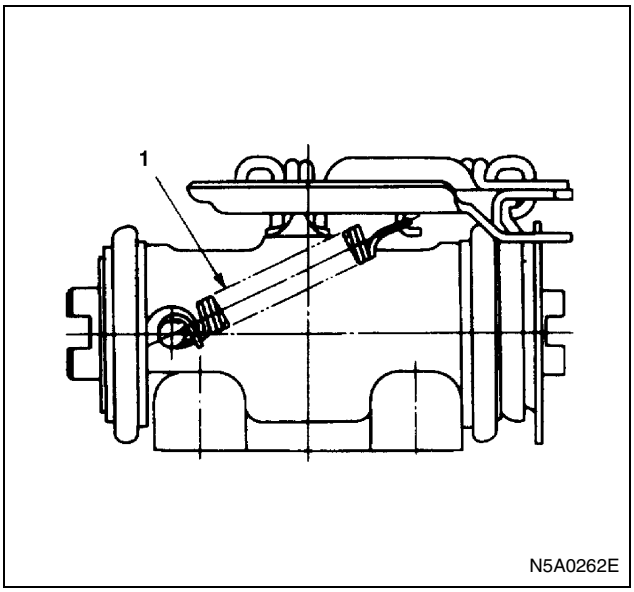
4) Push the wheel cylinder body and bracket to the left as shown in the illustration.



Legend
1. Pin head

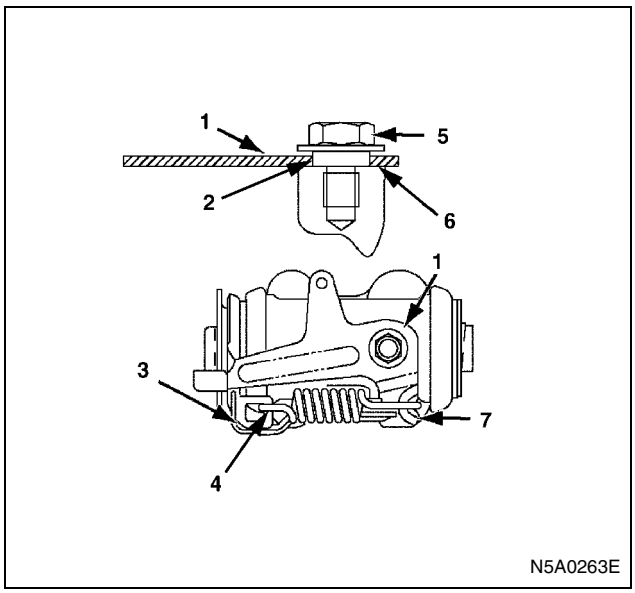
5) Turn the adjuster lever counterclockwise to install the pin head through the adjuster lever hole.

10. Return Spring
Hook the return spring to the wheel cylinder body pin.



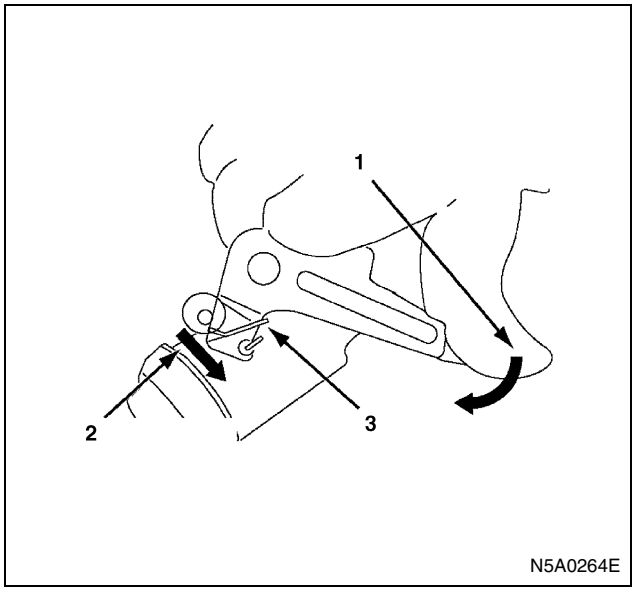
Legend
1. Return spring

Drum Inside Diameter 300, 320 mm



Legend
1. Lever
2. Bolt sleeve
3. Bracket
4. Spring hook (short): Hook to the bracket square hole
5. Lever fixing bolt
Torque: 7.85 — 11.77 N·m (0.80 — 1.20 kg·m/ 5.79 — 8.68 lb·ft)
6. Body surface
7. Spring hook (Long): Hook the lever

1. Reassemble the spring hook (short) to the bracket square hole and spring hook (long) to the lever.
2. Turn the lever to the direction at the connecting point of lever and spring and reassemble the lever to the bracket.



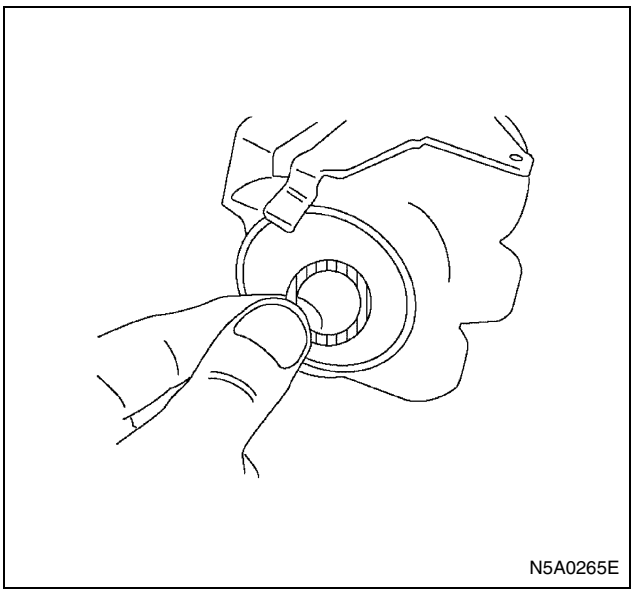
Legend

1. Turn the lever to the arrow, and extend the spring
2. Assemble the lever from the direction
3. Connecting point of lever and spring

3. Install the lever fixing bolt to the specified torque.
4. Make sure not to bite the lever between the bolt sleeve and body surface.
5. Make sure fit the lever to the gear properly after fixing the bolt.

Plain washer

Make sure to assemble the plain washer of coating side to the adjust side.



Assemble the plain washer with the copper-colored surface facing inward and the coating (black) surface facing outward.

Notice:

Failure to assemble the plain washer or assembling it inside out causes auto adjuster not to operate properly. Be sure to assemble it correctly.

Drum Inside Diameter 370 mm

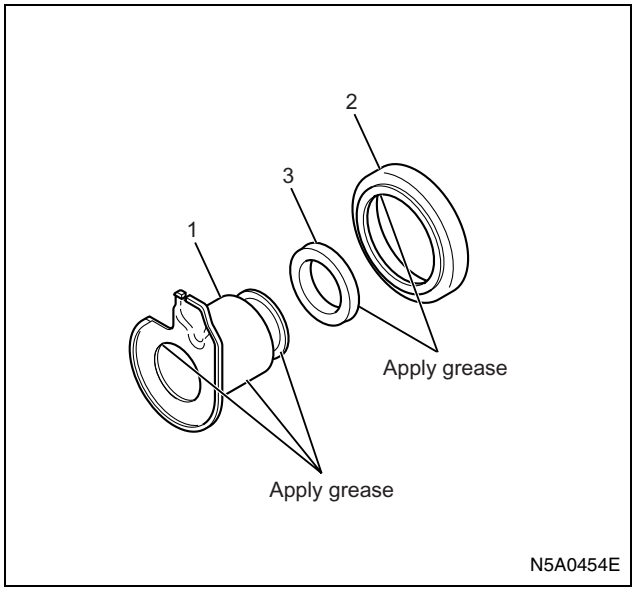
1. Assemble the piston.
   1) Apply grease to the outer circumference of piston (1) and installation groove of boot. Install the boot (2) and apply grease to the insertion groove of cup.

Notice:

After installation of boot, make sure that there are still enough grease in boot.

   2) Assemble the grease-applied piston cup (3) to piston.

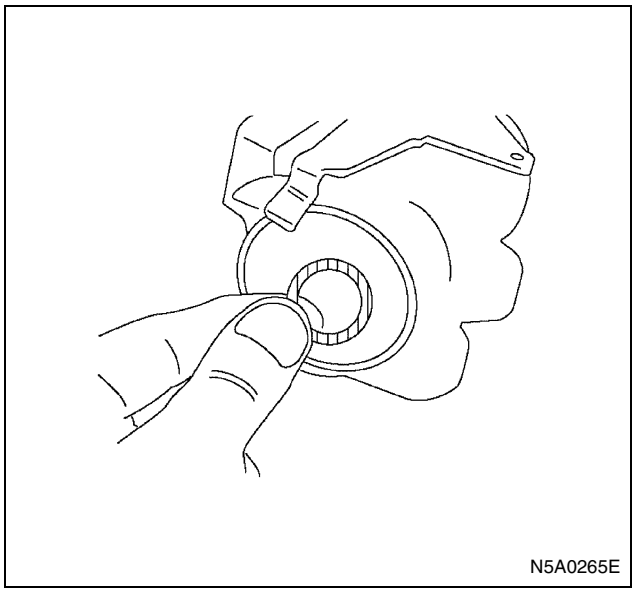
Grease: NIGLUBE RX-2



2. Install the washer (OIL LESS) (1).
   Apply grease to both sides.

Plain washer

Make sure to assemble the plain washer of coating side to the adjust side.



Assemble the plain washer with the copper-colored surface facing inward and the coating (black) surface facing outward.

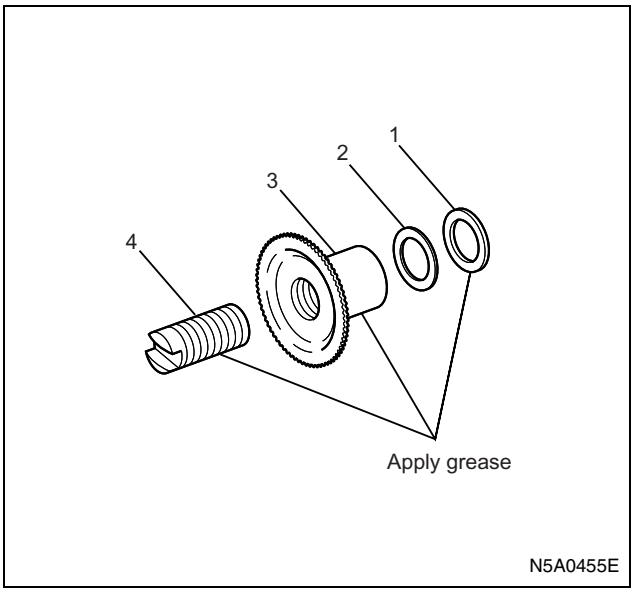
Notice:

Failure to assemble the plain washer or assembling it inside out causes auto adjuster not to operate properly. Be sure to assemble it correctly.

3. Install the washer (SUS) (2).
4. Install the adjuster gear and nut assembly (3).
   Apply grease to the inner surface of piston and adjuster gear and nut assembly, and assemble it to piston.

Grease: NIGLUBE RX-2

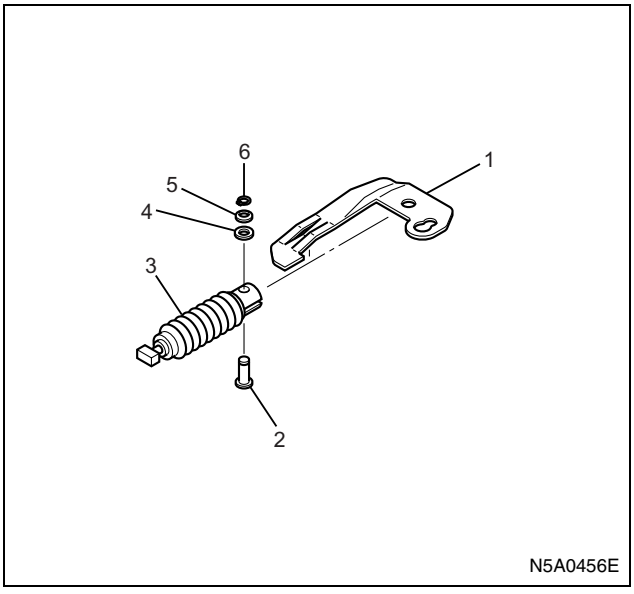
5. Install the adjusting screw (4).
   Apply grease and screw it in to adjuster gear and nut assembly.



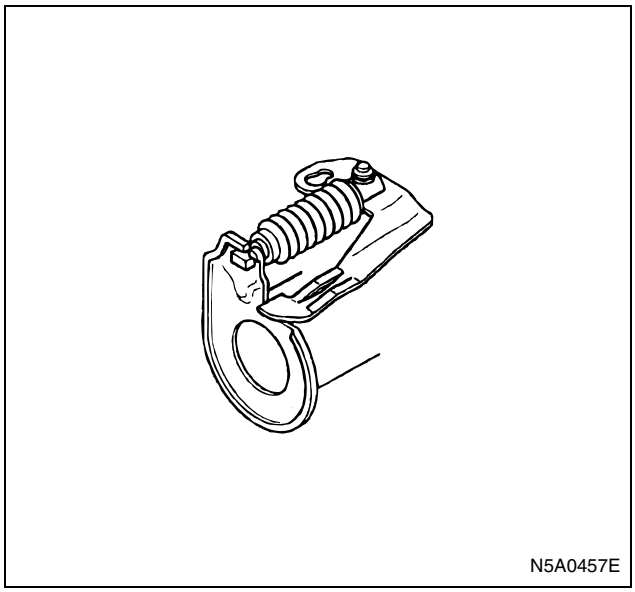
6. Install the cylinder assembly.
   Apply grease to the sliding part of piston. Assemble the piston and install the boot.

Grease: NIGLUBE RX-2

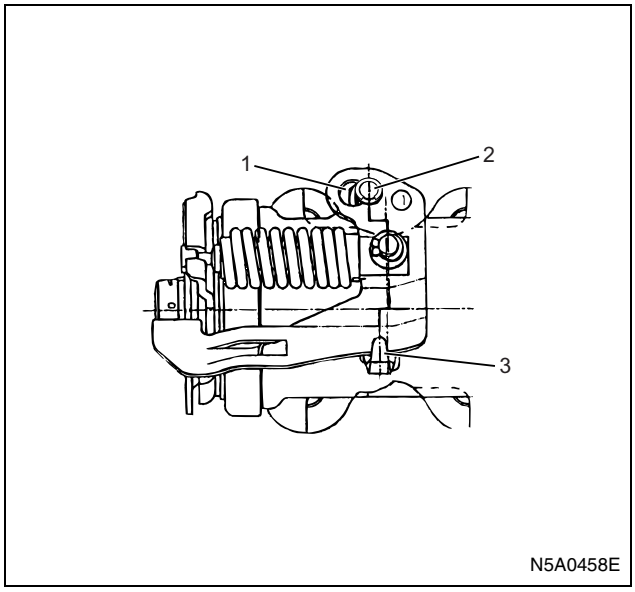
7. Assemble the lever assembly.
   Install the pin (2), spring assembly (3), washer (4), wave washer (5) and snap ring (6) to lever (1).



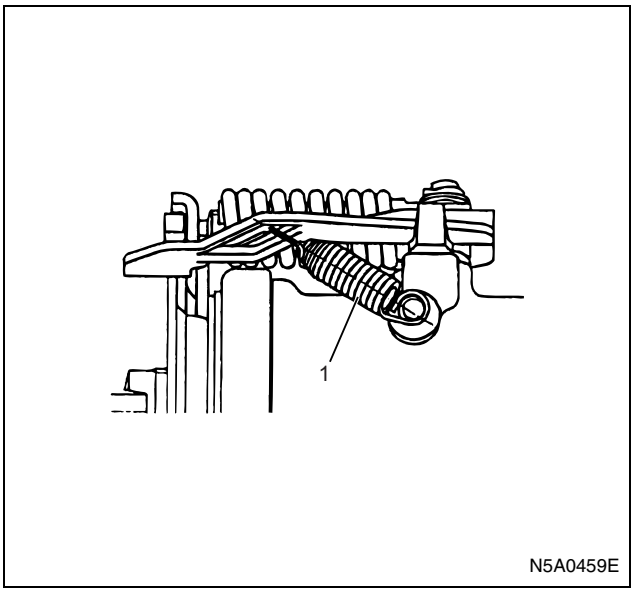
8. Fix the cylinder assembly in a vise and assemble the tip of spring assembly to cutout groove of piston flange.



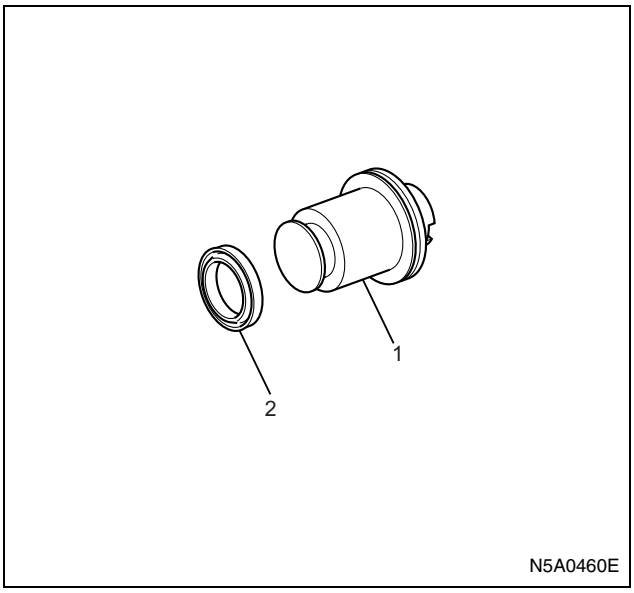
9. While matching the lever to cylinder's hook (3) and stretching the spring assembly, fix the lever to cylinder pin (2) through the double hole (1) of lever.



10. Install the return spring (1).
    Install the closed hook of return spring to pin side.

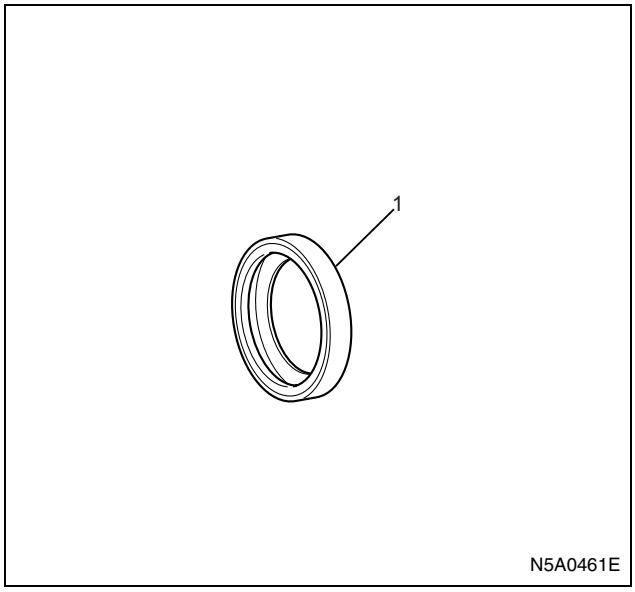


11. Install the piston (1).
    Apply grease to the outer circumference of piston and groove of piston cup (2), and install the grease-applied piston cup.



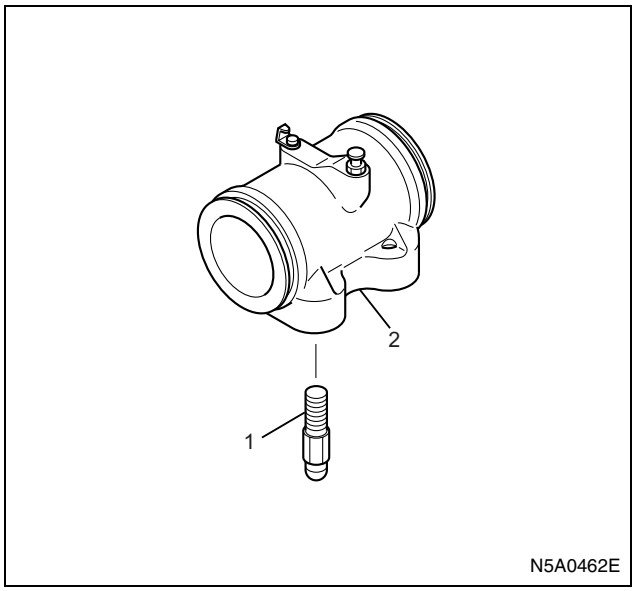
12. Install the boot (1).
    Apply grease to the boot installation groove of cylinder, fill the grease to inside of boot and install it.

Grease: BESCO rubber grease

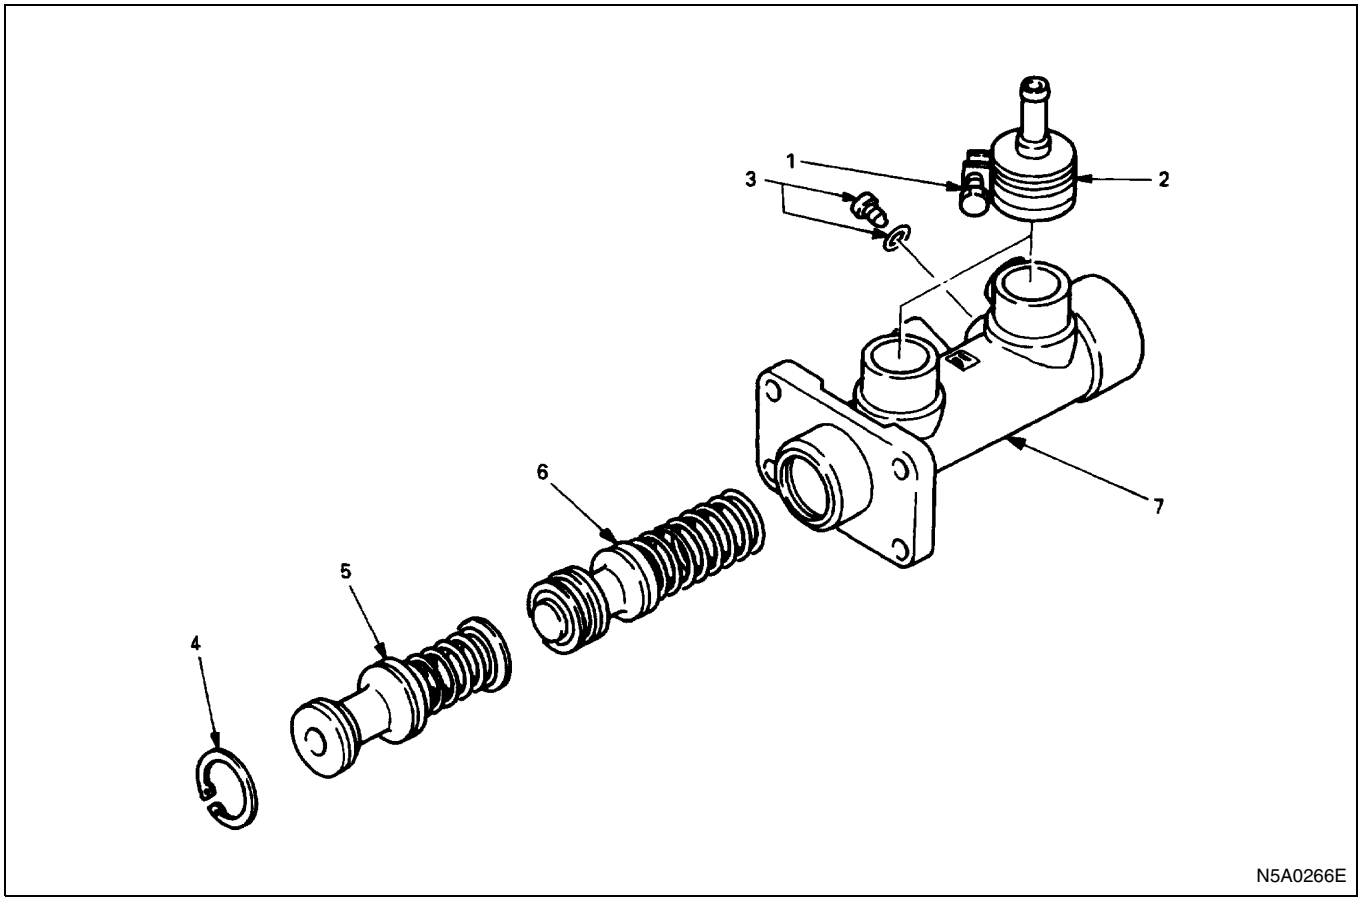


13. Install the bleeder (1) to cylinder assembly (2).

Tighten:
Bleeder to 6.9 — 11.8 N·m (0.7 — 1.2 kg·m / 5.1 — 8.7 lb·ft)



Master Cylinder Assembly (NHR)

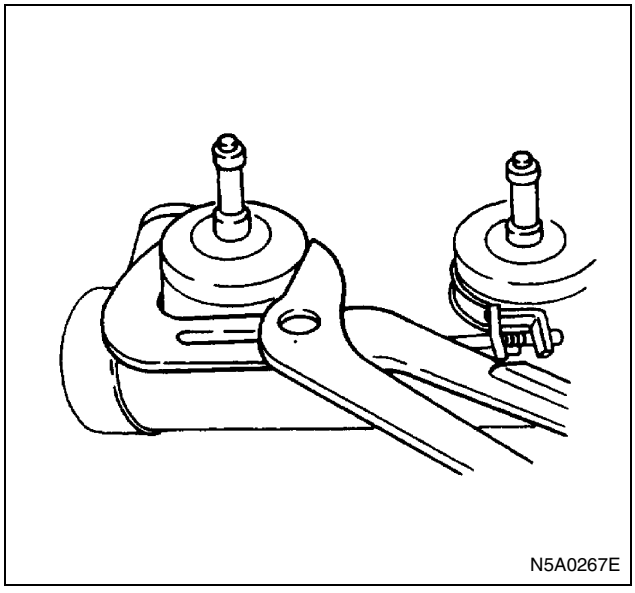


Legend

1. Hose clamp
2. Hose joint
3. Stopper screw and gasket
4. Snap ring
5. Primary piston assembly
6. Secondary piston assembly
7. Cylinder body

Disassembly

1. Hose Clamp
2. Hose Joint
   Use a pair of pliers to remove the hose joint.
   Take care not to damage the hose joint and the cylinder body.



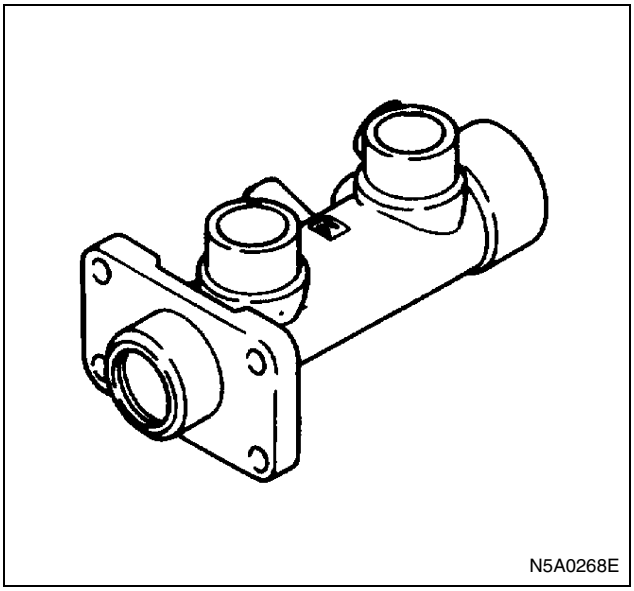
3. Stopper Screw and Gasket
4. Snap Ring
5. Primary Piston Assembly

6. Secondary Piston Assembly
7. Cylinder Body

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Cylinder Body



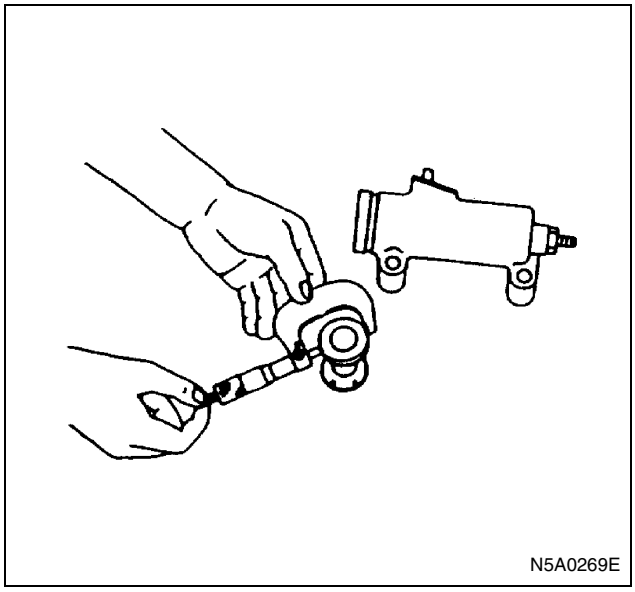
N5A0268E

Visually check that the master cylinder bore, for scuff or scratch, if these conditions are presented, the cylinder body must be replaced.

Piston and Master Cylinder Clearance

1. Use a micrometer to measure the piston diameter.
2. Use an inside dial indicator to measure the cylinder bore.
3. Calculate the clearance between the wheel cylinder and the piston.
   If the clearance exceeds the specified limit, the piston assembly must be replaced.

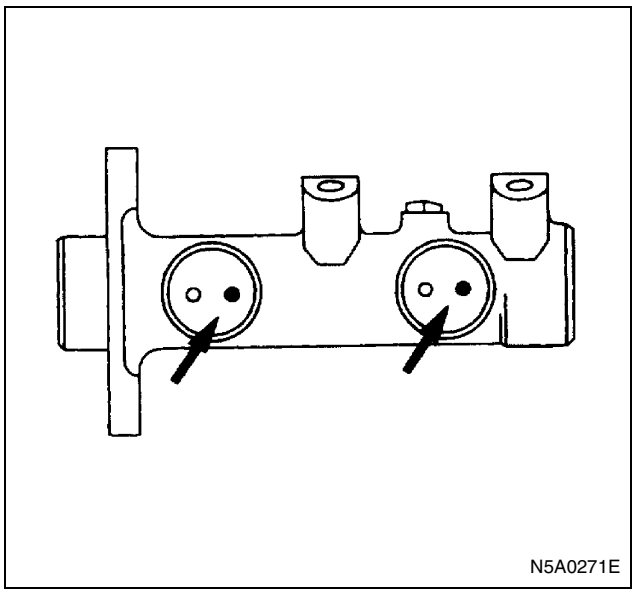
Piston and Master Cylinder Clearance mm (in)	
Standard	Limit
0.11 — 0.195 (0.004 — 0.008)	0.22 (0.009)



N5A0269E

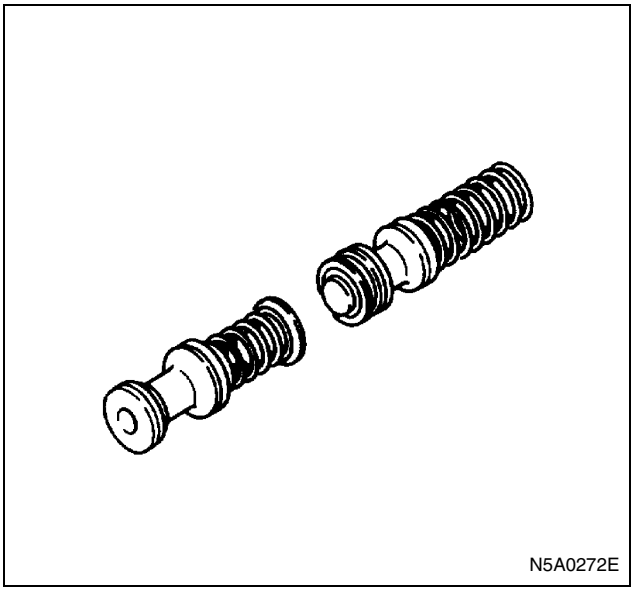
Reassembly

1. Cylinder Body
   Clean the cylinder body and blow the return ports with compressed air.
   Do not allow the return ports clogged with any foreign material.



N5A0271E

2. Secondary Piston Assembly



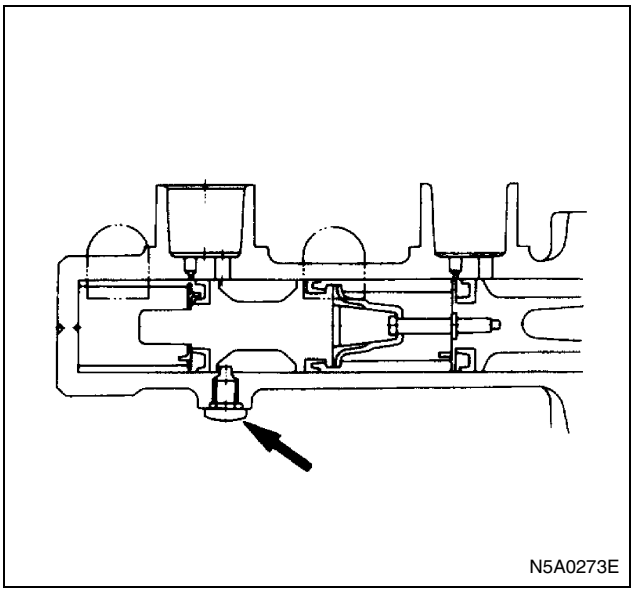
N5A0272E

3. Primary Piston Assembly
   1) Rinse the piston assembly in clean brake fluid.
   2) Install the piston assembly to the master cylinder.

Notice:
Take care not to scratch the primary and secondary cups when installing the piston assembly.

4. Snap Ring
5. Stopper Screw and Gasket
   1) Slide the piston until the oil cavity of the secondary piston dears the stopper bolt hole.
   2) Install the stopper screw and tighten it to the specified torque.

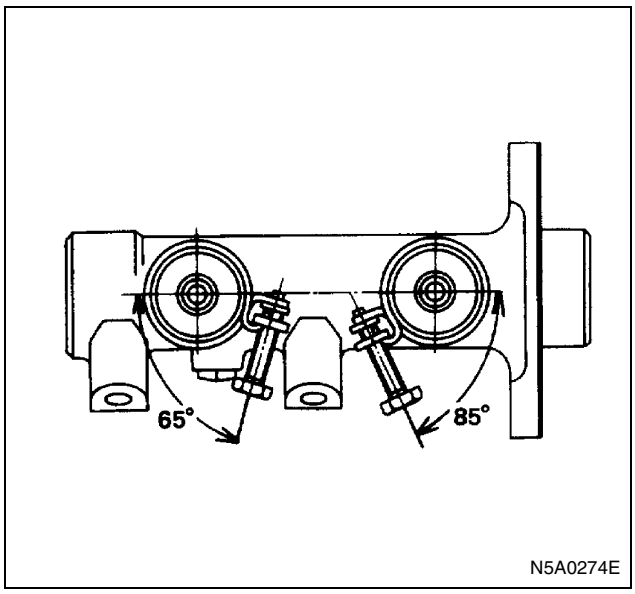
Tighten:
Stopper screw to 27 N·m (2.8 kg·m / 20 lb·ft)



N5A0273E

6. Hose Joint
7. Hose Clamp
   1) Set the clamp in position.
   2) Dip the hose joint in hot water (60 — 80°C / 140 — 176°F) for several minutes.
   3) Take out of the hose joint and blow off water immediately and completely.
   4) Fit the hose joint to the cylinder body.
   5) Align the position of the clamp screw as shown in the illustration.
   6) Tighten the clamp screw to the specified torque.

Tighten:
Clamp screw to 2 N·m (0.2 kg·m / 17 lb·in)



N5A0274E

18. Bushing
19. O-ring
20. Secondary Cup
21. Screw
22. Spring Retainer
23. Secondary Piston Spring
24. Secondary Piston

Inspection and Repair

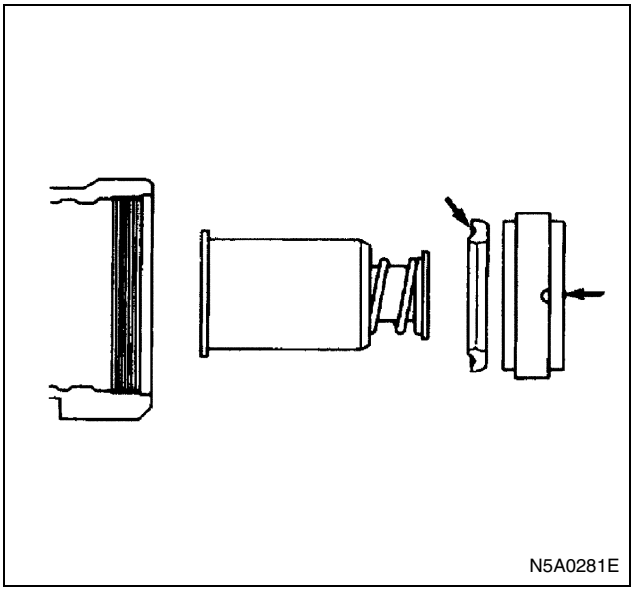
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Cup and O-ring

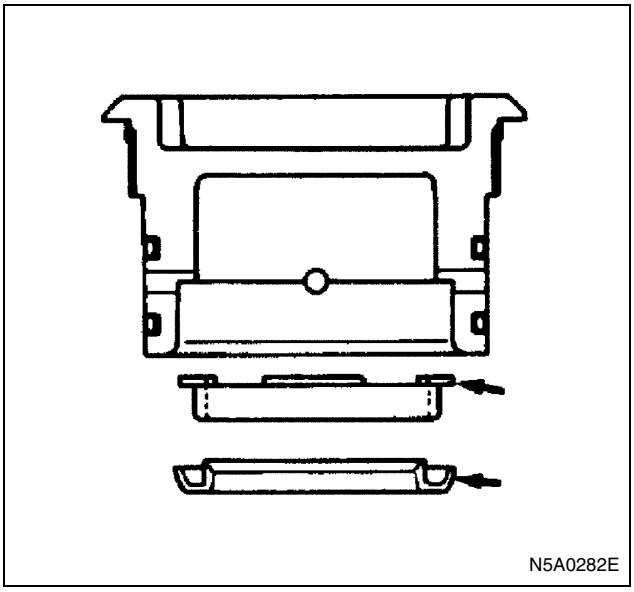
1. Wash each part with brake oil and check for wear, deterioration, and damage.
2. Replace the cups and O-rings.

Reassembly

1. Secondary Piston
2. Secondary Piston Spring
3. Spring Retainer
4. Screw
5. Secondary Cup
6. Bushing
   Combine secondary cup and bushing with secondary piston as indicated as arrows, and push the assembly in until bushing comes into contact with cylinder body step.
7. O-ring
   Install the O-ring to the bushing.



8. Primary Cup
9. Supporter
10. Plug and O-ring
    Combine primary cup and supporter with plug as indicated by arrows.



Then tighten plug to specified tightening torque.

Plug Torque		N·m (kg·m/lb·ft)
Master Cylinder Inside diameter (mm)	28.5	40 (4.1/30)
	30.1	44 (4.5/33)
	31.7	
	34.9	49 (5.0/37)

Support plate : 5-8840-2371-0

Wrench : 5-8840-2370-0

(Master cylinder inside diameter 31.7 mm, 30.1 mm)

Wrench : 5-8840-2369-0

(Master cylinder inside diameter 28.5 mm)

Wrench : 5-8840-2805-0

(Master cylinder inside diameter 34.9 mm)

Notice:

If plug tightened to specified torque is found floating from cylinder body, plug should be disassembled again and check for abnormal parts fitting. Then reassemble.

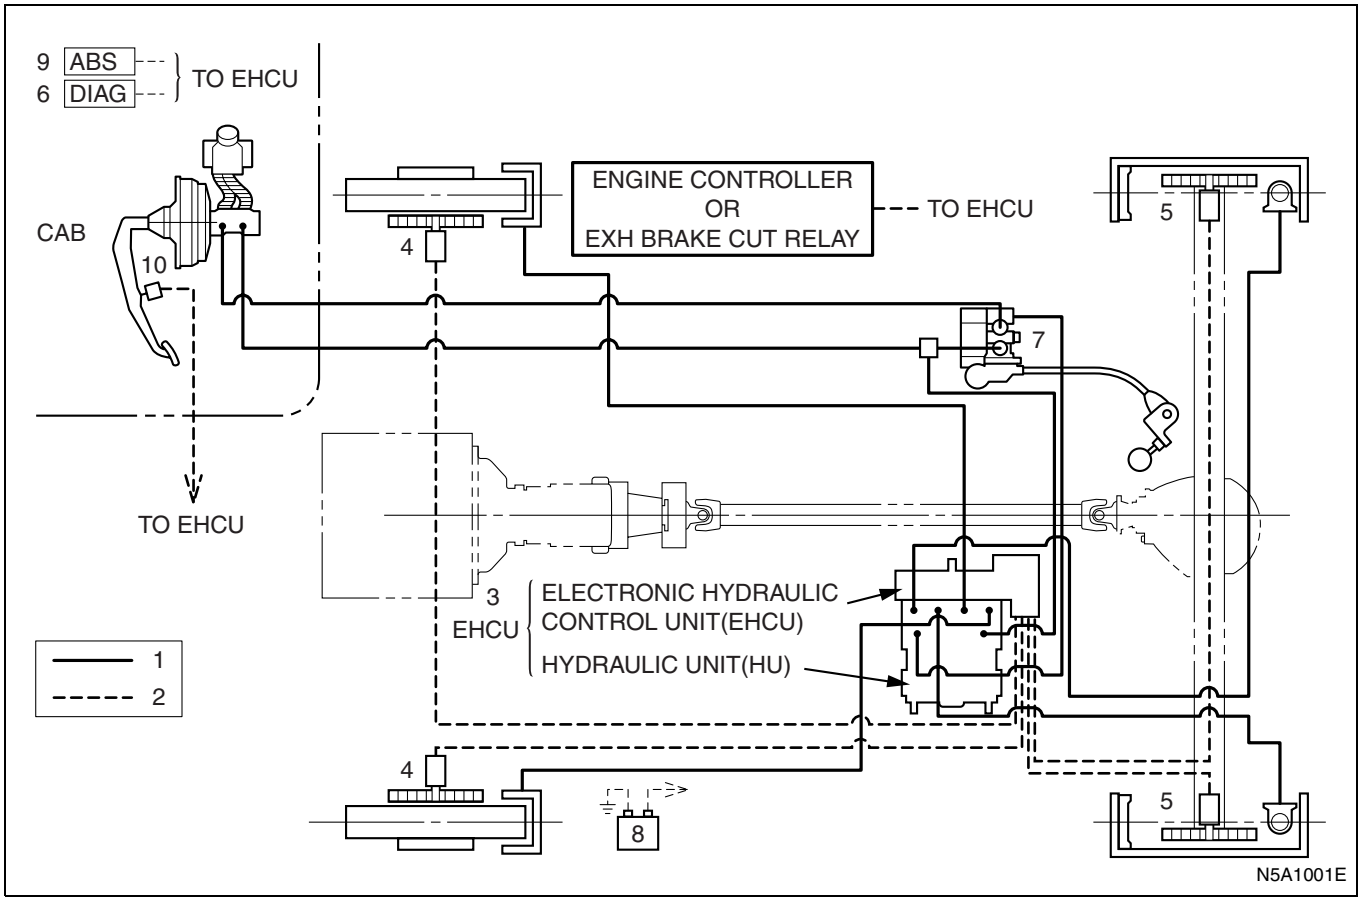
GENERAL DESCRIPTION

Service Precaution

Caution:
Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The Anti-lock Brake System (ABS) works on all four wheels. A combination of wheel speed sensor and Electronic Hydraulic Control Unit (EHCU) can determine when a wheel is about to stop turning and adjust brake pressure to maintain best braking.
This system helps the drive maintain greater control of the vehicle under heavy braking conditions.



Legend

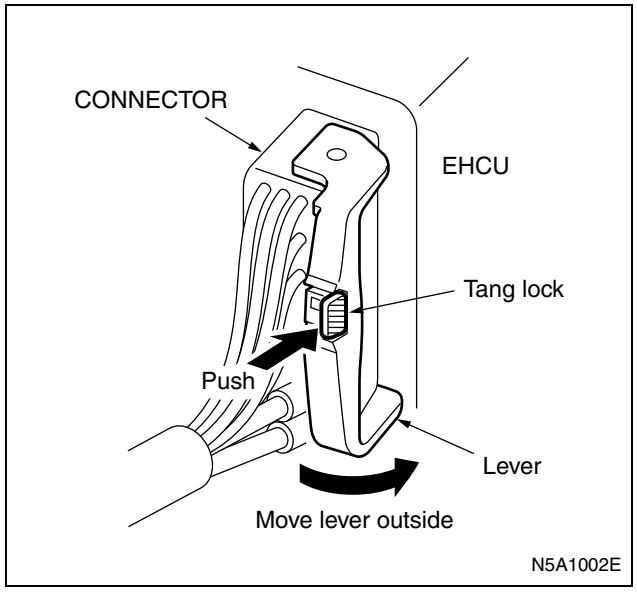
1. Hydraulic Line
2. Electronic Line
3. Electronic Hydraulic Control Unit (EHCU)
4. Front Wheel Speed Sensor
5. Rear Wheel Speed Sensor
6. Diagnosis Connector
7. Load Sensing Proportioning Valve (LSPV)
8. Battery
9. ABS Warning Light
10. Brake Switch

System Components

The Anti-lock Brake System consists of a Electronic Hydraulic Control Unit (EHCU), four Wheel Speed Sensors and Warning Light.

Electronic Hydraulic Control Unit (EHCU)

The EHCU consists of Electronic Brake Control Module (EBCM) and Hydraulic Unit (HU).
The EHCU is located at the frame side, in front of rear spring bracket.
The EHCU consists of ABS control circuits, fault detector, and a fail-safe. It drives the hydraulic unit according to the signal from each sensor, cancelling ABS to return to normal braking when a malfunction has occurred in the ABS.
The EHCU is self-diagnosing function which can indicate faulty circuits during diagnosis.

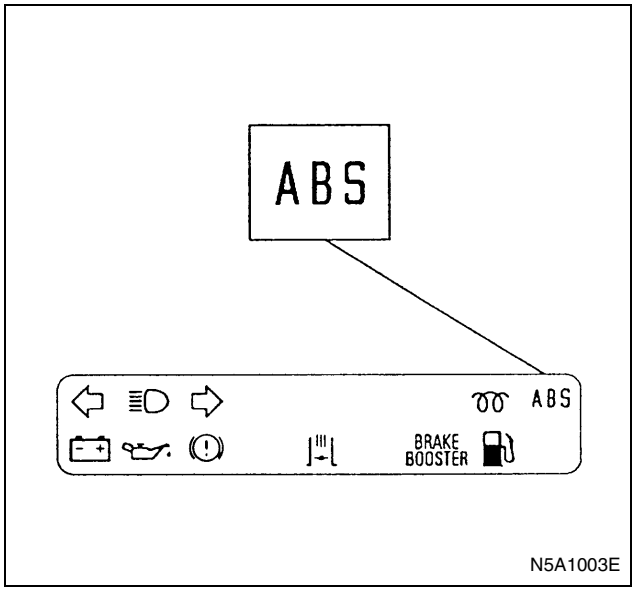


Notice:
When disconnecting harness connector from EHCU, push the tang lock of the connector and release the tang lock. Then move the lever.

Hydraulic Unit (HU)

It consists of a Motor, Plunger Pump, Solenoid Valves and Check Valve.
Solenoid Valves: Reduces or holds the caliper fluid pressure for each front brake or both rear brakes according to the signal sent from the EHCU.
Reservoir: Temporarily holds the brake fluid that returns from the front and rear wheel brake so that pressure of front wheel brake can be reduced smoothly.
Plunger Pump: Feeds the brake fluid held in the reservoir to the master cylinder.
Motor: Drives the pump according to the signal from EHCU. Check Valve: Controls the brake fluid flow.

ABS Warning Light



Vehicles equipped with the Anti-lock Brake System has an amber “ABS” warning light in the instrument panel. The “ABS” warning light will illuminate if a malfunction in the Anti-lock Brake System is detected by the Electronic Hydraulic Control Unit (EHCU). In case of an electronic malfunction, the EHCU will turn “ON” the “ABS” warning light and disable the Anti-lock braking function.
The “ABS” light will turn “ON” for 2 seconds after the ignition switch is to the “ON” position, and then will go out. If the “ABS” light comes “ON” and stays “ON” while driving, the Anti-lock Brake System should be inspected for a malfunction according to the diagnosis procedure.

Wheel Speed Sensor

It consists of a sensor and a rotor. The sensor is attached to the knuckle on the front wheels and to the bracket on the brake back plate on the rear wheels.
The front speed sensor is coil type and rear is Hall IC type.
The sensor rotors press-fitted to front and rear wheel hubs output pulse frequency depending on wheel rotation.
The speed sensors find vehicle speed from its frequency.

Normal and Anti-lock Braking

Under normal driving conditions, the Anti-lock Brake System functions the same as a standard power assisted brake system. However, with the detection of wheel lock-up, a slight bump or kick-back will be felt in the brake pedal. This pedal “bump” will be followed by a series of short pedal pulsations which occurs in rapid succession. The brake pedal pulsation will continue ANTI-LOCK BRAKE SYSTEM (ABS) 5A4-7 until there is no longer a need for the anti-lock function or until the vehicle is stopped. A slight ticking or popping noise may be heard during brake applications when the Anti-lock features is being used.

When the Anti-lock feature is being used, the brake pedal may rise even as the brakes are being applied.
This is also normal. Maintaining a consist force on the pedal will provide the shortest stopping distance.

Brake Pedal Travel

Vehicles equipped with the Anti-lock Brake System may be stopped by applying normal force to the brake pedal. Although there is no need to push the pedal beyond the point where it stops or holds the vehicle, by applying more force the pedal will continue to travel toward the floor.
This extra brake pedal travel is normal.

Wheel Speed Sensor

GENERAL DIAGNOSIS

General Information

ABS malfunction can be classified into two types, those which can be detected by the ABS warning light and those which can be detected as a vehicle abnormality by the driver.
In either case, locate the fault in accordance with the "BASIC DIAGNOSTIC FLOWCHART" and repair.
Please refer to Section 5A HYDRAULIC BRAKES for the diagnosis of mechanical troubles such as brake noise, brake judder (brake pedal or vehicle vibration felt when braking), uneven braking, and parking brake trouble.

ABS Service Precautions

Required Tools and Items:

- Box Wrench
- Brake Fluid
- Special Tool

Some diagnosis procedures in this section require the installation of a special tool.
High Impedance Multimeter: 5-8840-0285-0 (J-39200)
When circuit measurements are requested, use a circuit tester with high impedance.

Computer System Service Precautions

The Anti-lock Brake System interfaces directly with the Electronic Hydraulic Control Unit (EHCU) which is a control computer that is similar in some regards to the Engine Control Module. These modules are designed to withstand normal current draws associated with vehicle operation. However, care must be taken to avoid overloading any of the EHCU circuits. In testing for opens or shorts, do not ground or apply voltage to any of the circuits unless instructed to do so by the appropriate diagnostic procedure. These circuits should only be tested with a high impedance multimeter 5-8840-0285-0 (J-39200) or special tools as described in this section. Power should never be removed or applied to any control module with the ignition in the "ON" position. Before removing or connecting battery cables, fuses or connectors, always turn the ignition switch to the "OFF" position.

General Service Precautions

The following are general precautions which should be observed when servicing and diagnosing the Anti-lock Brake System and/or other vehicle systems. Failure to observe these precautions may result in Anti-lock Brake System damage.

- If welding work is to be performed on the vehicle using an electric arc welder, the EHCU connector should be disconnected before the welding operation begins.
- The EHCU connector should never be connected or disconnected with the ignition "ON".
- The EHCU is not separately serviceable and must be replaced as assemblies. Do not disassemble any component which is designated as non-serviceable in this Section.
- If only rear wheels are rotated using jacks or drum tester, the system will diagnose a speed sensor malfunction and the "ABS" warning light will illuminate. But actually no trouble exists. After inspection stop the engine once and re-start it, then make sure that the "ABS" warning light does not illuminate.

Note on Intermittents

As with virtually any electronic system, it is difficult to identify an intermittent failure. In such a case duplicating the system malfunction during a test drive or a good description of vehicle behavior from the customer may be helpful in locating a "most likely" failed component or circuit. The symptom diagnosis chart may also be useful in isolating the failure. Most intermittent problems are caused by faulty electrical connections or wiring. When an intermittent failure is encountered, check suspect circuits for:

- Suspected harness damage.
- Poor mating of connector halves or terminals not fully seated in the connector body (backed out).
- Improperly formed or damaged terminals.

Test Driving ABS Complaint Vehicles

In case that there has been an malfunction in the lighting pattern of "ABS" warning light, the fault can be located in accordance with the "DIAGNOSIS BY "ABS" WARNING LIGHT ILLUMINATION PATTERN". In case of such trouble as can be detected by the driver as a vehicle symptom, however, it is necessary to give a test drive following the test procedure mentioned below, thereby reproducing the symptom for trouble diagnosis on a symptom basis:

1. Start the engine and make sure that the "ABS" W/L goes OFF. If the W/L remains ON, it means that the Diagnostic Trouble Code (DTC) is stored. Therefore, read the code and locate the fault.
2. Start the vehicle and accelerate to about 30 km/h (19 mph) or more.
3. Slowly brake and stop the vehicle completely.
4. Then restart the vehicle and accelerate to about 40 km/h (25 mph) or more.
5. Brake at a time so as to actuate the ABS and stop the vehicle.
6. Be cautious of abnormality during the test. If the W/L is actuated while driving, read the DTC and locate the fault.
7. If the abnormality is not reproduced by the test, make best efforts to reproduce the situation reported by the customer.

8. If the abnormality has been detected, repair in accordance with the “SYMPTOM DIAGNOSIS”.

Notice:

- Be sure to give a test drive on a wide, even road with little traffic.
- If an abnormality is detected, be sure to suspend the test and start trouble diagnosis at once.

“ABS” Warning Light

When ABS trouble occurs and actuates when possible the “ABS” warning light, the trouble code corresponding to the trouble is stored in the EHCU.
Only the ordinary brake system is available when the ABS is turned OFF. When the “ABS” warning light is actuated, if the starter switch is set ON after setting it OFF once, the EHCU checks up on the entire system and, if there is no abnormality, judges ABS to work currently and the warning light works normally even though the trouble code is stored.

Notice:
Illumination of the “ABS” warning light indicates that anti-lock braking is no longer available. Power assisted braking without anti-lock control is still available.

Normal Operation

“ABS” Warning Light

When the ignition is first moved from “OFF” to “ON”, the amber “ABS” warning light will turn “ON” for 2 seconds and will turn “OFF”.

Basic Diagnostic Flow Chart

Step	Action	Value(s)	YES	NO
1	1. Customer complaint. 2. Questioning to customer. 3. Basic inspection (Refer to “Basic inspection procedure”). Using Tech 2?	—	Go to Step 2	Go to Step 3
2	Make sure of DTC by TROUBLE CODE. Is EHCU including DTC?	—	Go to Step 5	Go to Step 4
3	Check if the DTC is stored. Is EHCU including DTC?	—	Go to Step 5	Go to Step 4
4	Test drive. Is W/L lit?	—	Go to Step 5	Trouble diagnosis based on symptom (Refer to “SYMPTOM DIAGNOSIS”) Go to Step 5
5	1. Repair of faulty part. 2. Elimination of DTC. 3. Inspection of “ABS” W/L illumination pattern with ignition SW “ON”. 4. Test drive. Does the DTC repeat?	—	Repeat the diagnosis of the symptom or DTC appears again Go to Step 1	Go to Step 6
6	1. Reconnect all components and ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Finished	—

Basic Inspection Procedure

1. Basic Inspection of Service Brake

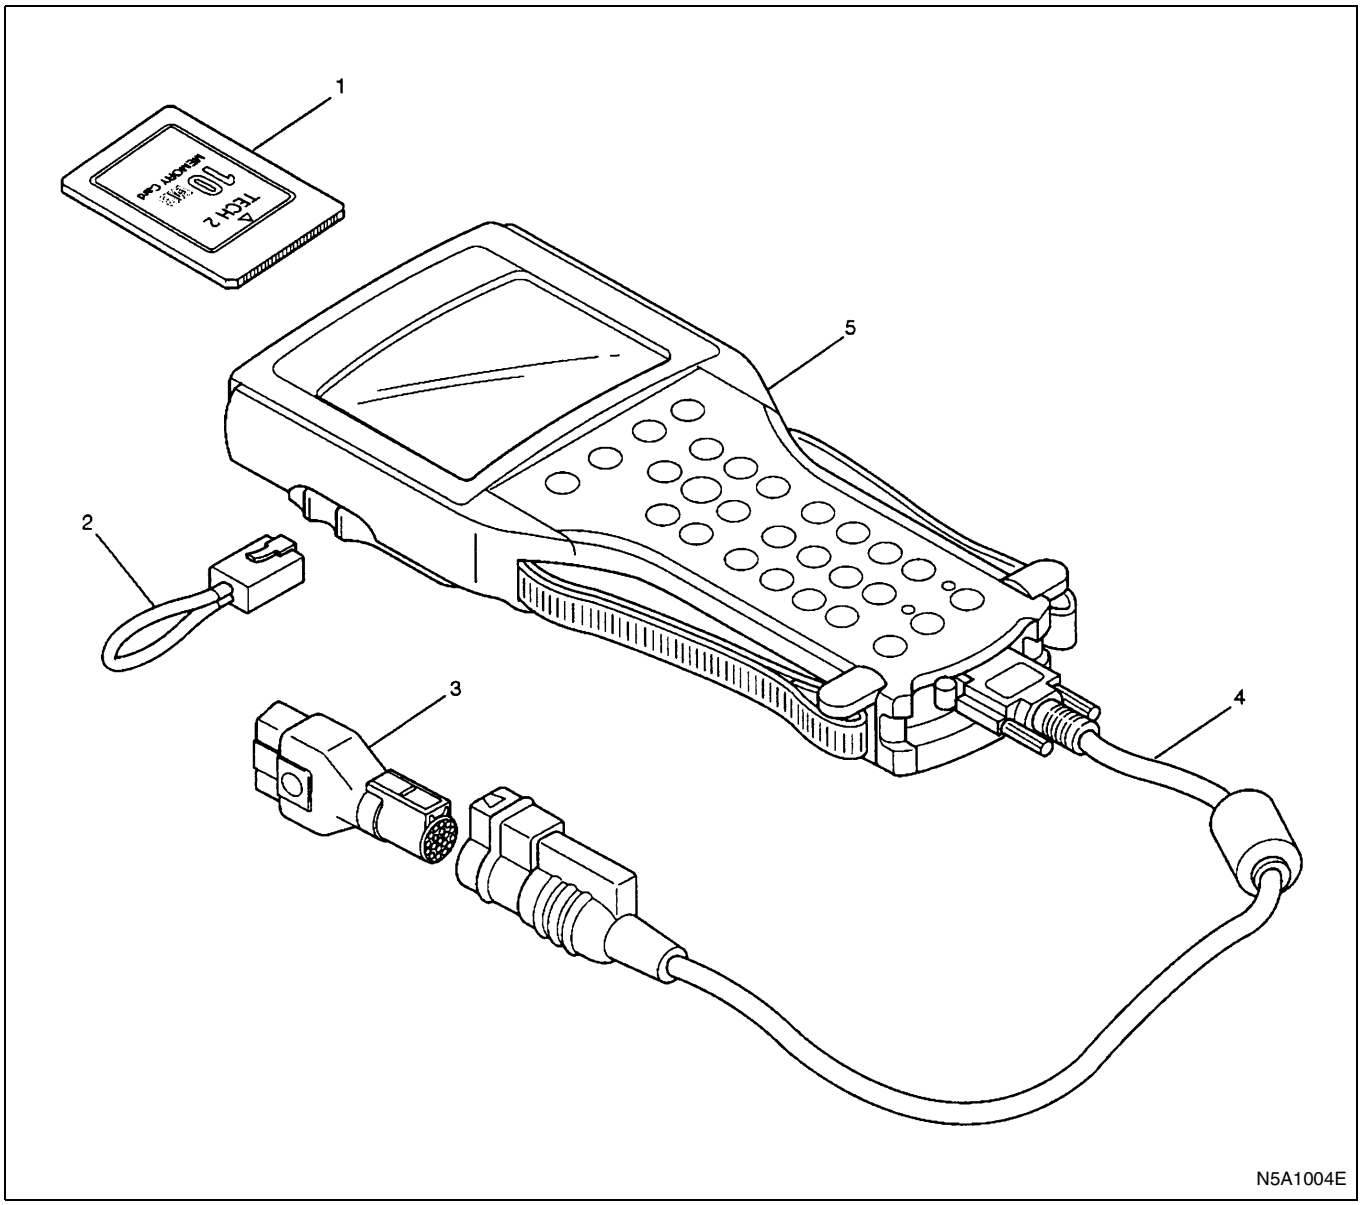
Step	Action	Value(s)	YES	NO
1	Is the fluid level normal?	—	Go to Step 2	Replenish with fluid. Go to Step 2
2	Does brake fluid leak from brake parts?	—	Repair. Go to Step 3	Go to Step 3
3	Is the booster functioning normal?	—	Go to Step 4	Repair. Go to Step 4
4	Is the pad and rotor normal?	—	Go to Step 5	Repair. Go to Step 5
5	Reconnect all components and ensure all components are properly mounted. Was this step finished?	—	Finished	—

2. Ground Inspection

Step	Action	Value(s)	YES	NO
1	Are ABS-related ground points ok?	—	Go to Step 2	Repair. Go to Step 2
2	Reconnect all components and ensure all components are properly mounted. Was this step finished?	—	Finished	—

Tech 2 Scan Tool

From 98 MY, Isuzu dealer service departments are recommended to use Tech 2. Please refer to Tech 2 scan tool user guide.



Legend

1. PCMCIA Card
2. RS 232 Loop Back Connector
3. SAE 16/19 Adapter
4. DLC Cable
5. Tech 2

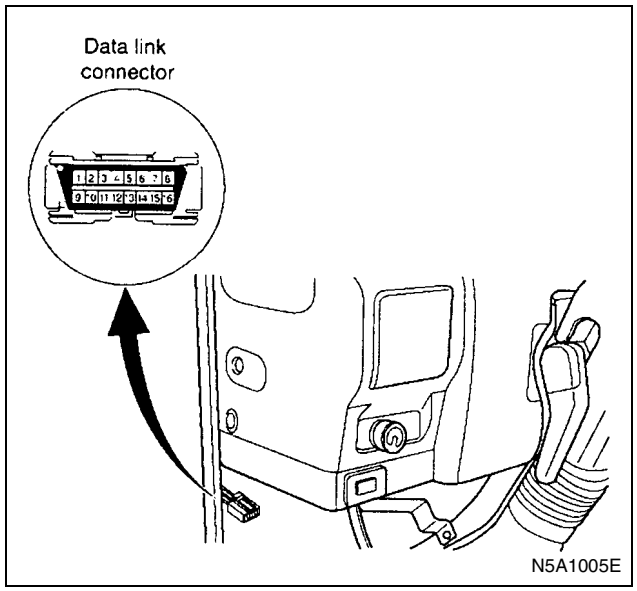
Tech 2 Features

1. Tech 2 is a 12 volt system. Do not apply 24 volt.
2. After connecting and/or installing the Vehicle Communications Interface (VCI) module, PCMCIA card and DLC connector to the Tech 2, connect the tool to the vehicle DLC.
3. Make sure the Tech 2 is powered OFF when removing or installing the PCMCIA card.
4. The PCMCIA card has a capacity of 10 Megabytes which is 10 times greater than the memory of the Tech 1 Mass Storage Cartridge. (except 2003 year model)
5. The Tech 2 has the capability of two snapshots.
6. The PCMCIA card is sensitive to magnetism and static electricity, so care should be taken in the handling of the card.
7. The Tech 2 can plot a graph when replaying a snapshot.
8. Always return to the Main Menu by pressing the EXIT key several times before shutting down.
9. To clear Diagnostic Trouble Codes (DTCs), open Application Menu and press “F1: Clear DTC Info”.

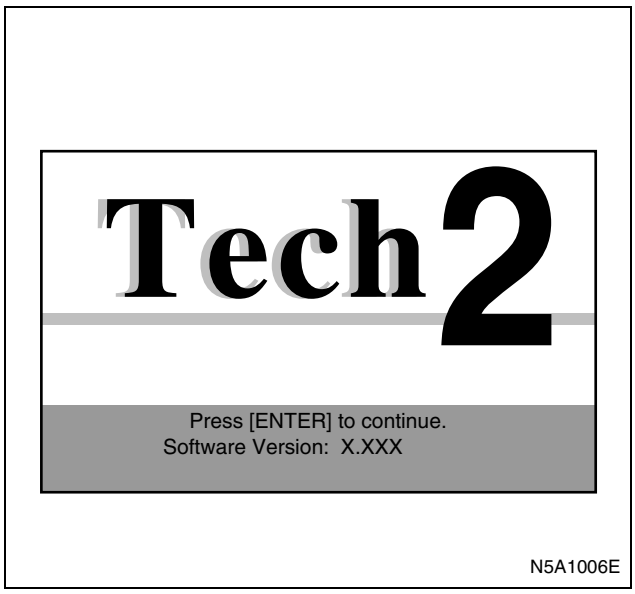
Getting Started

- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:

1. The Isuzu System PCMCIA card (1) inserts into the Tech 2 (5).
2. Connect the SAE 16/19 adapter (3) to the DLC cable (4).
3. Connect the DLC cable to the Tech 2 (5).
4. Make sure the vehicle ignition is off.
5. Connect the Tech 2 SAE 16/19 adapter to the vehicle DLC.



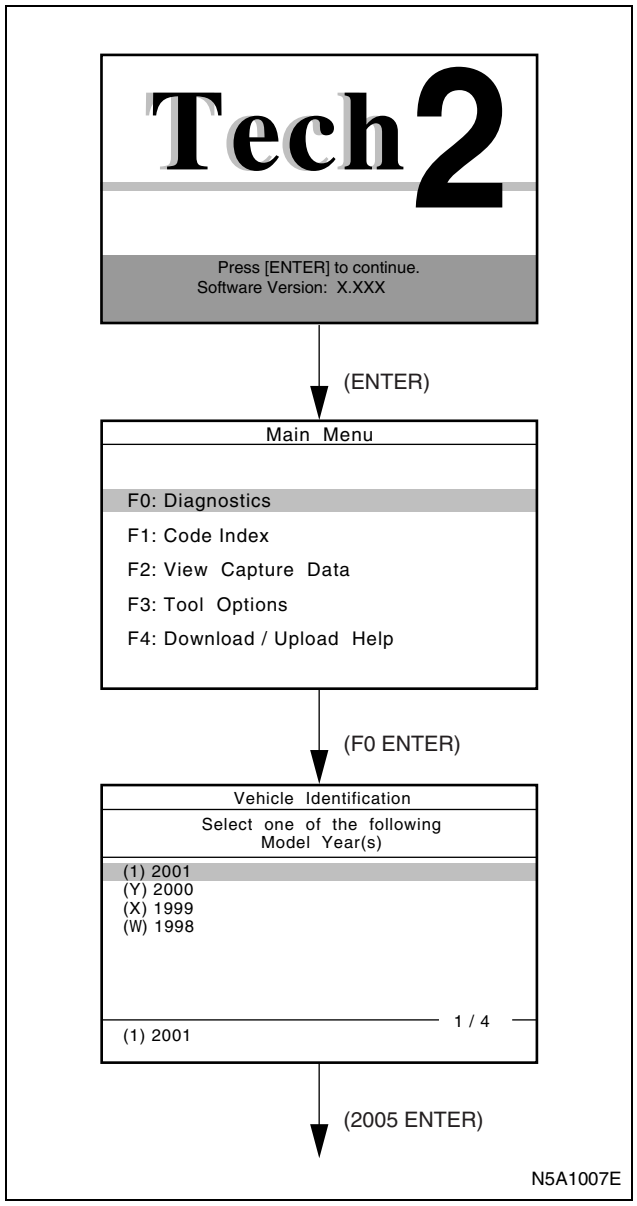
6. Turn on the vehicle ignition.
7. Power the Tech 2 ON and verify the Tech 2 power up display.

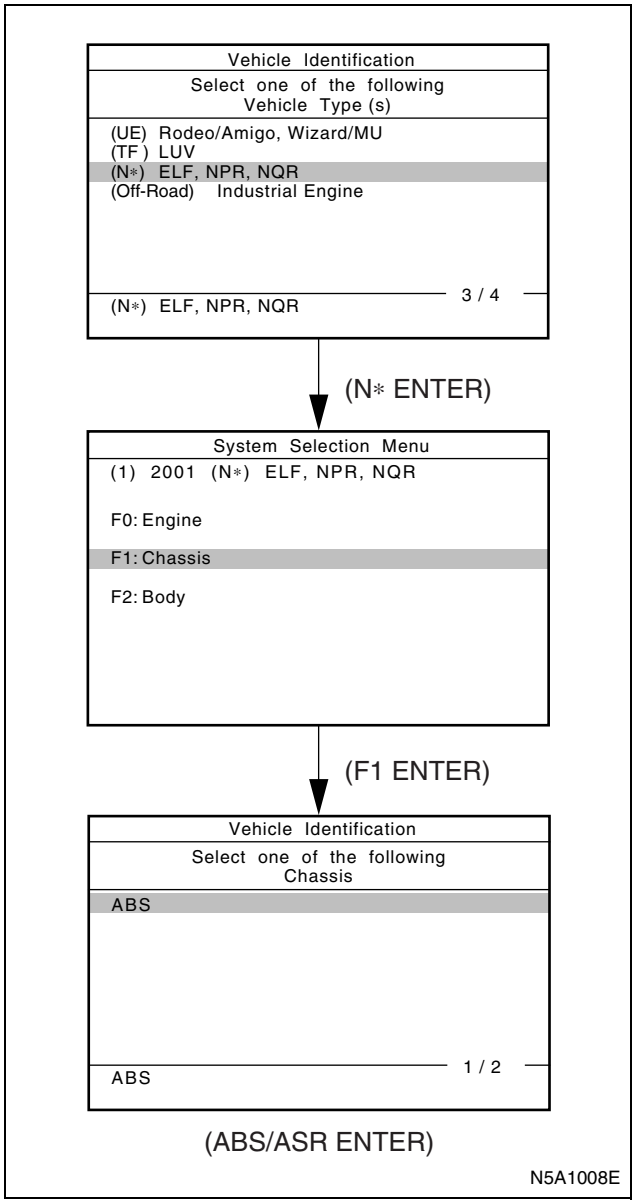


Notice:
The RS232 Loop back connector is only to use for diagnosis of Tech 2. Refer to user guide of the Tech 2.

Operating Procedure (For Example)

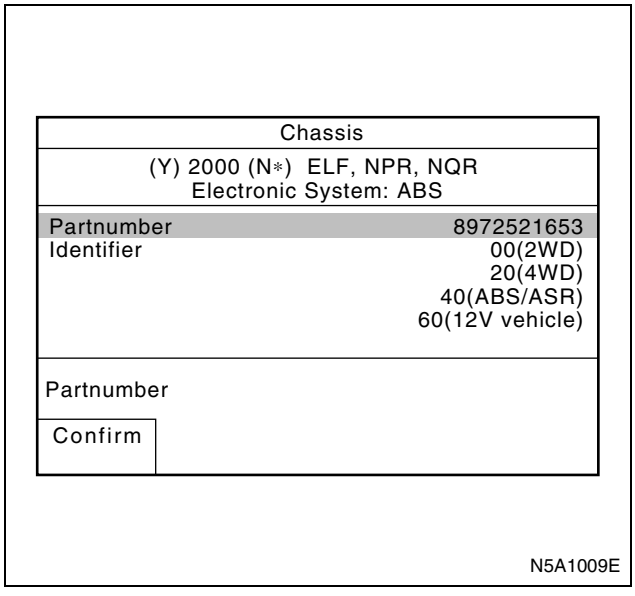
The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.



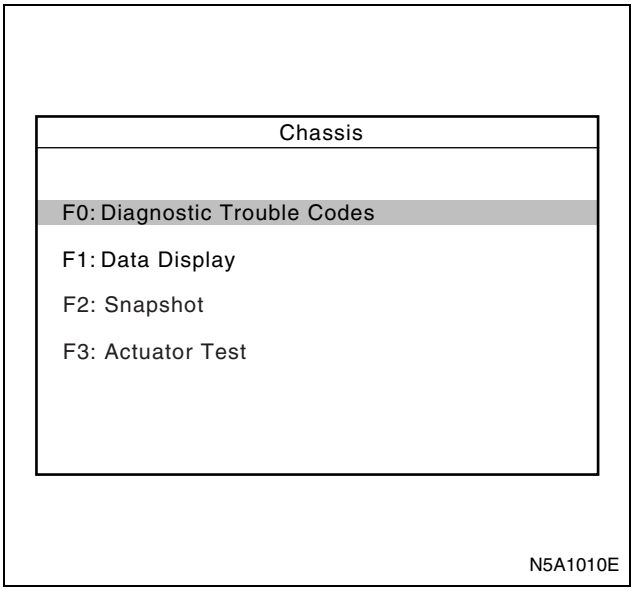


Menu

- The following table shows which functions are used for the available equipment versions.

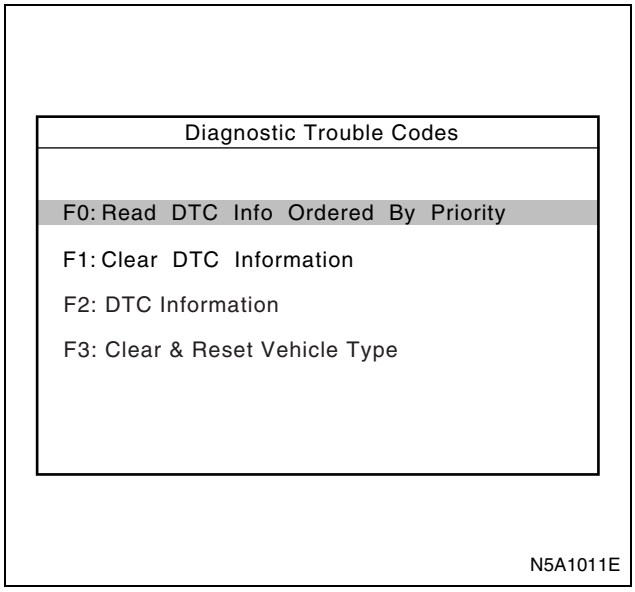


DTC Modes



There are two options available in Tech 2 DTC mode to display the enhanced information available. After selecting DTC, the following menu appears.

- DTC Info
- Clear Info



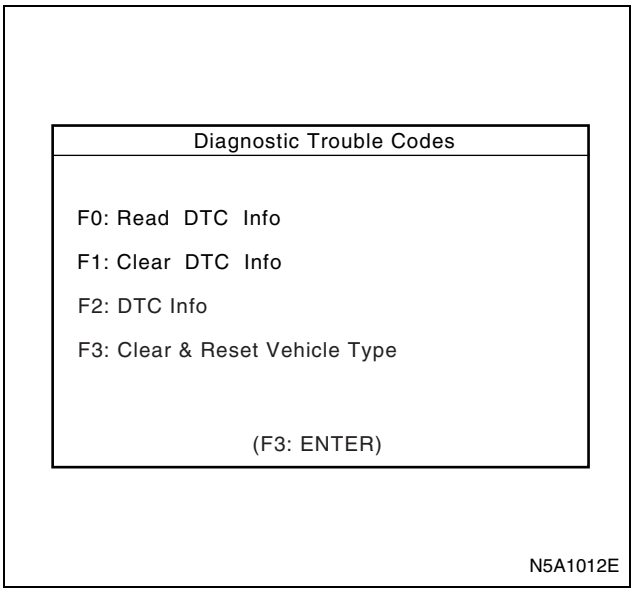
The following is a brief description of each of the sub menus in DTC Info and DTC. The order in which they appear here is alphabetical and not necessarily the way they will appear on the Tech 2.

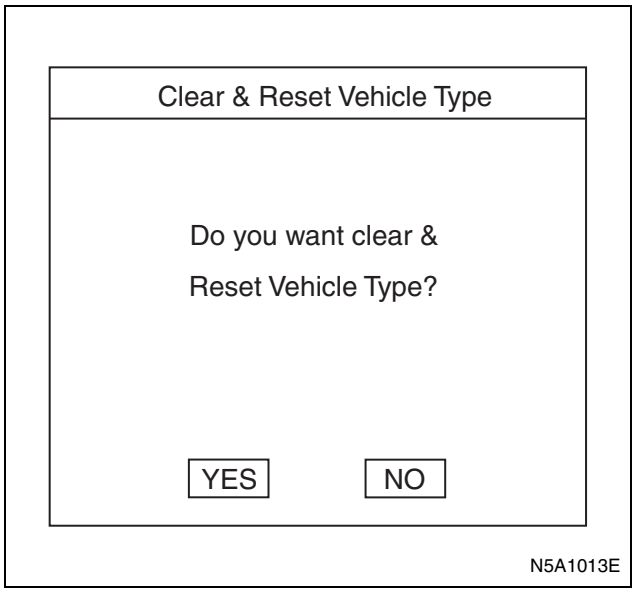
DTC Information Mode

Use the DTC info mode to search for a specific type of stored DTC information. There are two choices. The service manual may instruct the technician to test for DTCs in a certain manner. Always follow published service procedures.

When CODE "13" is Displayed (Vehicle Type Error)

Step	Action	Value(s)	YES	NO
1	Check harness. Is it okay?	—	Erase vehicle type with Tech 2 and reread harness information.	Replace the harness.





YES: Clear vehicle type and reread vehicle harness information.
NO: Return

DTC Status

Current Diagnostic Trouble Codes

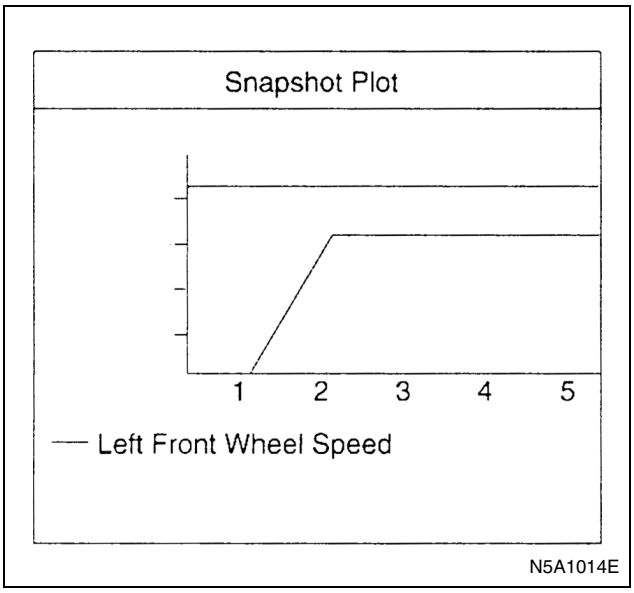
This selection will display all DTCs that have failed during the present ignition cycle.

History Diagnostic Trouble Codes

This selection will display only DTCs that are stored in the EHCU's history memory.

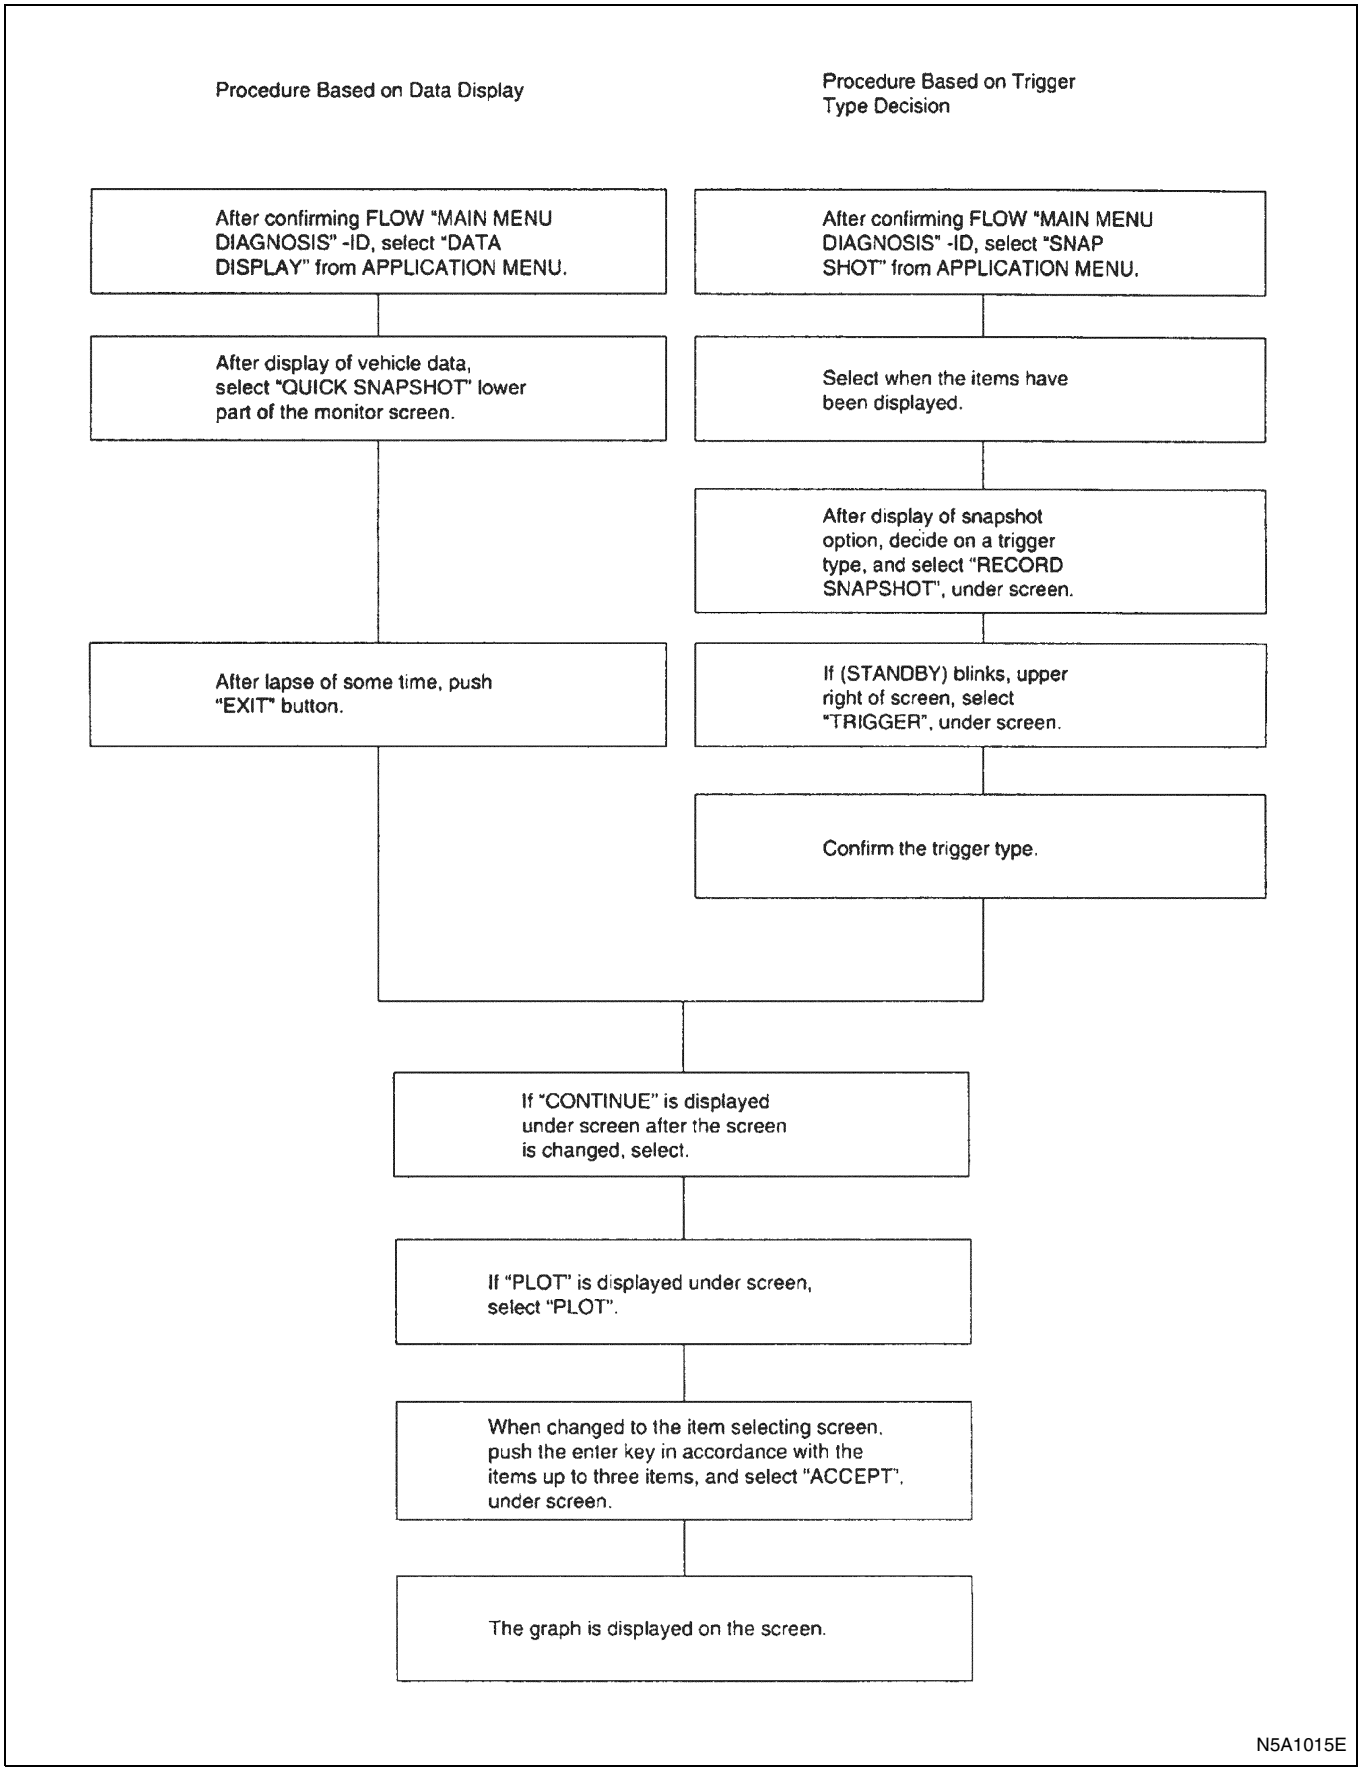
Plotting Snapshot Graph

This test selects several necessary items from the data list to plot graphs and makes data comparison on a long term basis. This test can check ABS performance and defect by graphing wheel speed differences between right and left sides, and front and rear sides obtained from the ABS data list menu.

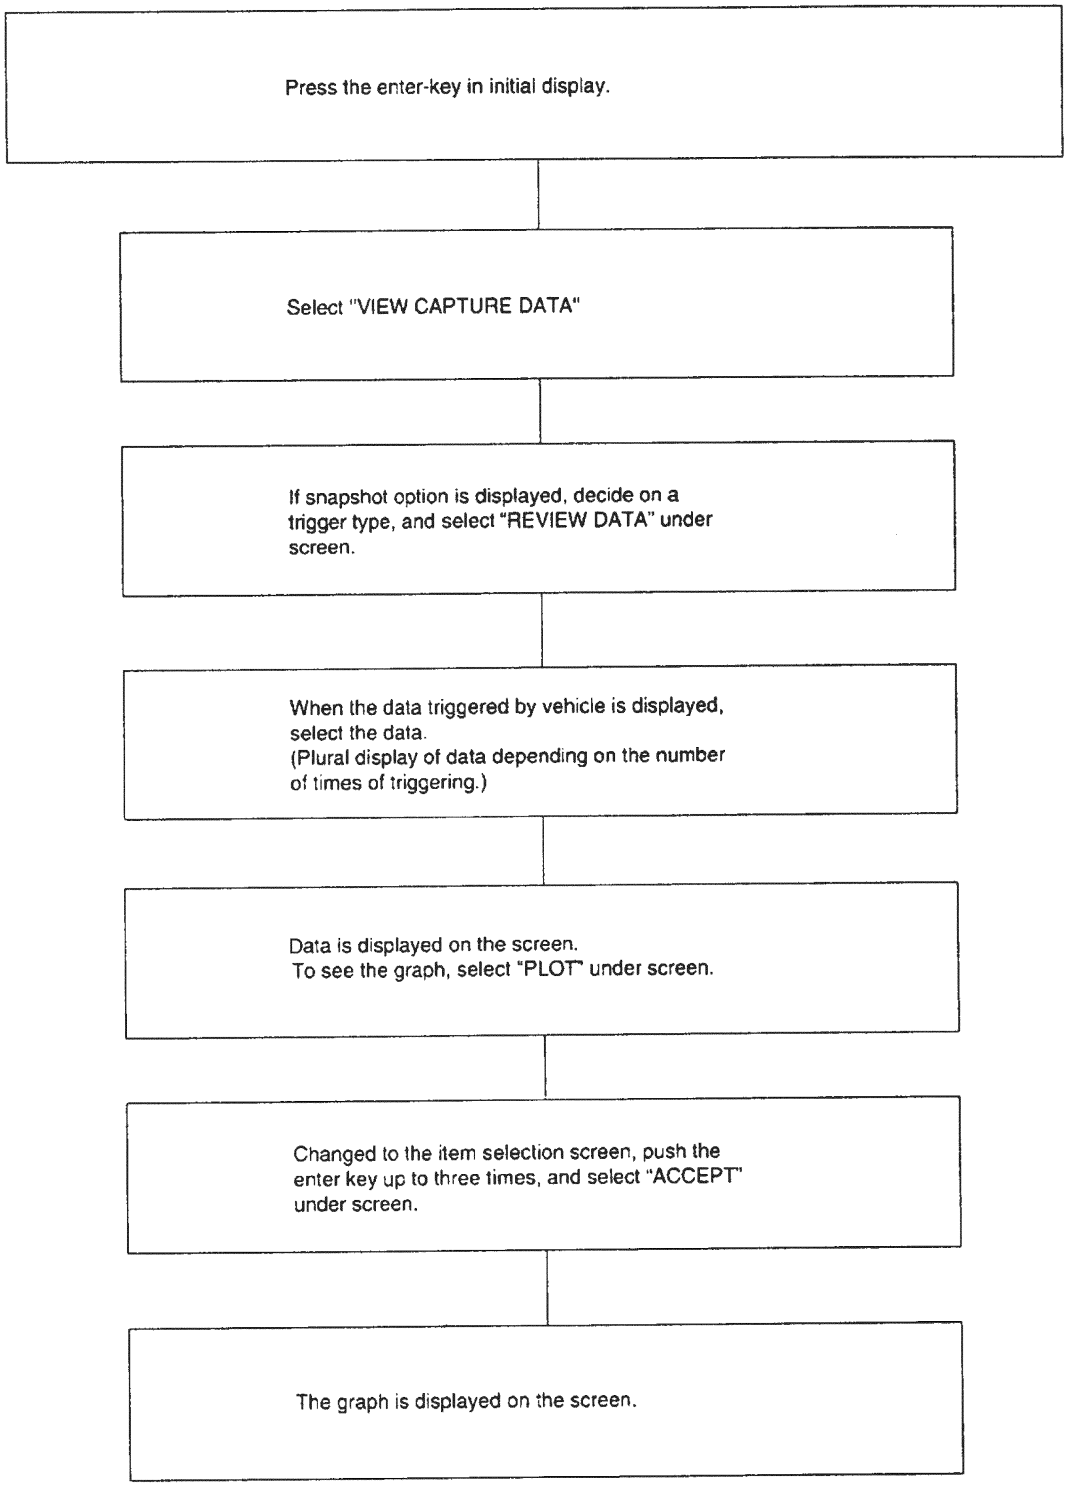


For trouble diagnosis, you can collect graphic data (snap shot) directly from the vehicle.
You can replay the snapshot data as needed.
Therefore, accurate diagnosis is possible, even though the vehicle is not available.

Plotting Graph Flow Chart (Plotting Graph after Obtaining Vehicle Information)



Flow Chart for Snapshot Replay (Plotting Graph)



N5A1016E

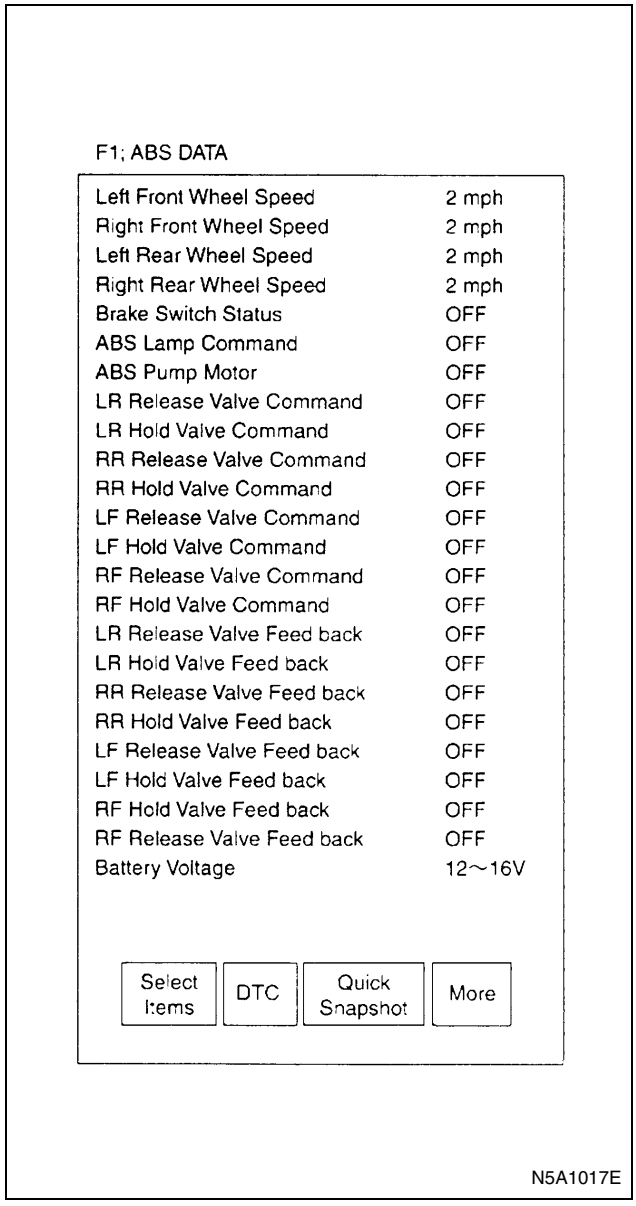
Tech 2 Data Display

Use the Tech 2 data Values only after the ABS Diagnostic System Check has been completed, no DTC(s) were noted, and you have determined that the on-board diagnostics are functioning properly. Tech 2 values from a properly-running engine may be used for comparison with the engine you are diagnosing.

ABS Data

Ignition SW is “ON” position.

(For example)



Special Function

There are 12 different menus available for this test.

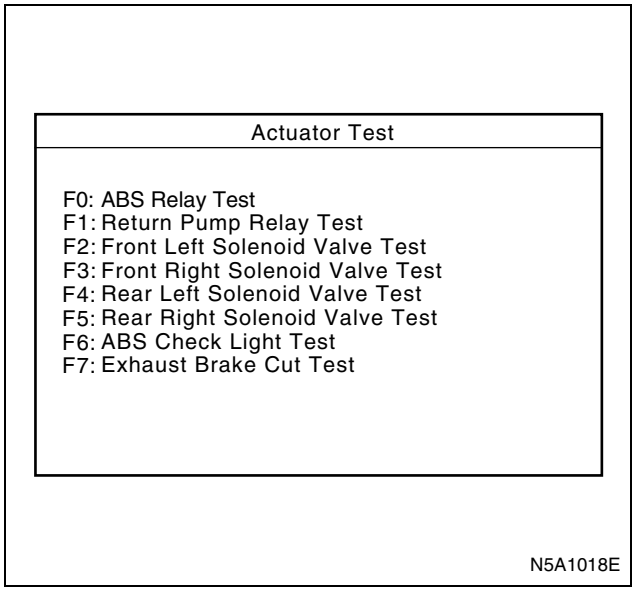
The state of each circuit can be tested by using these menus. Especially when DTC cannot be detected, a faulty circuit can be diagnosed by testing each circuit by means of these menus.

Even when DTC has been detected, the circuit tests using these menus could help discriminate between a mechanical trouble and an electrical trouble.

In all cases test condition; Engine stops with the key turned to the “ON” position. To be more specific, the test is conducted with the brake pedal stepped on after stepping once and releasing.

- Engine: Stop
- Ignition SW: ON
- Brake Pedal: ON-OFF-ON

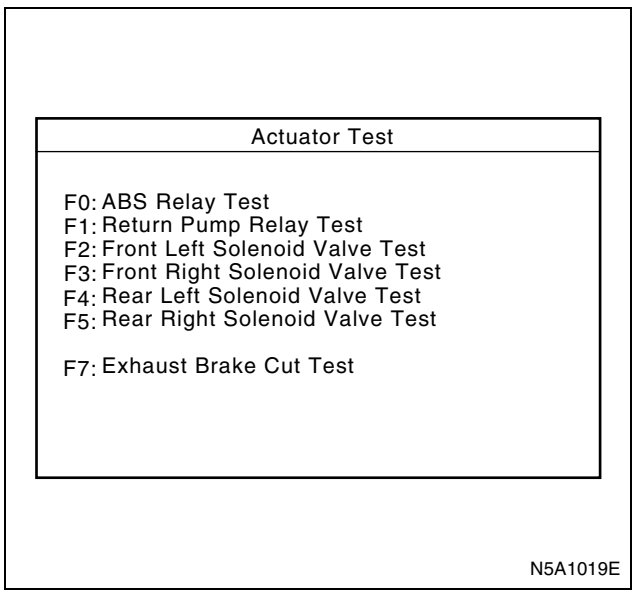
If the Ignition SW was turned OFF or communication was lost, make sure to apply the brake pedal ON-OFF-ON once again and then continue the test.



ABS Warning Lamp

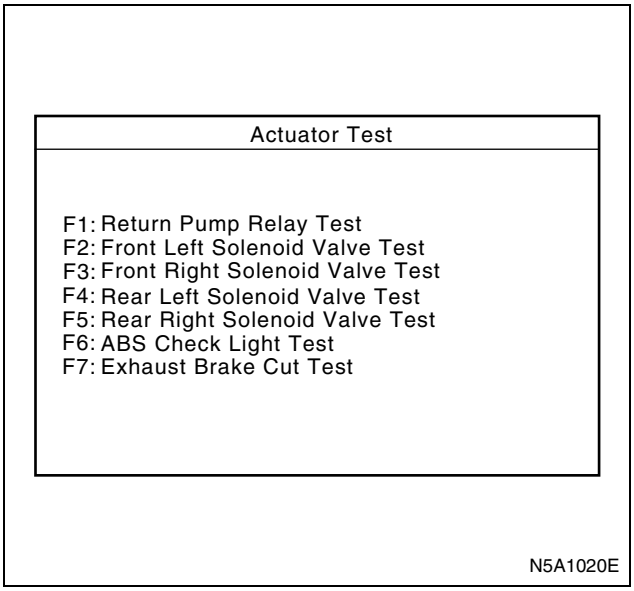
Test condition: Engine stops with the key turned to the “ON” position. To be more specific, the test is conducted with the brake pedal stepped on after stepping once and releasing.

- The circuit is normal if the warning light in the meter panel comes on and goes out in accordance with Tech 2’s instruction.



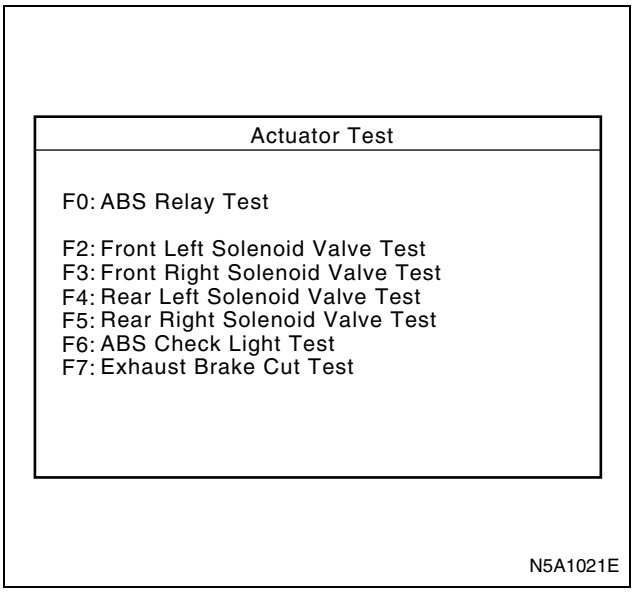
ABS Relay

Test condition: Engine stops with the key turned to the "ON" position. To be more specific, the test is conducted with the brake pedal stepped on after stepping once and releasing.
Make sure of the working sound of the ABS relay.
The circuit is normal if the working sound of the ABS relay is made in accordance with Tech 2's instruction.



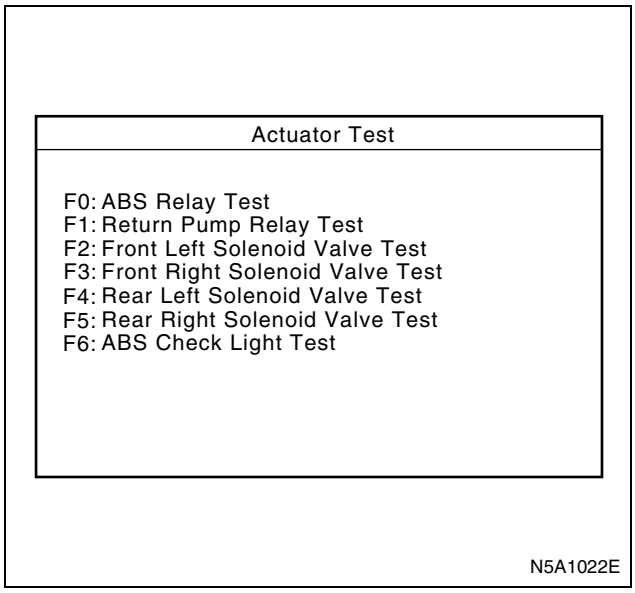
ABS Motor

Test condition: Engine stops with the key turned to the "ON" position. To be more specific, the test is conducted with the brake pedal stepped on after stepping once and releasing.
Make sure of the working sound of the ABS motor.
The circuit is normal if the working sound of the ABS motor is made in accordance with Tech 2's instruction.



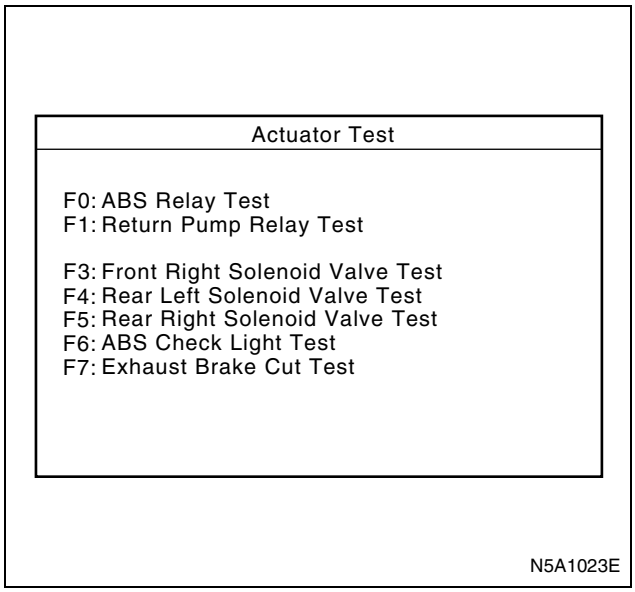
Exhaust Brake Cut Relay

Test condition: Engine stops with the key turned to the "ON" position. To be more specific, the test is conducted with the brake pedal stepped on after stepping once and releasing.
Make sure of the working sound of the exhaust brake cut relay.
The circuit is normal if the working sound of the exhaust brake cut relay is made in accordance with Tech 2's instruction.



Hold Valve Test

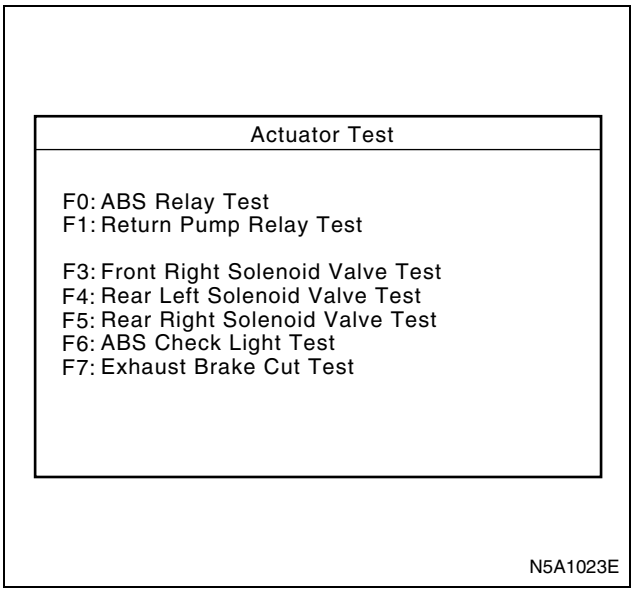
Purpose: The purpose of this test is to detect brake pipe and valve line harness wire wrong connections and valve trouble.
This test will help you confirm the result of your repair service including the removal/reinstallation of brake pipe, valve line harness and valve.



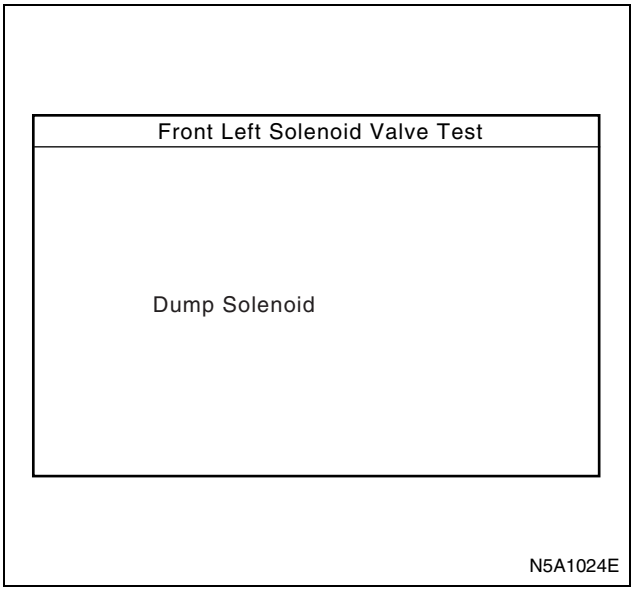
Test conditions: The ignition key is the “ON” position with the four wheels lifted up. The brake pedal is stepped on, released and stepped on again with the parking brake released.

Test procedure:

1. Connect Tech 2 with the vehicle, and select Special Function from the menus.
2. Select a Hold Valve Menu from the Special Function Menus.



Select a ISO Solenoid from the Front Left Solenoid Valve Test Function Menus.



3. Press the Hold Valve “ON” Soft Key with the brake pedal stepped on.
4. Release the brake pedal.
5. Make sure that the Hold Valve “ON” aimed at by Tech 2 and the wheel locked position are the same. If different, check brake pipe, valve line harness wiring and H/UNIT. Repair is needed if abnormality is found.
6. Conduct Step 2 through Step 5 above on all the four wheels.

Caution:

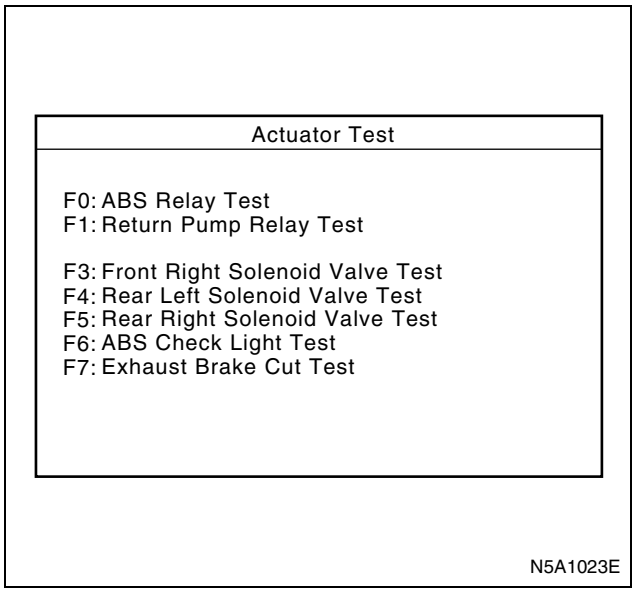
When conducting this test, please observe the following cautions.

1. Do not start the engine without fail.
2. Lift up the vehicle at the level floor.
   - Secure a clearance from the floor surface enough to allow the lifted tire to rotate.
3. Maintain the lift up.
4. Wipe the floor surface to remove water and oil so that the surface may become unslippery.
5. Do not load the vehicle.
   - When lifting up the vehicle, be sure to observe the lifting up points. Refer to vehicle lifting points in Section 0A GENERAL INFORMATION.

Release Valve Test

Purpose: The purpose of this test is to detect brake pipe and valve line harness wire wrong connections and valve trouble.

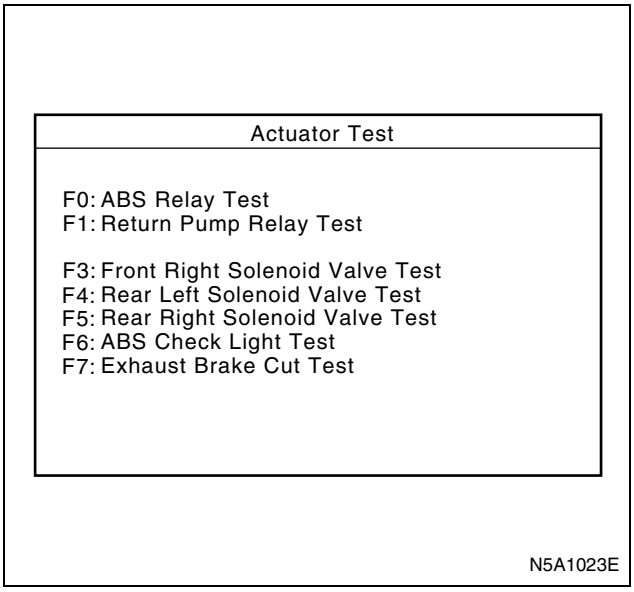
This test will help you confirm the result of your repair service including the removal/reinstallation of brake pipe, valve line harness and valve.



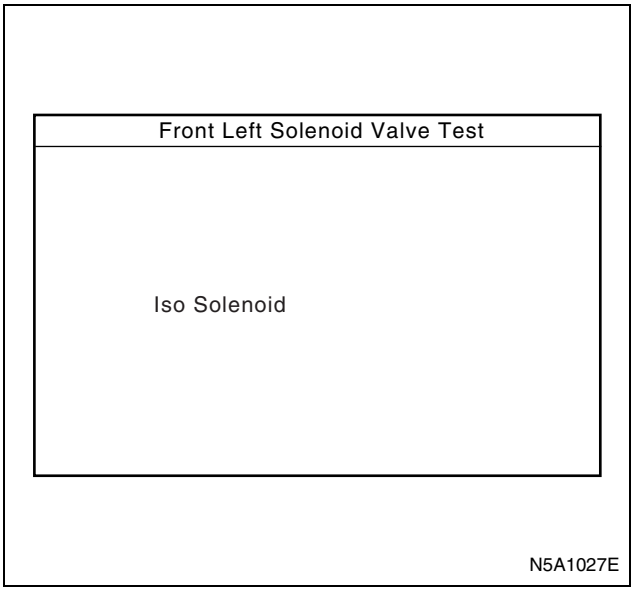
Test conditions: The ignition key is in the “ON” position with the four wheels lifted up. The brake pedal is stepped on, released and stepped on again with the parking brake released.

Test procedure:

1. Connect Tech 2 with the vehicle, and select Special Function from the menus.
2. Select a Release Valve Menu from the Special Function Menus.



Select a Dump Solenoid from the Front Left Solenoid Valve Test Function Menus.



3. Press the Release Valve “ON” Soft Key with the brake pedal stepped on.
4. Make sure that the Release Valve “ON” aimed at by Tech 2 and the wheel released position are the same. If different, check brake pipe, valve line harness wiring and H/UNIT. Repair is needed if abnormality is found.
5. Conduct Step 2 through Step 4 above on all the four wheels.

Caution:
When conducting this test, please observe the following cautions.

1. Do not start the engine without fail.
2. Lift up the vehicle at the level floor.
   - Secure a clearance from the floor surface enough to allow the lifted tire to rotate.
3. Maintain the lift up.
4. Wipe the floor surface to remove water and oil so that the surface may become unslippery.
5. Do not load the vehicle.
   - When lifting up the vehicle, be sure to observe the lifting up points. Refer to vehicle lifting points in Section 0A GENERAL INFORMATION.

EHCU Connector Pin-out Checks

- Disconnect EHCU.
- Perform checks with high impedance digital multimeter 5-8840-0285-0 (J-39200) or equivalent.

No.	Circuit to be Tested	Key Switch Position	Multimeter Scale/Range	Measure between Pin	Nominal Value (24 V Battery Vehicle)	Note
1	EHCU Power Circuit	OFF	VDC	3(+) — 1(–)	0 — 0.3 V	
		ON	VDC	3(+) — 1(–)	9.5 — 16.5 V (16.5 — 34 V)	
		OFF	VDC	2(+) — 1(–)	9.5 — 16.5 V (16.5 — 34 V)	
		OFF	VDC	24(+) — 1(–)	9.5 — 16.5 V (16.5 — 34 V)	
2	EHCU Ground Circuit	OFF	Ω	1(+) — GND	Less than 0.01 Ω	
		OFF	Ω	23(+) — GND	Less than 0.01 Ω	
3	EXHIN Circuit	ON	VDC	7(+) — 1(–)	9.5 — 16.5 V (16.5 — 34 V)	Engine Run
4	EXHOUT Circuit	ON	VDC	8(+) — 1(–)	9.5 — 16.5 V (16.5 — 34 V)	
		OFF	VDC	8(+) — 1(–)	0 — 0.3 V	
5	Brake Switch Signal Circuit	OFF	VDC	16(+) — 1(–)	0 — 0.3 V	
		OFF	VDC	16(+) — 1(–)	9.5 — 16.5 V (16.5 — 34 V)	Apply Brake Pedal
6	ABS W/L Circuit	ON	VDC	6(+) — 1(–)	9.5 — 16.5V (16.5 — 34 V)	
		OFF	VDC	6(+) — 1(–)	0 — 0.3 V	
7	FL Speed Sensor	OFF	kΩ	10(+) — 11(–)	1 — 2 kΩ	
		OFF	kΩ	10(+) — 1(–)	More than 1000 kΩ	
		OFF	VDC	10(+) — 11(–)	More than 200 mV	Turn Wheel at 0.5 RPS
8	FR Speed Sensor	OFF	kΩ	32(+) — 33(–)	1 — 2 kΩ	
		OFF	kΩ	32(+) — 1(–)	More than 1000 kΩ	
		OFF	VDC	32(+) — 33(–)	More than 200 mV	Turn Wheel at 0.5 RPS

SYMPTOM DIAGNOSIS

Symptom Diagnosis

The symptoms that cannot be indicated by the warning light can be divided in the following five categories:

1. ABS works frequently but vehicle does not decelerate.
2. Uneven braking occurs while ABS works.
3. The wheels lock during braking.
4. Brake pedal feel is abnormal.
5. ABS operating sound (from Hydraulic Unit) is heard while not braking.

These are all attributable to problems which cannot be detected by EHCU self-diagnosis. Use the customer complaint and a test to determine which symptom is present. Then follow the appropriate flow chart listed below.

No.	Symptom	Diagnostic Flow Charts	
		Without Tech 2	With Tech 2
1	ABS works frequently but vehicle does not decelerate.	Chart A-1	Chart TA-1
2	Uneven braking occurs while ABS works.	Chart A-2	Chart TA-2
3	The wheels are locked.	Chart A-3	Chart TA-3
4	ABS operating sound (from Hydraulic Unit) is heard while not braking.	Chart A-4	Chart TA-4

Chart A-1 ABS Works Frequently But Vehicle Does Not Decelerate

Step	Action	Value(s)	YES	NO
1	Inspect the tires. Are tire sizes as specified? Isn't there any abnormal wear?	—	Go to Step 2	Repair tires. Go to Step 2
2	Is braking force distribution normal between the front and rear of the vehicle?	—	Go to Step 3	Repair brake parts. Go to Step 7
3	Are axle parts installed normally?	—	Go to Step 4	Repair axle parts. Go to Step 7
4	Is there play in each wheel speed sensor?	—	Go to Step 5	Repair wheel speed sensor. Go to Step 7
5	Is there damage, or powdered iron sticking to each wheel speed sensor/sensor rotor?	—	Go to Step 6	Replace sensor or sensor rotor. Go to Step 7
6	Is the output of each wheel speed sensor normal? (Refer to chart C-1-1 to C-1-4 or TC-1)	—	Replace EHCU. Go to Step 7	Replace wheel speed sensor or repair harness. Go to Step 7
7	Reconnect all components and ensure all components are properly mounted. Was this step finished?	—	Repeat the "Basic diagnostic flow chart".	—

Chart TA-1 ABS Works Frequently But Vehicle Does Not Decelerate (Use Tech 2)

Step	Action	Value(s)	YES	NO
1	Return to Chart A-1. Was the Chart A-1 from Step 1 to Step 4 finished?	—	Go to Step 2	Repair tires. Go to Step 1
2	1. Connect Tech 2. 2. Confirm the output from each wheel sensor on DATA DISPLAY. Is the minimum vehicle speed output from each sensor stable at 4 km/h (3 mph) or less?	—	Go to Step 3	Replace wheel speed sensor. Go to Step 4
3	Return to Chart A-1. Was the Chart A-1 finished?	—	Go to Step 4	Go to Step 3
4	Reconnect all components, ensure all components are properly mounted. Was this step finished?	—	Repeat the “Basic diagnostic flow chart”.	—

Chart A-2 Uneven Braking Occurs While ABS Works

Step	Action	Value(s)	YES	NO
1	Is there play in each sensor?	—	Go to Step 2	Repair. Go to Step 5
2	Damage or powdered iron sticking to each sensor/sensor rotor?	—	Go to Step 3	Repair. Go to Step 5
3	Is the output of each sensor normal? (Refer to chart C-1-1 to C-1-4 or TC-1)	—	Go to Step 4	Replace sensor or repair harness. Go to Step 5
4	Is brake pipe connecting order correct?	—	Replace EHCU. Go to Step 5	Reconnect brake pipe correctly. Go to Step 5
5	Reconnect all components, ensure all components are properly mounted. Was this step finished?	—	Repeat the “Basic diagnostic flow chart”.	—

Chart TA-2 Uneven Braking Occurs While ABS Works (Use Tech 2)

Step	Action	Value(s)	YES	NO
1	1. Connect Tech 2. 2. WHEEL SENSORS make sure of the output conditions of each sensor. Is the output of each sensor normal?	—	Go to Step 2	Replace wheel speed sensor. Go to Step 3
2	Check the brake pipe connecting. Is brake pipe connecting order correct?	—	Replace EHCU. Go to Step 4	Repair brake pipe. Go to Step 4
3	Check the wheel speed sensor and repair if necessary (Refer to chart C-1-1 to C-1-4 or TC-1). Is each chart complete?	—	Go to Step 4	Go to Step 3
4	Reconnect all components, ensure all components are properly mounted. Was this step finished?	—	Repeat the “Basic diagnostic flow chart”.	—

Chart A-3, TA-3 The Wheels Are Locked

Step	Action	Value(s)	YES	NO
1	Is ABS working?	—	Go to Step 2	Go to Step 4
2	Is vehicle speed under 10 km/h (6 mph)?	—	Go to Step 3	Normal.
3	Is sensor output normal? (Chart C-1-1 to C-1-4 or TC-1)	—	Go to Step 4	Replace sensor or repair harness. Go to Step 5
4	Is hydraulic unit grounded properly?	—	Replace hydraulic unit. Go to Step 5	Correct. Go to Step 5
5	Reconnect all components, ensure all components are properly mounted. Was this step finished?	—	Repeat the “Basic diagnostic flow chart”.	—

Chart A-4, TA-4 Braking Sound (from Hydraulic Unit) Is Heard While Not Braking

Step	Action	Value(s)	YES	NO
1	Is this the first time the vehicle is being driven after starting the engine?	—	It is self checking sound. Normal.	Go to Step 2
2	Is vehicle speed under 10 km/h (6 mph)?	—	It is self checking sound. Normal.	Go to Step 3
3	Check for the following condition: • At the time of shift down or clutch operation. • At the time of low μ drive (ice or snow road) or rough road drive. • At the time of high-speed turn. • At the time of passing curb. • At the time of operating electrical equipment switches. • At the time of racing the engine. Did it occur under any one condition above?	—	ABS may sometime be actuated even when brake pedal is not applied.	Go to Step 4
4	Is there play in each sensor/wheel speed sensor rotor?	—	Go to Step 5	Repair. Go to Step 7
5	Damage or powdered iron sticking to each sensor/wheel speed sensor rotor?	—	Repair. Go to Step 7	Go to Step 6
6	Is each sensor output normal? (Refer to chart C-1-1 to C-1-4 or TC-1).	—	Check harness/ connector for suspected disconnection. If no disconnection is found, replace EHCU. Go to Step 7	Repair. Go to Step 7
7	Reconnect all components, ensure all components are properly mounted. Was this step finished?	—	Repeat the “Basic diagnostic flow chart”.	—

DIAGNOSTIC TROUBLE CODES

Diagnostic Trouble Codes

Choose and trace an appropriate flowchart by the numbers listed below to find fault and repair.

Code		Diagnosis	Item (except Wiring)	Chart No.
Flash out	Serial Communications			
12	—	Normal	—	—
13	C0213	Vehicle Type Error	EHCU	1
14	C0214	EHCU Abnormality	EHCU	2
15	C0215	Low Power Voltage	EHCU	3
25	C0225	Exhaust Brake Cut Circuit Abnormality	Relay or EHCU	4
33	C0233	Motor Drive Circuit Abnormality	EHCU	5
34	C0234	Abnormal Motor Rotation	EHCU	6
41	C0241	Solenoid Valve Power Supply Abnormality	EHCU	7
43	C0243	Solenoid Valve Circuit Abnormality	EHCU	8
45	C0245	Solenoid Valve Circuit Abnormality		
51	C0251	FL Speed Sensor Circuit Abnormality	Sensor, EHCU	9
52	C0252	FR Speed Sensor Circuit Abnormality		10
53	C0253	RL Speed Sensor Circuit Abnormality		11
54	C0254	RR Speed Sensor Circuit Abnormality		12
61	C0261	Abnormal FL Speed Sensor Signal		13
62	C0262	Abnormal FR Speed Sensor Signal		14
63	C0263	Abnormal RL Speed Sensor Signal		15
64	C0264	Abnormal RR Speed Sensor Signal		16

* Important: DTC 20 (Reference Voltage High) cannot be indicated by Tech 2. DTC 20 can be indicated and confirmed by flashing using Diagnosis Switch.

DIAGNOSIS BY “ABS” WARNING LIGHT ILLUMINATION PATTERN

Diagnosis by “ABS” Warning Light Illumination Pattern

In the event that there is abnormality in the “ABS” warning light illumination pattern while the key is in the ON position or if the warning light is actuated during driving, trouble should be diagnosed on a illumination pattern basis as follows:

No.	Condition	“ABS” Warning Light Illumination Pattern	Diagnostic
1	Warning light is actuated normally	 N5A1061E	Normal
2	Warning light is not lit	 N5A1062E	Warning light lighting circuit trouble → Go to Chart B-1

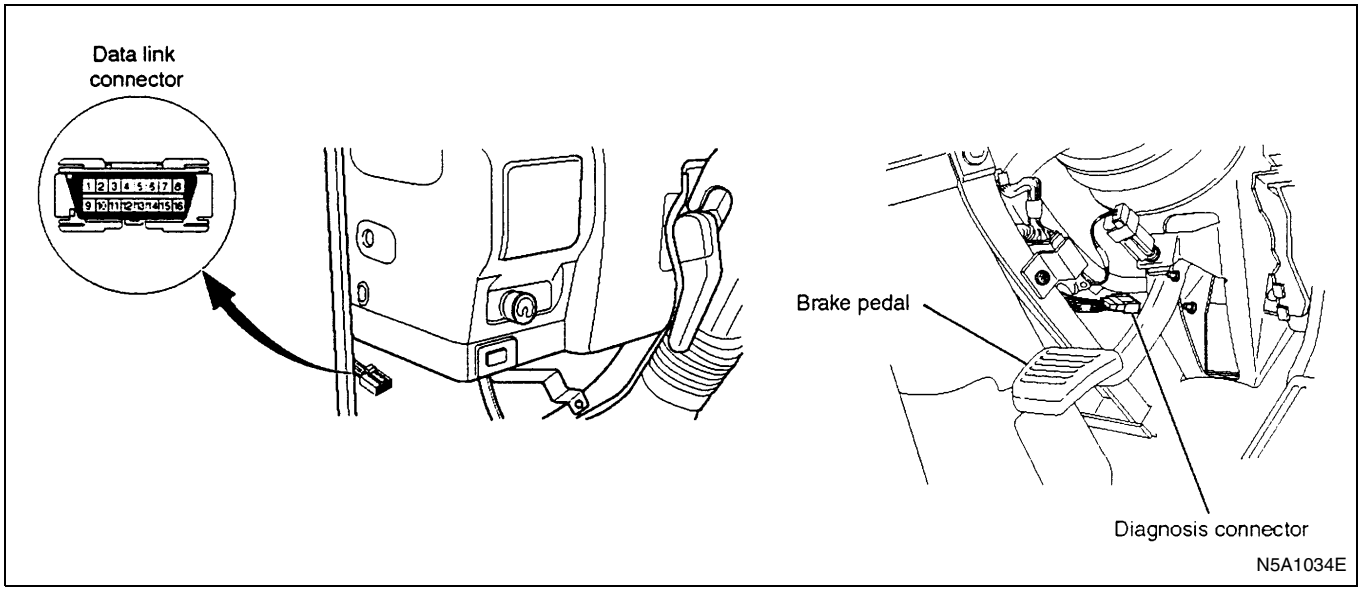
No.	Condition	"ABS" Warning Light Illumination Pattern	Diagnostic
3	Warning light is actuated while driving	 N5A1063E	Diagnostic trouble codes are stored. Display diagnostic trouble codes and diagnose on a code basis according to the flow charts.

Diagnostic Trouble Codes (DTCs)

When the warning light in the meter remains ON, the EHCU stores the fault identification and disables the ABS.

1. How to start DTC display:
   - Confirm that the vehicle has come to a complete stop (with the wheels standing still) and that the brake pedal is not depressed.
     (Unless these two conditions are satisfied, DTC display cannot be started.)
   - With the key switch OFF and short B-79 diagnosis connector terminal 12 to ground.
     Then turn the key switch ON.
   - DTCs can be displayed also by Tech 2.

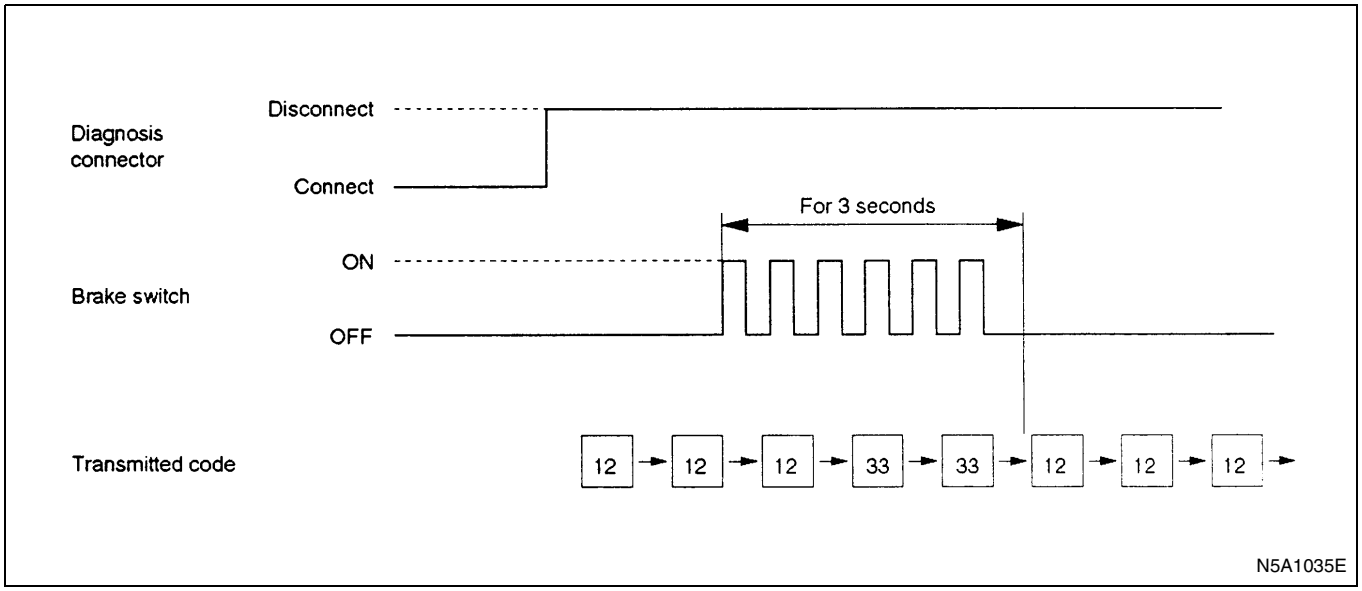
The DLC (for Tech 2) Is Located Behind The Driver Side Lower Cluster Panel



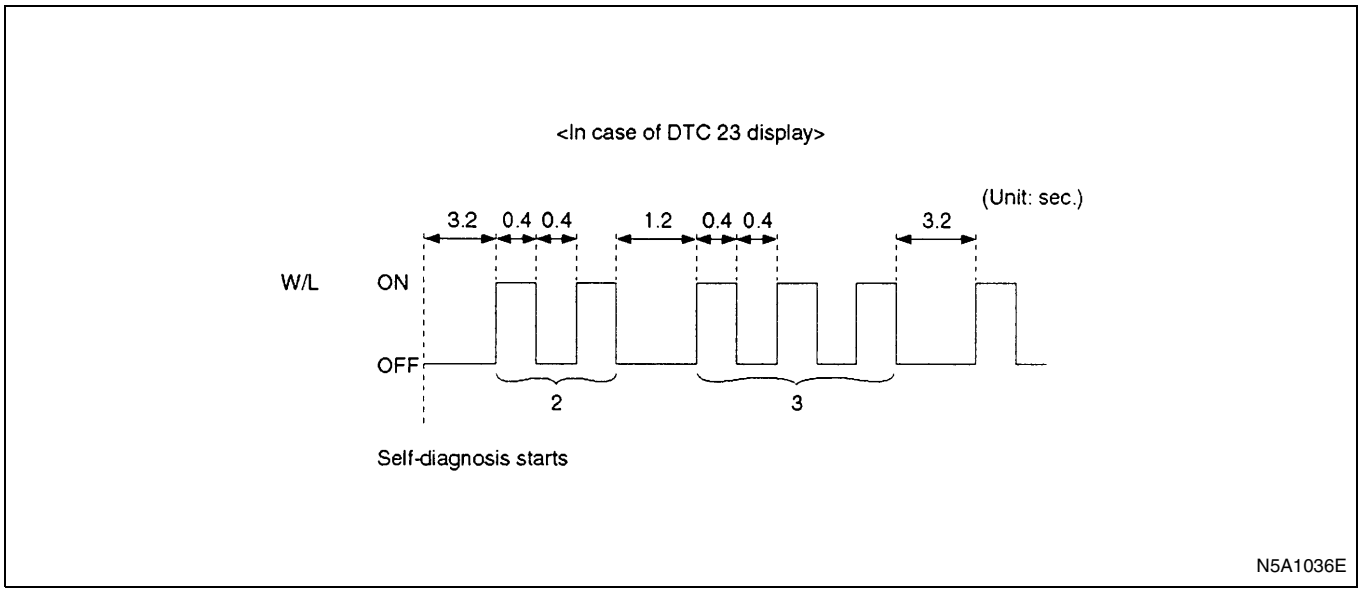
N5A1034E

2. DTC display:
   - DTC is displayed by blinking warning light.
   - Double-digit display.
   - First, normal DTC 12 is displayed three times and then any other DTCs are displayed three times. (If no other DTCs have been stored, the display of DTC 12 will be repeated.)

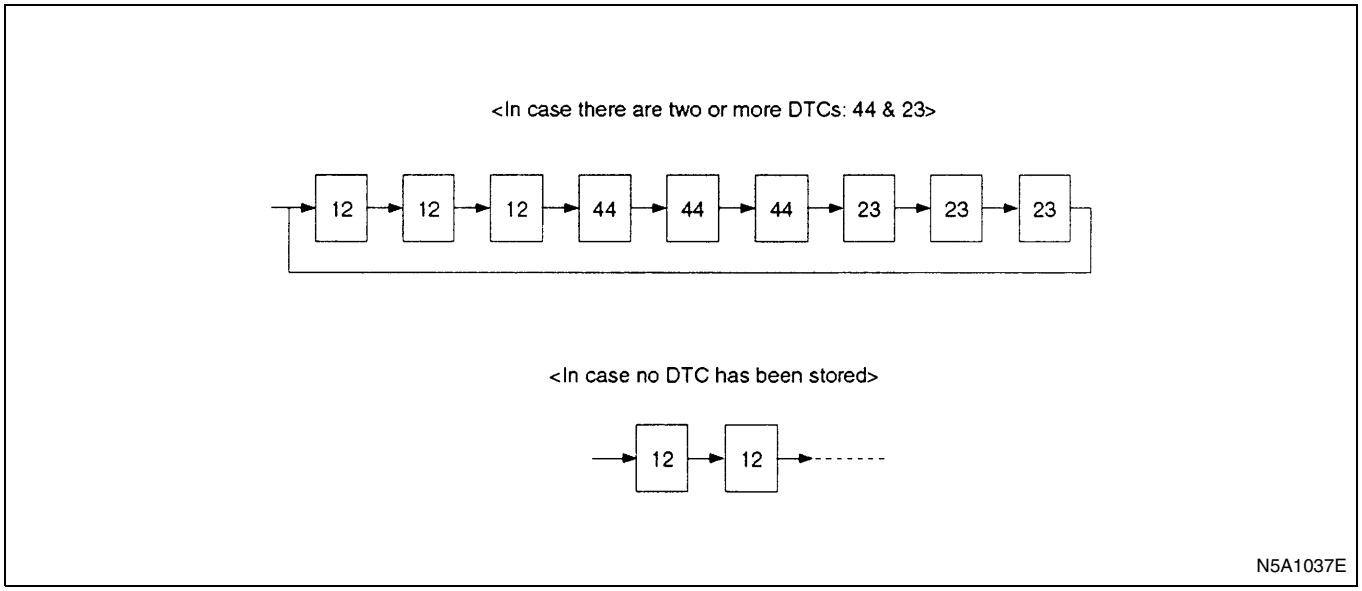
3. How to erase code:
   - Conduct brake switch ON/OFF operation 6 or more times within 3 seconds of self-diagnosis startup.
   - The code cannot be erased if more than 3 seconds have passed since self-diagnosis startup, or if self-diagnosis has started with brake switched on (brake pedal depressed).
   - DTCs can be erased also by Tech 2.



4. An example of DTC display
   Display of DTC 23



After displaying DTC 12 three times, one DTC after another is displayed, starting with the most recent one. (However, display is discontinued after about 5 minutes.)
The DTC 12 is displayed repeatedly. (display is discontinued after about 5 minutes)



5. How to display vehicle model:
   1) Turn the key switch OFF.
   2) Short the diagnosis connector terminal 12 to ground.
   3) Slightly push the brake pedal.
   4) Turn the key switch ON.
   5) ABS warning light illuminates.
   6) Illuminating number of times indicates the vehicle model.

Vehicle model	Illuminating number of times
NKR, NPR FRONT DISC BRAKE	1
NQR	8
NPR FRONT DRUM BRAKE	5

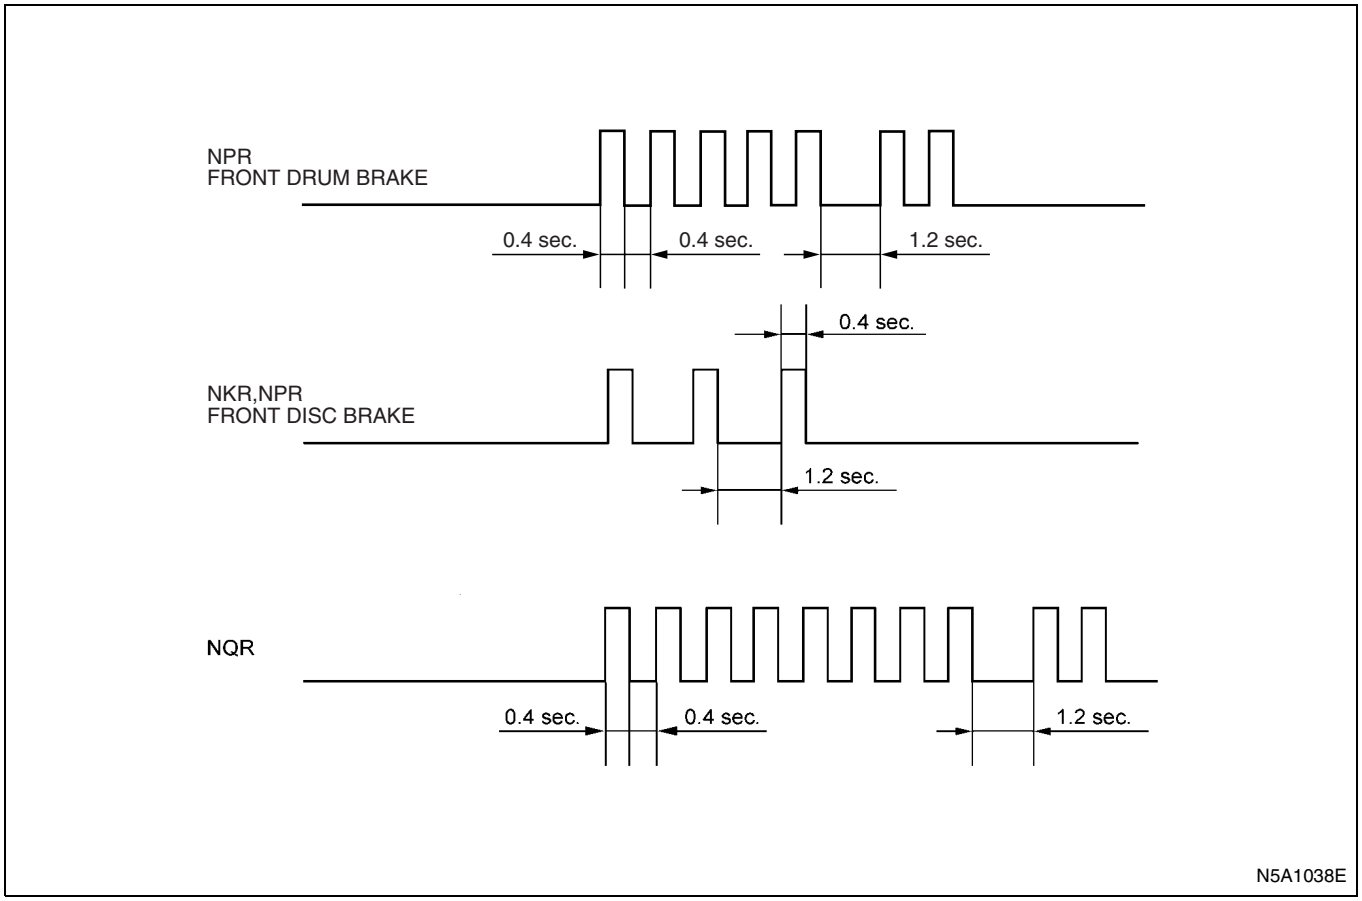


Chart B-1-1 With the key in the ON position (Before starting the engine). Warning light (W/L) is not activated.

Step	Action	Value(s)	YES	NO
1	Is W/L fuse F-16 blown out?	—	Go to Step 5	Go to Step 2
2	Is W/L bulb burnt out?	—	Go to Step 6	Go to Step 3
3	1. Turn the key off. 2. Disconnect EHCU connectors. 3. Turn the key on. 4. Using DVM, measure the voltage between J-177 EHCU connector terminals 6 and 1. Does the DVM display a voltage within the specified value?	12V: 9.5 — 16.5 V 24V: 16.5 — 34 V	Go to Step 4	Go to Step 7
4	Check the continuity between J-177 EHCU connector terminal 1 and body ground. Is there continuity?	—	Go to Step 9	Go to Step 8
5	Replace the fuse. Is action complete?	—	Go to Step 10	—
6	Replace the W/L bulb. Is action complete?	—	Go to Step 10	—
7	Locate and repair open circuit, poor connection or short circuit in the ignition feed circuit. Is action complete?	—	Go to Step 10	—
8	Locate and repair open circuit, poor connection or short circuit in the ground circuit. Is action complete?	—	Go to Step 10	—
9	1. Check the harness for suspected disconnection. 2. If no fault found, replace the EHCU. Is action complete?	—	Go to Step 10	—
10	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

Chart 1 (DTC13/C0213) Vehicle Type Error

Step	Action	Value(s)	YES	NO
1	1. Disconnect EHCU connector. 2. Turn the key on. 3. Measure the voltage at terminal 14, 15, and 17.	NQR: All terminal battery voltage NKR, NPR FRONT DISC BRAKE: All terminal 0 V NPR FRONT DRUM BRAKE: Terminal 14, 15: 0 V Terminal 17: battery voltage	Go to Step 2	Go to Step 5
2	1. Turn the key off and connect EHCU. 2. Connect the Tech 2. 3. Clear the vehicle type. 4. Does the warning light turn off?	—	Go to Step 3	Replace the EHCU. Go to Step 3
3	Confirm the vehicle type. Is the vehicle type okay?	—	Go to Step 4	Replace the EHCU. Go to Step 3
4	Clear the DTC.	—	Troubleshooting completed.	—
5	Repair harness. Does the warning light turn off?	—	Go to Step 3	Replace the EHCU. Go to Step 3

Chart 2 (DTC14/C0214) EHCU Abnormality

Step	Action	Value(s)	YES	NO
1	1. Turn the key off. 2. Disconnect the EHCU connector. 3. Measure continuity between the body ground and J-177 connector terminal 1, 23. Is there continuity?	—	Go to Step 2	Go to Step 3
2	1. Connect the EHCU connector. 2. Clear DTC. 3. Turn the key from off to on and perform diagnosis procedure. Does the DTC repeat?	—	Go to Step 4	Go to Step 5
3	Repair the open/short circuit or malfunction at connection of connector. Is this step completed?	—	Go to Step 5	—
4	Replace the EHCU. Is this step completed?	—	Go to Step 5	—
5	1. Install all parts. Verify each part is properly installed. 2. Clear DTC. Is this step completed?	—	Go to “Basic diagnostic flow chart”.	—

Chart 3 (DTC15/C0215) EHCU Voltage Out of Range

Step	Action	Value(s)	YES	NO
1	Is the battery voltage okay?	—	Go to Step 2	Go to Step 5
2	1. Turn the key off. 2. Disconnect the EHCU connector. 3. Start the engine. 4. Measure voltage between J-177 connector terminal 2 and J-177 connector terminal 1, 23. Is the voltage within the specified value? 5. Measure voltage between J-177 connector terminal 24 and J-177 connector terminal 1, 23.	12 V vehicle: 10 — 16 V 24 V vehicle: 17 — 33.5 V	Go to Step 3	Go to Step 6
3	Locate the malfunction of connection in the circuit. Is the circuit malfunction specified?	—	Go to Step 4	Go to Step 8
4	Repair the malfunction and perform diagnosis procedure. Does the DTC repeat?	—	Go to Step 7	Go to Step 8
5	Charge or replace the battery. Is this step completed?	—	Go to Step 8	—
6	Repair open/short circuit or malfunction at connection of connector between J-177 connector terminal 2 or 24 and fusible link FL- 9. Is this step completed?	—	Go to Step 8	—
7	Replace the EHCU. Is this step completed?	—	Go to Step 8	—
8	1. Install all parts. Verify each part is properly installed. 2. Clear DTC. Is this step completed?	—	Go to “Basic diagnostic flow chart”.	—

Chart 4 (DTC25/C0225) Exhaust Brake Cut Circuit Abnormality

Step	Action	Value(s)	YES	NO
1	1. Disconnect EHCU connector. 2. Start the engine. 3. Measure voltage between EHCU terminals 8 and 1. Is the voltage within the specified value?	12 V vehicle: More than 5 V 24 V vehicle: More than 10 V	Go to Step 2	Go to Step 4
2	Measure voltage between EHCU terminals 7 and 1. Is the voltage within the specified value?	12 V vehicle: More than 5 V 24 V vehicle: More than 10 V	Go to Step 3	Go to Step 6
3	Short EHCU terminal 8 to 1. Is the voltage at EHCU terminal 7 less than 1.5 V?	—	Replace the EHCU.	Replace the exhaust brake cut relay.
4	Measure resistance of the exhaust brake cut relay coil.	12 V vehicle: 60 — 120 ohms 24 V vehicle: 210 — 310 ohms	Go to Step 5	Replace the exhaust brake cut relay.
5	Measure voltage at coil power side of relay box connector. (key at on position) Is the voltage within the specified value?	12 V vehicle: 10 — 16 V 24 V vehicle: 20 — 32 V	Check harness between EHCU terminal 8 and exhaust brake cut relay. Repair as necessary.	Repair harness and/or power line.
6	Turn the exhaust brake switch on. Does the exhaust brake indicator light turn on?	—	Repair harness of EHCU terminal 7.	Go to exhaust brake diagnosis procedure.

Chart 5 (DTC33/C0233) Motor Drive Circuit Abnormality

Step	Action	Value(s)	YES	NO
1	1. Disconnect EHCU connector. 2. Measure voltage between EHCU terminals 24 and 23. Is the voltage within the specified value?	12 V vehicle: 10 — 16 V 24 V vehicle: 20 — 32 V	Go to Step 2	Go to Step 3
2	Measure continuity between EHCU terminals 23 and 1. Is there continuity?	—	Replace the EHCU.	Repair the harness.
3	Check the ABS fusible link (12 V: 60 A, 24 V: 40 A). Is it okay?	—	Repair the harness.	Replace the ABS fusible link (12 V: 60 A, 24 V: 40 A)

Chart 6 (DTC 34/C0234) Abnormal Motor Rotation

- Replace EHCU.

Chart 7 (DTC41/C0241) Solenoid Valve Power Supply Abnormality

Step	Action	Value(s)	YES	NO
1	1. Disconnect EHCU connector. 2. Measure voltage between EHCU terminals 2 and 1. Is the voltage within the specified value?	12 V vehicle: 10 — 16 V 24 V vehicle: 20 — 32 V	Replace the EHCU.	Go to Step 2
2	Check the ABS fusible link (12 V: 60 A, 24 V: 40 A). Is it okay?	—	Repair the harness.	Replace the ABS fusible link (12 V: 60 A, 24 V: 40 A).

Chart 8 (DTC 43, 45/C0243, C0245) Solenoid Valve Circuit Abnormality

- Replace EHCU.

Chart 9 (DTC51/C0251) FL Speed Sensor Circuit Abnormality

Step	Action	Value(s)	YES	NO
1	1. Disconnect EHCU connector. 2. Measure resistance between EHCU terminals 32 and 33. Is the resistance within the specified value?	1 — 2 k ohms	Replace the EHCU.	Go to Step 2
2	1. Disconnect the FL speed sensor connector. 2. Measure the FL speed sensor resistance. Is the resistance within the specified value?	1 — 2 k ohms	Repair the harness.	Replace the FL speed sensor.

Chart 10 (DTC52/C0252) FR Speed Sensor Circuit Abnormality

Step	Action	Value(s)	YES	NO
1	1. Disconnect EHCU connector. 2. Measure resistance between EHCU terminals 10 and 11. Is the resistance within the specified value?	1 — 2 k ohms	Replace the EHCU.	Go to Step 2
2	1. Disconnect the FR speed sensor connector. 2. Measure the FR speed sensor resistance. Is the resistance within the specified value?	1 — 2 k ohms	Repair the harness.	Replace the FR speed sensor.

Chart 11 (DTC53/C0253) RL Speed Sensor Circuit Abnormality

Step	Action	Value(s)	YES	NO
1	1. Turn the key off. 2. Disconnect EHCU connector J-177 and RL speed sensor connector J-149 (J-78). 3. Check the continuity between connector J-177 terminal 34 and sensor connector J-149 (J-78) terminal 2 (1). Is there continuity?	—	Go to Step 2	Go to Step 7
2	Check the continuity between connector J-177 terminal 34 and connector J-177 terminal 1. Is there continuity?	—	Go to Step 7	Go to Step 3
3	Check the continuity between connector J-177 terminal 22 and sensor connector J-149 (J-78) terminal 1 (2). Is there continuity?	—	Go to Step 4	Go to Step 7
4	Check the continuity between connector J-177 terminal 22 and connector J-177 terminal 1. Is there continuity?	—	Go to Step 7	Go to Step 5
5	1. Connect the connector J-177 with EHCU. 2. Turn the key on. 3. Using DVM, measure the voltage between connector J-149 (J-78) terminal 1 (2) (vehicle side) and ground. Does the DVM display a voltage within the specified value?	9 — 16 V	Go to Step 6	Go to Step 7
6	Check the RL sensor output. (Refer to Chart C-1-3) Does the DTC repeat?	—	Go to Step 8	Go to Step 9
7	Repair open circuit, poor connection and/or short circuit between the EHCU connectors and speed sensor connectors. Is this step complete?	—	Go to Step 9	—
8	Replace EHCU. Is this step complete?	—	Go to Step 9	—
9	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

Chart 12 (DTC54/C0254) RR Speed Sensor Circuit Abnormality

Step	Action	Value(s)	YES	NO
1	1. Turn the key off. 2. Disconnect EHCU connector J-177 and RL speed sensor connector J-148 (J-78). 3. Check the continuity between connector J-177 terminal 12 and sensor connector J-148 (J-78) terminal 1 (3). Is there continuity?	—	Go to Step 2	Go to Step 7
2	Check the continuity between connector J-177 terminal 12 and connector J-177 terminal 1. Is there continuity?	—	Go to Step 7	Go to Step 3
3	Check the continuity between connector J-177 terminal 21 and sensor connector J-148 (J-78) terminal 2 (4). Is there continuity?	—	Go to Step 4	Go to Step 7
4	Check the continuity between connector J-177 terminal 21 and connector J-177 terminal 1. Is there continuity?	—	Go to Step 7	Go to Step 5
5	1. Connect the connector J-177 with EHCU. 2. Turn the key on. 3. Using DVM, measure the voltage between connector J-148 (J-78) terminal 2 (4) (vehicle side) and ground. Does the DVM display a voltage within the specified value?	9 — 16 V	Go to Step 6	Go to Step 7
6	Check the RL sensor output. (Refer to Chart C-1-4) Does the DTC repeat?	—	Go to Step 8	Go to Step 9
7	Repair open circuit, poor connection and/or short circuit between the EHCU connectors and speed sensor connectors. Is this step complete?	—	Go to Step 9	—
8	Replace EHCU. Is this step complete?	—	Go to Step 9	—
9	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

Chart 13 (DTC61/C0261) Abnormal FL Speed Sensor Signal

Step	Action	Value(s)	YES	NO
1	Have the vehicle been jacked up? Have two or three wheels been turned on the brake tester intentionally?	—	Be careful that the system may fail if two or three wheels are turned forcibly. The flow is now complete.	Repair tires. Go to Step 2
2	Are tire pressures, sizes and wear normal?	—	Go to Step 3	Repair tires. Go to Step 2
3	Is there play in the FL wheel bearing?	—	Go to Step 12	Go to Step 4
4	Is there play in the FL speed sensor/sensor rotor?	—	Go to Step 13	Go to Step 5
5	Is there powdered iron sticking to FL speed sensor/sensor rotor?	—	Go to Step 14	Go to Step 6
6	Check the FL speed sensor. (Refer to Chart C-1-1 or TC-1) Is the FL sensor output normal?	—	Go to Step 7	Go to Step 10
7	Is there a broken tooth or indentation in the sensor rotor?	—	Go to Step 15	Go to Step 8
8	Using DVM, measure the resistance between J-177 EHCU connector terminal 33 and ground. Does the DVM display a resistance within the specified value?	1000 k ohms or more	Go to Step 9	Go to Step 11
9	1. Clear diagnostic trouble code. 2. Test drive and perform system self-check. Does the DTC repeat?	—	Go to Step 20	Go to Step 18
10	Is there damage or indentation in the speed sensor?	—	Go to Step 16	Go to Step 17
11	1. Disconnect FL sensor connector. 2. Using DVM, measure the resistance between J-75 sensor connector terminal 2 and ground. Does the DVM display a resistance within the specified value?	1000 k ohms or more	Go to Step 19	Go to Step 16
12	Adjust wheel bearing preload. Is action complete?	—	Go to Step 21	—
13	Repair or replace speed sensor/sensor rotor. Is action complete?	—	Go to Step 21	—
14	Repair speed sensor/sensor rotor. Is action complete?	—	Go to Step 21	—
15	Replace sensor rotor. Is action complete?	—	Go to Step 21	—

Step	Action	Value(s)	YES	NO
16	Replace FL speed sensor. Is action complete?	—	Go to Step 21	—
17	Check the FL speed sensor circuit. Refer to Chart 9. Is action complete?	—	Verify repair	—
18	Check for a poor connection and an open circuit on the harness between EHCU and sensor connectors. Refer to “Note on Intermittents” described in earlier this section. Is action complete?	—	Go to Step 21	—
19	1. Locate open circuit, poor connection or short circuit on the harness between EHCU and sensor connectors. 2. Repair the harness. Is action complete?	—	Go to Step 21	Go to Step 21
20	Replace EHCU. Is action complete?	—	Go to Step 21	—
21	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

Chart 14 (DTC62/C0262) Abnormal FR Speed Sensor Signal

Step	Action	Value(s)	YES	NO
1	Have the vehicle been jacked up? Have two or three wheels been turned on the brake tester intentionally?	—	Be careful that the system may fail if two or three wheels are turned forcibly. The flow is now complete.	Repair tires. Go to Step 2
2	Are tire pressures, sizes and wear normal?	—	Go to Step 3	Repair tires. Go to Step 2
3	Is there play in the FR wheel bearing?	—	Go to Step 12	Go to Step 4
4	Is there play in the FR speed sensor/sensor rotor?	—	Go to Step 13	Go to Step 5
5	Is there powdered iron sticking to FR speed sensor/sensor rotor?	—	Go to Step 14	Go to Step 6
6	Check the FR speed sensor. (Refer to Chart C-1-2 or TC-1) Is the FR sensor output normal?	—	Go to Step 7	Go to Step 10
7	Is there a broken tooth or indentation in the sensor rotor?	—	Go to Step 15	Go to Step 8

Step	Action	Value(s)	YES	NO
8	Using DVM, measure the resistance between J-177 EHCU connector terminal 11 and ground. Does the DVM display a resistance within the specified value?	1000 k ohms or more	Go to Step 9	Go to Step 11
9	1. Clear diagnostic trouble code. 2. Test drive and perform system self-check. Does the DTC repeat?	—	Go to Step 20	Go to Step 18
10	Is there damage or indentation in the speed sensor?	—	Go to Step 16	Go to Step 17
11	1. Disconnect FR sensor connector. 2. Using DVM, measure the resistance between J-74 sensor connector terminal 2 and ground. Does the DVM display a resistance within the specified value?	1000 k ohms or more	Go to Step 19	Go to Step 16
12	Adjust wheel bearing preload. Is action complete?	—	Go to Step 21	—
13	Repair or replace speed sensor/sensor rotor. Is action complete?	—	Go to Step 21	—
14	Repair speed sensor/sensor rotor. Is action complete?	—	Go to Step 21	—
15	Replace sensor rotor. Is action complete?	—	Go to Step 21	—
16	Replace FR speed sensor. Is action complete?	—	Go to Step 21	—
17	Check the FR speed sensor circuit. Refer to Chart 10. Is action complete?	—	Verify repair	—
18	Check for a poor connection and an open circuit on the harness between EHCU and sensor connectors. Refer to “Note on Intermittents” described in earlier this section. Is action complete?	—	Go to Step 21	—
19	1. Locate open circuit, poor connection or short circuit on the harness between EHCU and sensor connectors. 2. Repair the harness. Is action complete?	—	Go to Step 21	Go to Step 21
20	Replace EHCU. Is action complete?	—	Go to Step 21	—

Step	Action	Value(s)	YES	NO
21	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

Chart 15 (DTC63/C0263) Abnormal RL Speed Sensor Signal

Step	Action	Value(s)	YES	NO
1	Have the vehicle been jacked up? Have two or three wheels been turned on the brake tester intentionally?	—	Be careful that the system may fail if two or three wheels are turned forcibly. The flow is now complete.	Repair tires. Go to Step 2
2	Are tire pressures, sizes and wear normal?	—	Go to Step 3	Repair tires. Go to Step 2
3	Is there play in the RL wheel bearing?	—	Go to Step 10	Go to Step 4
4	Is there play in the RL speed sensor/sensor rotor?	—	Go to Step 11	Go to Step 5
5	Is there powdered iron sticking to RL speed sensor/sensor rotor?	—	Go to Step 12	Go to Step 6
6	Check the RL speed sensor. (Refer to Chart C-1-3 or TC-1) Is the RL sensor output normal?	—	Go to Step 7	Go to Step 9
7	Is there a broken tooth or indentation in the sensor rotor?	—	Go to Step 13	Go to Step 8
8	1. Clear diagnostic trouble code. 2. Test drive and perform system self-check. Does the DTC repeat?	—	Go to Step 17	Go to Step 16
9	Is there damage or indentation in the speed sensor?	—	Go to Step 14	Go to Step 15
10	Adjust wheel bearing preload. Is action complete?	—	Go to Step 18	—
11	Repair or replace speed sensor/sensor rotor. Is action complete?	—	Go to Step 18	—
12	Repair speed sensor/sensor rotor. Is action complete?	—	Go to Step 18	—
13	Replace sensor rotor. Is action complete?	—	Go to Step 18	—
14	Replace RL speed sensor. Is action complete?	—	Go to Step 18	—
15	Check the RL speed sensor circuit. Refer to Chart 11. Is action complete?	—	Verify repair	—

Step	Action	Value(s)	YES	NO
16	Check for a poor connection and an open circuit on the harness between EHCU and sensor connectors. Refer to “Note on Intermittents” described in earlier this section. Is action complete?	—	Go to Step 18	—
17	Replace EHCU. Is action complete?	—	Go to Step 18	—
18	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

Chart 16 (DTC64/C0264) Abnormal RR Speed Sensor Signal

Step	Action	Value(s)	YES	NO
1	Have the vehicle been jacked up? Have two or three wheels been turned on the brake tester intentionally?	—	Be careful that the system may fail if two or three wheels are turned forcibly. The flow is now complete.	Repair tires. Go to Step 2
2	Are tire pressures, sizes and wear normal?	—	Go to Step 3	Repair tires. Go to Step 2
3	Is there play in the RR wheel bearing?	—	Go to Step 10	Go to Step 4
4	Is there play in the RR speed sensor/sensor rotor?	—	Go to Step 11	Go to Step 5
5	Is there powdered iron sticking to RR speed sensor/sensor rotor?	—	Go to Step 12	Go to Step 6
6	Check the RR speed sensor. (Refer to Chart C-1-4 or TC-1) Is the RR sensor output normal?	—	Go to Step 7	Go to Step 9
7	Is there a broken tooth or indentation in the sensor rotor?	—	Go to Step 13	Go to Step 8
8	1. Clear diagnostic trouble code. 2. Test drive and perform system self-check. Does the DTC repeat?	—	Go to Step 17	Go to Step 16
9	Is there damage or indentation in the speed sensor?	—	Go to Step 14	Go to Step 15
10	Adjust wheel bearing preload. Is action complete?	—	Go to Step 18	—
11	Repair or replace speed sensor/sensor rotor. Is action complete?	—	Go to Step 18	—
12	Repair speed sensor/sensor rotor. Is action complete?	—	Go to Step 18	—

Step	Action	Value(s)	YES	NO
13	Replace sensor rotor. Is action complete?	—	Go to Step 18	—
14	Replace RR speed sensor. Is action complete?	—	Go to Step 18	—
15	Check the RR speed sensor circuit. Refer to Chart 12. Is action complete?	—	Verify repair	—
16	Check for a poor connection and an open circuit on the harness between EHCU and sensor connectors. Refer to “Note on Intermittents” described in earlier this section. Is action complete?	—	Go to Step 18	—
17	Replace EHCU. Is action complete?	—	Go to Step 18	—
18	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

UNIT INSPECTION PROCEDURE

Unit Inspection Procedure

This section describes the following inspection procedures referred to during “SYMPTOM DIAGNOSIS” and “DIAGNOSS BY ‘ABS’ WARNING LIGHT ILLUMINATION PATTERN”:

	without Tech 2	with Tech 2
Speed Sensor Output Inspection	Chart C-1-1 to C-1-4	Chart TC-1

Chart C-1-1 FL Speed Sensor Output Inspection Procedure

Step	Action	Value(s)	YES	NO
1	1. Turn the key off. 2. Disconnect EHCU connector. 3. Jack up the vehicle, with all wheels off the ground. 4. Measure the AC voltage between J-177 EHCU connector terminals 32 and 33 while turning FL wheel at a speed of 0.5 RPS. Does the DVM display a voltage within the specified value?	200 mV or more	Go to Step 5	Go to Step 2
2	1. Disconnect FL sensor connector. 2. Using DVM, measure the resistance between J-75 sensor connector terminals 1 and 2. Does the DVM display a resistance within the specified value?	1.0 — 2.0 k ohms	Go to Step 4	Go to Step 3
3	1. Locate open circuit, poor connection or short circuit on the harness between EHCU and sensor connectors. 2. Repair the harness. Is action complete?	—	Go to Step 5	—
4	Replace FL sensor. Is action complete?	—	Go to Step 5	—
5	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

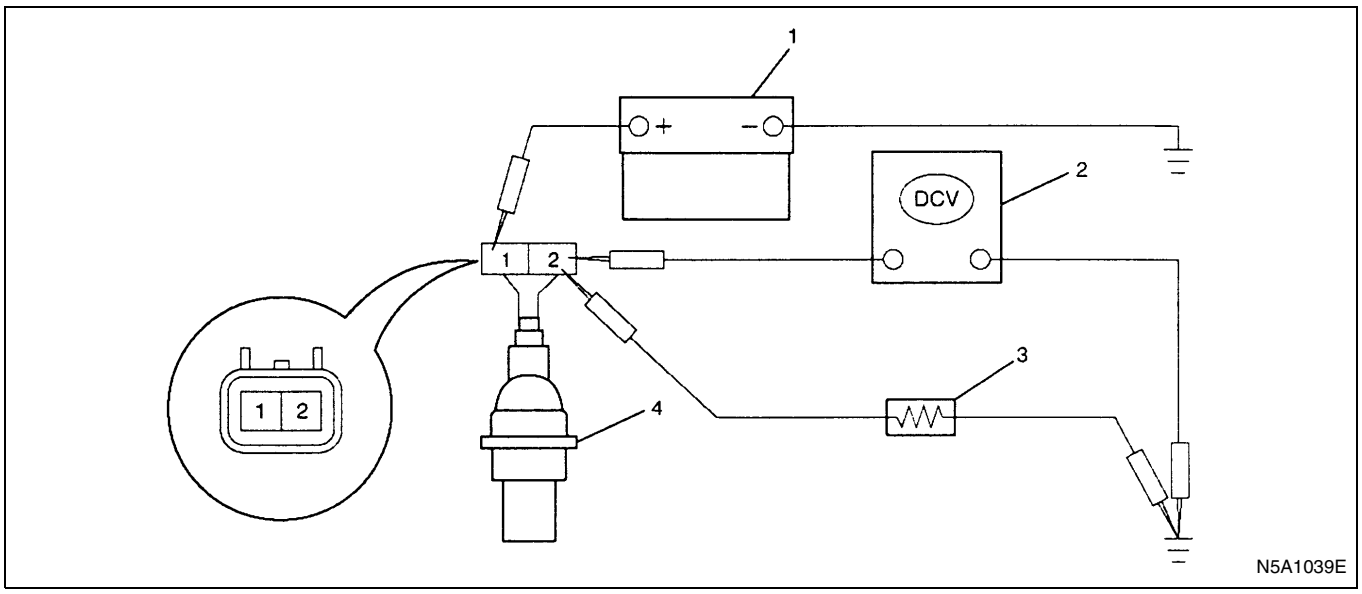
Chart C-1-2 FR Speed Sensor Output Inspection Procedure

Step	Action	Value(s)	YES	NO
1	1. Turn the key off. 2. Disconnect EHCU connector. 3. Jack up the vehicle, with all wheels off the ground. 4. Measure the AC voltage between J-177 EHCU connector terminals 10 and 11 while turning FR wheel at a speed of 0.5 RPS. Does the DVM display a voltage within the specified value?	200 mV or more	Go to Step 5	Go to Step 2
2	1. Disconnect FR sensor connector. 2. Using DVM, measure the resistance between J-74 sensor connector terminals 1 and 2. Does the DVM display a resistance within the specified value?	1.0 — 2.0 k ohms	Go to Step 4	Go to Step 3
3	1. Locate open circuit, poor connection or short circuit on the harness between EHCU and sensor connectors. 2. Repair the harness. Is action complete?	—	Go to Step 5	—
4	Replace FR sensor. Is action complete?	—	Go to Step 5	—
5	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

Chart C-1-3 RL Speed Sensor Output Inspection Procedure

Step	Action	Value(s)	YES	NO
1	1. Turn the key off. 2. Disconnect EHCU connector. 3. Jack up the vehicle, with all wheels off the ground. 4. Connect a 120 ohms resistor between J-177 EHCU connector terminal 22 and ground. Apply voltage of 12 V to EHCU connector terminal 22. 5. Using DVM, measure the DC voltage between J-177 connector terminal 22 and ground while turning RL wheel at a speed of 0.5 RPS. Does the DVM display a voltage within the specified value?	0.2 — 4.5 V	Go to Step 5	Go to Step 2

Step	Action	Value(s)	YES	NO
2	1. Turn the key off. 2. Disconnect RL sensor connector. 3. Connect a 120 ohms resistor between sensor connector terminal 2 (sensor side) and ground. 4. Apply 12 V voltage at sensor connector terminal 1 (sensor side). 5. Using DVM, measure the DC voltage between sensor connector terminal 2 (sensor side) and ground while turning RL wheel at a speed of 0.5 RPS. Does the DVM display a voltage within the specified value?	0.2 — 4.5 V	Go to Step 3	Go to Step 4
3	1. Locate open circuit, poor connection short circuit on the harness between EHCU and sensor connectors. 2. Repair the harness. Is action complete?	—	Go to Step 5	—
4	Replace RL sensor. Is action complete?	—	Go to Step 5	—
5	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—

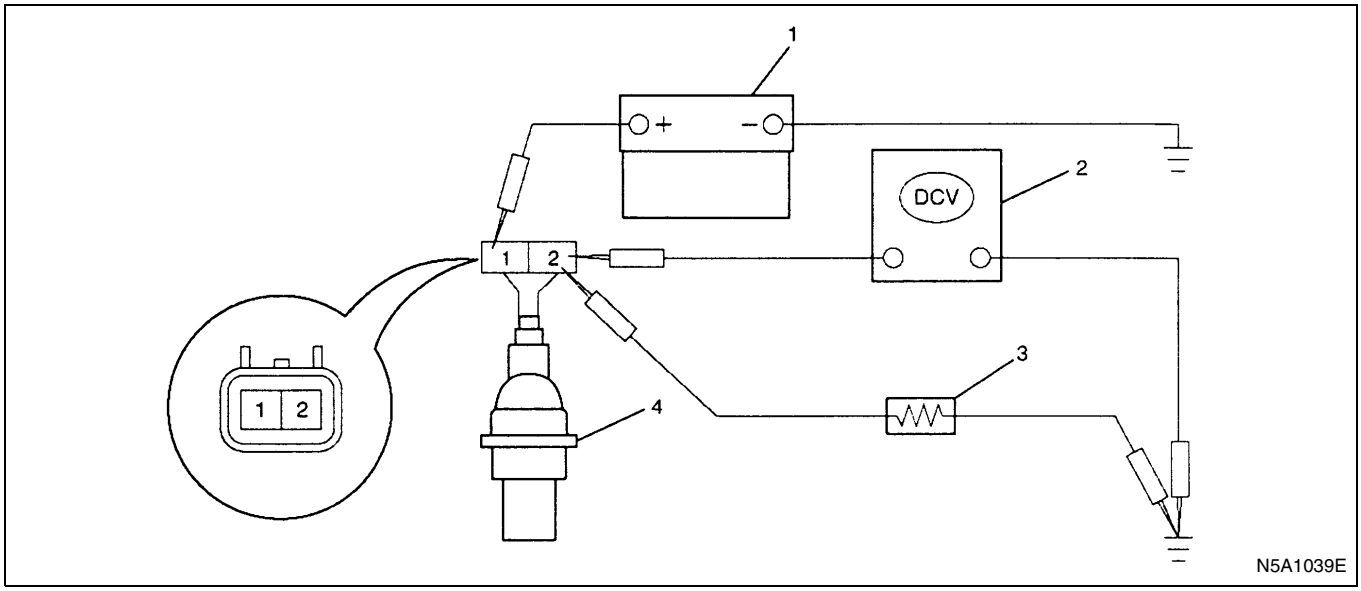


Legend

1. Battery
2. DVM
3. Resistor
4. Speed Sensor

Chart C-1-4 RR Speed Sensor Output Inspection Procedure

Step	Action	Value(s)	YES	NO
1	1. Turn the key off. 2. Disconnect EHCU connector. 3. Jack up the vehicle, with all wheels off the ground. 4. Connect a 120 ohms resistor between J-177 EHCU connector terminal 21 and ground. 5. Using DVM, measure the DC voltage between J-177 connector terminal 21 and ground while turning RR wheel at a speed of 0.5 RPS. Does the DVM display a voltage within the specified value?	0.2 — 4.5 V	Go to Step 5	Go to Step 2
2	1. Turn the key off. 2. Disconnect RR sensor connector. 3. Connect a 120 ohms resistor between sensor connector terminal 2 (sensor side) and ground. 4. Apply 12 V voltage at sensor connector terminal 1 (sensor side). 5. Using DVM, measure the DC voltage between sensor connector terminal 2 (sensor side) and ground while turning RR wheel at a speed of 0.5 RPS. Does the DVM display a voltage within the specified value?	0.2 — 4.5 V	Go to Step 3	Go to Step 4
3	1. Locate open circuit, poor connection short circuit on the harness between EHCU and sensor connectors. 2. Repair the harness. Is action complete?	—	Go to Step 5	—
4	Replace RR sensor. Is action complete?	—	Go to Step 5	—
5	1. Reconnect all components, ensure all components are properly mounted. 2. Clear diagnostic trouble code. Was this step finished?	—	Go to “Basic diagnostic flow chart”.	—



Legend

1. Battery
2. DVM
3. Resistor
4. Speed Sensor

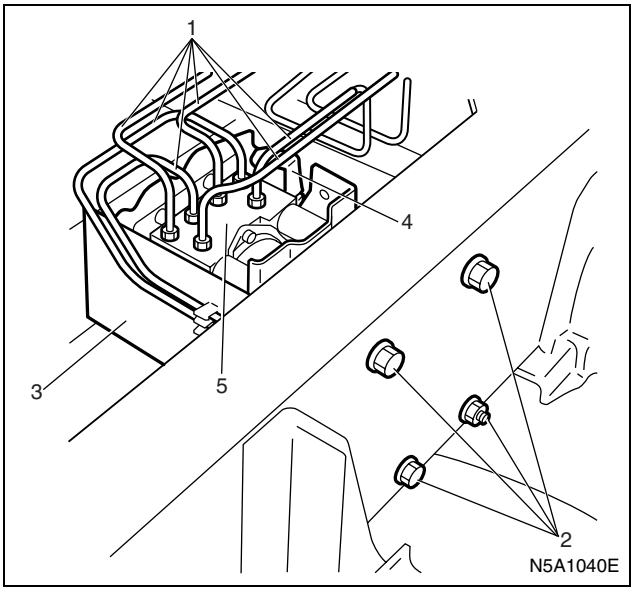
Chart TC-1 Sensor Output Inspection Procedure (Use Tech 2)

Step	Action	Value(s)	YES	NO
1	1. Connect Tech 2. 2. Check the minimum speed of each sensor by WHEEL SENSORS. Is sensor speed within the specified value?	More than 4 km/h (3 mph)	Go to Step 2	Go to Step 6
2	Check the sensor harness for suspected disconnection (check while shaking harness/connector). Is the sensor harness connection normal?	—	Replace speed sensor. Go to Step 3	Repair. Go to Step 2
3	Check the minimum speed of each sensor by WHEEL SENSORS. Is sensor speed within the specified value?	More than 4 km/h (3 mph)	Go to Step 4	Go to Step 6
4	Check the sensor rotor. Is the sensor rotor normal?	—	Go to Step 5	Replace sensor rotor. Go to Step 5
5	Check the minimum speed of each sensor by WHEEL SENSORS. Is sensor speed within the specified value?	More than 4 km/h (3 mph)	Repair harness or connector between EHCU and speed sensor. Go to Step 6	Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Was this step finished?	—	Repeat the “Basic diagnostic flow chart”.	—

ON-VEHICLE SERVICE

Electronic Hydraulic Control Unit (EHCU)

Removal



Legend

1. Brake Pipe
2. EHCU Bracket Fix Bolt & Nut
3. EHCU Bracket
4. Harness Connector
5. EHCU

1. Disconnect battery ground cable.
2. Disconnect brake pipes.
3. Remove EHCU bracket fix bolts & nut.
4. Remove EHCU bracket.
5. Remove EHCU.

Installation

To install, follow the removal steps in the reverse order, noting the following points.

Notice:

- If welding work is to be performed on the vehicle using an electric arc welder, the EHCU should be removed from the vehicle before the welding operation begins.
- Do not put a radio equipment etc, that emits strong radio wave near the EHCU.
- Do not wet the control unit. If wetted, wipe off water immediately and dry it fully.
- Never loosen any screw on the control unit.
- Do not paint the control unit.
- Prevent possible electrostatic discharge damage.
- Do not touch the control unit pin type terminal with a metallic tip of a screwdriver or tester.
- Do not apply voltage to the terminal.

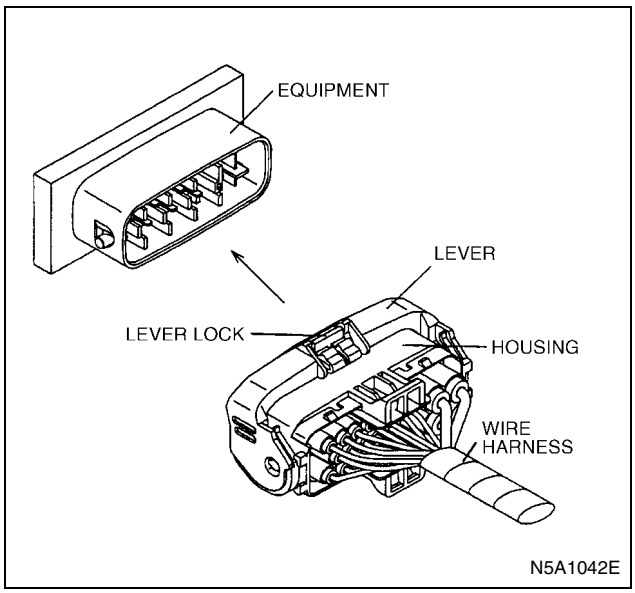
1. Master Cylinder (front)
2. Master Cylinder (rear)
3. Rear Right Wheel Cylinder
4. Rear Left Wheel Cylinder
5. Front Right Wheel Cylinder
6. Front Left Wheel Cylinder

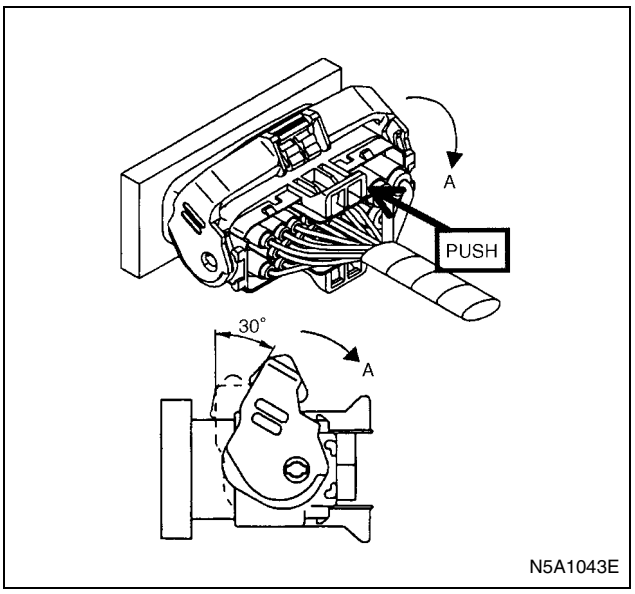
Methods of Matching and Taking Off Connectors

Before Matching



Semi Matching

Wire harness side connector should be inserted to equipment side, then lever folds up about 30°.

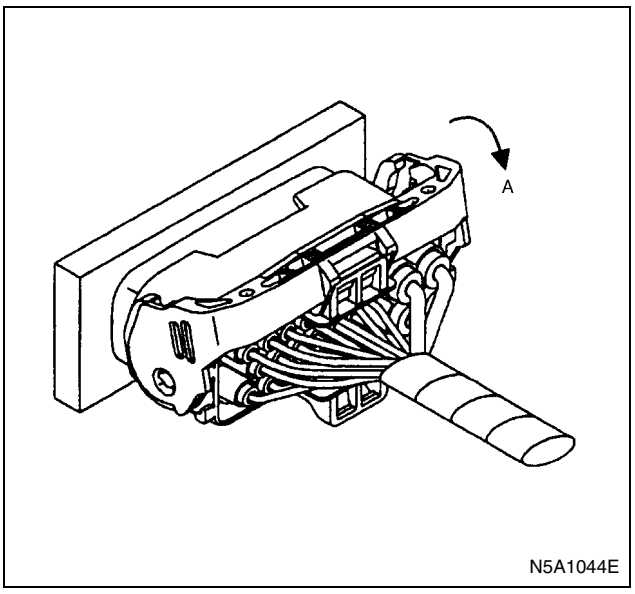


Notice:

Check the lever folding up.

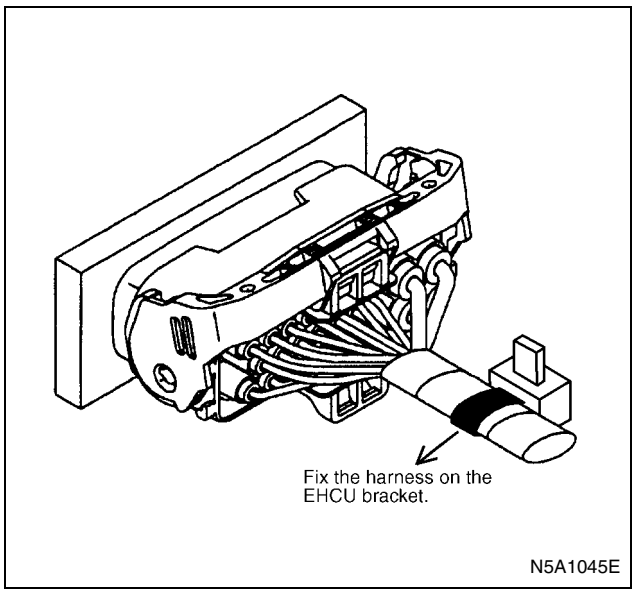
Matching

Turn the lever to direction A and fix the lever lock to the housing.



Finished Matching

On a vehicle in which the harness is clamped onto the EHCU bracket, clamp the harness after matching the connectors.

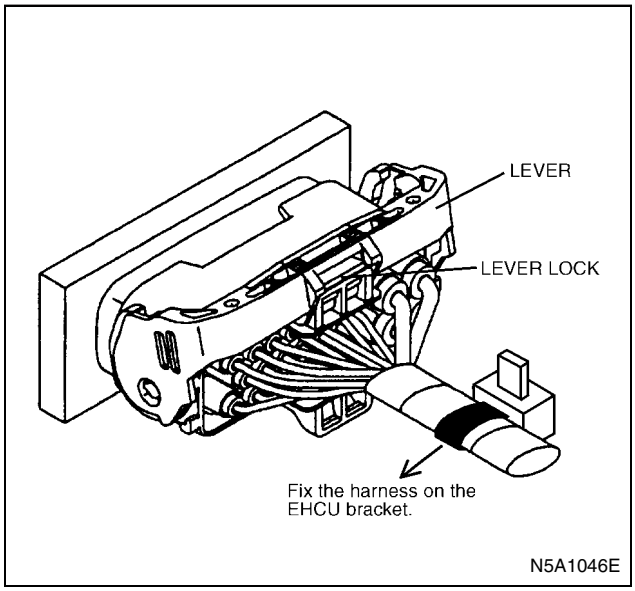


Notice:

Check the lever lock is fixed to housing certainly. The lever or housing can be broken by turned to direction A without the lever folding up (30°).

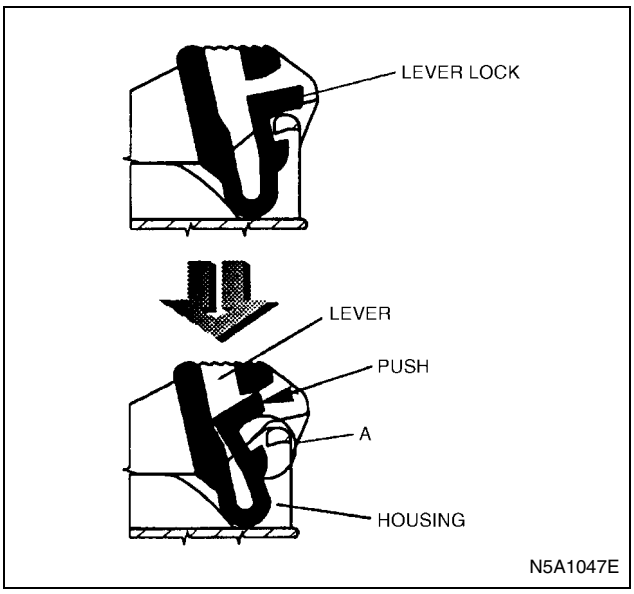
Condition of Matching

On a vehicle in which the harness is clamped onto the EHCU bracket, loosen the before taking off the connectors.



Release of Lock

Push lever lock down until the condition it can be released.



Notice:

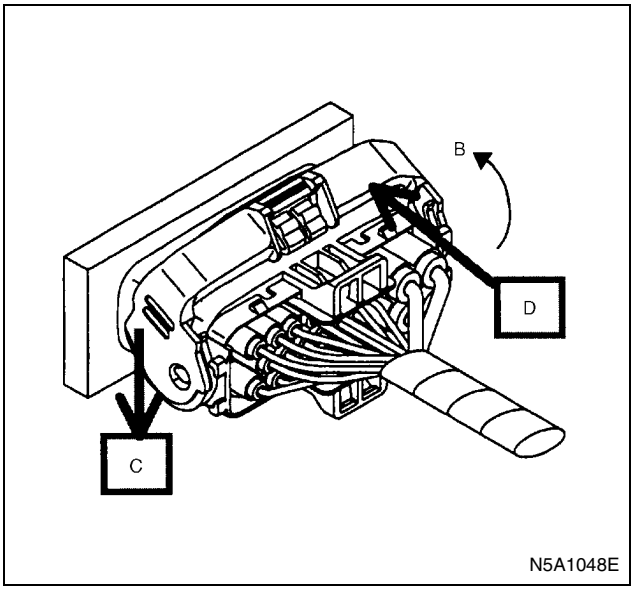
Check division A can be released.

Taking Off

Turn the lever to direction B.

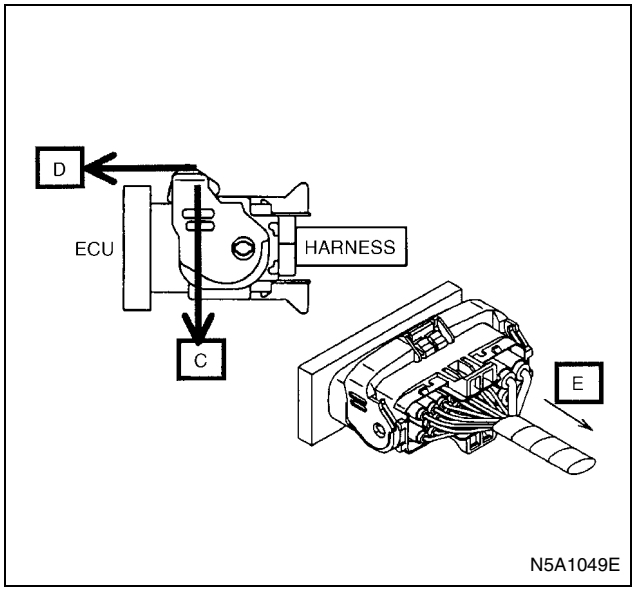
When you feel the lever heavy in your hand (after turning about 40 degrees), turn the lever in the direction of C.

The lever will not turn and the connector may fail if force is applied in the direction of D.



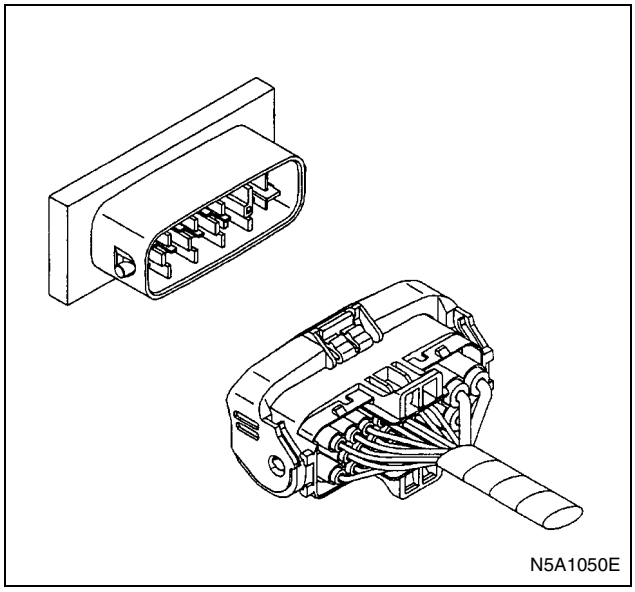
Notice:

The lockarm can be broken by being turned to direction B in case of incomplete locking.



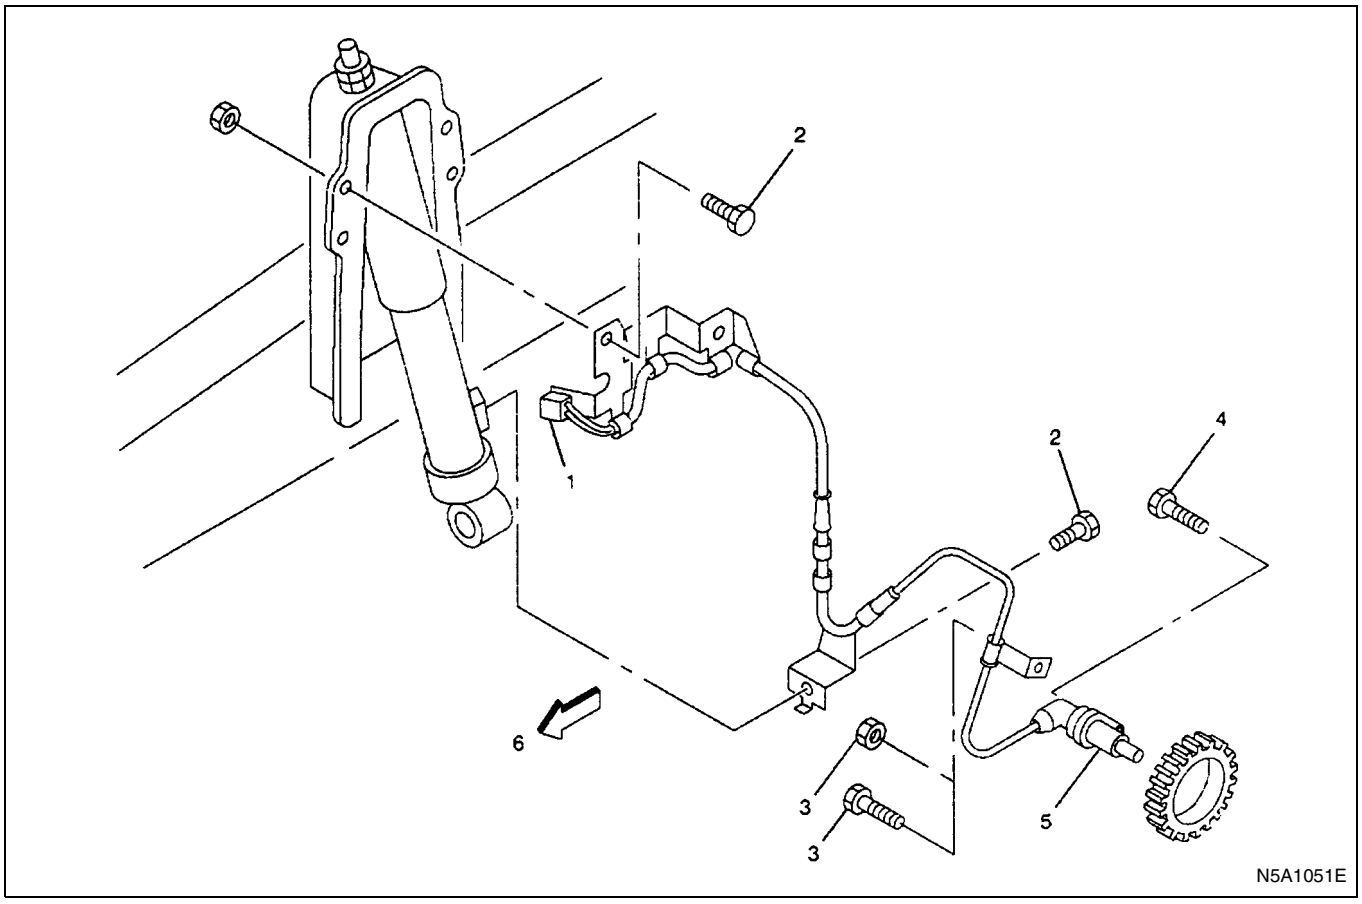
Check the lever is turned certainly and take connector off to direction E.

Finished Taking Off



Front Speed Sensor

Components



Legend

1. Speed Sensor Connector
2. Sensor Cable Fixing Bolt
3. Sensor Cable Fixing Bolt (Front Disc Brake model)
   Sensor Cable Fixing Nut (Front Drum Brake model)
4. Sensor Fixing Bolt
5. Speed Sensor
6. Front

Removal

1. Remove speed sensor connector.
2. Remove sensor cable fixing bolts and/or nut.
3. Remove the speed sensor fixing bolt.
4. Remove speed sensor.

Inspection and Repair

1. Check the speed sensor pole piece for presence of foreign materials; remove any dirt, etc.
2. Check the pole piece for damage; replace speed sensor if necessary.
3. Check the speed sensor cable for short or open circuit, and replace with a new one if necessary.
   To check for cable short or open, bend or stretch the cable while checking for continuity.

Installation

1. Install speed sensor and take care not to hit the speed sensor pole piece during installation.
2. Install speed sensor fixing bolt and tighten the fixing bolt to the specified torque.

Tighten:
Bolt to 22 N·m (2.2 kg·m/16 lb·ft)

3. Install speed sensor cable fixing bolts and tighten the fixing bolt to the specified torque.

Tighten:
Bolts (2) to 22 N·m (2.2 kg·m/16 lb·ft)
Bolts (3) to 45 N·m (4.6 kg·m/33 lb·ft)
Nut (3) to 15 N·m (1.5 kg·m/11 lb·ft)

Notice:
Confirm that a white or yellow line marked on the cable is not twisted when connecting the speed sensor cable.

4. Connect speed sensor connector.

Front Speed Sensor Rotor

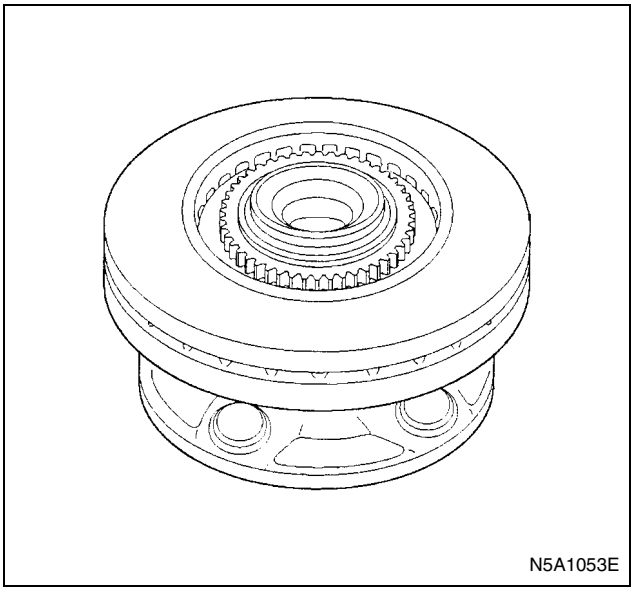
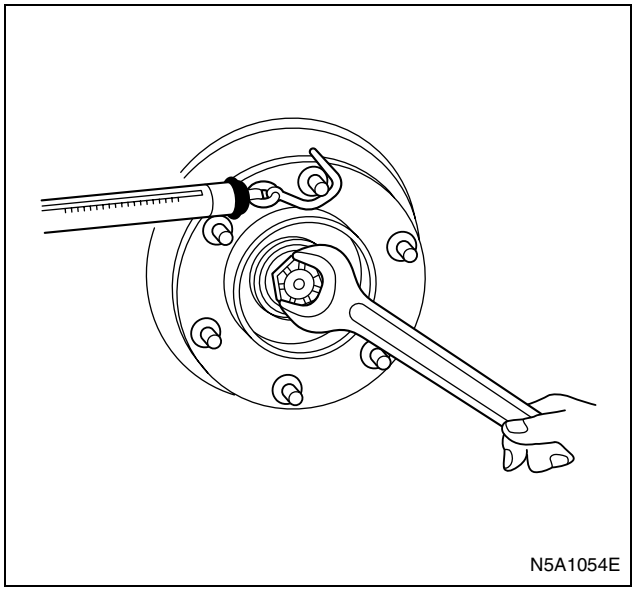
2. Hub Cap
3. Cotter Pin
4. Hub Nut
5. Washer
6. Hub and Disc Assembly
7. Speed Sensor Rotor
8. Inner Bearing and Outer Bearing
9. Oil Seal
10. Spacer

Removal

1. Remove disc brake assembly and support the caliper assembly so that the brake hose is not stretched or damaged.
2. Remove hub cap.
3. Remove cotter pin and hub nut.
4. Remove washer.
5. Remove hub and disc assembly.



N5A1053E



N5A1054E

6. Remove speed sensor rotor.
7. Remove inner bearing, oil seal spacer.

Inspection and Repair

1. Check the speed sensor rotor for damage including tooth chipping, and if damaged, replace the speed sensor rotor.

Installation

1. Using a bench press, install speed sensor rotor.
2. Install spacer onto the knuckle spindle.
3. Apply grease into the outer and inner bearings and install bearings in the hub.
4. Install oil seal into hub and disc assembly and install hub and disc assembly on to the knuckle spindle.

Preload Adjustment

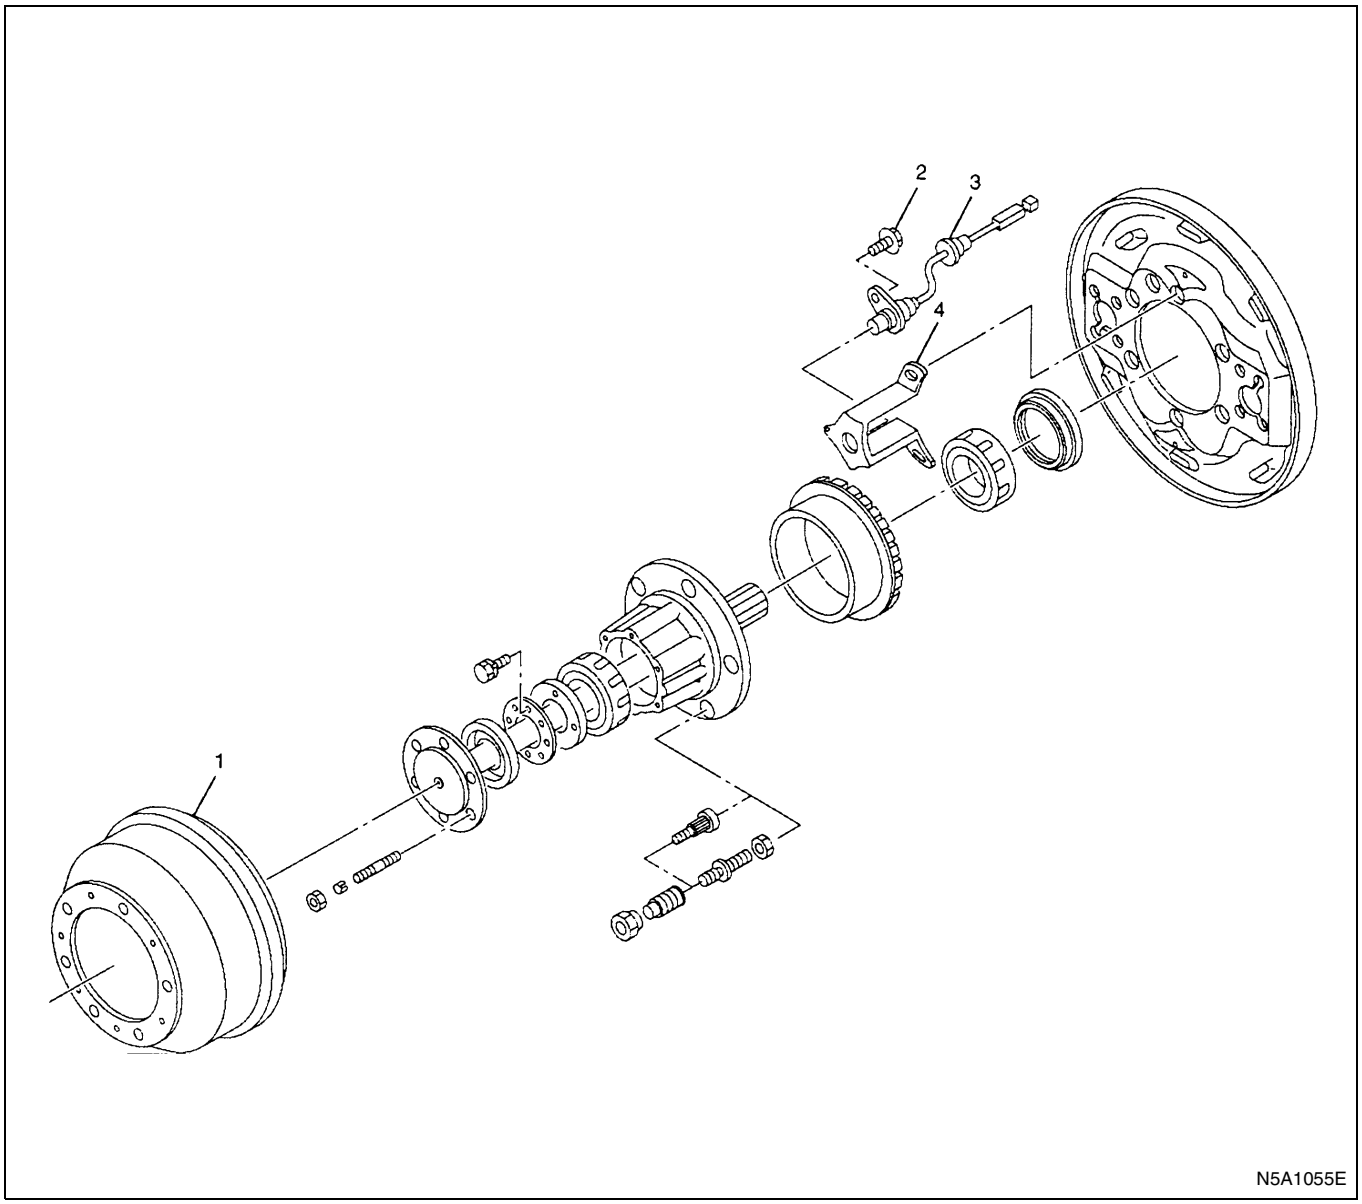
Adjust the wheel bearing as follows:

1. Tighten the nut until you are unable to manually rotate the hub and disc assembly.
2. Loosen the nut.
3. Attach a spring balancer to one stud. Gradually retighten the nut until the hub and disc assembly bearing is adjusted to the specified preload.
   - Hub bearing preload
     New Hub Bearing: 9.8 — 24.5 N (1 — 2.5 kg/ 2.2 — 5.5 lb)
     Reused Hub Bearing: 4.9 — 19.6 N (0.5 — 2 kg/1.1 — 4.4 lb)
4. Install a cotter pin through the nut and knuckle and bend it over.
   - If the notch in the nut does not line up with the cotter pin hole in the knuckle, tighten the nut until it does. Do not loosen the nut to line up a notch and the knuckle hole.
5. Apply grease into the hub cap and install it.
   - 0.4 N (40 g/0.09 lb)
6. Install the disc brake assembly and tighten two bolts to the specified torque.

Tighten:
Bolts to 221 N·m (22.5 kg·m/163 lb·ft)

Rear Speed Sensor

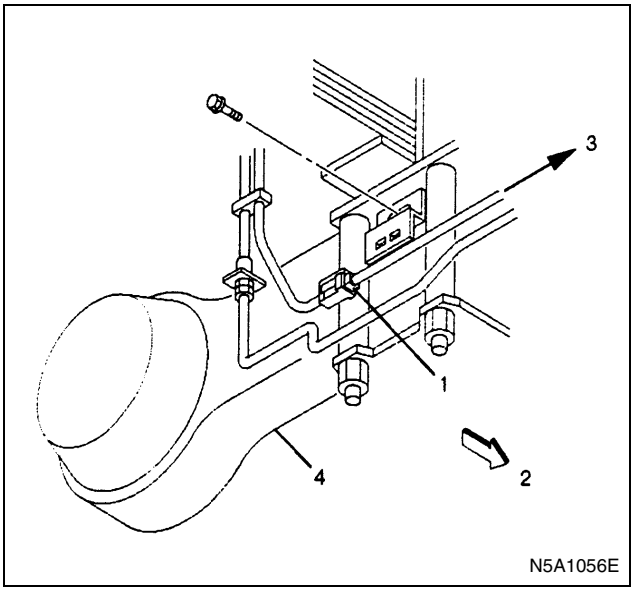
Components



Legend

1. Brake Drum
2. Speed Sensor Fixing Bolt
3. Speed Sensor
4. Speed Sensor Bracket

Removal



Legend

1. Speed Sensor Connector
2. Front
3. Speed Sensor
4. Rear Axle

1. Disconnect speed sensor connector.
2. Remove brake drum.
3. Remove speed sensor fixing bolt.
4. Remove speed sensor.
5. Remove speed sensor bracket.

Inspection and Repair

1. Check the speed sensor for presence of foreign materials; remove any dirt, etc.
2. Check the speed sensor for damage, and replace the speed sensor if necessary.
3. Check the speed sensor harness for a short or an open, and replace with a new one if necessary. To check for harness short or open, bend or stretch the cable while checking for continuity.

Installation

1. Install speed sensor bracket and tighten the nut to the specified torque.

Tighten:
Nut to
GVW Range 12,000 lbs. and 14,500 lbs. model:
108 N·m (11 kg·m/80 lb·ft)
GVW Range 17,950 lbs. model:
157 N·m (16 kg·m/116 lb·ft)

2. Install the speed sensor and take care not to hit the speed sensor during installation.
3. Install the speed sensor fixing bolt and tighten it to the specified torque.

Tighten:
Bolt to 18 N·m (1.8 kg·m/13 lb·ft)

4. Install brake drum and tighten bolts to the specified torque.

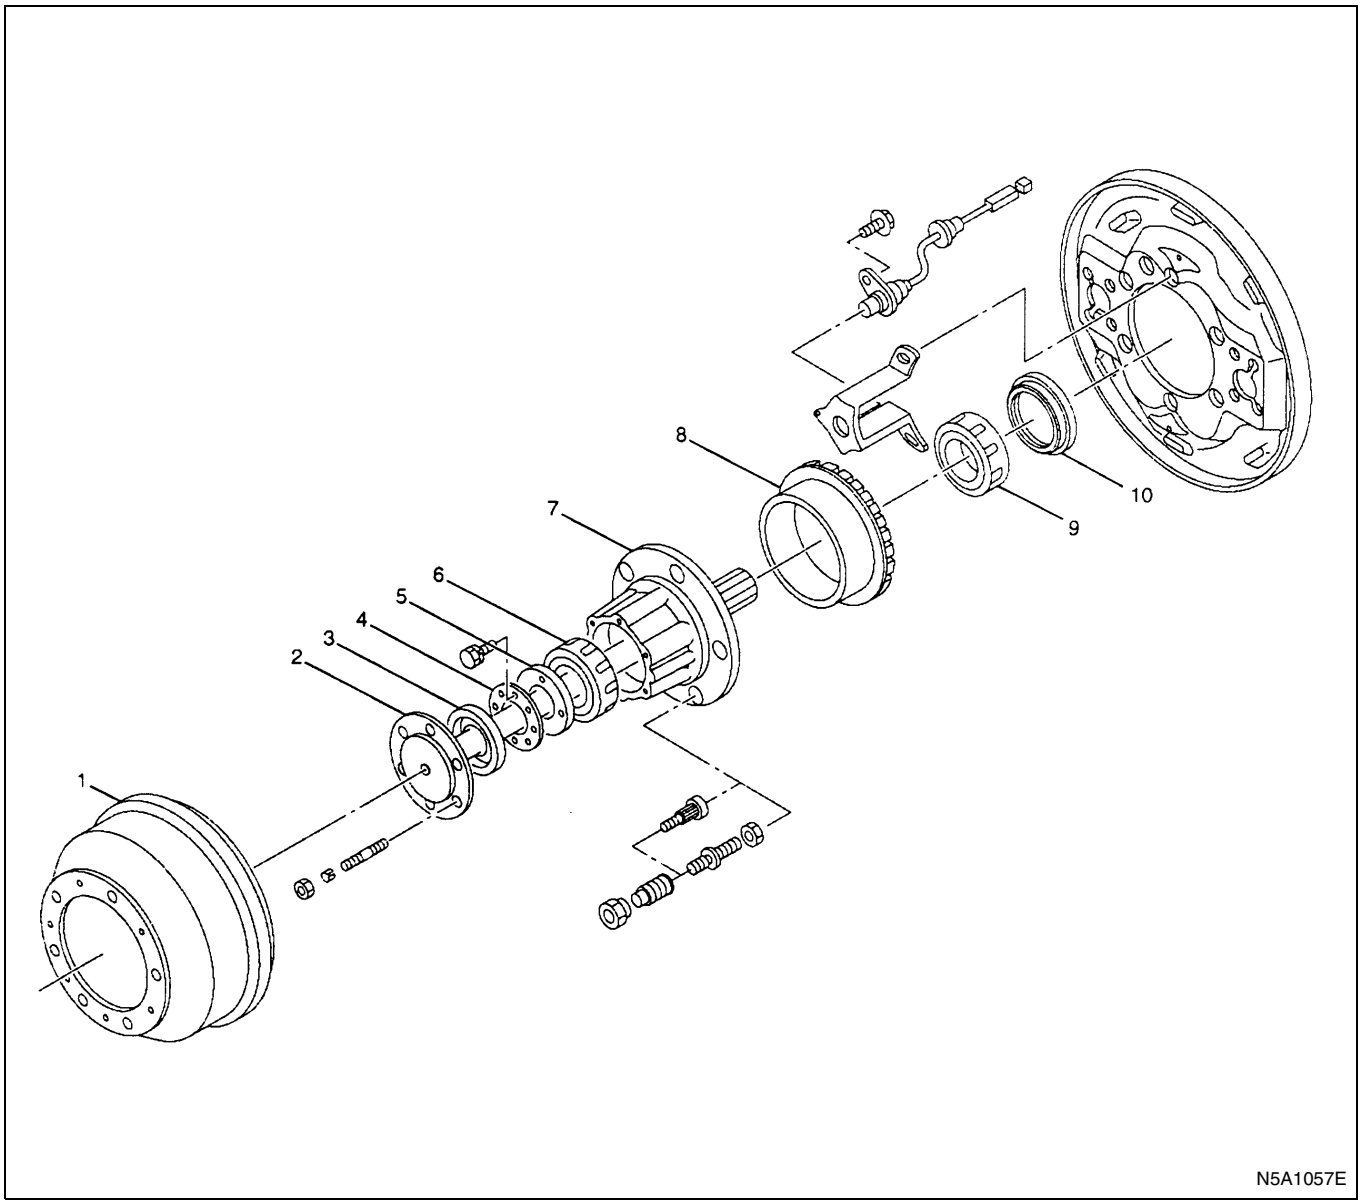
Tighten:
Bolts to 13 N·m (1.3 kg·m/9.5 lb·ft)

5. Connect speed sensor connector.

Notice:
Confirm that the harness is not twisted when connecting the speed sensor connector.

Rear Speed Sensor Rotor

Components



Legend

1. Brake Drum
2. Axle Shaft
3. Outer Oil Seal
4. Lock Washer
5. Bearing Nut
6. Outer Bearing
7. Rear Hub
8. Speed Sensor Rotor
9. Inner Bearing
10. Inner Oil Seal

Removal

1. Remove brake drum.
2. Remove axle shaft.
3. Remove outer oil seal, using a screwdriver.
4. Remove lock washer.
5. Remove bearing nut with a hub bearing nut wrench.
6. Remove hub assembly from axle case.
7. Remove outer bearing from hub assembly.
8. Remove speed sensor rotor from hub assembly.
9. Remove inner bearing and inner oil seal from axle case.

Inspection and Repair

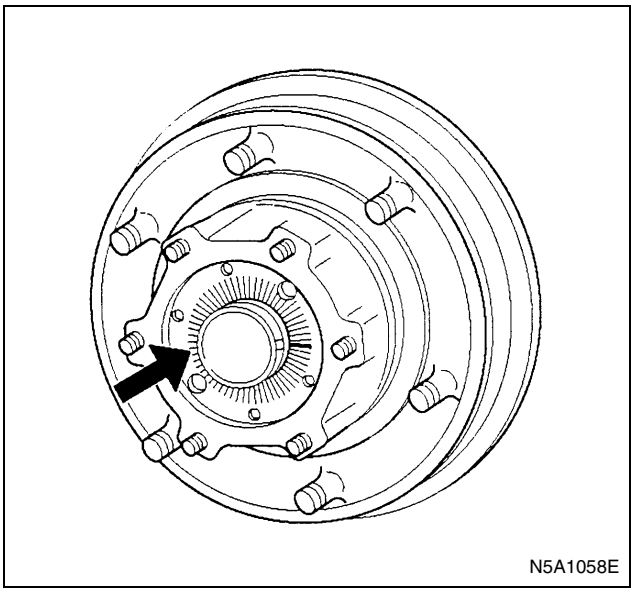
1. Check the speed sensor rotor for damage including tooth chipping. If damaged, replace speed sensor rotor.

Installation

1. Using a bench press, install speed sensor rotor.

Notice:
Do not reuse the sensor rotor.

2. Install spacer on to the axle case.
3. Apply grease into the outer and inner bearings and install bearings in the hub.
4. Install outer oil seal into hub.
5. Install hub assembly onto the axle case.

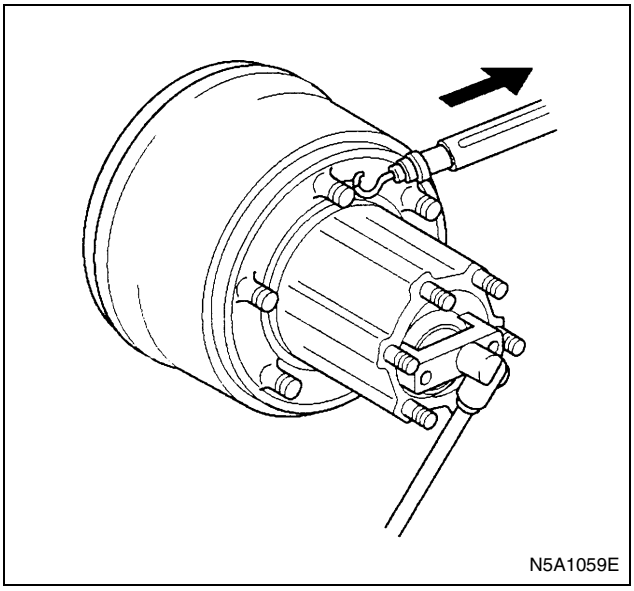


N5A1058E

6. Set the lock nut with the notched line facing out.

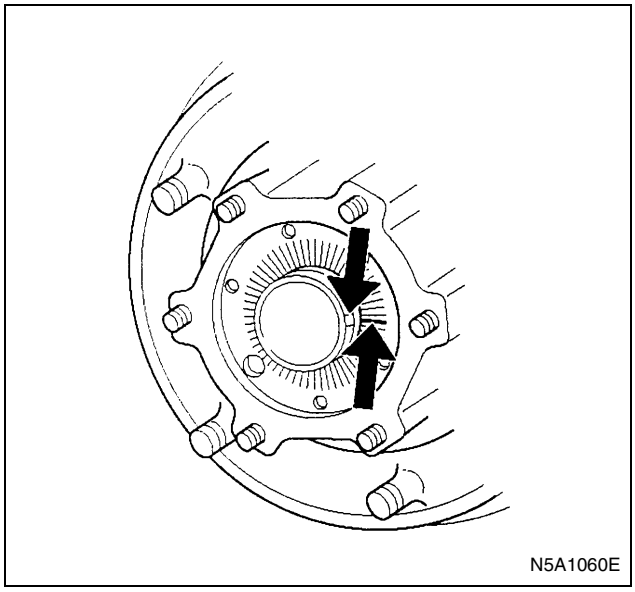
Preload Adjustment

1) Turn the hub to the left and right several times to establish bearing conformity.
2) Use the bearing nut wrench to tighten the bearing nut until the hub can not be manually rotated.
3) Loosen the bearing nut until hub rotates easily.



N5A1059E

4) Set the spring balancer to the wheel pin in the position shown in the illustration.
5) Measure the hub bearing preload by carefully pulling on the spring balancer and noting the indicator reading.
   Hub Bearing Preload (At Wheel Pin):
   42 — 52 N (4.3 — 5.3 kg/9.4 — 11.6 lb)
6) Rotate the hub several times to the right and left.
7) Measure the bearing preload a second time.



N5A1060E

8) Align the axle case groove with the closest bearing nut slit.

Notice:
If it is difficult to align the axle case and bearing nut, slightly tighten the bearing nut.

7. Install the lock washer with the lock washer tabs inserted to the axle case grooves.
   Install the lock bolts to prevent the bearing nut from loosening.
   Check that the lock washer tabs are inserted to the axle case grooves.
8. Apply grease to the outer oil seal lip inner and outer circumferences and install outer oil seal.
9. Clean the axle shaft.
   Apply gear oil to the axle shaft spline.
   Insert the axle shaft into the axle case.
   Take care not to damage the oil seal.
10. Tighten the axle shaft nuts to the specified torque a little at a time.

Tighten:
Nuts to 46 N·m (4.7 kg·m/34 lb·ft)

11. Install brake drum.

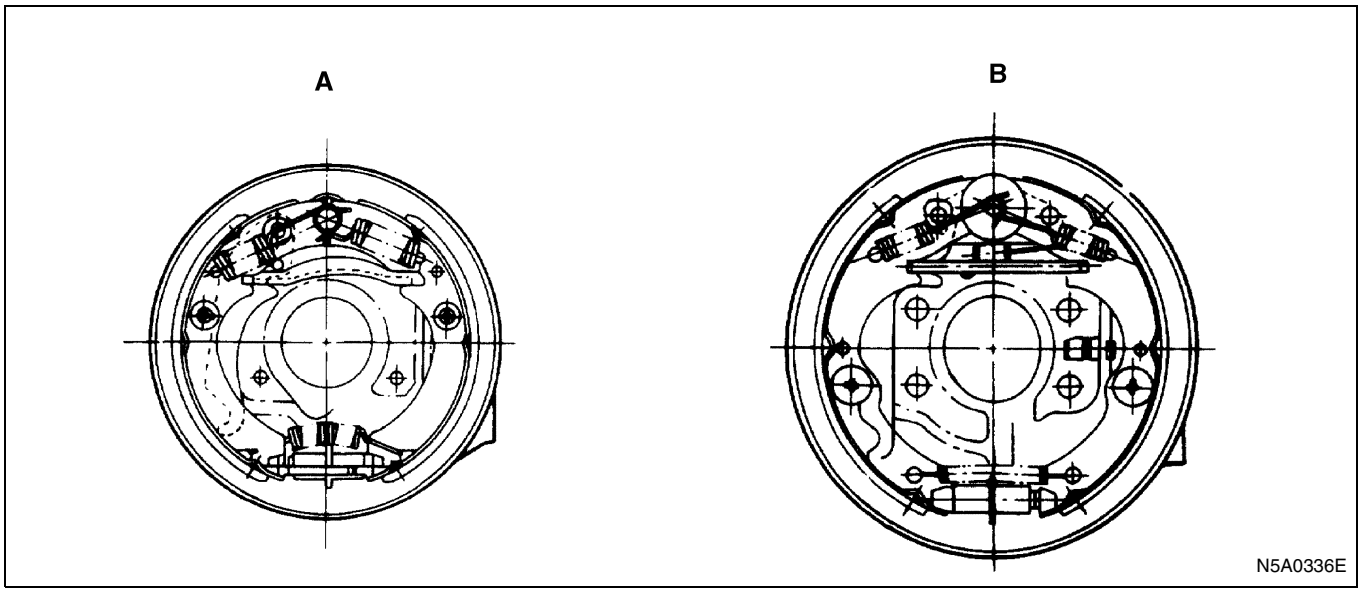
PARKING BRAKES

Contents

GENERAL DESCRIPTION 5C-2
PARKING BRAKE ASSEMBLY, PARKING BRAKE LEVER.....5C-3
UNIT REPAIR [178 mm, 190 mm TYPE].....5C-8
UNIT REPAIR [203 mm TYPE].....5C-11

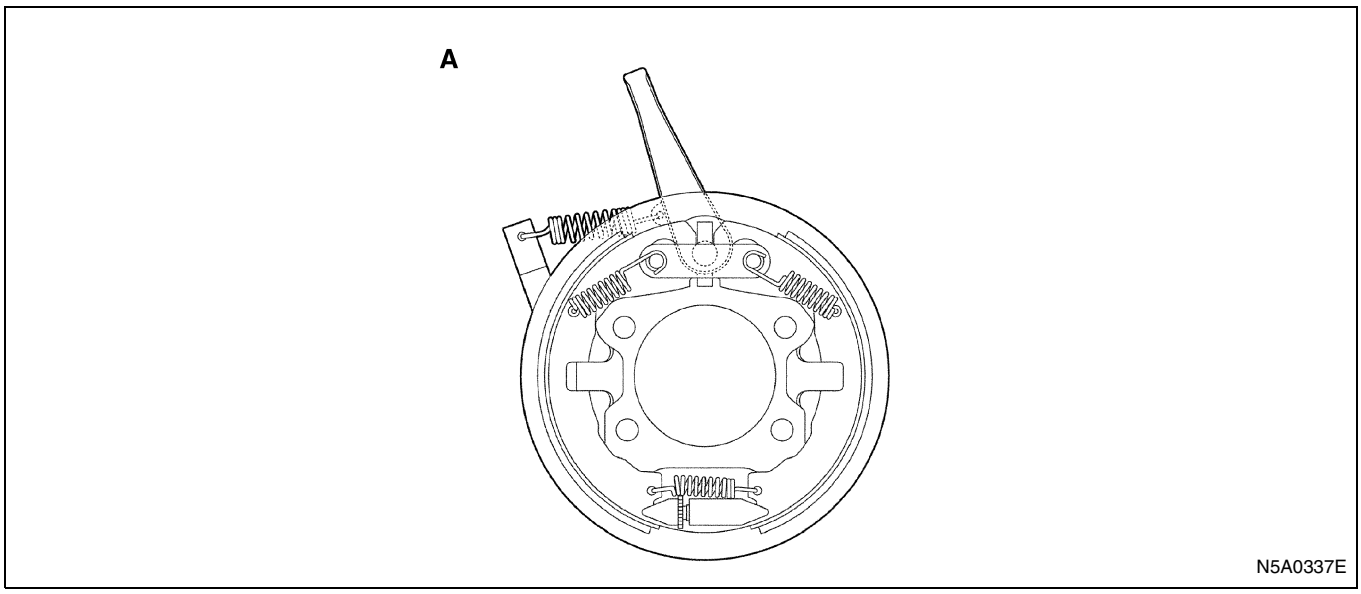
GENERAL DESCRIPTION

Parking Brake Assembly



Legend

A. 178 mm type
B. 190 mm type



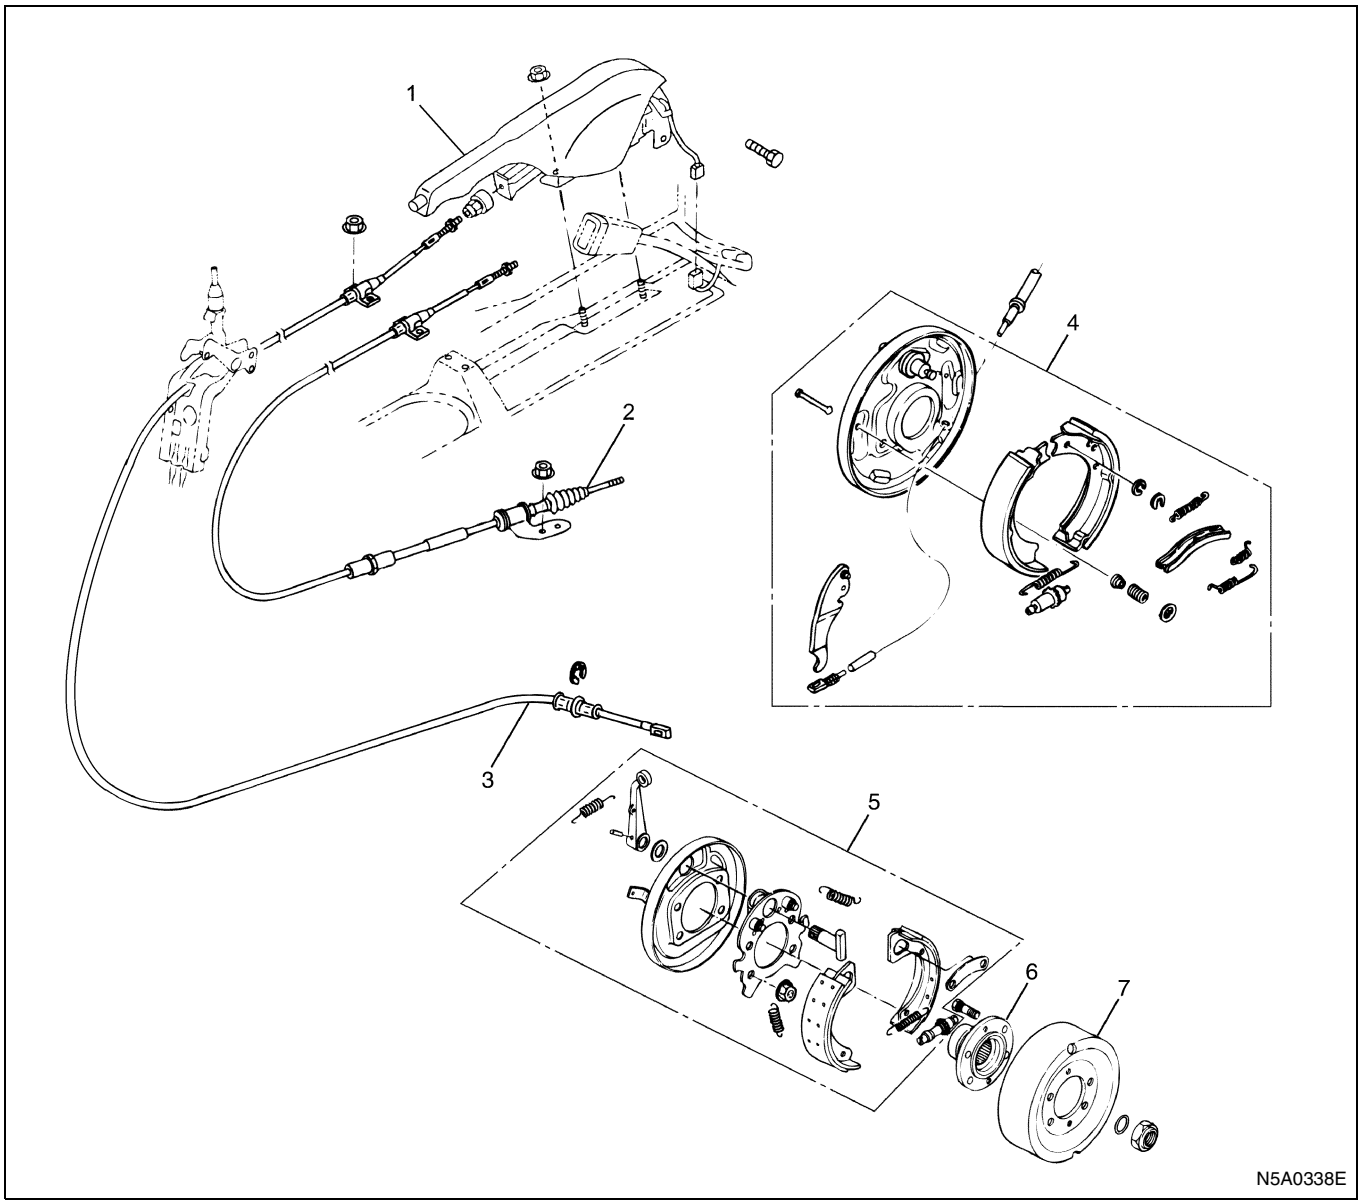
Legend

A. 203 mm type

The parking brake is a mechanically operated internal-expanding type drum brake. It is mounted on the rear of the transmission case.
The control cable is routed into the vehicle cab where it is connected to the parking brake lever.

PARKING BRAKE ASSEMBLY, PARKING BRAKE LEVER

Components



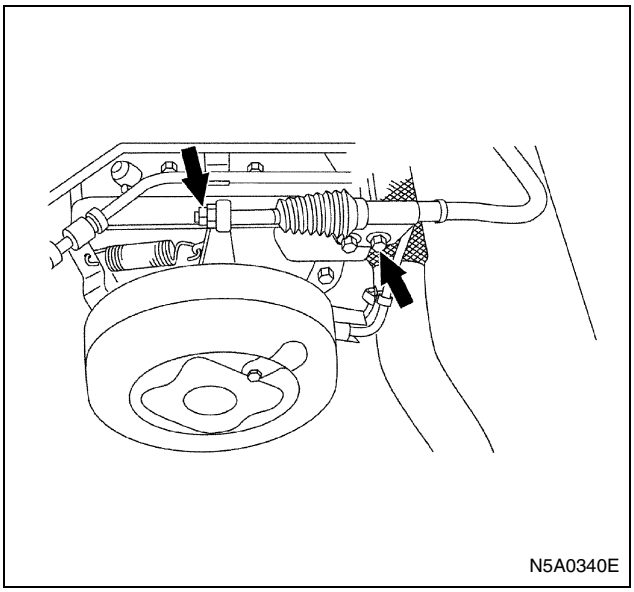
Legend

1. Parking brake lever assembly
2. Parking brake cable (203 mm TYPE)
3. Parking brake cable (178, 190 mm TYPE)
4. Parking brake assembly (178, 190 mm TYPE)
5. Parking brake assembly (203 mm TYPE)
6. Coupling driver
7. Parking brake drum

Removal

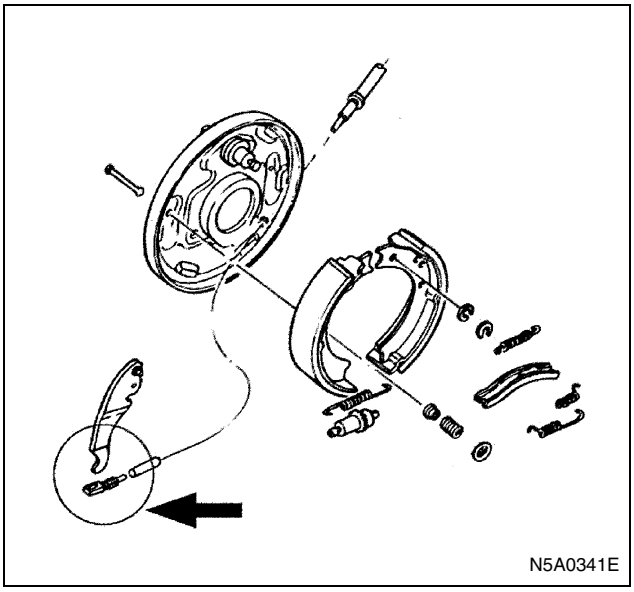
1. Jack up the body, and support the frame with the stand.
   Refer to “LIFTING INSTRUCTION” in Section 0A GENERAL INFORMATION.
2. Remove the rear propeller shaft.
   - Disconnect the propeller shaft from the transmission.
   - Remove the center bearing bracket as well in the case of the long type.
3. Loosen the coupling driver lock nut.
   - Apply the parking brake, completely raise the latch of the lock nut for the coupling driver, and loosen the lock nut. Then, release the parking brake.
4. Disconnect the parking brake cable.
   - 203 mm TYPE
     – Remove the lock nut from the lever of the parking brake assembly.

– Remove the mounting bolt from the cable bracket, and disconnect the parking brake cable from the transmission.



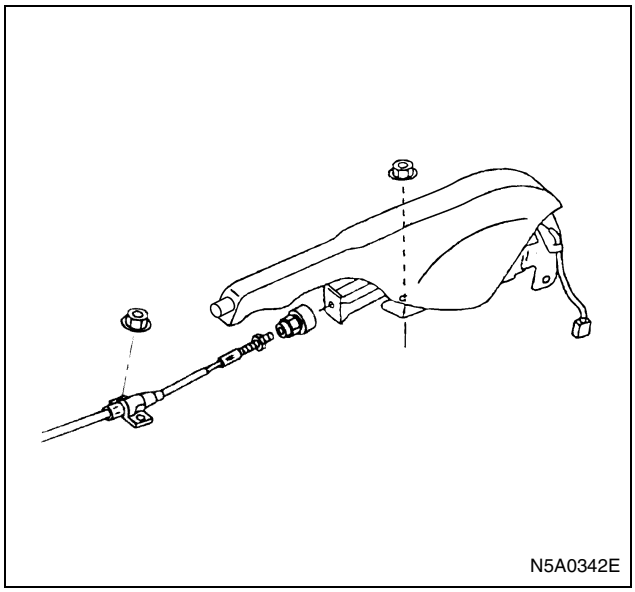
N5A0340E

• 178, 190 mm TYPE
  – Remove the parking brake drum.
  – Disconnect the cable from the lever of the parking brake assembly.



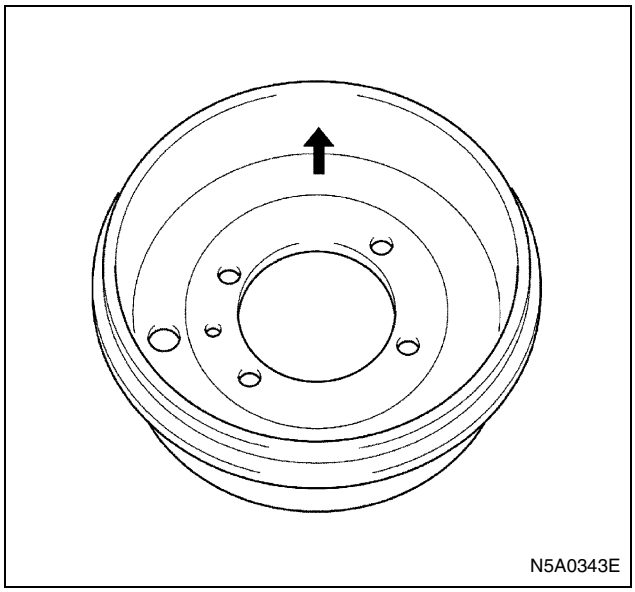
N5A0341E

5. Remove the parking brake drum.
  • Remove the adjusting hole cover and the parking brake drum.
6. Remove the coupling driver.
  • Remove the lock nut that was loosened in step 3, and remove the coupling driver using a universal puller.
7. Remove the parking brake assembly.
8. Remove the parking brake lever assembly.
  • Loosen the adjusting nut, and disconnect the parking brake cable from the lever.
  • Disconnect the connector.
  • Loosen the retaining nut, and remove the parking brake lever assembly.



N5A0342E

9. Inspect the parking brake drum.
  • Inspect the parking brake drum for damage, wear, step wear, or cracking. If any defect is found, correct or replace the parking brake drum with a new one.
  • Measure the inside diameter of the parking brake drum.



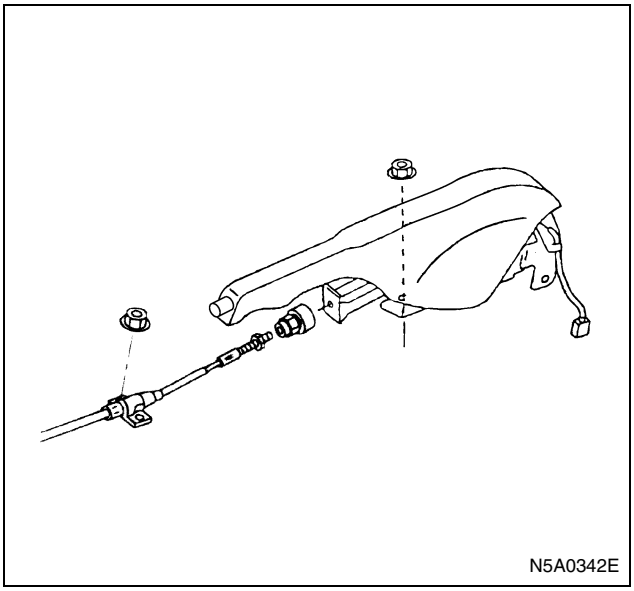
N5A0343E

Drum inside diameter
178 mm (7.00 in) type parking brake
Standard value = 178 mm (7.00 in), limit = 179 mm (7.05 in)
190 mm (7.48 in) type parking brake
Standard value = 190 mm (7.48 in), limit = 191 mm (7.52 in)
203 mm (7.99 in) type parking brake
Standard value = 203 mm (7.99 in), limit = 204 mm (8.03 in)

Notice:
Correct the drum inside diameter by grinding to the appropriate limit.

Installation

1. Mount the parking brake lever assembly.
   - Mount the parking brake lever assembly, connect the parking brake cable, and properly tighten the adjusting nut.



N5A0342E

2. Mount the parking brake assembly.
   - 178 mm type parking brake

Tighten:
M12 nut to 113 N·m (11.5 kg·m/83.3 lb·ft)
M8 bolt to 25 N·m (2.6 kg·m/18.4 lb·ft)

- 190 mm type parking brake
  - Wash the stud bolt and the bolt hole with volatile oil (thinner, alcohol, etc.).
  - Apply Loctite #638 to the embedded side (guide side) of the stud bolt and the bolt hole.
  - Attach the stud bolt (M12).

Tighten:
Stud bolt to 49 N·m (5.0 kg·m/36.1 lb·ft)

  - Mount the parking brake assembly, and fasten it with the caulking nut (M12).

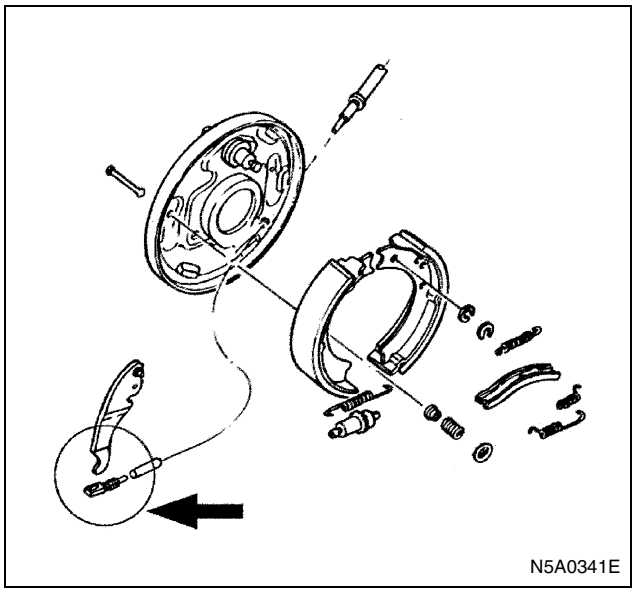
Tighten:
Caulking nut to 126.5 N·m (12.9 kg·m/93.3 lb·ft)

- 203 mm type parking brake

Tighten:
127 N·m (13.0 kg·m/93.7 lb·ft)

3. Connect the parking brake cable.
   - Connect the parking brake cable to the lever of the parking brake assembly (178, 190 mm TYPE).

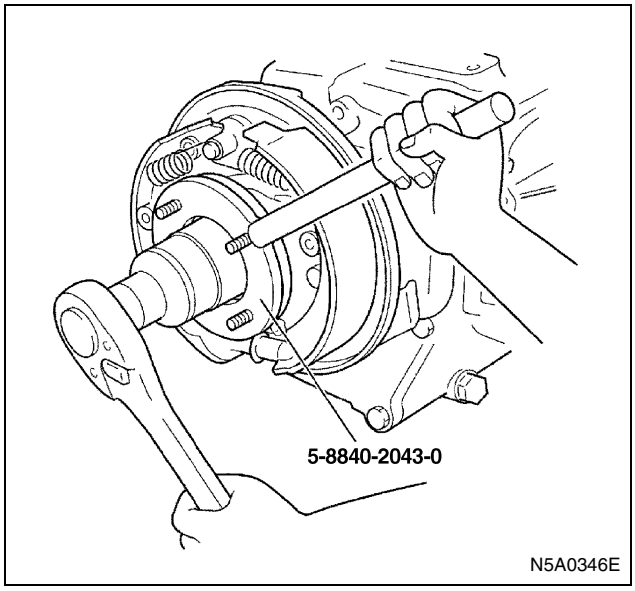
Notice:
Confirm that the portion indicated by the arrow is properly connected.



N5A0341E

4. Mount the coupling driver.
   - Attach the coupling driver to the main shaft, and fasten it with an O-ring, a conical washer (MSB only), and a lock nut.
     Tighten the lock nut while holding the coupling driver with a handle 5-8840-2043-0.

Tightening torque	N·m (kg·m/lb·ft)
MSB type transmission	226 (23.0/166.7)
MYY type transmission	289 (29.5/213.2)
MZZ type transmission	382 (39.0/281.8)

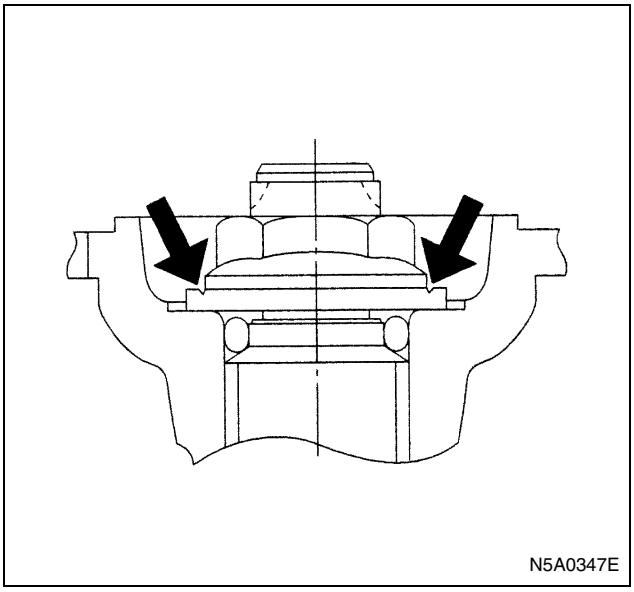


N5A0346E

Notice:

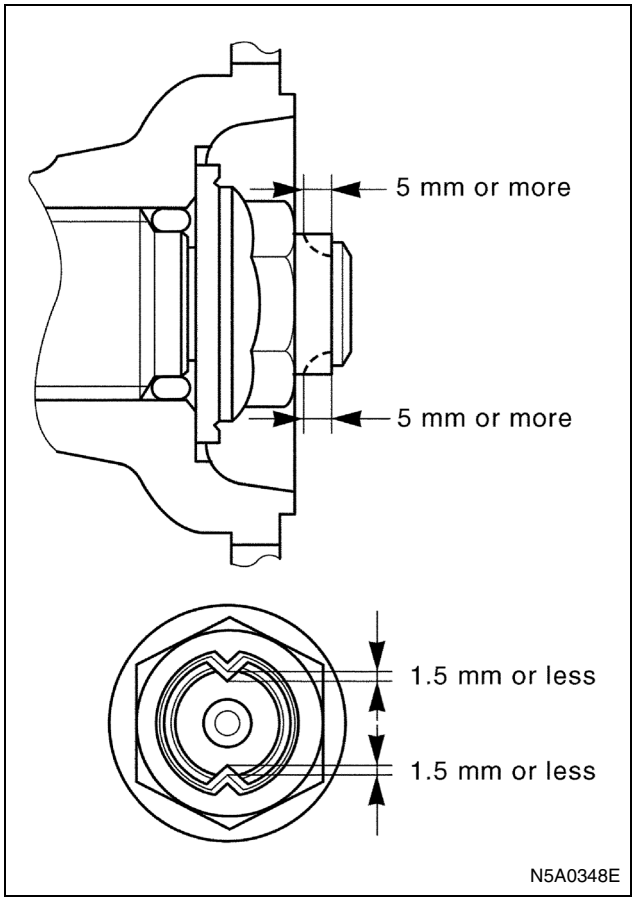
- Use a new lock nut because it is a caulking type. Apply oil to the seating face before attaching the lock nut.

- Use a new O-ring. Apply a thin coat of lubricating oil to the O-ring before attaching it.
- Attach the conical washer (MSB only) with the identification groove facing the lock nut (rear side).

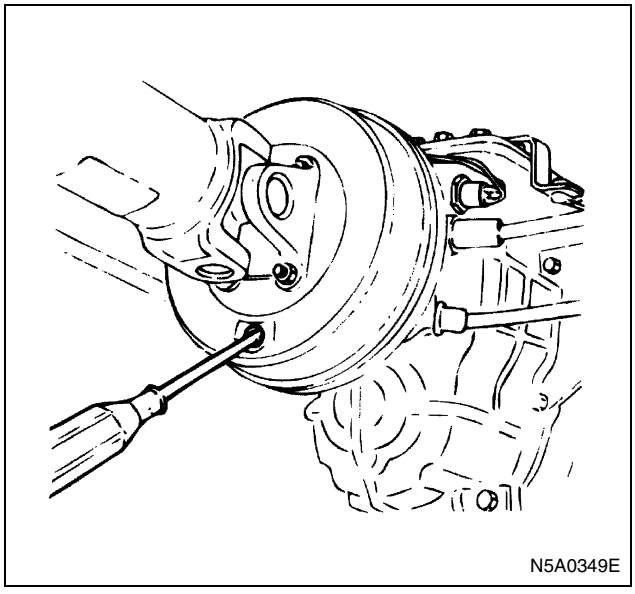


5. Caulk the lock nut.
   - Align the lip of the lock nut with the V-grooves cut in the tip of the main shaft, and securely caulk the lock nut at two points so that the caulking length will be 5 mm (0.2 in) or more and the clearance between the lower V-groove in the main shaft and the lock nut lip will be 1.5 mm (0.06 in) or less.

Notice:
After the caulking of the lock nut, check the caulked points for cracking. If there is any crack, replace the lock nut with a new one, and caulk it.



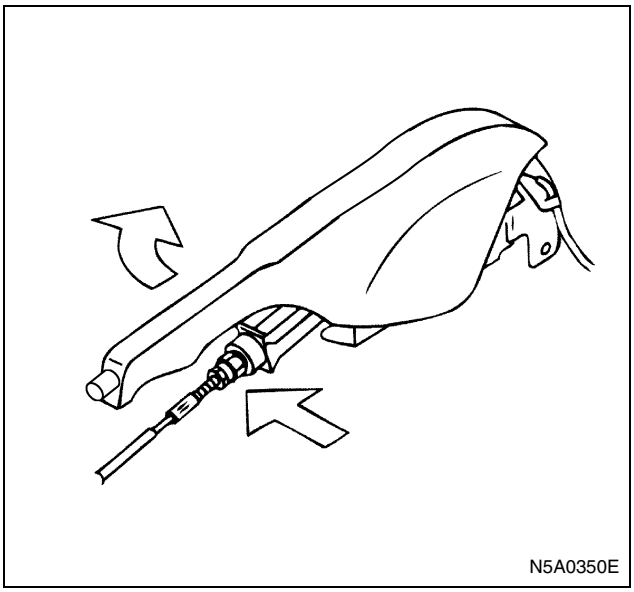
6. Mount the parking brake drum.
7. Adjust the pulling allowance of the parking brake.
   - Turn the adjuster until the parking brake drum stops turning. (Turn the parking brake drum downward in the case of vehicles with a 203 mm type or upward in the case of vehicles other than 203 mm type.)
   - Turn back the adjuster by the specified number of notches.



Number of notches by which the adjuster must be turned back

All vehicles equipped with other than 203 mm type = 30 notches

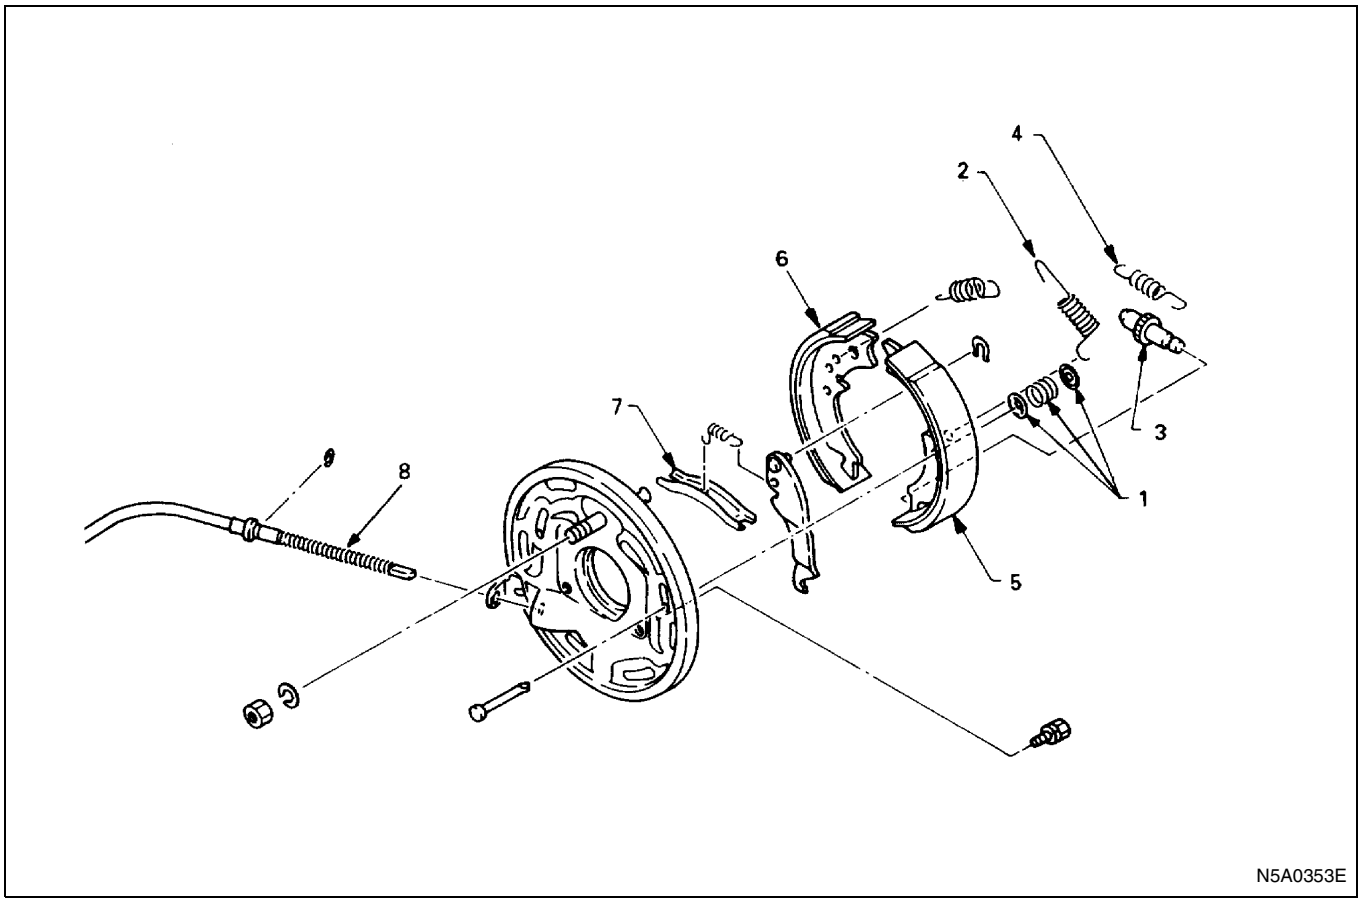
Vehicles equipped with a 203 mm type = 8 notches



- Adjust the pulling allowance of the parking brake lever by tightening the adjusting nut so that the allowance at a handle operating force of 147 N (15.0 kg / 33 lb) will be six to eight notches.
- Confirm that the brake does not drag.
- Mount the adjusting cover over the parking brake drum.

UNIT REPAIR [178 mm, 190 mm TYPE]

Parking Brake Assembly



Legend

8. Parking Cable

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Visual Check

Inspect the following parts for wear, corrosion, scuffs, scratches, deterioration or other abnormal conditions.

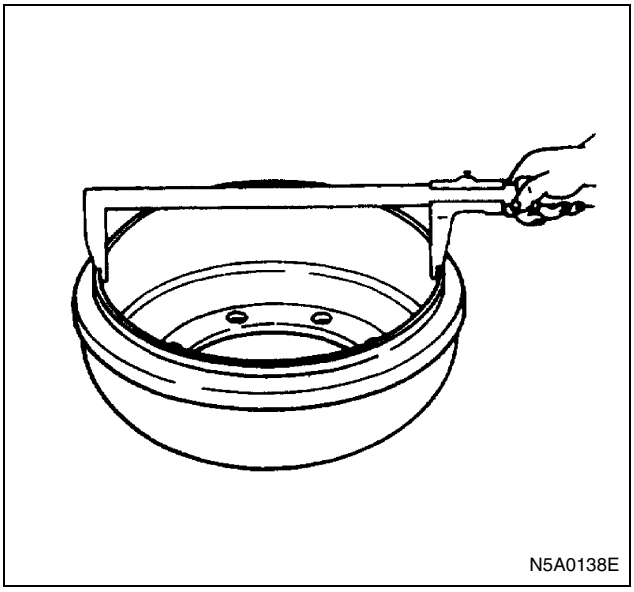
- Brake drum
- Brake lining
- Return spring
- Parking brake lever assembly
- Parking brake inner cable

Brake Drum

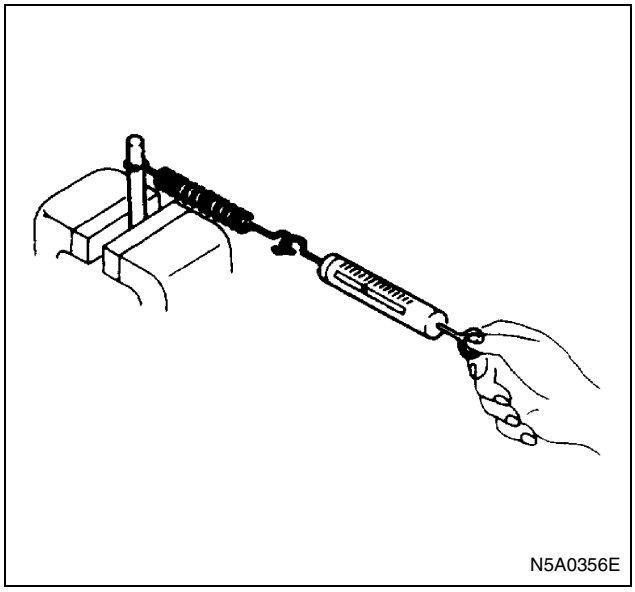
Use a vernier caliper to measure the brake drum inside diameter.

If the measured value exceeds the specified limit, the brake drum must be replaced.

Brake Drum Inside Diameter		mm (in)
	Standard	Limit
Inside diameter	178 (7.01) 190 (7.48)	179 (7.05) 191 (7.52)
Out of round: • Limit: 0.05 mm (0.0020 in) or less		



N5A0138E



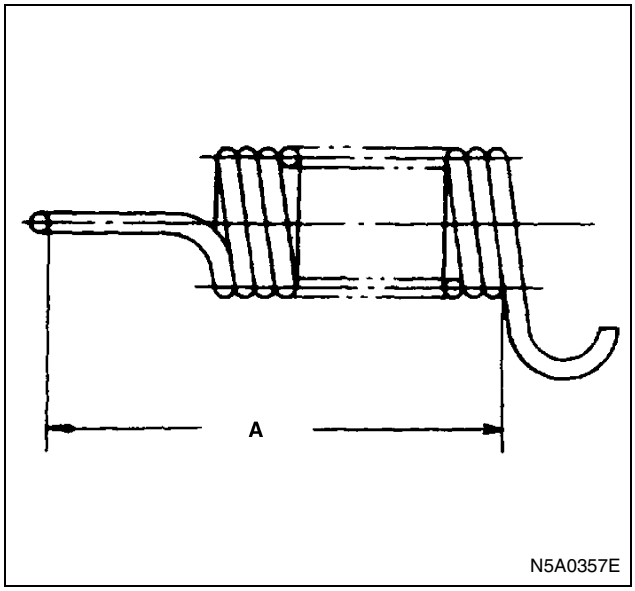
N5A0356E

Return Spring

Use a spring balancer to measure the return spring set load.

If the variation exceeds 10% of the specified value, the return spring must be replaced.

		Drum inside dia. mm (in)	
		178 (7.01)	190 (7.48)
Free length: mm (in)	Primary	62 (2.44)	62.1 (2.44)
	Secondary	49 (1.93)	
Set length: mm (in)	Primary	70 (2.76)	67.1 (2.64)
	Secondary	57 (2.24)	
Set load; N (kg/lb)	Primary	105.9 — 129.5 (10.8 — 13.2/23.8 — 29.1)	53 — 65.7 (5.4 — 6.6/ 11.9 — 14.6)
	Secondary	88.3 — 107.8 (9.0 — 11.0/19.8 — 24.3)	



N5A0357E

Legend

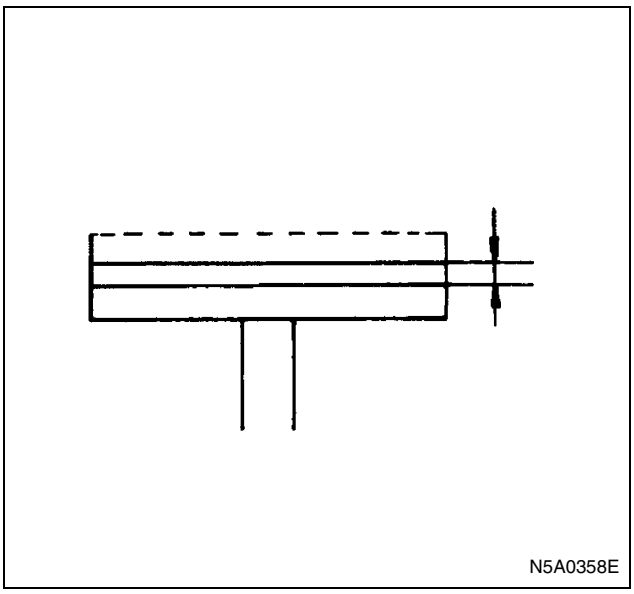
A. Length

Brake Lining Thickness

Use a vernier caliper to measure the brake lining thickness.

If the measured value is less than the specified limit, the brake shoe assembly must be replaced.

Brake Lining Thickness	mm (in)
Limit	1.0 (0.039)



Reassembly

1. Parking Cable Rear
2. Strut
3. Primary Brake Shoe Assembly
4. Secondary Brake Shoe Assembly
   Install the brake shoes by fitting them properly into slot in the adjuster and strut.
5. Spring; Adjuster
6. Adjuster Assembly
7. Return Spring

Drum inside diameter 178 mm only

Attach the return spring bauing fewer windings at the primary side as illustrated.

Inspection and Repair

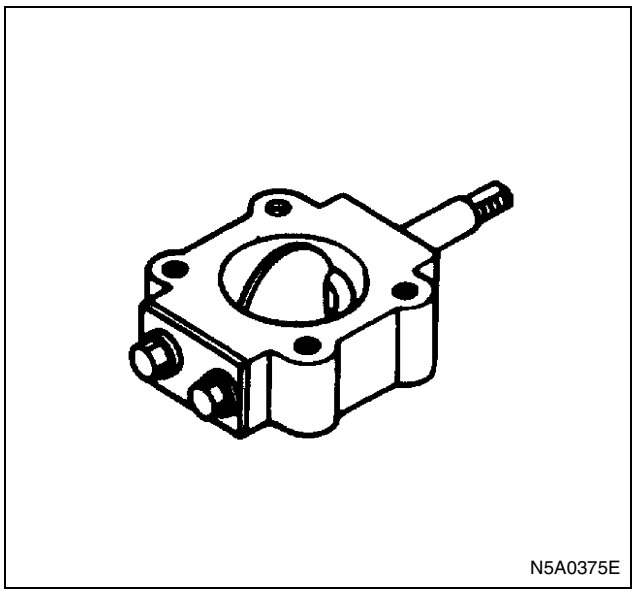
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Visual Inspection

Visually inspect the following parts for excessive wear and damage.

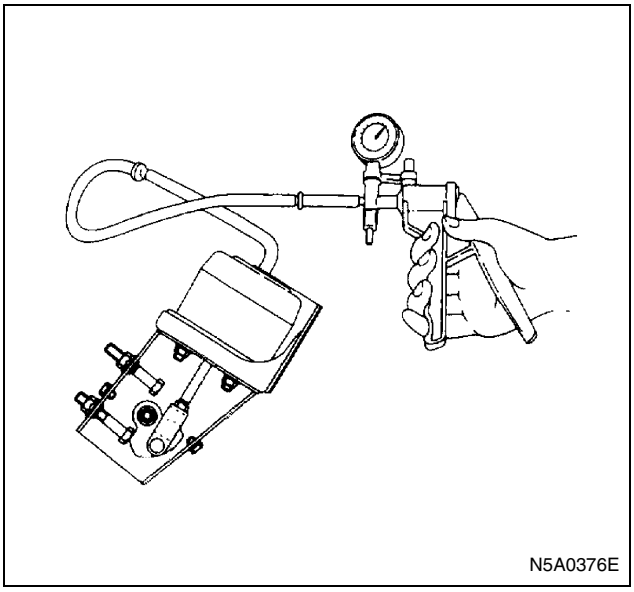
If excessive wear or damage is discovered during inspection, the part(s) must be replaced.

- Exhaust brake valve
- Exhaust brake shaft
- Butterfly valve
- Bushings
- Power chamber



Power Chamber

(1) The exhaust brake valve should operate smoothly when the negative pressure (400 mmHg to 700 mmHg) is applied to the power chamber via the vacuum pump.



N5A0376E

(2) At the points (A) and (B), the average clearance between the valve and the vehicle body should be as mentioned in the following table when the negative pressure (650 mmHg to 700 mmHg) is applied to the power chamber via the vacuum pump.

Clearance Between Valve And Body	mm (in)
	Standard
4HF1 Engine	0.4 — 0.6 (0.016 — 0.024)
Others	0.1 — 0.2 (0.004 — 0.008)

ABS/ASR System

Description of Function and Operation

Description of ABS/ASR

ABS (Anti-lock Brake System) and ASR (Anti-Slip Regulator) are the system to prevent the wheels from locking and wheel spin, and to assure stability and steering ability of the vehicle.
When a malfunction occurs in the system, fail-safe deactivate the ABS and ASR, and the warning lamp comes on. Also, the self-diagnosis function is equipped to improve serviceability.

Contents of ABS Control

The ABS controls the brake fluid pressure in the way that the electronic hydraulic control unit (EHCU) hold/decrease/increase the brake fluid pressure during brake operation, based on the signal transmitted from the wheel speed sensor.
The EHCU calculate the wheel speed, the wheel acceleration speed, and the vehicle speed based on the signal transmitted from the wheel speed sensor. When brake is applied while the vehicle is running, the wheel speed abruptly goes down, and the difference from the vehicle speed becomes more than specified; the EHCU judges that the wheel turns toward being locked, and it performs holding of the brake fluid pressure.
When the vehicle speed further goes down, the system judges that the wheel is about to be locked, and it performs decreasing of the brake fluid pressure. Consequently, when the system judges that wheel lock is avoided, it performs holding and increasing of the brake fluid pressure repeatedly.

Contents of ASR Control

The ASR controls the engine torque to prevent wheel spin of the drive wheel during sudden start/acceleration. The ABS/ASR control unit calculates the engine control speed (average of the drive wheel RH and LH speed) and the vehicle speed (driven wheel speed) based on the signal transmitted from each wheel speed sensor.

When the drive wheel spins and the speed difference between the engine control speed and the vehicle speed reaches the specified value, the ABS/ASR control unit send a signal to the engine control unit to operate the throttle closing direction to adjust the slip amount appropriately.

Symptom Specific to the Model with ABS

The vehicle equipped with ABS may develop the following symptoms, but those are inherent to the system and not malfunction.

1. Kickback or vibration in the break pedal, vibration in the steering wheel and vehicle are felt during abrupt braking or braking on a slippery surface.
2. Noise is generated around the brake pedal or from the vehicle rearward while ABS is in operation.
3. Motor operation noise is generated for short time immediately after engine starting.

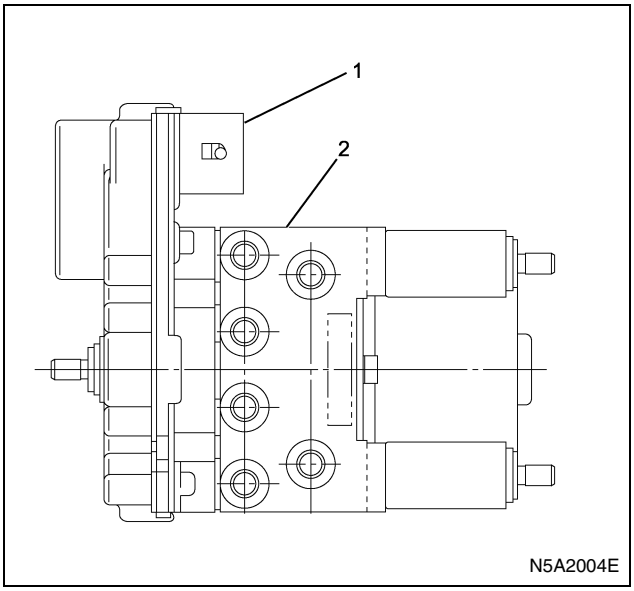
Electronic Hydraulic Control Unit (EHCU)



Legend

1. Electronic control unit part
2. Hydraulic control unit part

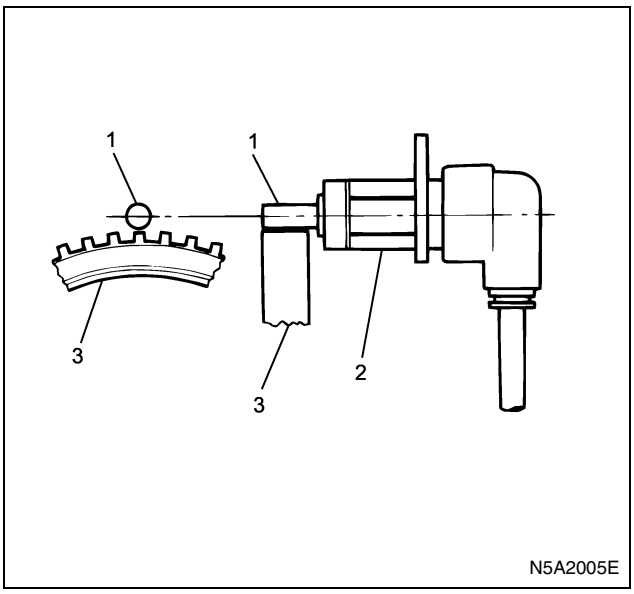
EHCU consists of ECU and HU. The ECU consists of the ABS/ASR control part, the fault detecting part, and the fail-safe part. It drives the hydraulic unit etc. based on the signal transmitted from each sensor. In case of system failure, it stops the fail-safe and returns to the normal brake. Also, the self-diagnosis function is equipped to indicate the trouble part during diagnosis.

The HU consists of the motor, the plunger pump, and the solenoid valve.
Solenoid valve: Decrease, hold, increase the brake fluid pressure based on the signal transmitted from the ECU.
Reservoir: Temporarily store the brake fluid from each caliper to lower the fluid pressure smoothly.
Plunger pump: Send the brake fluid stored in the reservoir to the master cylinder.
Motor: Drive the plunger pump based on the signal from ECU.
Check valve: Control the brake fluid flow.

CAUTION:
Turning the key ON with the harness disconnected from the EHCU means that the CAN communication line is not connected at this moment. Therefore, the systems which perform CAN communication such as engine and Smoother are judged as faulty. After replacing the EHCU, clear the DTCs of the systems which perform CAN communication. Also, do not drive the vehicle with the EHCU removed.

Wheel Speed Sensor

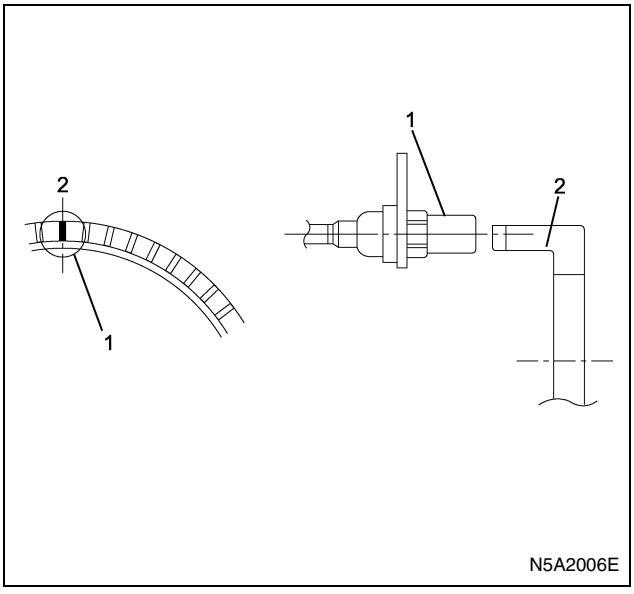
Front speed sensor



Legend

1. Electrode
2. Sensor
3. Sensor rotor

Rear speed sensor

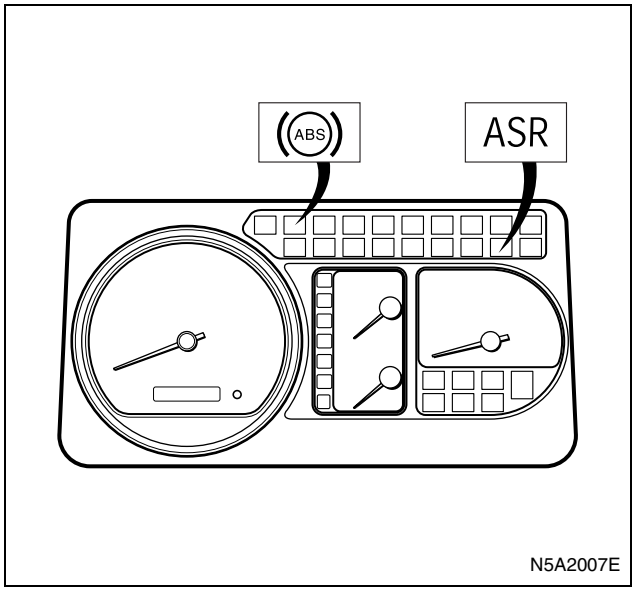


Legend

1. Sensor
2. Sensor rotor

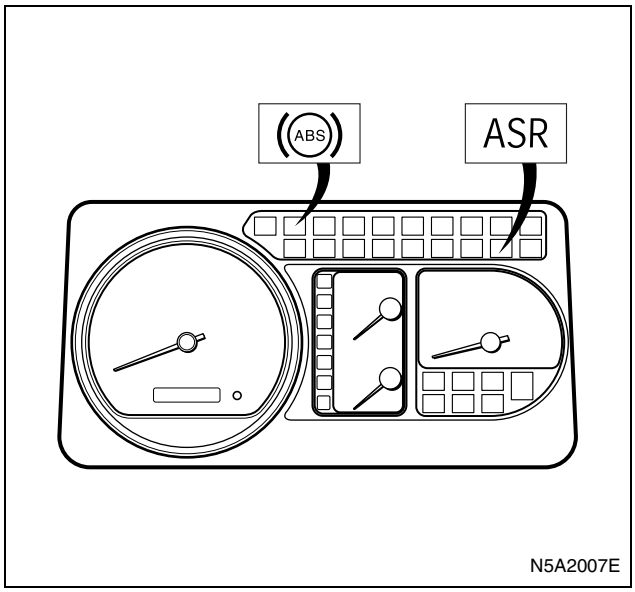
The front speed sensor consists of permanent magnet and coil, and the rear speed sensor is the 2 wire system hall IC type and is installed to the knuckle for front wheels, and to the brake back plate for rear wheels. Sensor rotors inserted in front/rear wheel hubs rotate to generate voltage in the sensor. Frequency of this voltage varies in relation to the rotor revolution speed; therefore this allows the sensor to detect the vehicle speed.

ABS Warning Lamp



The ABS warning lamp comes on with the starter switch ON, and then goes off if the ABS is normal.
It also comes on in case of ABS malfunction, and indicates the trouble code with blinking pattern upon change of the EHCU to diagnosis mode.

ASR Indicator/Off Lamp

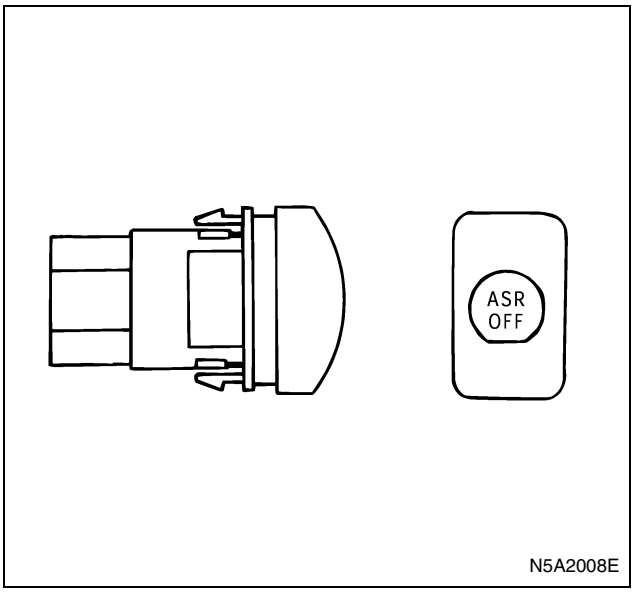


The ASR warning lamp comes on with the starter switch ON, and then goes off if the ASR is normal.
It blinks while the ASR is in operation.
It comes on in case of ASR malfunction and when the ASR off switch is pressed to deactivate the system.
It indicates the trouble code with blinking pattern upon changing to the diagnosis mode.

CAUTION:
When either of the ABS or ASR is faulty (which does not affect the other), the warning lamp of the affected sys-

tem only comes on and prohibit the system operation.
In this case, the other system is still workable if normal.

ASR Off Switch



Pressing the ASR off switch after starting the engine deactivates the ASR, and pressing again bring the system to stand-by condition. The ASR is set stand-by condition whenever the engine is started regardless of switch condition.

Procedure of Trouble Diagnosis

Description of Diagnosis

Trouble symptom related to ABS and ASR can be classified into two kinds; one is with ABS/ASR warning lamp illumination pattern, the other is from the trouble symptoms noticeable by the driver.
Refer to “Diagnosis with illumination pattern” in the first case, and “List of trouble symptoms” in the latter case for diagnostic procedures. Also, diagnostics with Tech 2 is available. Refer to sections 5A and 5C for the diagnosis of mechanical trouble, including brake noise, brake judder (vibration of pedal or vehicle body during normal brake operation), break pulling to one side, parking brake fault.

About Self-Diagnosis

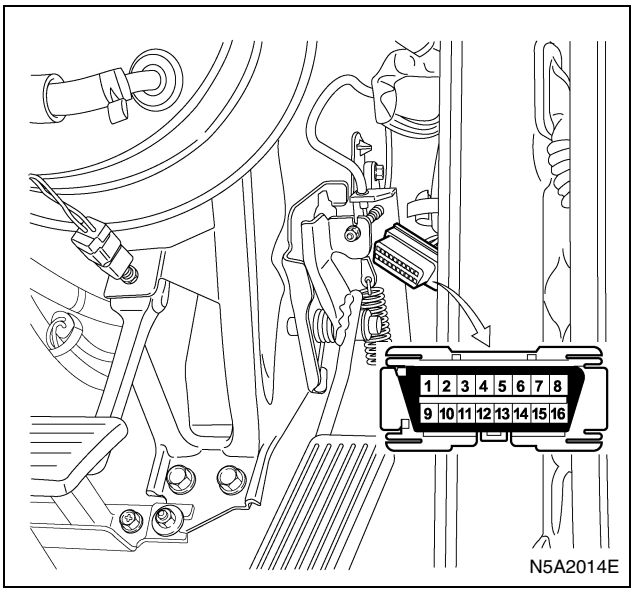
Self-diagnosis function is equipped with the EHCU, it performs the checks as shown in the illustration below to

examine the system for fault and identify the trouble part every time the system starts. If it found to be faulty, the system illuminates the ABS/ASR warning lamp to notify the fault, and stores the diagnostic trouble code (DTC). Illumination pattern differ depending on the fault condition; refer to “Diagnostic procedure with illumination pattern” described in later, and check and repair according to the relevant flow chart.

CAUTION:
Lamp illumination is reset every time the starter switch is OFF (system OFF), however the diagnosis code will not be erased unless it is compulsory erased. In case of faults while driving and intermittent fault, the control unit may judge it as normal at the time of diagnosis and indicate the normal code. Therefore perform the check and repair according to the diagnosis flow.

How to Indicate Trouble Codes

The vehicle must be parked (vehicle speed 3.3km/h (2 mph) or less). Short the terminal No. 12 with No. 4 or 5 (ground) of the self-diagnosis connector, and turn the starter switch to ON. The ABS/ASR warning lamp will blink to indicate the diagnosis trouble code.



The normal code 12 is repeatedly displayed if normal.
If faulty, after displaying the normal code 12 for three times, the stored diagnosis trouble code (DTC) is displayed for three times. Then back to the normal code again and repeats this display order. Maximum 6 codes are stored, and these are displayed in the reverse chronological order.
For details concerning DTCs, refer to “List of Diagnostic Trouble Code (DTC)” described later.

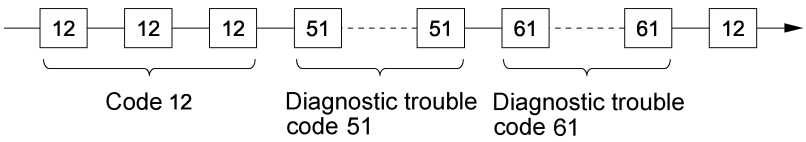
Indication sample of multiple diagnostic trouble code ; for code 51,61



N5A2016E

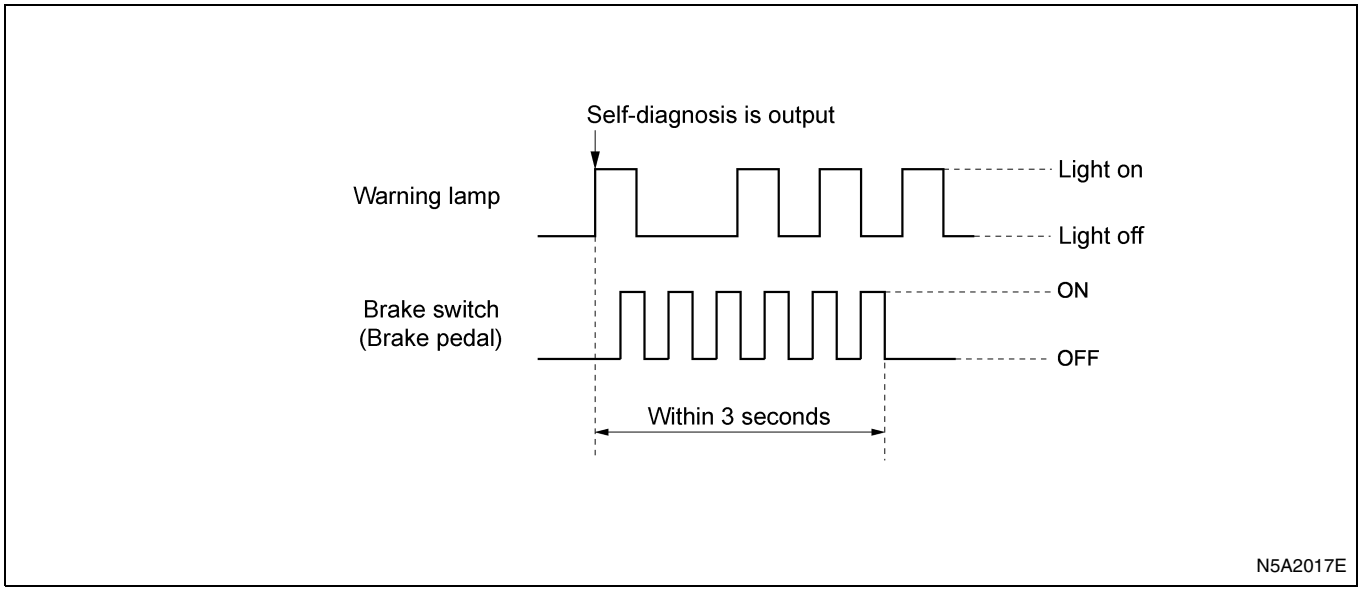
How to Clear Diagnosis Trouble Code (DTC)

DTCs stored in the EHCU will not be erased automatically upon repair. Clear the DTCs using either of the following procedure:

1. Input the brake switch ON/OFF signal for six times within three seconds while self-diagnosis result is being output.
2. Use Tech 2 to clear.

CAUTION:

- After performing the DTC clear procedure, ensure that it is cleared.
- If the step 1 does not work, perform with the step2.



Precautions During Diagnosis

At general baintenance

Adhere the following precautions when servicing and diagnosing of the ABS/ASR and other vehicle control systems.

- When performing electric-arc welding on the vehicle, disconnect the EHCU connector before starting welding work.
- Do not connect/disconnect the EHCU connector when the starter switch is ON.
- The EHCU is a non-disassembled part. Do not loosen the bolts and plugs of the EHCU.
- Be especially careful not to allow dirt, dust or metallic powder to get into the hydraulic circuit during checking and servicing the brake components.
- When only rear wheels are rotated using dram tester or jack-upped for inspection, the ABS judges it as sensor fault and illuminates the ABS warning lamp. This indicates no fault in the system. Erase the ABS diagnosis code after repair. Turn the starter switch to ON again, to make sure that the ABS warning lamp does not come on.

When servicing computer system

Extreme care is required to avoid overcurrent to the EHCU circuit. Do not ground to or apply voltage to the EHCU without careful consideration while checking open/short circuit. Use only the circuit tester having high internal resistance or the special tool described in this section to check those circuit. Do not connect/disconnect the power supply to the EHCU when the starter switch is ON. Be sure to turn the starter switch to OFF before disconnecting/connecting the battery cable, the fuse, or the connector.

When replacing EHCU

The EHCU body fault rarely occurs, but more cases are falsely identified as EHCU trouble, as it happened to be corrected when replacing the EHCU but the fact is mostly secondary failure caused by the harness-side trouble (such as short circuit) or undetectable cause due to intermittent trouble. Therefore, before replacing the EHCU, check if overcurrent is applied to the EHCU as well as improper connection of the connectors.

Intermittent trouble

Intermittent troubles are mostly caused by temporally disconnection of the harnesses and connectors. If a trouble occurs, check the related circuit in the following procedure.

1. Check for misconnection of the connector. Also check for improper connection of the connector terminal.
2. Check for deformation and damage of the terminal. If deformed or damaged, correct and reconnect it securely.
3. Simulated open circuit is also suspected. Check the circuit by shaking the harness in a degree that does not damage the harness.

Test run of vehicle with ABS problem

Trouble cause of the problem appeared as ABS warning lamp illumination, can be identified with “Diagnostic procedure with illumination pattern”. However for the problem that can solely be identified by the driver as trouble

symptoms, the following procedure is necessary to identify the trouble cause by reproducing the trouble symptom with test run the vehicle.

1. Start the engine, and make sure that the ABS warning lamp goes off. (If the lamp does not go off, read the DTC and identify the trouble part.)
2. Slowly start the vehicle and run at 30 km/h (19 mph) or more for three minutes, then apply the brake to stop the vehicle completely. Start the vehicle again and accelerate to 30 km/h (19 mph) or more. Repeat this operation a least three times.
3. Next, start the vehicle and accelerate to 40 km/h (25 mph) or more, and then abruptly apply the brake to activate the ABS, till stop the vehicle.
4. If the warning lamp comes on during the test run, check the DTC and inspect the vehicle according to the DTC. If no DTC appeared, or the warning light does not come on, reproduce the condition of the trouble occurrence claimed by the customer as much as possible.
5. If DTC appeared or trouble symptom is found, perform the appropriate inspection according to the diagnostic procedure.

Check after repair

Upon completion of repair, turn the starter switch to OFF and then start the engine to make sure each lamp goes off. Next, run the vehicle at 30 km/h (19 mph) or more for 1 minute, and check that the lamp does not come on.

Brake basic inspection

Step	Action	Value	YES	NO
1	Is the brake fluid level correct?	—	Go to Step2	Replenish fluid. Go to Step2
2	Is fluid leaked?	—	Go to Step3	Repair. Go to Step3
3	Does the vacuum booster operate normally?	—	Go to Step4	Repair. Go to Step4
4	Is the brake pad and rotor normal?	—	Go to Step5	Repair. Go to Step5
5	Install all the components, and check that those are installed properly. Is this step completed?	—	End.	Go to Step5

Ground check

Step	Action	Value	YES	NO
1	Are all the ground point related to ABS OK?	—	Go to Step2	Repair. Go to Step2
2	Install all the components, and check that those are installed properly. Is this step completed?	—	End.	Go to Step2

Diagnostic basic flow

Step	Action	Value	YES	NO
1	1. Complaint from the customer 2. Interview to the customer. 3. Perform the basic inspection. (Refer to “Brake basic inspection”.) Is Tech 2 required?	—	Go to Step2	Go to Step3
2	Check DTC. Is DTC appeared?	—	Go to Step5	Go to Step4
3	Check DTC (with warning lamp illumination pattern). Is DTC appeared?	—	Go to Step5	Go to Step4
4	Test run the vehicle. Does the warning lamp come on?	—	Go to Step5	Refer to “List of trouble symptom”.Go to Step5
5	1. Repair the trouble part. 2. Clear the DTC. 3. Check the ABS warning lamp for illumination pattern with the ignition switch ON. 4. Test run the vehicle. Is the trouble appeared again?	—	Repeat the “Diagnostic basic flow” if the trouble appeared again (with trouble symptom or DTC). Go to Step1	Go to Step6
6	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	End.	Go to Step6

4. ABS warning lamp

Starter Switch	Tester scale/ range	Connector terminal No. to be measured	Standard value	Remarks
ON	VDC	J-177,6(+)–J-177,1(–)	16.5–34V	
OFF	VDC	J-177,6(+)–J-177,1(–)	0–0.3V	

5. Front LH speed sensor

Starter Switch	Tester scale/ range	Connector terminal No. to be measured	Standard value	Remarks
OFF	kΩ	J-177,32(+)–J-177,33(–)	1–2kΩ	
OFF	kΩ	J-177,32(+)–J-177,1(–)	1000kΩ or more	
OFF	VDC	J-177,32(+)–J-177,33(–)	200mV or more	Tire half-turn/sec

6. Front RH speed sensor

Starter Switch	Tester scale/ range	Connector terminal No. to be measured	Standard value	Remarks
OFF	kΩ	J-177,10(+)–J-177,11(–)	1–2kΩ	
OFF	kΩ	J-177,10(+)–J-177,1(–)	1000kΩ or more	
OFF	VDC	J-177,10(+)–J-177,11(–)	200mV or more	Tire half-turn/sec

7. Rear LH speed sensor

Starter Switch	Tester scale/ range	Connector terminal No. to be measured	Standard value	Remarks
ON	VDC	J-177,22(+)–J-177,34(–)	0.2–4.5V	Tire half-turn/sec

8. Rear RH speed sensor

Starter Switch	Tester scale/ range	Connector terminal No. to be measured	Standard value	Remarks
ON	VDC	J-177,21(+)–J-177,12(–)	0.2–4.5V	Tire half-turn/sec

9. ASR cut switch (ASR only)

Starter Switch	Tester scale/ range	Connector terminal No. to be measured	Standard value	Remarks
ON	VDC	J-177,5(+)–J-177,1(–)	16.5–34V (switch pressed) 0–0.3V (switch released)	

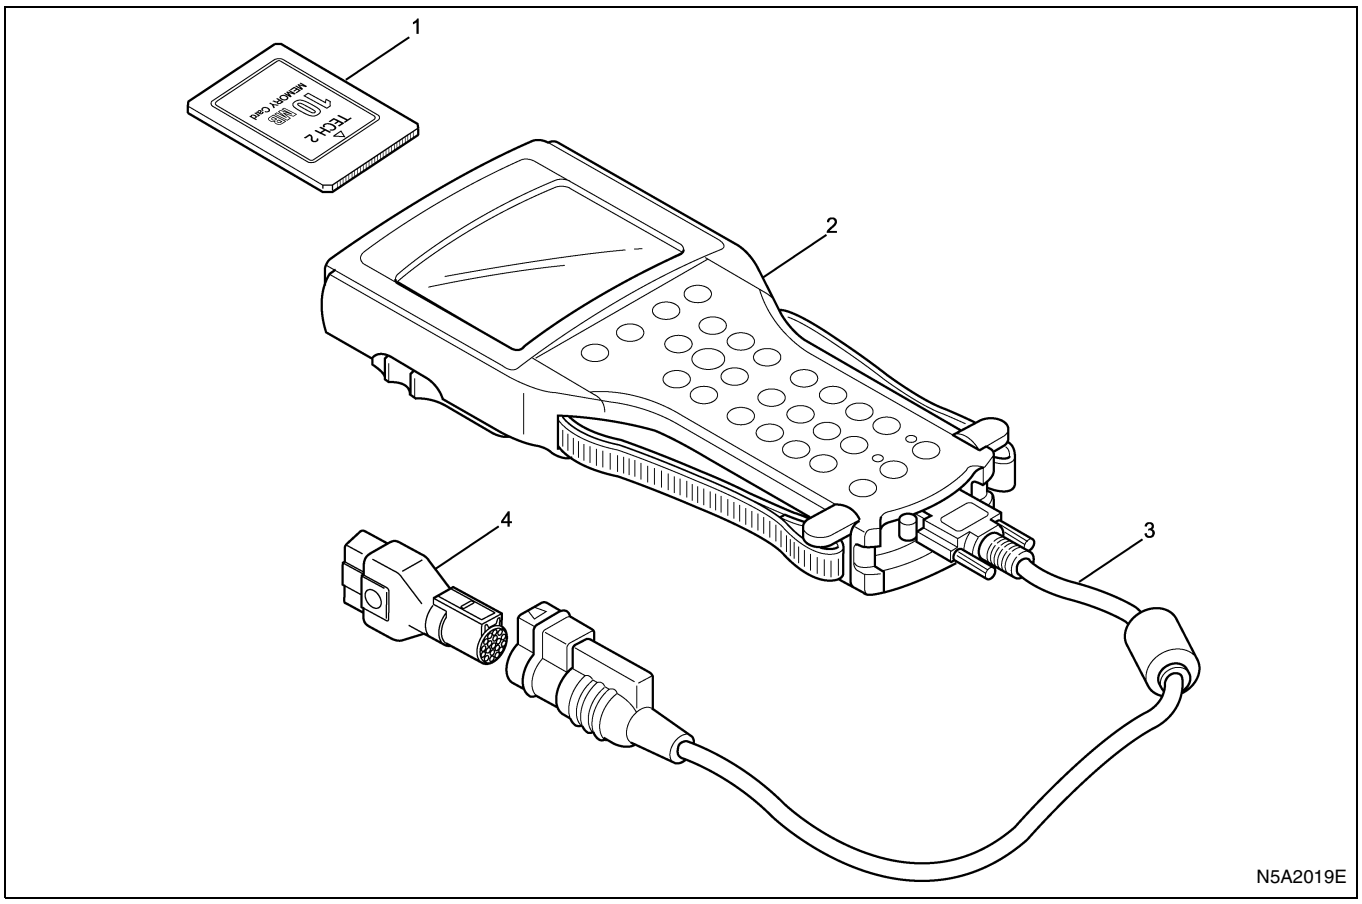
10. ASR warning lamp (ASR only)

Starter Switch	Tester scale/ range	Connector terminal No. to be measured	Standard value	Remarks
ON	VDC	J-177,30(+)–J-177,1(–)	16.5–34V	
OFF	VDC	J-177,30(+)–J-177,1(–)	0–0.3V	

Trouble Diagnosis with Scan Tool

Tech 2

Tech 2 is useful to diagnose the electric fault and the system check of the ABS control system. The Tech 2 is small and light tester. It can communicate with the ECM to perform various types of the diagnosis and the test by connecting the self-diagnosis connector equipped to the vehicle.



Legend

1. PCMCIA card
2. TECH 2
3. DLC cable
4. SAE16/19 pin adapter

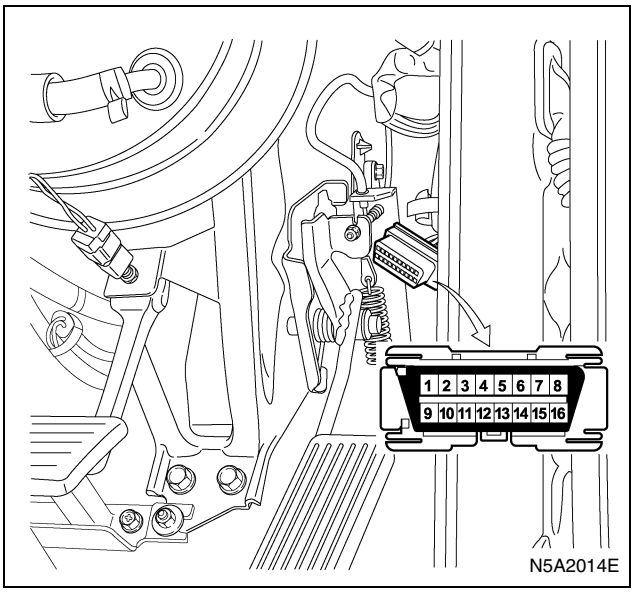
Feature of Tech 2

1. Tech 2 (2) is a 12-V power supply system. Do not use a 24-V power supply. If the vehicle system is equipped with a 24-V power supply, use a 12-V battery with an adapter for power distribution. Power distribution is not available from the cigar lighter.
2. Set the PCMCIA card (1) to the Tech 2 (2), and attach the VCI (Vehicle Communication Interface) (3)(4), and connect to the DLC in the vehicle.
3. Turn the power switch off before installing/removing the PCMCIA card.
4. The capacity of the PCMCIA card for Tech 2 is 10MB. It is ten times as large as Tech1 (1) mass storage.
5. Tech 2 has a capacity of equivalent to two snapshots.
6. The PCNCIA card is sensitive to magnetic and electrostatic. Please handle it with care.
7. Tech 2 can plot a graph of snapshots.
8. Pressing the EXIT key can bring back to the main menu anytime.
9. Open the application menu and press the “F1:Clear DTCInfo” or the DTC clear to erase the diagnosis trouble codes (DTCs).

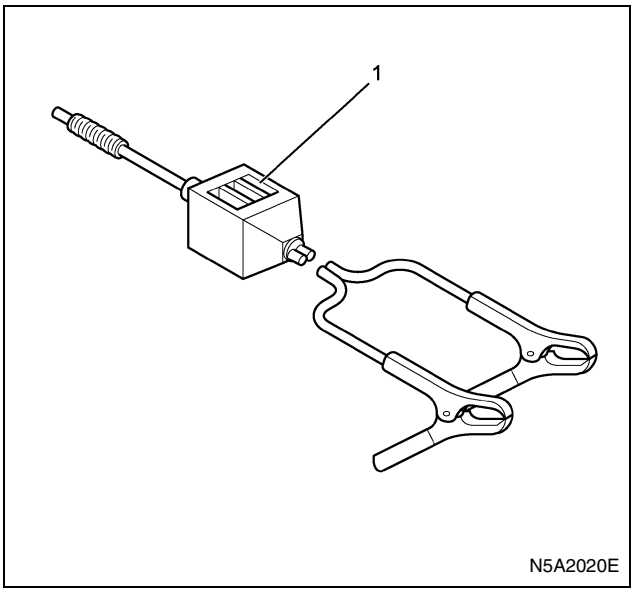
How to Connect Tech 2

1. Insert the PCMCIA card for ISUZU system to the Tech 2 body.
2. Install the SAE 16/19 adapter to the DLC cable.
3. Install the DLC cable to the Tech 2 body.
4. Make sure that the ignition is “OFF”.

5. Connect the SAE-16/19 adapter of the Tech 2 to the self-diagnosis cord (black) in the body side.



Connect an adapter cable between the Tech 2 and 12-V battery. (When connecting the adapter cable, start with the negative side.)



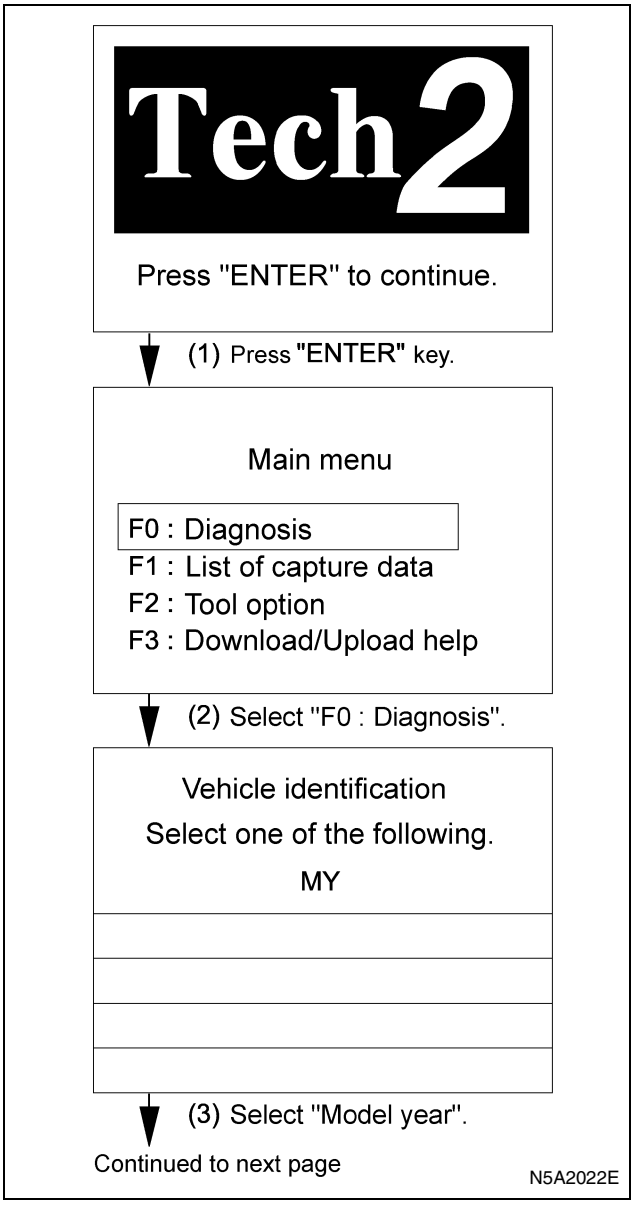
Legend

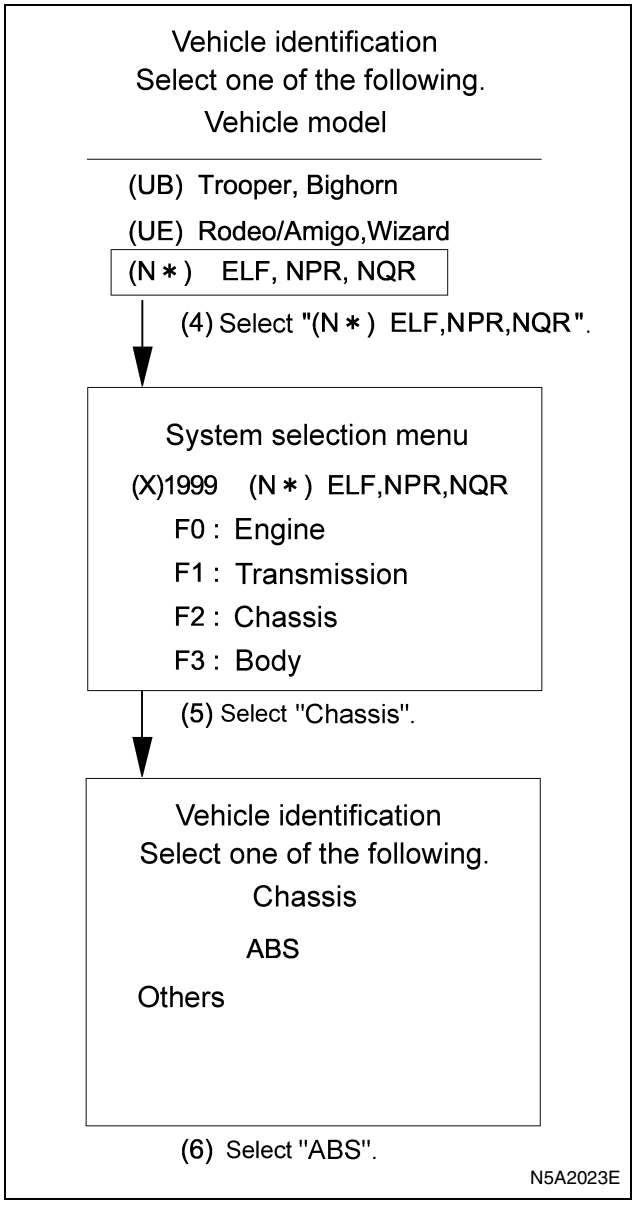
1. 3A-fuse

6. Turn the ignition switch to “ON” and press the “PWR” key of the Tech 2.
7. Check the display of the Tech 2.

CAUTION:
Make sure that no power is supplied to the Tech 2 when installing/removing the PCMCIA card.

Tech 2 Operation Procedure





The following chart shows the functions used by the current Tech 2 software.

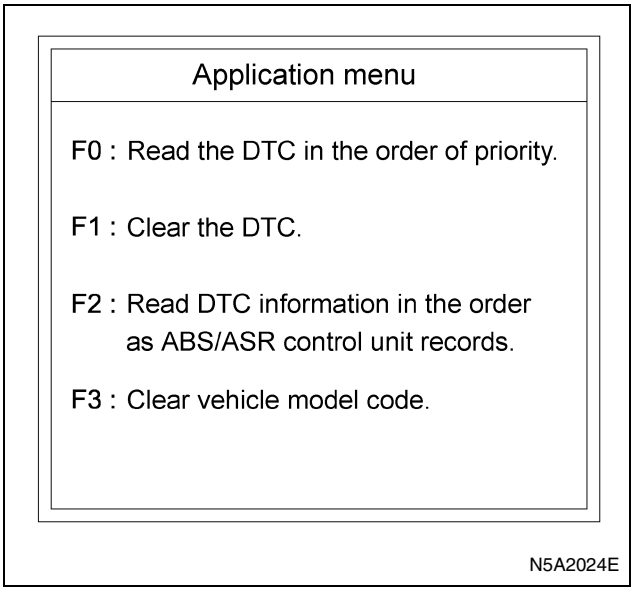
Menu

F0:	Diagnostic trouble code
	F0: Read the DTC in the order of priority. F1: Clear the DTC.
F1:	Data display
F2:	Snapshot
F3:	Actuator test

DTC (diagnostic trouble code) mode

Two options are available for Tech 2 DTC mode. After selecting the DTC, the following menu is displayed.

- DTC Info (DTC information)
- Clear Info (DTC clear)

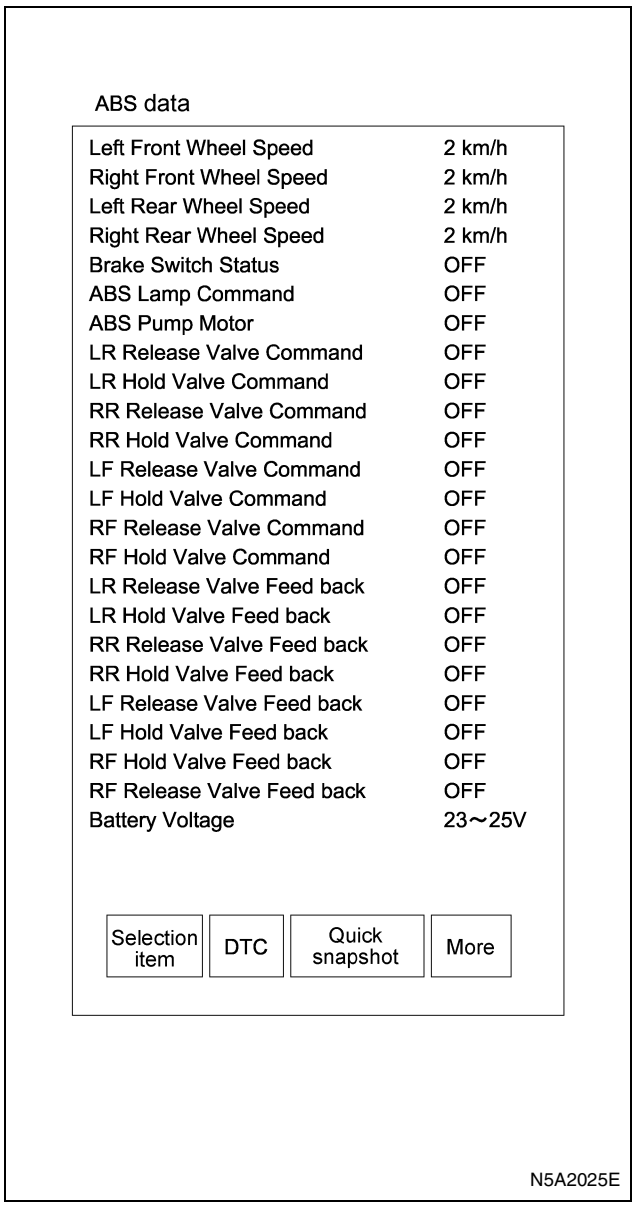


DTC is the language for technicians to communicate with the ECM on the vehicle.
DTC can roughly be classified into past DTC and current DTC.

- Current DTC: Trouble (fault) occurred current ignition cycle
- Past DTC: Trouble (fault) occurred previous ignition cycle or that in the past
- Multiple DTC: More than one DTC may be displayed in a time. It is called as multiple DTC. This happens when multiple troubles (faults) occurred in a time. Further this happens to the sensors and switches sharing same power source or ground. When such power source or ground is open or shorted, the DTCs of relevant sensors or switches are displayed.
  In this case, the power source or ground shared must be checked for open/short circuit.
  Use of DTC clear mode can erase the DTC memory stored in the vehicle.

Data display

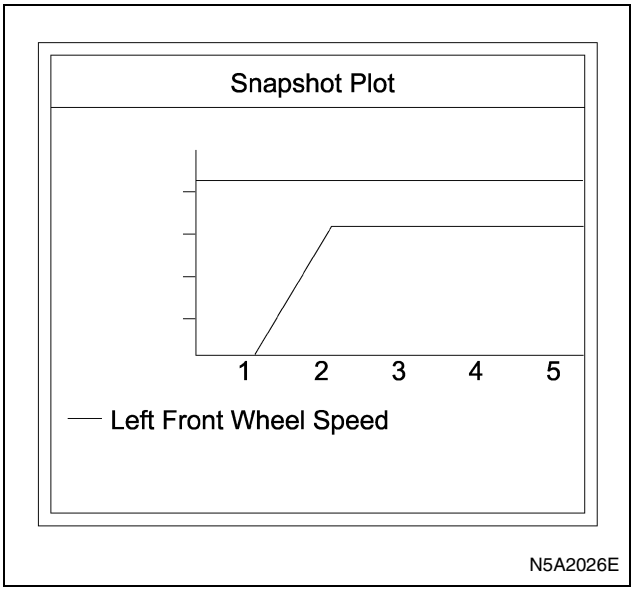
Example



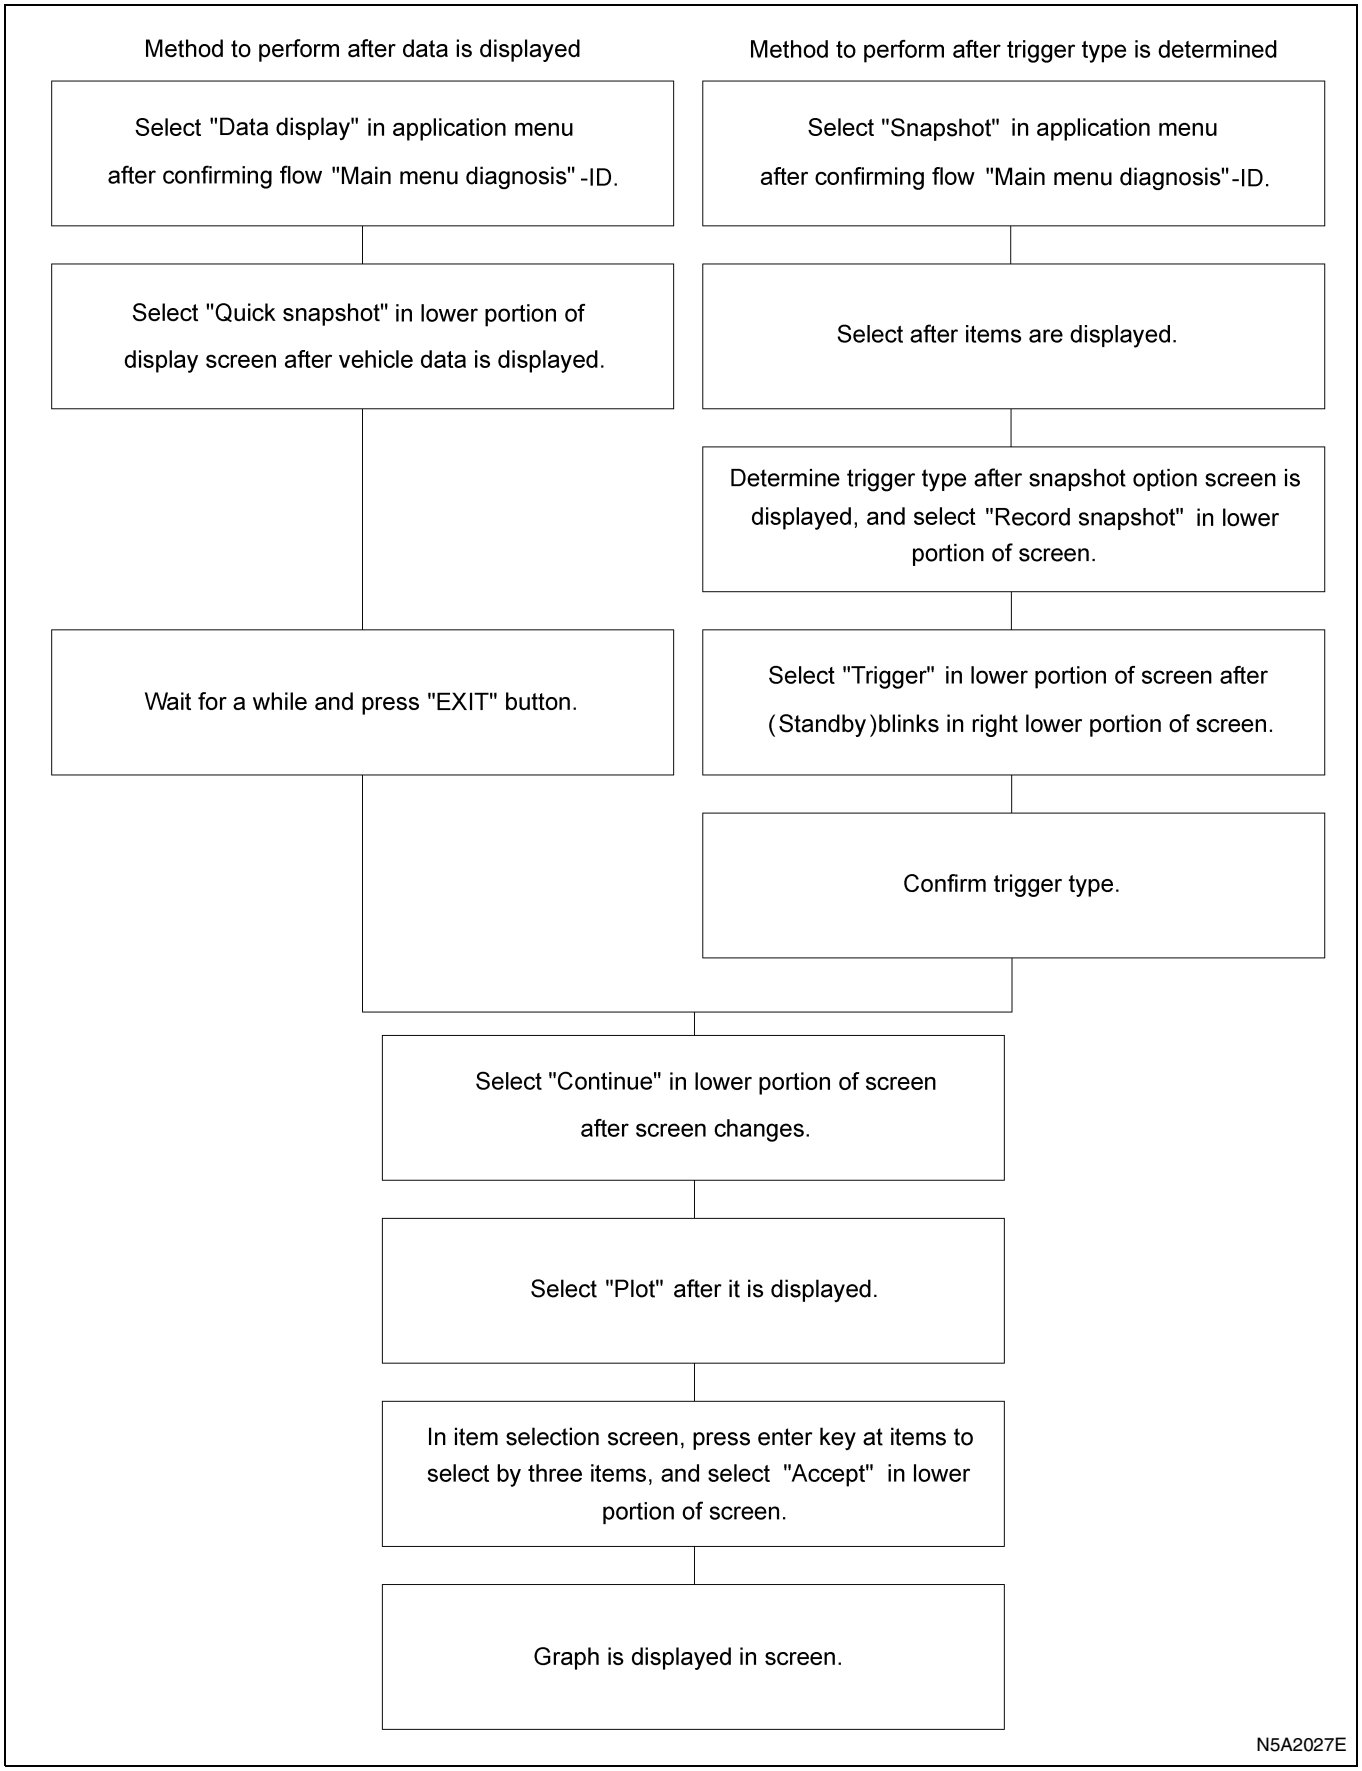
Use of this menu can display the current data.
Note that menu is subject to change.

CAUTION:
On the vehicle that the rear tires have smaller diameter, the rear wheel speed may be indicated a little higher than the front wheel speed. Check the speed after driving a while at a constant speed.

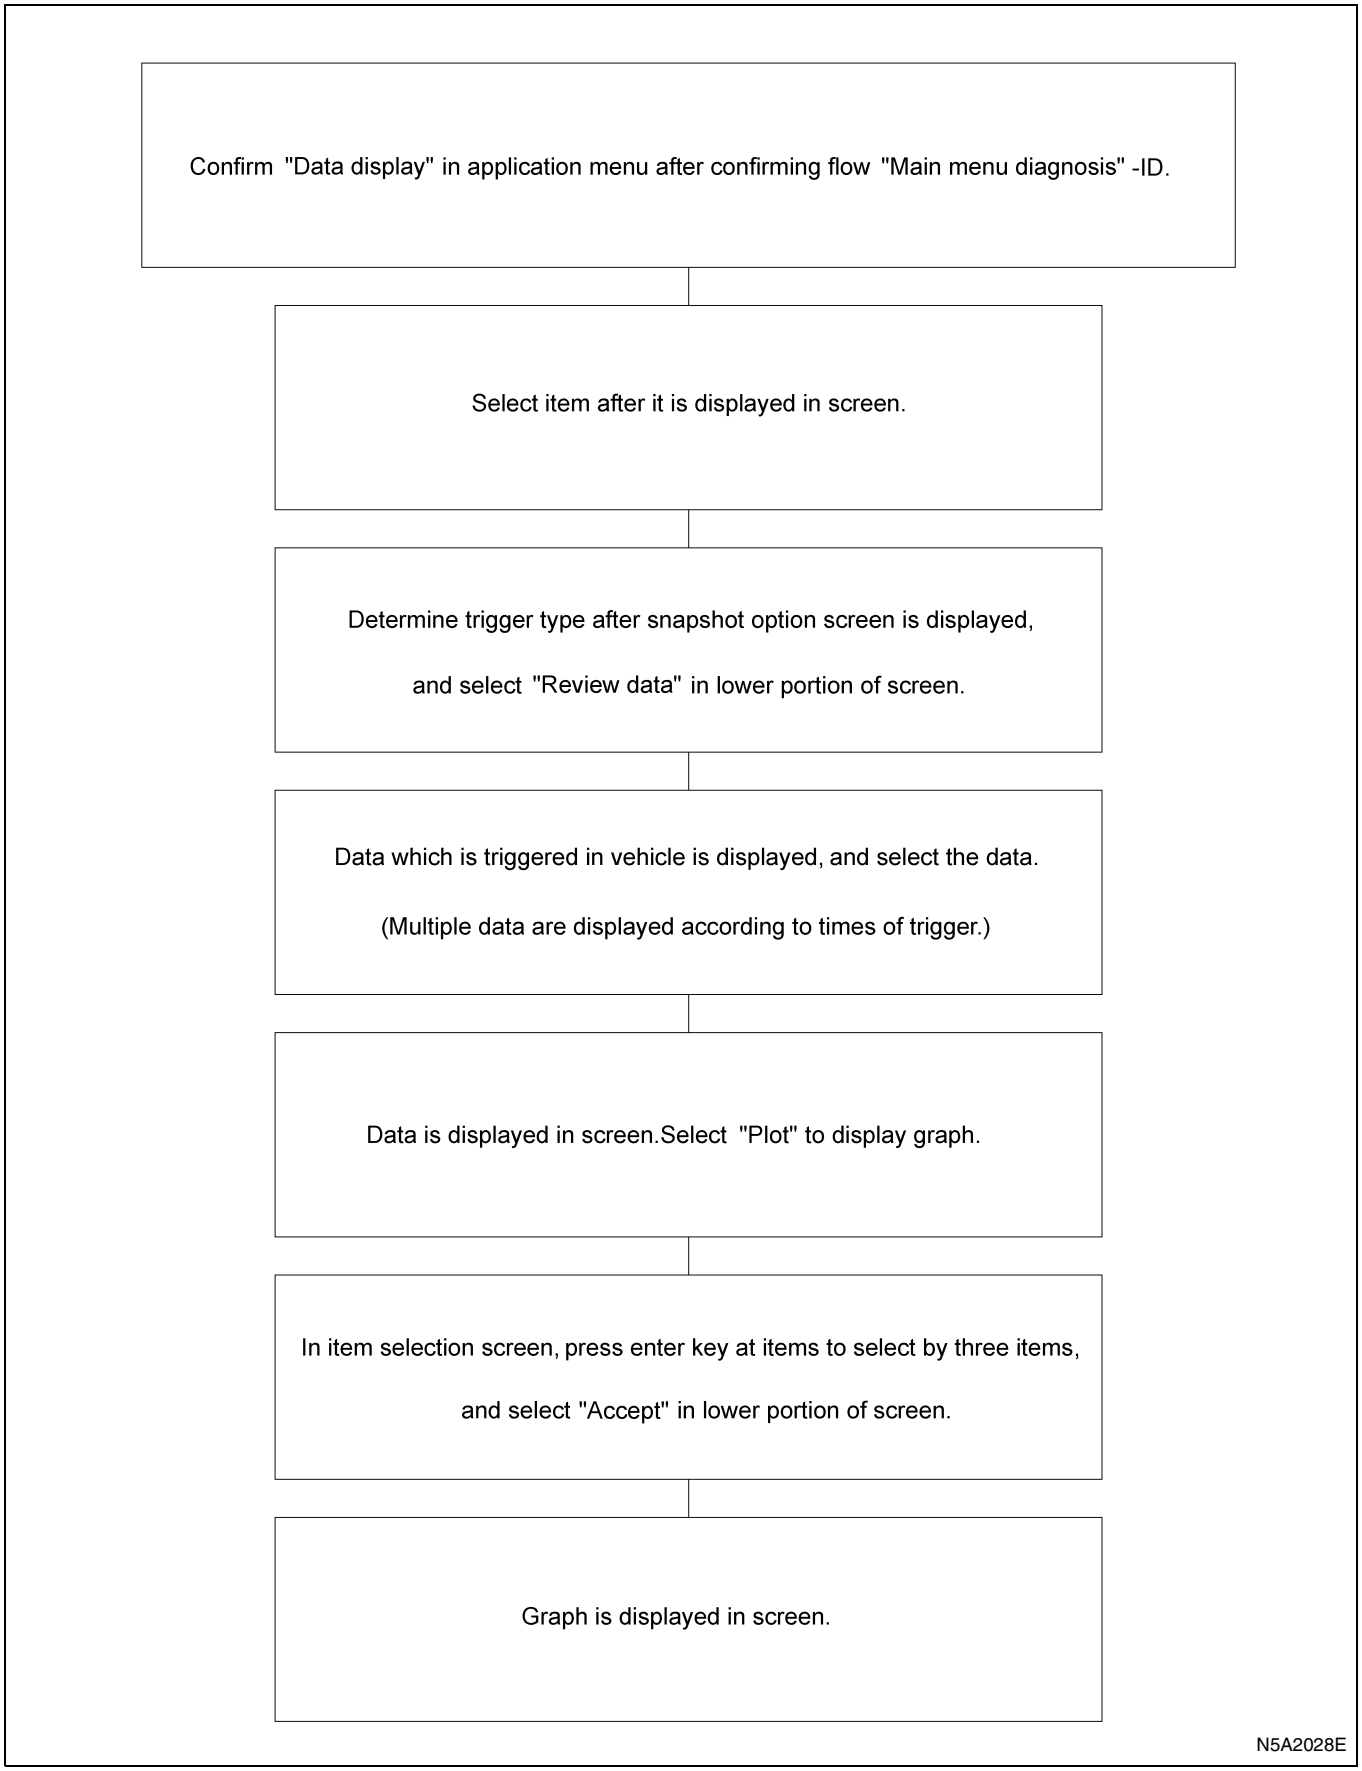
Snapshot (graph plotting)



- The snapshot can record the data list menu and plot a graph.
- Utilizing this mode, reproduce and record the conditions claimed by the customer to identify the engine data fault.
- The stored data can be replayed with a domestic power supply.



Method to perform after data is displayed
Select "Data display" in application menu after confirming flow "Main menu diagnosis" -ID.
Select "Quick snapshot" in lower portion of display screen after vehicle data is displayed.
Wait for a while and press "EXIT" button.
Method to perform after trigger type is determined
Select "Snapshot" in application menu after confirming flow "Main menu diagnosis" -ID.
Select after items are displayed.
Determine trigger type after snapshot option screen is displayed, and select "Record snapshot" in lower portion of screen.
Select "Trigger" in lower portion of screen after (Standby) blinks in right lower portion of screen.
Confirm trigger type.
Select "Continue" in lower portion of screen after screen changes.
Select "Plot" after it is displayed.
In item selection screen, press enter key at items to select by three items, and select "Accept" in lower portion of screen.
Graph is displayed in screen.
N5A2027E



Confirm "Data display" in application menu after confirming flow "Main menu diagnosis" -ID.
Select item after it is displayed in screen.
Determine trigger type after snapshot option screen is displayed,
and select "Review data" in lower portion of screen.
Data which is triggered in vehicle is displayed, and select the data.
(Multiple data are displayed according to times of trigger.)
Data is displayed in screen.Select "Plot" to display graph.
In item selection screen, press enter key at items to select by three items,
and select "Accept" in lower portion of screen.
Graph is displayed in screen.
N5A2028E

List of Diagnostic Trouble Code

DTC		Description	Check flow
Flash out code (warning lamp blinking pattern)	Tech 2 code		
12	C0212	Normal	—
13	C0213	Model type identification fault due to wrong assembly of control unit	B-2
14	C0214	EHCU fault	B-3
15	C0215	ECU power supply fault	B-4
16	C0216	CAN Communication fault	B-5
26	C0226	ECM Communication fault	B-6
33	C0233	Motor drive circuit fault	B-7
34	C0234	Motor rotation fault	B-8
35	C0235	ASR communication fault (ASR only) ASR continuous operation	B-9

51	C0251	Speed sensor open/short circuit; FL	B-13
52	C0252	Speed sensor open/short circuit; FR	B-14
53	C0253	Speed sensor open/short circuit; RL	B-15
54	C0254	Speed sensor open/short circuit; RR	B-16
61	C0261	Speed sensor signal fault/wrong tire size; FL	B-17
62	C0262	Speed sensor signal fault/wrong tire size; FR	B-18
63	C0263	Speed sensor signal fault/wrong tire size; RL	B-19
64	C0264	Speed sensor signal fault/wrong tire size; RR	B-20

Diagnosis with Blinking Pattern

If the ABS/ASR warning lamp blinking pattern is found to be faulty with the ignition switch ON, or when the warning lamp comes on during the test run, perform the diagnosis according to the chart shown below depending on the blinking pattern.

No.	Lamp condition	Warning lamp illumination pattern	Diagnostic flow
1	Warning lamp shows normal.	 N5A2029E	Normal
2	Warning lamp remains off.	 ※Non illumination may occur for “ABS” or “ASR” each. N5A2030E	ABS ABS warning lamp illumination circuit is faulty. Go to check flow B-1-1. ASR ASR warning lamp illumination circuit is faulty.

No.	Lamp condition	Warning lamp illumination pattern	Diagnostic flow
3	Warning lamp remains on.	 N5A2031E	DTC is stored. Display the DTC and perform the diagnosis for each code according to the diagnostic flow. If DTC is not stored, warning lamp illumination circuit or meter may be faulty. Check the meter itself or harness between the meter and EHCU connector terminal 6.
4	Warning lamp comes on when driving.	 ※ Either “ABS” or “ASR” is faulty,one of two illuminates.System without faulty can operate. N5A2032E	DTC is stored. Display the DTC and perform the diagnosis for each code according to the diagnostic flow.
5	Warning lamp repeats blinking after turning the starter switch ON, and then turns on when driving the vehicle.	 N5A2033E	Self-diagnosis circuit is faulty. Go to check flow B-1-2.

No.	Lamp condition	Warning lamp illumination pattern	Diagnostic flow
6	ASR lamp only comes on when driving.	 N5A2034E	Normal if ASR off switch has been operated. If not, the ASR off switch circuit is faulty. Check the ASR off switch itself, and the harness between the ASR off switch and the EHCU connector terminal 5.
7	ASR lamp only blinks when driving.	 N5A2035E	ASR is in operation. It is normal.

ABS Warning Lamp does not Come on with the Starter Switch ON.

Check flow B-1-1

Step	Action	Value	YES	NO
1	Is the F-16 meter backup lamp fuse blown?	—	Go to Step5	Go to Step2
2	Is the warning lamp bulb blown?	—	Go to Step6	Go to Step3
3	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Turn the starter switch ON. 4. Measure the voltage between the B-51 connector terminal 18 and the J-177 connector terminal 1,23. Is the voltage within specified value?	16.5 — 34V	Go to Step4	Go to Step7
4	Check for continuity between the J-177 connector terminal 1,23 and the body ground. Is there continuity?	—	Go to Step9	Go to Step8
5	Replace the fuse. Is this step completed?	—	Go to Step10	—
6	Replace the warning lamp. Is this step completed?	—	Go to Step10	—
7	Repair the circuit for open/short circuit, and the connector for improper connection. Is this step completed?	—	Go to Step10	—
8	Repair the circuit for open/short circuit, and the connector for improper connection. Is this step completed?	—	Go to Step10	—
9	1. Check the suspicious circuit for improper connection. 2. If the connection is normal, replace the EHCU. Is this step completed?	—	Go to Step10	—
10	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	—

ABS Warning Lamp Repeats Blinking After Turning the Starter Switch to ON.

Check flow B-1-2

Step	Action	Value	YES	NO
1	Is anything connected to the self-diagnosis connector?	—	Go to Step2	Go to Step3
2	Disconnect the connection. Is this step completed?	—	Go to Step7	—
3	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. Check for continuity between the J-177 connector terminal 4 and the J-177 connector terminal 1,23. Is there continuity?	—	Go to Step4	Go to Step5
4	Repair the circuit of the diagnosis connector J-177 terminal 4 and the B-79 connector terminal 12. Is this step completed?	—	Go to Step7	—
5	Is there any other trouble symptom?	—	Check according to the check flow of such symptom.	Go to Step6
6	Replace the EHCU. Is this step completed?	—	Go to Step7	—
7	Install all the components, and check that those are installed properly. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step7

ABS Warning Lamp Repeats Blinking After Turning the Starter Switch to ON.

Check flow B-1-3

Step	Action	Value	YES	NO
1	Is anything connected to the self-diagnosis connector?	—	Go to Step2	Go to Step3
2	Disconnect the connection. Is this step completed?	—	Go to Step7	—
3	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. Is there continuity between the J-177 connector terminal 4 and the J-177 connector terminal 1, 23?	—	Go to Step4	Go to Step5
4	Repair the circuit between the diagnosis connector J-177 terminal 4 and the B-79 connector terminal 12. Is this step completed?	—	Go to Step7	—
5	Is there any other trouble symptom?	—	Check according to the check flow of such symptom.	Go to Step6
6	Replace the EHCU. Is this step completed?	—	Go to Step7	—
7	Install all the components, and check that those are installed properly. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step7

DTC:C0213 (Flash Code 13) Model Type Identification Fault Due to Wrong Assembly of Control Unit

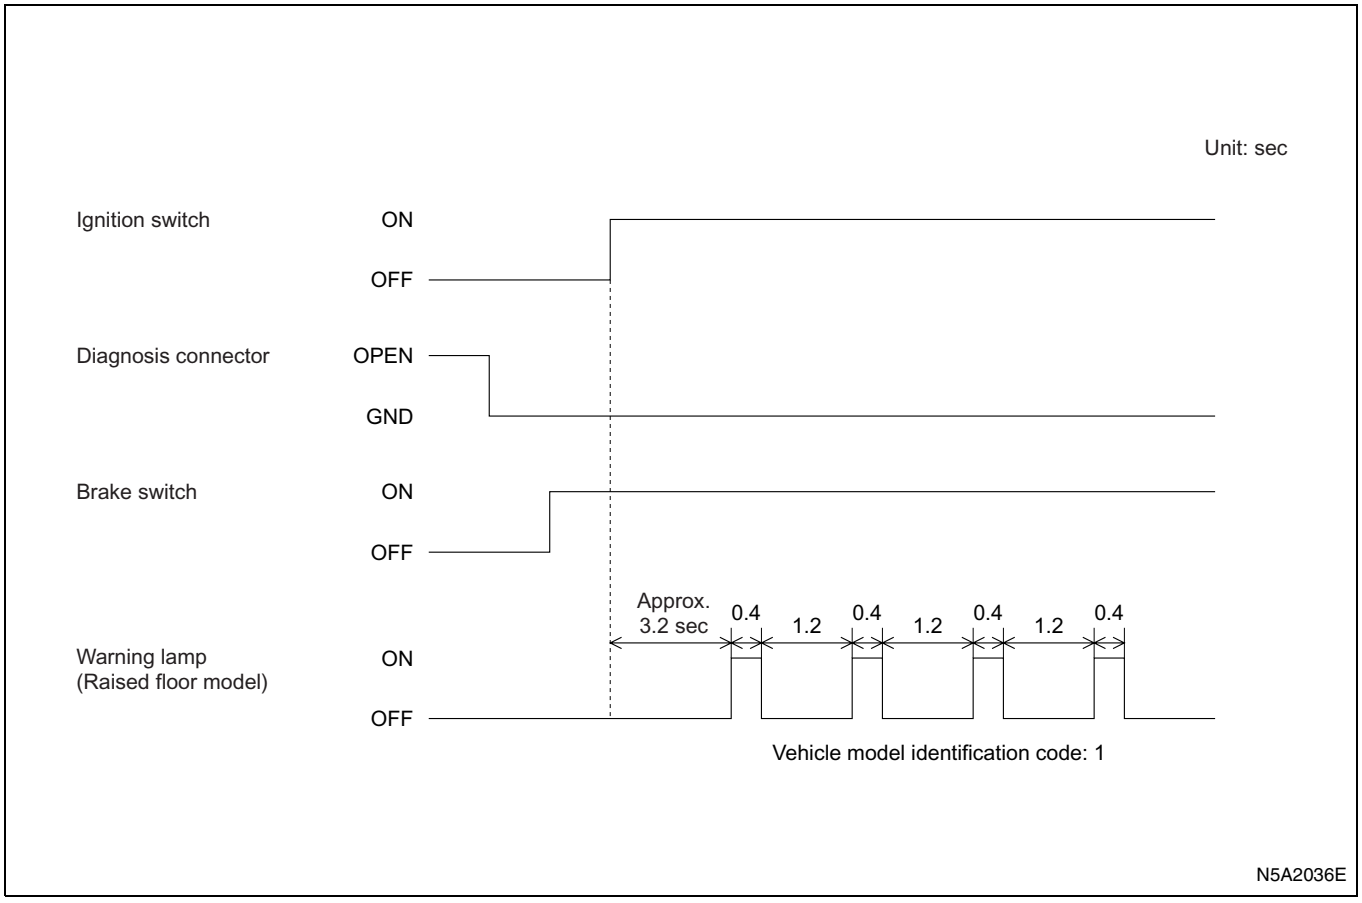
Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the J-177 connector of the EHCU. 3. Turn the starter switch ON. Measure the voltage between the J-177 connector terminal 18 and the 1,23. Is the voltage within the specified value?	0.5 — 4.5V	Go to Step2	Go to Step3
2	Repair the short circuit and improper connection in J-177 connector terminal 18. Measure the voltage between the J-177 connector terminal 18 and 1,23. Is the voltage within the specified value?	0.5 — 4.5V	Go to Step3	Go to Step4
3	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. 3. With Tech 2: • Connect the J-177 connector of the EHCU. Check the model type code. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step4
4	Replace the EHCU with a new one. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step3

Model Type Identification by Control Unit

EHCU (ABS control unit) is exclusively installed for each vehicle type, based the drive system, brake type, tire, etc. Also, you can use the warning lamp blinking pattern to identify the type of control unit (for which vehicle type).

How to Indicate Model Type Identification Result

With the ignition switch OFF, short the terminal 12 with the terminal 4 or 5 (ground) of the self-diagnosis connector, and depress the brake pedal and then turn the starter switch to ON. The ABS warning lamp will blink to indicate the result.



Model type identification code	2WD ABS
1	Raised floor model with front wheel disc brake
2	Flat low model with front wheel disc brake
3	Raised floor model with four wheel drum brake
7	NQR model for EC
8	NQR model for Australia

DTC:C0214 (Flash Code 14) EHCU Fault

Check flow B-3

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Check for continuity between the J-177 connector terminal 1,23 and the body ground. Is there continuity?	—	Go to Step2	Go to Step3
2	1. Connect the connector of the EHCU. 2. Clear the DTC. 3. Perform the self-diagnosis after turning the starter switch from OFF to ON. Is DTC displayed repeatedly?	—	Go to Step4	Go to Step5
3	Repair the circuit for open/short circuit, and the connector for improper connection. Is this step completed?	—	Go to Step5	—
4	Replace the EHCU. Is this step completed?	—	Go to Step5	—
5	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step5

DTC:C0215 (Flash Code 15) ECU Power Supply Fault

Check flow B-4

Step	Action	Value	YES	NO
1	Is the battery voltage normal?	—	Go to Step2	Go to Step5
2	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Start the engine. 4. Measure the voltage between the J-177 connector terminal 2 and the J-177 connector terminal 1,23. Is the value within specified value?	17 — 33.5V	Go to Step3	Go to Step6
3	Look for the circuit with improper connection. Is improper connection found?	—	Go to Step4	Go to Step8
4	Repair and perform the self-diagnosis. Is DTC displayed repeatedly?	—	Go to Step7	Go to Step8
5	Charge or replace the battery. Is this step completed?	—	Go to Step8	—
6	Repair the circuit for open/short circuit, and the connector for improper connection between the J-177 connector terminal 2 and the fusible link FL-9. Is this step completed?	—	Go to Step8	—
7	Replace the control unit. Is this step completed?	—	Go to Step8	—
8	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step8

DTC:C0216 (Flash Code 16) CAN Communication Fault

Check flow B-5

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Remove the harnesses from all the control units (engine, ABS, Smoother, etc.) connected to the CAN communication circuit. 3. Check for short circuit (shorts with ground, power supply, lines, and circuits) in the CAN communication circuit harnesses. Is the harness normal?	—	Go to Step3	Go to Step2
2	Repair the CAN communication circuit. Is the procedure completed?	—	Go to Step3	—
3	1. Turn the starter switch OFF. 2. Remove the harness from the EHCU. 3. Measure the circuit resistance between the terminals 14 and 15, and between terminals 26 and 27 in EHCU harness-side connector. Is the resistance within specified value?	100 —140Ω	Go to Step5	Go to Step4
4	Inspect the CAN communication circuit, terminating resistor, and connectors for faulty contact, the pin terminals for looseness, etc., and repair as necessary. Is the procedure completed?	—	Go to Step5	—
5	1. Turn the starter switch OFF. 2. Check the CAN communication (engine, ABS, Smoother, etc.) circuit harnesses for open circuit. Is the harness normal?	—	Go to Step7	Go to Step6
6	Repair the CAN communication circuit. Is the procedure completed?	—	Go to Step7	—
7	1. Turn the starter switch OFF. 2. Install the harnesses to all the control units connected to the CAN communication circuit. 3. Turn the starter switch ON. 4. Check each system (engine, Smoother, etc) for DTC. 5. If any DTC is detected in any system, repair it. Is the procedure completed?	—	Go to Step8	—
8	1. Clear the DTC. 2. Perform the test drive. 3. Check for DTC. Was DTC C0216 detected?	—	Go to Step9	Go to Step10

Step	Action	Value	YES	NO
9	Replace the EHCU. Is this step completed?	—	Go to Step10	—
10	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step10

DTC:C0226 (Flash Code 26) ECM Communication Fault

Check flow B-6

Step	Action	Value	YES	NO
1	Inspect the engine control, and repair or replace any faulty parts. Is this step completed?	—	Go to Step2	Go to Step1
2	Perform the check flow B-5. Is this step completed?	—	Go to Step3	Go to Step2
3	1. Clear the DTC. 2. Perform the test drive. 3. Check for DTC. Was DTC C0226 detected?	—	Go to Step4	Go to Step5
4	Replace the EHCU. Is this step completed?	—	Go to Step5	—
5	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step5

DTC:C0233 (Flash Code 33) Motor Drive Circuit Fault

Check flow B-7

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Turn the starter switch ON. 4. Measure the voltage between the J-177 connector terminal 24 and the J-177 connector terminal 23. Is the value within specified value?	20 — 32V	Go to Step5	Go to Step2
2	Repair the circuit between the J-177 connector terminal 24 and the FL-9, or replace the FL-9. Is this step completed?	—	Go to Step3	Go to Step2
3	Measure the voltage between the J-177 connector terminals 24 and 23. Is the value within specified value?	20 — 32V	Go to Step6	Go to Step4
4	Repair the harness between the J-177 connector terminal 23 and the chassis ground. Is this step completed?	—	Go to Step6	Go to Step4
5	Replace the EHCU. Is this step completed?	—	Go to Step6	Go to Step5
6	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. 3. Test run the vehicle. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step6

DTC:C0234 (Flash Code 34) Motor Rotation Fault

Check flow B-8

Step	Action	Value	YES	NO
1	Replace the EHCU. Is this step completed?	—	Go to Step2	Go to Step1
2	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. 3. Test run the vehicle. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step2

DTC:C0235 (Flash Code 35) ASR Communication Line Fault/ASR Continuous Operation

Check flow B-9

Step	Action	Value	YES	NO
1	1. Check the tire. 2. Check if specified tires are attached. 3. Check for abnormal wear on the tire outer surface. Are the tires normal?	—	Go to Step2	Replace with the specified tire, and Go to Step2
2	Check the speed sensor. (Check the sensor output by referring to the check flow C-1-1-C-1-4, or TC-1.) Is the sensor output normal?	100 — 140Ω	Go to Step3	Repair the faulty speed sensor, and Go to Step5
3	Check the engine control. Is the engine control normal?	"Diagnosis with Blinking Pattern" No.1	Go to Step4	Repair the engine control, and Go to Step5
4	Replace the EHCU. Is this step completed?	—	Go to Step5	Go to Step4
5	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to "Diagnostic basic flow".	Go to Step5

DTC:C0241 (Flash Code 41) Fail-Safe Relay Fault

Check flow B-10

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Turn the starter switch ON. 4. Measure the voltage between the J-177 connector terminal 2 and the J-177 connector terminal 1. Is the value within specified value?	16.5 — 34V	Go to Step6	Go to Step2
2	Repair the circuit between the J-177 connector terminal 2 and the FL-9. Is this step completed?	—	Go to Step3	Go to Step2
3	Measure the voltage between the J-177 connector terminals 2 and 1. Is the value within specified value?	16.5 — 34V	Go to Step7	Go to Step4
4	Repair the harness between the J-177 connector terminal 1 and the chassis ground. Is this step completed?	—	Go to Step5	Go to Step4
5	Measure the voltage between the J-177 connector terminals 2 and 1. Is the value within specified value?	16.5 — 34V	Go to Step7	Go to Step5
6	Replace the EHCU. Is this step completed?	—	Go to Step7	Go to Step6
7	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. 3. Test run the vehicle. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step7

DTC:C0243 (Flash Code 43) Solenoid Drive Circuit Fault

Check flow B-11

Step	Action	Value	YES	NO
1	Replace the EHCU. Is this step completed?	—	Go to Step2	Go to Step1
2	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. 3. Test run the vehicle. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step2

DTC:C0245 (Flash Code 45) Solenoid Monitor Circuit Fault

Check flow B-12

Step	Action	Value	YES	NO
1	Replace the EHCU. Is this step completed?	—	Go to Step2	Go to Step1
2	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. 3. Test run the vehicle. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step2

DTC:C0251 (Flash Code 51) Speed Sensor Open/Short Circuit; FL

Check flow B-13

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Measure the resistance between the J-177 connector terminals 32 and 33. Is the value within specified value?	1 — 2kΩ	Go to Step2	Go to Step3
2	Measure the resistance between the J-177 connector terminals 32 and the ground. Is the value within specified value?	1000kΩ or more	Go to Step7	Go to Step4
3	1. Disconnect the FL wheel speed sensor connector. 2. Measure the resistance between the J-75 connector terminals 1 and 2 (sensor side). Is the value within specified value?	1 — 2Ω	Go to Step5	Go to Step6
4	1. Disconnect the FL wheel speed sensor connector. 2. Measure the resistance between the J-75 connector terminal 1 (sensor side) and the ground. Is the value within specified value?	1000kΩ or more	Go to Step5	Go to Step6
5	Repair the circuit for open/short circuit between the control unit connector and the sensor connector. Is this step completed?	—	Go to Step8	—
6	Replace the FL wheel speed sensor. Is this step completed?	—	Go to Step8	—
7	Replace the control unit. Is this step completed?	—	Go to Step8	—
8	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step8

DTC:C0252 (Flash Code 52) Speed Sensor Open/Short Circuit; FR

Check flow B-14

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Measure the resistance between the J-177 connector terminals 10 and 11. Is the value within specified value?	1 — 2kΩ	Go to Step2	Go to Step3
2	Measure the resistance between the J-177 connector terminals 10 and the ground. Is the value within specified value?	1000kΩ or more	Go to Step7	Go to Step4
3	1. Disconnect the FR wheel speed sensor connector. 2. Measure the resistance between the J-74 connector terminals 1 and 2 (sensor side). Is the value within specified value?	1 — 2kΩ	Go to Step5	Go to Step6
4	1. Disconnect the FR wheel speed sensor connector. 2. Measure the resistance between the J-74 connector terminal 1 (sensor side) and the ground. Is the value within specified value?	1000kΩ or more	Go to Step5	Go to Step6
5	Repair the circuit for open/short circuit between the control unit connector and the sensor connector. Is this step completed?	—	Go to Step8	—
6	Replace the FR control unit. Is this step completed?	—	Go to Step8	—
7	Replace the control unit. Is this step completed?	—	Go to Step8	—
8	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step8

DTC:C0253 (Flash Code 53) Speed Sensor Open/Short Circuit; RL

Check flow B-15

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU and the RL wheel speed sensor connector J-149. 3. Check for continuity between the J-177 connector terminal 34 and the J-149 sensor connector terminal 2. Is there continuity?	—	Go to Step2	Go to Step7
2	Check for continuity between the J-177 connector terminals 34 and 1. Is there continuity?	—	Go to Step7	Go to Step3
3	Check for continuity between the J-177 connector terminal 22 and the J-149 sensor connector terminal 1. Is there continuity?	—	Go to Step4	Go to Step7
4	Check for continuity between the J-177 connector terminals 22 and 1. Is there continuity?	—	Go to Step7	Go to Step5
5	1. Connect the connector of the EHCU. 2. Turn the starter switch ON. 3. Measure the voltage between the J-149 sensor connector terminal 1 and the ground. Is the value within specified value?	9 — 16V	Go to Step6	Go to Step7
6	Check the RL wheel speed sensor output. (Refer to the check flow C-1-3.) Is the fail corrected?	—	Go to Step9	Go to Step8
7	Repair the circuit for open/short circuit, and the connector for improper connection between the connector of EHCU and the speed sensor connector. Is this step completed?	—	Go to Step9	Go to Step7
8	Replace the control unit. Is this step completed?	—	Go to Step9	Go to Step8
9	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step9

DTC:C0254 (Flash Code 54) Speed Sensor Open/Short Circuit; RR

Check flow B-16

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the connector of EHCU and the RR wheel speed sensor connector J-148. 3. Check for continuity between the J-177 connector terminal 12 and the J-148 sensor connector terminal 2. Is there continuity?	—	Go to Step2	Go to Step7
2	Check for continuity between the J-177 connector terminals 12 and 1. Is there continuity?	—	Go to Step7	Go to Step3
3	Check for continuity between the J-177 connector terminal 21 and the J-148 sensor connector terminal 1. Is there continuity?	—	Go to Step4	Go to Step7
4	Check for continuity between the J-177 connector terminals 21 and 1. Is there continuity?	—	Go to Step7	Go to Step5
5	1. Connect the connector of the EHCU. 2. Turn the starter switch ON. 3. Measure the voltage between the J-148 sensor connector terminal 1 and the ground. Is the value within specified value?	9 — 16V	Go to Step6	Go to Step7
6	Check the RR wheel speed sensor output. (Refer to the check flow C-1-4.) Is the fail corrected?	—	Go to Step8	Go to Step8
7	Repair the circuit for open/short circuit, and the connector for improper connection between the connector of EHCU and the speed sensor connector. Is this step completed?	—	Go to Step9	Go to Step7
8	Replace the control unit. Is this step completed?	—	Go to Step9	Go to Step8
9	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step9

DTC:C0261 (Flash Code 61) Speed Sensor Signal Fault/Wrong Tire Size; FL

Check flow B-17

Step	Action	Value	YES	NO
1	Check the tire. Is the tire specification correct? Is abnormal wear found in the outer surface?	—	Go to Step2	Replace with the specified tire without wear.Go to Step21
2	Has certain tire been rotated alone by perfuming for jack-up or roller tester?	—	DTC may be set if certain tire is rotated alone. Go to Step21	Go to Step3
3	Is the FL wheel bearing rattling?	—	Go to Step12	Go to Step4
4	Is the FL wheel speed sensor/sensor rotor rattling?	—	Go to Step13	Go to Step5
5	Is iron powder attached to the FL wheel speed sensor/sensor rotor?	—	Go to Step14	Go to Step6
6	Check the FL wheel speed sensor. (Refer to the check flow C-1-1 or TC-1.) Is the FL sensor output normal?	—	Go to Step7	Go to Step10
7	Does the sensor rotor have missing tooth or saw-toothed?	—	Go to Step15	Go to Step8
8	Measure the resistance between the B-177 connector terminals 33 and the ground. Is the value within specified value?	1000kΩ or more	Go to Step9	Go to Step11
9	1. Clear the DTC. 2. Test run the vehicle, and perform the self-diagnosis. Is DTC displayed repeatedly?	—	Go to Step20	Go to Step18
10	Is the speed sensor damaged or saw-toothed?	—	Go to Step16	Go to Step17
11	1. Disconnect the FL sensor connector. 2. Measure the resistance between the J-75 connector terminal 2 (sensor side) and the ground. Is the value within specified value?	1000kΩ or more	Go to Step19	Go to Step16
12	Adjust the preload of the wheel bearing. Is this step completed?	—	Go to Step21	—
13	Repair or replace the speed sensor/sensor rotor. Is this step completed?	—	Go to Step21	—
14	Repair the speed sensor/sensor rotor. Is this step completed?	—	Go to Step21	—
15	Replace the sensor rotor. Is this step completed?	—	Go to Step21	—
16	Replace the FL wheel speed sensor. Is this step completed?	—	Go to Step21	—

Step	Action	Value	YES	NO
17	Check the FL wheel speed sensor circuit. (Refer to the check flow B-13.) Is this step completed?	—	Check the repair.	—
18	Check the circuit for open circuit, and the connector for improper connection between the EHCU and the speed sensor connector. Refer to “Intermittent trouble”. Is this step completed?	—	Go to Step21	—
19	Repair the circuit for open/short circuit, and the connector for improper connection between the EHCU connector and the speed sensor connector. Is this step completed?	—	Go to Step21	Go to Step21
20	Replace the EHCU. Is this step completed?	—	Go to Step21	—
21	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step21

DTC:C0262 (Flash Code 62) Speed Sensor Signal Fault/Wrong Tire Size; FR

Check flow B-18

Step	Action	Value	YES	NO
1	Check the tire. Is the tire specification correct? Is abnormal wear found in the outer surface?	—	Go to Step2	Replace with the specified tire without wear.Go to Step21
2	Has certain tire been rotated alone by perfuming for jack-up or roller tester?	—	DTC may be set if certain tire is rotated alone. Go to Step21	Go to Step3
3	Is the FR wheel bearing rattling?	—	Go to Step12	Go to Step4
4	Is the FR wheel speed sensor/sensor rotor rattling?	—	Go to Step13	Go to Step5
5	Is iron powder attached to the FR wheel speed sensor/sensor rotor?	—	Go to Step14	Go to Step6
6	Check the FR wheel speed sensor. (Refer to the check flow C-1-2 or TC-1.) Is the FR sensor output normal?	—	Go to Step7	Go to Step10
7	Does the sensor rotor have missing tooth or saw-toothed?	—	Go to Step15	Go to Step8
8	Measure the resistance between the B-177 connector terminal 11 and the ground. Is the value within specified value?	1000kΩ or more	Go to Step9	Go to Step11
9	1. Clear the DTC. 2. Test run the vehicle, and perform the self-diagnosis. Is DTC displayed repeatedly?	—	Go to Step20	Go to Step18
10	Is the speed sensor damaged or saw-toothed?	—	Go to Step16	Go to Step17
11	1. Disconnect the FR sensor connector. 2. Measure the resistance between the J-74 connector terminal 2 (sensor side) and the ground. Is the value within specified value?	1000kΩ or more	Go to Step19	Go to Step16
12	Adjust the preload of the wheel bearing. Is this step completed?	—	Go to Step21	—
13	Repair or replace the speed sensor/sensor rotor. Is this step completed?	—	Go to Step21	—
14	Repair the speed sensor/sensor rotor. Is this step completed?	—	Go to Step21	—
15	Replace the sensor rotor. Is this step completed?	—	Go to Step21	—
16	Replace the FR wheel speed sensor. Is this step completed?	—	Go to Step21	—

Step	Action	Value	YES	NO
17	Check the FR wheel speed sensor circuit. (Refer to the check flow B-14.) Is this step completed?	—	Check the repair.	—
18	Check the circuit for open circuit, and the connector for improper connection between the EHCU and the speed sensor connector. Refer to “Intermittent trouble”. Is this step completed?	—	Go to Step21	—
19	Repair the circuit for open/short circuit, and the connector for improper connection between the EHCU connector and the speed sensor connector. Is this step completed?	—	Go to Step21	Go to Step21
20	Replace the EHCU. Is this step completed?	—	Go to Step21	—
21	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step21

DTC:C0263 (Flash Code 63) Speed Sensor Signal Fault/Wrong Tire Size; RL

Check flow B-19

Step	Action	Value	YES	NO
1	Check the tire. Is the tire specification correct? Is abnormal wear found in the outer surface?	—	Go to Step2	Replace with the specified tire without wear.Go to Step18
2	Has certain tire been rotated alone by perfuming for jack-up or roller tester?	—	DTC may be set if certain tire is rotated alone. Go to Step18	Go to Step3
3	Is the FL wheel bearing rattling?	—	Go to Step10	Go to Step4
4	Is the FL wheel speed sensor/sensor rotor rattling?	—	Go to Step11	Go to Step5
5	Is iron powder attached to the FL wheel speed sensor/sensor rotor?	—	Go to Step12	Go to Step6
6	Check the RL wheel speed sensor. (Refer to the check flow C-1-3.) Is the RL sensor output normal?	—	Go to Step7	Go to Step9
7	Does the sensor rotor have missing tooth or saw-toothed?	—	Go to Step13	Go to Step8
8	1. Clear the DTC. 2. Test run the vehicle, and perform the self-diagnosis. Is DTC displayed repeatedly?	—	Go to Step17	Go to Step16
9	Is the speed sensor damaged or saw-toothed?	—	Go to Step14	Go to Step15
10	Adjust the preload of the wheel bearing. Is this step completed?	—	Go to Step18	—
11	Repair or replace the speed sensor/sensor rotor. Is this step completed?	—	Go to Step18	—
12	Repair the speed sensor/sensor rotor. Is this step completed?	—	Go to Step18	—
13	Replace the sensor rotor. Is this step completed?	—	Go to Step18	—
14	Replace the RL wheel speed sensor. Is this step completed?	—	Go to Step18	—
15	Check the RL wheel speed sensor circuit. (Refer to the check flow B-15.) Is this step completed?	—	Check the repair.	—
16	Check the circuit for open circuit, and the connector for improper connection the EHCU connector and the speed sensor connector. Refer to “Intermittent trouble”. Is this step completed?	—	Go to Step18	—

Step	Action	Value	YES	NO
17	Replace the EHCU. Is this step completed?	—	Go to Step18	—
18	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step18

DTC:C0264 (Flash Code 64) Speed Sensor Signal Fault/Wrong Tire Size; RR

Check flow B-20

Step	Action	Value	YES	NO
1	Check the tire. Is the tire specification correct? Is abnormal wear found in the outer surface?	—	Go to Step2	Replace with the specified tire without wear.Go to Step18
2	Has certain tire been rotated alone by perfuming for jack-up or roller tester?		DTC may be set if certain tire is rotated alone. Go to Step18	Go to Step3
3	Is the RR wheel bearing rattling?	—	Go to Step10	Go to Step4
4	Is the RR wheel speed sensor/sensor rotor rattling?	—	Go to Step11	Go to Step5
5	Is iron powder attached to the RR wheel speed sensor/sensor rotor?	—	Go to Step12	Go to Step6
6	Check the RR wheel speed sensor. (Refer to the check flow C-1-4.) Is the RR sensor output normal?	—	Go to Step7	Go to Step9
7	Does the sensor rotor have missing tooth or saw-toothed?	—	Go to Step13	Go to Step8
8	1. Clear the DTC. 2. Test run the vehicle, and perform the self-diagnosis. Is DTC displayed repeatedly?	—	Go to Step17	Go to Step16
9	Is the speed sensor damaged or saw-toothed?	—	Go to Step14	Go to Step15
10	Adjust the preload of the wheel bearing. Is this step completed?	—	Go to Step18	—
11	Repair or replace the speed sensor/sensor rotor. Is this step completed?	—	Go to Step18	—
12	Repair the speed sensor/sensor rotor. Is this step completed?	—	Go to Step18	—
13	Replace the sensor rotor. Is this step completed?	—	Go to Step18	—
14	Replace the RR wheel speed sensor. Is this step completed?	—	Go to Step18	—
15	Check the RR wheel speed sensor circuit. (Refer to the check flow B-16.) Is this step completed?	—	Check the repair.	—
16	Check the circuit for open circuit, and the connector for improper connection the EHCU connector and the speed sensor connector. Refer to “Intermittent trouble”. Is this step completed?	—	Go to Step18	—

Step	Action	Value	YES	NO
17	Replace the EHCU. Is this step completed?	—	Go to Step18	—
18	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step18

List of Trouble Symptom

Troubles not appeared as warning lamp indication can be classified into the following five categories.

1. The ABS operates frequently but brake force is insufficient, or the ASR operates frequently.
2. The ABS operates but pulling to one side.
3. Wheels are locked during brake operation.
4. Feeling of brake pedal is faulty.
5. Brake operating noise comes from the EHCU though the brake pedal is not depressed.

Self-diagnosis function is unable to detect these symptoms.

Check the trouble symptom by reproducing the condition through interviewing customer with the test run, and perform the diagnosis according to each trouble symptom.

No.	Trouble symptom	Diagnostic check flow	
		Without Tech 2	With Tech 2
1	The ABS operates frequently but brake force is insufficient, or the ASR operates frequently.	Check flow A-1	Check flow TA-1
2	The ABS operates but pulling to one side.	Check flow A-2	Check flow TA-2
3	Wheels are locked during brake operation.	Check flow A-3	Check flow TA-3
4	Feeling of brake pedal is faulty.	Check flow A-4	—
5	Brake operating noise comes from the hydraulic unit though the brake pedal is not depressed.	Check flow A-5	Check flow TA-5

Symptom: [The ABS Operates Frequently but Brake Force is Insufficient, or the ASR Operates Frequently.] (Check Flow A-1)

Check flow A-1

Step	Action	Value	YES	NO
1	Check the tire. Is the tire specification correct? Is abnormal wear found in the outer surface?	—	Go to Step2	Replace with the specified tire without wear.Go to Step7
2	Is the brake balance between front and rear wheels correct?	—	Go to Step3	Repair the brake components.Go to Step7
3	Are the axle-related parts correctly assembled?	—	Go to Step4	Repair the parts.Go to Step7
4	Is the speed sensor installation normal?	—	Go to Step5	Repair the wheel speed sensor.Go to Step7
5	Is the speed sensor/sensor rotor damaged? Or iron powder attached?	—	Go to Step6	Replace the sensor or sensor rotor. Go to Step7
6	Are all the wheel speed sensor outputs normal?	—	Replace the control unit.Go to Step7	Replace the wheel speed sensor, or repair the circuit. Go to Step7
7	Install all the components, and check that those are installed properly. Is this step completed?	—	Repeat “Diagnostic basic flow”.	Go to Step7

Symptom: [The ABS Operates Frequently but Brake Force is Insufficient, or the ASR Operates Frequently.] (Check Flow TA-1)

Check flow TA-1

Step	Action	Value	YES	NO
1	1. Connect the Tech 2. 2. Check each sensor output from the “Wheel sensor”. Is the lowest value of each wheel sensor reading 4 km/h (2 mph) or less? And is the value stable?	—	Go to Step2	Replace the wheel speed sensor.Go to Step3
2	Go back to the check flow A-1. Is the check flow A-1 completed?	—	Go to Step3	Go to Step2
3	Assemble all the components, and check that those are installed properly. Is this step completed?	—	Repeat “Diagnostic basic flow”.	Go to Step3

CAUTION:
On the vehicle that the rear tires have smaller diameter, the rear wheel speed may be indicated a little higher than the front wheel speed. Check the speed after driving a while at a constant speed.

Symptom: [The ABS Operates but Pulling to One Side.] (Check Flow A-2)

Check flow A-2

Step	Action	Value	YES	NO
1	Is the speed sensor installation normal?	—	Go to Step2	Repair.Go to Step5
2	Is the wheel speed sensor/sensor rotor damaged? Or iron powder attached?	—	Go to Step3	Repair or replace it.Go to Step5
3	Are the wheel speed sensor outputs normal? (Refer to the check flow C-1 or TC-1)	—	Go to Step4	Replace the sensor or repair the circuit. Go to Step5
4	Is the brake pipe connection correct?	—	Replace the control unit.Go to Step5	Correct the connection.Go to Step5
5	Assemble all the components, and check that those are installed properly. Is this step completed?	—	Repeat “Diagnostic basic flow”.	Go to Step5

Symptom: [The ABS Operates but Pulling to One Side.] (Check Flow TA-2)

Check flow TA-2

Step	Action	Value	YES	NO
1	1. Connect the Tech 2. 2. Check each wheel speed sensor output. Is each sensor output normal?	—	Go to Step2	Go to Step3
2	Check the brake pipe. Is the pipe normal?	—	Replace the EHCU.Go to Step4	Repair the pipe.Go to Step4
3	Repair and check the wheel speed sensor. (Refer to the check flow C-1 or TC-1.) Is this step completed?	—	Go to Step4	Go to Step3
4	Assemble all the components, and check that those are installed properly. Is this step completed?	—	Repeat “Diagnostic basic flow”.	Go to Step4

CAUTION:
On the vehicle that the rear tires have smaller diameter, the rear wheel speed may be indicated a little higher than the front wheel speed. Check the speed after driving a while at a constant speed.

Symptom: [Wheels are Locked During Brake Operation.] (Check Flow A-3, TA-3)

Check flow A-3, TA-3

Step	Action	Value	YES	NO
1	Does the ABS operate?	—	Go to Step2	Go to Step4
2	Is the vehicle speed 10km/h (6 mph) or less?	—	Go to Step3	Normal
3	Are the wheel speed sensor outputs normal? (Refer to the check flow C-1 or TC-1)	—	Go to Step4	Replace the sensor or repair the circuit. Go to Step5
4	Is the EHCU grounded properly?	—	Replace the EHCU.Go to Step5	Repair.Go to Step5
5	Assemble all the components, and check that those are installed properly. Is this step completed?	—	Repeat “Diagnostic basic flow”.	Go to Step5

Symptom: [Feeling of Brake Pedal is Faulty.] (Check Flow A-4)

Check flow A-4

Step	Action	Value	YES	NO
1	Does the stop lamp come on when depressing the brake pedal?	—	Go to Step2	Go to Step3
2	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Measure the voltage between the J-177 connector terminal 16 and the J-177 connector terminal 1,23 with the brake pedal depressed. Is the power supply voltage supplied to it?	—	Go to Step4	Repair the circuit between the stop lamp switch and the control unit.Go to Step7
3	Is the stop lamp fuse F-5 normal?	—	Go to Step5	Replace the fuse.Go to Step7
4	Check for continuity between the J-177 connector terminal 1,23 and the body ground. Is there continuity?	—	Go to Step6	Repair the body ground circuit.Go to Step7
5	Is the stop lamp switch normal?	—	Repair the stop lamp circuit.Go to Step7	Replace the stop lamp switch.Go to Step7
6	Check the suspicious circuit/connector for improper connection. Is there improper connection?	—	Brake fluid line is leaked or air mixed. (Refer to Section 5A.)Go to Step7	Repair the circuit.Go to Step7
7	Assemble all the components, and check that those are assembled properly. Is this step completed?	—	Repeat “Diagnostic basic flow”.	Go to Step7

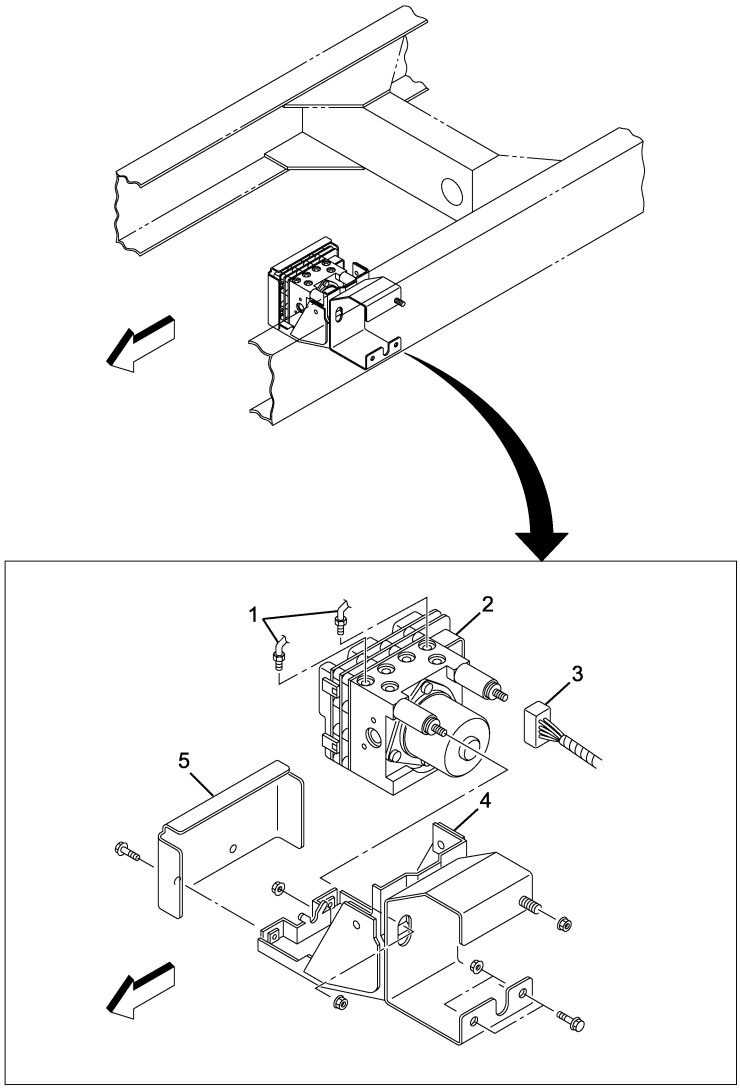
Symptom: [Brake Operating Noise Comes from the Hydraulic Unit Though the Brake Pedal is not Depressed.] (Check Flow A-5, TA-5)

Check flow A-5, TA-5

Step	Action	Value	YES	NO
1	Is this the first time operation since the engine is started?	—	Normal (It is a motor check operation noise of self-diagnosis function.)	Go to Step2
2	Is the vehicle speed 10km/h (6 mph) or less?	—	Normal (It is a motor check operation noise of self-diagnosis function.)	Go to Step3
3	Check for noise in the following conditions: • When shifting down, or when operating the clutch • When driving a slippery low-temperature road (iced or snow-covered), or when driving a rough road • While turning with high speed • When driving over a bump (such as curbstone) • When operating electrical switches • When running the engine high speed Is noise generated in any of the above conditions?	—	Normal (ABS may operate without depressing the brake pedal.)	Go to Step4
4	Do all the speed sensor/sensor rotor operate normally?	—	Go to Step5	Repair.Go to Step7
5	Is the wheel speed sensor/sensor rotor damaged? Or iron powder attached?	—	Go to Step7	Repair or replace it.Go to Step6
6	Are all the sensor outputs normal? (Refer to the check flow C-1 or TC-1)	—	Check the suspicious circuit/connector for improper connection. If the connection is normal, replace the EHCU.Go to Step7	Repair.Go to Step7
7	Assemble all the components, and check that those are installed properly. Is this step completed?	—	Repeat “Diagnostic basic flow”.	Go to Step7

Electronic Hydraulic Control Unit (EHCU)

Components



N5A2039E

Legend

1. Pipe
2. EHCU
3. Connector
4. Bracket
5. Cover

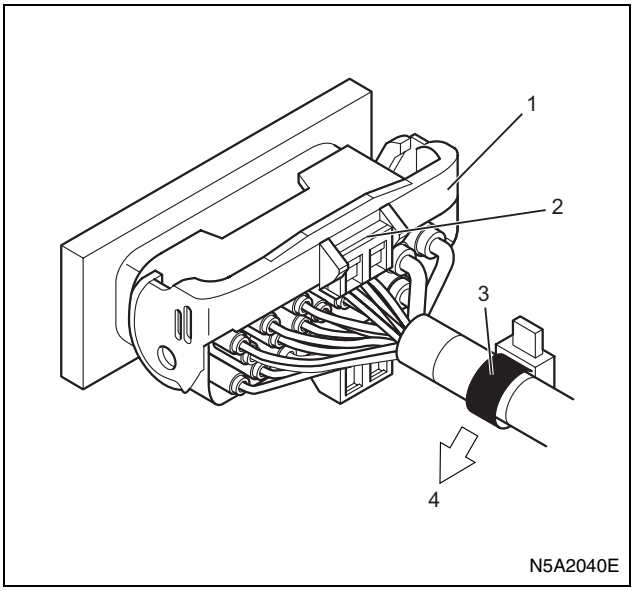
Removal

CAUTION:

- When performing electric-arc welding on the vehicle, remove the EHCU before starting welding work.
- When removing the EHCU from the vehicle, disconnect the battery cable first, and then disconnect the connector. Connect in the reverse order of disconnection.
- Do not place intense radio emission equipment such as radio device near the EHCU.
- Do not pour water to the EHCU directly.
- Never loosen the screw of the EHCU body. Nor apply paint to the EHCU body.
- Do not let metal products directly contact with the connector pin terminals, including screwdriver and or tester probe.
- Use special care for electrostatic.
- Do not directly apply external voltage to the terminals.

- When handling, do not hold the pipe of the upper EHCU.
- Never loosen the bolts and nuts of the EHCU body. If loosened, that EHCU must not be used anymore.

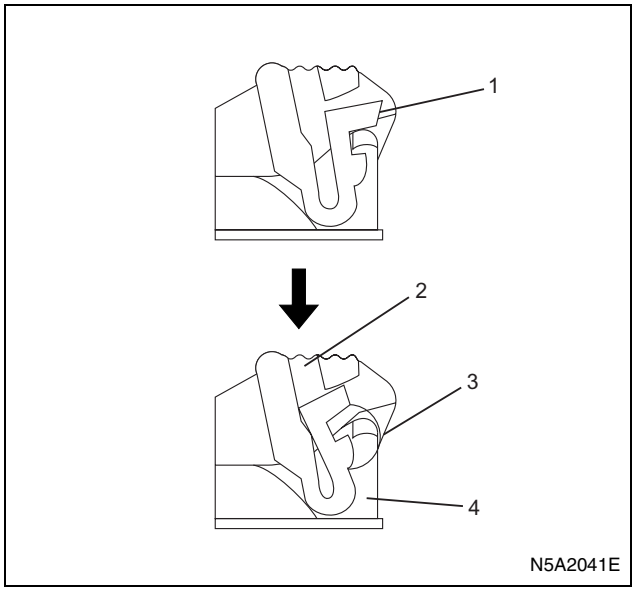
1. Cover
   - Remove the cover.
2. Harness connector
   - If the harness is fixed to the EHCU bracket, loosen the fixing clip.



Legend
1. Lever
2. Lever lock
3. Clip
4. Fixed to EHCU bracket.

- Unlock the connector. Pull down the lever lock to the unlock position.

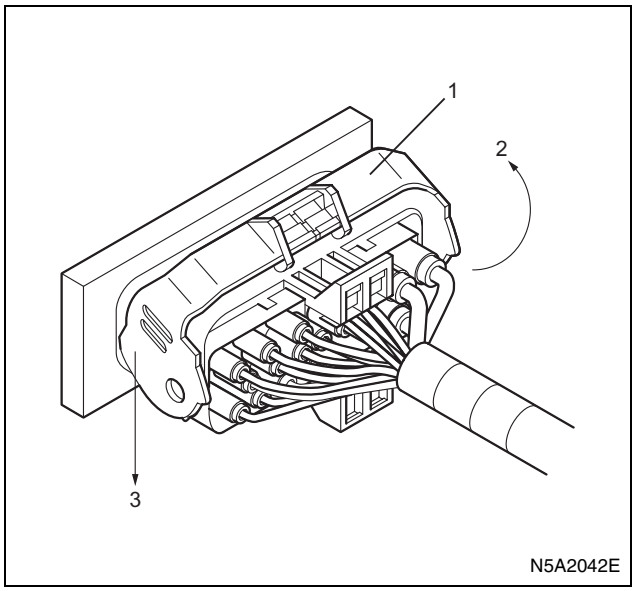
Notice:
Make sure the lock portion (A portion) is in the unlock position.



Legend
1. Lever lock
2. Lever
3. Lock portion (A portion)
4. Housing

- Operate the lever.

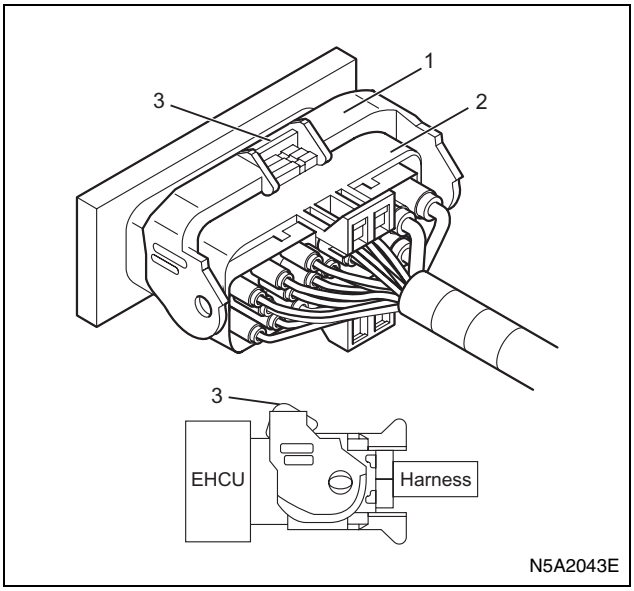
Notice:
Operate the lever till the lever becomes heavy. Then change the force direction to the downward of the connector. (See illustration.) Applying force to the EHCU-side may damage the connector.



Legend
1. Lever
2. Lever operation (rotation direction)
3. Force applied direction when operating lever

- Move the connector to the opposite side of the EHCU to remove.

Notice:
With the lever in stop position, make sure that the lever surface (lock portion side) is almost perpendicular to the connector before removing the connector.



Legend
1. Lever
2. Connector
3. Lever lock

3. Brake pipe
   - Disconnect the six brake pipes.
4. EHCU fixing nut
   - Disconnect the three nuts fixing the EHCU.
5. EHCU
   - Remove the EHCU.
6. Bracket
   - Remove the bracket.

Installation

CAUTION:
- Be sure to use ground bolt to install the ground.
- Make sure there is no dust or foreign materials in and around the pipe connection.
- Be careful that the pipe is connect to correctly.
- After EHCU installation, bleed air from the brake system completely. Remove the fuse (FL-9 (40A)) of ABS to deactivate the ABS before air bleeding operation.
- Be sure to use fresh specified brake fluid.

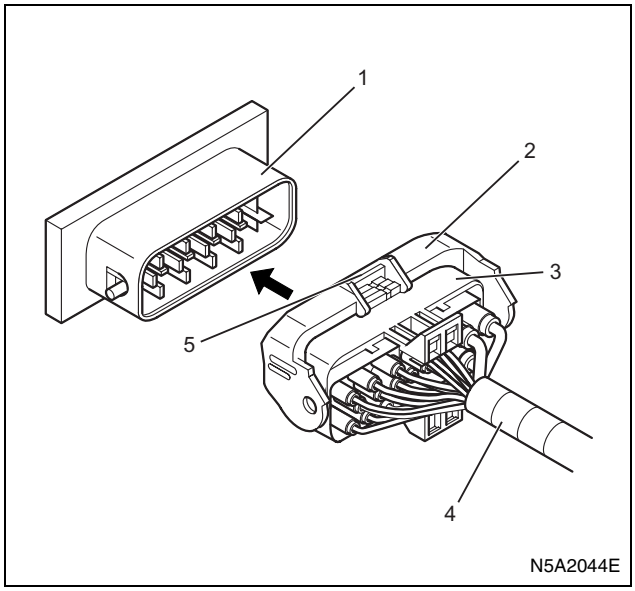
1. Bracket
   - Install the bracket to the frame if it has been removed.
2. EHCU
   - Install the EHCU to the bracket.
3. EHCU fixing nut
   - Install the EHCU fixing nuts.

Tighten:
Nut to 22 N·m (2.2 kg·m / 16.2 lb·ft)

4. Brake pipe
   - Install the brake pipe.

Tighten:
Brake pipe to 16 N·m (1.6 kg·m / 11.8 lb·ft)

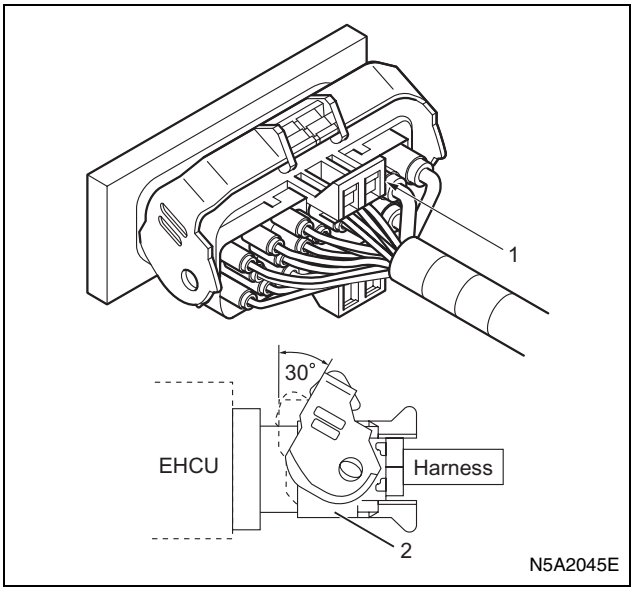
5. Harness connector
   - Align the harness-side connector with the EHCU-side connector.



Legend
1. EHCU-side connector
2. Lever
3. Housing
4. Harness
5. Lever lock

   - Insert the harness-side connector to the EHCU-side connector.

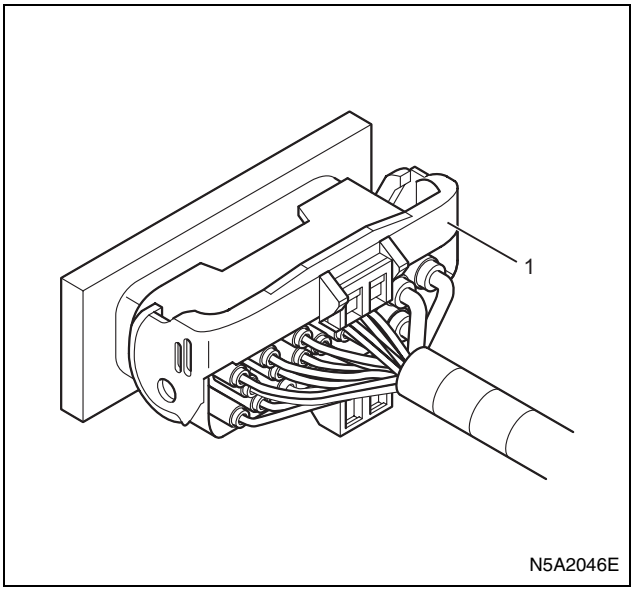
Notice:
The lever moves approx. 30° when the connector is inserted.



Legend

1. Pushing direction
2. Harness-side connector

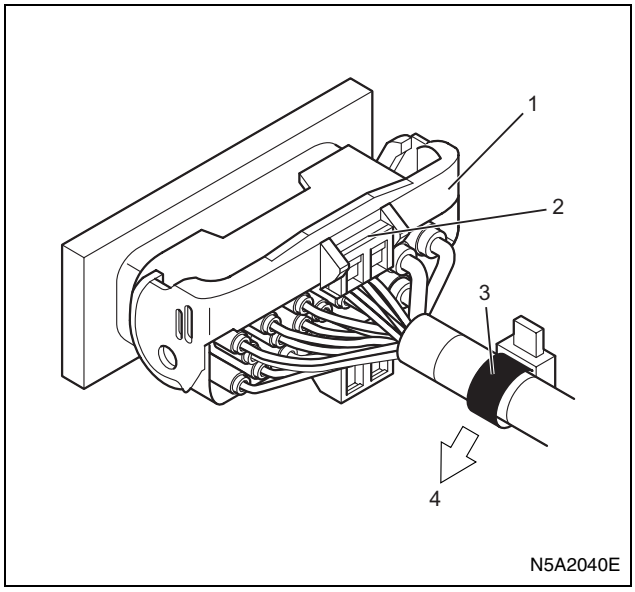
- Operate the lever to lock the lever lock to the housing.



Legend

1. Lever

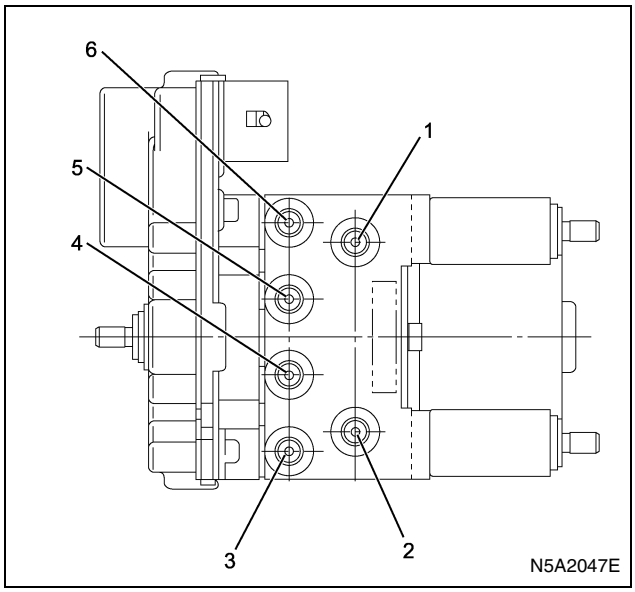
- If the harness was fixed to the EHCU bracket, fix the harness with the fixing clip.



Legend

1. Lever
2. Lever lock
3. Clip
4. Fixed to EHCU bracket.

6. Cover
   - Install the cover.

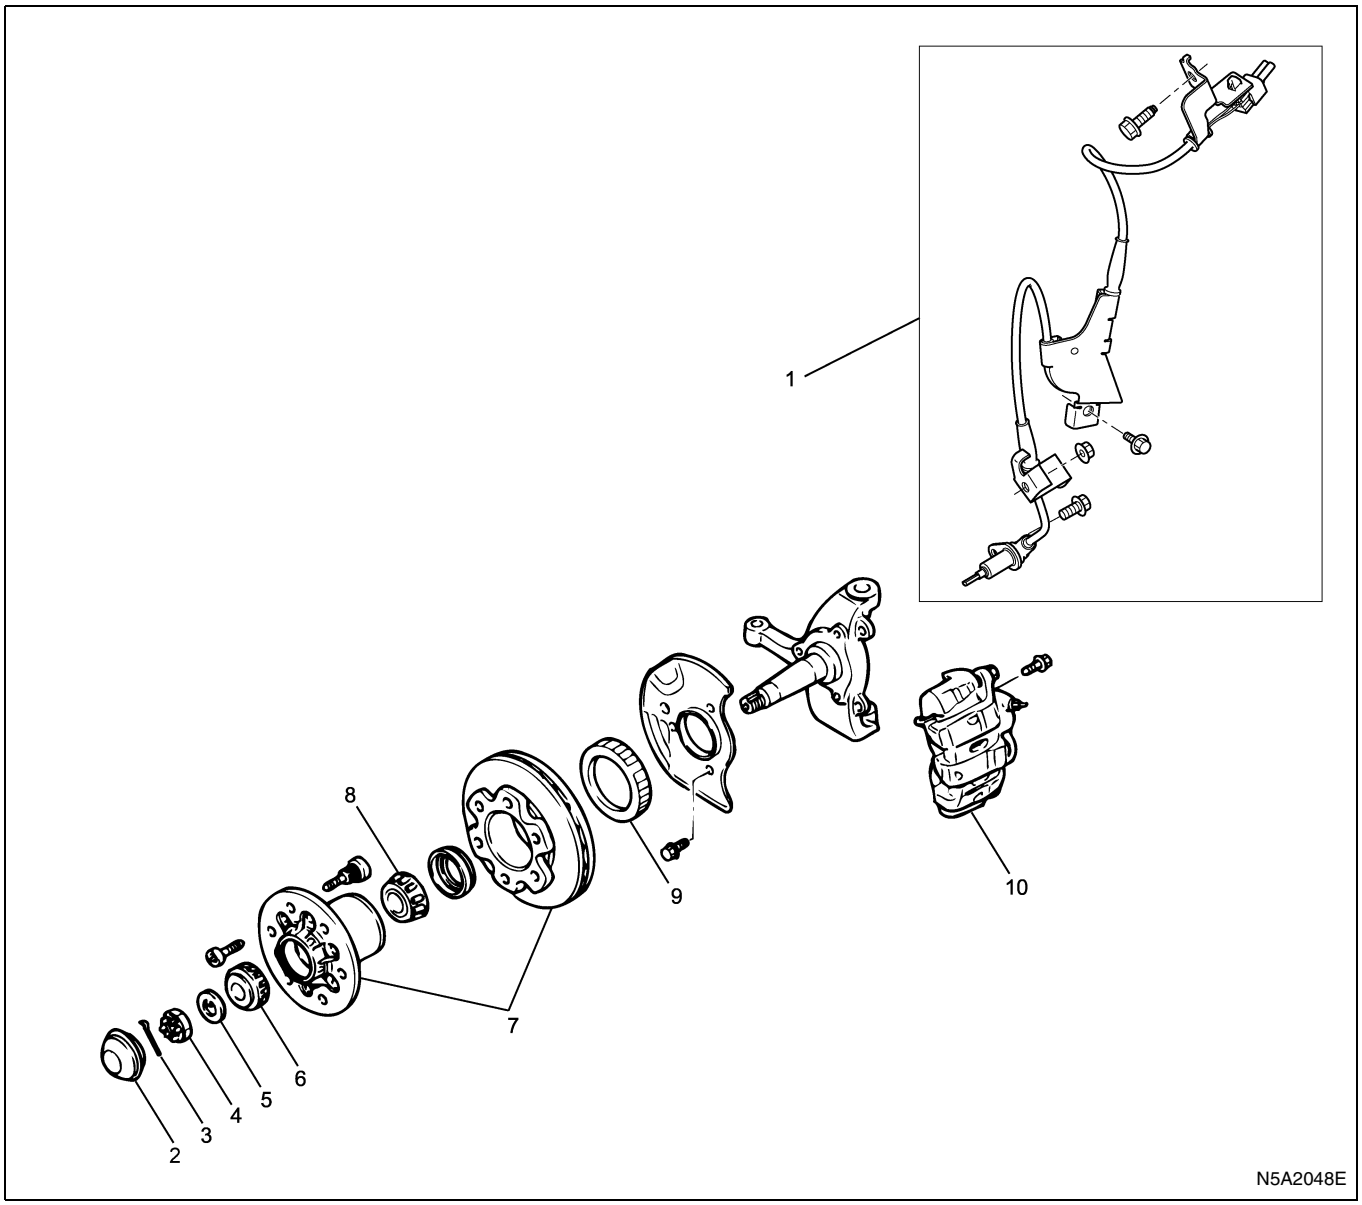


Legend

1. Master cylinder (front wheel)
2. Master cylinder (rear wheel)
3. RR wheel master cylinder
4. RL wheel master cylinder
5. FR wheel master cylinder
6. FL wheel master cylinder

Speed Sensor (Front)

Components



Legend

1. Speed sensor (model with rigid suspension)
2. Hub cap
3. Cotter pin
4. Hub nut
5. Thrust washer
6. Outer bearing
7. Hub & rotor assembly
8. Inner bearing
9. Sensor rotor
10. Disc caliper assembly

Removal

1. Harness connector
   - Disconnect the harness connector.
2. Harness fixing bolt
   - Remove the harness fixing bolt.
3. Sensor fixing bolt
   - Remove the sensor fixing bolt.
4. Speed sensor (front)

Installation

CAUTION:

- Do not let the speed sensor body contact with the sensor rotor during hub assembly. Otherwise the parts will be damaged.
- The speed sensor body has a built-in magnet. Be careful not to allow metallic materials attached to it.

- Remove the speed sensor before removing the hub & rotor assembly or the hub & drum assembly.
- Remove the speed sensor before hammering to remove the knuckle etc.
- Use the harness line as a reference to avoid the harness from twisting, when installing the sensor harness.
- To install the sensor, press-fit the sensor until the sensor flange contacts closely with the installing surface by your hand, and then tighten with the bolt.

1. Speed sensor (front)
   - Install the speed sensor.
2. Sensor fixing bolt
   - Install the sensor fixing bolt.

Tighten:
Bolt to 22 N·m (2.2 kg·m / 16.2 lb·ft)

3. Harness fixing bolt
   - Install the harness fixing bolt.

   Frame side

Tighten:
Bolt to 22 N·m (2.2 kg·m / 16.2 lb·ft)

Tighten together with the dust cover
(model with dram brake)

Tighten:
Bolt to 15 N·m (1.5 kg·m / 11.1 lb·ft)

Tighten together with the brake support
(model with rigid disc brake)

Tighten:
Bolt to 45 N·m (4.6 kg·m / 33.2 lb·ft)

4. Harness connector
   - Connect the harness connector.

Inspection

This section explores inspection procedures as the reference to perform “Diagnostics with symptom” and “Diagnosis with illumination pattern”.

	Without Tech 2	With Tech 2
Speed sensor output check	Check flow C-1-1 — C-1-4	Check flow TC-1

FL Wheel Speed Sensor Output Check Procedure
Check flow C-1-1

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the EHCU connector. 3. Jack-up the vehicle to lift the front wheels off the floor. 4. Measure the AC voltage between the J-177 connector terminals 32 and 33 while turning the FL wheel half turn/sec. Is the value within specified value?	200mV or more	Go to Step5	Go to Step2
2	1. Disconnect the FL sensor connector J-75. 2. Measure the resistance between the J-75 connector terminals 1 and 2 (sensor side). Is the value within specified value?	1 — 2kΩ	Go to Step4	Go to Step3
3	Replace the FL sensor. Is this step completed?	—	Go to Step5	—
4	Repair the circuit for open/short circuit, and the connector for improper connection between the connector of EHCU and the sensor connector. Is this step completed?	—	Go to Step5	—

Step	Action	Value	YES	NO
5	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step5

FR Wheel Speed Sensor Output Check Procedure
Check flow C-1-2

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the EHCU connector. 3. Jack-up the vehicle to lift the front wheels off the floor. 4. Measure the AC voltage between the J177 connector terminals 10 and 11 while turning the FR wheel half turn/sec. Is the value within specified value?	200mV or more	Go to Step5	Go to Step2
2	1. Disconnect the FR sensor connector J-74. 2. Measure the resistance between the J-74 connector terminals 1 and 2 (sensor side). Is the value within specified value?	1 — 2kΩ	Go to Step4	Go to Step3
3	Replace the FR sensor. Is this step completed?	—	Go to Step5	—
4	Repair the circuit for open/short circuit, and the connector for improper connection between the connector of EHCU and the sensor connector. Is this step completed?	—	Go to Step5	—
5	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step5

Speed Sensor Output Check Procedure (With Tech 2)
Check flow TC-1

Step	Action	Value	YES	NO
1	1. Connect the Tech 2. 2. Check each sensor lowest speed from the “Wheel sensor”. Is the sensor speed 4km/h (2mph) or more?	—	Go to Step2	Go to Step6
2	Check the suspicious sensor circuit for open circuit. (Check with shaking the wire and the connector.) Is the sensor circuit connection normal?	—	Replace the speed sensor.Go to Step3	Repair.Go to Step3

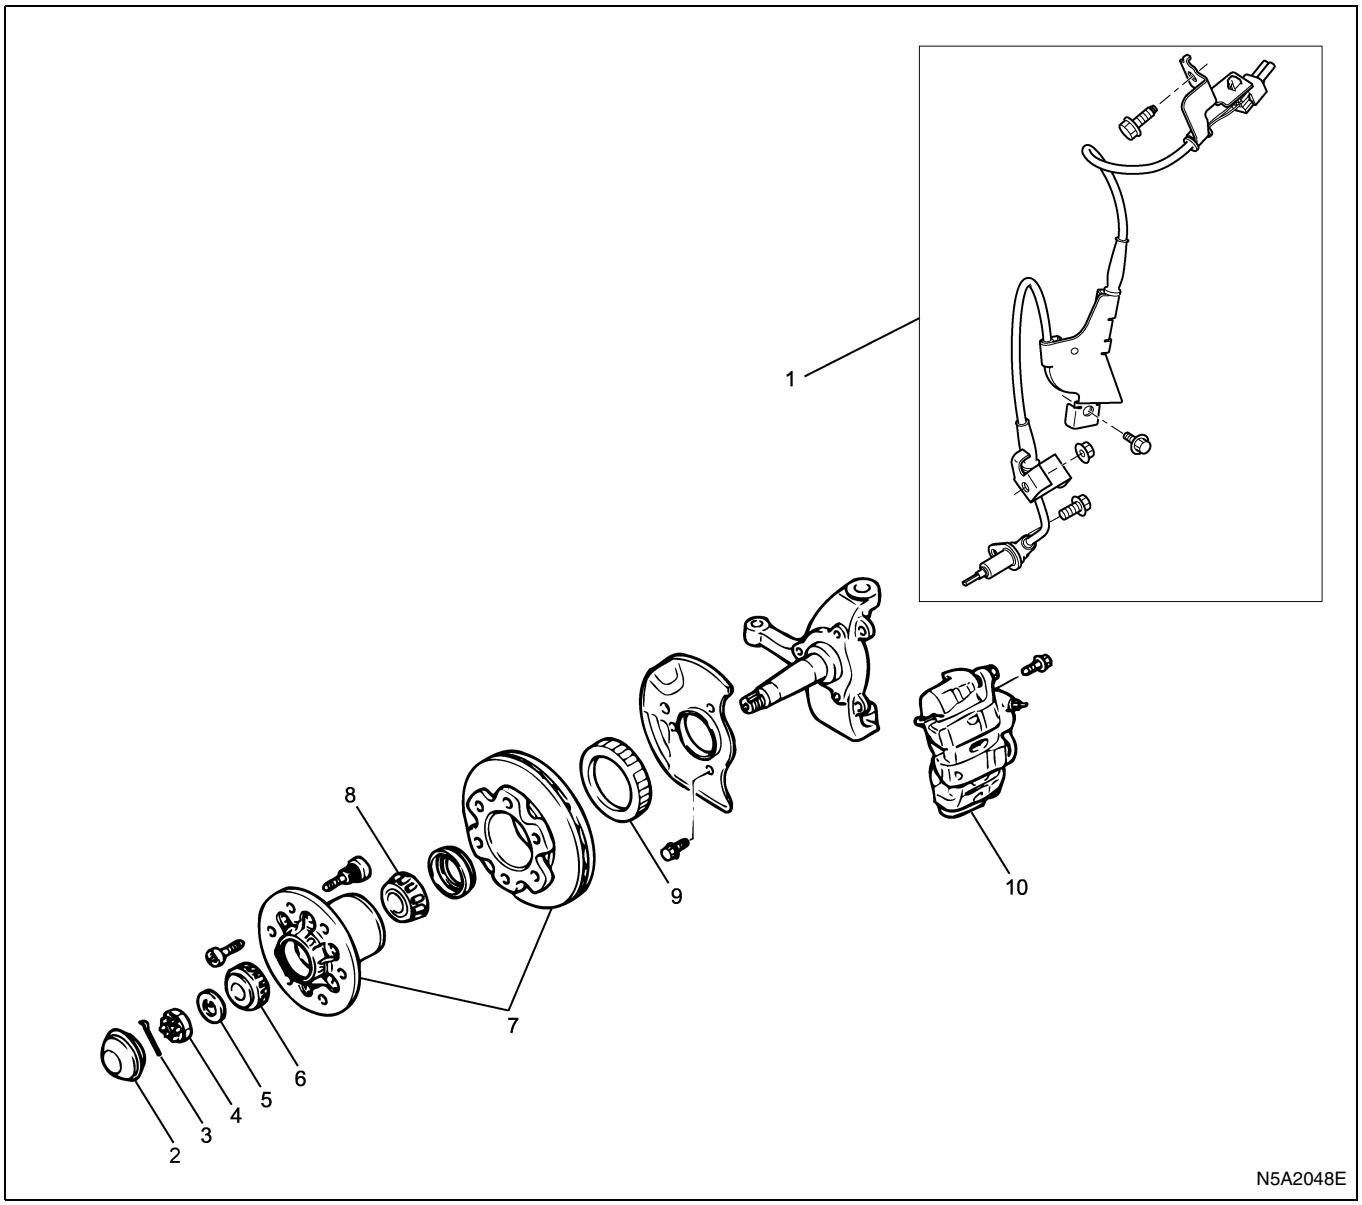
Step	Action	Value	YES	NO
3	Check each sensor lowest speed from the “Wheel sensor”. Is the sensor speed 4km/h (2mph) or more?	—	Go to Step4	Go to Step6
4	Check the sensor rotor. Is the sensor rotor normal?	—	Go to Step5	Replace the sensor rotor.Go to Step5
5	Check each sensor lowest speed from the “Wheel sensor”. Is the sensor speed 4km/h (2mph) or more?	—	Repair the circuit or circuit between the EHCU and the speed sensor. Go to Step6	Go to Step6
6	Install all the components, and check that those are installed properly. Is this step completed?	—	Repeat “Diagnostic basic flow”.	Go to Step6

Used for checking the front speed sensor, or the rear speed sensor when no DTC is set.

CAUTION:
On the vehicle that the rear tires have smaller diameter, the rear wheel speed may be indicated a little higher than the front wheel speed. Check the speed after driving a while at a constant speed.

Sensor Rotor (Front Wheel)

Components



Legend

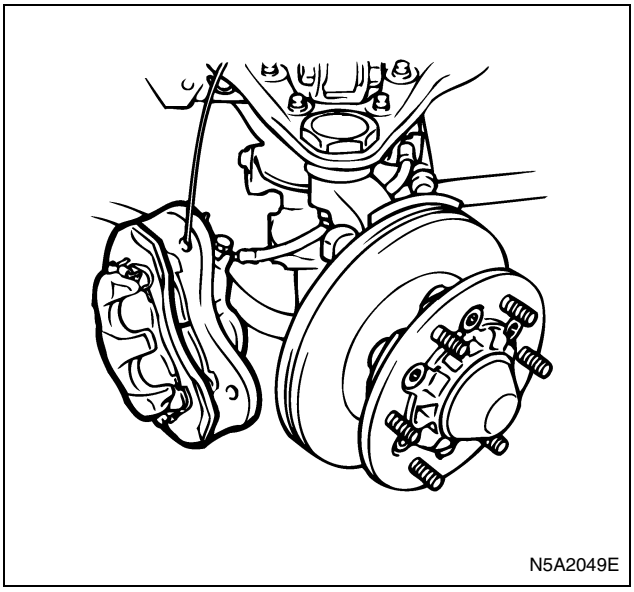
1. Speed sensor (model with rigid suspension)
2. Hub cap
3. Cotter pin
4. Hub nut
5. Thrust washer
6. Outer bearing
7. Hub & rotor assembly
8. Inner bearing
9. Sensor rotor
10. Disc caliper assembly

Removal

CAUTION:

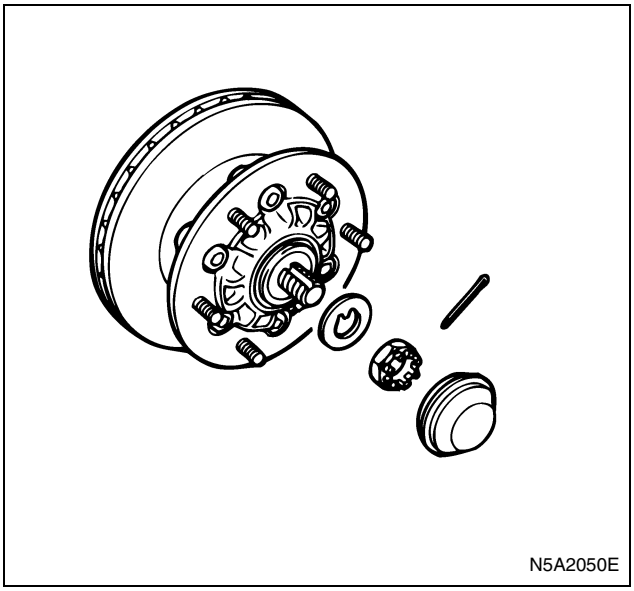
- Hold the brake hose and the caliper assembly with wire or the like to prevent them from dropping, to stand clear from the service work. Do not bend the hose sharply or stretch it to the limit.
- Remove the brake hose if necessary. If to be removed, be careful to prevent the brake fluid from flowing out and protect it from intrusion of foreign materials.

1. Remove the disc brake caliper. (Model with disc brake)



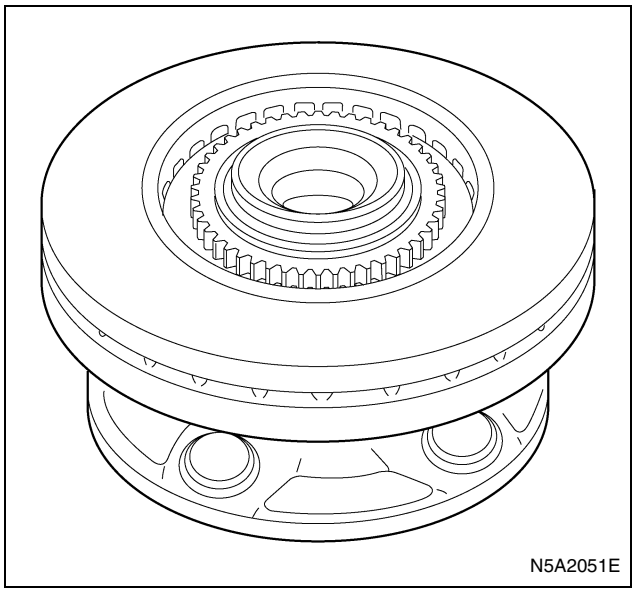
N5A2049E

2. Guard (NPR with disc brake)
   - Remove the guard.
3. Speed sensor (NPS)
   - Remove the head section of the speed sensor from the knuckle.
4. Hub cap (NPR)
   - Remove the hub cap.
5. Free wheel hub assembly (NPS)
   - Remove the free wheel hub assembly.
6. Cotter pin (NPR)
   - Remove the cotter pin.
7. Lock washer (NPS)
   - Remove the lock washer and the fixing screw.
8. Hub nut
   - Remove the hub nut.
9. Trust washer (NPR)
   - Remove the thrust washer.
10. Hub & rotor assembly



N5A2050E

11. Outer bearing inner race
12. Sensor rotor (front wheel)
    - Use a puller to take out the sensor rotor.

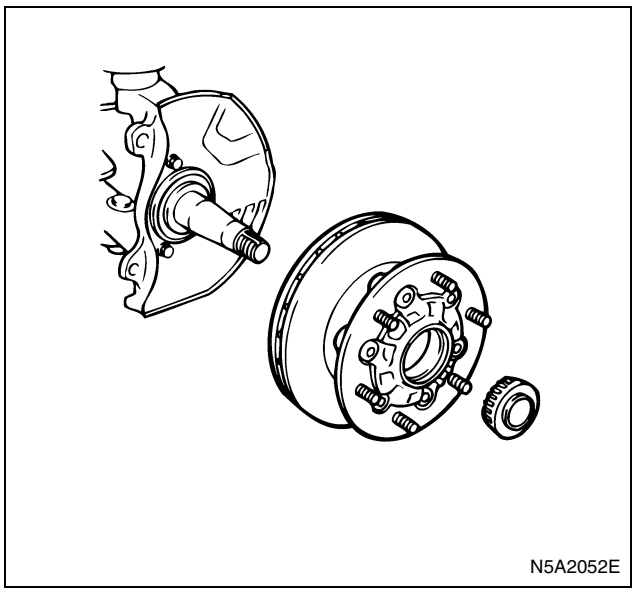


N5A2051E

Installation

1. Sensor rotor (front wheel)
   - Press-fit the new sensor rotor with a bench press around the circumference until it contacts.
2. Hub & rotor assembly
   - Fill the outer bearing with grease (Besco L-2), and install it to the hub.

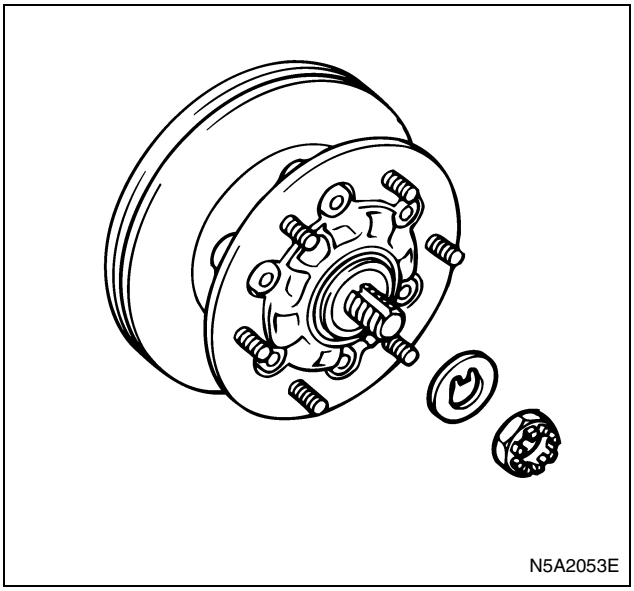
CAUTION:
Use new oil seal.



N5A2052E

3. Outer bearing inner race
4. Trust washer (NPR)
   - Install the thrust washer.
5. Hub nut
   - Install the hub nut.

CAUTION:
After installing the thrust washer and the hub nut, adjust the hub bearing preload.



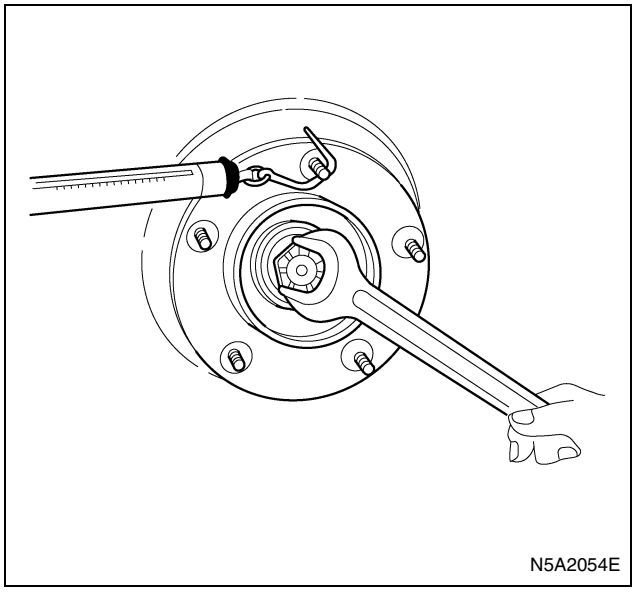
N5A2053E

Hub bearing preload adjustment

- Tighten the hub nut till the hub no longer be turned, and then loosen it completely.
- Turn the hub to make the bearing seated.
- Attach a spring balance to the wheel pin. While pulling the it tangentially, tighten the hub nut so that the hub rotates with the specified value.
- For hub bearing preload, refer to “FRONT AXLE” in Section 4C.

6. Cotter pin (NPR)
   - After preload adjustment, install the cotter pin. If the pin hole does not match the groove on the nut, adjust them by turning minimum to the tightening direction.
7. Lock washer (NPS)
   - Install the pawl to the cutout of the spindle securely, and tighten with the screw.

Tighten:
Lock washer to 10 N·m (1.0 kg·m / 7.4 lb·ft)



N5A2054E

8. Hub cap
   - Fill the hub cap with grease (Besco L-2), and drive it in to the hub.

9. Free wheel hub assembly (NPS)
   - Install the free wheel hub assembly.

CAUTION:
Be sure to adjust the drive shaft axial play.

10. Speed sensor (NPS)
    - Install the head section of the speed sensor to the knuckle and tighten the bolt to the specified torque.

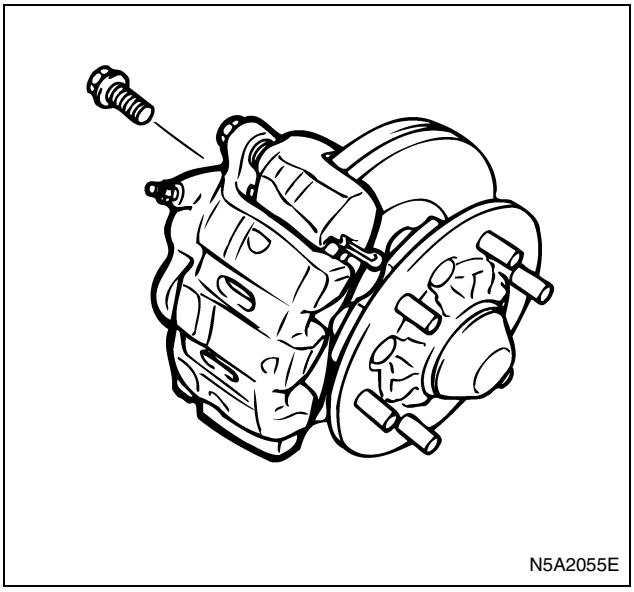
Tighten:
Speed sensor to 22 N·m (2.2 kg·m / 16.2 lb·ft)

11. Guard (NPR with disc brake)
    - Install the guard.

Tighten:
Guard to 37 N·m (3.7 kg·m / 27.3 lb·ft)

12. Disc brake caliper assembly (Model with disc brake)
    - Install the disc brake caliper assembly.

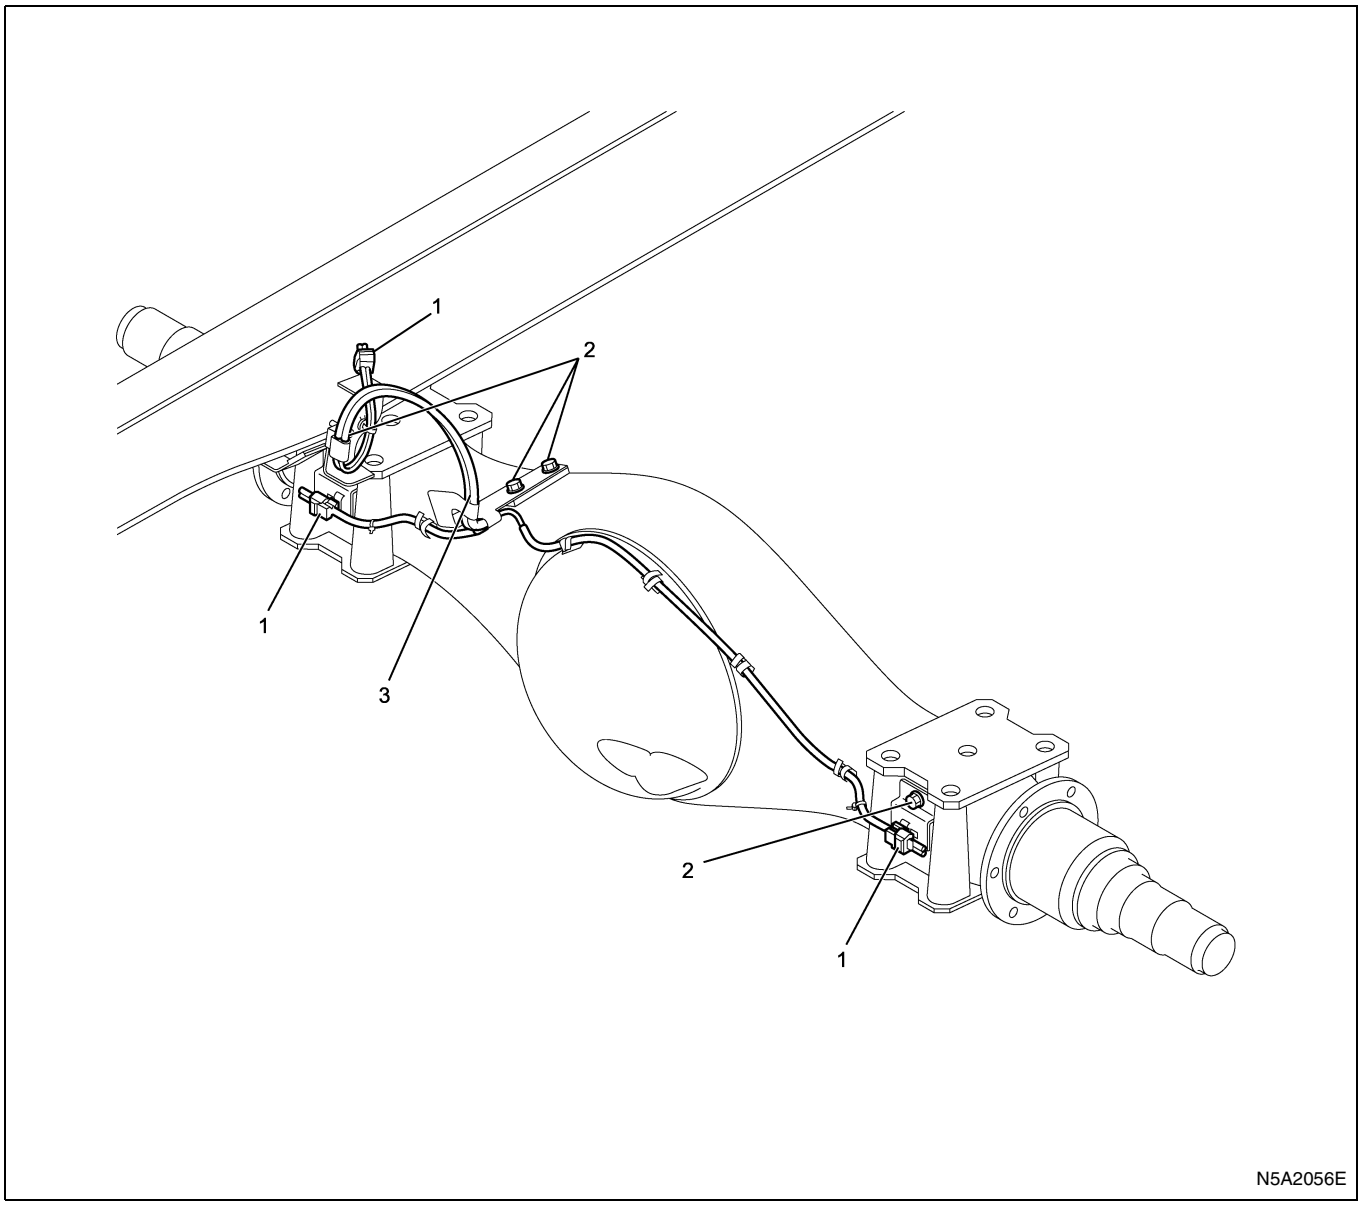
Tighten:
Disc brake calper to 220 N·m (22.5 kg·m / 162.3 lb·ft)



N5A2055E

Sensor Harness (Rear Axle)

Components



Legend

1. Harness connector
2. Harness bracket fixing bolt
3. Sensor harness

Removal

1. Harness connector
   - Disconnect the harness connector.
2. Harness bracket fixing bolt
   - Remove the harness bracket fixing bolt.
3. Sensor harness
   - Remove the sensor harness.

Installation

CAUTION:
Take care not to twist the harness during installation.

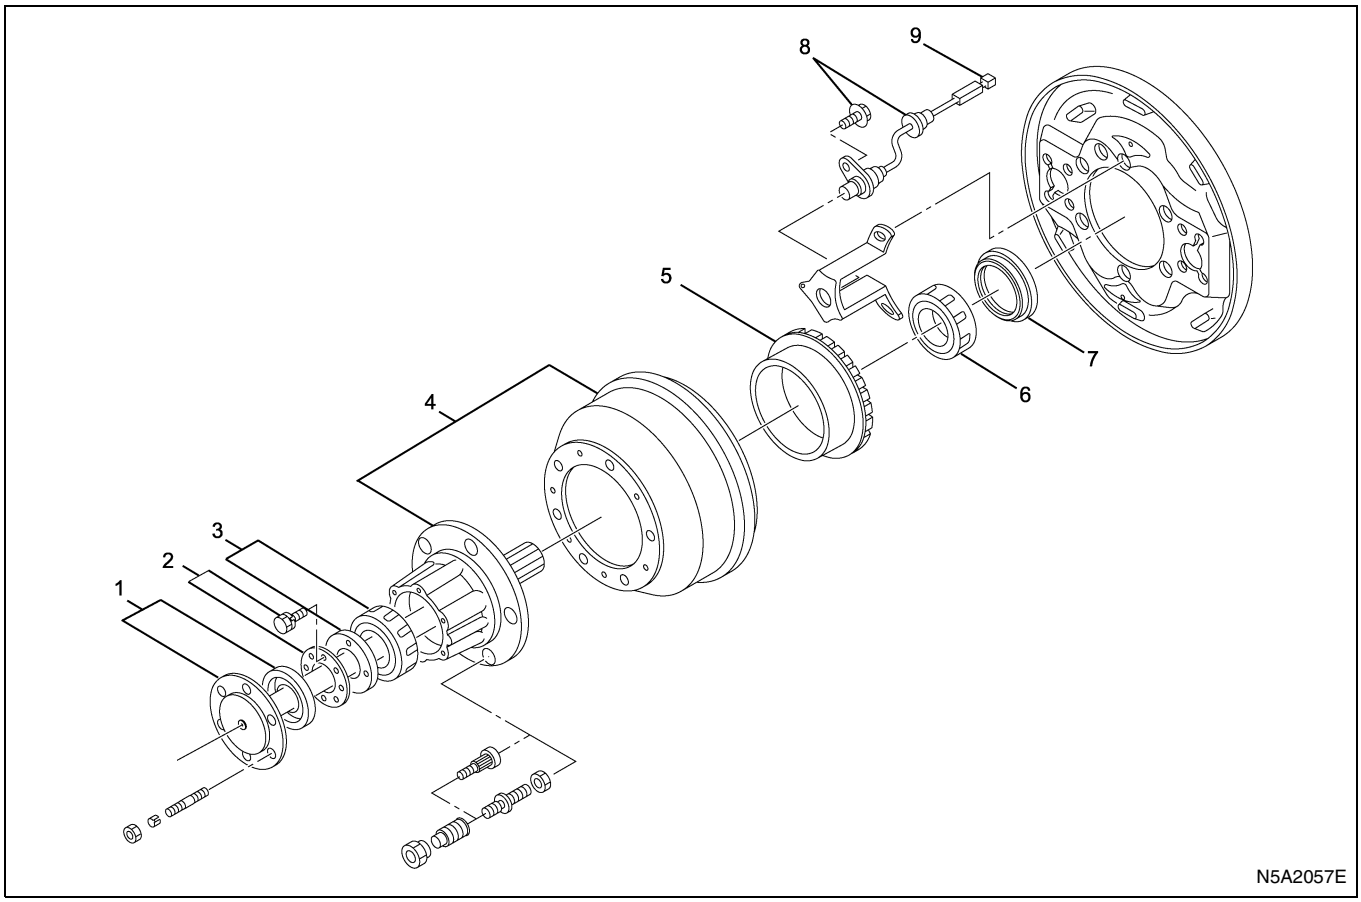
1. Sensor harness
   - Install the sensor harness.
2. Harness bracket fixing bolt
   - Install the harness bracket fixing bolt.

Tighten:
- Flange bolt (except below) to 22 N·m (2.2 kg·m / 16.2 lb·ft)
- SEMS bolt (2 points on the axle case upper face) to 13 N·m (1.3 kg·m / 9.6 lb·ft)

3. Harness connector
   - Connect the harness connector.

Rear Speed Sensor

Components



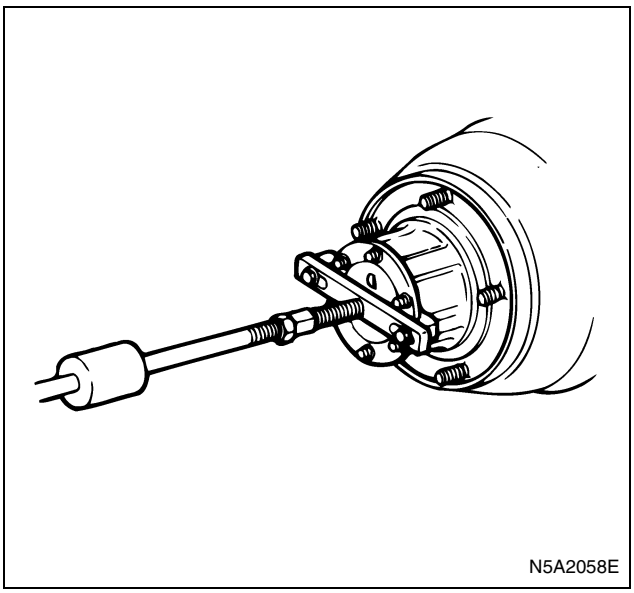
Legend

1. Axle shaft, outer oil seal
2. Bearing lock washer, lock nut
3. Outer bearing, bearing lock nut
4. Hub and drum
5. Sensor rotor
6. Inner bearing
7. Inner oil seal
8. Rear speed sensor
9. Harness connector

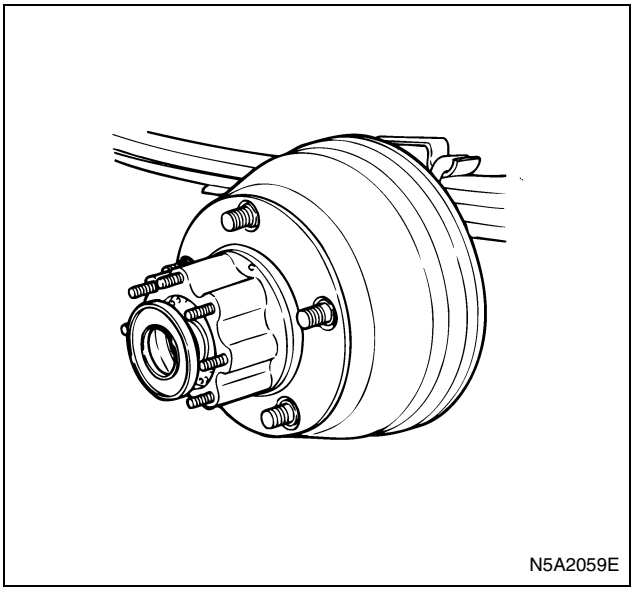
Removal

1. Rear axle shaft, outer oil seal, lock washer
   - Remove the axle shaft installing nut, and remove the rear axle shaft.

Special tool:
Universal puller: 5-8840-2027-0
Slide hammer: 5-8840-0084-0

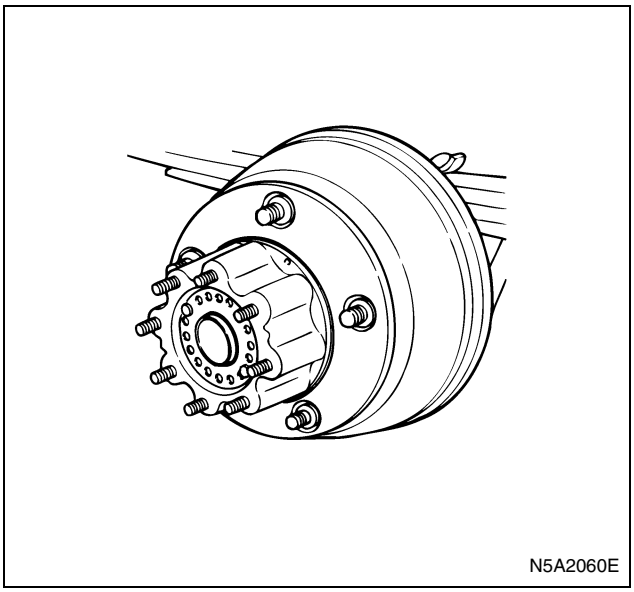


- Remove the outer oil seal.



N5A2059E

- Remove the lock washer installing bolt.

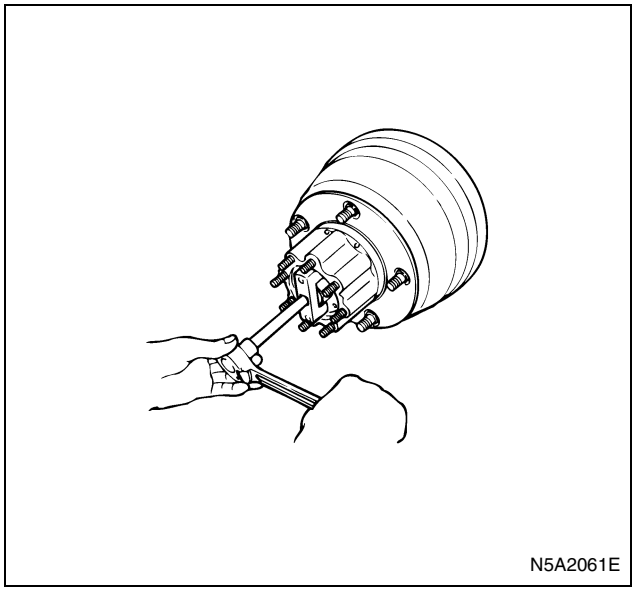


N5A2060E

2. Bearing lock nut, outer bearing, hub
   - Remove the bearing nut.

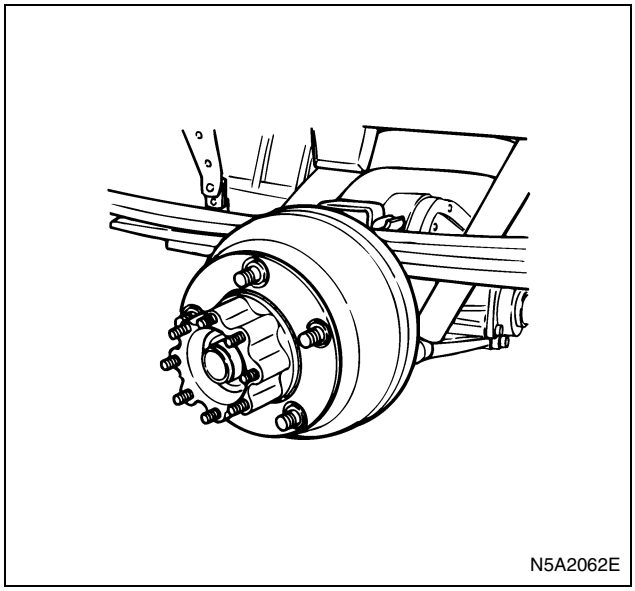
Special tool:
Wrench: 9-8522-1188-0

   - Remove the outer bearing.



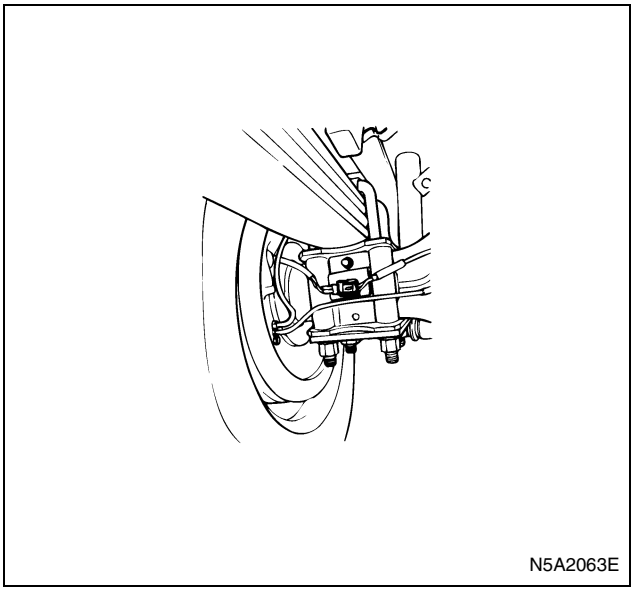
N5A2061E

3. Hub and drum assembly
   - Remove the hub and drum assembly.



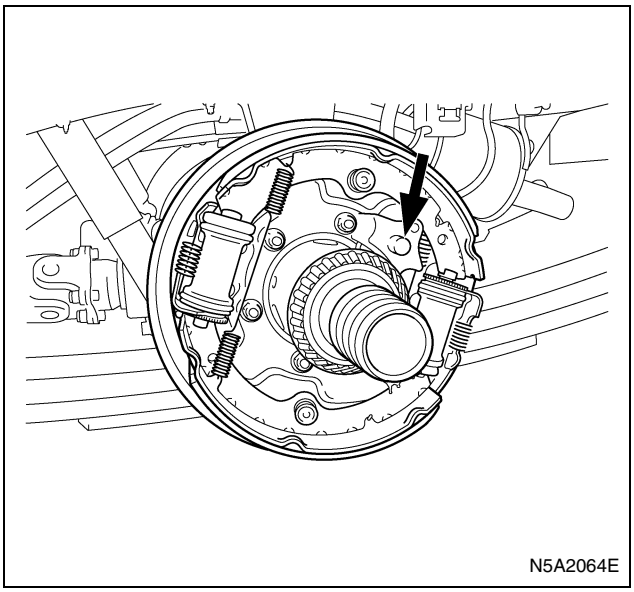
N5A2062E

4. Inner oil seal
   - Remove the inner oil seal.
5. Inner bearing
   - Remove the inner bearing.
6. Harness connector
   - Disconnect the connection of the harness connector.



N5A2063E

7. Rear speed sensor
   - Remove the speed sensor installing bolt, and take out from the sensor bracket.



N5A2064E

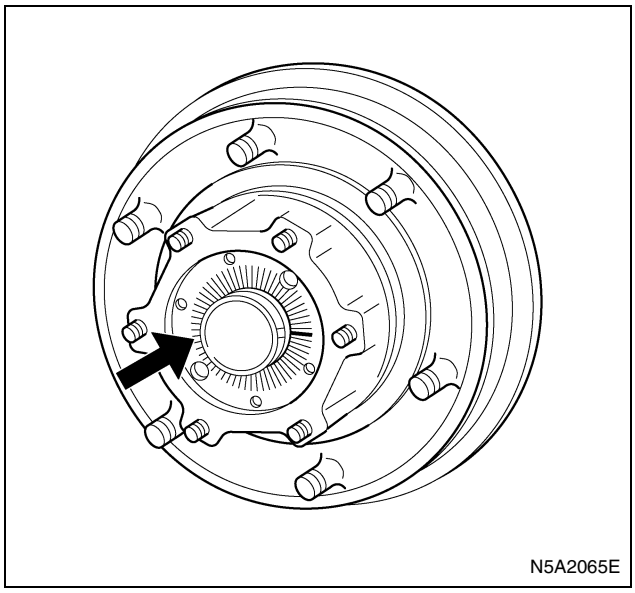
Installation

CAUTION:
- Grommet in the back plate must be installed securely.
- Bearing lock nut must be installed with its slit surface facing outside.

1. Rear speed sensor
   - Tighten the speed sensor installing bolt.

Tighten:
Bolt to 22 N·m (2.2 kg·m / 16.2 lb·ft)

2. Harness connector
   - Connect the harness connector.
3. Inner bearing
   - Install the inner bearing.
4. Inner oil seal
   - Install the inner oil seal.
5. Hub and drum assembly
   - Install the hub and drum assembly.
6. Outer bearing, hub, bearing lock nut
   - Install the outer bearing, hub, and bearing lock nut.

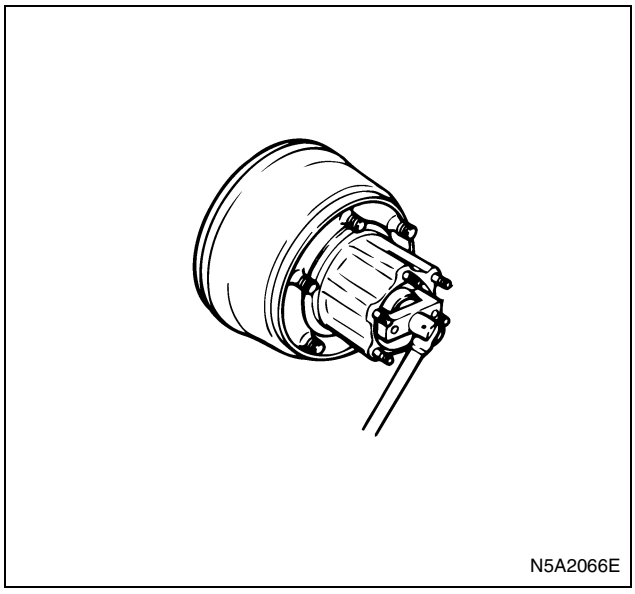


N5A2065E

Rear hub bearing preload adjustment

- Rotate the hub to the left and right several times to make it seated.
- Tighten the bearing lock nut till the hub no longer be turned. Then, back off to a degree that the hub rotates easily.

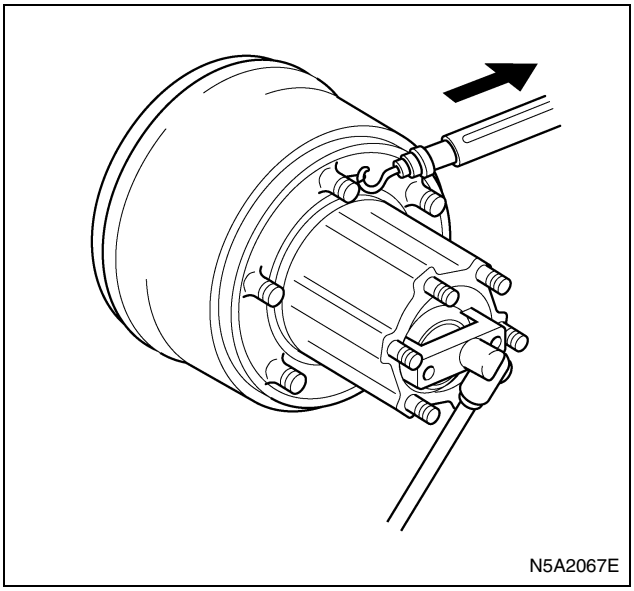
Special tool:
Wrench: 9-8522-1180-0



N5A2066E

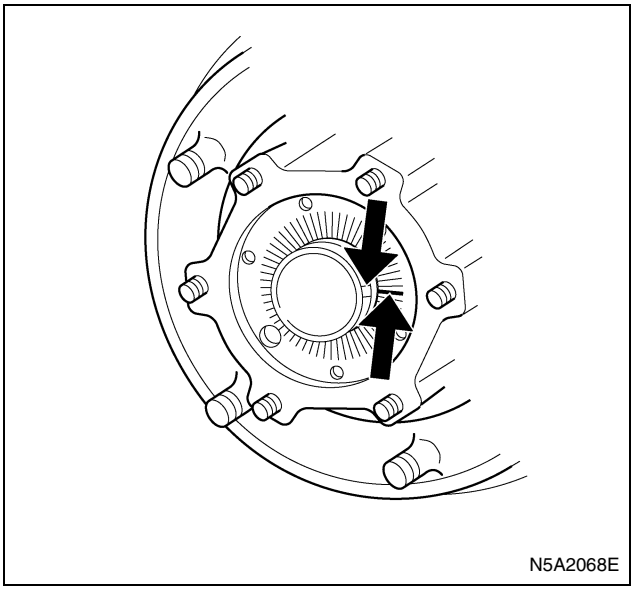
- Attach a spring balance to the wheel pin. While pulling it tangentially, tighten the bearing nut so that the spring balance reading shows the specified value when the hub starts rotation.

Tighten:
Starting to 42 — 52 N (4.3 — 5.3 kg / 9.4 — 11.7 lb)



N5A2067E

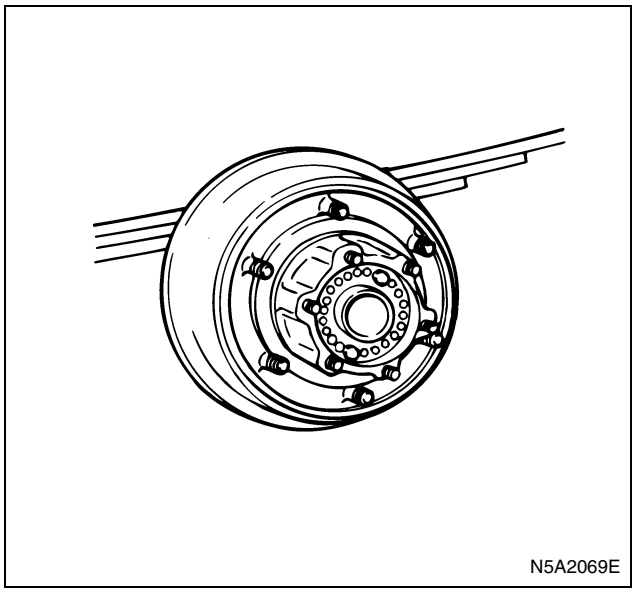
- After adjusting the starting torque, move the hub to the right and left side several times to make sure the value is correct.
- With the preload adjusted, match the lock cut-out center point of the axle case screw part with nearest ruling of the bearing lock nut. If it does not, rotate the nut in the tightening direction to match.



N5A2068E

7. Lock washer, outer oil seal, axle shaft
   - Install the pawl of the lock washer to the lock cutout of the axle case screw part securely, and tighten the bearing nut and the lock washer with the lock bolt.
   - Apply grease to the circumference of the outer oil seal inner lip, and install the outer oil seal.
   - Install the axle shaft.
     Install to the rear hub stud part through the special washer with the flange nut.

Tighten:
Flarge nut to 49 N·m (5.0 kg·m / 36.1 lb·ft)



N5A2069E

Inspection

RL Wheel Speed Sensor Output Check Procedure

Check flow C-1-3

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Jack-up the vehicle to lift the front wheels off the floor. 4. Connect a 120Ω resistance between the J-177 connector terminal 34 and the ground. 5. Apply a 9 — 16V voltage to the J-177 connector terminal 22. 6. Measure the DC voltage between the B-177 connector terminal 34 and the ground while turning the RL wheel half turn/sec. Is the value within specified value?	0.2 — 4.5V	Go to Step5	Go to Step2
2	1. Turn the starter switch OFF. 2. Disconnect the RL wheel speed sensor connector J-149. 3. Connect a 120Ω resistance between the J-149 connector terminal 2 and the ground. 4. Apply a 9 — 16V voltage to the J-149 connector terminal 1 (sensor side). 5. Measure the DC voltage between the J-149 connector terminal 2 and the ground while turning the RL wheel half turn/sec. Is the value within specified value?	0.2 — 4.5V	Go to Step3	Go to Step4
3	Repair the circuit for open/short circuit, and the connector for improper connection between the connector of EHCU and the sensor connector. Is this step completed?	—	Go to Step5	—
4	Replace the RL wheel speed sensor. Is this step completed?	—	Go to Step5	—
5	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step5

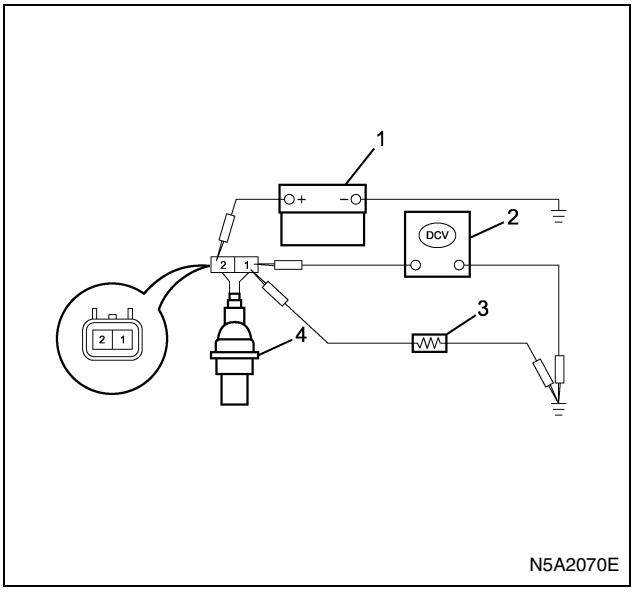
RR Wheel Speed Sensor Output Check Procedure

Check flow C-1-4

Step	Action	Value	YES	NO
1	1. Turn the starter switch OFF. 2. Disconnect the connector of the EHCU. 3. Jack-up the vehicle to lift the front wheels off the floor. 4. Connect a 120Ω resistance between the J-177 connector terminal 12 and the ground. 5. Apply a 9 — 16V voltage to the J-177 connector terminal 21. 6. Measure the DC voltage between the J-177 connector terminal 1 and the ground while turning the RR wheel half turn/sec. Is the value within specified value?	0.2 — 4.5V	Go to Step5	Go to Step2
2	1. Turn the starter switch OFF. 2. Disconnect the RR wheel speed sensor connector J-148. 3. Connect a 120Ω resistance between the J-148 connector terminal 2 and the ground. 4. Apply a 9 — 16V voltage to the J-148 connector terminal 1 (sensor side). 5. Measure the DC voltage between the J-148 connector terminal 2 and the ground while turning the RR wheel half turn/sec. Is the value within specified value?	0.2 — 4.5V	Go to Step3	Go to Step4
3	Repair the circuit for open/short circuit, and the connector for improper connection between the connector of EHCU and the sensor connector. Is this step completed?	—	Go to Step5	—
4	Replace the RR wheel speed sensor. Is this step completed?	—	Go to Step5	—
5	1. Install all the components, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Go to “Diagnostic basic flow”.	Go to Step5



Legend

1. Battery (12V)
2. Tester
3. Resistance
4. Speed sensor

Speed Sensor Output Check Procedure

Check flow TC-1

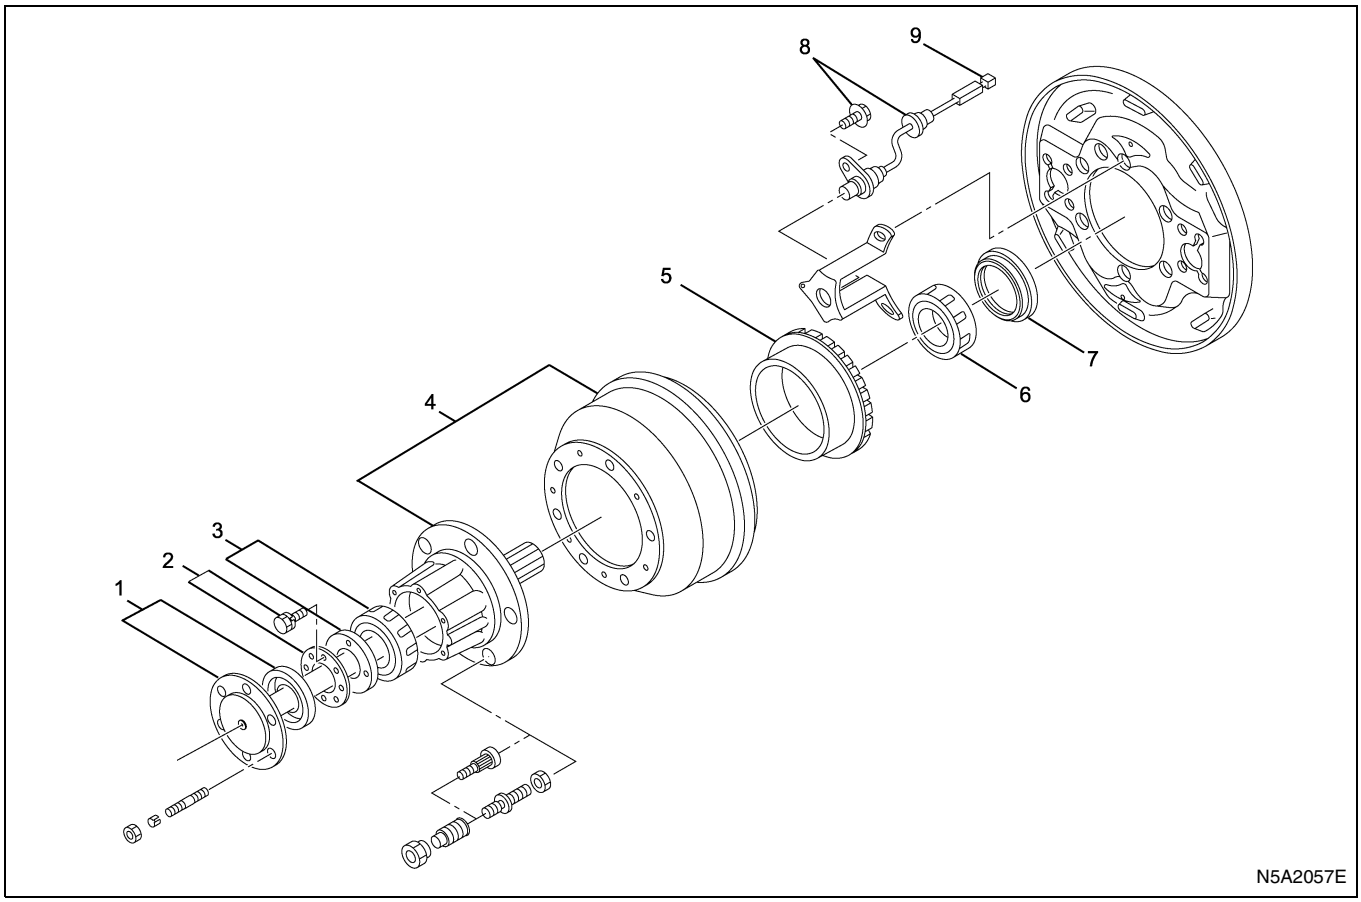
Step	Action	Value	YES	NO
1	1. Connect the Tech 2. 2. Check each sensor lowest speed from the “Wheel sensor”. Is the sensor speed 4km/h (2 mph) or more?	—	Go to Step2	Go to Step6
2	Check the suspicious sensor circuit for open circuit. (Check with shaking the wire and the connector.) Is the sensor circuit connection normal?	—	Replace the speed sensor.Go to Step3	Repair.Go to Step2
3	Check each sensor lowest speed from the “Wheel sensor”. Is the sensor speed 4km/h (2 mph) or more?	—	Go to Step4	Go to Step6
4	Check the sensor rotor. Is the sensor rotor normal?	—	Go to Step5	Replace the sensor rotor. Go to Step5
5	Check each sensor lowest speed from the “Wheel sensor”. Is the sensor speed 4km/h (2 mph) or more?	—	Repair the circuit or connector between the EHCU and the speed sensor. Go to Step6	Go to Step6
6	Install all the components, and check that those are installed properly. Is this step completed?	—	Repeat “Diagnostic basic flow”.	Go to Step6

Used for checking the front speed sensor, or the rear speed sensor when no DTC is set.

CAUTION:
On the vehicle that the rear tires have smaller diameter, the rear wheel speed may be indicated a little higher than the front wheel speed. Check the speed after driving a while at a constant speed.

Rear Sensor Rotor

Components



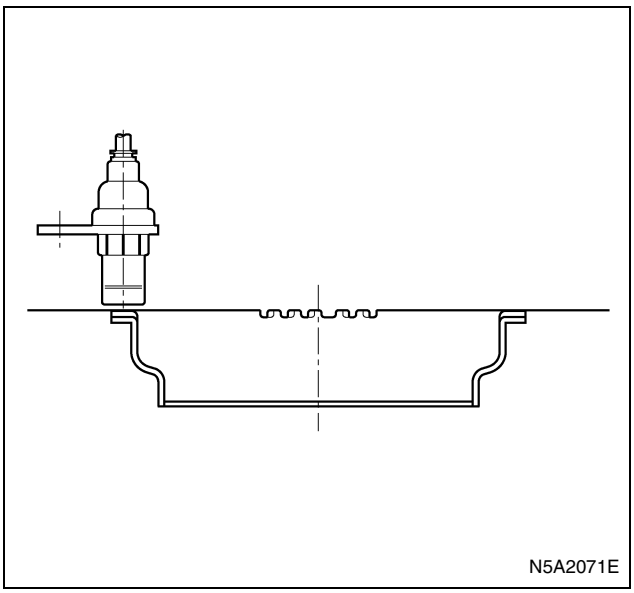
Legend

1. Axle shaft, outer oil seal
2. Bearing lock washer, lock nut
3. Outer bearing, bearing lock nut
4. Hub and drum
5. Sensor rotor
6. Inner bearing
7. Inner oil seal
8. Rear speed sensor
9. Harness connector

Removal

- Refer to the rear speed sensor removal procedure.

1. Rear sensor rotor
   - Use a puller to take out the sensor rotor.
2. Inner oil seal
   - Remove the inner oil seal.
3. Inner bearing
   - Remove the inner bearing.
   - Rotor runout must be ±0.1 mm (0.004 in) or less with the rotor installed.



Installation

1. Install the inner bearing to the hub.
2. Install the inner oil seal to the hub.
3. Install the new rear sensor rotor to the hub.
   - Press-fit with a bench press around the circumference until it contacts.
   - Refer to the rear speed sensor installation procedure step. 5 — 7.

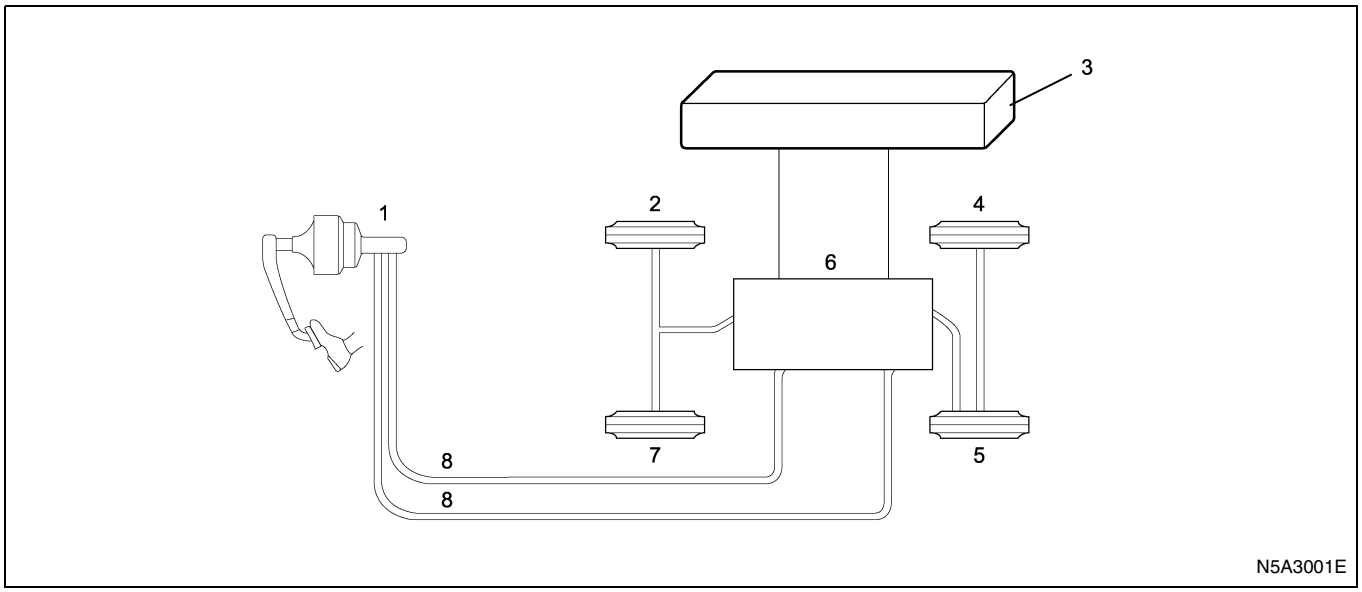
HSA System

Description of Function and Operation

The HSA (hill start aid) is the system to retain the brake force with brake pedal not depressed when the vehicle is parked, and to automatically release the brake force when starting the vehicle.

The HSA control unit drives the HSA valve located in the pipe route between the master cylinder and the wheel cylinder, to hold/release the brake fluid pressure. Also, alarm function (activates when the door opened with HSA operating, when the HSA system has running long time, when the HSA pressure goes down) and self-diagnosis function are equipped with the HSA control unit.



Legend

2. FR wheel cylinder
3. HSA control unit
4. RR wheel cylinder
5. RL wheel cylinder
6. HSA valve
7. FL wheel cylinder
8. Oil

Contents of HSA Control

The HSA operates when all the following conditions are completed.

1. Brake pedal depressed
2. Parking brake released
3. Vehicle standstill

Notice:
The HSA can operate wherever the gearshift lever is set.

The HSA is released when any of the following is completed.

1. Gear except in neutral and clutch engaged more than half
2. Parking brake applied
3. HSA off switch depressed
4. Starter switch in ACC or OFF

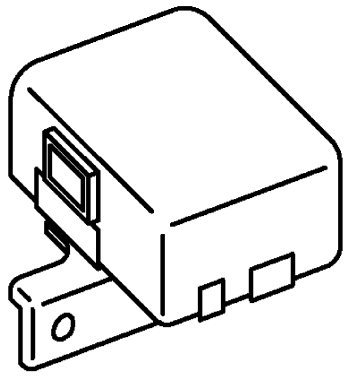
12. Stop lamp switch

HSA Control Unit



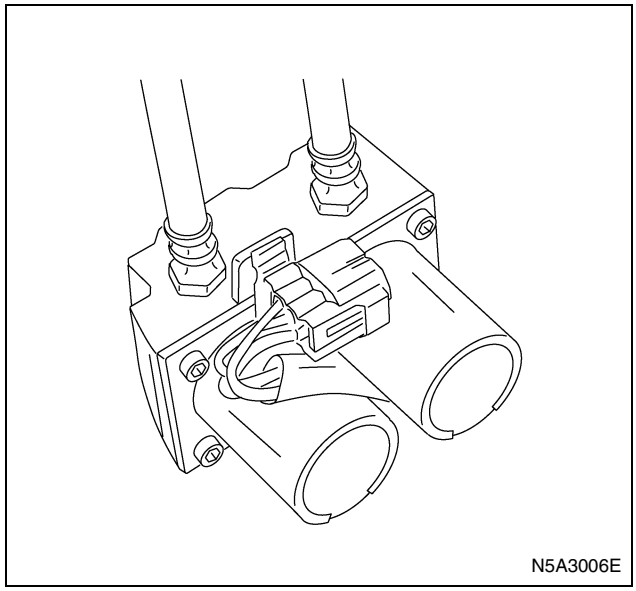
N5A3066E

The HSA control unit activates the HSA valve to hold/release the brake fluid pressure based on the input signal from each switch and sensor. When a malfunction occurs in the system, it activates the built-in buzzer and blinks the HSA indicator lamp to indicate the trouble code.

Also the system has the alarm functions as follows:

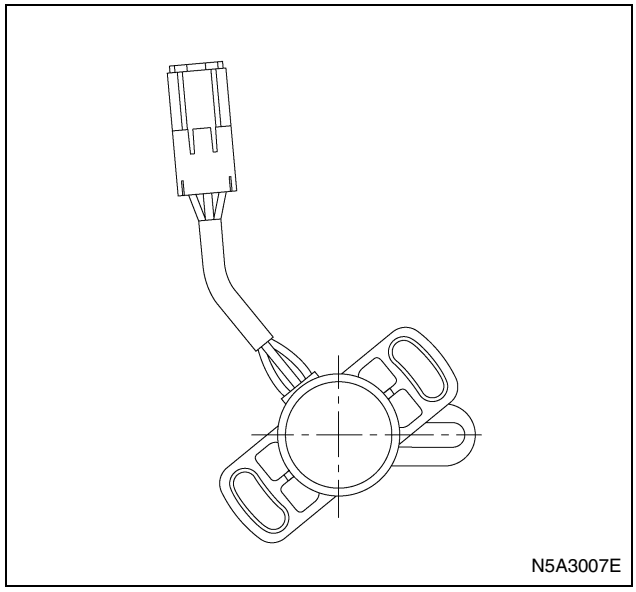
1. Door open alarm when HSA operating
   When the door is opened while the HSA is operating; it triggers the built-in buzzer and blink the HSA indicator lamp.
2. HSA long-time operation alarm
   When the HSA have operated for more than 8 minutes; it triggers the built-in buzzer and blink the HSA indicator lamp.
3. Vehicle motion alarm
   When the vehicle speed reaches aprrox. 1.5km/h (1 mph) while HSA operating; it triggers the built-in buzzer and blink the HSA indicator lamp. (However, the HSA is released when the vehicle speed reaches 5km/h (3 mph).)

HSA Valve



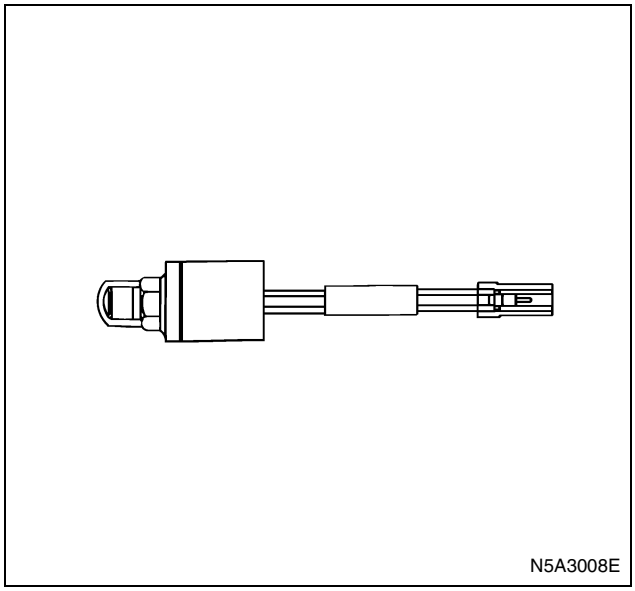
The HSA valve is located in the pipe route between the master cylinder and the wheel cylinder, and it is driven by the HSA control unit output (ON/OFF).

Clutch Sensor



The clutch sensor is installed to the clutch pedal bracket and changes the voltage being input to the HSA control unit by sensing the amount of clutch pedal depressed. This voltage is one of the signals to control the HSA operation/release.

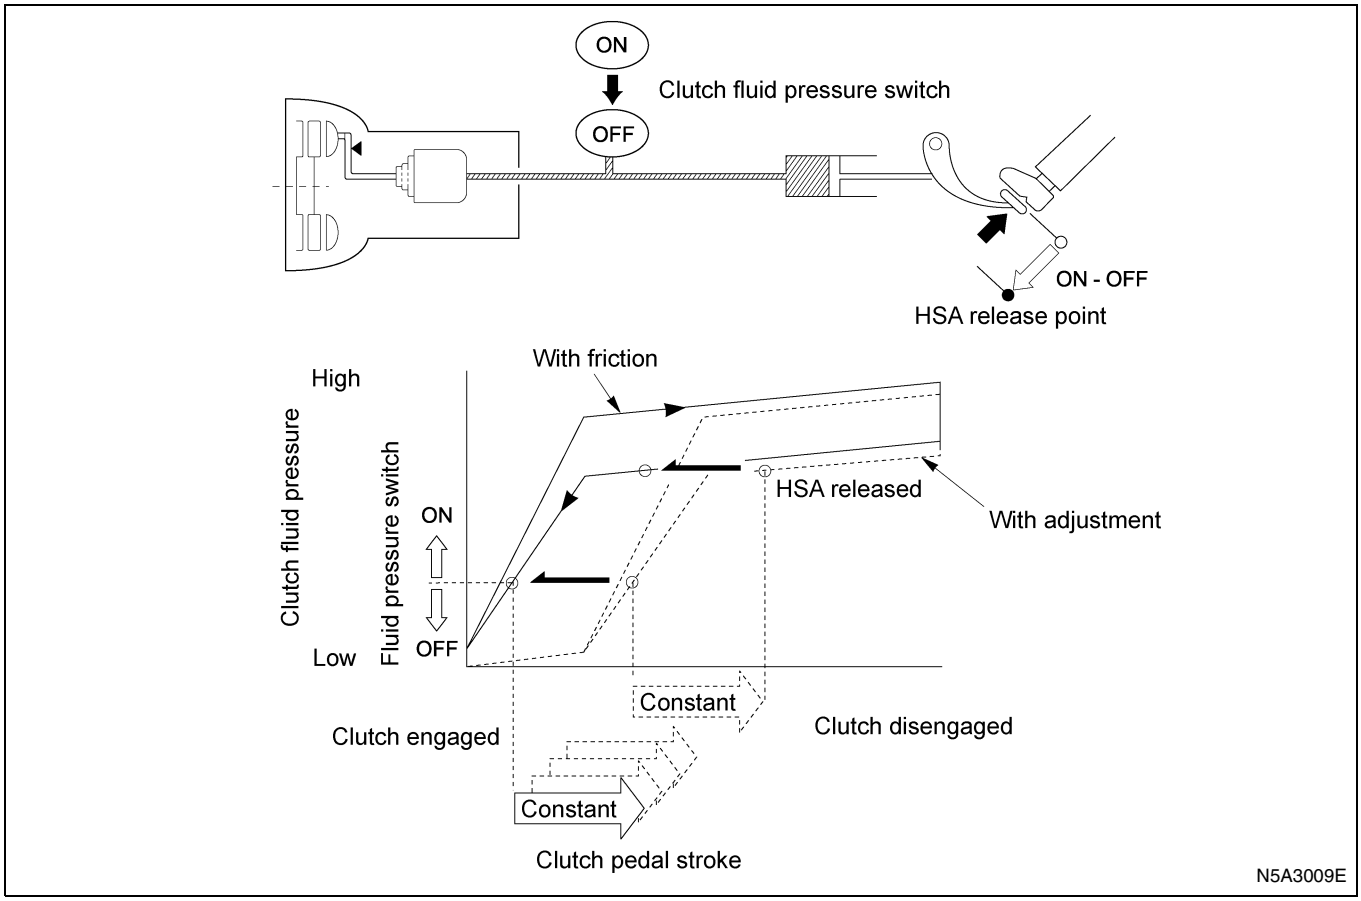
Clutch Fluid Pressure Switch



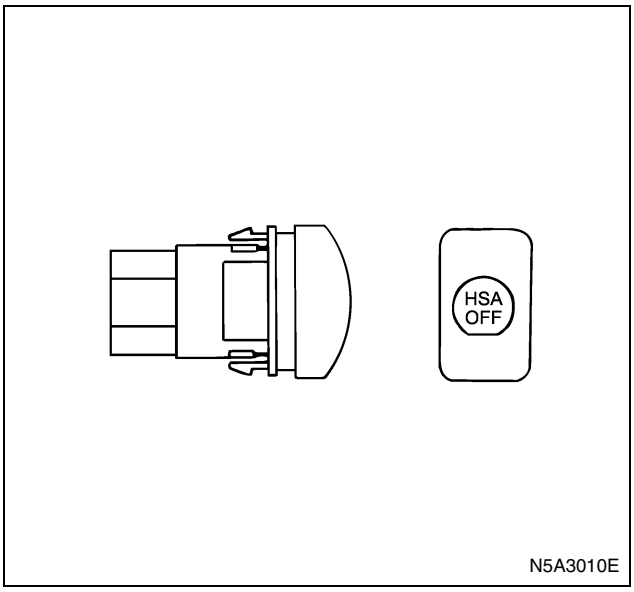
The clutch fluid pressure switch is off the contact with the clutch pedal fully engaged, and it contacts the point with the clutch pedal depressed (clutch disengaged).
The HSA system memorizes the clutch meeting point (engaging point) to release the brake force at that point. However, the meeting point is gradually raised as the driven plate wears, resulting the brake force be released before the clutch engages.
To prevent this, the HSA has a follow-up function automatically to co-op with the clutch wear.

Clutch-wear Automatic Follow-up Mechanism

The clutch fluid pressure switch is installed to the clutch master cylinder, and it turns ON with the clutch pedal depressed, and turns OFF with the clutch pedal released.
Positional relationship between the stroke point where the HSA is released and this clutch fluid pressure switch OFF position is constant regardless the degree of clutch disc wear.
Utilizing this characteristic, the HSA can follow-up the release point automatically even when the fluid pressure switch OFF point is shifted.

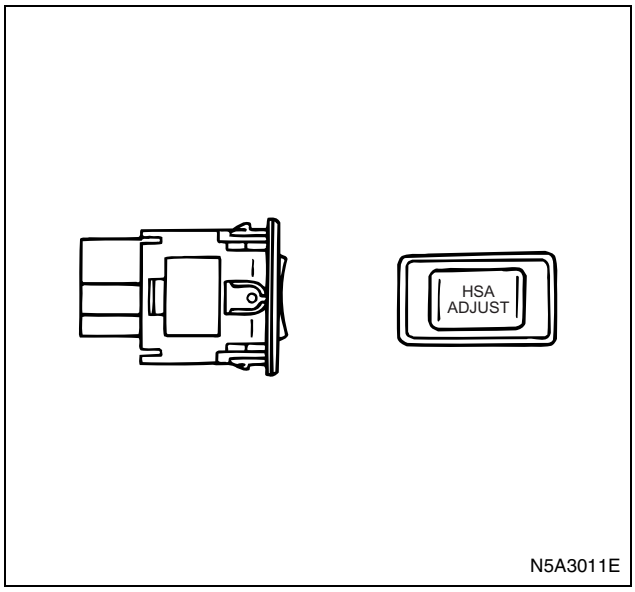


HSA Off Switch



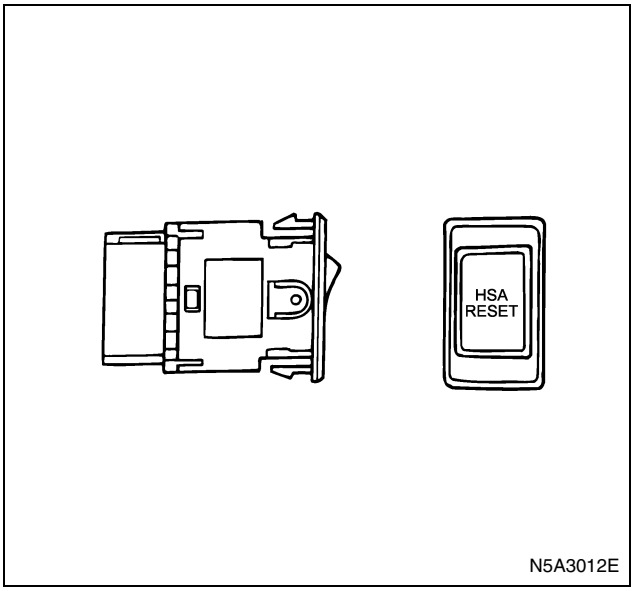
The HSA is released with this switch depressed. (HSA off warning light comes on at this time.)

HSA Adjust Switch



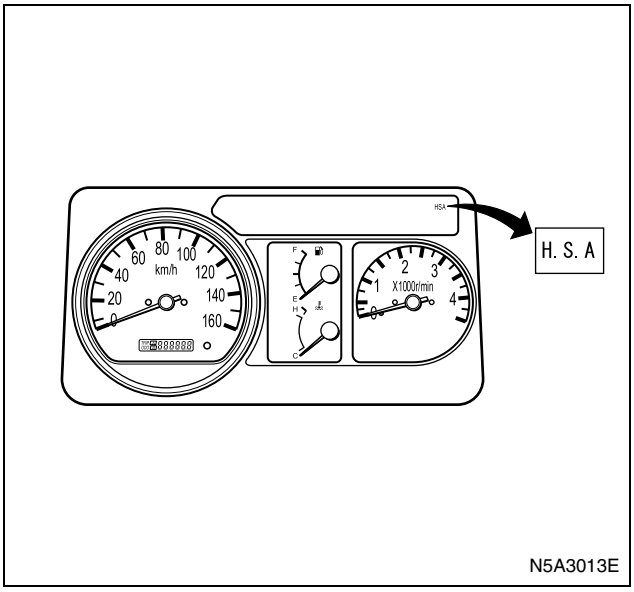
Used for fine adjustment of the clutch pedal position to release the HSA brake force when operating to start the vehicle. Also, used for initial adjustment.

HSA Reset Switch



Used when the timing to release the HSA brake force is shifted considerably when operating to start the vehicle after clutch replacement or clutch play adjustment.

HSA Indicator Lamp



The HSA indicator lamp comes ON when HSA operating, and OFF when not operating. Also, it blinks sycronized with alarm. It blinks or illuminates when a malfunction occurs. Also used for while diagnosing.

Procedure of Trouble Diagnosis

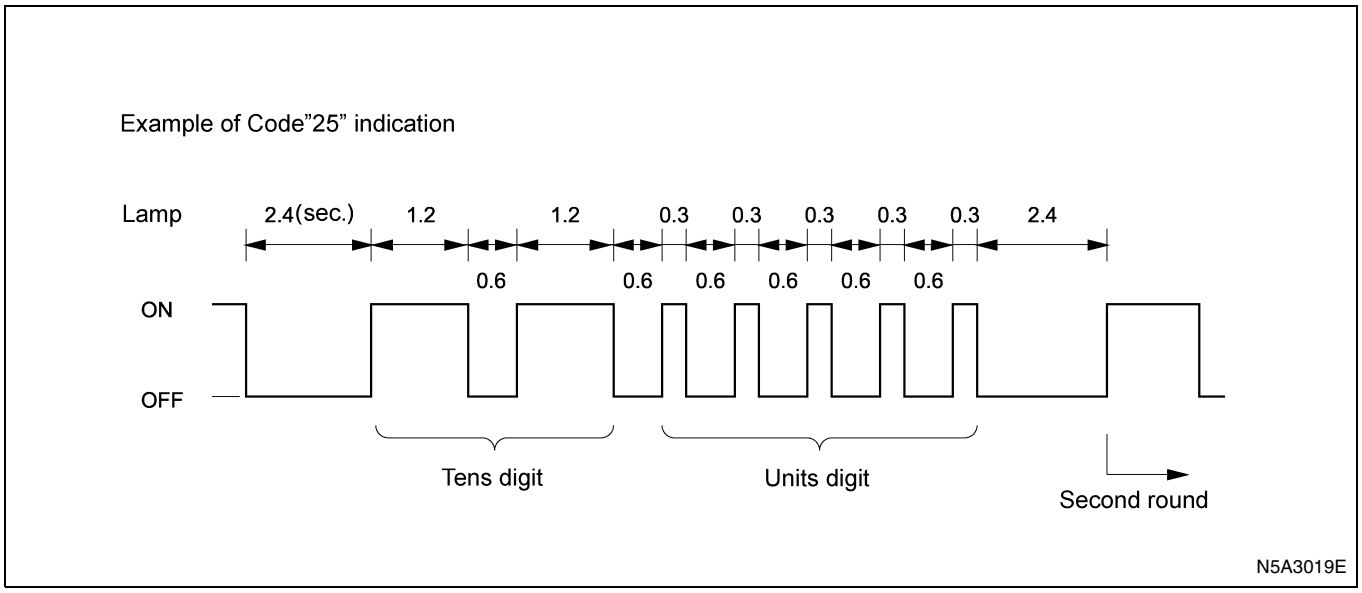
Description of Diagnosis

HSA diagnostic procedure is classified into two kinds; one is with diagnostic trouble codes indicated by blinking pattern of the HSA indicator lamp, and the other is from trouble symptoms. Refer to “Diagnostics with diagnostic trouble code” in the first case, and “Diagnostics with Phenomenon” in the latter case for diagnostic procedures.

Self-diagnosis

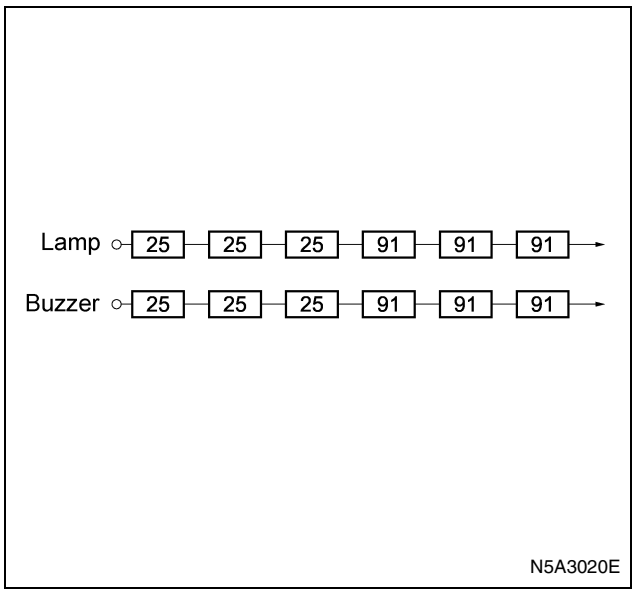
The HSA can perform the self-diagnosis when a malfunction occurs in the system.
Perform the self-diagnosis in the following procedure. HSA indicates the result in the lamp blinking pattern and the buzzer.

1. Park the vehicle and apply the parking brake.
2. Press the adjust switch “FAST” or “SLOW” and hold it. Self-diagnosis display continues while the switch is pressed.
3. While pressing the switch, diagnostic trouble codes (DTC) are displayed with the HSA indicator lamp blinking pattern. Buzzer beeps in synchronization with lamp while displaying the trouble code.



Caution:
DTCs are displayed for three times each in turn. After taking a round, the DTCs are displayed in the same order repeatedly.

- When multiple number of trouble code stored; Code 25/Code 91



Basic Diagnostic Procedure

Step	Action	Value	YES	NO
1	Turn the HSA off switch OFF. Does the HSA lamp blink?	—	 Go to Step2	 Go to Step3
2	Is there any trouble code?	—	Go to Step6, 7	Go to Step4, 5
3	Is the trouble reappeared?	—	Go to Step4, 5	Go to Step4, 5
4	What is the trouble symptom?	—	Go to Step5	Go to Step4
5	Has “Diagnostics with phenomenon” been performed?	—	Go to Step8	Go to Step5
6	Take notes all the trouble code appeared. What is the trouble code?	—	 Go to Step7	 Go to Step6
7	Has “Diagnostics with diagnostic trouble code” been performed?	—	Go to Step8	Go to Step7
8	Has the trouble part corrected?	—	End.	Go to Step8

Caution:
- Always perform the diagnosis in a predetermined sequence before performing the HSA system repair.
- After repair, make sure the HSA system operate/stop normally, and the trouble code does not appear again.
- Use the harness side (body side) connector to check for continuity (resistance) and voltage unless specified. Also, be especially careful not to damage the connector terminals with the tester etc.
- Check for continuity (resistance) with the starter switch OFF, and voltage with the starter switch ON.
- HSA control unit, HSA valve, clutch sensor, and speed sensor are non-disassembled parts; do not loosen the bolts and nuts.
- Do not directly apply external voltage to the HSA control unit, the clutch sensor, and the speed sensor. Use special care for electrostatic.

11	HSA indicator lamp circuit	ON	DCV	12 (+) — 30 (–)	Approx. 24 V	With indicator lamp OFF
		ON	DCV	12 (+) — 30 (–)	0 V	With indicator lamp ON
12	Clutch sensor circuit	OFF	Ω	24 — 26	2kΩ±400Ω	
		OFF	Ω	25 — 26	400Ω — 2.8kΩ	Clutch pedal operated
		ON	DCV	24 (+) — 30 (–)	4.5 V or more	
		ON	DCV	25 (+) — 30 (–)	0.5V±0.2V	Clutch pedal released (clutch fully engaged)
13	Speed sensor circuit	ON	DCV	17 (+) — 30 (–)	2V or 14V	
14	Generator L terminal circuit	ON	DCV	10 (+) — 30 (–)	0 V	Engine stopping
		ON	DCV	10 (+) — 30 (–)	Approx. 24 V	Engine running

*Note: Position the room lamp switch at door interlock.

Function Check

HSA Adjustment

The HSA memorize the clutch meeting point to release the brake force. Therefore, releasing point must be adjusted after clutch replacement or clutch play adjustment. Adjustment contains the “Initial adjustment” to memorize the clutch pedal position to release the HSA brake force, and the “Brake release adjustment” to fine adjustment of the clutch pedal position to release the brake for smooth starting of the vehicle.

Vehicle condition when adjustment is needed	Necessary adjustment
When the clutch-related parts are replaced, or clutch pedal play is adjusted. When the brake release timing is considerably fast/slow. When the brake drags at vehicle starting.	Initial adjustment
When the brake drags at vehicle starting. When the vehicle moves back at starting on a graded road. When the brake release timing does not match with the feeling.	Brake release adjustment (FAST) (SLOW) (FAST OR SLOW)

Initial Adjustment

1. Start the engine.
2. Make sure that the HSA off switch is not pressed (HSA in operation).
3. Apply the parking brake.
4. Disengage the clutch, move the gear position to 2nd, and press the HSA reset switch. (Buzzer (bleep*) continues at this time.)
5. Slowly release the clutch pedal, and press the “SLOW” or “FAST” of the HSA adjust switch when the engine speed goes down to 30 — 50 rpm lower than the idle speed. (Buzzer (bleep*) stops at this time.)
6. Move the gear back to neutral and slowly engage the clutch. In case when the buzzer goes off while in operation or when the HSA adjust switch is pressed by accident, retry the procedure from step 3.

Brake Release Adjustment

1. Start the engine.
2. Make sure that the HSA off switch is not pressed (HSA in operation).
3. Depress the brake, make sure the gear is in neutral, and release the parking brake lever.

4. Check that the HSA indicator lamp is ON, disengage the clutch, and move the gear except in neutral position.
5. When the brake release is too slow that the brake drags at vehicle starting, press the “FAST” of the adjust switch.
   When the brake release is too fast that the vehicle moves back at starting on a graded road, press the “SLOW” of the adjust switch.

Caution:
Each time pressing the switch, the buzzer bleeps. The number of times pressing the switch increase to the degree of change where to release the brake force at higher/lower clutch pedal position.

Number of times pressing the switch	
1 — 2 times	Fine adjustment “FAST” “SLOW”
2 — 3 times	When brake drags “FAST” When the vehicle on a graded road moves back. “SLOW”
3 — 5 times	When brake drags. “FAST” When the vehicle on a graded road moves back. “SLOW”

6. When the brake release timing does not match with the feeling, retry the procedure from step 3.
   (Start over from the initial adjustment if messed up.)

List of Diagnostic Trouble Code

Code	Diagnosis item
01	Normal code
03	Back-up fuse open
08	Clutch sensor output voltage fault
19	Adjust switch “FAST” or “SLOW” is ON even when out of the adjustment limit, or adjust switch “FAST” or “SLOW” is ON when the vehicle speed 5 km/h (3 mph) or more.
25	Vehicle speed sensor output voltage fault
33	Control unit fault
36	Generator L terminal output does not exist even when the clutch is engaged and the gear is shifted with vehicle running.
86	Clutch fluid pressure switch does not turn ON with clutch pedal depressed, and it turns ON with the clutch engaged. (Clutch fluid pressure switch fault)
91	Solenoid valve drive signal and solenoid valve monitor conditions are erratic. (HSA valve fault)
Vehicle motion alarm	Detects vehicle speed 1.5km/h (1 mph) or more with solenoid valve operated and gear in neutral.
Longtime alarm	Solenoid valve has operated for more than 8 minutes continuously with brake not depressed.

About Diagnostic Trouble Code

The control unit clears the fault code when the fault part is judged to be normal.

DTC 03 Back-up Fuse Open

Step	Action	Value	YES	NO
1	Check the fuse “F-19”. Is the fuse “F-19” normal?	—	Go to Step2	Go to Step3
2	Check for battery voltage between the HSA control unit connector terminal 29 “B-285” and the body ground. Does it have the battery voltage?	20 V or more	Go to Step6	Go to Step7
3	Repair the short circuit in the circuit and the parts connected to the fuse “F-19”. Is the repair completed?	—	Go to Step4	Go to Step3
4	Install a new fuse with the HSA control unit connector “B-285” disconnected. Is the fuse blown?	—	Go to Step2	Go to Step5
5	Connect the connector of the HSA control unit. Is the fuse blown?	—	Go to Step8	Go to Step10
6	Check the connector. Is the connector of the HSA control unit normal?	—	Go to Step8	Go to Step9
7	Repair the open circuit between the fuse “F-19” and 29 “B-285”. Is the repair completed?	—	Go to Step10	Go to Step7
8	Replace the HSA control unit. Is the replacement completed?	—	Go to Step10	Go to Step8
9	Repair the connector. Is the repair completed?	—	Go to Step10	Go to Step9
10	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step10

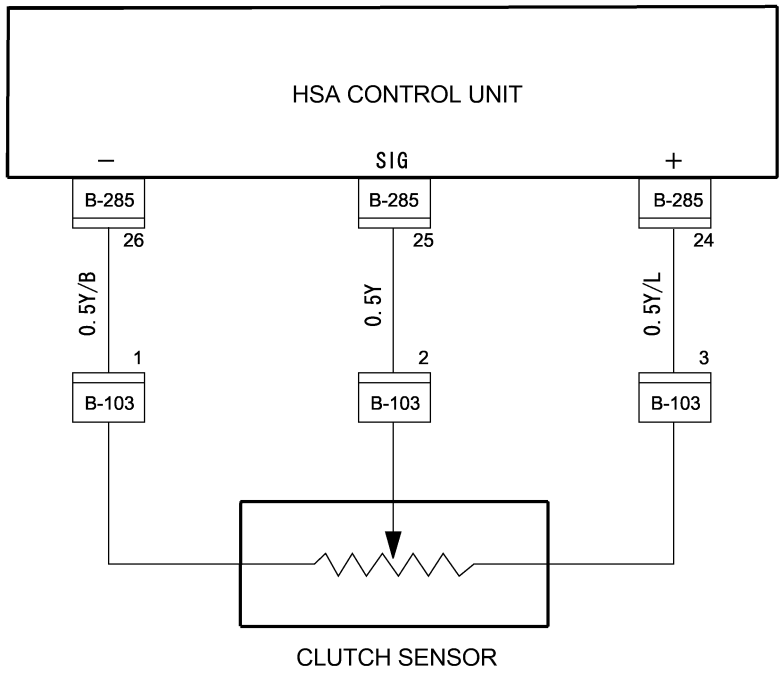
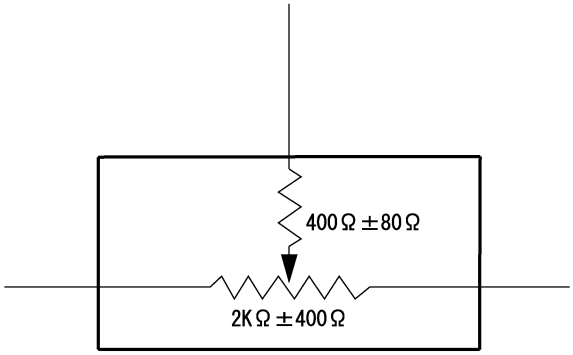
DTC 08 Clutch Sensor Output Voltage Fault

Step	Action	Value	YES	NO
1	Check the clutch sensor. Is the clutch sensor normal?	—	Go to Step2	Go to Step3
2	Measure the resistances between the HSA control unit and the clutch sensor connector terminals 24 “B-285” and 3 “B-103”, 25 “B-285” and 2 “B-103”, 26 “B-285” and 1 “B-103”. Are all the resistances less than 5Ω?	Less than 5Ω	Go to Step4	Go to Step5
3	Replace the clutch sensor. Is the replacement completed?	2kΩ±400	Go to Step4	Go to Step3
4	Replace the HSA control unit. Is the replacement completed?	—	Go to Step6	Go to Step4
5	Repair the open circuit of the circuit that has resistance of 5Ω or more. Is the repair completed?	—	Go to Step6	Go to Step5
6	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step6



CLUTCH SENSOR



CLUTCH SENSOR

N5A3022E

DTC 19 Adjust Switch “FAST” or “SLOW” Remain ON

Step	Action	Value	YES	NO
1	Is the battery voltage applied between the HSA adjust switch connector terminal 3 “B-106” and the body ground (connector disconnected)?	20 V or more	Go to Step2	Go to Step3
2	Is the continuity (resistance) of the HSA adjust switch normal?	—	Go to Step4	Go to Step5
3	Repair the open circuit between the fuse “F-17” and 3 “B-106”. Has the open circuit corrected?	—	Go to Step4	Go to Step3
4	Connect the connector of the HSA adjust switch. Measure the voltages between the HSA control unit connector terminals 15 “B-285”, 21 “B-285” and the body ground. Are the voltages 20V or more with adjust switch operating, and 0V not operating (with the HSA control unit connector disconnected)?	20V with switch operated 0V with not operated	Go to Step6	Go to Step7
5	Repair or replace the switch. Is the repair completed?	—	Go to Step6	Go to Step5
6	Replace the HSA control unit. Is the replacement completed?	—	Go to Step7	Go to Step6
7	Repair the open circuit between the HSA adjust switch connector terminals and the HSA control unit connector terminals 2 “B-106” — 15 “B-285”, 1 “B-106” — 21 “B-285”. Is the repair completed?	—	Go to Step8	Go to Step7
8	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step8

DTC 25 Vehicle Speed Sensor Output Voltage Fault

Step	Action	Value	YES	NO
1	Is there damage or improper connection in the HSA control unit and the speed sensor connector?	—	Go to Step2	Go to Step3
2	Measure the resistance between the speed sensor connector terminal 3 “J-32” and the control unit connector terminal 17 “B-285” (with the connector disconnected). Is the measurement completed?	Less than 5Ω	Go to Step4	Go to Step5
3	Repair the connector. Is the repair completed?	—	Go to Step4	Go to Step3
4	Measure the resistances between the speed sensor connector terminal 2 “J-32” and the body ground (with the connector disconnected). Is the measurement completed?	Less than 5Ω	Go to Step6	Go to Step7
5	Repair the open circuit, connector disconnection, etc. between 3 “J-32” and 17 “B-285” (with the connector disconnected). Is the repair completed?	—	Go to Step6	Go to Step5
6	Check for battery voltage between the speed sensor connector terminal 1 “J-32” and 2 “J-32” (with the connector disconnected). Is the measurement completed?	10V or more	Go to Step8	Go to Step9
7	Repair the open circuit, improper grounding, etc. between 2 “J-32” and “B-1” (with the connector disconnected). Is the repair completed?	—	Go to Step8	Go to Step7
8	Measure the sensor output voltage between the speed sensor connector terminal 3 “J-32” and 2 “J-32”. Is the measurement completed?	2V±1V — 14V+1V — 2V	Go to Step10	Go to Step11
9	Repair the open circuit, connector disconnection, etc. between 11 “B-53” (meter) and 1 “J-32” (with the connector disconnected). Is the repair completed?	—	Go to Step10	Go to Step9
10	Measure the resistance between the meter connector terminals 14 “B-52” and 11 “B-53”. Is the value 390 Ω± 5% (with the connector disconnected)?	390Ω±5%	Go to Step12	Go to Step13
11	Replace the speed sensor. Is the repair completed?	—	Go to Step14	Go to Step11
12	Replace the HSA control unit. Is the repair completed?	—	Go to Step14	Go to Step12
13	Replace the flexible substrate (printed circuit board) of the meter. Is the repair completed?	—	Go to Step14	Go to Step13
14	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step14

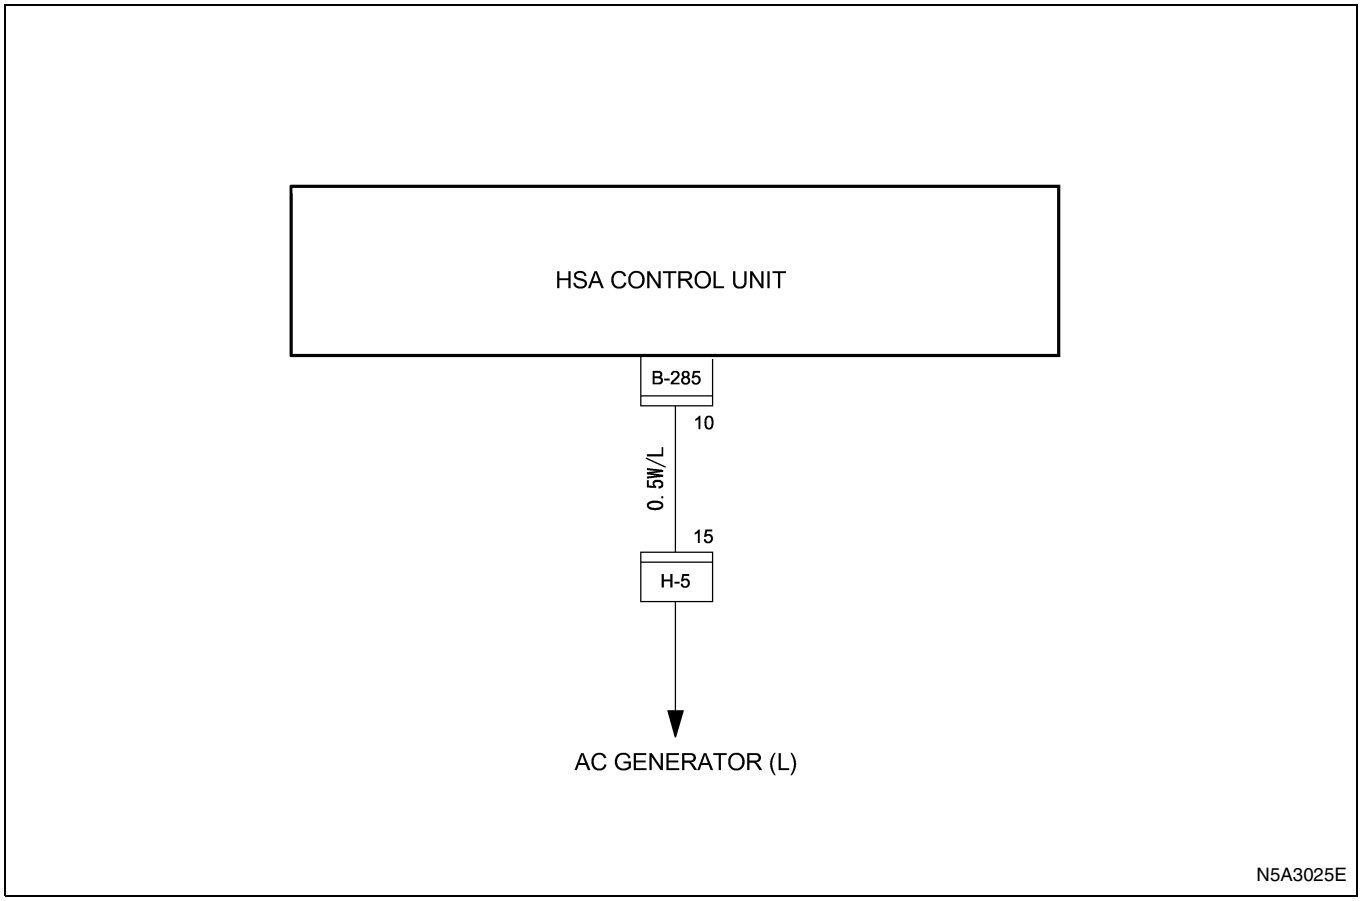
DTC 33 Control Unit Fault

Step	Action	Value	YES	NO
1	Disconnect the connector of the HSA control unit, and then reconnect it. When the trouble code “33” appears again, replace the HSA control unit. Is the repair completed?	—	Go to Step2	Go to Step1
2	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step2

DTC 36 Generator Terminal Output Does not Exist With the Clutch Engaged and Vehicle Running

Step	Action	Value	YES	NO
1	Disconnect the HSA control unit connector “B-285”, and start the engine. Is the voltage of approx. 24V applied between the connector terminal 10 “B-285” and the body ground?	Approx. 24V	Go to Step2	Go to Step3
2	Replace the HSA control unit. Is the repair completed?	—	Go to Step4	Go to Step2
3	Repair the open circuit between the AC generator “L” terminal and 10 “B-285”. Is the repair completed?	—	Go to Step4	Go to Step3
4	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step4



DTC 86 Clutch Switch Does not Turn ON With Clutch Pedal Depressed

Step	Action	Value	YES	NO
1	Is the clutch pedal play normal?	—	Go to Step2	Go to Step3
2	Is there improper connection or damage in the clutch fluid pressure switch connector?	—	Go to Step4	Go to Step5
3	Adjust the clutch play. Is the repair completed?	—	Go to Step4	Go to Step3
4	Measure the resistance of the clutch fluid pressure switch (at the switch side connector) (with the connector disconnected). Is the measurement completed?	5Ω or more with clutch pedal released, less than 5Ω with clutch pedal depressed	Go to Step6	Go to Step7
5	Repair the connector. Is the repair completed?	—	Go to Step6	Go to Step5
6	Measure the battery voltage between the clutch fluid pressure switch connector terminal 1 “B-102” and the body ground (with connector disconnected). Is the measurement completed?	20 V or more	Go to Step8	Go to Step9
7	Replace the clutch fluid pressure switch. Is the repair completed?	—	Go to Step8	Go to Step7
8	Measure the resistance between the clutch fluid pressure switch connector terminal 2 “B-102” and the HSA control unit connector terminal 6 “B-285” (with connector disconnected). Is the measurement completed?	Less than 5Ω	Go to Step10	Go to Step11
9	Repair the open circuit between the fuse “F-17” and 1 “B-102”. Is the repair completed?	—	Go to Step10	Go to Step9
10	Connect all the connectors, turn the starter switch to ON, engage the clutch then disengage the clutch for 5 seconds or more, and engage the clutch for 1 minute. Does the trouble code “86” appear again?	—	Go to Step12	Go to Step13
11	Repair the wire between 2 “B-102” and 6 “B-285”. Is the repair completed?	—	Go to Step13	Go to Step11
12	Replace the HSA control unit. Is the repair completed?	—	Go to Step13	Go to Step12
13	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step13

List of Trouble Phenomenon

For the troubles which are not appeared as trouble code, interview the customer and the test run the vehicle to check for trouble symptom, and perform the diagnosis according the symptom.

	Possible cause															
Trouble symptom	Door switch	Parking brake switch	Clutch fluid pressure switch	HSA reset switch	HSA valve, pipe	ACG	HSA lamp (including meter)	HSA off switch	HSA adjust switch	Speed sensor	Neutral switch	Stop lamp switch	Clutch sensor	Back-up lamp switch	Diode box	Action to be taken
HSA does not operate.		❍			❍	❍					❍	❍				Refer to the trouble symptom.
HSA does not release though the HSA off switch is depressed.					❍			❍								Refer to the trouble symptom.
HSA does not release though the vehicle is operated to start. (HSA indicator lamp remains ON.)											❍		❍			Refer to the trouble symptom.
HSA does not release though the parking brake is applied.		❍														Refer to the trouble symptom.
HSA indicator lamp does not come on. (HSA does not operate.)		❍			❍	❍					❍	❍				Refer to the trouble symptom.
HSA indicator lamp does not come on. (HSA does operate.)							❍									Refer to the trouble symptom.
HSA indicator lamp does not go off. (HSA released.)							❍									Refer to the trouble symptom.
Buzzer does not sound though the door is opened while HSA operating.	❍														❍	Refer to the trouble symptom.
HSA indicator lamp blinks abnormally and does not output the trouble cord during self-diagnosis.		❍					❍									Refer to the trouble symptom.
Buzzer beeps continuously during self-diagnosis (trouble code output impossible)									❍					❍		Refer to the trouble symptom.

Symptom: HSA Does not Operate

Step	Action	Value	YES	NO
1	Does the HSA indicator lamp not illuminate?	—	Go to Step2	Go to Step3
2	Is the fuse “F-17” normal?	—	Go to Step4	Go to Step5
3	Check the HSA valve and the pipe, and repair or replace. Is the repair completed?	—	Go to Step5	Go to Step3
4	Measure the battery voltage between the HSA control unit connector terminal 14 “B-285” and the body ground (with connector disconnected). Is the measurement completed?	20 V or more	Go to Step6	Go to Step7
5	Repair the short circuit in the circuit and the parts (clutch fluid pressure switch, HSA valve, etc.) connected to the fuse “F-17”, and then replace the fuse. Is the repair completed?	—	Go to Step6	Go to Step5
6	Measure the resistance between the HSA control unit connector terminal 30 “B-285” and the body ground (with connector disconnected). Is the measurement completed?	Less than 5Ω	Go to Step8	Go to Step9
7	Repair the open circuit between the fuse “F-17” and 14 “B-285”. Is the repair completed?	—	Go to Step8	Go to Step7
8	Measure the battery voltage between the HSA control unit connector terminal 2 “B-285” and the body ground (with connector disconnected) with the parking brake not applied. Is the measurement completed?	20 V or more	Go to Step10	Go to Step11
9	Repair the open circuit or improper grounding between 30 “B-285” and the ground terminal “B-7” (in front of the frame LH) (with the connector disconnected). Is the repair completed?	—	Go to Step10	Go to Step9
10	Is the fuse “F-5” normal?	—	Go to Step12	Go to Step13
11	Is the continuity (resistance) of the parking brake switch normal?	—	Go to Step28	Go to Step29
12	Measure the continuity (resistance) in the switch side terminal of the stop lamp switch. Does the resistance exist when the brake pedal depressed, and no resistance when the brake pedal released (with the connector disconnected)?	—	Go to Step14	Go to Step15
13	Check and repair the short circuit in the stop lamp circuit, and then replace the fuse. Is the repair completed?	—	Go to Step14	Go to Step13
14	Measure the battery voltage between the stop lamp switch connector terminal 1 “B-66” and the body ground (with connector disconnected). Is the measurement completed?	20V or more	Go to Step16	Go to Step17

Step	Action	Value	YES	NO
15	Repair or replace the stop lamp switch. Is the repair completed?	—	Go to Step15	Go to Step15
16	Connect the connector of the stop lamp switch. Measure the battery voltage between the HSA control unit connector terminal 19 “B-285” and the body ground (with connector disconnected) with the brake pedal depressed. Is the measurement completed?	20V or more	Go to Step18	Go to Step19
17	Repair the open circuit between the fuse “F-5” and 1 “B-66” (stop lamp switch). Is the repair completed?	—	Go to Step18	Go to Step17
18	Is the continuity (resistance) of neutral switch normal?	—	Go to Step20	Go to Step21
19	Repair the open circuit between 2 “B-66” and 19 “B-285”. Is the repair completed?	—	Go to Step20	Go to Step19
20	Measure the battery voltage between the neutral switch connector terminal 2 “J-50” and the body ground (with the connector disconnected). Is the measurement completed?	20V or more	Go to Step22	Go to Step23
21	Repair or replace the neutral switch. Is the repair completed?	—	Go to Step22	Go to Step21
22	Connect the connector “J-50” of the neutral switch. Measure the battery voltage between the HSA control unit connector terminal 18 “B-285” and the body ground (with connector disconnected) with the gear in neutral. Is the measurement completed?	20V or more with gear in neutral, 0V with gear except in neutral	Go to Step24	Go to Step25
23	Repair the open circuit between the fuse “F-28” and 2 “J-50”. Is the repair completed?	—	Go to Step24	Go to Step23
24	Measure the voltage between the HSA control unit connector terminal 10 “B-285” and the body ground (connector disconnected) with engine running. Is the measurement completed?	Approx. 24 V	Go to Step26	Go to Step27
25	Repair the open circuit between 1 “J-50” and 18 “B-285”. Is the repair completed?	—	Go to Step26	Go to Step25
26	Replace the HSA control unit. Is the repair completed?	—	Go to Step28	Go to Step29
27	Repair the open circuit between the AC generator “L” terminal and 10 “B-285”. Is the repair completed?	—	Go to Step30	Go to Step27
28	Replace the HSA control unit. Is the repair completed?	—	Go to Step30	Go to Step28

Step	Action	Value	YES	NO
29	Repair or replace the parking brake switch. Is the repair completed?	—	Go to Step30	Go to Step29
30	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step30

Symptom: HSA Does not Release Though the Vehicle Is Operated to Start (HSA Indicator Lamp Remains ON)

Step	Action	Value	YES	NO
1	Is the continuity (resistance) of neutral switch normal?	—	Go to Step2	Go to Step3
2	Is the clutch sensor properly installed (check the trouble code “08”)?	—	Go to Step4	Go to Step5
3	Repair or replace the neutral switch. Is the repair completed?	—	Go to Step4	Go to Step3
4	Is the resistance between the clutch sensor terminals within the specified range?	—	Go to Step6	Go to Step7
5	After installation, perform the initial adjustment. Is the repair completed?	—	Go to Step8	Go to Step8
6	Replace the HSA control unit. Is the repair completed?	—	Go to Step8	Go to Step6
7	Replace the clutch sensor. Is the repair completed?	—	Go to Step8	Go to Step7
8	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step8

Symptom: HSA Does not Release Though the Parking Brake Is Applied

Step	Action	Value	YES	NO
1	Is the continuity (resistance) of the parking brake switch normal?	—	Go to Step2	Go to Step3
2	Measure the battery voltage between the parking brake switch connector terminal 1 “N-6” and the body ground (with the connector disconnected). Is the measurement completed?	20V or more	Go to Step4	Go to Step5
3	Repair or replace the parking brake switch. Is the repair completed?	—	Go to Step4	Go to Step3
4	Measure the battery voltage between the HSA control unit connector terminal 2 “B-285” and the body ground (with connector disconnected). Is the measurement completed?	20V or more	Go to Step6	Go to Step7
5	Repair the improper connection or open circuit between 5 “B-51” (meter) and 1 “N-6”. Is the repair completed?	—	Go to Step7	Go to Step5
6	Replace the HSA control unit. Is the repair completed?	—	Go to Step8	Go to Step6
7	Repair the open circuit between 5 “B-51” (meter) and 2 “B-285”. Is the repair completed?	—	Go to Step8	Go to Step7
8	After HSA repair, make sure no trouble is found during self-diagnosis. Is this step completed?	—	—	Go to Step8

Symptom: Buzzer Beeps Continuously During Self-diagnosis (Trouble Code Output Impossible)

Step	Action	Value	YES	NO
1	Refer to “Symptom: HSA indicator lamp blinks abnormally”. Is this step completed?	—	—	Go to Step1

Symptom: HSA Warning Lamp Had Blinked or Buzzer Had Beeped In the Past (Currently the System Is Normal)

Symptom	Possible cause	Action to be taken
HSA warning lamp had blinked in the past.	The warning lamp blinked when the back-up fuse “F-19” was disconnected.	The warning lamp blinked when the adjusted value was extremely off the point, or when the clutch play adjustment was not completed.
	This indicates no malfunction.	Properly adjust according to the adjustment procedure.
	The warning lamp blinked when the HSA had been operated for 7 — 8 minutes.	Longtime alarm. This indicates no malfunction.
	The warning lamp blinked when the vehicle had moved while the HSA operating. (The warning lamp blinked when the vehicle was started with brake dragged, or when the vehicle moved back because the brake pedal was depressed insufficiently.)	Vehicle motion alarm This indicates no malfunction.
	The warning lamp blinked when the adjust switch “FAST” or “SLOW” was depressed while the vehicle running.	Fault in adjust switch (code 19) was detected but not a malfunction. (When turning the adjust switch to OFF, the diagnosis stops and the lamp goes off.)
HSA warning buzzer had beeped in the past.	The warning buzzer beeped when the HSA had been operated for 7 — 8 minutes.	Longtime alarm. This indicates no malfunction.
	The warning buzzer beeped when the vehicle had moved while the HSA operating. (The warning lamp blinked when the vehicle was started with brake dragged, or when the vehicle moved back because the brake pedal was depressed insufficiently.)	Vehicle motion alarm. This indicates no malfunction.
	The warning buzzer beeped when the starter switch was turned ON with the back-up fuse “F-19” disconnected.	It was caused by the control unit being reset, and not a malfunction.

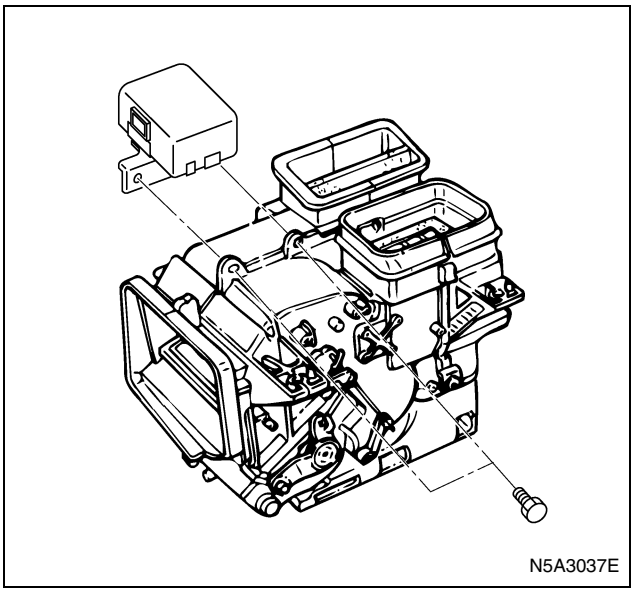
Caution:
The trouble code 03 is displayed when diagnosing with the fuse removed.
The warning lamp blinks when the HSA release adjustment is set-up fully to the FAST side or SLOW side with the HSA adjust switch depressed. With this condition, the vehicle will move back when starting or brake dragging. To prevent this, correctly adjust it.
Never operate the adjust switch while driving. Otherwise, it will lower the driver performance.

HSA Control Unit

Removal

1. Remove the instrument panel ASM.
   - Refer to the item regarding the instrument panel in the chapter 2 body section.
2. Remove the ventilation duct.
3. Remove the HSA control unit.
   - Remove the two installing bolts and nuts.

     Disconnect the two connectors.



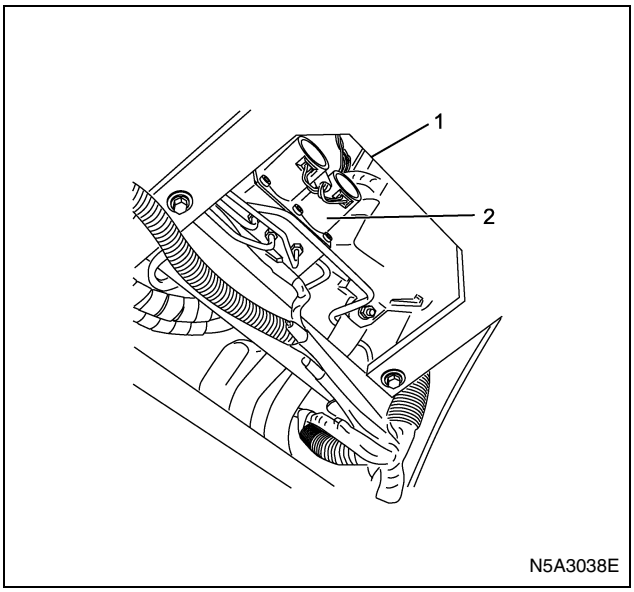
Installation

Install in the reverse order of removal.

HSA Valve

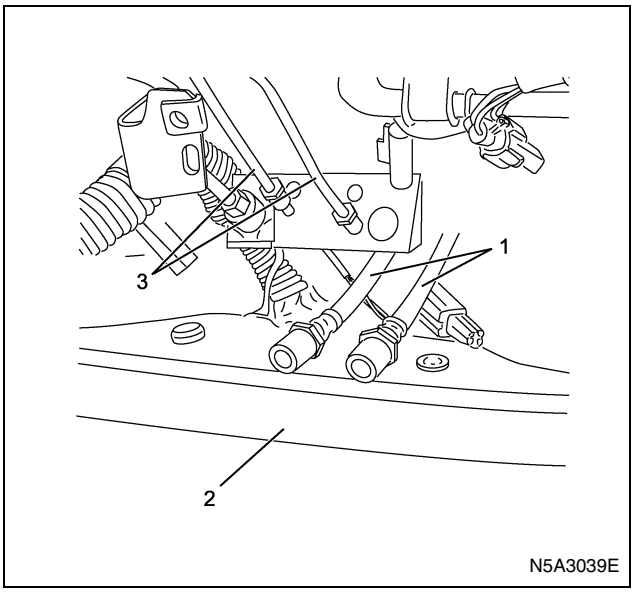
Removal

1. Remove the undercover.



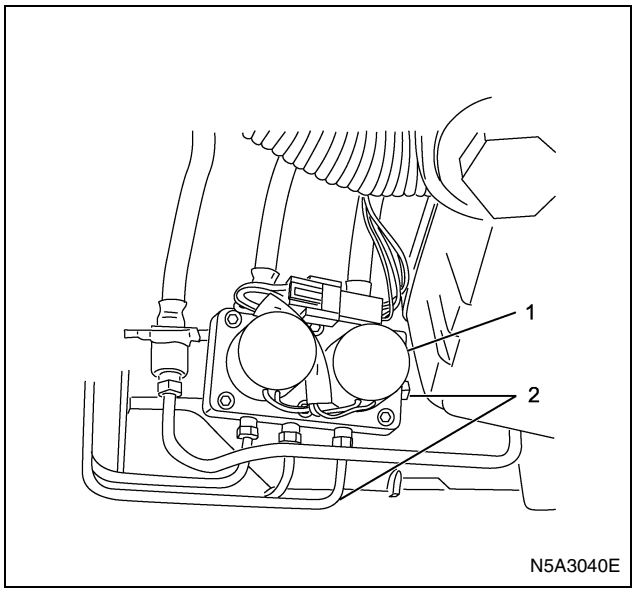
Legend
1. Undercover
2. HSA valve

2. Disconnect the HSA valve connector.



Legend
1. Hose
2. Bumper
3. Brake pipe

3. Remove the radiator grille.
4. Disconnect the connection of the brake pipe and the hose.



Legend
1. HSA valve
2. Pipe

5. Disconnect the pipe.
6. Disconnect the HSA valve.

Installation

1. Install the two installing bolts of HSA valve.

Tighten:
Bolts to 21 N·m (2.1 kg·m/15.5 lb·ft)

2. Install the brake pipe.

Tighten:
Brake pipe to 16 N·m (1.6 kg·m/11.8 lb·ft)

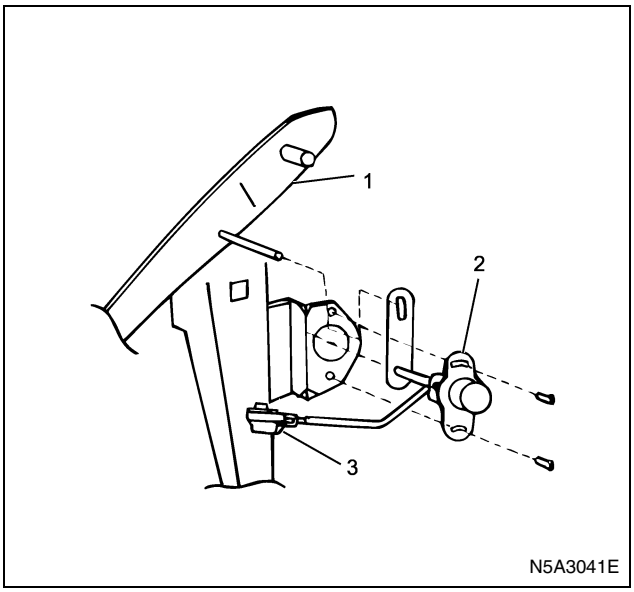
3. Connect the connector.

Caution:
- Make sure there is no dust or foreign materials in and around the pipe connection.
- Be careful to correctly connect the pipe.
- After installation, bleed air from the brake system completely.
- Be sure to use fresh specified brake fluid.

Clutch Sensor

Removal

1. Disconnect the connection of the connector.
2. Remove the two installing bolts of the clutch sensor.



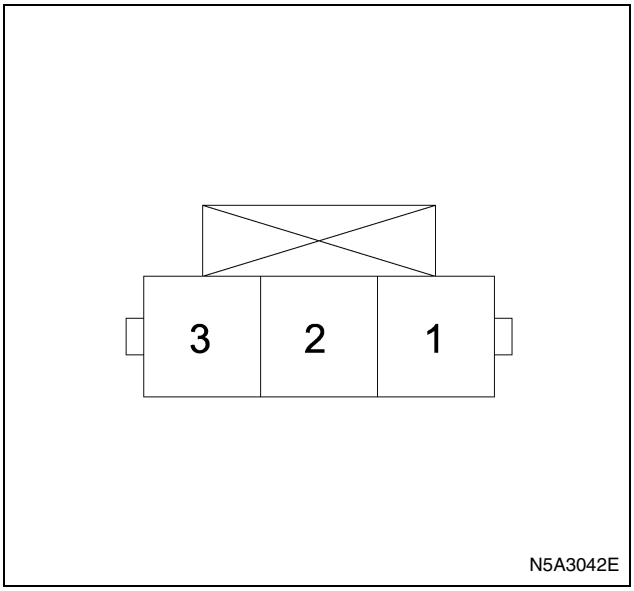
Legend

1. Clutch pedal
2. Clutch sensor
3. Connector

Inspection

Disconnect the connector of the clutch sensor, and measure the resistance between terminals.

1. Terminal 1 — Terminal 3 — 2kΩ±400Ω
2. Clutch pedal operated
   - Terminal 2 — Terminal 1 — Approx. 400Ω — 2.8kΩ

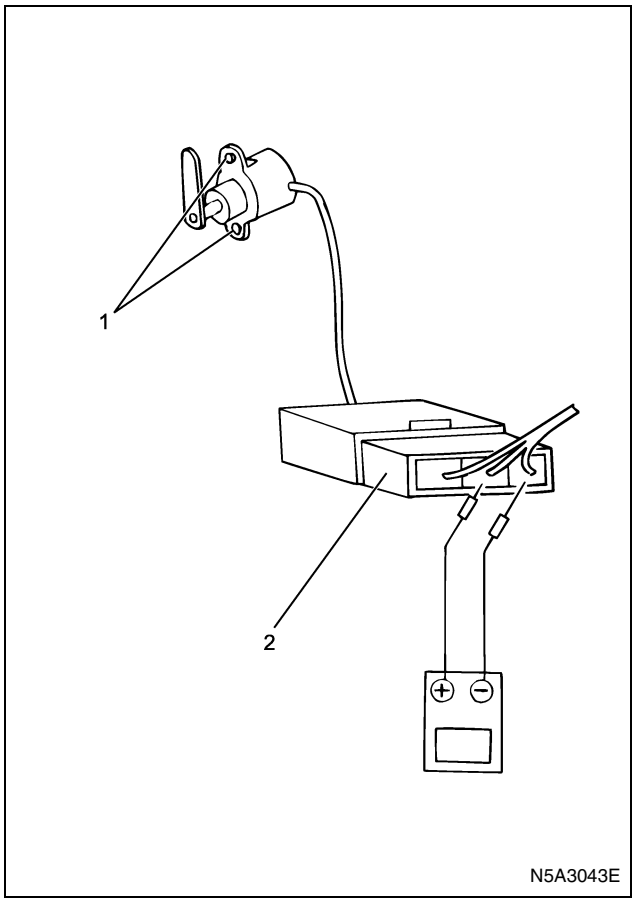


Adjustment

1. Loosen the installing bolts of the clutch sensor.
2. Turn the starter switch to “ON”.
3. Adjust the sensor installing position so that the voltage between the clutch sensor connector terminals 2 (SIG) — terminal 1 (GND) is 0.5±0.2V when the clutch pedal is fully released (clutch fully engaged).

Caution:

- Adjust with the clutch sensor connector connected to the body side harness connector.
- For voltage check, connect the tester from the backside of the body side connector.



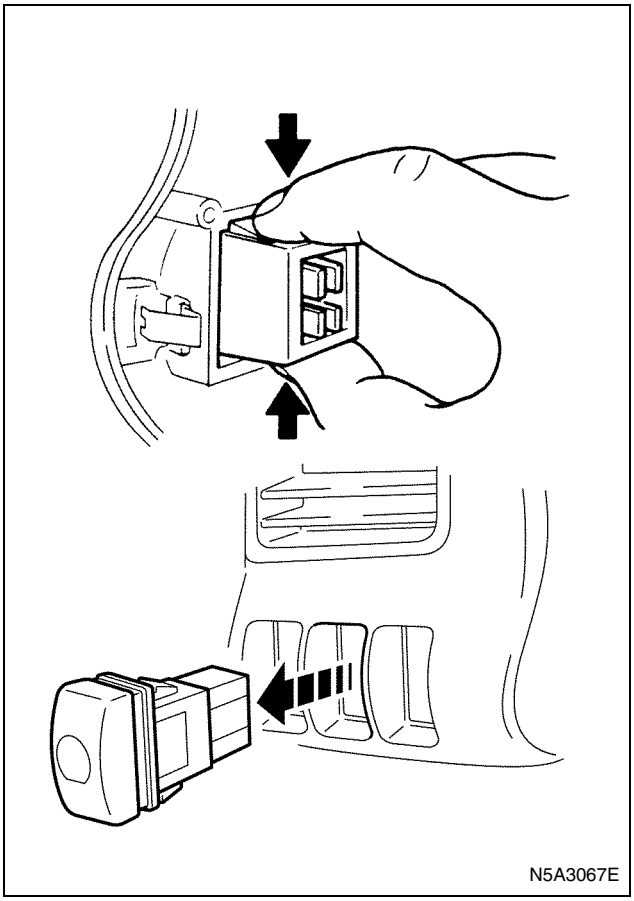
Legend

1. Clutch sensor installing nut
2. Body side connector

HSA Off Switch

Removal

1. Remove the meter clutster.
2. Disconnect the connector.
3. Remove the HSA off switch.
   - Remove it while pressing the switch claw from the backside of the instrument panel.

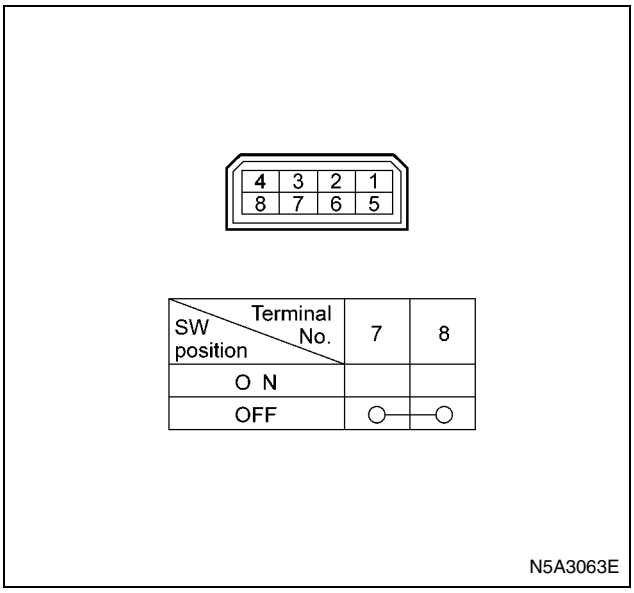


Installation

Install in the reverse order of removal.

Inspection

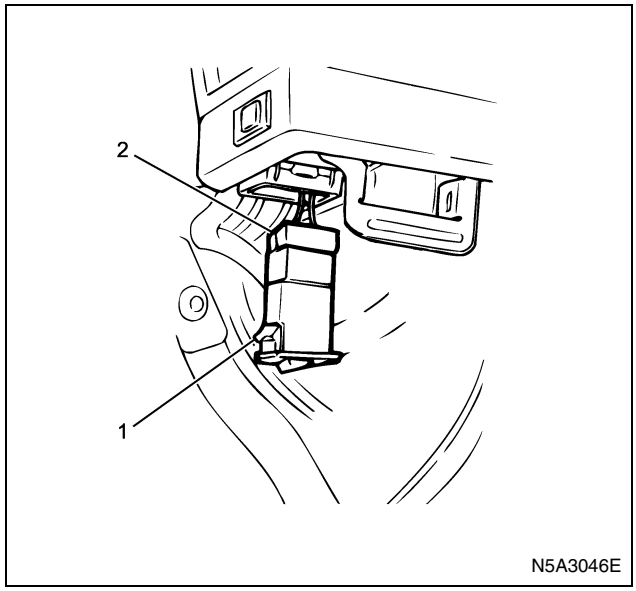
Check for continuity between the switch terminals.



HSA Reset Switch

Removal

1. Remove the HSA reset switch.
2. Disconnect the connector.

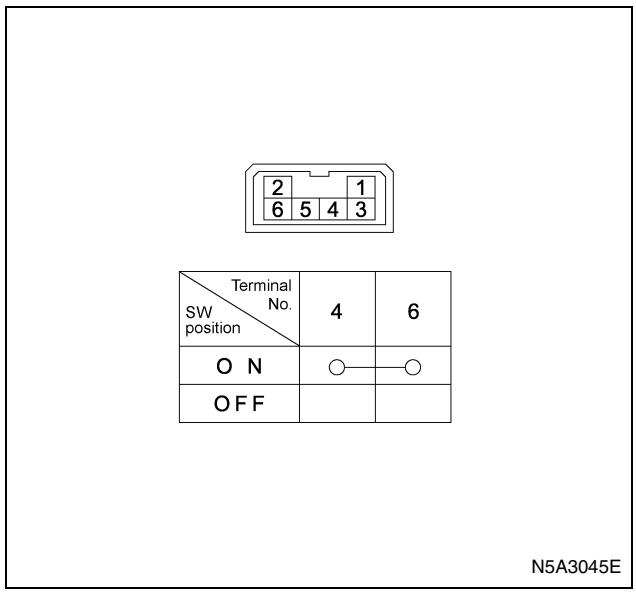


Legend

1. HSA reset switch
2. Connector

Inspection

Check for continuity between the switch terminals.



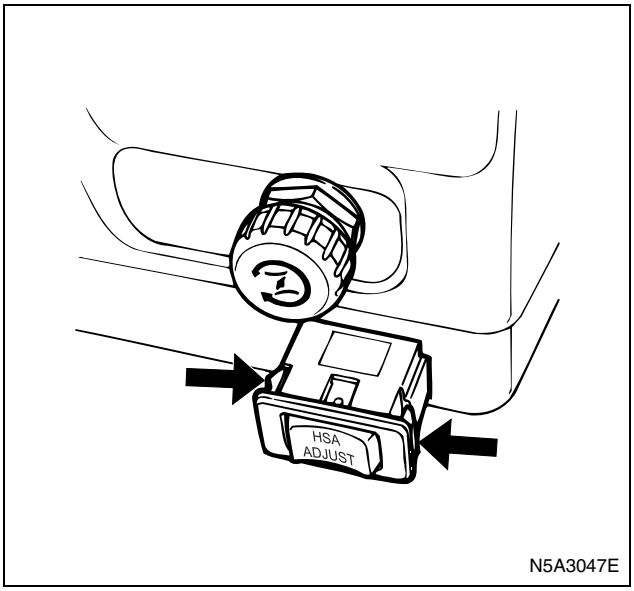
Installation

Install in the reverse order of removal.

HSA Adjust Switch

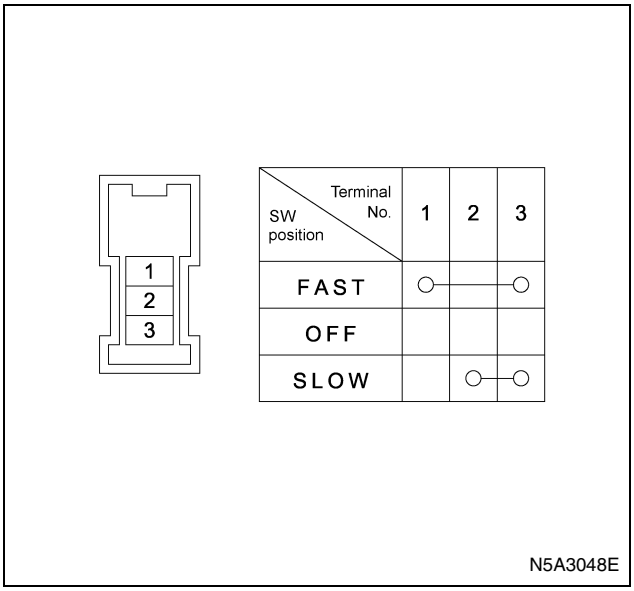
Removal

1. Disconnect the connector.
2. Remove the HSA adjust switch.
   - Remove it while pressing the switch claw from the backside of the instrument panel.



Inspection

Check for continuity between the switch terminals.



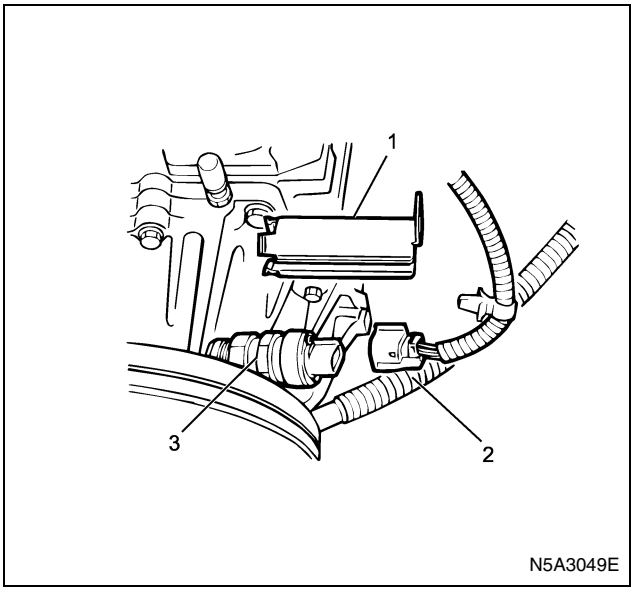
Installation

Install in the reverse order of removal.

Speed Sensor

Removal

1. Remove the protector.
2. Disconnect the connection of the connector.
3. Remove the speed sensor.



Legend

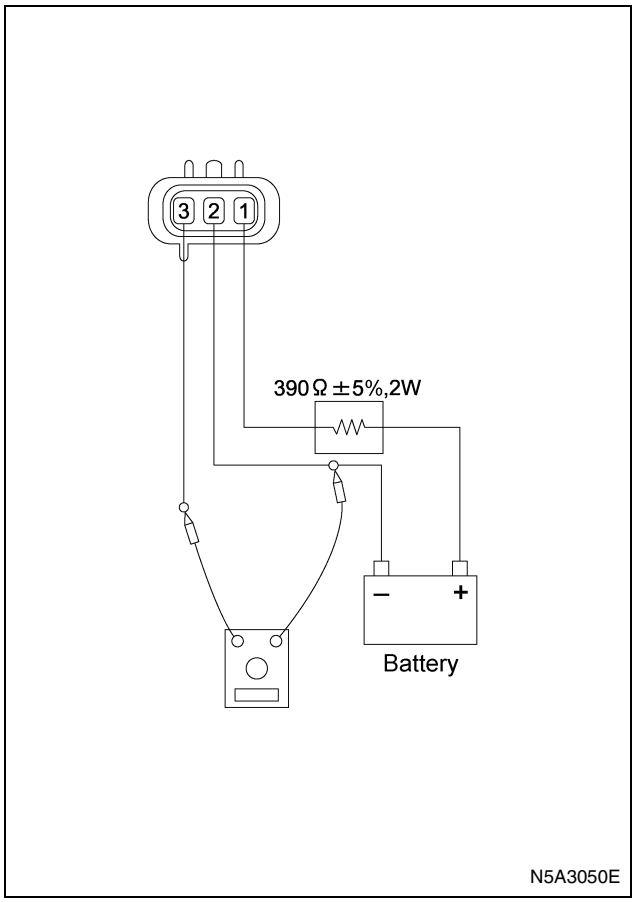
1. Protector
2. Connector
3. Speed sensor

Inspection

1. Connect a resistance of 390Ω±5%, 2W between the speed sensor connector terminal 1 “J-32” and the battery (+) terminal, and connect 2 “J-32” to the battery (−) terminal.

Caution:
Never connect the battery (+) terminal to the connector 3 “J-32”. It may cause the speed sensor failure.

2. Measure the voltage between 3 “J-32” and 2 “J-32” using a digital tester while slowly rotating the speed sensor shaft.
   The voltage shows 2V±1V and 14V (+1V, −2V) repeatedly for 8 times per one rotation of the shaft.
   If the result of the inspection is unsatisfactory, replace with a new part.



Installation

1. Install the speed sensor.

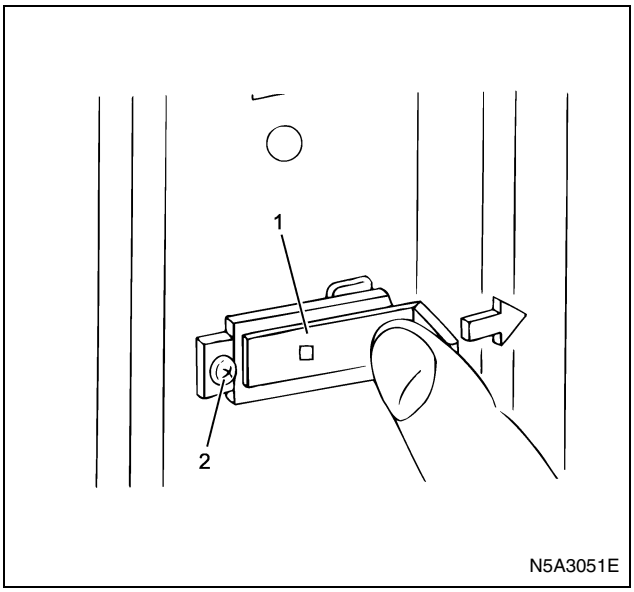
Tighten:
Speed sensor to 25 N·m (2.5 kg·m/18.4 lb·ft)

2. Install the protector.
3. Connect the connector.

Door Switch

Removal

1. Remove the installing screw while pressing the sliding part of the door switch.
   - Disconnect the connector.

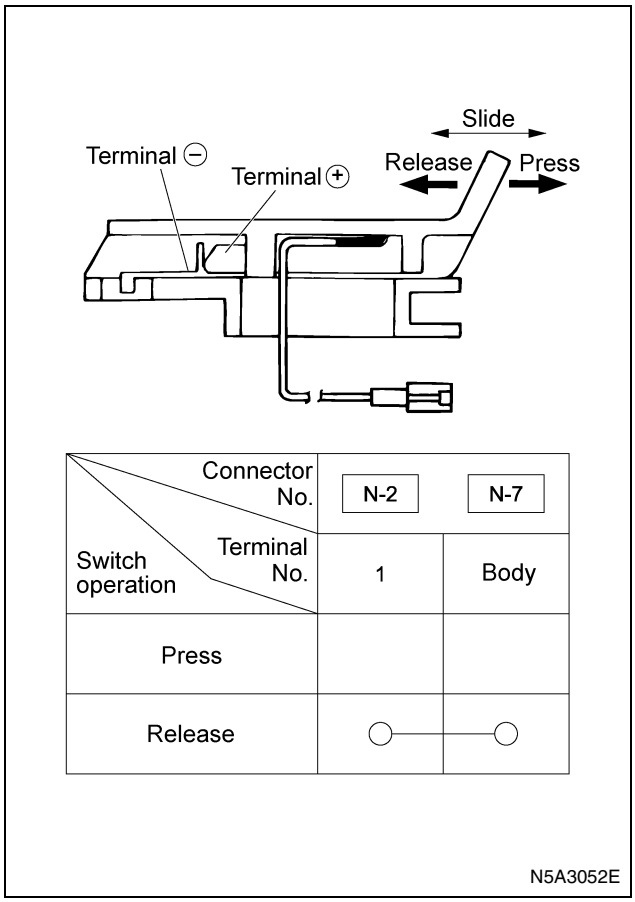


Legend

1. Sliding part
2. Screw

Inspection

Move the sliding part to check for continuity between the terminal and the body.



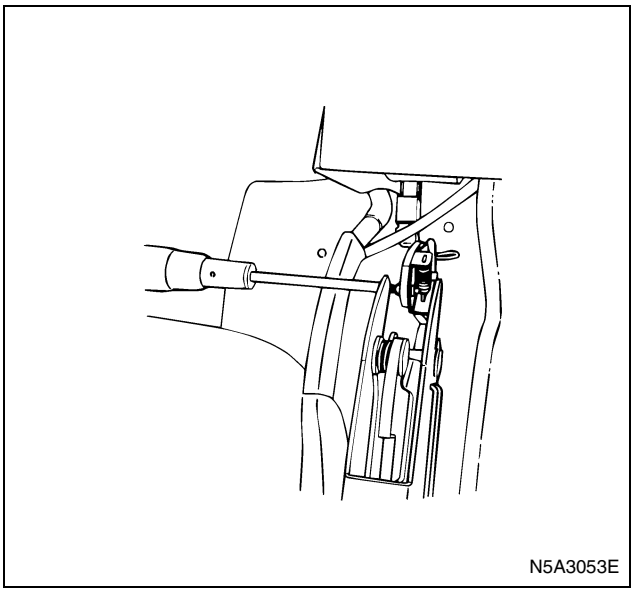
Installation

Install in the reverse order of removal.

Parking Brake Switch

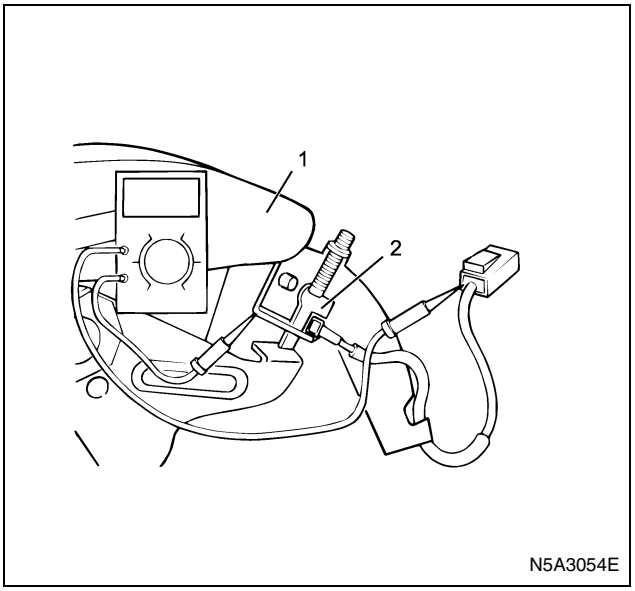
Removal

1. Remove the parking brake rear cover.
   - Disconnect the two clips.
2. Remove the parking brake switch.
   - Remove the one installing screw.
   - Disconnect the connector.



Inspection

1. Disconnect the parking brake switch connector.
2. Connect the circuit between the switch terminal and the body to check for continuity.
   With parking brake applied = Continuity exists
   With parking brake released = No continuity
   If the result of the inspection is unsatisfactory, repair or replace with a new part.



Legend

1. Parking brake lever
2. Parking brake switch

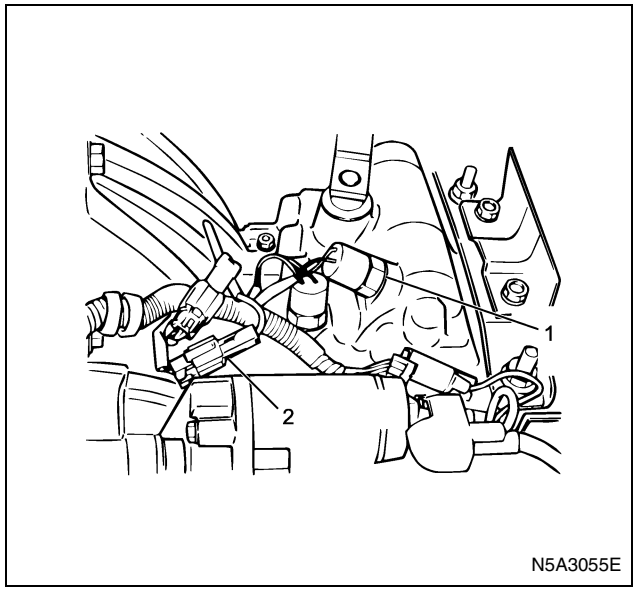
Installation

Install in the reverse order of removal.

Neutral Switch

Removal

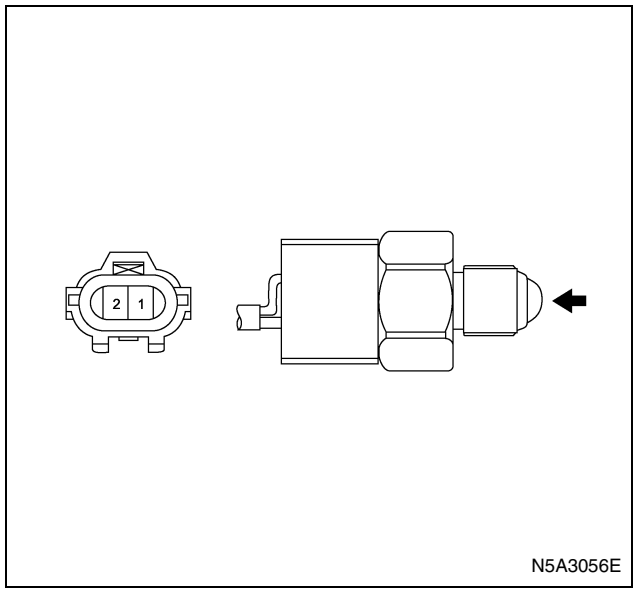
1. Remove the neutral switch.
   - Disconnect the connector.
   - Twist off the switch to remove.



Legend
1. Neutral switch
2. Connector (gray)

Inspection

Press the switch to check the continuity between the connector terminals.
With switch released = Continuity exists
With switch pressed = No continuity



Installation

1. Apply liquid gasket to the threaded portion of the neutral switch to install.

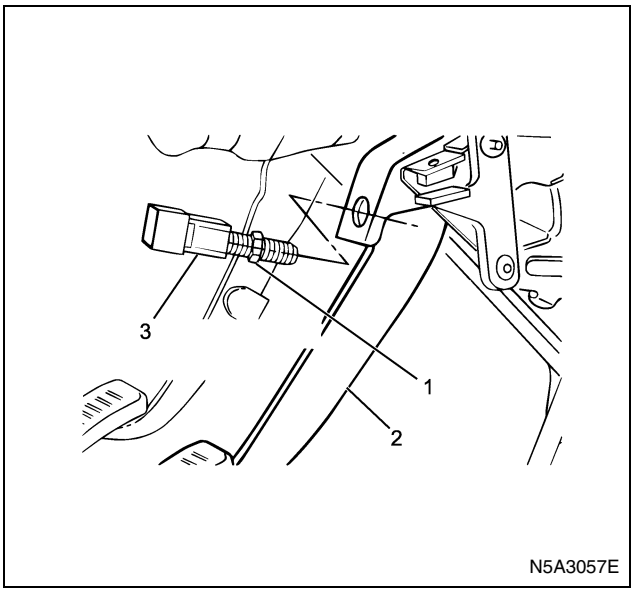
Liquid gasket: THREE BOND 1141

Tighten:
Neutral switch to 34 N·m (3.5 kg·m/25.1 lb·ft)

Stop Lamp Switch

Removal

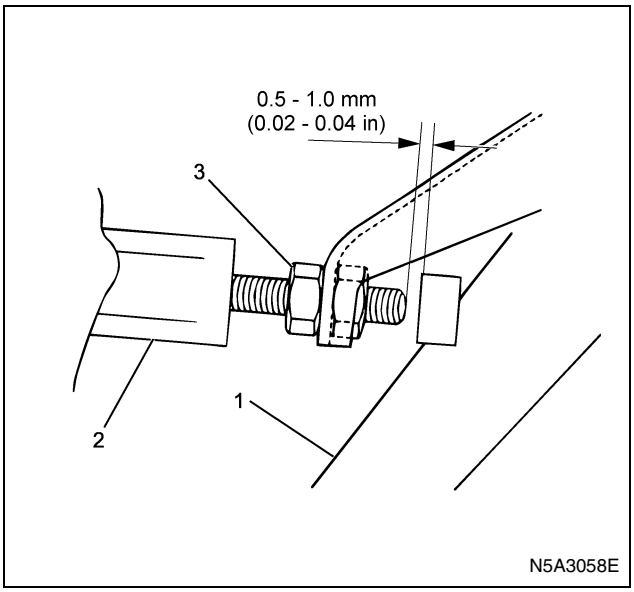
1. Remove the stop lamp switch.
   - Disconnect the connector of the stop lamp switch.
   - Loosen the lock nut.
   - Turn the switch body to remove from the bracket.



Legend
1. Lock nut
2. Brake pedal
3. Stop lamp switch

Installation

1. Install the stop lamp switch.
   - Screw in until the thread end of the stop lamp switch contacts the brake pedal.



Legend
1. Brake pedal
2. Stop lamp switch
3. Lock nut

Caution:
Screw in until the thread end of the stop lamp switch contacts the brake pedal.

- After contacting with the pedal, back off the switch to make clearance between 0.5 — 1.0 mm (0.02 — 0.04 in), and then tighten the lock nut.

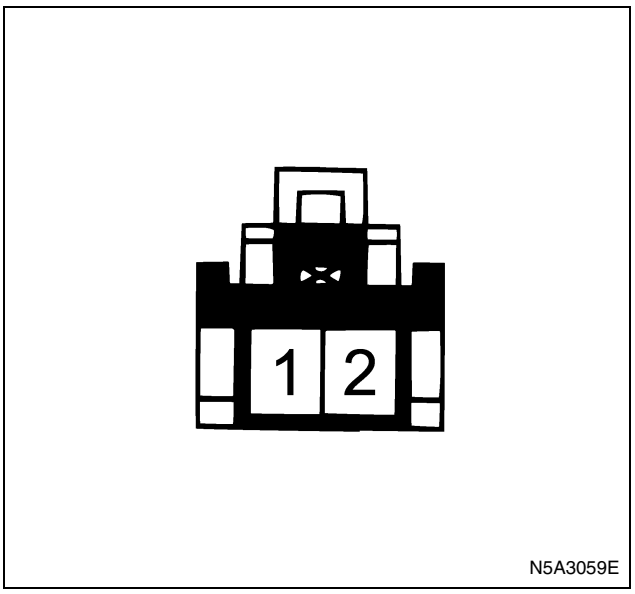
Clutch Fluid Pressure Switch

Removal

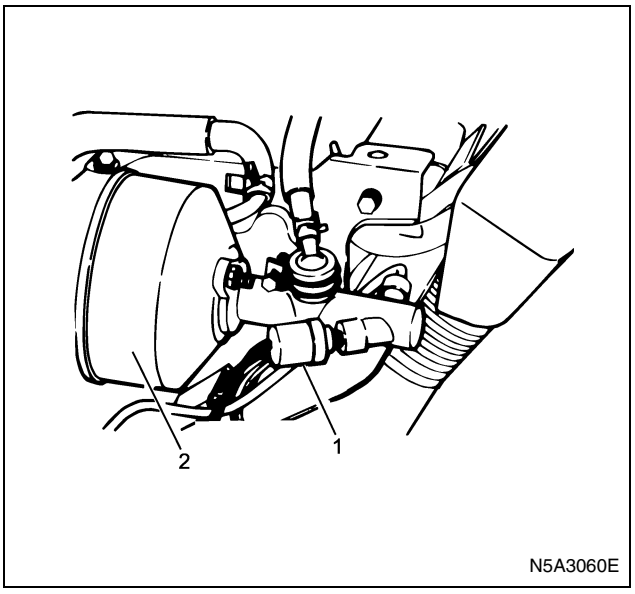
1. Check the clutch fluid pressure switch.
   - Disconnect the clutch fluid pressure switch connector, and check for continuity between the connector terminals with the clutch pedal fully depressed/released.

     With clutch pedal depressed = Continuity exists

     With clutch pedal released = No continuity



2. Remove the clutch fluid pressure switch.
   - Disconnect the connector, and twist off the hexagon nut portion of the switch.



Legend
1. Clutch fluid pressure switch
2. Clutch booster

Installation

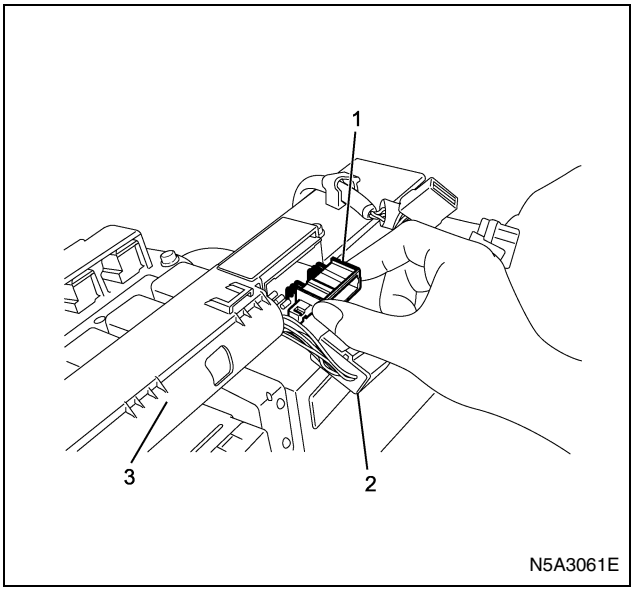
1. Install the clutch fluid pressure switch.

Tighten:
Clutch fluid pressure switch to 15 N·m (1.5 kg·m/11.1 lb·ft)

Diode Box

Removal

1. Remove the instrument panel.
2. Disconnect the connector.
3. Remove the diode box.

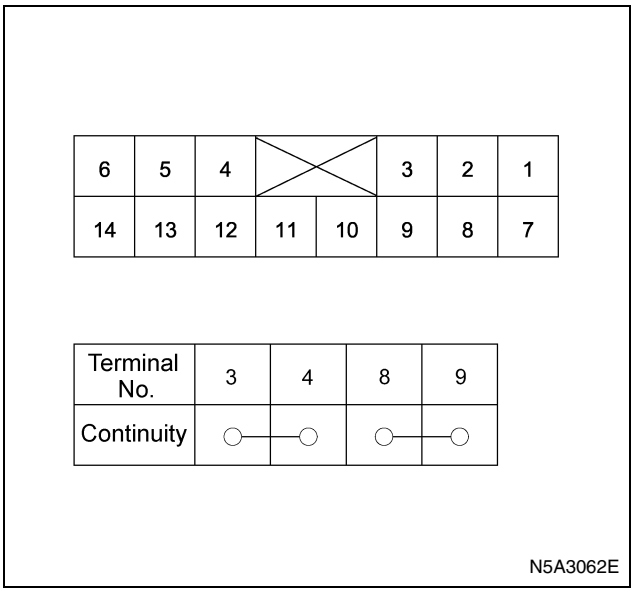


Legend

1. Diode box
2. Connector
3. Relay box

Inspection

Check for continuity between the unit terminals.



Installation

Install in the reverse order of removal.

TROUBLESHOOTING

Hard Starting

1. Starter Inoperative

Checkpoint	Possible cause	Correction
Battery	Loose battery cable terminal Poor connections due to rusting	Clean and/or retighten the battery cable terminal
	Battery discharged or weak	Recharge or replace the battery
	Fan belt loose or broken	Adjust or replace the fan belt
Fusible link	Fusible link shorted	Replace the fusible link
Starter switch	Defective starter switch or starter relay	Replace the starter switch or the starter relay
Starter motor	Defective magnetic switch or starter relay	Repair or replace the magnetic switch
	Defective starter motor	Repair or replace the starter motor

2. Starter Motor Operates But Engine Does Not Turn Over

Checkpoint	Possible cause	Correction
Battery	Loose battery cable terminal Poor connections due to rusting	Clean and/or retighten the battery cable terminal
	Battery discharged or weak	Recharge or replace the battery
	Fan belt loose or broken	Adjust or replace the fan belt
Starter motor	Defective pinion gear	Replace the pinion gear
	Defective magnetic switch	Repair or replace the magnetic switch
	Brush wear, Weak brush spring	Replace the brush and/or the brush spring
Engine	Piston, crank bearing seizure, or other damage	Repair or replace the related parts

3. Engine Turns Over But Does Not Start

Checkpoint	Possible cause	Correction
Engine stop mechanism	Defective fuel cut solenoid valve	Replace the fuel cut solenoid valve

Fuel is Not Being Delivered to The Injection Pump

Fuel	Fuel tank is empty	Fill the fuel tank
Fuel piping	Clogged or damaged fuel lines Loose fuel line connection	Repair or replace the fuel lines Retighten the fuel line connection
Fuel filter	Fuel filter overflow valve does not close	Repair or replace the fuel filter overflow valve
	Clogged fuel filter element	Replace the fuel filter element or the filter cartridge
Fuel system	Air in the fuel system	Bleed the air from the fuel system
Fuel feed pump	Defective feed pump	Repair or replace the feed pump

Fuel is Being Delivered to The Injection Pump

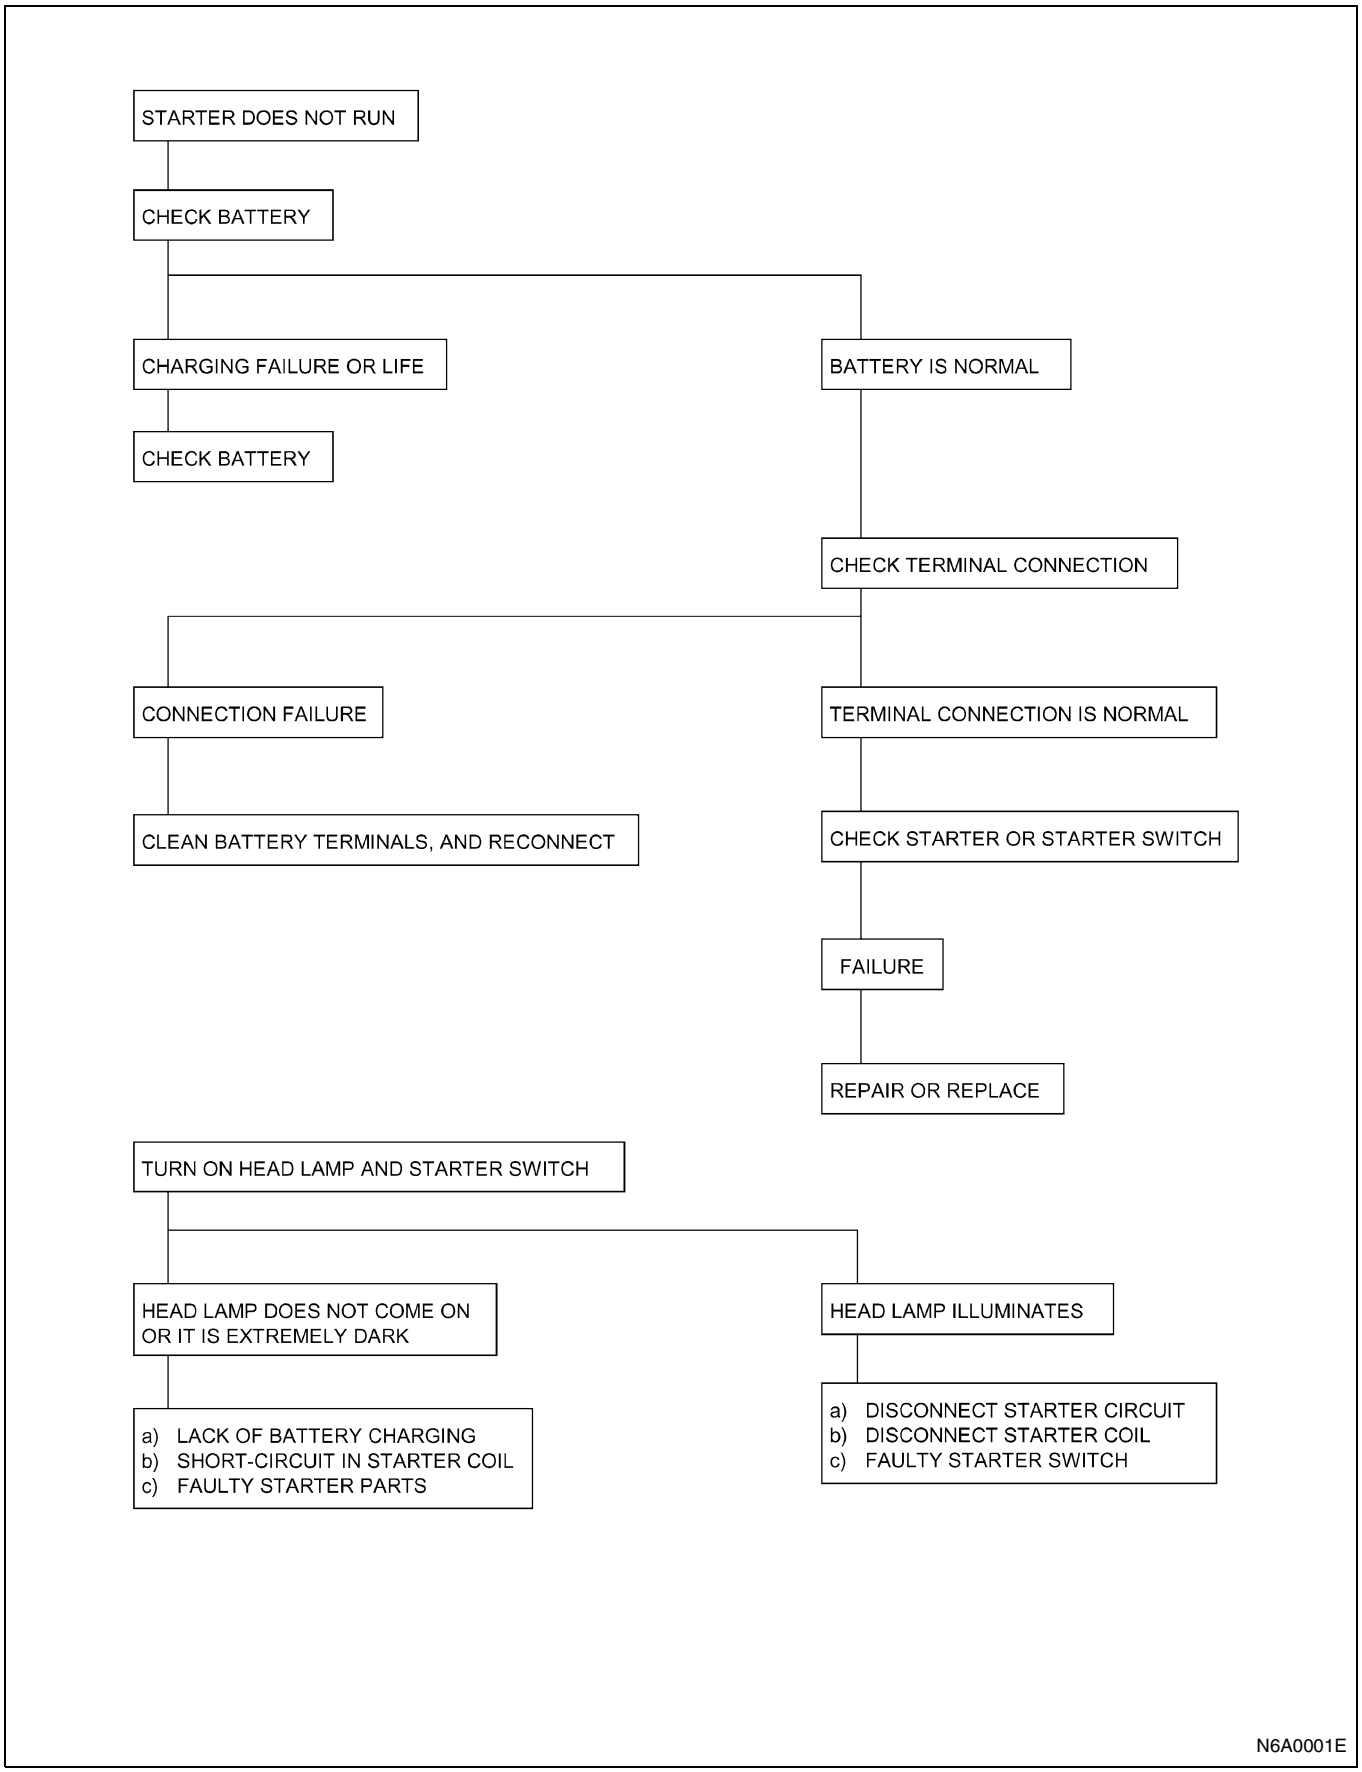
Fuel	Use of the wrong fuel	Use the correct fuel
	Water particles in the fuel	Charge the fuel
Fuel system	Air in the injection pump	Bleed the air from the fuel system

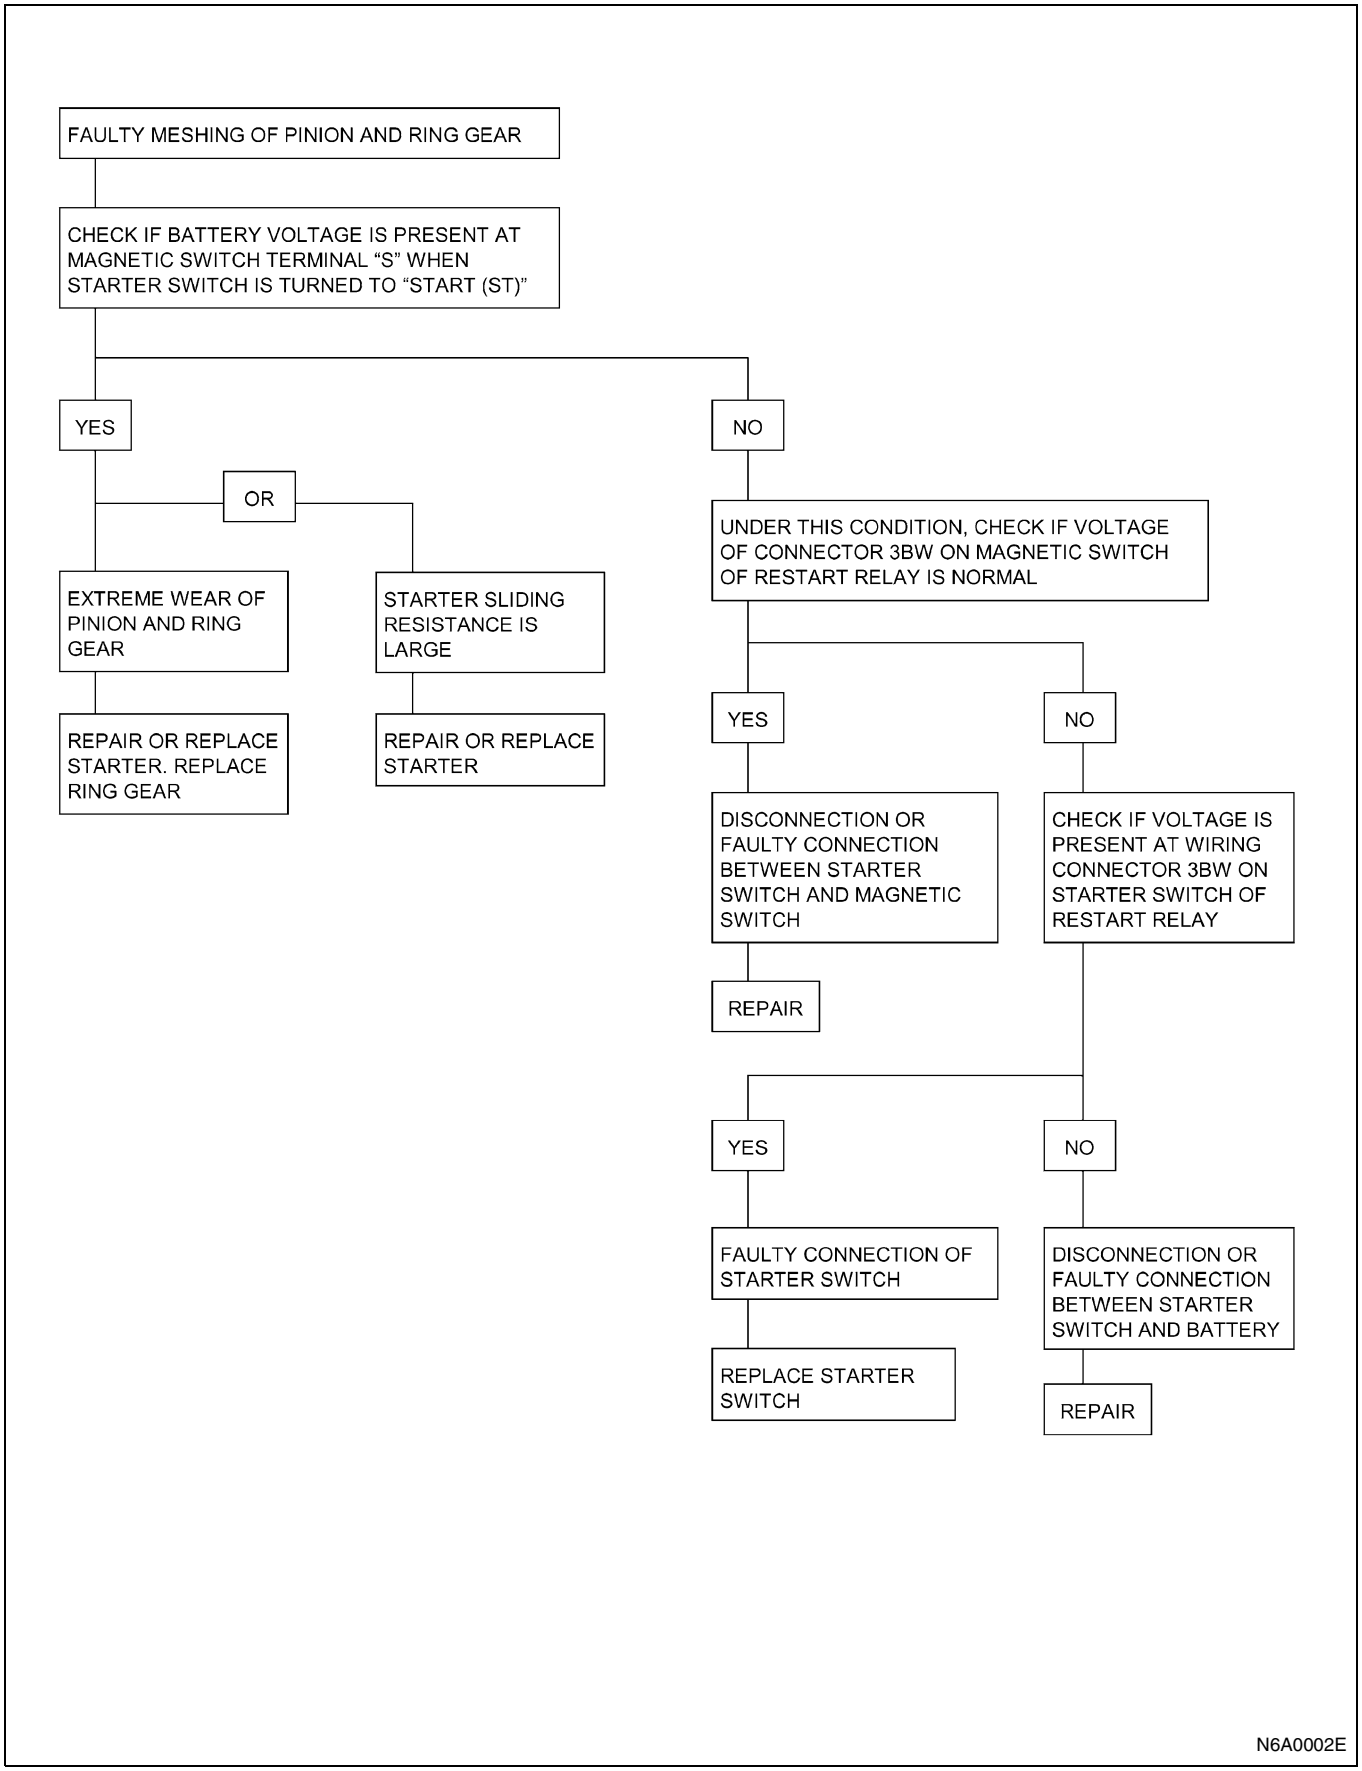
Checkpoint	Possible cause	Correction
Injection nozzle	Injection nozzle sticking	Replace the injection nozzle
	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Injection pump	Defective fuel injection nozzle resulting in the fuel drippage after fuel injection	Replace the delivery valve
	Defective injection pump control rack operation	Repair or replace the injection pump control rack
	Injection pump plunger worn or stuck	Replace the injection pump plunger assembly
	Injection pump drive shaft seizure or other damage	Replace the injection drive shaft
	Injection pump governor spring seizure	Replace the injection pump governor spring

4. Quick-on Start System

Check point	Possible cause	Correction
Glow plug indicator light does not turn on	1. Defective Fusible link wire	Replace the fusible link wire
	2. Broken indicator light fuse	Replace the indicator light fuse
	3. Defective indicator bulb	Replace the indicator light bulb
Preheating system dose not work	1. Defective fusible link wire shorted	Replace the fusible link wire
	2. Defective glow plug relay connector	Replace or Repair glow plug relay connector
	3. Defective glow plug connector	Replace or Repair glow plug connector
	4. Defective quick-on start timer connector	Replace or Repair quick-on start timer connector
Preheating time to long or to short	1. Defective thermo switch include defective wiring harness	Replace thermo switch
	2. Defective glow plug	Replace glow plug
	3. Defective timer unit	Replace timer unit

Check if battery is normal, then perform the following diagnosis.





FAULTY MESHING OF PINION AND RING GEAR
CHECK IF BATTERY VOLTAGE IS PRESENT AT MAGNETIC SWITCH TERMINAL “S” WHEN STARTER SWITCH IS TURNED TO “START (ST)”
YES
OR
EXTREME WEAR OF PINION AND RING GEAR
REPAIR OR REPLACE STARTER. REPLACE RING GEAR

N6A0004E

Unstable Idling

Check point	Possible cause	Correction
Idling system	Idling improperly adjusted	Adjust the idling
Fast idling speed control device	Defective fast idling speed control device	Repair or replace the fast idling speed control device
Accelerator control system	Accelerator control system improperly adjusted	Adjust the accelerator control system
Fuel system	Fuel system leakage or blockage	Repair or replace the fuel system
	Air in the fuel system	Bleed the air from the fuel system
	Water particles in the fuel system	Change the fuel
Fuel filter	Clogged fuel filter element	Replace the fuel filter element or the fuel filter cartridge
Fuel feed pump	Defective fuel feed pump	Repair or replace the fuel feed pump
Injection nozzle	Injection nozzle sticking	Replace the injection nozzle
	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Injection pump	Defective delivery valve resulting in fuel drippage after fuel injection	Replace the delivery valve
	Injection timing improperly adjusted	Adjust the injection timing
	Insufficient injection volume	Adjust the injection volume
	Defective idle spring	Replace the idle spring
	Defective governor lever operation	Repair or replace the governor lever
	Regulator valve improperly adjustment	Adjust or replace the regulator valve
	Broken plunger spring	Replace the plunger spring
	Worn plunger	Replace the plunger assembly
	Worn cam disc	Replace the cam disc
Valve clearance	Valve clearance improperly adjusted	Adjust the valve clearance
Compression pressure	Blown out cylinder head gasket Worn cylinder liner Piston ring sticking between the valve and the valve seat	Replace the related parts

Insufficient Power

Check point	Possible cause	Correction
Air cleaner	Clogged air cleaner element	Clean or replace the air cleaner element
Fuel	Water particle in the fuel	Replace fuel
Fuel filter	Clogged fuel filter element	Replace the fuel filter element or the fuel filter cartridge
Fuel feed pump	Defective fuel feed pump	Repair or replace the fuel feed pump
Injection nozzle	Injection nozzle sticking	Replace the injection nozzle
	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Fuel injection pipes	Fuel injection pipes damaged or obstructed	Replace the fuel injection pipes
Injection pump	Defective regulating valve	Repair or replace the regulating valve
	Defective delivery valve	Replace the delivery valve
	Defective timer	Repair or replace the timer
	Worn cam disk	Replace the cam disk
	Improper control lever operation	Adjust or replace the control lever
	Defective injection timing	Adjust the injection timing Repair or replace the injection pump timer
	Weak governor spring	Replace the governor spring
	Worn plunger	Replace the plunger assembly
Compression pressure	Blown out cylinder head gasket Worn cylinder liner Piston ring sticking	Replace the related parts
Valve clearance	Valve clearance improperly adjusted	Adjust the valve clearance
Valve spring	Valve spring weak or broken	Replace the valve spring
Exhaust system	Exhaust pipe clogged	Clean the exhaust pipe
Full load adjusting screw seal	Open and improperly set adjusting screw seal	Adjust and reseal the adjusting screw

Excessive Fuel Consumption

Check point	Possible cause	Correction
Fuel system	Fuel leakage	Repair or replace the fuel system related parts
Air cleaner	Clogged air cleaner element	Clean or replace the air cleaner element
Idling speed	Poorly adjusted idling speed	Adjust the idling speed
Injection nozzle	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Fuel injection timing	Fuel injection timing improperly	Adjust the fuel injection timing
Injection pump	Defective delivery valve resulting is fuel drippage after fuel injection	Replace the delivery valve
Valve clearance	Valve clearance improperly adjusted	Adjust the valve clearance
Compression pressure	Blown out cylinder head gasket Worn cylinder liner Piston ring sticking	Replace the related parts
Valve spring	Valve spring weak or broken	Replace the valve spring

Excessive Oil Consumption

Check point	Possible cause	Correction
Engine oil	Engine oil unsuitable Too much engine oil	Replace the engine oil Correct the engine oil level
Oil seal and gasket	Oil leakage from the oil seal and/or the gasket	Replace the oil seal and/or the gasket
Air breather	Clogged air breather	Clean the air breather
Intake and exhaust valve	Worn valve stems and valve guides	Replace the intake and exhaust valves and the valve guides

Overheating

Check point	Possible cause	Correction
Cooling water	Insufficient cooling water	Replenish the cooling water
Fan clutch	Oil leakage from the fan clutch	Replace the fan clutch
Fan belt	Fan belt loose or cracked causing slippage	Replace the fan belt
Radiator	Defective radiator cap or clogged radiator core	Replace the radiator cap or clean the radiator core
Water pump	Defective water pump	Repair or replace the water pump
Cylinder head and cylinder body sealing cap	Defective sealing cap resulting in water leakage	Replace the sealing cap
Thermostat	Defective thermostat	Replace the thermostat
Cooling system	Cooling system clogged by foreign material	Clean the foreign material from the cooling system
Fuel injection timing	Fuel injection timing improperly adjusted	Adjust the fuel injection timing

White Exhaust Smoke

Check point	Possible cause	Correction
Fuel	Water particles in the fuel	Replace the fuel
Fuel injection timing	Delayed fuel injection timing	Adjust the fuel injection timing
Compression pressure	Blown out cylinder head gasket Worn cylinder liner Piston ring sticking	Replace the related parts
Inlet and exhaust valves Valves seals	Defective valve seales Worn valves stems and valve guides	Replace the valve seales, the valves, and the valve guides

Dark Exhaust Smoke

Check point	Possible cause	Correction
Air cleaner	Clogged air cleaner element	Clean or replace the air cleaner element
Injection nozzle	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Fuel injection timing	Fuel injection timing improperly adjusted	Adjust the fuel injection timing
Injection pump	Defective delivery valve resulting in fuel drippage after fuel injection	Replace the delivery valve
	Excessive injection volume	Adjust the injection volume

Oil Pressure Does Not Rise

Check point	Possible cause	Correction
Engine oil	Improper viscosity engine oil Insufficient engine oil	Replace the engine oil Correct the engine oil volume
Oil pressure gauge or unit Oil pressure indicator light	Defective oil pressure gauge or unit Defective indicator light	Repair or replace the oil pressure gauge or unit Replace the indicator light
Oil filter	Clogged oil filter element	Replace the oil filter element or the oil filter cartridge
Relief valve and by-pass valve	Relief valve sticking and/or weak by-pass valve spring	Replace the relief valve and/or the by-pass valve spring
Oil pump	Clogged oil pump strainer	Clean the oil pump strainer
	Worn oil pump related parts	Replace the oil pump related parts
Rocker arm shaft	Worn rocker arm bushing	Replace the rocker arm bushing
Camshaft	Worn camshaft and camshaft bearing	Replace the camshaft and the camshaft bearing
Crankshaft and bearings	Worn crankshaft and bearings	Replace the crankshaft and/or the bearings

Abnormal Engine Noise

1. Engine Knocking
   Check to see that the engine has been thoroughly warmed up before beginning the troubleshooting procedure.

Check point	Possible cause	Correction
Fuel	Fuel unsuitable	Replace the fuel
Fuel injection timing	Fuel injection timing improperly adjusted	Adjust the fuel injection timing
Injection nozzle	Improper injection nozzle starting pressure and spray condition	Adjust or replace the injection nozzle
Compression pressure	Blown out head gasket	Broken piston ring Replace the head gasket or the piston ring

2. Gas Leakage Noise

Check point	Possible cause	Correction
Exhaust pipes	Loosely connected exhaust pipes Broken exhaust pipes	Tighten the exhaust pipe connections Replace the exhaust pipes
Injection nozzles and/ or glow plugs	Loose injection nozzles and /or glow plugs	Replace the washers Tighten the injection nozzles and/or the glow plugs
Exhaust manifold	Loosely connected exhaust manifold and/ or glow plugs	Tighten the exhaust manifold connections
Cylinder head gasket	Damaged cylinder head gasket	Replace the cylinder head gasket

3. Continuous Noise

Check point	Possible cause	Correction
Fan belt	Loose fan belt	Readjust the fan belt tension
Cooling fan	Loose cooling fan	Retighten the cooling fan
Water pump bearing	Worn or damaged water pump bearing	Replace the water pump bearing
Alternator or vacuum pump	Defective alternator or vacuum pump	Repair or replace the alternator or the vacuum pump
Valve clearance	Clearance improperly adjust	Adjust the valve clearance

4. Slapping Noise

Check point	Possible cause	Correction
Valve clearance	Valve clearance improperly adjusted	Adjust the valve clearance
Rocker arm	Damaged rocker arm	Replace the rocker arm
Flywheel	Loose flywheel bolts	Retighten the flywheel bolts
Crankshaft and thrust bearings	Worn or damaged crankshaft and/or thrust bearings	Replace the crankshaft and/or the thrust bearings
Crankshaft and connecting rod bearings	Worn or damaged crankshaft and/or connecting rod bearings	Replace the crankshaft and/or the connecting rod bearings
Connecting rod bushing and piston pin	Worn or damaged connecting rod bushing and piston pin	Replace the connecting rod bushing and/ or the piston pin
Piston and cylinder liner	Worn or damaged piston and cylinder liner Foreign material in the cylinder	Replace the piston and the cylinder liner

Engine Cooling Trouble

Condition	Possible cause	Correction
Engine overheating	Low coolant level	Replenish
	Thermo unit faulty	Replace
	Faulty thermostat	Replace
	Faulty coolant unit	Repair or replace
	Clogged radiator	Clean or replace
	Faulty radiator cap	Replace
	Low engine oil level or use of improper engine oil	Replenish or change oil Replenish
	Damaged cylinder head gasket	Replace
	Clogged exhaust system	Clean exhaust system or replace faulty parts
	Loose fan belt	Adjust
	Excessive fuel injected	Adjust
	Improper injection timing	Adjust
Engine overcooling	Faulty thermostat	Replace
Too long engine warm-up time	Faulty thermostat	Replace
	Thermo unit faulty	Replace

Starter Motor Does Not Stop

STARTER DOES NOT STOP THOUGH STARTER SWITCH IS RETURNED TO “ON”

DISCONNECTED STARTER SWITCH WIRING CONNECTOR, AND CHECK STARTER SWITCH OPERATION.

STARTER SWITCH KEY POSITION	Connector No.	B-67				B-68				
	Terminal No.	1	2	3	4	1	2	4	5	6
	Terminal No.	ACC	B	ON	ST	B_1	P_1	P_2	W	W
OFF	LOCK					○—○				
ON	ACC	○—○							○—○	
	ON	○—○—○				○—○				
	START		○—○—○			○—○				

THERE MUST BE NO CONTINUITY EXCEPT ABOVE LINES.

YES

MAGNETIC SWITCH CONTACTS ARE FUSED AND NOT MOVED, OR A RETURN SPRING IS BROKEN OR DETERIORATED

REPLACE MAGNETIC SWITCH

NO

REPLACE STARTER SWITCH

N6A0005E

MAIN DATA AND SPECIFICATIONS

Main Data and Specifications

Item				Engine Model	
				4HF1	4HF1-2
Item	Engine type			Four-cycle, overhead camshaft, water cooled	
	Combustion chamber type			Direct injection	
	Cylinder liner type			Dry liner, special compound metal	
	Timing drive system			Gear drive	
	No. of cylinders — Bore × stroke		mm (in)	4 — 112 × 110 (4 — 4.41 × 4.33)	
	No. of piston rings			Compression rings: 2, Oil ring: 1	
	Total piston displacement		cm^3 (in^3)	4334 (264.5)	
	Compression ratio		to : 1	19	
	Compression pressure kPa (kg / cm^2 / psi) — rpm			3,040 (31/441) — 200	3,226 (32.9/468) — 200
	Fuel injection order			1 — 3 — 4 — 2	
	Fuel injection timing (BTDC)		deg	8	12
	Specified fuel type			SAE No. 2 diesel fuel	
	Idling speed rpm			550 — 600	575 — 625
	Valve system				
	Valve clearances (At cold):	Intake	mm (in)	0.4 (0.016)	
		Exhaust	mm (in)	0.4 (0.016)	
	Valve timing (At valve clearances 0.4 mm (0.016 in))				
	Intake valves	Open at (BTDC)	deg	18	
		Close at (ABDC)	deg	50	
	Exhaust valves	Open at (BBDC)	deg	51	
		Close at (ATDC)	deg	17	
	Fuel system				
	Injection pump type			Bosch in-line type with automatic timer	Bosch “VE” distributor with automatic timer
	Plunger outside diameter		mm (in)	9.5 (0.374)	12 (0.472)
	Plunger lift		mm (in)	11.0 (0.433)	2.8 (0.110)
	Governor type			RLD-F mechanical (Variable speed)	Half all speed governor
	Automatic timer type			SCDM, centrifugal, flyweight	Hydraulic speed sensing type
	Fuel feed pump type			Piston	Vane

			Engine Model	
			4HF1	4HF1-2
Item	**Injection nozzle type**			
	Injection nozzle type		Hole type (with 5 orifices)	
	Pressure	MPa (kg / cm^2 / psi)	18.1 (185 / 2,631)	
	Pressure adjustment		Shim adjusted	
	Main fuel filter type		Disposal spin-on cartridge and remote mounted water separator	
	Lubricating system			
	Lubrication method		Full flow pressure circulation	
	Specified engine oil (API grade)		CD or above	
	Oil pressure	kPa (kg /cm^2 / psi) — rpm	147 (1.5 / 21) — 700 (SAE 10W-30 API CD grade engine oil at 80°C (176°F))	
	Oil pump type		Gear type	
	Oil filter type		Spin-on cartridge	
	Oil capacity	lit (US / UK gal)	10.5 (2.77 / 2.31)	
	Oil cooler type		Water cooled	
	Cooling system			
	Radiator type		Corrugated fin with reserve tank	
	Coolant capacity	lit (US / UK gal)	12 (3.17 / 2.64)	
	Water pump type		Centrifugal impeller, V-belt drive	
	Pump to crankshaft speed ratio	to : 1	1.16 (175 / 151)	
	Delivery volume	lit (US / UK gal)/min	200 (52.8 / 44.0) (Pump speed at 3,300 rpm Water temperature at 82°C (180°F))	
	Pump bearing type		Double row shaft	
	Thermostat type		Wax pellet	
	Valve initial opening temperature	°C (°F)	With jiggle valve: 85±1.5 (182 — 188) Without jiggle valve: 82±1.5 (177 — 182)	
	Valve lift	mm (in)	With jiggle valve: 8 (0.3) or more at 100°C (212°F) Without jiggle valve: 8 (0.3) or more at 95°C (203°F)	
	Air cleaner type		Dry paper element	
	Battery type	Volt-amp.hr.	55D23R / 12 — 60 : 2 pcs	
	Generator			
	Type		AC brush with IC regulator and vacuum pump	
	Voltage	V	24	
	Drive and rotation		V-belt, clockwise viewed from the drive pulley	
	Ground polarity		Negative	
	Maximum output	A	60 at 5,000 rpm	50 at 5,000 rpm (For Indonesian) 80 at 5,000 rpm
	Maximum speed	rpm	7,500 — 10,000	

			Engine Model	
			4HF1	4HF1-2
	Regulator			
	Type		IC	
	Regulating voltage	V	28 — 29	
	Vacuum pump			
	-66.7 kPa (-500 mmHg / -9.67 psi) build-up time		13 seconds or less at 1,000 rpm 4 seconds or less at 5,000 rpm	
	Maximum vacuum		-90.7 kPa (-680 mmHg / -13.1 psi) or more at 5,000 rpm	
	Starter motor			
	Type		Magnetic solenoid-controlled	
	Model		S25-168	
	Rated voltage	V	24	
	Rated output	kW	4.0	
Item	Load characteristics			
	Terminal voltage	V	18.55	
	Load current	A	250	
	Torque	N·m (kg·m / lb·ft)	14.22 (1.45 / 10.49) at 1,500 rpm or more	
	Preheating system		Quick-On-Start System II	
	Exhaust system			
	Pipe outside diameter × thickness			
	Front pipe	mm (in)	60.5 × 2.0 (2.38 × 0.079)	
	Middle pipe	mm (in)	60.5 × 2.0 (2.38 × 0.079)	
	Rear pipe	mm (in)	60.5 × 1.6 (2.38 × 0.063)	
	Silencer Type		Circular section-shell construction of triple skin and end plates, internal construction of baffles and perforated tubes	
	Inside diameter	mm (in)	Approximately 200 (7.87)

	Rated voltage	V	12 (For Venezuela) 24 (Except Venezuela)	
	Rated output	kW	3 (For Venezuela) 4.5 (Except Venezuela)	
	Load characteristics			
	Terminal voltage	V	14.3 (Except Venezuela)	
	Load current	A	890 (MAX) (For Venezuela) 400 (Except Venezuela)	
	Torque	N·m (kg·m / lb·ft)	29.4 (2.99 / 21.63) at 860 rpm or more (For Venezuela) 25.0 (2.55 / 18.4) at 1,000 rpm or more (Except Venezuela)	

			Engine Model	
			4HE1-TC (4HE1-XS, XN) 98EPA	4HE1-TC (4HE1-XS) SPEC. EURO3
Item	**Preheating system**		Quick-On-Start System II	
	Exhaust system			
	Pipe outside diameter × Thickness			
	Front pipe	mm (in)	60.5 × 2.0 (2.38 × 0.079)	
	Middle pipe	mm (in)	60.5 × 2.0 (2.38 × 0.079)	
	Rear pipe	mm (in)	60.5 × 1.6 (2.38 × 0.063)	
	Silencer type		Silencer with built-in catalytic converter (platinum)	Silencer with built-in catalytic converter (iron oxide)
	Inside diameter	mm (in)	Approximately 200 (7.87)	
	Exhaust gas recirculation system (EGR)		Equipped	Equipped (cooled)

SERVICE STANDARD

Engine

Item	Service Standard	Service Limit
Compression Pressure KPa (kg / cm^2 / psi) / rpm	3040 (31 / 441) or more Variance in pressure between the cylinders: less than 294 (3 / 43) / 200	2,157 (22 / 312)

Cylinder Head

Item	Service Standard	Service Limit
Inlet and Exhaust Valve Seat Depression mm (in)  N6A1400E	0.7 — 1.2 (0.028 — 0.047) Measurement should be taken by using a new valve.	2.5 (0.098)
Cylinder Head Lower Face Warpage mm (in)	0.05 (0.002) or less Do not regrind the cylinder head lower face.	0.2 (0.008)
Manifold Fitting Face Warpage mm (in)	0.05 (0.002) or less	0.2 (0.008)
Water Leak Test kPa (kg / cm^2 / psi)	490 (5 / 71) — 3 minutes	Repair or replace those having water leak.

Cylinder Head Gasket Selection
Remarks:
The grade mark of the cylinder head gasket is shown by semicircular notches on the left side of the front portion of the gasket.

4HF1/4HF1-2/4HG1-T
Cylinder Head Gasket Selection

mm (in)

Gasket Grade		Ti max	Gasket Thickness (Reference)
A		0.579 - 0.659 (0.0228 - 0.0259)	1.70 (0.0669)
B		0.659 - 0.739 (0.0259 - 0.0291)	1.75 (0.0689)
C		0.739 – 0.819 (0.0291 – 0.0322)	1.80 (0.0708)

Cylinder Body

Item		Service Standard	Service Limit
Cylinder Liner Bore Wear  N6A1413E 1. 20 mm (0.79 in) 2. 90 mm (3.54 in) 3. 160 mm (6.30 in)	mm (in)	4HF1: 4HF12: 112.021 — 112.050 (4.4103 — 4.4114) 4HG1: 4HG1-T: 115.021 — 115.050 (4.5284 — 4.5295) 4HE1-TC: 110.041 — 110.080 (4.3323 — 4.3338)	112.20 (4.417) 115.20 (4.535) 115.20 (4.535)
Cylinder Liner Projection	mm (in)	0.10 — 0.14 (0.0039 — 0.0055) The difference in the cylinder liner projection height between any two adjacent cylinders must not exceed 0.03 (0.0012)	There must be a projection on the cylinder liner.
Cylinder Body Upper Face Warpage	mm (in)	0.05 (0.002) or less Do not regrind the cylinder body upper face.	0.02 (0.008)

Item	Service Standard	Service Limit
Water Leak Test kPa (kg / cm^2 / psi)	490 (5 / 71) — 3 minutes	Repair or replace those having water leak.

Cylinder Liner Grade Selection
Remarks:
Cylinder Bore Grade Mark Position
The grade mark (1, 2 or 3) of the cylinder bore is stamped on the position just beside each cylinder on the upper left side (the upper portion of the oil cooler installation face) of the cylinder body.

Cylinder Liner Grade Mark Position
The outside diameter grade mark (1, 2 or 3) of the cylinder liner is stamped on the position approximately 160mm from the top face of the liner.

4HF1/4HF1-2

Line Grade	Cylinder Bore Diameter mm (in)	Service Grade	Liner Outside Diameter mm (in)
1	115.001 — 115.010 (4.5276 — 4.5279)	1X	114.991 — 115.000 (4.5272 — 4.5276)

Crankshaft Front and Rear Oil Seal and Slinger Wear			When there is an oil leak found, the oil seal and slinger must be replaced as a set. Insert it securely with a special tool.

Crankshaft Journal Bearing Selection
Remarks:
Crankshaft Bearing Housing Grade Mark Position
The crankshaft bearing housing grade marks (1 or 2) are stamped collectively for all cylinders on the underside of the left front portion of the cylinder body.

Crankshaft Journal Grade Mark Position
The crankshaft journal grade marks (1 or 2) are stamped collectively for all cylinders on the front side of the crankshaft No. 1 balancer

Crankshaft Bearing Grade Mark Position
The identification color code (black, brown or blue) of the crankshaft journal bearing grade mark is applied on the side of each bearing.

Crankshaft Journal No. 1, 2, 4 and 5

Bearing Housing		Crankshaft Journal		Crankshaft Bearing Color Code
Grade Mark	(Reference) Inside Diameter mm (in)	Grade Mark	(Reference) Outside Diameter mm (in)

Piston

Item	Service Standard	Service Limit
Piston and Cylinder Liner Clearance mm (in)	4HG1: 0.081 — 0.116 (0.0032 — 0.0044)	
	4HF1: 0.081 — 0.113 (0.0032 — 0.0044)	
	4HE1-TC: 0.091 — 0.131 (0.0036 — 0.0052)	

Piston Grade Selection
Remarks:
Piston Grade Mark Position
The piston grade marks (i.e. A, B, C) are stamped on the piston upper face.

Piston Outside Diameter Measuring Position
Take measurement of the Piston at the position 82mm (3.23 in) from the top in the direction of the longer diameter.
Piston Grade

Engine model	Cylinder Liner Bore Diameter mm (in)	Piston Service Grade	Piston Outside Diameter mm (in)
4HF1 4HF1-2	112.041 — 112.060 (4.4111 — 4.4118)	—	111.947 — 111.960 (4.4074 — 4.4079)
4HG1 4HG1-T	115.040 — 115.060 (4.5291 — 4.5299)	—	114.944 — 114.959 (4.5253 — 4.5259)

	Glow Plug Continuity			If no continuity exists, must be replaced.

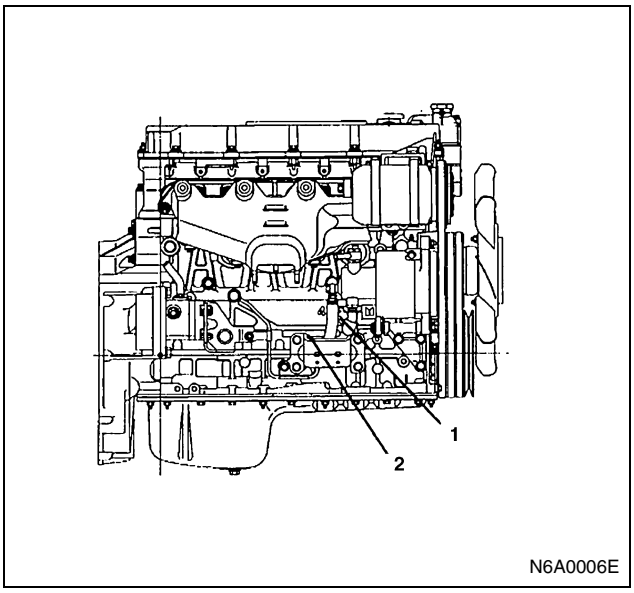
SERVICING

Servicing refers to general maintenance procedures to be performed by qualified service personnel.

Model Identification

Engine Serial Number

The engine number is stamped on the front left hand side of the cylinder body.



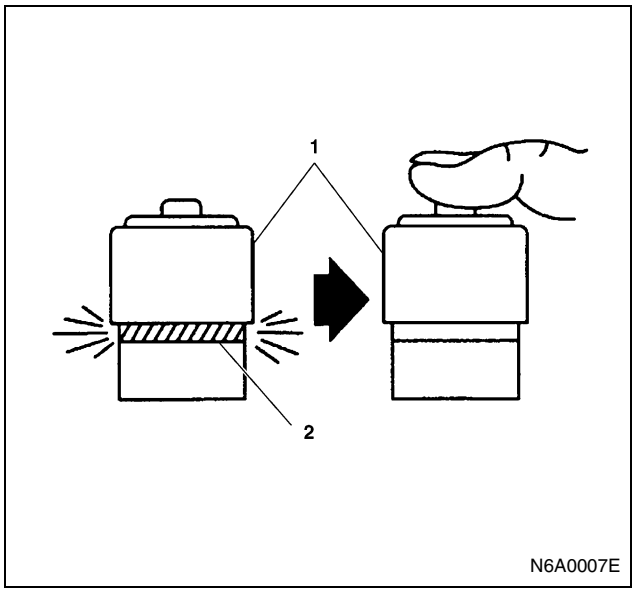
Legend

1. Engine type
2. Engine number

Air Cleaner

Dust Indicator

1. The dust indicator is installed to the air cleaner. (for Australia and GCC)
   Inspect the dust indicator. If the indicator plate is red, the air cleaner element must be cleaned or replaced.
2. Clean the air cleaner element once and reinstall it.
   Press the dust indicator button to clear the dust indicator.

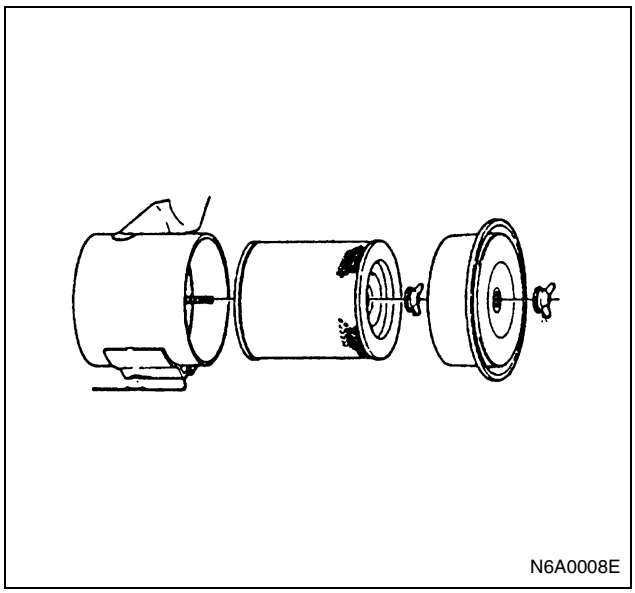


Legend

1. Dust indicator
2. Red color

Dry Type Washable Paper Element

Element cleaning procedures will vary according to the condition of the element.



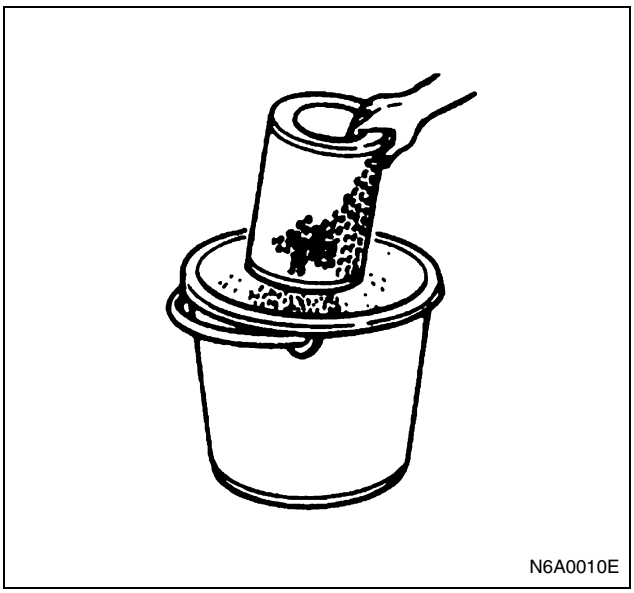
Dust Fouled Element

Rotate the element with your hand while applying compressed air to the inside of the element. This will blow the dust free.
Compressed air pressure must not exceed 686 kPa (7 kg/cm^2 / 99.6 psi).

N6A0009E

Carbon and Dust Fouled Element

1. Prepare a cleaning solution of Isuzu Genuine Element Cleaner (Donaldson D1400) diluted with water.
2. Immerse the element in the solution for twenty minutes.



N6A0010E

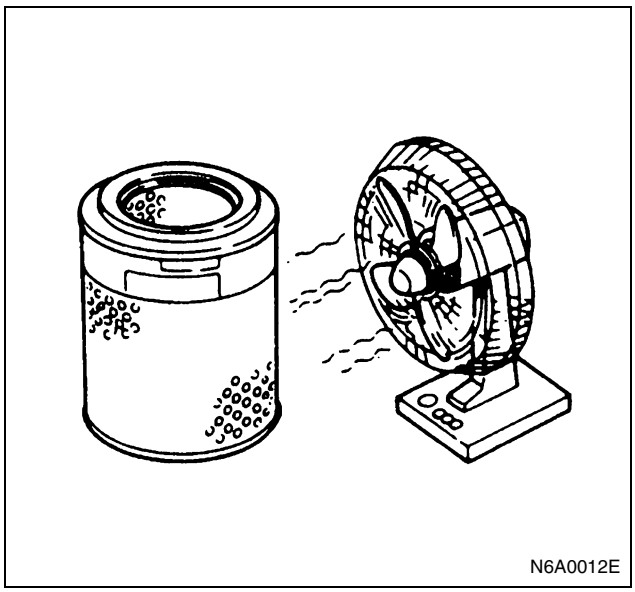
3. Remove the element from the solution and rinse it well with running water.
   Water pressure must not exceed 274 kPa (2.8 kg/cm^2 / 39.8 psi).

N6A0011E

4. Dry the element in a well ventilated area.
   An electric fan will hasten drying.

Caution:
Do not use compressed air or an open flame to dry the element quickly. Damage to the element will result.

It will usually take two or three days for the element to dry completely. Therefore, it is a good idea to have a spare on hand to use in the interim.



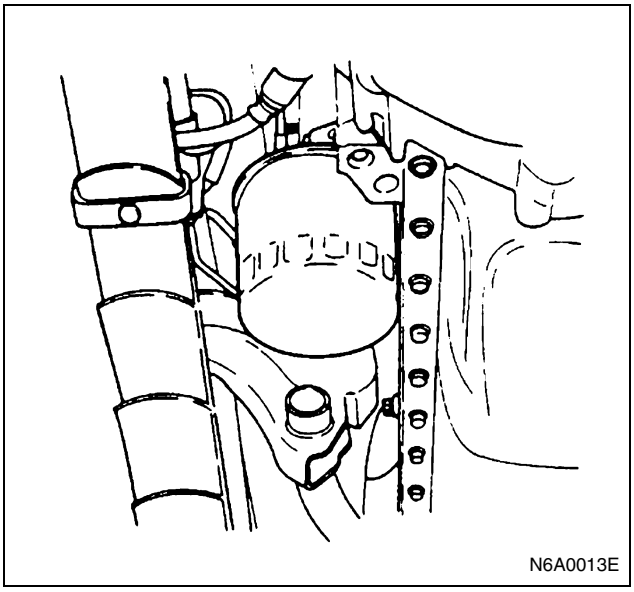
N6A0012E

Lubricating System

Main Oil Filter (Disposable Spin-On Cartridge Element)

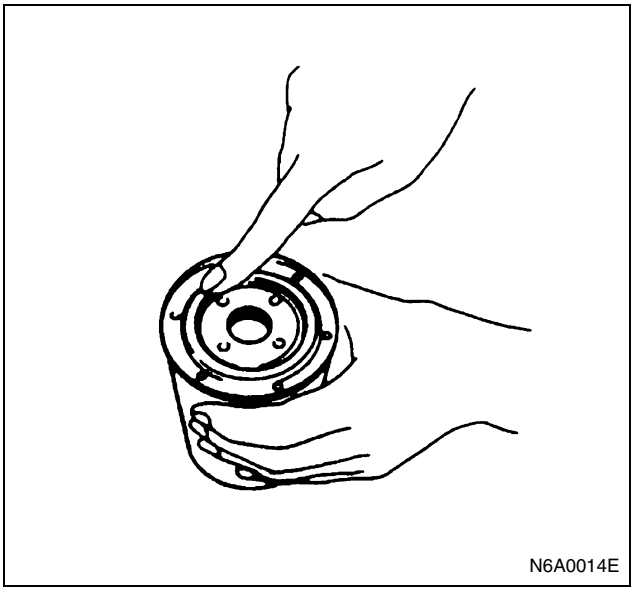
Replacement Procedure

1. Loosen the used oil filter by turning it counterclockwise with the filter wrench.
   Filter Wrench: 1-85221-097-0



N6A0013E

2. Clean the oil filter fitting face.
   This will allow the new oil filter to seat properly.
3. Apply a light coat of engine oil to the O-ring.

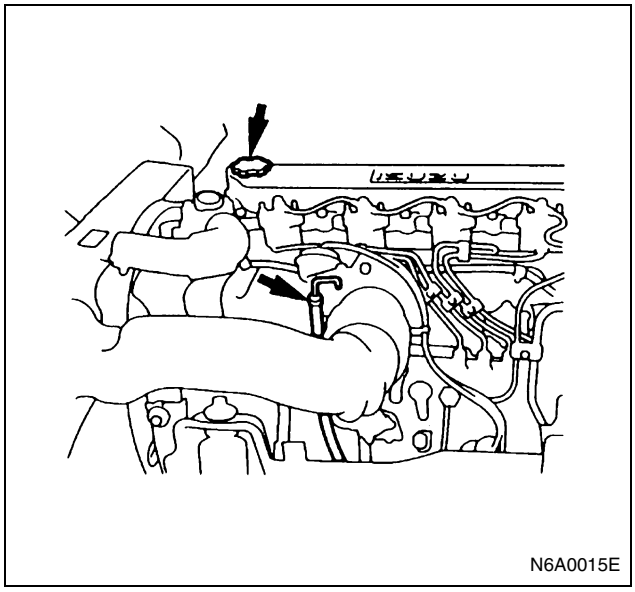


N6A0014E

4. Turn in the new oil filter until the filter O-ring is fitted against the sealing face.
5. Use the filter wrench to turn in the filter an additional one full turn.
6. Check the engine oil level and replenish to the specified level if required.

Engine Oil Replenishment	lit (US/UK gal)
0.7 (0.19/0.15)	

7. Start the engine and check for oil leakage from the main oil filter.



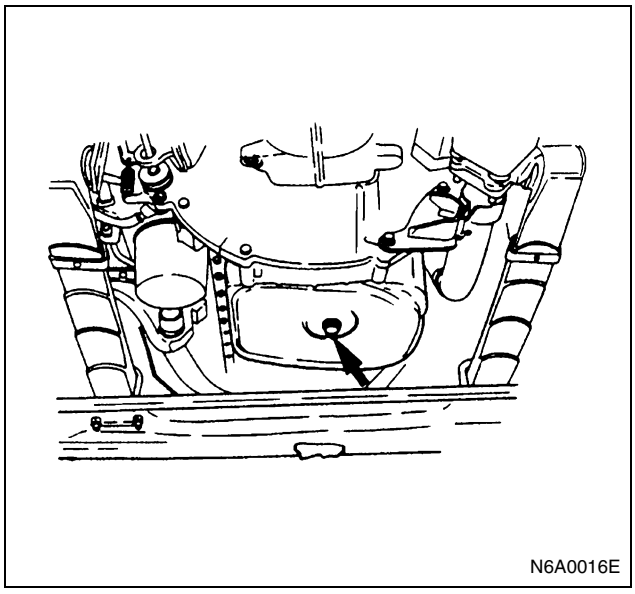
N6A0015E

Engine Oil Replacement

Draining

1. Remove the drain plug to completely drain the engine oil.
   Do this while the engine is hot.
2. Replace the drain plug.
3. Tighten the drain plug to the specified torque.

Tighten:
Drain plug to 78 N·m (8.0 kg·m/58 lb·ft)

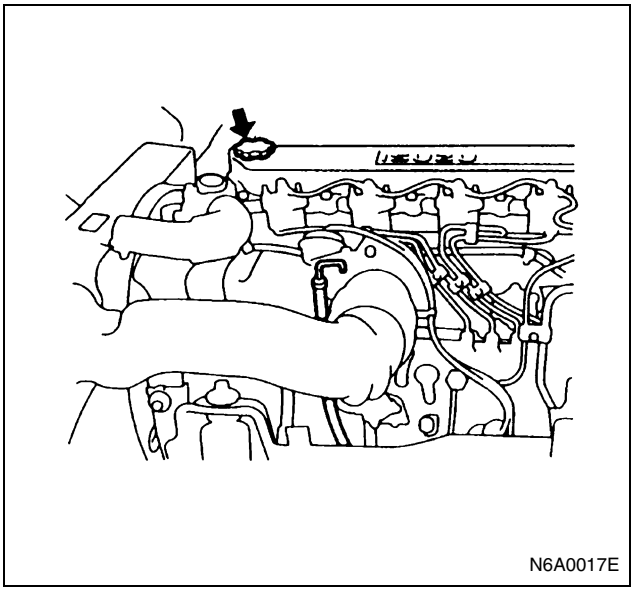


N6A0016E

Replenishment

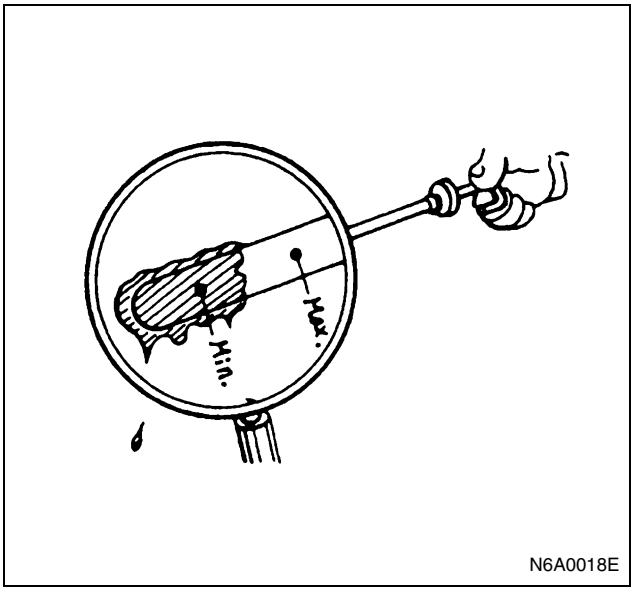
1. Remove the filler cap.
2. Pour the specified engine oil into the crankcase through the oil filler.
3. Replace the filler cap.

Crankcase and Filter Oil Capacity	lit (US/UK gal)
10.5 (2.8/2.3)	



N6A0017E

4. Start the engine and allow it to idle for a few minutes.
5. Stop the engine.
6. Use the dipstick to check the oil level.
   If the oil level is below the “MIN” line, add oil through the oil filler.
   If the oil level is above the “MAX” line, drain off the excess oil through the drain plug.



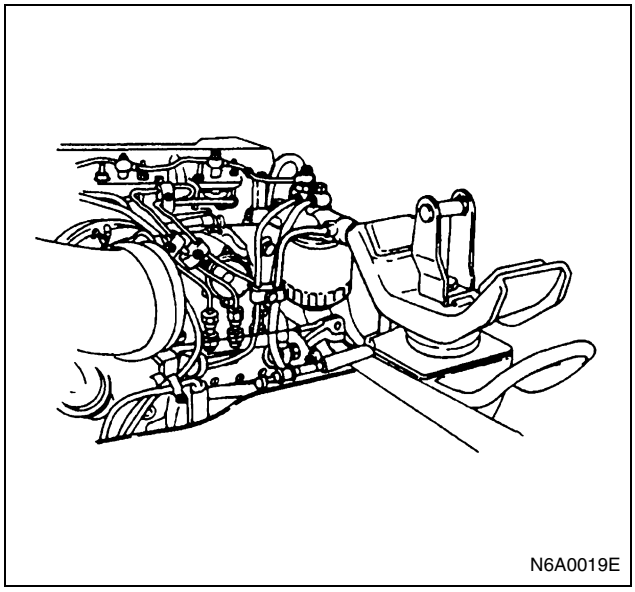
N6A0018E

Fuel System

Fuel Filter

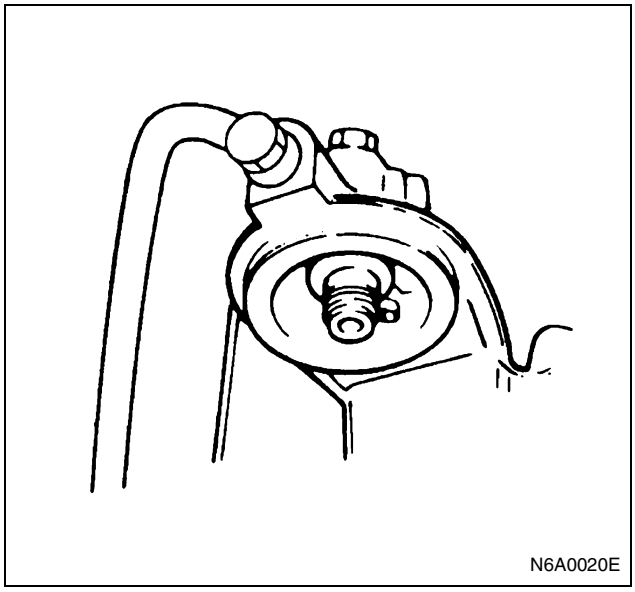
Replacement Procedure

1. Loosen the used fuel filter by turning it counterclockwise with the universal filter wrench.



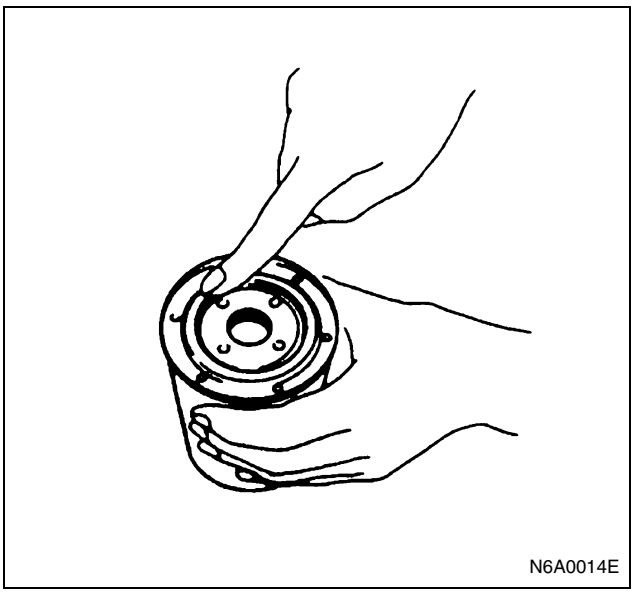
N6A0019E

2. Clean the upper cover fitting face.
   This will allow the new fuel filter to seat properly.



N6A0020E

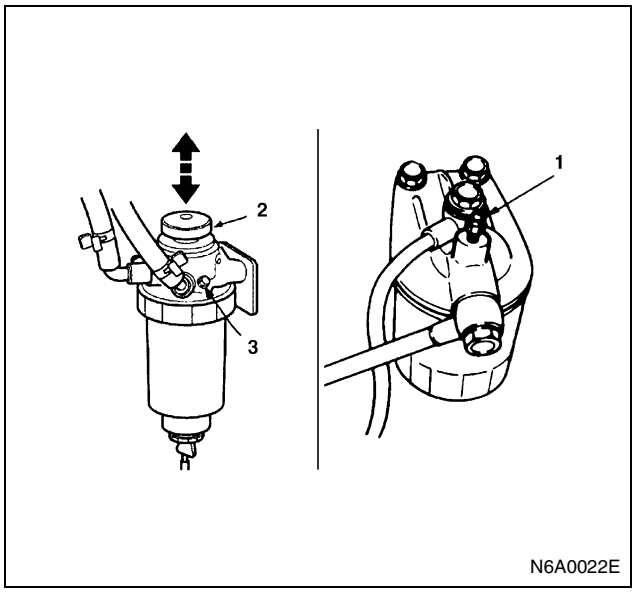
3. Apply a light coat of engine oil to the O-ring.



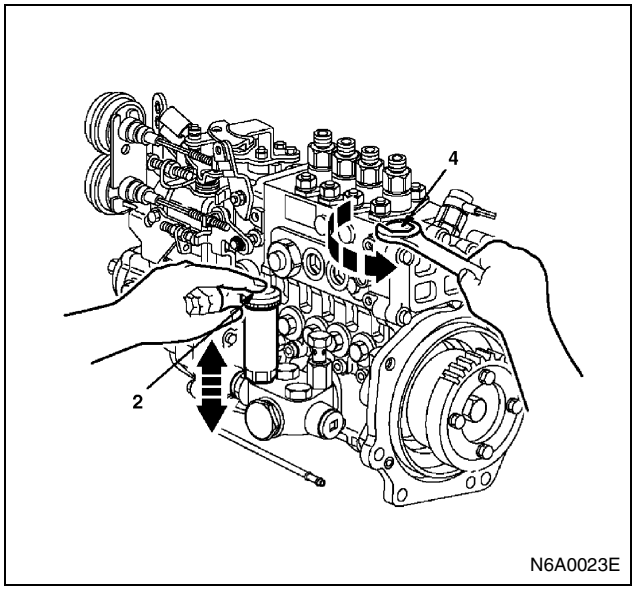
N6A0014E

4. Supply fuel to the new fuel filter to facilitate bleeding.
5. Turn in the new fuel filter until the filter O-ring is fitted against the sealing face.
   Be very careful to avoid fuel spillage.
6. Use the filter wrench to turn in the fuel filter an additional 1/3 to 2/3 of a turn.
7. Operate the priming pump to bleed the air from the fuel line in the following procedures.
   - Loosen the priming pump cap (2).
   - Loosen the air bleeding plug (3).
     (4HG1-T model only)
   - Operate the priming pump.
     Pump the primer pump until fuel flow is free of air bubbles.
     (Except 4HG1-T model)
   - Tighten the air bleeding plug (3).
     (4HG1-T model only)
   - Loosen the bleeding plug (1).
   - Operate the priming pump.
     Pump the primer pump until fuel flow is free of air bubbles.
   - Tighten the bleeder plug (1).
   - Operate the priming pump.
     Pump the primer pump until fuel flow is free of air bubbles.
     (Except 4HE1-TC model)
   - Loosen the bleeding plug on the injection pump (4).
     (4HE1-TC model only)
   - Operate the priming pump.
     Pump the primer pump until fuel flow is free of air bubbles.
     (4HE1-TC model only)
   - Tighten the bleeding plug on the injection pump (4).
     (4HE1-TC model only)
   - Lock the priming pump cap (2).

Notice:
Check for fuel leakage from around the injection pump and the fuel filter.



N6A0022E



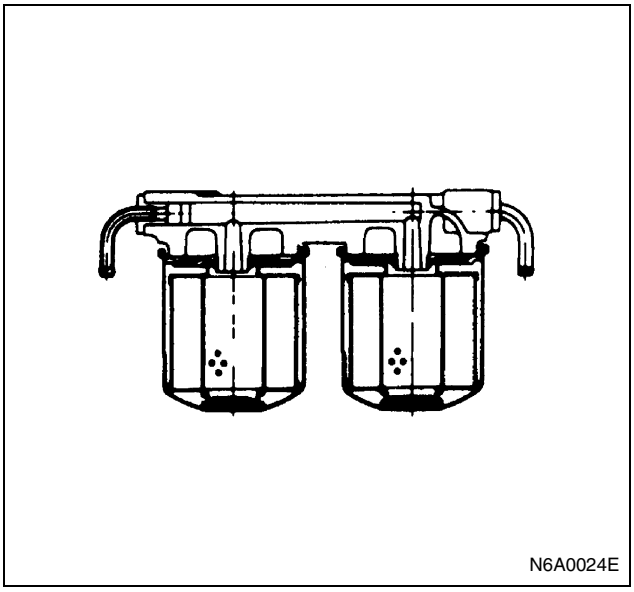
N6A0023E

8. Start the engine.
   Crank the engine for ten seconds or until it starts.
   If the engine does not start after ten seconds, repeat Step 7.

Sub Fuel Filter (Dual Type)

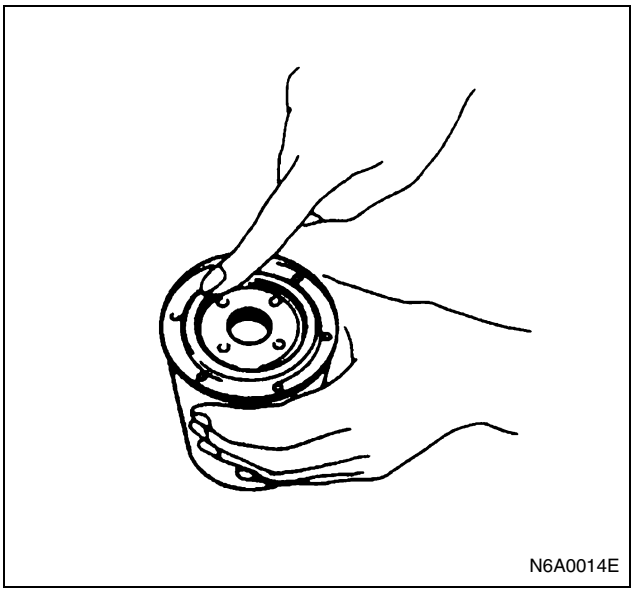
Replacement Procedure

1. Loosen the fuel filters by turning them counterclockwise with the universal filter wrench.
2. Clean the upper cover fitting faces.
   This will allow the new fuel filters to seat properly.



N6A0024E

3. Apply a thin coat of engine oil to the O-rings.



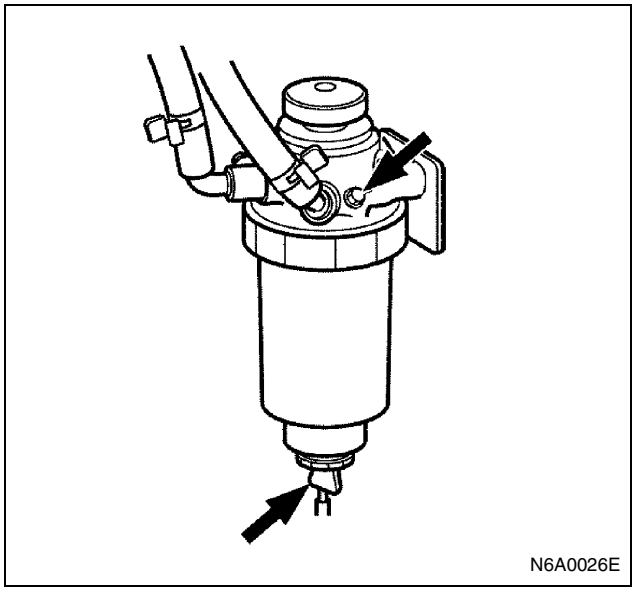
N6A0014E

4. Install the filter assemblies.
   Carefully turn each assembly clockwise until the O-ring is fitted against the filter cover sealing face.
5. Use the filter wrench to turn in each filter assembly an additional 1/3 to 2/3 of turn.
6. Operate the priming pump on the fuel filter to bleed the fuel system.
   Refer to “AIR BLEEDING” for more detailed information.

Pre-fuel Filter Water Draining Procedure

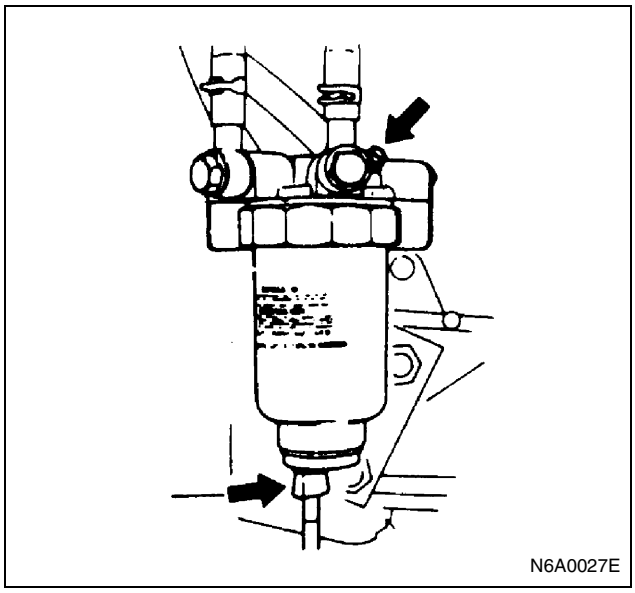
The indicator light will come on when the water level in the water separator exceeds the specified level.
Drain the water and foreign material from the water separator with the following procedure.

1. Place the end of a vinyl hose (beneath the drain plug) in a container.
2. Loosen the air intake plug and drain plug, then drain water.



N6A0026E

3. After draining, securely tighten the drain plug and air intake plug.



N6A0027E

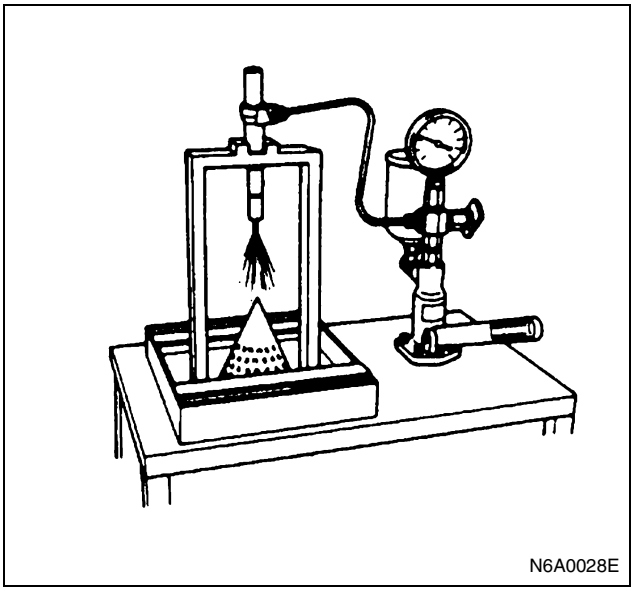
4. Then, operate the priming pump on the injection pump to bleed the fuel system.
5. After starting the engine, check to see that no fuel leaks from the drain plug.

Injection Nozzle

Pressure and Spray Condition Check

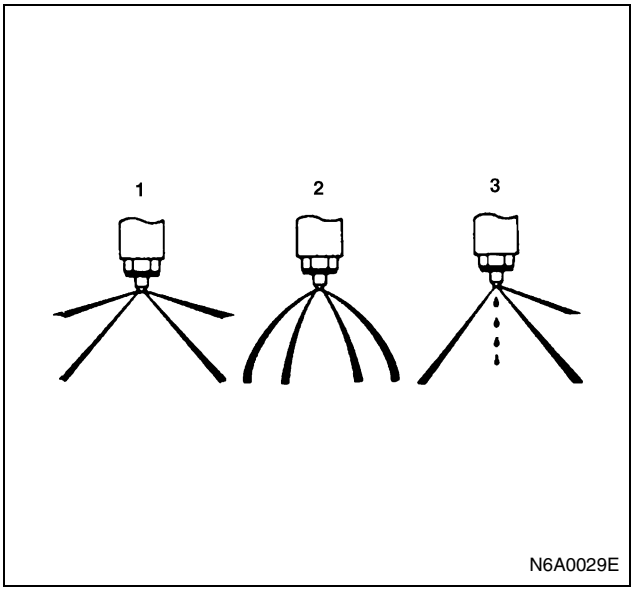
1. Use a nozzle tester to check the injection nozzle opening pressure.
   If the opening pressure is above or below the specified value, the injection nozzle must be replaced or adjusted.
   Refer to “Adjustment.”

Injection Nozzle Opening Pressure	Mpa (kg/cm^2/psi)
4HF1/4HF1-2/4HG1	18.14 (185/2,631)
4HE1-TC	21.57 (220/3,128)
4HG1-T	1st: 18.1 (185/2,631) 2nd: 21.1 (215/3,057)



N6A0028E

2. Check the spray condition.
   Refer to the illustration.
   Spray Condition



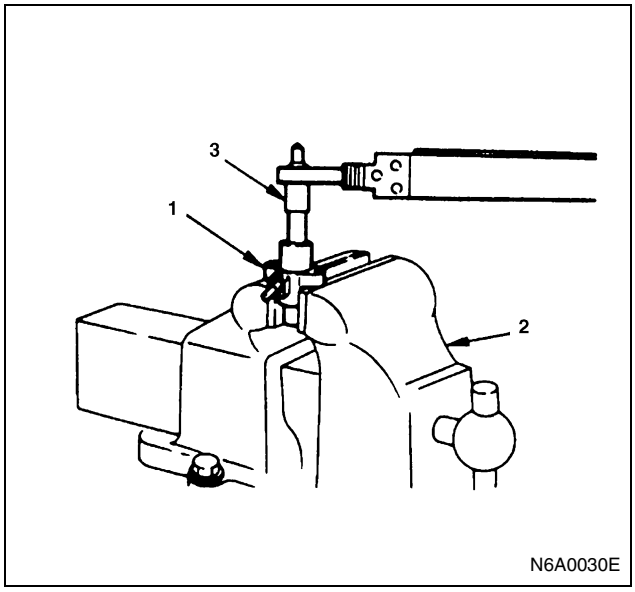
N6A0029E

1) Correct
2) Incorrect (Restrictions in orifice)
3) Incorrect (Dripping)

If the spray condition is bad, the injection nozzle must be replaced or adjusted.
Refer to “6C FUEL SYSTEM”.

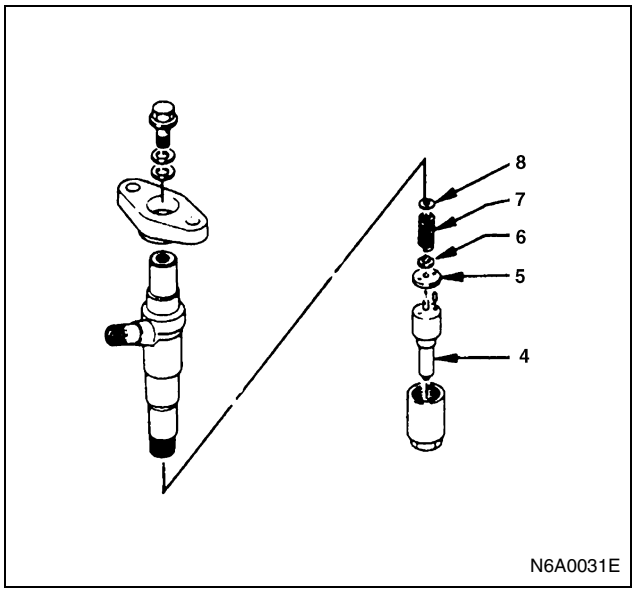
Adjustment

1. Clamp the injection nozzle holder (1) in a vise (2).
2. Use a wrench to remove the injection nozzle retaining nut (3).



N6A0030E

3. Remove the injection nozzle holder from the vise.
4. Remove the injection nozzle (4), the spacer (5), the spring seat (6) the spring (7) and the adjusting shim (8).



N6A0031E

5. Install the new adjusting shim, the spring, the spring seat, the spacer, the injection nozzle, and the retaining nut.
6. Clamp the injection nozzle holder in the vise.
7. Tighten the injection nozzle holder retaining nut to the specified torque.

Tighten:
Injection nozzle holder retaining nut to 34 N·m (3.5 kg·m/ 25 lb·ft)

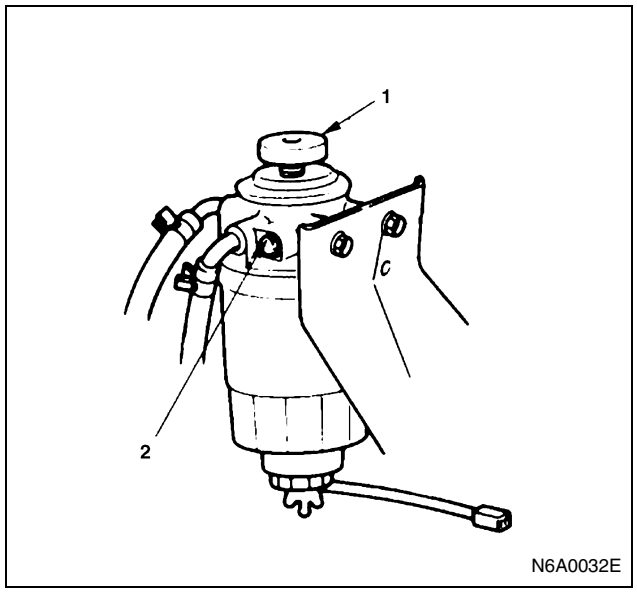
8. Remove the injection nozzle holder from the vise.

9. Attach the injection nozzle holder to the injection nozzle tester.
10. Apply pressure to the nozzle tester to check that the injection nozzle opens at the specified pressure.
    If the injection nozzle does not open at the specified pressure, install or remove the appropriate number or adjusting shims to adjust it.
    Removing or installing one shim will increase or decrease the nozzle opening pressure approximately 370 kPa (3.77 kg/cm^2 / 53.6 psi).

Adjust Shim Arailability	mm (in)
Range	0.5 — 1.5 (0.02 — 0.06)
Increment	0.025 (0.001)
Total Number of Shims	41

Air Bleeding (Except 4HF1-2 model only)
Above works refer to “FUEL SYSTEM” in this section.
Air Bleeding (4HF1-2 model only)

1. Actuate the priming pump (1) to send the air in the fuel system to the injection pump.
2. Loosen the sedimenter air bleeding plug (2) and operate the priming pump until no bubbles appear.
3. Tighten the air bleeding plug (2) completely.



4. Try to start the engine. If the engine is not started within 10 seconds, air bleeding should be conducted once again.
5. Check that there is no fuel leak, and then tighten the priming pump completely.

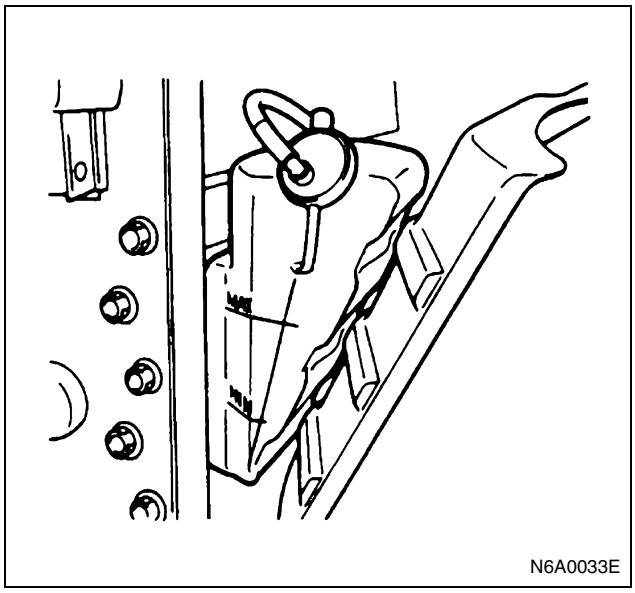
Water Drain
If more water than specified has collected, the warning light is lit. Under this condition, follow the following water drain procedure:

1. Place a container (Approximately 0.2 liters capacity) beneath the drain plug on the separator.
2. Loosen the drain plug and air bleeding plug.
3. After draining, tighten the drain plug.
4. Operate the priming pump several times again and check for fuel leak.
5. Tighten the air bleeding plug.
6. Make sure that the warning light in the instrument panel is off. (Except 4HE1-TC model)

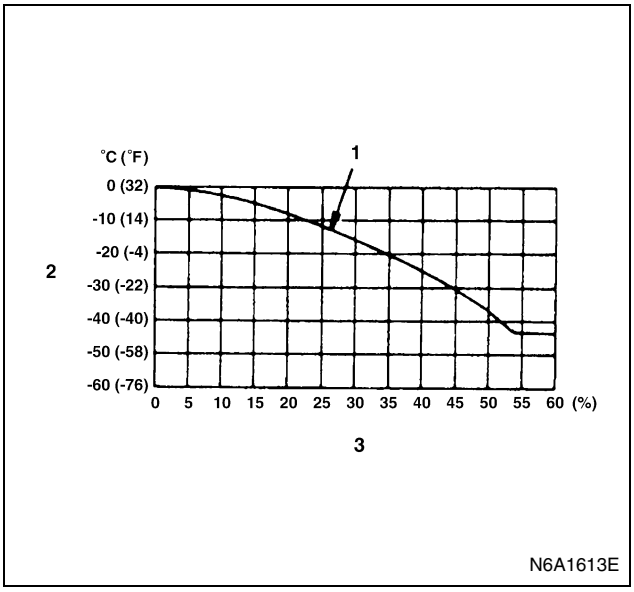
Cooling System

Coolant Level

Check the coolant level and replenish the radiator reserve tank if necessary.
If the coolant level falls below the “MIN” line, carefully check the cooling system for leakage. Then add enough coolant to bring the level up to the “MAX” line.



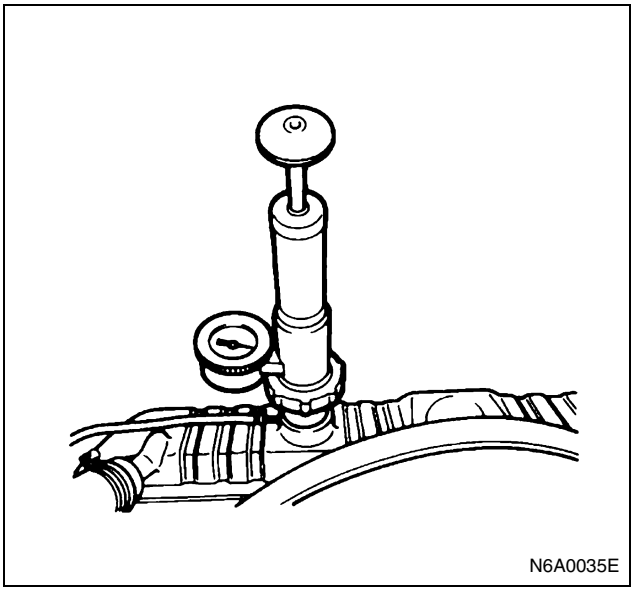
Notice:
Do not overfill the reserve tank.
Remove the radiator filler cap only when absolutely necessary.
Always check the coolant level when the engine is cold.
Always refer to the chart at the left to determine the correct cooling water to antifreeze solution mixing ratio.



Legend
1. Good quality ethylene glycol anti-freeze
2. Freezing point
3. Mixing ratio

Cooling System Leakage Inspection

Clog up the reserver tank hose carefully and check the cooling system for leakage with a radiator cap tester by applying an air pressure of 196 kPa (2 kg/cm^2/28 psi) from filler neck to inside the radiator.
As the radiator upper tank is provided with a valve, the pressure fails to rise higher than the valve opening pressure unless the hose is clogged up.



Radiator Valve Inspection

Apply air pressure from filler neck using radiator cap tester and check the opening pressure of radiator valve. If the valve opening pressure is out of the standard value range, replace with a new radiator valve.

Radiator valve opening pressure kPa (kg/cm^2/psi)
93 — 123 (0.95 — 1.25/13.5 — 17.8)

Remove the radiator valve and check a negative pressure valve as the center of the valve seat side. If the negative pressure valve does not work smoothly, clean or replace the radiator valve.

Tighten:
Radiator valve fixing to 6 N·m (0.6 kg·m/4 lb·ft)

Conduct cooling system leakage check after reinstalling the radiator valve.

Thermostat Operating Test
1. Completely submerge the thermostat in water.
2. Heat the water.

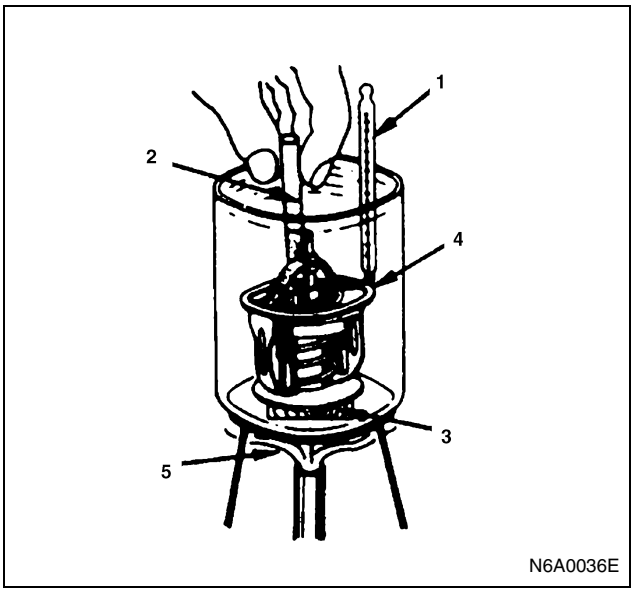
Stir the water constantly to avoid direct heat being applied to the thermostat.

3. Check the valve initial opening temperature.

Valve Initial Opening Temperature °C (°F)		
		Standard
without jiggle valve	Primary valve	83 — 87 (181 — 189)
	Secondary valve	80 — 84 (176 — 183)
with jiggle valve		83.5 — 86.5 (182 — 188)

4. Check the valve lift full opening temperature.

Valve Lift Full Opening Temperature °C (°F)	
	Standard
without jiggle valve	95 (203)
with jiggle valve	100 (212)



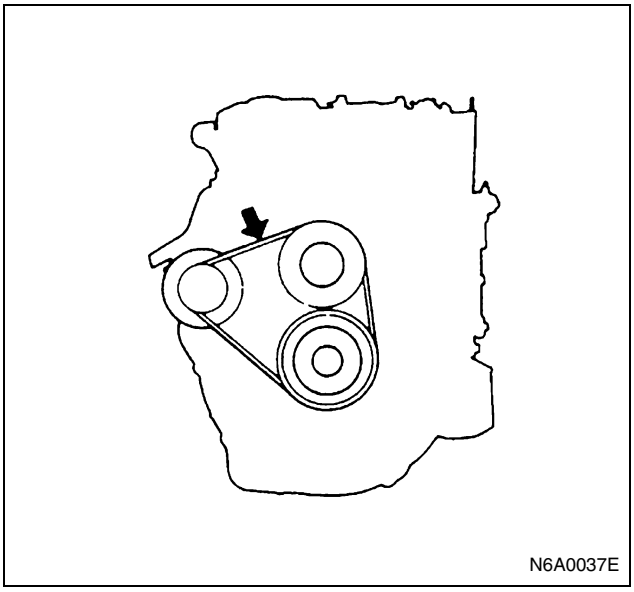
Legend
1. Thermometer
2. Aditating rod
3. Wooden piece
4. Thermostat
5. Heat

Fan Belt

Check the drive belt tension.
Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
8 — 12 (0.31 — 0.47) ... New belt 10 — 14 (0.39 — 0.55) ... Reuse belt	

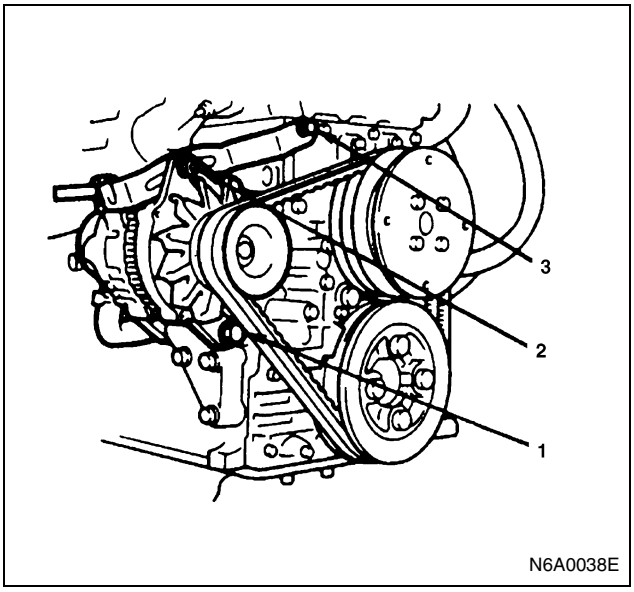
Check the drive belt for cracking and other damage.
- Crankshaft damper pulley
- Generator pulley
- Cooling fan pulley



N6A0037E

Fan Belt Adjustment
Fan belt tension is adjusted by moving the generator.

Tighten:
Bolt 1 to 40 N·m (4.1 kg·m/30 lb·ft)
Bolt 2 to 24 N·m (2.4 kg·m/17 lb·ft)
Bolt 3 to 46 N·m (4.7 kg·m/34 lb·ft)



N6A0038E

If equipped with A/C compressor, loosen the A/C drive belt tension pulley adjust bolt and lock nut. Then free the A/C drive belt. When finishing the fan belt adjustment, adjust the A/C drive belt and check the belt tension.

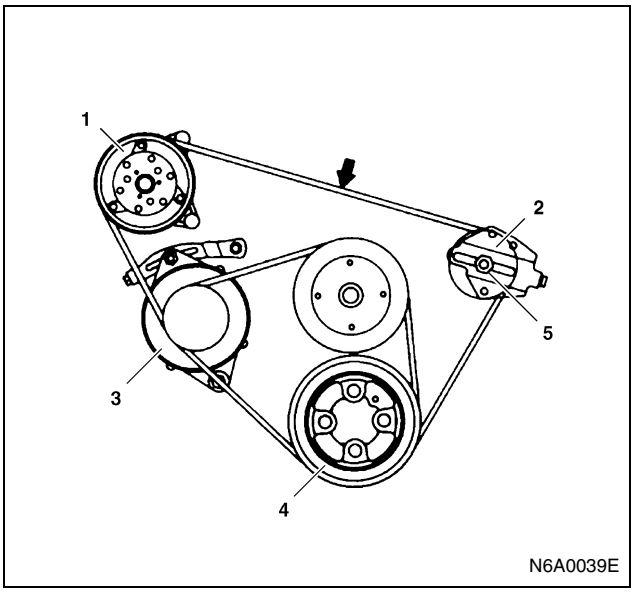
Air Conditioning (A/C) Compressor Drive Belt

Check the drive belt tension.
- Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
16 — 20 (0.63 — 0.79) ... New belt 18 — 22 (0.71 — 0.87) ... Reuse belt	

Check the drive belt for cracking and other damage.
A/C compressor drive belt tension is adjusted by moving the tension pulley.
When finishing the fan drive belt, then adjust the A/C drive belt.

Tighten:
Locking nut to 27 N·m (2.8 kg·m/20 lb·ft)



N6A0039E

Legend

1. A/C compressor pulley
2. Tension pulley
3. Generator pulley
4. Crankshaft damper pulley
5. Tension pulley lock nut

Engine Control

Idling Speed Inspection

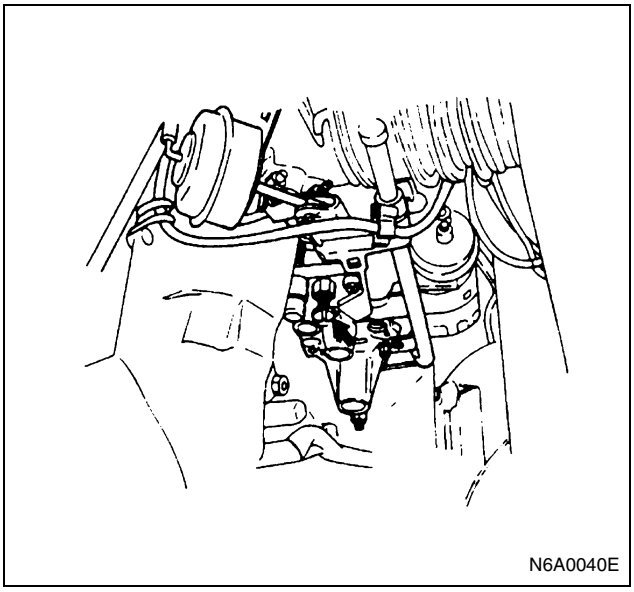
1. Set the vehicle parking brake and chock the drive wheels.
2. Place the transmission in neutral.
3. Start the engine and allow it to warm up.
4. Check that the idling control knob is in the engine idling position.
5. Set a tachometer to the engine.
6. Check the engine idling speed.
   Engine idling speed should be as below.

Engine Idling Speed		rpm
4HF1	M/T	550 — 625
4HF1-2	M/T	575 — 625
4HG1	M/T	550 — 600
4HG1-T	M/T	600 — 650
4HE1-TC (4HE1-TC-XS, XN) 98EPA	M/T	775 — 825
4HE1-TC (4HE1-TC-XS, XN) SPEC. EURO3	M/T	775 — 825

If the engine idling speed is outside the specified range, it must be adjusted.

Idling Speed Adjustment

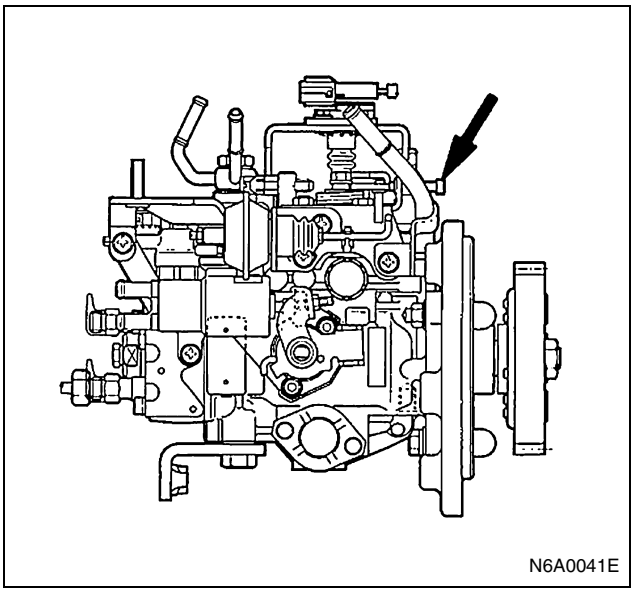
1. Loosen the idling set bolt lock nut on the injection pump.
2. Adjust the idling speed with the idling set bolt.
3. Tighten the lock nut.



N6A0040E

Idling Speed Check & Adjustment (4HF1-2 model only)

1. Warm up the engine.
2. Measure idling speed by means of tachometer.
3. If idling speed is out of the standard, adjust with an idling adjust bolt (indicated by an arrow mark).
   Idling speed: 575 — 625 rpm

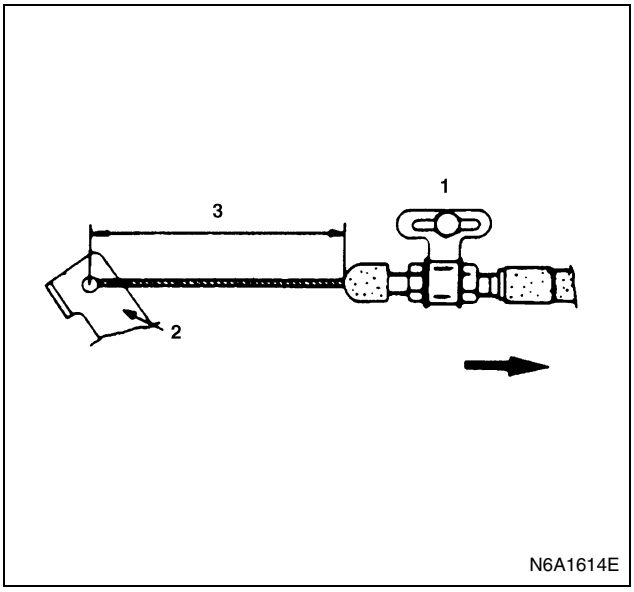


N6A0041E

Accelerator Control

Accelerator Control Cable Adjustment

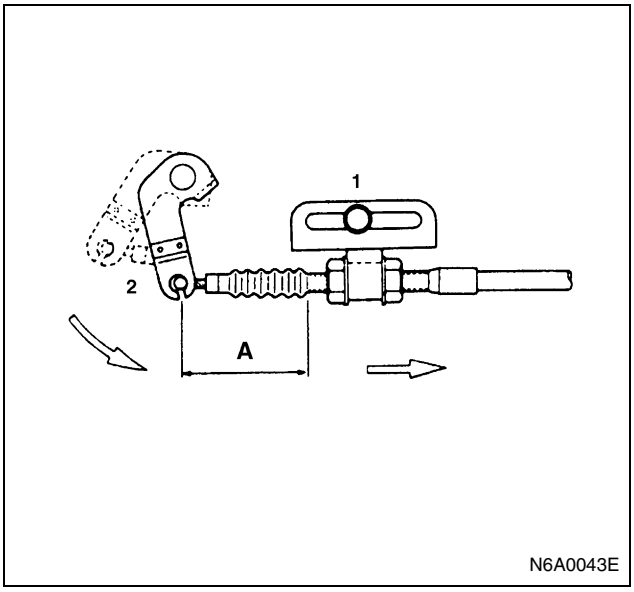
1. Loosen the accelerator cable clamp bolt (1).
2. Check that the idling control knob is in the engine idling position.
3. Hold the accelerator lever (2) in the fully closed position and stretch the control cable (3) in the direction indicated by the arrow to remove any slack.



Engine Stop Control

Adjustment

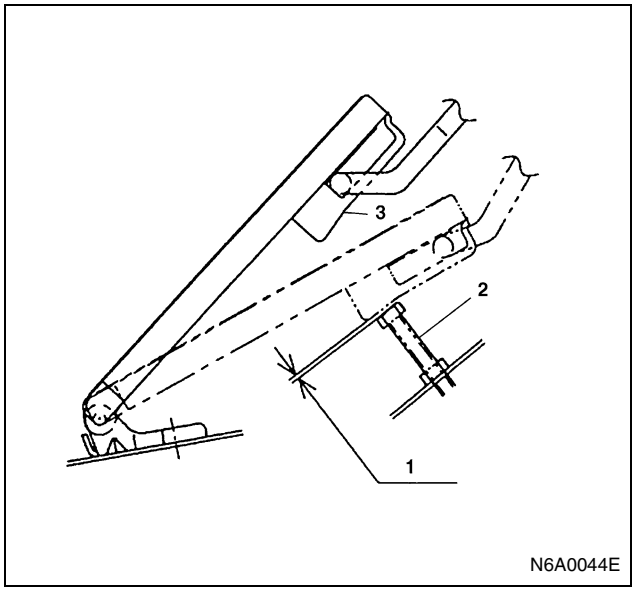
1. Check that the key switch is either in the “LOCK” position or removed from the engine.
2. Loosen the bolt (1).
3. Pull the fuel cut lever (2) as far as possible and hold it.
4. Remove cable slackness (A) by pulling the cable in the direction of the arrow in the illustration.
5. Tighten the bolt (1).



Accelerator Pedal Adjustment

1. Press the accelerator pedal to the floorboard and hold it.
2. Use the stopper bolt (2) to adjust the clearance between the stopper bolt end and the accelerator pedal (3) lower face.

Accelerator Pedal Clearance	mm (in)
0 — 2 (0 — 0.079)	



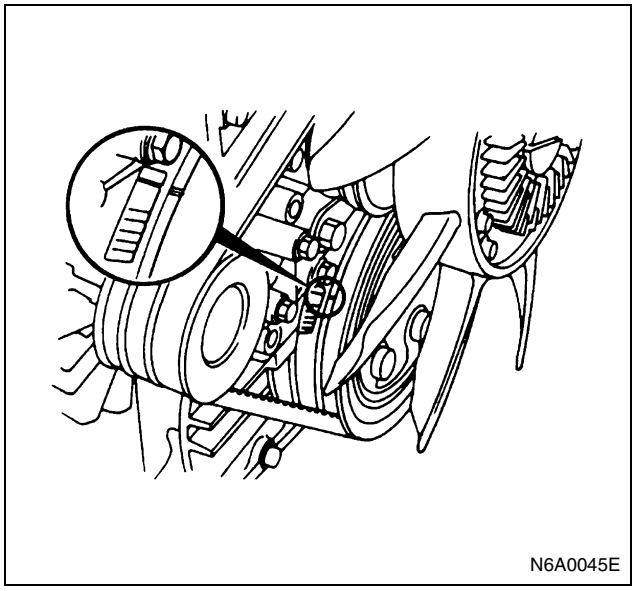
Legend

1. Full stroke 0 — 2 mm (0 — 0.079 in)
2. Stopper bolt
3. Accelerator pedal

Valve Clearance Adjustment

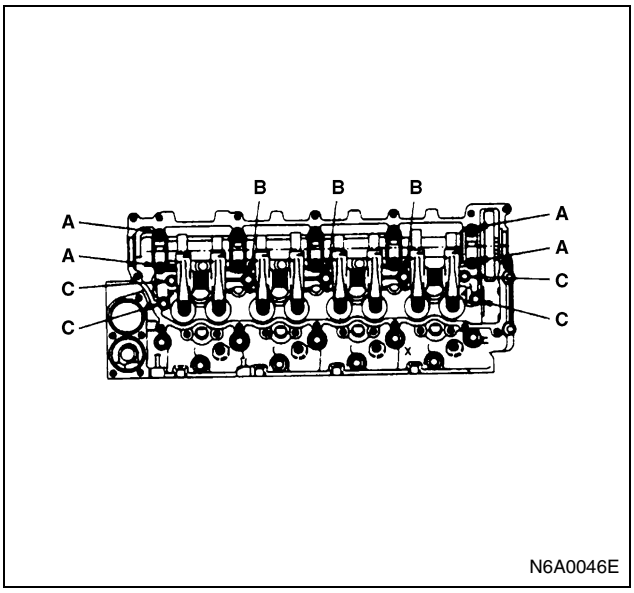
1. Bring the piston in either the No.1 cylinder or the No.4 cylinder to TDC on the compression stroke by turning the crankshaft until the crankshaft damper pulley timing mark is aligned with the TDC notched line.

Notice:
If there are two marks on the crank pulley, the front side of mark is for setting BTDC 49° and the rear side of mark is for setting TDC.



2. Tighten the rocker arm shaft bracket nuts and bolts to the specified torque in numerical order a little at a time as shown in the illustration.

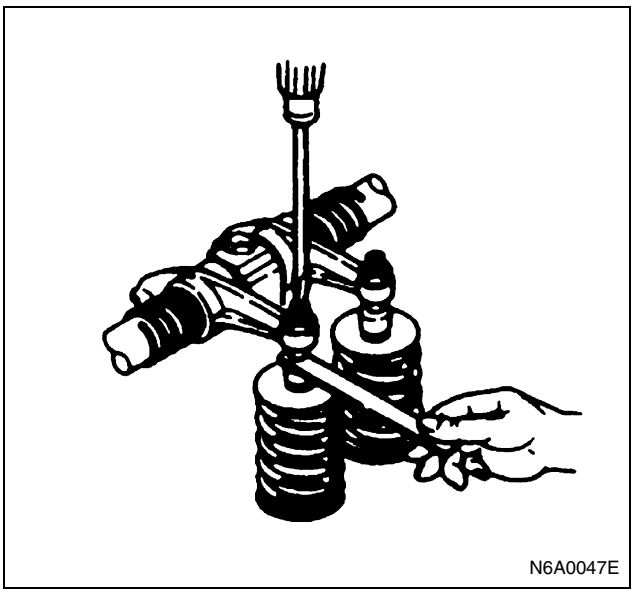
Tighten:
Rocker arm shaft bracket nut and bolt to
- Nut (A) 27 N·m (2.8 kg·m/20 lb·ft)
- Bolt (B) 56 N·m (5.7 kg·m/41 lb·ft)
- Bolt (C) 27 N·m (2.8 kg·m/20 lb·ft)



N6A0046E

- Apply engine oil to the threaded portion of the nuts marked with “A” and the bolts with “B”shown in the illustration, and then tighten them to the specified torque.

3. Check for play in the No.1 intake and exhaust valve rocker arms.
   If the No.1 cylinder intake and exhaust valve rocker arms have play, the No.1 piston is at TDC on the compression stroke.
   If the No.1 cylinder intake and exhaust valve rocker arms are depressed, the No.4 piston is at TDC on the compression stroke.

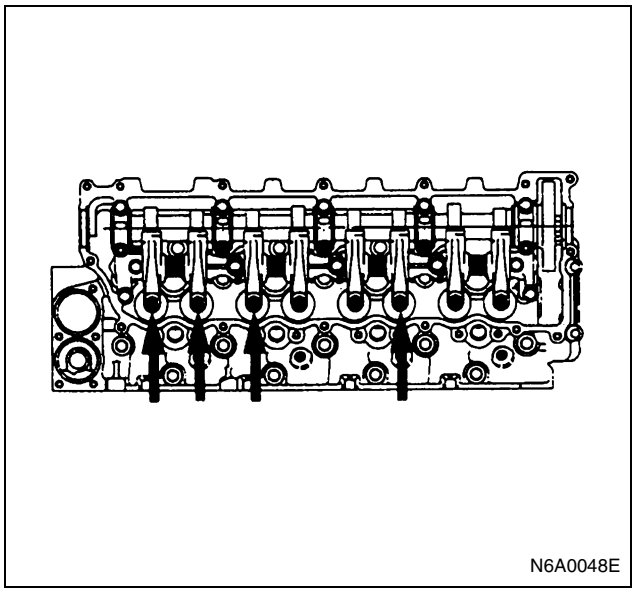


N6A0047E

Adjust the No.1 or the No.4 cylinder valve clearance while their respective cylinders are at TDC on the compression stroke.

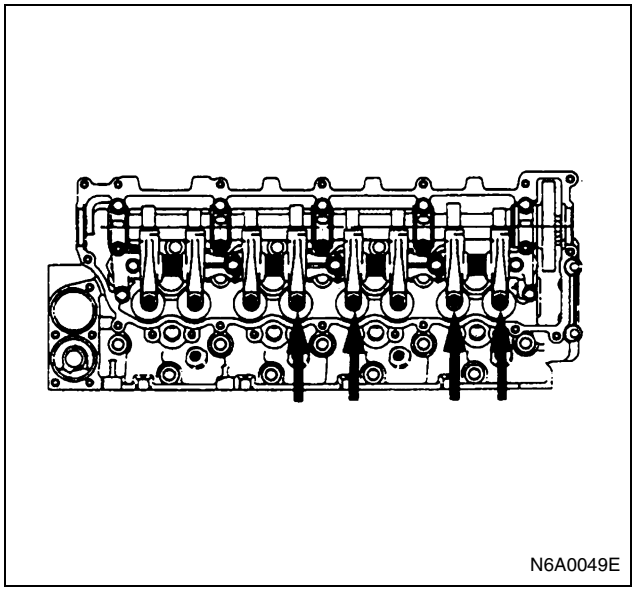
Valve Clearance	mm (in)
At cold	0.40 (0.016)

4. Loosen each valve clearance adjusting screw as shown in the illustration.



N6A0048E

5. Insert a feeler gauge of the appropriate thickness between the rocker arm and the valve stem end.
6. Turn the valve clearance adjusting screw until a slight drag can be felt on the feeler gauge.
7. Tighten the lock nut securely.
8. Rotate the crankshaft 360 degrees.
9. Realign the crankshaft damper pulley timing mark with the TDC notched line.
10. Adjust the clearance for the remaining valves as shown in the illustration.

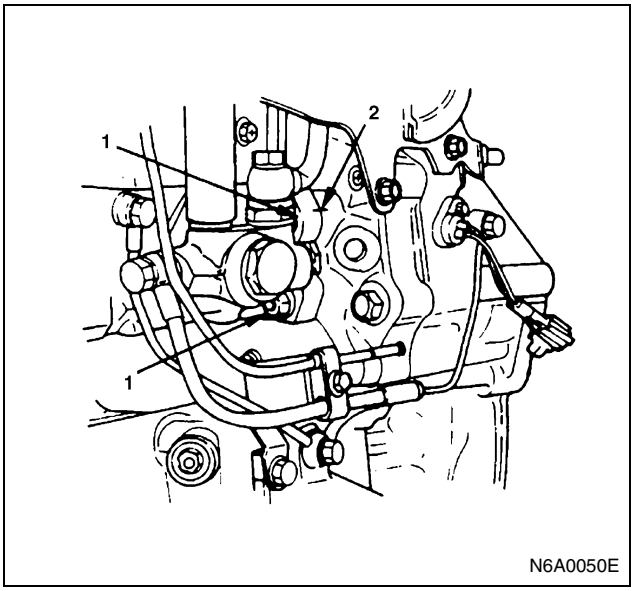


N6A0049E

Injection Timing Adjustment

Injection Pump Notched Line Inspection

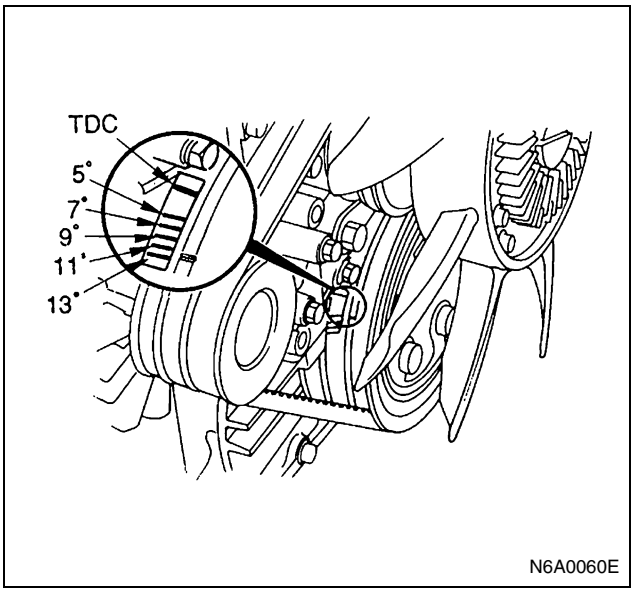
1. Check the injection pump bracket nuts (1) for looseness.
   Tighten as required.
2. Check that the notched lines (2) on the injection pump bracket and the timing gear case are aligned.
   If the notched lines are not aligned, the injection timing must be checked.



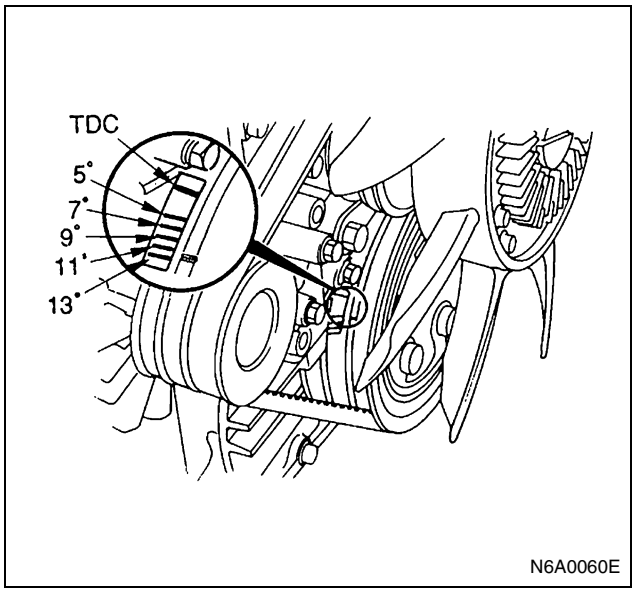
3. Some time, check injection timing on the crank damper pulley.
   If the injection timing aligned with in correct, the injection timing must be readjusted.

Injection Timing Adjustment

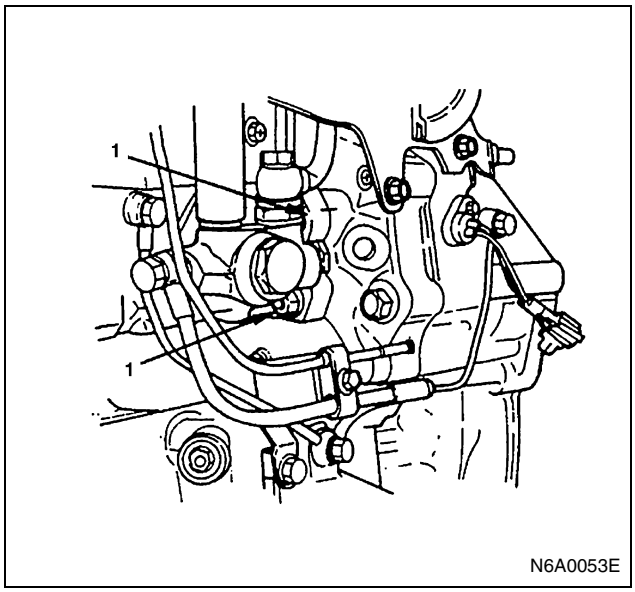
1. Turn the crankshaft until the timing mark on the crankshaft damper pulley is aligned with the BTDC (injection timing of each engine model) mark in the illustration.



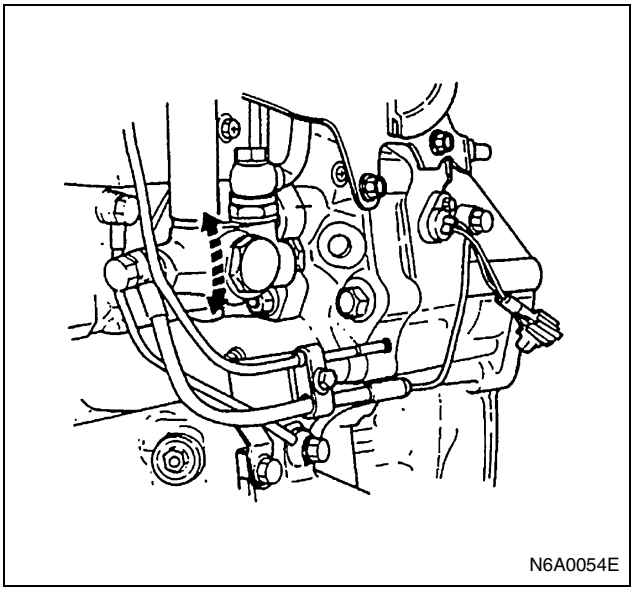
Injection Timing	deg
4HF1 4HE1-TC (4HE1-XS, XN)	BTDC 8
4HG1	BTDC 9
4HEI-T	BTDC 7
4HE1-TC (4HE1-XS)	BTDC 9 (Spec EURO3)



2. Remove the two foam rubbers.
3. Loosen the four injection pump fixing nuts (1).
   This will allow the pump to pivot.
   Do not bend or scratch the fuel pipe.



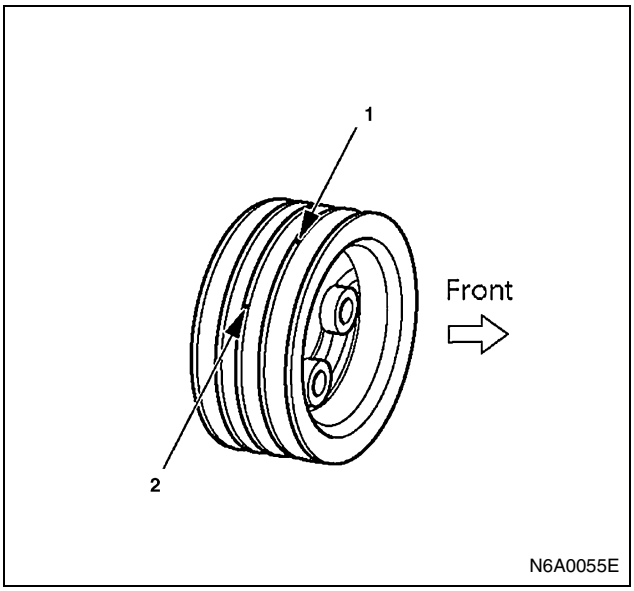
4. Align the notched line between the injection pump bracket and the timing gear case.
   Make sure that the timing mark on the crank damper pulley is aligned with correct injection timing.



N6A0054E

Notice:
In case the crank pulley has two marks as illustrated, (1) BTDC 49° mark on the second crest and (2) TDC mark on the third crest (as viewed from the front side), be sure to set at the mark (2). (If there are two different marks on one and same crest, set at the mark which comes second when rotated in the normal direction.)

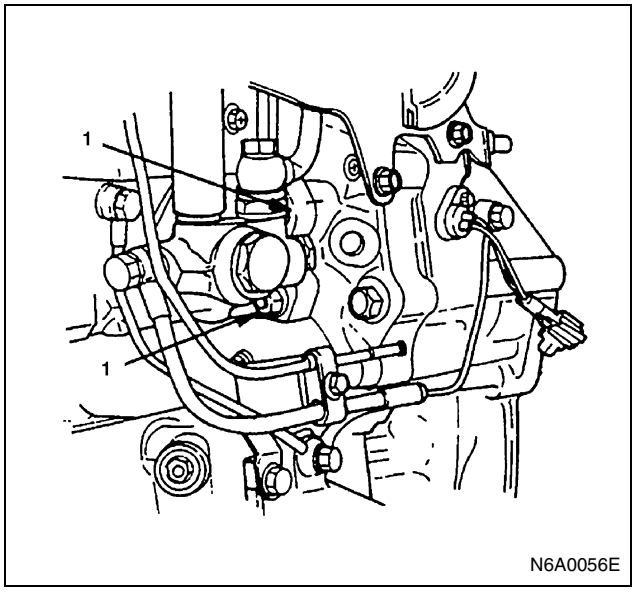
The mark (1) is used when installing the injection pump for 4HF1-2.



N6A0055E

5. Tighten the injection pump fixing nuts (1) to the specified torque.

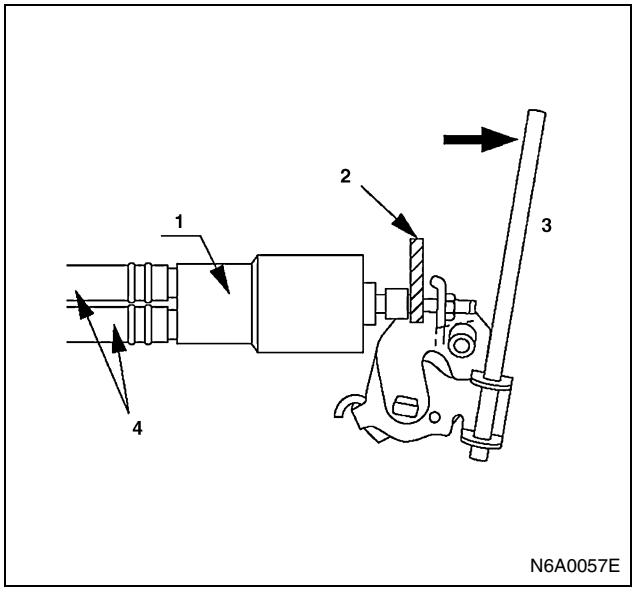
Tighten:
Injection pump fixing nut to 25 N·m (2.6 kg·m/19 lb·ft)



N6A0056E

Injection Timing Check (4HF1-2 model only)

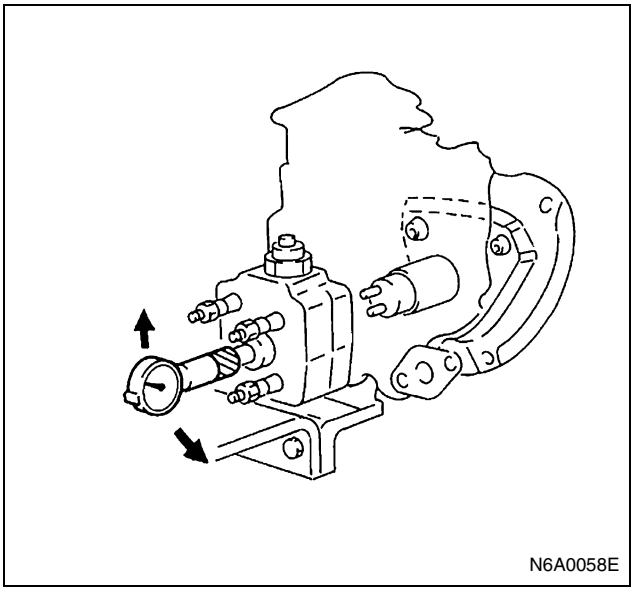
1. Set No. 1 Cylinder to the TDC in the compression stroke.
2. Disconnect Injection Pipe.
3. Put down Wax CSD lever, insert a spacer 10 — 20 mm (0.39 — 0.47 in) thick between the plunger and adjust bolt, and cancel the Wax CSD.



N6A0057E

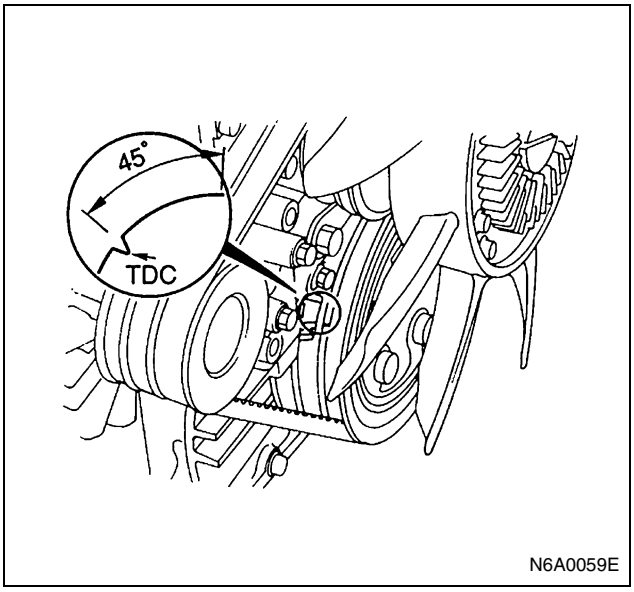
Legend
1. Wax CSD
2. Spacer
3. Lever
4. Water hose

4. Remove the pump rear plug, connect a dial gage and set the lift at 1 mm (0.039 in).
   Special Tool
   Measuring device: 5-8840-0145-0



N6A0058E

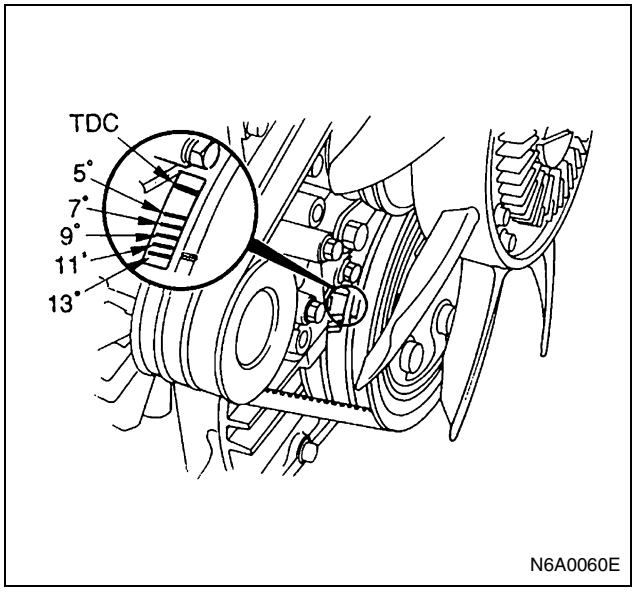
5. Set the crankshaft damper pulley TDC mark to the pointer or 45° before TDC.



N6A0059E

6. Set the dial gage to the “0” position.
7. Turn the crankshaft leftwise and rightwise a little and make sure that the needle stays in the “0” position.
8. Turn the crankshaft in the normal direction and read the measuring device’s indication at the 12° before TDC position.

Notice:
As there is no 12° mark, set midway between the 11° and 13° marks.
Standard value: 0.5 mm (0.0197 in)



N6A0060E

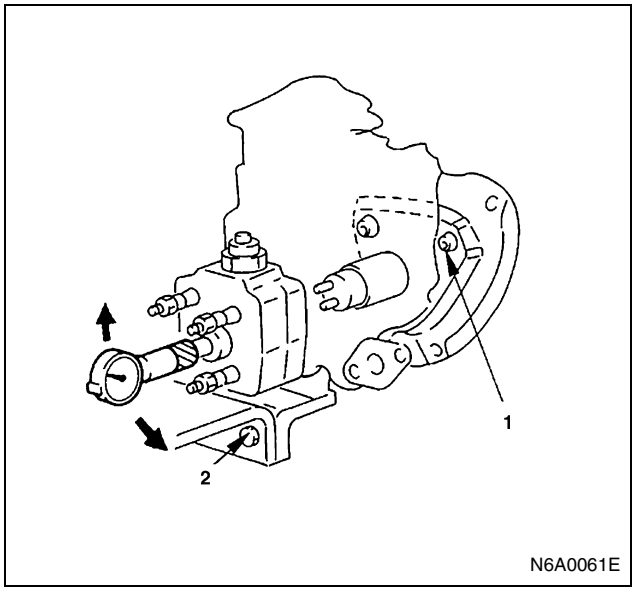
Injection Timing Adjustment (4HF1-2 model only)

If injection timing is out of the specified range, follow the following procedure for adjustment:

1. Loosen injection pump fixing nuts (1) and bracket bolt (2).
2. Adjust the mounting angle of injection pump:
   - If injection timing is too fast, bring the injection pump closer to the engine.
   - If injection timing is too slow, put the injection pump more distant from the engine.
3. When the dial gage has indicated the specified value, tighten the fixing nuts (1) and bolt (2) to specified torque:

Tighten:
Fixing nut to 24 N·m (2.4 kg·m/17 lb·ft)

Tighten:
Bracket bolt to 48 N·m (4.9 kg·m/35 lb·ft)



N6A0061E

4. Disconnect the dial gage, install and tighten the plug to specified torque. (Make sure of a copper washer being attached to the plug)

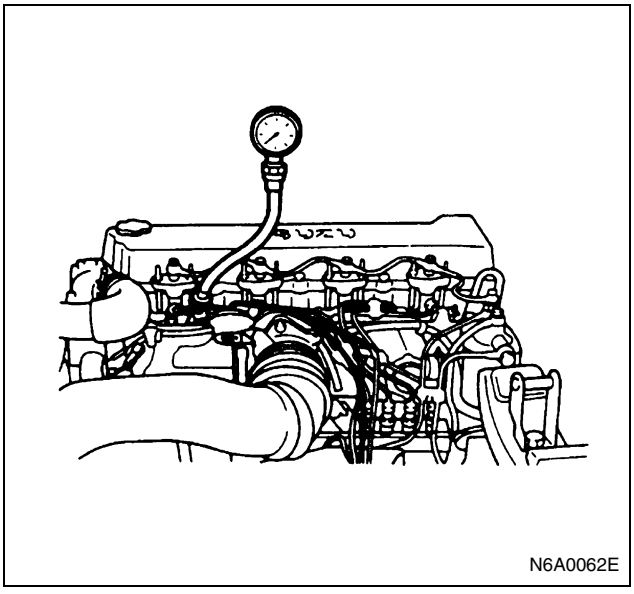
Tighten:
Pump rear plug to 17 N·m (1.7 kg·m/12 lb·ft)

5. Release the wax CSD and connect the injection pipe.

Tighten:
Pipe sleeve nut to 29 N·m (3.0 kg·m/22 lb·ft)

Compression Pressure Measurement

1. Start the engine and allow it to warm up.
   Engine Coolant Temperature: Above 80°C (176°F)
2. Stop the engine.
3. Remove the following parts.
   - Glow plugs.
   - In case VE pump;
     Fuel cut solenoid connector.
   - In case line pump;
     F-9 fuse in fuse box.
4. Set the adapter and the compression gauge to the No.1 cylinder glow plug hole.
   Compression Gauge: 5-8840-2675-0
   Adapter; Compression Gauge: 5-8531-7001-0



N6A0062E

5. Connect a tachometer and check that engine cranking speed is 200 rpm or higher.
6. Turn the engine over with the starter motor and take the compression gauge reading.
7. Repeat the procedure (steps 4,5 and 6) for the remaining cylinders.

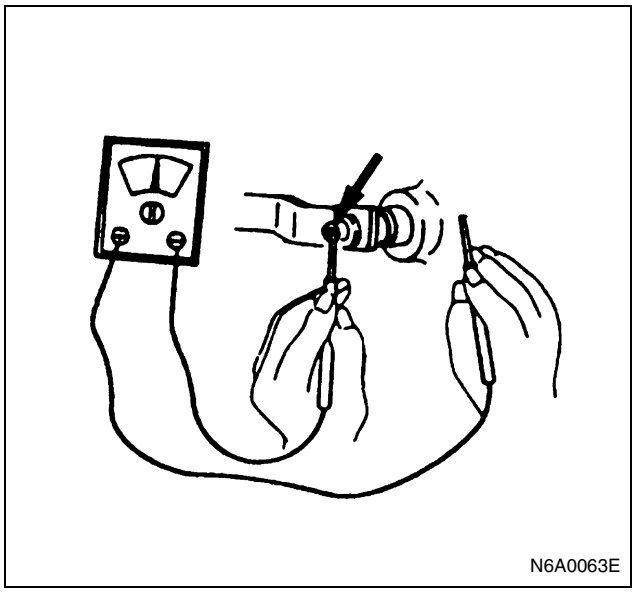
Compression Pressure kPa (kg/cm^2/psi) at 200 rpm	
Standard	More than 2,942 (30/426)
Limit for use	2,157(22/312)
Variance in pressure between cylinders	Less than 294 (3/43)

If the measured valve is less than the specified limit, above works refer to “TROUBLESHOOTING” Section in this manual.

Quick-On-Start II System

Inspection Procedure

1. Disconnect the thermoswitch connection on the thermostat outlet pipe.
2. Turn the key switch to the “ON” position.
   If the Quick-ON-Start II system is operating properly, the flow relay will make a clicking sound within three seconds.
3. Measure the glow plug terminal voltage with a circuit tester as soon as possible after turning the key switch to the “ON” position.



N6A0063E

4. Check the glow plug heating time.

Approximate Glow Plug Heating Time	sec

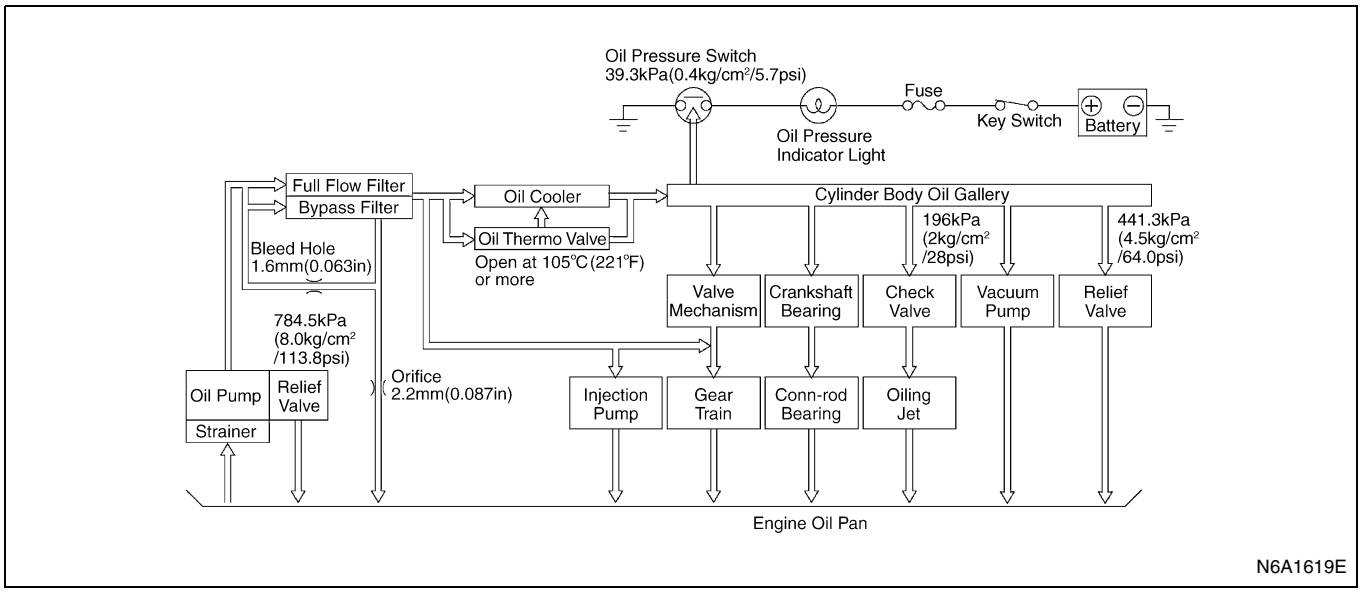
LUBRICATING SYSTEM

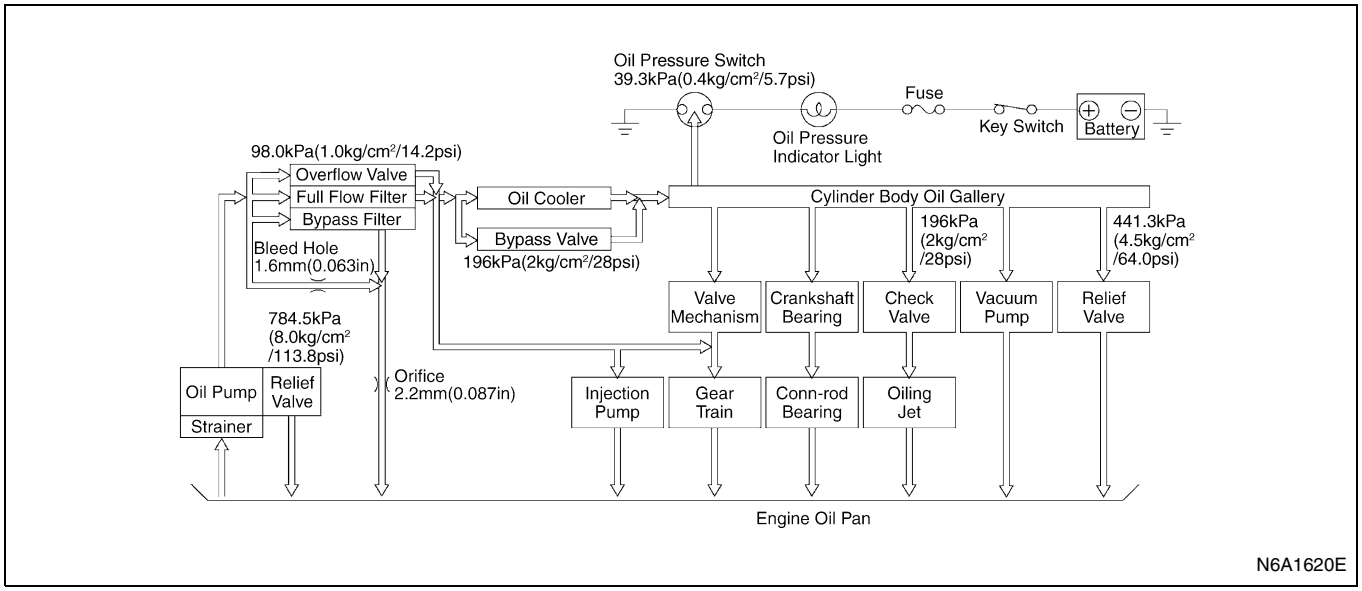
General Description

Lubricating Oil Flow

4HF1, 4HF1-2, 4HG1-T Model



4HE1-TC Model



The engine lubricating system is a full flow type.
Lubricating oil is pumped from the oil pump to the cylinder body oil gallery through the oil filter and the oil cooler. It is then delivered to the vital parts of the engine from the cylinder body oil gallery.
Oil jets installed on the cylinder body spray engine oil to the piston inside faces to achieve maximum cooling effect.

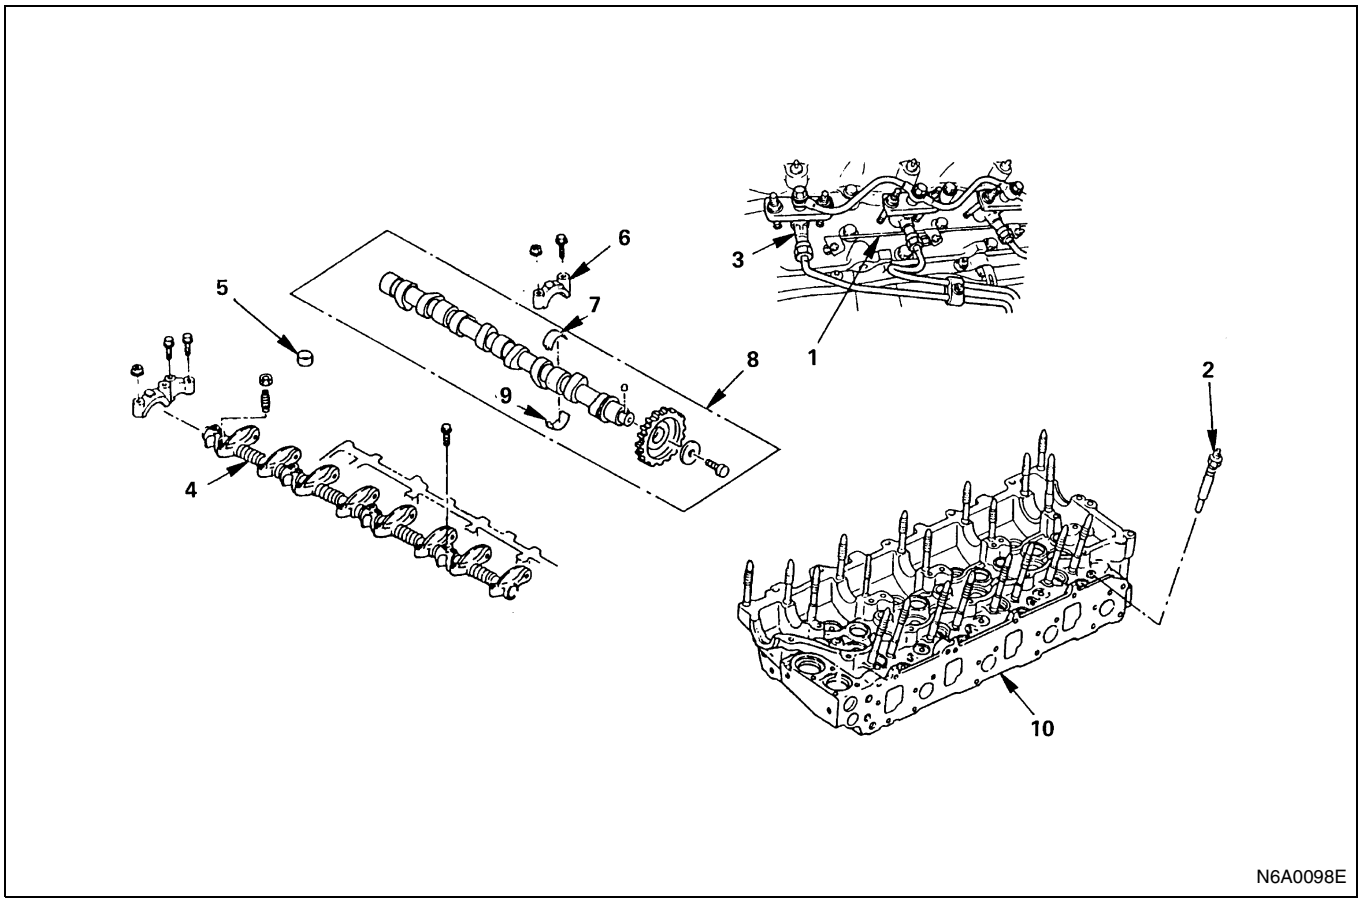
CYLINDER HEAD

Component



Legend

1. Glow plug connector
2. Glow plug
3. Injection nozzle holder assembly
4. Rocker arm shaft assembly
5. Valve cap
6. Camshaft bearing cap
7. Camshaft bearing upper
8. Camshaft assembly
9. Camshaft bearing lower
10. Cylinder head

Notice:

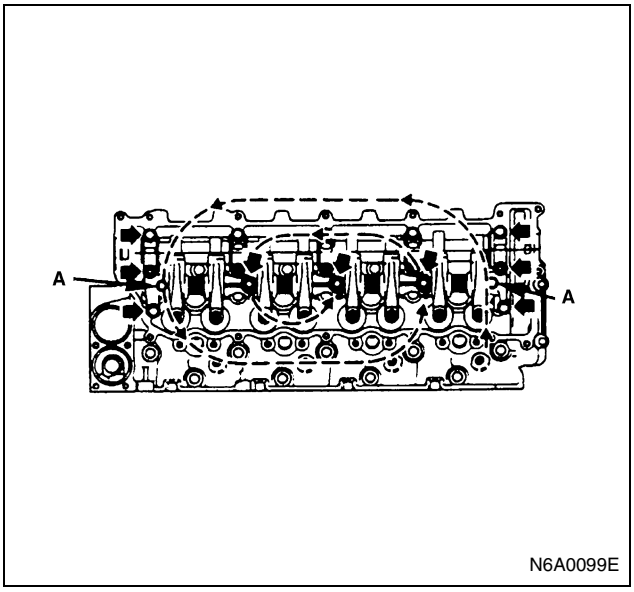
- During disassembly, be sure that the valve train components are kept together and identified so that they can be re-installed in their original locations.
- Before removing the cylinder head from the engine and before disassembling the valve mechanism, make a compression test and note the results.

Disassembly

1. Glow Plug Connector
2. Glow Plug
3. Injection Nozzle Holder Assembly
   Mark the nozzle holder assemblies fitting positions by tagging each nozzle holder assembly with the cylinder number from which it was removed.
4. Rocker Arm Shaft Assembly
   1) Loosen the rocker arm shaft bracket nuts and bolts in numerical order a little at a time and remove the rocker arm shaft assembly with the camshaft brackets.
   2) Leave the (A) indicated bolt unremoved on this occasion, since it is the rocker arm fixing bolt.

Caution:

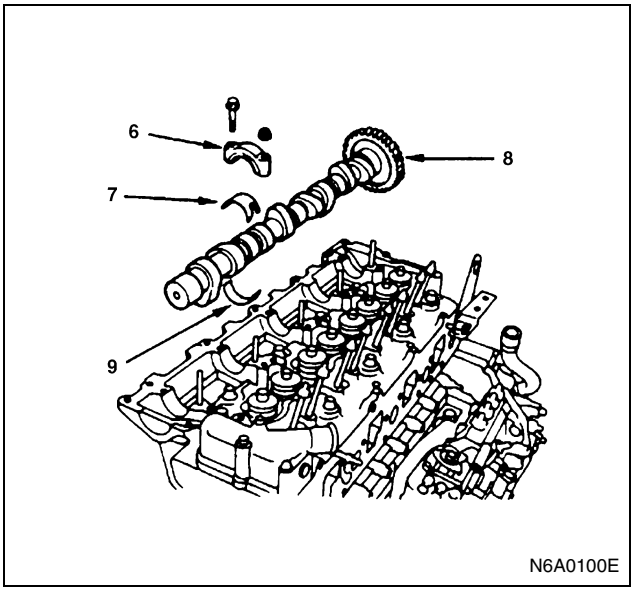
Failure to loosen the rocker arm shaft bracket nuts and bolts in numerical order a little at a time will adversely affect the rocker arm shaft.



5. Valve Cap

Caution:
Take sufficient care not to let valve caps fall into the gear case or oil return hole.

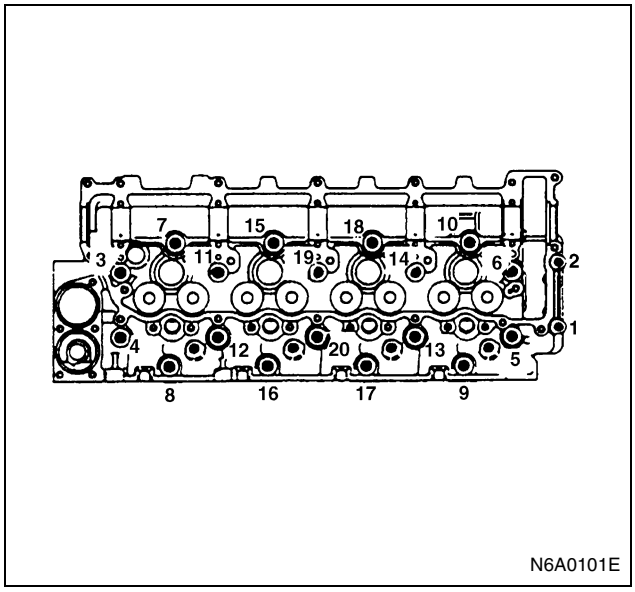
6. Camshaft Bearing Cap
7. Camshaft Bearing Upper
8. Camshaft Assembly
9. Camshaft Bearing Lower
   If the camshaft bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



10. Cylinder Head
    Loosen the cylinder head bolts in numerical order a little at a time.

Caution:
Failure to loosen the cylinder head bolts in numerical order a little at a time will adversely affect the cylinder head lower surface.

- Refer to Section 6A3 “CYLINDER HEAD”.



Clean

- Cylinder head bolts
- Cylinder head
  Carefully remove all varnish, soot and carbon to the bare metal. Do not use a motorized wire brush on any gasket sealing surface.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

- Cylinder head gasket and mating surfaces for leaks, corrosion and blow-by. If the gasket has failed, determine the cause;
  - Improper installation
  - Loose or warped cylinder head
  - Insufficient torque on head bolts
  - Warped case surface

1. Cylinder head bolts for damaged threads or stretching and damaged heads caused by improper use of tools.

Caution:
Suspected bolts must be replaced.

2. Cylinder head for cracks, especially between valve seats and in the exhaust ports.
3. Cylinder head deck for corrosion, sand particles in head and porosity.

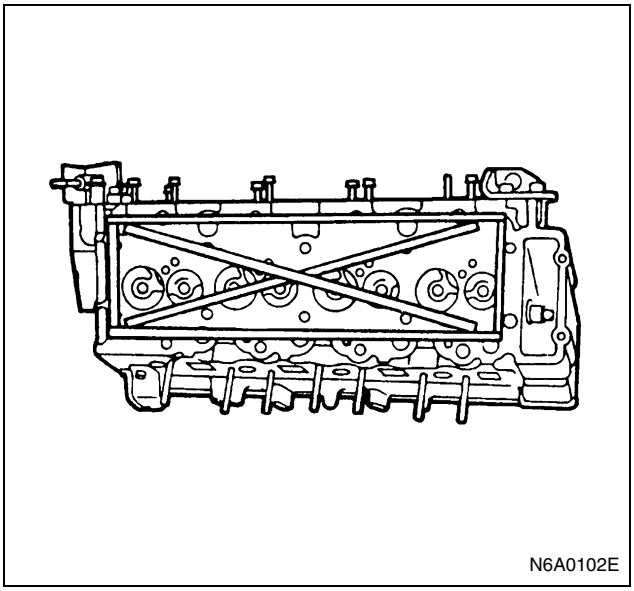
Caution:
Do not attempt to weld the cylinder head. Replace it.

Cylinder Head Lower Face Warpage

1. Use a straight edge and a feeler gauge to measure the four sides and the two diagonals of the cylinder head face.
2. If the measured values exceed the specified limit, the cylinder head must be replaced.

Notice:
Do not regrind the cylinder head lower face.

Cylinder Head Lower Face Warpage	mm (in)
Standard	Limit
0.05 (0.002) or less	0.2 (0.008)

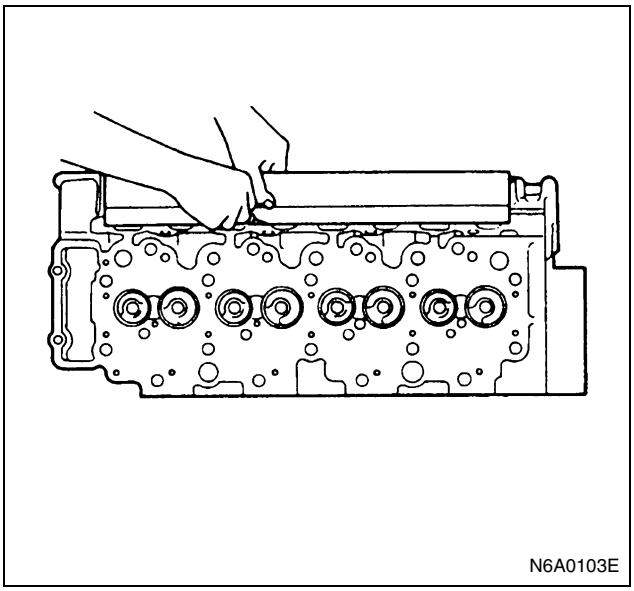


N6A0102E

Manifold Fitting Face Warpage

Use a straight edge and a feeler gauge to measure the manifold cylinder head fitting face warpage.
Regrind the manifold cylinder head fitting faces if the measured value is greater than the specified limit.

Manifold Fitting Face Warpage	mm (in)
Standard	Limit
0.05 (0.002) or less	0.2 (0.008)

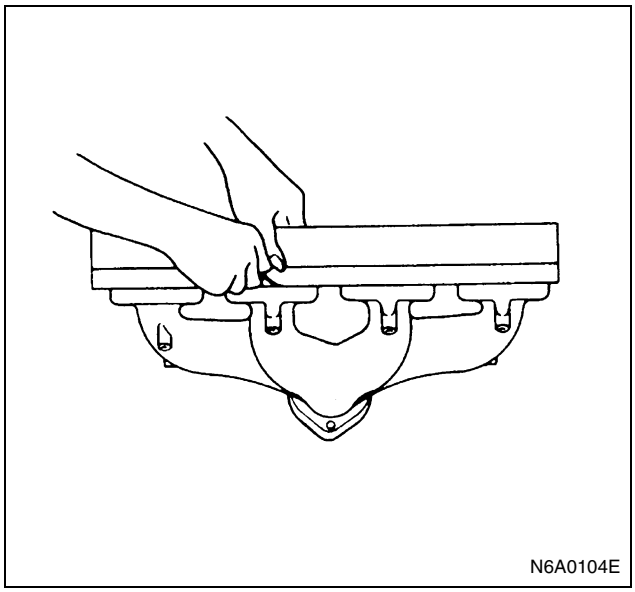


N6A0103E

Exhaust Manifold Warpage

Use a straight edge and a feeler gauge to measure the manifold cylinder head fitting face warpage.
If the measured values exceed the specified limit, the manifold must be replaced.

Exhaust Manifold Warpage	mm (in)
Standard	Limit
0.05 (0.002) or less	0.24 (0.008)



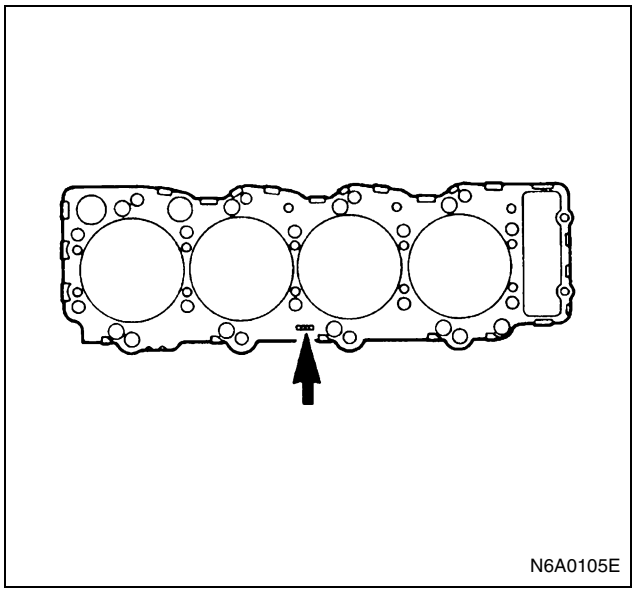
N6A0104E

Reassembly

Install the cylinder head gasket with its “PART NUMBER” mark facing up and toward the left of the engine.

Caution:
Do not reuse the cylinder head gasket.

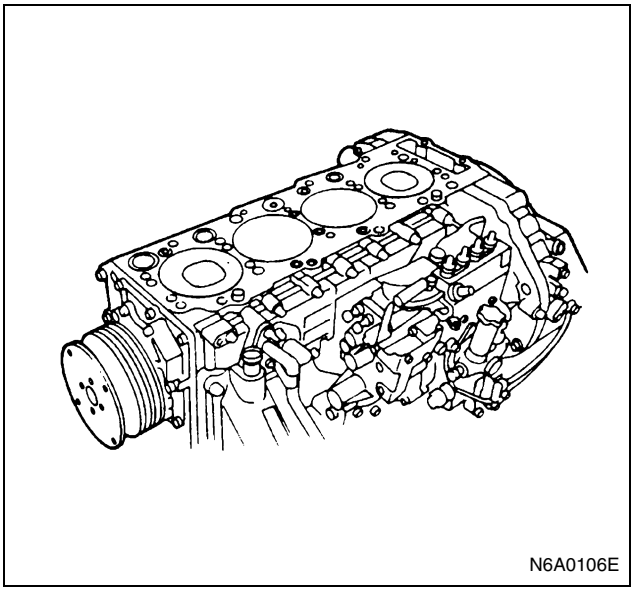
Above works refer to “CYLINDER BLOCK” section in this manual.



N6A0105E

1. Cylinder Head

1) Align the cylinder body dowels and the cylinder head dowel holes.
2) Carefully place the cylinder head on the cylinder head gasket.



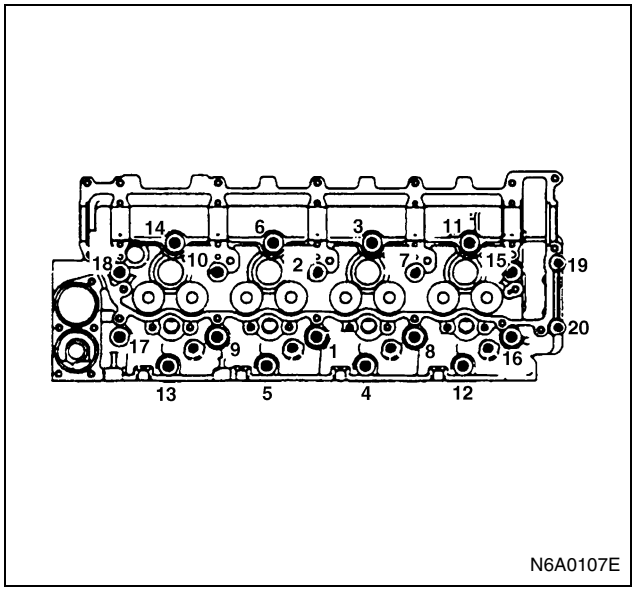
N6A0106E

3) Apply a coat of molybdenum disulfide grease to the M14 cylinder head bolt threads and setting faces and apply a coat of engine oil to the M10 cylinder head bolt threads and setting faces.
4) Use the angular tightening method to tighten the bolts (M14) to the specified torque in three steps following the numerical order shown in the illustration.

Tighten:
Cylinder head bolt (M14: (1) — (18)) to
- 1st step: 98 N·m (10 kg·m / 72 lb·ft)
- 2nd step: 147 N·m (15 kg·m / 108 lb·ft)
- 3rd step: 30 — 60°

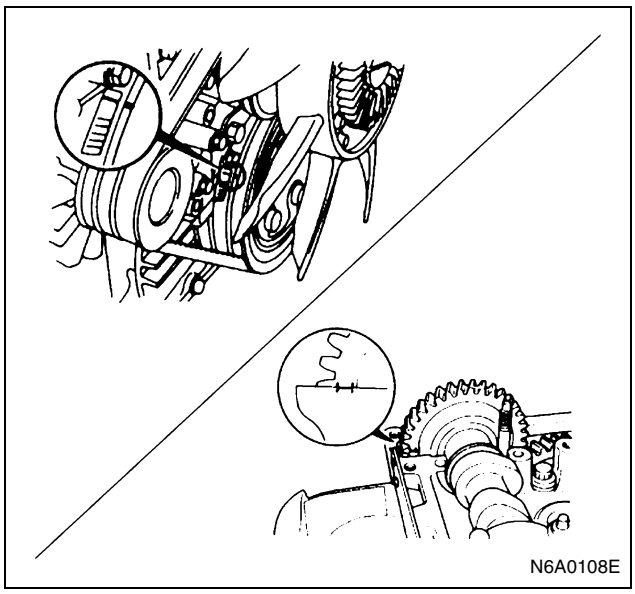
5) Tighten the cylinder head to the flywheel housing bolts (M10) to the specified torque.

Tighten:
Cylinder head bolt to (M10: (19) — (20)) to 38 N·m (3.9 kg·m / 28 lb·ft)



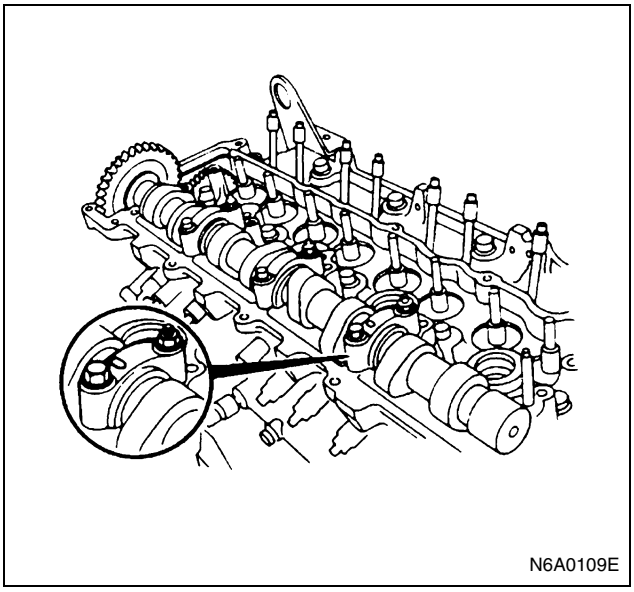
N6A0107E

2. Camshaft Bearing Lower
3. Camshaft Assembly
   1) Turn the crankshaft in the direction of normal rotation until the timing mark on the crankshaft damper pulley is aligned with the TDC notched line. (Confirm that the No. 1 cylinder piston comes to the compression top dead center.)



N6A0108E

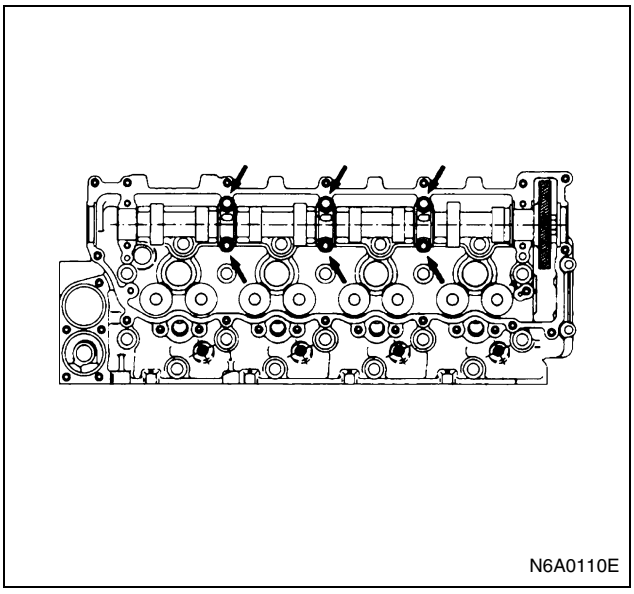
   2) Apply engine oil to the camshaft journal and the camshaft bearing surfaces before installation.
   3) Carefully align the camshaft gear “I” mark and the cylinder head upper face shown in the illustration.
4. Camshaft Bearing Upper
5. Camshaft Bearing Cap
   1) Install the bearing caps with the bearing cap head mark (arrow) facing forward.



N6A0109E

2) Apply a coat of engine oil to the bearing cap bolt and stud threads.
3) Tighten the bearing cap bolts and studs to the specified torque.

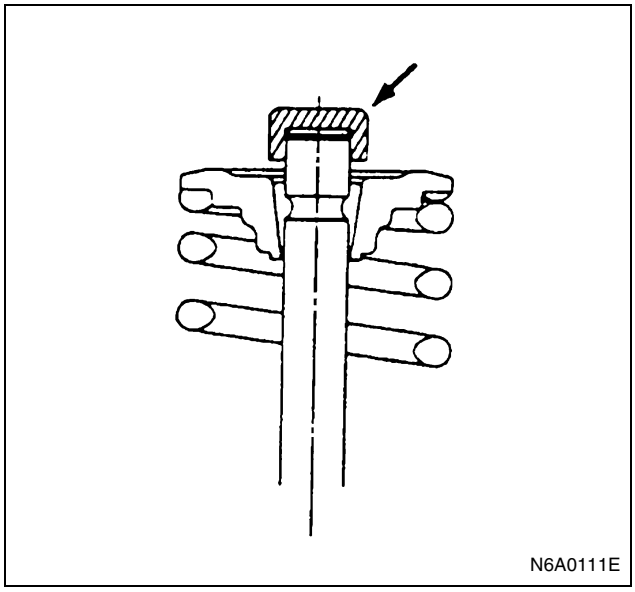
Tighten:
Camshaft bearing cap nut and bolt to 27 N·m (2.8 kg·m / 20 lb·ft)



N6A0110E

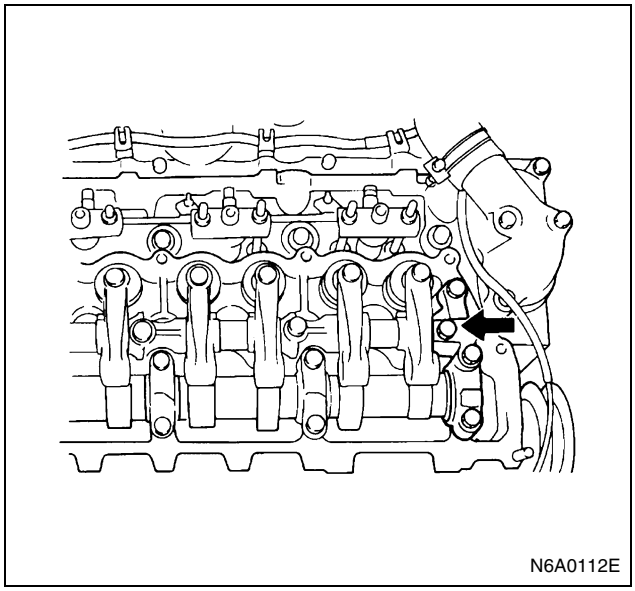
6. Valve Cap
Apply engine oil to the inside of the valve caps and install them to the valve stem end.

Caution:
Take sufficient care not to let valve caps fall into the gear.



N6A0111E

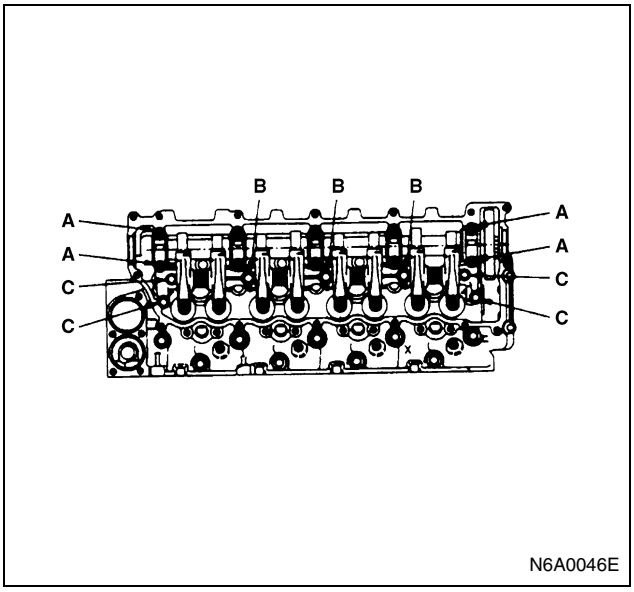
7. Rocker Arm Shaft Assembly
1) Temporarily tighten the bolts marked with the arrow in the illustration.



N6A0112E

2) Loosen the rocker arm adjust screws and apply engine oil to the rocker arm roller portions.
3) Install the rocker arm assembly on the cylinder head.
4) Tighten the rocker arm shaft bracket nuts and bolts to the specified torque in numerical order a little at a time as shown in the illustration.

Tighten:
Rocker arm shaft bracket nut and bolt to
- Nut (A): 27 N·m (2.8 kg·m / 20 lb·ft)
- Bolt (B): 56 N·m (5.7 kg·m / 41 lb·ft)
- Bolt (C): 27 N·m (2.8 kg·m / 20 lb·ft)

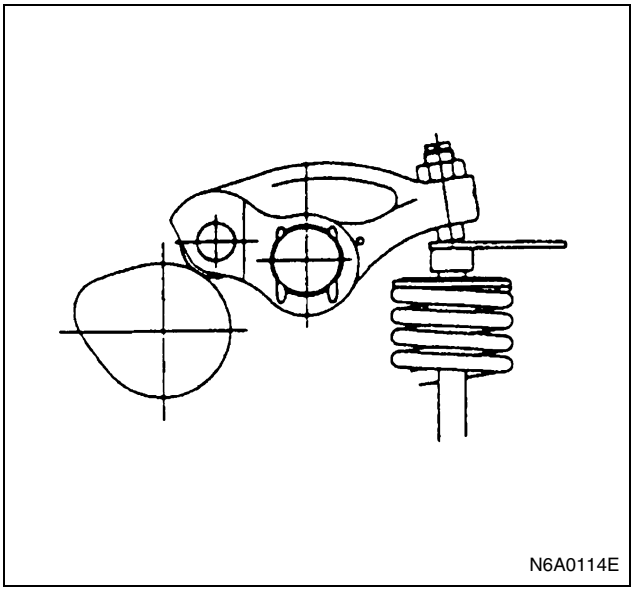


5) Apply engine oil to the threaded portion of the nuts marked with “A” and the bolts with “B” shown in the illustration left, and tighten them to the specified torque.

Adjust the valve clearance.

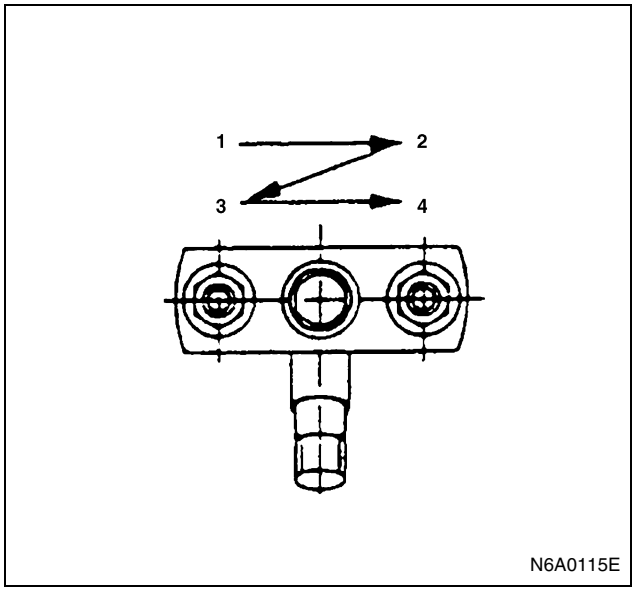
Valve Clearance	mm (in)
At cold	0.4 (0.016)

Above works refer to “SERVICING” “VALVE CLEARANCE ADJUSTMENT” previously section in this manual.



8. Injection Nozzle Holder Assembly
   Tighten the nozzle holder flange nuts to the specified torque in the numerical order shown in the illustration.

Tighten:
Nozzle holder flange nut to 19 N·m (1.9 kg·m / 14 lb·ft)



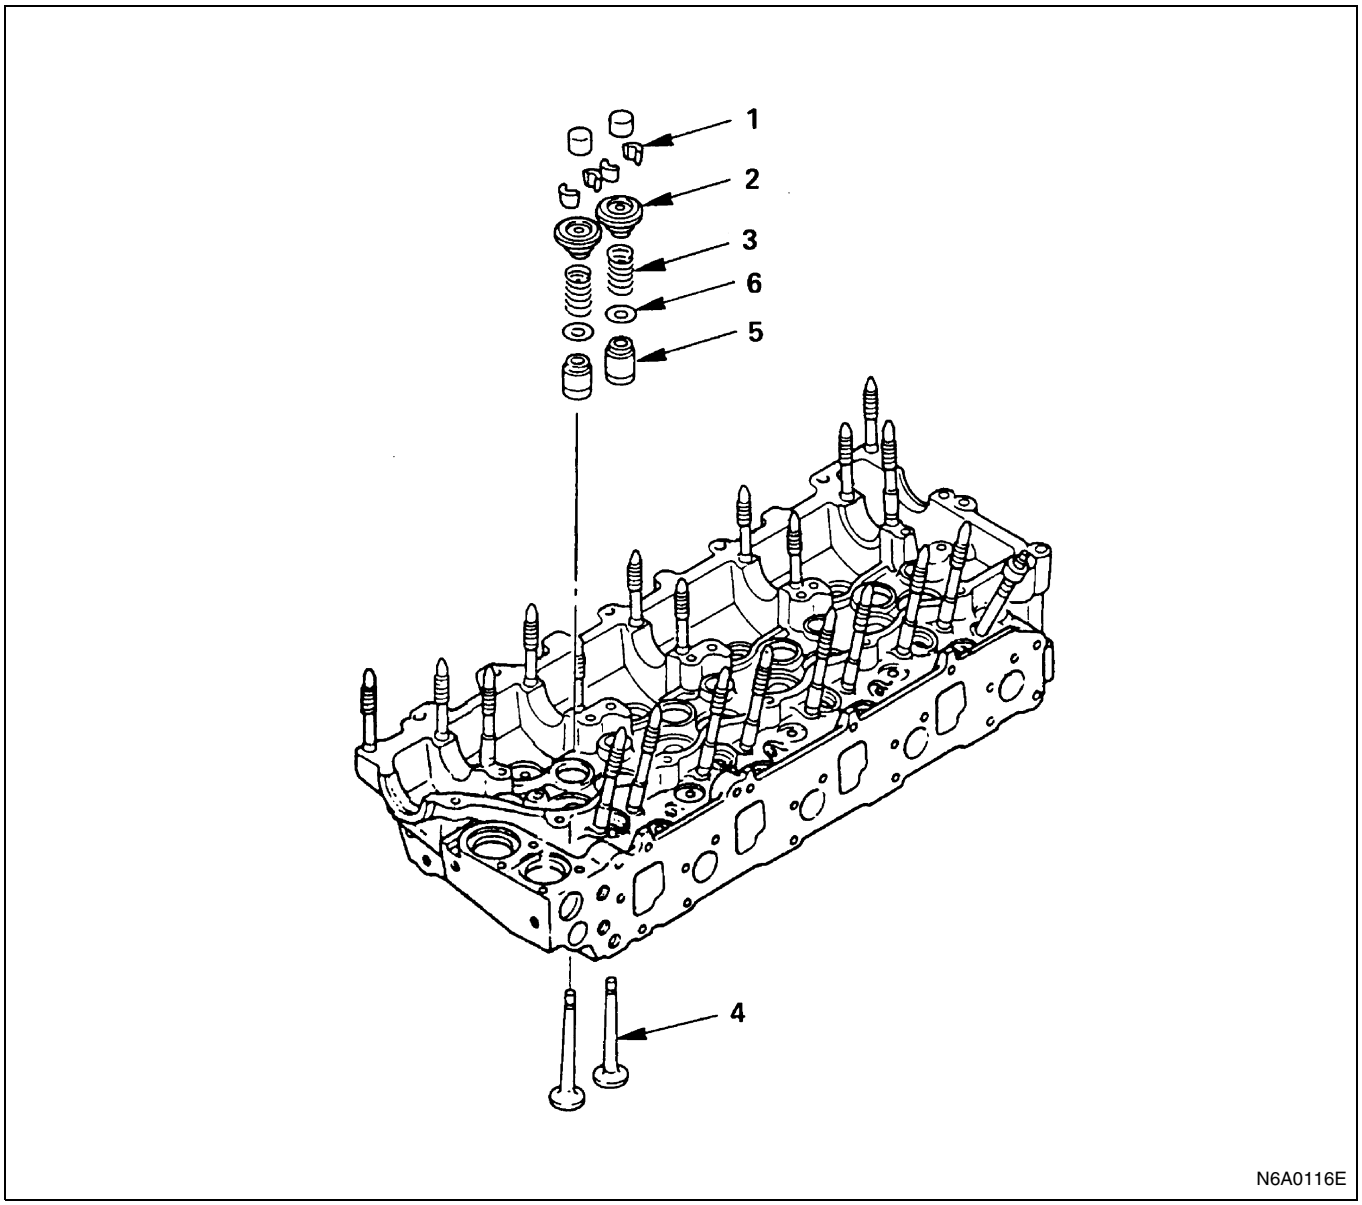
9. Glow Plug

Tighten:
Glow Plug to 23 N·m (2.3 kg·m / 17 lb·ft)

10. Glow Plug Connector

VALVE SPRING, VALVE GUIDE OIL SEAL, VALVE, VALVE GUIDE

Component



Legend

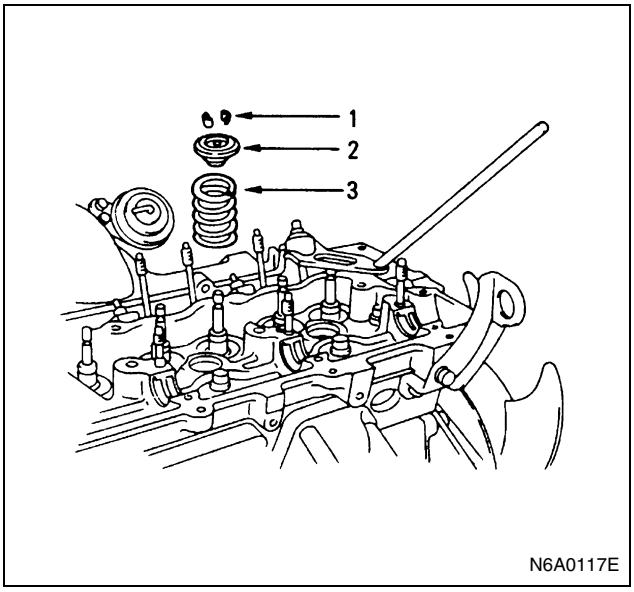
1. Split collar
2. Spring upper seat
3. Valve spring
4. Intake and exhaust valve
5. Valve guide seal
6. Spring lower seat

Disassembly

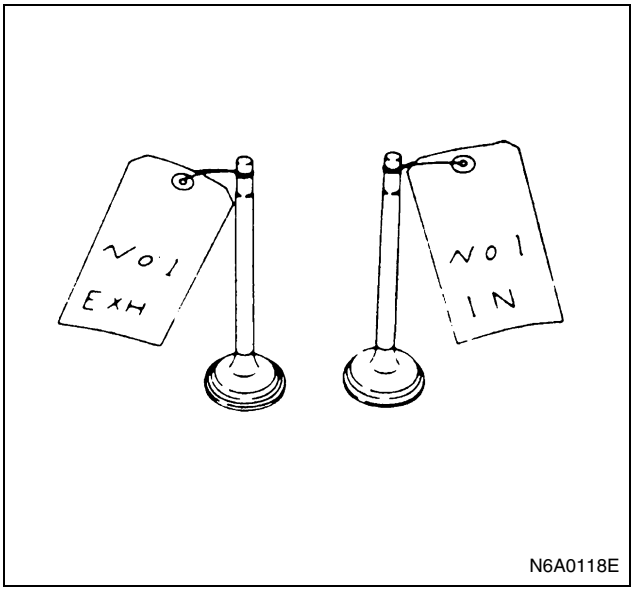
Preparation

- Remove all the parts only with the cylinder head assembly left.
  (Above works refer to “CYLINDER HEAD GASKET” section 6A3 in this manual.)

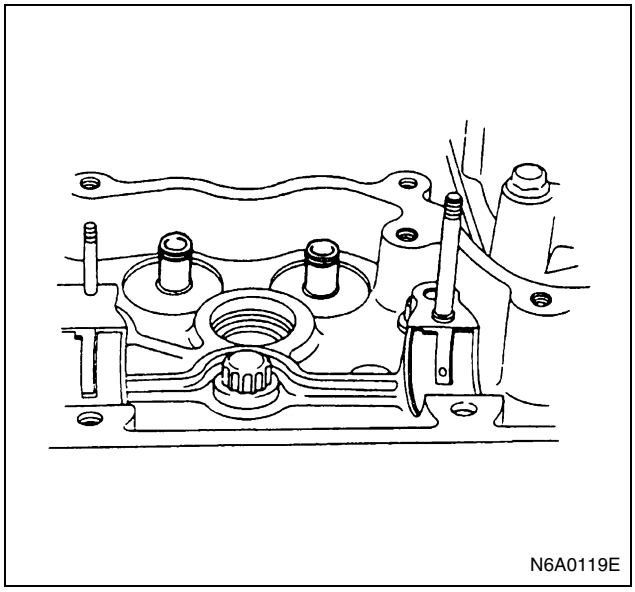
1. Cotter Collar
   1) Place the cylinder head on a flat wooden surface.
   2) Use the valve spring compressor to remove the cotter collar.
      Do not allow the valve to fall from the cylinder head.
      Valve Spring Compressor: 5-8840-2228-0
2. Spring Upper Seat
3. Valve Spring



4. Intake and Exhaust Valve
   If the intake and exhaust valves are to be reinstalled, mark their installation positions by tagging each valve with the cylinder number from which it was removed.
   If the intake and exhaust valves are to be replaced, the valve guides must also be replaced.



5. Valve Guide Seal
6. Spring Lower Seat



Inspection and Repair

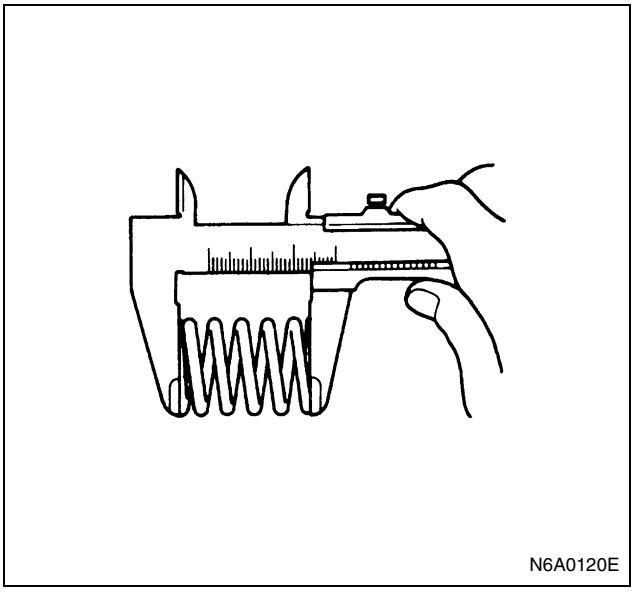
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Valve Spring Free Height

Use a vernier caliper to measure the valve spring free height.
If the measured valve is less than the specified limit, the valve spring must be replaced.

Valve Spring Free Height 4HF1: 4HF1-2: 4HG1: 4HG1-T	mm (in)
Nominal Size	Limit
62.5 (2.46)	59.4 (2.34)

4HE1-TC:		mm (in)
	Nominal size	Limit
Intake Inner	53.2 (2.094)	50.1 (1.972)
Intake Outer	55.6 (2.189)	52.5 (2.067)
Exhaust Inner	58.6 (2.307)	55.5 (2.185)
Exhaust Outer	62.0 (2.441)	58.9 (2.319)

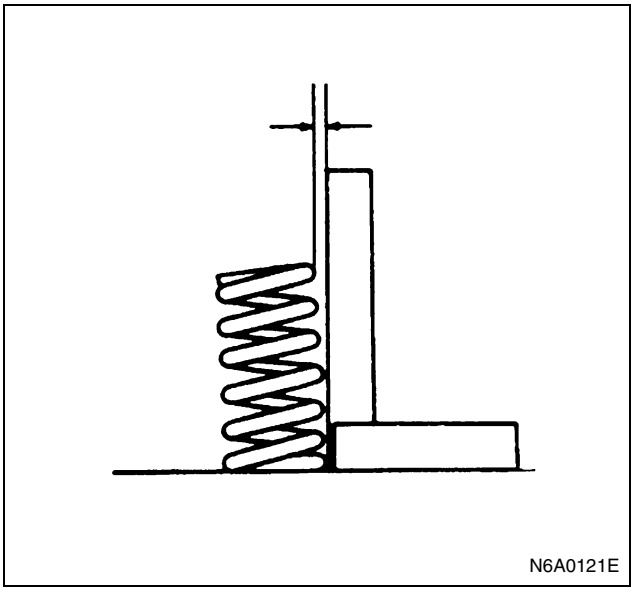


N6A0120E

Valve Spring Squareness

Use a surface plate and a square to measure the valve spring squareness.
If the measured value exceeds the specified limit, the valve spring must be replaced.

Valve Spring Squareness	mm (in)
Limit	1.0 (0.04)

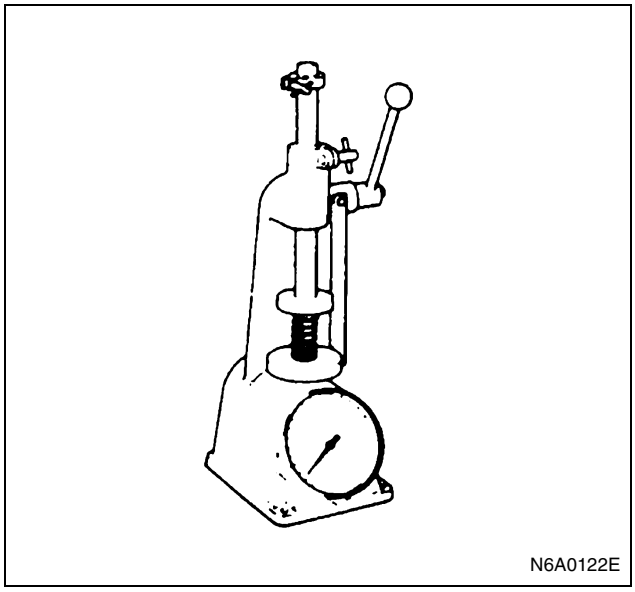


N6A0121E

Valve Spring Tension

Use spring tester to measure the valve spring tension.
If the measured valve is less than the specified limit, the valve spring must be replaced.

Valve Spring Tension		N (kg/lb)
Set Length mm (in)	Standard	Limit
47.0 (1.85)	414 — 477 (42.2 — 48.6/93 — 107)	401 (40.9/98)



N6A0122E

Valve Guide

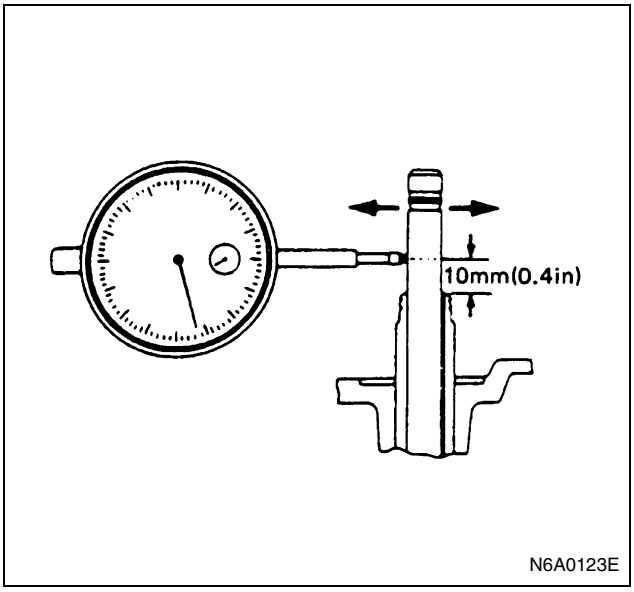
Caution:
Taking care not to damage the valve seat contact surface, when removing carbon adhering to the valve head.
Carefully inspect the valve stem for scratching or abnormal wear. If these conditions are present, the valve and the valve guide must be replaced as a set.

Valve Stem and Valve Guide Clearance

(Measuring Method-I)

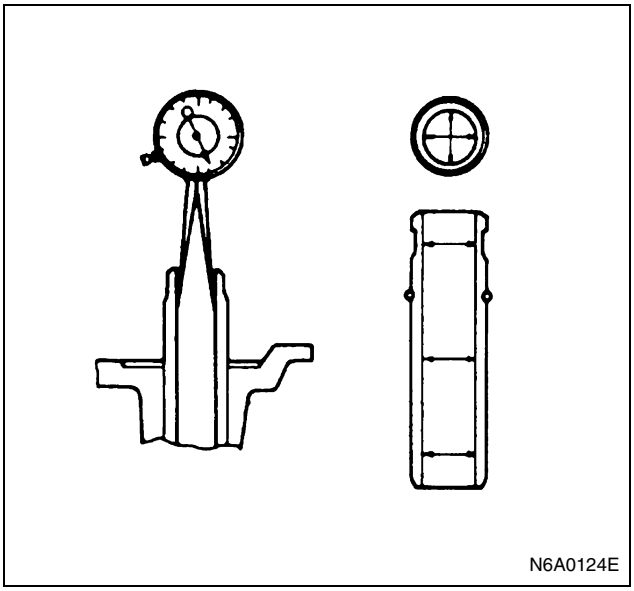
1. Set the dial indicator to the valve stem measuring point.
2. Move the valve stem end from side to side.
   Read the dial indicator.
   Note the total indicator reading.
   If the measured values exceed the specified limit, the valve and the valve guide must be replaced as a set.

Total Dial Indicator Reading (Valve Stem and Valve Guide Clearance)		mm (in)
Valve	Standard	Limit
Intake Valve	0.038 — 0.071 (0.0015 — 0.0028)	0.20 (0.0079)
Exhaust Valve	0.064 — 0.096 (0.0025 — 0.0038)	0.25 (0.0098)



(Measuring Method-II)

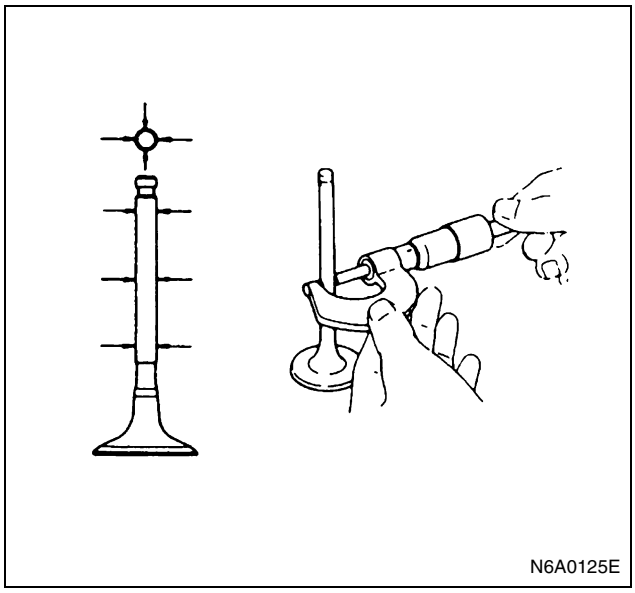
1. Measure the valve stem outside diameter.
   Refer to the “Valve Stem Outside Diameter”.
2. Use a caliper calibrator or a telescoping gauge to measure the valve guide inside diameter.
3. Calculate the clearance between the valve guide inside diameter and the valve stem outside diameter.
   If the clearance exceeds the specified limit, the valve and the valve guide must be replaced as a set.



Valve Stem Outside Diameter

Measure the valve stem diameter at three points.
If the measured valve is less than the specified limit, the valve and the valve guide must be replaced as a set.

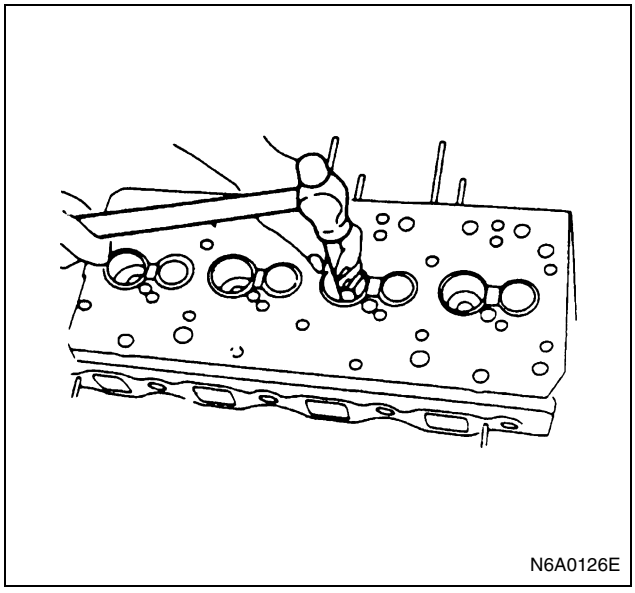
Valve Stem Outside Diameter		mm (in)
Valve	Standard	Limit
Intake Valve	8.946 — 8.962 (0.3522 — 0.3528)	8.88 (0.350)
Exhaust Valve	8.921 — 8.936 (0.3512 — 0.3529)	8.80 (0.346)



Valve Guide Replacement

Valve Guide Removal

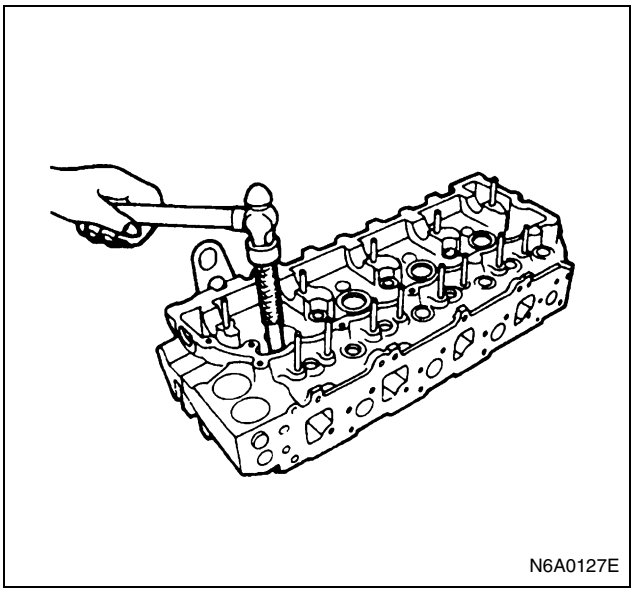
Use a hammer and the valve guide replacer to drive out the valve guide from the cylinder head lower face.
Valve Guide Replacer: 5-8840-2227-0



Valve Guide Installation

1. Apply engine oil to the valve guide outer circumference.
2. Attach the valve guide installer to the valve guide.
   Valve Guide Replacer: 5-8840-2227-0

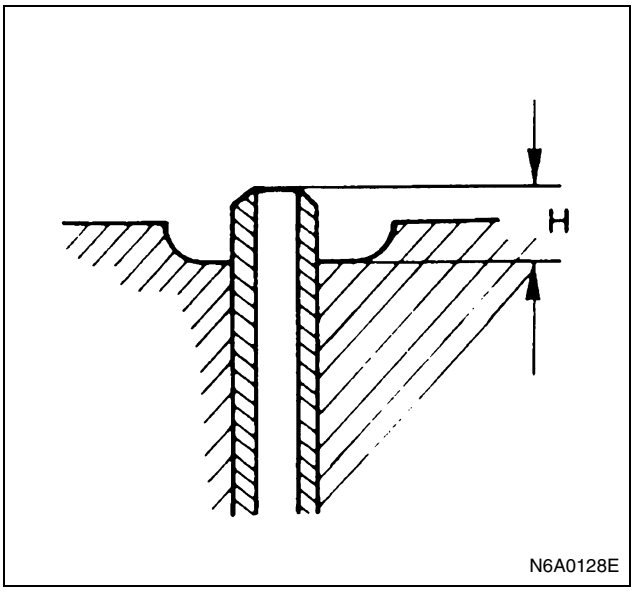
3. Use a hammer to drive the valve guide into position from the cylinder head upper face.



4. Measure the height (H) of the valve guide upper end from the cylinder head upper face.

Valve Guide Upper End Height (H)	mm (in)
14.1 ± 0.2 (0.555 ± 0.008)	

Notice:
If the valve guide has been removed, both the valve and the valve guide must be replaced as a set.

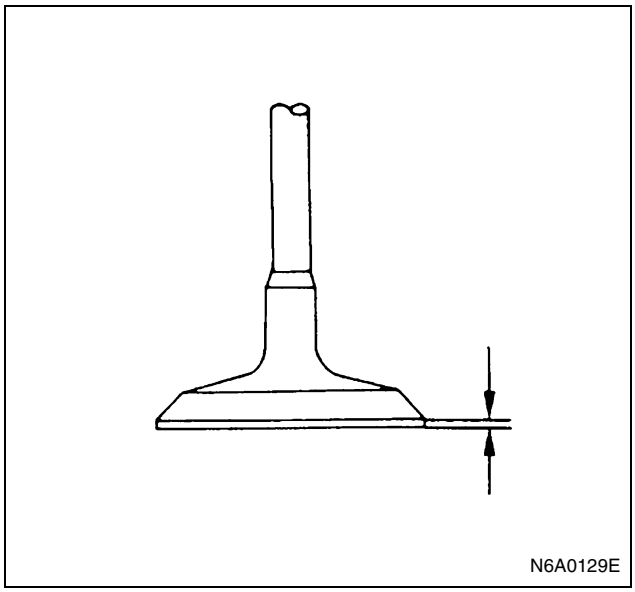


Valve and Valve Seat Insert

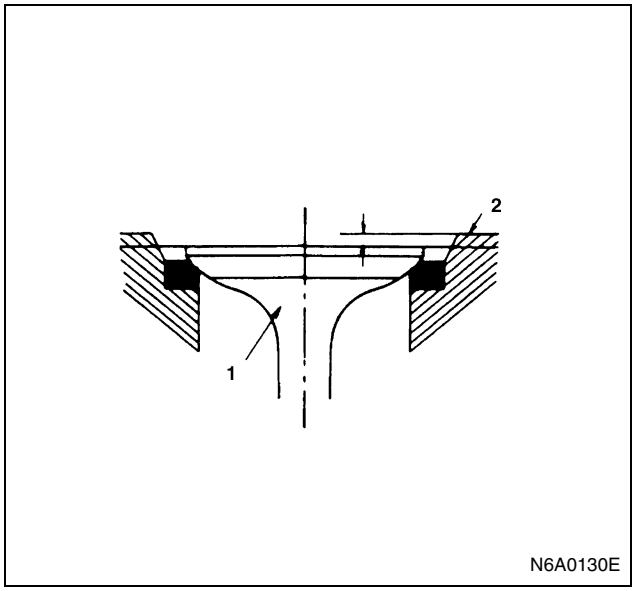
Valve Thickness and Depression

1. Measure the valve thickness.
   If the measured value is less than the specified limit, the valve and the valve seat insert must be replaced as a set.

Intake and Exhaust Valve Thickness		mm (in)
Valve	Nominal Size	Limit
Inlet	1.8 (0.071)	1.3 (0.051)
Exhaust	1.75 (0.069)	1.3 (0.051)



2. Install the new valve (1) to the cylinder head (2).



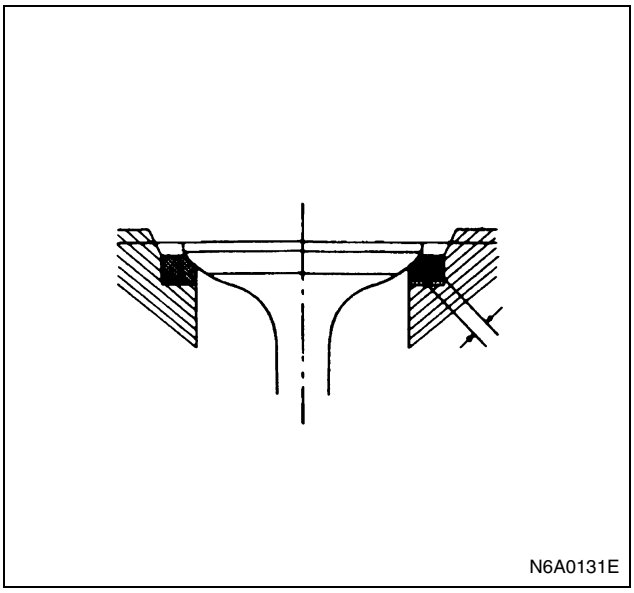
3. Use a depth gauge or a straight edge with steel rule to measure the valve depression from the cylinder head lower surface.
   If the measured value exceeds the specified limit, the valve seat insert and/or the valve must be replaced.

Intake and Exhaust Valve Depression	mm (in)
Standard	Limit
0.7 — 1.2 (0.028 — 0.047)	2.5(0.098)

Valve Contact Width

1. Check the valve contact faces for roughness and unevenness.
   Make smooth the valve contact surfaces.
2. Measure the valve contact width.
   If the measured value exceeds the specified limit, the valve seat insert must be corrected or replaced.

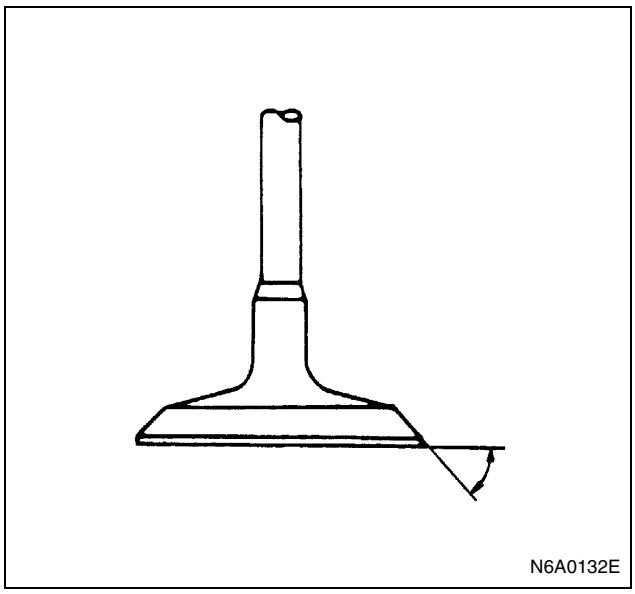
Valve Contact Width		mm (in)
Valve	Nominal Size	Limit
Intake	2.5 (0.098)	3.0 (0.118)
Exhaust	2.0 (0.079)	2.5 (0.098)



Contact Surface Angle on Valve Seat on Valve

1. Measure contact surface angle on valve seat.
2. If the measured value exceeds the limit, replace valve, valve guide and valve seat as a set.

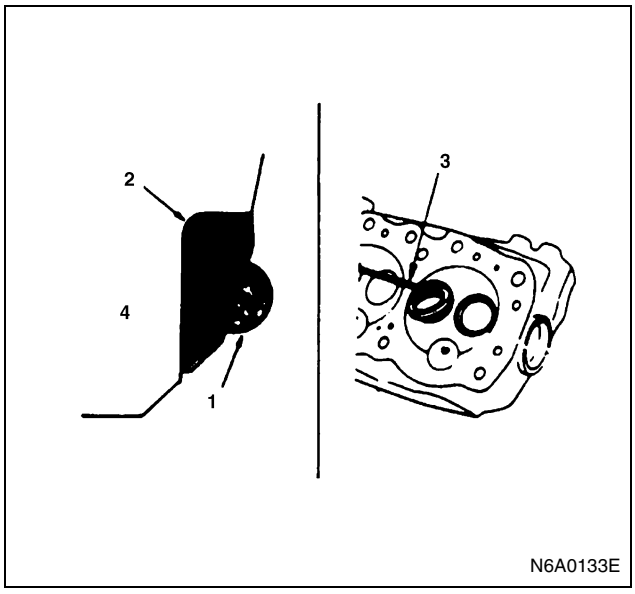
Standard	Degrees
45°	



Valve Seat Insert Replacement

Valve Seat Insert Removal

1. Arc weld the entire inside circumference (1) of the valve seat insert (2).
2. Allow the valve seat insert to cool for a few minutes. This will invite contraction and make removal of the valve seat insert easier.
3. Use a screwdriver (3) to pry the valve seat insert free. Take care not to damage the cylinder head (4).
4. Carefully remove carbon and other foreign material from the cylinder head insert bore.



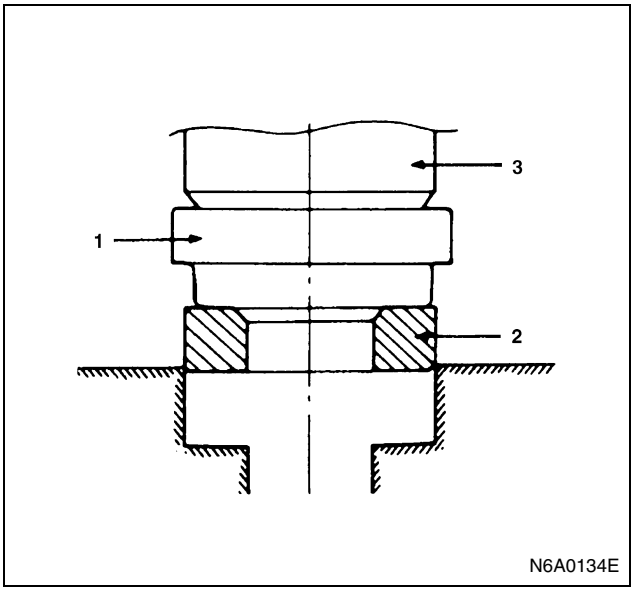
Valve Seat Insert Installation

1. Carefully place the attachment (1) (having a smaller outside diameter than the valve seat insert) on the valve seat insert (2).

Notice:
The smooth side of the attachment must contact the valve seat insert.

2. Use a bench press (3) to gradually apply pressure to the attachment and press the valve seat insert into place.

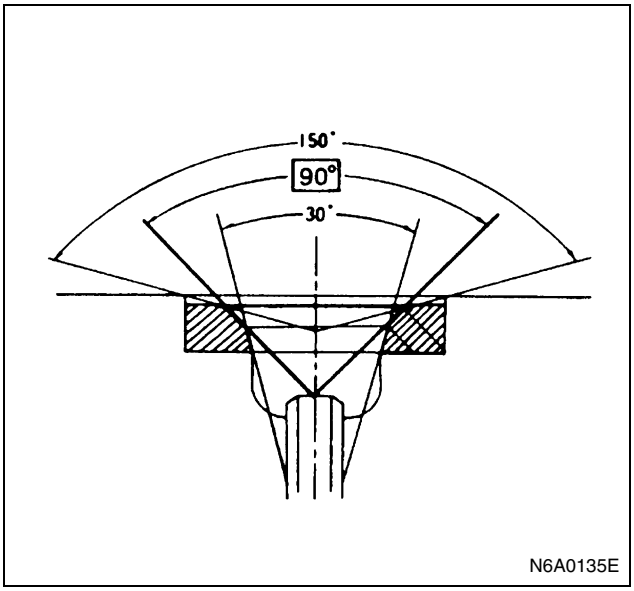
Caution:
Do not apply an excessive amount of pressure with the bench press. Damage to the valve seat insert will result.



3. The valve should be lapped before final assembly to ensure a good valve seal.
   Above works refer to “Valve Seat Insert Correction” section in this manual.

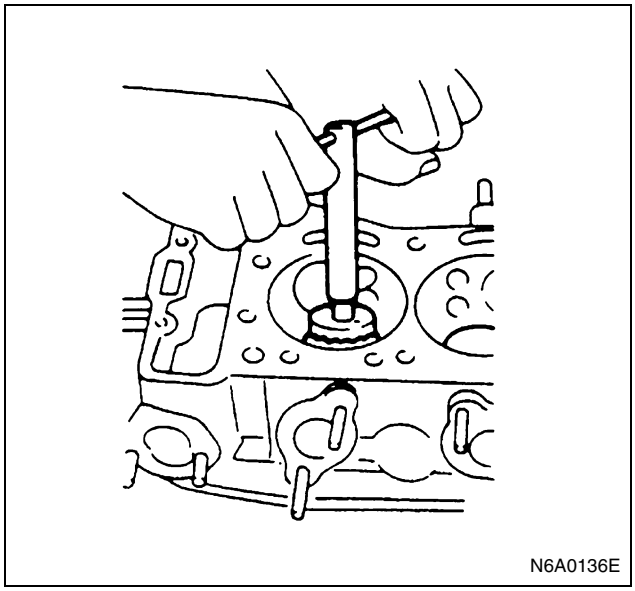
Valve Seat Insert Correction

1. Remove the carbon from the valve seat insert surface.
2. Use a valve cutter (15°, 45°, and 75° blades) to minimize scratches and other rough areas. This will bring the contact width back to the standard value. Remove only the scratches and rough areas. Do not cut away too much. Take care not to cut away unblemished areas of the valve seat surface.

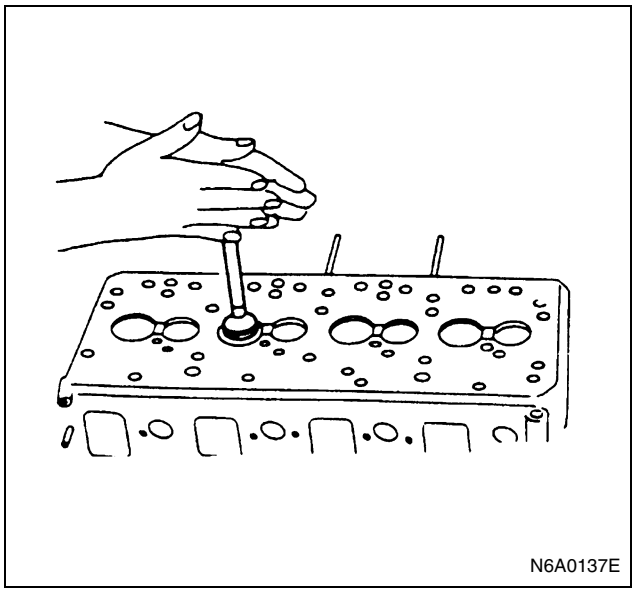


Valve Seat Angle	Degrees
45°	

Notice:
Use an adjustable valve cutter pilot.
Do not allow the valve cutter pilot to wobble inside the valve guide.



3. Apply abrasive compound to the valve seat insert surface.
4. Insert the valve into the valve guide.
5. Turn the valve while tapping it to fit the valve seat insert.

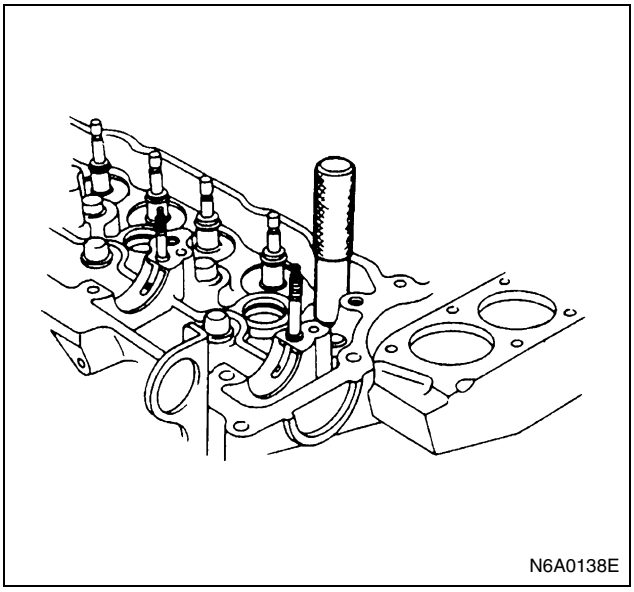


6. Check to see if the valve contact width is correct.
7. Check to see if the valve seat insert surface is in contact with the entire circumference of the valve.

Reassembly

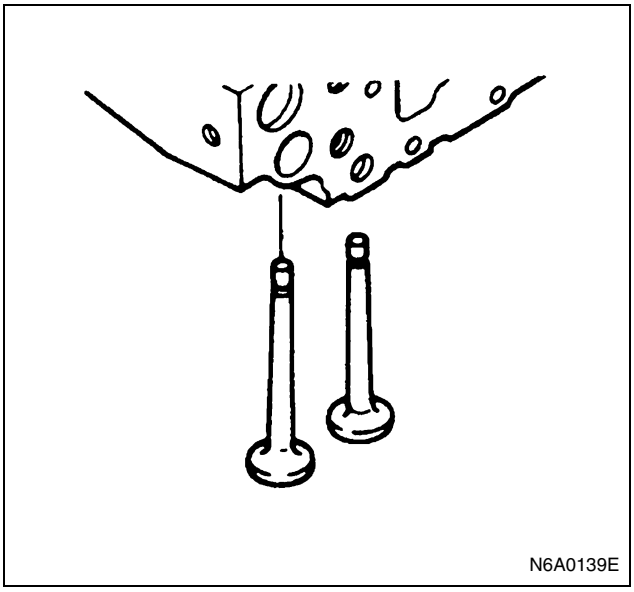
1. Spring Lower Seat

2. Valve Guide Seal
   1) Apply a coat of engine oil to the valve guide seal inner face.
   2) Use a valve guide seal installer to install the valve guide seal to the valve guide
      Valve Guide Seal Installer: 8-9439-6815-0



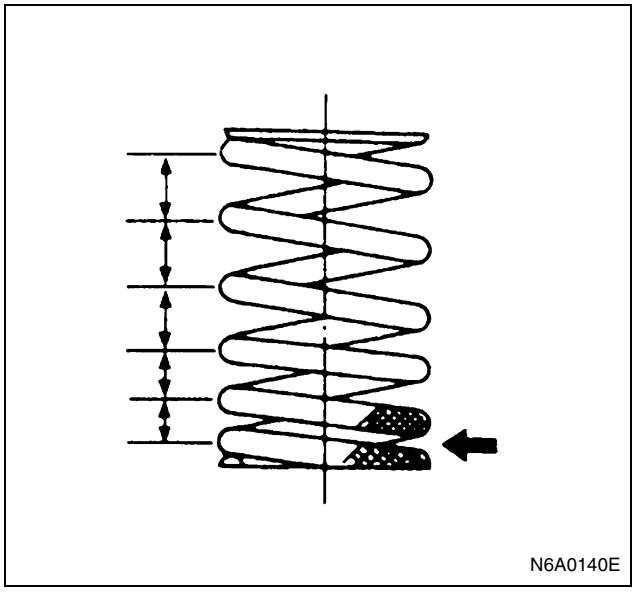
N6A0138E

3. Intake and Exhaust Valve
   1) Apply a coat of engine oil to each valve stem before installation.
   2) Install the intake and exhaust valve.



N6A0139E

   3) Turn the cylinder head up to install the valve spring. Take care not to allow the installed valves to fall free.
4. Valve Spring
   Install the valve spring with its fine pitched (or painted) end side down.



N6A0140E

5. Spring Upper Seat
6. Cotter Collar
   1) Use the valve spring compressor to push the valve spring into position.
      Valve Spring Compressor: 5-8840-2228-0
   2) Install the cotter collar to the valve stem.
   3) Set the cotter collar by tapping around the head of the collar with a rubber hammer.

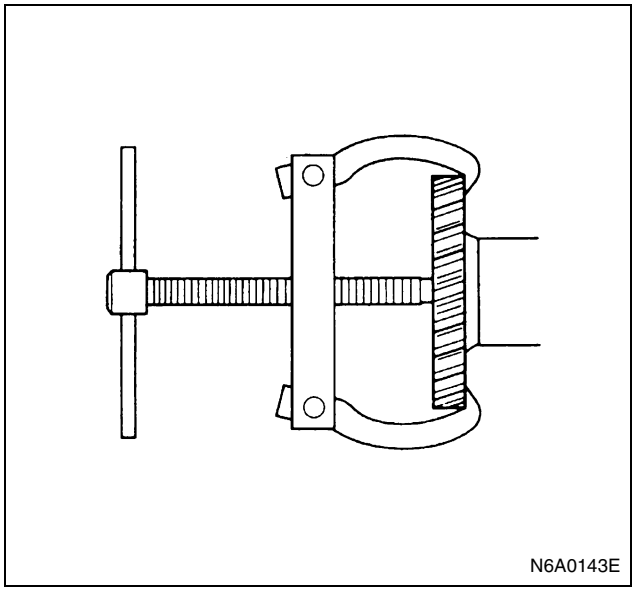
   Universal puller: 5-8840-2027-0/5-8840-0086-0
8. Key



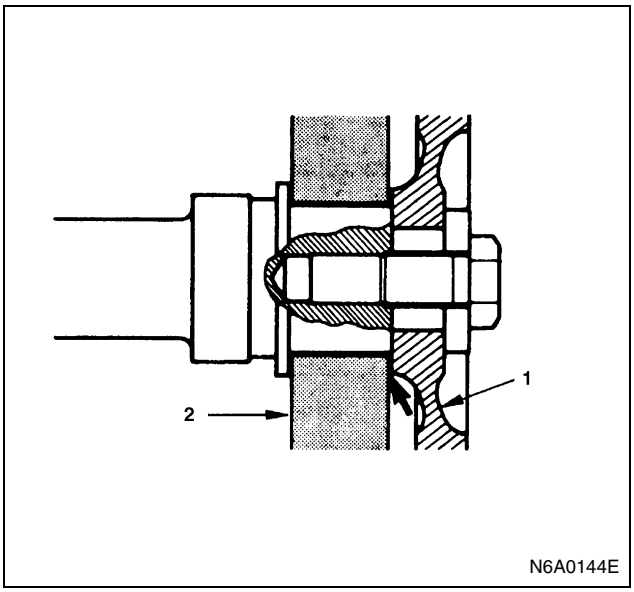
Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Camshaft End Play

Use a thickness gauge to measure the clearance between the camshaft gear (1) and the camshaft bracket (2).
If the measured value exceeds the specified limit, the camshaft gear or the camshaft must be replaced.

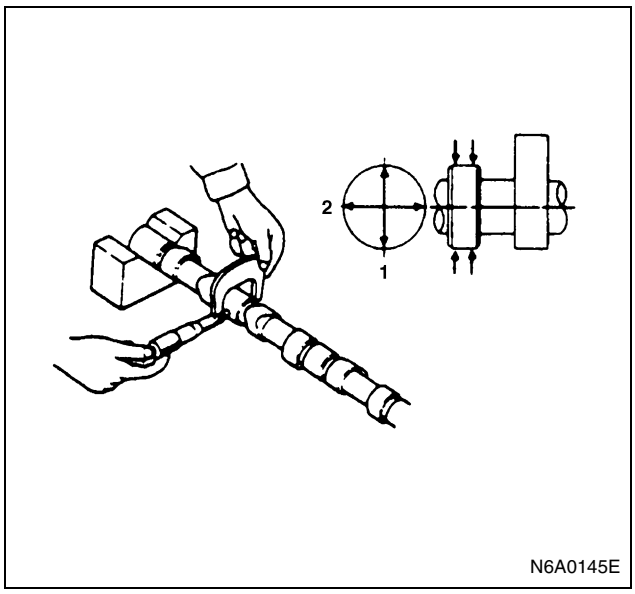
Camshaft End Play	mm (in)
Standard	Limit
0.085 — 0.205 (0.0033 — 0.0081)	0.25 (0.0098)



Camshaft Journal Diameter

Use a micrometer to measure each camshaft journal diameter in two directions ((1) and (2)). If the measured value is less than the specified limit, the camshaft must be replaced.

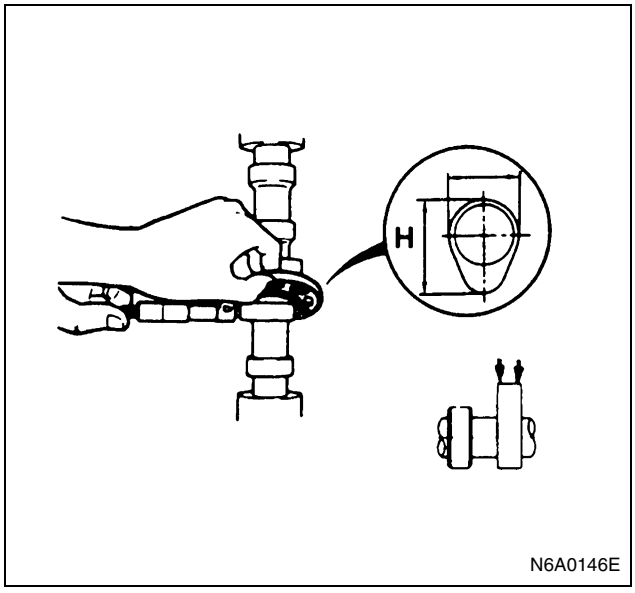
Camshaft Journal Diameter	mm (in)
Standard	Limit
39.950 — 39.975 (1.5728 — 1.5738)	39.850 (1.569)



Cam Height

Measure the cam height “H” with a micrometer. If the measured value is less than the specified limit, the camshaft must be replaced.

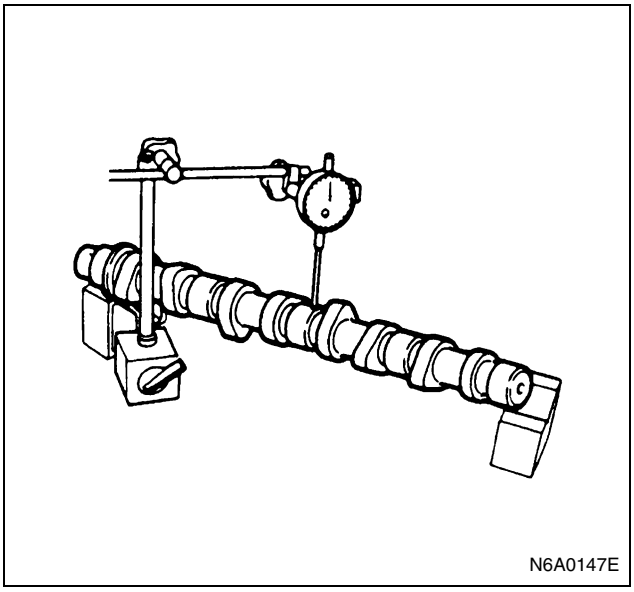
Cam Height “H”		mm (in)
Engine model	Standard	Limit
Except 4HE1-TC	52.8 (2.078)	51.8 (2.039)
4HE1-TC	53.6 (2.110)	52.6 (2.071)



Camshaft Run-Out

1. Mount the camshaft on V-blocks.
2. Measure the run-out with a dial indicator.
   If the measured value exceeds the specified limit, the camshaft must be replaced.

Camshaft Run-Out	mm (in)
Limit	0.05 (0.002)



N6A0147E

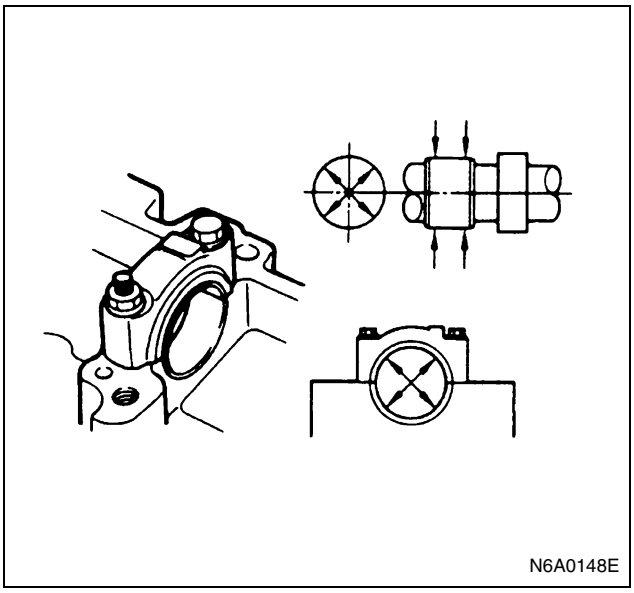
Camshaft and Camshaft Bearing Clearance

Use an inside dial indicator to measure the camshaft bearing inside diameter.

Camshaft Bearing Inside Diameter	mm (in)
Standard	40.000 — 40.037 (1.5748 — 1.5763)

If the clearance between the camshaft bearing inside diameter and the journal exceeds the specified limit, the camshaft bearing must be replaced.

Camshaft Bearing Clearance	mm (in)
Standard	Limit
0.025 — 0.087 (0.00098 — 0.00343)	0.15 (0.0059)

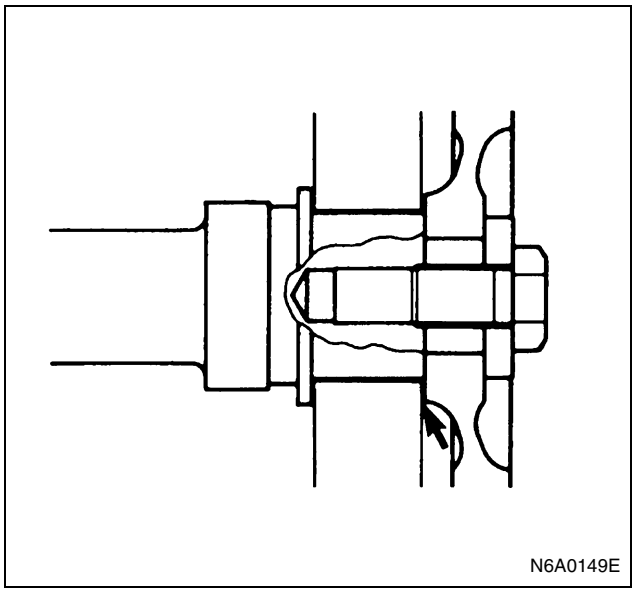


N6A0148E

Reassembly

1. Key
2. Camshaft Gear
   - With the projection of the camshaft gear center boss turned to the camshaft side, set it to the knock pin and install the camshaft gear.

Tighten:
Camshaft gear bolt to 142 N·m (14.5 kg·m / 105 lb·ft)



N6A0149E

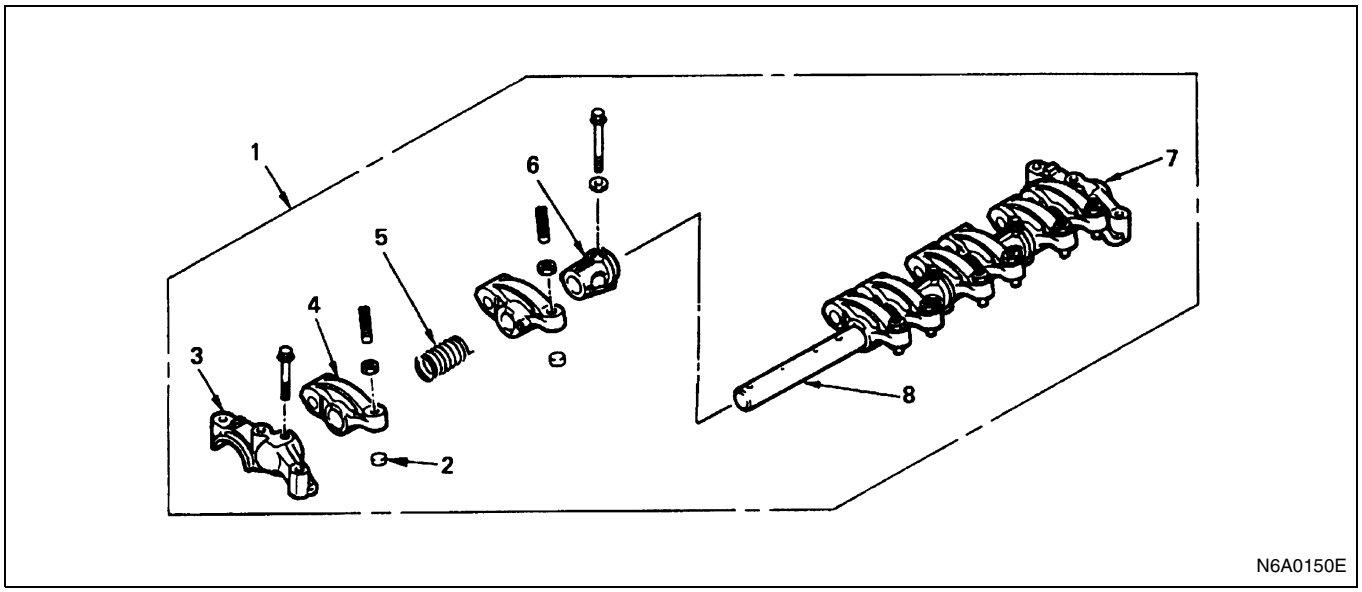
ROCKER ARM ASSEMBLY

Component



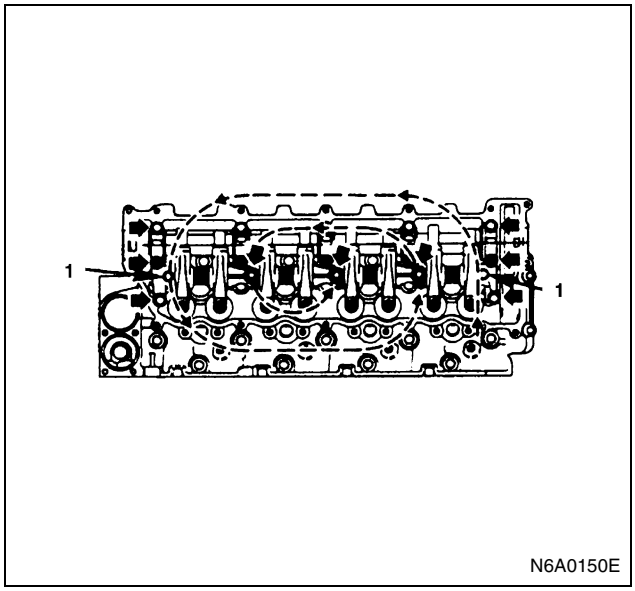
Legend

1. Rocker arm shaft assembly
2. Valve cap
3. Camshaft bracket
4. Rocker arm
5. Spring
6. Rocker arm bracket
7. Camshaft bracket
8. Rocker arm shaft

Disassembly

1. Rocker Arm Shaft Assembly
   1) Loosen the rocker arm shaft bracket nuts and bolts in numerical order a little at a time and remove the rocker arm shaft assembly with the camshaft brackets.
   2) Leave the (1) indicated bolt unremoved on this occasion, since it is the rocker arm fixing bolt.

Caution:
Failure to loosen the rocker arm shaft bracket nuts and bolts in numerical order a little at a time will adversely affect the rocker arm shaft.



2. Valve Cap

Caution:
Take sufficient care not to let the valve caps fall into the gear case or oil return hole.

3. Camshaft Bracket
4. Rocker Arm
5. Spring
6. Rocker Arm Bracket
7. Camshaft Bracket

8. Rocker Arm Shaft

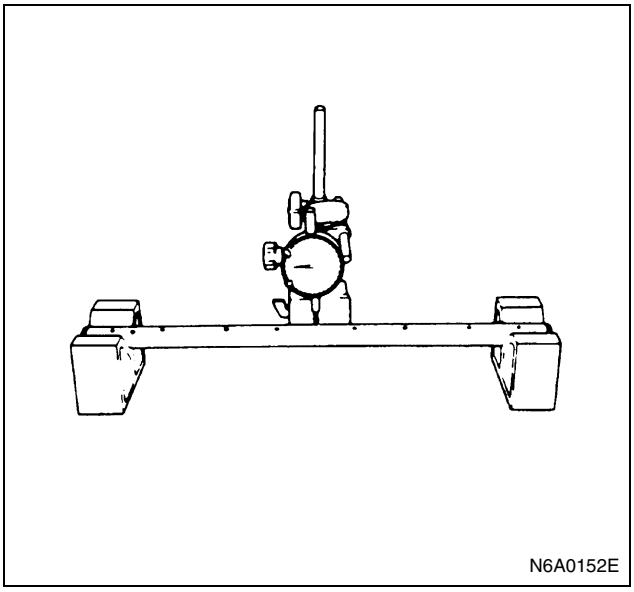
Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Rocker Arm Shaft Run-Out

1) Place the rocker arm shaft on V-blocks.
2) Use a dial indicator to measure the rocker arm shaft central portion run-out.
   If the run-out is very slight, correct the rocker arm shaft run-out with a bench press. The rocker arm must be at cold condition.
   If the measured rocker arm shaft run-out exceeds the specified limit, the rocker arm shaft must be replaced.

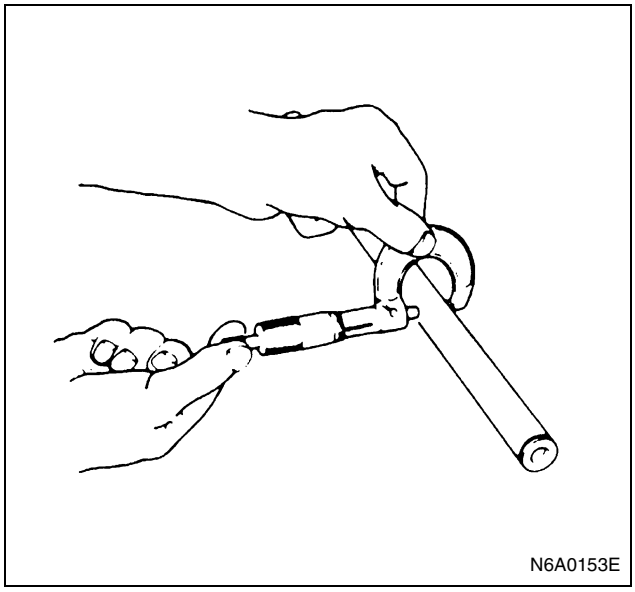
Rocker Arm Shaft Run-Out	mm (in)
Limit	0.3 (0.012)



Rocker Arm Shaft Outside Diameter

Use a micrometer to measure the rocker arm fitting portion outside diameter.
If the measured value is less than the specified limit, the rocker arm shaft must be replaced.

Rocker Arm Shaft Outside Diameter		mm (in)
Standard	Limit	
21.979 — 22.000 (0.8653 — 0.8661)	21.85 (0.8602)	

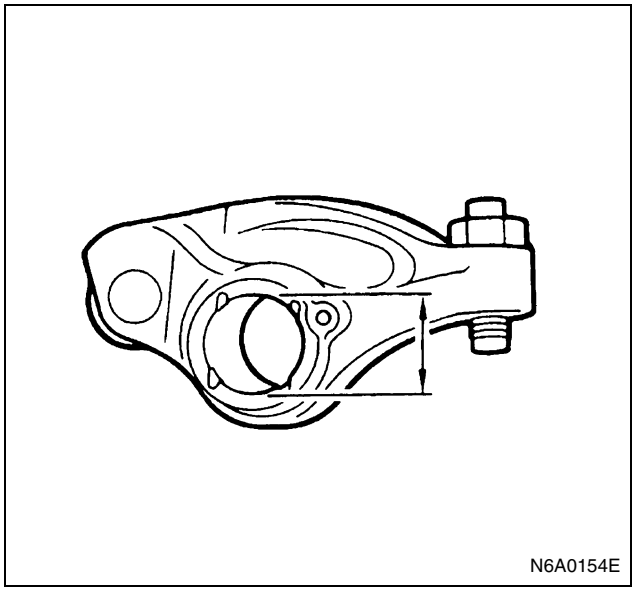


Rocker Arm Bushing Inside Diameter

Use either a vernier caliper or a dial indicator to measure the rocker arm bushing inside diameter.

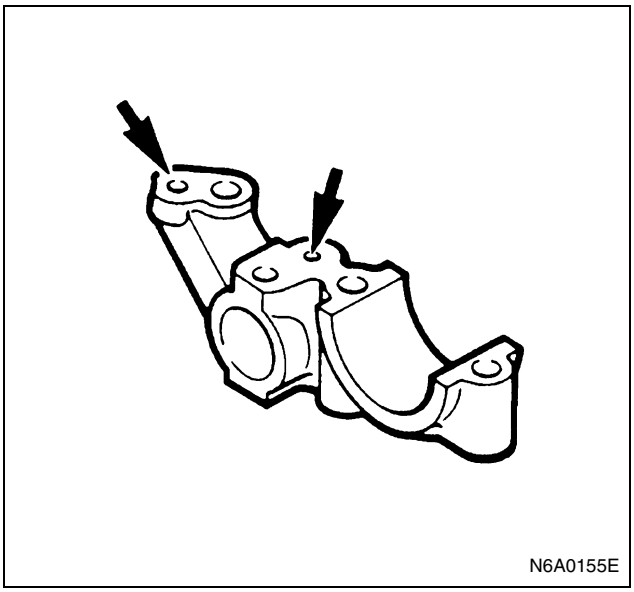
Rocker Arm Bushing Inside Diameter		mm (in)
Standard	Limit	
22.010 — 22.035 (0.8665 — 0.8675)	22.15 (0.8720)	

Rocker Arm and Rocker Arm Shaft Clearance		mm (in)
Standard	Limit	
0.010 — 0.056 (0.0004 — 0.0022)	0.2 (0.0079)	



Check to see if the rocker arm oil port is free of obstructions.

If necessary, use compressed air to clean the rocker arm oil port.

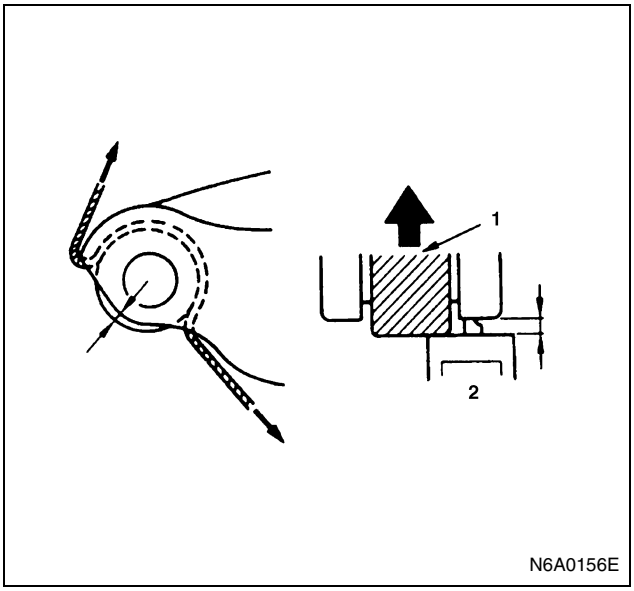


N6A0155E

Rocker Arm Roller and Rocker Arm Pin

1. Pass a string through the rocker arm-roller clearance and measure the roller protrusion while pulling both ends of the string in the arrow-indicated directions to push out the roller.
2. Mark the measuring point and draw out the string. Measure the roller protrusion again while the roller is pushed in.
3. Note the difference in the above measurements is the standard roller-rocker arm pin clearance. Should the clearance exceed the limit, replace the rocker arm.

Rocker Arm Roller and Pin Clearance	mm (in)
Standard	Limit
0.040 — 0.084 (0.0016 — 0.0033)	0.5 (0.02)



N6A0156E

Legend
1. Roller
2. Depth gauge

Valve Cap Wear

Inspect the valve cap surface contacting the rocker arm using a dial gauge.
If wear exceeds the limit, replace the valve cap with a new one.

Valve Cap Worn	mm (in)
Limit	0.1 (0.004)

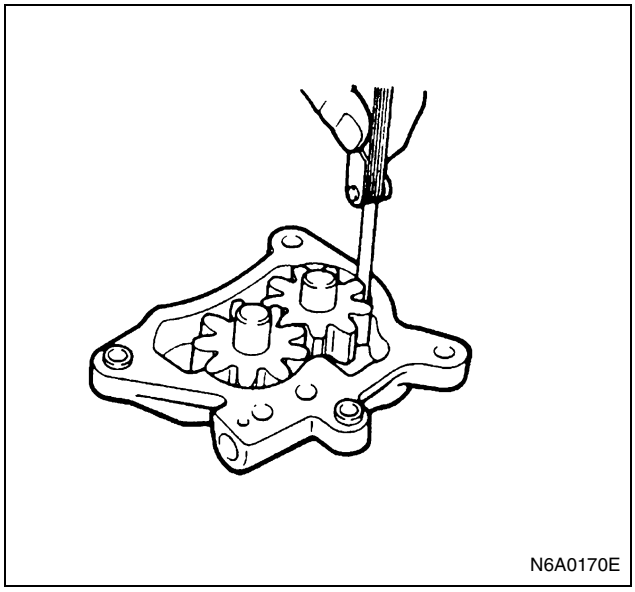
Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Gear Teeth and Cover Inner Wall Clearance

Use a feeler gauge to measure the clearance between the gear teeth and the cover inner wall.
If the clearance between the gear teeth and the cover inner wall exceeds the specified limit, the oil pump assembly must be replaced.

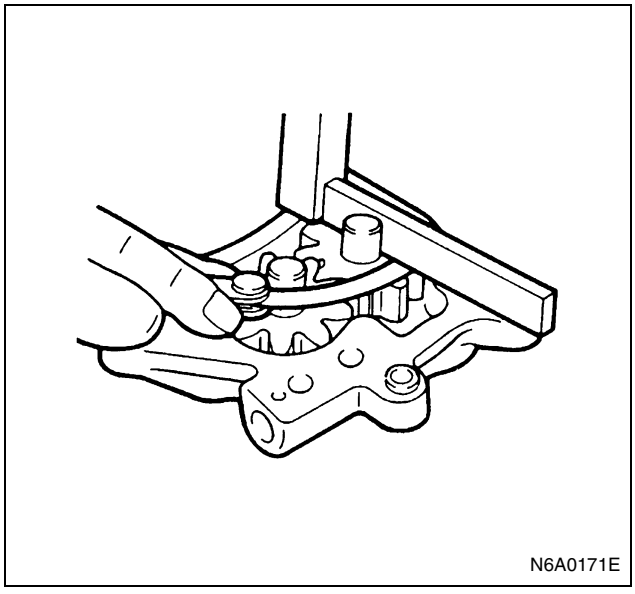
Gear Teeth and Cover Inner Wall Clearance	mm (in)
Standard	Limit
0.125 — 0.220 (0.0049 — 0.0087)	0.3 (0.012)



Gear and Cover Clearance

Use a feeler gauge to measure the clearance between the cover and the gear.
If the clearance between the gear and the cover exceeds the specified limit, the oil pump assembly must be replaced.

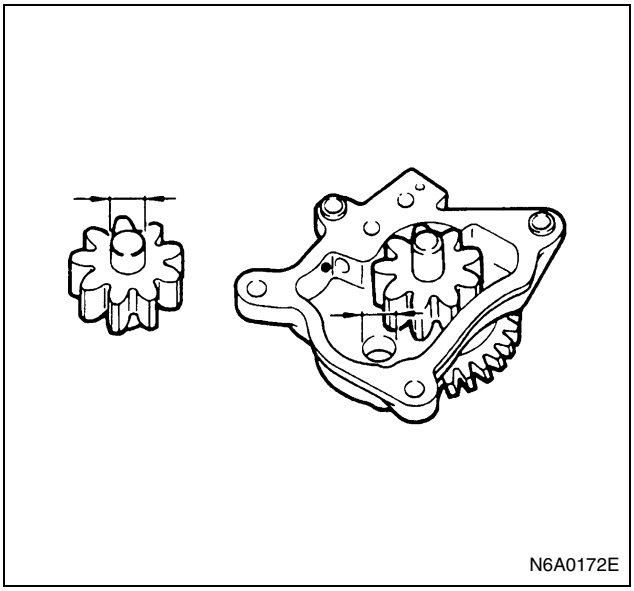
Gear and Cover Clearance	mm (in)
Standard	Limit
0.064 — 0.109 (0.0025 — 0.0043)	0.2 (0.008)



Driven Gear Shaft and Bushing Clearance

1. Use a micrometer to measure the gear shafts outside diameter.

Gear Shaft Outside Diameter	mm (in)
Standard	Limit
15.989 —16.000 (0.6295 — 0.6299)	15.9 (0.626)



N6A0172E

2. Use an inside dial indicator or inside micrometer to measure the pump cover bushing inside diameter and the cylinder body inside diameter.
   If clearance between the gear shaft and the bushing exceeds the specified limit, the oil pump assembly must be replaced.

Gear Shaft and Bushing Clearance	mm (in)
Standard	Limit
0.04 — 0.07 (0.0016 — 0.0028)	0.2 (0.012)

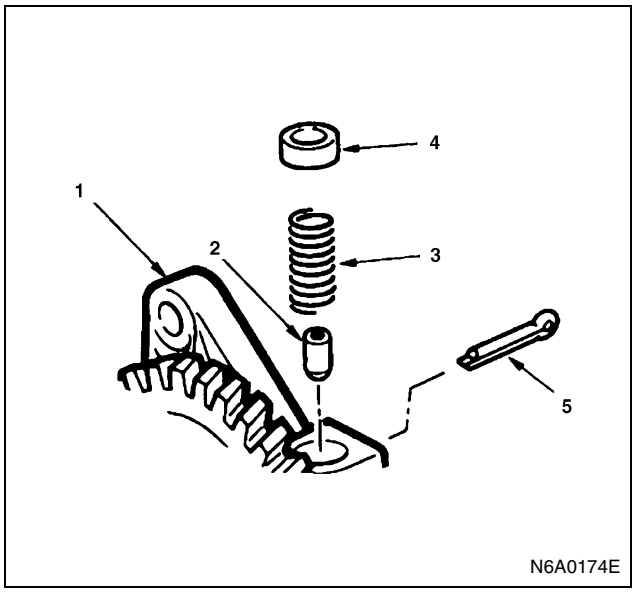
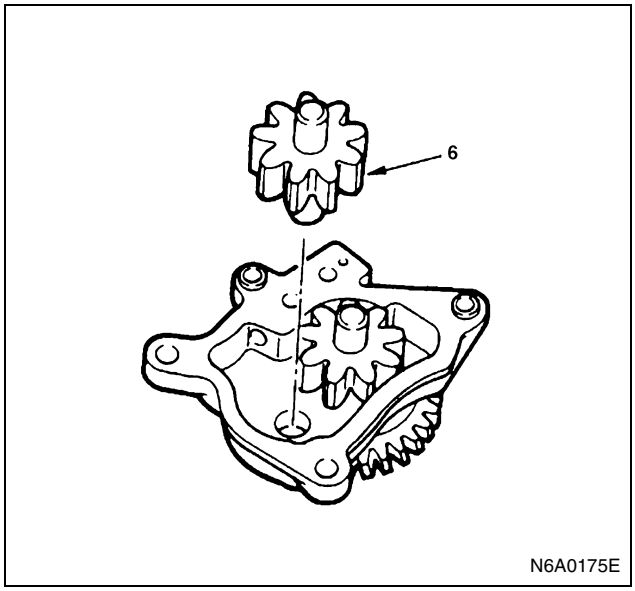
4. Sprig Seat
5. Cotter Pin



N6A0174E

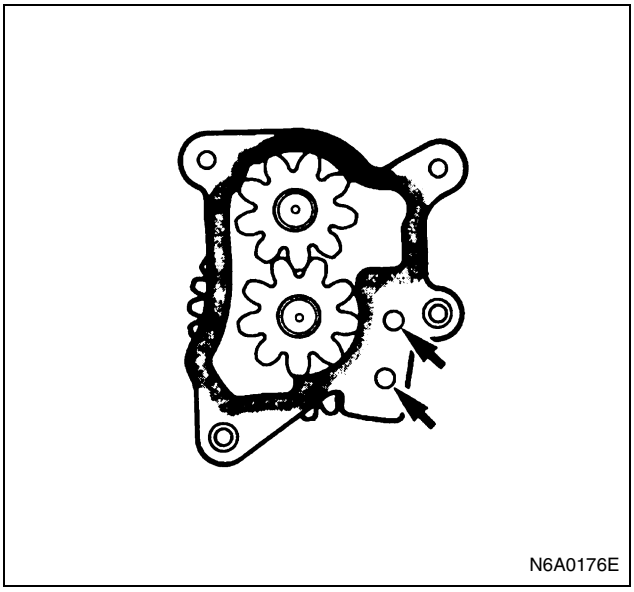
6. Driven Gear and Shaft
   Apply the engine oil to the driven gear shaft.



N6A0175E

7. Oil Pump Assembly
   1) Carefully wipe any foreign material from cylinder body rear surface.
   2) Apply the recommended liquid gasket (Three Bond 1141E) or its equivalent to the shaded areas shown in the illustration.

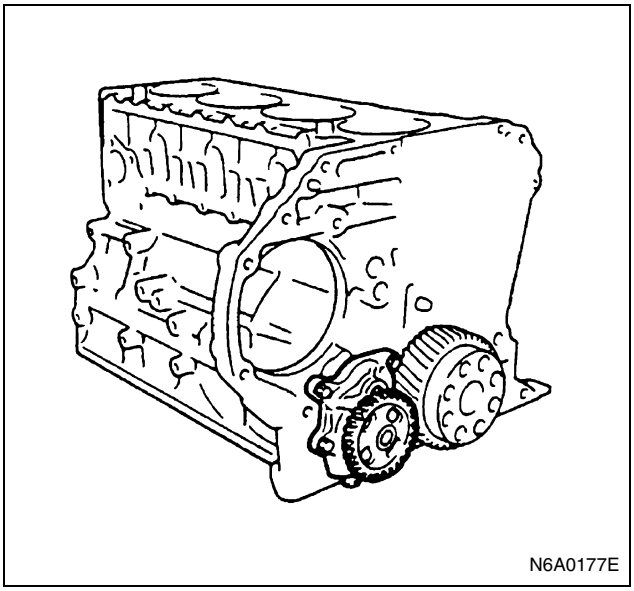
Caution:
Be careful that no liquid gasket gets into the holes in the arrow-marked portion in the illustration and the inside of the oil pump cover.



N6A0176E

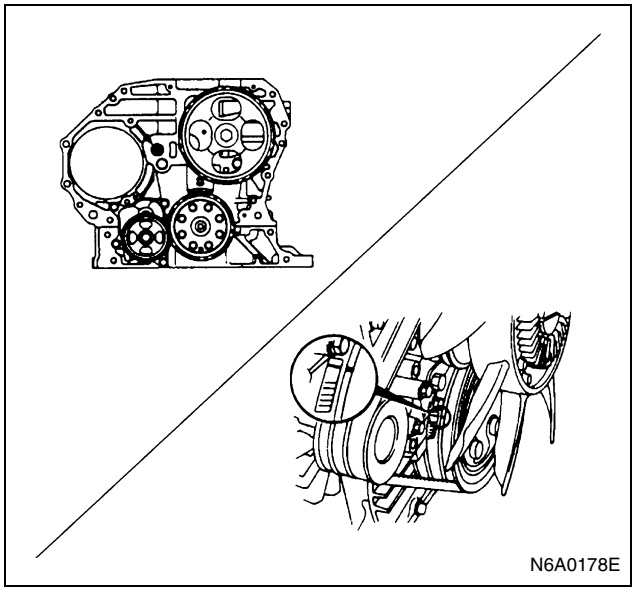
3) Install the oil pump to the cylinder body.
4) Tighten the oil pump to the specified torque.

Tighten:
Oil pump bolt to 31 N·m (3.2 kg·m / 23 lb·ft)



N6A0177E

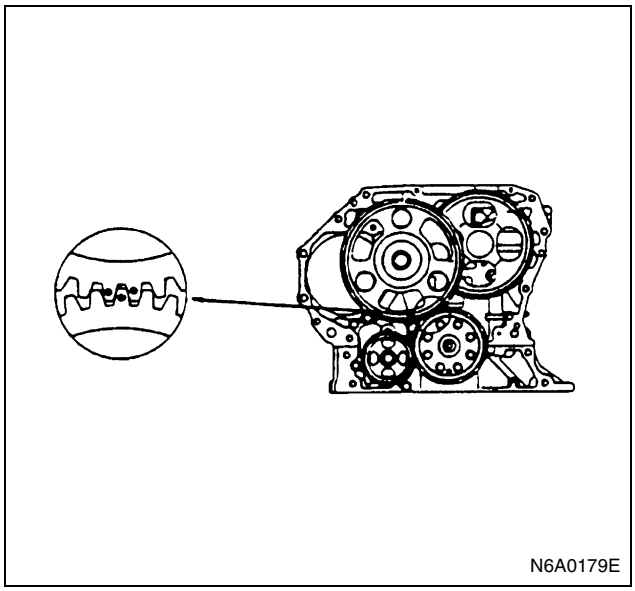
8. Idle Gear A
   1) Turn the crankshaft clockwise so that the engagement mark of the crankshaft gear faces to the shaft center of the idle gear A and the No.1 cylinder piston comes to the top dead center.



N6A0178E

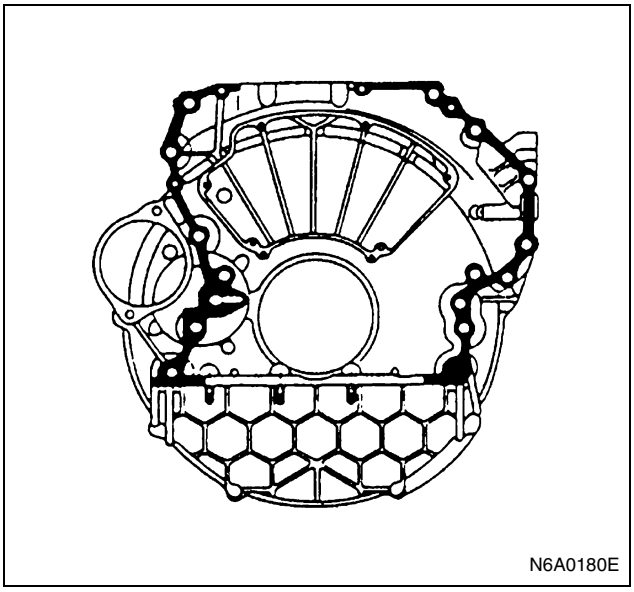
2) Align the crankshaft gear with the engagement mark of the idle gear and install the idle gear A.

Tighten:
Idle gear A bolt to 133 N·m (13.6 kg·m / 98 lb·ft)



N6A0179E

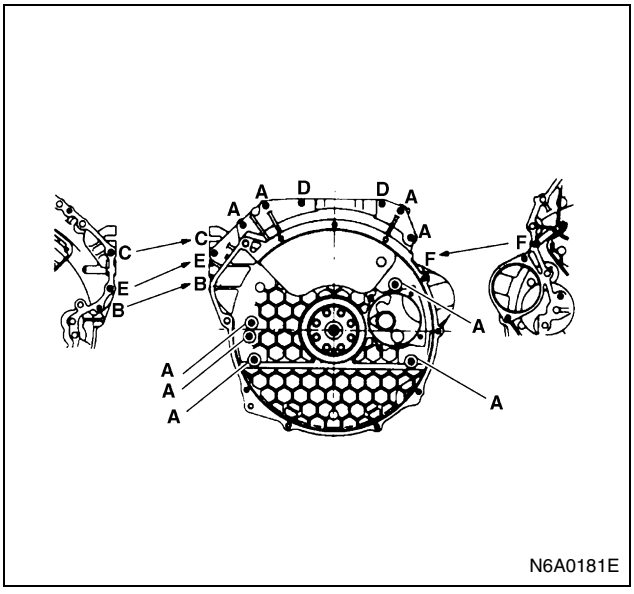
9. Flywheel Housing
   1) Carefully wipe any foreign material from the cylinder body rear face.
   2) Apply the recommended liquid gasket (Three Bond 1207C) or its equivalent to the shaded areas shown in the illustration.



N6A0180E

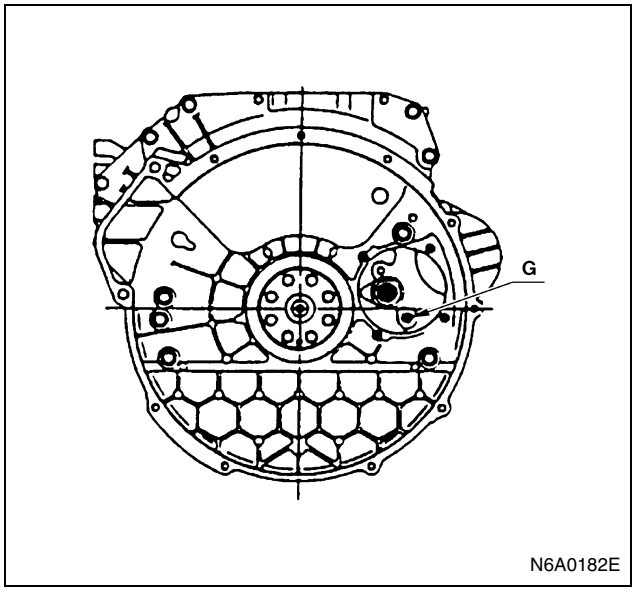
3) Align the cylinder body knock pins with the flywheel housing knock pin holes.
4) Tighten the flywheel housing bolts to the specified torque shown in the illustration.

Tighten:
Flywheel housing bolt to
- A: 96 N·m (9.8 kg·m / 71 lb·ft)
- B: 48 N·m (4.9 kg·m / 35 lb·ft)
- C: 94 N·m (9.6 kg·m / 69 lb·ft)
- D: 25 N·m (2.6 kg·m / 19 lb·ft)
- E: 76 N·m (7.7 kg·m / 56 lb·ft)
- F: 38 N·m (3.9 kg·m / 28 lb·ft)
    - Tighten the bolts marked with “E” or “B” from the injection pump side, and those with “F” from the cylinder body side.



N6A0181E

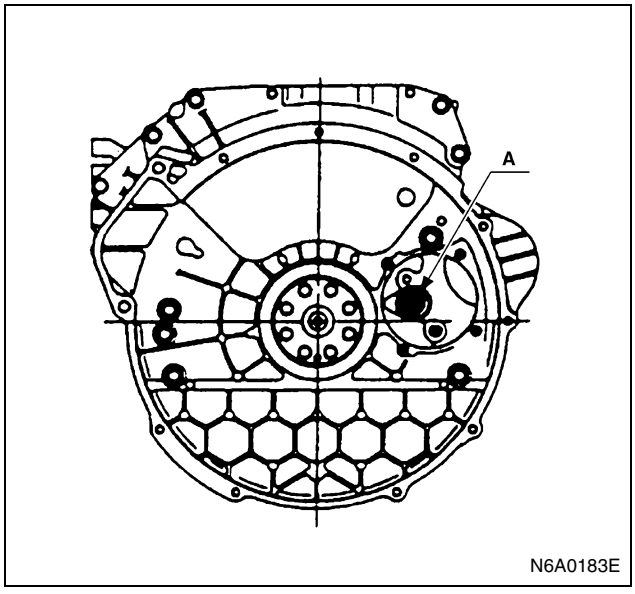
Tighten:
Flywheel housing bolt (G) to 96 N·m (9.8 kg·m / 71 lb·ft)



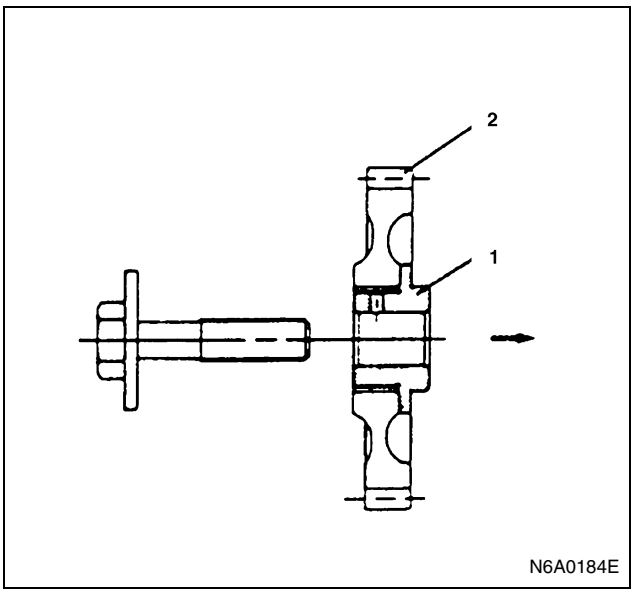
N6A0182E

10. Power Steering Pump Idle Gear
    1) Apply the engine oil to the idle gear shaft.
    2) Install the idle gear shaft (1) with the idle gear (2) to the cylinder body “A” portion as shown in the illustration.

Tighten:
Idle gear shaft bolt to 133 N·m (13.6 kg·m / 98 lb·ft)



N6A0183E



11. Power Steering Pump Idle Gear Cover
    Install the gear cover with the O-ring.

Tighten:
Gear cover bolt to 19 N·m (1.9 kg·m / 14 lb·ft)

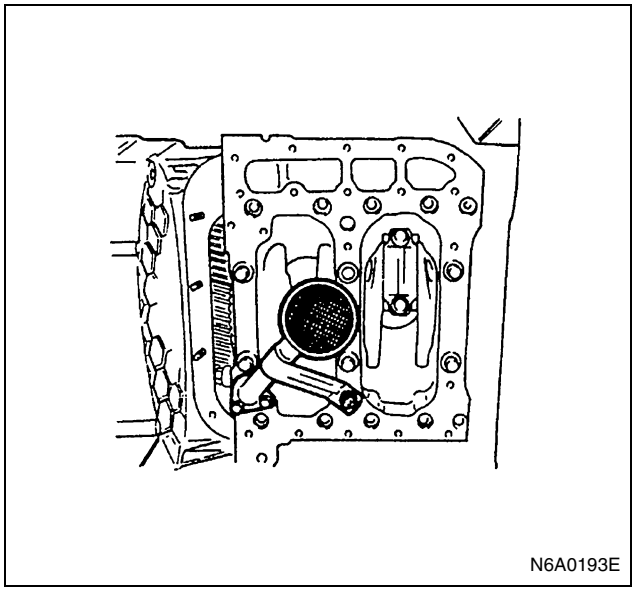
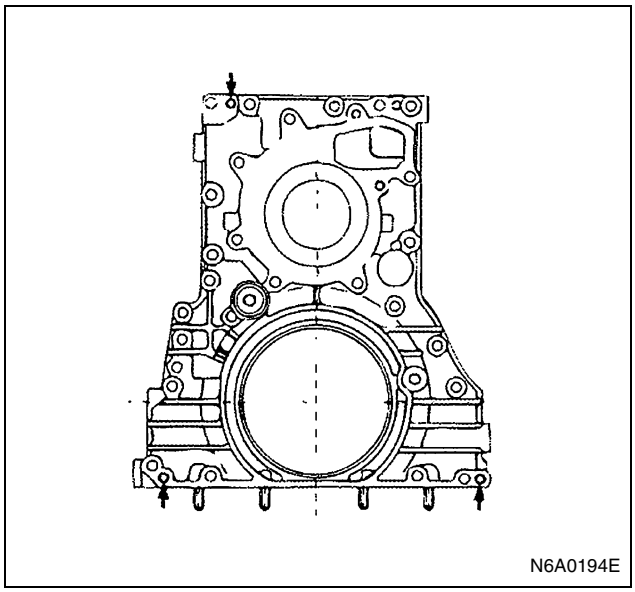
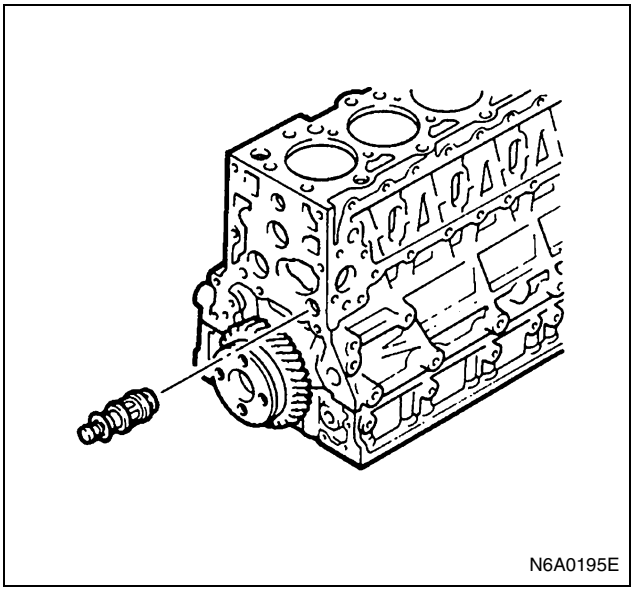
24. Oil Pan
25. Oil Pump Strainer
26. Water Pump Pulley
27. Water Pump



28. Front Retainer
    Install the three front retainer fixing bolts to the front retainer replacer holes as shown in the illustration, and tighten the bolts alternately a little at a time.

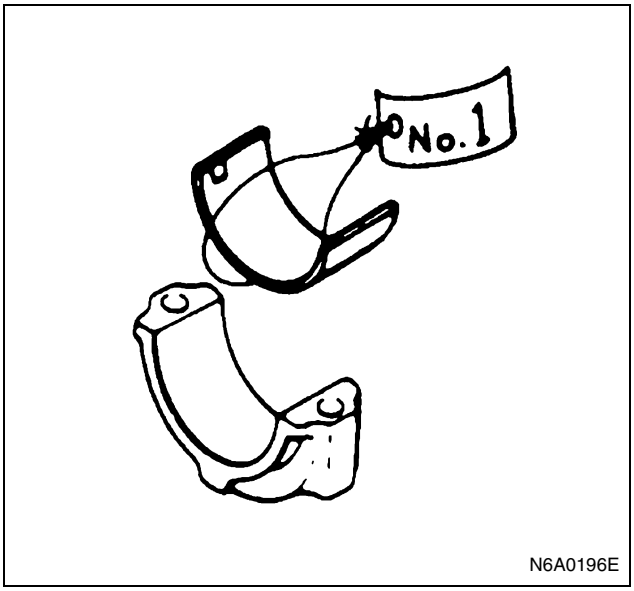


29. Oil Thermo Valve (4HF1, 4HF1-2, 4HG1, 4HG1-T)
    Pull out the thermo valve from the cylinder body.



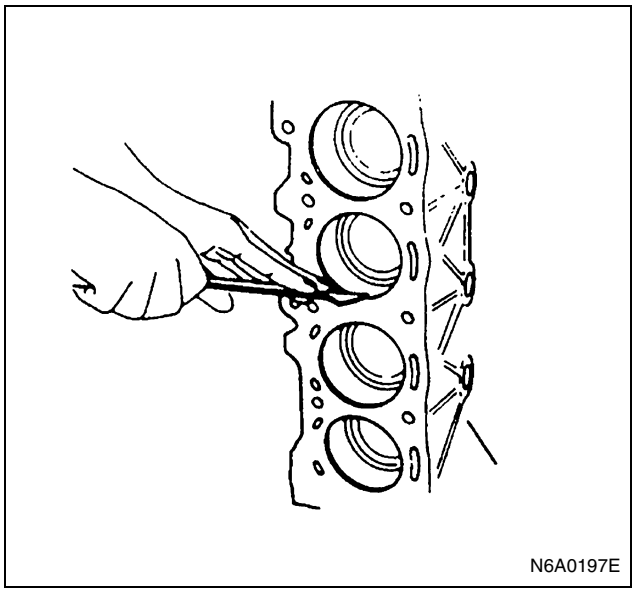
N6A0195E

30. Bypass Valve (4HE1-TC)
    Pull out the bypass valve from the cylinder body.
31. Power Steering Pump Idle Gear Cover
32. Power Steering Pump Idle Gear
33. Flywheel Housing
34. Idle Gear A
35. Oil Pump Assembly
    Above works refer to “OIL PUMP” section in this manual.
36. Connecting Rod Cap Assembly
37. Connecting Rod Lower Bearing
    1) Take out the connecting rod bearing cap bolts and remove the bearing cap with the lower bearing.
    2) If the connecting rod lower bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



N6A0196E

38. Piston and Connecting Rod Assembly
    1) To facilitate smooth removal of piston, remove carbon from the upper part of the cylinder wall using a scraper or equivalent.



N6A0197E

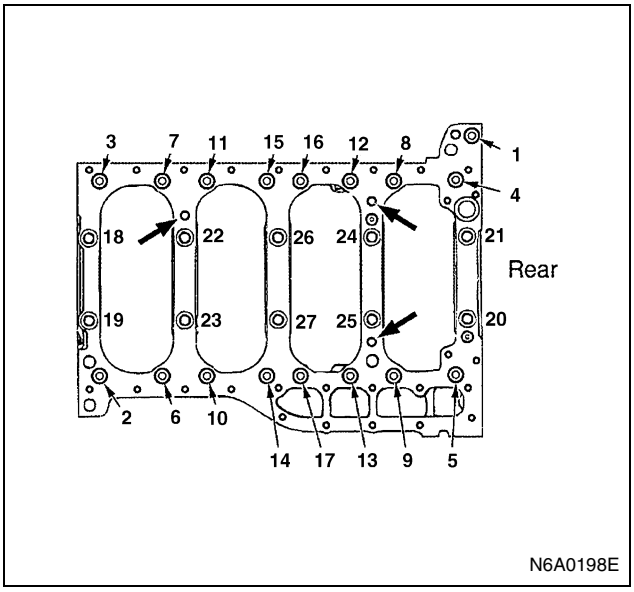
    2) Remove the piston and connecting rod assembly upward by pushing on the edge of the connecting rod with a hammer handle or equivalent.
    3) If the connecting rod bearing are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.

Caution:
Do not bend or damage the oiling jet.

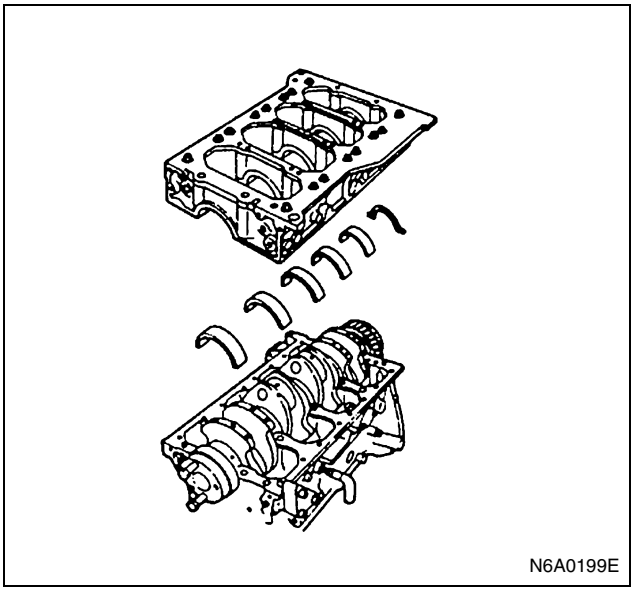
Notice:
When removing the piston and connecting rod assembly, pull the connecting rod in parallel with the cylinder bore.

39. Crankcase
    1) Loosen the crankcase bolts in numerical order a little at a time.
    2) Install the three crankcase fixing bolts (See left arrow marks) to the crankcase replacer holes as shown in the illustration, and tighten the bolts alternate a little at a time.

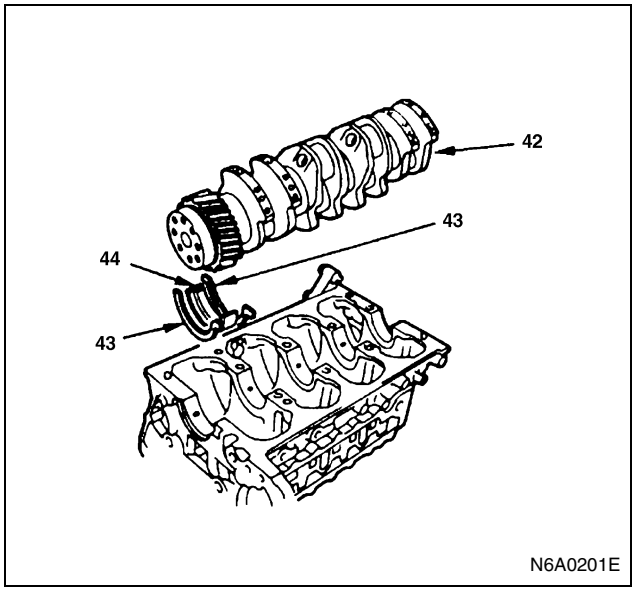
Notice:
When removing the crankcase, be sure to remove the oil pump and the generator bracket before that.



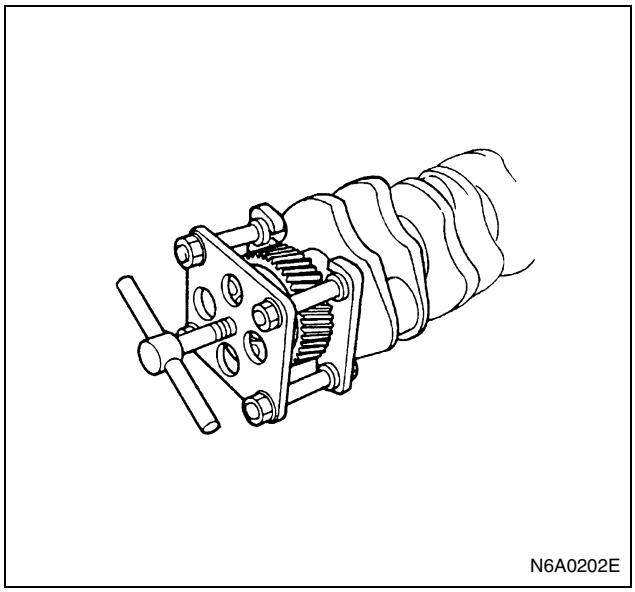
40. Thrust Bearing Lower
41. Crankshaft Bearing Lower



42. Crankshaft Assembly
43. Thrust Bearing Upper
44. Crankshaft Bearing Upper



45. Crankshaft Gear
    1) Use the crankshaft gear remover to remove the crankshaft gear.
       Crankshaft Gear Remover: 8-9439-6818-0
    2) Remove the crankshaft feather key.



46. Crankshaft

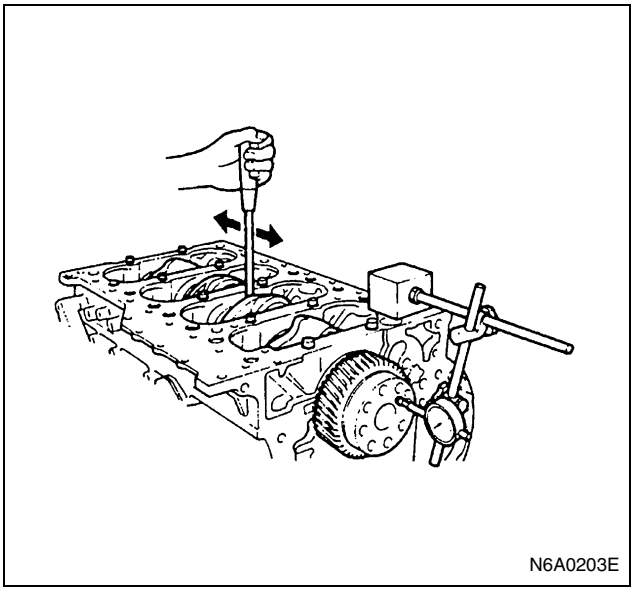
Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Crankshaft End Play

1. Set the dial indicator to the crankshaft end and measure the end play.
2. If the measured value exceeds the specified limit, the thrust bearings must be replaced.

Crankshaft End Play	mm (in)
Standard	Limit
0.104 — 0.205 (0.0041 — 0.0081)	0.35 (0.014)



N6A0203E

Crankshaft and Bearing

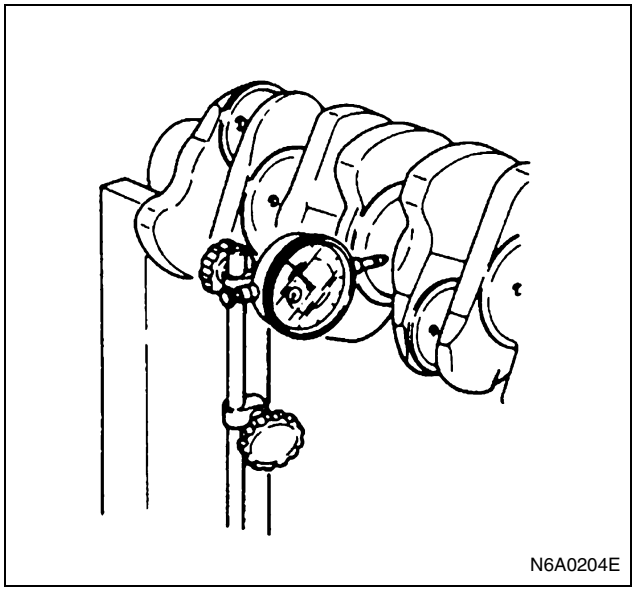
Inspect the surface of the crankshaft journals and crankpins for excessive wear and damage.
Inspect the oil seal fitting surfaces for excessive wear and damage.
Inspect the oil ports for obstructions.

Crankshaft Run-Out

1. Set a dial indicator to the center of the crankshaft journal.
2. Gently turn the crankshaft in the normal direction of rotation.

Read the dial indicator as you turn the crankshaft.
If the measured value exceeds the specified limit, the crankshaft must be replaced.

Crankshaft Run-Out	mm (in)
Standard	Limit
0.05 (0.002) or less	0.30 (0.012)

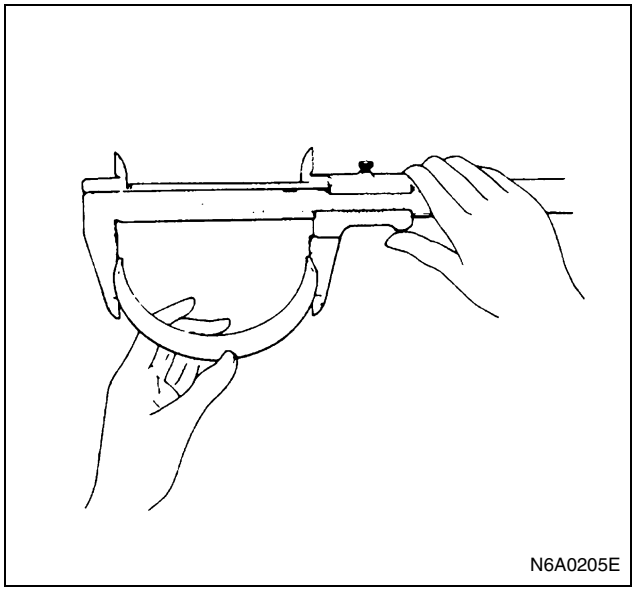


N6A0204E

Bearing Spread

Use a vernier caliper to measure the bearing spread.
If the measured value is less than the specified limit, the bearing must be replaced.

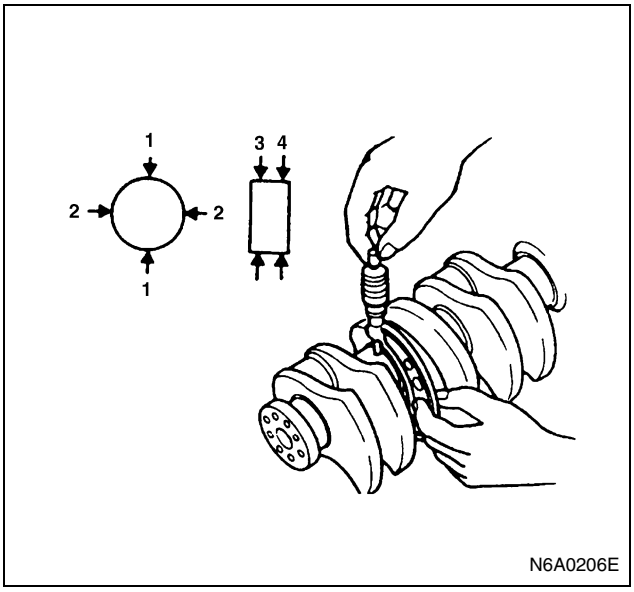
Bearing Spread	mm (in)
Limit	87 (3.43)



N6A0205E

Crankshaft Journal and Crankpin Diameter

1. Use a micrometer to measure the crankshaft journal diameter across points (1) — (1) and (2) — (2).
2. Use the micrometer to measure the crankshaft journal diameter at the two points (3) and (4).



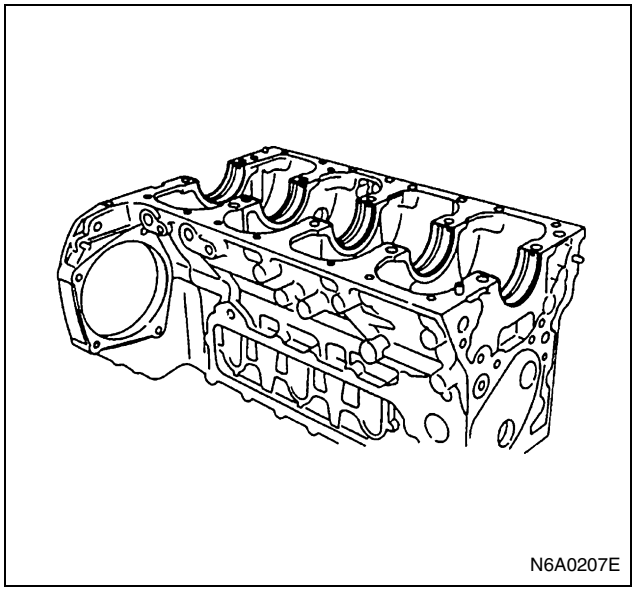
3. Repeat Steps 1 and 2 to measure the crankpin diameter.
   If the measured values are less than the limit, the crankshaft must be reground or replaced.

Crankshaft Journal and Crankpin Diameter			mm (in)
Engine model		Standard	Limit
ALL	No.1,2,4 and 5 Journal	81.905 — 81.925 (3.2246 — 3.2254)	81.85 (3.2224)
ALL	No.3 Journal	81.891 — 81.911 (3.2240 — 3.2248)	81.85 (3.2224)
Except 4HE1-TC	Crankpin	65.902 — 65.922 (2.5946 — 2.5954)	65.85 (2.5925)
4HE1-TC	Crankpin	72.902 — 72.922 (2.8702 — 2.8433)	72.85 (2.8681)

Crankshaft Journal and Crankpin Diameter Uneven Wear		mm (in)
Except 4HE1-TC	Limit	0.050 (0.002)
4HE1-TC		0.0050 (0.0002)

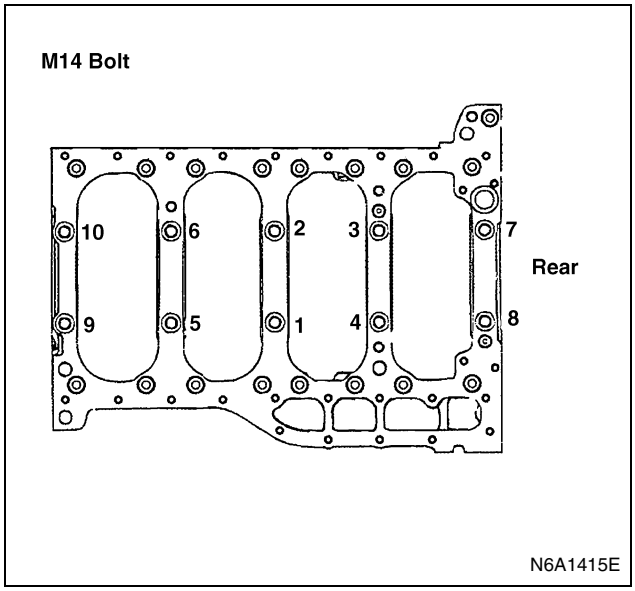
Crankshaft Journal and Bearing Clearance

1. Clean the cylinder body and crankcase, the journal bearing fitting surface, and the journal bearings.
2. Install the bearings to the cylinder body and crankcase.
3. Install the crankcase to the cylinder body.

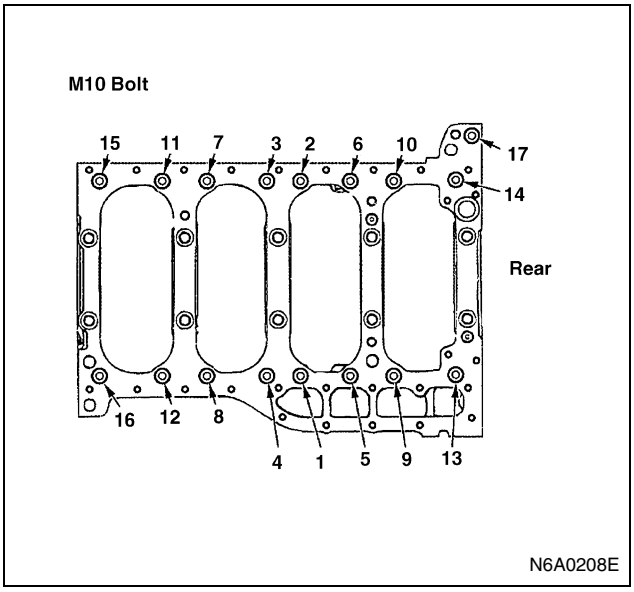


4. Tighten the crankcase to the specified torque in the numerical order shown in the illustration.

Tighten:
Crankcase bolt (M14: (1) — (10)) to
- 1st step: 98 N·m (10 kg·m / 72 lb·ft)
- 2nd step: 132 N·m (13.5 kg·m / 98 lb·ft)
- 3rd step: 30 — 60°



Tighten:
Crankcase bolt (M10: (1) — (17)) to 37 N·m (3.8 kg·m / 27 lb·ft)



5. Use a dial indicator to measure the crankshaft journal inside diameter.
6. If the clearance between the crankshaft journal and the bearing exceeds the specified limit, the crankshaft must be either reground or replaced.

Crankshaft Journal and Bearing Clearance		mm (in)
	Standard	Limit
No.1, 2, 4 and 5 Journal	0.037 — 0.072 (0.0015 — 0.0028)	0.11 (0.0043)
No.3 Journal	0.051 — 0.086 (0.0020 — 0.0034)	0.11 (0.0043)

7. Remove the crankcase and the bearings.

Undersized Crankshaft Journal Bearing Availability (Except 4HE1-TC)	mm (in)
0.25 (0.01)	0.50 (0.02)

Crankshaft Bearing Selection

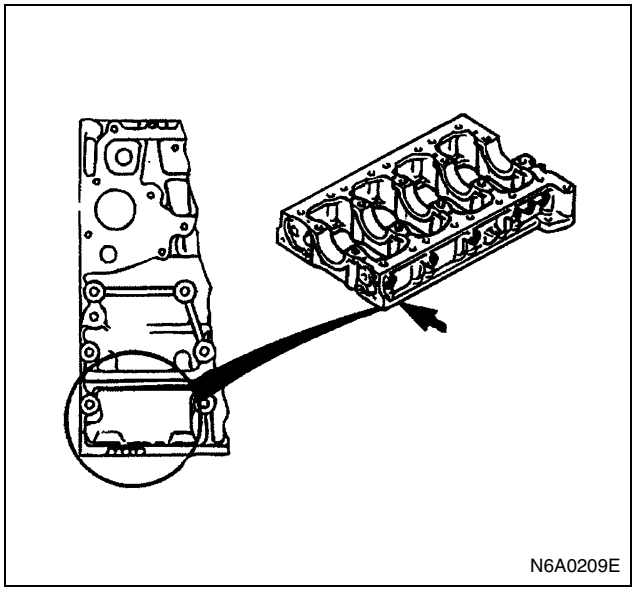
Refer to the following table when replacing the crankshaft and/or the crankshaft bearings.
Crankshaft bearing selection is based on the measured diameters of the crankshaft journals and the bearing housing.
Match the crankshaft bearing housing grade marks and the crankshaft journal grade marks in the table below to determine the correct crankshaft bearing size.

Crankshaft Bearing Insert Grade Mark Position

The crankshaft bearing housing grade marks (1 or 2) are stamped collectively for all cylinders on the underside of the left front portion of the crankcase.

Example:

1	2	1	1	2
↑	↑	↑	↑	↑
No.1 Bearing Housing	No. 2 Bearing Housing	No. 3 Bearing Housing	No. 4 Bearing Housing	No. 5 Bearing Housing

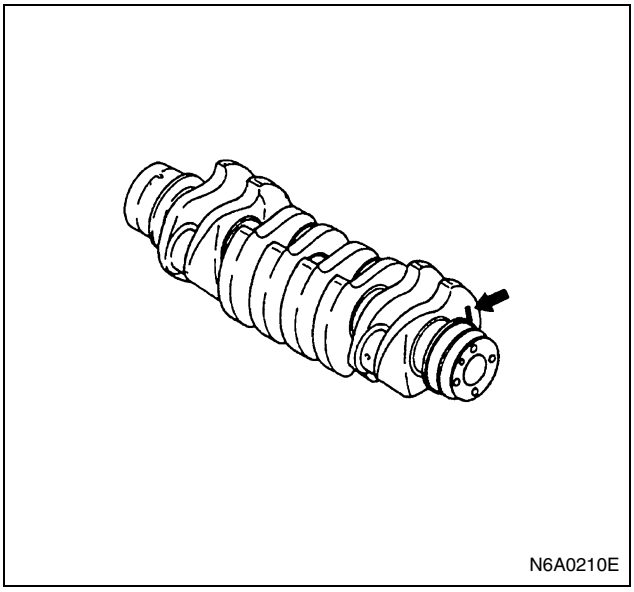


Crankshaft Journal Grade Mark Position

The crankshaft journal grade marks (1 or 2) are stamped collectively for all cylinders on the front side of the crankshaft No.1 balancer.
The clearance between the crankshaft journal and the bearing must be the same for each position after installation of the crankshaft and the crankshaft bearings.

Example:

2	1	2	2	1
↑	↑	↑	↑	↑
No.1 Journal	No.2 Journal	No.3 Journal	No.4 Journal	No.5 Journal



N6A0210E

Grade Mark	Diameter	Grade Mark	Diameter	Color Code	
1	87.000 — 87.009 (3.4252 — 3.4255)	1	81.890 — 81.900 (3.2240 — 3.2244)	Black	0.053 — 0.084 (0.0021 — 0.0033)
		2	81.901 — 81.910 (3.2244 — 3.2248)	Brown	0.051 — 0.082 (0.0020 — 0.0032)
2	87.010 — 87.019 (3.4256 — 3.4259)	1	81.890 — 81.900 (3.2240 — 3.2244)	Blue	0.055 — 0.086 (0.0022 — 0.0034)
		2	81.901 — 81.910 (3.2244 — 3.2248)	Black	0.053 — 0.084 (0.0021 — 0.0033)

Crankpin and Connecting Rod Bearing Clearance

1. Clean the crankshaft, the connecting rod, the bearing cap, and the bearings.
2. Install the bearing to the connecting rod and the bearing cap.
3. Apply a coat of molybdenum disulfide grease to the bearing cap bolt threads and setting faces.
4. Prevent the connecting rod from moving.
5. Tighten the bearing cap to the specified torque.

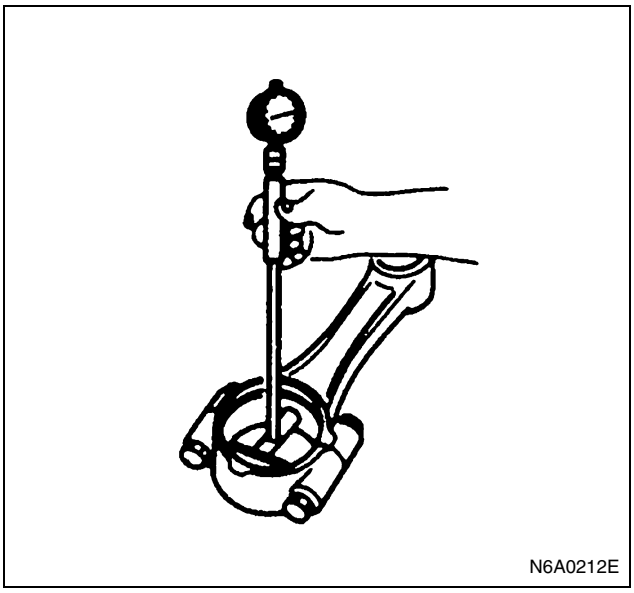
Tighten:

Connecting rod bearing cap bolt to

- 1st step: 39 N·m (4.0 kg·m / 29 lb·ft)
- 2nd step: 60°
- 3rd step: 30°

6. Use the dial indicator to measure the connecting rod bearing inside diameter.

Crankpin and Connecting Rod Bearing Clearance	mm (in)
Standard	Limit
0.036 — 0.077 (0.0014 — 0.0030)	0.10 (0.004)



N6A0212E

7. If the clearance between the measured bearing inside diameter and the crankpin exceeds the specified limit, the bearing and/or the crankshaft must be replace or reground. (Except 4HE1-TC)
8. Remove the bearing cap and the bearings.

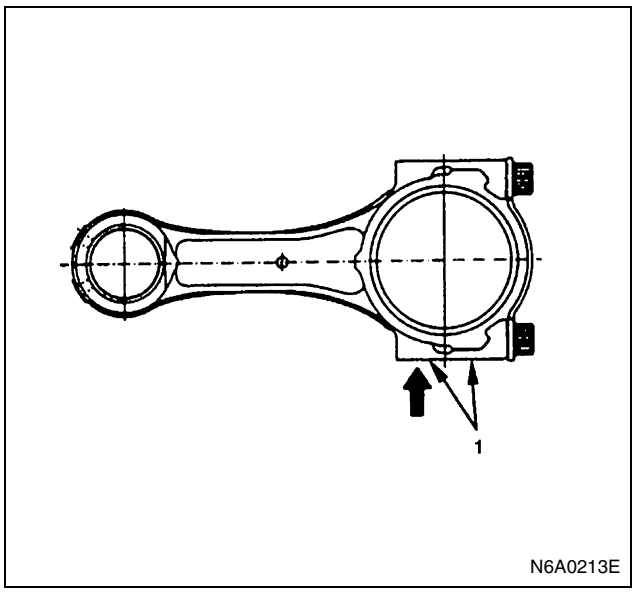
Undersized Connecting Rod Bearing Availability	mm (in)
0.25 (0.01)	0.50 (0.02)

Connecting Rod Bearing Selection

Refer to the following table when installing or replacing the connecting rod bearings.

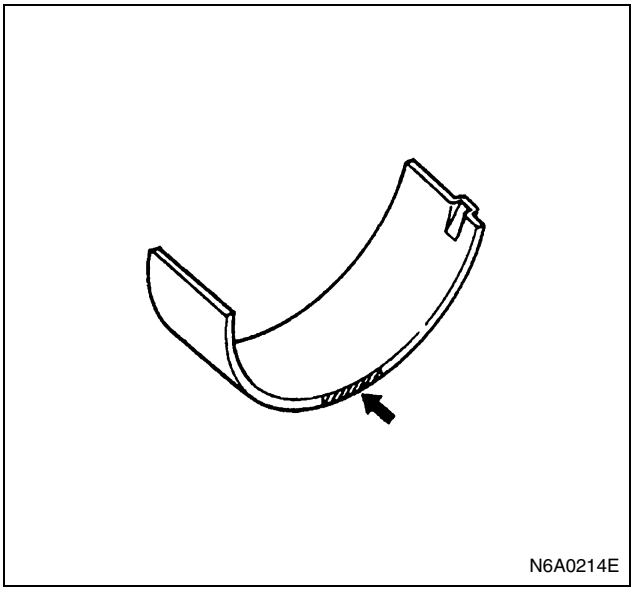
Pay close attention to the size mark on the big end of the connecting rod.

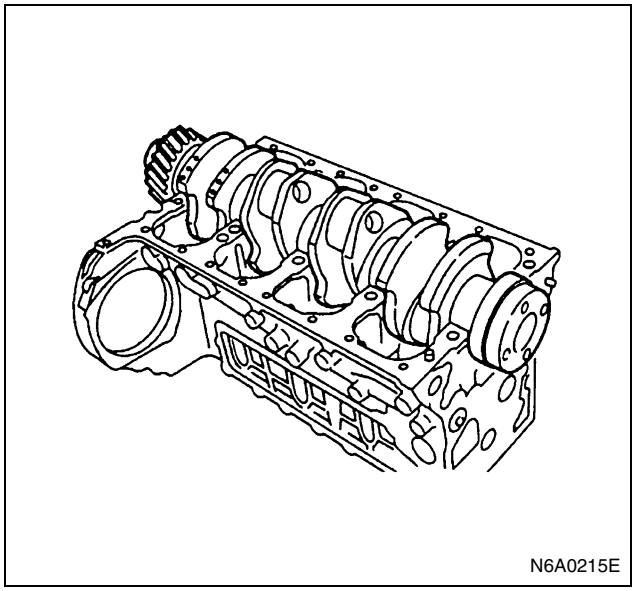
Do not confuse the size mark on the big end of connecting rod with the alignment cylinder No. (1) mark.



N6A0213E

Connecting Rod Bearing Combination					mm (in)
Engine Model	Connecting Rod Big End		Crankpin	Connecting Rod Bearing	Oil Clearance
	Grade Mark	Diameter	Diameter	Color Code	
4HF1 4HF1-2 4HG1 4HG1-T	A	69.985 — 69.992 (2.7553 — 2.7556)	65.902 — 65.992 (2.5946 — 2.5954)	Green	0.036 — 0.077 (0.0014 — 0.0030)
	B	69.993 — 70.000 (2.7556 — 2.7559)	65.902 — 65.922 (2.5946 — 2.5954)	Yellow	0.036 — 0.070 (0.0014 - 0.0030)
4HE1-TC	A	77.985 — 77.992 (3.0703 — 3.0705)	72.902 — 72.922 (2.8702 — 2.8709)	Green	0.037 — 0.077 (0.0015 — 0.0030)
	B	77.993 — 78.000 (3.0706 — 3.0709)		Yellow	

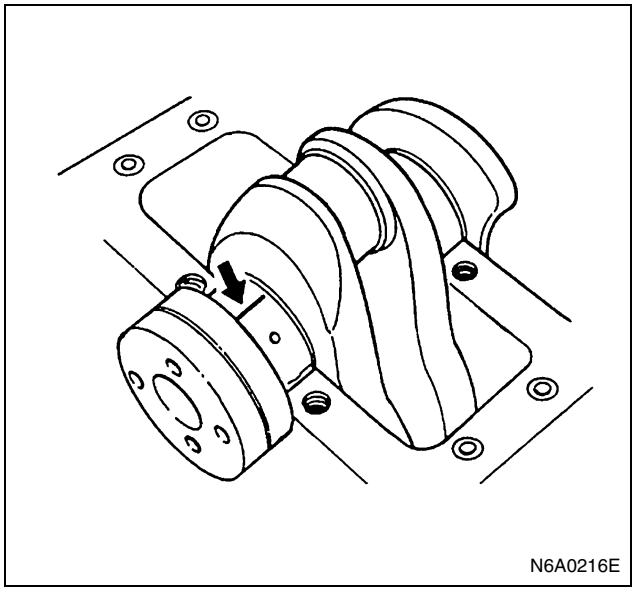




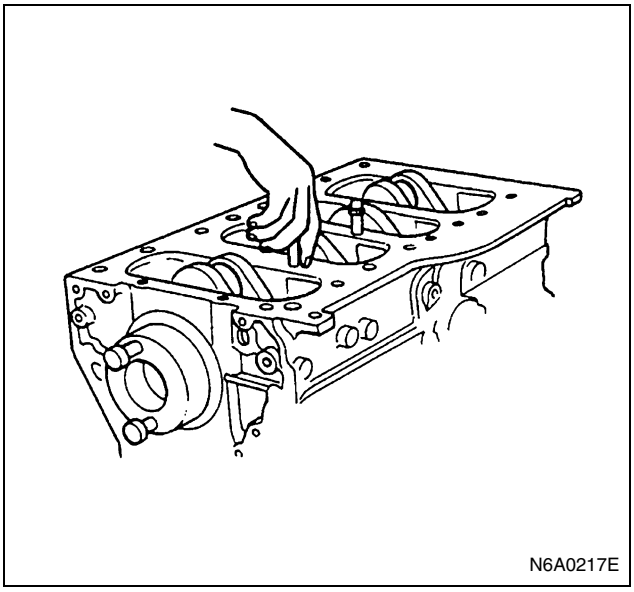
Clearance Measurements (With Plastigage)

Crankshaft Journal and Bearing Clearance

1. Clean the cylinder body and crankcase, the journal bearing fitting surface, and the journal bearings.
2. Install the bearings to the cylinder body and crankcase.
3. Carefully place the crankshaft on the bearings.
4. Rotate the crankshaft approximately 30 degrees to seat the bearing.
5. Place the Plastigage (arrow) over the crankshaft journal across the full width of the bearing.



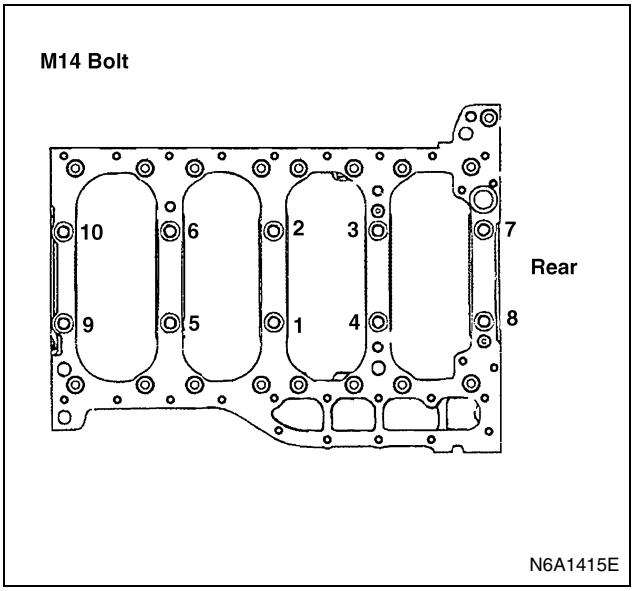
6. Install the crankcase to the cylinder body.



N6A0217E

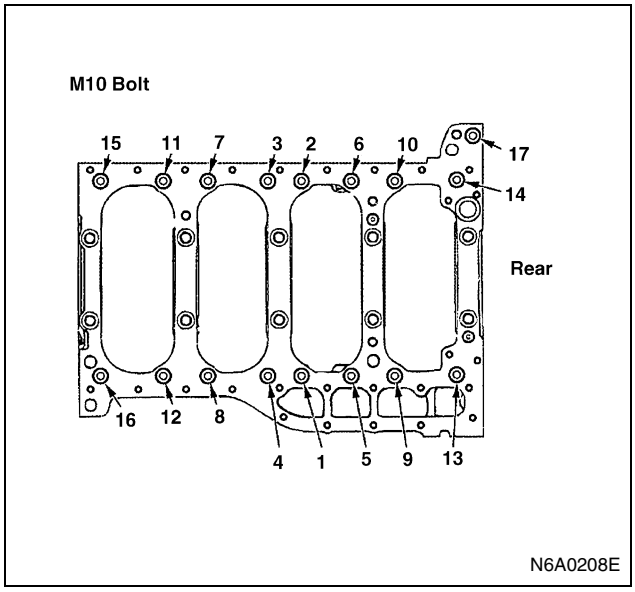
7. Tighten the crankcase to the specified torque in the numerical order shown in the illustration.

Tighten:
Crankcase bolt (M14: (1) — (10)) to
- 1st step: 98 N·m (10 kg·m / 72 lb·ft)
- 2nd step: 132 N·m (13.5 kg·m / 98 lb·ft)
- 3rd step: 30 — 60°



N6A1415E

Tighten:
Crankcase bolt (M10: (1) — (17)) to 3.9±0.7 N·m (28±5 kg·m / 38±7 lb·ft)

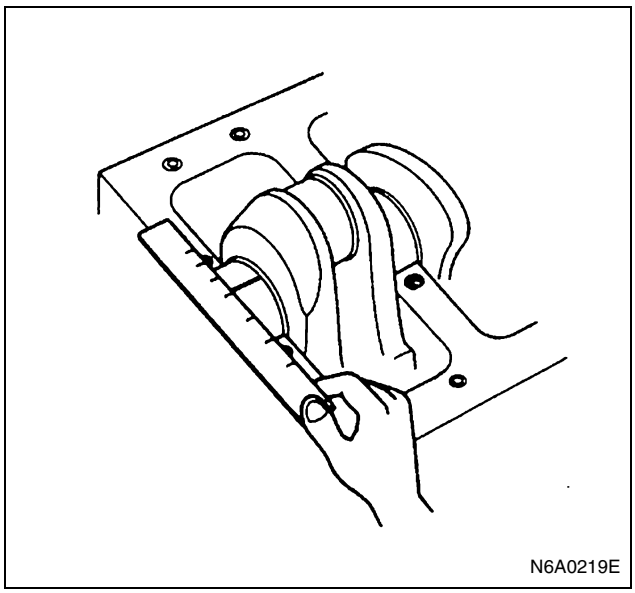


N6A0208E

Do not allow the crankshaft to turn during bearing cap installation and tightening.

8. Remove the bearing beam and the crankcase with bearings.
9. Compare the width of the Plastigage attached to either the crankshaft or the bearing with the scale printed on the Plastigage container.

Crankshaft Journal and Bearing Clearance		mm (in)
	Standard	Limit
No.1, 2, 4 and 5 Journal	0.037 — 0.072 (0.0015 — 0.0028)	0.11 (0.0043)
No.3 Journal	0.051 — 0.086 (0.0020 — 0.0034)	0.11 (0.0043)



N6A0219E

10. If the measured value exceeds the limit, perform the following additional steps.

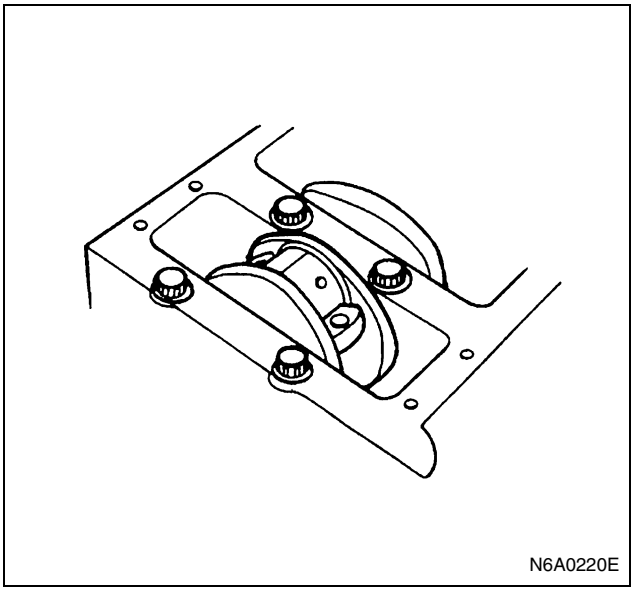
- Use a micrometer to measure the crankshaft outside diameter.
- Use an inside dial indicator to measure the bearing inside diameter.
  If the crankshaft journal and bearing clearance exceeds the limit, the crankshaft and/or the bearing must be reground (Except 4HE1-TC) or replaced.

Undersized Crankshaft Journal Bearing Availability (Except 4HE1-TC)	mm (in)
0.25 (0.01)	0.50 (0.02)

11. Remove the crankshaft and bearings.

Crankpin and Connecting Rod Bearing Clearance

1. Clean the crankshaft, the connecting rod, the bearing cap, and the bearings.
2. Install the bearing to the connecting rod and the bearing cap.
   Do not allow the crankshaft to move when installing the bearing cap.
3. Prevent the connecting rod from moving.
4. Attach the Plastigate to the crankpin.
   Apply engine oil to the Plastigate to keep it from falling.



N6A0220E

5. Apply a coat of molybdenum disulfide grease to the bearing cap bolt threads and setting faces.
6. Install the bearing cap and tighten it to the specified torque.
   Do not allow the connecting rod to move when installing and tightening the bearing cap.

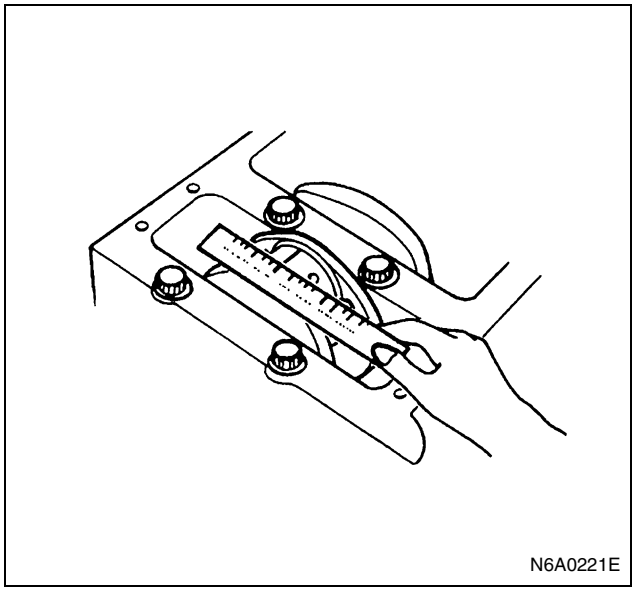
Tighten:

Connecting rod bearing cap bolt to

- 1st step: 39 N·m (4.0 kg·m / 29 lb·ft)
- 2nd step: 60°
- 3rd step: 30°

7. Remove the bearing cap.
8. Compare the width of the Plastigate attached to either the crankshaft or the bearing against the scale printed on the Plastigage container.

Crankpin and Connecting Rod Bearing Clearance	mm (in)
Standard	Limit
0.036 — 0.077 (0.0014 — 0.0030)	0.10 (0.004)



N6A0221E

9. If the measured value exceeds the specified limit, perform the following additional steps.
   - Use a micrometer to measure the crankpin outside diameter.
   - Use an inside dial indicator to measure the bearing inside diameter.
     If the clearance between the crankpin and the bearing exceeds the specified limit, the crankshaft and / or the bearing must be reground (except 4HE1-TC) or replaced.

Undersized Connecting Rod Bearing Availability (Except 4HE1-TC)	mm (in)
0.25 (0.01)	0.50 (0.02)

Crankshaft Regrinding (Except 4HE1-TC)

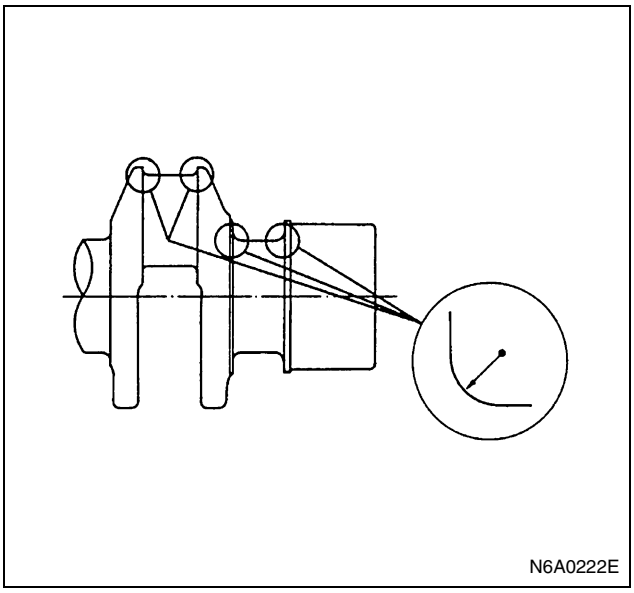
To ensure crankshaft reliability, pay close attention to the following items during and after the crankshaft journal and crankpin regrinding procedure.

Undersized Bearing Availability	mm (in)
0.25 (0.01)	0.50 (0.02)

Crankshaft Journal and Crankpin Grinding Limit (Reference)		mm (in)
Journal	No.1, 2, 4, 5	81.405 (3.2049)
	No.3	81.390 (3.2043)
Crankpin		65.402 (2.5749)

Crankshaft Regrinding Procedure (Except 4HE1-TC)

1. Regrind the crankshaft journals and the crankpins.
2. Fillet the crankshaft journals and the crankpin radiuses to a minimum of R 4.8±0.2 mm (0.189±0.0078 in).
   There must be no stepping around the fillet area.



3. Finish the crankshaft journals, the crankpins, and the oil port corners to a smooth surface having a chamfer radius of 1 mm (0.04 in).

Crankshaft Journal and Crankpin Roughness
0.4 μm or less

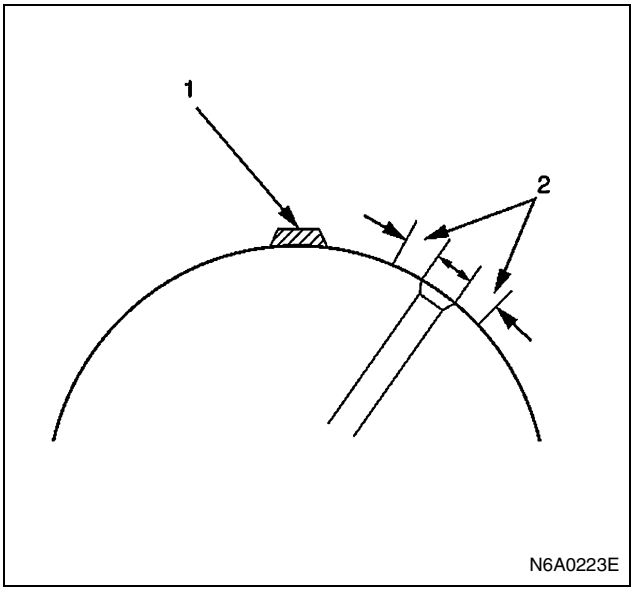
4. Check the crankshaft journal and crankpin clearance.
   Refer to the “Crankshaft Journal and Bearing Clearance” and “Crankpin and Connecting Rod Bearing Clearance”.
5. Check the crankshaft run-out.
   Refer to the “Crankshaft Run-Out”.

Caution:
The crankshaft for 4HE1-TC is applied soft nitrided surface (Taftriding). Therefore, the crankshaft for 4HE1-TC not could be ground.

Inspection Procedure for Soft Nitrided (Taftriding) Crankshaft (For 4HE1-TC)

1. Inspect the crankshaft following points.
   - Excessive wear and damage on the surface of crankshaft journals.
   - Excessive wear and damage on the surface of crankpin.
   - Excessive wear and damage on the oil seal fitting surface.
   - Inspect the oil ports foe obstructions.
2. Inspect the crankshaft soft nitrided surface (Taftriding). The soft nitrided crankshaft has been applied to increase crankshaft strength.
   Because of this, it is not possible to regrind the crankshaft surfaces.
   1) Inspection conditions.
      - Remove the oil and other material on the crankshaft inspection area.
      - The portion to be tested must be held horizontally so as not let the test solution flow.
      - Test liquid should not be applied to the approximately 10 mm (0.39 in) area around the oil port (2).
   2) Inspection method
      - Use an organic cleaner to thoroughly clean the crankshaft. There must be no traces of oil the surfaces to be inspected.
      - Prepare a 5 — 10 percent solution of ammonium cupric chloride (dissolved in distilled water).
      - Use a syringe to apply the solution (1) to the surface to be inspected. Hold the surface to be inspected perfectly horizontal to prevent the solution from running.
   3) Judgement
      - Wait for thirty to forty seconds. If there is no discoloration after thirty to forty seconds, the crankshaft is usable. If discoloration appears (the surface being tested will become the color copper), the crankshaft must be replaced.
      - Steam clean the crankshaft surface immediately after completing the inspection.

Notice:
The ammonium cupric chloride solution is highly corrosive. Because of this, it is imperative that the surfaces being inspected be cleaned immediately after completing the inspection.

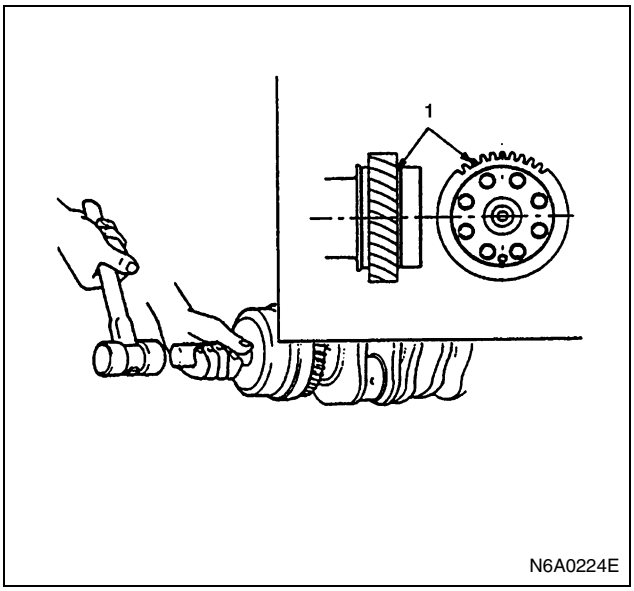


Reassembly

1. Crankshaft
2. Crankshaft Gear
   1) Use a piston heater to heat the crankshaft gear to 170 — 250°C (338 — 482°F).
   2) With the alignment mark “S” on the side of the crankshaft gear turned outward, align the groove on the gear side with the crankshaft pin position and hammer it in with a crankshaft gear installer until it hits the bottom.

Caution:
When hammered in with the gear slanted, the crankshaft gear may be caught in the middle and cannot be hammered in fully. Hammer it inquickly enough not to allow a shaft line along the gear and the crankshaft to slant.

Crankshaft Gear Installer: 8-9439-6819-0

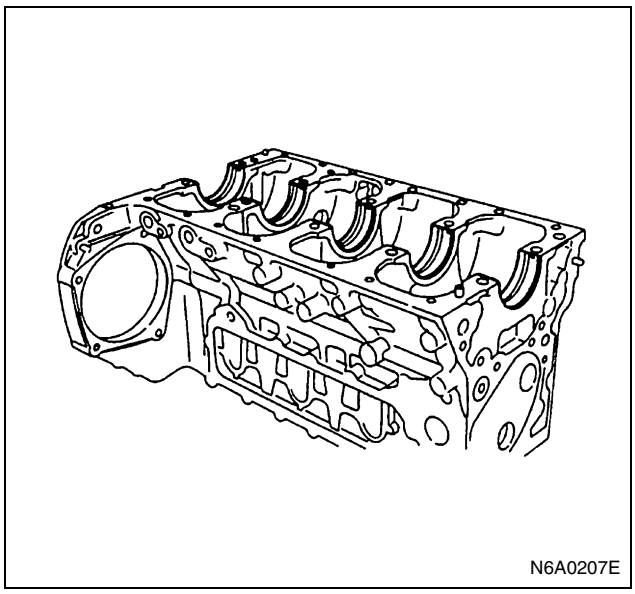


Legend
1. Alignment mark

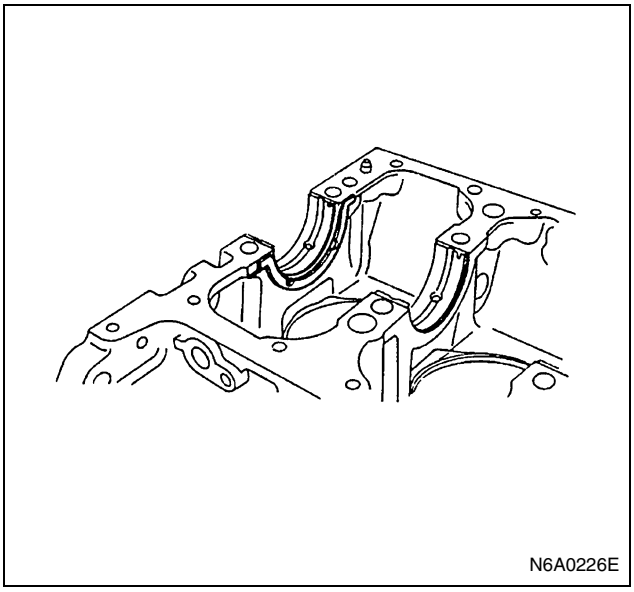
3. Crankshaft Bearing Upper
   When replacing the crankshaft or the crankshaft bearing with a new one, select the crankshaft bearing according to the respective grades stamped on the crankshaft and the cylinder body.
   Above works refer to “CRANKSHAFT” section in this manual.
   All upper bearings have oil grooves.
   1) Carefully wipe any foreign material from the upper bearing.

Caution:
Do not apply engine oil to the bearing back faces and the cylinder body bearing fitting surfaces.

   2) Locate the position mark applied at disassembly if the removed upper bearings are to be reused.

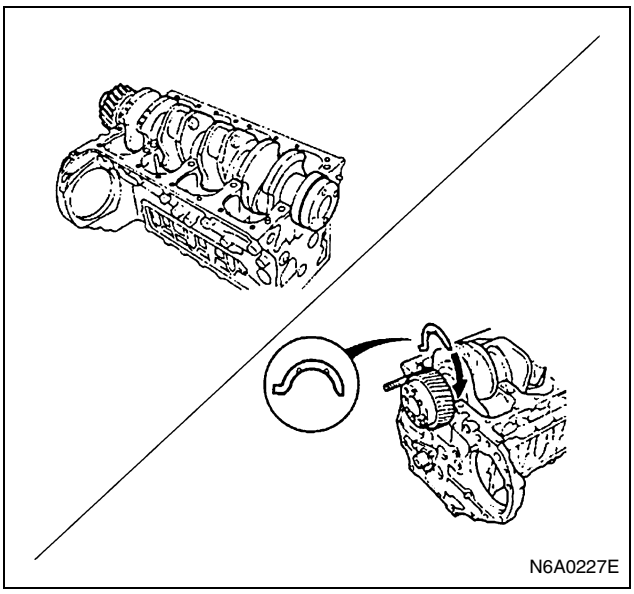


4. Thrust Bearing Upper
   1) Install the thrust bearing upper to the front side of the cylinder body No.5 journal. At this time, the thrust bearing upper may be pasted to the cylinder body with grease. However, wipe off any excessive grease clean.
   2) The thrust bearing oil grooves must be facing the sliding faces.



N6A0226E

5. Crankshaft Assembly
   1) Apply an ample coat of the engine oil to the crankshaft journals and the crankshaft bearing surfaces before installing the crankshaft with timing gear.
   2) With the installed crankshaft pressed on to the rear side, install the thrust bearing upper to the rear side of the cylinder body No.5 journal.
   3) The thrust bearing oil grooves must be facing the sliding faces.



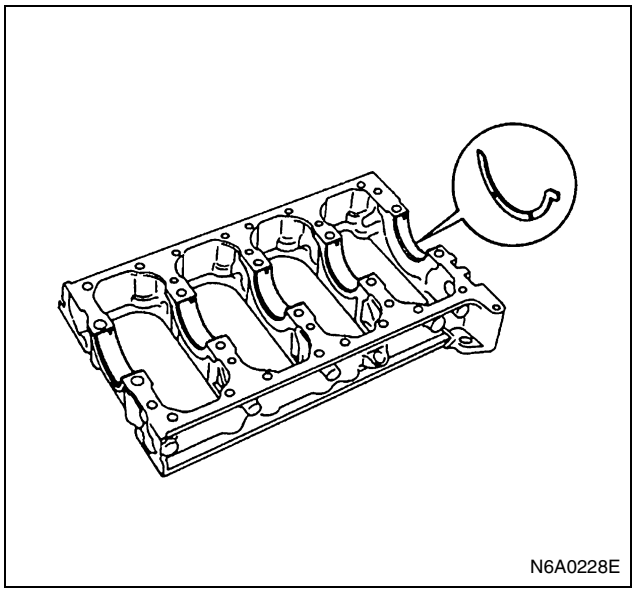
N6A0227E

6. Crankshaft Bearing Lower
   All lower bearings does not have oil grooves.
   1) Carefully wipe any foreign material from the lower bearing.

Caution:
Do not apply engine oil to the bearing back faces and the crankcase bearing fitting surfaces.

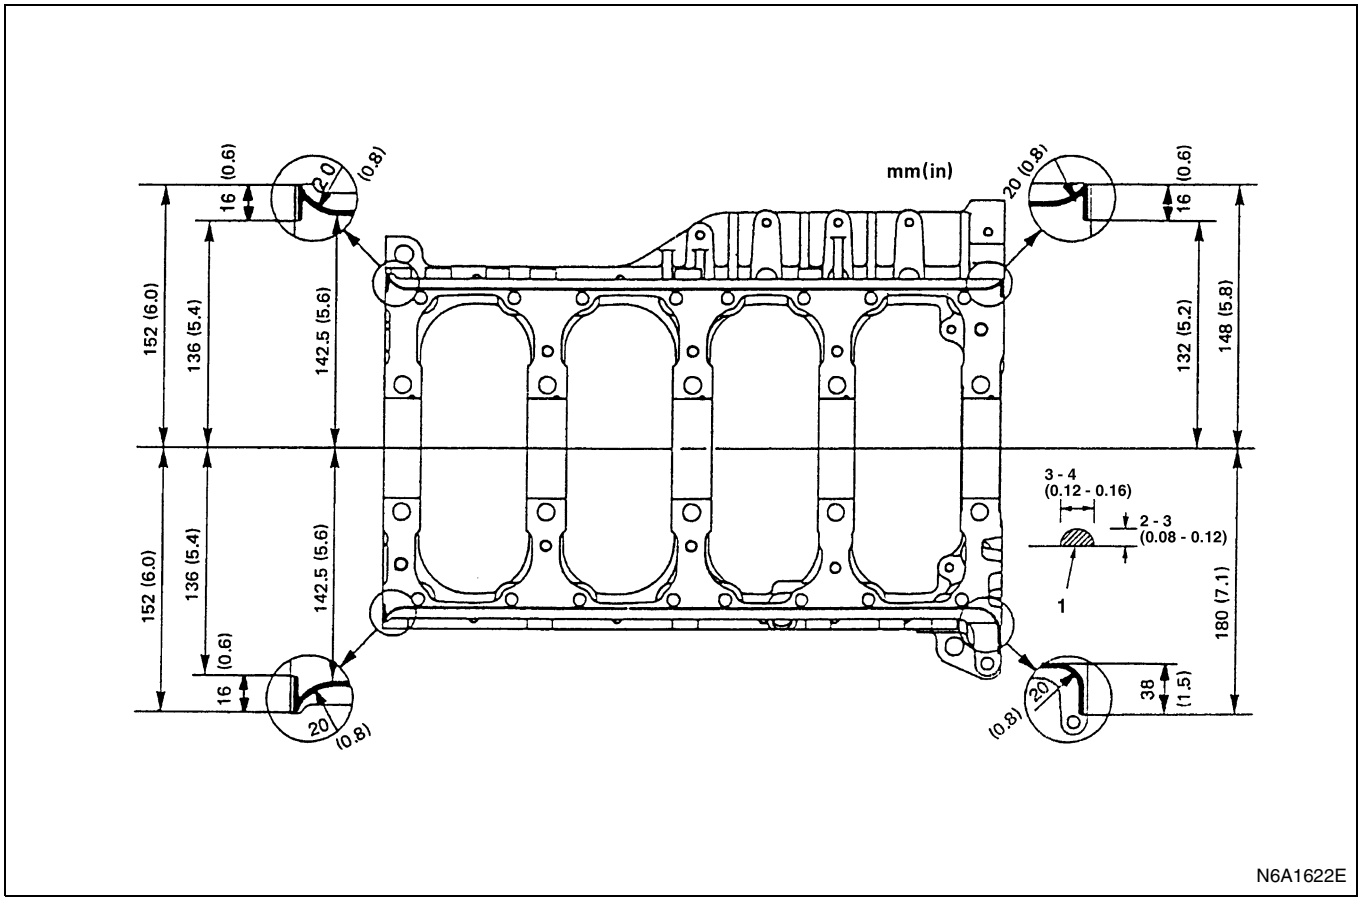
   2) Locate the position mark applied at disassembly if the removed lower bearings are to be reused.

7. Thrust Bearing Lower
   1) Install the thrust bearing lower to the rear side of the crankcase No.5 journal.
   2) The thrust bearing oil grooves must be facing the sliding faces.



N6A0228E

8. Crankcase
   1) Apply a 3 mm (0.12 in) bead of recommended liquid gasket (Three Bond 1207C) or its equivalent to the crankcase upper surface as shown in the illustration.
   2) Carefully place the crankcase on the cylinder body.
   • Install the crankcase within 20 minutes after application of liquid gasket.



Legend

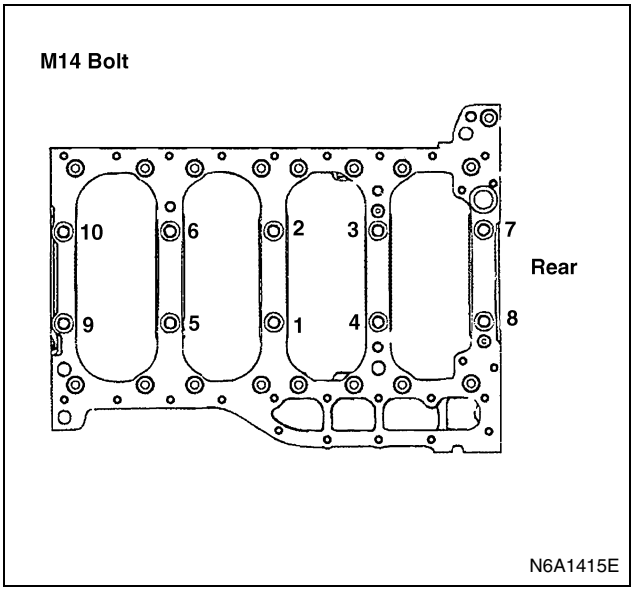
1. Liquid gasket

3) Tighten the crankcase to the specified torque in the numerical order shown in the illustration.

Tighten:

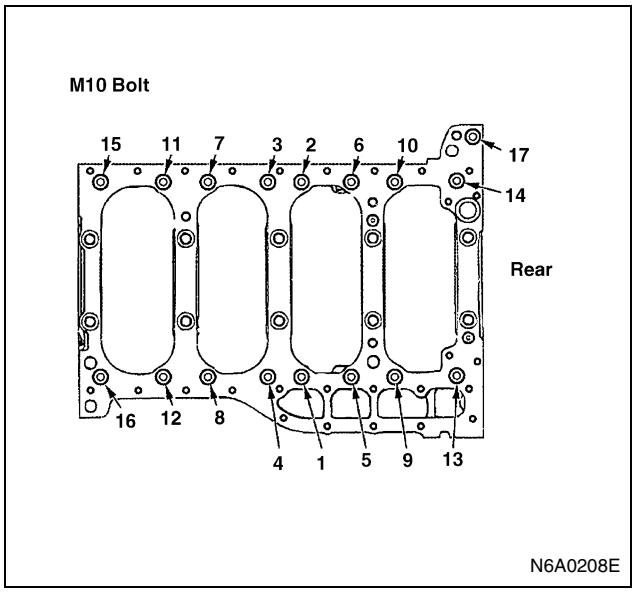
Crankcase bolt (M14: (1) — (10)) to

- 1st step: 98 N·m (10 kg·m / 72 lb·ft)
- 2nd step: 132 N·m (13.5 kg·m / 98 lb·ft)
- 3rd step: 30 — 60°



Tighten:

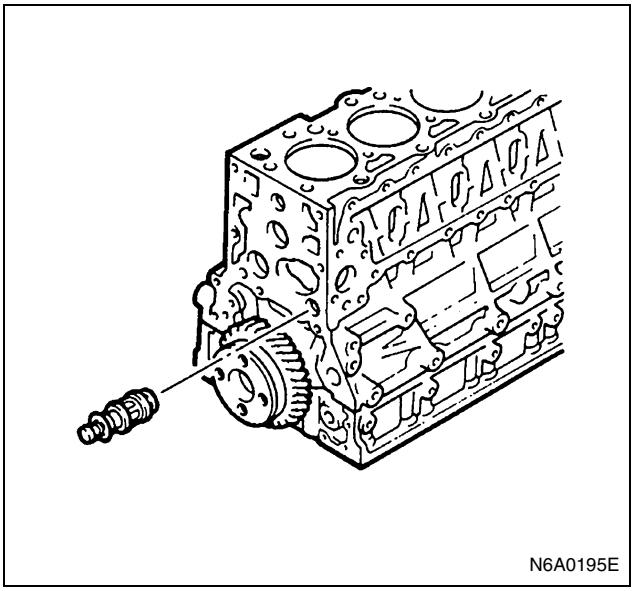
Crankcase bolt (M10: (1) — (17)) to 37 N·m (3.8 kg·m / 27 lb·ft)



Angle gauge: 5-8840-0266-0

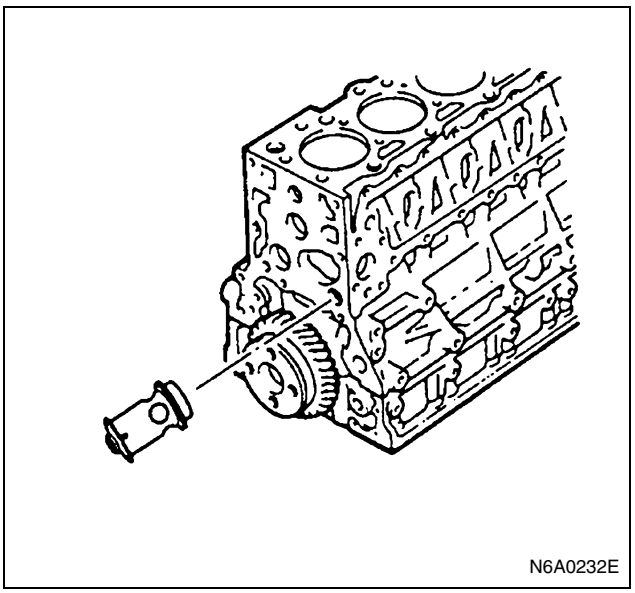
9. Piston and Connecting Rod Assembly
10. Connecting Rod Lower Bearing

11. Connecting Rod Cap Assembly
    Above works refer to “PISTON AND CONNECTING ROD” section in this manual.
12. Oil Pump Assembly
13. Idle Gear A
14. Flywheel Housing
15. Power Steering Pump Idle Gear
16. Power Steering Pump Idle Gear Cover
    Above works refer to O”IL PUMP” section in this manual.
17. Oil Thermo Valve (4HF1, 4HF1-2, 4HG1, 4HG1-T)
    Insert the oil thermo valve into the cylinder body.



N6A0195E

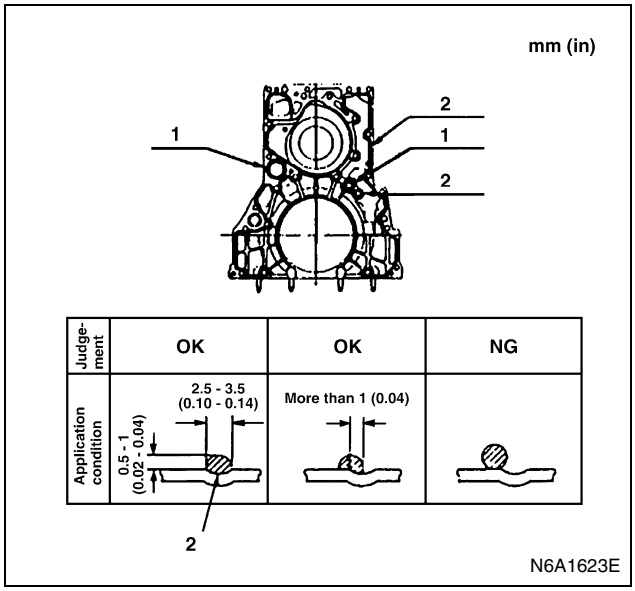
18. Bypass Valve (4HE1-TC)
    Insert the bypass valve into the cylinder body.



N6A0232E

19. Front Retainer
    1) Carefully wipe any foreign material from the cylinder body front face.
    2) Apply 2.5 — 3.5 mm (0.10 — 0.14 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the groove of the front retainer fitting surface shown in the illustration.
    3) Install the O-rings (2 pieces) to the front retainer.

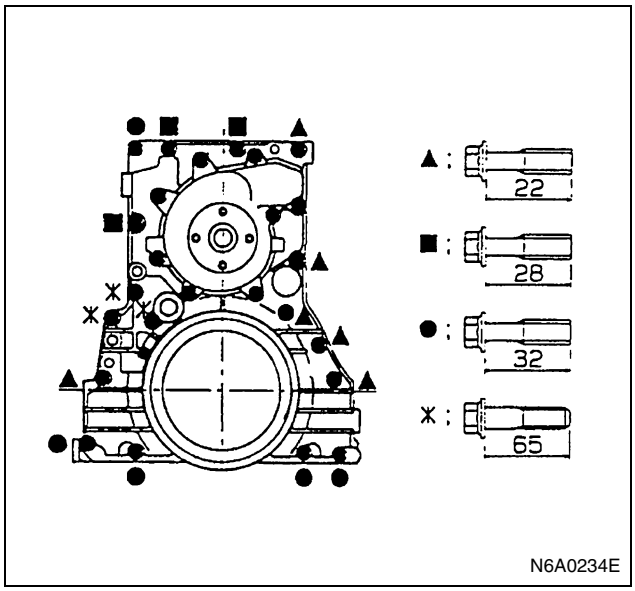
    • Install the front retainer within 7 minutes after application of liquid gasket.
    • For the dislocation of liquid gasket, refer to the illustration.



Legend
1. O-ring
2. Liquid gasket

    4) Align the cylinder body knock pins with the front retainer knock pin holes.

Tighten:
Front retainer bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

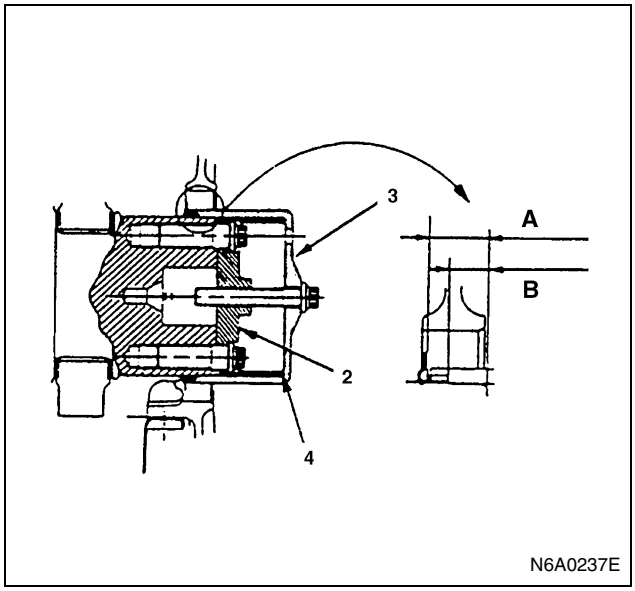


20. Water Pump Assembly
21. Water Pump Pulley
22. Oil Pump Strainer

23. Oil Pan
24. Spacer Rubber
    Above works refer to “CYLINDER BLOCK” section in this manual.
25. Crankshaft Rear Slinger
    Press in the slinger using oil seal setting tool kit.
    1) Insert the slinger (1) into the end of the adapter (2) and install the adapter on the crankshaft.

    2) Cover the sleeve (3) and tighten the bolt until the sleeve comes to contact the adapter stopper (4).

    3) Make sure of measurements specified in the illustration as well as of slinger deflection.
    (A): 17.3 ± 0.3 mm (0.681 ± 0.012 in)
    (B): 10.8 ± 0.1 mm (0.425 ± 0.004 in)



Notice:
Be sure to replace the slinger and oil seal as a set.

Oil Seal Setting Tool Kit: 5-8840-2431-0

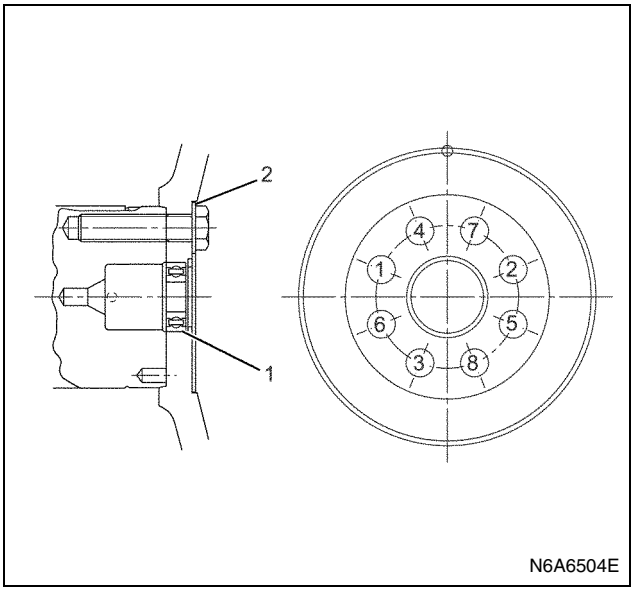
7. Center bolt

27. Flywheel Assembly
    1) Apply molybdenum disulfide grease to the flywheel bolt threads and setting faces.
    2) Align the flywheel with the crankshaft knock pin and temporarily tighten the flywheel bolts.
    3) Use the crankshaft stopper to prevent the crankshaft from turning.
    Crankshaft Stopper: 5-8840-2230-0
    4) Install the washer and the flywheel bolts and tighten to the specified torque in numerical order show in the illustration.

Tighten:
Flywheel bolt to
- 1st step: 78 N·m (8.0 kg·m / 58 lb·ft)
- 2nd step: 90 — 120°



Legend
1. Washer
2. Pilot bearing

5) Remove the crankshaft stopper.

28. Crankshaft Front Slinger
Press in the slinger using the oil seal setting tool kit.
Oil Seal Setting Tool Kit: 5-8840-2431-0

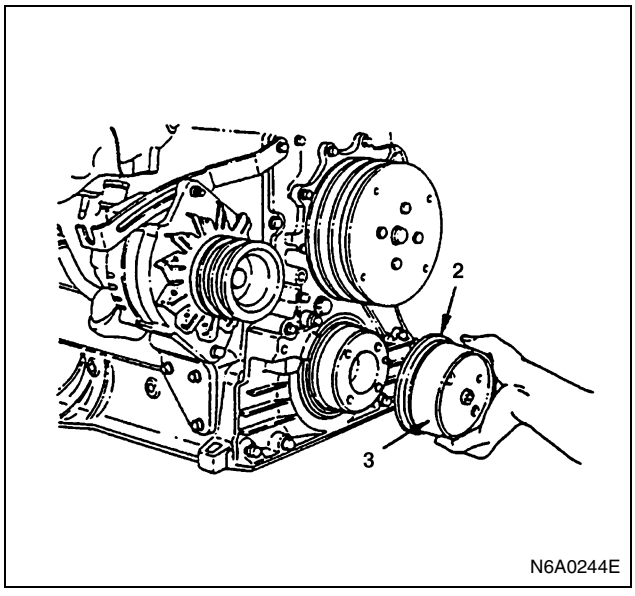
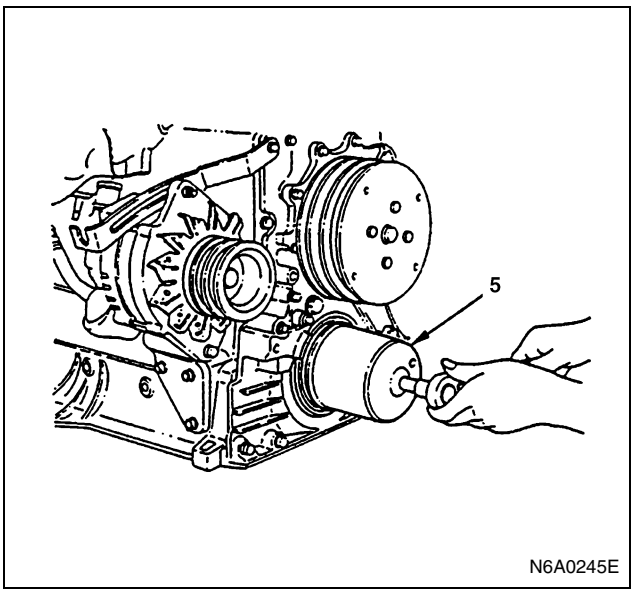
4. Adapter bolt
5. Sleeve
6. Washer (5 mm (0.20 in))
7. Center bolt

1) Insert the slinger (2) into the end of the adapter (3) and install the adapter on the crankshaft.

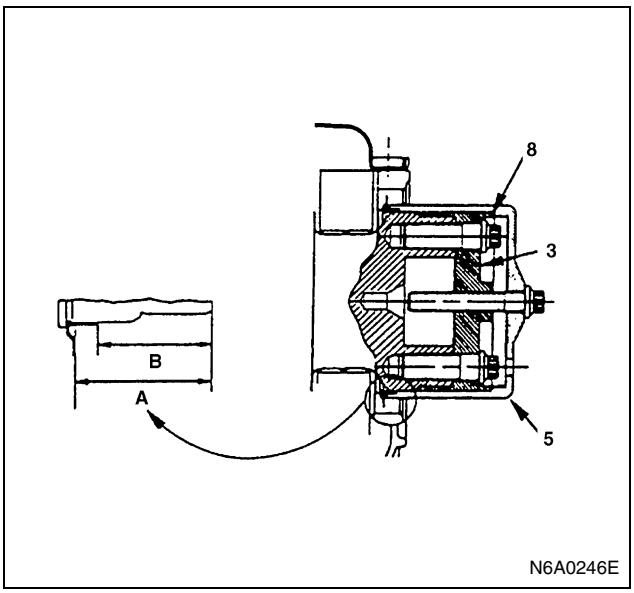


2) Cover the sleeve (5)and tighten the bolt until the sleeve comes to contact the adapter stopper (8).

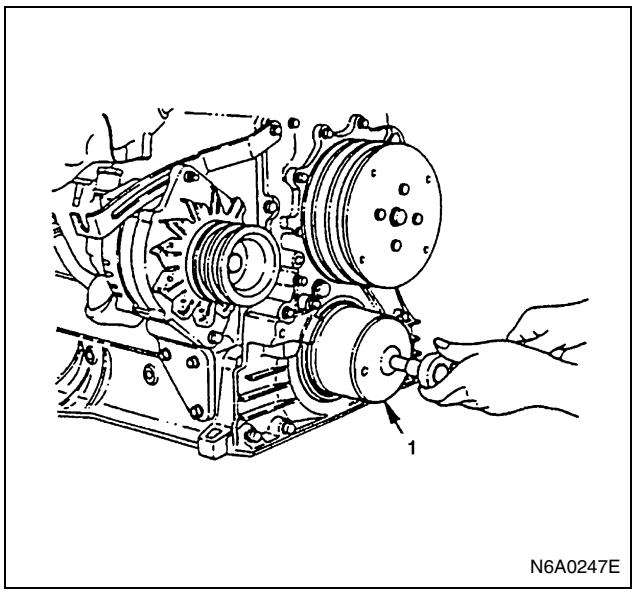


3) Make sure of measurements specified in the illustration as well as of slinger deflection.
(A): 40.5 ± 0.3 mm (1.594 ± 0.012 in)
(B): 34.0 ± 0.1 mm (1.339 ± 0.004 in)

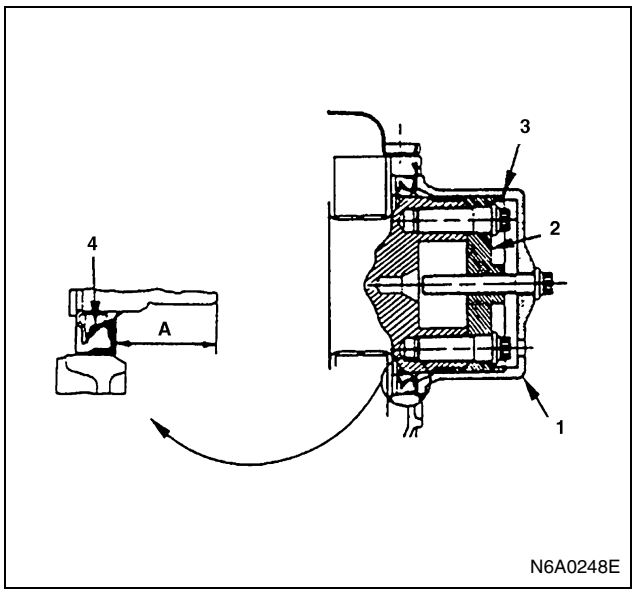
Notice:
Be sure to replace the slinger and the oil seal as a set. Use about 5mm (0.20 in) thickness plain washer on the center bolt.

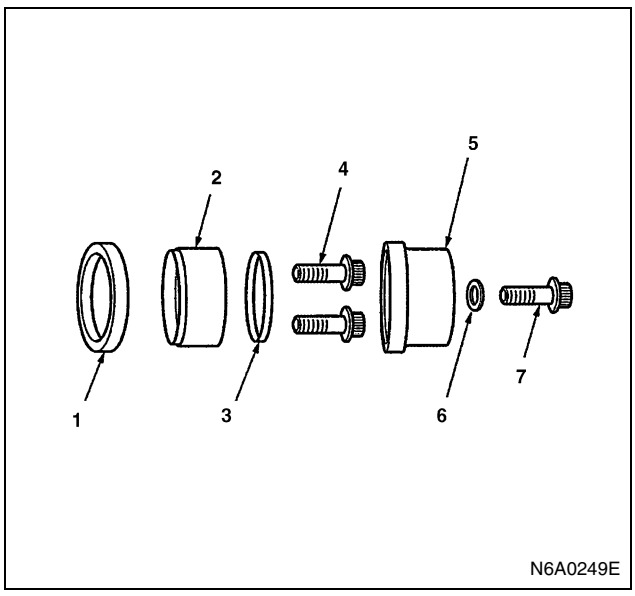


29. Crankshaft Front Oil Seal
    1) Apply engine oil to the lip of the oil seal.
    2) Press in the oil seal using the front oil seal setting tool kit.
    3) Remove the slinger sleeve and insert the oil seal (4) into the adapter (2).
    4) Install the adapter ring into the sleeve.
    5) Install the oil seal sleeve (1) to the adapter (2) and tighten the center bolt until the sleeve comes to contact the adapter stopper (3).



6) Make sure of the measurements specified in the illustration.
(A): 31 ± 0.3 mm (1.220 ± 0.012 in)





Legend

1. Oil seal
2. Adapter
3. Ring
4. Adapter bolt
5. Sleeve
6. Washer (5 mm (0.20 in))
7. Center bolt

30. Crankshaft Damper Pulley
    1) Apply a coat of engine oil to the threads of the bolts.
    2) Align the damper pulley with the crankshaft knock pin and tighten the bolts to the specified torque in numerical order.

Tighten:
Damper pulley bolt to 200 N·m (20.4 kg·m / 147 lb·ft)

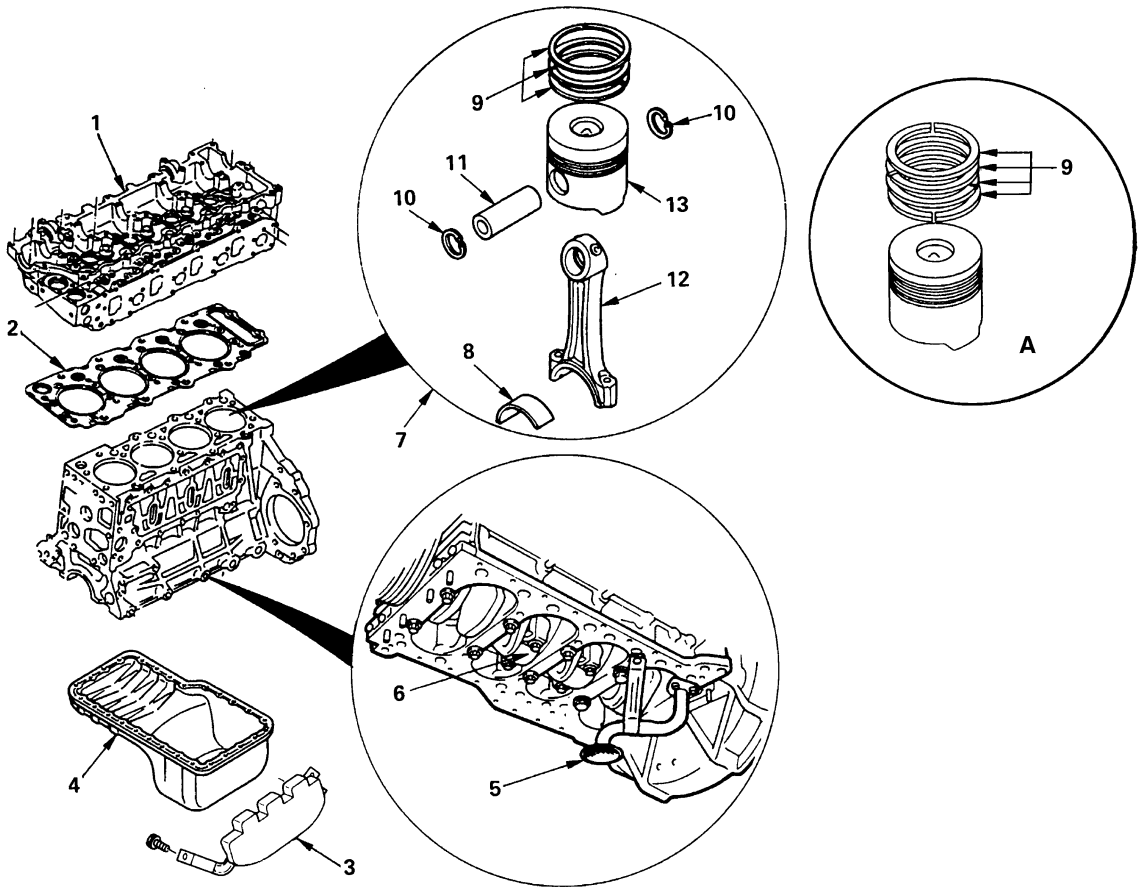
Component



Legend

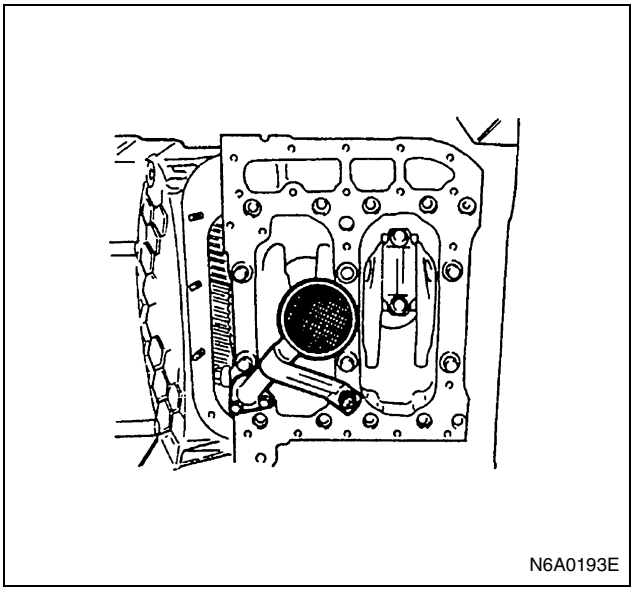
A. For 4HE1-TC
1. Cylinder head assembly
2. Cylinder head gasket
3. Spacer rubber
4. Oil pan
5. Oil pump strainer
6. Connecting rod cap
7. Piston and connecting rod
8. Connecting rod bearing
9. Piston ring
10. Piston pin snap ring
11. Piston pin
12. Connecting rod
13. Piston

Disassembly

1. Cylinder Head Assembly
   Above works refer to “CYLINDER HEAD” section in this manual.
2. Cylinder Head Gasket

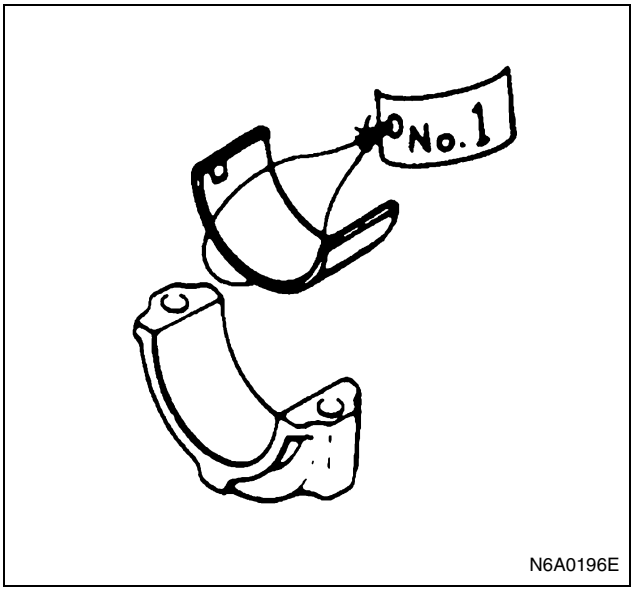
Caution:
Do not reuse the cylinder head gasket.

3. Spacer Rubber
4. Oil Pan
5. Oil Pump Strainer



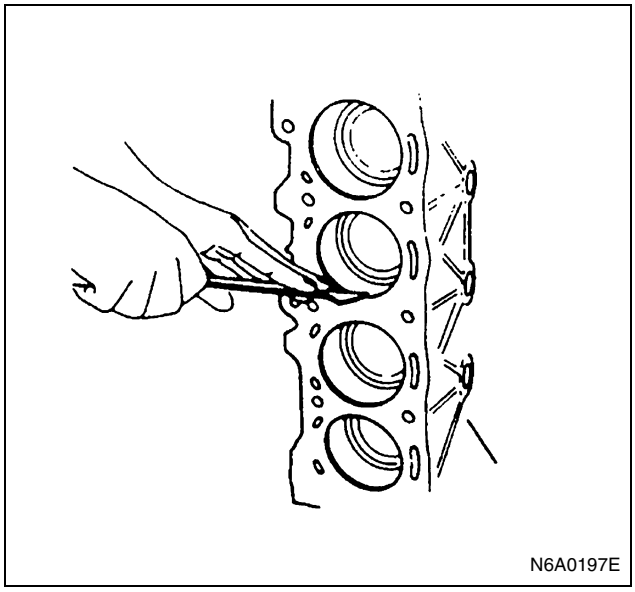
N6A0193E

6. Connecting Rod Cap
   1) Take out the connecting rod bearing cap bolts and remove the bearing cap with the lower bearing.
   2) If the connecting rod lower bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



N6A0196E

7. Piston and Connecting Rod Assembly
   1) To facilitate smooth removal of piston, remove carbon from the upper part of the cylinder wall using a scraper or equivalent.



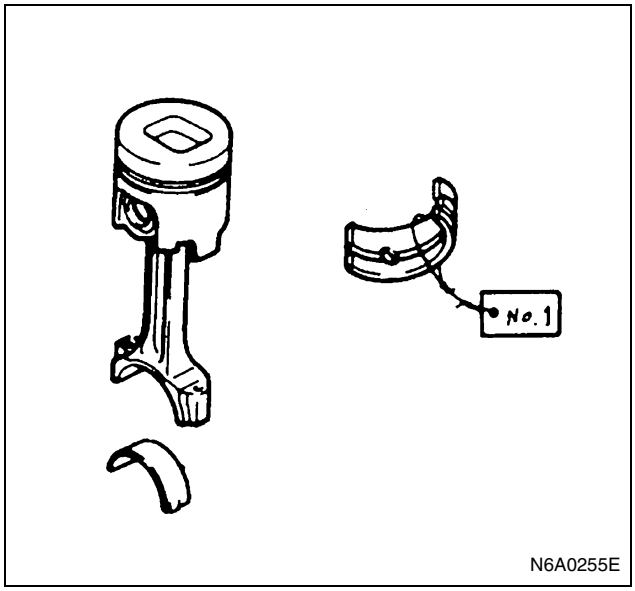
N6A0197E

   2) Remove the piston and connecting rod assembly upward by pushing on the edge of the connecting rod with a hammer handle or equivalent.
   3) If the connecting rod bearing are to be reinstalled, mark their fitting positions by taggfing each bearing with the cylinder number from which it was removed.

Caution:
Do not bend or damage the oiling jet.

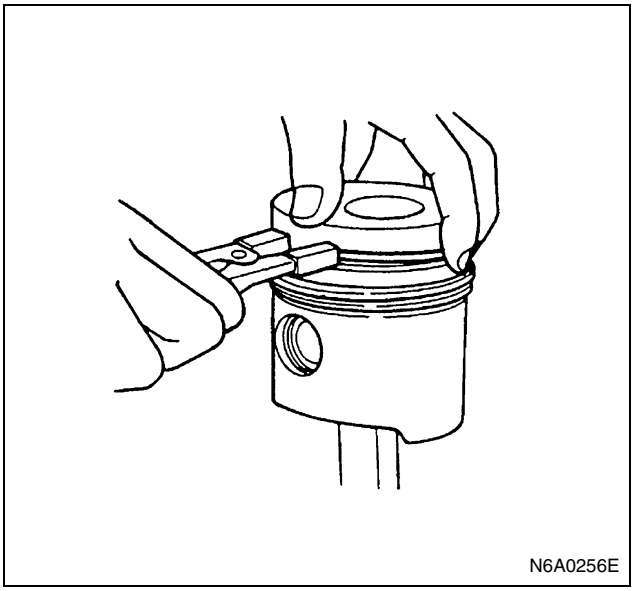
Notice:
When removing the piston and connecting rod assembly, pull the connecting rod in parallel with the cylinder bore.

8. Connecting Rod Bearing
   If the connecting rod bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



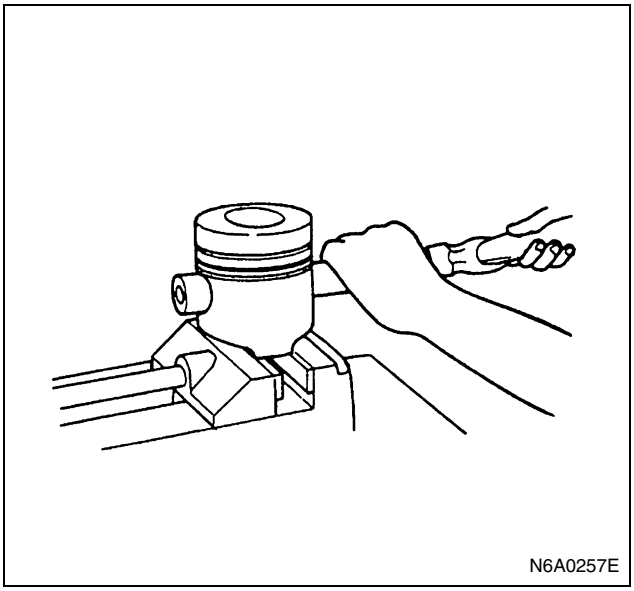
N6A0255E

9. Piston Ring
   1) Clamp the connecting rod in a vise.
      Take care not to damage the connecting rod.
   2) Use piston ring replacer to remove the piston rings.
      Do not attempt to use some other tool to remove the piston rings. Piston ring stretching will result in reduced piston ring tension.



N6A0256E

10. Piston Pin Snap Ring
    Use a pair of snap ring pliers to remove the piston pin snap rings.
11. Piston Pin
12. Connecting Rod
13. Piston
    Tap the piston pin out with a hammer and a brass bar. If the pistons are to be reinstalled, mark their installation positions by tagging each piston with the cylinder number from which it was removed.



N6A0257E

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

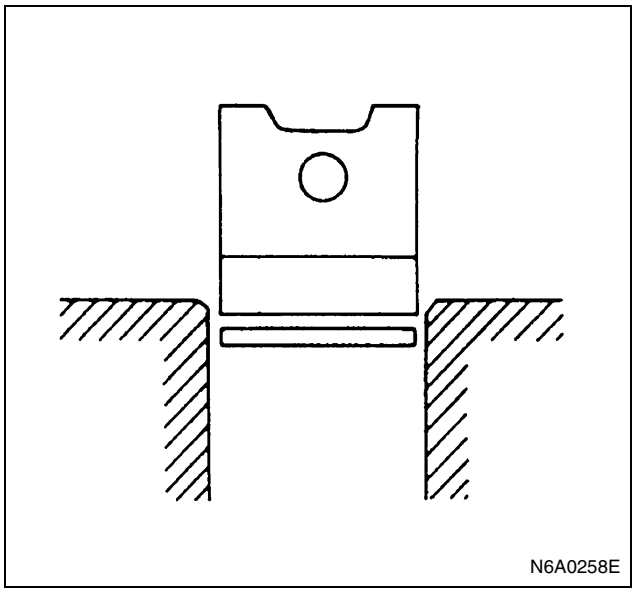
Piston Grade Selection and Cylinder Bore Measurement

Refer to the Section “CYLINDER BLOCK”, Item “Cylinder Liner Bore Measurement” for details on piston grade selection and cylinder liner bore measurement.

Piston Ring

Piston Ring Gap

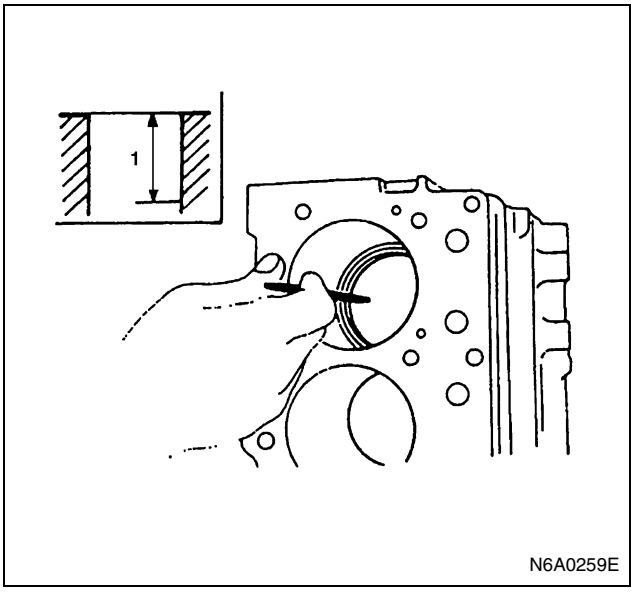
1. Insert the piston ring horizontally (in the position it would assume if it were installed to the piston) into the cylinder liner bore.



N6A0258E

2. Push the piston ring into the cylinder liner bore until it reaches the point (1) where the cylinder liner bore is the smallest.
   Do not allow the piston ring to slant to one side or the other. It must be perfectly horizontal.

Measuring Point	mm (in)
Approx. 150 (6)	



3. Use a feeler gauge to measure the piston ring gap. If the measured valve exceeds the specified limit, the piston ring must be replaced.

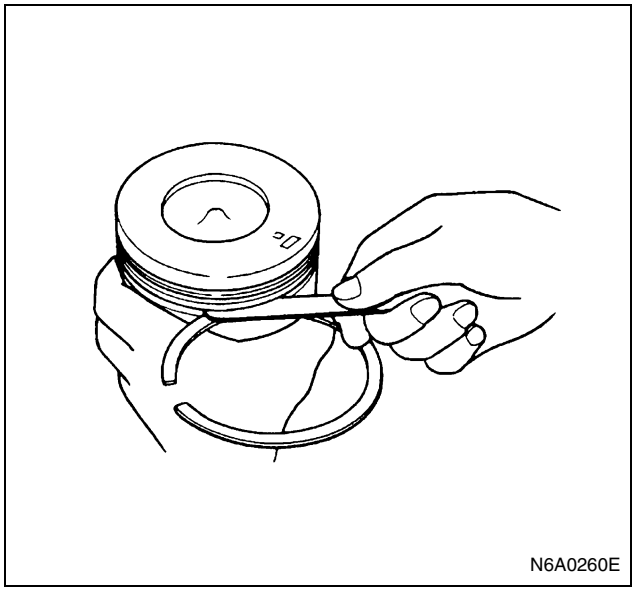
Piston Ring Gap / 4HF1 / 4HF1-2		mm (in)
	Standard	Limit
1st compression ring gap	0.24 — 0.39 (0.0094 — 0.0153)	1.50 (0.0591)
2nd compression ring gap	0.35 — 0.50 (0.0138 — 0.0197)	
Oil ring gap	0.02 — 0.40 (0.0008 — 0.0157)	

Piston Ring Gap / 4HG1 / 4HG1-T		mm (in)
	Standard	Limit
1st compression ring gap	0.24 — 0.39 (0.0094 — 0.0153)	1.50 (0.0591)
2nd compression ring gap	0.35 — 0.50 (0.0138 — 0.0197)	
Oil ring gap	0.15 — 0.35 (0.00591 — 0.0138)	

Piston Ring Gap / 4HE1-TC		mm (in)
	Standard	Limit
1st compression ring gap	0.24 — 0.40 (0.0094 — 0.0157)	1.50 (0.0591)
2nd and 3rd compression ring gap	0.30 — 0.450 (0.0118 — 0.0177)	
Oil ring gap	0.20 — 0.40 (0.0078 — 0.0157)	

Piston Ring and Piston Ring Groove Clearance

1. Use a feeler gauge to measure the clearance between the piston ring and the piston ring groove at several points around the piston.



Piston Ring and Piston Ring Groove Clearance / 4HF1, 4HF1-2, 4HG1, 4HG1-T		mm (in)
	Standard	Limit
1st Compression Ring	0.062 — 0.092 (0.0024 — 0.0036)	0.20 (0.0079)
2nd Compression Ring	0.04 — 0.08 (0.0015 — 0.0031)	0.15 (0.0059)
Oil ring gap	0.02 — 0.06 (0.0008 — 0.0024)	

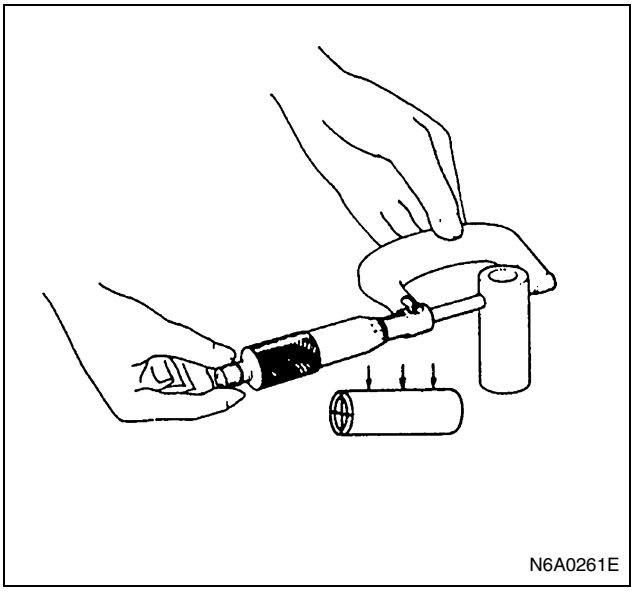
Groove Clearance / 4HE1-TC		mm (in)
	Standard	Limit
1st Compression Ring	0.09 — 0.13 (0.0035 — 0.0051)	0.20 (0.0078)
2nd and 3rd Compression Ring	0.09 — 0.13 (0.0035 — 0.0051)	
Oil ring gap	0.03 — 0.07 (0.0012 — 0.0028)	0.15 (0.0059)

2. Visually inspect the piston ring grooves. If a piston ring groove is damaged or distorted, the piston must be replaced.

Piston Pin

Piston Pin Diameter

Use a micrometer to measure the piston pin outside diameter at several points.
If the measured value is less than the specified limit, the piston pin must be replaced.



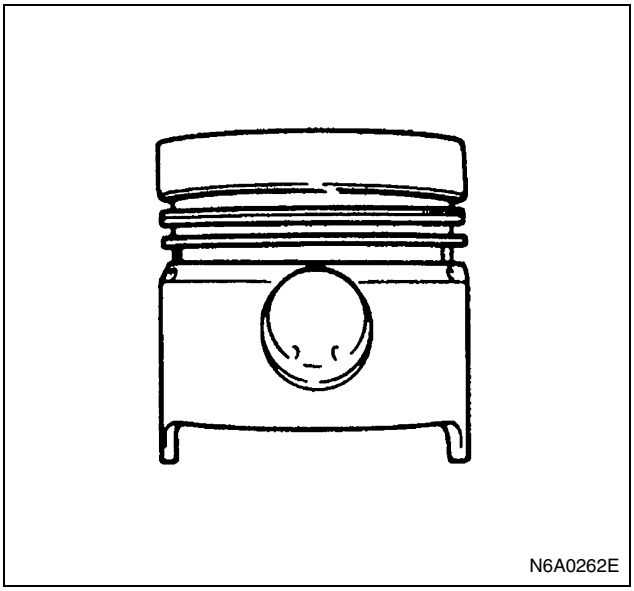
N6A0261E

Piston Pin Diameter		mm (in)
Engine model	Standard	Limit
Except 4HE1-TC	35.995 — 36.000 (1.4171 — 1.4173)	35.970 (1.4161)
4HE1-TC	39.995 — 40.000 (1.5746 — 1.5748)	39.970 (1.5736)

Piston Pin Hole and Piston Pin Clearance

Use an inside dial indicator to measure the piston pin hole (in the piston).

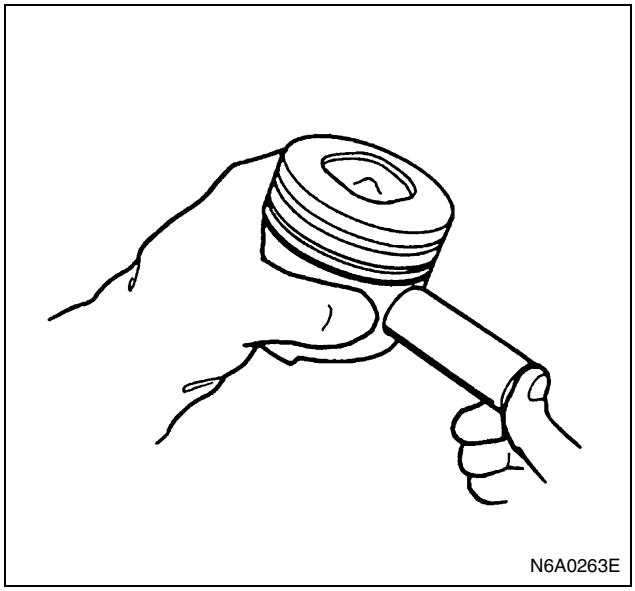
Piston Pin Hole and Piston Pin Clearance	mm (in)
Standard	Limit
0.004 — 0.017 (0.00016 — 0.00067)	0.04 (0.0016)



N6A0262E

If an inside dial indicator is not available, use the following procedure to check the piston pin clearance.

1. Use a piston heater to heat the piston to approximately 80 — 100°C (176 — 212°F)
2. Push strongly against the piston pin with your thumbs. The piston pin should move smoothly with little or no resistance.



N6A0263E

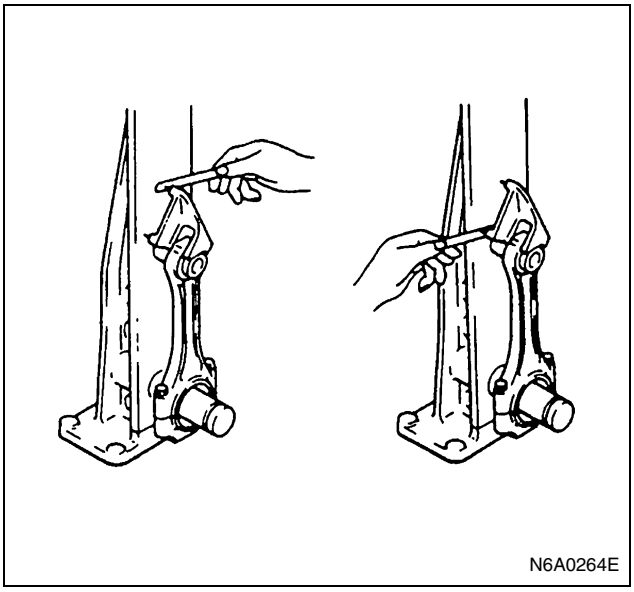
Connecting Rod

Connecting Rod Alignment

Use a connecting rod aligner to measure the distortion and the parallelism between the connecting rod big end hole and the connecting rod small end hole.

If either the measured distortion or parallelism exceeds the specified limit, the connecting rod must be replaced.

Connecting Rod Alignment		mm (in)
Per Length of 100 (3.94)		
	Standard	Limit
Distortion	0.05 (0.002) or less	0.20 (0.008)
Parallelism		



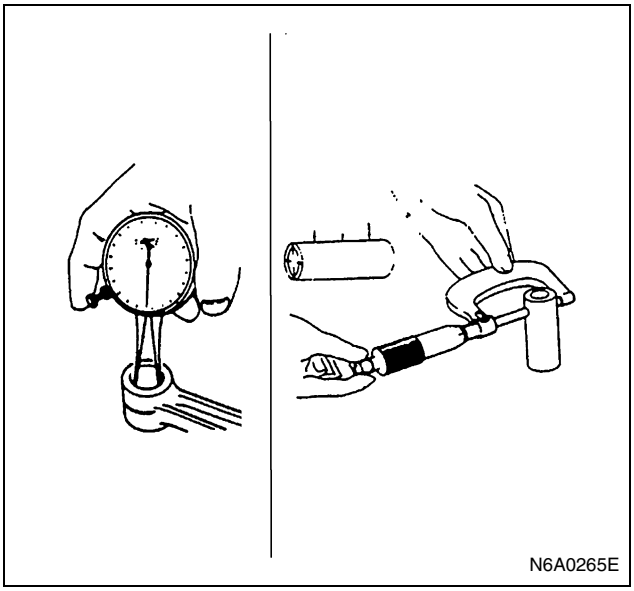
N6A0264E

Piston Pin and Connecting rod Small End Bushing Clearance

Use a caliper calibrator and a dial indicator to measure the clearance between the piston pin and connecting rod small end bushing.

If the clearance between the piston pin and the connecting rod small end bushing exceeds the specified limit, replace the piston pin and/or the connecting rod bushing.

Piston Pin and Connecting Rod Small End Bushing Clearance	mm (in)
Standard	Limit
0.012 — 0.027 (0.0005 — 0.0011)	0.05 (0.002)

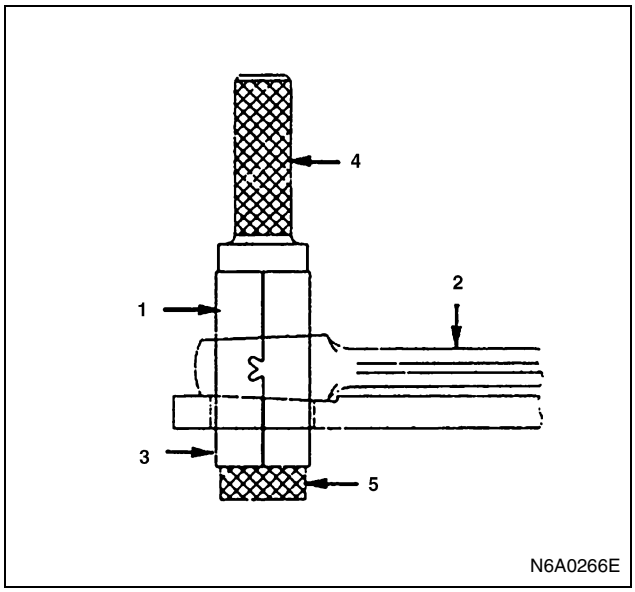


N6A0265E

Connecting Rod Bushing Replacement

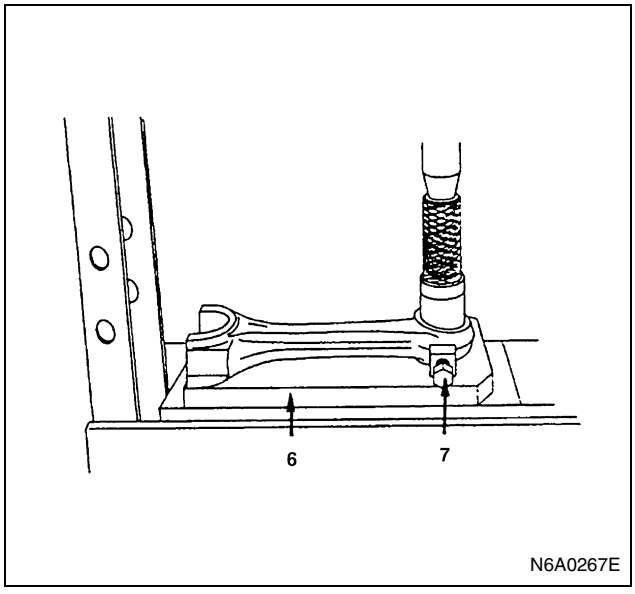
Connecting Rod Bushing Removal

1. Set the collar (1), the connecting rod (2), and the collar (3) to the setting bar (4).
   Connecting Rod Bushing Replacer: 5-8840-2340-0
2. Hand-tighten the nut (5) until there is no more gap.



N6A0266E

3. Set the connecting rod bushing replacer base (6) to the bench press.
4. Set the connecting rod to the connecting rod bushing replacer base.
5. Tighten the bolt (7).

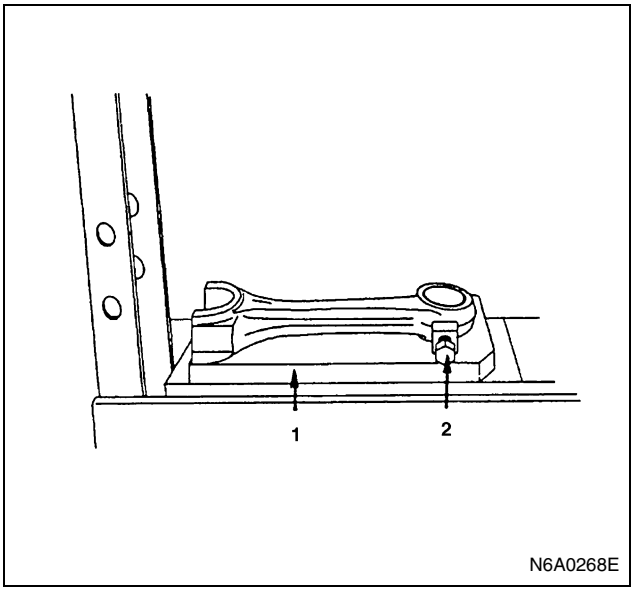


N6A0267E

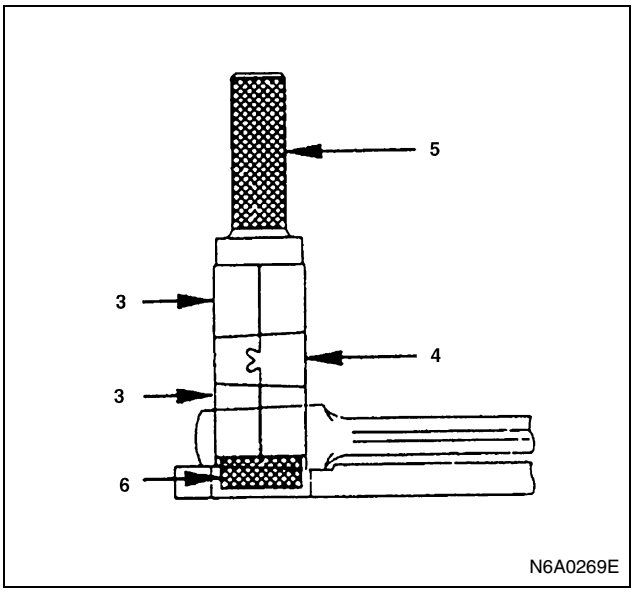
6. Use the bench press to force the bushing from the connecting rod.

Connecting Rod Bushing Installation

1. Set the connecting rod bushing replacer base (1) to the bench press.
   Connecting Rod Bushing Replacer: 5-8840-2340-0
2. Set the connecting rod to the connecting rod replacer base.
   The connecting rod must be perfectly horizontal.
3. Tighten the bolt (2) to hold the connecting rod small end in place.

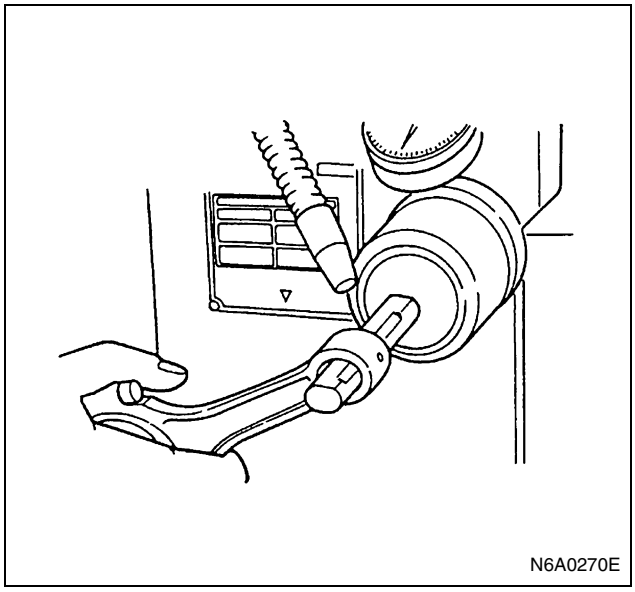


4. Install the two collars (3) and the new bushing (4) to the setting bar (5).
   Align the bushing clinch line and the collar setting marks.
   Tighten the nut (6).



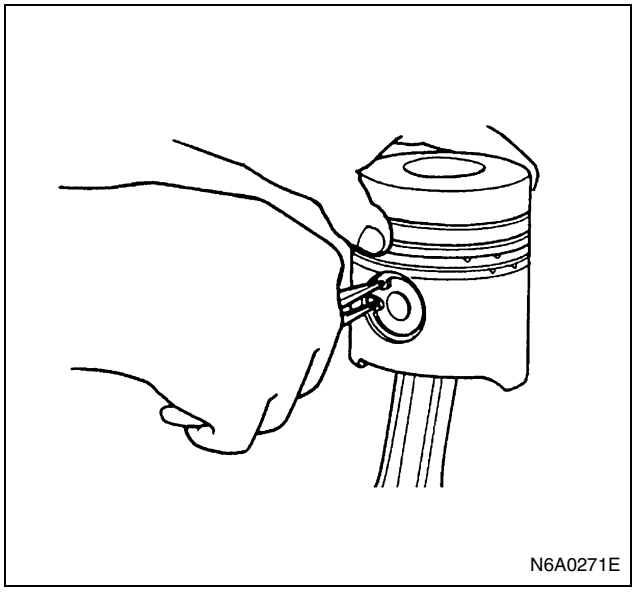
5. Use the bench press to press the new bushing into position inside the connecting rod.
   Check that the bushing oil holes and the connecting rod oil holes are aligned.
6. Use a pinhole grinder to finish the new bushing.

Connecting Rod Small End Bushing Inside Diameter	mm (in)
Except 4HE1-TC	36.012 — 36.022 (1.4178 — 1.4182)
4HE1-TC	40.012 — 40.022 (1.5753 — 1.5767)

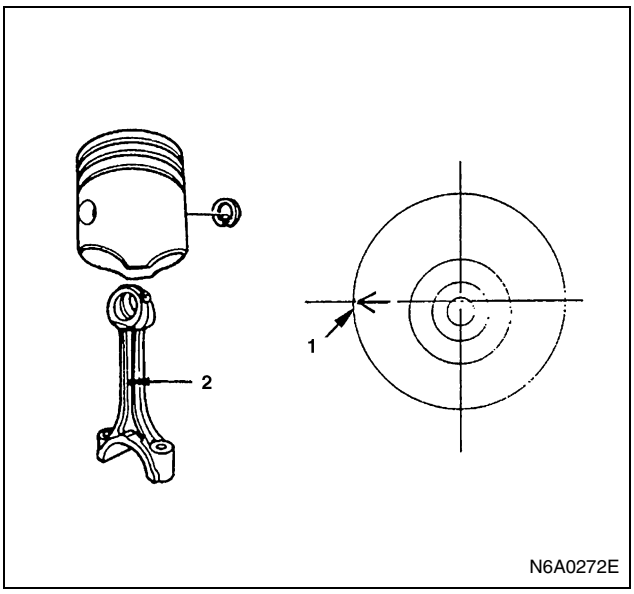


Reassembly

1. Piston
2. Piston Pin Snap Ring
   Use a pair of snap ring pliers to install the piston pin snap ring to the piston.



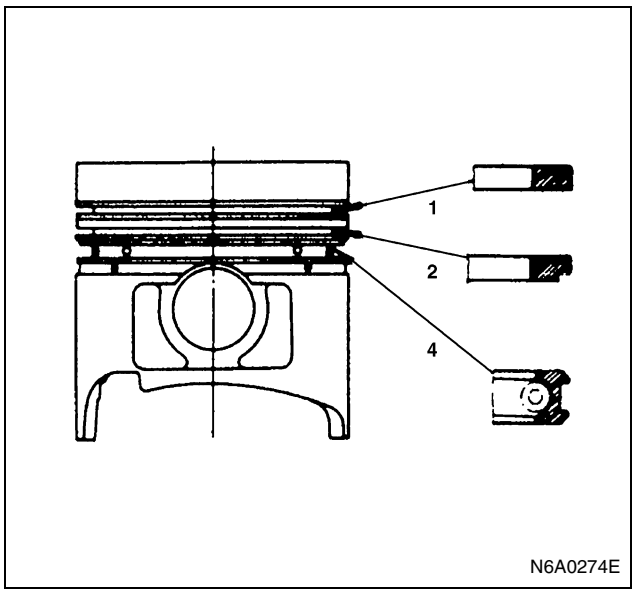
3. Connecting Rod
   1) Clamp the connecting rod in a vise.
      Take care not to damage the connecting rod.
   2) Install the connecting rod so that the piston head front mark (1) and the connecting rod forging mark (projecting) (2) are set in the same direction.



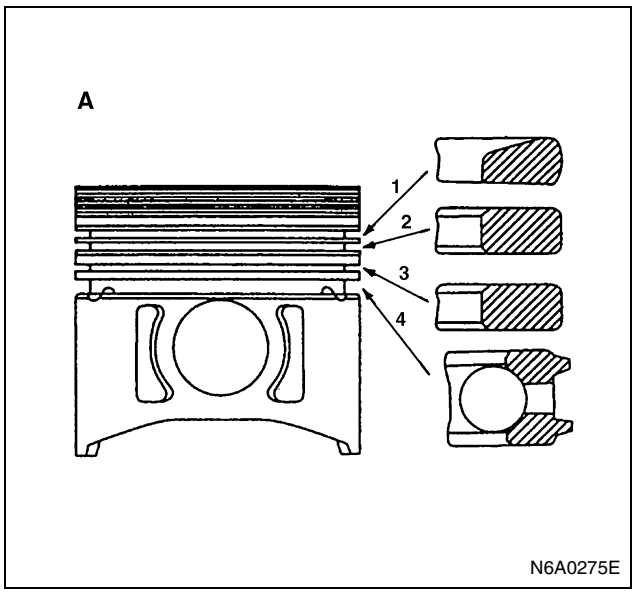
4. Piston Pin
   If could not be installed piston pin, it is recommended to remove it by following procedure.
   1) Use a piston heater to heat the piston to 80 — 100°C (176 — 212°F).

   2) Apply a coat of the engine oil to the piston pin.
   3) Use your fingers to force the piston pin into the piston until it makes contact with the snap ring.
   4) Check to see if the connecting rod moves smoothly on the piston pin.
5. Snap Ring
6. Piston Ring
   1) Use a piston ring replacer to install the three piston rings.

   Install the piston rings in the order shown in the illustration.



Legend
1. 1st compression ring
2. 2nd compression ring
4. Oil ring



Legend
A. For 4HE1-TC
1. 1st compression ring
2. 2nd compression ring
3. 3rd compression ring (For 4HE1-TC)
4. Oil ring

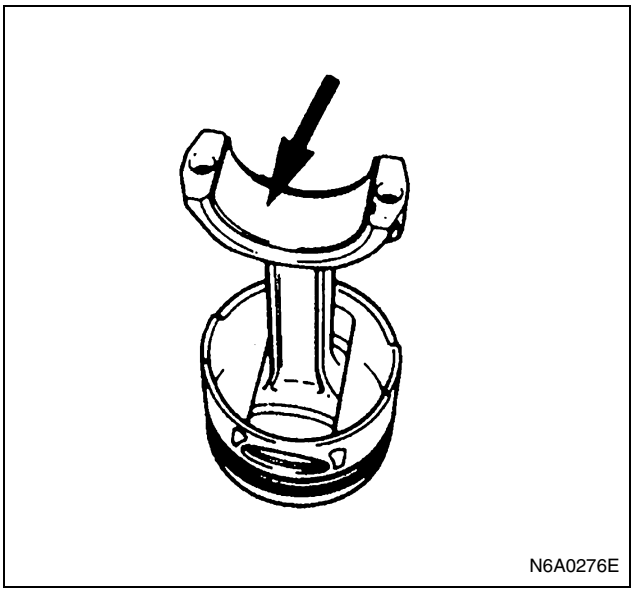
Notice:
Insert the expander coil into the oil ring groove so that there is no gap on either side of the expander coil before installing the oil ring.

Install the compression rings with the stamped side facing up.

   2) Apply engine oil to the piston ring surfaces.

3) Check to see if the piston rings rotate smoothly in the piston ring grooves.

7. Connecting Rod Bearing
Carefully wipe any oil or other foreign material from the connecting rod bearing back face and the connecting rod bearing fitting surface.

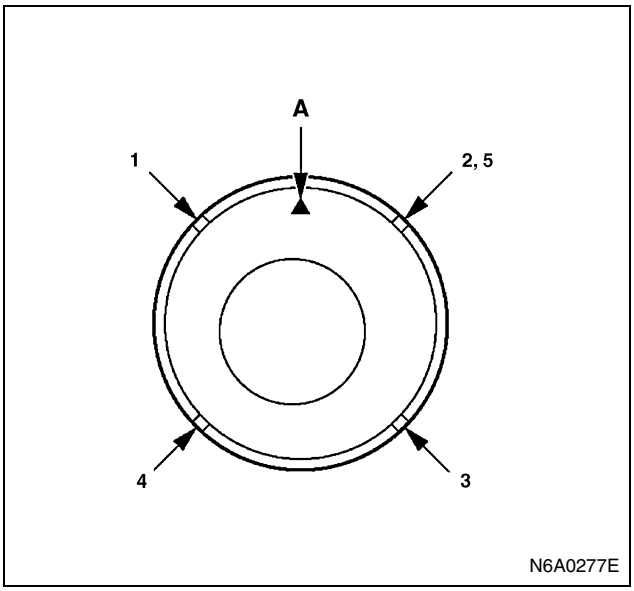


N6A0276E

8. Piston and Connecting Rod Assembly

Notice:
When installing new connecting rod and/or connecting rod bearings, refer to the selection table. Above works refer to “CRANKSHAFT” section in this manual.

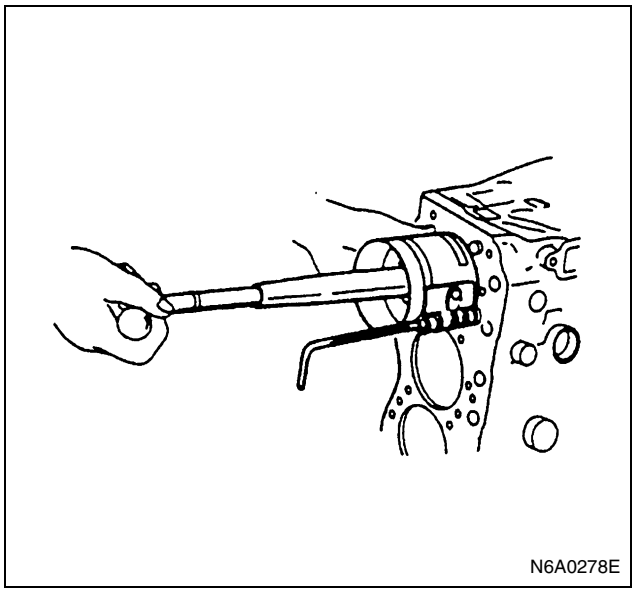
1) Apply a coat of the engine oil to the circumference of each piston ring and piston.
2) Position the piston ring gaps as shown in the illustration.



N6A0277E

Legend
A. Front mark
1. 1st compression ring
2. 2nd compression ring
3. 3rd compression ring (For 4HE1-TC only)
4. Oil ring
5. Coil expander

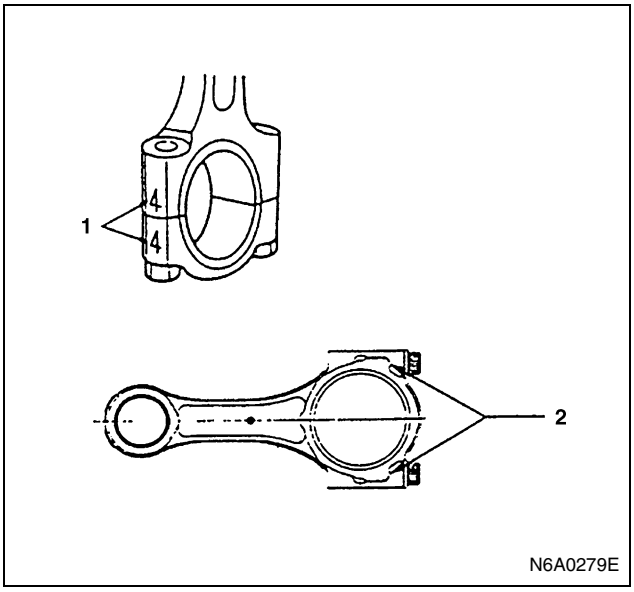
3) Apply a coat of molybdenum disulfide grease to the two piston skirts.
This will facilitate smooth break-in when the engine is first started after reassembly.
4) Apply a coat of the engine oil to the upper bearing surfaces.
5) Apply a coat of the engine oil to the cylinder wall.
6) Position the piston head front mark so that it is facing the front of the engine.
7) Use the piston ring compressor to compress the piston rings.
Piston Ring Compressor: 5-8840-9018-0
8) Use a hammer grip to push the piston in until the connecting rod makes contact with the crankpin.
At the same time, rotate the crankshaft until the crankpin is at bottom dead center.



N6A0278E

Caution:
Do not bend or damage the oiling jet.

9. Connecting Rod Cap
1) Install the connecting rod bearing caps.
2) Align the bearing cap cylinder number marks (1) and the connecting rod cylinder number marks (1).
3) Apply a coat of molybdenum disulfide grease to the threads and setting faces of each connecting rod cap bolts.

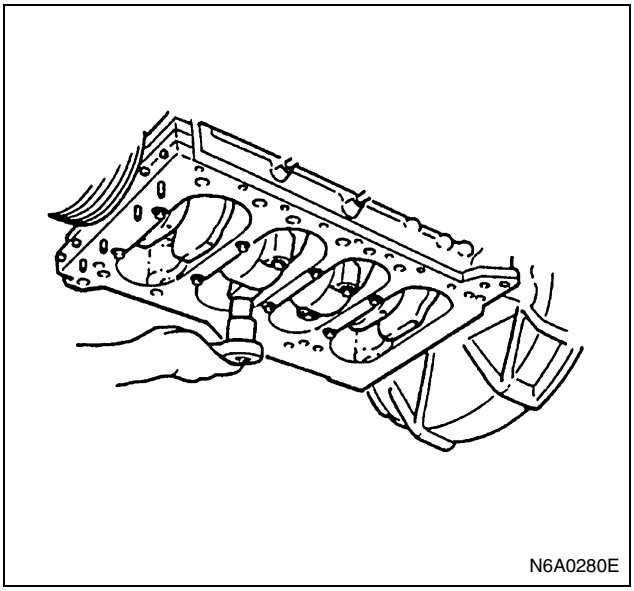


Legend
1. Alignment
2. Boss discriminating the front from the rear

4) Tighten the connecting rod caps to the specified torque.

Tighten:
Connecting rod bearing cap bolt to
- 1st step: 39 N·m (4.0 kg·m / 29 lb·ft)
- 2nd step: 60°
- 3rd step: 30°

Angle gauge: 5-8840-0266-0



10. Oil Pump Strainer
11. Oil Pan

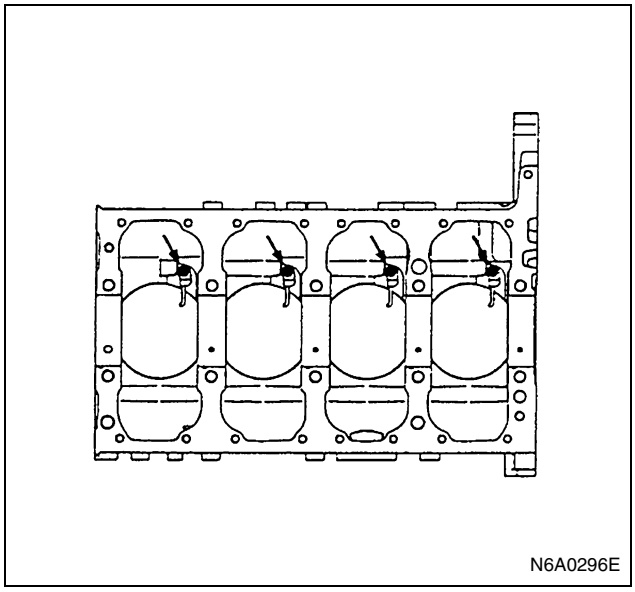
53. Crankshaft Bearing Upper
    Above works refer to “CRANKSHAFT” section in this manual.
54. Piston Oiling Jet
    Loosen the check valves to remove both the check valves and the oiling jets.
    Take care not to bend or damage the oiling jets.



55. Cylinder Block

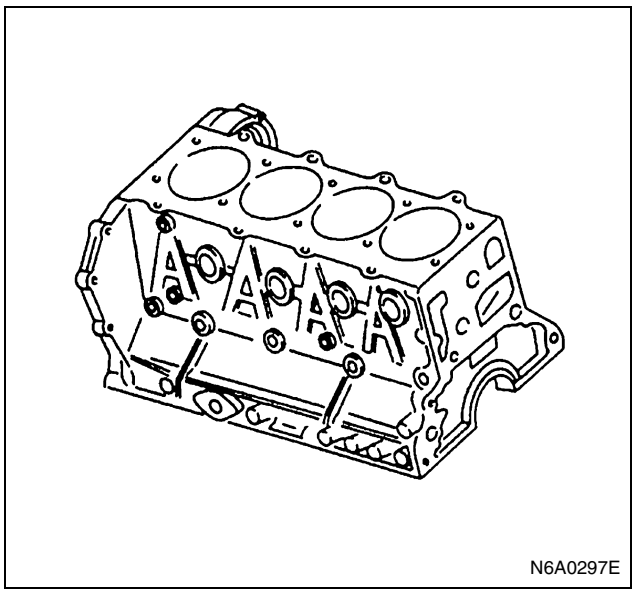
Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

1. Remove the gasket and any other material adhering to the upper surface of the cylinder block.
   Be very careful not to allow any material to accidentally drop into the cylinder block.
   Be very careful not to scratch the cylinder block.
2. Carefully remove the oil pump, rear oil seal, and oil pan installation surface seal.
3. Wipe the cylinder block clean.

Cylinder Body Upper Face Warpage

1. Remove the cylinder body dowel.
2. Remove the cylinder liner.
   Refer to “Cylinder Liner Replacement”.

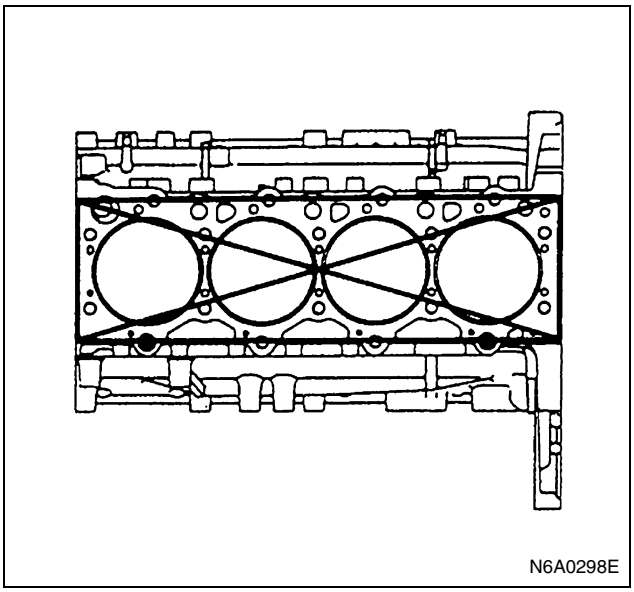


3. Use a straight edge and a feeler gauge to measure the four sides and the two diagonals of the cylinder body upper face.
4. If the measured values exceed the specified limit, the cylinder body must be replaced.

Caution:
Do not regrind the cylinder body upper face.

Cylinder Body Upper Face Warpage	mm (in)
Standard	Limit
0.05 (0.002) or less	0.20(0.008)

Cylinder Body Height (H) (Reference)	mm (in)
Standard	
279.965 — 280.035 (11.022 — 11.025)	



N6A0298E

5. Reinstall the cylinder liner.
   Refer to the “Cylinder Body Bore Measurement”.
6. Reinstall the cylinder body dowel.

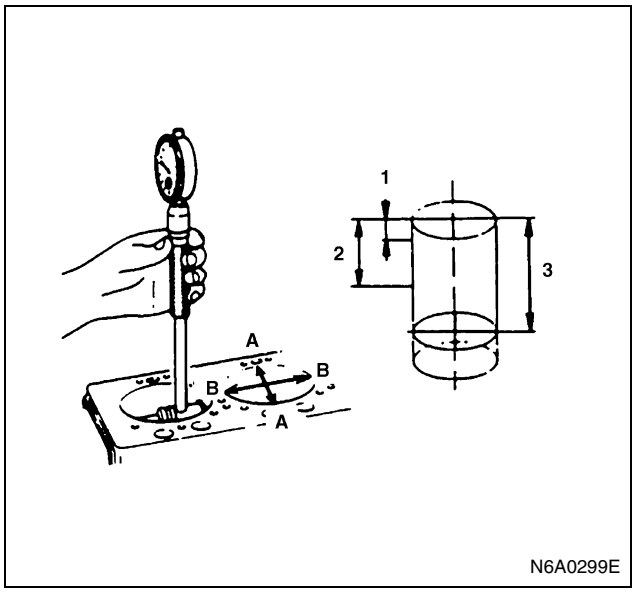
Cylinder Liner Bore Measurement

Use a cylinder indicator to measure the cylinder bore at measuring points (1), (2) and (3) in the A — A and B — B directions of the crankshaft.
Measuring points:

1. 20 mm (0.79 in)
2. 90 mm (3.54 in)
3. 160 mm (6.30 in)

If the measured value exceeds the specified limit, the cylinder liner must be replaced.

Cylinder Liner Bore		mm (in)
	Standard	Limit
4HF1 4HF1-2	112.021 — 112.050 (4.4103 — 4.4114)	112.20 (4.417)
4HG1 4HG1-T	115.021 — 115.050 (4.5284 — 4.5295)	115.20 (4.535)
4HE1-TC	110.041 — 110.080 (4.3323 — 4.3338)	110.23 (4.340)



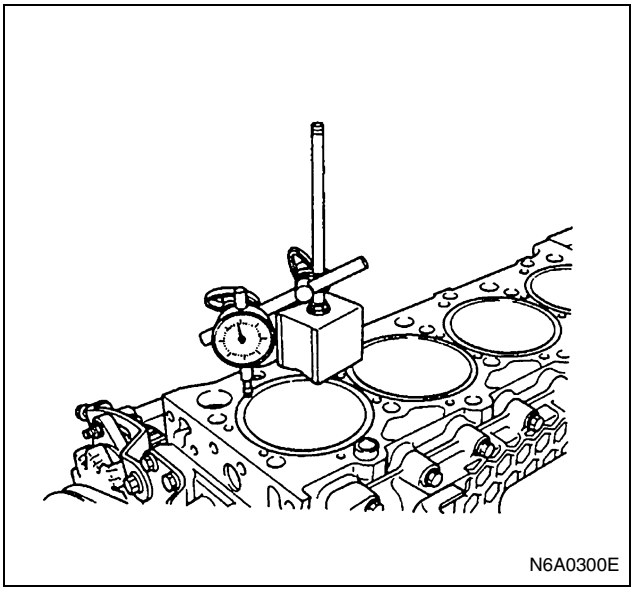
N6A0299E

Notice:
The inside of the dry type cylinder liner is made of thin cast iron. It cannot be rebored or honed.
If the inside of the cylinder liner is scored or scorched, the cylinder liner must be replaced.

Cylinder Liner Projection Inspection
Use a dial gauge to measure the projection of each cylinder.

Cylinder Liner Projection	mm (in)
Standard	
0.09 — 0.14 (0.0035 — 0.0055)	

The difference in the cylinder liner projection height between any two adjacent cylinders must not exceed 0.03 mm (0.0012 in).



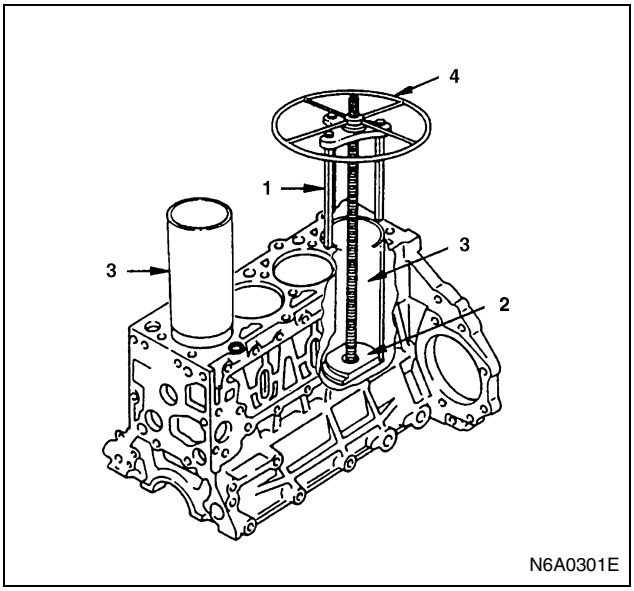
N6A0300E

Cylinder Liner Replacement

Cylinder Liner Removal

If could not be removed cylinder liner, it is recommended to remove it by following procedure.

1. Set the cylinder liner remover (1) to the cylinder liner (3).
2. Check to see if the remover shaft ankle (2) is firmly gripping the cylinder liner bottom edge.
3. Slowly turn the remover shaft handle (4) clockwise to pull the cylinder liner free.
   Cylinder Liner Remover:
   9-8523-1169-0
   Cylinder Liner Remover Ankle:
   5-8840-2220-0
   Ankle:
   5-8840-2397-0 (4HG1)

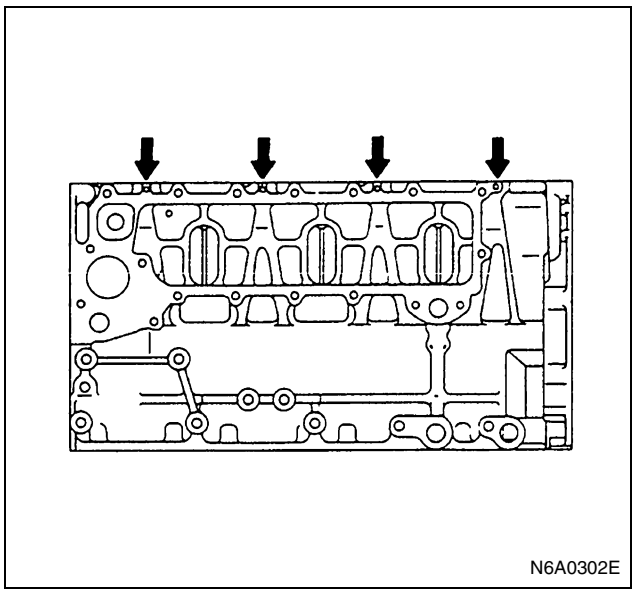


N6A0301E

Caution:
Take care not to damage the cylinder body upper face during the cylinder liner removal procedure.

Cylinder Liner Grade Selection and Standard Fitting Interference

Accurately measured fitting interference and proper cylinder liner grade selection are extremely important.
If the cylinder liner fitting interference is too small, engine cooling efficiency will be adversely affected.
If the cylinder liner fitting interference is too large, it will be difficult to insert the cylinder liner into the cylinder body.
A mark was stamped on the left side of the cylinder block during production to indicate the correct liner. The liner grade (i.e.1, 2, 3) is indicated in metal stamp.



N6A0302E

Cylinder Liner Grade

- 4HF1 / 4HF1-2

Line Grade	Cylinder Bore Diameter mm (in.)	Service Grade	Liner Outside Diameter mm (in.)
1	115.001 — 115.010 (4.5276 — 4.5279)	1X	114.991 — 115.000 (4.5272 — 4.5276)
2	115.011 — 115.020 (4.5280 — 4.5283)	3X	115.001 — 115.010 (4.5276 — 4.5279)
3	115.021 — 115.030 (4.5284 — 4.5287)		

• 4HG1 / 4HG1-T

Line Grade	Cylinder Bore Diameter mm (in.)	Service Grade	Liner Outside Diameter mm (in.)
1	118.001 — 118.010 (4.6457 — 4.6461)	1X	117.991 — 118.000 (4.6453 — 4.6457)
2	118.011 — 118.020 (4.6461 — 4.6464)	3X	118.001 — 118.010 (4.6457 — 4.6461)
3	118.021 — 118.030 (4.6465 — 4.6468)		

• 4HE1-TC

Line Grade	Cylinder Bore Diameter mm (in.)	Service Grade	Liner Outside Diameter mm (in.)
1	115.001 — 115.010 (4.5276 — 4.5279)	1X	115.021 — 115.030 (4.5284 — 4.5287)
2	115.011 — 115.020 (4.5280 — 4.5283)	3X	115.031 — 115.040 (4.5289 — 4.5291)
3	115.021 — 115.030 (4.5284 — 4.5287)		

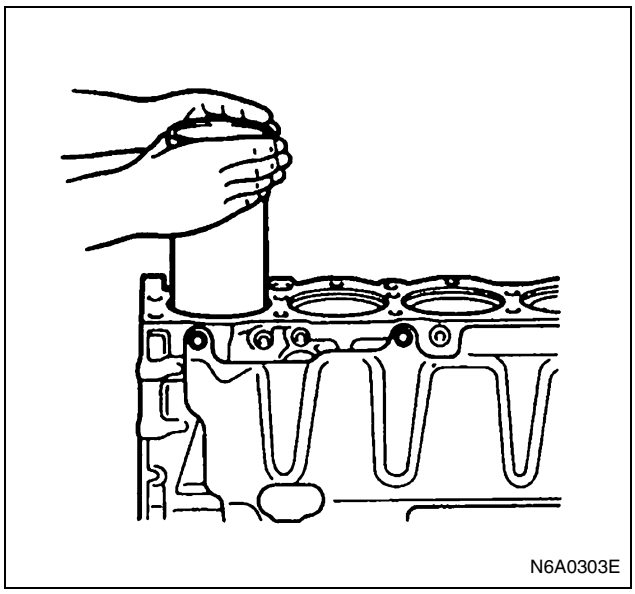
The cylinder liner grade is stamped on the outside of the cylinder liner.

Cylinder Liner Installation (For 4HF1, 4HF1-2, 4HG1 and 4HG1-T Engine)

1. Use new kerosene or diesel oil to thoroughly clean the cylinder liners and bores.
2. Use compressed air to blow dry the cylinder liner and bore surfaces.

Caution:
All foreign material must be carefully removed from the cylinder liner and the cylinder bore before installation.

3. Install the cylinder liner perpendicularly to the cylinder bore. Do not give any excessive force such as knocking while inserting cylinder liner into the cylinder bore.



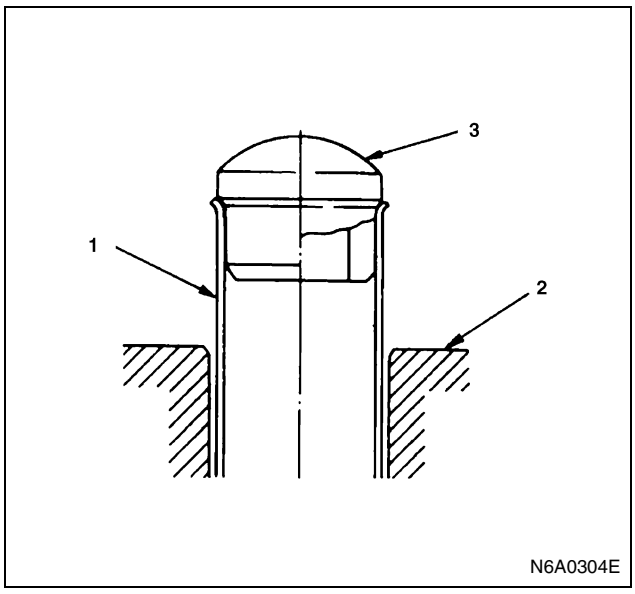
N6A0303E

Cylinder Liner Installation (For 4HE1-TC Engine)

1. Cylinder Liner Installation Using The Special Tool
   - Use new kerosene or diesel oil to thoroughly clean the cylinder liners and bores.
   - Use compressed air to blow-dry the cylinder liner and bore surfaces.

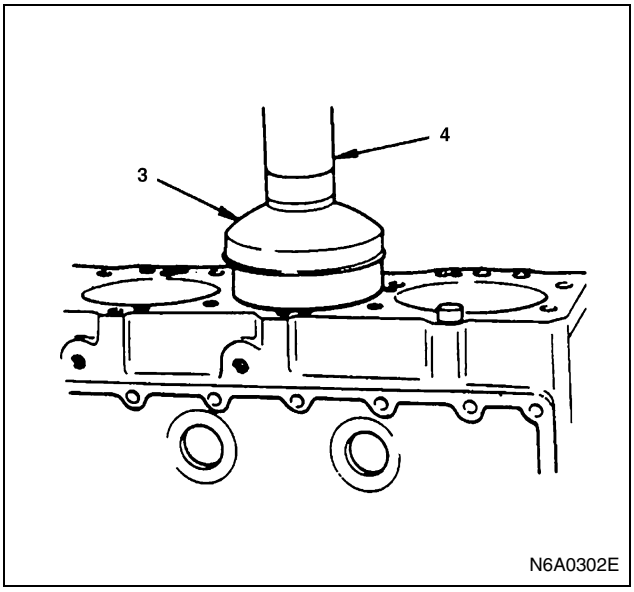
Caution:
All foreign material must be carefully removed from the cylinder liner and the cylinder bore before installation.

- Insert the cylinder liner (1) into the cylinder body (2) from the top of the cylinder body.
- Set the cylinder liner installer (3) to the top of the cylinder liner.
  Cylinder Liner Installer: 5-8840-2337-0



N6A0304E

- (3) is directly beneath the bench press shaft center (4).



Caution:
Check that the cylinder liner is set perpendicular to the bench press and that there is no wobble.

- Use the bench press to apply a seating force of 4,900 N (500 kg / 1,102.5 lb) to the cylinder liner.
- Apply a force of 24,500 N (2,500 kg / 5,512.5 lb) to fully seat the cylinder liner.
- After installing the cylinder liner, measure the cylinder liner projection.
  Refer to “Cylinder Liner Projection Inspection”.

2. Cylinder Liner Installation Using Dry Ice
   If the cylinder liner is a chrome plated dry type, it is advisable to use dry ice during the installation procedure.
   Cooling the cylinder liner with dry ice will cause the cylinder liner to contract, thus making installation easier.

Caution:
It is important that the cylinder liner be inserted to the cylinder body immediately after it has been cooled.

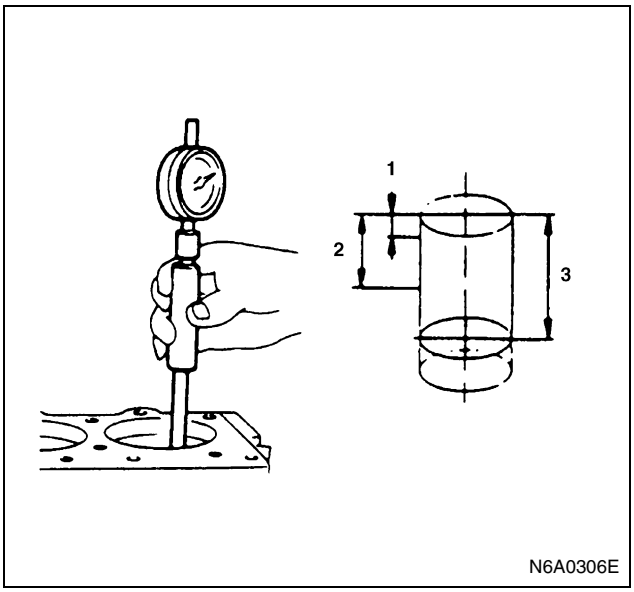
WARNING:
DRY ICE MUST BE USED WITH GREAT CARE. CARELESS HANDLING OF DRY ICE CAN RESULT IN SEVERE FROSTBITE.

Piston Grade Selection

Measure the cylinder liner bore after installing the cylinder liner. Then select the appropriate piston grade for the installed cylinder liner.

1. Measure the cylinder liner bore.
   Refer to the “Cylinder Liner Bore Measurement”.
   Measuring Point (1) 20 mm (0.79 in)
   Measuring Point (2) 90 mm (3.54 in)
   Measuring Point (3) 160 mm (6.30 in)

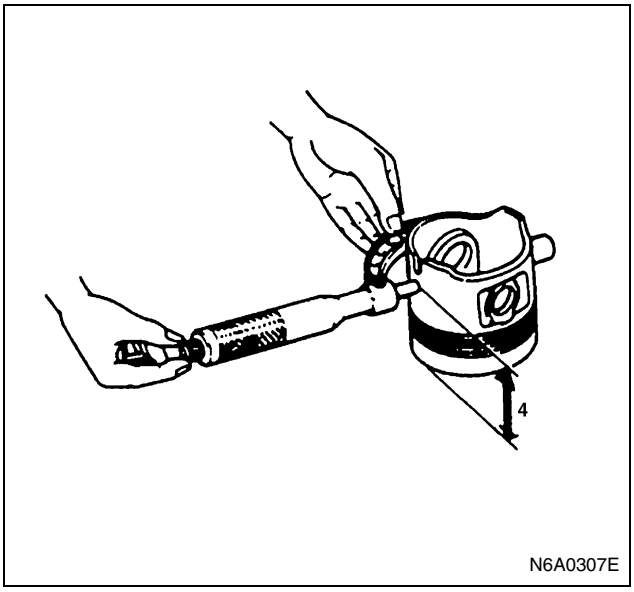
Cylinder Liner Bore		mm (in)
	Standard	Limit
4HF1 4HF1-2	112.021 — 112.050 (4.4103 — 4.4114)	112.20 (4.417)
4HG1 4HG1-T	115.021 — 115.050 (4.5284 — 4.5295)	115.20 (4.535)
4HE1-TC	110.041 — 110.080 (4.3323 — 4.3338)	110.23 (4.340)



Caution:
It is most important that the correct piston grade be used. Failure to select the correct piston grade will result in engine failure. Always measure the cylinder bore and select the correct piston grade.

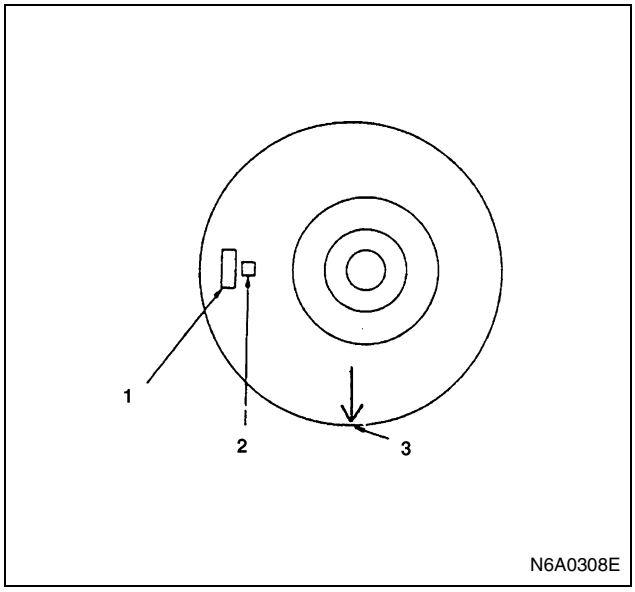
2. Measure the piston outside diameter (Reference).
   Piston Measuring Point (4): 82 mm (3.23 in)

Cylinder Liner and Piston Clearance mm (in)
4HF1 / 4HF1-2: 0.081 — 0.113 (0.0032 — 0.0044)
4HG1 / 4HG1-T: 0.081 — 0.116 (0.0032 — 0.0046)
4HE1-TC: 0.091 — 0.131 (0.0036 — 0.0052)



The piston grade (i.e. A, B, C) is indicated in metal stamp on the piston upper face.

Piston Grade			
Engine Model	Cylinder Liner Bore Diameter mm (in)	Piston Service Grade	Piston Outside Diameter mm (in)
4HF1 4HF1-2	112.041 — 112.060 (4.4111 — 4.4118)	—	111.944 — 111.959 (4.4072 — 4.4078)
4HG1 4HG1-T	115.041 — 115.060 (4.5292 — 4.5299)	—	114.944 — 114.959 (4.5253 — 4.5259)
4HE1-TC	110.066 — 110.075 (4.3333 — 4.3337)	AX	109.944 — 109.959 (4.3285 — 4.3291)
	110.076 — 110.085 (4.3337 — 4.3340)	CX	109.960 — 109.975 (4.3291 — 4.3297)



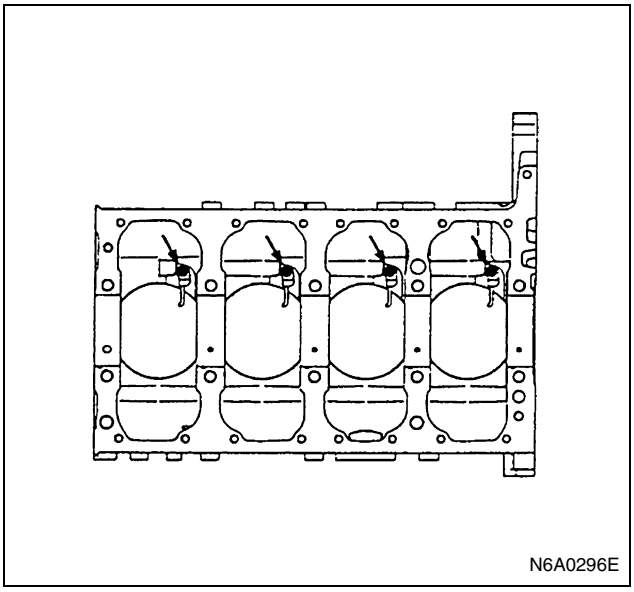
Legend
1. Part No.
2. Grade
3. Front mark

Caution:
Cylinder liner kit clearances are preset. However, the cylinder liner installation procedure may result in slight decreases in cylinder liner clearances. Always measure the cylinder liner clearance after installation to be sure that it is correct.

Reassembly

1. Cylinder Block
   Use compressed air to thoroughly clean the inside and outside surfaces of the cylinder body, the oil holes, and the water jackets.
2. Piston Oiling Jet
   1) Install the oiling jets together with the check valves. Take care not to damage the oiling jet nozzles.
   2) Tighten the check valves and oiling jets to the specified torque.

Tighten:
Check valve and oiling jet to 21 N·m (2.1 kg·m / 15 lb·ft)

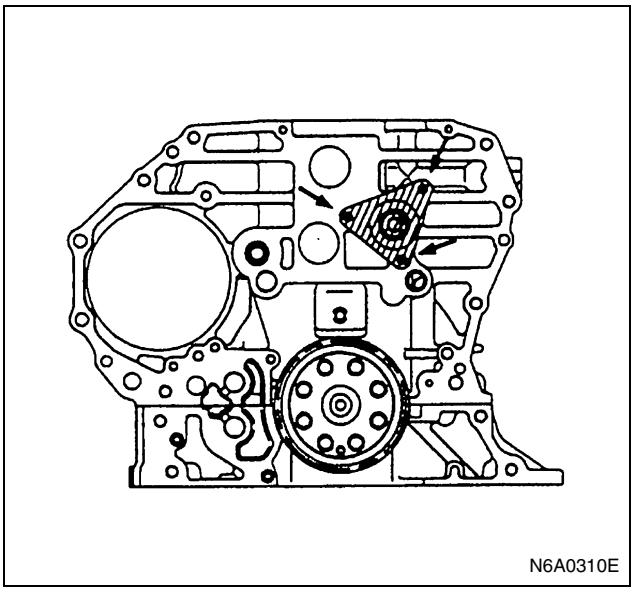


N6A0296E

3. Crankshaft Bearing Upper
4. Thrust Bearing Upper
5. Crankshaft Assembly
6. Crankshaft Bearing Lower
7. Thrust Bearing Lower
8. Crankcase
   Above works refer to “CRANKSHAFT” section in this manual.
9. Piston and Connecting Rod Assembly
10. Connecting Rod Lower Bearing
11. Connecting Rod Cap
    Above works refer to “PISTON AND CONNECTING ROD” section in this manual.
12. Oil Pump Assembly
13. Idle Gear B Shaft

Tighten:
Idle gear B shaft bolt to 31 N·m (3.2 kg·m / 23 lb·ft)

Apply the engine oil to the idle gear shaft after installation.

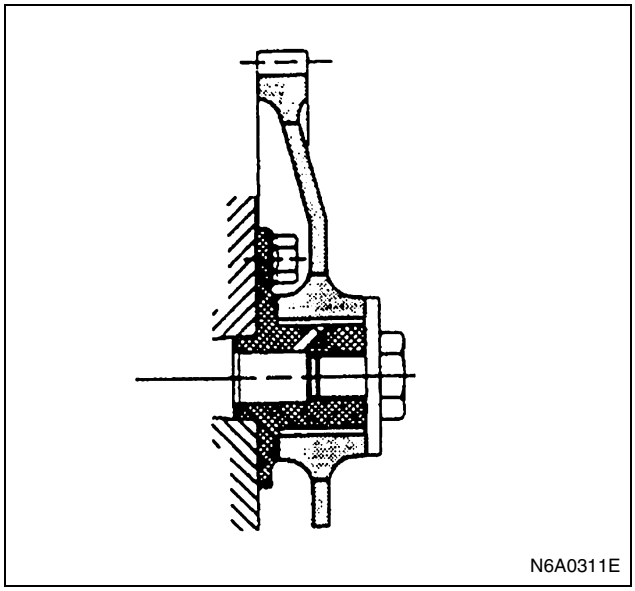


N6A0310E

14. Idle Gear B

The face of the idle gear B with longer boss should be positioned toward the rear side shown in the illustration.

Tighten:
Idle gear B bolt to 110 N·m (11.2 kg·m / 81 lb·ft)

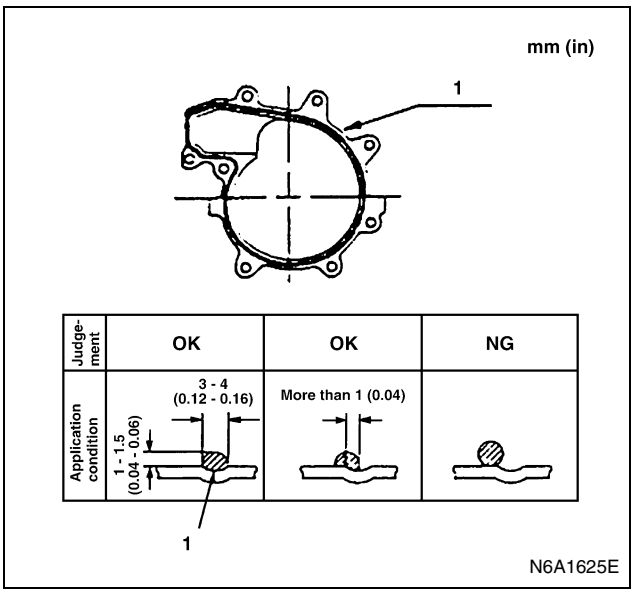


N6A0311E

15. Idle Gear A
16. Flywheel Housing
17. Power Steering Pump Idle Gear
18. Power Steering Pump Idle Gear Cover
    Above works refer to “OIL PUMP” section in this manual.
19. Oil Thermo Valve
20. Front Retainer
    Above works refer to “CRANKSHAFT” section in this manual.
21. Water Pump Assembly
    1) Apply 3 — 4 mm (0.12 — 0.16 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the water pump fitting surface.
    2) Install the water pump to the front retainer.

Tighten:
Water pump bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

- Install the water pump within 7 minutes after application of liquid gasket.
- For the dislocation of liquid gasket, refer to the illustration.

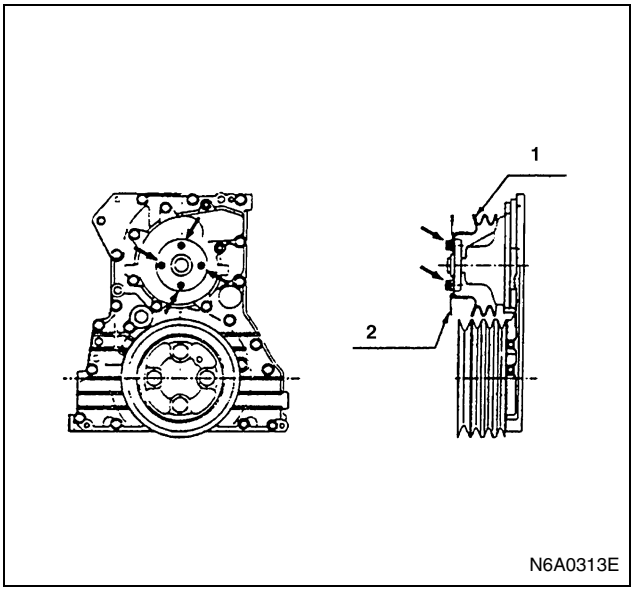


Legend
1. Liquid gasket

Caution:
The water pump clamping bolt is also used to tighten the front retainer. So, install the water pump before liquid gasket gets dry immediately after installation of the front retainer.

22. Water Pump Pulley

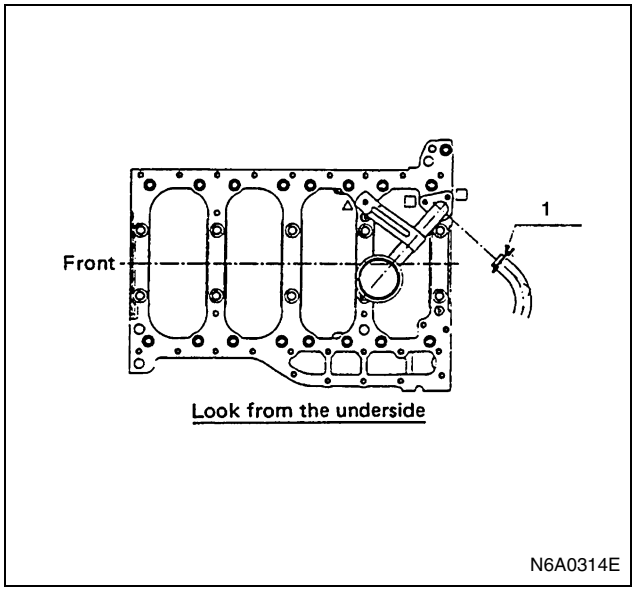
Tighten:
Water pump pulley bolt to 24 N·m (2.4 kg·m / 17 lb·ft)



Legend
1. Pulley
2. Set plate

23. Oil Pump Strainer
    Install the O-ring (1) to the oil pump strainer pipe and install the oil pump strainer to the cylinder body shown in the illustration.

Tighten:
Oil pump strainer bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

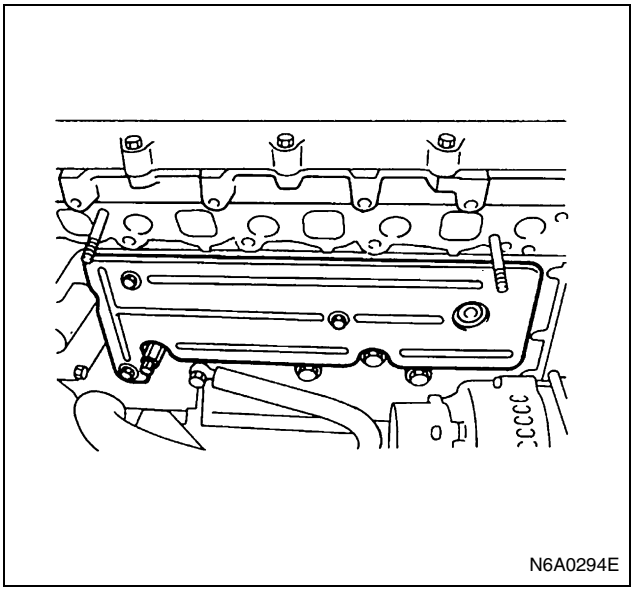


24. Oil Pan
    Above works refer to “OIL PAN” section in this manual.
25. Spacer Rubber

Tighten:
Spacer rubber bolt to 76 N·m (7.7 kg·m / 56 lb·ft)

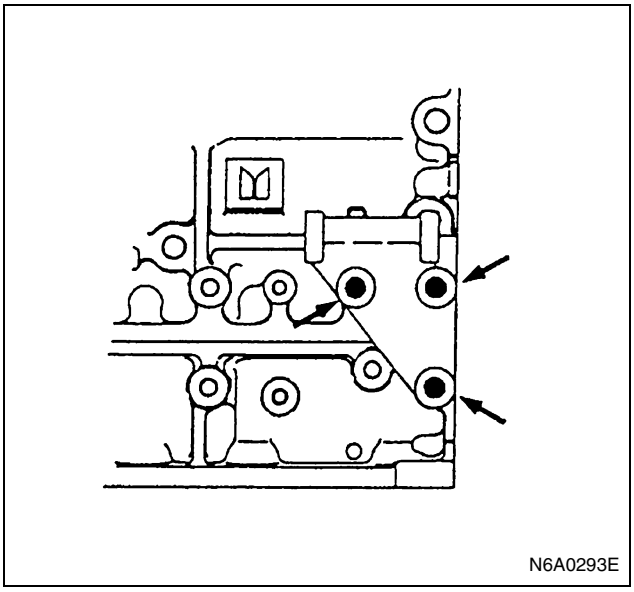
26. Crankshaft Rear Slinger
27. Crankshaft Rear Oil Seal
28. Flywheel Assembly
29. Crankshaft Front Slinger
30. Crankshaft Front Oil Seal
31. Crankshaft Damper Pulley
    Above works refer to “CRANKSHAFT” section in this manual.
32. Cover

Tighten:
Cover Bolt to 13 N·m (1.3 kg·m / 9 lb·ft)



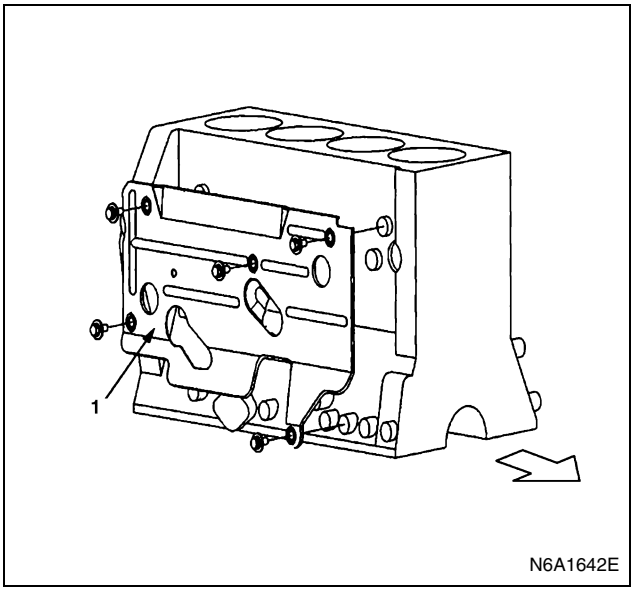
N6A0294E

4HE1-TC
4HE1-TC engines use a larger rubber spacer than other engines.



N6A0293E

34. Fan Belt Adjust Plate
    Install the adjust plate and temporarily tighten the adjust plate bolt.

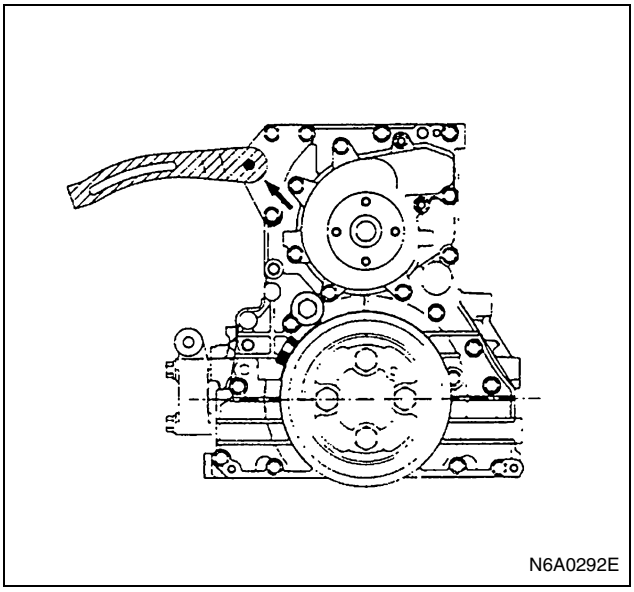


N6A1642E

Legend
1. Cover

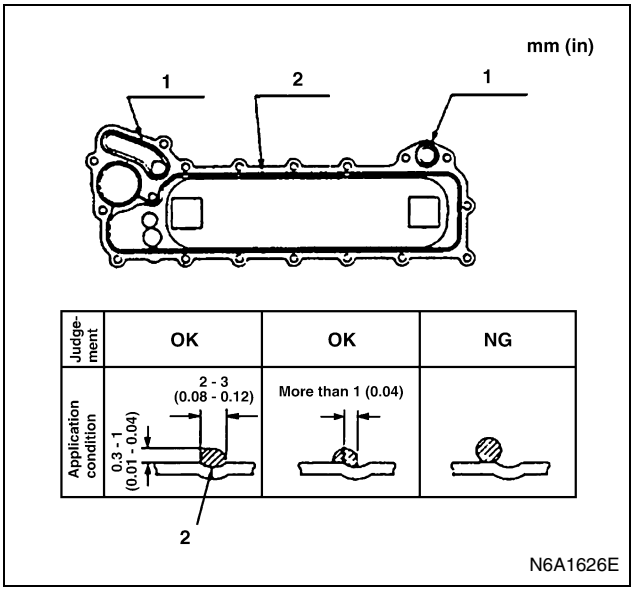
33. Generator Bracket

Tighten:
Generator bracket bolt to 48 N·m (4.9 kg·m / 35 lb·ft)



N6A0292E

35. Oil Cooler Assembly
    1) Apply 2 — 3 mm (0.08 — 0.12 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the oil cooler fitting surface.
    2) Apply a coat of engine oil to the O-rings (2 pieces) and install the O-rings to the oil cooler.



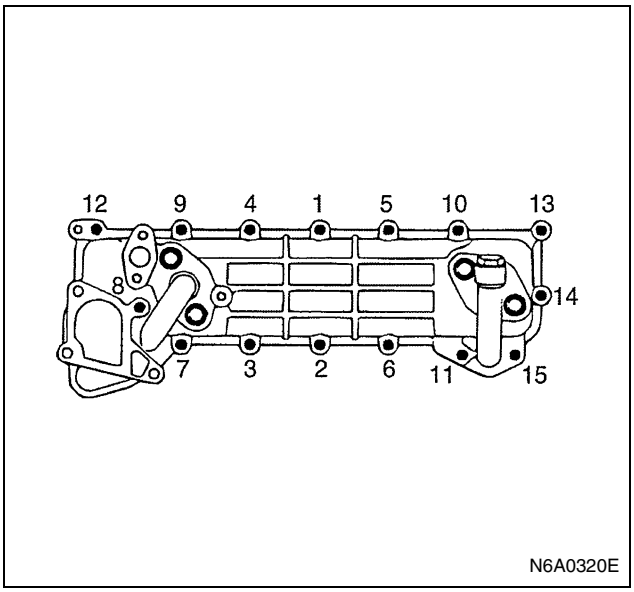
Legend
1. O-ring
2. Liquid gasket

Notice:
Take care that the O-ring is not smeared with liquid gasket.

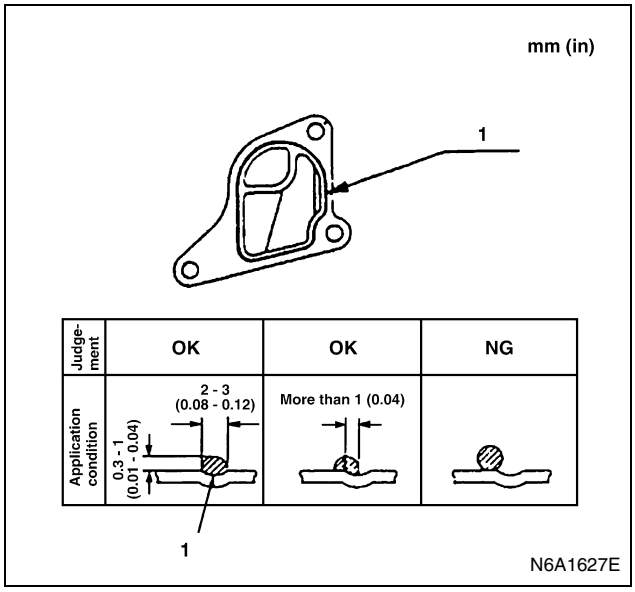
- Install it within 7 minutes after application of liquid gasket.
- For the dislocation of liquid gasket, refer to the illustration.

3) Tighten the oil cooler bolts and nut to the specified torque a little at a time in the sequence shown in the illustration.

Tighten:
Oil cooler bolt and nut to 24 N·m (2.4 kg·m / 17 lb·ft)



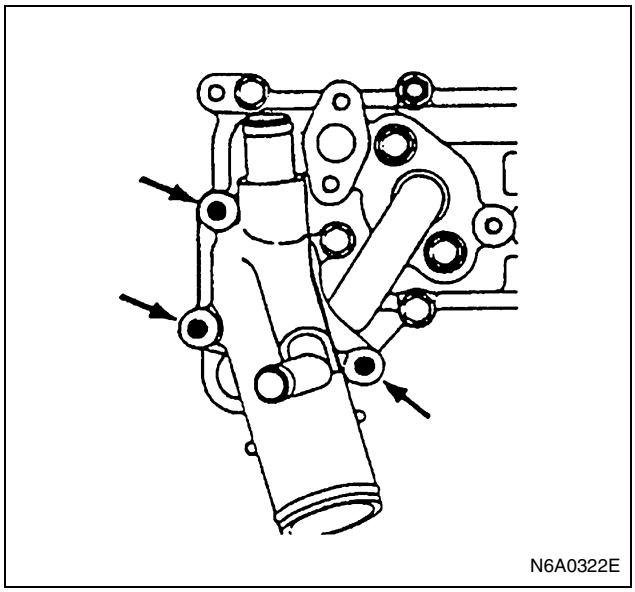
36. Water Suction Pipe
    1) Apply 2 — 3 mm (0.08 — 0.12 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the groove of the water suction pipe fitting surface.
    2) Install the water suction pipe to the oil cooler.
    - For the dislocation of liquid gasket, refer to the illustration.



Legend
1. Liquid gasket

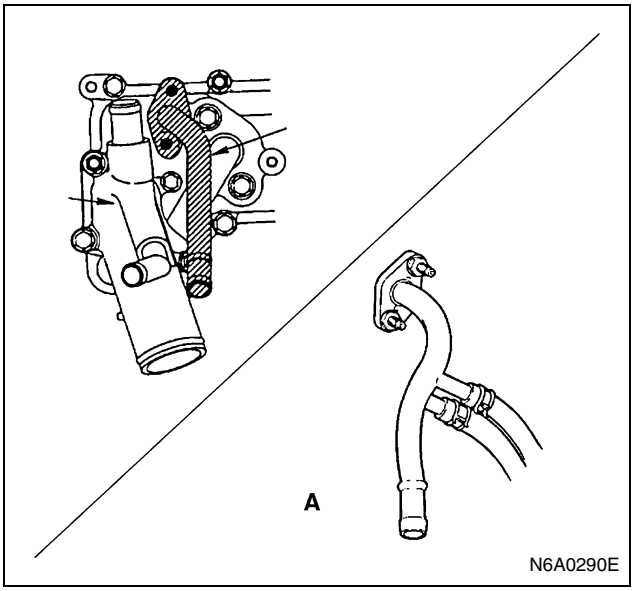
Tighten:
Water suction pipe bolt and nuts to 24 N·m (2.4 kg·m / 17 lb·ft)

Notice:
Install the water suction pipe immediately after the installation of the oil cooler.



37. Heater Pipe
    1) Install the O-ring to the heater pipe.
    2) Install the heater pipe to the oil cooler.

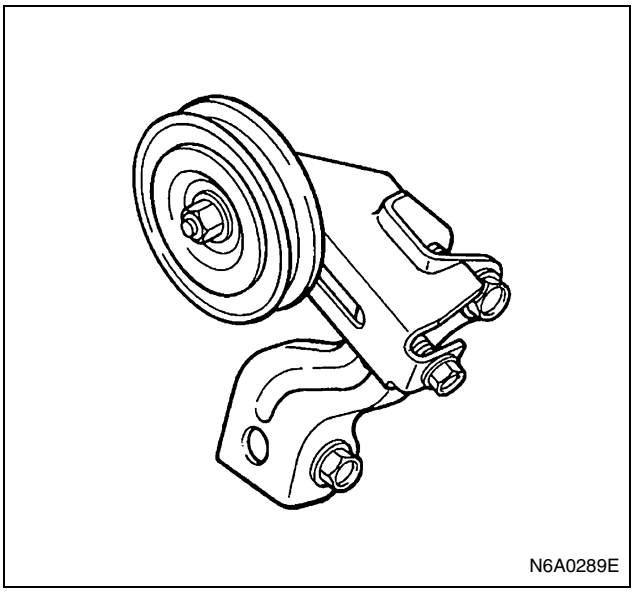
Tighten:
Heater pipe bolt to 24 N·m (2.4 kg·m / 17 lb·ft)



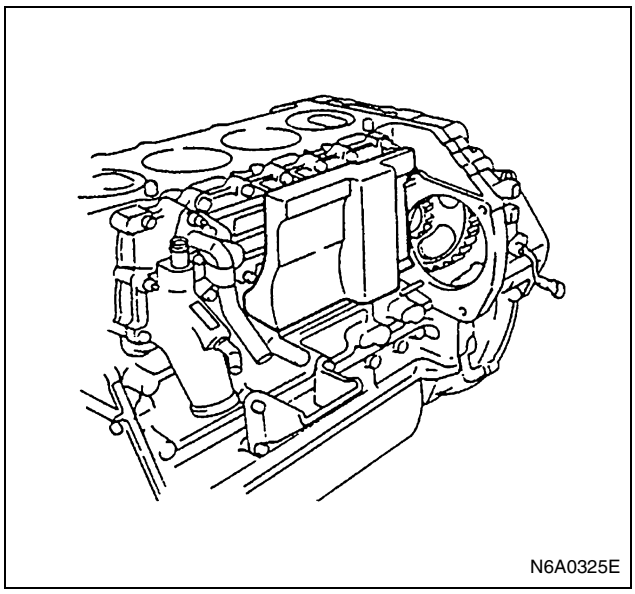
Legend
A. 4HF1-2

38. Idle Pulley Bracket (If equipped with A/C)

Tighten:
Idle pulley bracket bolt to 48 N·m (4.9 kg·m / 35 lb·ft)



39. Injection Pump Rubber Spacer
    Stick the rubber spacer to the location indicated in the illustration with pressure sensitive adhesive double coated tape.



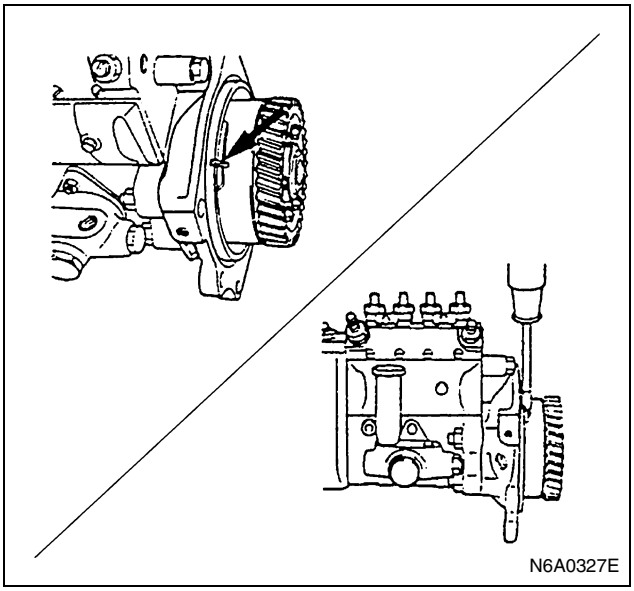
40. Injection Pump Assembly (Except 4HF1-2)
    1) Turn the crankshaft until the timing mark on the crankshaft damper pulley is aligned with “13°” line.

Notice:
BTDC 13° to be aligned with here is an angle at which the injection pump is installed, and has nothing to do with the injection timing.

    2) Remove the inspection hole plug from the cylinder body.
    3) Install the O-ring to the injection pump bracket.
    4) Align the injection pump bracket slit with the timer slit.
    5) Install the injection pump assembly to the cylinder body.

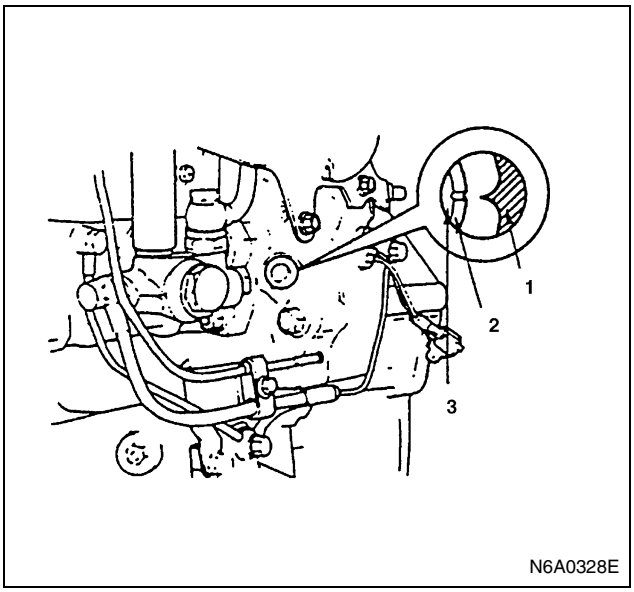
Notice:
When the injection pump has a poor gear engagement while installing the assembly to the cylinder body, insert a screwdriver into the slit on the timer peripheral with the

pump bracket slit used as a guide, and move it up and down to get it into forcibly.



N6A0327E

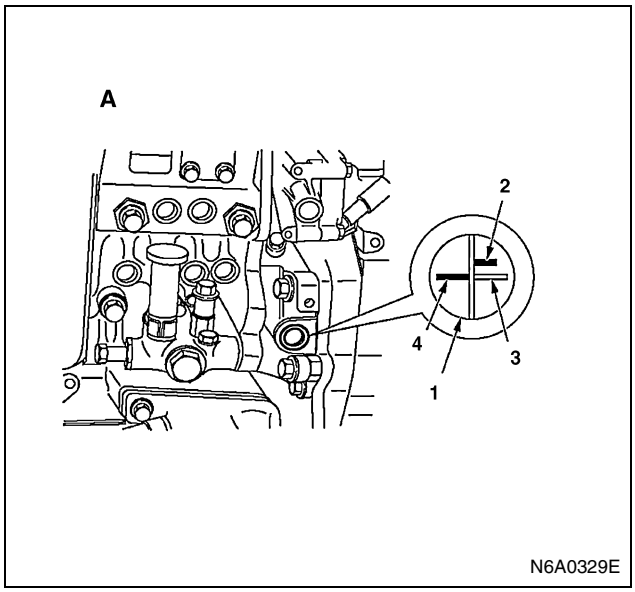
6) After installation of the injection pump, the injection timing can be checked through the timing check hole provided to the injection pump bracket.
Set the No.1 cylinder to BTDC (Injection timing of each engine model) on the compression stroke. When the pointer of the timing check hole comes in line with the mark on the timer periphery of the injection pump as shown in the illustration, the injection timing is normal. After completion of the injection timing check, tighten the check hole plug to the specified torque.



N6A0328E

Legend
1. Pointer
2. Timer outside mark
3. Timing check hole

Injection Timing	deg
4HF1 4HE1-TC (4HE1-XS, XN)	BTDC 8
4HG1	BTDC 9
4HG1-T	BTDC 7 (Except Colombia) BTDC 9 (For Colombia)
4HE1-TC (4HE1-XS)	BTDC 9 (Spec EURO3)

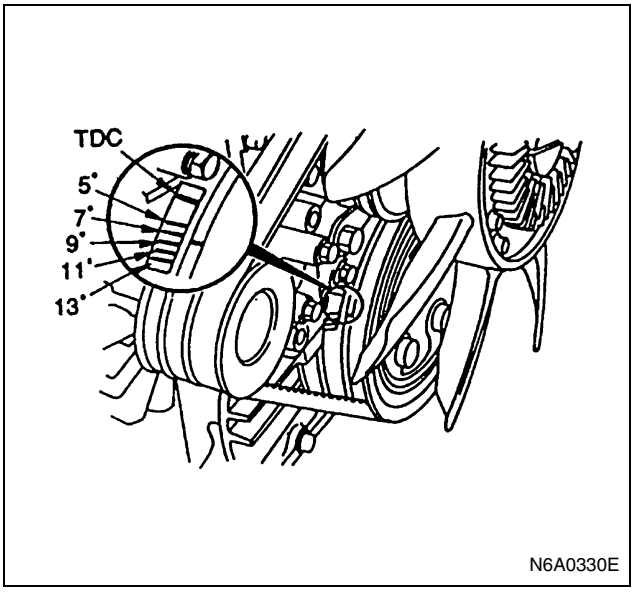


N6A0329E

Legend
A. For 4HF1-TC
1. Timing check hole
2. 8° Mark
3. 13° Mark
4. Pointer

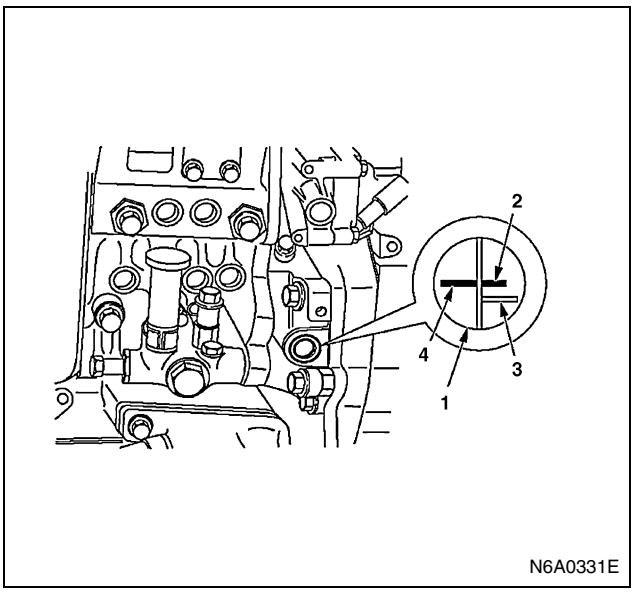
7) Turn the crankshaft until the timing mark on the crankshaft damper pulley is aligned with “8°” (98EPA) or “9°” (Spec EURO3) line.

Notice:
Position in its normal rotating direction. (for 4HE1-TC only)



8) Adjust injection pump downward so that the "8°" (98EPA) or "9°" (Spec EURO3) comes to position in the timing check hole. (for 4HE1-TC only)

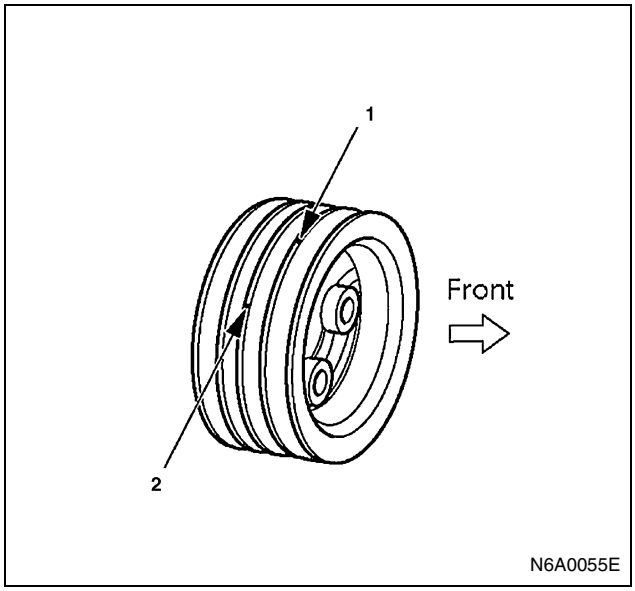
Notice:
When ever the injection pump is replaced, be sure to adjust the injection timing for the details of the adjustment, refer to the "SECTION 00 SERVICING: INJECTION TIMING INSPECTION AND ADJUSTMENT."



Legend
1. Timing check hole
2. 8° Mark
3. 13° Mark
4. Pointer

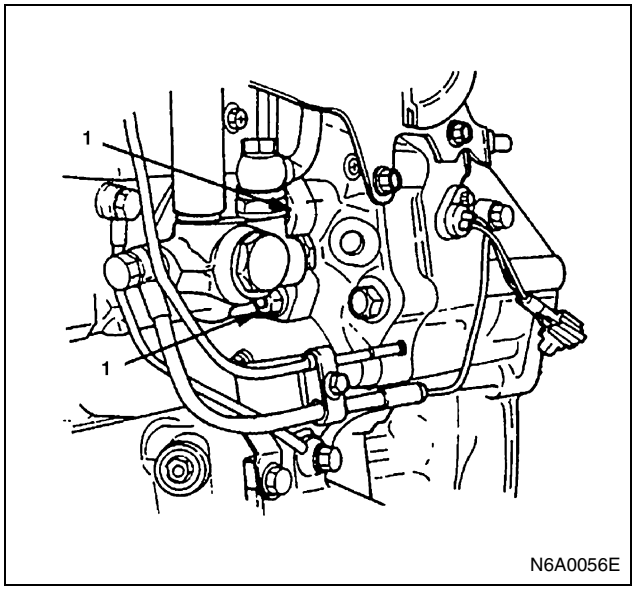
Notice:
In case the crank pulley has two marks as illustrated, (1) BTDC 49° mark on the second crest and (2) TDC mark on the third crest (as viewed from the front side), be sure to set at the mark (2). (If there are two different marks on one and same crest, set at the mark which comes second when rotated in the normal direction.)

The mark (1) is used when installing the injection pump for 4HF1-2.



9) Tighten the injection pump bracket nuts and bolts to the specified torque.

Tighten:
Injection pump bracket nut and bolt (1) to 48 N·m (4.9 kg·m / 35 lb·ft)



10) Install the injection pump rear bracket.

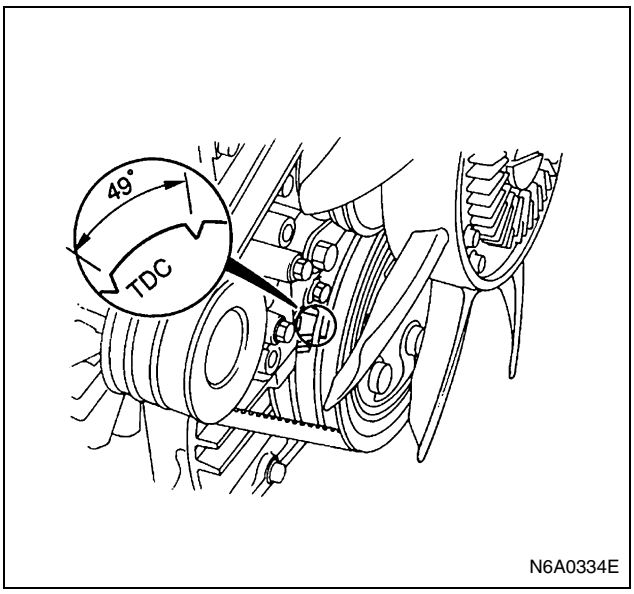
Tighten:
Injection pump rear bracket bolt to 48 N·m (4.9 kg·m / 35 lb·ft)

11) Install the inspection hole plug.

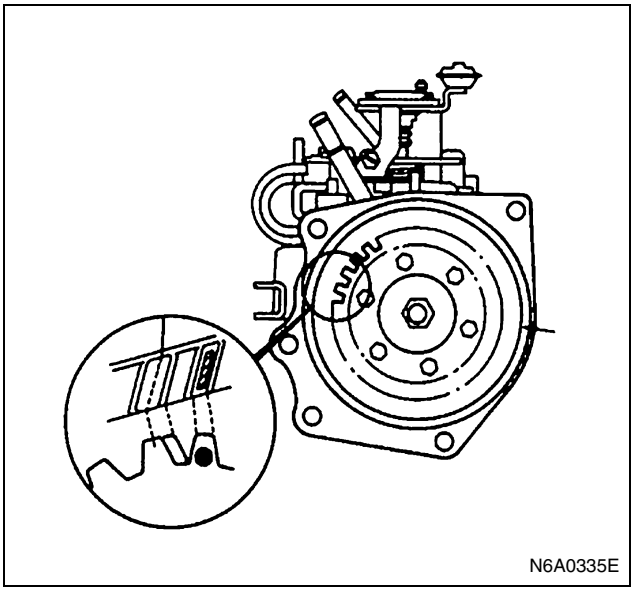
Tighten:
Inspection hole plug to 48 N·m (4.9 kg·m / 35 lb·ft)

41. Injection Pump Assembly (4HF1-2 model only)

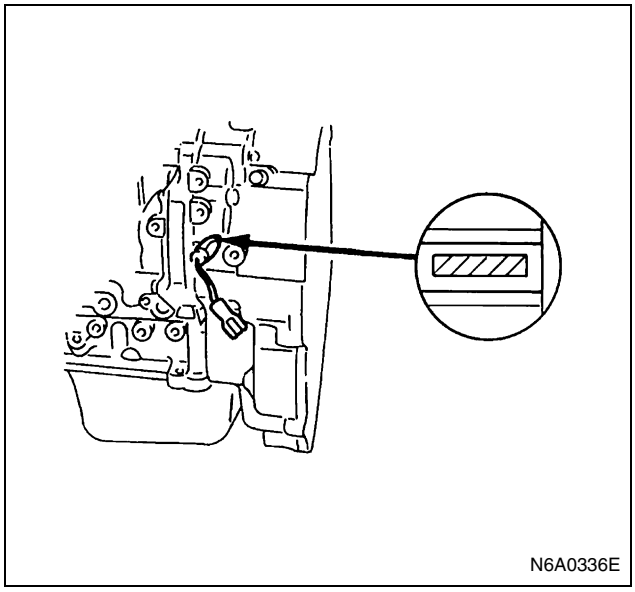
1) Turn the crankshaft to set No.1 cylinder to 49° before TDC in its compression stroke.
(49° is a pump installing alignment angle, not related to injection timing.)



2) Install O-ring to the injection pump.
3) Apply paint on the • (Z) marked side of the injection pump gear.
4) Align the pump bracket mark with the tooth (under side of the pump) just before the • (Z) marked tooth.



5) Insert the pump using the block side of stud bolt as a guide.
6) After installing the injection pump, remove the tachometer sensor from the housing, and make sure that the painted gear is at the center of the sensor mounting hole.



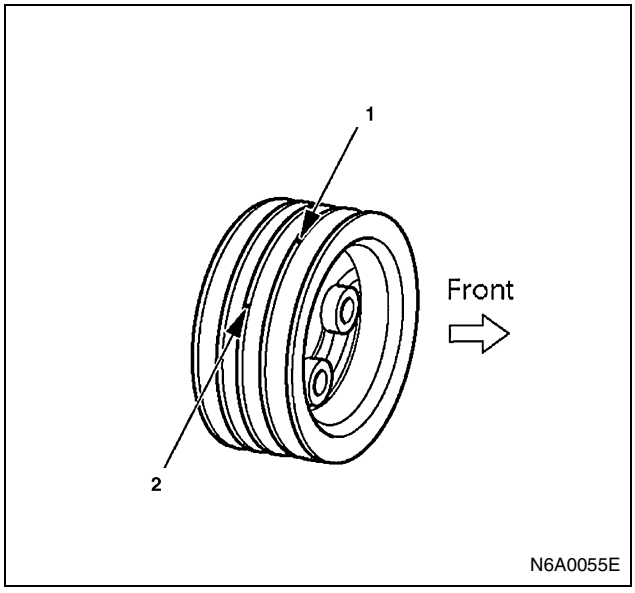
7) Tighten injection pump clamping bolt and nut to specified torque:

Tighten:
Bolt to 48 N·m (4.9 kg·m / 35 lb·ft)

Tighten:
Nut to 24 N·m (2.4 kg·m / 17 lb·ft)

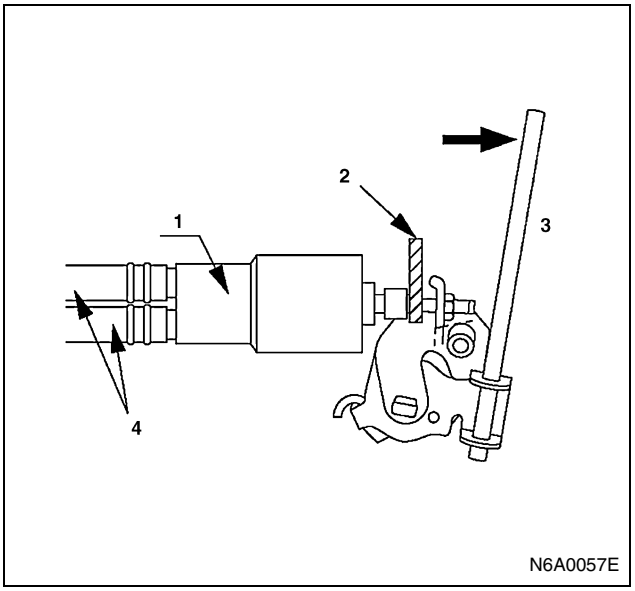
8) With reference to Injection Timing Check & Adjustment, set No. 1 Cylinder to 12° before its TDC.

Notice:
In case the crank pulley has two marks as illustrated (1), BTDC 49° mark on the second crest and (2) TDC mark on the third crest (as viewed from the front side), be sure to set at the mark (2). (If there are two different marks on one and same crest, set at the mark which comes second when rotated in the normal direction.)



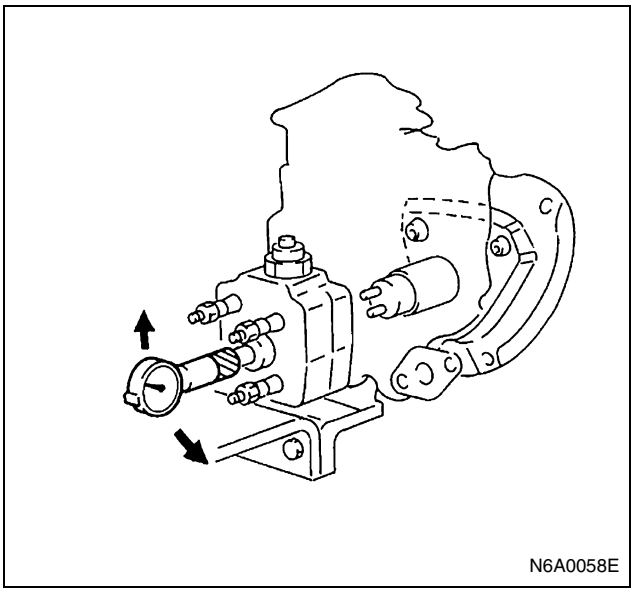
42. Injection Timing Check (4HF1-2 model only)
1) Set No. 1 Cylinder to the TDC in the compression stroke.

2) Disconnect Injection Pipe.
3) Put down Wax CSD lever, insert a spacer 10 — 20 mm (0.39 — 0.47 in) thick between the plunger and adjust bolt, and cancel the Wax CSD.

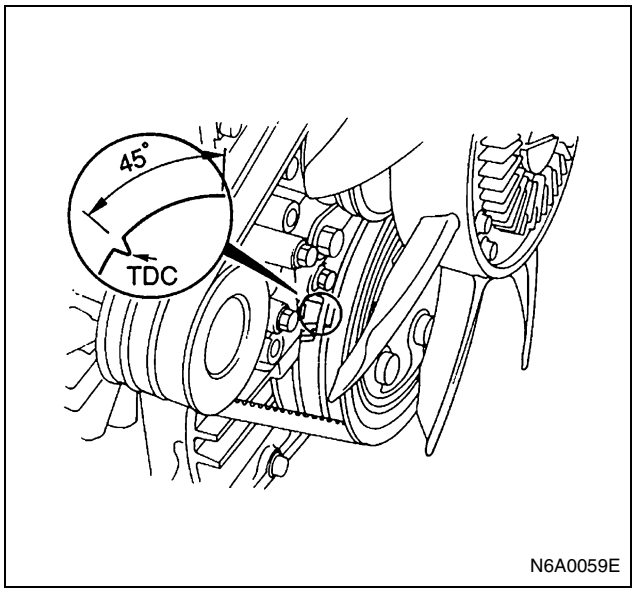


Legend
1. Water house
2. Wax CSD
3. Spacer
4. Lever

4) Remove the pump rear plug, connect a dial gage and set the lift at 1 mm (0.039 in).
Special Tool
Measuring device: 5-8840-0145-0

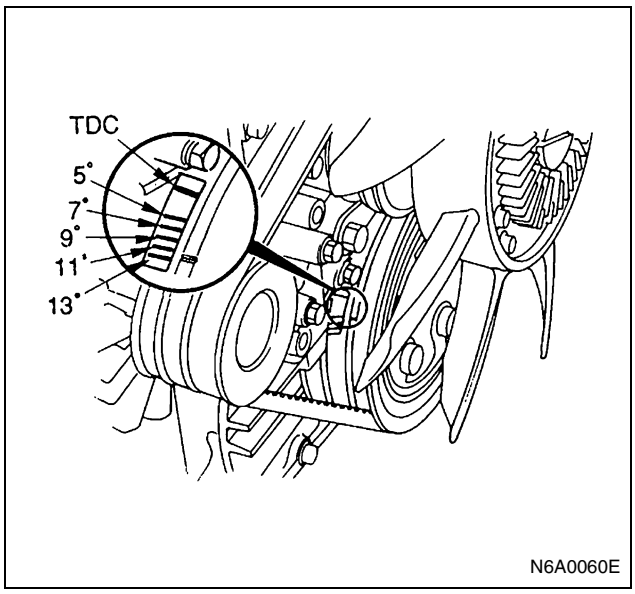


5) Set the crankshaft damper pulley TDC mark to the pointer or 45° before TDC.
6) Set the dial gage to the “0” position.
7) Turn the crankshaft leftwise and rightwise a little and make sure that the needle stays in the “0” position.



8) Turn the crankshaft in the normal direction and read the measuring device’s indication at the 12° before TDC position.

Notice:
As there is no 12° mark, set midway between the 11° and 13 marks.
Standard value: 0.5 mm (0.0197 in)



43. Injection Timing Adjustment (4HF1-2 model only)
If injection timing is out of the specified range, follow the following procedure for adjustment:
1) Loosen injection pump fixing nuts and bracket bolt.
2) Adjust the mounting angle of injection pump:
   - If injection timing is too fast, bring the injection pump closer to the engine.
   - If injection timing is too slow, put the injection pump more distant from the engine.

3) When the dial gage has indicated the specified value, tighten the fixing nuts and bolt to specified torque:

Tighten:
Nut to 24 N·m (2.4 kg·m / 17 lb·ft)

Tighten:
Bolt to 48 N·m (4.9 kg·m / 35 lb·ft)

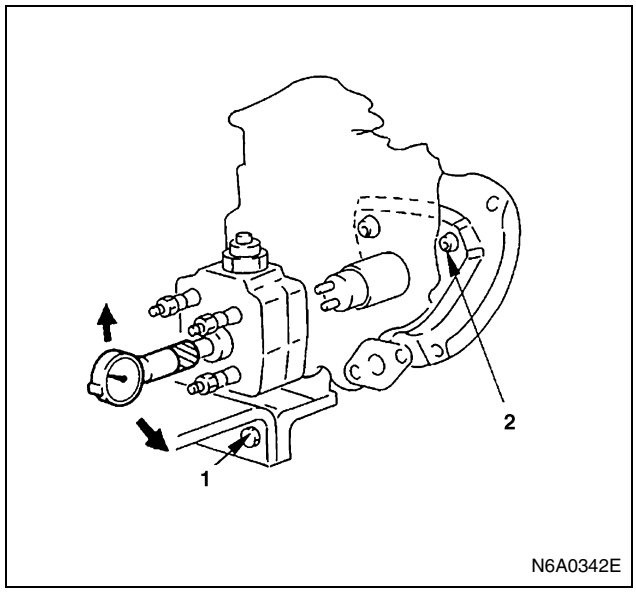
4) Disconnect the dial gage, install and tighten the plug to specified torque. (Make sure of a copper washer being attached to the plug)

Tighten:
Pump rear plug to 17 N·m (1.7 kg·m / 12 lb·ft)

5) Release the wax CSD and connect the injection pipe.

Tighten:
Pipe sleeve to 29 N·m (3.0 kg·m / 22 lb·ft)

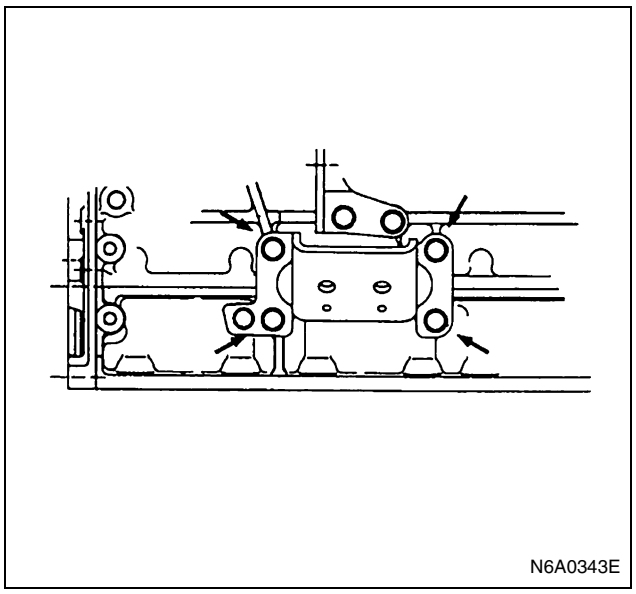
Notice:
If there are two marks on the crank pulley, the front side of mark is for setting BTDC 49° and the rear side of mark is for setting TDC.



Legend
1. Bolts
2. Nuts

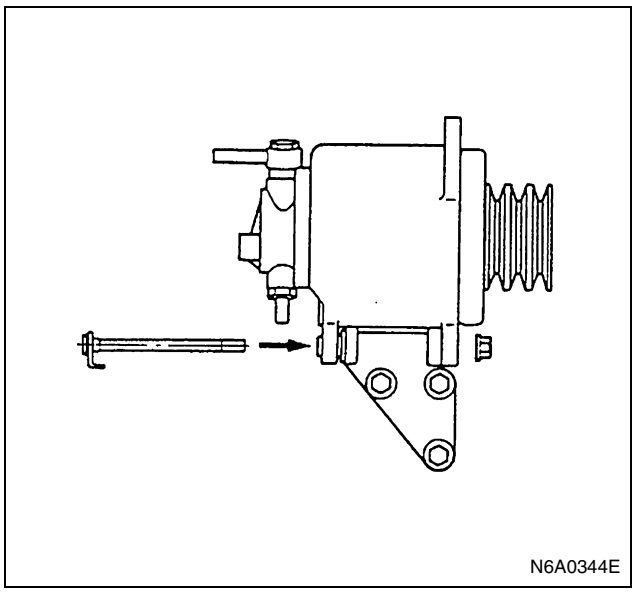
44. Engine Foot

Tighten:
Engine foot bolt to 51 N·m (5.2 kg·m / 38 lb·ft)



45. Generator

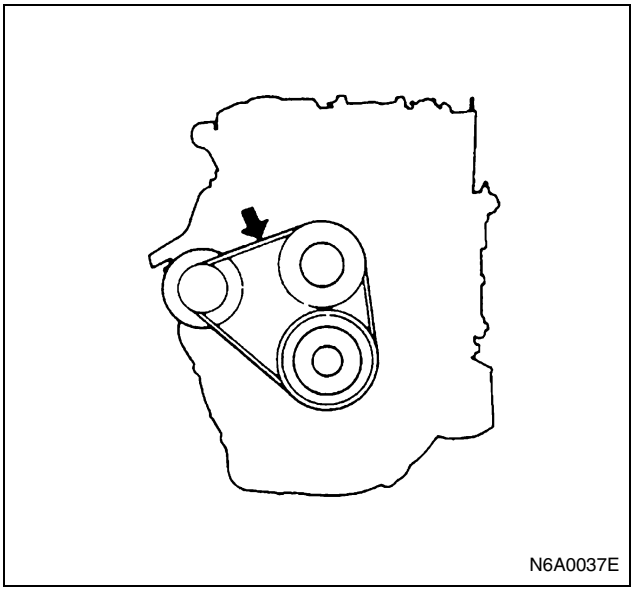
Notice:
Before tightening the generator securely, tighten it temporarily in advance after adjusting the fan belt. Put the lower fixing bolt through from the rear side and tighten it with the nut on the front side as shown in the illustration.



46. Fan Belt
Check the drive belt tension.
Depress the drive belt mid-portion with a 10 kg (22 lb / 98 N) force.

Drive Belt Deflection	mm (in)
New belt	8 — 12 (0.31 — 0.47)
Reuse belt	10 — 14 (0.39 — 0.55)

Check the drive belt for cranking and other damage.



N6A0037E

47. Fan Belt Adjustment
    Fan belt tension is adjusted by moving the alternator.

Tighten:
Bolt to
- (1): 40 N·m (4.1 kg·m / 30 lb·ft)
- (2): 24 N·m (2.4 kg·m / 17 lb·ft)
- (3): 46 N·m (4.7 kg·m / 34 lb·ft)

Tighten:
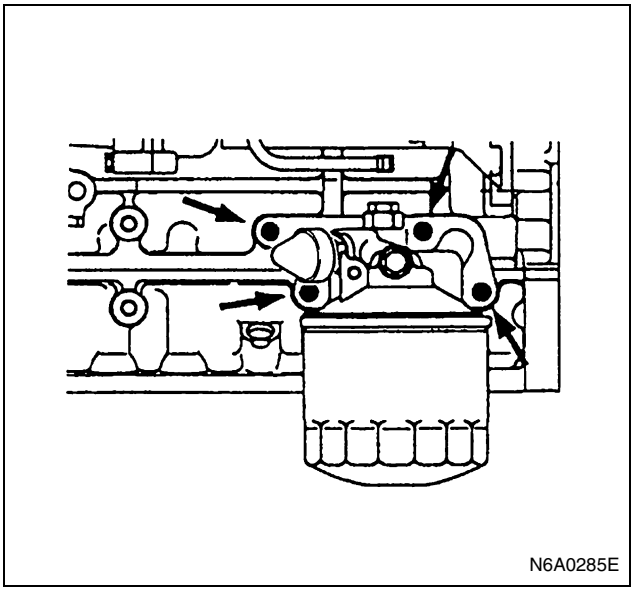
Oil filter bolt to 48 N·m (4.9 kg·m / 35 lb·ft)

53. Oil Pipe

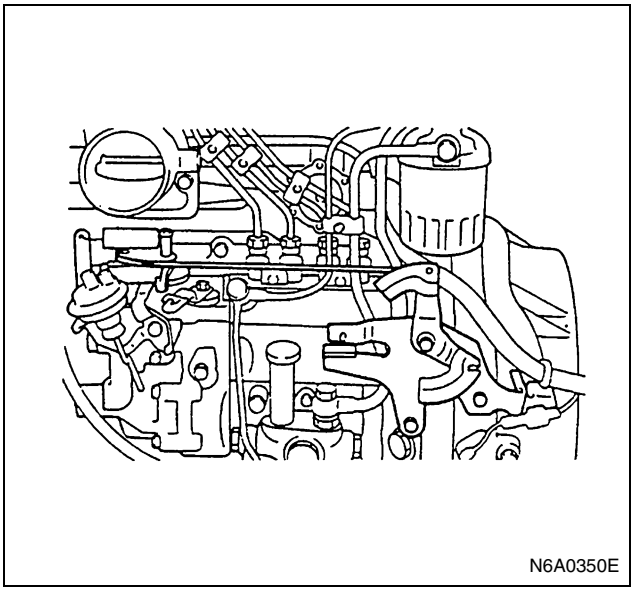
Tighten:
Oil pipe joint bolt to 17 N·m (1.7 kg·m / 12 lb·ft)



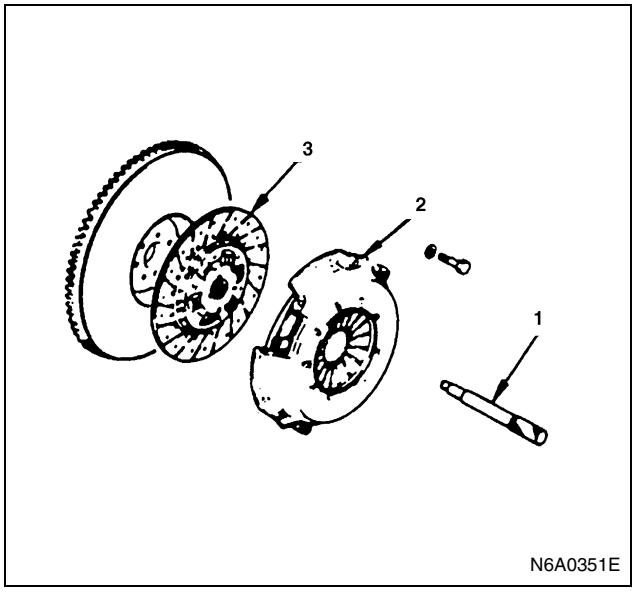
54. Engine Control Lever Assembly

Tighten:
Engine control lever bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

55. Engine Control Wire



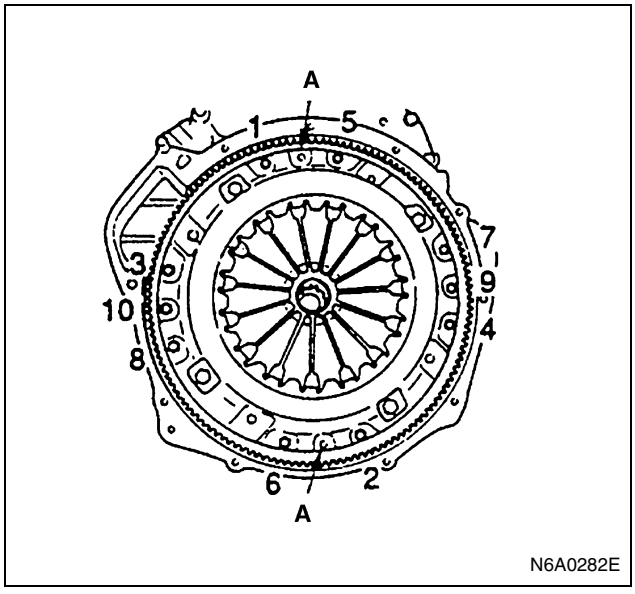
56. Driven Plate
    Use the clutch pilot aligner to install the driven plate.
    Clutch Pilot Aligner: 5-8840-2240-0



Legend
1. Clutch pilot aligner
2. Clutch pressure plate assembly
3. Driven plate

57. Clutch Pressure Plate Assembly
    1) Align the clutch pressure plate with the flywheel knock pin.
    2) Tighten the pressure plate bolts to the specified torque in numerical order.

Tighten:
Clutch pressure plate bolt to 40 N·m (4.1 kg·m / 30 lb·ft)



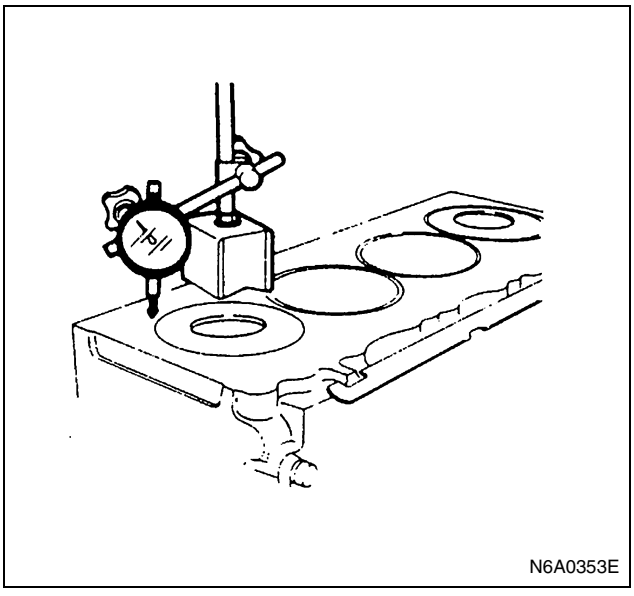
Legend
A. Knock pin

58. Cylinder Head Gasket

1) When any of the cylinder block, crankshaft, crankshaft bearing, connecting rod, connecting rod bearing, and piston is replaced with a new one, cylinder head gasket thickness should be determined newly.
2) When replacing the cylinder head gasket alone without replacing any of the parts mentioned in 1) above, the gasket to be used should be the same grade as the one used before.
3) Correct the cylinder head gasket thickness is important. Installing the wrong thickness gasket can result in greatly reduced engine performance.
4) There are three cylinder head gaskets available.

59. Piston Head Projection Measurement

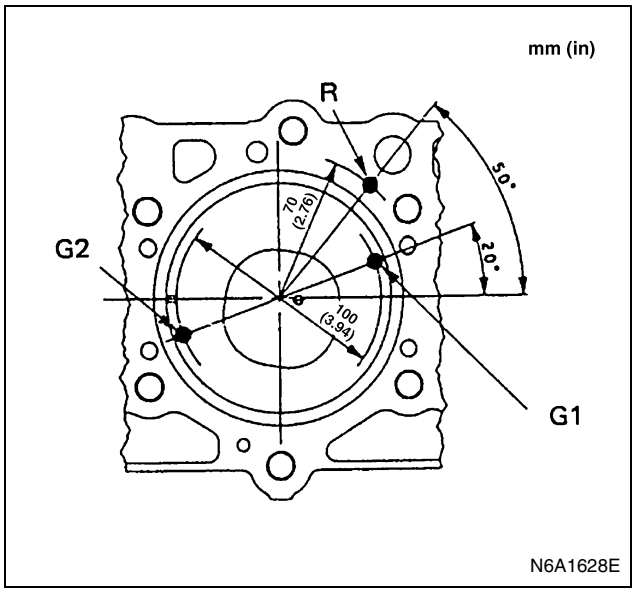
- Select a cylinder head gasket.
- Clean thoroughly the top faces of the piston head and the cylinder body.
- Use the dial gauge to measure the piston head projection. Take measurements at two locations for each cylinder.
- The measurement points of the piston head and the reference point of the cylinder body are shown in the illustration.
  Measurement points: Points G1 and G2 of the piston head
  Reference point: Point R on the top face of the cylinder body



N6A0353E

Notice:
Note that there are three types of a cylinder head gasket available as shown in the table following, according to the piston projection.

- For each cylinder, calculate the average value (Ti) of the piston projection.
- Find the maximum value (Timax) of the average value (Ti) of each cylinder.
- Based on the Timax obtained, select a gasket of the appropriate grade.



4HF1/4HF1-2/4HG1-T
Cylinder Head Gasket Selection

mm (in)

Gasket Grade	Ti max	Gasket Thickness (Reference)

GENERAL DESCRIPTION

The engine is a four-cycle, four-cylinder, in-line, direct fuel injection type diesel engine with the piston displacement of 4,334 cc. It features a gear driven OHC (overhead camshaft) timing train and the unique mechanisms and systems designed for outstanding cleanness, economy and durability. Its torque characteristics promise dynamic ride at high speed, high power at low speed, and smooth and continuous torque at medium to high ranges.

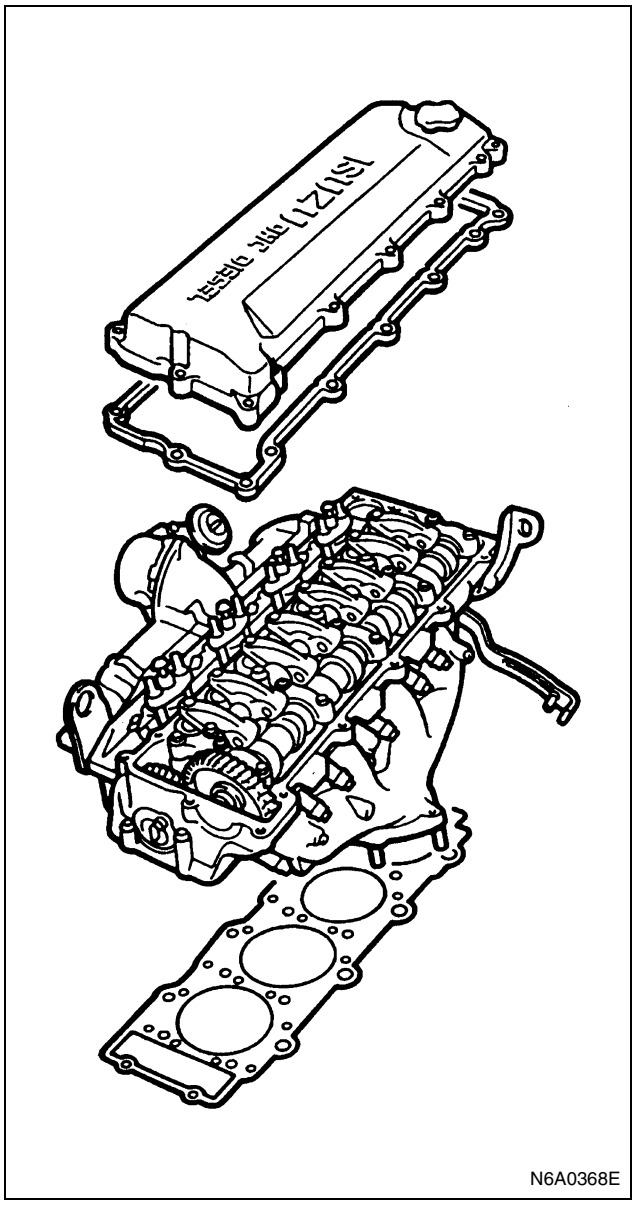
N6A0367E

Cylinder Head

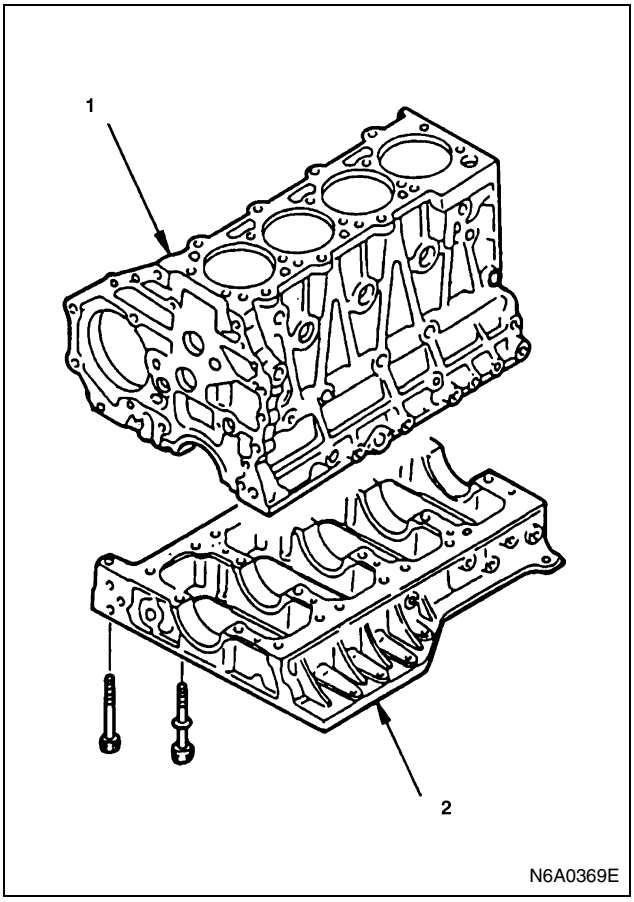
- The cylinder head is made of cast iron and has a crossflow layout with the intake system in the left side and the exhaust system in the right side, designed to reduce resistance in the intake and exhaust systems.
- The valve diameter is increased to offset the mass of the valve operating system reduced by the introduction of the OHC mechanism.
  In addition, the intake and exhaust ports are put in a smoother and less resistant layout to enhance intake and exhaust efficiency.
- The cylinder head gasket is of the laminated steel of least fatigue in combination with the angular cylinder head bolt tightening method, equally designed to increase reliability against gas and water leakage, in addition, selective assembly of gaskets of various thicknesses minimizes the wasted space between the piston and the cylinder head to maintain performance at a high level.
- The cylinder head cover is made of aluminum to reduce noise.



N6A0368E

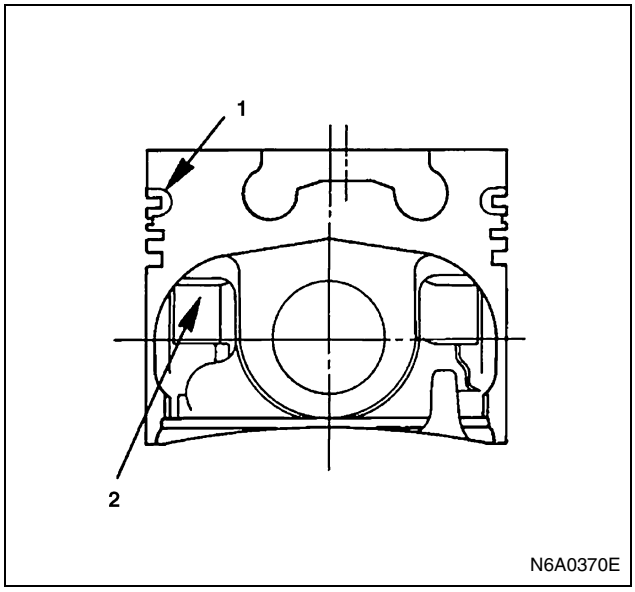
Cylinder Block

- The cylinder block (1) is made of cast iron having dry cylinder liner and five bearings.
  The bearing cap has a ladder frame (2) construction integrating the crankcase to increase rigidity.
- The cylinder liner is made of thin iron plus special alloys and is combined with the chrome-plated piston ring to ensure good resistance against wear.
- The oil pan is made of vibration-damping steel to reduce noise.



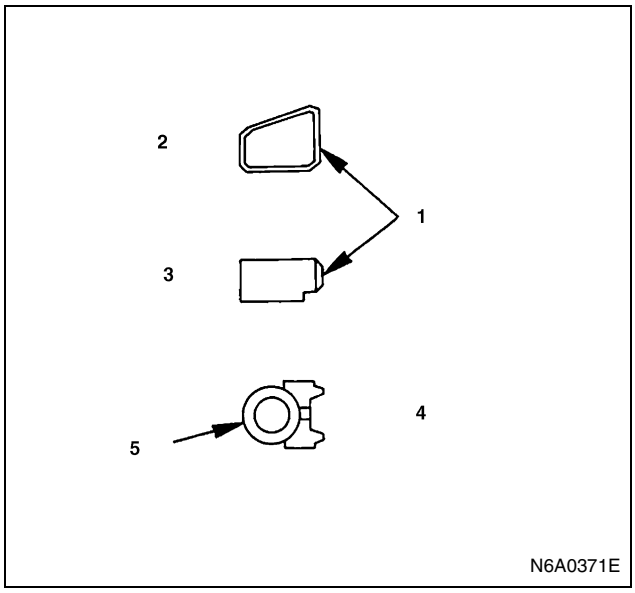
Piston, Connecting Rod and Crankshaft

- The piston is made of aluminum alloy. A ring trigger is cast into the top ring groove and chrome plating is applied to four sides of the top ring to ensure sufficient strength and wear resistance of the ring and the ring groove. The piston bottom has a thermal flow shape to increase cooling efficiency of the oiling jet. This design reduces thermal load while increasing rigidity (see figure).
- The combustion chamber has a square shelf of proven performance to ensure outstanding stability in exhaust gas control (see figure).
- The autothermatic piston and offset piston pin reduces piston flapping and other noise.



Legend

1. Ring trigger
2. Strut

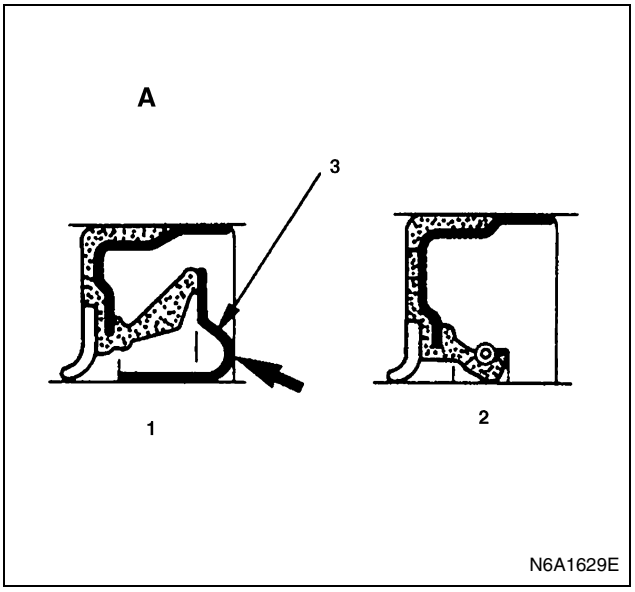


Legend

1. Chrome plated
2. Top ring
3. 2nd ring
4. Nitriding
5. Oil ring expander

- The crankshaft is made of cast carbon steel with five bearings and eight counterweights to reduce revolution load to the bearing. The ladder frame design that integrates the bearing cap and the crankcase increases bearing rigidity. The angular tightening method of the bearing bolt further increases reliability and durability.

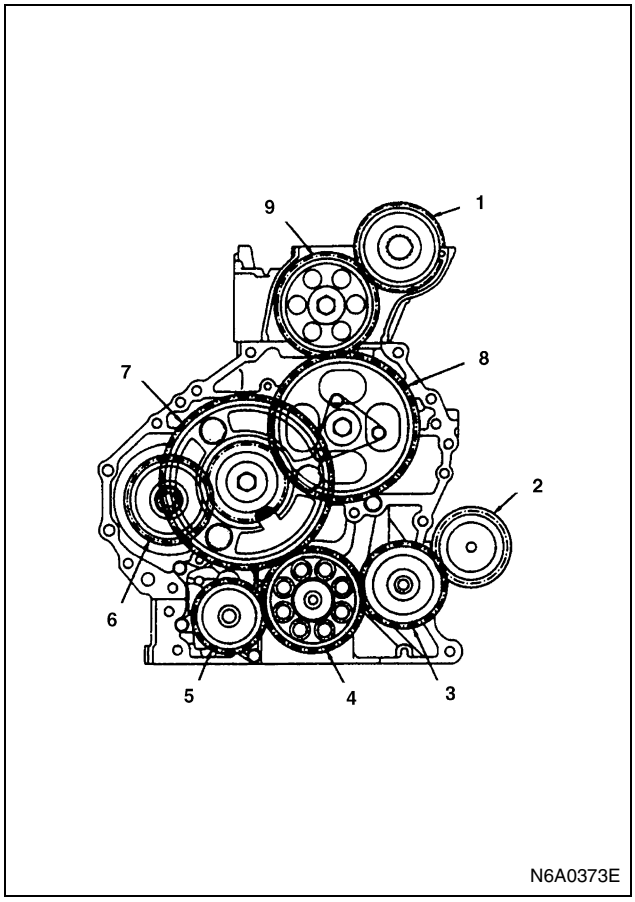
- The connecting rod is made of cast carbon steel and the cap is bolted by angular tightening method to maintain reliability.
- The bearing, as well as the crank journal and crank pin bearings, are made of Kelmet metal.
  Oil clearance is controlled accurately through selective assembly by thickness to reduce noise and increase reliability.
- The crankshaft has the axial type oil seal that drastically improves durability and reliability.
  Compared with the conventional radial type (lips in a radial orientation), the axial type oil seal has lips in an axial orientation to minimize lip wear. It also precludes lip peeling and damage, spring dislocation and other problems associated with the radial type oil seal (see figure).



Legend
A. Crankshaft oil seal
1. Axial type
2. Radial type
3. Slinger

Valve Train

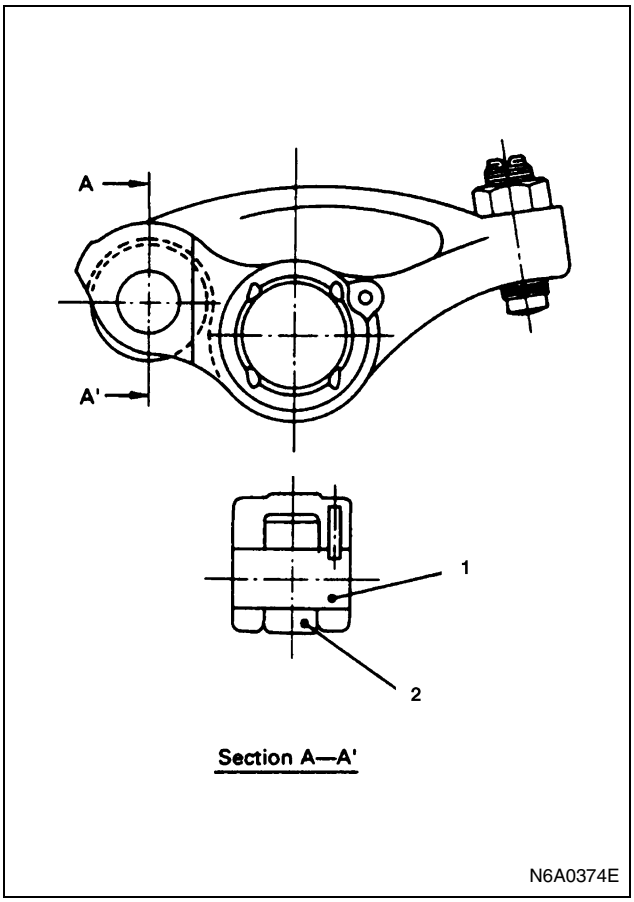
- The gear train is located at the end of the cylinder block to minimize influence of the torsional vibration of the crankshaft and the radiant sound. Noise is further reduced, to the same level as a timing belt driven system, by integrating the crank gear with the crankshaft by shrink fit and by careful turning of the gear precision, teeth contact ratio of gear, backlash, bearing rigidity, neutral frequency, etc. (See figure).



Legend
1. Camshaft gear
2. Power steering pump gear
3. Power steering pump idle gear
4. Crankshaft gear
5. Oil pump drive gear
6. Injection pump gear
7. Idle gear A
8. Idle gear B
9. Idle gear C

- Gears are of the forged type. Gears are tufftrided to secure sufficient durability.
- The camshaft is made of carbon steel with five bearings. The cam's nose and the journal are induction-hardened to secure sufficient durability.
- The cam has a Fourier-dyne profile to maximize the intake and exhaust valve lifts and the valve opening and closing timing is optimized to increase intake and exhaust efficiency.
- The valve spring is a single spring having an egg-shaped cross section to reduce weight while reducing stress. Coupled with the unique cam profile, the spring increases the jump-and bounce-free limit at high-speed operation to provide reserve characteristics.
- The rocker arm is made of diecast aluminum and is of the center pivot type having a roller. This increases reliability while reducing friction and con-

tributes to increased power output and fuel efficiency (See figure).



Legend
1. Pin
2. Roller

- The rocker shaft is chrome plated to secure sufficient durability.

Fuel System

LINE Pump

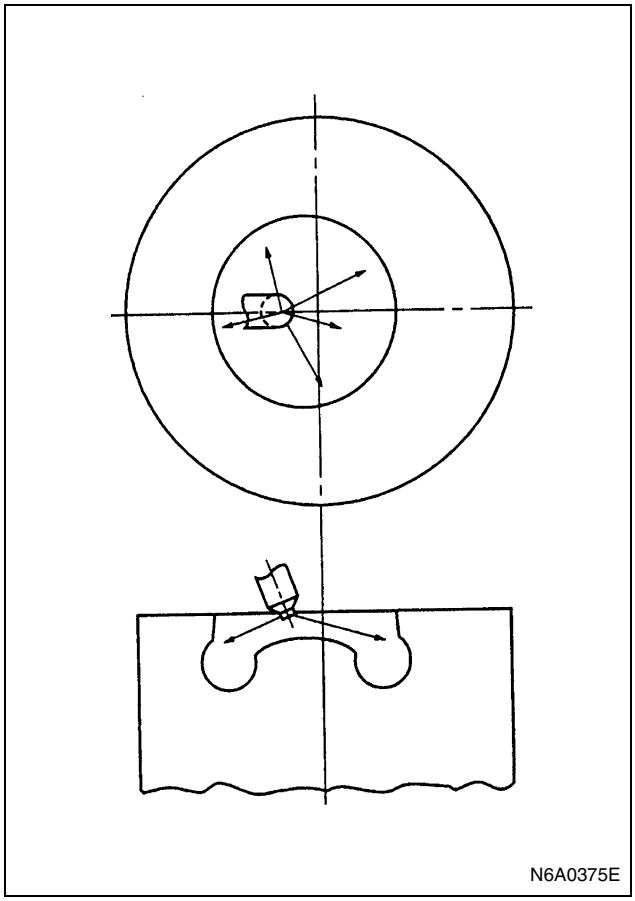
- The injection pump is of Bosch A type with the plunger outside diameter of 9.5 mm (0.37 in) and cam lift of 9 mm (0.35 in).
  The plunger has a special notch for advancing the timing at starting.
- The governor is of a mechanical RLD type to ensure sustained power at high speed.
- The timer is of the SCDM (eccentric) type.

VE Pump

- A Bosch Distributor Type injection Pump is used.
  A single reciprocating / revolving plunger delivers the fuel uniformly to the injection nozzles, regardless of the number of cylinders.
- The governor, the injection timer, and the feed pump are all contained in the injection pump housing. The injection pump is compact, light weight, and provides reliable high-speed operation.
  An android compensator is available as an option for vehicles to be operated at high altitudes. It adjusts the fuel and air mixing ratio.

Injection Nozzle

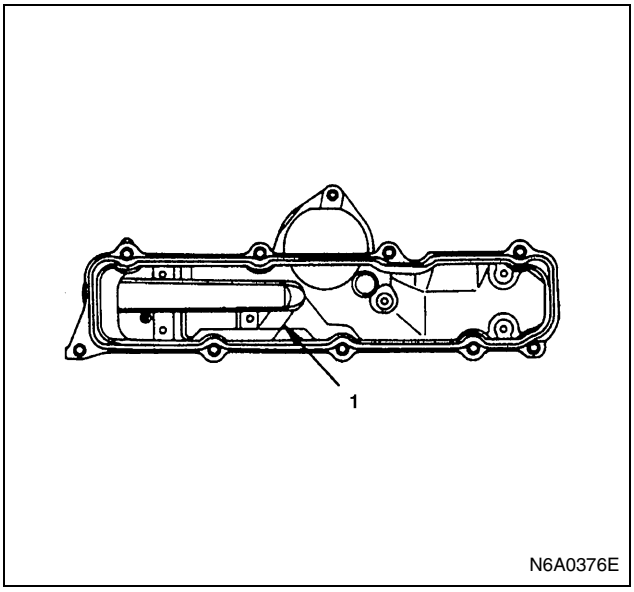
- The injection nozzle is of the P type to bring it as technically close as possible to the center of the combustion chamber. The nozzle inclination is also reduced to minimum to increase combustion efficiency.
  The nozzle has five jets and the valve opening pressure is set at 185 kg/cm^2 (2,630 psi, 18,142 kPa) (See figure).



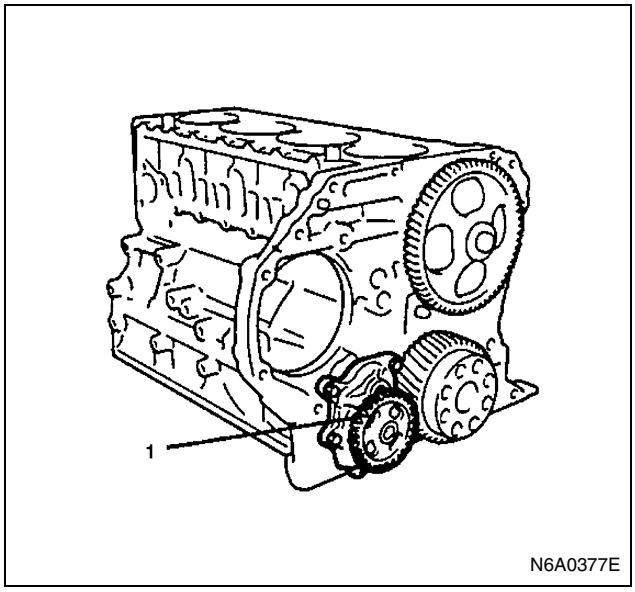
- The injection pipe is laid in such a way that the overall length is minimized to enhance performance.

Intake and Exhaust Systems

- The resin-made intake manifold is of the cover type having an inner cover made of rubber and steel. This design effectively reduces radiant sound and transmitted sound.
- The intake manifold has a straightening vane inside to stabilize swirl and improve performance. It also contains a built-in Positive Crankcase Ventilation (PCV) valve to minimize the overall size (See figure).
- The exhaust manifold is mode of cast iron and heatresisting alloys. Ports are shaped carefully to minimize exhaust resistance.



Legend
1. Straightening wall



Legend
1. Oil pump gear

Lubrication System

- The oil pump is driven by the crank gear directly to increase durability while maintaining sufficient delivery.
  The pump body is partially integrated with the cylinder block to reduce the overall size and weight (See figure)
- The oil filter is of the cartridge type integrating the full flow filter and bypass filter as a single unit. This presents several advantages such as an extended interval between oil exchanges and greater ease of maintenance resulting in cost reduction. The bypass valve is fitted to the body itself to avoid flow of foreign matter due to bypassing of oil thereby maintaining sufficient reliability.
- The oil cooler is of a large-capacity, water-cooled and multiple-partition type built into the side of the cylinder block. This design maintains necessary stability in oil temperature. It also has a bypass valve to minimize delay of the oil gallery pressure build-up for cold starting.

Cooling System

- The water pump is driven by a V-belt and the pump body is made of diecast aluminum. Part of the swirl chamber is built into the engine front cover to reduce the overall size and weight.
  A sintered carbon type seal unit is chosen to secure reliability. The shaft bearing combines roller bearing and ball bearing to maintain necessary durability. The outlet for draining is located behind the pulley to prevent dust from entering the system as much as possible. (See figure)
- The cooling fan operation is regulated by a temperature-sensitive clutch to enhance fuel efficiency while reducing noise.

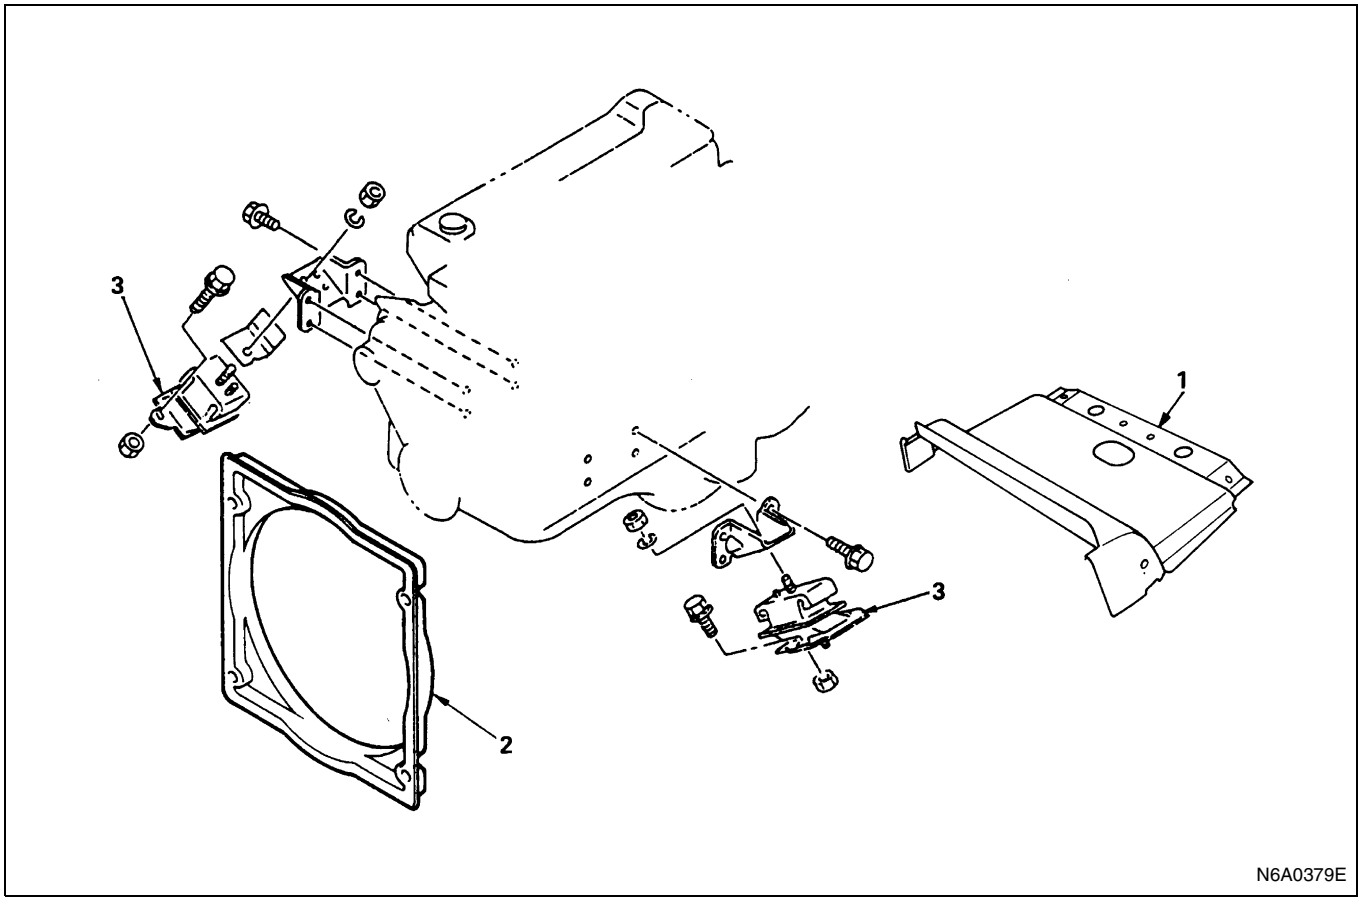
Important Operations

1. **Axial Type Oil Seal**
   - As crankshaft front and rear oil seals are both axial type, attention must be paid to the following: when replacing, replace oil seal and slinger as a set.
   - Be sure to use the special tool correctly since oil seal and slinger must be set accurately in their longitudinal direction.
2. **Valve Cap**
   - As intake and exhaust valves have caps, take sufficient care not to let them fall into the gear case or oil return hole during disassembly or reassembly.
3. **Application of Liquid Gasket**
   - Oil pan, crankcase, oil cooler, retainer front, and water pump are not sealed with sheet gasket but with liquid gasket only.
   - Prior to application, be sure to remove old hardened liquid gasket or oil from those surfaces to which new gasket will be applied. Further, if the old gasket can hardly be removed, mask such surfaces with gasket remover (Three Bond PANDO-391D; ISUZU Genuine Parts No. 1-8844-0542-0) or equivalent in accordance with the instructions manual.
   - Liquid gasket should be applied evenly so that no breaks and omissions may be made. Further, were O-ring is used should not be exposed to liquid gasket.
4. **Plastic-Region Angular Bolt Tightening Method**
   - Clamping bolts of connecting rod and cylinder head (M14 only) are tightened by plastic region angular bolt tightening method. This method is applied with bolt threads and setting faces coated with molybdenum disulfide grease.

ENGINE MOUNT (RH,LH)

Component



Legend

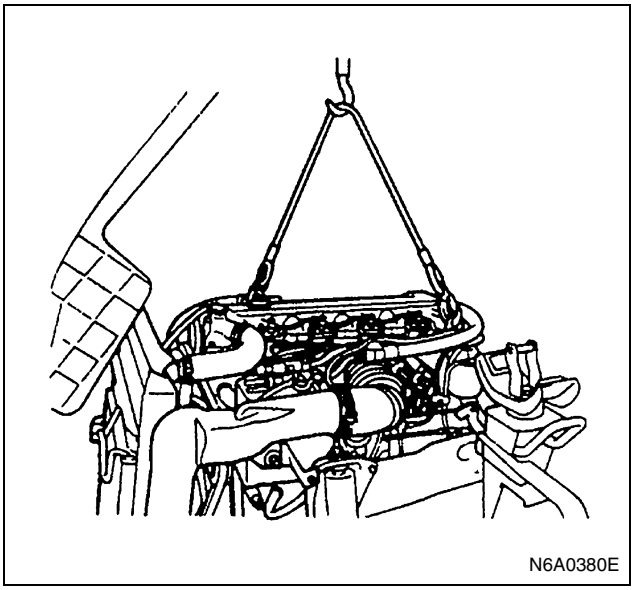
1. Transmission panel
2. Fan guide
3. Engine mount

Removal

Preparation

- Disconnect battery ground cable.
- Tilt the cab.

1. Transmission Panel
2. Fan Guide
   Remove the fan guide and hang it on the fan side.
3. Engine Mount
   1) Hang the engine by the hoist before dismounting the engine mount.
   2) Remove the nuts that fix the engine foot and the engine mount.
   3) Remove the fixing bolts on the chassis frame side of the engine mount.
   4) Hoist the engine assembly a little, and dismount the engine mount.



Installation

1. Engine Mount
   Tighten the fixing bolts to the specified torque.

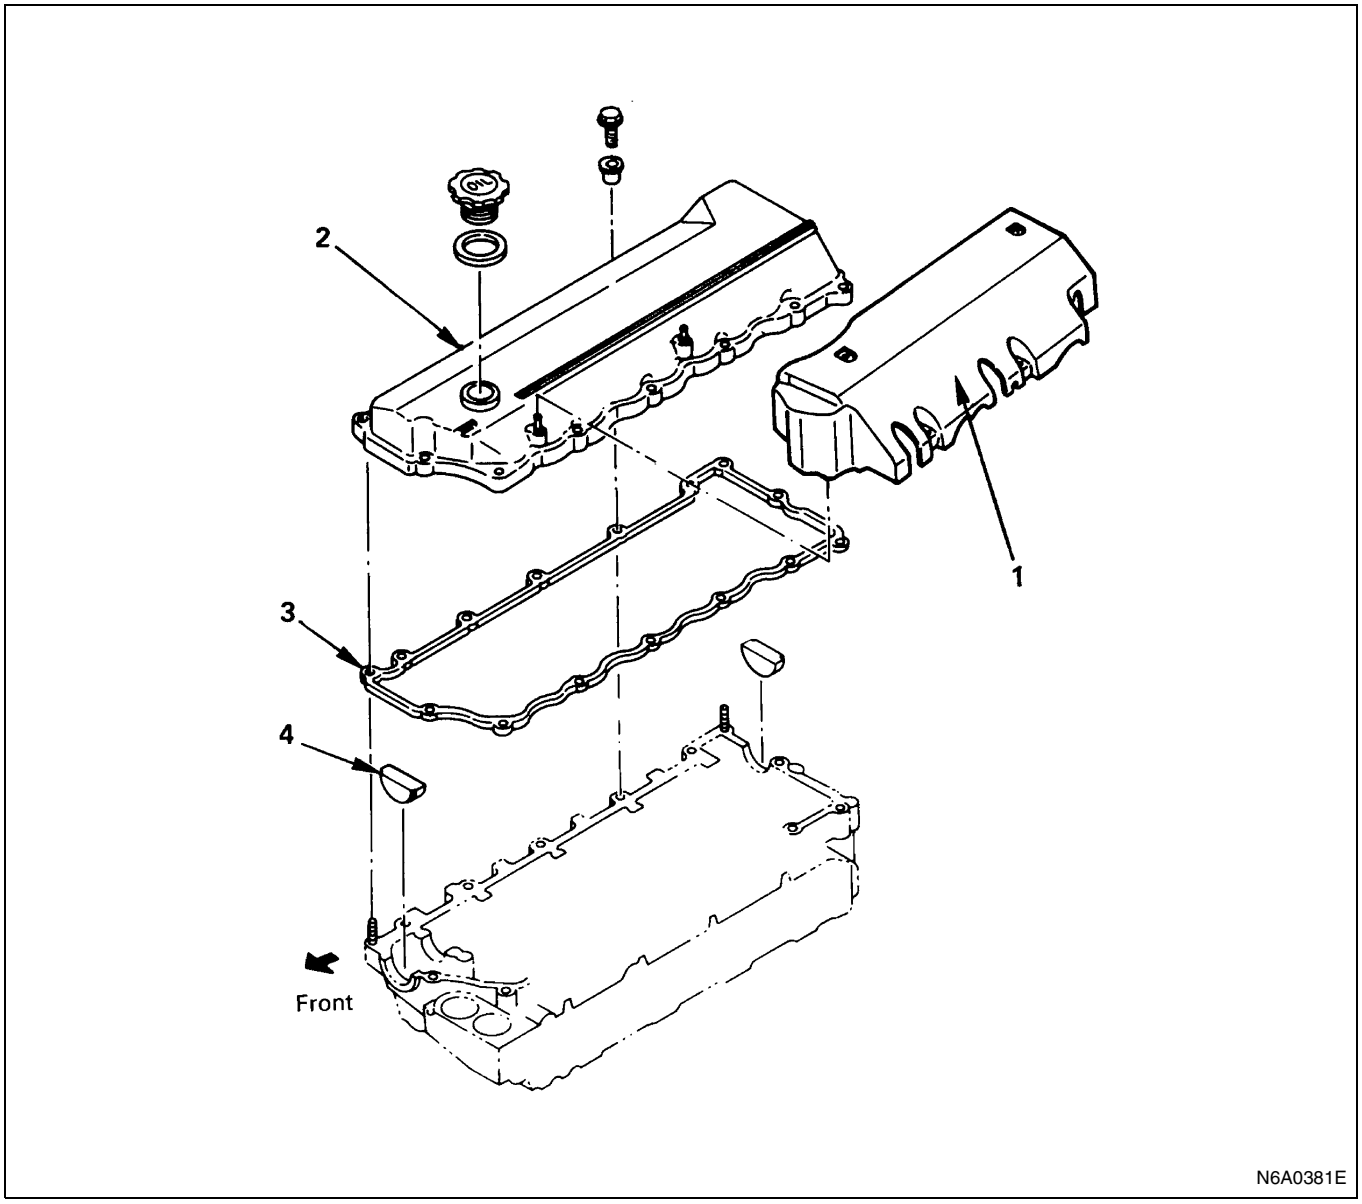
Tighten:
Chassis frame side bolt to 48 N·m (4.9 kg·m/35 lb·ft)

Tighten:
Engine foot side nut to 82 N·m (8.4 kg·m/61 lb·ft)

2. Fan Guide
3. Transmission Panel
   1) Connect the negative battery cable.
   2) Lower the cab
   3) Start the engine, and check for any abnormal conditions with the engine mount.

CYLINDER HEAD COVER

Component



Legend

1. Nozzle cover
2. Cylinder head cover
3. Cylinder head cover gasket
4. Rubber plug

Removal

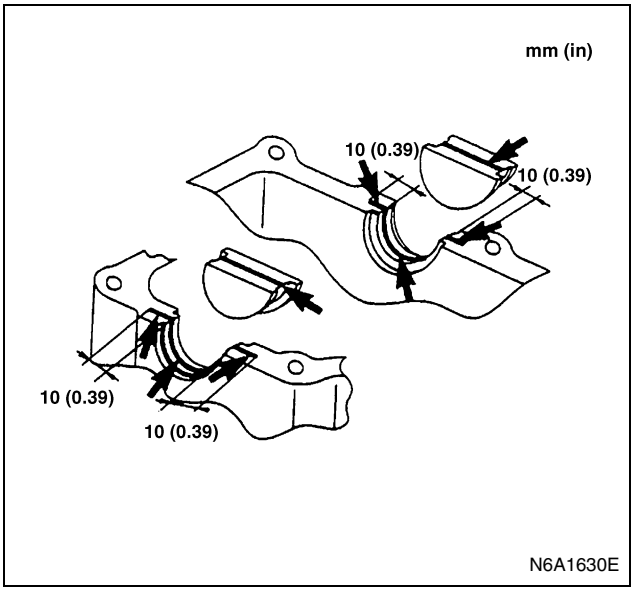
Preparation

- Disconnect battery ground cable.
- Tilt the cab.

1. Nozzle Cover
2. Cylinder Head Cover
3. Cylinder Head Cover Gasket
4. Rubber Plug

Installation

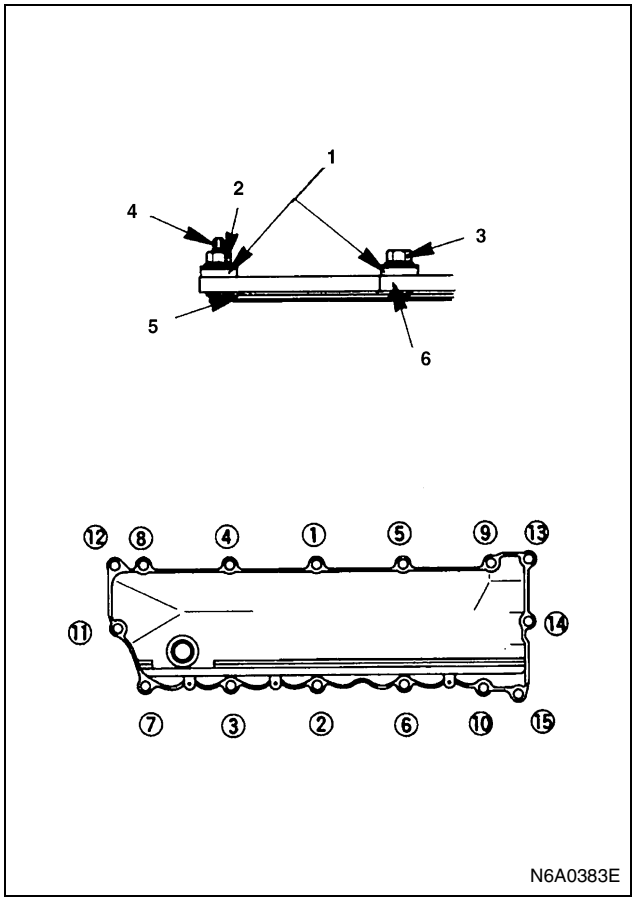
1. Rubber Plug
   1) Apply a 3 — 4 mm (0.12 — 0.16 in) bead of the recommended liquid gasket (Three Bond 1207B) or its equivalent to the cylinder head front and rear plug arch.
   2) Install the rubber plugs to the cylinder head upper faces.
   3) Apply a 3 — 4 mm (0.12 — 0.16 in) bead of the recommended liquid gasket (Three Bond 1207B) or its equivalent to the rubber plugs and cylinder head upper faces. Refer to arrows in the illustration.



Install the cylinder head cover within 7 minutes after application of liquid gasket.

2. Cylinder Head Cover Gasket
   Install the gasket to the cylinder head cover.
3. Cylinder Head Cover
   1) Install the cylinder head cover.
   2) Tighten the cylinder head cover nuts and bolts to the specified torque in the numerical order shown in the illustration.

Tighten:
Cylinder head cover nut and bolt to 18 N·m (1.8 kg·m/13 lb·ft)



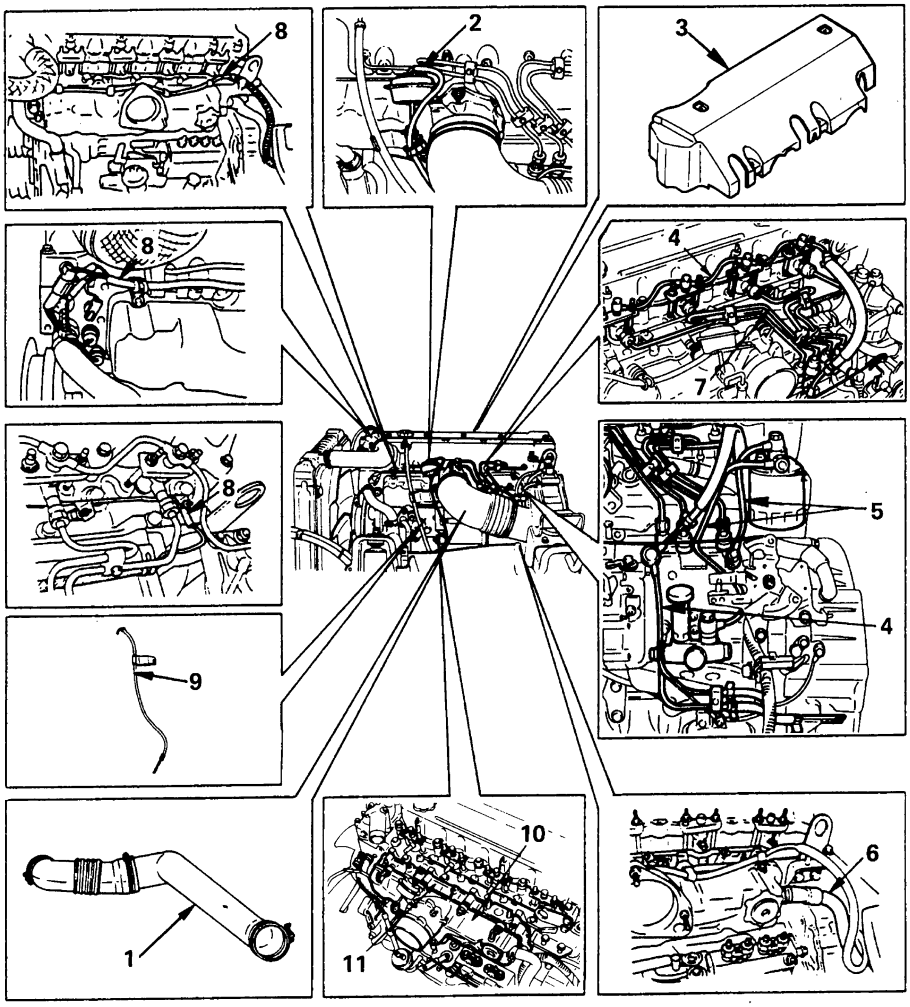
Legend
1. Mounting rubber
2. Nut
3. Bolt
4. Stud
5. Gasket
6. Head cover

4. Nozzle Cover
   - Connect the negative battery cable.
   - Lower the cab.
   - Start engine and check for oil leakage carefully.

INLET COVER / INLET CASE

Component

For 4HF1



N6A0384E

Legend

1. Intake air duct
2. Vacuum hose
3. Nozzle cover
4. Leak off pipe
5. Fuel pipe
6. PCV hose
7. Injection pipe
8. Engine harness
9. Oil level guide tube
10. Inlet cover
11. Inlet case

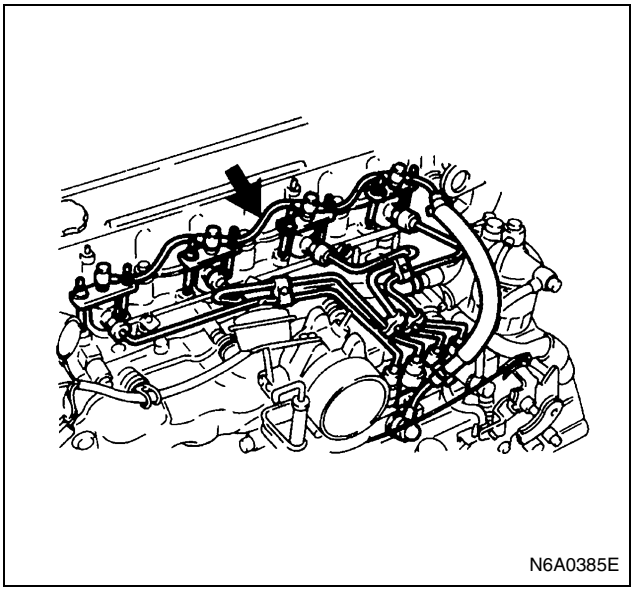
Removal

Preparation

- Disconnect battery ground cable.
- Tilt the cab.

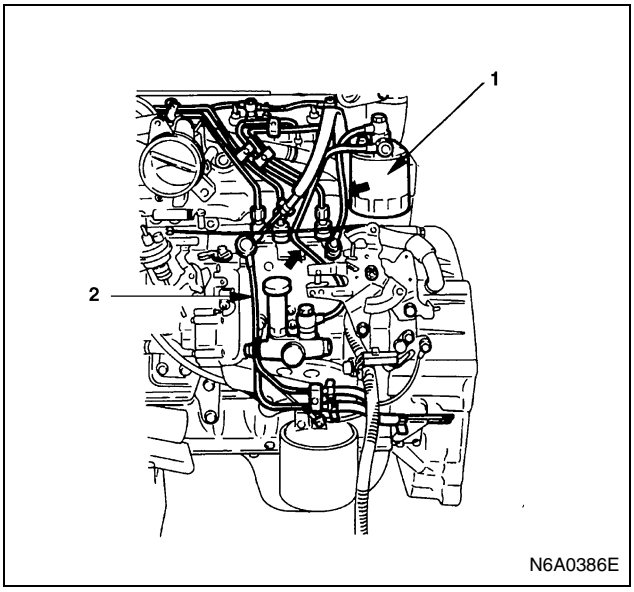
1. Intake Air Duct
   1) Remove the clips at the connections with the inlet cover and with the air cleaner.
   2) Remove the intake air duct with the connector hose attached.
2. Vacuum Hose
3. Nozzle Cover

4. Leak off Pipe



N6A0385E

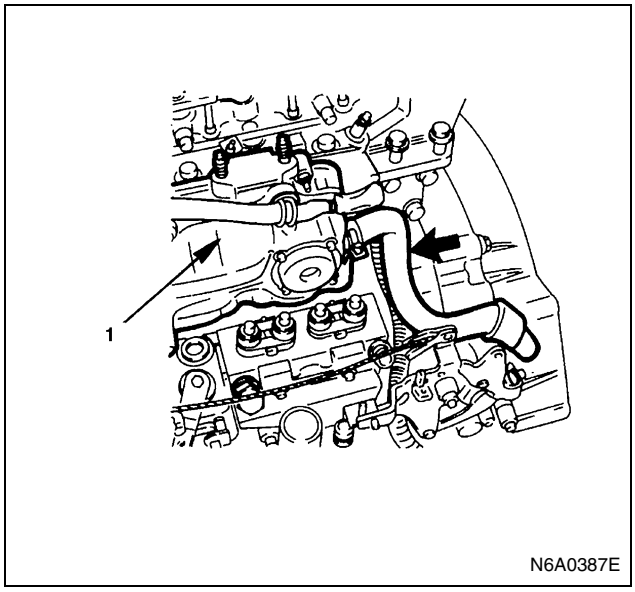
5. Fuel Pipe
   Do not apply excessive force to the fuel pipes.



N6A0386E

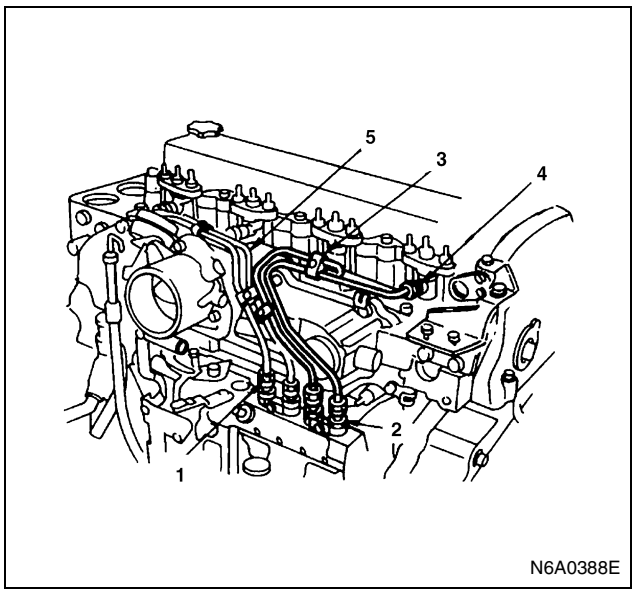
Legend
1. Fuel filter
2. Leak off

6. Positive Crankcase Ventilation (PCV) Hose
   Disconnect the PCV hose from inlet cover (1).



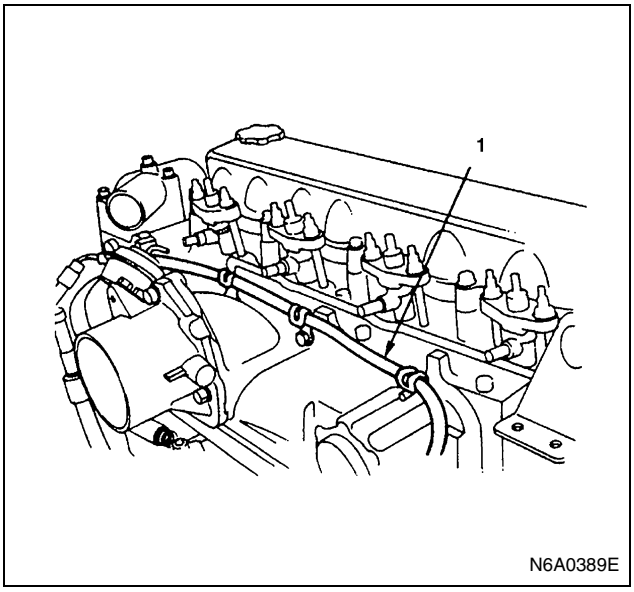
N6A0387E

7. Fuel Injection Pipe
   1) Loosen the injection pipe sleeve nuts (1).
   2) Do not apply excessive force to the injection pipes (5).
   3) Loosen the injection pipes clips (3).
   4) Remove the injection pipe assembly.
      Plug the delivery valve holder (2) ports and nozzle holder (4) ports with caps to prevent the entry of foreign material.



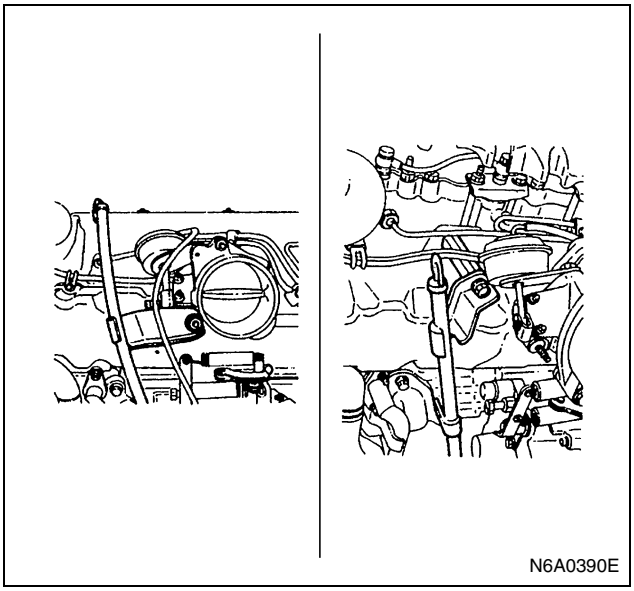
N6A0388E

8. Engine Harness
   Disconnect thermometer unit, thermo switch, tachometer sensor and glow plug harness connectors and separate harness from clips.

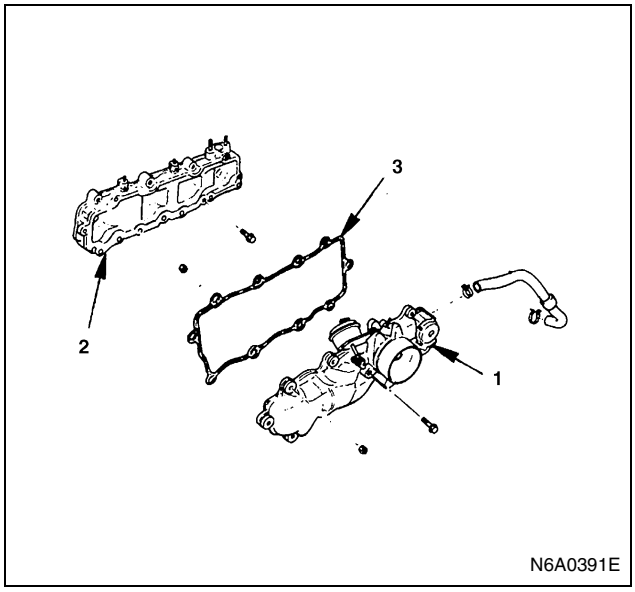


Legend
1. Engine harness

9. Oil Level Guide Tube
   Remove the guide tube fixing bolt and pull out the guide tube.



10. Inlet Cover
11. Inlet Case
    Remove the inlet case while removing the liquid gasket.



Legend
1. Inlet cover
2. Inlet case
3. Gasket

Installation

1. Inlet Case
   1) Apply 2 — 3 mm (0.08 — 0.12 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the groove (1) of the inlet case fitting surfaces shown in the illustration.
   - Clean the inlet case fitting surface of the cylinder head.

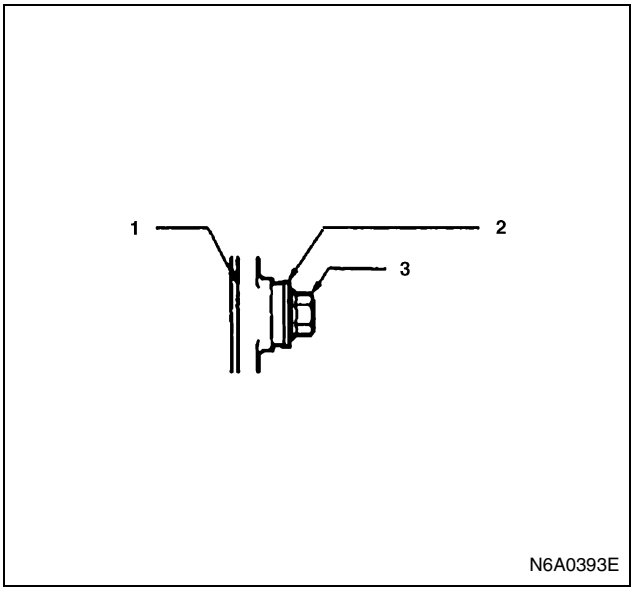
   2) Install the inlet case to the cylinder head.
   - Install the inlet case within 7 minutes after application of liquid gasket.
   3) Tighten the inlet case to the specified torque.

Tighten:
Inlet case nuts and bolts to 19 N·m (1.9 kg·m/ 14 lb·ft)

2. Inlet Cover
   1) Attach harness clips ((1), (6) and (7)) and tighten the inlet cover bolts and nuts to the specified torque in the numerical order shown in the illustration.

   2) ★ marks are located on the nut positions.

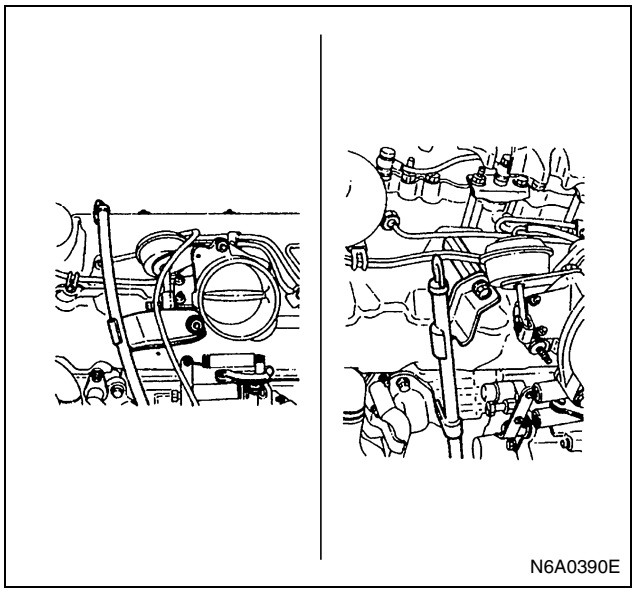
Tighten:
Inlet cover bolt and nut to 13 N·m (1.3 kg·m/9 lb·ft)



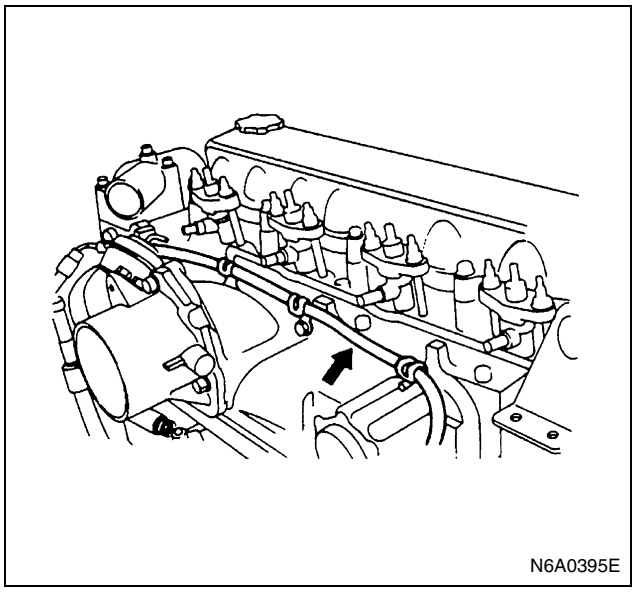
Legend
1. Inlet cover
2. Mounting rubber
3. Bolt

3. Oil Level Guide Tube
   1) Install the O-rings to the guide tube lower portion and insert the guide tube completely to the cylinder body.
   2) Tighten the guide tube bolt to the specified torque.

Tighten:
Guide tube bolt to 13 N·m (1.3 kg·m/9.4 lb·ft)



4. Engine Harness
   Connect thermometer unit, thermo switch, tachometer sensor and glow plug harness connector and fasten the engine harness with clips.

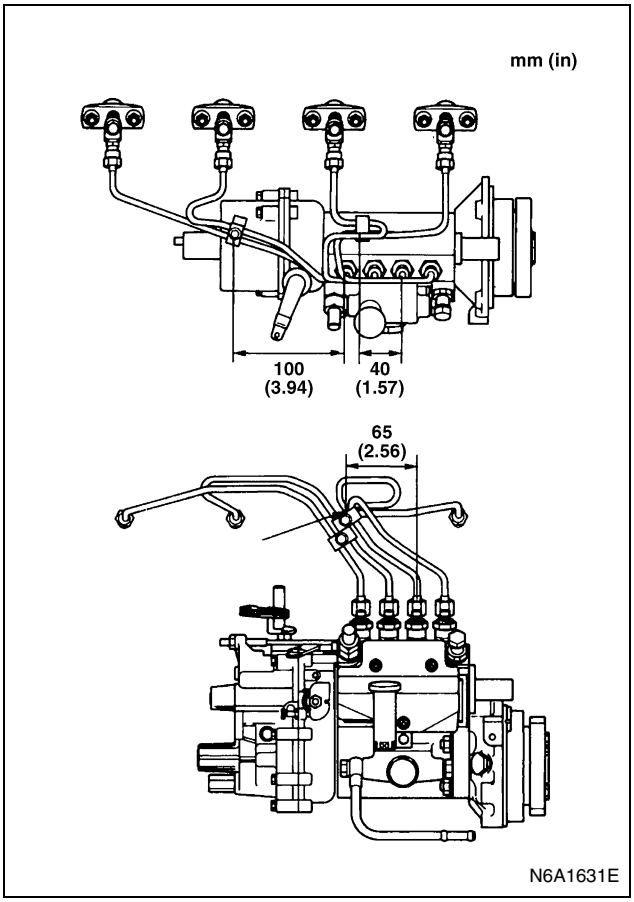


5. Injection Pipe
   1) Install the injection pipe assembly and temporarily tighten the injection pipe sleeve nuts.
   2) Set the clips in the prescribed position shown in the illustration.

Caution:
Make absolutely sure that the clip is correctly positioned.

An improperly positioned clip will result in injection pipe breakage and fuel pulsing noise.

Tighten:
Clip screw to 3 N·m (0.3 kg·m/26 lb·in)



3) Tighten the injection pipe sleeve nuts to the specified torque.

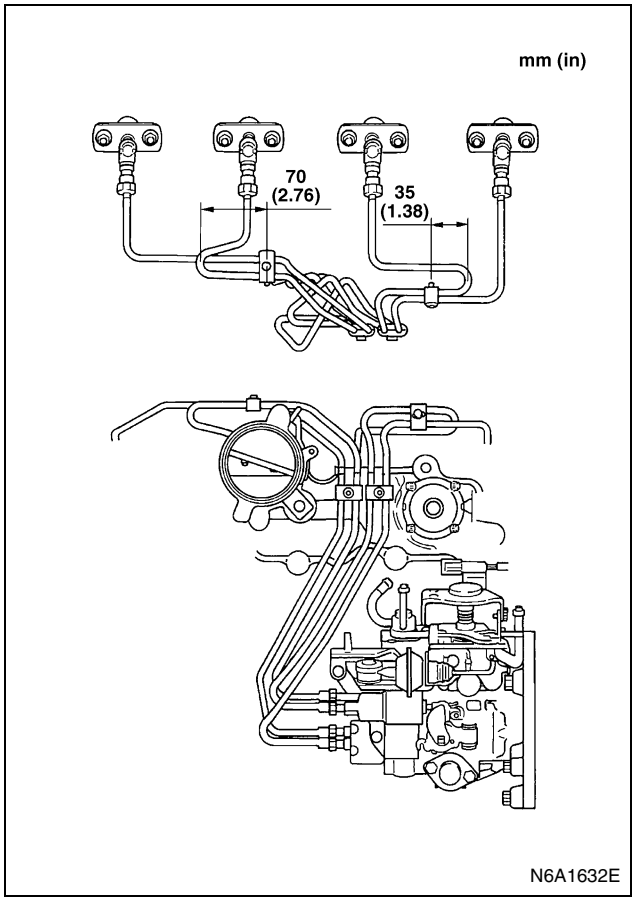
Tighten:
Injection pipe sleeve nut to 29 N·m (3 kg·m/22 lb·ft)

Injection Pipe (4HF1-2 model only)

1) Install the injection pipe assembly and temporarily tighten the injection pipe sleeve nuts.
2) Set the clips in the prescribed position shown in the illustration.

Caution:
Make absolutely sure that the clip is correctly positioned.
An improperly positioned clip will result in injection pipe breakage and fuel pulsing noise.

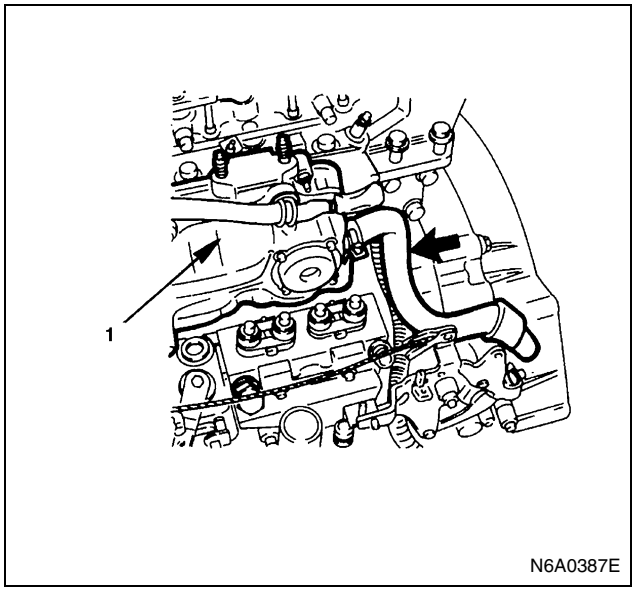
Tighten:
Clip screw to 3 N·m (0.3 kg·m/26 lb·in)



3) Tighten the injection pipe sleeve nuts to the specified torque.

Tighten:
Injection pipe sleeve nut to 29 N·m (3 kg·m/22 lb·ft)

6. Positive Crankcase Ventilation (PCV) Hose



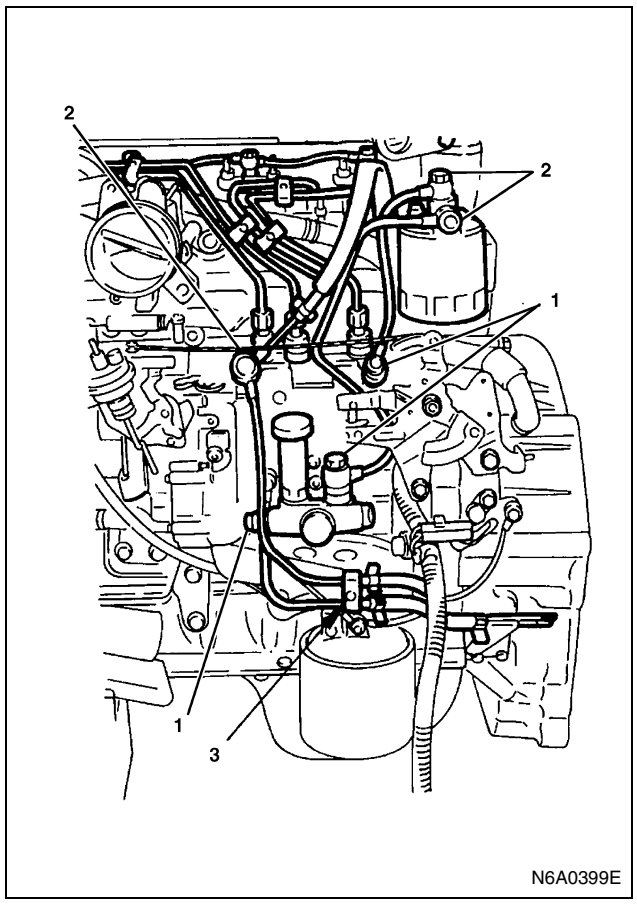
Legend
1. Inlet cover

7. Fuel Pipe
   Do not apply excessive force to the fuel pipe.

Tighten:
Fuel pipe joint bolt (1) to 41 N·m (4.2 kg·m/30 lb·ft)

Tighten:
Fuel pipe joint bolt (2) to 23 N·m (2.3 kg·m/17 lb·ft)

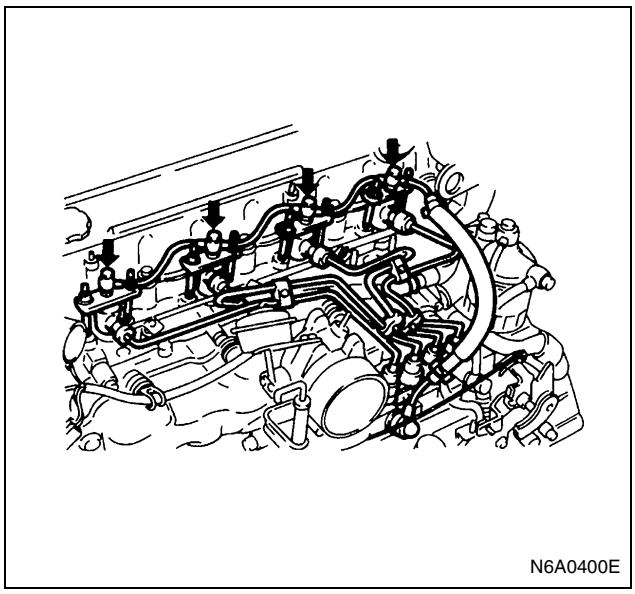
Tighten:
Clip screw to 4 N·m (0.4 kg·m/35 lb·in)



Legend
1. Fuel pipe joint bolt
2. Fuel pipe joint bolt
3. Clip

8. Leak Off Pipe

Tighten:
Leak-Off pipe joint bolt to 13 N·m (1.3 kg·m/113 lb·in)

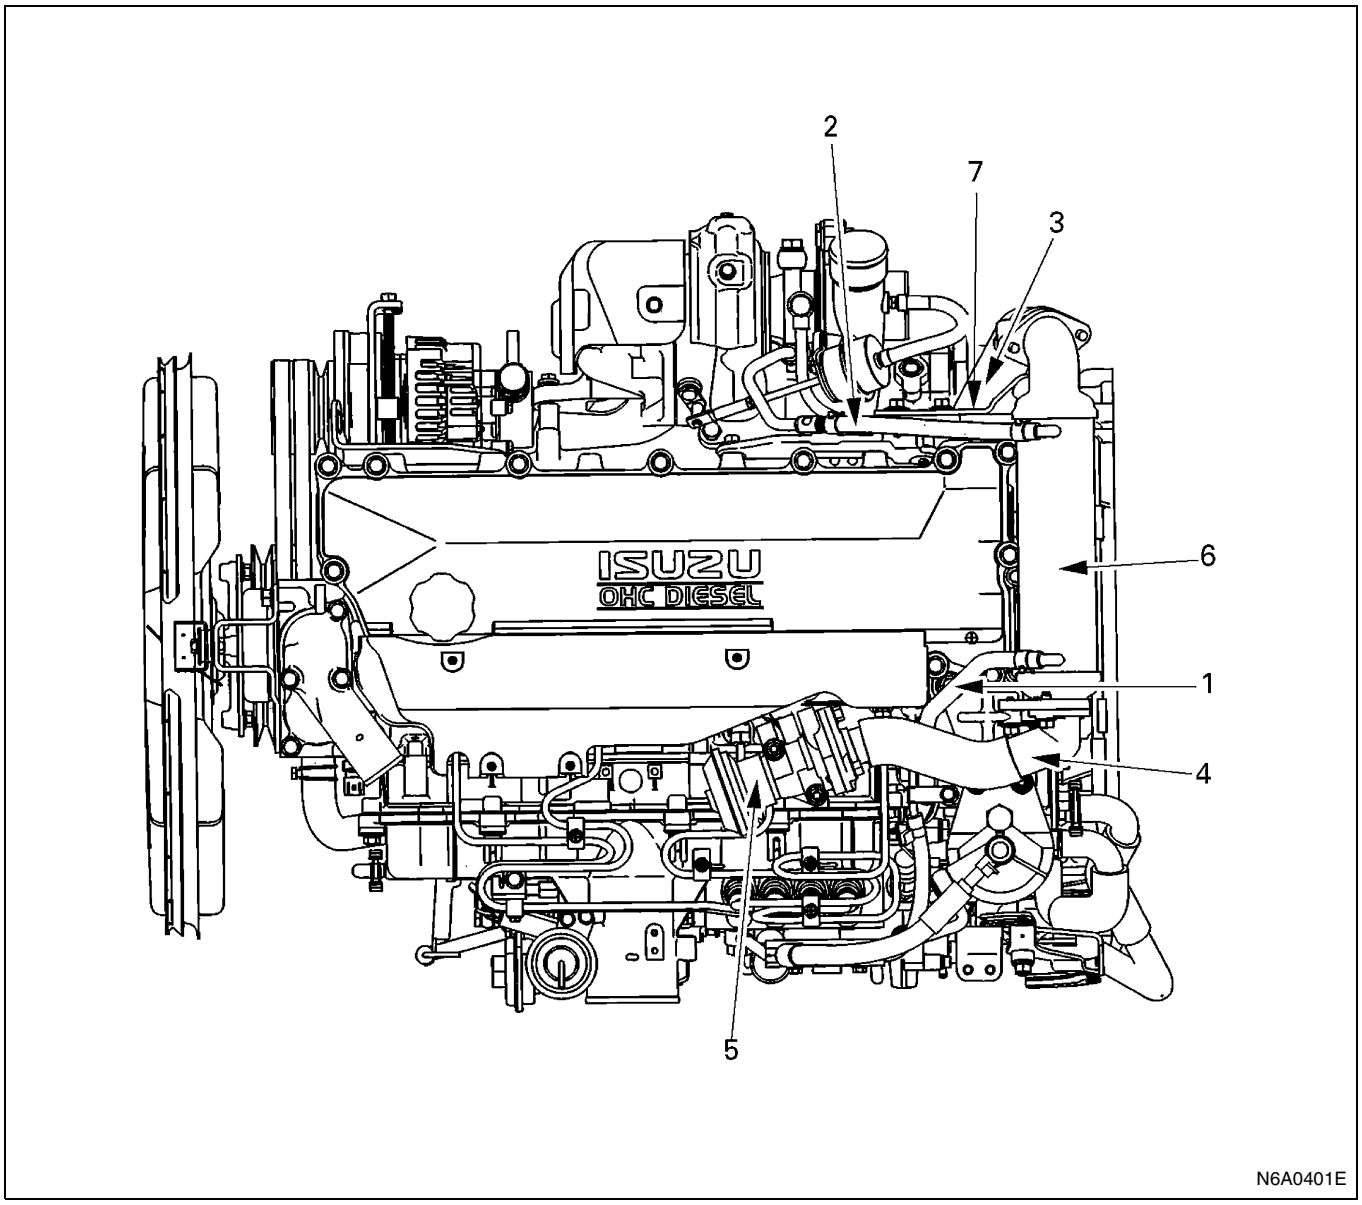


9. Nozzle Cover
10. Vacuum Hose
11. Intake Air Duct
    - Connect the negative battery cable.
    - Lower the cab.
    - Start engine and check for fuel leakage carefully.

4HE1-TC (4HE1-XS) for EURO3

EXHAUST GAS RECIRCULATION SYSTEM (EGR)

Component



Legend

1. Water hose (out)
2. Water hose (in)
3. EGR pipe (right side)
4. EGR pipe (left side)
5. EGR valve
6. EGR cooler
7. EGR cooler bracket

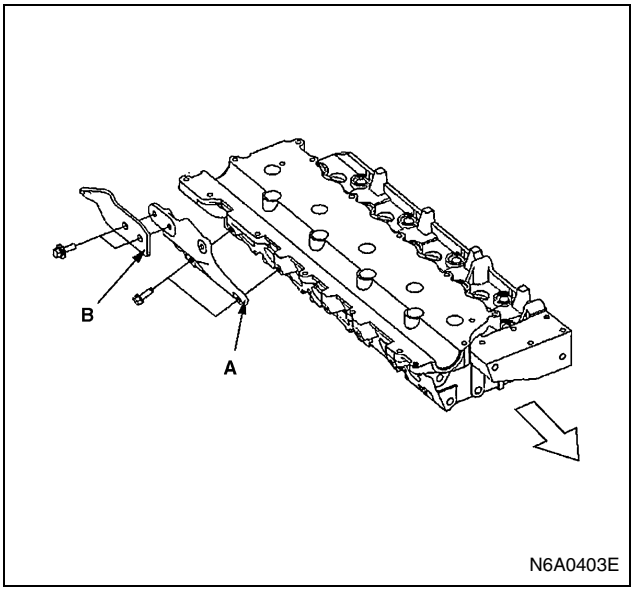
Removal

1. Water hose (out)
2. Water hose (in)
3. EGR pipe (right side)
4. EGR pipe (left side)
5. EGR valve
6. EGR cooler
7. EGR cooler bracket

Installation

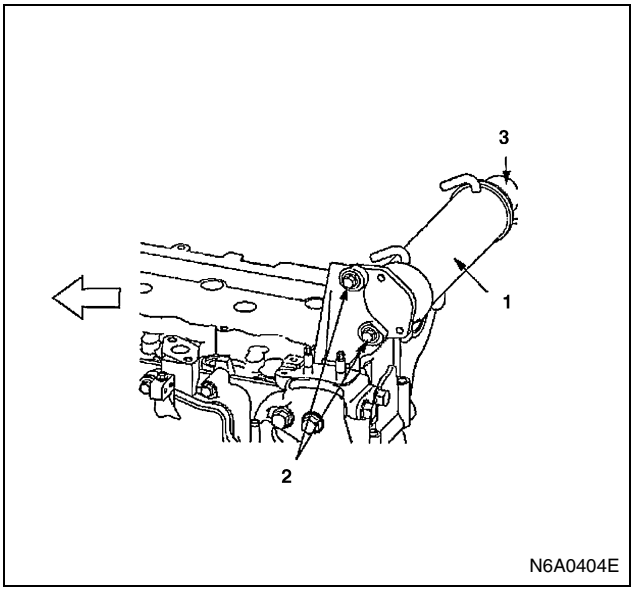
1. EGR Cooler Bracket
   Temporarily tighten the EGR cooler bracket (B) to the EGR cooler bracket (A).

Tighten:
EGR cooler bracket bolt (A) to 31 N·m (3.2 kg·m/23 lb·ft)



2. EGR Cooler
   1) Temporarily tighten the EGR cooler bolts left side.
   2) Tighten the EGR cooler bolt right side.

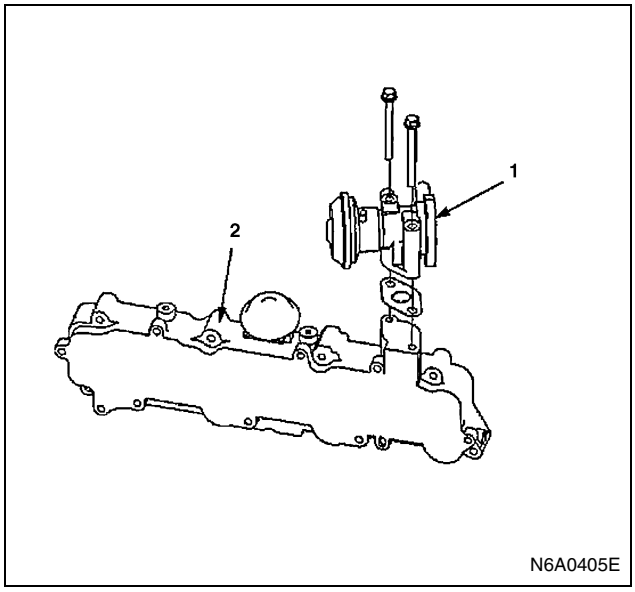
Tighten:
EGR cooler bracket bolt (right side) to 33 N·m (3.4 kg·m/ 25 lb·ft)



Legend
1. EGR cooler
2. Left side
3. Right side

3. EGR Valve
   Insert the gasket and install the EGR valve to the intake manifold.

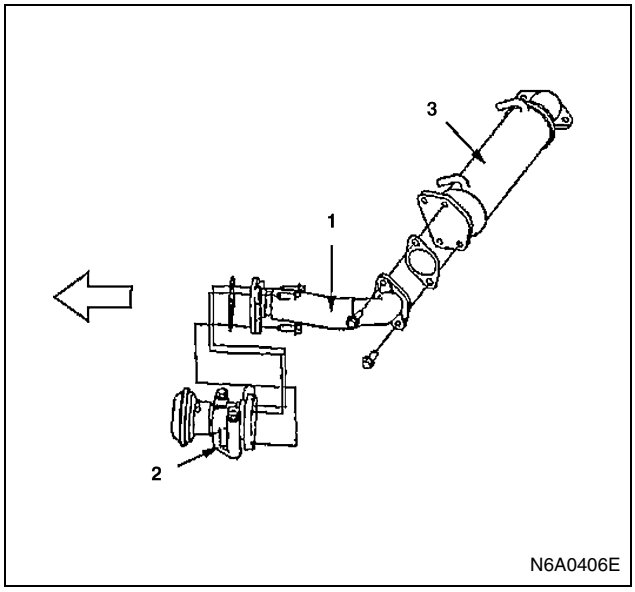
Tighten:
EGR valve bolt to 24 N·m (2.4 kg·m/17 lb·ft)



Legend
1. EGR valve
2. Inlet case

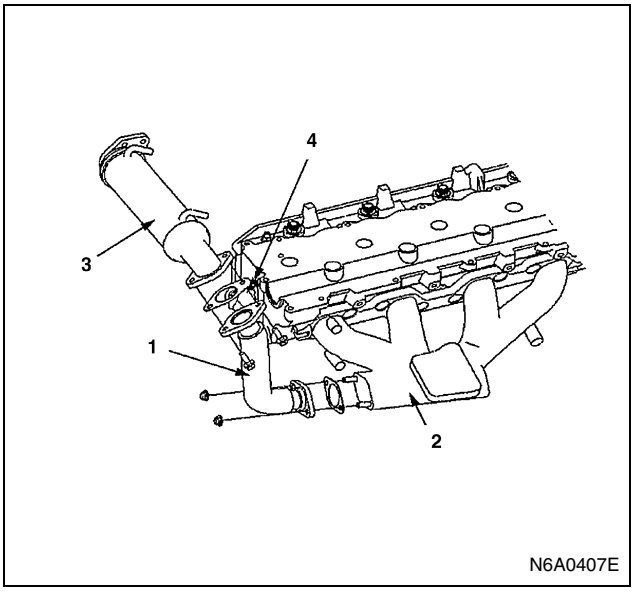
4. EGR Pipe (left side)
   Insert the gasket into the left-hand EGR pipe (1). Install the pipe between the EGR valve (2) and the EGR cooler (3).

Tighten:
EGR pipe (left side) bolt to 24 N·m (2.4 kg·m/17 lb·ft)



5. EGR Pipe (right side)
   1) Insert the gasket into the right-hand EGR pipe (refer to the illustration). Install the pipe between the exhaust manifold and the EGR cooler.

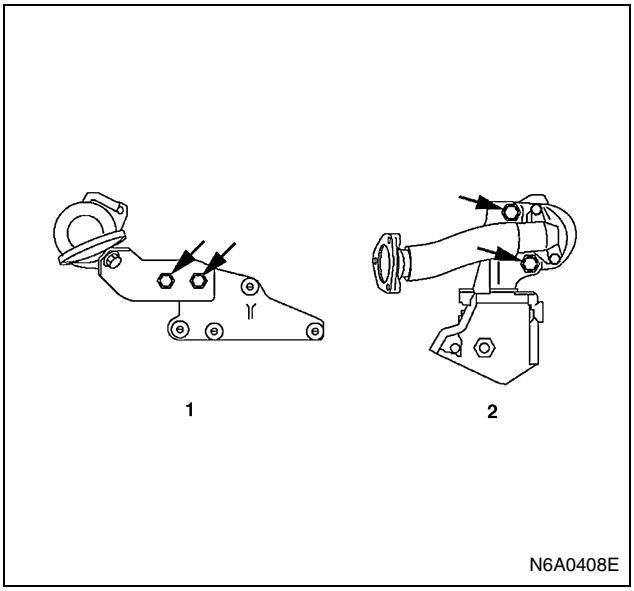
Tighten:
EGR pipe nut and bolt to 28 N·m (2.9 kg·m/21 lb·ft)



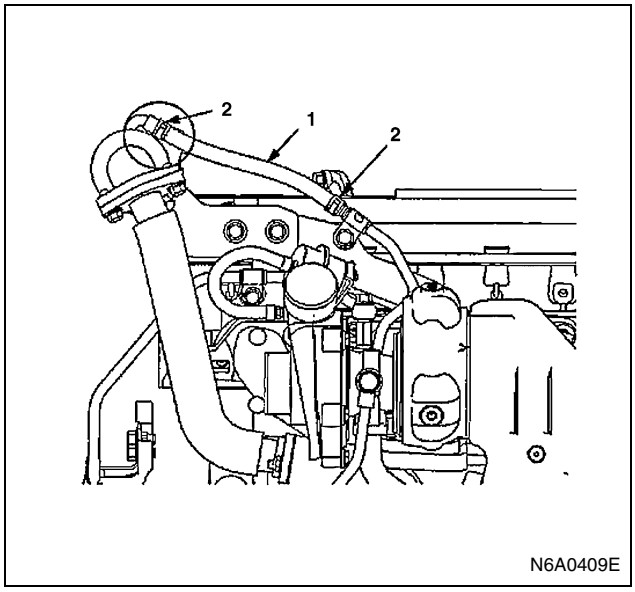
Legend
1. EGR pipe
2. Exhaust manifold
3. EGR cooler
4. TAB

2) Adjust bracket position to eliminate any play using the bracket adjustment holes. Tighten the bolts as shown by the arrows in the illustration.

Tighten:
EGR cooler bracket bolt to
- Right side (1): 26 N·m (2.7 kg·m/20 lb·ft)
- Left side (2): 24 N·m (2.4 kg·m/17 lb·ft)

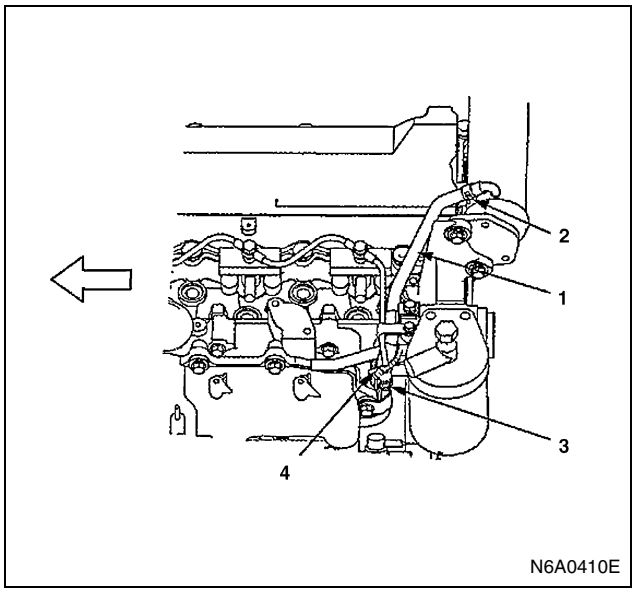


6. Water Hose (in)
Arrange the clips so that the jaws face the side of the engine.



Legend
1. Water hose (in)
2. Clip

7. Water Hose (out)
Insert clip (2) so that the jaws face the side of the engine.
Install clip (3) so that the jaws face away from the engine.

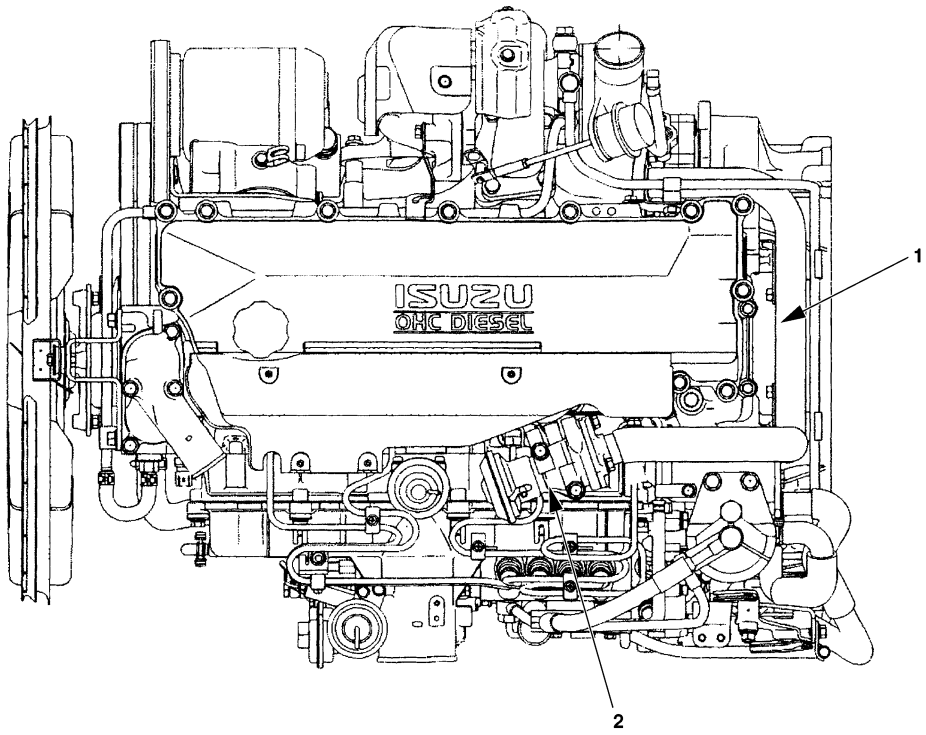


Legend
1. Water hose (out)
2. Clip
3. Clip
4. Band clip

4HE1-TC (98EPA)

EXHAUST GAS RECIRCULATION SYSTEM (EGR)

Component



N6A1601E

Legend

1. EGR pipe assembly
2. EGR valve

Removal

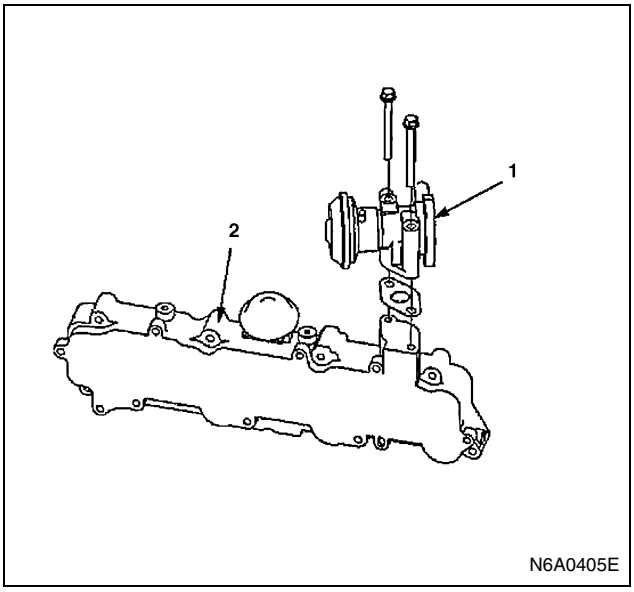
1. EGR pipe assembly
2. EGR valve

Installation

1. EGR valve
   Insert the gasket and install the EGR valve to the intake manifold.

Notice:
The gasket of 4HE1-XS and 4HE1-XN are dirrerent.

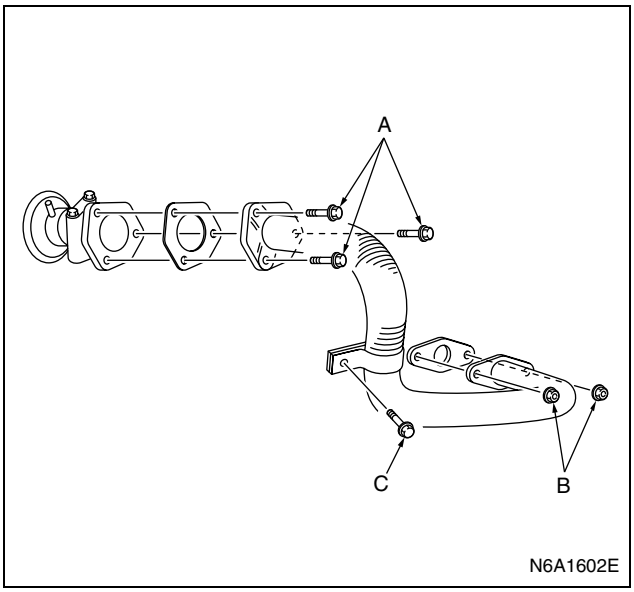
Tighten:
EGR valve bolt to 23.5 ± 5 N·m (2.4 ± 0.5 kg·m/17 ± 3.7 lb·ft)



Legend
1. EGR valve
2. Inlet case

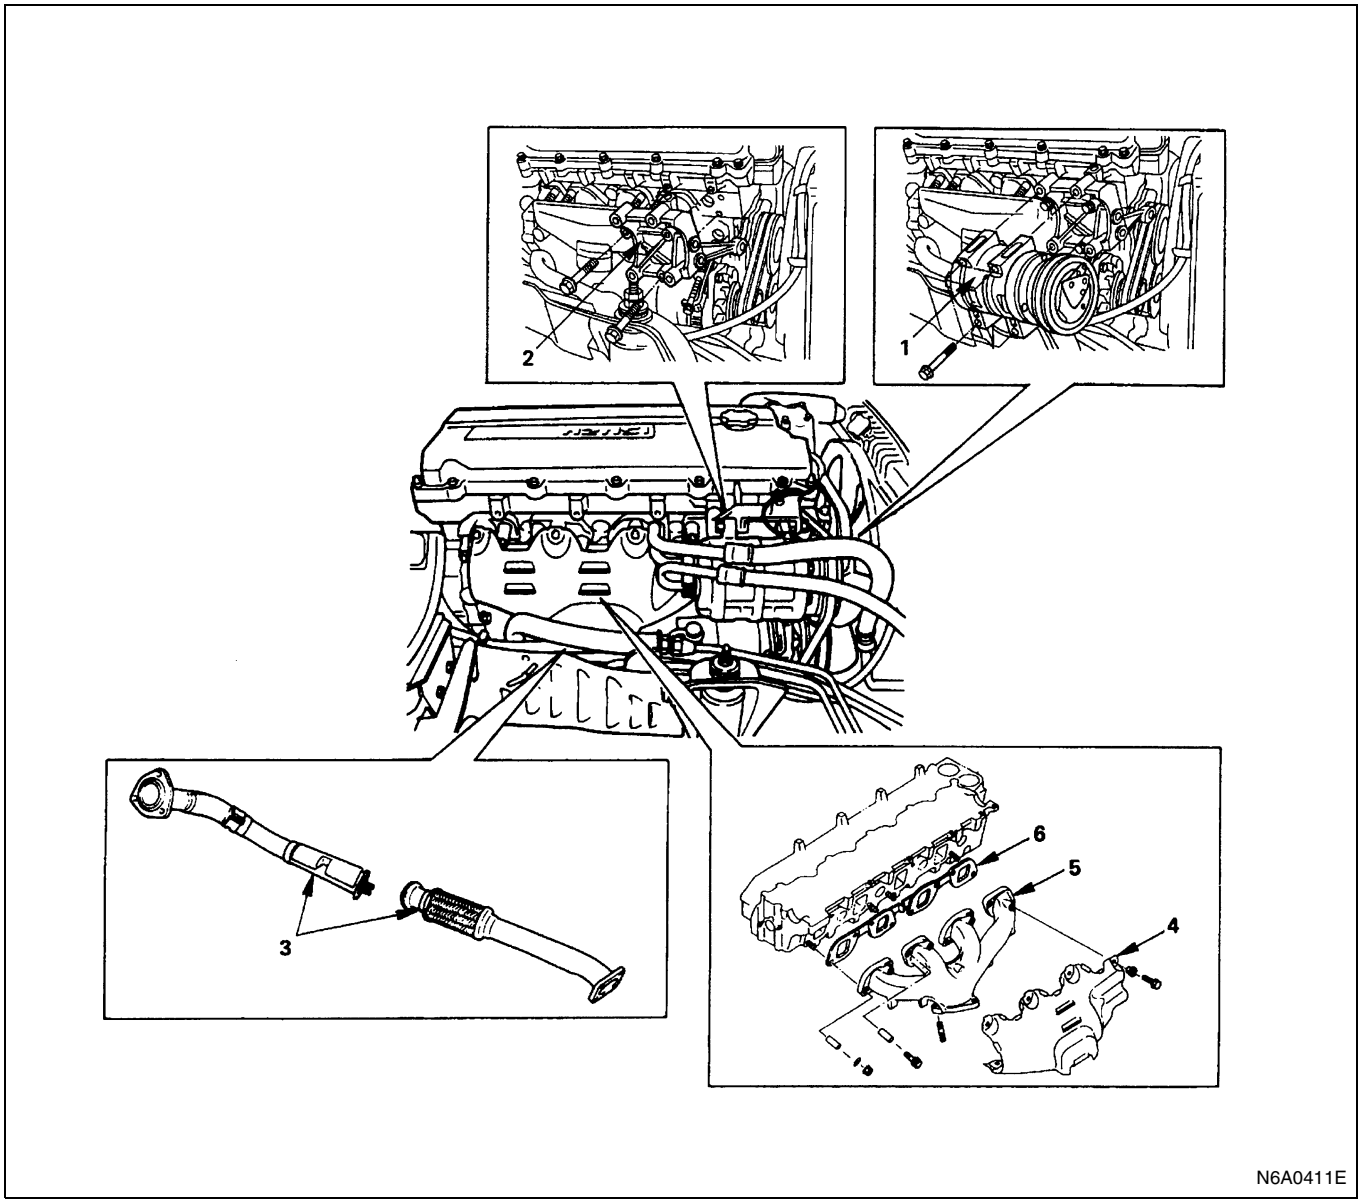
2. EGR Pipe assembly
   Install the EGR pipe assembly to the exhaust manifold and the EGR valve with gasket.

Tighten:
A: Bolt to 23.5 ± 5 N·m (2.4 ± 0.5 kg·m/17 ± 3.7 lb·ft)
B: Nut to 28.4 ± 4 N·m (2.9 ± 0.4 kg·m/21 ± 3.1 lb·ft)
C: Bolt to 23.5 ± 5 N·m (2.4 ± 0.5 kg·m/17 ± 3.7 lb·ft)



EXHAUST MANIFOLD

Component



Legend

1. A/C compressor (If equipped with A/C)
2. A/C compressor bracket (If equipped with A/C)
3. Front exhaust Pipe
4. Heat protector
5. Exhaust manifold
6. Exhaust gasket

Removal

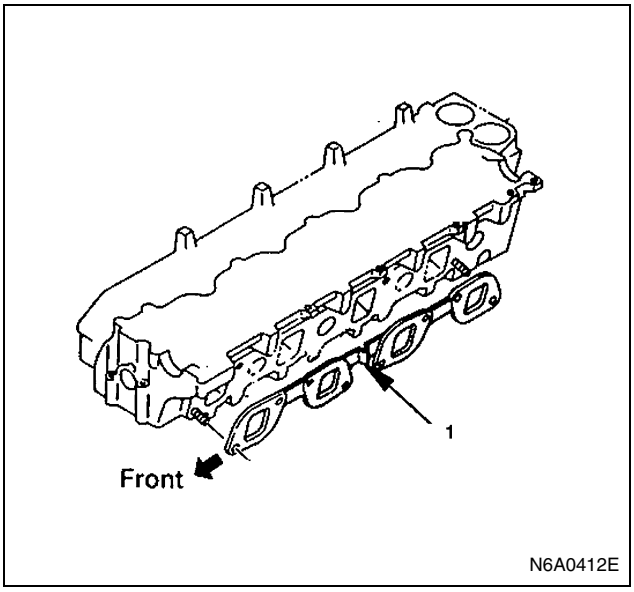
Preparation

- Disconnect battery ground cable.
- Tilt the cab.

1. Air Conditioning (A/C) Compressor (If equipped with A/C)
   1) Disconnect magnetic clutch harness connector.
   2) Dismount the compressor together with the hoses from the A/C compressor bracket, and fasten it to the appropriate location with a wire.
2. A/C Compressor Bracket (If equipped with A/C)
3. Front Exhaust Pipe
4. Heat Protector
5. Exhaust Manifold
6. Exhaust Gasket

Installation

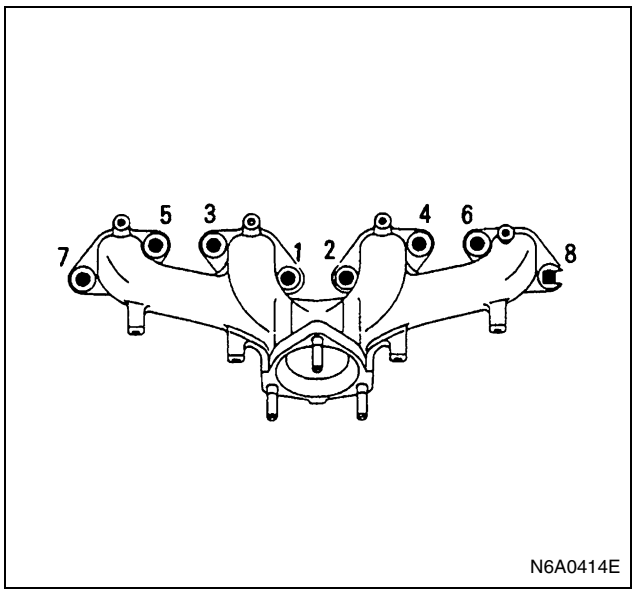
1. Exhaust Gasket
   Insert the gasket into the stud provided to the cylinder head (with the projection (1) of the gasket on this side).



2. Exhaust Manifold
   1) Install exhaust manifold gaskets (1), exhaust manifold (2), distance pieces (3), dish washers (4) and nuts (5) to the stud bolts shown in the illustration.

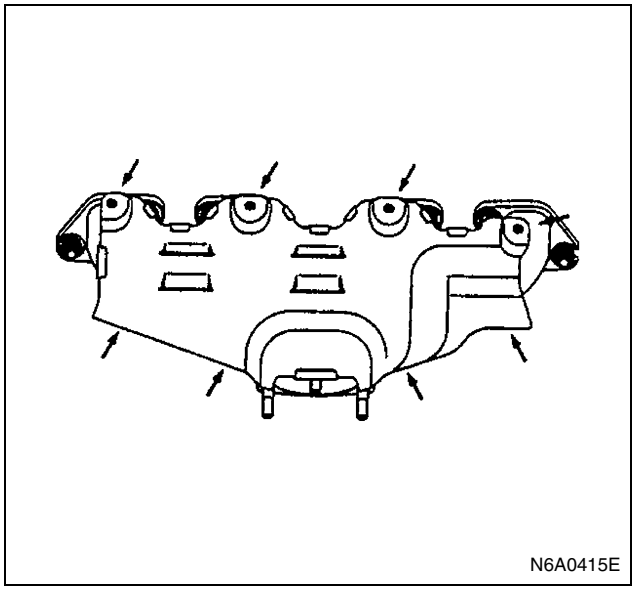
   2) Tighten the nuts to the specified torque in the numerical order shown in the illustration.

Tighten:
Exhaust manifold nut to 34 N·m (3.5 kg·m/25 lb·ft)



3. Heat Protector

Tighten:
Heat protector bolt to 10 N·m (1.0 kg·m/7 lb·ft)

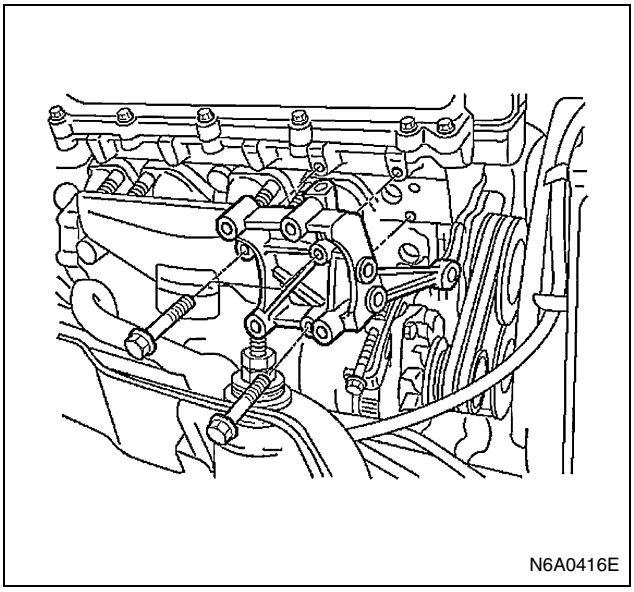


4. Front Exhaust Pipe

Tighten:
Front exhaust pipe to
- Exhaust manifold side: 67 N·m (6.8 kg·m/49 lb·ft)
- Exhaust brake side: 17 N·m (1.7 kg·m/12 lb·ft)

5. Air Conditioning (A/C) Compressor Bracket (If equipped with A/C)
   Tighten fixing bolts to the specified torque.

Tighten:
A/C compressor bracket bolt to 48 N·m (4.9 kg·m/35 lb·ft)

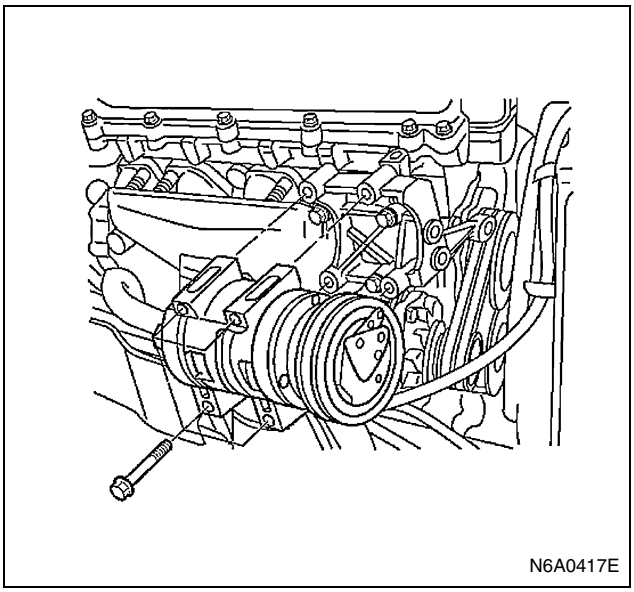


N6A0416E

6. A/C Compressor (If equipped with A/C)
   1) Tighten fixing bolts to the specified torque.

Tighten:
A/C compressor bolt to 48 N·m (4.9 kg·m/35 lb·ft)

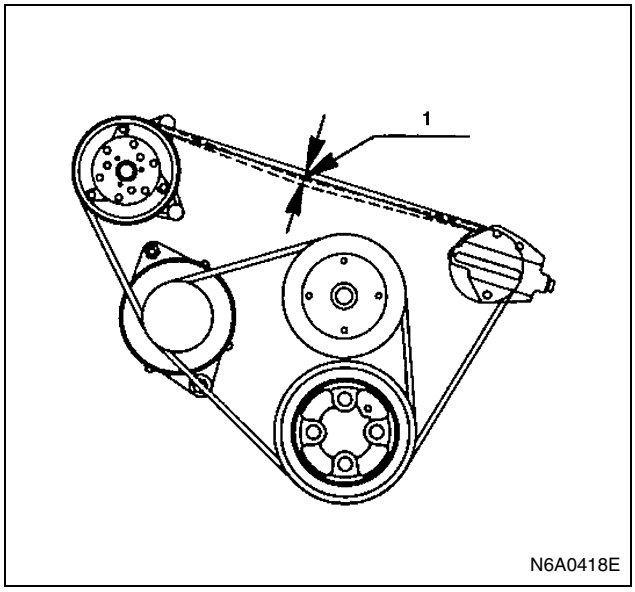
Notice:
When tightening the compressor fixing bolts, tighten first the 2 bolts on the rear side, and then the remaining 2 on the front.



N6A0417E

   2) Install drive belt adjust belt tension by adjusting bolt and tighten locking nut to the specified torque.
   3) Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
16 — 20 (0.63 — 0.79) ... New belt 18 — 22 (0.71 — 0.87) ... Reuse belt	



N6A0418E

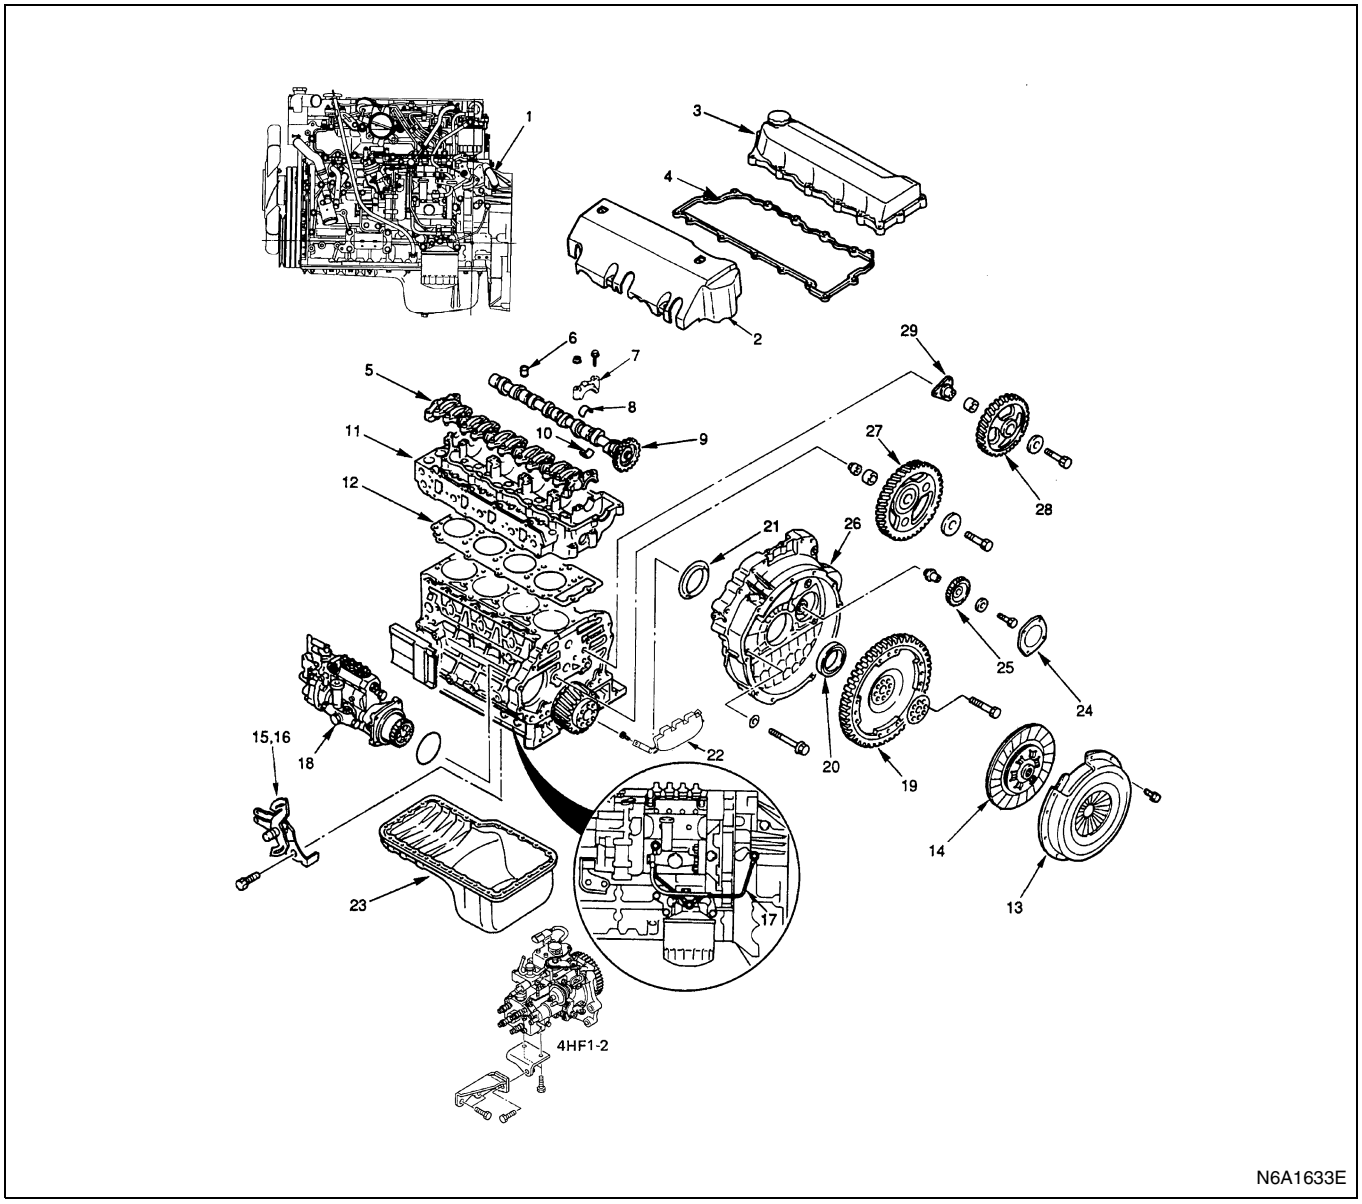
Legend
1. Belt deflection

Tighten:
Locking nut to 27 N·m (2.8 kg·m/20 lb·ft)

- Connect the negative battery cable.
- Lower the cab.
- Start engine and check for gas leakage carefully.

TIMING GEAR REPLACEMENT

Component



Legend

1. Engine assembly
2. Nozzle cover
3. Cylinder head cover
4. Head cover gasket
5. Rocker arm shaft assembly
6. Valve cap
7. Camshaft bearing cap
8. Camshaft bearing upper
9. Camshaft assembly
10. Camshaft bearing lower
11. Cylinder head assembly
12. Cylinder head gasket
13. Clutch pressure plate assembly
14. Driven plate
15. Engine control wire
16. Engine control lever assembly
17. Oil pipe
18. Injection pump assembly
19. Flywheel
20. Rear oil seal
21. Slinger
22. Spacer rubber
23. Oil pan
24. Power steering pump idle gear cover
25. Power steering pump idle gear
26. Flywheel housing
27. Idle gear A
28. Idle gear B
29. Idle gear B shaft

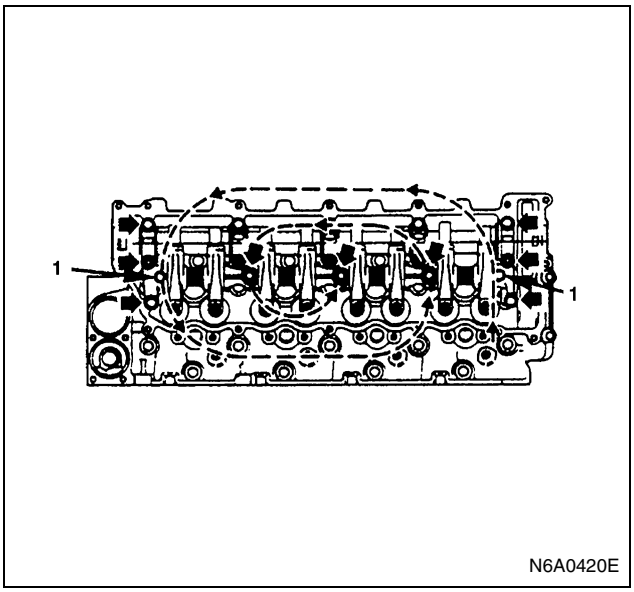
Removal

Preparation

- Disconnect battery ground cable.
- Tilt the cab.
- Drain coolant and engine oil.

1. Engine Assembly
   Above works refer to “ENGINE ASSEMBLY” section in this manual.
2. Nozzle Cover
3. Cylinder Head Cover
4. Head Cover Gasket
5. Rocker Arm Shaft Assembly
   1) Loosen the rocker arm shaft bracket nuts and bolts in numerical order a little at a time and remove the rocker arm shaft assembly with the camshaft brackets.
   2) Leave the (1) indicated bolt unremoved on this occasion, since it is the rocker arm fixing bolt.

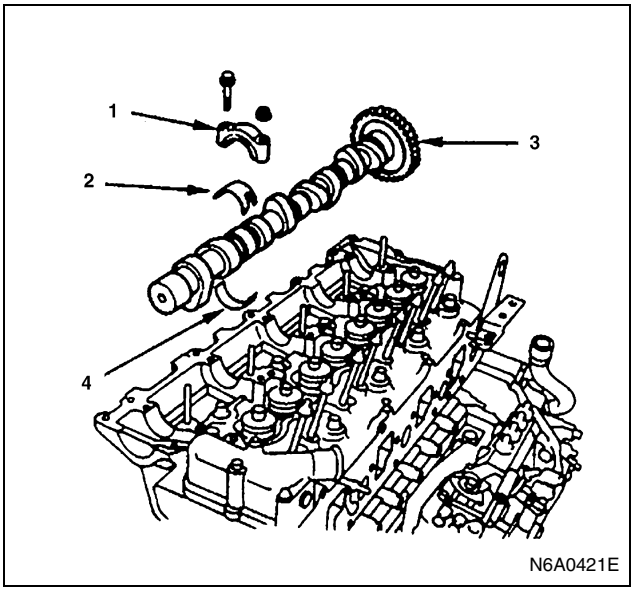
Caution:
Failure to loosen the rocker arm shaft bracket nuts and bolts in numerical order a little at a time will adversely affect the rocker arm shaft.



6. Valve Cap

Caution:
Take sufficient care not to let valve caps fall into the gear case or oil return hole.

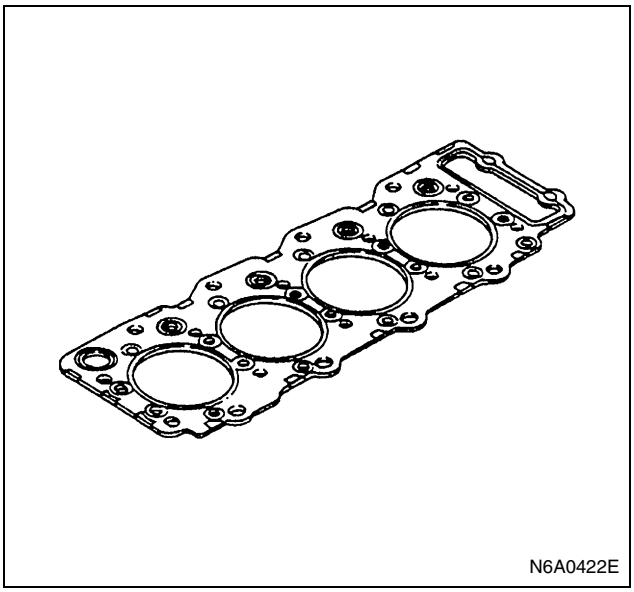
7. Camshaft Bearing Cap
8. Camshaft Bearing Upper
9. Camshaft Assembly
10. Camshaft Bearing Lower
    If the camshaft bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



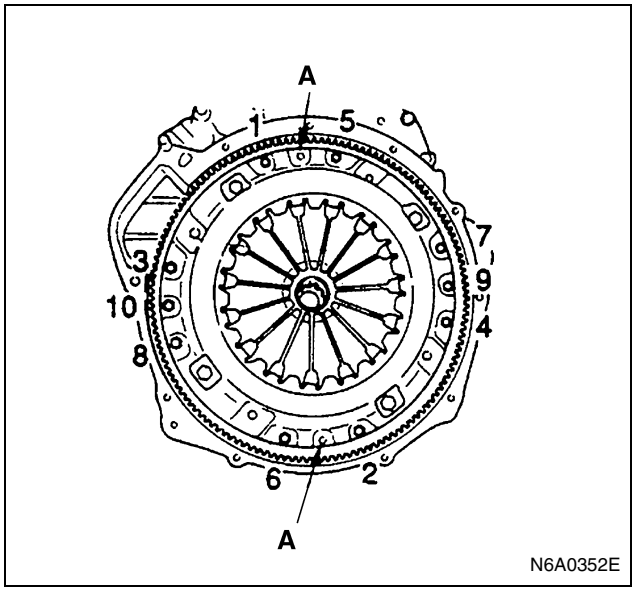
Legend
1. Camshaft bearing cap
2. Camshaft bearing upper
3. Camshaft assembly
4. Camshaft bearing lower

11. Cylinder Head Assembly
    Above works refer to “CYLINDER HEAD” section in this manual.
12. Cylinder Head Gasket

Caution:
Do not reuse the cylinder head gasket.

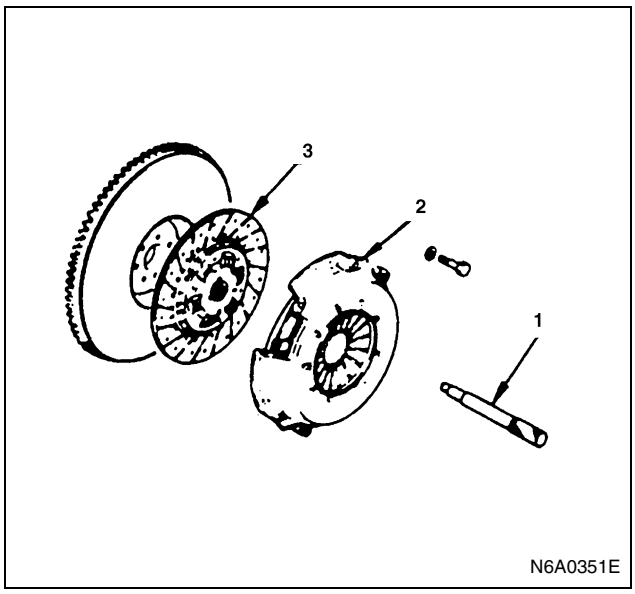


13. Clutch Pressure Plate Assembly
    1) Insert the clutch pilot aligner to the clutch assembly.
       Clutch Pilot Aligner: 5-8840-2240-0
    2) Loosen the pressure plate bolts in numerical order a little at a time as shown in the illustration.



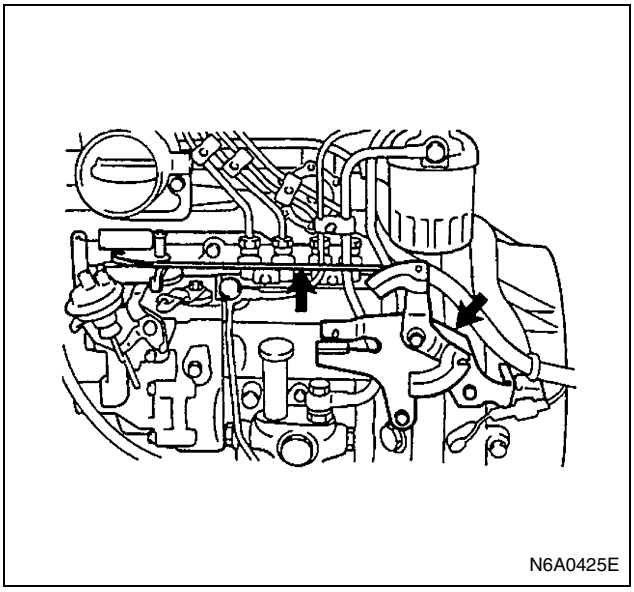
Legend
A. Knock pin

    3) Remove the pressure plate assembly.
14. Driven Plate
    Remove the driven plate with the clutch pilot aligner.



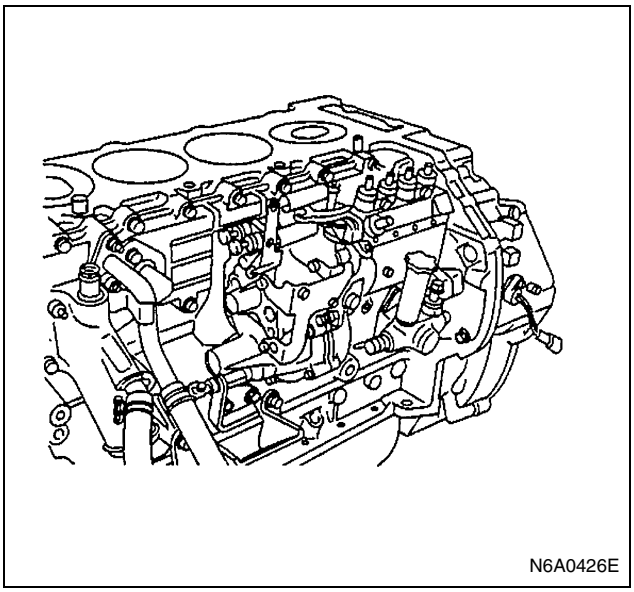
Legend
1. Clutch pilot aligner
2. Clutch pressure plate assembly
3. Driven plate

15. Engine Control Wire
16. Engine Control Lever Assembly



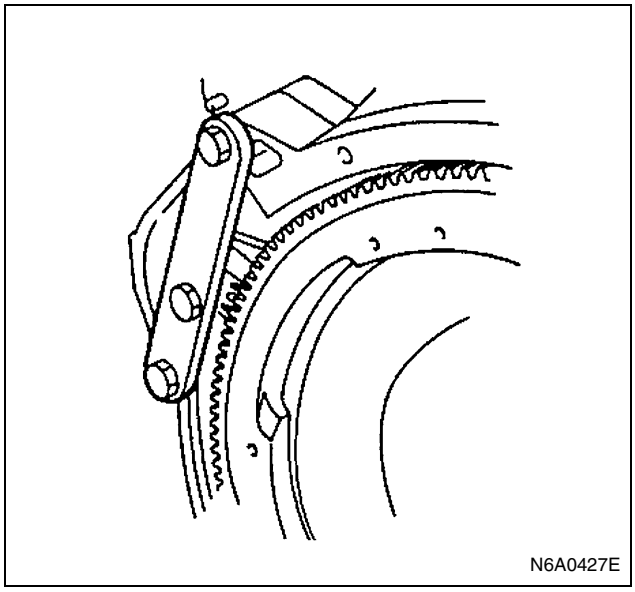
N6A0425E

17. Oil Pipe
18. Injection Pump Assembly
    1) Remove the injection pump bracket bolts and the injection pump rear bracket bolts.
    2) Then remove the injection pump assembly.



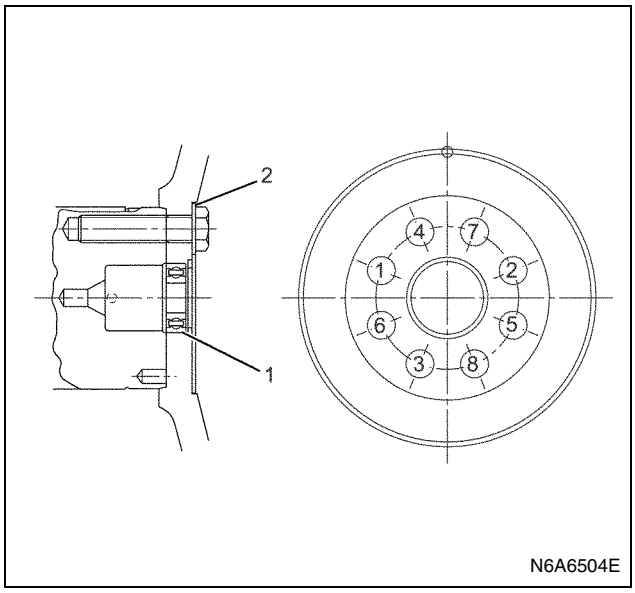
N6A0426E

19. Flywheel
    1) Use the crankshaft stopper to prevent the crankshaft from turning.
       Crankshaft Stopper: 5-8840-2230-0



N6A0427E

    2) Loosen the flywheel bolts in numerical order a little at a time as shown in the illustration.

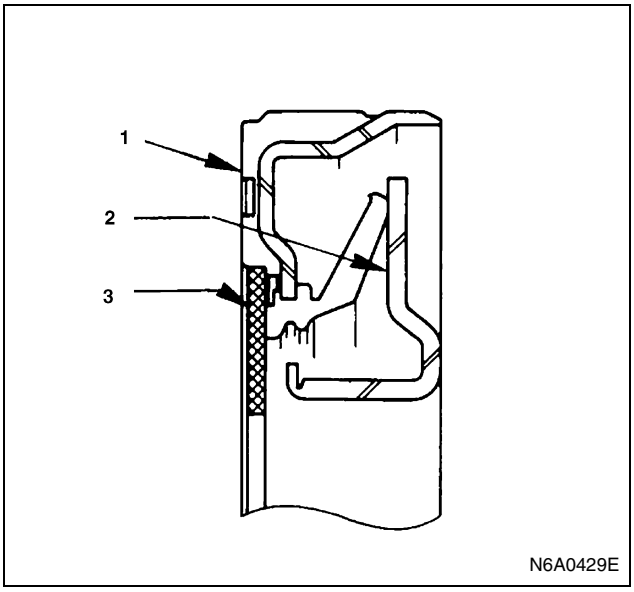


N6A6504E

Legend
1. Washer
2. Pilot bearing

    3) Remove the flywheel stopper and the flywheel assembly.
20. Crankshaft Rear Oil Seal

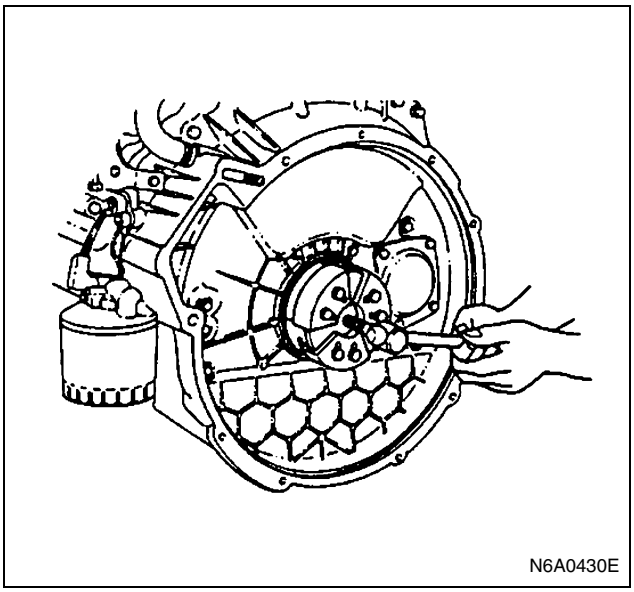
Caution:
Be careful not to damage the crankshaft oil seal contact surface during the removal procedure.



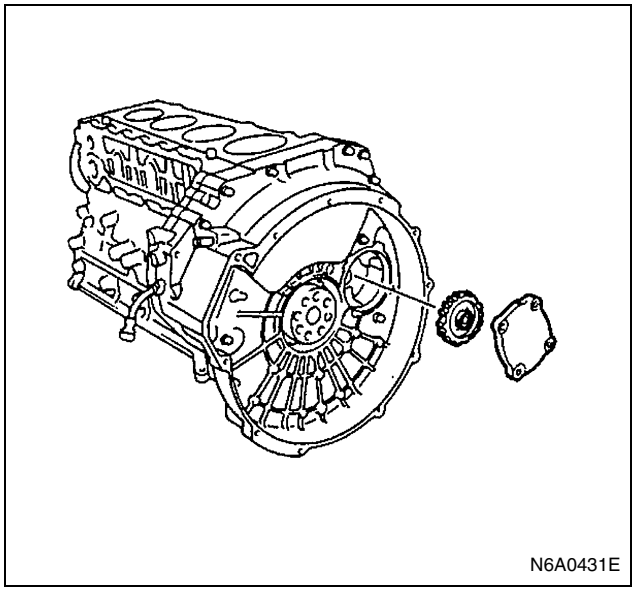
Legend

1. Oil seal
2. Slinger
3. Felt

21. Crankshaft Rear Slinger
    Use the slinger puller to pull out the slinger.
    Slinger Puller: 5-8840-2360-0

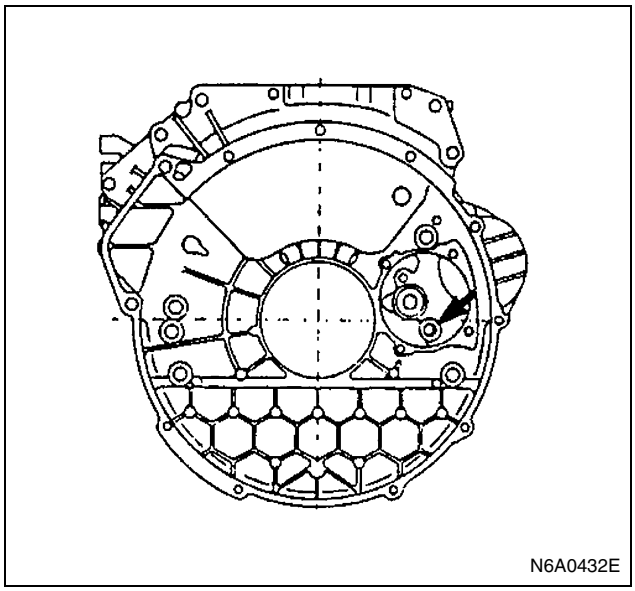


22. Spacer Rubber
    (Remove the stiffener before removing the spacer rubber.)
23. Oil Pan
24. Power Steering Pump Idle Gear Cover
25. Power Steering Pump Idle Gear

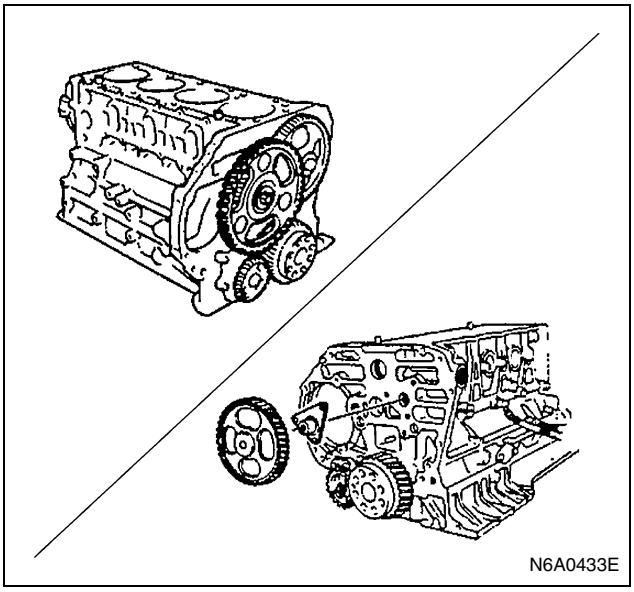


26. Flywheel Housing

Notice:
Be careful not to fail to remove the bolts shown in the illustration.



27. Idle Gear A
28. Idle Gear B
29. Idle Gear B shaft



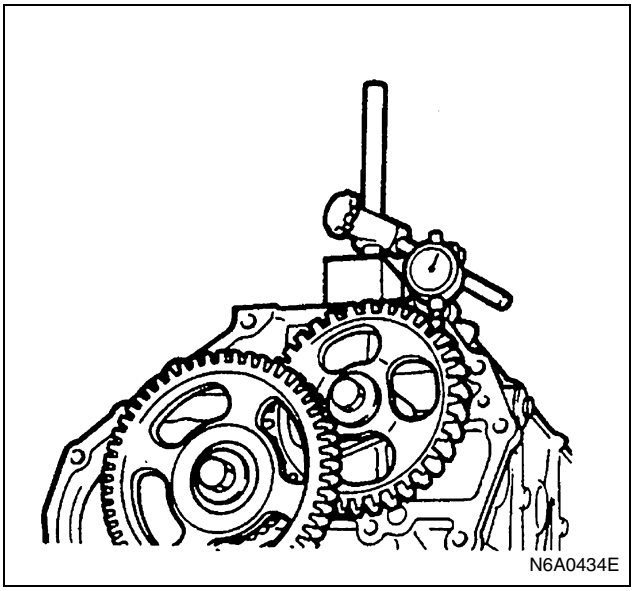
N6A0433E

Inspection

Idle Gear Backlash Measurement

1. Set a dial indicator to the timing gear to be measured.
   Hold both the gear to be checked and the adjoining gear stationary.
2. Move the gear to be checked right and left as far as possible. Take the dial indicator reading.

Timing Gear Backlash Gear to Gear	mm (in)
Standard	Limit
0.10 — 0.17 (0.0039 — 0.0067)	0.30 (0.012)

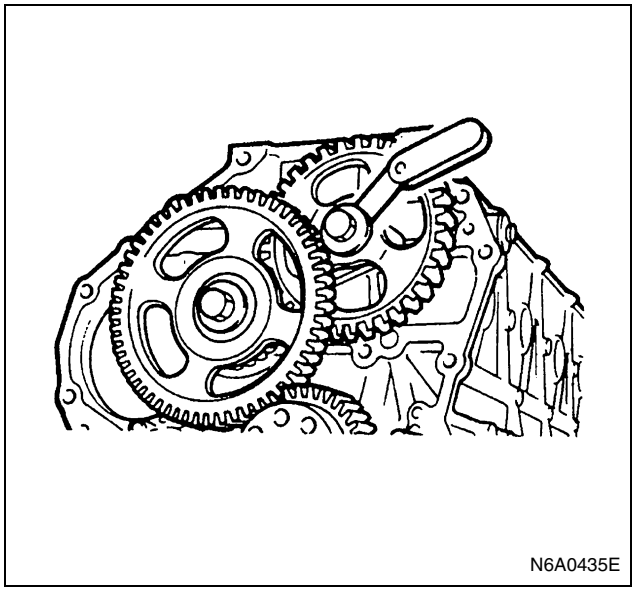


N6A0434E

Idler Gear End Play Measurement

Insert a feeler gauge between the idler gear and the thrust collar to measure the gap and determine the idler gear end play.
If the measured value exceeds the specified limit, the thrust collar must be replaced.

Idler Gear End Play	mm (in)
Standard	Limit
0.058 — 0.115 (0.002 — 0.005)	0.2 (0.008)

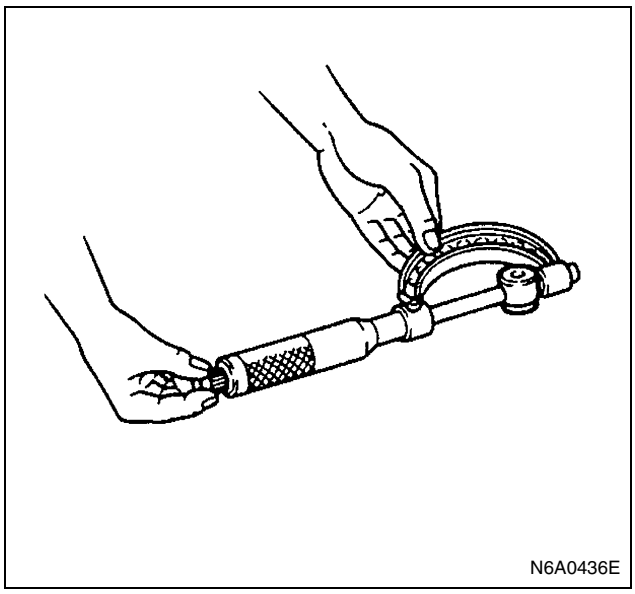


N6A0435E

Idler Gear Shaft Outside Diameter

Use a micrometer to measure the idler gear shaft outside diameter.
If the measured value is less than the specified limit, the idler gear must be replaced.

Idler Gear Shaft Outside Diameter	mm (in)
Standard	Limit
29.959 — 29.980 (1.1795 — 1.1803)	29.80 (1.1732)

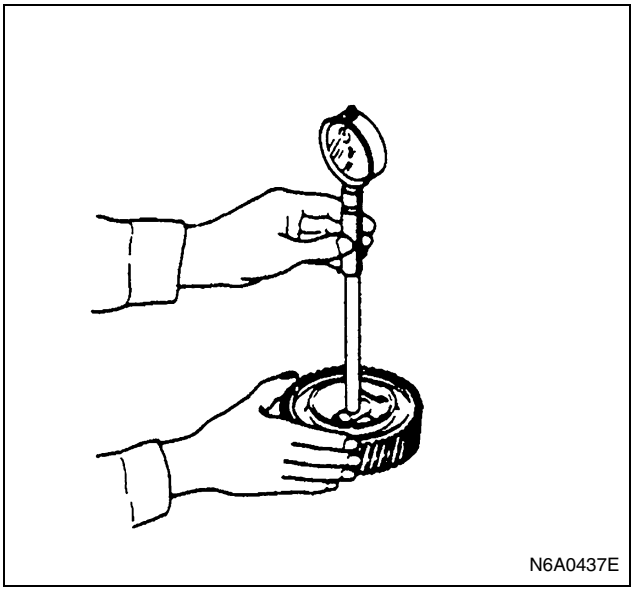


N6A0436E

Idler Gear Inside Diameter

Use an inside dial indicator or an inside micrometer to measure the idler gear inside diameter.

Idler Gear Inside diameter	mm (in)
Standard	Limit
30.000 — 30.021 (1.1811 — 1.1819)	30.100 (1.1850)



N6A0437E

If the clearance between the idler gear shaft outside diameter and the idler gear inside diameter exceeds the limit, the idler gear must be replaced.

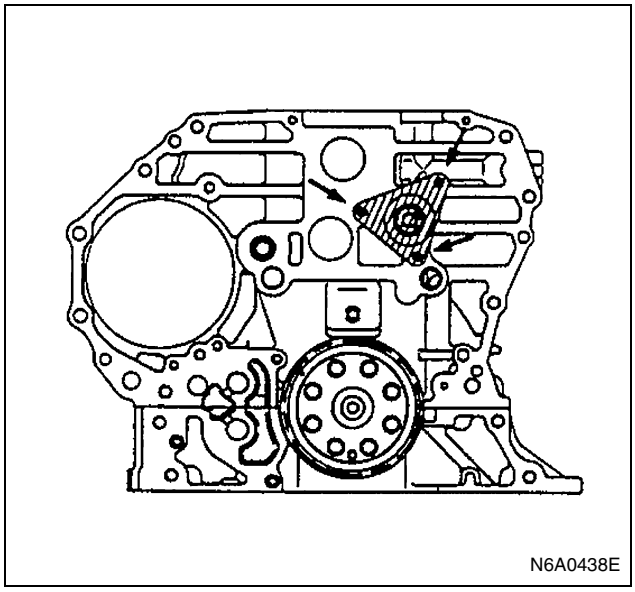
Idler Gear Shaft and Idler Gear clearance mm (in)	
Standard	Limit
0.020 — 0.062 (0.0008 — 0.0024)	0.200 (0.0079)

Installation

1. Idler Gear B Shaft

Tighten:
Idle gear B shaft bolt to 31 N·m (3.2 kg·m/23 lb·ft)

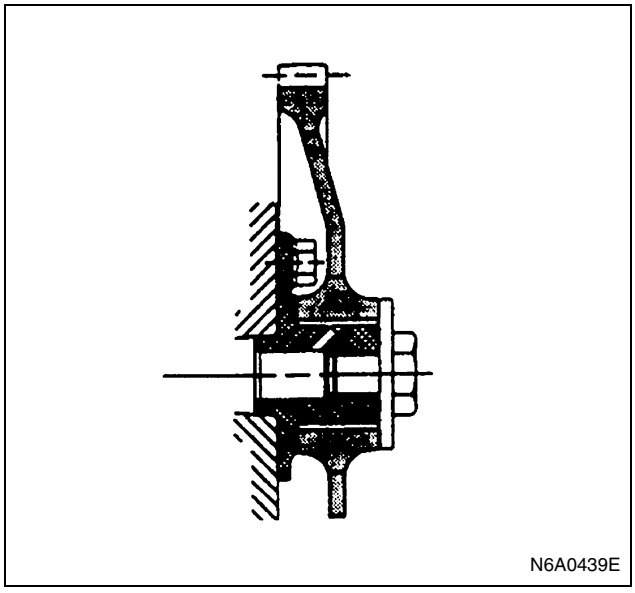
Apply the engine oil to the idle gear shaft after installation.



N6A0438E

2. Idle Gear B
   The face of the idle gear B with longer boss should be positioned toward the rear side shown in the illustration.

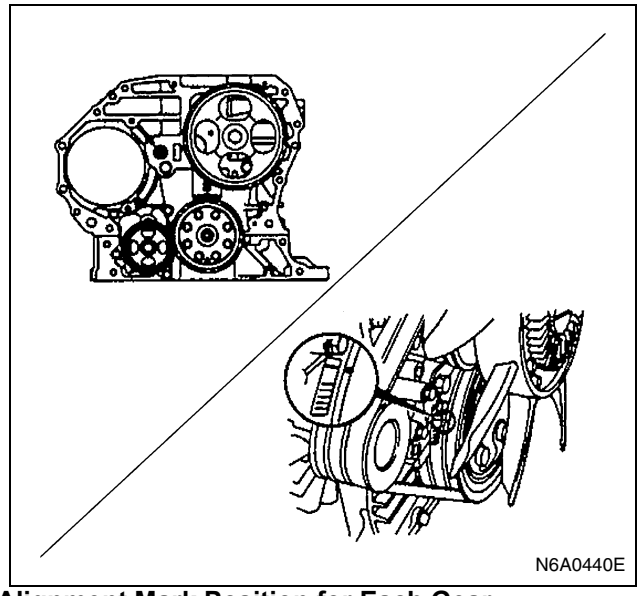
Tighten:
Idle gear B bolt to 110 N·m (11.2 kg·m/81 lb·ft)



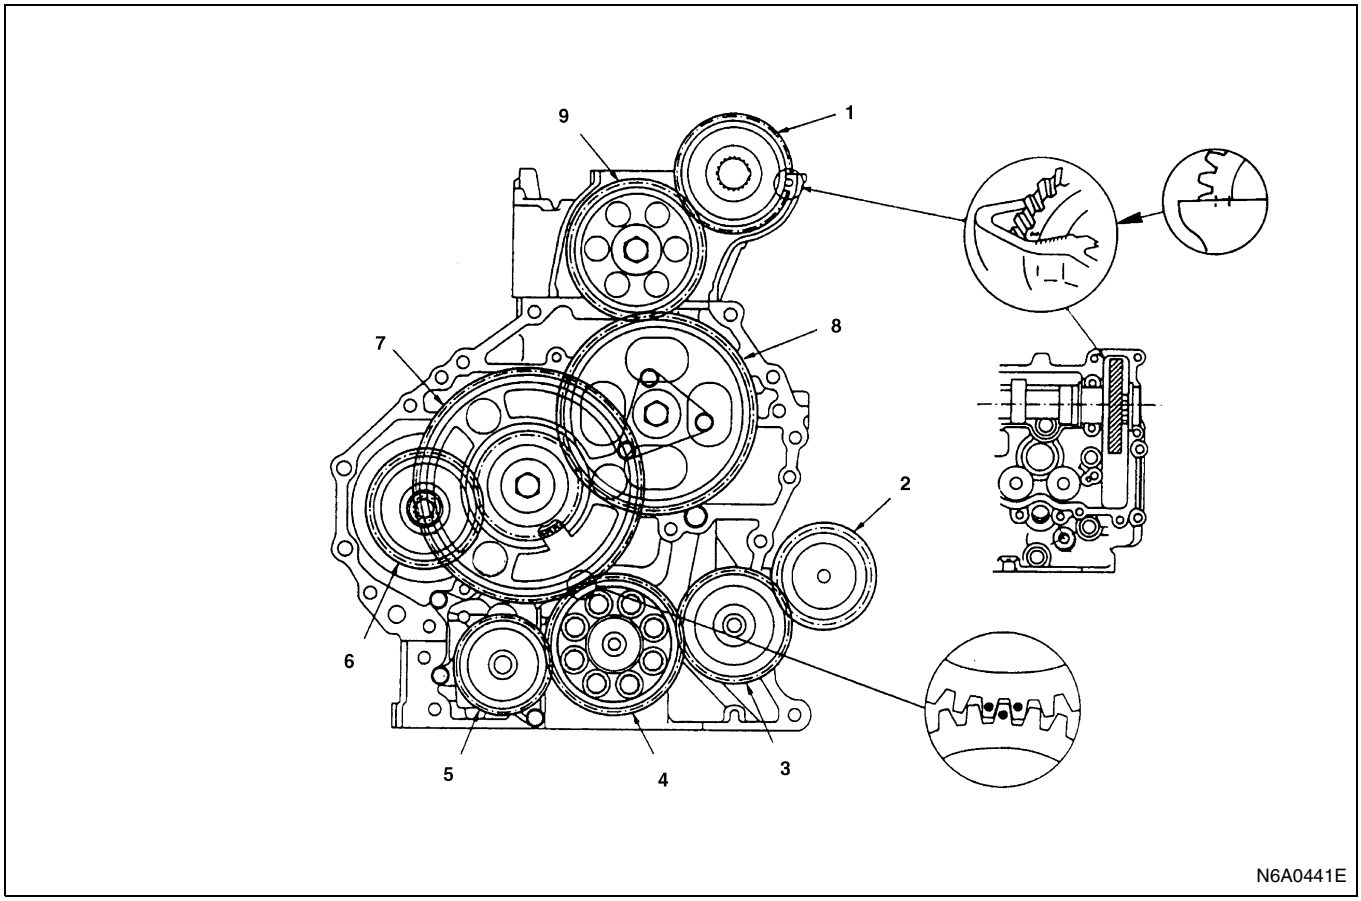
N6A0439E

3. Idle Gear A
   1) Turn the crankshaft clockwise so that the engagement mark of the crankshaft gear faces to the shaft center of the idle gear A and the No.1 cylinder piston comes to the top dead center.
   2) Align the crankshaft gear with the engagement mark of the idle gear and install the idle gear A.

Tighten:
Idle gear A bolt to 133 N·m (13.6 kg·m/98 lb·ft)



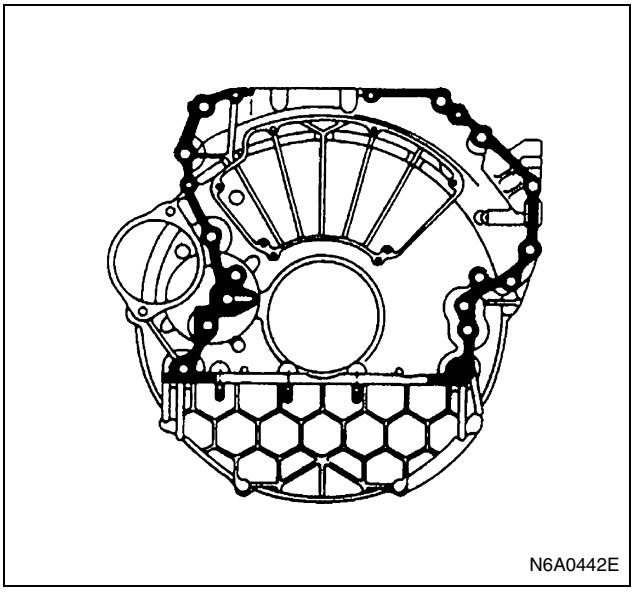
Alignment Mark Position for Each Gear



Legend

1. Camshaft gear
2. Power steering pump gear
3. Power steering pump idle gear
4. Crankshaft gear
5. Oil pump drive
6. Injection pump gear
7. Idle gear A
8. Idle gear B
9. Idle gear C

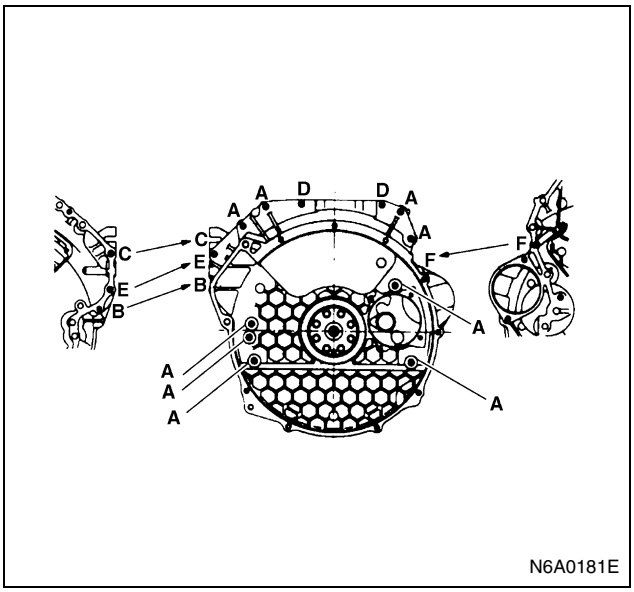
4. Flywheel Housing
   1) Carefully wipe any foreign material from the cylinder body rear face.
   2) Apply the recommended liquid gasket (Three Bond 1207C) or its equivalent to the shaded areas shown in the illustration.



N6A0442E

3) Align the cylinder body knock pins with the flywheel housing knock pin holes.
4) Tighten the flywheel housing bolts to the specified torque shown in the illustration.

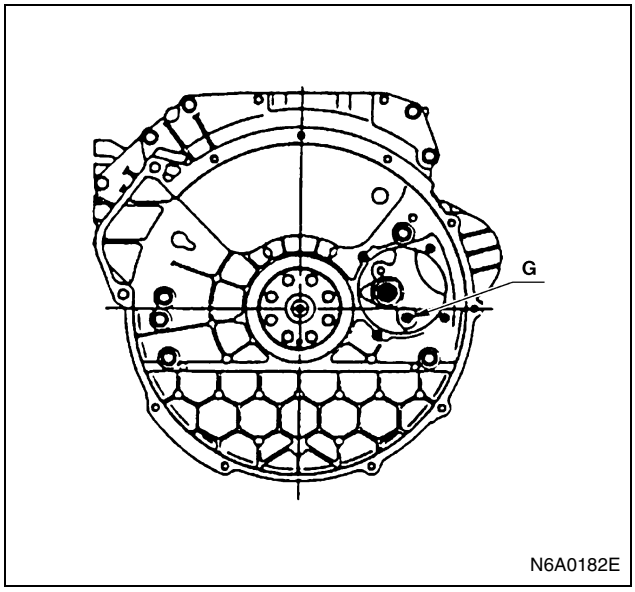
Tighten:
Flywheel housing bolt to
- (A): 96 N·m (9.8 kg·m/71 lb·ft)
- (B): 48 N·m (4.9 kg·m/35 lb·ft)
- (C): 94 N·m (9.6 kg·m/69 lb·ft)
- (D): 25 N·m (2.6 kg·m/19 lb·ft)
- (E): 76 N·m (7.7 kg·m/56 lb·ft)
- (F): 48 N·m (4.9 kg·m/35 lb·ft)



N6A0181E

- Tighten the bolts marked with “E” or “B” from the injection pump side, and those with “F” from the cylinder body side.

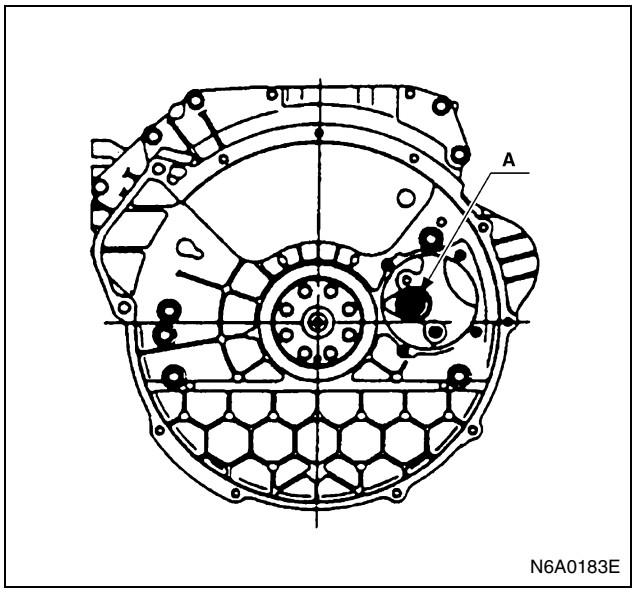
Tighten:
Flywheel housing bolt (G) to 96 N·m (9.8 kg·m/71 lb·ft)



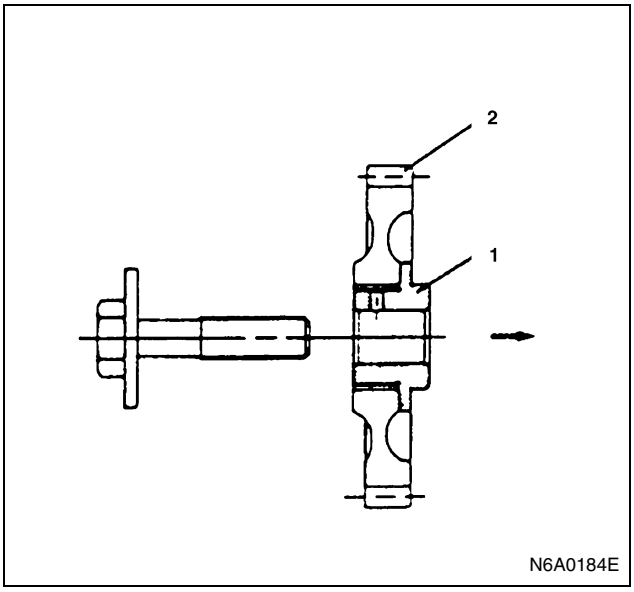
N6A0182E

5. Power Steering Pump Idle Gear
   1) Apply the engine oil to the idle gear shaft.
   2) Install the idle gear shaft (1) with the idle gear (2) to the cylinder body A portion as shown in the illustration.

Tighten:
Idle gear shaft bolt to 135 N·m (13.6 kg·m/98 lb·ft)

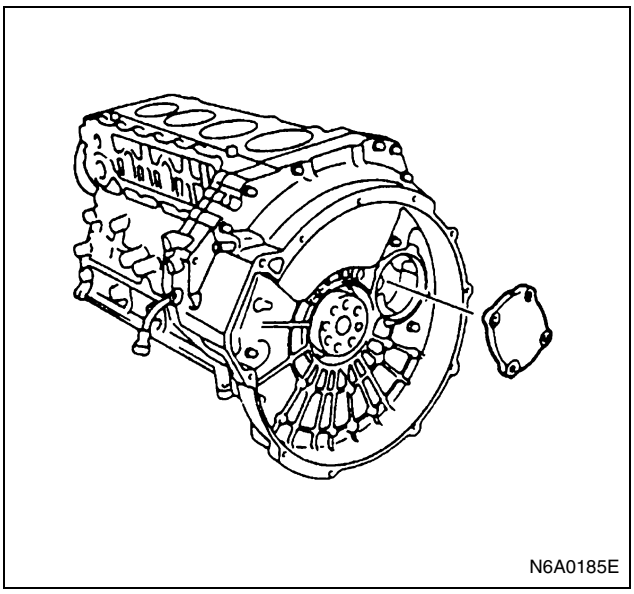


N6A0183E



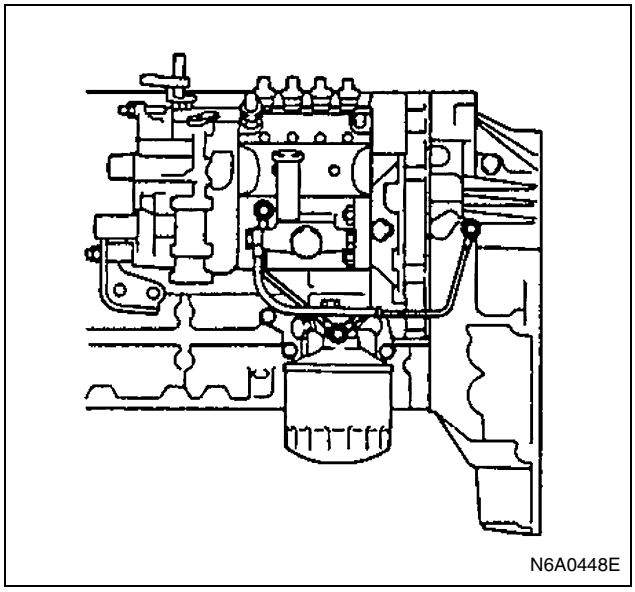
6. Power steering Pump Idle Gear Cover
   Install the gear cover with the O-ring.

Tighten:
Gear cover bolt to 19 N·m (1.9 kg·m/14 lb·ft)



7. Oil Pan
8. Spacer Rubber
   Above works refer to “OIL PAN” section in this manual.
9. Crankshaft Rear Slinger
10. Crankshaft Rear Oil Seal
11. Flywheel
    Above works refer to “CRANKSHAFT REAR OIL SEAL” section in this manual.
12. Injection Pump Assembly
    Above works refer to “INJECTION PUMP ASSEMBLY” section in this manual.
13. Oil Pipe

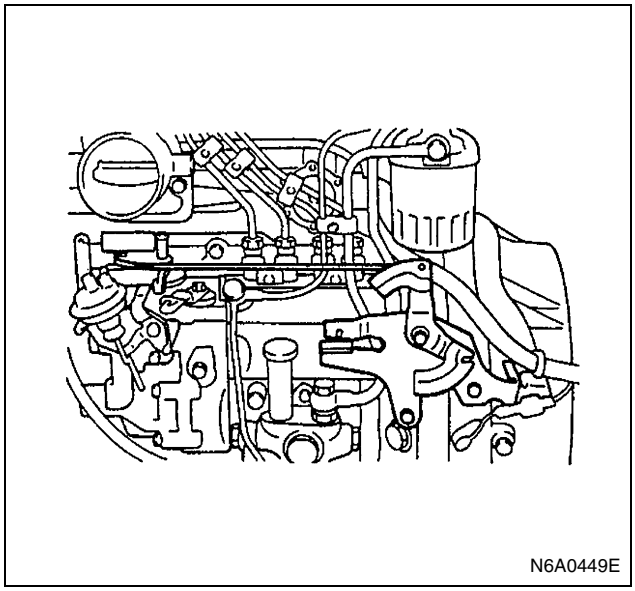
Tighten:
Oil pipe joint bolt to 17 N·m (1.7 kg·m/12 lb·ft)



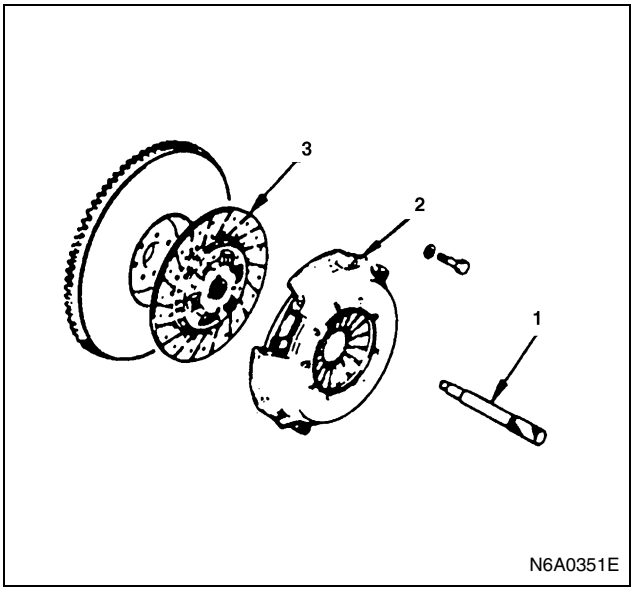
14. Engine Control Lever Assembly

Tighten:
Engine control lever bolt to 24 N·m (2.4 kg·m/17 lb·ft)

15. Engine Control Wire



16. Driven Plate
    Use the clutch pilot aligner to install the driven plate.
    Clutch Pilot Aligner: 5-8840-2240-0

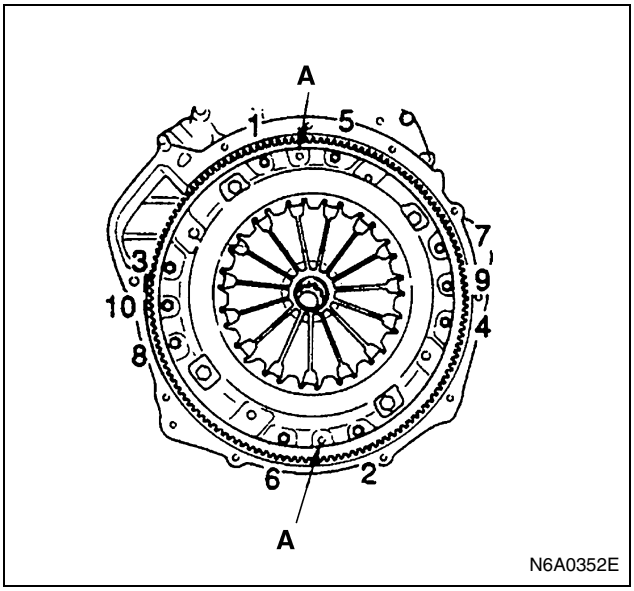


Legend

1. Clutch pilot aligner
2. Clutch pressure plate assembly
3. Driven plate

17. Clutch Pressure Plate Assembly
    1) Align the clutch pressure plate with the flywheel knock pin.
    2) Tighten the pressure plate bolts to the specified torque in numerical order.

Tighten:
Clutch pressure plate bolt to 40 N·m (4.1 kg·m/30 lb·ft)



Legend

A. Knock pin

18. Cylinder Head Gasket
    Above works refer to “CYLINDER HEAD GASKET” section in this manual.
19. Cylinder Head Assembly
    Above works refer to “CYLINDER HEAD GASKET” section in this manual.
20. Camshaft Bearing Lower
21. Camshaft Assembly
22. Camshaft Bearing Upper
23. Camshaft Bearing Cap
24. Valve Cap
25. Rocker Arm Shaft Assembly
    Above works refer to “CAMSHAFT ASSEMBLY” section in this manual.
26. Head Cover Gasket
27. Cylinder Head Cover
    Above works refer to “CYLINDER HEAD COVER” section in this manual.
28. Nozzle Cover
29. Engine Assembly
    Above works refer to “ENGINE ASSEMBLY” section in this manual.

15. Cotter collar
16. Spring upper seat
17. Valve spring
18. Valve guide seal

Removal

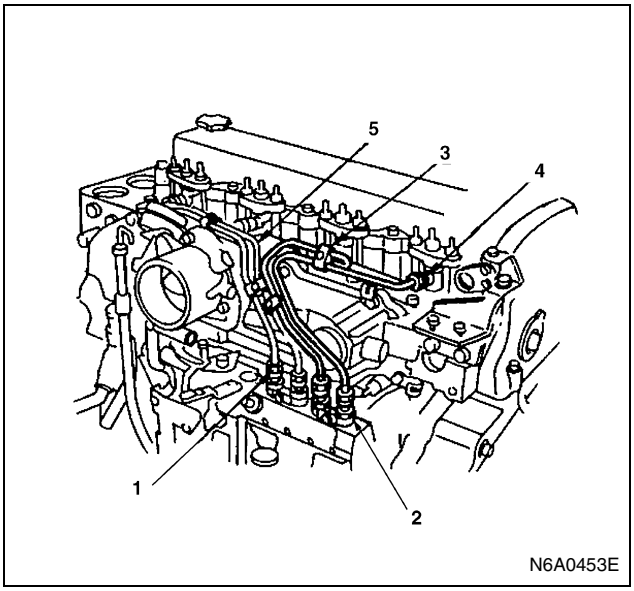
Preparation

- Disconnect battery ground cable.
- Tilt the cab.

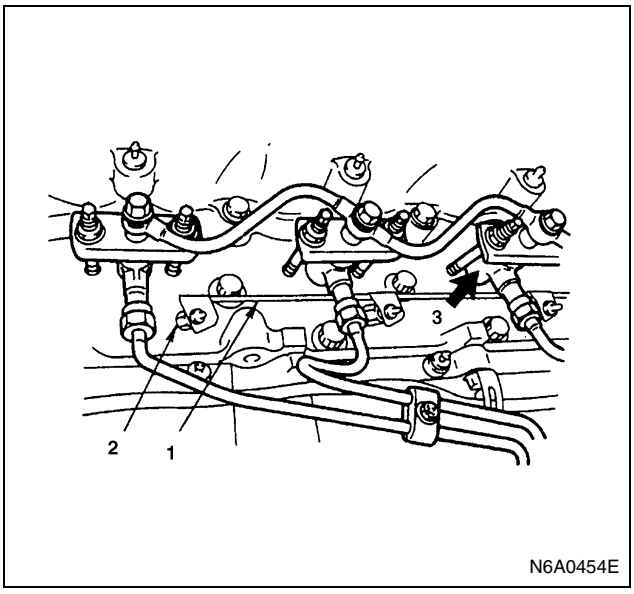
1. Nozzle Cover
2. Leak Off Pipe
3. Injection Pipe
   - Loosen the injection pipe sleeve nuts (1).

Do not apply excessive force to the injection pipes (5).

- Loosen the injection pipes clips (3).
  Remove the injection pipe assembly.
  Plug the delivery valve holder (2) ports and nozzle holder (4) ports with caps to prevent the entry of foreign material.



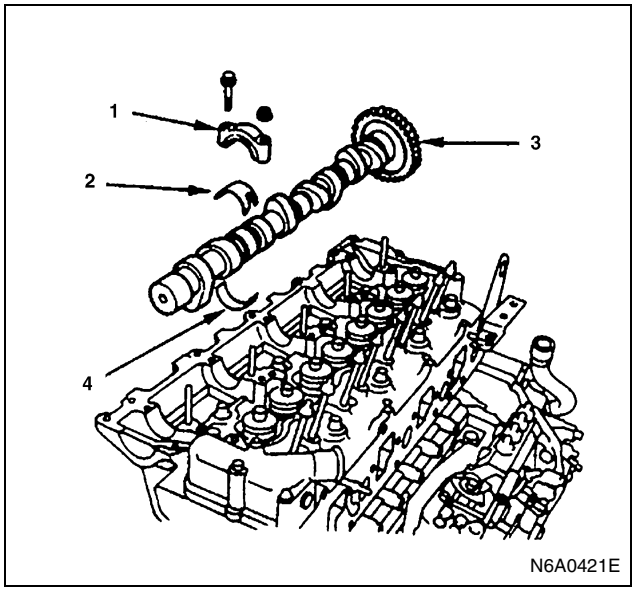
4. Glow Plug Connector
5. Glow Plug
6. Injection Nozzle Holder Assembly
   Mark the nozzle holder assemblies fitting positions by tagging each nozzle holder assembly with the cylinder number from which it was removed.



Legend

1. Glow plug connector
2. Glow plug
3. Injection nozzle holder assembly

7. Cylinder Head Cover
8. Cylinder Head Cover Gasket
9. Rocker Arm Shaft Assembly
   Above works refer to “ROCKER ARM SHAFT ASSEMBLY” section in this manual.
10. Valve Cap
11. Camshaft Bearing Cap
12. Camshaft Bearing Upper
13. Camshaft Assembly
14. Camshaft Bearing Lower
    - If the camshaft bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.

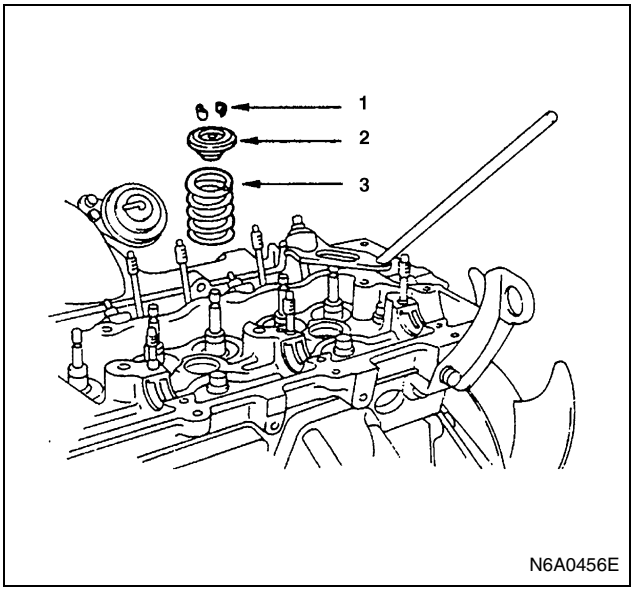


Legend

1. Camshaft bearing cap
2. Camshaft bearing upper
3. Camshaft assembly
4. Camshaft bearing lower

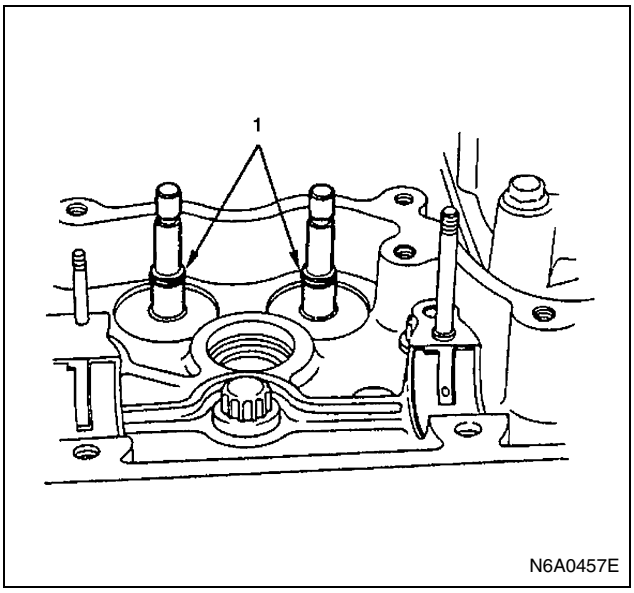
15. Cotter Collar
16. Spring Upper Seat
17. Valve Spring
    - Apply compressed air to cylinder from the glow plug hole to hold the valve in place.
    - Using special tool, compress valve spring and remove cotter collar.

    Valve Spring Compressor: 5-8840-2228-0



Legend
1. Cotter collar
2. Spring upper seat
3. Valve spring

18. Valve Guide Seal

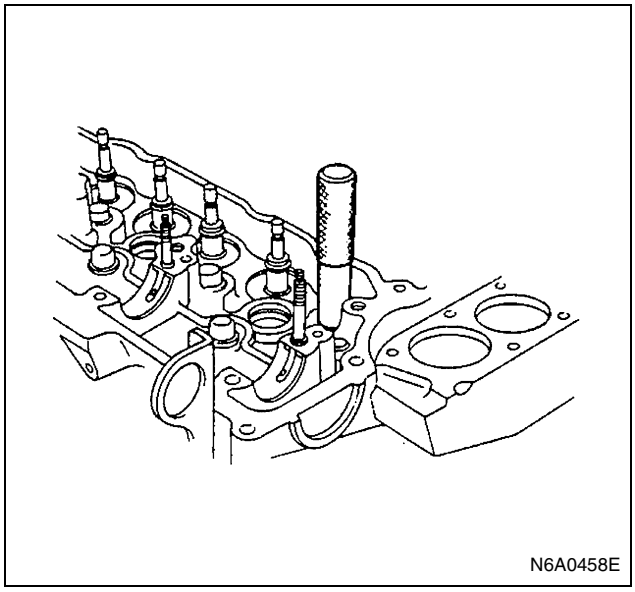


Legend
1. Oil seal

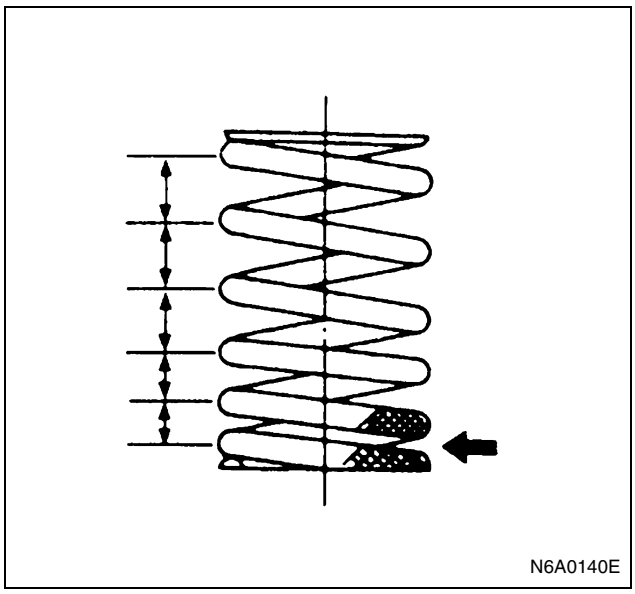
Installation

1. Valve Guide Seal
   - Apply a coat of engine oil to the valve guide seal inner face.
   - Use a valve guide seal installer to install the valve guide seal to the valve guide

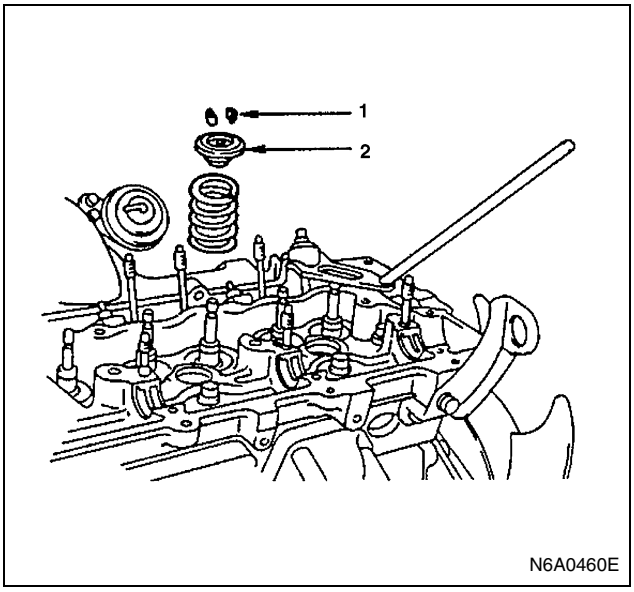
   Valve Guide Seal Installer: 8-9439-6815-0



2. Valve Spring
   Install the valve spring with its fine pitched (or painted) end side down.



3. Spring Upper Seat
4. Cotter Collar
   1) Use the valve spring compressor to push the valve spring into position.
      Valve Spring Compressor: 5-8840-2228-0
   2) Install the cotter collar to the valve stem.
   3) Set the cotter collar by tapping around the head of the collar with a rubber hammer.

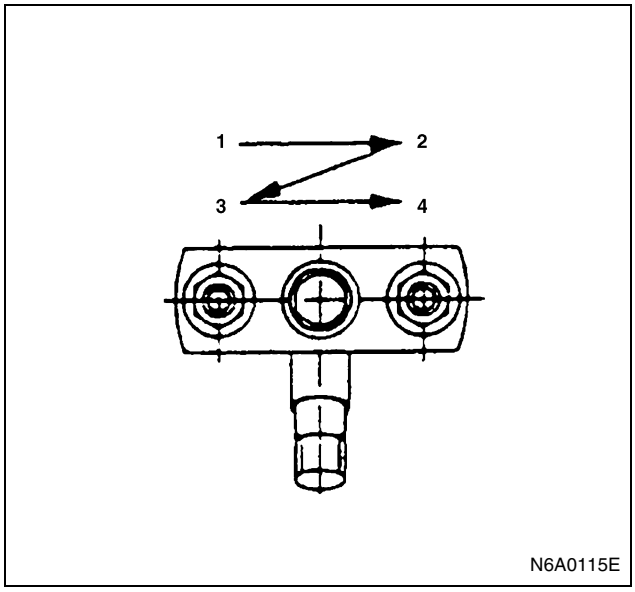


Legend

1. Cotter collar
2. Spring upper seat

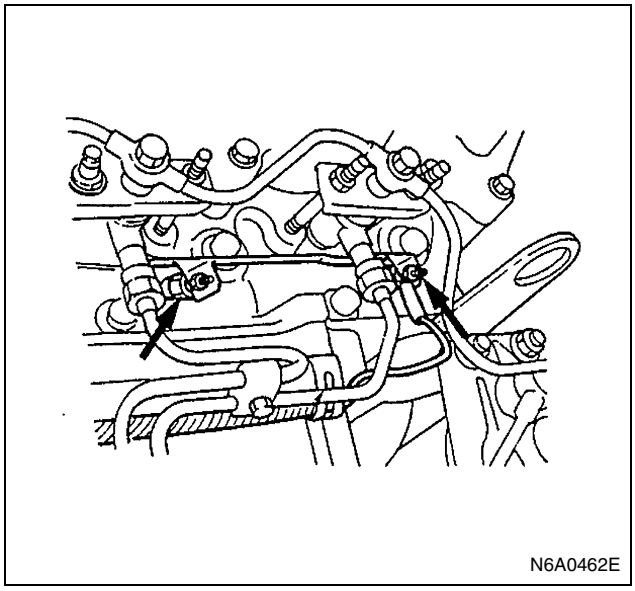
5. Camshaft Bearing Lower
6. Camshaft Assembly
7. Camshaft Bearing Upper
8. Camshaft Bearing Cap
9. Valve Cap
   Above works refer to “CAMSHAFT ASSEMBLY” section in this manual.
10. Rocker Arm shaft Assembly
    Above works refer to “ROCKER ARM SHAFT ASSEMBLY” section in this manual.
11. Cylinder Head Cover Gasket
12. Cylinder Head Cover
    Above works refer to “CYLINDER HEAD COVER” section in this manual.
13. Injection Nozzle Holder Assembly
    Tighten the nozzle holder flange nuts to the specified torque in the numerical order shown in the illustration.

Tighten:
Nozzle holder flange nut to 19 N·m (1.9 kg·m/14 lb·ft)

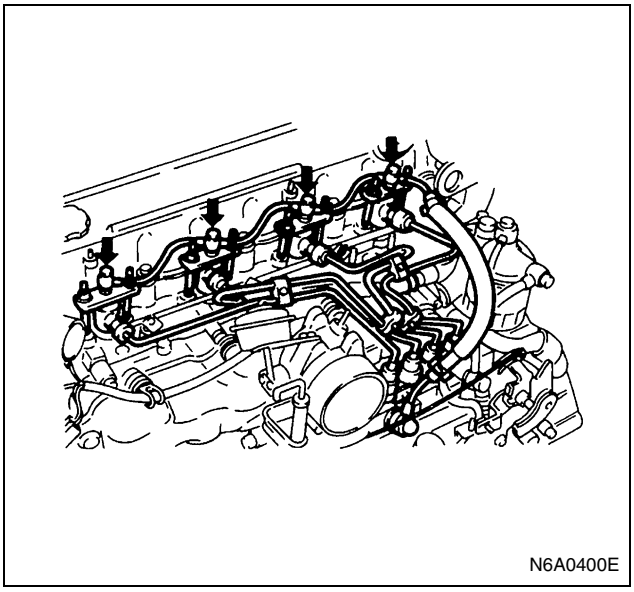


14. Glow Plug

Tighten:
Glow plug to 23 N·m (2.3 kg·m/17 lb·ft)



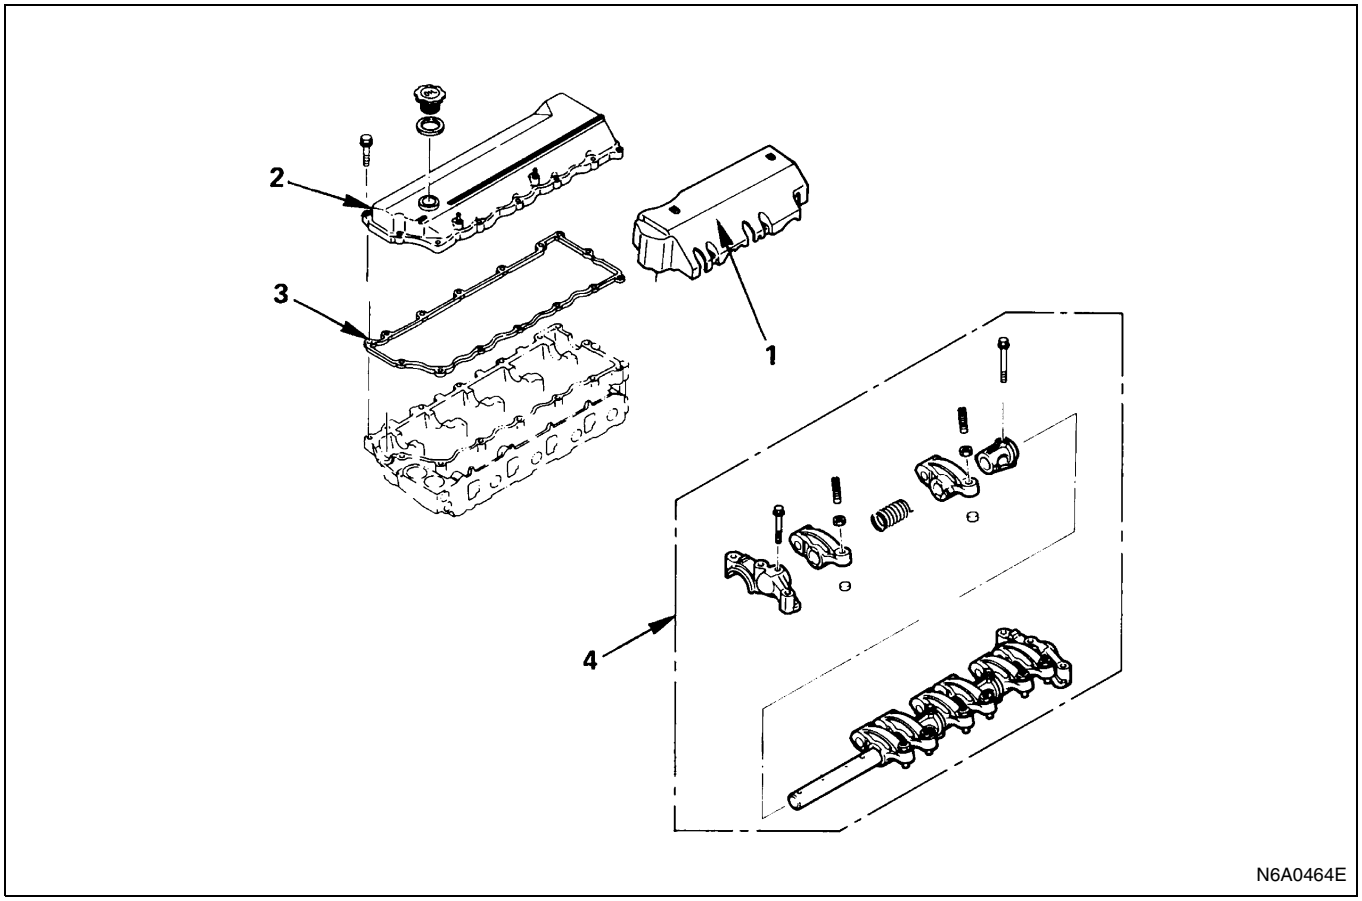
15. Glow Plug Connector
16. Injection Pipe
17. Leak Off Pipe
    Above works refer to “INJECTION PUMP ASSEMBLY” section in this manual.



18. Nozzle Cover
    - Connect the negative battery cable
    - Lower the cab
    - Start engine and check for fuel leakage carefully.

ROCKER ARM SHAFT ASSEMBLY

Component



Legend

1. Nozzle cover
2. Cylinder head cover
3. Cylinder head cover gasket
4. Rocker arm shaft assembly

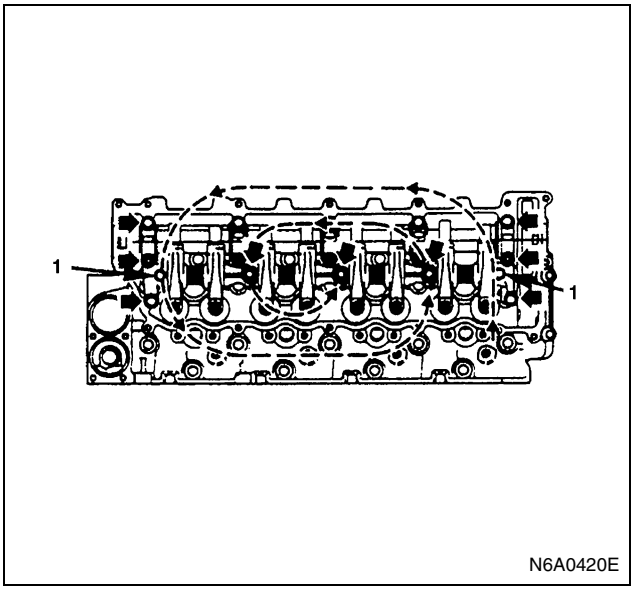
Removal

Preparation

- Disconnect battery ground cable.
- Tilt the cab.

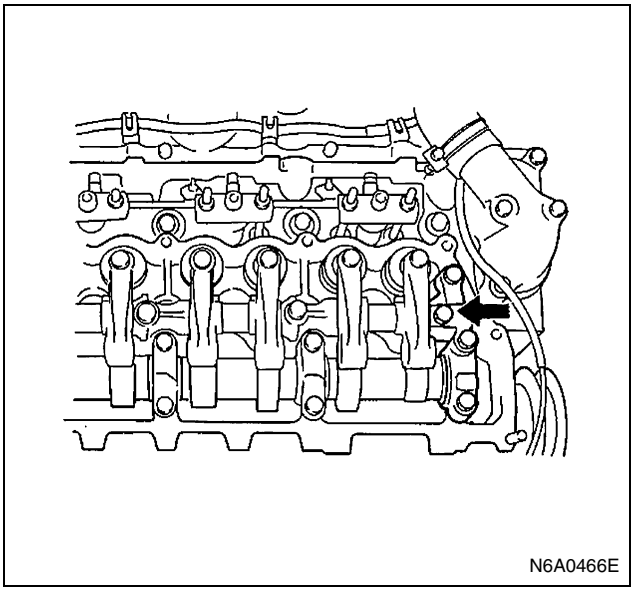
1. Nozzle Cover
2. Cylinder Head Cover
3. Cylinder Head Cover Gasket
4. Rocker Arm Shaft Assembly
   1) Loosen the rocker arm shaft bracket nuts and bolts in numerical order a little at a time and remove the rocker arm shaft assembly with the camshaft brackets.
   2) Leave the (1) indicated bolt unremoved on this occasion, since it is the rocker arm fixing bolt.

Caution:
Failure to loosen the rocker arm shaft bracket nuts and bolts in numerical order a little at a time will adversely affect the rocker arm shaft.



Installation

1. Rocker Arm Shaft Assembly
   1) Slightly loosen the bolts marked with the arrow in the illustration.

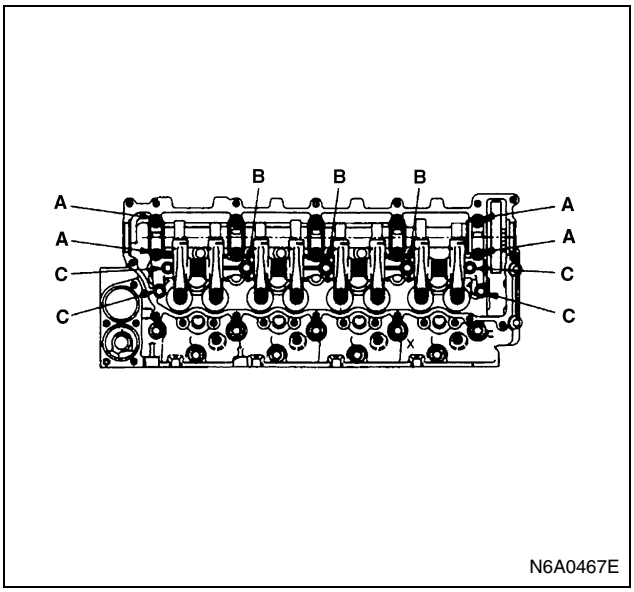


N6A0466E

   2) Loosen the rocker arm adjust screws and apply engine oil to the rocker arm roller portions.
   3) Install the rocker arm assembly on the cylinder head.
   4) Tighten the rocker arm shaft breaker nuts and bolts to the specified torque in numerical order a little at a time as shown in the illustration.

Tighten:
Rocker arm shaft bracket nut and bolt to
- Nut (A): 27 N·m (2.8 kg·m/20 lb·ft)
- Bolt (B): 56 N·m (5.7 kg·m/41 lb·ft)
- Bolt (C): 27 N·m (2.8 kg·m/20 lb·ft)

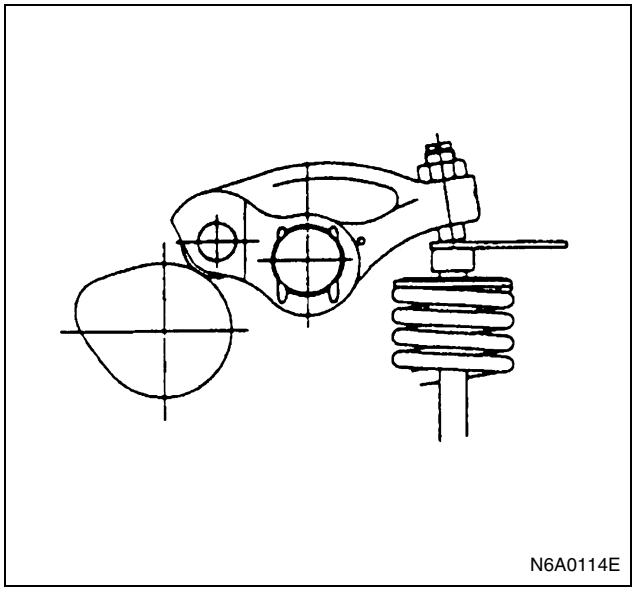
   5) Apply engine oil to the threaded portion of the nuts marked with “A” and the bolts with “B” shown in the illustration left, and then tighten them to the specified torque.



N6A0467E

Adjust the valve clearance.

Valve Clearance	mm (in)
At cold	0.4 (0.016)

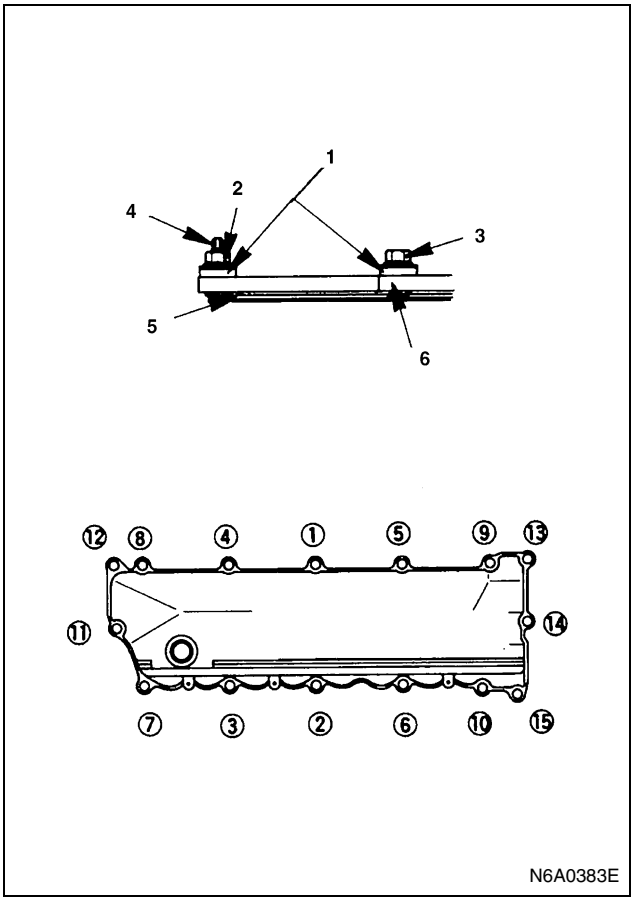


N6A0114E

Above works refer to “SERVICING” VALVE CLEARANCE ADJUSTMENT” previously section in this manual.

2. Cylinder Head Cover Gasket
   Install the gasket to the cylinder head cover.
3. Cylinder Head Cover
   1) Install the cylinder head cover.
   2) Tighten the cylinder head cover nuts and bolts to the specified torque in the numerical order shown in the illustration.

Tighten:
Cylinder head cover nut and bolt to 18 N·m (1.8 kg·m/13 lb·ft)



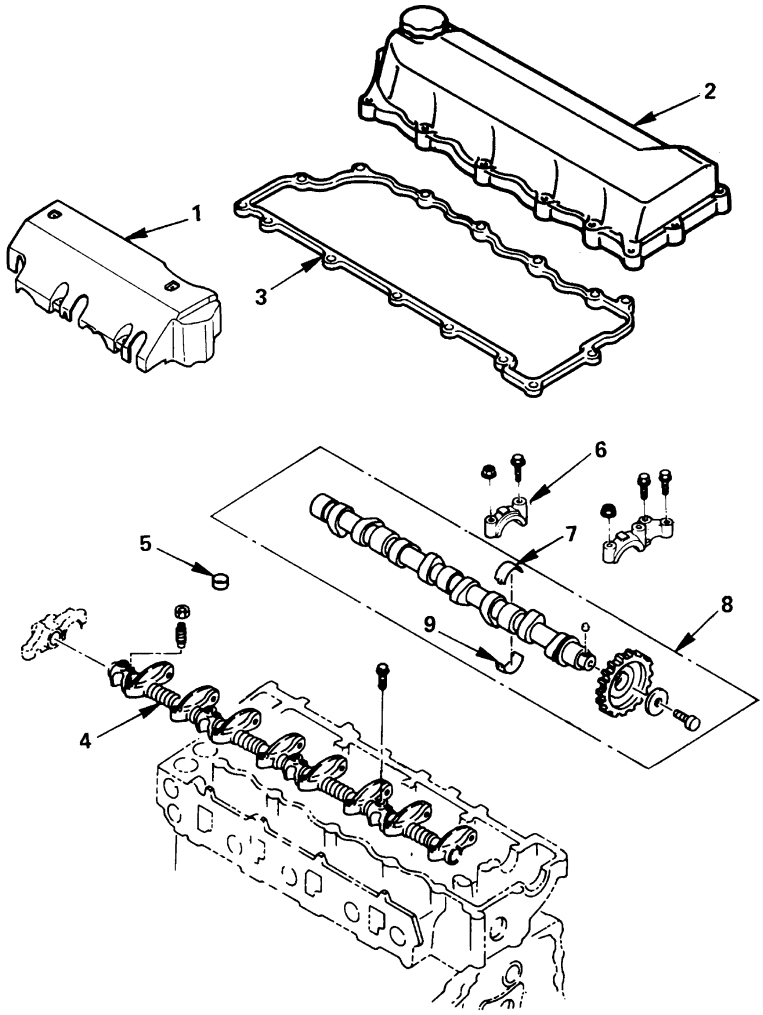
Legend

1. Mounting rubber
2. Nut
3. Bolt
4. Stud
5. Gasket
6. Head cover

4. Nozzle Cover
   - Connect the battery ground cable.
   - Lower the cab.
   - Start the engine and check for the oil leakage carefully.

CAMSHAFT ASSEMBLY

Component



N6A0470E

Legend

1. Nozzle cover
2. Cylinder head cover
3. Cylinder head cover gasket
4. Rocker arm shaft assembly
5. Valve cap
6. Camshaft bearing cap
7. Camshaft bearing upper
8. Camshaft assembly
9. Camshaft bearing lower

Removal

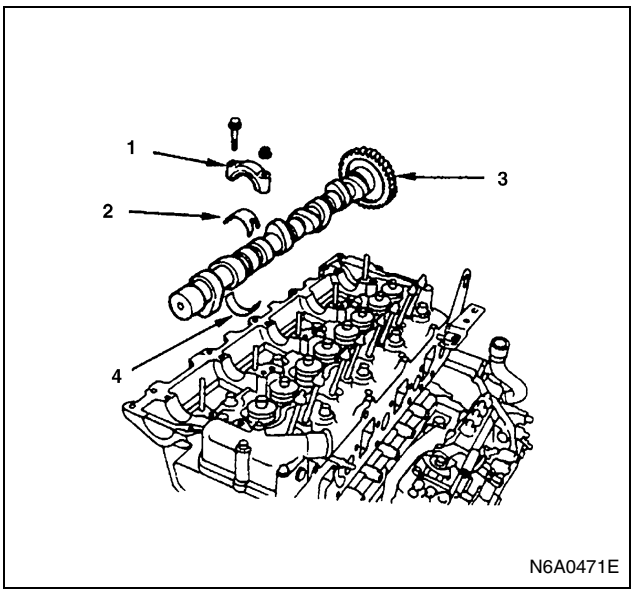
Preparation

- Disconnect battery ground cable.
- Tilt the cab.

1. Nozzle Cover
2. Cylinder Head Cover
3. Cylinder Head Cover Gasket
4. Rocker Arm Shaft Assembly

   Above works refer to “ROCKER ARM SHAFT ASSEMBLY” section in this manual.
5. Valve Cap
6. Camshaft Bearing Cap
7. Camshaft Bearing Upper
8. Camshaft Assembly
9. Camshaft Bearing Lower

- If the camshaft bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.

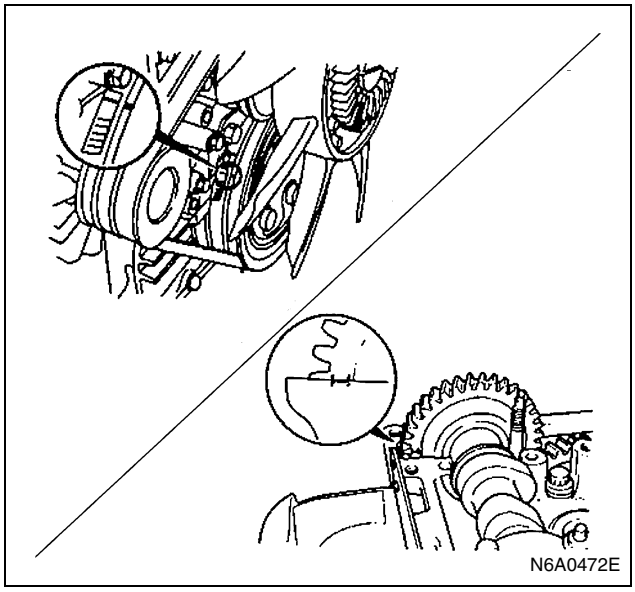


Legend

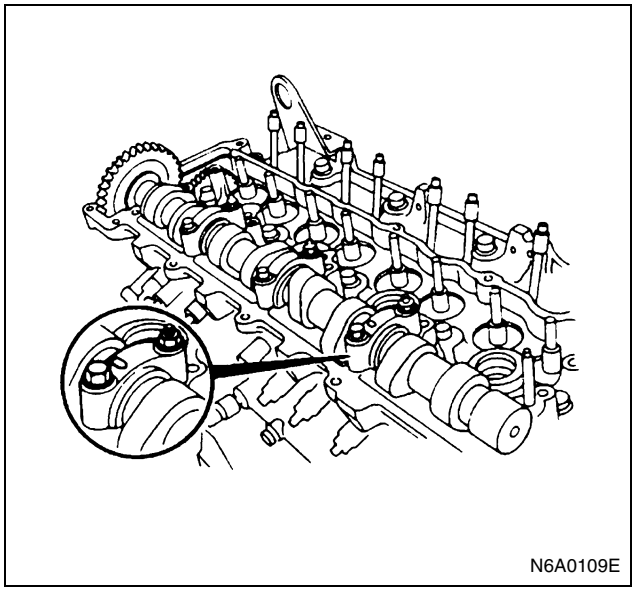
1. Camshaft bearing cap
2. Camshaft bearing upper
3. Camshaft assembly
4. Camshaft bearing lower

Installation

1. Camshaft Bearing Lower
2. Camshaft Assembly
   1) Turn the crankshaft in the direction of normal rotation until the timing mark on the crankshaft damper pulley is aligned with the TDC notched line.
   2) Apply engine oil to the camshaft journal and the camshaft bearing surfaces before installation.
   3) Carefully align the camshaft gear "I" mark and the cylinder head upper face shown in the illustration.

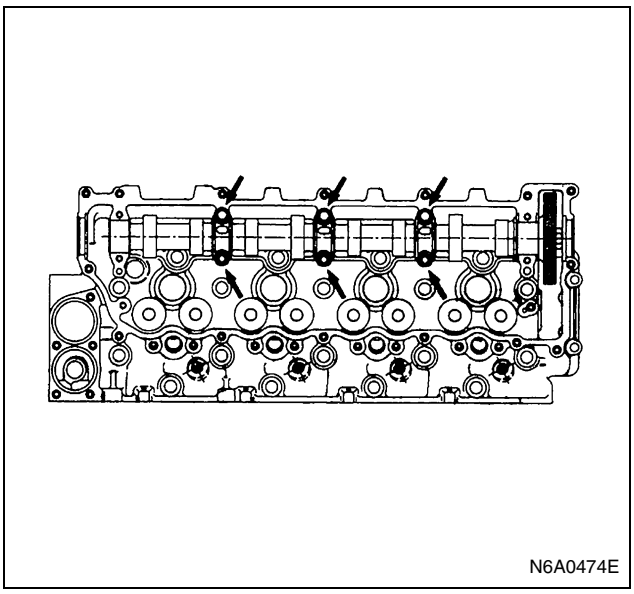


3. Camshaft Bearing Upper
4. Camshaft Bearing Cap
   - Install the bearing caps with the bearing cap head mark (arrow) facing forward.
   - Apply a coat of engine oil to the bearing cap bolt and stud threads.



- Tighten the bearing cap bolts and studs to the specified torque.

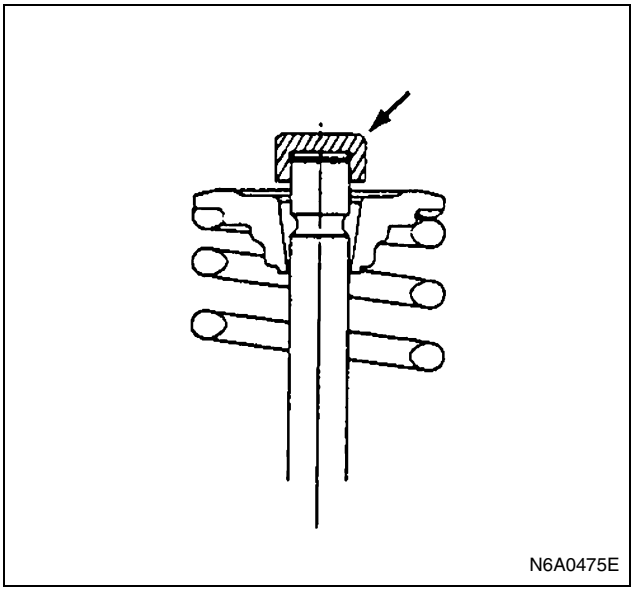
Tighten:
Camshaft bearing cap nut and bolt to 27 N·m (2.8 kg·m/ 20 lb·ft)



N6A0474E

5. Valve Cap
   Apply engine oil to the inside of the valve caps and install them to the valve stem end.

Caution:
Take sufficient care not to let the valve caps fall into the gear.



N6A0475E

6. Rocker Arm Shaft Assembly
   Above works refer to “ROCKER ARM SHAFT ASSEMBLY” section in this manual.
7. Cylinder Head Cover Gasket
8. Cylinder Head Cover
   Above works refer to “CYLINDER HEAD COVER” section in this manual.
9. Nozzle Cover
   - Connect the battery ground cable.
   - Lower the cab.
   - Start engine and check for oil leakage carefully.

8. Valve cap
9. Camshaft bearing cap
10. Camshaft bearing upper
11. Camshaft assembly
12. Camshaft bearing lower
13. Cylinder head assembly
14. Cylinder head gasket

Removal

Preparation

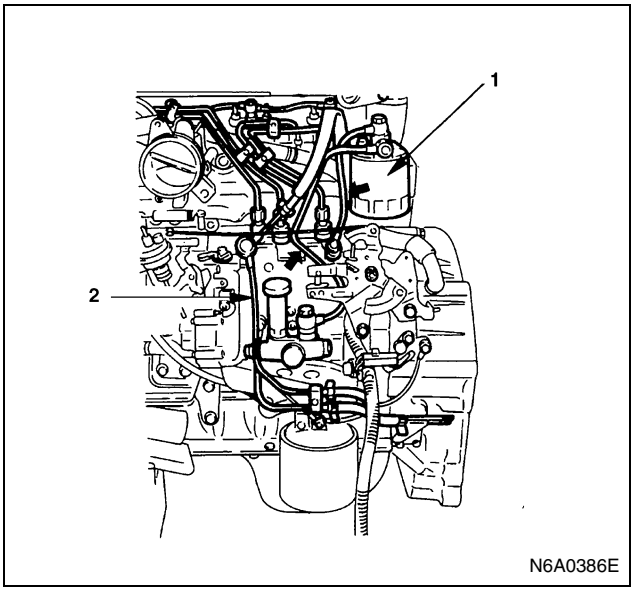
- Disconnect battery ground cable
- Tilt the cab.
- Drain coolant

Engine Right Side

1. Front Exhaust Pipe
2. Air Conditioning (A/C) Compressor Drive Belt (If equipped with A/C)
3. A/C Compressor (If equipped with A/C)
   1) Disconnect magnetic clutch harness connector.
   2) Dismount the compressor together with the hoses from the A/C compressor bracket, and fasten it with a wire to the appropriate location.

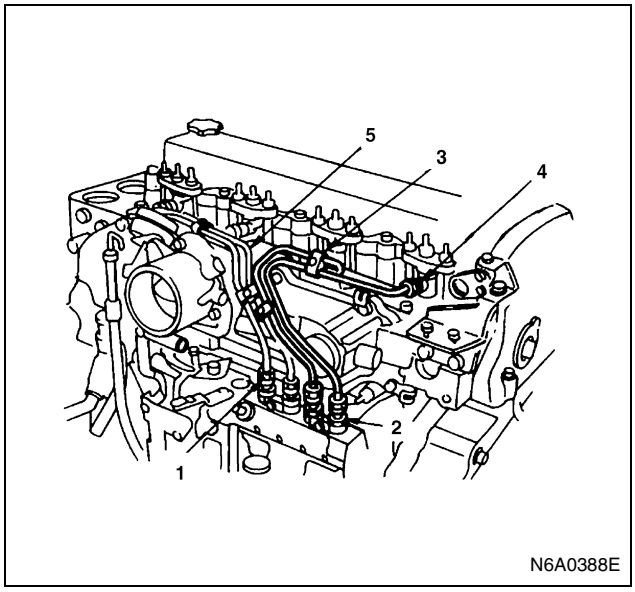
Engine Left Side

1. Intake Air Duct
   1) Remove the clips at the connections with the inlet cover and with the air cleaner.
   2) Remove the intake air duct with the connecting hoses attached.
2. Vacuum Hose
3. Nozzle Cover
4. Leak Off Pipe
5. Fuel Pipe

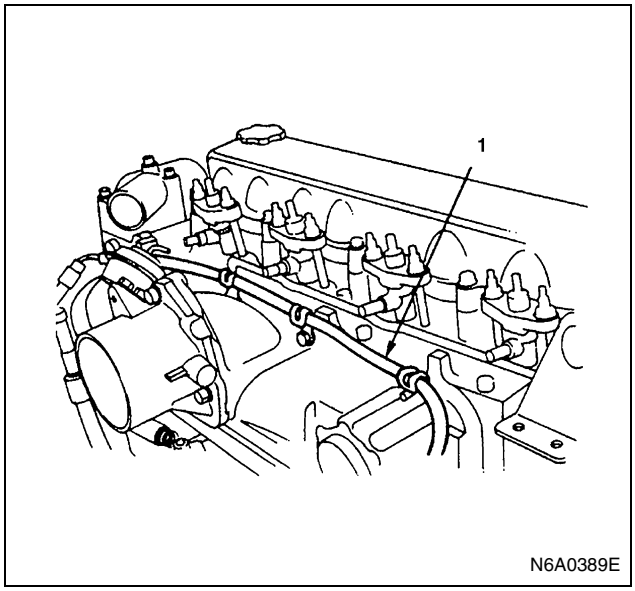


Legend
1. Fuel filter
2. Leak off

6. Fuel filter & Bracket
7. Water Bypass Hose
8. Positive Crankcase Ventilation (PCV) Hose
9. Injection Pipe
   1) Loosen the injection pipe sleeve nuts (1).
   Do not apply excessive force to the injection pipes (5).
   2) Loosen the injection pipes clips (3).
   3) Remove the injection pipe assembly.
   Plug the delivery valve holder (2) ports and nozzle holder (4) ports with caps to prevent the entry of foreign material.

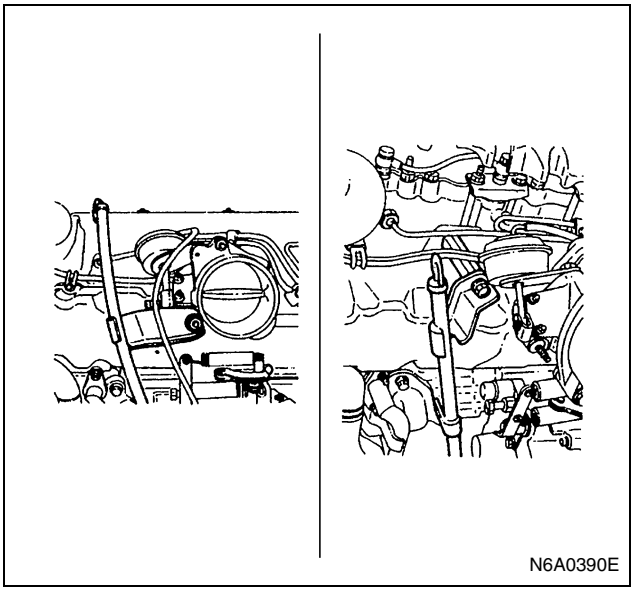


10. Engine Harness
    Disconnect thermometer unit, thermo switch, tachometer sensor and glow plug harness connectors an separate harness from clips.



Legend
1. Engine harness

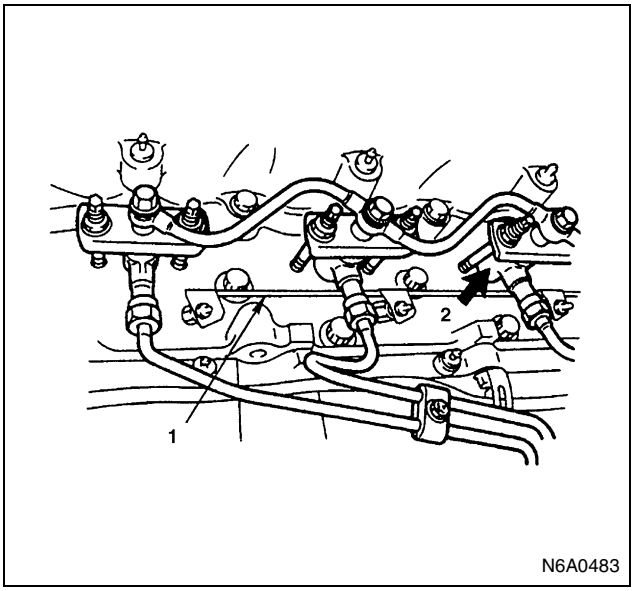
11. Oil Level Gauge Guide Tube
    Remove the guide tube fixing bolt and pull out the guide tube.



N6A0390E

Cylinder Head Side

1. Radiator Upper Hose
2. Coolant Reserve Tank Hose/Bypass Hose
3. Cylinder Head Cover
4. Cylinder Head Cover Gasket
5. Glow Plug Connector
6. Injection Nozzle Holder Assembly
   Mark the nozzle holder assemblies fitting positions by tagging each nozzle holder assembly with the cylinder number from which it was removed.



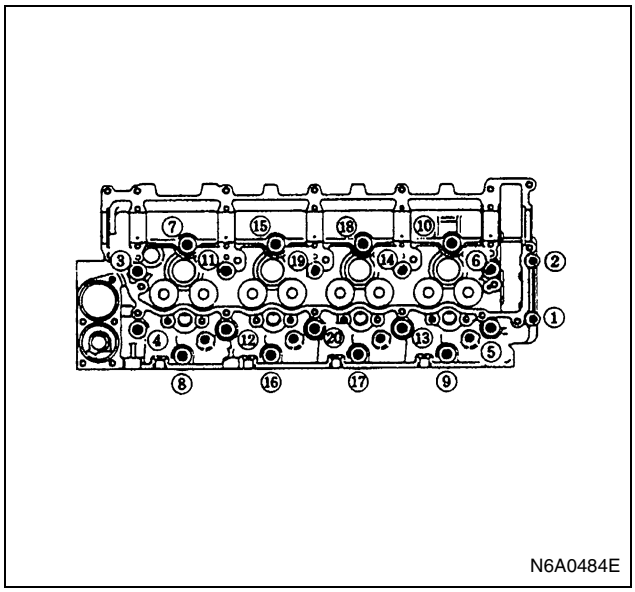
N6A0483

Legend

1. Glow plug connector
2. Injection nozzle holder assembly

7. Rocker Arm Shaft Assembly
8. Valve Cap
9. Camshaft Bearing Cap
10. Camshaft Bearing Upper
11. Camshaft Assembly
12. Camshaft Bearing Lower
    Above works refer to “ROCKER ARM SHAFT ASSEMBLY AND CAMSHAFT ASSEMBLY” section in this manual.
13. Cylinder Head Assembly
    Loosen the cylinder head bolts in numerical order a little at a time.

Caution:
Failure to loosen the cylinder head bolts in numerical order a little at a time will adversely affect the cylinder head lower surface.



N6A0484E

14. Cylinder Head Gasket

Caution:
Do not reuse the cylinder head gasket.

Installation

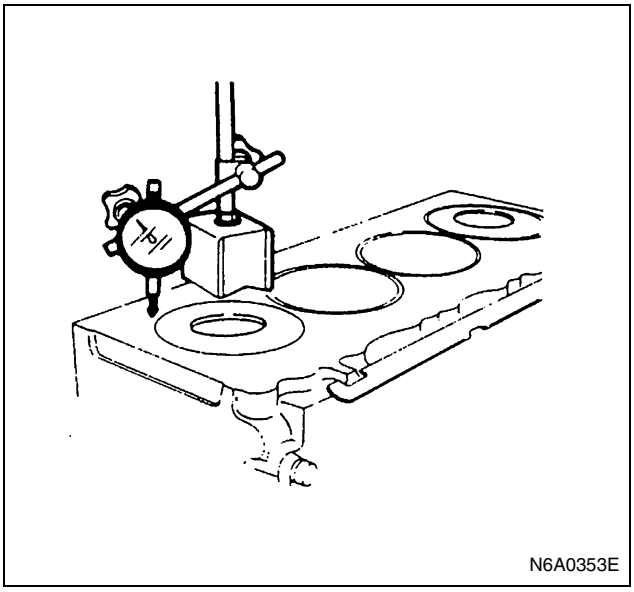
Cylinder Head Side

1. Cylinder Head Gasket
   1) When any of the cylinder block, crankshaft, crankshaft bearing, connecting rod, connecting rod bearing, and piston is replaced with a new one, cylinder head gasket thickness ahold be determined newly.
   2) When replacing the cylinder head gasket alone without replacing any of the parts mentioned in 1) above, the gasket to be used should be the same grade as the one used before.
   3) Correct cylinder head gasket thickness is important.
      Installing the wrong thickness gasket can result in greatly reduced engine performance.
   4) There are three cylinder head gaskets available.

Piston Head Projection Measurement

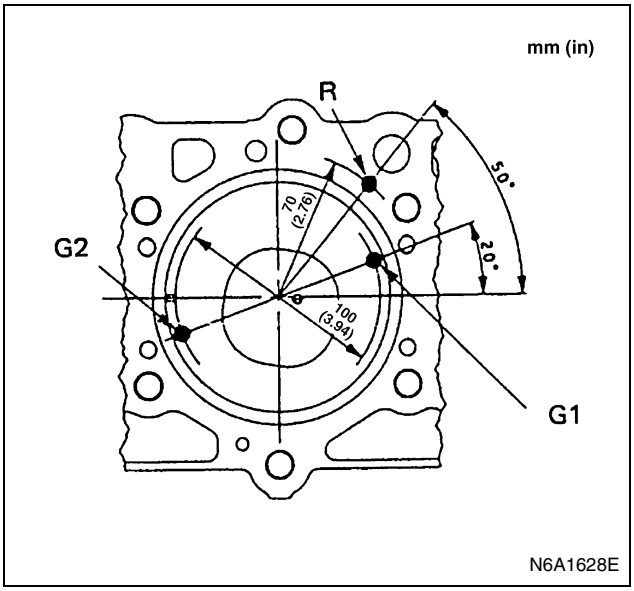
- Select a cylinder head gasket.
- Clean thoroughly the top faces of the piston head and the cylinder body.

- Use the dial gauge to measure the piston head projection. Take measurements at two location for each cylinder.
- The measurement points of the piston head and the reference point of the cylinder body are shown in the illustration.



N6A0353E

Measurement points: Points G1 and G2 of the piston head
Reference point: Point R on the top face of the cylinder body



N6A1628E

Notice:
Note that there are three types of a cylinder head gasket available as below, according to the piston projection.

- For each cylinder, calculate the average value (Ti) of the piston projection.
- Find the maximum value (Ti max) of the average of each cylinder.
- Based on the Timax obtained, select a gasket of the appropriate grade.

4HF1/4HF1-2/4HG1-T
Cylinder Head Gasket Selection

mm (in)

Gasket Grade	Ti max	Gasket Thickness (Reference)
A	0.579 - 0.659 (0.0228 - 0.0259)	1.70 (0.0669)
B	0.659 - 0.739 (0.0259 - 0.0291)	1.75 (0.0689)
C	0.739 - 0.819 (0.0291 - 0.0322)	1.80 (0.0708)

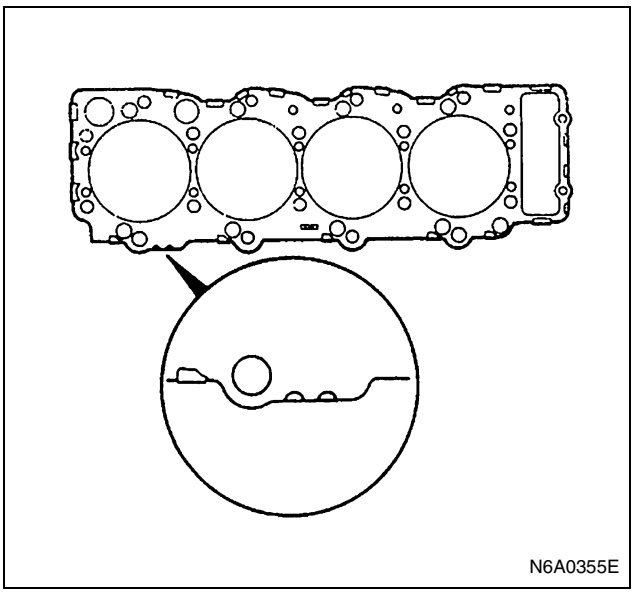
4HE1-TC
Cylinder Head Gasket Selection

mm (in)

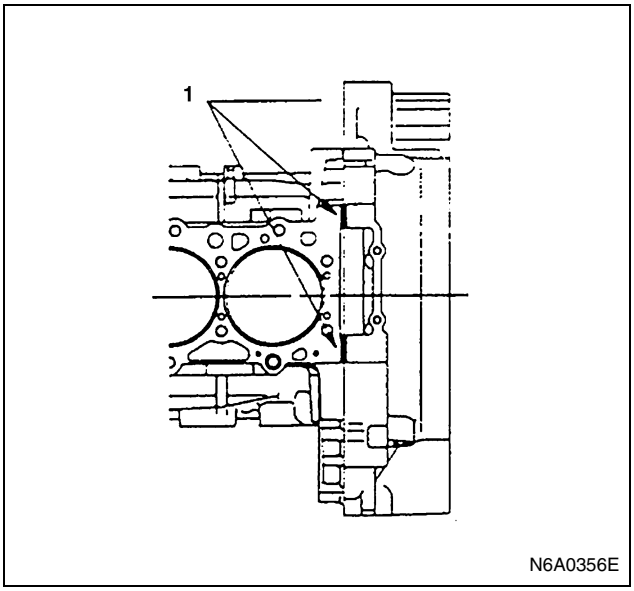
Gasket Grade	Ti max	Gasket Thickness (Reference)
A	0.529 - 0.609 (0.0208 - 0.0240)	1.70 (0.0669)
B	0.609 - 0.679 (0.0240 - 0.0267)	1.75 (0.0689)
C	0.679 - 0.759 (0.0267 - 0.0300)	1.80 (0.0708)

N6A1397E



N6A0355E

5) Apply a 3 mm (0.12 in) bead or recommended liquid gasket (Three Bond 1207C) or its equivalent to the shaded areas shown in the illustration.

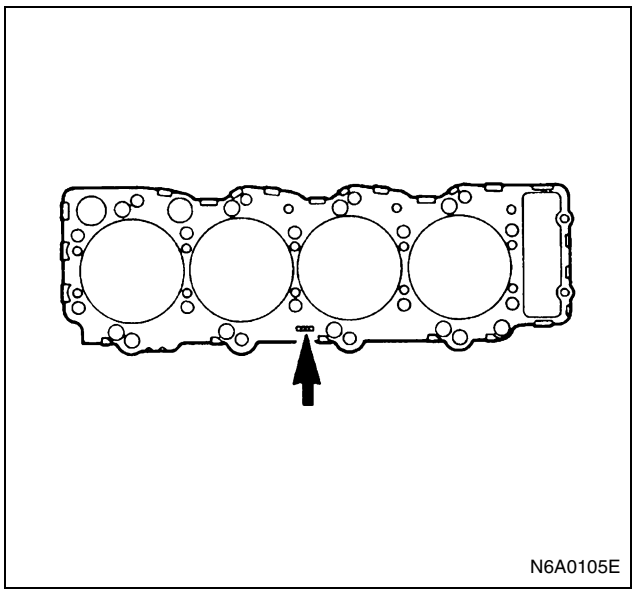


N6A0356E

Legend
1. Bead width ϕ3

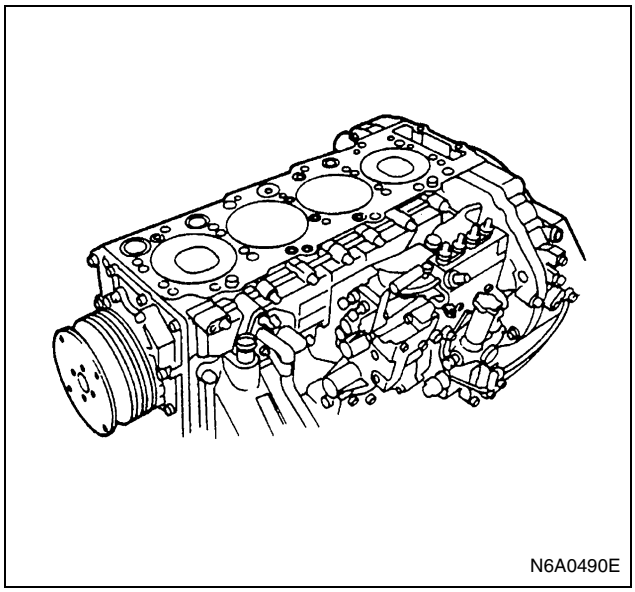
6) Install the cylinder head gasket with its "PART NUMBER" mark facing up and toward the left of the engine.

Caution:
Do not reuse the cylinder head gasket.



N6A0105E

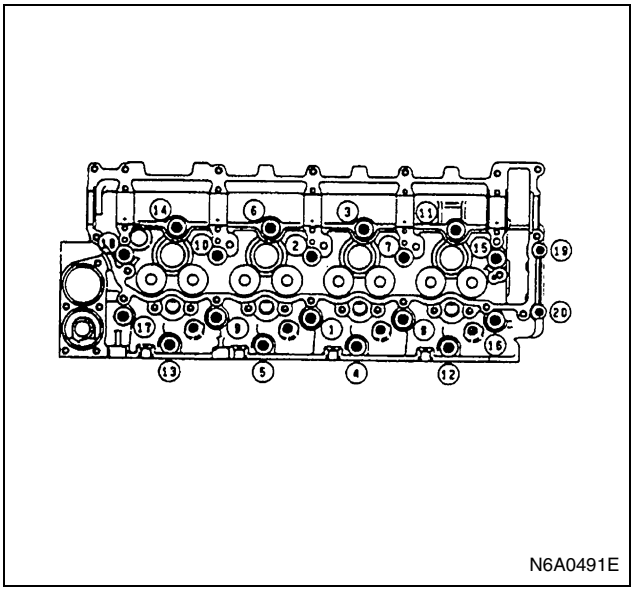
2. Cylinder Head Assembly
   1) Align the cylinder body dowels and the cylinder head dowel holes.
   2) Carefully place the cylinder head on the cylinder head gasket.



N6A0490E

   3) Apply a coat of molybdenum disulfide grease to the M14 cylinder head bolt threads and setting faces and apply a coat of engine oil to the M10 cylinder head bolt threads and setting faces.
   4) Use the angular tightening method to tighten the bolts (M14) to the specified torque in three steps following the numerical order shown in the illustration.

Tighten:
Cylinder head bolt (M14: (1) — (18)) to
- 1st step: 98 N·m (10 kg·m/72 lb·ft)
- 2nd step: 147 N·m (15 kg·m/108 lb·ft)
- 3rd step: 30 — 60°

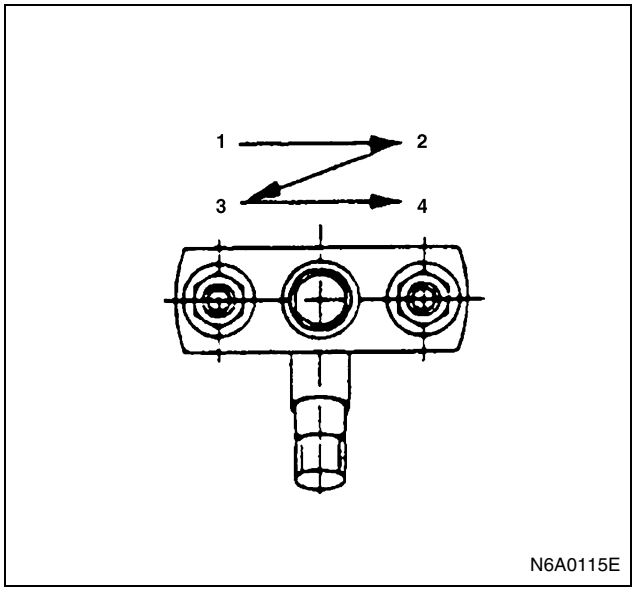


5) Tighten the cylinder head to the flywheel housing bolts (M10) to the specified torque.

Tighten:
Cylinder head bolt (M10: (19), (20)) to 38 N·m (3.9 kg·m/ 28 lb·ft)

3. Camshaft Bearing Lower
4. Camshaft Assembly
5. Camshaft Bearing Upper
6. Camshaft Bearing Cap
7. Valve Cap
   Above works refer to “CAMSHAFT ASSEMBLY” section in this manual.
8. Rocker Arm Shaft Assembly
   Above works refer to “ROCKER ARM SHAFT ASSEMBLY” section in this manual.
9. Injection Nozzle Holder Assembly
   Tighten the nozzle holder flange nuts to the specified torque in the numerical order shown in the illustration.

Tighten:
Nozzle holder flange nut to 19 N·m (1.9 kg·m/14 lb·ft)

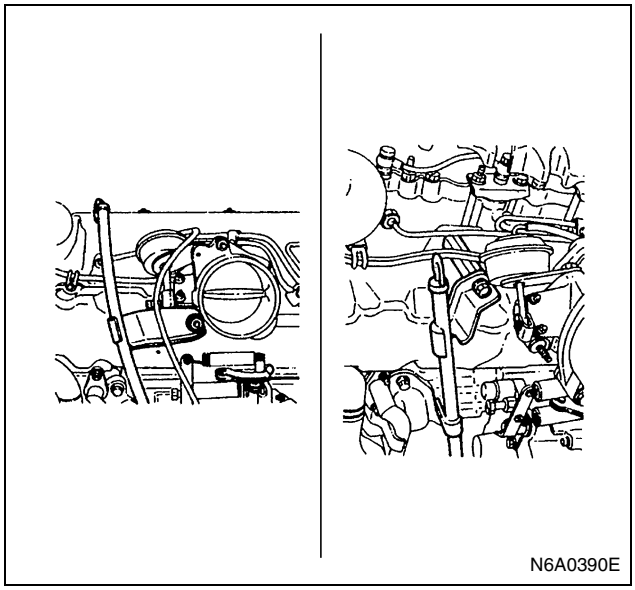


10. Glow Plug Connector
11. Head Cover Gasket
    Install the gasket to the cylinder head cover.
12. Cylinder Head Cover
    Above works refer to “CYLINDER HEAD COVER” section in this manual.
13. Coolant Reserve Tank Hose/Bypass Hose
14. Radiator Upper Hose

Engine Left Side

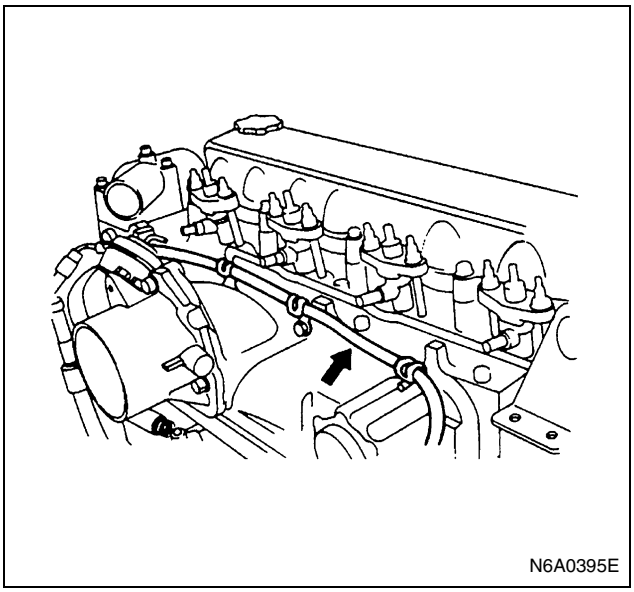
1. Oil Level Gauge Guide Tube
   1) Install the O-rings to the guide tube lower portion and insert the guide tube completely to the cylinder body.
   2) Tighten the guide tube bolt to the specified torque.

Tighten:
Guide tube bolt to 13 N·m (1.3 kg·m/113 lb·in)



2. Engine Harness

Connect thermometer unit, thermo switch, tachometer sensor and glow plug harness connector and fasten the engine harness with clips.



N6A0395E

3. Fuel Injection Pipe Assembly
   Above works refer to “INJECTION PUMP ASSEMBLY” section in this manual.
4. Positive Crankcase Ventilation (PCV) Hose
5. Water Bypass Hose
6. Fuel Filter & Bracket

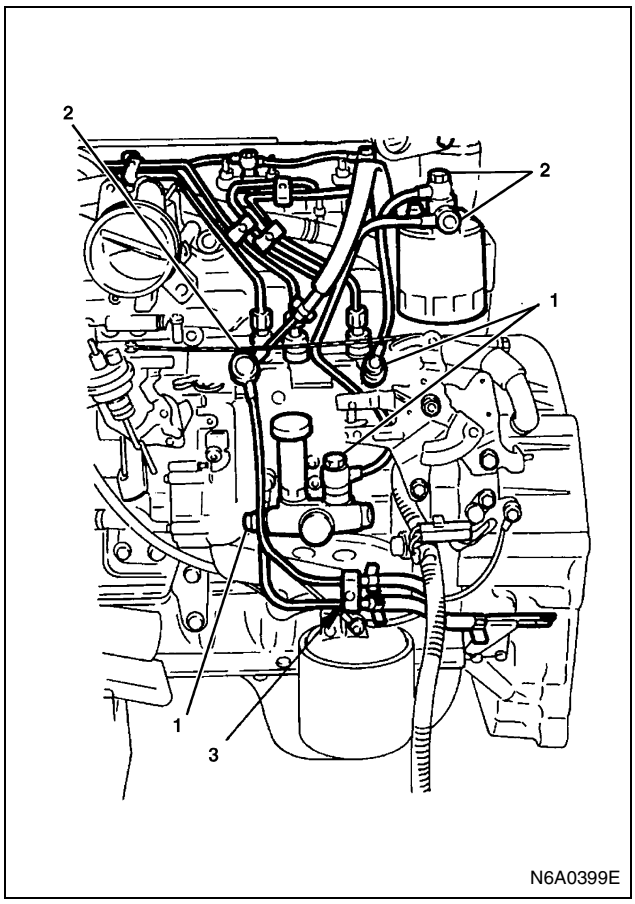
Tighten:
Fuel filter bracket to 34 N·m (3.5 kg·m/25 lb·ft)

7. Fuel Pipe
   Do not apply excessive force to the fuel pipe.

Tighten:
Fuel pipe joint bolt (1) to 41 N·m (4.2 kg·m/30 lb·ft)

Tighten:
Fuel pipe joint bolt (2) to 23 N·m (2.3 kg·m/17 lb·ft)

Tighten:
Clip screw to 4 N·m (0.4 kg·m/35 lb·in)

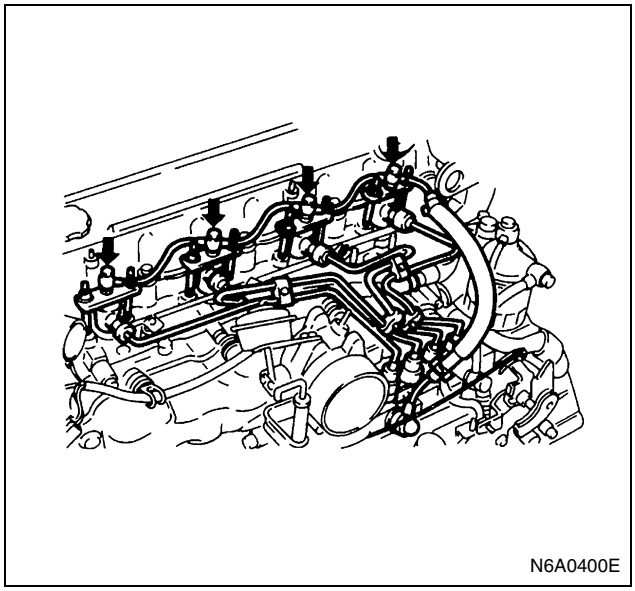


N6A0399E

Legend
1. Fuel pipe joint bolt
2. Fuel pipe joint bolt
3. Clip

8. Leak Off Pipe

Tighten:
Leak-off pipe joint bolt to 13 N·m (1.3 kg·m/113 lb·in)



N6A0400E

9. Nozzle Cover
10. Vacuum Hose

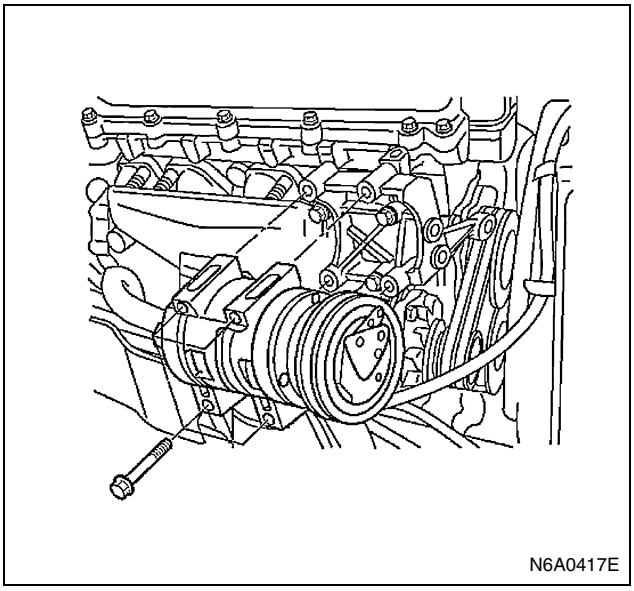
11. Intake Air Duct

Engine Right Side

1. Air Conditioning (A/C) Compressor (If equipped with A/C)
   Tighten fixing bolts to the specified to torque.

Tighten:
A/C compressor bolt to 48 N·m (4.9 kg·m/35 lb·ft)

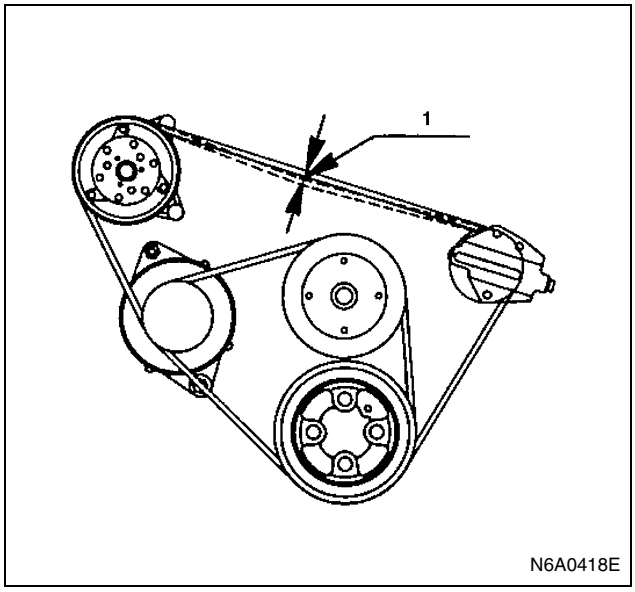
Notice:
When tightening the compressor fixing bolts, tighten first the 2 bolts on the rear side, and then the remaining 2 on the front side.



N6A0417E

2. A/C Compressor Drive Belt (If equipped with A/C)
   1) Install drive belt adjust belt tension by adjusting bolt and tighten locking nut to the specified torque.
   2) Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
16 — 20 (0.63 — 0.79) ... New belt 18 — 22 (0.71 — 0.87) ... Reuse belt	



N6A0418E

Legend
1. Belt deflection

Tighten:
Locking nut to 27 N·m (2.8 kg·m/20 lb·ft)

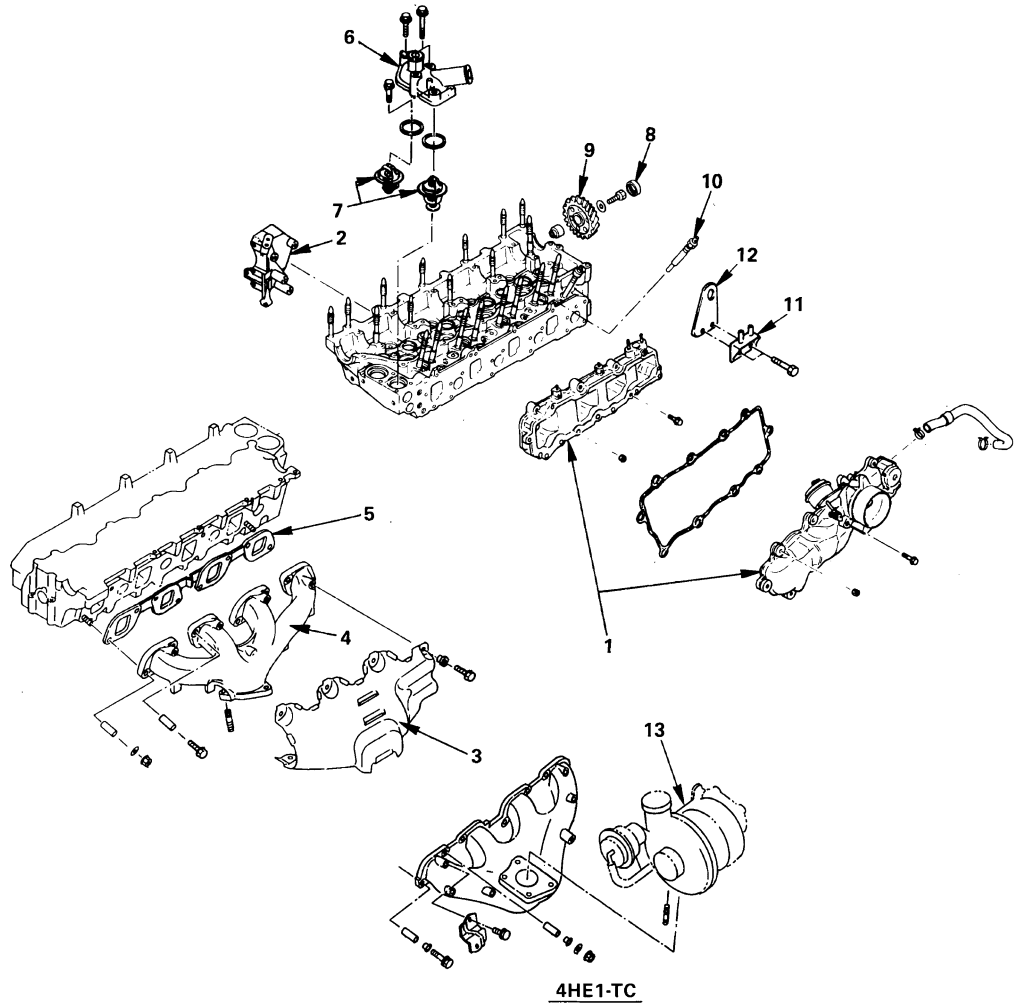
3. Front Exhaust Pipe

Tighten:
Front exhaust pipe to
- Exhaust manifold side: 67 N·m (6.8 kg·m/49 lb·ft)
- Exhaust brake side: 17 N·m (1.7 kg·m/12 lb·ft)

  - Connect the negative battery cable.
  - Lower the cab.
  - Start engine and check for oil, fuel and water leakage carefully.

CIRCUMFERENCE PARTS OF CYLINDER HEAD

Component



N6A0499E

Legend

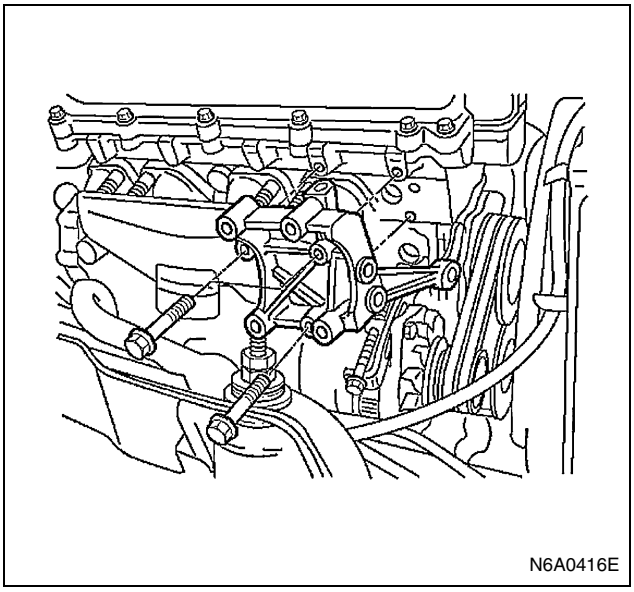
1. Inlet cover/inlet case
2. A/C compressor bracket (If equipped with A/C)
3. Heat protector
4. Exhaust manifold
5. Exhaust gasket
6. Water outlet pipe
7. Idle gear C cover
8. Idle gear C cover
9. Idle gear C
10. Glow plug
11. Fuel filter bracket
12. Engine hanger
13. Turbocharger

Removal

Preparation

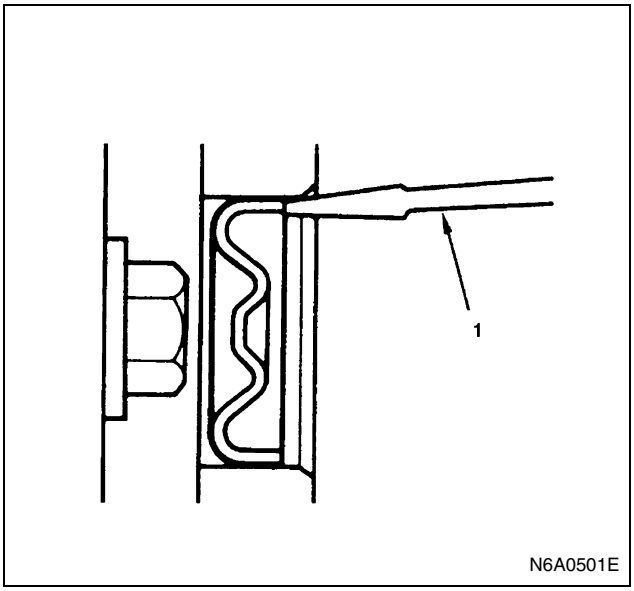
- Disconnect battery ground cable
- Tilt the cab
- Drain coolant
- Remove each part from the cylinder head assembly.
  For details, refer to the “CYLINDER HEAD” in this section.

1. Inlet Cover/Inlet Case
2. Air Conditioning (A/C) Compressor Bracket (If equipped with A/C)



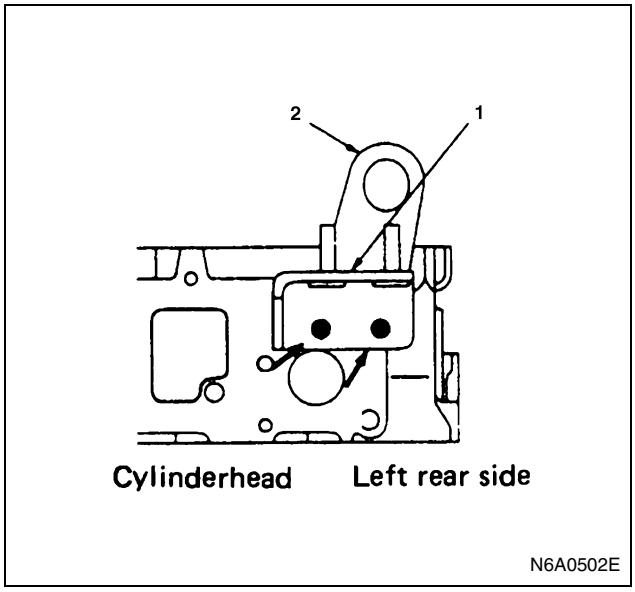
N6A0416E

3. Heat Protector
4. Exhaust Manifold
5. Exhaust Gasket
6. Water Outlet Pipe
7. Thermostat
8. Idle Gear C Cover
   Tap the outside of the sealing cup with a screwdriver (1) to deform one end of it and draw it out with pliers.



N6A0501E

9. Idle Gear C
10. Glow Plug
11. Fuel Filter Bracket
12. Engine Hanger



N6A0502E

Legend
1. Fuel filter bracket
2. Engine hanger

Installation

1. Engine Hanger
2. Fuel Filter Bracket

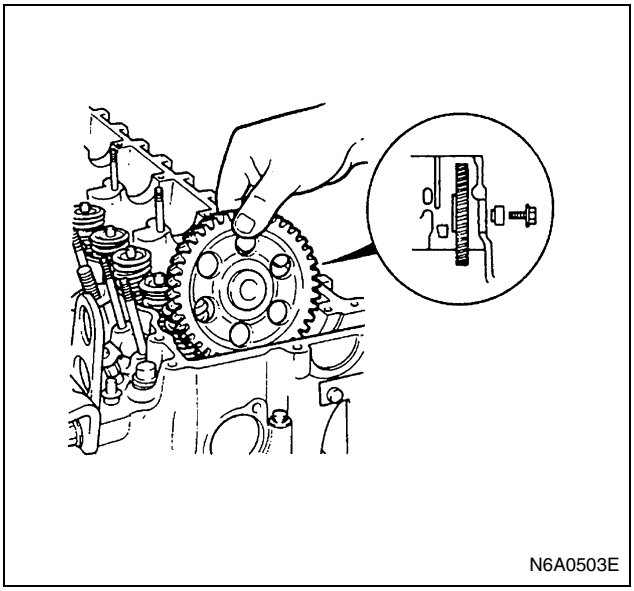
Tighten:
Fuel filter bracket bolt to 104 N·m (10.6 kg·m/77 lb·ft)

3. Glow Plug

Tighten:
Glow plug to 23 N·m (2.3 kg·m/17 lb·ft)

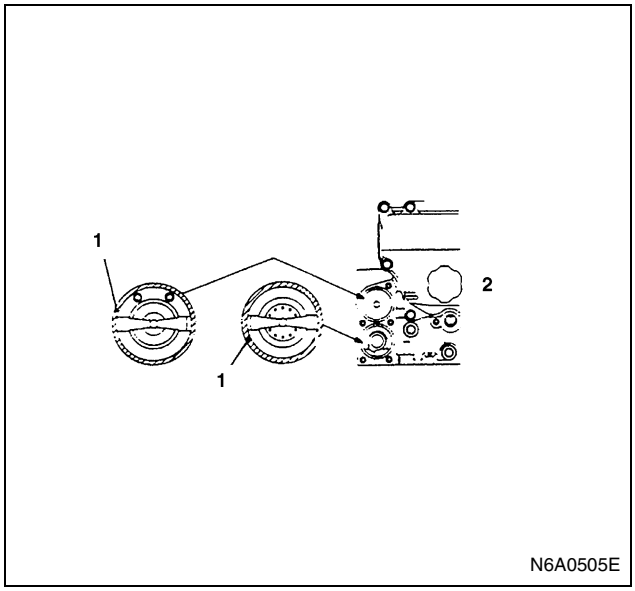
4. Idle Gear C
   1) Apply engine oil to the idle gear shaft, bushing and idle gear before installation.
   2) Install the idle gear with the boss side facing to the camshaft as shown in the illustration.

Tighten:
Idle gear C bolt to 95 N·m (9.7 kg·m/70 lb·ft)



N6A0503E

5. Idle Gear C Cover
   1) Apply the recommended liquid gasket (LOCTITE 262) or its equivalent to the outside of the sealing cup and install it to the cylinder head.
   2) Use the sealing cup installer and a hammer to drive the sealing cup into position from the cylinder head side as shown in the illustration.
      Sealing Cup Installer: 5-8840-2222-0

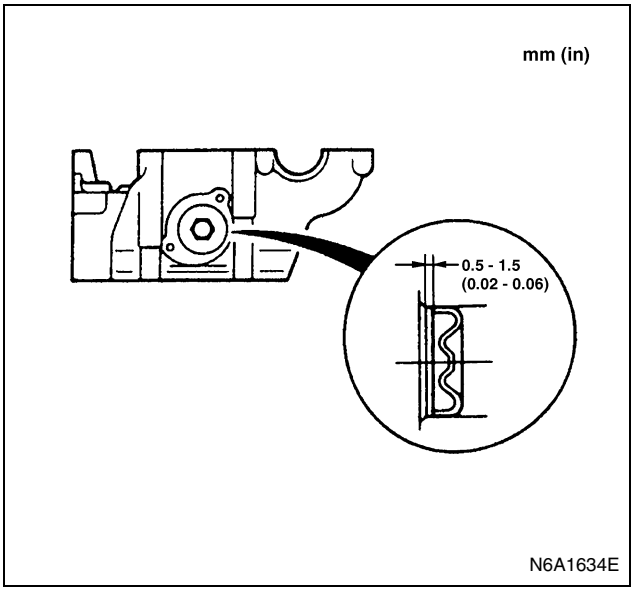


N6A0505E

Legend
1. Gasket
2. Top face of the head

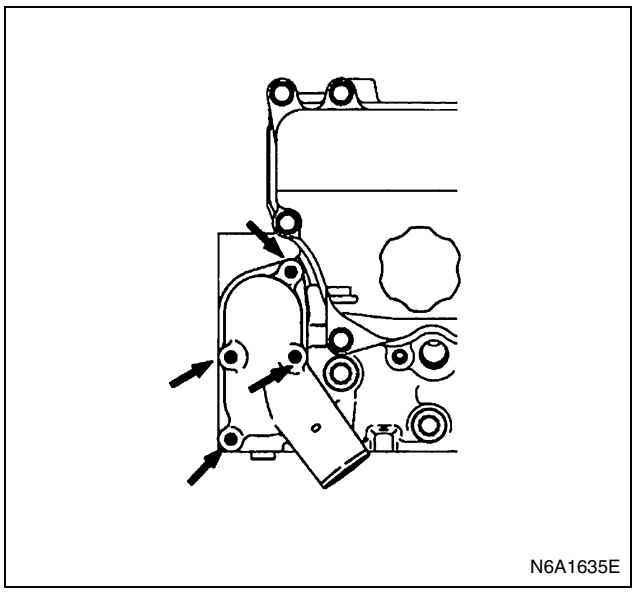
7. Water Outlet Pipe

Tighten:
Water outlet pipe bolt to 24 N·m (2.4 kg·m/17 lb·ft)



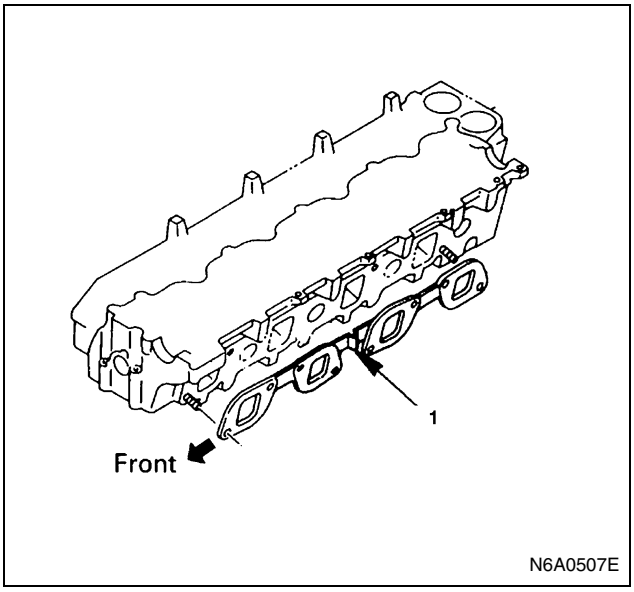
N6A1634E

6. Thermostat
   Install the gaskets to the thermostat and install them to the cylinder head as shown in the illustration.



N6A1635E

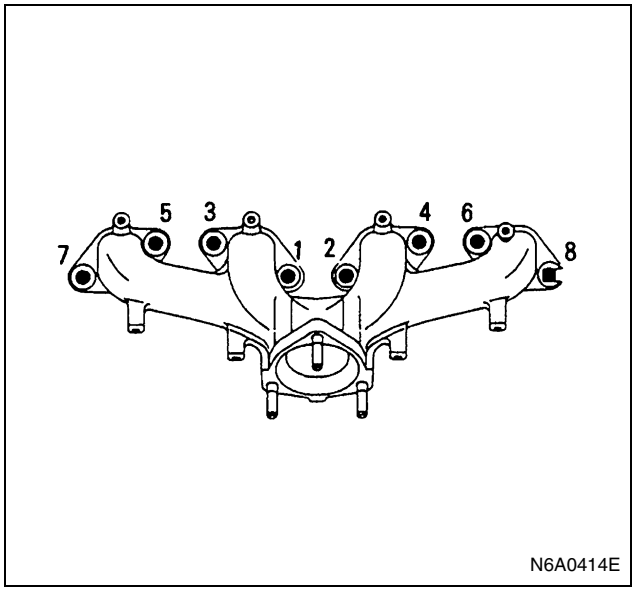
8. Exhaust Gasket
   Insert the gasket into the stud provided to the cylinder head (with the projection (1) of the gasket on this side).

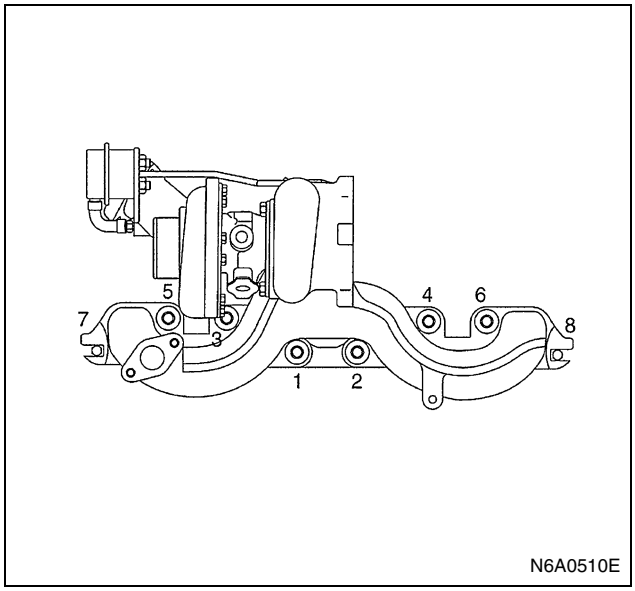


9. Exhaust Manifold
   1) Install exhaust manifold gaskets (1), exhaust manifold (2), distance pieces (3), dish washers (4) and nuts (5) to the stud bolts shown in the illustration.

   2) Tighten the nuts to the specified torque in the numerical order shown in the illustration.

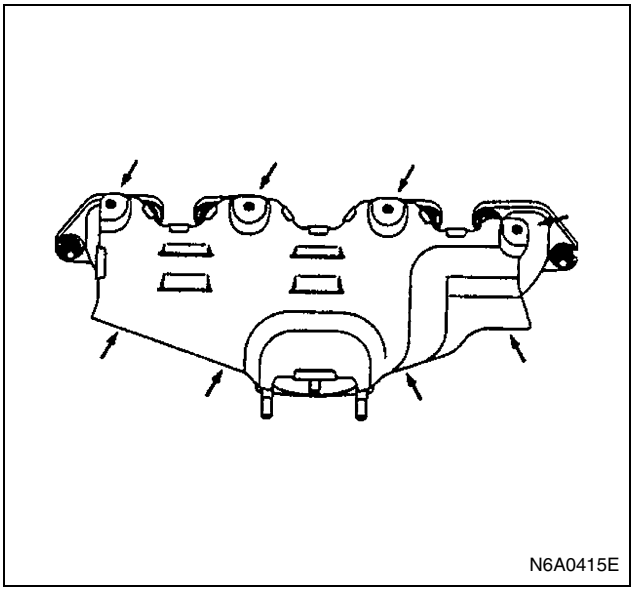
Tighten:
Exhaust manifold nut to 34 N·m (3.5 kg·m/25 lb·ft)





10. Heat Protector

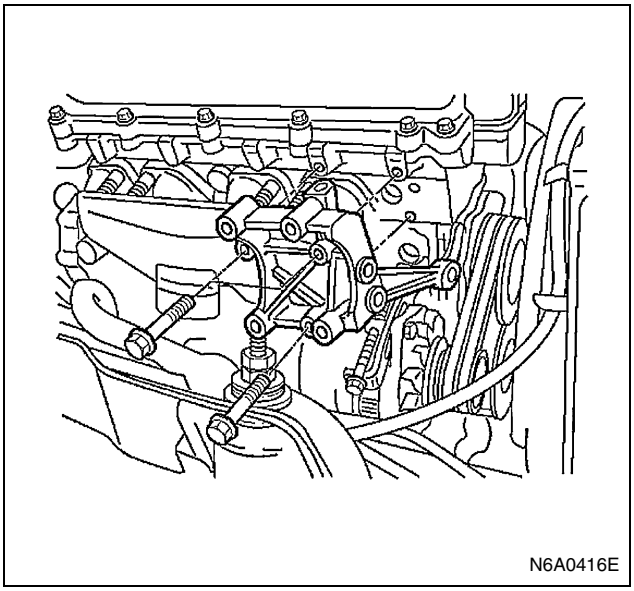
Tighten:
Heat protector bolt to 10 N·m (1.0 kg·m/87 lb·in)



N6A0415E

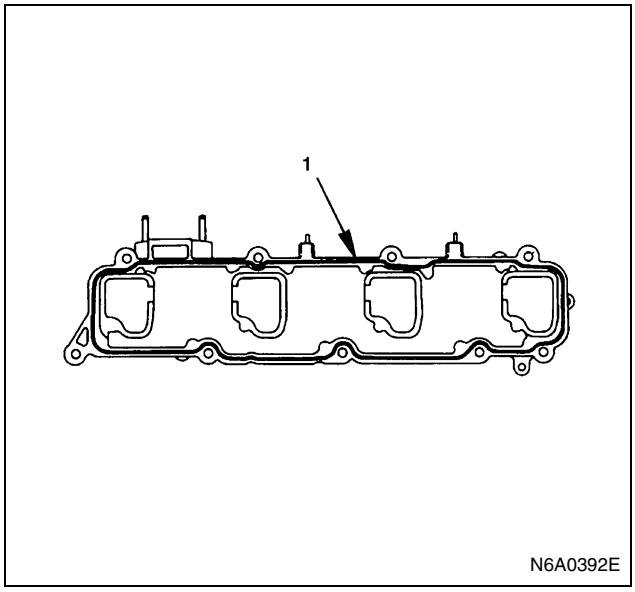
11. Air Conditioning (A/C) Compressor Bracket (If equipped with A/C)
    Tighten fixing bolts to the specified torque.

Tighten:
A/C compressor bracket bolt to 48 N·m (4.9 kg·m/35 lb·ft)



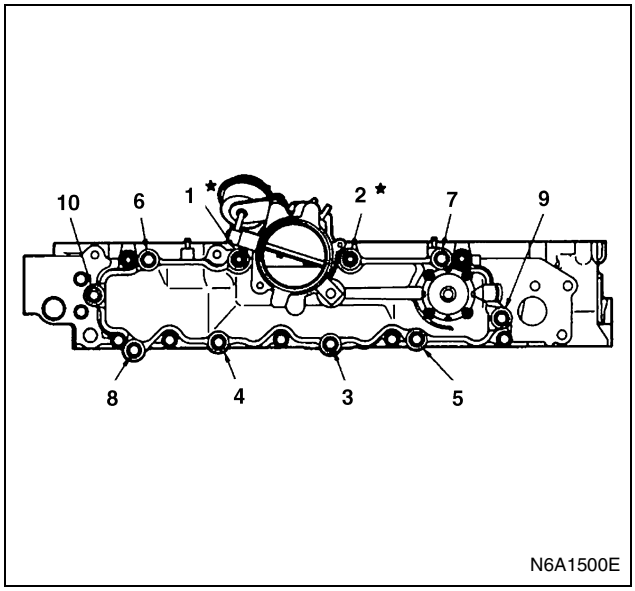
N6A0416E

12. Inlet Cover/Inlet Case
    1) Apply 2 — 3 mm (0.08 — 0.12 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the groove (1) of the inlet case fitting surfaces shown in the illustration.
    - Clean the inlet case fitting surface of the cylinder head.



N6A0392E

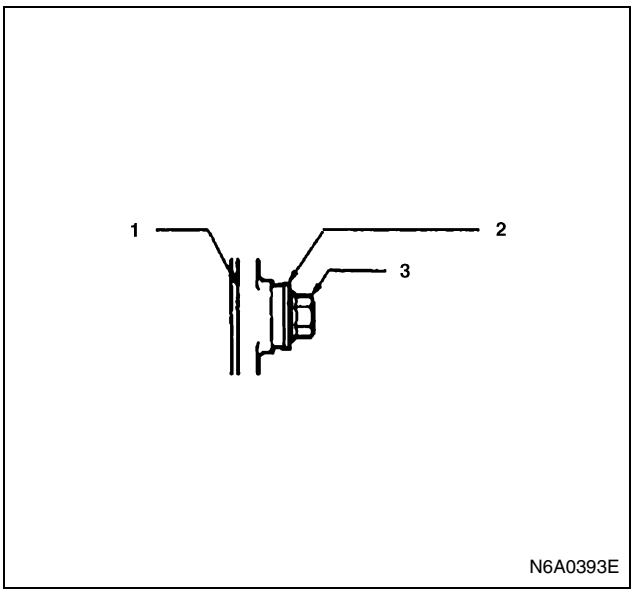
    2) Install the inlet case to the cylinder head.
    - Install the inlet case within 7 minutes after application of liquid gasket.
    - Attach harness clips ((1), (6) and (7)) and tighten the inlet cover bolts and nuts to the specified torque in the numerical order shown in the illustration.



N6A1500E

    - ★ marks are located on nut positions.

Tighten:
Inlet cover bolt and nut to 13 N·m (1.3 kg·m/9 lb·ft)



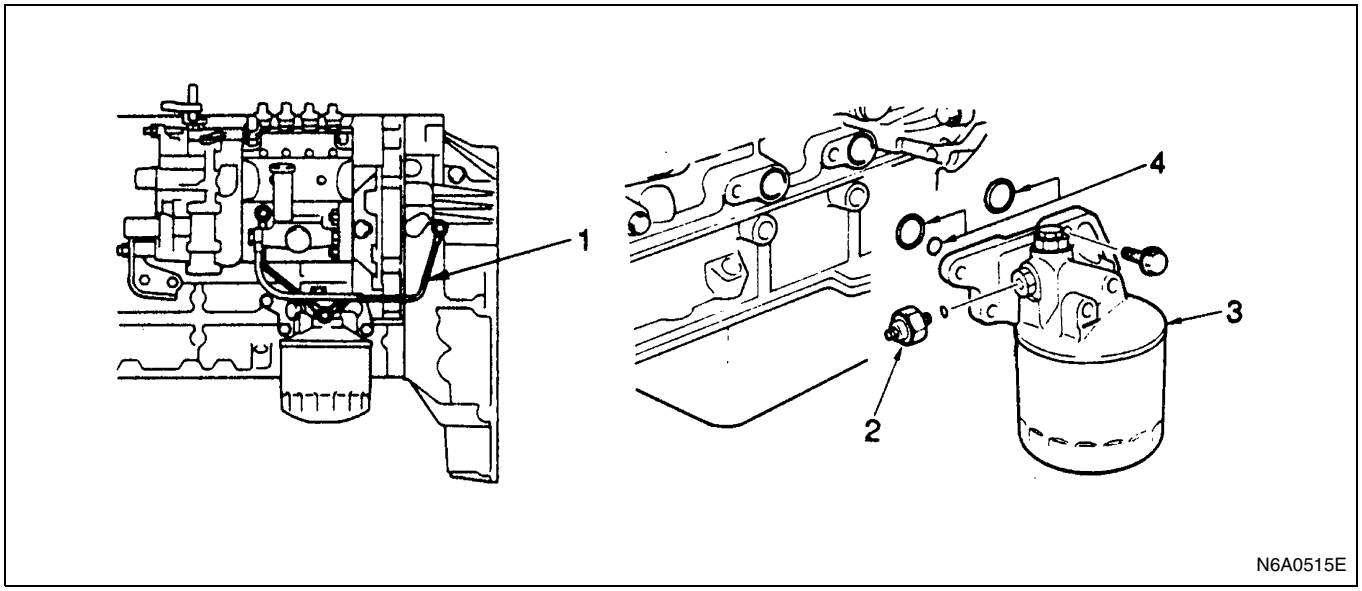
Legend

1. Inlet cover
2. Mounting rubber
3. Bolt

Refer to “CYLINDER HEAD” in this section, install the remaining parts.

OIL FILTER ASSEMBLY

Component



Legend

1. Oil pipe
2. Oil pressure switch
3. Oil filter
4. O-ring

Removal

Preparation

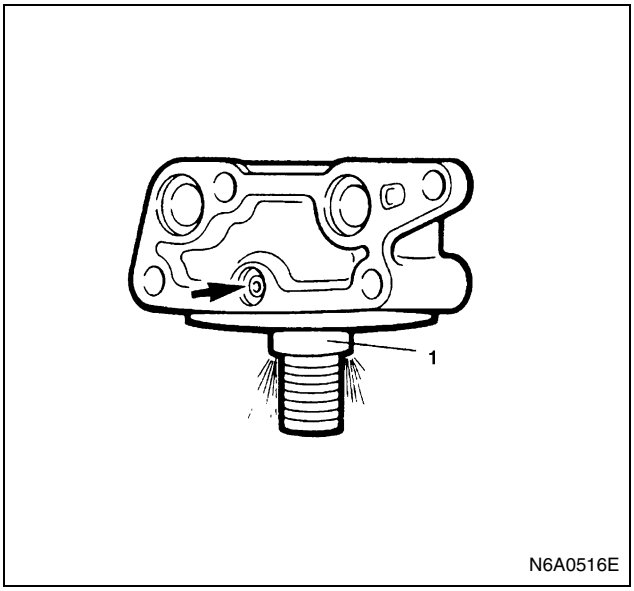
- Disconnect battery ground cable.
- Place a receptacle beneath the oil filter to contain the drained oil.

1. Oil Pipe
2. Oil Pressure Switch
3. Oil Filter
4. O-ring

Inspection

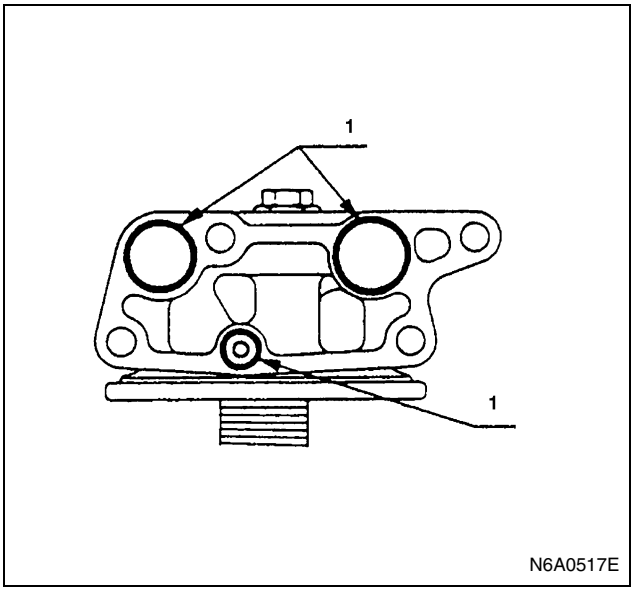
Oil Filter Cover

1. Check the partial filter orifice for any clogging.
2. Send air into the arrow-marked hole in the illustration, and check to see if the air blows out from the small holes in the center sleeve (1).



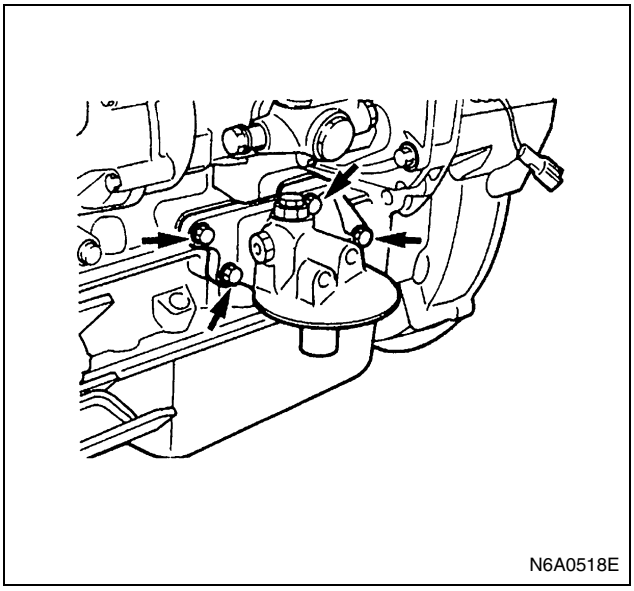
Installation

1. O-Ring
   Apply a coat of engine oil to the O-rings (1) and install them to the cylinder body.



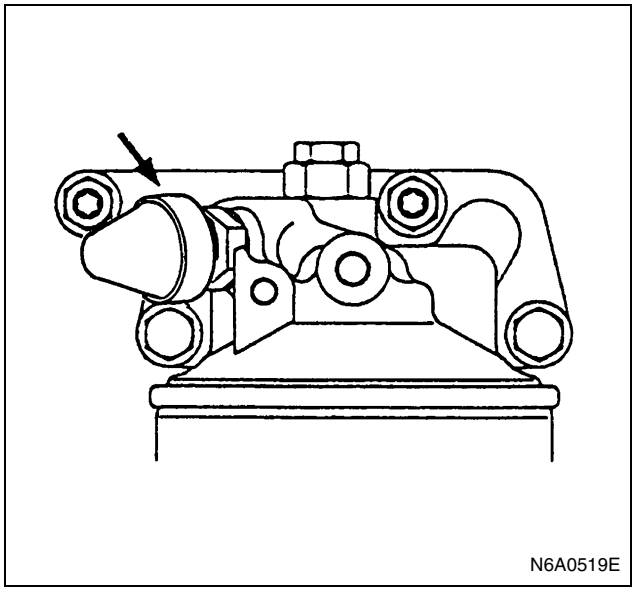
2. Oil Filter

Tighten:
Oil filter cover bolt to 48 N·m (4.9 kg·m/35 lb·ft)



3. Oil Pressure Switch
   1) Apply the recommended liquid gasket (LOCTITE 262) or its equivalent to at least 2 — 3 of the oil pressure switch threaded areas.
   2) Install the oil pressure switch to the oil filter cover.

Tighten:
Oil pressure switch to 13 N·m (1.3 kg·m/113 lb·in)



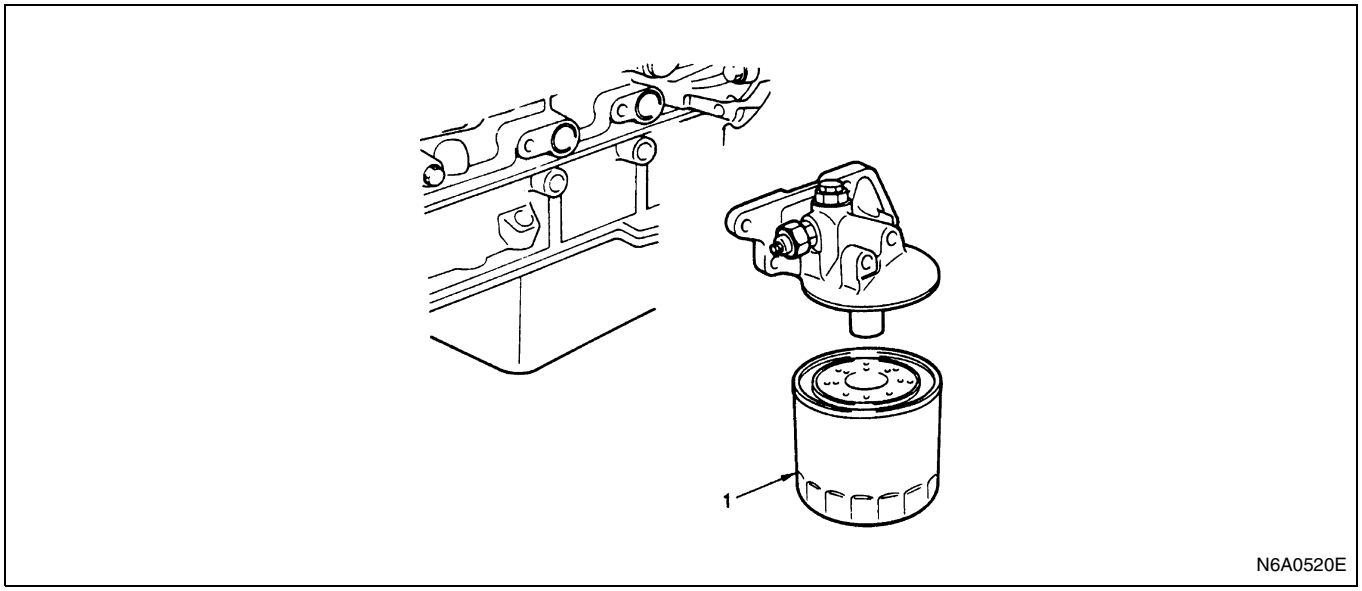
4. Oil Pipe

Tighten:
Oil pipe joint bolt to 17 N·m (1.7 kg·m/12 lb·ft)

- Connect battery ground cable.
- Start engine and check for oil leakage carefully.

OIL FILTER CARTRIDGE

Component

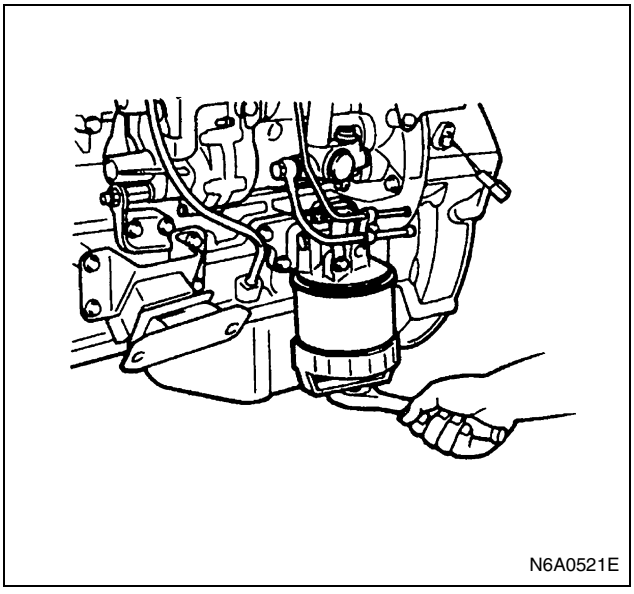


Legend
1. Oil filter cartridge

Removal

Preparation
- Disconnect battery ground cable.
- Place a receptacle beneath the oil filter to contain the drained oil.

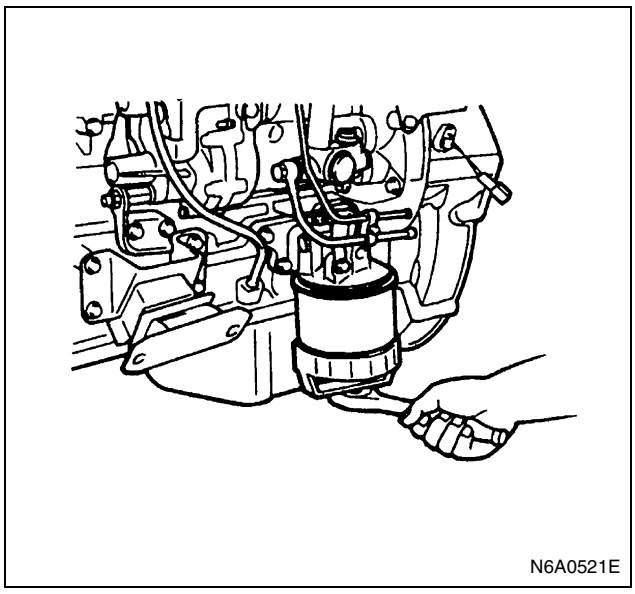
1. Oil Filter Cartridge
   Use an oil filter wrench to remove the oil filter cartridge.
   Oil Filter Wrench: 1-8522-1097-0
   5-8840-2094-0 (4WD model)



Installation

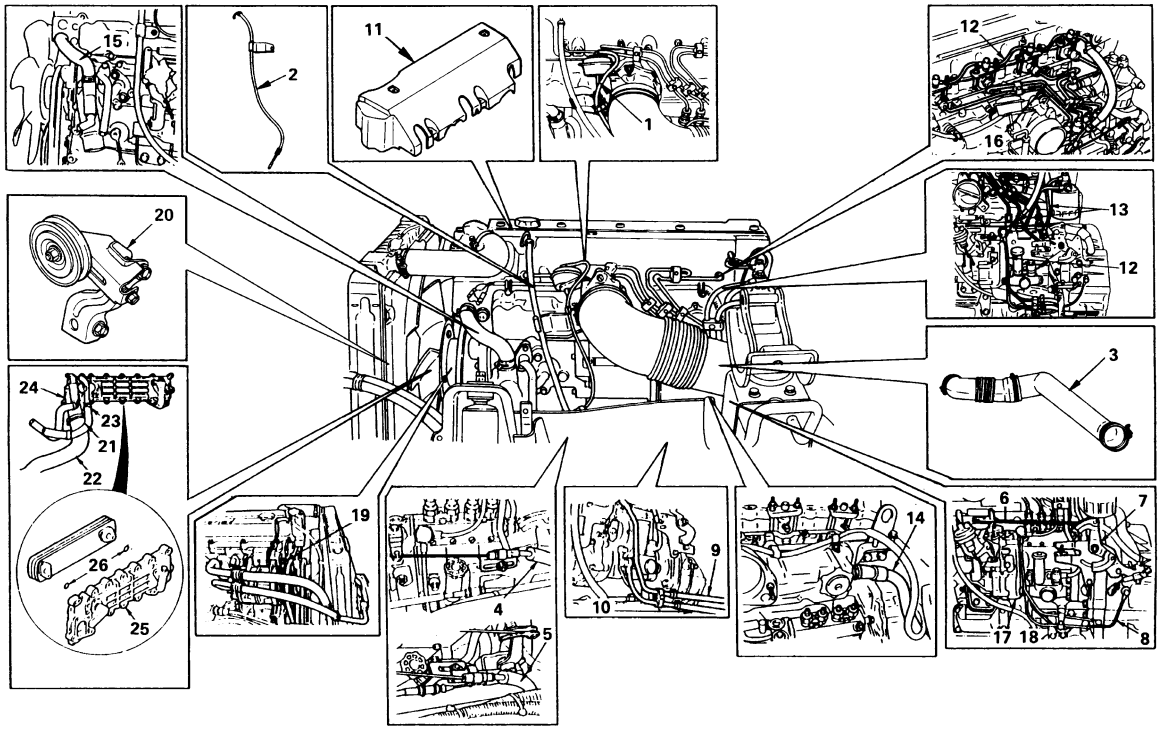
1. Oil Filter Cartridge
   1) Clean the oil filter fitting face.
   2) Apply a light coat of engine oil to the O-ring.
   3) Turn in the new oil filter until the filter O-ring is fitted against the sealing face.
   4) Use an oil filter wrench to install the new oil filter cartridge.
      Oil Filter Wrench: 1-8522-1097-0
      5-8840-2094-0 (4WD model)

Tighten:
Oil filter to 64 N·m (6.5 kg·m/47 lb·ft)



OIL COOLER

Component



Legend

1. Vacuum hose
2. Oil level guide tube
3. Intake air duct
4. Engine stop cable
5. Accelerator control cable
