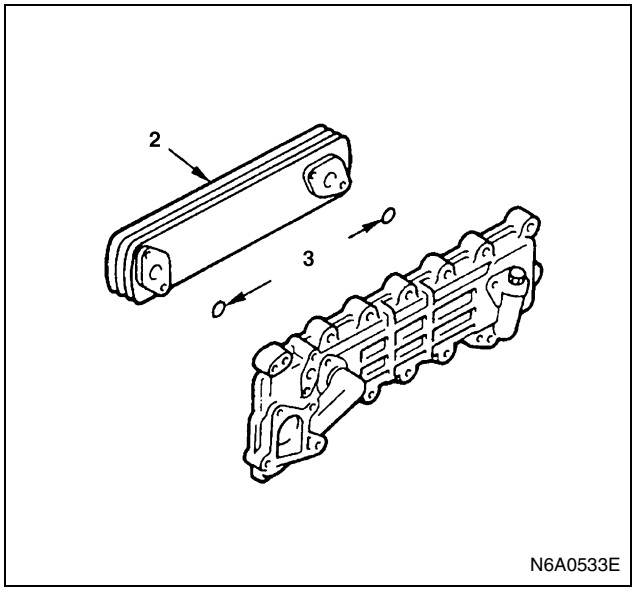
26. O-Ring

Disassembly

(Oil Cooler Assembly)

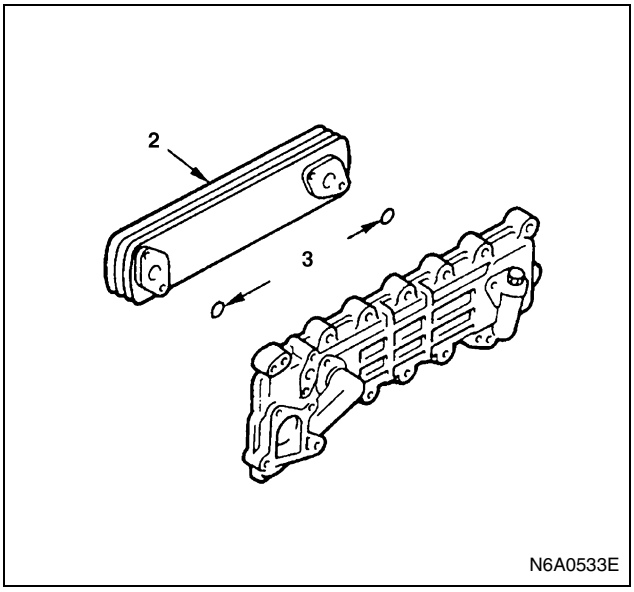
1. Element fixing bolts
2. Element
3. O-Ring



N6A0533E

Reassembly

1. O-Ring
   Apply a coat of engine oil to the O-rings and install the O-rings the oil cooler.
2. Element



Legend
2. Element
3. O-ring

3. Element fixing bolts

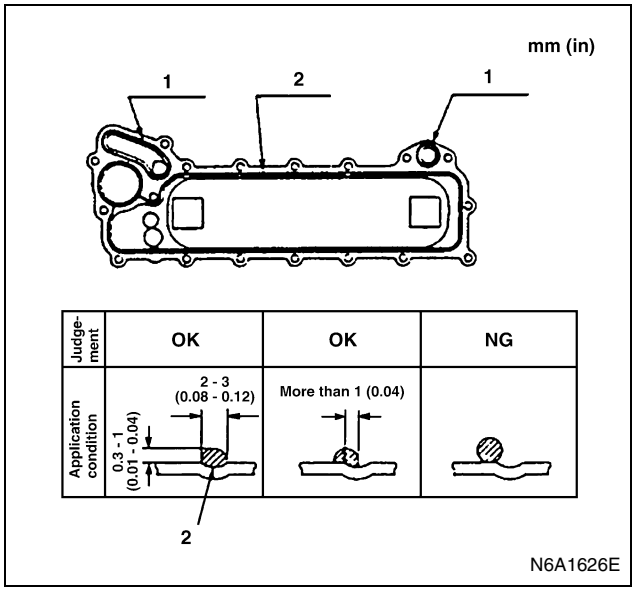
Tighten:
Element fixing bolts to 20 N·m (2.0 kg·m/14 lb·ft)

Installation

1. O-Ring
2. Oil Cooler Assembly
   1) Apply 2 — 3 mm (0.08 — 0.12 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the oil cooler fitting surface.
   2) Apply a coat of engine oil to the O-rings (2 pieces) and install the O-rings to the oil cooler.

Notice:
Take care that the O-ring is not smeared with liquid gasket.

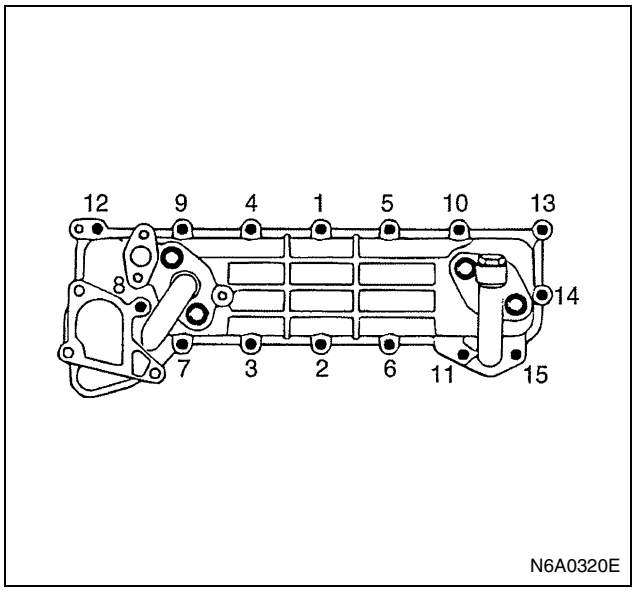
- Install the oil cooler within 7 minutes after application of liquid gasket.
- For the dislocation of liquid gasket, refer to the illustration.



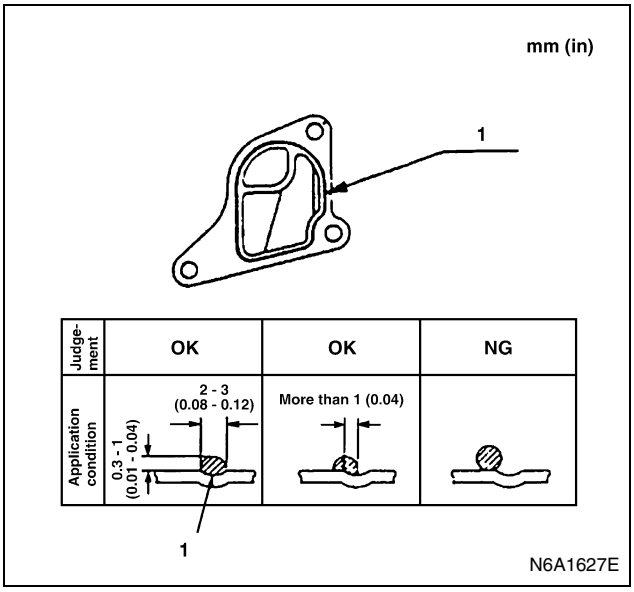
Legend
1. O-ring
2. Liquid gasket

3) Tighten the oil cooler bolts and nut to the specified torque a little at a time in the sequence shown in the illustration.

Tighten:
Oil cooler bolt and nut to 24 N·m (2.4 kg·m/17 lb·ft)



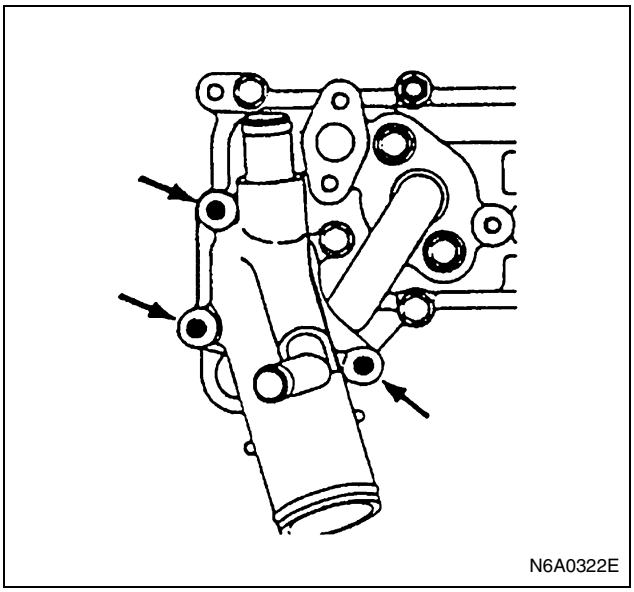
3. Water Suction Pipe
   1) Apply 2 — 3 mm (0.08 — 0.12 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the groove of the water suction pipe fitting surface.
   2) Install the water suction pipe to the oil cooler.
   - For the dislocation of liquid gasket, refer to the illustration.



Legend
1. Liquid gasket

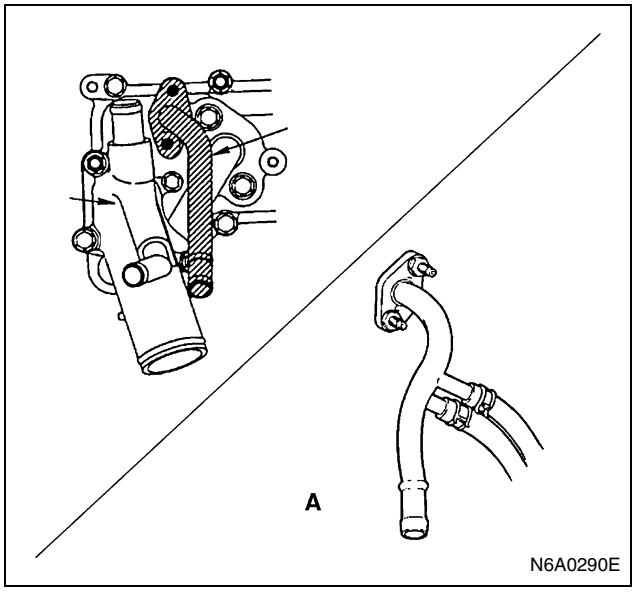
Tighten:
Water suction pipe bolt to 24 N·m (2.4 kg·m/17 lb·ft)

Notice:
Install the water suction pipe immediately after the installation of the oil cooler.



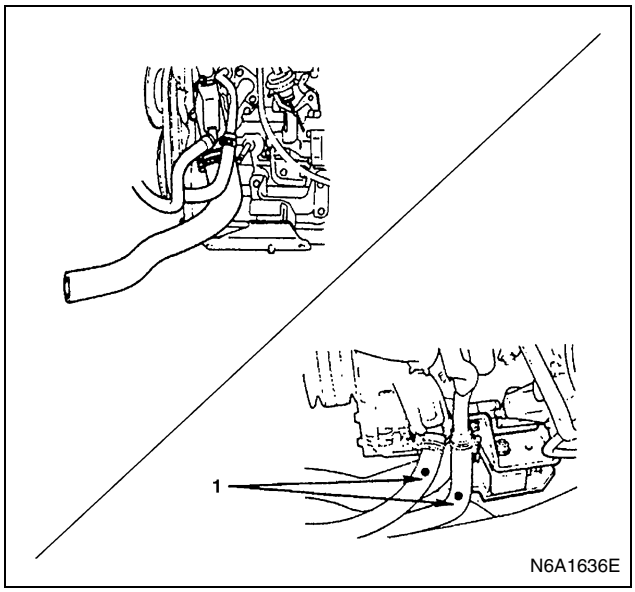
4. Heater Pipe
   1) Install the O-ring to the heater pipe.
   2) Install the heater pipe to the oil cooler.

Tighten:
Heater pipe bolt to 24 N·m (2.4 kg·m/17 lb·ft)



Legend
A. 4HF1-2

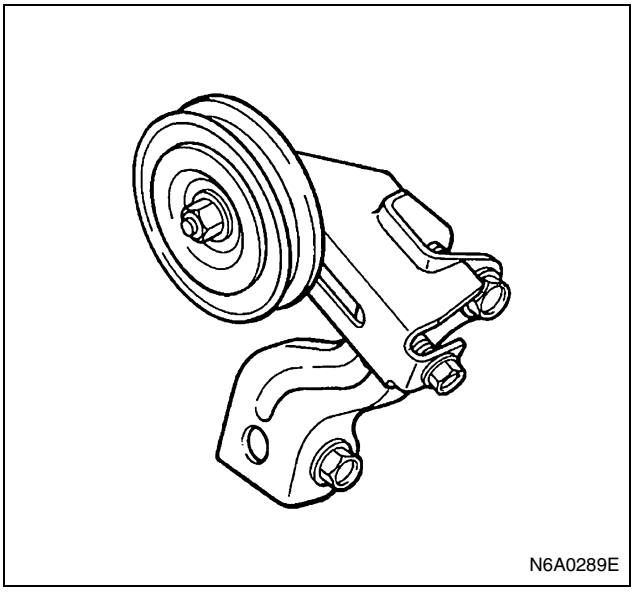
5. Radiator Lower Hose
6. Heater Hose



Legend
1. Mark

7. Idle Pulley Bracket (If equipped with A/C)

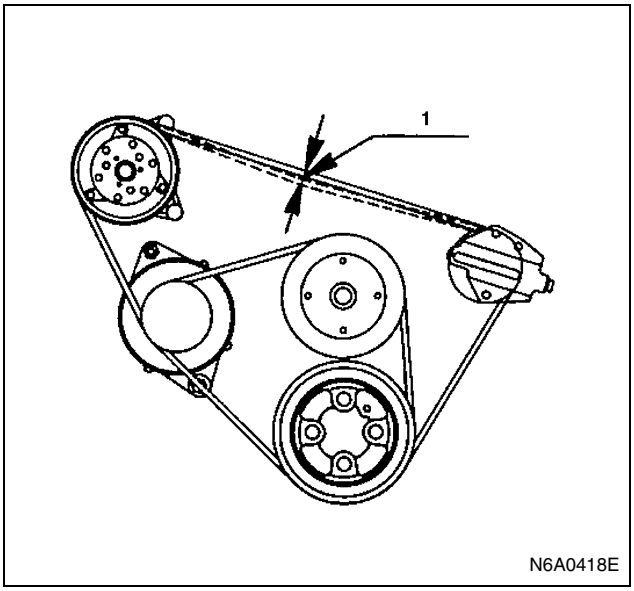
Tighten:
Idle pulley bracket bolt to 48 N·m (4.9 kg·m/35 lb·ft)



N6A0289E

8. Air Conditioning (A/C) Drive Belt (If equipped with A/C)
   - Install drive belt adjust belt tension by adjusting bolt and tighten locking nut to the specified torque.
   - Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
16 — 20 (0.63 — 0.79) ... New belt 18 — 22 (0.71 — 0.87) ... Reuse belt	



N6A0418E

Legend
1. Belt deflection

Tighten:
Locking nut to 27 N·m (2.8 kg·m/20 lb·ft)

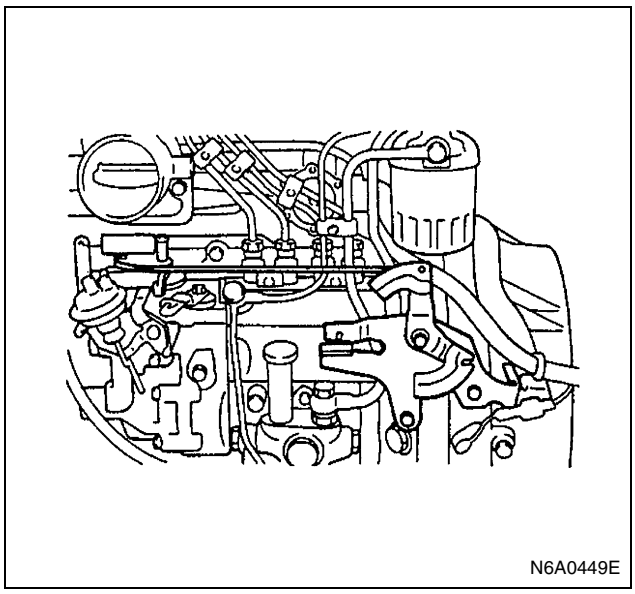
18. Fuel Return Hose

Air Bleeding
Above works refer to “INJECTION PUMP ASSEMBLY” section in this manual.

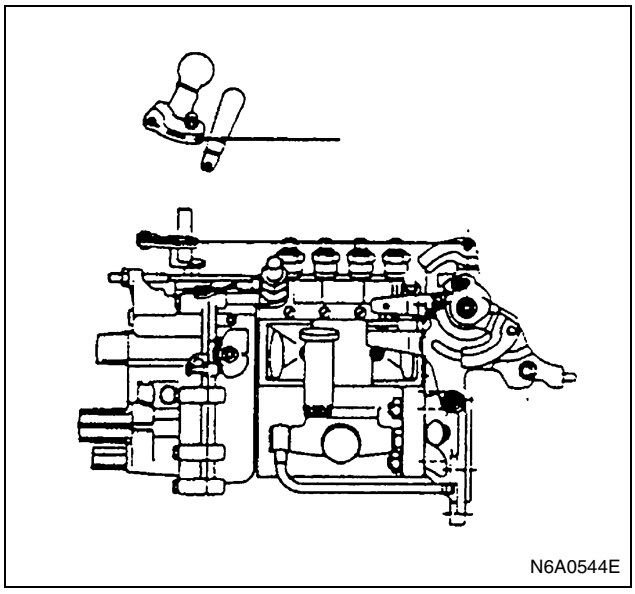
19. Oil Pipe
20. Engine Control Lever Assembly

Tighten:
Engine control lever bolt to 24 N·m (2.4 kg·m/17 lb·ft)



N6A0449E

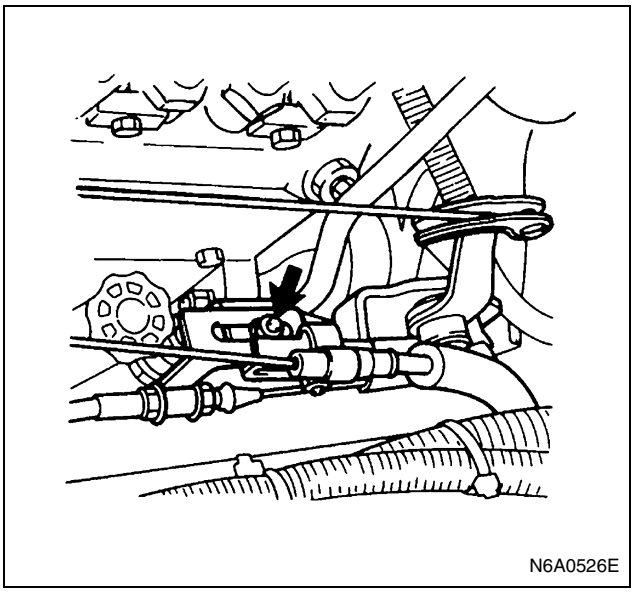
21. Engine Control Cable



N6A0544E

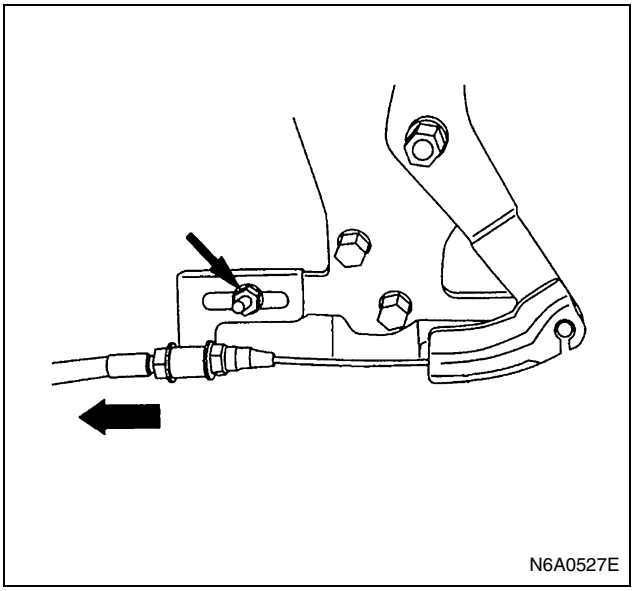
22. Accelerator Control Cable
    1) Check to see if the idling control knob is turned to the utmost limit to the left.

2) Install the end tip of the cable to the engine control lever.
3) With the outer cable pulled toward the front of the vehicle, provide the engine control wire and the inner cable with the appropriate play. Then, fasten the clamp with a nut.



N6A0526E

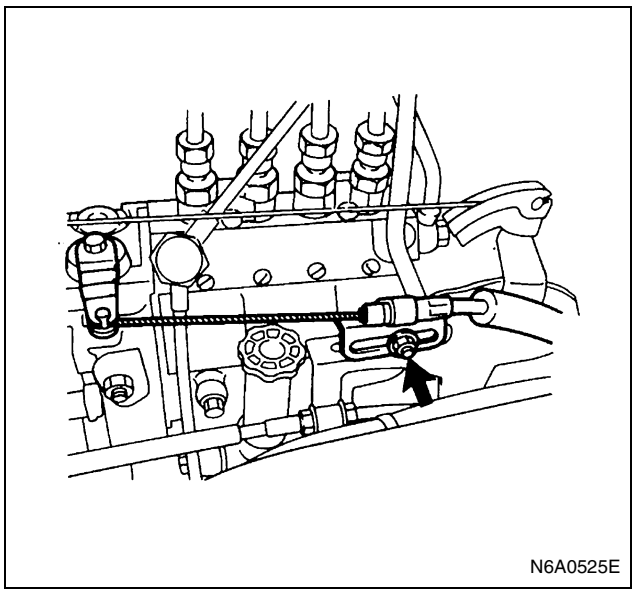
For 4HE1-TC



N6A0527E

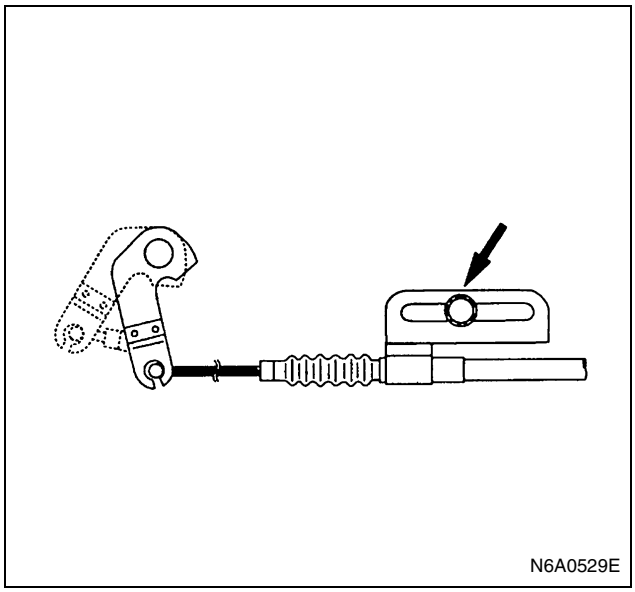
4) Check to see if the control lever of the injection pump is set at the idling position (with the lever attached to the stopper bolt).

23. Engine Stop Cable
    1) Install the end tip of the cable to the engine stop lever.
    2) Pull the cable toward the rear of the vehicle, and fasten the clamp with a nut at the position where the lever stops.



N6A0525E

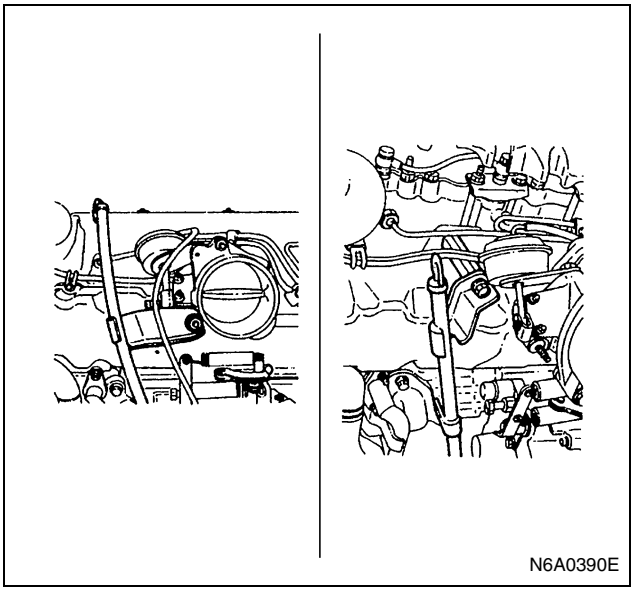
For 4HE1-TC



N6A0529E

24. Intake Air Duct
25. Oil Level Gauge Guide Tube
    1) Install the O-rings to the guide tube lower portion and insert the guide tube completely to the cylinder body.
    2) Tighten the guide tube bolt to the specified torque.

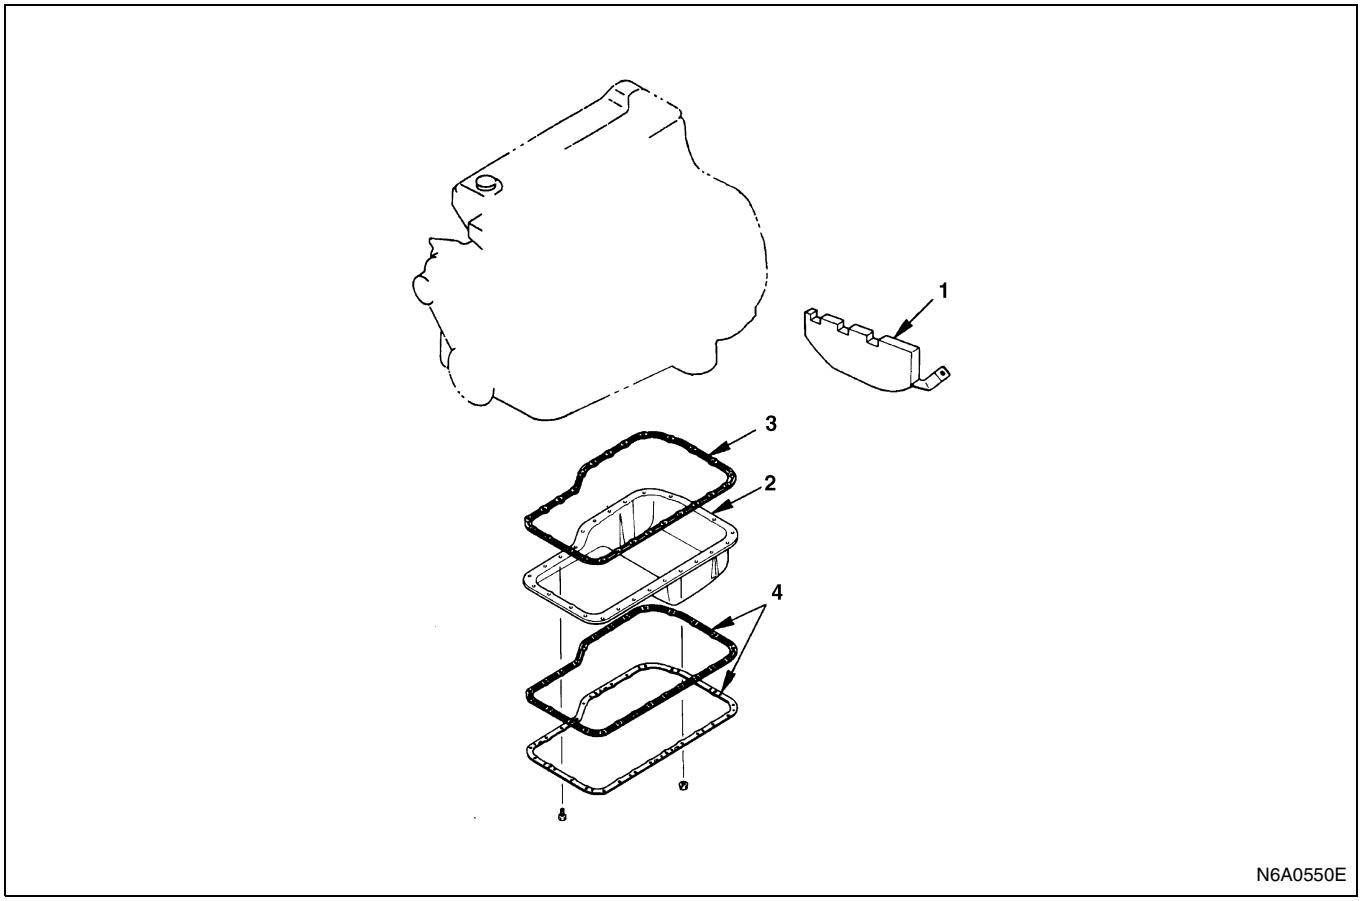
Tighten:
Guide tube bolt to 13 N·m (1.3 kg·m/113 lb·in)



26. Vacuum Hose
    - Pour coolant into radiator.
    - Connect battery ground cable.
    - Start engine and check for oil and water leakage carefully.

OIL PAN

Component



Legend

1. Spacer rubber
2. Oil pan
3. Gasket
4. Rubber assembly

Removal

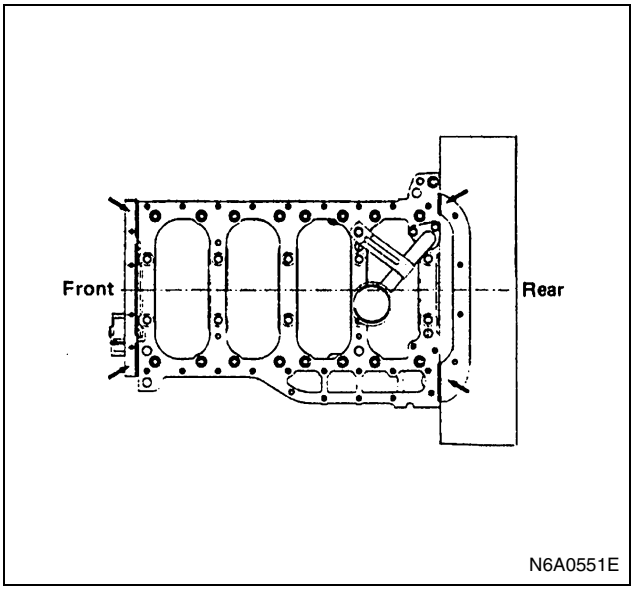
Preparation

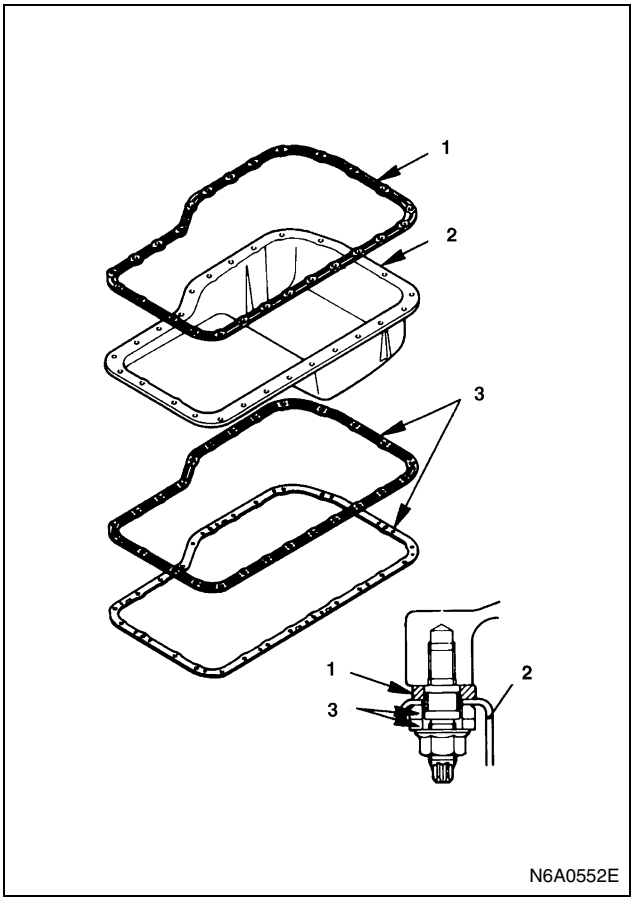
- Disconnect battery ground cable
- Lift up car
- Drain engine oil

1. Spacer Rubber
   - Remove the stiffener before removing the spacer rubber.
2. Oil Pan

Installation

1. Oil Pan
   1) Apply a 3 mm (0.12 in) bead of recommended liquid gasket (Three Bond 1207C) or its equivalent to the shaded areas shown in the illustration.



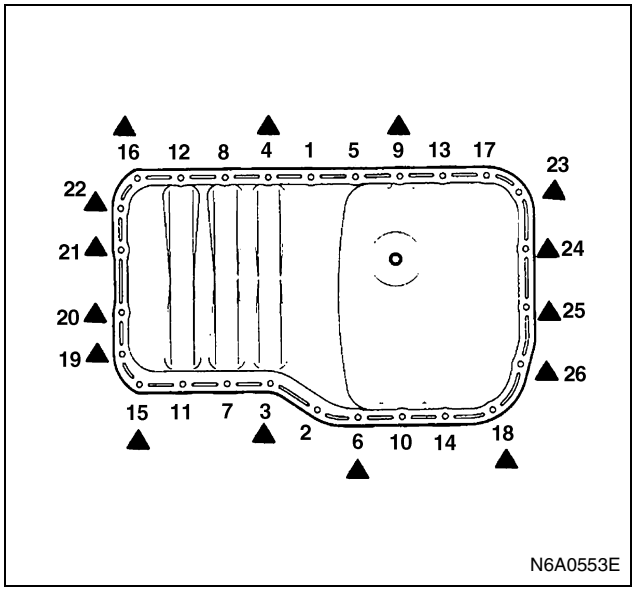


Legend
1. Gasket
2. Oil pan
3. Rubber assembly

2) Tighten the oil pan nuts and bolts to the specified torque in the numerical order as shown in the illustration.
▲marks are located on nut positions.

Tighten:
Oil Pan nuts and bolts to 11 N·m (1.1 kg·m/8 lb·ft)

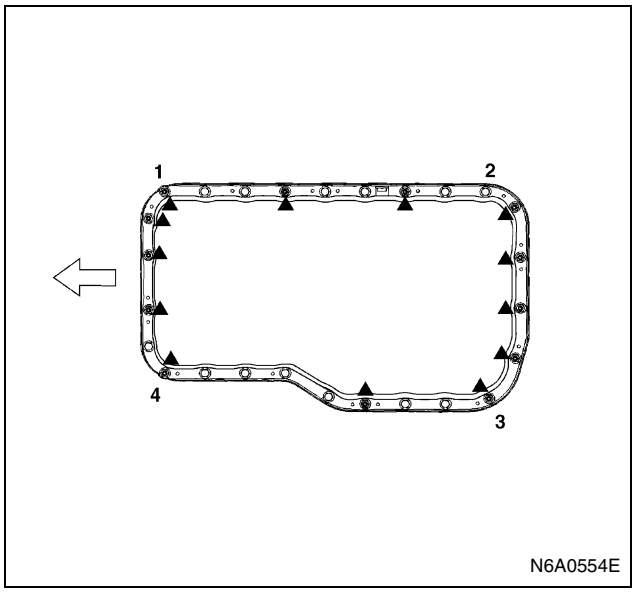
Except 4HE1-TC



- Tighten bolts (1), (2), (3), and (4) in numerical order.
- Tighten the remaining bolts (numerical order is not requred).

Tighten:
Oil pan nuts and bolts to 11 N·m (1.1 kg·m/8 lb·ft)

For 4HE1-TC

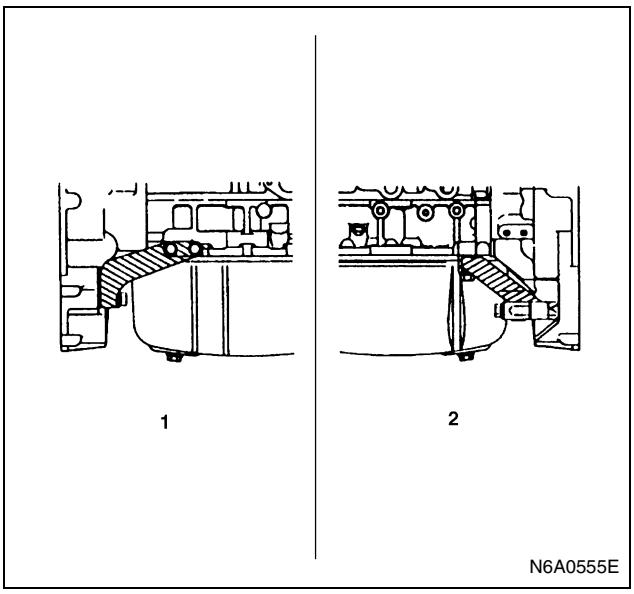


2. Spacer Rubber

Tighten:
Spacer rubber bolts to 76 N·m (7.7 kg·m/56 lb·ft)

- Tighten the spacer rubber together with the stiffener.

Tighten:
Spacer rubber bolts to
- Cylinder body RH side: 48 N·m (4.9 kg·m/35 lb·ft)
- Cylinder body LH side: 128 N·m (12.9 kg·m/93 lb·ft)
- Flywheel housing side: 76 N·m (7.7 kg·m/56 lb·ft)



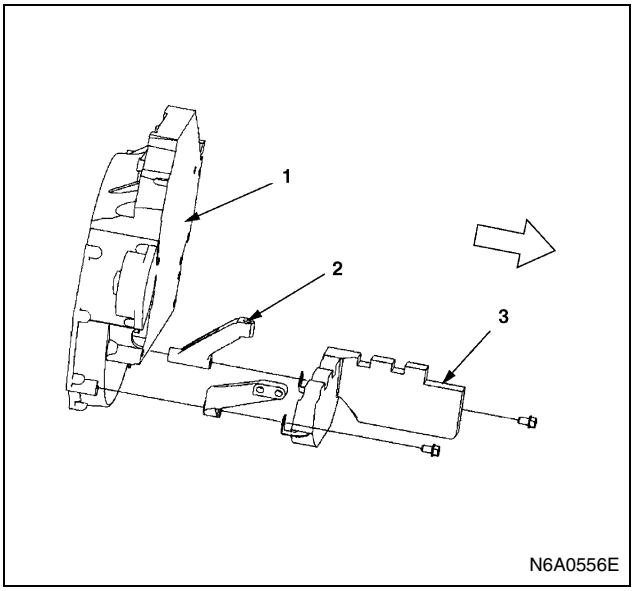
Legend
1. Right side
2. Left side

- 4HE1-TC engines use a larger rubber spacer than other engines.

Tighten:
Space rubber bolts to 76 N·m (7.7 kg·m/56 lb·ft)

- Install the rubber spacer to the bracket from the outside of the spacer. Tighten the stiffener together with the rubber spacer.

For 4HE1-TC



Legend
1. Flywheel housing
2. Stiffener
3. Space rubber

OIL PUMP ASSEMBLY

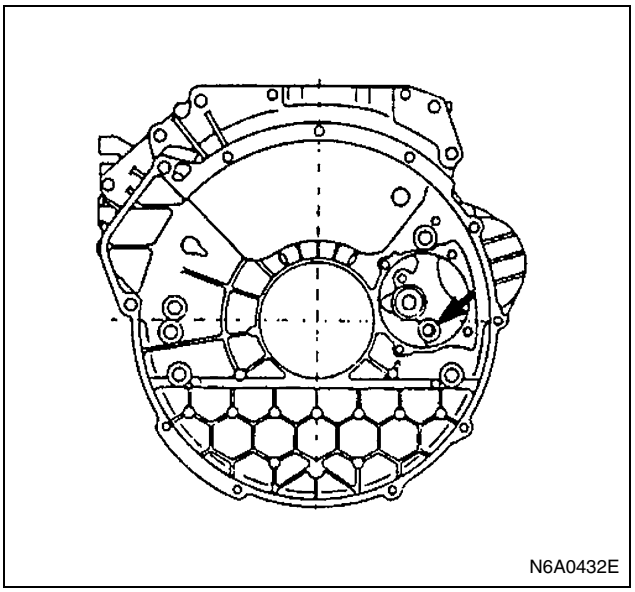
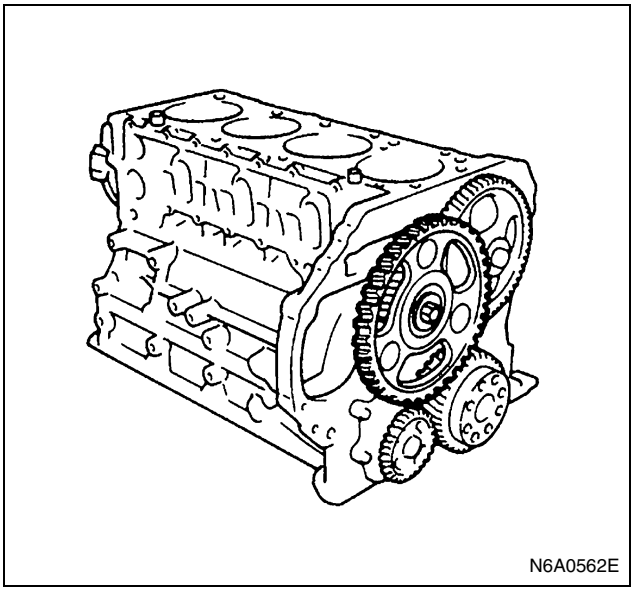
24. Power Steering Pump Idle Gear Cover
25. Power Steering Pump Idle Gear
26. Flywheel Housing

Notice:
Be careful not to fail to remove the bolts shown in the illustration.



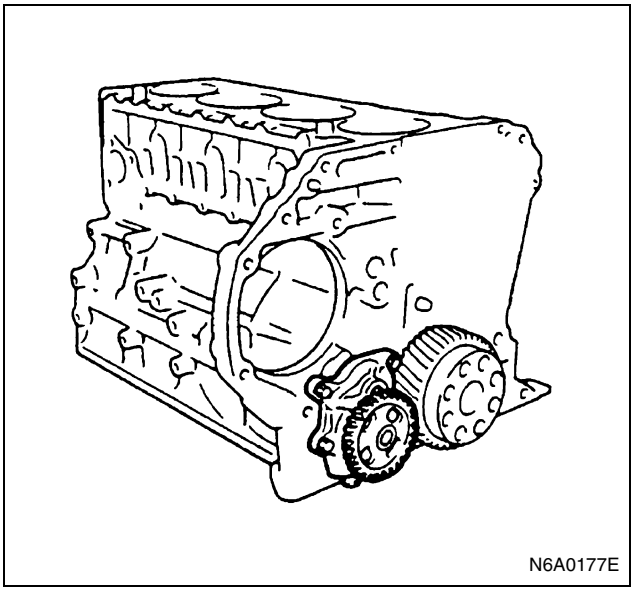
N6A0432E

27. Idle Gear A



N6A0562E

28. Oil Pump Assembly

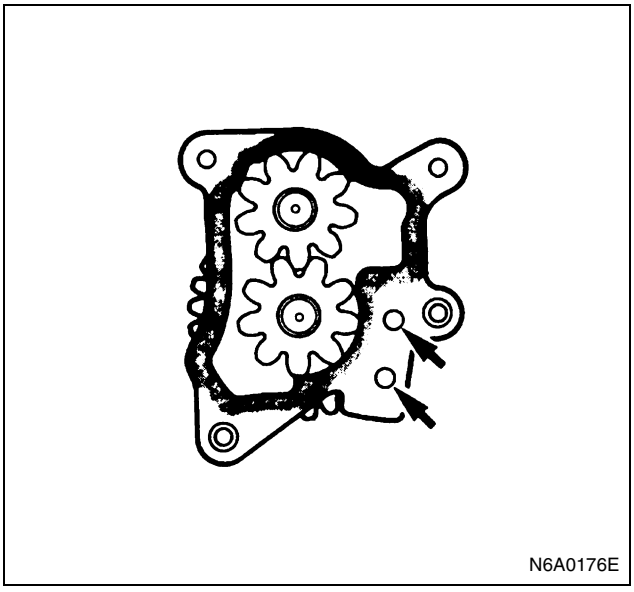


N6A0177E

Installation

1. Oil Pump Assembly
   1) Carefully wipe any foreign material from the cylinder body rear surface.
   2) Apply the recommended liquid gasket (Three Bond 1141E) or its equivalent to the shaded areas shown in the illustration.

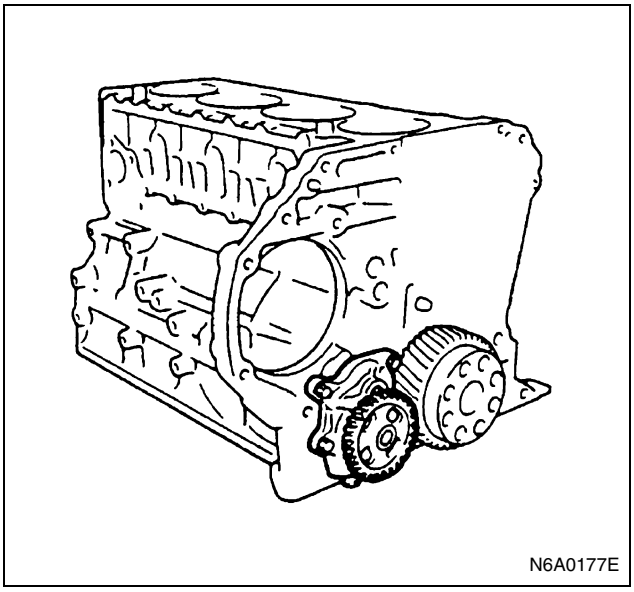
Caution:
Be careful that no liquid gasket gets into the holes in the arrow-marked portion in the illustration and the inside of the oil pump cover.



N6A0176E

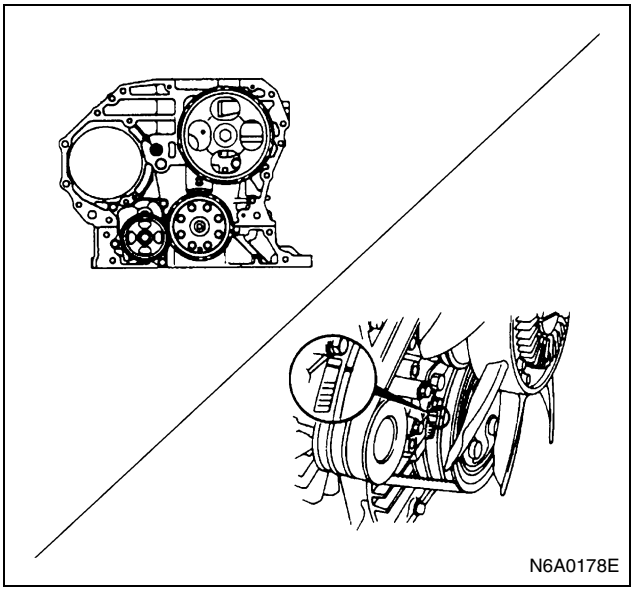
   3) Install the oil pump to the cylinder body.
   4) Tighten the oil pump to the specified torque.

Tighten:
Oil pump bolt to 31 N·m (3.2 kg·m/23 lb·ft)



N6A0177E

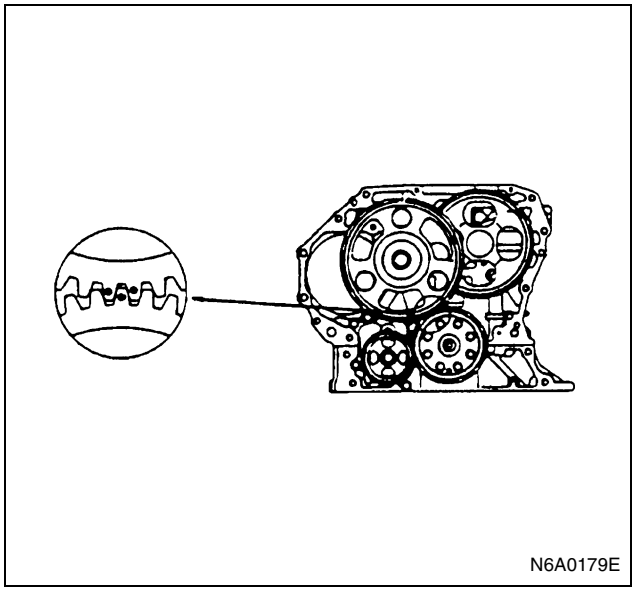
2. Idle Gear A
   1) Turn the crankshaft clockwise so that the engagement mark of the crankshaft gear faces to the shaft center of the idle gear A and the No.1 cylinder piston comes to the top dead center.



N6A0178E

   2) Align the crankshaft gear with the engagement mark of the idle gear and install the idle gear A.

Tighten:
Idle gear A bolt to 133 N·m (13.6 kg·m/98 lb·ft)



N6A0179E

3. Flywheel Housing
4. Power Steering Pump Idle Gear
5. Power Steering Pump Idle Gear Cover

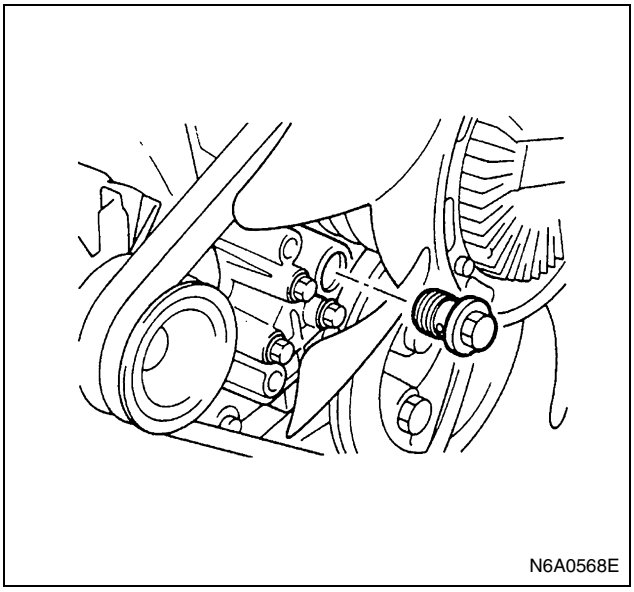
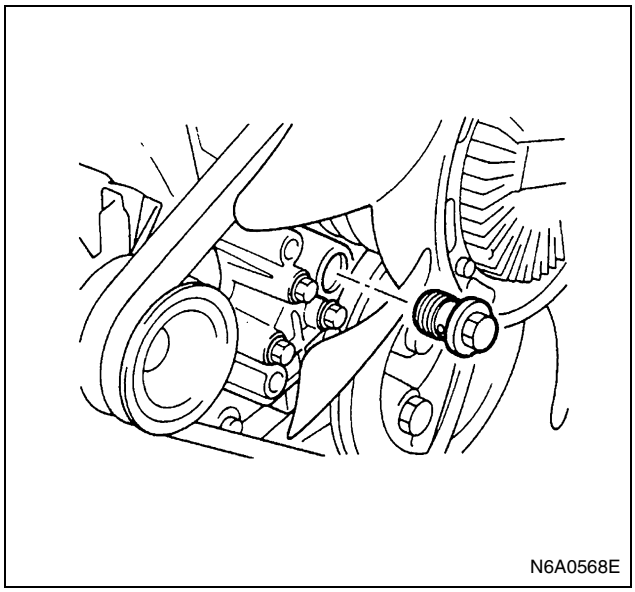
    Above works refer to “ENGINE ASSEMBLY” section in this manual.

OIL RELIEF VALVE

Removal

1. Oil Relief Valve





Inspection and Repair

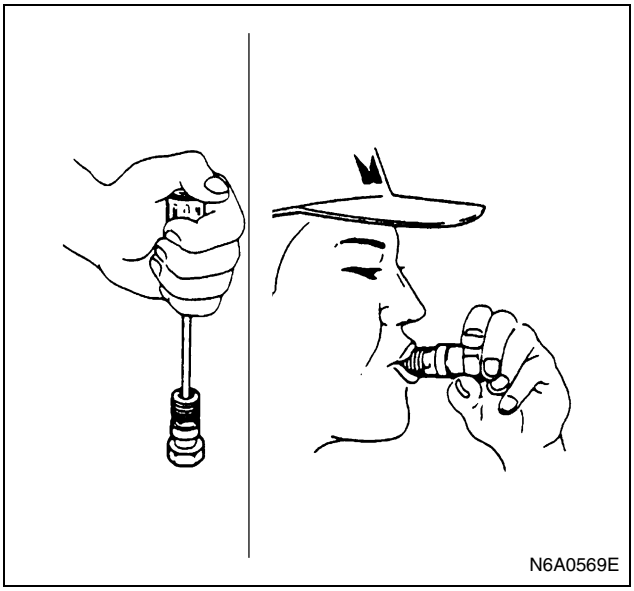
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Valve

Push the valve with a screwdriver to check it for binding. When the valve is binding, replace the relief valve with a new one.

Spring

Blow the valve and check it for air leak. When there is any air leak in the valve, replace it with a new one.



Installation

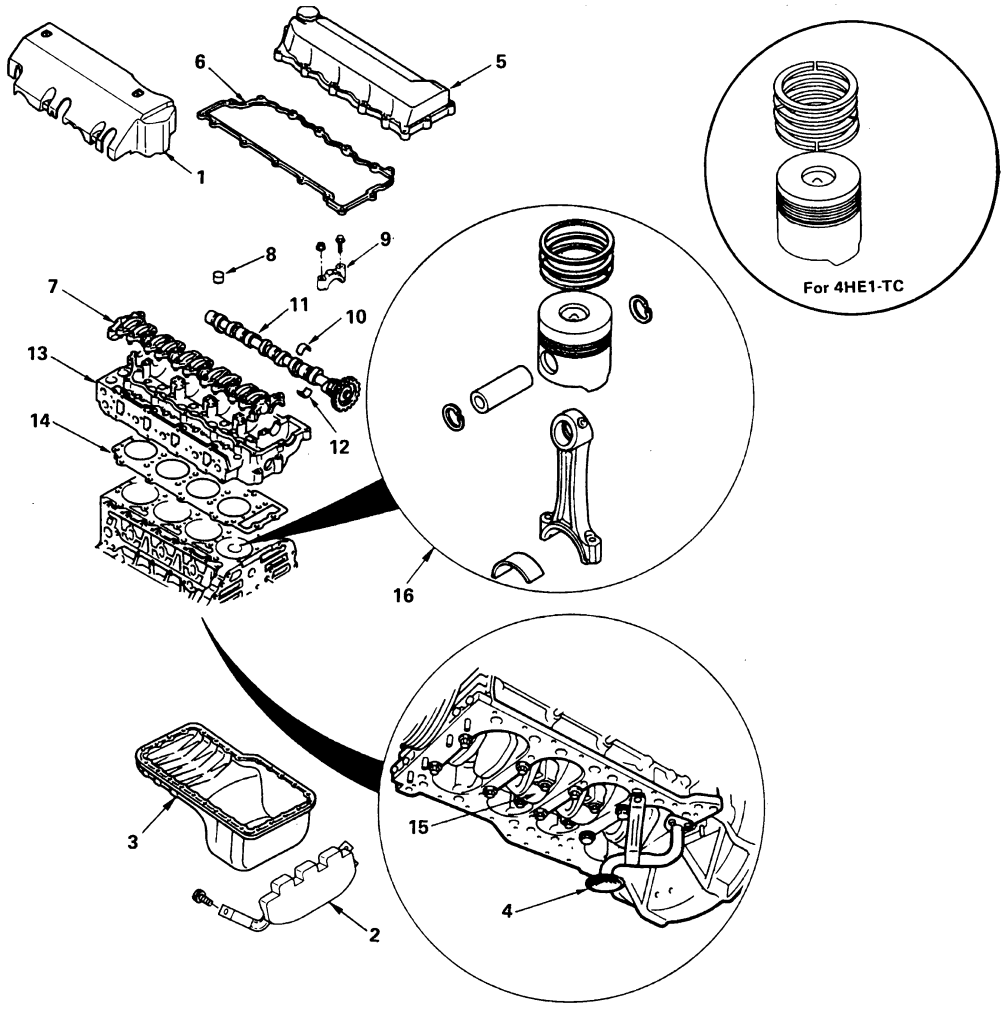
1. Oil Relief Valve

Tighten:

Oil relief valve to 39 N·m (4.0 kg·m/29 lb·ft)

PISTON, PISTON RING, PISTON PIN AND CONNECTING ROD

Component



Legend

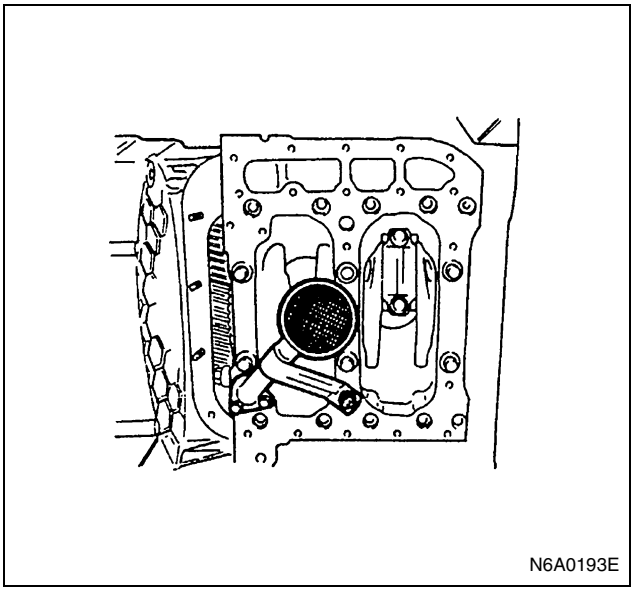
1. Nozzle cover
2. Spacer rubber
3. Oil pan
4. Oil pump strainer
5. Cylinder head cover
6. Cylinder head cover gasket
7. Rocker arm shaft assembly
8. Valve cap
9. Camshaft bearing cap
10. Camshaft bearing upper
11. Camshaft assembly
12. Camshaft bearing lower
13. Cylinder head assembly
14. Cylinder head gasket
15. Connecting rod cap
16. Piston and connecting rod assembly

Removal

Preparation

- Disconnect battery ground cable.
- Tilt the cab.
- Drain coolant and engine oil.

1. Nozzle Cover
2. Spacer Rubber
   Remove the stiffener before removing the spacer rubber.
3. Oil Pan
4. Oil Pump Strainer



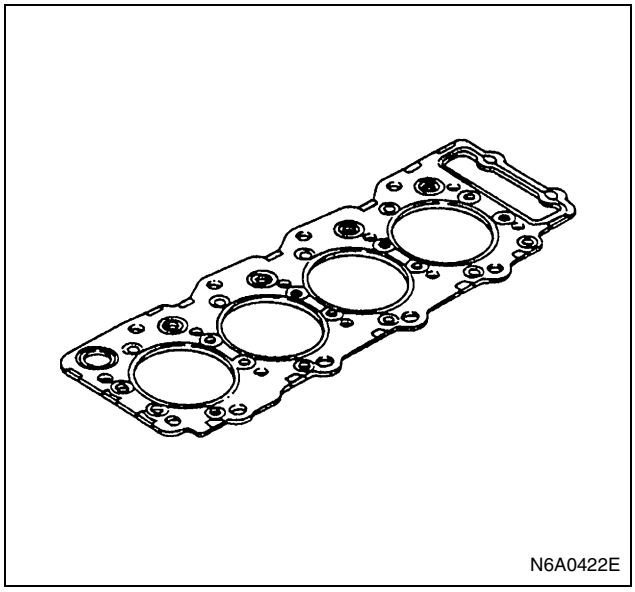
N6A0193E

5. Cylinder Head Cover
6. Cylinder Head Cover Gasket
7. Rocker Arm Shaft Assembly
   Above works refer to “ROCKER ARM SHAFT ASSEMBLY” section in this manual.
8. Valve Cap

Caution:
Take sufficient care not to let valve caps fall into the gear case or oil return hole.

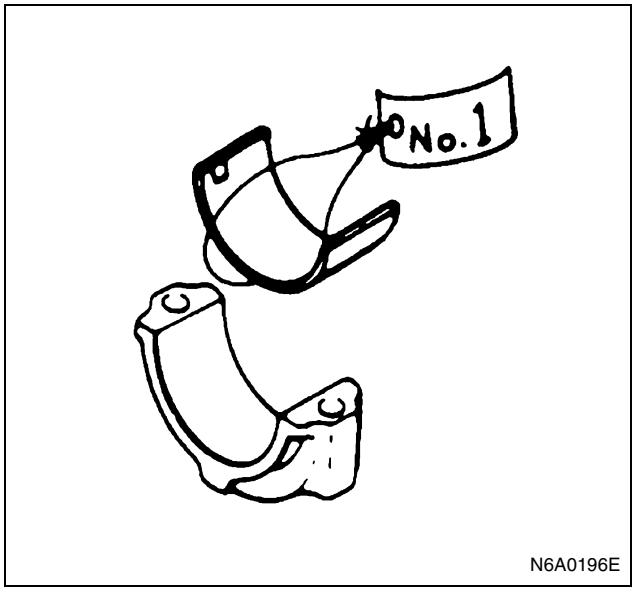
9. Camshaft Bearing Cap
10. Camshaft Bearing Upper
11. Camshaft Assembly
12. Camshaft Bearing Lower
    Above works refer to “CAMSHAFT ASSEMBLY” section in this manual.
13. Cylinder Head Assembly
    Above works refer to “CYLINDER HEAD” section in this manual.
14. Cylinder Head Gasket

Caution:
Do not reuse the cylinder head gasket.



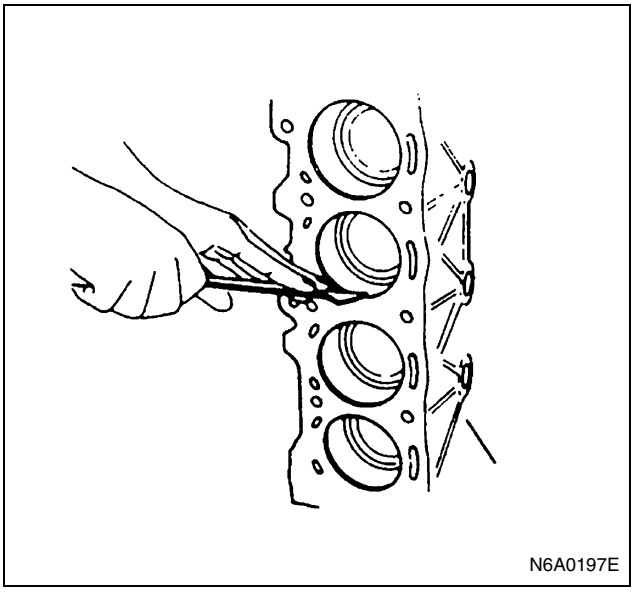
N6A0422E

15. Connecting Rod Cap
    1) Take out the connecting rod bearing cap bolts and remove the bearing cap with the lower bearing.
    2) If the connecting rod lower bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



N6A0196E

16. Piston and Connecting Rod Assembly
    1) To facilitate smooth removal of piston, remove carbon from the upper part of the cylinder wall using a scraper or equivalent.



N6A0197E

2) Remove the piston and connecting rod assembly upward by pushing on the edge of the connecting rod with a hammer handle or equivalent.
3) If the connecting rod bearing are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.

Caution:
Do not bend or damage the oiling jet.

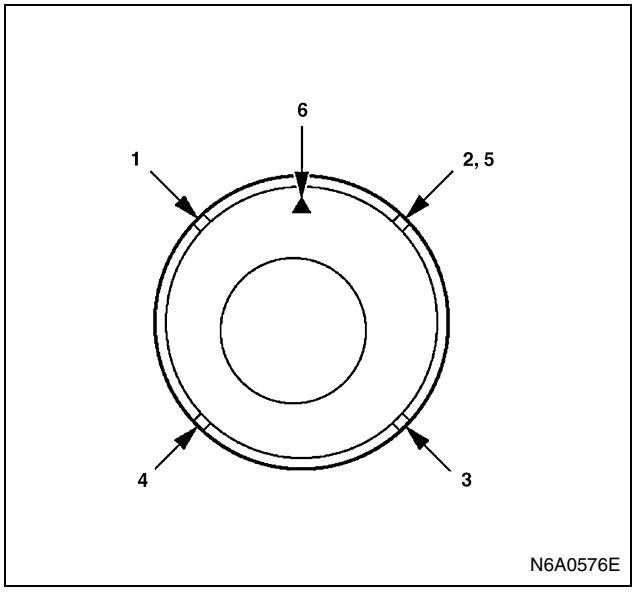
Notice:
When removing the piston and connecting rod assembly, pull the connecting rod in parallel with the cylinder bore.

Installation

1. Piston and Connecting Rod Assembly

Notice:
When installing new connecting rod and/or connecting rod bearings, refer to the selection table. Above works refer to “CRANKSHAFT” section 6A in this manual.

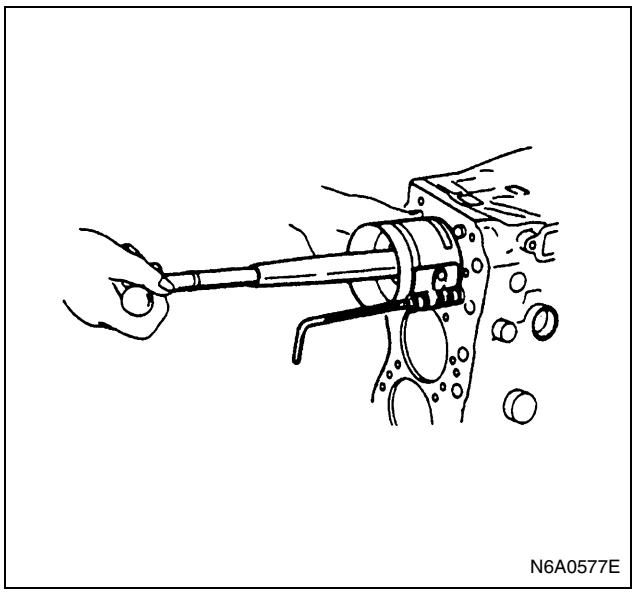
1) Apply a coat of engine oil to the circumference of each piston ring and piston.
2) Position the piston ring gaps as shown in the illustration.



N6A0576E

Legend
1. 1st compression ring
2. 2nd compression ring
3. 3rd compression ring (4HE1-TC only)
4. Oil ring
5. Coil expander
6. Front mark

3) Apply a coat of molybdenum disulfide grease to the two piston skirts.
This will facilitate smooth break-in when the engine is first started after reassembly.
4) Apply a coat of engine oil to the upper bearing surfaces.
5) Apply a coat of engine oil to the cylinder wall.
6) Position the piston head front mark so that it is facing the front of the engine.
7) Use the piston ring compressor to compress the piston rings.
Piston Ring Compressor: 5-8840-9018-0

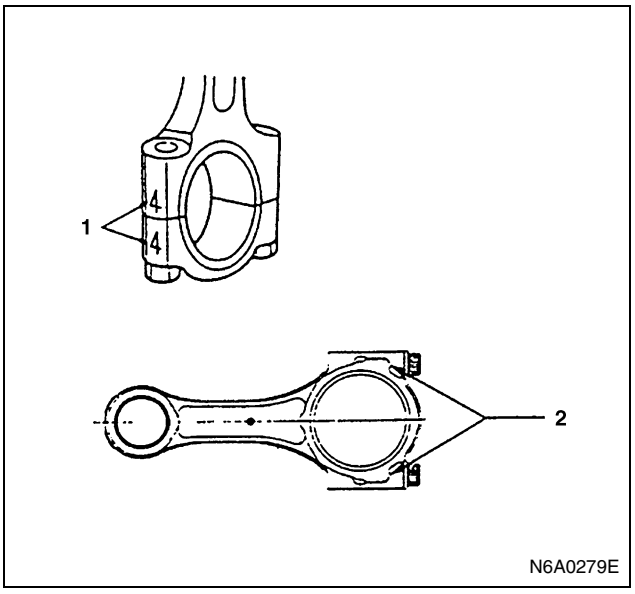


N6A0577E

8) Use a hammer grip to push the piston in until the connecting rod makes contact with the crankpin.
At the same time, rotate the crankshaft until the crankpin is at bottom dead center.

Caution:
Do not bend or damage the oiling jet.

2. Connecting Rod Cap
   1) Install the connecting rod bearing caps.
   2) Align the bearing cap cylinder number marks and the connecting rod cylinder number marks.
   3) Apply a coat of molybdenum disulfide grease to the threads and setting faces of each connecting rod cap bolts.

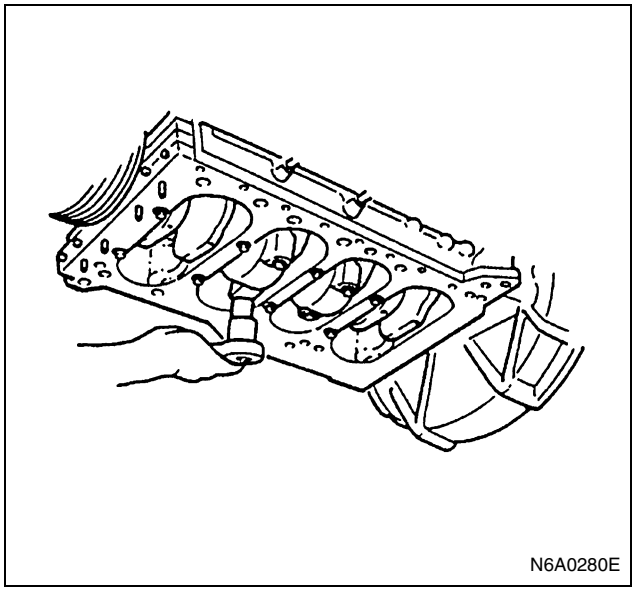


Legend
1. Alighment
2. Boss discriminating the front from rear

   4) Tighten the connecting rod caps to the specified torque.

Tighten:
Connecting rod bearing cap bolt to
- 1st step: 39 N·m (4.0 kg·m/29 lb·ft)
- 2nd step: 60°
- 3rd step: 30°

Angle gauge: 5-8840-0266-0



3. Cylinder Head Gasket
   Above works refer to “CYLINDER HEAD” section in this manual.
4. Cylinder Head Assembly
   Above works refer to “CYLINDER HEAD” section in this manual.
5. Camshaft Bearing Lower
6. Camshaft Assembly
7. Camshaft Bearing Upper
8. Camshaft Bearing Cap
9. Valve Cap
   Above works refer to “CAMSHAFT ASSEMBLY” section in this manual.

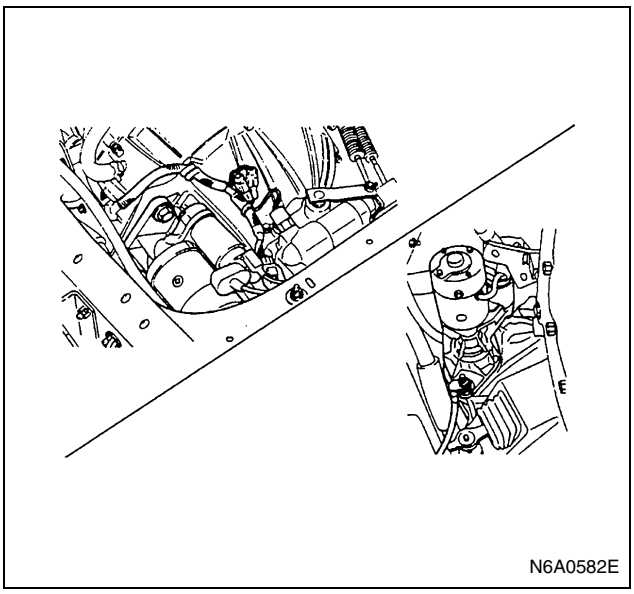
3. Transmission assembly
4. Clutch pressure plate assembly
5. Driven plate
6. Washer
7. Flywheel assembly
8. Snap ring
9. Pilot bearing
10. Engine side

Removal

Preparation

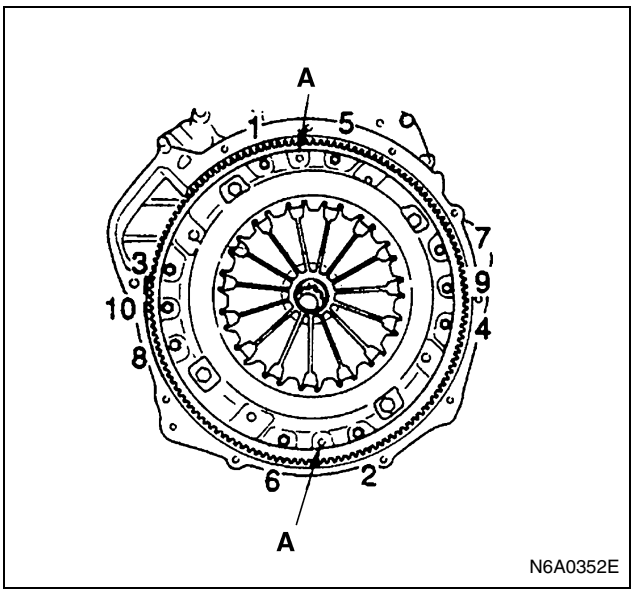
- Disconnect battery ground cable.

1. Transmission Panel
2. Starter
   1) Disconnect the battery cable at the starter motor.
   2) Remove the starter assembly from flywheel housing.



N6A0582E

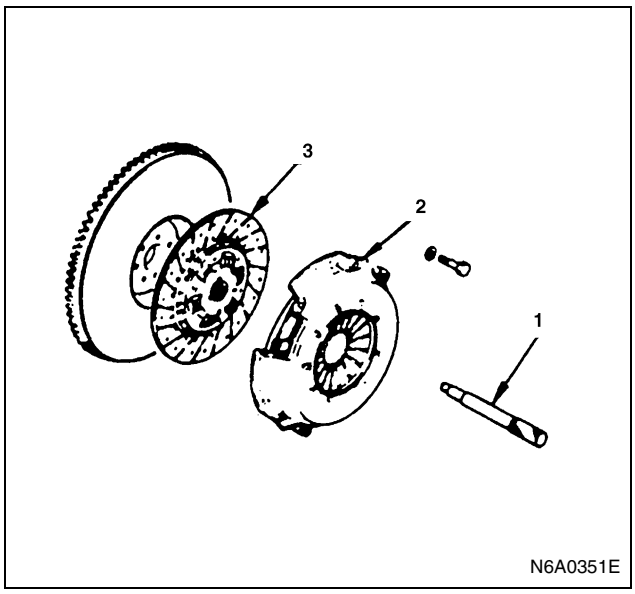
3. Transmission Assembly
   Above works refer to “ENGINE ASSEMBLY” section in this manual.
4. Clutch Pressure Plate Assembly
   1) Insert the clutch pilot aligner to the clutch assembly.
      Clutch Pilot Aligner: 5-8840-2240-0
   2) Loosen the pressure plate bolts in numerical order a little at a time as shown in the illustration.



N6A0352E

Legend
A. Knock pin

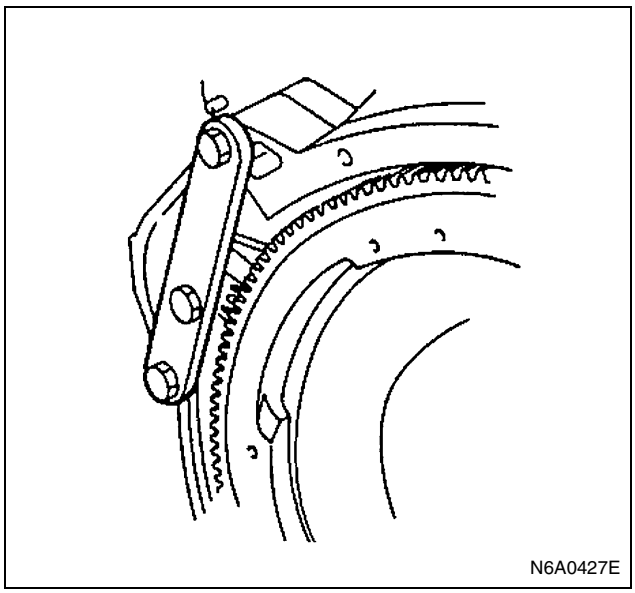
   3) Remove the pressure plate assembly.
5. Driven Plate
   Remove the driven plate with the clutch pilot aligner.



N6A0351E

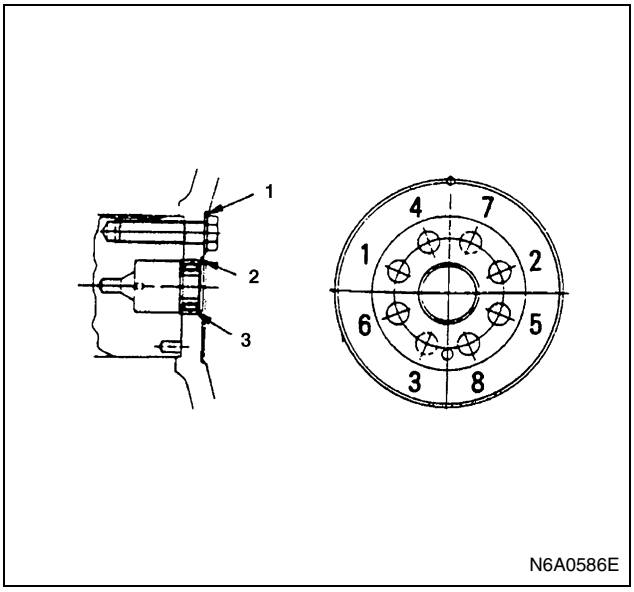
Legend
1. Clutch pilot aligner
2. Clutch pressure plate assembly
3. Driven plate

6. Washer
7. Flywheel Assembly
   1) Use the crankshaft stopper to prevent the crankshaft from turning.
      Crankshaft Stopper: 5-8840-2230-0



N6A0427E

   2) Loosen the flywheel bolts in numerical order a little at a time as shown in the illustration.



N6A0586E

Legend
1. Washer
2. Snap ring
3. Pilot bearing

3) Remove the flywheel stopper and the flywheel assembly.

8. Snap Ring
   Use a snap ring pliers to remove the snap ring from the flywheel.
9. Pilot Bearing

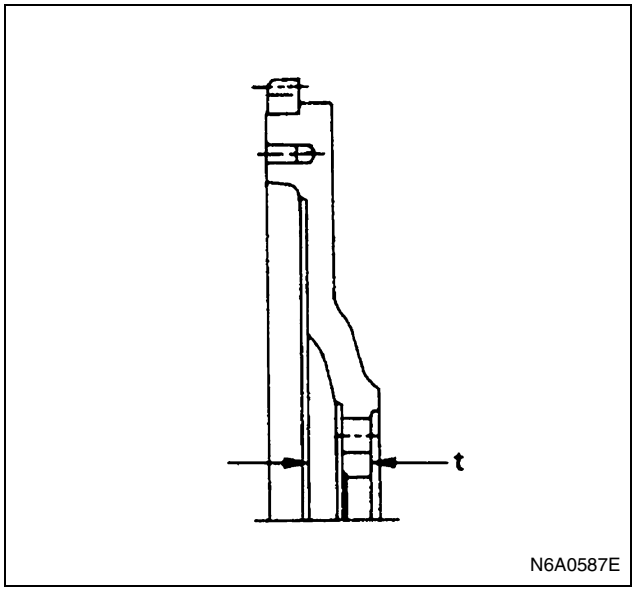
Inspection and Repair

Flywheel

1. Inspect the flywheel friction surface for excessive wear and heat cracks.
2. Measure the flywheel thickness (t) between the flywheel friction surface and crankshaft setting face.
   If the measured value is between the standard and the specified limit, the flywheel may be reground.
   If the measured value exceeds the specified limit, the flywheel must be replaced.

Flywheel Thickness (t) mm (in)		
Engine model	Standard	Limit
Others	31.4 — 31.6 (1.236 — 1.244)	31.0 (1.220)
4HG1-TC	37.4 — 37.6 (1.472 — 1.480)	37.0 (1.457)

Flywheel Friction Surface Roughness mm (in)
Less than 0.006 (0.00024)

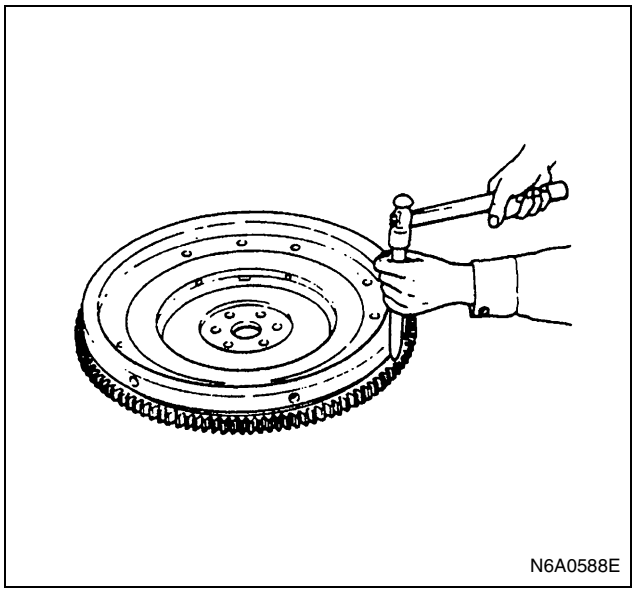


N6A0587E

Ring Gear
Inspect the ring gear
If the ring gear teeth are broken or excessively worn, the ring gear must be replaced.

Ring Gear Replacement

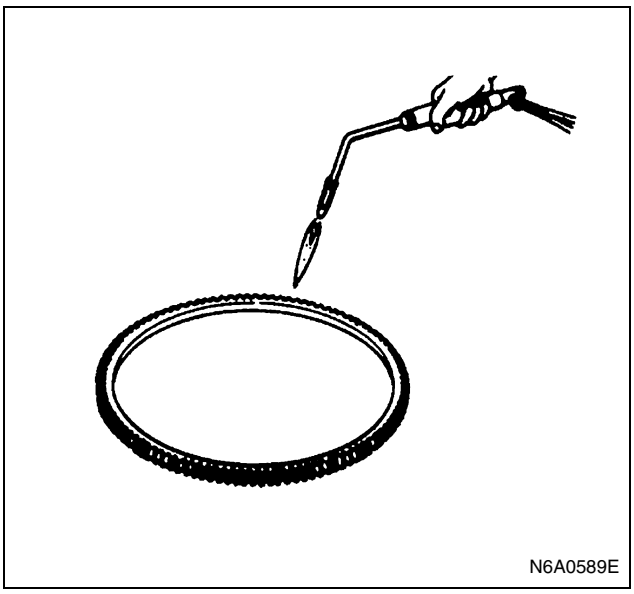
REMOVAL
Strike around the edges of the ring gear with a hammer and chisel to remove it.



N6A0588E

INSTALLATION

1. Heat the ring gear evenly with a gas burner to invite thermal expansion.



N6A0589E

2. Install the ring gear when it is sufficiently heated. The ring gear must be installed with the chamfer facing the clutch.

Pilot Bearing

Check the pilot bearing for wear or damage and replace with a new one if any abnormal condition is noticeable.

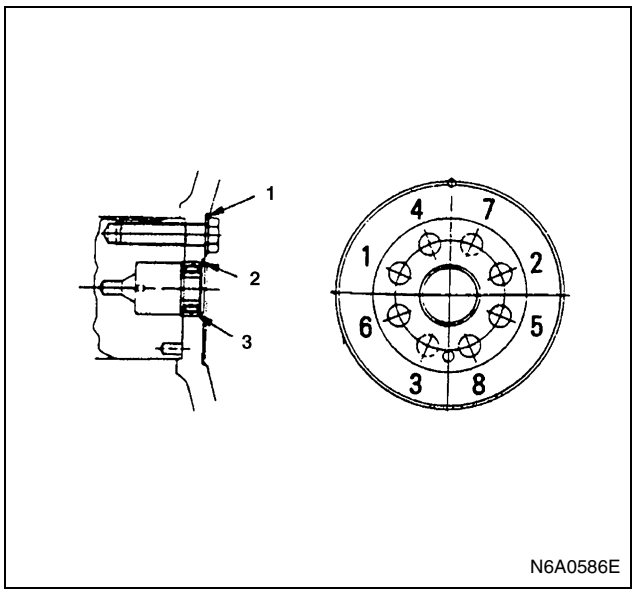
Installation

1. Pilot Bearing
2. Snap Ring
3. Flywheel Assembly
4. Washer
   1) Align the flywheel with the crankshaft knock pin and temporarily tighten the flywheel bolts.
   2) Use the crankshaft stopper to prevent the crankshaft from turning.
      Crankshaft stopper: 5-8840-2230-0
   3) Install the washer and the flywheel bolts and tighten to the specified torque in numerical order show in the illustration.

Tighten:

Flywheel bolt to

- 1st step: 78 N·m (8.0 kg·m/58 lb·ft)
- 2nd step: 90 — 120°



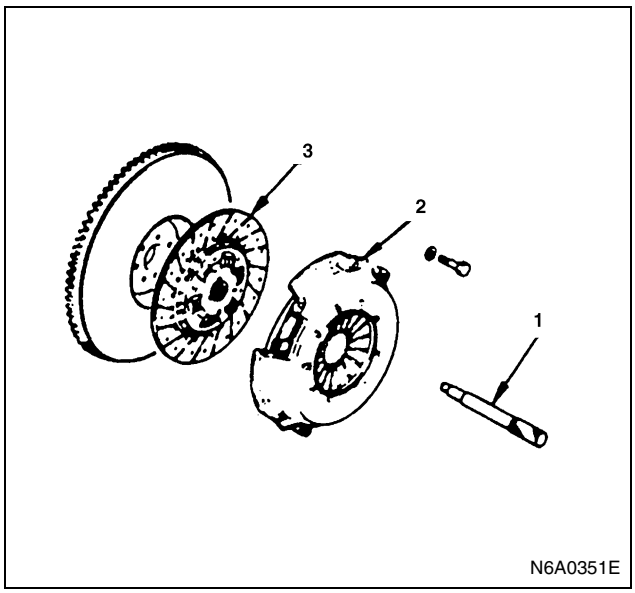
N6A0586E

Legend

1. Washer
2. Snap ring
3. Pilot bearing

   4) Remove the crankshaft stopper.

5. Driven Plate
   Use the clutch pilot aligner to install the driven plate.
   Clutch Pilot Aligner: 5-8840-2240-0



N6A0351E

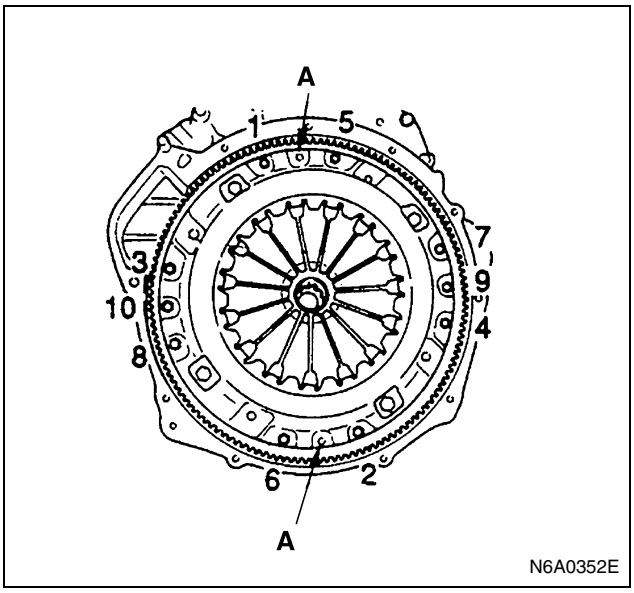
Legend

1. Clutch pilot aligner
2. Clutch pressure plate assembly
3. Driven plate

6. Clutch Pressure Plate Assembly
   1) Align the clutch pressure plate with the flywheel knock pin.

2) Tighten the pressure plate bolts to the specified torque in numerical order.

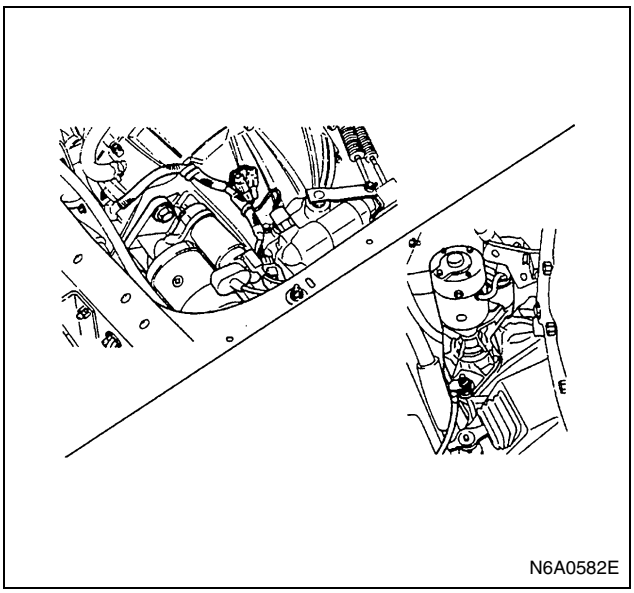
Tighten:
Clutch pressure plate bolt to 40 N·m (4.1 kg·m/30 lb·ft)



Legend
A. Knock pin

7. Transmission Assembly
   Above works refer to “ENGINE ASSEMBLY” section in this manual.
8. Starter

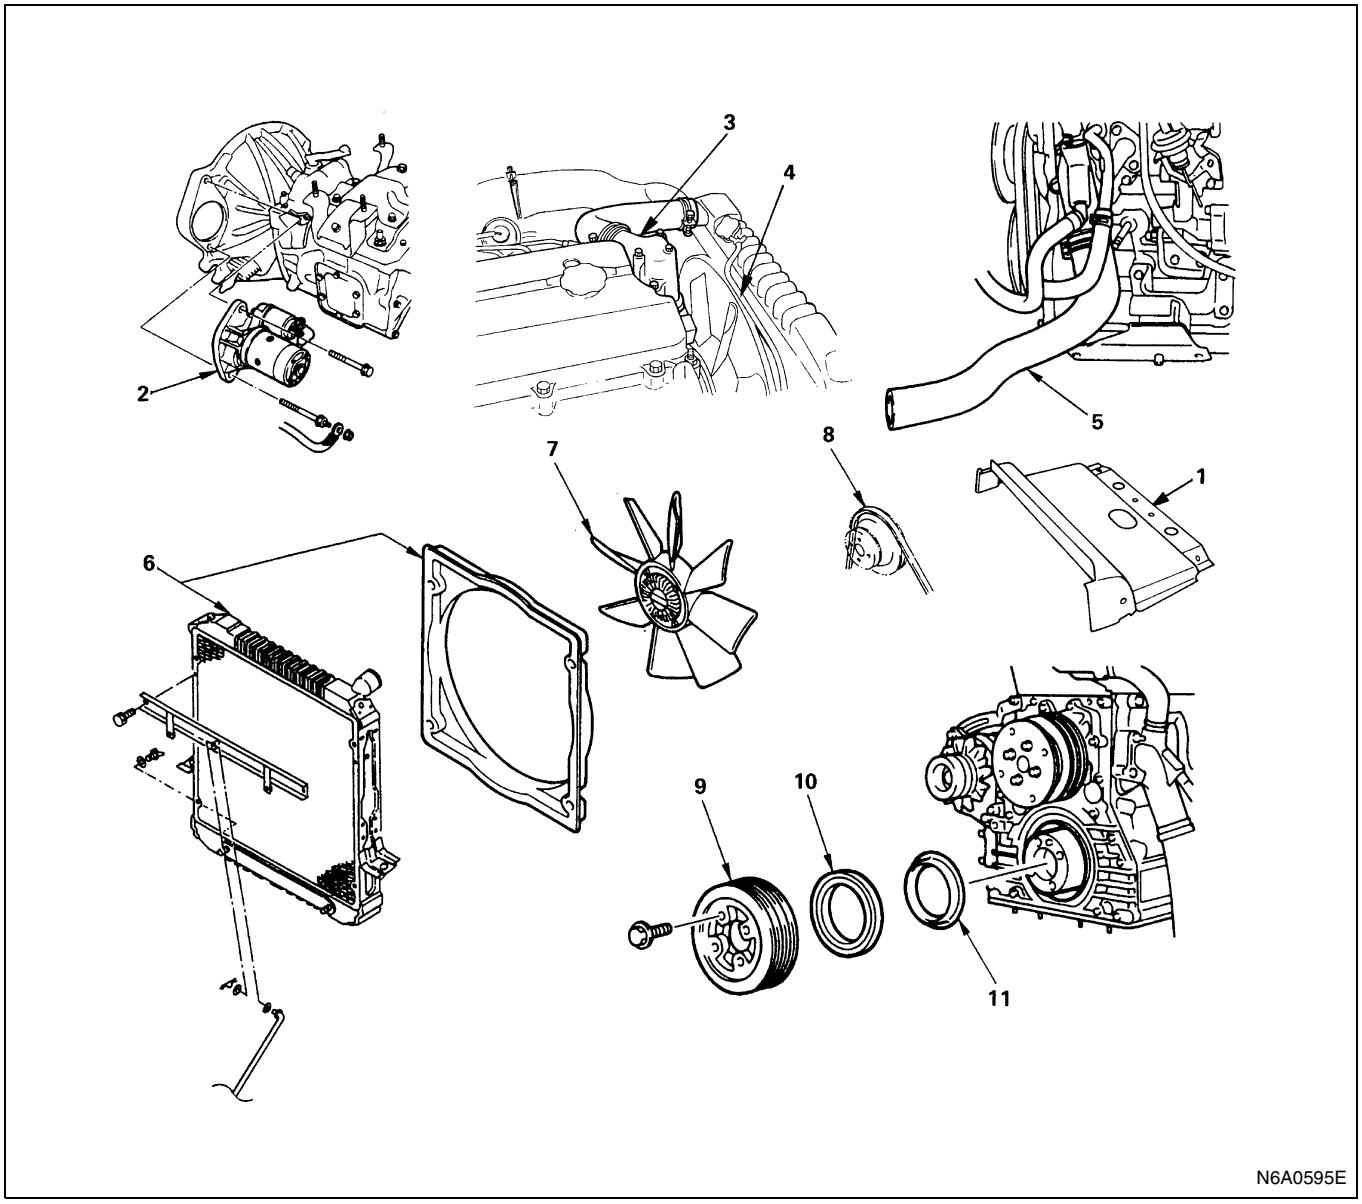
Tighten:
Starter bolt to 76 N·m (7.7 kg·m/56 lb·ft)



9. Transmission Panel
   - Connect the battery ground cable.

CRANKSHAFT FRONT OIL SEAL

Component



Legend

1. Transmission panel (Australia only)

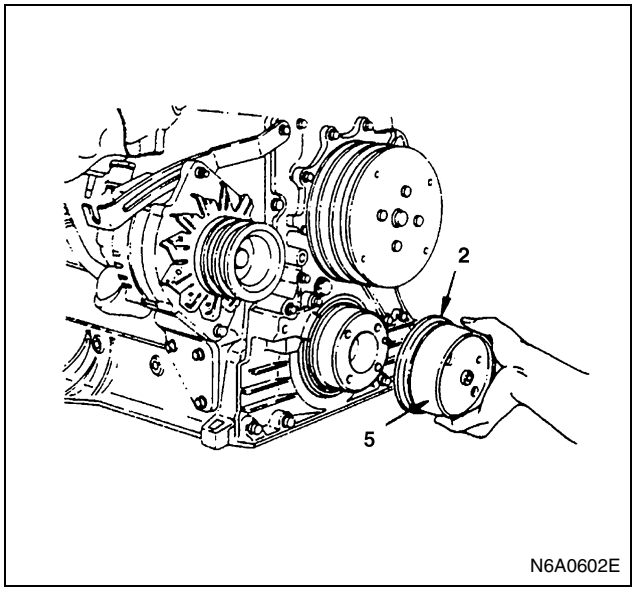
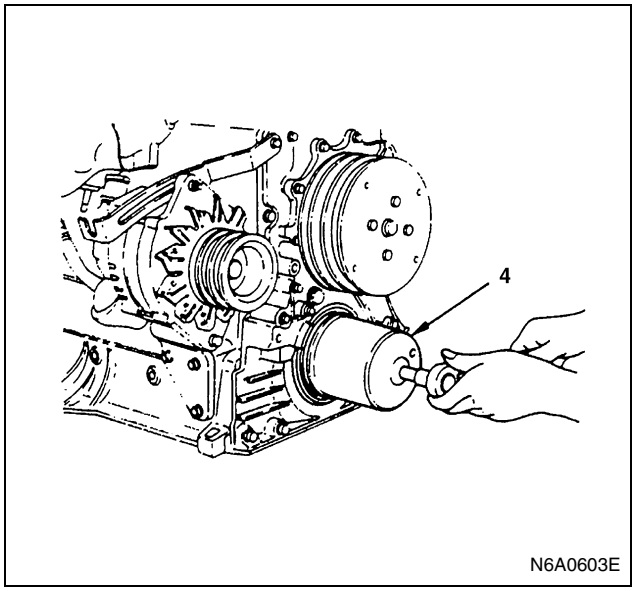
4. Sleeve
5. Adapter
6. Washer (5 mm (0.20 in))
7. Center bolt

1) Insert the slinger (2) into the end of adapter (5) and install the adapter on the crankshaft.

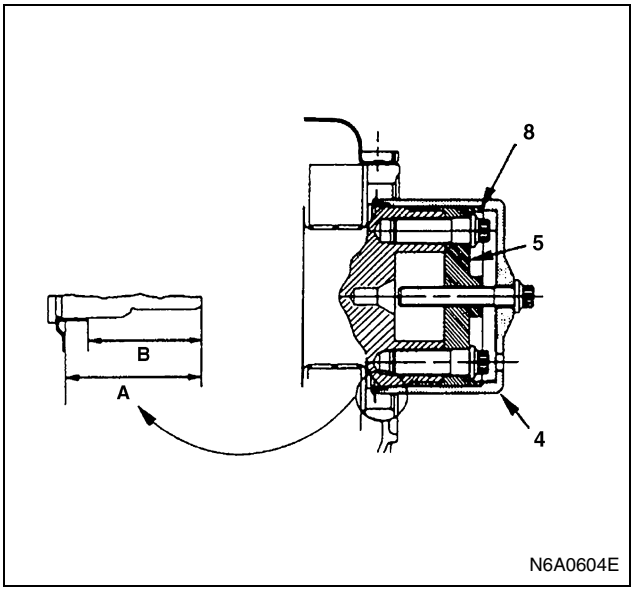


N6A0602E

2) Cover the sleeve (4) and tighten the bolt until the sleeve comes to contact the adapter stopper (8).



N6A0603E



3) With the slinger pressed in, make sure of measurements specified in the illustration as well as of slinger deflection.
(A): 40.5 ± 0.3 mm (1.594 ± 0.012 in)
(B): 34.0 ± 0.1 mm (1.339 ± 0.004 in)

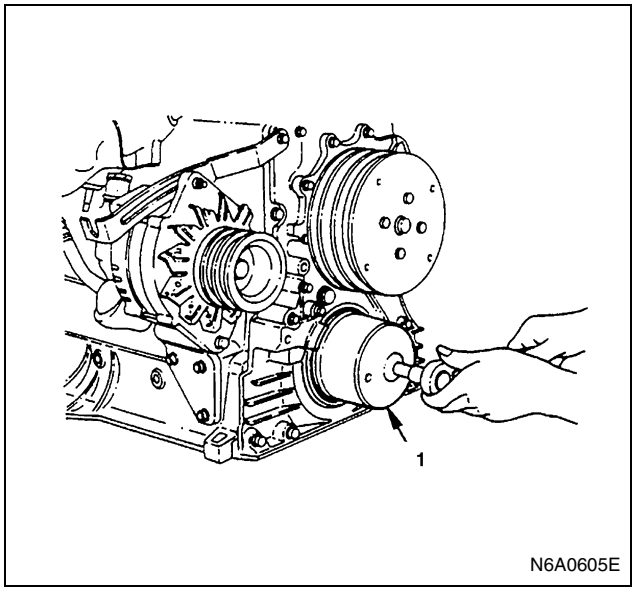
Notice:
Be sure to replace the slinger and oil seal as a set.

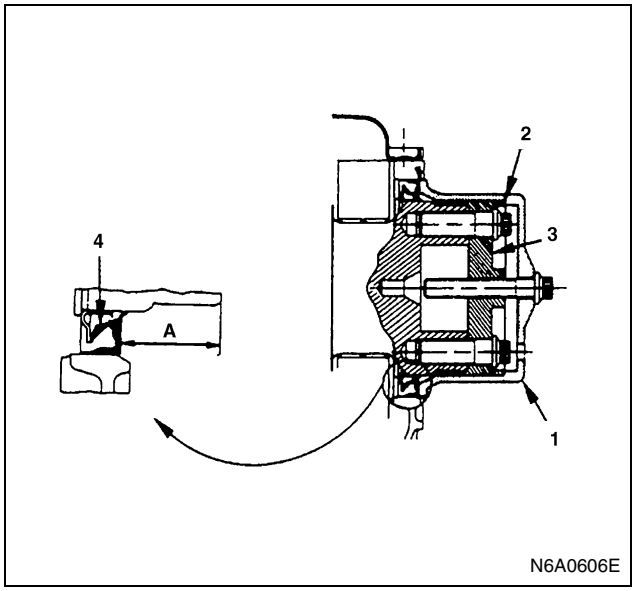
Use about 5 mm (0.20 in) thickness plain washer on the center bolt.

2. Crankshaft Front Oil Seal
   1) Apply engine oil to the lip of the oil seal.
   2) Press in the oil seal using the front oil seal setting tool kit.
   - Remove the slinger sleeve and insert the oil seal (4) into the adapter (3).
   - Install the oil seal sleeve (1) to the adapter (3) and tighten the center bolt until the sleeve comes to contact the adapter stopper (2).
   - With the oil seal pressed in, make sure of the measurements specified in the illustration.
     (A): 31 ± 0.3 mm (1.220 ± 0.012 in)

Notice:
Be sure to replace the slinger and oil seal as a set.

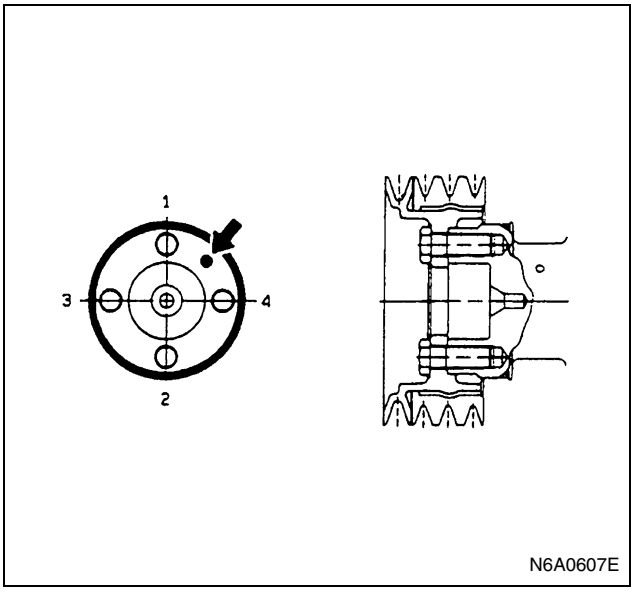
Use about 5 mm (0.20 in) thickness plain washer on the center bolt.





3. Crankshaft Damper Pulley
   1) Apply a coat of engine oil to the threads of the bolts.
   2) Align the damper pulley with the crankshaft knock pin and tighten the bolts to the specified torque in numerical order.

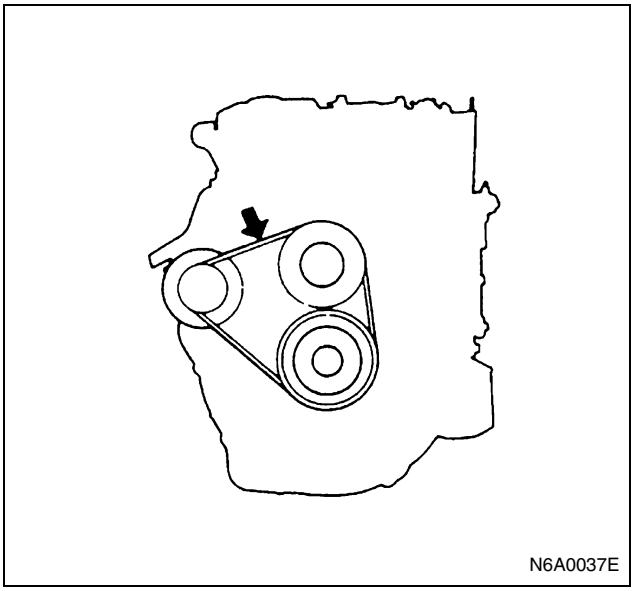
Tighten:
Damper pulley bolt to 200 N·m (20.4 kg·m/147 lb·ft)



4. Fan Belt
   Check the drive belt tension.
   Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

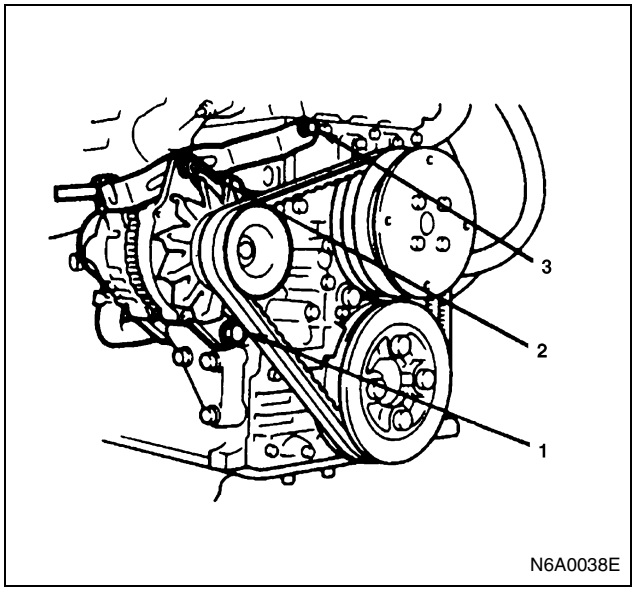
Drive Belt Deflection	mm (in)
8 — 12 (0.31 — 0.47) ... New belt 10 — 14 (0.39 — 0.55) ... Reuse belt	

   Check the drive belt for cranking and other damage.



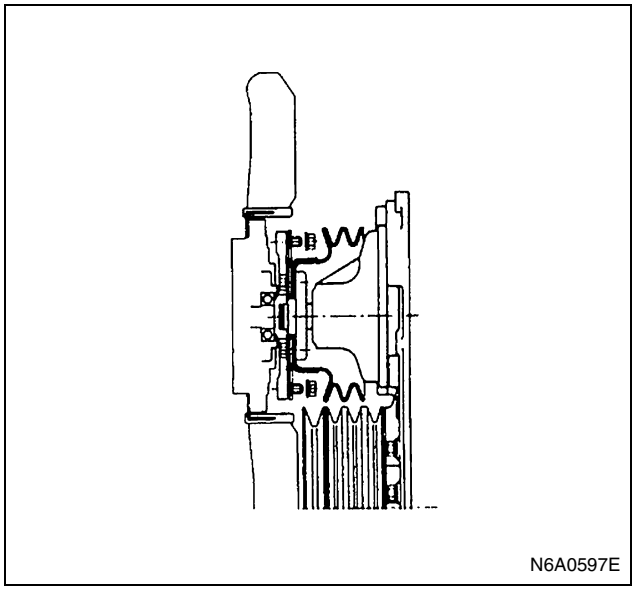
Fan Belt Adjustment
Fan belt tension is adjusted by moving the generator.

Tighten:
Belt to
- (1): 40 N·m (4.1 kg·m/30 lb·ft)
- (2): 24 N·m (2.4 kg·m/17 lb·ft)
- (3): 46 N·m (4.7 kg·m/34 lb·ft)



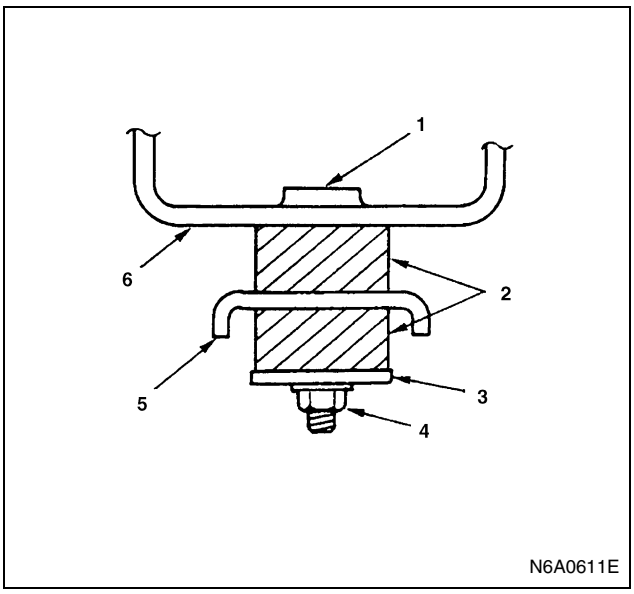
5. Fan Assembly

Tighten:
Fan bolt to 24 N·m (2.4 kg·m/17 lb·ft)



6. Radiator (with Guide)

Tighten:
Radiator bolt to 55 N·m (5.6 kg·m/41 lb·ft)

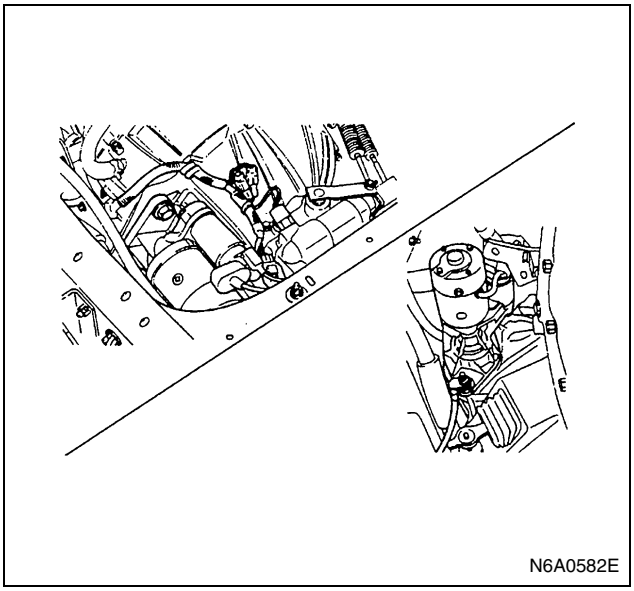


Legend

1. Stud bolt
2. Rubber
3. Washer
4. Flange nut
5. Flame side bracket
6. Radiator side bracket

7. Radiator Lower Hose
8. Coolant reserve Tank Hose/Bypass Hose
9. Radiator Upper Hose
10. Starter

Tighten:
Starter bolt to 76 N·m (7.7 kg·m/56 lb·ft)



11. Transmission Panel
    - Connect battery ground cable.
    - Pour engine coolant into engine.

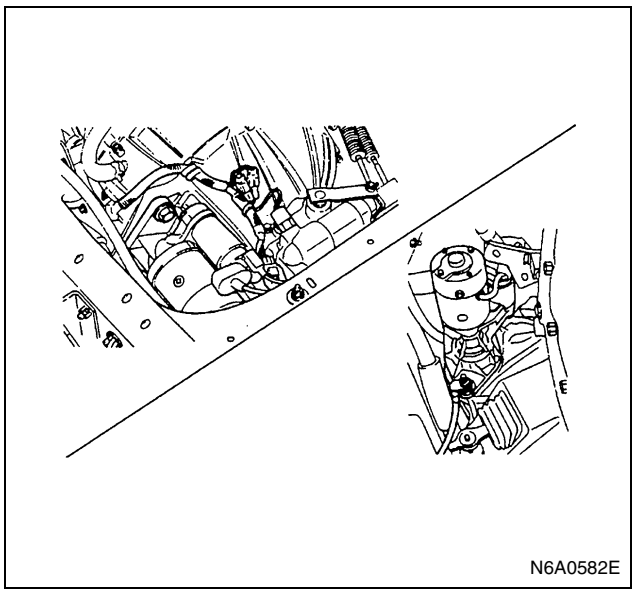
5. Driven plate
6. Flywheel assembly
7. Crankshaft rear oil seal
8. Crankshaft rear slinger

Removal

Preparation

- Disconnect battery ground cable.

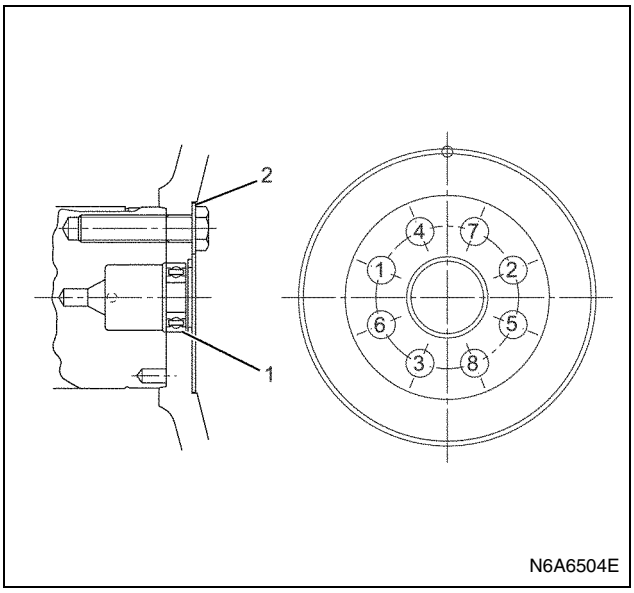
1. Transmission Panel
2. Starter
   1) Disconnect the battery cable at the starter motor.
   2) Remove the starter assembly from flywheel housing.



3. Transmission Assembly

Above works refer to “ENGINE ASSEMBLY” section in this manual.

4. Clutch Pressure Plate Assembly
5. Driven Plate
6. Flywheel Assembly
   Above works refer to “FLYWHEEL AND PILOT BEARING” section in this manual.



N6A6504E

Legend

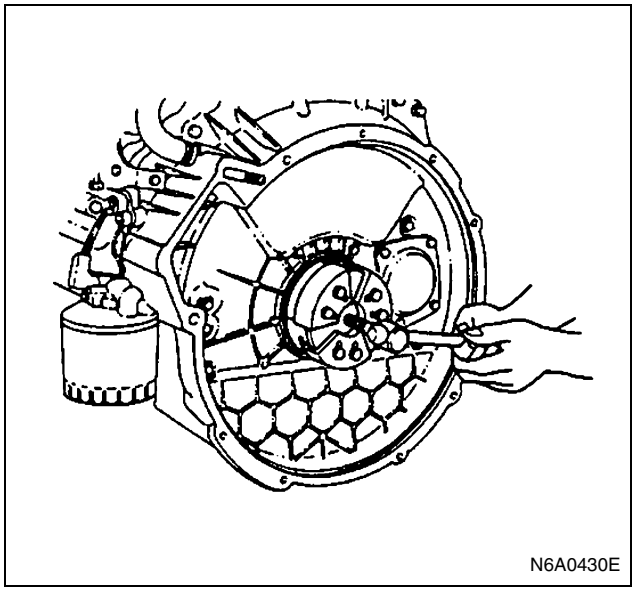
Legend

1. Oil seal
2. Slinger
3. Felt

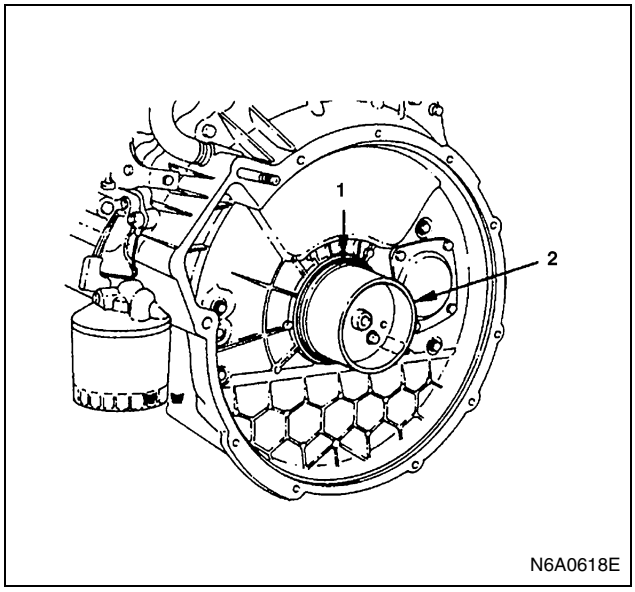
8. Crankshaft Rear Slinger
   Use the slinger puller to pull out the slinger.
   Slinger Puller: 5-8840-2360-0



N6A0430E

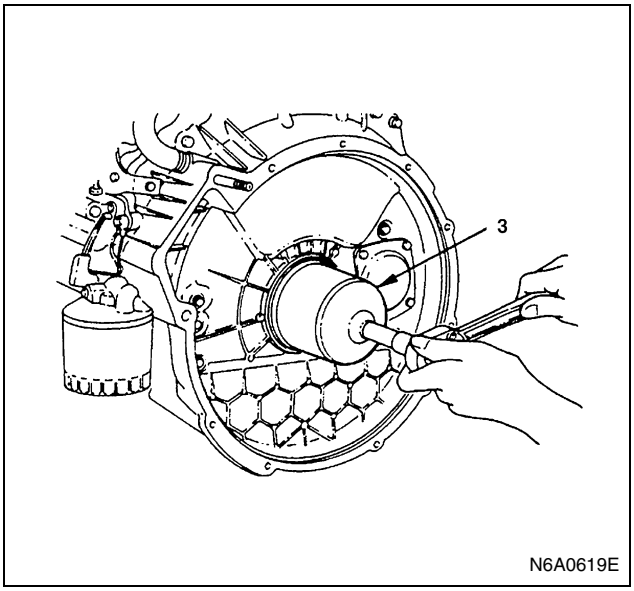
Installation

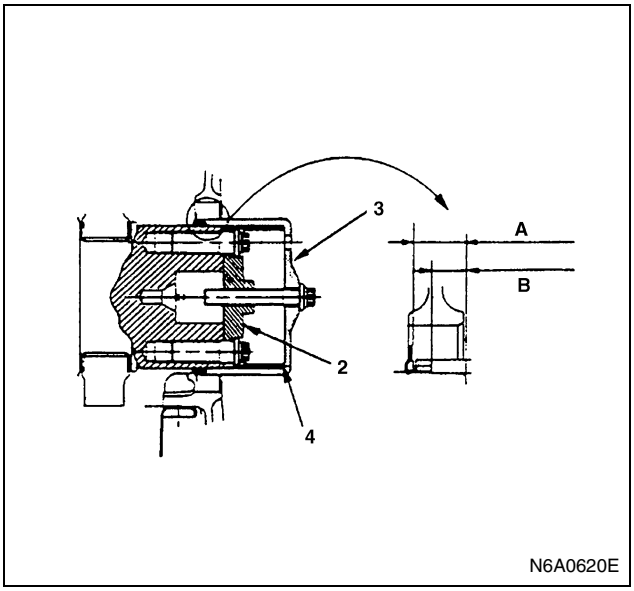
1. Crankshaft Rear Slinger
   Press in the slinger using oil seal setting tool kit.
   - Insert the slinger (1) into the end of adapter (2) and install the adapter on the crankshaft.



N6A0618E

   - Cover the sleeve (3) and tighten the bolt until the sleeve comes to contact the adapter stopper (4).





- Make sure of measurements specified in the illustration as well as of slinger deflection.
  (A): 17.3 ± 0.3 mm (0.681 ± 0.012 in)
  (B): 10.8 ± 0.1 mm (0.425 ± 0.004 in)

Notice:
Be sure to replace the slinger and oil seal as a set.

Oil Seal Setting Tool Kit: 5-8840-2431-0

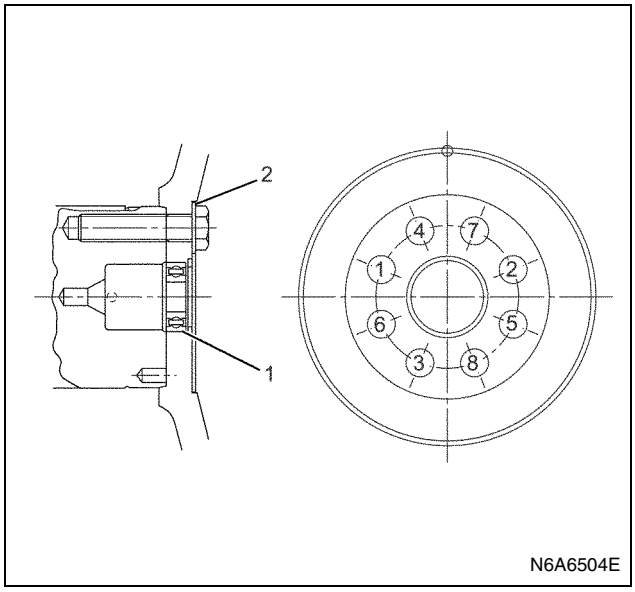
3. Flywheel Assembly
   1) Apply a coat of molybdenum disulfide grease to the flywheel bolt threads and setting faces.
   2) Align the flywheel with the crankshaft knock pin and temporarily tighten the flywheel bolts.
   3) Use the crankshaft stopper to prevent the crankshaft from turning.
      Crankshaft Stopper: 5-8840-2230-0
   4) Install the washer and the flywheel bolts and tighten to the specified torque in numerical order show in the illustration.

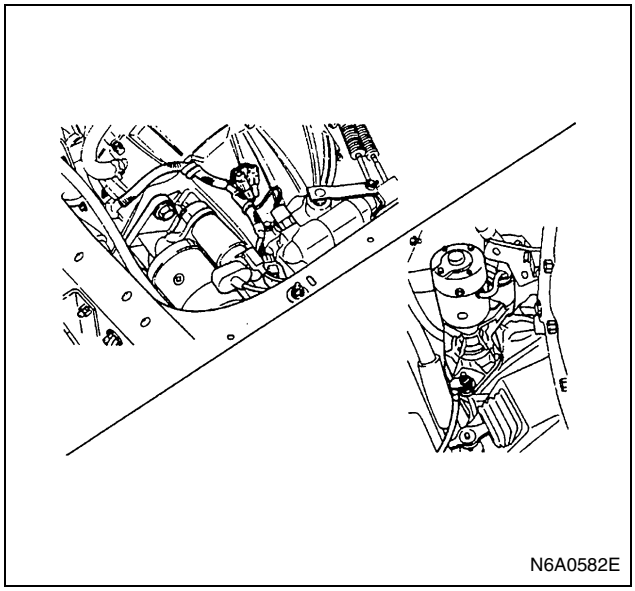
Tighten:
Flywheel bolt to
- 1st step: 78 N·m (8.0 kg·m/58 lb·ft)
- 2nd step: 90 — 120°



Legend
1. Washer
2. Pilot bearing

   5) Remove the crankshaft stopper.
4. Driven Plate
5. Clutch Pressure Plate Assembly
   Above works refer to “FLYWHEEL AND PILOT BEARING” section in this manual.
6. Transmission Assembly
   Above works refer to “ENGINE ASSEMBLY” section in this manual.
7. Starter

Tighten:
Starter bolt to 76 N·m (7.7 kg·m/56 lb·ft)



8. Transmission Panel
   - Connect the battery ground cable.

55. Crankshaft Gear
    1) Use the crankshaft gear remover to remove the crankshaft gear.
       Crankshaft Gear Remover: 8-9439-6818-0

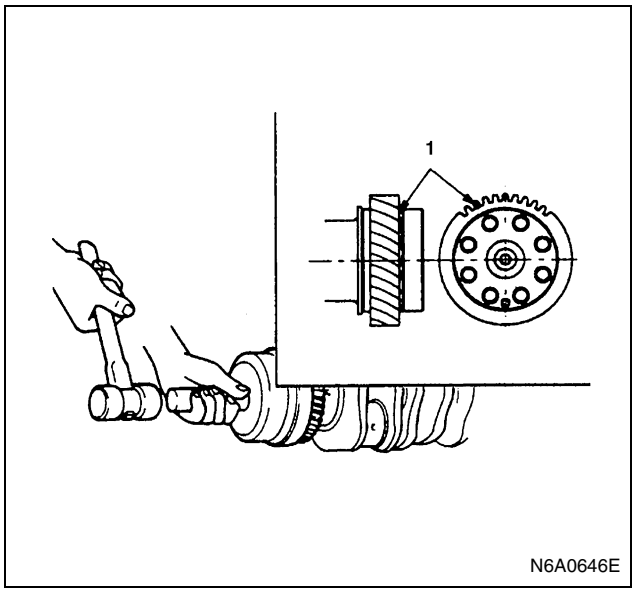
    2) Remove the crankshaft feather key.
56. Crankshaft

Installation

1. Crankshaft
2. Crankshaft Gear
    1) Use a piston heater to heat the crankshaft gear to 170 — 250°C (338 — 482°F).
    2) With the alignment mark “S” on the side of the crankshaft gear turned outward, align the groove on the gear side with the crankshaft pin position and hammer it in with a crankshaft gear installer until it hits the bottom.

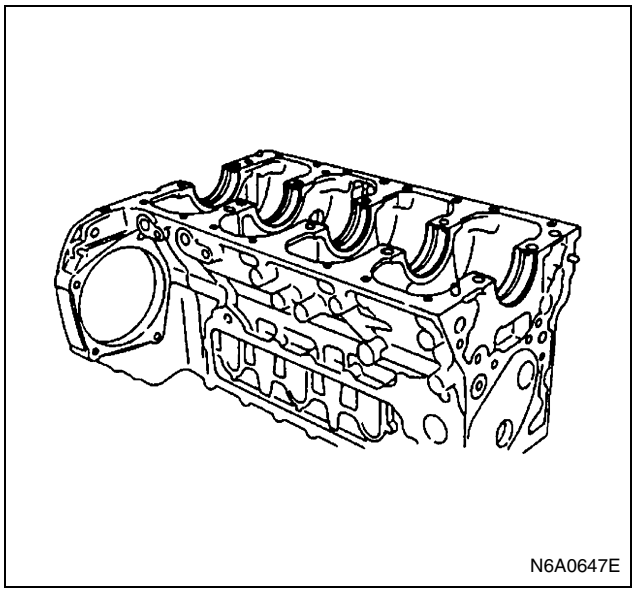
Caution:
When hammered in with the gear slanted, the crankshaft gear may be caught in the middle and cannot be hammered in fully. Gear it in quickly enough not to allow a shaft line along the gear and the crankshaft to slant.

Crankshaft Gear Installer: 8-9439-6819-0



Legend
1. Alighment mark

3. Crankshaft Bearing Upper
   When replacing the crankshaft or the crankshaft bearing with a new one, select the crankshaft bearing according to the respective grades stamped on the crankshaft and the cylinder body.
   Refer to the “CRANKSHAFT”.
   All upper bearings have oil grooves.



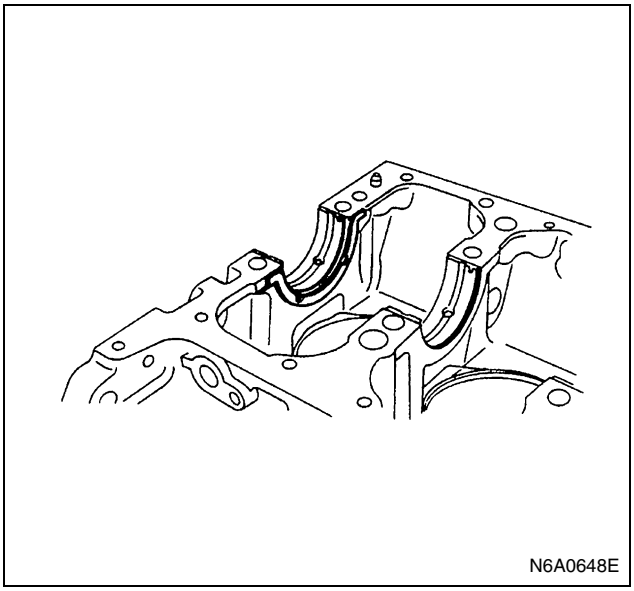
1) Carefully wipe any foreign material from the upper bearing.

Caution:
Do not apply engine oil to the bearing back faces and the cylinder body bearing fitting surfaces.

2) Locate the position mark applied at disassembly if the removed upper bearings are to be reused.

4. Thrust Bearing Upper
Install the thrust bearing upper to the front side of the cylinder body No.5 journal. At this time, the thrust bearing upper may be pasted to the cylinder body with grease.
However, be sure to wipe off any excessive grease.

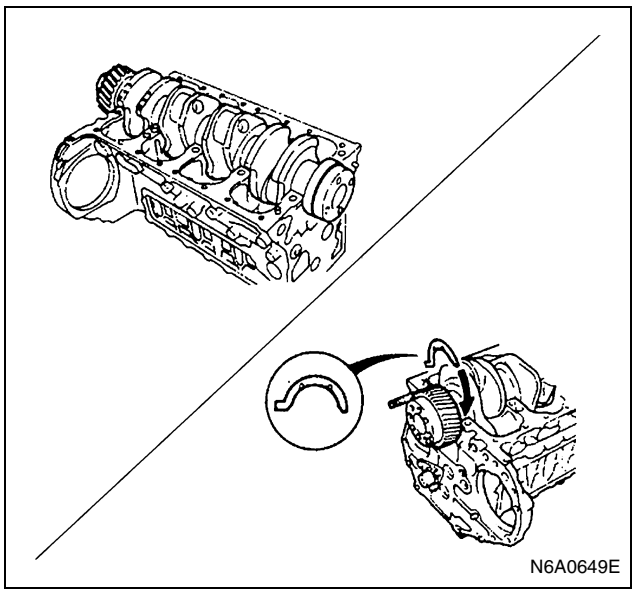
Caution:
The thrust bearing oil grooves must be facing the sliding faces.



N6A0648E

5. Crankshaft Assembly
Apply an ample coat of engine oil to the crankshaft journals and the crankshaft bearing surfaces before installing the crankshaft with timing gear.
   - While pressing on the installed crankshaft toward the rear side, insert the thrust bearing upper into the rear side of the cylinder body No.5 journal.

Caution:
The thrust bearing oil grooves must be facing the sliding faces.



N6A0649E

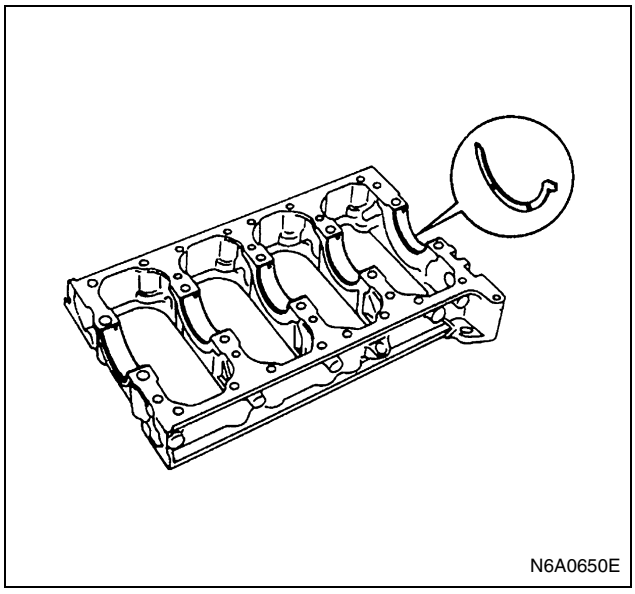
6. Crankshaft Bearing Lower
All lower bearings does not have oil grooves.
   1) Carefully wipe any foreign material from the lower bearing.

Caution:
Do not apply engine oil to the bearing back faces and the crankcase bearing fitting surfaces.

2) Locate the position mark applied at disassembly if the removed lower bearings are to be reused.

7. Thrust Bearing Lower
Install the thrust bearing lower to the rear side of the crankcase No.5 journal.

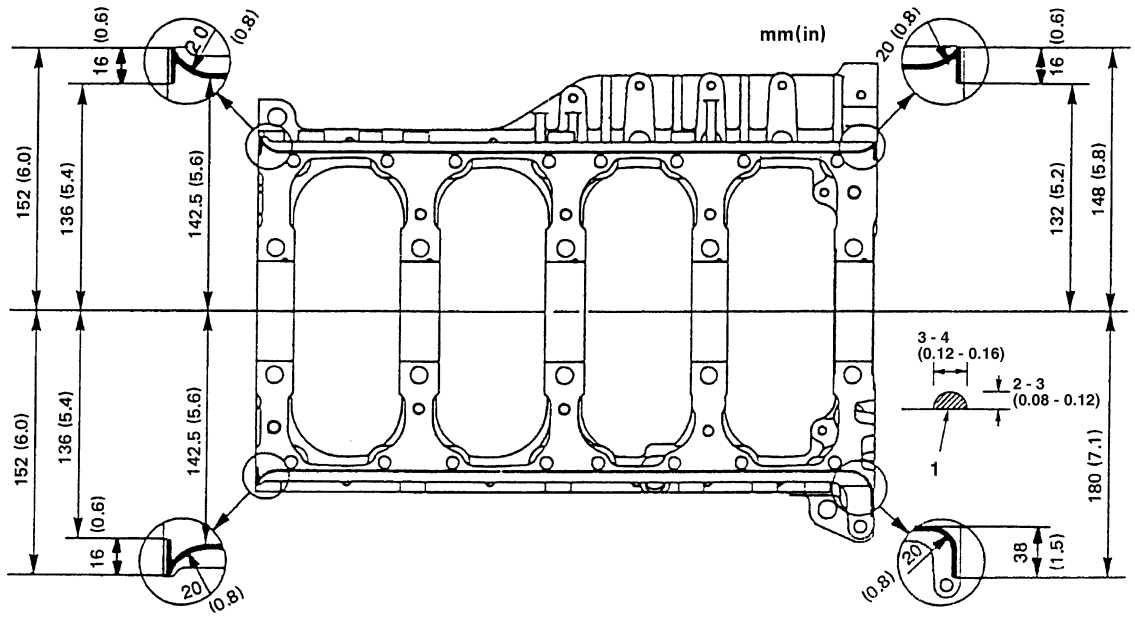
Caution:
The thrust bearing oil grooves must be facing the sliding faces.



N6A0650E

8. Crankcase
   1) Apply a 3 mm (0.12 in) bead of recommended liquid gasket (Three Bond 1207C) or its equivalent to the crankcase upper surface as shown in the illustration.
   2) Carefully place the crankcase on the cylinder body.

   • Install the crankcase within 20 minutes after application of liquid gasket.



N6A1622E

Legend

1. Liquid gasket

   3) Tighten the crankcase to the specified torque in the numerical order shown in the illustration.

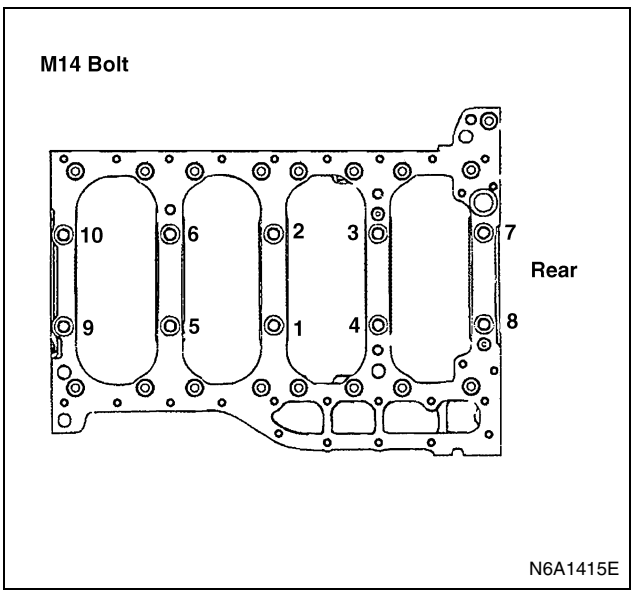
Tighten:

Crankcase bolt (M14: (1) — (10)) to

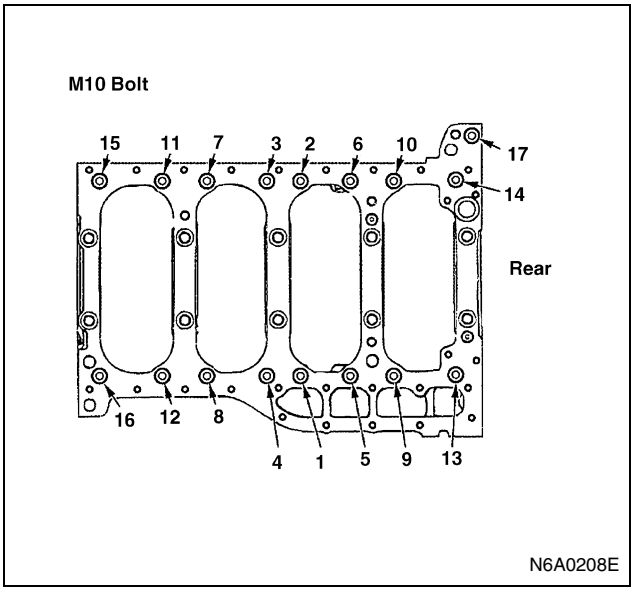
- 1st step: 98 N·m (10 kg·m/72 lb·ft)
- 2nd step: 132 N·m (13.5 kg·m/98 lb·ft)
- 3rd step: 30 — 60°

Crankcase bolt (M10:(1) — (17)) to 37 N·m (3.8 kg·m/27 lb·ft)

Angle gauge: 5-8840-0266-0



N6A1415E



9. Piston and Connecting Rod Assembly
10. Connecting Rod Lower Bearing
11. Connecting Rod Cap Assembly
    Above works refer to “PISTON AND CONNECTING ROD” section in this manual.

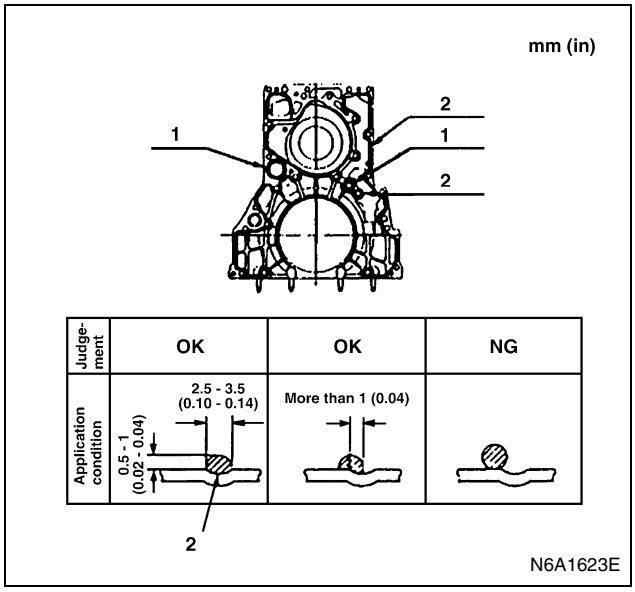
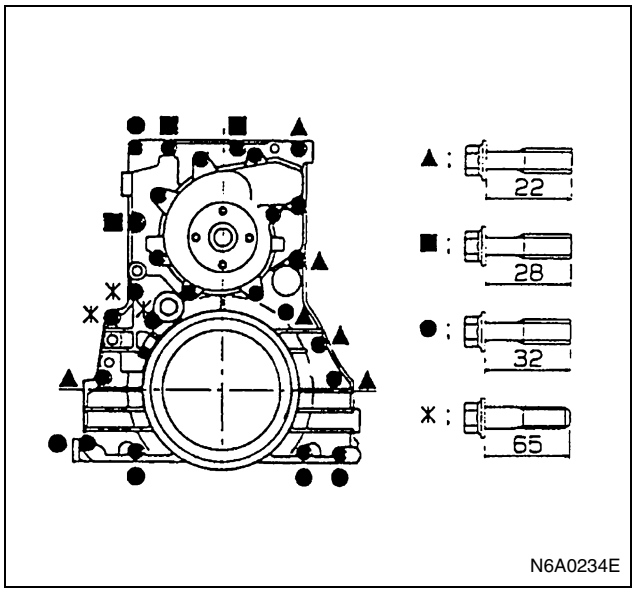
15. Power Steering Pump Idle Gear
16. Power Steering Pump Idle Gear Cover
17. Oil Thermo Valve
    Above works refer to “TIMING GEAR REPLACEMENT” section in this manual.
18. Front Retainer
    1) Carefully wipe any foreign material from the cylinder body front face.
    2) Apply 2.5 — 3.5 mm (0.10 — 0.14 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the groove of the front retainer fitting surface shown in the illustration.
    3) Install the O-rings (2 pieces) to the front retainer.
    - Install the front retainer within 7 minutes after application of liquid gasket.
    - For the dislocation of liquid gasket, refer to the illustration.
    4) Align the cylinder body knock pins with the front retainer knock pin holes.

Tighten:
Front retainer bolt to 24 N·m (2.4 kg·m/17 lb·ft)



Legend
1. O-ring
2. Liquid gasket



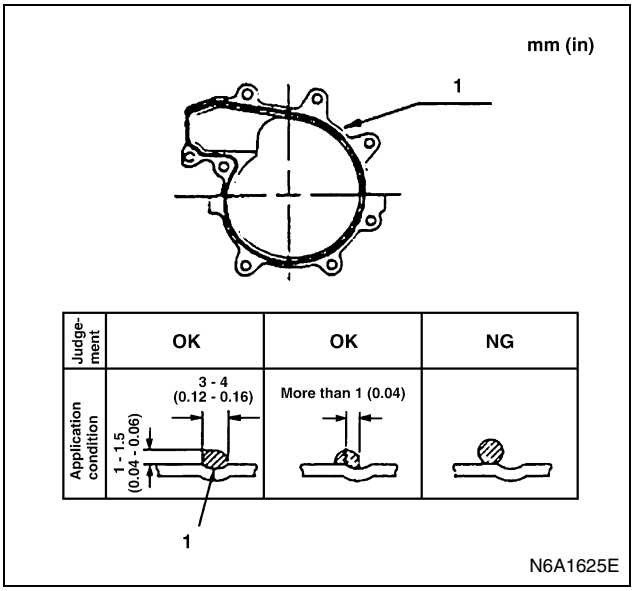
19. Water Pump Assembly
    1) Apply 3 — 4 mm (0.12 — 0.16 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the water pump fitting surface.
    2) Install the water pump to the front retainer.

Tighten:
Water pump bolt to 24 N·m (2.4 kg·m/17 lb·ft)

- Install the water pump within 7 minutes after application of liquid gasket.
- For the dislocation of liquid gasket, refer to the illustration.

Caution:
The water pump clamping bolt is also used to tighten the front retainer. So, install the water pump before liquid

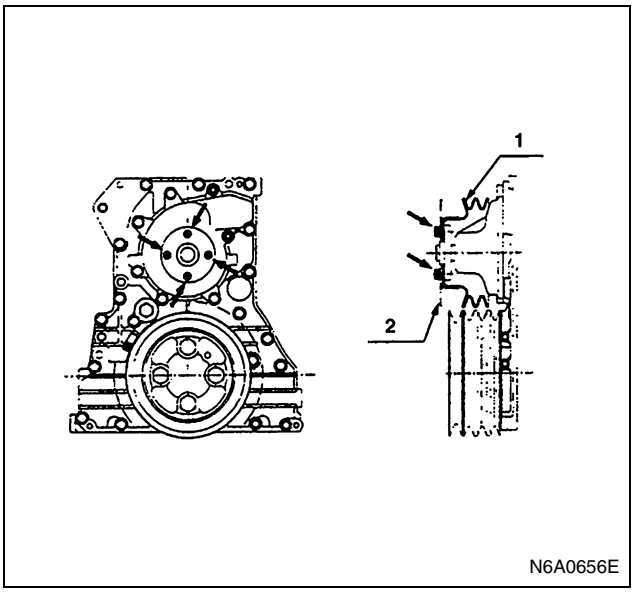
gasket gets dry immediately after installation of the front retainer.



Legend
1. Liquid gasket

20. Water Pump Pulley

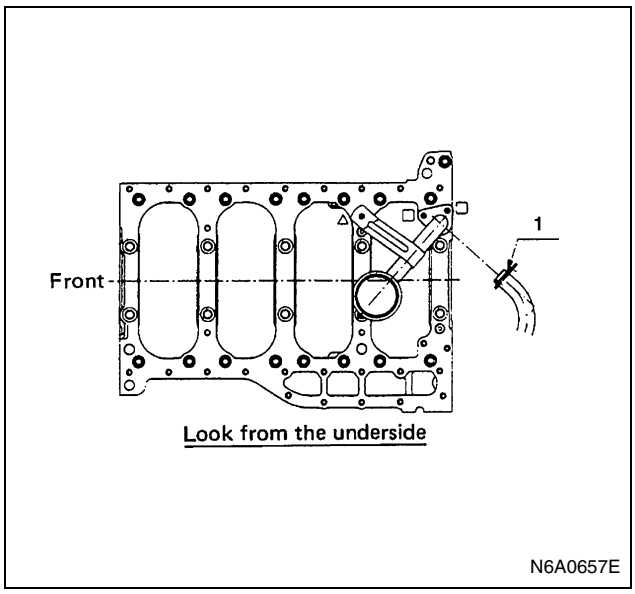
Tighten:
Water pump pulley bolt to 24 N·m (2.4 kg·m/17 lb·ft)



Legend
1. Pulley
2. Set plate

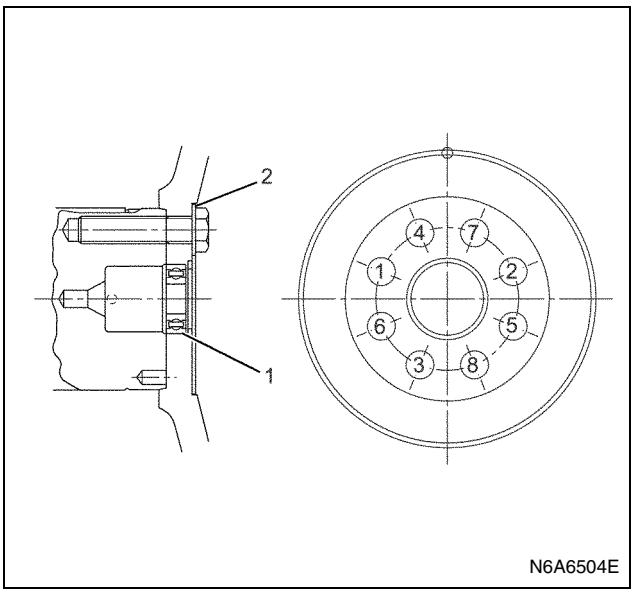
21. Oil Pump Strainer
    Install the O-ring (1) to the oil pump strainer pipe and install the oil pump strainer to the cylinder body shown in the illustration.

Tighten:
Oil pump strainer bolt to 24 N·m (2.4 kg·m/17 lb·ft)



22. Oil Pan
23. Spacer Rubber
    Above works refer to “OIL PAN” section in this manual.
24. Crankshaft Rear Slinger
25. Crankshaft Rear Oil Seal
    Above works refer to “CRANKSHAFT REAR OIL SEAL” section in this manual.
26. Flywheel
    1) Align the flywheel with the crankshaft knock pin and temporarily tighten the flywheel bolts.
    2) Use the crankshaft stopper to prevent the crankshaft from turning.
       Crankshaft Stopper: 5-8840-2230-0
    3) Install the washer and the flywheel bolts and tighten to the specified torque in numerical order show in the illustration.

Tighten:
Flywheel bolt to
- 1st step: 78 N·m (8.0 kg·m/58 lb·ft)
- 2nd step: 90 — 120°

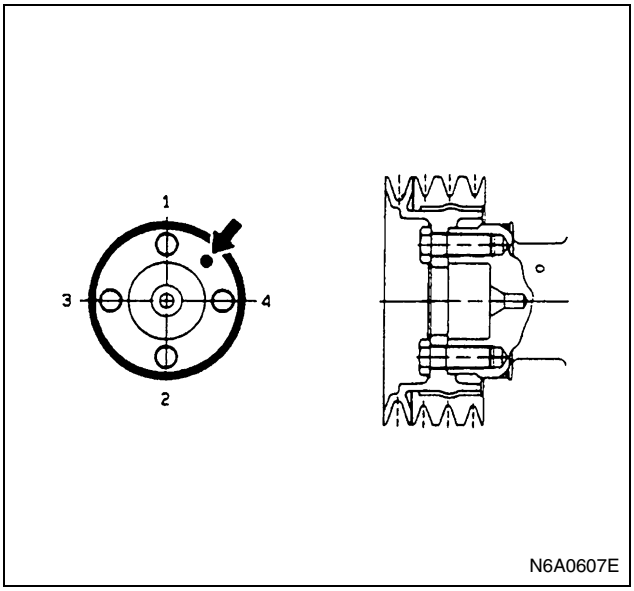


Legend
1. Washer
2. Pilot bearing

4) Remove the crankshaft stopper.

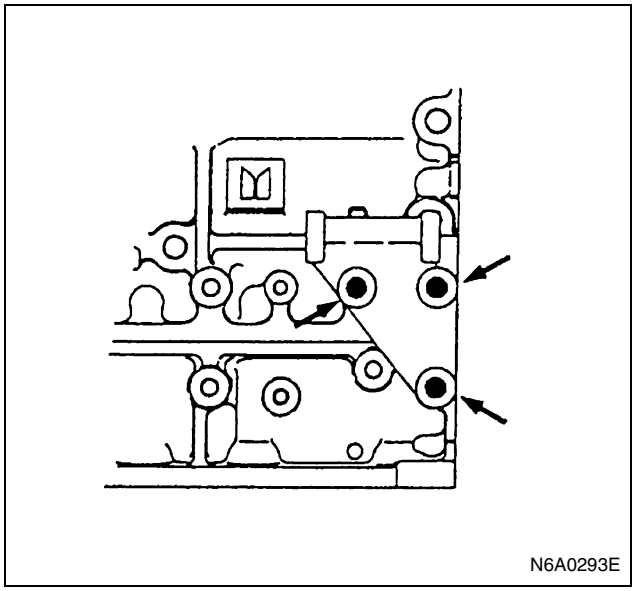
27. Crankshaft Front Slinger
28. Crankshaft Front Oil Seal
    Above works refer to “CRANKSHAFT FRONT OIL SEAL” section in this manual.
29. Crankshaft Damper Pulley
    1) Apply a coat of engine oil to the threads of the bolts.
    2) Align the damper pulley with the crankshaft knock pin and tighten the bolts to the specified torque in numerical order.

Tighten:
Damper pulley bolt to 200 N·m (20.4 kg·m/147 lb·ft)

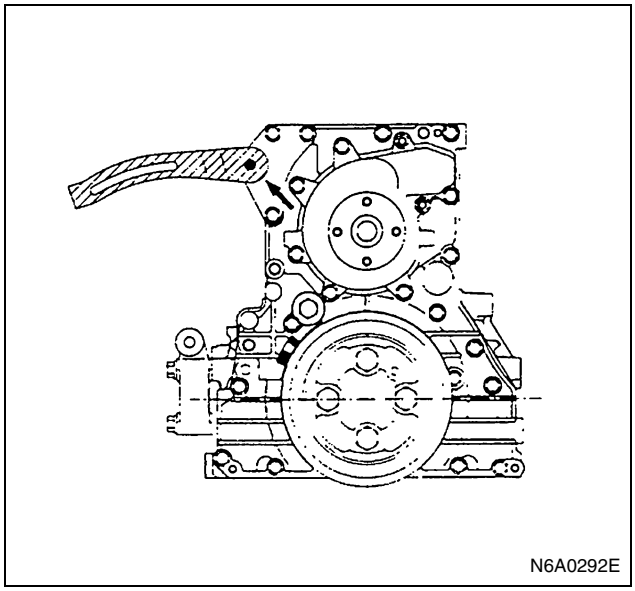


30. Generator Bracket

Tighten:
Generator bracket bolt to 48 N·m (4.9 kg·m/35 lb·ft)

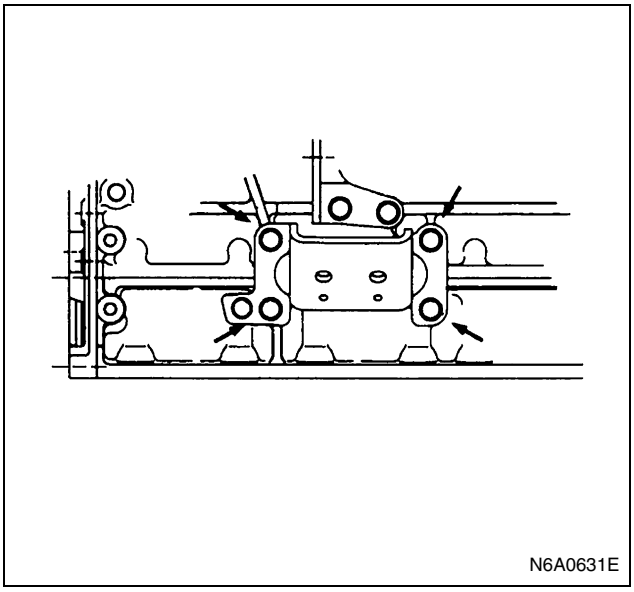


31. Fan Belt Adjust Plate
    Install the adjust plate and temporarily tighten the adjust plate bolt.



32. Injection Pump Assembly
    Above works refer to “INJECTION PUMP ASSEMBLY” section 6C in this manual.
33. Engine Foot

Tighten:
Engine foot bolt to 51 N·m (5.2 kg·m/38 lb·ft)



N6A0631E

34. Generator

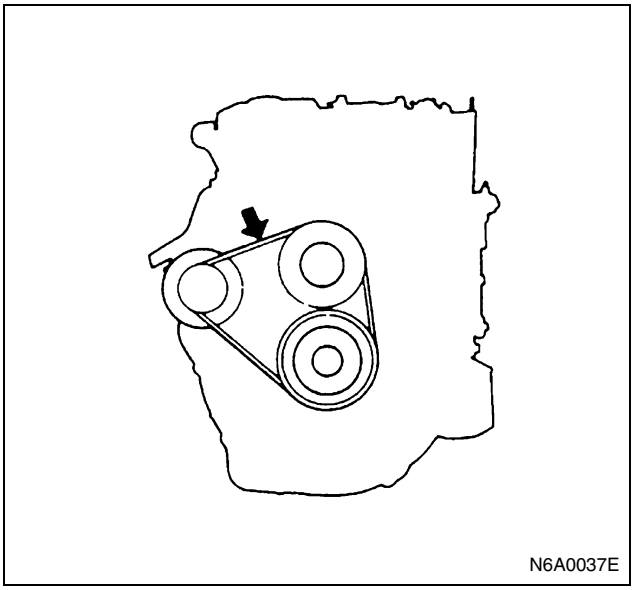
Notice:
When tightening the generator, tighten in advance the fan belt temporarily after its adjustment.

- Insert through the lower fixing bolt from the rear side as shown in the illustration, and tighten it with a nut on the front side.

35. Fan Belt
Check the drive belt tension.
Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
8 — 12 (0.31 — 0.47) ... New belt 10 — 14 (0.39 — 0.55) ... Reuse belt	

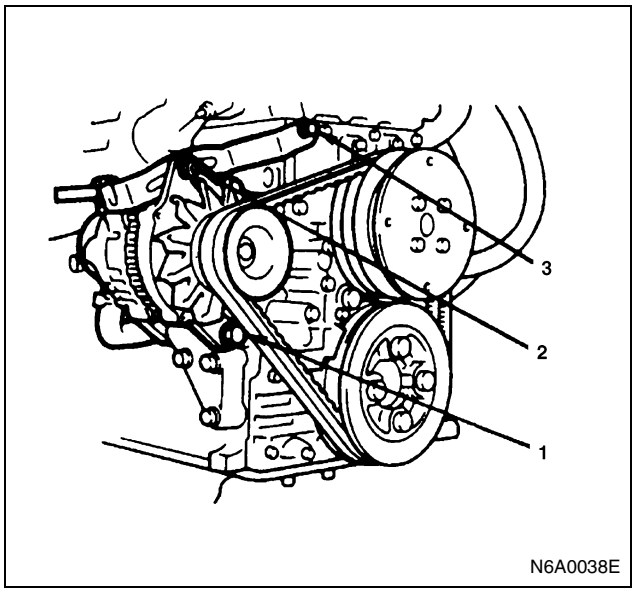
Check the drive belt for cranking and other damage.



N6A0037E

Fan Belt Adjustment
Fan belt tension is adjusted by moving the generator.

Tighten:
Bolt to
- (1): 40 N·m (4.1 kg·m/30 lb·ft)
- (2): 24 N·m (2.4 kg·m/17 lb·ft)
- (3): 46 N·m (4.7 kg·m/34 lb·ft)



N6A0038E

36. Vacuum Pump Rubber Hose (12)
37. Vacuum Pump Oil Pipe (11)

Tighten:

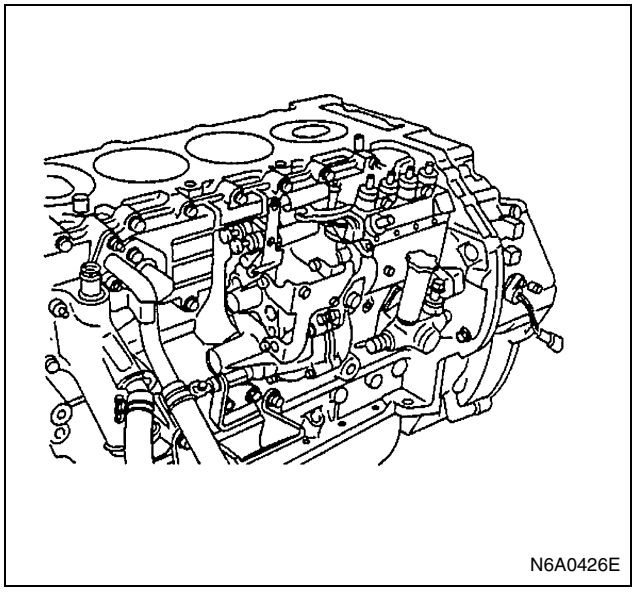
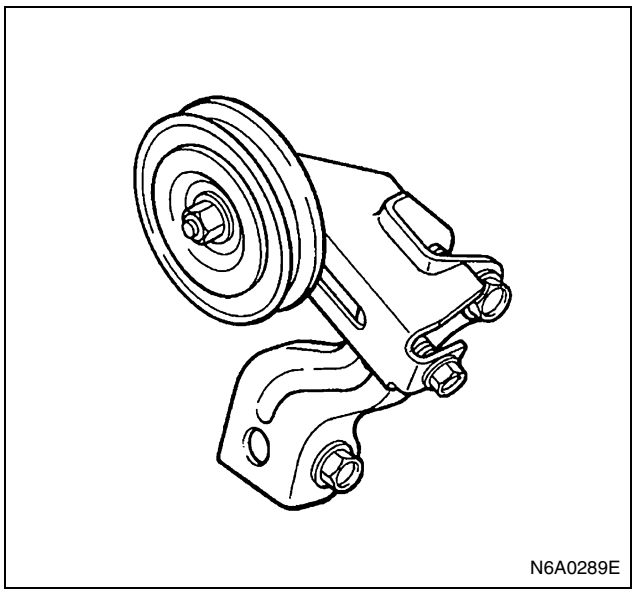
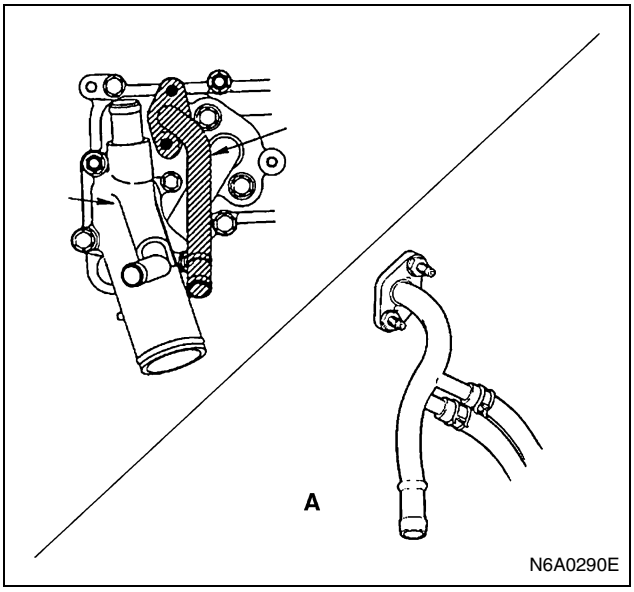
    2) Then remove the injection pump assembly.



27. Injection Pump Rubber Spacer
28. Idle Pulley Bracket (If equipped with A/C)

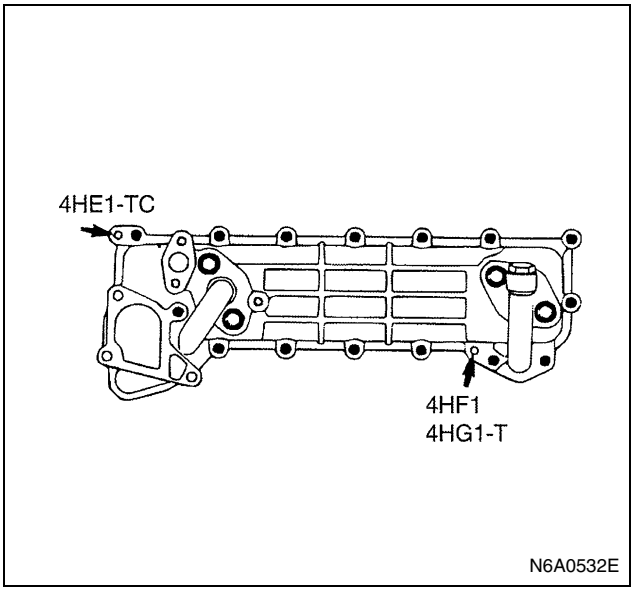


29. Heater Pipe

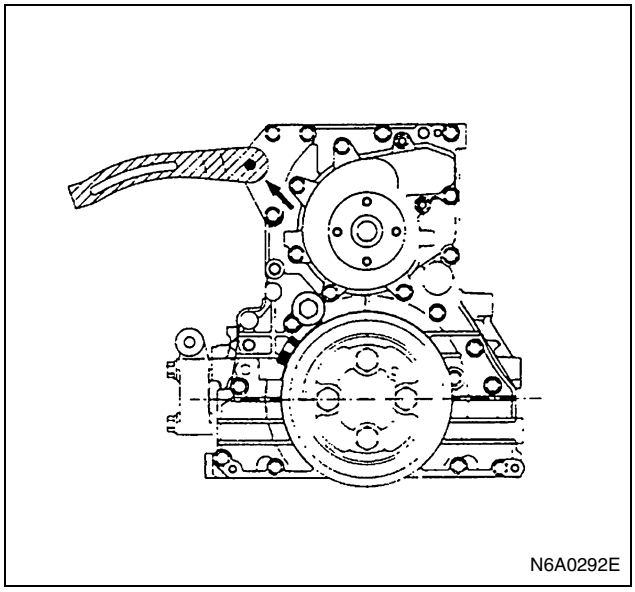


Legend
A. 4HF1-2

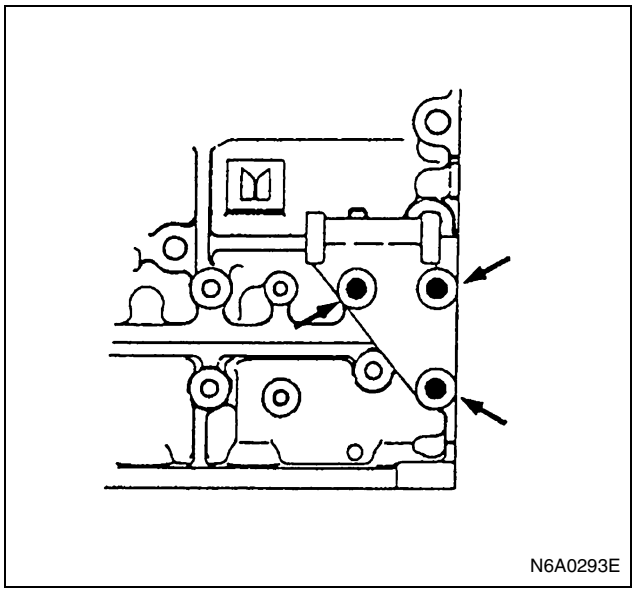
30. Water Suction Pipe
31. Oil Cooler Assembly
    1) Remove the oil cooler bolts.
    2) Install a oil cooler fixing bolt to the oil cooler replacer hole as shown in the illustration, and tighten the bolt alternately a little at a time.



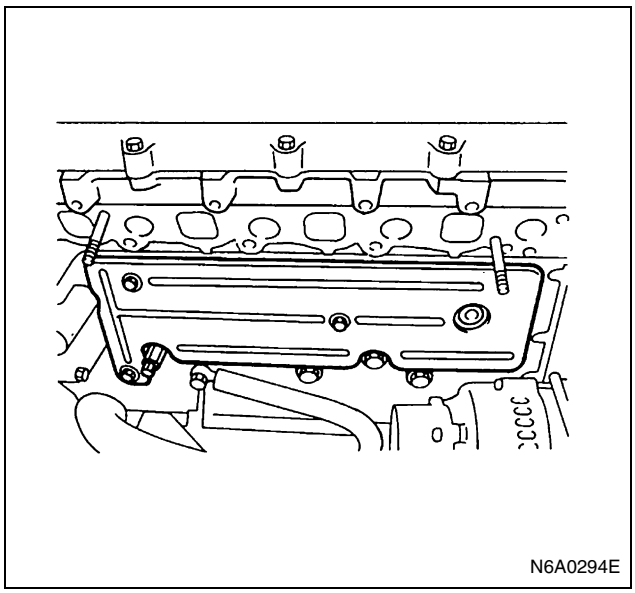
32. Fan Belt Adjust Plate



33. Generator Bracket



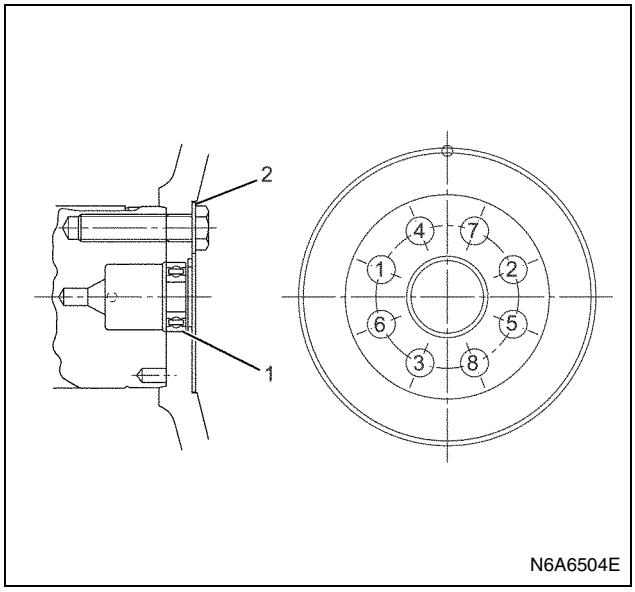
34. Cover



35. Crankshaft Damper Pulley
    1) Use the crankshaft stopper to prevent the crankshaft from turning.
       Crankshaft Stopper: 5-8840-2230-0

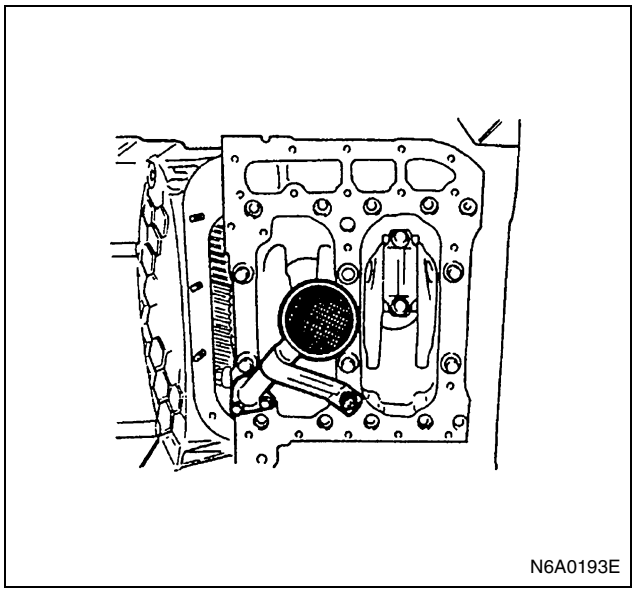
    2) Loosen the damper pulley bolts and remove the damper pulley.
36. Crankshaft Front Oil Seal
37. Crankshaft Front Slinger
    Above works refer to “CRANKSHAFT FRONT OIL SEAL” section in this manual.
38. Flywheel Assembly
    1) Use the crankshaft stopper to prevent the crankshaft from turning
       Crankshaft Stopper: 5-8840-2230-0

    2) Loosen the flywheel bolts in numerical order a little at a time as shown in the illustration.
    3) Remove the flywheel stopper and the flywheel assembly.

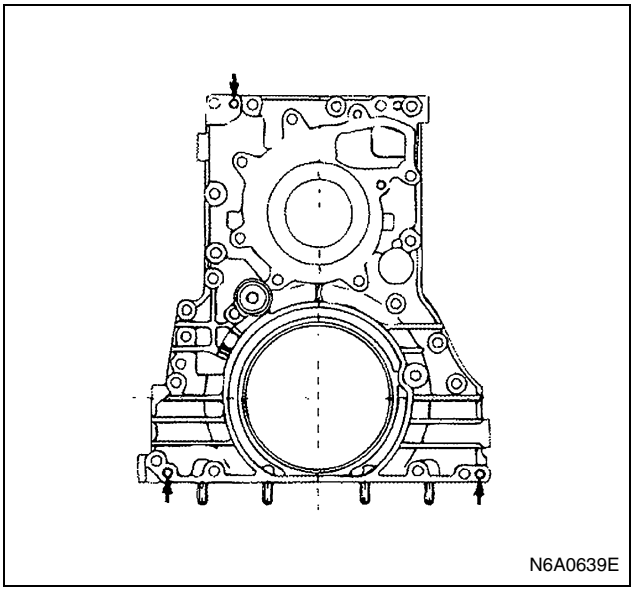


Legend
1. Washer
2. Pilot bearing

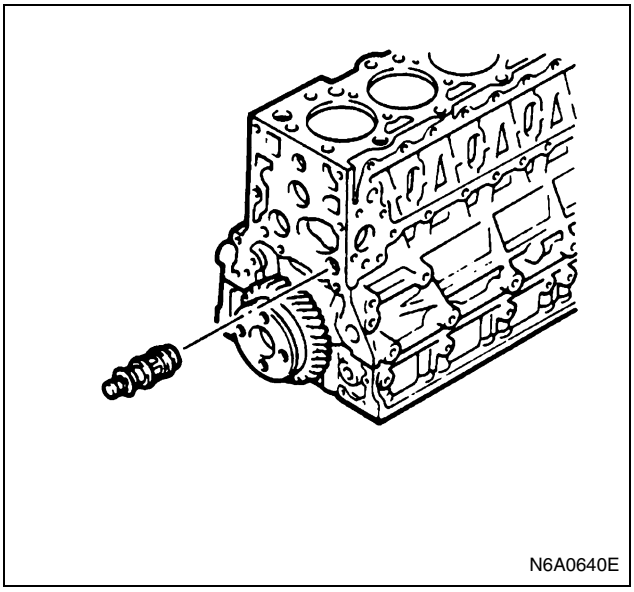
39. Crankshaft Rear Seal
40. Crankshaft Rear Slinger
    Above works refer to “CRANKSHAFT REAR OIL SEAL” section in this manual.
41. Spacer Rubber
    Remove the stiffener before removing the spacer rubber.
42. Oil Pan
43. Oil Pump Strainer



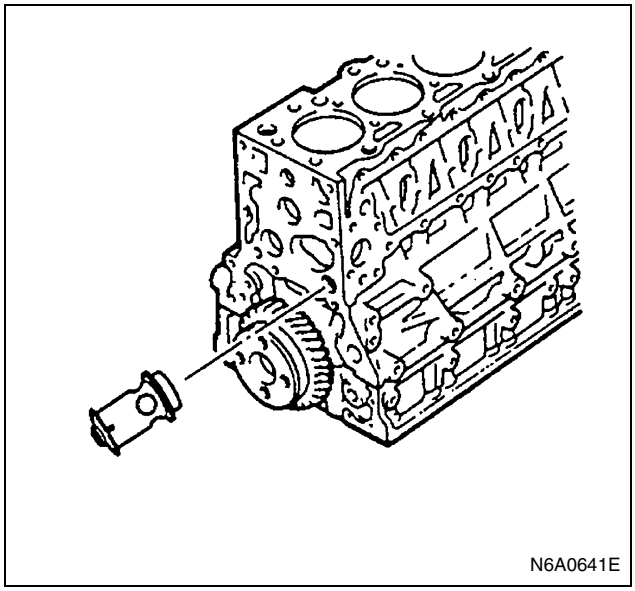
44. Water Pump Pulley
45. Water Pump
46. Front Retainer
    Install the three front retainer fixing bolts to the front retainer replacer holes as shown in the illustration, and tighten the bolts alternately a little at a time.



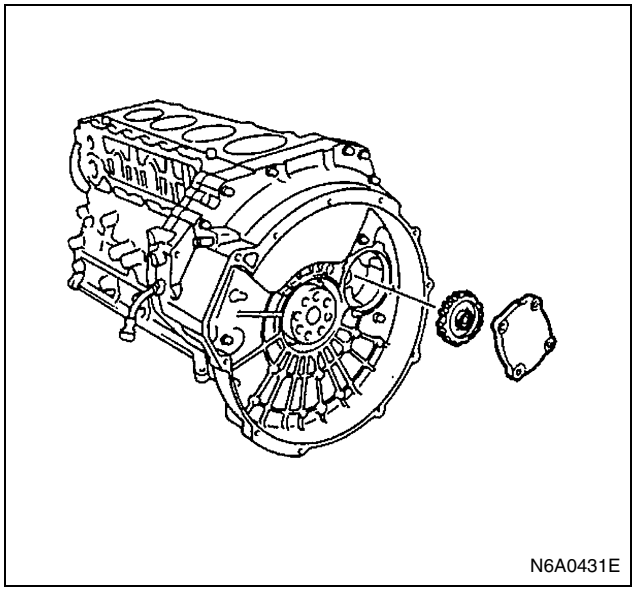
47. Oil Thermo Valve (4HF1, 4HF1-2, 4HG1, 4HG1-T)
Pull out the thermo valve from the cylinder body.



48. Bypass Valve (4HE1-TC)
Pull out the bypass valve from the cylinder body.

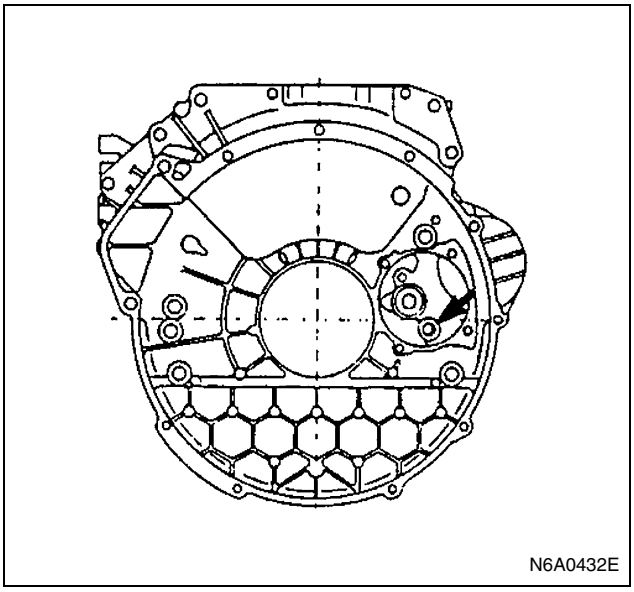


49. Power Steering Pump Idle Gear Cover
50. Power Steering Pump Idle Gear

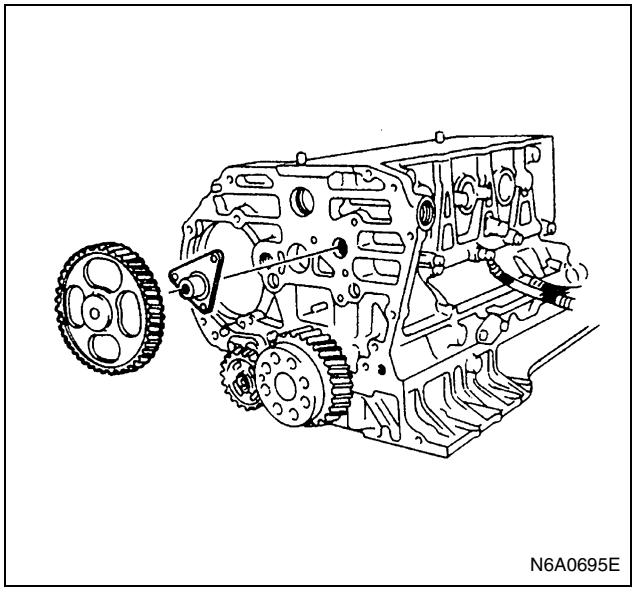


51. Flywheel Housing

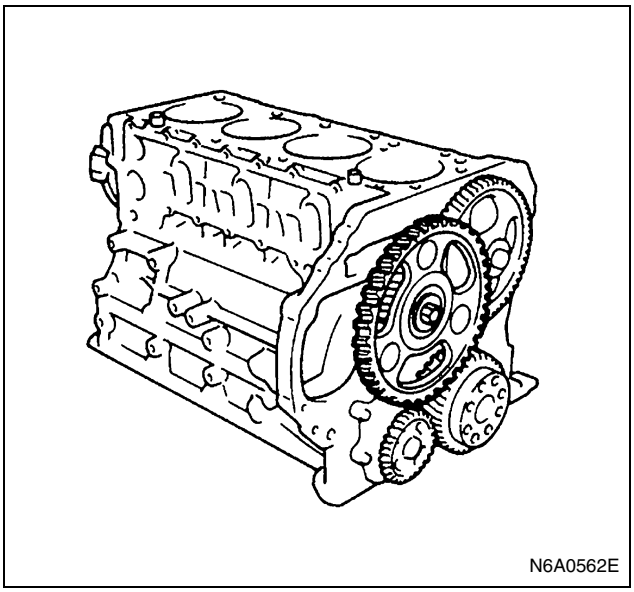
Notice:
Be careful not to fail to remove the bolts shown in the illustration.



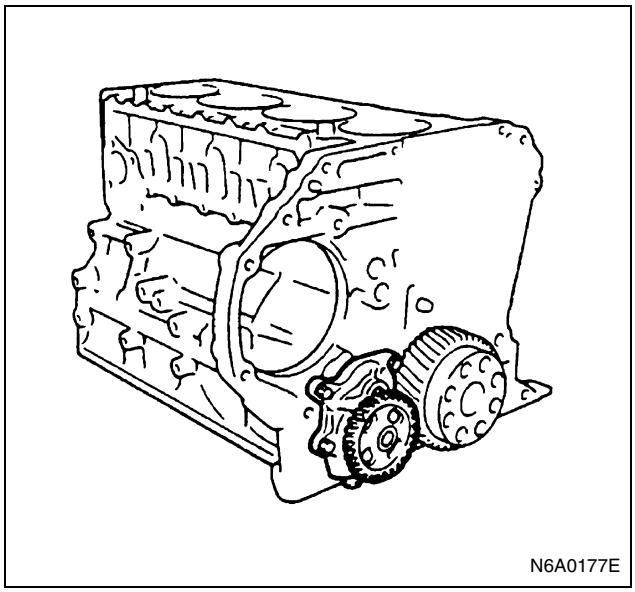
52. Idle Gear A



55. Oil Pump Assembly

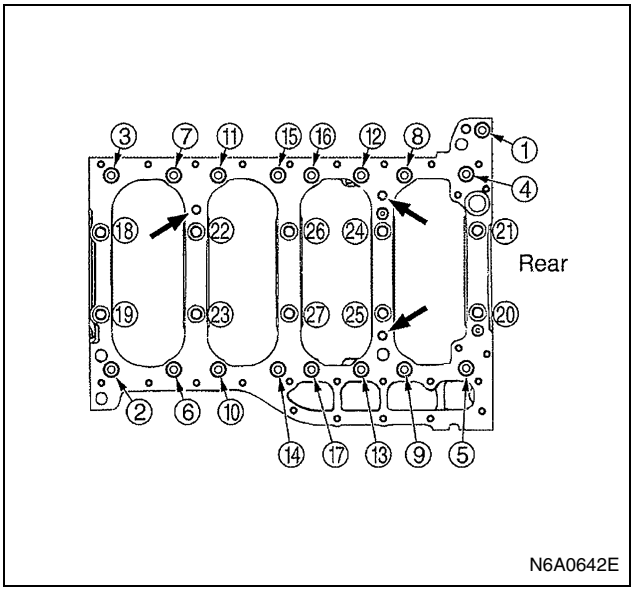


53. Idle Gear B
54. Idle Gear B Shaft

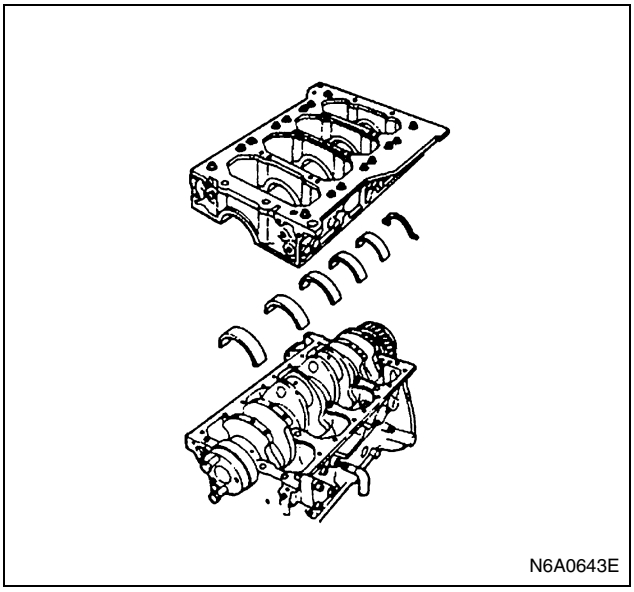


56. Connecting Rod Cap
57. Connecting Rod Lower Bearing
58. Piston and Connecting Rod Assembly
    Above works refer to “PISTON AND CONNECTING ROD” section in this manual.
59. Crankcase
    1) Loosen the crankcase bolts in numerical order a little at a time.
    2) Install the three crankcase fixing bolts (See arrow marks) to the crankcase replacer holes as shown in the illustration, and tighten the bolts alternate a little at a time.

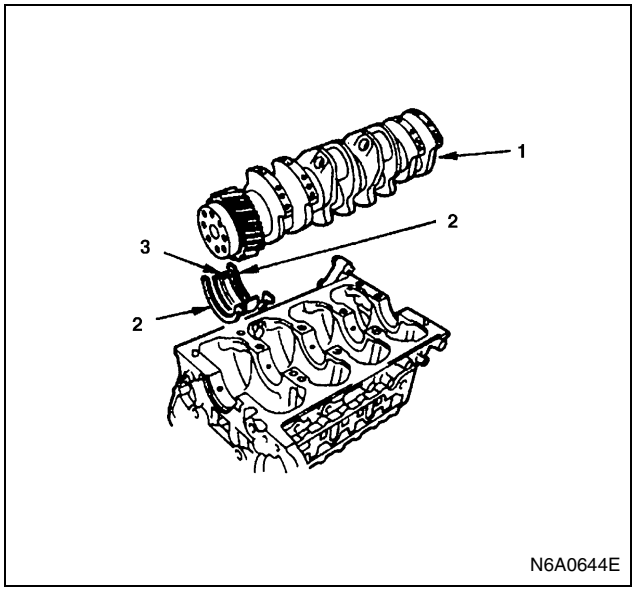
Notice:
When removing the crankcase, be sure to remove the oil pump and the generator bracket before that.



60. Thrust Bearing Lower
61. Crankshaft Bearing Lower



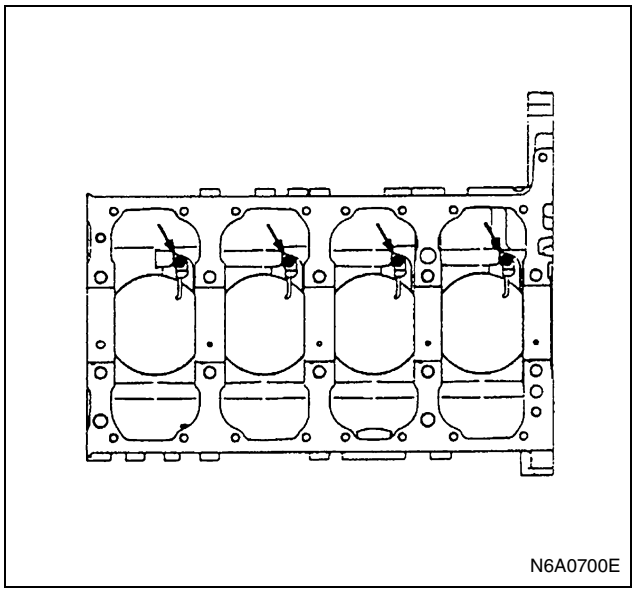
62. Crankshaft Assembly
63. Thrust Bearing Upper
64. Crankshaft Bearing Upper



Legend

1. Crankshaft assembly
2. Thrust bearing upper
3. Crankshaft bearing upper

65. Oiling Jet
    Loosen the check valves to remove both the check valves and the oiling jets.
    Take care not to bend or damage the oiling jets.



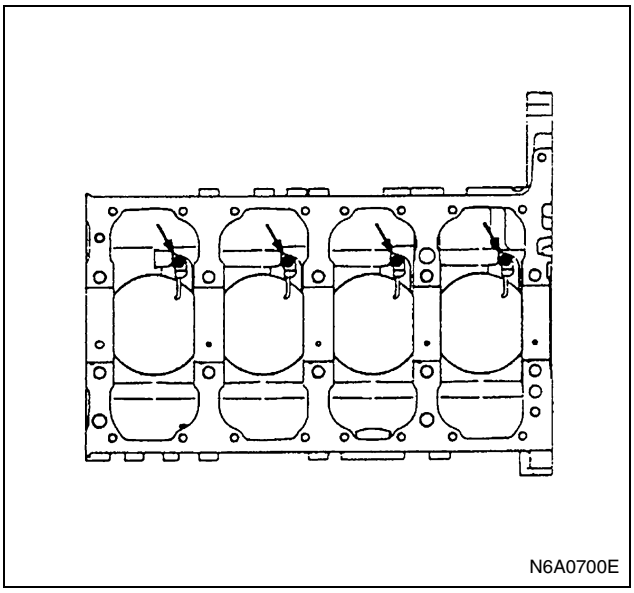
66. Cylinder Block

Installation

1. Cylinder Block
   Use compressed air to thoroughly clean the inside and outside surfaces of the cylinder body, the oil holes, and the water jackets.
2. Oiling Jet
   1) Install the oiling jets together with the check valves.
      Take care not to damage the oiling jet nozzles.

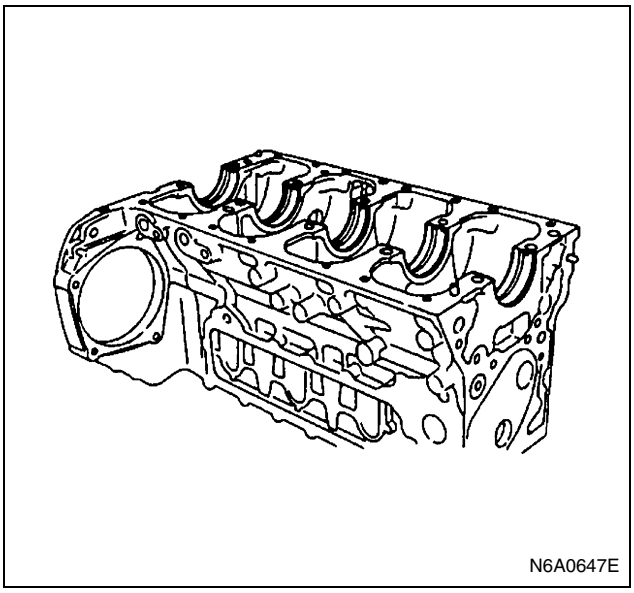
2) Tighten the check valves and oiling jets to the specified torque.

Tighten:
Check valve and oiling jet to 21 N·m (2.1 kg·m/15 lb·ft)



N6A0700E

3. Crankshaft Bearing Upper
When replacing the crankshaft or the crankshaft bearing with a new one, select the crankshaft bearing according to the respective grades stamped on the crankshaft and the cylinder body.
Refer to the “CRANKSHAFT” in section 6A.
All upper bearings have oil grooves.



N6A0647E

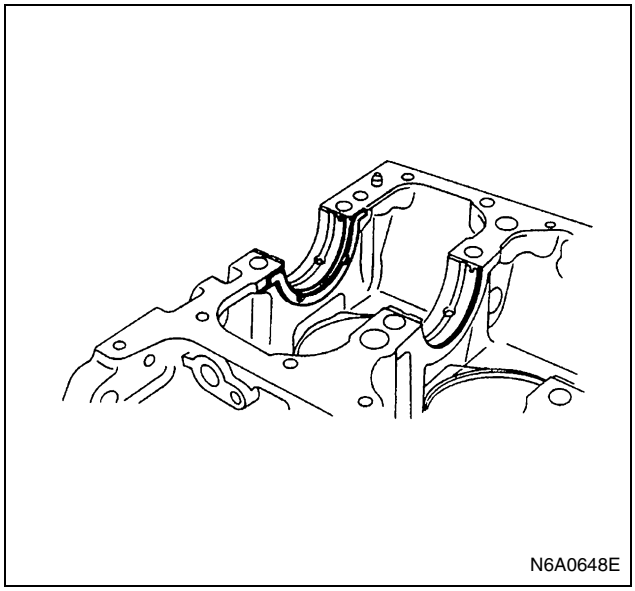
1) Carefully wipe any foreign material from the upper bearing.

Caution:
Do not apply engine oil to the bearing back faces and the cylinder body bearing fitting surface.

2) Locate the position mark applied at disassembly if the removed upper bearings are to be reused.

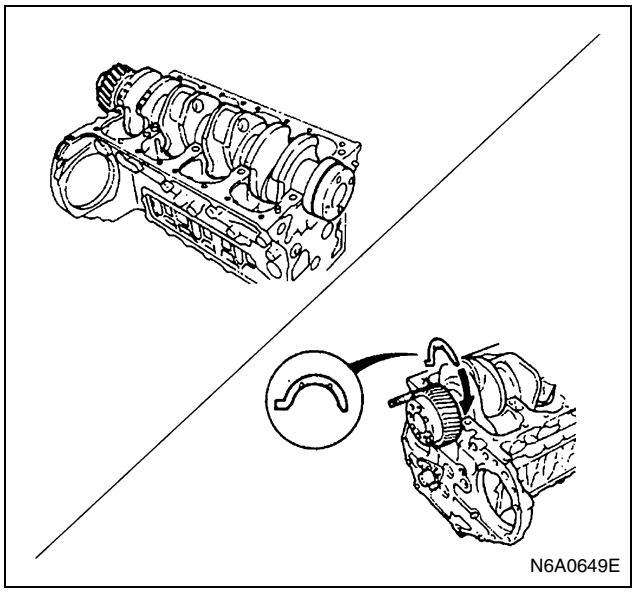
4. Thrust Bearing Upper
Install the thrust bearing upper to the front side of the cylinder body No.5 journal. At this time, the thrust bearing upper may be pasted to the cylinder body with grease.
However, be sure to wipe off nay excessive grease.

Caution:
The thrust bearing oil grooves must be facing the sliding faces.



N6A0648E

5. Crankshaft Assembly
Apply an ample coat of engine oil to the crankshaft journals and the crankshaft bearing surfaces before installing the crankshaft with timing gear.



N6A0649E

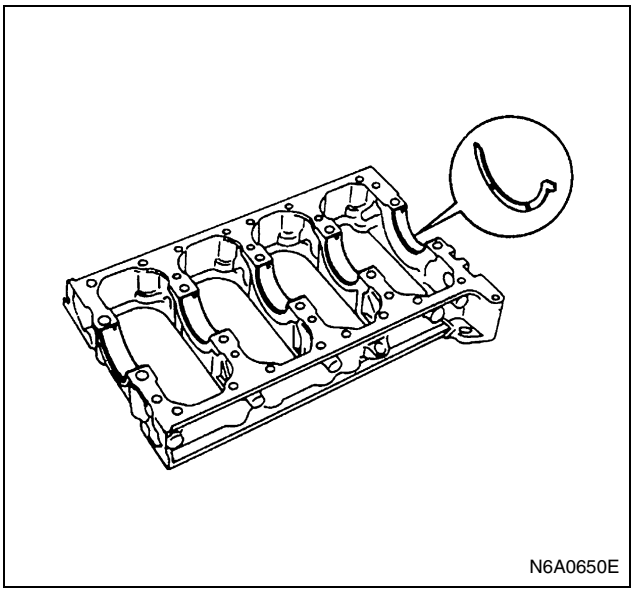
6. Crankshaft Bearing Lower
All lower bearings does not have oil grooves.
1) Carefully wipe any foreign material from the lower bearing.

Caution:
Do not apply engine oil to the bearing back faces and the crankcase bearing fitting surfaces.

2) Locate the position mark applied at disassembly if the removed lower bearings are to be reused.

7. Thrust Bearing Lower
   Install the thrust bearing lower to the rear side of the crankcase No.5 journal.

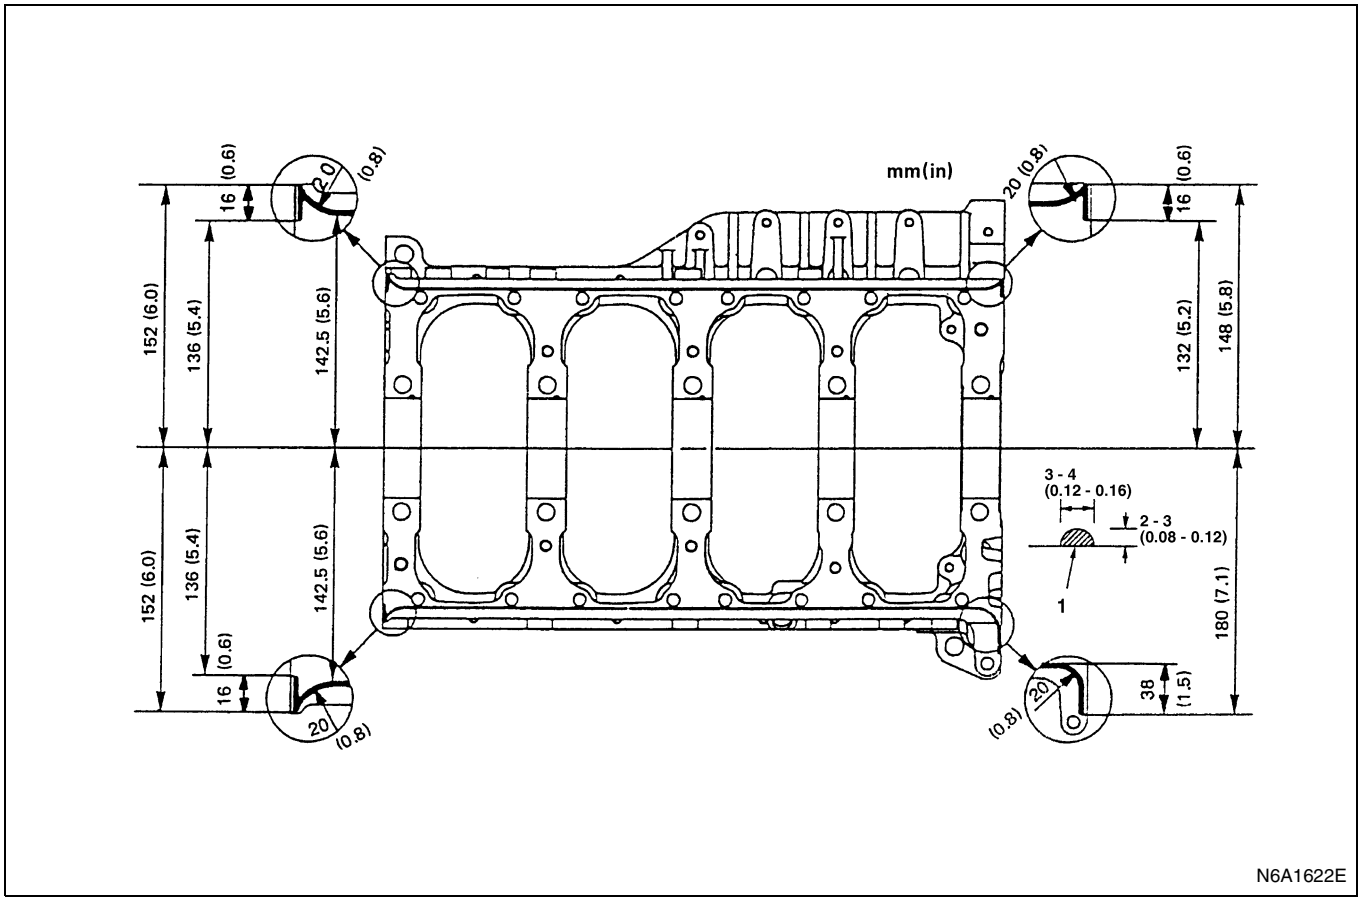
Caution:
The thrust bearing oil grooves must be facing the sliding faces.



N6A0650E

8. Crankcase
   1) Apply a 3 mm (0.12 in) bead of recommended liquid gasket (Three Bond 1207C) or its equivalent to the crankcase upper surface as shown in the illustration.
   2) Carefully place the crankcase on the cylinder body.

   • Install the crankcase within 20 minutes after application of liquid gasket.



Legend

1. Liquid gasket

3) Tighten the crankcase to the specified torque in the numerical order shown in the illustration.

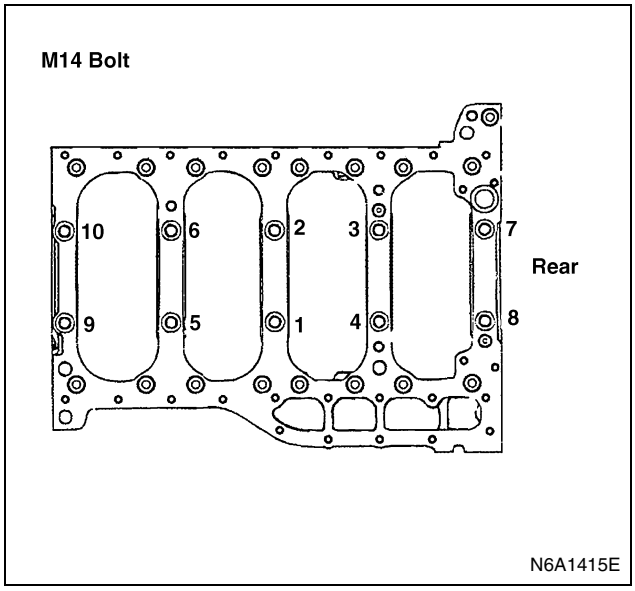
Tighten:

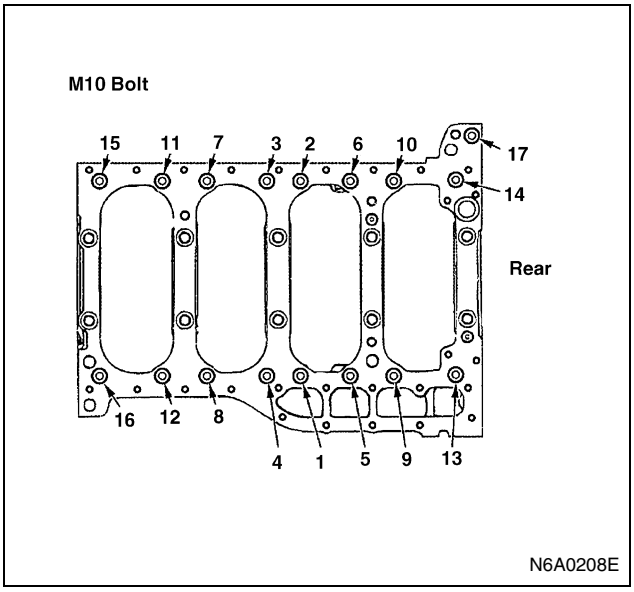
Crankcase bolt (M14: (1) — (10)) to

- 1st step: 98 N·m (10 kg·m/72 lb·ft)
- 2nd step: 132 N·m (13.5 kg·m/98 lb·ft)
- 3rd step: 30 — 60°

Crankcase bolt (M10: (1) — (17)) to 37 N·m (3.8 kg·m/ 27 lb·ft)

Angle gauge: 5-8840-0266-0

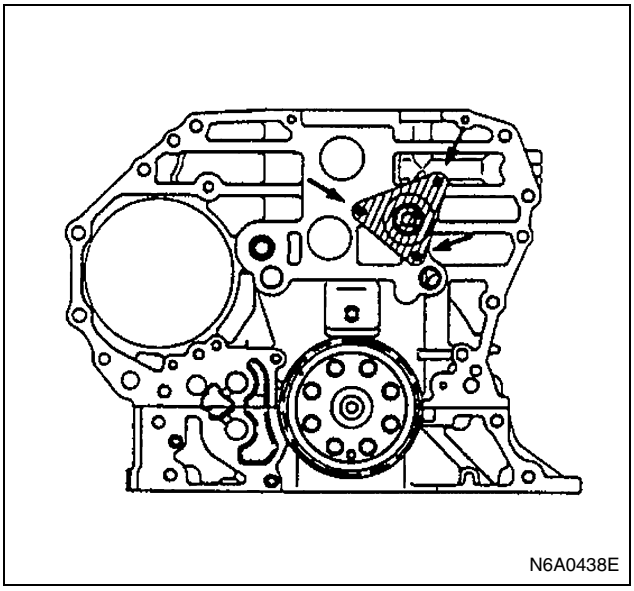




9. Piston and Connecting Rod Assembly
10. Connecting Rod Bearing
11. Connecting Rod Cap
    Above works refer to “PISTON AND CONNECTING ROD” section in this manual.
12. Oil Pump Assembly
    Above works refer to “OIL PUMP ASSEMBLY” section in this manual.
13. Idle Gear B Shaft

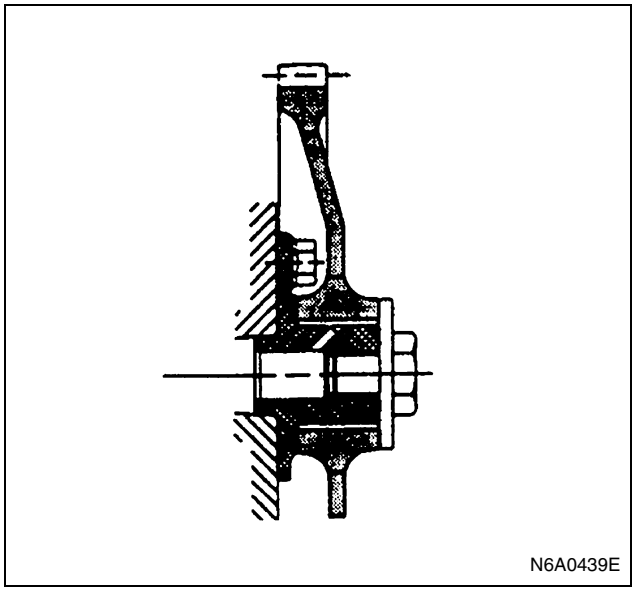
Tighten:
Idle gear B shaft bolt to 31 N·m (3.2 kg·m/23 lb·ft)

Apply the engine oil to the idle gear shaft after installation.



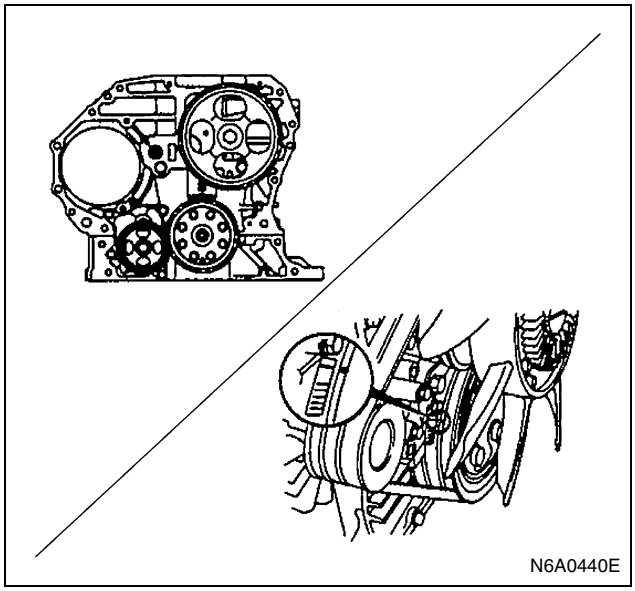
14. Idle Gear B
    The face of the idle gear B with longer boss should be positioned toward the rear side shown in the illustration

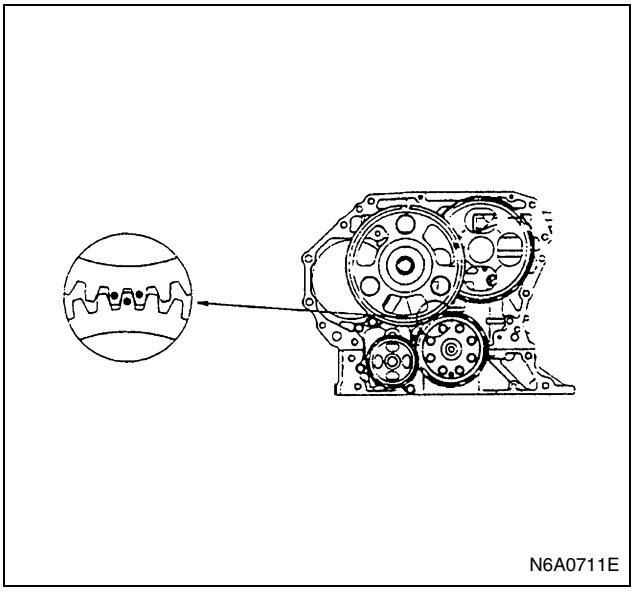
Tighten:
Idle gear B bolt to 110 N·m (11.2 kg·m/81 lb·ft)



15. Idle Gear A
    1) Turn the crankshaft clockwise so that the engagement mark of the crankshaft gear faces to the shaft center of the idle gear A and the No.1 cylinder piston comes to the top dead center.
    2) Align the crankshaft gear with the engagement mark of the idle gear and install the idle gear A.

Tighten:
Idle gear A bolt to 133 N·m (13.6 kg·m/98 lb·ft)

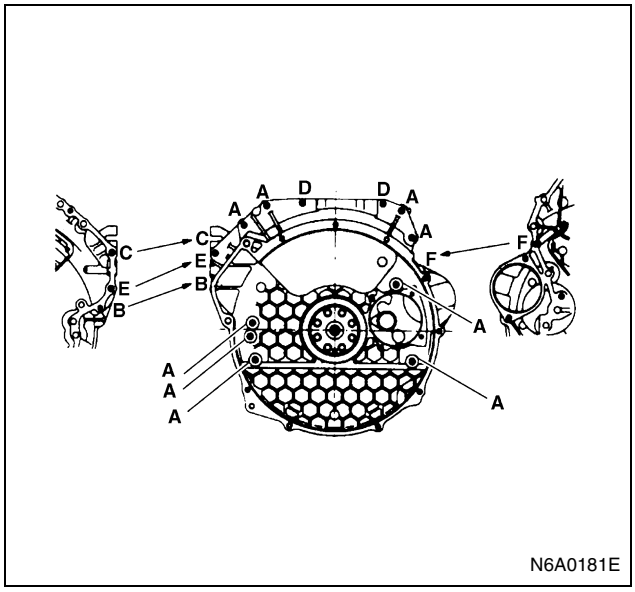




16. Flywheel Housing
    1) Carefully wipe any foreign material from the cylinder body rear face.
    2) Apply the recommended liquid gasket (Three Bond 1207C) or its equivalent to the shaded areas shown in the illustration.

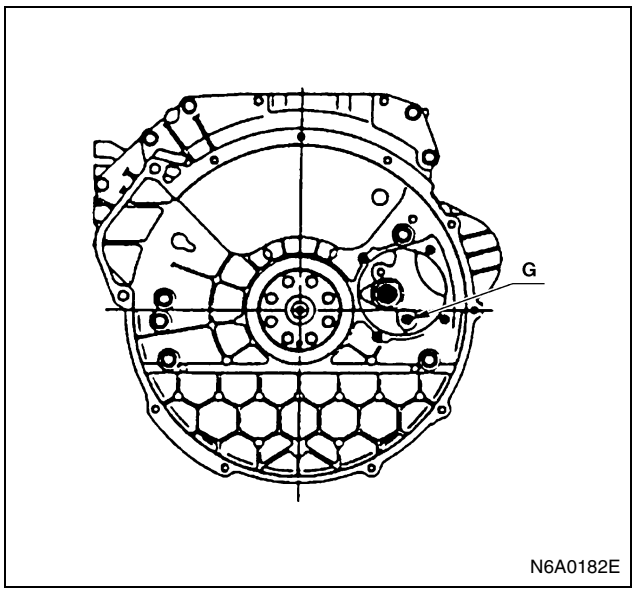
    3) Align the cylinder body knock pins with the flywheel housing knock pin holes.
    4) Tighten the flywheel housing bolts to the specified torque shown in the illustration.

Tighten:
Flywheel housing bolt to
- (A): 96 N·m (9.8 kg·m/71 lb·ft)
- (B): 48 N·m (4.9 kg·m/35 lb·ft)
- (C): 94 N·m (9.6 kg·m/69 lb·ft)
- (D): 25 N·m (2.6 kg·m/19 lb·ft)
- (E): 76 N·m (7.7 kg·m/56 lb·ft)
- (F): 48 N·m (4.9 kg·m/35 lb·ft)



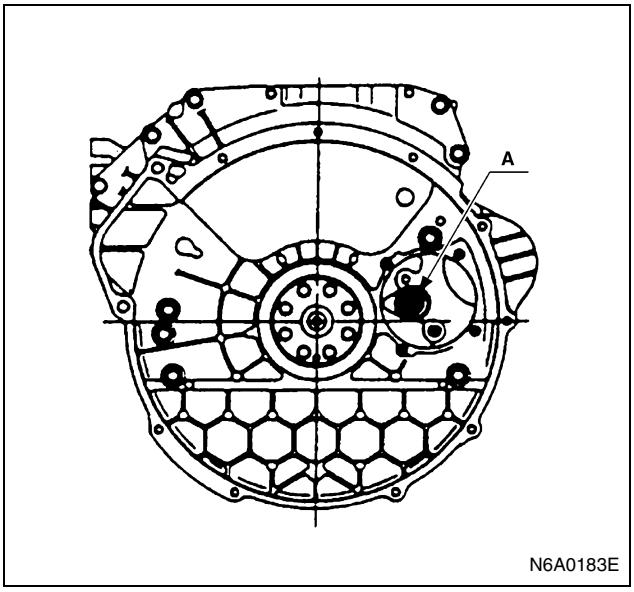
- Tighten the bolts marked with “E” or “B” from the injection pump side, and those with “F” from the cylinder body side.

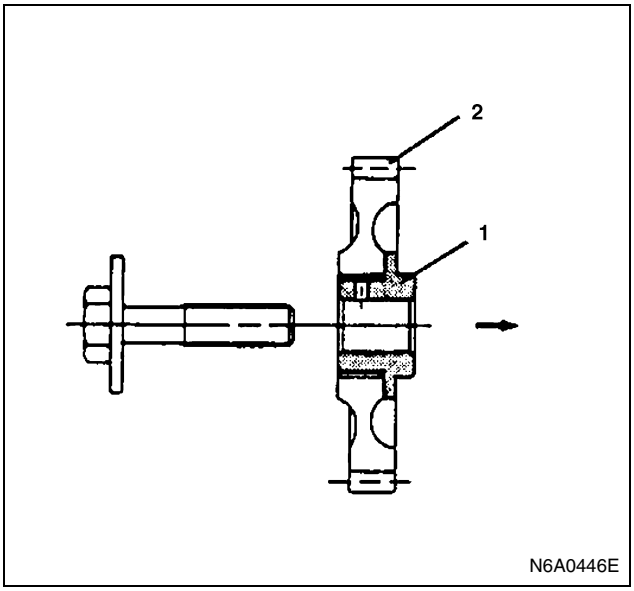
Tighten:
Flywheel housing bolt (G) to 96 N·m (9.8 kg·m/71 lb·ft)



17. Power Steering Pump Idle Gear
    1) Apply the engine oil to the idle gear shaft.
    2) Install the idle gear shaft (1) with the idle gear (2) to the cylinder body A portion as shown in the illustration.

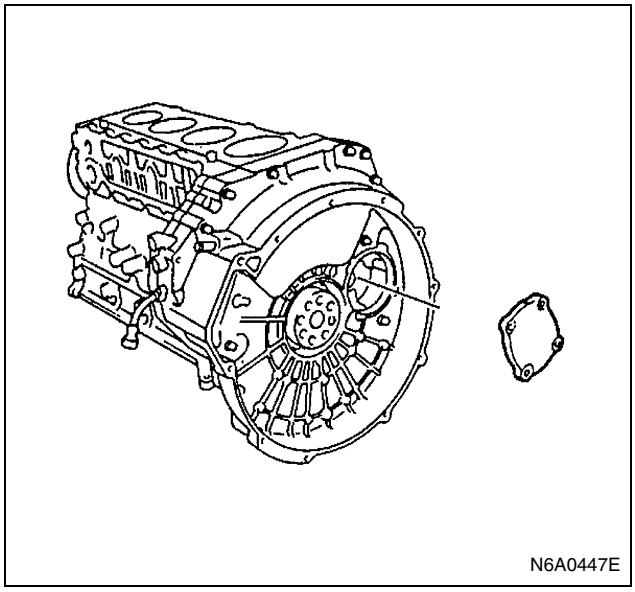
Tighten:
Idle gear shaft bolt to 133 N·m (13.6 kg·m/98 lb·ft)



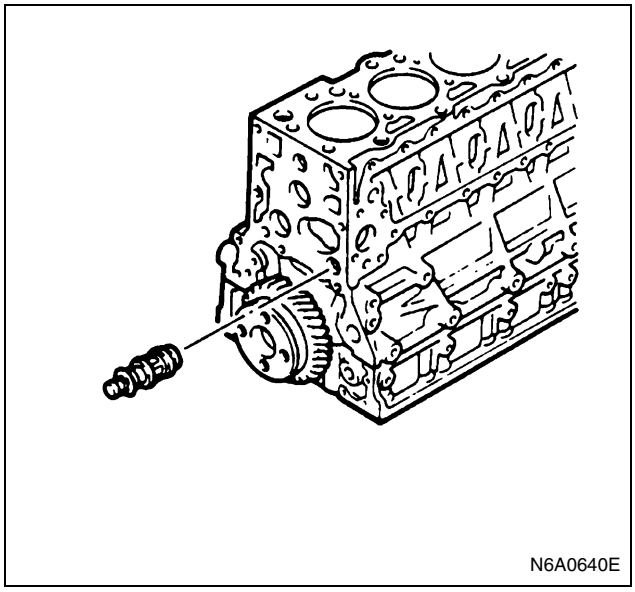


18. Power Steering Pump Idle Gear Cover
    Install the gear cover with the O-ring.

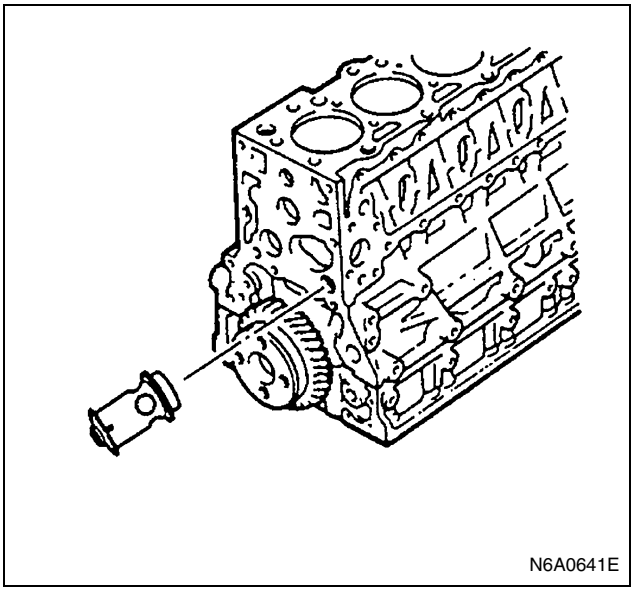
Tighten:
Gear cover bolt to 19 N·m (1.9 kg·m/14 lb·ft)



19. Oil Thermo Valve (4HF1, 4HF1-2, 4HG1, 4HG1-T)
    Insert the oil thermo valve into the cylinder body.

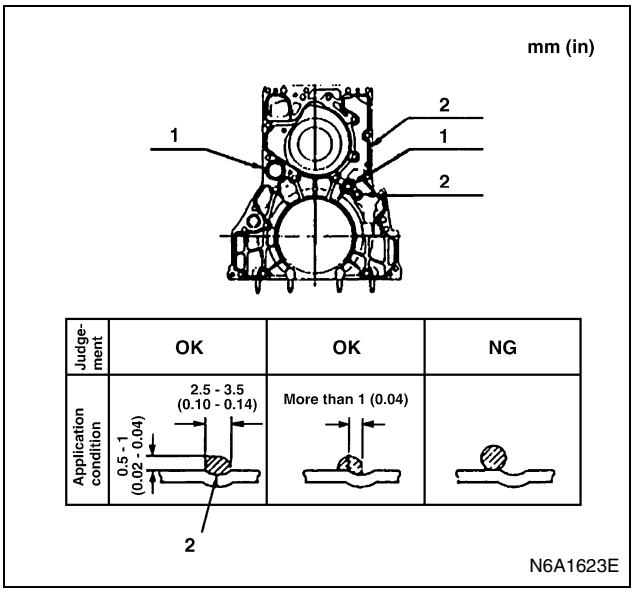


20. Bypass Valve (4HE1-TC)
    Insert the bypass valve into the cylinder body.

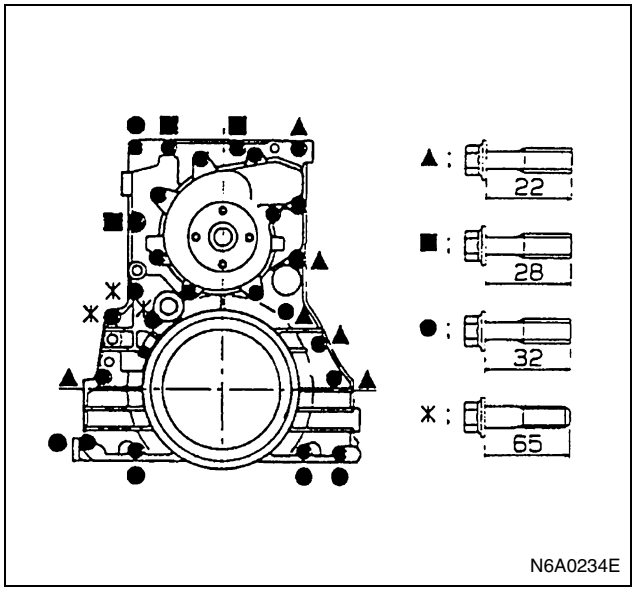


21. Front Retainer
    1) Carefully wipe any foreign material from the cylinder body front face.
    2) Apply a 2.5 — 3.5 mm (0.10 — 0.14 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the groove of the front retainer fitting surface shown in the illustration.
    3) Install the O-rings (2 pieces) to the front retainer.
    - Install the front retainer within 7 minutes after application of the liquid gasket.
    - For the dislocation of liquid gasket, refer to the illustration.
    4) Align the cylinder body knock pins with the front retainer knock pin holes.

Tighten:
Front retainer bolt to 24 N·m (2.4 kg·m/17 lb·ft)



Legend
1. O-ring
2. Liquid gasket

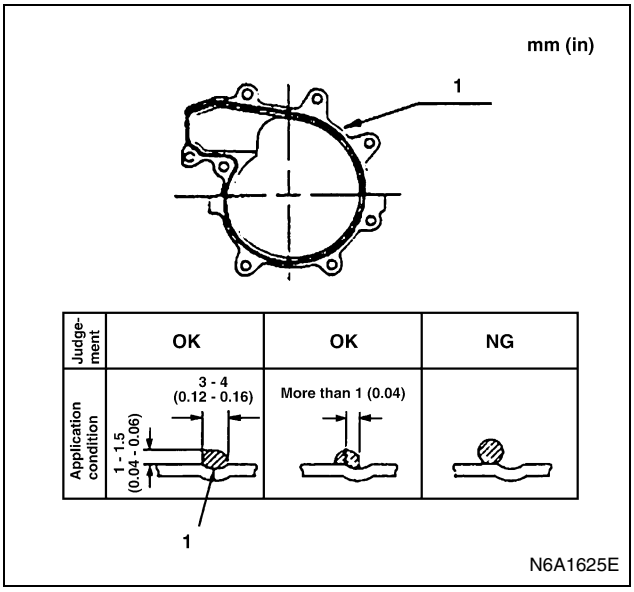


22. Water Pump Assembly
    1) Apply 3 — 4 mm (0.12 — 0.16 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the water pump fitting surface.
    2) Install the water pump to the front retainer.

Tighten:
Water pump bolt to 24 N·m (2.4 kg·m/17 lb·ft)

- Install the water pump within 7 minutes after application of liquid gasket.
- For the dislocation of liquid gasket, refer to the illustration.

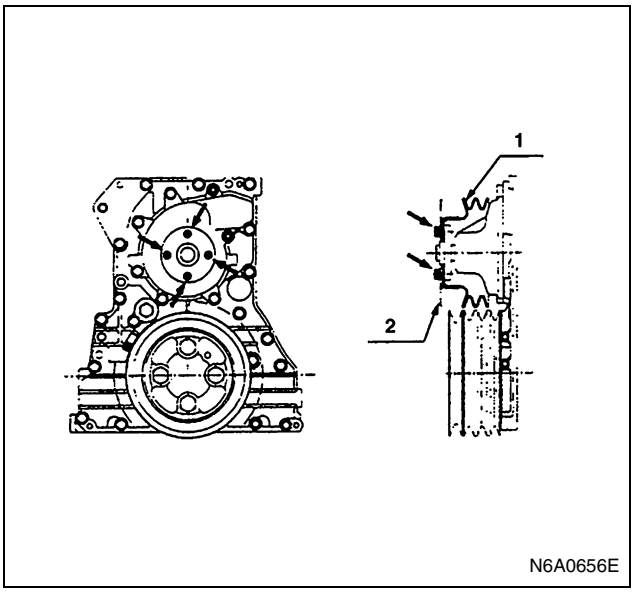
Caution:
The water pump clamping bolt is also used to tighten the front retainer. So, install the water pump before liquid gasket gets dry immediately after installation of the front retainer.



Legend
1. Liquid gasket

23. Water Pump Pulley

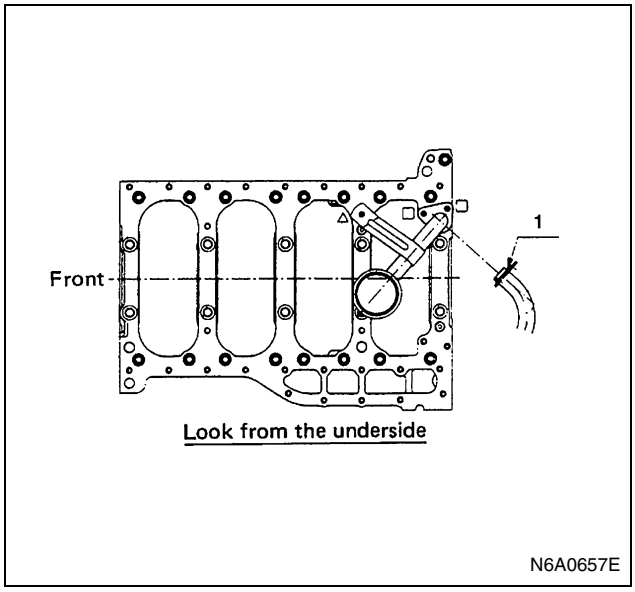
Tighten:
Water pump pulley bolt to 24 N·m (2.4 kg·m/17 lb·ft)



Legend
1. Pulley
2. Set plate

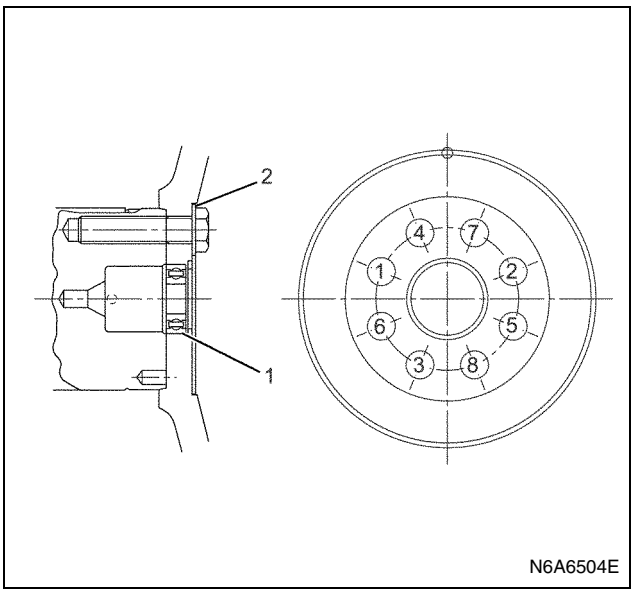
24. Oil Pump Strainer
    Install the O-ring (1) to the oil pump strainer pipe and install the oil pump strainer to the cylinder body shown in the illustration.

Tighten:
Oil pump strainer bolt to 24 N·m (2.4 kg·m/17 lb·ft)



25. Oil Pan
    Above works refer to “OIL PAN” section in this manual.
26. Spacer Rubber
    Above works refer to “OIL PAN” section in this manual.
27. Crankshaft Rear Slinger
28. Crankshaft Rear Oil Seal
    Above works refer to “CRANKSHAFT REAR OIL SEAL” section in this manual.
29. Flywheel Assembly
    1) Align the flywheel with the crankshaft knock pin and temporarily tighten the flywheel bolts.
    2) Use the crankshaft stopper to prevent the crankshaft from turning.
       Crankshaft Stopper: 5-8840-2230-0
    3) Install the washer and the flywheel bolts and tighten to the specified torque in the numerical order show in the illustration.

Tighten:
Flywheel bolt to
- 1st step: 78 N·m (8.0 kg·m/58 lb·ft)
- 2nd step: 90 — 120°

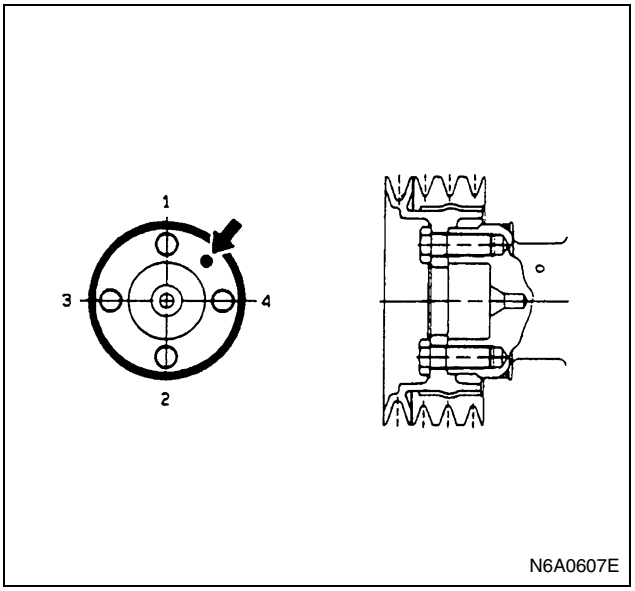


Legend
1. Washer
2. Pilot bearing

4) Remove the crankshaft stopper.

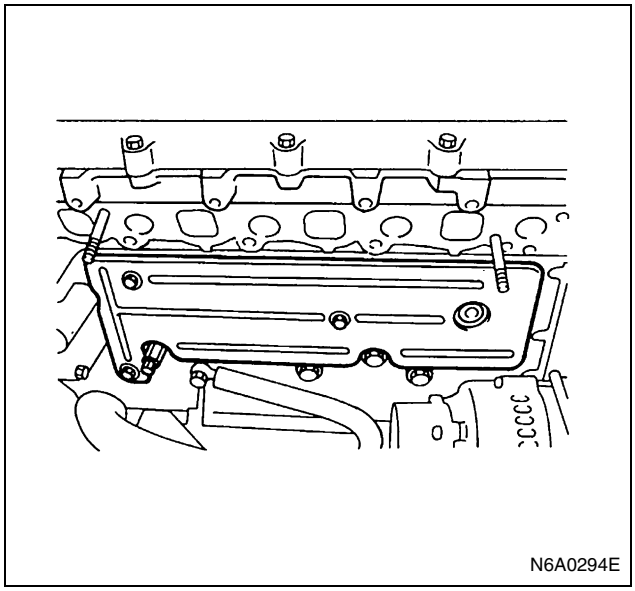
30. Crankshaft Front Slinger
31. Crankshaft Front Oil Seal
    Above works refer to “CRANKSHAFT FRONT OIL SEAL” section in this manual.
32. Crankshaft Damper Pulley
    1) Apply a coat of the engine oil to the threads of the bolts.
    2) Align the damper pulley with the crankshaft knock pin and tighten the bolts to the specified torque in the numerical order.

Tighten:
Damper pulley bolt to 200 N·m (20.4 kg·m/147 lb·ft)

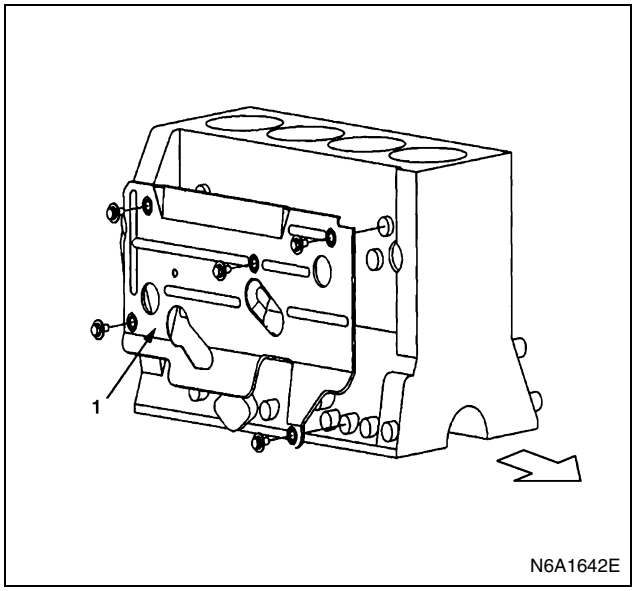


33. Cover

Tighten:
Cover Bolt to 13 N·m (1.3 kg·m/113 lb·in)



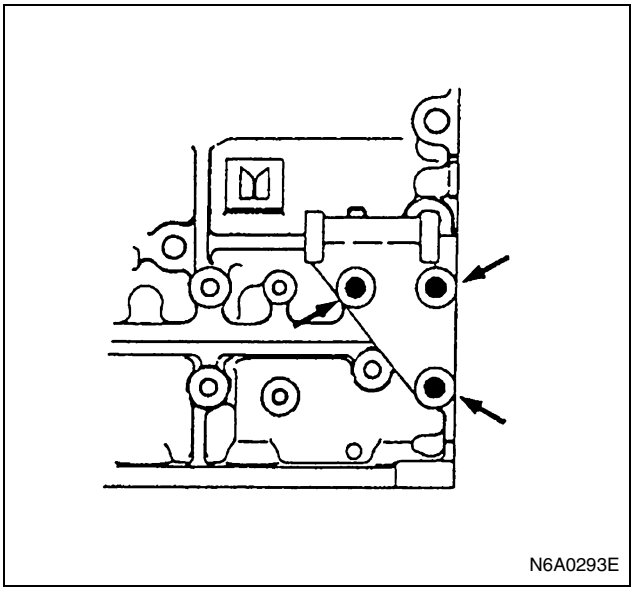
4HE1-TC
4HE1-TC engines use a larger rubber spacer than other engines.



Legend
1. Cover

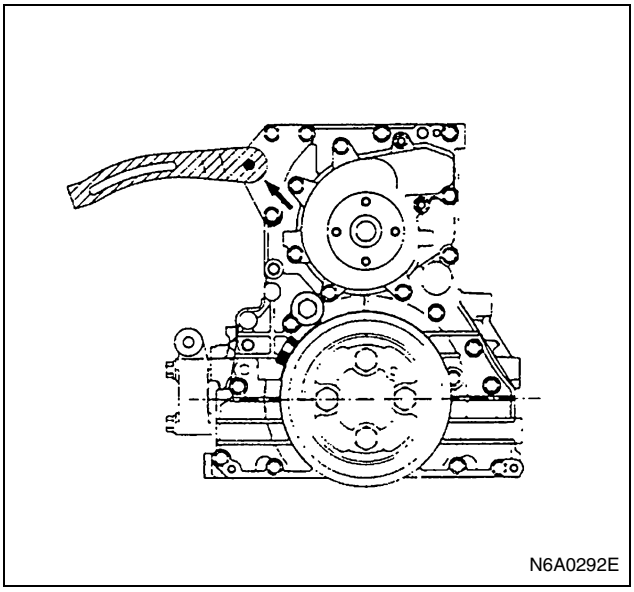
34. Generator Bracket

Tighten:
Generator bracket bolt to 48 N·m (4.9 kg·m/35 lb·ft)



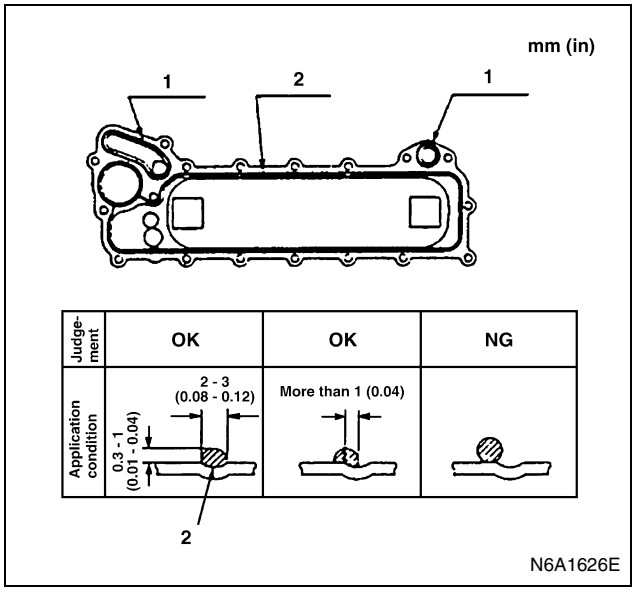
N6A0293E

35. Fan Belt Adjust Plate
    Install the adjust plate and temporarily tighten the adjust plate bolt.



N6A0292E

36. Oil Cooler Assembly
    1) Apply 2 — 3 mm (0.08 — 0.12 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the oil cooler fitting surface.
    2) Apply a coat of engine oil to the O-rings (2 pieces) and install the O-rings to the oil cooler.



N6A1626E

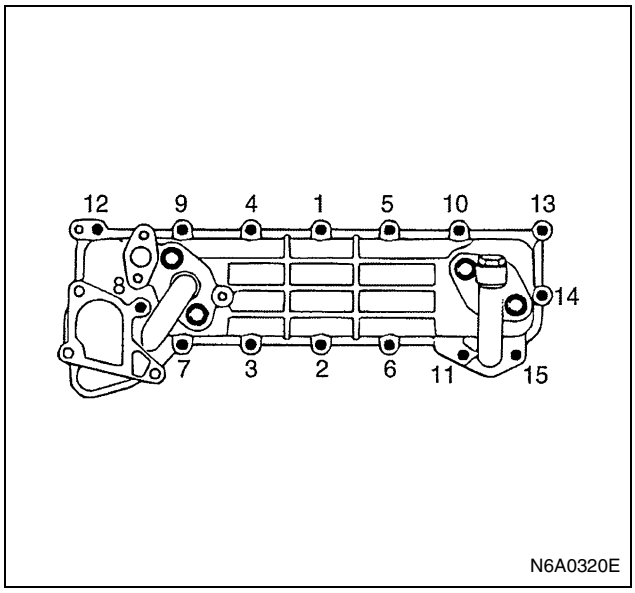
Legend
1. O-ring
2. Liquid gasket

Notice:
Take care that the O-ring does not get smeared with liquid gasket.

- Install the oil cooler within 7 minutes after application of the liquid gasket.
- For the dislocation of the liquid gasket, refer to the illustration.

3) Tighten the oil cooler bolts and nut to the specified torque a little at a time in the sequence shown in the illustration.

Tighten:
Oil cooler bolt and nut to 24 N·m (2.4 kg·m/17 lb·ft)



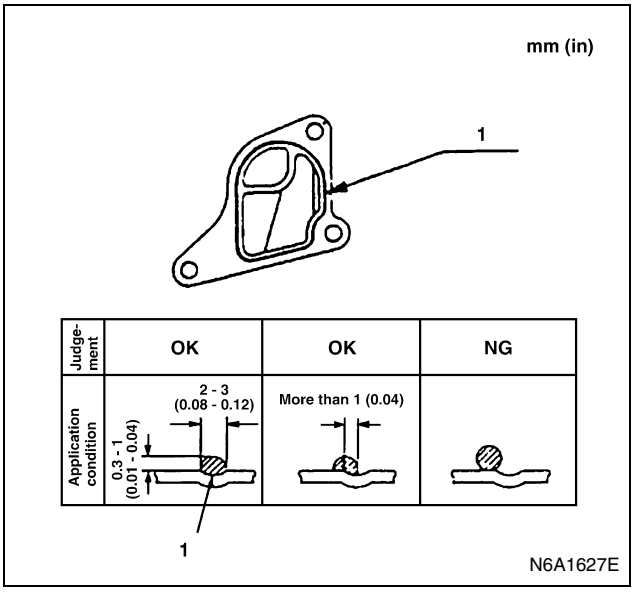
N6A0320E

37. Water Suction Pipe
    1) Apply a 2 — 3 mm (0.12 — 0.16 in) bead of the recommended liquid gasket (Three Bond

1207C) or its equivalent on the groove of the water suction pipe fitting surface.

2) Install the water suction pipe to the oil cooler.

- For the dislocation of liquid gasket, refer to the illustration.



Legend

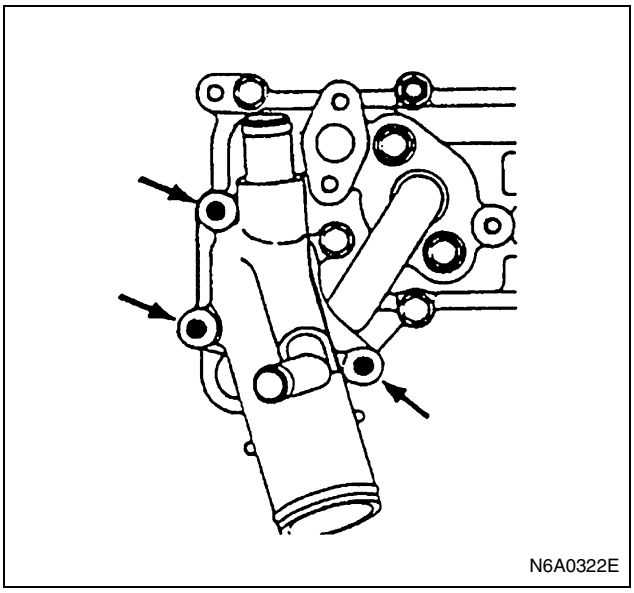
1. Liquid gasket

Tighten:

Water suction pipe bolt and nuts to 24 N·m (2.4 kg·m/17 lb·ft)

Notice:

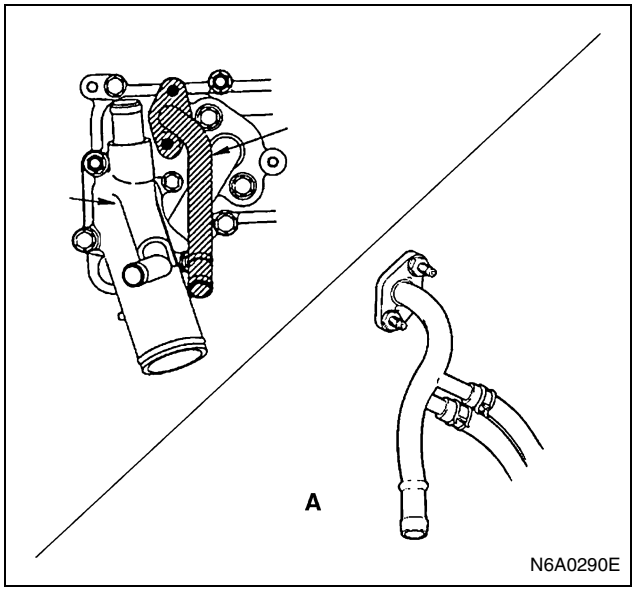
Install the water suction pipe immediately after the installation of the oil cooler.



38. Heater Pipe
    1) Install the O-ring to the heater pipe.
    2) Install the heater pipe to the oil cooler.

Tighten:

Heater pipe bolt to 24 N·m (2.4 kg·m/17 lb·ft)



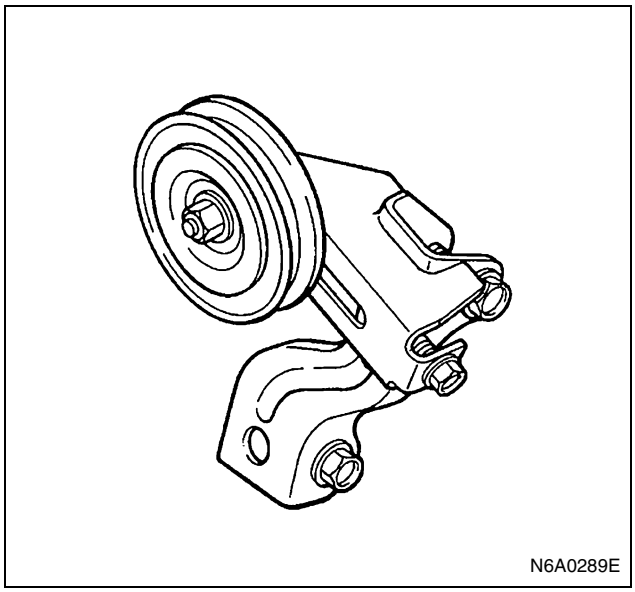
Legend

A. 4HF1-2

39. Idle Pulley Bracket (If equipped with A/C)

Tighten:

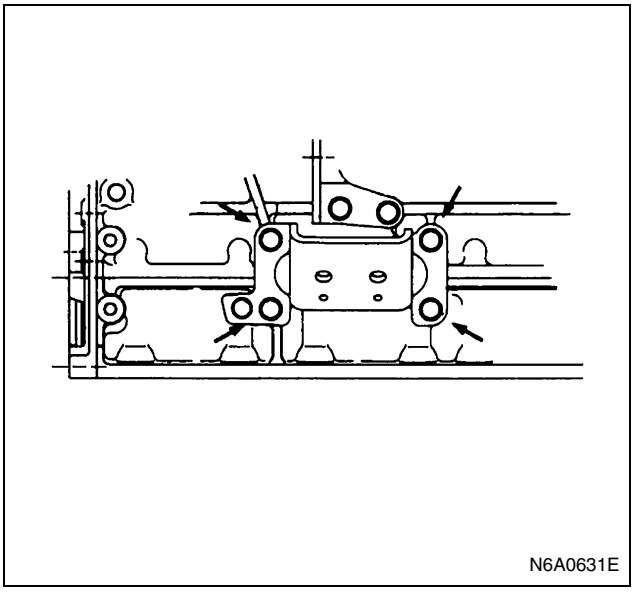
Idle pulley bracket bolt to 48 N·m (4.9 kg·m/35 lb·ft)



40. Injection Pump Rubber Spacer
41. Injection Pump Assembly
    Above works refer to “INJECTION PUMP ASSEMBLY” section in this manual.
42. Engine Foot

Tighten:

Engine foot bolt to 51 N·m (5.2 kg·m/38 lb·ft)

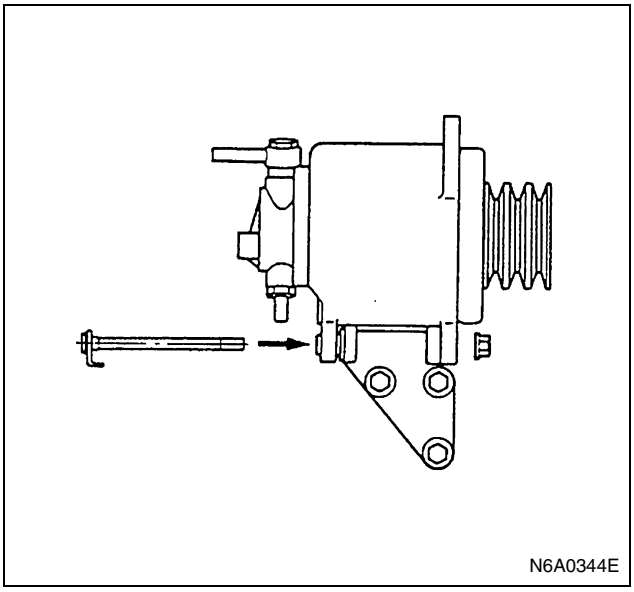


N6A0631E

43. Generator

Notice:
When tightening the generator, tighten in advance the fan belt temporarily after its adjustment.

- Insert through the lower fixing bolt from the rear side as shown in the illustration, and tighten it with a nut on the front side.



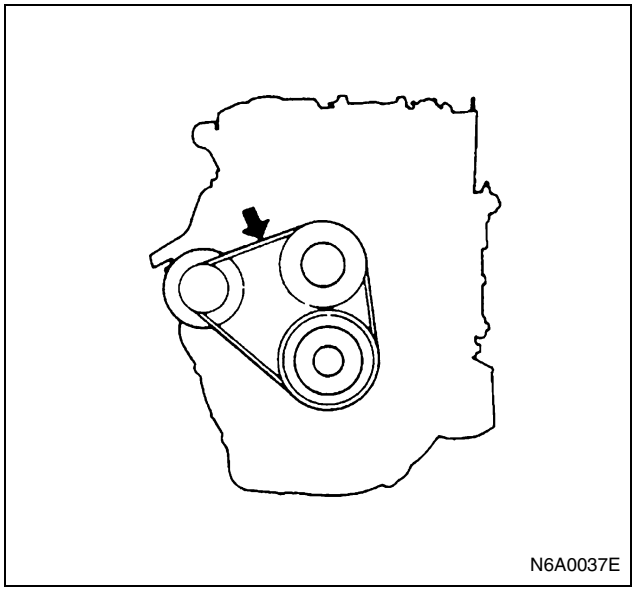
N6A0344E

44. Fan Belt
Check the drive belt tension.

Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
8 — 12 (0.31 — 0.47) ... New belt 10 — 14 (0.39 — 0.55) ... Reuse belt	

Check the drive belt for cranking and other damage.



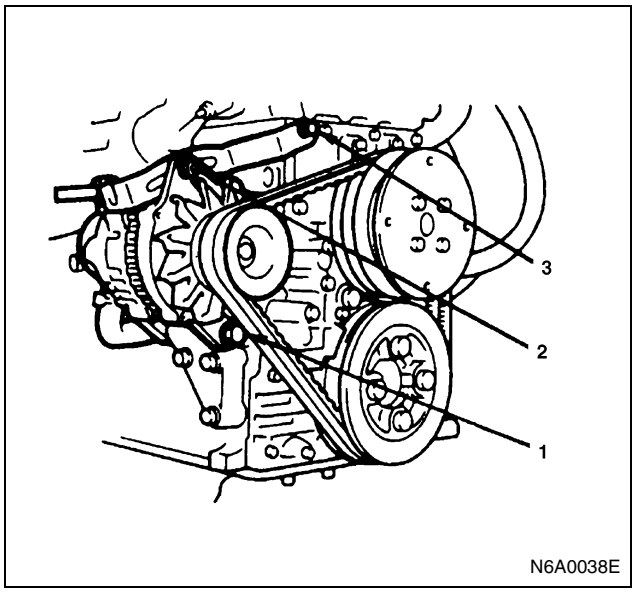
N6A0037E

Fan Belt Adjustment

Fan belt tension is adjusted by moving the generator.

Tighten:
Bolt to

- (1): 40 N·m (4.1 kg·m/30 lb·ft)
- (2): 24 N·m (2.4 kg·m/17 lb·ft)
- (3): 46 N·m (4.7 kg·m/34 lb·ft)

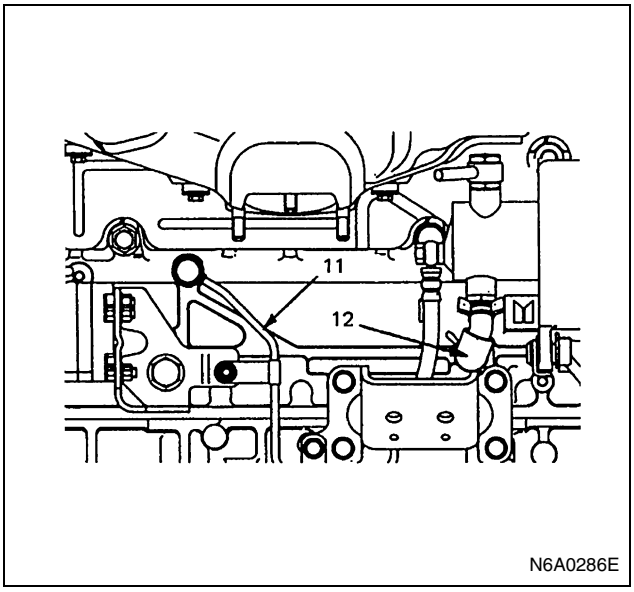


N6A0038E

45. Vacuum Pump Rubber Hose (12)
46. Vacuum Pump Oil Pipe (11)

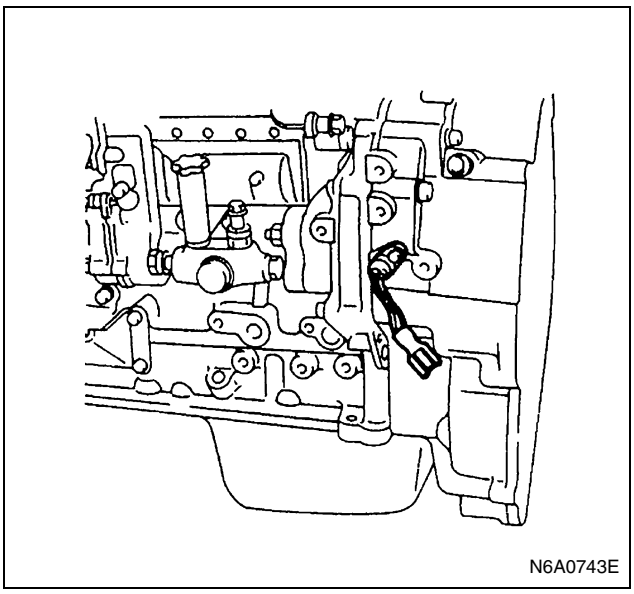
Tighten:
Vacuum pump oil pipe to

- Cylinder body side: 41 N·m (4.2 kg·m/30 lb·ft)
- Generator side: 23 N·m (2.3 kg·m/17 lb·ft)



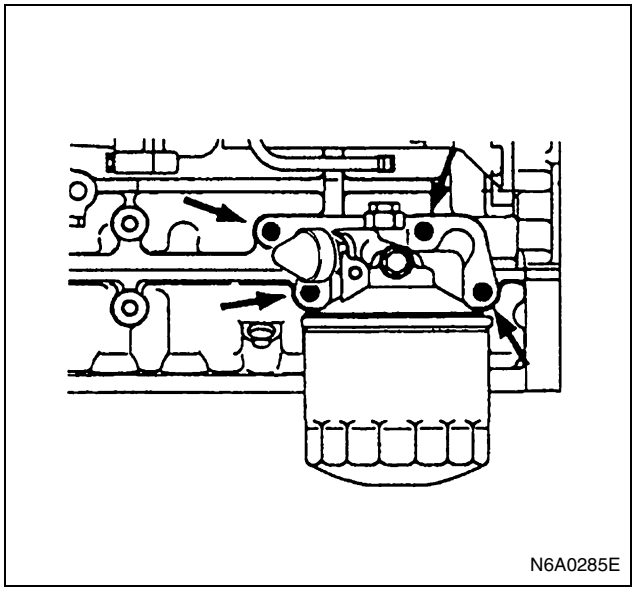
47. Fuel Pipe Bracket
48. Tachometer Sensor

Tighten:
Tachometer bolt to 8 N·m (0.8 kg·m/69 lb·in)



49. Oil Filter Assembly

Tighten:
Oil filter bolt to 8 N·m (4.9 kg·m/35 lb·ft)



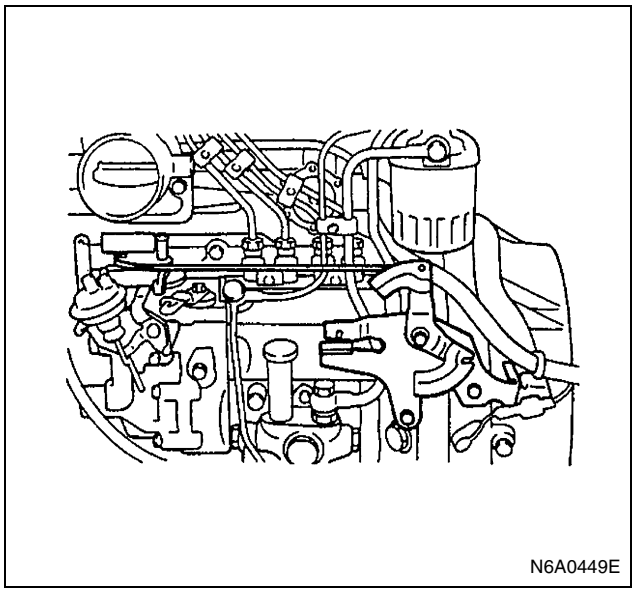
50. Oil Pipe

Tighten:
Oil pipe joint bolt to 17 N·m (1.7 kg·m/12 lb·ft)

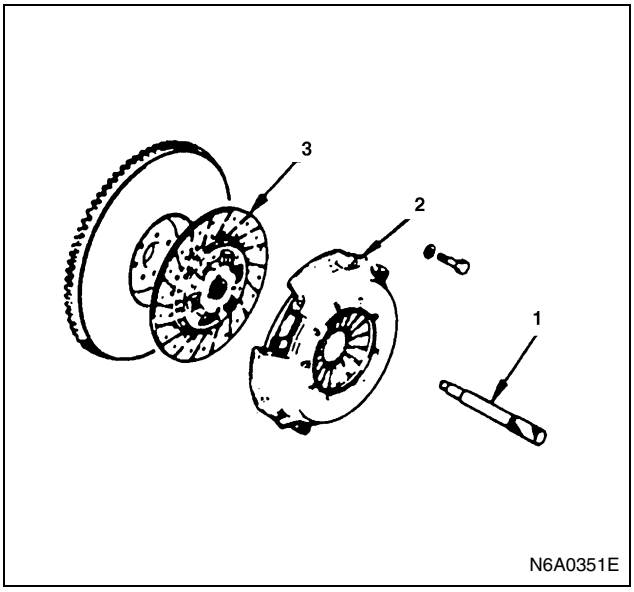
51. Engine Control Lever Assembly

Tighten:
Engine control lever bolt to 24 N·m (2.4 kg·m/17 lb·ft)

52. Engine Control Wire



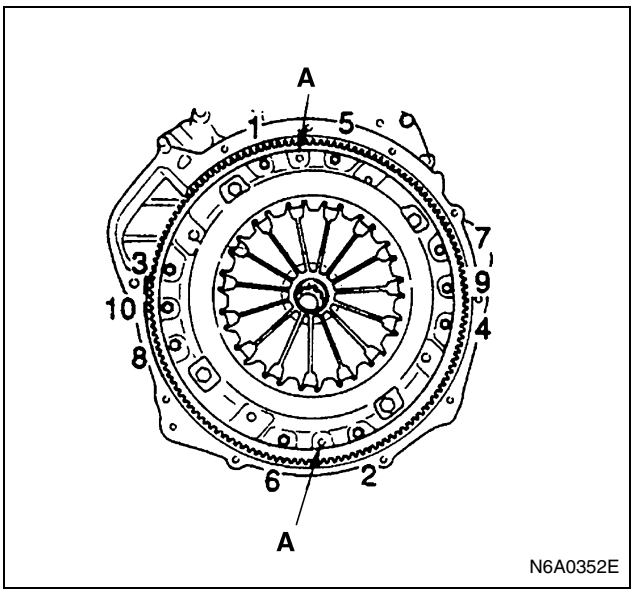
53. Driven Plate
    Use the clutch pilot aligner to install the driven plate.
    Clutch Pilot Aligner: 5-8840-2240-0



Legend
1. Clutch pilot aligner
2. Clutch pressure plate assembly
3. Driven plate

54. Clutch Pressure Plate Assembly
    1) Align the clutch pressure plate with the flywheel knock pin.
    2) Tighten the pressure plate bolts to the specified torque in numerical order.

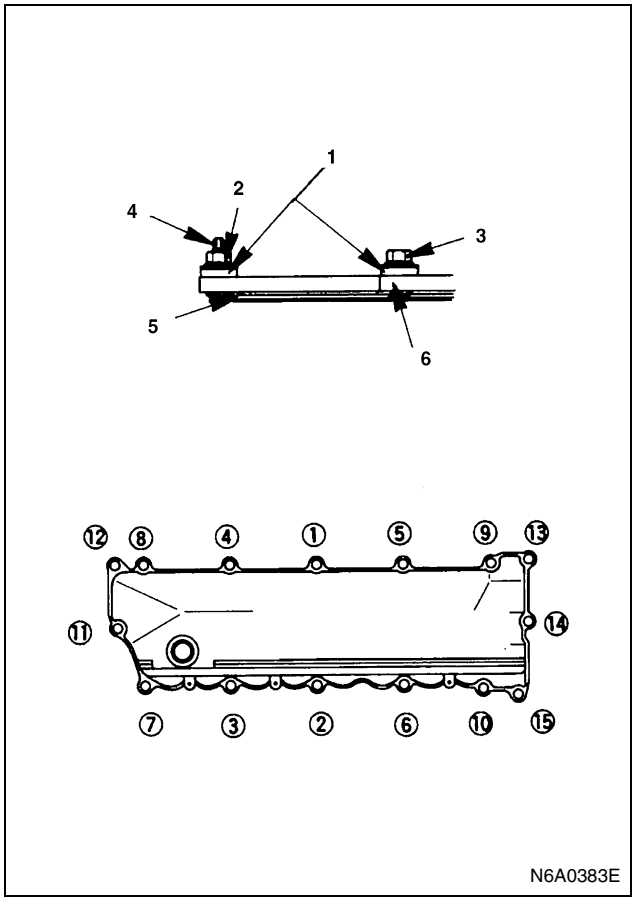
Tighten:
Clutch pressure plate bolt to 40 N·m (4.1 kg·m/30 lb·ft)



Legend
A. Knock pin

55. Cylinder Head Gasket
56. Cylinder Head Assembly
    Above works refer to “CYLINDER HEAD” section in this manual.
57. Camshaft Bearing Lower
58. Camshaft Assembly
59. Camshaft Bearing Upper
60. Camshaft Bearing Cap
61. Valve Cap
    Above works refer to “CAMSHAFT ASSEMBLY” section in this manual.
62. Rocker Arm Shaft Assembly
    Above works refer to “ROCKER ARM SHAFT ASSEMBLY” section in this manual.
63. Head Cover Gasket
    Above works refer to “CYLINDER HEAD” section in this manual.
64. Cylinder Head Cover
    1) Install the cylinder head cover.
    2) Tighten the cylinder head cover nuts and bolts to the specified torque in the numerical order shown in the illustration.

Tighten:
Cylinder head cover nut and bolt to 18 N·m (1.8 kg·m/13 lb·ft)



Legend

1. Mounting rubber
2. Nut
3. Bolt
4. Stud bolt
5. Gasket
6. Head cover

65. Nozzle Cover
66. Engine Assembly
    Above works refer to “ENGINE ASSEMBLY” section in this manual.

1. Engine mount
2. Engine assembly

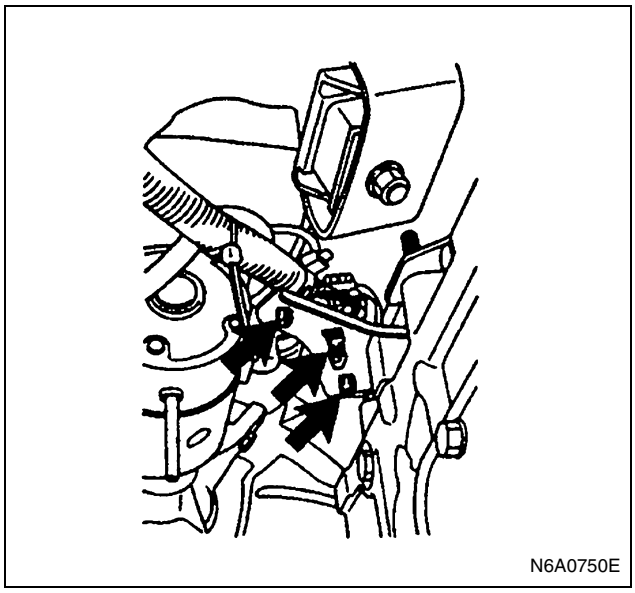
Removal

Preparation

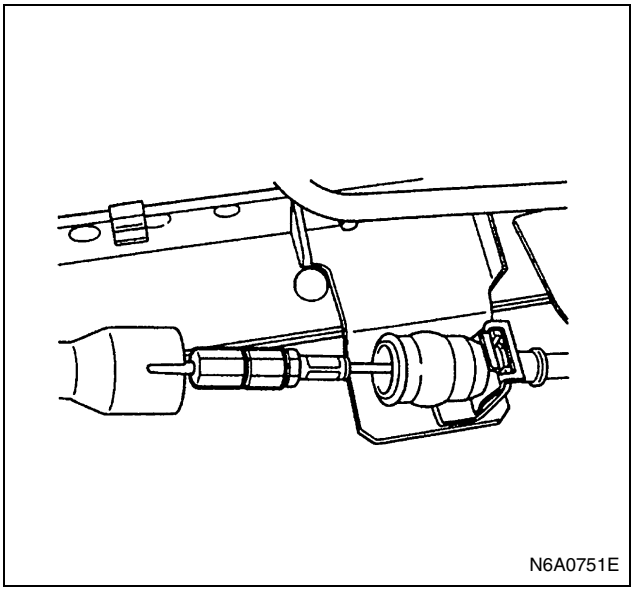
- Disconnect battery ground cable
- Tilt the cab
- Remove the transmission panel
- Drain coolant

Transmission Side

1. Propeller shaft Assembly
   1) Put in advance an alignment mark to the drum and the flange yoke.
   2) Put the drum and the flange yoke aside and hang them with a wire so that they do not interfere with servicing work.
2. Car Speed Sensor Connector
3. Neutral Switch Connector
4. Back-up Lamp Connector
5. Harness Connector
   Remove the connectors from the harness bracket. At that time, take care not to cause any damages to the clips.

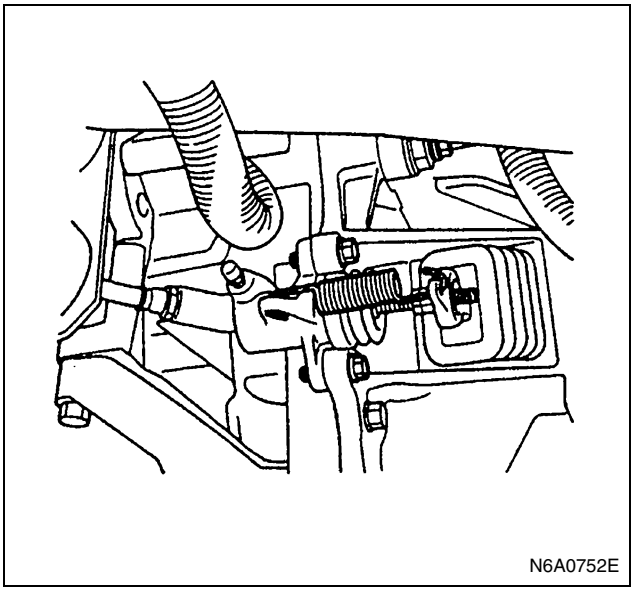


6. Parking Brake Cable
   Remove the clip and slide the cover provided in the middle of the cable. Then, loosen the longer nut on the front side of the vehicle to disconnect the parking brake cable.



N6A0751E

7. Shift Cable
8. Select Cable
9. Clutch Slave Cylinder
   1) Disconnect the clutch return spring from the clutch slave cylinder.
   2) Remove the slave cylinder from the clutch shift fork.



N6A0752E

10. Starter Earth Cable
11. Starter
    1) Disconnect the battery cable at the starter motor.
    2) Remove the starter assembly from flywheel housing.
12. Transmission Mounting Nut
    1) Check that the engine lifting is securely supporting the engine.
    2) Remove the engine rear mounting bracket nuts from the No.3 crossmember.
13. Transmission Assembly

    Remove the transmission nuts and bolts from the flywheel housing.

    • Remove the transmission by pulling it toward the rear of the vehicle while slowly lowering the transmission jack.

Engine Left Side

1. Intake Air Duct
2. Heater Hose
3. Vacuum Hose
4. Engine Stop Cable
   Loosen locking nut at bracket and disconnect engine stop cable from injection pump stop lever.
5. Accelerator Control Cable
   Loosen locking nut at bracket and disconnect accelerator control cable from injection pump control lever.
6. Fuel Return Hose
7. Fuel Feed Hose
   Disconnect fuel hose from injection pump side and take care not to spill and enter dust.

Engine Front Side

1. Radiator Upper Hose
2. Coolant Reserve Tank Hose/Bypass Hose
3. Radiator Lower Hose
4. Fan Guide
5. Radiator
6. Fan

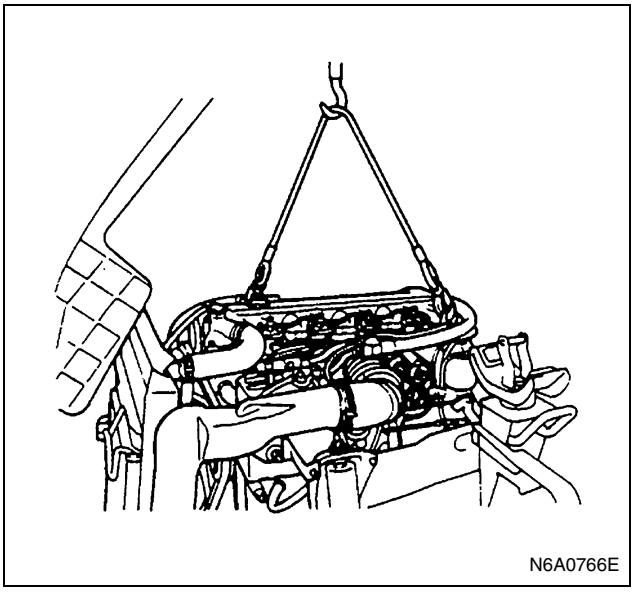
Engine Right Side

1. Front Exhaust Pipe
2. Power Steering Pump
   Remove the power steering pump from the engine side with the bracket attached, and fasten it with a wire to the appropriate location, together with the hoses.
3. Air Conditioning (A/C) Compressor (If equipped with A/C)
   1) Remove the A/C compressor drive belt.
   2) Dismount the compressor from the A/C compressor bracket, and fasten it with a wire to the appropriate location, together with the hoses.
4. ACG Vacuum Hose
   Disconnect the vacuum hoses from vacuum pump side.
5. ACG Harness
   Disconnect the B terminal cable and harness connector from generator.

Engine Mounting Side

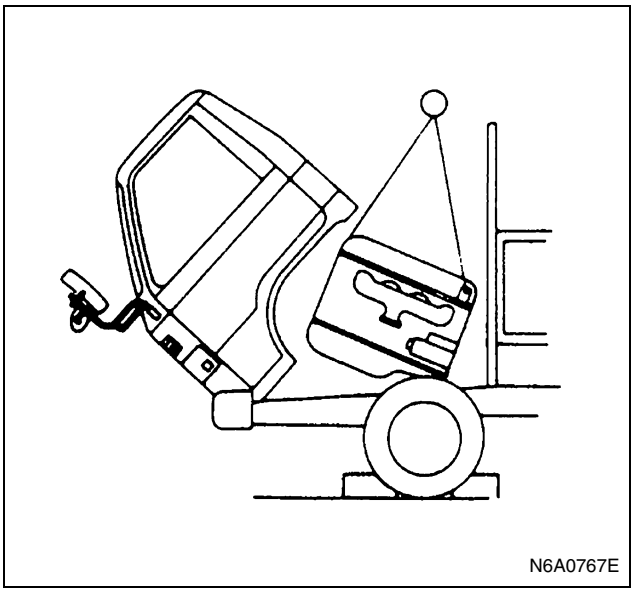
1. Engine Mount
   Attach lifting wires to the engine lifting hangers and slightly raise the engine.

   Remove the engine mounting rubber nuts attaching the engine mounting crossmembers.



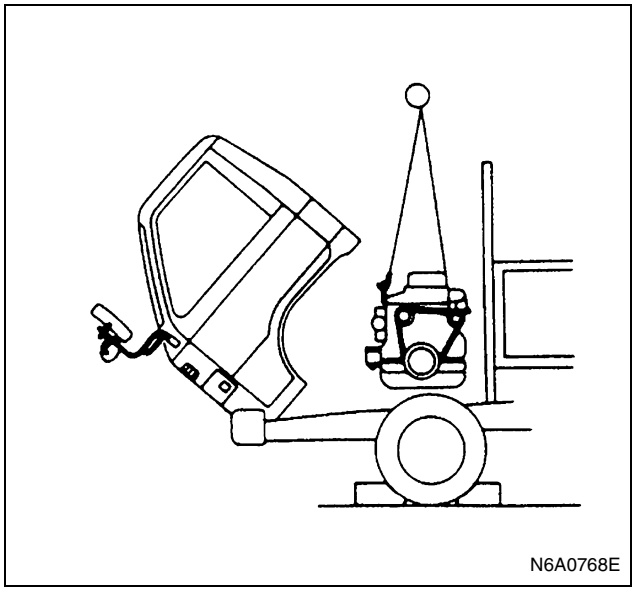
N6A0766E

2. Engine Assembly
   1) Make sure that the connecting pipes, hoses, and cables have all been removed from the engine.
   2) Operate the hoist to slowly raise the engine until it is clear of the chassis frame.



N6A0767E

   3) Rotate the engine 90 degrees.
   4) Continue to lift the engine from the chassis.
   5) Carefully move the hoist and engine.
   6) Set the engine on an engine stand.

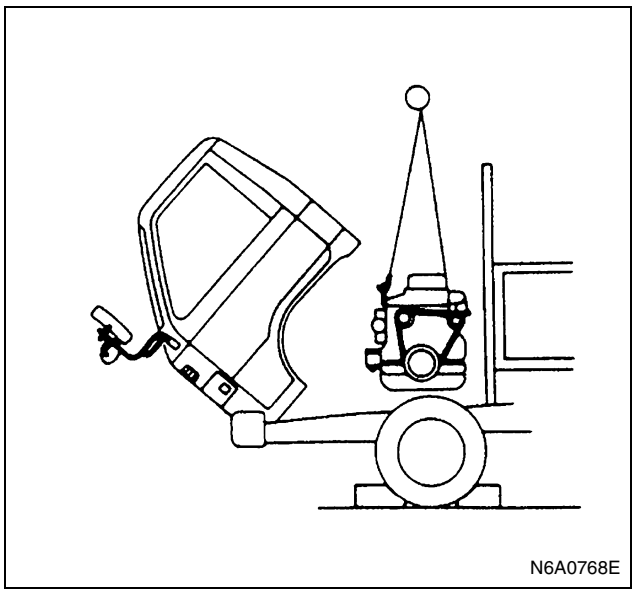


N6A0768E

Installation

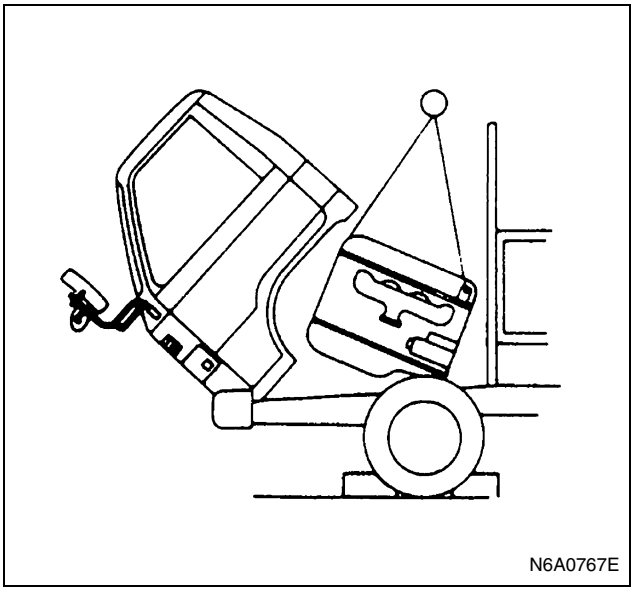
Engine Mounting Side

1. Engine Assembly
   1) Attach a lifting wire to the engine lifting hangers.
   2) Operate the hoist to position the engine above the chassis frame.
   3) Carefully lower the engine until it is just above the chassis frame.



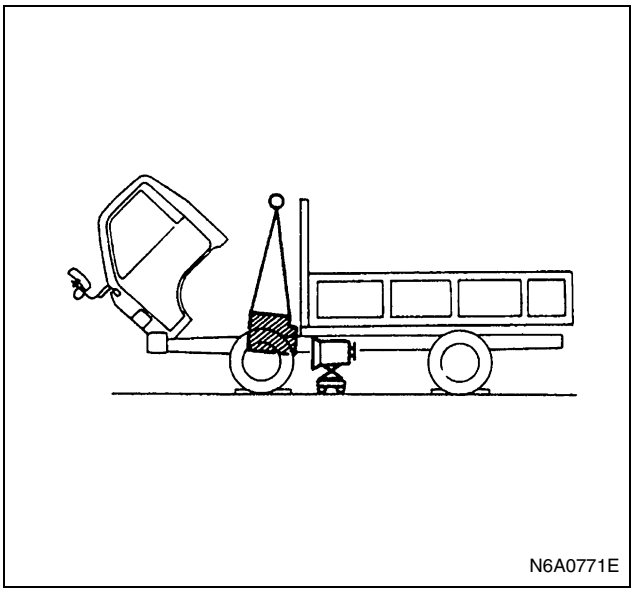
N6A0768E

   4) Rotate the engine 90° to position it for final installation.
   5) Carefully set the engine to the chassis.
      The front of the engine should be held higher than the rear at this time.
      Be careful not to damage the exposed parts.



N6A0767E

6) Lower the engine until it contacts the engine mounting crossmember.
7) Set the engine mounting rubbers to the engine mounting crossmember.
8) Temporarily tighten the engine mounting rubber bolts.
The bolts will be finally tightened after the transmission has been installed to the engine and the engine rear mounting bracket and the No.3 crossmember connected.



N6A0771E

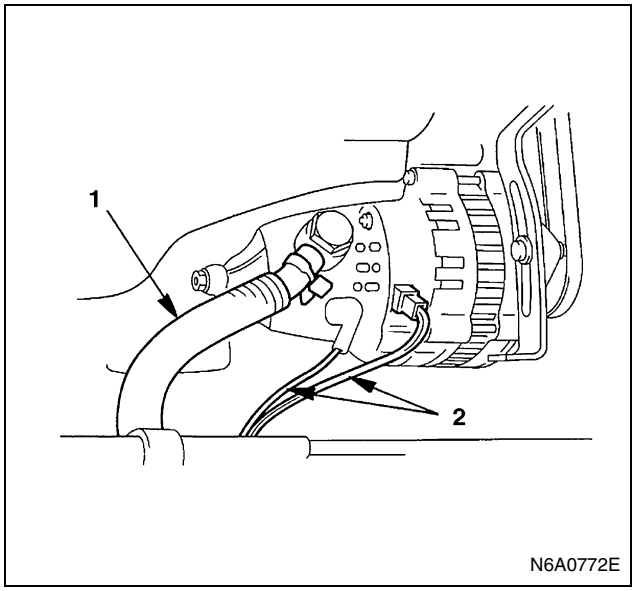
2. Engine Mount
Install the engine mount with it set to the holes of the engine mount crossmember. Then tighten it to the specified torque.

Tighten:
Mounting rubber nut to 48 N·m (4.9 kg·m/35 lb·ft)

Engine Right Side

1. ACG Harness
2. ACG Vacuum Hose

1) Connect the B terminal cable and the harness connector.
2) Connect the vacuum hoses to the vacuum pump.



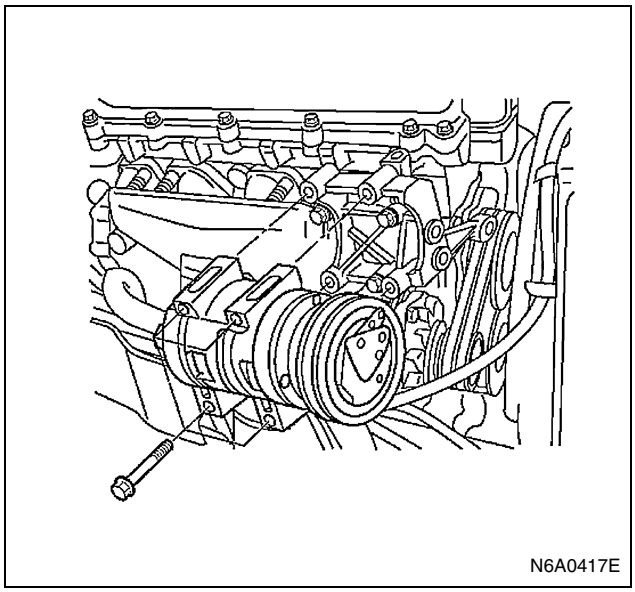
N6A0772E

Legend
1. ACG vacuum hose
2. ACG harness

3. Air Conditioning (A/C) Compressor
   • Tighten the fixing bolts to the specified torque.

Tighten:
A/C compressor bolt to 48 N·m (4.9 kg·m/35 lb·ft)

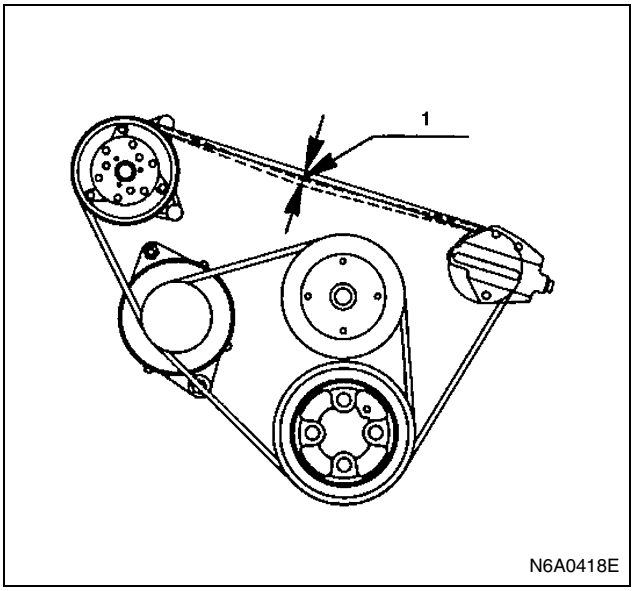
Notice:
When tightening the compressor fixing bolts, tighten the first 2 bolts on the rear side, and then the remaining 2 on the front.



N6A0417E

- Install the drive belt adjust belt tension by adjusting bolt and tighten the locking nut to the specified torque.
- Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
16 — 20 (0.63 — 0.79) ... New belt 18 — 22 (0.71 — 0.87) ... Reuse belt	



Legend

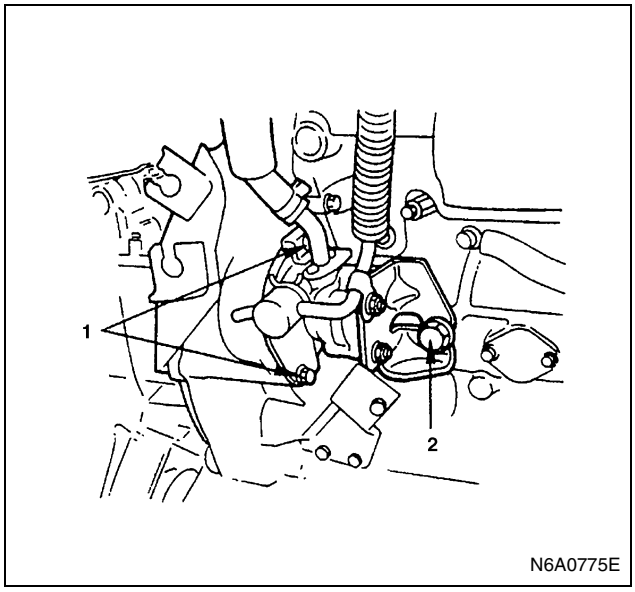
1. Belt deflection

Tighten:
Locking nut to 27 N·m (2.8 kg·m/20 lb·ft)

4. Power Steering Pump

Tighten:
Bolt to

- (1): 43 N·m (4.4 kg·m/32 lb·ft)
- (2): 44 N·m (4.5 kg·m/33 lb·ft)



5. Front Exhaust Pipe

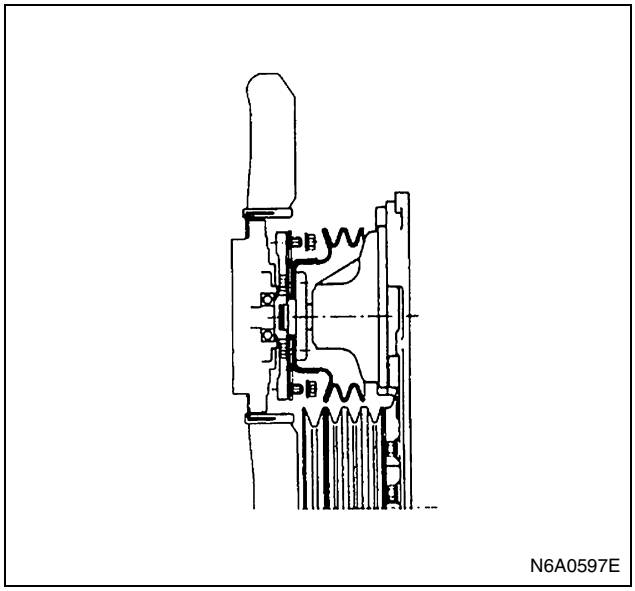
Tighten:
Front exhaust pipe to

- Exhaust manifold side: 67 N·m (6.8 kg·m/49 lb·ft)
- Exhaust brake side: 17 N·m (1.7 kg·m/12 lb·ft)
- Cylinder body side: 17 N·m (1.7 kg·m/12 lb·ft)

Engine Front Side

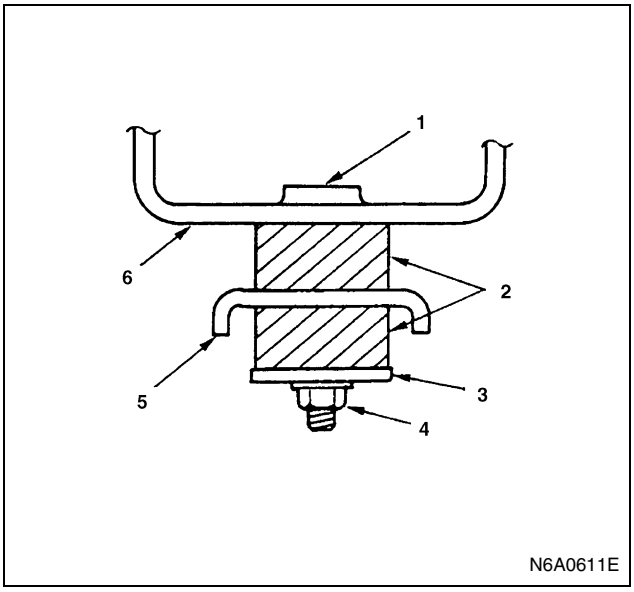
1. Fan

Tighten:
Fan bolt to 24 N·m (2.4 kg·m/17 lb·ft)



2. Radiator

Tighten:
Radiator bracket bolt to 55 N·m (5.6 kg·m/41 lb·ft)



Legend

1. Stud bolt
2. Rubber
3. Washer
4. Flange nut
5. Flame side bracket
6. Radiator side bracket

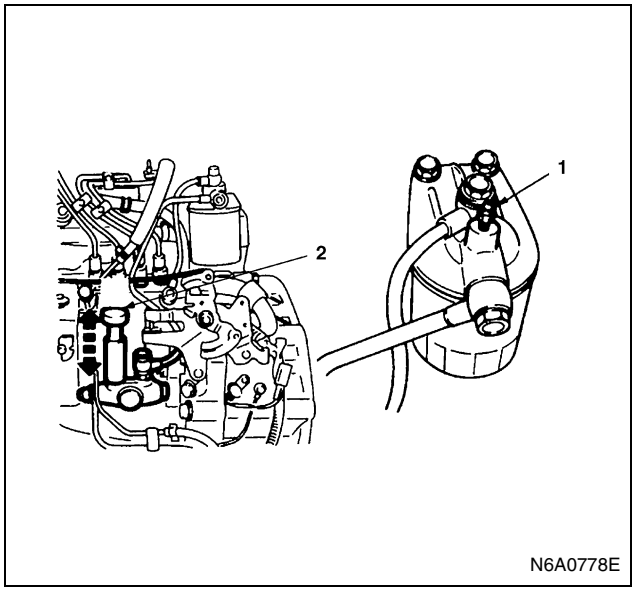
3. Fan Guide
4. Radiator Lower Hose
5. Coolant Reserve Tank Hose/Bypass Hose
6. Radiator Upper Hose

Engine Left Side

1. Fuel Feed Hose
2. Fuel Return Hose

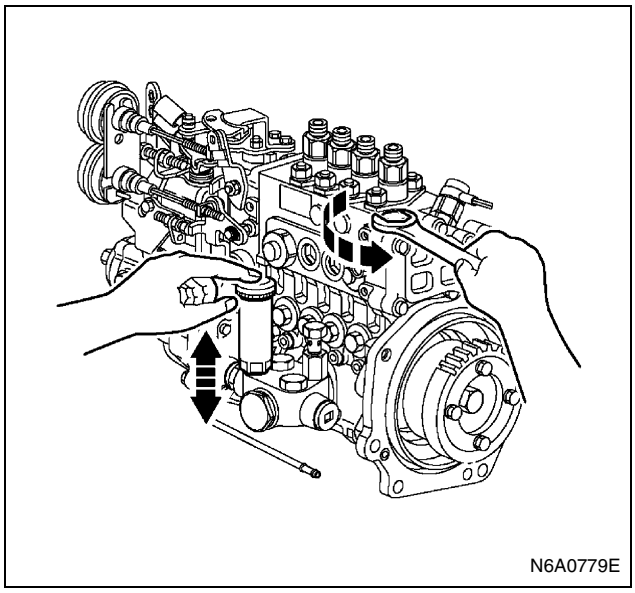
Air Bleeding

1) Loosen the priming pump cap (2) at the side of the injection pump.
2) Loosen the bleeder valve (1) (4HF1) at the top of the fuel filter.

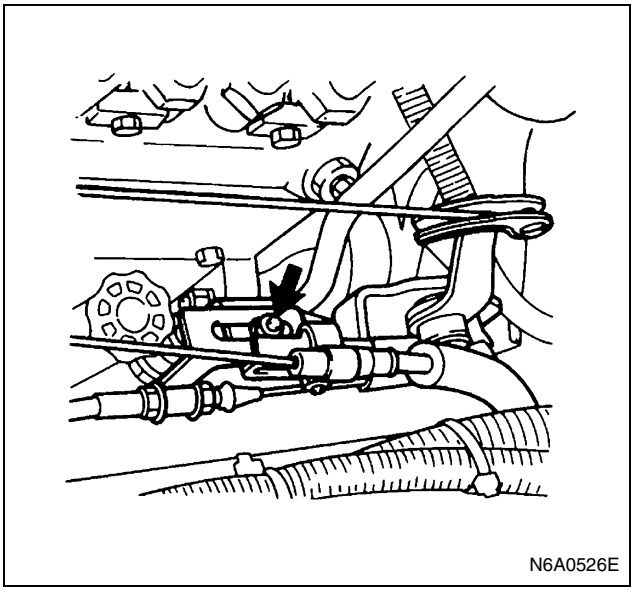


3) Operate the priming pump to bleed the air from the injection pump.
4) Retighten the bleeder valve.
5) Operate the priming pump.
   Check for fuel leakage from around the injection pump and the fuel filter.
6) Lock the priming pump cap to the injection pump.

For 4HE1-TC



3. Accelerator Control Cable
   1) Check to see if the idling control knob is turned to the extreme left.
   2) Attach the end tip of the cable to the engine control lever.
   3) Pull the outer cable toward the front of the vehicle, and provide the engine control wire and the inner cable with an appropriate play before fastening the clamp with a nut.



N6A0526E

For 4HE1-TC

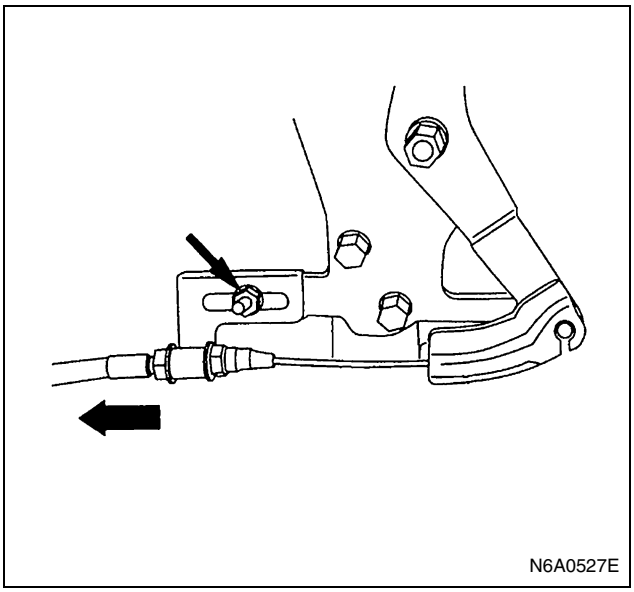
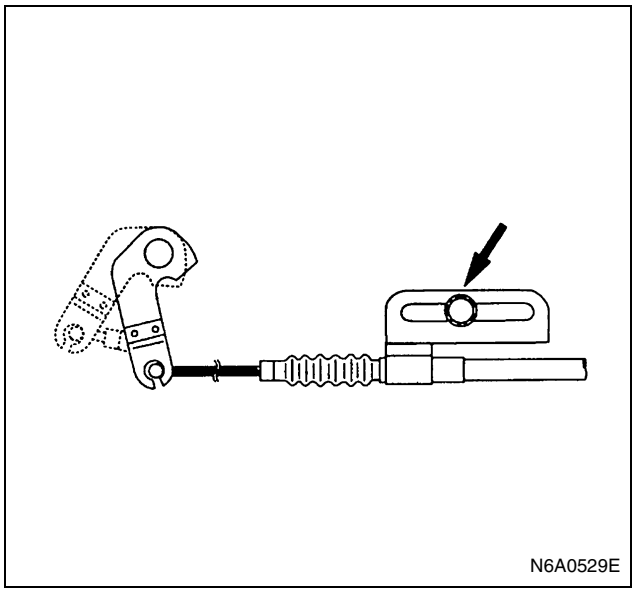
For 4HE1-TC



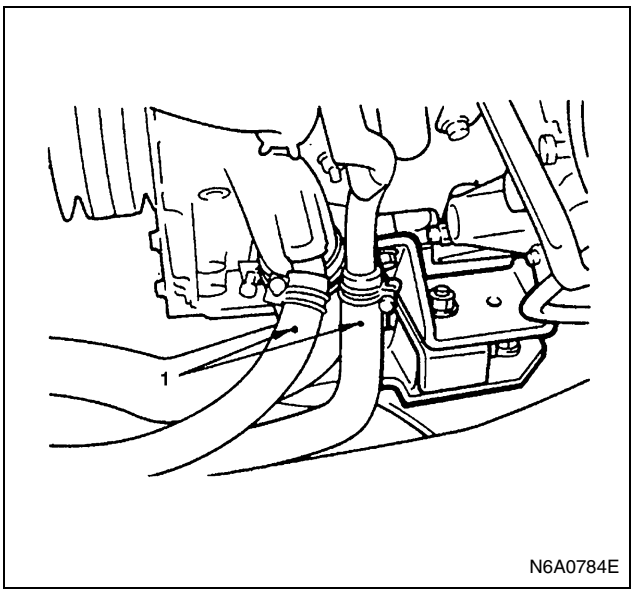
N6A0527E



N6A0529E

4) Check to see if the control lever of the injection pump is at the idle position (with the lever in touch with the stopper bolt).

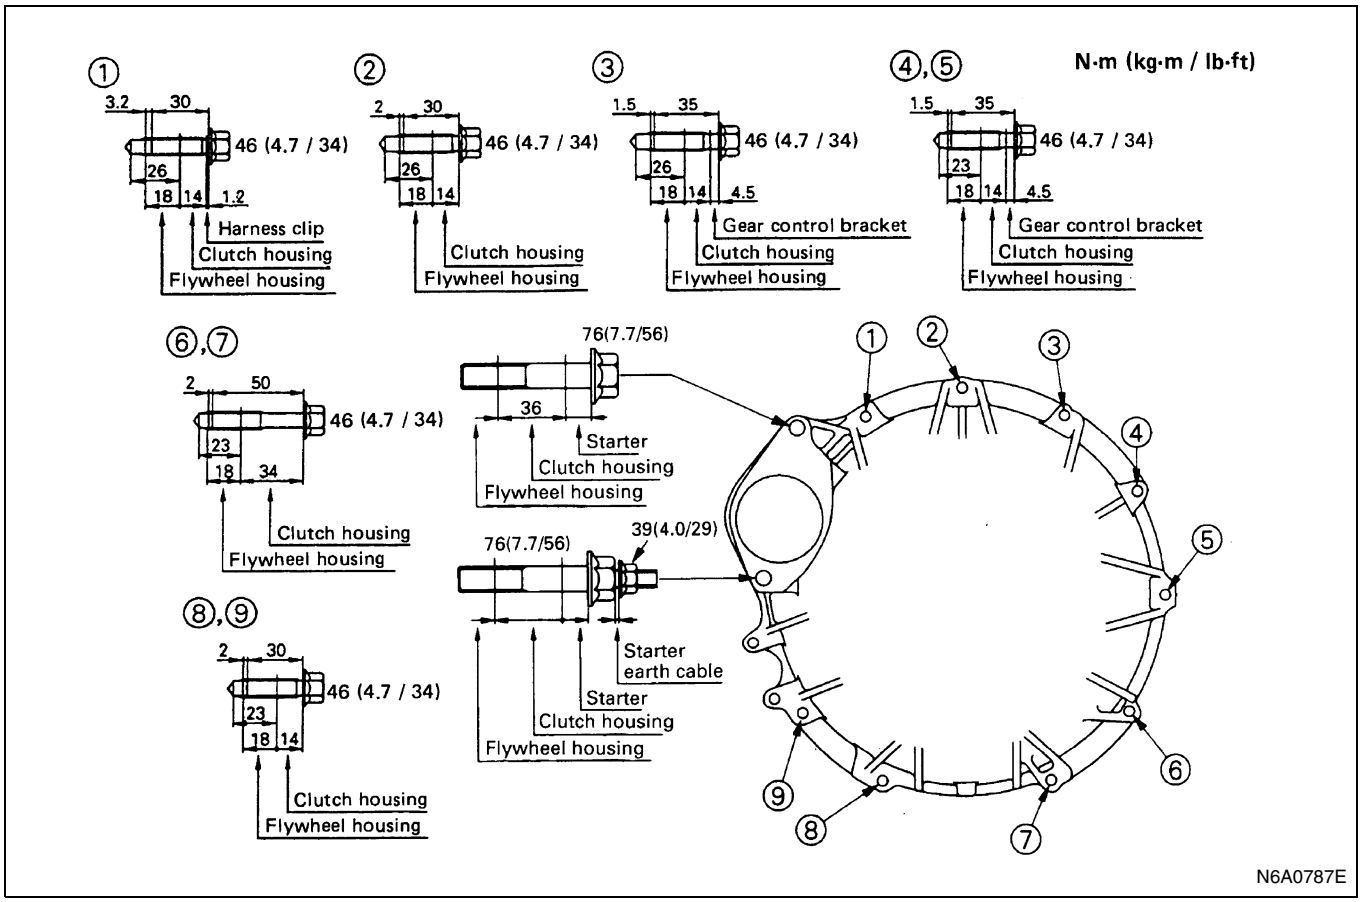
4. Engine Stop Cable
   1) Attach the end tip of the cable to the engine stopper lever.
   2) Pull the cable toward the rear side of the vehicle, and fasten the clamp with a nut at the position where the lever stops.
5. Vacuum Hose
6. Heater Hose
   Install the hose with its mark (1) turned up.



7. Intake Air Duct

Transmission Side

1. Transmission Assembly
   Fasten the transmission to the transmission jack with a chain in the same manner as when dismounting it, and tighten the clutch housing clamping bolt to the specified torque.
   (Refer to the illustration below.)



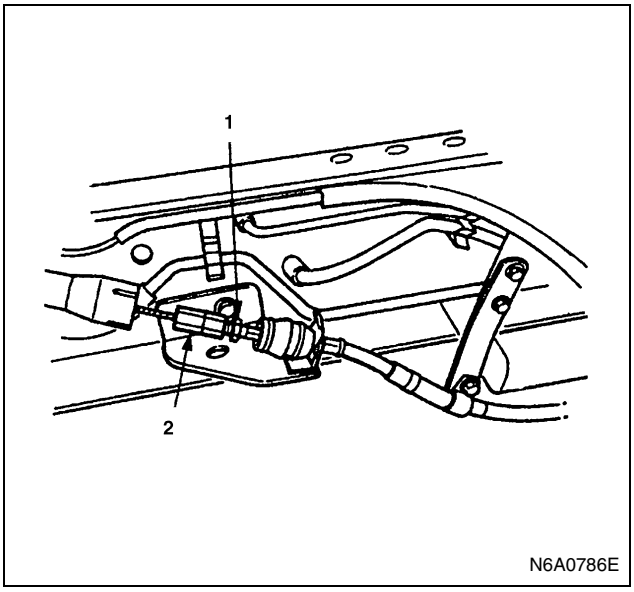
2. Transmission Mounting Nut

Tighten:
Transmission mounting nut to 40 N·m (4.1 kg·m/30 lb·ft)

3. Starter
4. Starter Earth Cable
   Refer to the preceding page.
5. Clutch Slave Cylinder
   1) Install the clutch slave cylinder.

Tighten:
Slave cylinder bolts to 16 N·m (1.6 kg·m/12 lb·ft)

   2) Install the clutch return spring to the clutch shift fork.
6. Select Cable
7. Shift Cable
8. Parking Brake Cable
   1) With the lock nut (1) of the parking brake side cable tightened to the limit, rotate the nut (2) to connect it with the front side cable.
   2) After tightening the front side nut (2) to the limit, fasten the parking brake cable with the lock nut (1).



3) Pull the parking brake lever to the limit (with the operating force of about 147 N (15 kg/33 lb) at the hand), adjust the lever with the lever adjusting nut so that the number of notches becomes 6 to 8 notches.

9. Harness Connector
10. Back-up Lamp Connector
11. Neutral Switch Connector
12. Car Speed Sensor Connector
13. Propeller Shaft Assembly

Tighten:
Propeller shaft bolt to 103 N·m (10.5 kg·m/76 lb·ft)

Engine Warm-Up
After completing the required maintenance procedures, start the engine and allow it to warm up. Then check the following:

1) Engine idling speed
   Refer to “Servicing” for the idling speed adjustment procedure.
2) Engine noise level
3) Engine oil, coolant and fuel leakage
4) Engine control cable operation
5) Clutch engagement
6) Indicator warning light operation

5. Drain cock
6. Cooling fan
7. Water pump
8. Air bleeding
9. Water outlet pipe
10. Thermostat
11. Thermometer unit
12. Water jacket
13. Oil cooler

The engine cooling system consists of the radiator, the water pump, the cooling fan, and the thermostats.

To quickly increase cold engine coolant temperature for smooth engine operation, the coolant is circulated by the water pump and thermostats through the by-pass hose and back to the cylinder body. The coolant does not circulate through the radiator.

When the coolant temperature reaches 82°C (180°F), the thermostat will begin to open and a gradually increasing amount of coolant will circulate through the radiator.

The thermostats will be fully open when the coolant temperature reaches 100°C (212°F). All of the coolant is now circulating through the radiator for effective engine cooling.

Engine coolant change procedure.

1. To change engine coolant, make sure that the engine is cool.

WARNING:
WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

2. Open radiator cap and drain the cooling system by loosening the drain valve on the radiator and on the cylinder body.

Notice:
For best result it is suggested that the engine cooling system be flushed at least once a year.

It is advisable to flash the interior of the cooling system including the radiator before using anti-freeze (ethylene-glycol based).

Replace damaged rubber hoses as the engine anti-freeze coolant is liable to leak out even minor cracks.

Isuzu recommends to use Isuzu genuine anti-freeze (ethylene-glycol based) or equivalent, for the cooling system and not add any inhibitors or additives.

Caution:
A failure to correctly fill the engine cooling system in changing or topping up coolant may sometimes cause the coolant to overflow from the filler neck even before the engine and radiator are completely full.

If the engine runs under this condition, shortage of coolant may possibly result in engine overheating. To avoid such trouble, the following precautions should be taken in filling the system.

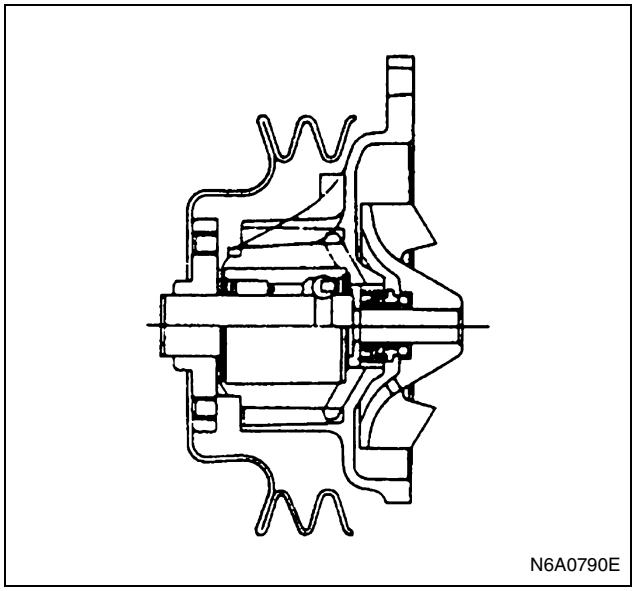
3. To refill engine coolant, pour coolant up to filler neck using a filling hose which is smaller in outside diameter of the filler neck. Otherwise air between the filler neck and the filling hose will block entry, preventing the system from completely filling up.
4. Keep a filling rate of 9 liter/min or less. Filling over this maximum rate may force air inside the engine and radiator.
   And also, the coolant overflow will increase, making it difficult to determine, whether or not the system is completely full.
5. After filling the system to the full, pull out the filling hose and check to see if air trapped in the system is dislodged and the coolant level goes down.
   Should the coolant level go down, repeat topping-up until there is no more drop in the coolant level.
6. After directly filling the radiator, fill the reservoir to the maximum level.
7. Install and tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.

WARNING:
WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

8. After tightening radiator cap, warm up the engine at about 2,000 rpm.
   Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
9. Check to see the thermostat has opened through the needle position of water thermometer, conduct a 5-minute idling again and stop the engine.
10. When the engine has been cooled, check filler neck for water level and replenish if required.
    Should extreme shortage of coolant is found, check the coolant system and reservoir tank hose for leakage.
11. Fill the coolant into the reservoir tank up to “MAX” line.

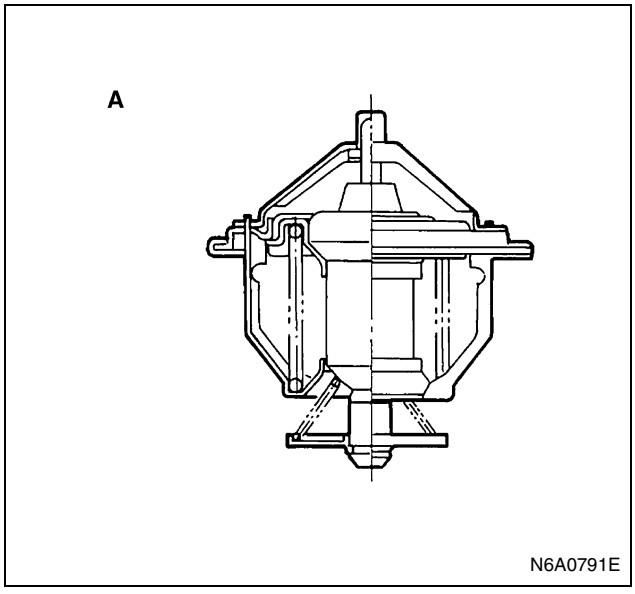
Water Pump

The coolant pump is a centrifugal impeller type and is driven by V type drive belt.

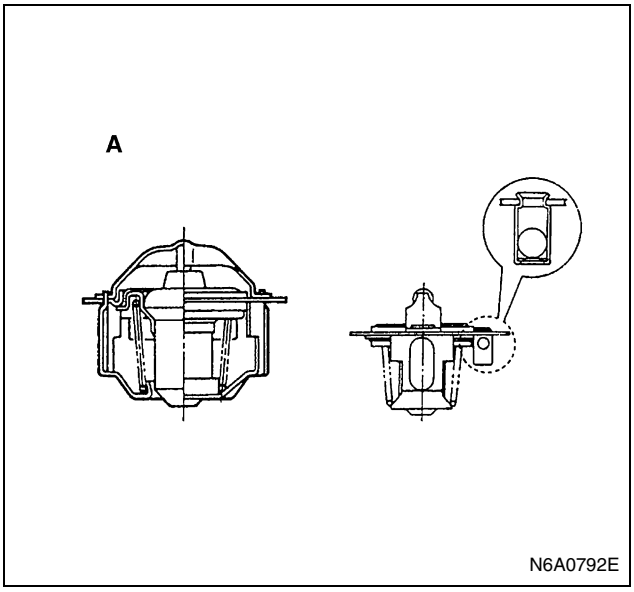


Thermostat

The thermostat is a wax pellet type with a jiggle valve and is installed in the outlet pipe.



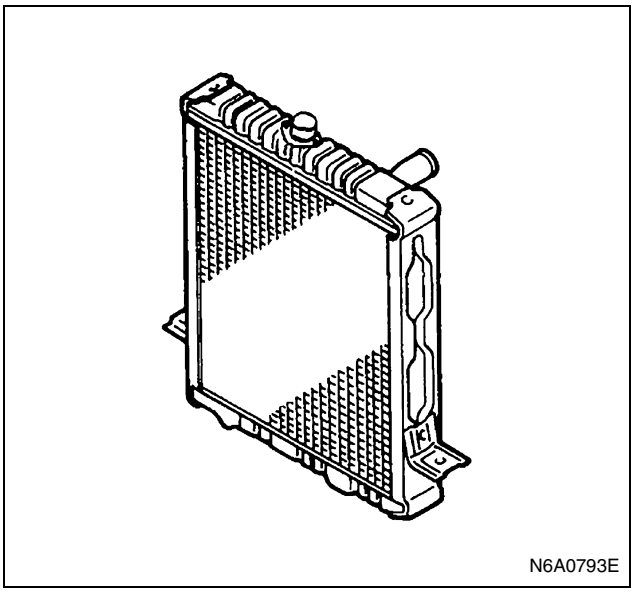
Legend
A. Without jiggle valve



Legend
A. With jiggle valve

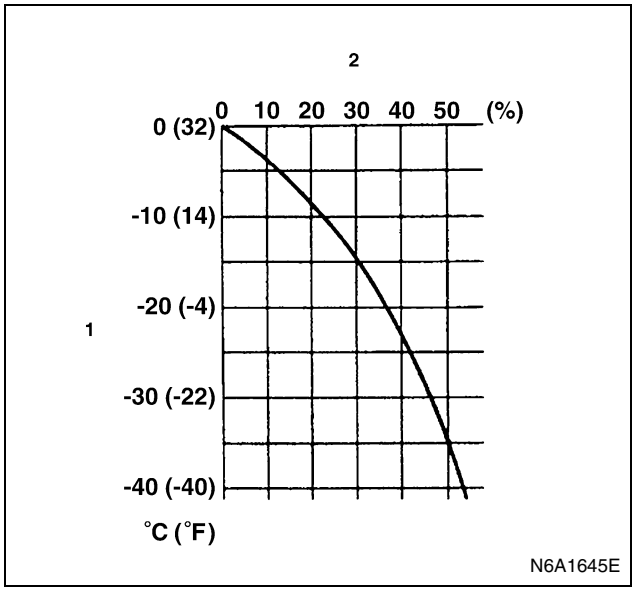
Radiator

The radiator is a tube type with corrugated fins. In order to raise the boiling point of coolant, the radiator is adjusted through a valve fitted to the upper tank to a pressure range of 93 — 123 kPa (0.95 — 1.25 kg/cm^2). The cap fitted to the cylinder head thermostat housing has only a water supply function.



Anti-freeze Solution

- Relation between Mixing ratio and Freezing point
  Freezing temperature of the engine coolant varies with the ratio of anti-freeze solution in water.
  Proper mixing ratio can be determined by referring to the chart. Supplemental inhibitors or additives claiming to increase cooling capability that have not been specifically approved by Isuzu are not recommended for addition to the cooling system.



Legend
1. Freezing point
2. Mixing ratio

- Calculation of mixing ratio

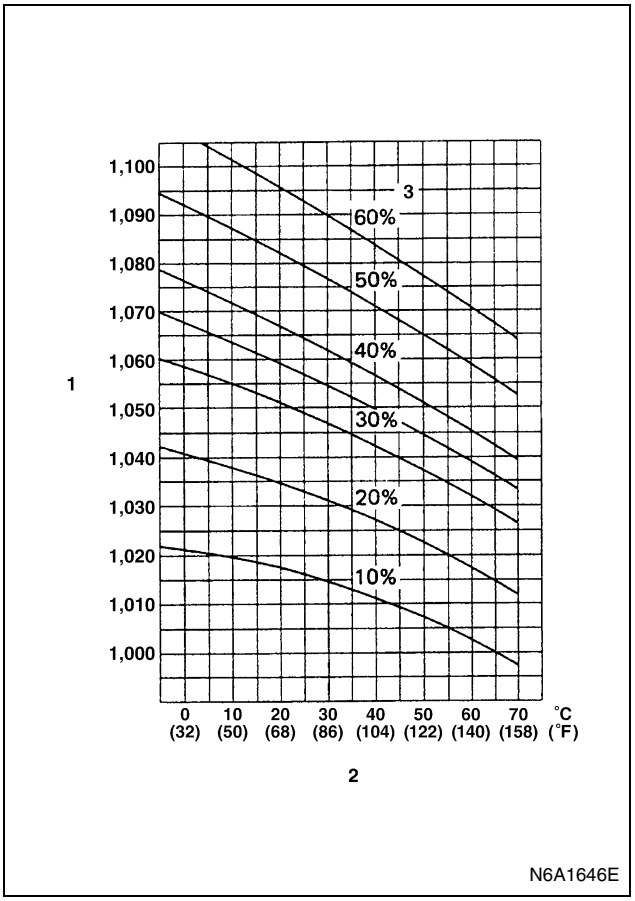
$$\text{Mixing ratio} = \frac{\text{Anti-freeze solution (Lit/qt.)}}{\text{Anti-freeze solution (Lit/qt.) + water (Lit/qt.)}}$$

Notice:
Anti-freeze solution + Water = Total cooling system capacity.

In case of 12 lit (3.17 US gal/2.64 UK gal) total cooling system capacity

Freezing point: °C (°F)	Mixing ratio: %	Anti-freeze solution: L (Imp.qt./U.S.qt)	Water: L (Imp.qt/U.S. qt)
-18 (4)	35	4.2 (4.44/3.70)	7.8 (8.24/6.86)
-25 (-13)	42	5.0 (5.29/4.40)	7.0 (7.40/6.16)
-35 (-31)	50	6.0 (6.34/5.28)	6.0 (6.34/5.28)
-40 (-40)	53	6.4 (6.76/5.63)	5.6 (5.92/4.93)

- Mixing ratio
  Check the specific gravity of engine coolant in the cooling system in temperature ranges from 0 — 50°C (32 — 122°F) using a suction type hydrometer, then determine the mixing ratio of the coolant by referring to the table.

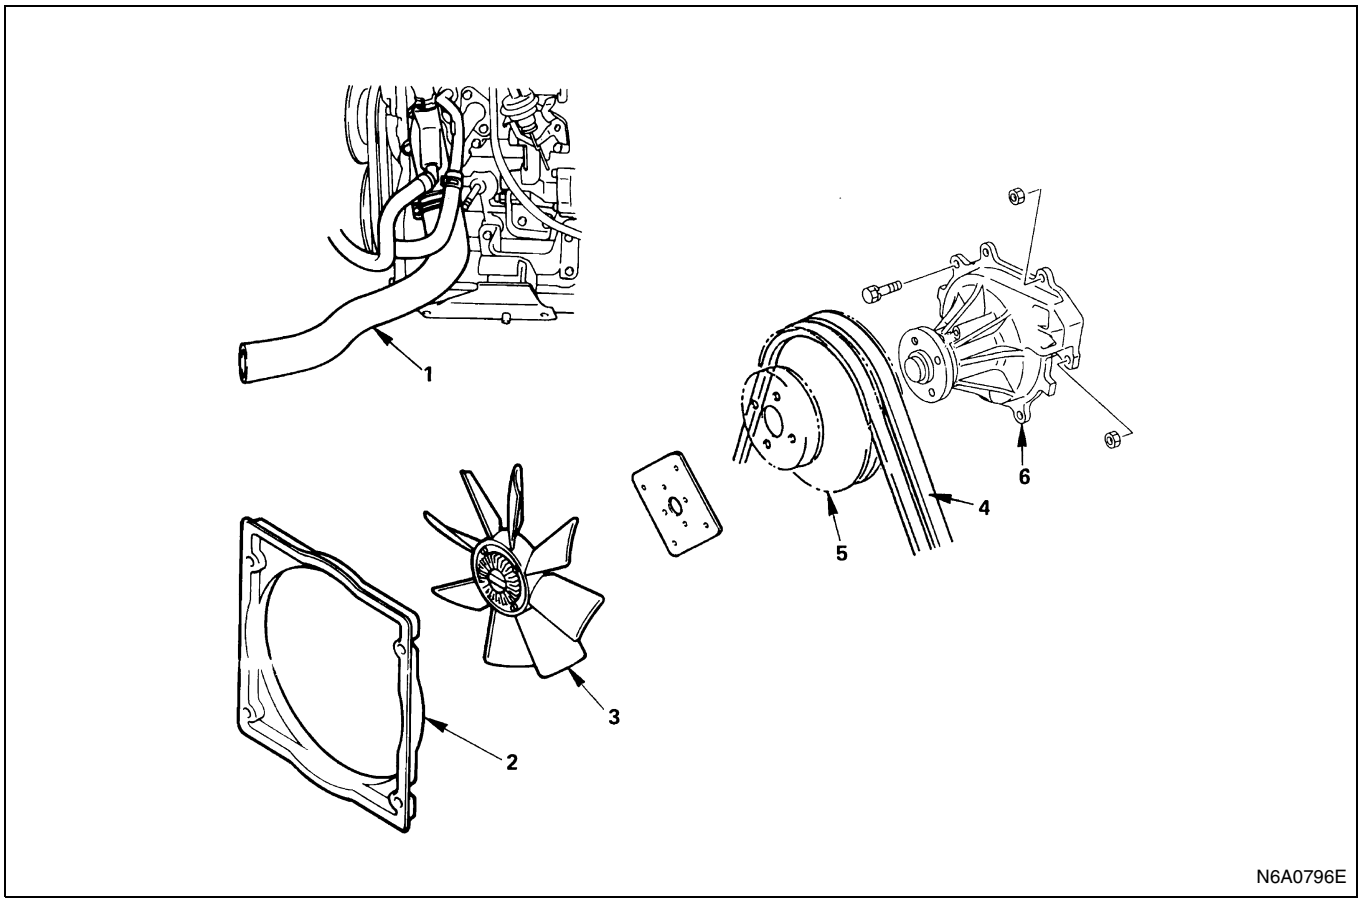


Legend

1. Specific gravity
2. Coolant temperature
3. Mixing ratio

WATER PUMP

Component



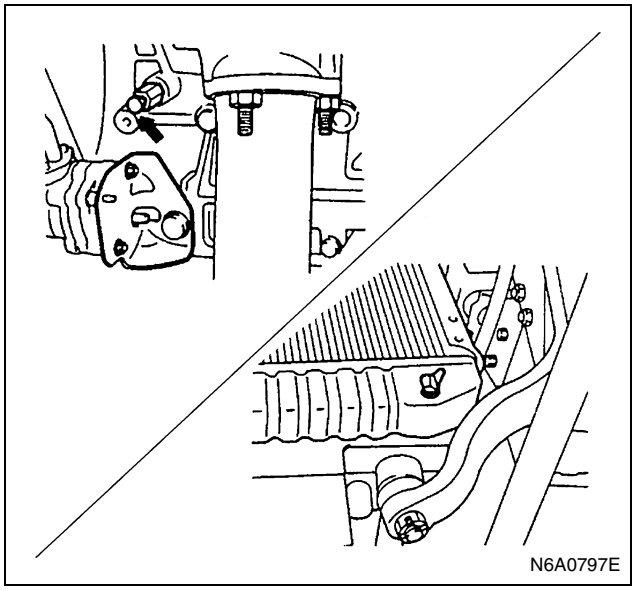
Legend

1. Radiator lower hose
2. Fan guide
3. Fan
4. Fan belt
5. Water pump pulley
6. Water pump assembly

Removal

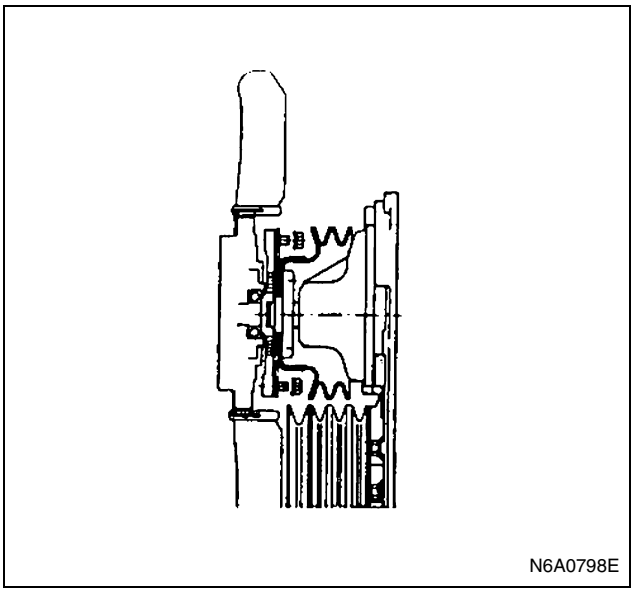
Preparation

- Disconnect battery ground cable.
- Drain coolant.
- Tilt the cab.



1. Radiator Lower Hose
   Disconnect radiator Lower hose from radiator.

2. Fan Guide
3. Fan



N6A0798E

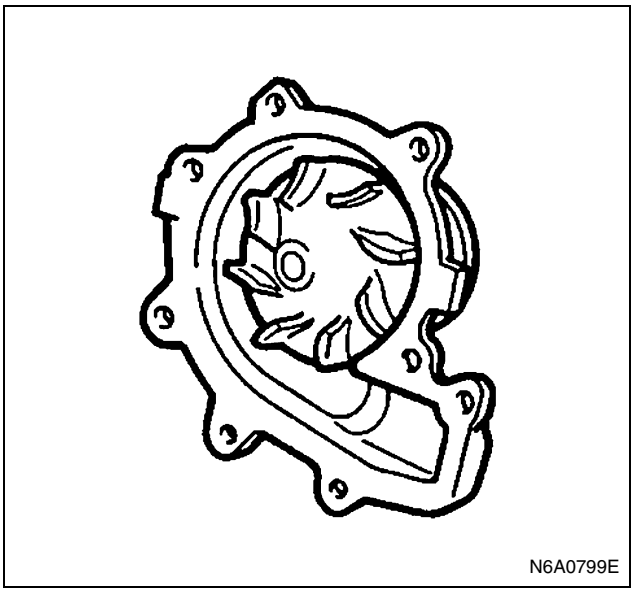
4. Fan Belt
5. Water Pump Pulley
6. Water Pump Assembly

Inspection

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Water Pump Assembly

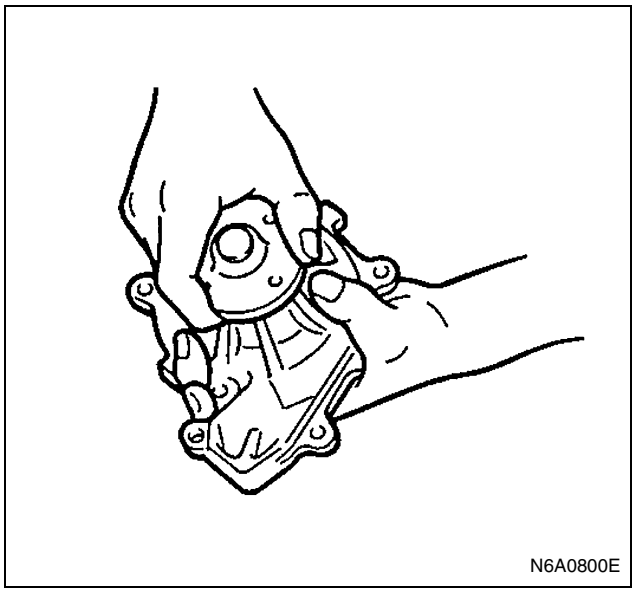
1. Check the pump body for crack and damage.
2. Check the impeller for crack and corrosion.
3. Check the seal unit leakage.
4. If there is any abnormal condition, replace the water pump as an assembly.



N6A0799E

Bearing Unit

1. Rotate the fan center while pushing it toward the radius, and check to see if there is any excessive play or noise.
2. When there is any excessive play or noise found, replace it as a water pump assembly.



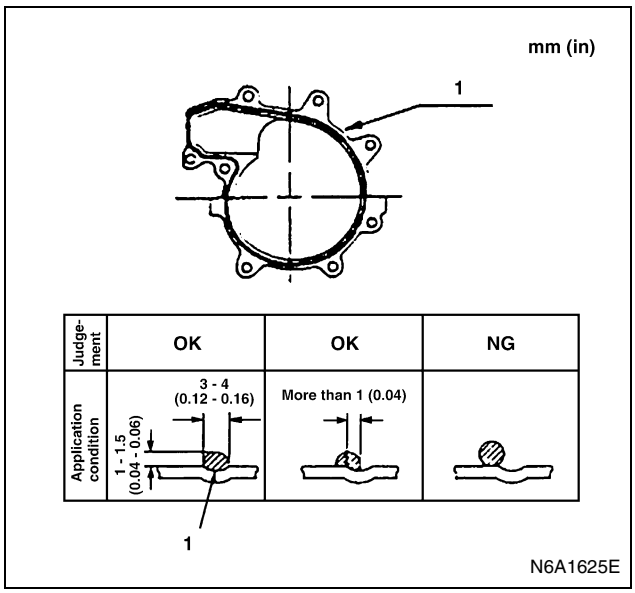
N6A0800E

Installation

1. Water Pump Assembly
   1) Apply 3 — 4 mm (0.12 — 0.16 in) bead of the recommended liquid gasket (Three Bond 1207C) or its equivalent on the water pump fitting surface.
   2) Install the water pump to the front retainer.

Tighten:
Water pump bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

- Install the water pump within 7 minutes after application of liquid gasket.
- For the dislocation of liquid gasket, refer to the illustration.



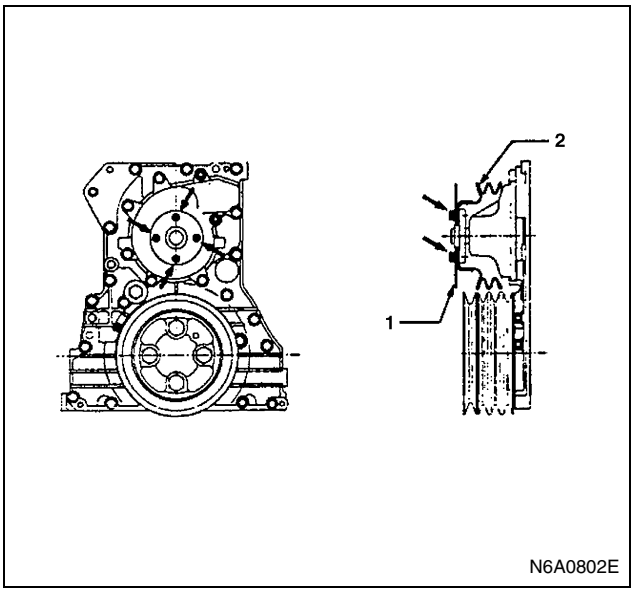
N6A1625E

Legend
1. Liquid gasket

Caution:
The water pump clamping bolt is also used to tighten the front retainer. So, install the water pump before liquid gasket gets dry immediately after installation of the front retainer.

2. Water Pump Pulley

Tighten:
Water pump pulley bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

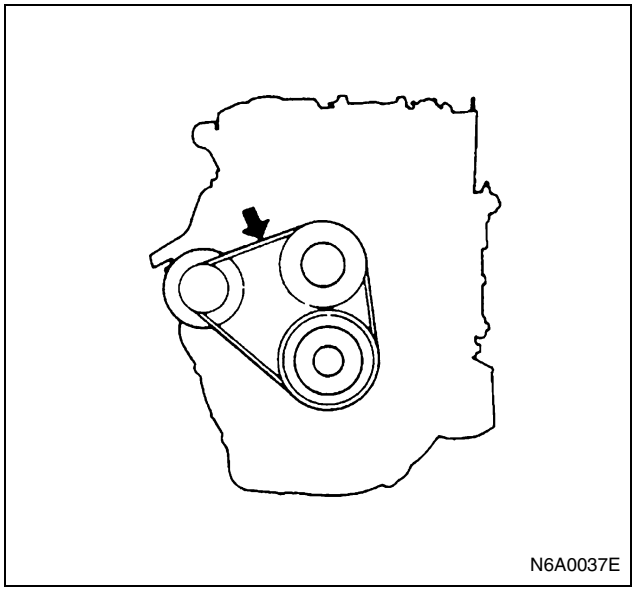


Legend
1. Set plate
2. Pulley

3. Fan Belt
   Check the drive belt tension.
   Depress the drive belt mid-portion with a 98 N (10 kg / 22 lb) force.

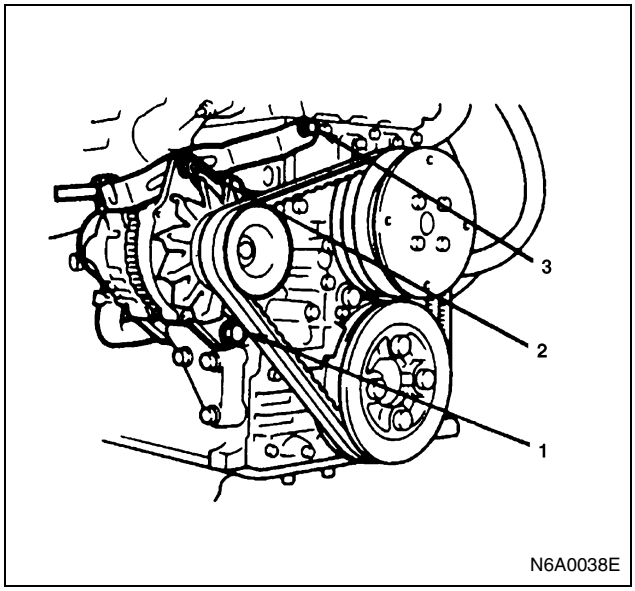
Drive Belt Deflection	mm (in)
New belt	8 — 12 (0.31 — 0.47)
Reuse belt	10 — 14 (0.39 — 0.55)

   Check the drive belt for cranking and other damage.



Fan Belt Adjustment
Fan belt tension is adjusted by moving the generator.

Tighten:
Bolt to
- (1): 40 N·m (4.1 kg·m / 30 lb·ft)
- (2): 24 N·m (2.4 kg·m / 17 lb·ft)
- (3): 46 N·m (4.7 kg·m / 34 lb·ft)



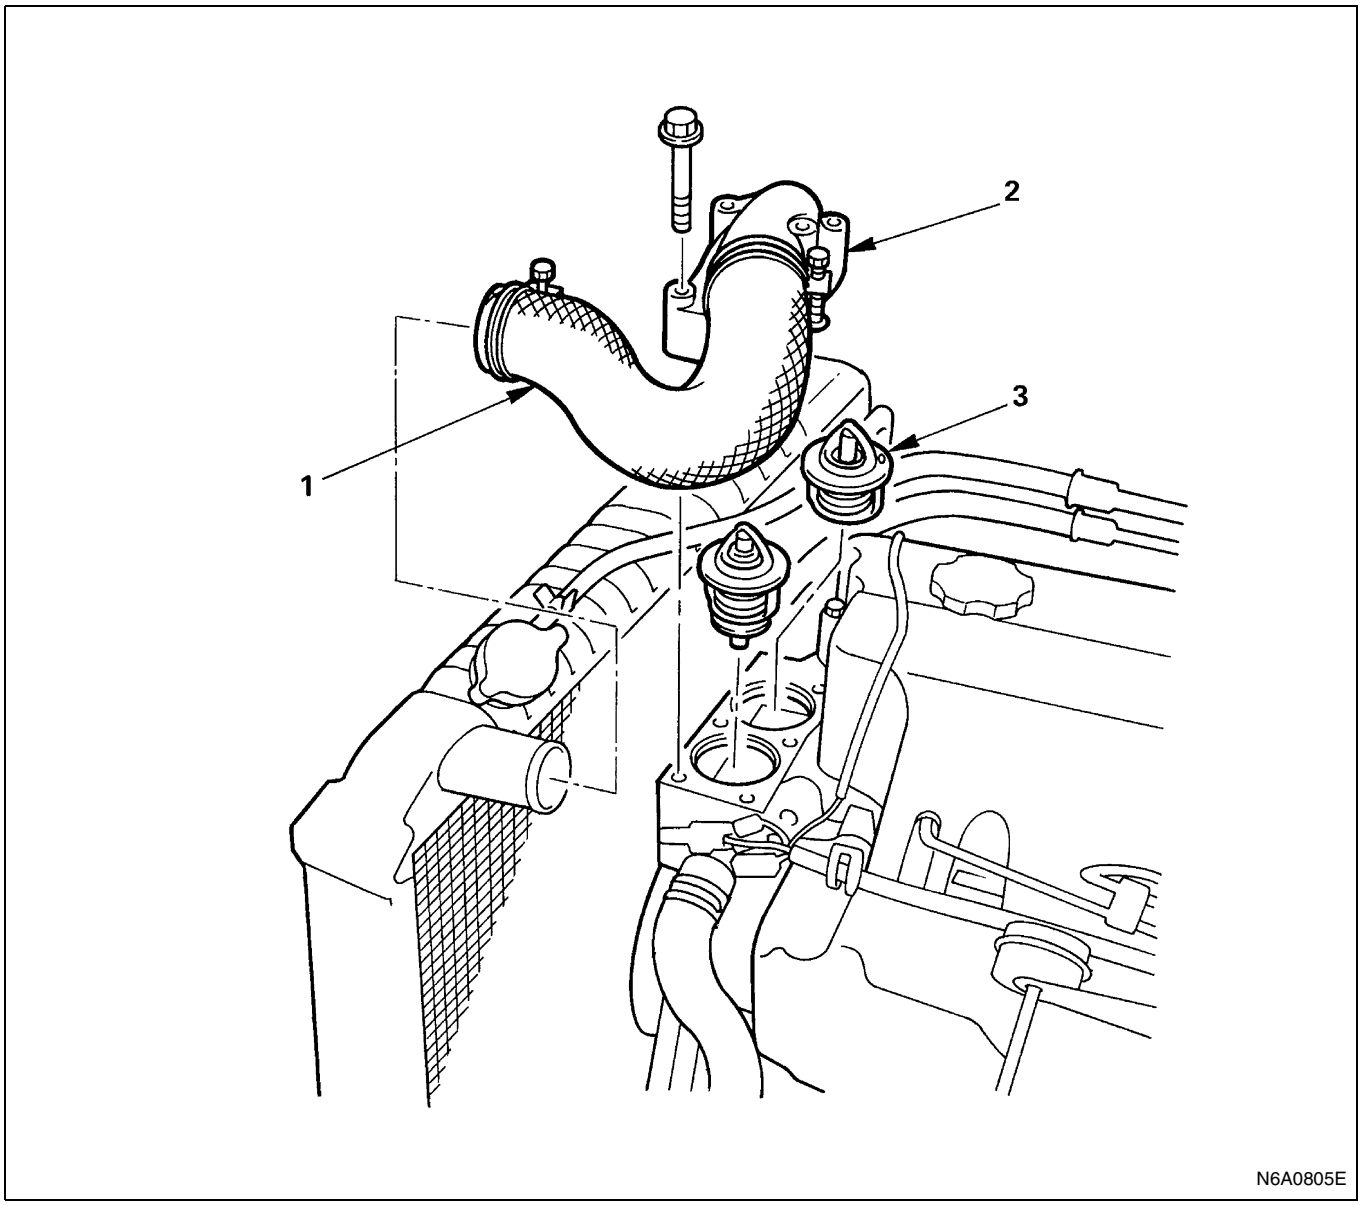
4. Fan

Tighten:
Fan bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

5. Fan Guide
6. Radiator Lower Hose
   - Pour coolant into radiator.
   - Connect battery ground cable.
   - Start engine and check for water leakage carefully.

THERMOSTAT

Component



Legend

1. Radiator upper hose
2. Water outlet pipe
3. Thermostat

Removal

Preparation

- Disconnect battery ground cable
- Drain coolant

1. Radiator Upper Hose
   Disconnect radiator upper hose from radiator.
2. Water Outlet Pipe
   Remove mounting bolt and remove outlet pipe together with radiator upper hose.
3. Thermostat

Inspection

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

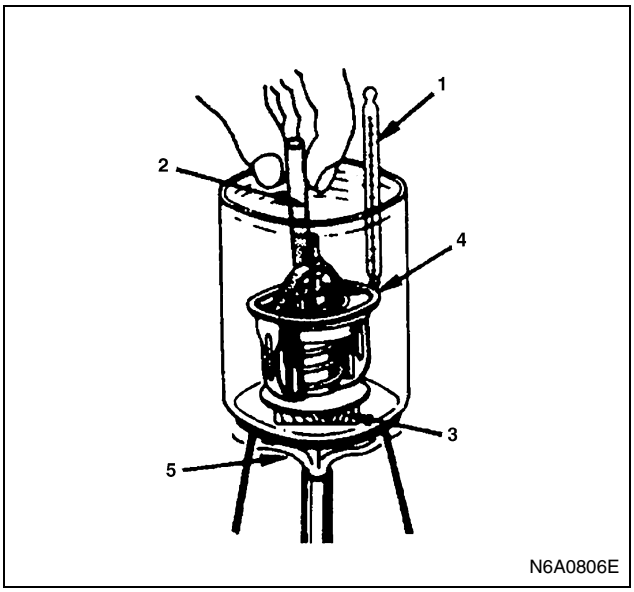
Operating Test

1. Completely submerge the thermostat in water.
2. Heat the water.
   Stir the water constantly to avoid direct heat being applied to the thermostat.
3. Check the valve initial opening temperature.

Valve Initial Opening Temperature		°C (°F)
		Standard
without jiggle valve	Primary valve	80 — 84 (176 — 183)
	Secondary valve	83 — 87 (181 — 189)
with jiggle valve		83.5 — 86.5 (182 — 188)

4. Check the valve lift full opening temperature.

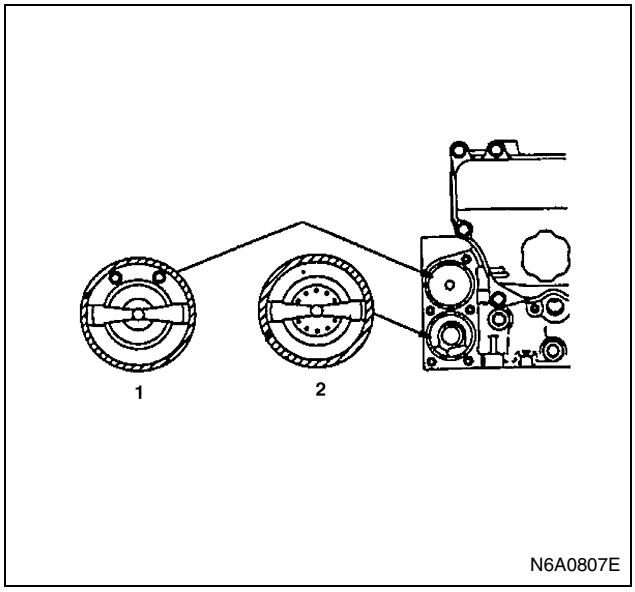
Valve Lift Full Opening Temperature	°C (°F)
	Standard
without jiggle valve	95 (203)
with jiggle valve	100 (212)



Legend
1. Thermometer
2. Agitating rod
3. Wooden piece
4. Thermostat
5. Heat

Installation

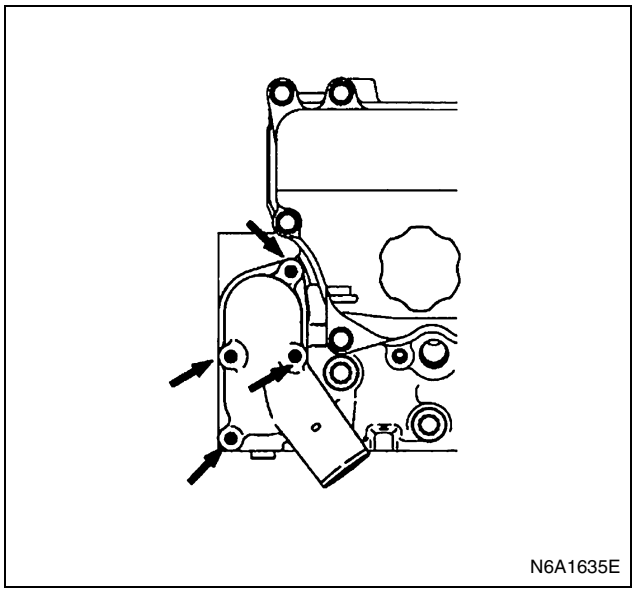
1. Thermostat
   Install the gaskets to the thermostats and the thermostats to the cylinder head as shown in the illustration.



Legend
1. With jiggle valve
2. Without jiggle valve

2. Water Outlet Pipe
   Install the water outlet pipe with thermostat to the cylinder head.
   Tighten the water outlet pipe bolts to the specified torque.

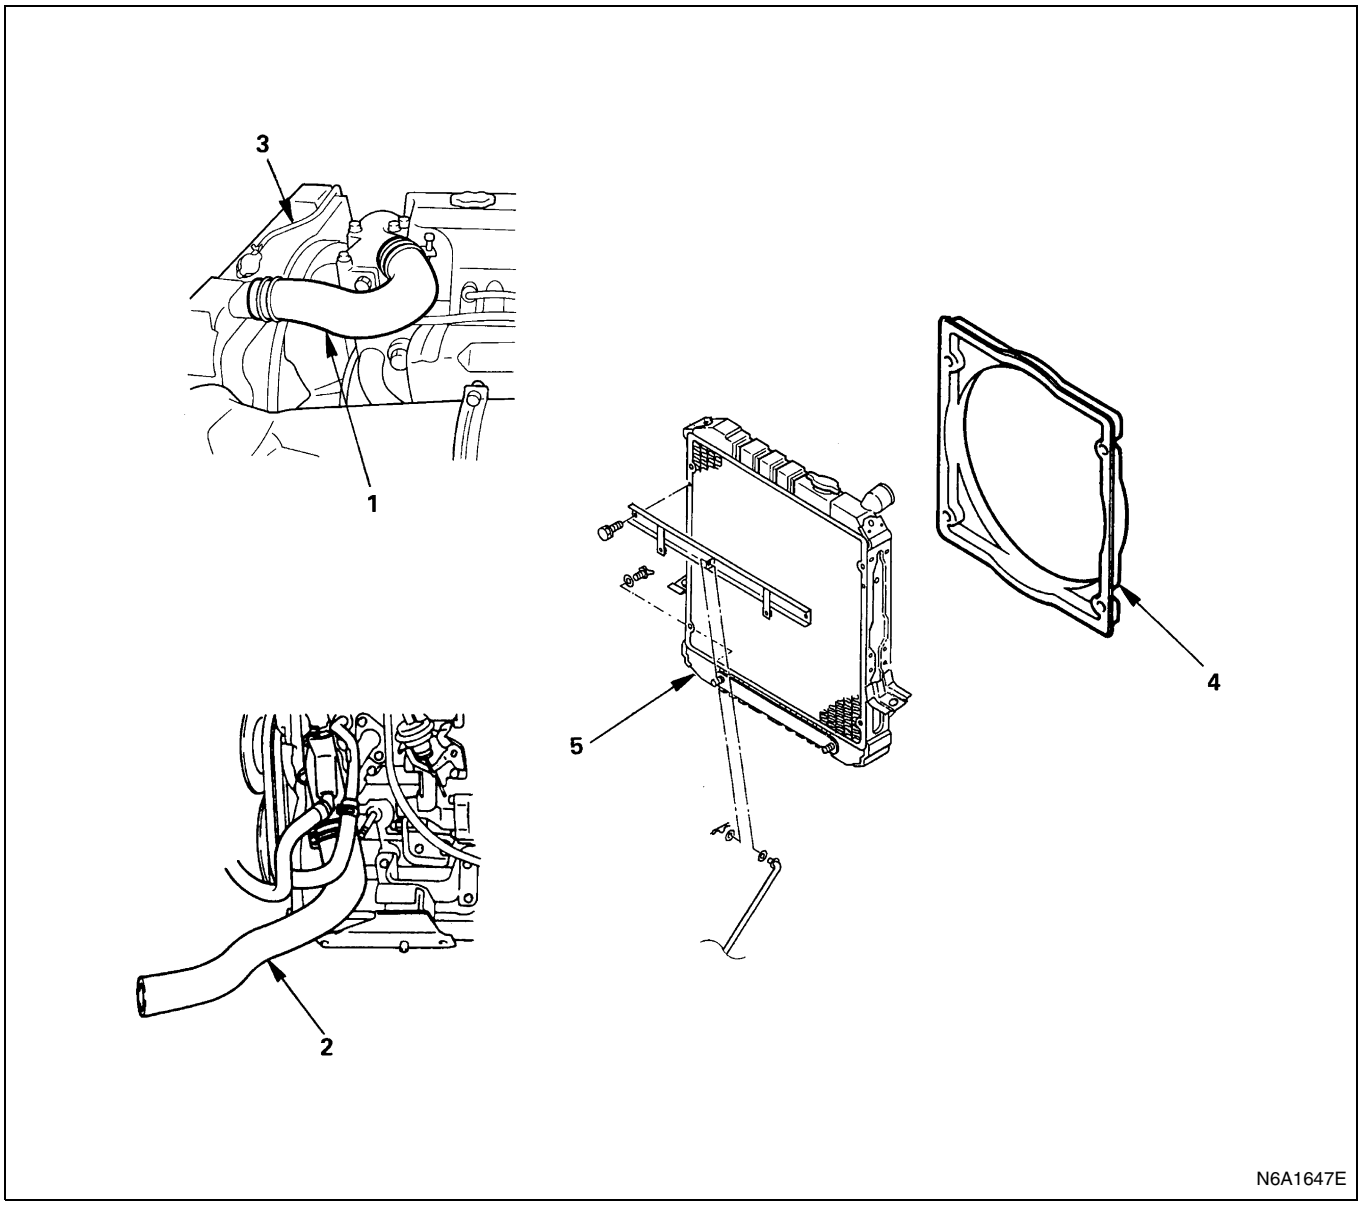
Tighten:
Water outlet pipe bolt to 24 N·m (2.4 kg·m / 17 lb·ft)



3. Radiator Upper
   - Connect battery ground cable.
   - Pour coolant
   - Start the engine and check coolant leakage.

RADIATOR

Component

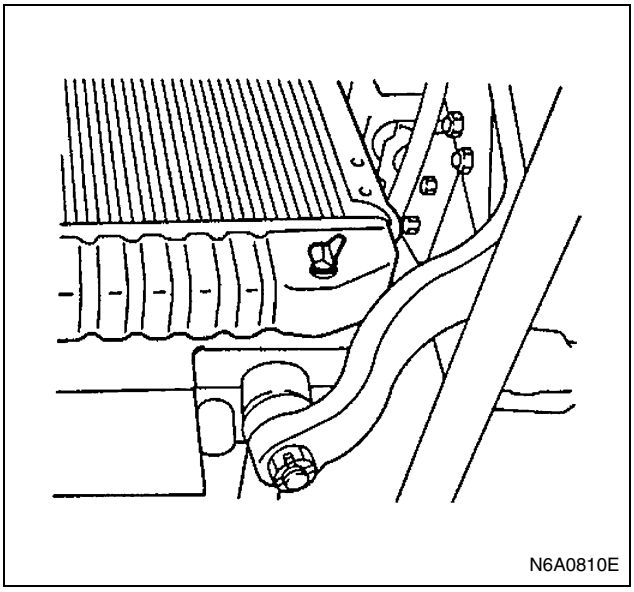


Legend

1. Radiator upper hose
2. Radiator lower hose
3. Coolant reserve tank hose
4. Fan guide
5. Radiator

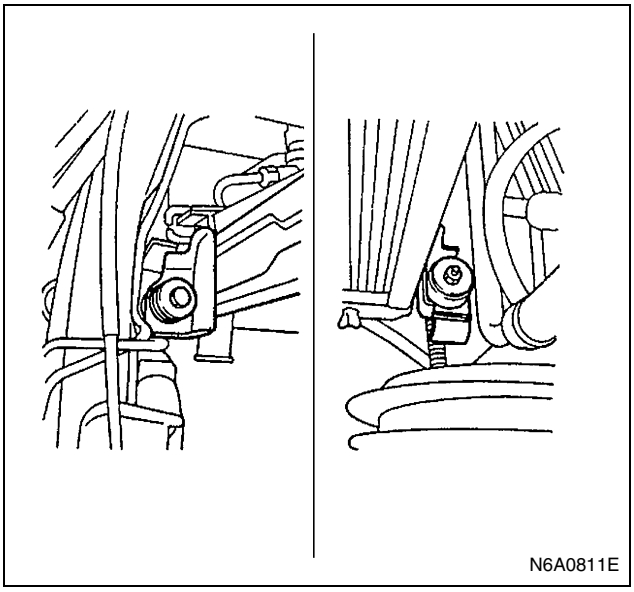
Removal

- Disconnect battery ground cable.
- Tilt the cab.
- Loosen drain plug to drain coolant.



N6A0810E

1. Radiator Upper Hose
2. Radiator Lower Hose
   Disconnect upper hose and lower hose from the radiator.
3. Coolant Reserve Tank Hose
4. Fan Guide
5. Radiator
   1) Remove upward the radiator assembly with hose, taking care not to damage the radiator core by fan blade.



N6A0811E

Inspection

Radiator Valve Check

1. Apply air pressure from filler neck using radiator cap tester and check the opening pressure of radiator valve. If the valve opening pressure is out of the standard value range, replace with a new radiator valve.

Radiator Valve Opening Pressure kPa (kg/cm^2/psi)
93 — 123 (0.95 — 1.25/13.5 — 17.8)

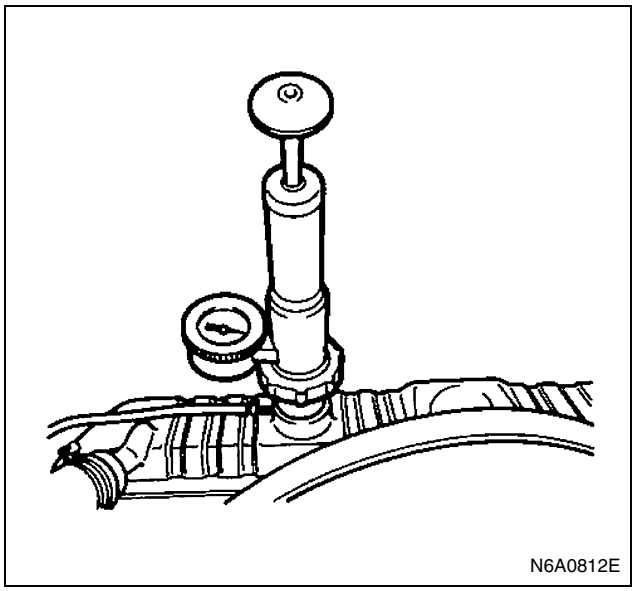
2. Remove the radiator valve and check a negative pressure valve as the center of the valve seat side. If the negative pressure valve does not work smoothly, clean or replace the radiator valve.

Tighten:
Radiator valve fixing to 6 N·m (0.6 kg·m / 4 lb·ft)

3. Conduct cooling system leakage check after reinstalling the radiator valve.

Cooling System Leakage Check

1. Clog up the reservoir tank hose carefully and check the cooling system for leakage with a radiator cap tester by applying an air pressure of 196 kPa (2 kg/cm^2/28 psi) from filler neck to inside the radiator.
2. As the radiator upper tank is provided with a valve, the pressure fails to rise higher than the valve opening pressure unless the hose is clogged up.



N6A0812E

Radiator Core

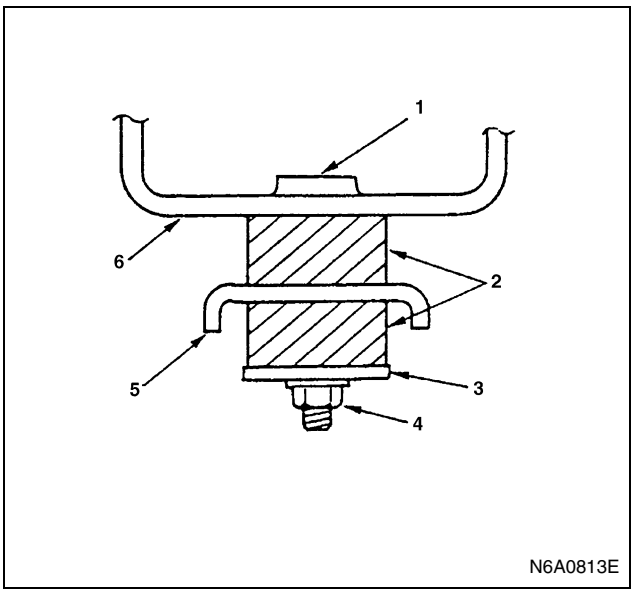
1. Deformed radiator fins could reduce radiation effects, resulting in overheat. Straighten the fins. In such a case, take care not to damage the fin roots.
2. Remove dust and other foreign materials.

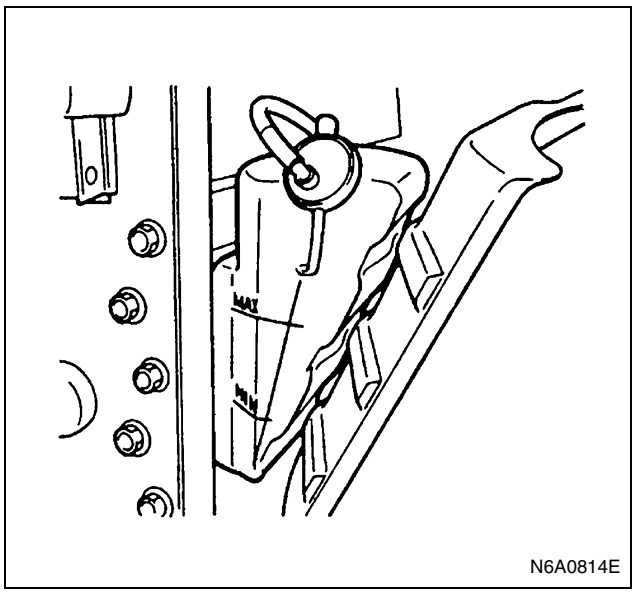
Flushing the Radiator

Wash the inside of radiator and the coolant passage with water and neutral detergent. Remove all scales and rust.

Installation

1. Radiator
   With due attention paid not to damage the radiator core by the fan blades, install the both brackets of the radiator to the brackets on the frame as shown in the illustration.





Legend

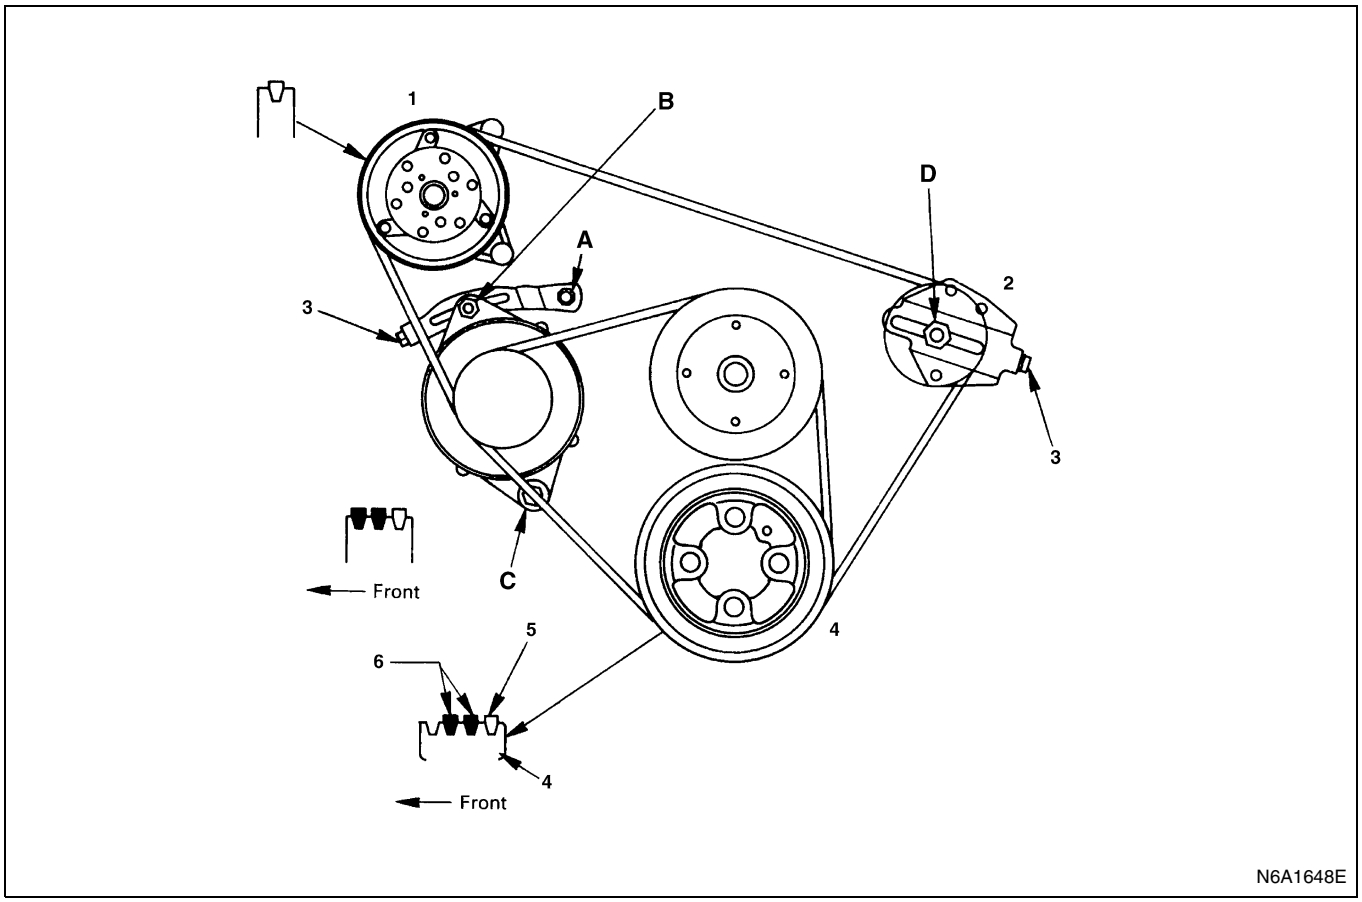
1. Stud bolt
2. Rubber
3. Washer
4. Flange nut
5. Flame side bracket
6. Radiator side bracket

---

2. Fan Guide
3. Coolant Reserve Tank Hose
4. Radiator Lower Hose
5. Radiator Upper Hose
   - Connect battery ground cable.
   - Pour coolant
   - Pour coolant up to filler neck of outlet pipe, and up to MAX mark of reserve tank.
   - Start engine to warm up, and check for coolant level.
     Replenish coolant if it does not reach the outlet pipe filler neck, and tighten the cap completely.

DRIVE BELT ADJUSTMENT

Component



Legend

1. A/C compressor
2. Tension pulley
3. Adjust bolt
4. Crank pulley
5. Compressor drive belt
6. Generator drive belt

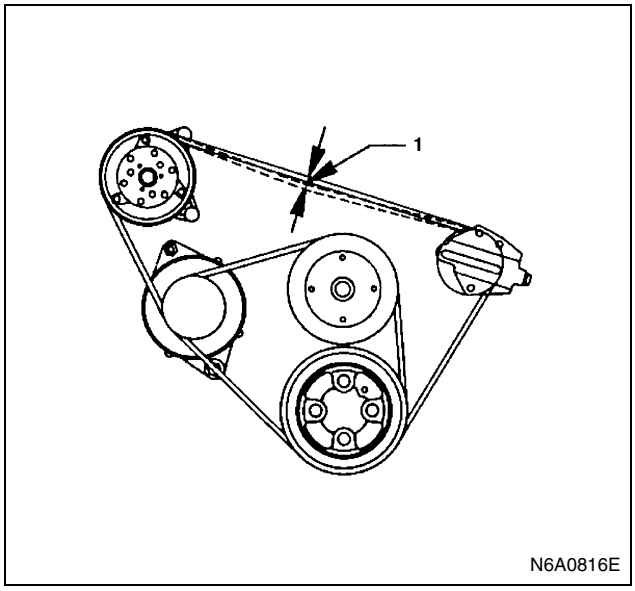
Inspection

Check drive belts for wear or damage, and replace with new ones as necessary. Check belts for tension, and adjust as necessary.

1. Check drive belts tension
2. Push the middle of belts with a force of 98 N (10 kg / 22 lb) and check each belt for deflection.
3. Standard deflection

Fan Drive Belt Deflection	mm (in)
New belt	8 — 12 (0.31 — 0.47)
Reuse belt	10 — 14 (0.39 — 0.55)

A/C Drive Belt Deflection	mm (in)
New belt	16 — 20 (0.63 — 0.79)
Reuse belt	18 — 22 (0.71 — 0.87)



Legend
1. Belt deflection

Tension Adjustment

(Refer to the illustration on the previous page.)

1. Generator & Water Pump Pulley Drive Belt
   1) Loosen the Air Conditioning (A/C) drive belt tension pulley adjust bolt and lock nut (D). Then free the A/C drive belt.
   2) Loosen the adjust plate lock nut (B), the fixing bolt (A), and the fixing bolts (C) on the lower side of the generator.
   3) Rotate the adjust bolt to adjust the belt.
   4) After adjustment, tighten each section to the specified torque.

Tighten:
Bolt and nut to
- (A): 46 N·m (4.7 kg·m / 34 lb·ft)
- (B): 24 N·m (2.4 kg·m / 17 lb·ft)
- (C): 40 N·m (4.1 kg·m /30 lb·ft)

   5) Adjust the A/C drive belt tension.

2. A/C Compressor Drive Belt
   1) Loosen the tension pulley lock nut (D), and rotate the adjust bolt to adjust the belt.
      When finishing the fan drive belt adjustment, then adjust the A/C drive belt.
      After adjustment, tighten the lock nut (D) to the specified torque.

Tighten:
Lock nut (D) to 27 N·m (2.8 kg·m / 20 lb·ft).

GENERAL DESCRIPTION

Caution

When working on the fuel system, there are several things to keep in mind:

- Any time the fuel system is being worked on, disconnect the negative battery cable except for those tests where battery voltage is required.
- Always keep a dry chemical (Class B) fire extinguisher near the work area.
- Replace all pipes with the same pipe and fittings that were removed.
- Clean and inspect “O” rings. Replace where required.
- Always relieve the line pressure before servicing any fuel system components.
- Do not attempt repairs on the fuel system until you have read the instructions and checked the pictures relating to that repair.

Description

Fuel Filters

The Purpose of the fuel filters is to clean the fuel of any dirt particles that can cause wear on the fuel injection nozzle’s sliding surface; and to separate any water from the fuel, which is ever-present from the condensation in the fuel tank. The pre-fuel filter (water separator) is located between the fuel tank and the injection pump. The secondary fuel filter is located between the fuel pump and the injection pump.

Pre-Fuel Filter

When the condensed water in the pre-fuel filter (water separator) comes to the warning level indicated on its plastic body, drain the fluid immediately from the drain plug located bottom of water separator.

Injection Pump

The fuel injection system includes a fuel tank, fuel hoses and lines, a fuel/water separator, fuel filters, a fuel pump, a Bosch-type in-line fuel injection pump with an internal governor, delivery valves, fuel injection lines and for fuel injection nozzles.

The fuel pump, injection pump and the nozzle are manufactured by Bosch AS corporation, but serviced by Bosch.

Remove the injection pump and governor assembly as a unit to have it services. Do not open or break any seals on the pump or the warranty is void. The injection pump has an identification plate attached to the pump body.

Aneroid Compensator Function

The bellows in the aneroid compensator is provided with an initial set force by the aneroid compensator spring and is compressed by the push rod C. As the atmospheric pressure drops, the bellows begins to expand against the force of the aneroid compensator spring, which in turn causes the push rod B, through the push rod C and the boost compensator lever F, to move to the left.

Then the push rod B comes into contact with the U-shaped lever and, as the expanding bellows over come the force of the cancel spring installed on the U-shaped lever, causes the U-shaped lever to turn clockwise. Because the bottom of the sensor lever is in touch with the torque cam, the torque cam then works as a pivot on which the top of the sensor lever moves to the right together with the U-shaped lever. At the same time, the control rack, which is hooked on the sensor lever, moves toward the governor to reduce fuel injection.

Brief Explanation of Emission and Electrical Control System

MITICS (Mechanically Integrated Timing and Injection Control System)

4HE1-TC

The Mechanically Integrated Timing and Injection rate Control System (MITICS) utilizes mechanical control, in comparison with TICS systems, which utilize electronic control.

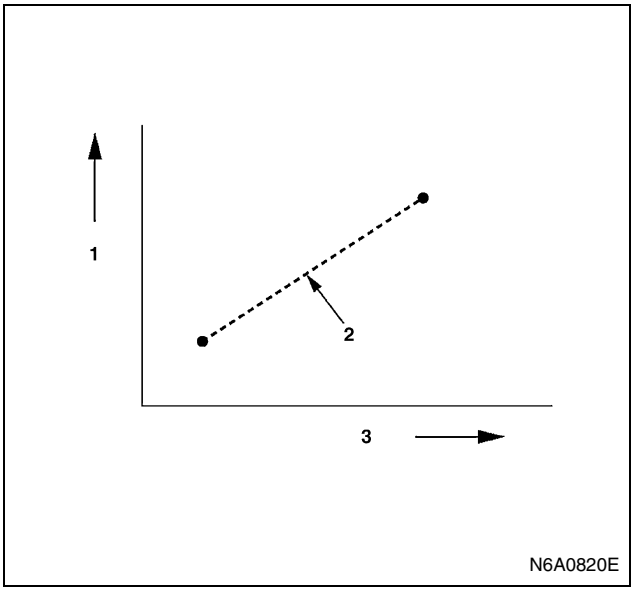
MITICS is equipped with the RLD-M type governor, which contains a pre-stroke control mechanism. With this, pre-stroke position (i.e, beginning of static injection) can be varied to control injection timing and injection rate (i.e., the fuel injection quantity injected from the nozzle per cam angle degree).

This enables high injection rates1 in the low and medium speed ranges through a short injection interval, thus contributing to higher engine torque and cleaner exhaust.

MITICS was developed in response to the demands of medium sized diesel engines for low cost, low fuel consumption, high output and cleaner emissions.

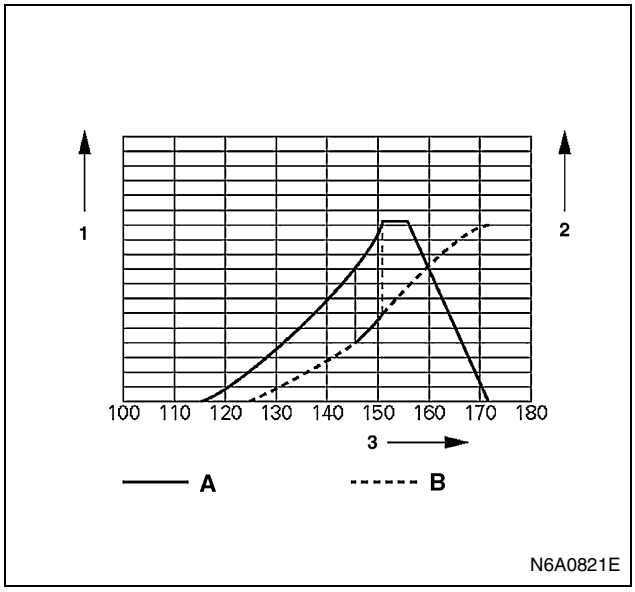
High injection rates using a short injection interval.

- The speed at which the injection pump plunger rises slows as engine speed decreases and the pressure inside the injection pipe decreases. Because of this, the nozzle spray deteriorates and makes it impossible to obtain the proper fuel - air mixture.
  To obtain the proper mixture at low and medium speeds, it is necessary to increase the pressure inside the injection pipes using a short injection interval.



Legend
1. Injection pipe pressure
2. PE-AD type injection pump
3. Engine speed

- The following figure shows plunger speed and cam lift in relation to cam angle. It can be seen from the graph that plunger speed increases together with cam lift.
  MITICS varies the beginning of injection position at low and medium speeds so that injection occurs when the plunger speed increases during the latter half of cam lift (shown by the bold line). At high speeds, injection is performed when the plunger speed decreases during the first half of cam lift to prevent an excessive increase in injection pipe pressure.
  This enables high pressures at low and medium speeds with a fast plunger speed. Thus, a fine fuel oil spray is injected into the cylinder from the nozzles within a short time to provide the proper mixture for combustion, helping to increase torque and keep exhaust emissions clean.



Legend
A. Plunger speed
B. Cam lift
1. Plunger speed (m/sec)
2. Cam lift (mm)
3. Cam angle (degrees)

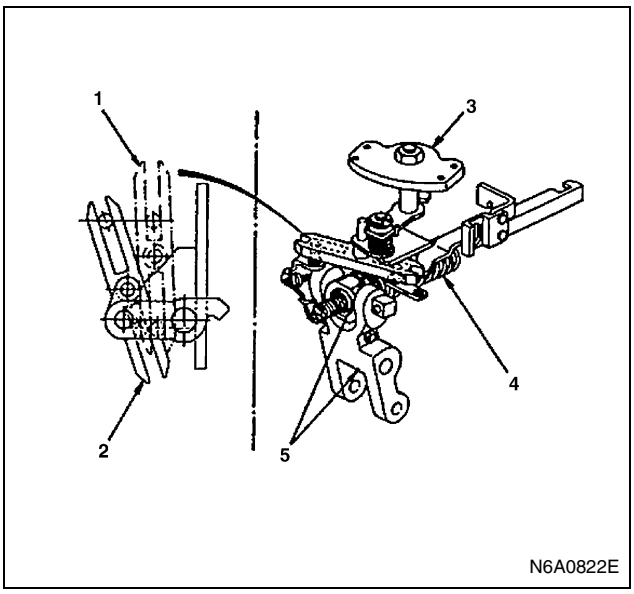
Governor (Model RLD-M)

4HE1-TC

The RLD-J type governor can be used with the MI, MITICS injection pumps, and was designed to have better control and endurance than the previous RLD type governor.
Although the basic construction is identical to that of the RLD type governor, the RLD-M type is larger to match the applicable pumps' larger size.

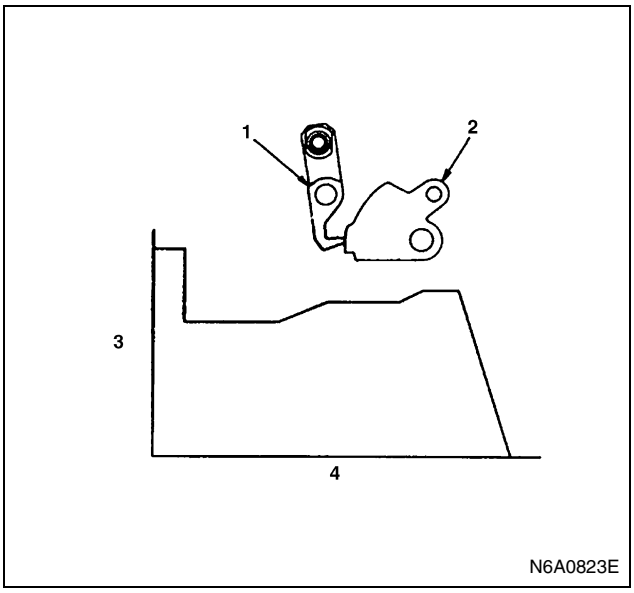
Features

1. Variable speed control governor with decreased lever reaction force
   As with the previous RLD type governor, RLD-M governor control is accomplished using the speed control lever to change the fulcrum of the internal link mechanism.
   Consequently, as the reaction force of the governor spring does not act directly on the speed control lever, only a very small lever reaction force is exerted on the accelerator pedal.



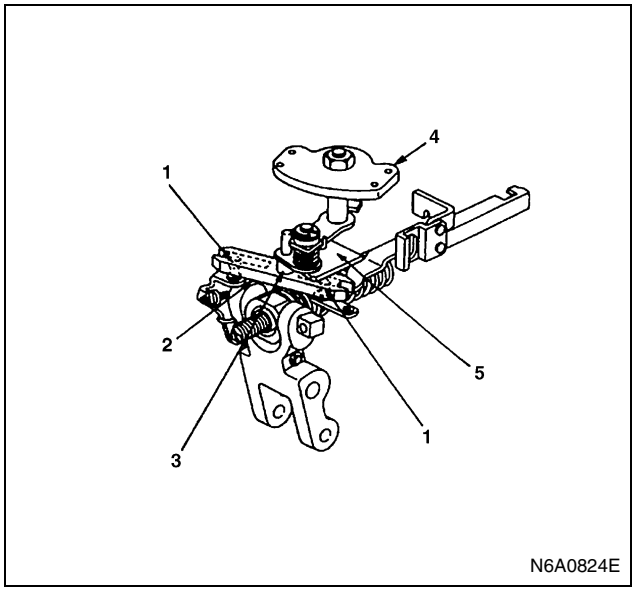
Legend
1. At maximum speed control
2. At idle speed control
3. Speed control lever
4. Governor spring
5. Link mechanism

2. Set torque characteristics through internal torque cam
   At full load, the tip of the sensor lever traces the face of the torque cam to determine the full load rack position and control the full load injection quantity.
   Consequently, the torque characteristics demanded by the engine can be freely set by changing the shape of the torque cam face.



Legend
1. Sensor lever
2. Torque cam
3. Control rack position (mm)
4. Pump speed (r/min)

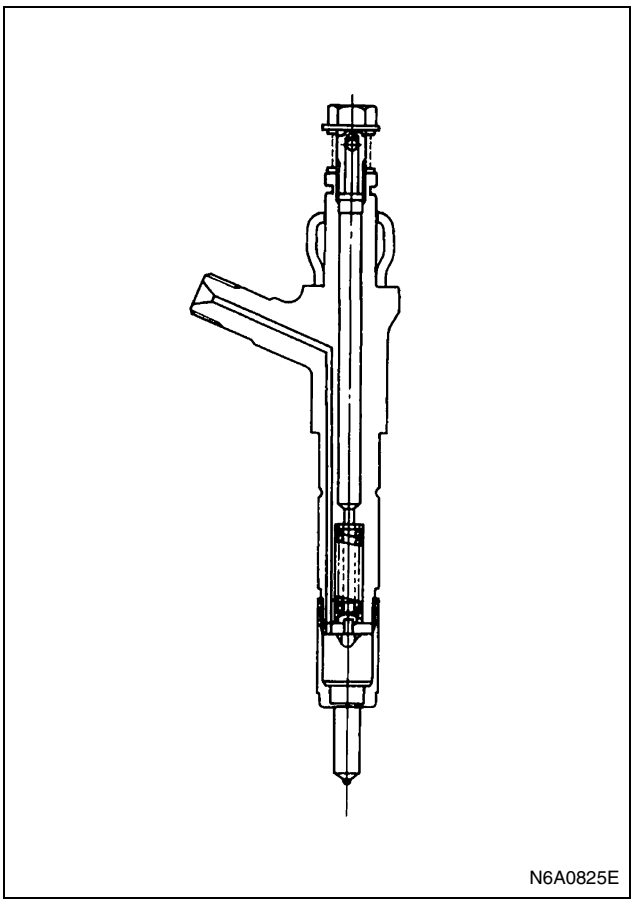
3. Improved control through internal guide plate
   When the speed control lever is operated, the 2nd supporting lever's pin moves along the guide plate. The floating lever connected to the pin thus moves to change the ball joint fulcrum positions. In the intermediate to high speed ranges, the guide plate causes the floating lever to move to increase the lever ratio continuously from 1.1 (idling) — 6 (full speed). This increase in the lever ratio in the intermediate to high speed range improves speed droop.



Legend
1. Ball joint
2. Floating lever
3. 2nd supporting lever pin
4. Speed control lever
5. Guide plate

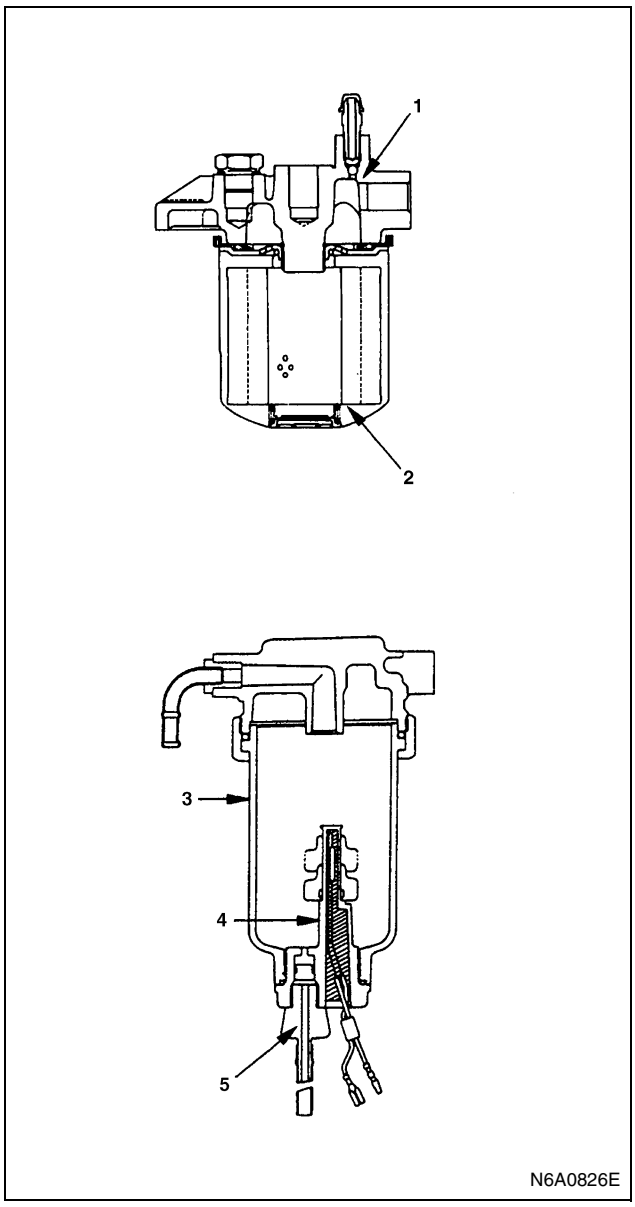
Injection Nozzle

A Bosch hole type injection nozzle is used. It consists of the nozzle body and the needle valve assembly.
The injection nozzle assembly sprays pressurized fuel from the injection pump into the combustion chamber through the nozzle body injection orifice.



Fuel Filter and Water Separator

A cartridge type fuel filter and a water separator are used along with the in-line type injection pump.
As the inside of the injection pump is lubricated by the fuel which it is pumping, the fuel must be perfectly clean. The fuel filter and the water separator remove water particles and other foreign material from the fuel before it reaches the injection pump.
The water separator has an internal float. When the float reaches the specified level, a warning light comes on to remind you to drain the water from the separator.

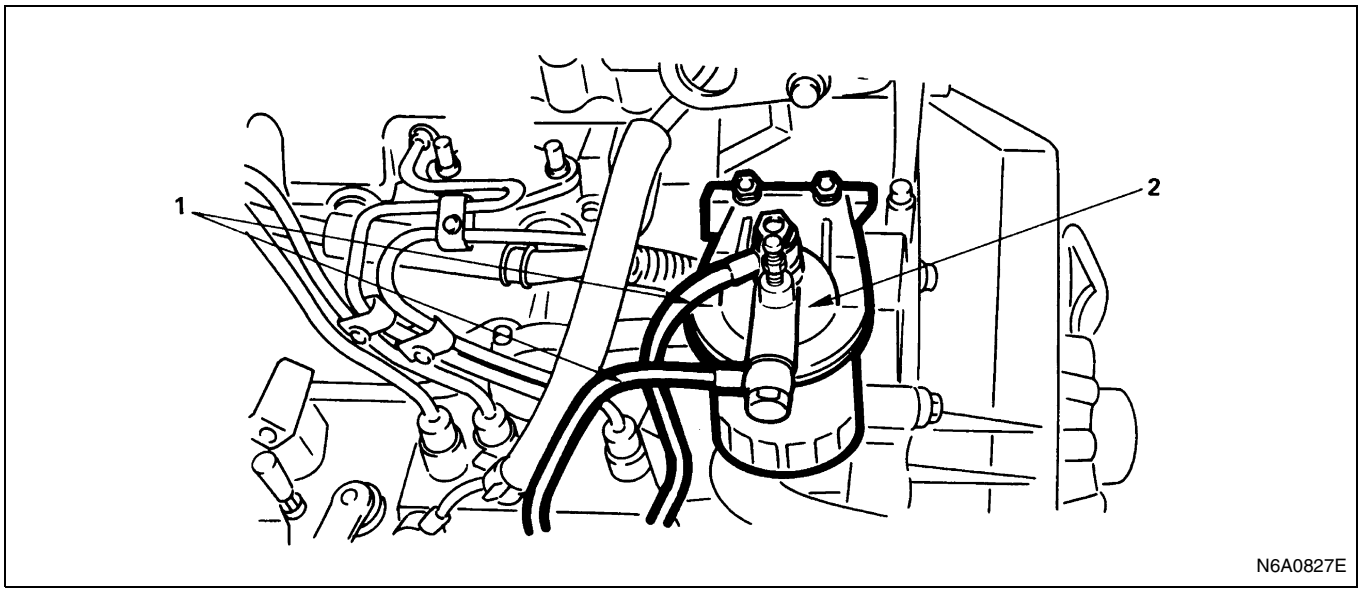


Legend

1. Body assembly
2. Filter cartridge
3. Case
4. Lever sensor
5. Drain plug

FUEL FILTER ASSEMBLY (Except 4HF1-2 model)

Component



Legend

1. Fuel pipe
2. Fuel filter

Removal

Preparation

- Disconnect battery ground cable.
- Tilt the cab

1. Fuel Pipe
2. Fuel Filter Assembly

Installation

1. Fuel Filter Assembly

Tighten:
Fuel filter bracket to 34 N·m (3.5 kg·m / 25 lb·ft)

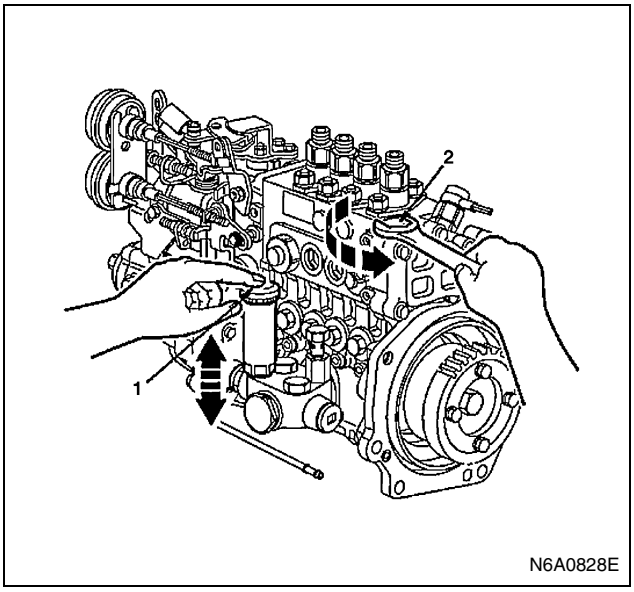
2. Fuel Pipe

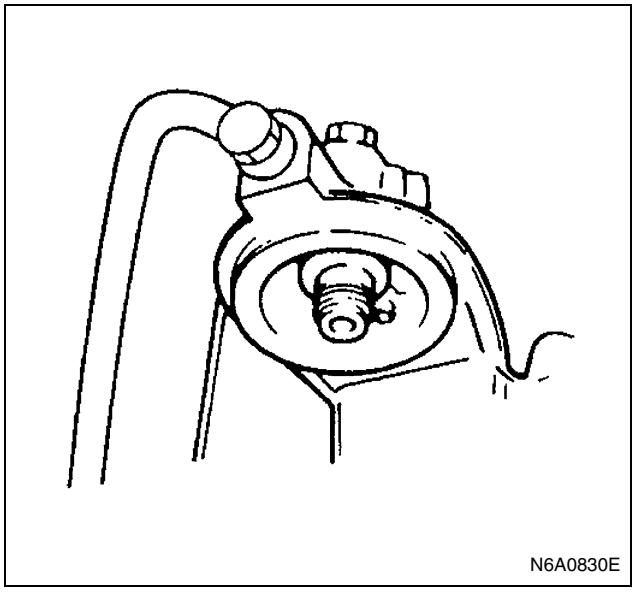
Tighten:
Fuel pipe joint bolt to 23 N·m (2.4 kg·m / 17 lb·ft)

Air Bleeding

- Loosen the priming pump cap (1).
- Loosen the air bleeding plug. (4HG1-T model only)
- Operate the priming pump.
  Pump the primer pump until fuel flow is free of air bubbles. (Except 4HG1-T model)
- Tighten the air bleeding plug. (4HG1-T model only)
- Loosen the bleeding plug.
- Operate the priming pump.
  Pump the primer pump until fuel flow is free of air bubbles.
- Tighten the bleeder plug.
- Operate the priming pump.
  Pump the primer pump until fuel flow is free of air bubbles. (Except 4HE1-TC model)
- Loosen the bleeding plug on the injection pump (2). (4HE1-TC model only)
- Operate the priming pump.
  Pump the primer pump until fuel flow is free of air bubbles. (4HE1-TC model only)
- Tighten the bleeding plug on the injection pump (2). (4HE1-TC model only)
- Lock the priming pump cap (1).

Notice:
Check for fuel leakage from around the injection pump and the fuel filter.



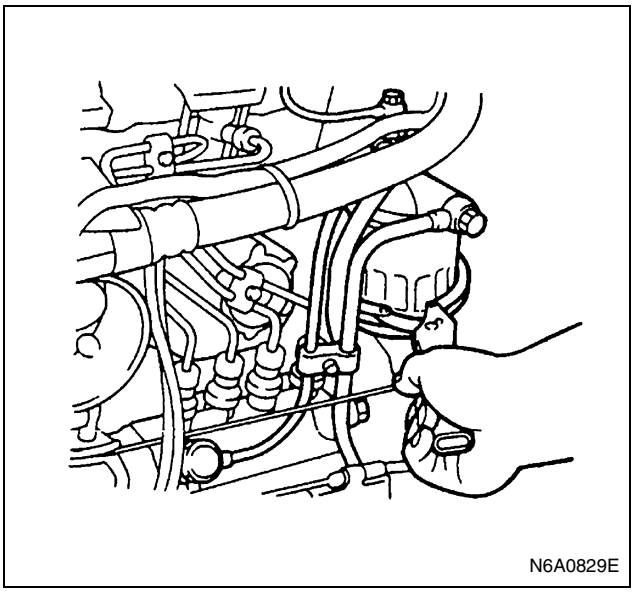


Cartridge Replacement

Removal

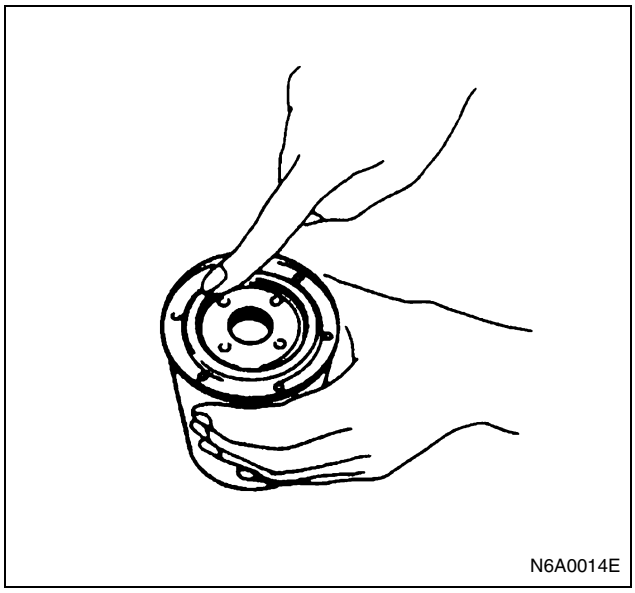
Replacement Procedure

1. Loosen the used fuel filter by turning it counterclockwise with the filter wrench.



Installation

1. Clean the upper cover fitting face.
   This will allow the new fuel filter to seat properly.
2. Apply a light coat of engine oil to the O-ring.
3. Supply fuel to the new fuel filter to facilitate bleeding.
4. Turn in the new fuel filter until the filter O-ring is fitted against the sealing face.
   Be very careful to avoid fuel spillage.

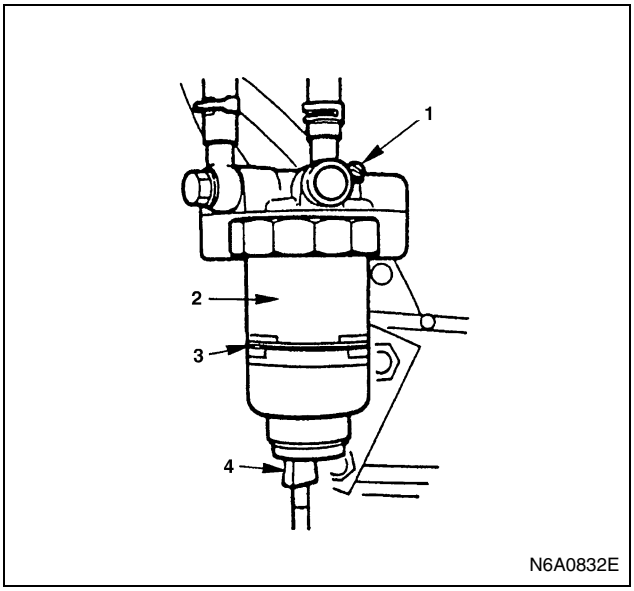


5. Use the filter wrench to turn in the fuel filter an additional 1/3 to 2/3 of a turn.
6. Operate the priming pump to bleed the air from the fuel line.
   Refer to “FUEL FILTER ASSEMBLY” for more detailed information.
7. Start the engine.
   Crank the engine for ten seconds or until it starts.
   If the engine does not start after ten seconds, repeat Step 6.

Draining the Pre-fuel Filter

1. Loosen the air bleeding plug and drain plug by turning them counterclockwise.

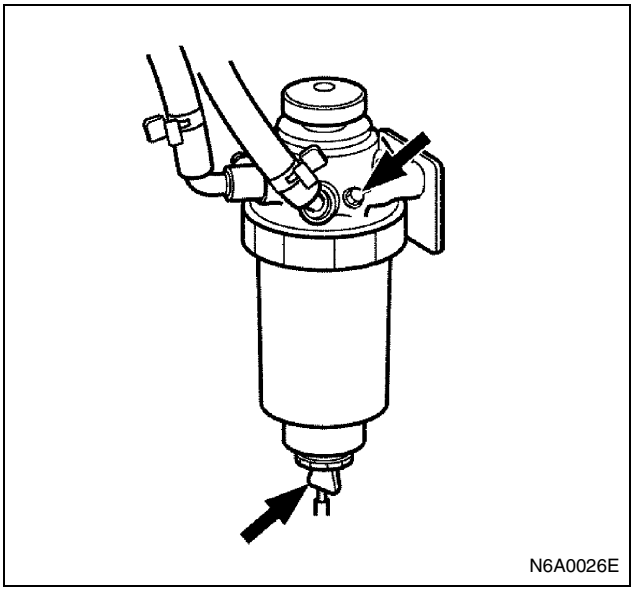
2. Drain approximately 0.1 liters (3.4 oz) of water.
3. Securely tighten the drain plug.
4. Operate the primer pump on the fuel pump to bleed the fuel system.
5. Tighten the air bleeding plug.



Legend

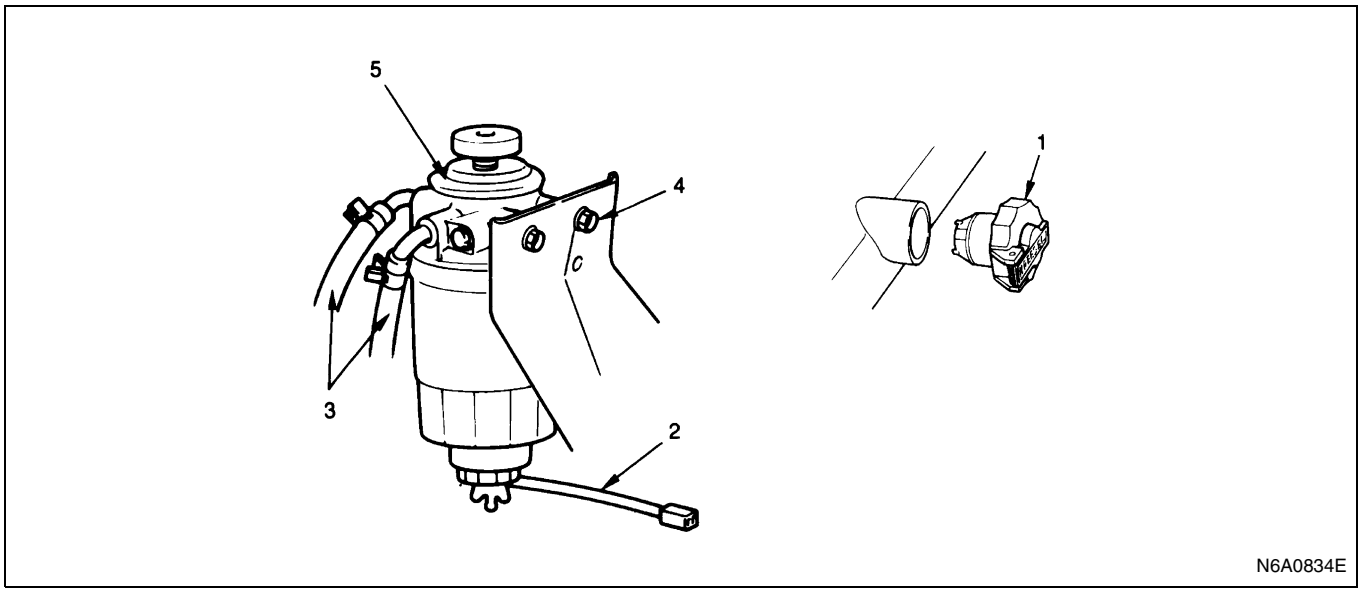
1. Air bleeding plug
2. Pre-fuel filter
3. Drain level
4. Drain plug

6. Start the engine and check to be sure no fuel is leaking from the drain plug.
7. Make sure that the warning light in the instrument panel is off. (Except 4HE1-TC)



FUEL FILTER ASSEMBLY (4HF1-2 model only)

Component



Legend

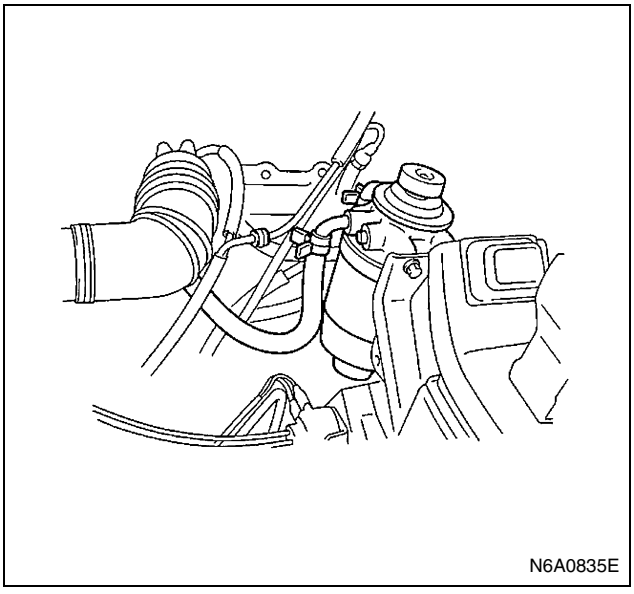
1. Filter cap
2. Lead switch wiring connector
3. Fuel hoses
4. Fuel filter installing bolt
5. Fuel filter assembly

Removal

Preparation

- Disconnect battery ground cable.

1. Filler cap
2. Lead switch wiring connector
3. Fuel hose
   - Draw out inlet and outlet hoses from the fuel filter and cork the hoses to prevent fuel outflow.
4. Fuel filter installing bolt
5. Fuel filter assembly



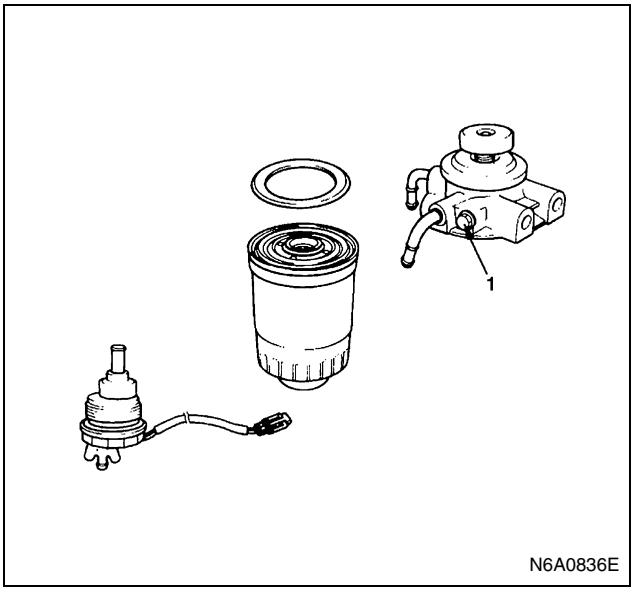
Installation

1. Fuel filter assembly
2. Fuel filter installing bolt
3. Fuel hose
   - Connect the inlet hose and outlet hose.
4. Lead switch wiring connector
5. Filler cap

Cartridge Replacement

Removal

1. Remove the cartridge using a filter wrench.
   Special Tool
   Filter wrench: 5-8840-0253-0
2. Remove the sedimenter/center.

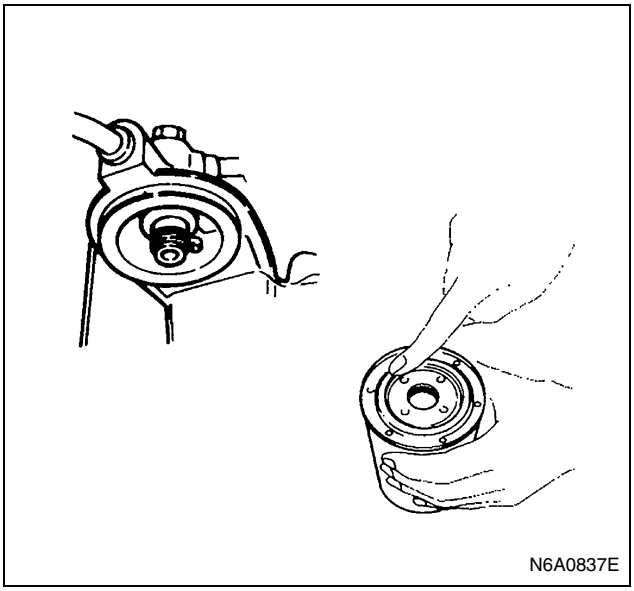


Legend

1. Air bleeding plug

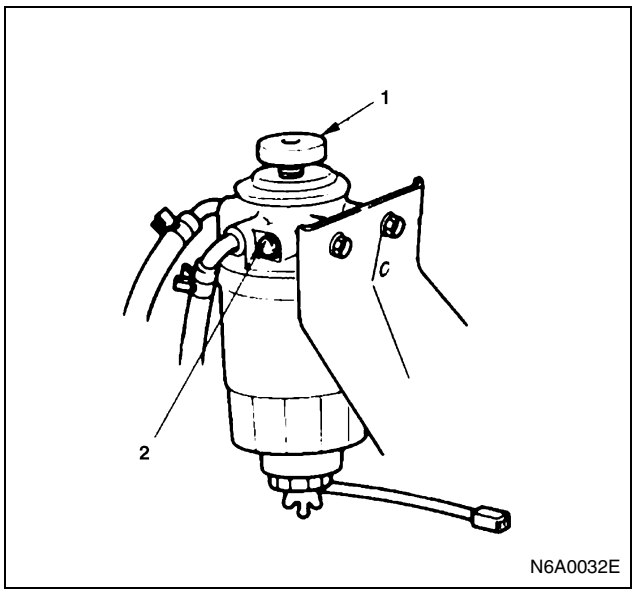
Reassembly

1. Fit the sedimenter/center in a new cartridge.
2. Clean the cartridge mounting surface of the filter body so that the new cartridge can be seated completely.
3. Apply engine oil thinly to the new cartridge O-ring.
4. Fill the new cartridge with light oil to facilitate air bleeding.
5. Tighten the cartridge until the O-ring comes into contact with the sealing surface. Sufficient care should be taken not to spill the light oil.
   Give 1/3 to 2/3 of a turn using a filter wrench.
   Special Tool
   Filter wrench: 5-8840-0253-0



Air Bleeding

1. Actuate the priming pump (1) to send the air in the fuel system to the injection pump.
2. Loosen the sedimenter air bleeding plug (2) and operate the priming pump until no bubbles appear.
3. Tighten the air bleeding plug completely.
4. Try to start the engine. If the engine is not started within 10 seconds, air bleeding should be conducted once again.
5. Check that there is no fuel leak, and then tighten the priming pump completely.



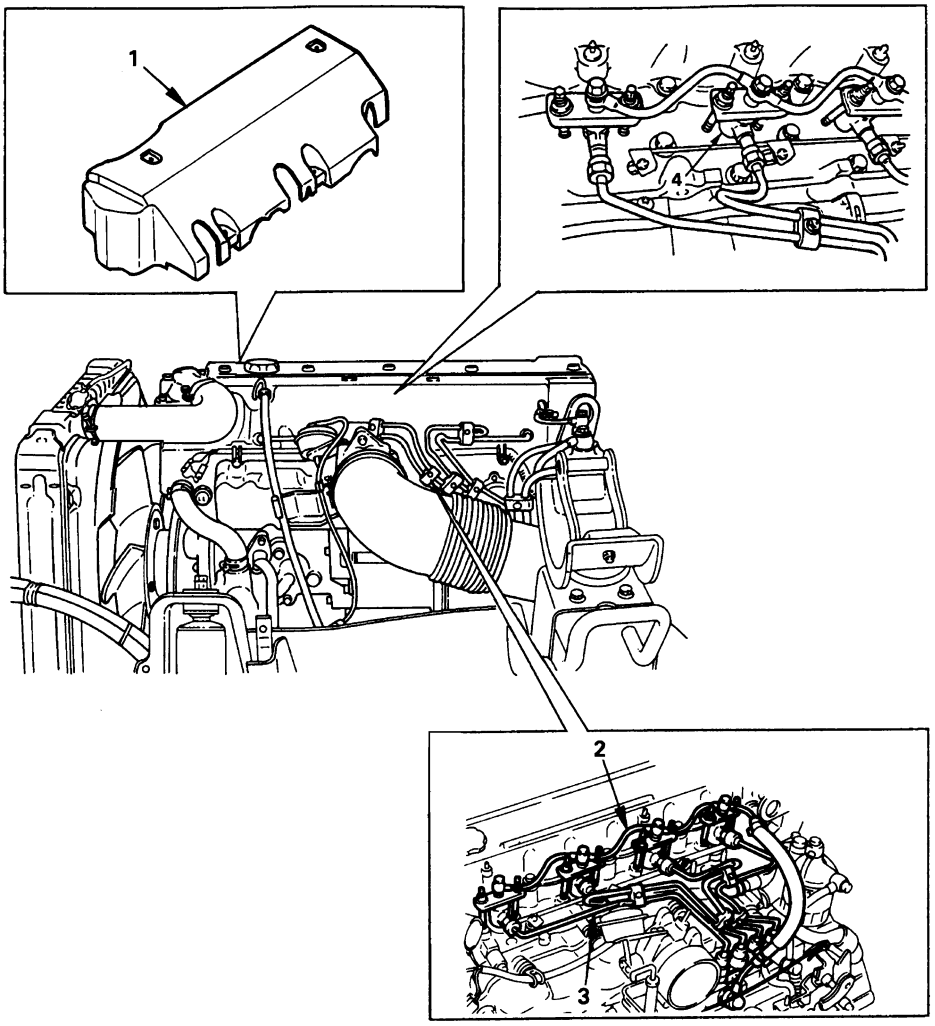
Water Drain

If more than specified has collected, the warning light is lit. Under this condition, follow the following water drain procedure:

1. Place a container (Approximately 0.2 lit (0.18 Imp qt/0.21 US qt) capacity) beneath the drain plug on the separator.
2. Loosen the drain plug and air bleeding plug.
3. After draining, tighten the drain plug.
4. Operate the priming pump several times again and check for fuel leak.
5. Tighten the air bleeding plug.
6. Make sure that the warning light in the instrument panel is off.

INJECTION NOZZLE ASSEMBLY

Component

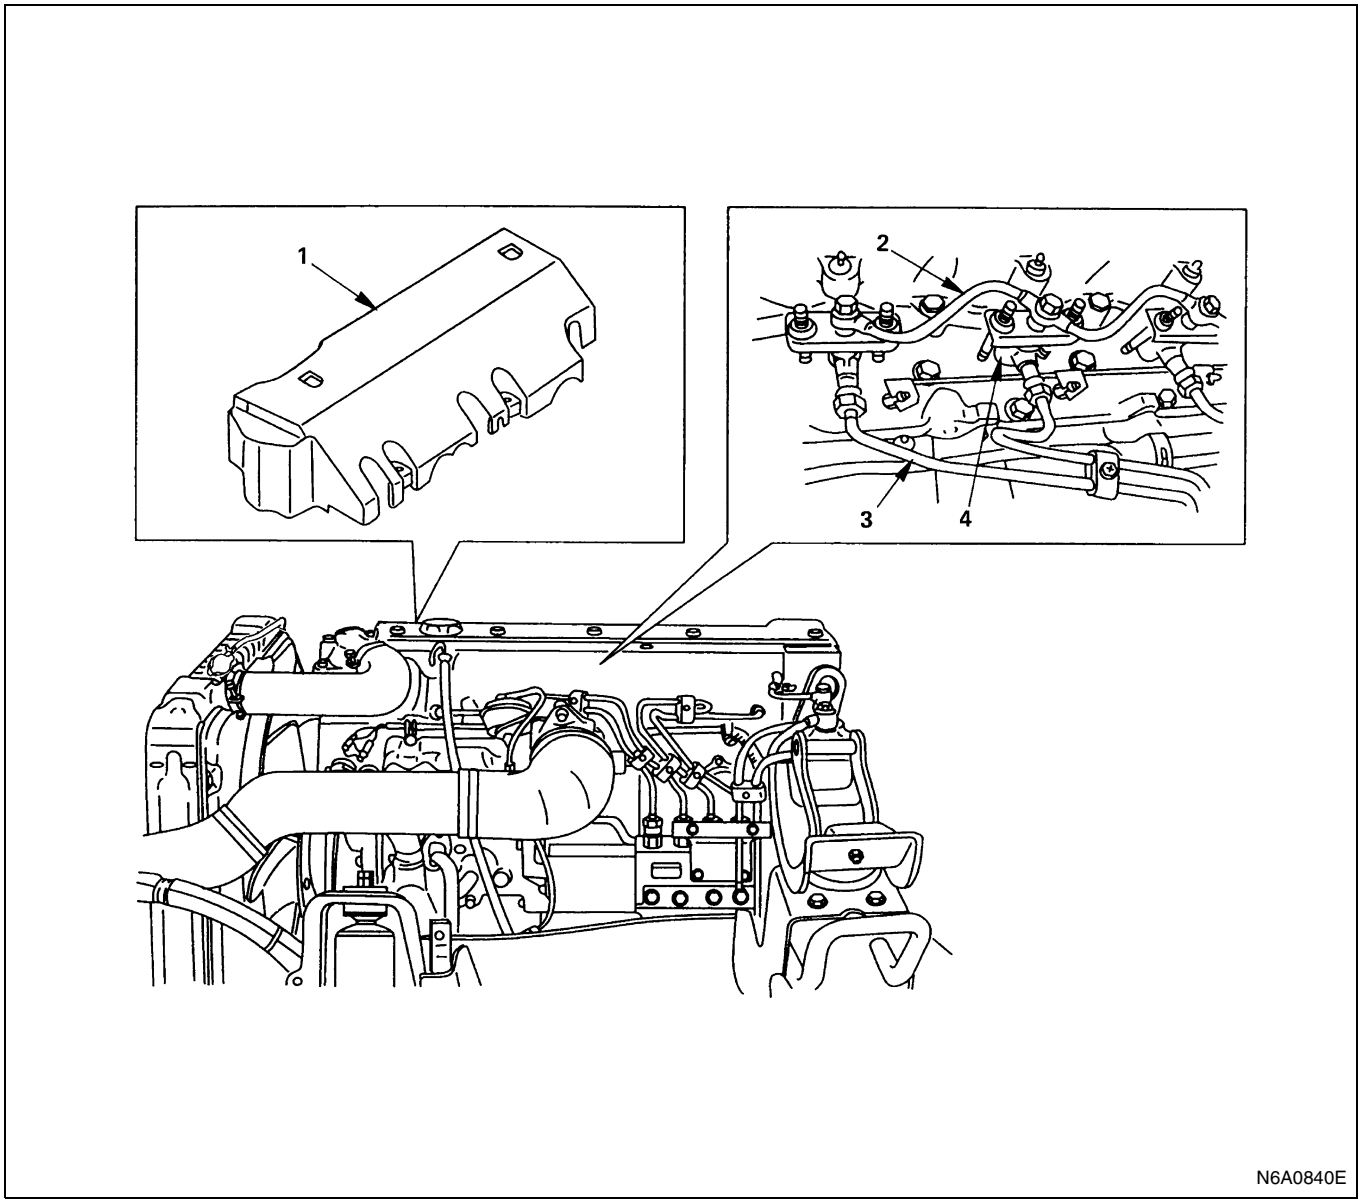


N6A0839E

Legend

1. Nozzle cover
2. Leak off pipe
3. Injection pipe
4. Injection nozzle assembly

4HE1-TC (Engine)



Legend

1. Nozzle cover
2. Leak off pipe
3. Injection pipe
4. Injection nozzle assembly

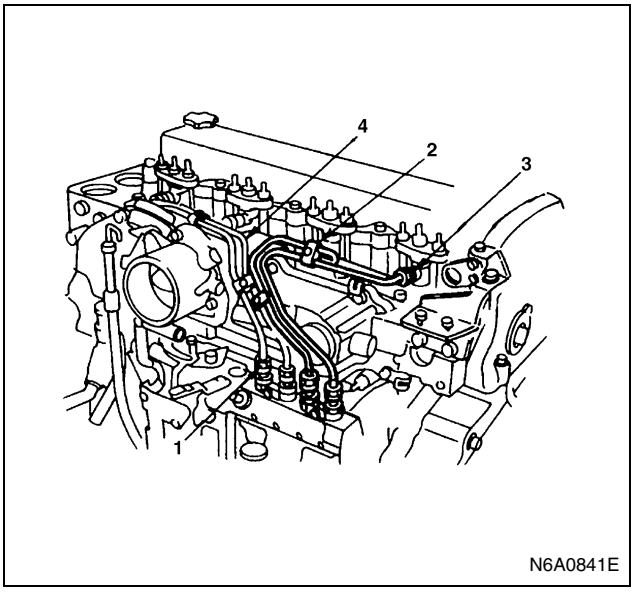
Removal

Preparation

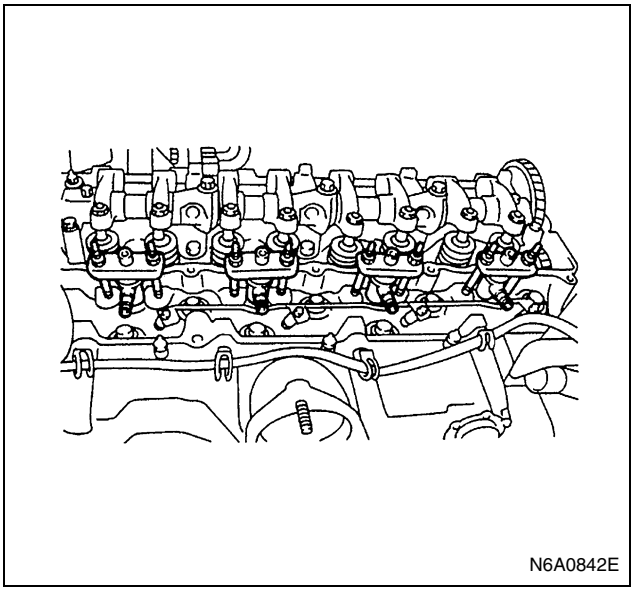
- Disconnect battery ground cable.
- Tilt the cab.

1. Nozzle Cover
2. Leak-Off Pipe
3. Fuel Injection
   1) Loosen the injection pipe sleeve nuts (1). Do not apply excessive force to the injection pipes (4).
   2) Loosen the injection pipes clips (2).
   3) Remove the injection pipe assembly.

Plug the delivery valve holder ports and nozzle holder (3) ports with caps to prevent the entry of foreign material.



4. Injection Nozzle Assembly
   Mark the nozzle holder assemblies fitting positions by tagging each nozzle holder assembly with the cylinder number from which it was removed.



Inspection

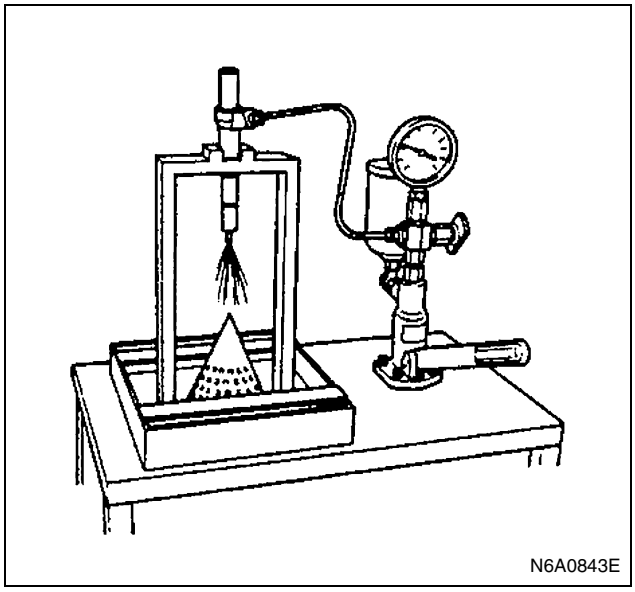
Before disassembling the injection nozzle assembly, check nozzle opening pressure, spray pattern, chatter and oil leakage.

Opening Pressure

Use a nozzle tester to check the injection nozzle opening pressure.

If the opening pressure is above or below the specified value, the injection nozzle must be replaced or adjusted.

Injection Nozzle Opening Pressure		MPa (kg/cm^2/psi)
4HF1/4HF1-2/4HG1		18.1 (185/2,631)
4HE1-TC		21.6 (220/3,128)
4HG1-T	1st	18.1 (185/2,631)
	2nd	21.1 (215/3,057)



Spray Pattern

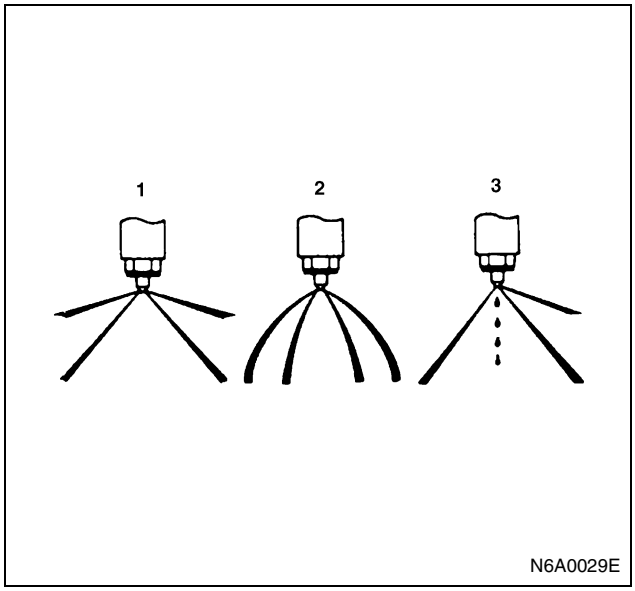
Check the spray pattern

Refer to the illustration.

Spray Condition

- Correct (1)
- Incorrect (Restrictions in orifice) (2)
- Incorrect (Dripping) (3)

If the spray condition is bad, the injection nozzle must be replaced or adjusted.



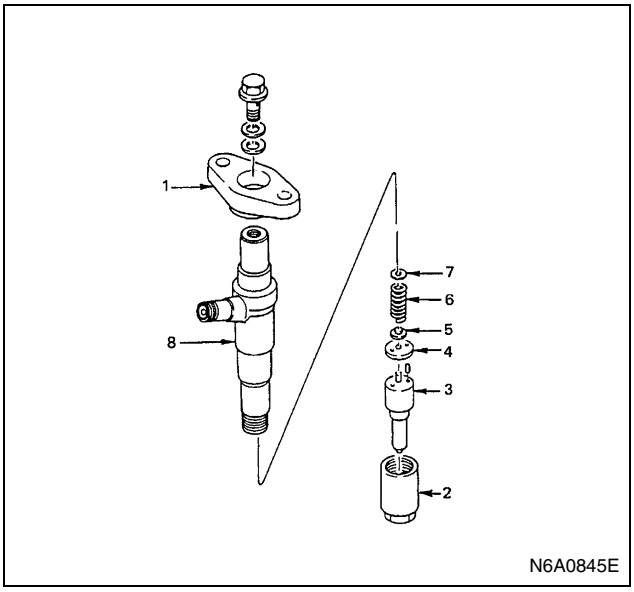
Leakage
Hold the tester handle to about 2,070 kPa (21 kg/cm^2/ 300 psi) below the opening pressure. If no drops of fuel fall from the nozzle tip within 10 seconds, the nozzle is not leaking.

Chatter
An easily audible chatter at all pump lever speeds should be heard.

WARNING:
TEST FLUID FROM THE INJECTION NOZZLE WILL SPRAY OUT UNDER GREAT PRESSURE. IT CAN EASILY PUNCTURE A PERSON'S SKIN. KEEP YOUR HANDS AWAY FROM THE INJECTION NOZZLE TESTER AT ALL TIMES.

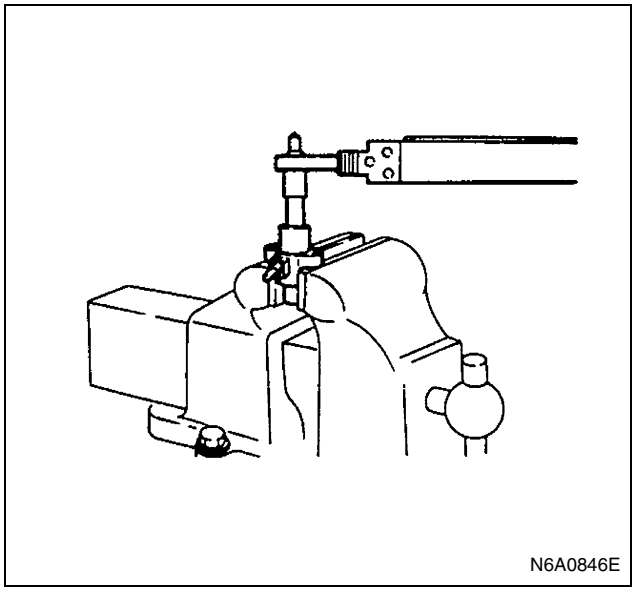
Disassembly

Clamp the injection nozzle holder in a vice.



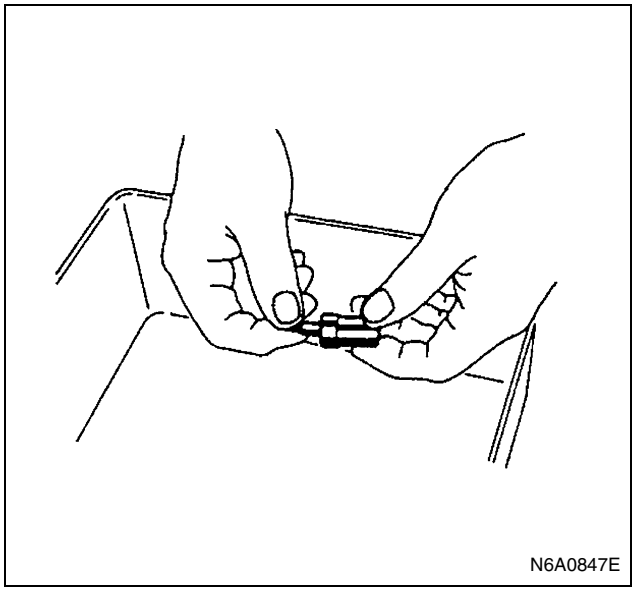
Legend
1. Flange
2. Retaining nut
3. Injection nozzle
4. Spacer
5. Spring seat
6. Nozzle spring
7. Adjusting shim
8. Nozzle holder body

1. Flange
2. Retaining Nut
   Use a wrench to remove the injection nozzle retainer nut.



3. Injection Nozzle
   Keep the nozzle along with the needle valve separately to maintain the original nozzle to needle valve combination.
4. Spacer
5. Spring Seat
6. Nozzle Spring
7. Adjusting Shim
   Keep the adjusting shims in the original groups to hold the initial shim to nozzle spring combination.
8. Nozzle Holder Body

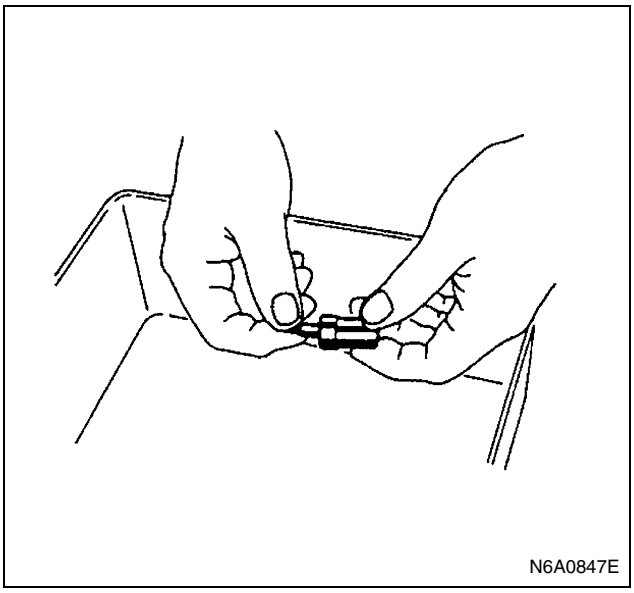
Caution:
- Wash all the parts removed and arrange them on a cylinder basis, care should be taken not to miss any parts.
- Soak the nozzle assembly in a parts receptacle filled with light oil.
- Care should be taken not to miss shim, if used.



Inspection

Injection Nozzle Needle

1. Remove the nozzle from the nozzle body.
2. Carefully wash the nozzle needle and the nozzle body in clean diesel fuel.
3. Check that the nozzle needle moves smoothly inside the injection nozzle body.
   If the nozzle does not move smoothly, it must be repaired (See “Nozzle Lapping Procedure” below).

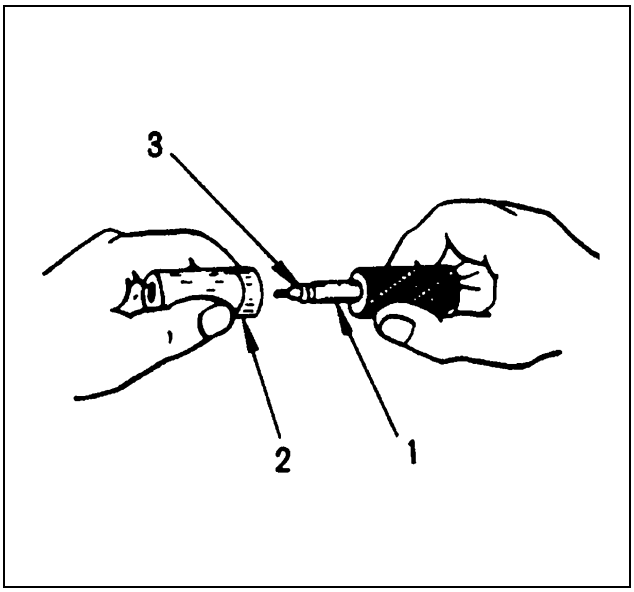


N6A0847E

Nozzle Lapping Procedure

1. Lap the nozzle needle (1) and the nozzle body (2) by applying a compound of oxidized chrome and animal oil (3).

Notice:
Do not apply an excessive amount of the oxidized chrome and animal oil compound to the injection needle valve seat area.



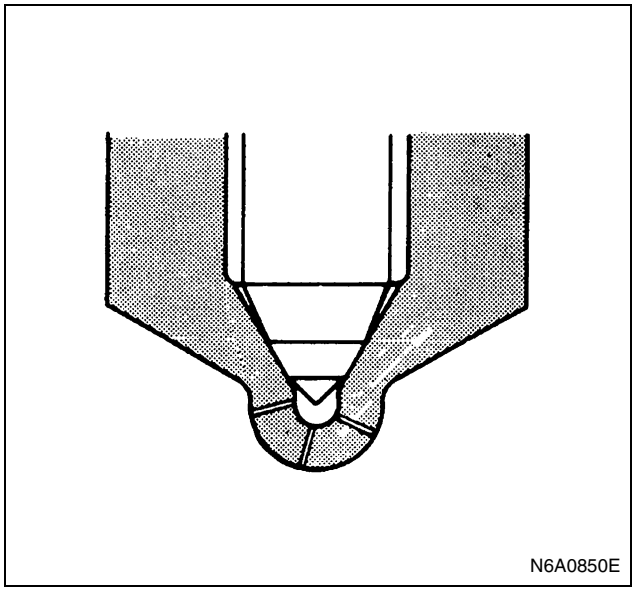
2. Carefully wash the needle valve and the nozzle body in clean diesel fuel after lapping.

Nozzle Body and Needle Valve

Check the nozzle body and the needle valve for damage and deformation.
The nozzle and body assembly must be replaced if either of these two conditions are discovered during inspection.

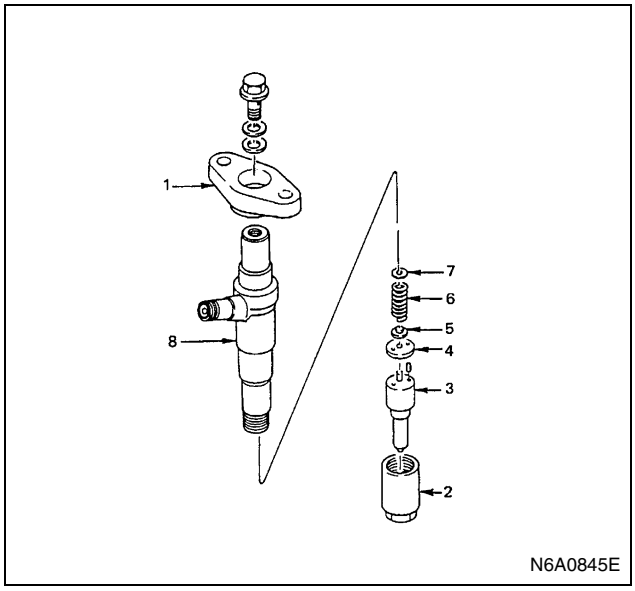
Notice:
New nozzles must be cleaned in a solvent to remove protective coating.

The nozzle body and needle must always be replace as an assembly.



N6A0850E

Reassembly



N6A0845E

Legend

1. Flange
2. Retaining nut
3. Injection nozzle
4. Spacer
5. Spring seat
6. Nozzle spring

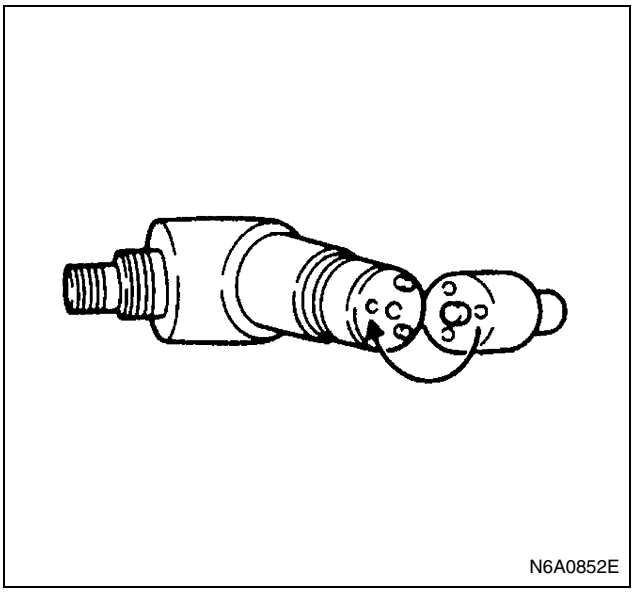
8. Nozzle holder body

1. Nozzle Holder Body
2. Adjusting Shim
3. Nozzle Spring
4. Spring Seat
5. Spacer
6. Injection Nozzle
   Install the nozzle dowel pin with it set to the dowel hose of the nozzle holder body.



7. Retaining Nut
   Clamp the injection nozzle holder in a vice.
   Tighten the injection nozzle holder retaining nut to the specified torque.

Tighten:
Injection nozzle holder retaining nut to 34 N·m (3.5 kg·m / 25 lb·ft)

   Remove the injection nozzle holder from the vice.
8. Flange

Adjustment of Injection Starting Pressure

After reassemble of the injection nozzle, recheck the opening pressure and spray condition.

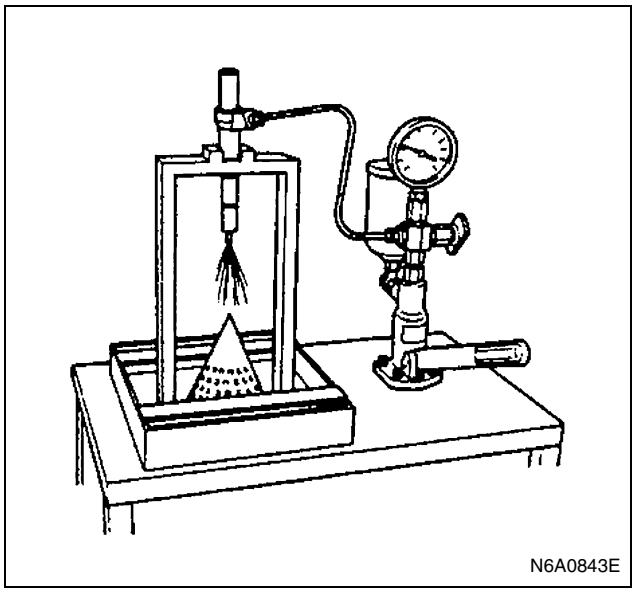
Opening Pressure

Attach the injection nozzle holder to the injection nozzle tester.

Apply pressure to the nozzle tester to check that the injection nozzle opens at the specified pressure.

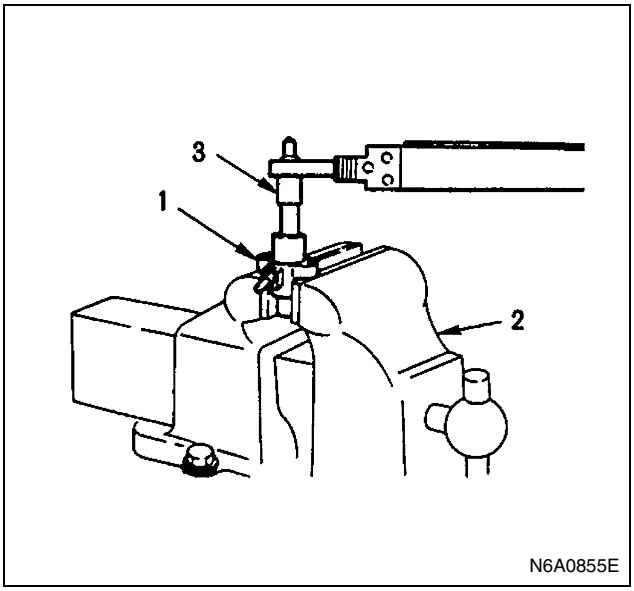
If the injection nozzle does not open at the specified pressure, install or remove the appropriate number of adjusting shims to adjust it.

Injection Nozzle Opening Pressure	MPa (kg/cm^2/psi)
4HF1/4HF1-2/4HG1	18.1 (185/2,631)
4HE1-TC	21.6 (220/3,128)

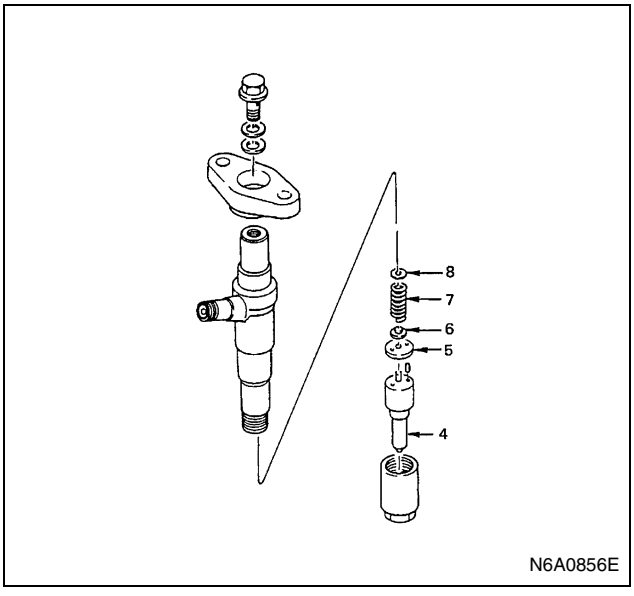


Opening Pressure Adjustment

1. Clamp the injection nozzle holder (1) in a vise (2).
2. Use a wrench to remove the injection nozzle retaining nut (3).



3. Remove the injection nozzle holder from the vise.
4. Remove the injection nozzle (4), the spacer (5), the spring seat (6) the spring (7) and the adjusting shim (8).
5. Install the new adjusting shim, the spring, the sprig seat, the spacer, the injection nozzle, and the retaining nut.



6. Clamp the injection nozzle holder in the vise.
7. Tighten the injection nozzle holder retaining nut to the specified torque.

Tighten:
Injection nozzle holder retaining nut to 34 N·m (3.5 kg·m / 25 lb·ft)

8. Remove the injection nozzle holder from the vise.
9. Attach the injection nozzle holder to the injection nozzle tester.
10. Apply pressure to the nozzle tester to check that the injection nozzle opens at the specified pressure.
    If the injection nozzle does not open at the specified pressure, install or remove the appropriate number or adjusting shims to adjust it.
    Removing or installing one shim will increase or decrease the nozzle opening pressure approximately 370 kPa (3.77 kg/cm^2 / 53.6 psi).

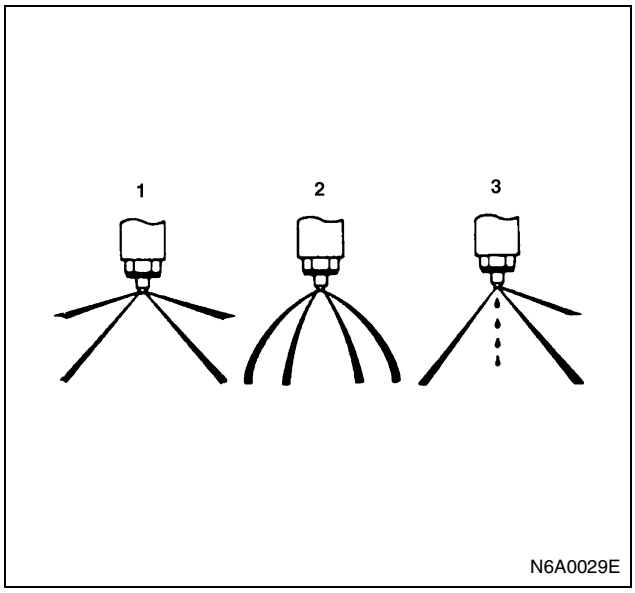
Adjusting Shim Availability	mm (in)
Range	0.5 — 1.5 (0.02 — 0.06)
Increment	0.025 (0.001)
Total Number of Shims	41

Spray Pattern

Check the spray condition.
Refer to the illustration.
Spray Condition

- Correct (1)
- Incorrect (Restrictions in orifice) (2)
- Incorrect (Dripping) (3)

If the spray condition is bad, the injection nozzle must be replaced or adjusted.



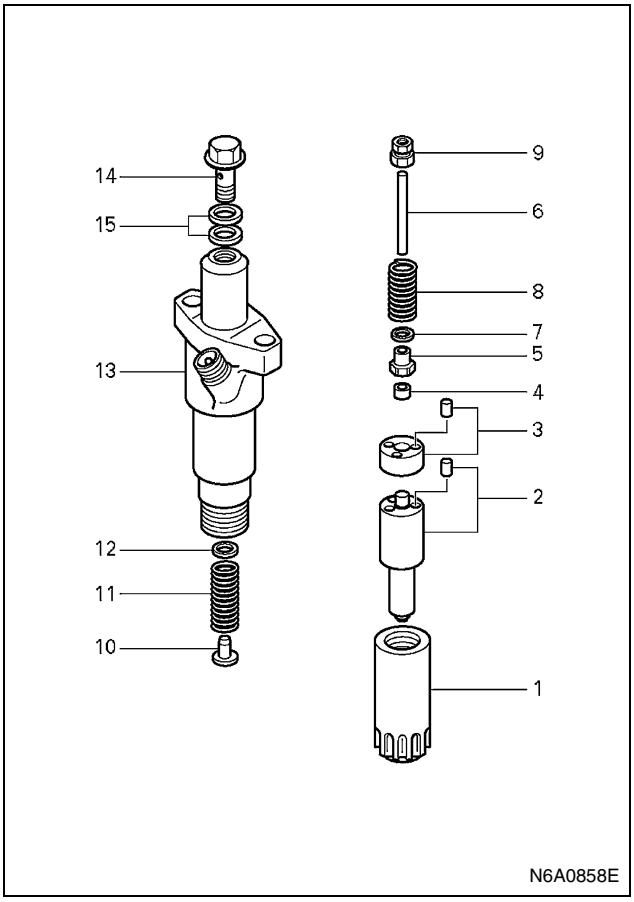
Refer to “Adjustment”.

Notice:
Adjust the nozzle in a well ventilated area. Do not inhale oil or spray injected from the nozzle.

Disassembly

4-1 Injection Nozzle (Two spring nozzle holder) (4HG1-T only)

The two-spring nozzle holder has been developed to reduce NOx (Nitrogen Oxides) and particulates from direct injection diesel engine exhaust.



Legend

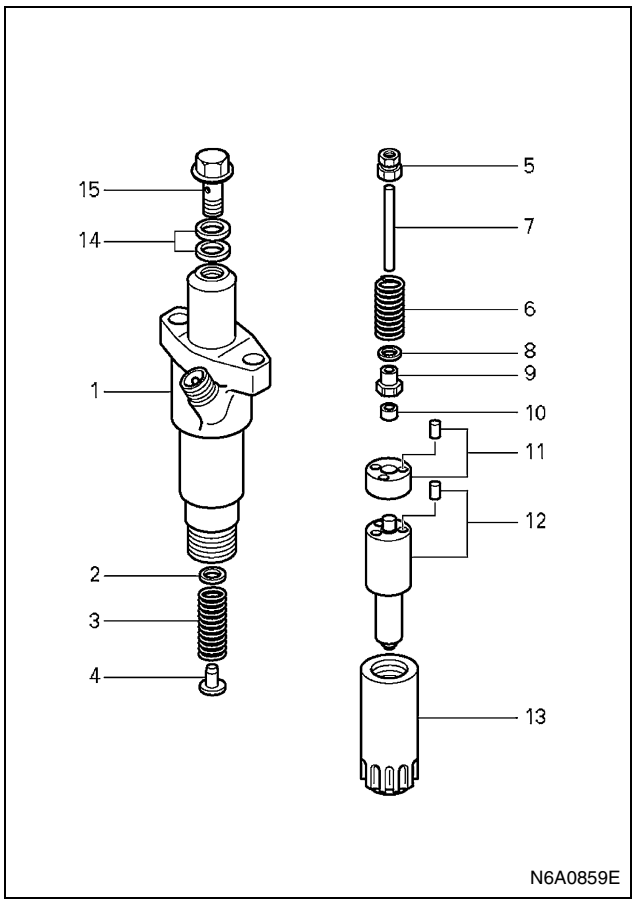
1. Retaining nut
2. Nozzle & pin
3. Spacer & pin
4. Lift piece
5. Spring seat
6. Push rod
7. Shim (Second nozzle opening pressure adjustment)
8. Second spring
9. Collar
10. Spring seat
11. First spring
12. Shim (First nozzle opening pressure adjustment)
13. Nozzle holder body
14. Eye bolt
15. Gasket

1. Before disassembly remove carbon deposit from nozzle and nozzle holder using a wire brush and wash the outside nozzle holder assembly.

Caution:
Do not touch nozzle holes with the wire brush during cleaning it.

2. Disassemble the nozzle holder assembly to numerical order.

Reassembly and Opening Pressure Adjustment



Legend

1. Nozzle holder body
2. Shim (First opening pressure adjustment)
3. First spring
4. Spring seat
5. Collar
6. Second spring
7. Push rod
8. Shim (Second opening pressure adjustment)
9. Spring seat
10. Lift piece
11. Spacer & pin
12. Nozzle & pin
13. Retaining nut
14. Gasket
15. Eye bolt

The nozzle holder is adjusted as the components are reassembled in the sequence above.
As adjustment of the two-spring nozzle holder is made in hundredths of a millimeter, clean the parts thoroughly in light oil to completely remove any dirt or foreign matter.

Reassembly and Adjustment Procedure

1. First nozzle opening pressure adjustment
   - Adjust the first nozzle opening pressure using the shim.

2. Full needle valve lift confirmation
   - Confirm the full needle valve lift in accordance with the closed method.
3. Pre-lift confirmation
   - Confirm pre-lift in accordance with the closed method.

Caution:
If not as specified, replace the nozzle assembly, lift piece, pins and spacer using the nozzle service kit.

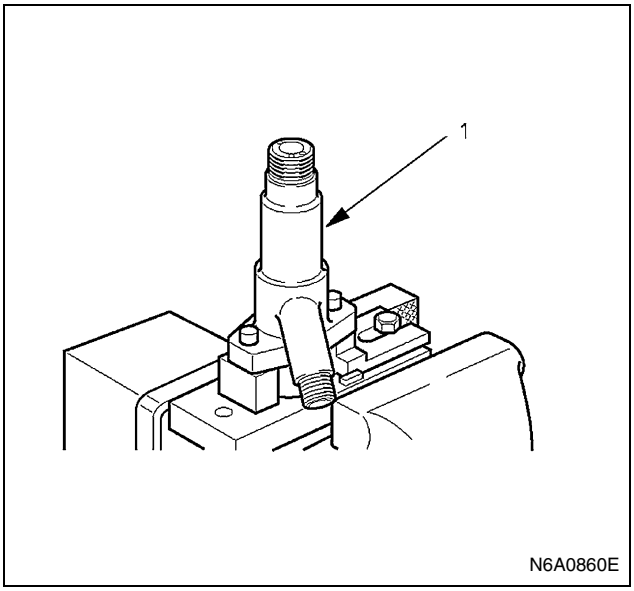
4. Second nozzle opening pressure confirmation
   - Confirm the second nozzle opening pressure in accordance with the closed method.
5. Second nozzle opening pressure adjustment
   - Adjust the second nozzle opening pressure using the shim.
6. Final inspection
   - Confirm the condition of the fuel spray with the nozzle and nozzle holder assembled.

Adjustment Service Data (4HG1-T only)

Nozzle needle valve full-lift		0.30 mm (0.0118 in)
Nozzle needle valve pre-lift		0.04 mm (0.0016 in) at 19.1 MPa (195 kg/cm^2, 2,770 psi)
Nozzle pressure	1st Stage	18.1 MPa (185 kg/cm^2, 2,630 psi)
	2nd Stage	22.1 — 23.0 MPa (225 — 235 kg/cm^2, 3,200 — 3,342 psi) at lift 0.09 mm (0.0035 in) = pre lift + 0.05 mm (0.0020 in)

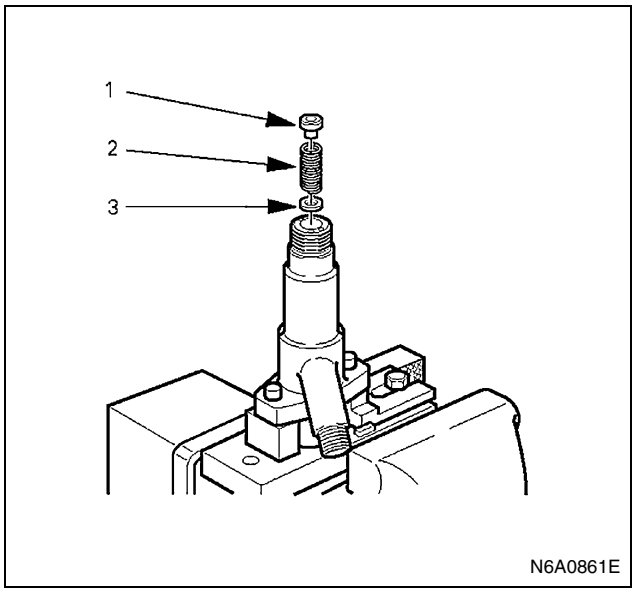
First nozzle opening pressure adjustment

1. Clamp the nozzle holder in a vise.



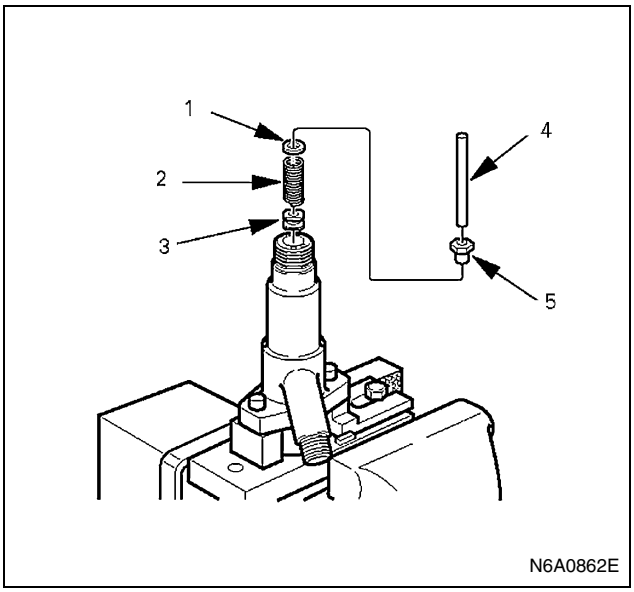
Legend
1. Nozzle holder body

2. Install the shim, first spring and spring seat in the nozzle holder.



Legend
1. Spring seat
2. First spring
3. First nozzle opening pressure adjusting shim

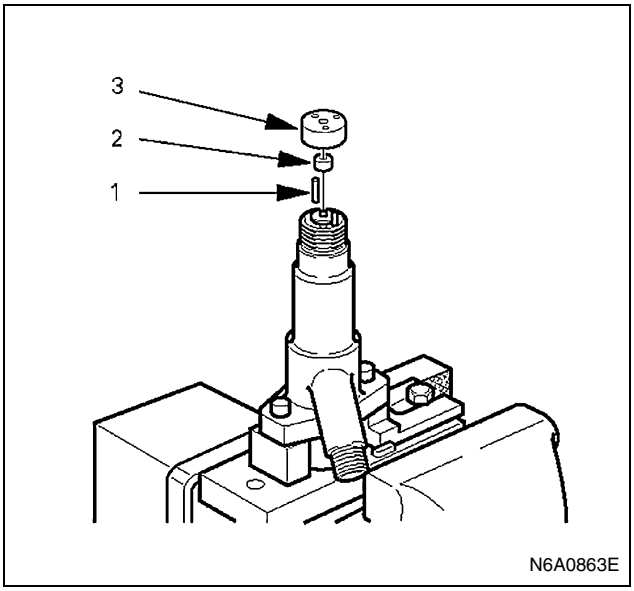
3. Install the collar, second spring, shim, spring seat and push rod in the nozzle holder.



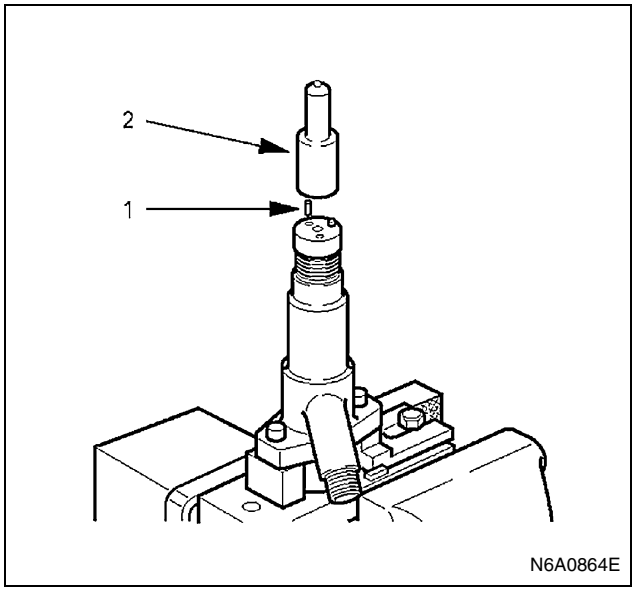
Legend

1. Second nozzle opening pressure adjusting shim
2. Second spring
3. Collar
4. Push rod
5. Spring seat

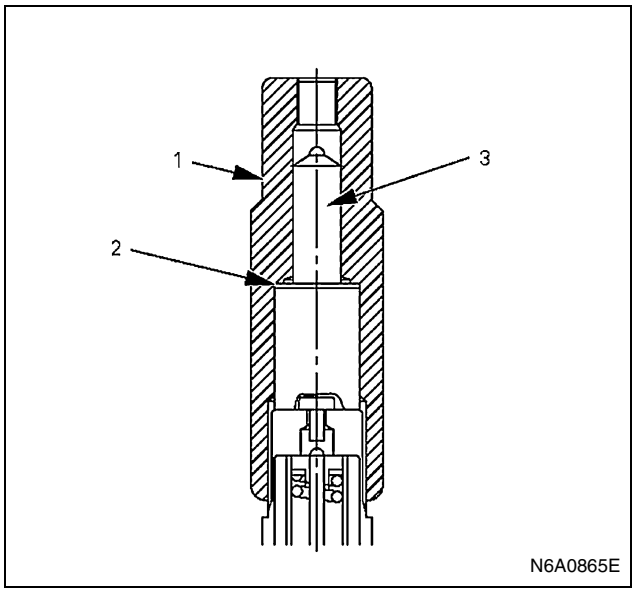
4. Install the pins (1), lift piece (2) and spacer (3) in the nozzle holder.



5. Install the pins (1) in the spacer.
6. Install the nozzle (2) on the spacer.



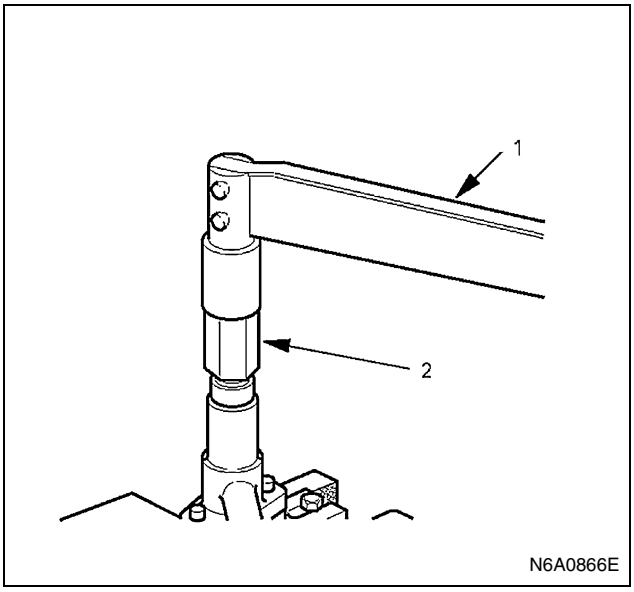
7. Hand-tighten the adjustment retaining nut together with the gasket to the nozzle holder.
   Retaining nut: 157892-3200 (* Bosch AS)
   Gasket: 157892-5100 (* Bosch AS)
   (* Bosch Automotive System Corporation)



Legend

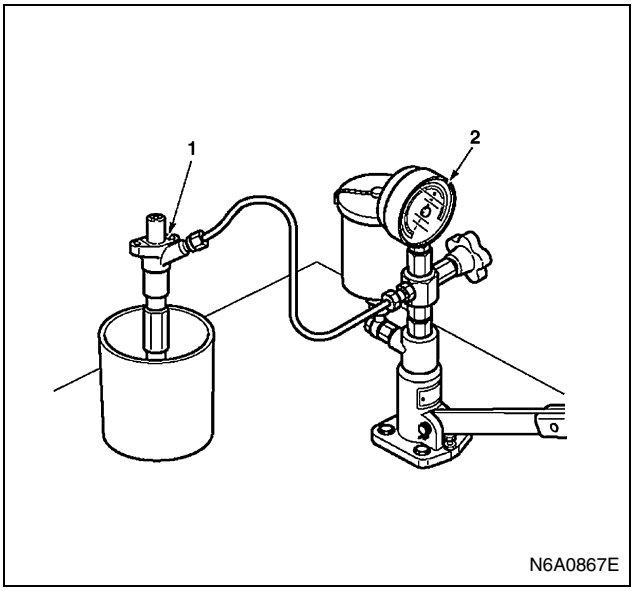
1. Retaining nut (special tool)
2. Gasket
3. Nozzle

8. Tighten the adjustment retaining nut to the specified torque.
   Torque: 29 — 39 N·m (3.0 — 4.0 kg·m/257 — 345 lb·in)



Legend
1. Torque wrench
2. Retaining nut (special tool)

9. Set the nozzle holder (1) to the nozzle tester (2).



10. Operate the nozzle tester and measure the first nozzle opening pressure.
11. If the first nozzle opening pressure is not as specified, disassemble the nozzle holder and replace the shim until the pressure is as specified.

Caution:
- Use a micrometer to measure shim thickness.
- Use some combination of 3 adjusting shims to adjust the pressure.
- First nozzle opening pressure adjusting shims

Part No. (ISUZU)	Thickness mm (in)
115349-0420	0.40 (0.0157)
115349-0430	0.50 (0.0197)
115349-0440	0.52 (0.0205)
115349-0450	0.54 (0.0213)
115349-0460	0.56 (0.0220)
115349-0470	0.58 (0.0228)
115349-0480	0.60 (0.0236)
115349-0490	0.70 (0.0276)

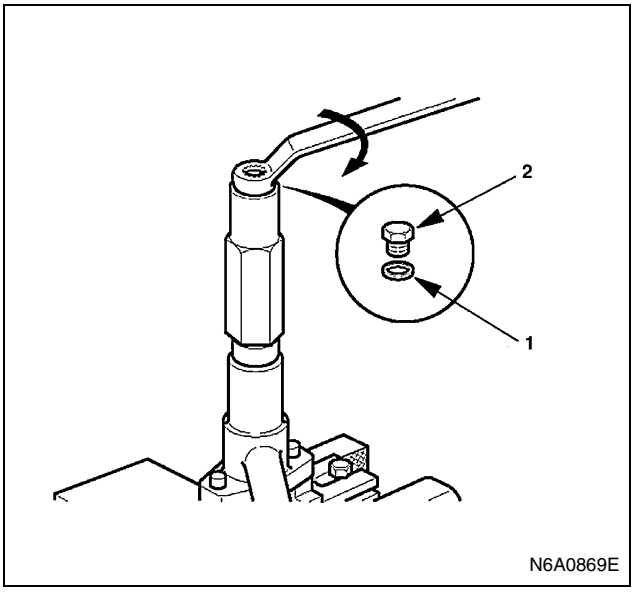
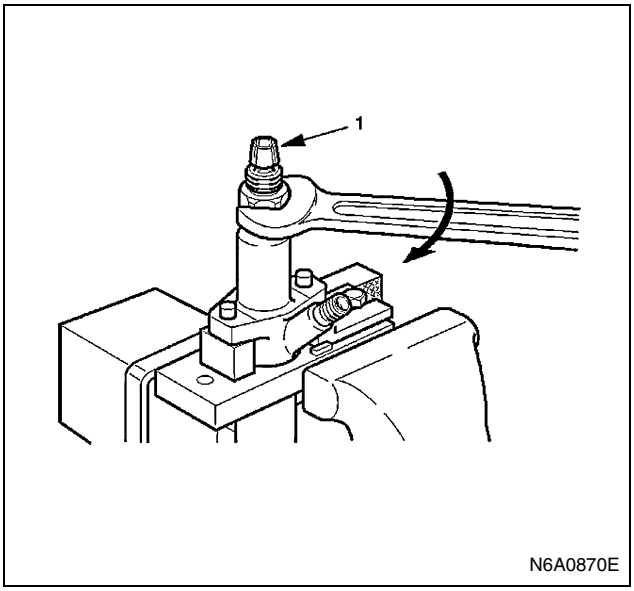
Full Needle Valve Lift Confirmation

1. Install the gasket (1) and plug (2) on the adjustment retaining nut.
   Gasket:
   026508-1140 (Bosch AS)
   894227-6020 (ISUZU)
   Plug:
   157892-1600 (Bosch AS)

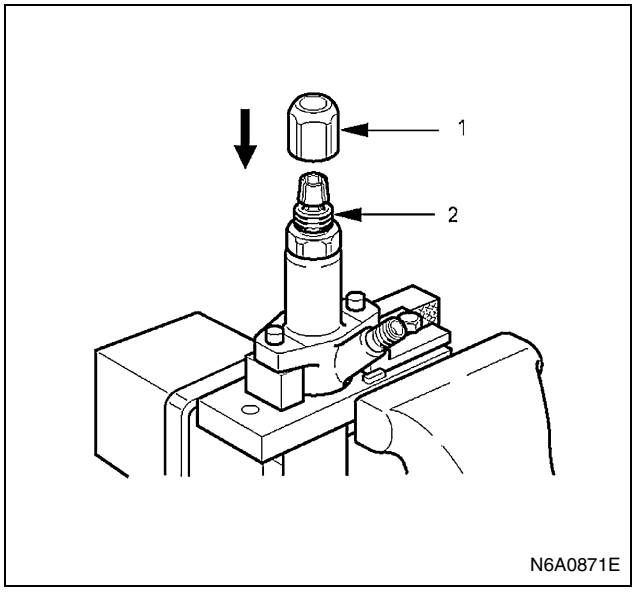


2. Position the nozzle holder with the nozzle facing down and install the dial gauge holder on the nozzle holder.
   Dial gauge holder: 157892-5000 (Bosch AS)



Legend
1. Holder (special tool)

3. Install the nut on the dial gauge holder.
   Nut: 157892-1000 (Bosch AS)

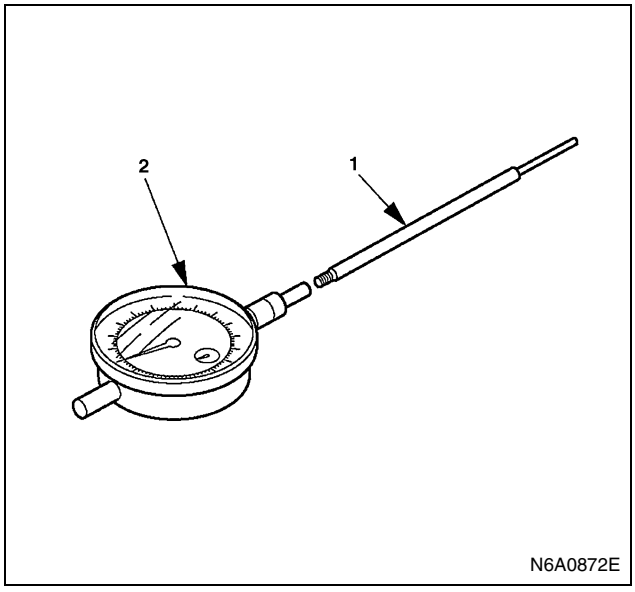


Legend
1. Nut (special tool)
2. Holder (special tool)

4. Install the pin (1) to the dial gauge (2).

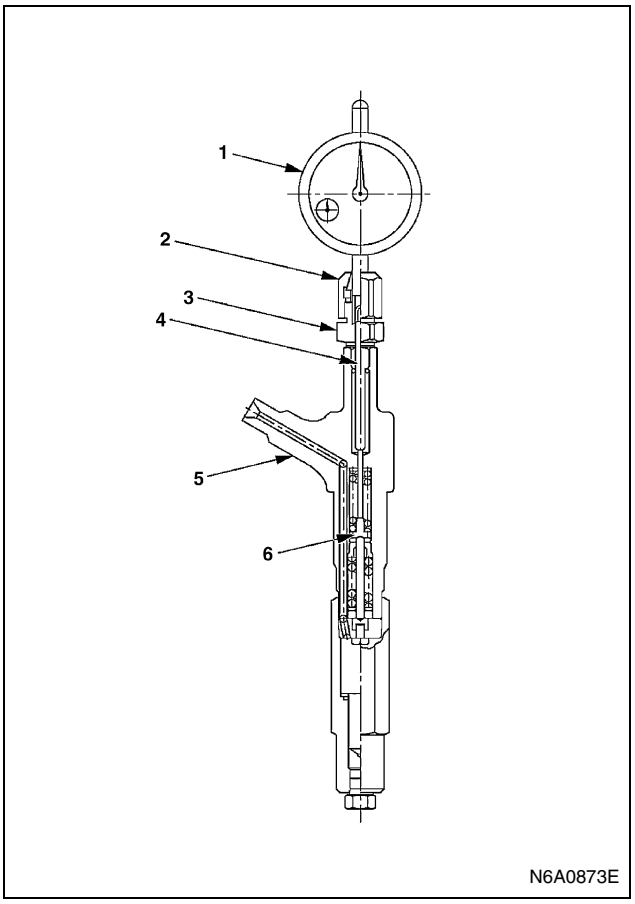
Notice:
The lengths of the pins do not include the threaded portions.

Pin (l=100 mm (3.94 in)):
157892-5200 (Bosch AS)
Dial gauge:
157954-3800 (Bosch AS)
185317-0150 (ISUZU)



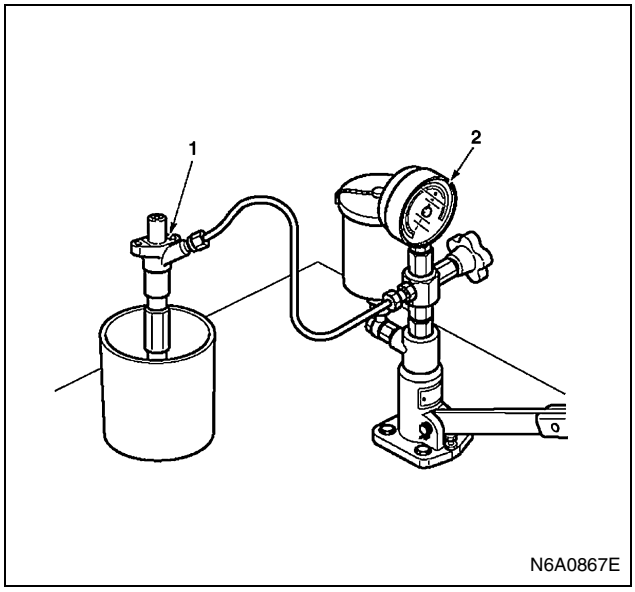
5. Secure the dial gauge to the nozzle holder using the nut so that the pin contacts the tip of the first spring seat.

Caution:
- Secure the dial gauge so that a stroke of 2 mm (0.08 in) can be measured.
- Do not over-tighten the nut as the dial gauge shaft may jam. (Confirm from the dial gauge that the shaft moves smoothly.)



Legend
1. Dial gauge
2. Nut
3. Holder
4. Pin
5. Nozzle holder
6. First spring seat

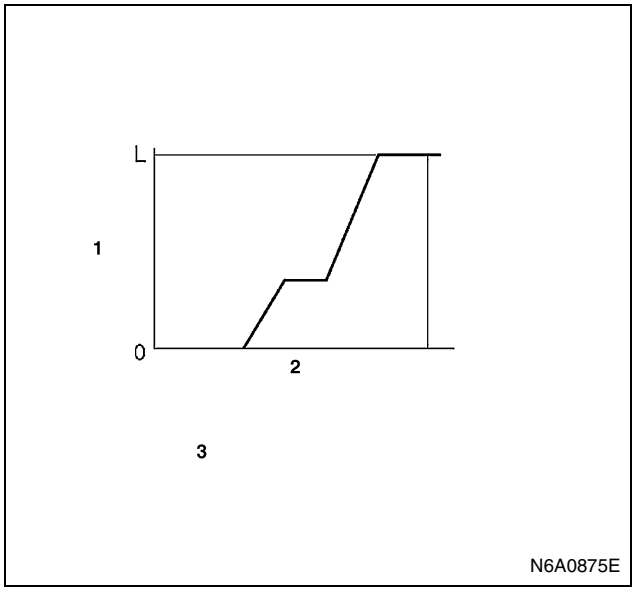
6. Set the nozzle holder (1) to the nozzle tester (2) and put needle to zero on the dial gauge.
7. Operate the nozzle tester to bleed any air from inside the retaining nut and to confirm that no fuel leaks.



8. Operate the nozzle tester and increase the in-line pressure to 34.3 — 44.1 MPa (350 — 450 kg/cm^2 / 4,975 — 6,396 psi) so that the nozzle's needle valve moves through its full lift.
   Record full lift 'L'. (Read dial gauge)

Nozzle Full Lift	mm (in)
0.30 (0.0118)	

Notice:
The above operation is used to determine whether the nozzle seat is worn and whether the nozzle assembly is in good condition.

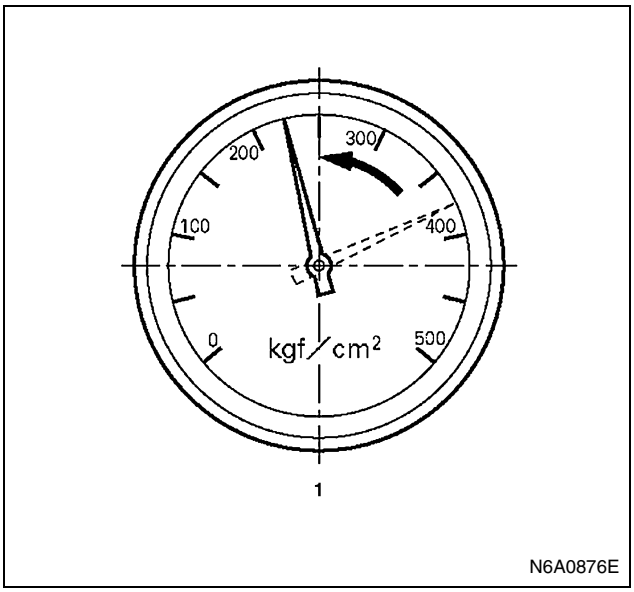


Legend
1. Needle valve
2. First nozzle opening pressure 34.3 — 44.1 MPa (350 — 450 kg/cm^2 / 4,975 — 6,396 psi)
3. In line pressure

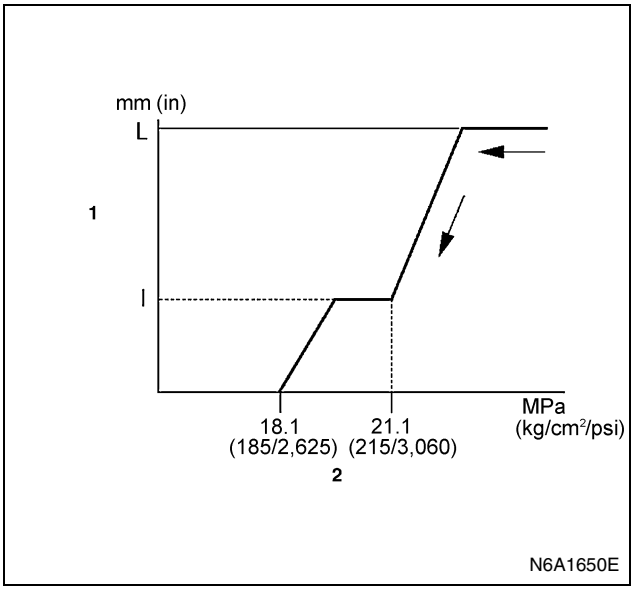
Pre-lift Confirmation

1. With the needle valve at full lift, release the nozzle tester handle.

Notice:
The in-line pressure will decrease and needle valve lift (as indicated on the dial gauge) will also decrease a little.



Legend
1. Pressure gauge



Legend
1. Needle valve lift
2. In line pressure

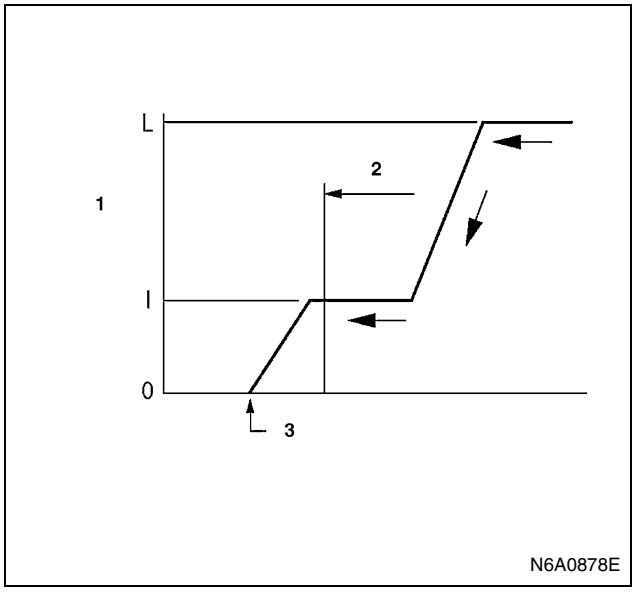
2. Read the needle valve lift 'I' from the dial gauge indication (once the needle valve has descended when the second spring has stopped operating). Refer to the pre-lift measuring point for 'I'.

Pre-lift measuring point:

Read the dial gauge at **first nozzle opening pressure +approx 1 MPa (10 kg/cm^2 / 145 psi)**.

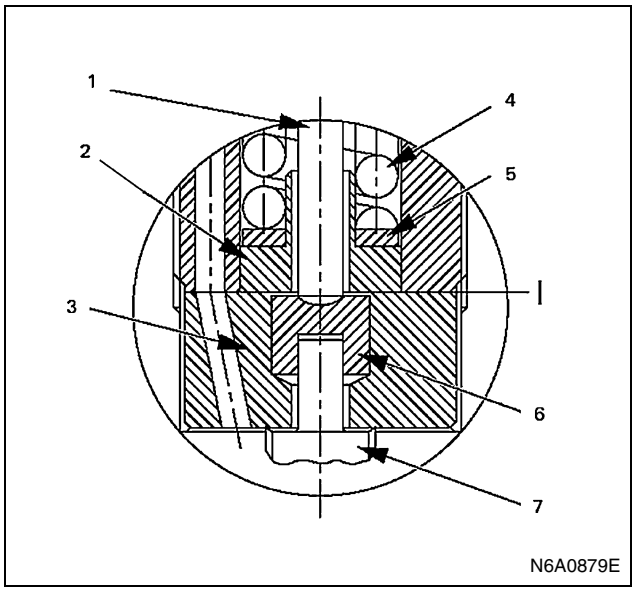
Pre-lift		
Engine	Pressure MPa (kg/cm^2 / psi)	Lift mm (in)
4HG1-T	19.1 (195/2,770)	0.04 (0.0016)

Notice:
This point can be found while the pressure is decreasing.



Legend
1. Needle valve lift
2. Measuring point of prelift
3. First nozzle opening pressure

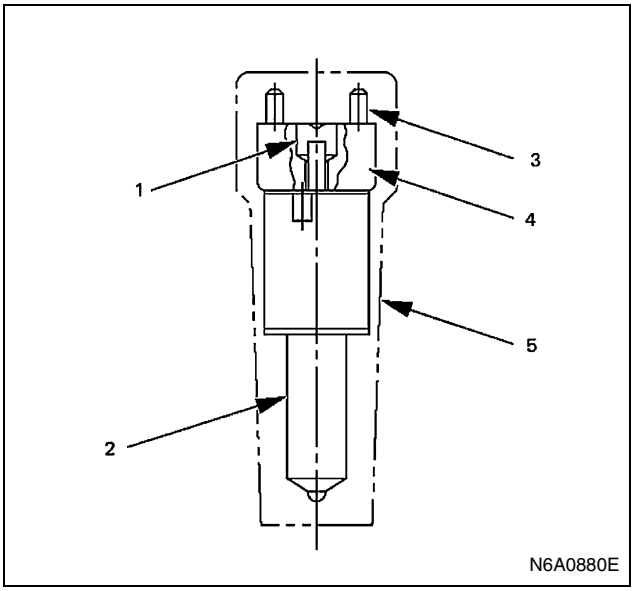
3. Confirm that pre-lift 'I' is as specified.



Legend
1. Push rod
2. Spring seat
3. Spacer
4. Second spring
5. Adjusting shim
6. Lift piece
7. Needle valve

4. If pre-lift is not as specified, replace the pins, lift piece, spacer and nozzle assembly as a set with the service kit.

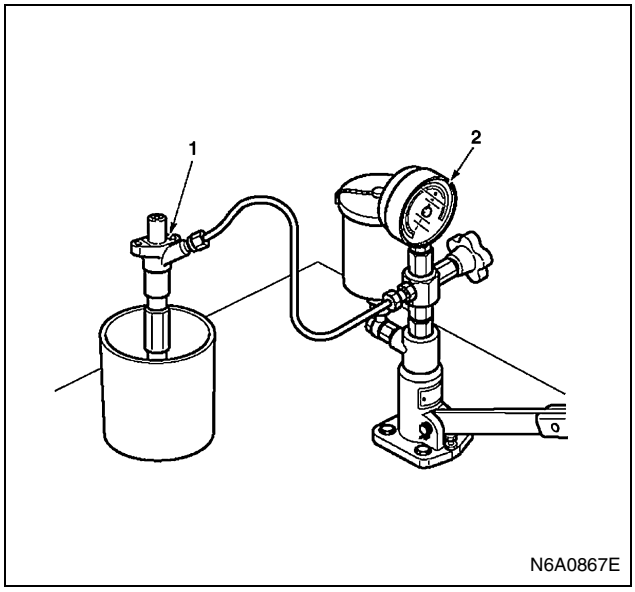
Service kit:	
4HG1-T	897313-8970



Legend
1. Lift piece
2. Nozzle assembly
3. Pin
4. Spacer
5. Capsule

Second Nozzle Opening Pressure Confirmation

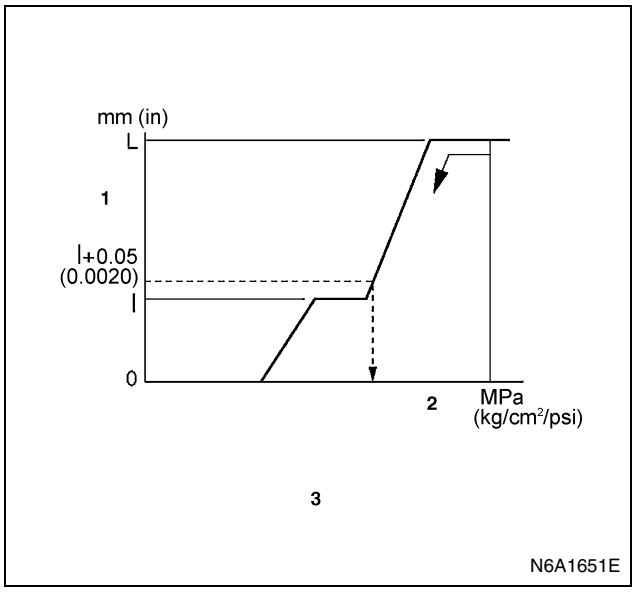
1. After pre-lift confirmation, operate the nozzle tester to increase in-line pressure to 34.3 — 44.1 MPa (350 — 450 kg/cm^2 / 4,975 — 6,396 psi) so that the nozzle's needle valve moves through its full lift.



Legend
1. Nozzle holder
2. Nozzle tester

2. Release the nozzle tester handle so that in-line pressure decreases.

Notice:
The in-line pressure will decrease and needle valve lift (as indicated on the dial gauge) will also decrease a little.

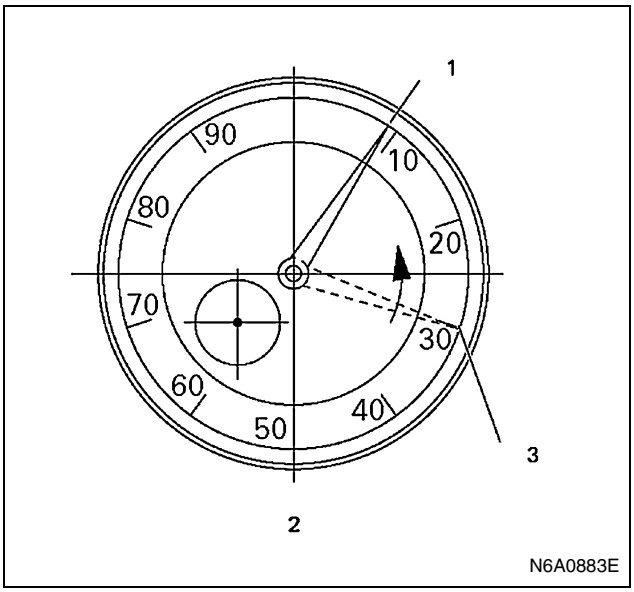


Legend
1. Needle valve lift
2. Second nozzle opening pressure 34.3 — 44.1 MPa (350 — 450 kg/cm^2 / 4,975 — 6,396 psi)
3. In line pressure

3. Then, read the pressure gauge indication (second nozzle opening pressure) the instant that the dial

gauge indicates the specified needle valve lift (usually pre-lift l + 0.05 mm (0.0020 in).

Second Nozzle Opening Pressure		
	Lift mm (in)	Pressure MPa (kg/cm^2/psi)
4HG1-T	0.09 (0.0035)	22.1 — 23.0 (225 — 235/ 3,200 — 3,342)



Legend

1. When needle valve lift is l + 0.05 mm (0.0020 in)
2. Dial gauge
3. Full needle valve lift

Second Nozzle Opening Pressure Adjustment

If the second nozzle opening pressure is not as specified, disassemble the nozzle from the nozzle holder and replace the shim until the pressure is as specified.

Caution:

- Because the second opening pressure changes when the first opening pressure changes, the second opening pressure must be adjusted when the first opening pressure changes.
- Use a micrometer to measure shim thickness.
- Use some combination of 3 adjusting shims to adjust the pressure.
- Second nozzle opening pressure adjusting shims

Part No. (ISUZU)	Thickness mm (in)

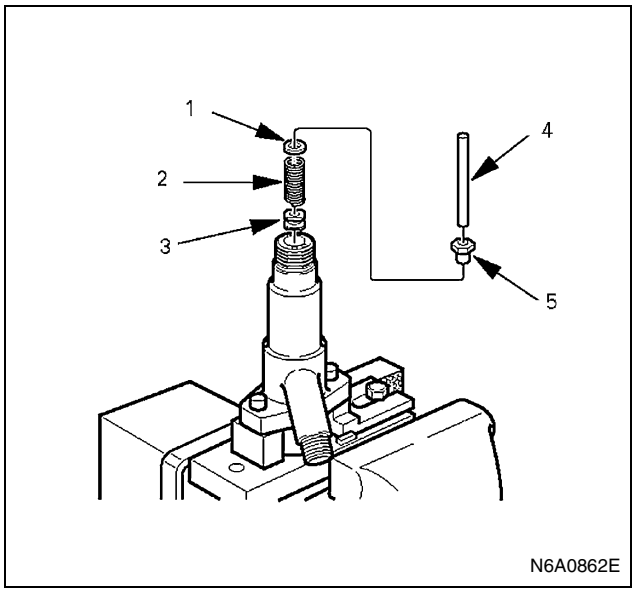
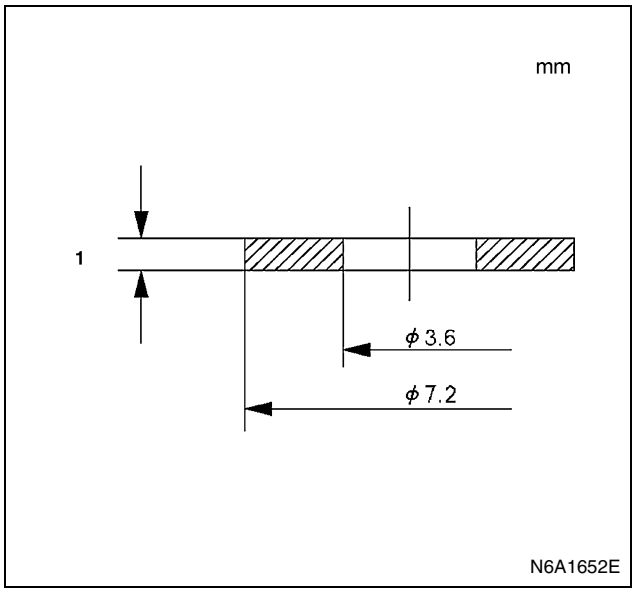
897116-0420	0.57 (0.0224)
897116-0430	0.58 (0.0228)
897116-0440	0.59 (0.0232)



Legend

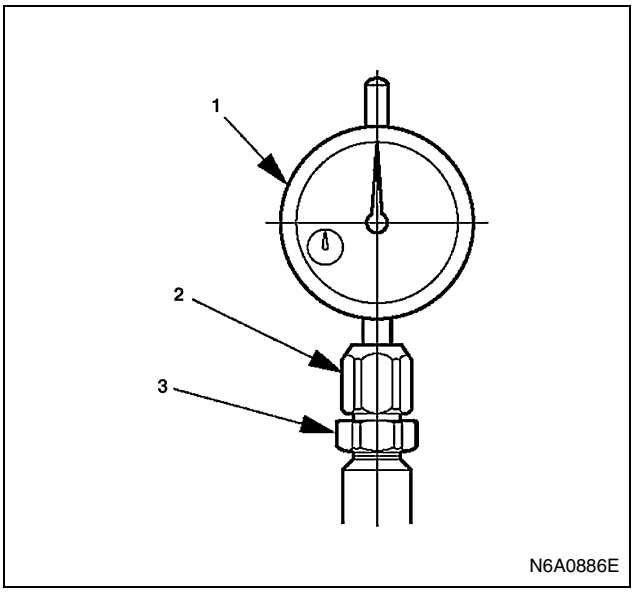
1. Second nozzle opening pressure adjusting shim
2. Second spring
3. Collar
4. Push rod
5. Spring seat



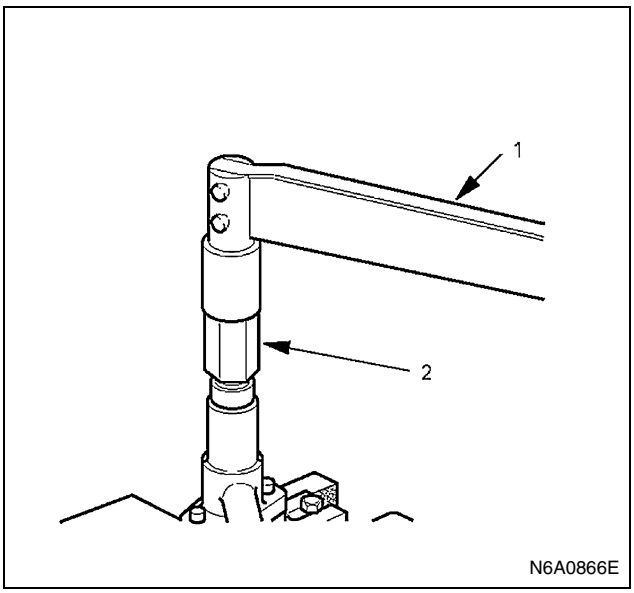
Legend
1. Thickness

Final Inspection

1. Remove the dial gauge (1), nut (2) and dial gauge holder (3).



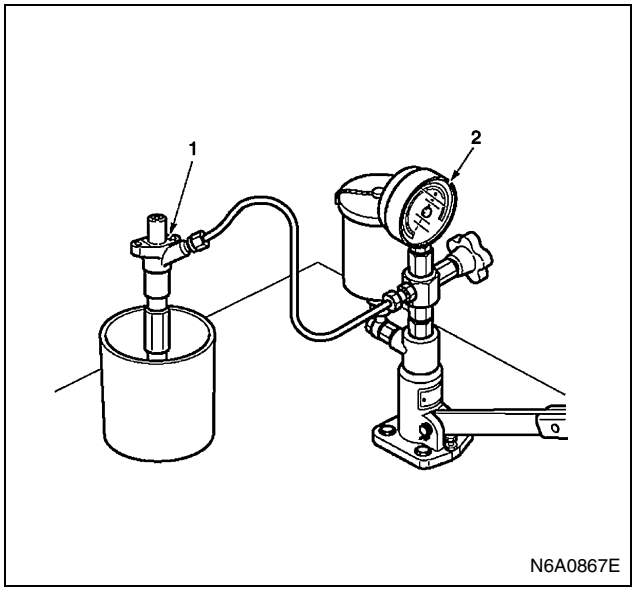
2. Remove the adjustment retaining nut and gasket.
3. Install the original retaining nut, confirm that the pins are inserted fully into the nozzle, and then hand-tighten the retaining nut. Then, tighten the original retaining nut to the specified torque.
   Torque: 29 — 39 N·m (3.0 — 4.0 kg·m / 22 — 29 lb·ft)



Legend
1. Torque wrench
2. Retaining nut (special tool)

4. Set the nozzle holder (1) to the nozzle tester (2) and check first nozzle opening pressure, spray condition, seat oil tightness and each part for oil leaks.
5. When replacing the nozzle, replace the nozzle, lift piece, pins and spacer as a set with the nozzle service kit.

Caution:
Pre-lift will not be as specified if only the nozzle is replaced.

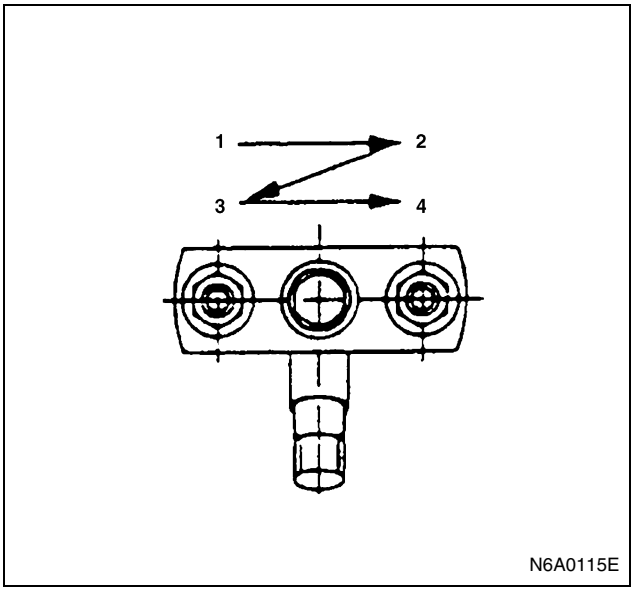


Installation

1. Injection Nozzle Assembly
   1) Install a new injection nozzle (1) gasket and O-ring (2) to the nozzle holder, and then install the nozzle holder to the cylinder head as shown in the illustration.

   2) Tighten the nozzle holder flange nuts to the specified torque in the numerical order.

Tighten:
Nozzle holder flange nuts to 19 N·m (1.9 kg·m / 14 lb·ft)



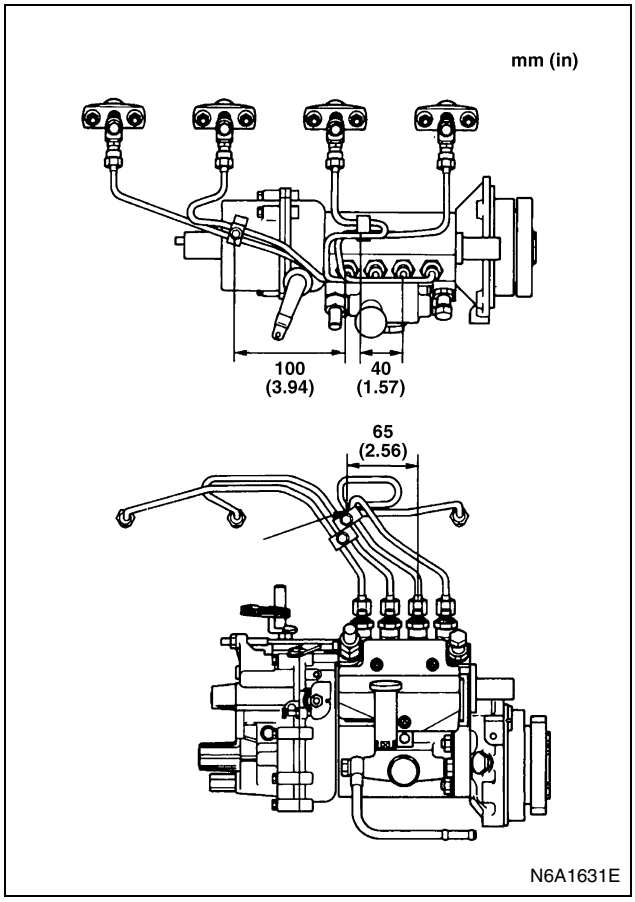
2. Fuel Injection Pipe
   1) Install the injection pipe assembly and temporarily tighten the injection pipe sleeve nuts.
   2) Set the clips in the prescribed position shown in the illustration.

Caution:
Make absolutely sure that the clip is correctly positioned.
An improperly positioned clip will result in injection pipe breakage and fuel pulsing noise.

Tighten:
Clip screw to 3 N·m (0.3 kg·m / 26 lb·in)

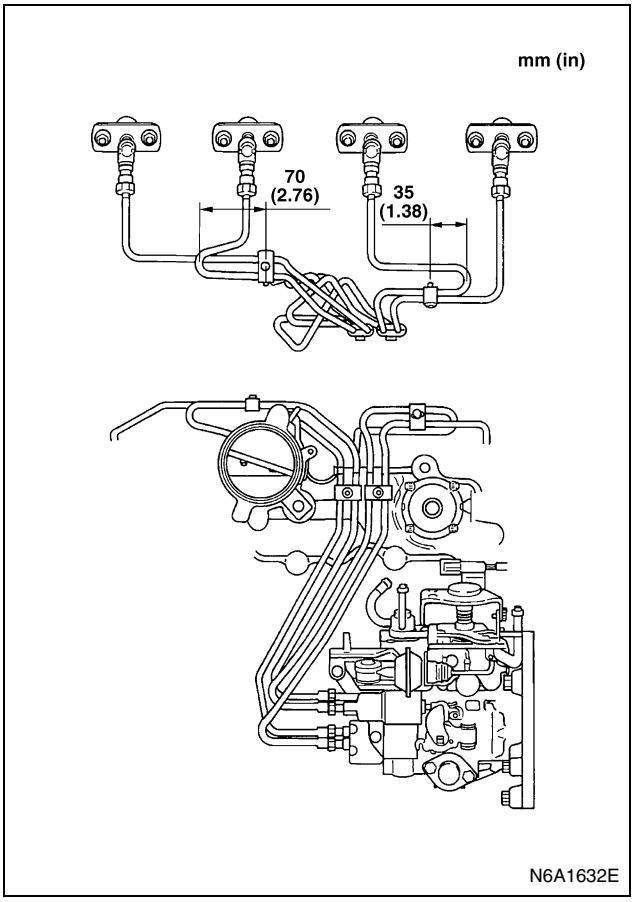
   3) Tighten the injection pipe sleeve nuts to the specified torque.

Tighten:
Injection pipe sleeve nut to 29 N·m (3 kg·m / 22 lb·ft)



3. Fuel Injection Pipe (4HF1-2 model only)
   1) Connect Injection Pipe and fix with clips as illustrated.

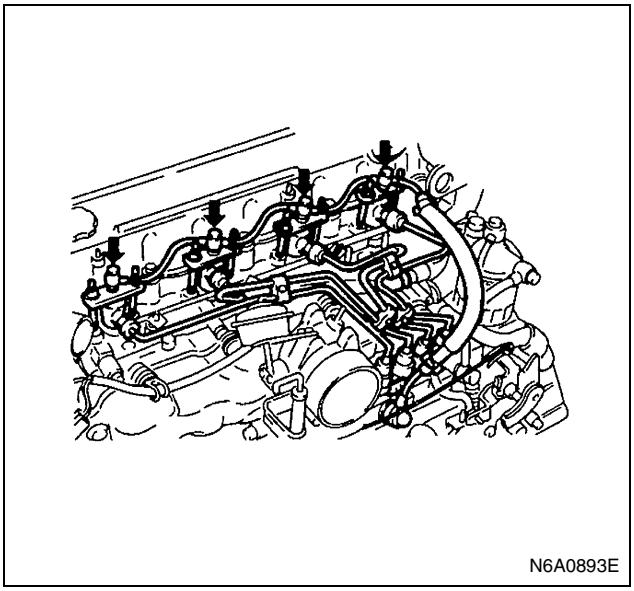
Tighten:
- Injection pipe to 29 N·m (3.0 kg·m / 22 lb·ft)
- Clip to 3 N·m (0.3 kg·m / 26 lb·in)



4. Leak Off Pipe

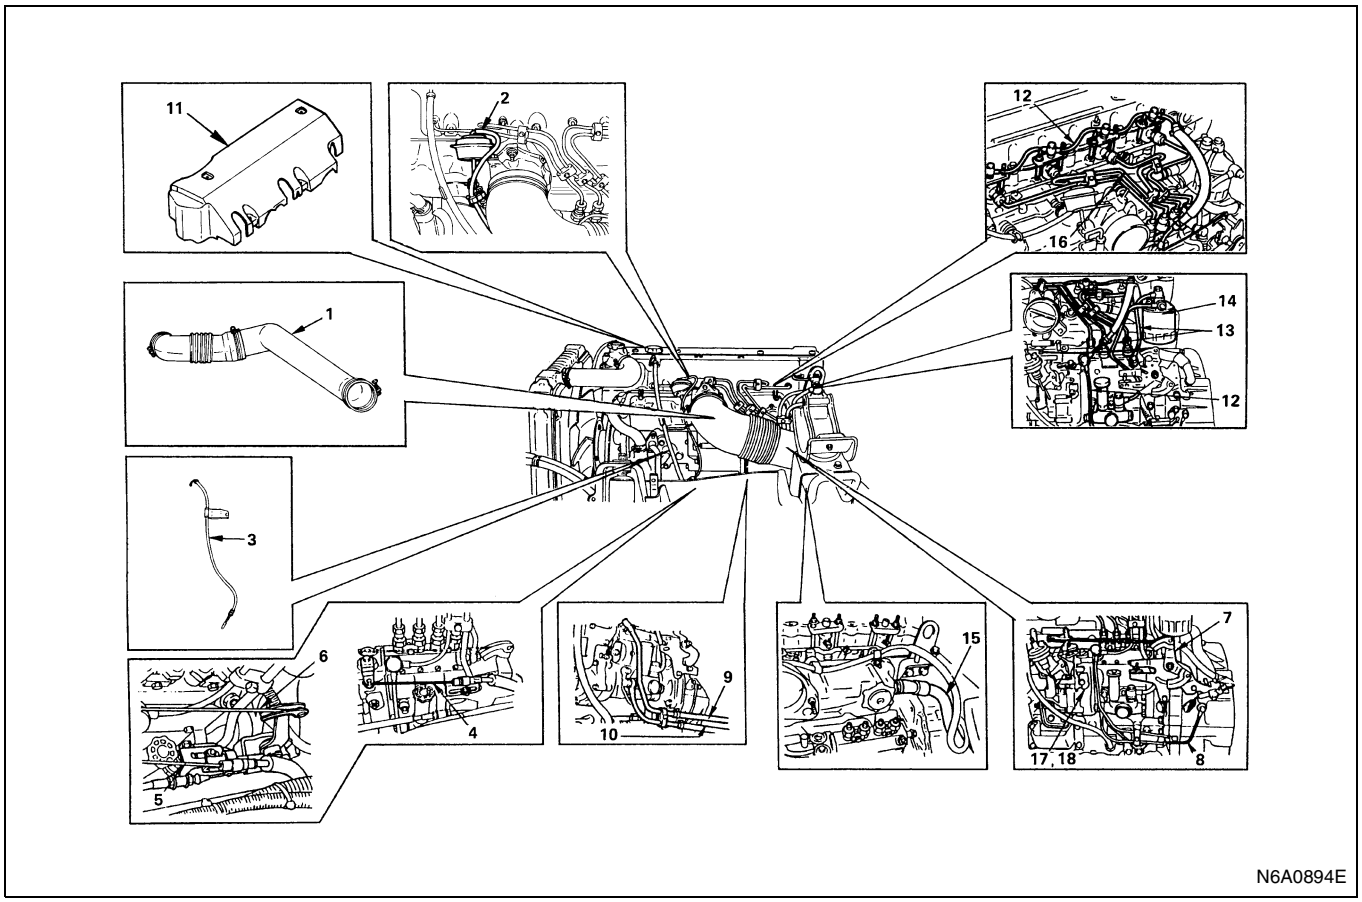
Leak-off pipe joint bolt 13 N·m (1.3 kg·m / 113 lb·in)

5. Nozzle Cover
    - Connect battery ground cable.



INJECTION PUMP ASSEMBLY (Except 4HF1-2 model)

Component



Legend

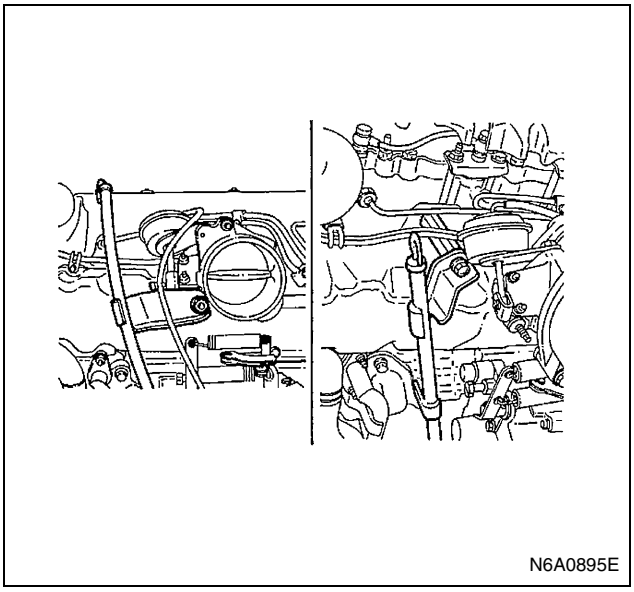
1. Intake air duct
2. Vacuum hose
3. Oil level guide tube
4. Engine stop cable
5. Accelerator control cable
6. Engine control wire
7. Engine control lever
8. Oil pipe
9. Fuel return hose
10. Fuel feed hose
11. Nozzle cover
12. Leak off pipe
13. Fuel pipe
14. Fuel filter assembly
15. PCV hose
16. Injection pipe
17. Injection pump assembly
18. Injection rubber spacer

Removal

Preparation

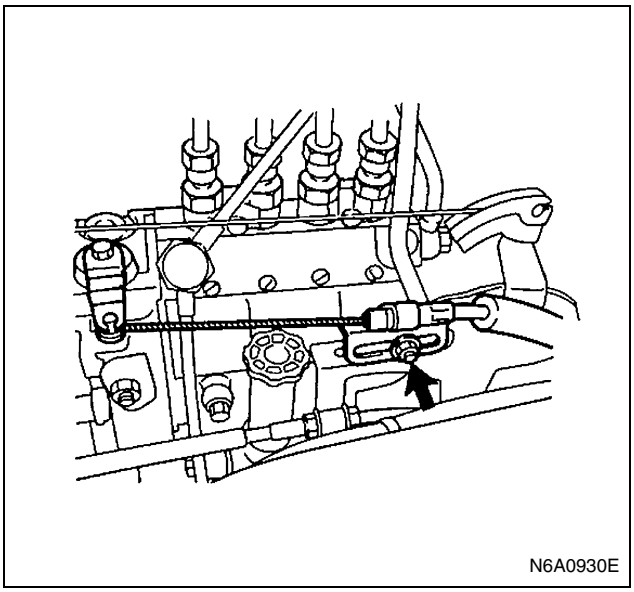
- Disconnect the battery ground cable
- Drain coolant

1. Intake Air Duct
2. Vacuum Hose
3. Oil Level Guide Tube
   - Remove the guide tube fixing bolt and pull out the guide tube.



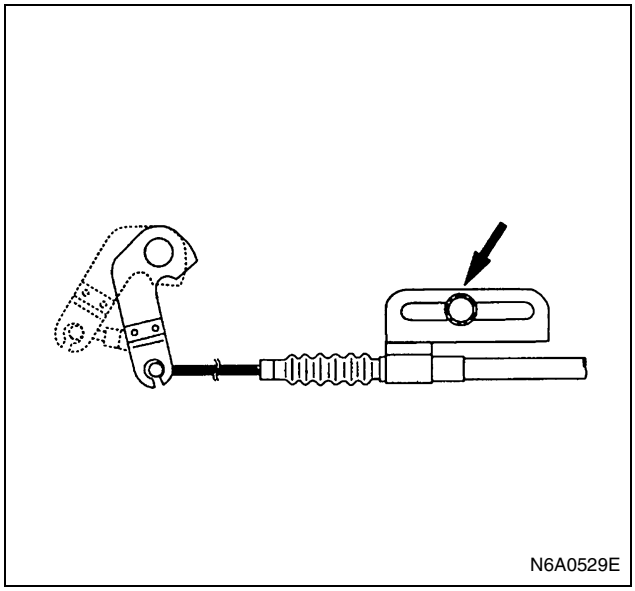
N6A0895E

4. Engine Stop Cable
   - Loosen the locking nut at bracket and disconnect engine stop cable from the injection pump stop lever.



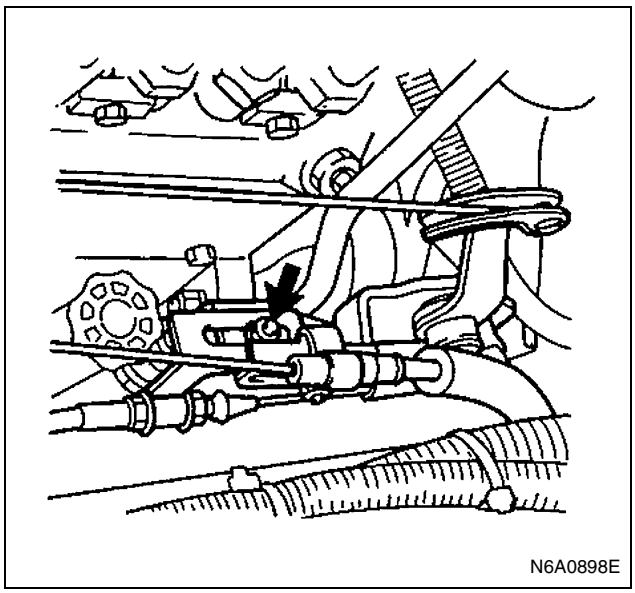
N6A0930E

For 4HE1-TC



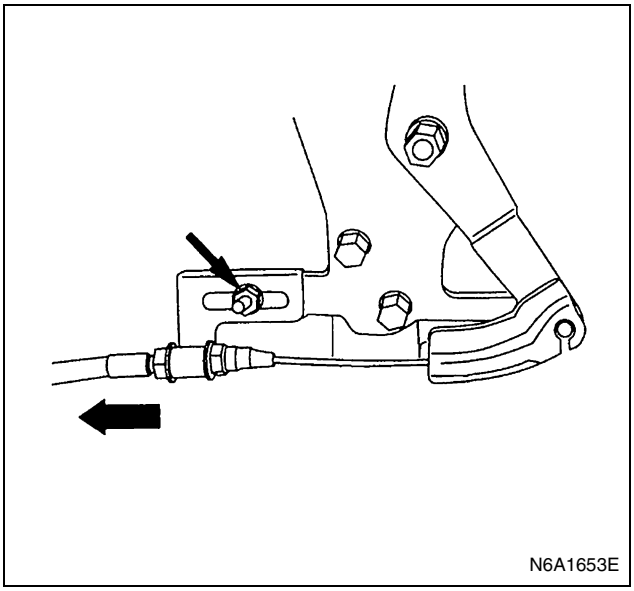
N6A0529E

5. Accelerator Control Cable
   - Loosen the locking nut at bracket and disconnect the accelerator control cable from the injection pump control lever.



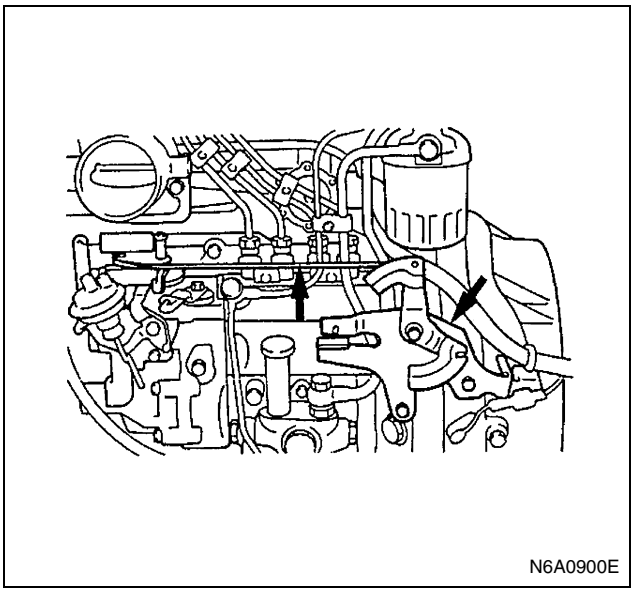
N6A0898E

For 4HE1-TC



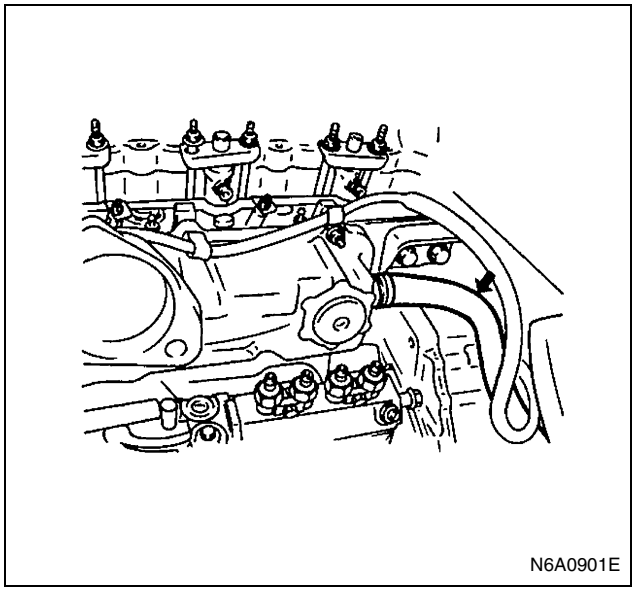
N6A1653E

6. Engine Control Wire
7. Engine Control Lever
8. Oil Pipe
9. Fuel Return Hose
10. Fuel Feed Hose
    - Disconnect fuel hose from injection pump side and take care not to spill and enter dust.
11. Nozzle Cover



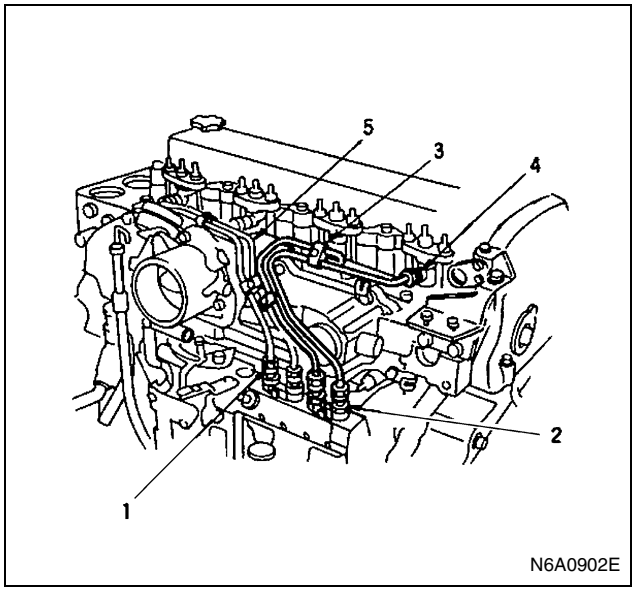
N6A0900E

12. Leak-Off Pipe
13. Fuel Pipe
14. Fuel Filter Assembly
15. PCV Hose



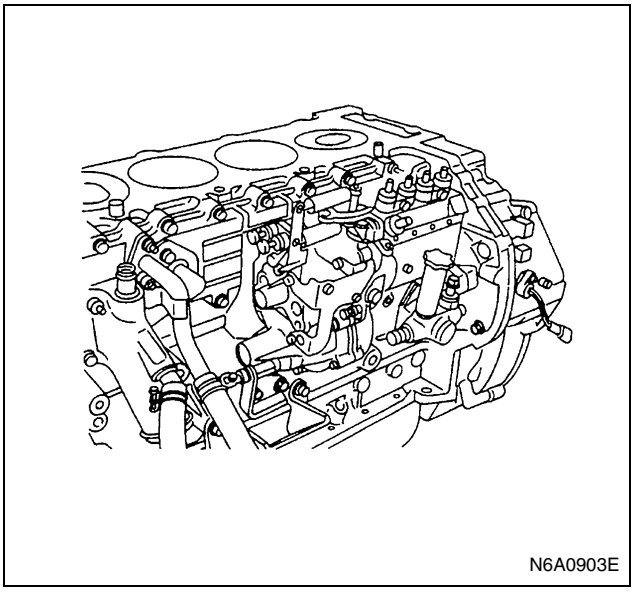
N6A0901E

16. Injection Pipe
    - Loosen the injection pipe sleeve nuts (1). Do not apply excessive force to the injection pipes (5).
    - Loosen the injection pipes clips (3).
    - Remove the injection pipe assembly. Plug the delivery valve holder (2) ports and nozzle holder (4) ports with caps to prevent the entry of foreign material.



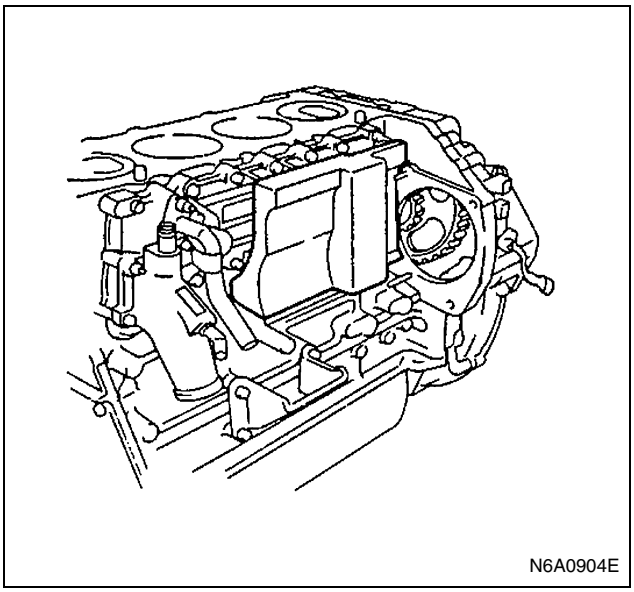
N6A0902E

17. Injection Pump Assembly
    1) Remove the injection pump bracket bolts and the injection pump rear bracket bolts.
    2) Then remove the injection pump assembly.



N6A0903E

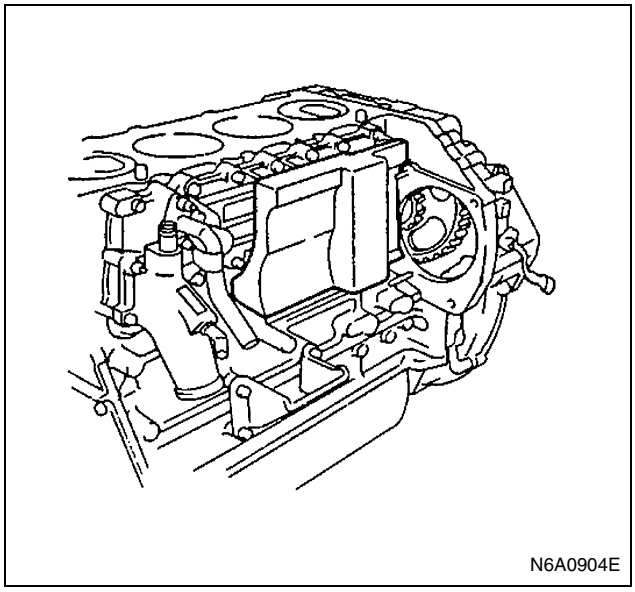
18. Injection Pump Rubber Spacer (For 4HF1/4HG1)



N6A0904E

Installation

1. Injection Pump Rubber Spacer
   1) Stick the rubber spacer to the location indicated in the illustration with pressure sensitive adhesive double coated tape. (4HF1/4HG1 Engine)
   2) 4HE1-TC (4HE1-XS) EURO-3 engines use a larger rubber spacer than other engines. However, engines destined for Hong Kong do not have a rubber spacer.

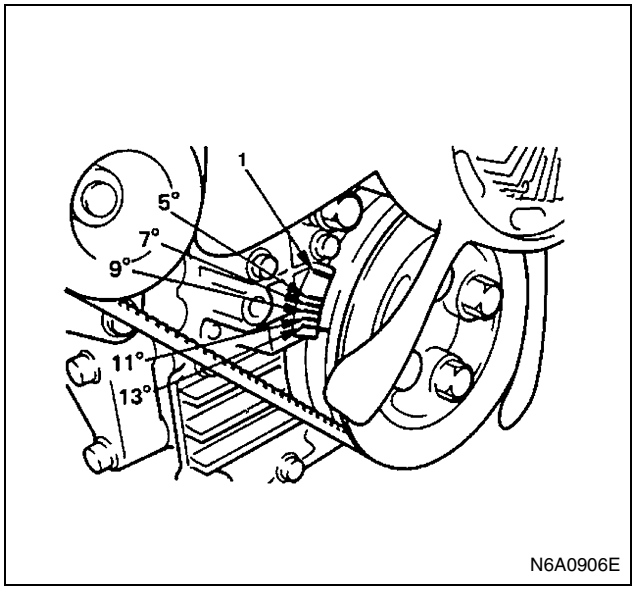


N6A0904E

2. Injection Pump Assembly
   1) Turn the crankshaft until the timing mark on the crankshaft damper pulley is aligned with “13°” line.
   2) Check the No.1 cylinder intake and exhaust valve rocker arms for any play.
      If the No.1 cylinder intake and exhaust valve rocker arms are depressed the No.4 piston is at on the compression stroke.
      Rotate the crankshaft one full turn (360 degrees) and realign the crankshaft damper pulley timing mark with the “13°” line.

Notice:
BTDC 13° to be aligned with here is an angle at which the injection pump is installed, and has nothing to do with the injection timing.

- Remove the inspection hole plug from the cylinder body.
- Install the O-ring to the injection pump bracket.

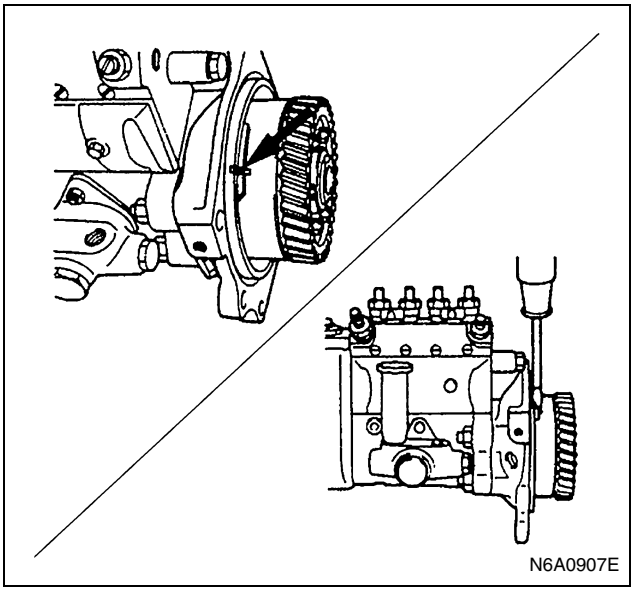


N6A0906E

Legend
1. TDC

3) Align the injection pump bracket slit with the timer slit.
4) Install the injection pump assembly to the cylinder body.

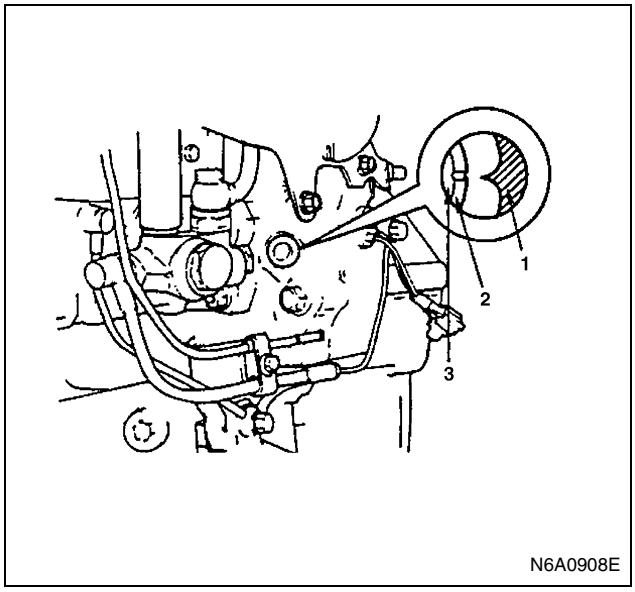
Notice:
When the injection pump has a poor gear engagement while installing the assembly to the cylinder body, insert a screwdriver into the slit on the time peripheral with the pump bracket slit used as a guide, and move it up and down to get it into forcibly.



N6A0907E

5) After installing the injection pump, the injection timing can be checked through the timing check hole provided at the injection pump bracket.
Set the No.1 cylinder to the BTDC (injection timing of engine mode) on the compression stroke. When the pointer of the timing check hole comes in line with the mark on the timer periphery of the injection pump as shown in the illustration, the injection timing is normal.
After completion of the injection timing check, tighten the check hole plug to the specified torque.

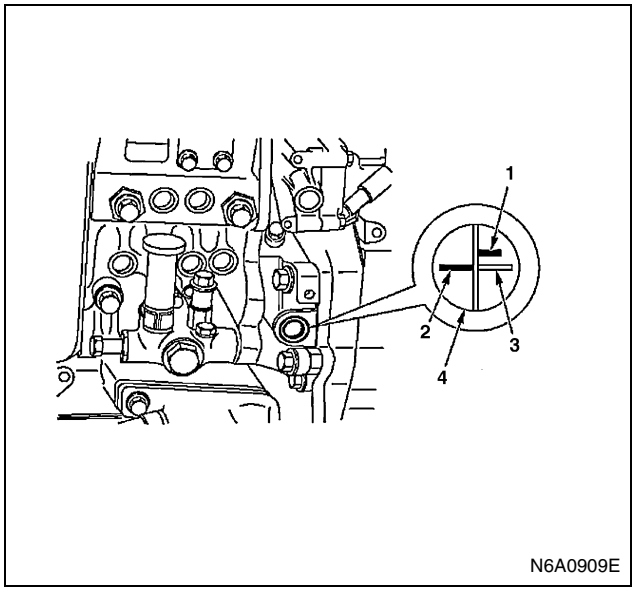
Injection Timing	deg
4HF1: 4HE1-TC (4HE1-XS, XN)	BTDC 8
4HG1	BTDC 9
4HG1-T	BTDC 7 BTDC 9 (For Colombia)
4HE1-TC (4HE1-XS)	BTDC 9 (Spec EURO3)



N6A0908E

Legend
1. Pointer
2. Timer outside mark
3. Timing check hole

For 4HE1-TC

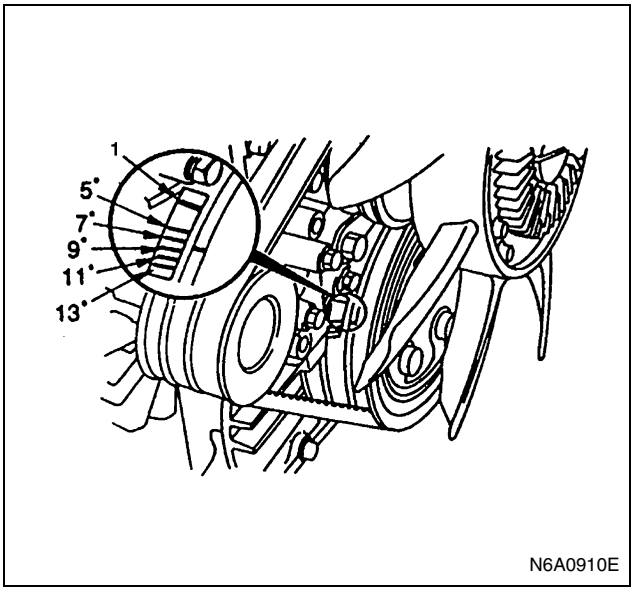


N6A0909E

Legend
1. 8° mark
2. Pointer
3. 13° mark
4. Timing check hole

6) Turn the crankshaft until the timing mark on the crankshaft damper pulley is aligned with “8°” (98EPA) or “9°” (Spec EURO3) line.

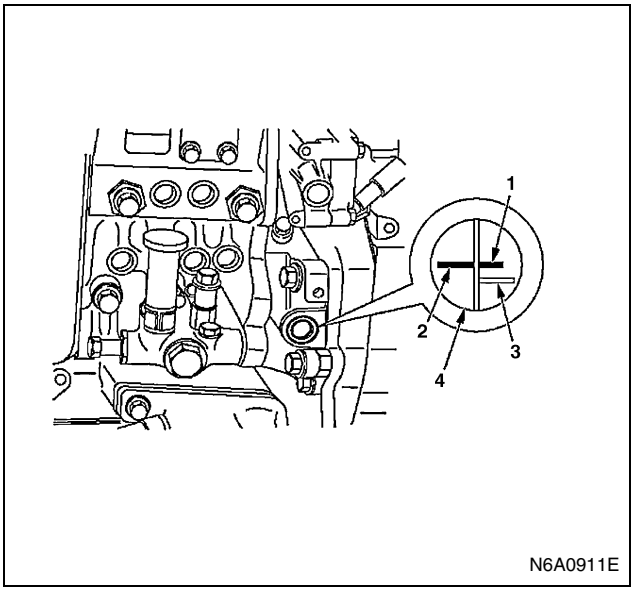
Notice:
Position in its normal rotating direction. (for 4HE1-TC only)



Legend
1. TDC

7) Adjust injection pump downward so that the "8°" (98EPA) or "9°" (Spec EURO3) comes to position in the timing check hole. (for 4HE1-TC only)

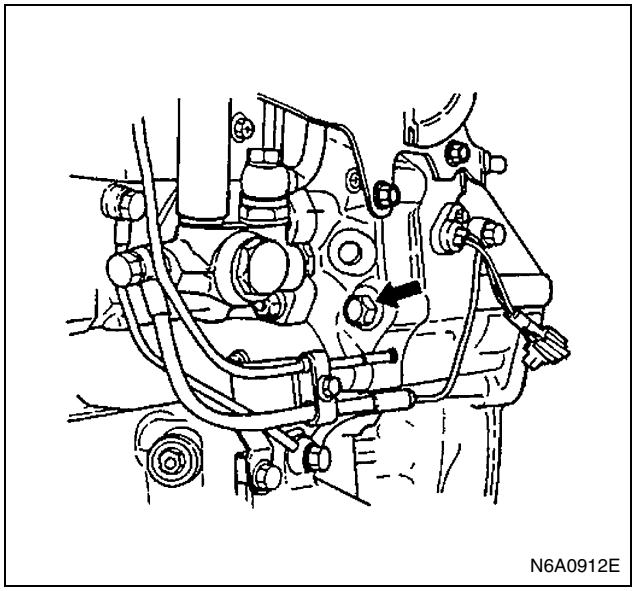
Notice:
Whenever the injection pump is replaced, be sure to adjust the injection timing. For the details of the adjustment, refer to the "SECTION 00 SERVICING: INJECTION TIMING INSPECTION AND ADJUSTMENT".



Legend
1. 8° mark
2. Pointer
3. 13° mark
4. Timing check hole

8) Tighten the injection pump bracket nuts and bolts to the specified torque.

Tighten:
Injection pump bracket nut and bolt to 48 N·m (4.9 kg·m / 35 lb·ft)



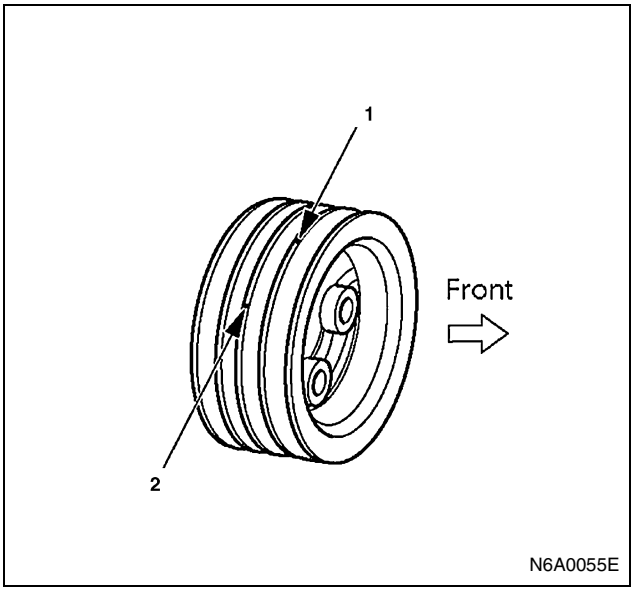
9) Install the injection pump rear bracket.

Tighten:
Injection pump rear bracket bolt to 48 N·m (4.9 kg·m / 35 lb·ft)

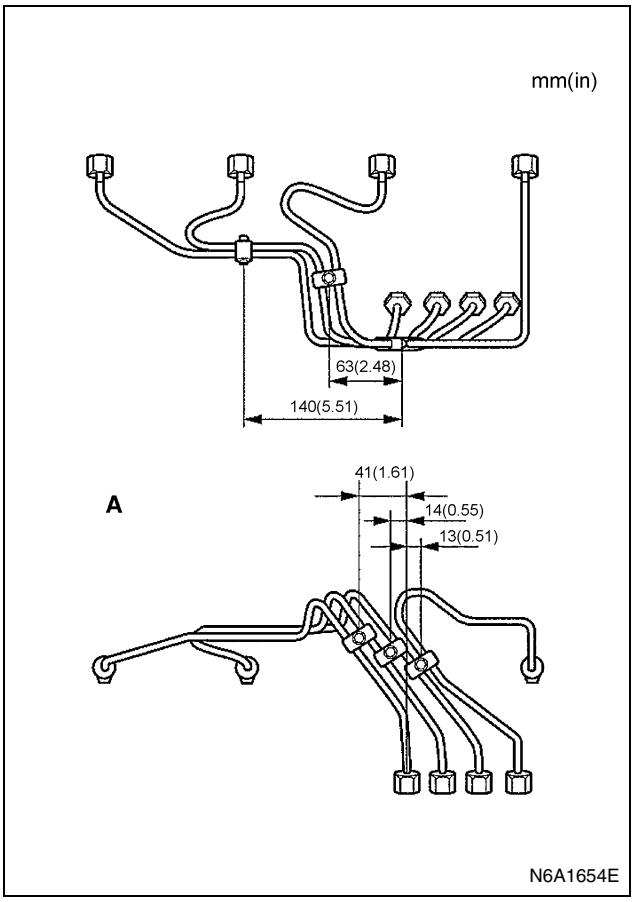
10) Install the inspection hole plug.

Tighten:
Inspection hole plug to 48 N·m (4.9 kg·m / 35 lb·ft)

Notice:
In case the crank pulley has two marks as illustrated, (1) BTDC 49° mark on the second crest and (2) TDC mark on the third crest (as viewed from the front side), be sure to set at the mark (2). (If there are two different marks on one and same crest, set at the mark which comes second when rotated in the normal direction.) The mark (1) is used when installing the injection pump for 4HF1-2.



3. Fuel Injection Pipe
   1) Install the injection pipe assembly and temporarily tighten the injection pipe sleeve nuts.
   2) Set the clips in the prescribed position shown in the illustration.



Legend
A. 4HG1-T

Caution:
Make absolutely sure that the clip is correctly positioned.

An improperly positioned clip will result in injection pipe breakage and fuel pulsing noise.

Tighten:
Clip screw to 3 N·m (0.3 kg·m / 26 lb·in)

   3) Tighten the injection pipe sleeve nuts to the specified torque.

Tighten:
Injection pipe sleeve nut to 29 N·m (3 kg·m / 22 lb·ft)

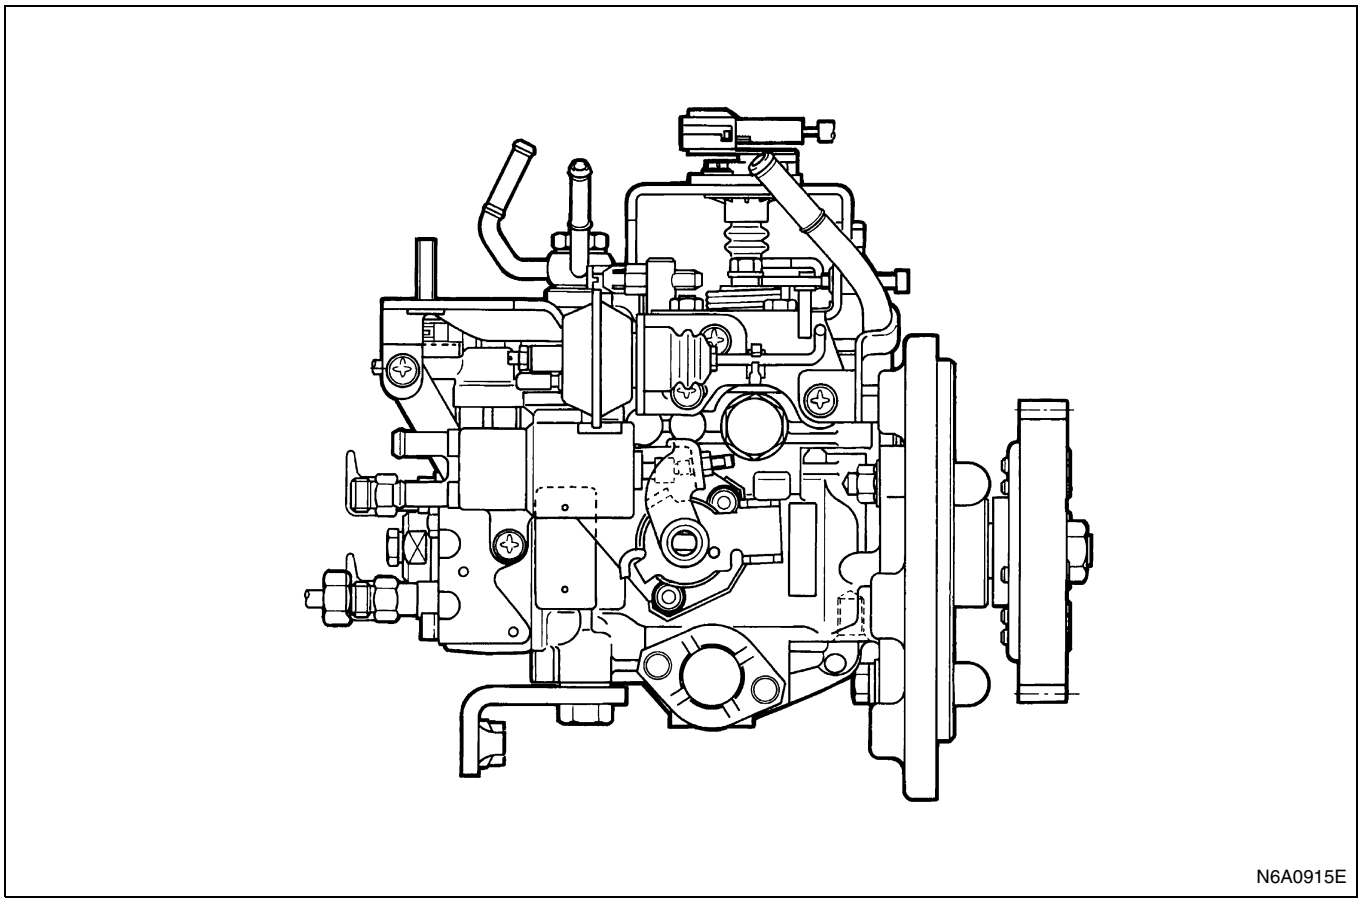
4. PCV Hose
5. Fuel Filter

Tighten:
Fuel filter bracket bolt to 34 N·m (3.5 kg·m / 25 lb·ft)

6. Fuel Pipe
7. Leak Off Pipe
8. Nozzle Cover
9. Fuel Feed Hose
10. Fuel Return Hose
11. Oil Pipe
12. Engine Control Lever
13. Engine Control Wire
14. Accelerator Control Cable
15. Engine Stop Cable
16. Oil Level Guide Tube
17. Vacuum Hose
18. Intake Air Duct

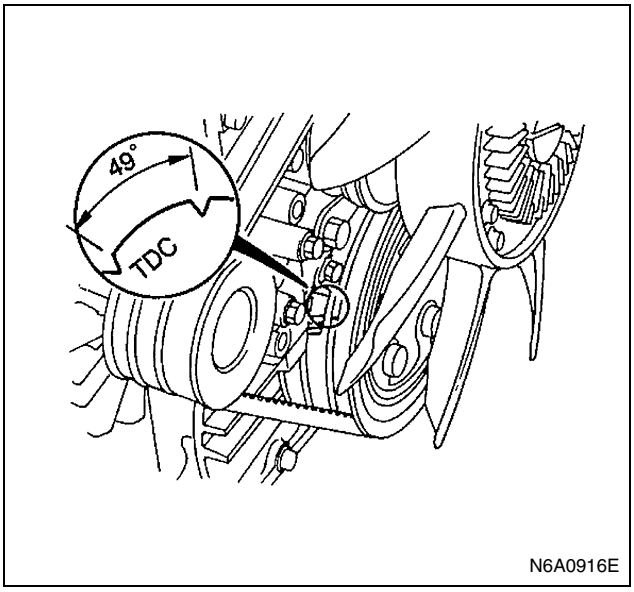
INJECTION PUMP ASSEMBLY (4HF1-2 model only)

Component

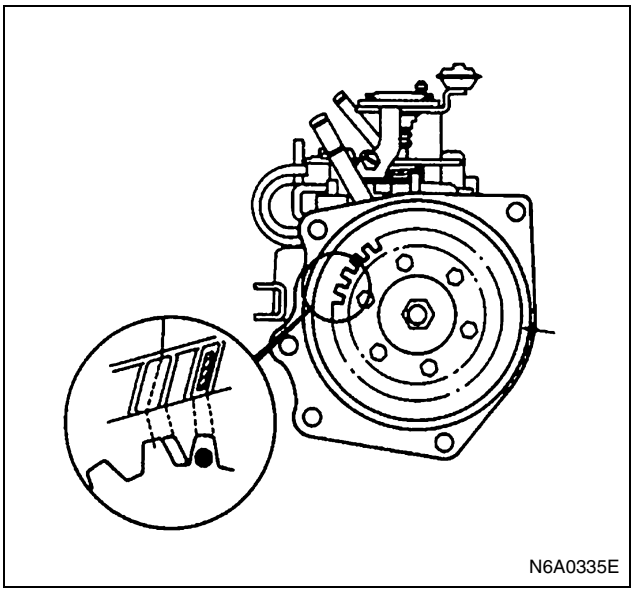


Installation

1. Turn the crankshaft to set No. 1 cylinder to 49° before TDC in its compression stroke. (49° is a pump assembling angle, not related to injection timing.)

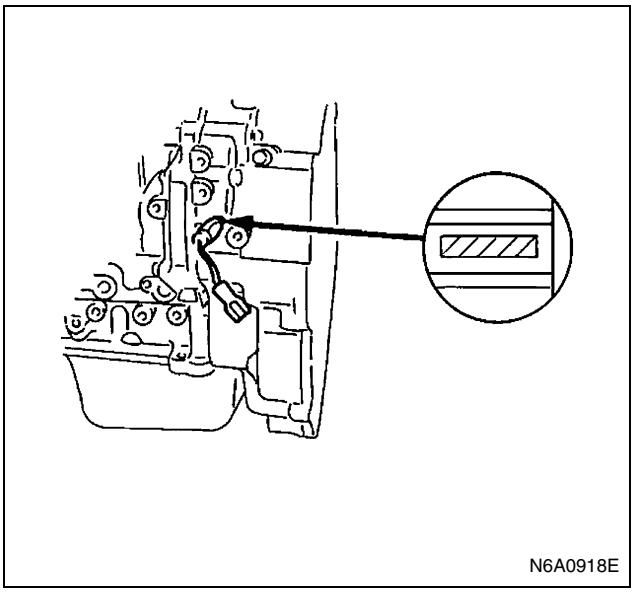


2. Install O-ring to the injection pump.
3. Apply paint on the • (Z) marked side of the injection pump gear.
4. Align the pump bracket mark with the tooth (under side of the pump) just before the • (Z) marked tooth.
5. Insert the pump using the block side of stud bolt as a guide.



6. After installing the injection pump, remove the tachometer sensor from the housing, and make sure

that the painted gear is at the center of the sensor mounting hole.

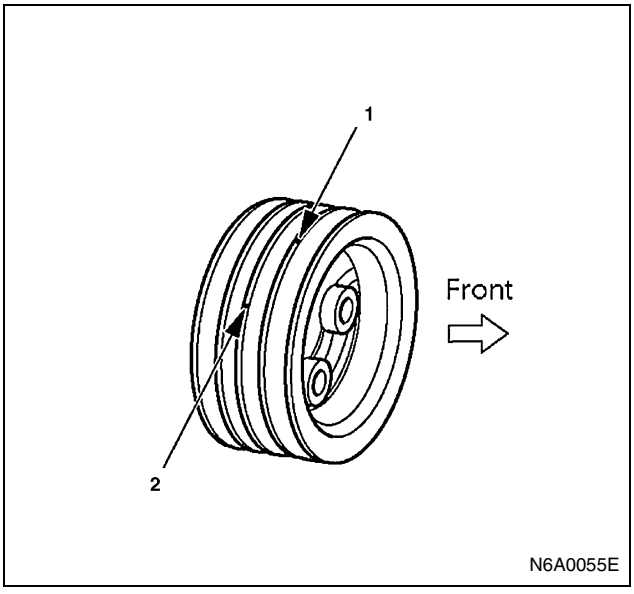


7. Tighten injection pump clamping bolt and nut to specified torque:

Tighten:
- Bolt to 48 N·m (4.9 kg·m / 35 lb·ft)
- Nut to 24 N·m (2.4 kg·m / 17 lb·ft)

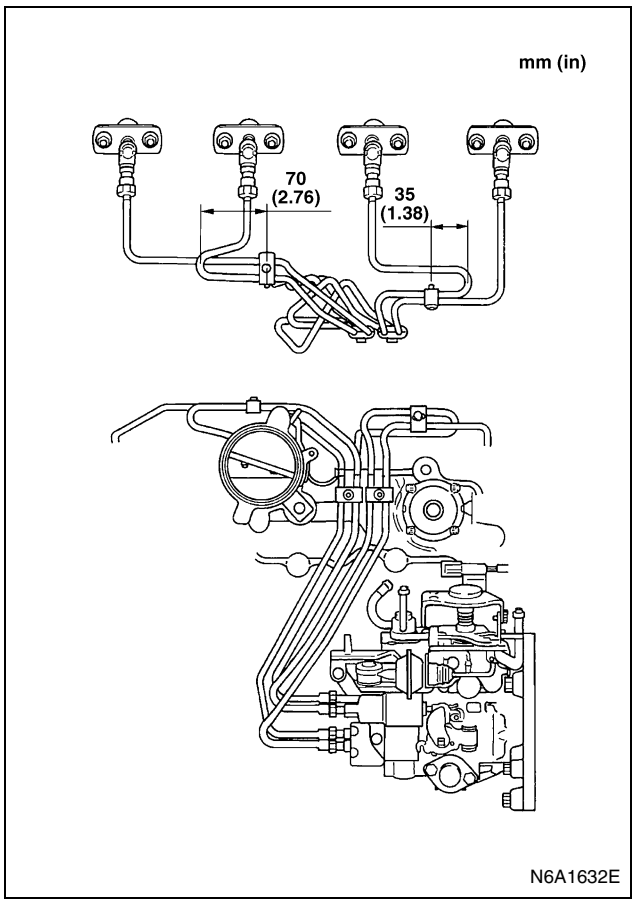
8. With reference to Injection Timing Check & Adjustment, set No. 1 Cylinder to 12° before its TDC.

Notice:
In case the crank pulley has two marks as illustrated, (1) BTDC 49° mark on the second crest and TDC mark on the third crest (as viewed from the front side), be sure to set at the mark (2). (If there are two different marks on one and same crest, set at the mark which comes second when rotated in the normal direction.)



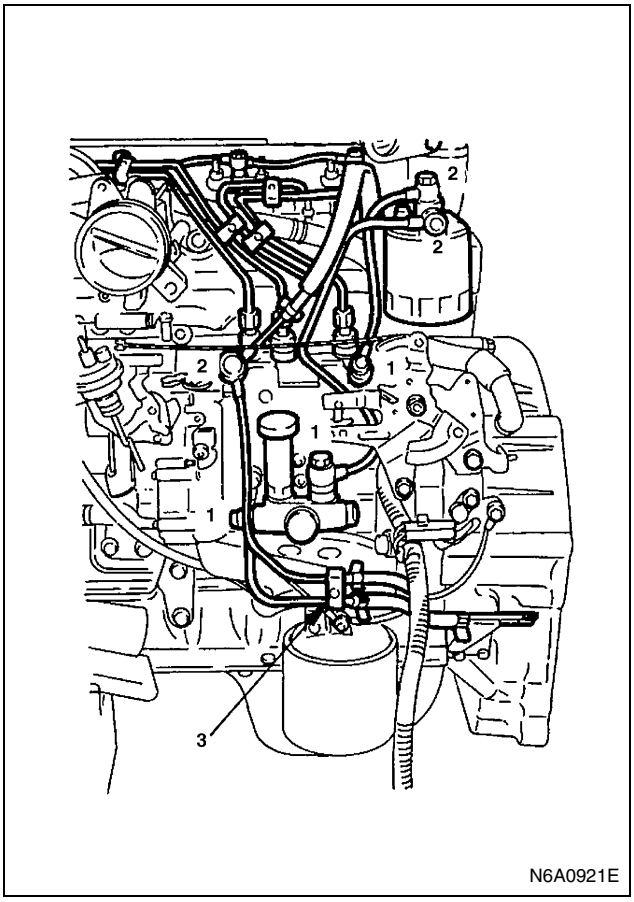
9. Injection Pipe (4HF1-2 model only)
   1) Connect Injection Pipe and fix with clips as illustrated.

Tighten:
- Injection pipe to 29 N·m (3.0 kg·m / 22 lb·ft)
- Clip to 3 N·m (0.3 kg·m / 26 lb·in)



10. Fuel Pipe
    Do not apply excessive force to the fuel pipe.

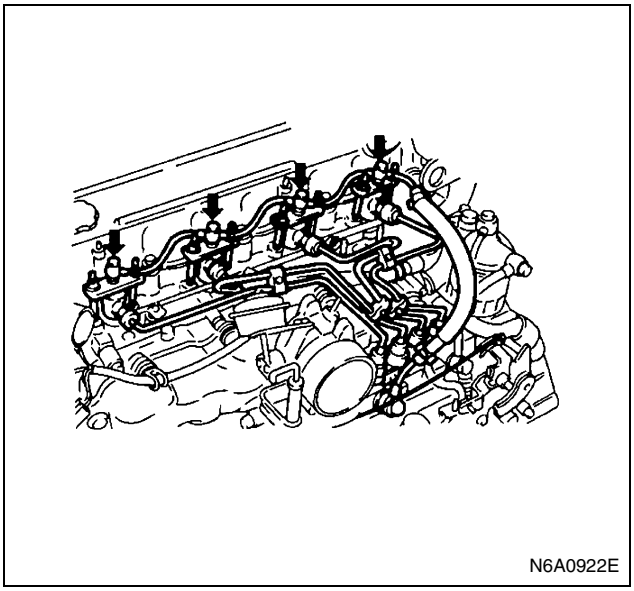
Tighten:
- Fuel pipe joint bolt (1) to 41 N·m (4.2 kg·m / 30 lb·ft)
- Fuel pipe joint bolt (2) to 23 N·m (2.3 kg·m / 17 lb·ft)
- Clip screw to 4 N·m (0.4 kg·m / 35 lb·in)



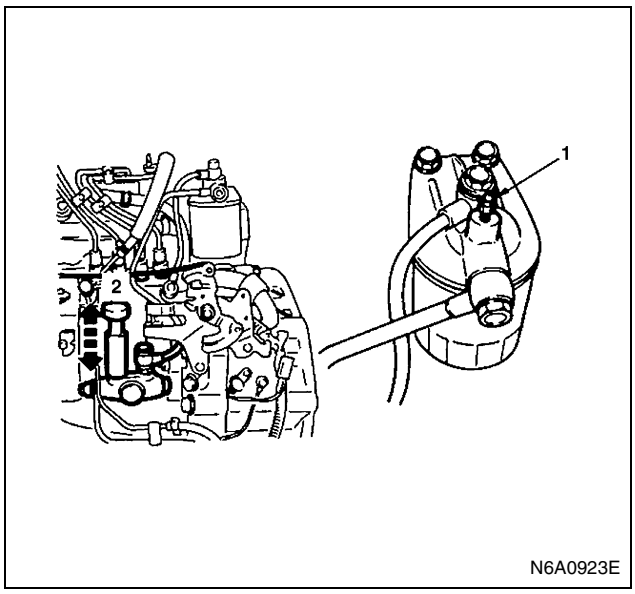
Legend
1. Fuel pipe joint bolt
2. Fuel pipe joint bolt
3. Clip

11. Leak Off Pipe

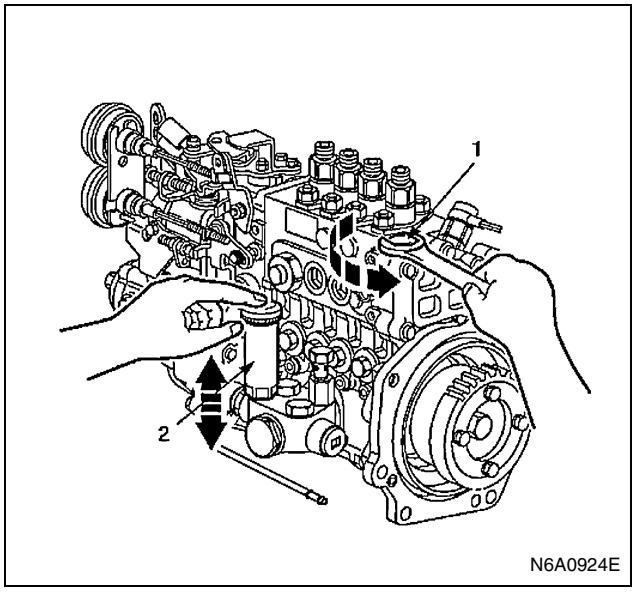
Tighten:
Leak-off pipe joint bolt to 13 N·m (1.3 kg·m / 9.6 lb·ft)



12. Nozzle Cover
13. Fuel Feed Hose
14. Fuel Return Hose
15. Air Bleeding
    1) Loosen the priming pump cap (2) at the side of the injection pump.
    2) Loosen the bleeder valve (1) at the top of the fuel filter.
    3) Operate the priming pump to bleed the air from the injection pump.
    4) Retighten the bleeder valve (1).
    5) Operate the priming pump.
       Check for fuel leakage from around the injection pump and the fuel filter.
    6) Lock the priming pump cap (2) to the injection pump.

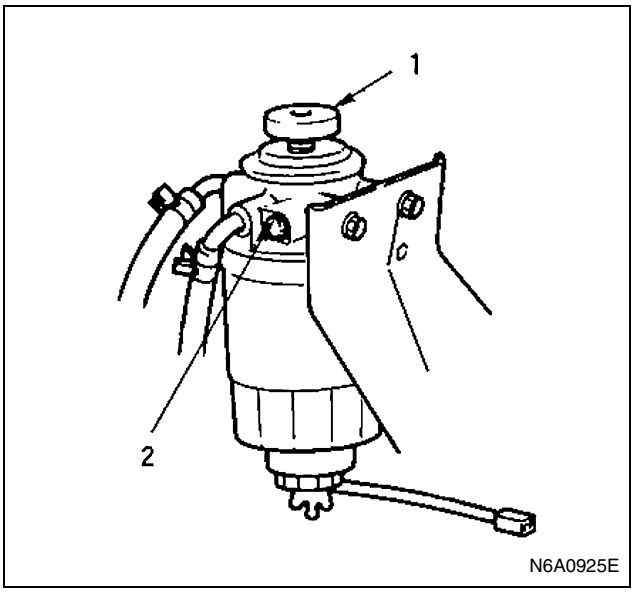


For 4HE1-TC



16. Air Bleeding (4HF1-2 model only)
    1) Actuate the priming pump (1) to send the air in the fuel system to the injection pump.

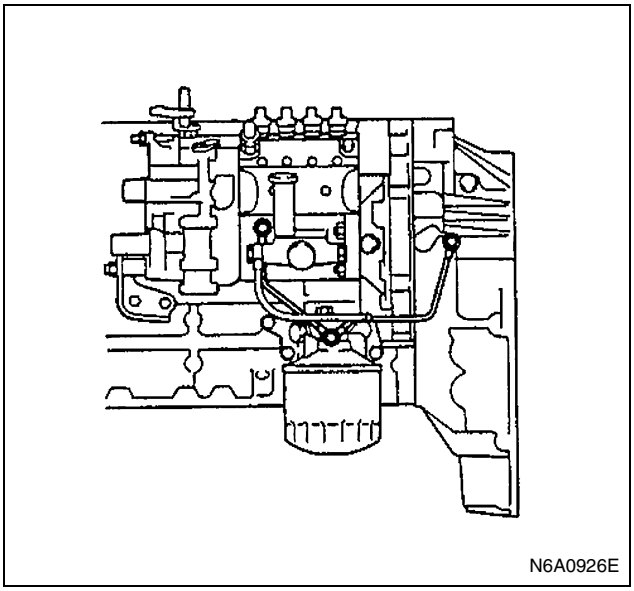
2) Loosen the sedimenter air bleeding plug (2) and operate the priming pump until no bubbles appear.



3) Tighten the air bleeding plug completely.
4) Try to start the engine. If the engine is not started within 10 seconds, air bleeding should be conducted once again.
5) Check that there is not fuel leak, and then tighten the priming pump completely.

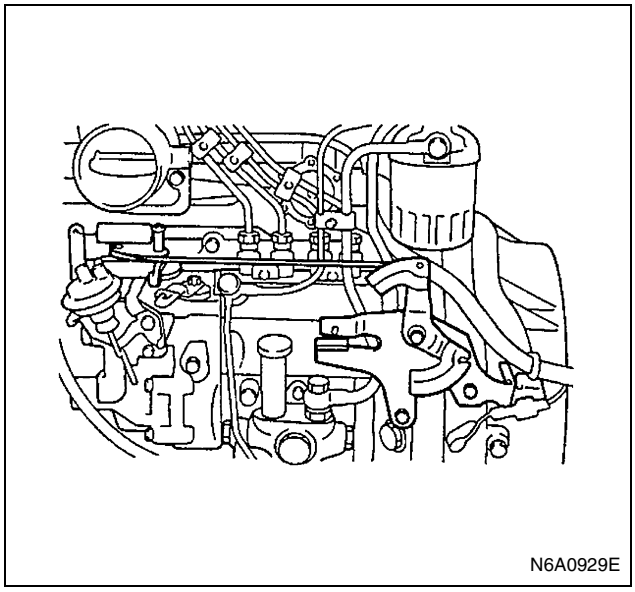
17. Oil Pipe

Tighten:
Oil pipe joint bolt to17 N·m (1.7 kg·m / 12 lb·ft)

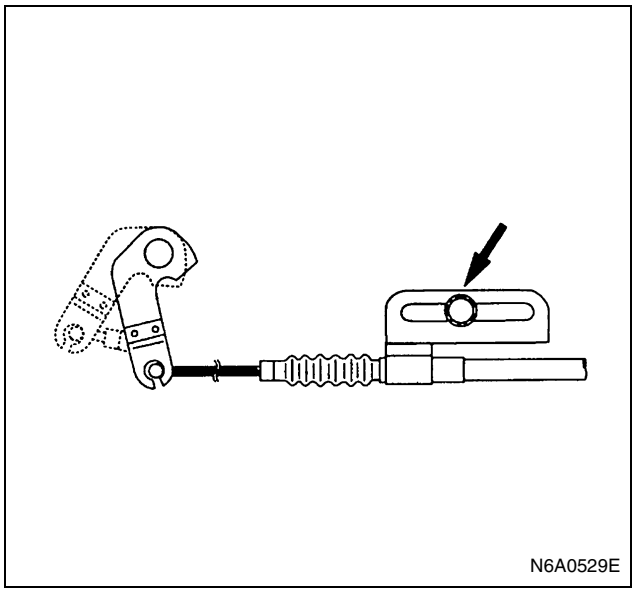


18. Engine Control Lever Assembly

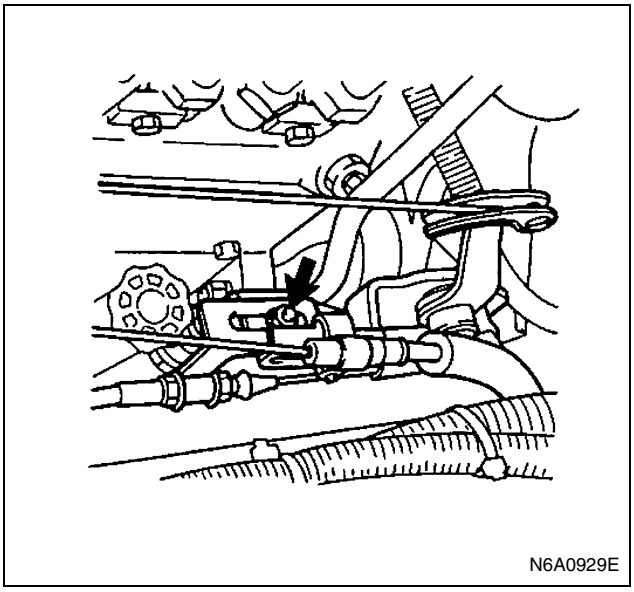
Tighten:
Engine control lever bolt to 24 N·m (2.4 kg·m / 17 lb·ft)



For 4HE1-TC



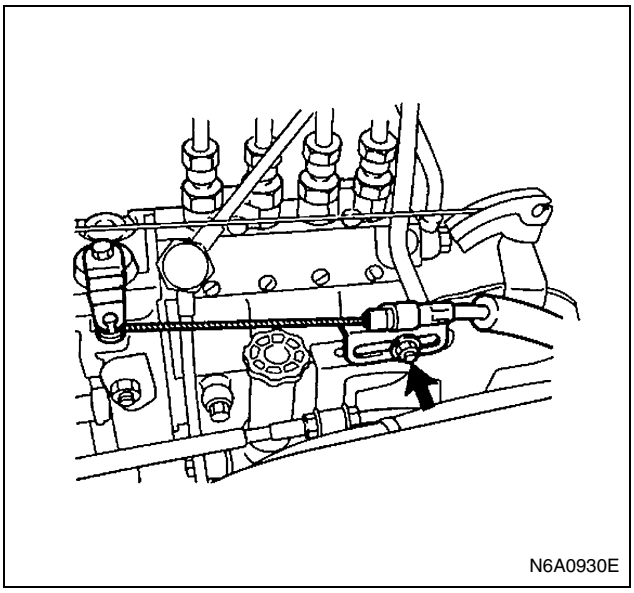
19. Engine Control Wire
20. Accelerator Control Cable
    1) Check to see if the idling control knob is turned to the extreme left.
    2) Attach the tip end of the cable to the engine control lever.
    3) Pull the outer cable toward the front side of the vehicle, and provide the engine control wire and the inner cable with an appropriate play before fastening the clamp with a nut.



N6A0929E

4) Check to see if the injection pump control lever is at the idling position (with the lever in touch with the stopper bolt).

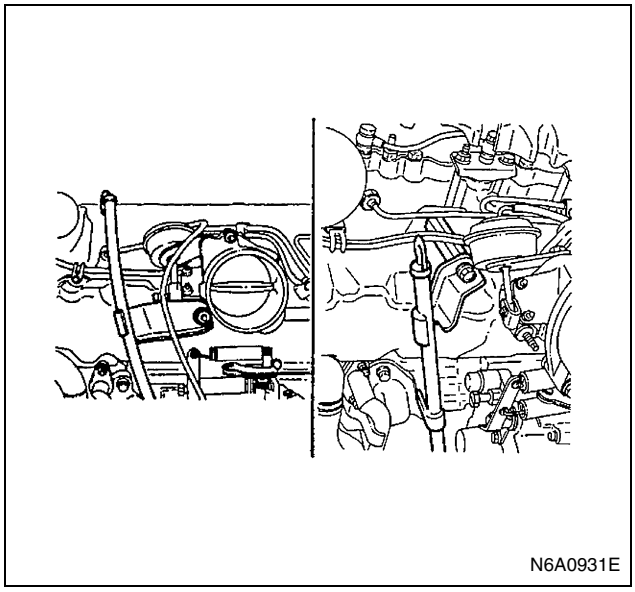
21. Engine Stop Cable
    1) Attach the end tip of the cable to the engine stop lever.
    2) Pull the cable toward the rear side of the vehicle, and fasten the clamp with a nut at the position where the lever stops.



N6A0930E

22. Oil Level Gauge Guide Tube
    1) Install the O-rings to the guide tube lower portion and insert the guide tube completely to the cylinder body.
    2) Tighten the guide tube bolt to the specified torque.

Tighten:
Guide tube bolt to 13 N·m (1.3 kg·m / 9.6 lb·ft)



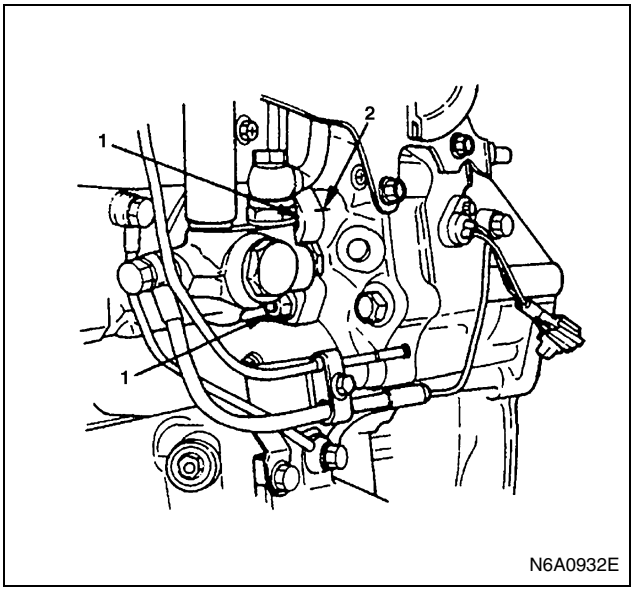
N6A0931E

23. Vacuum Hose
24. Intake Air Duct
    - Pour coolant into radiator.
    - Connect battery ground cable.
    - Start engine and check for oil and fuel leakage carefully.

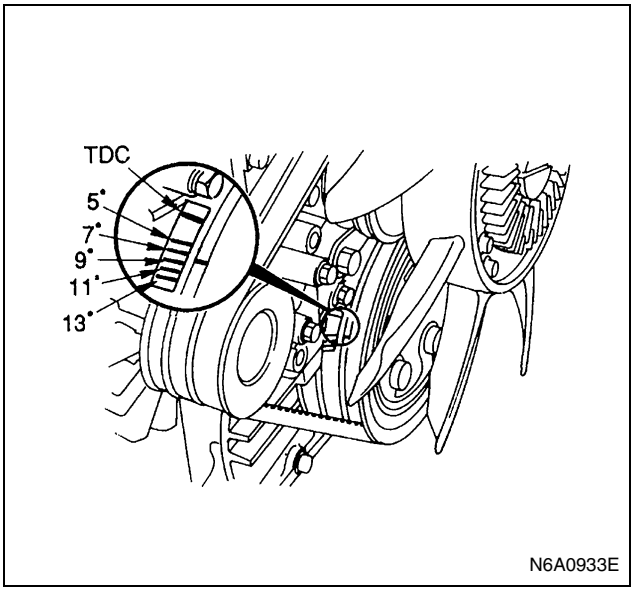
INJECTION TIMING ADJUSTMENT

Injection Pump Notched Line Inspection

1. Check the injection pump bracket nuts (1) for looseness.
   Tighten as required.
2. Check that the notched lines (2) on the injection pump bracket and the timing gear case are aligned.
   If the notched lines are not aligned, the injection timing must be checked.



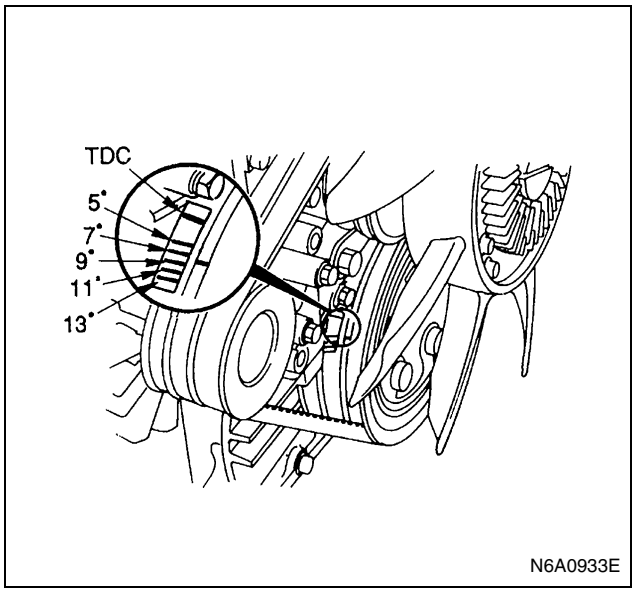
3. Same time, check injection timing on the crank damper pulley. If the injection timing aligned with incorrect, the injection timing must be readjusted.



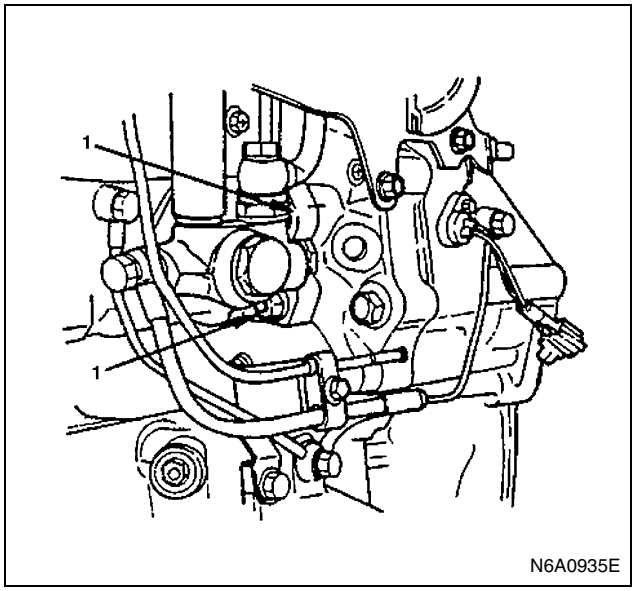
Injection Timing Adjustment (Except 4HF1-2 model)

1. Turn the crankshaft until the timing mark on the crankshaft damper pulley is aligned with the injection timing of each engine mode mark in the illustration.

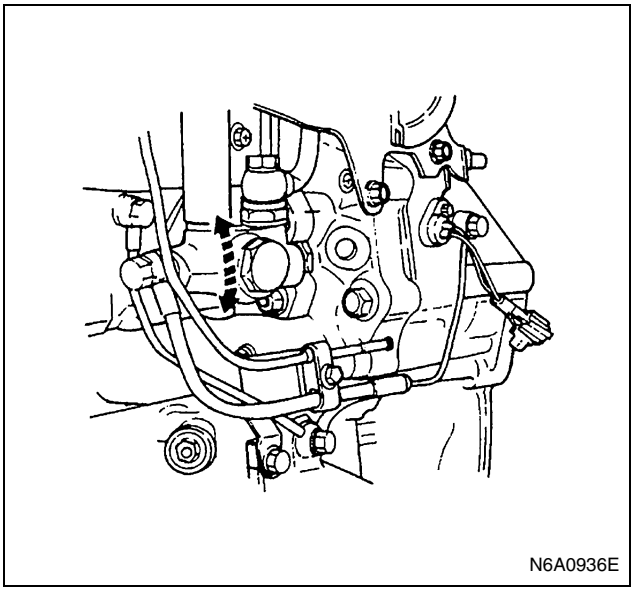
Injection Timing	deg
4HF1 4HE1-TC (4HE1-XS)	BTDC 8
4HG1	BTDC 9
4HG1-T	BTDC 7 BTDC 9 (For Colombia)
4HE1-TC (4HE1-XS)	BTDC 9 (Spec EURO3)



2. Remove the two foam rubbers.
3. Loosen the four injection pump fixing nuts (1). This will allow the pump to pivot.
   Do not bend or scratch the fuel pipe.



4. Align the notched line between the injection pump bracket and the timing gear case.
   Make sure that the timing mark on the crank damper pulley is aligned with correct injection timing.

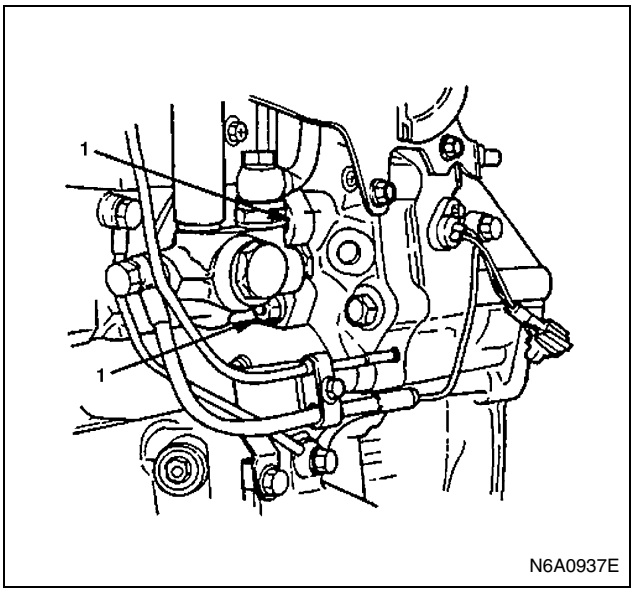


N6A0936E

5. Tighten the injection pump fixing nuts (1) to the specified torque.

Tighten:
Injection pump fixing nut to 25 N·m (2.6 kg·m / 19 lb·ft)

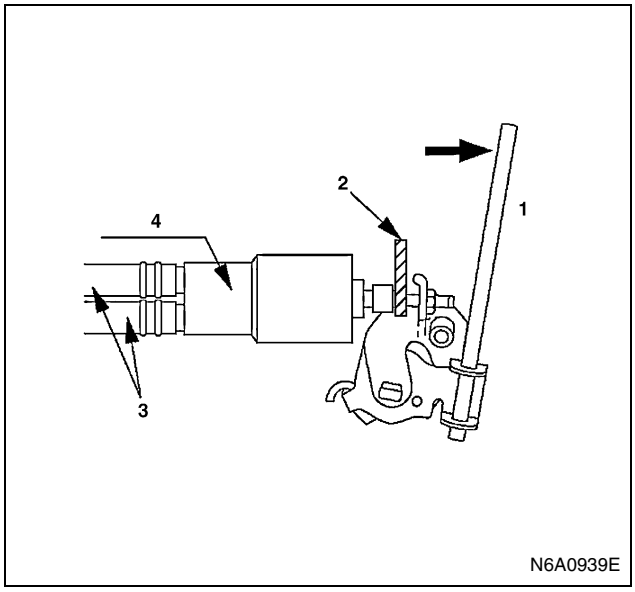
Notice:
If there are two marks on the crank pulley, the front side of mark is for setting BTDC 49° and the rear side of mark is for setting TDC.



N6A0937E

Injection Timing Check (4HF1-2 model only)

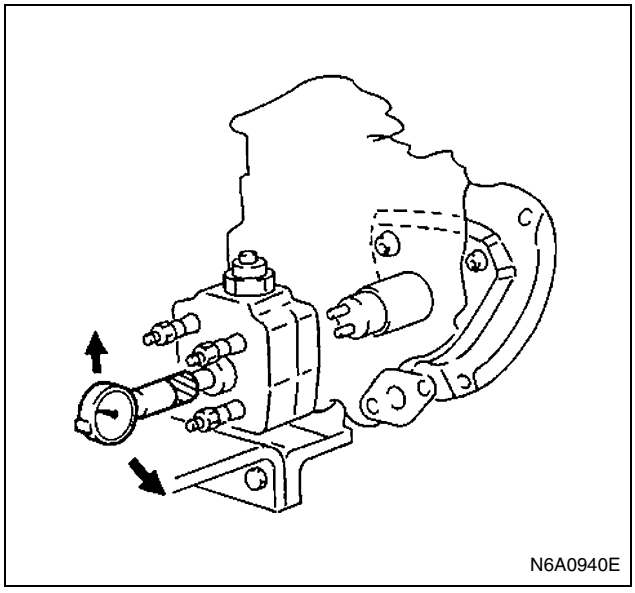
1. Set No. 1 Cylinder to the TDC in the compression stroke.
2. Disconnect Injection Pipe.
3. Put down Wax CSD lever, insert a spacer 10 — 12 mm (0.39 — 0.47 in) thick between the plunger and adjust bolt, and cancel the Wax CSD.



N6A0939E

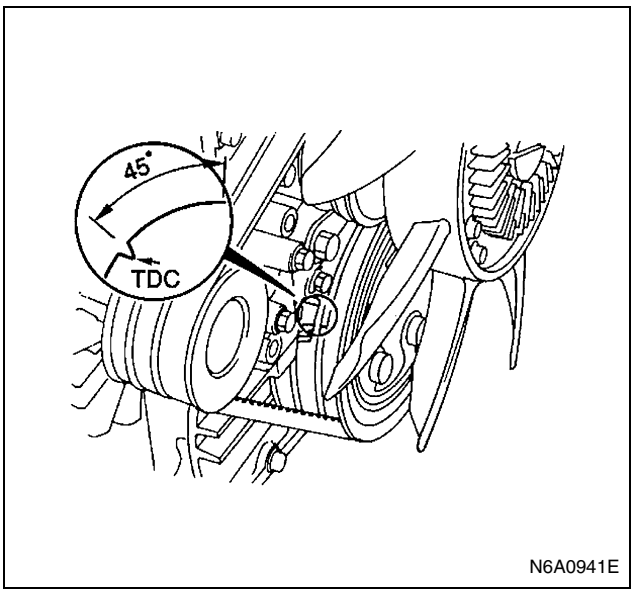
Legend
1. Lever
2. Spacer
3. Water hose
4. Wax CSD

4. Remove the pump rear plug, connect a dial gage and set the lift at 1 mm (0.039 in).
   Special Tool
   Measuring device: 5-9940-0145-0



N6A0940E

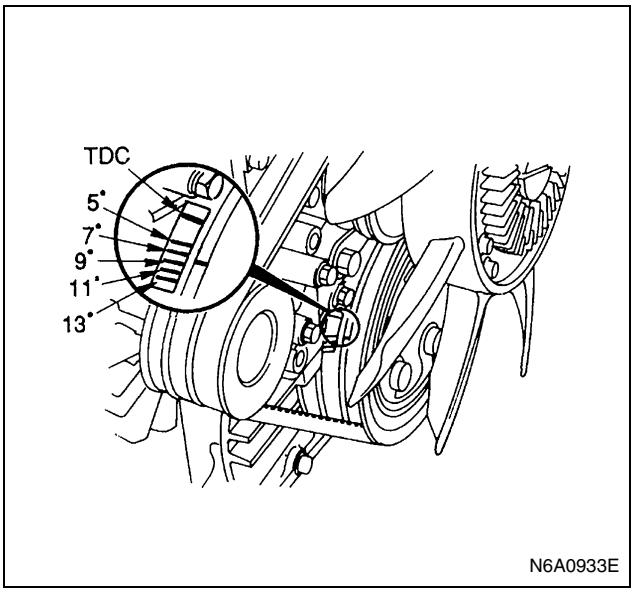
5. Set the crankshaft damper pulley TDC mark to the pointer or 45° before TDC.



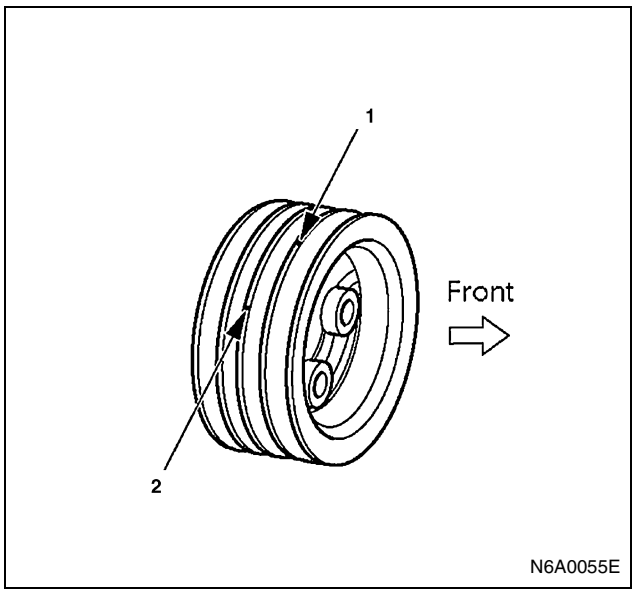
6. Set the dial gage to the “0” position.
7. Turn the crankshaft leftwise and rightwise a little and make sure that the needle stays in the “0” position.
8. Turn the crankshaft in the normal direction and read the measuring device’s indication at the 12° before TDC position.

Notice:
As there is no 12° mark, set midway between the 11° and 13° marks.

Standard value: 0.5 mm (0.0197 in)



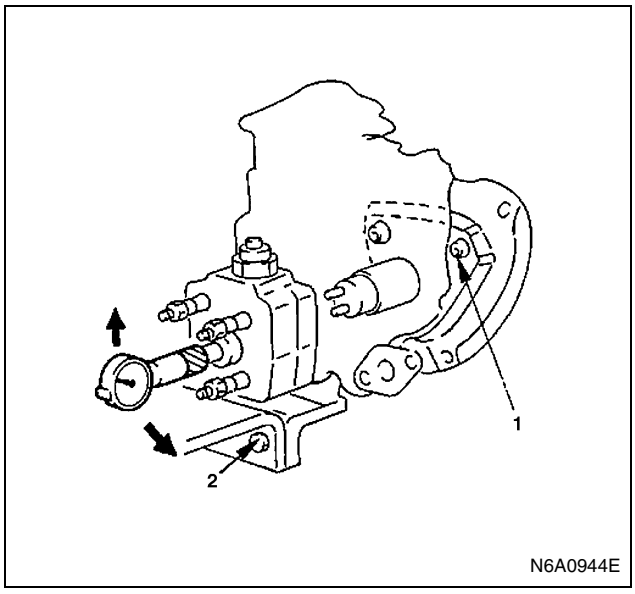
Notice:
In case the crank pulley has two marks as illustrated, (1) BTDC 49° mark on the second crest and (2) TDC mark on the third crest (as viewed from the front side), be sure to set at the mark (2). (If there are two different marks on one and same crest, set at the mark which comes second when rotated in the normal direction.) The mark (1) is used when installing the injection pump for 4HF1-2.



Injection Timing Adjustment (4HF1-2 model only)

If injection timing is out of the specified range, follow the following procedure for adjustment:

1. Loosen injection pump fixing nuts (1) and bracket bolt (2).



2. Adjust the mounting angle of injection pump:
   - If injection timing is too fast, bring the injection pump closer to the engine.
   - If injection timing is too slow, put the injection pump more distant from the engine.
3. When the dial gage has indicated the specified value, tighten the fixing nuts and bolt to specified torque.

Tighten:
- Nut to 24 N·m (2.4 kg·m / 17 lb·ft)
- Bolt to 48 N·m (4.9 kg·m / 35 lb·ft)

4. Disconnect the dial gage, install and tighten the plug to specified torque. (Make sure of a coper washer being attached to the plug)

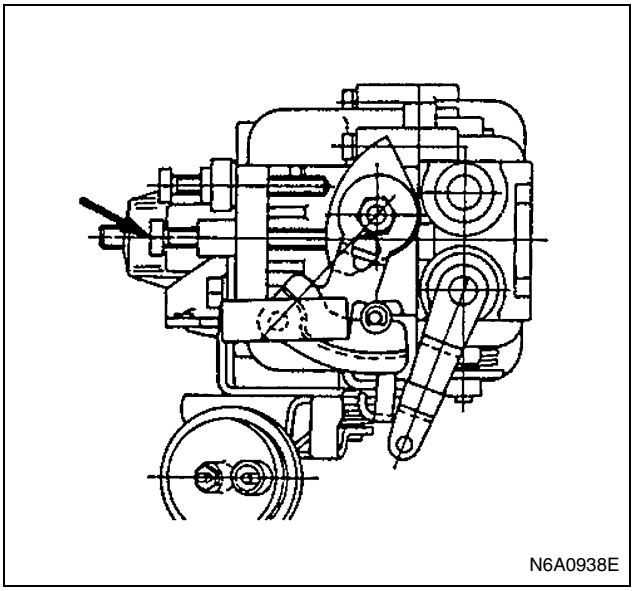
Tighten:
Plug to 17 N·m (1.7 kg·m / 12 lb·ft)

5. Release the wax CSD and connect the injection pipe.

Tighten:
Pipe sleeve nut to 29 N·m (3.0 kg·m / 22 lb·ft)

Idling Speed Adjustment (Except 4HF1-2 model)

1. Idling Rotation Check
   1) Idle the engine.
   2) Measure the number of the idling rotations with a tachometer.
   3) When the number of the idling rotations is outside the specified value, adjust it with the idling adjust bolt (arrow-marked).

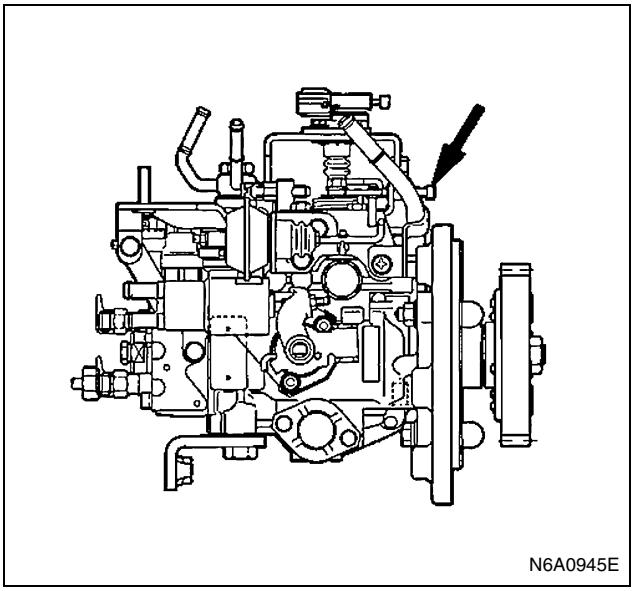


N6A0938E

Number of idling rotations:
550 — 600 rpm
(4HE1-TC)
775 — 825 rpm

Idling Speed Check & Adjustment (4HF1-2 model only)

1. Warm up the engine.
2. Measure idling speed by means of tachometer.
3. If idling speed is out of the standard, adjust with an idling adjust bolt (indicated by arrow mark).
   Idling speed: 575 — 625 rpm



N6A0945E

Injection Timing

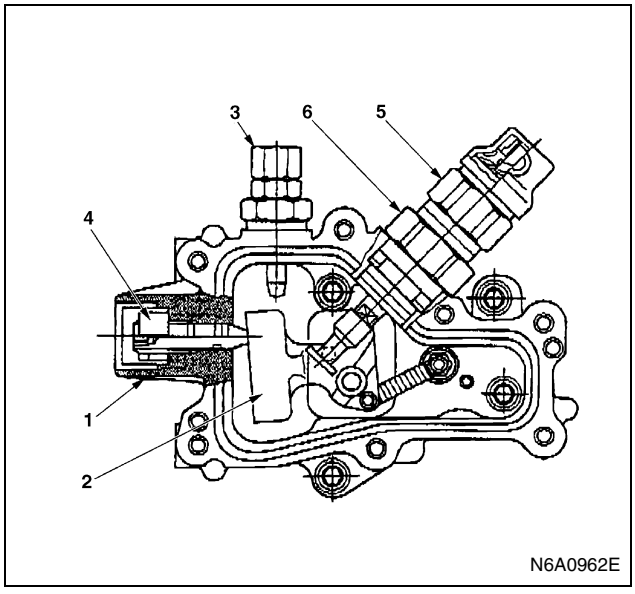
Pre-stroke	: No. 1 plunger 4.0±0.03 mm (0.1575±0.0012 in)	
Injection order	: 1 — 3 — 4 — 2 (interval 90°±15′) Plungers are numbered from the Governor side	
Tappet clearance	: Shim adjustment type	: Manually rotate the camshaft 2 — 3 times and confirm that it rotates smoothly.

Injection Timing Adjustment

(Refer to the MITICS Repair and Maintenance Service Manual for adjustment details.)

Adjustment Preparation

1. Install setscrew (3) (P/N 157927-2820), screw (4) (P/N 157927-3321) and solenoid switch (5) into housing (1).
   1) Screw in setscrew (3) until the counterweight contacts the housing's pressfitted stopper pin.
   2) Tighten screw (4) until clearance between screw (4) and counterweight (2) is 1 — 2 mm (0.04 — 0.08 in).
   3) Tighten solenoid switch (5) until clearance between solenoid switch and counterweight (2)'s pin is 1 — 2 mm (0.04 — 0.08 in), then tighten locknut (6).



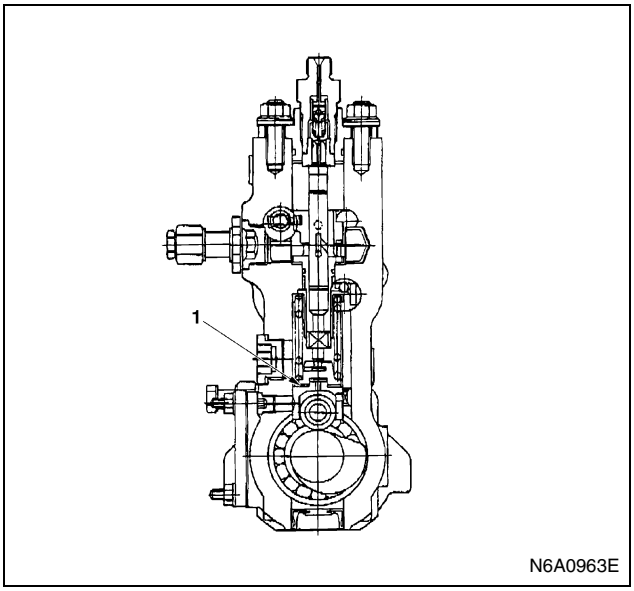
2. Install starting advance mechanism's cover.
3. Position control rack in full position.
4. Set power supply voltage to manual controller at 12V.

Pre-stroke adjustment

Adjust No.1 cylinder's start of static injection using the shim (1).

Individual cylinder's injection order adjustment

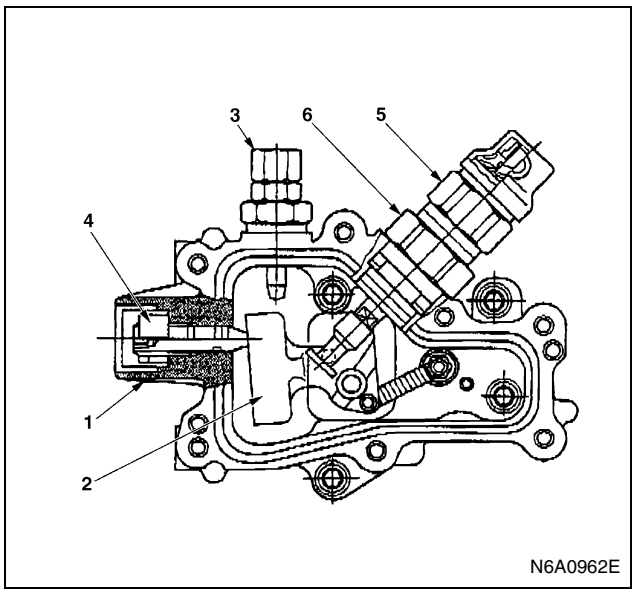
Adjust difference between each cylinder's injection angle based on that of the No.1 cylinder using the shim (1).



Measuring pre-stroke output voltage

1. Install the measuring device (P/N 105782-6420).
2. Remove the setscrew (3) (P/N 157927-2820) and install the air bleeder bolt.
3. Screw in screw (4) (P/N 157927-3321) and measure the No 1 cylinder's output voltage for pre-stroke lift values in the table below.

Adjusting point confirmation point	Pre-stroke (mm (in))	Output voltage (actual)	Remarks
a	3.70 (0.1457)	a1	+ tolerance
	3.44 (0.1354)	a2	– tolerance
b	3.24 (0.1276)	b1	+ tolerance
	3.04 (0.1197)	b2	– tolerance
(calculate form each specification)			



Advice

If measuring device (P/N 105782-6420) is removed, the output voltage (a1, a2) should be remeasured.

Minimum advance angle adjustment stopper adjustment

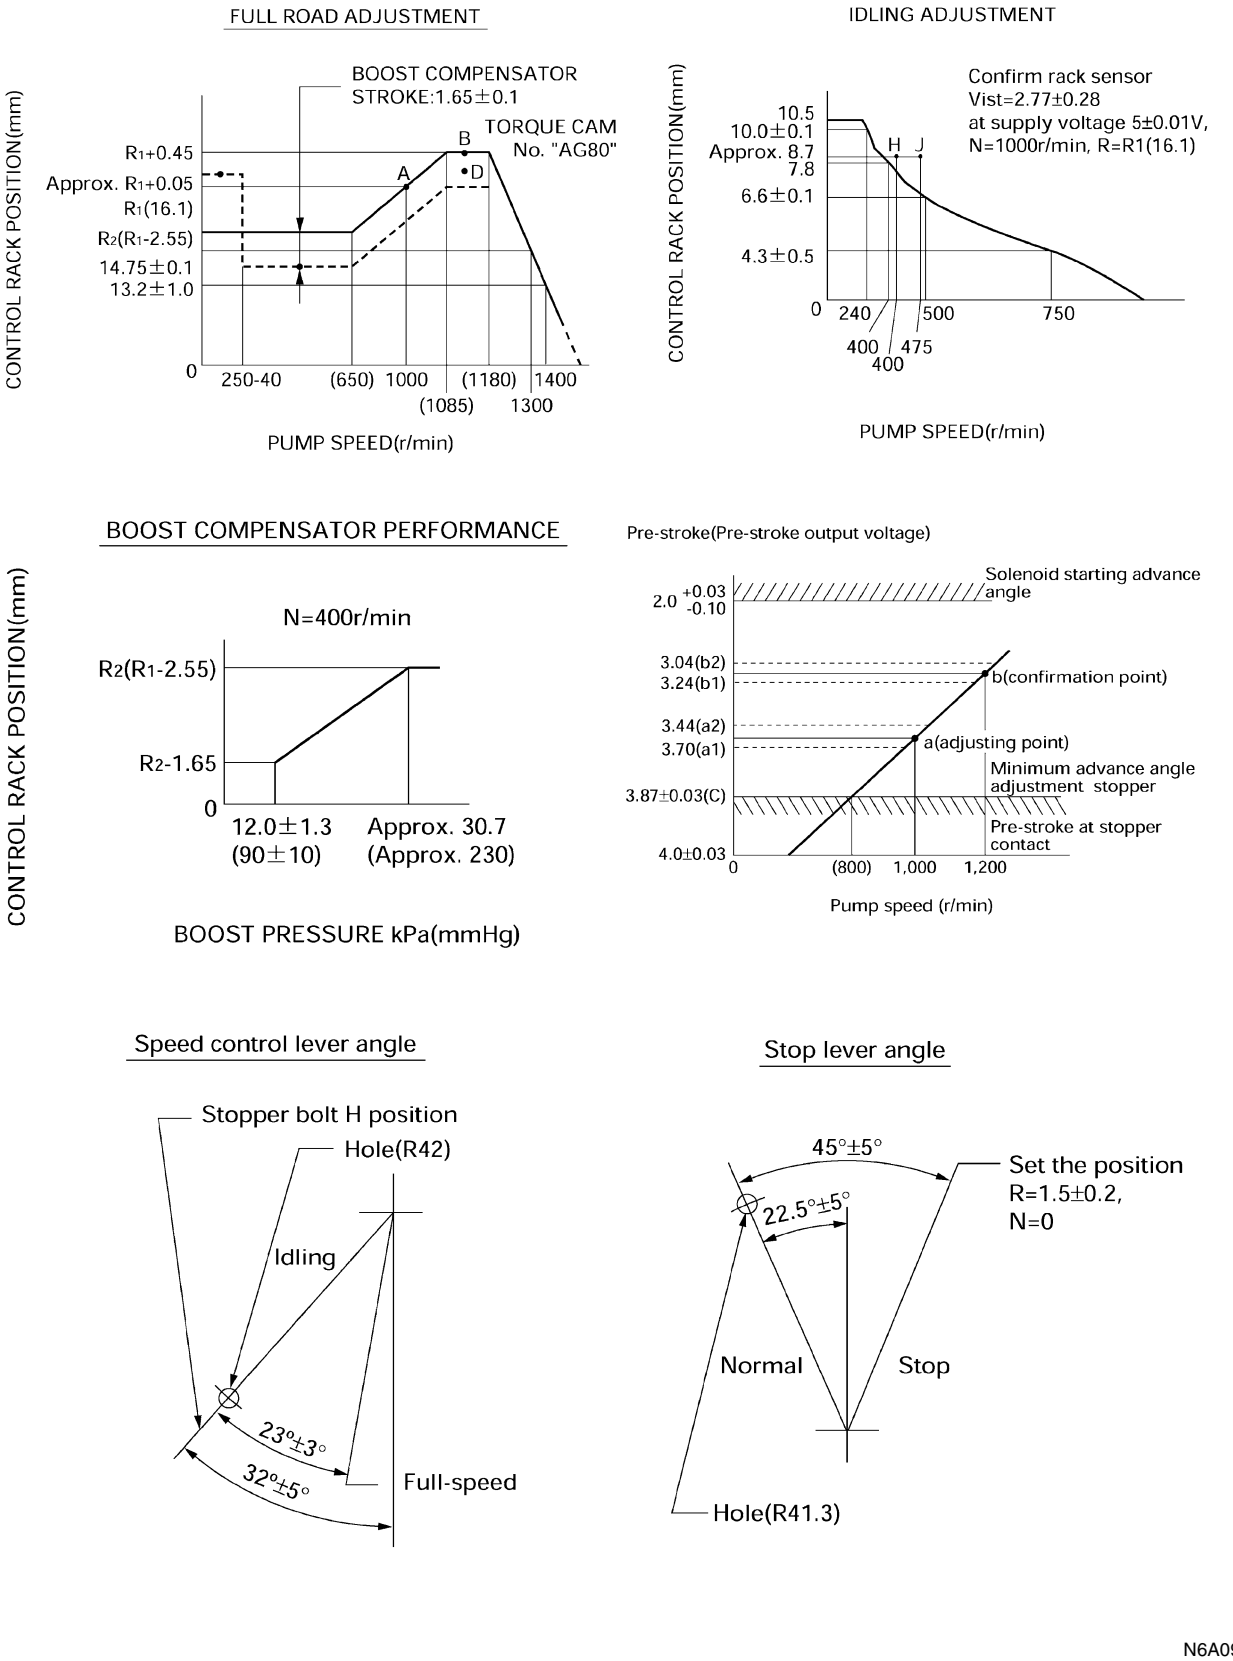
1. Remove the screw (4) (P/N 157927-3321) and install minimum advance angle adjustment stopper.
2. Screw in minimum advance angle adjustment stopper until No 1 cylinder's pre-stroke is 3.84 — 3.90 mm (0.1512 — 0.1535 in).
   Then, tighten locknut to specified torque.
3. Measure the output voltage (c) at this time.

Solenoid switch adjustment

1. Apply 24 V voltage to solenoid switch (5).
2. Loosen solenoid switch (5) until No 1 cylinder's pre-stroke is 1.90 — 2.03 mm (0.0748 — 0.0799 in), then tighten the locknut to the specified torque.
3. Confirm solenoid switch operates at 14.5 — 0.1 V.

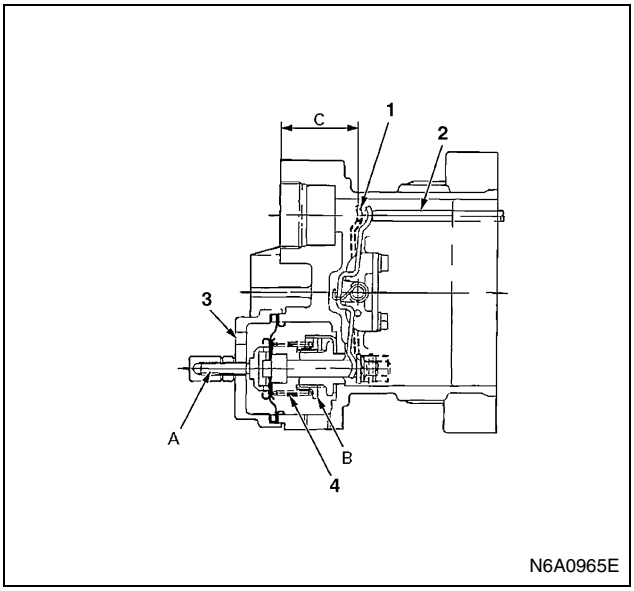
Governor Adjustment

Governor adjustment



Boost compensator adjustment

1. Select a push rod so (C) = 37.5±0.5 mm (1.48±0.02 in) at full boost pressure. ((C) is the distance from the end face of the housing to top of the lever.)
2. Adjust the boost compensator stroke using screw (A). (0 boost pressure position adjustment)
   Adjust the beginning of boost compensator operation by adjusting the notch adjusting nut (B).



Legend

1. Top of lever
2. Push rod
3. Boost pressure inlet
4. Boost compensator spring

Timing cam adjustment (Timing cam No: 510)

1. Hold speed control lever against full speed stopper bolt.
2. Supply boost pressure of at least 44.0 kPa (330 mmHg/6.38 psi)
3. Operate pump at the timing cam adjusting point (point a table below: Np = 1,000 r/min).
4. Perform timing cam adjustment so output voltage is within range of a1 — a2 actually measured for pore-stroke output voltage during injection timing adjustment in 3 — 4.

Adjusting point	Pre-stroke (mm (in))	Output voltage (actual)	Remarks
a	3.70 (0.1457)	a1	+ tolerance
	3.44 (0.1354)	a2	– tolerance

5. Operate the pump at the timing cam confirmation point.
   (point b in table below: Np = 1,200 r/min)
6. Confirm that the pre-stroke output voltage is within the range b1 — b2.

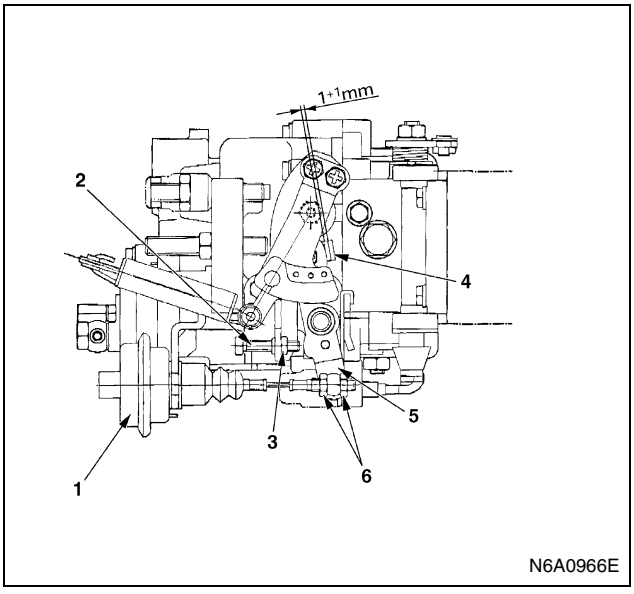
Confirmation point	Pre-stroke (mm (in))	Output voltage (actual)	Remarks
b	3.24 (0.1276)	b1	+ tolerance
	3.04 (0.1197)	b2	– tolerance

Injection Quantity

Adjusting point	Rack position (mm (in))	Pump speed (r/min)	Injection q'ty (cm^3 /1,000 strokes)	Max. variation between cylinders	Fixed	Pre-stroke at adjustment	Remarks	
—	16.1 (0.6339)	1,000	124±1.6	±4	Rack	a1 — a2 (v)	Basic	Cylinder variation adjustment standard
Z	8.7±0.5 (0.3425± 0.0197)	585	14±1.5	±14	Rack	c (v)		Cylinder variation adjustment standard
A	R1 (16.1 (0.6339))	1,000	124±1	—	Lever	a1 — a2 (v)	Basic	Boost press. kPa (mmHg/ psi) Above 44.0 (330/6.38)
B	R1+0.45 (0.0177)	1,150	123.5±2	—	Lever	Measure		Boost press. kPa (mmHg/ psi) Above 44.0 (330/6.38)
D*	16.15±0.1 (0.6358± 0.0039)	1,150	—	—	Lever	Measure		Boost press. kPa (mmHg/ psi) Above 44.0 (330/6.38) Negative press. kPa (mmHg/psi) 53.3 (400/7.73)
D*: Aneroid compensator actuator adjustment point								

FICD Adjustment

1. Stop the injection pump.
2. Hold speed control lever against idling stopper bolt.
3. Adjust clearance between FICD actuator lever and speed control lever to approx. 1+1 mm (0.0394+0.0394 in).
4. Loosen nut (3) and fully tighten FICD set bolt (2).
5. Apply 53.3 kPa (400 mmHg/7.73 psi) negative pressure to the actuator (1) and set the pump speed at 450 r/min.
6. Gradually loosen set bolt (2) then fix bolt using nut when the rack position is 8.1±0.1 mm (0.3189±0.0039 in).
7. Apply above negative pressure several times and confirm FICD actuator is operating properly and clearance between FICD actuator lever and speed control lever.



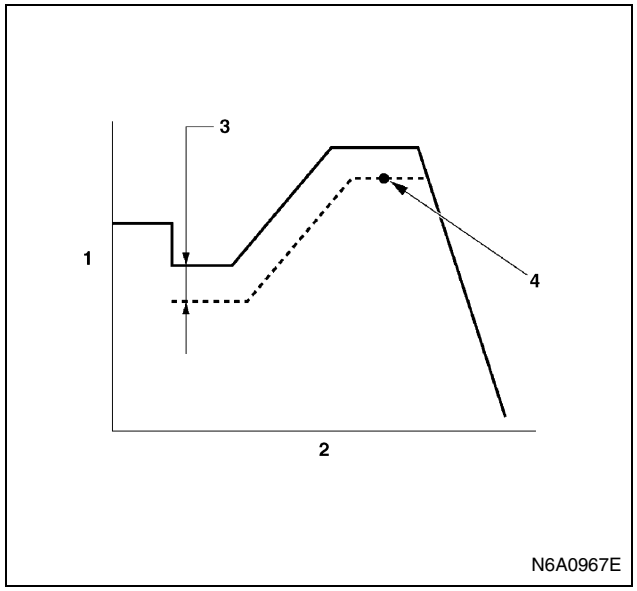
Legend

1. Actuator
2. Set bolt
3. Nut
4. Speed control lever
5. FICD actuator lever
6. Tightening torque 5 — 7 N·m (0.5 — 0.7 kg·m/ 3.7 — 5.2 lb·ft)

Aneroid Compensator Actuator Adjustment (Injection Quantity Decrease)

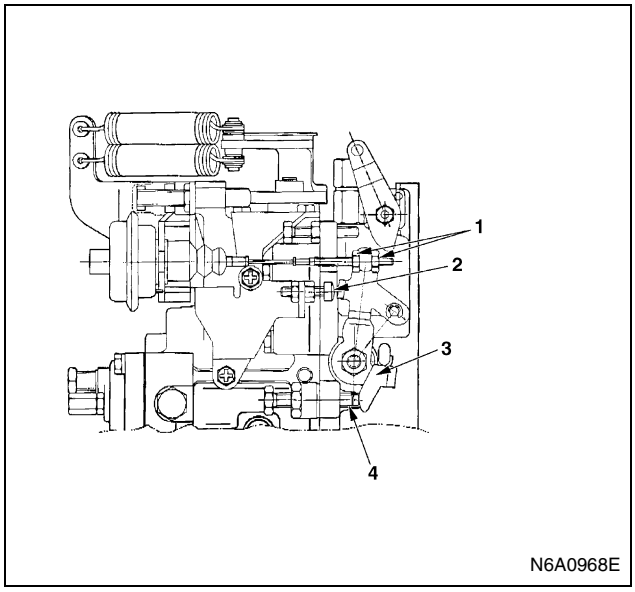
Notice:
Set this actuator after adjusting the full rack position.

1. Stop injection pump.
2. Adjust wire nut so full load set lever contacts full load set bolt and aneroid compensator actuator wire is not loose. Then, fix the nut.
3. Apply 53.3 kPa (400 mmHg/7.73 psi) negative pressure to aneroid compensator, set pump speed at 1,150 r/min.



Legend
1. Rack position (mm)
2. Pump speed (r/min)
3. Stroke
4. Injection quantity decrease adjustment point

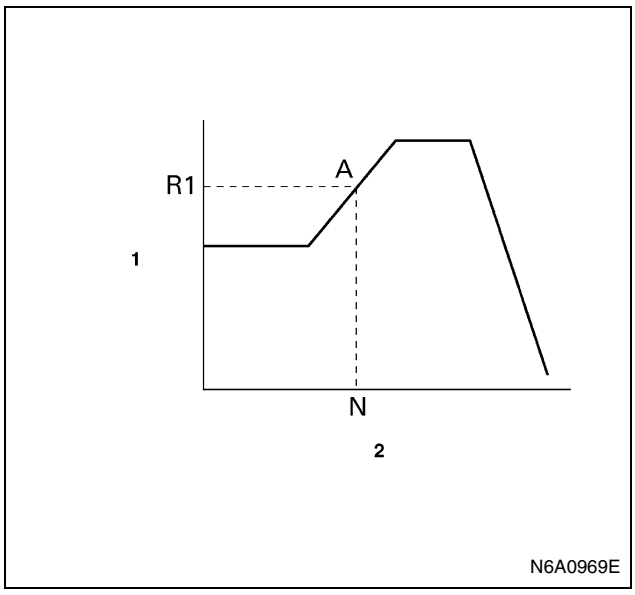
4. Apply at least 44.0 kPa (330 mmHg/6.38 psi) boost pressure to the boost compensator.
5. After operating full load set lever, adjust aneroid compensator set bolt so control rack position is 16.15±0.1 mm (0.6358±0.0039 in) and fuel injection quantity is as specified. Then, fix the set bolt.



Legend
1. Nut
2. Set bolt
3. Full load set lever
4. Full load set bolt

Rack Sensor Adjustment

1. Before removing rack position measuring device, apply at least 44.0 kPa (330 mmHg/6.38 psi) boost pressure and confirm rack position is R1 = 16.1 mm and fuel injection quantity is 124±1 mm^3/st at N = 1,000 r/min.



Legend
1. Rack position (mm)
2. Pump speed (r/min)

2. Remove the rack position measuring device.
3. Attach the rack sensor core to the control rack.

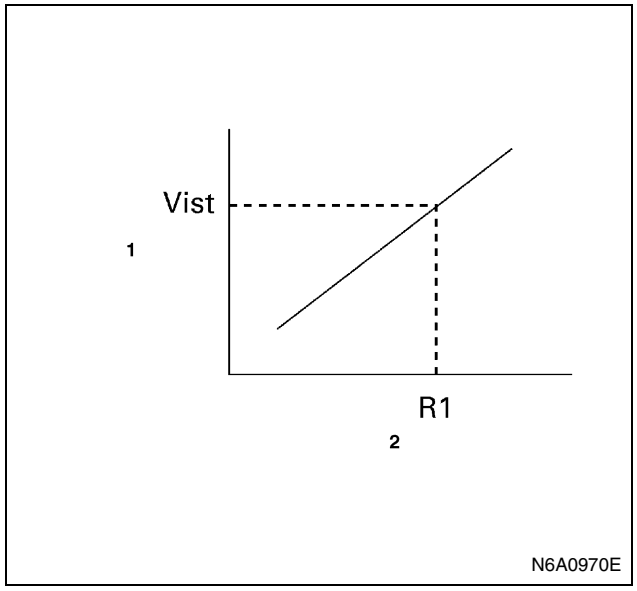
At this time, hold control rack using a spanner (to prevent the rack from bending).

Specified torque: 3.4 — 4.9 N·m (0.35 — 0.5 kg·m/2.5 — 3.6 lb·ft)

4. While pulling stop lever, install rack sensor to rack sensor core.
5. Tighten the two flnge fixing screws.

Specified torque: 6.9 — 8.8 N·m (0.7 — 0.9 kg·m/5.1 — 6.5 lb·ft))

6. Connect the rack sensor wire harness to constant voltage power supply and digital voltmeter.
7. Turn constant voltage power supply power switch ON and set it to DC 5±0.01V.
8. Apply at least 44.0 kPa (330 mmHg/6.38 psi) boost pressure, set pump speed at N = 1,000 r/min, and hold speed control lever against the full speed stopper bolt.
9. Confirm the rack sensor output voltage from the digital voltmeter. (Vist = 2.77±0.28V)
10. Confirm that the voltage changes when the speed control lever is moved to the idle and full sides.

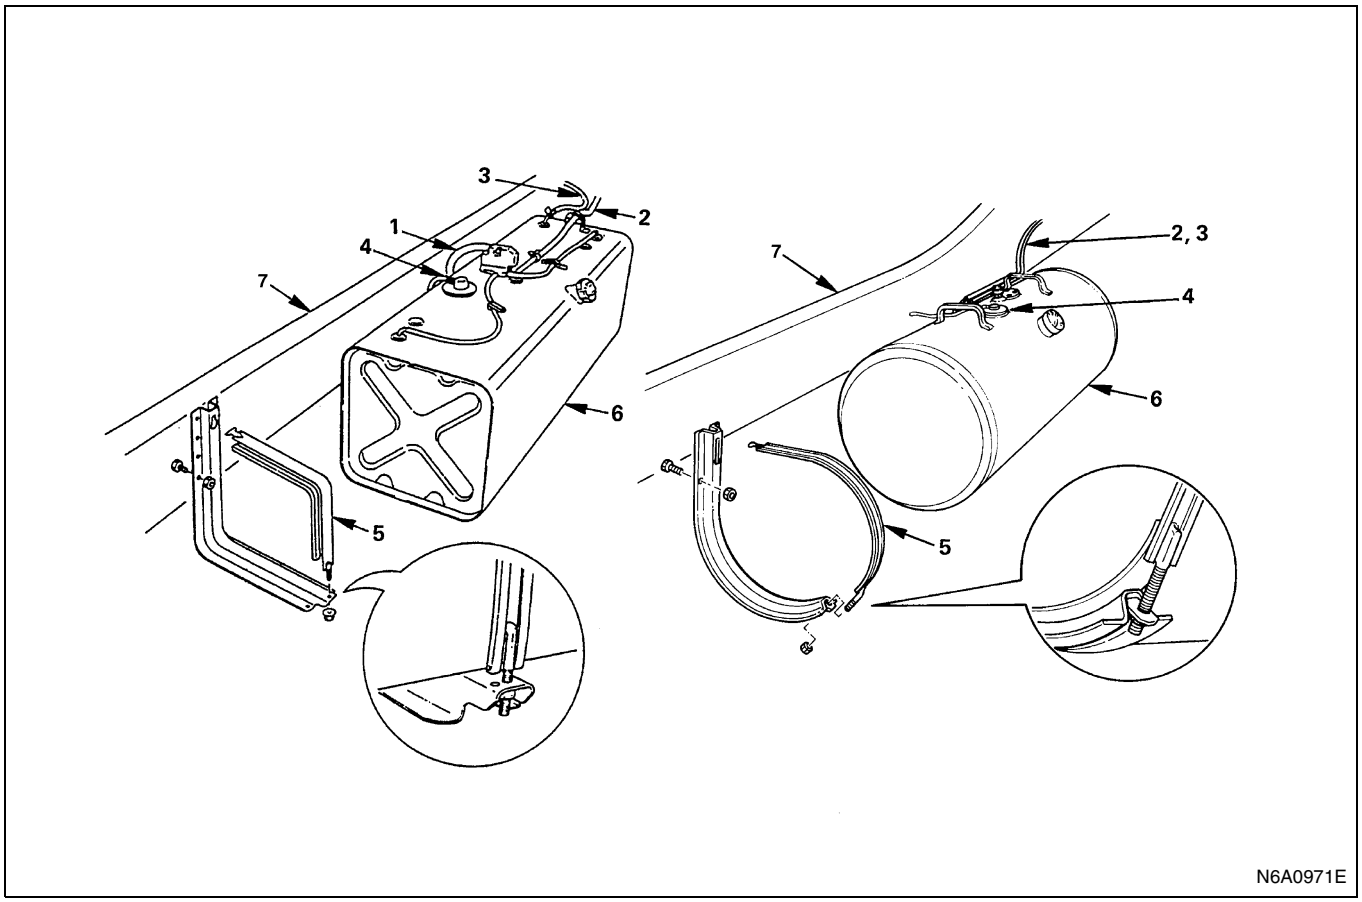


Legend

1. Sensor output voltage (V)
2. Rack position (mm)

FUEL TANK

Component



Legend

1. Evapo fuel hose
2. Fuel feed hose
3. Fuel return hose
4. Fuel gauge unit connector
5. Band
6. Fuel tank
7. Frame

Removal

Preparation

- Disconnect the battery ground cable.
- Loosen the fuel filler cap.
- Drain fuel from drain plug.
- After the drain fuel, tighten the drain plug to the specified torque.

Tighten:
Drain plug to 29 N·m (3 kg·m / 22 lb·ft)

1. Evapo Fuel Hose
2. Fuel Feed Hose
3. Fuel Return Hose
   - Plugging the return hose to prevent fuel from getting spilt, tie it to the fame with the plugged end up.
4. Fuel Gauge Unit Connector
   - Remove the fuel gauge unit connector.
5. Band
   - Remove the nut of the fuel tank fixing band, and then remove the band end on the frame side.
6. Fuel Tank
   - Pull out the fuel tank to the outside.

Notice:
When it is not possible to pull out the fuel tank, remove the bracket and then draw out the fuel tank downward.

Installation

1. Fuel Tank

Notice:
When the bracket was removed to take off the fuel tank, install the bracket to the frame and tighten it to the specified torque.

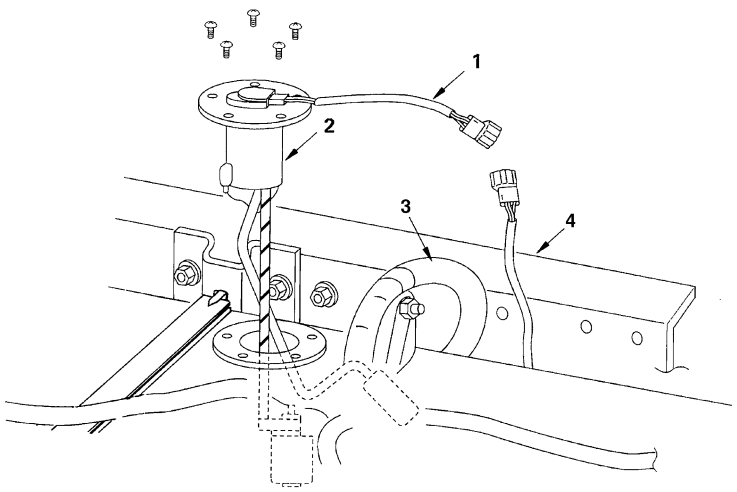
Tighten:
Fuel tank bracket to 55 N·m (5.6 kg·m / 41 lb·ft)

Also, when mounting the fuel tank to the bracket, place the packing section attached to the fuel tank securely on the bracket.

2. Band
   - Tighten the band to 12 N·m (1.2 kg·m /104 lb·in)
3. Fuel Gauge Unit Connector
   - Connect the fuel gauge unit connector.
4. Fuel Return Hose
5. Fuel Feed Hose
   - Set the hose to the pipe more than 25 mm (0.98 in) deep.
6. Evapo Fuel Hose
   - Fill the fuel to the fuel tank.
   - Connect battery ground cable.

FUEL GAUGE UNIT

Component



N6A0972E

Legend

1. Fuel gauge unit connector
2. Fuel gauge unit
3. Evapo fuel hose
4. Frame

Removal

Preparation

Disconnect the Battery ground cable.

1. Fuel Gauge Unit Connector
   - Disconnect the fuel gauge unit connector from the fuel gauge unit.
2. Fuel Gauge Unit
   - Remove the fuel gauge unit fixing screw and fuel gauge unit.

Notice:

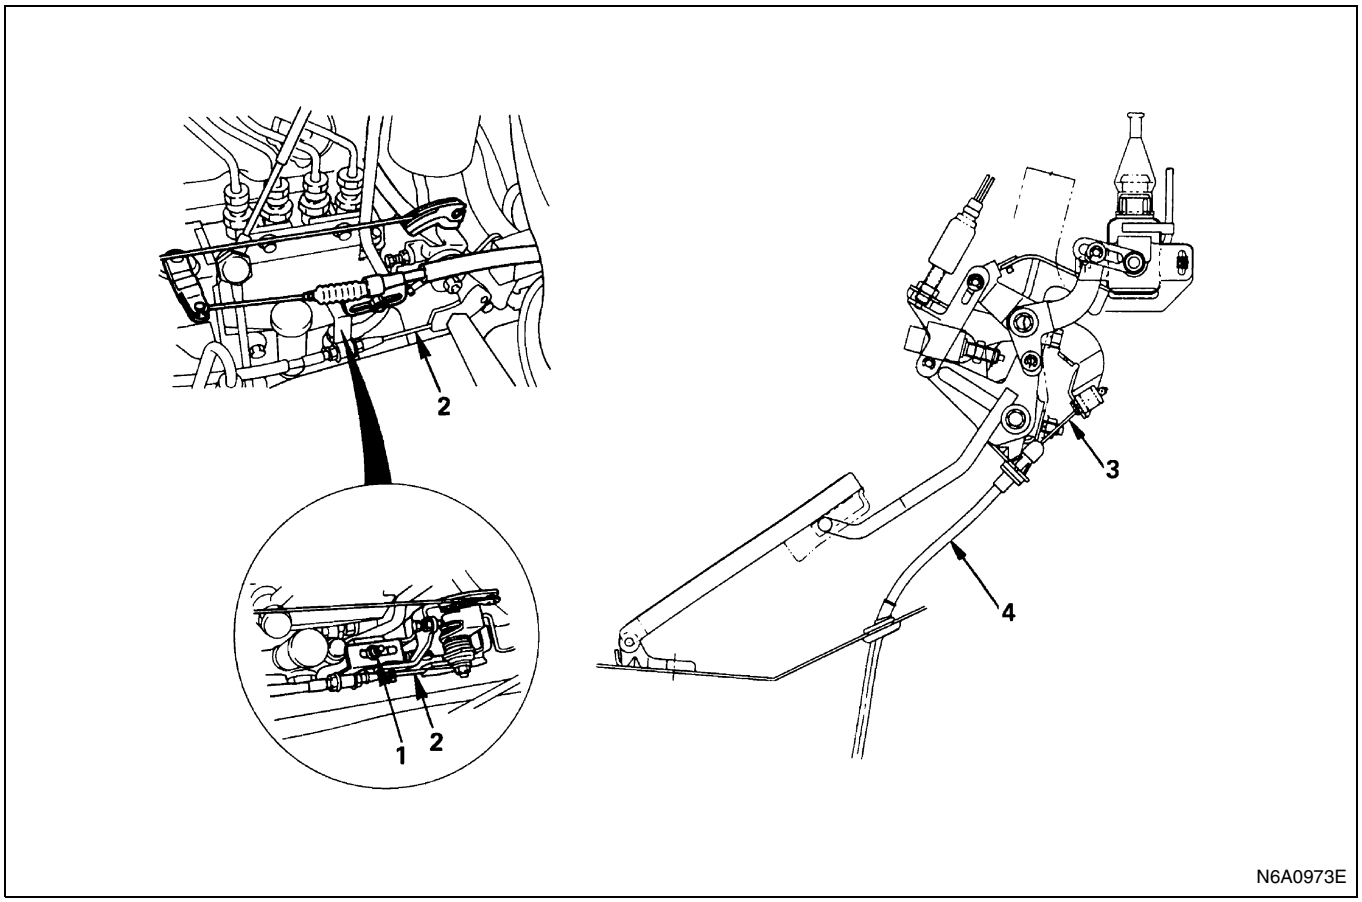
After removing fuel gauge unit, cover fuel tank with waste to prevent any dust entering

Installation

1. Fuel Gauge Unit
2. Fuel Gauge Unit Connector
   - Connect the wiring connector to the fuel gauge unit.

ACCELERATOR CONTROL CABLE

Component



Legend

1. Adjust nut
2. Accelerator control wire (Injection pump side)
3. Accelerator control wire (Accelerator pedal side)
4. Accelerator control cable

Removal

1. Adjust Nut
   - Loosen the adjust nut on the cable bracket mounted.
2. Accelerator Control Wire (Injection pump side)
   - Remove the control wire from injection pump control lever.
3. Accelerator Control Wire (Accelerator pedal side)
   - Remove the Accelerator control wire from accelerator pedal.
4. Accelerator Control Cable
   - Pull out the wire to the chassis side through the grommet hole of the floor board, and remove the control cable.

Inspection

Check the following items, and replace the control cable if any abnormality is found.

- The control cable should move smoothly.
- The control cable should not be bent or kinked.
- The control cable should be free of damage and corrosion.

Installation

1. Accelerator Control Cable
   - Take care that the core wire of the cable does not get damaged or inded.
   - Put the cable through the grommet hole from under the floor.
   - Set the groove of the grommet securely into the floor panel.
2. Accelerator Control Wire (Accelerator Pedal side)
   - Connect the accelerator control wire to Accelerator pedal.
3. Cable Clips
   - Install the cable clip to chassis frame.
   - Tighten the cable clips to 16 N·m (1.6 kg·m / 12 lb·ft)
4. Accelerator Control Wire

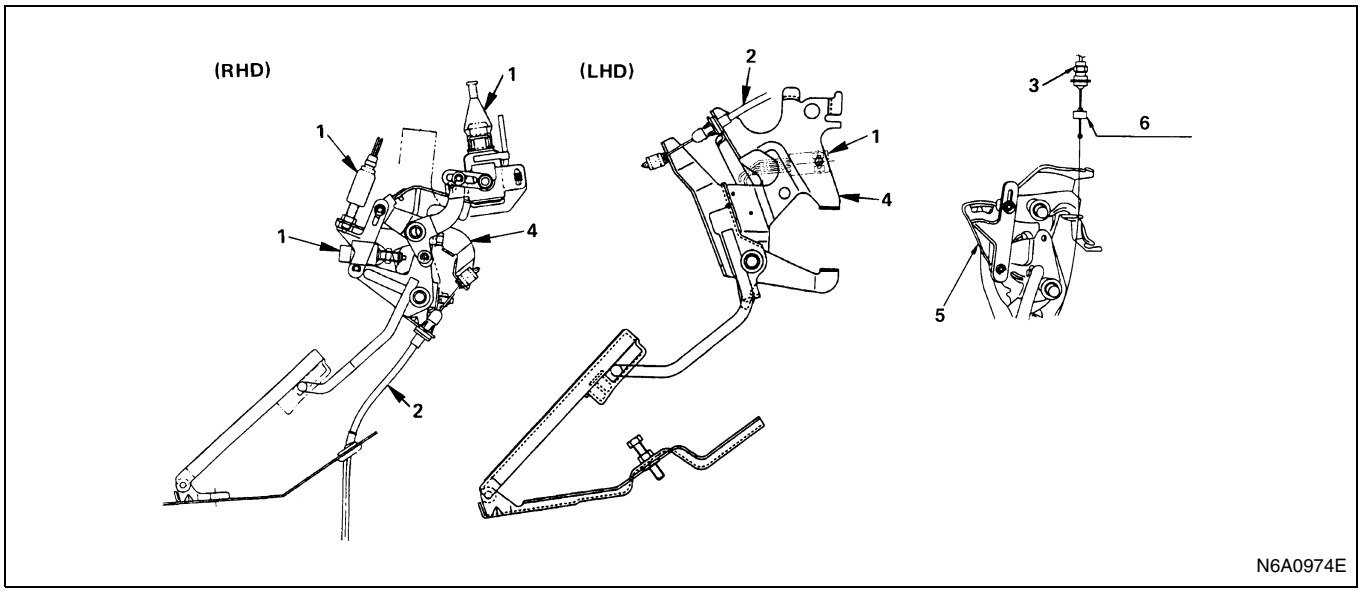
5. Adjust Nut
   - Attach the end tip of the wire to the engine control lever.
   - Pull the outer cable gently toward the front of the vehicle, and provide the engine control wire and the accelerator control wire an appropriate play before fastening the clamp with a nut.

Tighten:
Nut to 8 N·m (0.8 kg·m /69 lb·in)

- Check to see if the injection pump lever is at the idle position (with the lever in touch with the stopper bolt).
- Connect the battery ground cable.
- Check to see if the accelerator pedal fully is in the range of 5 — 10 mm (0.2 — 0.4 in) above the pedal pad.
- Press down on the accelerator pedal fully, and check to see if the engine rotates at the maximum speed with the linkage in the smooth operation.
- In the operating range of the accelerator pedal, check to see if the accelerator pedal and the injection pump lever return without fail to the original positions.

ACCELERATOR PEDAL

Component

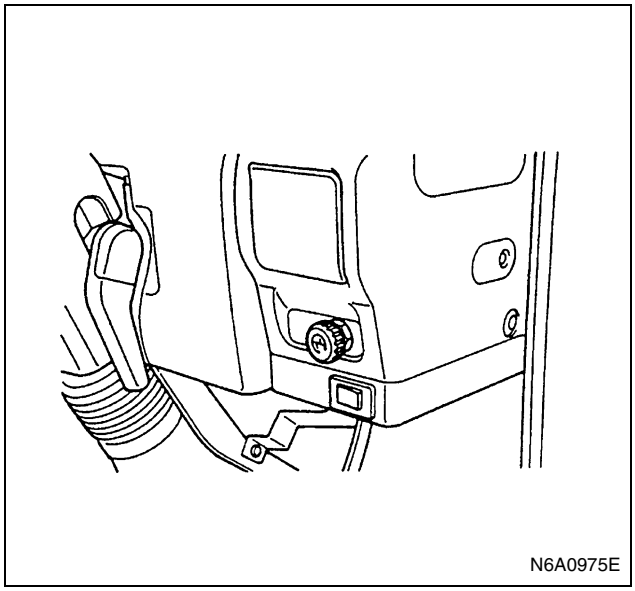


Legend

1. Switch connector
2. Accelerator control cable
3. Idling control cable
4. Accelerator pedal assembly
5. Accele pedal bracket
6. Wire guide

Removal

1. Switch Connector
2. Accelerator Control Cable.
   - Remove control cable from Accelerator pedal bracket.
3. Idling Control Cable
   - Remove control cable from accelerator pedal bracket.
4. Accelerator Pedal Assembly
   - Remove accelerator pedal assembly from brake pedal bracket.

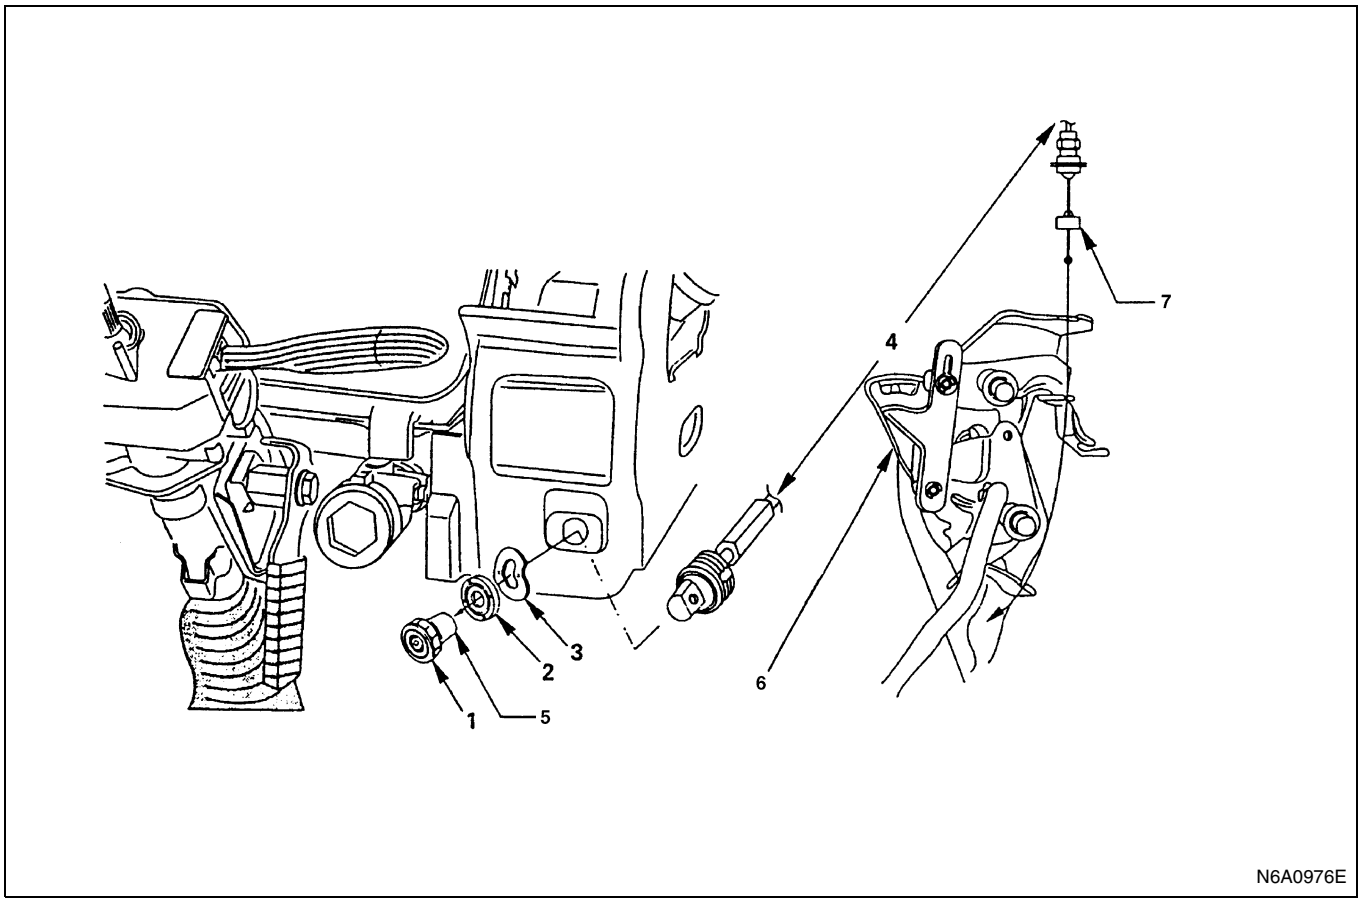


Installation

1. Accelerator Pedal Assembly
   - Apply grease to the sliding portion, and install it to the brake pedal bracket.
2. Idling Control Cable
   - Install the idling control cable to the lever of the accelerator pedal bracket.
3. Accelerator Control Cable
   - After confirming that the idling control knob is turned fully to the left, install the accelerator control cable.
4. Switch Connector

IDLING CONTROL CABLE

Component



Legend

1. Idling control knob
2. Idling control cable nut
3. Wave washer
4. Idling control cable
5. Screw
6. Accelerator pedal bracket
7. Wire guide

Removal

1. Idling Control Knob
   - Loosen the idling control knob screw and remove the knob from cable.
2. Idling Control Cable Nut
3. Wave Washer
4. Idling Control Cable
   - Remove control cable from accelerator pedal bracket.

Installation

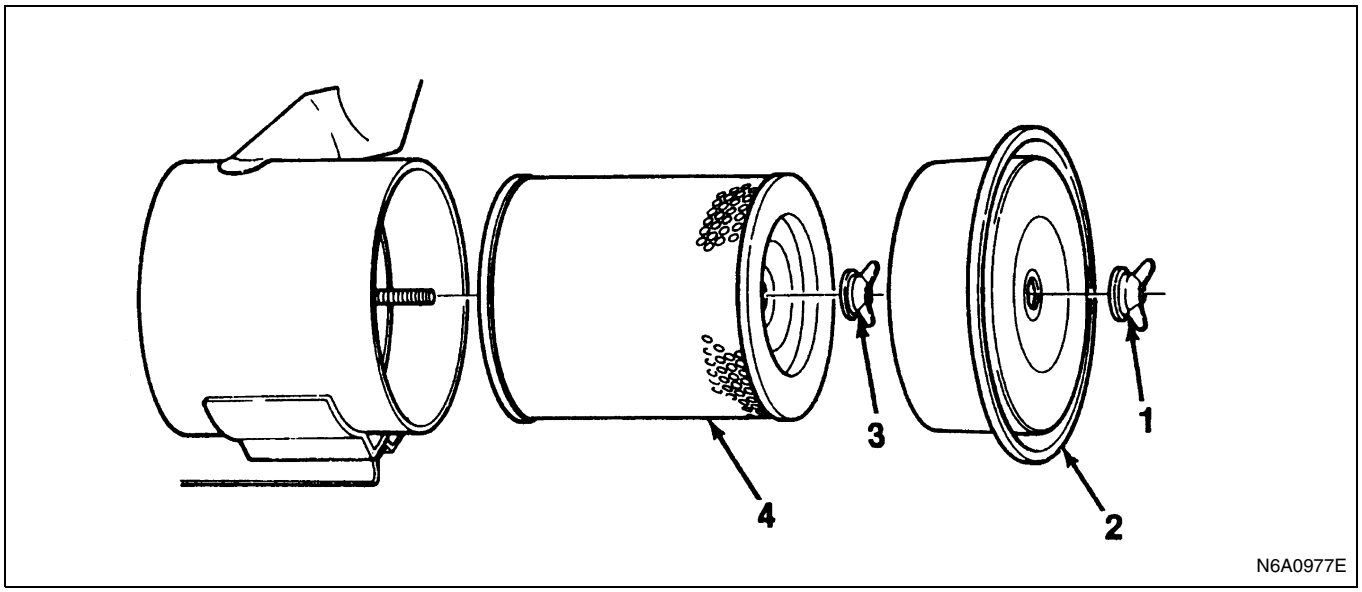
1. Idling Control Cable
   - Install control cable to Accelerator pedal bracket.
2. Wave Washer
3. Idling Control Cable Nut
   - Insert the idling control cable into the specified hole of the instrument panel.
   - Install the washer to the cable, and tighten it with a nut.
4. Idling Control Knob
   - Insert the idling control knob into the cable, and tighten the screw.

Inspection:

- With the idling control knob not in use, check to see if the injection pump lever is at the idle position (with the lever in contact with the stopper bolt).
- With the idling control knob turned fully to the right, check to see if the number of the engine idling rotations gets to 1,500 rpm or more.

AIR CLEANER ELEMENT

Component



Legend

1. Cover wing nut
2. End cover
3. Filter wing nut
4. Air cleaner element

Removal

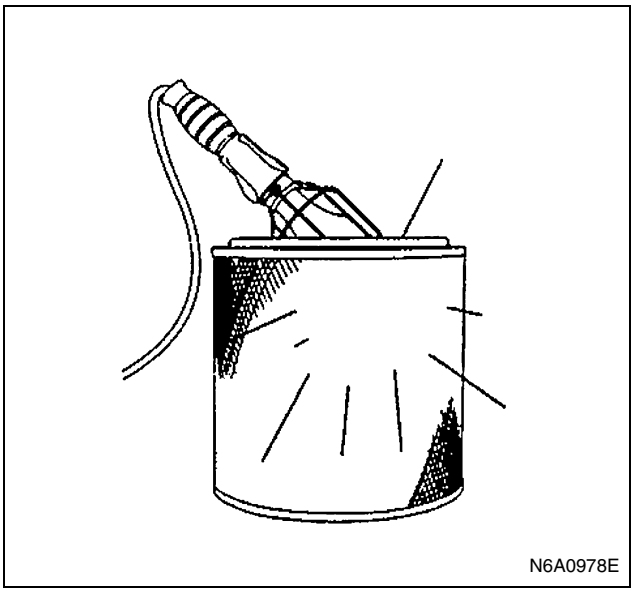
1. Cover Wing Nut
2. End Cover
3. Filter Wing Nut
4. Air Cleaner Element

Clean

- Wipe out the inside of the Air cleaner assembly
- Wipe off the Cover

Inspection

- The air filter with a light for fears or holes.



Cleaning Method

Dust Fouled Element

Rotate the element with your hand while applying compressed air to the inside of the element. This will blow the dust free.

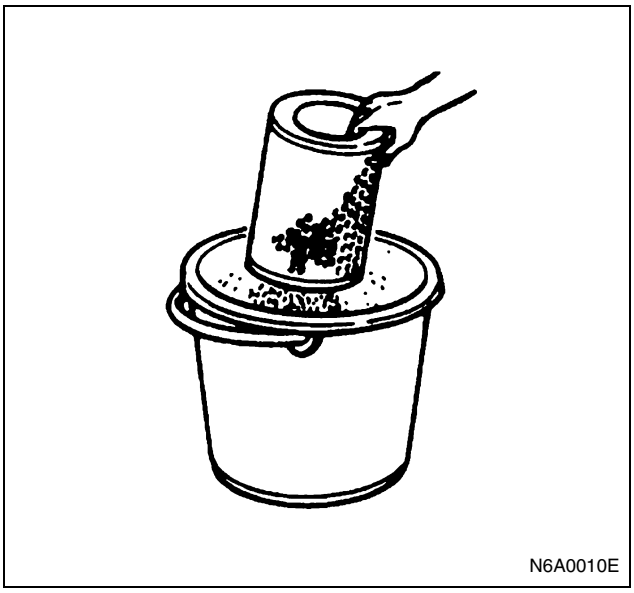
Compressed air pressure	kPa (kg/cm^2/psi)
392 — 490 (4 — 5/57 — 71)	

Caution:
Do not bang the element against another object in an attempt to clean it. Damage to the element will result.

N6A0009E

Carbon and Dust Fouled Element

1. Prepare a cleaning solution of Isuzu Genuine Element Cleaner (Donaldson D1400) diluted with water.
2. Submerge the element in the solution for twenty minutes.



N6A0010E

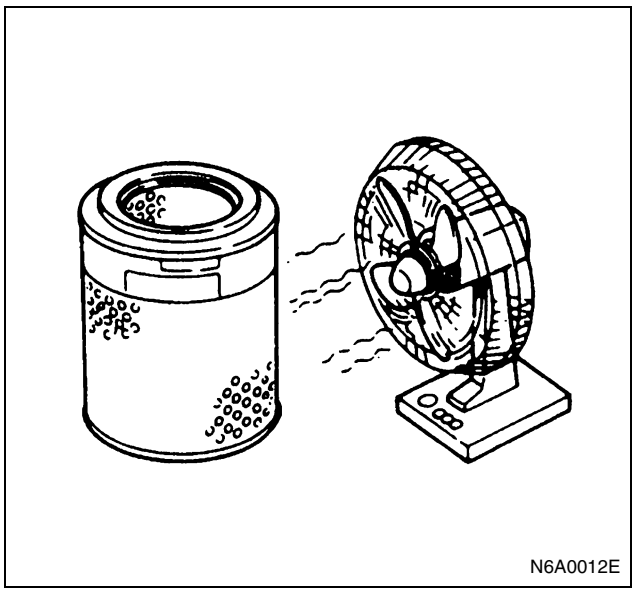
3. Remove the element from the solution and rinse it well with running water.
   Water pressure must not exceed 274 kPa (2.8 kg/cm^2/40 psi)

N6A0011E

4. Dry the element in a well ventilated area.
   An electric fan will hasten drying.

Notice:
Do not use compressed air or an open flame to dry the element quickly. Damage to the element will result.

It will usually take two or three days for the element to dry completely. Therefore, it is a good idea to have a spare on hand to use in the interim.



N6A0012E

Installation

1. Air Cleaner Element
2. Filter Wing Nut
3. End Cover
4. Cover Wing Nut

BATTERY....6D1-2
General Description....6D1-2
Diagnosis....6D1-2
On-vehicle Service....6D1-3
Main Data and Specifications....6D1-4

BATTERY

General Description

There are six battery fluid caps at the top of the battery. The battery is completely sealed except for the six small vent holes at the side. These vent holes permit the escape of small amounts of gas generated by the battery. This type of battery has the following advantages over conventional batteries:

1. There is no need to add water during the entire service life of the battery.
2. The battery protects itself against overcharging. The battery will refuse to accept an excessive charge.
   (A conventional battery will accept an excessive charge, resulting in gassing and loss of battery fluid.)
3. The battery is much less vulnerable to self-discharge than a conventional type battery.

Diagnosis

Visual Inspection

Inspect the battery for obvious physical damage, such as a cracked or broken case, which would permit electrolyte loss.
Replace the battery if obvious physical damage is discovered during inspection.
Check for any other physical damage and correct it as necessary. If not, proceed to “Hydrometer check”.

Hydrometer Check

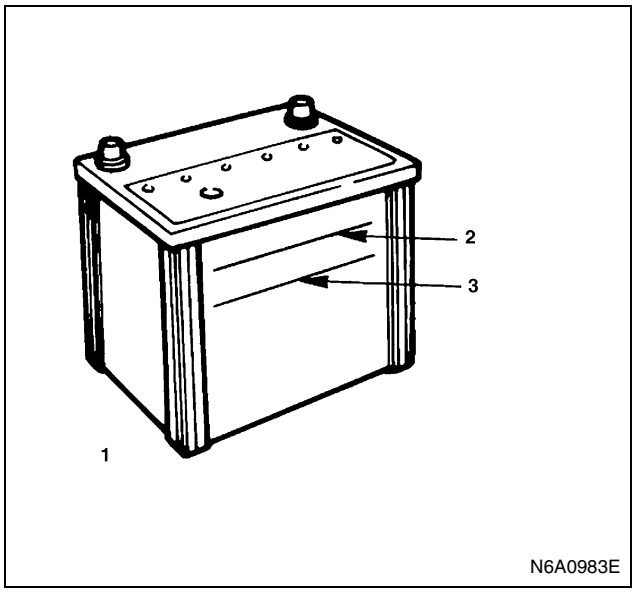
There is a built-in hydrometer (Charge test indicator) at the top of the battery. It is designed to be used during diagnostic procedures.
Before trying to read the hydrometer, carefully clean the upper battery surface.
If your work area is poorly lit, additional light may be necessary to read the hydrometer.

a. BLUE RING OR DOT VISIBLE - Go to “Voltage check”.
b. BLUE RING OR DOT NOT VISIBLE - Go to “Fluid level check”.

Fluid Level Check

The fluid level should be between the upper level line and lower level line on side of the battery.

a. CORRECT FLUID LEVEL - Charge the battery.
b. BELOW LOWER LEVEL - Replace battery.



Legend

1. Battery
2. Upper level
3. Lower level

Voltage Check

1. Put voltmeter test leads to battery terminals.
   a. VOLTAGE IS 12.4V OR ABOVE - Go to “Load test”.
   b. VOLTAGE IS UNDER 12.4V - Go to procedure 2 below.
2. Determine fast charge amperage from specification.
   (See Main Data and Specifications in this section).
   Fast charge battery for 30 minutes at amperage rate no higher than specified value.
   Take voltage and amperage readings after charge.
   a. VOLTAGE IS ABOVE 16V AT BELOW 1/3 OF AMPERAGE RATE - Replace battery.
   b. VOLTAGE IS ABOVE 16V AT ABOVE 1/3 OF AMPERAGE RATE - Drop charging voltage to 15V and charge for 10 — 15 hours.
   Then go to “Load test”.
   c. VOLTAGE IS BETWEEN 12V AND 16V - Continue charging at the same rate for an additional 3-1/2 hours. Then go to “Load test”.
   d. VOLTAGE IS BELOW 12V - Replace battery.

Load Test

1. Connect a voltmeter and a battery load tester across the battery terminals.
2. Apply 300 ampere load for 15 seconds to remove surface charge from the battery.
   Remove load.

3. Wait 15 seconds to let battery recover. Then apply specified load from specifications (See Main Data and Specifications in this section).
   Read voltage after 15 seconds, then remove load.
   1) VOLTAGE DOES NOT DROP BELOW THE MINIMUM LISTED IN FOLLOWING TABLE - The battery is good and should be returned to service.
   2) VOLTAGE IS LESS THAN MINIMUM LISTED -Replace battery.

ESTIMATED TEMPERATURE		MINIMUM VOLTAGE
°F	°C	
70	21	9.6
60	16	9.5
50	10	9.4
40	4	9.3
30	−1	9.1
20	−7	8.9
10	−12	8.7
0	−18	8.5
The battery temperature must be estimated by feel and by the temperature the battery has been exposed to for the preceding few hours.		

On-vehicle Service

Battery Charging

Observe the following safety precautions when charging the battery:

1. Never attempt to charge the battery when the fluid level is below the lower level line on the side of the battery.
   In this case, the battery must be replaced.
2. Pay close attention to the battery during the charging procedure.
   Battery charging should be discontinued or the rate of charge reduced if the battery feels hot to the touch.
   Battery charging should be discontinued or the rate of charge reduced if the battery begins to gas or spew electrolyte from the vent holes.
3. In order to more easily view the hydrometer blue dot or ring, it may be necessary to jiggle or tilt the battery.
4. Battery temperature can have a great effect on battery charging capacity.
5. The sealed battery used on this vehicle may be either quick-charged or slow-charged in the same manner as other batteries.
   Whichever method you decide to use, be sure that you completely charge the battery. Never partially charge the battery.

Jump Starting

Jump Starting With An Auxiliary (Booster) Battery

Caution:

Never push or to the vehicle in an attempt to start it.

Serious damage to the emission system as well as other vehicle parts will result.

Treat both the discharged battery and the booster battery with great care when using jumper cables.

Carefully follow the jump starting procedure, being careful at all times to avoid sparking.

WARNING:

FAILURE TO CAREFULLY FOLLOW THE JUMP STARTING PROCEDURE COULD RESULT IN THE FOLLOWING:

1. **SERIOUS PERSONAL INJURY, PARTICULARLY TO YOUR EYES.**
2. **PROPERTY DAMAGE FROM A BATTERY EXPLOSION, BATTERY ACID, OR AN ELECTRICAL FIRE.**
3. **DAMAGE TO THE ELECTRONIC COMPONENTS OF ONE OR BOTH VEHICLES PARTICULARLY.**

Never expose the battery to an open flame or electrical spark. Gas generated by the battery may catch fire or explode.

Remove any rings, watches, or other jewelry before working around the battery. Protect your eyes by wearing an approved set of goggles.

Never allow battery fluid to come in contact with your eyes or skin.

Never allow battery fluid to come in contact with fabrics or painted surfaces.

Battery fluid is a highly corrosive acid.

Should battery fluid come in contact with your eyes, skin, fabric, or a painted surface, immediately and thoroughly rinse the affected area with clean tap water.

Never allow metal tools or jumper cables to come in contact with the positive battery terminal, or any other metal surface of the vehicle. This will protect against a short circuit.

Always keep batteries out of the reach of young children.

Jump Starting Procedure

1. Set the vehicle parking brake.
   If the vehicle is equipped with an automatic transmission, place the selector lever in the “PARK” position.
   If the vehicle is equipped with a manual transmission, place the shift lever in the “NEUTRAL” position.
   Turn “OFF” the ignition.
   Turn “OFF” all lights and any other accessory requiring electrical power.
2. Look at the built-in hydrometer.
   If the indication area of the built-in hydrometer is completely clear, do not try to jump start.

3. Attach the end of one jumper cable to the positive terminal of the booster battery.
   Attach the other end of the same cable to the positive terminal of the discharged battery.
   Do not allow the vehicles to touch each other.
   This will cause a ground connection, effectively neutralizing the charging procedure.
   Be sure that the booster battery has a 12 volt rating.
4. Attach one end of the remaining cable to the negative terminal of the booster battery.
   Attach the other end of the same cable to a solid engine ground (such as the A/C compressor bracket or the generator mounting bracket) of the vehicle with the discharged battery.
   This ground connection must be at least 450 mm (18 in) from the battery of the vehicle whose battery is being charged.

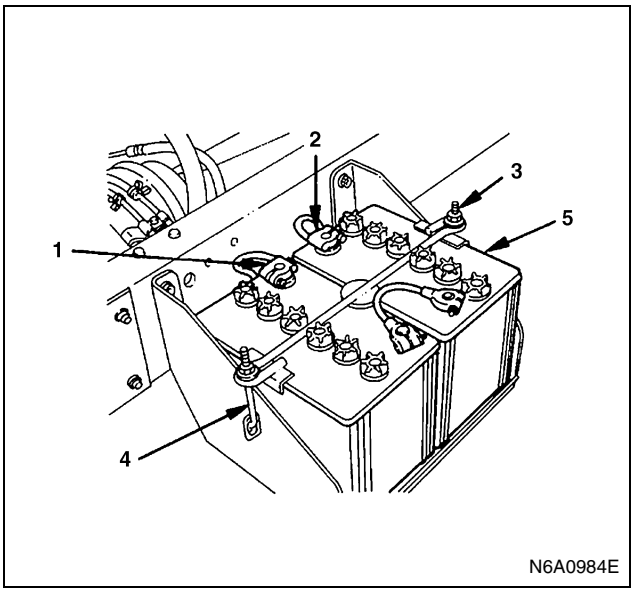
WARNING:
NEVER ATTACH THE END OF THE JUMPER CABLE DIRECTLY TO THE NEGATIVE TERMINAL OF THE DEAD BATTERY.

5. Start the engine of the vehicle with the good battery.
   Make sure that all unnecessary electrical accessories have been turned “OFF”.
6. Start the engine of the vehicle with the dead battery.
7. To remove the jumper cables, follow the above directions in the reverse order.

Be sure to first disconnect the negative cable from the vehicle with the discharged battery.

Removal

1. Negative cable
2. Positive cable
3. Retainer screw and rods
4. Retainer
5. Battery



Installation

To install the battery, follow the removal procedure in the reverse order, noting the following points:

1. Make sure that the rod is hooked on the body side.

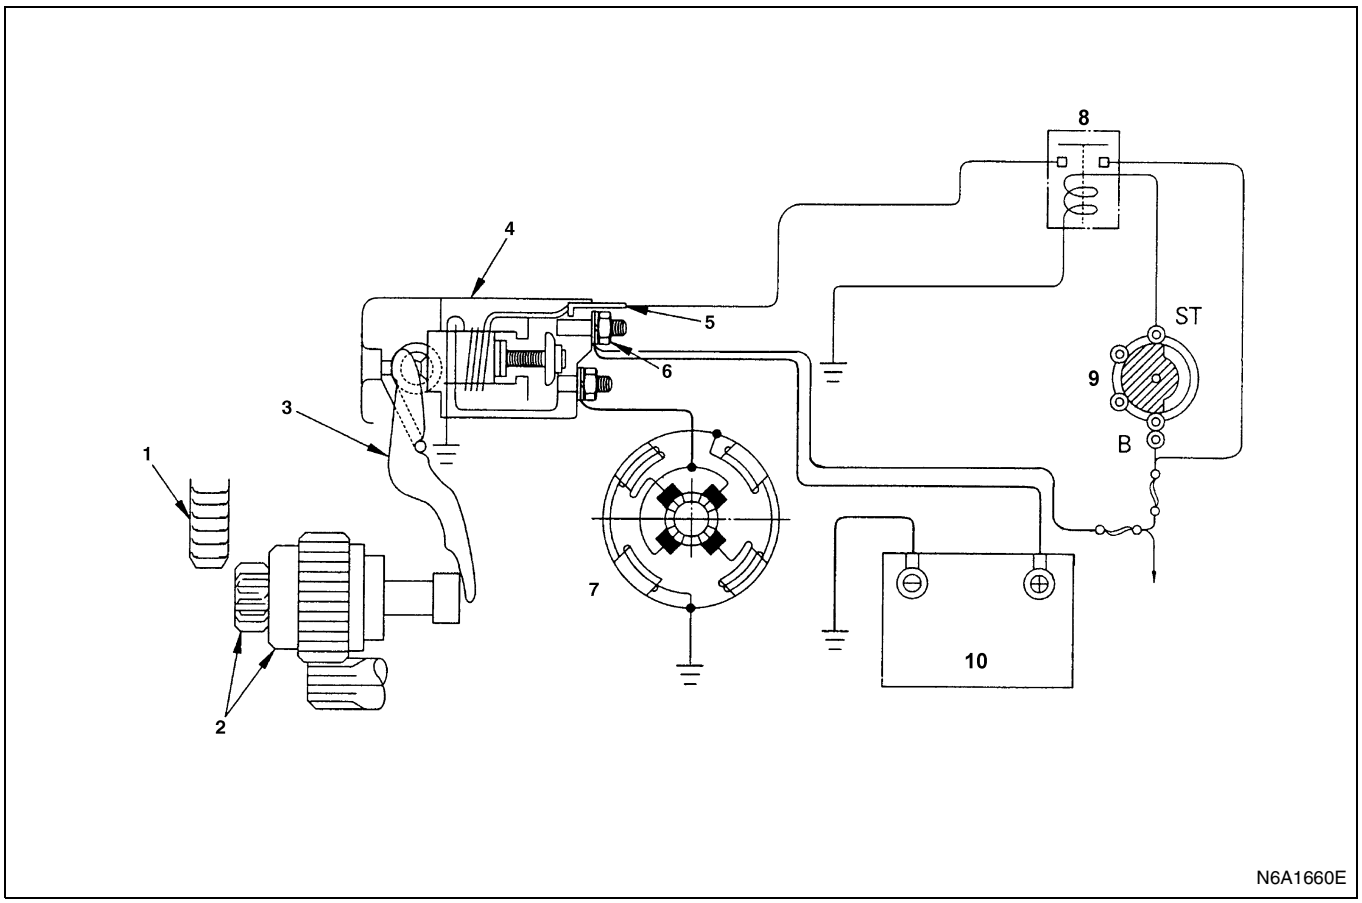
GENERAL DESCRIPTION

Component

Starting Circuit

The cranking system consists of a battery, starter, starter switch, starter relay, etc. and these main components are connected as shown in figure. For details of the starting circuit.



Legend

5. “S” terminal
6. “B” terminal
7. Starter
8. Relay; starter
9. Starter switch
10. Battery

Starter

The starting system employs a magnetic type reduction starter in which the motor shaft is also used as a pinion shaft. When the starter switch is turned on, the contacts of magnetic switch are closed, and the armature rotates. At the same time, the plunger is attracted, and the pinion is pushed forward by the shift lever to mesh with ring gear.

Then, the ring gear runs to start the engine. When the engine starts and the starter switch is turned off, the plunger returns, the pinion is disengaged from ring gear, and the armature stops rotation. When the engine speed is higher than the pinion, the pinion idles, so that the armature is not driven.

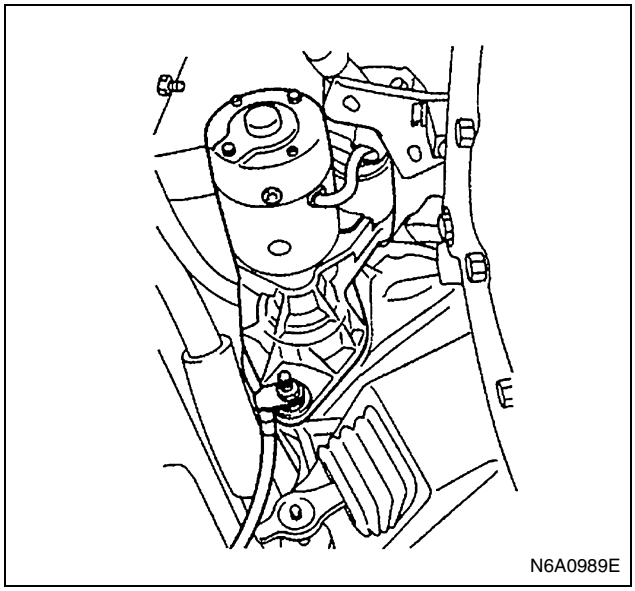
2. Starter assembly
3. Starter wiring connector

Removal

Preparation

- Disconnect the battery ground cable (both batteries).

1. Starter Earth Cable

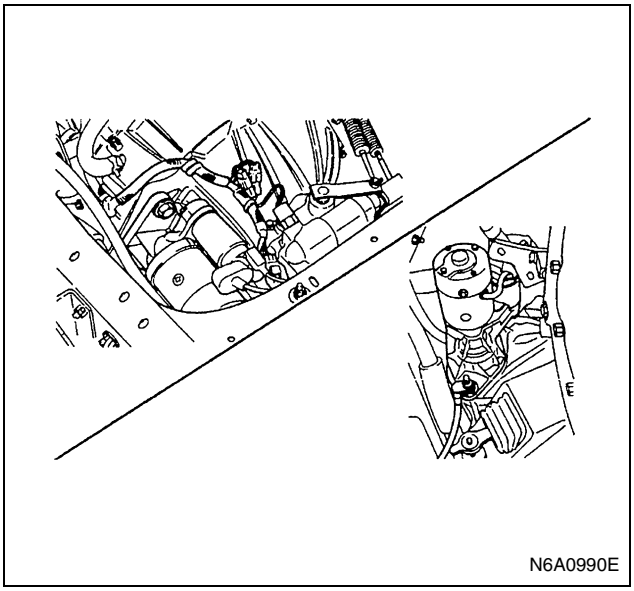


N6A0989E

- Disconnect the starter earth cable at the starter motor.

- Disconnect the front frame harness connector somewhere near the control box of the transmission, remove each clip that fastens the harness.

2. Starter Assembly

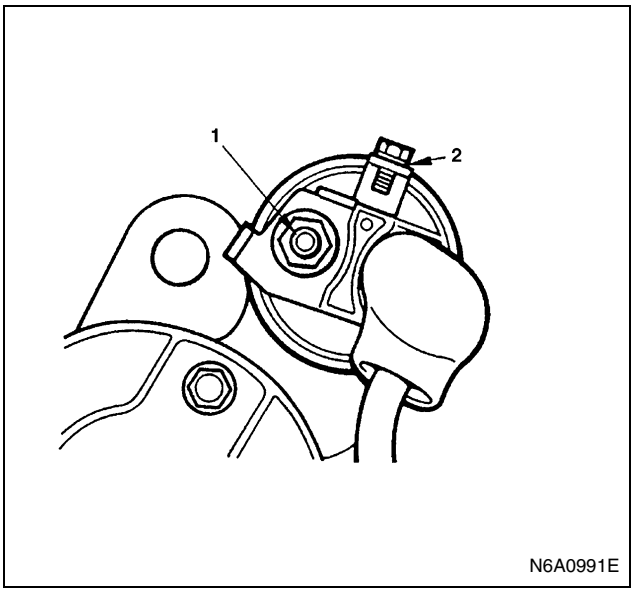


- Remove the starter assembly from flywheel housing.

3. Starter Wiring Connector

Installation

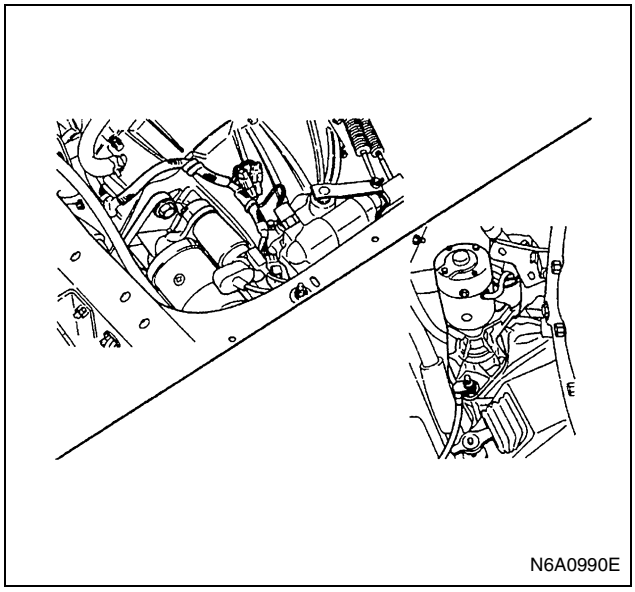
1. Starter Wiring Connector



Legend

1. Terminal B
2. Terminal S

2. Starter Assembly



- Install the starter to the flywheel housing.

Tighten:

Starter bolt to 126 N·m (12.9 kg·m / 93 lb·ft)

3. Starter Earth Cable
   - Connect the earth cable to the starter motor.
   - Connect the battery ground cable.

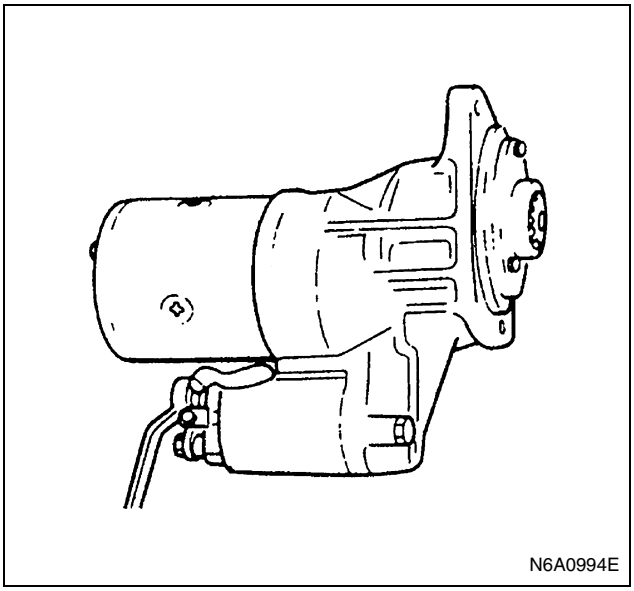
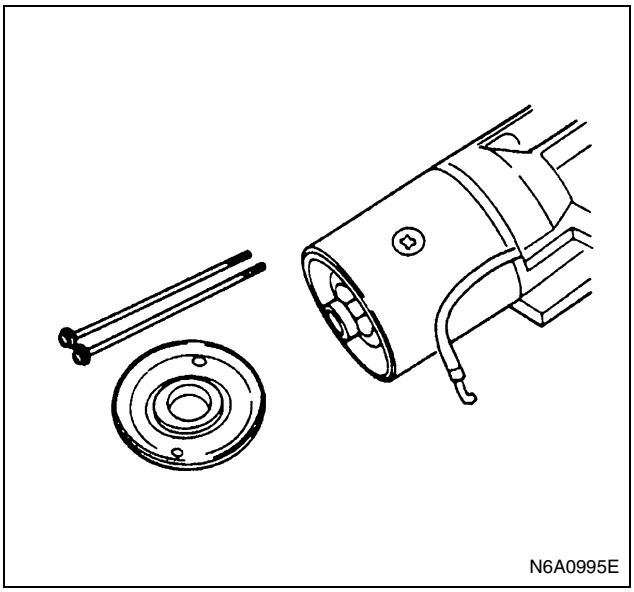
Disassembly



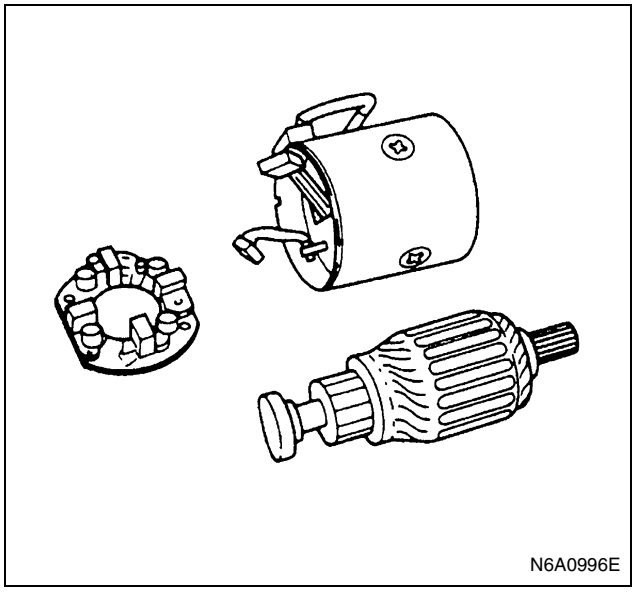
N6A0994E

1. Lead Wire Nut
   Disconnect the lead wire at the magnetic switch.
2. Through Bolt



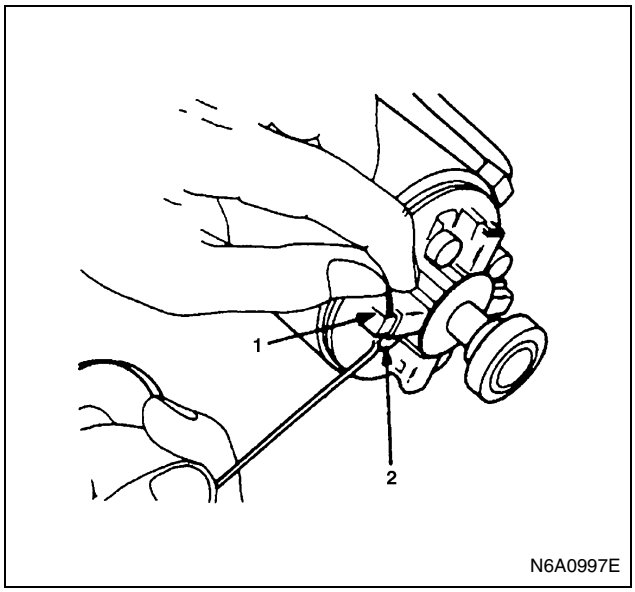
N6A0995E

3. Rear Cover
   Remove the through bolts, then remove the rear cover.
4. Brush Holder



N6A0996E

5. Armature
6. Yoke
   Remove the brush holder and pull the armature assembly from the yoke.
   Remove the four brushes from the brush holders.

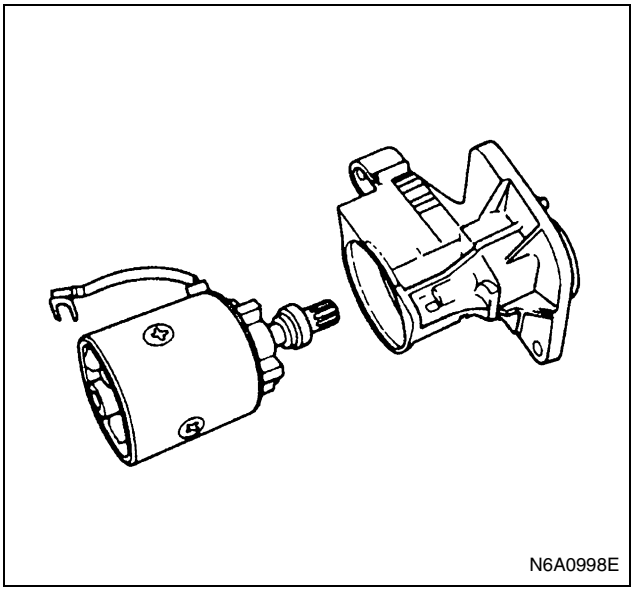


N6A0997E

Legend

1. Brush
2. Brush spring

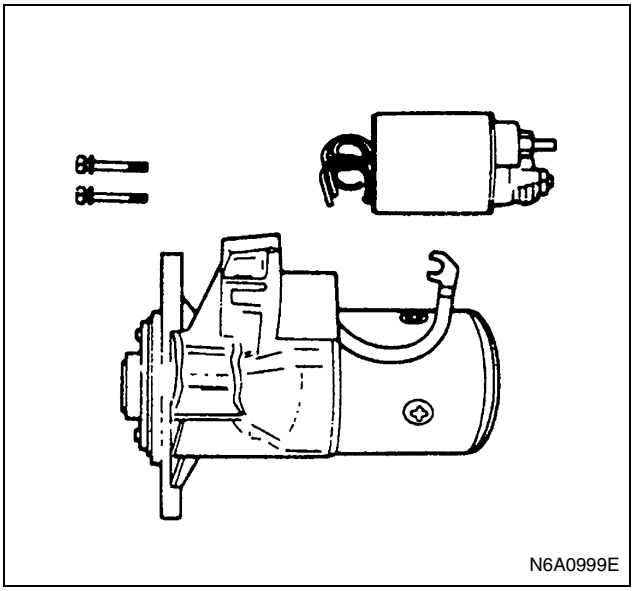
Remove the yoke along with the armature and the brush holder from the drive housing.



N6A0998E

Remove the brushes and commutator carefully so as not to allow them in contact with the adjacent parts.

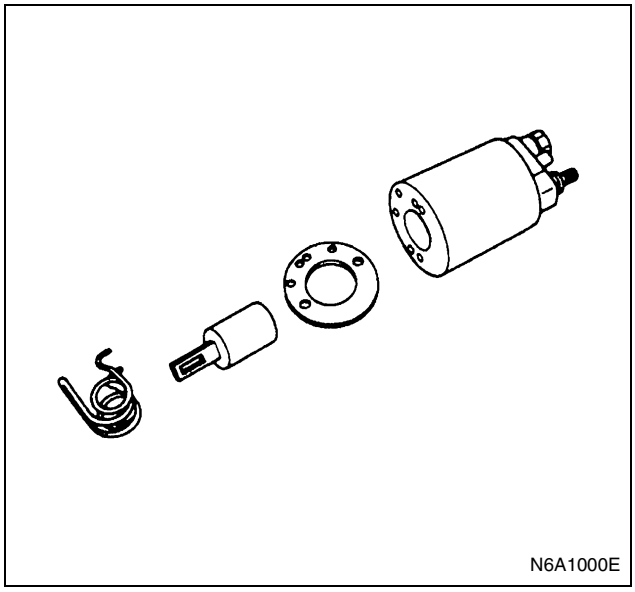
7. Bolt
8. Torsion Spring
9. Magnetic Switch Assembly



N6A0999E

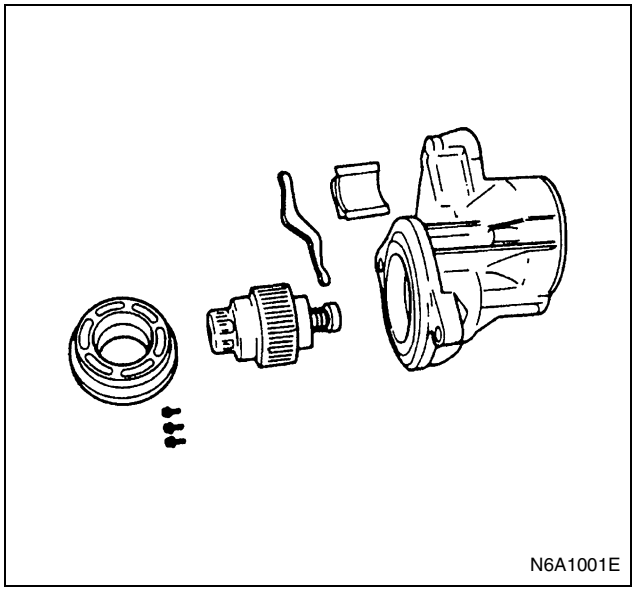
Remove the magnetic switch bolts, then remove the switch from the shift lever.

Remove the torsion spring from the magnetic switch.



N6A1000E

10. Dust Cover
11. Shift Lever
12. Bearing Retainer
13. Clutch Assembly

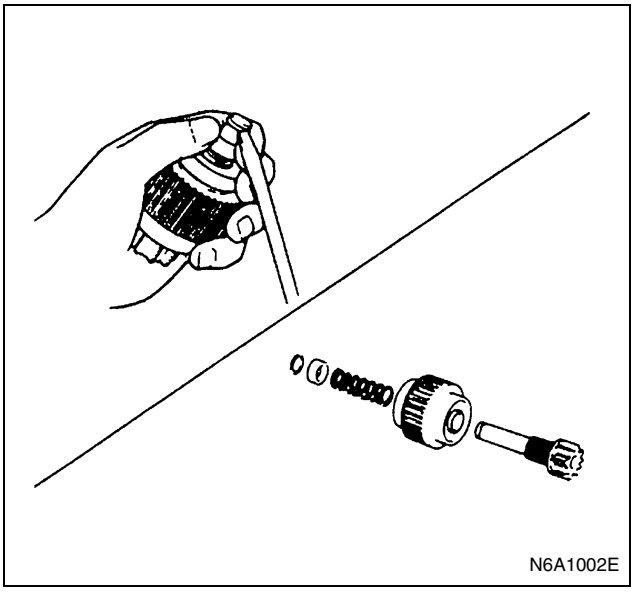


N6A1001E

1) Remove the bearing retainer.
2) Remove the clutch assembly from the gear case.

14. Bearing Holder
15. Ball Bearing
16. Pinion Stopper Clip
17. Pinion Stopper
18. Return Spring
19. Pinion Shaft
20. Pinion Clutch

Use a screwdriver to remove the stopper clip. Then disassemble the clutch assembly.



N6A1002E

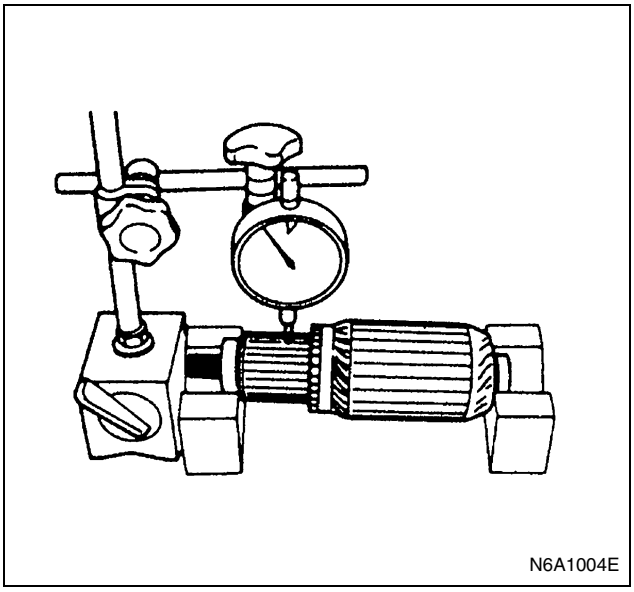
Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Armature

1. Measure the commutator run-out.
   Replace the commutator if the measured run-out exceeds the specified limit.

Commutator Run-Out	mm (in)
Standard	Limit
0.05 (0.002) or less	0.2 (0.008)



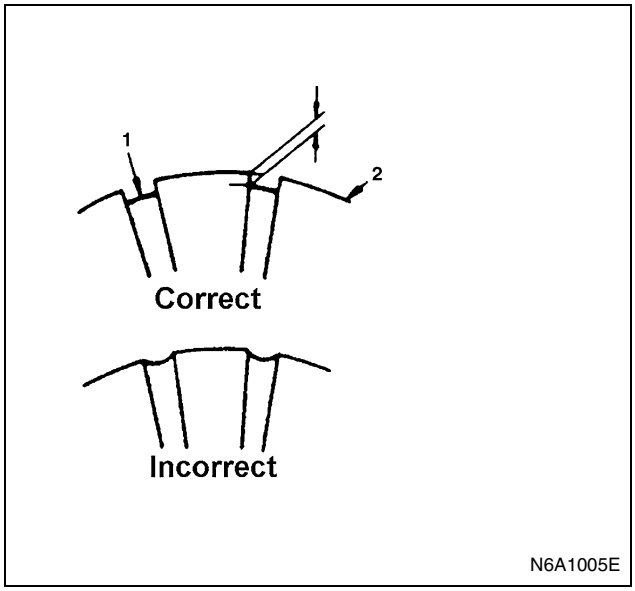
N6A1004E

2. Check the commutator mica segments for excessive wear.
3. Measure the mica segment depth.

Mica Segment Depth	mm (in)
Standard	Limit
0.5 — 0.8 (0.020 — 0.031)	0.2 (0.008)

If the mica segment depth is less than the standard but more than the limit, the commutator may be reground.

If the mica segment depth is less than the limit, the commutator must be replaced.

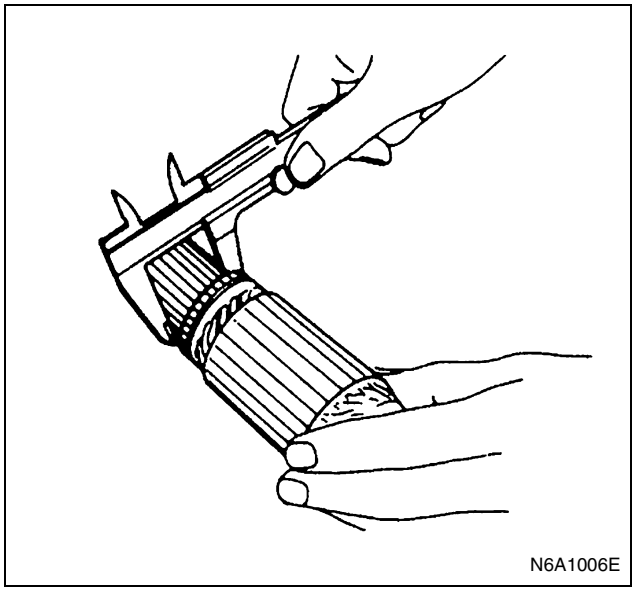


N6A1005E

Legend

1. Insulator
2. Commutator segments

4. Measure the commutator outside diameter.

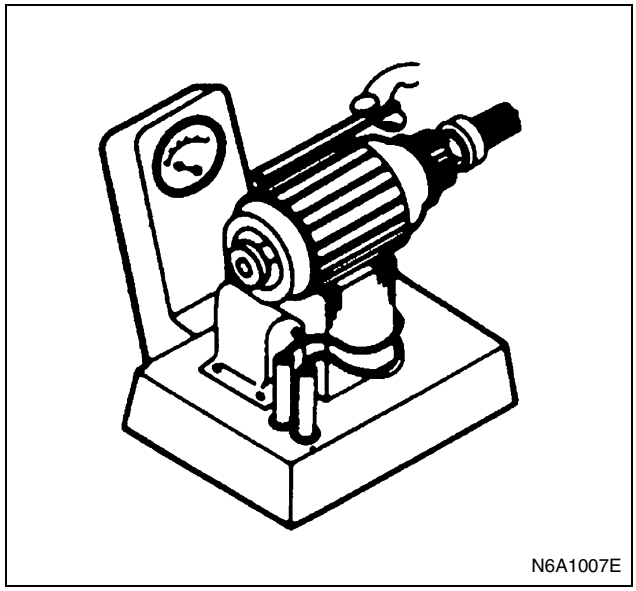


N6A1006E

Commutator Outside Diameter			mm (in)
Model	Yoke Diameter	Standard	Limit
S25-163C	ϕ80	36.5 (1.437)	35.5 (1.398)
S25-305C	ϕ90	38.0 (1.496)	36.6 (1.441)

If the measured outside diameter is less than the specified limit, the commutator must be replaced.

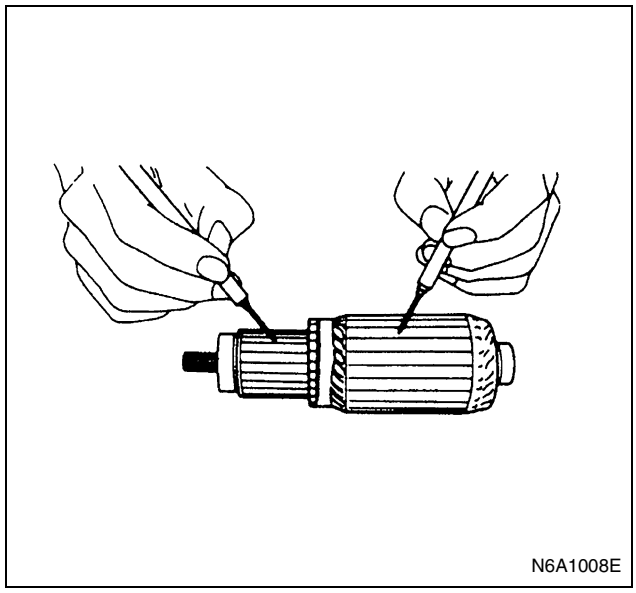
5. Test the armature for short circuiting.



N6A1007E

a. Place the armature in a growler tester.
b. Hold a hacksaw blade against the armature core.
   If the armature has a short circuit, the hacksaw blade will vibrate.
   Replace the armature if there is a short circuit.

6. Use a circuit tester to check the armature for grounding.



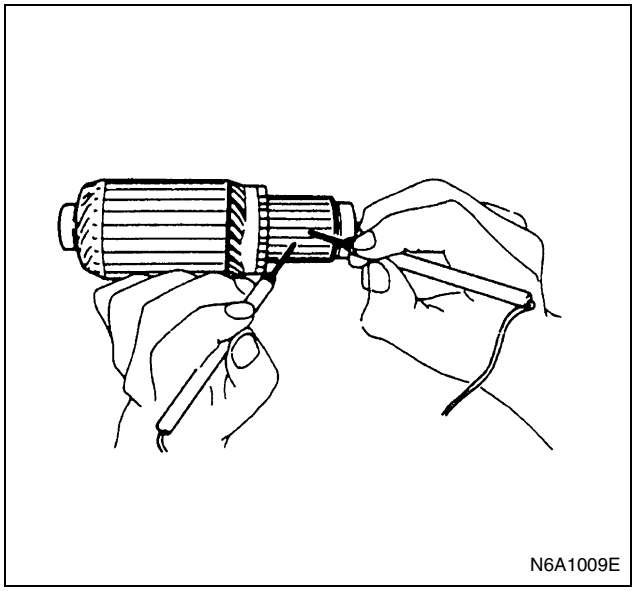
N6A1008E

1) Hold one probe of the circuit tester against the commutator segment.
2) Hold the other circuit tester probe against the armature core.

If the circuit tester indicates continuity, the armature is grounded.

The armature must be replaced.

7. Use the circuit tester to check the armature for continuity.



N6A1009E

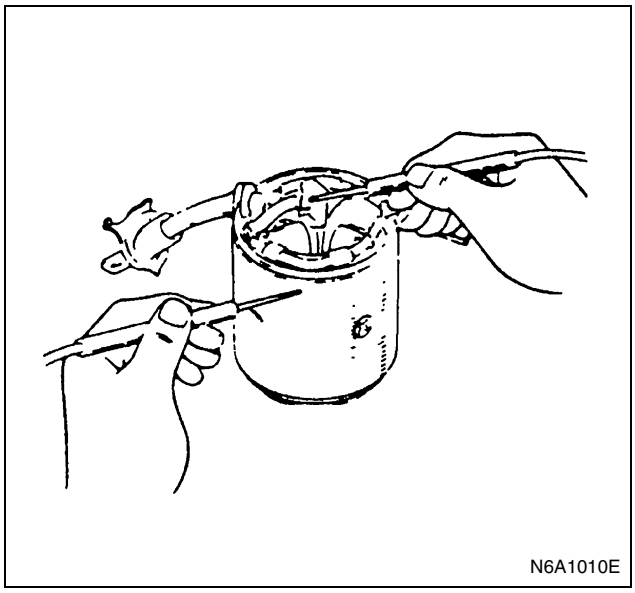
1) Hold the circuit tester probes against two armature core segments.
2) Repeat Step 1 at different segments of the armature core.

There should be continuity between all segments of the armature core.

If there is not, the armature must be replaced.

Yoke

1. Use a circuit tester to check the field winding ground.



N6A1010E

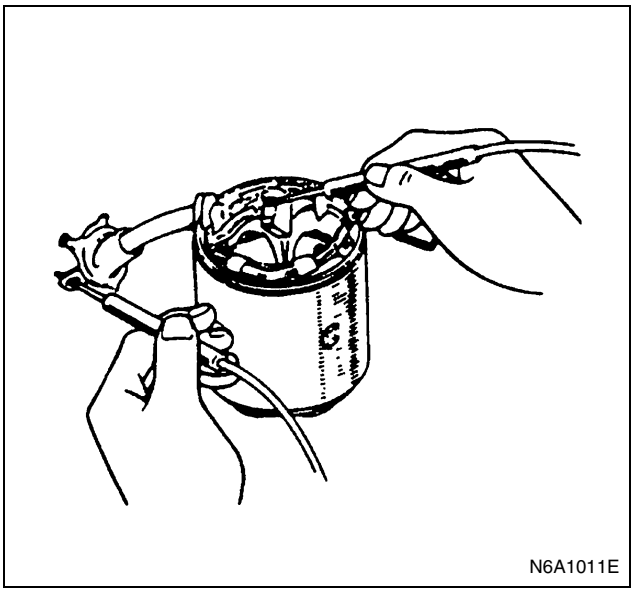
1) Hold one circuit tester probe against the field winding end or brush.
2) Hold the other circuit tester probe against the bare surface of the yoke body.

There should be no continuity.

If there is continuity, the field coil is grounded.

The yoke must be replaced.

2. Use the circuit tester to check the field winding continuity.



N6A1011E

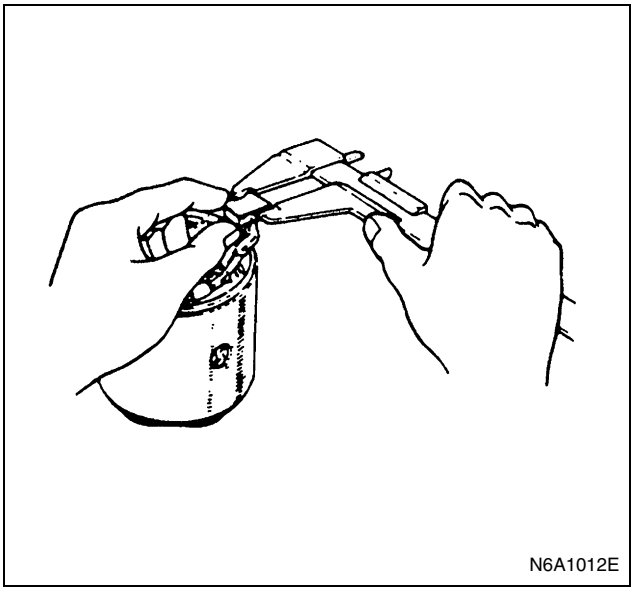
1) Hold one circuit tester probe against the “C” terminal lead wire.
2) Hold the other circuit tester probe against the field winding brush.

There should be continuity.

If there is no continuity, the yoke must be replaced.

Brush and Brush Holder

1. Use a vernier caliper to measure the brush length (four brushes).

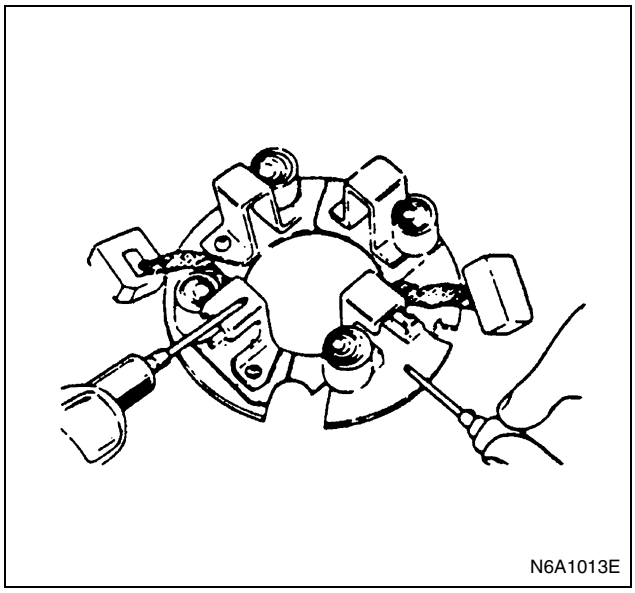


N6A1012E

Replace the brushes as a set if one or more of the brush length is less than the specified limit.

Brush Length			mm (in)
Model	Yoke Diameter	Standard	Limit
S25-168	ϕ80	15.0 (0.591)	10.5 (0.413)
S25-305	ϕ90	18.0 (0.709)	11.0 (0.433)

2. Use a circuit tester to check the brush holder insulation.



N6A1013E

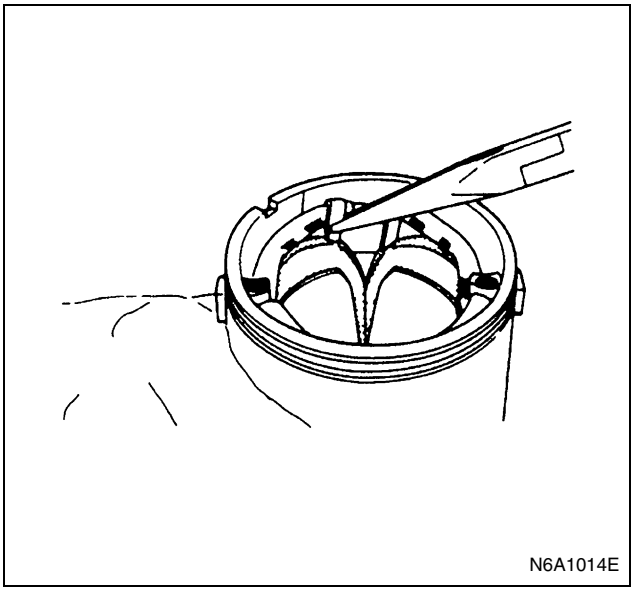
Touch one probe to the holder plate and the other probe to the positive brush holder.

There should be no continuity.

3. Inspect the brushes for excessive wear.
If the negative brushes have excessive wear, the entire brush holder assembly must be replaced.

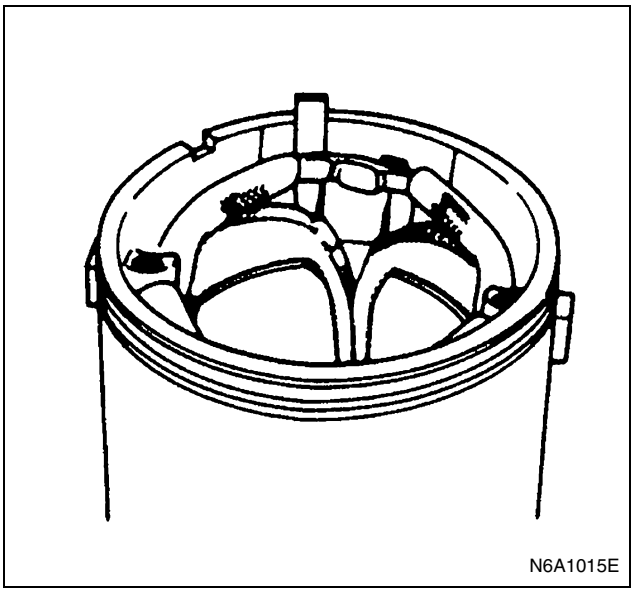
If the positive brushes have excessive wear, only the brushes must be replaced.

1) Use a pair of side cutters to cut the lead wire from the brush.



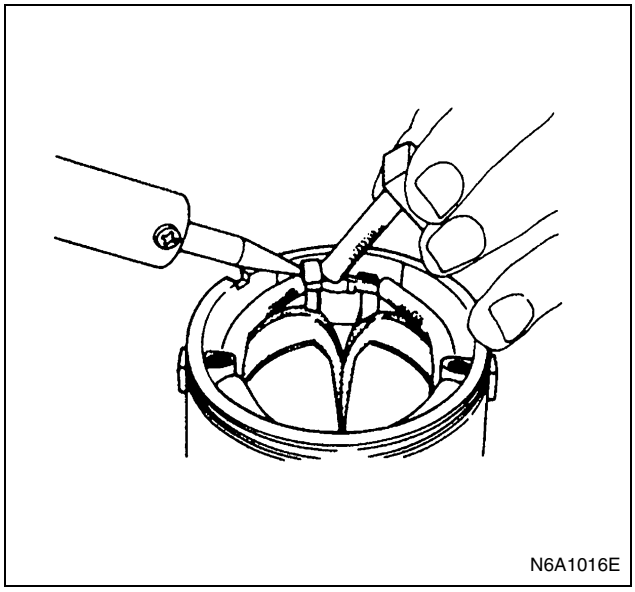
N6A1014E

2) File away any foreign material clinging to the edge of the lead wire.
3) Remove the brushes from the brush holder.
4) Install the new brushes.
5) Straighten the bent portion of the clip.



N6A1015E

6) File away any foreign material clinging to the clip surface.
7) Place the lead wire in the clip.
8) Bend the clip shut.
9) Solder the brush lead.

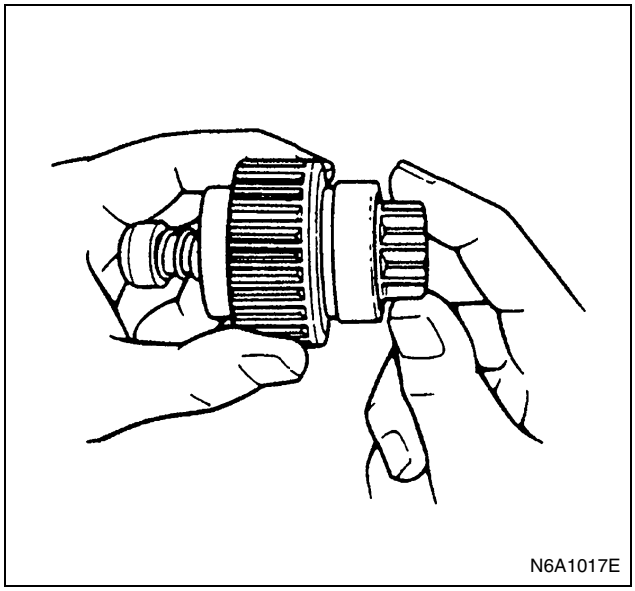


N6A1016E

10) Repeat the procedure for each of the brushes.

Overrunning Clutch

1. Inspect the overrunning clutch gear teeth for excessive wear and damage.
   Replace the overrunning clutch if necessary.
2. Rotate the pinion clockwise.

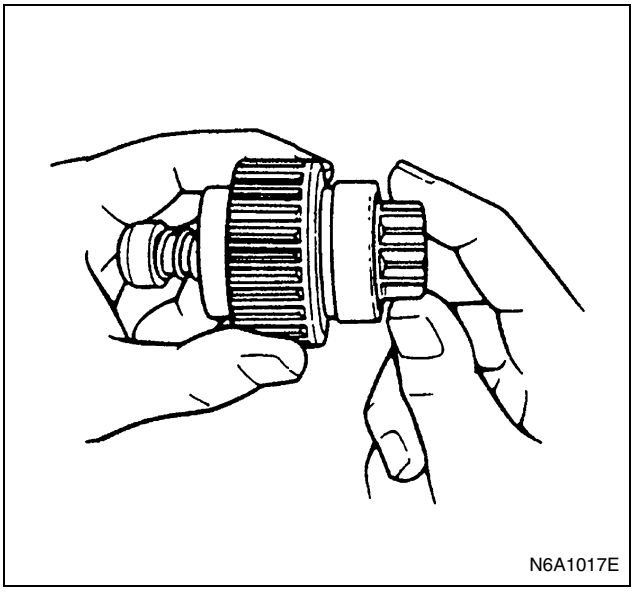


N6A1017E

   It should turn smoothly.
3. Try to rotate the pinion in the opposite direction.
   The pinion should lock.

Ball Bearing

Inspect the bearings for excessive wear and damage.
Replace the bearings if necessary.

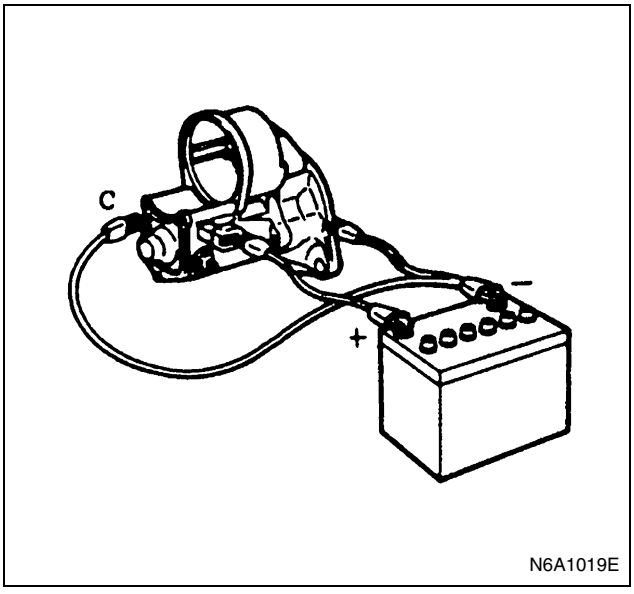


N6A1017E

Magnetic Switch

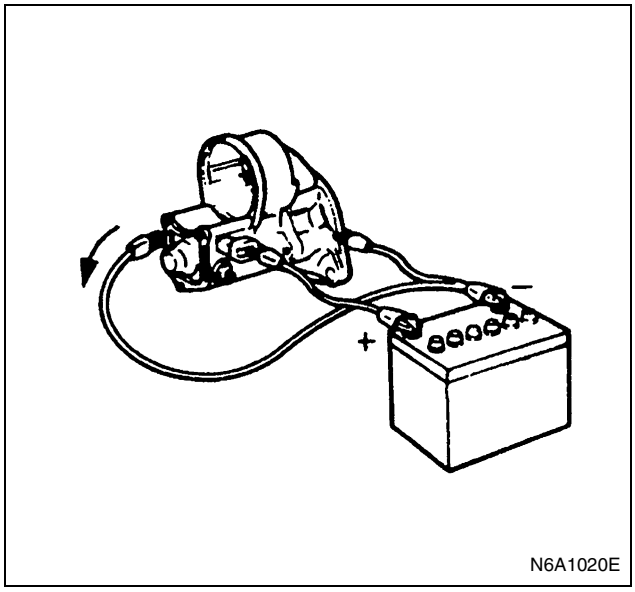
The following tests must be performed with the starter motor fully assembled.
The yoke lead wire must be disconnected from the “C” terminal.
To prevent coil burning, complete each test as quickly as possible (within three to five seconds).
Temporarily connect the magnetic switch between the clutch and the housing and run the following test.
Complete each test within three to five seconds.

1. Pull-Out Test
   Connect the battery negative terminal with the magnetic switch body and the C terminal. When current is applied to the 50 terminal from the battery positive terminal, the pinion should flutter.



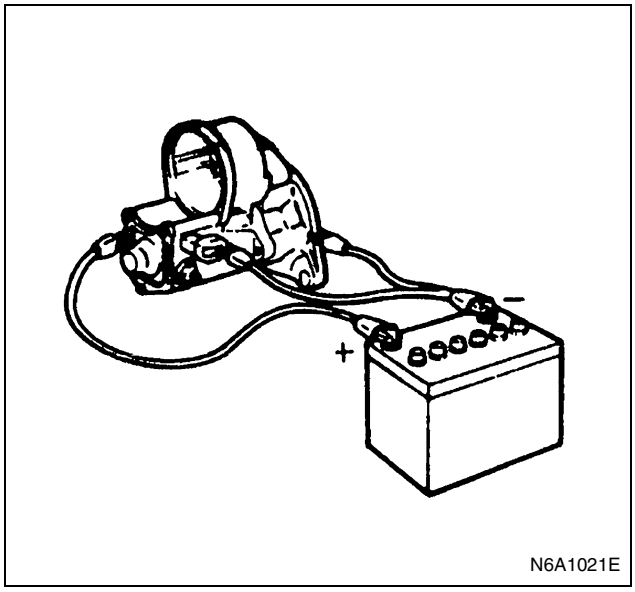
N6A1019E

2. Hold-in Maintenance Test
   Disconnect the lead at the C terminal. The pinion should continue to flutter.



N6A1020E

3. Return Test
   Connect the battery negative leads to the starter body and the 50 terminal.

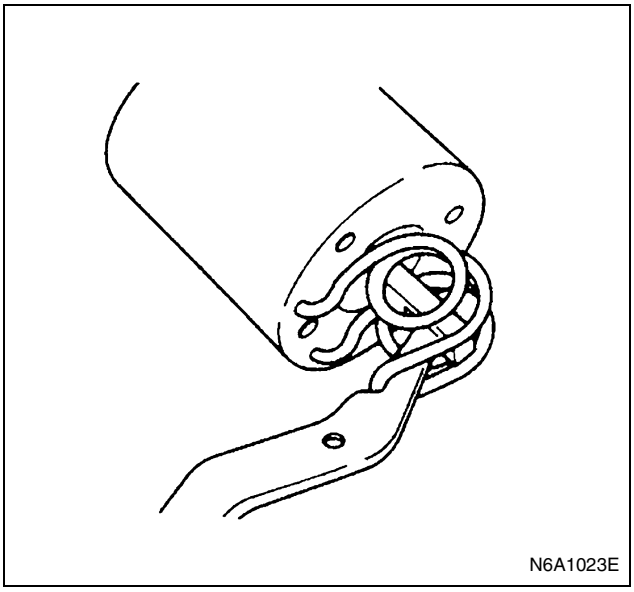


N6A1021E

Connect the battery positive lead at the C terminal.
The pinion should return to its home position.

Reassembly

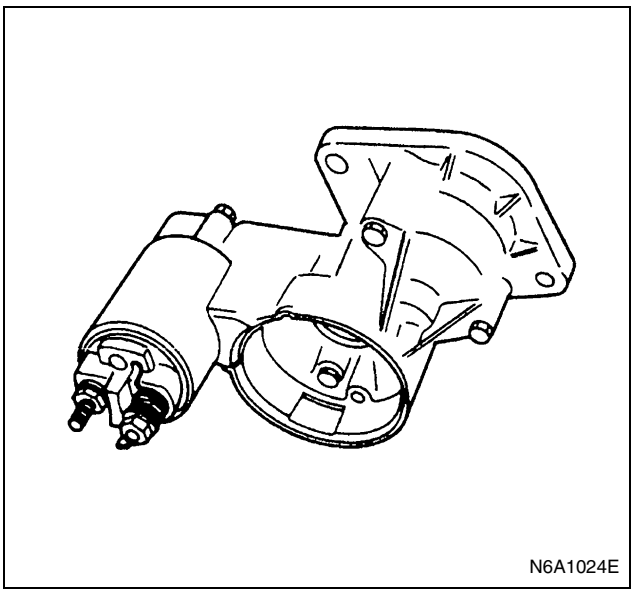
1. Gear Case
2. Magnetic Switch Assembly
3. Torsion Spring
4. Shift Lever
   1) Attach the torsion spring to the hole in the magnetic switch as illustrated.



N6A1023E

2) Insert the shift lever into the plunger hole of the magnetic switch.

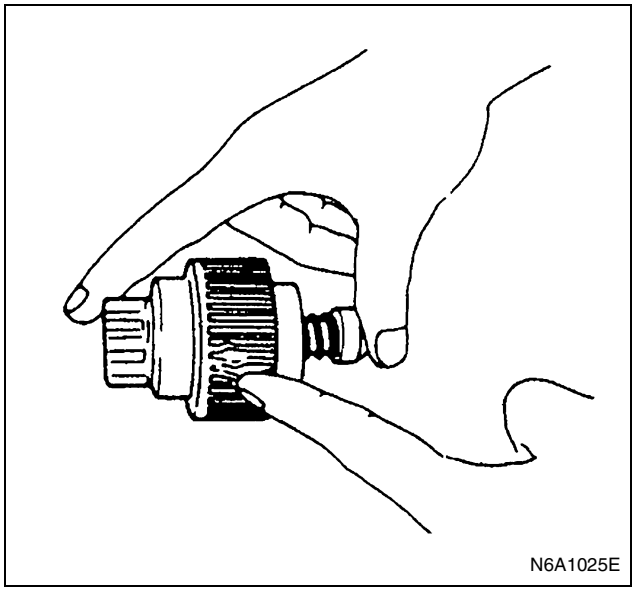
5. Dust Cover
   Install the dust cover.
6. Bolt
   Install the magnetic switch assembly in the gear case and tighten the bolt to the specified torque.



N6A1024E

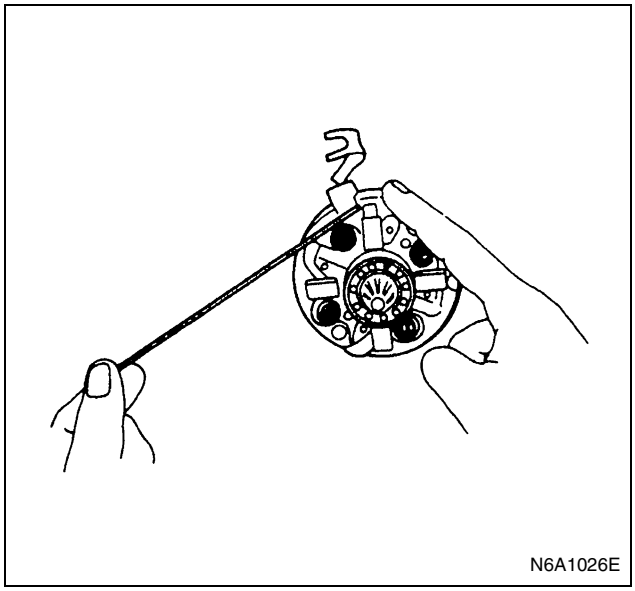
Tighten:
Gear case bolt to 8 N·m (0.8 kg·m / 69 lb·in)

7. Pinion Clutch
8. Pinion Shaft
   Apply a coat of grease to the pinion clutch gear and install the pinion assembly to the armature shaft.



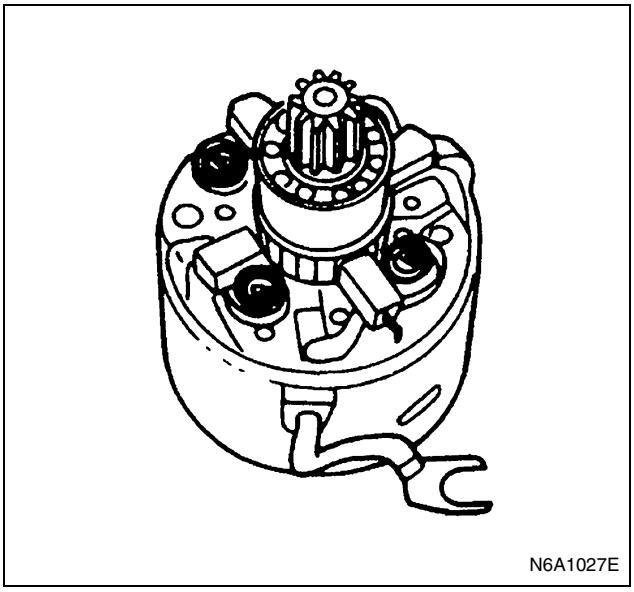
N6A1025E

9. Return Spring
10. Pinion Stopper
11. Pinion Stopper Clip
12. Ball Bearing
13. Bearing Holder
14. Clutch Assembly
15. Bearing Retainer
16. Armature
17. Yoke
18. Brush Holder



N6A1026E

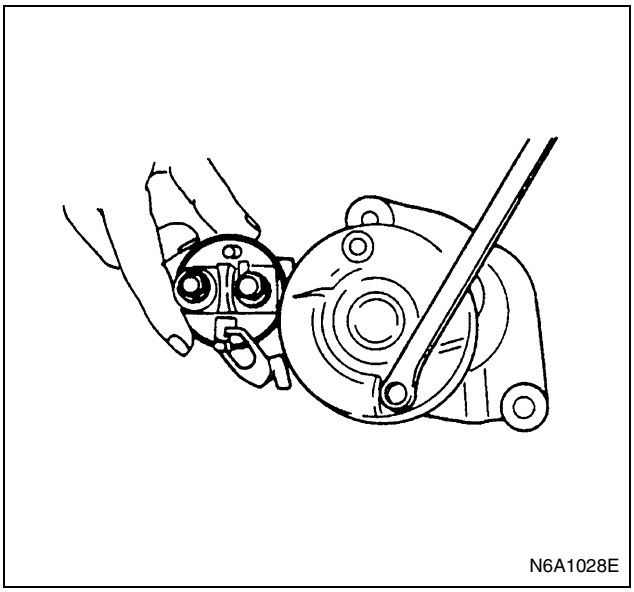
1) Twist the holder spring and hold it.
2) Install the brush to the brush holder.
3) Repeat step 1 and 2 for the reaming holders.
4) Install the brush holder assembly to the yoke.



N6A1027E

Take care not to damage the commutator face and the brushes.

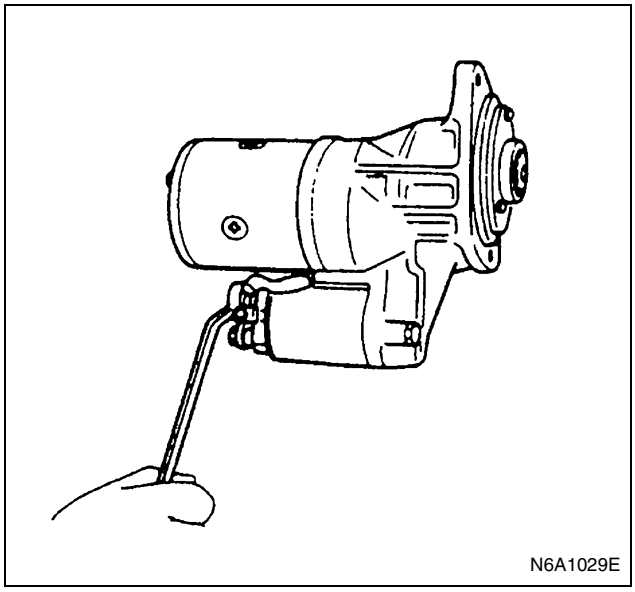
19. Rear Cover
20. Through Bolt
    Install the through bolts in the rear cover and tighten them to the specified torque.



N6A1028E

Tighten:
Through bolt to 6 N·m (0.6 kg·m / 52 lb·in)

21. Lead Wire Nut
    Connect the lead wire in the magnetic switch and tighten the terminal nut to the specified torque.

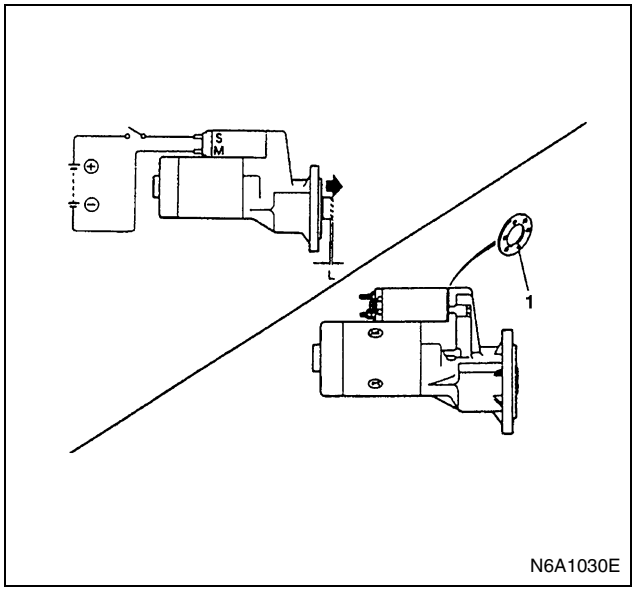


N6A1029E

Tighten:
Lead wire terminal nut to 10 N·m (1.0 kg·m / 87 lb·in)

Pinion Jump-out dimension

- Connect the (+) cable of battery to terminal S and the (–) cable to terminal M. Turn the switch on, and measure pinion travel dimension “L” in thrust direction from the jump-out position.



N6A1030E

Legend
1. Spacer

In measuring the dimension, pull the pinion out a little in the arrow direction.

	mm (in)
Dimension	Standard
L	0.3 — 0.1 (0.01 — 0.004)

If the measured value is out of standard, adjust the of shims.

GENERAL DESCRIPTION

The charging system is the IC integral regulator charging system and its main components are connected as shown in figure.
The regulator is a solid state type and it is mounted along with the brush holder assembly inside the generator installed on the rear end cover.
The generator does not require particular maintenance such as voltage adjustment. The rectifier connected to the stator coil has nine diodes to transform A.C. voltage into D.C. voltage. This D.C. voltage is connected to the output terminal of generator.

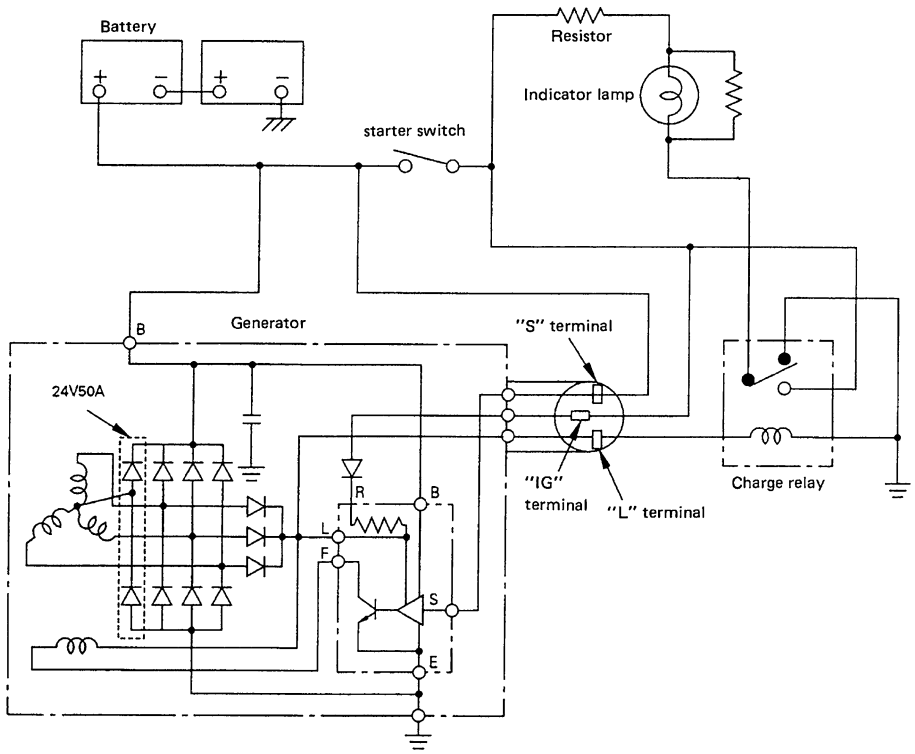
DIAGNOSIS

General On-Vehicle Inspection

The operating condition of charging system is indicated by the charge warning lamp. The warning lamp comes on when the starter switch is turned to “ON” position. The charging system operates normally if the lamp goes off when the engine starts. If the warning lamp shows abnormality or if undercharged or overcharged battery condition is suspected, perform diagnosis by checking the charging system as follows:



N6A1034E

1. Check visually the belt and wiring connector.
2. With the engine in stop status, turn the starter switch to “ON” position and observe the warning lamp.
   - If lamp does not come on:
     Disconnect wiring connector from generator, and ground the terminal “L” on connector side.
   - If lamp comes on:
     Repair or replace the generator.

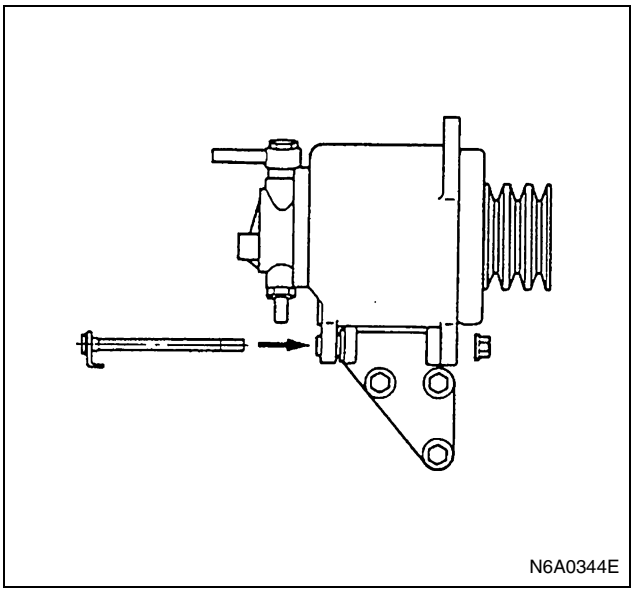
5. Generator

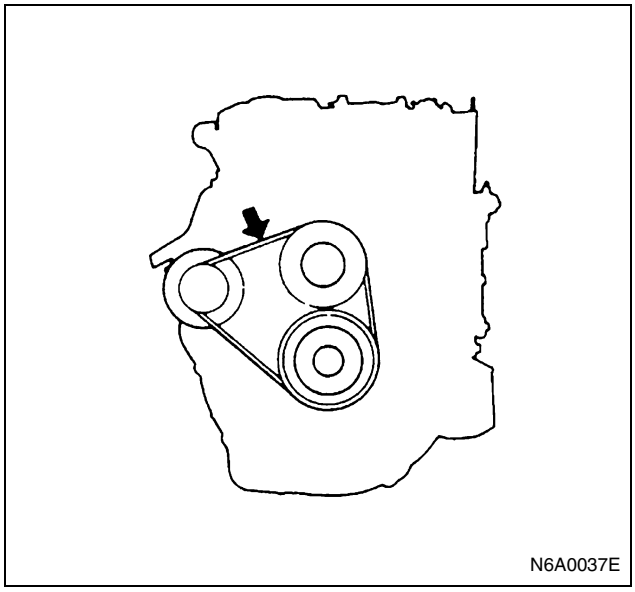
2. Generator

Notice:
Before tightening the generator, tighten in advance the fan belt temporarily after its adjustment.

- Insert the lower fixing bolt from the rear side as shown in the illustration, and tighten it with a nut on the front side.



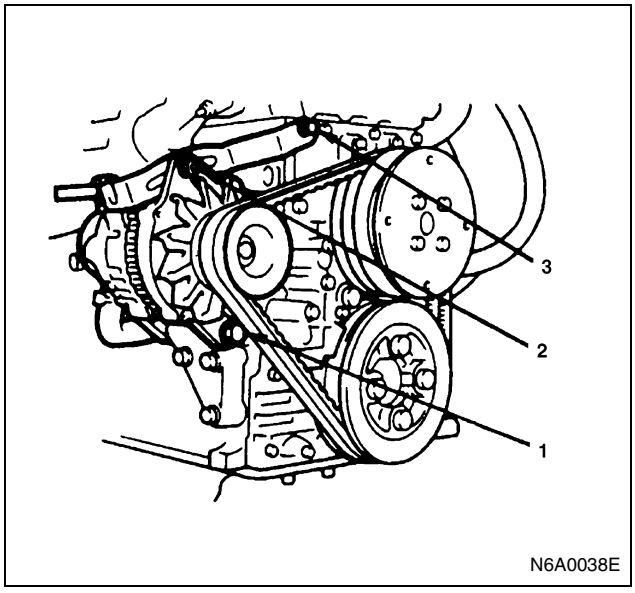
3. Fan Belt
   Check the drive belt tension.
   Depress the drive belt mid-portion with a 98 N (10 kg / 22 lb) force.



Drive Belt Deflection	mm (in)
New belt	8 — 12 (0.31 — 0.47)
Reuse belt	10 — 14 (0.39 — 0.55)

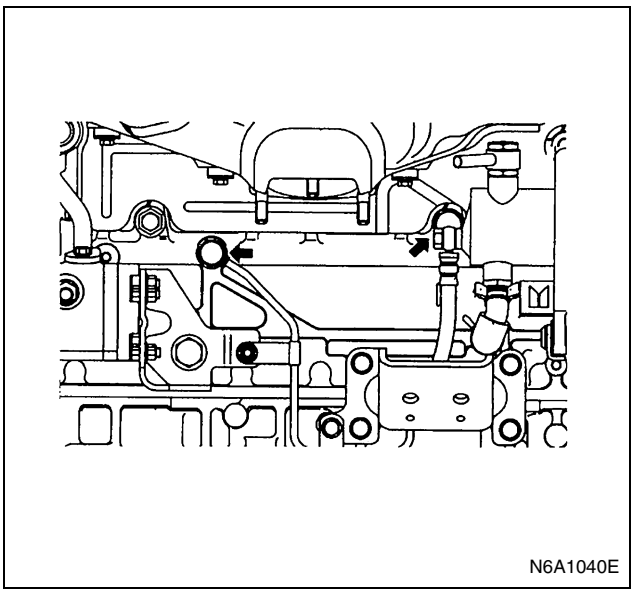
   Check the drive belt for cranking and other damage.

Fan Belt Adjustment
Fan belt tension is adjusted by moving the generator.



Tighten:
Bolt to
- (1): 40 N·m (4.1 kg·m / 30 lb·ft)
- (2): 24 N·m (2.4 kg·m / 17 lb·ft)
- (3): 46 N·m (4.7 kg·m / 34 lb·ft)

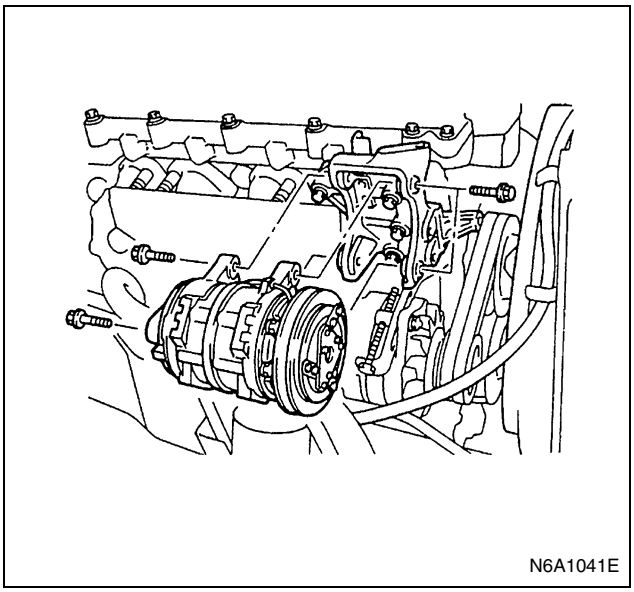
4. ACG Harness
5. Vacuum Hose
6. Vacuum Pump Rubber Hose
7. Vacuum Pump Oil Pipe



N6A1040E

Tighten:
Vacuum pump oil pipe to
- Cylinder body side: 41 N·m (4.2 kg·m / 30 lb·ft)
- Generator side: 23 N·m (2.3 kg·m / 17 lb·ft)

8. A/C Compressor (If equipped with A/C)



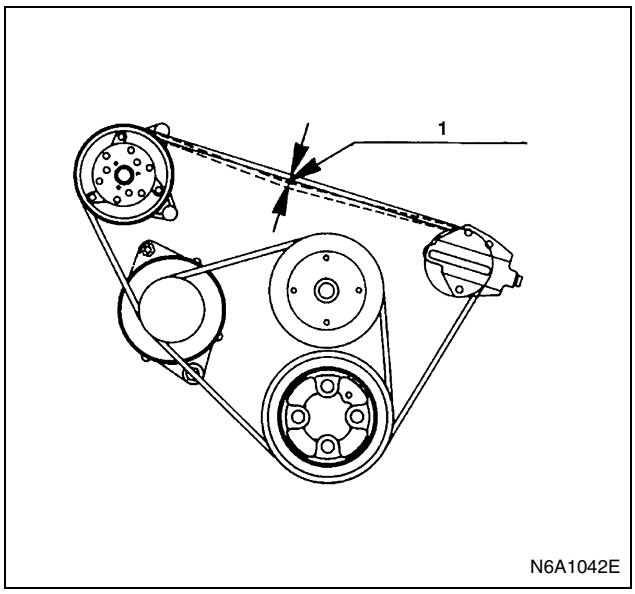
N6A1041E

- Tighten the fixing bolts to the specified torque.

Tighten:
A/C compressor bolt to 48 N·m (4.9 kg·m / 35 lb·ft)

Notice:
When installing the compressor fixing bolts, tighten first the 2 bolts on the rear side, and then the remaining 2 on the front side.

9. A/C Compressor Drive Belt (If equipped with A/C)
   - Install the drive belt adjust belt tension by adjusting bolt and tighten the locking nut to the specified torque.
   - Depress the drive belt mid-portion with a 98 N (10 kg / 22 lb) force.



N6A1042E

Legend
1. Belt deflection

Drive Belt Deflection	mm (in)
New belt	16 — 20 (0.63 — 0.79)
Reuse belt	18 — 22 (0.71 — 0.87)

Tighten:
Locking nut to 27 N·m (2.8 kg·m / 20 lb·ft)

- Connect the negative battery cable.
- Lower the cab.

UNIT REPAIR

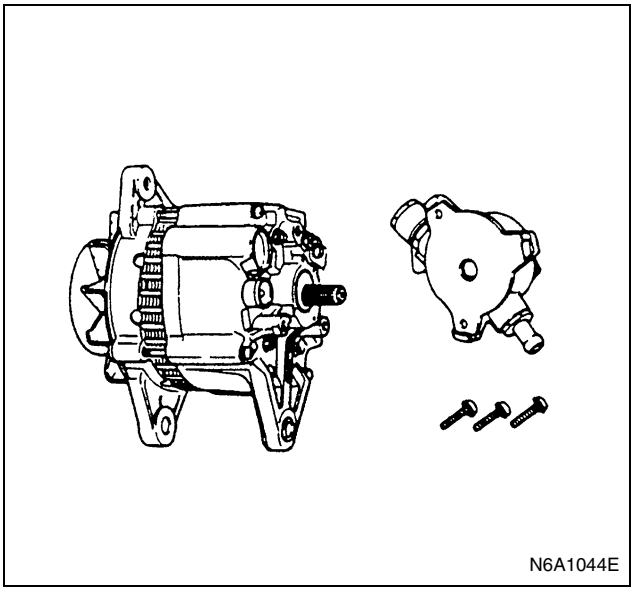
18. Brush and IC regulator
19. Rear cover

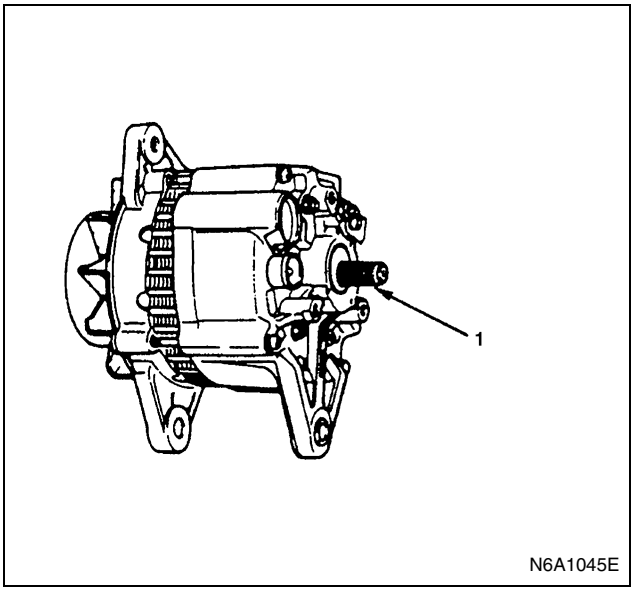
Disassembly

1. Vacuum Pump Assembly



N6A1044E

   1) Loosen the vacuum pump fixing bolts.
   2) Support the vacuum pump center plate.
   3) Carefully remove the vacuum pump.
2. Through Bolt
3. Rotor and Front Cover Assembly
4. Stator and Rear Cover Assembly
   1) Loosen the through bolts.
   2) Remove the rotor and front cover assembly from the stator and rear cover assembly.
      Do not allow the stator to separate from the rear cover.
      Take care not to damage the oil seal.
      Tape the rotor splines to protect them from damage.



N6A1045E

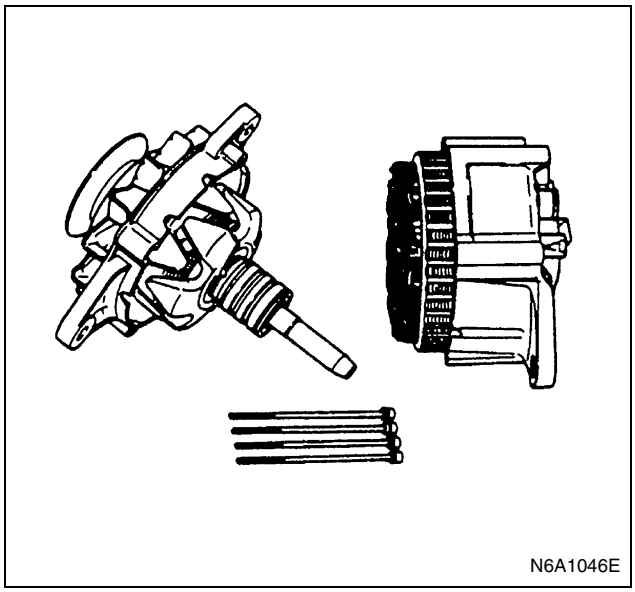
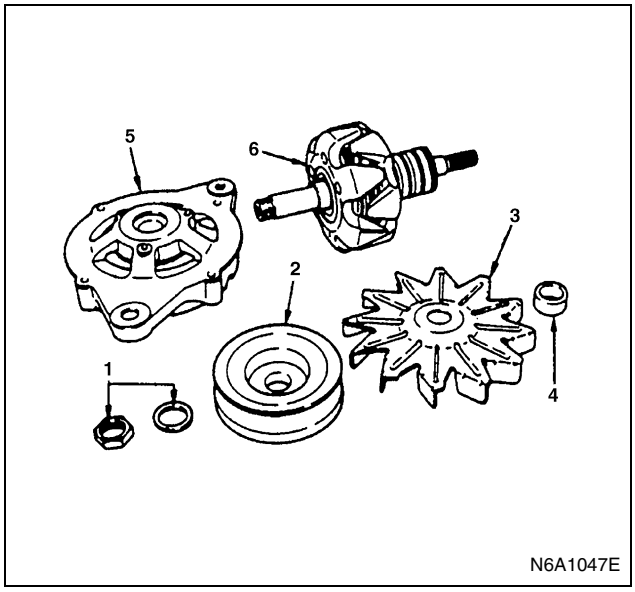
6. Pulley
7. Fan
8. Spacer
9. Rotor



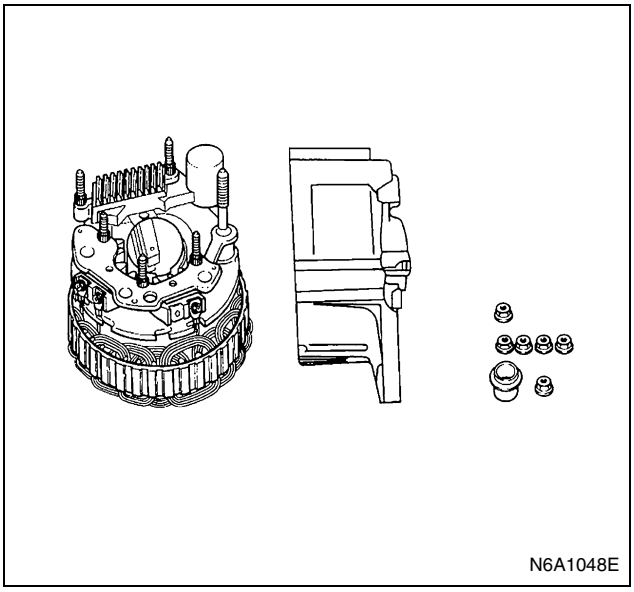
N6A1046E

   1) Carefully clamp the rotor assembly in a vice.



N6A1047E

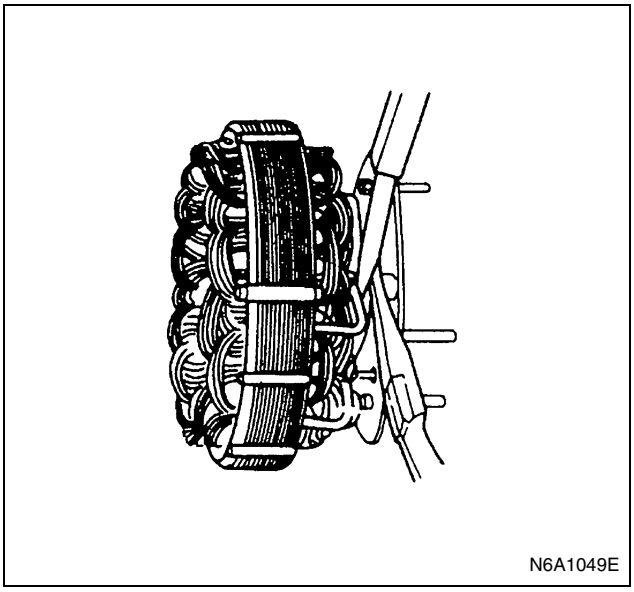
   2) Loosen the pulley nut (1).
   3) Remove the pulley (2), the fan (3), the spacer (4), the front cover (5) and the rotor (6).
10. Front Cover
11. Bearing Retainer
12. Front Ball Bearing
13. Rear Ball Bearing
14. Terminal Nut and Bolt
15. Stator



N6A1048E

1) Loosen the terminal nuts and bolts.
2) Remove the lead wire, the insulators, and the washers.
3) Remove the stator and the IC regulator assembly from the rear cover.

16. Fan guide
17. Rectifier
18. Brush and IC Regulator
    Disconnect the stator coil leads between each rectifier and the N-terminal by melting the solder connection.

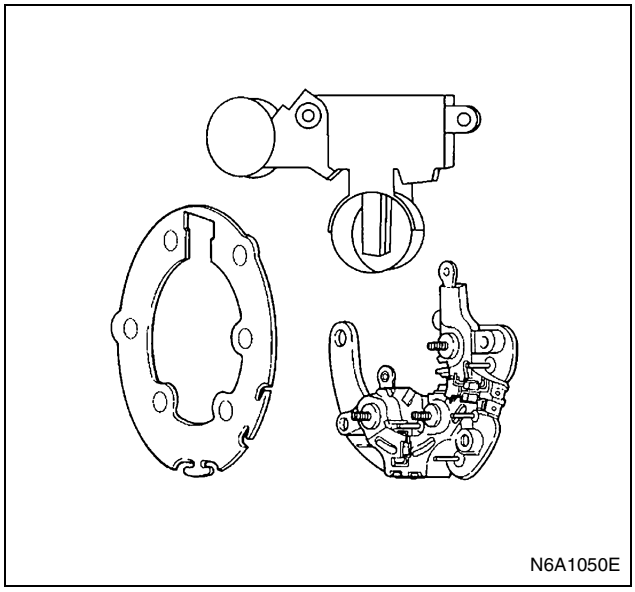


N6A1049E

Notice:
Hold the lead wire between the solder and the rectifier with a pair of long nose pliers.

This will prevent heat transfer and resultant damage to the rectifier.

Refer to “INSPECTION AND REPAIR” for the IC regulator, the rectifier, the brush holder, and the condenser replacement procedures.



N6A1050E

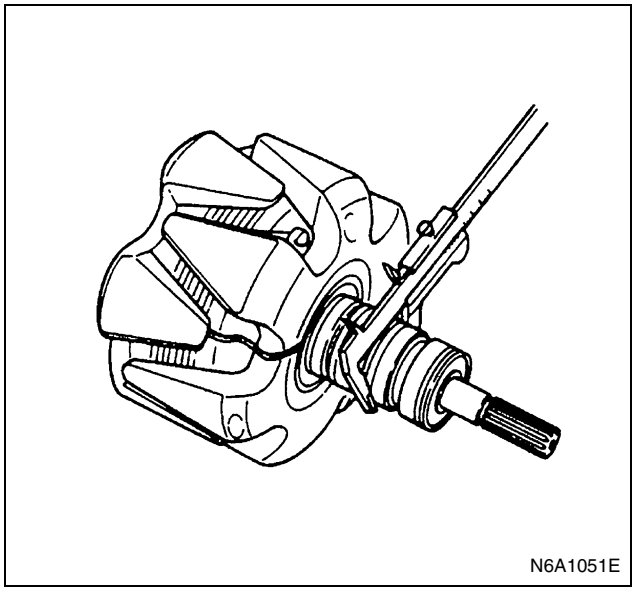
19. Rear Cover

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Rotor

1. Inspect the slip ring faces for dirt and pitting.
   Wipe away any dirt with a clean cloth soaked in alcohol.
   Use a hand grinder to remove pitting.
2. Measure the slip ring diameter.

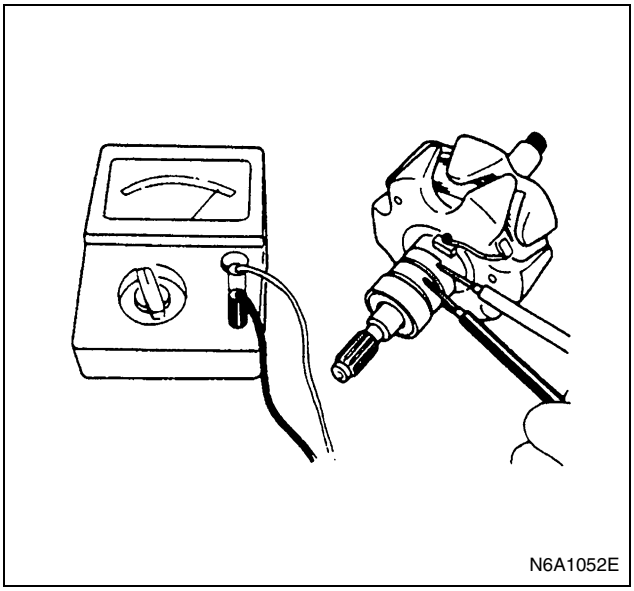


N6A1051E

Slip Ring Diameter	mm (in)
Standard	Limit
37.6 (1.480)	36.6 (1.441)

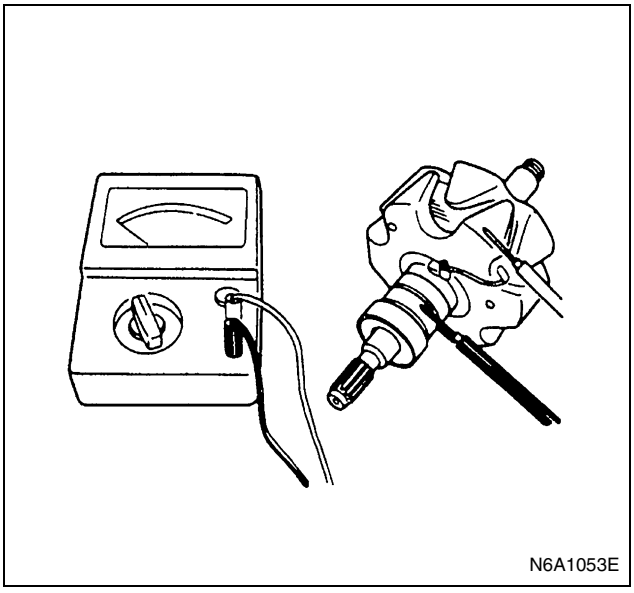
If the slip ring diameter is less than the specified limit, the slip rings must be replaced.

3. Measure the rotor coil resistance.



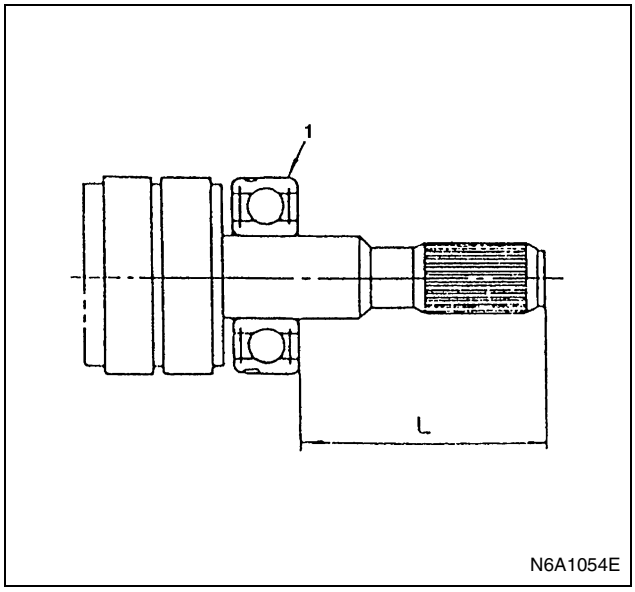
Rotor Coil Resistance at 20°C (68°F)	ohms
Standard	12.6

4. Check for continuity between the slip rings and the rotor core or shaft.



If there is continuity, the entire rotor assembly must be replaced.

5. Rear ball bearing



Legend

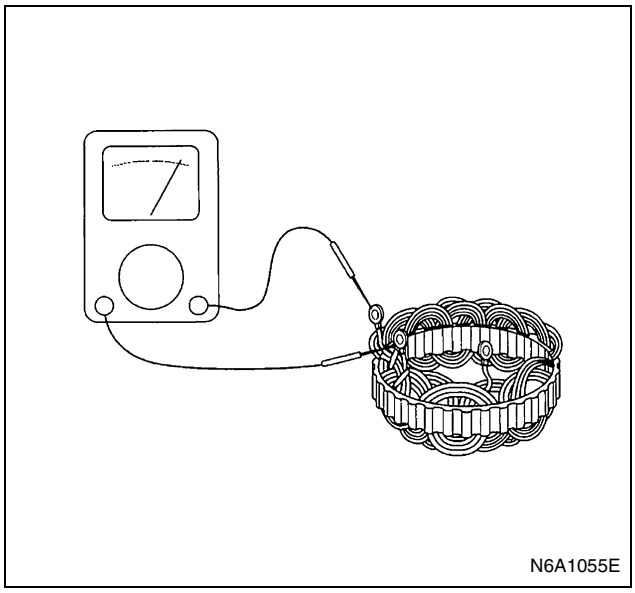
1. Ball bearing

- Check to see if the ball bearings rotate lightly with no noise heard.
- As the result of inspection, it is found that the ball bearing do not rotate lightly or any noises are heard, replace them with new ones.

Press-in measurement (L) when changing bearings	mm (in)
Standard	58.0 — 58.2 (2.283 — 2.291)

Stator

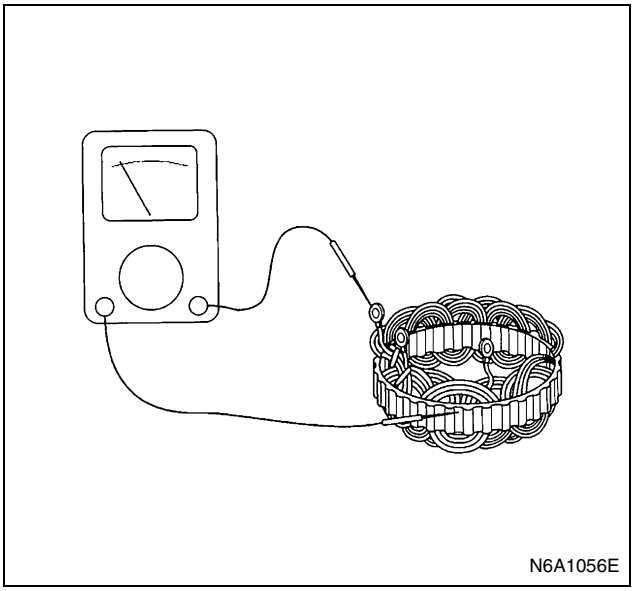
1. Check for continuity across the stator coils.



If there is no continuity, the stator coils must be replaced.

Resistance Between The Coil End “N” And The Each Coil Ends (Reference)	ohms
Standard	0.17

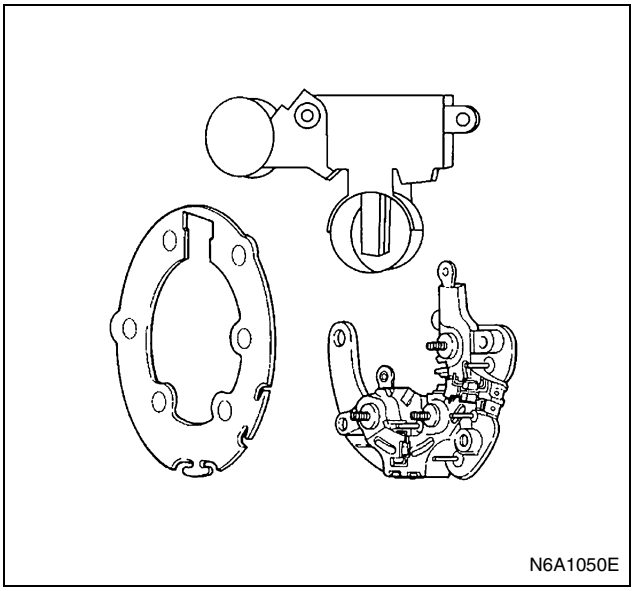
2. Check for continuity between each stator coil and the stator core.



If there is continuity, the stator coils must be replaced.

Rectifier, IC Regulator, and Brush Holder Assembly

Disassembly



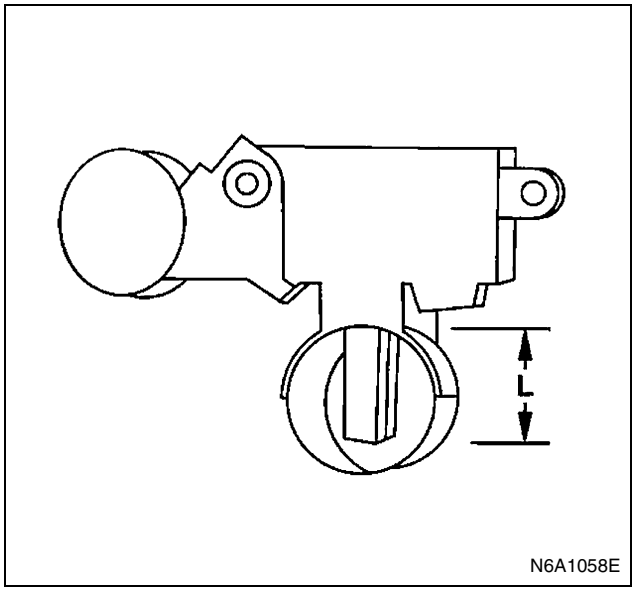
1. Disconnect the IC regulator and the rectifier by melting the solder connections.
2. Loosen the terminal bolt to remove the rectifier.
3. Disconnect the IC regulator, the brush holder, and the condenser by melting the solder connections.
4. Remove the IC regulator from the terminal plates.
5. Remove the stud bolts from the terminal plate.

Notice:
If the brushed, brush holder, and the condenser to be reused, do not remove the stud bolts.

6. Remove the brush holder from the terminal plate.

Inspection

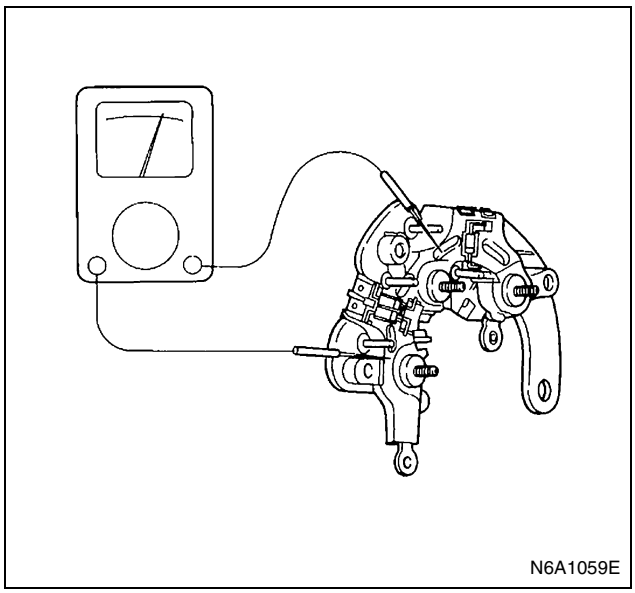
1. Brush
   Each brush has a line to indicate whether or not the brush is serviceable.

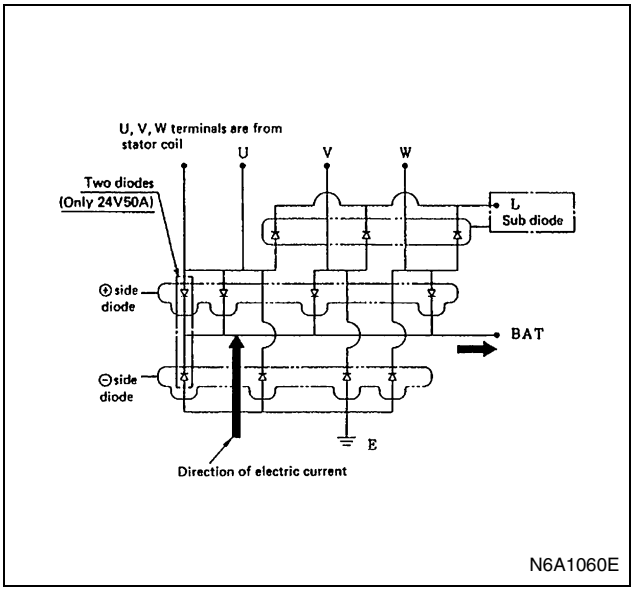


If the line is not visible, the brush must be replaced.

Brush Length (Reference)	mm (in)
Standard	Limit
25 (0.984)	6 (0.236)

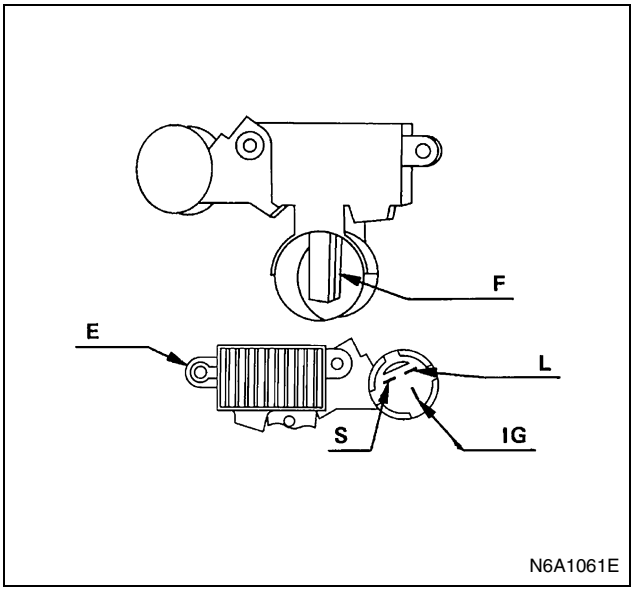
2. Rectifier





1) Check for continuity with a circuit tester between the battery and each of the three stator coil lead terminals.
   If there is continuity from battery to each of the three stator coil lead terminals, the rectifier is normal.
   If there is no continuity, the rectifier must be replaced.
   Check for continuity with a circuit tester between the earth and each of the three stator coil lead terminals.
   If there is continuity from each of the three stator coil lead terminals to earth, the rectifier is normal.
   If there is no continuity, the rectifier must be replaced.
2) Reverse the polarity of the test probes.
   If there is no continuity, the rectifier is normal.
   If there is continuity, the rectifier must be replaced.

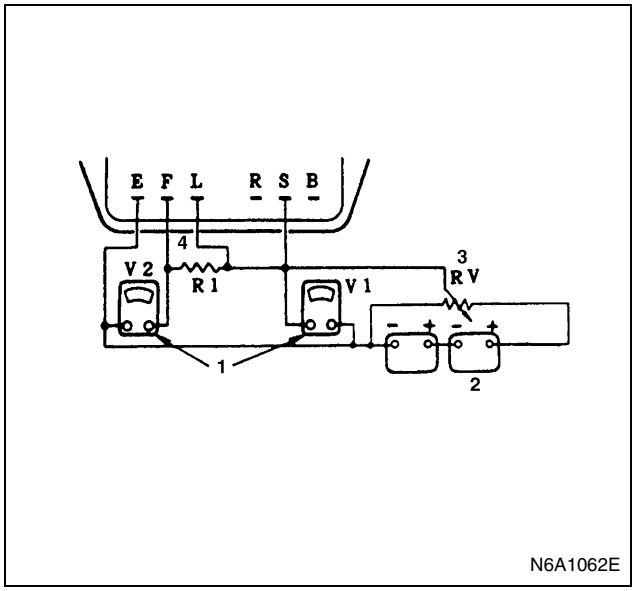
3. IC Regulator



The IC regulator may be tested with either a circuit tester or pair of standard voltmeters.
Refer to the illustration.

1) Circuit tester (or voltmeter) range is from 0 — 50 volts in 0.5 volt increments.
2) Two twelve volt batteries are required.
3) Note the variable resistor.
4) This resistor is rated at 100 watts/3 ohms.

4. Testing the IC Regulator



Refer to the wiring diagram when testing the IC regulator.

1) Connect the batteries in series.
2) Measure the battery power (voltage).

Battery Power	V
28 — 29	

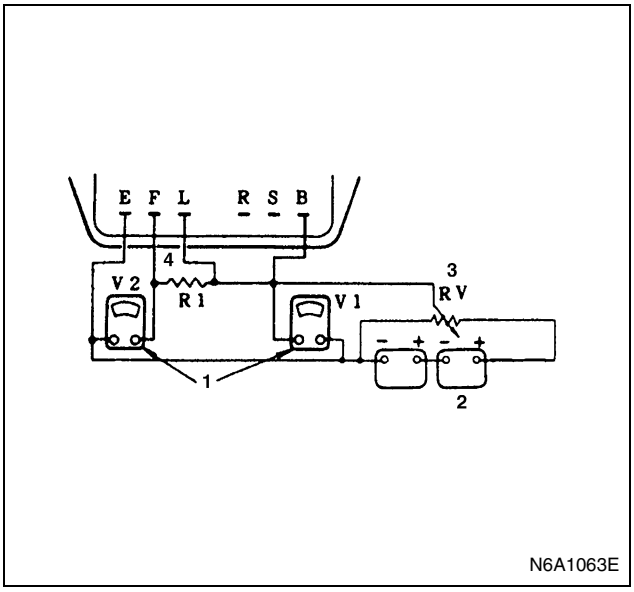
3) Connect the circuit tester (1) (or voltmeter V2) as shown in the illustration.
4) Set the variable resistor (3) to zero.
5) Slowly increase the resistance of the variable resistor toward the build-up point.
   Measure the voltage between E and F.
   As long as the resistance is below the build-up point, the voltage reading should be stable and less than two volts.
   When the resistance exceeds the build-up point, the voltage reading should be two volts or greater.
   If the voltage does not exceed two volts after reaching the build-up point, the IC regulator must be replaced.
6) Return the variable resistor (3) to zero.
7) Connect the circuit tester (or voltmeter V1) as shown in the illustration.
8) Measure the voltage at terminals S, L, and E.
9) Slowly increase the resistance of the variable resistor.

Note the point at which the voltage quickly builds up to between 2 and 6 volts.

This will indicate the point at which the voltage regulator begins to function.

If the measured voltage is outside the specified range, the voltage regulator must be replaced.

10) Repeat Steps 3 through 5 to measure the voltage between terminals B, L, and E.

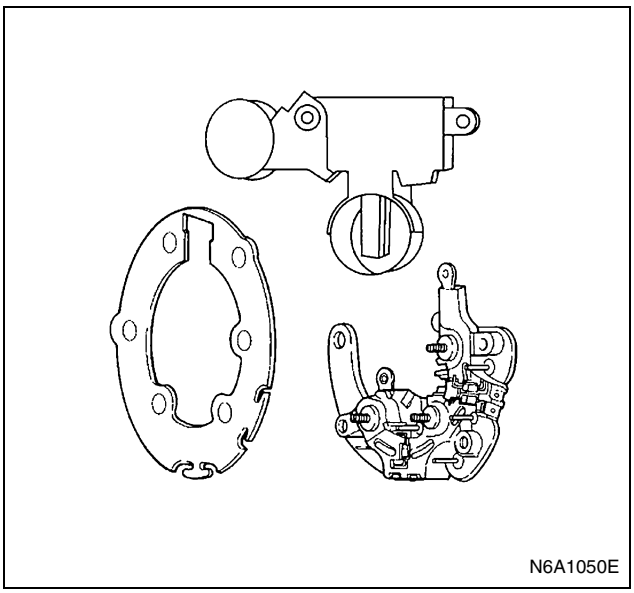


Refer to the wiring diagram.

The regulator voltage should be between 0.5 and 3 volts higher than the measured voltage.

If the regulator voltage is outside this range, the voltage regulator must be replaced.

Reassembly



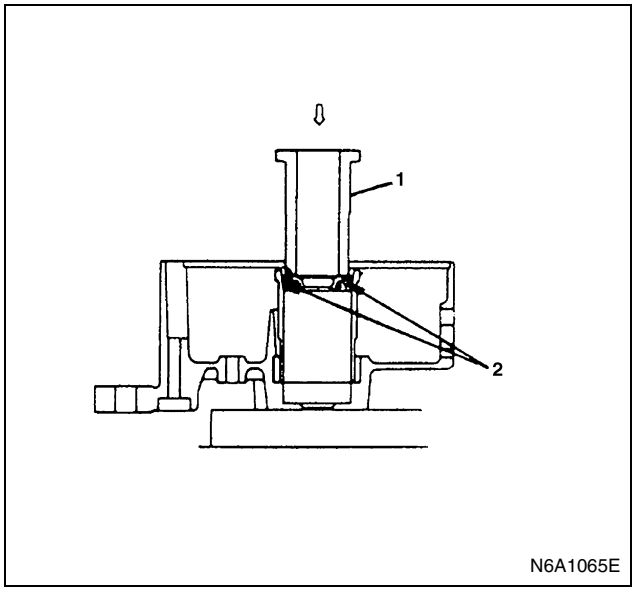
1. Install the brush holder and the stud bolts to the terminal plate.
   Check that the stud bolts fit properly.
2. Attach the IC regulator to the terminal plate.
3. Solder the IC regulator, the brush holder and the condenser.
   Take care not to heat the IC regulator.
   Over-heating will resulting damage to the IC regulator.
4. Set the rectifier to the IC regulator assembly.
5. Solder rectifier and IC regulator.
   Take care not to heat the IC regulator.
   Over-heating will resulting damage to the rectifiers and the IC regulator.
6. Tighten the rectifier terminal bolt.

Oil Seal

Check the rear cover oil seal bore for oil leakage.

Oil Seal Replacement

1. Use a screwdriver to remove the oil seal from the rear cover side.
   Take care not to damage the oil seal bore.
2. Discard the used oil seal.
3. Use the oil seal installer to install the new oil seal.

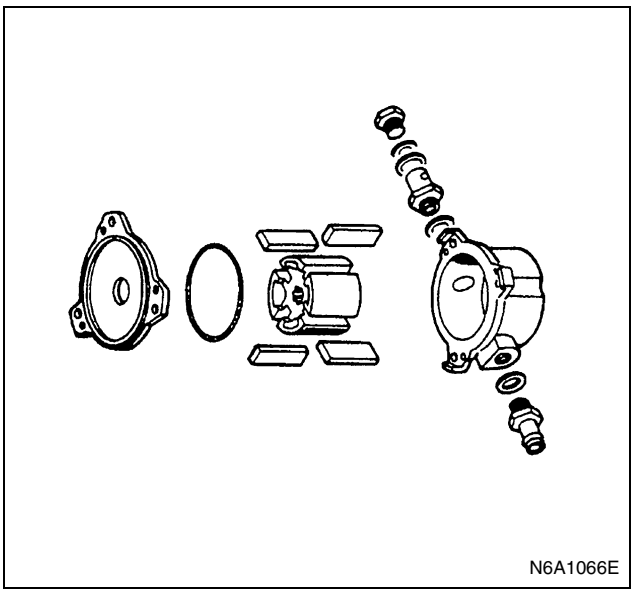


Legend

1. Oil seal installer
2. Oil seal

Vacuum Pump

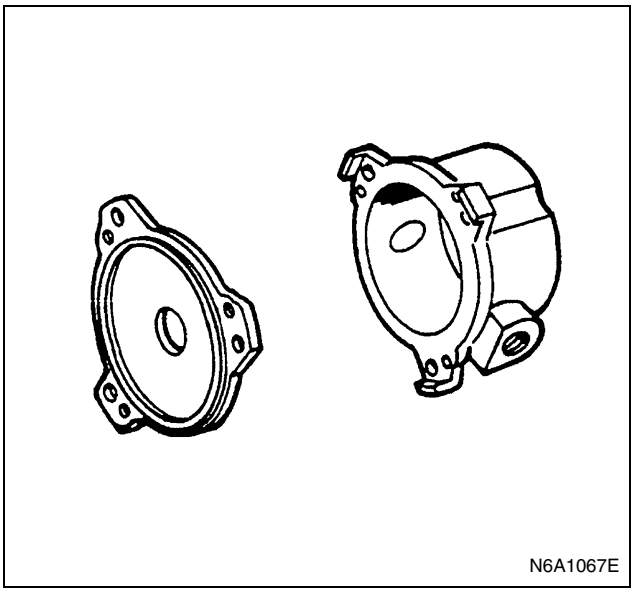
Disassembly



1. Remove the center plate from the vacuum pump housing.
2. Remove the vacuum pump rotor and the vanes from the housing.

Inspection and Repair

1. Vacuum Pump Housing and Center Plate



Inspect the vacuum pump housing and the center plate for excessive wear, abrasion, and scoring.

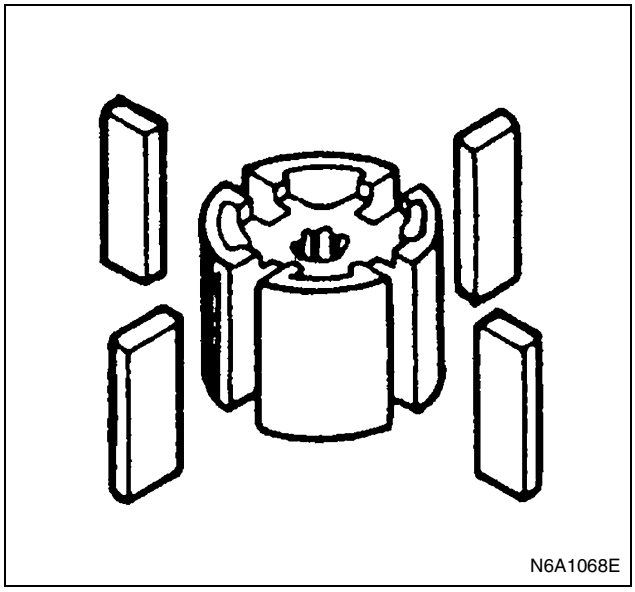
If any of these conditions are present, the vacuum pump housing and center plate must be replaced.

Inspect the vacuum pump housing inside for wear and damage.

If the measured inside diameter is outside the specified range, replace the vacuum pump housing.

Vacuum Pump Housing Inside Diameter (Reference)	mm (in)
Standard	69.5 — 69.6 (2.736 — 2.740)

2. Vane



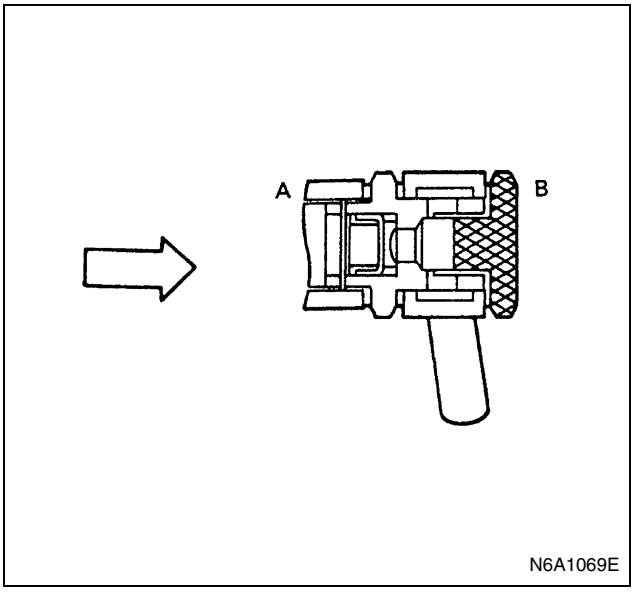
Inspect the vanes for excessive wear and damage.

Replace all four vanes if either of these conditions are present.

Never replace only one vane.

Vane Length (Reference)	mm (in)
Standard	18.0 (0.709)

3. Rotor
   1) Inspect the rotor for excessive wear, abrasion, and scoring.
      Pay particular attention to the internal spline.
      Replace the rotor if any of these conditions are present.
   2) Inspect the generator rotor shaft splines for backlash.
      Replace the rotor if backlash is present.
4. Check Valve
   1) Carefully force the valve from the “B” side as shown in the illustration.



The valve must move smoothly.

If it does not, the check valve must be replaced.

2) Apply compressed air to the “A” side.

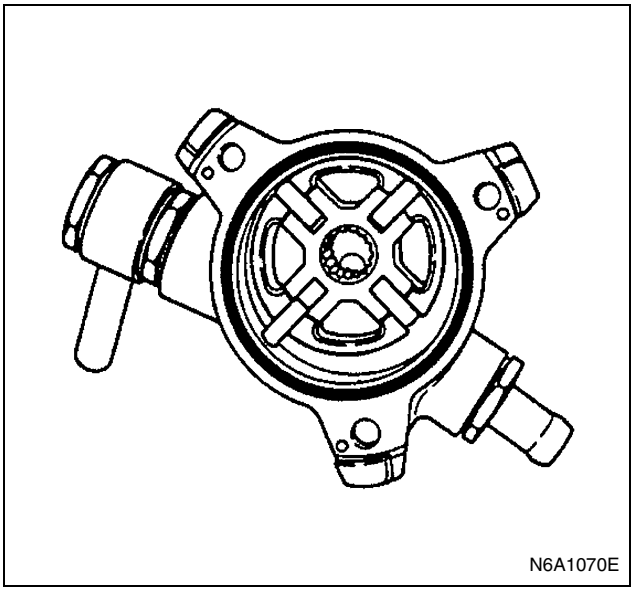
Air Pressure	kPa (kg/cm^2/psi)
98 — 490 (1 — 5/14.22 — 71.10)	

Check for air leakage from the check valve.

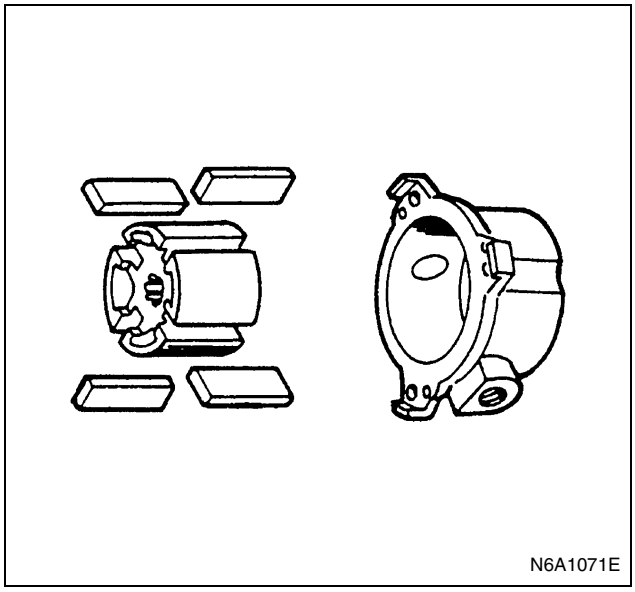
If there is air leakage, the valve must be replaced.

Reassembly

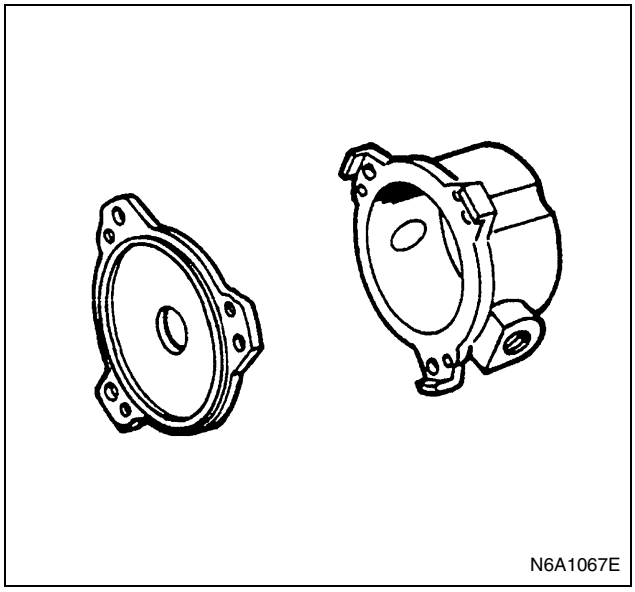
1. Install the vanes to the rotor slits.
   The rounded side of the vanes must be facing the rotor housing.



2. Install the rotor with the concave side facing the center plate.

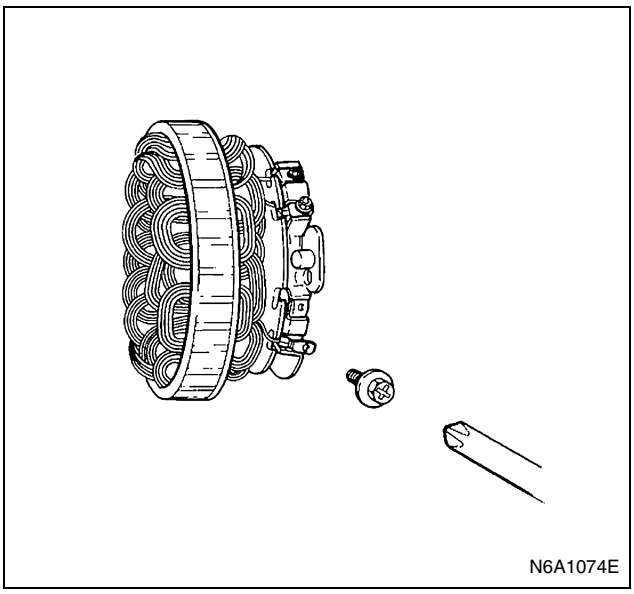


3. Install the center plate to the rotor housing.
   Be sure to use a new O-rings.



Reassembly

1. Rear Cover
2. Brush and IC Regulator
3. Rectifier
4. Fan Guide
5. Stator



N6A1074E

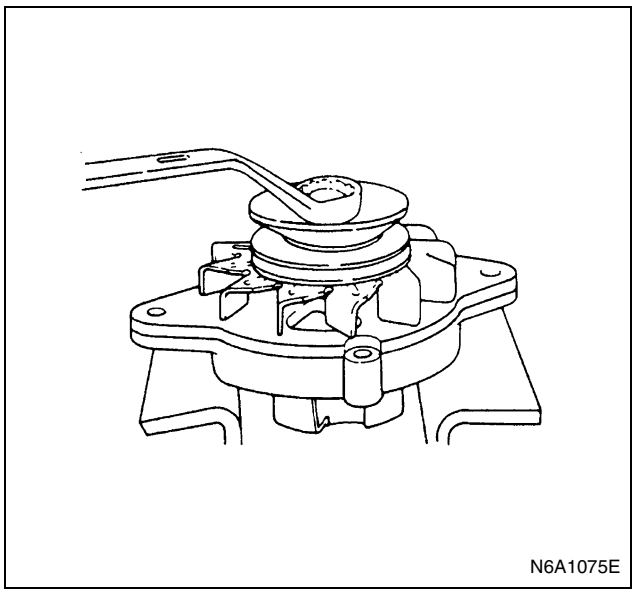
1) Solder together the rectifier and stator leads. Hold the rectifier lead near the rectifier with a pair or long-nose pliers to protect the rectifier from heat.

   Complete the soldering procedure as quickly as possible.

2) Install the IC regulator/stator assemblies to the rear cover.
   Be absolutely sure that the washers and the insulators are reinstalled to their original positions.

   Hold the stator coil against the rear cover.

6. Terminal Nut and Bolt
7. Rotor
8. Rear Ball Bearing
9. Front Cover
10. Front Ball Bearing
11. Bearing Retainer
12. Spacer
13. Fan
14. Pulley
15. Pulley Nut
    1) Carefully clamp the rotor and cover assembly in a vise.
    2) Install the pulley and the pulley nut.



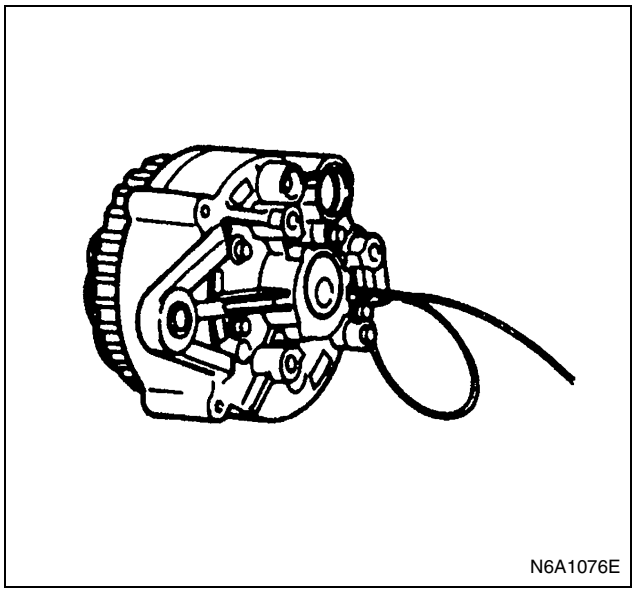
N6A1075E

3) Tighten the pulley to the specified torque.

Tighten:
Pulley nut to 98 N·m (10.0 kg·m / 72 lb·ft)

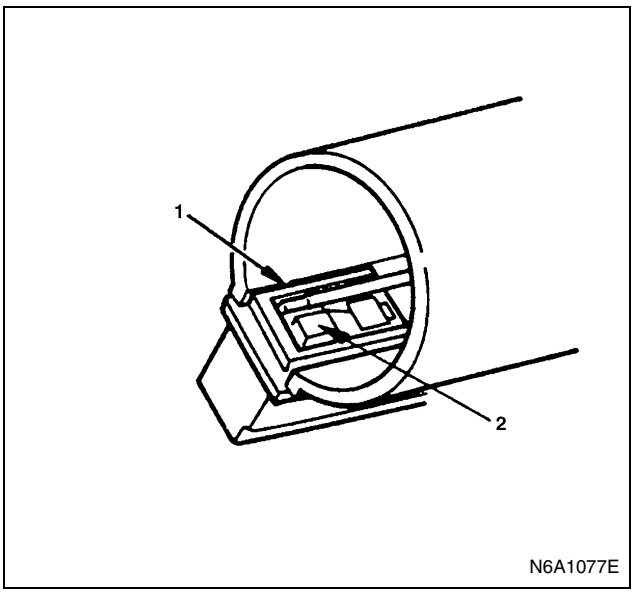
Notice:
Take care not to damage the rotor when clamping it in a vise.

16. Stator and Rear Cover Assembly



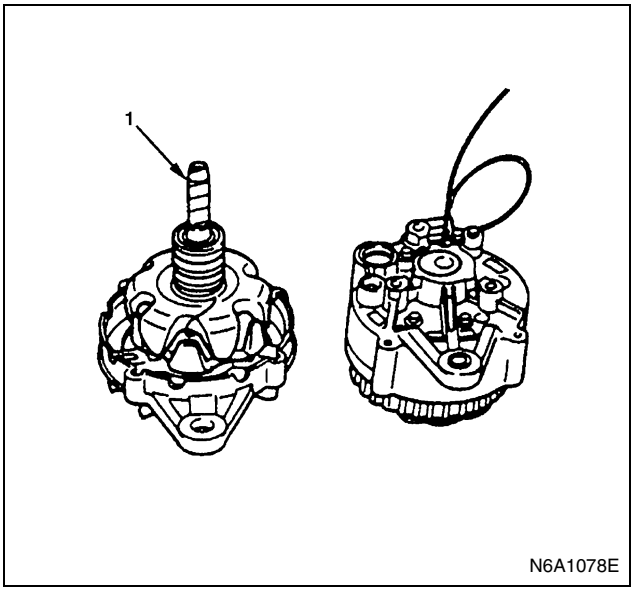
N6A1076E

17. Rotor and Front Cover Assembly
18. Through Bolt
    1) Prepare a brush holding wire or a pin.
    2) Set the holding wire or the pin to the brushes from the vacuum pump side.
    3) Push the brushes into the holder.



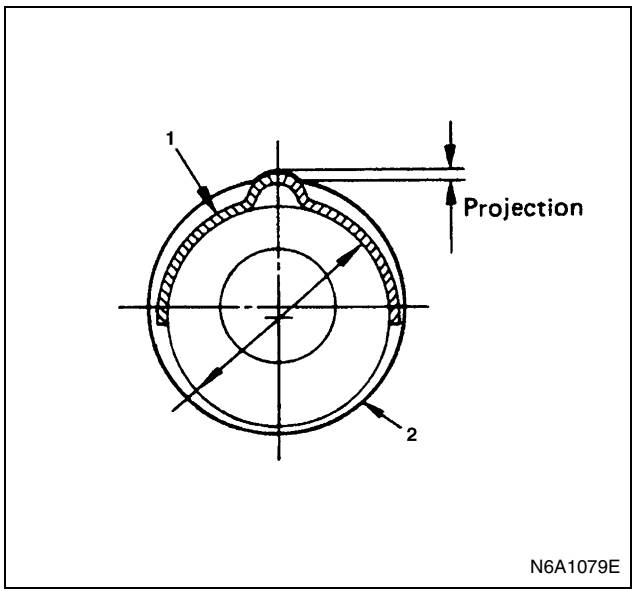
Legend
1. Brush holding wire or pin
2. Brush

4) Bend the wire end to hold the brushes.
   If the holding wire does not hold the brushes properly, the brushes will be damaged.
5) Tape the rotor shaft spline.



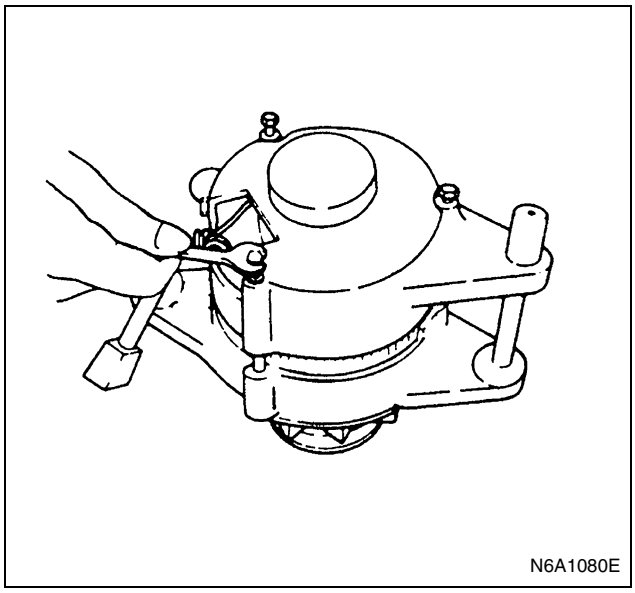
Legend
1. Taping

   This will prevent oil seal damaged.
6) Place the bearing retainer ring.
   Ring projection must be less than 0.65 mm (0.025 in)



Legend
1. Retainer ring
2. Bearing outer race

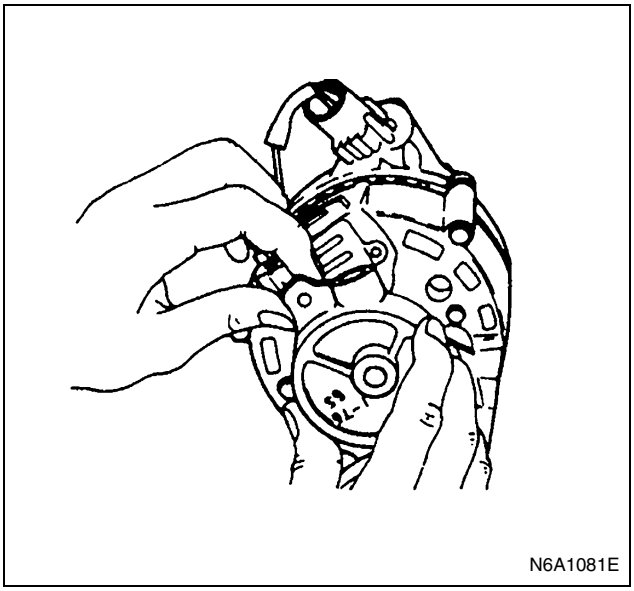
7) Install the front cover and rotor assembly to the rear cover.
   Take care not to damage the rotor, the coil leads, the oil seal lip, and the splines.
8) Place the guide bar into the rear cover bracket hole.
   Align the front cover bracket hole with the guide bar.
9) Install the through bolts.
10) Tighten the through bolts to the specified torque.



Tighten:
Through bolt to 4 N·m (0.4 kg·m / 35 lb·in)

11) Carefully remove the holding wire from the rear cover.

19. Vacuum Pump Assembly
    1) Position the pump rotor together with the pump housing on the center plate.
       The rotor serrated side must be facing up.



N6A1081E

    2) Rotate the rotor to align the rotor bore with the center plate bore.
    3) Install the housing, the rotor, and the center plate.
       The O-ring must not be projecting beyond the center plate slot.
       Take care not to scratch the vanes.
    4) Turn the housing to align it with the center plate.
    5) Tighten the vacuum pump fixing bolts.

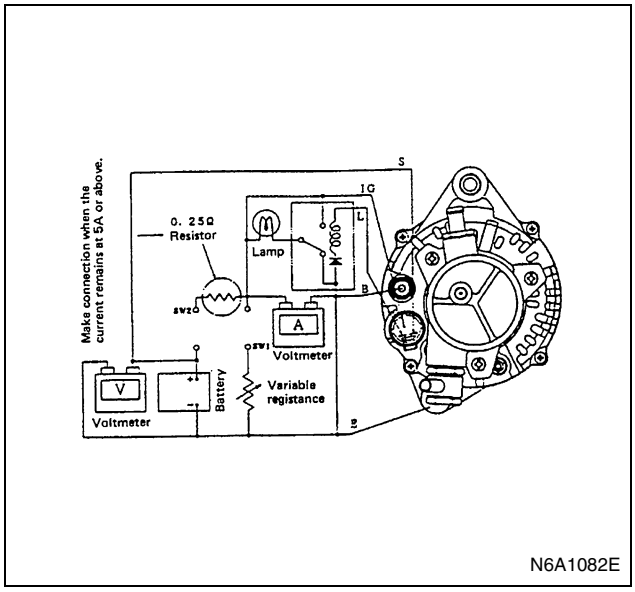
Tighten:
Vacuum pump fixing bolt to 7 N·m (0.7 kg·m / 61 lb·in)

    6) Add 5cc of engine oil through the filler port.
    7) Check that the generator spins smoothly by turning it with your hand.

Inspection

Performance Test

1. Generator
   - Connect the generator as shown in the illustration.

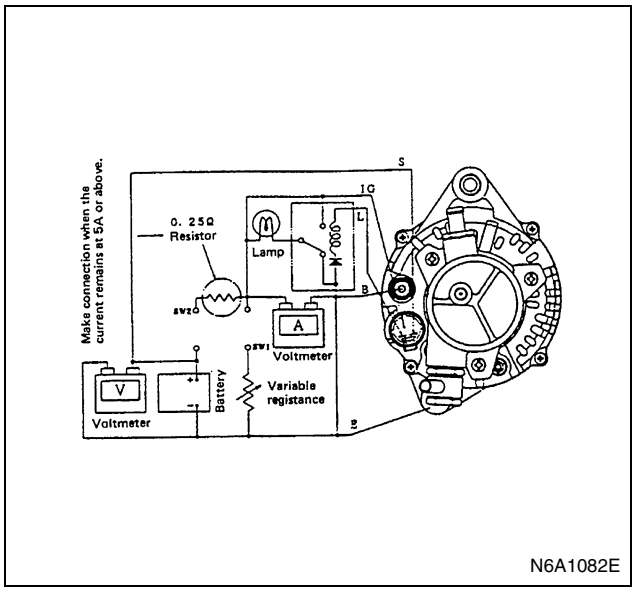


N6A1082E

   - Use a fully charged battery to conduct the measurement with the current outputted from the battery terminals at 5A or less.

Notice:
When conducting the performance test:
For the connection between the generator B terminal and the battery (+) terminal and between the E terminal and the battery (–) terminal, use a lead wire with a cross section of 8 mm^2 and the length of 2.5 m or less.

2. Adjusting voltage measurement



N6A1082E

   - Open SW1 and close SW2.
   - With the number of the generator rotations raised up to its rated rotations of 5,000 rpm, measure the adjusting voltage.

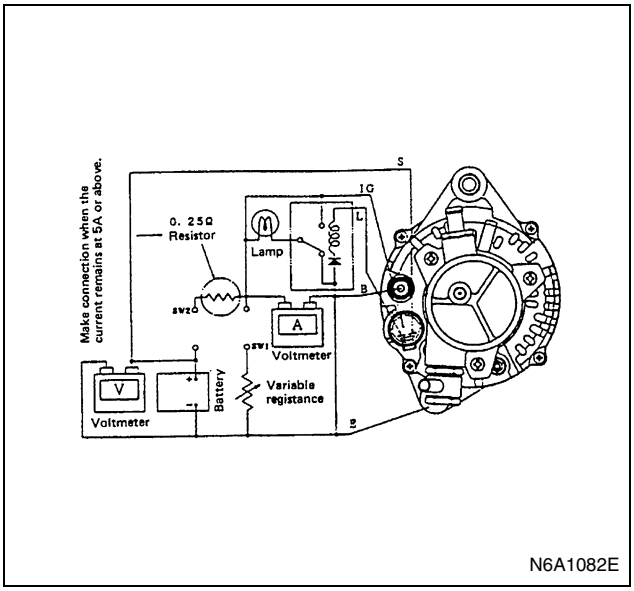
   Adjusting voltage = 28 - 29V

   - Check to see if the fluctuation in the adjusting voltage is not caused by the increased number of rotations.

3. Measurement of the number of rotations at 27V
   - Open SW1 and close SW2.

- Increase the number of the generator rotations gradually until the reading of the voltmeter indicates 27V. Measure the number of rotations at this time.

4. Output current measurement



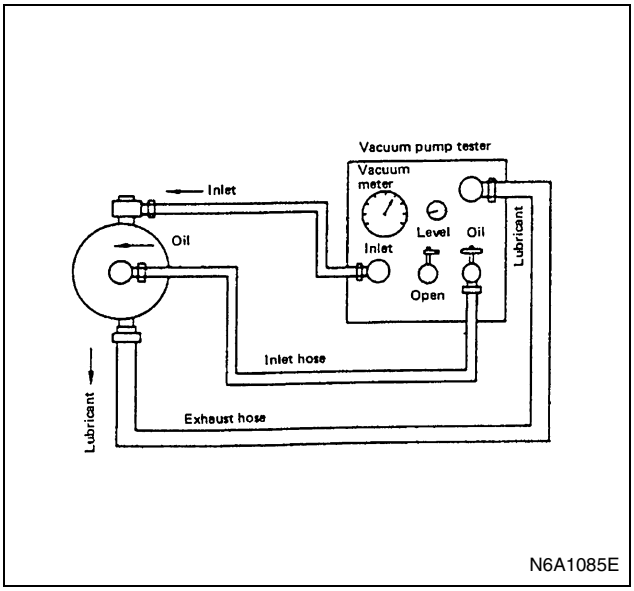
N6A1082E

- Set the resistance of the variable resistor at the minimum, and rotate the generator with SW1 and SW2 closed.
- While keeping the voltage steady at 27V after adjusting the variable resistor, read the indicated value of the ammeter at the generator rotation of 5,000 rpm.

Current at 27V with 5,000 rpm = 35A or more (for 35A specification)

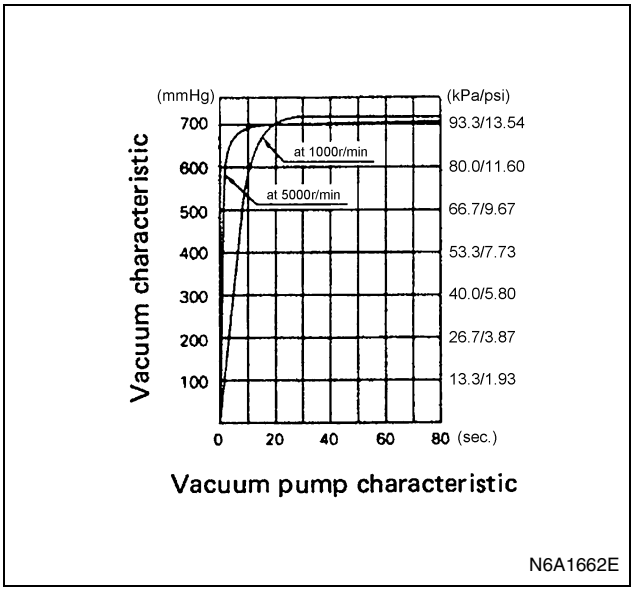
Current at 27V with 5,000 rpm = 45A or more (for 50A specification)

5. Unit test of vacuum pump
   - With a pipe arrangement as shown in the illustration, use the vacuum pump tester to conduct the measurement.

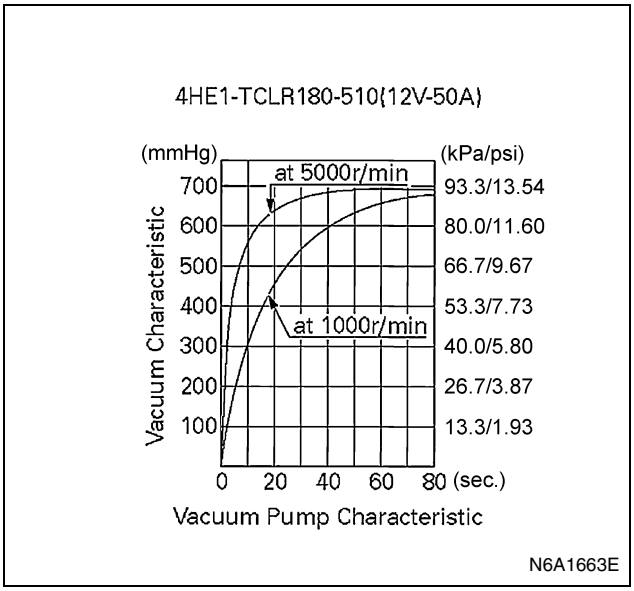


N6A1085E

- Pour about 20 liter (5.28 US gal/4.40 UK gal) of engine oil into the vacuum pump tester.
- Increase the generator rotations gradually, and check to see if the engine oil is fully circulated by discharging oil from the exhaust side of the vacuum pump.
- Close the release valve and measure the “vacuum characteristic” and the “vacuum drop characteristic (air tight characteristic)”. Then check the obtained values based on the following table.



N6A1662E



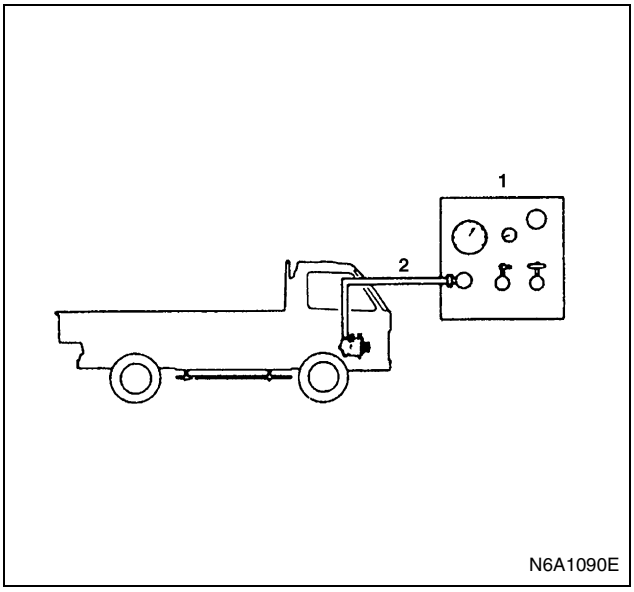
N6A1663E

Item	Performance		Specifications
Vacuum characteristic	5000 rpm — 66.7 kPa (500 mmHg / 9.67 psi)		Less than 4 sec.
	Max. 5000 rpm		More than 90.7 kPa (680 mmHg / 13.15 psi)
Vacuum-down performance	Valve of vacuum-down 15 sec. after the vacuum pump is stopped at 53.3 kPa (400 mmHg / 7.73 psi).		Less than 2.67 kPa (20 mmHg / 0.39 psi)
Test condition	Oil used	Mobil oil #30	
	Oil temperature	75±5°C (167±41°F)	
	Oil pressure	441 kPa (4.5 kg/cm^2 / 63.96 psi)	

- 4HE1-TC LR180-510 (12-50A)

Item	Performance		Specifications
Vacuum characteristic	5000 rpm — 66.7 kPa (500 mmHg / 9.67 psi)		Less than 10 sec.
	Max. 5000 rpm		More than 90.7 kPa (680 mmHg / 13.15 psi)
Vacuum-down performance	Valve of vacuum-down 15 sec. after the vacuum pump is stopped at 53.3 kPa (400 mmHg / 7.73 psi).		Less than 2.67 kPa (20 mmHg / 0.39 psi)
Test condition	Oil used	Mobil oil #30	
	Oil temperature	75±5°C (167±41°F)	
	Oil pressure	441 kPa (4.5 kg/cm^2 / 63.96 psi)	

6. On-vehicle test of the vacuum pump
   - Install the generator to the engine.
   - With the engine idling, check to see if oil is being discharged sufficiently from the exhaust side of the vacuum pump.
   - Idle the engine until the engine oil temperature gets to the range of 70 — 80°C (158 — 176°F).
   - Connect the pipe only to the suction side of the vacuum pump tester, and conduct the test in the same manner as in the unit test. When the resulting value is outside the specified range, re-check the vacuum pump.



Legend
1. Vacuum pump tester
2. Intake

QOS II PREHEATING SYSTEM

Contents

GENERAL DESCRIPTION 6D6-2
Component 6D6-3
STARTING CIRCUIT DIAGRAM (REFERENCE) ... 6D6-4
Component 6D6-4
Inspection and Repair 6D6-5
TROUBLESHOOTING 6D6-8

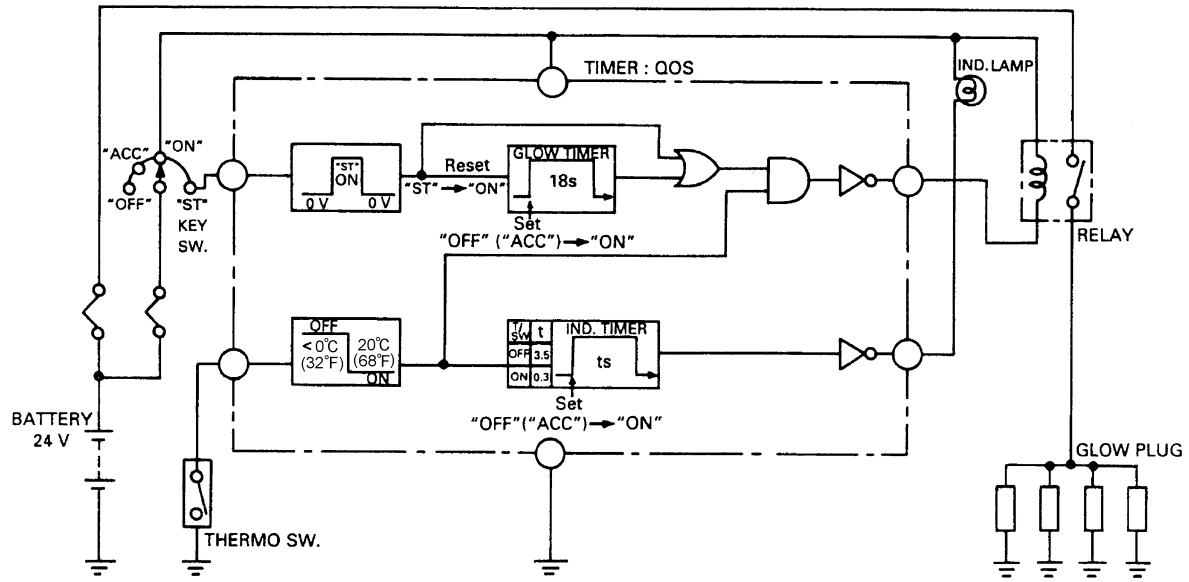
GENERAL DESCRIPTION

QOS II preheating system features a quick-on glow plug with thermometer control of the glowing time and the after-glow time function.
The system consists of a timer, indicator lamp, thermosensor, relay and temperature self-control type glow plug (4 pcs).
With the employment of the thermosensor, the glow time changes according to the engine coolant temperature, thus allowing optimum starting conditions to be obtained.
The afterglow time function is controlled by thermosensor.

Component

Quick-On-Start II (QOS II)

SYSTEM DIAGRAM



TIMING CHART

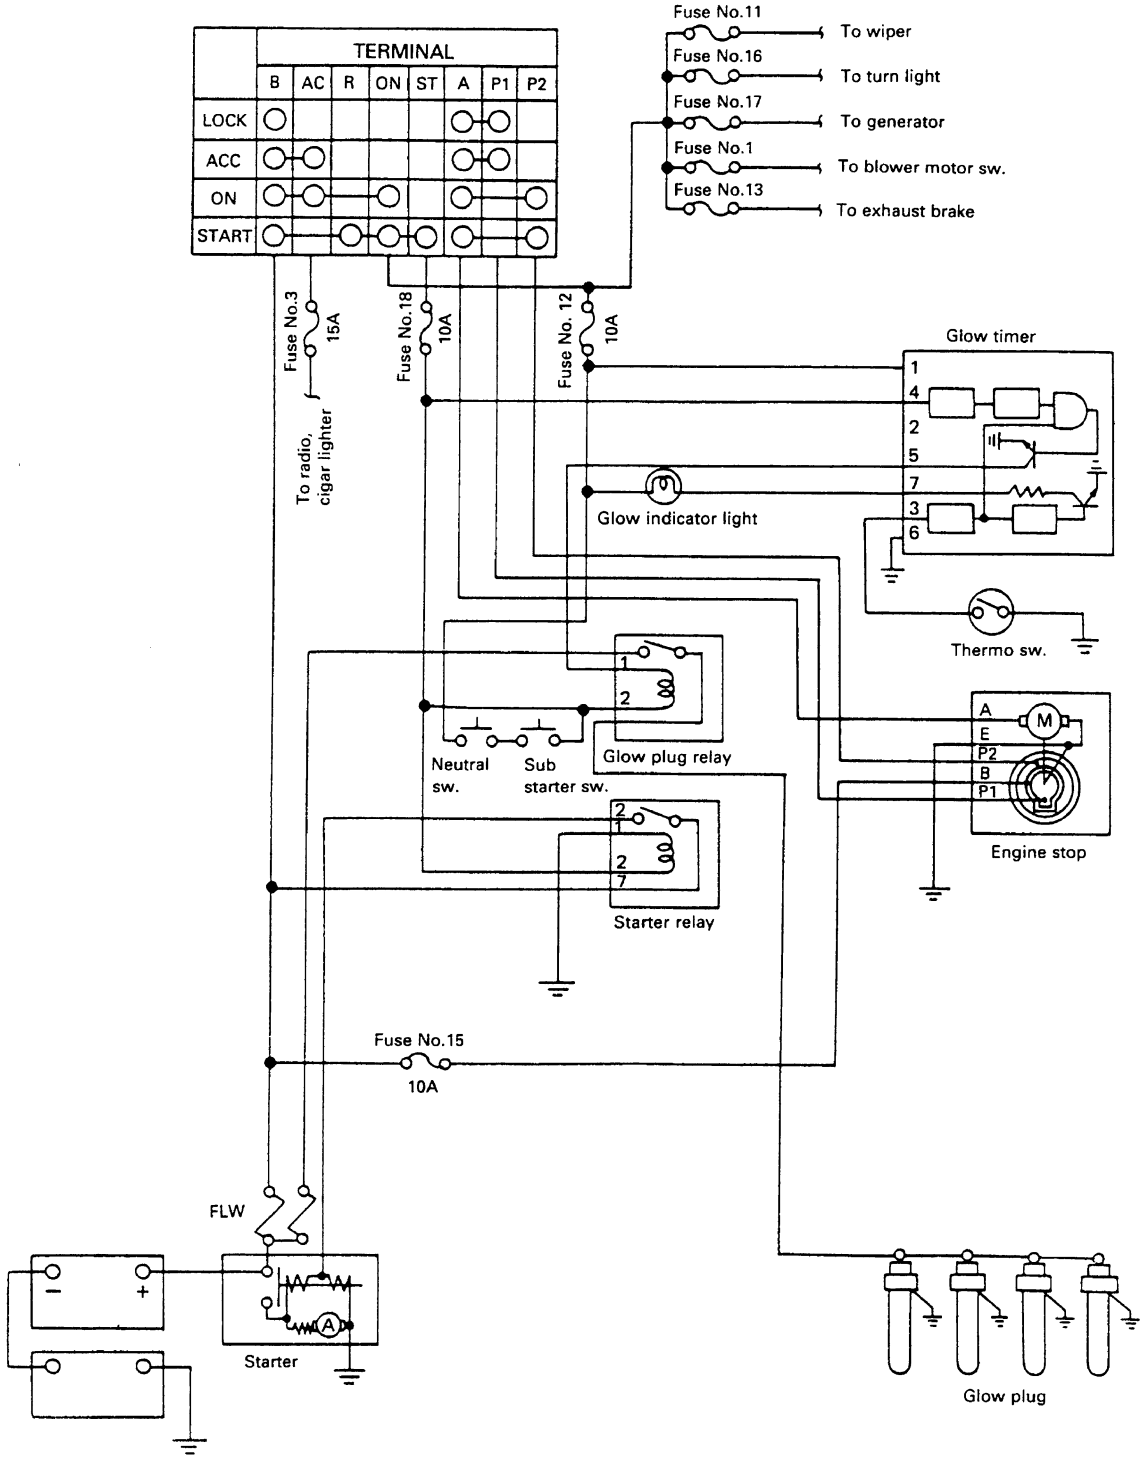
STARTING CIRCUIT DIAGRAM (REFERENCE)

Component



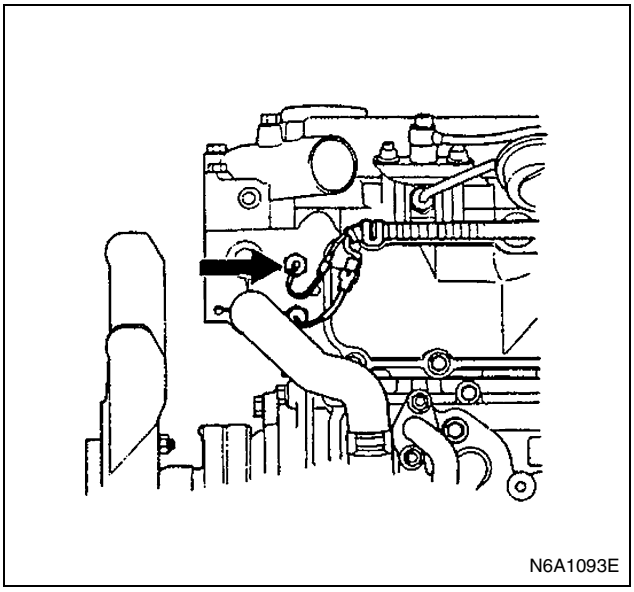
Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Quick-On-Start II (QOS II)

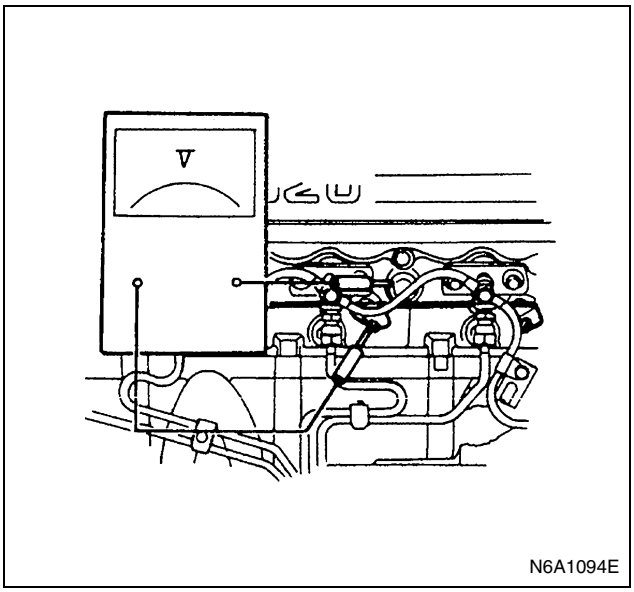
System

1. Disconnect the connector of the thermo switch.



N6A1093E

2. Set the voltage meter in connection as shown in the illustration.



N6A1094E

3. Turn the key switch to “ON” position without engine turned and check the following items.

Glow Indicator Lighting Time	Seconds
Standard	3.5

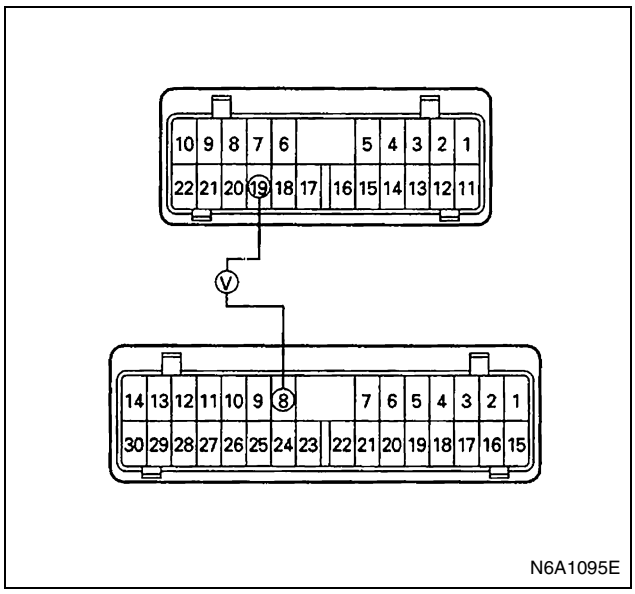
Power Source Voltage Indicating Time	Seconds
Standard	18

When abnormal, check the QOS timer, the glow relay and the thermo switch.

When normal, check the glow plug.

Timer

1. Disconnect the connector of the thermo switch.
2. Set the voltage meter in connection as shown the illustration with connector connected.



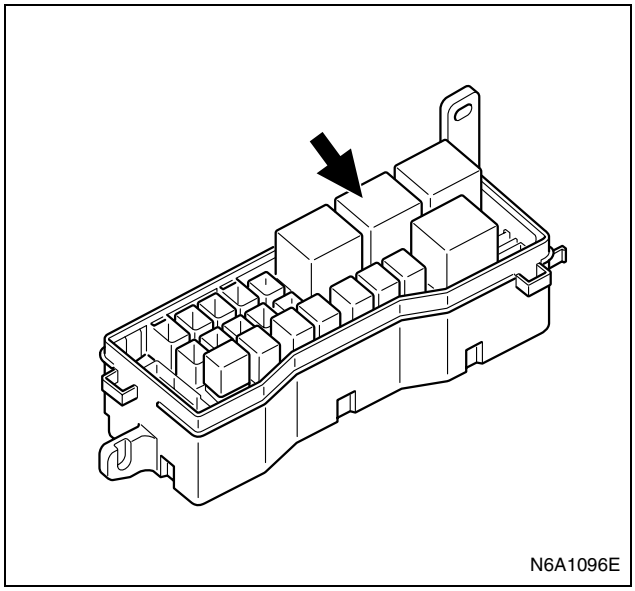
N6A1095E

3. Turn the key switch to “ON” position without engine turned, and check the following.

0 Volts Indicating Time	Seconds
Standard	18

Glow Plug Relay

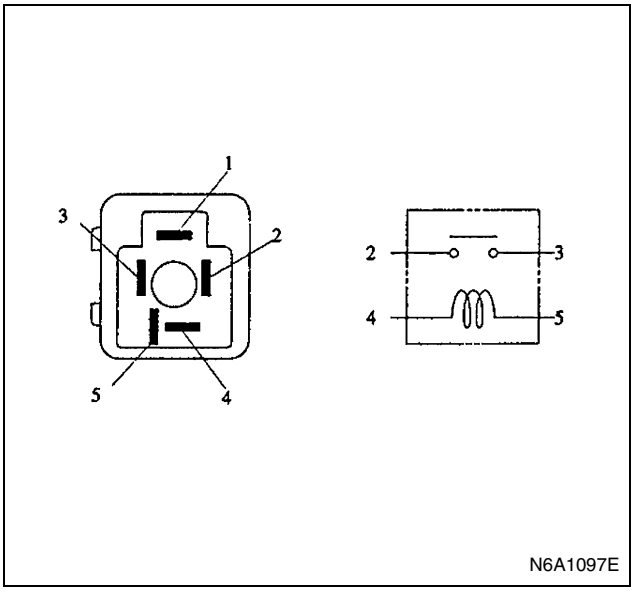
Location



N6A1096E

Specification

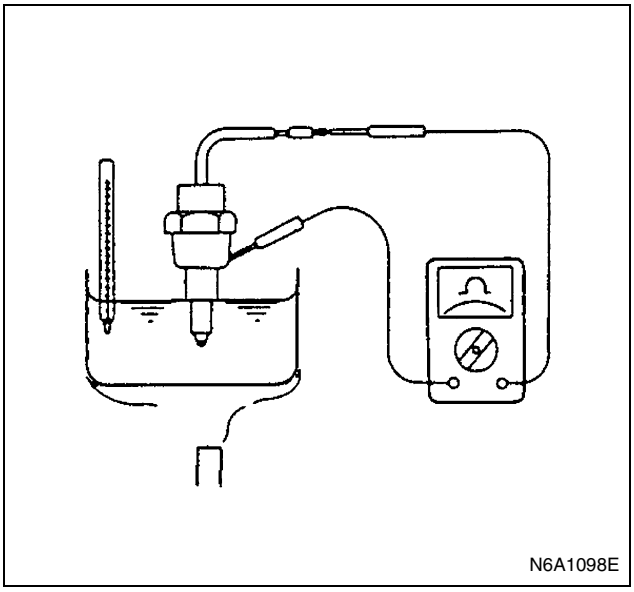
Measure the glow relay resistance between the terminal (4) and the (5) with a circuit tester.



If the measured resistance is outside the specified range, the glow relay must be replaced.

Glow Relay Resistance (Reference)	ohms
Standard	100

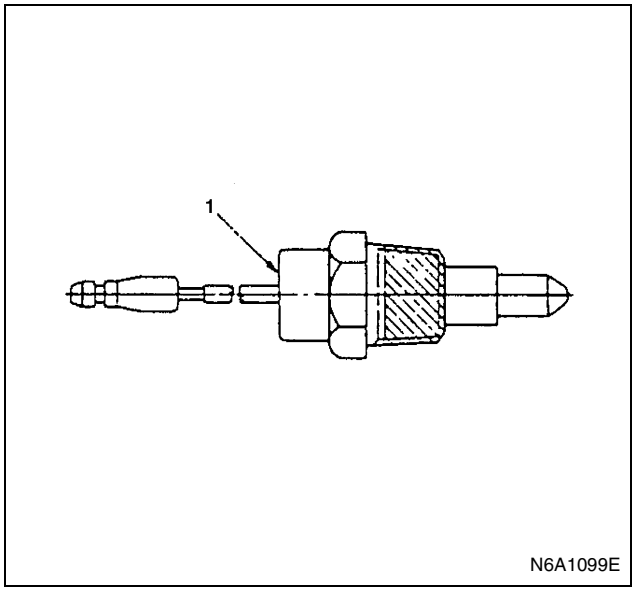
Thermo-Switch



Specification

Operating Temperature	°C (°F)
OFF → ON	7 — 13 (44.6 — 55.4)
ON → OFF	Over 3 (37.4)

- Before installing the thermo-switch, apply LOC-TITE 262 or its equivalent to the portion shown in the illustration.

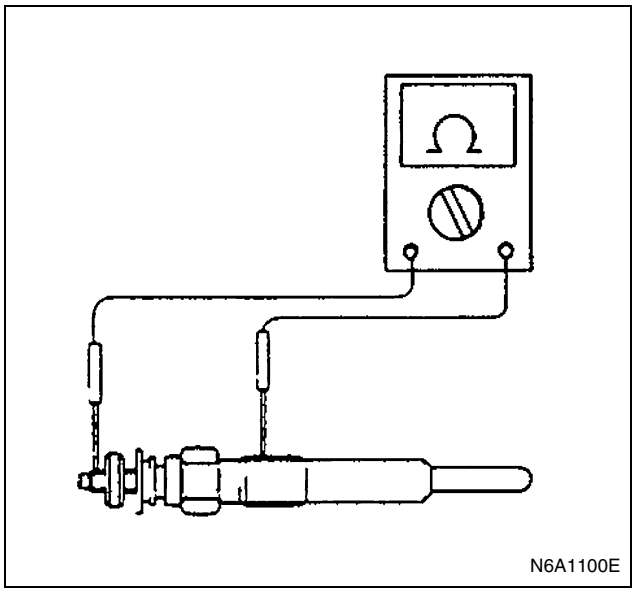


Legend

1. Pink (resin)

Glow plug check

- Use the circuit tester to measure the continuity of the glow plug.

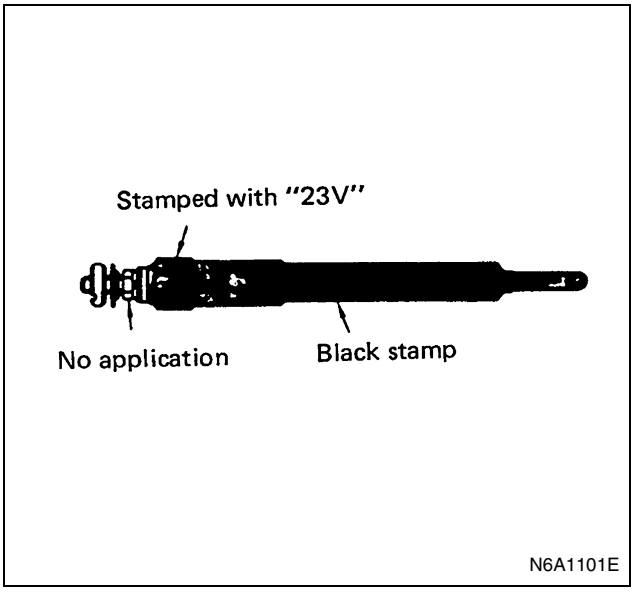


- When the obtained value is outside the specified range, replace the glow plug with a new one.

Glow plug resistance = About 4Ω (at room temperature)

Notice:

When changing glow plugs, use a set of 4 glow plugs of the same manufacture.



- Note that an identification mark is provided to prevent any possible faulty assembly.

Type	Rated Voltage (V)	Total length mm (in)
Standard	23	141 (5.55)

QOS Timer

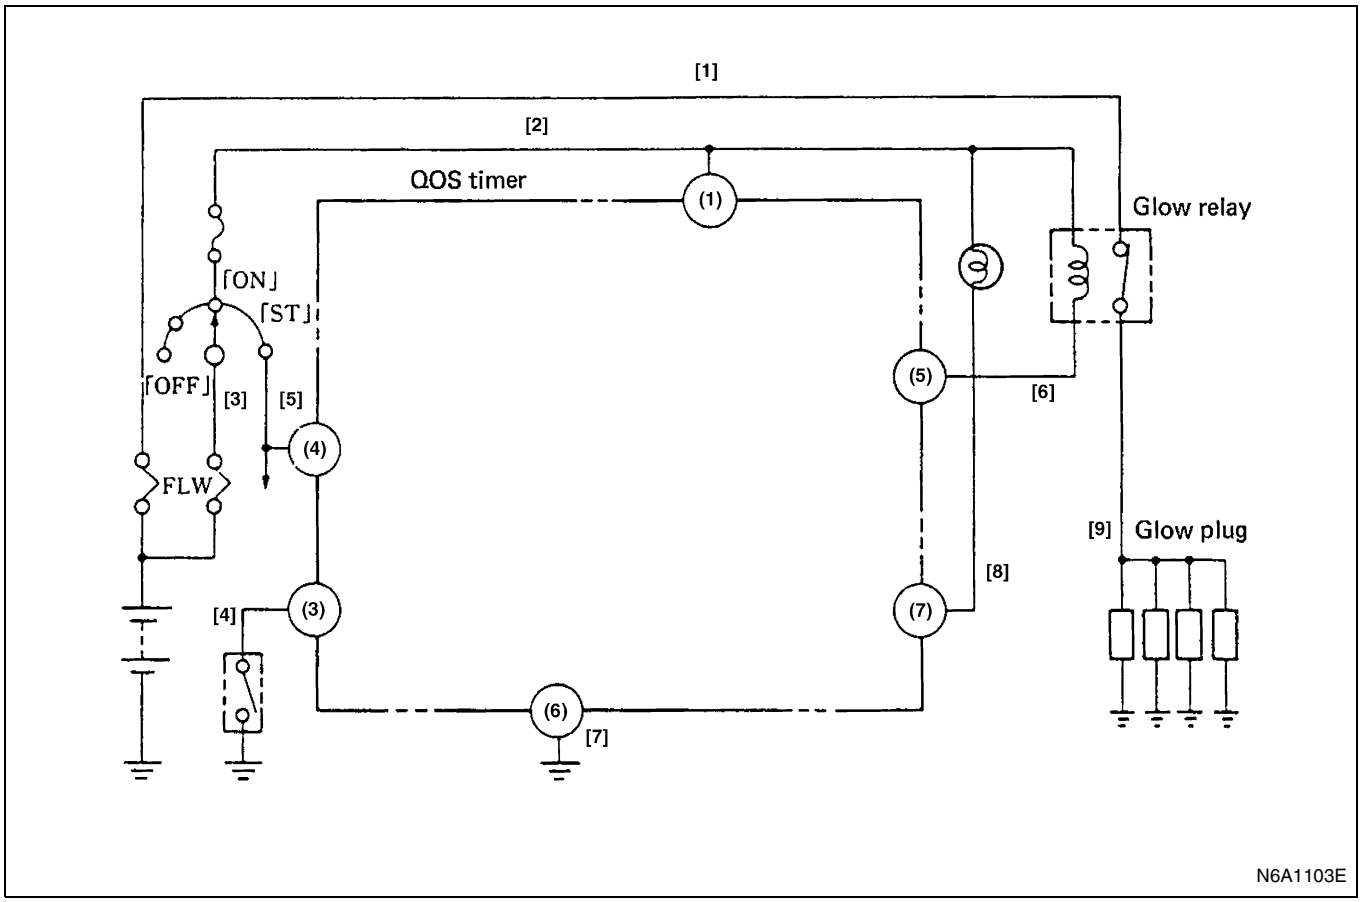
TROUBLESHOOTING

Circuit diagram



Notice:
A figure in a circle “( )” shows a terminal No.
A figure in a square “[ ]” shows a circuit No.

When the Cooling Water Temperature is Below 0°C (32°F).

Condition	Possible cause	Circuit
The glow relay does not turn on.	1. Defective connection in fusible link between battery and starter switch	[3]
	2. Defective connection or broken wire in starter switch circuit	
	3. Defective connection or broken wire in fuse No.3	[2]
	4. Defective starter switch * Items 3 and 4 above coincide with troubles in other circuits.	
	5. Defective connection of glow relay terminal	[1]
	6. Broken wire in glow relay excitation coil	
	7. Broken wire in the circuit between glow relay and timer	[6]
	8. Defective glow relay (There is no continuity in main connection.)	
	9. Defective connection in QOS timer Defective QOS timer	
	10. Defective ground circuit in QOS timer	[7]
	11. Defective thermo-switch (The thermo-switch does not turn off even when water temperature is below zero.)	
	12. Defective ground circuit in thermo-switch	[7]
Glow relay turns on, but does not get pre-heated.	1. Defective connection of fusible link between battery and start switch	[1]
	2. Defective connection of glow relay main link terminal connector, or broken wire in preheating circuit	
	3. Defective connection of plug connector with preheating circuit	[9]
Glow relay remains on, and does not turn off.	1. Defective QOS timer	
	2. Circuit is shorted to ground between QOS timer terminal (5) and glow relay	[6]
	3. Defective glow relay	
Indicator lamp does not light on.	1. Defective QOS timer	
	2. Broken wire in bulb	[8]
	3. Broken wire in indicator lamp harness	

When the Cooling Water Temperature is Over 0°C (32°F).

Condition	Possible cause	Circuit
Indicator lamp does not light on.	1. Defective QOS timer	
	2. Broken wire in bulb	[8]
Indicator lamp lights on for a long time.	1. Defective thermo-switch, or broken wire in thermo-switch circuit (Indicator lights on for about 3.5 sec.)	[4]
	2. Defective QOS timer	
Glow relay is ready to turn on, or remains on.	1. Circuit is shorted to ground between terminal (5) and glow relay.	[6]

ENGINE 4H SERIES

SECTION 6E (4HE1-TC/4HG1-T Only)

EMISSION AND ELECTRICAL DIAGNOSIS

Caution:
When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength for (stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound, will be called out. The correct torque values must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

GENERAL DESCRIPTION

The emission and electrical control system operates on a 12 or 24 volt power supply with negative ground polarity. Each wire in the vehicle is of a specific size and has an identifying colored insulation.
These colors are indicated in wiring diagrams and will help in tracing circuits and making proper connections.
Wire size is determined by load capacity and circuit length. Some wires are grouped together and taped.
Such a grouping of wires is called a harness.

The harness use a split corrugated tube to protect the wires from the elements. Each circuit consists of the following:

- Power source - the battery and the alternator.
- Wires - To carry electrical current through the circuit.
- Fuses - To protect the circuit against current overload.
- Relays - To protect voltage drop between the battery and the circuit parts and to protect the switch points against burning.
- Switches - To open and close the circuit.
- Load - Any device, such as a light or a motor, which converts the electrical current into useful work.
- Ground - To allow the current to flow back to the power source.

In this manual, such electrical device is classified by system. For major parts shown on the circuit based on the circuit diagram for each system, inspection and removal and installation procedures are detailed.

Notes for Working on Electrical Items

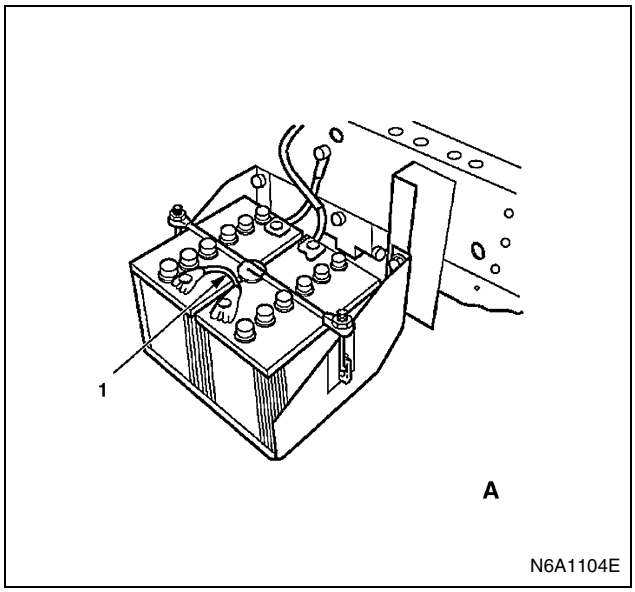
Battery Cable

Disconnecting the Battery Cable

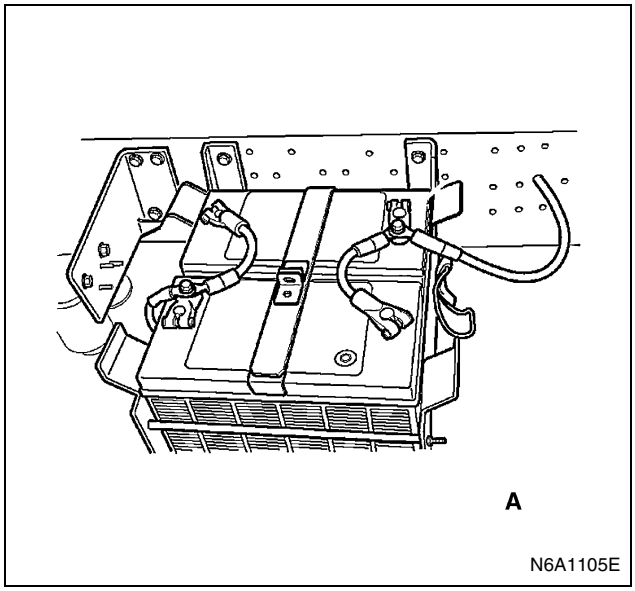
1. All switches should be in the “OFF” position.
2. Disconnect the battery ground cable.
3. Disconnect the battery positive cable
4. Disconnect the battery cable (1).

Caution:
It is important that the battery ground cable be disconnected first.

Disconnecting the battery positive cable first can result in a short circuit.



Legend
A. For 24 volt
1. Cable



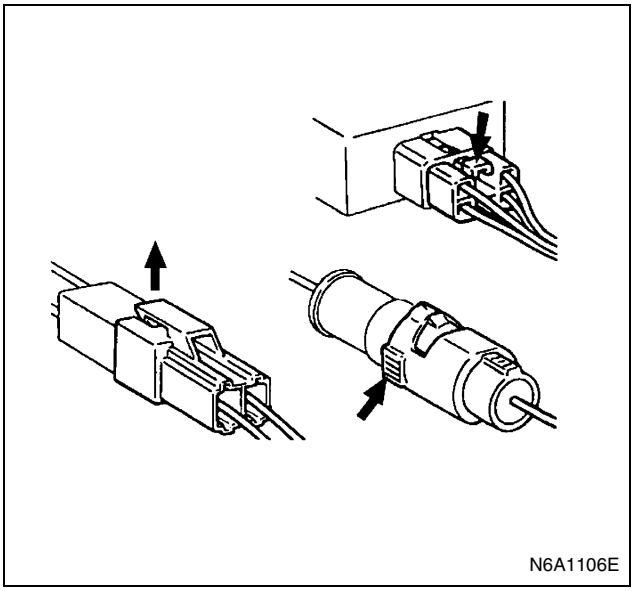
Legend
A. For 12 volt

Connecting the Battery Cable
Follow the disconnecting procedure in the reverse order.

Caution:
Clean the battery terminal and apply a light coat of grease to prevent terminal corrosion.

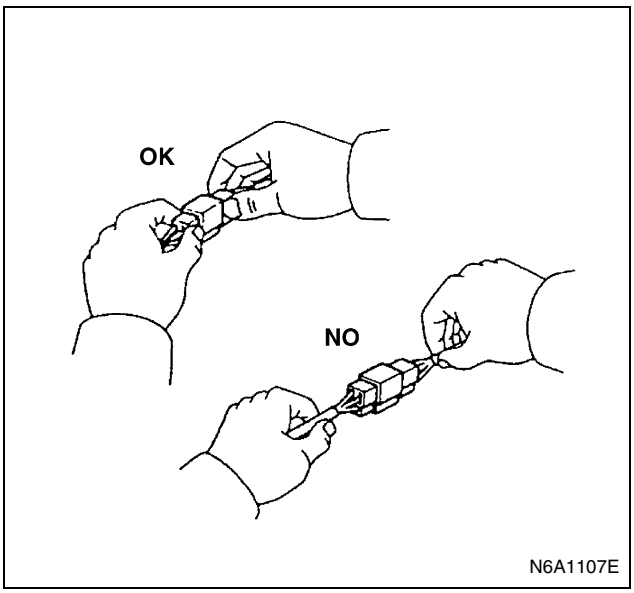
Connecting Handling
Disconnecting the Connectors
Some connectors have a tang lock to hold the connectors together during vehicle operation.

Some tang locks are released by pulling them towards you.
Other tang locks are released by pressing them forward.
Determine which type of tang lock is on the connector being handled.
Firmly grasp both sides (male and female) of the connector.
Release the tang lock and carefully pull the two halves of the connector apart.



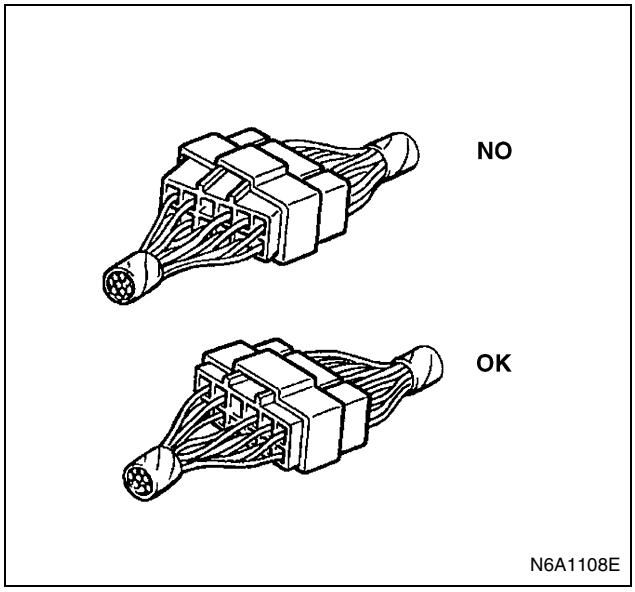
N6A1106E

Never pull on the wires to separate the connectors. This will result in wire breakage.



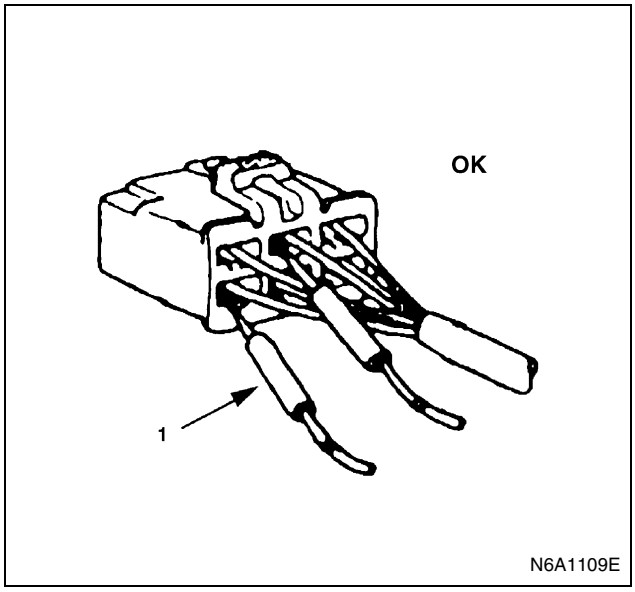
N6A1107E

Connecting the Connector
Firmly grasp both sides (male and female) of the connector. Be sure that the connector pins and pin holes match. Be sure that both sides of the connector are aligned with each other. Firmly but carefully push the two sides of the connector together until a distinct click is heard.



N6A1108E

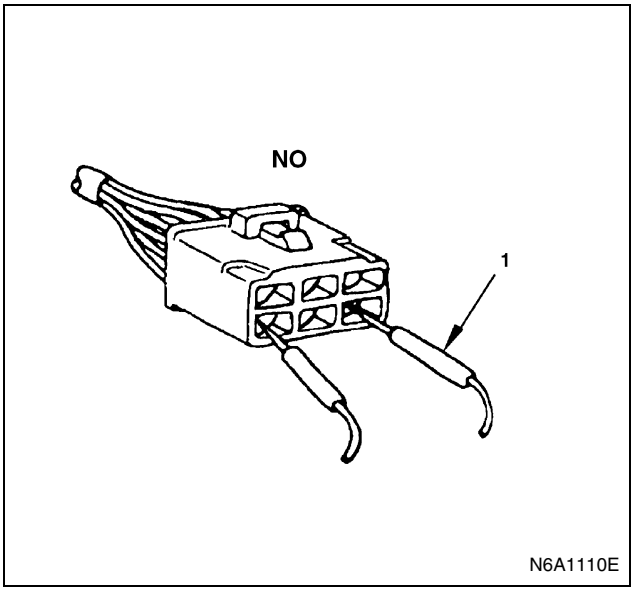
Connector Inspection
Use a circuit tester to check the connector for continuity. Insert the test probes from the connector wire side.



N6A1109E

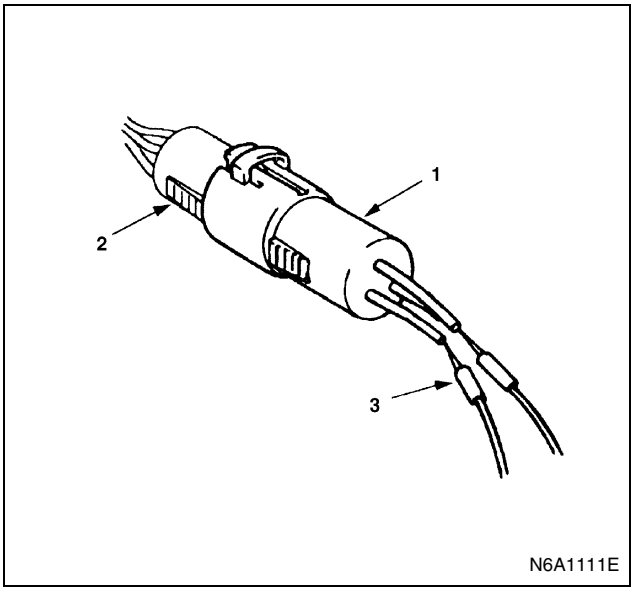
Legend
1. Test probe

Never insert the circuit tester test probes into the connector open end to test the continuity. Broken or open connector terminals will result.



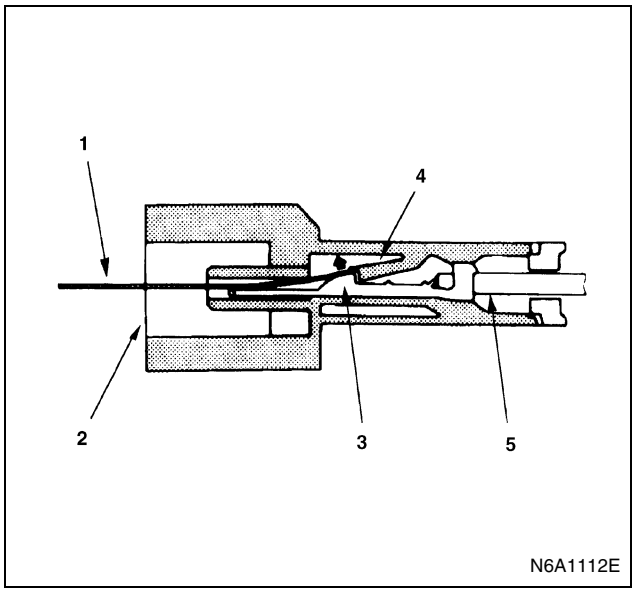
Legend
1. Test probe

Waterproof Connector Inspection
It is not possible to insert the test probes into the connector wire side of a waterproof connector.
Use one side of a connector (1) with its wires cut to make the test. Connect the test connector (2) to the connector to be tested. Connect the test probes to the cut wires to check the connector continuity.



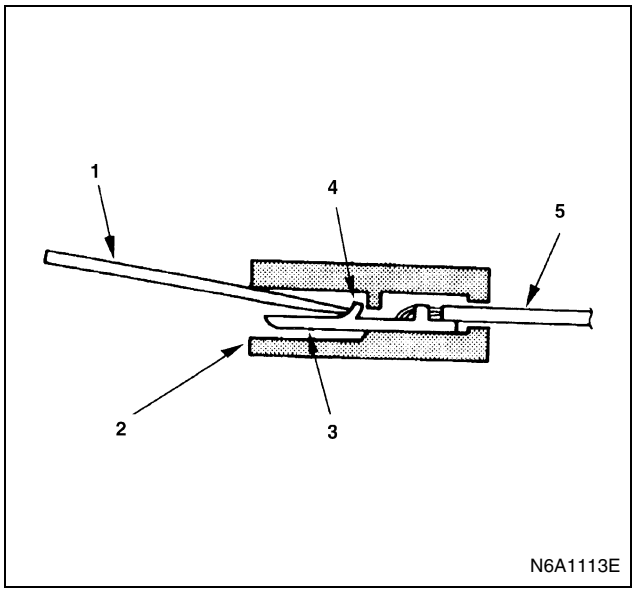
Legend
1. Connector
2. Test connector
3. Test probe

Connector Pin Removal
Connector Housing Tang Lock Type
1. Insert a slender shaft into the connector housing open end.
2. Push the tang lock up (in the direction of the arrow in the illustration). Pull the wire with pin free from the wire side of the connector.



Legend
1. Slender shaft
2. Housing open pad
3. Pin
4. Tang lock
5. Wire

Pin Tang Lock Type
1. Insert a slender shaft into the Connector housing open end.
2. Push the tang lock flat (toward the wire side of the connector). Pull the wire with pin free from the wire side of the connector.

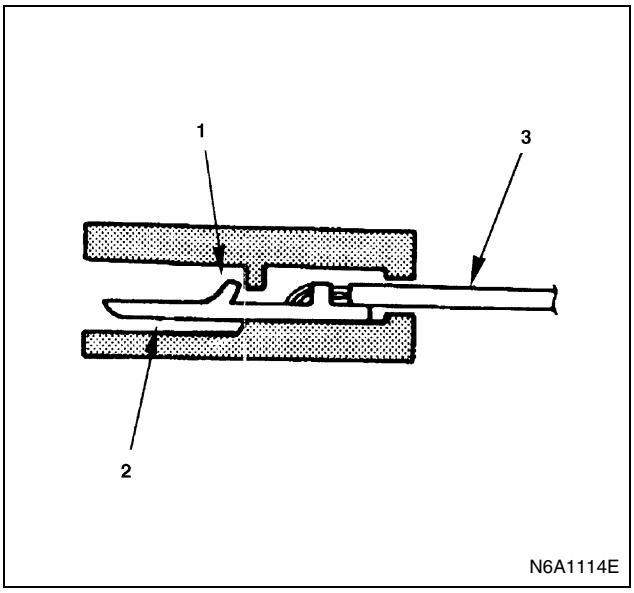


Legend

1. Slender shaft
2. Housing open pad
3. Pin
4. Tang lock
5. Wire

Connector Pin Insertion

1. Check that the tang lock is fully up.
2. Insert the pin from the connector wire side.
   Push the pin in until the tang lock closes firmly.
3. Gently pull on the wires to make sure that the connector pin is firmly set in place.

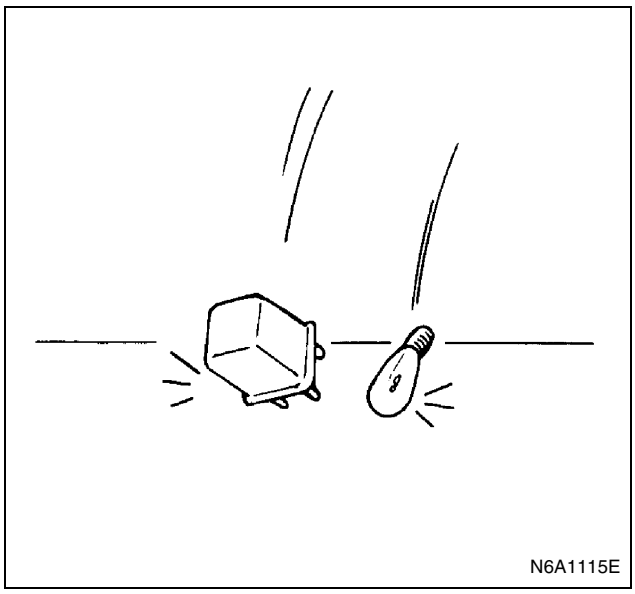


Legend

1. Tang lock
2. Pin
3. Wire

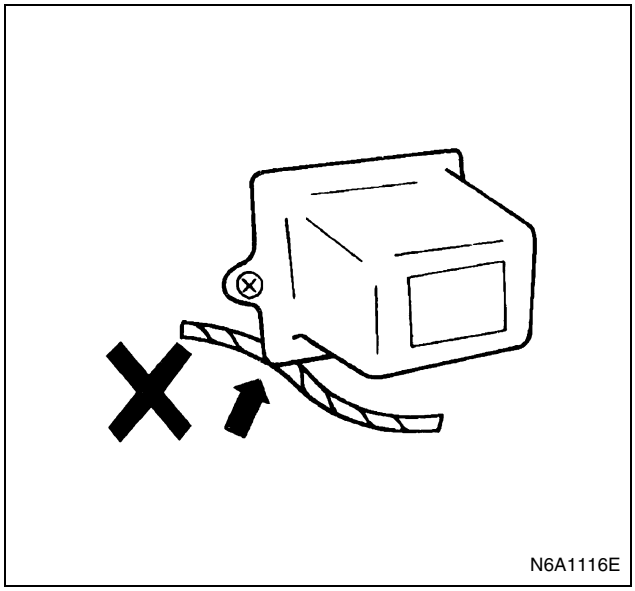
Parts Handling

Be careful when handling electrical parts. They should not be dropped or thrown, because short circuit or other damage may result.



Cable Harness

When installing the parts, be careful not to pinch or wedge the wiring harness.
All electrical connections must be kept clean and tight.

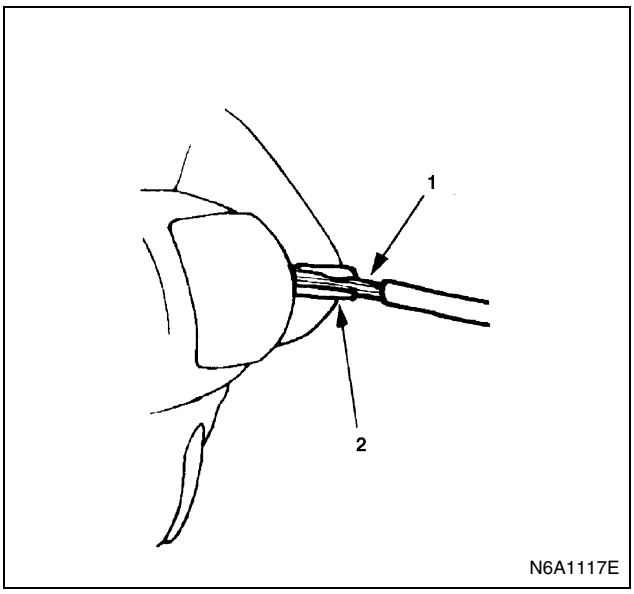


Splicing Wire

1. Open the Harness
   If the harness is taped, remove the tape. To avoid wire insulation damage, use a sewing “seam ripper” (available from sewing supply stores) to cut open the harness.
   If the harness has a block plastic conduit, simply pull out the desired wire.
2. Cut the wire
   Begin by cutting as little wire off the harness as possible. You may need the extra length of wire later if you decide to cut more wire off to change the location of a splice. You may have to adjust splice locations to make certain that each splice is at least 1.5 in (40 mm) away from other splices, harness branches, or connectors.
3. Strip the insulation

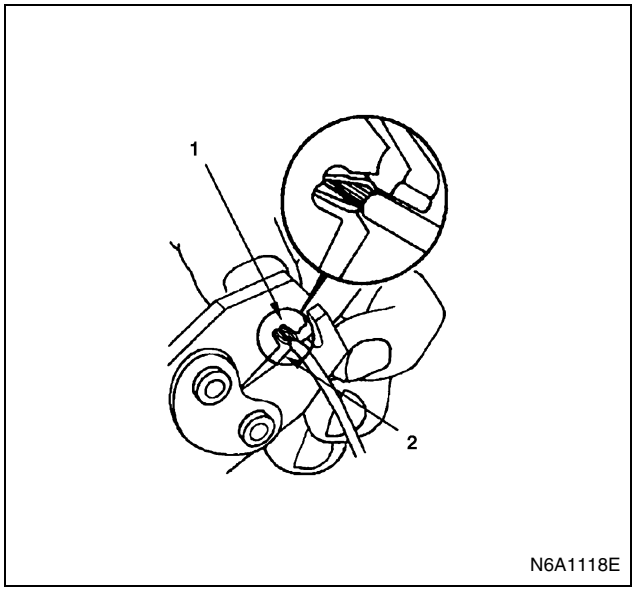
When replacing a wire, use a wire of the same size as the original wire. Check the stripped wire for nicks or cut stands. If the wire is damaged, repeat the procedure on a new section of wire. The two stripped wire ends should be equal in length.

4. Crimp the Wires
   Select the proper clip to secure the splice. To determine the proper clip size for the wire being spliced, follow the directions included with your clips. Select the correct anvil on the crimper. (On most crimpers your choice is limited to either a small or large anvil.) Overlap the two stripped wire ends and hold them between your thumb and forefinger. Then, center the splice clip under the stripped wires and hold it in place.



Legend
1. Over lap bare wires
2. Splice clip

- Open the crimping tool to its full width and rest one handle on a firm flat surface.
- Center the back of the splice clip on the proper anvil and close the crimping tool to the point where the back of the splice clip touches the wings of the clip.
- Make sure that the clip and wires are still in the correct position. then, apply steady pressure until the crimping tool closes.

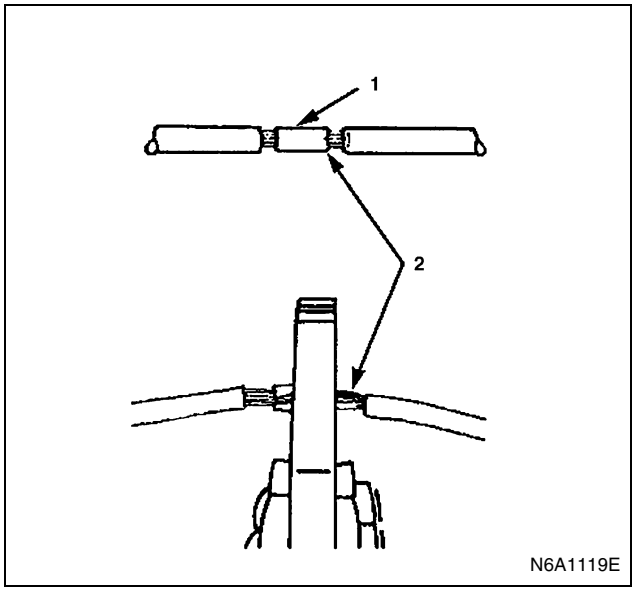


Legend
1. Wings of clip touching former
2. Back of clip centered on anvil

Before crimping the ends of the clip, be sure that:

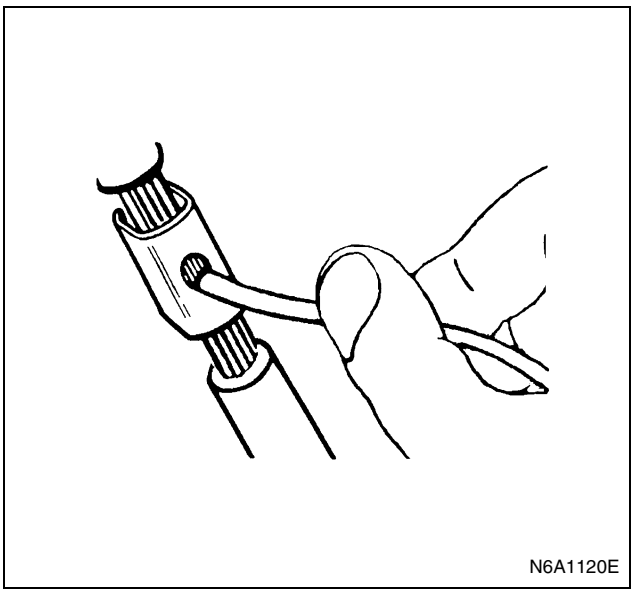
- The wires extend beyond the clip in each direction.
- No stands of wire are cut loose, and
- No insulation is caught under the clip.

Crimp the splice again, once on each end. Do not let the crimping tool extend beyond the edge of the clip or you may damage or nick the wires.



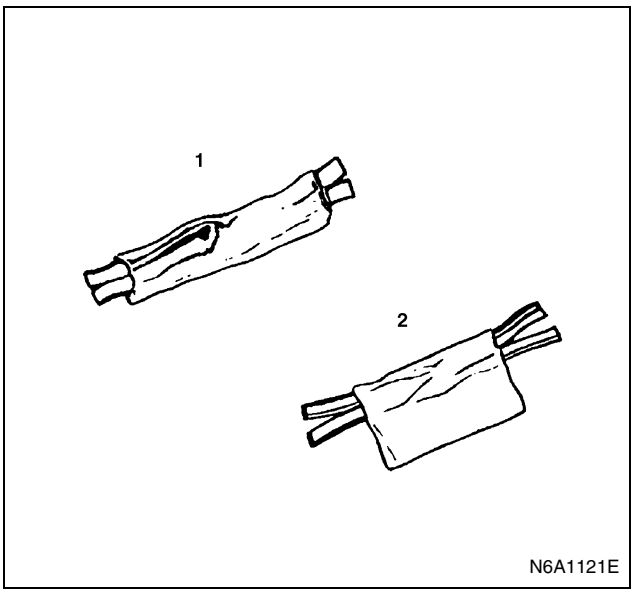
Legend
1. Splice clip
2. Align tool with edge of clip to crimp ends of splice

5. Solder
   Apply 60/40 rosin core colder to the opening in the back of the clip. Follow the manufacturer's instructions for the solder equipment you are using.



N6A1120E

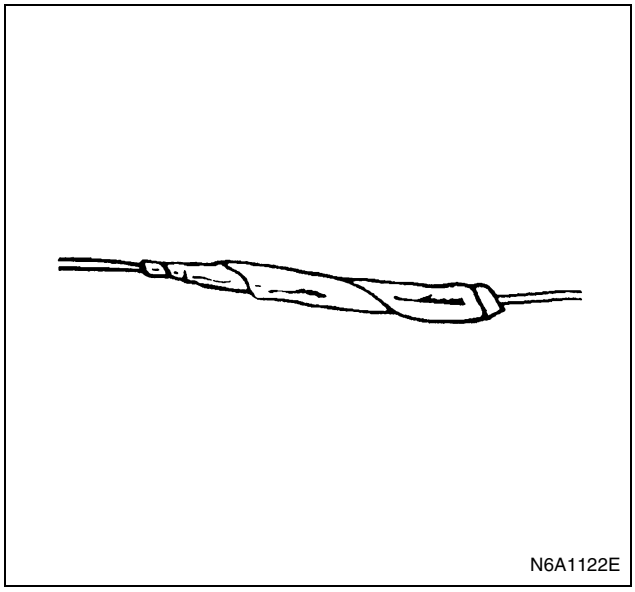
6. Tape the Splice
   Center and roll the splicing tape. The tape should cover the entire splice. Roll on enough tape to duplicate the thickness of the insulation on the existing wires. Do not flag the tape. Flagged tape may not provide enough insulation, and the flagged ends will tangle with the other wires in the harness.



N6A1121E

Legend
1. Good (Rolled)
2. Bad (Flaged)

If the wire does not belong in a conduit or other harness covering, tape the wire again. Use a winding motion to cover the first piece of tape.



N6A1122E

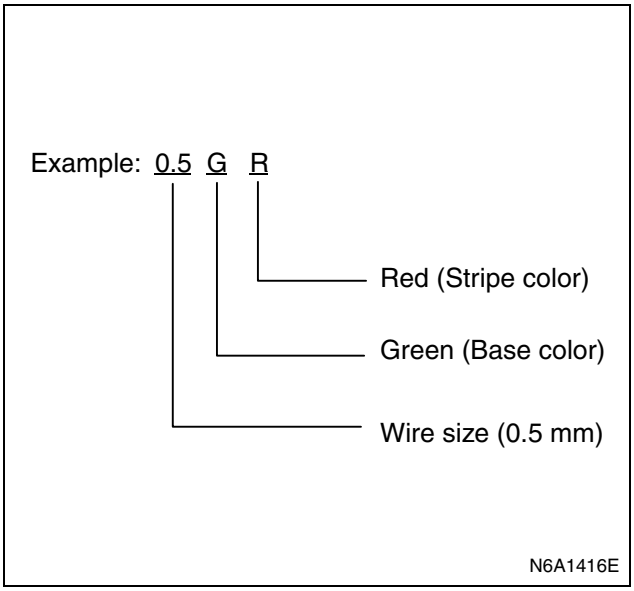
Parts for Electrical Circuit

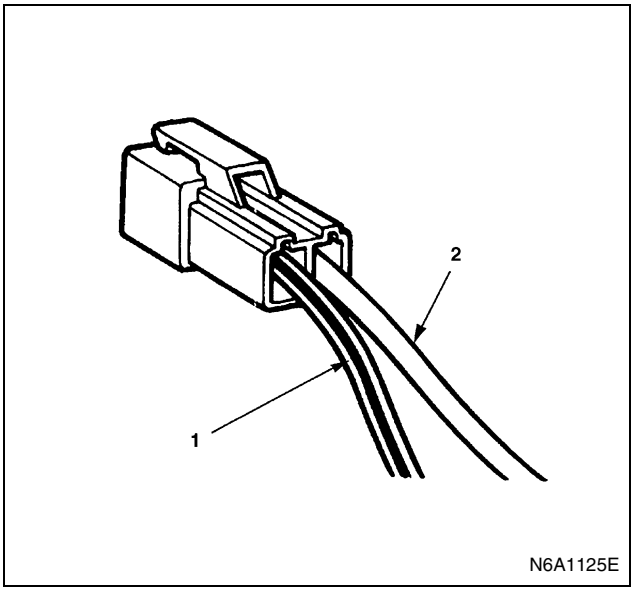
Wiring

Wire Color

All wires have color-coded insulation.
Wires belonging to a system's main harness will have a single color. Wires belonging to a system's sub circuits will have a colored stripe. Striped wires use the following code to show wire size and colors.

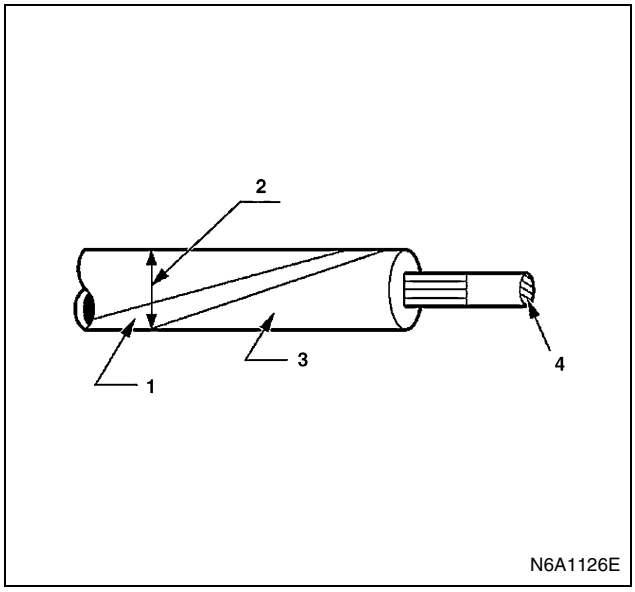


Abbreviations are used to indicate wire color within a circuit diagram.
Refer to the following table.



Legend

1. Colored stripe
2. Single color



Legend

1. Stripe color
2. Outside diameter
3. Base color
4. Cross sectional area

Wire Color Coding

Color-coding	Meaning	Color-coding	Meaning
B	Black	Br	Brown
W	White	Lg	Light green
R	Red	Gr	Gray
G	Green	P	Pink

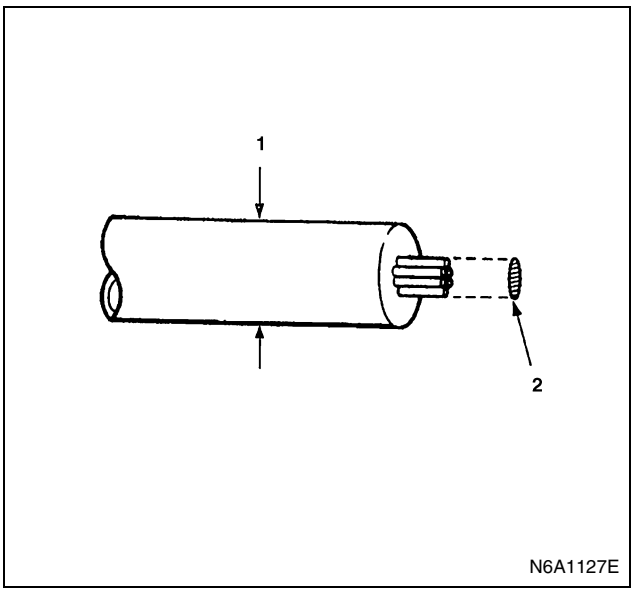
YB	Yellow	Black
YB	Yellow	Green
YV	Yellow	Violet

Wire Size

The size of wire, used in a circuit is determined by the amount of current (amperage), the length of the circuit, and the voltage drop allowed. The following wire size and load capacity, shown below, are specified by JIS (Japanese Industrial Standard) (Nominal size means approximate cross sectional area)

Legend

1. Outside diameter
2. Cross sectional area



Nominal size (mm)	Cross sectional area (mm^2)	Outside diameter (mm)	Allowable current (A)
0.3	0.372	1.8	9
0.5	0.563	2	12
0.85	0.885	2.2	16
1.25	1.287	2.5	21
2	2.091	2.9	28

5	5.227	4.4	53
8	7.952	5.5	67
15	13.36	7	75
20	20.61	8.2	97

DIAGNOSIS (4HE1-TC Only)

Strategy-based Diagnostics

Strategy-Based Diagnostics

The strategy-based diagnostic is a uniform approach to repair all Electrical/Electronic (E/E) systems. The diagnostic flow can always be used to resolve an E/E system problem and is a starting point when repairs are necessary. The following steps will instruct the technician how to proceed with a diagnosis:

1. Verify the customer complaint.
   - To verify the customer complaint, the technician should know the normal operation of the system.
2. Perform preliminary checks.
   - Conduct a thorough visual inspection.
   - Review the service history.
   - Detect unusual sounds or odors.
   - Gather diagnostic trouble code information to achieve an effective repair.
3. Check bulletins and other service information.
   - This includes videos, newsletters, etc.
4. Refer to service information (manual) system check (s).
   - “System checks” contain information on a system that may not be supported by one or more DTCs.
     System checks verify proper operation of the system. This will lead the technician in an organized approach to diagnostics.
5. Refer to service diagnostics.

Diagnostic Trouble Code (DTC) Stored

Follow the designated DTC chart exactly to make an effective repair.

No DTC

Select the symptom from the symptom tables.

Follow the diagnostic paths or suggestions to complete the repair. You may refer to the applicable component/ system check in the system checks.

No Matchig Symptom

1. Analyze the complaint.
2. Develop a plan for diagnostics.
3. Utilize the wiring diagrams and the theory of operation.

Call technical assistance for similar cases where repair history may be available. Combine technician knowledge with efficient use of the available service information.

Intermittents

Conditions that are not always present are called intermittents. To resolve intermittents, perform the following steps:

1. Observe history DTCs, DTC modes.
2. Evaluate the symptoms and the conditions described by the customer.
3. Use a check sheet or other method to identify the circuit or electrical system component.
4. Follow the suggestions for intermittent diagnosis found in the service documentation.

Most scan tool, such as the Tech II have data-capturing capabilities that can assist in detecting intermittents.

No Trouble Found

This condition exists when the vehicle is found to operate normally. The condition described by the customer may be normal. Verify the customer complaint against another vehicle that is operating normally. The condition may be intermittent. Verify the complaint under the conditions described by the customer before releasing the vehicle.

1. Re-examine the complaint
   When the Complaint cannot be successfully found or isolated, a re-evaluation is necessary.
   The complaint should be re-verified and could be intermittent as defined in Intermittents, or could be normal.
2. Repair and verify.
   After isolating the cause, the repairs should be made.
   Validate for proper operation and verify that the symptom has been corrected. This may involve road testing or other methods to verify that the complaint has been resolved under the following conditions:
   - Conditions noted by the customer.
   - If a DTC was diagnosed, verify a repair by duplicating conditions present according to customer complaint.

Verifying Vehicle Repair

Verification of the vehicle repair will be more comprehensive for vehicles with OBD system diagnostics. Following a repair, the technician should perform the following steps:

Important:

Follow the steps below when you verify repairs on board diagnostic systems. Failure to follow these steps could result in unnecessary repairs.

1. Review and record the Failure Records for the DTC which has been diagnosed.
2. Clear the DTC (S).
3. Operate the vehicle within conditions according to customer complaint.
4. Monitor the Diagnostic Trouble Code (DTC) status information for the specific DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

General Service Information

On Board Diagnostic (OBD) Serviceability Issues

The list of non-vehicle faults that could affect the performance of the OBD system has been complied. These non-vehicle faults vary from environmental conditions to the quality of fuel used.

The illumination of the Malfunction Indicator Lamp (MIL) ("Check Engine" lamp) due to a non-vehicle fault could lead to misdiagnosis of the vehicle, increased warranty expense and customer dissatisfaction. The following list of non-vehicle faults does not include every possible fault and may not apply equally to all product lines.

Poor Vehicle Maintenance

The sensitivity of OBD diagnostics will cause the MIL to turn on if the vehicle is not maintained properly. Restricted air filters, fuel filters, oil filters, and crankcase deposits due to lack of oil changes or improper oil viscosity can trigger actual vehicle faults that were not previously monitored prior to OBD. Poor vehicle maintenance can not be classified as a "non-vehicle fault", but with the sensitivity of OBD diagnostics, vehicle maintenance schedules must be more closely followed.

Maintenance Schedule

Refer to the maintenance Schedule.

Visual/Physical Engine Compartment Inspection

Perform a careful visual and physical engine compartment inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual/physical inspection:

- Inspection all vacuum hoses for punches, cuts, disconnects, and correct rouring.
- Inspect hoses that are difficult to see behind other components.
- Inspect all wires in a engine compartment for proper connections, burned or chafed spots, pinched wires, contact with sharp edges or contact with hot exhaust manifolds or pipes.

Basic Knowledge of Tools Required

Notice:

Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in an incorrect diagnosis or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge.

A basic understanding of hand tools is necessary to effectively use this section of the Service Manual.

On-Board Diagnostic (OBD)

On-Board Diagnostic Tests

A diagnostic test is a series of steps, the result of which is a pass or fail reported to the diagnostic executive. When a diagnostic test reports a pass result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The diagnostic test has passed during the current ignition cycle.
- The fault identified by the diagnostic test is not currently active.

When a diagnostic test reports a fail result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The fault identified by the diagnostic test is currently active.
- The fault has been active during this ignition cycle.
- The operating conditions at the time of the failure.

Common OBD Terms

Diagnostic

When used as a noun, the word diagnostic refers to any on-board test run by the vehicle's Diagnostic Management System. A diagnostic is simply a test run on a system or component to determine if the system or component is operating according to specification.

Enable Criteria

The term "enable criteria" is engineering language for the conditions necessary for a given diagnostic test to run. Each diagnostic has a specific list of conditions which must be met before the diagnostic will run. "Enable criteria" is another way of saying "conditions required".

Trip

Technically, a trip is a key on-run-key off cycle in which all the enable criteria for a given diagnostic are met, allowing the diagnostic to run. Unfortunately, this concept is not quite that simple. A trip is official when all the enable criteria for a given diagnostic are met. But because the enable criteria vary from one diagnostic to another, the definition of trip varies as well. Some diagnostic are run when the vehicle is at operating temperature, some when the vehicle first start up; some require that the vehicle be cruising at a steady highway speed, some run only when the vehicle is idle.

Some run only immediately following a cold engine start-up.

A trip then, is defined as a key on-run-key off cycle in which the vehicle was operated in such a way as to satisfy the enables criteria for a given diagnostic, and this diagnostic will consider this cycle to be one trip. However, another diagnostic with a different set of enable criteria (which were not met) during this driving event, would not consider it a trip. No trip will occur for that particular diagnostic until the vehicle is driven in such a way as to meet all the enable criteria.

Diagnostic Information
The diagnostic charts and functional checks are designed to locate a faulty circuit or component through a process of logical decisions. The charts are prepared with the requirement that the vehicle functioned correctly at the time of assembly and that there are not multiple faults present.
There is a continuous self-diagnosis on certain control functions. This diagnostic capability is complemented by the diagnostic procedures contained in this manual. The language of communicating the source of the malfunction is a system of diagnostic trouble codes. When a malfunction is detected by the control module, a diagnostic trouble code is set and the Malfunction Indicator Lamp (MIL) is illuminated.
Data Link Connector (DLC)
The provision for communication with the control module is the Data Link Connector (DLC). It is located at near the A post of driver side. The DLC is used to connect to a scan tool. Some common uses of the scan tool are listed below:

- Identifying stored Diagnostic Trouble Codes (DTCs).
- Clearing DTCs.
- Reading serial data.

Decimal/Binary/Hexadecimal Conversions
All scan tool manufacture will display a variety of vehicle information which will aid in repairing the vehicle. Some scan tools will display encoded messages which will aid in determining the nature of the concern. The method of encoding involves the use of a two additional numbering systems: Binary and Hexadecimal.
The binary number system has a base of two numbers. Each digits is either a 0 or a 1. A binary number is an eight digit number and is read from right to left. Each digit has a position number with the farthest right being the 0 position and the farthest left being the 7 position. The 0 position, when displayed by a 1, indicates 1 in decimal. Each position to the left is double the previous position and added to any other position values marked as a 1.
A hexadecimal system is composed of 16 different alpha numeric characters. The alpha numeric characters used are numbers 0 through 9 and letters A through F. The hexadecimal system is the most natural and common approach for scan tool manufactures to display data represented by binary numbers and digital code.
Verifying Vehicle Repair
Verification of vehicle repair will be more comprehensive for vehicle with OBD system diagnostic. Following a repair, the technician should perform the following steps:

1. Review and record the Fail Records for the DTC which has been diagnosed.
2. Clear DTC (s).
3. Operate the vehicle within conditions noted in the Fail Records.
4. Monitor the DTC status information for the specific DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

Following these steps are very important in verifying repairs on OBD systems. Failure to follow these steps could result in unnecessary repairs.
On-Board Diagnostic (OBD) System Check
OBD System should be checked as follows:

1. When Ignition key is turned from the “OFF” to the “ON” position, make sure that MIL is lit for 0.3 — 0.8 sec.
2. Connect Scan Tool and check to see if MIL is always lit.
   If so, OBD System is normal.

Reading Diagnostic Trouble Codes Using a Tech 2 or Other Scan Tool

The procedure for reading diagnostic trouble codes is to be used a diagnostic scan tool. When reading DTCs, follow instructions supplied by tool manufacturer.

Clearing Diagnostic Trouble Codes

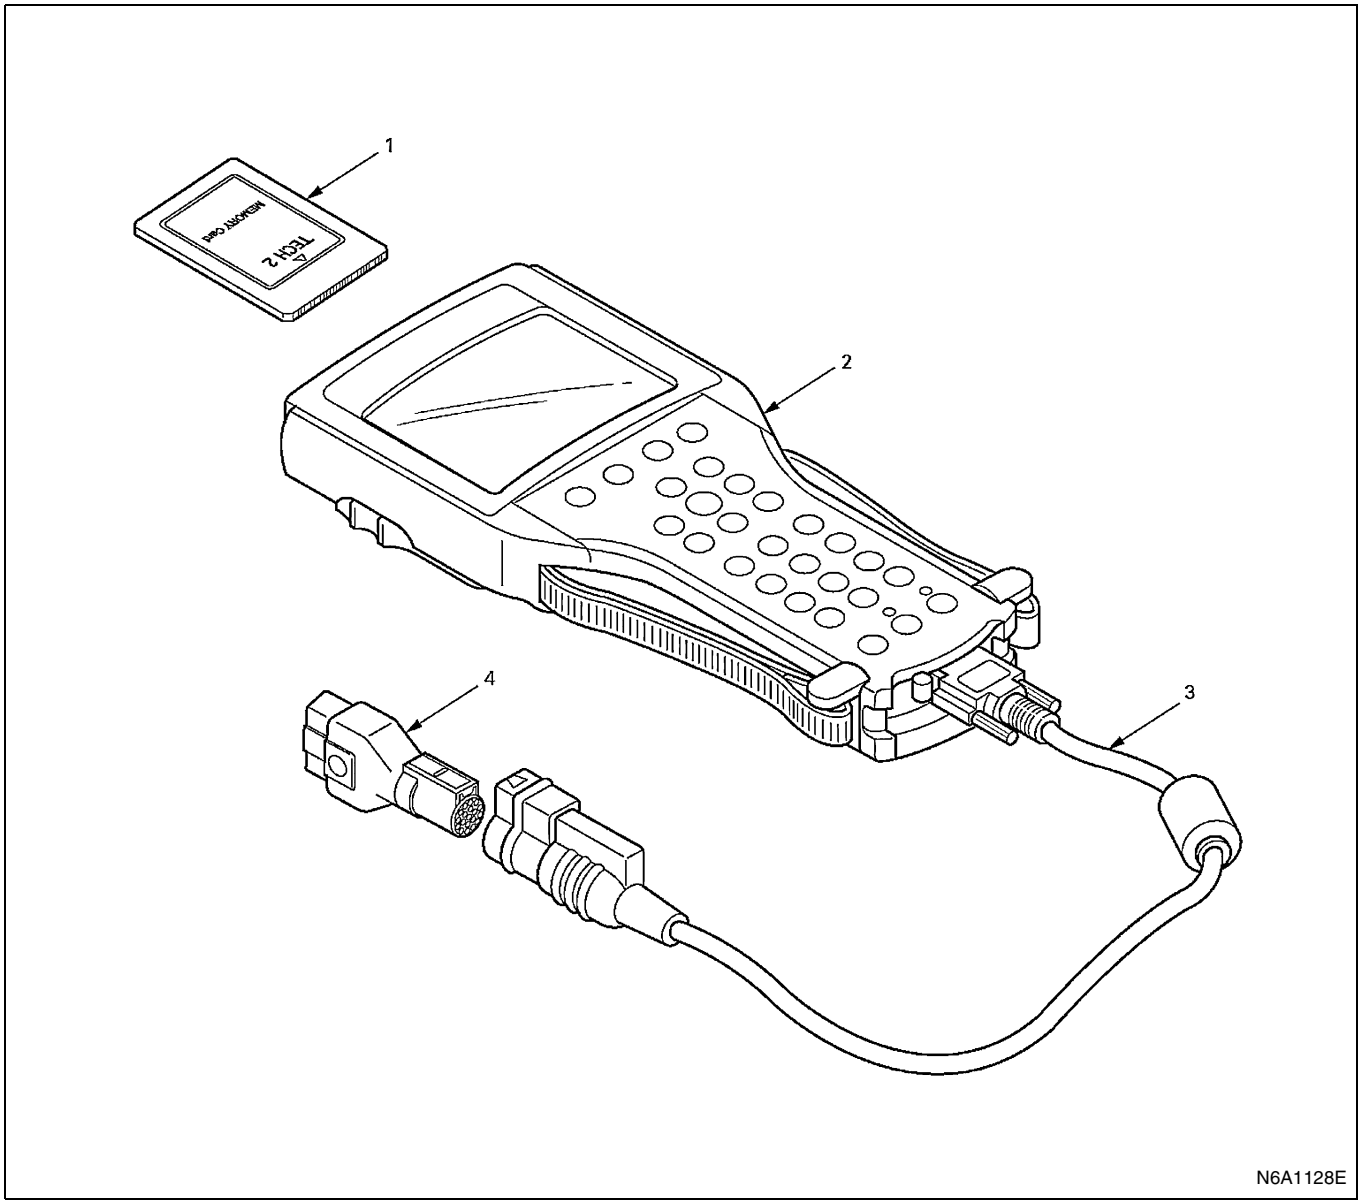
Important:
Do not clear DTCs unless directed to do so by the service information provided for each diagnostic procedure. When DTCs are cleared, the Freeze Frame and Failure Record data which may help diagnose an intermittent fault will also be erased from memory.

If the fault that caused the DTC to be stored into memory has been corrected, the Diagnostic Executive will begin to count the “warm-up” cycles with no further faults detected, the DTC will automatically be cleared from the Engine Control Module (ECM) memory.
To clear Diagnostic Trouble Codes (DTCs), use the diagnostic scan tool “clear DTCs” or “clear Information” function. When clearing DTCs follow instructions supplied by the tool manufacturer.
When a scan tool is not available, DTCs can also be cleared by disconnecting one of the following sources for at least thirty (30) seconds.

Notice:
To prevent system damage, the ignition key must be “OFF” when disconnecting or reconnecting battery power.

- The power source to the control module. Examples: fuse, pigtail at battery ECM connectors etc.
- The negative battery cable. (Disconnecting the negative battery cable will result in the loss of other on-board memory data, such as preset radio tuning).

Tech 2 Scan Tool
From 98 MY, Isuzu Dealer service departments are recommended to use Tech 2. Refer to Tech 2 scan tool user guide.



Legend

1. PCMCIA card
2. SAE 16/19 adapter
3. DLC cable
4. Tech-2

Getting Started

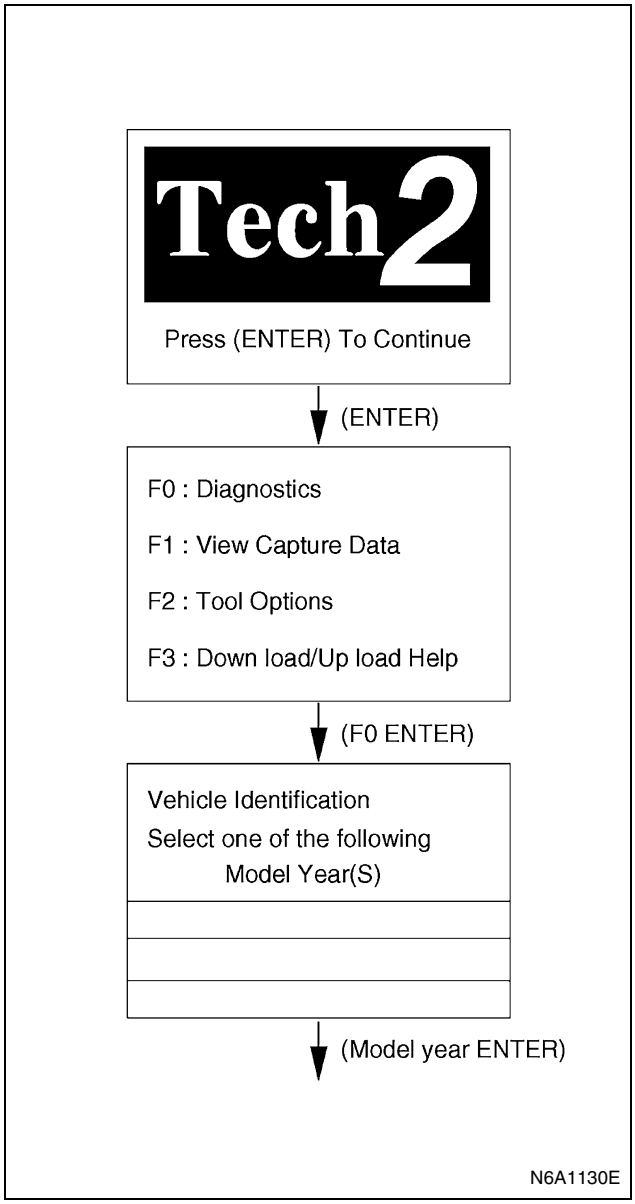
- Before operating the Isuzu PCMCIA card with the Tech 2, the following steps must be performed:

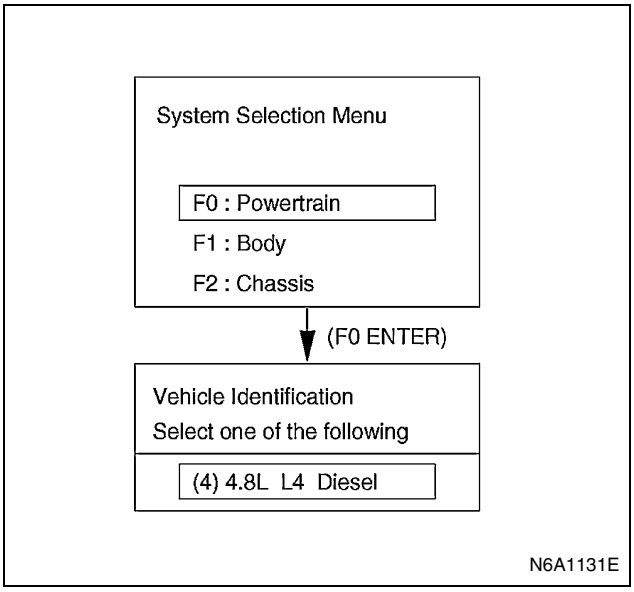
1. The Isuzu 98 System PCMCIA card (1) inserts into the Tech 2 (2).
2. Connect the SAE 16/19 adapter (4) to the DLC cable (3).
3. Connect the DLC cable to the Tech 2 (2).
4. Make sure the vehicle ignition key is off.
5. Connect the Tech 2 SAE 16/19 adapter to the vehicle ALDL/DLC.
6. The vehicle ignition turns on.
7. Verify the Tech 2 power up display.

Notice:
The RS232 Loop back connector is only to use for diagnosis of Tech 2 and refer to user guide of the Tech 2.

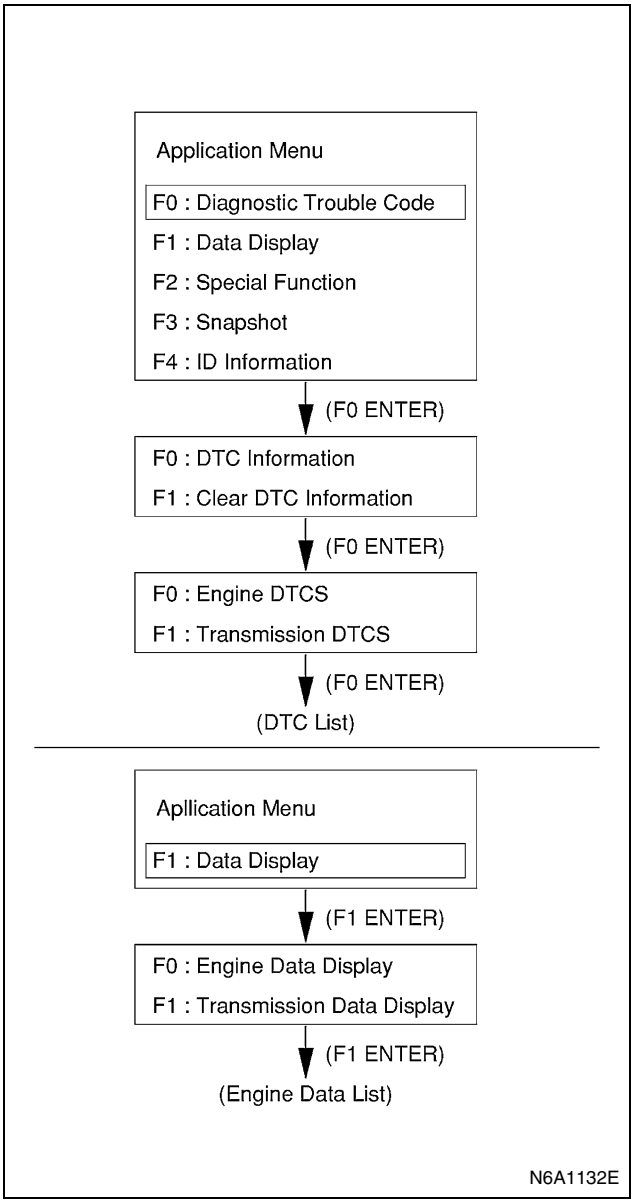
Operating Procedure (For example)

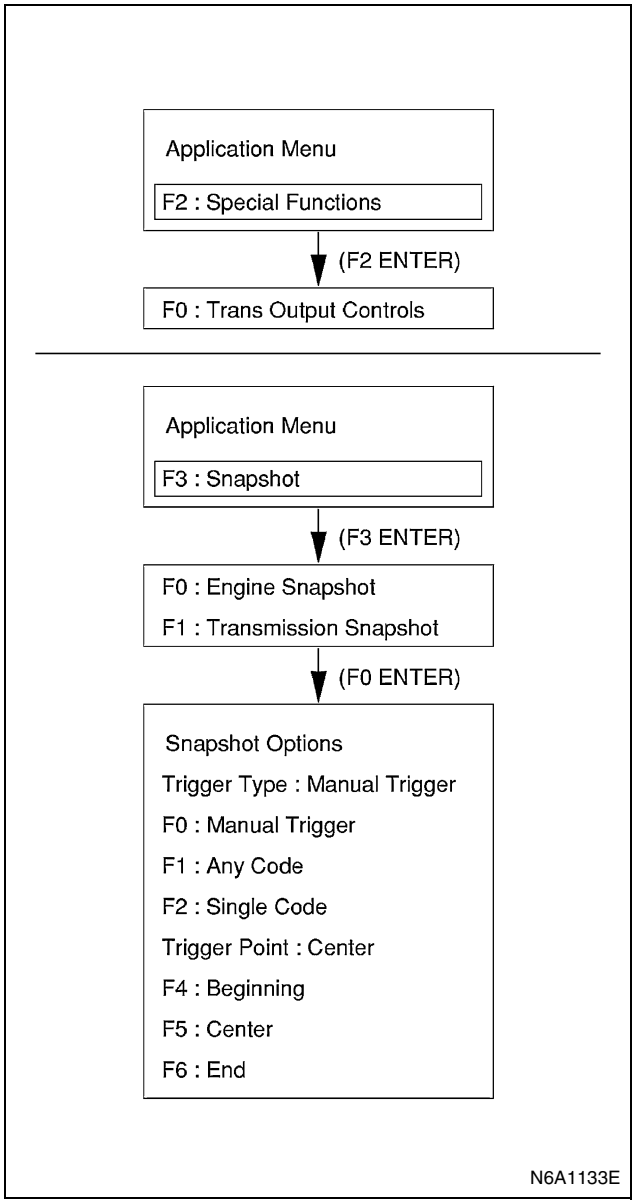
The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure below.

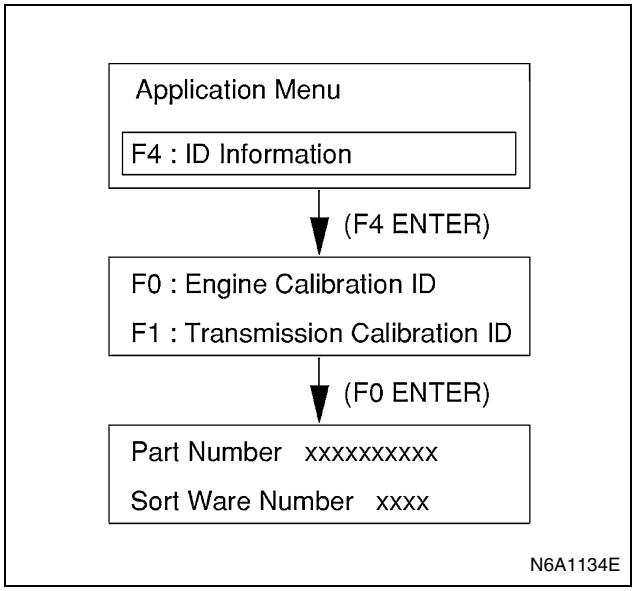




- The following table shows, which functions are used the available equipment versions.







Typical Scan Data Values

Use the Typical Scan Data Values Table only after the On-Board Diagnostic System Check has been completed, no diagnostic trouble codes were noted, and you have determined that the on-board diagnostics are functioning properly. Scan tool values from a properly-running engine may be used for comparison with the engine you are diagnosing. The typical scan data values represent values that would be seen on a normally-running engine.

Notice:
A scan tool that displays faulty data should not be used, and the problem should be reported to the scan tool manufacturer. Use of a faulty scan tool can result in misdiagnosis and unnecessary replacement of parts.

Only the parameters listed below are referred to in this service manual for use in diagnosis. For further information on using the scan tool to diagnose the engine control module and related sensors, refer to the applicable reference section listed below. If all values are within the typical range described below, refer to the symptoms section for diagnosis.

Test Conditions

Engine running, lower radiator hose hot, transmission in park or neutral, closed loop, accessories off, brake not applied and air conditioning off.

Data List (Typical Data)

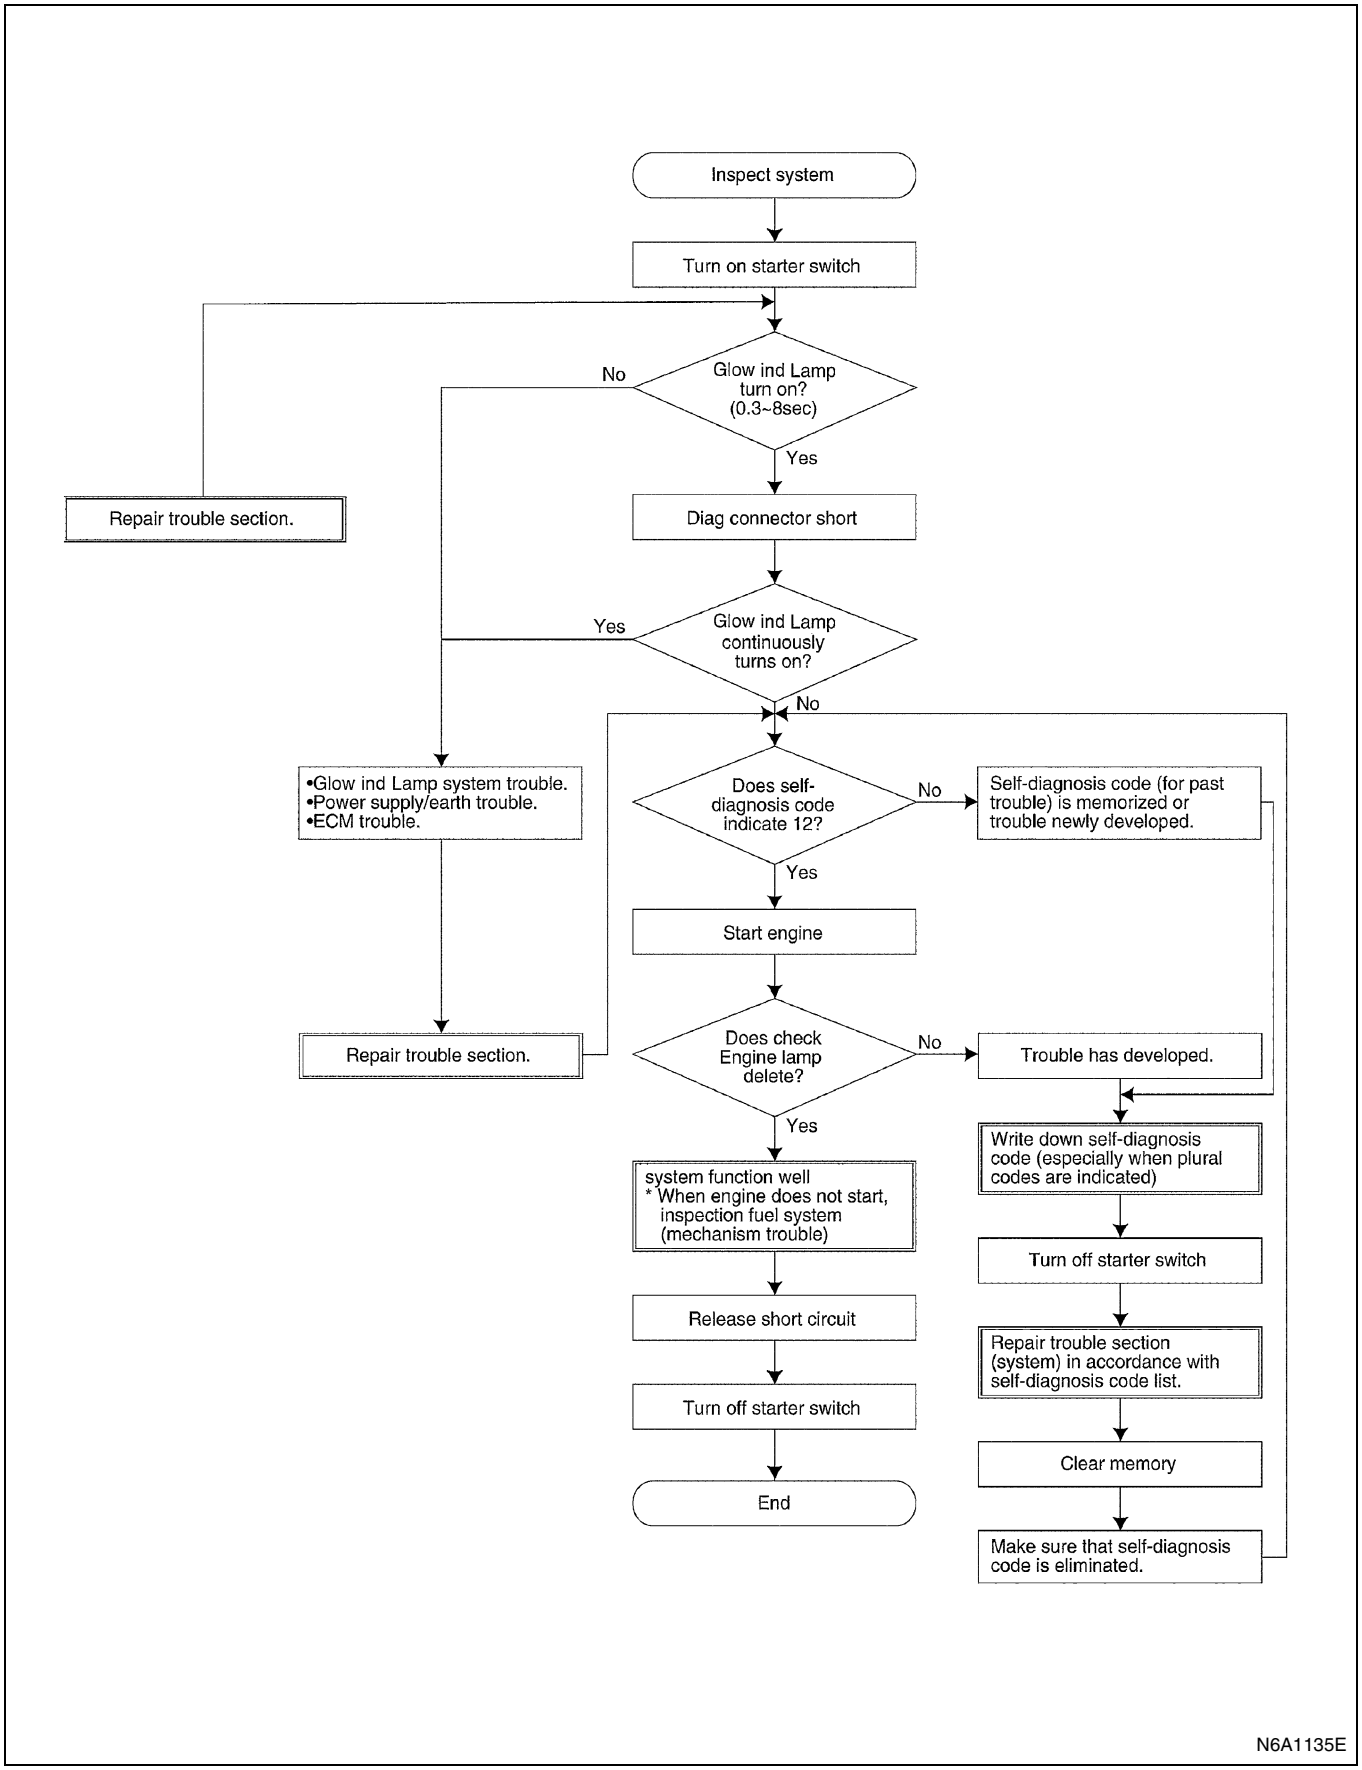
TECH 2 STRING		TYPICAL DATA VALUES (IDLE)
Ignition Switch	(On/Off)	On
Starter Switch	(On/Off)	Off
Exhaust Break Switch	(On/Off)	Off
Transmission Gear Position Switch		N.2.3.4.5.6
Transmission Spec. Select Switch	(AT/MT)	Automatic Trans
Engine Spec. Select Switch	(S/N)	S/N
IAT Switch	(Yes/No and High/Low)	High
EGR/VSS System	(Yes/No)	Yes
Rack Sensor Voltage	(V)	1
Engine Coolant Temperature Sensor Voltage	(V)	1.7 —1.9
Engine Coolant Temperature	°F(°C)	176 (80)
Engine Speed	(rpm)	800
Barometric Voltage	(V)	2.9
Barometric Pressure	(mmHg)	761

Troubleshooting

Caution taken in inspecting

1. In inspecting system, write down self-diagnosis code to be indicated. (especially, when plural self-diagnosis codes are indicated.)
2. Before eliminating the indicated self-diagnosis codes by a memory clear switch, doubly inspect abnormal place as indicated in self-diagnosis code. (Self-diagnosis code means ‘Warning.’ Make sure to inspect abnormal section.)

Inspection Procedure Flowchart



Notice:
Please note that some items of self-diagnosis code may not be generated unless the engine is warmed up or unless the vehicle is driven under load.

Self-diagnosis Functions

Memorization of self-diagnosis code
The self-diagnosis code indicated will be memorized in Electronically Erasable Programmable Read Only Memory (EEPROM) with in the Engine Control Module (ECM). Accordingly even if the starter switch turns off or the ECM is removed from the vehicle, the memorized self-diagnosis code will not be eliminated.
* Unless an elimination procedure is taken, the self-diagnosis code will remain in memory. (The memory will be eliminated only by a memory clear switch.)

Elimination of self-diagnosis code
The self-diagnosis code memorized in the EEPROM with in the ECM can be eliminated only by Scan Tool or the operation of the memory clear switch.
The elimination method memory clear switch will be described below:

1. Turn OFF ignition switch.
2. Use 4.7kΩ resistance and make short circuit on memory clear switch.
3. Turn ON ignition switch. The indication lamp turn on (lighting) continuously after three seconds flashing the indication lamp.
4. Turn OFF ignition switch.
5. Remove shortage resistance from memory clear switch.

How to read flashing of the indicator lamp:
The two-digit self-diagnosis code flashes starting from ten's figure to indicate the self-diagnosis code.
Please read the self-diagnosis code from the flashing.
If the plural self-diagnosis codes are indicated, the same self-diagnosis code is flashed repeatedly in steps of three times.
Please read it correctly.

- Diagnostic Trouble Code (DTC) outputting is done in decreasingly order of DTC number.
- Indication is changed over on completion of output DTC indication.
- DTC indicator is stopped with diagnostic switch being off.
- When there is no DTC output, "1" is outputted in normal DTC code.
- After indicating 3 times pear 1 DTC, shift is conducted to the next DTC. (After making a round, the indications are repeated again.)
- In case of the same diagnostic code, it is used 1 DTC (3 times indication.)

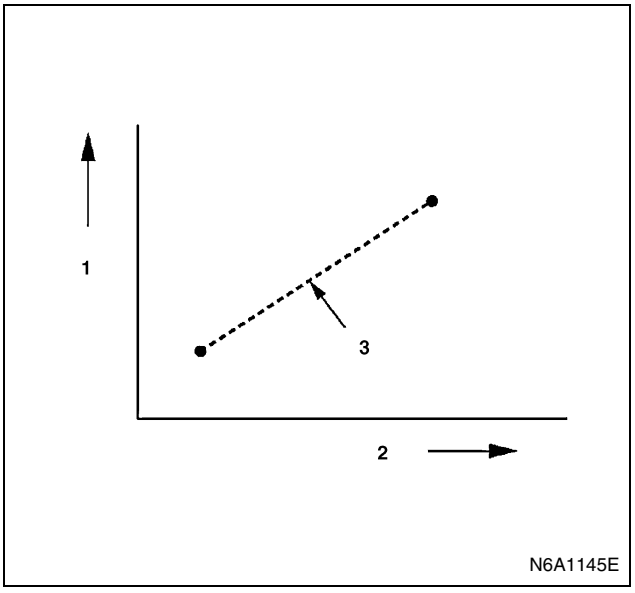
BRIEF EXPLANATION OF EMISSION AND ELECTRICAL CONTROL SYSTEM

MITICS (Mechanically Integrated Timing and Injection Control System)

The Mechanically Integrated Timing and Injection rate Control System (MITICS) utilizes mechanical control, in comparison with TICS systems, which utilize electronic control.
MITICS is equipped with the RLD-M type governor, which contains a pre-stroke control mechanism.
With this, pre-stroke position (i.e., beginning of static injection) can be varied to control injection timing and injection rate (i.e., the fuel injection quantity injected from the nozzle per cam angle degree).
This enables high injection rates1 in the low and medium speed ranges through a short Injection interval, thus contributing to higher engine torque and cleaner exhaust.
MITICS was developed in response to the demands of medium sized diesel engines for low cost, low fuel consumption, high output and cleaner emissions.

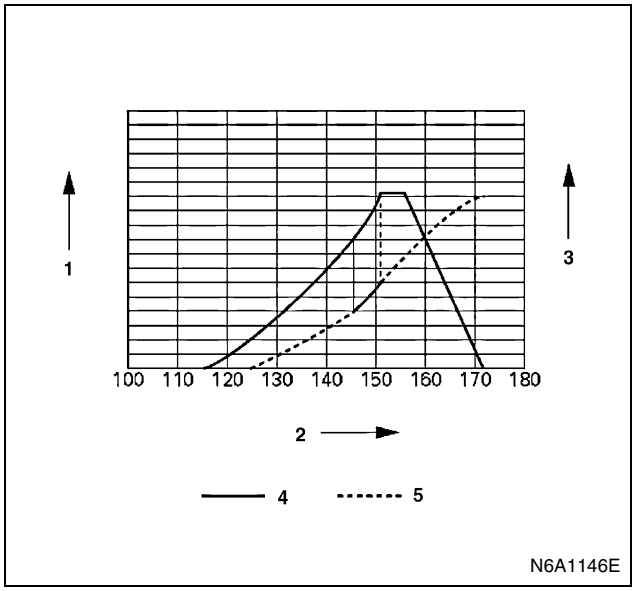
High injection rates using a short injection interval.

- The speed at which the injection pump plunger rises slows as engine speed decreases and the pressure inside the injection pipe decreases.
  Because of this, the nozzle spray deteriorates and makes it impossible to obtain the proper fuel - air mixture.
  To obtain the proper mixture at low and medium speeds, it is necessary to increase the pressure inside the injection pipes using a short injection interval.



Legend
1. Injection pipe pressure
2. Engine speed
3. PE-AD type injection pump

- The left hand figure shows plunger speed and cam lift in relation to cam angle. It can be seen from the graph that plunger speed increases together with cam lift.
  MITICS varies the beginning of injection position at low and medium speeds so that injection occurs when the plunger speed increases during the latter half of cam lift (shown by the bold line).
  At high speeds, injection is performed when the plunger speed decreases during the first half of cam lift to prevent an excessive increase in injection pipe pressure.
  This enables high pressures at low and medium speeds with a fast plunger speed.
  Thus, a fine fuel oil spray is injected into the cylinder from the nozzles within a short time to provide the proper mixture for combustion, helping to increase torque and keep exhaust emissions clean.



Legend
1. Plunger speed (m/sec)
2. Cam angle (degrees)
3. Cam lift (mm)
4. Plunger speed
5. Cam lift

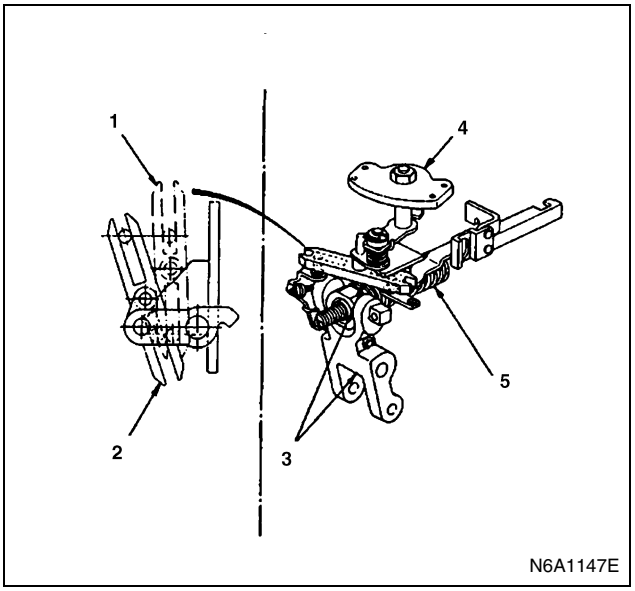
Governor (Model RLD-M)

The RLD-J type governor can be used with the MI, MITICS injection pumps, and was designed to have better control and endurance than the previous RLD type governor.
Although the basic construction is identical to that of the RLD type governor, the RLD-M type is larger to match the applicable pumps' larger size.

Features

Variable speed control governor with decreased lever reaction force

As with the previous RLD type governor, RLD-M governor control is accomplished using the speed control lever to change the fulcrum of the internal link mechanism. Consequently, as the reaction force of the governor spring does not act directly on the speed control lever, only a very small lever reaction force is exerted on the accelerator pedal.

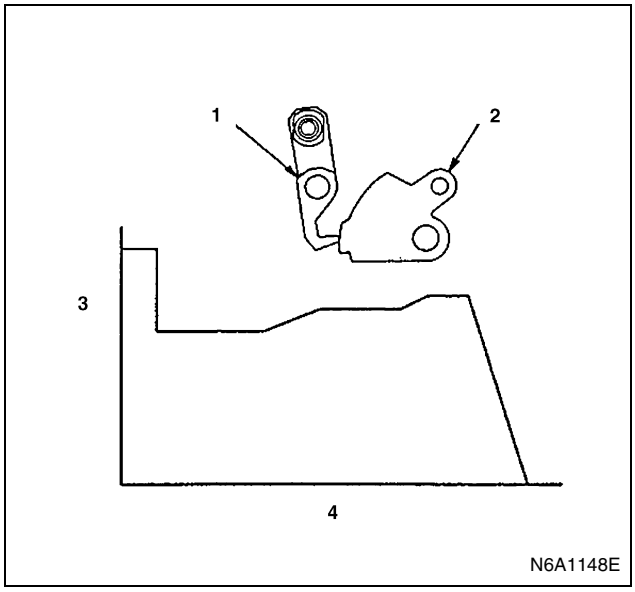


Legend

1. At maximum speed control
2. At idle speed control
3. Link mechanism
4. Speed control lever
5. Governor spring

Set torque characteristics through internal torque cam

At full load, the tip of the sensor lever traces the face of the torque cam to determine the full load rack position and control the full load injection quantity.
Consequently, the torque characteristics demanded by the engine can be freely set by changing the shape of the torque cam face.

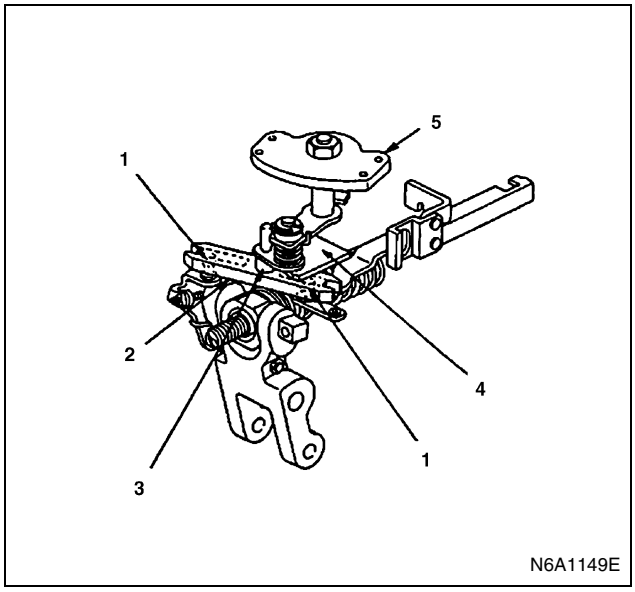


Legend

1. Sensor lever
2. Torque cam
3. Control rack position (mm)
4. Pump speed (r/min)

Improved control through internal guide plate

When the speed control lever is operated, the 2nd supporting lever's pin moves along the guide plate. The floating lever connected to the pin thus moves to change the ball joint fulcrum positions.
In the intermediate to high speed ranges, the guide plate causes the floating lever to move to increase the lever ratio continuously from 1.1 (idling) — 6 (full speed). This increase in the lever ratio in the intermediate to high speed range improves speed droop.



Legend

1. Ball joint
2. Floating lever
3. 2nd supporting lever pin
4. Guide plate
5. Speed control lever

Timing Advance Control

Timing advance control is measuring the ECT to calculate drive current of the solenoid switch for the injection timing advance.

The injection timing is controlled by according to the ECT when engine is started.

Solenoid Switch

The solenoid switch is installed on the top of the injection pump to push the advance lever in the injection pump when 12 or 24 volts is supplied.

In this condition the injection timing is an additional.

10 degree (BTDC) from normal injection timing.

If there is some trouble for electricity current, it will set the DTC-P23 or P24.

Refer to the DTC chart.

If remove the solenoid switch, it can not be reinstalled because it is necessary to readjust advance value on the injection pump tester.

EGR (Exhaust Gas Recirculation) System

EGR Purpose

The exhaust gas recirculation (EGR) system is use to reduce emission levels of the oxides of nitrogen (NOx). The NOx emission levels are caused by a high combustion temperature. The EGR system lowers the NOx emission levels by decreasing the combustion temperature.

EGR Control

The main element of the system is the EGR valve.

The EGR valve feeds small amounts of the exhaust gas back into the intake manifold.

The EGR valve is controlled by the ECM and the ECM uses information from the following sensors to control the EGR valve.

- Engine coolant temperature (ECT) sensor.
- Engine speed sensor.
- Rack sensor
- Exhaust brake switch condition.
- Atmospheric pressure sensor.

EGR Valve Operation and Results of Incorrect Operation

The EGR valve is designed to accurately supply EGR to the engine independent of he intake manifold.

The EGR valve controls EGR flow from the exhaust manifold to the intake manifold through the VSV (Vacu-

um Switching Valve) with a ECM controlled EVRV (Electronic Vacuum Regulating Valve).
The ECM monitors related sensor or switch condition, if EVRV solenoid has incorrect operation, DTC P31 or P32 will be set.
If DTCs P13, P14, P21, P22,P35, P36, P45 or P61 are set, refer to the DTC charts.

Rack Sensor

The rack sensor is engaged with tip of injection pump rack.
The rack sensor signal will send during vehicle operating to the ECM, the ECM calculate together with other sensor's signal, the ECM output activation signal for EVRV.

Atmospheric Pressure Sensor

The atmospheric pressure censor is built-in the ECM.
The EVRV activity will be stopped, when the atmospheric pressure will comes below the setting pressure.

Exhaust Brake Switch

The exhaust brake switch is equipped on the steering column.
The exhaust brake switch is controlled by vehicle operator, when during the vehicle operating the vehicle operator will demand to apply the exhaust brake for assist the main brake system.

EGR Quick Cut Control

During the VSV action, when the EVRV drive current will comes over the setting valve (the drive current will decide relation of the engine load and speed) immediate stop the VSV.
Result of this action will reduce the PM (Particulate Mater).

EVRV Control

The EGR is controlled under normal temperature with separate stage by the ECT of engine condition.
ECM refer to EGR action map to demand the EVRV drive current, also ECM controls agree EVRV drive current and EVRV actual drive current each other.
Otherwise the ECM transitional stage controls for current of EVRV when EGR is controlled moving OFF area to ON area on the EGR action map.
Also stop the EVRV drive for stop the EGR system under following conditions.
When under low temperature of the ECT.
When acting the QWS system.
When acting the exhaust brake
When the atmospheric pressure comes under setting the pressure valve.

VSS (Variable Swirl System)

The Variable Swirl System (VSS) is designed to adjust the intensity of swirl by allowing or not allowing air to flow through a sub-port (or bypass) the runs in parallel with the intake port for each cylinder. The swirl intensifies when there is no air flow through the sub-port, and vice versa.

The air flow is controlled by the on-off valve at the inlet to the sub-port and the valve in turn is turned on and off by computer signals which are dependent on engine speed, load and coolant temperature. Basically, the air is cut off at low speeds to maintain high swirl and is allowed to flow at high speeds to maintain low swirl.

Step	Action	Value	YES	NO
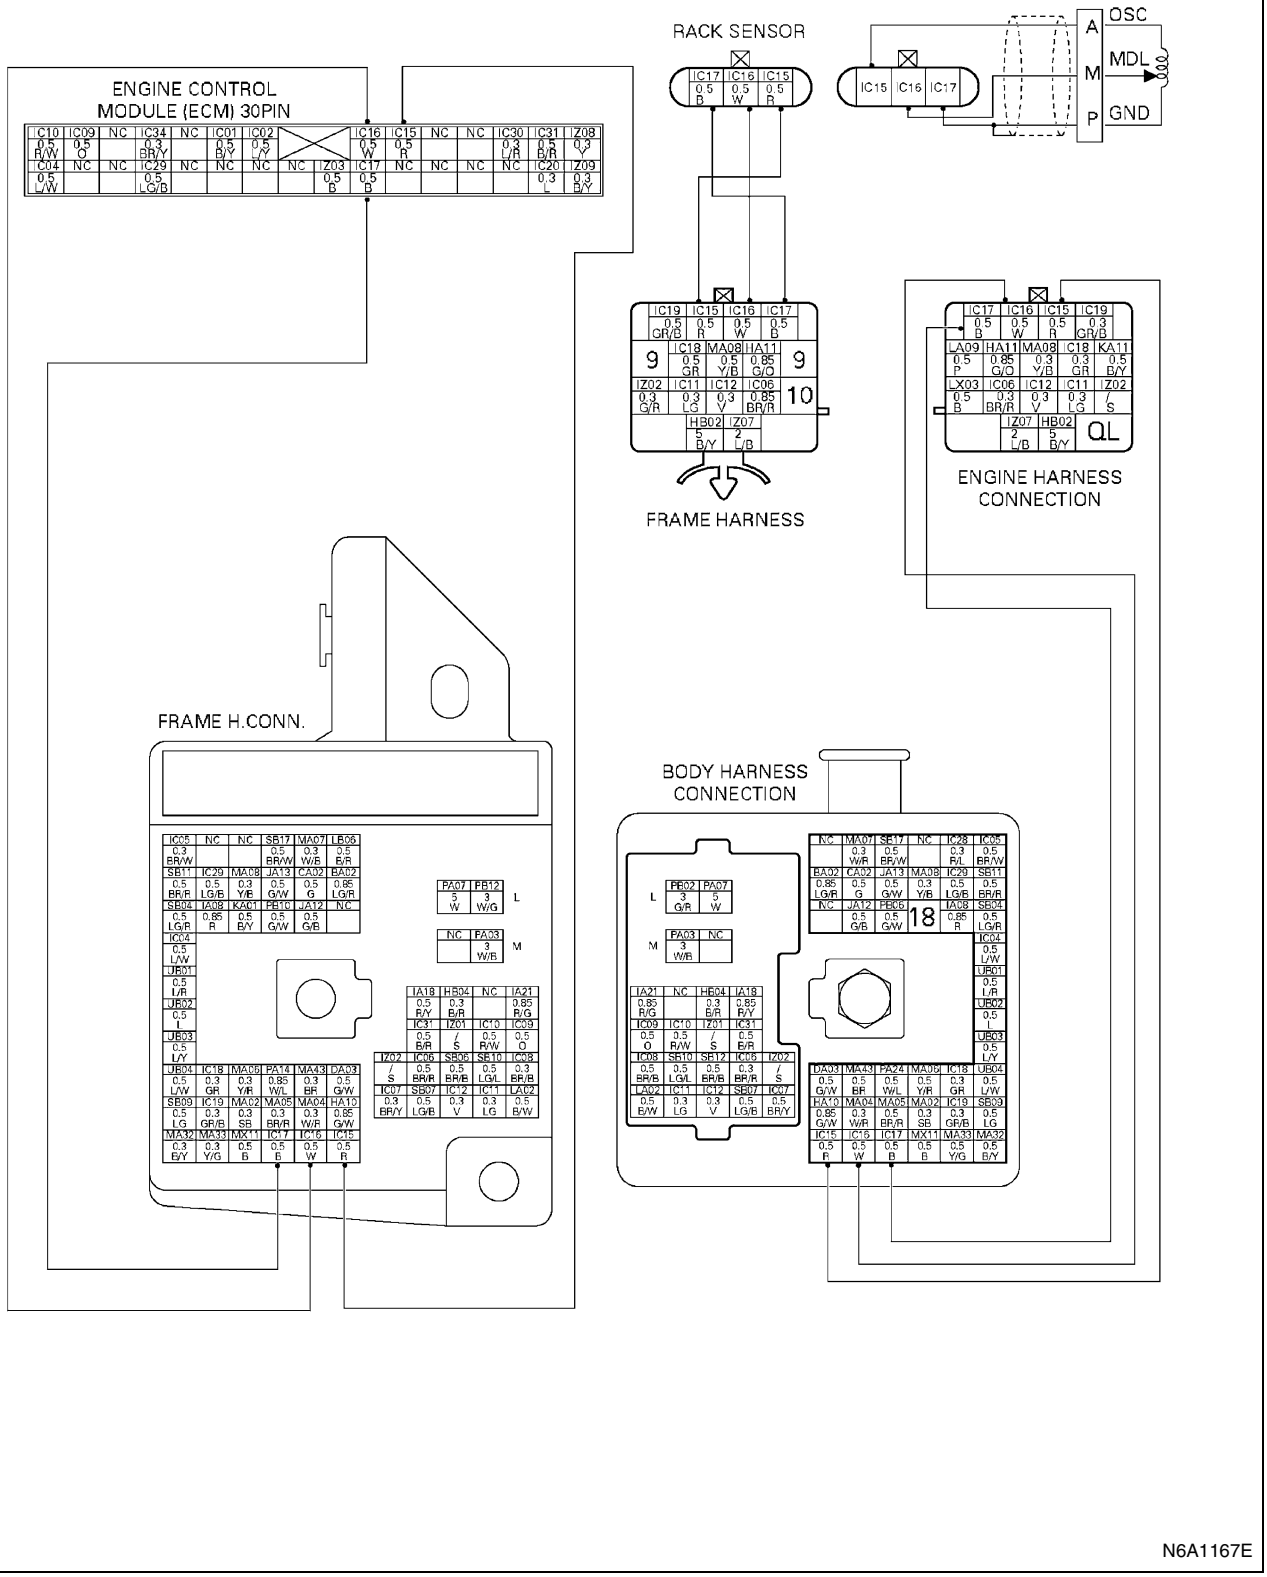
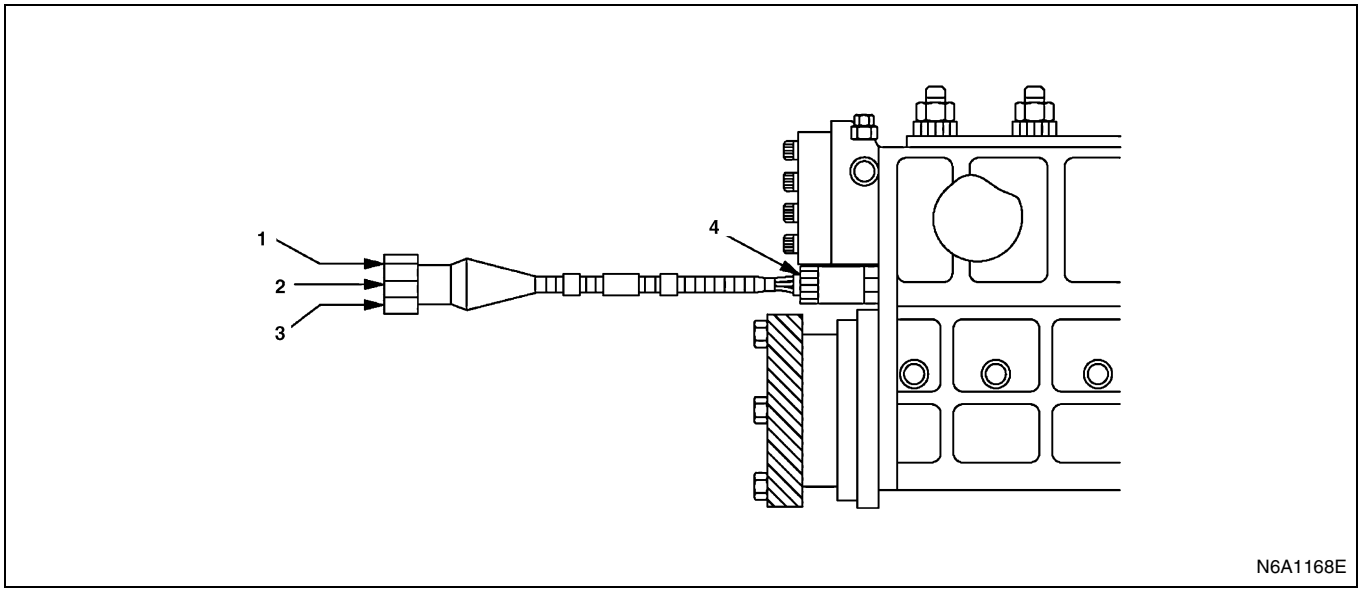
1	Was the on-board diagnostic (OBD) system check performed?	—	Go to Step 2	Go to self diag system check
2	1. Check harness side power source circuit and signal circuit for GND short. 2. Repair if necessary. Has DTC21 been corrected?	—	Go to Step 10	Go to Step 3
3	Disconnect the Sensor Connector. Jumper RACK+ and RACK signal. Free from trouble now? Ignore code 22.	—	Go to Step 4	Go to Step 6
4	1. Apply 5V to RACK+ TERMINAL. Measure RACK SIG Voltage. Is RACK SIG VOLTAGE as specified?	0.9 — 2.0V (Idling speed)	Go to Step 7	Go to Step 5
5	1. Check Rack Sensor Harness Signal Circuit and power source for GND short. Check signal circuit for disconnect. 2. Repair if necessary. Free from trouble now?	—	Go to Step 10	Go to Step 7
6	1. Check harness signal circuit and power source circuit for disconnect. 2. Repair if necessary. Free from trouble now?	—	Go to Step 10	Go to Step 8
7	1. Check the iron core of RACK Sensor for damage, seizure, and wear. 2. After check, repair if necessary. Was there any trouble in the iron core (RACK end) inside RACK Sensor?	—	Go to Step 10	Go to Step 9
8	1. Replace the RACK Sensor. Is the action complete?	—	Go to Step 10	—
9	1. Replace the ECM. Is the action complete?	—	Go to Step 10	—
10	1. Reconnect all the connectors removed. 2. Ignition -ON+, Engine “OFF” Is DTC 21 all right under Scan Tool Check?	—	Go to Step 10	Go to Step 2
11	Is any current trouble other than DTC 21 displayed by scan tool?	—	Go to trouble code section	Trouble code clear

DTC-P22 Rack Sensor Circuit High Voltage



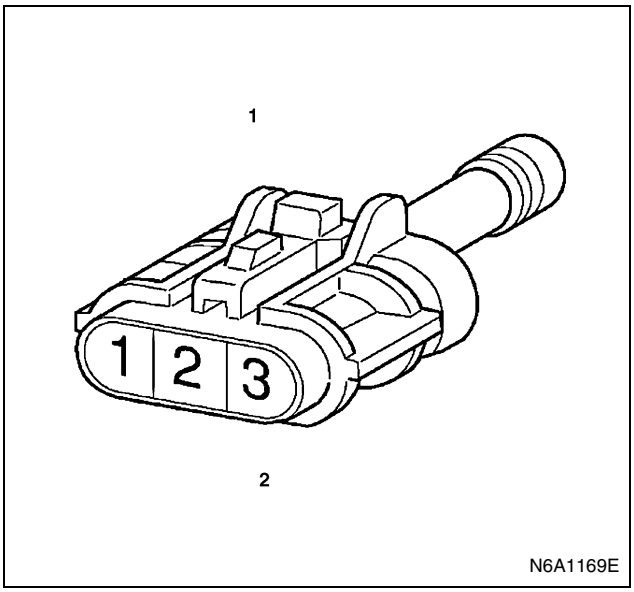
Location of Rack Sensor Connector



Legend

1. OSC (red)
2. MDL (white)
3. GND (black)
4. Rack sensor

Connector Name of Rack Sensor



Legend

1. Rack sensor connector
2. Natural 3 pin

Notice:
Mark "___" on connector which is plugged, therefore, should be confirmed to be played.

Relation Between Connector Number and Signal Name

Connector No	Signal	Wire color
1	Rack sensor (OSC)	R
2	Rack sensor (MDL)	W
3	Rack sensor (GND)	B

Step	Action	Value	YES	NO
1	Was the “on-board diagnostic (OBD) system check” performed?	—	Go to Step 2	Go to self diag system check
2	Remove Sensor Connector. Has DTC22 been corrected? (Ignore DTC21)	—	Go to Step 3	Go to Step 7
3	1. Jump between Harness signal Terminal and GND terminal at the Sensor side of Connector. 2. Ignition “ON” Has DTC22 been corrected?	—	Go to Step 4	Go to Step 5
4	1. Check the Sensor Connector for inter terminal short. After check, repair if necessary. Was Connector Terminal shorted?	—	Go to Step 12	Go to Step 6
5	1. Check GND Circuit for disconnect. After check, repair if necessary. Is GND circuit disconnect?	—	Go to Step 12	Go to Step 11
6	1. Check Sensor Harness signal circuit and power source circuit for short. After check, repair if necessary. Was Harness shorted?	—	Go to Step 12	Go to Step 8
7	1. Check Harness signal circuit and power source for short. After check, repair if necessary. Was Harness shorted?	—	Go to Step 12	Go to Step 11
8	1. Apply 5V to RACK+ TERMINAL. 2. Measure RACK SIG Voltage. Is RACK SIG VOLTAGE as specified?	0.9 — 2.0V (Idling speed)	Go to Step 9	Go to Step 10
9	1. Check the iron core of RACK Sensor for damage, seizure, and wear. 2. After check, repair if necessary. Was there any trouble in the iron core(RACK end) inside RACK Sensor?	—	Go to Step 12	Go to Step 11
10	Replace the RACK Sensor. Is the action complete?	—	Go to Step 12	—
11	Replace the ECM. Is the action complete?	—	Go to Step 12	—
12	1. Reconnect all the connectors removed. 2. Ignition “ON”, Engine “OFF” Is DTC22 all right under Scan Tool Check?	—	Go to Step 13	Go to Step 2
13	Is any current trouble other than DTC 22 displayed by scan tool?	—	Go to trouble code section	Trouble code clear

Resistance value

Inspection Point		Resistance	Reference
Inspection relay unit	2 ⟷ 4	240 to 290 (Ω) (for 12 volt) 256 to 276 (Ω) (for 24 volt)	
	1 ⟷ 5	∞	Not be supplied electricity
		Below 0.5 (Ω)	Be supplied electricity
	3 ⟷ 5	Below 0.5 (Ω)	Be supplied electricity
		∞	Not be supplied electricity

Step	Action	Value	YES	NO
1	Was the “on-board diagnostic (OBD) system check” performed?	—	Go to Step 2	Go to self diag system check
2	1. Ignition “OFF”, Engine “ON”. 2. Jumper the magnetic switch Relay ground circuit at the Relay connector to chassis ground. 3. Observe the “Relay; solenoid switch” circuit open status on the scan tool. Has DTC23 been corrected?	—	Go to Step 4	Go to Step 3
3	1. Check for poor connector at the Relay connector and replace the terminals if necessary. Did any terminals require replacement?	—	Go to Step 11	Go to Step 5
4	1. Check the Relay ground circuit for an open. 2. If the Relay ground circuit is open, repair it as necessary. Was the Relay ground circuit open?	—	Go to Step 11	Go to Step 2

Step	Action	Value	YES	NO
5	1. Ignition “OFF”, with scan tool disconnected. 2. Disconnect the Solenoid switch Relay connector. 3. Apply a circuit tester with voltage range or a test light to the output line for the Relay. 4. Ignition “ON”, Measure the voltage or check the test light “ON”. Ignition “OFF”	≥8V or light “ON” (for 12 Volt) ≥16V or light “ON” (for 24 Volt)	Go to Step 8	Go to Step 6
6	1. Ignition “ON”. 2. Disconnect ECM, and check for the Relay signal circuit terminal connector at the ECM and clean or replace terminal if necessary. Did any terminals need to be repaired?	—	Go to Step 11	Go to Step 7
7	1. Check the Relay signal circuit for an open. 2. If the Relay signal circuit is open, repair it as necessary. Was the Relay signal circuit open?	—	Go to Step 11	Go to Step 8
8	1. Disconnect the Relay. 2. Measure the resistance between the coil circuit terminals of the Relay. Is the resistance within specific value?	240 — 290Ω (for 12 Volt) 256 — 276Ω (for 24 Volt)	Go to Step 10	Go to Step 9
9	1. Replace the Relay. Is the action complete?	—	Go to Step 11	—
10	1. Replace the ECM Is the action complete?	—	Go to Step 11	—
11	1. Reconnect all the connectors removed. 2. Ignition “ON”, Engine “OFF”. 3. Ignition “OFF” after 30 seconds. 4. Install Scan tool. Is DTC 23 all right under Scan Tool Check?	—	Go to Step 12	Go to Step 2
12	Is any current trouble other than DTC 23 displayed by scan tool?	—	Go to trouble code section	Trouble code clear

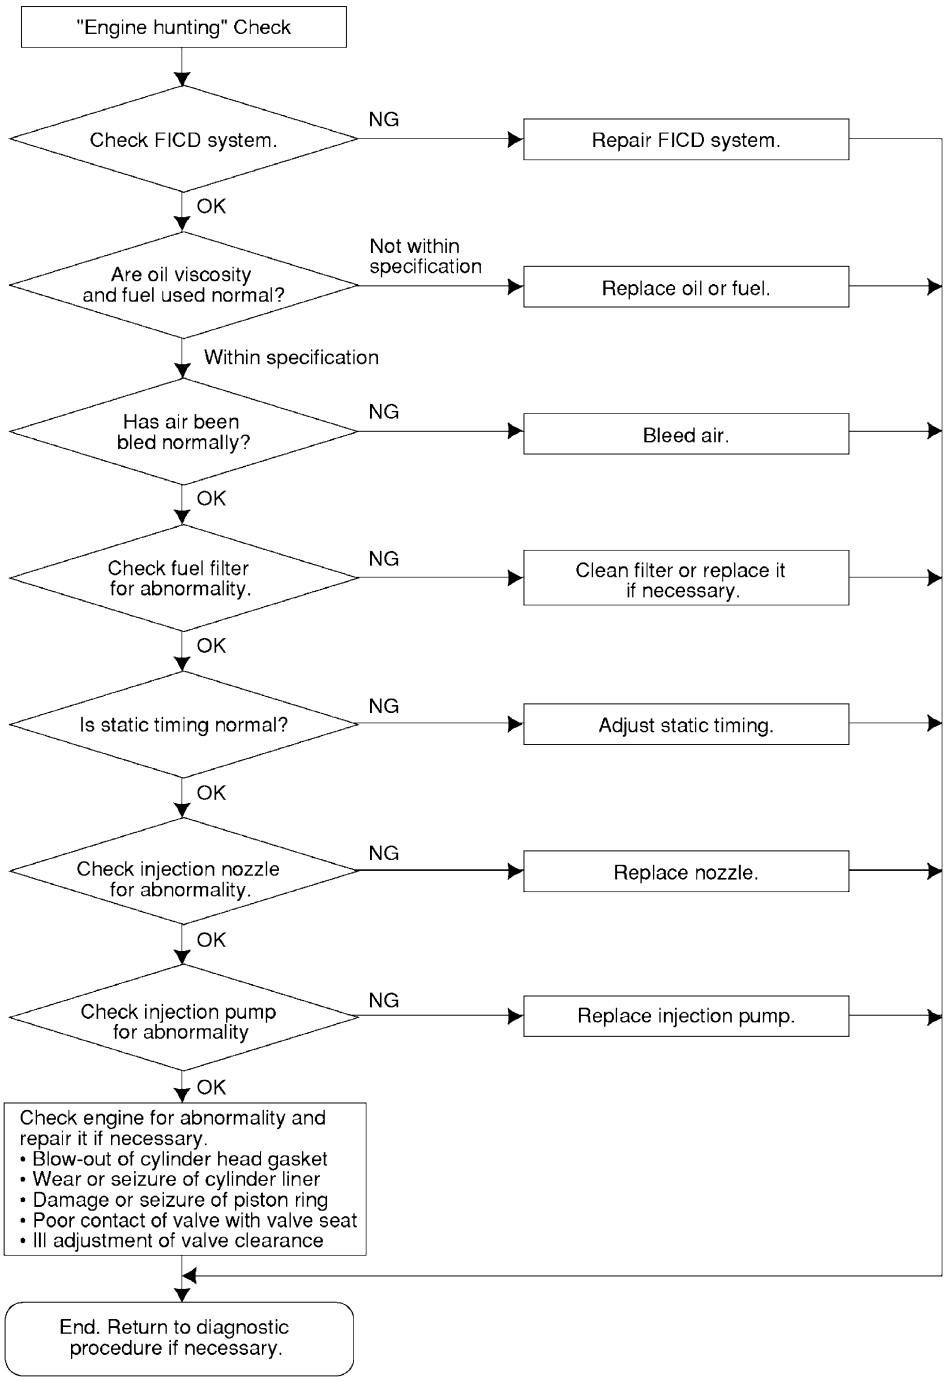
WITHOUT DIAGNOSIS TROUBLE CODE

Introduction

If there occurs a malfunction although no Diagnostic Trouble Code (DTC) is generated, then inspect and repair the system in accordance with the flowcharts given on the following pages.

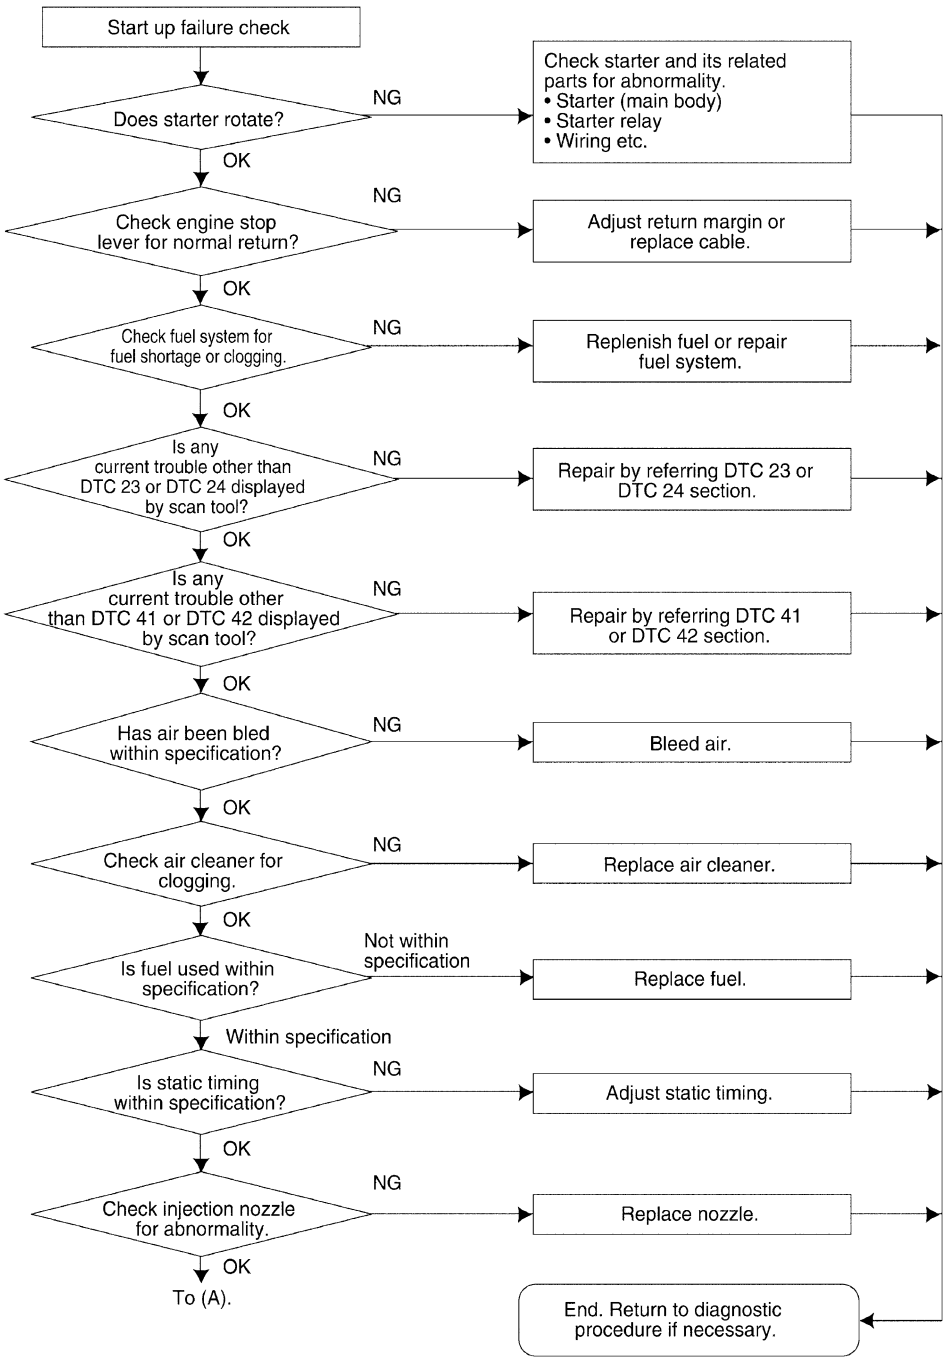
When a Diagnostic Trouble Code (DTC) is produced, inspect and repair system with reference to “EMISSION AND ELECTRICAL DIAGNOSIS”.

Engine Hunting

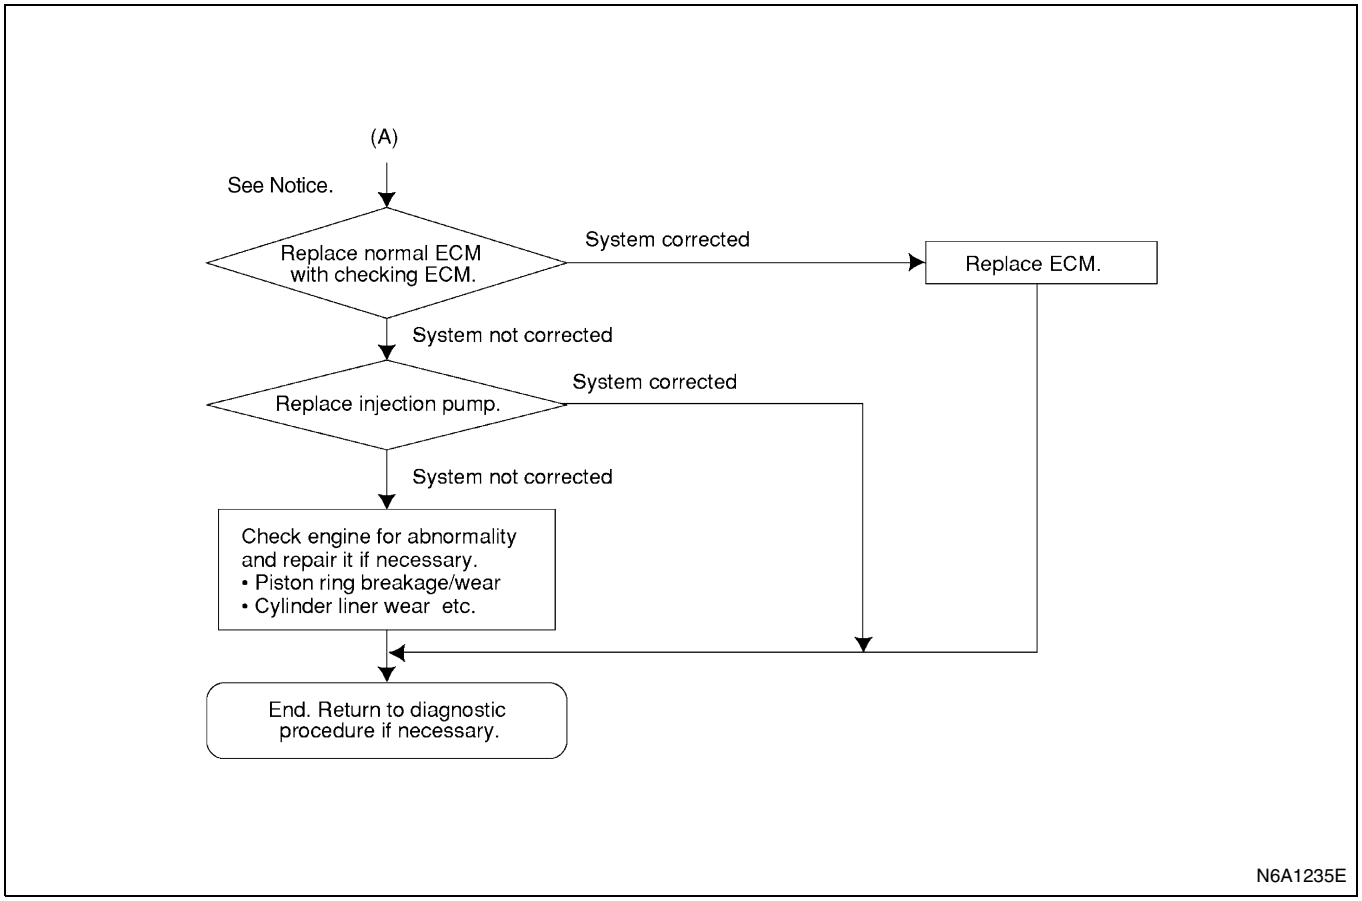


N6A1233E

Startup Failure

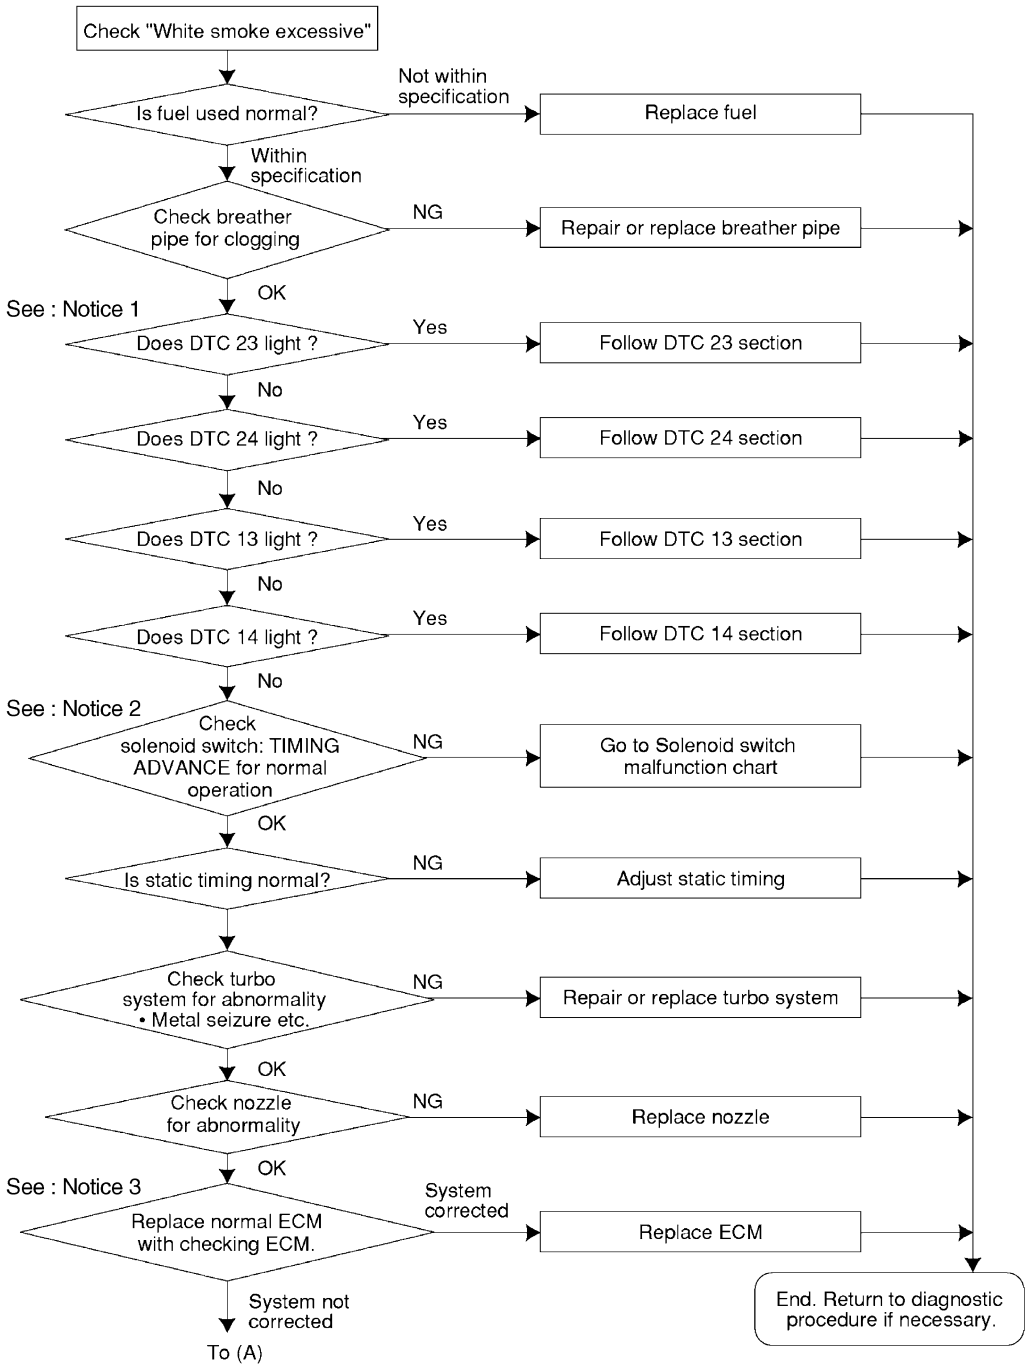


N6A1234E

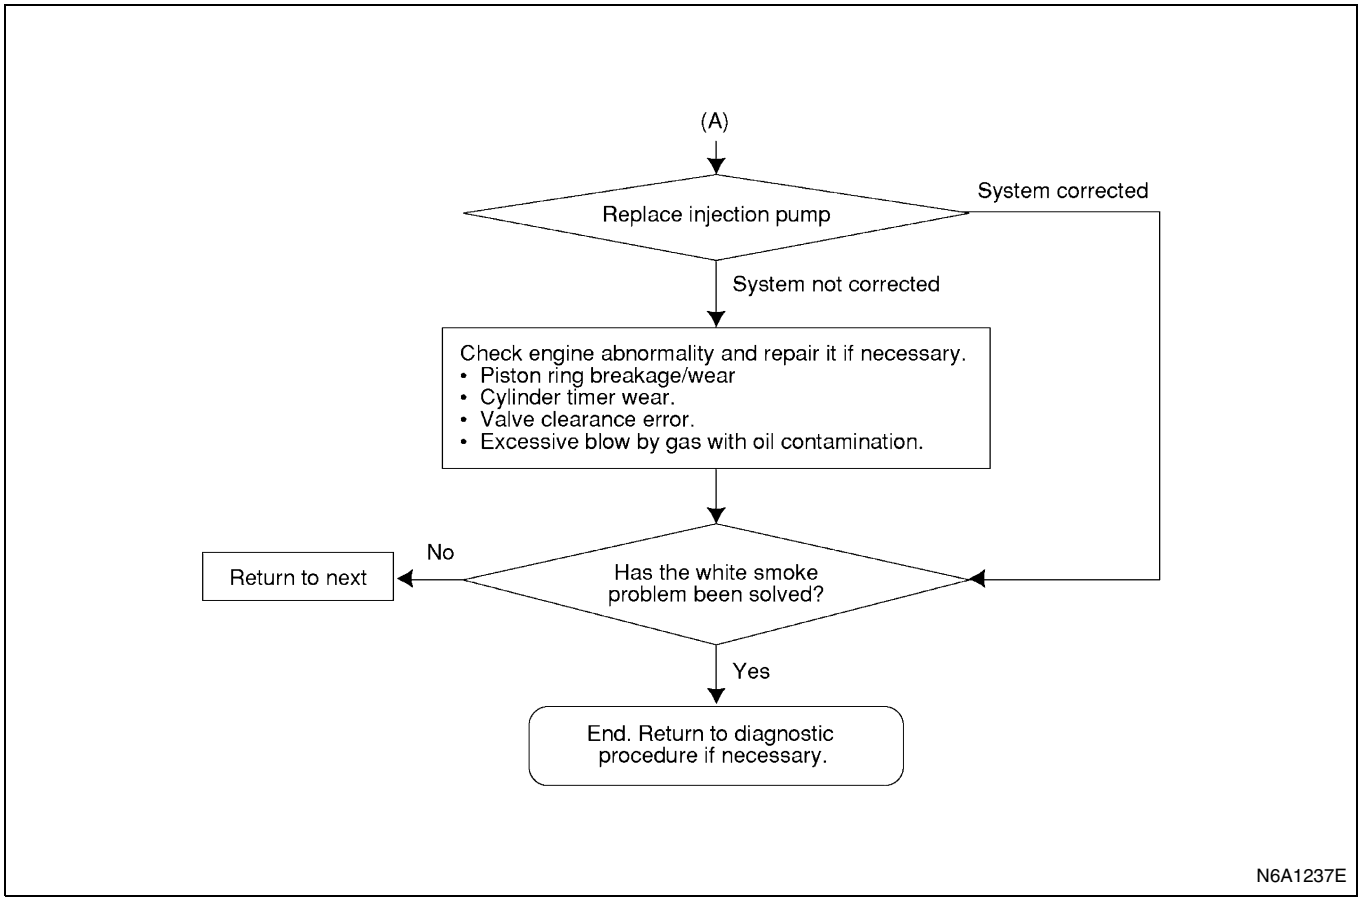


Notice:
The condition of the system in which the malfunction has occurred should be checked by making comparisons between the vehicle Engine Control Module (ECM) and the checking ECM.

White Smoke (Excessive)



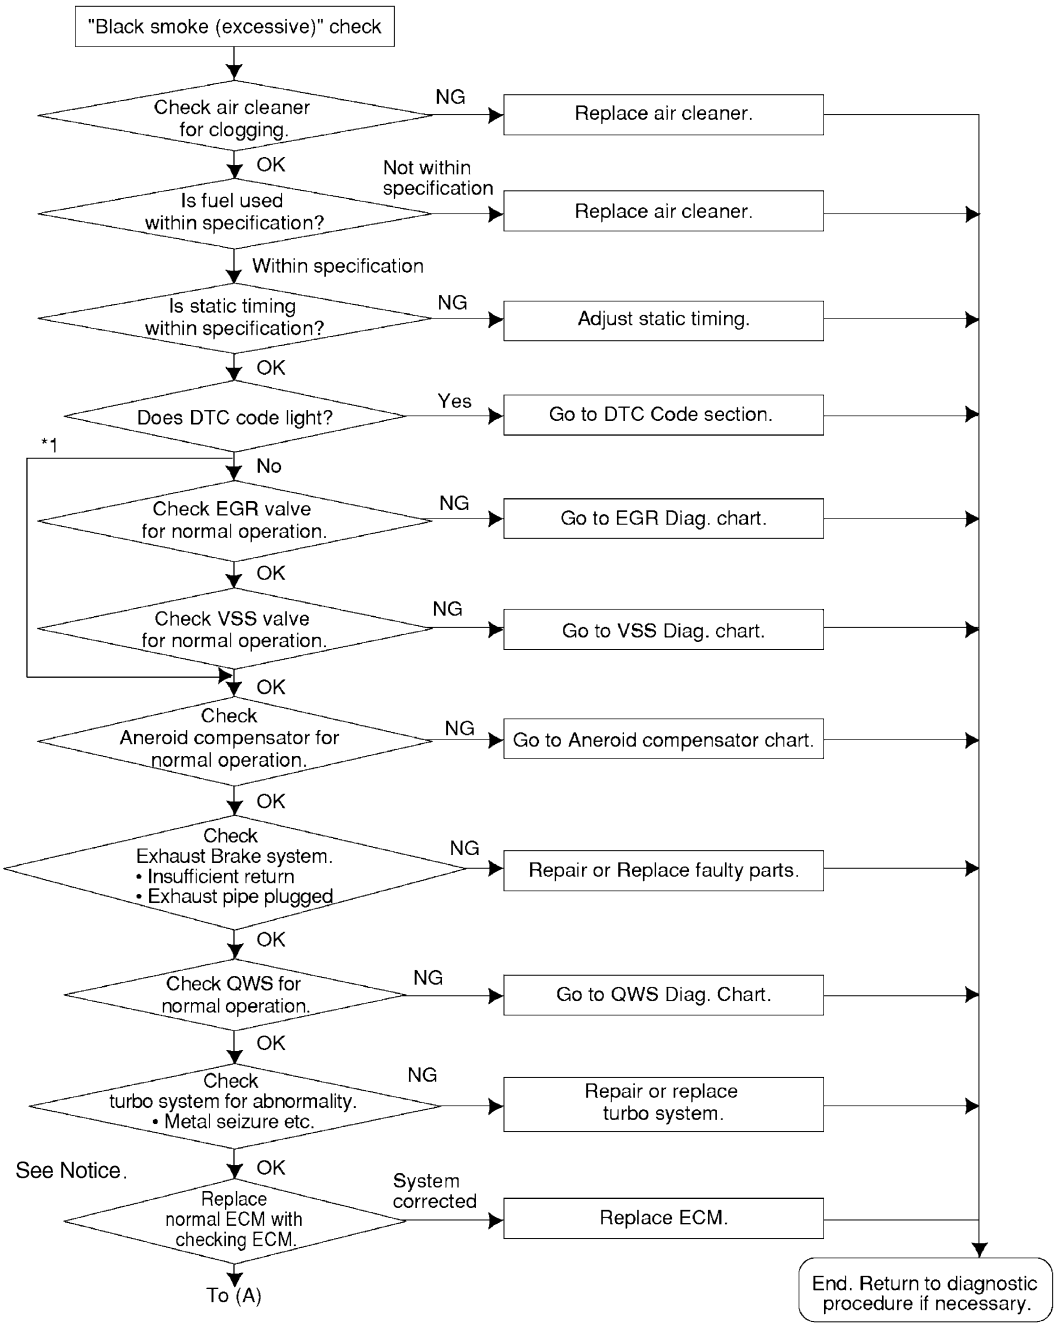
N6A1236E



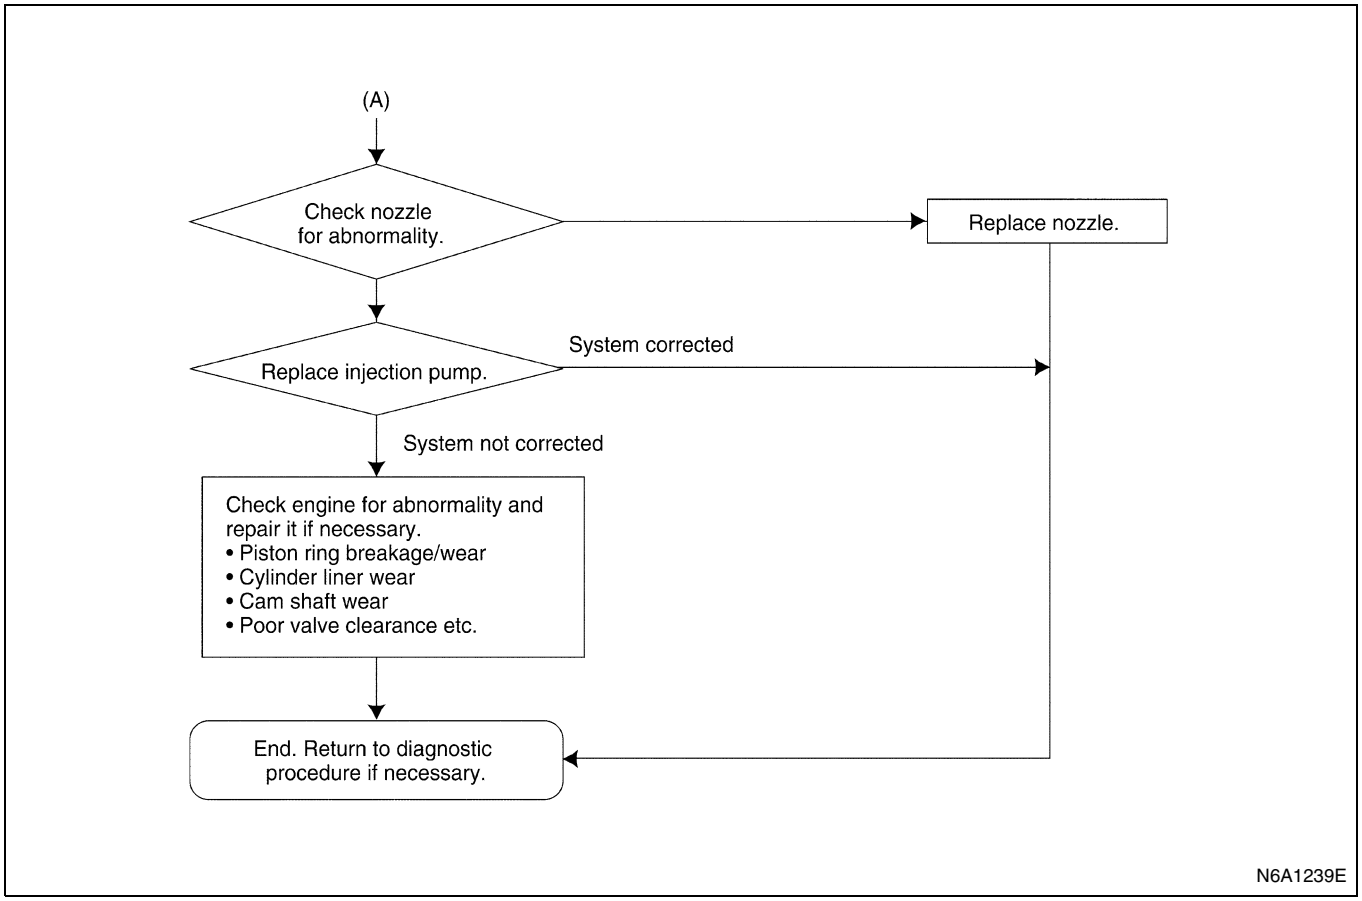
Notice:

1. “Follow (DTC-13, 14, 23, 24)” means to refer “Workshop Manual EMISSION AND ELECTRICAL DIAGNOSIS 4HE1 6E Section of Diagnosis Trouble Code (DTC-13, 14, 23, 24)” for other DTC code, follow concerned DTC sections.
2. Turn the ignition key from the “OFF” position to the “ON” position to put on the solenoid switch attached to the injection pump. After the solenoid switch being on for 18 consecutive seconds, check from the outside of the vehicle if the release sound of the solenoid switch is heard.
3. The condition of the system in which the malfunction has occurred should be checked by making comparisons between the vehicle Engine Control Module (ECM) and the checking ECM.

Black Smoke (Excessive)



N6A1238E

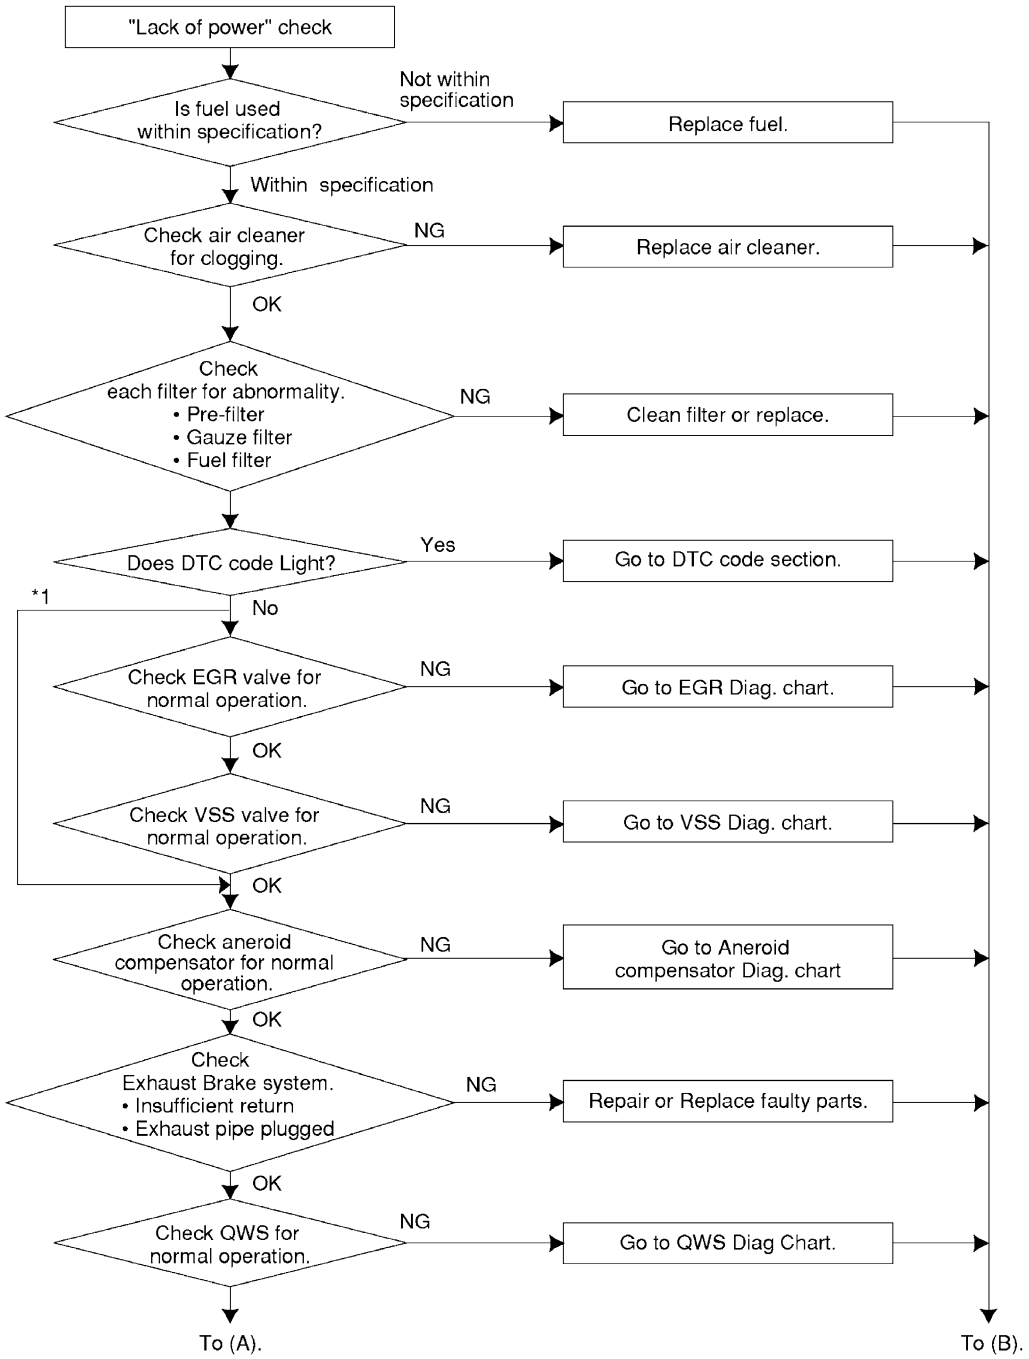


Notice:
The condition of the system in which the malfunction has occurred should be checked by making comparisons between the vehicle Engine Control Module (ECM) and the checking ECM.

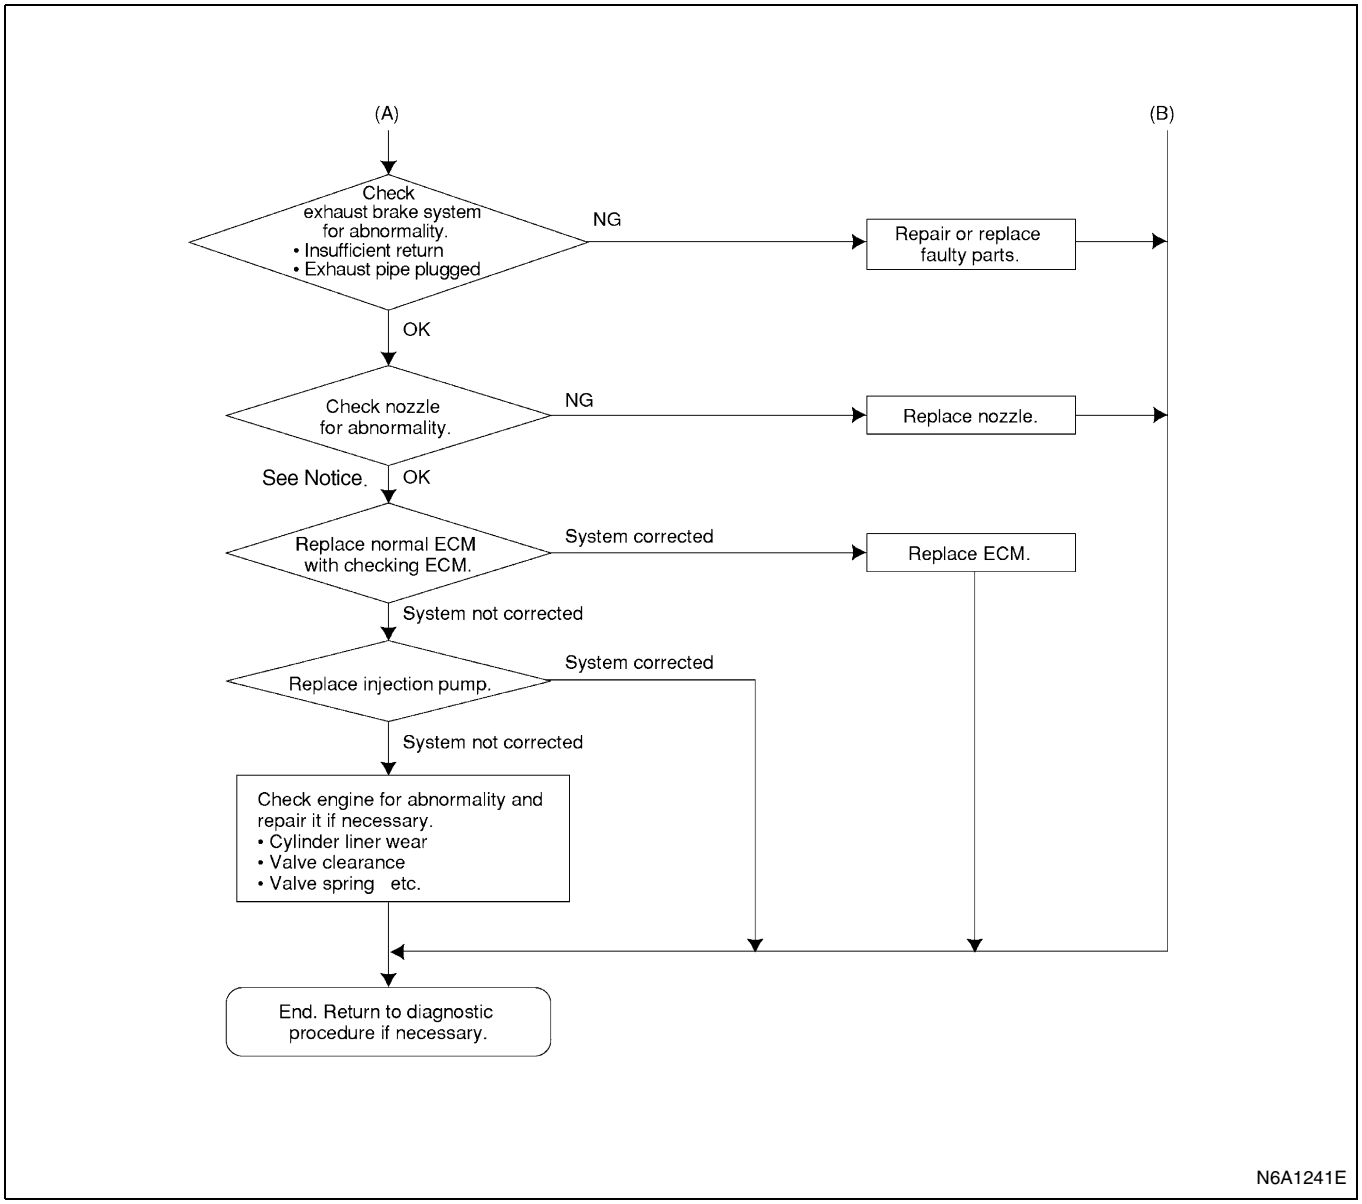
Refer to a trouble code for a supplier's check, if available.

*1. Equipped without Exhaust Gas Recirculation (EGR) and Variable Swirl System (VSS).

Lack of Power



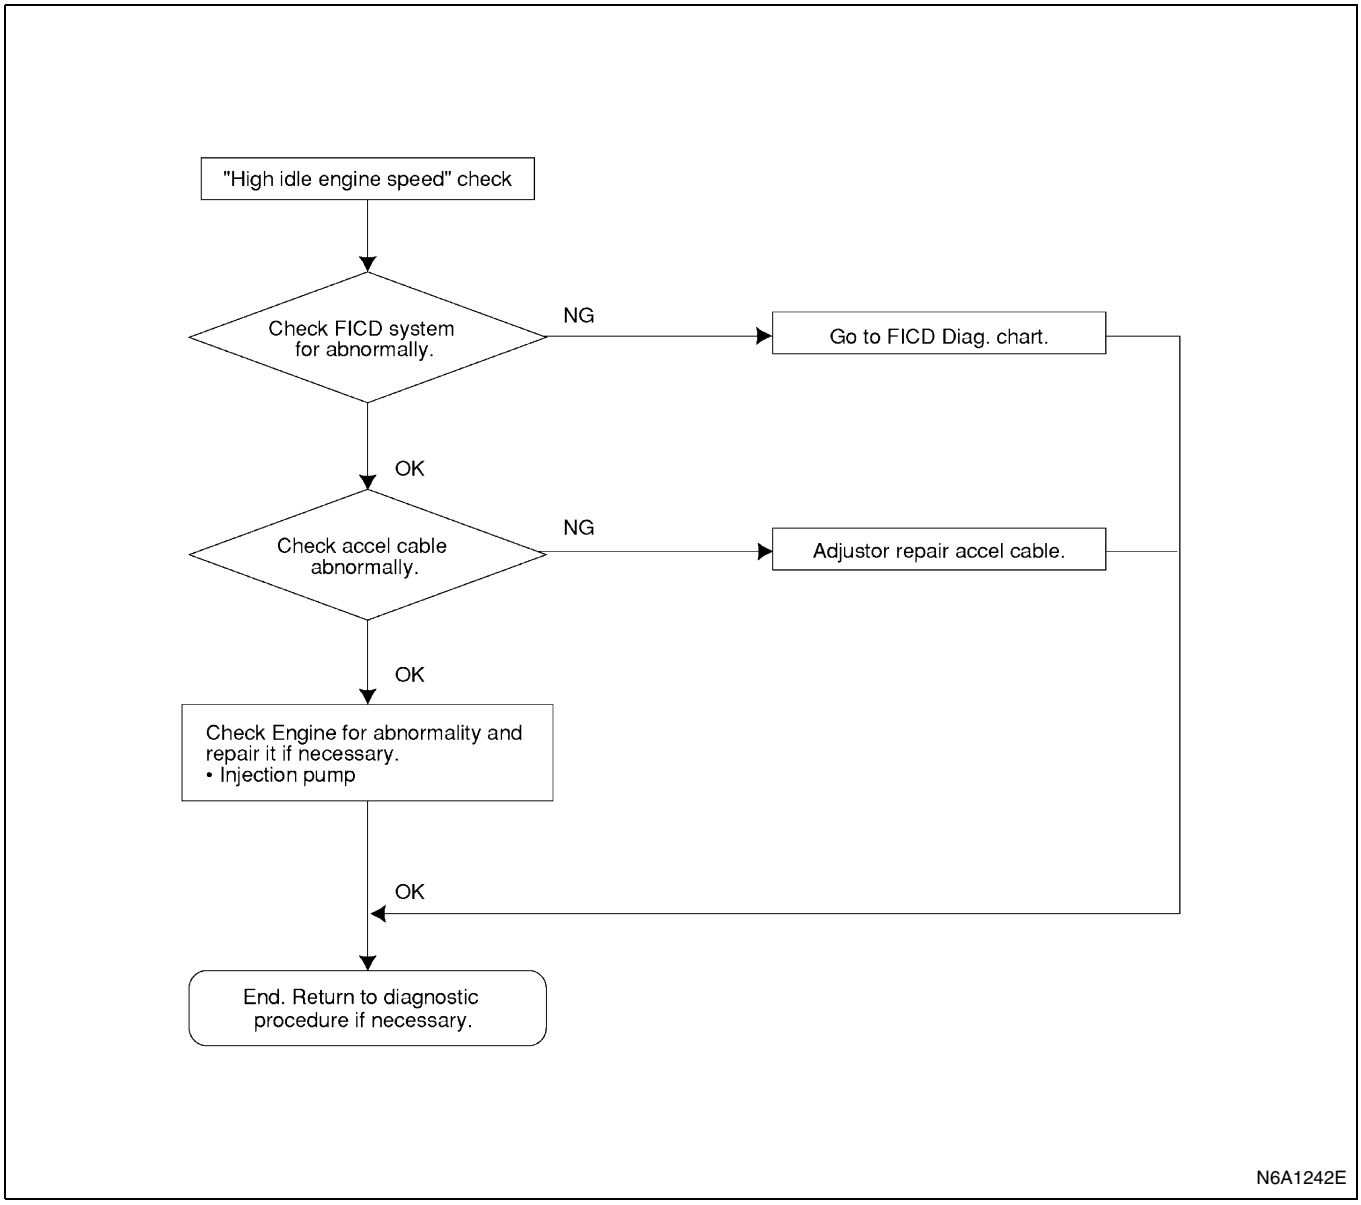
N6A1240E



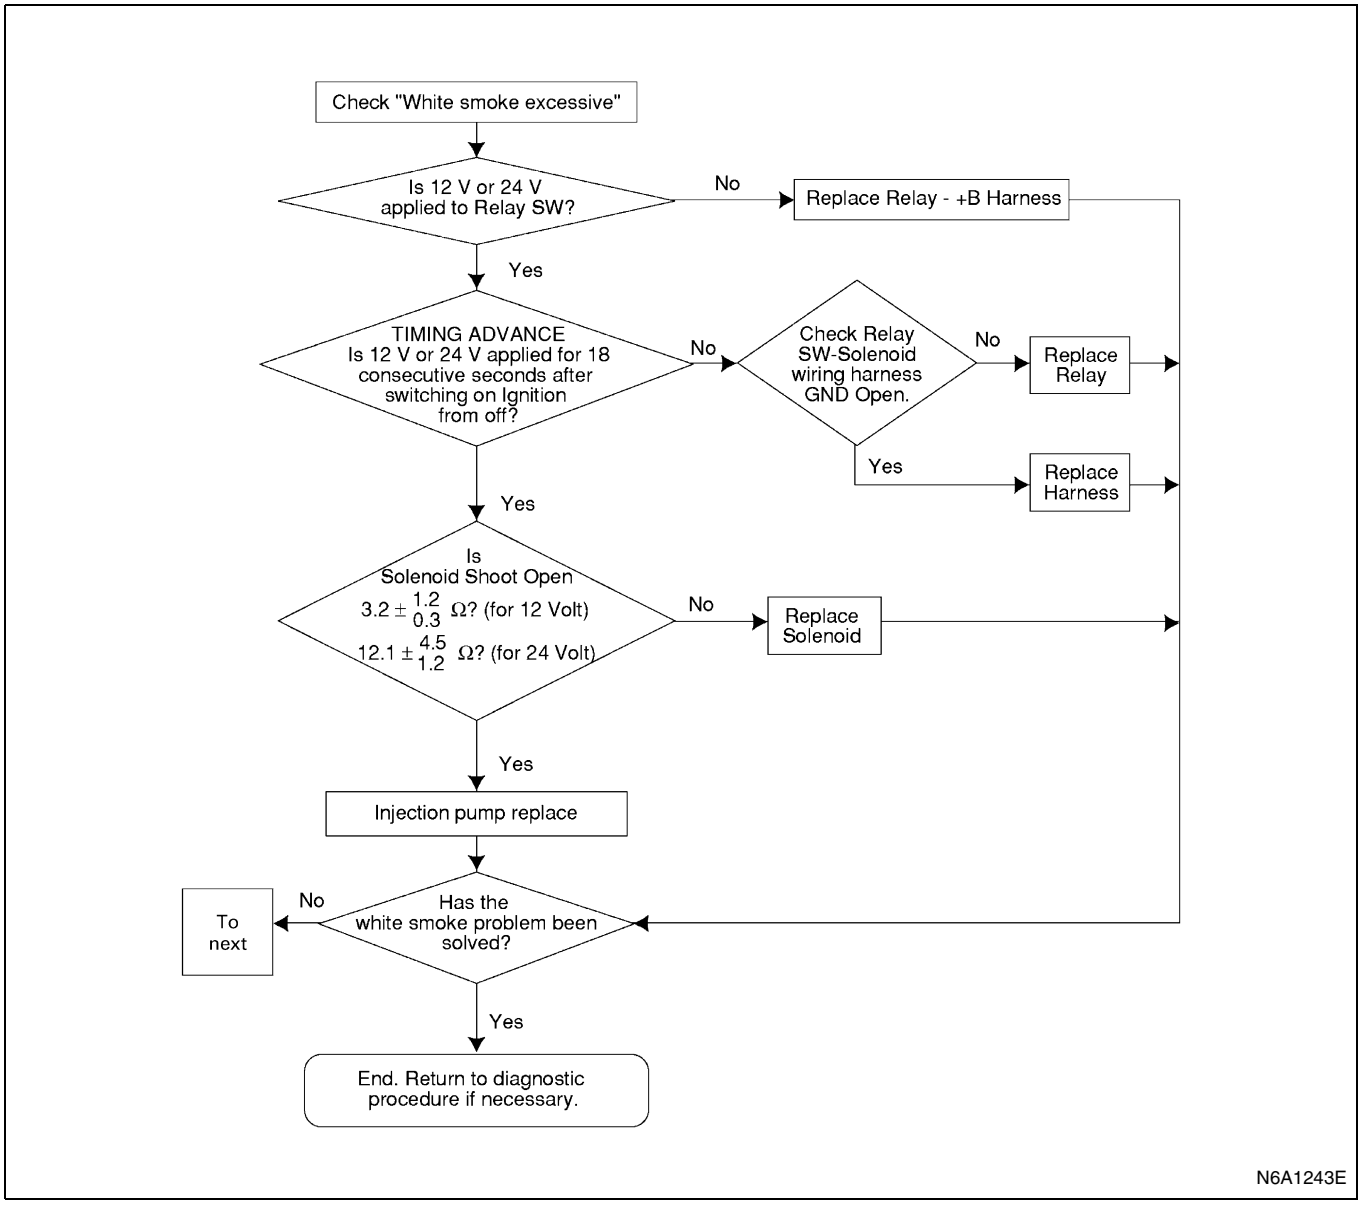
Notice:
The condition of the system in which the malfunction has occurred should be checked by making comparisons between the vehicle Engine Control Module (ECM) and the checking ECM.

*1. Equipped without Exhaust Gas Recirculation (EGR) and Variable Swirl System (VSS).

High Idle Engine Speed



Solenoid Switch Malfunction



Inspection

Solenoid Switch

Disconnect the connector on the solenoid switch.

Apply 12 volts or 24 volts DC to the solenoid switch and hear the touching noise between solenoid switch and advance lever in the injection pump.

If can not hear the touching noise, do not remove the solenoids switch and contact injection pump service shop to repair it.

Exhaust Brake Malfunction

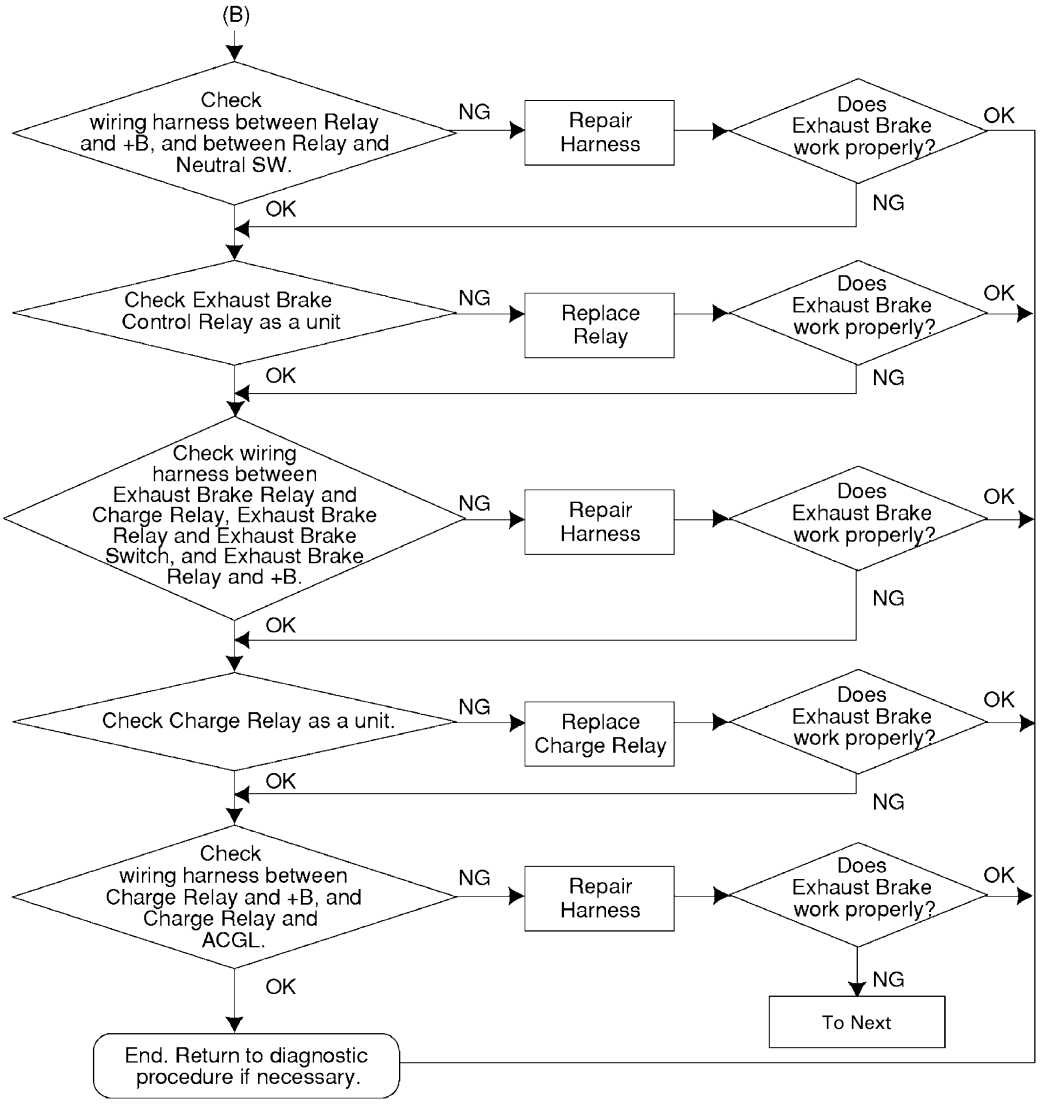
N6A1245E



* Repair of wiring harness includes diode check.

N6A1246E

Inspection

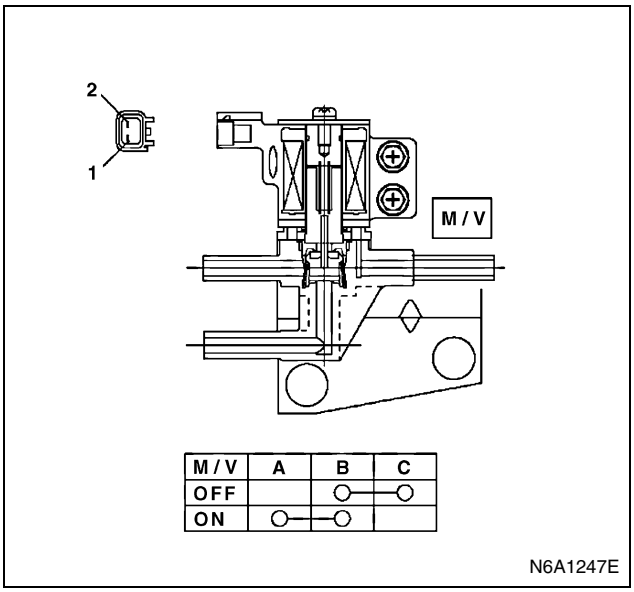
1. Exhaust Brake Magnetic Valve

Inspection

Connect the magnetic valve connector terminal No.1 and No.2 to (+) terminal and (-) terminal of battery, respectively, and check the continuity between the ports.

Caution:

When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.



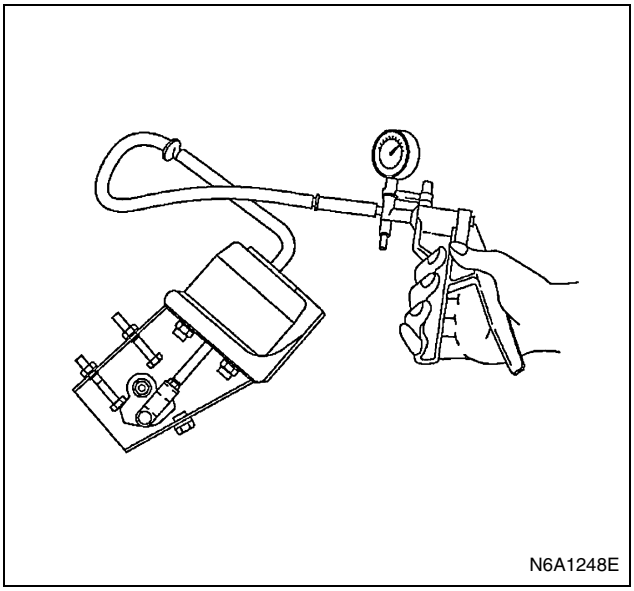
Legend

A. Inlet (Vacuum pump)
B. Outlet (unit)
C. Exhaust (air filter)

2. Exhaust Throttle Valve

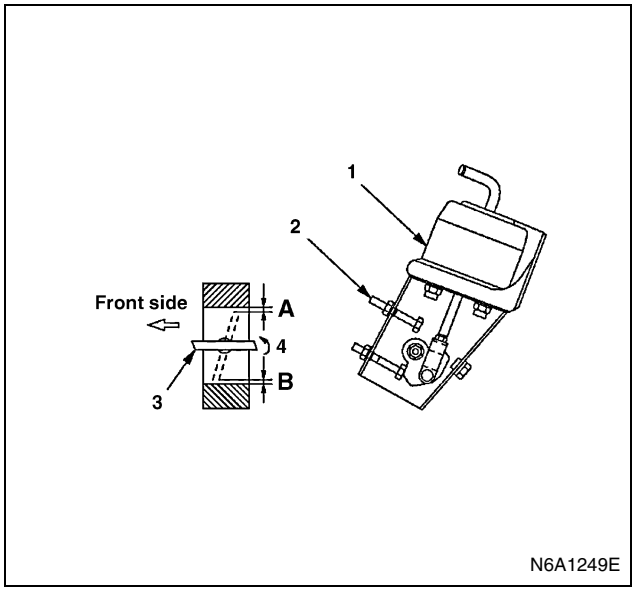
Working Check

Actuate the exhaust brake with the engine idling and make sure that you hear the valve strike on the stopper.



Airtight Check

Apply a negative pressure of 53.3 — 93.3 kPa (400 — 700 mmHg/7.73 — 13.54 psi) to the power chamber by means of a vacuum pump and make sure of the smooth opening/closing of the exhaust brake valve.

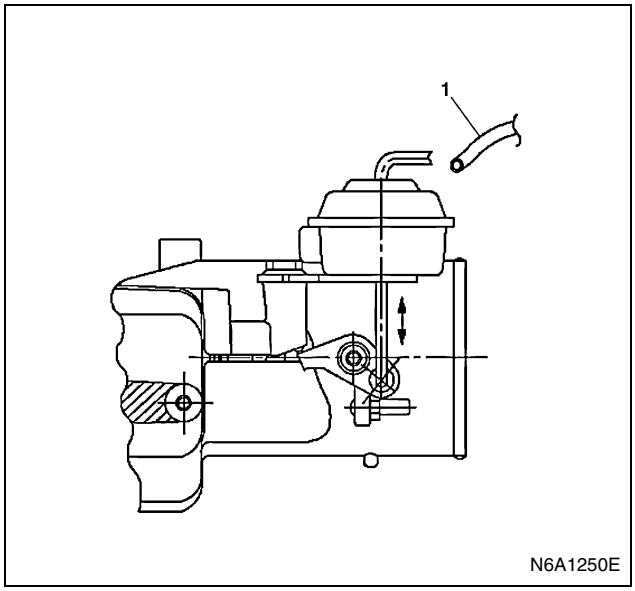


Legend

1. Power chamber
2. Adjust bolt
3. Valve
4. Close

Apply a negative pressure of 86.7 — 93.3 kPa (650 — 700 mmHg/12.57 — 13.54 psi) to the power chamber using a vacuum pump and make sure the average of measurements at Point A and Point B of the clearance between valve and body is as follows: 0.4 — 0.6 mm (0.016 — 0.024 in) (Minimum: 0.4 mm/0.016 in)

If the clearance is out of this range, adjust with the adjusting bolt.



Legend

1. Vacuum hose

3. Intake Throttle Valve

Working Check

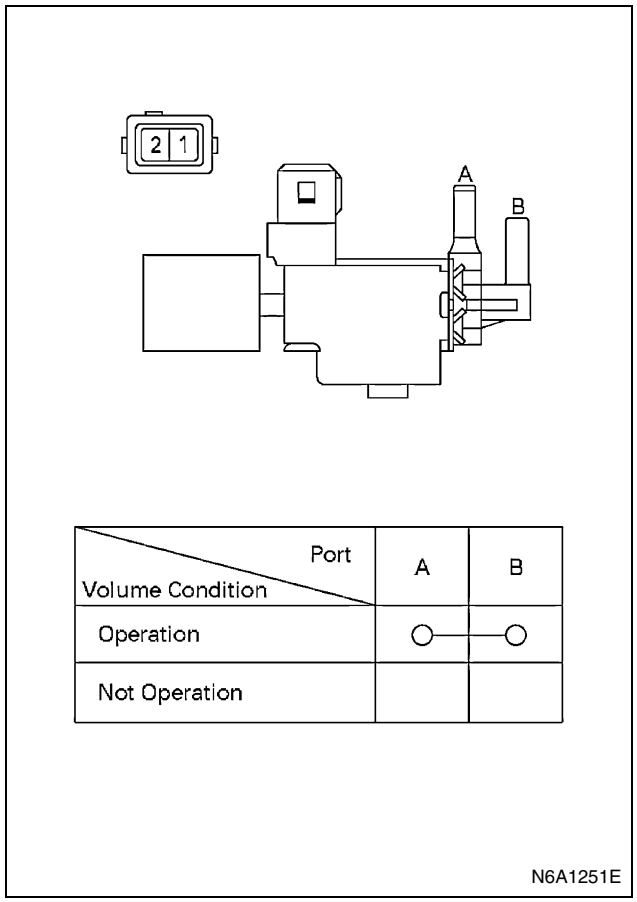
Disconnect the vacuum hose from the actuator and try to move the rod by hand, making sure of the smooth move of the rod.

4. Vacuum Switching Valve; Intake Throttle

Inspection

Connect the vacuum switching valve connector terminals No.1 and No.2 to (+) terminal and (-) terminals of battery, respectively, and check the continuity between the ports.

If the check result is abnormal, repair or replace the valve.



5. Accelerator Switch (2-pole connector type)

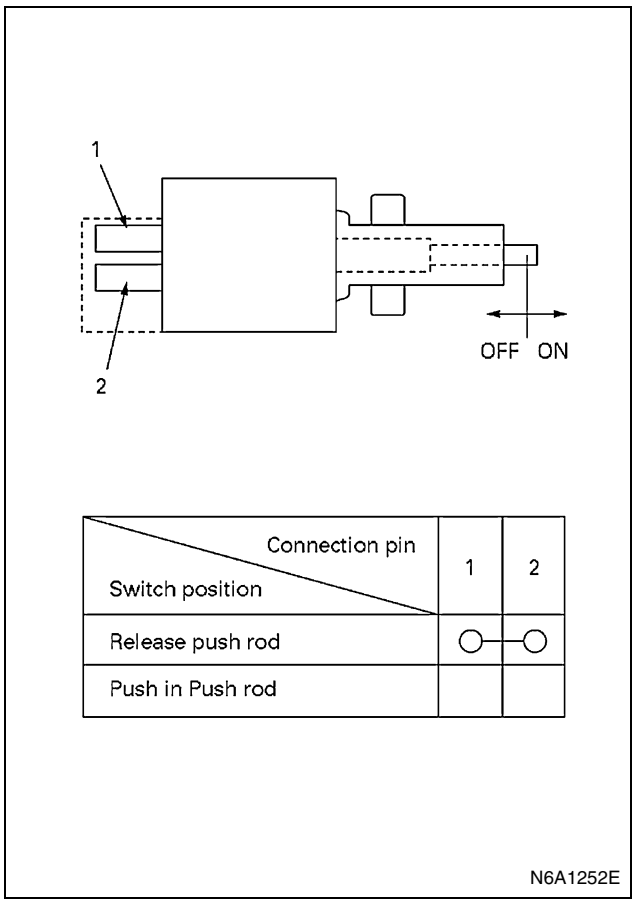
Inspection

1) Check the continuity between the switch connector terminals.

Caution:

When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.

2) Check the smooth move of the pushrod. If the check result is abnormal, repair or replace the push rod.



Removal

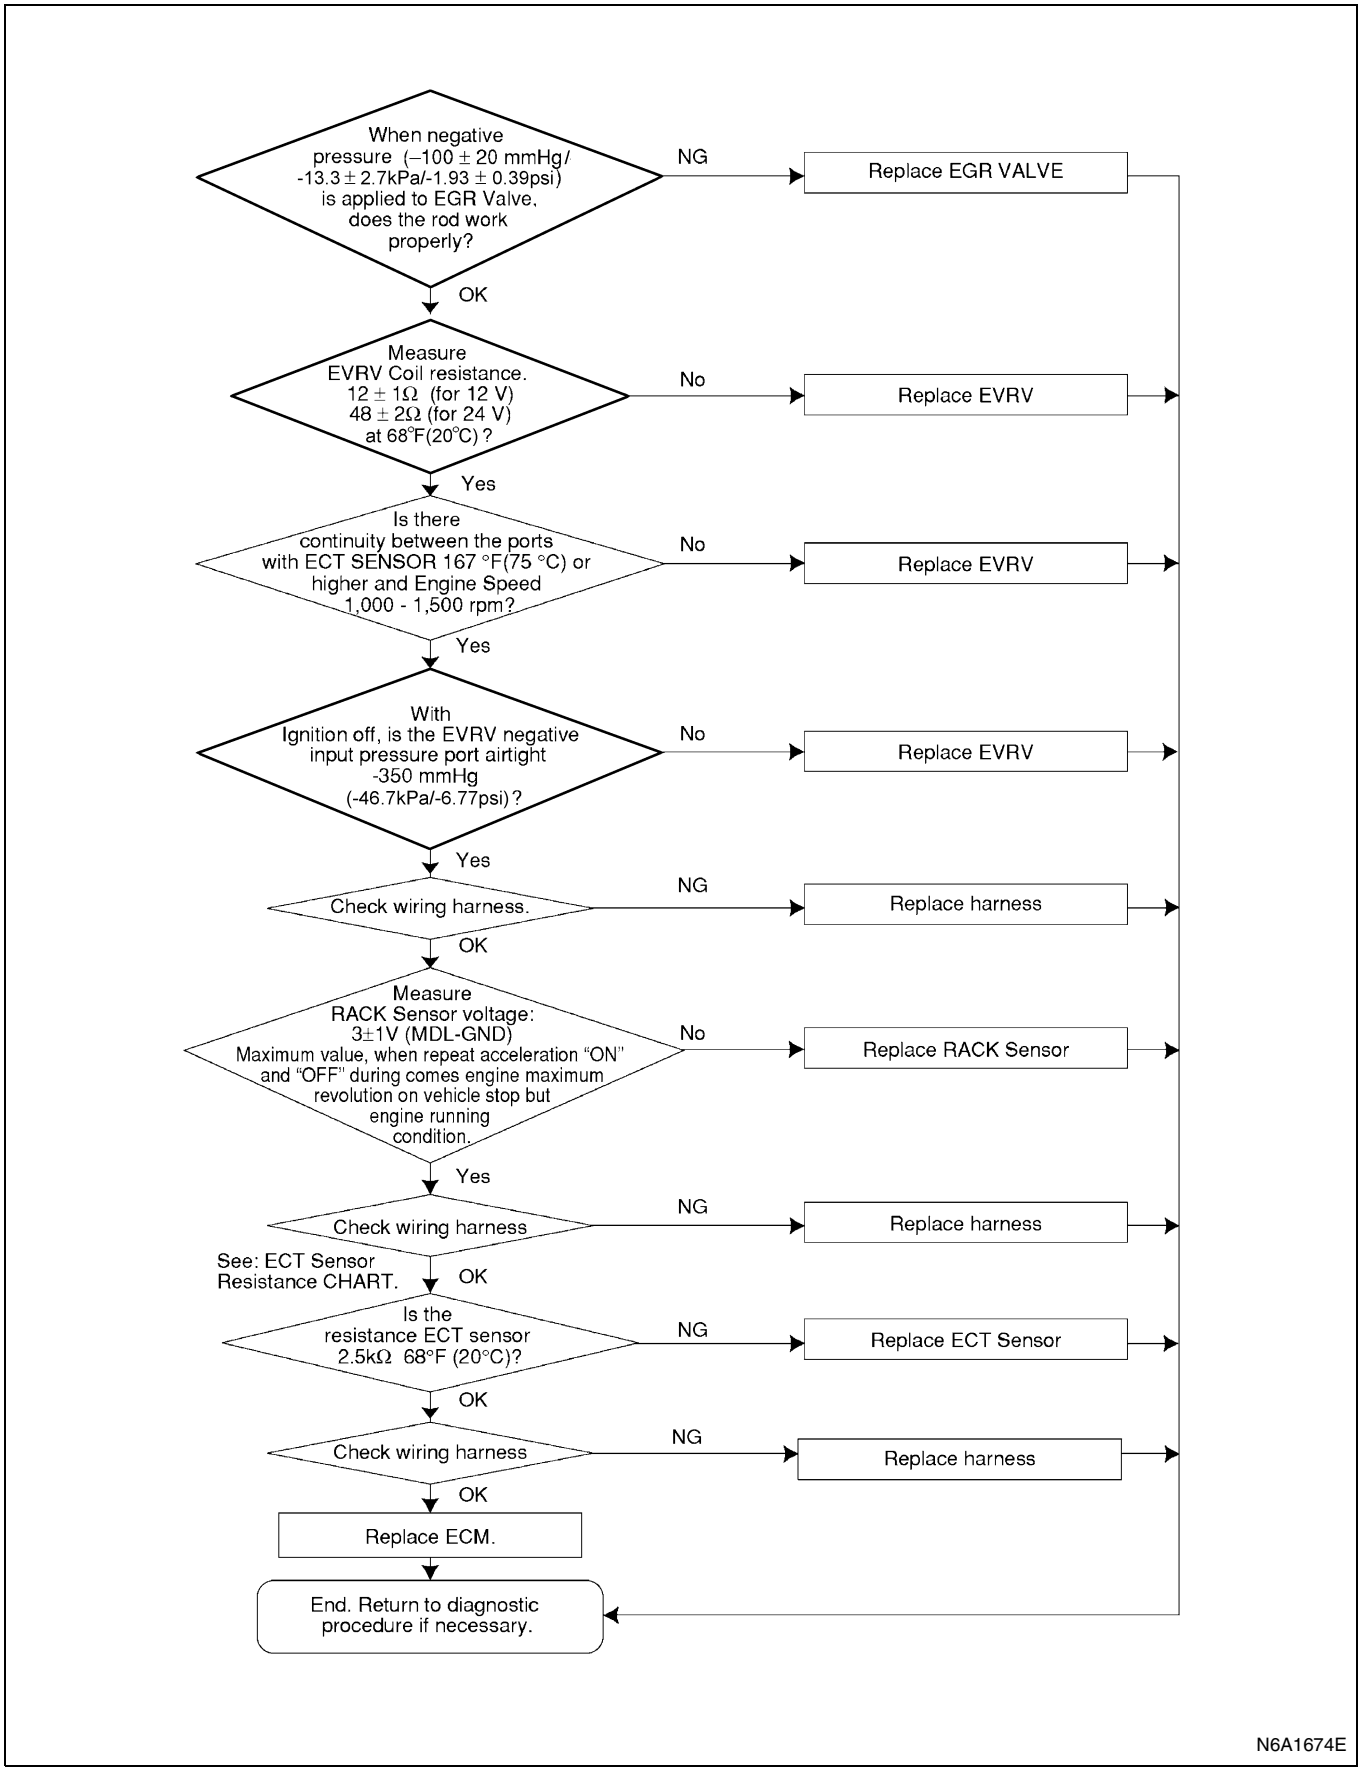
1) Accelerator Switch
2) Disconnect the connector.
   Loosen the lock nut.
   Turn the switch to remove.

Reinstallation

To install, follow the removal procedure in reverse order:

1) Drive the threaded part of the switch until its end surface becomes flush with that of the bracket side of nut.
2) Tighten the lock nut.
   Tightening torque: 1.3 N·m (0.13 kg·m/11.5 lb·in)

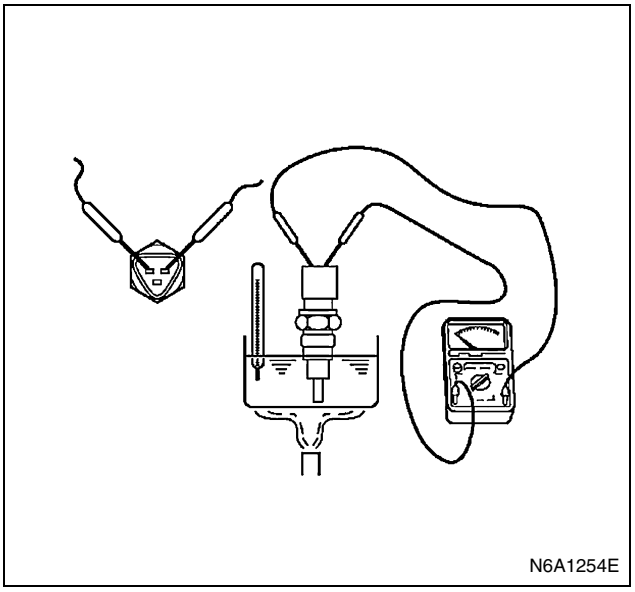
EGR System Malfunction



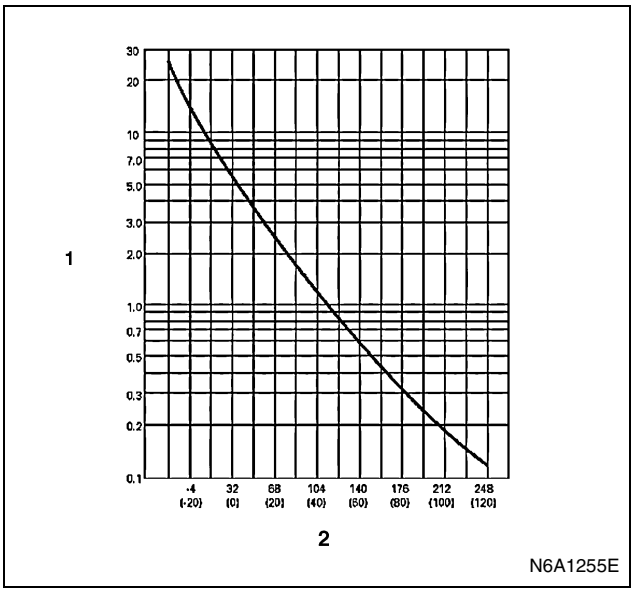
N6A1674E

Inspection

1. Thermosensor (Engine Coolant Temperature)
   Soak the temperature sensitive part of a thermosensor in the water, and while changing the water temperature, make sure the resistance is changed as the following graph shows:



N6A1254E



N6A1255E

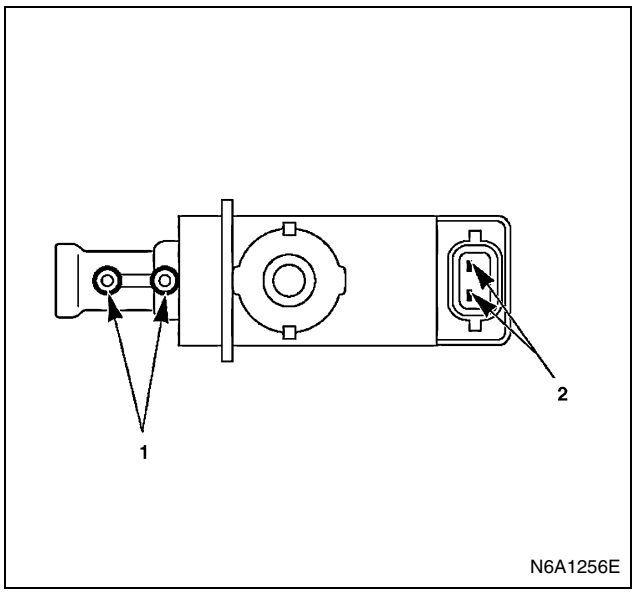
Legend
1. Resistance (kΩ)
2. ECT °F (°C)

2. Electronic Vacuum Regulating Valve (EVRV) (Equipped with Exhaust Gas Recirculation (EGR) and Variable Swirl System (VSS))

Resistance Check

Check the resistance between the EVRV connector terminals using a circuit tester.

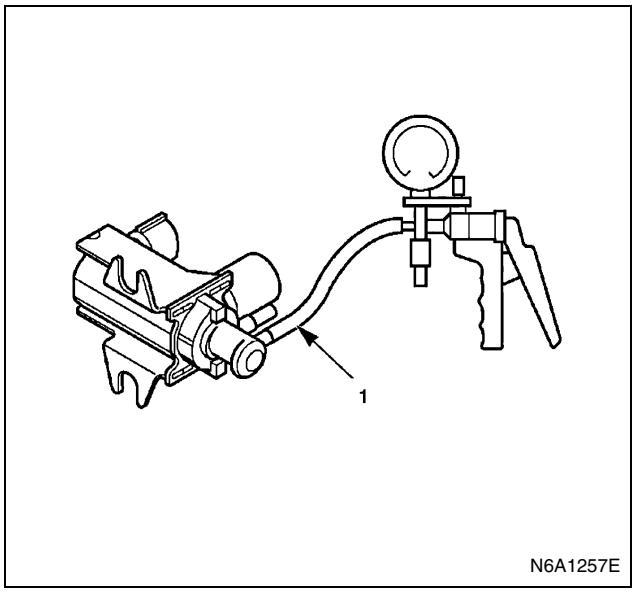
Cold Resistance: 12±1 (Ω)



N6A1256E

Legend
1. Port
2. Pin

Connect battery voltage between EVRV connector terminals and make sure of the continuity between the ports.



N6A1257E

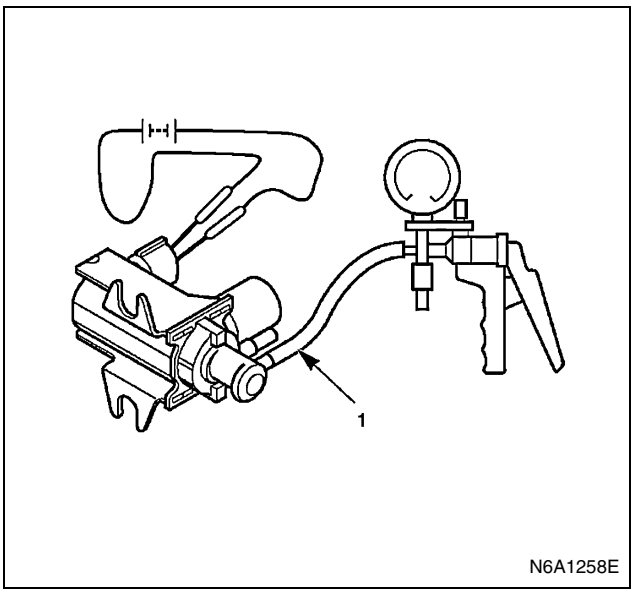
Legend
1. Vacuum port

Airtight Check

Apply negative pressure to the negative pressure input port as illustrated on the left.

Although there is leakage, it is no problem if the negative pressure rises to -46.7 kPa (-350 mmHg / -6.77 psi) or more.

Caution:
When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.



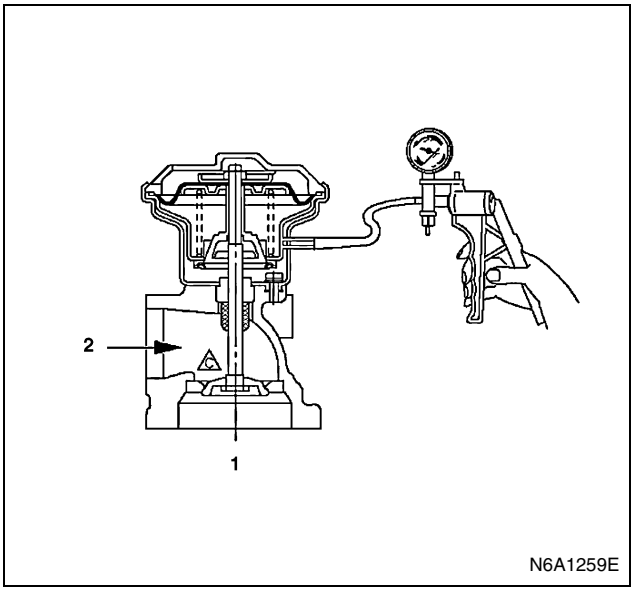
Legend

1. Vacuum port

Working Check

Apply powervoltage between the terminals, there is no problem if the negative pressure does not rise when applied to the input port.

3. Exhaust Gas Recirculation (EGR) Valve (Equipped with EGR and Variable Swirl System (VSS))
   With negative pressure applied to the diaphragm chamber, make sure that the valve is smoothly actuated to make the area between (1) and (2) ventilated.
   Startup: About -13.3 ± 2.7 kPa (-100 ± 20 mmHg / -1.93 ± 0.39 psi)

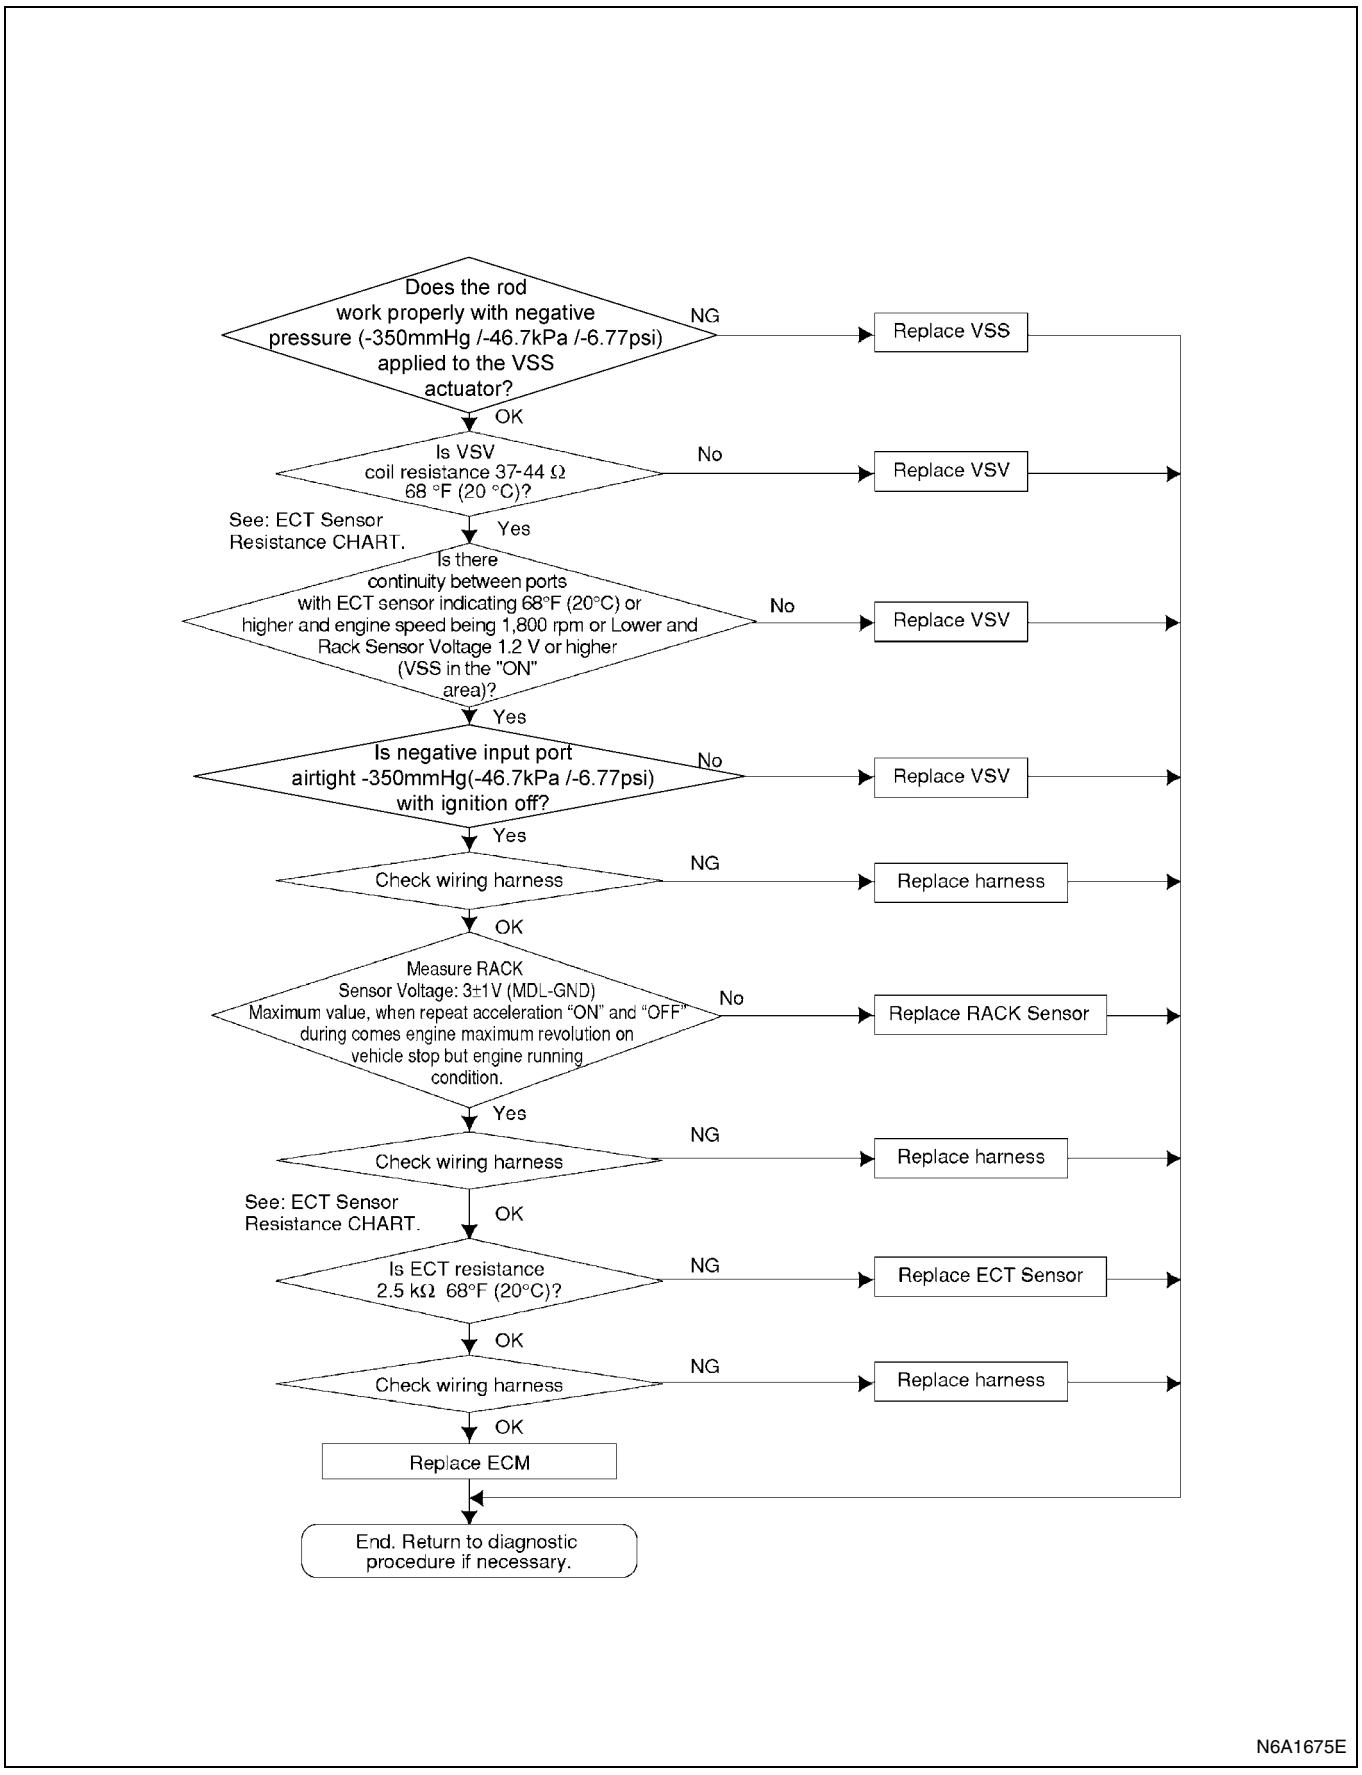


Check to see if EGR valve is normally actuated under the following conditions:

QWS off (After warming up)

Engine coolant temp.: 80°C (176°F) or higher

Variable Swirl System (VSS) System Malfunction (Equipped with Exhaust gas recirculation and VSS)



N6A1675E

VSS (Variable Swirl System)

The Variable Swirl System (VSS) is designed to adjust the intensity of swirl by allowing or not allowing air to flow through a sub-port (or bypass) the runs in parallel with the intake port for each cylinder. The swirl intensifies when there is no air flow through the sub-port, and vice versa.
The air flow is controlled by the on-off valve at the inlet to the sub-port and the valve in turn is turned on and off by computer signals which are dependent on engine speed, load and coolant temperature, Basically, the air is cut off at low speeds to maintain high swirl and is allowed to flow at high speeds to maintain low swirl.

Variable Swirl System (Equipped with Exhaust gas recirculation (EGR) and VSS)

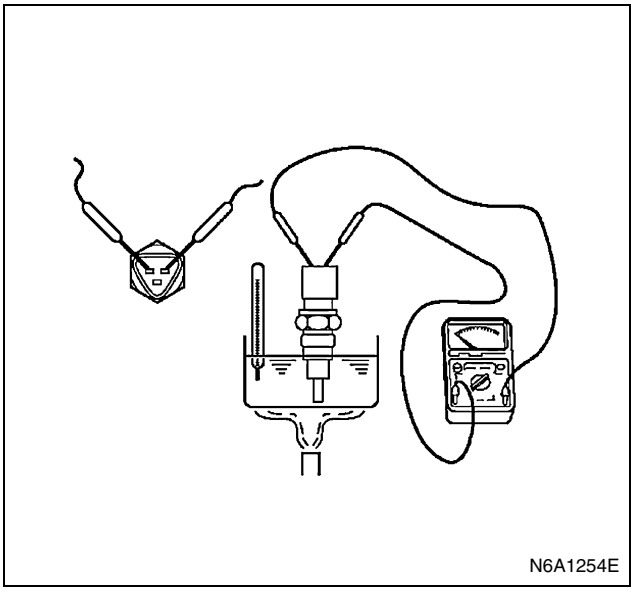
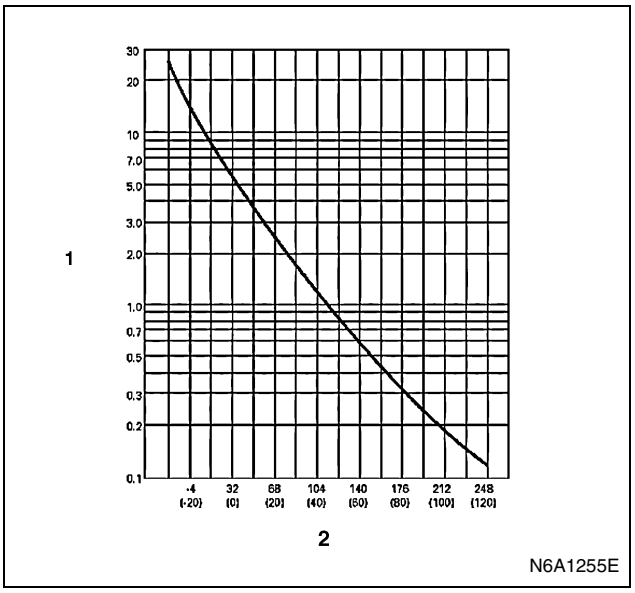
8. VSV; VSS
9. Actuator
10. Thermo sensor
11. Engine speed sensor
12. Rack sensor

Inspection

1. Thermosensor (Engine coolant temperature)
   Soak the temperature sensitive part of a thermosensor in the water, and while changing the water temperature, make sure the resistance is changed as the following graph shows:



N6A1254E



N6A1255E

Legend
1. Resistance (kΩ)
2. ECT °F (°C)

2. Vacuum Switching Valve (VSV)

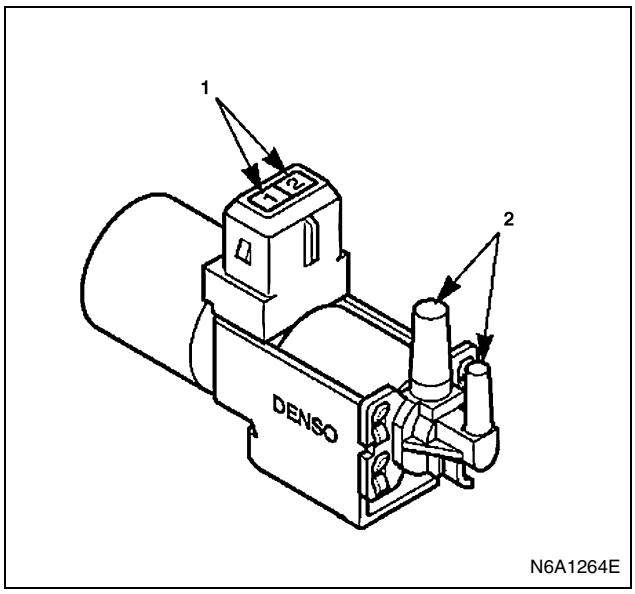
Resistance Check

Check the resistance between the VSV connector terminals using a circuit tester.

Cold Resistance

: 37 — 44 (Ω) (for 12 volt)

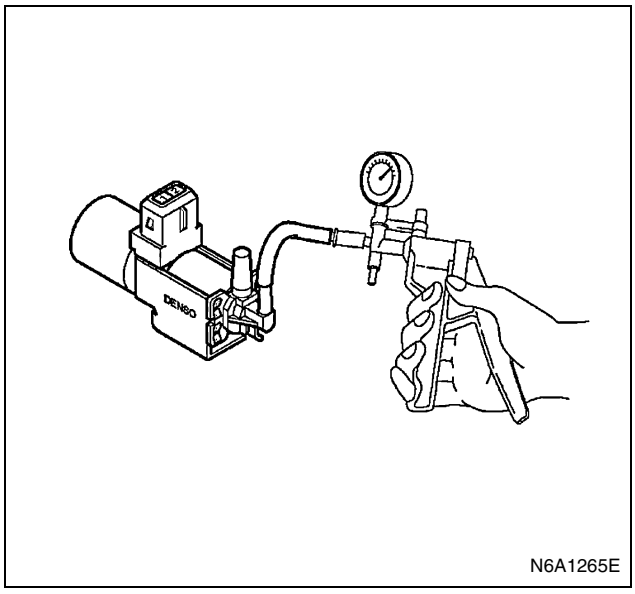
: 159 — 169 (Ω) (for 24 volt)



N6A1264E

Legend
1. 2 Pin
2. Port

Connect battery voltage between VSV connector terminals and make sure of the continuity between the ports.

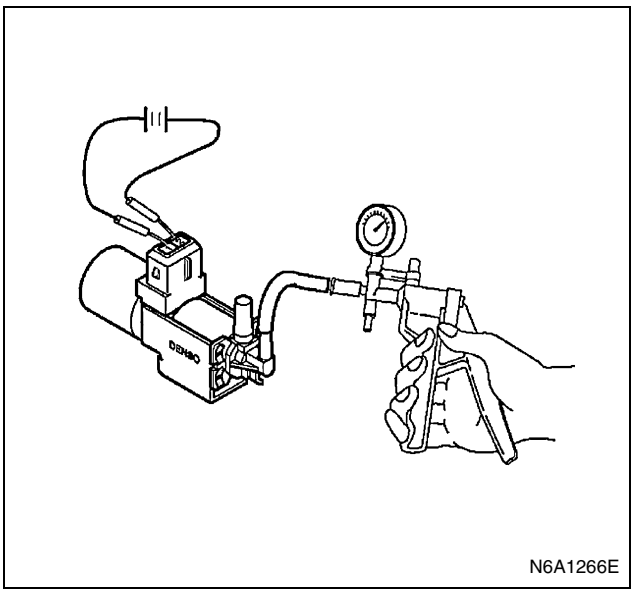


N6A1265E

Airtight Check

Apply negative pressure to the negative pressure input port as illustrated on the left.

Although there is leakage, it is no problem if the negative pressure rises to -46.7 kPa (-350 mmHg / -6.77 psi) or more.



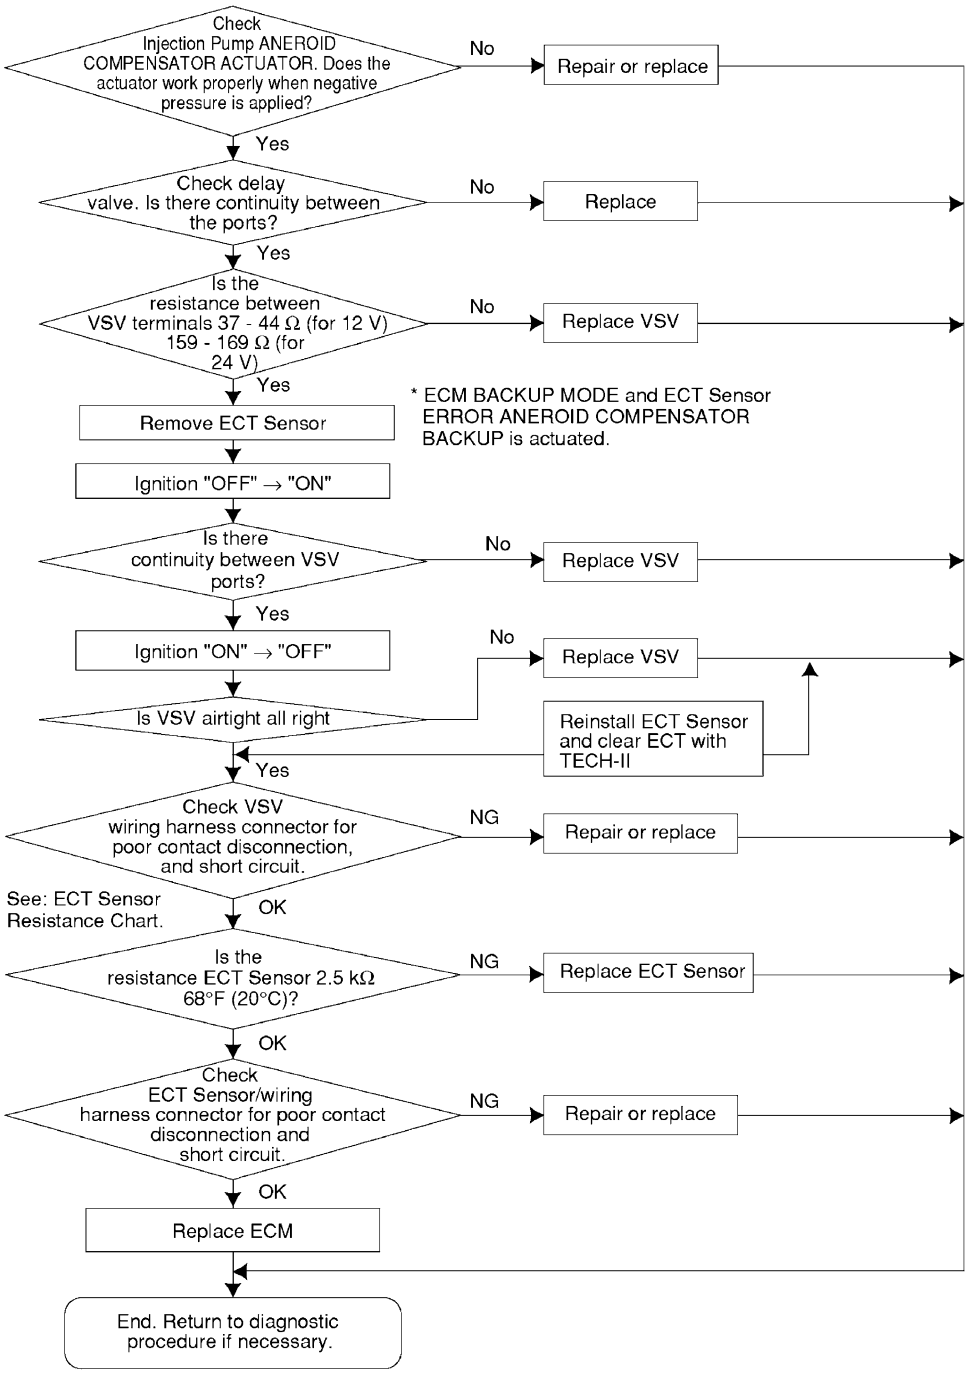
Working Check

Apply powervoltage between the terminals, there is no problem if the negative pressure does not rise when applied to the input port.

Caution:

When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.

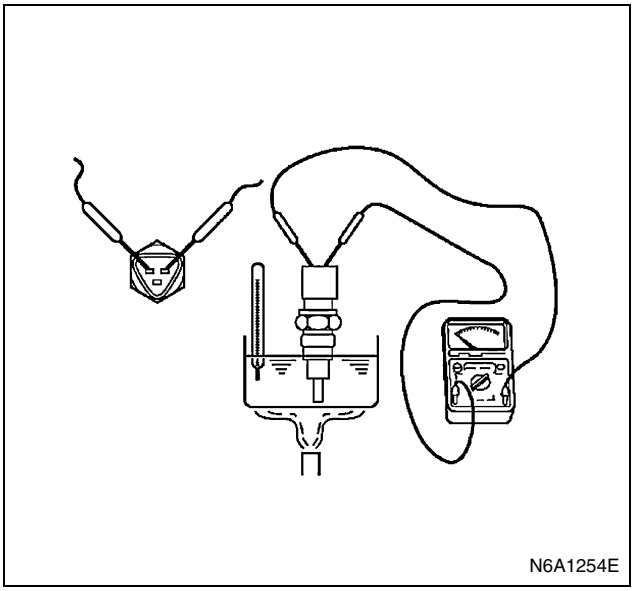
Aneroid Compensator Malfunction



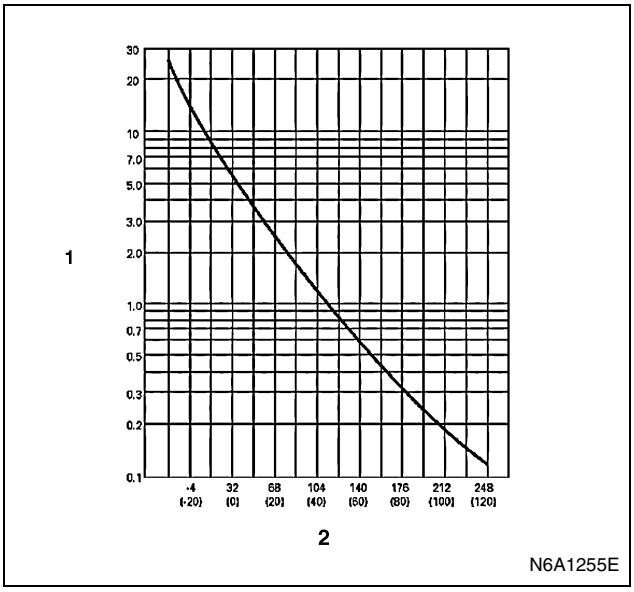
N6A1267E

Inspection

1. Thermosensor (Engine coolant temperature (ECT))
   Soak the temperature sensitive part of a thermosensor in the water, and while changing the water temperature, make sure the resistance is changed as the following graph shows:



N6A1254E



N6A1255E

Legend
1. Resistance (kΩ)
2. ECT °F (°C)

2. Vacuum Switching Valve (VSV)

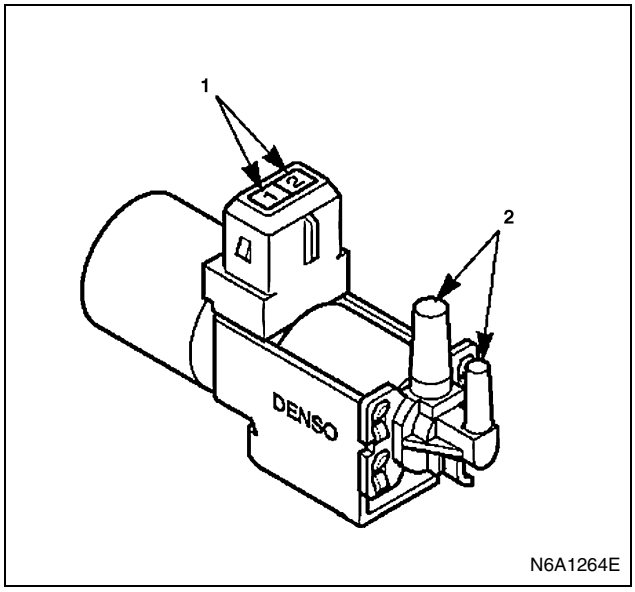
Resistance Check

Check the resistance between the VSV connector terminals using a circuit tester.

Cold Resistance

: 37 — 44 (Ω) (for 12 Volt)

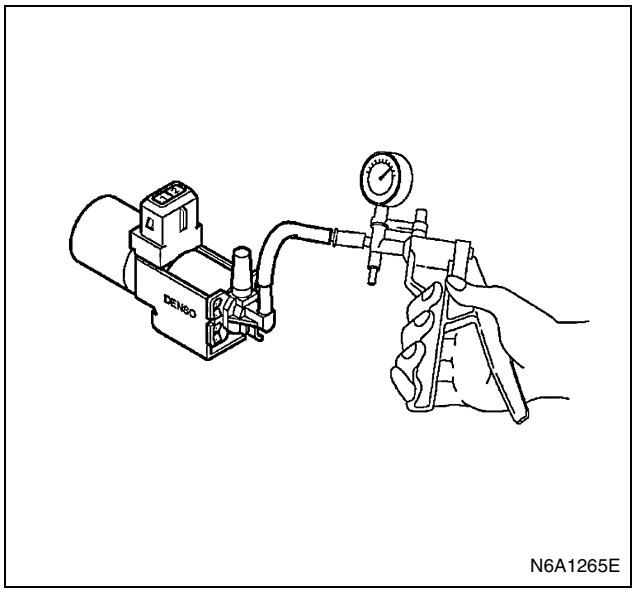
: 159 — 169 (Ω) (for 24 Volt)



N6A1264E

Legend
1. 2 Pin
2. Port

Connect battery voltage between VSV connector terminals and make sure of the continuity between the pots.

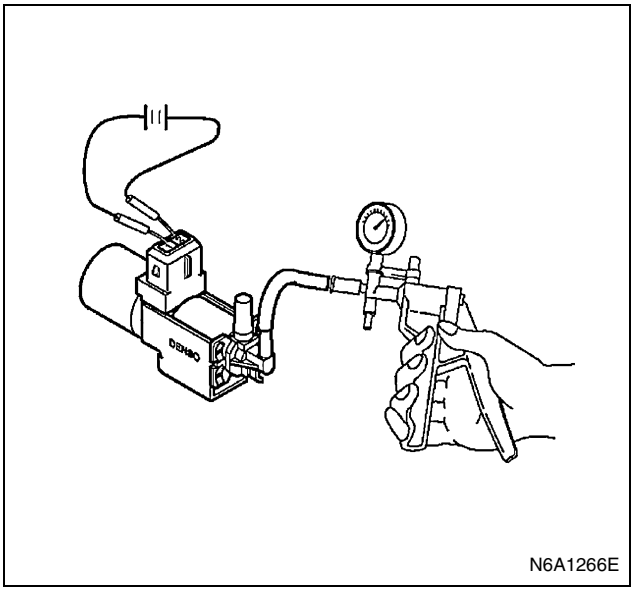


N6A1265E

Airtight Check

Apply negative pressure to the negative pressure input port as illustrated on the left.

Although there is leakage, it is no problem if the negative pressure rises to -46.7 kPa (-350 mmHg / -6.77 psi) or more.



N6A1266E

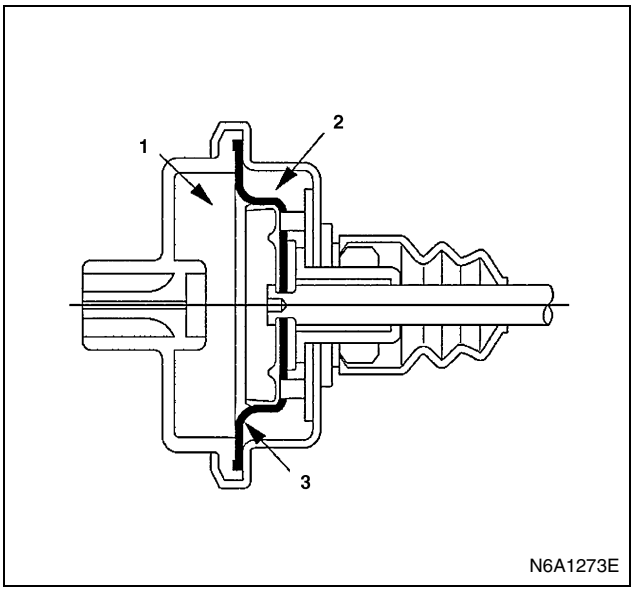
Working Check

Apply powervoltage between the terminals, there is no problem if the negative pressure does not rise when applied to the input port.

Caution:

When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.

3. Actuator
   Diaphragm is built in the actuator, by which the inside of the actuator is divided into two, atmospheric room and negative pressure room.

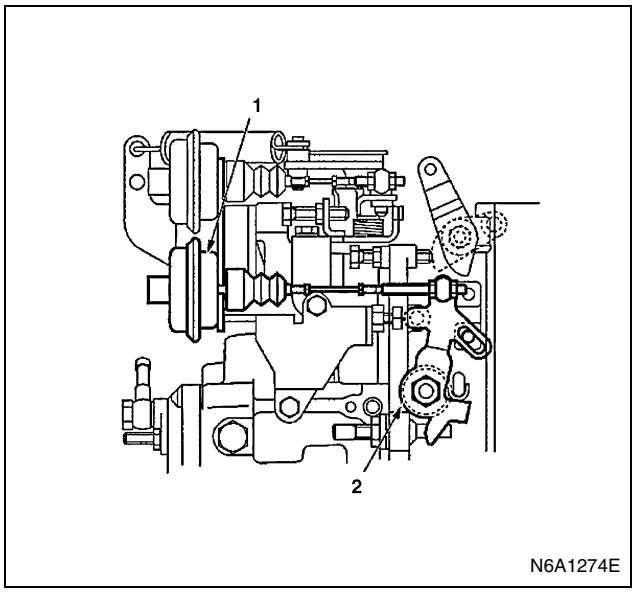


N6A1273E

Legend

1. Vacuum chamber
2. Atmospheric chamber
3. Diaphragm

4. Aneroid compensator Actuator
   The link of the actuator for the aneroid compensator is connected to full load set lever.
   The full load set lever is connected to a U-lever.
   When the atmospheric sensor built in Engine Control Module (ECM) makes the actuator work, the full load set lever and U-lever are rotated to a specified position so that the control rack is drawn in the direction of reducing fuel injection amount.



N6A1274E

Legend

1. Resistance (kΩ)
2. ECT °F (°C)

6. Vacuum Switching Valve; Intake Throttle

Inspection

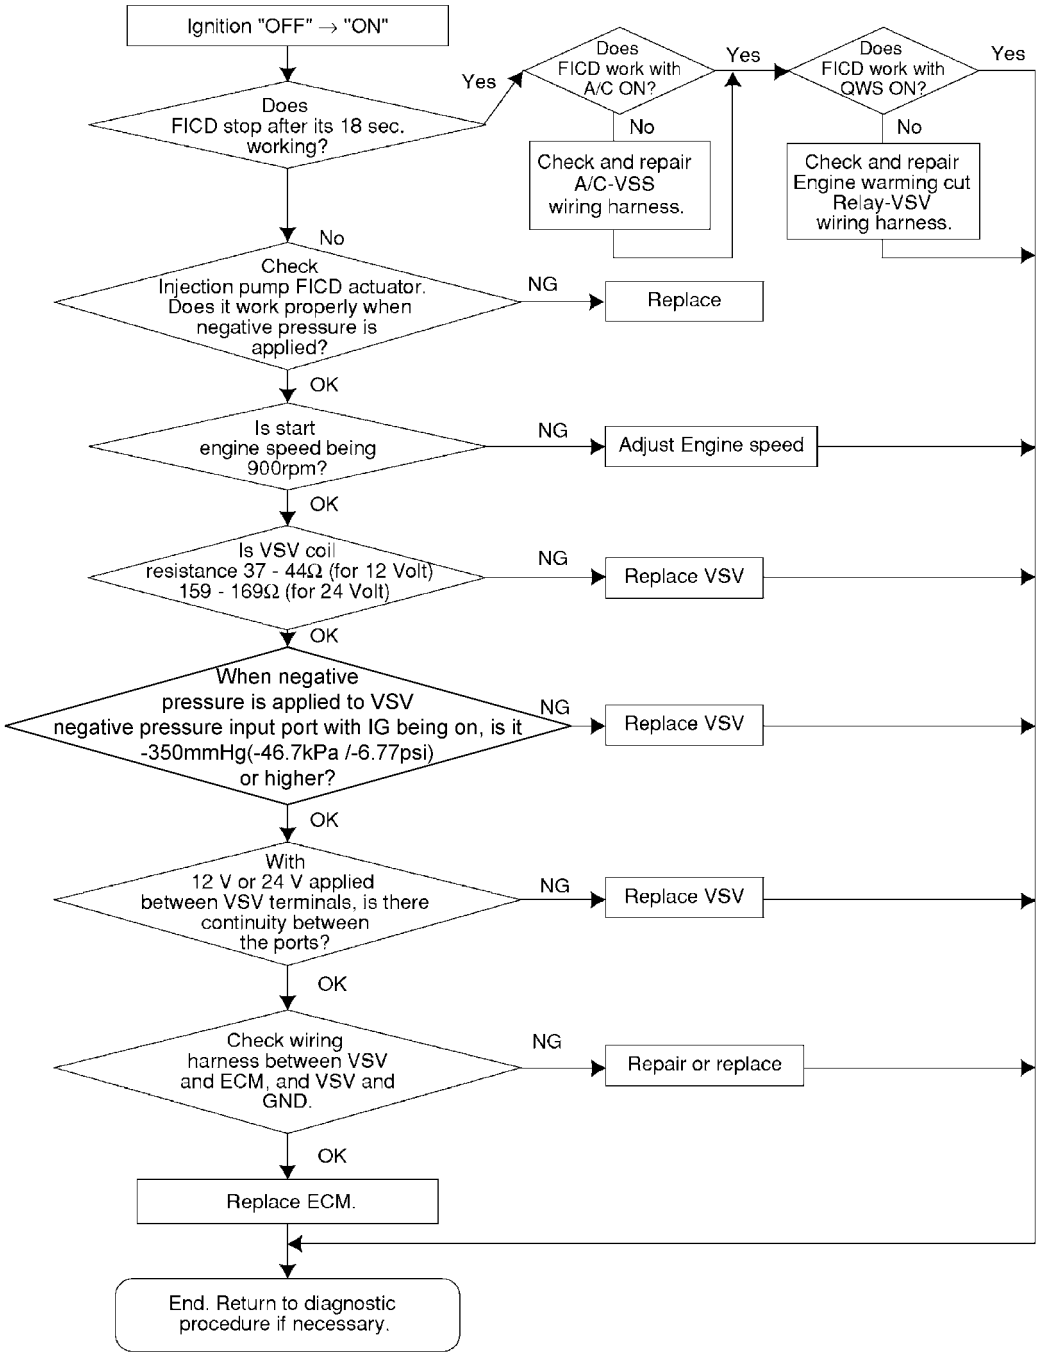
Connect the vacuum switching valve connector terminals No.1 and No.2 to (+) terminal and (-) terminals of battery respectively, and check the continuity between the ports.

If the check result is abnormal, repair or replace the valve.

Caution:

When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.

Fast Idle Control Device (FICD) System Malfunction



N6A1677E

Inspection

Vacuum Switching Valve (VSV)

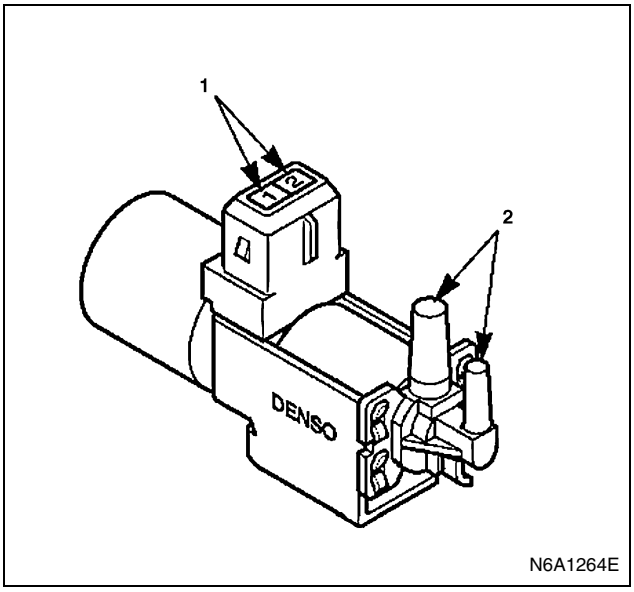
Resistance Check

Check the resistance between the VSV connector terminals using a circuit tester.

Cold Resistance

: 37 — 44 (Ω) (for 12 Volt)

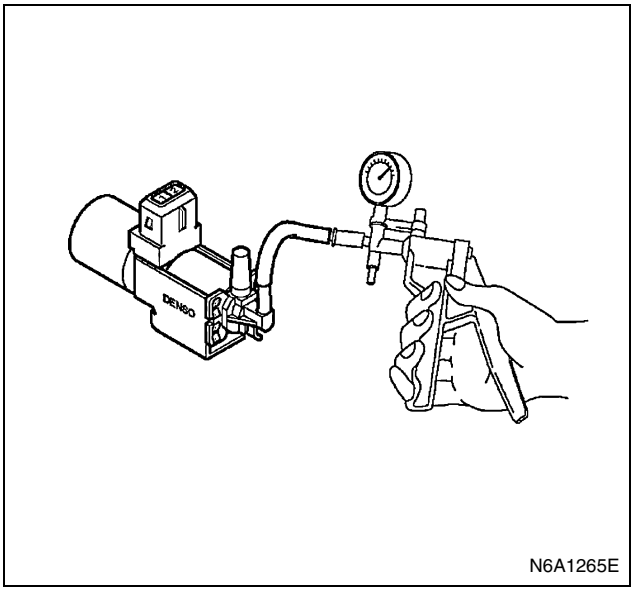
: 159 — 169 (Ω) (for 24 Volt)



Legend

1. 2 Pin
2. Port

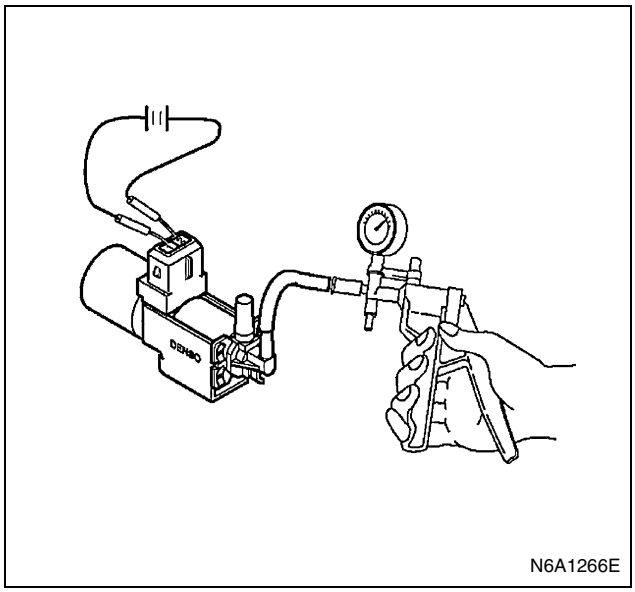
Connect the battery voltage between VSV connector terminals and make sure of the continuity between the ports.



Airtight Check

Apply negative pressure to the negative pressure input port as illustrated on the left.

Although there is leakage, it is no problem if the negative pressure rises to -46.7 kPa (-350 mmHg / -6.77 psi) or more.

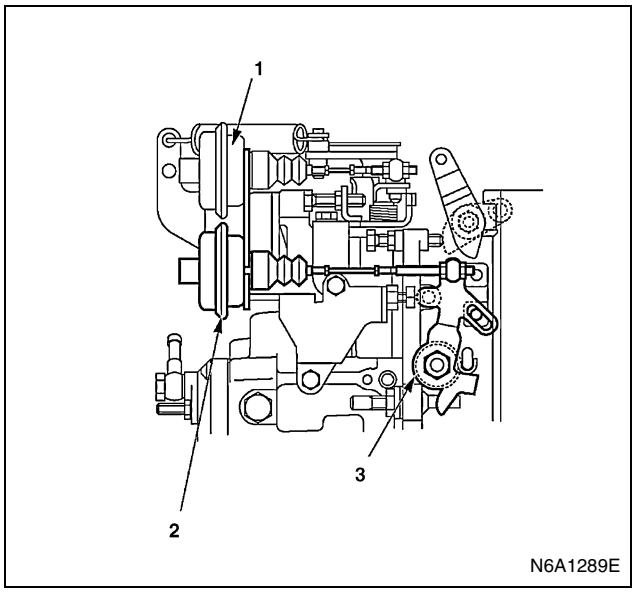


Caution:

When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.

Working Check

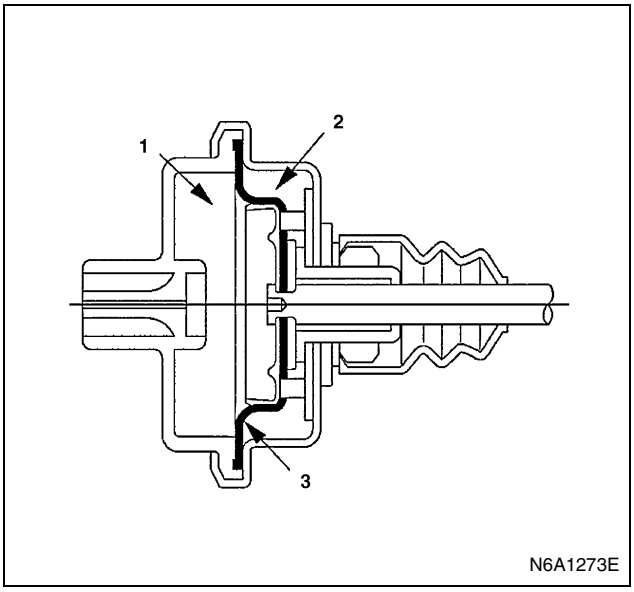
Apply powervoltage between the terminals, there is no problem if the negative pressure does not rise when applied to the input port.



Legend

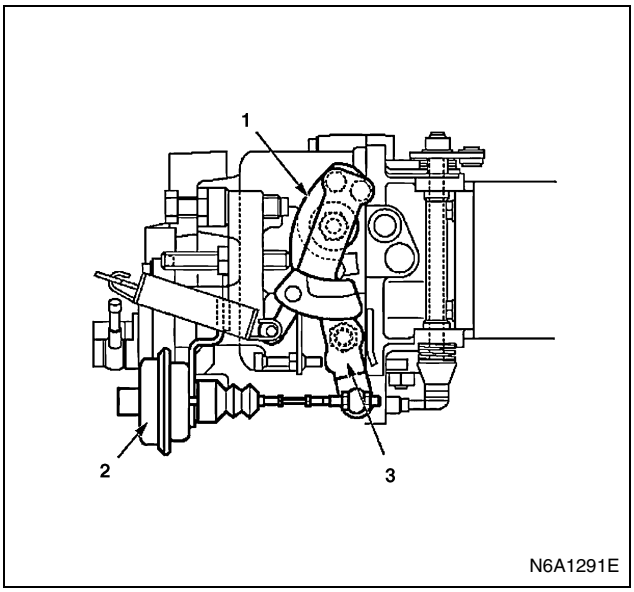
1. FICD actuator
2. Aneroid compensator actuator
3. Full rod set lever

1. Diaphragm is built in the actuator, by which the inside of the actuator is divided into two, atmospheric room and negative pressure room.



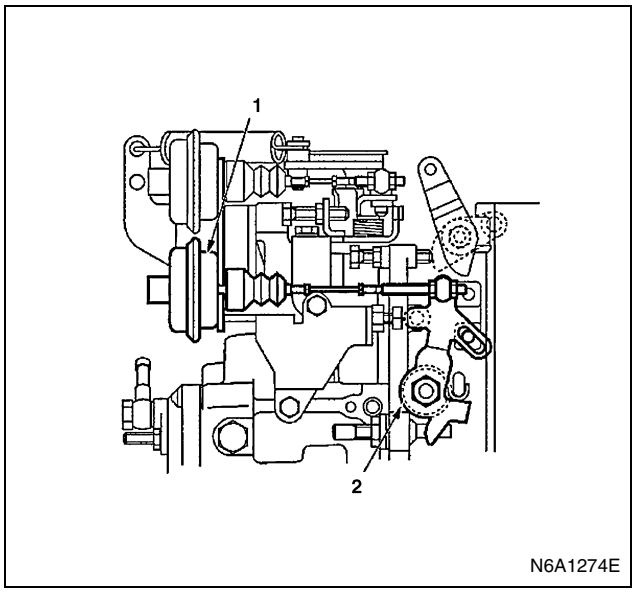
Legend
1. Vacuum chamber
2. Atmospheric chamber
3. Diaphragm

2. Fast Idle Control Device (FICD) actuator link is connected to FICD lever, setting speed control lever at a specified speed when FICD is at work at the time of idling.



Legend
1. Speed control lever
2. FICD actuator
3. FICD lever

3. The link of the actuator for the aneroid compensator is connected to full load set lever. The full load set lever is connected to a U-lever. When the atmospheric sensor built in Engine Control Module (ECM) makes the actuator work, the full load set lever and U-lever are rotated to a specified position so that the control rack is drawn in the direction of reducing fuel injection amount.



Legend
1. Aneroid compensator actuator
2. Full load set lever

DIAGNOSIS (4HG1-T Only)

Strategy-Based Diagnostics

Strategy-Based Diagnostics

The strategy-based diagnostic is a uniform approach to repair all Electrical/Electronic (E/E) systems. The diagnostic flow can always be used to resolve an E/E system problem and is a starting point when repairs are necessary. The following steps will instruct the technician how to proceed with a diagnosis:

1. Verify the customer complaint.
   - To verify the customer complaint, the technician should know the normal operation of the system.
2. Perform preliminary checks.
   - Conduct a thorough visual inspection.
   - Review the service history.
   - Detect unusual sounds or odors.
   - Gather diagnostic trouble code information to achieve an effective repair.
3. Check bulletins and other service information.
   - This includes videos, newsletters, etc.
4. Refer to service information (manual) system check (s).
   - “System checks” contain information on a system that may not be supported by one or more DTCs.
     System checks verify proper operation of the system. This will lead the technician in an organized approach to diagnostics.
5. Refer to service diagnostics.

Diagnostic Trouble Code (DTC) Stored

Follow the designated DTC chart exactly to make an effective repair.

No DTC

Select the symptom from the symptom tables.
Follow the diagnostic paths or suggestions to complete the repair. You may refer to the applicable component/ system check in the system checks.

No Matchig Symptom

1. Analyze the complaint.
2. Develop a plan for diagnostics.
3. Utilize the wiring diagrams and the theory of operation.

Call technical assistance for similar cases where repair history may be available. Combine technician knowledge with efficient use of the available service information.

Intermittents

Conditions that are not always present are called intermittents. To resolve intermittents, perform the following steps:

1. Evaluate the symptoms and the conditions described by the customer.
2. Use a check sheet or other method to identify the circuit or electrical system component.
3. Follow the suggestions for intermittent diagnosis found in the service documentation.

No Trouble Found

This condition exists when the vehicle is found to operate normally. The condition described by the customer may be normal. Verify the customer complaint against another vehicle that is operating normally. The condition may be intermittent. Verify the complaint under the conditions described by the customer before releasing the vehicle.

1. Re-examine the complaint When the Complaint cannot be successfully found or isolated, a re-evaluation is necessary.
   The complaint should be re-verified and could be intermittent as defined in Intermittents, or could be normal.
2. Repair and verify.
   After isolating the cause, the repairs should be made.
   Validate for proper operation and verify that the symptom has been corrected. This may involve road testing or other methods to verify that the complaint has been resolved under the following conditions:
   - Conditions noted by the customer.
   - If a DTC was diagnosed, verify a repair by duplicating conditions present according to customer complaint.

Verifying Vehicle Repair

Verification of the vehicle repair will be more comprehensive for vehicles with self diagnostic system diagnostics. Following a repair, the technician should perform the following steps:

Important:
Follow the steps below when you verify repairs on self diagnostic systems. Failure to follow these steps could result in unnecessary repairs.

1. Review and record the Failure Records for the DTC which has been diagnosed.
2. Clear the DTCs.
3. Operate the vehicle within conditions according to customer complaint.
4. Monitor the Diagnostic Trouble Code (DTC) status information for the specific DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

GENERAL SERVICE INFORMATION

Visual/Physical Engine Compartment Inspection
Perform a careful visual and physical engine compartment inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual/physical inspection:

- Inspection all vacuum hoses for punches, cuts, disconnects, and correct rouring.
- Inspect hoses that are difficult to see behind other components.
- Inspect all wires in a engine compartment for proper connections, burned or chafed spots, pinched wires, contact with sharp edges or contact with hot exhaust manifolds or pipes.

Basic Knowledge of Tools Required

Notice:
Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in an incorrect diagnosis or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge.

A basic understanding of hand tools is necessary to effectively use this section of the Servise Manual

Self Diagnostic System Check
Self Diagnostic System should be checked as follows:

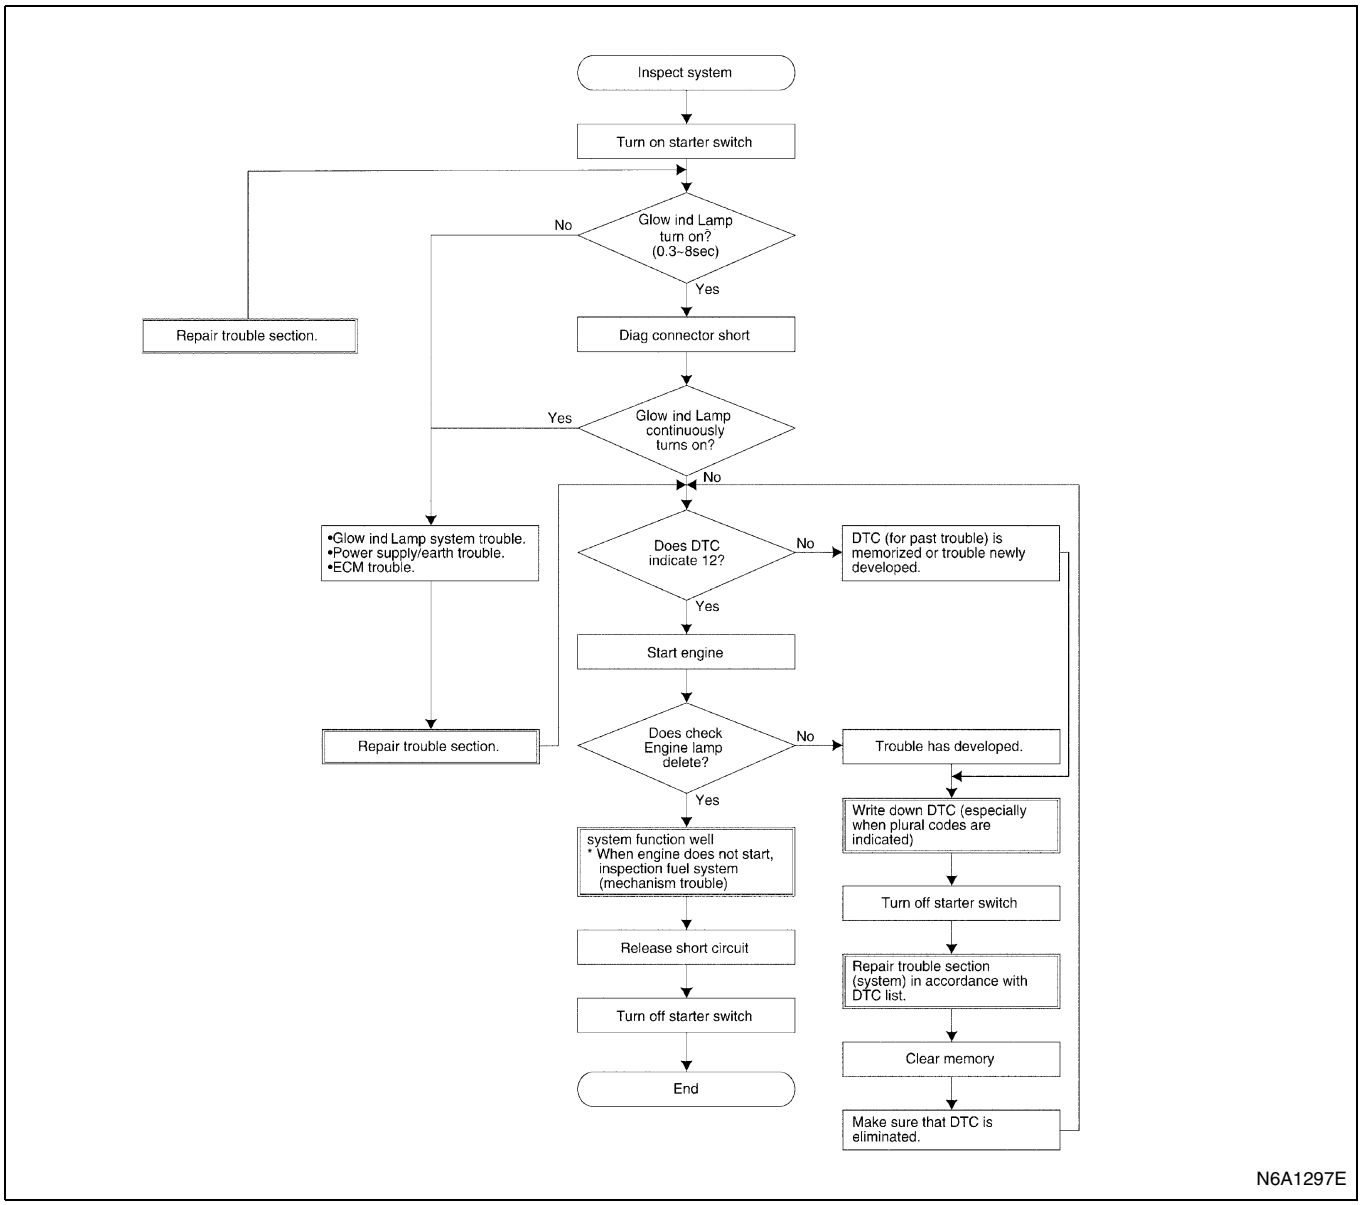
1. When Ignition key is turned from the “OFF” to the “ON” position, make sure that Malfunction Indicator Lamp (MIL) is lit for 0.3 — 0.8 sec.
2. Connect Scan Tool and check to see if MIL is always lit.
   If so, Self Diagnostic System is normal.

Troubleshooting

Caution taken in inspecting

1. In inspecting system, write down Diagnostic Trouble Code (DTC) to be indicated. (especially, when plural self-diagnosis codes are indicated.)
2. Before eliminating the indicated DTC by a memory clear switch, doubly inspect abnormal place as indicated in DTC.

Inspection Procedure Flowchart (Diagnostic System Check)



Notice:

Please note that some items of DTC may not be generated unless the engine is warmed up or unless the vehicle is driven under load.

Self-diagnosis Functions

Memorization of diagnostic trouble code

The self-diagnosis code indicated will be memorized in Electronically Erasable Programmable Read Only Memory (EEPROM) with in the Engine Control Module (ECM).

Accordingly even if the starter switch turns off or the ECM is removed from the vehicle, the memorized self-diagnosis code will not be eliminated.

* Unless an elimination procedure is taken, the diagnostic trouble code (DTC) will remain in memory. (The memory will be eliminated only by a memory clear switch.)

Elimination of diagnostic trouble code

The DTC memorized in the EEPROM with in the ECM can be eliminated only by the operation of the memory clear switch. The elimination method memory clear switch will be described below:

1. Turn OFF ignition switch.
2. Use 4.7kΩ resistance and make short circuit on memory clear switch.
3. Turn ON ignition switch. The indication lamp turn on (lighting) continuously after three seconds flashing the indication lamp.
4. Turn OFF ignition switch.
5. Remove shortage resistance from memory clear switch.

How to read flashing of the indicator lamp:

The two-digit diagnosis code flashes starting from ten's figure to indicate the diagnosis code.
Please read the diagnosis code from the flashing.
If the plural diagnosis codes are indicated, the same diagnosis code is flashed repeatedly in steps of three times.
Please read it correctly.

- Diagnostic Trouble Code (DTC) outputting is done in decreasingly order of DTC number.
- Indication is changed over on completion of output DTC indication.
- DTC indicator is stopped with diagnostic switch being off.
- When there is no DTC output, -12+ is outputted in normal DTC code.
- After indicating 3 times pear 1 DTC, shift is conducted to the next DTC. (After making a round, the indications are repeated again.)
- In case of the same diagnostic code, it is used 1 DTC (3 times indication.)

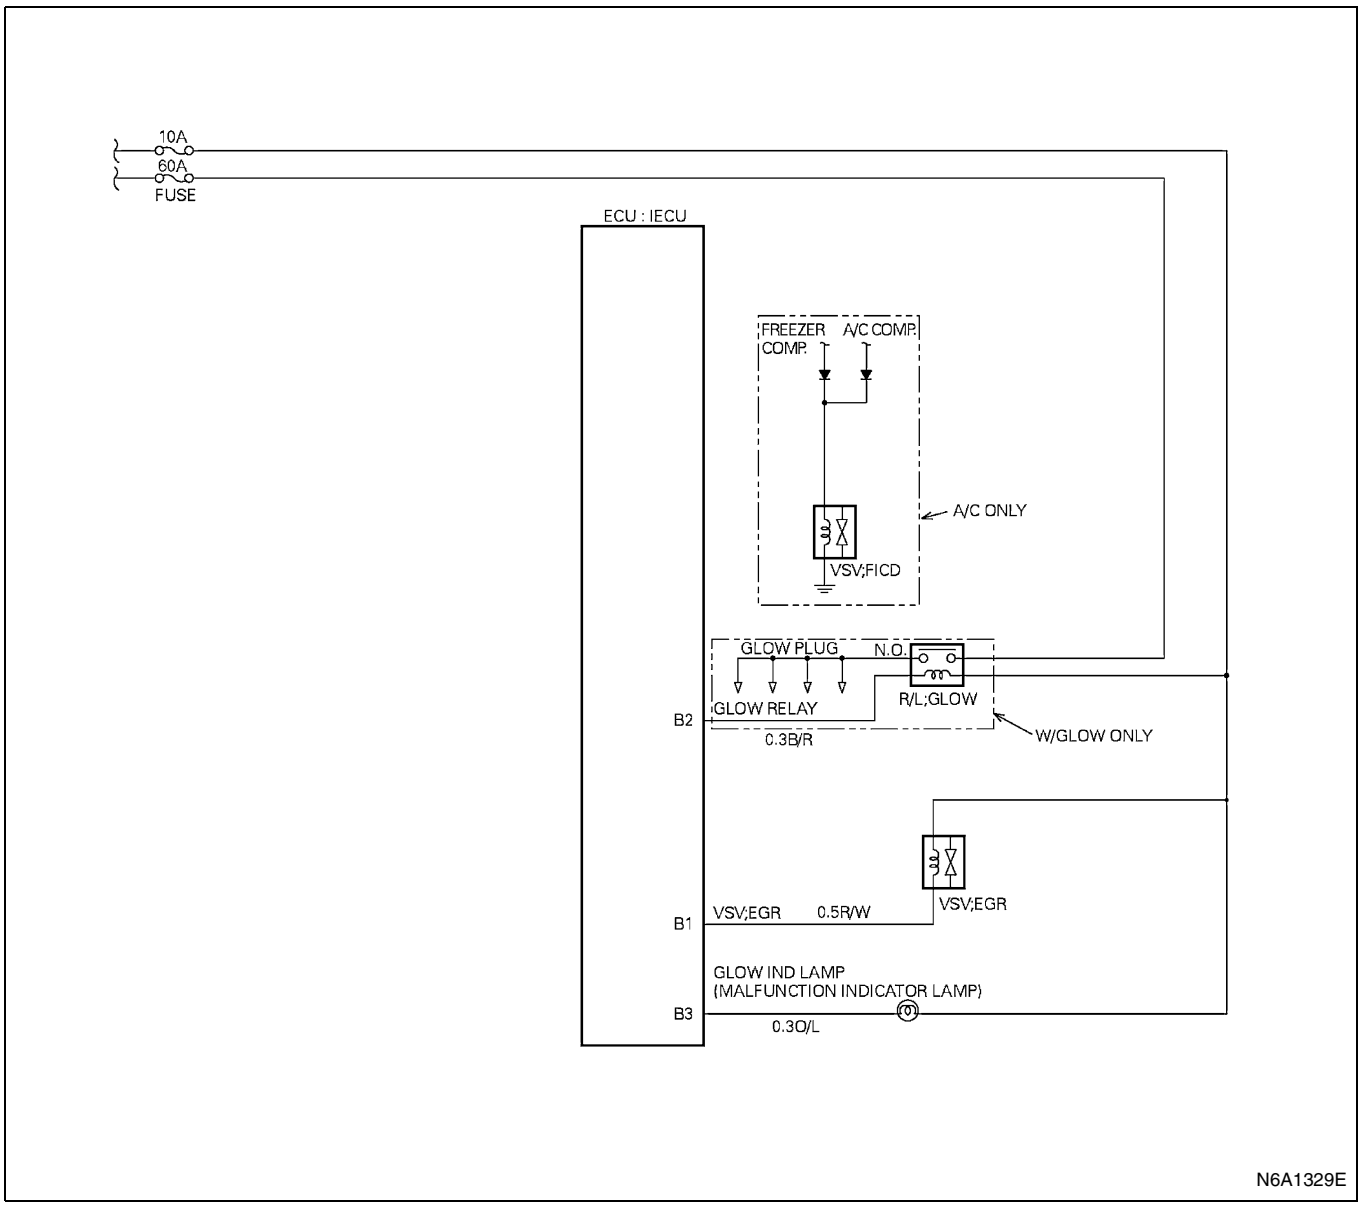
	1 ←→ Body	∞	SIG ←→ Body

Notice:
Resistance value is difference according to the engine temperature (condition of engine warming up).

Step	Action	Value	YES	NO
1	Was the "Diagnostic system check" performed?	—	Go to Step 2	Go to diagnostic system check
2	1. Ignition "OFF". 2. Disconnect the VSV from the wiring harness connector. 3. Ignition "ON" Engine "OFF". 4. Using the Digital Voltmeter (DVM), check for voltage on the "Power supply side terminal" of the VSV harness connector. Does the DVM read the following value?	12 Volt or 24 Volt	Go to Step 4	Go to Step 3
3	1. Check the suspect circuit between the VSV connector and "Engine Ignition". Fuse for the following condition. • A short to ground • An open circuit 2. Repair if necessary. Has DTC 31 been corrected?	—	Go to Step 8	—
4	Using the DVM, check the resistance of the VSV. Does the DVM read the following Value?	37 — 44Ω 159 — 169Ω	Go to Step 5	Go to Step 6
5	1. Ignition "OFF" 2. Disconnect the ECM connector from ECM. 3. Check the VSV circuit between the ECU and VSV connector. • A short to ground • An open circuit 4. Repair if necessary. Has DTC 31 been corrected?	—	Go to Step 8	Go to Step 7
6	Replace the VSV. Is the action complete?	—	Go to Step 8	—
7	Replace the ECM. Is the action complete?	—	Go to Step 8	—
8	1. Reconnect all the connectors removed. 2. Ignition "ON", Engine "OFF". Does DTC 31 come normal condition?	—	Go to Step 9	Go to Step 2

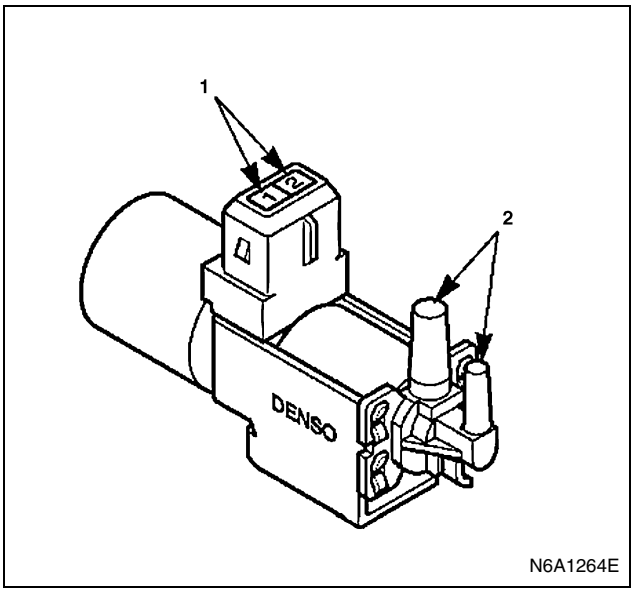
Step	Action	Value	YES	NO
9	Is any current trouble other than DTC 31 displayed by indicator light?	—	Go to trouble code section	Trouble code clear

DTC-32 Exhaust Gas Recirculation (EGR) Vacuum Switching Valve (VSV) Solenoid Control High Voltage



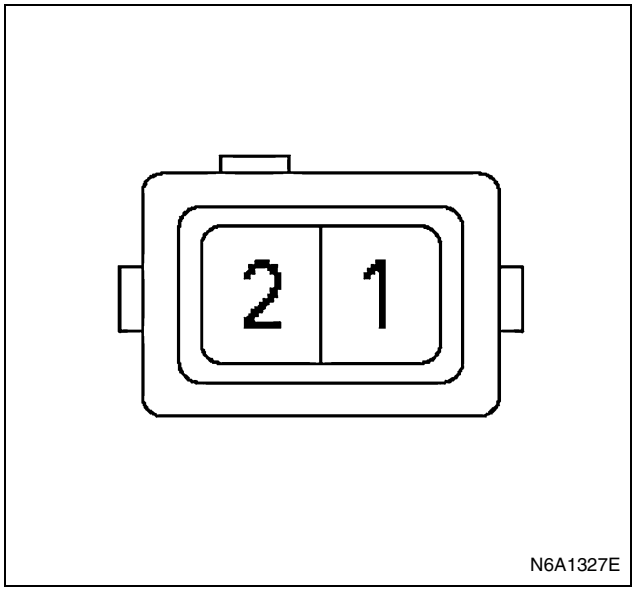
Appearance of Vacuum Switching Valve (VSV): Exhaust Gas Recirculation (EGR) Connector

VSV: EGR



Legend
1. 2 pin
2. Port

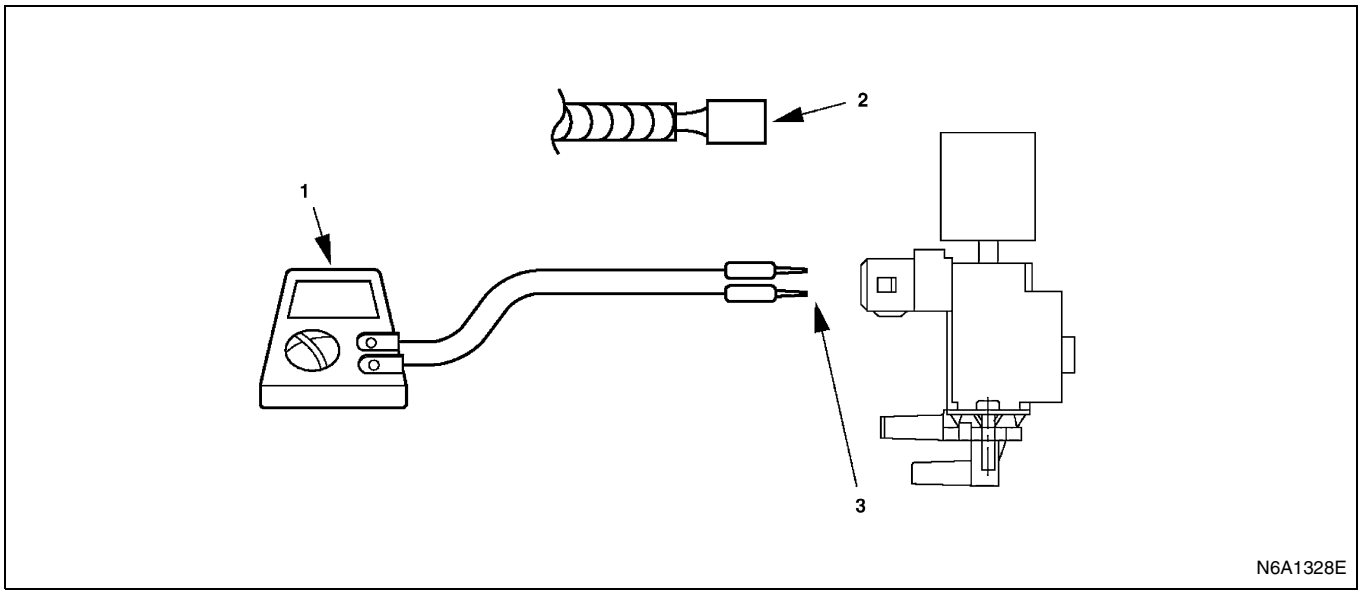
VSV: EGR Connector



Connector No	Signal
1	GND
2	SIG

Measure Resistance at VSV: EGR

Caution:
When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.



Legend
1. Circuit tester
2. Remove VSV wire harness
3. Measure resistance between connector pin

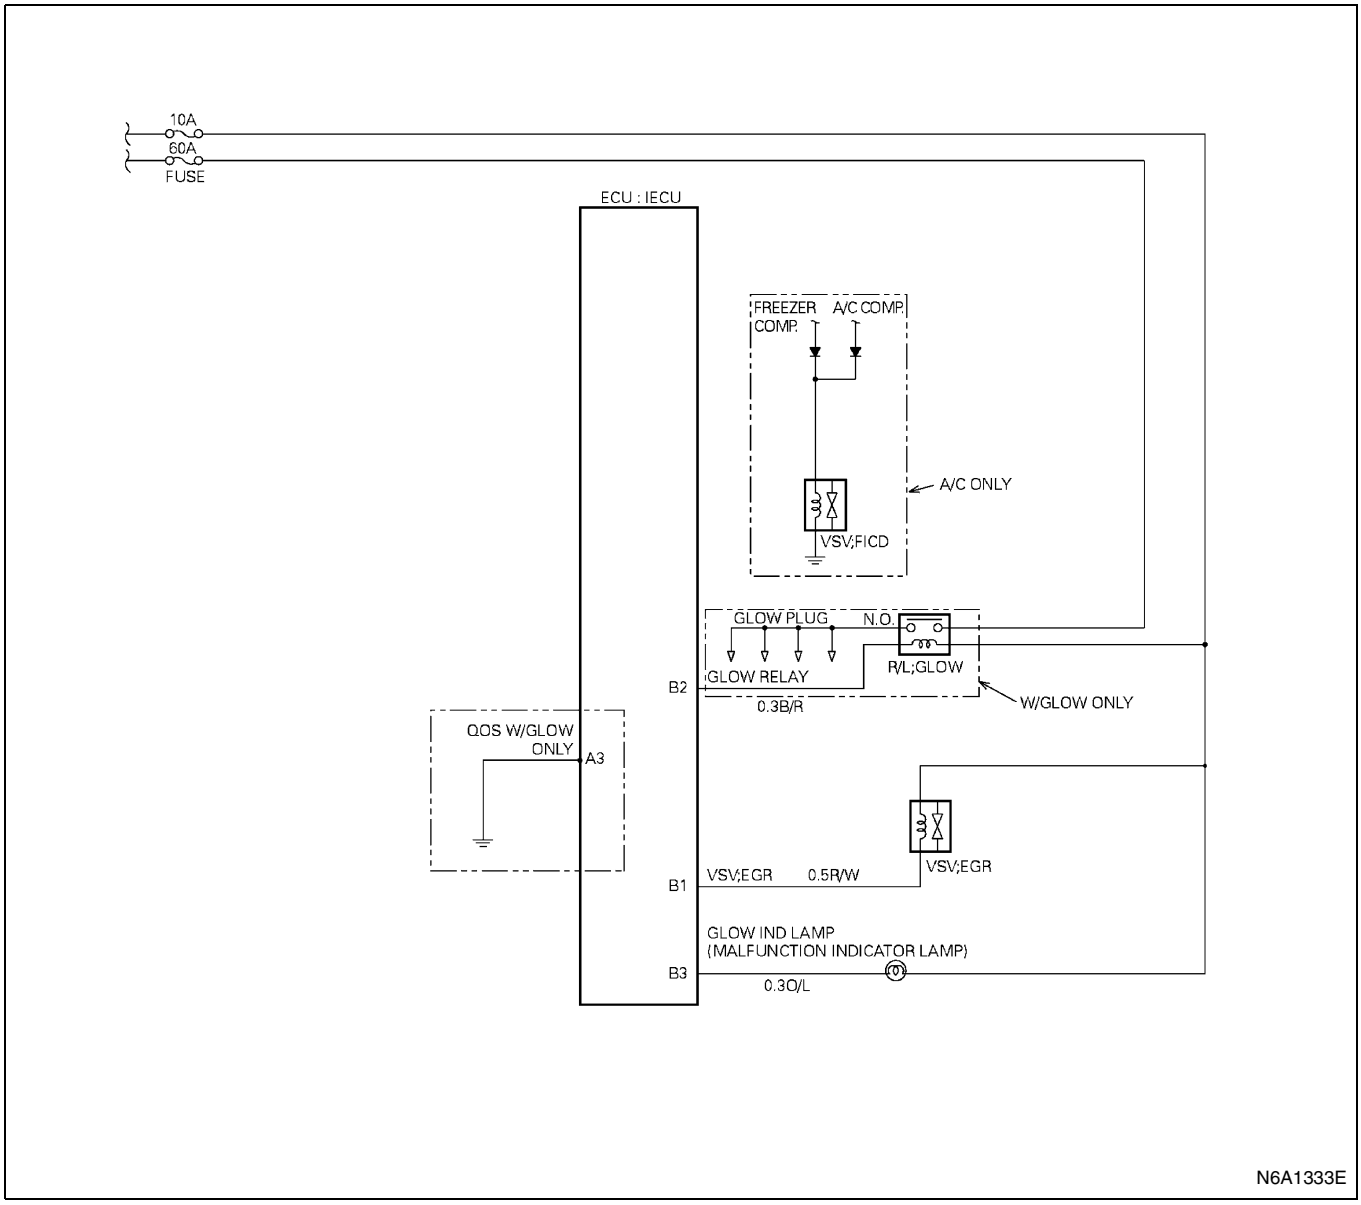
Resistance value

Inspection Point		Resistance Value (kΩ)	Reference
Connector	Pin No.		
2 pin Black	2 ←→ 1	37 to 44 (for 12 volt) 159 to 169 (for 24 volt)	SIG ←→ GND
	1 ←→ Body	∞	SIG ←→ Body

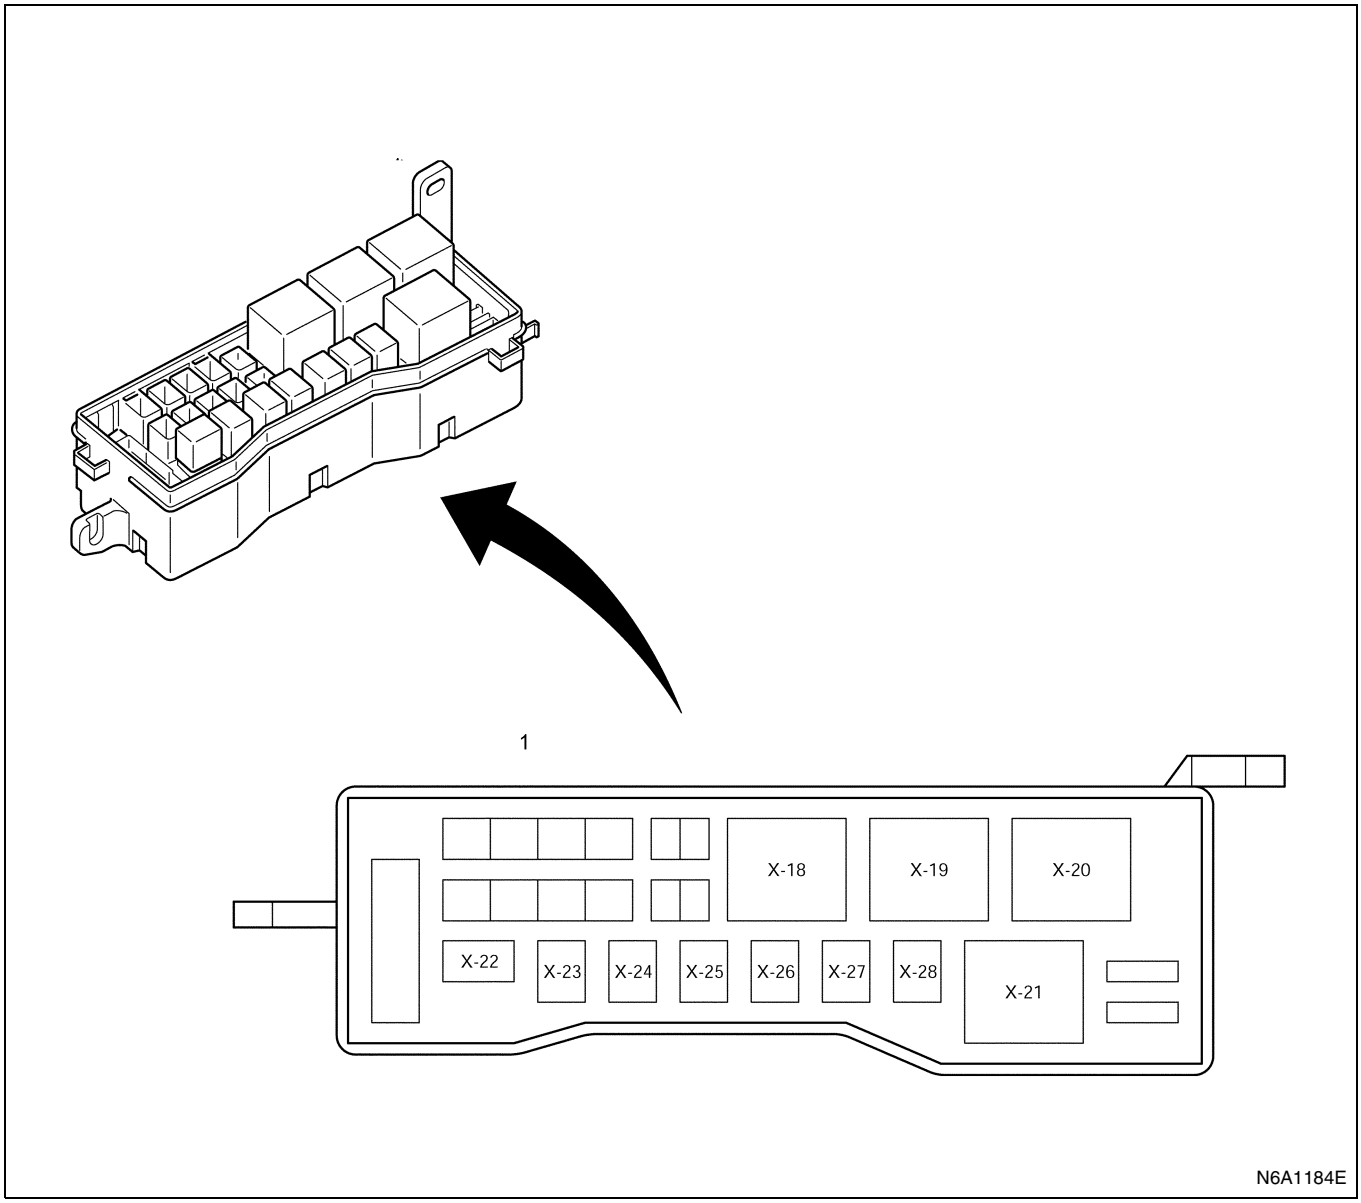
Notice:
Resistance value is difference according to the engine temperature (condition of engine warming up).

Step	Action	Value	YES	NO
1	Was the “Diagnostic system check” performed?	—	Go to Step 2	Go to diagnostic system check
2	Using the DVM, check the resistance of the VSV. Does the DVM read the following Value?	37 — 44Ω 159 — 169Ω	Go to Step 3	Go to Step 4
3	1. Ignition “OFF”. 2. Disconnect the ECM connector from ECM. 3. Check the short to voltage of VSV circuit between the ECM and VSV connector. 4. Repair if necessary. Has DTC 32 been corrected?	—	Go to Step 6	Go to Step 5
4	Replace the VSV. Is the action complete?	—	Go to Step 6	—
5	Replace the ECM. Is the action complete?	—	Go to Step 6	—
6	1. Reconnect all the connectors removed. 2. Ignition “ON”, Engine “OFF”. Does DTC 32 come normal condition?	—	Go to Step 7	Go to Step 2
7	Is any current trouble other than DTC 32 displayed by indicator light?	—	Go to trouble code section	Trouble code clear

DTC-41 Quick On Start (QOS) Relay Control Circuit Low Voltage



Location of Relay



Legend

1. Relay box (Installed on the left side rear of the cab)

NO	RELAY NAME

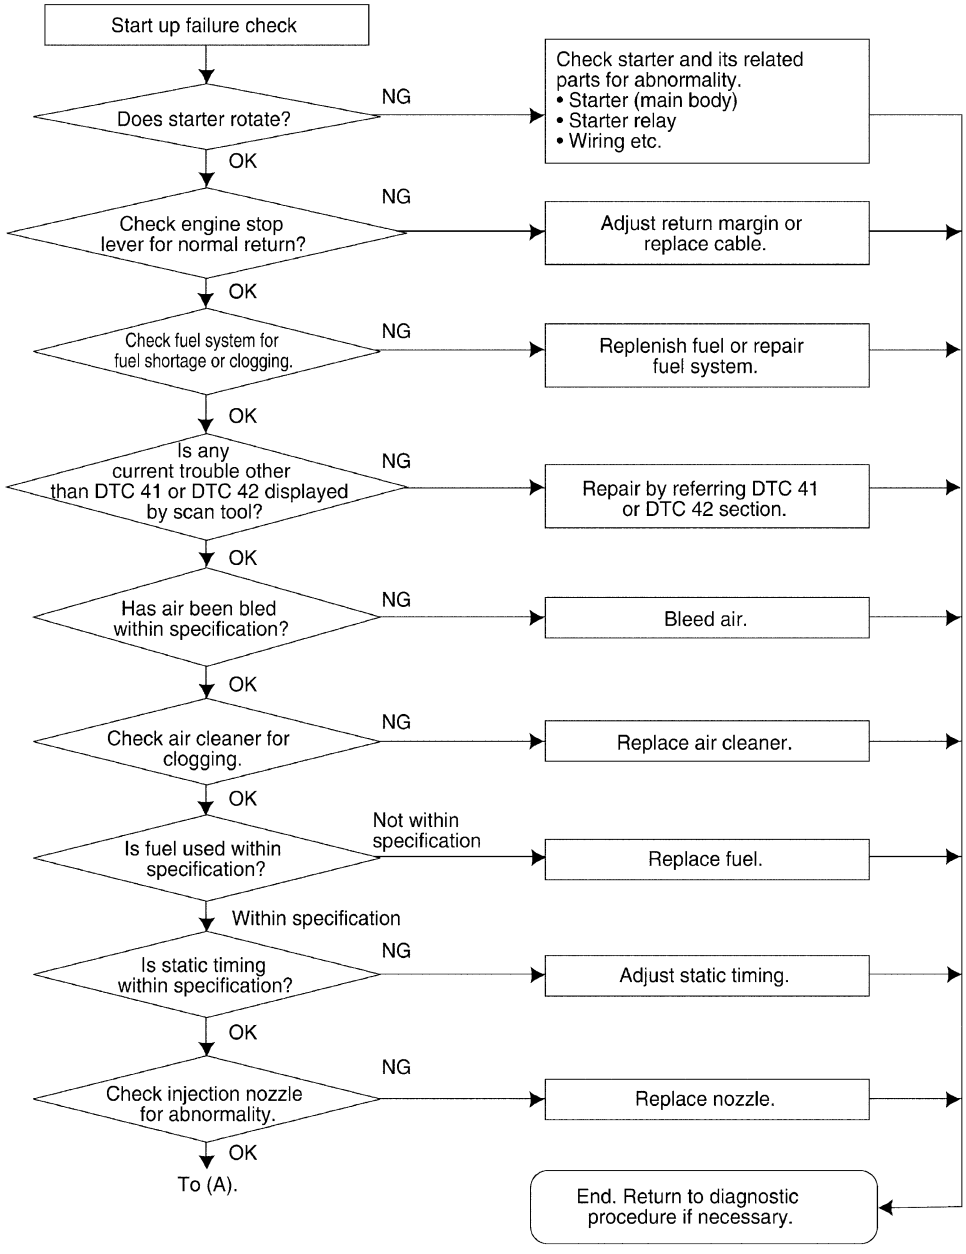
WITHOUT DIAGNOSIS TROUBLE CODE

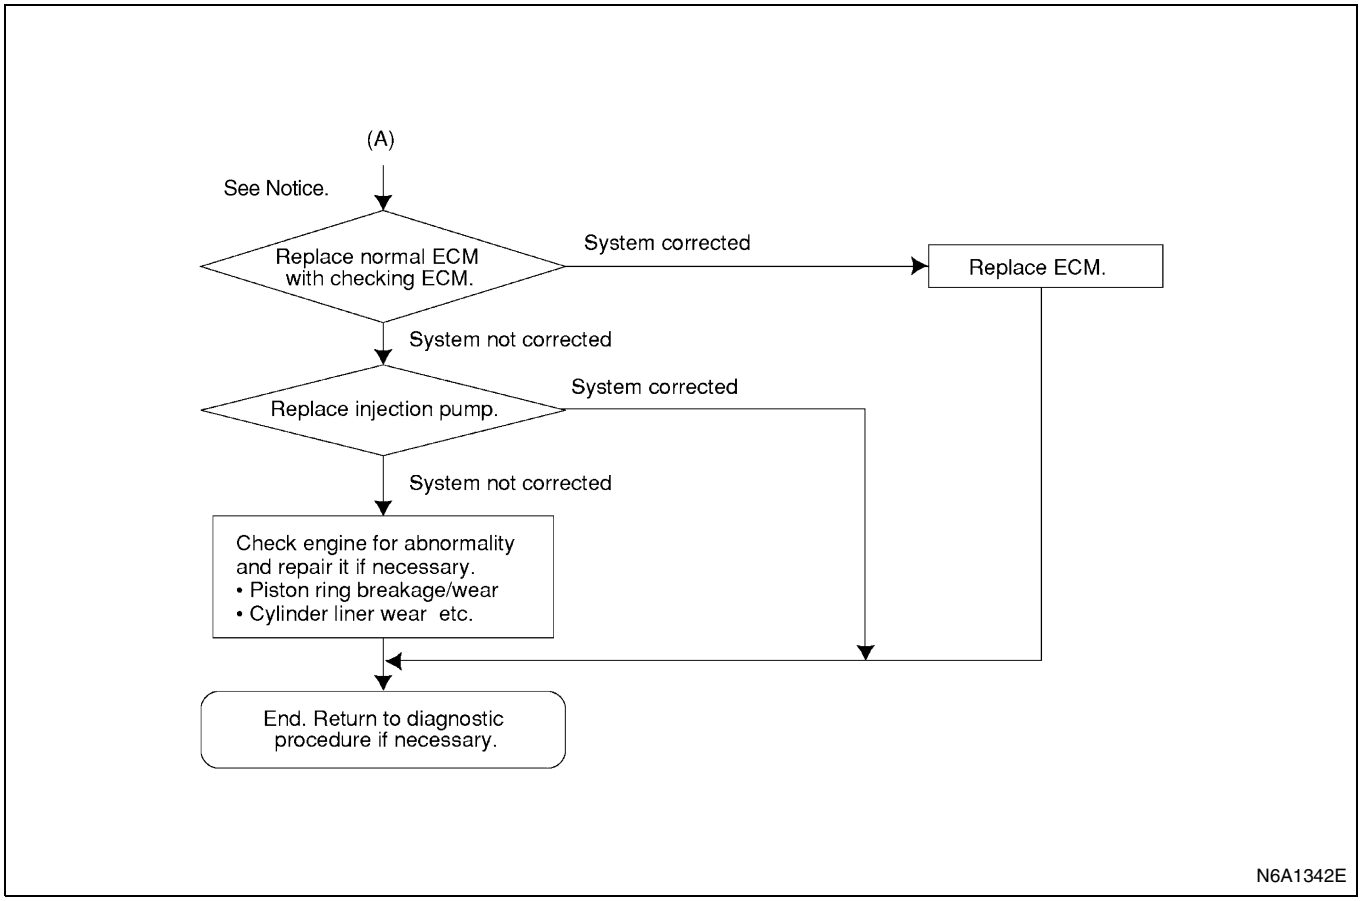
Introduction
If there occurs a malfunction although no Diagnostic Trouble Code (DTC) is generated, then inspect and repair the system in accordance with the flowcharts given on the following pages.

When a Diagnostic Trouble Code (DTC) is produced, inspect and repair system with reference to “EMISSION AND ELECTRICAL DIAGNOSIS”

Startup Failure (Quick On Start (QOS) only)

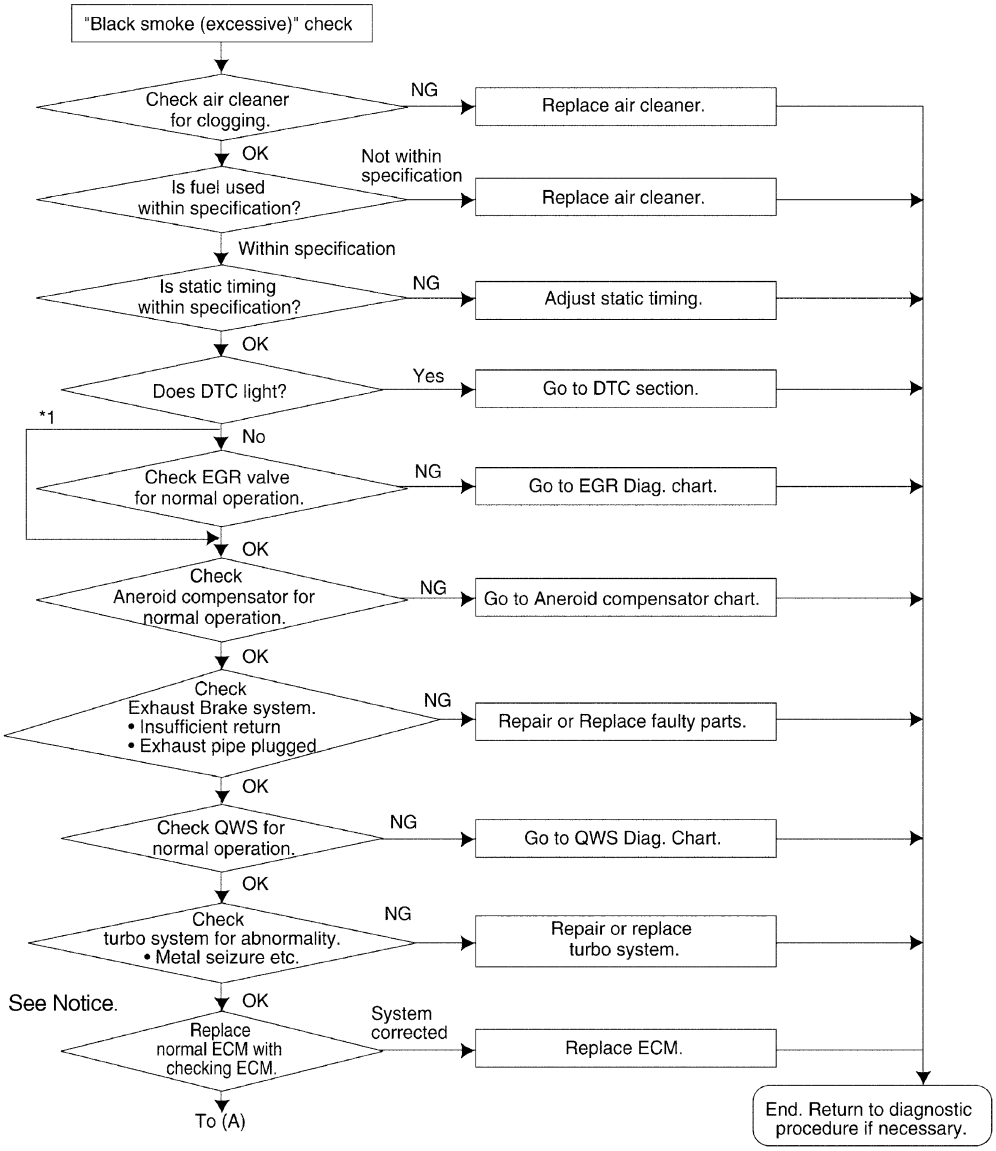


N6A1341E

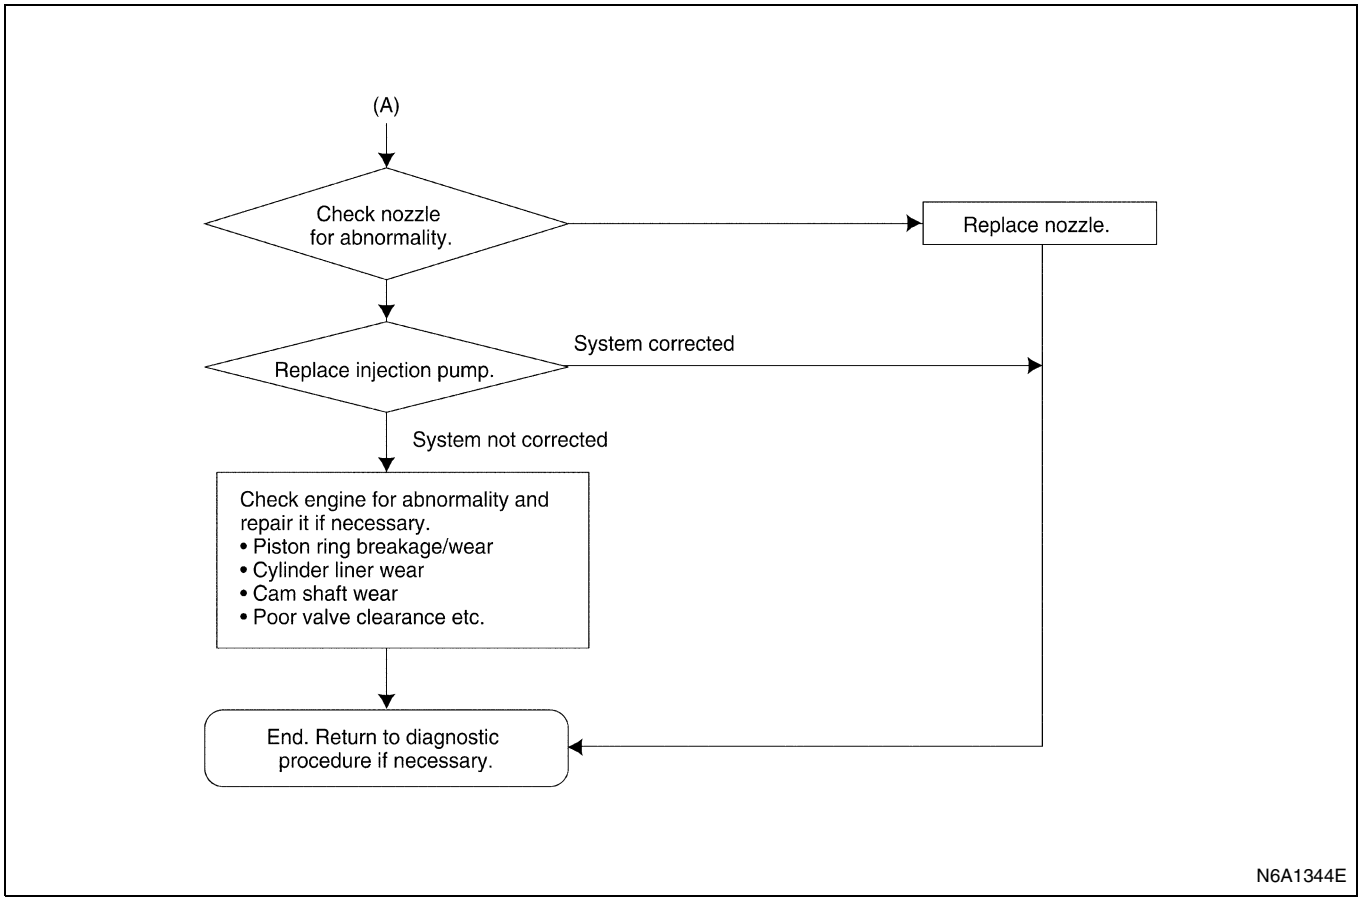


Notice:
The condition of the system in which the malfunction has occurred should be checked by making comparisons between the vehicle Engine Control Module (ECM) and the checking ECM.

Black Smoke (Excessive)



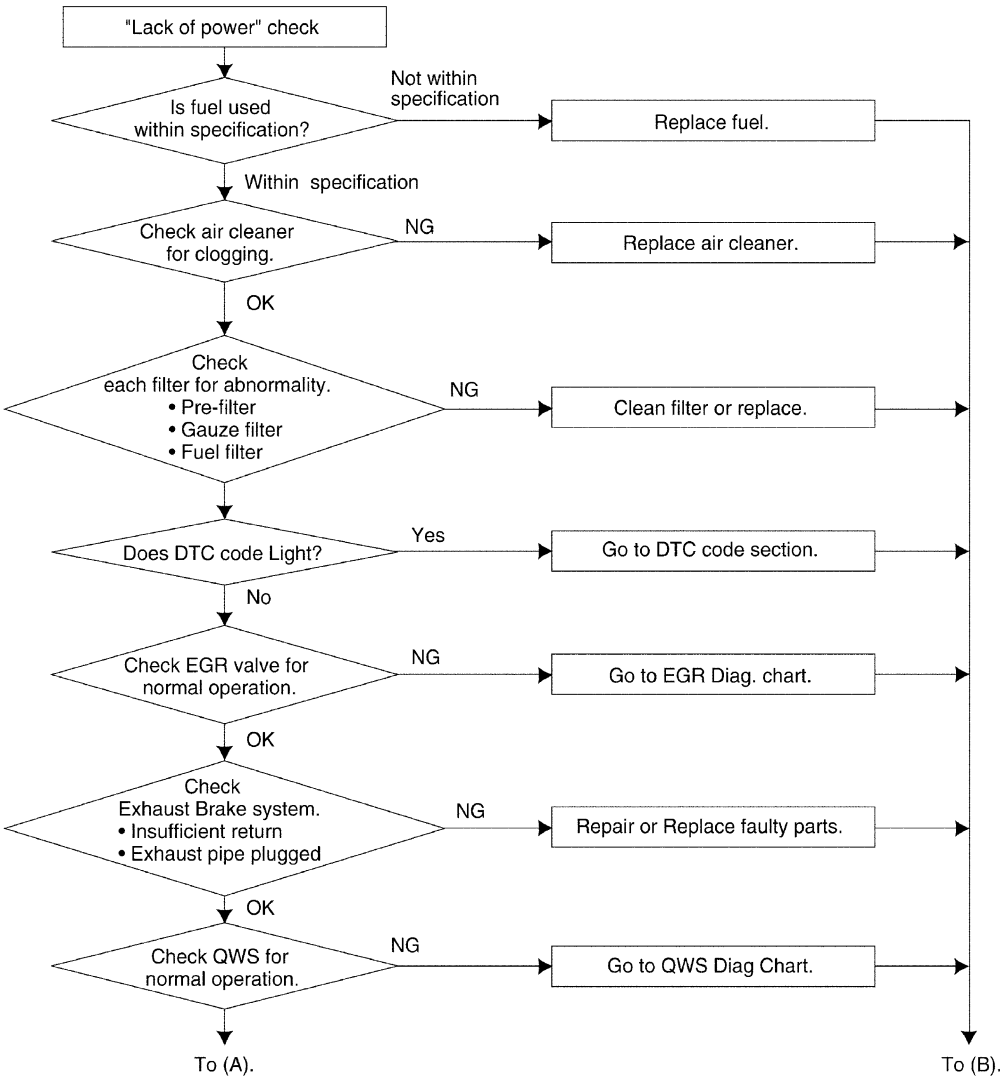
N6A1343E



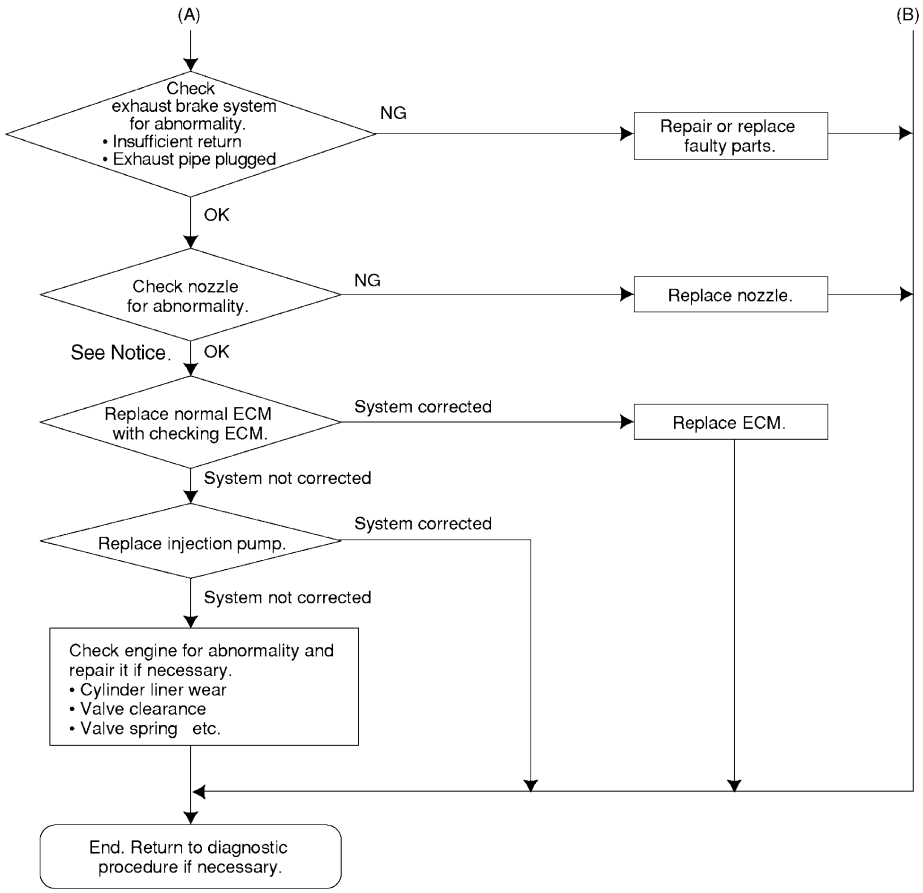
Notice:
The condition of the system in which the malfunction has occurred should be checked by making comparisons between the vehicle Engine Control Module (ECM) and the checking ECM.

Refer to a trouble code for a supplier's check, if available.

Lack of Power



N6A1345E



N6A1346E

Notice:
The condition of the system in which the malfunction has occurred should be checked by making comparisons between the vehicle Engine Control Module (ECM) and the checking ECM.

N6A1349E

Inspection

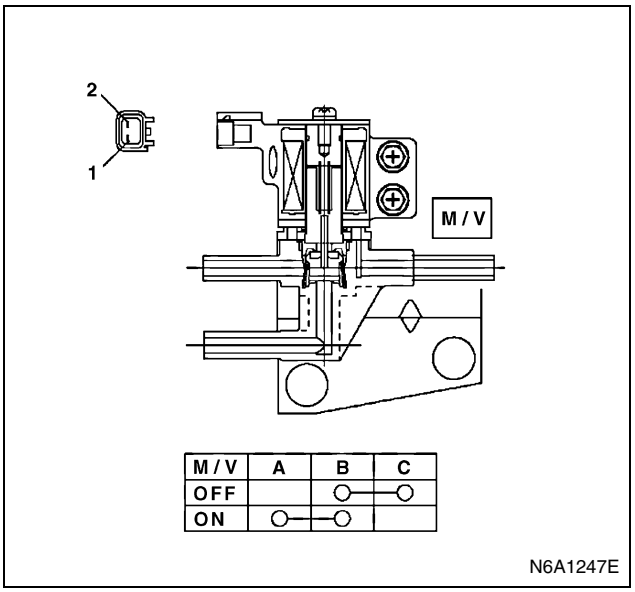
1. Exhaust Brake Magnetic Valve

Inspection

Connect the magnetic valve connector terminal No.1 and No.2 to (+) terminal and (-) terminal of battery, respectively, and check the continuity between the ports.

Caution:

When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.



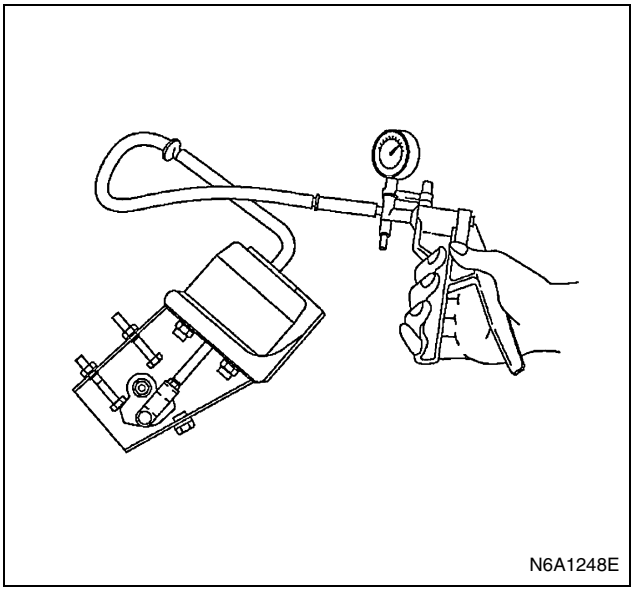
Legend

A. Inlet (Vacuum pump)
B. Outlet (unit)
C. EXH (air filter)

2. Exhaust Throttle Valve

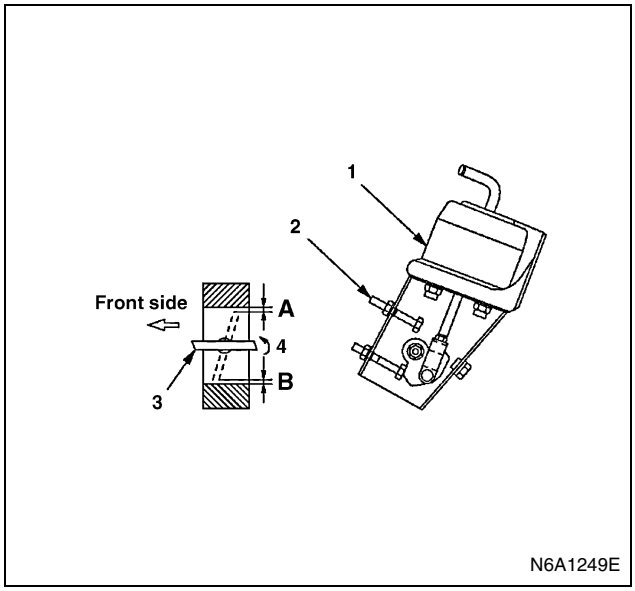
Working Check

Actuate the exhaust brake with the engine idling and make sure that you hear the valve strike on the stopper.



Airtight Check

Apply a negative pressure of 53.3 — 93.3 kPa (400 — 700 mmHg/7.73 — 13.54 psi) to the power chamber by means of a vacuum pump and make sure of the smooth opening/closing of the exhaust brake valve.



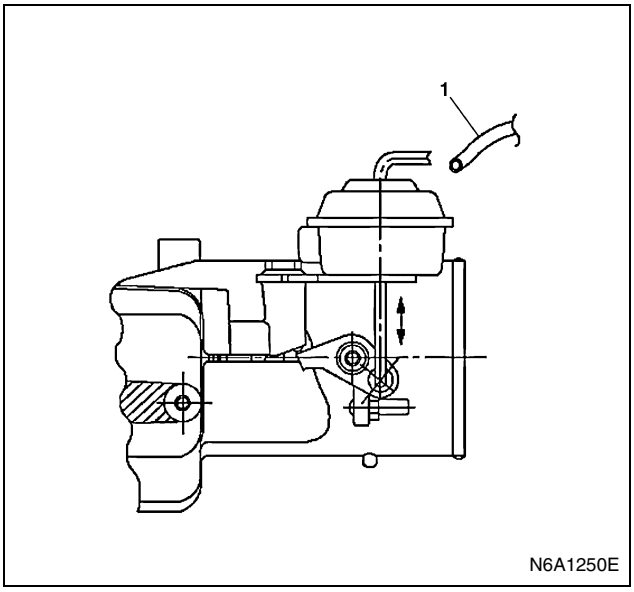
Legend

1. Power chamber
2. Adjust bolt
3. Valve
4. Close

Apply a negative pressure of 86.7 — 93.3 kPa (650 — 700 mmHg/12.57 — 13.54 psi) to the power chamber using a vacuum pump and make sure the average of measurements at Point A and Point B of the clearance between valve and body is as follows:

0.4 — 0.6 mm (0.016 — 0.024 in) (Minimum: 0.4 mm/0.016 in)

If the clearance is out of this range, adjust with the adjusting bolt.



Legend

1. Vacuum hose

3. Intake Throttle Valve

Working Check

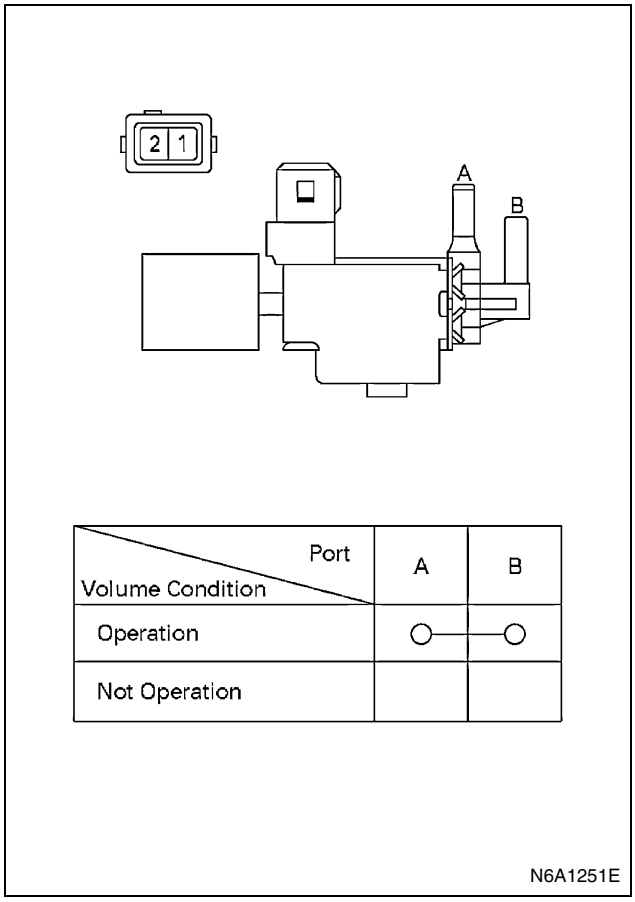
Disconnect the vacuum hose from the actuator and try to move the rod by hand, making sure of the smooth move of the rod.

4. EXHAUST GAS RECIRCULATION (EGR) SYSTEM MALFUNCTION4. Vacuum Switching Valve; Intake Throttle

Inspection

Connect the vacuum switching valve connector terminals No.1 and No.2 to (+) terminal and (-) terminals of battery, respectively, and check the continuity between the ports.

If the check result is abnormal, repair or replace the valve.



5. Accelerator Switch (2-pole connector type)

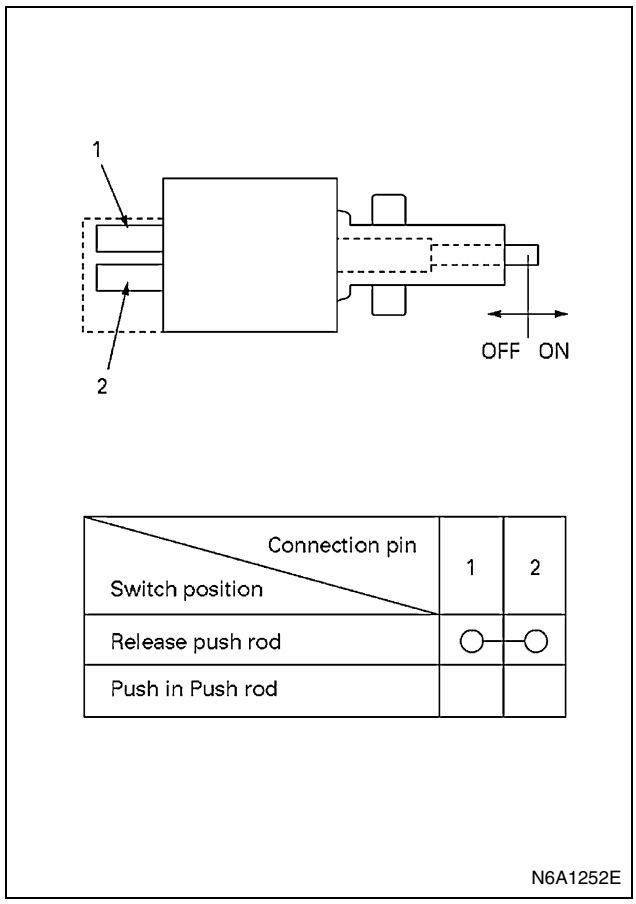
Inspection

1) Check the continuity between the switch connector terminals.

Caution:

When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.

2) Check the smooth move of the pushrod. If the check result is abnormal, repair or replace the pushrod.



Removal

1) Accelerator Switch
   Disconnect the connector.
   Loosen the lock nut.
   Turn the switch to remove.

Reinstallation

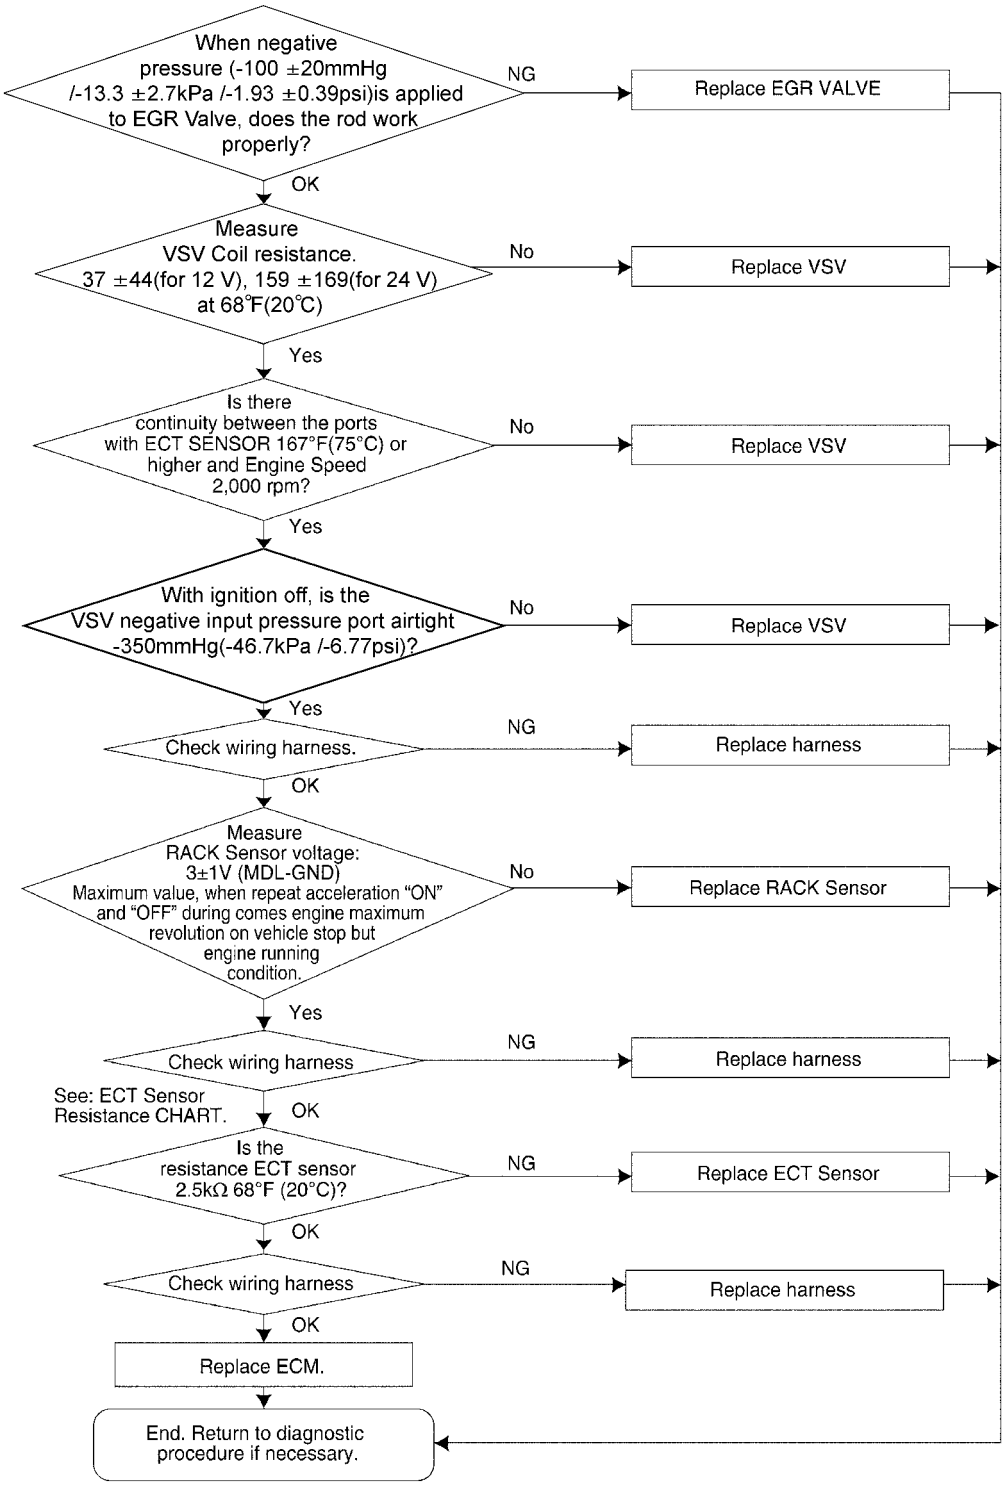
To install, follow the removal procedure in reverse order:

1) Drive the threaded part of the switch until its end surface becomes flush with that of the bracket side of nut.
2) Tighten the lock nut.

Tighten:

- Lock nut to 1.3 N·m (0.13 kg·m/11.5 lb·in)

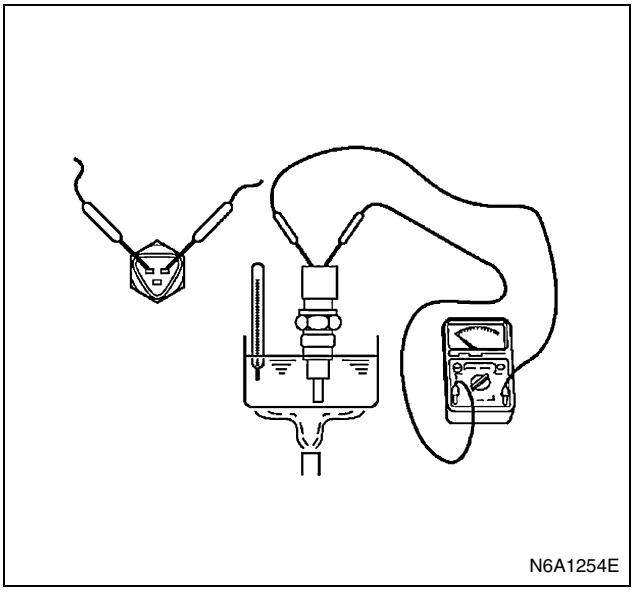
Exhaust Gas Recirculation (EGR) System Malfunction



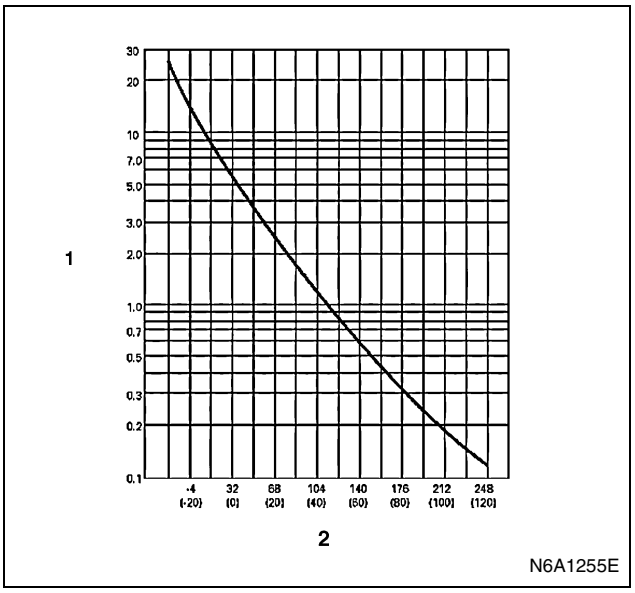
N6A1680E

Inspection

1. Thermosensor (Engine coolant temperature)
   Soak the temperature sensitive part of a thermosensor in the water, and while changing the water temperature, make sure the resistance is changed as the following graph shows:



N6A1254E



N6A1255E

Legend
1. Resistance (kΩ)
2. ECT °F (°C)

2. Vacuum Switching Valve (VSV)

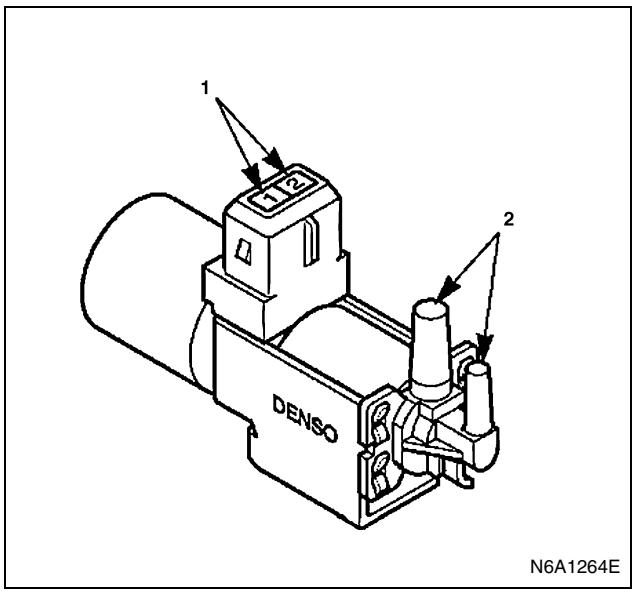
Resistance Check

Check the resistance between the VSV connector terminals using a circuit tester.

Cold Resistance

: 37 — 44 (Ω) (for 12 volt model)

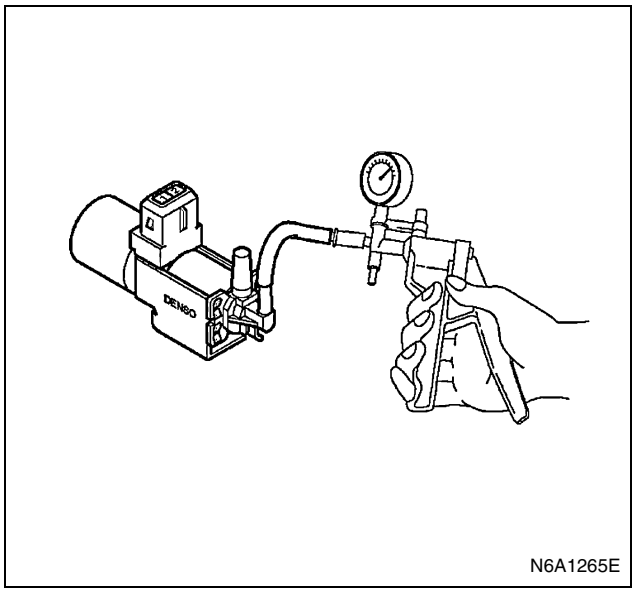
: 159 — 169 (Ω) (for 24 volt model)



N6A1264E

Legend
1. 2 Pin
2. Port

Connect battery voltage between VSV connector terminals and make sure of the continuity between the ports.

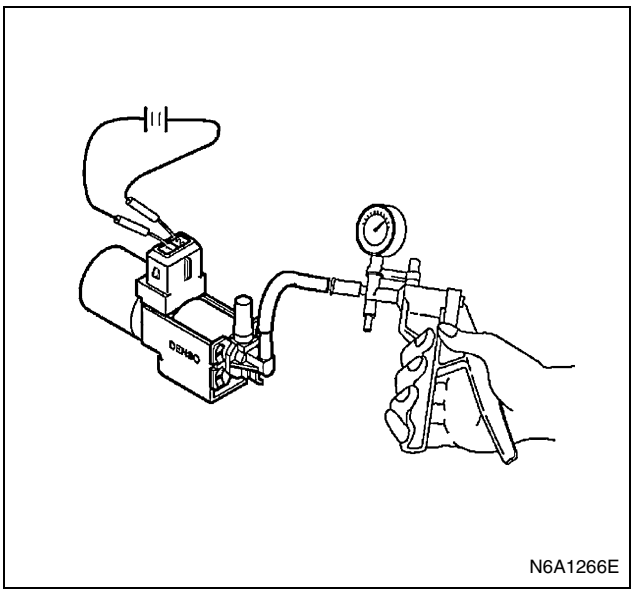


N6A1265E

Airtight Check

Apply negative pressure to the negative pressure input port as illustrated on the left.

Although there is leakage, it is no problem if the negative pressure rises to -46.7 kPa (-350 mmHg / -6.77 psi) or more.



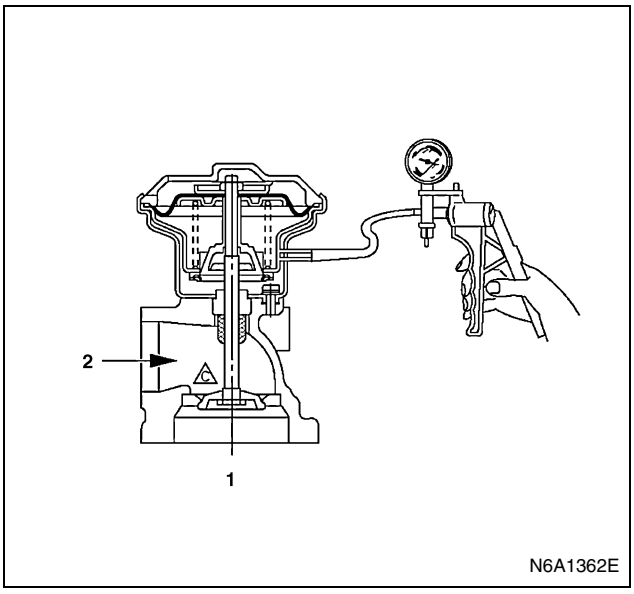
Working Check

Apply powervoltage between the terminals, there is no problem if the negative pressure does not rise when applied to the input port.

Caution:

When measuring resistance with a circuit tester, be careful not to damage or deform the terminals.

3. Exhaust Gas Recirculation (EGR) Valve
   With negative pressure applied to the diaphragm chamber, make sure that the valve is smoothly actuated to make the area between (1) and (2) ventilated.
   Startup: About -13.3 ± 2.7 kPa (-100 ± 20 mmHg / -1.93 ± 0.39 psi)



Check to see if EGR valve is normally actuated under the following conditions:

Engine coolant temp.: 80°C (176°F) or higher

SPECIAL TOOLS

Illustration	Tool Number / Description / Remarks

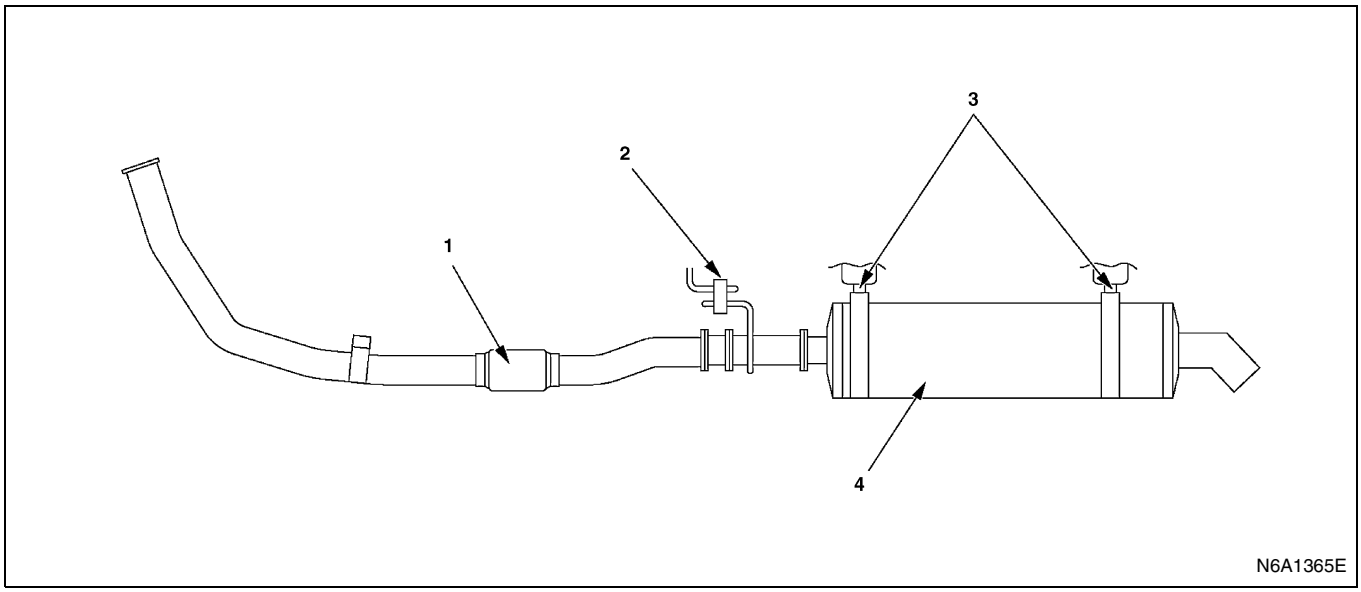
Installation 6F-5

GENERAL DESCRIPTION

Component



Legend

1. Flexible tube
2. Rubber support
3. Rubber mount
4. Silencer with converter

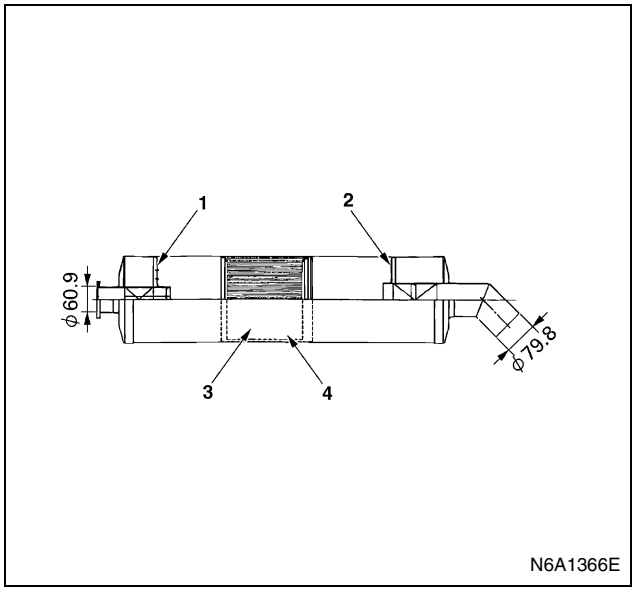
The vehicle is equipped with a single horizontal exhaust system which consists of a front exhaust pipe with a heat shield attached, a main exhaust pipe, a silencer with catalytic converter and a tail pipe.
An engine exhaust brake is attached between the front exhaust pipe and the exhaust manifold.
The exhaust brake, when turned on, restricts the flow of exhaust gases and thereby slows the engine.
Be sure the exhaust brake system is turned off before performing any exhaust system diagnosis.

Gasket

The gasket must be replaced whenever a new exhaust pipe, muffler or exhaust throttle is installed.

Catalytic Converter

For Taiwan



Legend

2. Outlet assembly
3. Catalyst assembly
4. P.NO.

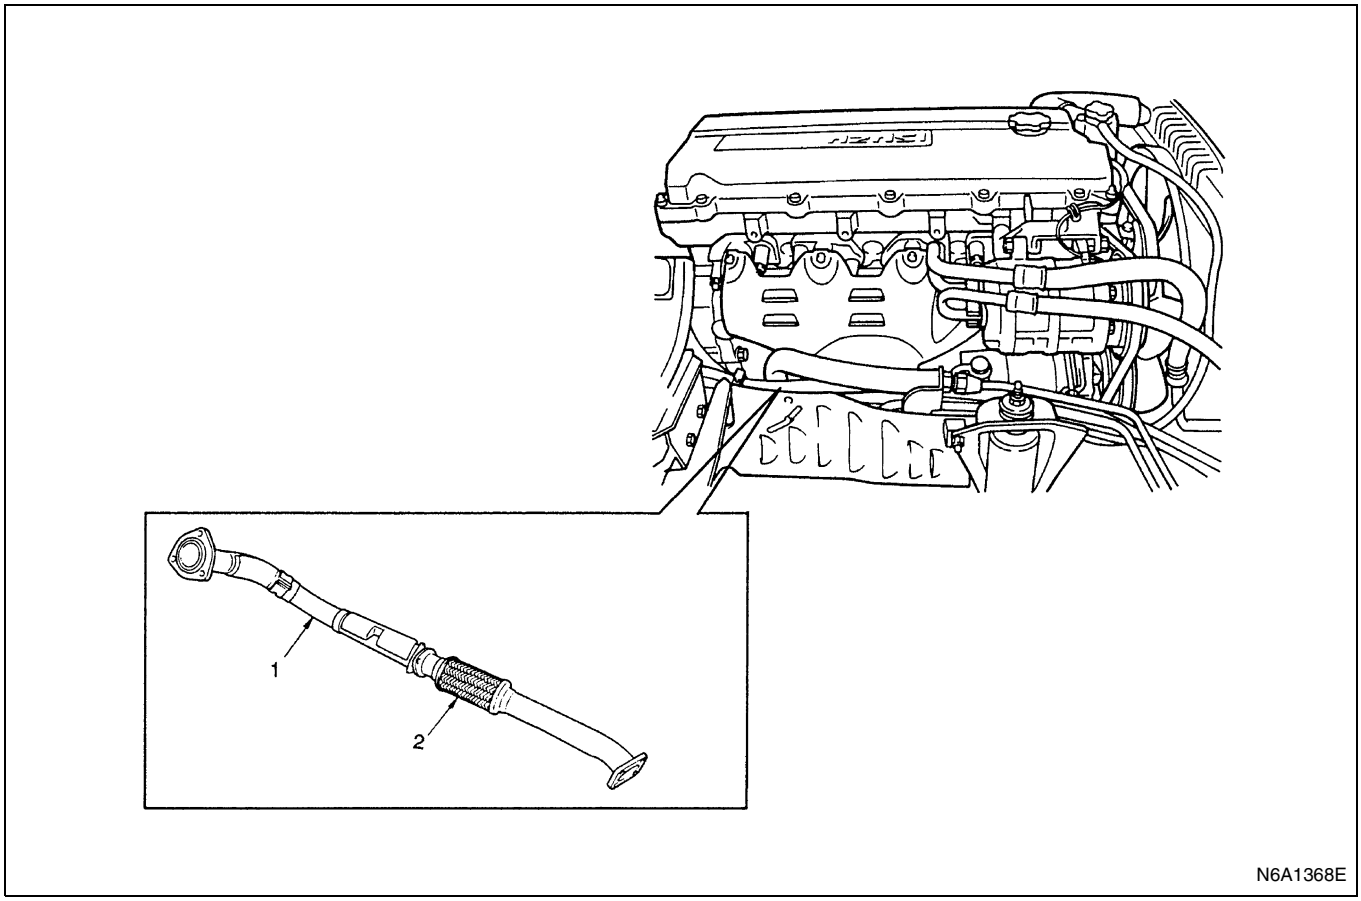
ON-VEHICLE SERVICE

Rattles and noise vibrations in the exhaust system are usually caused by misalignment of parts. When aligning the system, leave all bolts or nuts loose until all parts are properly aligned; then tighten, working from front to rear.

1. Check connections for looseness or damage, especially for exhaust gas leakage.
2. Check clamps and rubbers for weakness, cracks or damage.
3. Check for dents or damage and for any holes or cracks caused by corrosion.

Component

Front Exhaust Pipe



Legend

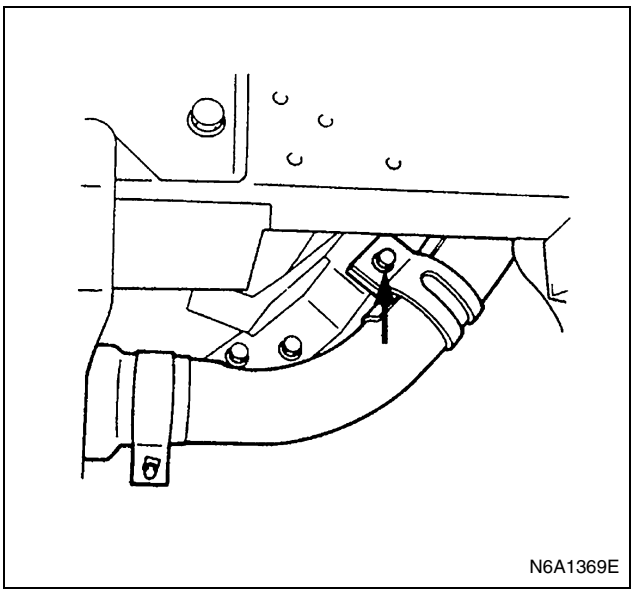
1. Front exhaust pipe I (Exhaust manifold side)
2. Front exhaust pipe II (Exhaust brake side)

Removal

Preparation

- Disconnect battery negative cable.

1. Front Exhaust Pipe I (Exhaust manifold side)
   - Remove the three nuts from front exhaust pipe I (exhaust manifold side)
   - Remove the bolt from mounting bracket (engine right side)



- Remove the four bolts and nuts from front exhaust pipe II (exhaust brake side)

2. Front Exhaust Pipe II (exhaust brake side)

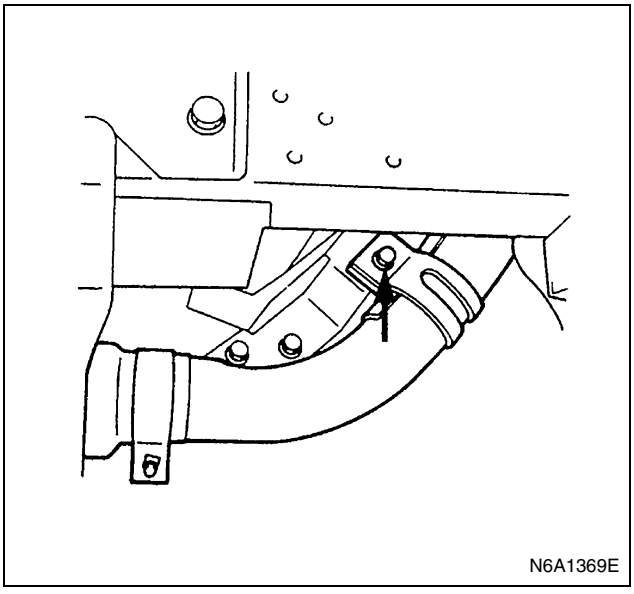
Installation

1. Front Exhaust Pipe II (exhaust brake side)

Tighten:
Exhaust brake unit fixing bolt to 17 N·m (1.7 kg·m/12 lb·ft)

2. Front Exhaust Pipe I (exhaust manifold side)

Tighten:
Exhaust Pipe II side to 17 N·m (1.7 kg·m/12 lb·ft)
Mounting Bracket Bolt to 18 N·m (1.8 kg·m/13 lb·ft)



Tighten:
Manifold Fixing Nut to 67 N·m (6.8 kg·m /49 ft·lb)

- Connect battery ground cable.
- Start engine and check for exhaust gas leakage from exhaust pipes.

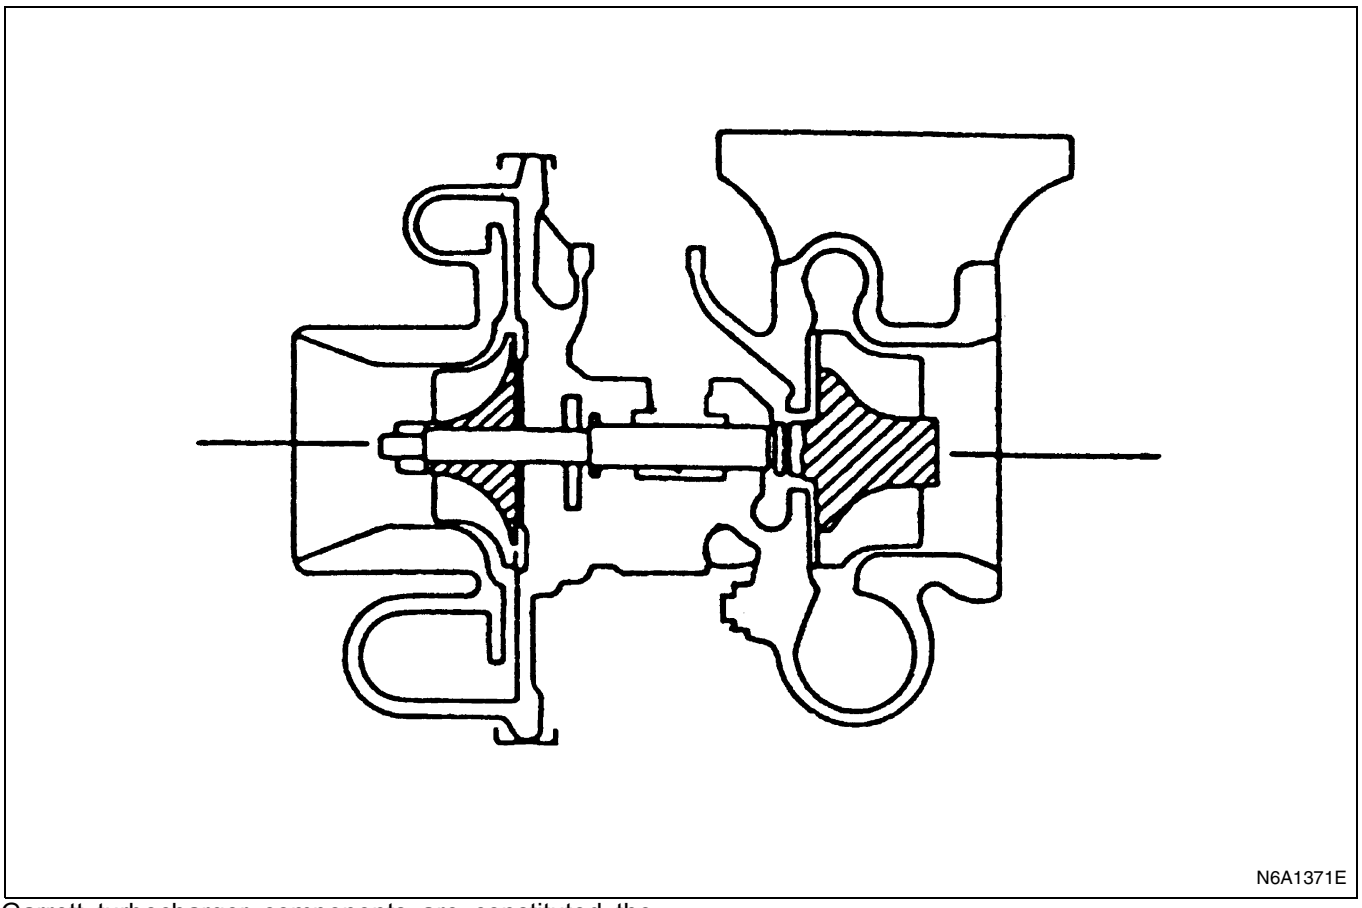
GENERAL DESCRIPTION

Turbocharger



N6A1371E

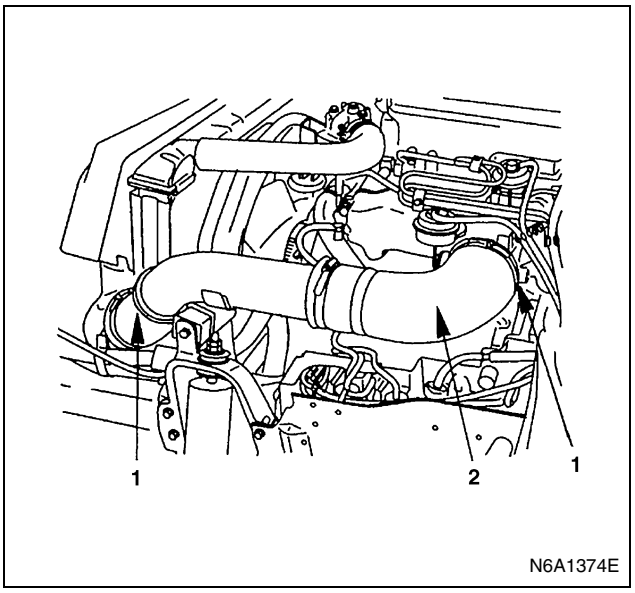
Garrett turbocharger components are constituted the Center Housing and Rotating Assembly (CHRA), the compressor housing, and the turbine housing.
Rotating parts include the turbine shaft, the compressor wheel, the shaft bearings, the thrust bearings and the oil seal rings. These parts are supported by the center housing.
The turbocharger bearing and turbine shaft are lubricated with engine oil and at the same time are cooled with engine coolant to improve their durability.
The turbocharger increase air intake efficiency, the results in increased engine power, reduced fuel consumption and minimal engine noise.
Turbocharger rotating parts operate at very high speeds and temperatures. The parts materials have been carefully selected and machined to extremely high precision.
The turbocharger for 4HG1-T Engine has a unit construction of turbine housing and exhaust manifold.
Color for caution plate on the 4HE1-TC turbocharger are, EURO3 vehicles have a blue caution plate. All other vehicles have a silver caution plate.

ON-VEHICLE SERVICE

Charge Air Pipe

Removal

1. Connecting hose clamps.
2. Connecting hoses.



3. Bracket bolts and washers and charge air pipe.
4. Clamps.
5. Connecting hose.
6. Bracket accelerator cable.
7. Bracket engine stop cable and vacuum hose.
8. Engine harness connector.
9. Charge air pipe.
10. Gasket.

Caution:

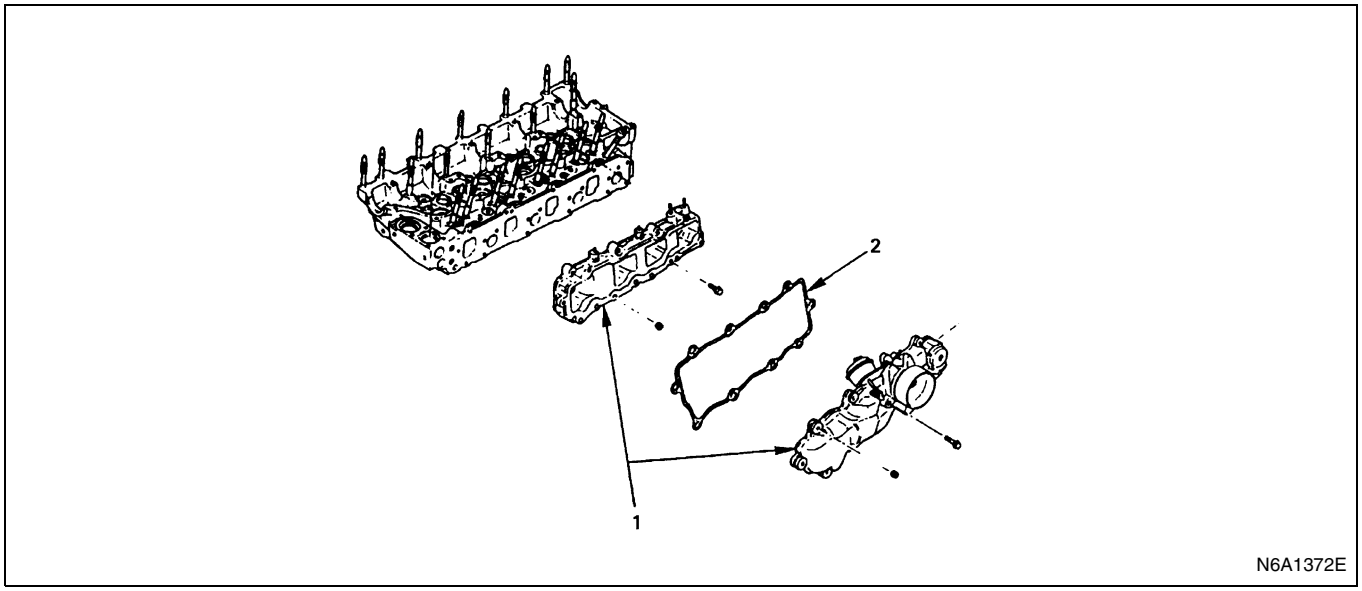
- Check hoses for deterioration, or damage.
- Charge air pipes for damage.

Installation

1. Gasket to the intake manifold.
2. Charge air pipe.
3. Engine harness connector.
4. Bracket engine stop cable and vacuum hose.
5. Bracket accelerator cable.
6. Connecting hose.
7. Clamps.
8. Charge air pipe and bracket bolts.
9. Connecting hoses.
10. Clamps.

Intake Manifold

Component



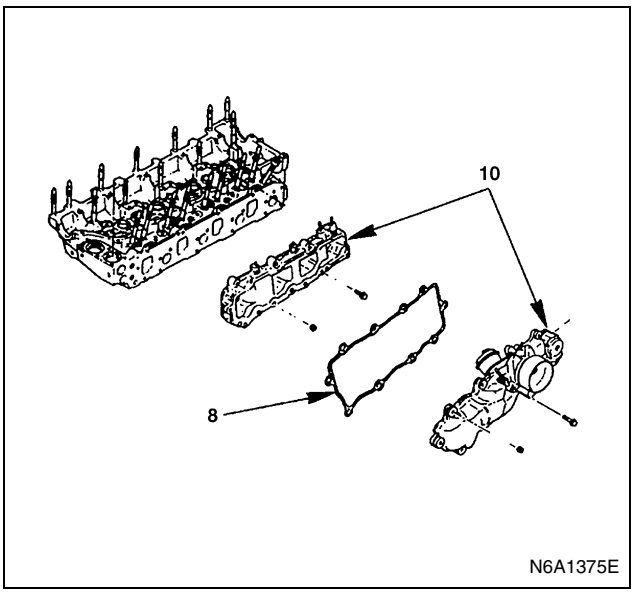
Legend

1. Intake manifold
2. Intake manifold gasket

Removal

1. PCV hose.
2. Accelerator cable injection pump side.
3. Connecting hose.
4. Bracket accelerator cable.
5. Bracket engine stop cable and vacuum hose.
6. Engine harness connector.
7. Charge air pipe.

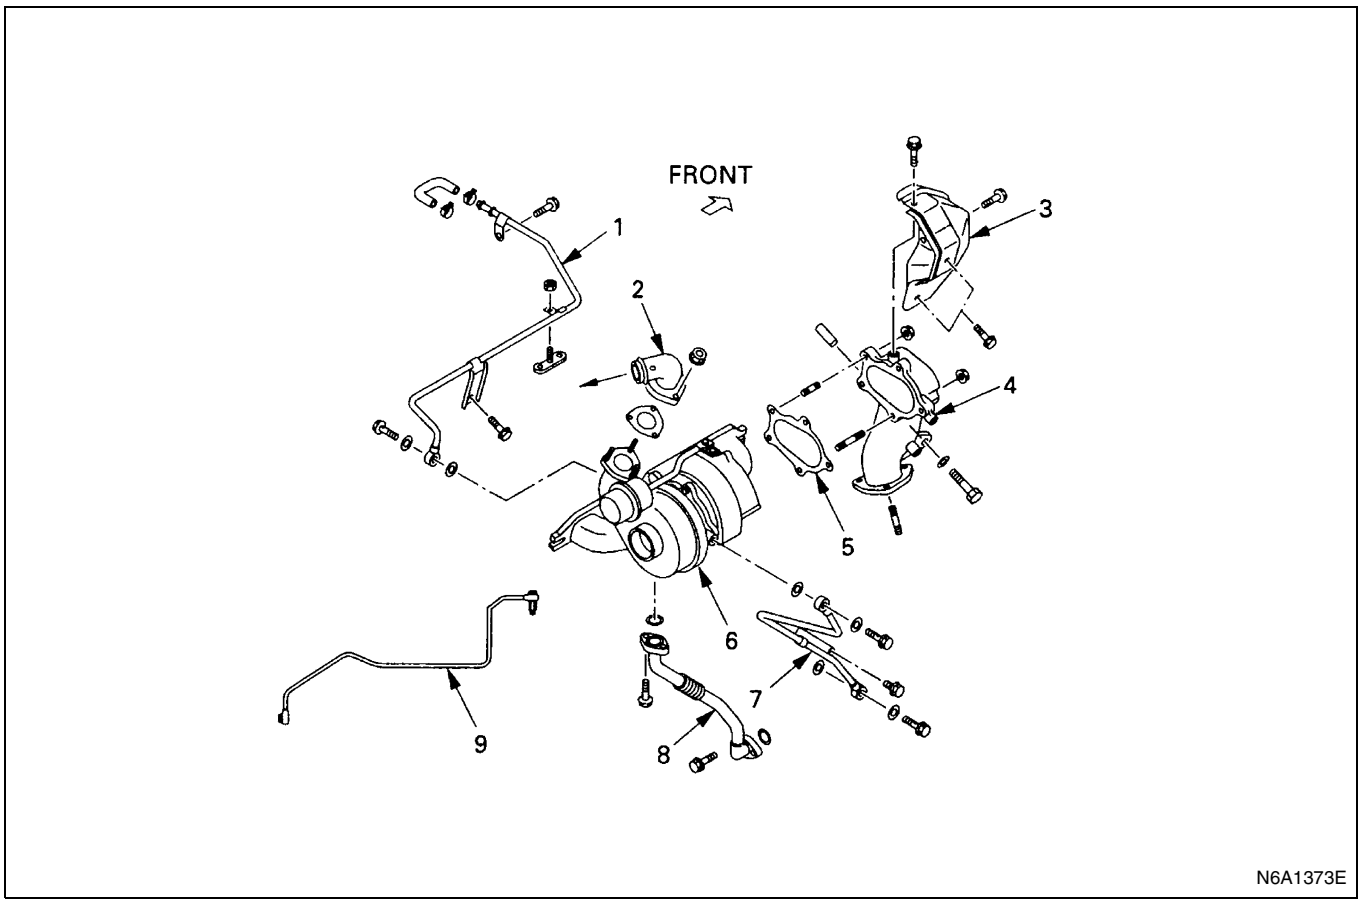
8. Gasket.
9. Injection pipe.
10. Intake manifold.
11. Gasket and discard.



Turbocharger

Refer to “Statement on Cleanliness and Care” previously in this section.

Component



Installation

1. Intake manifold.

Tighten:
Intake manifold to 19 N·m(1.9 kg·m/ 14 lb·ft)

2. Injection pipe

Tighten:
Fuel injector line nuts to 26 N·m(2.7 kg·m/ 20 lb·ft)

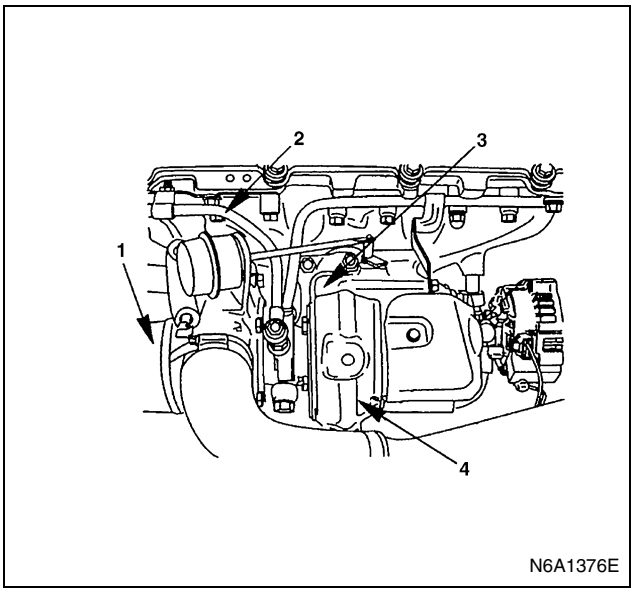
3. Gasket
4. Charge air pipe.
5. Engine harness connector.
6. Bracket engine stop cable and vacuum hose.
7. Bracket accelerator cable.
8. Connecting hose.
9. Accelerator cable injection pump side.
10. PCV hose.

Legend

1. Water return pipe
2. Turbocharger intake pipe
3. Heat shield
4. Exhaust adapter
5. Gasket
6. Turbocharger assembly
7. Water feed pipe
8. Oil return pipe
9. Oil feed pipe

Removal

1. Turbocharger air inlet pipe.
2. Turbocharger intake pipe.
3. Connecting hose.
4. Exhaust gas recirculation (EGR) pipe.
5. Heat shield bolt.
6. Water feed and drain lines.
7. Oil feed line.
8. Oil drain line.
9. Exhaust pipe to exhaust adapter nuts.
10. Exhaust adapter to turbocharger nuts.
11. Turbocharger to exhaust manifold nuts.



Legend

1. Air inlet pipe
2. Oil supply line
3. Turbo charger
4. Heat shield

Caution:
The turbocharger for 4HG1-T Engine has a unit construction of turbin housing and exhaust manifold.

Inspection and Repair

Caution:

- Turbocharger housing for cracks or damage.
- Gasket surfaces for damage.
- Seals and gaskets for damage.
- Turbine and compressor blades for damage or carbon buildup.
- Air and exhaust exit openings for oil or wetness.
- For grinding or roughness when spinning turbine and compressor wheels by hand.
- For evidence of turbine or compressor blades contacting the shroud or housing. If any of the above conditions exist, the turbocharger must be replaced or repaired by an authorized repair facility.

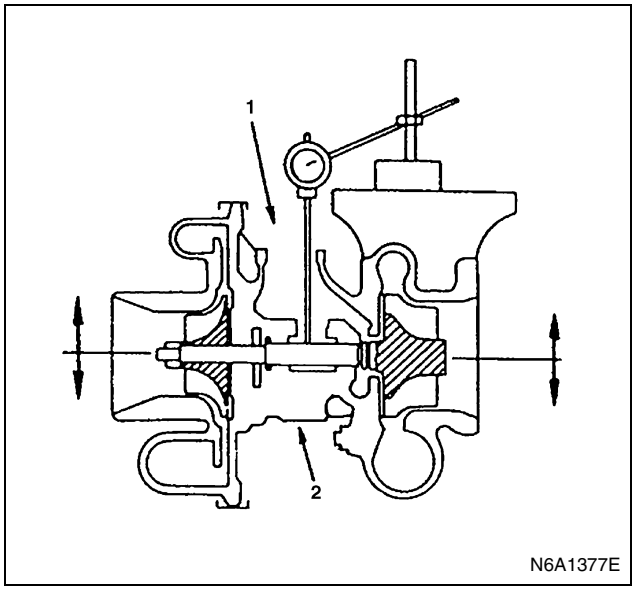
Play in Radial Clearance

Moving the rotor in the radial clearance, measure the play by a dial gage.

- Measure the play at several points while letting the rotor revolve.
- Use only the flat dial gage attachment. Do not use the pointed one.
- Attach the turbocharger and dial gage firmly.

Play in radial clearance	mm (in)
Standard	Limit
0.056 — 0.127 (0.0022 — 0.0050)	0.140 (0.0055)

If excessive, replace the turbocharger.



Legend

1. Oil outlet
2. Oil inlet

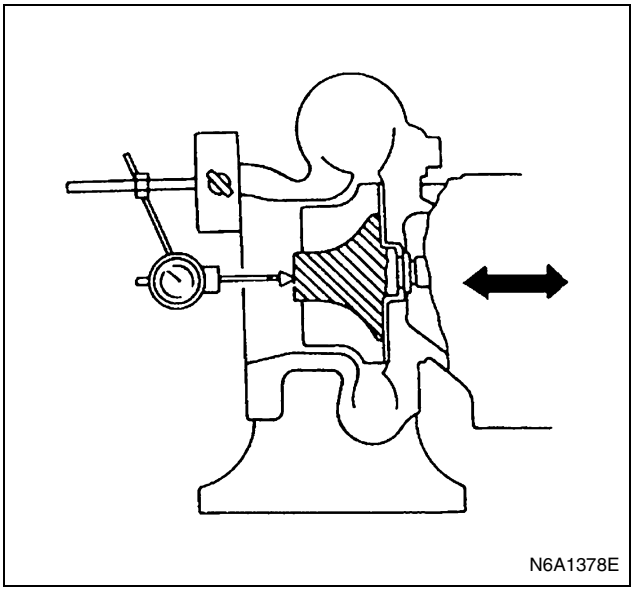
Play in Axial Clearance

Moving the rotor in the axial clearance, measure the play by a dial gage.

- Measure the play at several points while letting the rotor revolve.
- Attach the turbocharger and dial gage firmly.

Play in axial clearance	mm (in)
Standard	Limit
0.013 — 0.097 (0.0005 — 0.0038)	0.097 (0.0038)

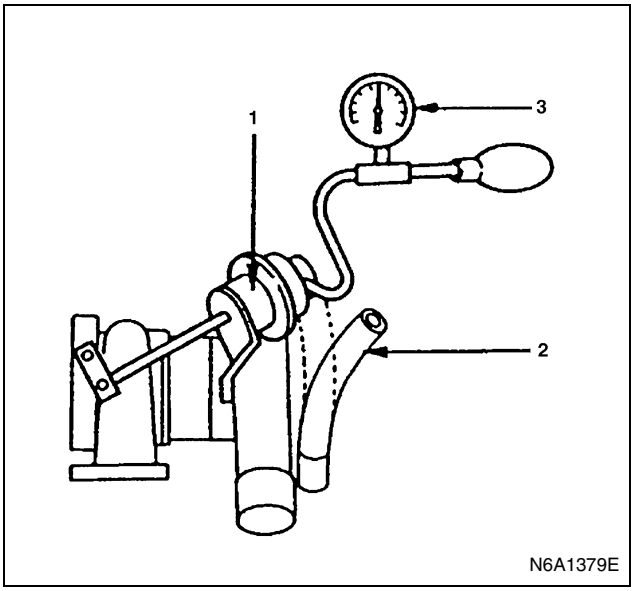
If excessive, replace the turbocharger.



N6A1378E

Operation of Waste Gate

- Disconnect hose (2) from waste gate (1), and install pressure gauge (3) as shown in the figure.
- With the engine stopped, operate the pressure gauge pump to apply pressure to the waste gate for check the waste gate function.



N6A1379E

Oil Leakage Check

1. Remove the charge air pipe connecting hose to the compressor side of the turbocharger.
2. Clean the area around the compressor wheel.
3. Remove the blow-by hose.
4. Start the engine and let idle. Rev the engine and hold at wide open throttle (WOT) for five seconds, then release and let idle for five seconds. Repeat this cycle for a total of five times then let the engine idle steady for five minutes.
5. Shut off the engine.
6. Check the compressor area for an oil stream.

Caution:

- A stream of oil indicates a possible defective turbocharger. If mist or spray is present, however, this is normal and is NOT indicative of a turbocharger problem.

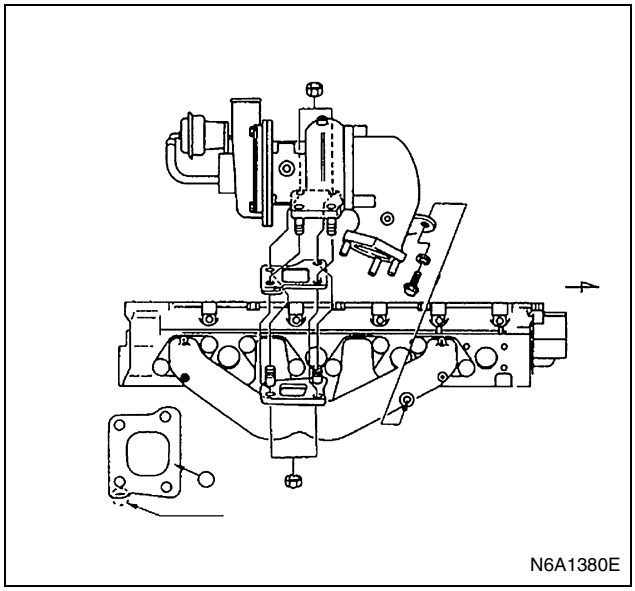
7. If the turbocharger is suspect, refer to the on-vehicle service procedures in this section.

Installation

1. Exhaust manifold to turbocharger.
2. New gasket and turbocharger to exhaust manifold.

Tighten:

Turbo charger to 52 N·m (5.3 kg·m/ 38 lb·ft)

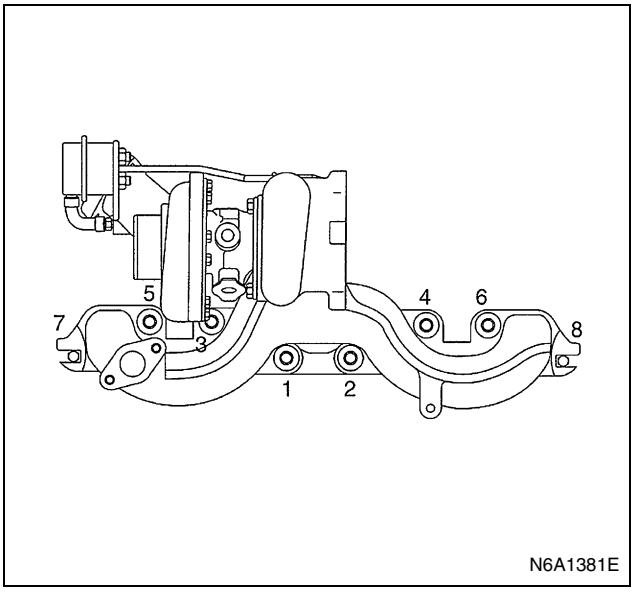


N6A1380E

3. Tighten the cylinder head to turbinhousing and exhaust manifold to the specified torque in the numerical order shown in the illustration. (4HG1-T)

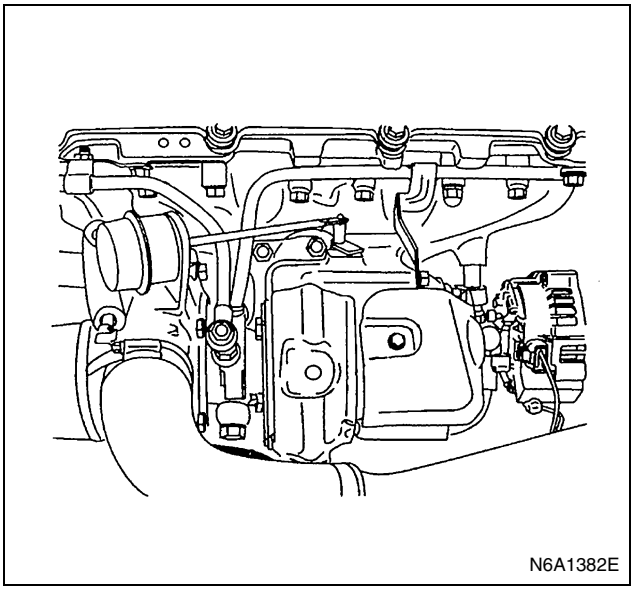
Tighten:

Exhaust manifold to 34 N·m (3.5 kg·m/ 25 lb·ft)



4. Turbocharger to exhaust adapter.

Tighten:
Exhaust adapter to 32 N·m (3.3 kg·m/ 24 lb·ft)



5. Exhaust pipe to exhaust adapter.

Tighten:
Exhaust pipe to 67 N·m (6.8 kg·m/ 49 lb·ft)

6. Turbocharger oil drain line.

Tighten:
Oil drain line to
- Turbocharger 9 N·m (0.9 kg·m/ 6 lb·ft)
- Cylinder body 21 N·m (2.1 kg·m/ 15 lb·ft)

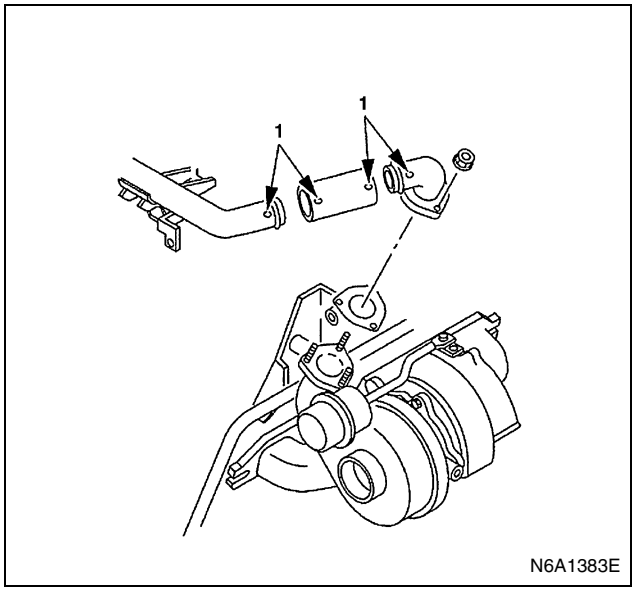
7. Turbocharger oil supply line to turbocharger.

Tighten:
Oil supply line to 27 N·m (2.8 kg·m/ 20 lb·ft)

8. Water supply and drain lines.

Tighten:
Water supply to 41 N·m (4.2 kg·m/ 30 lb·ft)

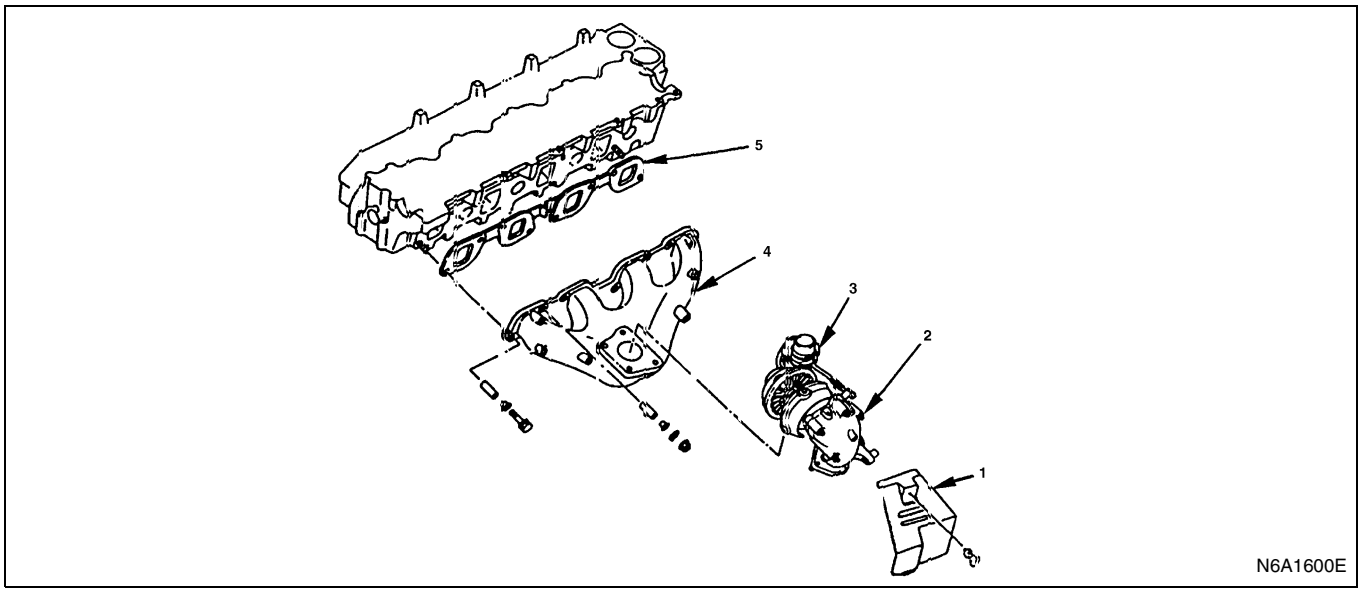
9. Heat shield to exhaust adapter
10. Charge air pipe connecting hoses and clamps to turbocharger.
11. Air inlet pipe to turbocharger.
12. Fit the connecting hose over the pipe to its projecting part. (4HG1-T)
13. Align connecting hose and pipe marks with each other (4HG1-T)



Legend
1. Mark

Exhaust Manifold

Component

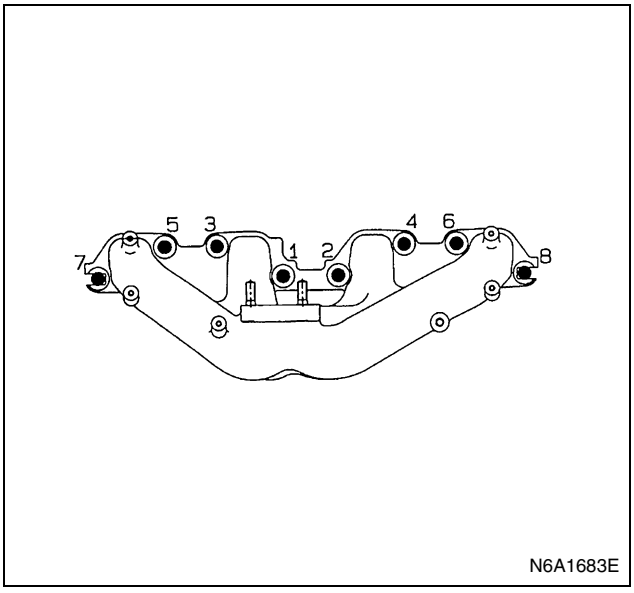


Legend

1. Heat shield
2. Exhaust adapter
3. Turbocharger
4. Exhaust manifold
5. Exhaust manifold gasket

Removal

1. Turbocharger as outlined previously in this section.
2. Heat shield
3. Loosen the exhaust manifold bolts, nuts and washers in numerical order shown in the illustration.



4. Exhaust manifold
5. Gaskets

Caution:

- Exhaust manifold and cylinder head for cracks or damage to gasket surfaces.

Installation

1. Gaskets.
2. Exhaust manifold.
3. Washers nuts and bolts.

Tighten:

Exhaust manifold to 34 N·m (3.5 kg·m/ 25 lb·ft)

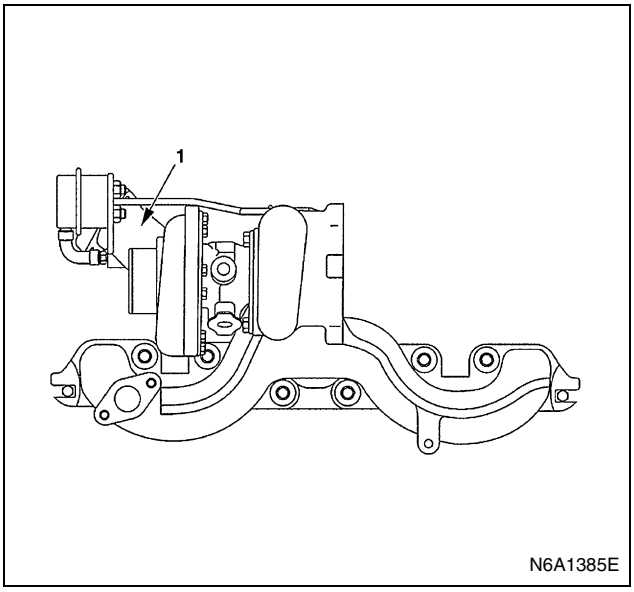
4. Heat shield
5. Turbocharger as outlined previously in this section.

Turbocharger Turbine Housing Replacement (For 4HG1-T Model)

Changing the turbine housing of the turbocharger (integrated with the exhaust manifold)

Inspection

Before replacing the turbine housing, make sure there are no abnormalities in other parts.



Legend

1. Compressor port

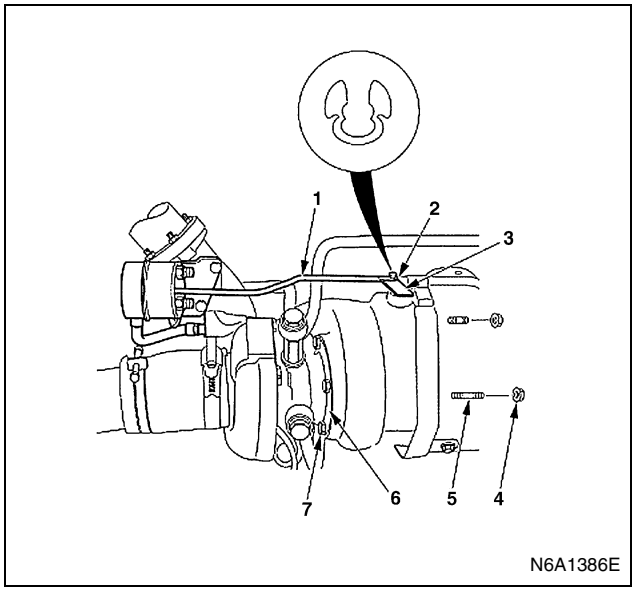
Notice:

- It is normal to find some oil inside the compressed-air duct. The oil is to lubricate the turbine shaft, and as long as the exhaust is not abnormally white in color, this does not indicate a problem.

1. Make sure the parts have no cracks, impeded movement, damage, or distortion of shape, that there is no oil leakage from the seal, and that there is no gas leakage.
2. Turn the rotor to see if it rotates smoothly, also checking the rotation direction as well as the amount of slack.
   Refer to the separate reference sheet for the proper amount of slack.
   If there is an abnormality in any of the above, you will have to change the turbocharger as a unit.

Disassembly

1. Separate the end of the actuator rod (1) from the E Ring (2), then remove the crank (3) from the end of the rod (1).
2. Remove the turbine housing tie-down bolts (7).



3. Separate the turbine housing from the sensor housing.

Notice:

- Be careful not to scratch the turbine blades when removing parts.

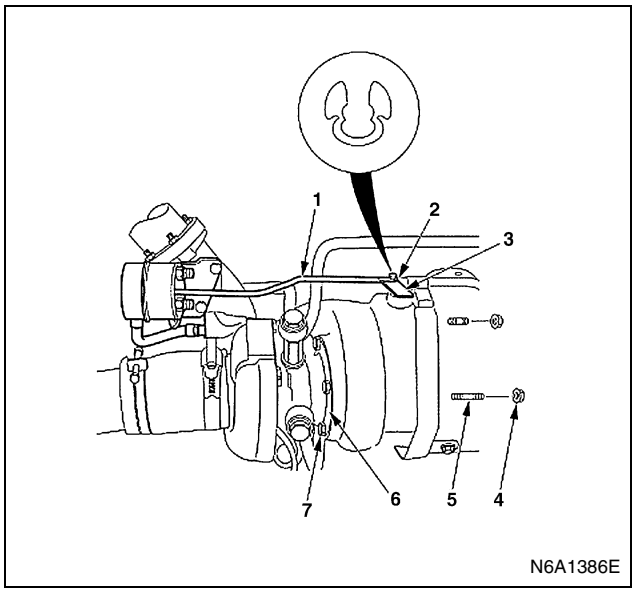
Inspecting the center housing assembly:

Check that none of the blades is bent, cracked, or scratched. Make sure there are no obstructions that would interfere with the movement of the blades or with mounting the new housing. Remove any excess carbon or oil.

Replacing Parts

When reassembling, be sure to replace the following parts. (Use only genuine Isuzu parts.)

1. E Ring (2)
2. Turbine housing tie-down bolts (7)
3. Turbine housing clamp (6)
4. Adapter nut (4)
5. Adapter stud (5)



Cleaning

Thoroughly clean off the oil and carbon from abutting surfaces, the oil passages, flange surfaces, air and exhaust ducts, etc. Always air-dry the parts after cleaning.

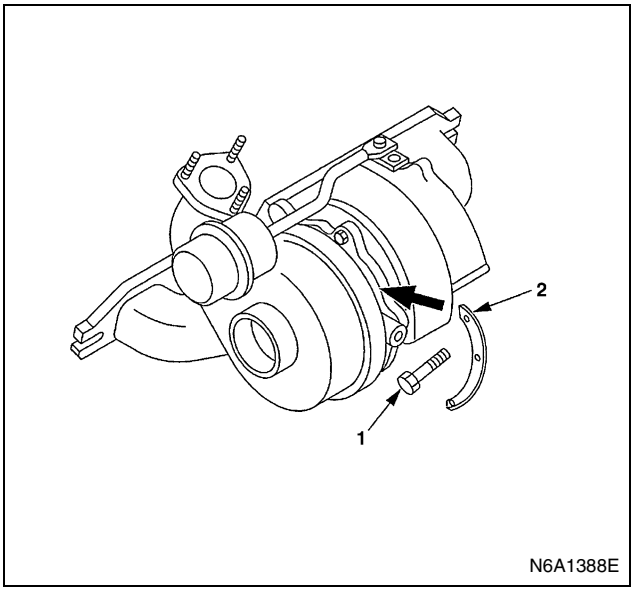
Assembly

1. Insert the sensor housing into the turbine housing.

Notice:

- When inserting the sensor housing, make sure it will not impede the movement of the turbine blades.

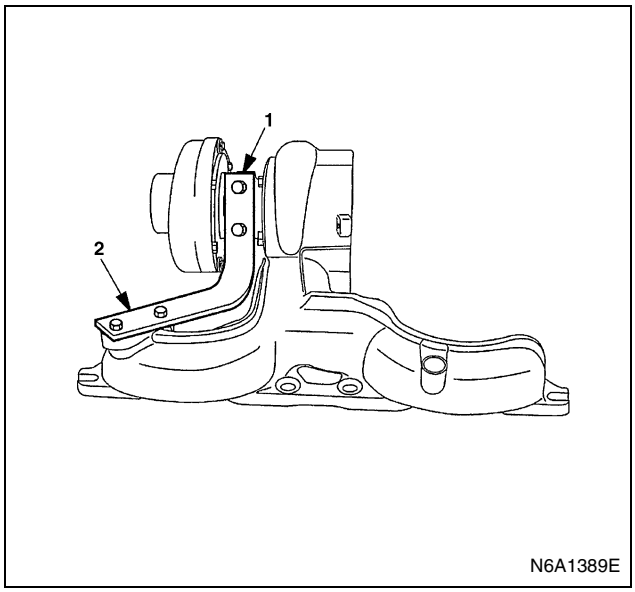
2. Apply molybdenum disulfide to the thread and underside of the head of each bolt (1).
3. Temporarily secure the sensor housing in place with the clamp (2).



4. Connect the oil side of the sensor housing (1) and the EGR-connection side of the exhaust manifold (2) to the angle setting gauge, then tighten the bolt to secure the gauge in place. (The angle of the sensor housing and turbine housing will be set with the use of this gauge).

Turbocharger housing setting gauge: 5-8840-2673-0
(1) M6 × P = 1.00
(2) M8 × P = 1.25

5. To give the sensor housing some slack, loosen the bolt on side (1) by half a turn.

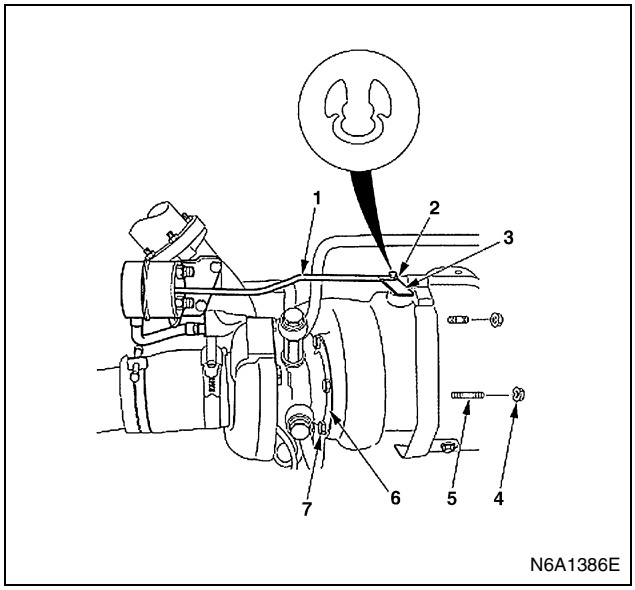


6. Tighten the turbine housing tie-down bolts to the specified torque.

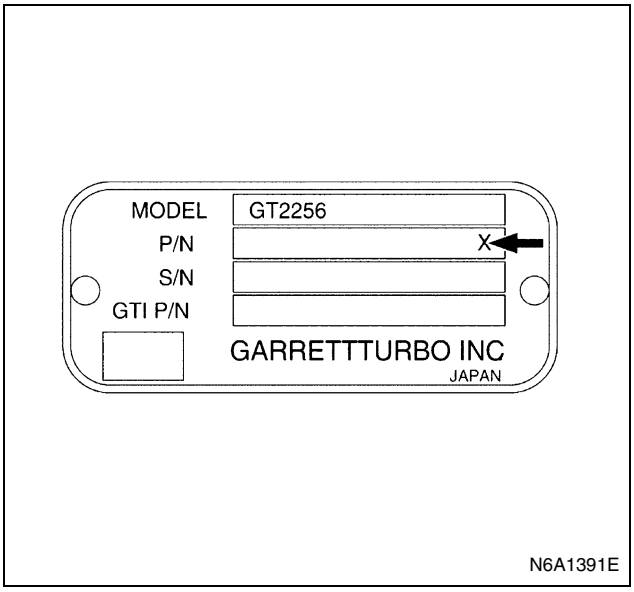
Tighten:

Housing tie-down bolts to 22 N·m (2.2 kg·m/ 16 lb·ft)

7. Remove the bolt that secures the pressure gauge, then remove the gauge.
8. Manually turn the rotor clockwise to be sure it it rotates smoothly. Check for abnormal noise, drag, etc.
9. Attach the end of the actuator rod (1) to the crank at the waste gate (3), and secure with the E Ring (2).



10. (Indicate on the nameplate that parts were replaced.)

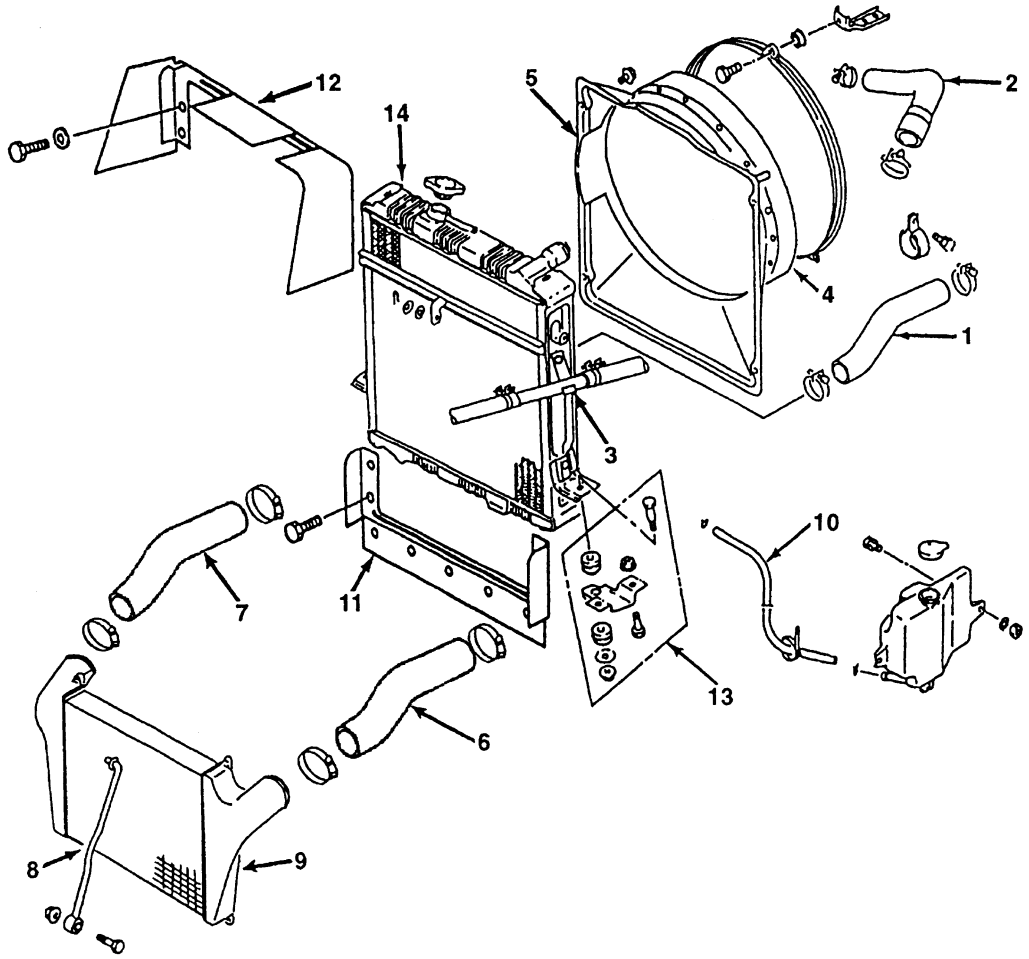


11. Pour clean oil through the oil filler port to prevent corrosion.
12. Seal the air and exhaust ducts of the turbocharger, as well as the water and oil filler ports to prevent foreign matter from entering.

Follow the assembly directions to reattach to the engine.

Charge Air Cooler

Component



N6A1684E

Legend

1. Lower radiator hose

ISUZU DIESEL ENGINE (4HK1-TC)

Service Precautions

Matters that require attention in terms of maintenance

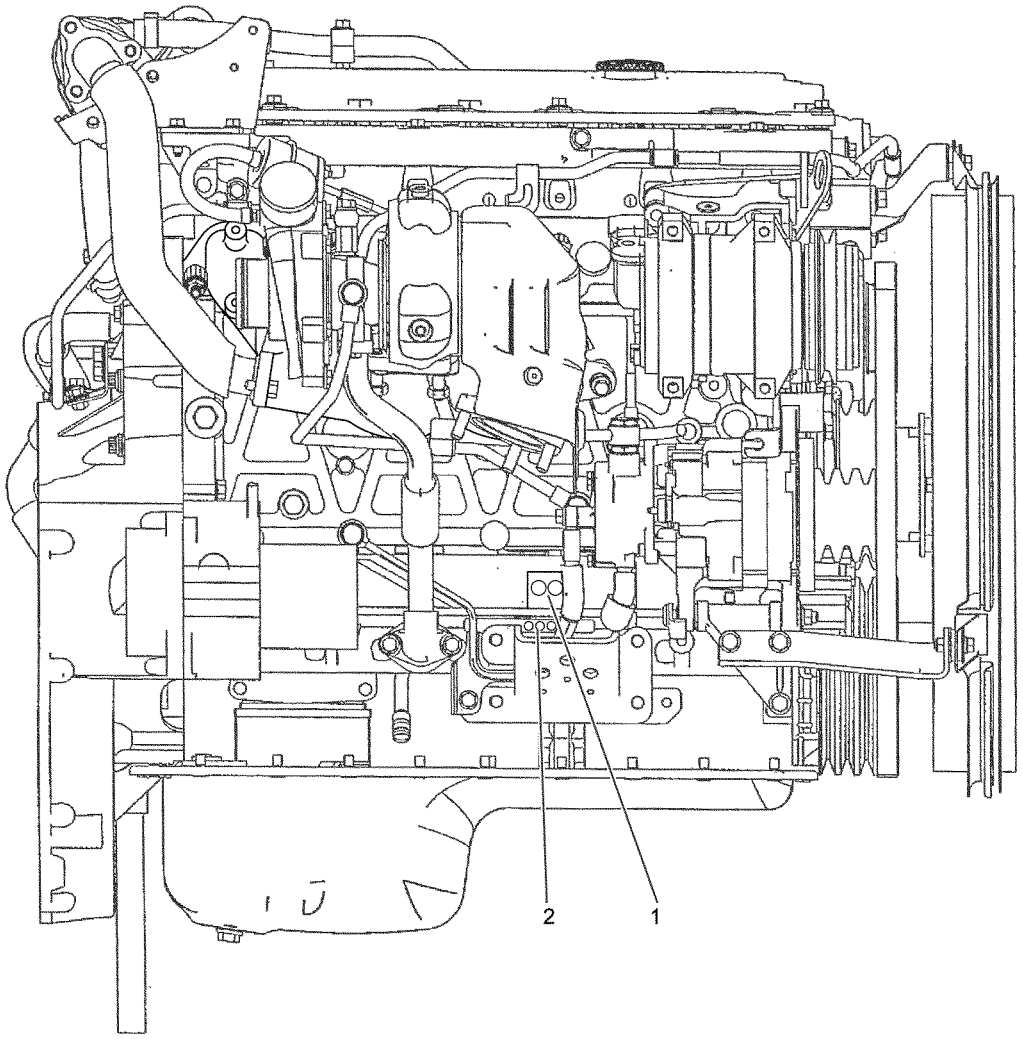
To prevent damage to the engine and ensure reliability of its performance, pay attention to the following in maintaining the engine:

- When lifting up or supporting the engine, do not apply a jack on the oil pan.
  When taking down the engine on the ground, do not make the bearing surface of the oil pan touch directly the ground. Use a wood frame, for example, to support the engine with the engine foot and the flywheel housing.
  Because there is only a small clearance between the oil pan and the oil pump strainer, it can damage the oil pan and the oil strainer.
- When the air duct or air cleaner is removed, cover the air intake opening to prevent foreign matter from getting into the cylinder. If it gets into it, it can considerably damage the cylinder and others while the engine is operating.
- When maintaining the engine, never fail to remove the battery earth cable. If not, it may damage the wire harness or electrical parts. If you need electricity on for the purpose of inspection, for instance, watch out for short circuits and others.
- To protect and lubricate the rotational surface during the initial operation, apply plenty of engine oil to it.
- When valve train parts, pistons, piston rings, connecting rods, connecting rod bearings or crankshaft journal bearings are removed, put them in order and keep them.
- When installing them, put them back to the same location as they were removed.
- Parts, such as gaskets, oil seals and O-rings, have to be replaced by brand-new ones every time the engine is dismantled.
- As for parts where a liquid gasket is used, remove an old liquid gasket completely and clean it up thoroughly so that no oil, water or dust may be clung to them. Then, apply the designated liquid gasket to each place anew before assembly.
- Assemble it within 7 minutes after applying the liquid gasket.
  If 7minutes or longer passed, remove the liquid gasket and apply it again.
- When assembling or installing parts, fasten them with the prescribed tightening torque so that they may be installed properly.

Matters that require attention in specifically dealing with this engine

Holes or clearances in the fuel system which serve as a passage of fuel, including the inside of injector, are finished extremely precisely. For this reason, they are highly sensitive to foreign matter. If it gets inside, it can lead to breakdown on the road. Be sure to prevent it from getting inside.

How To Read The Model



Legend

1. Engine Model
2. Engine Selial Number

Explanation of Functions and Operations

Electronic Engine Control

With the control unit, the range from injection to air intake/exhaust, including fuel injection quantity, injection timing, intake air restriction, EGR, and idling rpm, is controlled.

Cylinder Block

The cylinder block is cast-iron with the center distance of each bore being equal and is of the highly rigid, symmetrical structure with the crankshaft center being the center. The bearing cap is of the ladder frame structure and tightened up under the plastic range rotation angle method.

Cylinder Liner

The cylinder liner is selected to match an internal diameter of a bore of the cylinder block and built, which is imprinted on the left side of the cylinder.

Piston

The piston is aluminum-alloy and an autothermatic piston with a strut cast, while the combustion chamber is a round reentrant type.

Cylinder Head

The cylinder head is cast-iron and there are 4 valves per cylinder. The angular tightening method of the cylinder head bolt further increases reliability and durability.

Crankshaft

Tuftriding is given, while on the No. 1 balance weight imprinted is the grade of each journal diameter.

EGR System

Based upon data, including water temperature, engine speeds or engine loads, it is controlled via Engine Control Module (ECM) to purify exhaust by recycling part of it.
Its main components include an EGR valve, an EGR cooler and various sensors.

Connecting Rod Cap Bolt

The angular tightening method of the connecting rod cap bolt further increases reliability and durability.

Common Rail-type Electronic Control Injection System

The common rail-type electronic control injection system is composed of a fuel supply pump that sets the target pressure of high-pressure fuel and supply it, a fuel rail that measures such high-pressure fuel and an fuel injector that turns it into a fine spray and injects it. Each is controlled via ECM based upon various signals, while injection timing or fuel injection quantity is controlled under every possible driving condition.

Fuel Injector

The fuel injector is a 7-hole nozzle that adjusts fuel injection quantity or injection timing by opening or closing an electromagnetic valve on the head of the fuel injector.
ECM corrects the dispersion of fuel injection quantity between fuel injectors according to ID code data in memory. At the replacement of fuel injectors, ID code data should be stored in ECM.

Fuel Filter with Sedimenter

It is a fuel filter with sedimenter that gets rid of water by making use of the difference in specific gravity between light oil and water, which comes with an indicator that notifies you that it is filled with water.

Preheating System

The preheating system consists the ECM, the glow relay, glow plugs and the glow indicator lamp. The preheating system is operated when the engine coolant temperature is low, and make the engine easy to start.

Lubrication System

It is an oil filter with full-flow bypass, which uses a water-cool oil cooler and oil jet to cool the piston.

Functional Inspection

Inspection/adjustment of valve clearance

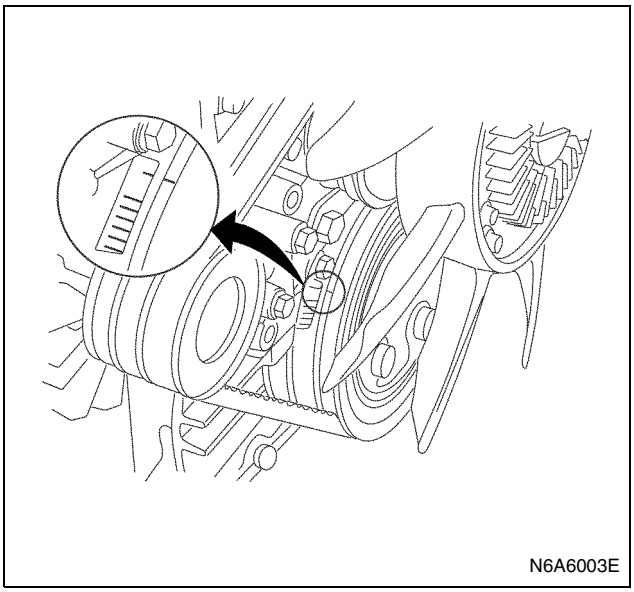
1. Inspection of valve clearance
   a. Remove the cylinder head cover.
   b. Remove the fuel injector harness assembly.
   c. Loosen the terminal nuts alternately to remove.
   d. Remove the leak-off pipe.
   e. Rotate the crankshaft to make the No.1 cylinder meet the compression top dead center (TDC).

Notice:
There are 2 timing marks on the crankshaft pulley.
Mark (1) is near the cylinder block and is used to bring the 4HK1-TC engine to TDC.
Mark (2) is not applicable to this engine.
Be sure to use mark (1) when bringing the engine to TDC.

   - Insert a 0.4 mm (0.016 in) thickness gauge into a clearance between the rocker arm and the bridge to check it and adjust it if needed.

Valve clearance	mm (in)
Intake valve	0.4 (0.016)
Exhaust valve	0.4 (0.016)

Caution:
Adjust while being cold.

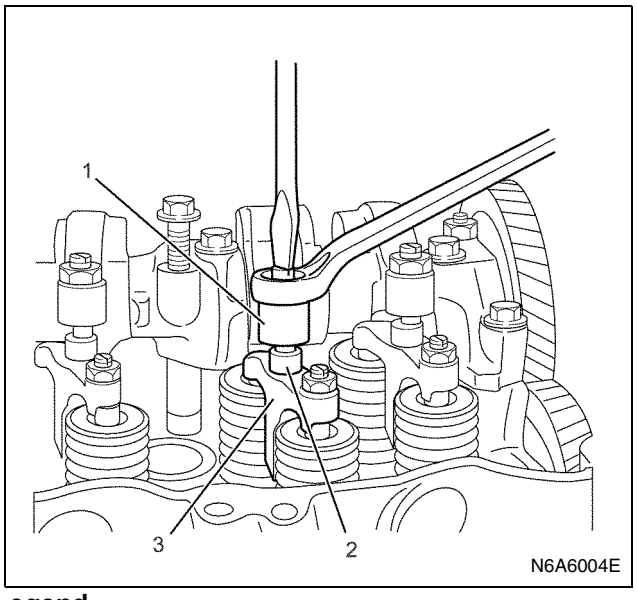


2. Adjustment of valve clearance

Caution:
Adjust valve clearance carefully so that the bridge contacts the end of the 2 valve stem.

a. Completely loosen all of the bridge and rocker arm adjusting nuts and adjusting screws (8 nuts and 8 screws).
b. Place a 0.4 mm (0.016 in) thickness gauge between the No. 1 cylinder rocker arm end and the bridge cap.
c. Tighten the rocker arm adjusting screw until the thickness gauge is snug (not tight) between the rocker arm end and the bridge cap.
d. Tighten the rocker arm lock nut.
e. Tighten the bridge adjusting screw until the bridge contacts the valve head.
f. Tighten the bridge lock nut.
g. Check that the thickness gauge is still held snugly between the rocker arm end and the bridge cap. If it is too tight, slightly loosen the bridge adjusting screw and lock nut to restore snugness.
h. Remove the thickness gauge.
i. Repeat Steps b through h for the remaining cylinders.

Tighten:
Bridge lock nut to 22 N·m (2.2 kg·m/16 lb·ft)

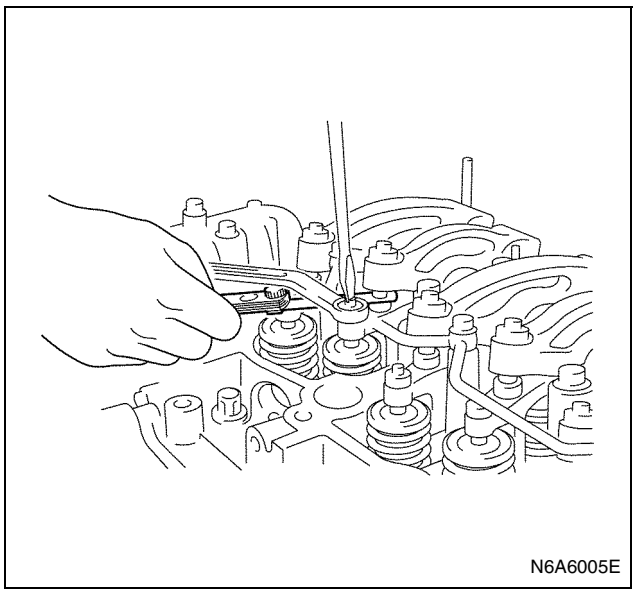


Legend
1. Rocker Arm
2. Bridge Cap
3. Bridge

a. With a thickness gauge kept inserted, tighten an adjusting screw of the bridge lightly and make sure that the tip of the adjusting screw touches the end of valve stem and the movement of the thickness gauge has become tight.
b. Then, check if the end of the valve stem on the opposite side is unstable or hits diagonally. If so, loosen the bridge adjusting screw a little so that the end of the valves on both sides may touch properly.
Valve bridge clearance: ± 0.1 mm (0.0039 in) or less
c. After making an adjustment so that the end of the valves on both sides may touch properly, tighten up an adjusting screw nut of the bridge with a minus driver so that the bridge adjusting screw may not rotate.

Tighten:
Adjusting screw nut to 22 N·m (2.2 kg·m/16 lb·ft)

Caution:
If the adjusting screw of the bridge is poorly adjusted, the bridge would tilt and be pushed down and seized, which may damage the bridge guide, for example. Thus, adjust it accurately.



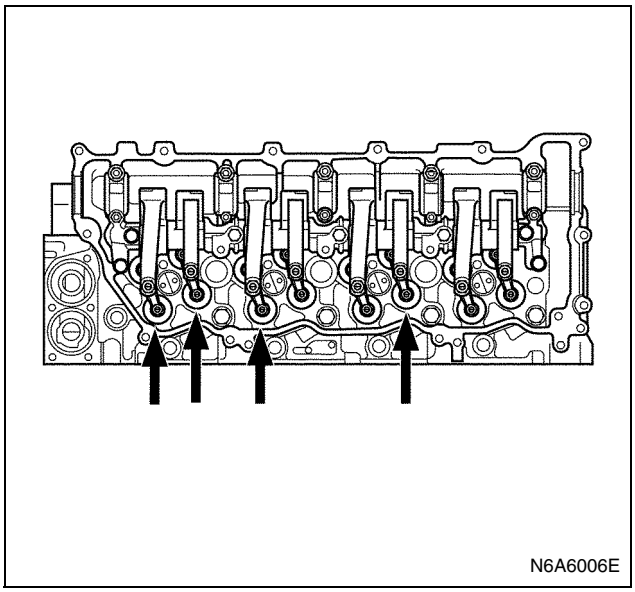
Tighten:
Rocker arm adjustment screw nut to 22 N·m (2.2 kg·m/16 lb·ft)

Bridge adjustment screw nut to 22 N·m (2.2 kg·m/16 lb·ft)

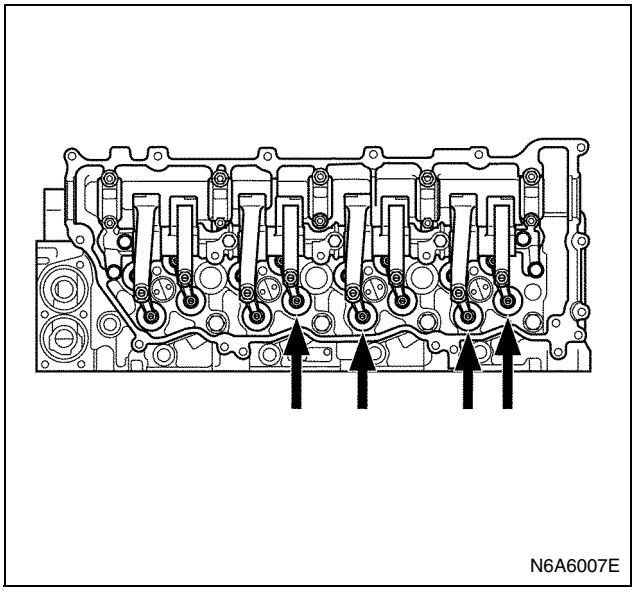
Adjustment table

Cylinder No.	1		2		3		4	
Valve arrangement	IN	EX	IN	EX	IN	EX	IN	EX
No. 1 cylinder Compression TDC	○	○	○			○		
No. 4 cylinder Compression TDC				×	×		×	×

- If the No. 1 cylinder is the compression TDC, adjust a valve clearance with ○ mark given on the table and if the No. 4 cylinder is the compression top dead center, that with × mark.



N6A6006E



N6A6007E

- Attach the harness assembly to the fuel injector.
  Tighten the harness bracket with the designated torque.

Tighten:
Harness bracket to 48 N·m (4.9 kg·m/35 lb·ft)

- Attach the terminal nuts to the fuel injector.

Tighten:
Terminal nuts to 2 N·m (0.2 kg·m/17 lb·in)

Notice:

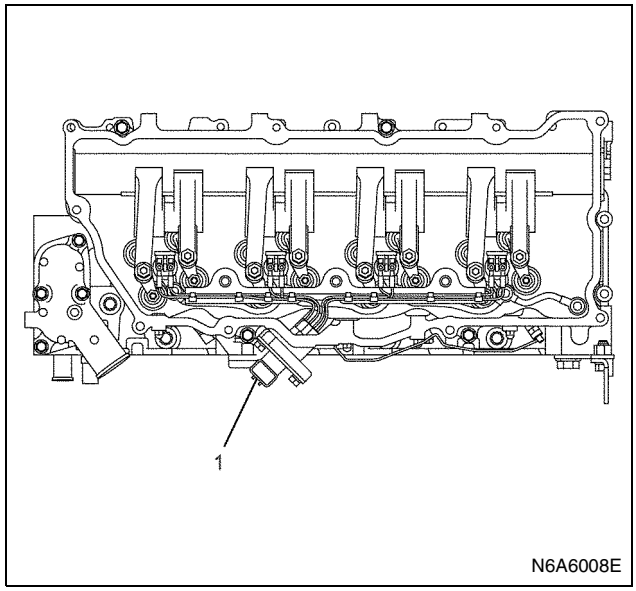
- Tighten the terminal nuts alternately in order to prevent imbalance in tightening because they are unified.
- Do not tighten the nuts too tightly because it leads to damage to the terminal studs.

- Install the cylinder head cover.
  Refer to “Cylinder Head Cover.”

Compression pressure inspection

- Warm up the engine.
- Remove a minus terminal of the battery and remove all the glow plugs.
- Remove the harness connector for the fuel injector built on the lower head cover (no fuel will be injected).

Caution:
When the harness connector is removed, ECM judges that it broke down and DTC is recorded. Upon completion of measurement, never fail to clear memory of ECM.
(For how to clear memory of ECM, refer to Section 6E)

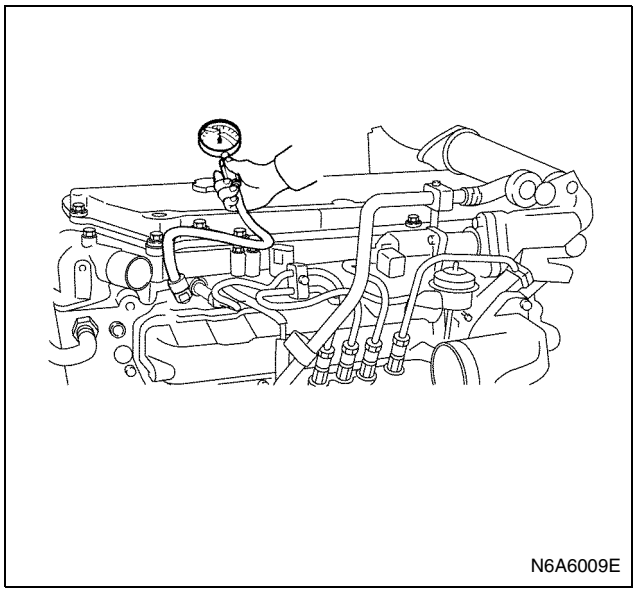


N6A6008E

Legend
1. Fuel Injector Harness Connector

- Install the minus terminal of the battery.
- Turn on the starter to emit foreign matter within the cylinders.

- Install an adapter and a gauge of a compression gauge of the special tool.



Compression gauge set: 5-8840-2008-0
(Compression gauge: J-26999-12,
Gauge adapter: EN-46722)

- Turn on the starter to inspect compression pressure.

Compression pressure	MPa (kg/cm^2 / psi) / 220 rpm
Standard	2.60 – 2.89 (26.5 – 29.5 / 377 – 419)
Limit	1.96 (20.0 / 284)
Differences among the cylinders	294 kPa (3.0 kg/cm^2 / 43 psi)

- Measure each cylinder one by one.

Caution:
To keep engine speed at 220 rpm or more, use fully charged batteries.

- Remove a compression gauge of the special tool.
- Remove a minus terminal of the batteries.
- Install a harness connector for the fuel injector built on the lower head cover.
- Install all the glow plugs.

Tighten:
Glow plugs to 20 N·m (2.0 kg·m/15 lb·ft)

- Install a minus terminal of the batteries.

A list of defective phenomena

- Engine does not turn over.
- Engine turns over but does not start.
- Excessive black exhaust smoke.
- Excessive white exhaust smoke.
- Engine knocking.
- Abnormal engine rotation.
- Abnormal battery charging.

Trouble Shooting

Engine does not turn over

Condition	Possible Cause	Correction
Starter motor does not rotate	Dead or weak battery	Charge or Replace battery
	Incomplete circuit	Connect Repair
	Starter relay	Replace starter relay
	Starter motor brushes stuck, worn, or broken	Replace brushes
	Starter motor internal damage	Repair motor
Starter motor not meshed with flywheel	Ring gear abrasion	Replace ring gear
	Pinion gear abrasion	Replace pinion gear
	Magnetic switch (starter motor) not properly adjusted	Adjust
Starter motor pinion meshed with ring gear but does not rotate	Dead or weak battery	Charge battery Replace battery
	Insufficient contact pressure between starter motor brushes and commutator	Adjust pressure
	Armature (starter motor) stuck	Repair armature
	Engine internal damage (Seizure)	Repair engine

Engine turns over but does not start

Condition	Possible Cause	Correction
Fuel is not delivered to fuel supply pump	Air in fuel system	Bleed air from fuel system
	Air entering fuel pipe	Replace pipe and bleed air from fuel system
	Empty fuel tank	Replenish fuel
	Clogged strainer (fuel suction)	Clean or replace strainer
	Clogged fuel pipe	Clean or replace pipe
	Use of wrong fuel for prevailing temperatures	Drain existing fuel and replace with appropriate fuel
	Clogged fuel filter	Replace filter
Fuel is delivered to fuel supply pump	Loose injection pipe connections	Tighten connections
	Loose or broken electrical connectors	Tighten and/or replace connectors
	Bad rotational sensor	Replace sensor
	Engine control system malfunction	System diagnosis
Insufficient or unstable fuel delivery volume	Air in fuel system	Bleed air from fuel system
	Feed pump malfunction	Repair pump
	Loose or broken electrical connectors	Tighten and/or replace connectors
	Clogged fuel filter	Replace filter
	Engine control system malfunction	System diagnosis

Excessive black exhaust smoke

Condition	Possible Cause	Correction
Bad injection timing	Engine control system malfunction	System diagnosis
Bad injection nozzle condition	Carbon deposit at nozzle tip	Clean nozzle tip
	Sticking nozzle	Replace fuel injector assembly
	Engine control system malfunction	System diagnosis
Insufficient compression pressure	Excessive valve clearance	Adjust clearance
	Sticking valve stem (valve open)	Repair or replace valve
	Damaged valve spring	Replace spring
	Valve seat abrasion	Repair valve seat
	Compression leakage due to damaged piston ring	Replace piston ring
	Damaged gasket	Replace gasket
	Piston scoring	Replace piston
Fuel condition	Water in fuel	Drain existing fuel and replace with new fuel
	Poor fuel quality	Drain existing fuel and replace with new fuel
Poor engine aspiration	Clogged intake pipes	Clean or replace pipes
	Clogged air cleaner element	Clean or replace element
Malfunction detected by engine control system	Defective sensor	Replace sensor
	Engine control system malfunction	System diagnosis
EGR valve and/or intake throttle valve malfunction	Intake throttle valve sticking	Repair or replace valve
	EGR valve sticking	Repair or replace valve
	Exhaust brake valve sticking	Repair or replace valve
	Engine control system malfunction	System diagnosis
Turbocharger malfunction	Damaged turbocharger fan	Replace turbocharger
	Rough turbocharger shaft rotation	Replace turbocharger
	Oil leakage from oil seal	Replace turbocharger
	Defective booster sensor	Replace sensor

Excessive white exhaust smoke

Condition	Possible Cause	Correction
Bad injection timing	Engine control system malfunction	System diagnosis
Malfunction detected by engine control system	Engine control system malfunction	System diagnosis
	Control unit malfunction	Replace unit
	Defective sensor	Replace sensor
Insufficient compression pressure	Excessive valve clearance	Adjust clearance
	Sticking valve stem (valve open)	Repair or replace valve
	Damaged valve spring	Replace spring
	Valve seat abrasion	Repair valve seat
	Compression leakage due to damaged piston ring	Replace piston ring
	Damaged gasket	Replace gasket
	Piston scoring	Replace piston

Condition	Possible Cause	Correction
Fuel condition	Water in fuel	Drain existing fuel and replace with new fuel
Excessive oil consumption	Worn or damaged piston ring(s)	Replace ring(s)
	Defective valve stem oil seal	Replace oil seal
	Defective turbocharger oil seal	Replace turbocharger
	Clogged turbocharger oil return pipe	Repair pipe

Engine knocking

Condition	Possible Cause	Correction
Bad timing	Engine control system malfunction	System diagnosis
Malfunction detected by engine control system	Defective sensor	Replace sensor
	Control unit malfunction	Replace unit
	Engine control system malfunction	System diagnosis
Fuel condition	Poor quality fuel	Drain existing fuel and replace with new fuel
Poor engine aspiration	Clogged intake pipes	Clean or replace pipes
	Engine control system malfunction	System diagnosis
Engine break-down	Foreign material in cylinders	Engine overhaul
	Scored pistons and/or bearings	Replace pistons and/or bearings

Abnormal engine rotation

Condition	Possible Cause	Correction
Engine speed cannot be increased	Engine control system malfunction	System diagnosis
	Defective control unit	Replace unit
Engine speed unstable	Defective control unit	Replace unit
	Engine control system malfunction	System diagnosis
	Clogged fuel filter element	Replace element
	Defective fuel injector nozzle(s)	Replace fuel injector assembly
	Water in fuel	Drain existing fuel and replace with new fuel
	Air in fuel system	Bleed air from fuel system
	Exhaust brake valve sticking	Repair or replace valve
Turbocharger malfunction	Damaged turbocharger fan	Replace turbocharger
	Rough turbocharger shaft rotation	Replace turbocharger
	Defective booster sensor	Replace sensor

Abnormal battery charging

Condition	Possible Cause	Correction
No charging	Open or shorted wiring and/or connectors	Repair or replace wiring and/or connectors
	Defective generator	Repair or replace generator
	Defective battery	Replace battery

Condition	Possible Cause	Correction
Insufficient charging	Open or shorted wiring and/or connectors	Repair or replace wiring and/or connectors
	Defective generator	Repair or replace generator
	Loose generator drive belt	Adjust belt tension or replace belt
	Defective battery	Replace battery
Excessive charging	Shorted wiring	Repair or replace wiring
	Defective generator	Repair or replace generator
	Defective battery	Replace battery

Turbocharger Troubleshooting

Condition	Possible Cause	Correction
Engine has less than normal power	Air leakage from intake pipe rubber hose	Repair
	Air leakage from inlet cover	Repair
	Clogged intercooler cooling section	Clean
	Clogged air cleaner element	Clean or replace
	Exhaust brake valve stuck	Repair or replace
	Turbine and housing contact (Interference)	Replace
	Excessive carbon deposit near turbine exhaust port that interferes with turbine	Clean or repair
	Rough turbine shaft rotation	Repair or replace
	Damaged turbine fan	Repair or replace
Blue exhaust smoke	Oil leakage from turbocharger oil seal	Repair or replace
	Clogged turbocharger oil return pipe	Repair
	Clogged center housing oil passages	Repair or replace
	Engine oil deterioration	Change engine oil
Noisy turbocharger operation	Gas leakage from intake or exhaust system	Repair
	Turbine and housing contact (Interference)	Repair or replace
	Damaged turbine fan	Replace
	Turbine shaft bearing abrasion or scoring	Repair or replace
Excessive rotating part wear	Engine oil deterioration	Change engine oil
	Clogged turbocharger oil feed pipe	Repair
	Low engine oil pressure	Repair

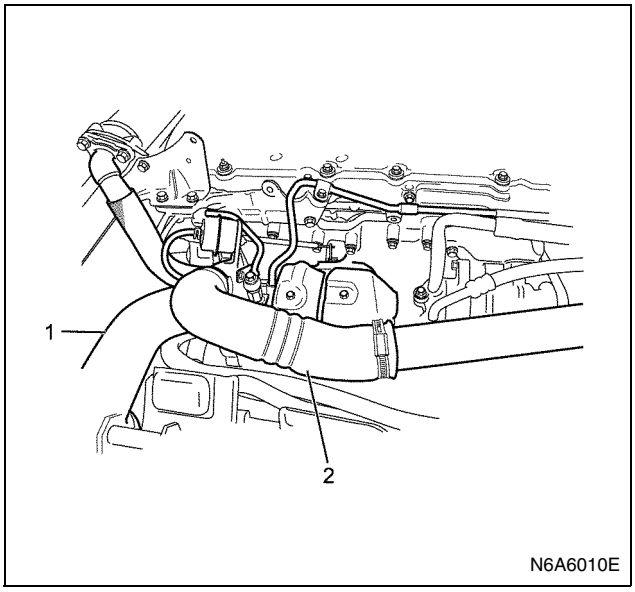
Special Tool

Illustration	Tool Number / Description / Remarks
 5884020080	5-8840-2008-0 Compression Gauge Set (J-26999-12 / Compression Gauge, EN-46722 / Gauge Adapter)

Engine Assembly

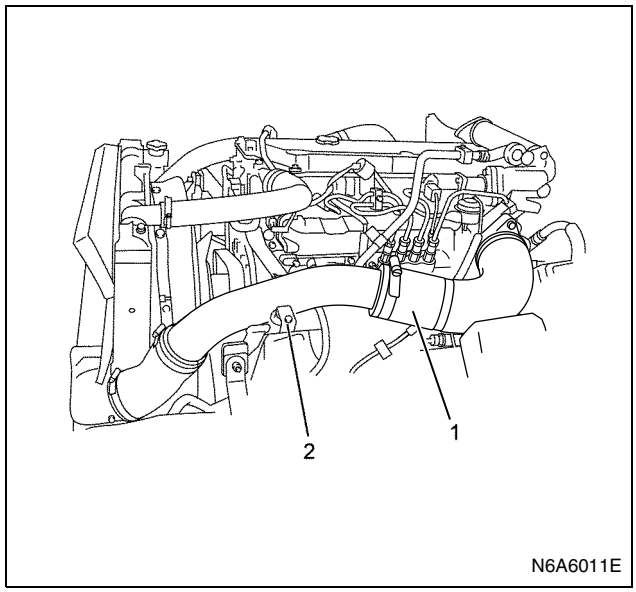
Removal

1. Remove a minus (-) terminal of the battery.
2. Drain the coolant.
3. Remove the starter motor.
   - Disconnect the front frame harness connector in the vicinity of the control box of the transmission and remove each clip that fixes the harness.
   - Remove 2 bolts that fasten the starter and remove the starter from the clutch housing.
   - Fix the starter motor with wire, for instance, in a place that does not get in the way in removing the transmission.
4. Remove the transmission assembly.
   Refer to “Transmission Assembly”
5. Remove the charge air hose (between turbocharger and inlet pipe).



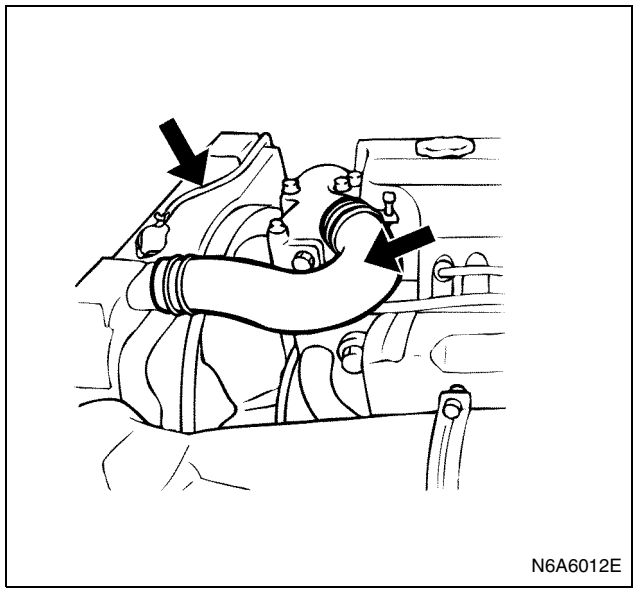
Legend
1. Duct
2. Charge Air Hose

6. Remove the inlet hose (between air cleaner and turbocharger).
7. Remove the charge air hose (between intercooler and inlet duct).
   - Remove the connector of the boost pressure sensor.



Legend
1. Charge Air Hose
2. Boost Pressure Sensor

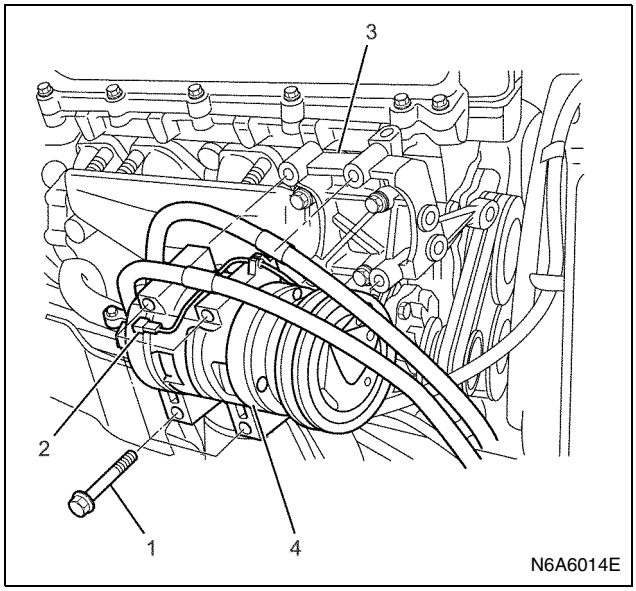
8. Remove the upper hose of the radiator.
   - Remove the band clip and VSV vacuum hose.



9. Remove a bracket of the fan guide.
10. Remove the fan assembly.
    - Remove the nuts and pull them out upward.
11. Remove the heater hoses.

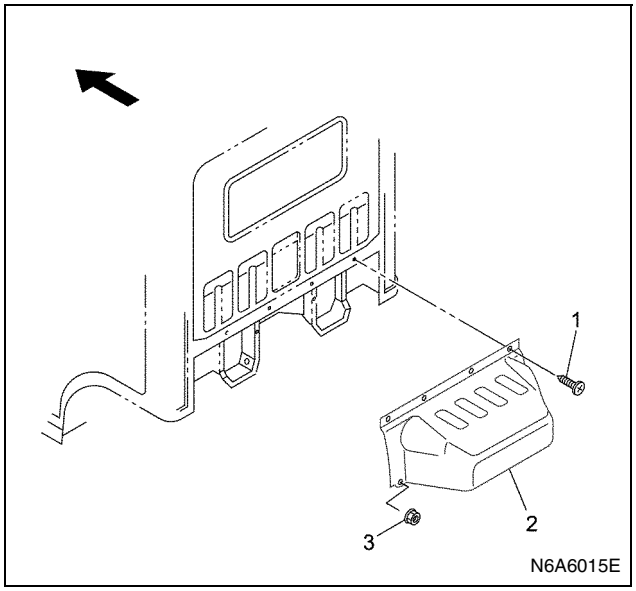
- Remove 2 hoses on the engine side.

12. Remove the engine harness.
    - Remove the ECM.
    - Disconnect the two main harness connectors from the ECM (For SLD equipped, disconnect the unsealed connector.)
    - Remove the engine ground cable.
13. Remove the A/C compressor.
    - Remove the drive belt.
    - Remove the connector.
    - Remove the A/C compressor and fix it with wire, for example, to an appropriate place along with hoses and others.



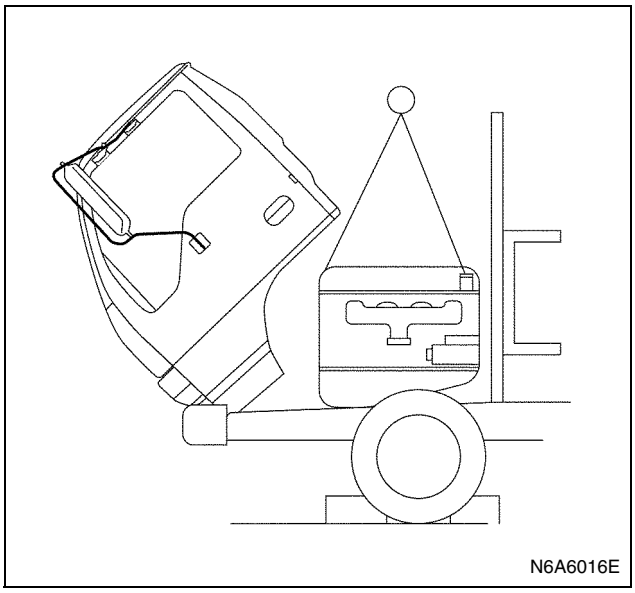
Legend
1. Fixing Bolt
2. Connector
3. Bracket
4. A/C Compressor

14. Remove the AC generator harness.
    - Remove the terminal B cable and harness connector from the generator.
15. Remove the vacuum hose on the vacuum pump side.
16. Remove a bracket by the blow-by separator and remove the harness connector and HBB oil hose bracket.
17. Remove the blow-by separator hose.
18. To prevent oil from flowing out when the hydraulic booster brake hose is removed, remove the fastening bolts for the hydraulic booster brake tank to lower the tank.
19. Remove one side of the hydraulic booster brake hose on the high-pressure side.
20. To prevent oil from flowing out when the power steering oil hose is removed, remove the fastening bolts for the power steering reserve tank to lower the tank.
21. Remove the power steering oil hose.
22. Remove the lower hose of the radiator on the engine side.
23. Hang wire on the engine hanger and hoist to lift up the engine slightly.
24. Remove the front exhaust pipe.
    - Remove the front exhaust pipe from the turbo and exhaust brake.
25. Remove the fuel hose on the feed and return sides.
26. Remove the engine mount.
    - Remove the fastening bolts for the engine mount on the chassis frame side.
27. Remove the engine assembly.
    - Remove the cab back cover.

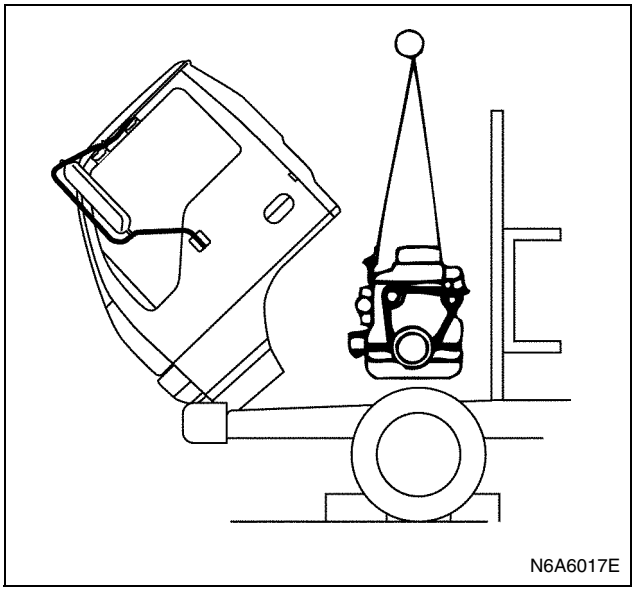


Legend
1. Screw
2. Cab Back Cover
3. Nut

- Operate a hoist slowly and hoist the engine until it comes up to the surface of the chassis frame.
- Turn the engine at an angle of 90 degrees to move from the surface of the chassis frame and remove the engine assembly.



N6A6016E

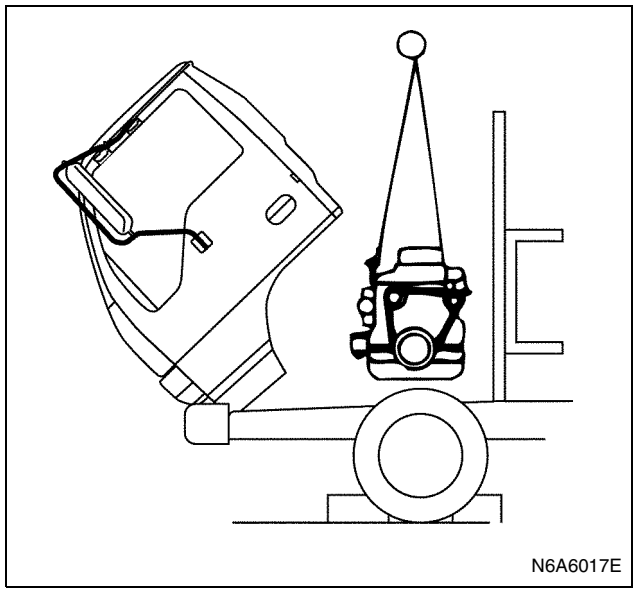


N6A6017E

Installation

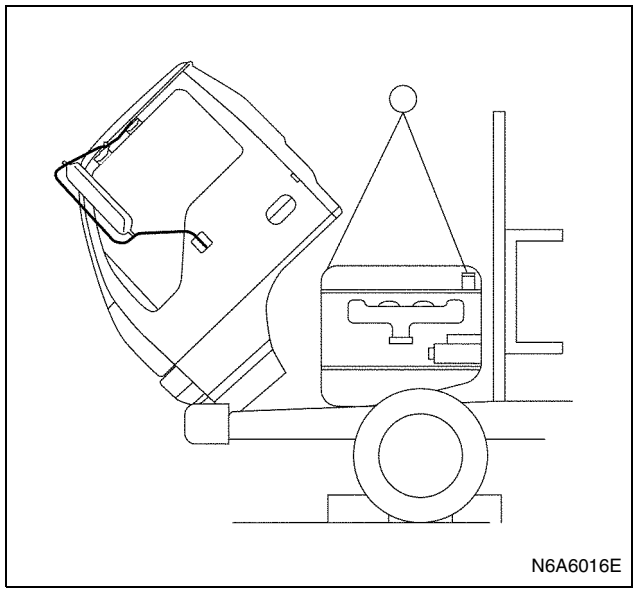
Notice:
Be absolutely sure that each harness is reconnected to its original position.

1. Install the engine assembly.
   - Hang wire on the engine hanger and hoist to lift up the engine.
   - Operate a hoist slowly to move the engine to the place where it is to be installed.



N6A6017E

   - Turn the engine at an angle of 90 degrees to lower the engine slowly to the place it is to be installed.



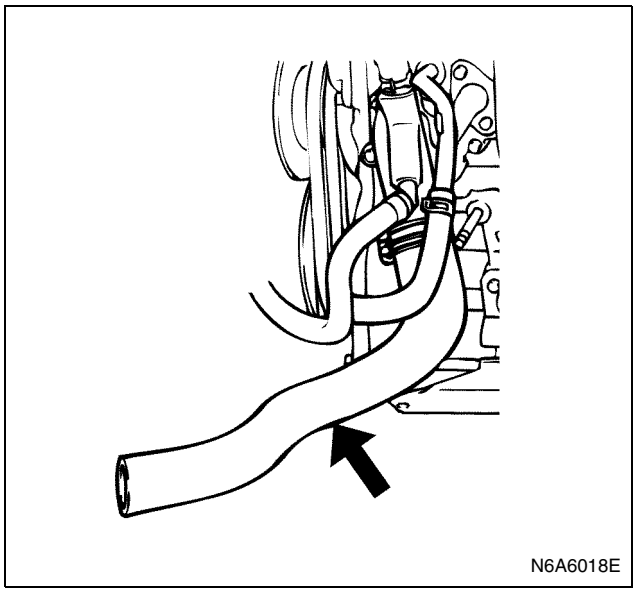
N6A6016E

   - Make the transmission side lower and operate a hoist slowly, pulling it backward to the engine.
2. Install the engine mount.
   - Install the engine mount to fit into the holes of the engine mounting cross member and tighten it up with the specified torque.

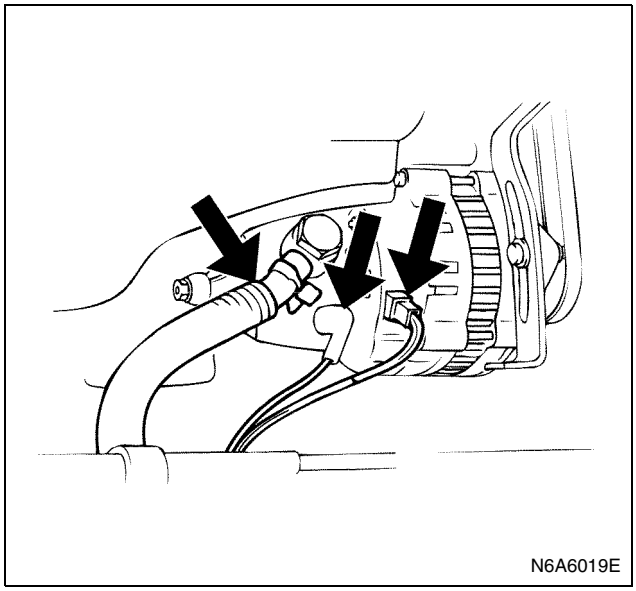
Tighten:
Cross member to 48 N·m (4.9 kg·m/35 lb·ft)

3. Install the feed and return sides of the fuel hose.
4. Install the front exhaust pipe.

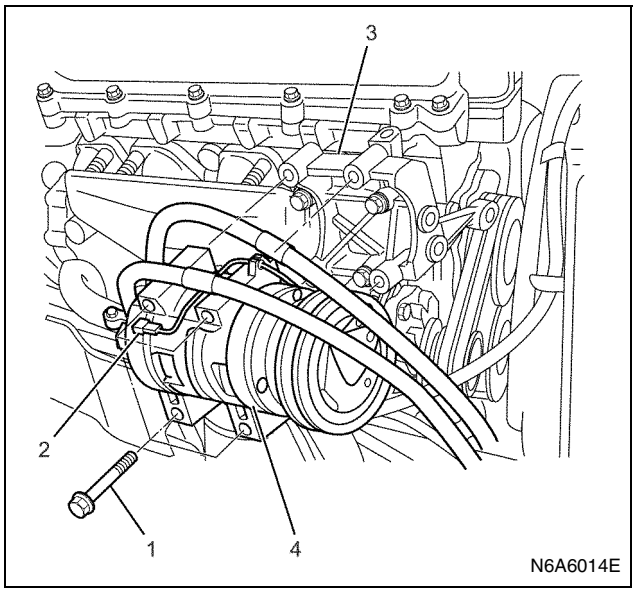
5. Install the lower hose of the radiator.



6. Install the power steering oil hose.
7. Install the power steering reserve tank.
8. Install the hydraulic booster brake hose on the high-pressure side.
9. Install the hydraulic booster brake tank.
10. Install the blow-by separator hose.
11. Install a bracket by the blow-by separator and install the harness connector and HBB oil hose bracket.
12. Install a vacuum hose to the vacuum pump.



13. Install the AC generator harness.
    - Install the terminal B cable and the harness connector to the generator.
14. Install the A/C compressor.
    - Install the connector.

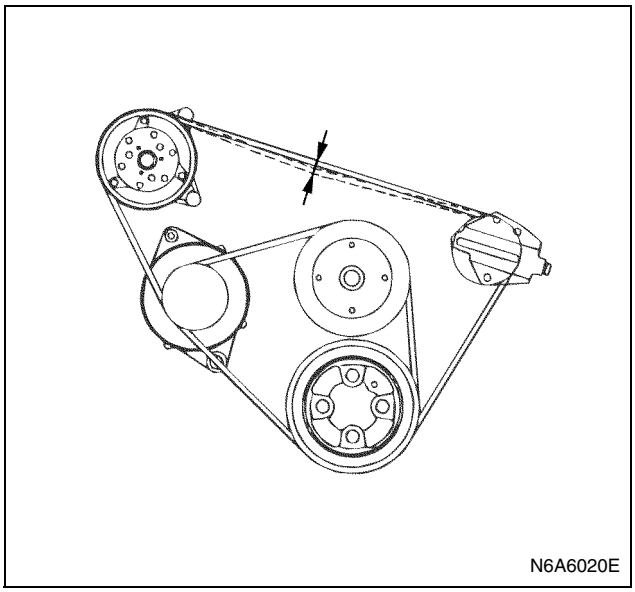


Legend

1. Fixing Bolt
2. Connector
3. Bracket
4. A/C Compressor

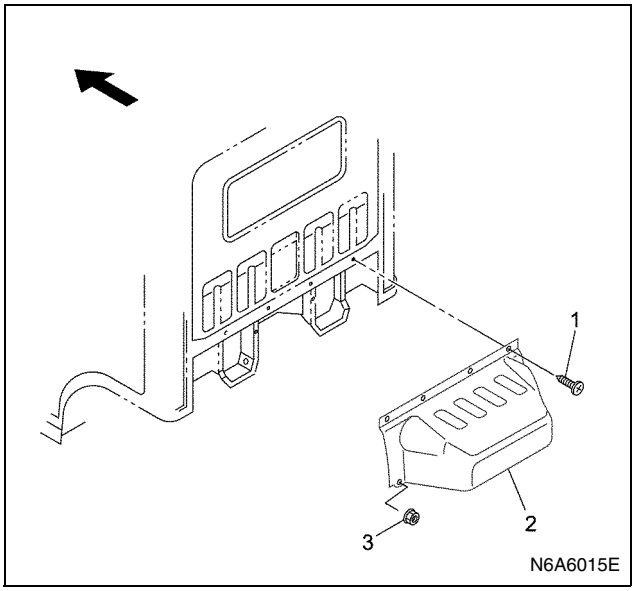
- Install the drive belt.
- Hang the drive belt to adjust its tension with an adjusting bolt of the tension pulley.
- For further details for adjusting tension of the belt, refer to “Drive Belt” in Section 6B.
- Check if a flexure is within the specified range when the center part is pressed by the hand with 98 N (22 lb) by using a scale, for instance. In addition, check if it is not damaged as well.
- Flexure of the A/C compressor belt.
- 16 – 20 mm (0.62 – 0.79 in) (when the belt is new)
- 18 – 22 mm (0.71 – 0.87 in) (when the belt is reused)

- After adjusting tension of the belt, tighten up the lock nut of the tension pulley.



N6A6020E

15. Install the cab back cover.



N6A6015E

Legend

1. Screw
2. Cab Back Cover
3. Nut

16. Install the engine harness.
17. Install the heater hoses.

- Install 2 hoses.

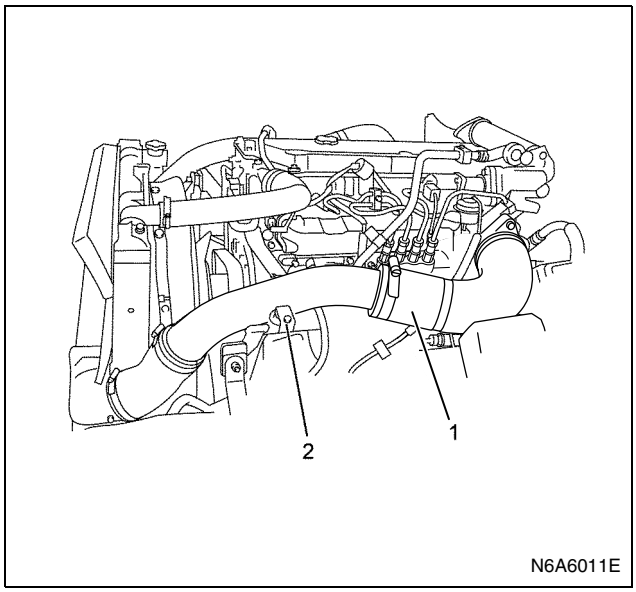
N6A6013E

18. Install the fan assembly.
19. Install a bracket for the fan guide.
20. Install an upper hose of the radiator.
    - Install the VSV vacuum hose and bundle it and upper hose with a band clip.

N6A6012E

21. Install the charge air hose (between intercooler and inlet duct).

- Install the connector of the boost pressure sensor.

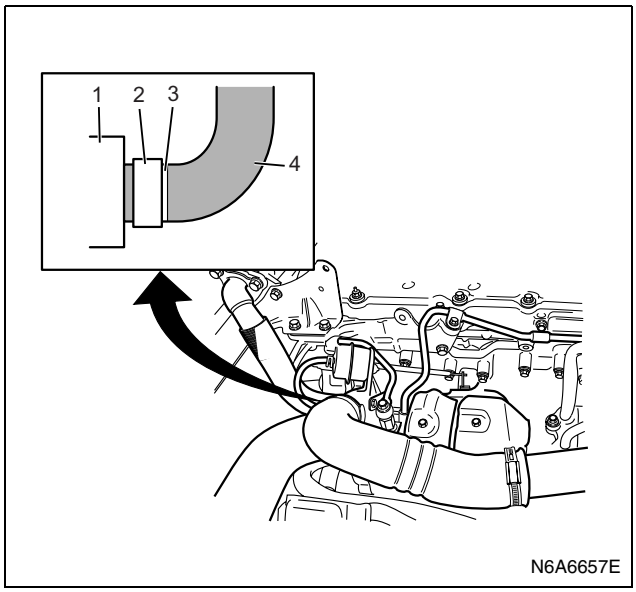


Legend

1. Charge Air Hose
2. Boost Pressure Sensor

22. Install the inlet hose (between air cleaner and turbocharger).
    - Hose is inserted until bumping to turbocharger.
    - Clip assembled along the white line on hose.

Clip Tightening torque: 6.3 N·m (56 lb ft)



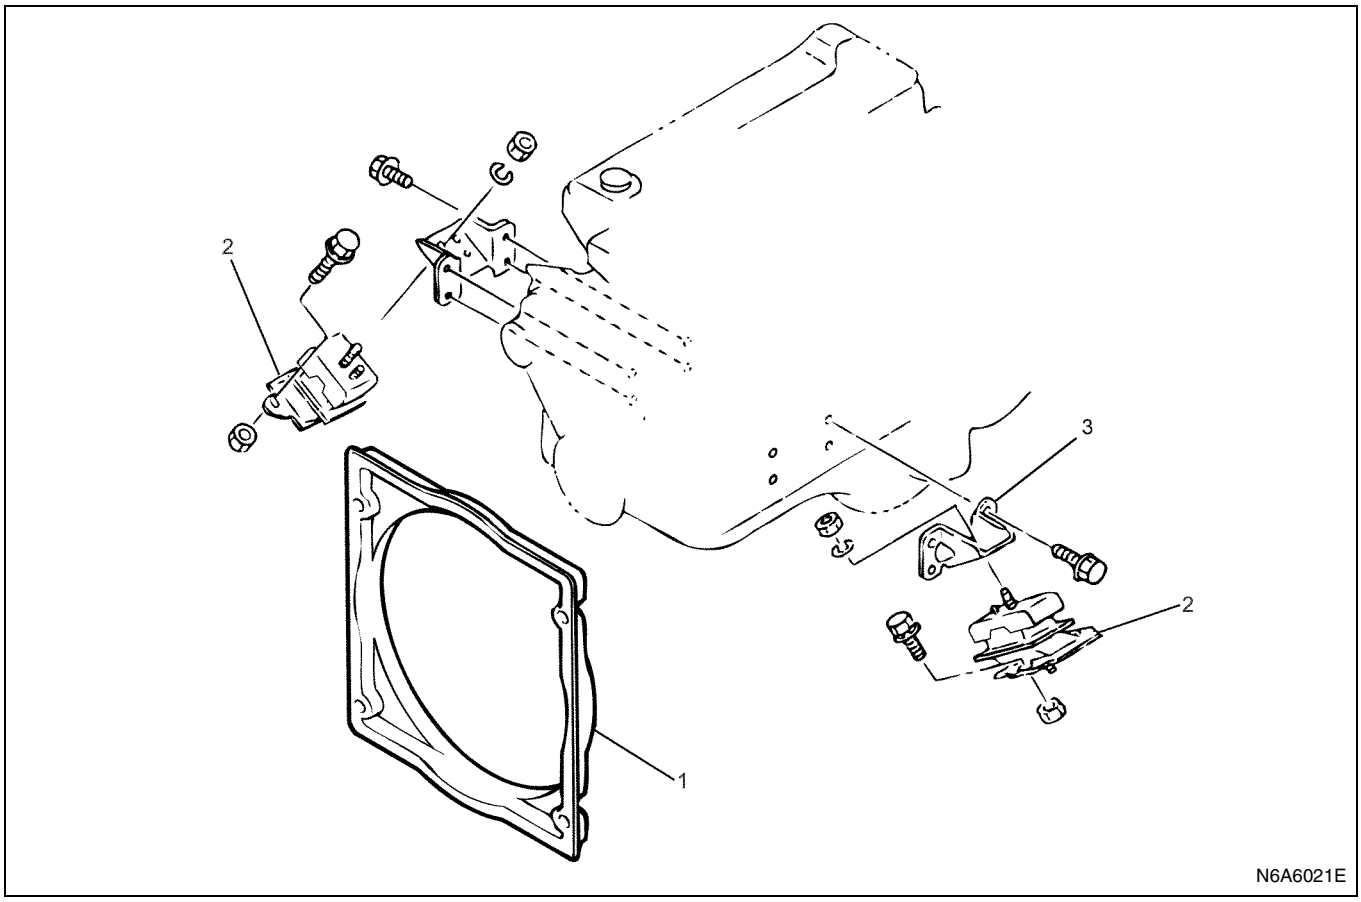
Legend

1. Turbocharger
2. Clip
3. White Line
4. Hose

23. Install the charge air hose (between turbocharger and intercooler).
24. Install the transmission assembly.
    Refer to “Transmission Assembly”.
25. Install the starter motor.
    - Install 2 up and down bolts to fasten the starter.
    - Connect the front frame harness connector and install each clip which fixes the harness.
26. Replenish the coolant.
27. Install a minus (–) terminal of the battery.

Engine Mount

Component



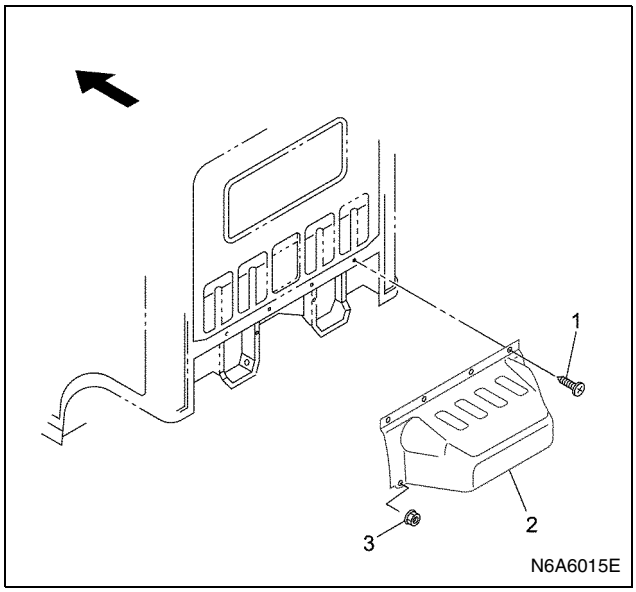
Legend

1. Fan Guide
2. Engine Mount
3. Engine Foot

Removal

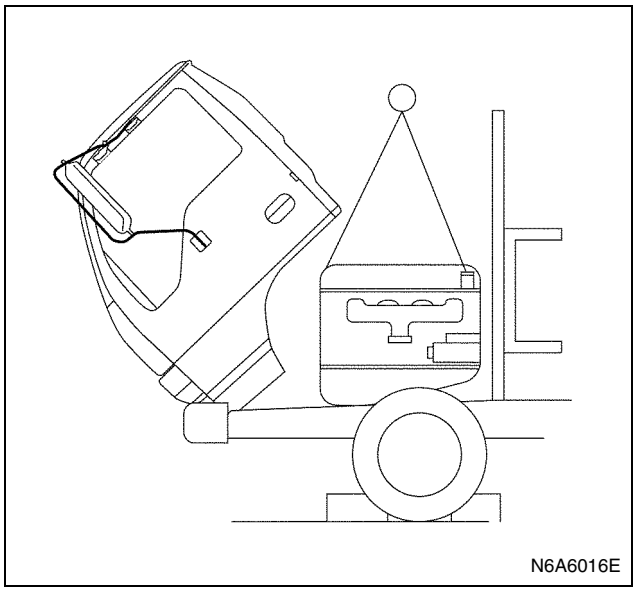
1. Remove the fan guide bracket.
2. Remove the engine mount.

- Remove the cab back cover.



Legend
1. Screw
2. Cab Back Cover
3. Nut

- Before removing the engine mount, hang the engine with a hoist.
- Remove the nuts fastened to the engine foot and engine mount.
- Remove the bolts fastened to the engine mount on the chassis frame side.
- Hoist the engine assembly slightly to remove the engine mount.

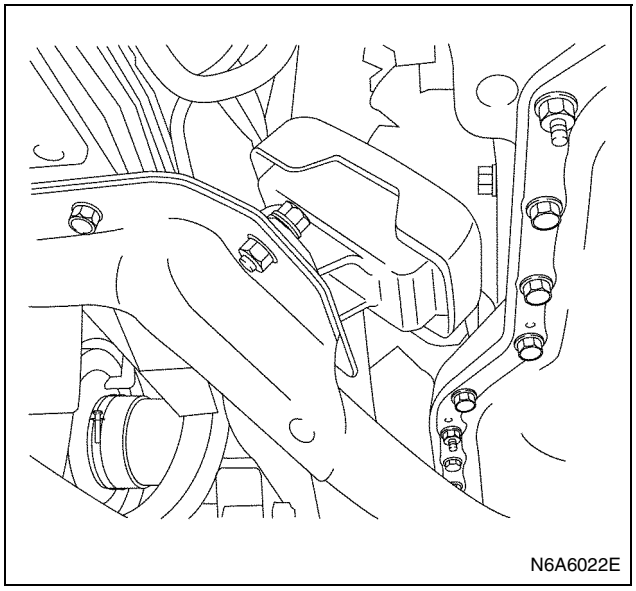


Installation

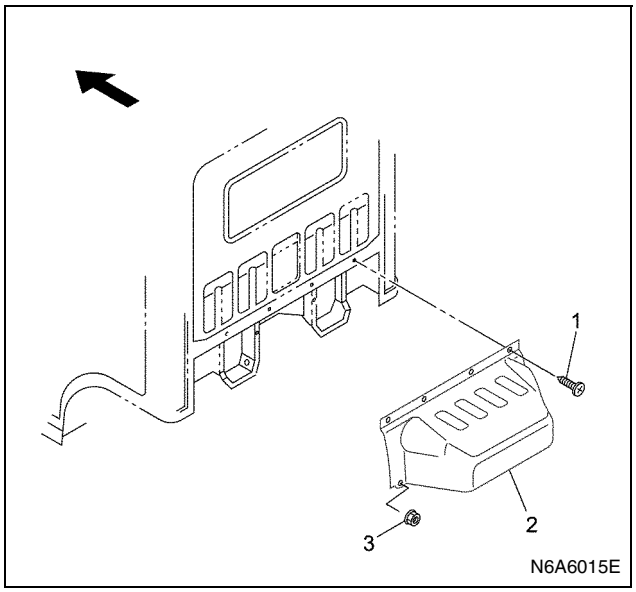
1. Install the engine mount and tighten up with the specified torque.

Tighten:
The nuts on the chassis frame side to 82 N·m (8.4kg·m/ 61 lb·ft)

The bolts on the engine foot side to 51 N·m (5.2kg·m/38 lb·ft)

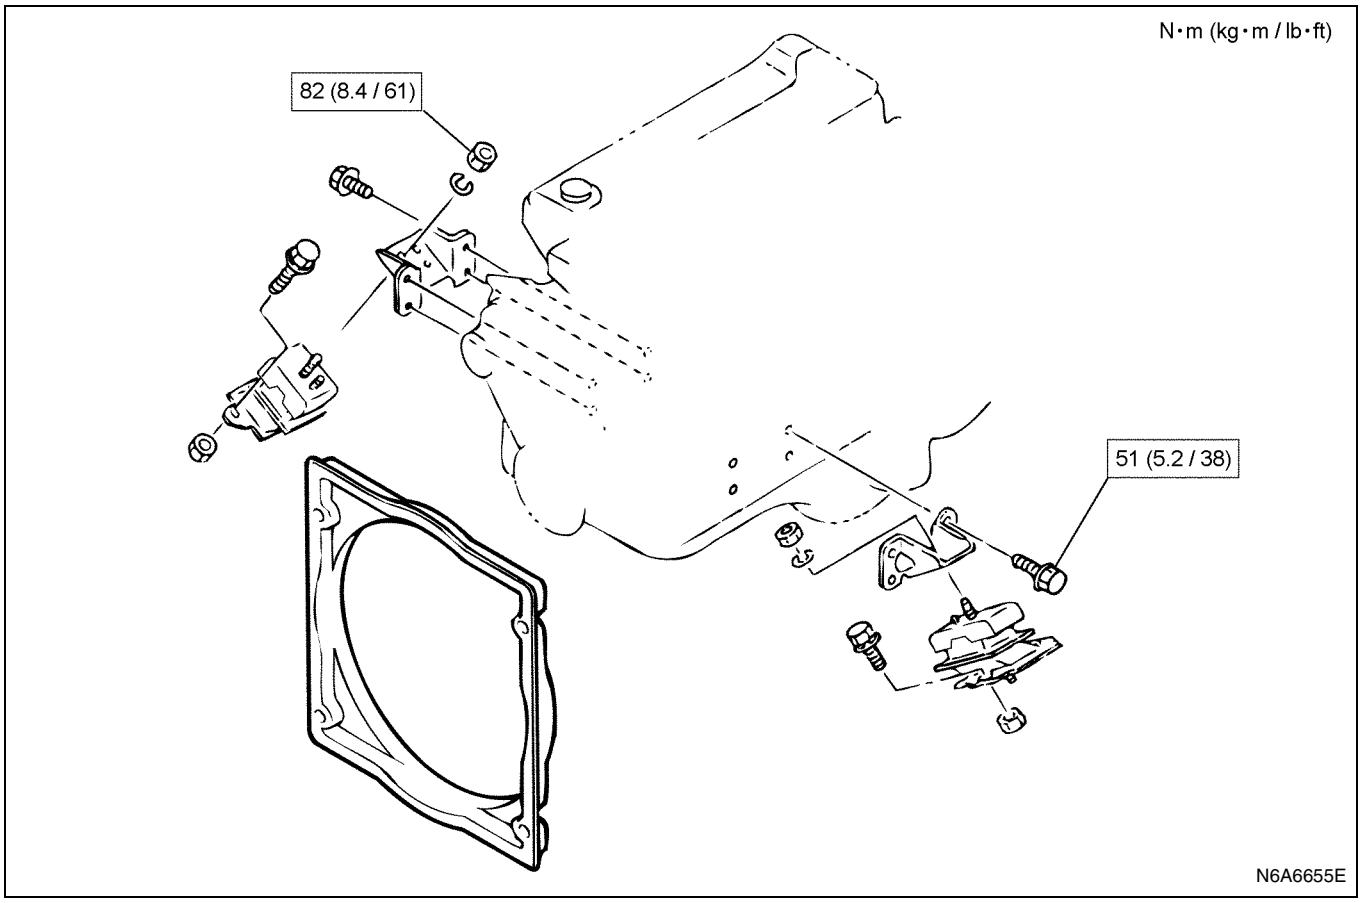


2. Install the fan guide bracket.
   - Check if nothing is wrong with the engine mount by starting the engine.
3. Install the cab back cover.



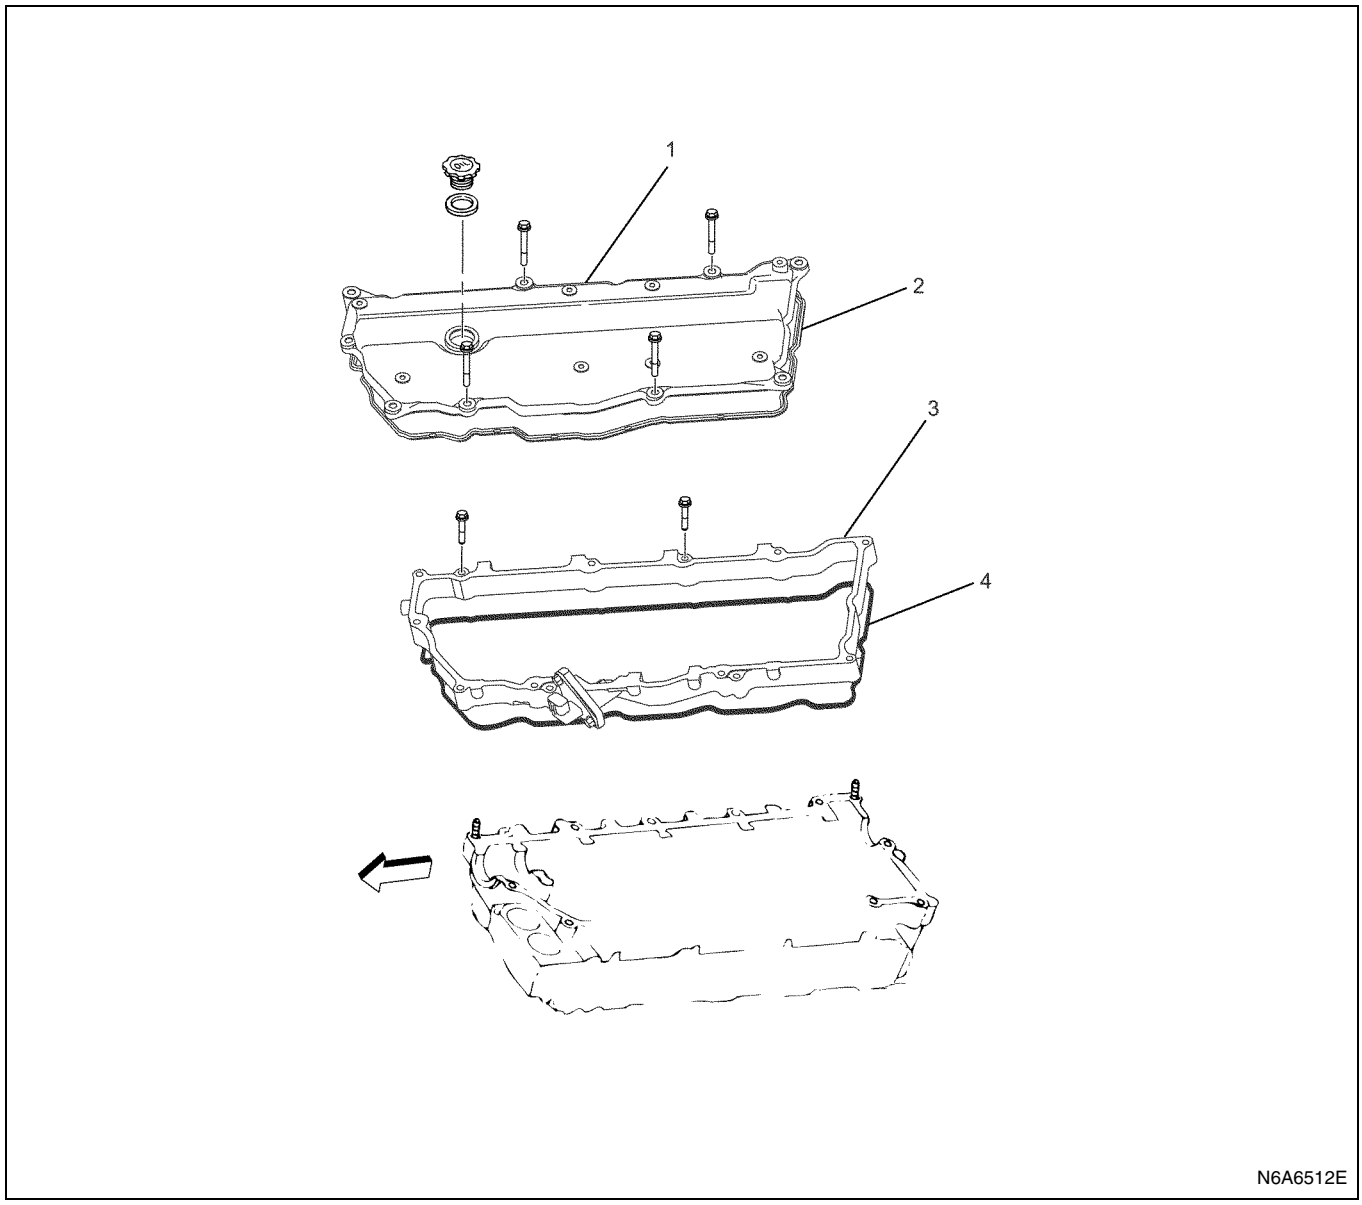
Legend
1. Screw
2. Cab Back Cover
3. Nut

Torque Specifications



Cylinder Head Cover (Except Europe)

Component



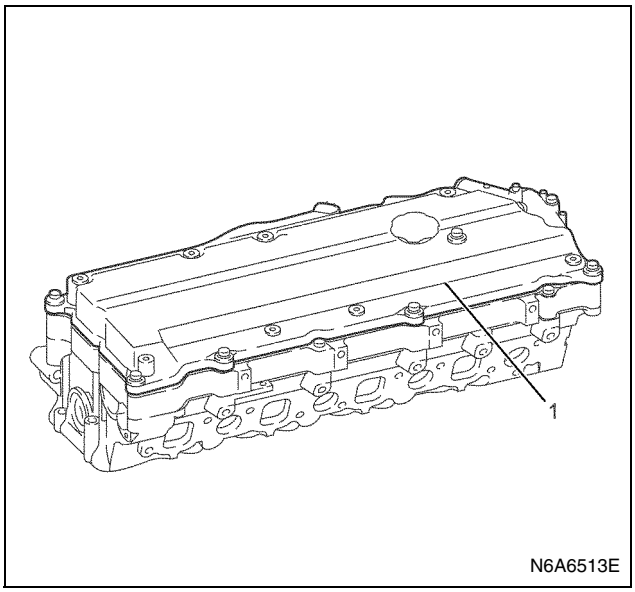
Legend

1. Head Cover
2. Gasket
3. Head Cover Case
4. Gasket

Removal

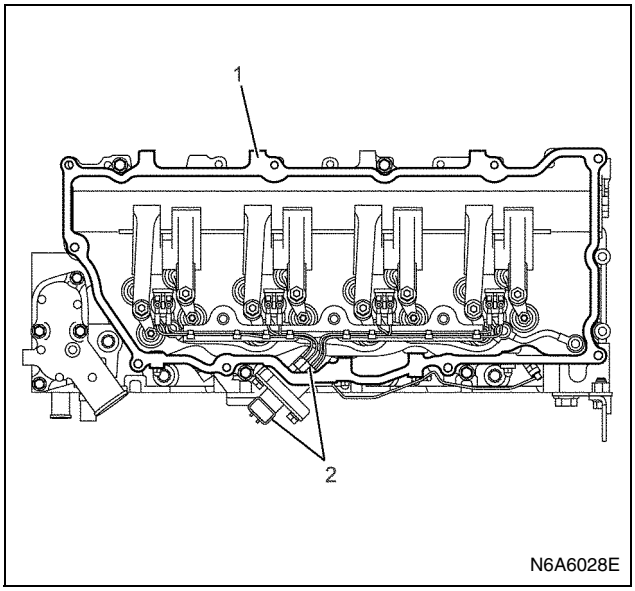
1. Remove the head cover.

2. Remove the gasket.



Legend
1. Head Cover

3. Remove the fuel injector harness connector.
4. Remove the head cover case.
5. Remove the gasket.



Legend
1. Head Cover Case
2. Fuel Injector Harness Connector

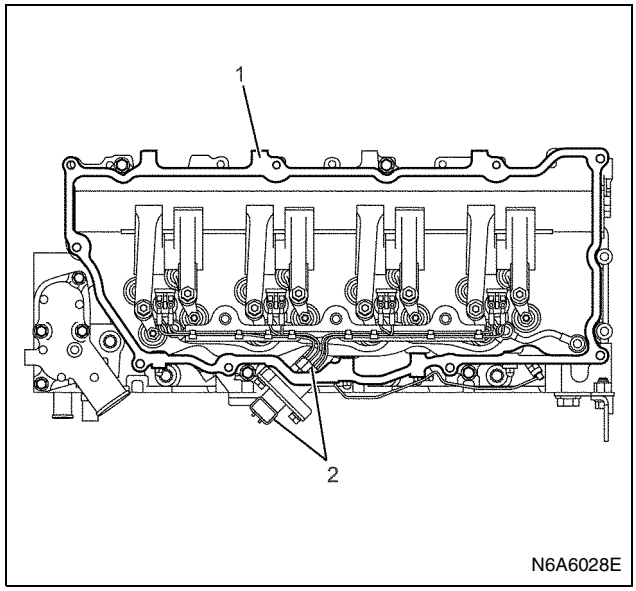
Installation

1. Install the gasket on the lower cover.
2. Install the head cover case.

Tighten:
Bolts to 18 N·m (1.8 kg·m/13 lb·ft)

3. Install the fuel injector harness connector.

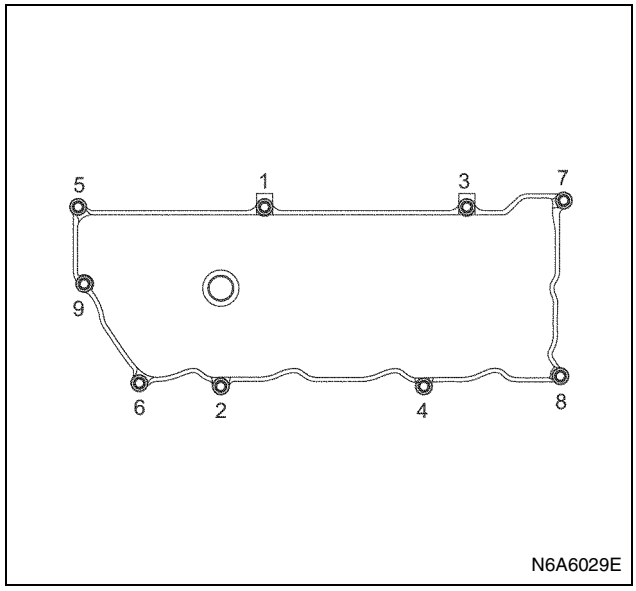
Caution:
Push it in thoroughly until the claws of the lock raise.



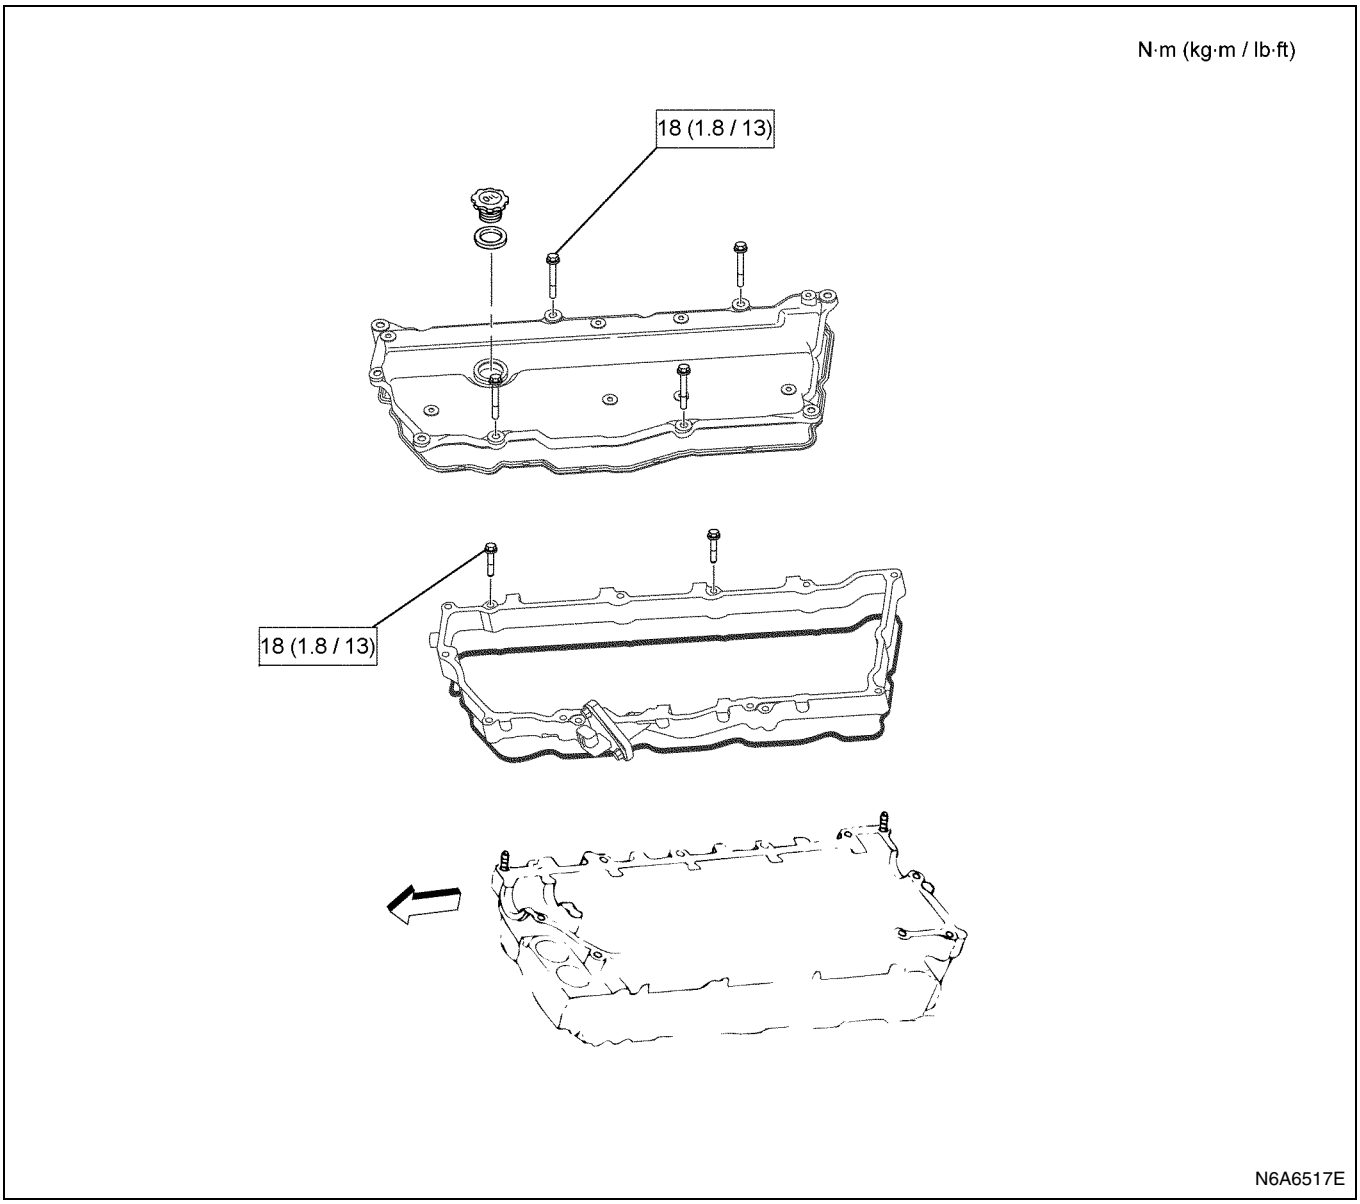
Legend
1. Head Cover Case
2. Fuel Injector Harness Connector

4. Install the gasket on the head cover.
5. Install the head cover and tighten up according to the orders given on the figure.

Tighten:
Bolts to 18 N·m (1.8 kg·m/13 lb·ft)

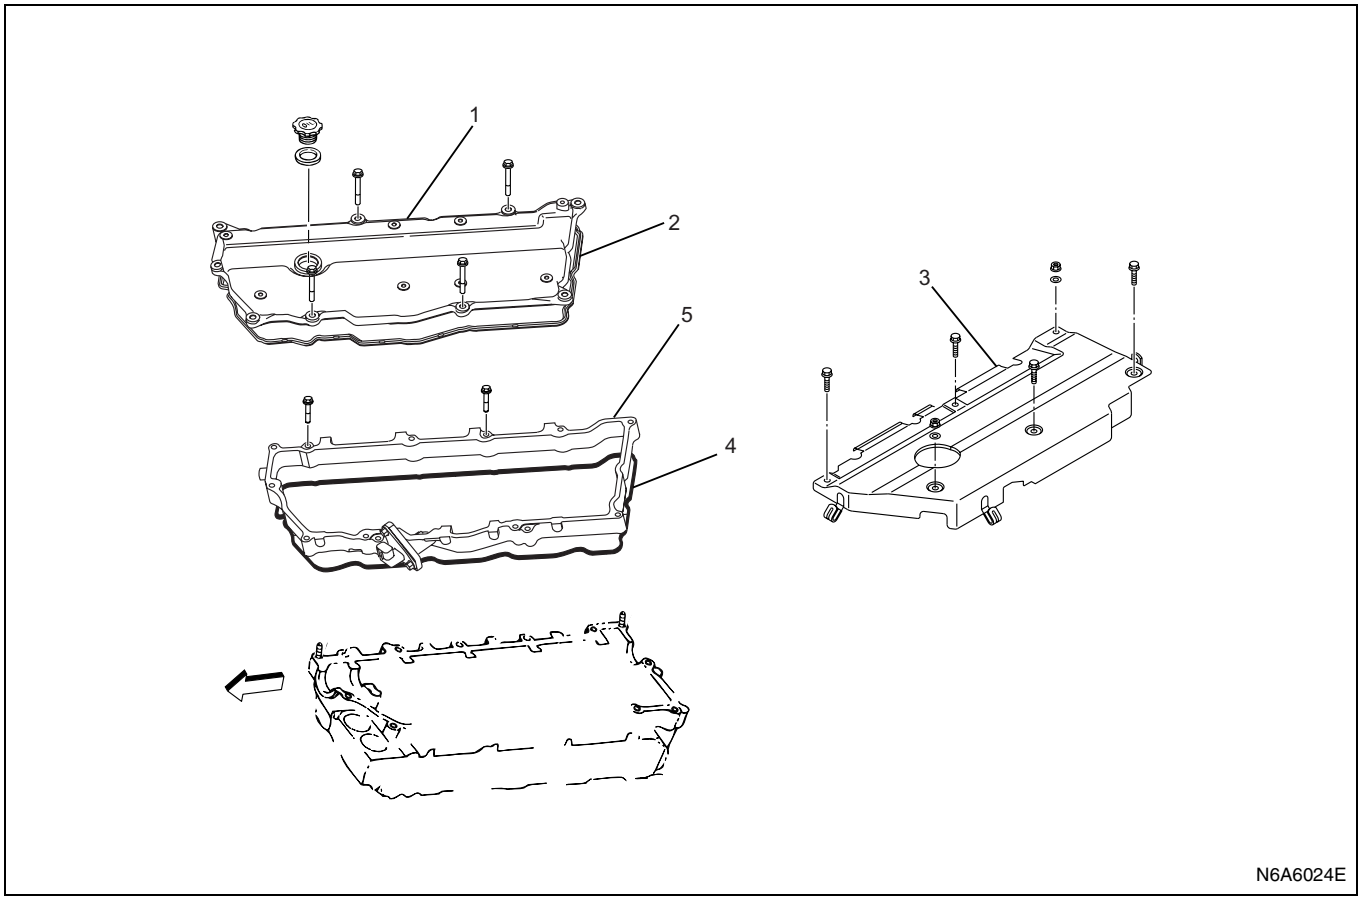


Torque Specifications



Cylinder Head Cover (For Europe)

Components



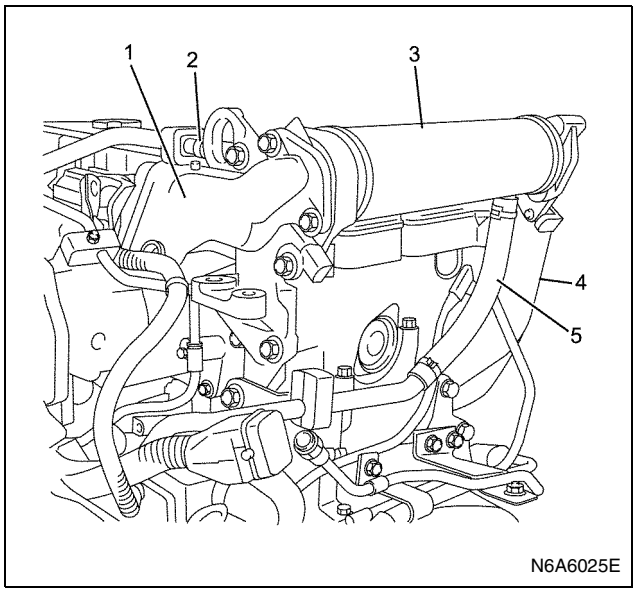
Legend

1. Head Cover
2. Gasket
3. Sound Insulation Cover
4. Gasket
5. Head Lower Cover

Removal

1. Drain engine coolant. Refer to Engine Cooling System section.
2. Remove EGR valve connector.

3. Remove the EGR pipe.

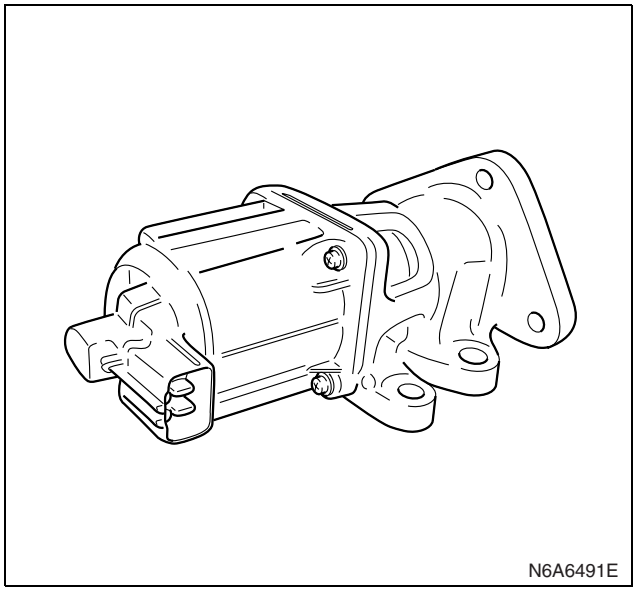


Legend

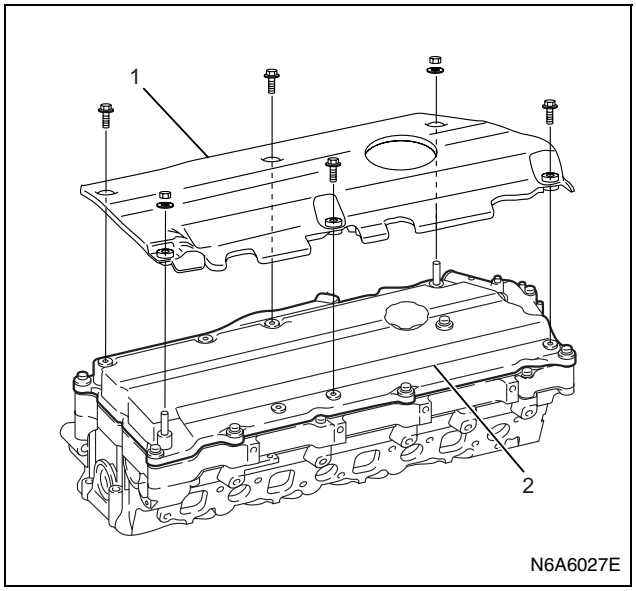
1. EGR Adapter
2. Water Return Pipe
3. EGR Cooler
4. EGR Pipe
5. Water Feed Pipe

4. Remove the cooling water pipes.
5. Remove the EGR adapter.
6. Remove the EGR cooler.
7. Remove the EGR valve.

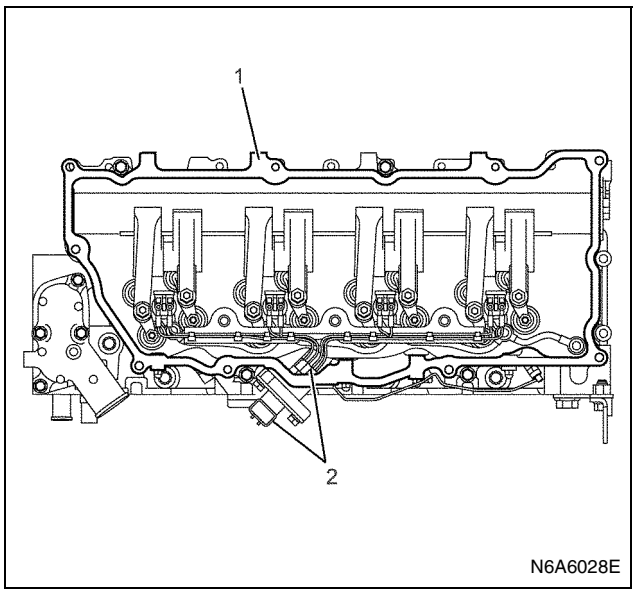
Caution:
After removing the EGR valve and EGR adapter, seal the opening so that foreign matter does not enter.



8. Remove the sound insulation cover (1).
9. Remove the head cover (2)
10. Remove the gasket.



11. Remove the fuel injector harness connector (2).
12. Remove the head lower cover (1).
13. Remove the gasket.



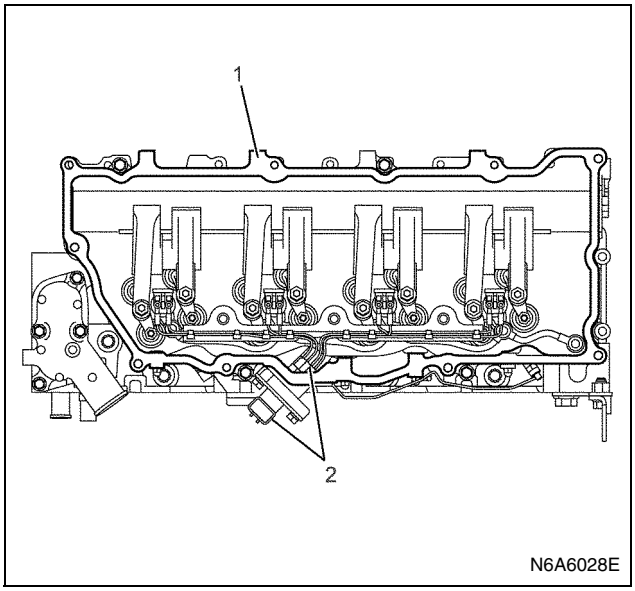
Installation

1. Install the gasket on the head lower cover (1).
2. Install the head lower cover (1).

Tighten:
Bolts to 18 N·m (1.8 kg·m/13 lb·ft)

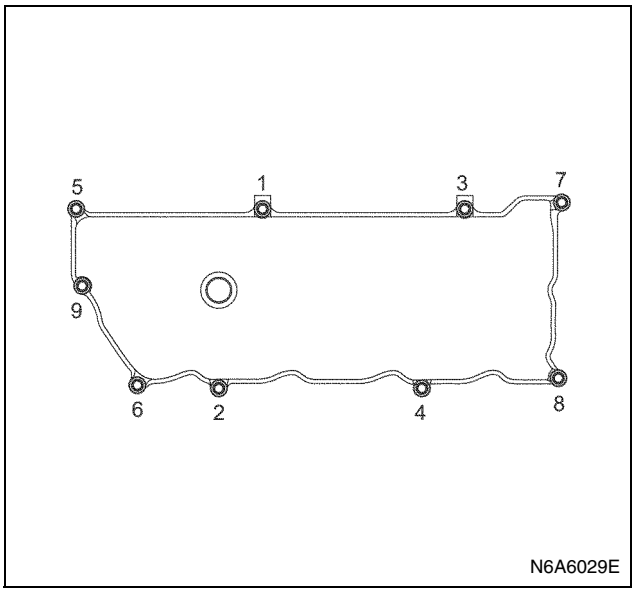
3. Install the fuel injector harness connector (2).

Caution:
Push it in thoroughly until the claws of the lock raise.



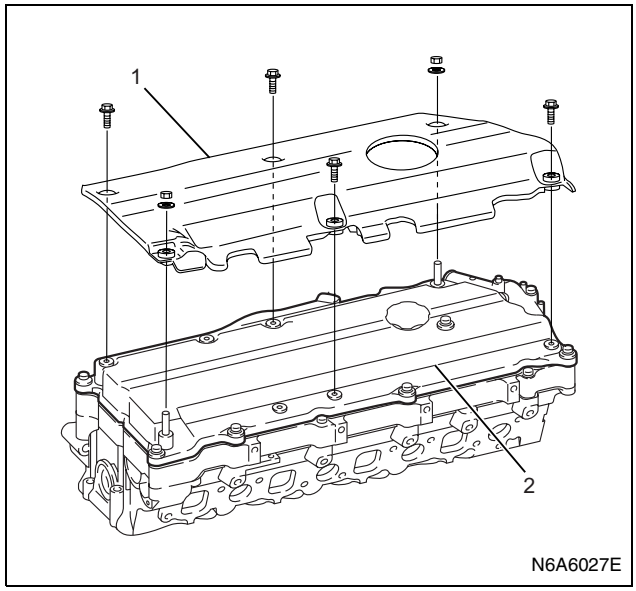
4. Install the gasket on the head cover.
5. Install the head cover and tighten up according to the orders given on the figure.

Tighten:
Bolts to 18 N·m (1.8 kg·m/13 lb·ft)



6. Install the sound insulation cover.

Tightening torque: 8 N·m (0.8 kg·m/6 lb·ft)



Legend
1. Sound Insulation Cover
2. Head Cover

7. Mount the EGR valve.
   - Insert the gasket and temporarily fit the EGR valve.

Notice:
Temporarily tighten the bolts.

8. Install the EGR cooler.
   - Temporarily fit the EGR cooler to the bracket.

Notice:
Temporarily tighten the bolts.

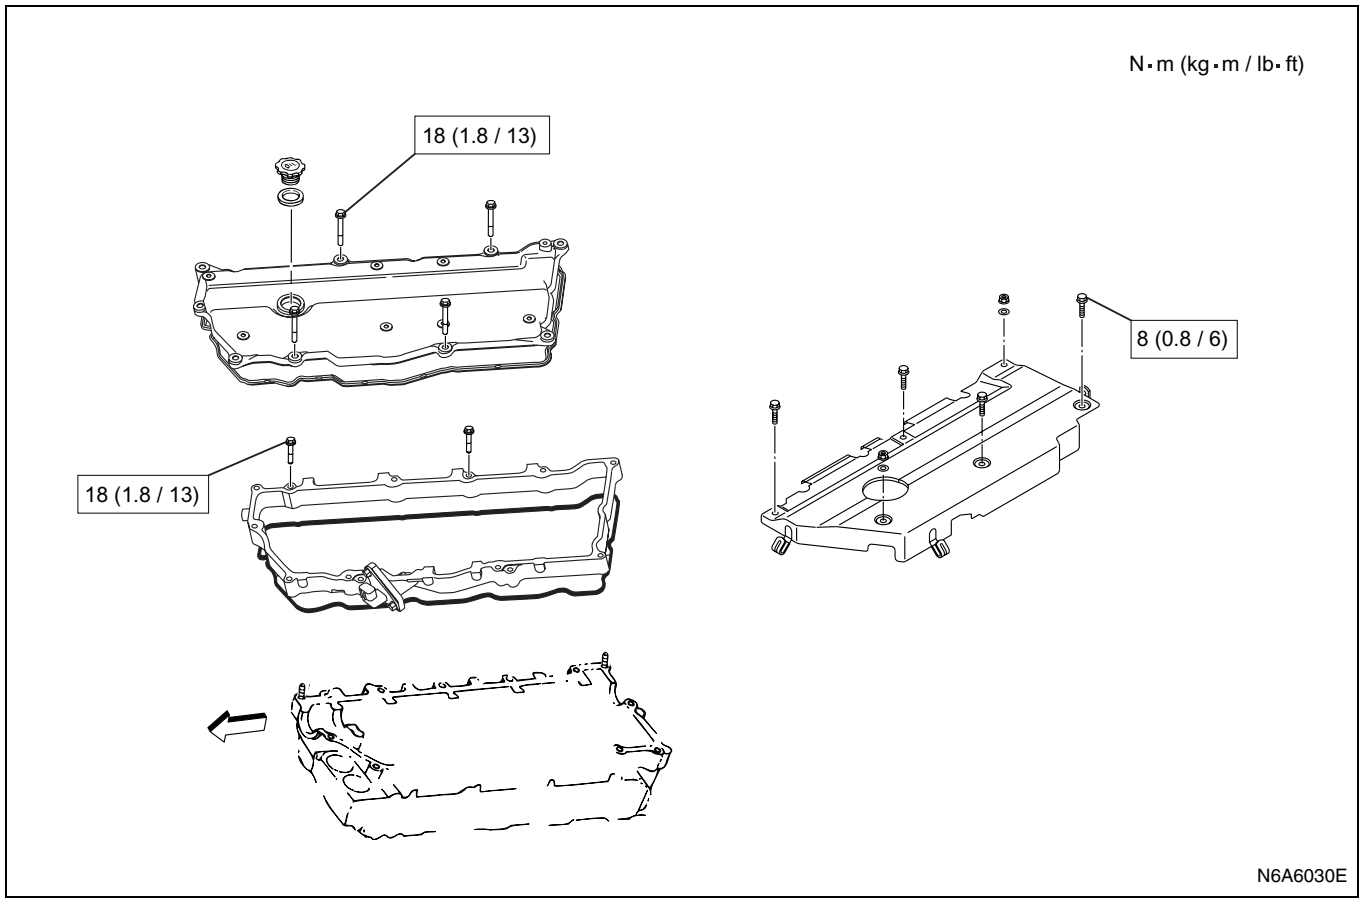
9. Install the EGR adapter.
   - Temporarily fit the EGR adapter between the EGR cooler and exhaust manifold.

Notice:
Temporarily tighten the bolts.

10. Install the EGR pipe.
    - Insert the gasket between the two ends of the EGR pipe and temporarily fit it.

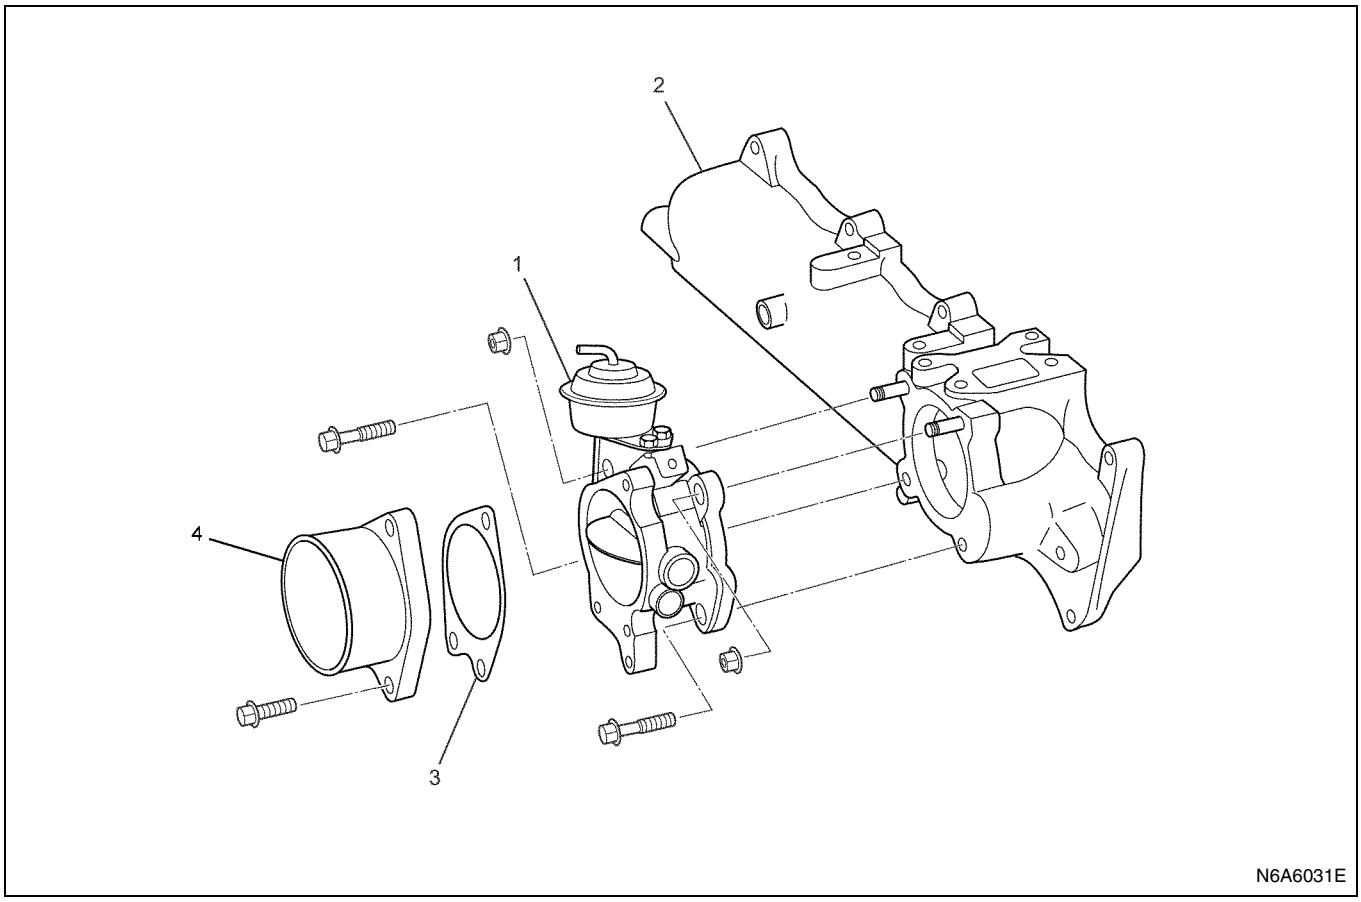
Notice:
Temporarily tighten the bolts.

Tightening Torque Specifications



Inlet Cover

Component

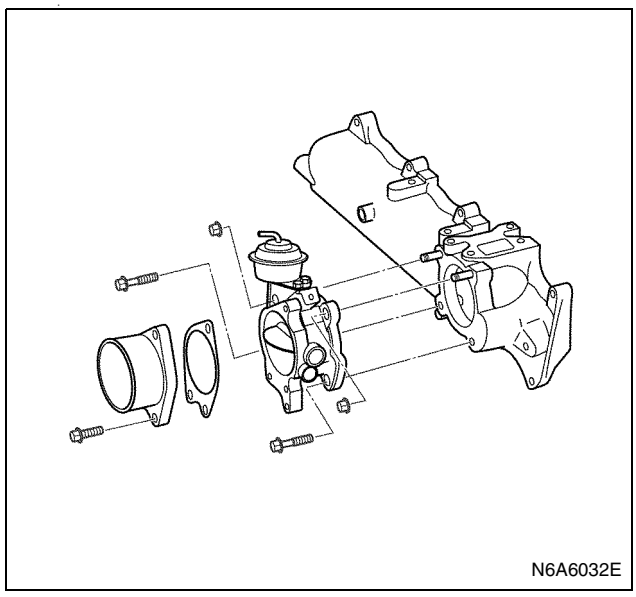


Legend

1. Throttle Assembly
2. Inlet Cover
3. Inlet Pipe Gasket
4. Inlet Pipe

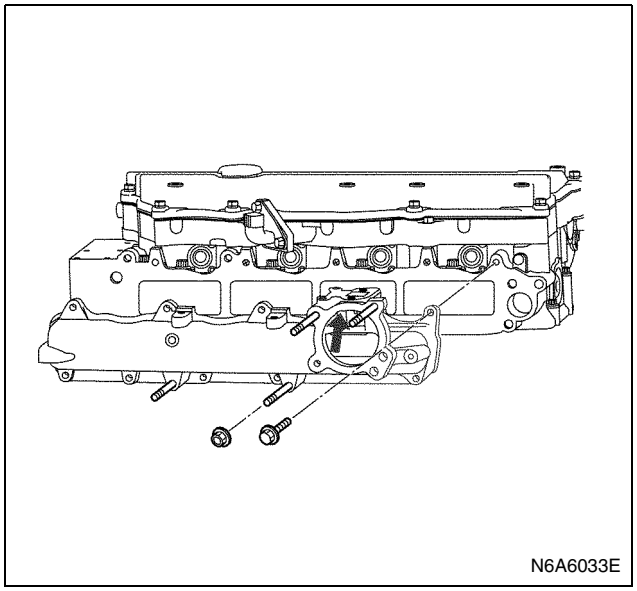
Removal

1. Remove the fuel rail.
   Refer to “Fuel Rail” in Section 6C.
2. Remove the EGR valve.
   Refer to “EGR Valve and EGR Cooler” in Section 6F.
3. Remove the inlet pipe.
4. Remove the throttle assembly.



5. Remove the inlet cover.

- On the place where the throttle assembly is to be installed inside the inlet cover (arrow) is a bolt. Be careful not to forget to remove it.
- Peel the liquid gasket off carefully.



N6A6033E

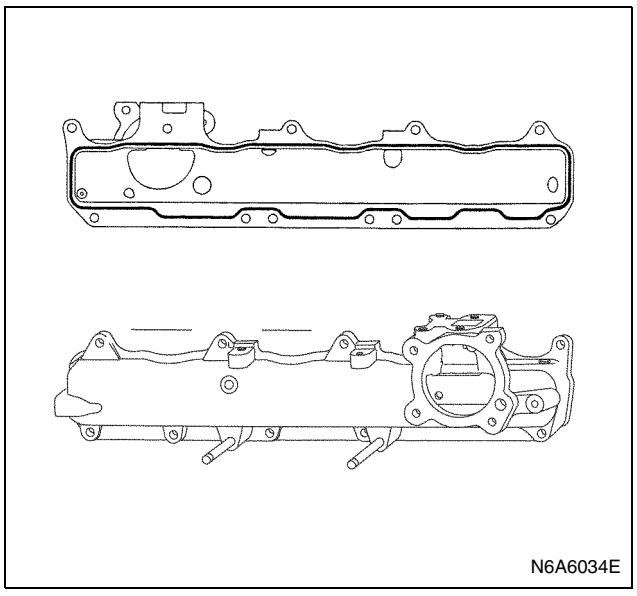
Installation

1. Install the inlet cover.
   - Apply the liquid gasket (ThreeBond 1207C or equivalent) keeping a bead diameter of 2.5–5.5 mm (0.1–0.2 in) along the groove of the inlet cover.
   - Install it within 7 minutes after applying the liquid gasket.

Tighten:
Bolt and nut to 22 N·m (2.2 kg·m/16 lb·ft)

Caution:

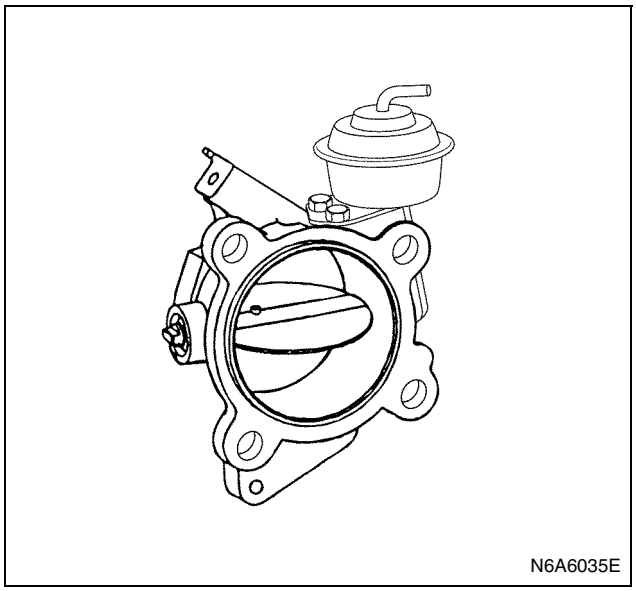
- Be careful not to forget to fasten the bolt indicated with an arrow.
- Tighten up the stud part together with the fuel rail.



N6A6034E

2. Install the throttle assembly.
   - Apply the liquid gasket and mount within 7 minutes.

Tighten:
Bolt and nut to 24 N·m (2.4 kg·m/17 lb·ft)



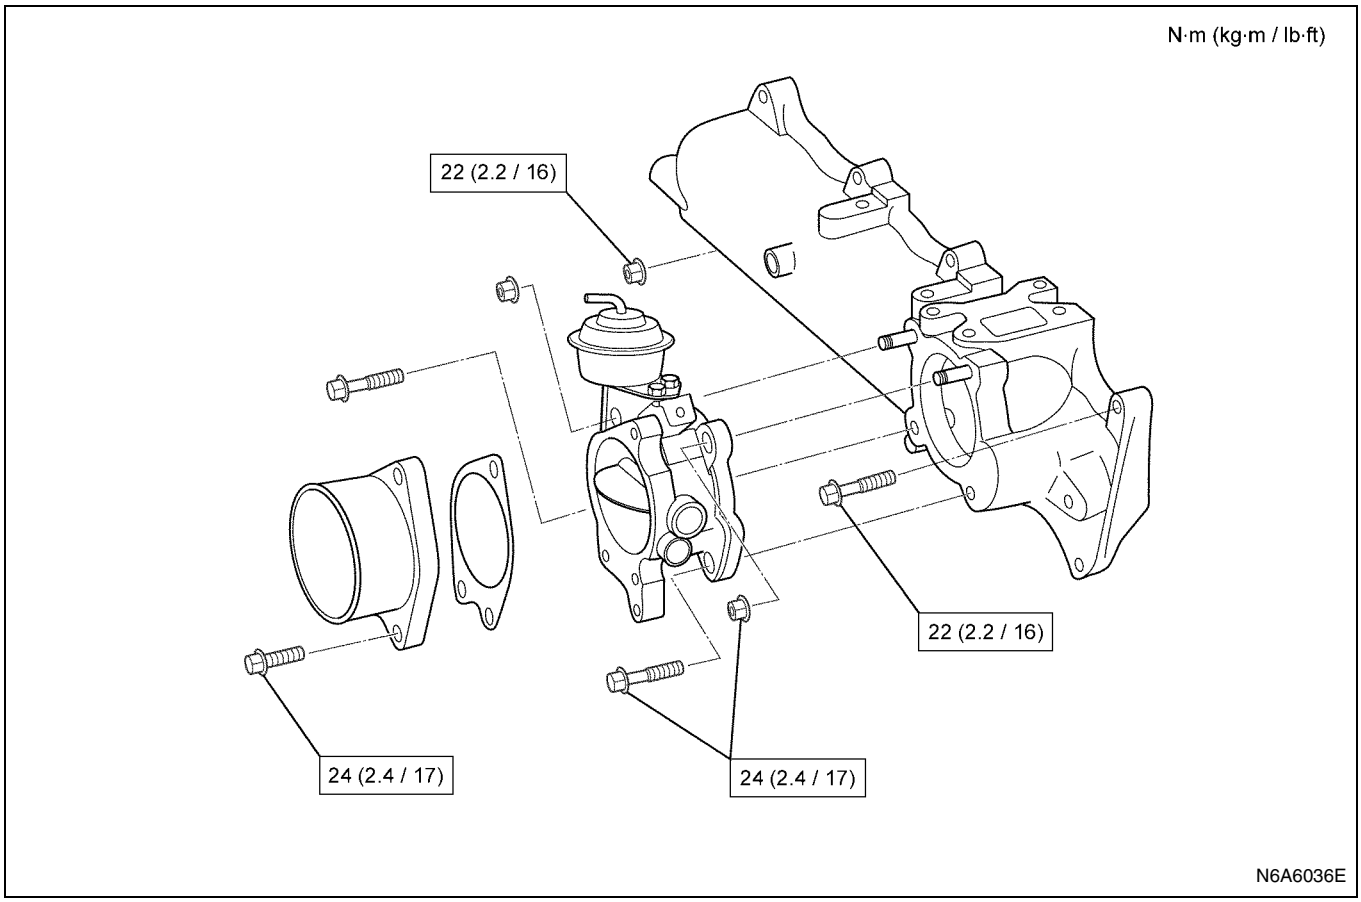
N6A6035E

3. Install the gasket on the inlet pipe and tighten up with the prescribed torque.

Tighten:
Bolt to 24 N·m (2.4 kg·m/17 lb·ft)

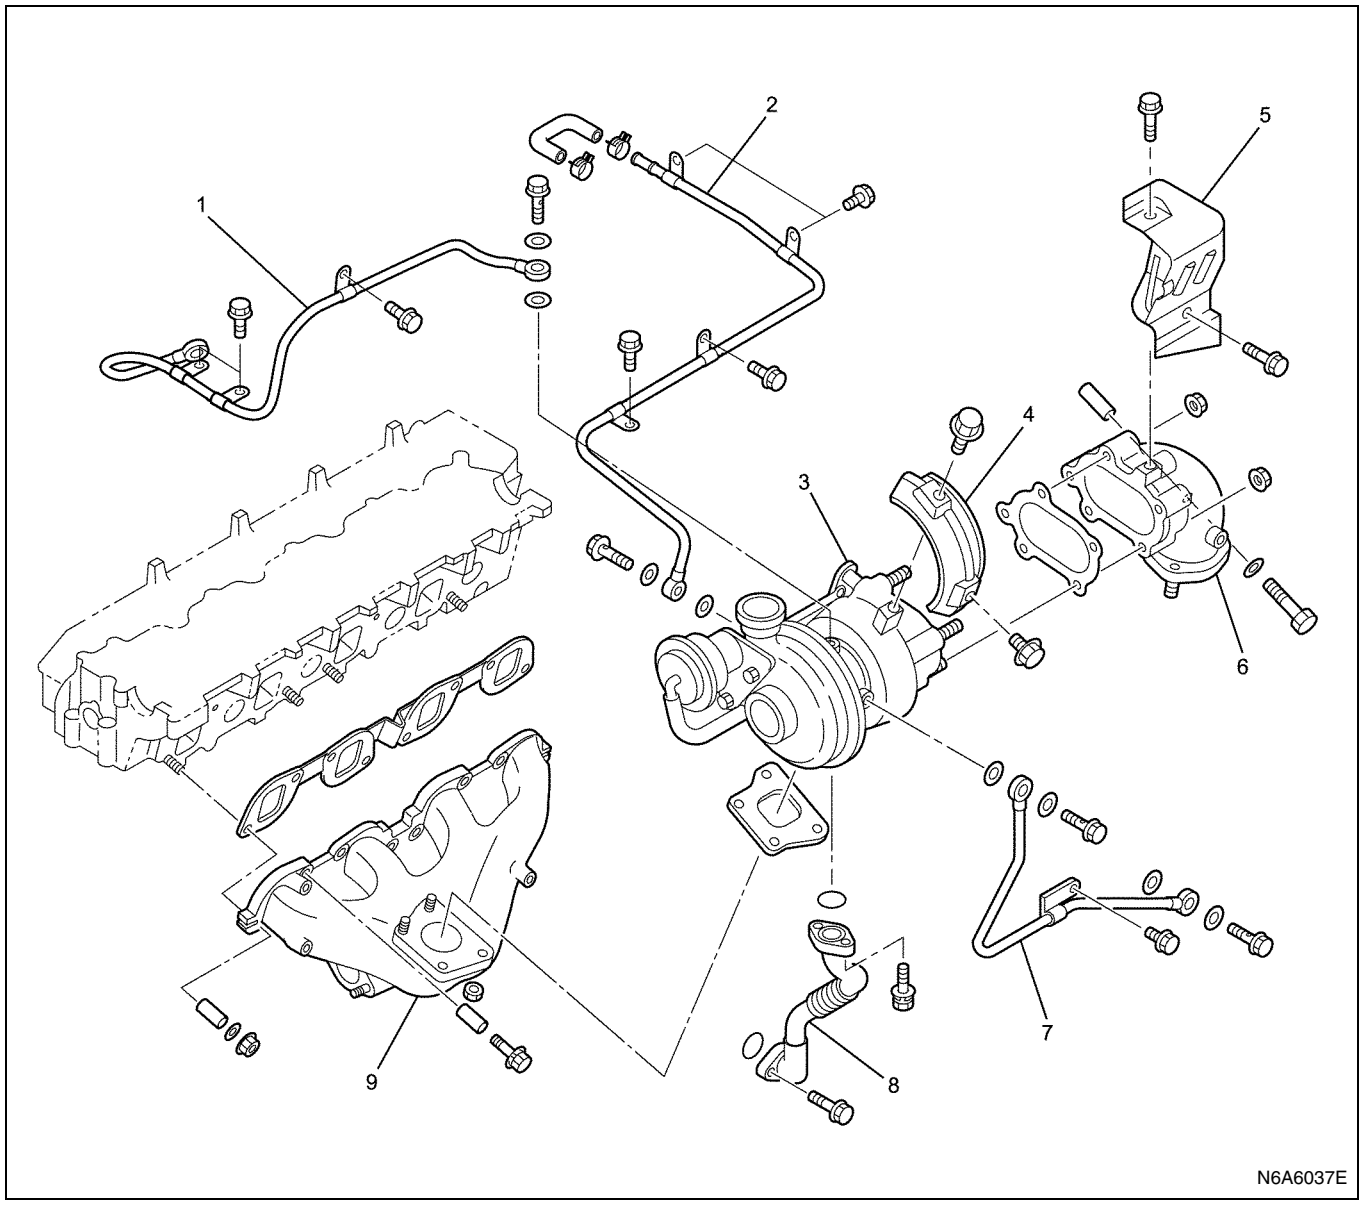
4. Install the EGR valve.
   Refer to “EGR Valve and EGR Cooler” in Section 6F.
5. Install the fuel rail.
   Refer to “Fuel Rail” in Section 6C.

Torque Specifications



Turbocharger and Exhaust Manifold

Component



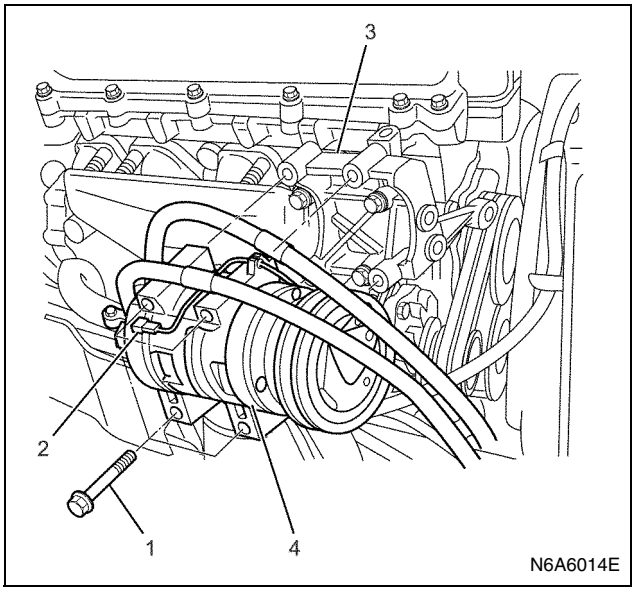
Legend

1. Oil Feed Pipe
2. Water Return Pipe
3. Turbocharger Assembly
4. Heat Protector
5. Heat Protector
6. Exhaust Adapter
7. Water Feed Pipe
8. Oil Return Pipe
9. Exhaust Manifold

Removal

1. Loosen the radiator drain cock to drain coolant.
2. Remove the air intake duct from the turbocharger and the air cleaner.
3. Remove the charge air pipe from the turbocharger and the charge air cooler.
4. Remove the front exhaust pipe.
5. Remove the EGR pipe.
6. Remove the A/C compressor harness.
7. Remove the A/C compressor bracket.

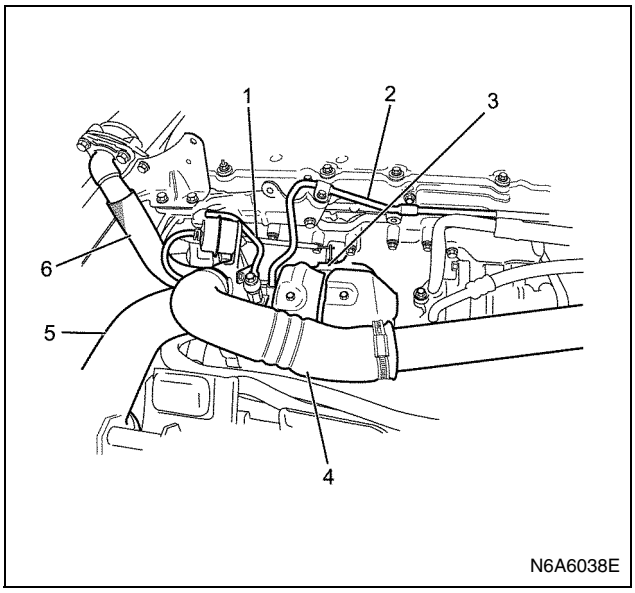
- Without disconnecting the hose of the A/C compressor, remove the compressor from the bracket and remove the compressor bracket from the cylinder head.



Legend

1. Fixing Bolt
2. A/C Compressor Harness
3. A/C Compressor Bracket
4. A/C Compressor

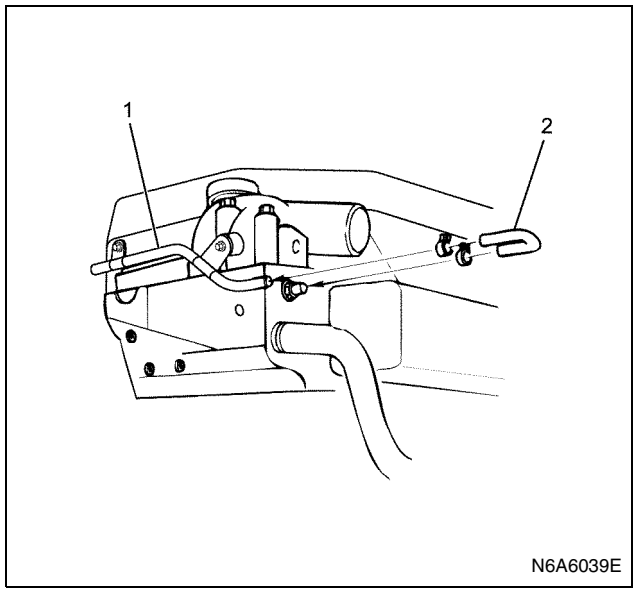
- Remove the oil feed pipe.
- Remove the oil return pipe.
- Remove the oil feed pipe.



Legend

1. Oil Feed Pipe
2. Water Return Pipe
3. Heat Protector
4. Charge Air Hose
5. Inlet Duct
6. EGR Pipe

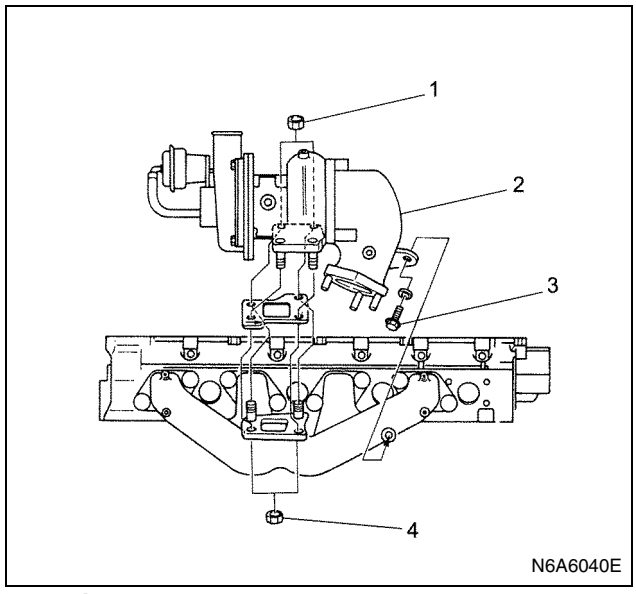
- Remove the water return pipe.



Legend

1. Water Return Pipe
2. Rubber Hose

- Remove the heat protector on the turbocharger.
- Remove the exhaust adapter bolts.
- Remove the four turbocharger clamping nuts.
- Remove the turbocharger from the exhaust manifold.



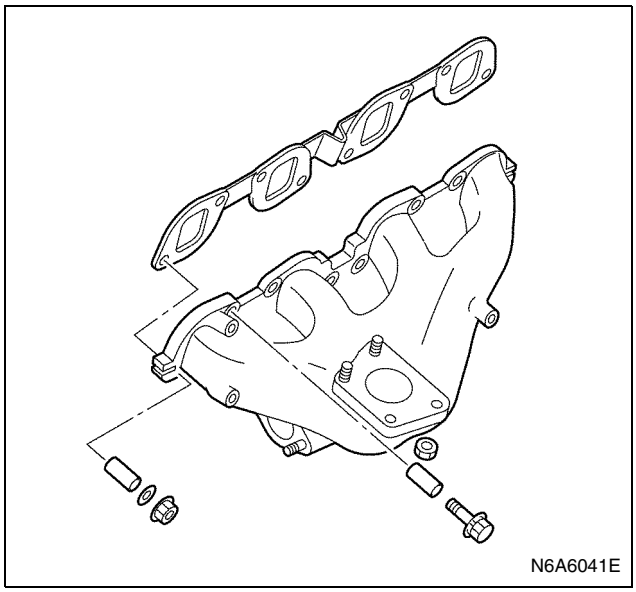
Legend

1. Fixing Nut
2. Exhaust Adapter
3. Fixing Bolt
4. Fixing Nut

---

8. Remove the exhaust manifold.

- Remove the 2 nuts and 6 bolts to remove the exhaust manifold.



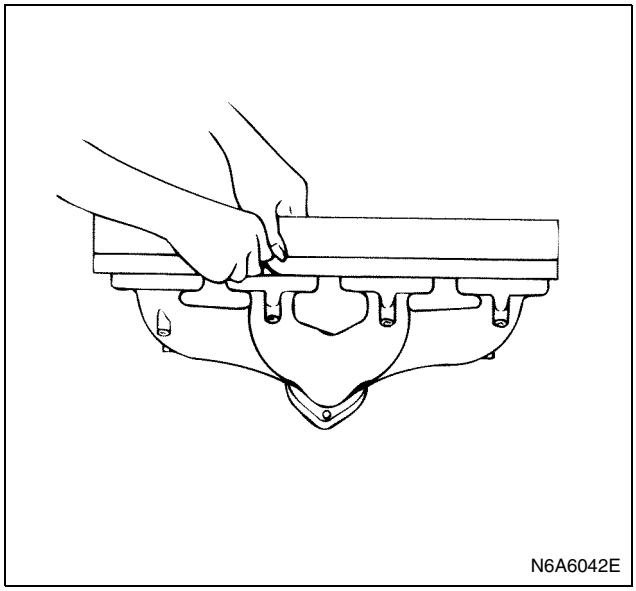
N6A6041E

Inspection

- Inspection of the exhaust manifold
  Inspect the plane surface of the plane on which the manifold and the cylinder head are to be installed.

Manifold installation plane surface	mm (in)
Standard	0.3 (0.01) or lower
Limit	0.5 (0.02)

Caution:
If the plane surface exceeds the limit, replace it.



N6A6042E

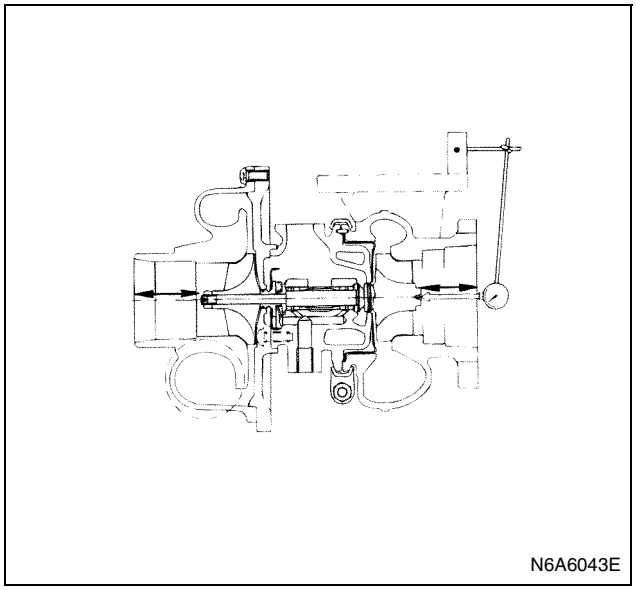
- Check a crack in the exhaust manifold visually.

Carefully inspect the turbocharger for abrasion and/or excessive wear. Make any necessary adjustments, repairs, and/or part replacements.

Wheel shaft axle play

Use a dial gauge to measure the wheel axle shaft play when a fore of 12 N (2.6 lb) is alternately applied to both sides of the compressor wheel.

Axle play	mm (in)
Standard	0.013 – 0.097 (0.0005 – 0.0038)
Limit	0.100 (0.0039)

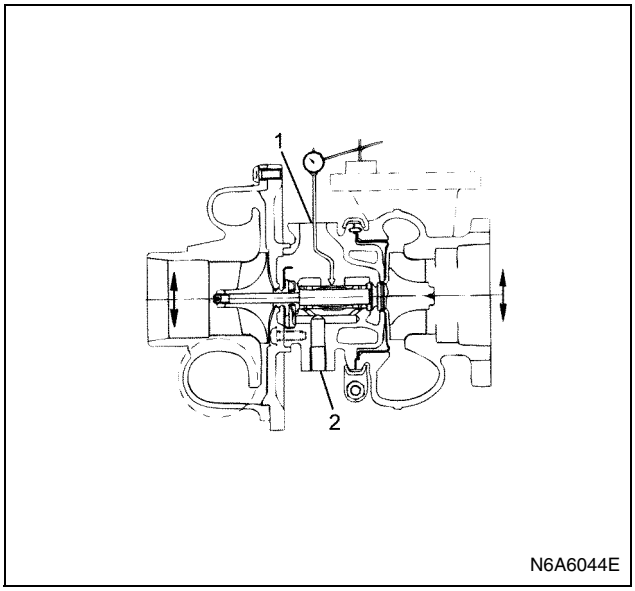


N6A6043E

Wheel shaft and bearing clearance

Use a dial gauge to measure the clearance between the wheel shaft and the bearing.

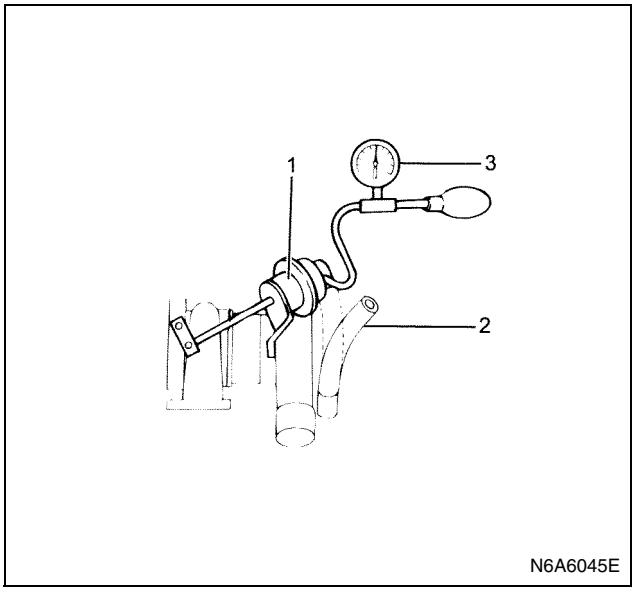
Clearance	mm (in)
Standard	0.069 – 0.140 (0.0027 – 0.0055)
Limit	0.15 (0.0059)



Legend
1. Oil Outlet
2. Oil Inlet

Waste gate operation (absolute pressure)

1. Remove the hose from the waste gate actuator.
2. Install the pressure gauge (general tool). Refer to the illustration.



Legend
1. Waste Gate Actuator
2. Waste Gate Hose
3. Pressure Gauge (General Tool)

3. Use the pressure gauge pump to apply pressure (load) to the waste gate actuator (the engine must be off).
4. Check the pressure and control rod movement.

Movement, mm (in)	0.38 (0.0150)	4.00 (0.1575)
Pressure, kPa (psi)	160 (23)	180 (26)

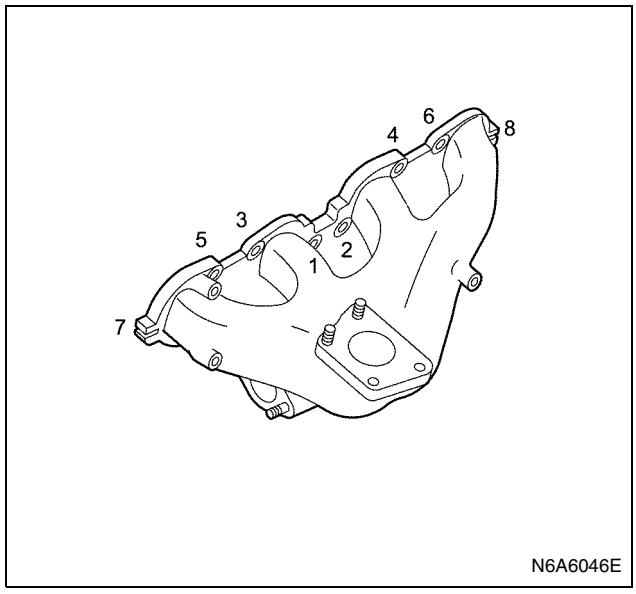
5. Inspect the hose for cracks and other damage. Replace the hose if necessary.
6. Do not apply a pressure of more than 200 kPa (1.2 kg/cm^2 / 29 psi) to the waste gate actuator.

Installation

1. Put the gasket in to install the exhaust manifold.
   - Tighten up with the 2 nuts and 6 bolts according to the order given on the figure.

Tighten:
Bolts (1), (2), (3), (4), (5), (6) and Nuts (7), (8) to 34 N·m (3.5 kg·m/25 lb·ft)

Caution:
Do not tighten up too much because it hampers expansion and contraction due to the heat from the manifold.

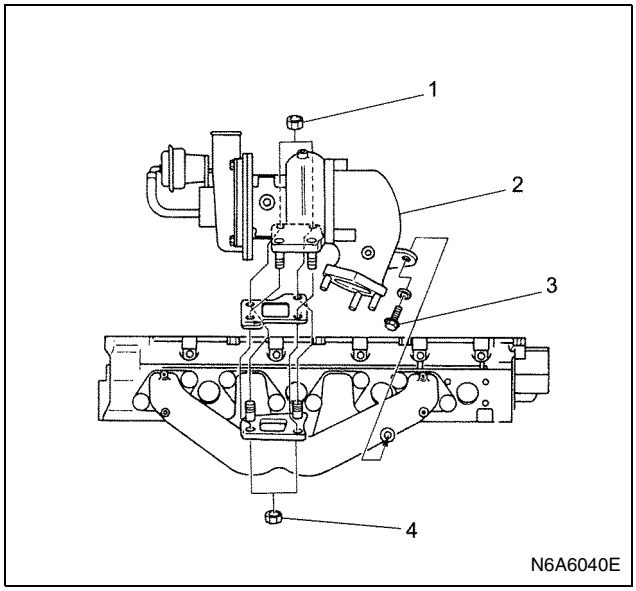


2. Install the gasket and turbocharger to the exhaust manifold. Tighten the nuts to the specified torque.

Tighten:
Nuts to 52 N·m (5.3 kg·m/38 lb·ft)

3. Tighten the adapter bolts (exhaust manifold side) to the specified torque.

Tighten:
Bolts to 25 N·m (2.5 kg·m/19 lb·ft)



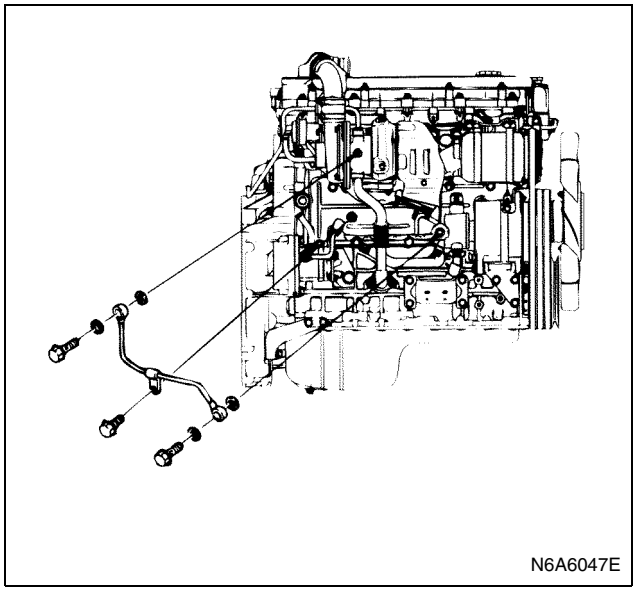
Legend
1. Fixing Nut
2. Exhaust Adapter
3. Fixing Bolt
4. Fixing Nut

4. Install the water feed pipe to the turbocharger.
   - Tighten the joint bolts to the specified torque.

Tighten:
Joint bolts to 41 N·m (4.2 kg·m/30 lb·ft)

   - Install the pipe bracket and tighten the bolts to the specified torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/17 lb·ft)



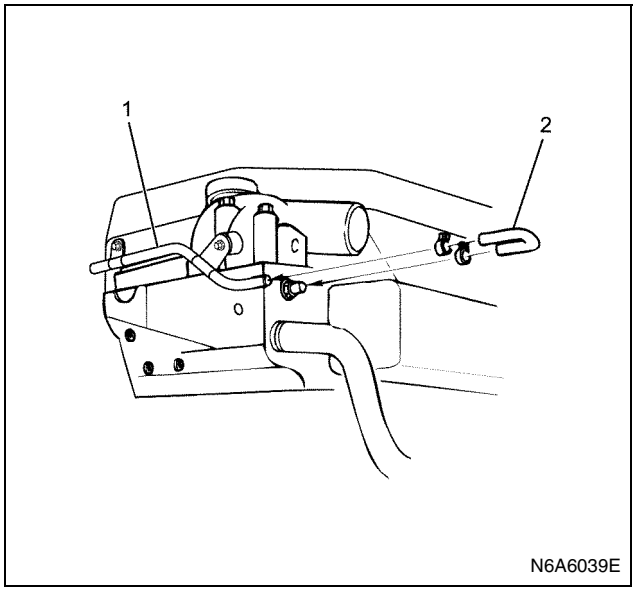
5. Install the water return pipe. Tighten the joint bolts to the specified torque.

Tighten:
Joint bolts to 41 N·m (4.2 kg·m/30 lb·ft)

6. Install the water return pipe bracket. Tighten the bolts to the specified torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/17 lb·ft)

   - Install the rubber hose between the water return pipe and the thermostat housing.



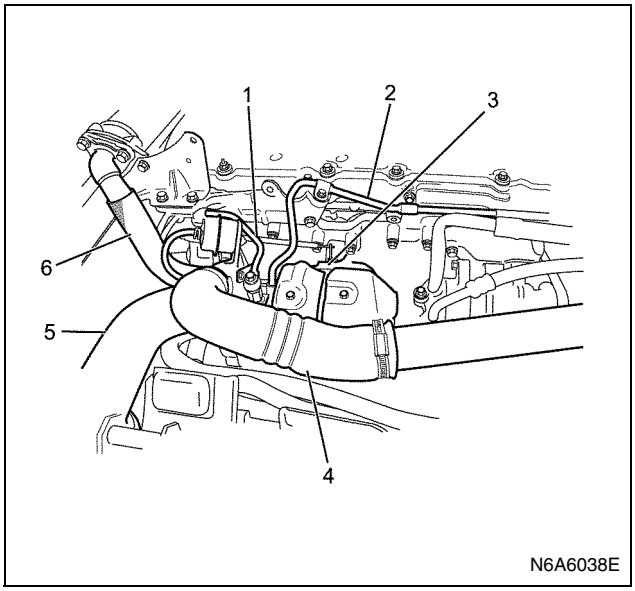
Legend
1. Water Return Pipe
2. Rubber Hose

7. Install the turbocharger oil feed pipe to the top of the turbocharger. Tighten the joint bolts to the specified torque.

Tighten:
Joint bolts to 27 N·m (2.8 kg·m/19.9 lb·ft)

   - Install the pipe bracket and tighten the bolts to the specified torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/17 lb·ft)

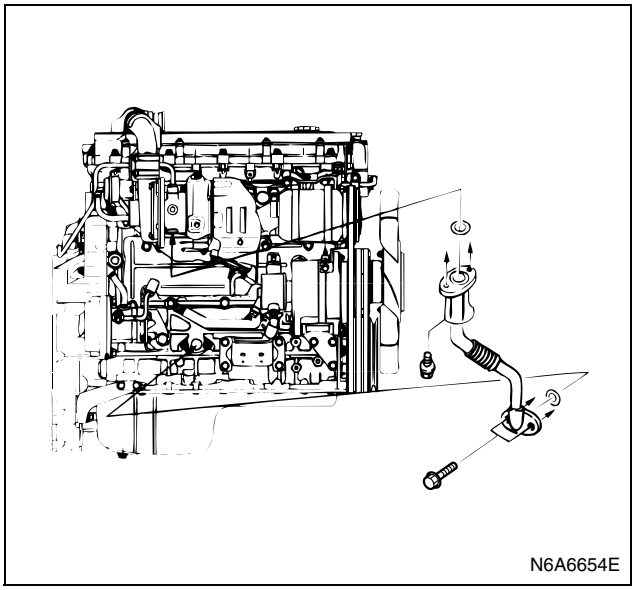


Legend

1. Oil Feed Pipe
2. Water Return Pipe
3. Heat Protector
4. Charge Air Hose
5. Inlet Duct
6. EGR Pipe

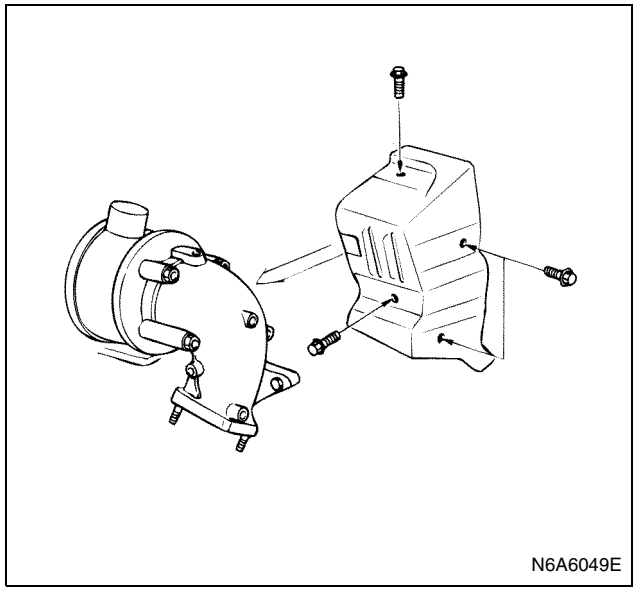
8. Tighten the oil return pipe bolts to the specified torque.

Tighten:
Bolts to
Turbocharger side: 9 N·m (0.9 kg·m/78 lb·in)
Cylinder block side: 22 N·m (2.2 kg·m/15 lb·ft)



9. Install the heat protector and tighten the bolts to the specified torque.

Tighten:
Bolts to 10 N·m (1.0 kg·m/87 lb·in)



10. Install the air intake duct and tighten the bolts to the specified torque.

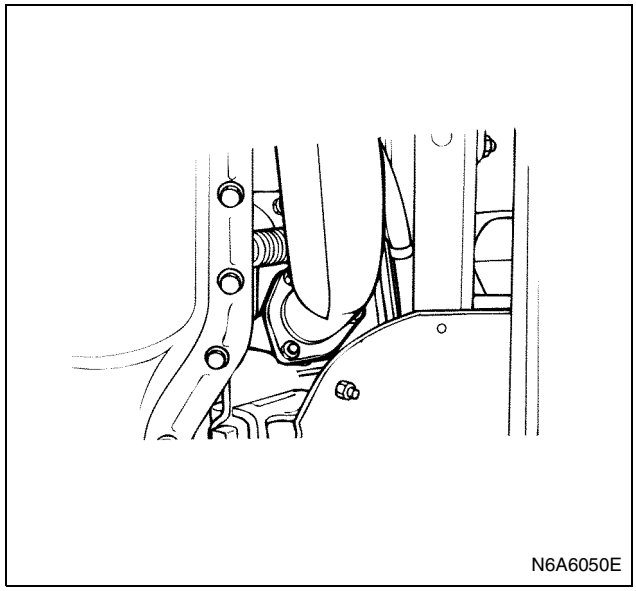
Tighten:
Bolts to 10 N·m (1.0 kg·m/87 lb·in)

11. Install the charge air pipe in the turbo charger and the charge air cooler.

Tighten:
Duct bolt to 21 N·m (2.1 kg·m/15 lb·ft)
Duct clip to 6 N·m (0.6 kg·m/52 lb·in)

12. Install the front exhaust pipe to the turbocharger and tighten the nuts to the specified torque.

Tighten:
Nuts to 67 N·m (6.8 kg·m/49 lb·ft)

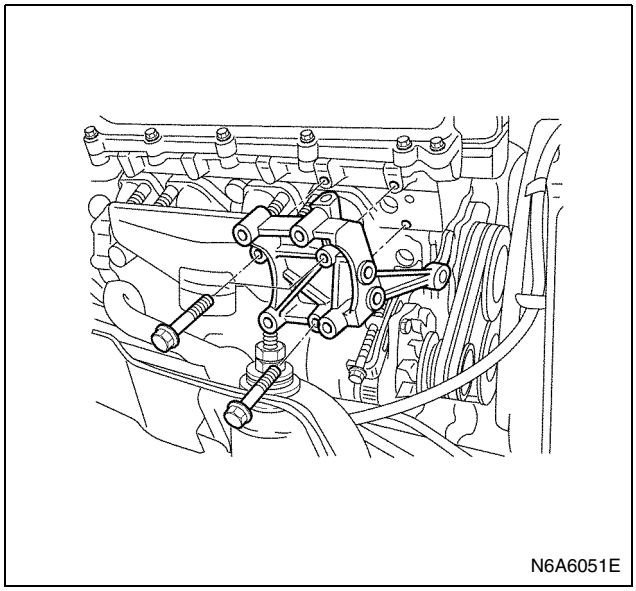


13. Add cooling water to the radiator.
14. Install the A/C compressor bracket.
    - Install the A/C compressor bracket on the cylinder head and tighten up with the prescribed toque.

Tighten:
Bolts to 48 N·m (4.9 kg·m/35 lb·ft)

- Install the A/C compressor on the bracket and tighten up with the prescribed torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/17 lb·ft)

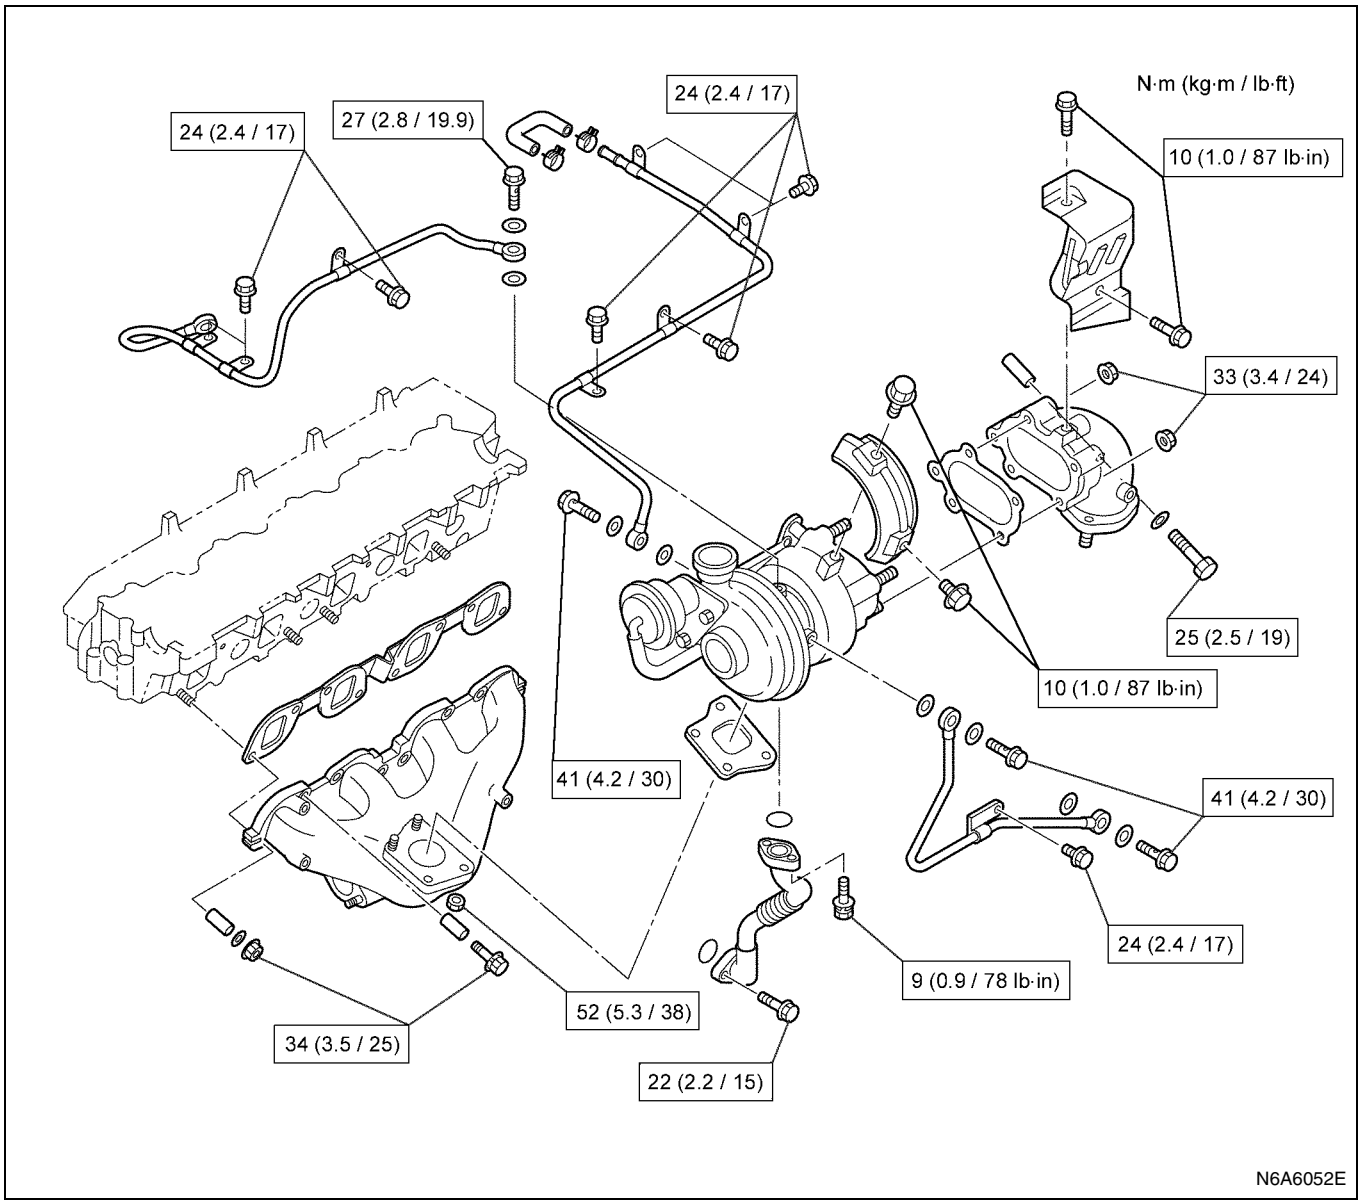


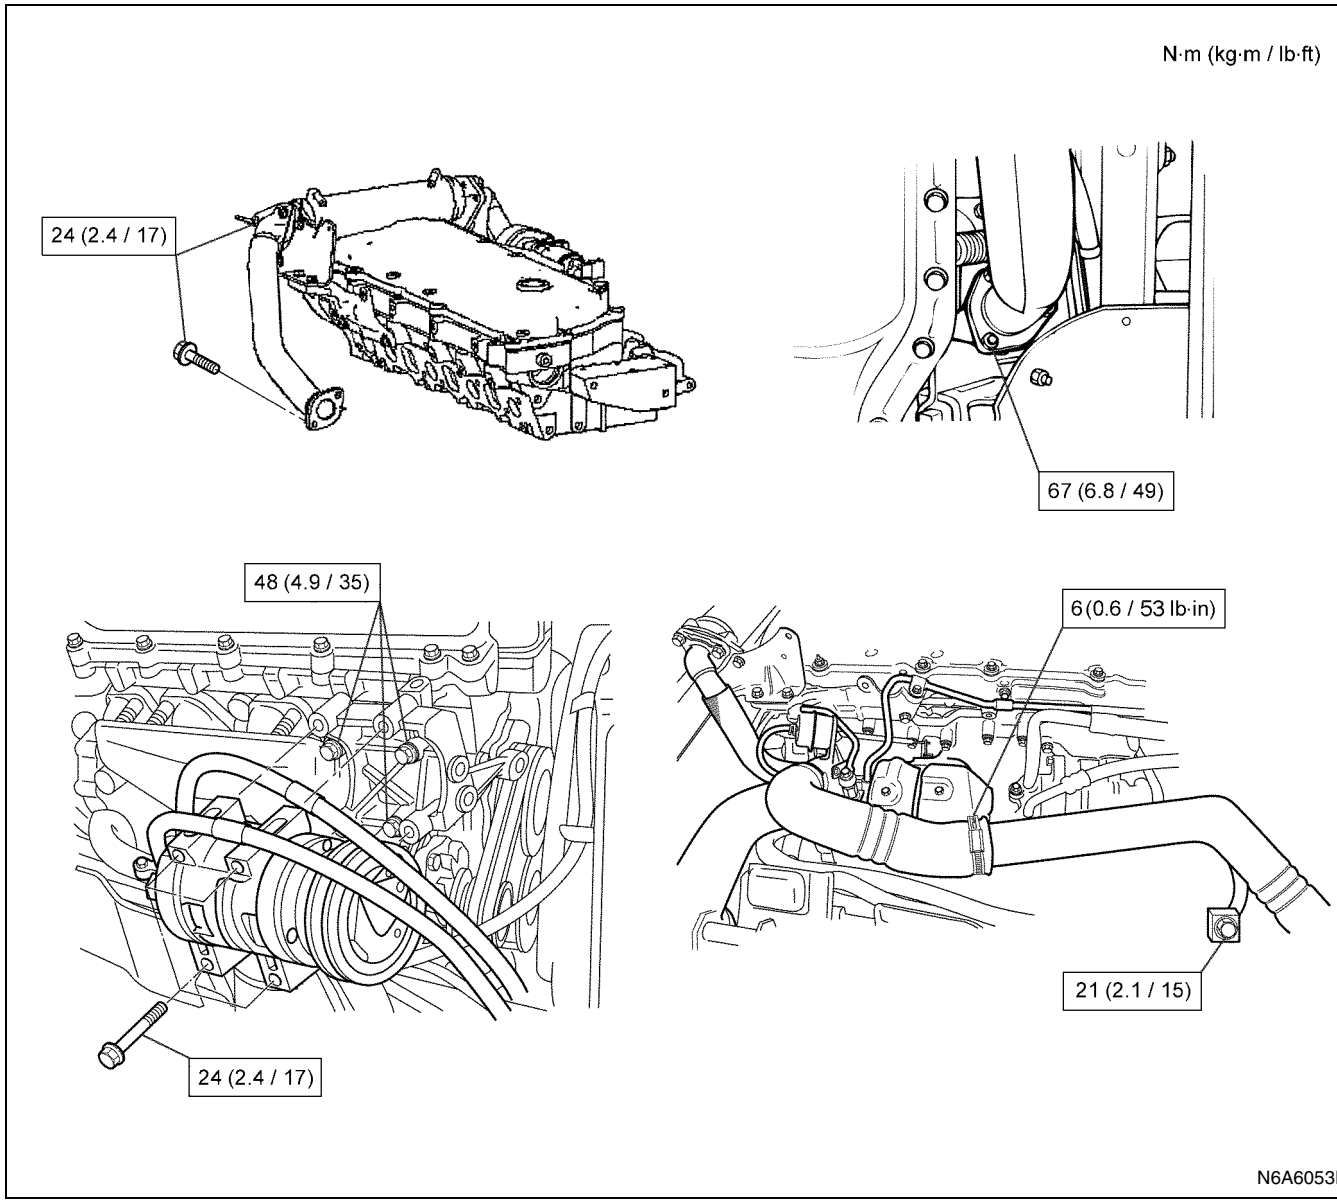
15. Install the EGR pipe.
    - Put the gasket between both ends of the EGR pipe and install to the specified torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/17 lb·ft)

16. Replenish the coolant.

Torque Specifications





N·m (kg·m / lb·ft)
24 (2.4 / 17)
67 (6.8 / 49)
48 (4.9 / 35)
6 (0.6 / 53 lb·in)
21 (2.1 / 15)
24 (2.4 / 17)

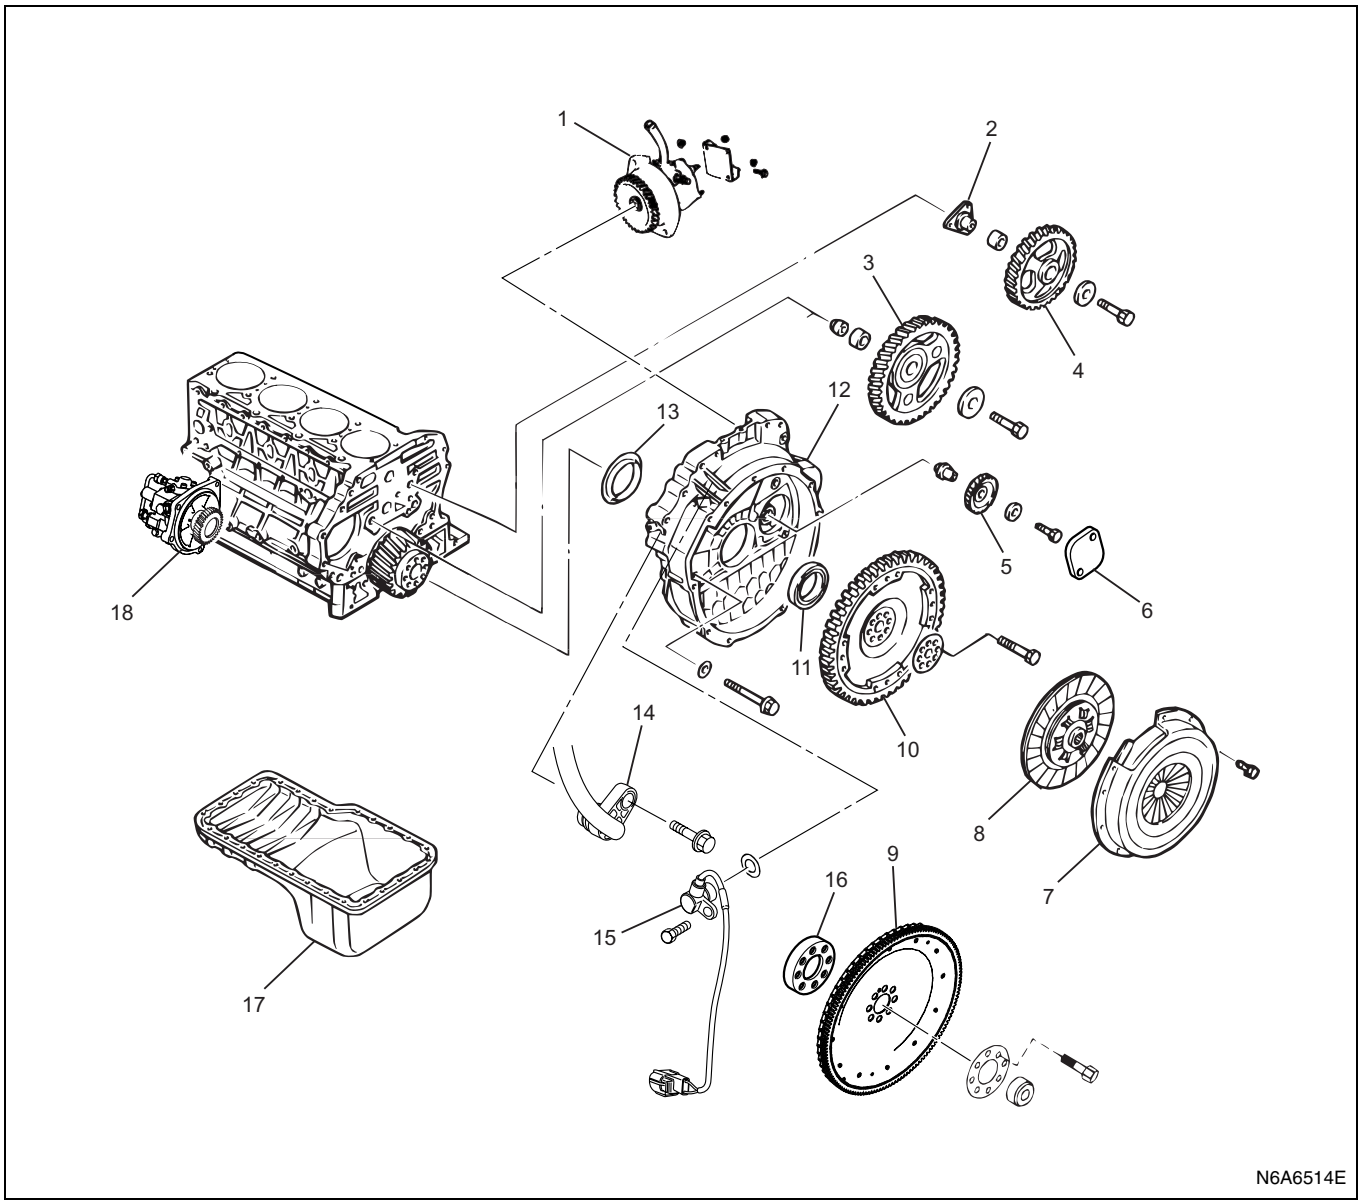
Timing Gear Train

Component



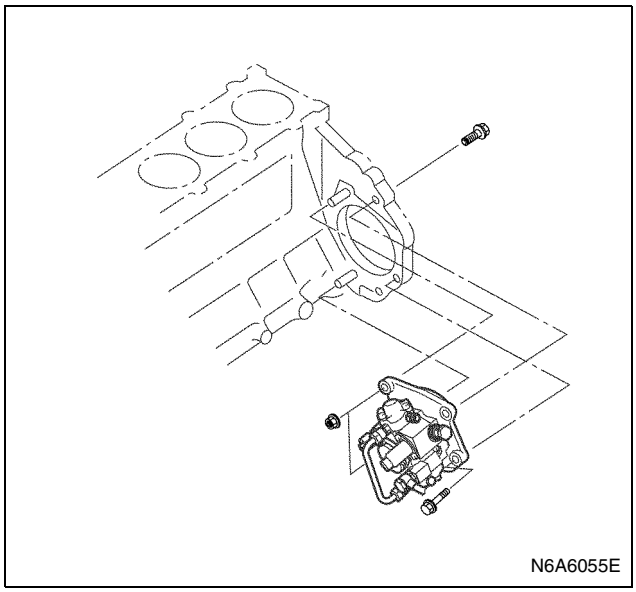
Legend

1. Power Steering Pump
2. Idle Gear B Shaft
3. Idle Gear A
4. Idle Gear B
5. Power Steering Pump Idle Gear
6. Power Steering Pump Idle Gear Cover
7. Clutch Pressure Plate
8. Driven Plate
9. Flexible Plate (Smoother)
10. Flywheel (M/T)
11. Rear Oil Seal
12. Flywheel Housing
13. Slinger
14. Plug
15. Crankshaft Position Sensor
16. Crank shaft End Spacer (Smoother)
17. Oil Pan
18. Fuel Supply Pump

Removal

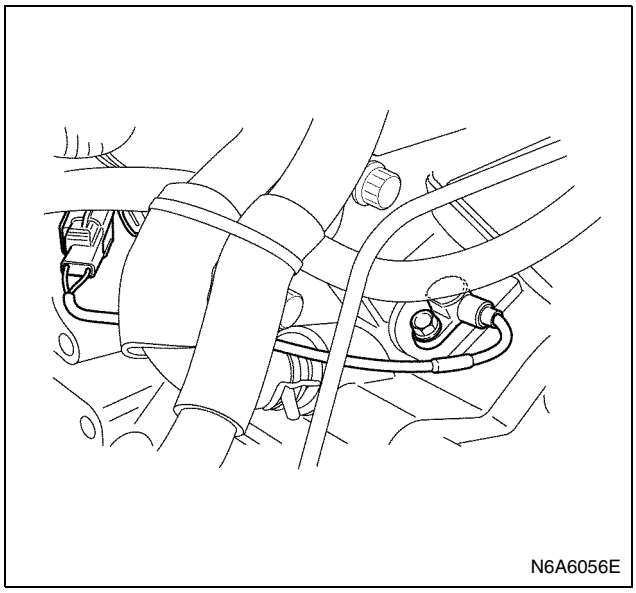
1. Remove the cylinder head cover.
   Refer to “Cylinder Head Cover”.
2. Remove the rocker arm shaft assembly.
   Refer to “Rocker Arm Shaft Assembly”.
3. Remove the camshaft assembly.
   Refer to “Camshaft Assembly”.
4. Remove the cylinder head assembly.
   Refer to “Cylinder Head”.

5. Remove the fuel supply pump assembly.
   Refer to “Fuel Supply Pump” in Section 6C.



N6A6055E

6. Remove the crankshaft position sensor.
   - Remove the crankshaft position sensor before remove flywheel.

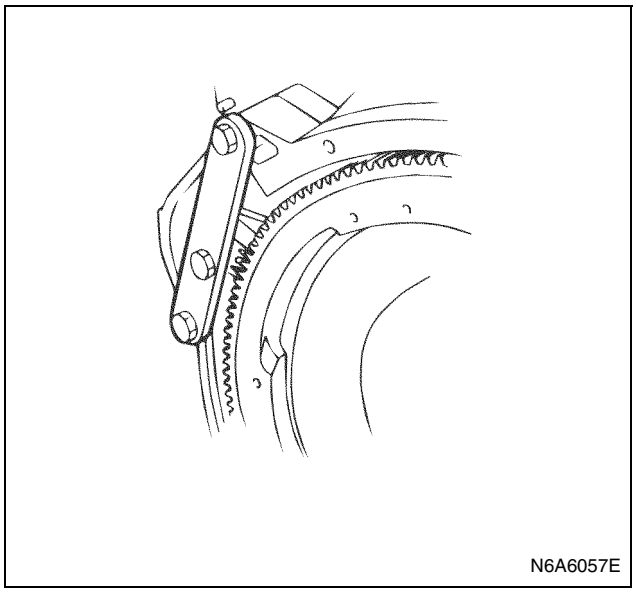


N6A6056E

7. Remove the flywheel.
   - Install the crankshaft stopper on the starter part of the flywheel housing to stop the crankshaft from rotating.

Caution:
Check if the stopper meshes with the ring gear without fail and is installed properly.

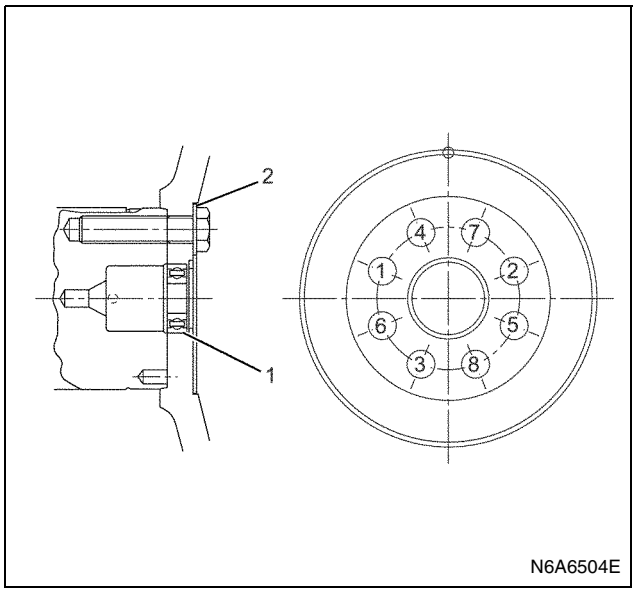
Special tool
Crankshaft stopper: 5-8840-2230-0 (EN-47680)



N6A6057E

   - Loosen the fastening bolts of the flywheel little by little according to the order given on the figure.
   - After loosening all the bolts, remove the stopper to remove the flywheel.

In the case of smoother vehicle, after loosening the bolts to fasten the flexible plate, remove the washer, the flexible plate, the spacer according to this order.

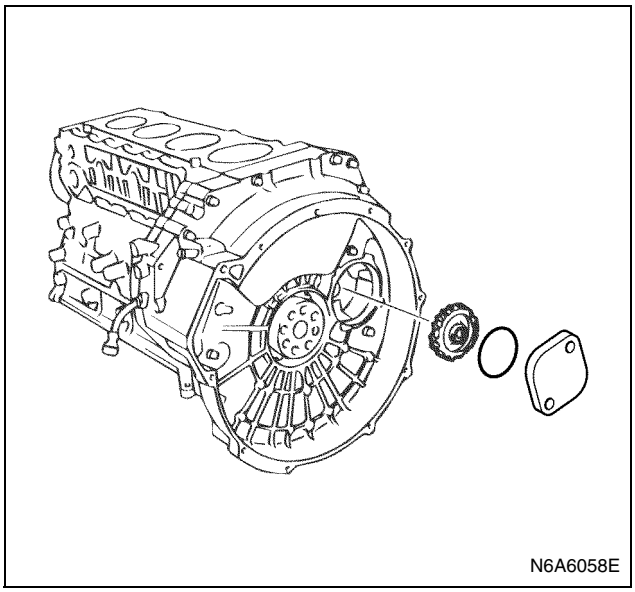


N6A6504E

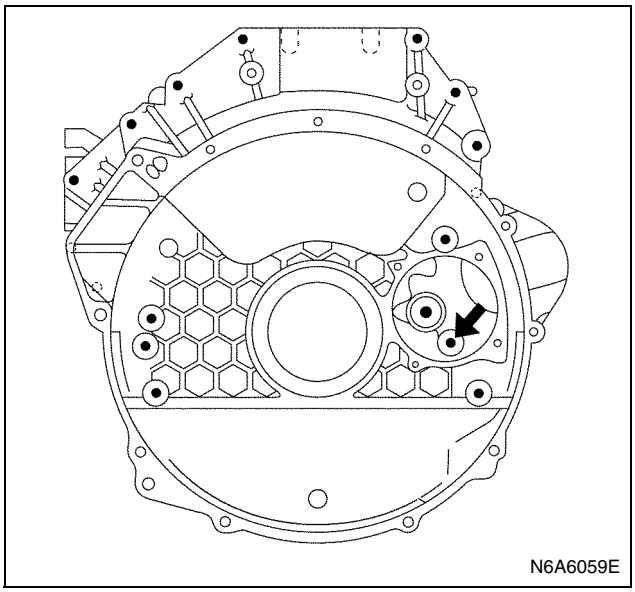
Legend
1. Pilot Bearing
2. Washer

8. Remove the rear oil seal and the slinger.
   Refer to “Crankshaft Rear Oil Seal”.
9. Remove the oil pan.
10. Remove the power steering pump.
11. Remove the power steering pump idle gear cover.

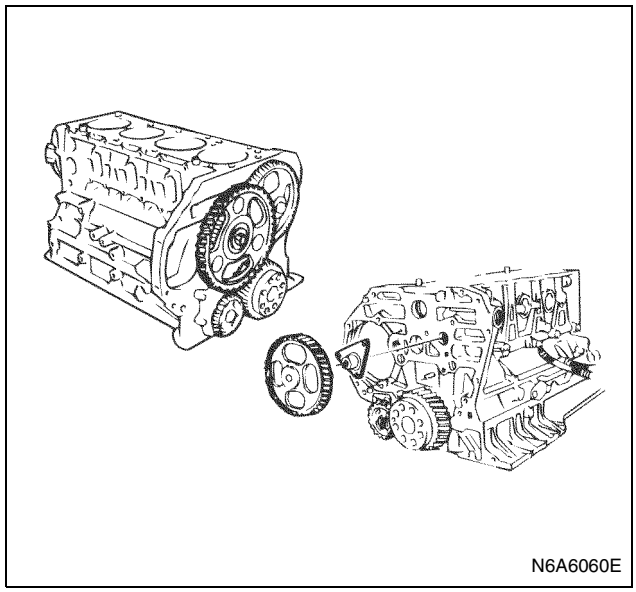
12. Remove the power steering pump idle gear.



13. Remove the flywheel housing.
    - Never fail to remove the bolt(s) given on the figure.



14. Remove the idle gear A.
15. Remove the idle gear B.
16. Remove the idle gear B shaft.

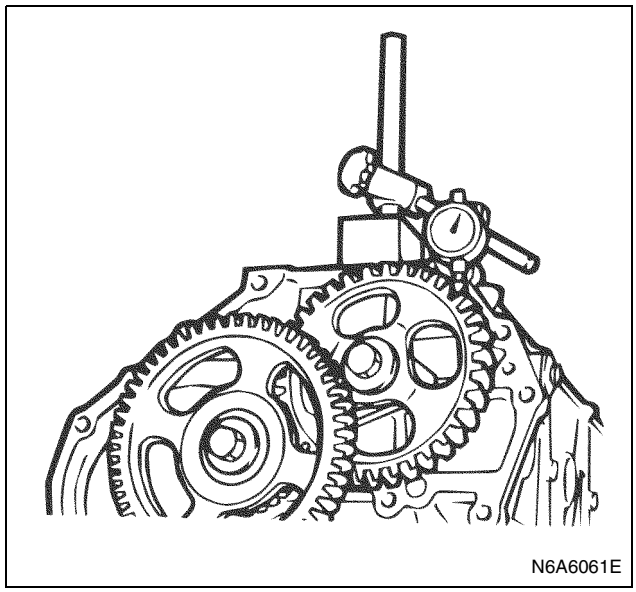


Inspection

1. Measurement of idle gear backlash
    - Apply a dial gauge on the teeth of the idle gear to be measured and move the gear to right and left lightly to read how much the dial gauge shook (never fail to fix the gear).
    - If the measurement exceeds the limit, replace the idle gear.

Backlash of the timing gear	mm(in)
Standard	0.10 – 0.17 (0.004 – 0.006)
Limit	0.30 (0.01)

    - Measure backlash of the idle gear before removing the idle gear A.

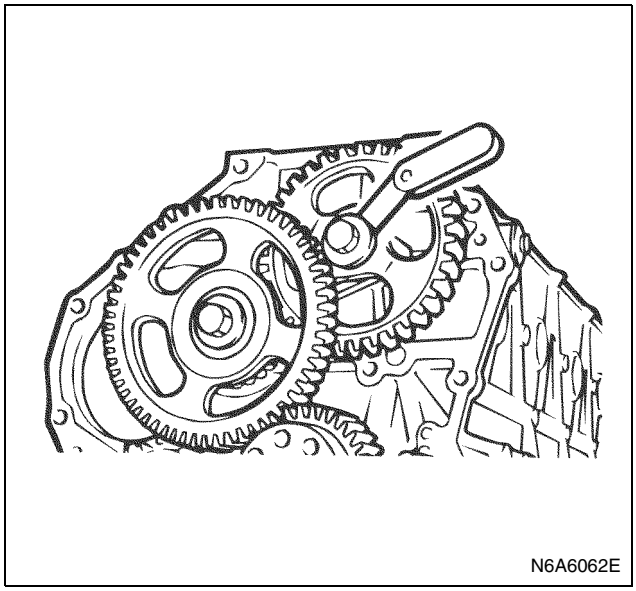


2. Measurement of end clearance of the idle gear.

- Insert a thickness gauge between the idle gear and the thrust collar to measure a clearance.
- If the measurement exceeds the limit, replace either the idle gear or the thrust collar.

End clearance of the idle gear	mm (in)
Standard	0.080 – 0.155 (0.003 – 0.006)
Limit	0.20 (0.008)

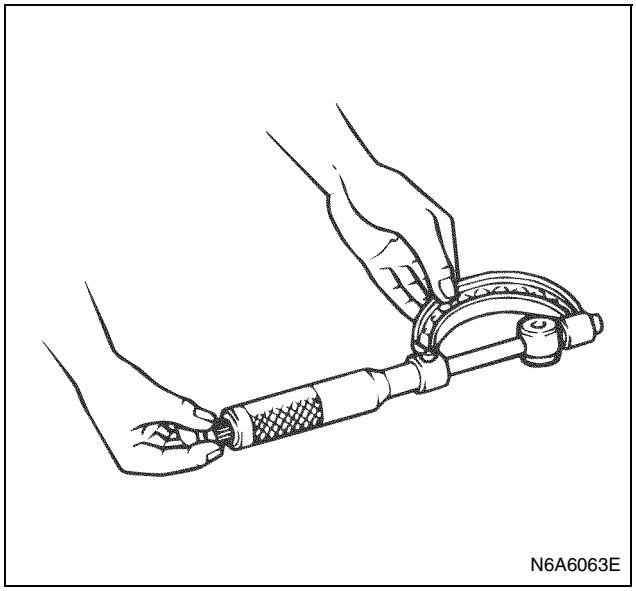
- Measure an end clearance of the idle gear before removing the idle gear B.



N6A6062E

3. External diameter of the idle gear shaft
   - Use a micrometer to measure an external diameter of each idle gear shaft.
   - If the measurement exceeds the limit, replace the shaft.

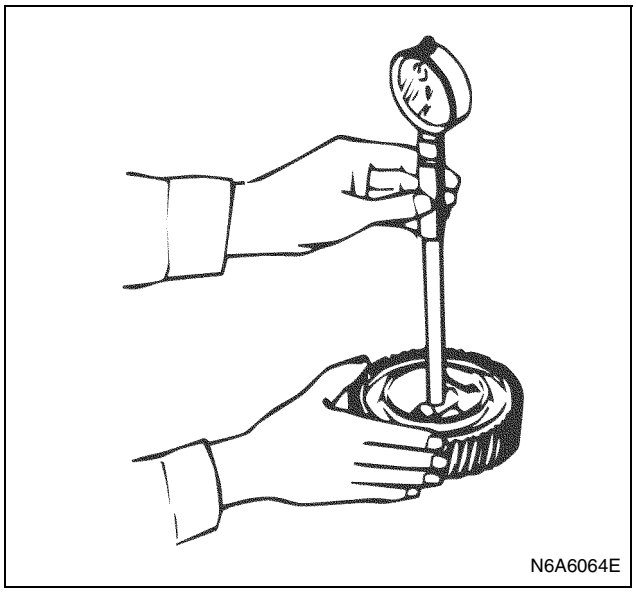
External diameter of the idle gear shaft	mm (in)
Standard	29.959 – 29.980 (1.179 – 1.180)
Limit	29.80 (1.173)



N6A6063E

4. Clearance between the idle gear and the idle gear shaft
   - Measure an inside diameter of the idle gear bush to calculate a clearance between the idle gear and the idle gear shaft.
   - If the measurement exceeds the limit, replace either the idle gear or the shaft.

Clearance between the idle gear and the shaft	mm (in)
Standard	0.020 – 0.062 (0.0007 – 0.0024)
Limit	0.200 (0.0079)



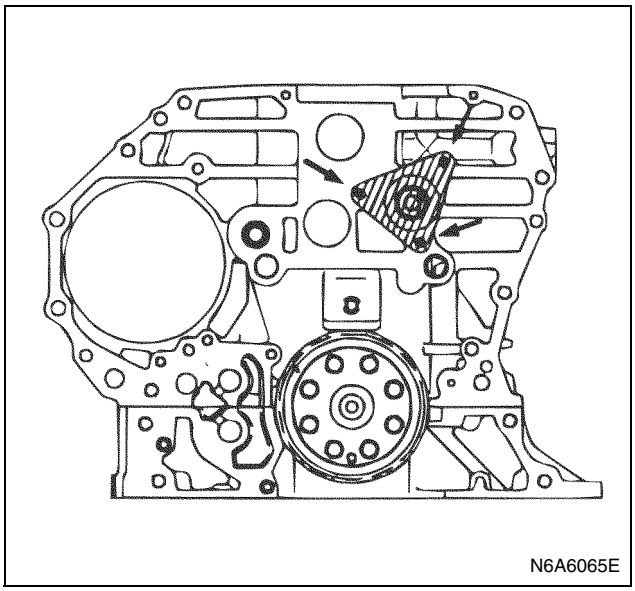
N6A6064E

Installation

1. Install the idle gear B shaft.
   - Tighten up the idle gear B shaft with the prescribed torque.

Tighten:
Bolts to 31 N·m (3.2 kg·m/23 lb·ft)

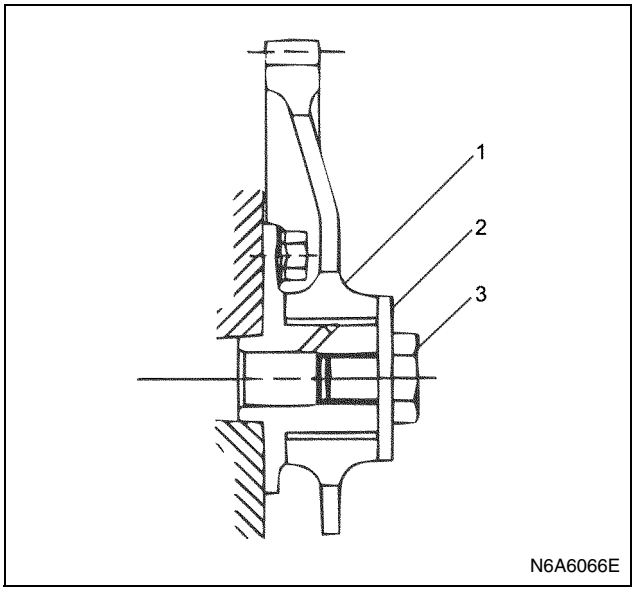
   - After installation, apply engine oil over the shaft.



N6A6065E

2. Install the idle gear B.
   - Install the idle gear B in the direction given on the figure and tighten up the fastening bolts with the prescribed torque.

Tighten:
Bolts to 110 N·m (11.2 kg·m/81 lb·ft)

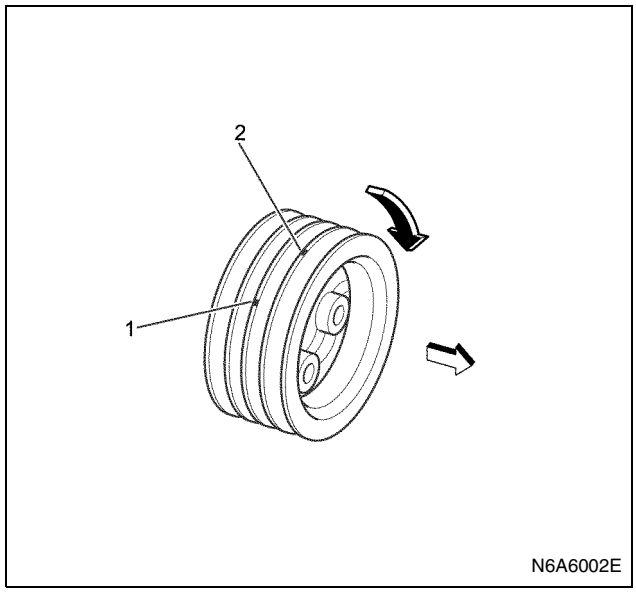


N6A6066E

Legend
1. Idle Gear
2. Thrust Collar
3. Bolt

3. Install the idle gear A.
   - Turn the crankshaft in the normal direction of engine rotation until the No. 1 or No. 4 cylinder is at TDC on the compression stroke.

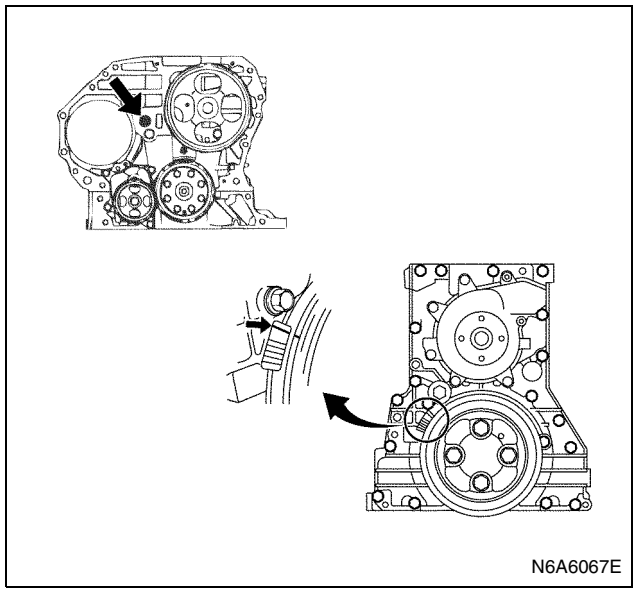
Notice:
There are 2 timing marks on the crankshaft pulley.
Mark (1) is near the front cover and is used to bring the 4HK1-TC engine to TDC.
Mark (2) is not applicable to this engine.
Be sure to use mark (1) when bringing the engine to TDC.



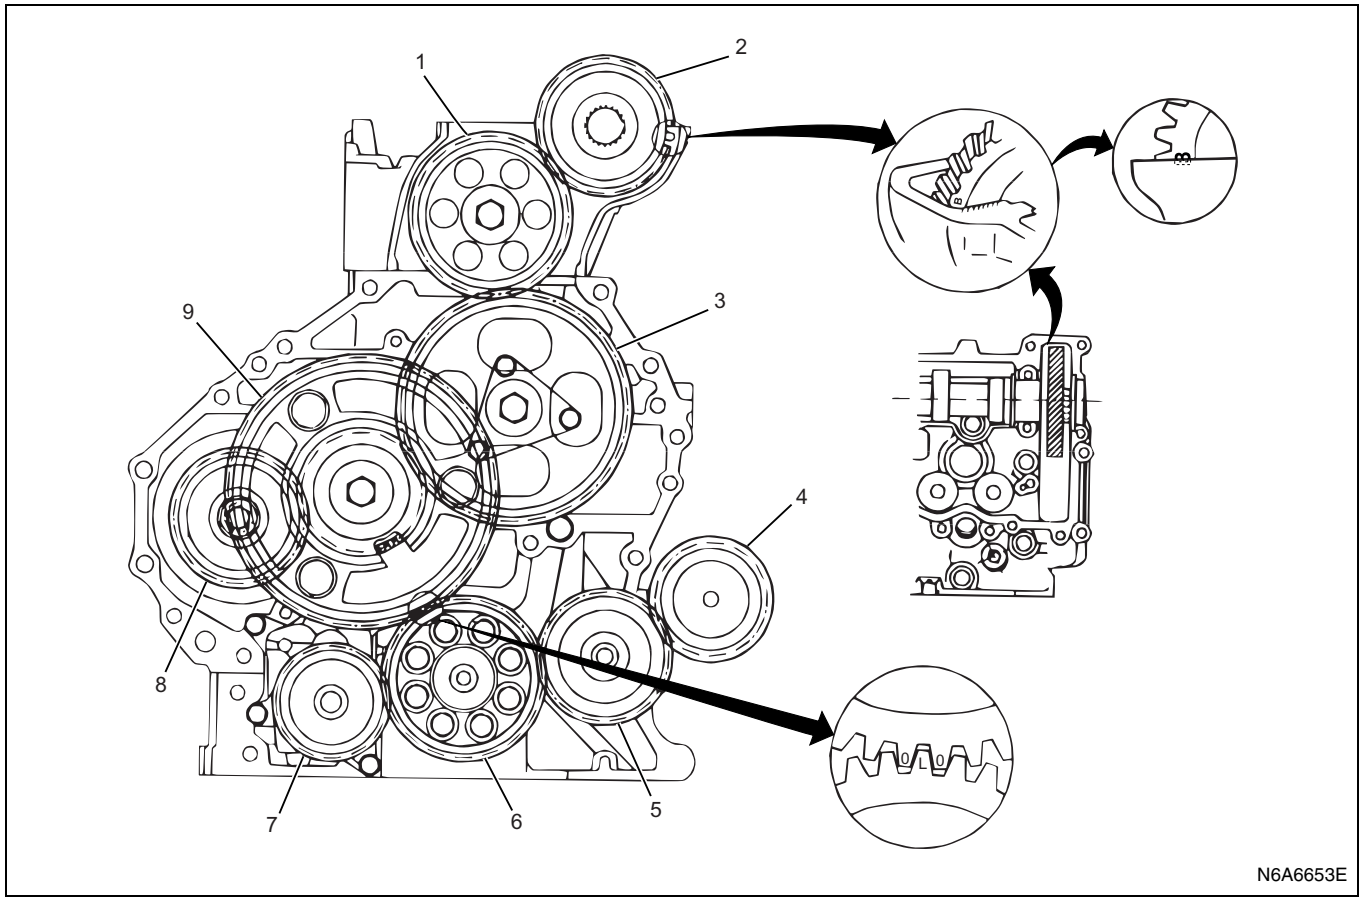
N6A6002E

   - Make the meeting marks of the crankshaft gear and the idle gear A meet and install it on the cylinder block.
   - Tighten up the fastening bolts with the prescribed torque.

Tighten:
Bolts to 133 N·m (13.6 kg·m/98 lb·ft)



N6A6067E



Legend

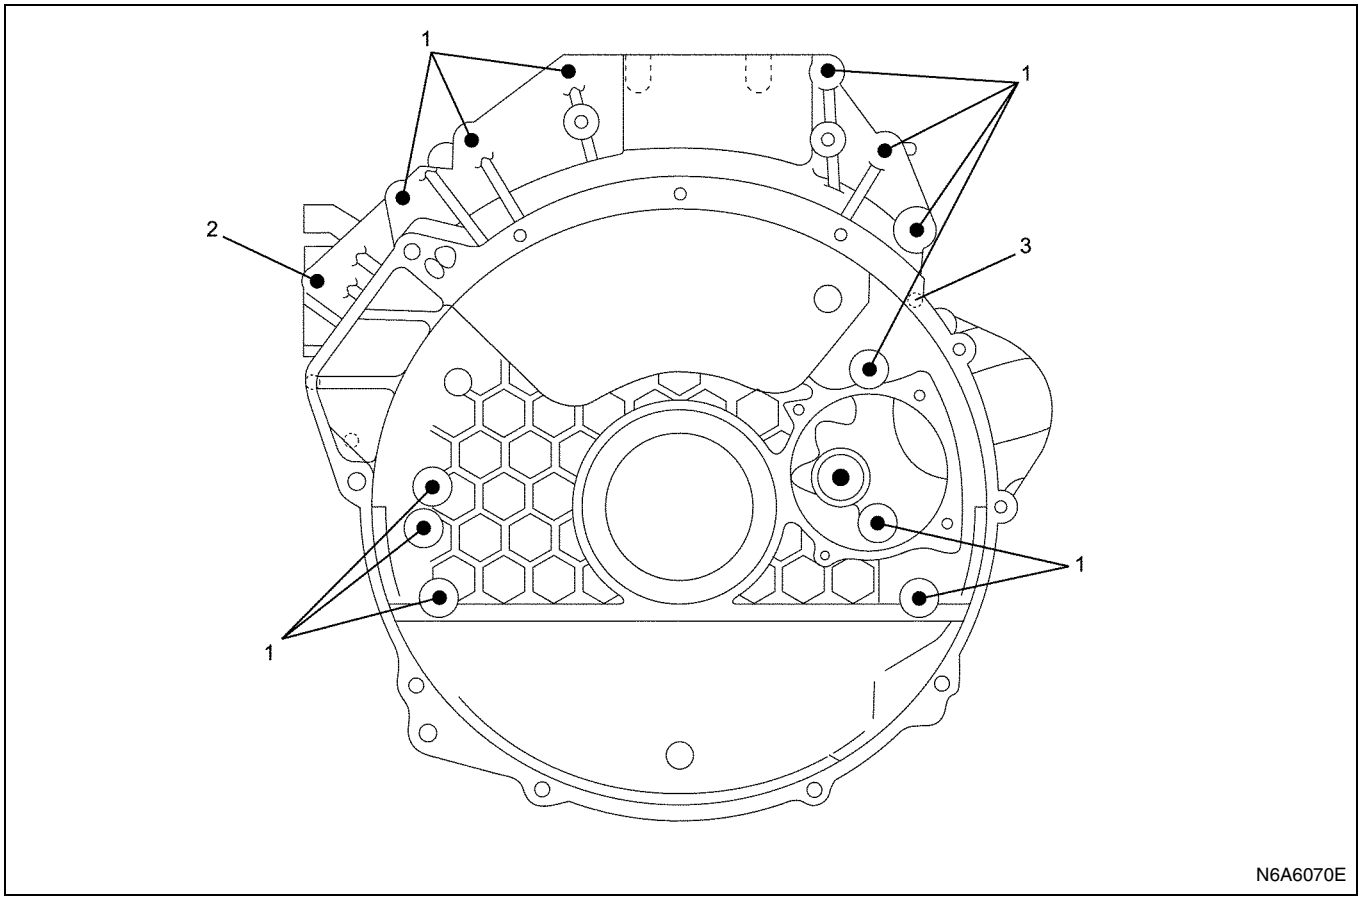
1. Idle Gear C
2. Camshaft Gear
3. Idle Gear B
4. Power Steering Pump Gear
5. Power Steering Pump Idle Gear
6. Crankshaft Gear
7. Oil pump Drive Gear
8. Fuel Supply Pump Gear
9. Idle Gear A

4. Install the flywheel housing.
   - Clean the rear side of the cylinder block. In particular, remove overflow liquid gasket thoroughly when the crankcase is installed.
   - As the figure shows, apply the liquid gasket (ThreeBond 1207C or equivalent) inside a hole of the bolt (except the bolt holes indicated with an arrow) evenly.

   - Along with the dowel pin of the cylinder block, install the flywheel housing.

Tighten:
Bolts (1) to 96 N·m (9.8 kg·m/71 lb·ft)
Bolts (2) to 77 N·m (7.9 kg·m/57 lb·ft)
Bolts (3) to 38 N·m (3.9 kg·m/28 lb·ft)

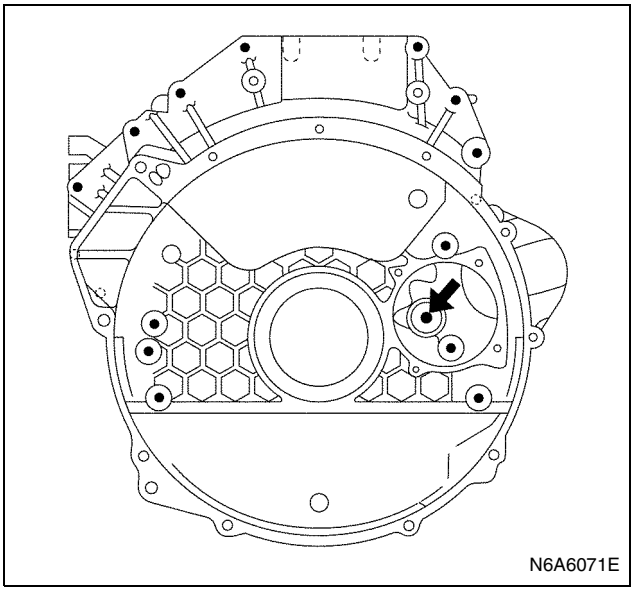
- Tighten up the Mark 3 from the cylinder block side.



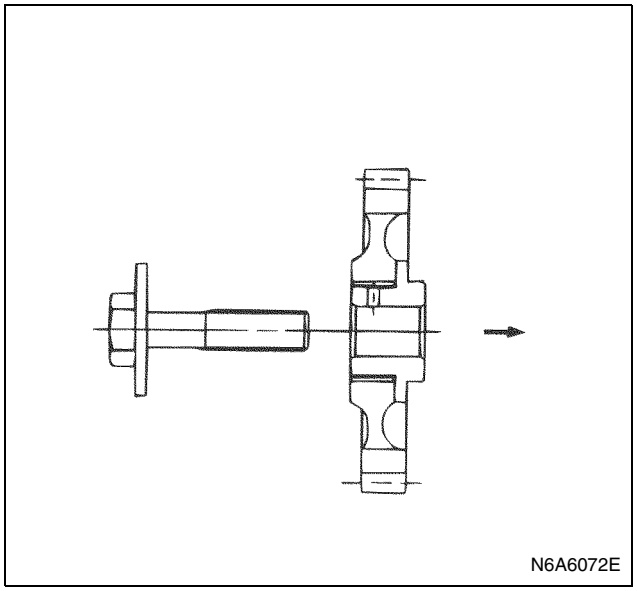
N6A6070E

5. Install the power steering pump idle gear.
   - Apply engine oil over the part where the gear of the idle gear shaft is to be put together.
   - Put the idle gear and the shaft together and install it on the location given on the figure and tighten up with the prescribed torque.

Tighten:
Bolts to 133 N·m (13.6 kg·m/98 lb·ft)



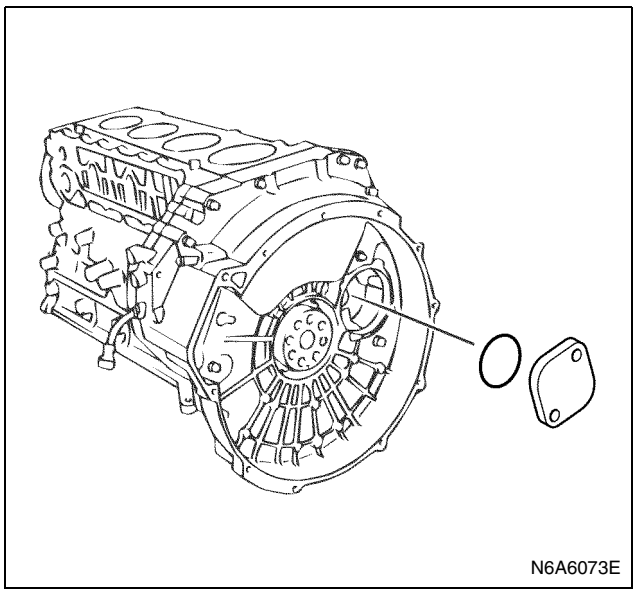
N6A6071E



N6A6072E

6. Install the power steering pump idle gear cover.
   - Install the O-ring on the cover and install it on the flywheel housing and tighten up the tightening bolts with the prescribed torque.

Tighten:
Bolts to 19 N·m (1.9 kg·m/14 lb·ft)

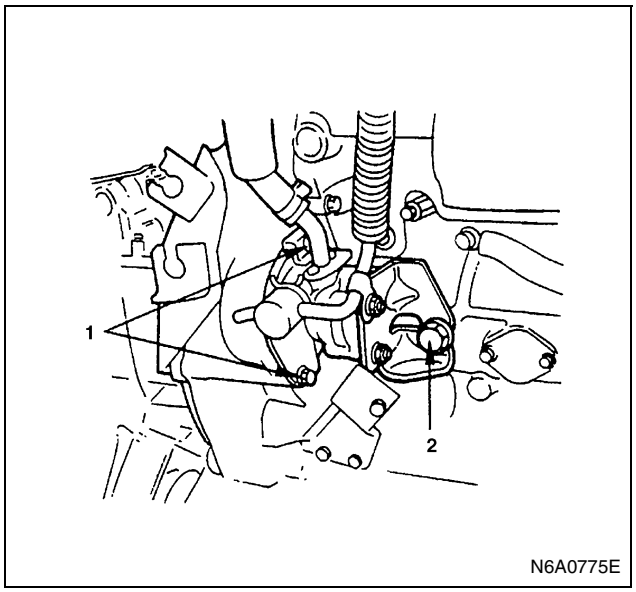


N6A6073E

7. Install the power steering pump.
   - Install the power steering pump and tighten up with the prescribed torque.

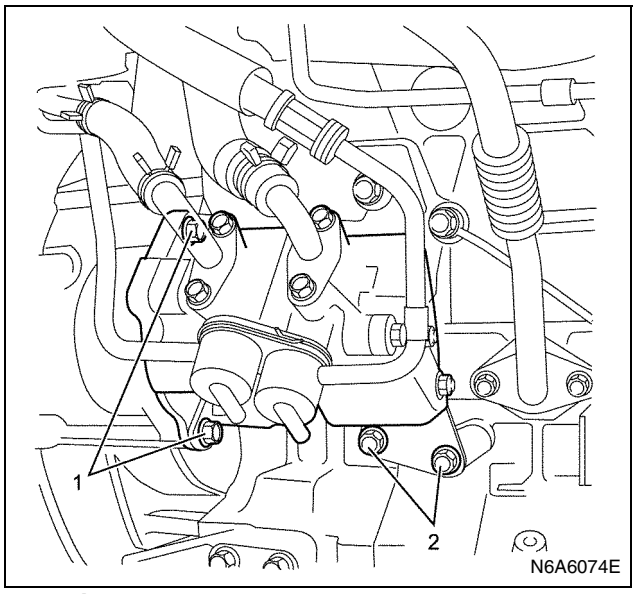
Tighten:
Fixing bolts to
Flywheel housing side (1): 43 N·m (4.4 kg·m/32 lb·ft)
Cylinder block side (2): 44 N·m (4.5 kg·m/32 lb·ft)

Without HBB



N6A0775E

With HBB

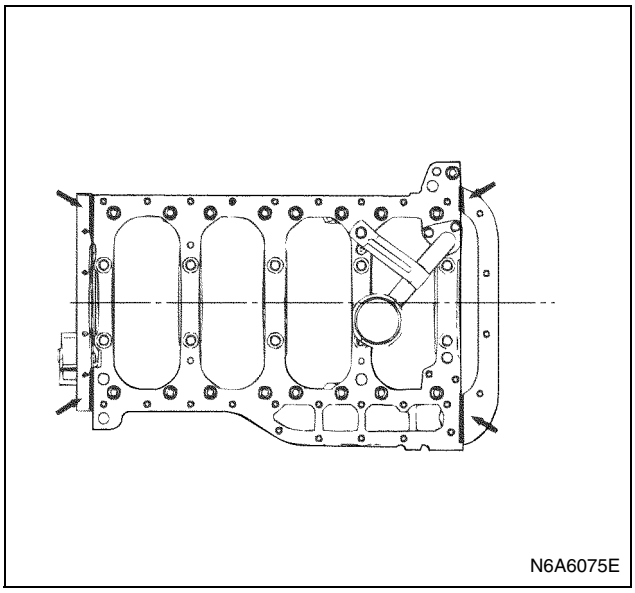


N6A6074E

Legend
1. Flywheel Housing Fixing Bolt
2. Cylinder Block Fixing Bolt

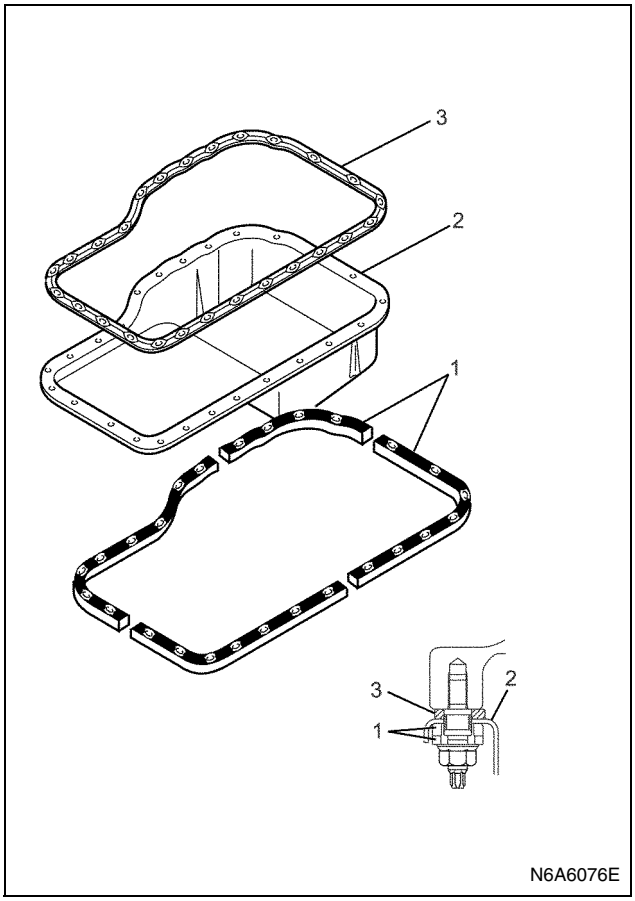
8. Install the oil pan
   - Apply the liquid gasket (ThreeBond1207C or equivalent) on a joint between the cylinder block, the front cover and the flywheel housing with a beat diameter of 3 mm (0.1 in).

- Install the oil pan within 7 minutes after applying the liquid gasket.



N6A6075E

- With the flywheel housing, the front cover and the stud of the crankcase as a guide, put together the gasket and put the oil pan on it. Then, put the rubber assembly on the oil pan and fix it by fastening bolts and nuts.

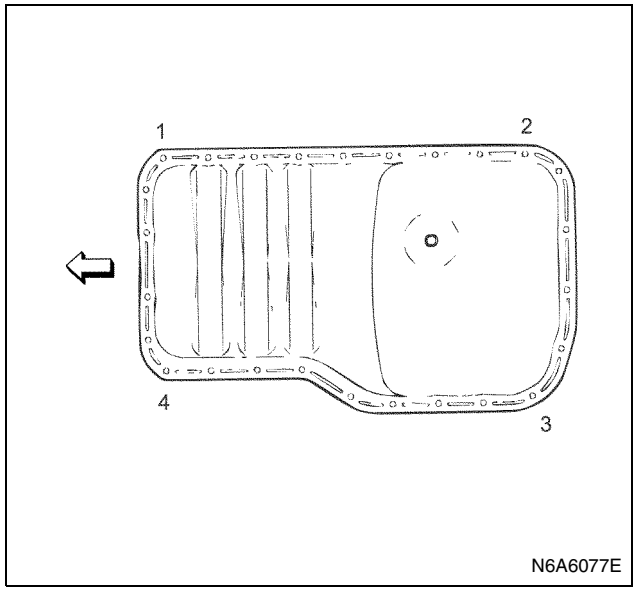


N6A6076E

Legend
1. Rubber Assembly
2. Oil Pan
3. Gasket

- After fastening the oil pan at the respective points of (1), (2), (3), and (4), fasten other parts.

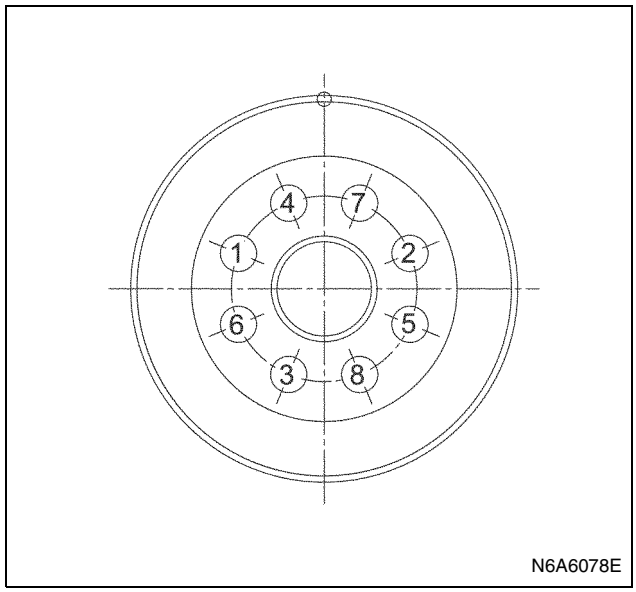
Tighten:
Bolts and nuts to 11 N·m (1.1 kg·m/95 lb·in)



N6A6077E

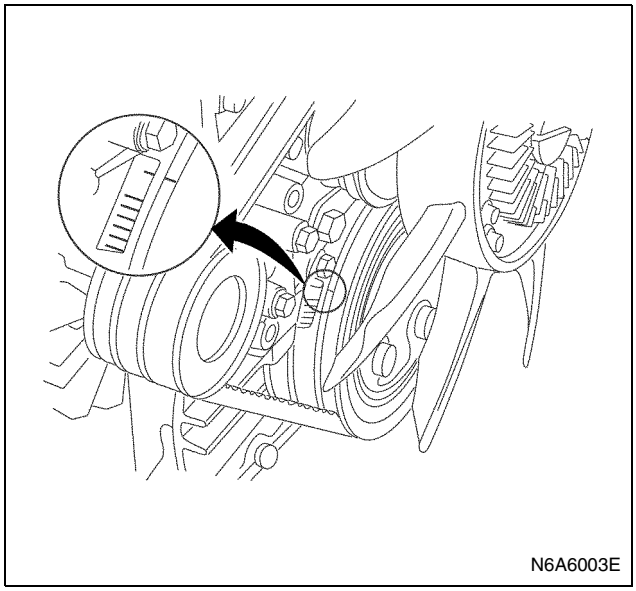
9. Install the rear slinger and the oil seal. Refer to “Crankshaft Rear Oil Seal”.
10. Install the flywheel.
    - Along with the knock pin of the crankshaft, install the flywheel and tighten up with the prescribed torque according to the order given on the figure.

Tighten:
Bolts to
1st step: 78 N·m (8.0 kg·m/57 lb·ft)
2nd step: 120° – 150° (degrees)



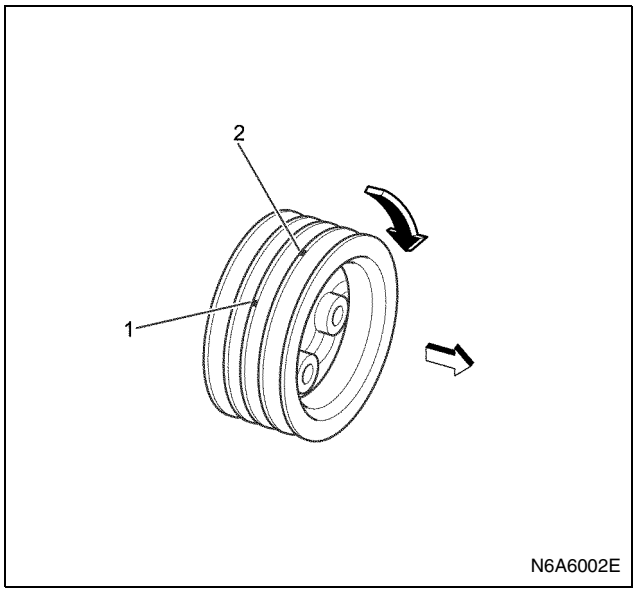
N6A6078E

11. Turn the crankshaft in the normal direction of engine rotation until the No. 1 or No. 4 cylinder is at TDC on the compression stroke.
    Refer to illustration.



N6A6003E

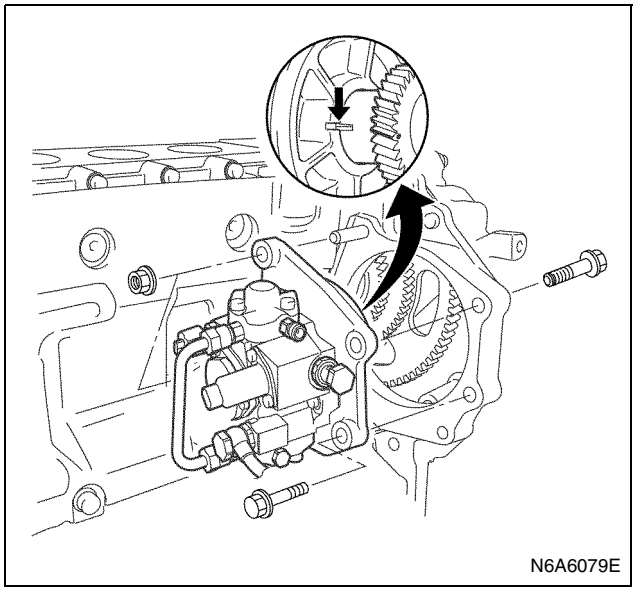
Notice:
There are 2 timing marks on the crankshaft pulley.
Mark (1) is near the front cover and is used to bring the 4HK1-TC engine to TDC.
Mark (2) is not applicable to this engine.
Be sure to use mark (1) when bringing the engine to TDC.



N6A6002E

12. Remove the oil drain adapter.
13. Install the O-ring on the fuel supply pump.
14. Align the slits as shown in the illustration.
15. Insert the stud bolts into the guides and temporarily tighten them.

Caution:
- If the stud bolts (cylinder block side) have been loosened or replaced, apply Loctite No. 262 to the recessed portion of the bolts.

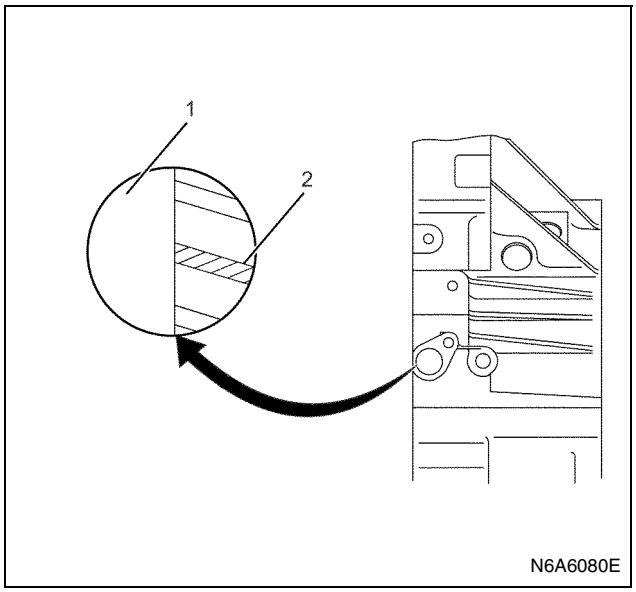


N6A6079E

- Check if the meeting mark of the gear painted white is at the location given on the figure when viewed from the plug hole and tighten up with the prescribed torque.

Tighten:
Nut to 50 N·m (5.1 kg·m/36 lb·ft)
Bolt to 76 N·m (7.7 kg·m/56 lb·ft)

- If the location of the teeth of the painted gear is not in the right place, put it together all over again.



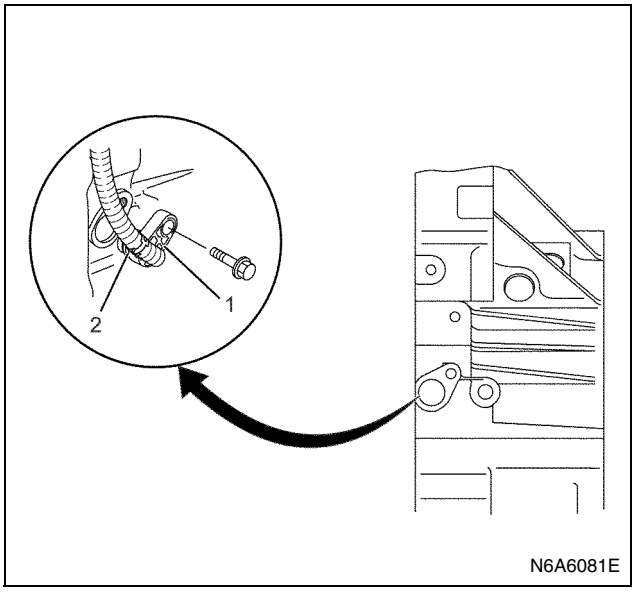
N6A6080E

Legend
1. Plug Hole
2. Meeting Mark

16. Install the adapter assembly: oil drain on the plug hole and tighten up with the prescribed torque.

Tighten:
Bolt to 8 N·m (0.8 kg·m/69 lb·in)

- Apply engine oil over the O-ring nice and thin and install it.



Legend
1. Adapter
2. O-ring

17. Install the cylinder head assembly.
    Refer to “Cylinder Head”.
18. Install the camshaft assembly.
    Refer to “Camshaft Assembly”.
19. Install the rocker arm shaft assembly.
    Refer to “Rocker Arm Shaft Assembly”.
20. Install the cylinder head cover.
    Refer to “Cylinder Head Cover”.

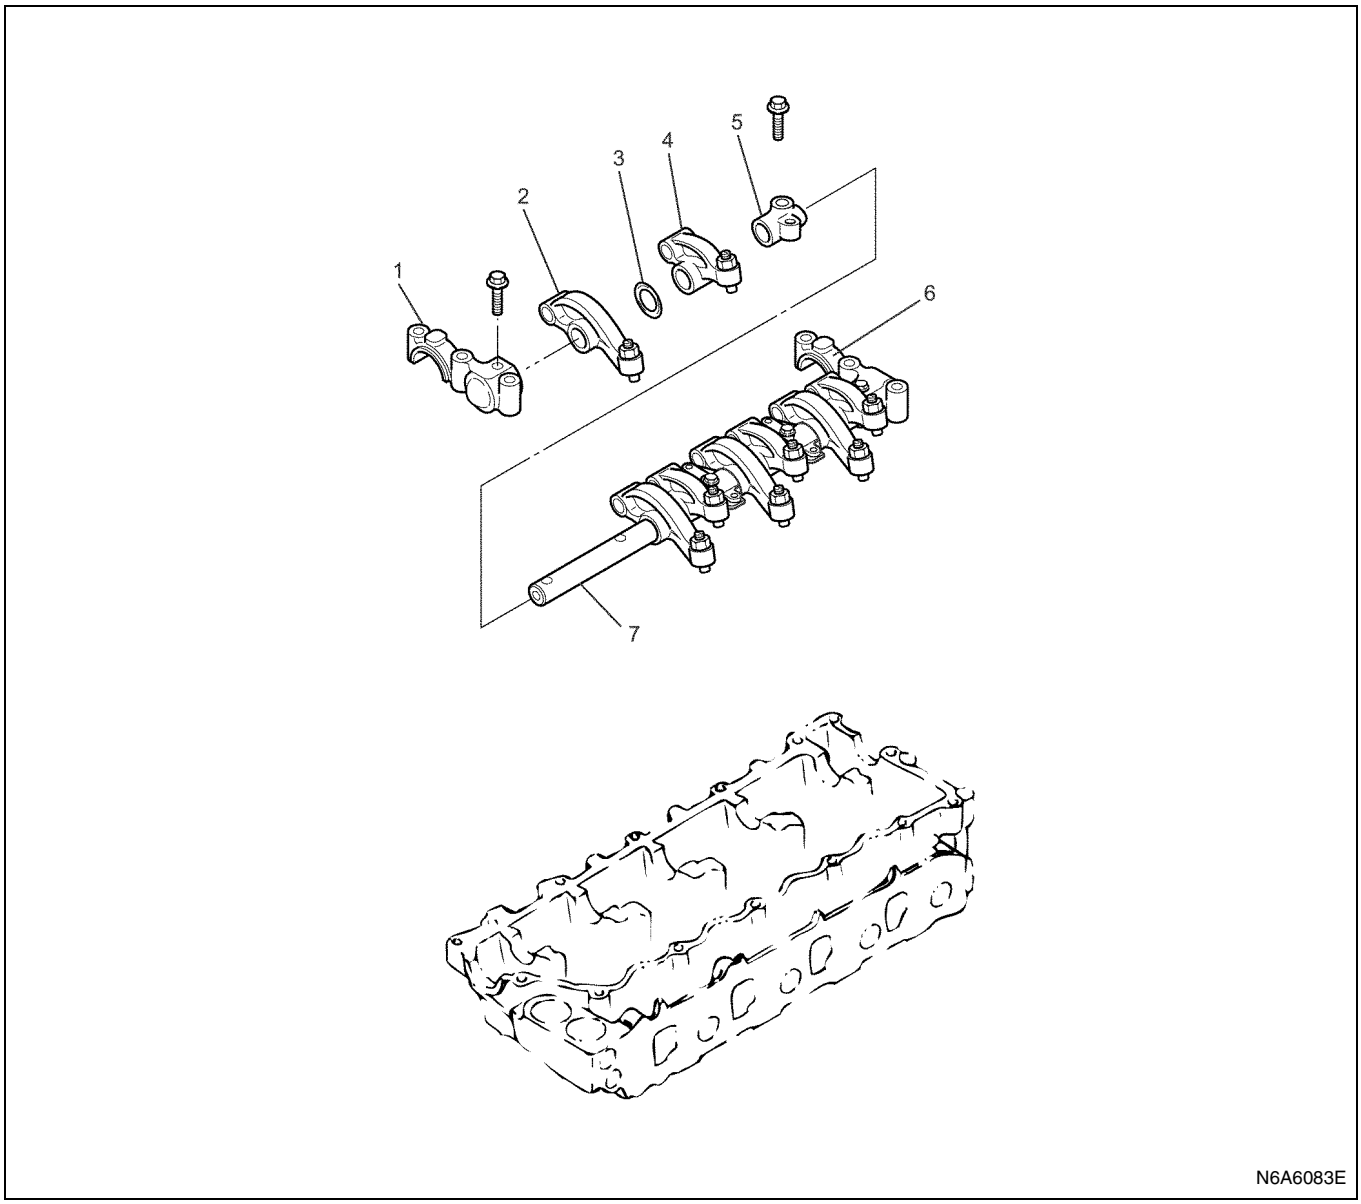
Rocker Arm Shaft Assembly

Component



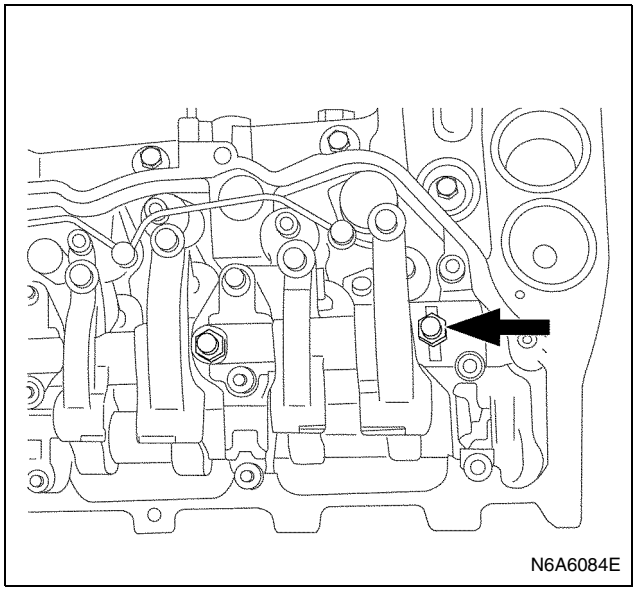
Legend

1. Camshaft Bracket
2. Rocker Arm
3. Wave Washer
4. Rocker Arm
5. Rocker Arm Bracket
6. Camshaft Bracket
7. Rocker Arm Shaft

Removal

1. Remove the cylinder head cover.
   Refer to “Cylinder Head Cover”.
2. Remove the rocker arm shaft assembly.
   - Along with the camshaft bracket, remove the rocker arm shaft assembly.

- Keep the 2-bolts (arrowed in the figure) fixing the rocker arm shaft to the camshaft bracket, before removal of all the rocker arm brackets

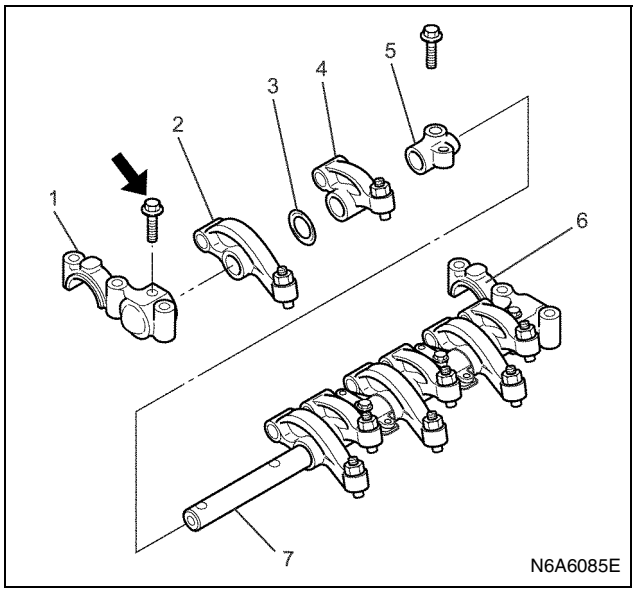


N6A6084E

Caution:
Pay full attention so as not to drop the bridge cap in the gear case of the rear part of the cylinder head or the hole into which oil pours back in the front.

Dismount

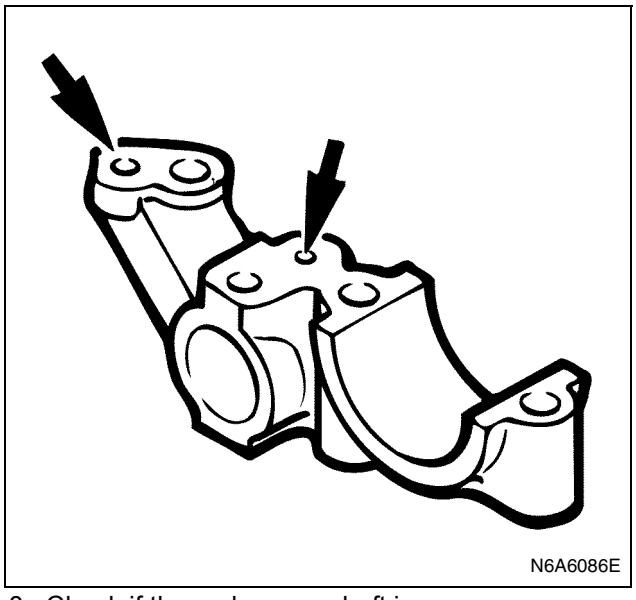
1. Remove the camshaft bracket.
2. Remove the rocker arm.
3. Remove the wave washer.
4. Remove the rocker arm.
5. Remove the rocker arm bracket.
   - Repeat the procedure of (2) to (5).
6. Remove the camshaft bracket to take the shaft out.



N6A6085E

Legend
1. Camshaft Bracket
2. Rocker Arm
3. Wave Washer
4. Rocker Arm
5. Rocker Arm Bracket
6. Camshaft Bracket
7. Rocker Arm Shaft

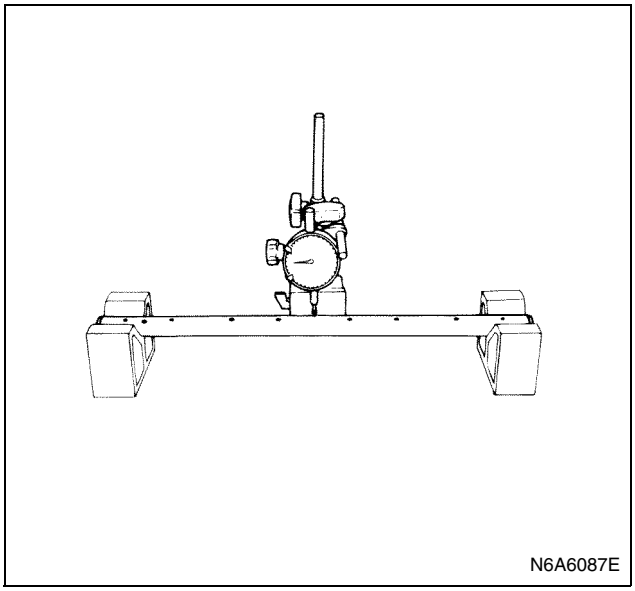
7. Check if the oil hole of the camshaft bracket (on the rear side) is clogged.



N6A6086E

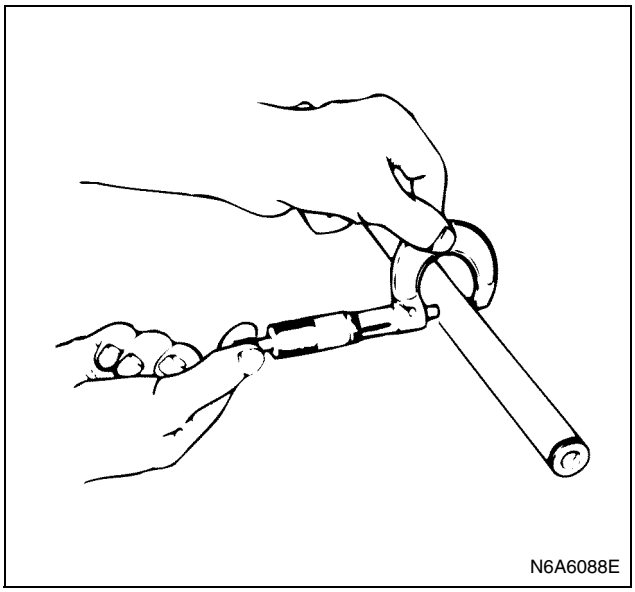
8. Check if the rocker arm shaft is warpage.
   - Place the rocker arm shaft on a V block.
   - Mesure the runout of the rocker arm shaft with a dial gauge on the center of the shaft.
   - As a result of measurement, if its bend is slight, press it to rectify it (do not heat).
   - If the warpage of the shaft exceeds the limit, replace the shaft.

Bend of the rocker arm shaft	mm (in)
Limit	0.3 (0.012)



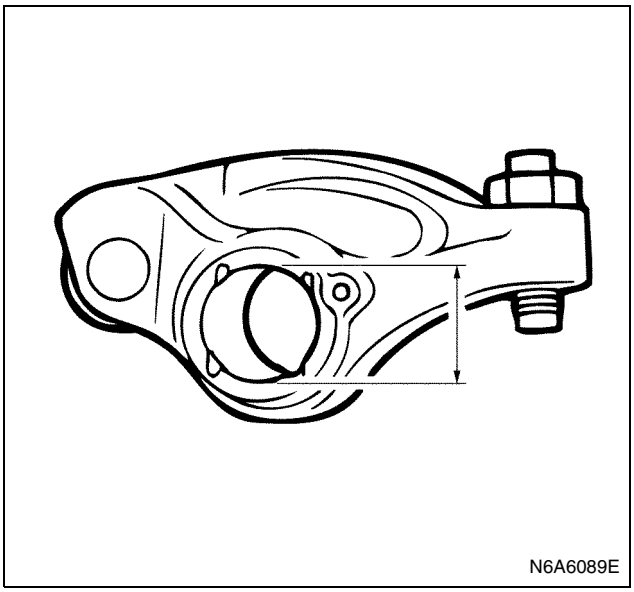
9. Check if the rocker arm shaft is worn.
   - Use a micrometer to measure 8 places rubbed by the rocker arms.
   - Replace the shaft if the diameter is less than the limit.

External diameter of the rocker arm shaft	mm (in)
Standard	21.979 – 22.000 (0.865 – 0.866)
Limit	21.85 (0.860)



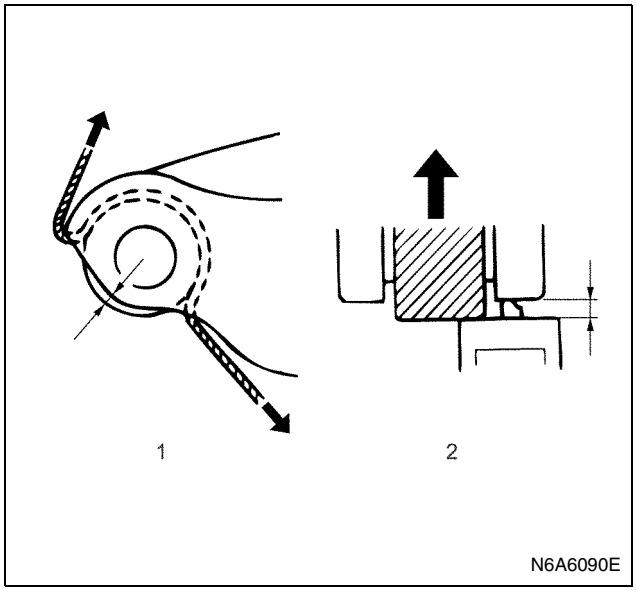
10. Inspect a clearance between the rocker arm and the rocker arm shaft.
    - Use a cylinder gauge to measure an inside diameter of the bush of the rocker arm to measure a clearance between the external diameter of the shaft.
    - If the measurement exceeds the limit, replace the rocker arm and the shaft.

Clearance between the rocker arm and rocker arm shaft	mm (in)
Standard	0.010 – 0.056 (0.0004 – 0.0022)
Limit	0.2 (0.0079)



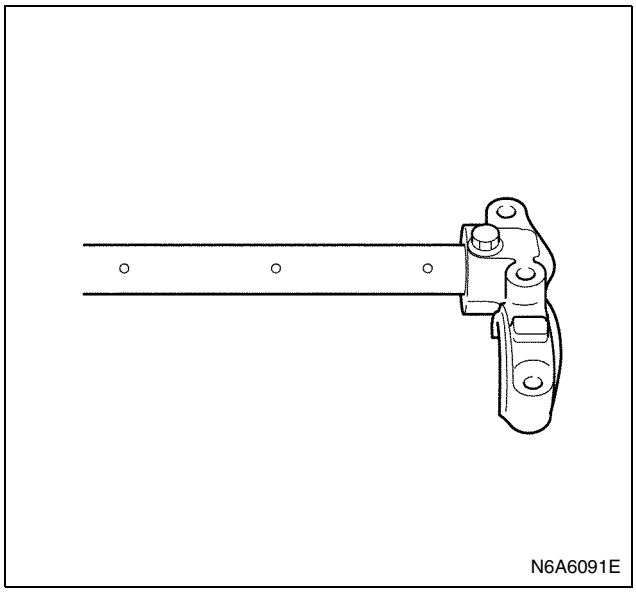
11. Inspect a clearance between the roller of the rocker arm and the rocker arm pin.
    a. Pass a string, through the opening between the rocker arm and the roller, pull it strongly in the direction indicated with arrows and measure the gap between the rocker arm and the roller with the roller being hulled out. (Figure 1)
    b. After marking the measuring point, pull the string out push the roller fully into the rocker arm, and measure the gap of the marked place. (Figure 2)
    c. The gap between the measurement taken under a. and that under b. Is the a clearance between the roller and the rocker arm pin. If it exceeds the limit, replace the rocker arm.

Clearance between the roller and the rocker arm pin	mm (in)
Standard	0.068 – 0.100 (0.0026 – 0.0039)
Limit	0.2 (0.0079)

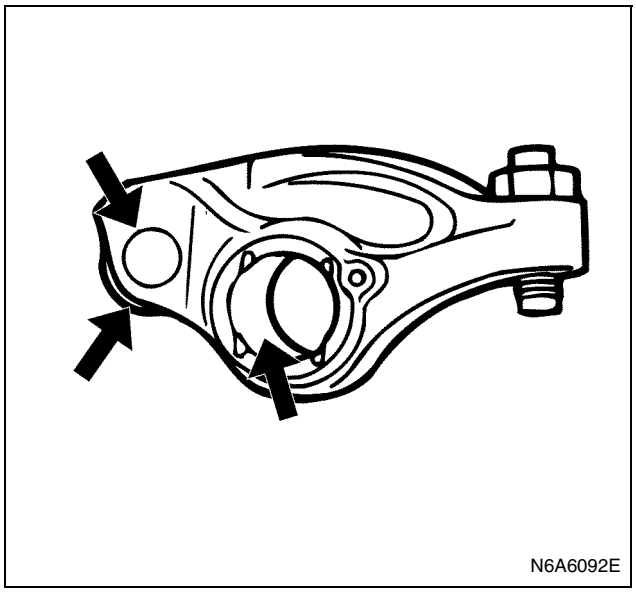


Reassembly

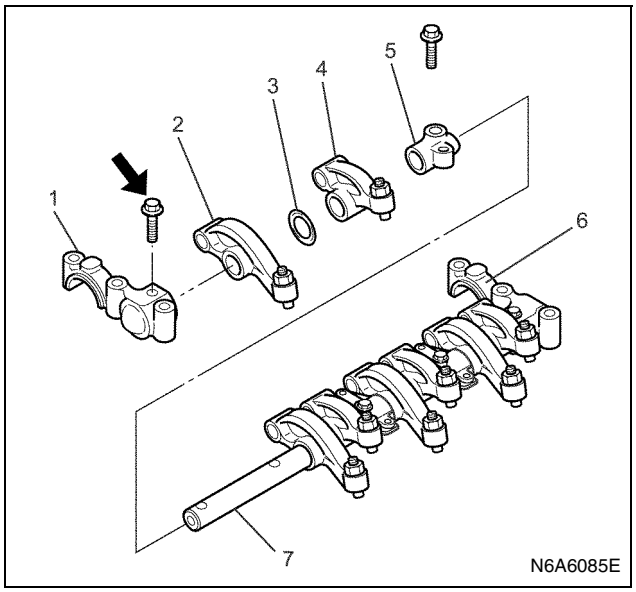
1. Install the camshaft bracket to one side of the rocker arm shaft tentatively first. (Tighten them up, after the rocker arm shaft assembly is installed on the cylinder head.)
   - Assemble in the reverse order to dismounting.



2. Install the rocker arm.
   - Apply engine oil to the hole of the rocker arm, the roller and the rocker arm pin.



3. Install the wave washer between the rocker arm.
4. Install the rocker arm bracket.
   - Paying attention to the direction of the rocker arm bracket, repeat the step 2 to 4.
5. Install the camshaft bracket.
   - Install the camshaft bracket on the rocker arm shaft with the bolts indicated with an arrow tightened tentatively. (Tighten them up, after the rocker arm shaft assembly is installed on the cylinder head.)



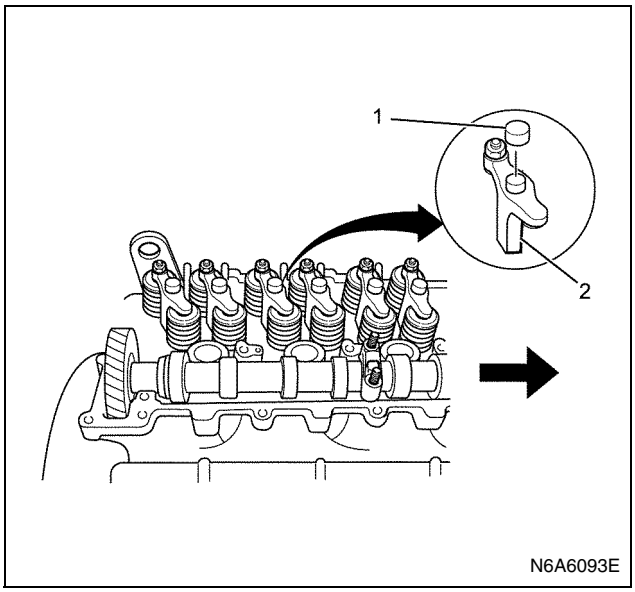
Legend

1. Camshaft Bracket
2. Rocker Arm
3. Wave Washer
4. Rocker Arm
5. Rocker Arm Bracket
6. Camshaft Bracket
7. Rocker Arm Shaft

Installation

1. Install the rocker arm shaft assembly.
   - If the bridge cap comes off, apply engine oil over the inside of the bridge cap and put it together with the bridge.

Caution:
Pay full attention so as not to drop the bridge cap in the gear case of the rear part of the cylinder head or the hole into which oil pours back in the front.

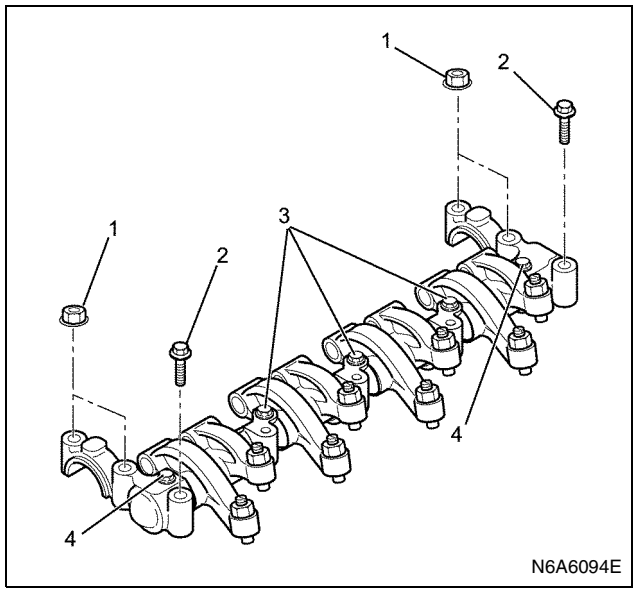


Legend
1. Bridge Cap
2. Bridge

   1) Temporarily tighten the bolts marked with the arrow in the illustration.
   2) Loosen the rocker arm adjust screws and apply engine oil to the rocker arm roller portions.
   3) Install the rocker arm assembly on the cylinder head.

   - Apply engine oil on threads of the bolts and nuts, and fix them tentatively (about tighten up).
   - Tighten them up according to the order specified below gradually, taking care not to incline the entire rocker arm assembly.
     Tightening order:
     1. Nuts (1) from near side of the rocker arm shaft
     2. Bolts (2)
     3. Bolts (3) from out side
     4. Bolts (4)

Tighten:
Bolt (3) to 56 N·m (5.7 kg·m/41 lb ft)
Nut (1), Bolt (2), (4) to 27 N·m (2.8 kg·m/20 lb ft)



Legend
1. Camshaft Bracket Fixing Nut
2. Camshaft Bracket Fixing Bolt
3. Rocker Arm Bracket Fixing Bolt
4. Rocker Arm Shaft Set Bolt

   - Adjust valve clearance.
     Refer to “Functional Inspection”.

2. Install the cylinder head cover.
   Refer to “Cylinder Head Cover”.

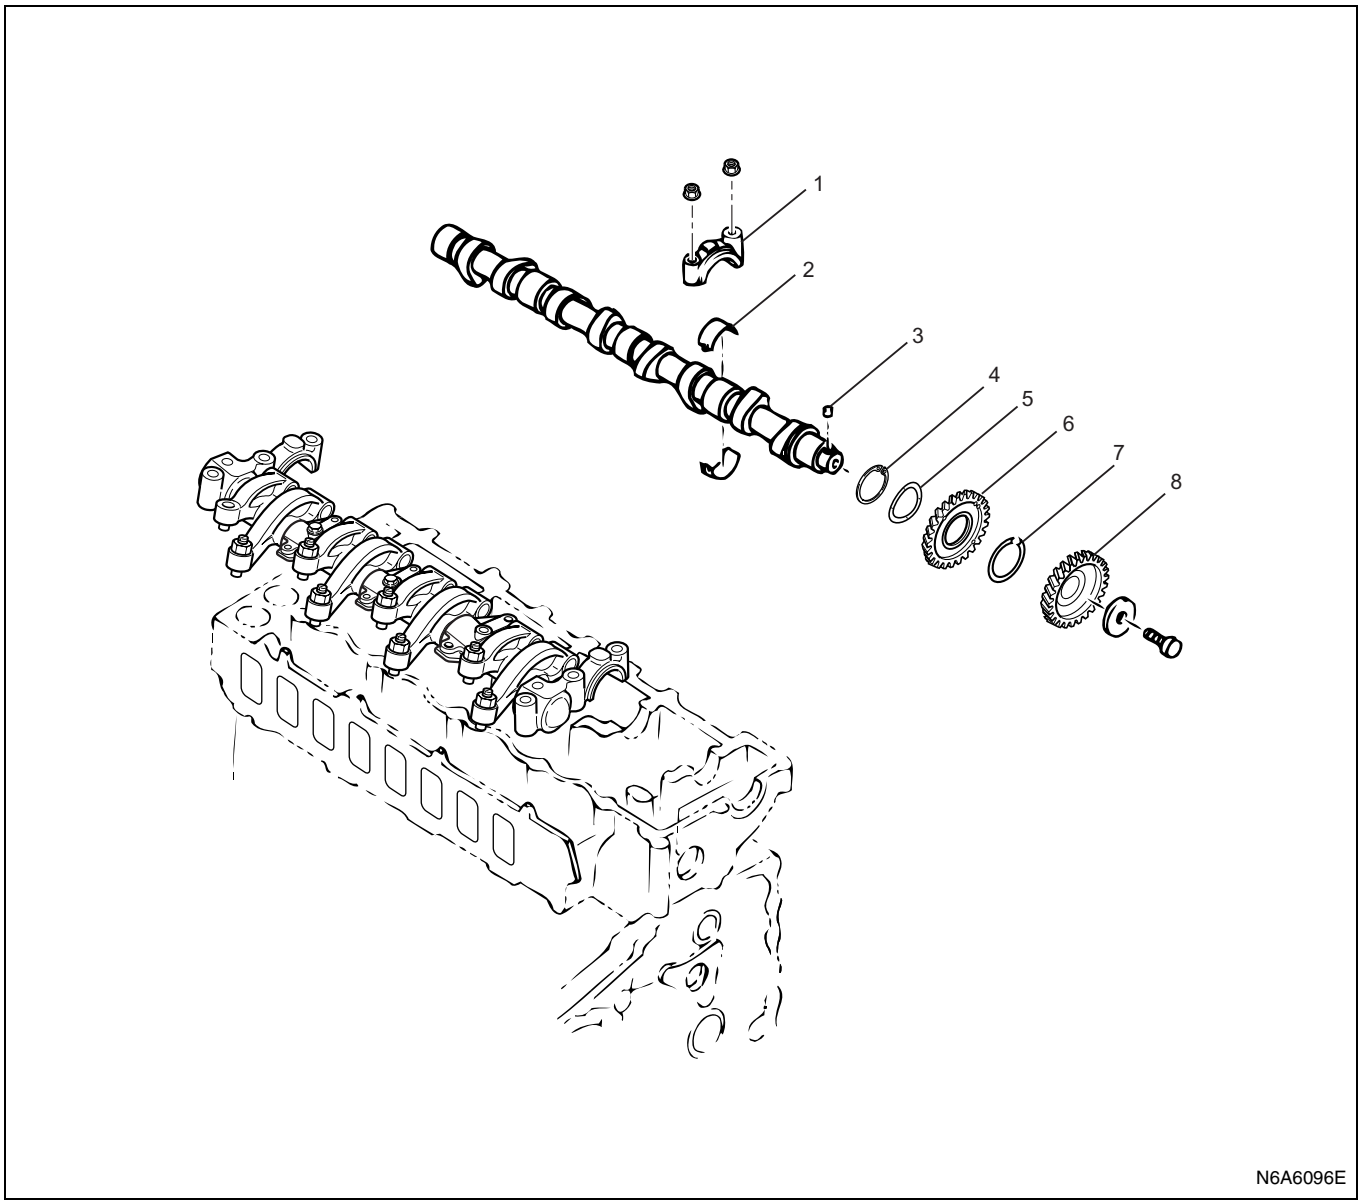
Camshaft Assembly

Component



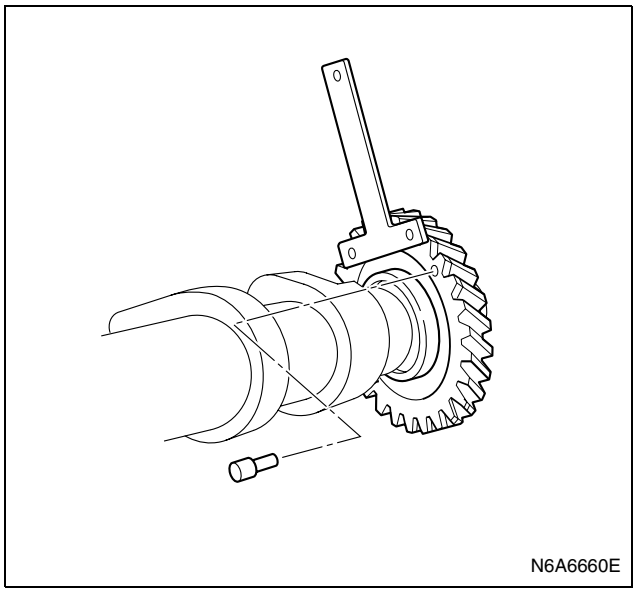
Legend

1. Bearing Cap
2. Bearing
3. Knock Pin
4. Snap Ring
5. Dish Washer
6. Sub Gear
7. Spring
8. Camshaft Gear

Removal

1. Rotate the crank shaft to make the No. 1 cylinder meet the compression TDC.
2. Remove the cylinder head cover.
   Refer to the “cylinder head cover.”
3. Remove the rocker arm shaft assembly.
   Refer to the “rocker arm shaft assembly.”
4. Remove the camshaft bearing cap.

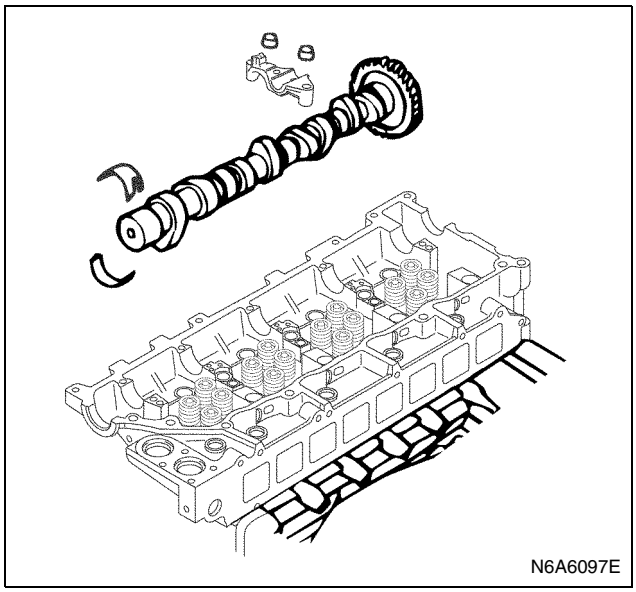
- Before removing the camshaft from the cylinder head, rotate the sub gear using the special tool to prevent the spring force which acts on the sub gear from affecting. Align the hole of the sub gear with the camshaft main gear and install the phase alignment pin from the sub gear side to match the teeth.
  Special tool
  Scissors gear spring wrench: 5-8840-2674-0



N6A6660E

5. Remove the bearing upper.
6. Remove the camshaft assembly.
7. Remove the bearing lower.

Caution:
Put the removed bearings in order with a tag, for example, by cylinder.

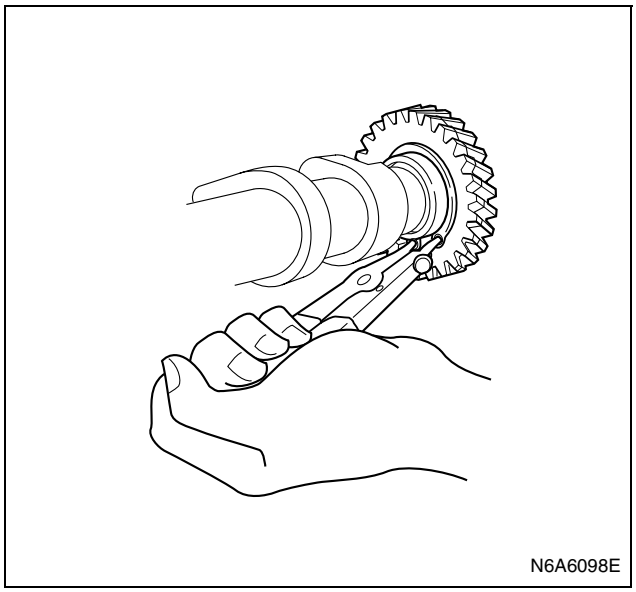


N6A6097E

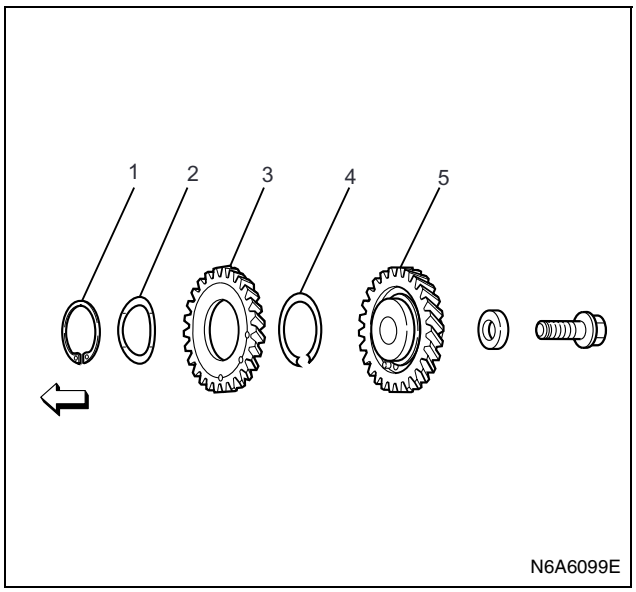
Disassembly

1. Remove the scissors gear assembly.
   - Fix the hexagon portion of the camshaft in a vise using a mouth ring. Use snap ring pliers to remove the sub gear.

Caution:
Take care not to damage to the cam portion and the journal portion of the camshaft.



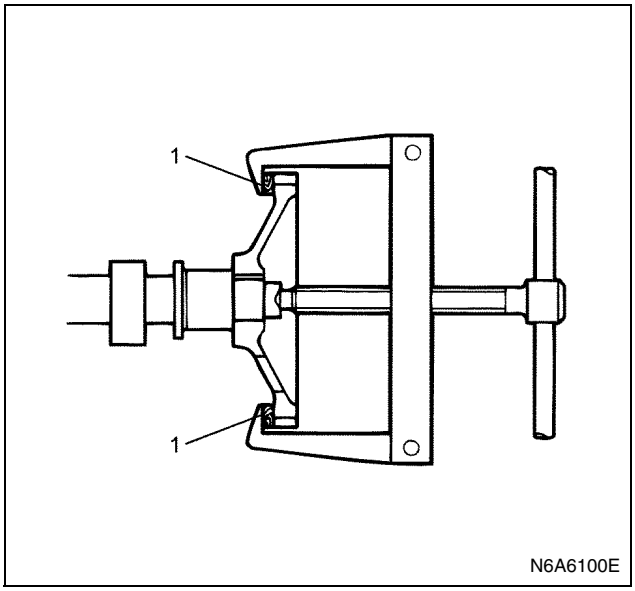
N6A6098E



N6A6099E

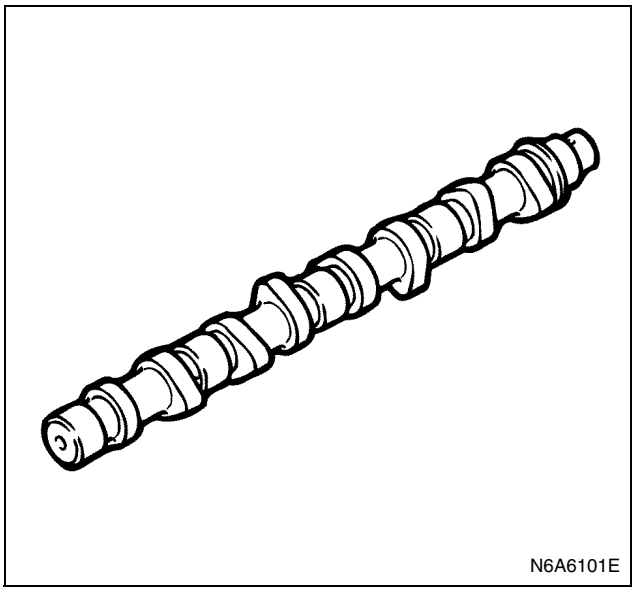
Legend
1. Snap Ring
2. Dish Washer
3. Sub Gear
4. Spring
5. Camshaft Gear

2. Remove the camshaft gear.
   - Remove the fastening bolts of the camshaft gear and put the block of wood in a puller to remove the camshaft gear.



Legend
1. Wood

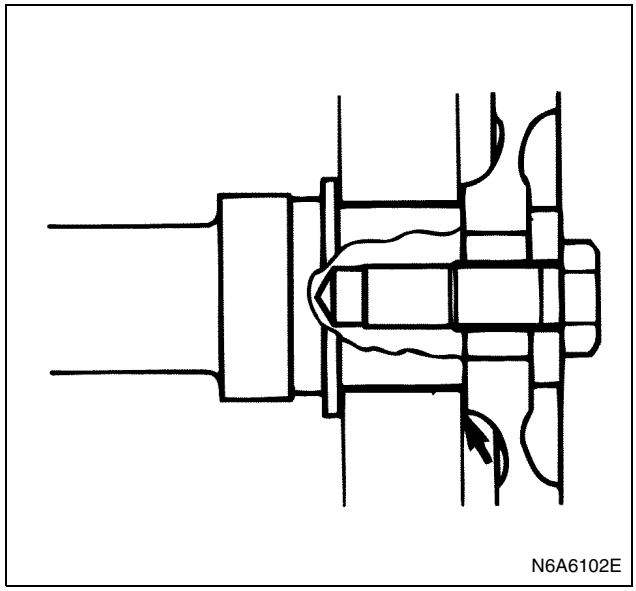
3. Remove the dowel pin.
4. Inspect the camshaft visually.
   - Check if the journal and cam parts of the camshaft are worn or damaged, if so, replace it.



5. Inspect an end clearance of the camshaft.
   - Use a thickness gauge to measure an end clearance of the camshaft gear and the camshaft bracket.
   - If the measurement exceeds the limit, replace the camshaft gear or the camshaft.

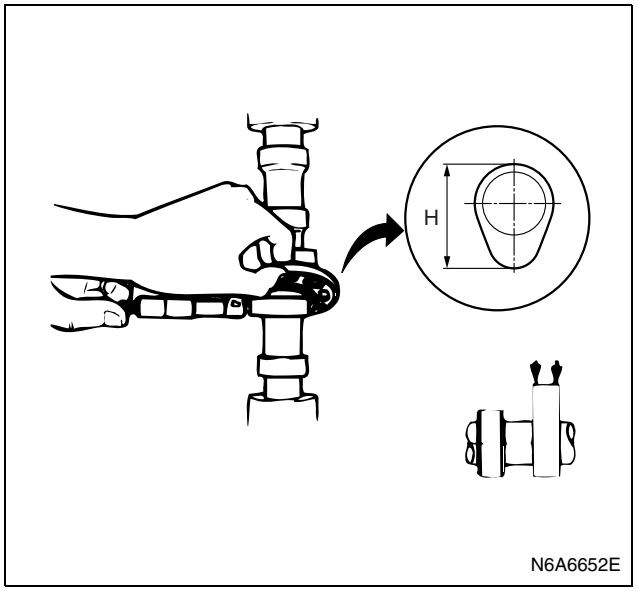
End clearance of the camshaft	mm (in)
Standard	0.085 – 0.205 (0.033 – 0.008)
Limit	0.25 (0.009)

Caution:
Measure an end clearance of the camshaft before disassembling.



6. Check if the cam lobe is worn.
   - Measure the height “H” of the cam lobe with a micrometer.
   - If the height of the cam lobe is the limit or less, replace the camshaft.

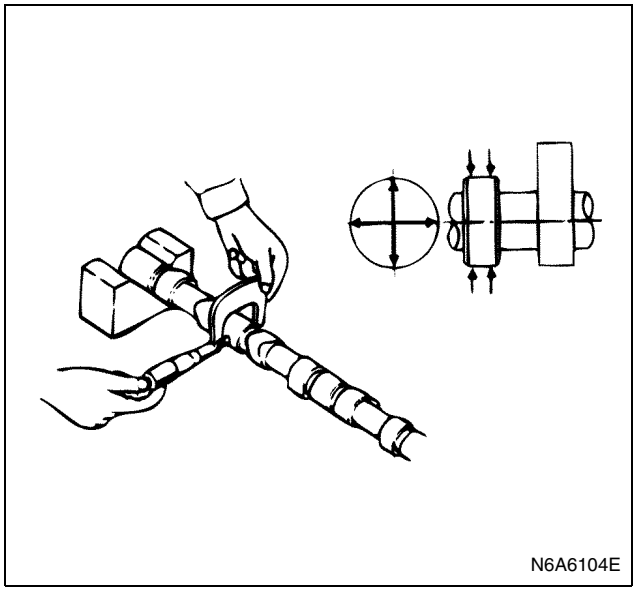
Height of the cam lobe		mm (in)
	Inlet	Exhaust
Standard	52.8 (2.08)	54.5 (2.15)
Limit	51.8 (2.04)	53.5 (2.11)



7. Check if the camshaft journal is worn.
   - Use a micrometer to measure wear which is not even with a diameter of the camshaft journal.
   - If the measured uneven wear exceeds the limit, replace the camshaft.

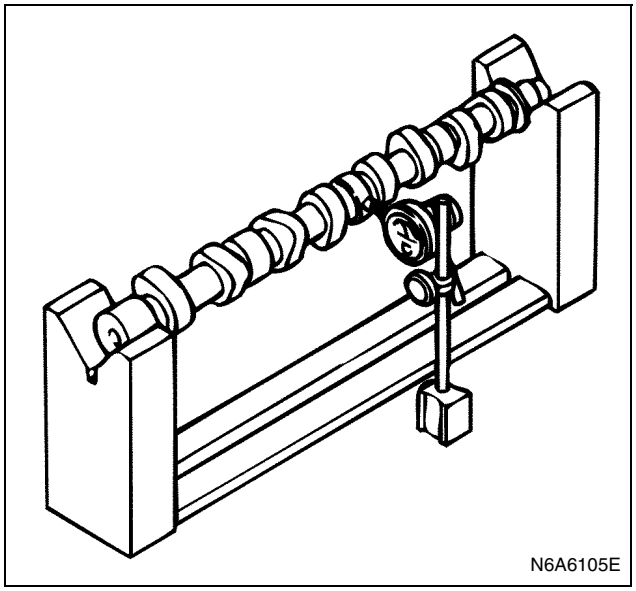
External diameter of the camshaft journal part	mm (in)
Standard	39.950 – 39.975 (1.5728 – 1.5738)
Limit	39.850 (1.5688)

Partial wear of the camshaft journal part	mm (in)
Limit	0.05 (0.0019)



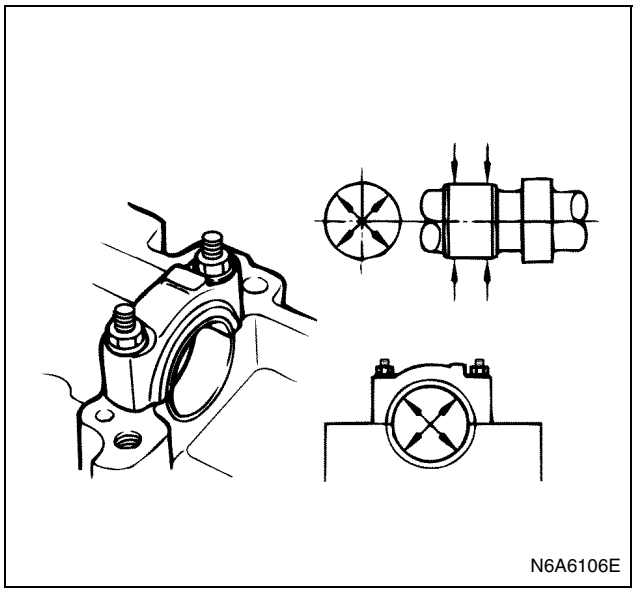
8. Check if the camshaft is warpage.
   - Place the camshaft on a V block to measure a runout with a dial gauge.
   - Rotate the camshaft slowly and measure the range of fluctuation. If it exceeds the limit, replace the camshaft.

Warpage of the camshaft	mm (in)
Limit	0.05 (0.0019)



9. Measure camshaft journal oil clearance.
   a. Measure the inside diameter of the camshaft bearing with a dial gauge.
   b. Read the difference between the inside diameter of the camshaft bearing and the diameter of the camshaft journal.
      If the measured oil clearance exceeds the limit, replace the camshaft bearing.

Clearance of the journal part	mm (in)
Standard	0.025 – 0.087 (0.0009 – 0.0034)
Limit	0.15 (0.0059)

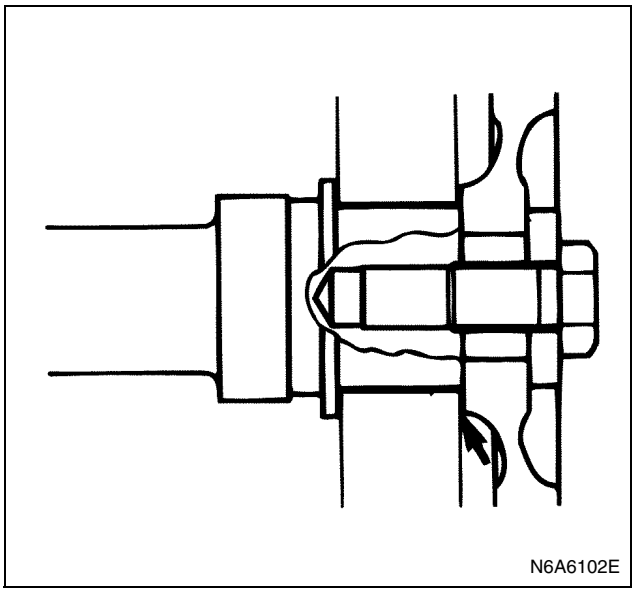


Reassembly

1. Install the knock pin.
2. Install the camshaft gear.
   - With the side of the camshaft gear center boss part stuck out being on the camshaft side, install the camshaft gear along with the knock pin.

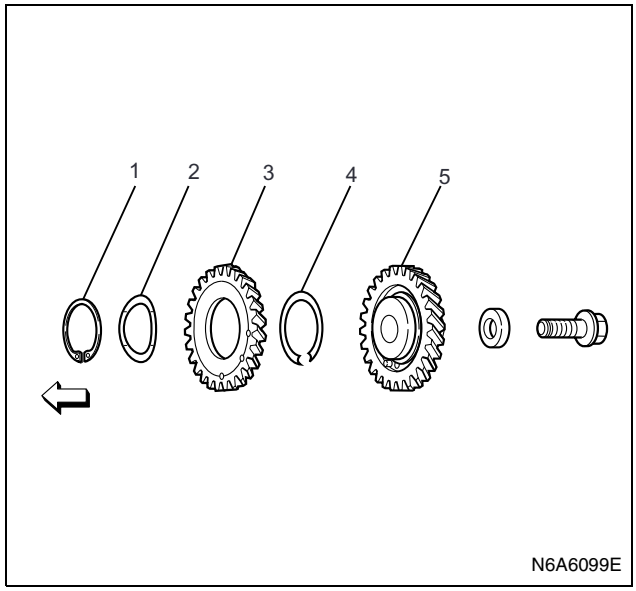
Tighten:
Bolt to 142 N·m (14.5 kg·m/105 lb·ft)

Caution:
Be careful not to damage the cam and journal parts when tightening up the gear.



N6A6102E

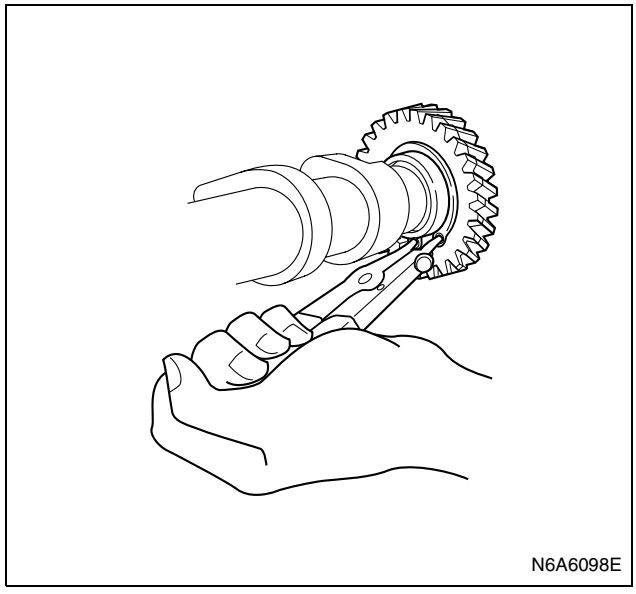
3. Install the scissors gear assembly.
   - Fix the hexagon portion of the camshaft in a vise using a mouth ring. Assemble the spring with its left end contacting the pin of camshaft main gear to make a gap on the right.
   - Assemble the sub gear so that its pin is inserted into the gap between the right side of pin of the camshaft main gear and the right end of the spring.



N6A6099E

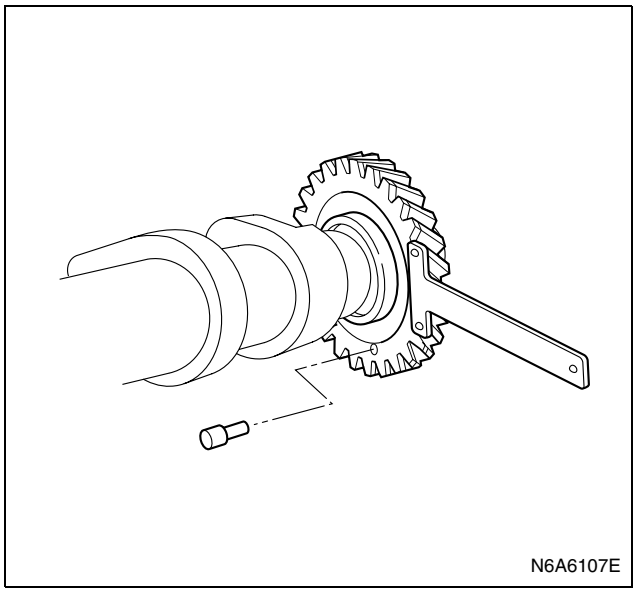
Legend
1. Snap Ring
2. Dish Washer
3. Sub Gear
4. Spring
5. Camshaft Gear

   - Use snap ring pliers to assemble the snap ring and the dish washer securely.



N6A6098E

- Before installing the camshaft to the cylinder head, rotate the sub gear using the special tool to prevent the spring force which acts on the sub gear from affecting. Align the hole of the sub gear with the camshaft main gear and install the phase alignment pin from the sub gear side to match the teeth.
  Special tool
  Scissors gear spring wrench: 5-8840-2674-0

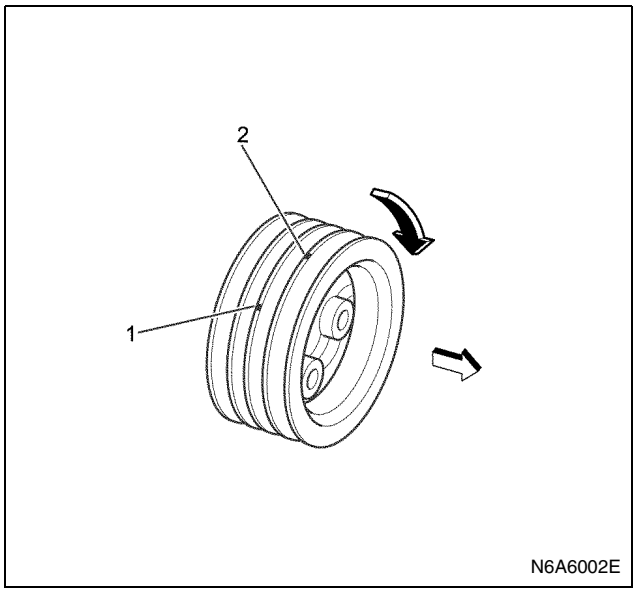


N6A6107E

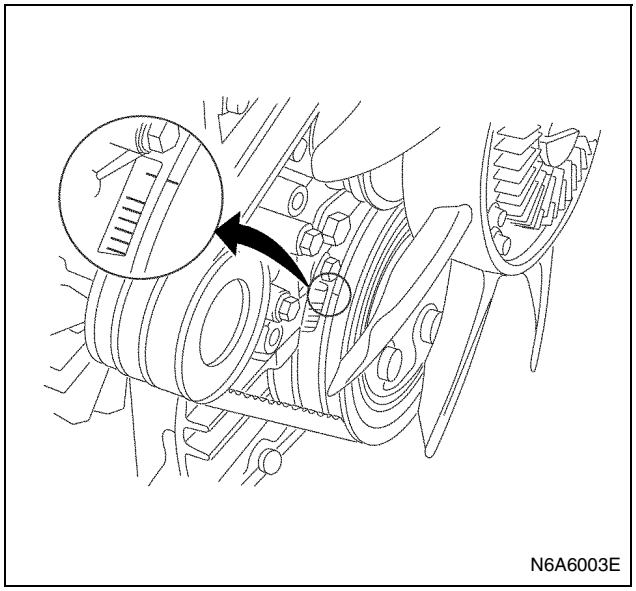
Installation

1. Turn the crankshaft in the normal direction of engine rotation until the No. 1 or No. 4 cylinder is at TDC on the compression stroke.

Notice:
There are 2 timing marks on the crankshaft pulley.
Mark (1) is near the cylinder block and is used to bring the 4HK1-TC engine to TDC.
Mark (2) is not applicable to this engine.
Be sure to use mark (1) when bringing the engine to TDC.

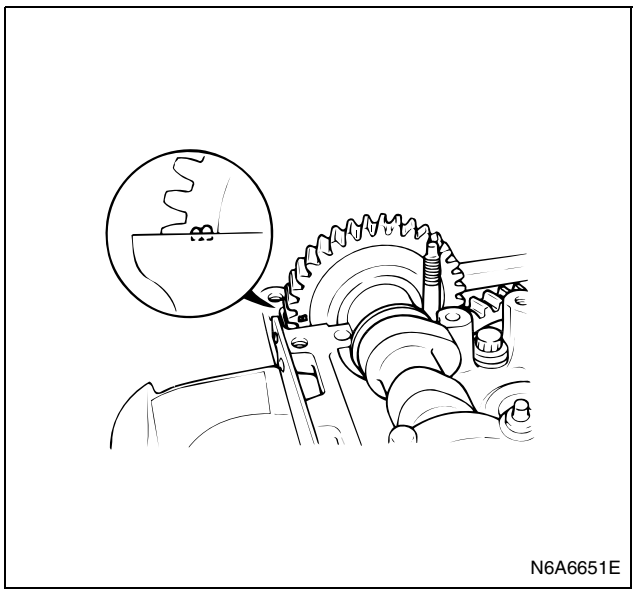


N6A6002E



N6A6003E

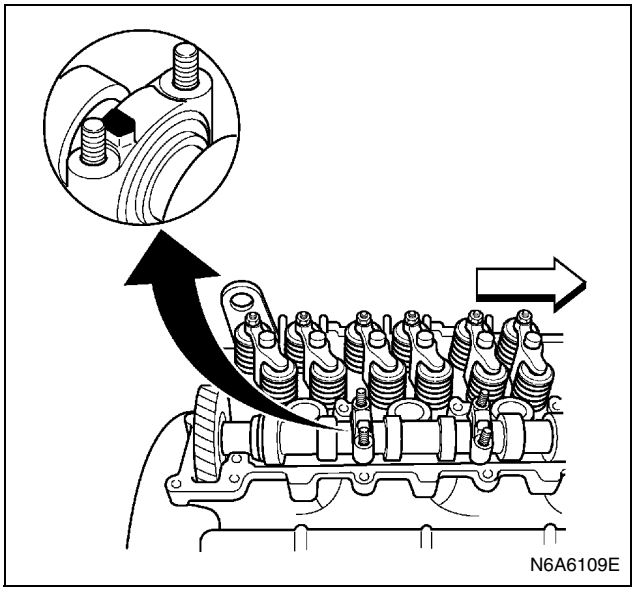
2. Install the camshaft bearing lower.
   - Apply engine oil over the camshaft bearing lower and install it on the cylinder head.
3. Install the camshaft assembly.
   - The camshaft assembly 'B' mark must be facing the cylinder head upper face. If not, serious engine damage will result.



N6A6651E

4. Install the baring upper to the bearing cap.
5. Install the bearing cap.
   - Apply engine oil on the bearing upper.

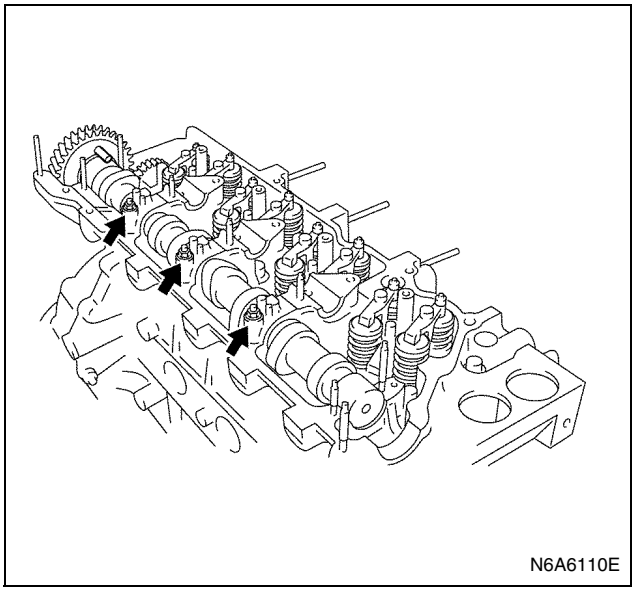
- Direct the front mark of the bearing cap toward the front of the engine and put it together with the cylinder head in numerical order.



N6A6109E

- Apply engine oil to the thread and tighten up the bearing cap with the prescribed torque.

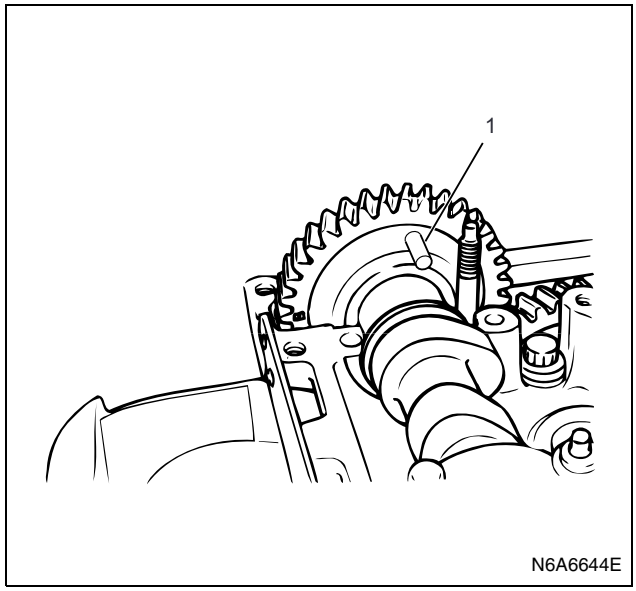
Tighten:
Nut to 27 N·m (2.8 kg·m/20 lb·ft)



N6A6110E

- Pull out the phase alignment pin of the gear (1) carefully so that it does not fall into inside the engine.

Caution:
Be careful not to forget to pull out the phase alignment pin of the gear.



N6A6644E

Legend
1. Phase Alignment Pin

6. Install the rocker arm shaft assembly.
   Refer to “Rocker Arm Shaft Assembly”.
7. Install the cylinder head cover.
   Refer to “Cylinder Head Cover”.

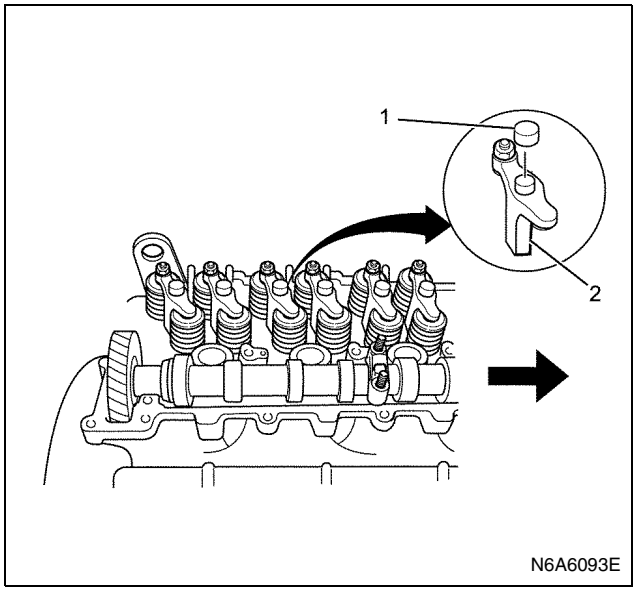
2. Camshaft Bearing
3. Camshaft Assembly
4. Rocker Arm Shaft Assembly
5. Valve Stem Oil Seal
6. Valve Spring
7. Spring Upper Seat
8. Split Collar
9. Bridge

Removal

1. Remove the cylinder head cover.
   Refer to “Cylinder Head Cover”.
2. Remove the rocker arm shaft assembly.
   Refer to “Rocker Arm Shaft Assembly”.
3. Remove the camshaft assembly.
   Refer to “Camshaft Assembly”.
4. Remove the bridge cap (1).
5. Remove the bridge (2).

Caution:
Keep the removed bridge and bridge cap properly so that they may be put back to the original position.

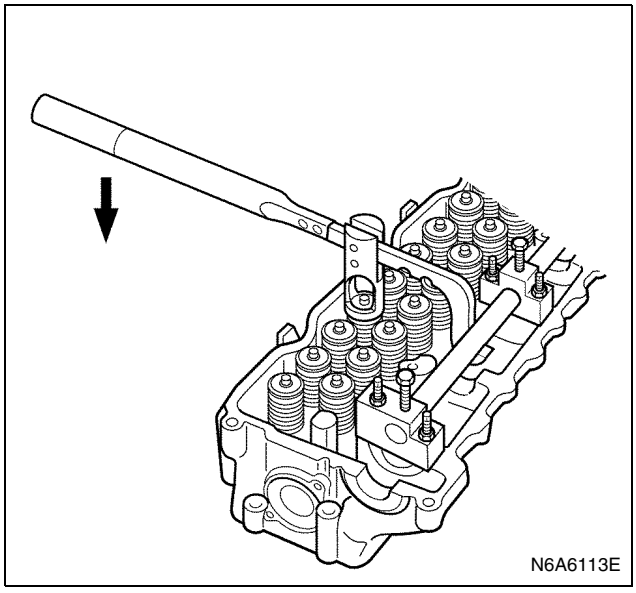


Legend
1. Bridge Cap
2. Bridge

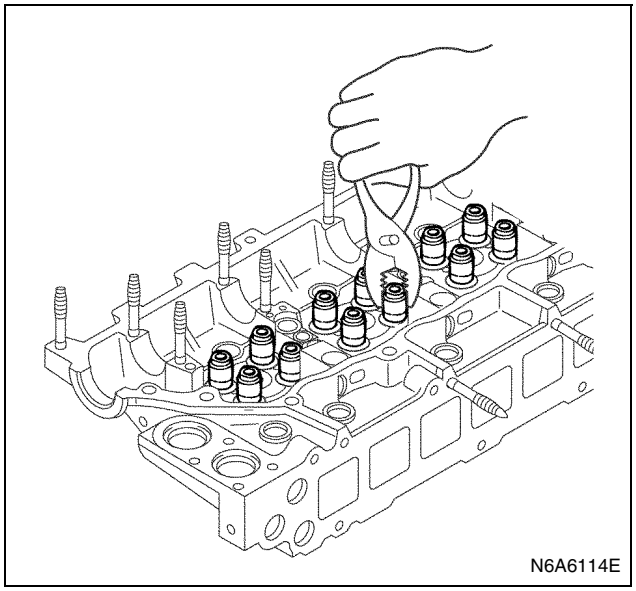
Caution:
Pay full attention so as not to drop the bridge cap in the gear case of the rear part of the cylinder head or a hole into which oil pours back in the front.

6. Remove the split collar.
   - Apply compressed air over the cylinder from a glow plug hole to keep the valve at the home position.
   - Use a replacer to compress the valve spring to remove the split collar.

     Special tool
     Valve spring replacer: 5-8840-2621-0 (J-43263)
     Pivot: 5-8840-2808-0 (EN-46721)



7. Remove the spring upper seat.
   - Remove the special tool to remove the upper seat.
8. Remove the valve spring.
   Put the removed valve springs in order by cylinder number.
9. Remove the valve stem oil seal.
   - Use pliers to remove the oil seal.



Caution:
Do not use the removed oil seal again.

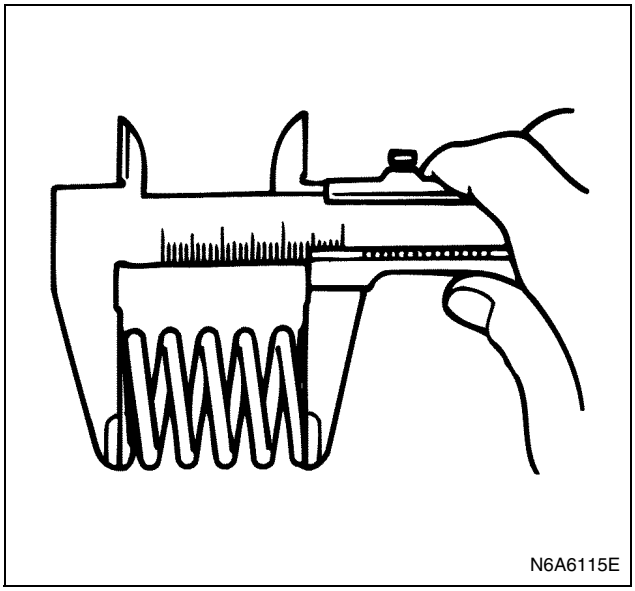
Inspection

Inspect the valve spring

Caution:
Check the valve spring visually and if there is clear damage or wear-out, replace it.

1. Free length
   - Measure free length of the spring and if it is shorter than the prescribed limit, replace the spring.

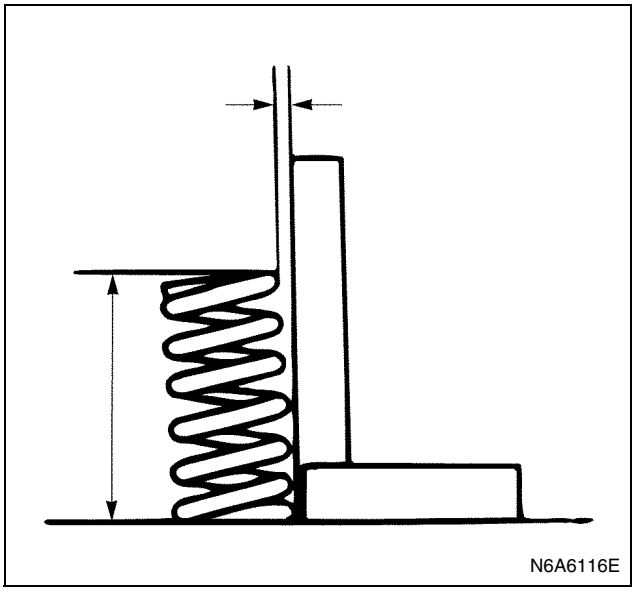
Free length of the valve spring		mm (in)
	Inlet	Exhaust
Standard	59.9 (2.36)	70.3 (2.76)
Limit	56.9 (2.24)	67.3 (2.65)



N6A6115E

2. Valve spring squareness
   - Use a surface plate and a square to measure the valve spring squareness.
     If the measured value exceeds the specified limit, replace the valve spring.

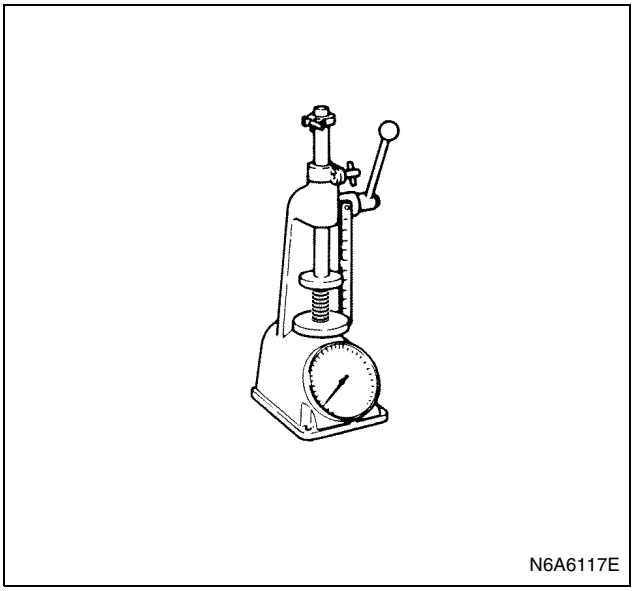
Valve spring squareness	mm (in)
Limit	1.0 (0.04)



N6A6116E

3. Tension
   - Use a spring tester to compress the spring to the installation height. Measure tension of the compressed spring. If the measurement is lower than the limit, replace the spring.

Tension of the valve spring		
	Inlet	Exhaust
Installation length mm (in)	47.0 (1.85)	47.0 (1.85)
Standard N (lb)	333 (74.9)	490 (110.2)
Limit N (lb)	315 (71.0)	463 (104.3)



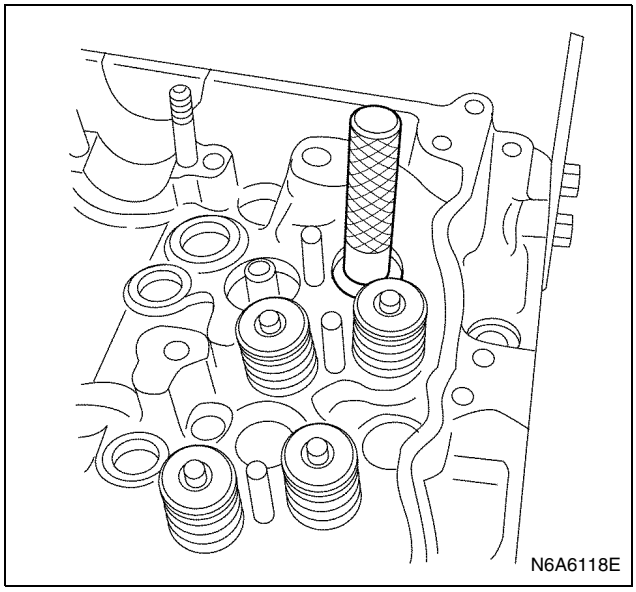
N6A6117E

Installation

1. Install the valve stem oil seal.
   - Apply engine oil over the peripheral part of the valve guide and install the oil seal by using a valve stem seal installer.

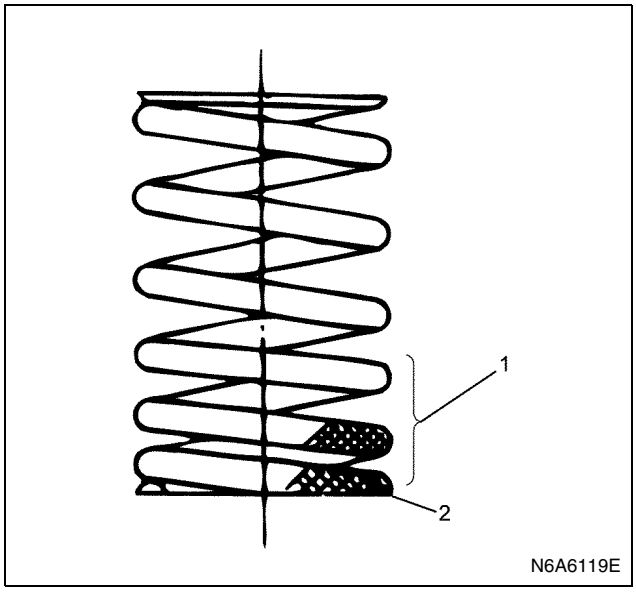
Caution:
After installing the valve stem oil seal, check if it is inserted deeply enough and the oil seal is not tilted or the garter spring has not come off.

Special tool
Valve stem seal installer: 5-8840-2833-0 (EN-47685)



2. Install the valve spring.
   - Install it with the paint mark or the narrow side of the spring pitch being the lower side (cylinder head side).

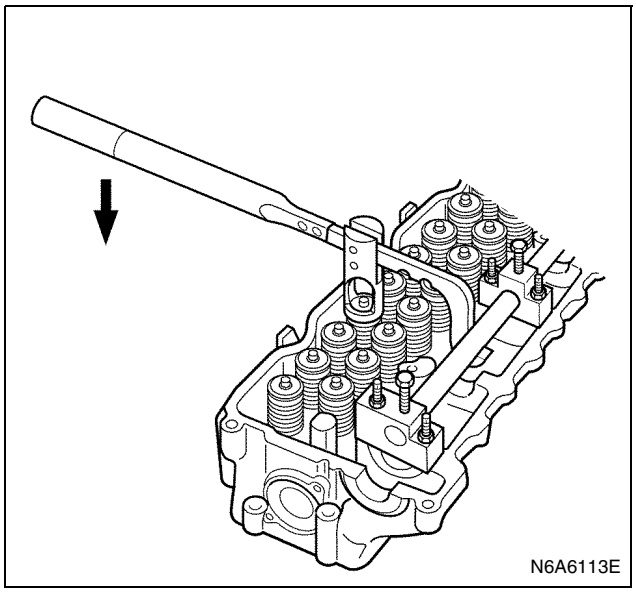
	Paint mark
Inlet	Blue
Exhaust	Red



Legend
1. Spring Pitch
2. Paint Mark

3. Install the spring upper seat.
4. Install the split collar.
   - Apply compressed air over the cylinder from the glow plug holes to keep the valve at the home position.
   - Use a replacer to compress the valve spring and install the split collar.

   Special tool
   Valve spring replacer: 5-8840-2621-0 (J-43263)
   Pivot: 5-8840-2808-0 (EN-46721)

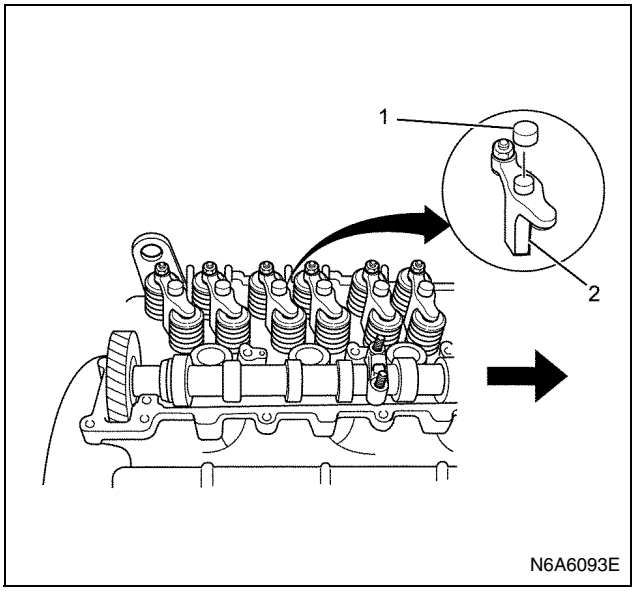


5. Apply engine oil over the bridge and install it.

Caution:
Move it up and down to check if them moves smoothly.

6. Apply engine oil over the bridge cap and install it.

Caution:
Pay full attention so as not to drop the bridge cap in the gear case of the rear part of the cylinder head or the hole into which oil pours back in the front.



Legend

1. Bridge Cap
2. Bridge

7. Install the camshaft assembly.
   Refer to “Camshaft Assembly”.
8. Install the rocker arm shaft assembly.
   Refer to “Rocker Arm Shaft Assembly”.
9. Install the cylinder head cover.
   Refer to “Cylinder Head Cover”.

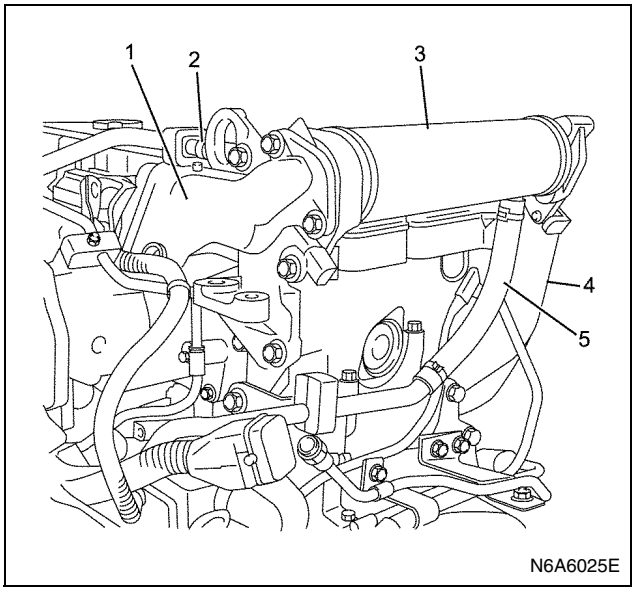
14. A/C Compressor Bracket
15. Thermostat
16. Water Outlet Pipe

Caution:
To avoid electric shock;
Set the switch to the 'OFF' position and disconnect battery negative cable before checking or repairing the fuel injector, wiring or/and connectors.

Removal

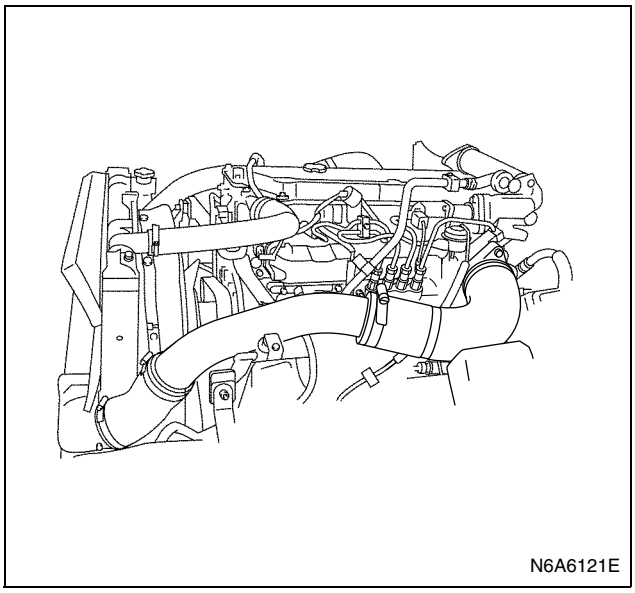
1. Drain the coolant.
2. Remove the engine harness.
3. Remove the front exhaust pipe.
4. Remove the turbocharger.
   Refer to "Turbocharger and Exhaust Manifold".

5. Remove the left-hand EGR adapter and right-hand EGR pipe.
6. Remove the EGR water feed pipe.
7. Remove the EGR water return pipe.
8. Remove the EGR cooler.
9. Remove the water feed pipe for coolant water for the EGR cooler and the water return pipe.

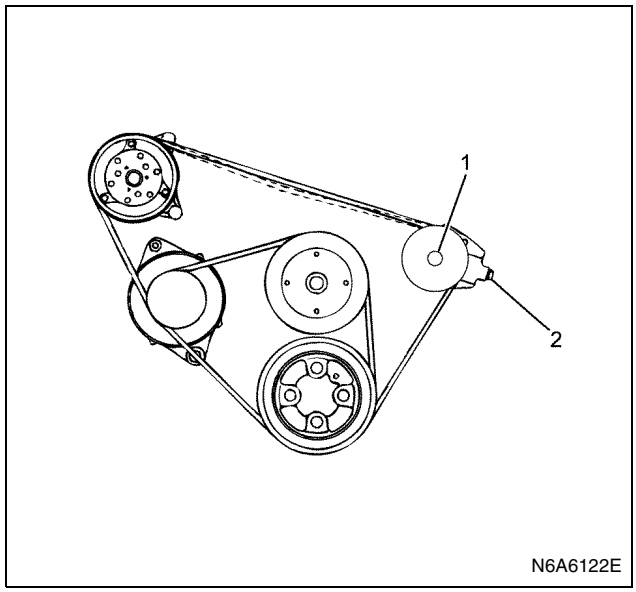


Legend
1. EGR Adapter
2. Water Return Pipe
3. EGR Cooler
4. EGR Pipe
5. Water Feed Pipe

10. Remove the fan guide bracket.
11. Remove the left-hand intake pipe between the inter-cooler and the inlet duct.

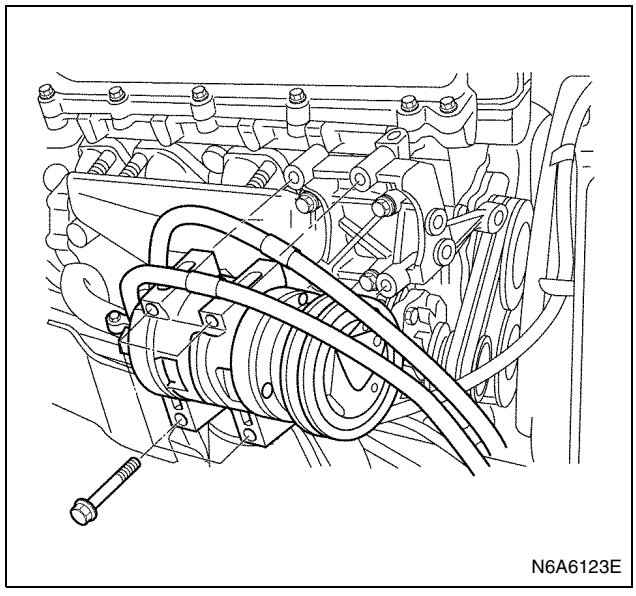


12. Remove the A/C compressor drive belt.
    - Loosen the tension pulley nut and the adjust bolt and remove the drive belt.



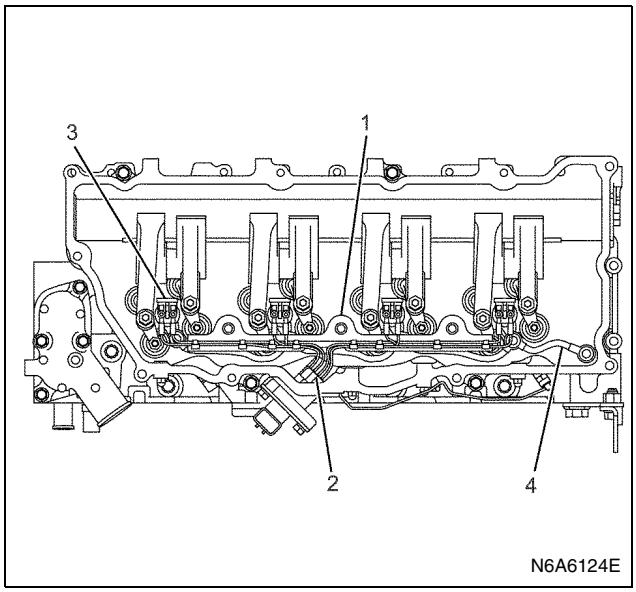
Legend
1. Tension Pulley Nut
2. Adjust Bolt

13. Remove the A/C compressor.
    - Remove the A/C compressor harness connector, remove the compressor from the A/C compressor bracket, and fix it with wires and others.



14. Remove the cylinder head cover.
    Refer to “Cylinder Head Cover.”
15. Remove radiator upper hose.
16. Loosen the fuel injector terminal nuts alternately to the same level, and remove the terminal.
17. Loosen the fuel injector harness bracket bolt, remove the inside connector, and remove the harness bracket.

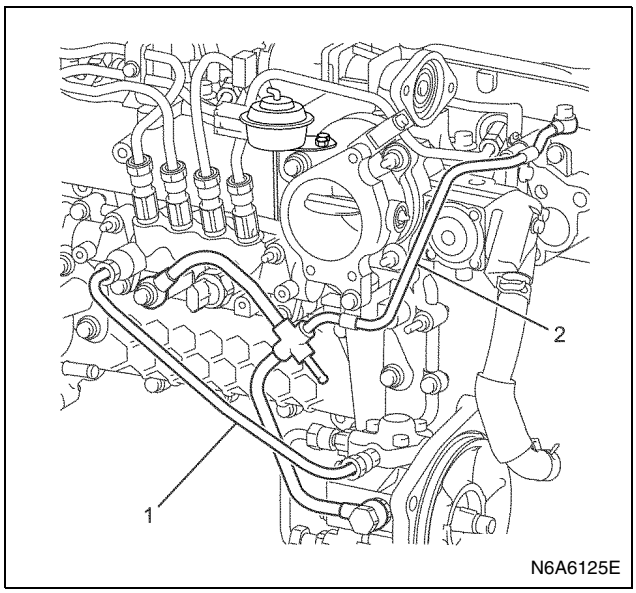
18. Remove the nozzle leak-off pipe (4).



Legend

1. Harness Bracket
2. Harness Connector
3. Fuel Injector Terminal Nut
4. Nozzle Leak-off Pipe

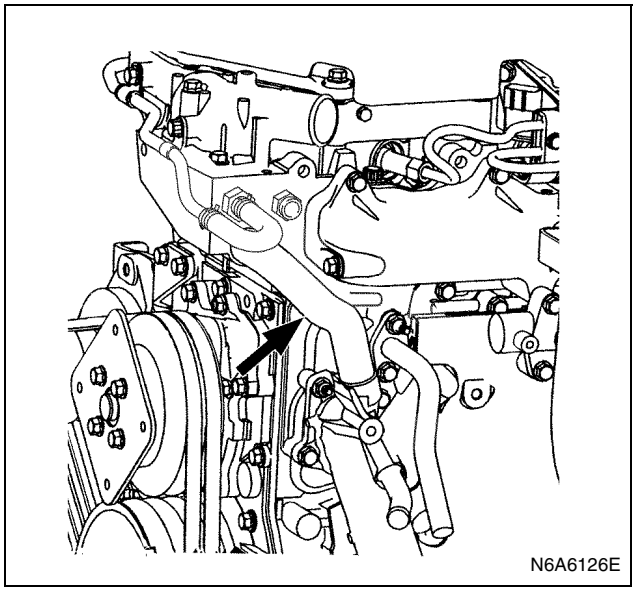
19. Remove the fuel leak-off hose.
20. Remove the fuel leak-off pipe (2).



Legend

1. High Pressure Pipe
2. Leak-off Pipe

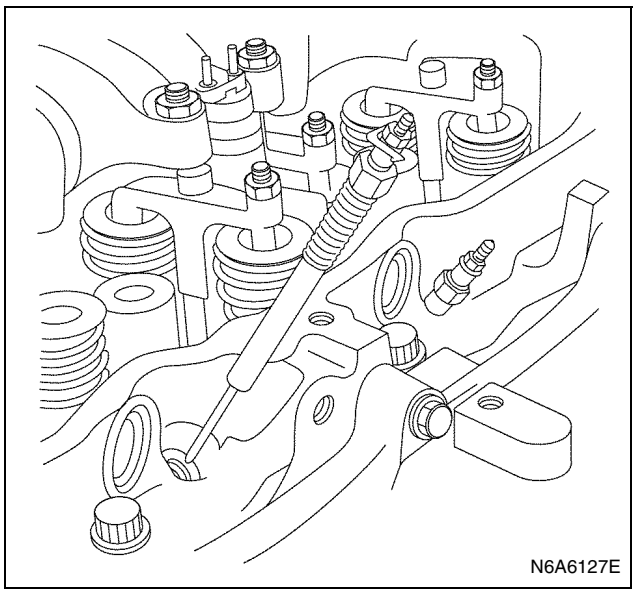
21. Remove the water bypass hose from the cylinder head side.
    - Remove the engine coolant temperature sensor connector.



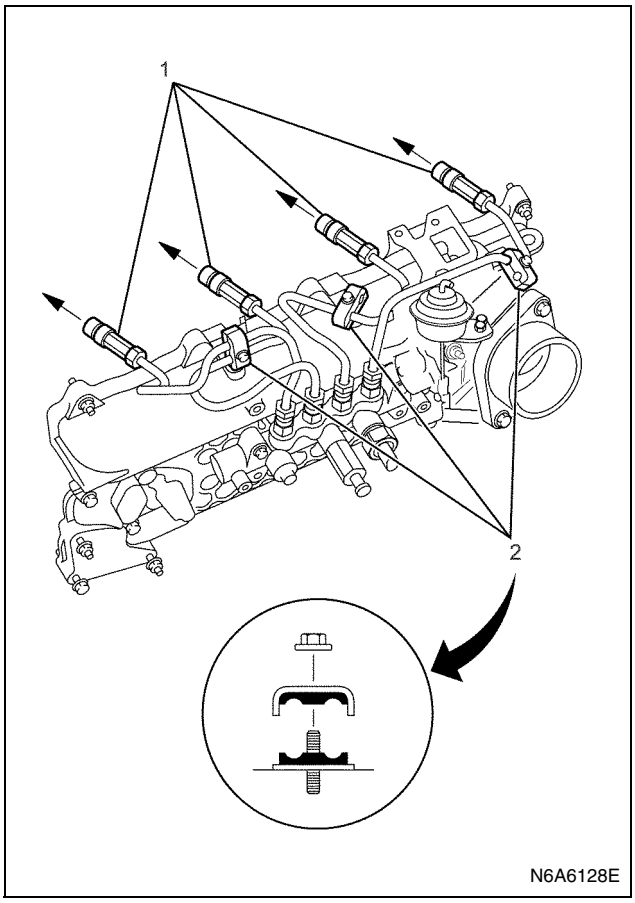
22. Remove the EGR valve and EGR valve connector.
23. Remove the camshaft position sensor connector.
24. Remove the rocker arm shaft assembly.
    Refer to “Rocker Arm Shaft Assembly”.
25. Remove the camshaft assembly.
    Refer to “Camshaft Assembly”.
26. Remove the bridge cap carefully so that it does not fall into inside the engine.
27. Remove the bridge.

Caution:
Store the removed bridge and bridge cap so that they can be placed in their original locations.

28. Remove the glow plug connector.
29. Remove the glow plug.



30. Remove the injection pipe clip, and remove the injection pipes.



Legend
1. Fuel Injection Pipe
2. Fuel Injection Pipe Clip

31. Remove the fuel rail.
    - Remove the fuel rail pressure sensor connector.
32. Remove the fuel injector bracket.
33. Loosen the fuel injector clamp fixing bolts and remove the fuel injectors.

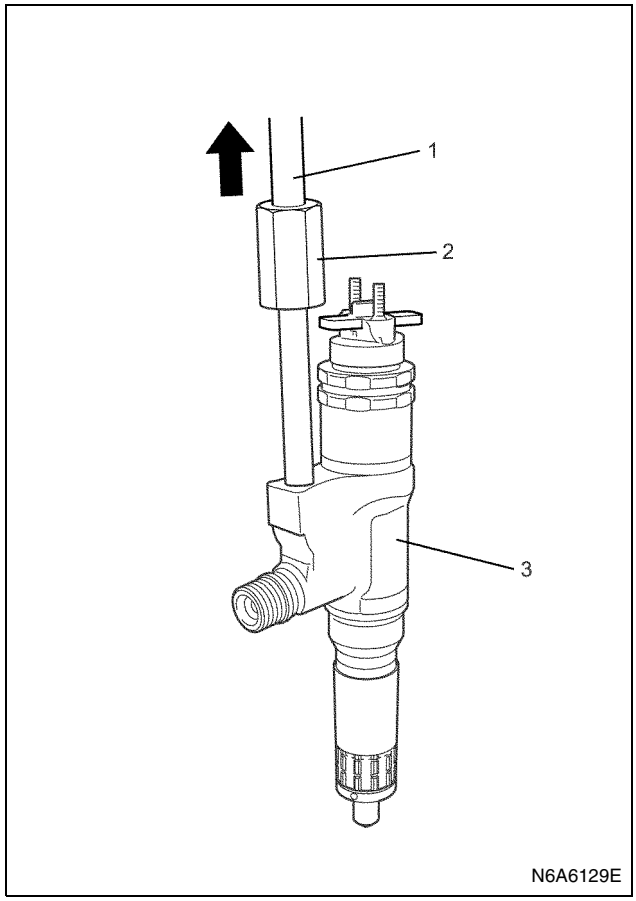
If the fuel injectors are difficult to remove, use the fuel injector remover. Install the fuel injector remover to the leak-off pipe attachment part on the fuel injector. Use a sliding hammer to force the fuel injector clamp off the fuel injector.

Caution:
Do not remove the fuel injector sleeve.

Special tool
Fuel injector remover: 5-8840-2826-0 (EN-46720)
Sliding hammer: 5-8840-0019-0 (J-23907)

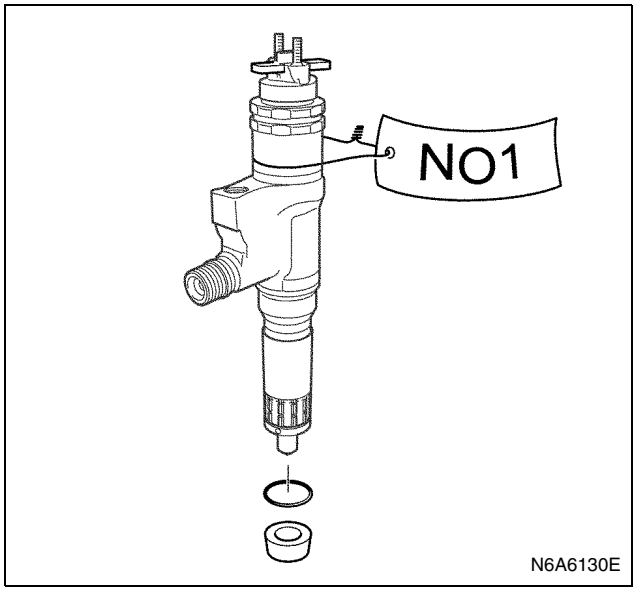
34. Mark each fuel injector with the number of the cylinder from which it was removed. Store the fuel injectors in a safe place. Position the fuel injector so that the nozzle is protected.

Caution:
- Do not tamper with the electromagnetic portion of the fuel injector. Reduced electromagnetic function will result in injector failure.



Legend
1. Sliding Hammer
2. Fuel Injector Remover
3. Fuel Injector Assembly

Caution:
Attach a cylinder number to the removed fuel injectors til re-install them.
Be sure not to make the nozzle touch something.

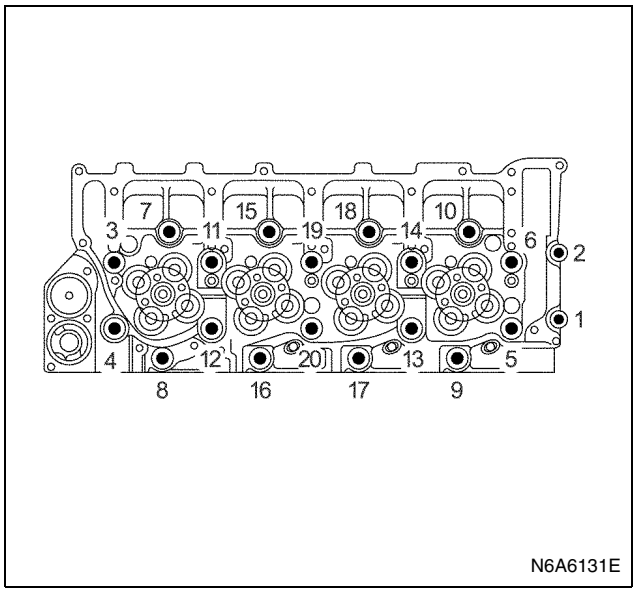


35. Remove the lower head cover.
36. Remove the cylinder head assembly.
    - Loosen the cylinder head bolts in the described order in the drawing.

Caution:
Be sure not to overlook (1) and (2) because they are attached with the flywheel housing with M10 bolts.

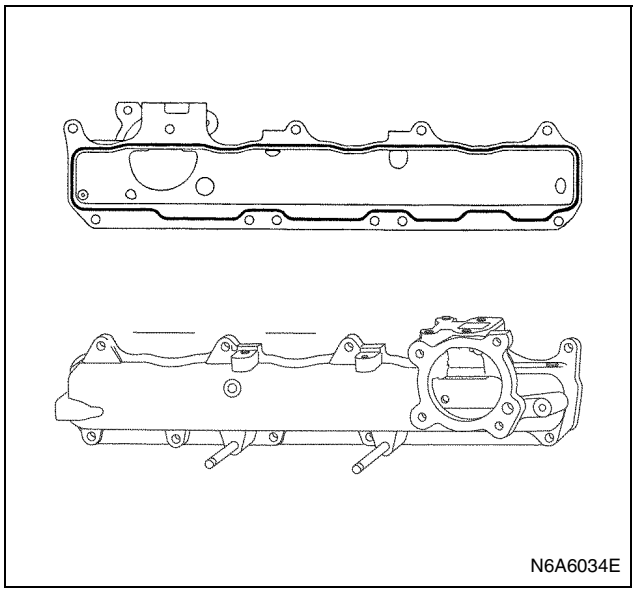
- Remove the cylinder head gasket.

Caution:
Replace the head gasket with a new one once it was removed.

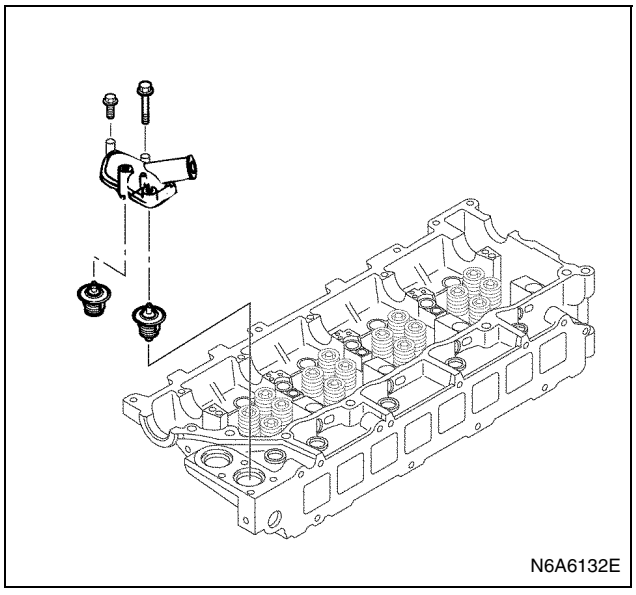


Disassembly

1. Remove the throttle assembly.
    - Remove the intake throttle valve connector.
2. Remove the inlet cover.
    - Remove liquid gasket adherent to the removed inlet cover.

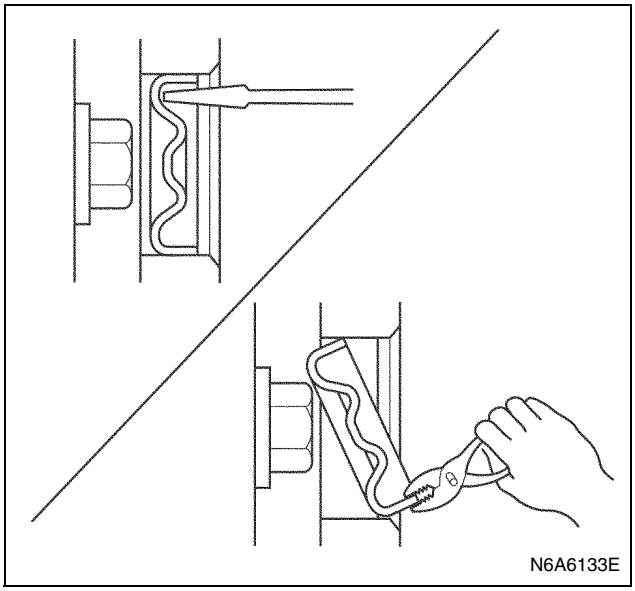


3. Remove the A/C compressor bracket.
4. Remove the exhaust manifold.
   Refer to “Exhaust”.
5. Remove the exhaust gasket.
6. Remove the water outlet pipe.
7. Remove the thermostat.

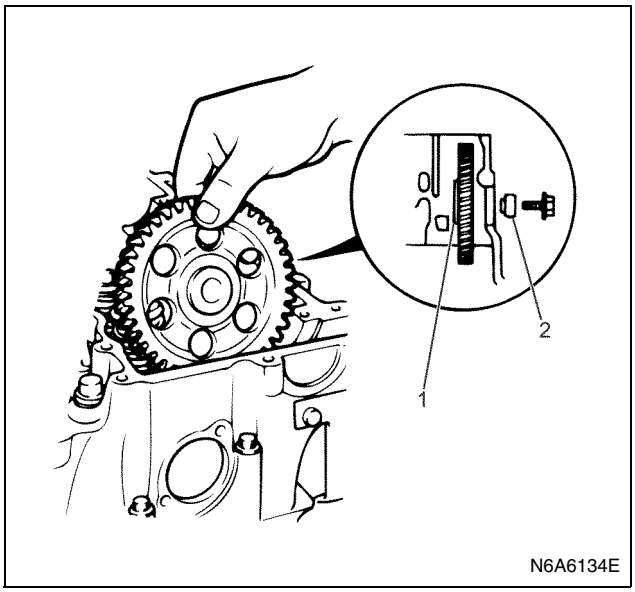


8. Remove the idle gear C cover.

- Put the edge of a driver on the outer circle of the sealing cup as shown in the drawing, tap it lightly, reverse it, then pull it out with pliers or other equipment.



9. Remove the idle gear C.



Legend

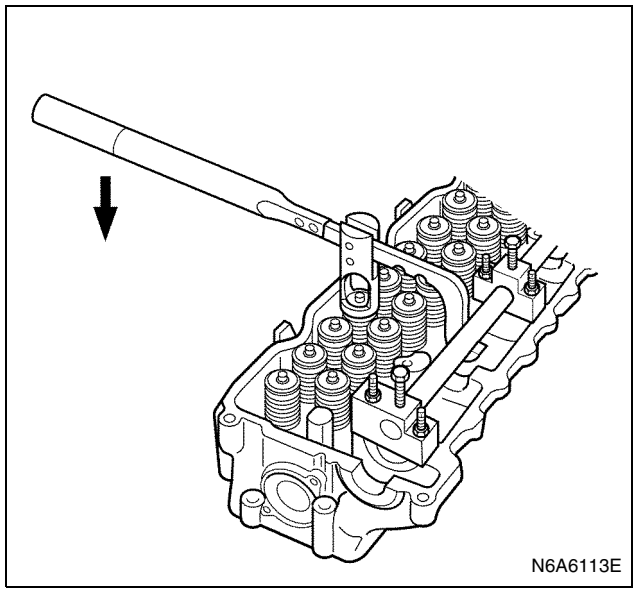
1. Idle Gear C
2. Shaft

10. Remove the split collar.
11. Remove the spring upper sheet.
12. Remove the valve spring.
    - Use a replacer to compress the valve spring, then remove the split collar.

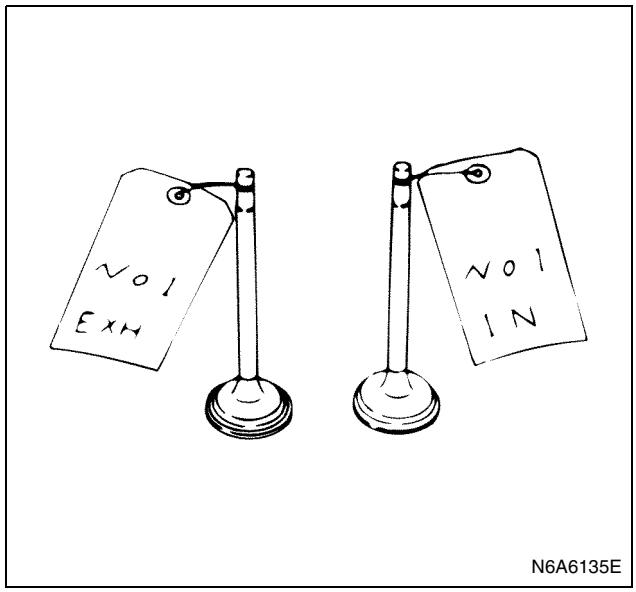
      Special tool
      Valve spring replacer: 5-8840-2621-0 (J-43263)
      Pivot: 5-8840-2808-0 (EN-46721)

- Remove the special tool, then remove the upper sheet and springs.

  Sort the removed valve springs by cylinder number.

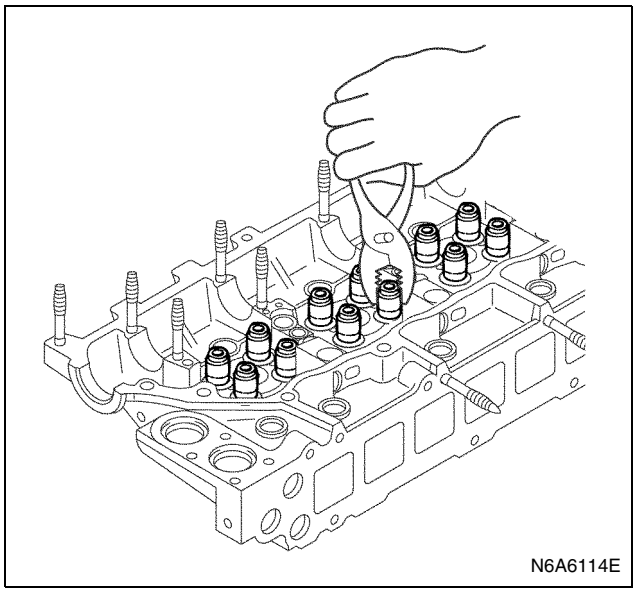


13. Remove the intake and exhaust valves.
    - Sort the removed valves according to cylinders by using tags and others.



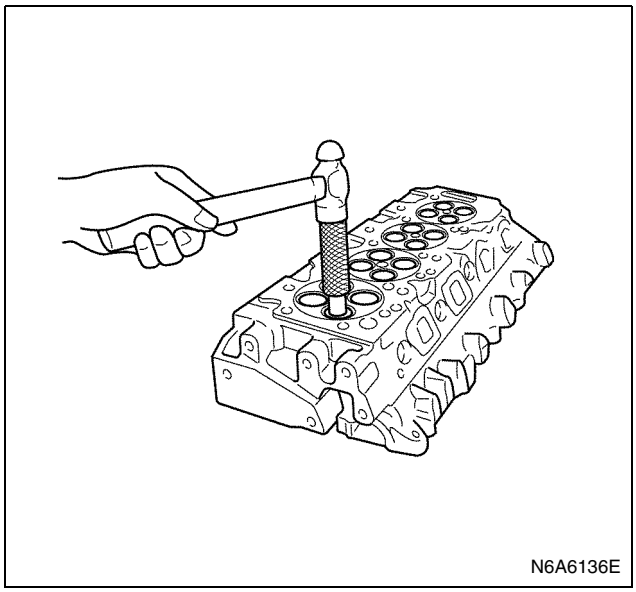
14. Remove the valve stem oil seals.

- Use pliers to remove the oil seals.



15. Remove the valve guides.
    - Use the valve guide replacer to press out the valve guides from the bottom side of the cylinder head.

      Special tool
      Valve guide replacer: 5-8840-2628-0 (J-43272)

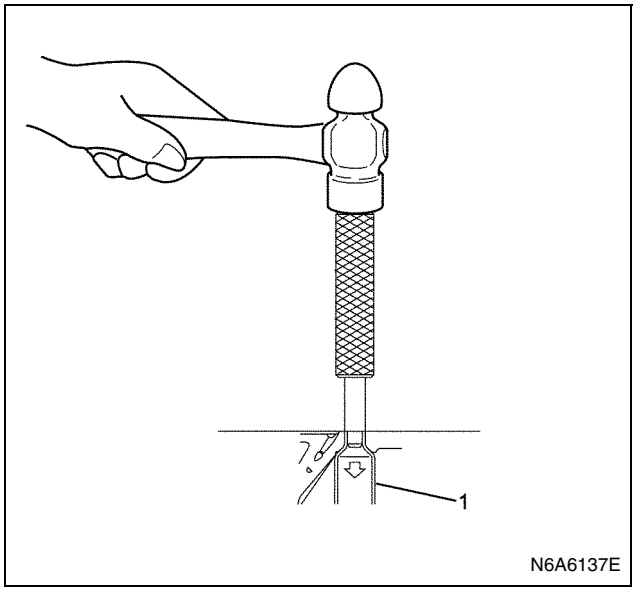


16. Put the nozzle sleeve remover on the nozzle sleeve from the bottom side of the cylinder head, then pull out the nozzle sleeve.

    Special tool
    Nozzle sleeve remover: 5-8840-2623-0 (J-43265)

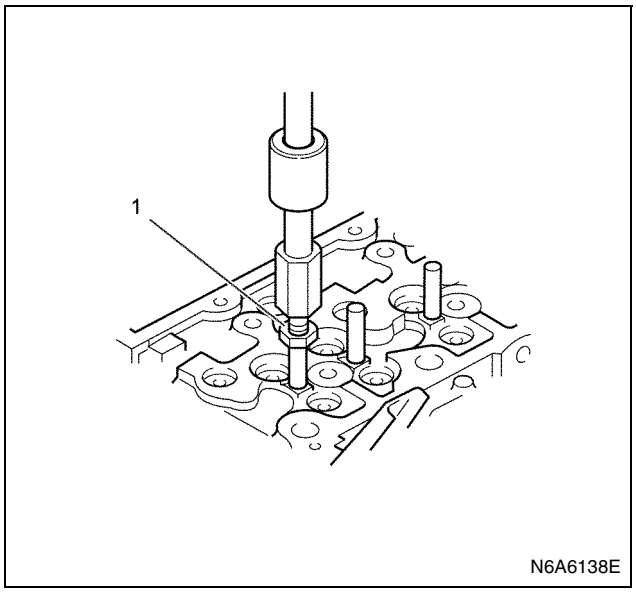
Caution:

- Be sure not to scratch the bottom side of the cylinder head.
- Do not reuse the removed nozzle sleeve.
- Carefully remove sawdust in the screw groove.



Legend
1. Nozzle Sleeve

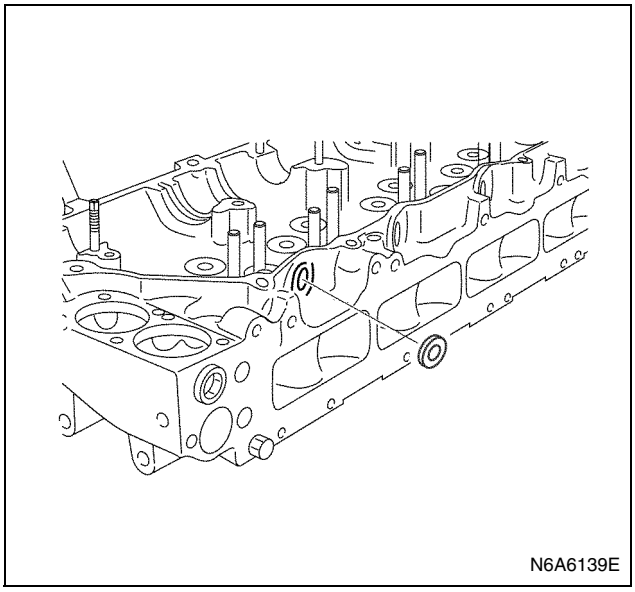
17. Remove the bridge guide.
    - Electrically weld the nut on the head of the bridge guide, attach the sliding hammer and pull it out.



Legend
1. Nut

18. Remove the oil seal.

- Press the tool against the oil seal. Strike the tool to remove the seal from the inside of the cylinder head.



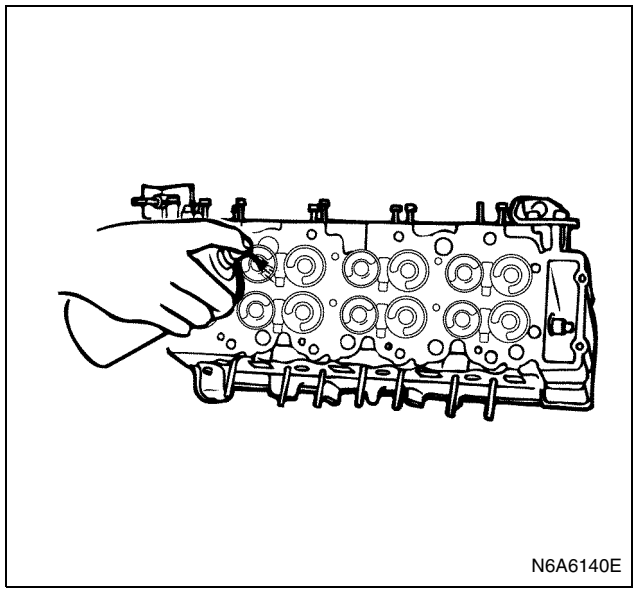
Inspection

1. Inspect the cylinder head assembly.
   - Remove varnish, soot and others adhered on the metal surface completely. Use metal brush and others so that the seal surface of the surface where the gasket is installed is not damage.
   - Check the following causes in the case of leak of the seal surface of the cylinder head, corrosion, air leak and defective gasket.
     - Defective installation.
     - Defective tightening of the cylinder head.
     - Winding seal surface of the cylinder block.

a. Damage on the screw surface or extracted cylinder head bolt due to extra tightening torque

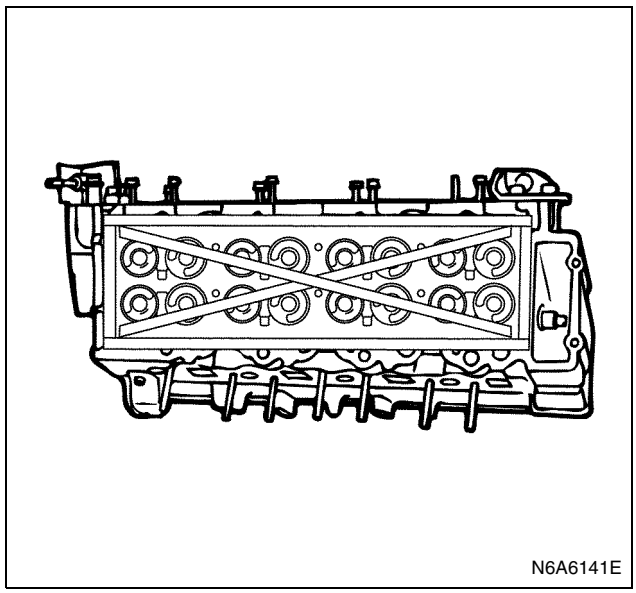
Caution:
Replace suspicious bolt.

b. Inside the combustion chamber, glow plug hole.
   - Check whether there is a crack between the valve sheets and in the cylinder head of the exhaust port part, and replace the cylinder head if there is serious damage or crack. Check the collar if necessary.



c. Flatness of the under surface of the cylinder head
   - Use a straight edge ruler and thickness gauge to measure the four sides and diagonal lines as shown in the drawing, and replace if they exceed the limit.

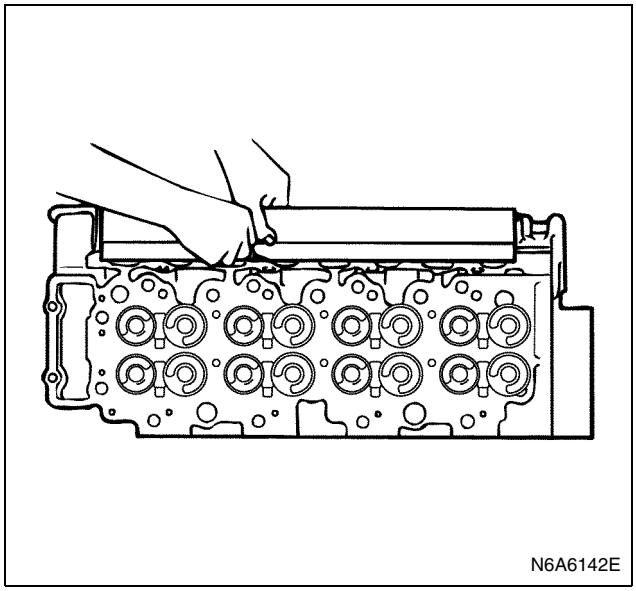
Distortion of the under surface of the cylinder head	mm (in)
Standard	0.05 (0.002) or less
Limit	0.20 (0.0079)



d. Flatness of the surface where the exhaust manifold and inlet cover are installed

- Use a straight edge ruler and thickness gauge to measure the four sides and diagonal lines as shown in the drawing, and replace if they exceed the limit.

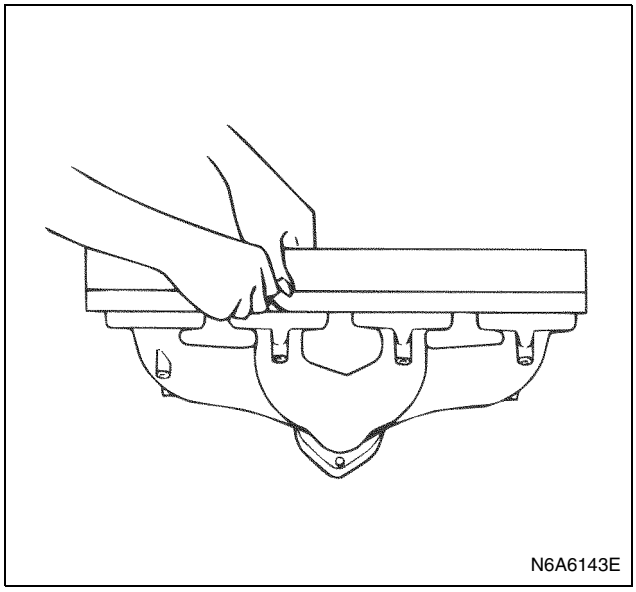
Distortion of the surface where the manifold and cover are installed	mm (in)
Standard	0.05 (0.002) or less
Limit	0.2 (0.0079)



N6A6142E

e. Flatness of the exhaust manifold
- Use a straight edge ruler and thickness gauge to measure the flatness. If it exceeds the limit, replace the exhaust manifold.

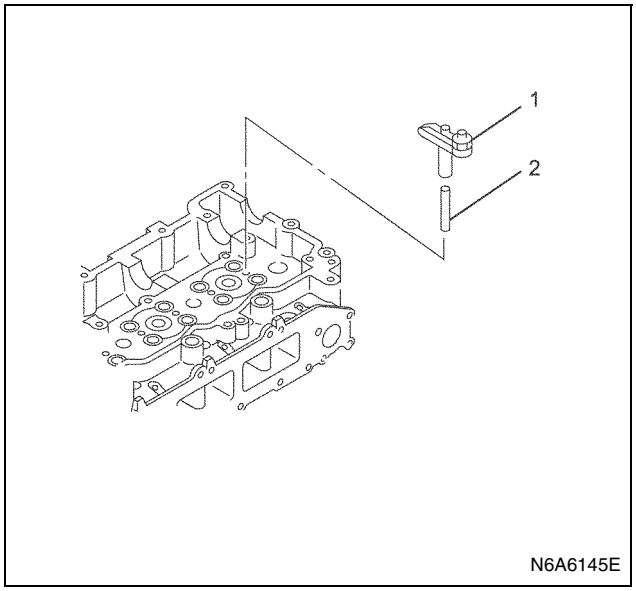
Distortion of the exhaust manifold	mm (in)
Standard	0.3 (0.0118)or less
Limit	0.5 (0.0197)



N6A6143E

2. Bridge
- Make sure the bridge moves smoothly along the bridge guide.
- Measure the gap between the bridge and bridge guide.

Gap between the bridge guide and bridge guide	mm (in)
Assembly standard	0.020 (0.00079) – 0.056 (0.00220)
Usage limit	0.1 (0.0039)



N6A6145E

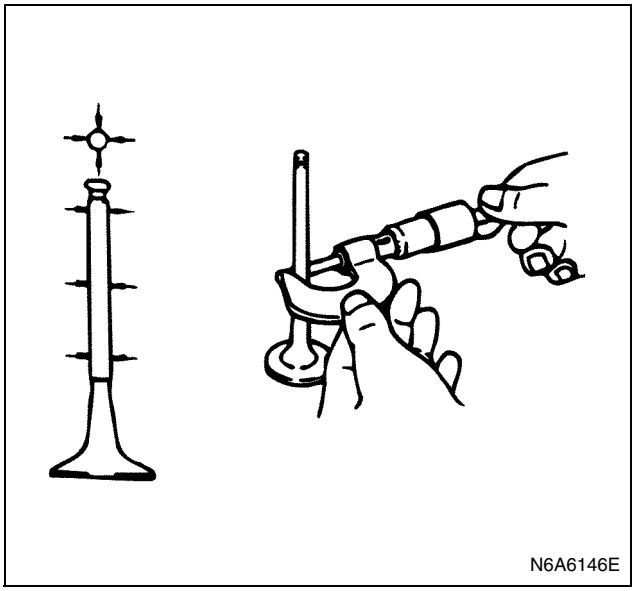
Legend
1. Bridge
2. Bridge Guide

3. Inspect the valve guide.

Caution:
If there is a scratch or abnormal abrasion in the valve stem and the inner diameter part of the valve guide, replace it with new one along with valve guide.

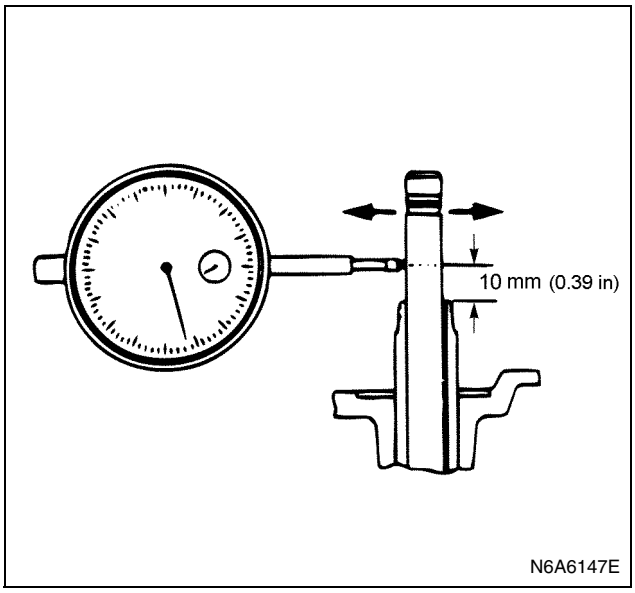
a. Measure the valve guide clearance.
- Measure the diameter of the valve stem with a micro meter.
  If the diameter of the valve stem is smaller than the limit, replace the valve and valve stem altogether.

The external diameter of the valve stem		mm (in)
	Standard	Limit
Intake valve	7.946 (0.3128) – 7.961 (0.3134)	7.88 (0.3102)
Exhaust valve	7.921 (0.3118) – 7.936 (0.3124)	7.80 (0.3071)



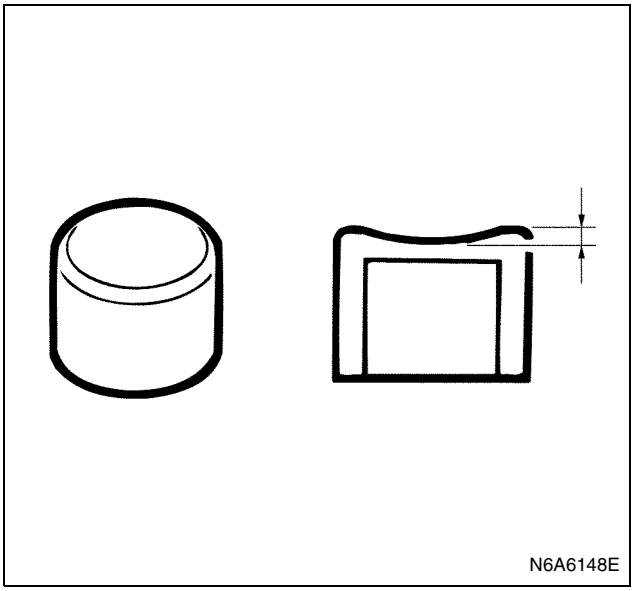
- Measure the gap between the valve guide and valve stem within 10 mm (0.39 in) from the valve guide, using a dial gauge.
- If the measured value exceeds the limit, replace the valve guide and valve altogether.

Gap between the valve guide and valve stem		mm (in)
	Standard	Limit
Intake valve	0.039 (0.00153) – 0.071 (0.00280)	0.20 (0.00787)
Exhaust valve	0.064 (0.00252) – 0.096 (0.00378)	0.25 (0.00984)



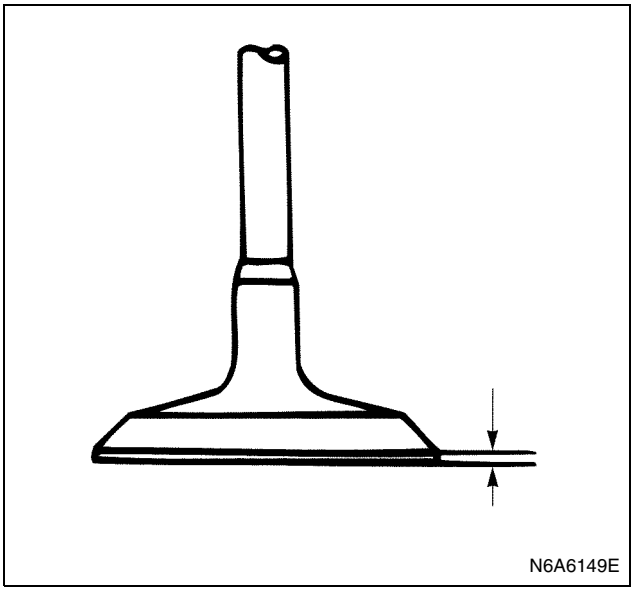
4. Inspect abrasion of the bridge gap.
   - Measure the contact surface of bridge cap and the rocker arm, using a dial gauge.
   - If the abrasion exceeds the limit, or there is an abnormal abrasion (zonal abrasion), replace the bridge cap.

Abrasion of the bridge cap	mm (in)
Limit	0.1 (0.00394)



5. Inspect the valve.
   Thickness of the valve
   - Measure the thickness of the valve.
   - If the measured value exceeds the limit, replace the valve and valve guide altogether.

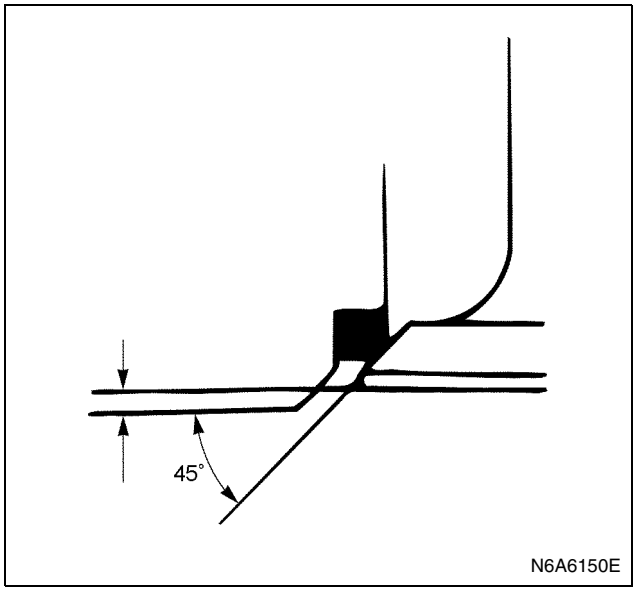
Thickness of the valve		mm (in)
	Standard	Limit
Intake valve	1.71 (0.0673)	1.3 (0.0512)
Exhaust valve	1.75 (0.0689)	1.3 (0.0512)



Valve sheet

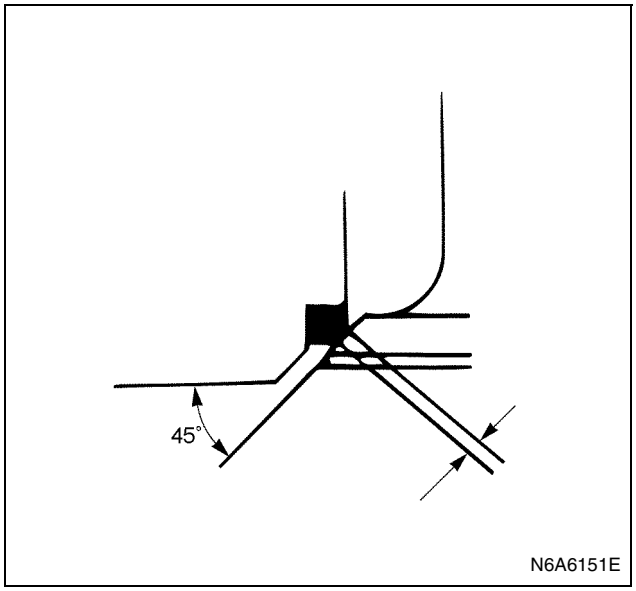
- Remove carbon, water stain and others on the under surface of the cylinder head.
  Install the valve in the cylinder head.
  Measure the depth of the valve from the under surface of the cylinder head, using a depth gauge or straight edge ruler.
  If it exceeds the limit, replace the valve insert or cylinder head assembly.

Depth of the valve	mm (in)
Standard	0.7 (0.0276) – 1.2 (0.0472)
Limit	2.5 (0.0984)



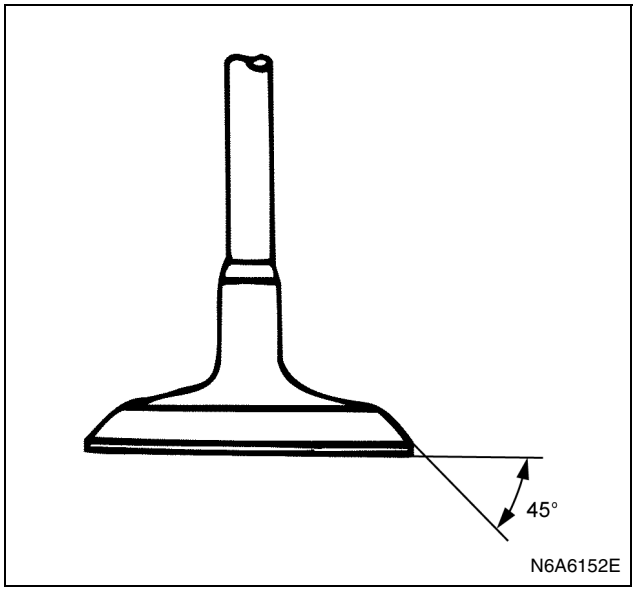
- Measure the contact width of the valve seat. If the seat contact surface has a scratch or is rough, or if the abrasion of the contact surface exceeds the limit, modify or replace it.

Contact width of the valve seat		mm (in)
	Standard	Limit
Intake valve	2.5 (0.0984)	3.0 (0.1181)
Exhaust valve	2.0 (0.0787)	2.5 (0.0984)



Contact surface of the valve seat

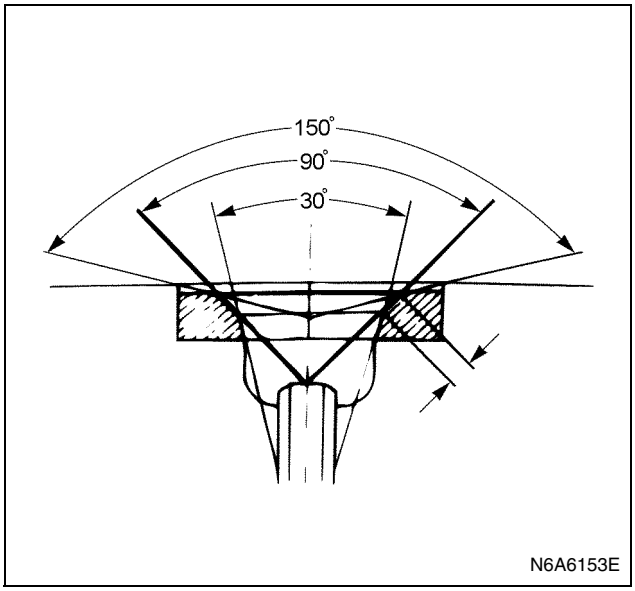
- If the contact surface of the valve seat is defective, modify it or replace the valve, valve guide and valve seat altogether.
  Angle of the contact surface: 45° (degrees)



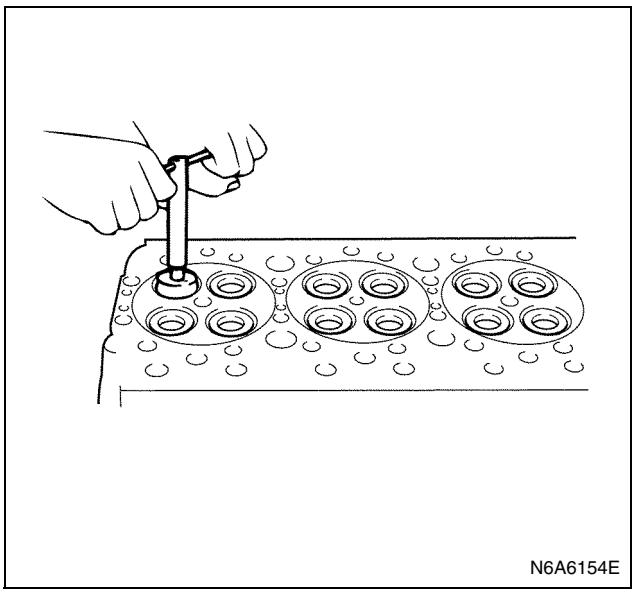
Repair of the seat surface

- Remove carbon from the surface of the valve insert seat.

- Use a seat cutter to minimize the scratch and other roughness (15/45/75 degree-blade), thereby returning the contact width to the standard value.

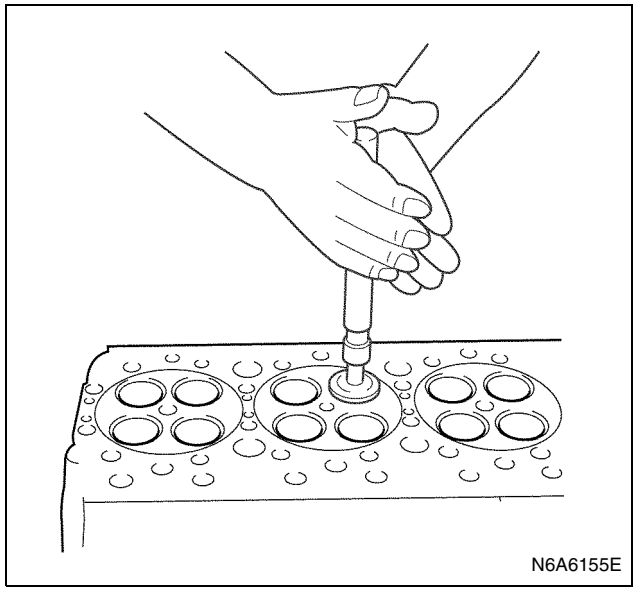


Caution:
Remove only scratches and roughness, and do not cut the surface too much.
Use the free adjustment valve cutter pilot.
Do not let the valve cutter pilot waver inside the valve guide.



- Attach abrasives in the valve insert seat.
- Insert the valve into the valve guide.
- Attach abrasives on the valve seat surface, rotate the valve and hit it lightly to grind them, and confirm that it has even contact all round.

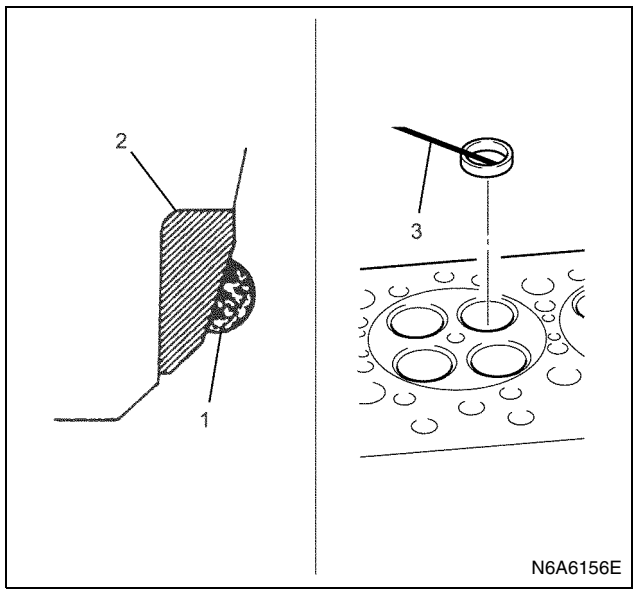
Caution:
Remove abrasives completely after grinding.



Replace the valve seat insert

Remove the valve seat insert

- Arc-weld the entire inner diameter of the valve seat insert.
- Cool the valve seat insert for two to three minutes. Contraction fur to cooling makes it easier to remove the valve seat insert.
- Remove the valve seat insert, using a screw driver. Be sure not to damage the cylinder head.

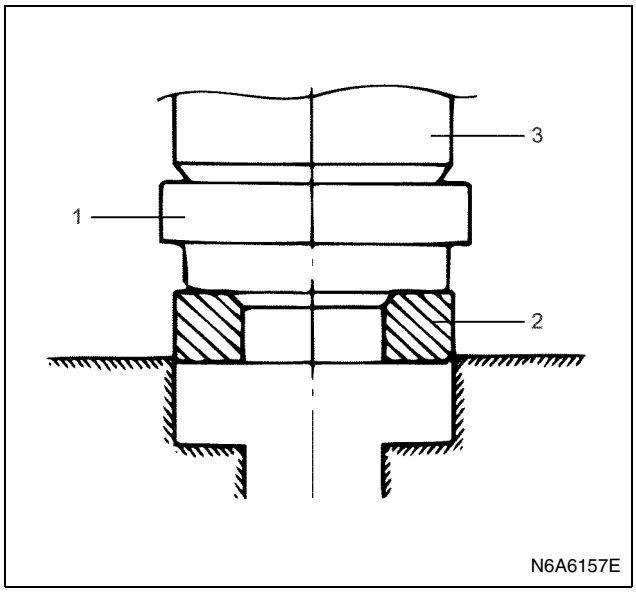


Legend
1. Arc-weld
2. Valve Seat Insert
3. Screw Driver

Install the valve seat insert

- Carefully place an attachment (the outer diameter is smaller than the valve seat insert) on the valve seat insert.
- Use the press to apply pressure gradually on the washer, thereby pushing the valve seat insert.

Caution:
Do not apply too much pressure with the press.
Attach compound on the valve seat surface, rotate the valve and hit it lightly to grind them, and confirm that it has even contact all round.



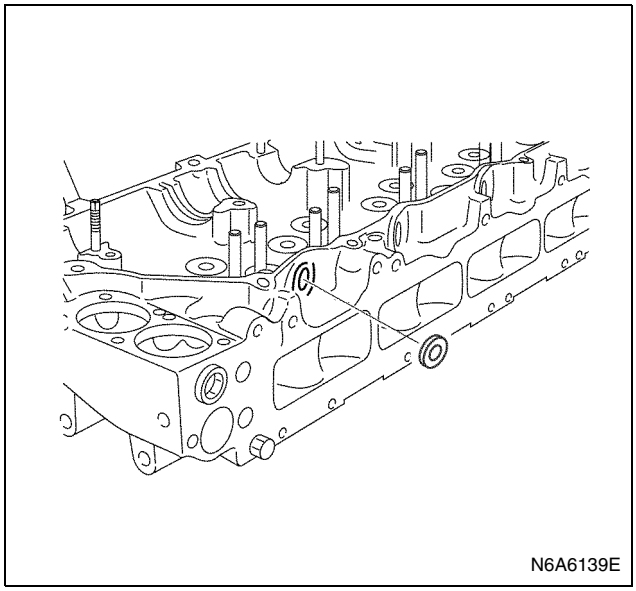
Legend
1. Attachment
2. Valve Seat Insert
3. Press

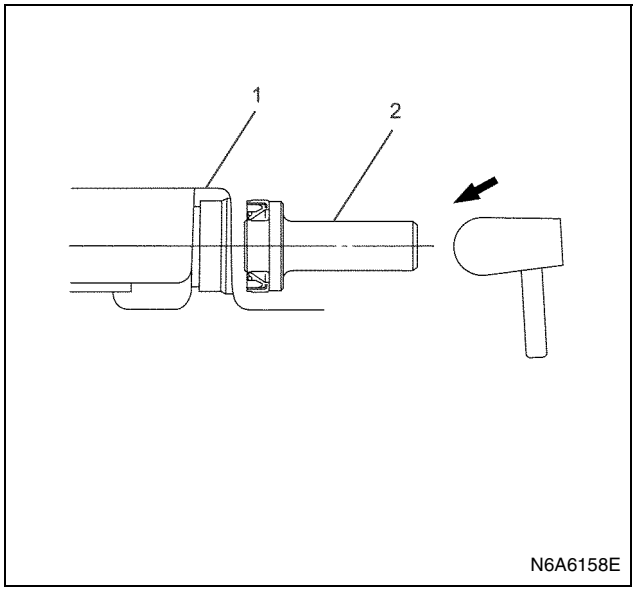
Reassembly

1. Install the oil seal.
   - Install on the surface of injection pipe insert.
   - Hammer it in so that the seal does not incline.

Caution:
Be sure not to damage the rip.

Special tool
Oil seal installer: 5-8840-2627-0 (J-43269)

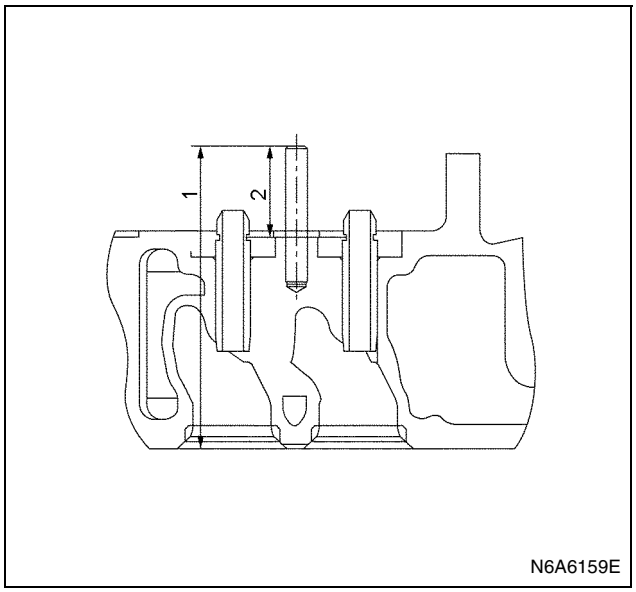




Legend
1. Cylinder Head
2. Oil Seal Installer

2. Install the bridge guide.
   - Apply engine oil on the outer diameter of the guide, then use the installer to hammer it into the depth of the finishing part of the hole of the cylinder head.
     (Note: the height of the bridge guide is about 37.5 mm (1.48 in) from the upper surface of the head)

     Special tool
     Bridge guide installer: 5-8840-2626-0 (J-43268)

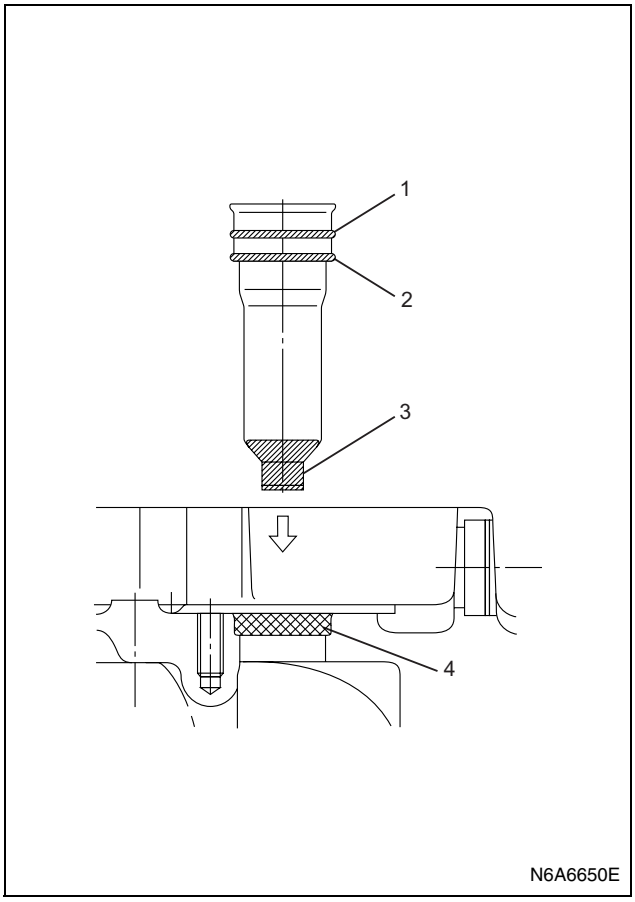


Legend
1. 122.5 ± 0.5 mm (4.82 ± 0.02 in)
2. 37.5 mm (1.48 in)

3. Install the nozzle sleeve.
   - Install the O-ring on the nozzle sleeve, apply engine oil.

- Apply seal material on the taper section.

Loctite No.TL290



Legend

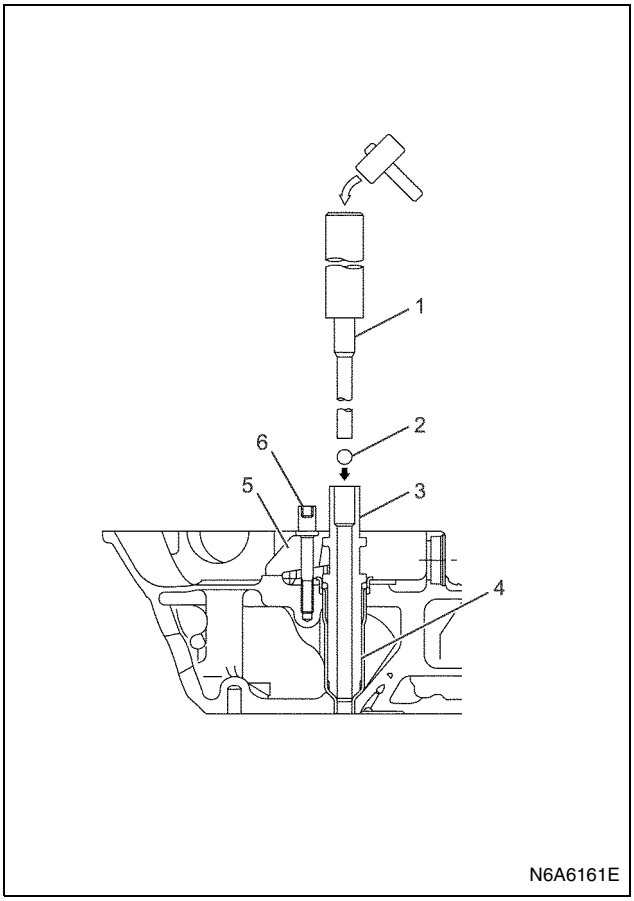
1. O-ring (White Paint)
2. O-ring
3. Apply the Loctite
4. Engine Oil

- Install the nozzle sleeve on the cylinder head, insert the guide sleeve.
- Use the guide sleeve to push in so that the nozzle sleeve fully contacts with the under surface of the cylinder head.
- Insert the sleeve and fix it with the tighten and bolt.
- Insert the ball (bearing steel ball 9.525 mm (0.375 in)) into the guide sleeve, attach the punch bar and hammer out the ball.

Caution:

- Leave the cylinder head floating so that the ball comes off from the under surface.

Special tool
Nozzle sleeve installer: 5-8840-2624-0 (J-43266)



Legend

1. Punch Bar
2. Ball
3. Guide Sleeve
4. Nozzle Sleeve
5. Bracket
6. Bolt

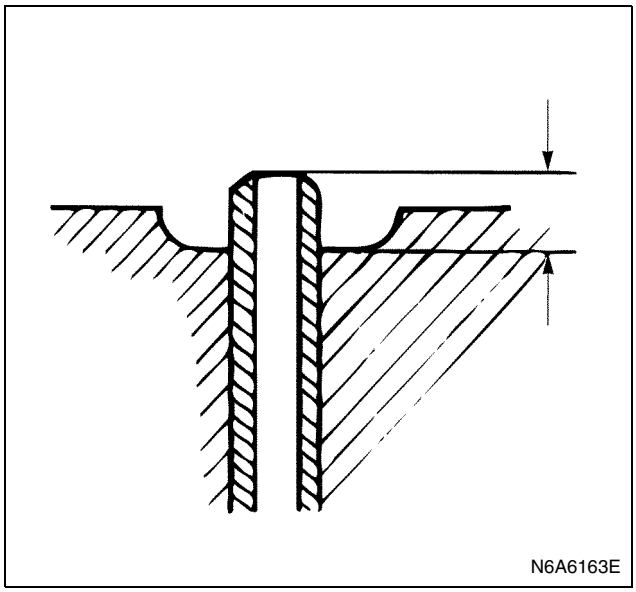
4. Install the valve guide.

- Hammer in the valve guide from the upper surface of the cylinder head, using the valve guide replacer.

  Special tool
  Valve guide replacer: 5-8840-2628-0 (J-43272)

  Height from the upper surface of the cylinder head to the edge surface of the valve guide: 18.75 – 19.25 mm (0.7381 – 0.7578 in)

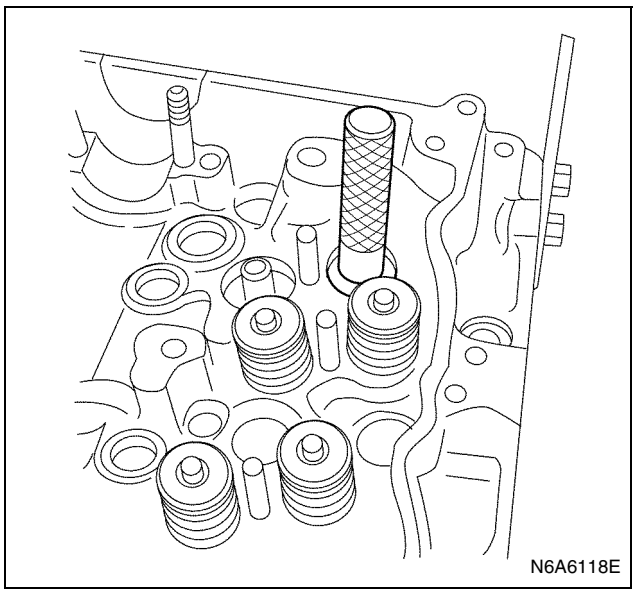
Caution:
When replacing the valve guide, it must be replaced together with the valve.



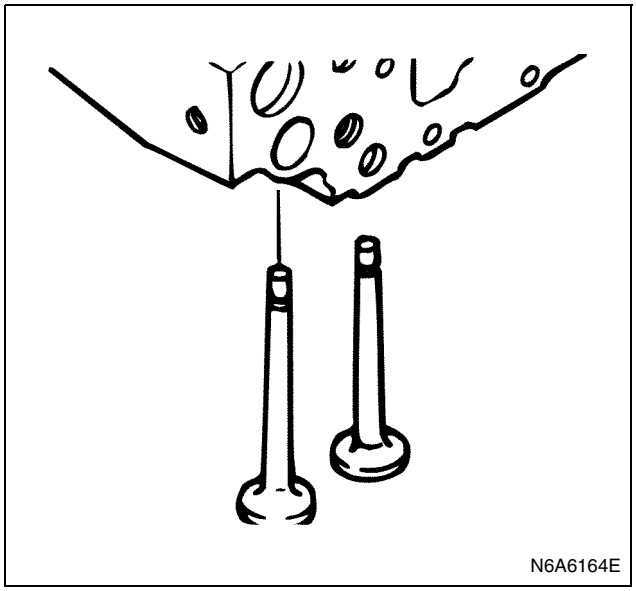
5. Install the valve stem oil seal.
   - Apply engine oil on the outer diameter of the valve guide, use the valve stem seal installer to install the oil seal.

Caution:
After installation of the valve stem seal, confirm that the oil seal is not inclining and the garter spring is in place.

  Special tool
  Valve stem seal installer: 5-8840-2833-0 (EN-47685)

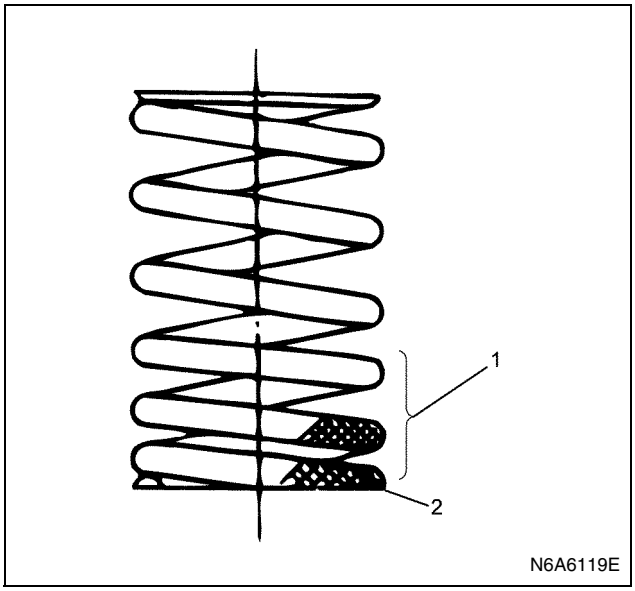


6. Install the intake and exhaust valves.
   - Apply engine oil on the valve stem part and install the valve.



7. Install the valve spring.
   - Install the valve spring with the paint mark or the narrower side of the spring pitch on the under side (the cylinder head side).

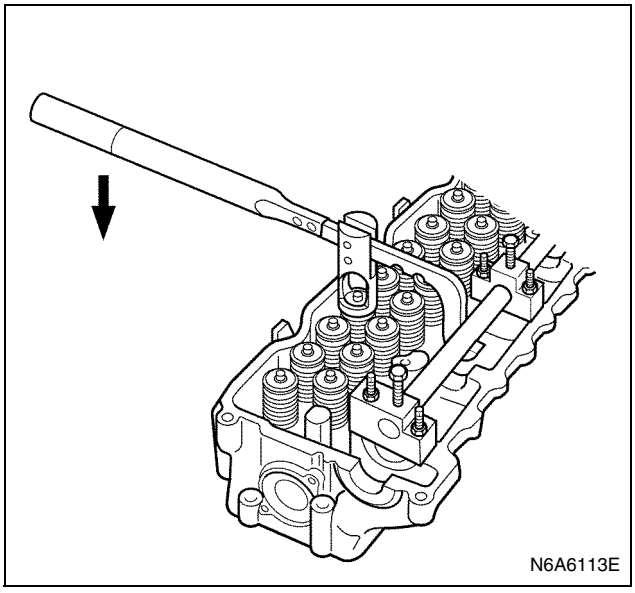
	Paint mark
Intake side	Blue
Exhaust side	Red



Legend
1. Spring Pitch
2. Paint Mark

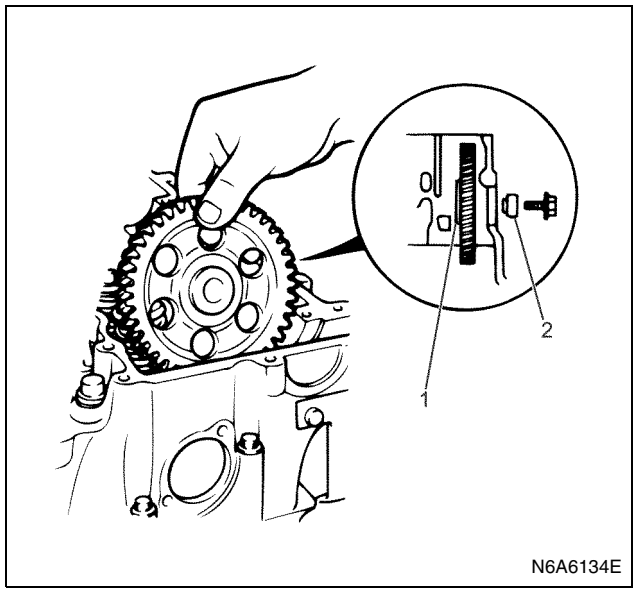
8. Install the spring upper sheet.
9. Install the split collar.
   - Use the replacer to compress the valve spring and install the split collar.

     Special tool
     Valve spring replacer: 5-8840-2621-0 (J-43263)
     Pivot: 5-8840-2808-0 (EN-46721)



10. Install the idle gear C.
    - Apply engine oil on the idle gear C shaft and the inner diameter of the idle gear, install the idle gear C so that the side with gear groove is on the side of the rear surface of the engine.
    - Tighten the idle gear C with the designated torque.
    - Do not use impact wrench and like.

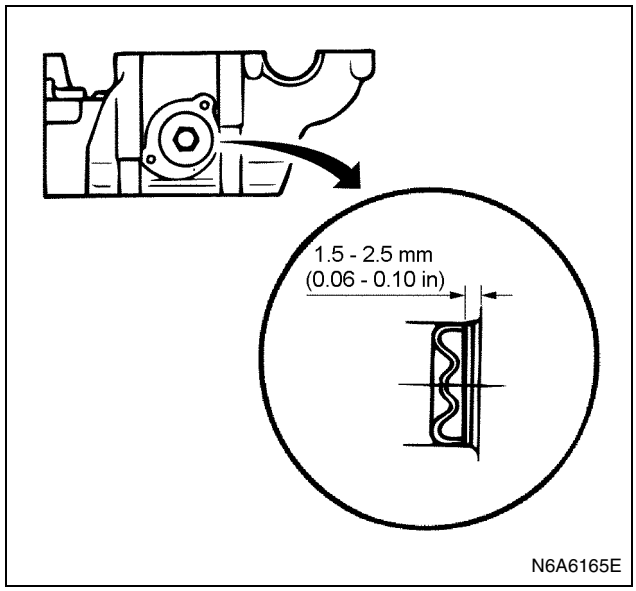
Tighten:
Bolt to 95 N·m (9.7 kg·m/70 lb·ft)



Legend
1. Idle Gear C
2. Shaft

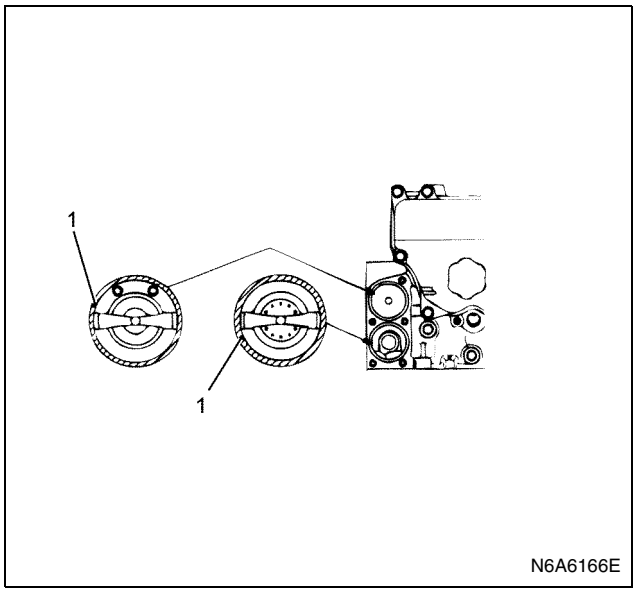
11. Install the idle gear C cover.
    - Apply liquid gasket (Loctite 262) on the outer diameter of the idle gear C cover, use the sealing cup setting tool to hammer it in so that the measurements follow the drawing.

      Special tool
      Sealing cup installer: 5-8840-2222-0 (EN-47690)



12. Install the thermostat.

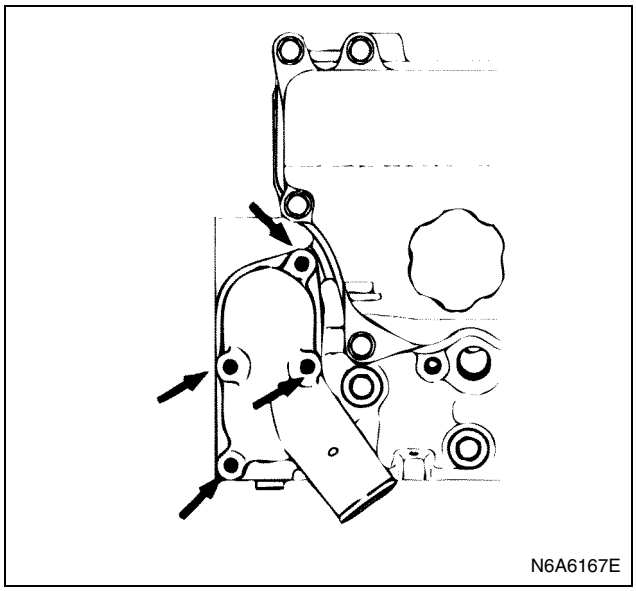
- Install the thermostat on the position shown in the drawing.



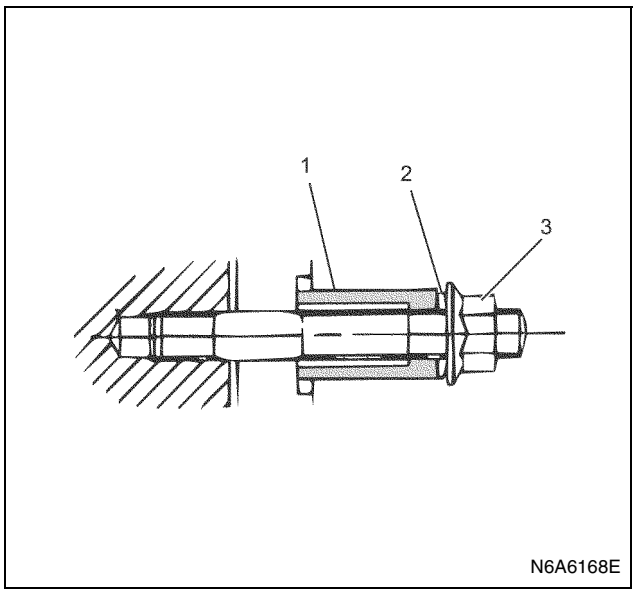
Legend
1. Thermostat

13. Install the water outlet pipe.
    - Tighten the water outlet pipe with the designated torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/17 lb·ft)



14. Install the exhaust gasket.
15. Install the exhaust manifold.
    - Install the distance tube conical spring and the nut on the stud of the cylinder head in this order.



Legend
1. Distance Tube
2. Conical Spring
3. Nut

    - Tighten the exhaust manifold in the order described in the drawing.

Tighten:
Bolt (1),(2),(3),(4),(5),(6) and Nut (7), (8) to 34 N·m (3.5 kg·m/25 lb·ft)

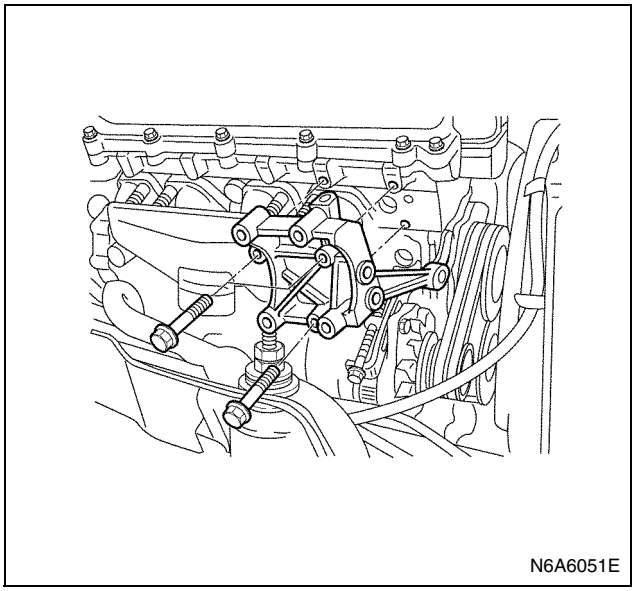
Caution:
Do not tighten it too much so that it hinders extraction and contraction of the manifold due to heat.

    - Install the heat protector.

Tighten:
Bolts to 10 N·m (1.0 kg·m/87 lb·ft)

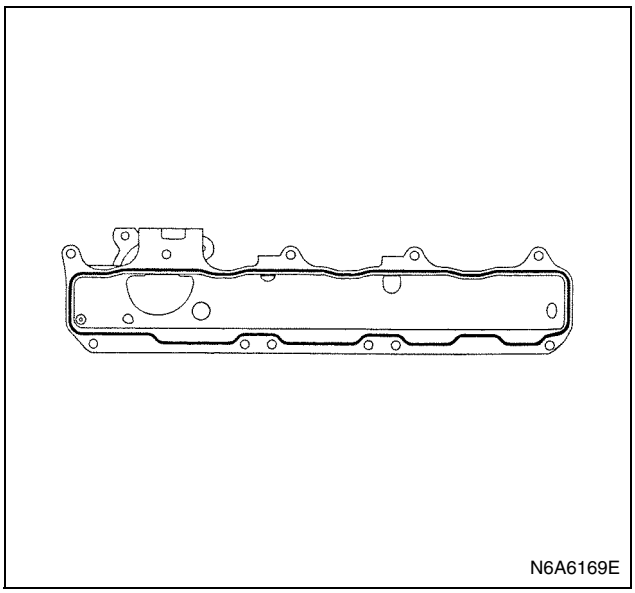
16. A/C compressor bracket.
    Install the bracket, tighten the bolt with the designated torque.

Tighten:
Bolts to 48 N·m (4.9 kg·m/35 lb·ft)



N6A6051E

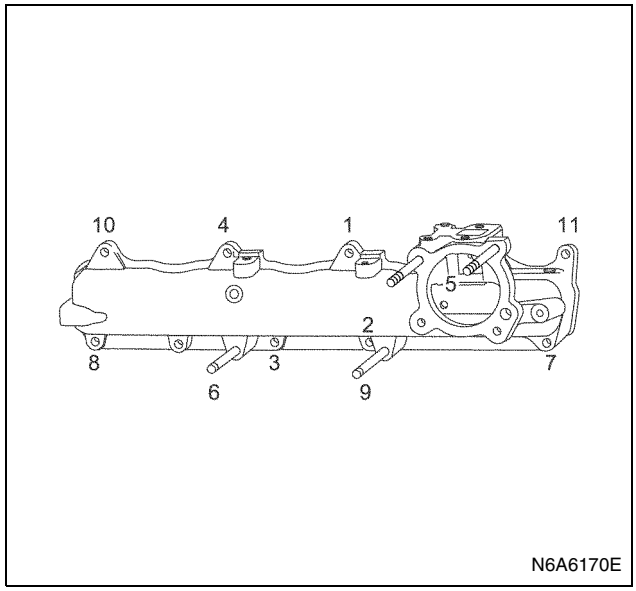
17. Install the inlet cover.
    - Apply liquid gasket (ThreeBond1207C or equivalent) in accordance with the groove of the inlet cover, with the bead diameter of ϕ2.5 – 5.5 mm (0.0984 – 0.2165 in).



N6A6169E

- Tighten in the order described in the drawing.
- Tighten the stud bolts (6) and (9) jointly with the fuel rail.

Tighten:
Stud bolts to 22 N·m (2.2 kg·m/16 lb·ft)

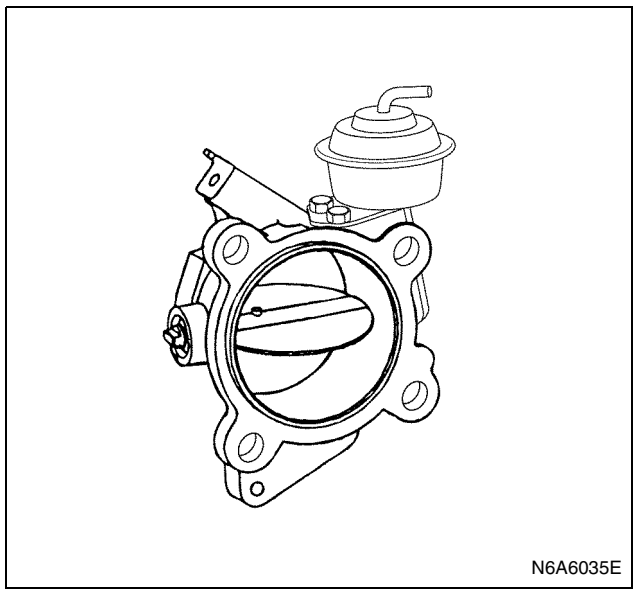


N6A6170E

18. Install the throttle assembly.
    - Coat the liquid gasket and mount within 7 minutes.

Tighten:
Bolt and nut to 24 N·m (2.4 kg·m/17 lb·ft)

- Install the intake throttle valve connector.

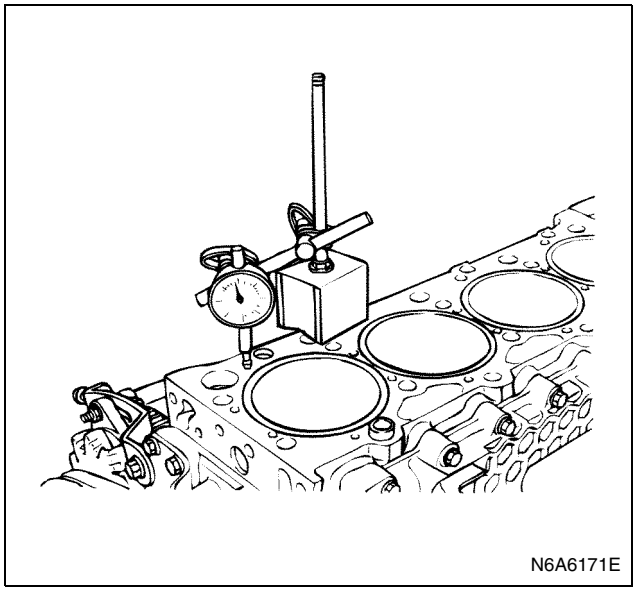


N6A6035E

Installation

1. Install the cylinder head gasket.
   - Select the cylinder head gasket.
   - Clean the head of the piston and the upper surface of the cylinder block.
   - Use a dial gauge to measure the extrusion of the piston. Measure at two points of each cylinder.

- The following drawing shows the measurement points and the standard point of the cylinder block.

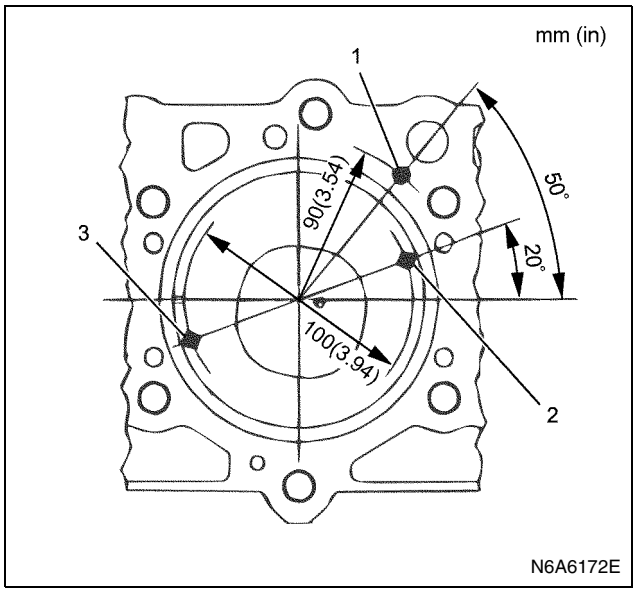


N6A6171E

Measurement points:	Head of the piston	(2) and (3)
Standard point:	Upper surface of the cylinder block	(1)

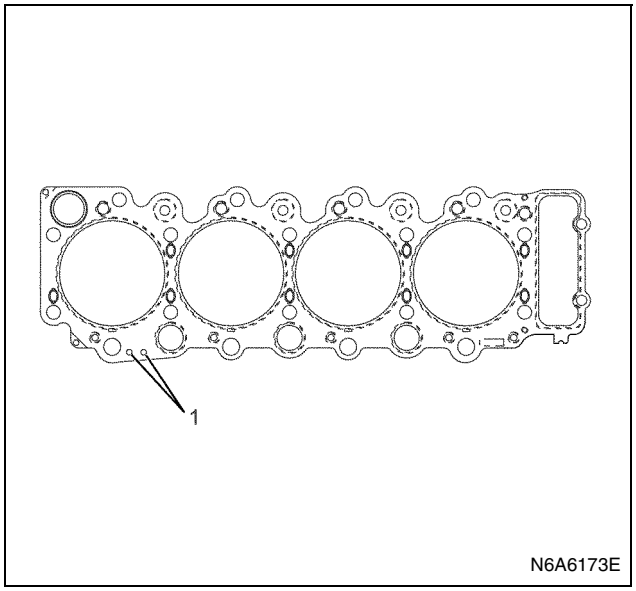
Caution:
Note that there are three options for the head gasket according to the amount of extrusion of piston shown in the following table.

- Calculate the average piston extrusion amount of each cylinder.
- Calculate the maximum amount of the average amount of each cylinder.
- Select a gasket of an appropriate grade based on Timax.



N6A6172E

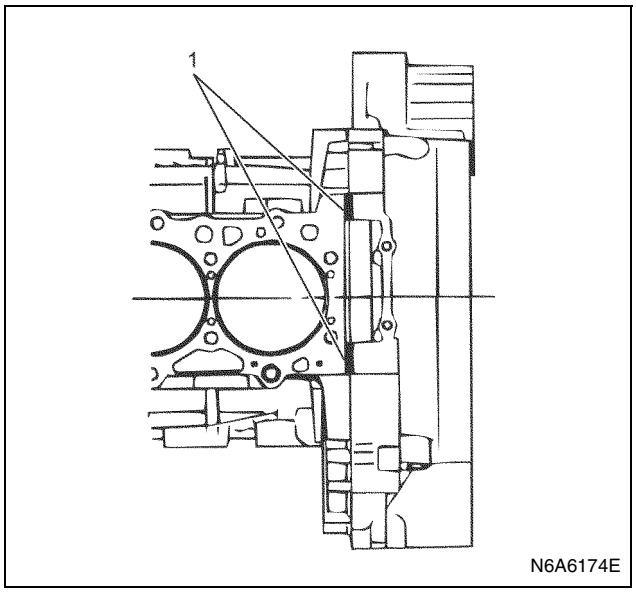
Gasket Grade	Recognized by	Piston extrusion amount mm (in)
A	(no hole)	0.439 (0.01728) – 0.519 (0.02043)
B	(1 hole)	0.519 (0.02043) – 0.589 (0.02319)
C	(2 holes)	0.589 (0.02319) – 0.669 (0.02633)



N6A6173E

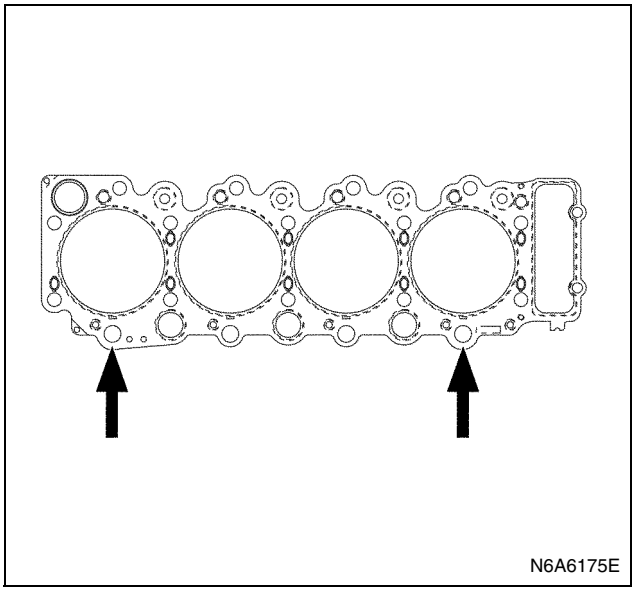
Legend
1. Grade Recognition Hole

- Apply liquid gasket
- Apply liquid gasket (ThreeBond 1207C or equivalent) on the joint (1) of the cylinder block and the flywheel housing with the bead diameter of 3 mm (0.118 in).
- Install the cylinder head within seven minutes after applying liquid gasket.



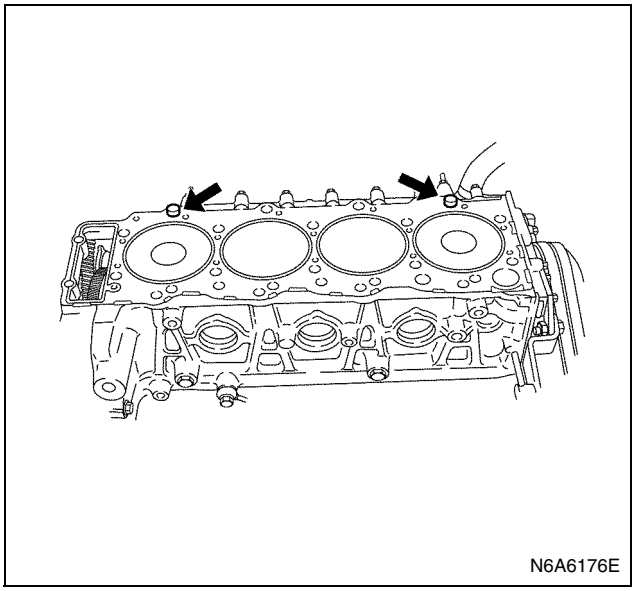
N6A6174E

- Install the cylinder head gasket.
- Install the cylinder head gasket with the parts number upside, along with the cylinder head rear gear case and dowel.



2. Install the cylinder head assembly.
   - Install the cylinder head, adjusting the dowel of the cylinder block.

Caution:
Be sure not to damage the head gasket when installing it.

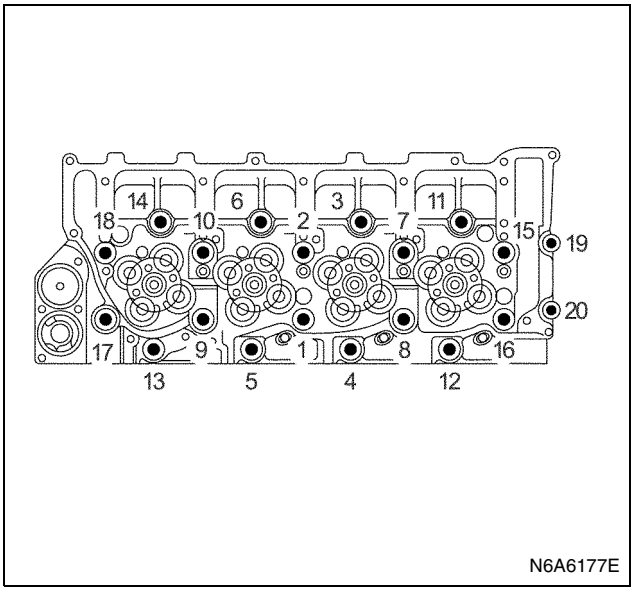


- Apply molybdenum disulfide on the thread and setting face of the head bolt of M14, and apply engine oil on the thread and setting face of the head bolt of M10.
- Use a torque wrench and angle gauge to tighten the head bolts in the order described in the drawing.

Tighten:
M14 bolts (1 – 18) to
1st step: 98 N·m (10.0 kg·m/72 lb·ft)
2nd step: 147 N·m (15.0 kg·m/108 lb·ft)
3rd step: 30° – 60° (degrees)
M10 bolts (19, 20) to
4th step: 38 N·m (3.9 kg·m/28 lb·ft)

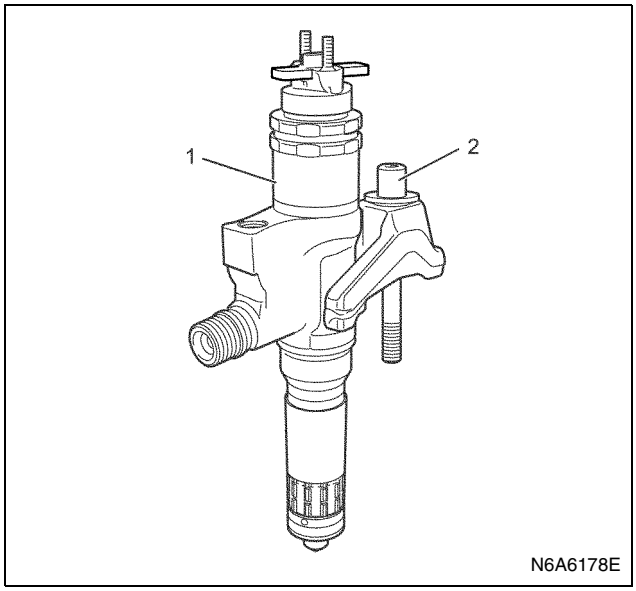
- Tighten bolts from 1-18 (M14) and confirm that they are tightened to a torque of 167 N·m (17.0 kg·m/123 lb·ft) or more.

  Special tool
  Angle gauge: 5-8840-0266-0 (J-45059)



3. Install the fuel injector on the cylinder head.
4. Apply molybdenum disulfide on the thread and setting face of the fuel injector tighten bolt and tighten it tentatively.

Important:
Reinstall each fuel injector to the original cylinder from which it was removed during the disassembly procedure.



Legend
1. Fuel Injector Assembly
2. Fuel Injector Tighten Bolt

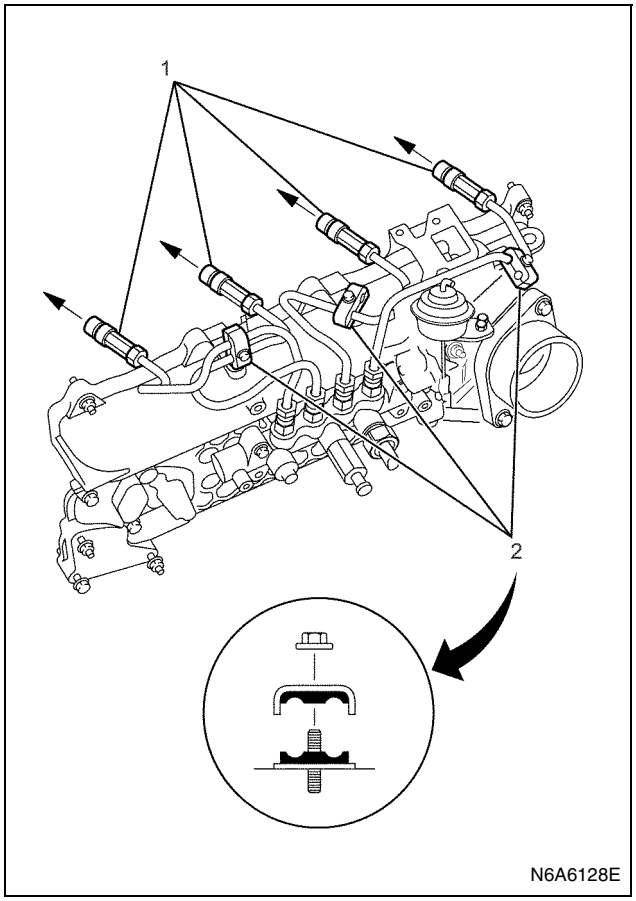
5. Install the fuel rail.

Tighten:
Fuel rail to 19 N·m (1.9 kg·m/14 lb·ft)

- Install the fuel rail pressure sensor.

6. Install the injection pipe.
   - Apply a thin coat of engine oil on the outer diameter of the sleeve nut on the side of the fuel injector and install the injection pipe.
   - Use a spanner to tighten the sleeve nut until it completely contacts both on the fuel injector and fuel rail.
   - Tighten the injection pipe clip with the designated torque.

Tighten:
Clip to 6 N·m (0.6 kg·m/52 lb·in)



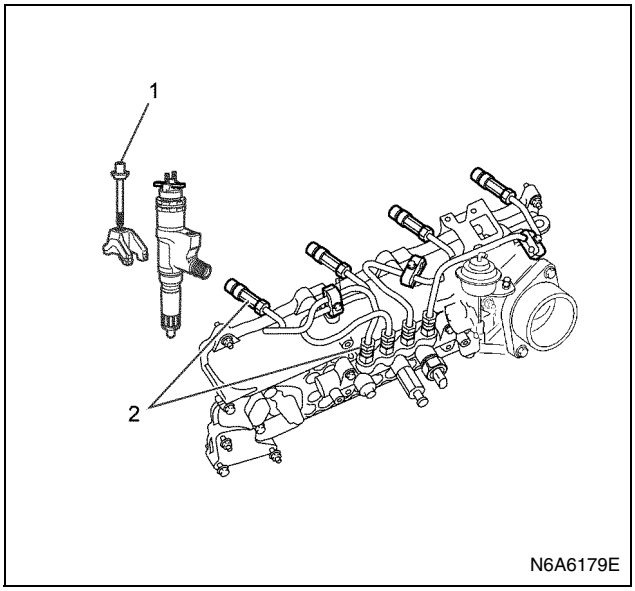
Legend
1. Fuel Injection Pipe
2. Fuel Injection Pipe Clip

7. Final tighten the injection clamp bolts to the specified torque.

Tighten:
Bolts to 30 N·m (3.0 kg·m/22 lb·ft)

8. Tighten the injection pipes to the specified torque.

Tighten:
Nuts to 44 N·m (4.5 kg·m/33 lb·ft)



Legend
1. Injection Clamp Bolt
2. Injection Pipe Sleeve Nut

9. Install the glow plug.

Tighten:
Glow plug to 20 N·m (2.0 kg·m/15 lb·ft)

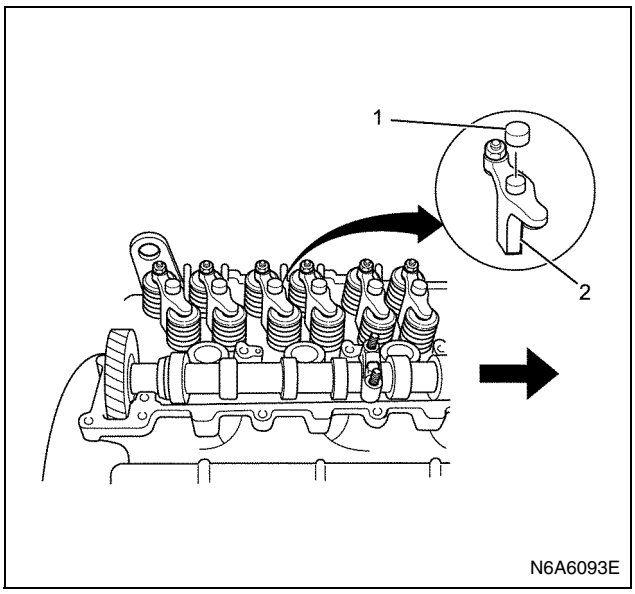
10. Install and tighten the glow connector with the designated torque.

Tighten:
Glow connector to 1.2 N·m (0.1 kg·m/10.5 lb·in)

11. Apply engine oil on the bridge, install it.

Caution:
Move it up and down to confirm that it moves smoothly.

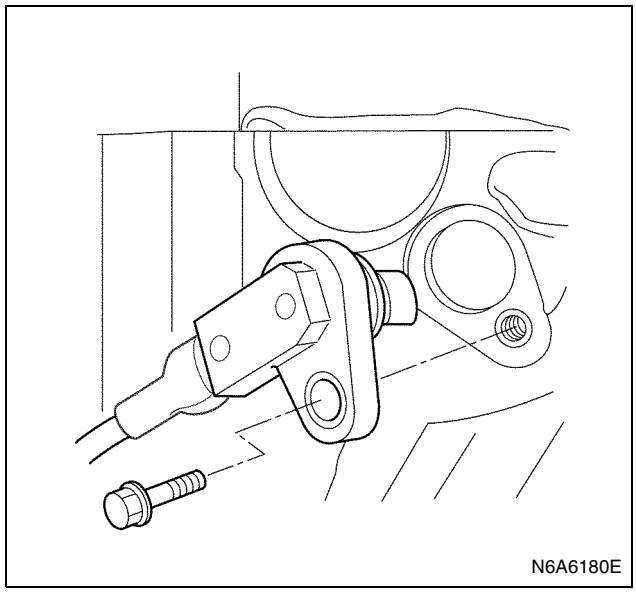
12. Apply a thin coat of engine oil inside the bridge cap, install it.



Legend
1. Bridge Cap
2. Bridge

13. Install the camshaft assembly.
Refer to “Camshaft Assembly”.
14. Install the rocker arm shaft assembly.
Refer to “Rocker Arm Shaft Assembly”.
15. Install and tighten the camshaft position sensor with the designated torque.

Tighten:
Bolt to 8 N·m (0.8 kg·m/69 lb·in)



16. Install the water bypass hose.
17. Install the engine coolant temperature sensor on the thermostat housing.

Tighten:
Engine coolant temperature sensor to 25 N·m (2.5 kg·m/18.4 lb·ft)

18. Install the leak-off pipe.

Tighten:
Leak-off pipe to 12 N·m (1.2 kg·m/104 lb·in)

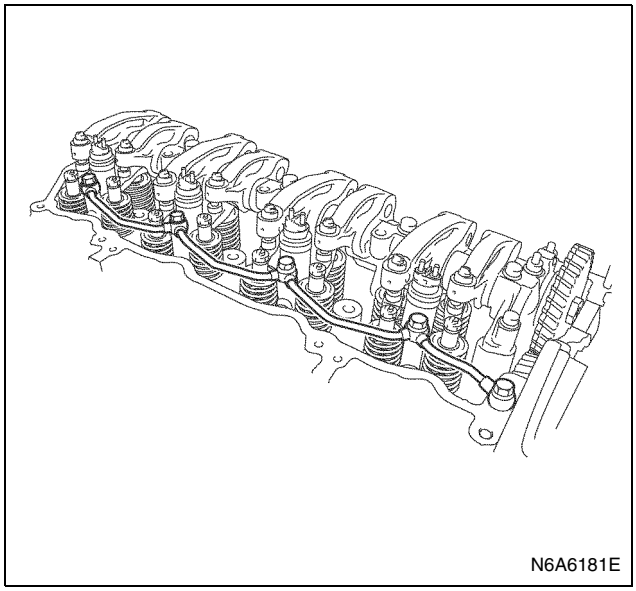
19. Install the fuel leak-off hose.
20. Clip a new gasket to the fuel nozzle leak-off pipe and install the fuel leak-off pipe.

Tighten:
Nozzle leak-off pipe (injector to cylinder head) to 12 N·m (1.2 kg·m/104 lb·in)

Fuel leak-off pipe (cylinder head side) 12 N·m (1.2 kg·m/104 lb·in)

Fuel leak-off pipe (supply pump side) 18 N·m (1.8 kg·m/13.3 lb·ft)

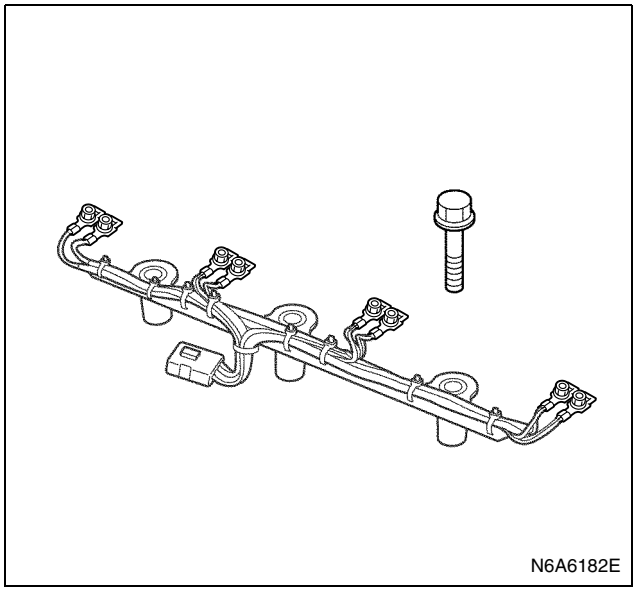
Caution:
Use new gaskets.



N6A6181E

21. Install the fuel injector harness connectors.
22. Install the harness bracket and tighten the bolts to the specified torque.

Tighten:
Bolt to 48 N·m (4.9 kg·m/35 lb·ft)



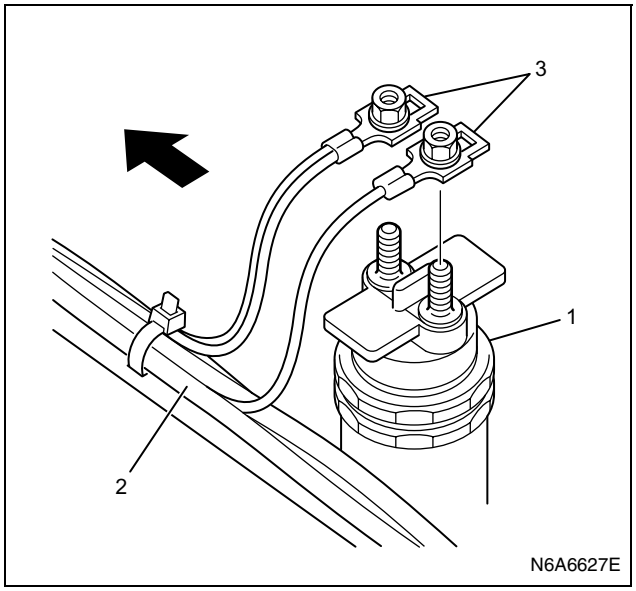
N6A6182E

23. Install the terminal nuts on the fuel injector.

Tighten:
Terminal nuts to 2 N·m (0.2 kg·m/17 lb·in)

Caution:

- Do not over tighten the nuts. Damage to the terminal studs will result.
- The terminal nut with two wires is engine front side.



N6A6627E

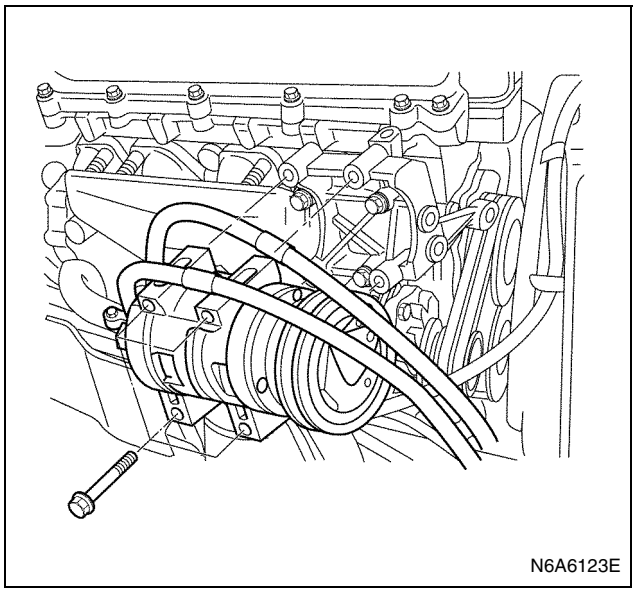
Legend

1. Fuel Injector
2. Fuel Injector Harness
3. Fuel Injector Terminal Nut

24. Install the cylinder head cover.
    Refer to “Cylinder Head Cover”.
25. Install the radiator upper hose.
26. Install the A/C compressor.
    - Install the A/C compressor bracket on the A/C compressor and tighten it with the designated torque.

Tighten:
Bolt to 24 N·m (2.4 kg·m/18 lb·ft)

- Install the A/C compressor harness connector.



N6A6123E

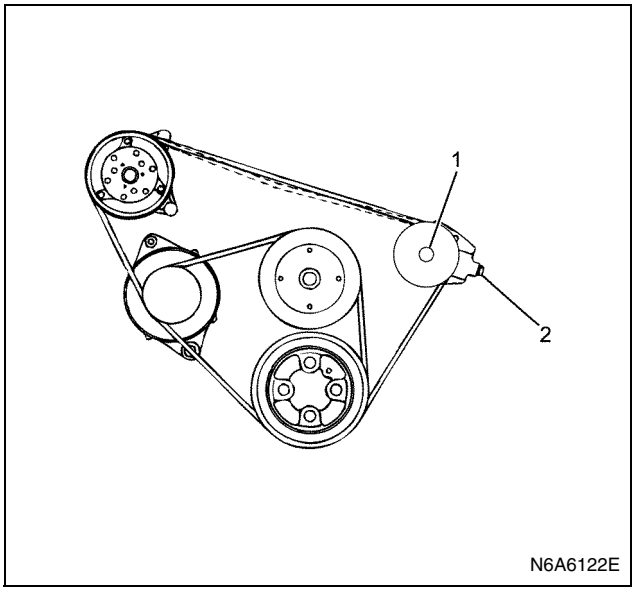
27. Install the A/C compressor drive belt.
    - Place the drive belt and adjust its tension with the adjust bolt of the tension pulley.

- Use a scale or other equipment to inspect whether the flexure of the belt when it was pushed by hand with pressure of 98 N (22 lb) is within the designated range.

A/C belt flexure	mm (in)
New belt	16 (0.63) – 20 (0.79)
Reused belt	18 (0.71) – 22 (0.87)

- Tighten the locknut of the tension pulley with the designated torque after adjusting the tension of the belt.

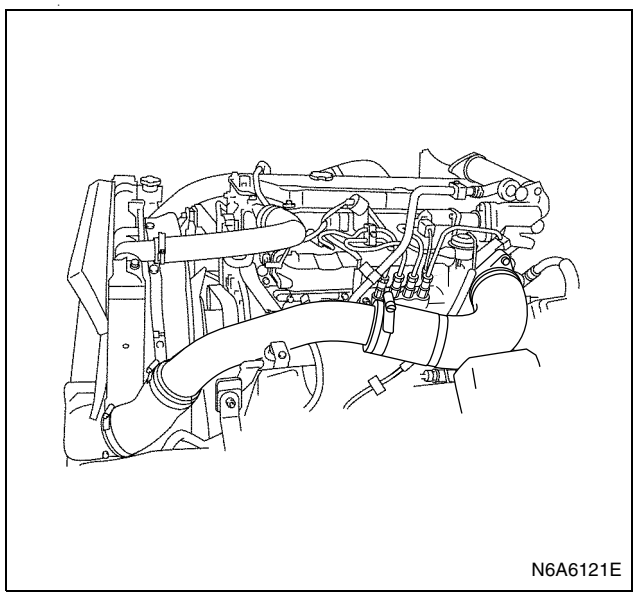
Tighten:
Lock nut to 27 N·m (2.8 kg·m/20 lb·ft)



Legend
1. Tension Pulley Lock Nut
2. Tension Pulley Adjusting Bolt

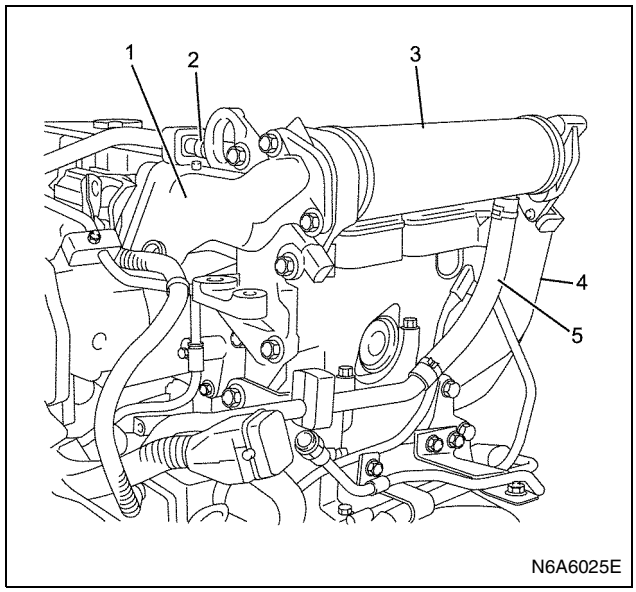
28. Install the intake pipe.
    - Install the bolt and clip band, tighten the bolt with the designated torque.

Tighten:
Bolt to 10 N·m (1.0 kg·m/87 lb·in)



- Install the fan guide bracket.

29. Install the EGR valve and EGR cooler.
    For details of installation, refer to “EGR Valve and EGR Cooler” in Section 6F.



Legend
1. EGR Adapter
2. Water Return Pipe
3. EGR Cooler
4. EGR Pipe
5. Water Feed Pipe

30. Install the oil level gauge and guide tube.
31. Install the exhaust pipe.
    - Install the front exhaust pipe and tighten with the designated torque.

Tighten:
Nuts to
Exhaust manifold side: 67 N·m (6.8 kg·m/49 lb·ft)
Exhaust brake side: 17 N·m (1.7 kg·m/13 lb·ft)

32. Install the engine harness.
33. Replenish the coolant.

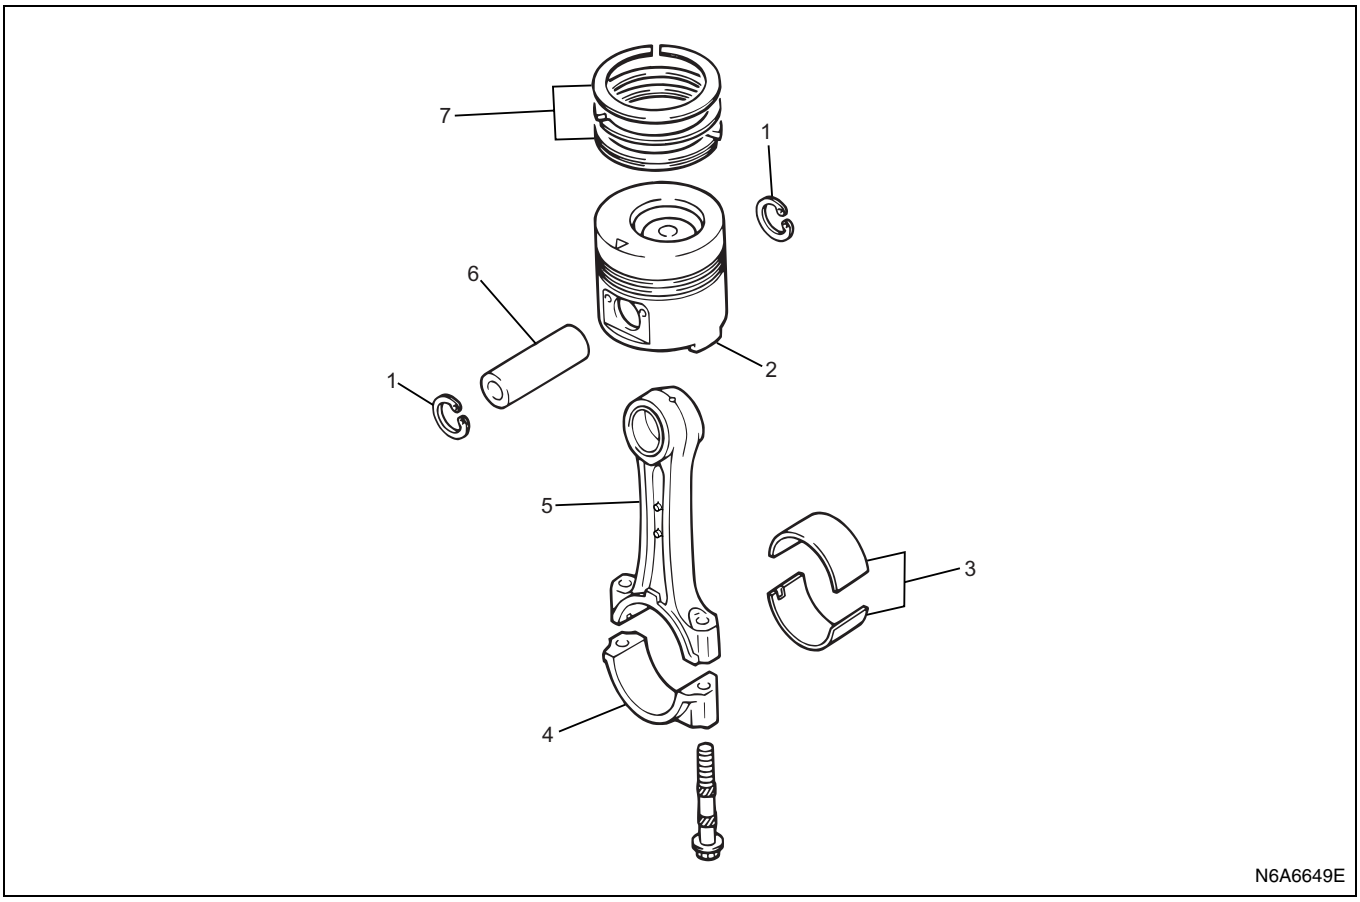
Piston and Connecting Rod

Component



Legend

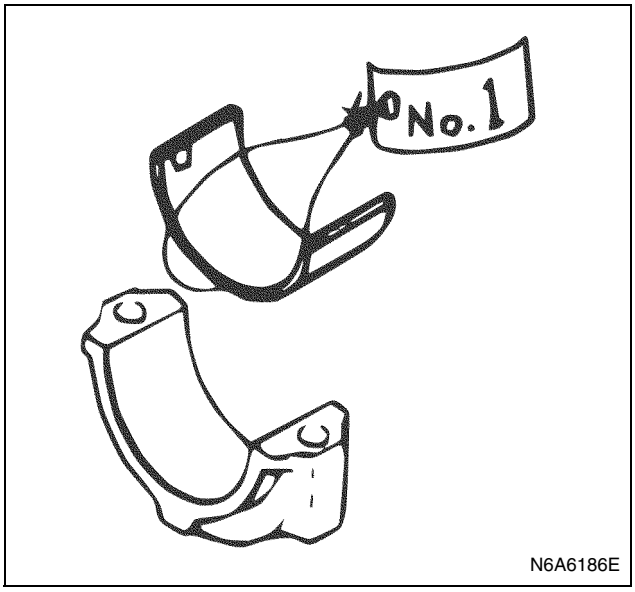
1. Snap Ring
2. Piston
3. Bearing
4. Connecting Rod Cap
5. Connecting Rod
6. Piston Pin
7. Piston Ring

Removal

1. Remove the oil pan.

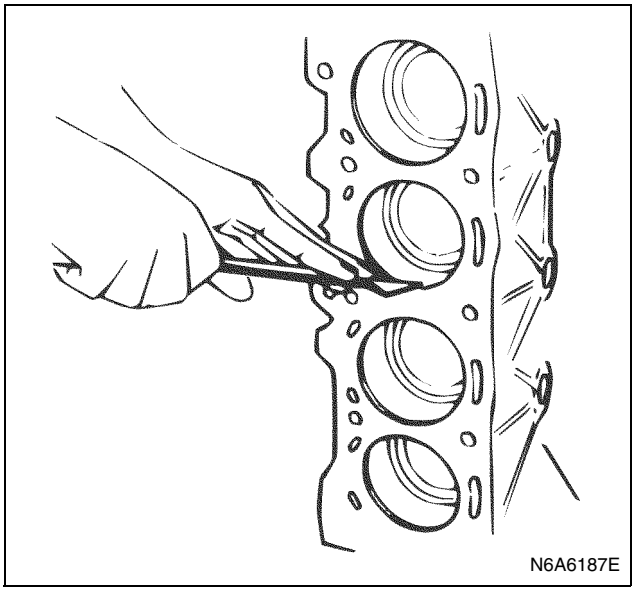
   Refer to “Oil Pan”.
2. Remove the cylinder head cover.
   Refer to “Cylinder Head Cover”.
3. Remove the rocker arm shaft assembly.
   Refer to “Rocker Arm Shaft Assembly”.
4. Remove the camshaft assembly.
   Refer to “Camshaft Assembly”.
5. Remove the cylinder head.
   Refer to “Cylinder Head”.
6. Remove the connecting rod cap.

Caution:
Sort the removed bearings according to cylinders by using tags.



7. Remove the piston and connecting rod.
   - Remove carbon on the upper side of the cylinder liner with a scraper.
   - Pull out the piston and connecting rod towards the cylinder head.

Caution:
Be sure not to damage the oil jet and cylinder liner when pushing out the connecting rod.



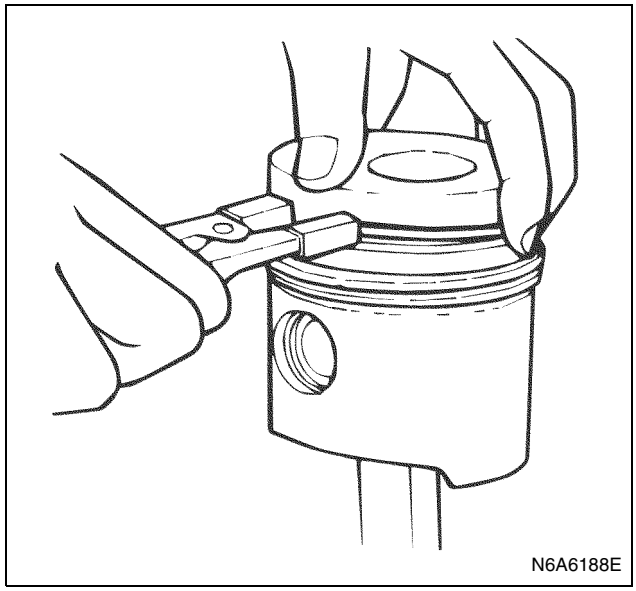
8. Remove the connecting rod bearing.

Caution:
Arrange the bearings in the order of cylinders. Be sure to put them back to the original cylinders.

Disassembly

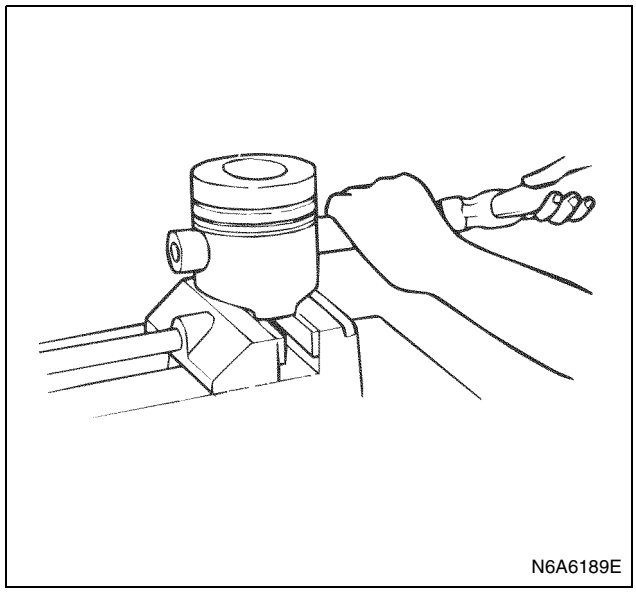
1. Remove the piston ring.
   - Use ring pliers to remove the piston ring.

Caution:
Sort the piston rings in the order of cylinders when reusing them so that they will not be confused with the pistons and piston rings of other cylinders.



2. Remove the snap ring.
3. Remove the piston pin.

Caution:
Sort the disassembled piston pins, pistons and connecting rods together in the order of cylinders.

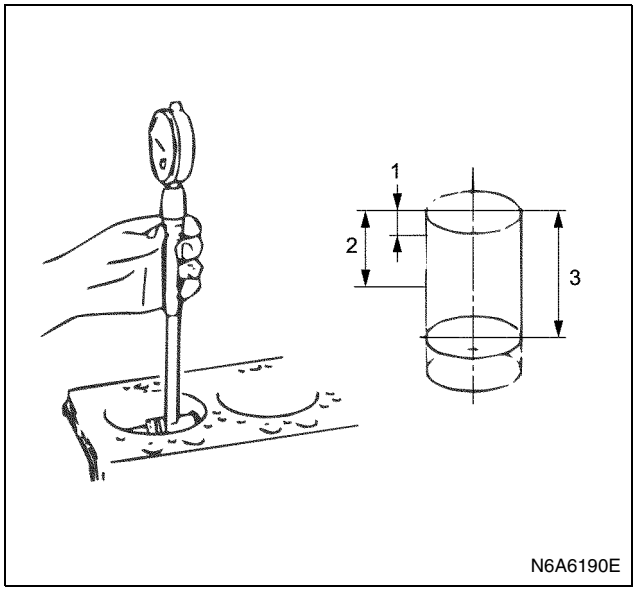


4. Remove the connecting rods from the piston.
5. Piston
   - Clean carbon carefully that is adhered to the head of the piston and the groove of the piston ring.

Caution:
Do not use wire brush to clean the piston because it scratches the piston.
Inspect the piston with eyes for cracks, burns and other excessive wear, and replace it if there is any abnormality.

6. Measure the gap between the piston and the inner diameter of the cylinder liner.
   Inner diameter of the cylinder liner.
   - Use a cylinder bore dial indicator to measure the liner inner diameter both in the thrust and radial directions in the designated position.
   - Measurement position (from the upper surface of the cylinder block)
     1. 20 mm (0.79 in)
     2. 110 mm (4.33 in)
     3. 190 mm (7.48 in)
   - Measure the liner inner diameter based on the average value of the actual measurement values on 6 positions.

Cylinder liner inner diameter	mm (in)
115.021 – 115.050 (4.52838 – 4.52952)	



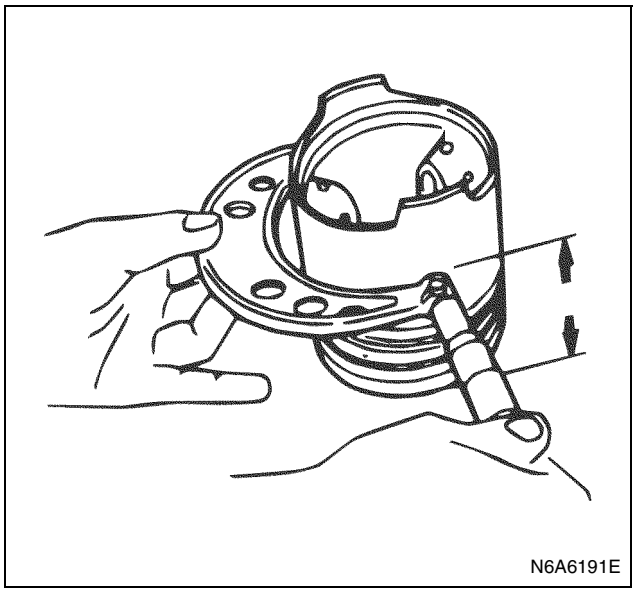
Legend
1. 20 mm (0.79 in)
2. 110 mm (4.33 in)
3. 190 mm (7.48 in)

Piston outside diameter
- Use a micrometer to measure the outside diameter of the piston in the right angle to the piston pin in the designated position.
- Measurement position (from the upper surface of the piston) 82 mm (3.2 in).

Piston diameter	mm (in)
Standard	114.924 – 114.939 (4.52456 – 4.52515)

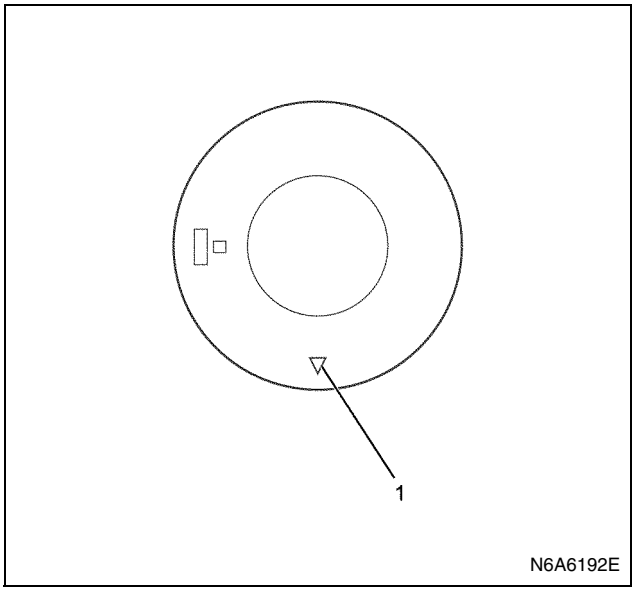
Gap between the piston and the inner diameter of the cylinder liner	mm (in)
Standard	0.082 – 0.126 (0.0032 – 0.0050)

Caution:
If it is found that the gap between the cylinder liner inner diameter and the piston exceeds the standard value, replace the piston or cylinder liner.



7. Piston replacement
   - You do not need to select grades because there is only one grade for each of the piston and the cylinder liner inner diameter.
     If you replace the cylinder liner, you must select the cylinder block (1, 2, 3) because there are two types of the liner outer diameter.
   - Refer to “Cylinder Block” if you replace the cylinder liner.

Caution:
The head of piston has a marking of grade B or C when it is shipped from the factory.



Legend
1. Front Mark Cut

8. Inspect the piston ring.
   Measure the joint of the piston ring (remove carbon on the ring joint)
   - Insert the piston ring into the cylinder liner.
   - Use the piston to push the ring to reach the under edge of the cylinder liner.

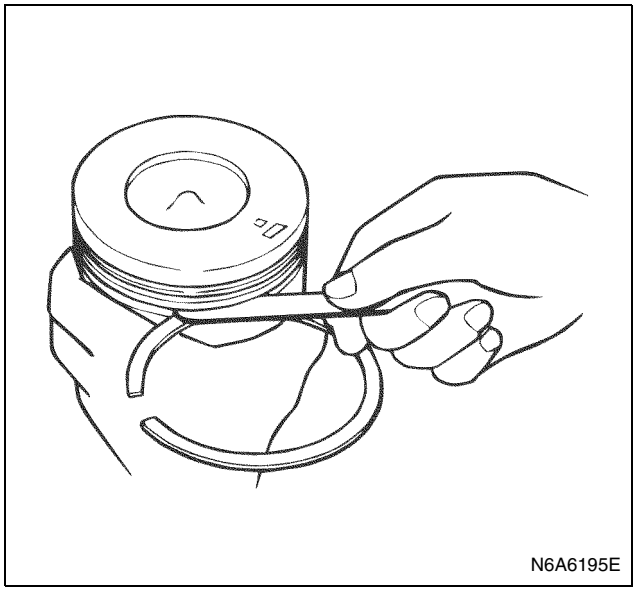
   - Use a thickness gauge to measure the gap of the ring joint.

   - If the measurement exceeds the limit, replace the piston ring.

Piston ring gap		mm (in)
	Standard	Limit
1st compression ring	0.20 – 0.30 (0.0079 – 0.0118)	1.20 (0.047)
2nd compression ring	0.30 – 0.45 (0.0118 – 0.0177)	1.20 (0.047)
Oil ring	0.20 – 0.40 (0.0079 – 0.0157)	1.20 (0.047)

Measure the clearance between the piston ring groove and the piston.
- Remove carbon in the piston ring groove.
- Put the piston ring in the piston ring groove, use a thickness gauge to measure the gap between them.
- If the clearance between the piston ring groove and the piston exceeds the limit, replace the piston and the piston ring.

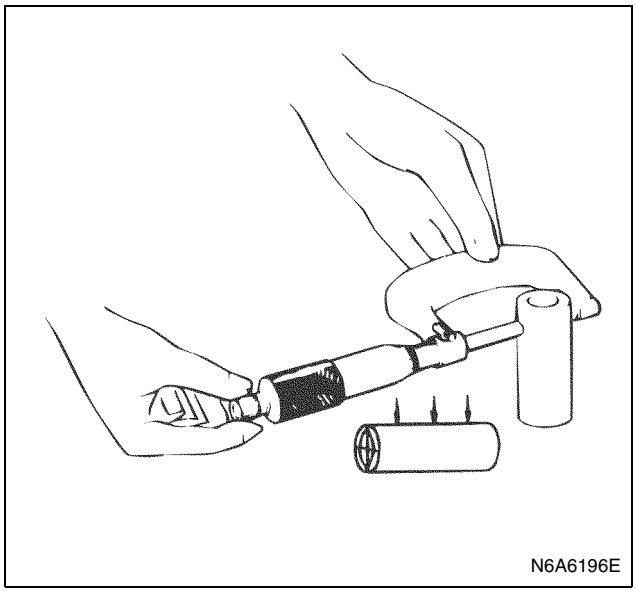
Piston ring and piston ring groove clearance		mm (in)
Piston ring	Standard	Limit
1st compression ring	0.07 – 0.11 (0.0028 – 0.0043)	0.20 (0.0079)
2nd compression ring	0.03 – 0.07 (0.0012 – 0.0028)	0.15 (0.0059)
Oil ring	0.03 – 0.07 (0.0012 – 0.0028)	0.15 (0.0059)



N6A6195E

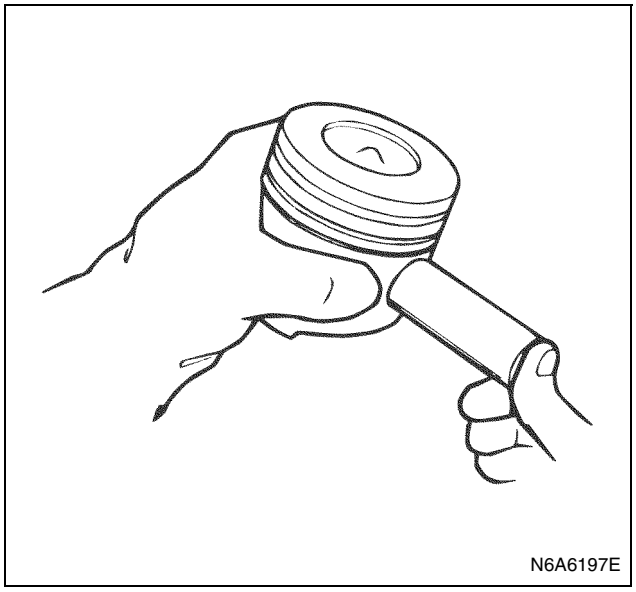
9. Inspect the piston pin.
   - Inspect the piston pin with eyes for cracks, scratches and other damages, replace it if necessary.
   - Use a micrometer to measure the outer diameter of the piston pin. If the measured value exceeds the limit, replace the piston pin.

Piston pin outer diameter	mm (in)
Standard	39.995 – 40.000 (1.5746 – 1.5748)
Limit	39.970(1.5736)



N6A6196E

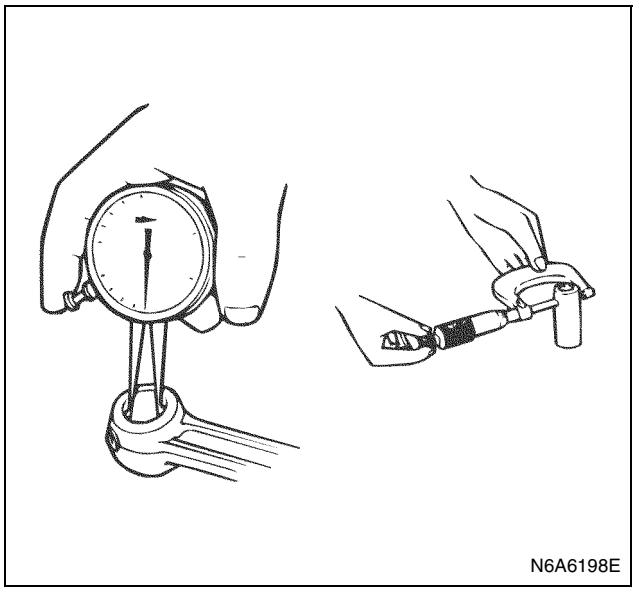
   - Inspect to make sure that there is a resistance to the extent which the piston can push the piston pin lightly in normal temperatures.
   - If it feels a large looseness or instability in normal temperatures, replace the piston or piston pin.



N6A6197E

   - Measure the bush of the small edge of the connecting rod. If the clearance of the bush inner diameter and the pin diameter exceeds the limit, replace the bush or connecting rod assembly, and the pin.

Piston pin and connecting rod small end bushing clearance	mm (in)
Standard	0.012 – 0.027 (0.0005 – 0.0011)
Limit	0.05(0.0020)



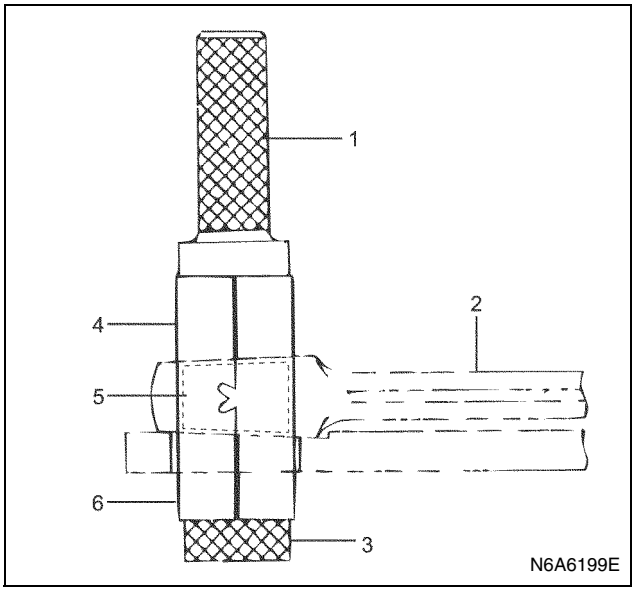
N6A6198E

10. Measure the clearance between the piston and the piston pin.

- Apply engine oil on the piston pin. Use your finger to push it in hole of the piston and rotate it. If the pin smoothly rotates without instability, the clearance is normal. If there is instability, measure the clearance. If the clearance exceeds the limit, replace the piston and the piston pin.

Piston pin and piston pin hole clearance	mm (in)
Standard	0.004 – 0.017 (0.00016 – 0.00067)
Limit	0.04 (0.0016)

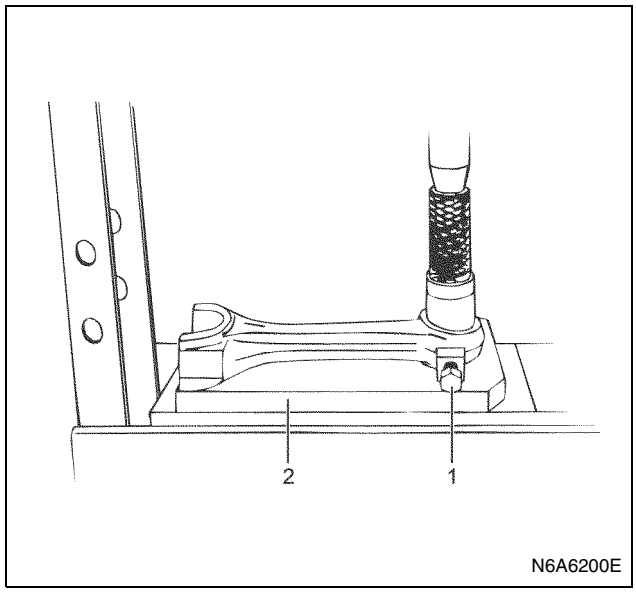
11. Remove the bush.
    - Set the collar, connecting rod and collar on the setting bar as shown in the drawing.
    - Tighten the nut.



Legend
1. Setting Bar
2. Connecting Rod
3. Nut
4. Collar
5. Bush
6. Collar

- Place the connecting rod bush replacer base on press, tighten the fixation bolt.
- Use the bench press to replace the bush.

  Special tool
  Connecting rod bush replacer: 5-8840-2340-0 (EN-47682)

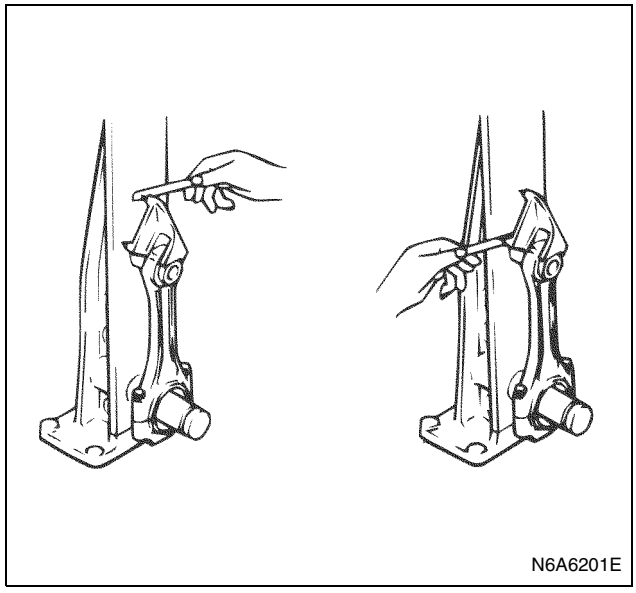


Legend
1. Bolt
2. Connecting Rod Bush Replacer

---

12. Measure the connecting rod alignment.
    - Use a connecting rod aligner to measure the parallelism of the big end hole and the small end hole. If the measured value exceeds the limit, replace it.

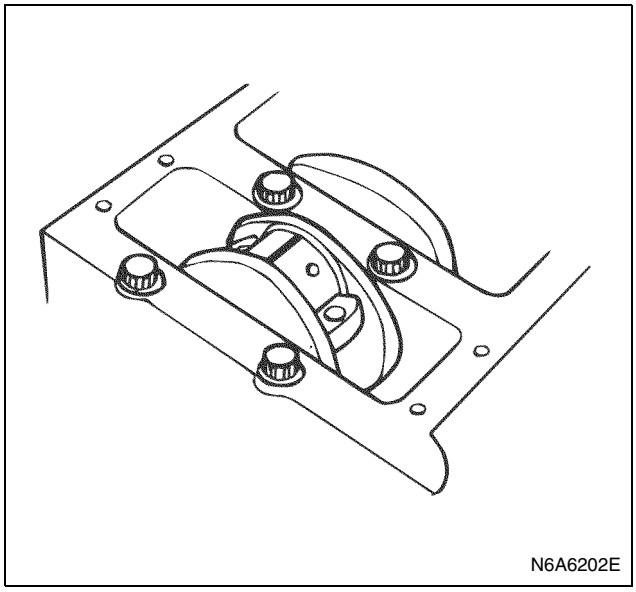
Connecting rod alignment (par length of 100 mm (3.94 in))		mm (in)
	Standard	Limit
Distortion and Parallelism	0.05 (0.002)	0.20 (0.008)



13. Measure the bearing oil clearance.
    - Measure the oil clearance between the connecting rod bearing and the crank pin with the following method.
      - Remove the connecting rod cap. Sort the removed caps according to the cylinder number.
      - Clean the bearing and the shaft pin.
      - Inspect the bearing. If it is damaged or worn seriously, replace the entire bearing.
    - Place the plastigauge on the crankshaft pin.
    - Install the bearing cap and tighten the bolt with the designated torque.
      Apply molybdenum disulfide on the screw part and the bearing surface.

Tighten:
Connecting rod bearing cap bolt to
1st step: 39 N·m (4.0 kg·m/29 lb·ft)
2nd step: 60° (degrees)
3rd step: 30° (degrees)

Caution:
Do not rotate the crankshaft.

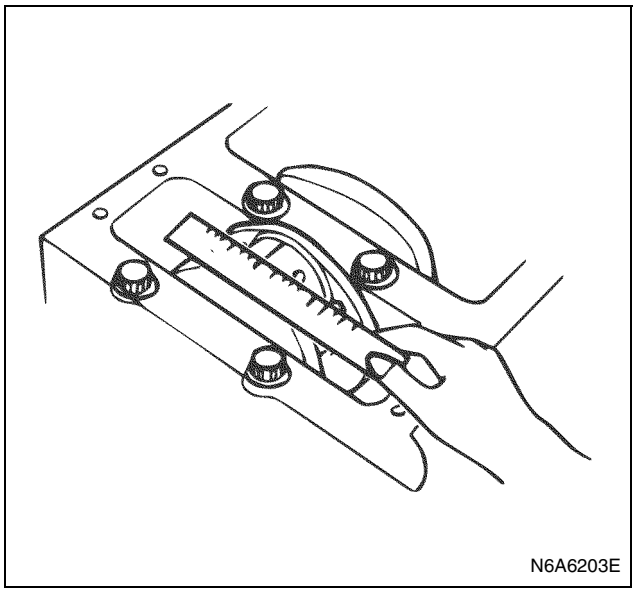


N6A6202E

      - Remove the cap.
      - Measure the largest width of the plastigauge to calculate the oil clearance. If the clearance exceeds the limit, replace the entire bearing.

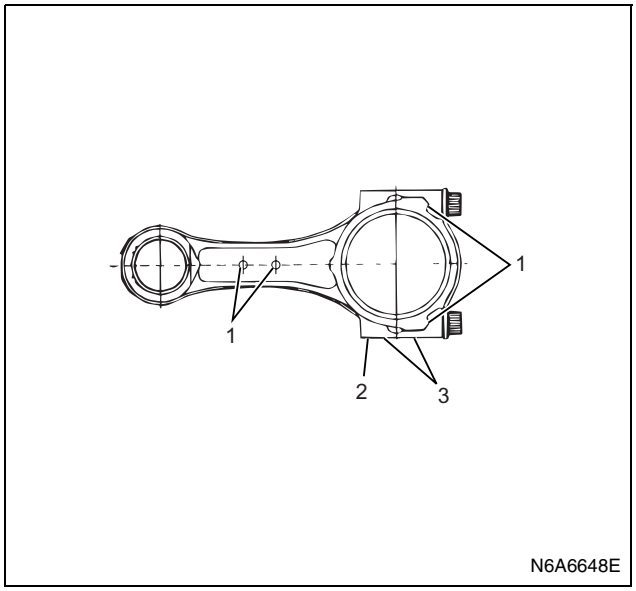
Crankpin and bearing clearance	mm (in)
Standard	0.037 – 0.077 (0.0015 – 0.0030)
Limit	0.10 (0.0039)

      - Remove the plastigauge from the bearing and crankpin.



N6A6203E

14. Select the connecting rod bearing.
    - Select bearings carefully by the grade of big end hole diameter of the connecting rod according to the selection table.

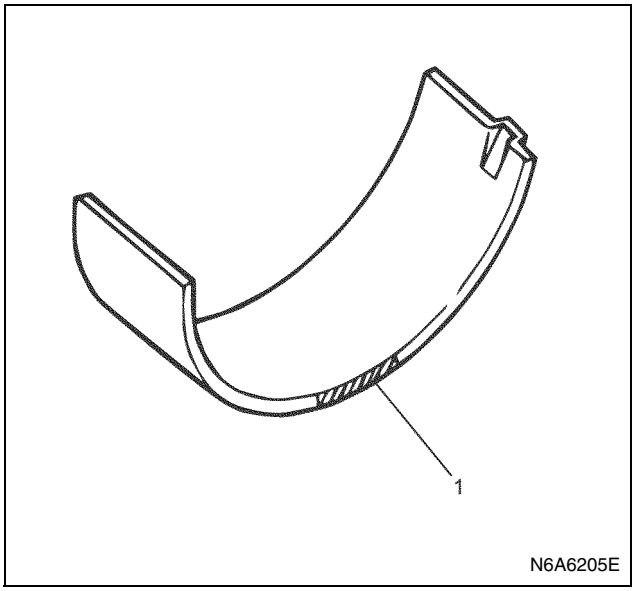


N6A6648E

Legend
1. Top and Back Recognition Boss
2. Big End Diameter Grade Mark
3. Cylinder Number

Bearing selection table

Big end hole diameter Grade	Bearing recognition color	Oil clearance mm (in)
A	Green	0.037 – 0.077 (0.0015 – 0.0030)
B	Yellow	0.037 – 0.077 (0.0015 – 0.0030)

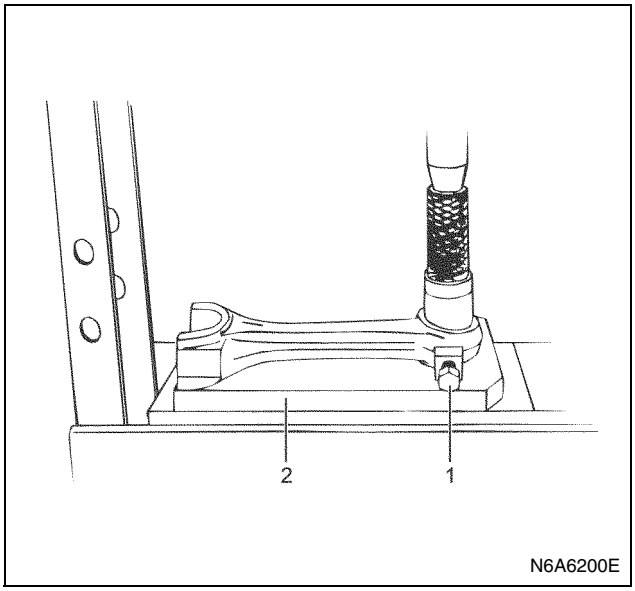


Legend
1. Grade Recognition Color

Reassembly

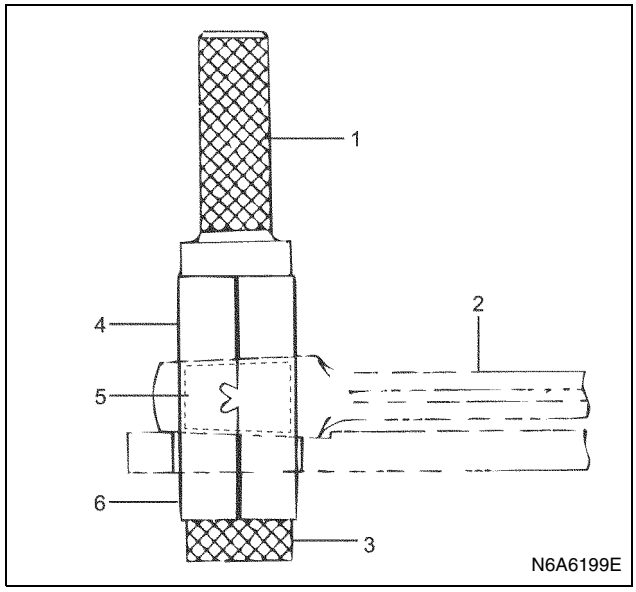
1. Install the bush
   - Place the connecting rod bush replacer base on a press, set the connecting rod and tighten the fixation bolt.

     Special tool
     Connecting rod bush replacer: 5-8840-2340-0 (EN-47682)



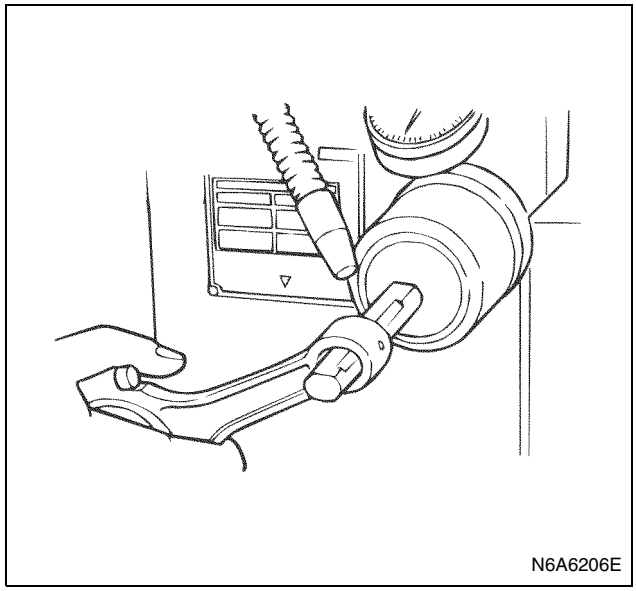
Legend
1. Bolt
2. Connecting Rod Bush Replacer

   - Set the collar, new bush and collar on the setting bar as shown in the drawing.
   - Tighten the nut.
   - Adjust the oil hole of the connecting rod and the oil hole of the bush, and use the bench press to install the bush.



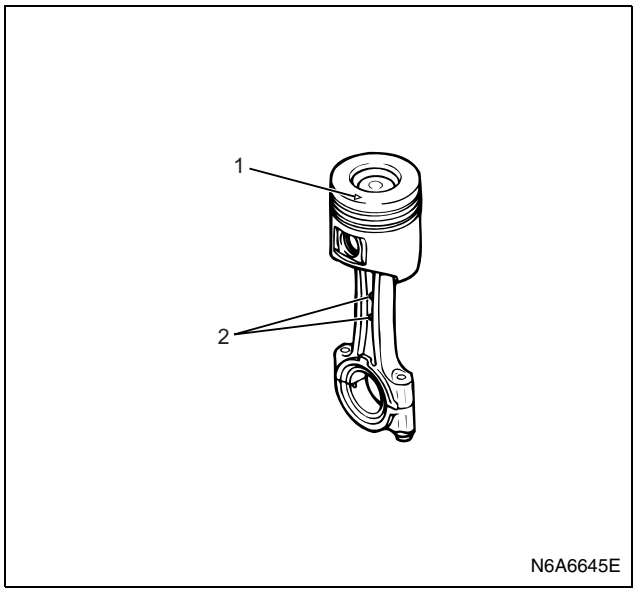
Legend
1. Setting Bar
2. Connecting Rod
3. Nut
4. Collar
5. Bush
6. Collar

   - After installing the new bush, use a grinder to machine the pin hole so that the pin clearance equals the standard value.



2. Install the piston.
3. Install the connecting rod.
   - Install it so that the front mark of the head of the piston and the connecting rod forging mark (projecting) on the connecting rod face the same direction.

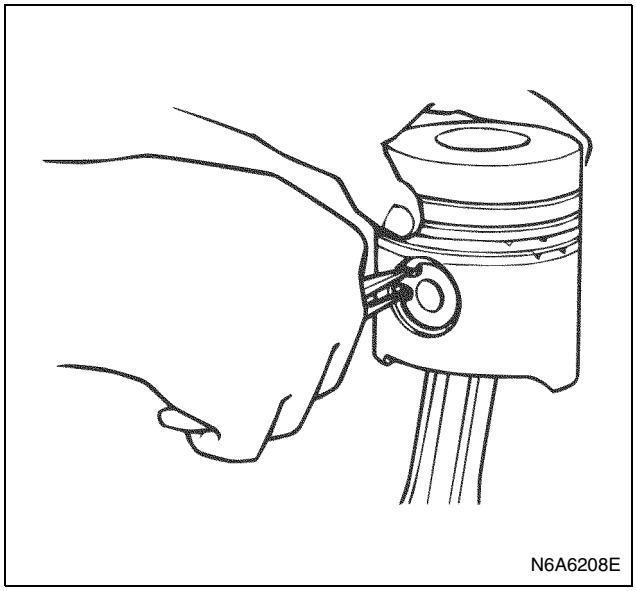
- Use snap ring pliers to install the snap ring of one side.



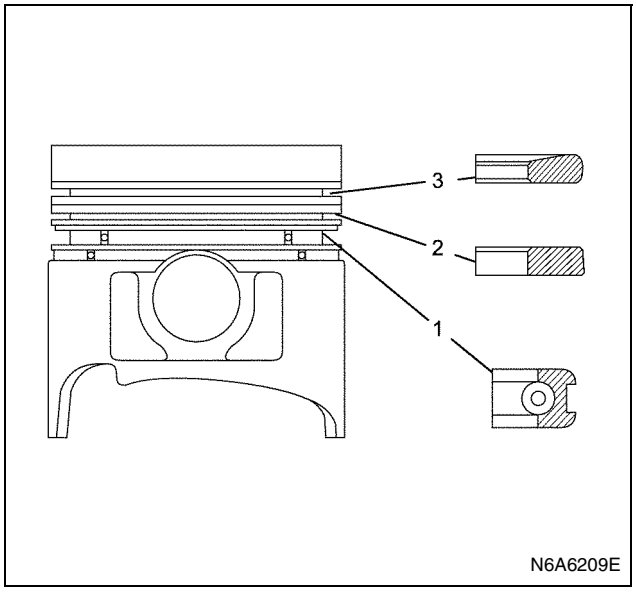
Legend
1. Front Mark
2. Forging Mark (Projecting)

4. Apply enough engine oil on the piston pin, push it in the piston and the connecting rod small edge.
5. Use snap ring pliers to install the snap ring.

Caution:
Make sure that the snap ring is installed in the ring groove properly. Make sure that the connecting rod moves smoothly.

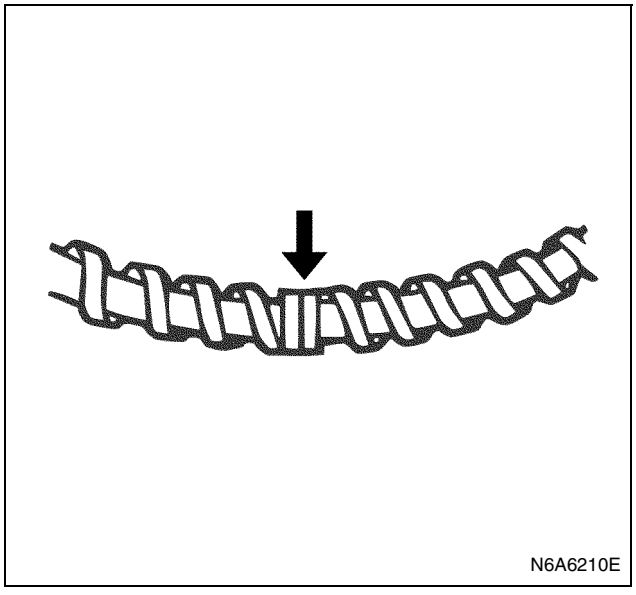


6. Use ring pliers to install the piston ring.
   - Install the oil ring so that the joint angle of the ring and coil expander is in the opposite 180° direction.
   - Install 2nd and 1st compression rings in this order so that the marks “2T” and “1T” face upward.



Legend
1. Oil ring
2. Compression Ring 2nd
3. Compression Ring 1st

Caution:
Note that the shapes of compression rings 1st and 2nd are different.
Make sure that there is no gap in the position indicated in the drawing when the oil ring coil expander was installed.



Installation

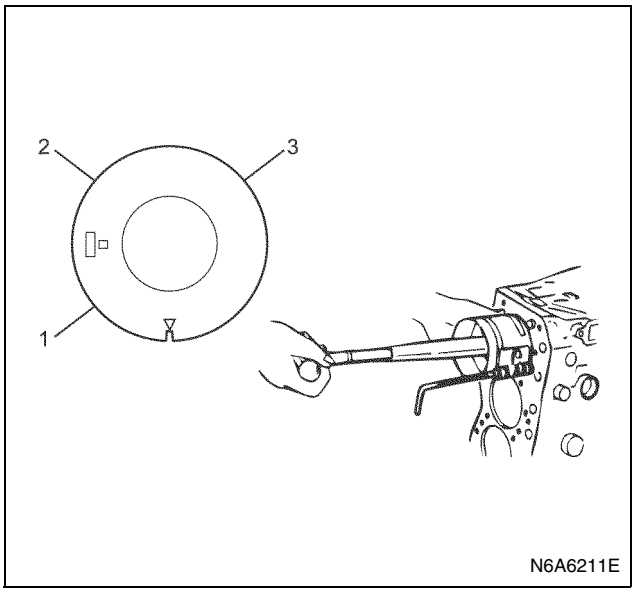
1. Install the connecting rod bearing.
   - Install the bearing on the connecting rod, apply engine oil on the bearing.
2. Install the piston and connecting rod assembly.

- Apply enough engine oil on the piston ring, ring groove and piston side surface.
- Dislocate the piston ring joint so that (1) is 1st ring, (3) is 2nd ring and (2) is oil ring, as shown in the drawing.
- Face the piston front mark cut to forward, use the piston ring compressor to insert the piston in the cylinder liner.

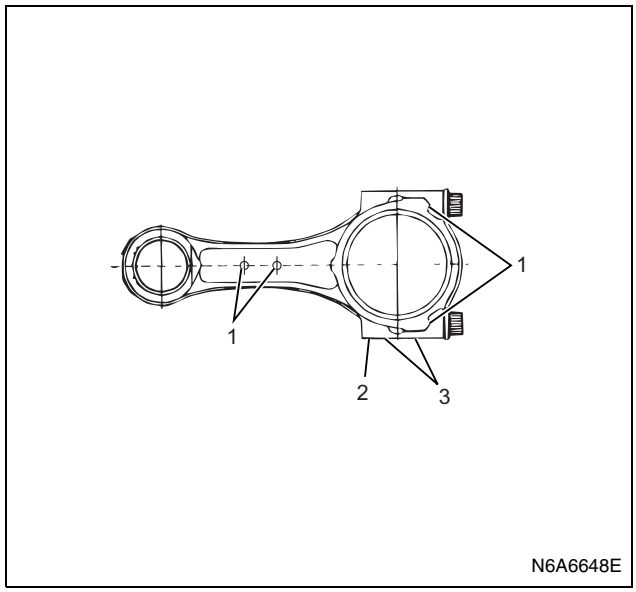
Caution:

- Be sure not to make the connecting rod touch the oil jet when pushing in the piston.
- Be sure not to damage the inside of the liner when pushing in the piston.

Special tool
Piston ring compressor: 5-8840-9018-0 (J-8037)



3. Install the connecting rod cap.
   - Install the bearing on the connecting rod cap and apply engine oil.
   - Install the cap, matching the numbers (1, 2, 3, 4) of the caps and connecting rods.



Legend

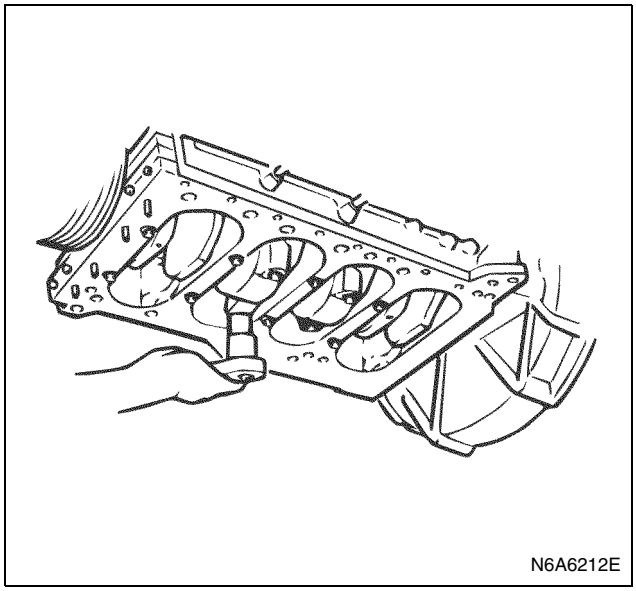
1. Back and Top Recognition Boss
2. Big End Hole Diameter Grade Mark
3. Cylinder Number

- Apply molybdenum disulfide on the screw part and the setting face of the tightening bolt and tighten it with the designated torque.
- Tighten two bolts alternately in each step.

Tighten:
Tightening bolt to
1st step: 39 N·m (4.0 kg·m/29 lb·ft)
2nd step: 60° (degrees)
3rd step: 30° (degrees)

Special tool
Angle gauge: 5-8840-0266-0 (J-45059)

Caution:
Make sure that the crankshaft smoothly rotates.



N6A6212E

4. Install the cylinder head.
   Refer to “Cylinder Head”.
5. Install the camshaft assembly.
   Refer to “Camshaft Assembly”.
6. Install the rocker arm shaft assembly.
   Refer to “Rocker Arm Shaft Assembly”.
7. Install the cylinder head cover.
   Refer to “Cylinder Head Cover”.
8. Install the oil pan.
   Refer to “Oil Pan”.

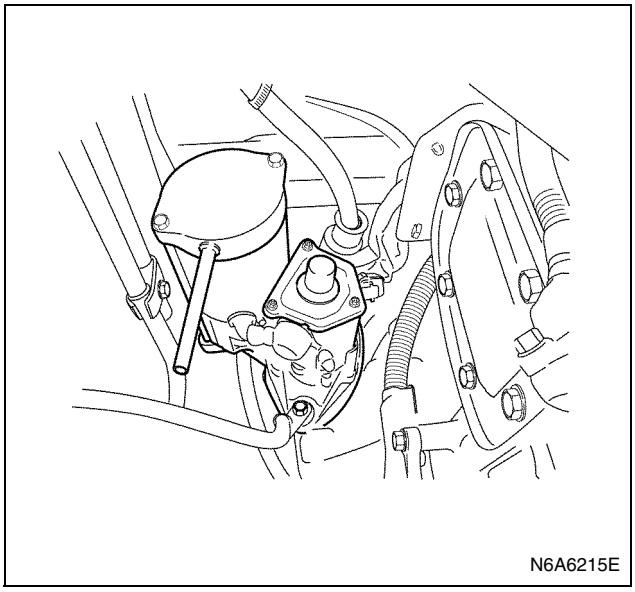
5. Clutch Pressure Plate Assembly (MT)
6. Pilot Bearing (MT)
7. Crankshaft Position Sensor
8. Flexible Plate (Smoother)
9. Crankshaft End Spacer (Smoother)

Removal

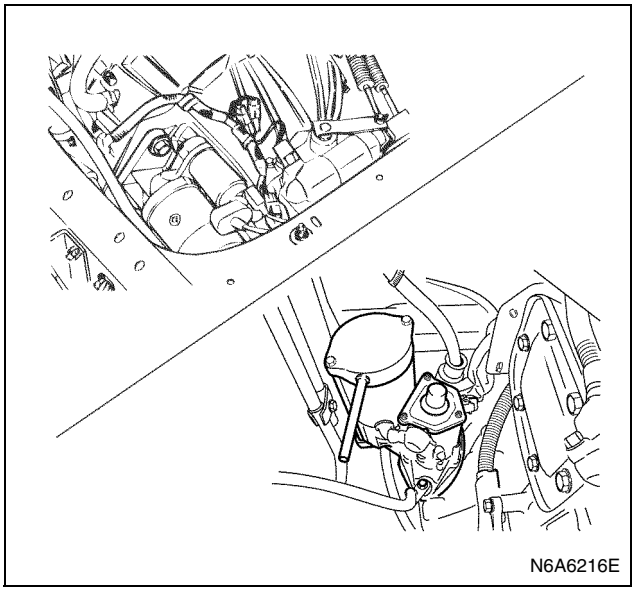
1. Remove the starter motor.
   - Remove the earth cable of the starter motor.

- Disconnect the front frame harness connector near the control box of the transmission, remove the clips that fix the harness.



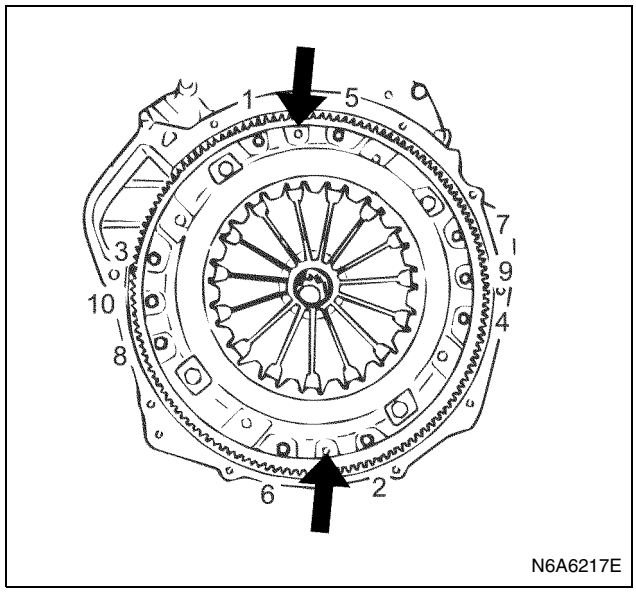
N6A6215E

- Remove the two bolts on the upper side and lower side that fix the starter, remove the starter from the clutch housing.
- Use wire to secure the starter to the transmission. Position the wire and starter so that it does not interfere with the transmission removal procedure.



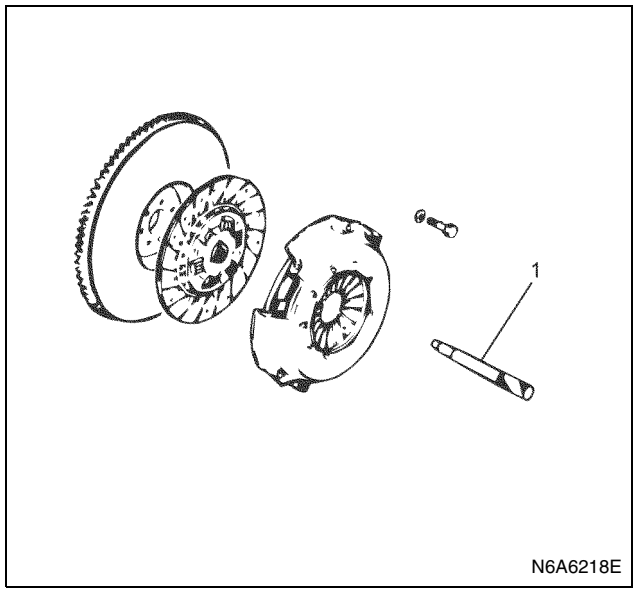
N6A6216E

2. Remove the transmission assembly.
   Refer to “Engine Assembly”.
3. Remove the clutch pressure plate assembly.
   - Insert the clutch aligner on the spline of the driven plate.
   - Remove the clutch pressure plate assembly installation bolts in the order shown in the drawing.
   - Remove the clutch pressure plate assembly from the flywheel.



N6A6217E

4. Remove the clutch plate assembly.
   - Remove the clutch plate assembly from the flywheel along with the clutch aligner (1).



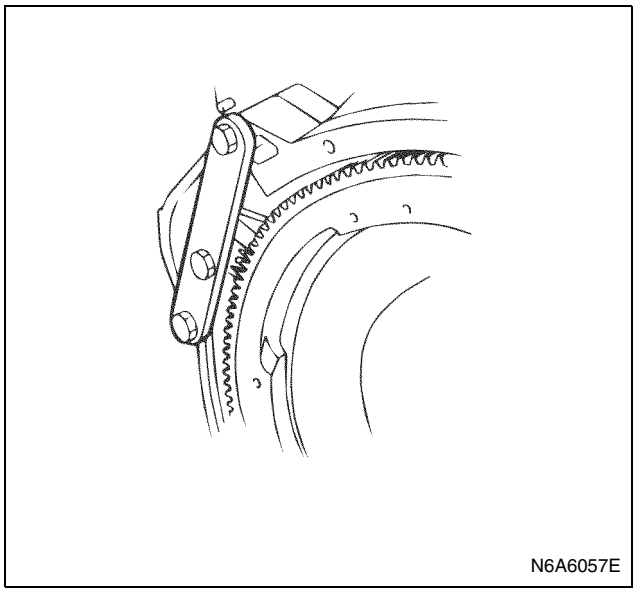
N6A6218E

Legend
1. Clutch Aligner

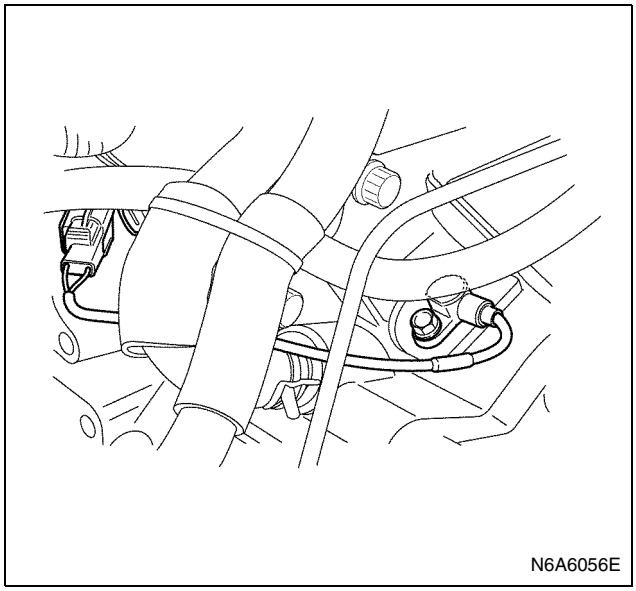
- Install the crankshaft stopper in the starter installation part of the flywheel housing.

Caution:
Make sure that the stopper is applied with the ring gear and installed properly.

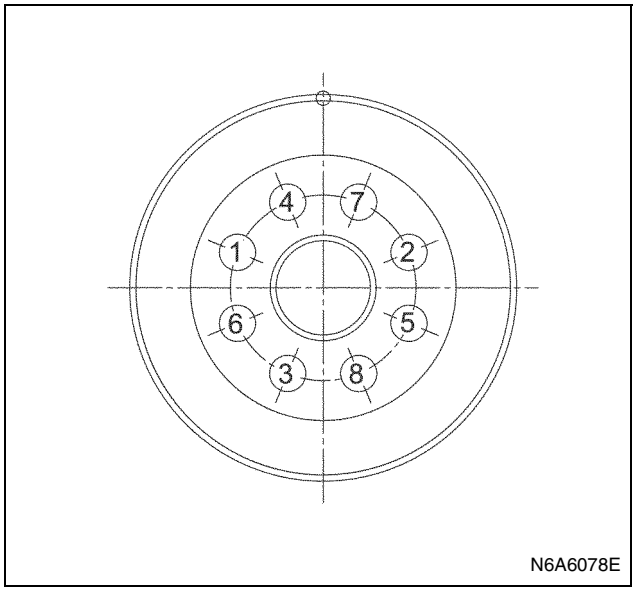
Special tool
Crankshaft stopper: 5-8840-2230-0 (EN-47680)



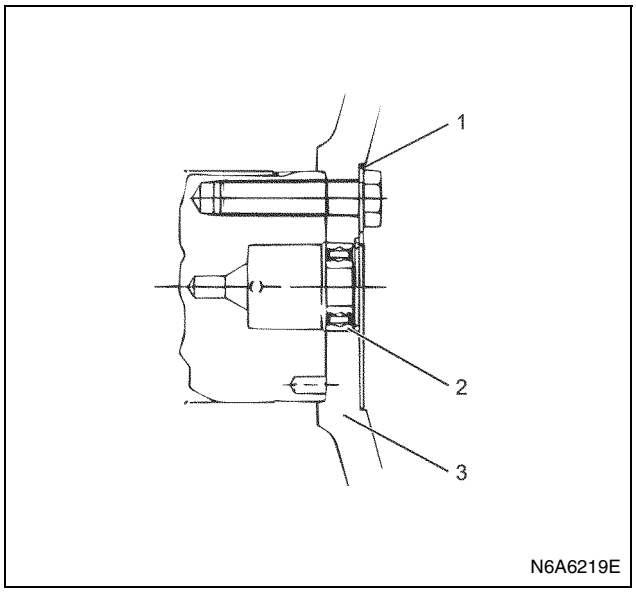
5. Remove the crankshaft position sensor.
   - Remove to prevent contact damage when the flywheel is removed.
   - Do not throw or drop because it is vulnerable to shock.



6. Remove the washer.
7. Remove the flywheel.
   - Gradually loosen the flywheel installation bolts in the order shown in the drawing so that the flywheel does not rotate.
   - After loosening the bolts, remove the stopper and remove the flywheel.
   - In the case of smoother vehicle, after loosening the flexible plate installation bolts, remove the washer, flexible plate, spacer in this order.



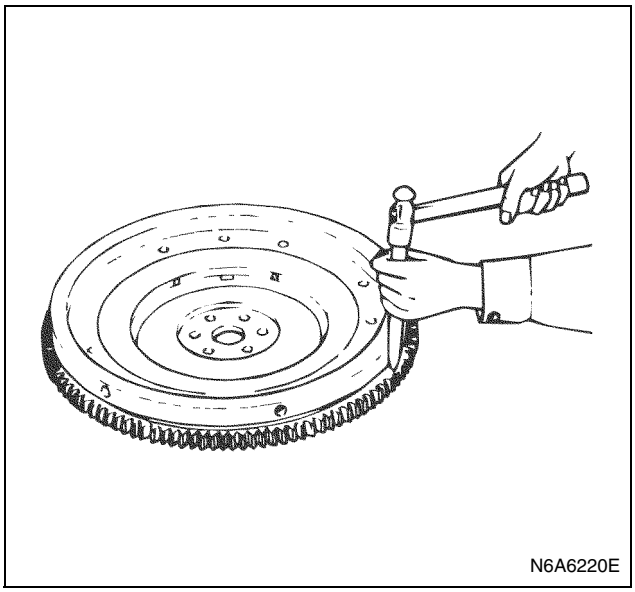
8. Remove the pilot bearing.
   - Remove the pilot bearing from the flywheel.



Legend
1. Washer
2. Pilot Bearing
3. Flywheel

9. Remove the ring gear.

- Put a bar on the ring gear and hit it with a hammer to remove it.



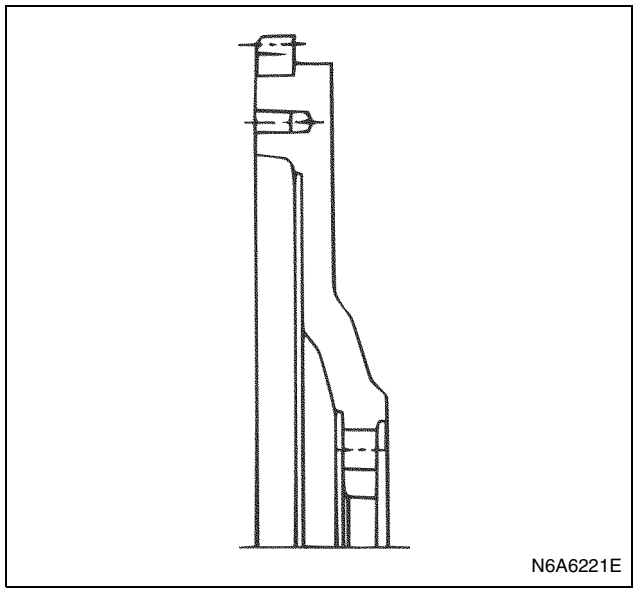
N6A6220E

Inspection

1. Inspection with eyes
   - Inspect the flywheel friction surface for cracks and damages, and replace it if it has abnormality.
   - Inspect the tooth part of the ring gear, replace the ring gear if it has damage or serious wear.
2. Measurement of the friction surface
   - Measure the depth of the friction surface of the flywheel.
   - Adjust it if the measured value is between the standard value and the limit.
   - If the measured value exceeds the limit, replace the flywheel.

Depth of the friction surface of the flywheel mm (in)	
Standard	19 (0.75)
Limit	20 (0.79)

Depth = From the pressure installation surface to the friction surface.



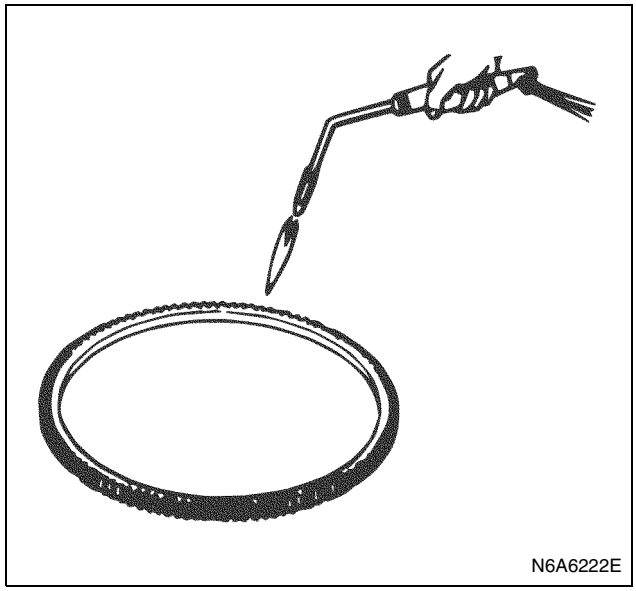
N6A6221E

Installation

1. Install the ring gear.
   - After heating the ring gear with a gas burner equally, install it in the flywheel.
   - During shrinkage cooling of the ring gear, maintain the flatness by applying force of 68.6 kN (15,400 lbf).

Caution:

- Install the ring gear in the direction within the chamfered face comes to the side of pressure installation surface.
- Shrink fit the ring gear to the flywheel.
  Make sure that flywheel and ring gear adhesion is complete.



N6A6222E

2. Install the flywheel.
3. Install the washer.

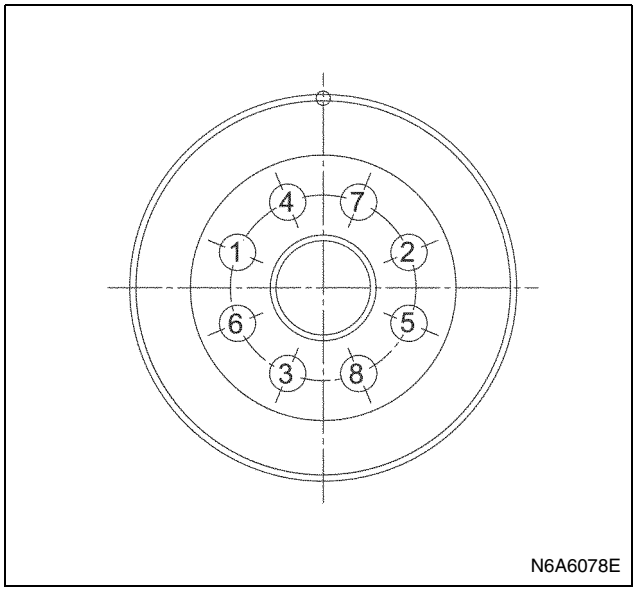
M/T specification

1) Align the flywheel with the crankshaft knock pin and temporarily tighten the flywheel bolts.
2) Use the crankshaft stopper to prevent the crankshaft from turning.
   Crankshaft stopper: 5-8840-2230-0 (EN-47680)
- Apply molybdenum disulfide on the thread and setting face of the bolt.

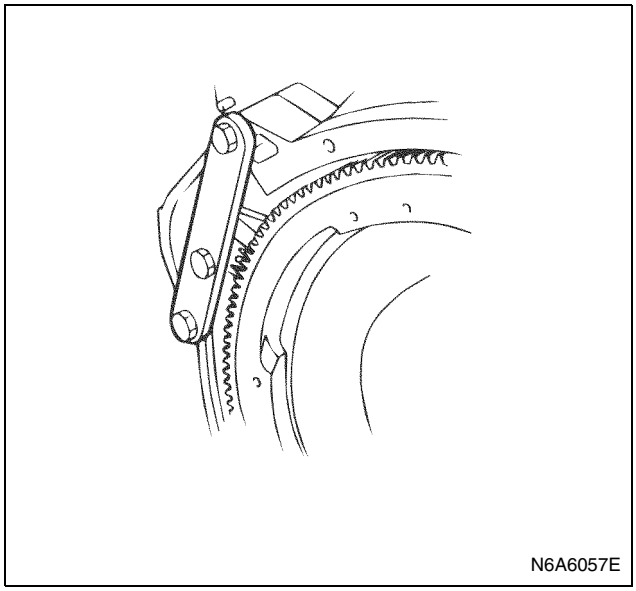
3) Install the washer and the flywheel bolts and tighten to the specified torque in numerical order show in the illustration.

Tighten:
Bolts to
1st step: 78 N·m (8.0 kg·m/58 lb·ft)
2nd step: 120° – 150° (degrees)

Special tool
Crankshaft stopper: 5-8840-2230 (EN-47680)
Angle gauge: 5-8840-0266-0 (J-45059)



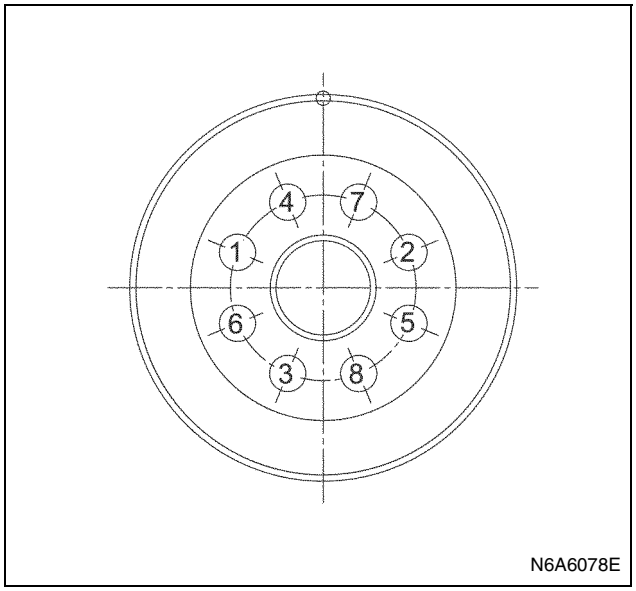
N6A6078E



N6A6057E

Smoother specification

1) Align the knock pin on the crankshaft to install the spacer.
2) Install the flexible plate and washer, also aligning to the knock pin on the crankshaft.
3) Apply molybdenum disulfide grease to the bolt thread and seat to install the flywheel fixing hole. Tighten bolt to two stage tightening method in the numerical order.
   1st step; 78 N·m (8.0 kg·m/58 lb·ft)
   2nd step; 90° – 120° (degrees)



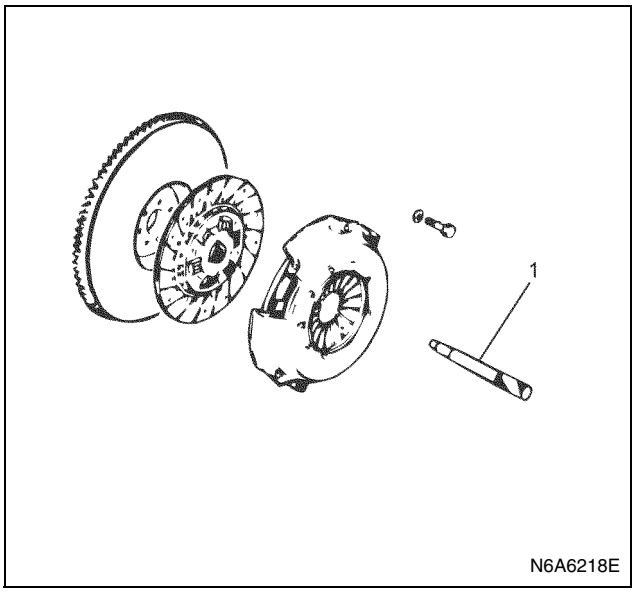
N6A6078E

4. Install and tighten the crankshaft position sensor with the designated torque.

Tighten:
Bolt to 8 N·m (0.8 kg·m/69 lb·in)

5. Hammer in the pilot bearing until it reaches the edge surface of the crank.
6. Install the clutch plate assembly.

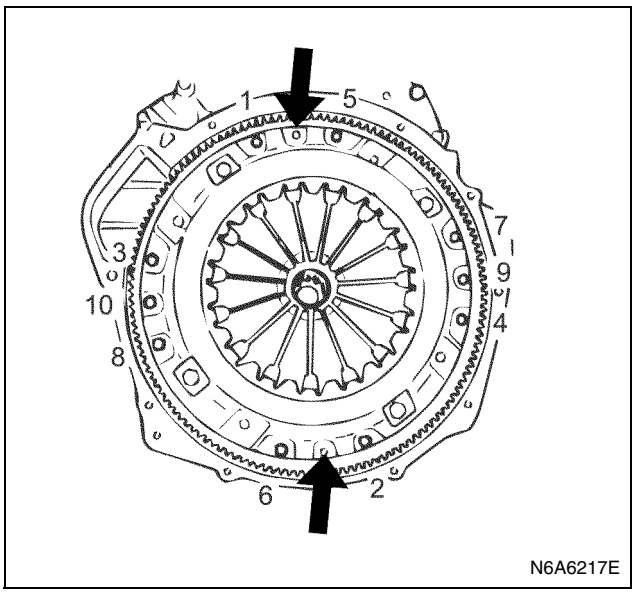
- Use a clutch aligner to install the clutch plate assembly on the flywheel.



Legend
1. Clutch Aligner

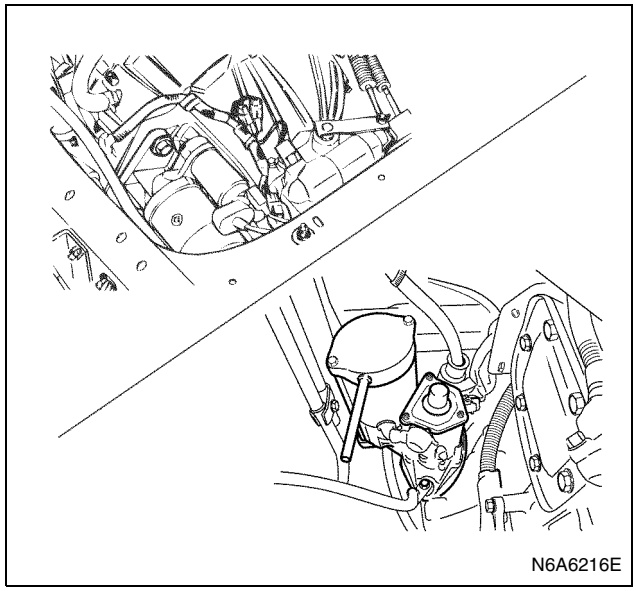
7. Install the clutch pressure plate assembly.
   - Install the clutch pressure plate assembly on the flywheel so that the installation hole of the clutch pressure plate assembly matches with the dowel pins of the flywheel.
   - Tighten the clutch pressure plate assembly in the order shown in the drawing.

Tighten:
Bolts to 40 N·m (4.1 kg·m/30 lb·ft)



8. Install the transmission assembly.
   Refer to “Engine Assembly”.
9. Install the starter motor on the clutch housing with bolts.

Tighten:
Bolts to 76 N·m (7.7 kg·m/56 lb·ft)



- Install the earth cable of the starter motor.
- Connect the front frame harness connector.

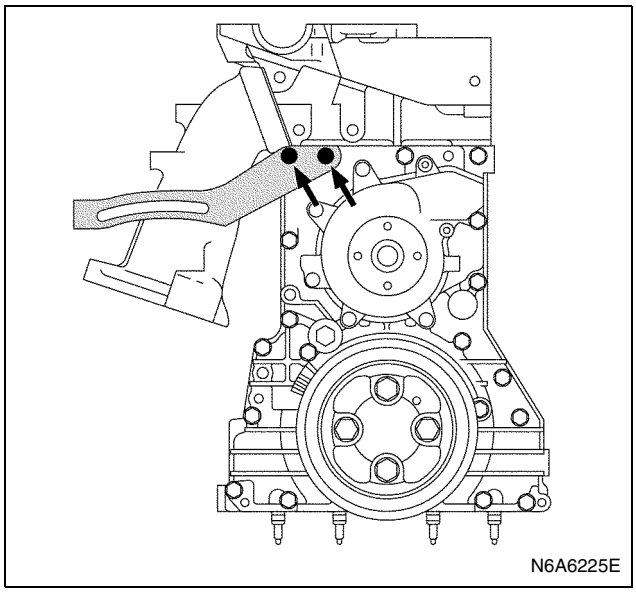
Removal

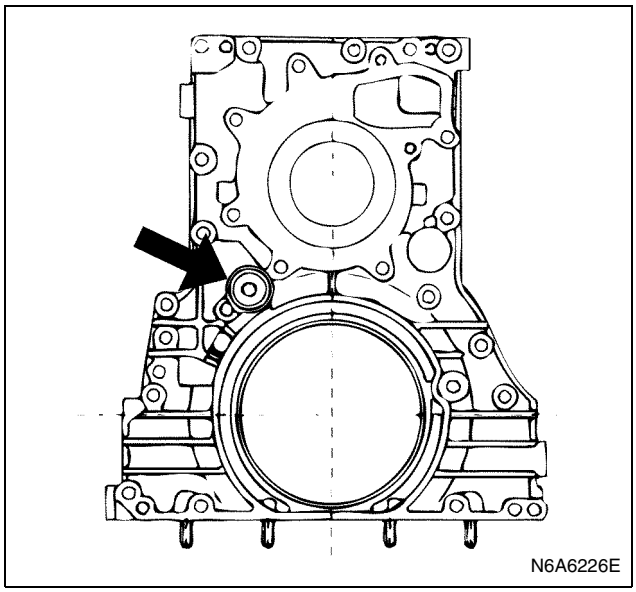
1. Remove the front oil seal.
   Refer to “Crankshaft Front Oil Seal”.
2. Remove the oil pan
   Refer to “Oil Pan”.
3. Remove the water pump.
   Refer to “Water Pump” in Section 6B.
4. Remove the front cover.

- Remove the generator adjust plate.



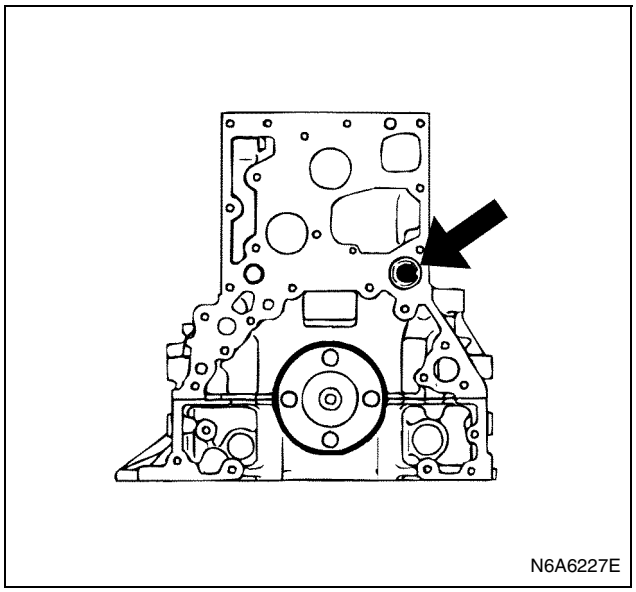
N6A6225E

- Remove the oil relief valve (arrowed), loosen the front cover installation bolts and remove the front cover.



N6A6226E

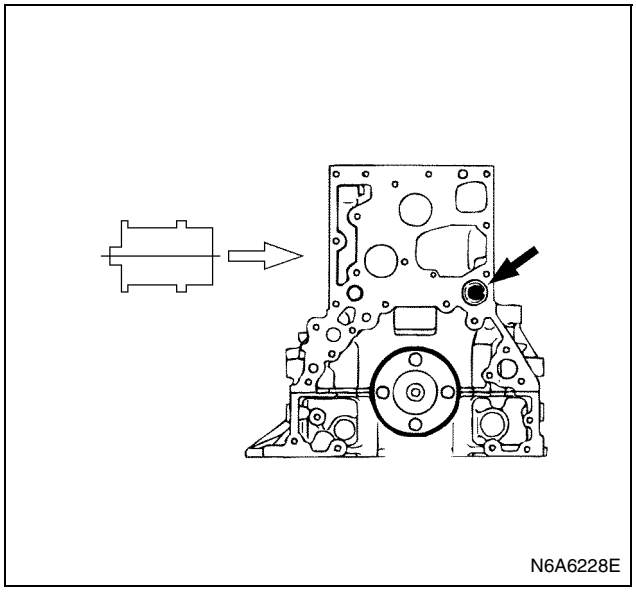
5. Remove the oil cooler bypass valve.
   - Pull out the oil cooler bypass valve from the cylinder block.



N6A6227E

Installation

1. Install the oil cooler bypass valve.
   - Insert the oil cooler bypass valve into the cylinder block. Be sure not to insert in a wrong direction.



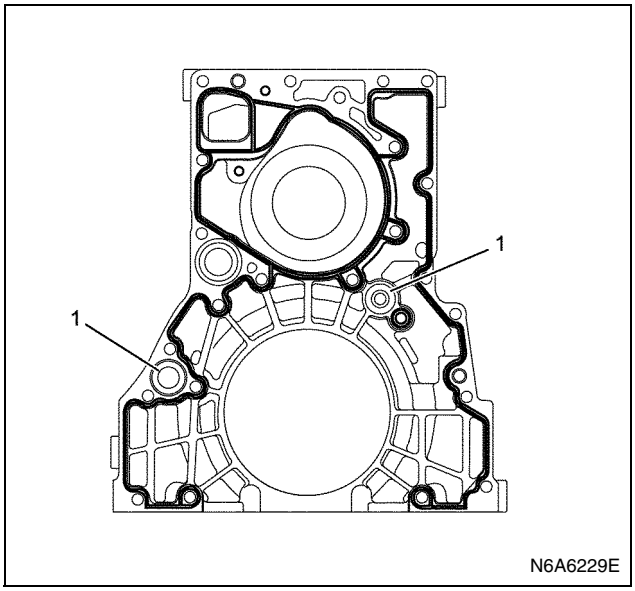
N6A6228E

2. Install the front cover.
   - Clean the cylinder block front surface. In particular, remove liquid gasket leaked during installation of the crankcase.
   - Install two O-rings and apply liquid gasket (ThreeBond 1207B, 1207C, 1207F or equivalent) along with the groove of the front cover installation surface.

Beat width:	1.5 – 5mm (0.059 – 0.20 in)
Beat height:	0.3 – 1.5mm (0.012 – 0.059 in) from the joint surface

- Install within seven minutes after applying liquid gasket.

Caution:
Apply liquid gasket so that it does not adhere to the O-ring.



Legend
1. O-ring

- Install the front cover to match with the dowel pins of the cylinder block.

Caution:
Along with the front cover, install the water pump assembly (before liquid gasket becomes dry)

Tighten:
Front cover bolt to 24 N·m (2.4 kg·m/18 lb·ft)

- Tighten bolts with (*) mark together with the adjust plate of the generator.
- Tighten the oil relief valve (5) with the designated torque.

Tighten:
Oil relief valve to 39 N·m (4.0 kg·m/29 lb·ft)

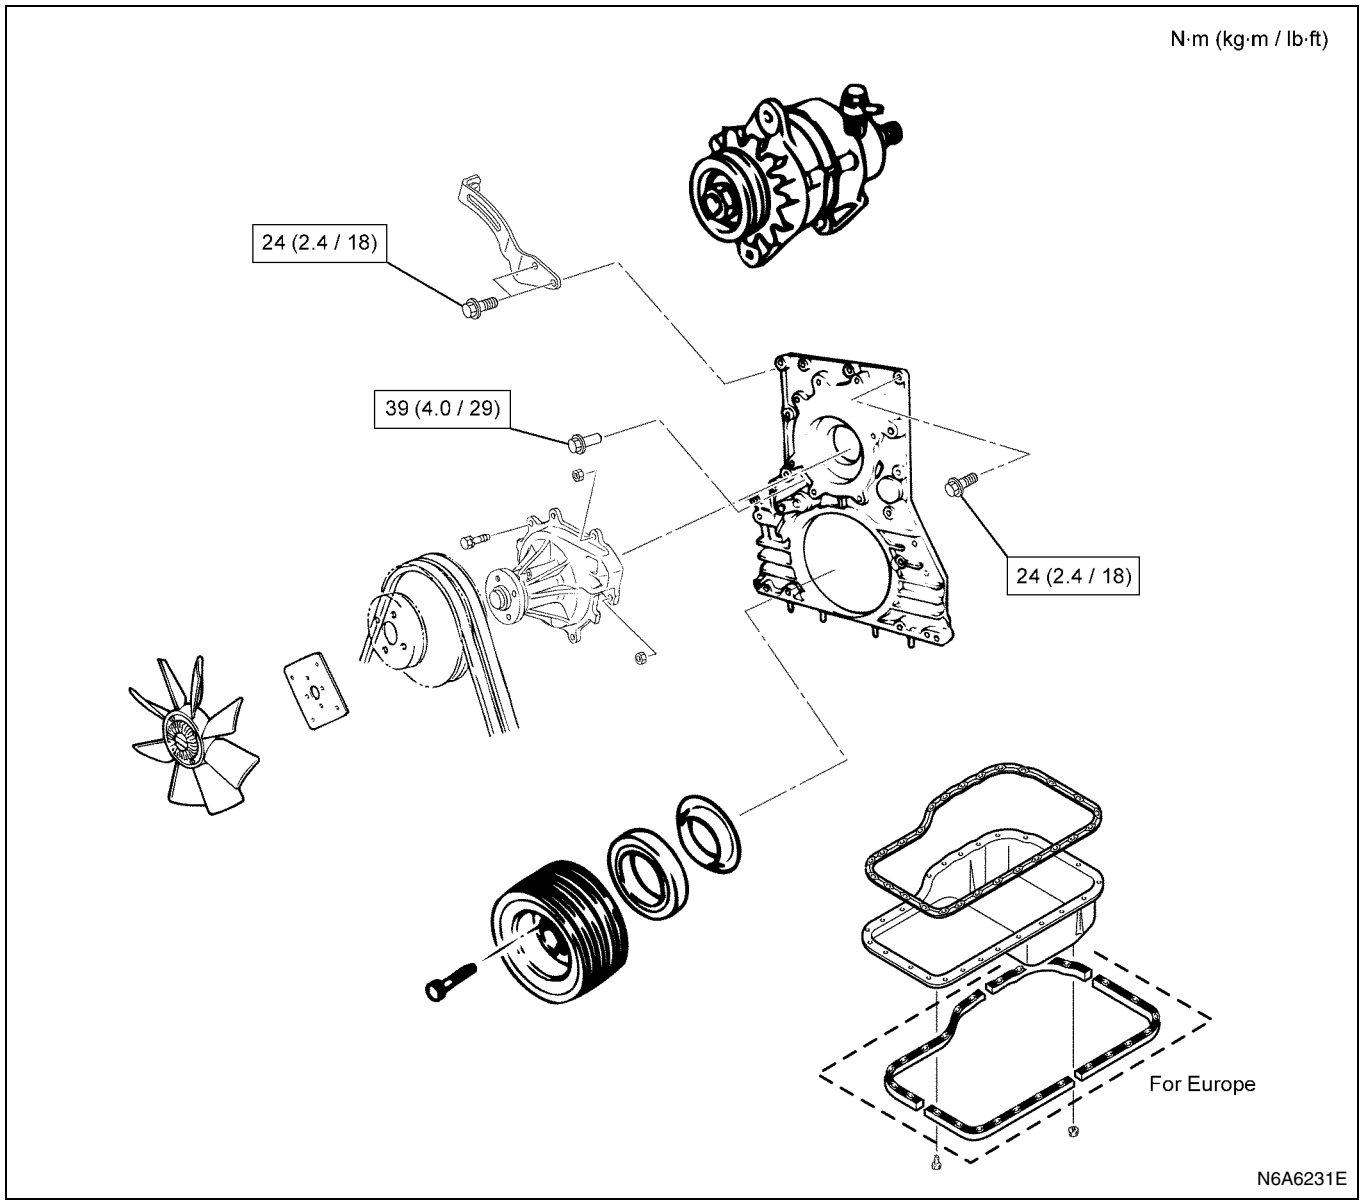
4. BOLT : L = 30 mm (1.18 in)
5. Oil Relief Valve

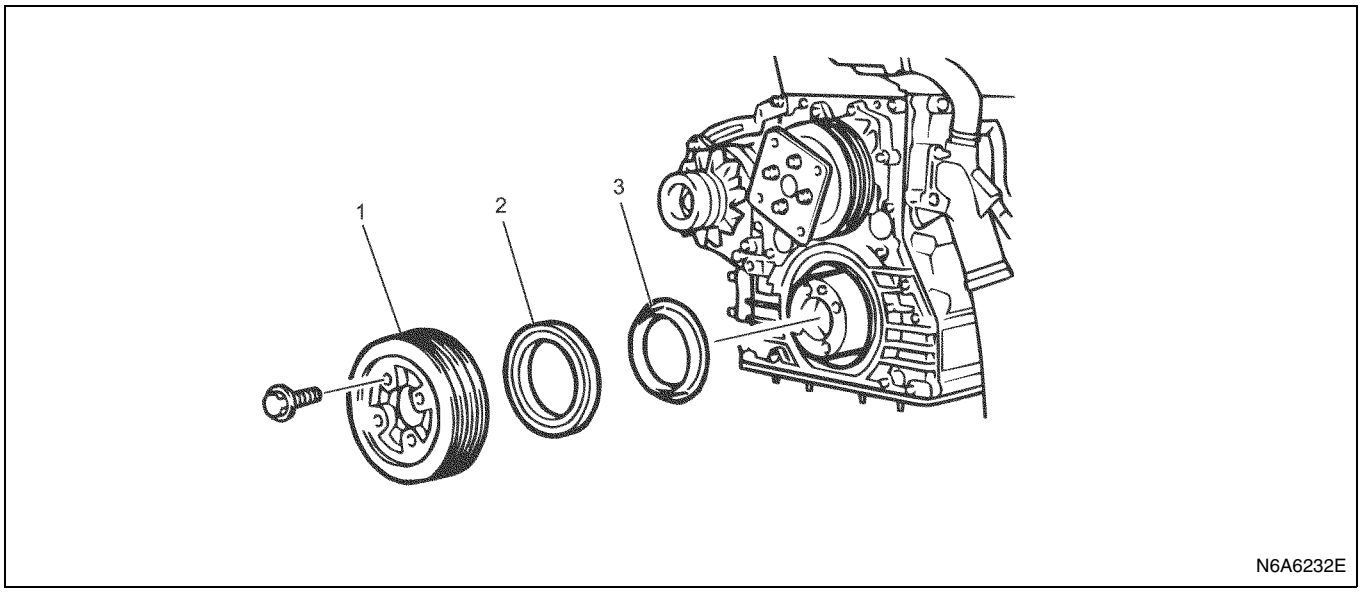
3. Install the water pump.
   Refer to “Water Pump” in Section 6B.
4. Install the oil pan.
   Refer to the “Oil Pan”.
5. Install the front oil seal.
   Refer to the “Crankshaft Front Oil Seal”.

Torque Specifications



Crankshaft Front Oil Seal

Component



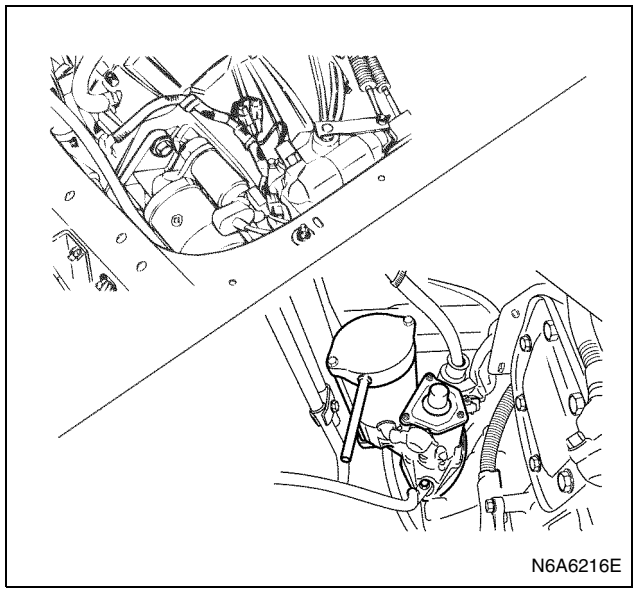
Legend

1. Crankshaft Pulley
2. Crankshaft Front Oil Seal
3. Crankshaft Front Slinger

Removal

1. Drain coolant.
2. Remove the starter.
   - Disconnect the starter ground cable.
   - Disconnect the front frame harness connector at a position near the transmission control box and unlatch fixing clips from the harness.

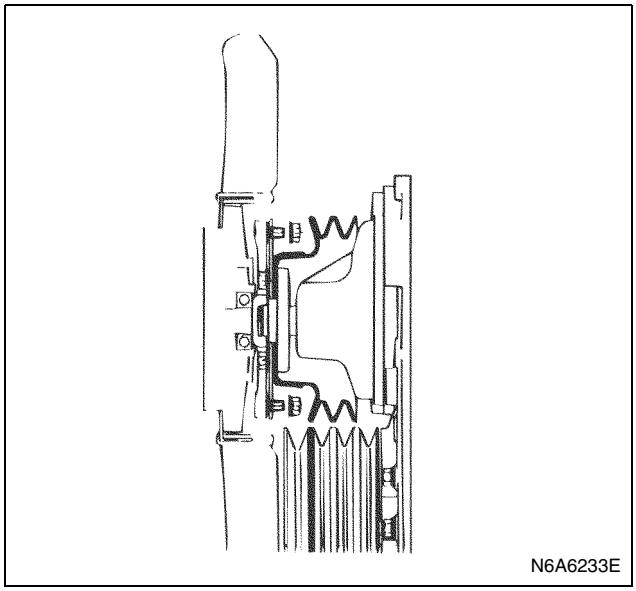
   - Remove two mounting bolts.
   - Fix the detached starter with a wire or the like at a position where it will not be a hindrance to removing the transmission.



3. Disconnect the upper radiator hose on the engine side.
4. Disconnect the coolant reserve tank hose on the radiator side.
5. Disconnect the lower radiator hose on the engine side.
6. Remove the radiator (with the fan guide) detaching right and left brackets.
7. Remove the fan assembly.

- Remove the fan assembly unscrewing four mounting nuts.

8. Remove the fan belt.

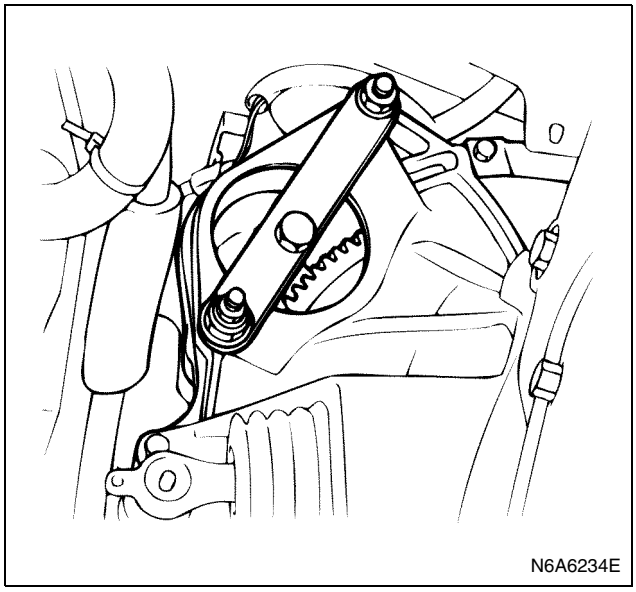


N6A6233E

9. Remove the crankshaft pulley.
   - Loosen the pulley bolts blocking the crankshaft from turning by placing a crankshaft stopper on the starter mounting position on the flywheel housing.

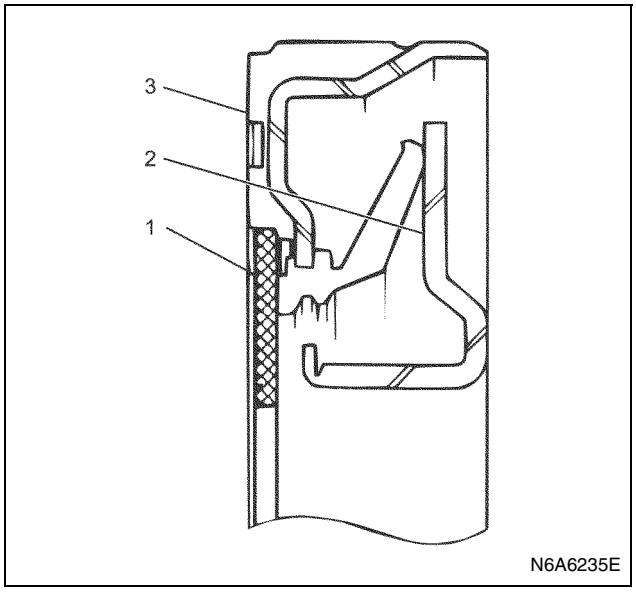
Caution:
Make sure that the stopper is properly fitted and engaged with the ring gear.

Special tool
Crankshaft stopper: 5-8840-2230-0 (EN-47680)



N6A6234E

10. Remove the crankshaft front oil seal.
    - Remove only the oil seal off with a screwdriver or the like avoiding damage to the oil seal contact surface on the front cover and the shaft.

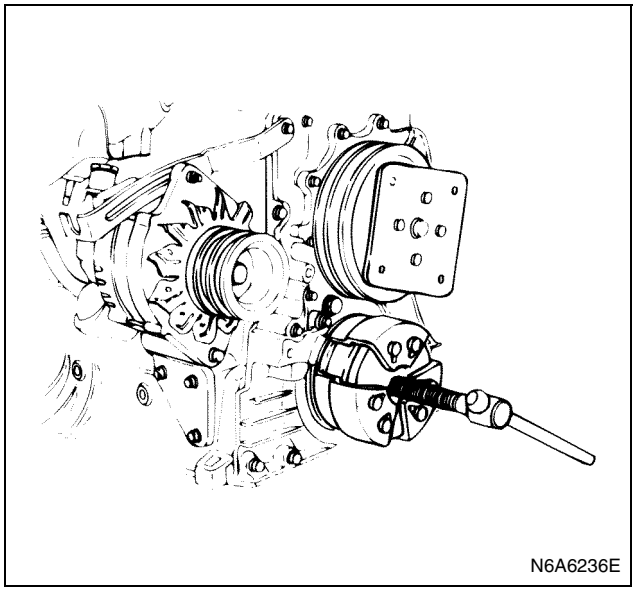


N6A6235E

Legend
1. Felt
2. Slinger
3. Oil Seal

11. Remove the crankshaft front slinger.
    - Pull out the slinger using a slinger puller. (Fixing the circumference of the puller with a clip band will make the procedure easier.)

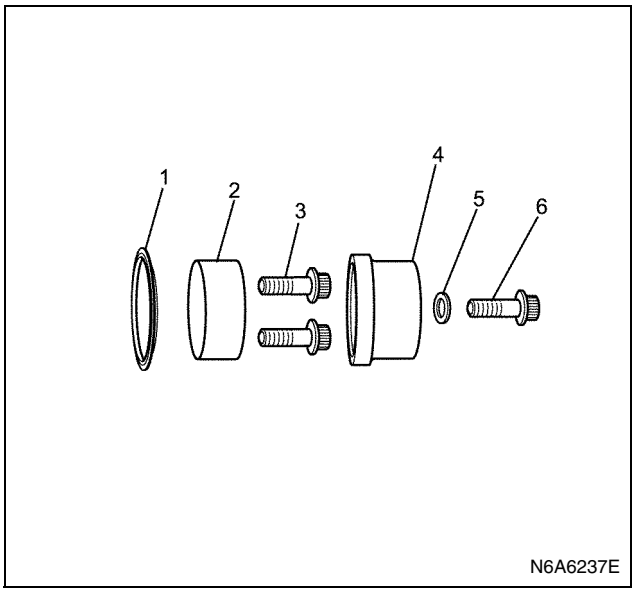
Special tool
Slinger puller: 8-9439-6858-0 (J-43285)



N6A6236E

Installation

1. Install the crankshaft front slinger.
   - Press-fit the slinger using an oil seal installer kit.



Legend
1. Front Slinger
2. Adapter (Front)
3. Fixing Bolt
4. Sleeve (Front)
5. Washer (Front)
6. Center Bolt

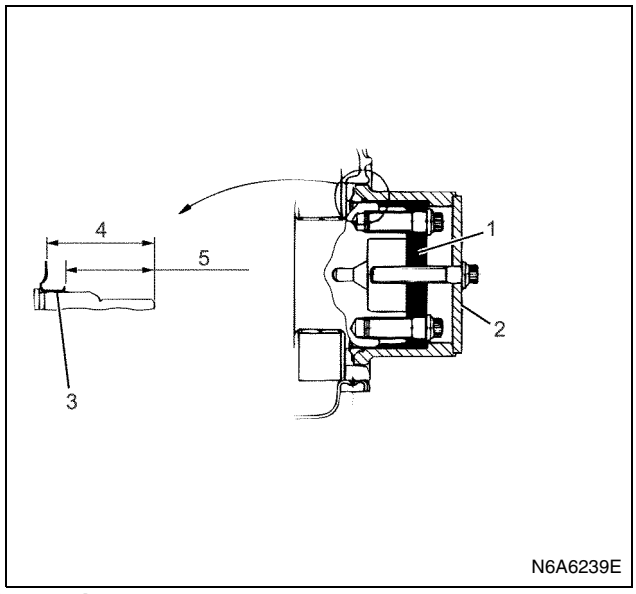
Special tool
Oil seal installer kit: 5-8840-2703-0 (J-43282)
(Use the parts listed below for the front oil seal.)

No.	Part Name	Slinger	Oil seal
1	Sleeve (front)	O	O
2	Adapter (front)	O	O
3	Adapter ring (front)	—	O
4	Washer (front)	O	O
5	Center bolt	O	O
6	Fixing bolt	O	O

   - Insert the front slinger into the end of the adapter and fit them on the crankshaft.
   - Put the sleeve over the adapter, place a washer on the center bolt and tighten the bolt until the sleeve touches the adapter to press fit the front slinger.

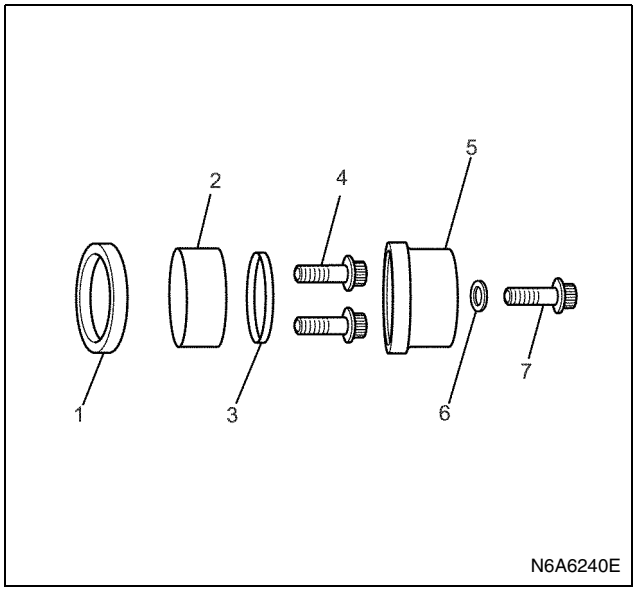
   - After you have pressed the front slinger, confirm the measurement shown (depth from the end surface of the crankshaft to the flange of the slinger) and check for deflection of the slinger.

Caution:
Be careful not to put the slinger inside out or mistake front side slinger for rear one, and vice versa. Rear side slinger has four right-hand threads on it while front one has four left-hand threads. Slinger and oil seal should always be replaced in pairs.



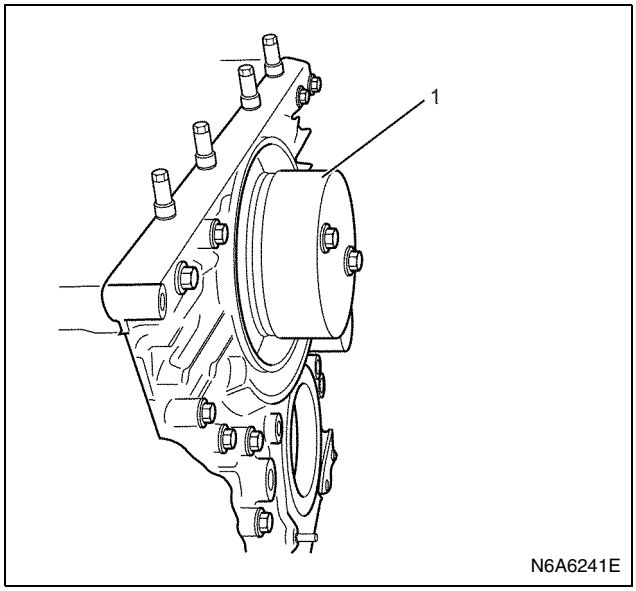
Legend
1. Adapter
2. Sleeve
3. Slinger
4. 40.5 ± 0.3 mm (1.594 ± 0.012 in)
5. 34 ± 0.1 mm (1.339 ± 0.004 in)

2. Install the crankshaft front oil seal.
   - Press fit the oil seal using an oil seal installer kit.



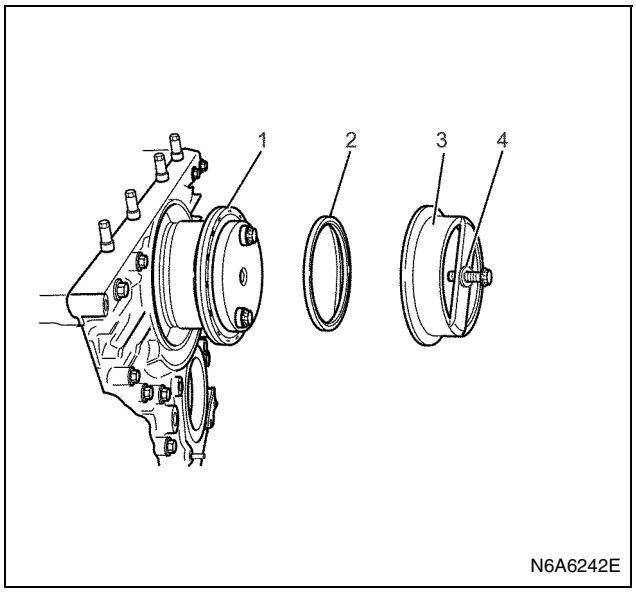
Legend
1. Oil Seal
2. Adapter (Front)
3. Adapter Ring (Front)
4. Fixing Bolt
5. Sleeve (Front)
6. Washer (Front)
7. Center Bolt

   - Mount the adapter onto the crankshaft with fixing bolts.

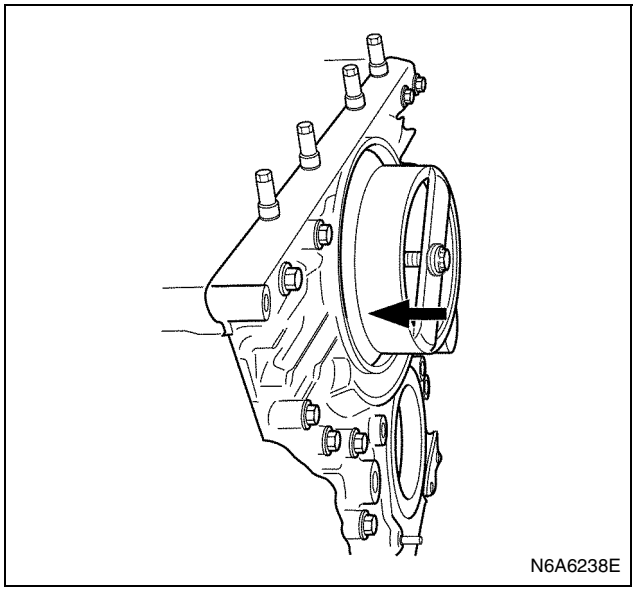


Legend
1. Adapter

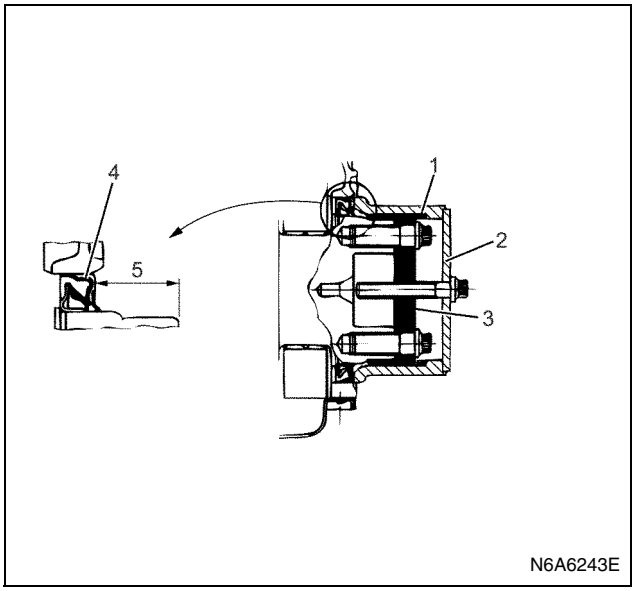
   - Apply engine oil to the lip of the oil seal and place it on the front side adapter.
   - Put the front side adapter ring in the sleeve and fix the sleeve on the adapter with the center bolt and a washer.
   - Tighten the bolt until the sleeve touches the adapter to press fit the front oil seal.



Legend
1. Oil Seal
2. Adapter Ring
3. Sleeve
4. Bolt and Washer



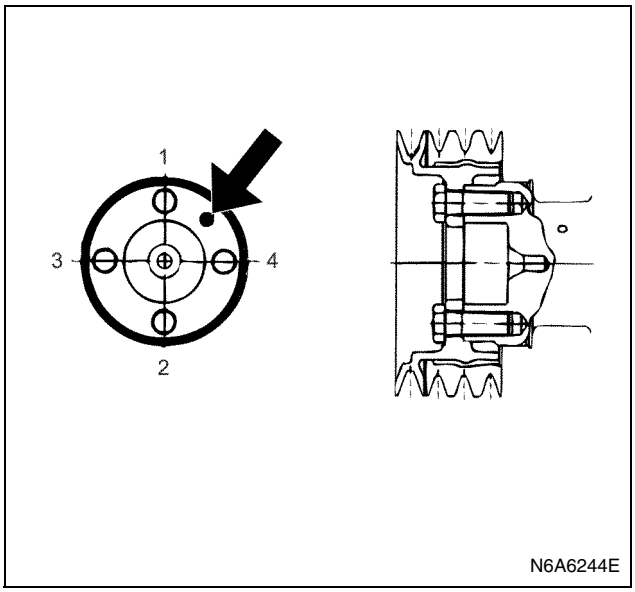
- After you have press-fitted the front oil seal, confirm the measurement shown (depth from the end surface of the crankshaft to the oil seal) and check for deflection of the oil seal.



Legend
1. Adapter Ring
2. Sleeve
3. Adapter
4. Oil Seal
5. 31 ± 0.3 mm (1.220 ± 0.012 in)

3. Install the crankshaft pulley.
   - Apply engine oil to the threads of the fastening bolts.
   - Install the crankshaft pulley aligning with the dowel pins on the crankshaft.
   - Tighten in the sequence shown.

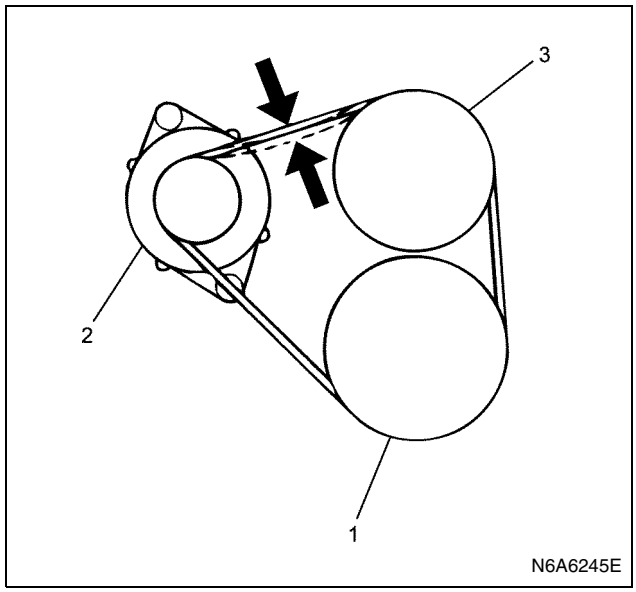
Tighten:
Bolt to 200 N·m (20.4 kg·m/148 lb·ft)



4. Install the fan belt.
   - When adjusting the fan belt, you should also adjust ACG belt and air conditioner belt at the same time.
   - Fit the fan belt and adjust the tension following the below procedures.
   - Refer to “Drive Belt” in Section 6B for details of the belt tension adjustment.

   a. Inspection of fan belt deflection
      - Check with a scale if the belt deflection is within the specified limits when pressure of 98 N (22 lb) is applied mid-way along the belt’s longest run. Also check the belt for damage.

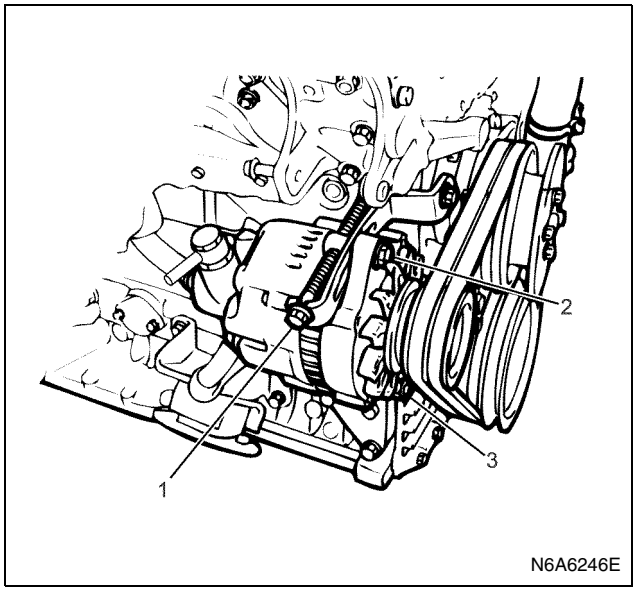
Fan belt deflection	mm (in)
New belt	8 – 12 (0.31 – 0.47)
Reused belt	10 – 14 (0.39 – 0.55)
A/C belt deflection	mm (in)
New belt	16 – 20 (0.630 – 0.787)
Reused belt	18 – 22 (0.709 – 0.866)



Legend
1. Crankshaft Pulley
2. Generator
3. Fan Pulley

   b. Adjustment of the fan belt
      - Loosen (2) and (3), adjust the fan belt moving the generator.

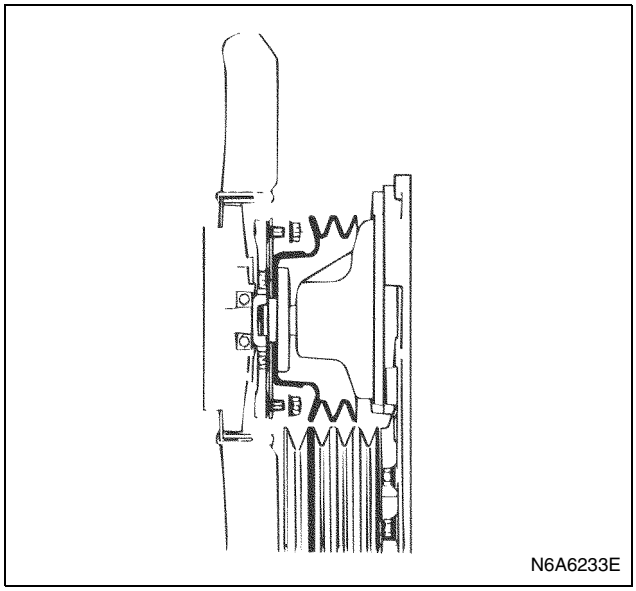
Tighten:
Bolt (2) to 24 N·m (2.4 kg·m/18 lb·ft)
Bolt (3) to 40 N·m (4.1 kg·m/30 lb·ft)



Legend
1. Adjustment Bolt
2. Fixing Nut
3. Fixing Bolt

5. Tighten the fan assembly to the specified tightening torque.

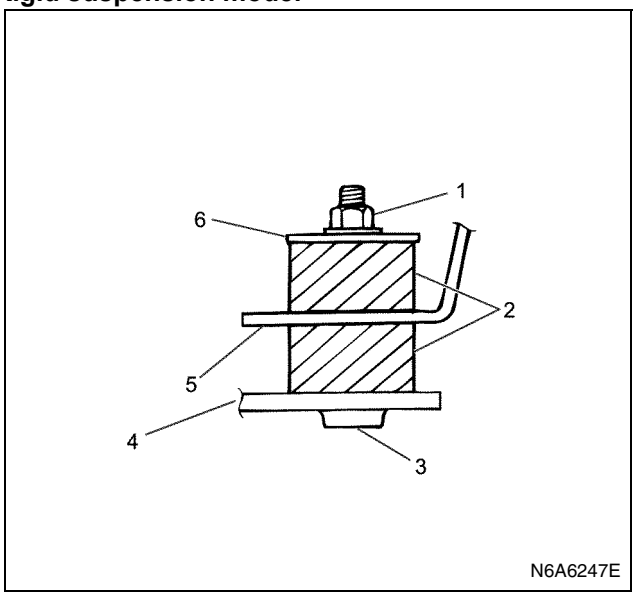
Tighten:
Nuts to 24 N·m (2.4 kg·m/18 lb·ft)



6. Install the radiator.
   - Attach right and left brackets of the radiator to the brackets on the frame as illustrated.

Tighten:
Brackets to 55 N·m (5.6 kg·m/41 lb·ft)

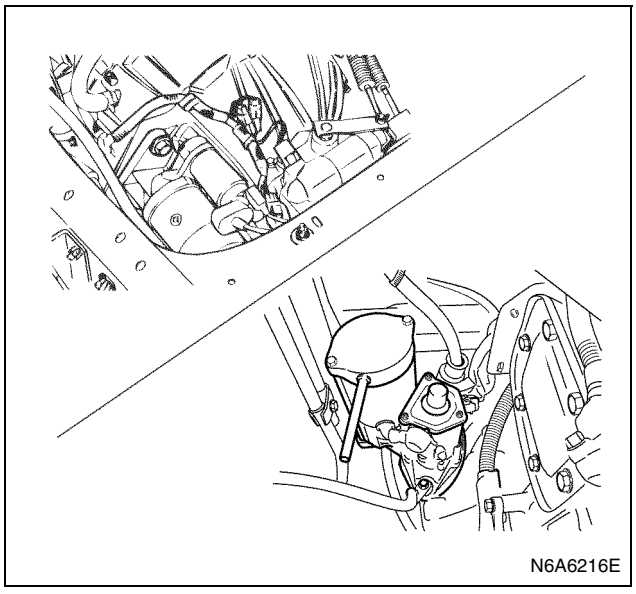
Rigid suspension model



Legend
1. Flange Nut
2. Rubber
3. Stud Bolt
4. Frame Side Bracket
5. Radiator Side Bracket
6. Washer

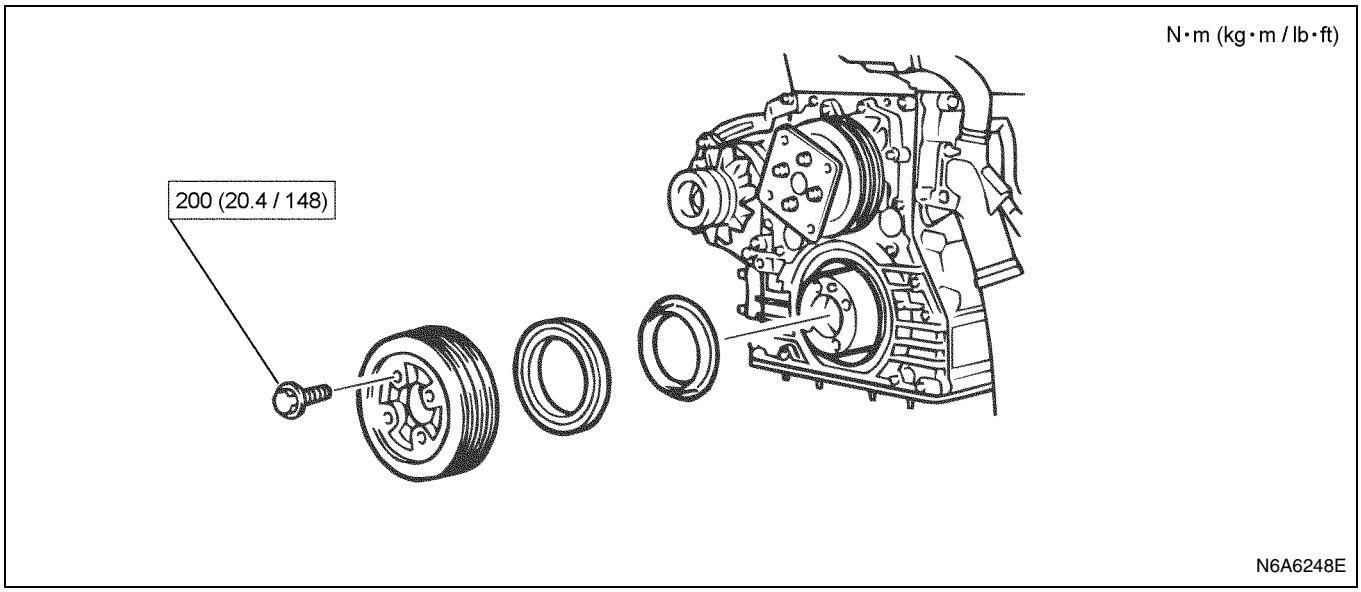
7. Connect the lower radiator hose.
8. Connect the coolant reserve tank hose.
9. Connect the upper radiator hose.
10. Install the starter in the clutch housing with bolts and tighten to the specified tightening torque.

Tighten:
Bolt to 76 N·m (7.7 kg·m/56 lb·ft)
   - Connect the starter ground cable.
   - Connect the front frame harness connector.



11. Refill the radiator with coolant.

Torque Specifications



Special Tool

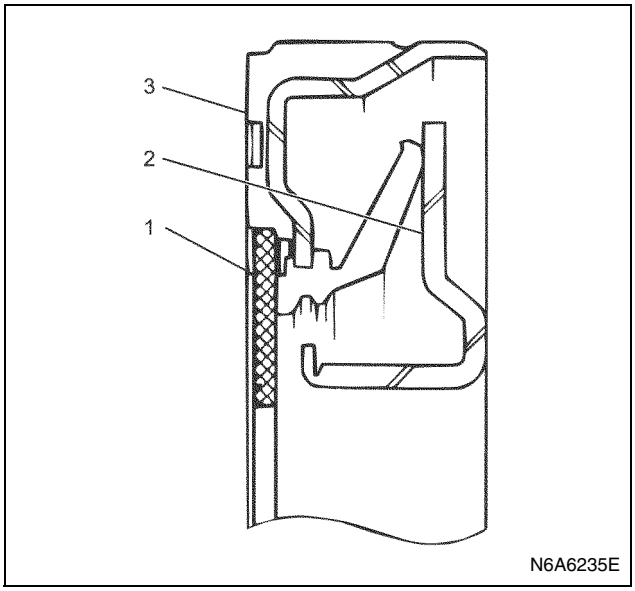
2. Transmission Assembly
3. Clutch Pressure Plate Assembly (MT)
4. Clutch Plate Assembly (MT)
5. Flywheel (MT)
6. Crankshaft Rear Oil Seal
7. Crankshaft Rear Slinger
8. Flexible Plate (Smoother)
9. Crankshaft End Spacer (Smoother)

Removal

1. Remove the flywheel.
   Refer to “Flywheel”.
2. Remove the crankshaft rear oil seal.

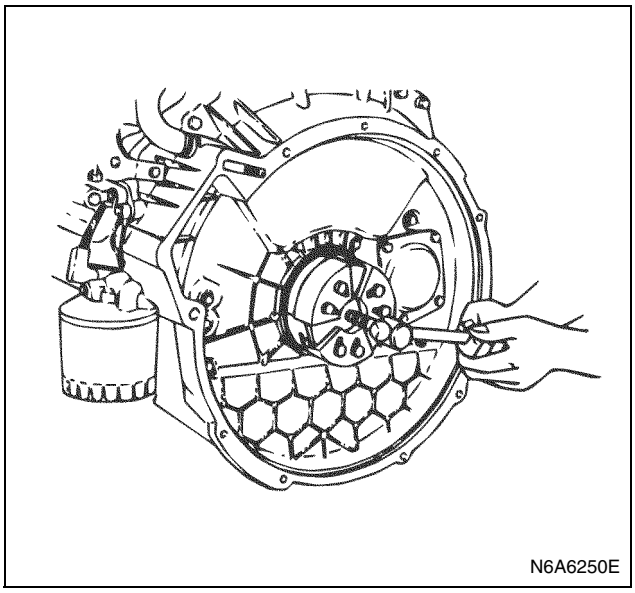
- Remove only the oil seal off with a screwdriver or the like avoiding damage to the oil seal contact surface on the flywheel housing and the shaft.



Legend
1. Felt
2. Slinger
3. Oil Seal

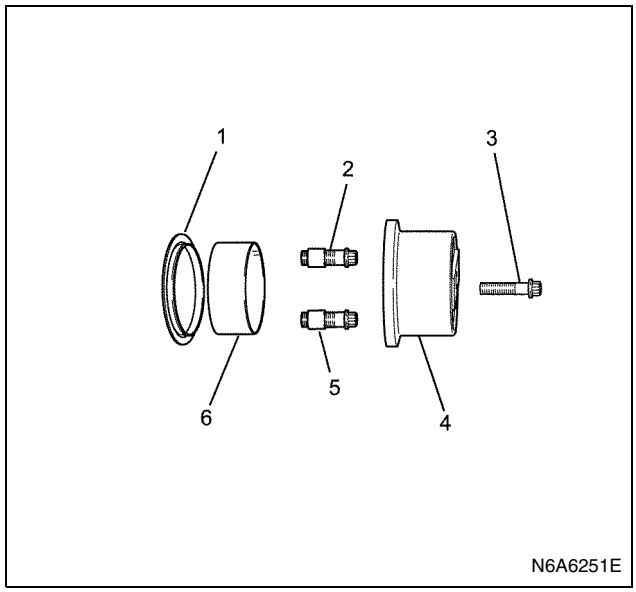
3. Remove the crankshaft slinger.
   - Pull out the slinger using a slinger puller. (Fixing the circumference of the puller with a clip band will make the procedure easier.)

     Special tool
     Slinger puller: 8-9439-6858-0 (J-43285)



Installation

1. Install the crankshaft rear slinger.
   - Press fit the rear sling using the oil seal installer kit.

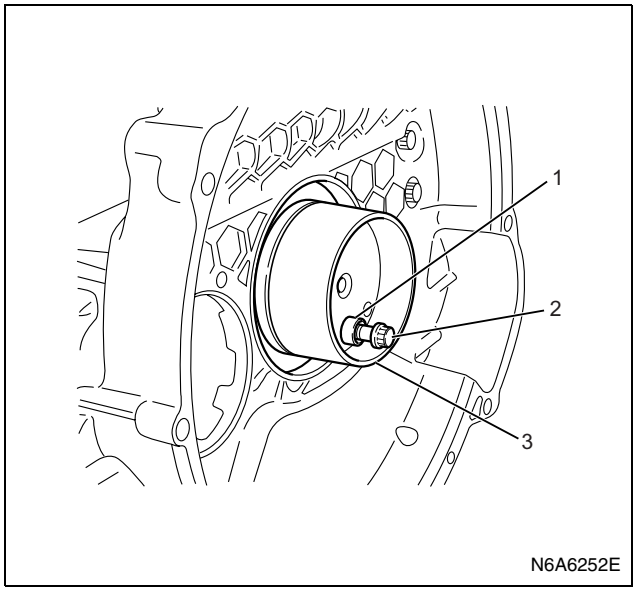


Legend
1. Rear Slinger
2. Fixing Bolt
3. Center Bolt
4. Sleeve (Rear)
5. Collar (Rear)
6. Adapter (Rear)

Special tool
Oil seal installer kit: 5-8840-2703-0 (J-43282)

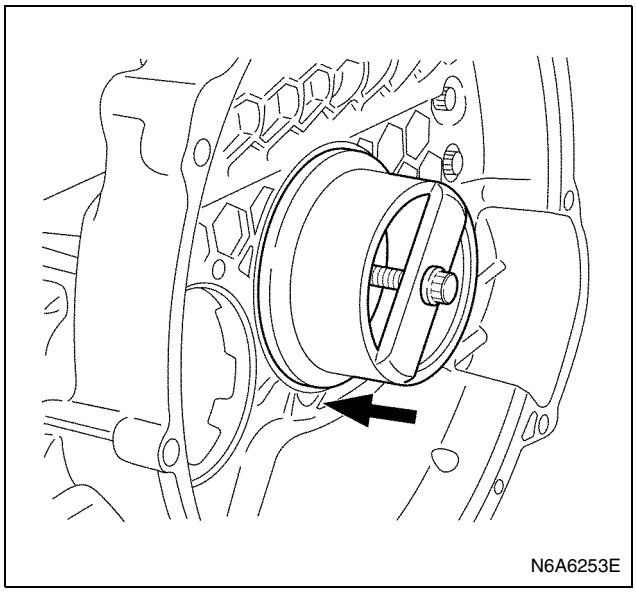
No.	Part Name	Slinger	Oil seal
1	Sleeve (rear)	○	○
2	Adapter (rear)	○	○
3	Collar (rear)	○	○
4	Adapter ring (rear)	—	○
5	Center bolt	○	○
6	Fixing bolt	○	○

- Insert the rear slinger into the end of the rear side adapter and mount the adapter on the crankshaft with the fixing bolt with a collar placed on it.



Legend
1. Collar
2. Fixing Bolt
3. Adapter

- Put a sleeve over the adapter and tighten the center bolt until the sleeve touches the adapter to press fit the rear slinger.



- After you have press-fitted the rear slinger, confirm the measurement shown (depth from the end surface of the crankshaft to the slinger) and check for deflection of the slinger.

Caution:
Be careful not to put the slinger inside out or mistake the front slinger for the rear one, and vice versa. Rear side slinger has four right-hand threads on it while front one has four left-hand threads. Slinger and oil seal should always be replaced in pairs.

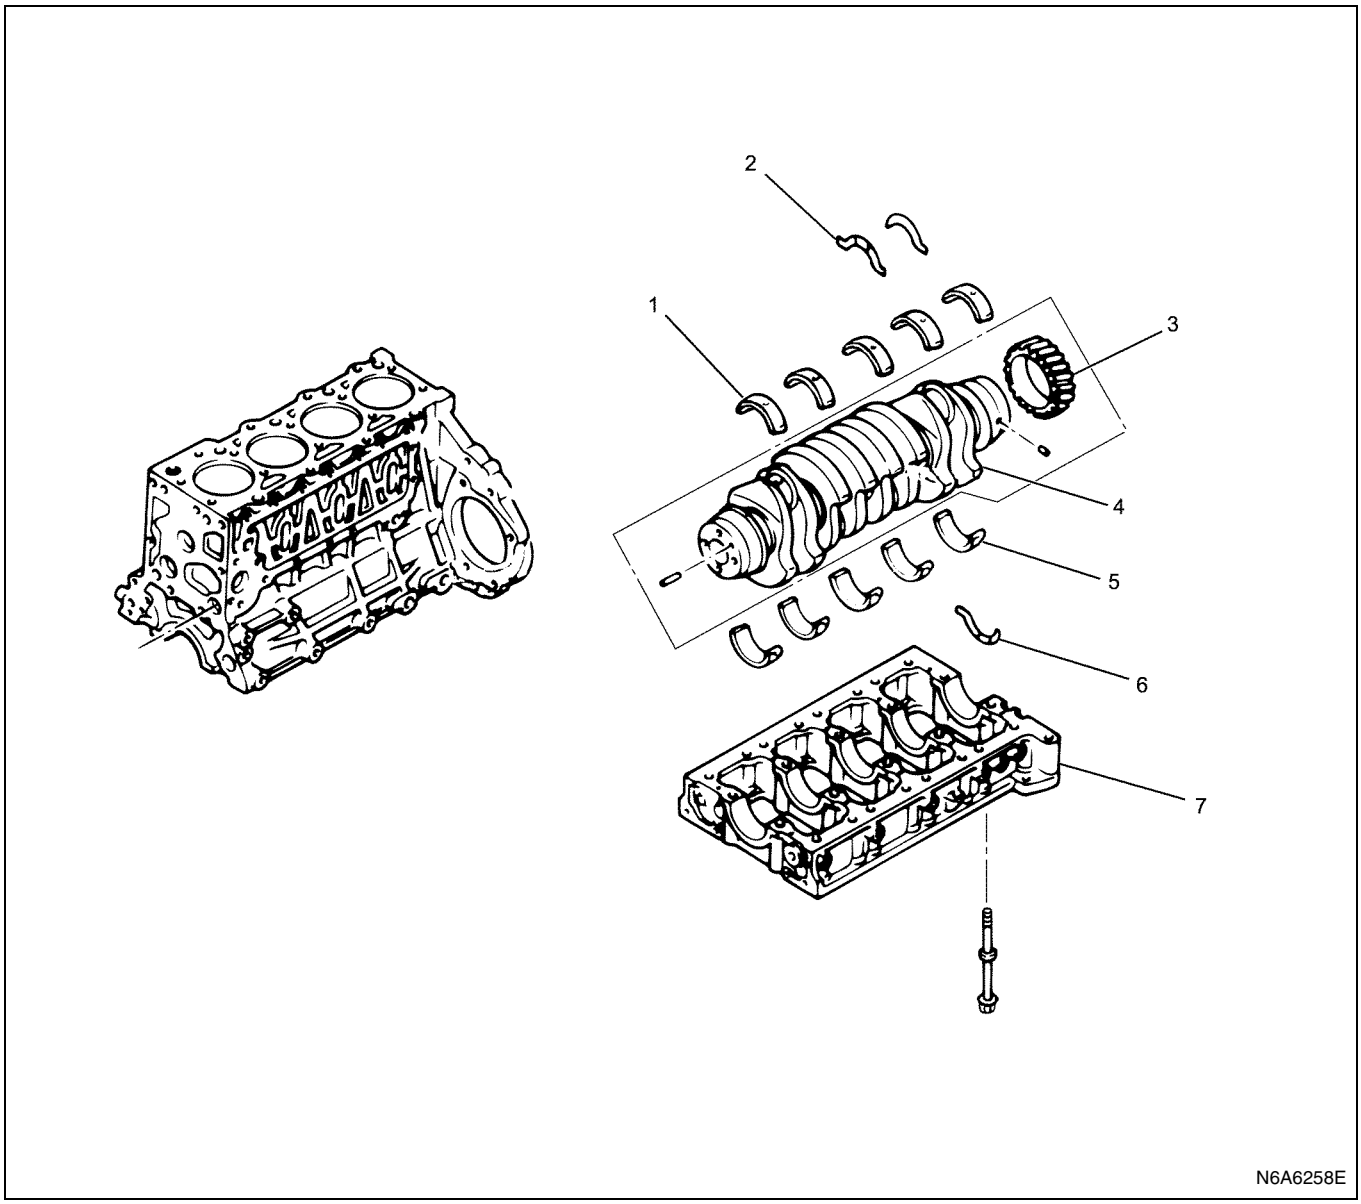
Crankshaft

Component



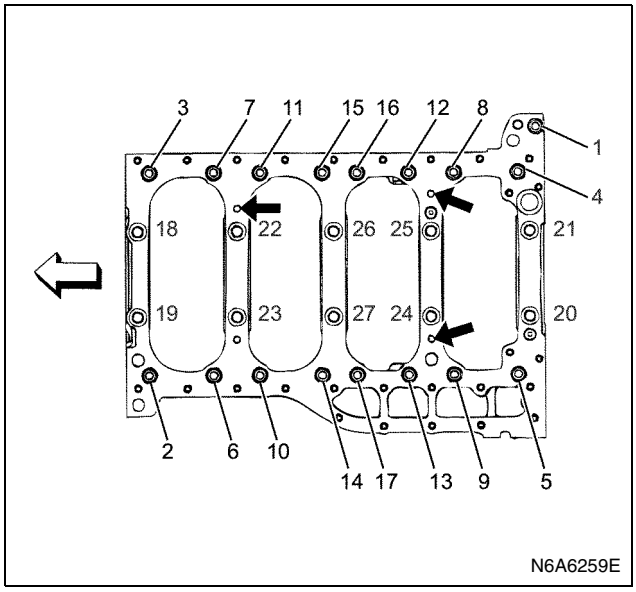
Legend

1. Upper Bearing
2. Upper Thrust Bearing
3. Gear
4. Crankshaft
5. Lower Bearing
6. Lower Thrust Bearing
7. Crankcase

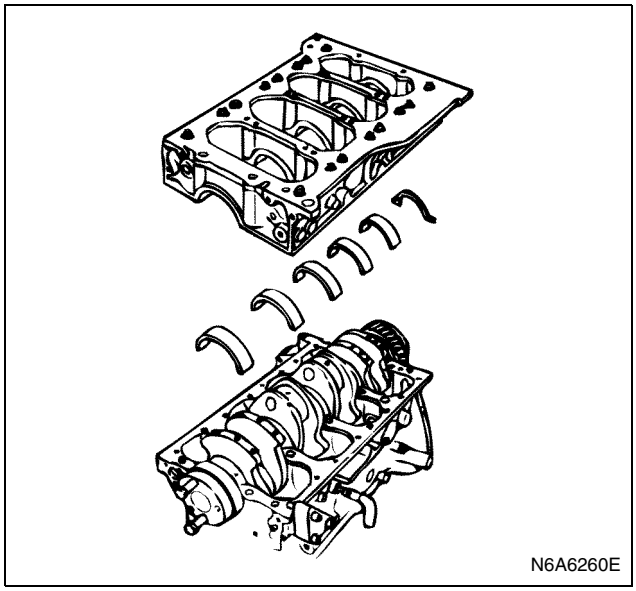
Removal

1. Demount the engine assembly.
   Refer to “Engine Assembly”.
2. Remove the cylinder head cover.
   Refer to “Cylinder Head Cover”.
3. Remove the rocker arm shaft.
   Refer to “Rocker Arm Shaft Assembly”.
4. Remove the camshaft.
   Refer to “Camshaft Assembly”.
5. Remove the cylinder head.
   Refer to “Cylinder Head”.
6. Remove the fuel supply pump.
   Refer to “Fuel Supply Pump” in Section 6C.
7. Remove the crankshaft front oil seal.
   Refer to “Crankshaft Front Oil Seal”.
8. Remove the crankshaft rear oil seal.
   Refer to “Crankshaft Rear Oil Seal”.
9. Remove the oil pan.
   Refer to the “Oil Pan”.

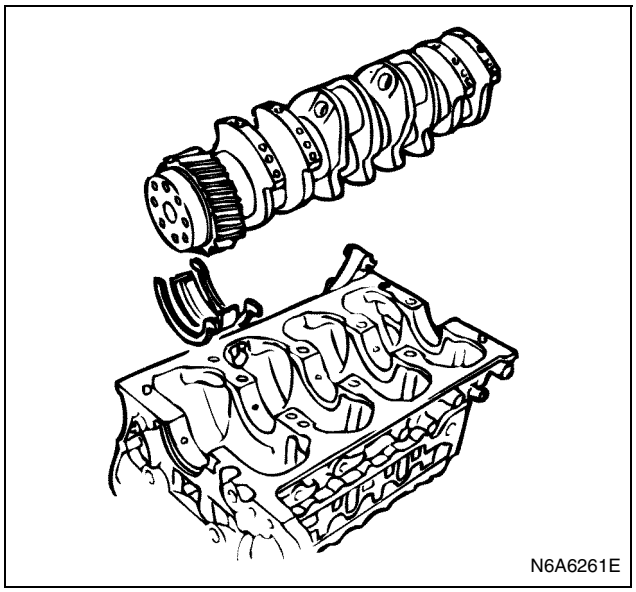
10. Remove the water pump.
    Refer to “Water Pump” in Section 6B.
11. Remove the front cover.
    Refer to “Front Cover”.
12. Remove the timing gear train.
    Refer to “Timing Gear Train”.
13. Remove the oil pump.
    Refer to “Oil Pump”.
14. Remove pistons and connecting rods.
    Refer to “Pistons and Connecting Rod”.
15. Remove the crankcase.
    - Gradually loosen crankcase mounting bolts in the sequence shown and remove the crankcase using the three replacer holes (arrowed holes in the figure).



16. Remove the lower thrust bearing.
17. Remove the lower crankshaft bearings.



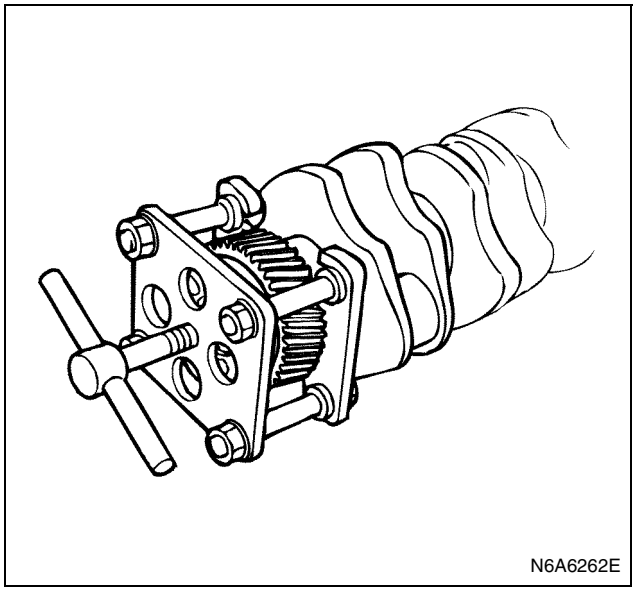
18. Remove the crankshaft assembly.
19. Remove the upper thrust bearing.
20. Remove the upper crankshaft bearings.



Disassembly

1. Remove the gear.
   - Remove the gear using a gear puller.

     Special tool
     Crankshaft gear puller: 8-9439-1097-0 (EN-47684)

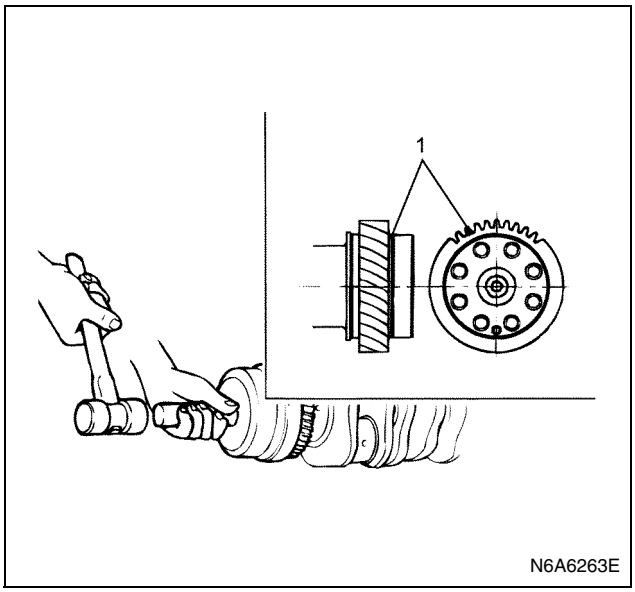


Reassembly

1. Install the gear.
   - Heat the gear to 170 – 250°C (338 – 482°F) and install it aligning the groove on the gear with the pin on the crankshaft.

- Insert the gear at one push into the flange with its end side with the alignment mark “S” facing outward. If you are fitting the gear while it is cold, beat the gear in until it impinges on the end using the installer.

  Special tool
  Crankshaft gear installer: 5-8840-2667-0 (J-41222)



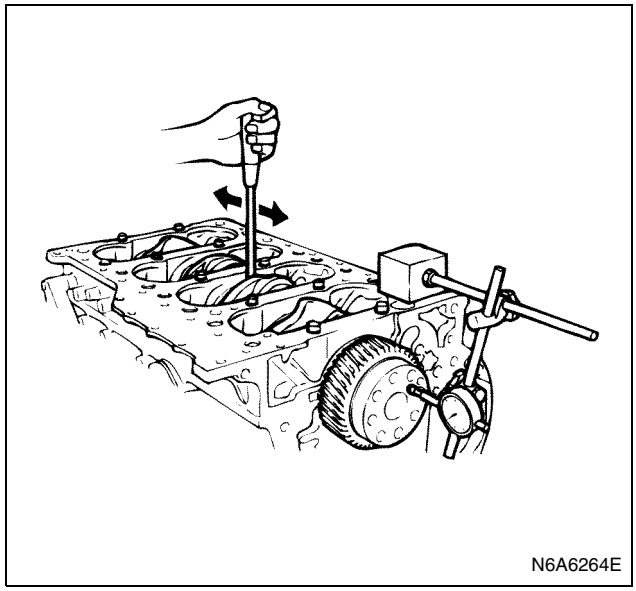
Legend
1. Alignment Mark

Inspection

1. Thrust clearance
   - Set a dial gauge as shown and measure the crankshaft thrust clearance.
   - If the thrust clearance exceeds the limit, replace the thrust bearings in a pair.

Axial play of the crankshaft	mm (in)
Standard	0.104 – 0.205 (0.0041 – 0.0081)
Limit	0.35 (0.0138)

Caution:
Measure the thrust clearance before dismounting.

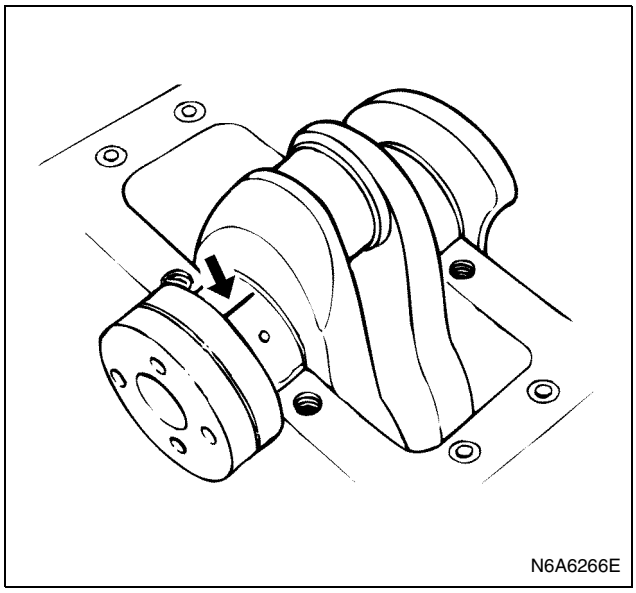


2. Main bearing clearance
   - Remove the crankshaft. Remove the main bearings.
     Set out disassembled main bearings in the order of the numbers.
   - Clean the crankshaft journal upper and lower bearings and upper and lower thrust bearings.
   - Check the bearings for damage or excessive wear. If you find damage or excessive wear in the check, replace the bearings in pairs.
   - Place the upper bearings and the crankshaft on the cylinder block. Install the crankshaft so that it becomes horizontal.

Caution:
Turn the crankshaft about 30 degrees to allow the bearings to settle in.

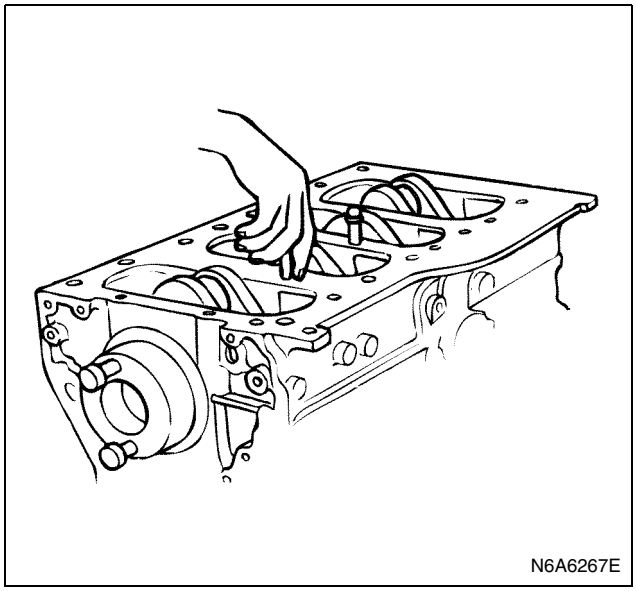
   - Place Plastigage on the crankshaft journal as shown.

- Place the lower bearings at original positions on the crankcase.

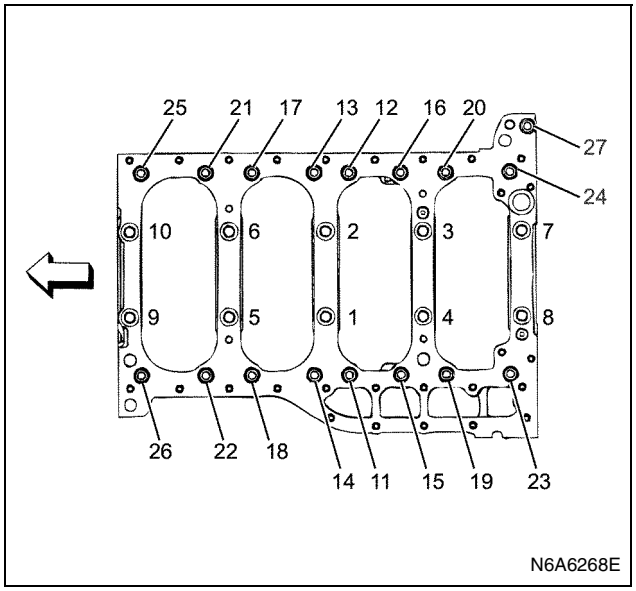


N6A6266E

- Install the crankcase and tighten bolts to the specified tightening torque.
- Tighten the crankcase in the sequence shown using a torque wrench and an angle gauge.



N6A6267E



N6A6268E

Tighten:
M14 bolts (1 – 10) to
1st step: 98 N·m (10.0 kg·m/72 lb·ft)
2nd step: 132 N·m (13.5 kg·m/97 lb·ft)
3rd step: 30° – 60° (degrees)
M10 bolts (11 – 27) to
4th step: 38 N·m (3.9 kg·m/28 lb·ft)

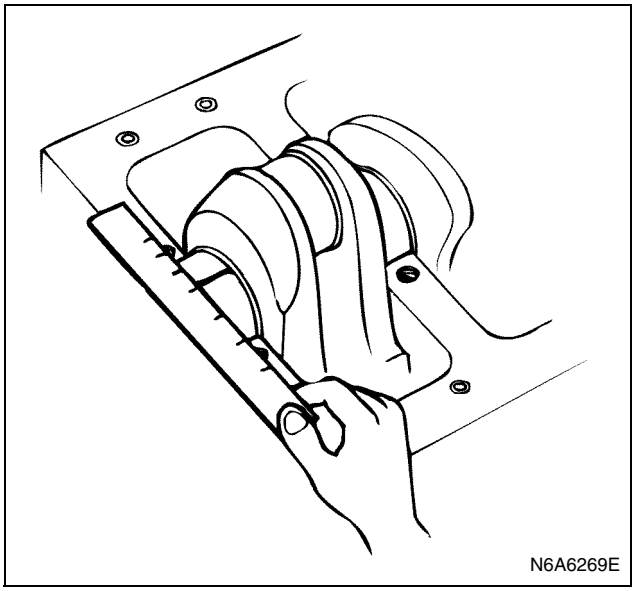
- Tighten the bolts (M14) from 1-10 and confirm that they are tightened to a torque of 167 N·m (17.0 kg·m/123 lb·ft) or more.

  Special tool
  Angle gauge: 5-8840-0266-0 (J-45059)

Caution:
Do not turn the crankshaft after you have tightened the crankcase.

- Loosen the bolts and gently remove the crankcase.
- Measure the widest part of the Plastigage flattened by tightening the crankcase to determine the clearance.

Journal oil clearance		mm (in)
	Standard	Limit
No.1, 2, 4, 5	0.039 – 0.070 (0.0015 – 0.0028)	0.11 (0.0043)
No.3	0.053 – 0.084 (0.0021 – 0.0033)	0.11 (0.0043)



N6A6269E

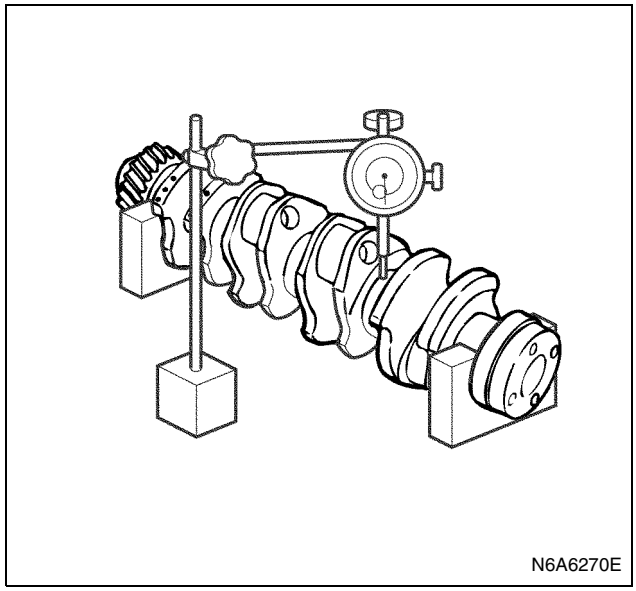
- If the journal oil clearance exceeds the limit, replace the main bearings altogether or the crankshaft.
- Remove the Plastigage from the bearings and the crankshaft.

Inspection of the crankshaft

- Check the crankshaft journal and crank pin surfaces for wear and damage. Check the oil seal contact surface for excessive wear and damage.
- Check the oil port for clogging.

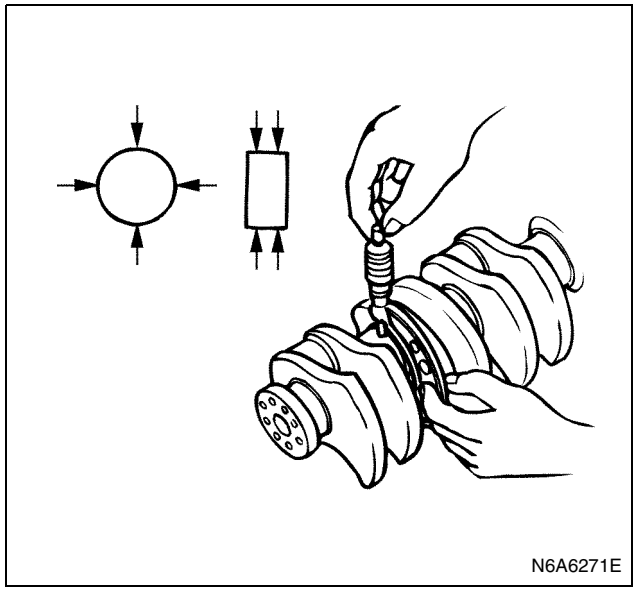
3. Crankshaft run-out
   Carefully set the crankshaft on the V block. Slowly turn the crankshaft to measure the run-out. If the crankshaft run-out exceeds the limit, replace the crankshaft.

Crankshaft run-out	mm (in)
Standard	0.05 or less (0.0020 or less)
Limit	0.30 (0.012)



N6A6270E

4. Measure the journal and the crankpin diameters and uneven wear.
   - Measure outer diameters of the journal and the pin and calculate differences between the maximum and the minimum values. Take measurements at four positions for both the journal and the pin.



N6A6271E

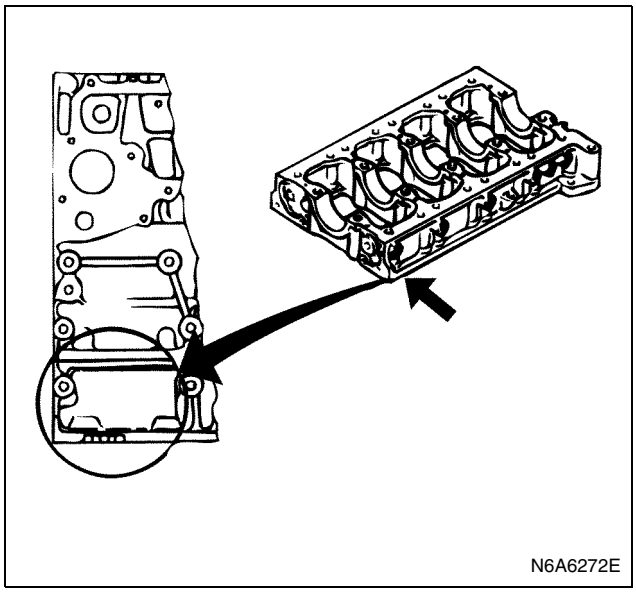
Crankshaft outside diameter		mm (in)
	Standard	Limit
Journal #1, 2, 4, 5	81.905 – 81.925 (3.22460 – 3.22538)	81.85 (3.222)
Journal #3	81.891 – 81.911 (3.22408 – 3.22483)	81.85 (3.222)
Pin	72.902 – 72.922 (2.87015 – 2.87094)	72.850 (2.8681)

Difference	mm (in)
Limit	0.005 (0.0002)

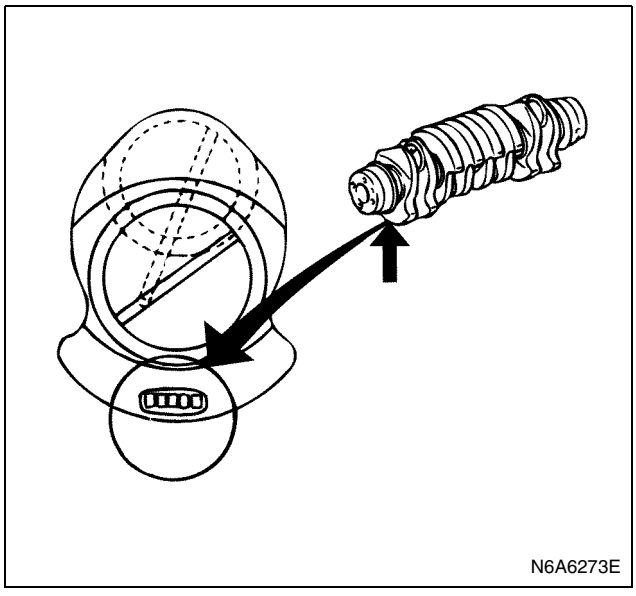
Caution:
Tufftriding (soft nitriding treatment) is applied to enhance strength of the crankshaft. Therefore, do not polish the surface of the crankshaft.

Crankshaft bearing selection

- When installing new crankshaft bearings or replacing bearings in use, make reference to the Bearing Selection Table.
- Select and install new bearings paying close attention to the cylinder block journal internal diameter grade and the crankshaft journal diameter grade.
- Journals are numbered from 1 to 5 from left to right when viewed so that the numbers are in normal reading orientation.

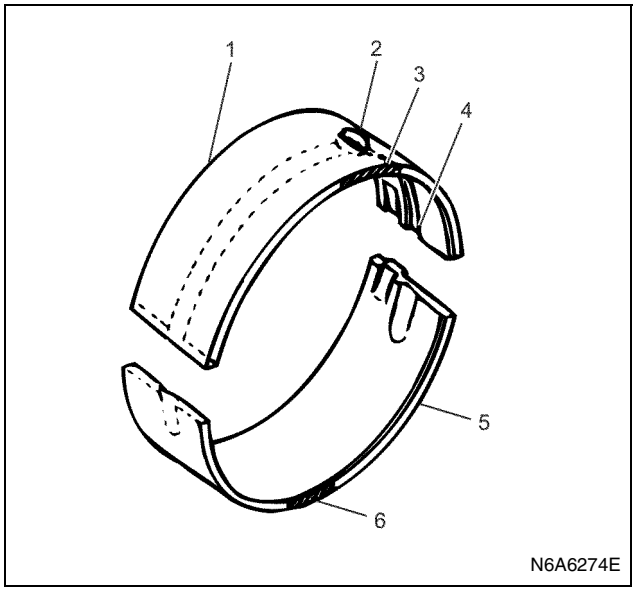


N6A6272E



N6A6273E

Caution:
Be careful about difference in the shape of the bearings when installing them.



N6A6274E

Legend
1. Upper Bearing
2. Oil Gallery
3. Grade Identification Color
4. Oil Groove
5. Lower Bearing
6. Grade Identification Color

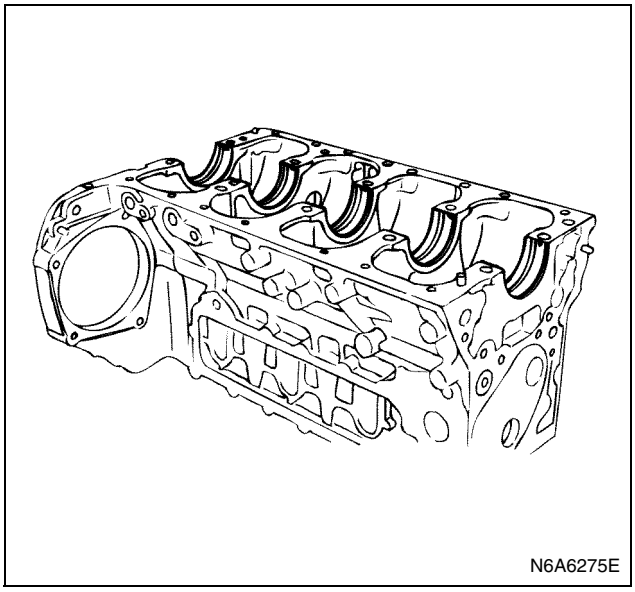
Bearing Selection Table

Combination of grades			Oil clearance mm (in)	
Cylinder block Grade	Crank journal Grade	Bearing identification color	#1, 2, 4, 5	#3
1	1	Black	0.039 – 0.070 (0.00154 – 0.00276)	0.053 – 0.084 (0.00209 – 0.00331)
1	2	Brown	0.037 – 0.068 (0.00146 – 0.00267)	0.051 – 0.082 (0.00201 – 0.00323)
2	1	Blue	0.041 – 0.072 (0.00161 – 0.00283)	0.055 – 0.086 (0.00217 – 0.00339)
2	2	Black	0.039 – 0.070 (0.00154 – 0.00276)	0.053 – 0.084 (0.00209 – 0.00331)

Installation

1. Install the crankshaft upper bearing.
   - Install the upper bearing in the cylinder block and apply oil.

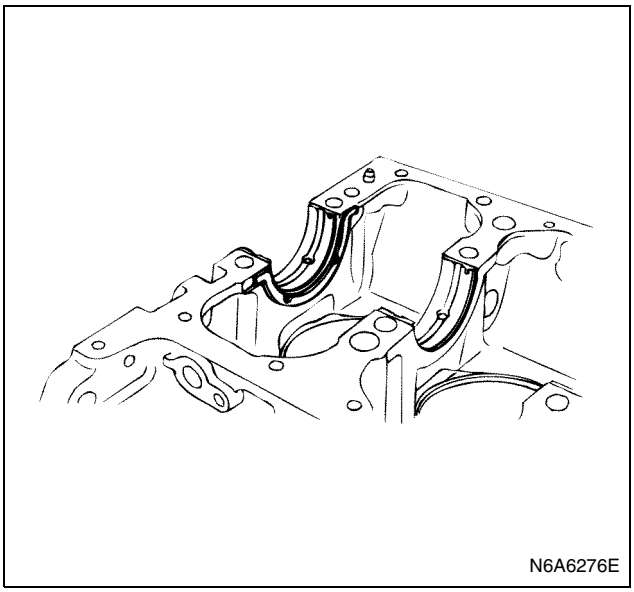
Caution:
When replacing the crankshaft bearings, select grades referring to the Bearing Selection table. Do not apply oil to the bearing installation surface on the cylinder block and external surface of the bearing.



N6A6275E

2. Install the upper thrust bearing.
   - Install the upper thrust bearing in the front side of the cylinder block journal No.5. In doing this, you may attach the upper thrust bearing to the cylinder block with grease. Then, be sure to wipe up excess grease.

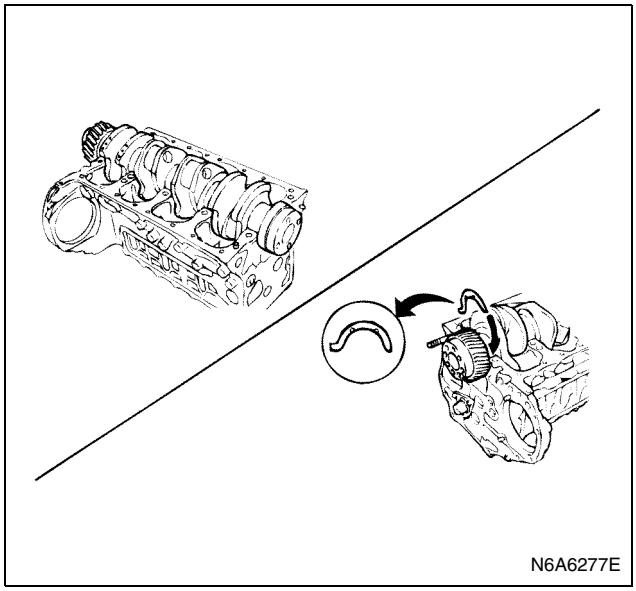
Caution:
Install the thrust bearing so that the oil groove contacts the crankshaft.



N6A6276E

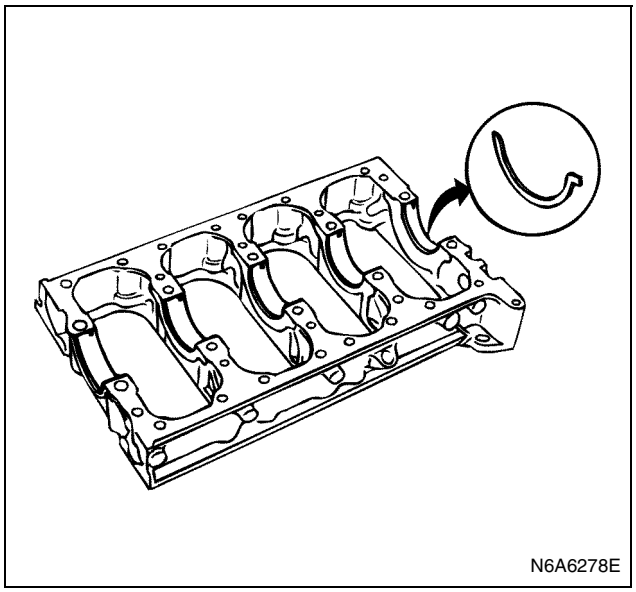
3. Install the crankshaft assembly.
   - Apply engine oil to the crankshaft journal and gently place the crankshaft on the cylinder block.
   - Press the crankshaft to the rear and insert the upper thrust bearing in the rear side of the cylinder block journal No.5.

Caution:
Install the thrust bearing so that the oil groove contacts the crankshaft.



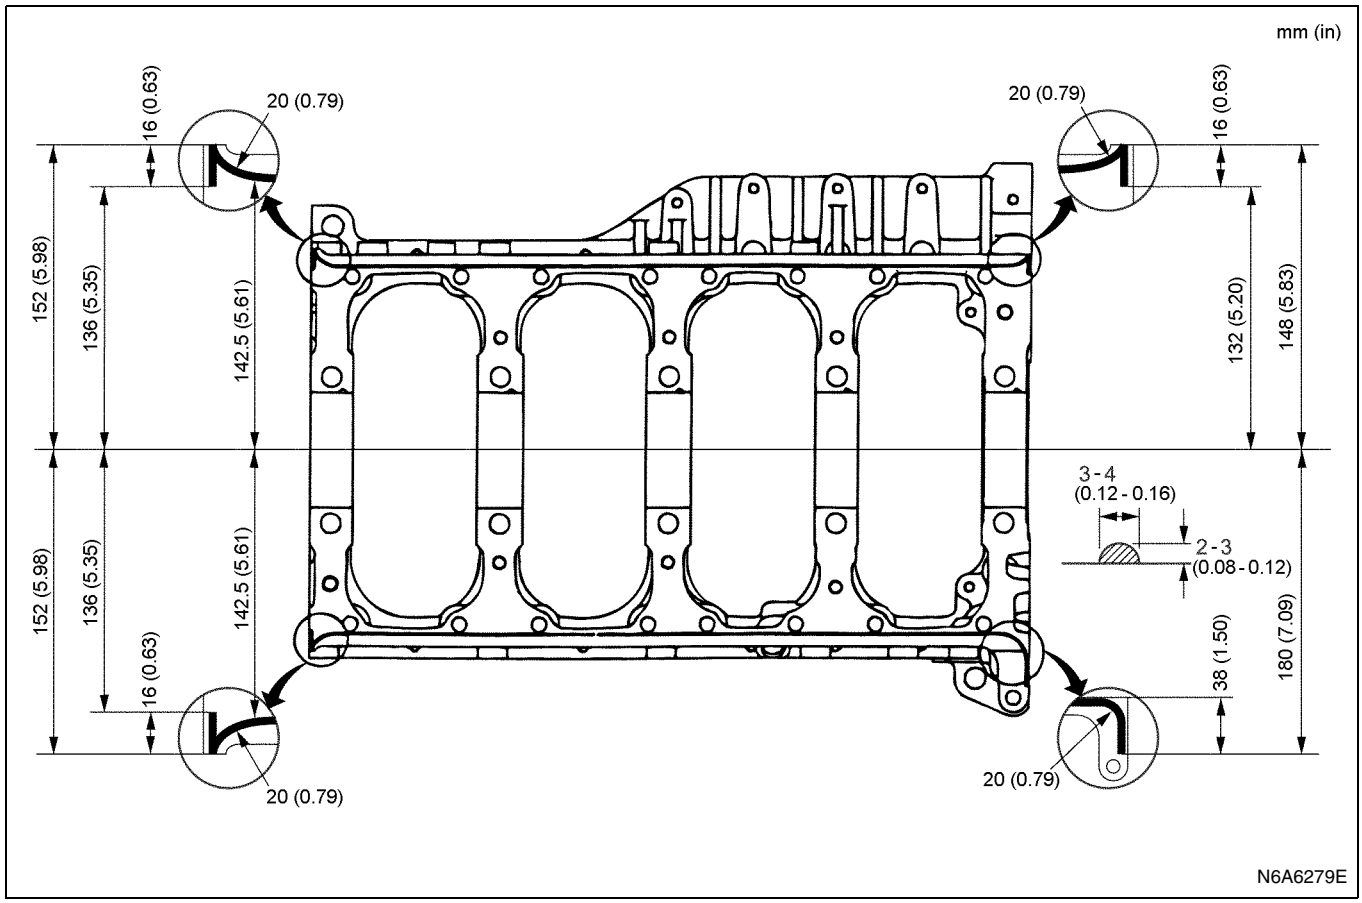
N6A6277E

4. Install the lower crankshaft bearing.
5. Install the lower thrust bearing.
   - Install the lower thrust bearing in the rear side of the crankcase journal No.5.
   - Install the thrust bearing so that the oil groove contacts the crankshaft.



N6A6278E

6. Install the crankcase.
   - Apply liquid gasket (ThreeBond 1207C or equivalent) to the crankcase forming beads with diameters of 3 – 4 mm (0.12 – 0.16 in).
   - Install the crankcase within 7 minutes after you have applied the liquid gasket.
   - Gently place the crankcase on the cylinder block.



N6A6279E

   - Apply Molybdenum Disulfide to M14 bolt's threads and setting faces and tighten them to the specified tightening torque in the sequence shown.

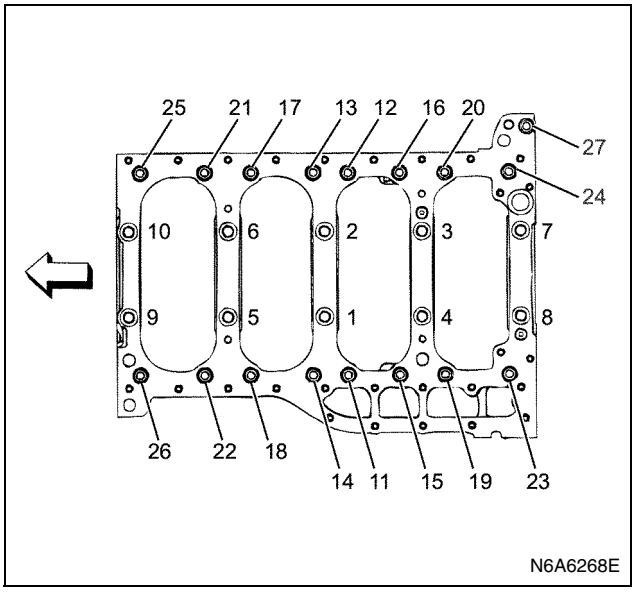
- Do not apply any oil to M10 bolts.

Tighten:
M14 bolts (1 – 10) to
1st step: 98 N·m (10.0 kg·m/72 lb·ft)
2nd step: 132 N·m (13.5 kg·m/97 lb·ft)
3rd step: 30° – 60° (degrees)
M10 bolts (11 – 27) to
4th step: 38 N·m (3.9 kg·m/28 lb·ft)

- Tighten bolts from 1-10 (M14) and confirm that they are tightened to a torque of 167 N·m (17.0 kg·m/123 lb ft) or more.

  Special tool
  Angle gauge: 5-8840-0266-0 (J-45059)

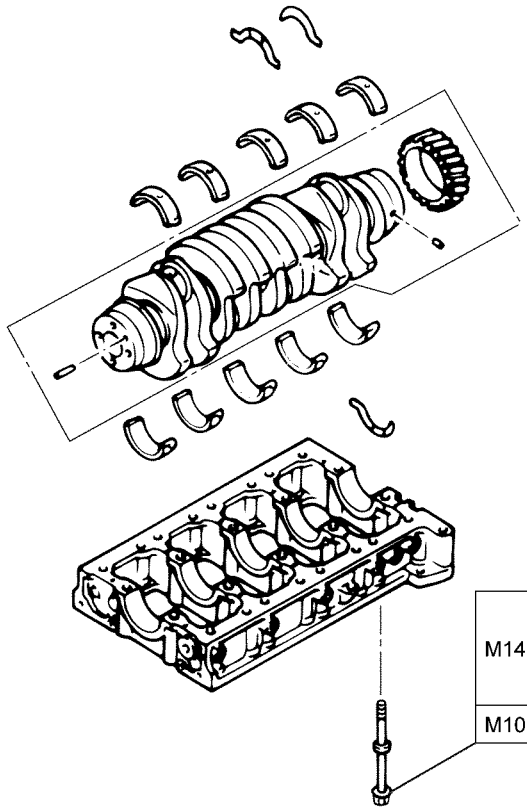
Caution:
Confirm that the crankshaft turns smoothly.



7. Install pistons and connecting rods.
   Refer to “Piston and Connecting Rod”.
8. Install the oil pump.
   Refer to “Oil Pump”.
9. Install the timing gear train.
   Refer to “Timing Gear Train”.
10. Install the front cover.
    Refer to the “Front Cover”.
11. Install the water pump.
    Refer to “Water Pump” in Section 6B.
12. Install the oil pan.
    Refer to “Oil Pan”.
13. Install the crankshaft rear oil seal.
    Refer to “Crankshaft Rear Oil Seal”.
14. Install the crankshaft front oil seal.
    Refer to “Crankshaft Front Oil Seal”.
15. Install the fuel supply pump.
    Refer to “Fuel Supply Pump” in Section 6C.
16. Install the cylinder head.
    Refer to “Cylinder Head”.
17. Install the camshaft assembly.
    Refer to “Camshaft Assembly”.
18. Install the rocker arm shaft assembly.
    Refer to “Rocker Arm Shaft Assembly”.
19. Install the cylinder head cover.
    Refer to “Cylinder Head Cover”.
20. Mount the engine assembly on the chassis.
    Refer to “Engine Assembly”.

Torque Specifications

N·m (kg·m / lb·ft)



M14	1st	98 (10.0 / 72)
	2nd	132 (13.5 / 97)
	3rd	30° — 60°
M10		38 (3.9 / 8)

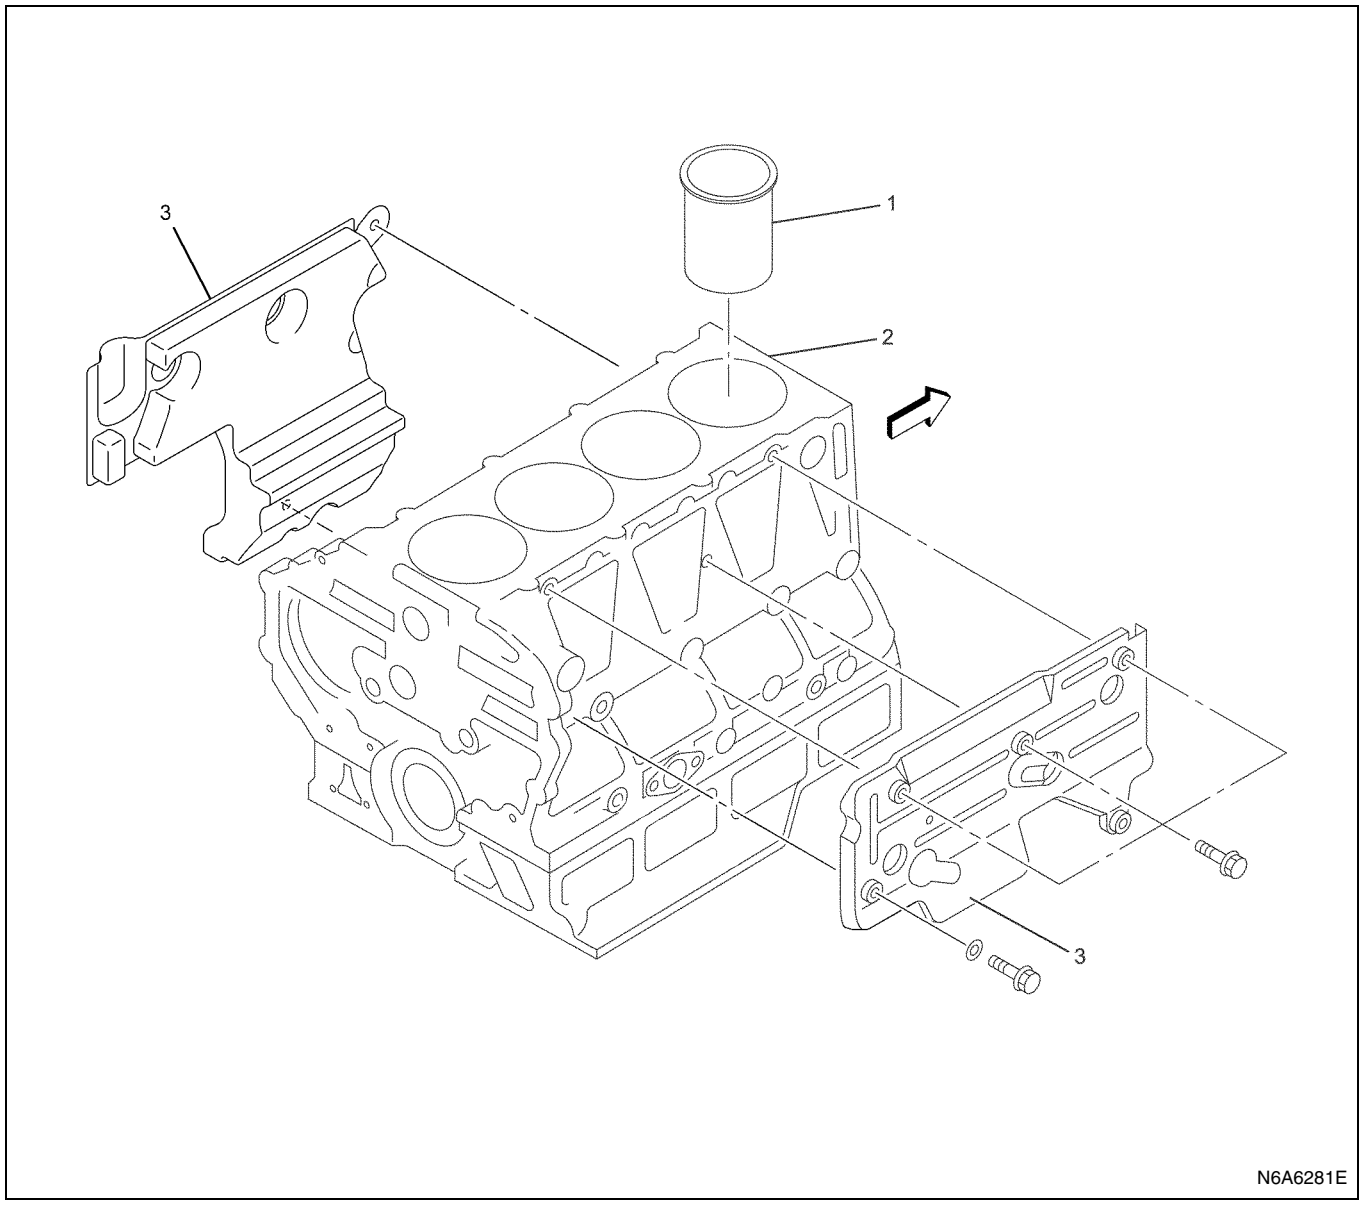
Cylinder Block

Component



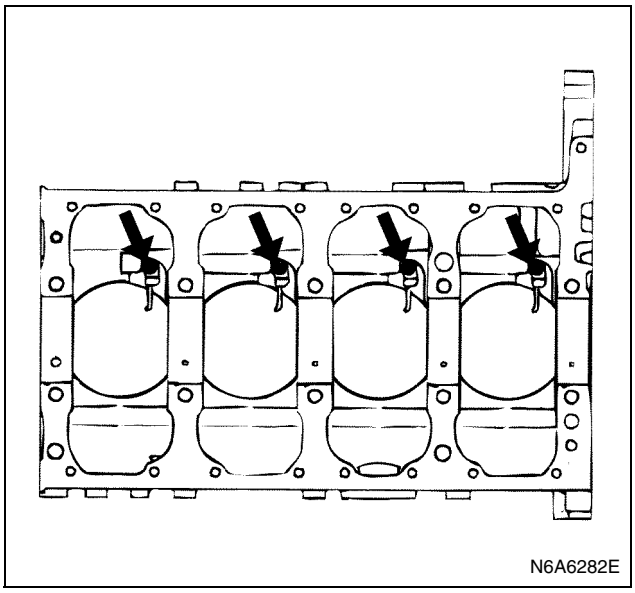
Legend

1. Cylinder Liner
2. Cylinder Block
3. Cover (For Europe)

Removal

1. Demount the engine assembly.
   Refer to “Engine Assembly”.
2. Remove the cylinder head cover.
   Refer to “Cylinder Head Cover”.
3. Remove the rocker arm shaft assembly.
   Refer to “Rocker Arm Shaft Assembly”.
4. Remove the camshaft assembly.
   Refer to “Camshaft Assembly”.
5. Remove the cylinder head.
   Refer to “Cylinder Head”.
6. Remove the fuel supply pump.
   Refer to “Fuel Supply Pump” in Section 6C.
7. Remove the crankshaft front oil seal.
   Refer to “Crankshaft Front Oil Seal”.
8. Remove the crankshaft rear oil seal.
   Refer to “Crankshaft Rear Oil Seal”.
9. Remove the oil pan.
   Refer to “Oil Pan”.
10. Remove the water pump.
    Refer to “Water Pump” in Section 6B.
11. Remove the front cover.
    Refer to the “Front Cover”.

12. Remove the timing gear train.
    Refer to “Timing Gear Train”.
13. Remove the oil pump.
    Refer to “Oil Pump”.
14. Remove pistons and connecting rods.
    Refer to “Pistons and Connecting Rod”.
15. Remove the crankshaft.
    Refer to “Crankshaft”.
16. Remove piston oil jet.

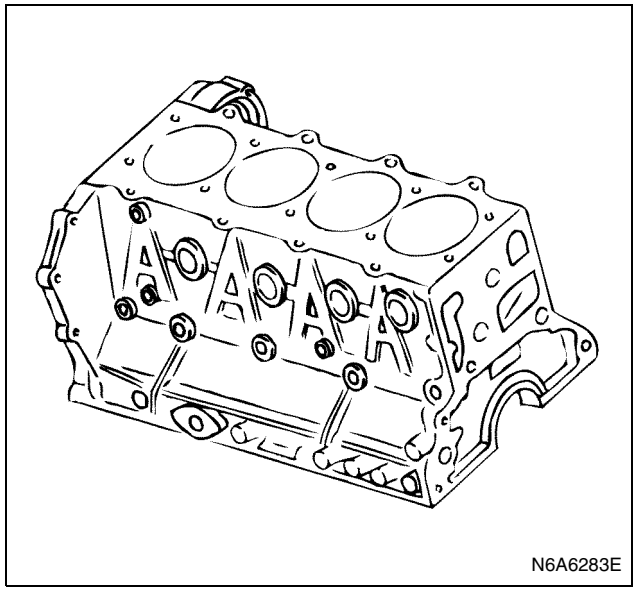


N6A6282E

17. Remove the cylinder liner.
    If the cylinder liner cannot be pulled free by hand, tap around the lower side of the liner with a hammer grip or similar object loosen it.

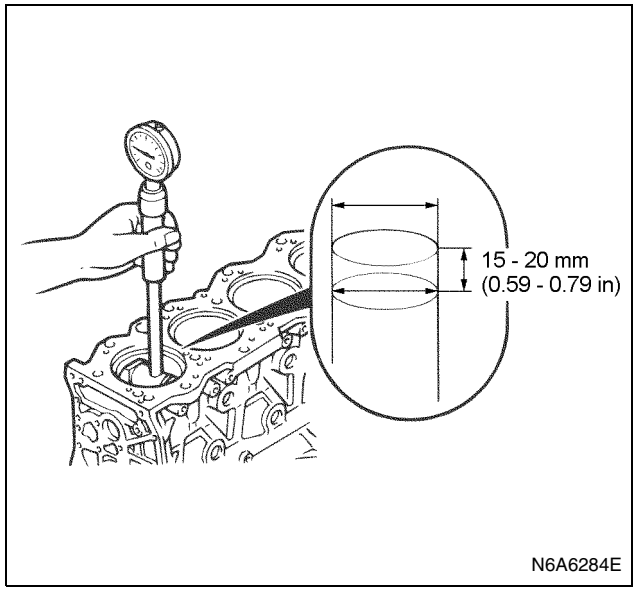
Inspection

1. Carefully remove water stains or other foreign matters on the surface of the cylinder block.
   - Be careful not to damage the cylinder block.
2. Carefully remove the liquid gasket on the crankcase mounting surface.
3. Clean up the cylinder block.
4. Visually inspect the cylinder block.
   - Conduct color check and hydraulic (or pneumatic) test and if you find crack or other damage, replace the cylinder block.



N6A6283E

5. Cylinder liner wear measurement
   - Check the internal surface of the liner for flaw or damage.
   - Measure the liner bore diameter at the most worn part (it wears more in the rotation direction) at 15 – 20 mm (0.59 – 0.79 in) from the top end of the liner with the liner installed in the cylinder block. If the wear is over the application limit, replace it.



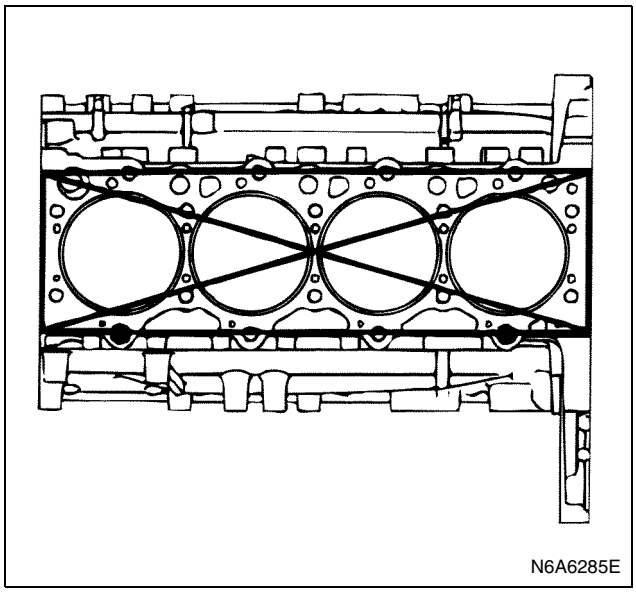
N6A6284E

Cylinder liner bore diameter	mm (in)
Standard	115.021 – 115.050 (4.52837 – 4.52952)
Limit	115.20 (4.5354)

Caution:
You need not select piston grade since cylinder liner bore is only available in one size against the liner grade selection of its outer diameter.

6. Cylinder block upper face warpage
   - Pull out the cylinder liners and remove water stains on the cylinder block.
   - Measure four sides and two diagonals of the top surface of the cylinder block using a straight edge and a thickness gauge.
   - Replace the cylinder block if the measurements exceed limit values.

Cylinder block upper face warpage	mm (in)
Standard	0.05 or less (0.002 or less)
Limit	0.20 (0.079)

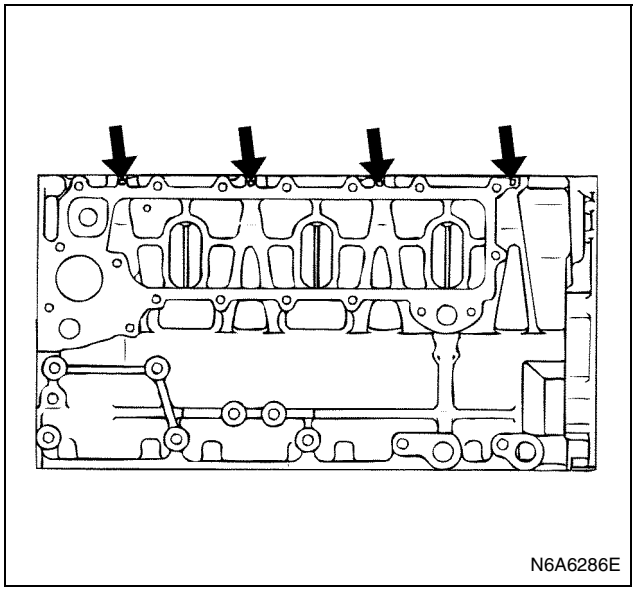


N6A6285E

Installation

1. Cylinder liner grade selection
   - Select liner outer diameter grades according to the cylinder block bore grades stamped on the cylinder block at arrowed positions in the figure.

Grade matching of cylinder block and liner		
Grade of Cylinder block (stamp)	1, 2	3
Grade of Liner outside diameter	1X	3X



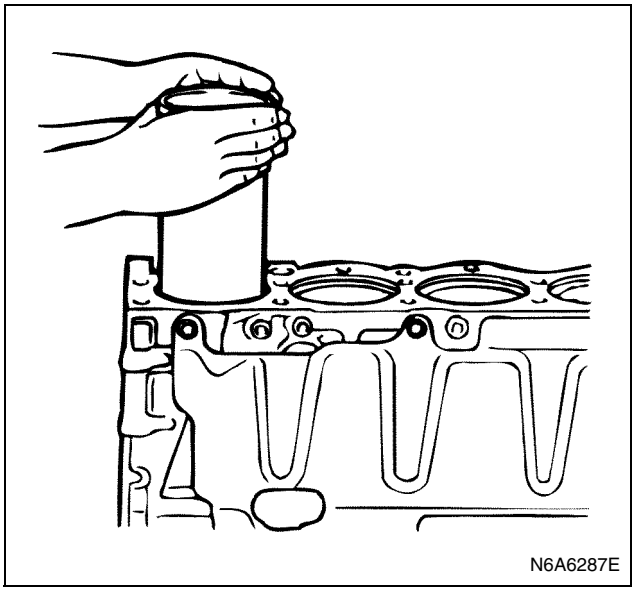
N6A6286E

Cylinder block bore and liner grade (for reference)		mm (in)
Grade	(1,2)/(1X)	(3)/(3X)
Cylinder block Bore diameter	118.001 – 118.020 (4.64699 – 4.64654)	118.021 – 118.030 (4.64649 – 4.64684)
Liner outside diameter	117.991 – 118.000 (4.64531 – 4.64566)	118.001 – 118.010 (4.64570 – 4.64605)

(Reference)
When replacing liners, a “liner set” let you obtain a piston of proper grade for a given liner bore diameter only by specifying a liner outside diameter grade.

2. Install the cylinder liners.
   - Install the cylinder liners perpendicular to the cylinder block.
   - Do not hammer the liner or apply excessive force to insert it.

Caution:
Clean up and blow with compressed air the cylinder block and the cylinder liners before installing them.

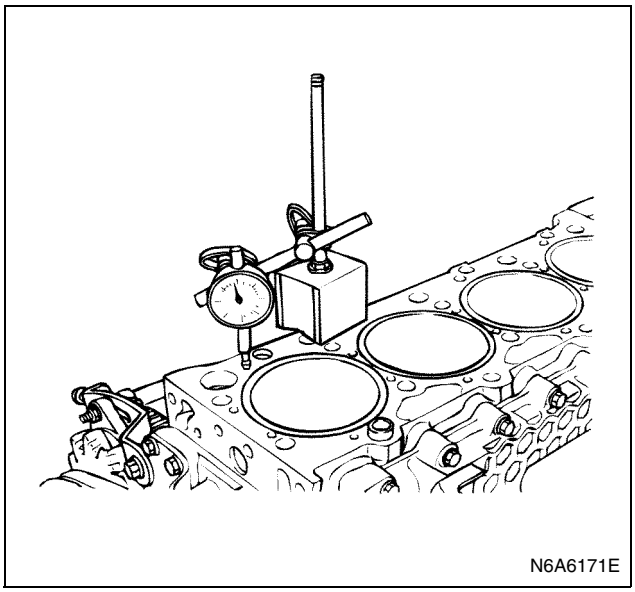


N6A6287E

3. Amount of the cylinder liner extrusion
   Measure the amount of the cylinder liner extrusion using a dial gauge.
   Difference of the amount of the extrusion between adjacent two cylinders should be within 0.03 mm (0.0012 in).

Amount of the cylinder liner extrusion	mm (in)
Standard	0.05 – 0.10 (0.0020 – 0.0039)

Caution:
Be sure to measure the cylinder liner extrusion whenever you have replaced cylinder liners.

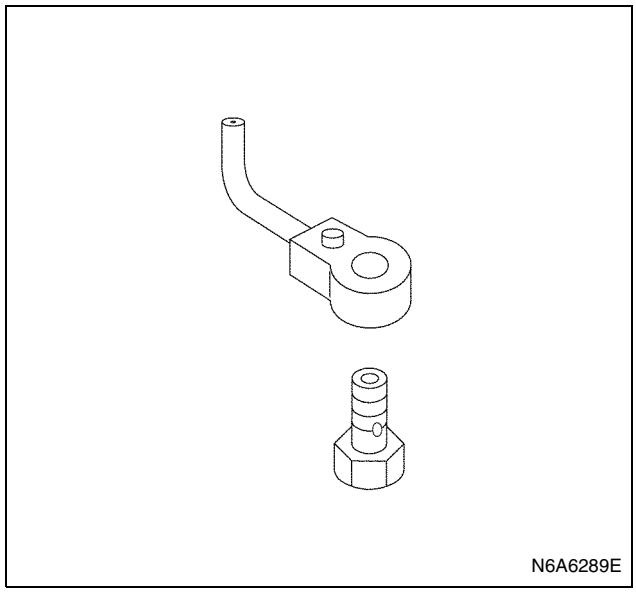


N6A6171E

4. Install the piston oil jet.
   - Align the dowel pin of the oil jet with the pin hole on the cylinder block and tighten with the check valve.

Tighten:
Bolts to 21 N·m (2.1 kg·m/15 lb·ft)

Caution:
Be careful not to deform or damage the oil jet nozzle.



N6A6289E

5. Install the crankshaft.
   Refer to “Crankshaft”.
6. Install pistons and connecting rods.
   Refer to “Pistons and Connecting Rod”.
7. Install the oil pump.
   Refer to “Oil Pump”.
8. Install the timing gear train.
   Refer to “Timing Gear Train”.
9. Install the front cover.
   Refer to “Front Cover”.
10. Install the water pump.
    Refer to “Water Pump” in Section 6B.
11. Install the oil pan.
    Refer to “Oil Pan”.
12. Install the crankshaft rear oil seal.
    Refer to “Crankshaft Rear Oil Seal”.
13. Install the crankshaft front oil seal.
    Refer to “Crankshaft Front Oil Seal”.
14. Install the fuel supply pump.
    Refer to “Fuel Supply Pump” in Section 6C.
15. Install the cylinder head.
    Refer to “Cylinder Head”.
16. Install the camshaft assembly.
    Refer to “Camshaft Assembly”.
17. Install the rocker arm shaft assembly.
    Refer to “Rocker Arm Shaft Assembly”.
18. Install the cylinder head cover.
    Refer to “Cylinder Head Cover”.
19. Mount the engine assembly on the chassis.
    Refer to “Engine Assembly”.

Lubrication System

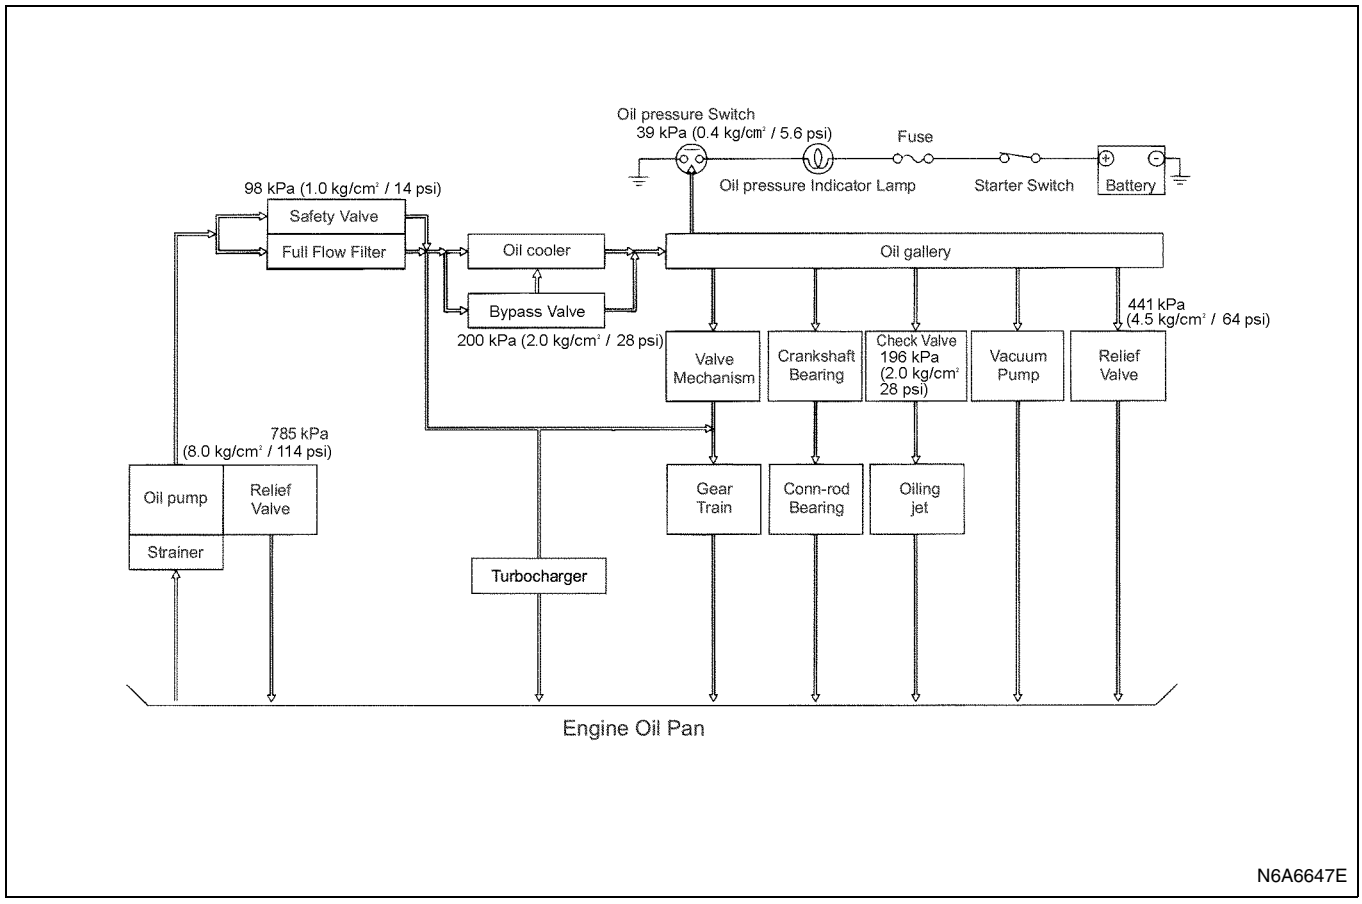
Service Precautions

- During each disassembly, remove the old gasket adhering to each part and mating part completely using a scraper at the location, where the fluid gasket is to be used, clean the traces of oil, moisture, and dirt completely using waste cotton and apply the specified new fluid gasket at each location.
- Avoid excessive or insufficient coating amount. Note that seizure may occur in case of excessive coating due to clogging of the oil gallery and oil jet, and oil and water leakage may occur if the coating is insufficient.
- Always, the starting and ending piston of application should be overlapped.

Explanations on Functions and Operation

The lubrication system uses the filter element combined with a full flow bypass, water-cooled oil cooler, and oil jet for piston cooling.

Lubricating System Diagram



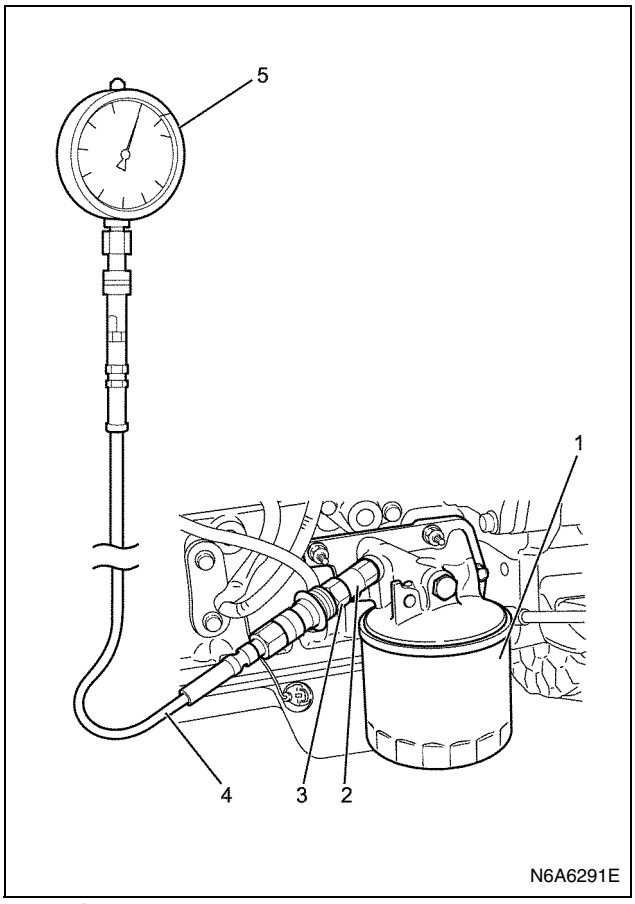
Functional Check

Oil pressure check

1. Check whether the engine oil is contaminated with dirt, fuel or water. If contaminated with dirt, fuel, or water (after examining the cause and taking the appropriate measures for fuel or water contamination), replace the oil.
2. Check the engine oil level. The oil level should be between the two holes of the level gauge. If the oil level is insufficient, replenish it.
3. Remove the oil pressure switch on the oil filter body.

4. Install the oil pressure gauge on the oil filter body.

   Special tool
   Oil pressure gauge set:
   5-8840-2843-0
   (Oil pressure gauge: J-43630-20)
   (Hose: J-43630)
   (Connector: J-43630-14)
   (Oil pressure testing adapter: EN-46333)

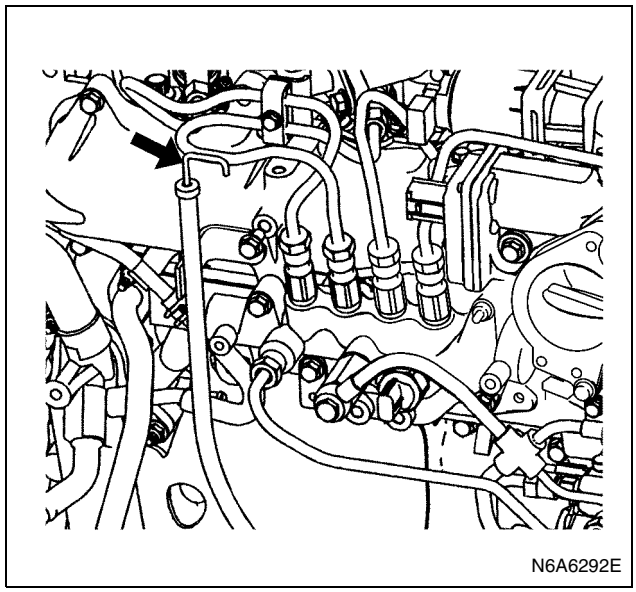


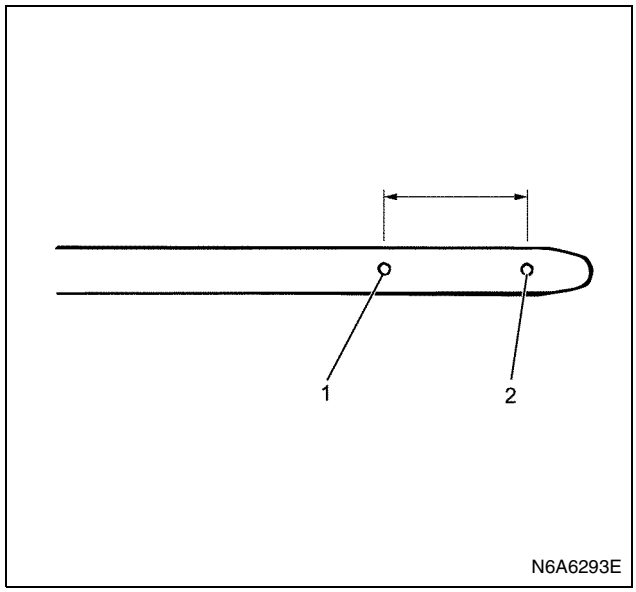
Legend
1. Oil Filter Cartridge
2. Oil Pressure Testing Adapter
3. Connector
4. Hose
5. Oil Pressure Gauge

5. Warm the engine.
6. Measure the oil pressure, to check whether it is more than 343 kPa (3.5 kg/cm^2 / 50 psi) at 3200 rpm.
7. Stop the engine.
8. Remove the oil pressure gauge.
9. Install the oil pressure switch.
10. Start the engine and check for oil leakage.

Engine oil

- Ensure the car is at a level ground. Before starting the engine or when 5 minutes or more have elapsed after stopping the engine, check the engine oil volume using the level gauge. The volume is appropriate if the engine oil is between the upper and lower limits of the level gauge. Replenish the engine oil, if level is below the lower limit. Also, check for contamination of the engine oil.





Legend
1. Upper Limit
2. Lower Limit

Engine oil leakage

- In the lift up condition, confirm that there are no leaks from the cylinder head cover and oil pan.

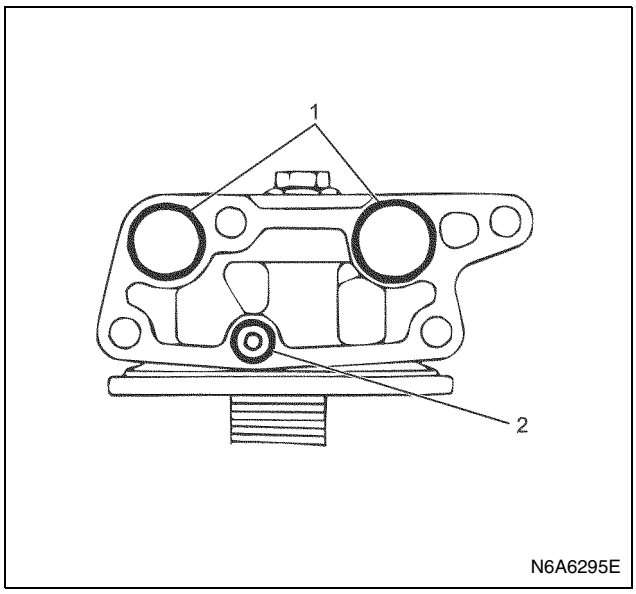
1. Oil Pressure Switch
2. Oil Filter Body
3. O-ring

Removal

1. Place a tray under the oil filter cartridge.
2. Remove the oil filter cartridge.
3. Remove the oil pressure switch.
4. Remove the oil filter body.
5. Remove the O-ring.

Installation

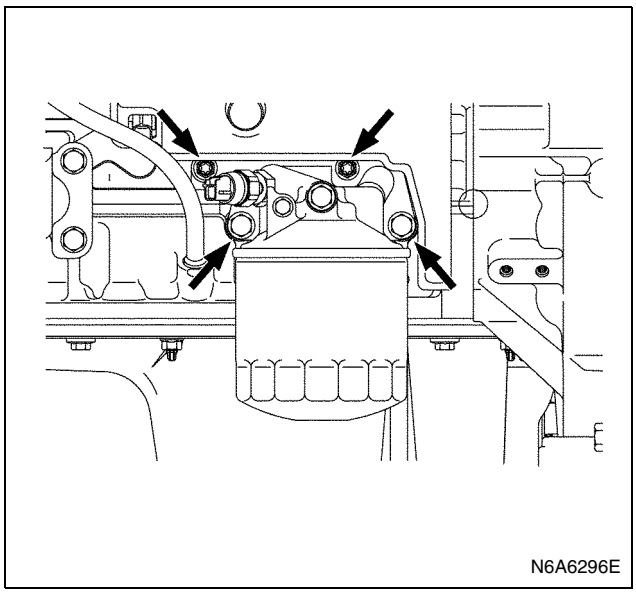
1. Install the O-rings and on the oil filter body.



Legend
1. O-ring
2. O-ring

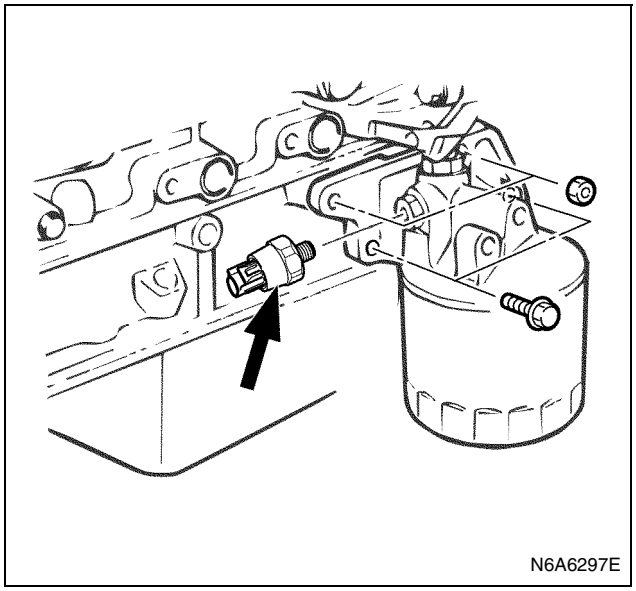
2. Install the oil filter on the cylinder block and tighten it using the specified torque.

Tighten:
Nuts and bolts to 48 N·m (4.9 kg·m/35 lb·ft)



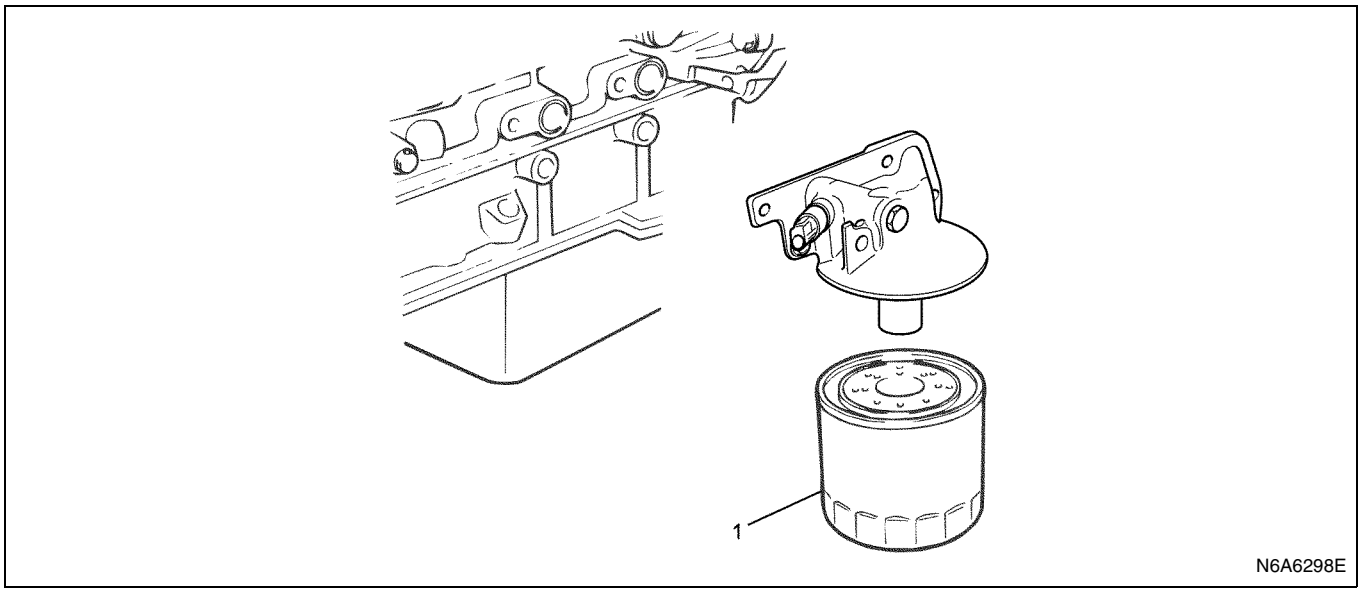
3. Install the oil pressure switch on the oil filter body.
   - Apply the liquid gasket (Loctite 262) on 2 to 3 peaks from the tip of the threaded part of the oil pressure switch and install it at the position shown in the figure.

Tighten:
Oil pressure switch to 13 N·m (1.3 kg·m/113 lb·in)



Oil Filter Cartridge

Components

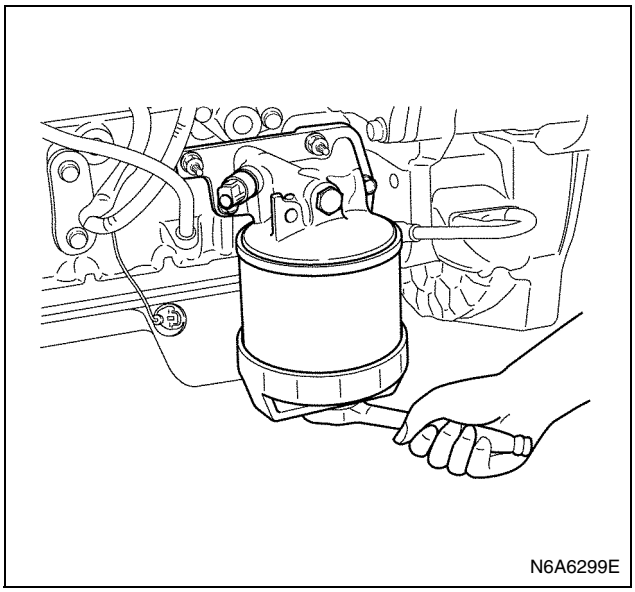


Legend
1. Oil Filter Cartridge

Removal

1. Place a tray under the oil filter cartridge.
2. Remove the oil filter cartridge using the oil filter wrench.

   Special tool
   Oil filter wrench: 1-8522-1097-0 (EN-47683)



Installation

1. Install the oil filter cartridge.
   - Apply grease or engine oil to the seal in the cartridge and install it using the oil filter wrench.
   - Tighten the cartridge using the specified torque.

Tighten:
Cartridge to 20 N·m (2.0 kg·m/14 lb·ft)
After it comes in contact with the oil seal, tighten it through an additional turn of 1 and 1/4.

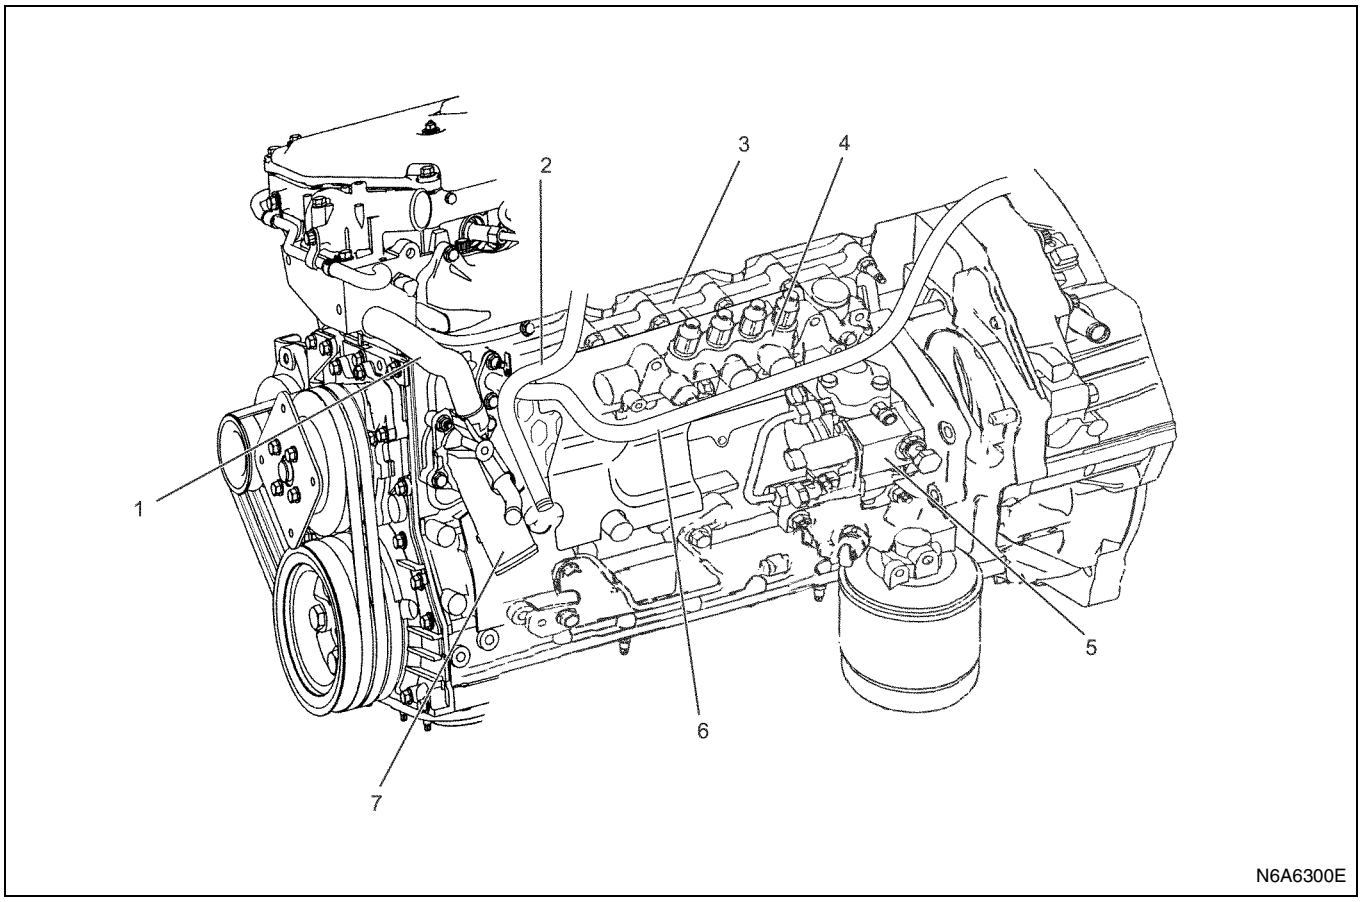
Special tool
Oil filter wrench: 1-8522-1097-0 (EN-47683)

Special Tool

Illustration	Tool Number / Description / Remarks
 1852210970	1-8522-1097-0 (EN-47683) Oil Filter Wrench

Oil Cooler

Components

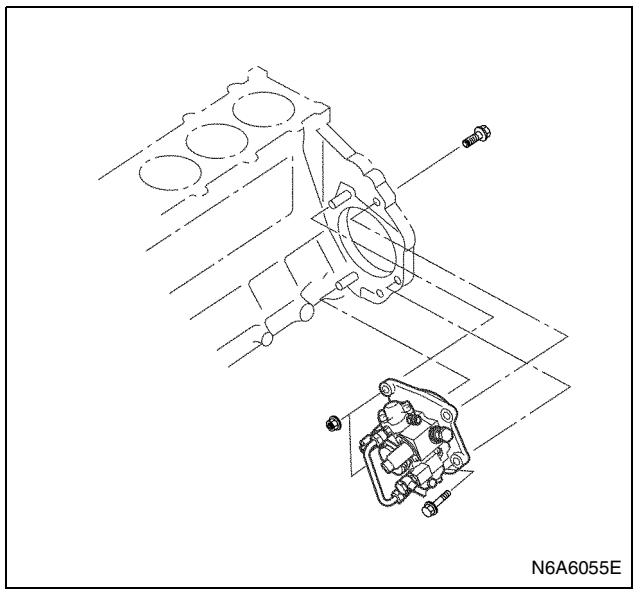


Legend

1. Bypass Hose
2. EGR Cooler Water Return Pipe
3. Oil Cooler
4. Fuel Rail
5. Fuel Supply Pump
6. EGR Cooler Water Feed Pipe
7. Suction Pipe

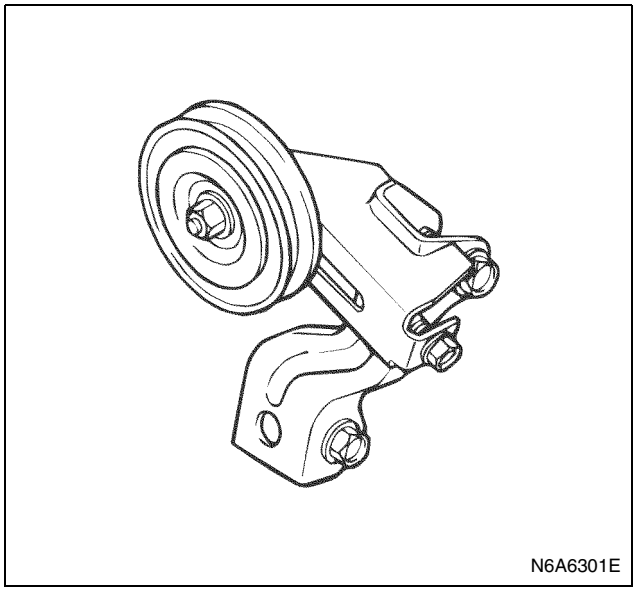
Removal

1. Remove the fuel rail.
   Refer to “Fuel Rail” in Section 6C.
2. Remove the fuel supply pump.



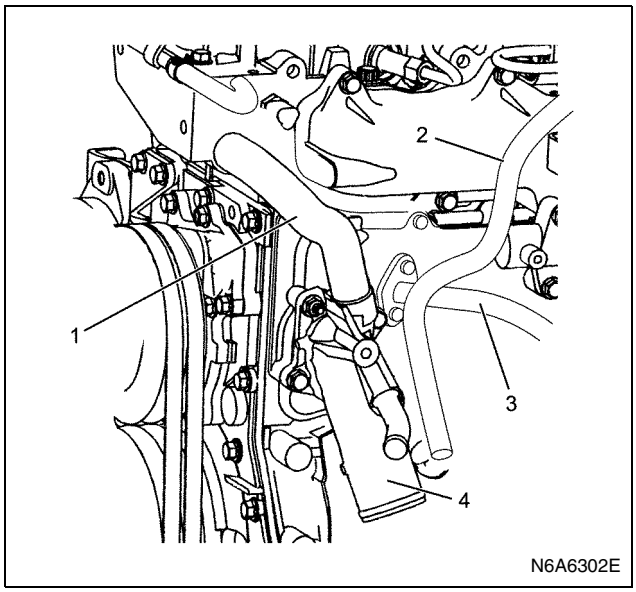
3. Remove the A/C drive belt.

4. Remove the idling pulley bracket.
   - Remove the drive belt for A/C and the bracket fixing bolts, and then remove the bracket along with tensioner and idling pulley.



N6A6301E

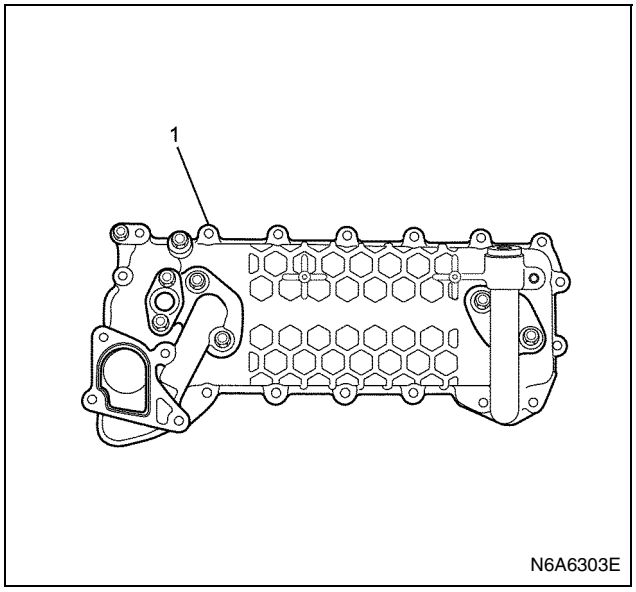
5. Remove the EGR cooler water return pipe.
   - Remove the brackets to the water pipe at three locations to make the pipe unsupported.
6. Remove the EGR cooler water feed pipe.
7. Remove the clip on the head side of the water bypass hose and remove the hose from the suction pipe and assembly.



N6A6302E

Legend
1. Bypass Hose
2. EGR Cooler Water Return Pipe
3. EGR Cooler Water Feed Pipe
4. Suction Pipe

8. Remove the oil cooler assembly.
   - Screw the removed fixing bolt of the oil cooler into the replacer hole at the location 1 of the figure and remove the oil cooler.



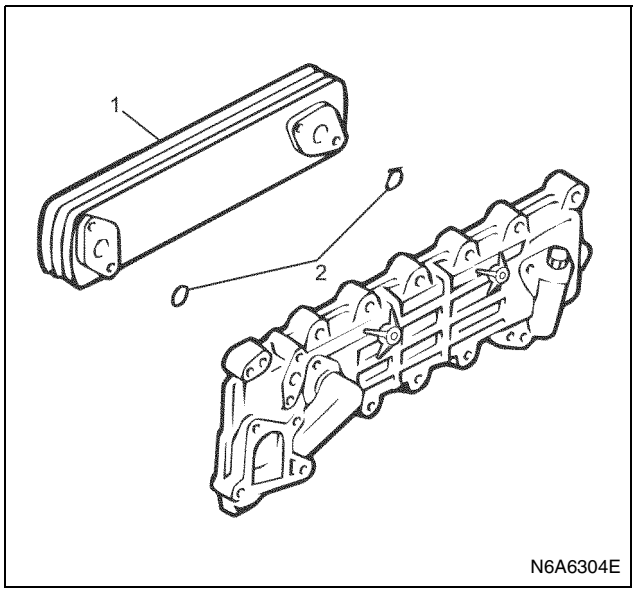
N6A6303E

Legend
1. Oil Cooler Assembly

9. Remove the O-ring.

Disassembly

1. Remove the element mounting bolts.
2. Remove the element.
3. Remove the O-ring.



N6A6304E

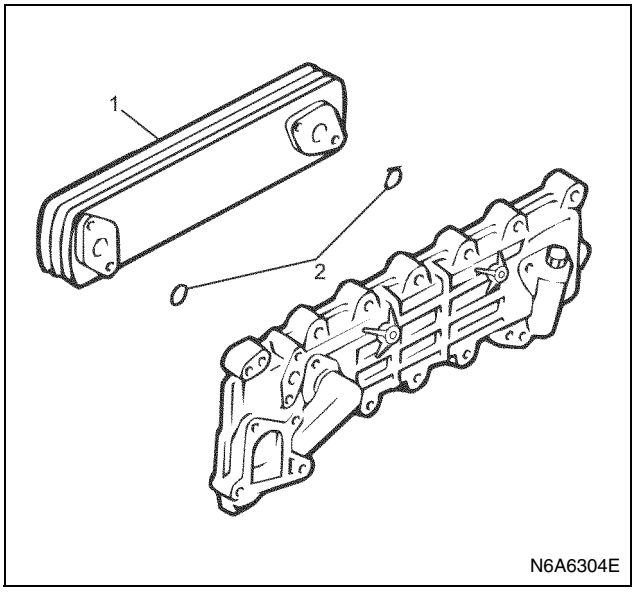
Legend
1. Element
2. O-ring

Reassembly

1. Install the O-ring on the oil cooler case.
2. Install the element.

3. Tighten the element fixing bolts using the specified torque.

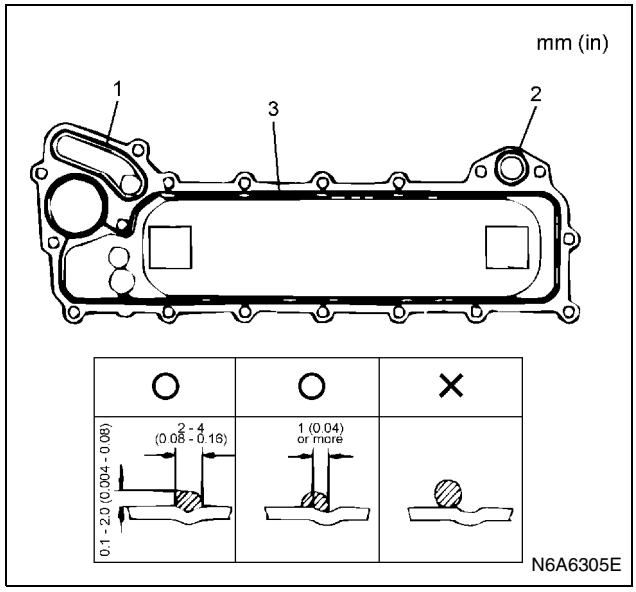
Tighten:
Bolts to 20 N·m (2.0 kg·m/15 lb·ft)



Legend
1. Element
2. O-ring

Installation

1. Install the oil cooler assembly.
   - Apply liquid gasket (ThreeBond1207C or equivalent) to the flange surface groove (cylinder block). Bead diameter must be between 2 and 4 mm (0.08 and 0.16 in).
     Refer to the illustration for the offset position (no more than 1 mm (0.04 in)).
   - Install the O-rings (1) and (2) to the oil passage inlet and outlet. Do not allow the liquid gasket to contact the O-ring.

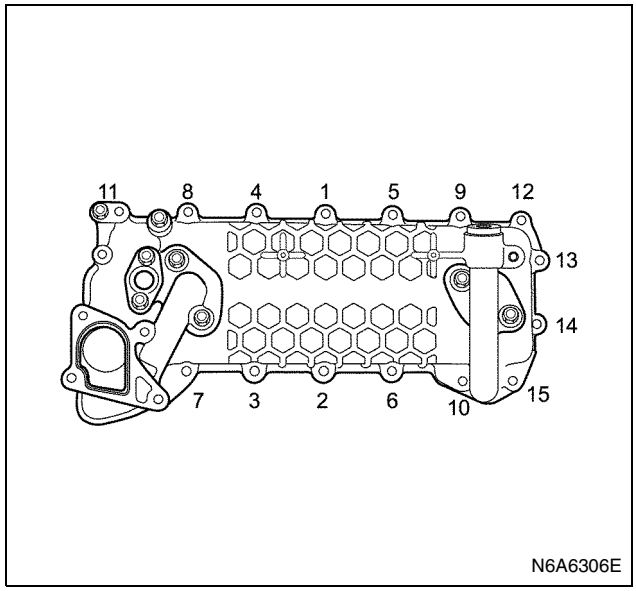


Legend
1. O-ring
2. O-ring
3. Liquid Gasket

   - Align the oil cooler holes with the cylinder block studs.
   - Install the oil cooler and glow plug controller bracket to the cylinder block.
   - Tighten the bolts to the specified torque in the order shown in the illustration.

Tighten:
Bolts to 24 N·m (2.4 kg·m/18 lb·ft)

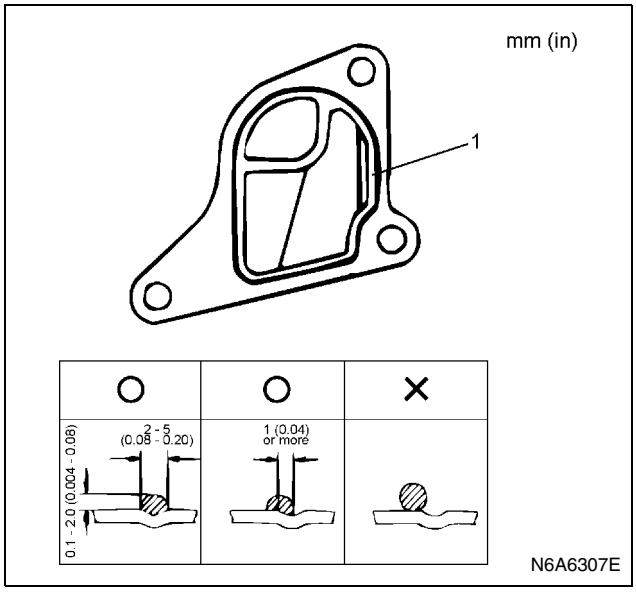
   - Liquid gasket quickly hardens.
     Make it complete within 7 minutes after applying the liquid gasket.



Legend
1. Oil Cooler Assembly

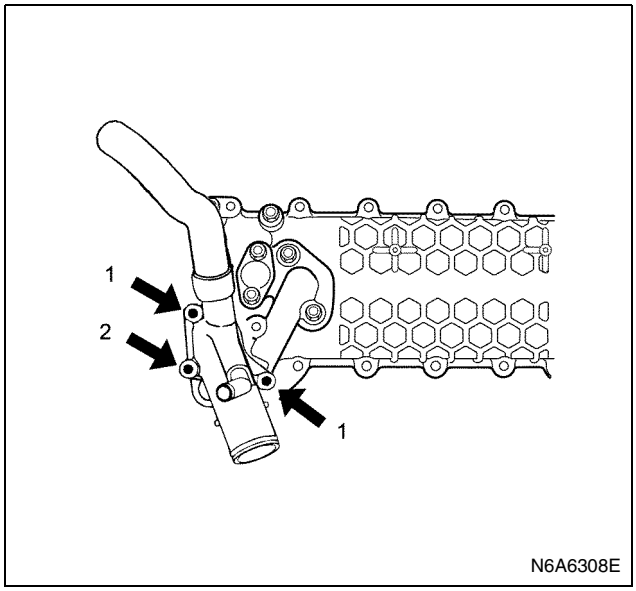
2. Install the water suction pipe.
   - Apply liquid gasket (ThreeBond 1207C) to the flange of the water suction pipe. Bead diameter must be between 2 and 5 mm (0.008 and 0.20 in). Refer to the illustration for the offset position (no more than 1 mm (0.04 in)).
   - Install the water suction pipe to the oil cooler. Refer to the illustration.
   - Tighten the bolts to the specified torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/18 lb·ft)



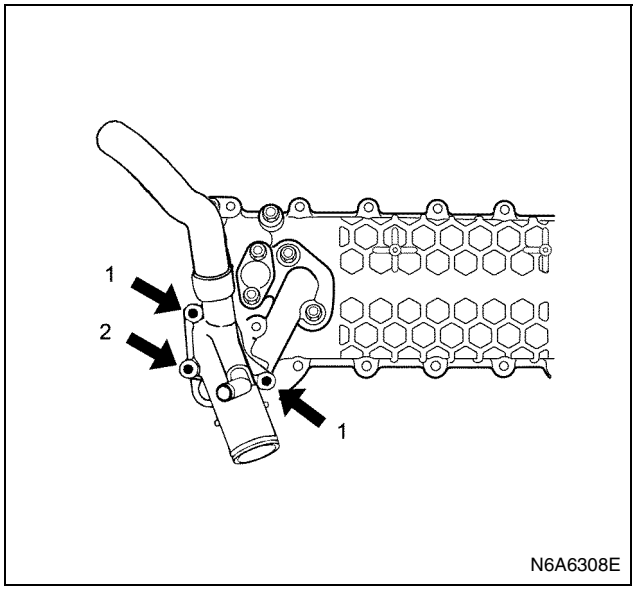
Legend
1. Liquid Gasket

Caution:
The water suction pipe must be installed immediately after the oil cooler (the pipe and cooler use the same liquid gasket).



3. Install the EGR cooler water feed pipe.
   - Install the O-ring on the EGR cooler water feed pipe.
   - Install at the position shown in the figure and tighten using the specified torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/18 lb·ft)



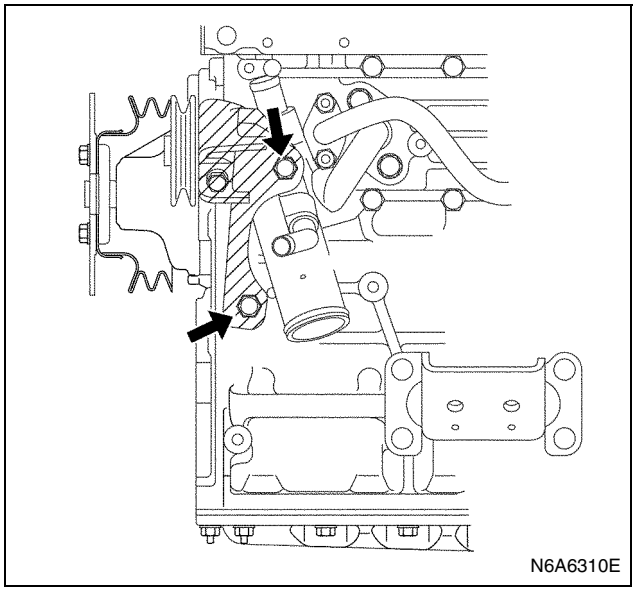
4. Install the EGR cooler water pipe.
5. Install the body cover assembly LH on the surface of the oil cooler and cylinder block and tighten it using the specified torque.

Tighten:
Body cover assembly LH to 19 N·m (1.9 kg·m/14 lb·ft)

6. Install the idling pulley bracket and tighten it using the specified torque.

Tighten:
Idling pulley bracket to 24 N·m (2.4 kg·m/18 lb·ft)

7. Install the A/C drive belt.
   Refer to “Drive Belt” in Section 6B.

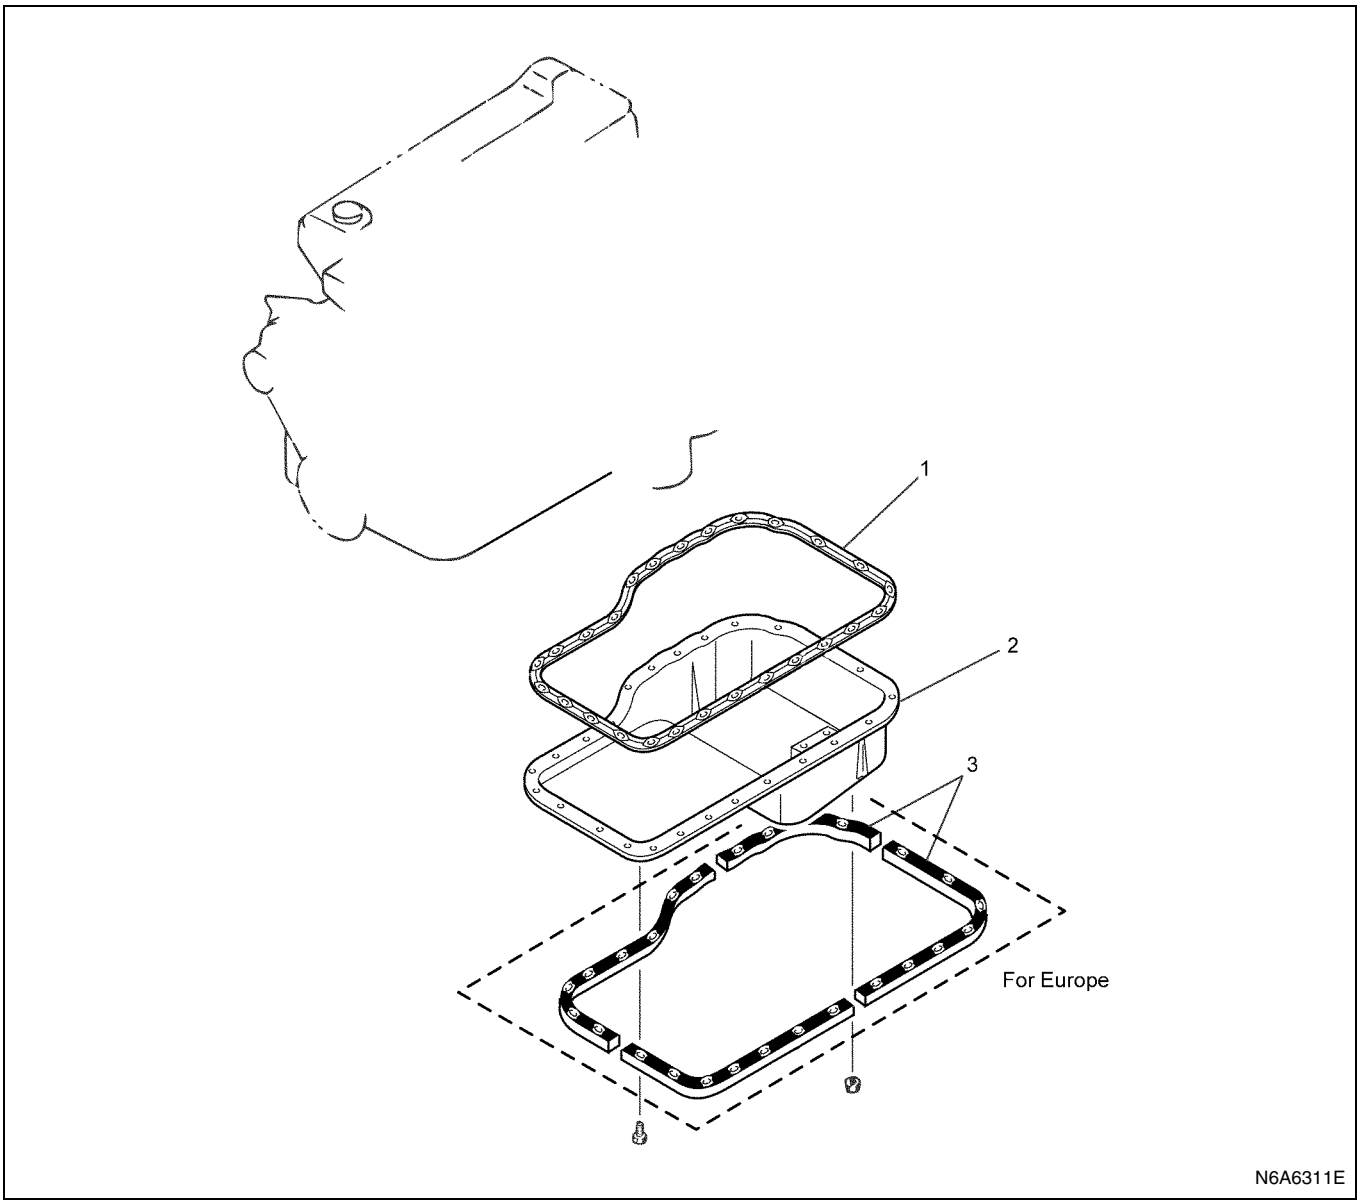


8. Remove the oil drain adapter.

9. Install the fuel supply pump.
    - Refer to “Fuel Supply Pump” in Section 6C.
10. Install the fuel rail.
    - Refer to “Fuel Rail” in Section 6C.

Oil Pan

Components



Legend

1. Oil Pan Gasket
2. Oil Pan
3. Oil Pan Rubber (For Europe)

Removal

1. Drain out the engine oil.
   - Install the drain plug.

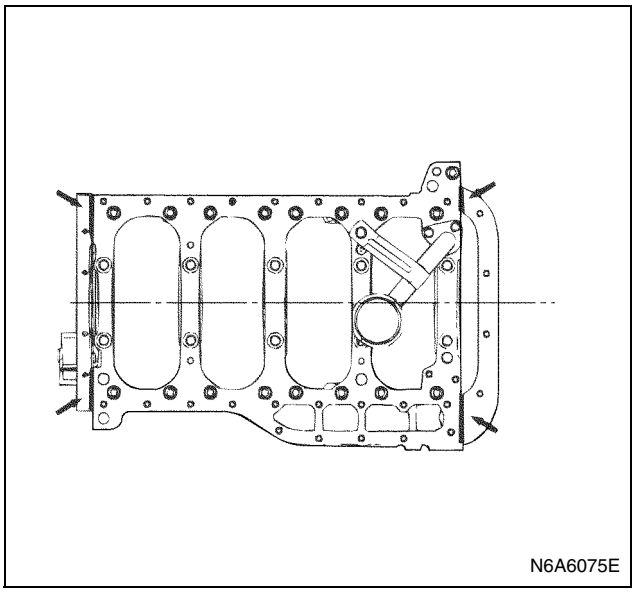
Tighten:
Drain plug to 8.5 N·m (0.9 kg·m/61 lb·ft)

2. Remove the oil pan.

Installation

1. Install the oil pan.
   - At the seam between the cylinder block and the front cover with the flywheel housing, apply the liquid gasket (ThreeBond 1207C or equivalent) to a bead diameter of 3 mm (0.12 in).

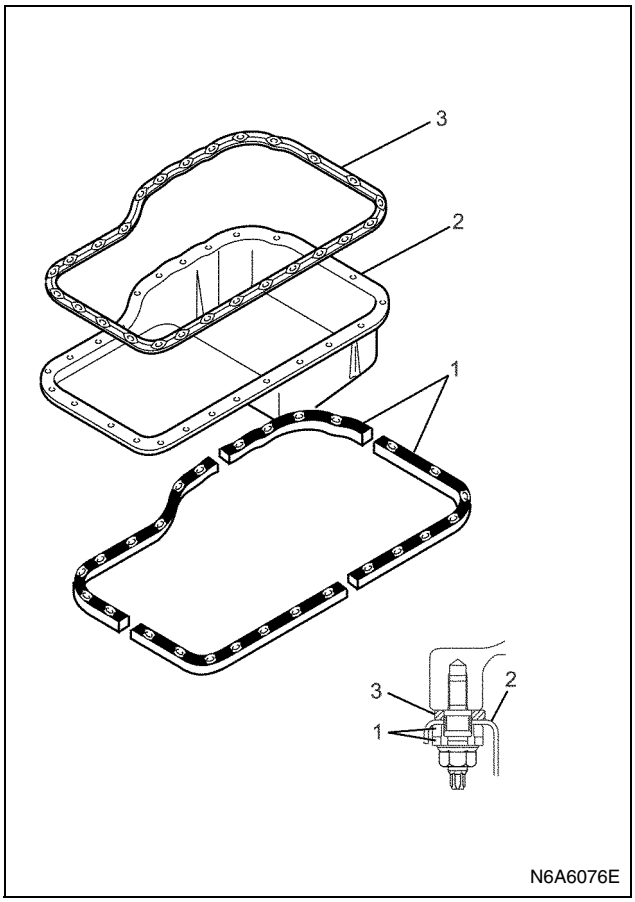
- Apply the liquid gasket and install the oil pan within 7 minutes.



N6A6075E

For Europe

- Install the gasket using the studs of the crankcase, flywheel housing, and front cover as guide and mount the oil pan.
  Install the rubber assembly on the oil pan and secure it using nuts and bolts.

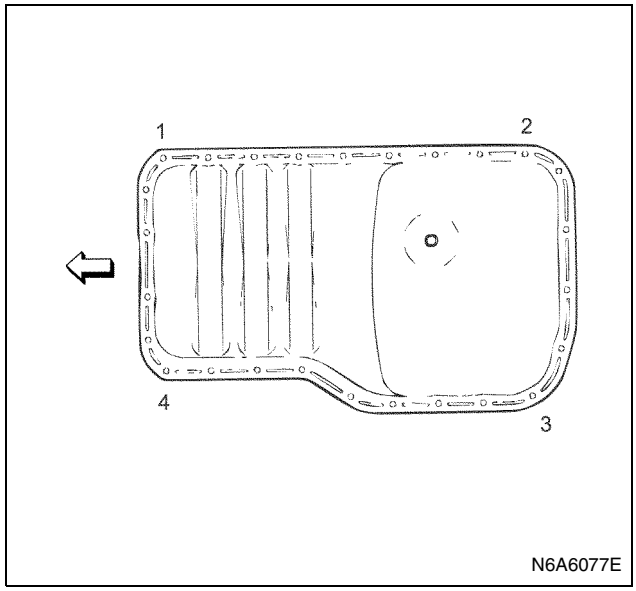


N6A6076E

Legend

1. Rubber Assembly (For Europe)
2. Oil Pan
3. Gasket

- Tighten the locations (1), (2), (3), and (4) as shown in the figure and then tighten others. (In any sequence)

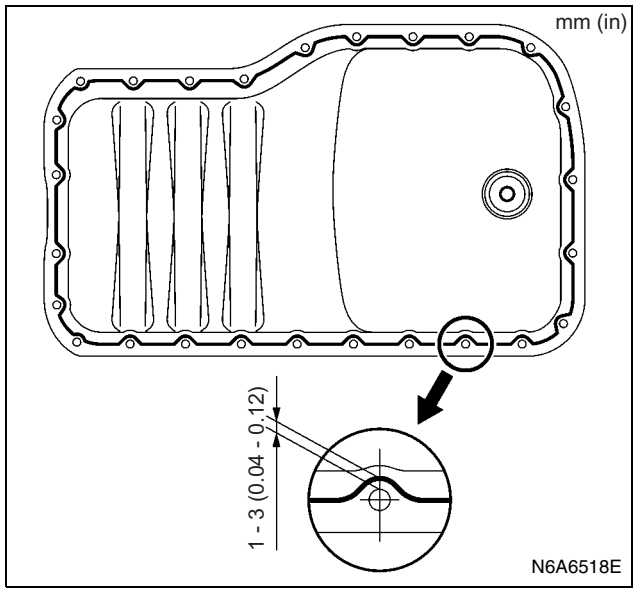


N6A6077E

Tighten:
Nuts and bolts to 11 N·m (1.1 kg·m/95 lb·in)

Except Europe

- As the figure shows, apply the liquid gasket (Three bond 1207C or equivalent) inside a hole of the bolt evenly.



N6A6518E

- Tighten the oil pan nut and bolts to the specified torque in the numerical order as shown in the figure.
  ▲ marks are located on nut positions.

Tighten:
Star mark bolt to 18 N·m (1.8 kg·m/13 lb·ft)
Other bolts and nuts to 24N·m (2.4 kg·m/17 lb·ft)

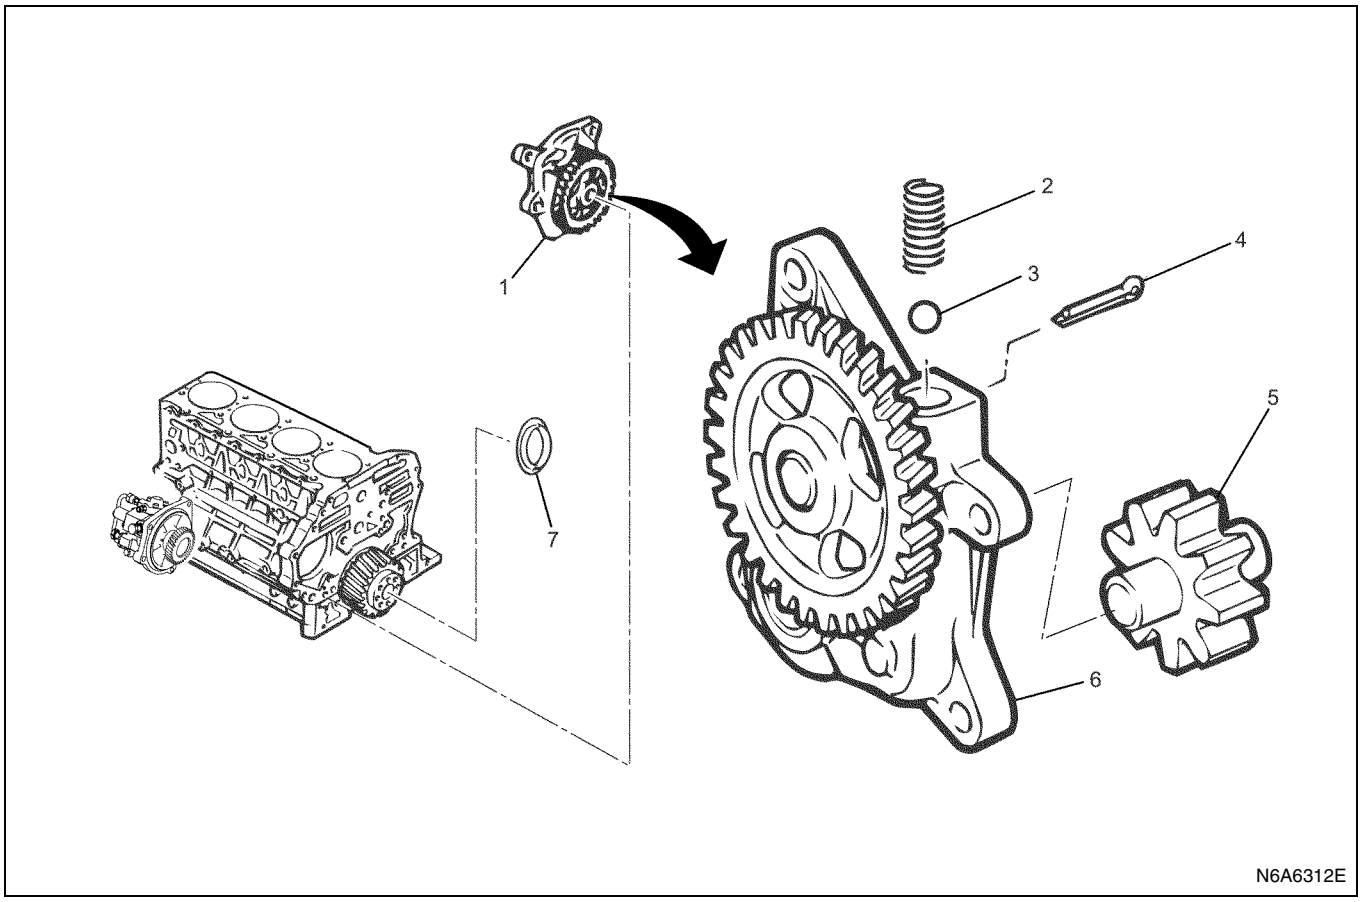
Oil Pump

Components



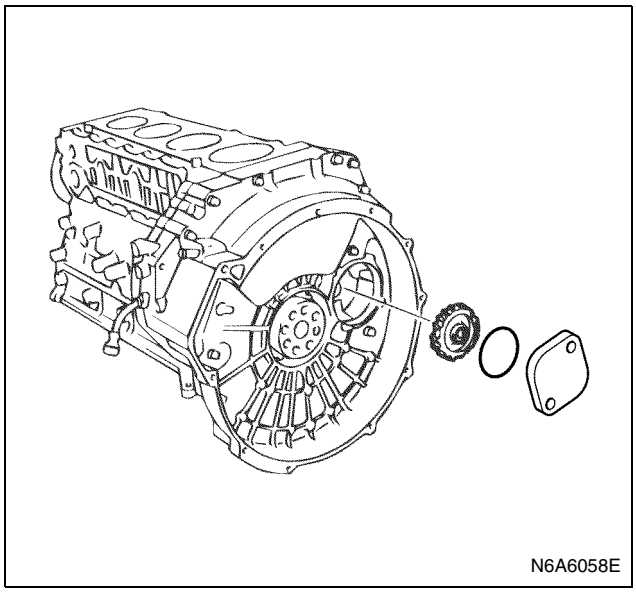
Legend

1. Oil Pump Assembly
2. Spring
3. Ball
4. Split Pin
5. Driven Gear and Shaft
6. Oil Pump Body
7. Slinger

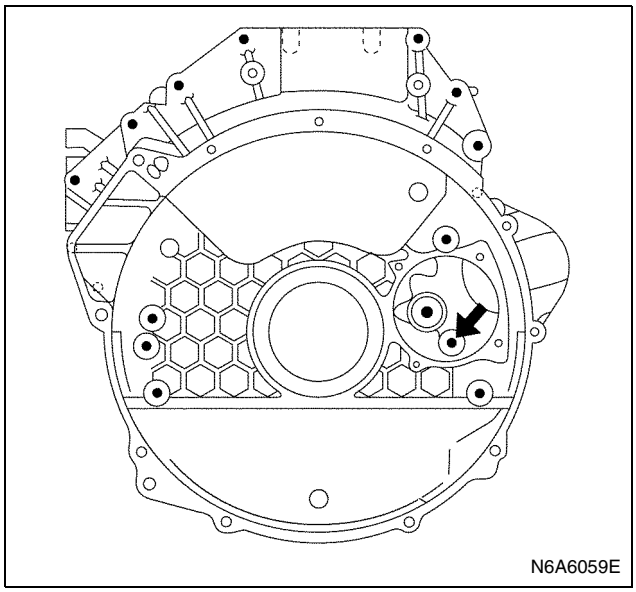
Removal

1. Drain out the engine oil.
2. Drain out the cooling water.
3. Remove the cylinder head cover.
   Refer to “Cylinder Head Cover”.
4. Remove the rocker arm shaft assembly.
   Refer to “Rocker Arm Shaft Assembly”.
5. Remove the camshaft assembly.
   Refer to “Camshaft Assembly”.
6. Remove the cylinder head assembly.
   Refer to “Cylinder Head”.
7. Clutch pressure plate assembly
   Refer to “Flywheel”.
8. Driven plate
   Refer to “Flywheel”.
9. Remove the fuel supply pump assembly.
   Refer to “Fuel Supply Pump” in Section 6C.
10. Remove the flywheel.
    Refer to “Flywheel”.
11. Remove the rear oil seal of the crankshaft.
    Refer to “Crankshaft Rear Oil Seal”.
12. Remove the oil pan.
13. Remove the power steering pump.
14. Remove the idle gear cover of the power steering pump.

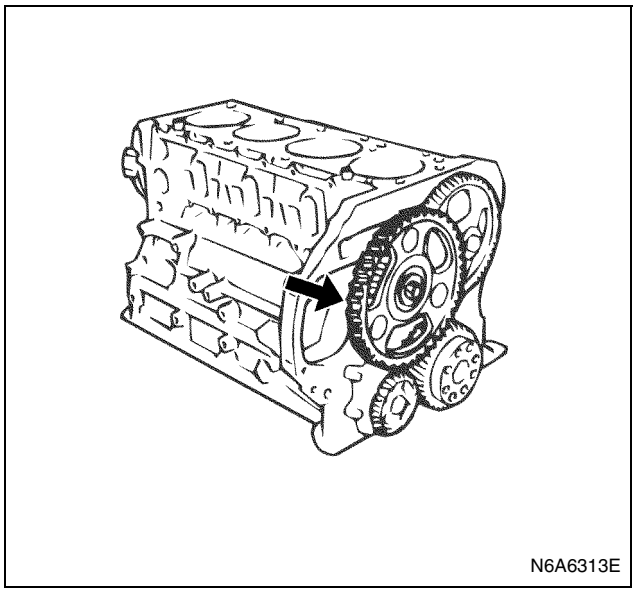
15. Remove the idle gear of the power steering pump.



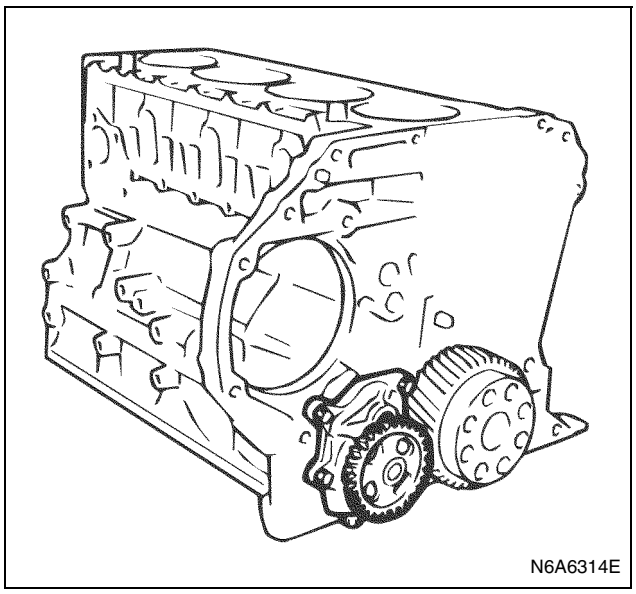
16. Remove the flywheel housing.
    - Make sure you remove the bolts shown in the figure.



17. Remove the idle gear A.



18. Remove the oil pump assembly.



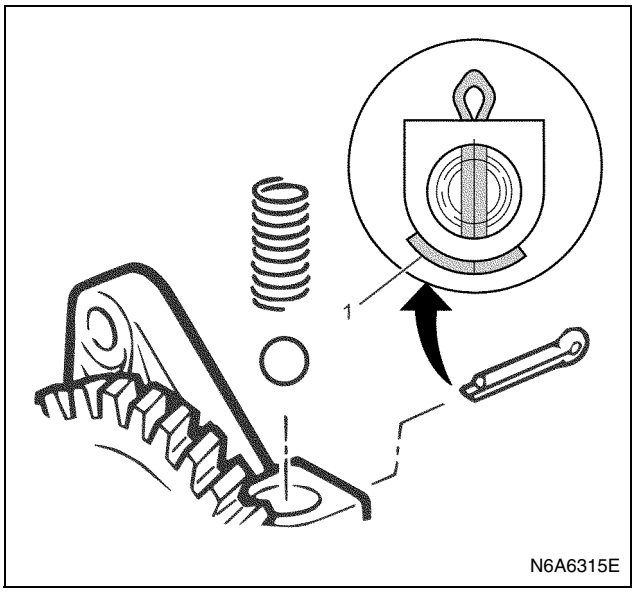
Disassembly

1. Remove the driven gear and shaft.
2. Remove the split pin.
3. Remove the spring.
4. Remove the ball.

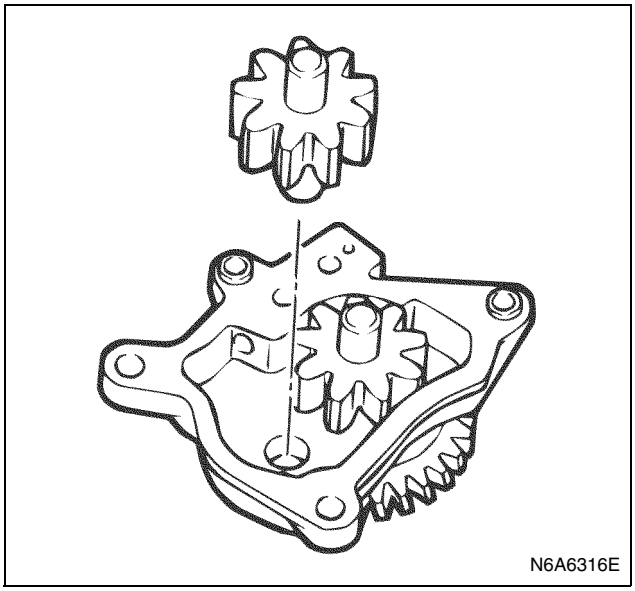
Reassembly

1. Install the ball.
2. Install the spring.

3. Install the split pin and fold it according to (1).



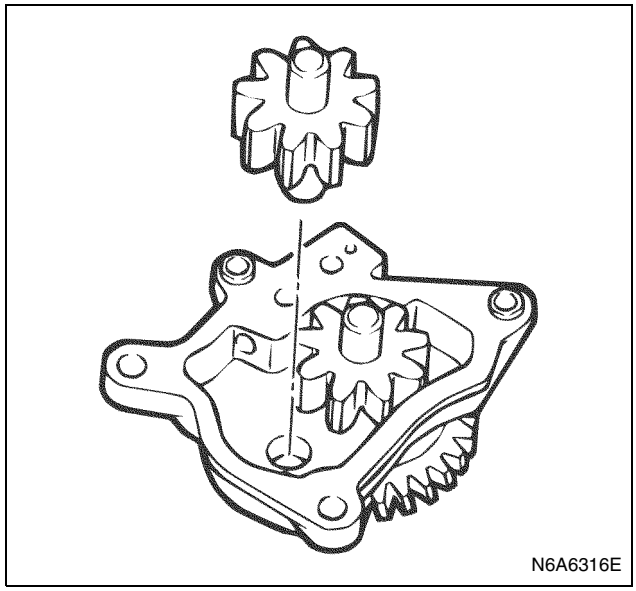
4. Apply engine oil on the driven gear and shaft and mount them on the oil pump body.



Inspection

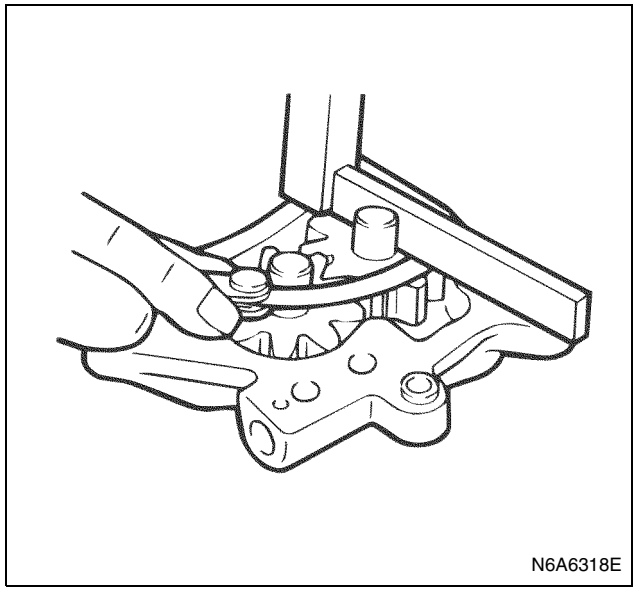
1. Measure the clearance between the gear and the inner wall of the oil pump body.
   - Measure the clearance between the gear and oil pump body using a thickness gauge.
   - If the clearance between the gear and inner wall of the body exceeds the limit, replace the gear assembly or the driven gear assembly.

Clearance between the gear and inner wall of the body	mm (in)
Standard	0.125 – 0.220 (0.0049 – 0.0087)
Limit	0.30 (0.0118)



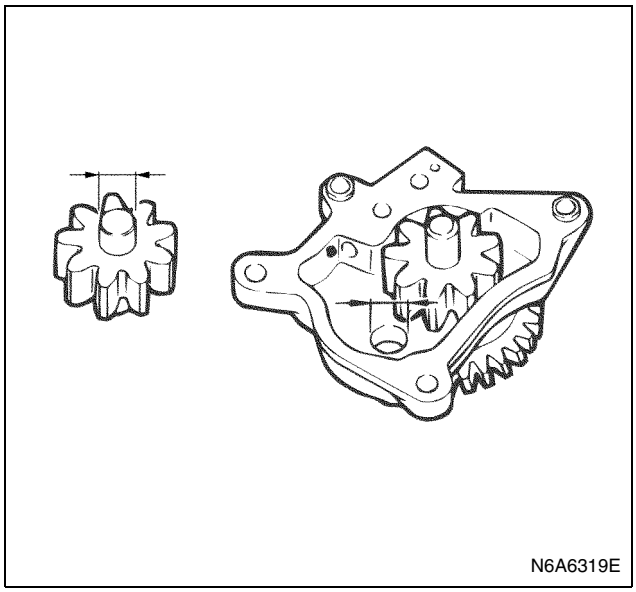
2. Measure the clearance between the gear side surface and the upper surface of the oil pump body.
   - Measure the clearance between the gear surface and the upper surface of the oil pump body using the thickness gauge and square.
   - If the clearance between the gear and inner wall of the body exceeds the limit, replace the gear assembly or the driven gear assembly.

Clearance between the gear side surface and the upper surface of the oil pump body	mm (in)
Standard	0.064 – 0.109 (0.0025 – 0.0043)
Limit	0.20 (0.0079)



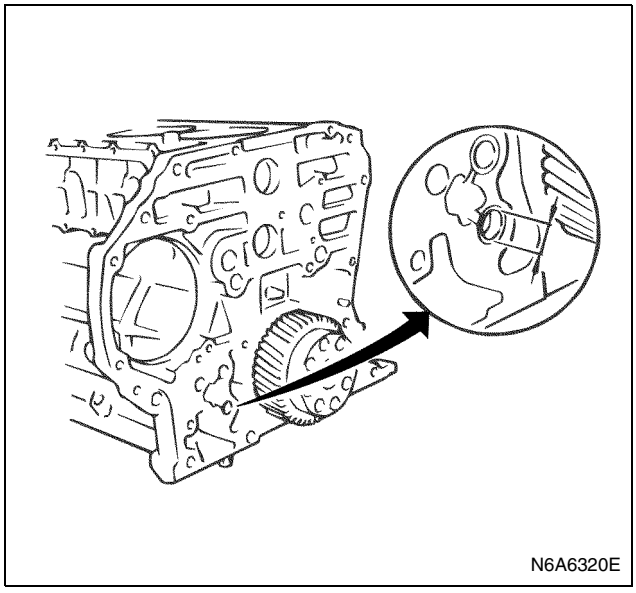
3. Measure the clearance between the driven gear shaft and the bush.
   - Measure the outside diameter of the driven gear shaft using a micrometer.

Outside diameter of the driven gear shaft mm (in)	
Standard	15.989 – 16.000 (0.62949 – 0.62992)
Limit	15.900 (0.62598)



- Measure the inside diameter of the bushes of the oil pump body and cylinder block using the dial gauge.
- If the clearance between the driven gear shaft and bush exceeds the limit, replace the driven gear assembly.

Clearance between the driven gear shaft and bush mm (in)	
Standard	0.04 – 0.07 (0.0016 – 0.0028)
Limit	0.20 (0.0079)

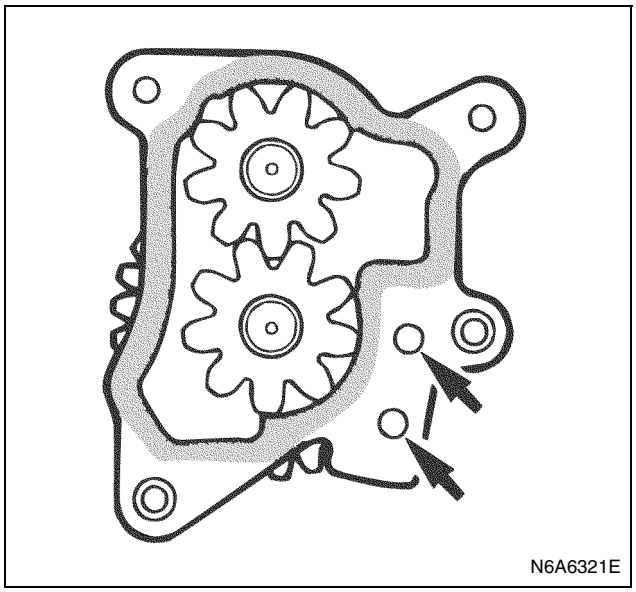


Installation

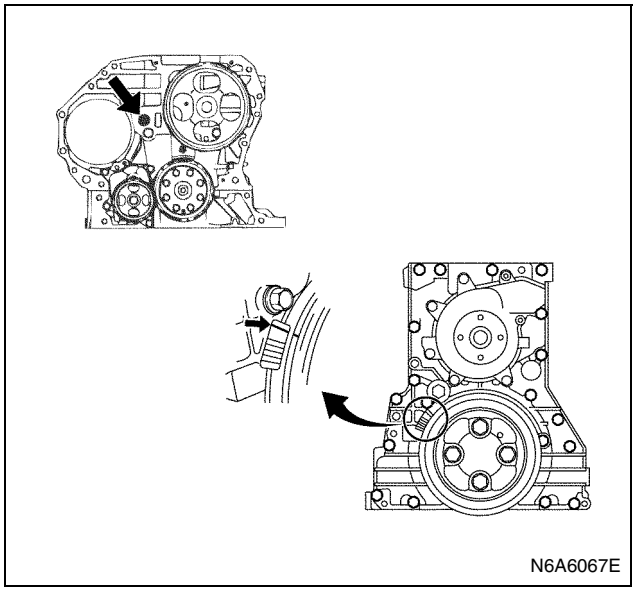
1. Install the oil pump assembly.
   - Apply the liquid gasket (ThreeBond 1141E or equivalent) as shown in the figure, mount it on the cylinder block within one hour, and tighten it using the specified torque.

Tighten:
Oil pump assembly to 24 N·m (2.4 kg·m/17 lb·ft)

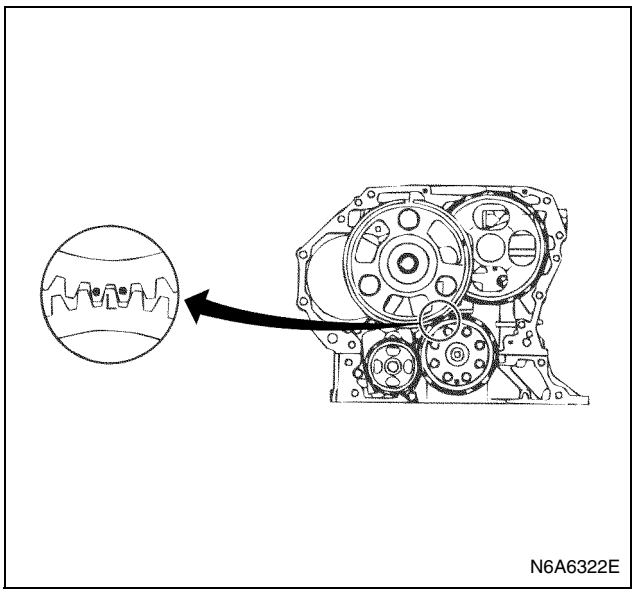
Caution:
Apply the fluid gasket such that it does not enter the holes shown by arrows in the figure, gear, and the oil pump body.



2. Install the idling gear A.
   - Install the idling gear shaft at the position shown in the figure and apply engine oil on the shaft.
   - Rotate the crankshaft clockwise and bring the piston of the No.1 cylinder to the top dead center.



- Match the coincidence marks of the crankshaft gear and the idle gear A, and install them on the cylinder block.

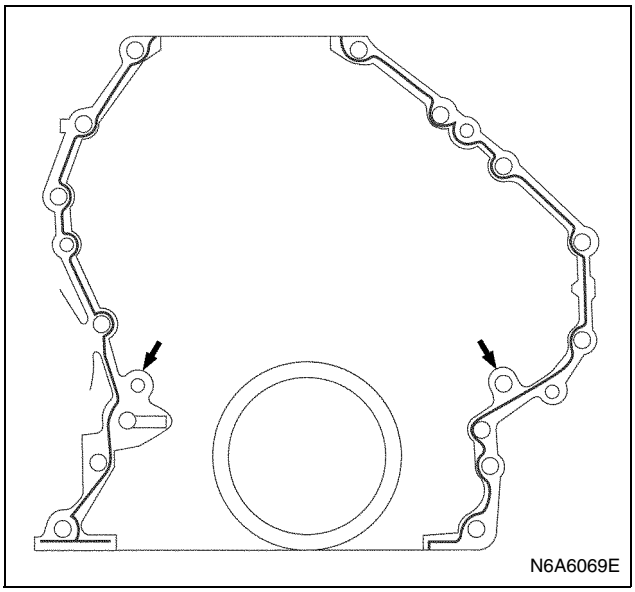


N6A6322E

- Tighten the mounting bolts using the specified torque.

Tighten:
Bolts to 133 N·m (13.6 kg·m/98 lb·ft)

3. Install the flywheel housing.
   - Clean properly the rear surface of the cylinder block. Remove the protruding fluid gasket thoroughly, especially, when mounting the crankcase.
   - Apply the liquid gasket (ThreeBond1207C) uniformly on the inside surface of the bolt holes (excluding the bolt holes indicated by arrows) as shown in the figure.
   - After applying the liquid gasket, quickly install it.

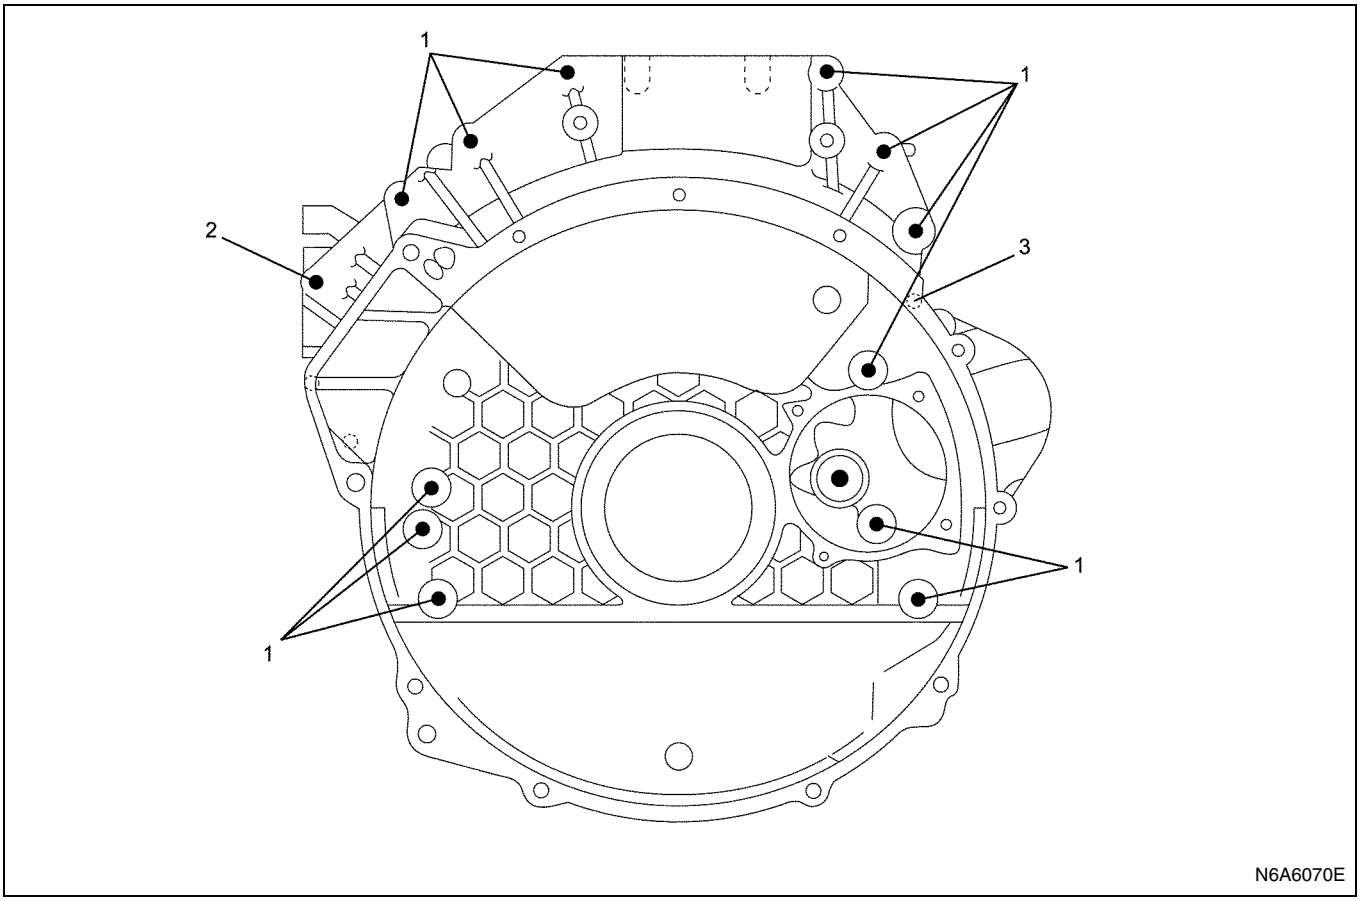


N6A6069E

- Match the dowel pin of the cylinder block and then install the flywheel housing.

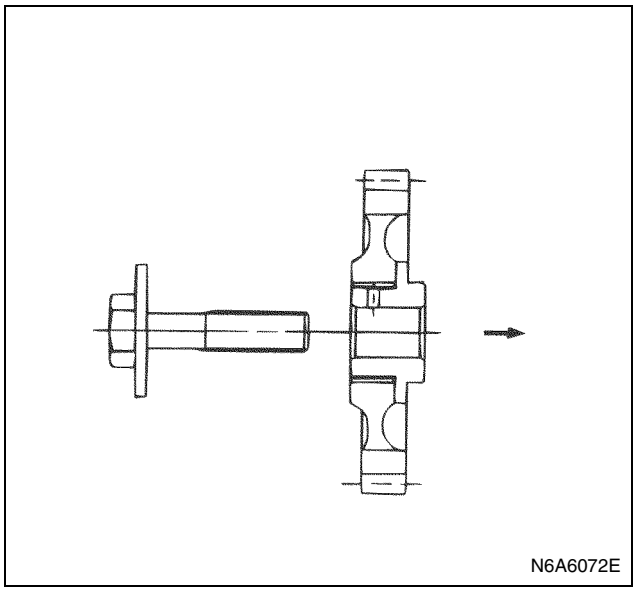
Tighten:
Bolts (1) to 96 N·m (9.8 kg·m/71 lb·ft)
Bolts (2) to 77 N·m (7.9 kg·m/57 lb·ft)
Bolts (3) to 38 N·m (3.9 kg·m/28 lb·ft)

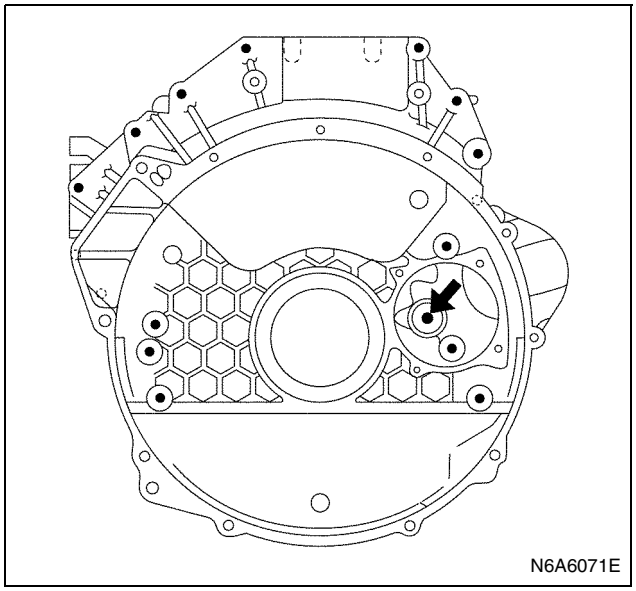
- The seal is tightened from the cylinder block side.



4. Install the power steering pump idling gear.
   - Apply the engine oil on the gear assembly unit of the idling gear shaft.
   - Assemble the idling gear and the shaft in the direction shown in the figure, mount it on the flywheel housing, and tighten it using the specified torque.

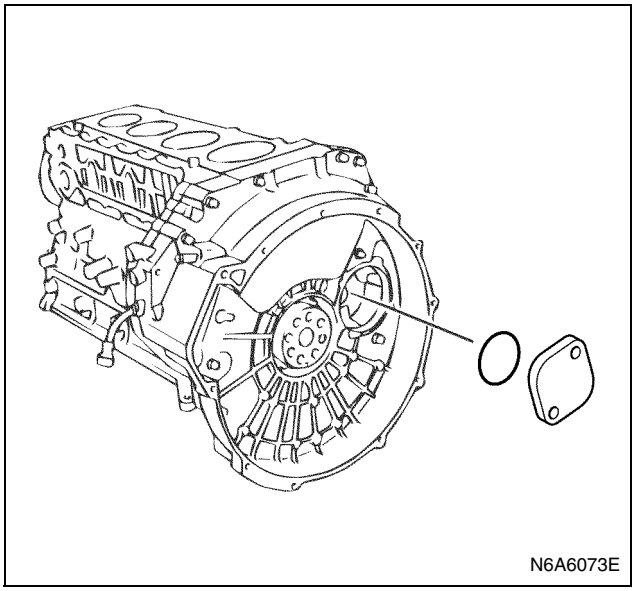
Tighten:
Bolt to 133 N·m (13.6 kg·m/98 lb·ft)





5. Install the idling gear cover of the power steering pump.
   - Install the O-ring on the cover and on the flywheel housing, and tighten the fixing bolts using the specified torque.

Tighten:
Bolt to 19 N·m (1.9 kg·m/14 lb·ft)



N6A6073E

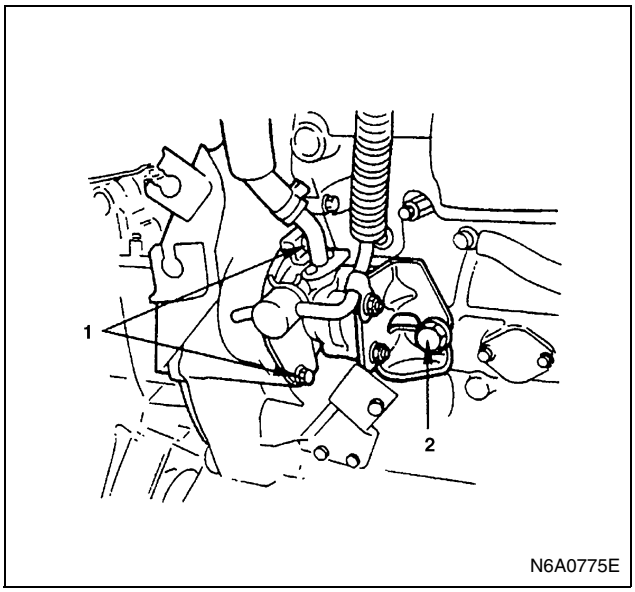
6. Install the power steering pump and tighten it using the specified torque.

Tighten:

Flywheel housing fixing bolt (1) to 43 N·m (4.4 kg·m/32 lb·ft)

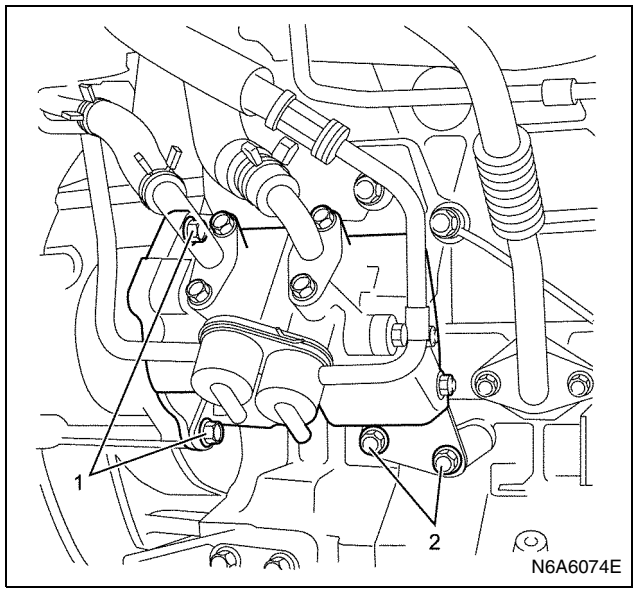
Cylinder block fixing bolts (2) to 44 N·m (4.5 kg·m/33 lb·ft)

Without HBB



N6A0775E

With HBB



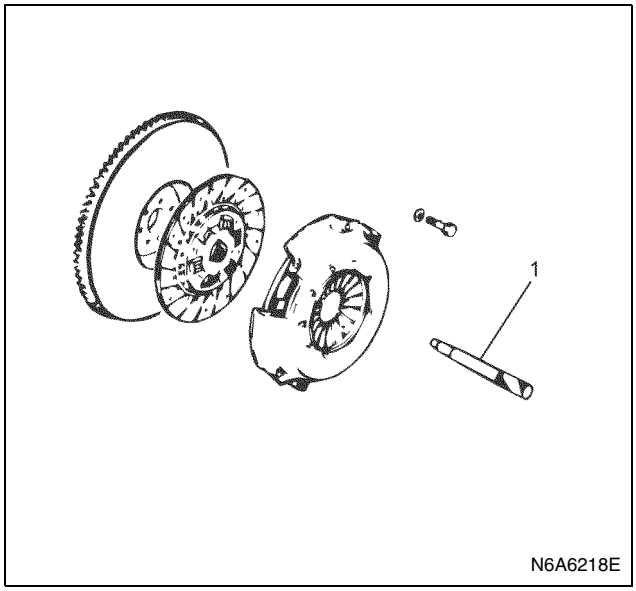
N6A6074E

Legend

1. Flywheel Housing Bolt
2. Cylinder Block Bolt

7. Install the oil pan.
   Refer to “Oil Pan”.
8. Install the rear seal of the crankshaft.
   Refer to “Crankshaft Rear Oil Seal”.
9. Install the flywheel.
   Refer to “Flywheel”.
10. Install the fuel supply pump assembly.
    Refer to “Fuel Supply Pump” in Section 6C.
11. Install the clutch plate assembly.
12. Install the clutch pressure plate assembly.
    - Insert the clutch aligner in the spline of the clutch plate assembly.
    - Install the clutch plate assembly on the flywheel.

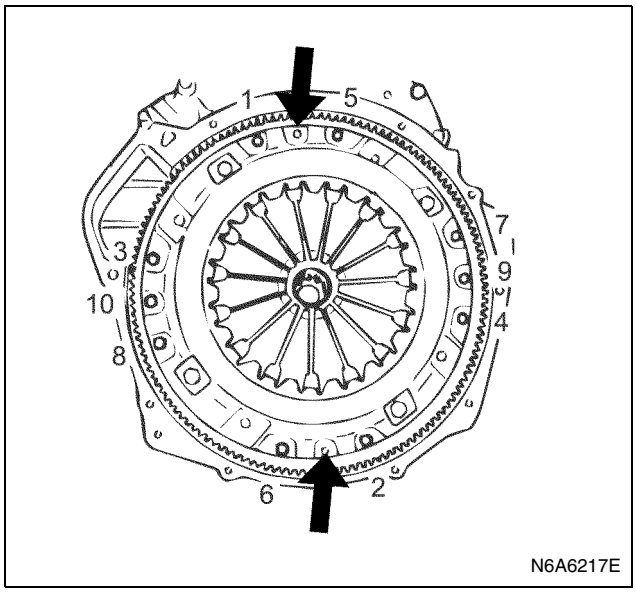
- Match the mounting hole of the clutch pressure plate assembly with the dowel pin of the flywheel, and install the clutch pressure plate assembly on the flywheel.



Legend
1. Clutch Aligner

- Tighten the clutch pressure plate assembly in the sequence shown in the figure using the specified torque.

Tighten:
Bolts to 40 N·m (4.1 kg·m/30 lb·ft)

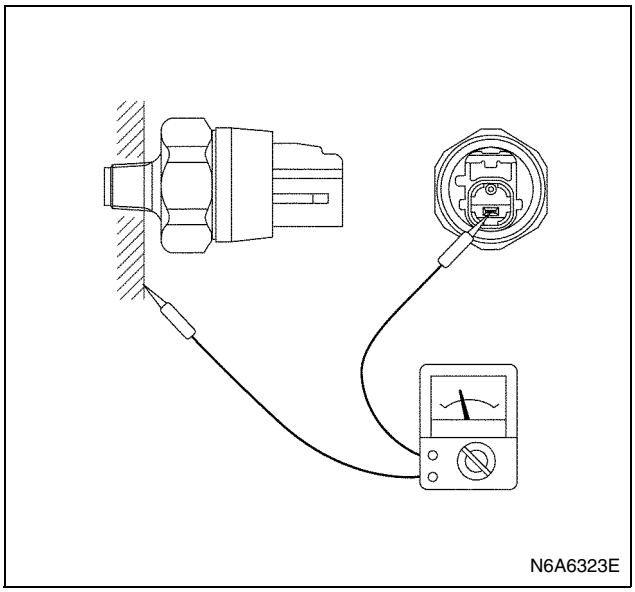


13. Install the cylinder head assembly.
    Refer to “Cylinder Head”.
14. Install the camshaft assembly.
    Refer to “Camshaft Assembly”.
15. Install the rocker arm shaft assembly.
    Refer to “Rocker Arm Shaft Assembly”.
16. Tighten the cylinder head cover.
    Refer to “Cylinder Head Cover”.

Oil Pressure Switch

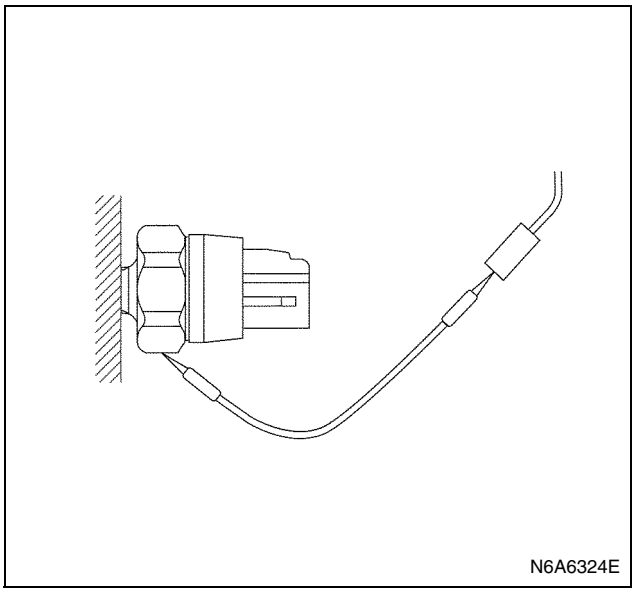
Inspection

Check the continuity between the switch terminal and the body grounding in the no-load condition.
If there is no connectivity, replace with normal parts. (Refer to “Oil Filter Assembly”)



Circuit check

1. Turn the starter switch to ON.
2. Disconnect the oil pressure switch connector, and confirm that the oil pressure-warning lamp lights when the connector on the harness side is grounded.
   If the warning lamp does not light up, check the circuit between the meter and the oil pressure switch, and repair the disconnected locations.



Air Cleaner Element

Removal

1. Remove the air cleaner cover fixing bolt.
2. Remove the air cleaner element assembly.

Inspection

- Check for damage to the element or clogging due to dirt. If the element is damaged, then replace it. If clogged, then clean it.
- The viscous-type (wet type) element cannot be cleaned; therefore, it has to be replaced if it is very dirty.

Replacement period	Every 40,000 km (24,000 miles) or every two years

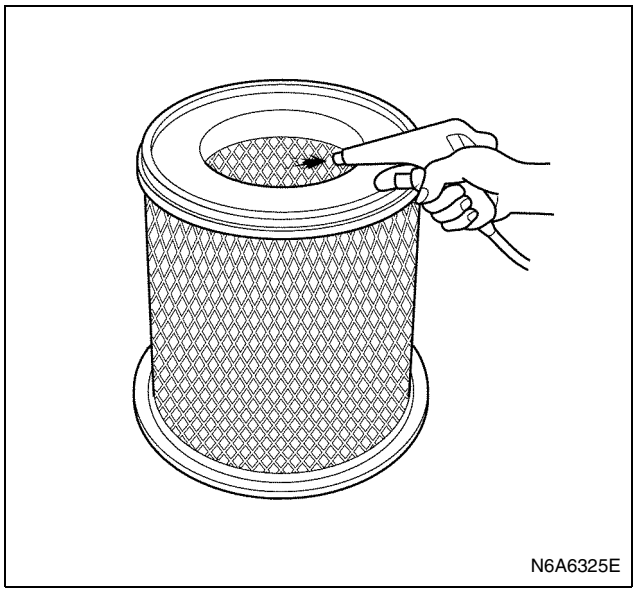
Installation

1. Install the air cleaner element assembly.
2. Tighten the air cleaner cover fixing bolt.

Cleaning

Dry type element

- While rotating the element, blow air under 690 kPa (7.0 kg/cm^2 / 100 psi) and remove the dust.



- Dissolve the filter cleaner ND1500 in water and soak the element for approximately 30 minutes. Then wash it properly with water and allow it to dry in natural conditions (two to three days.)

Cooling System

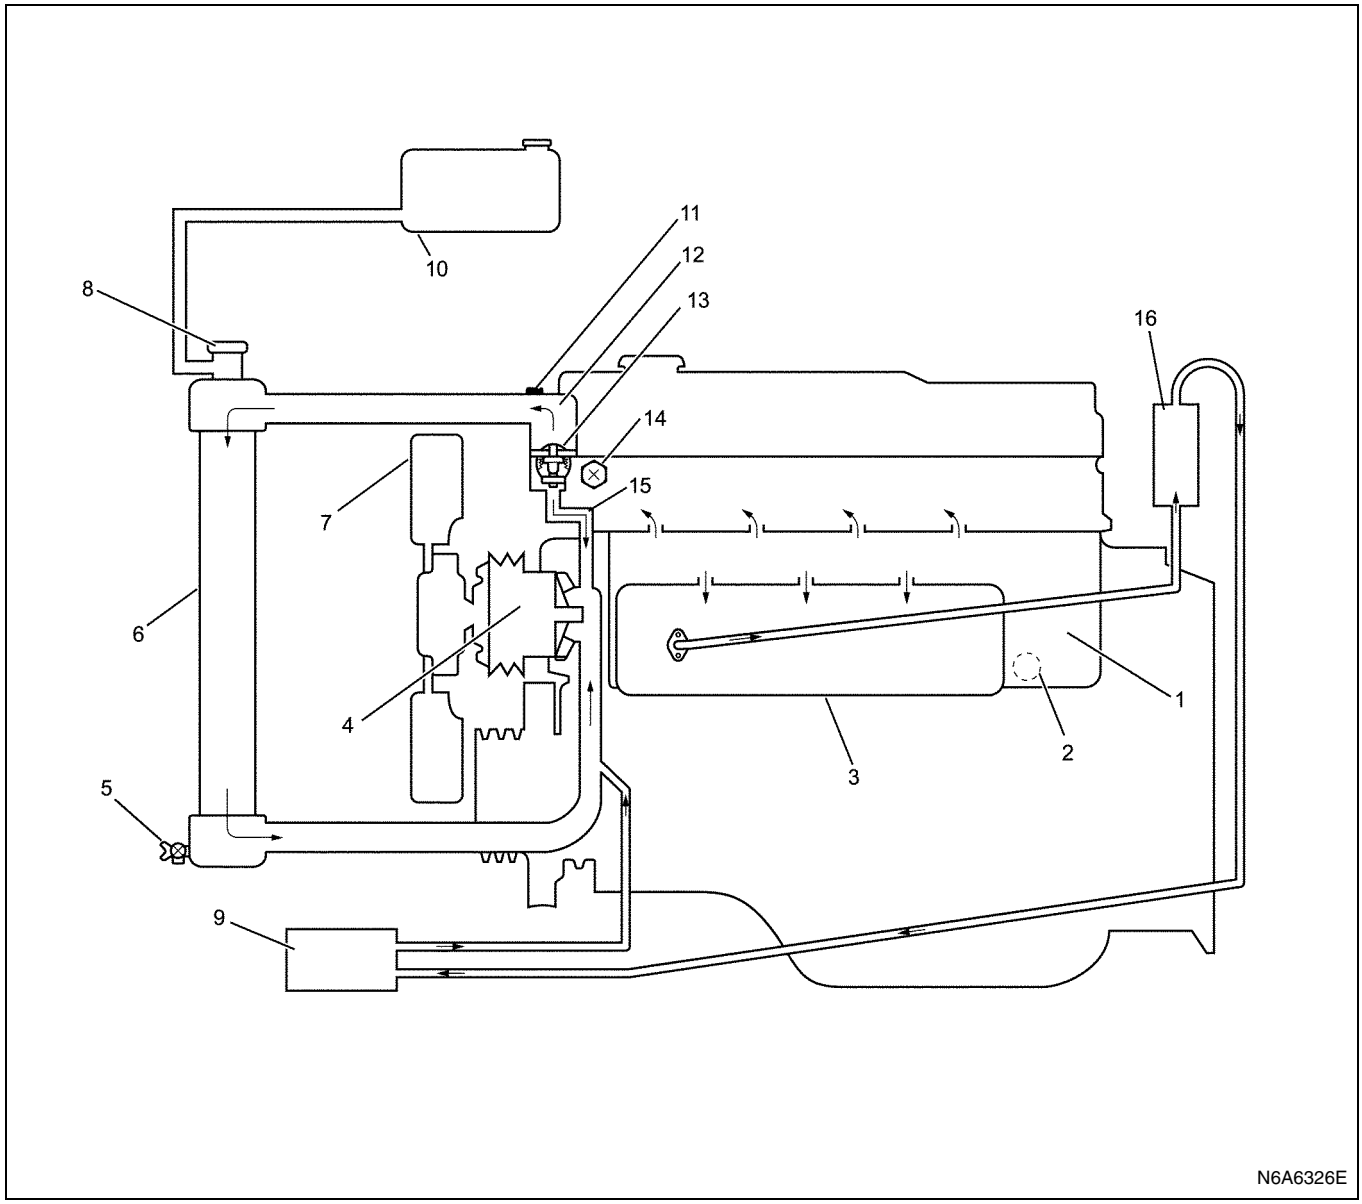
Service Precautions

WARNING:
Do not remove the radiator cap when the cooling water is at high temperature. Steam or boiling water will gush out and you may be burnt. To open the radiator cap, cover the cap with a thick cloth when the cooling water is cool, release the pressure by slowly turning the cap, and then remove the cap.

Explanations on Functions and Operation

Cooling Water System

The cooling water system, which is the forced circulation system, consists of a water pump, thermostat, and radiator as its main components.

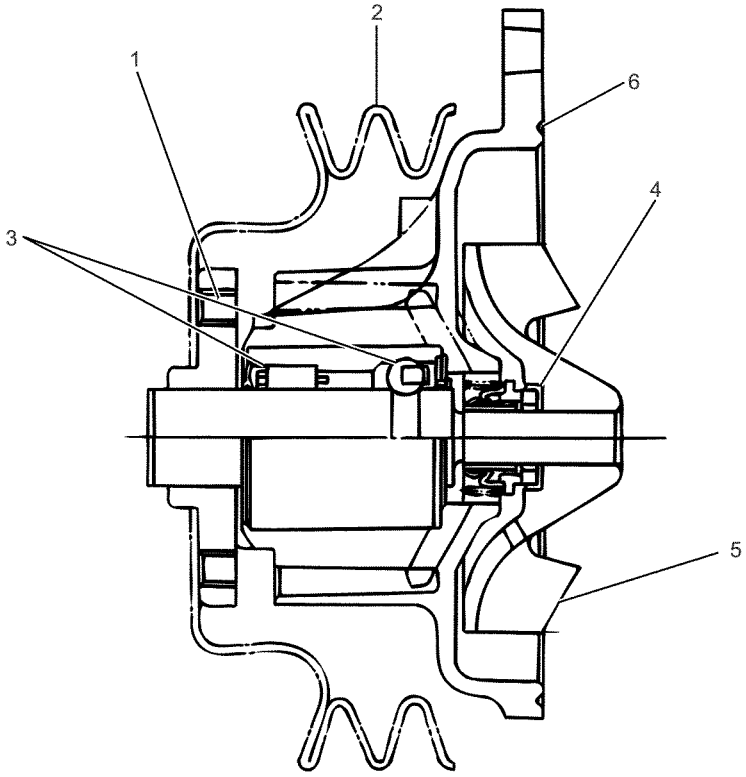


Legend

1. Water Jacket
2. Drain Plug
3. Oil Cooler
4. Water Pump
5. Drain Cock
6. Radiator
7. Cooling Fan
8. Radiator Cap
9. Heater Core
10. Reserve Tank
11. Air Bleeding Plug
12. Water Outlet Pipe
13. Thermostat (2 nos.)
14. Thermometer Unit
15. Bypass Route
16. EGR Cooler

Water Pump

The water pump, which uses the centrifugal impeller system, is driven by the engine fan belt.



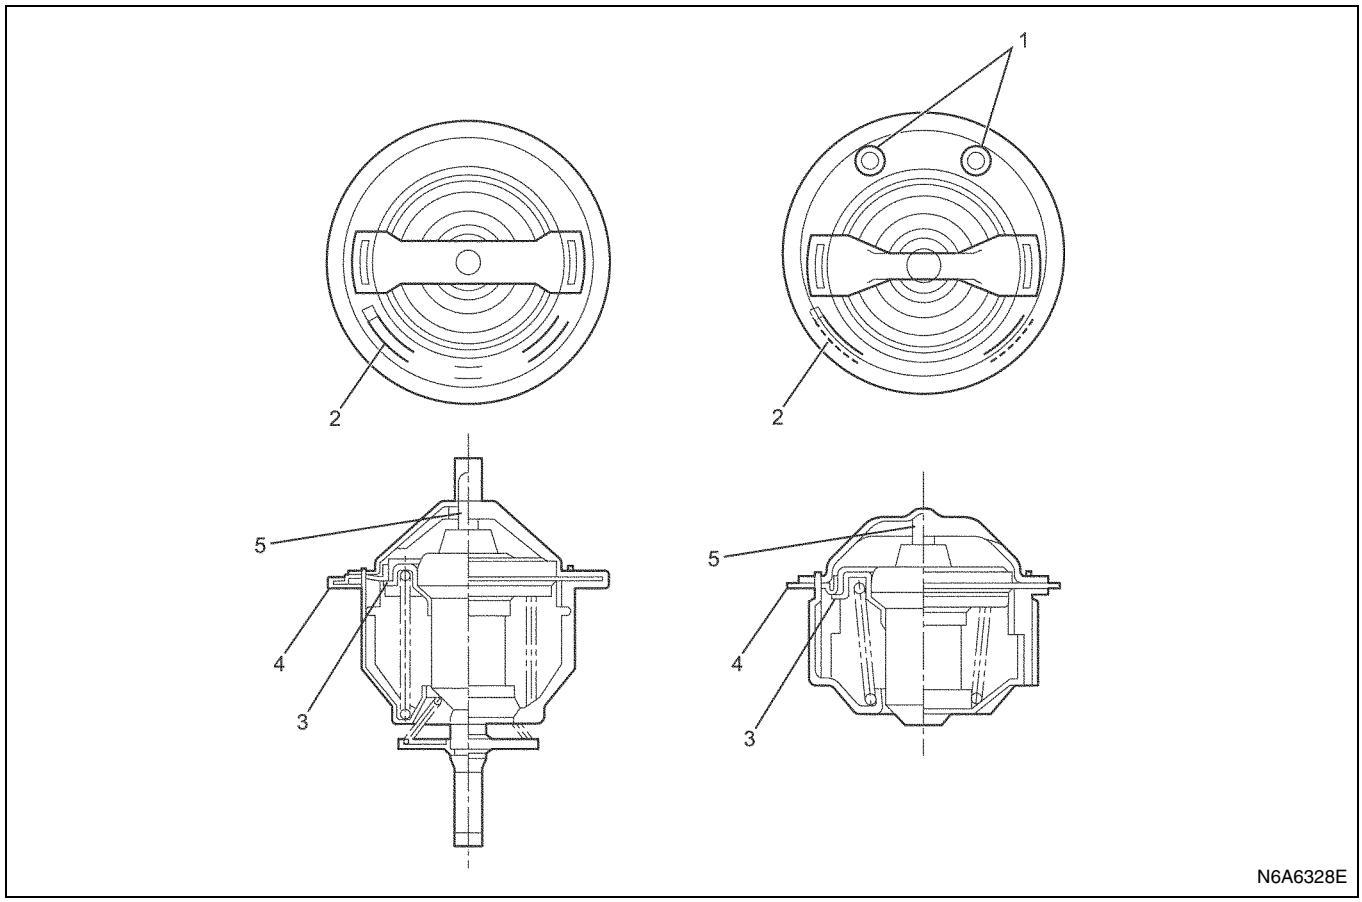
N6A6327E

Legend

1. Fan Center
2. Fan Pulley
3. Bearing
4. Seal Unit
5. Impeller
6. Groove

Thermostat

The thermostat is a wax pellet type and consists of two units, in which one unit (bottom bypass type) has an valve initial opening temperature of 82 °C (180 °F) and the second (inline type) has an valve initial opening temperature of 85 °C (185 °F). It is designed such that the water temperature can be adjusted finely and it is mounted within the thermostat-housing unit.

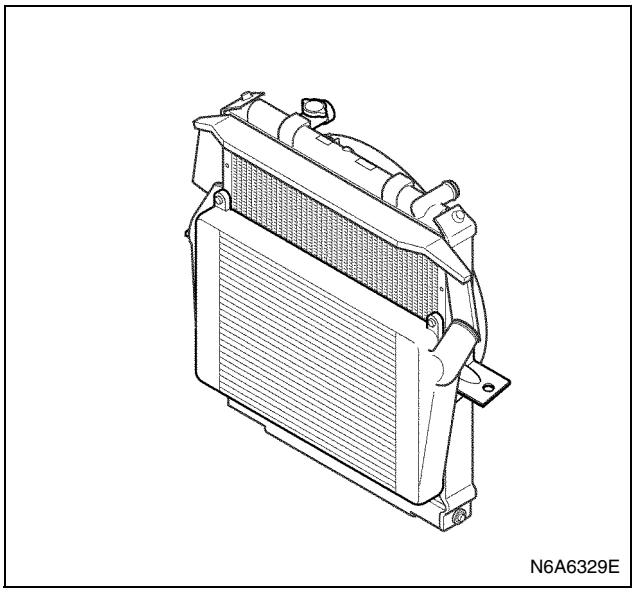


Legend

1. Jiggle Valve
2. Stamp Mark (Valve Initial Opening Temperature)
3. Valve
4. Gasket
5. Piston

Radiator

The radiator is a tube with corrugated fins. To increase the boiling point of the cooling water, a radiator cap of injection valve opening pressure of 108 ± 14.7 kPa (1.1 ± 0.15 kg/cm^2 / 15.7 ± 2.1 psi) is attached.

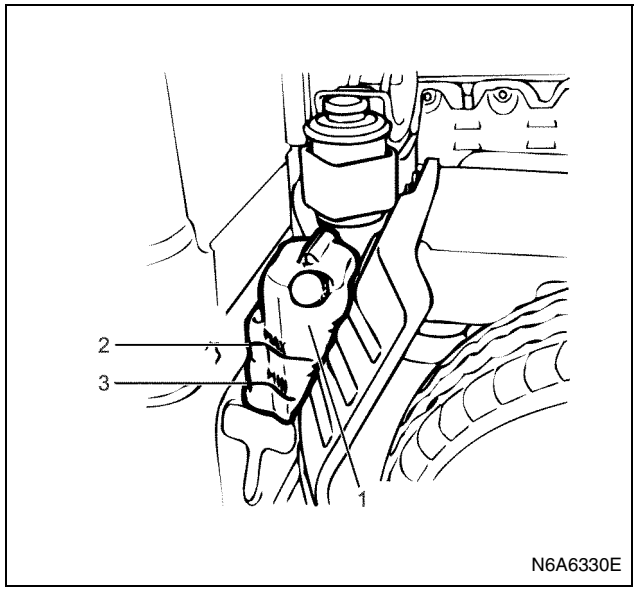


N6A6329E

Functional Check

1. Cooling water level check
   - Check the cooling water level within the reserve tank and the level is appropriate when the cooling water level is within the MAX (upper limit) and MIN (lower limit) range. In case the volume of the cooling water is deficient, remove the reserve tank cap and replenish with a mixture of tap water and engine coolant in the ratio of 1:1 until the level comes close to the MAX line.

Standard value	
Cooling water level	17.6 liters (4.65 US gal. / 3.87 Imp gal.) (between MIN and MAX level)
Replacement period	Every two years or 40,000 kilometers (24,000 miles)



N6A6330E

Legend

1. Reserve Tank
2. MAX Line (Upper Limit)
3. MIN Line (Lower Limit)

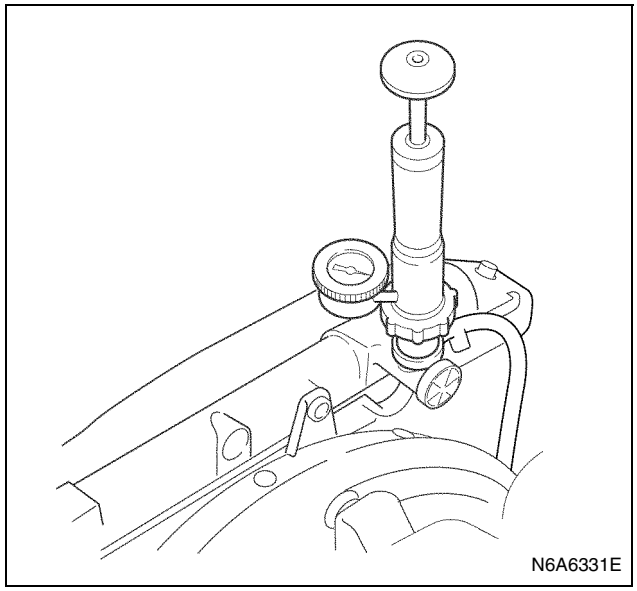
Inspection

Cooling water leak check

- Use the radiator cap tester and apply a pressure of 196 kPa (2.0 kg/cm^2 / 28.4 psi) and check for leaks in the locations given below. Check that the radiator hose and heater hose are not damaged or degraded and the hose clamp is not loose.

Inspection locations

- Radiator assembly, water pump assembly, radiator hose, and heater hose.

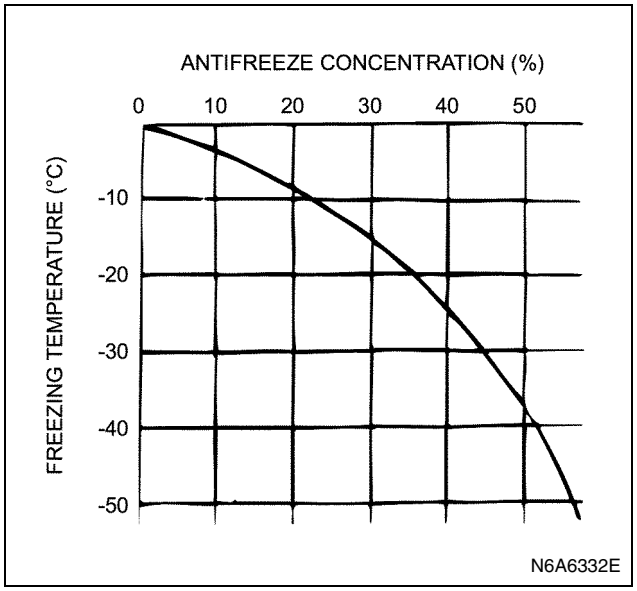


N6A6331E

Coolant

1. About the engine coolant concentration

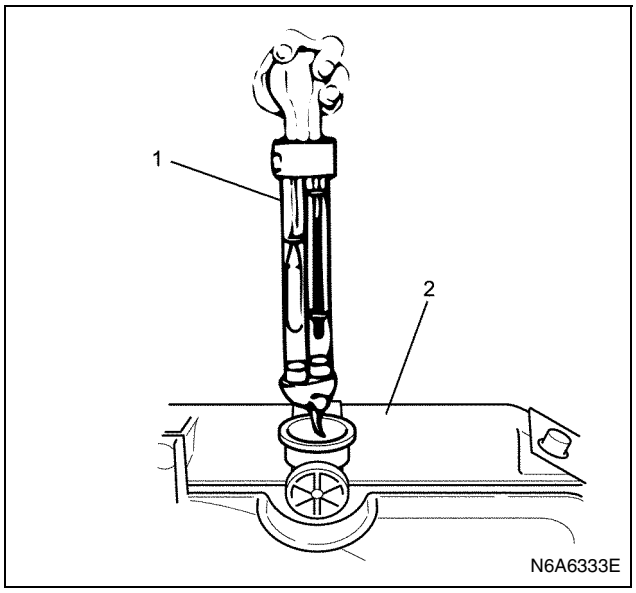
- Take the concentration corresponding to the minimum temperature because the freezing temperature varies according to the concentration of the engine coolant.
- Use only genuine Isuzu engine coolant.
- Use engine coolant with a mix ratio in the range of 30 to 60% because over heating is likely to occur if the ratio is greater than 60% and corrosion prevention is inadequate if the ratio is less than 30%.



Freezing temperature guideline	Mix ratio Liter (qts)		Concentration of engine coolant
	Engine coolant	Tap water	
-18°C (-0.4°F)	4.2 (4.4)	7.8 (8.2)	35%
-25°C (-13°F)	5.0 (5.3)	7.0 (7.4)	42%
-35°C (-31°F)	6.0 (6.3)	6.0 (6.3)	50%
-40°C (-40°F)	6.4 (6.8)	5.6 (5.9)	53%

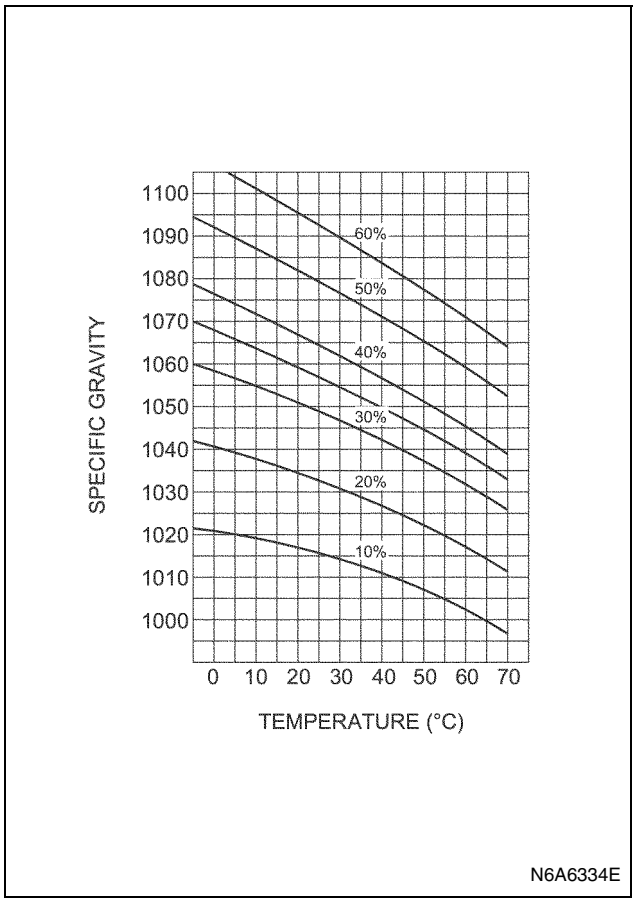
2. Engine coolant density measurement
   Methods for measuring specific gravity
   - Measure the specific gravity and the temperature of the cooling water using an anti-freeze specific gravity meter and thermometer.

     Take precautionary measures as the boiled cooling water may gush out at high temperatures if the cap is removed.
   - Use a deep container to suit the height of the specific gravity meter.



Legend
1. Radiator
2. Anti-Freeze Specific Gravity Meter

- Fix the temperature of the cooling water being measured in the range of 0 to 50 °C (32 to 122 °F).
- Measure the temperature and specific gravity and determine the concentration from the table given below.



Coolant scooping method

- Measure the concentration using the coolant scoop.

A List of Defective Phenomena

- Engine overheats
- Engine overcools

Engine overheats

Condition	Possible Cause	Correction
Engine overheats	Cooling water volume is deficit.	Replenish.
	Thermometer unit is defective.	Replace.
	Thermostat is defective.	Replace.
	Water pump is defective.	Replace.
	Radiator is clogging.	Clean or replace.
	Radiator cap is defective.	Replace.
	Engine oil volume is deficient or incorrect engine oil is used.	Replenish or change the engine oil.
	Cylinder head gasket is defective.	Replace.
	The fan belt is loose.	Adjust.
	Exhaust system is clogging.	Clean or replace.
	The fuel injection quantity is in surplus.	Diagnose the engine control system.
	Fuel injection timing is incorrect.	Diagnose the engine control system.
	Starting pressure of fuel injection is low.	Diagnose the engine control system.

Engine overcools

Condition	Possible Cause	Correction
Engine overcools	Thermostat is defective.	Replace.

Main Data and Specifications

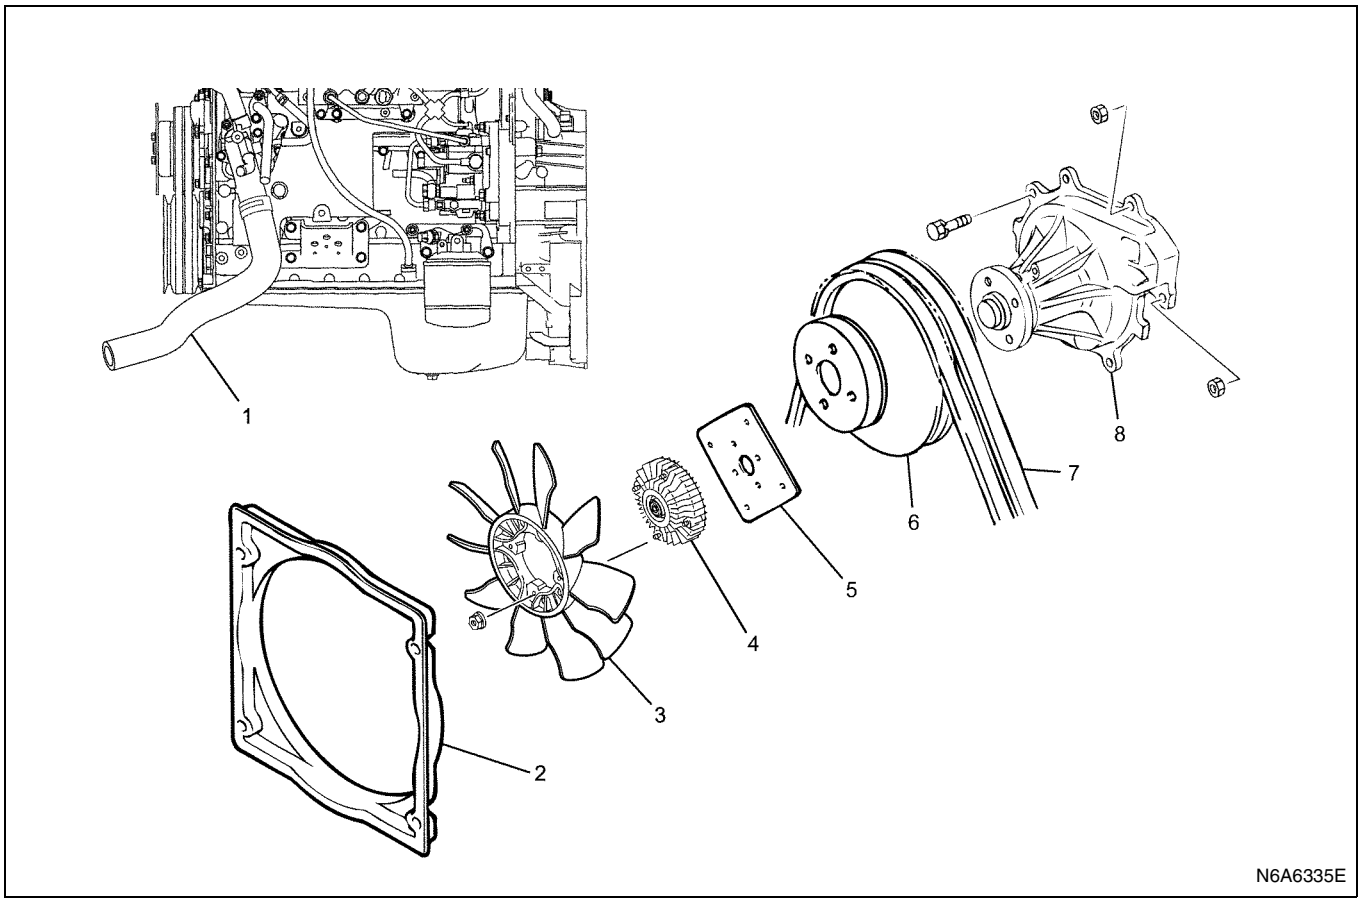
Main Data and Specifications

Cooling methods		Forced circulation system
Radiator		Tubes with corrugated fins
Radiation capacity	kW (kcal/h)	120 (103200)
Radiation area	m^2 (ft^2)	17.78 (191.3)
Frontal area	m^2 (ft^2)	0.367 (4.05)
Dry mass	N (lb)	196 (44.1)
Radiator cap		
Valve opening pressure	kPa (kg/cm^2 / psi)	108 ± 14.7 (1.1 ± 0.15 / 15.7 ± 2.1)
Cooling water capacity	Liters (US / Imp gal.)	3.2 (0.85 / 0.70)
Water pump		Centrifugal impeller system
Pulley ratio		1.190

Thermostat		Wax pellet system
Valve opening temperature	°C (°F)	With jiggle valve 85 (185) Without jiggle valve 82 (180)
Temperature when fully open	°C (°F)	With jiggle valve 100 (212) Without jiggle valve 95 (203)
Cooling water total capacity	Liters (US / Imp gal.)	17.6 (4.65 / 3.87)

Water Pump

Components

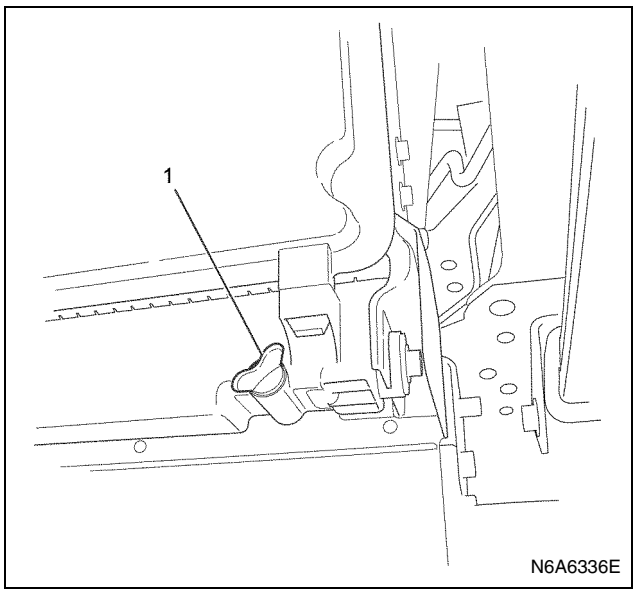


Legend

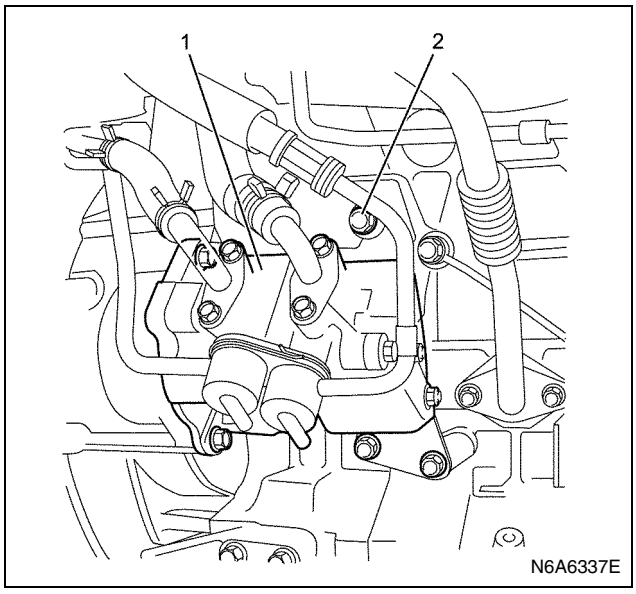
1. Radiator Lower Hose
2. Fan Guide
3. Fan
4. Cooling Fan Clutch
5. Setting Plate
6. Water Pump Pulley
7. Fan Belt
8. Water Pump Assembly

Removal

1. Drain the coolant water.

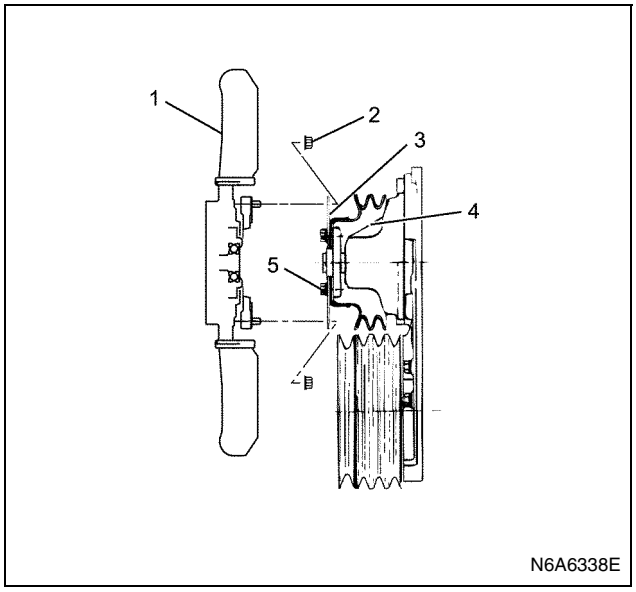


Legend
1. Radiator Drain Cock



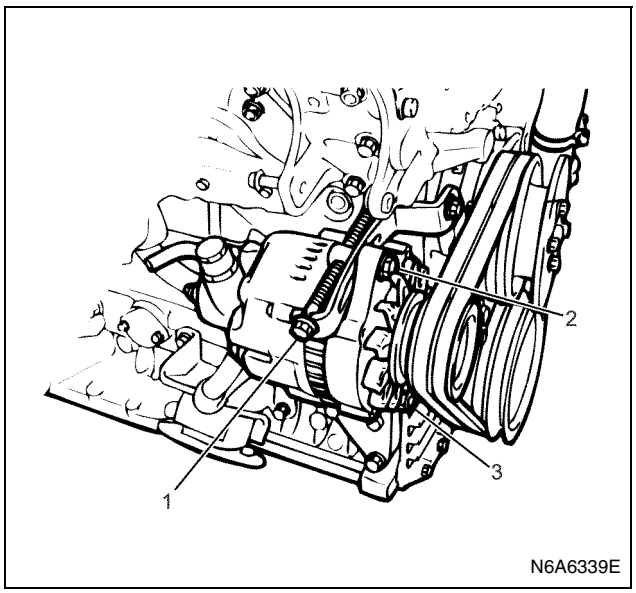
Legend
1. Power Steering Pump
2. Drain Plug

2. Remove the radiator lower hose on the radiator side.
3. Take out the fan guide from below.
4. Remove the four mounting nuts and then the fan assembly. Also, loosen the four bolts for tightening the setting plate and water pump pulley together.



Legend
1. Fan
2. Nut
3. Setting Plate
4. Water Pump Pulley
5. Bolt

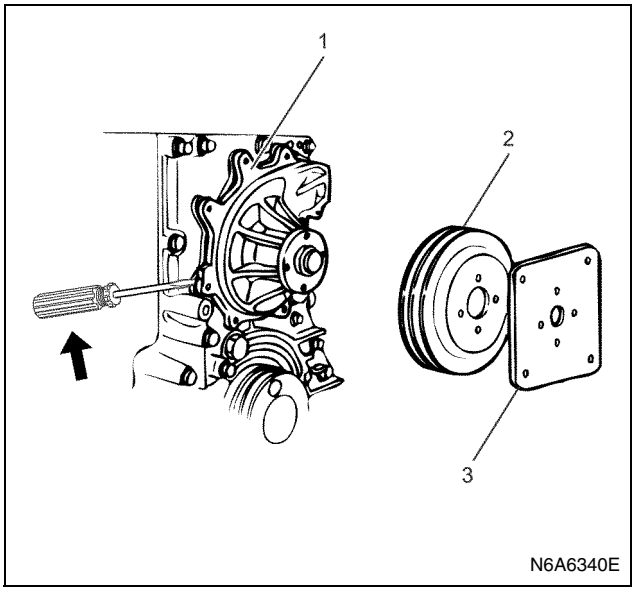
5. (2) and (3) that tighten the setting plate and water pump together. Loosen the adjusting bolts (1) in the generator and remove the fan belt.



Legend
1. Adjusting Bolt (With A/C)
2. Lock Nut
3. Bolt

6. Remove the setting plate and water pump pulley.

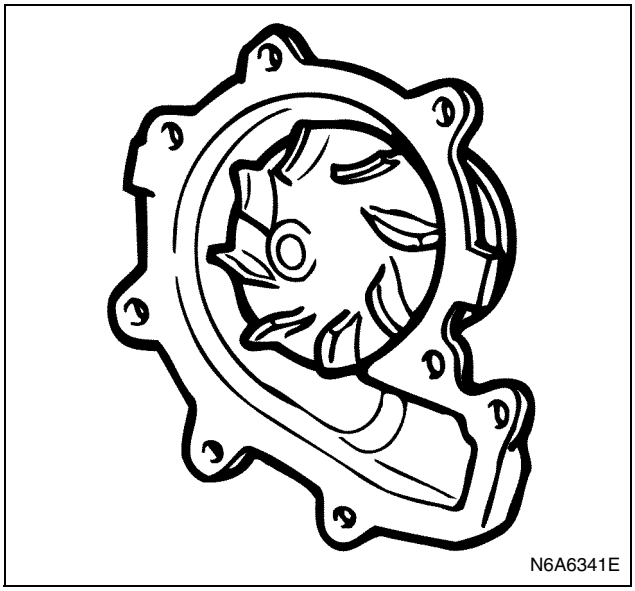
7. Remove the water pump assembly while inserting and scraping with the driver at the position shown in the figure.



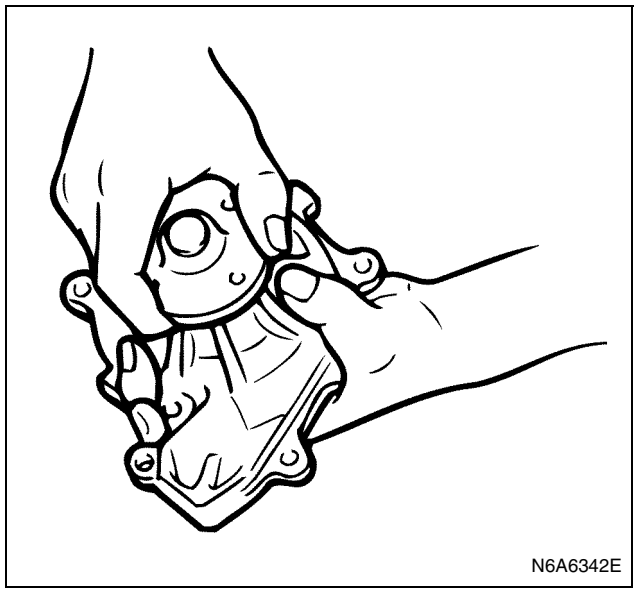
Legend
1. Water Pump
2. Water Pump Pulley
3. Setting Plate

Inspection

1. External check
   - Check for cracks or damage in the pump body.
   - Check for cracks and corrosion in the impeller.
   - Check for water leakage from the seal unit.
   - If you find abnormalities, replace with the water pump assembly.



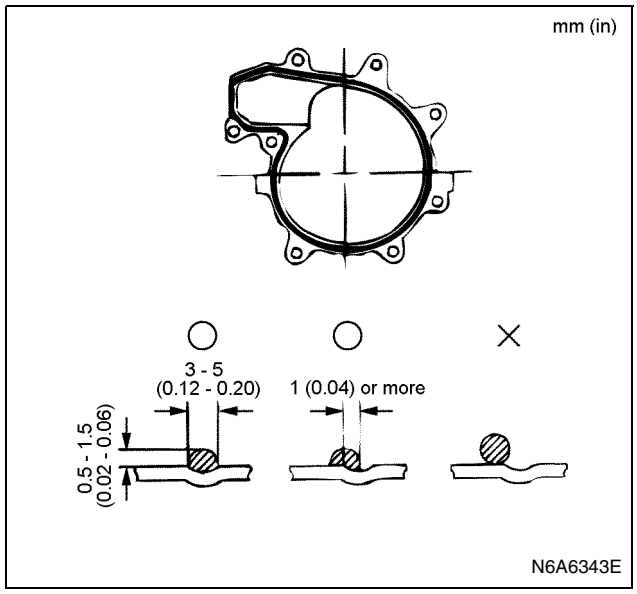
2. Bearing nut check
   - Rotate the fan center while pushing it along the radial direction. Confirm that there is no abnormal noise and no excessive play.
   - If you find abnormalities, replace with the water pump assembly.



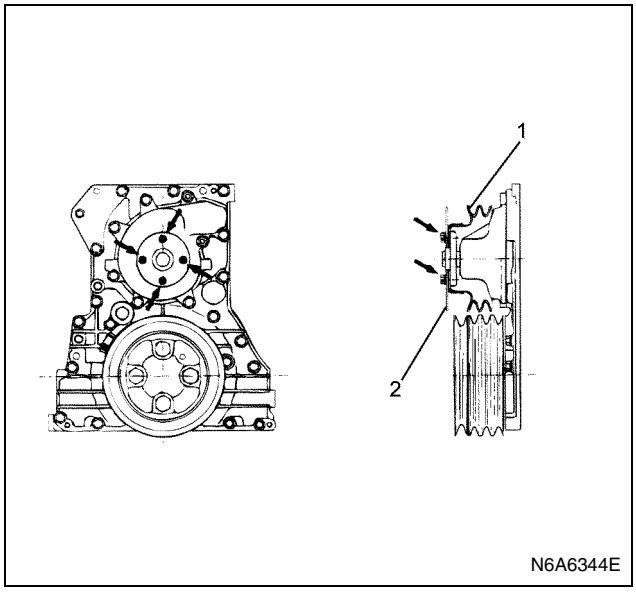
Installation

1. Mount the water pump assembly.
   - Coat the fluid gasket (ThreeBond 1207C or equivalent) to a bead diameter 3 to 5 mm (0.12 to 0.20 in) in the groove of the mounting surface of the water pump.
   - Mount the water pump to match with the studs of the front cover within 7 minutes after coating the fluid gasket.
   - Refer to the figure for the offset in position of the fluid gasket.

Tighten:
Bolts and nuts to 24 N·m (2.4 kg·m/17 lb·ft)



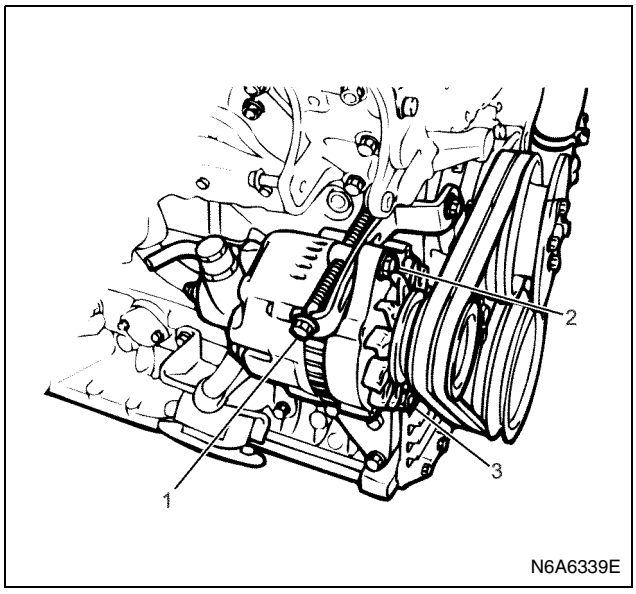
2. Temporarily fit the bolts until the water pump pulley and the setting plate are properly seated in the water pump assembly.



Legend
1. Fan Pulley
2. Setting Plate

3. Mount the fan belt, tighten the adjusting bolts of the generator, and adjust the tension.
   - Refer to “Drive Belt” in Section 6B.
4. After fan belt adjustments, tighten the generator using the specified torque.

Tighten:
Nut and bolt to 2 members: 24 N·m (2.4 kg·m / 17 lb·ft)
Nut and bolt to 3 members: 40 N·m (4.1 kg·m / 30 lb·ft)



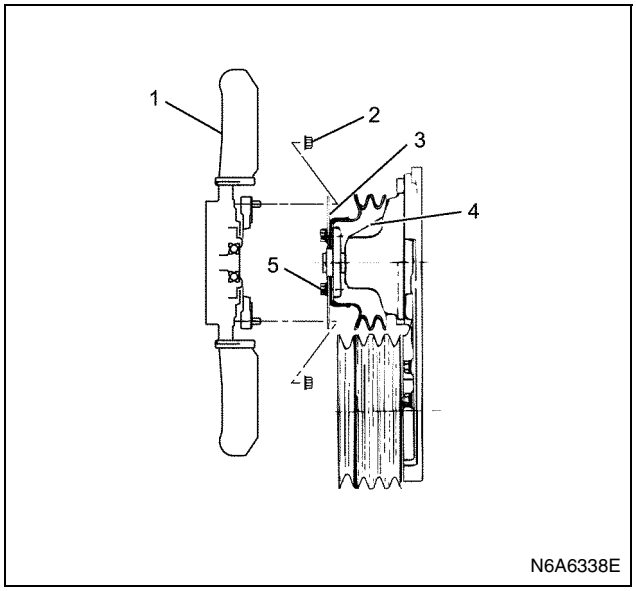
Legend
1. Adjusting Bolt (With A/C)
2. Lock Nut
3. Bolt

5. After the fan belt adjustments, tighten the temporarily fitted fan pulley and setting plate using the specified torque.

Tighten:
Bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

6. Tighten the fan assembly using the specified torque for mounting.

Tighten:
Nut to 24 N·m (2.4 kg·m / 17 lb·ft)



Legend
1. Fan Assembly
2. Nut

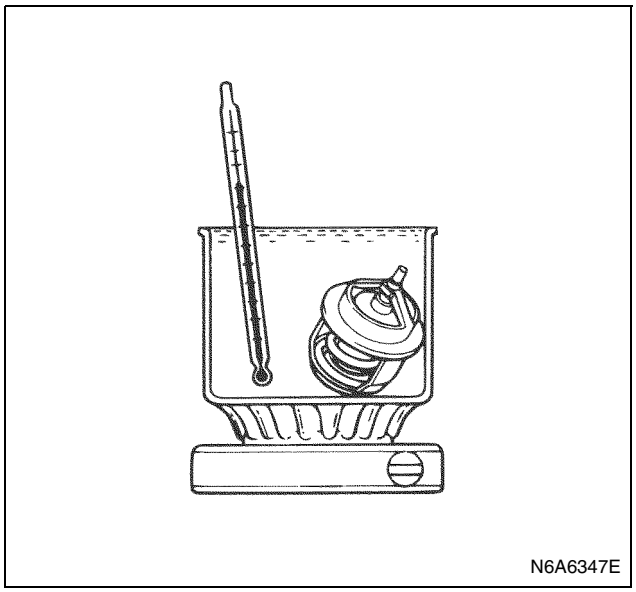
2. Water Outlet Pipe
3. Thermostat
4. Gasket

Removal

1. Drain the cooling water. Prepare the container for discharging and use it for replenishment when mounting the thermostat. Set the discharge of cooling water such that the water does not flow out of the thermostat housing.
2. Remove the radiator upper hose from the radiator side.
3. Remove the water outlet pipe.
4. Remove the thermostat.
5. Remove the gasket from the thermostat.

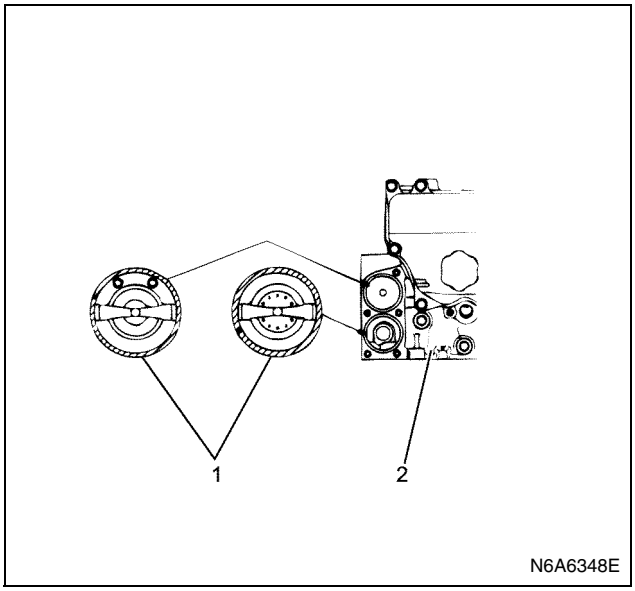
Inspection

- Place the thermostat in water and increase the temperature while stirring it sufficiently.
- Measure the temperature when the valve is just opened and when it is fully open.



Installation

1. Mount the gasket on the thermostat and mount it at the position shown in the figure.
   - Mount the thermostat at the position shown in the figure, as there are two types of thermostats with different shapes.
   - Fit the thermostat gasket ensuring that it does not come out of and on top of the external housing on the cylinder head side.

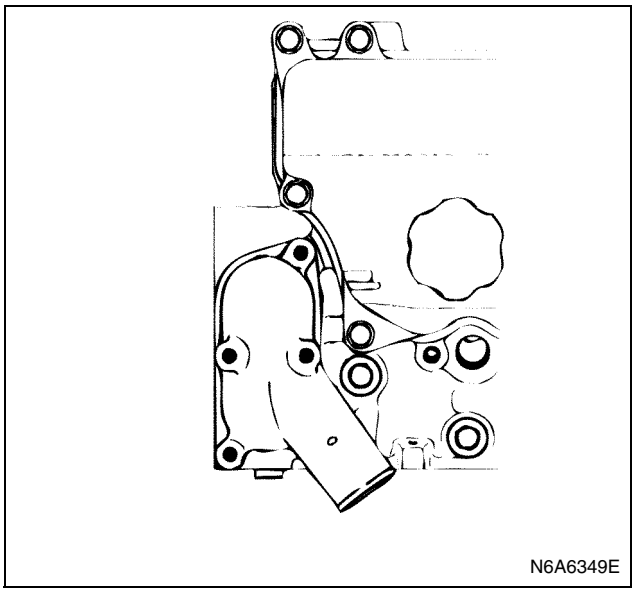


Legend
1. Thermostat
2. Cylinder Head

2. Mount the water outlet pipe.

Tighten:
Bolt to 24 N·m (2.4 kg·m / 17 lb·ft)

3. Mount the radiator upper hose.



4. Replenish the cooling water stored during the discharge, and check the volume of the cooling water.

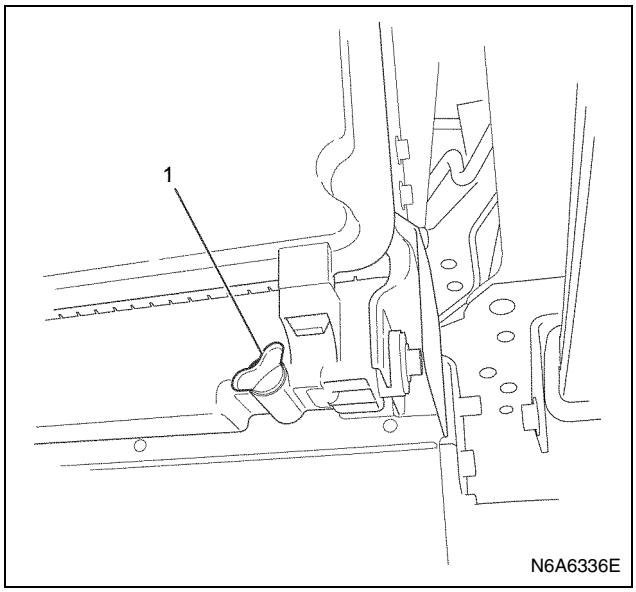
3. Radiator and Intercooler
4. Fan Guide
5. Radiator Lower Hose

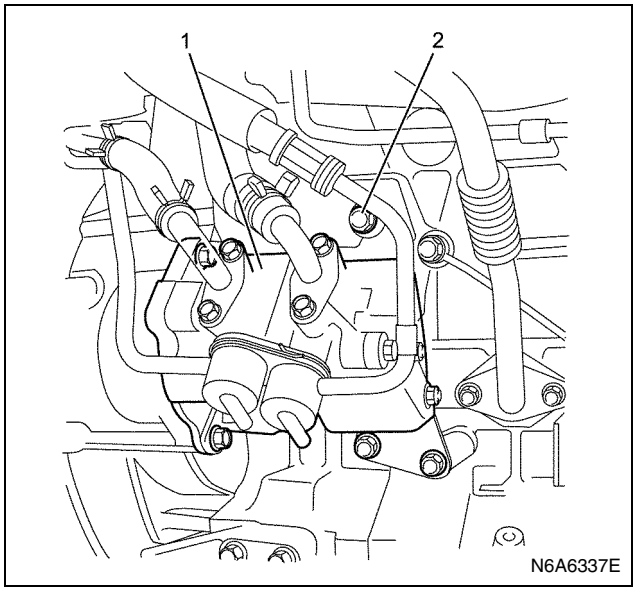
Removal

1. Loosen the water drain plug (to the right of the engine toward the rear) and radiator drain plug, and discharge the cooling water completely.

- After discharging the water, tighten the drain cock.

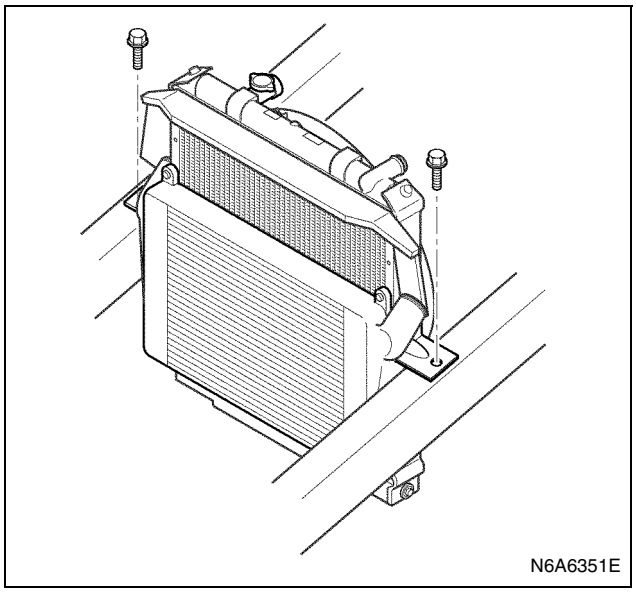


Legend
1. Radiator Drain Cock



Legend
1. Power Steering Pump
2. Drain Plug

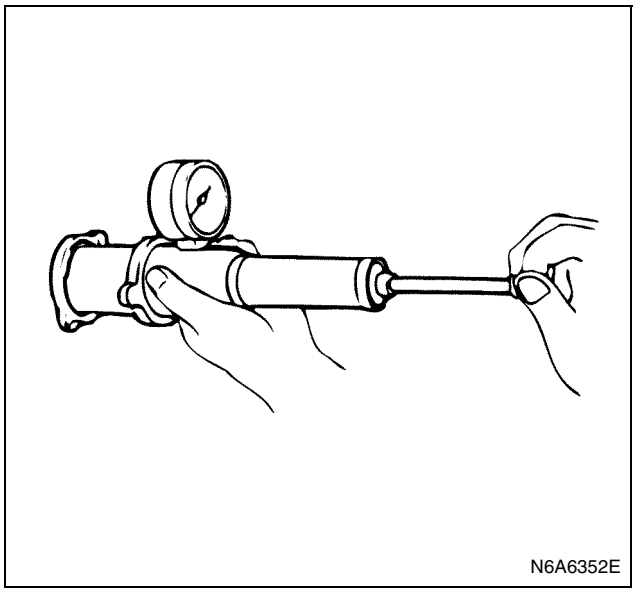
2. Remove the intake pipe from the intake manifold and inter-cooler (right side).
3. Remove the intake pipe from the turbo charger and inter-cooler (left side).
4. Remove the 2 transmission oil pipes on the underside of the radiator.
5. Remove the upper hose on the radiator side.
6. Remove the lower hose on the radiator side.
7. Remove the coolant reserve tank hose from the radiator side.
8. Take care to avoid damage to the radiator core from the fan blade, and remove the brackets on the right and left sides of the radiator. Simultaneously remove the radiator and inter-cooler.



Inspection

Radiator cap

1. Check the valve opening pressure using the radiator cap tester. If the valve opening pressure deviates from the standard value, replace the radiator cap.
   Valve opening pressure =
   108 ± 14.7 kPa (1.1 ± 0.15 kg/cm^2 / 15.7 ± 2.1 psi)



2. Check the state of the negative pressure valve situated at the center on the valve seat side of the cap. If the valve seat does not function smoothly due to rust or dirt, clean or replace the radiator cap.

Radiator core

1. If the radiator fin is deformed, the radiation effect deteriorates causing overheating. Therefore, modify the fin. Make sure that the root base of the fin is not damaged during modification.
   - Eliminate dust or other foreign matter.

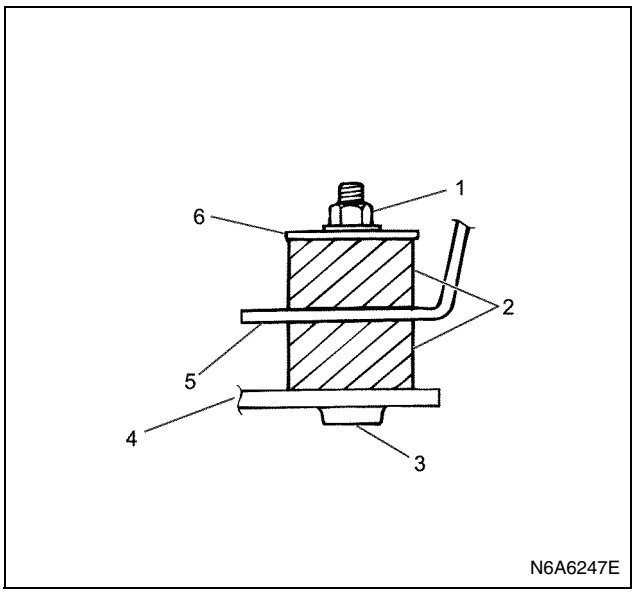
Washing the radiator

1. Wash the internal parts of the radiator and cooling water passage using water and detergent. Eliminate scale and rust completely.

Installation

1. Ensure that no damage occurs to the radiator core because of the fan blade. Mount the brackets on the left and right sides of the radiator on the frame according to the figure.

Tighten:
Bolts to 55 N·m (5.6 kg·m / 41 lb·ft)



Legend
1. Flange Nut
2. Rubber
3. Stud Bolt
4. Frame
5. Bracket on The Radiator Side
6. Washer

2. Mount the reserve tank hose of the coolant on the radiator.
3. Mount the radiator lower hose.
4. Mount the radiator upper hose.
   - Fill the cooling water.
5. Install the 2 transmission oil pipes on the underside of the radiator.
6. Install the intake pipe from the turbocharger and inter-cooler (left side).
7. Install the intake pipe from the intake manifold and inter-cooler (right side).

Reference

Cooling water injection procedure (in case of changing the cooling water completely)

- Confirm that the engine has cooled.
- Open the radiator cap and the reserve tank cap.
- Pour the cooling water up to the filler neck.
- Pour the cooling water up to the “MAX” line in the reserve tank.
- Close the radiator cap and the reserve tank cap and start the engine. Stop the engine after running for about 2 to 3 minutes at the idling rpm. Open the radiator cap again and replenish if the water level is low.

WARNING:
DO NOT LOOSEN OR REMOVE THE RADIATOR CAP WHEN THE TEMPERATURE OF THE COOLING WATER IS HIGH. STEAM OR BOILING WATER WILL GUSH OUT AND YOU MAY BE BURNT. TO OPEN THE RADIATOR CAP, COVER THE CAP WITH A THICK CLOTH WHEN THE COOLING WATER IS COOL, RELEASE THE PRESSURE BY SLOWLY TURNING THE CAP, AND THEN REMOVE THE CAP.

- After tightening the radiator cap, warm up the engine by running it at about 2000 rpm. Also, adjust the temperature of the heater to maximum temperature and circulate the cooling water even in the heater water conduit system.
- When the pointer of the thermometer crosses the median and the thermostat has activated, run at idling rpm for another 5 minutes, then stop the engine and leave it as-is.
- After the engine has cooled down sufficiently, check the water level in the filler neck part and replenish if necessary. If the level is extremely low, check for leaks in the cooling water conduit system and reserve tank hose.

- Pour the cooling water up to the “MAX” line in the reserve tank again.

7. Lock Nut
8. Adjusting Plate
9. A/C Compressor Drive Belt
10. Water Pump Pulley
11. Lock Nut
12. Tension Pulley
13. Adjusting Bolt

Inspection

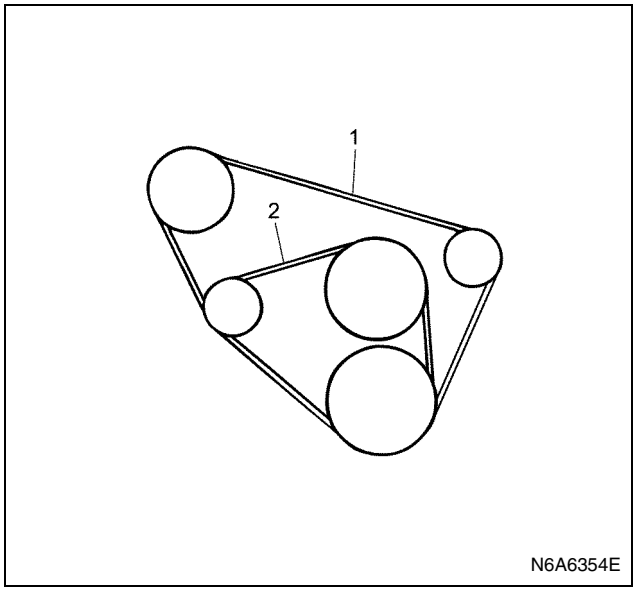
Check for the presence of wear or damage in the drive belt and renew the parts if necessary.
Check the tension of the belt and adjust if necessary.

Deflection Standard

Apply a pressure of 98 N (22 lb) at the center of the long span of each belt and check the deflection of the belt.

Deflection of A/C compressor drive belt
- When the belt is new
  16 to 20 mm (0.630 to 0.787 in)
- When the belt is reused
  18 to 22 mm (0.709 to 0.866 in)

Deflection of generator drive belt
- When the belt is new
  8 to 12 mm (0.315 to 0.472 in)
- When the belt is reused
  10 to 14 mm (0.394 to 0.551 in)



Legend
1. A/C Compressor Drive Belt
2. Generator Drive Belt

Adjustment

Adjust simultaneously the generator drive belt and A/C compressor drive belt for adjustment of belt.

With A/C

1. Loosen the tension pulley lock nut and tension pulley adjusting bolt of the tension pulley of the A/C compressor drive belt and bring the belt to free state.
2. Loosen the adjusting plate lock nuts and the mounting bolts of generator on the underside of the generator.
3. Rotate the adjusting bolts of generator and adjust the belt (remove and fit).
   - When replacing the belt, you must always replace both the belts.
4. After adjustments, tighten the adjusting plate lock nuts and the mounting bolts of generator on the underside of the generator using the specified torque.

Without A/C

Fan belt tension is adjusted by moving the generator.

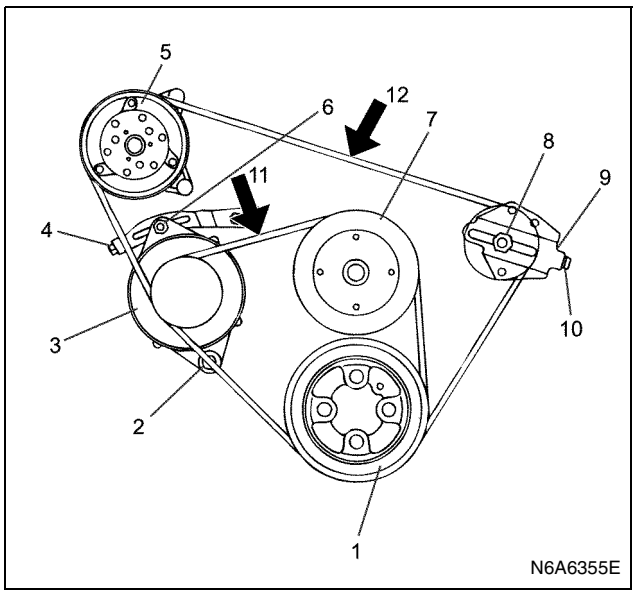
Tighten:
Nuts and bolts to 6 members: 24 N·m (2.4 kg·m / 17 lb·ft)
Nuts and bolts to 2 members: 40 N·m (4.1 kg·m / 30 lb·ft)

- Finally, adjust the tension of A/C compressor drive belt.

Caution:
You must adjust the tension of A/C compressor drive belt after adjusting generator belt.

a. Rotate the tension pulley adjusting bolt of the tension pulley and adjust the belt (remove and fit).
b. After adjustments, tighten the tension pulley lock nut using the specified torque.

Tighten:
Lock nut to 27 N·m (2.8 kg·m / 20 lb·ft)



Legend

Fuel System

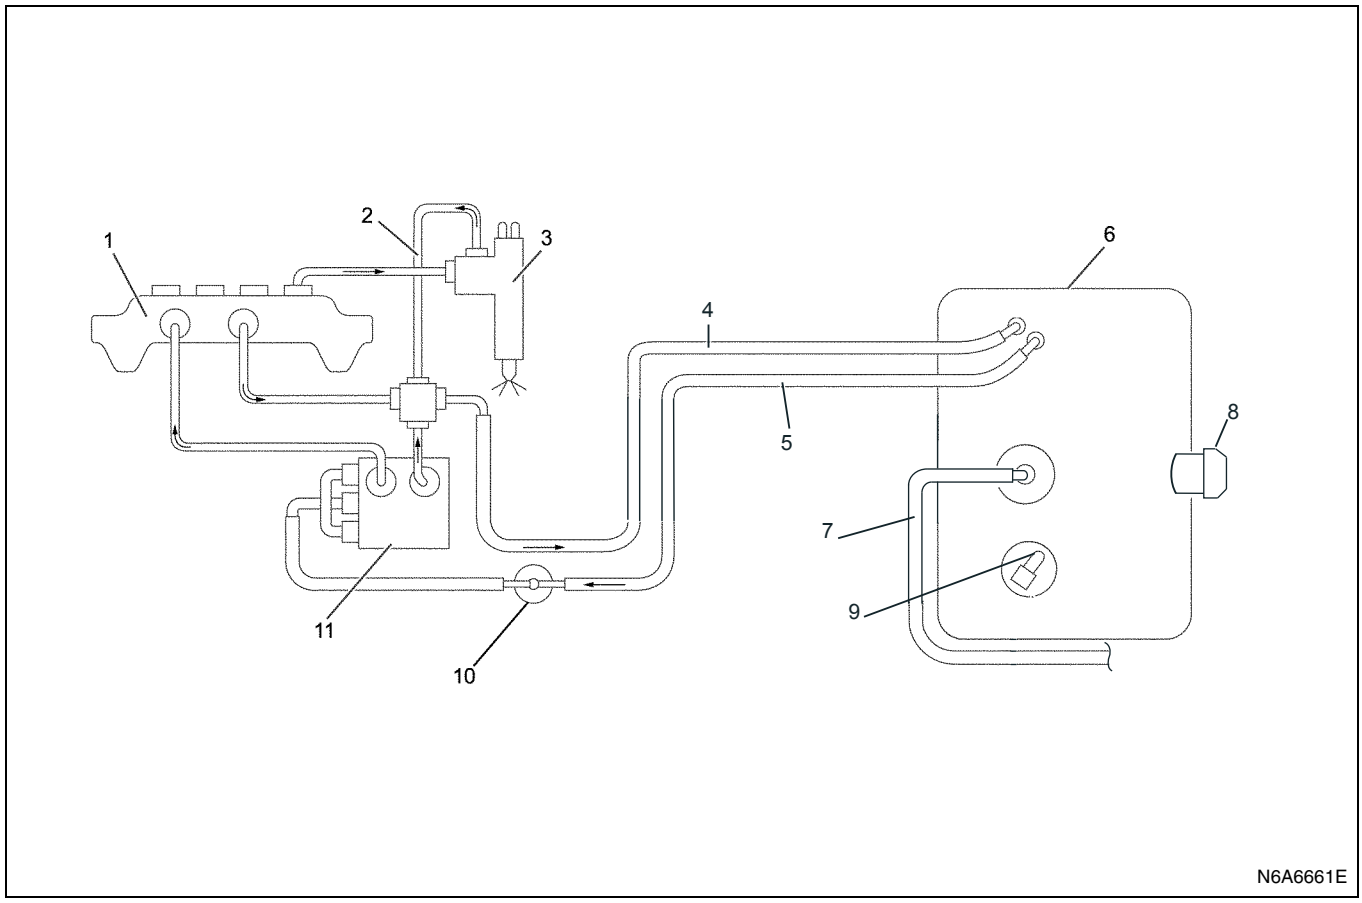
Service Precautions

Parts of the fuel system such as the internal part of the fuel injector, holes and clearances that form passages for fuel are finished to a very high degree of accuracy. They are therefore highly sensitive to foreign matter and the entry of foreign matter could cause damage to the fuel passage. Therefore, effective measures should be taken to prevent the entry of foreign matter.
If water removal agent is used in the fuel then it will absorb moisture in the light oil and may cause rust. Therefore, do not use water removal agent in the fuel tank.

Explanations on Functions and Operation

Fuel System Diagram



Legend

1. Fuel Rail
2. Leak-off Pipe

5. Fuel Feed Pipe
6. Fuel Tank
7. Ventilation Hose
8. Fuel Filler Cap
9. Fuel Level Sensor
10. Fuel Filter With Sedimenter
11. Fuel Supply Pump

Work Procedure

- The fuel opening must be quickly sealed when removing the fuel pipe, injection pipe, fuel injector, fuel supply pump, and fuel rail.
- The eyebolts and gasket must be stored in a clean parts box with a lid to prevent adhesion of foreign matter.
- Fuel leakage could cause fires. Therefore, after finishing the work, wipe off the fuel that has leaked out and make sure there is no fuel leakage after starting the engine.

Caution:

- Do not let foreign matter such as sand or dust get into fuel.
- Use gas oil for fuel, not others.

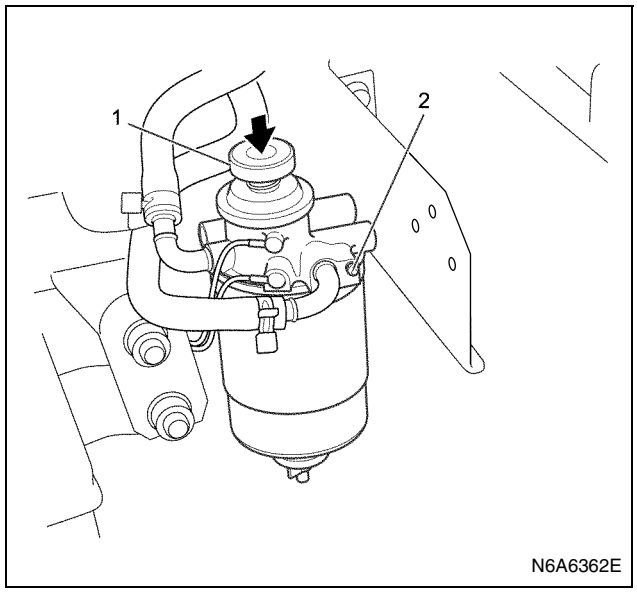
Functional check

Air bleeding



Legend

1. Priming Pump
2. Air Bleed Plug

1. Before starting the engine
   a. Fit a tray below the fuel filter (below the air bleed plug).
   b. Loosen the plug adequately and operate the priming pump more than 20 times until the fuel overflows from the plug hole.

c. Tighten the plug, and operate the priming pump more than 10 times until it is filled with fuel. After waiting for approximately a minute, loosen the plug and bleed off the air in the fuel filter. (This work must be repeated a minimum of three times until no more air comes out from the plug.)

d. Tighten the plug firmly and wipe the fuel in the surrounding area. Operate the priming pump (10 to 15 times) till it is filled with fuel and then send fuel to the engine.

2. After starting the engine

a. Start the engine by rotating the starter without depressing the accelerator pedal.

b. After starting, maintain the idling rotation for 5 seconds.

c. Slowly rotate the idling control knob clockwise and maintain it for 3 minutes.

d. Fully depress the accelerator pedal and increase the rotations to maximum. (Repeat this operation several times)

e. Rotate the idling knob counterclockwise and return to idling mode.

Caution:
If the air bleeding work is insufficient then it could lead to faults in the engine. Therefore, the procedures after starting the engine should always be implemented.

Water drain

A warning lamp will light up if water is collected more than fixed quantity in the sedimenter. If the warning lights up, drain out the water by following operations:

- Fit a tray below the fuel filter.
- Loosen the drain plug.
- Operate the priming pump several times to discharge the water.
- Tighten the drain plug after discharging the water.
- Operate the priming pump several times and check for fuel leakage.
- Check that the warning lamp in the meter is off.

Fuel system vacuum check

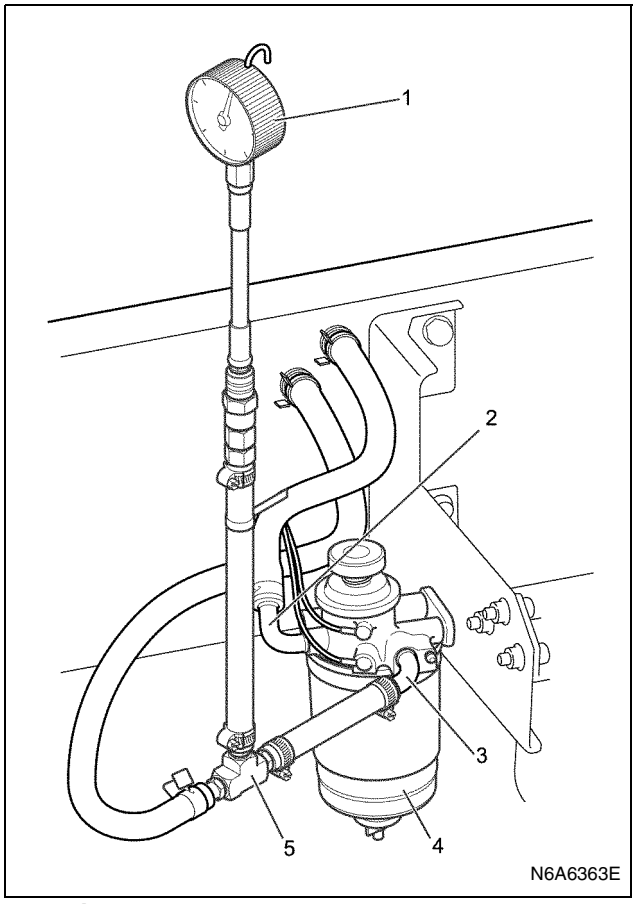
Use this procedure to measure the vacuum (negative pressure) discharge side the fuel system.

Important:
The fuel pressure/vacuum gauge assembly (gauge (1)) and the fuel pressure/vacuum gauge adapter (adapter (5)) must be cleaned before connect to the fuel line. Otherwise, foreign material adherent to the tools may damage the fuel supply pump.

1. Disconnect the fuel hose from the fuel filter housing. (fuel supply pump side).
2. Install the adapter.

   Special tool
   Fuel Pressure/Vacuum Gauge Set:
   5-8840-2844-0
   (Fuel pressure/vacuum gauge adapter:
   EN-47667)
3. Connect the gauge (1) with hose to the adapter (5).

   Special tool
   Fuel Pressure/Vacuum Gauge Set:
   5-8840-2844-0
   (Fuel pressure/vacuum gauge assembly:
   J-44638)



Legend
1. Fuel Pressure/Vacuum Gauge Assembly
2. Fuel Pipe (Intake Side)
3. Fuel Pipe (Discharge Side)
4. Fuel Filter
5. Fuel Pressure/Vacuum Gauge Adapter

4. Loosen the air bleeding plug on the supply pump.
5. Use your hand to operate the fuel filter priming pump. Operate the pump until all the air has been bled from the system.
6. Start the engine and allow it to idle.

7. Note the gauge (1) reading. If the reading is normal, go to Step 8. If the fuel vacuum is greater than the specified value, there is a problem in the fuel system. Perform the procedures outlined below.

Standard fuel vacuum: Less than 5 inHg

- Replace the cartridge fuel filter element.
- Check the fuel delivery pipe. If it is clogged, it must be replaced.
- Remove the fuel pipe at the fuel filter inlet. Use high-pressure air forced through the fuel pipe to clean the fuel system.

Caution:

- Remove the fuel filler cap before applying high-pressure air.
- Do not perform this procedure if the fuel tank is nearly full (fuel approaching or flowing into the fuel filler neck). The forced air will spray fuel from the fuel filler neck.

Special Tool

Illustration	Tool Number / Description / Remarks
 5884028440	5-8840-2844-0 Fuel Pressure / Vacuum Gauge Set (J-44638 [Fuel Pressure / Vacuum Gauge Assembly] EN-47667 [Suction Side Fuel Pressure / Vacuum Gauge Adapter])

8. Remove the gauge (1) and hose from the adapter (5).
9. Remove the adapter (5).
10. Connect the fuel hose.
11. Use your hand to operate the fuel filter priming pump. Operate the pump until all the air has been bled from the system.
12. Start the engine and allow it to idle.
13. Inspect the fuel system for fuel leakage.

A List of Defective Phenomena

- Problems with starting
- Hunting during idling
- Insufficient horsepower
- Maximum engine speed is too low
- Engine does not stop
- Exhaust gas is blue or black.

Trouble Shooting

Problems with starting

Condition	Possible Cause	Correction
Problems with starting	Fuel tank is empty	Fill the tank.
	Air has entered the fuel system.	Bleed the air.
	Fuel line is clogged or damaged. Connection to the fuel line is loose.	Repair or replace the fuel line. Re-tighten the connection.
	Fuel filter element is clogged.	Replace the cartridge.
	Fault in the feed pump	Replace the fuel supply pump.
	Regulating valve is open.	Replace.
	Sticking of the fuel injector nozzle	Replace the fuel injector.
	Defective engine control system	Diagnose the engine control system.

Unstable idling

Condition	Possible Cause	Correction
Hunting during idling	Air has entered the fuel system.	Bleed air from the fuel system.
	Leakage or clogging of the fuel system	Repair or replace the fuel system.
	Water particles or foreign matter in the fuel system.	Replace the fuel.
	Fuel filter element is clogged.	Replace the fuel filter element (cartridge).
	Sticking of the fuel injector nozzle	Replace the fuel injector.
	Defective engine control system	Diagnose the engine control system.

Insufficient power

Condition	Possible Cause	Correction
Insufficient horsepower	Air has entered the fuel system.	Bleed air from the fuel system.
	Leakage or clogging of the fuel system	Repair or replace the fuel system.
	Water mixes in the fuel system	Replace the fuel.
	Fuel filter element is clogged.	Replace the element or the cartridge.
	Sticking of the fuel injector nozzle	Replace the fuel injector.
	Defective engine control system	Diagnose the engine control system.

Maximum engine speed is too low

Condition	Possible Cause	Correction
Maximum engine speed is too low	Fuel line is clogged or damaged.	Repair or replace the fuel line.
	Defective engine control system	Diagnose the engine control system.

Engine does not stop

Condition	Possible Cause	Correction
Engine does not stop	Defective engine control system	Diagnose the engine control system.

Exhaust gas is blue or black

Condition	Possible Cause	Correction
Exhaust gas is blue or black.	Reduction in injection-valve opening pressure or defective atomizing status	Replace the fuel injector.
	Engine control system malfunction	System diagnosis.

Fuel System Check

Description

The common rail fuel system is comprised of two fuel Pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the engine control module (ECM) using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. In case of fuel rail overpressure, a pressure limiter valve threaded into the fuel rail will open to release overpressure and return fuel back to the fuel tank.

The Fuel System Check diagnostic table directs the service technician to the appropriate fuel system diagnosis. The diagnostic table assumes the following conditions are met:

- The batteries are completely charged.
- The engine cranking speed is normal.
- There is adequate fuel in the fuel tank.
- There is no air in the fuel line.

Diagnostic Aids

- The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight or if there is a crack in one of the fuel hoses. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load.
- If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the supply pump is interrupted. Perform bleeding of fuel system after refilling.

Step	Action	Value(s)	Yes	No
1	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Diagnostic Trouble Code (DTC) Information of the engine control module with a Tech 2. Are any DTC(s) set?	—	Refer to Applicable DTC in Engine Control Section	Go to Step 2

Step	Action	Value(s)	Yes	No
2	1. Inspect the high pressure side between the fuel supply pump and the fuel injectors for fuel leakage. The following components may contain an external leak: • Fuel supply pump • Fuel rail • Pressure limiter valve • Flow damper valve • Fuel rail pressure (FRP) sensor • Fuel pipe between the fuel supply pump and fuel rail • Fuel pipe between the fuel rail and fuel injectors • Each fuel pipe sleeve nuts **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel in the engine oil. 2. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 3
3	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load. 3. Pump the priming pump on the fuel filter until it becomes firm .If there is a leak on the suction side of the fuel system between the priming pump and the fuel supply pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Make sure the fuel tank(s) have adequate fuel and the fuel quality is good (take a sample). 2. Bleed the air from the fuel system as necessary. Refer to Fuel System Air Bleeding in this section. 3. Start the engine and let idle. If the engine does not start, continue to crank. 4. Observe the Differential Fuel Rail Pressure parameter with the Tech 2 while cranking over the engine or running the engine. Is the Differential Fuel Rail Pressure parameter within the specified value?	±5MPa ±(725 psi)	System OK	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the fuel injector in-line harness connector (H-125) from the cylinder head cover case. 3. Remove the rubber fuel hose from the fuel filter housing (fuel supply pump side). Use a pan to catch the fuel leakage from the removed fuel line. **Important:** The fuel vacuum pump/pressure gauge connector and the adapter hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the tools line may damage the fuel supply pump. 4. Connect the suction side fuel pressure adapter 5-8840-2844-0 (EN-47667) with fuel vacuum/pressure gauge assembly 5-8840-2844-0 (J-44638) in series with the filter housing and the disconnected fuel hose. Ensure the service tool and fuel line connections are tight. 5. Bleed the fuel system by priming the priming pump until it becomes firm, then crank over the engine for a maximum of 5 seconds. Perform procedure three times. 6. Fully clamp off a fuel hose as close to the fuel tank as possible (this will draw vacuum on the fuel system). You can also disconnect a fuel line and plug it. 7. Crank over the engine (for no longer than 15 seconds) while monitoring the fuel pressure/vacuum gauge. **Notice:** Release the clamp or open the plug when the gauge is likely to be more than 8 inHg during the test. Can a vacuum of at least the specified amount be pulled on the fuel system?	8 inHg	Go to Step 8	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Inspect the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 2. Draw fuel from the fuel tank at the fuel line going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0 (J-23738-A) with a clear hose or equivalent) This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. 3. Repair as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 7
7	1. Replace the fuel filter cartridge. Refer to Fuel Filter Cartridge Replacement in this section. 2. Retest the fuel system vacuum test described in Step 5. Can a vacuum of at least the specified amount be pulled on the fuel system?	8 inHg	Go to Step 18	Go to Step 17
8	1. Unclamp or unplug the fuel line from Step 5 and reconnect the fuel line. 2. Prime the priming pump until firmness is felt. 3. Crank over the engine for 5 seconds. 4. Repeat steps 2 and 3 three times to bleed the fuel system. 5. Crank over the engine (for no longer than 15 seconds at a time) while monitoring the fuel pressure/vacuum gauge. Does the vacuum/pressure gauge ever indicate a larger than the specified value?	5 inHg	Go to Step 9	Go to Step 10
9	1. Inspect the fuel lines between the fuel supply pump and fuel tank for being crushed or kinked. 2. Inspect the fuel tank vent hose for a plugged or kinked condition. 3. Inspect the fuel cap for a plugged or kinked condition. 4. Inspect inside the fuel tank (if possible) for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. 5. Repair the condition as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 14

Step	Action	Value(s)	Yes	No
10	1. Turn OFF the ignition. 2. Make sure the fuel injector in-line harness connector (H-125) is disconnected from the cylinder head cover case. 3. Remove the eyebolt from the cylinder head that connects to the leak-off pipe. 4. Connect the fuel adapter 5-8840-2845-0 (J-45873-103) with hose assembly to the cylinder head. Install the hose into a graduated cylinder from the 5-8840-2845-0 (J-45873-100) kit. 5. Remove the eyebolt from the pressure limiter valve that connects to the leak-off pipe. 6. Connect the fuel adapter 5-8840-2845-0 (J-45873-105) with hose assembly to the pressure limiter valve. 7. Crank over the engine for 10 seconds. Make sure the batteries are fully charged and the engine is cranking at normal speed for each test. **Notice:** Perform this test three times and take the average of the fuel return amount coming from the cylinder head. Is fuel leaking from the pressure limiter valve?	—	Go to Step 15	Go to Step 11
11	Is the average fuel return coming from the cylinder head less than the specified value?	15ml	Go to Step 12	Go to Step 13
12	1. Remove each glow plug from the cylinder head. 2. Inspect the tip of the plugs for wet fuel. Did you find wet fuel on any glow plug?	—	Go to Step 16	Go to Step 17
13	1. Remove the cylinder head cover and injector harness in order to connect the fuel adapter 5-8840-2845-0 (J-45873-101) with hose assembly to each injector leak-off port. Refer to Fuel Injector Replacement in this section. 2. Crank over the engine for 10 seconds. **Important:** Replacement injector must be programmed. 3. Replace the injector(s) that return fuel more than the specified value. Refer to Fuel Injector Replacement/Fuel Injector ID Code Data Programming in this section. 4. Retest after replacement of the fuel injector(s). Did you complete the replacement?	3ml	Go to Step 18	—

Step	Action	Value(s)	Yes	No
14	Replace the fuel filter cartridge. Refer to Fuel Filter Cartridge Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—
15	Replace the pressure limiter valve. Refer to Fuel Rail Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—
16	**Important:** Replacement injector must be programmed. Replace the appropriate injector(s) that was leaking fuel found at Step. Refer to Fuel Injector Replacement/Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 18	—
17	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. Replace the fuel supply pump. Refer to Fuel Supply Pump Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—
18	1. Reconnect all previously disconnected harness connector(s) or components. 2. Turn OFF the ignition for 30 seconds. 3. Bleed the air from the fuel system. Refer to Fuel System Air Bleeding in this section. 4. Start the engine and let idle. 5. Observe the Differential Fuel Rail Pressure parameter with the Tech 2. Is the Differential Fuel Rail Pressure parameter within the specified value?	±5 MPa (±725 psi)	System OK	Go to Step 1

1. Filler Cap
2. Fuel Hose
3. Fuel Sedimenter Connector
4. Bolt
5. Fuel Filter Assembly

Removal

1. Remove the filler cap.
2. Remove the fuel sedimenter connector and the clip on the bracket.
3. Remove the feed hose and the return hose from the fuel filter and plug it so that the fuel does not flow out.
4. Remove the bolts for mounting the fuel filter.
5. Remove the fuel filter assembly.

Installation

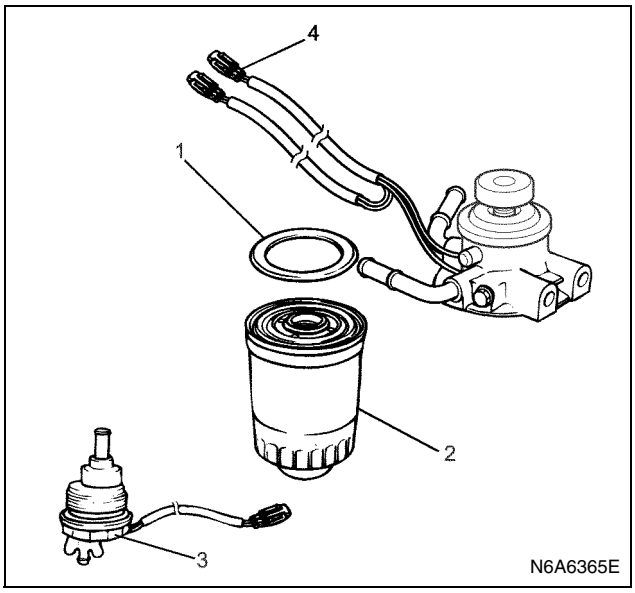
1. Install the fuel filter assembly.
2. Install the bolts for mounting the fuel filter.
3. Install the inlet hose and the outlet hose.
4. Install the fuel sedimenter and clip the cable to the bracket.
5. Install the filler cap.
6. Bleed out the air.
   - Refer to “Fuel System/Air bleeding”.

Fuel Filter Cartridge

Removal

1. Remove the cartridge using the filter wrench.

   Special tool
   Filter wrench: 5-8840-0253-0 (J-22700)
2. Remove the sedimenter sensor.



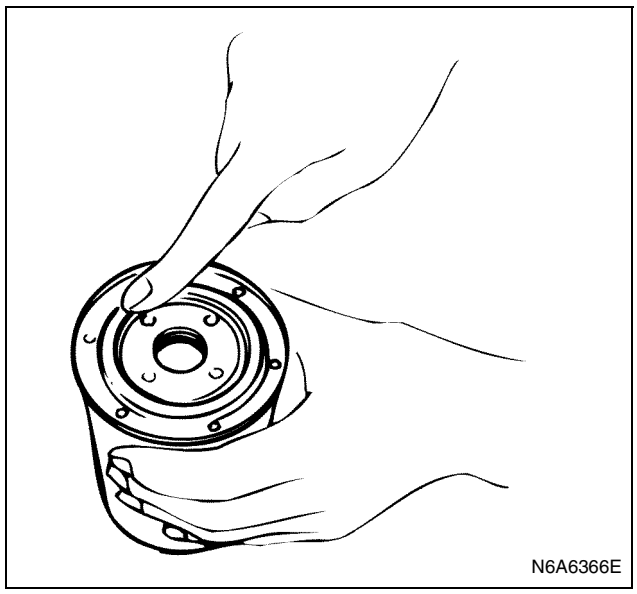
Legend

1. O-Ring
2. Cartridge
3. Sedimenter Sensor
4. Fuel Heater Connector

Installation

1. Assemble the sedimenter sensor in the new cartridge.
2. Clean the cartridge mounting surface in the filter body so that the cartridge can be seated securely.
3. Coat a thin layer of fuel on the O-ring in the new cartridge.
4. To simplify air bleed, fill light oil on the new cartridge.
5. Tighten the cartridge until the O-ring touches the sealing surface. During this process take adequate care that the fuel inside does not flow out.
6. Use the filter wrench and tighten rotating by 1/3 to 2/3.

   Special tool
   Filter wrench: 5-8840-0253-0 (J-22700)

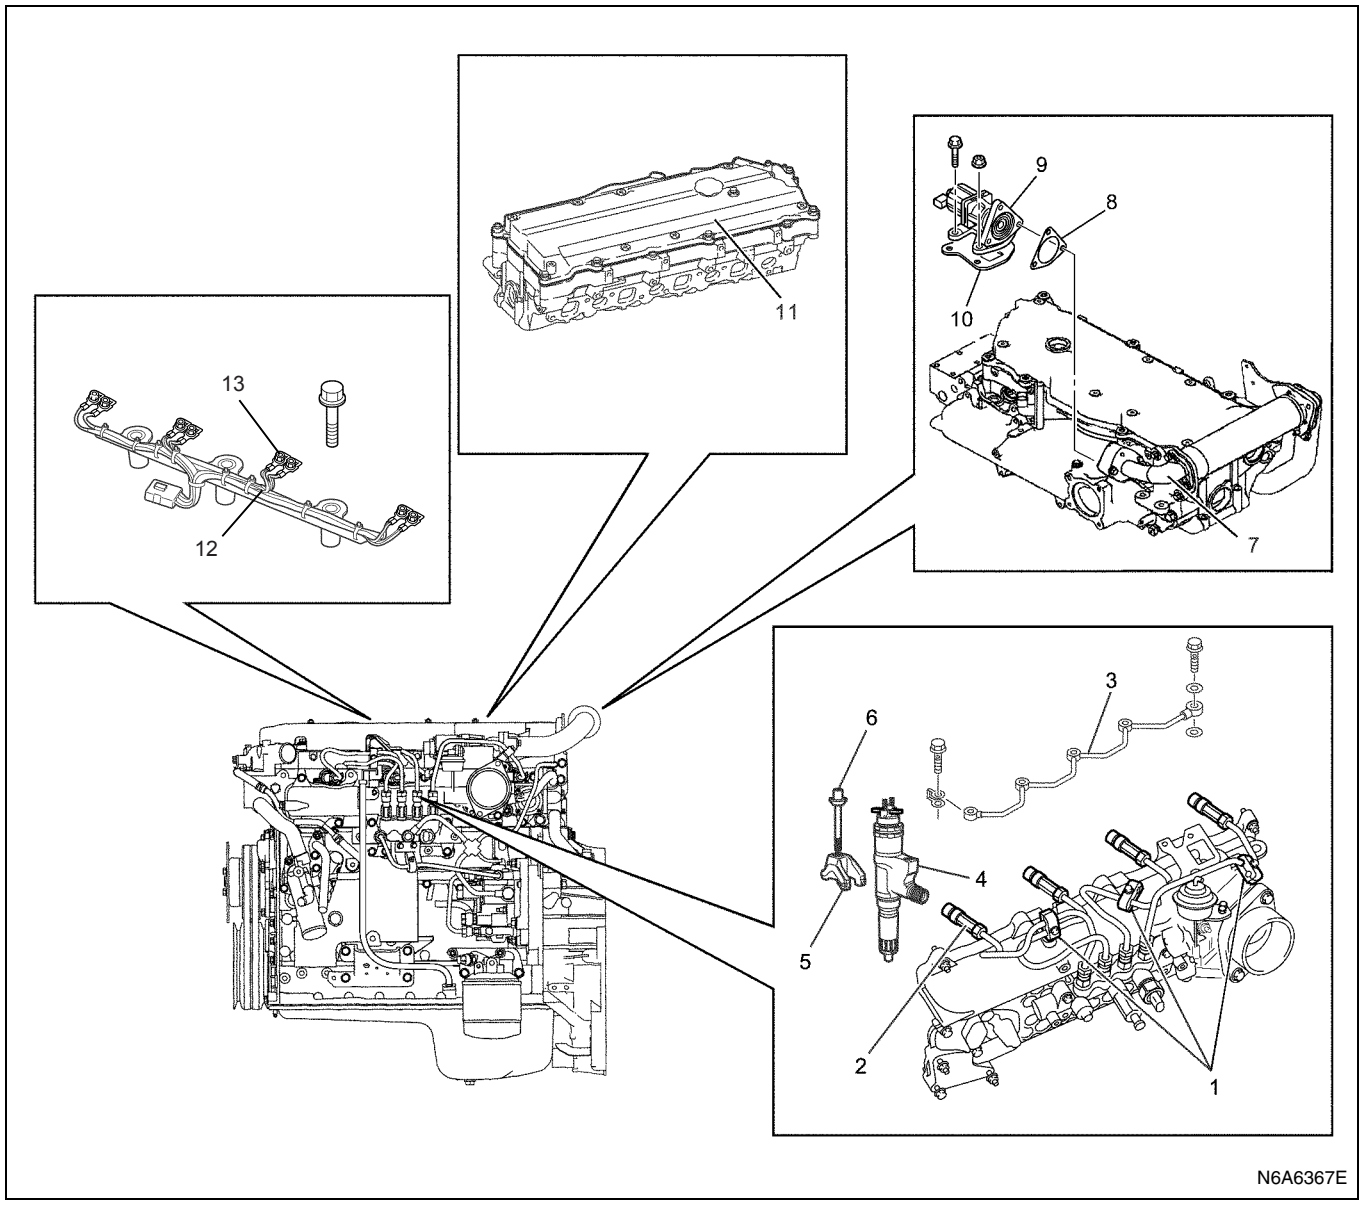


Special Tool

Illustration	Tool Number / Description / Remarks
5884002530	5-8840-0253-0 (J-22700) Filter Wrench

Fuel Injector

Components



Legend

1. Fuel Injection Pipe Clip
2. Fuel Injection Pipe
3. Fuel Injector Leak-off Pipe
4. Fuel Injector
5. Fuel Injector Clamp
6. Fuel Injector Clamp Bolt
7. EGR Adapter
8. EGR Valve Gasket
9. EGR Valve
10. EGR Valve Gasket
11. Cylinder Head Cover
12. Fuel Injector Harness Bracket
13. Fuel Injector Terminal

The fuel system consists of many tiny holes and spaces that allow the movement of fuel from one place to another. These holes and spaces are milled to extremely high precision. This is especially true of the fuel injectors.

The fuel injector is very sensitive to foreign material. Foreign material will result in fuel system breakdown. Exercise great care not to allow the entry of foreign material into the fuel system or fuel injectors during the removal and installation procedure.

Caution:

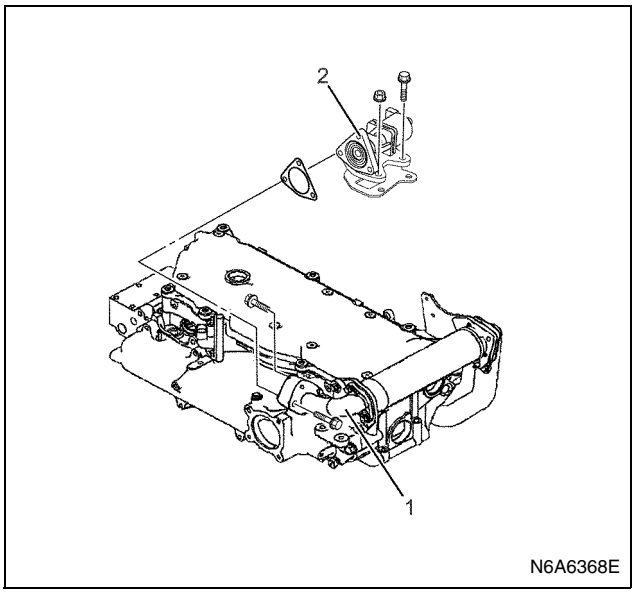
To avoid electric shock;

Set the switch to the ‘OFF’ position and disconnect battery negative cable before checking or repairing the fuel injector, wiring or/and connectors.

Important:
The Fuel Injector ID Code Data Programming MUST be done when the fuel injector is being replaced. The Fuel Injector ID Code information MUST be recorded before assembling the cylinder head cover.

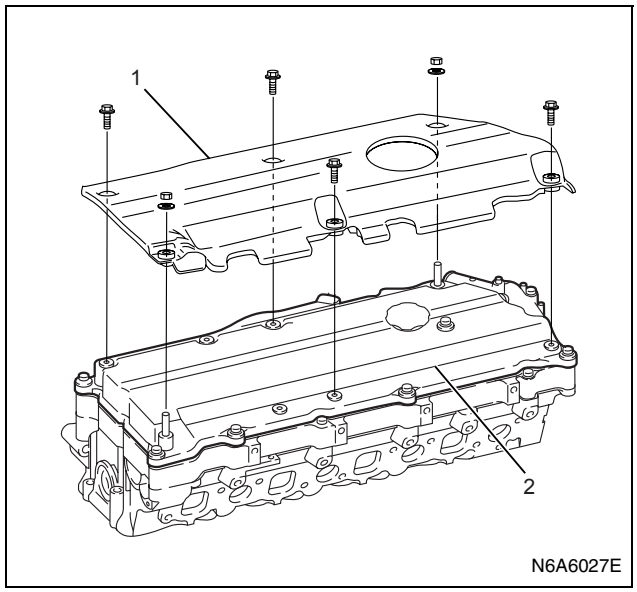
Removal

1. Remove the engine harness, the throttle position sensor, the EGR valve, the pressure sensor, and all of the fuel injector connectors.
2. Remove the EGR valve and the EGR adapter.
3. Tape the EGR case holes shut to prevent the entry of foreign material.



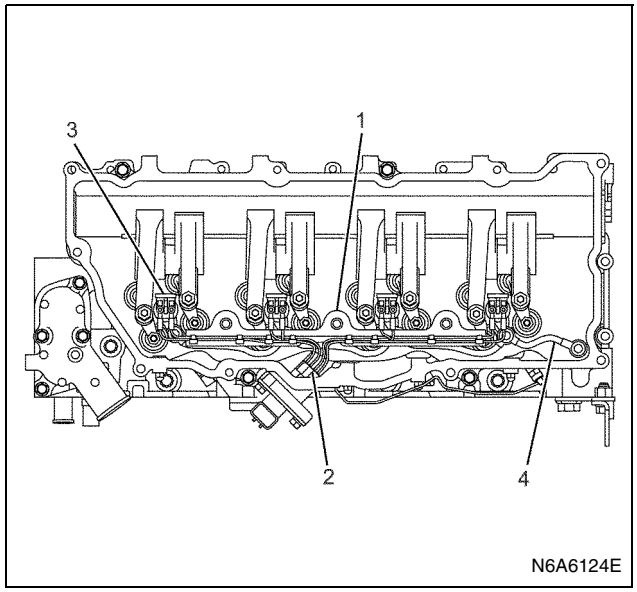
Legend
1. EGR Adapter
2. EGR Valve

4. Remove the sound insulation cover.
5. Remove the head cover.



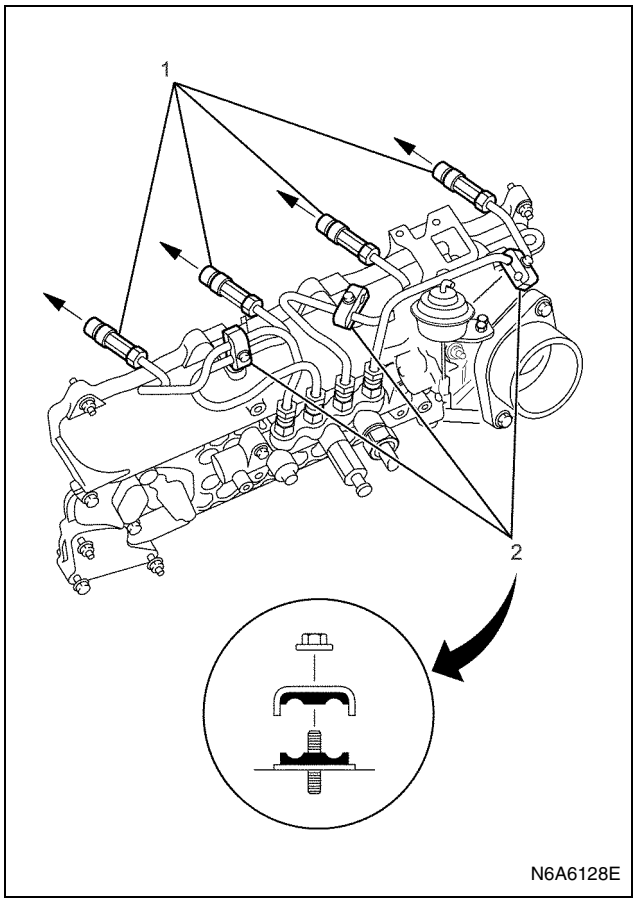
Legend
1. Sound Insulation Cover (For Europe)
2. Head Cover

6. Loosen the fuel injector terminal nuts.
7. Loosen the fuel injector harness bracket bolts. Remove the inside connector and the harness bracket.
8. Remove the fuel injector leak-off pipe.
9. Remove the lower cover.



Legend
1. Harness Bracket
2. Harness Connector
3. Fuel Injector Terminal
4. Fuel Leak-off Pipe

10. Remove the fuel injection pipe clips and the injection pipes.



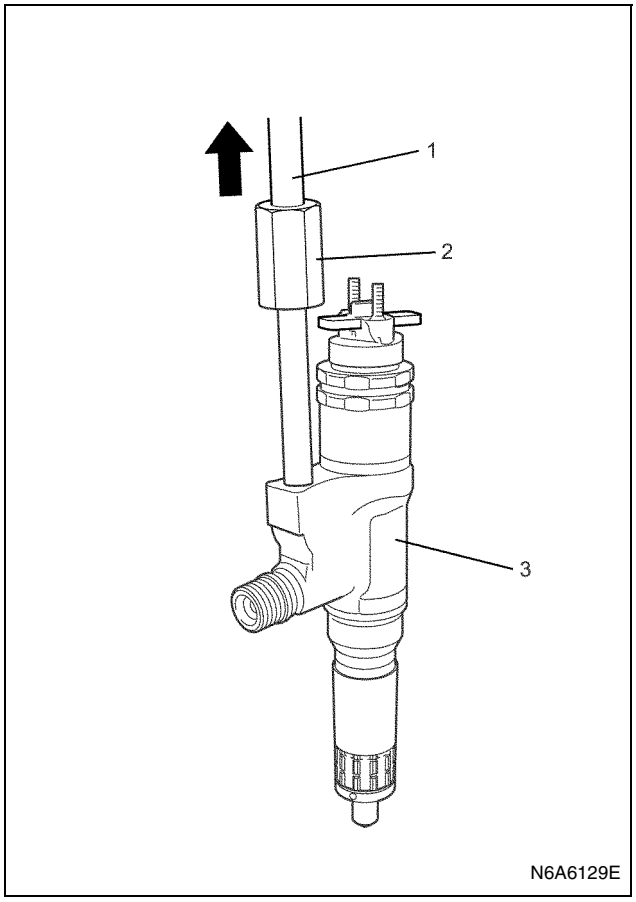
Legend
1. Fuel Injection Pipe
2. Pipe Clip

11. Loosen the fuel injector clamp fixing bolts and remove the fuel injectors.

If the fuel injectors are difficult to remove, use the fuel injector remover. Install the fuel injector remover to the leak-off pipe attachment part on the fuel injector. Use a sliding hammer to force the fuel injector clamp off the fuel injector.

Caution:
Do not remove the fuel injector sleeve.

Special tools
Fuel injector remover: 5-8840-2826-0 (EN-46720)
Sliding hammer: 5-8840-0019-0 (J-23907)



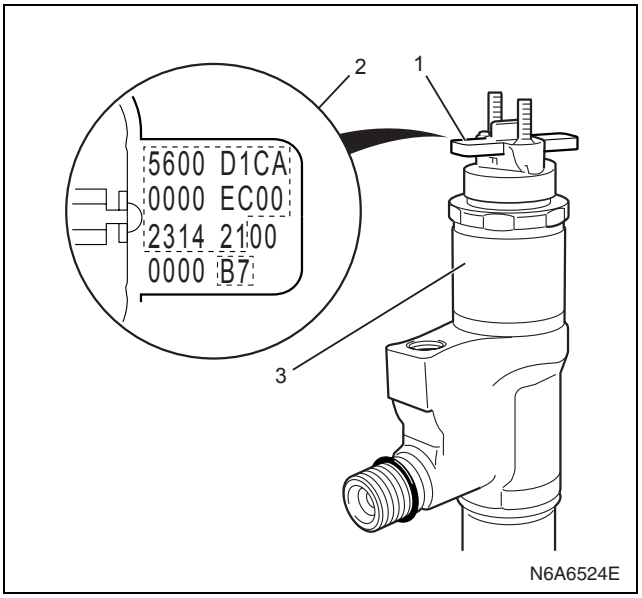
Legend
1. Sliding Hammer
2. Remover
3. Fuel Injector Assembly

12. Mark each fuel injector with the number of the cylinder from which it was removed. Store the fuel injectors in a safe place. Position the fuel injector so that the nozzle is protected.

Caution:
- Do not tamper with the electromagnetic portion of the fuel injector. Reduced electromagnetic function will result in injector failure.

Recording from the each fuel injector ID plate

Record 24 figures of each fuel injector ID plate. The correct order for the fuel injector ID code for the following illustration is as follows:
56 00 D1 CA 00 00 EC 00 23 14 21 B7

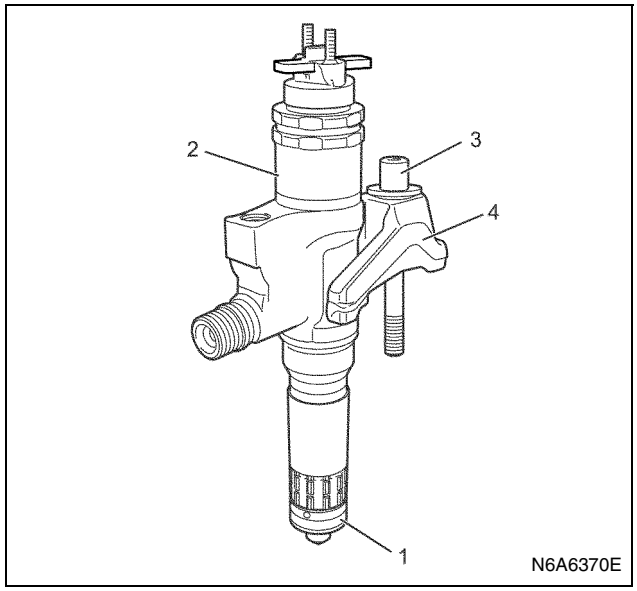


Legend
1. Fuel Injector ID Plate
2. Fuel Injector ID Code
3. Fuel Injector

Installation

Important:
Install each of the fuel injectors on its original position. (the cylinder from which it was removed)

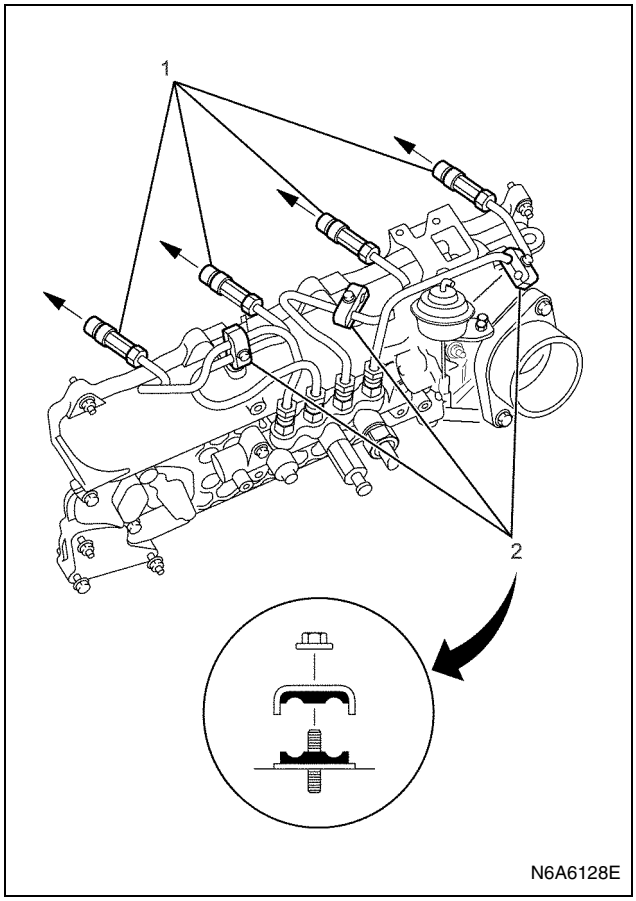
1. Install a new gasket and O-ring to each of the fuel injector clamps. Refer to the illustration.



Legend
1. Gasket
2. Fuel Injector
3. Bolt
4. Fuel Injector Clamp

2. Apply molybdenum to the threads and seating surfaces of the clamp bolts.
3. Install the fuel injector clamps to the cylinder head.
4. Temporarily tighten the clamp bolts.
5. Apply a thin coat of engine oil to the outer surface of the fuel injector side sleeve nuts.
6. Install the fuel injection pipes to the position shown in the illustration.
7. Use a spanner to carefully the sleeve nuts until the fuel injection pipes contact the fuel injector and common rail.
8. Tighten the fuel injection pipe clips to the specified torque.

Tighten:
Clips to 6 N·m (0.6 kg·m/52 lb·in)



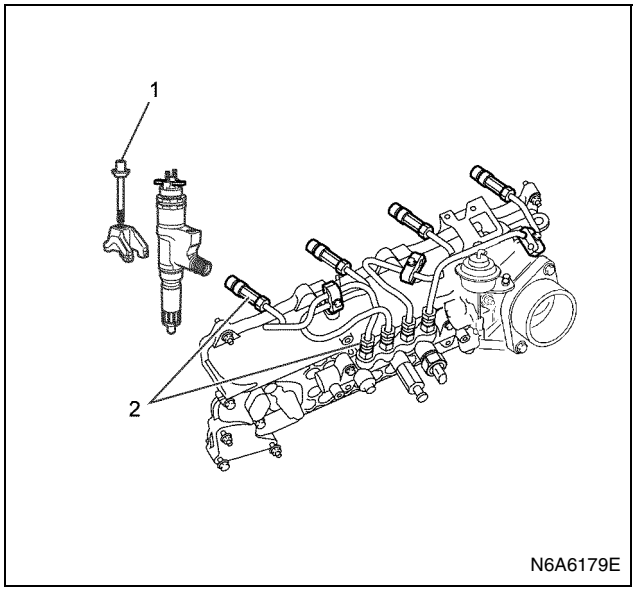
Legend
1. Fuel Injection Pipe
1. Pipe Clip

9. Final tighten the injection clamp bolts to the specified torque.

Tighten:
Bolts to 30 N·m (3.1 kg·m/22 lb·ft)

10. Tighten the injection pipes to the specified torque.

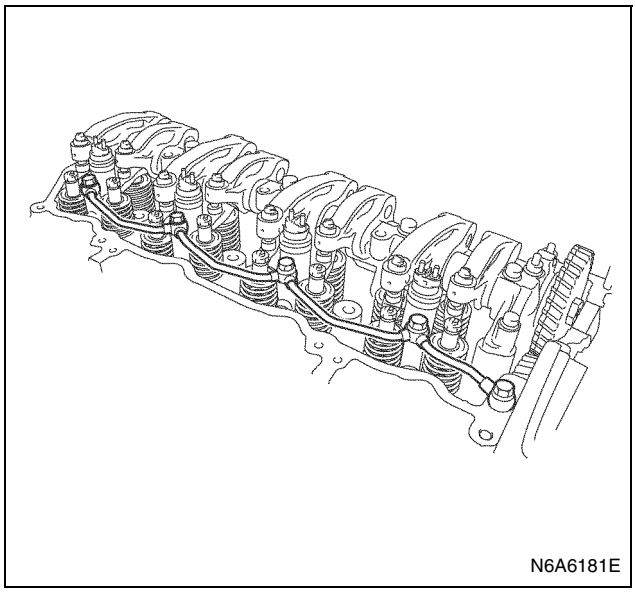
Tighten:
Injection pipes to 44 N·m (4.5 kg·m/33 lb·ft)



Legend
1. Clamp Bolt
2. Sleeve Nut

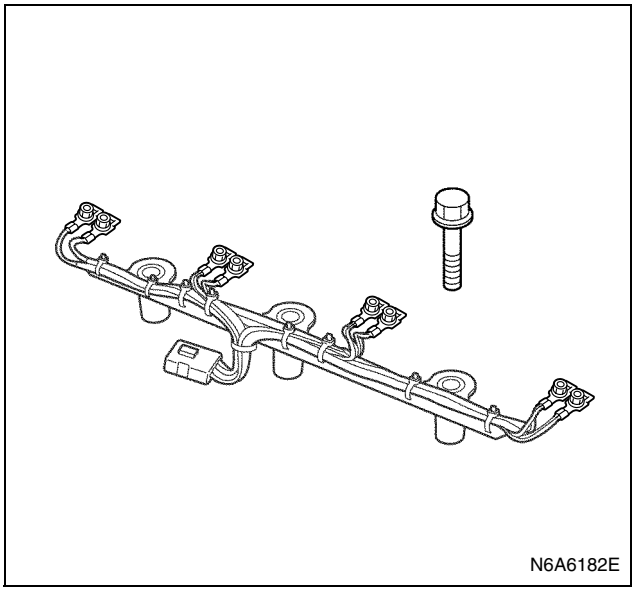
11. Install the nozzle leak-off pipes together with the new gaskets. Tighten the pipes to the specified torque.

Tighten:
Pipes to 12 N·m (1.2 kg·m/104 lb·in)



12. Install the fuel injector harness connectors. Work from the inside out.
13. Install the harness bracket and tighten the bolts to the specified torque.

Tighten:
Bolts to 48 N·m (4.9 kg·m/35 lb·ft)

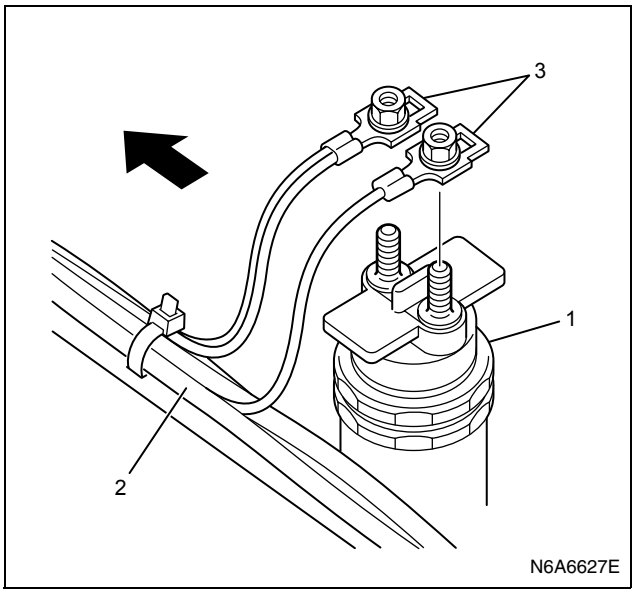


14. Install the fuel injector terminal nuts to the injector.

Tighten:
Nut to 2 N·m (0.2 kg·m/17 lb·in)

Caution:

- Do not overtighten the nuts. Damage to the terminal studs will result.
- The terminal nut with two wires is engine front side.

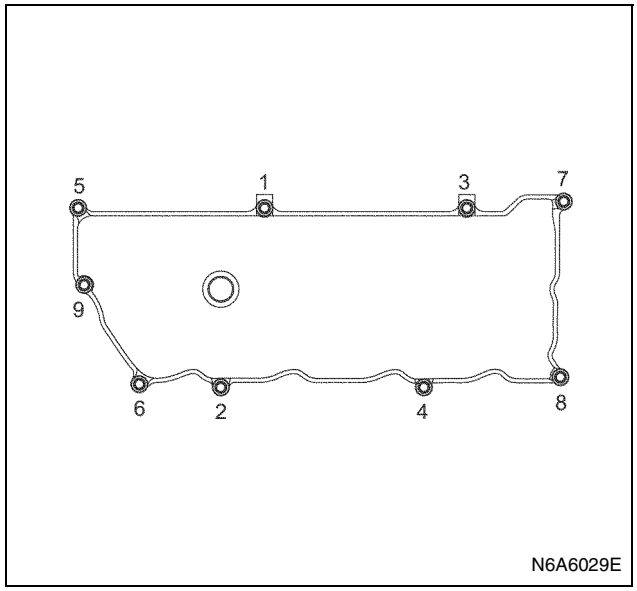


Legend

1. Fuel Injector
2. Harness
3. Terminal Nut

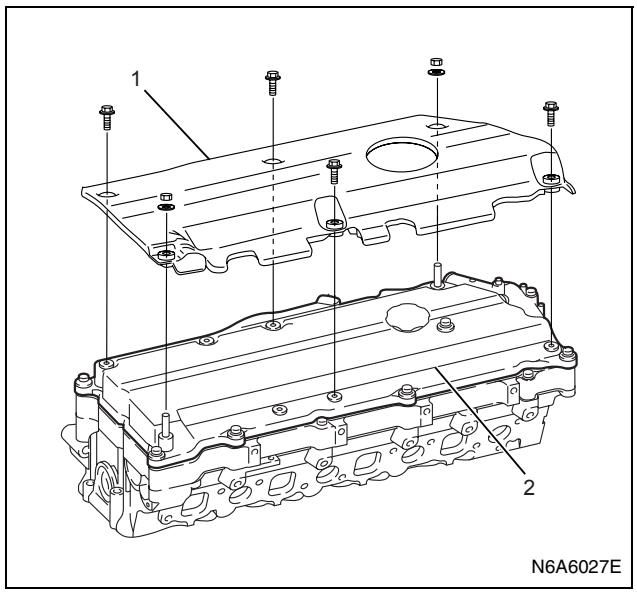
15. Install the gasket to the cylinder head cover.
16. Install the cylinder head cover and tighten up according to the order.

Tighten:
Bolts to 18 N·m (1.8 kg·m/13 lb·ft)



17. Install the sound insulation cover (For Europe).

Tighten:
Bolts to 8 N·m (0.8 kg·m/6 lb·ft)



Legend

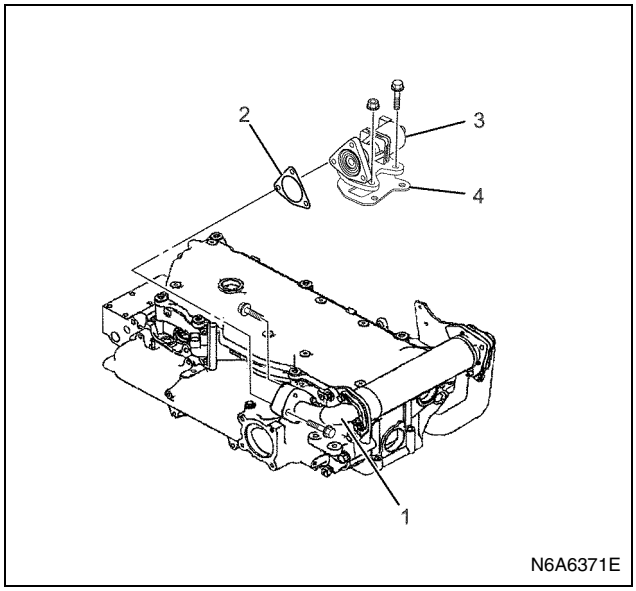
1. Sound Insulation Cover (For Europe)
2. Head Cover

18. Install the gasket to the EGR valve and tighten the bolts to the specified torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/17 lb·ft)

19. Install the gasket to the EGR adapter and tighten the bolts to the specified torque.

Tighten:
Bolts to 24 N·m (2.4 kg·m/17 lb·ft)



Legend

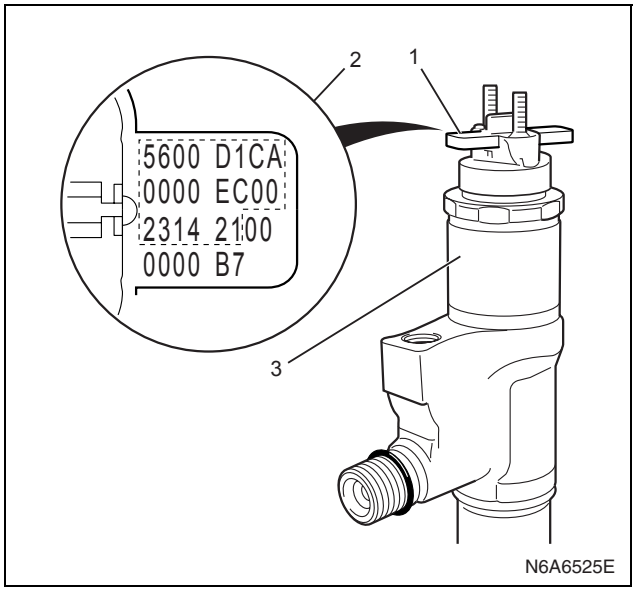
1. EGR Adapter
2. EGR Valve Gasket
3. EGR Valve
4. EGR Valve Gasket

20. Attach the engine harness connectors. Each composite connector should make a loud click when it is securely attached.

Fuel Injector ID Code Data Programming Procedure

1. Install the Tech 2.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > appropriate vehicle identification > 4HK1 (Common Rail) > Programming > Injector ID Code > ID Code Registration.
4. Select replaced cylinder and press Change. Input 22 figures. Then, input in order from the left edge of upper sequence to the right sequence. The correct order for the fuel injector ID code for the following illustration is as follows:
   56 00 D1 CA 00 00 EC 00 23 14 21

Important:
The number of places required for input is 22 figures except last 2 figures.



Legend

1. Fuel Injector ID Plate
2. Fuel Injector ID Code
3. Fuel Injector

5. After complete the registration, turn OFF the ignition for 30 second.
6. Turn ON the ignition.
7. Select Diagnostics > appropriate vehicle identification > 4HK1 (Common Rail) > Programming > Injector ID Code > Injector ID Code. At this point, all registered fuel injector ID code data can be verified. Compare the ID code values registered into the ECM and each fuel injector including the last 2 figures. If the registered ID code is incorrect, go back to Step 4 ID Code Registration.
8. Start the engine and let idle.
9. Inspect for a proper engine running condition and for no DTC's. Refer to the Diagnostic System Check-Engine Controls if needed.

Notice:
After replacement of the fuel injector, perform the following procedure.
All fuel injectors are replaced:
Remove the fuel injector ID code label on the cylinder head cover.
Any fuel injector(s) is replaced:
Blackout the replaced cylinder fuel injector ID code on the cylinder head cover with a marking pen or equivalent.

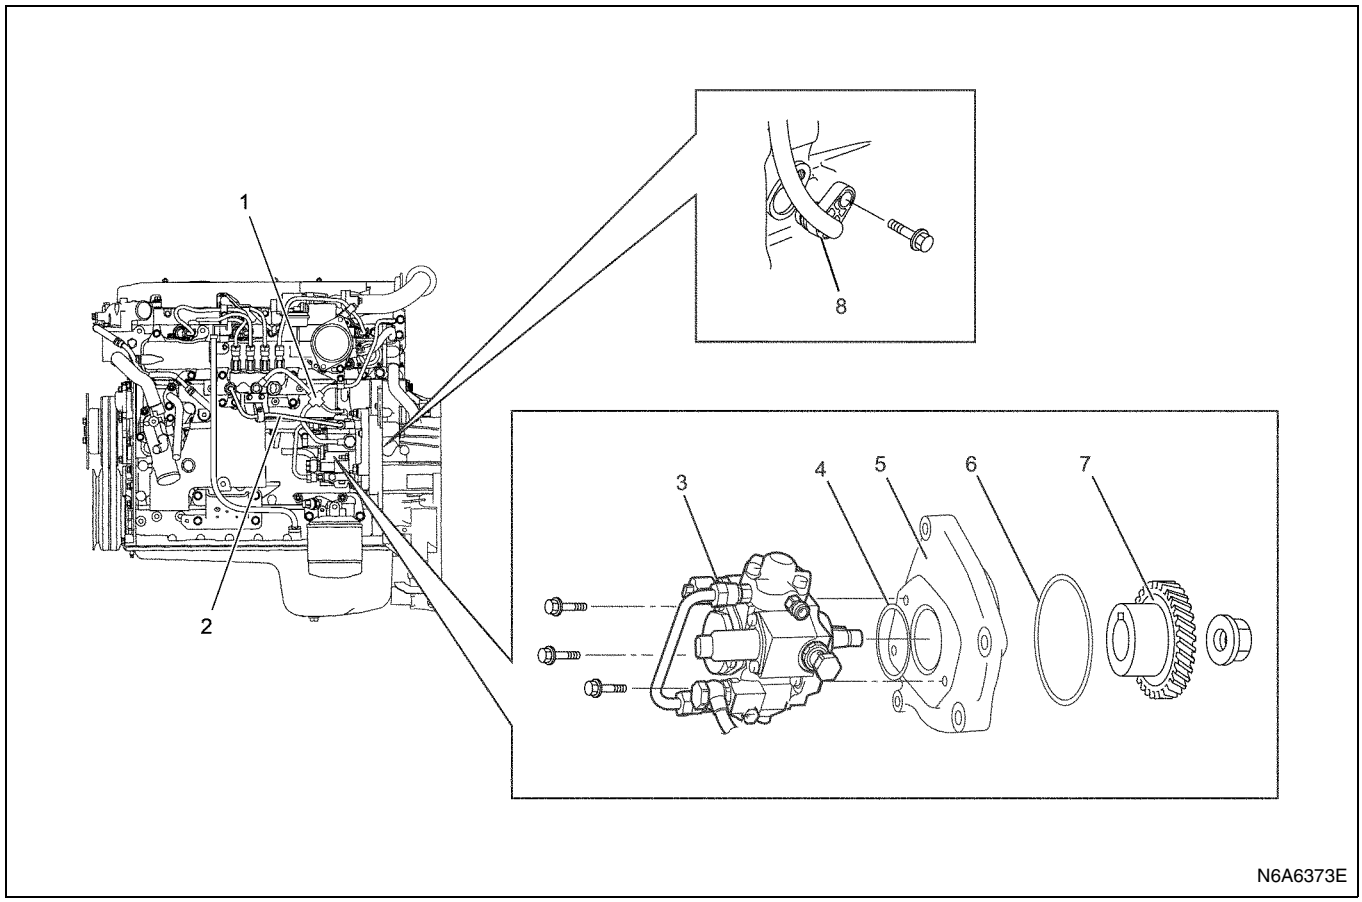
Fuel Supply Pump

Components



Legend

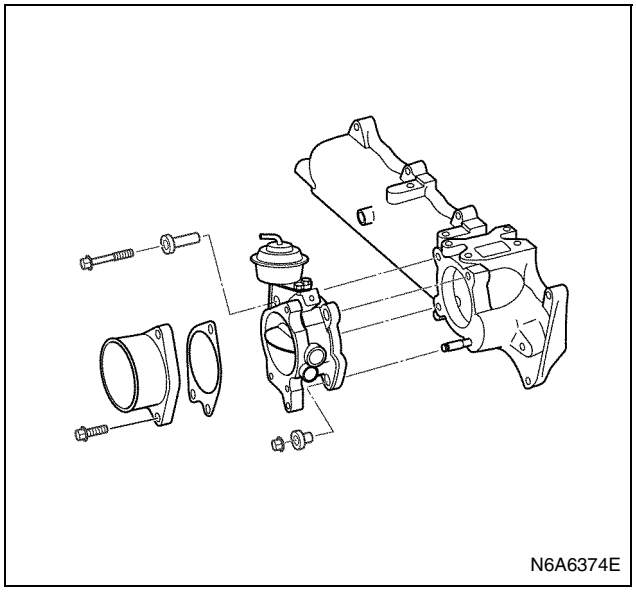
1. Fuel Leak-off Pipe
2. Fuel Pipe
3. Fuel Supply Pump
4. O-ring
5. Bracket
6. Bracket O-ring
7. Drive Gear
8. Oil Drain Adapter

The fuel system consists of many tiny holes and spaces that allow the movement of fuel from one place to another. These holes and spaces are milled to extremely high precision. This is especially true of the fuel injectors.
The fuel injector is very sensitive to foreign material. Foreign material will result in fuel system breakdown. Exercise great care not to allow the entry of foreign material into the fuel system or fuel injectors during the removal and installation procedure.

Important:
The Fuel supply pump must be timed to the engine.

Removal

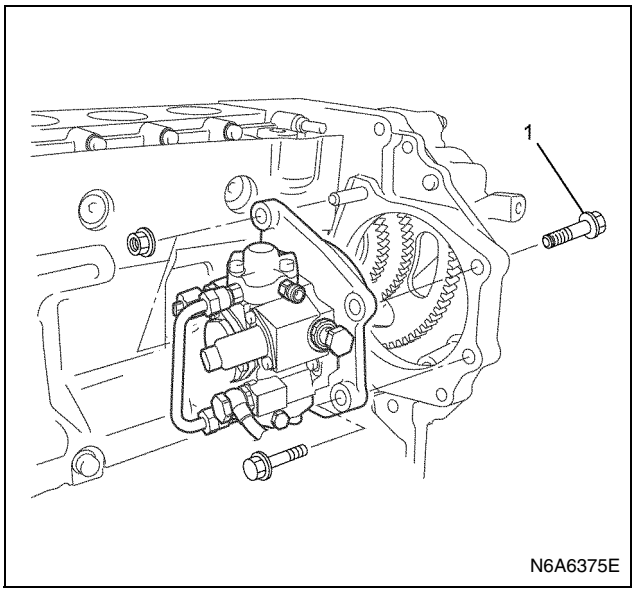
1. Remove the intake pipe and the intake throttle valve.
2. Remove the fuel pipe and fuel leak-off pipe.



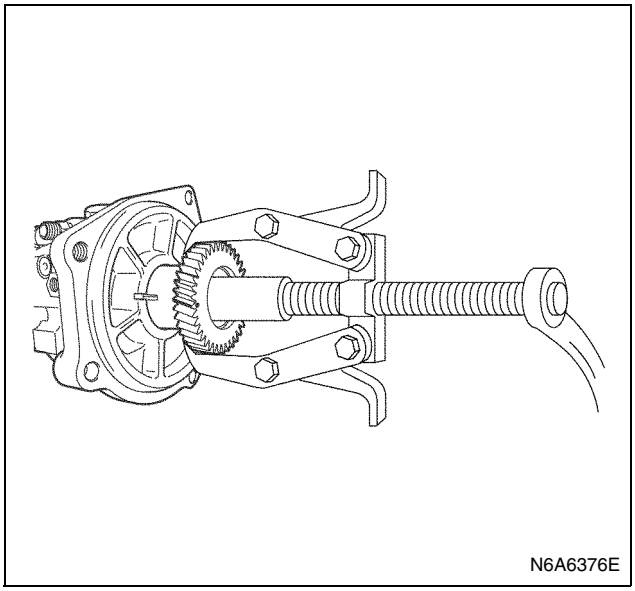
3. Remove the fuel feed hose.

4. Disconnect the fuel temperature sensor and the fuel rail pressure regulator harness connector from the fuel supply pump.
5. Remove the fuel supply pump attachment bolts and nuts, then remove the fuel supply pump.

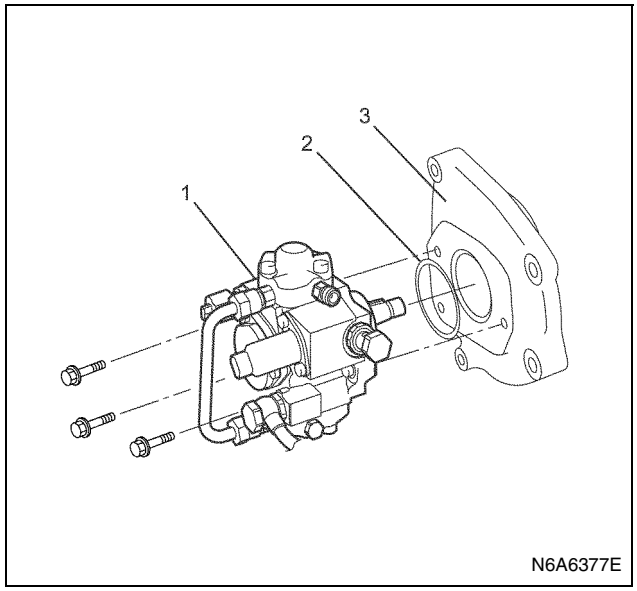
Notice:
One of the attachment bolt (1) secures the fuel supply pump to the flywheel housing as denoted in the picture below.



6. Use a gear puller to remove the fuel supply pump gear and the O-ring.



7. Loosen the 3 bolts holding the fuel supply pump bracket. Remove the bracket and the O-ring.



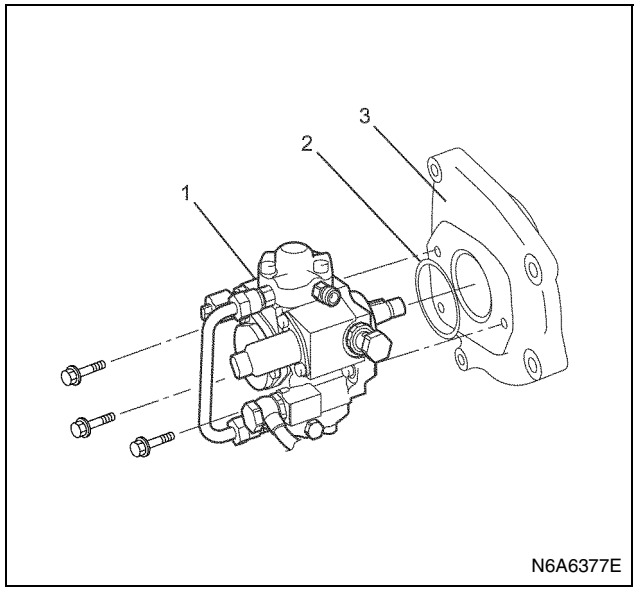
Legend
1. Fuel Supply Pump
2. O-ring
3. Fuel Supply Pump Bracket

Installation

1. Install the O-ring to the fuel supply pump.
2. Install the pump to the bracket and tighten the 3 bolts to the specified torque.

Tighten:
Bolts to 19 N·m (1.9 kg·m/14 lb·ft)

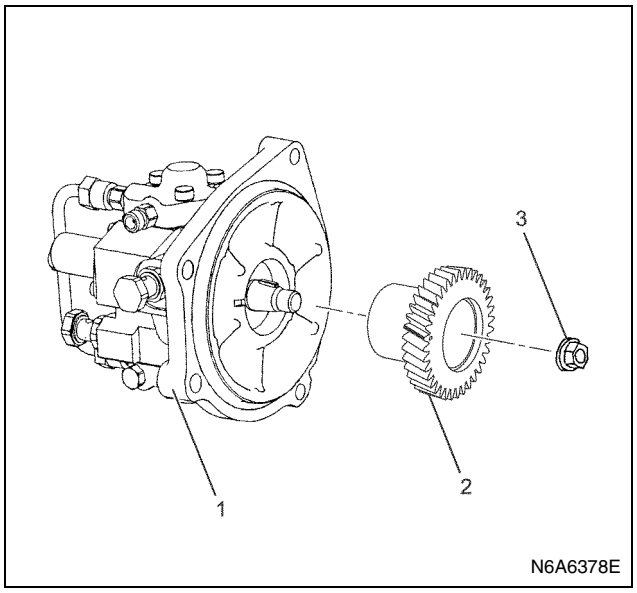
Caution:
Take care not to twist the O-ring.



Legend
1. Fuel Supply Pump
2. O-ring
3. Fuel Supply Pump Bracket

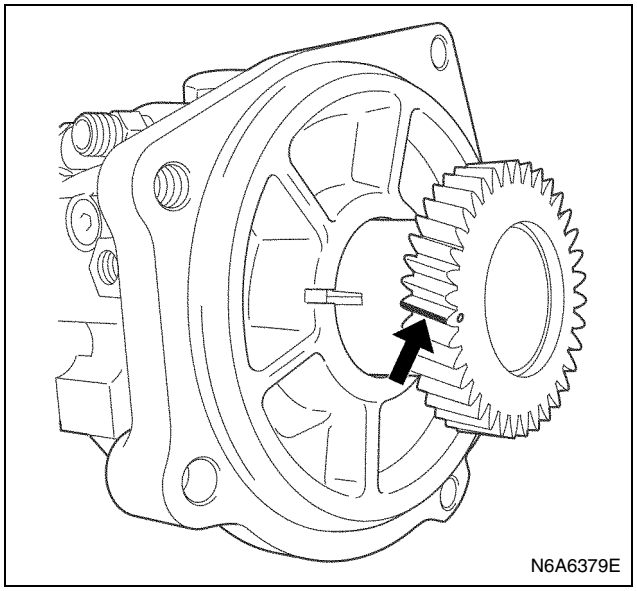
3. Align the fuel supply pump shaft key and gear. Install the gear and tighten the nut to the specified torque.
   There is a round alignment mark on the gear (white paint).

Tighten:
Nut to 64 N·m (6.5 kg·m/47 lb·ft)

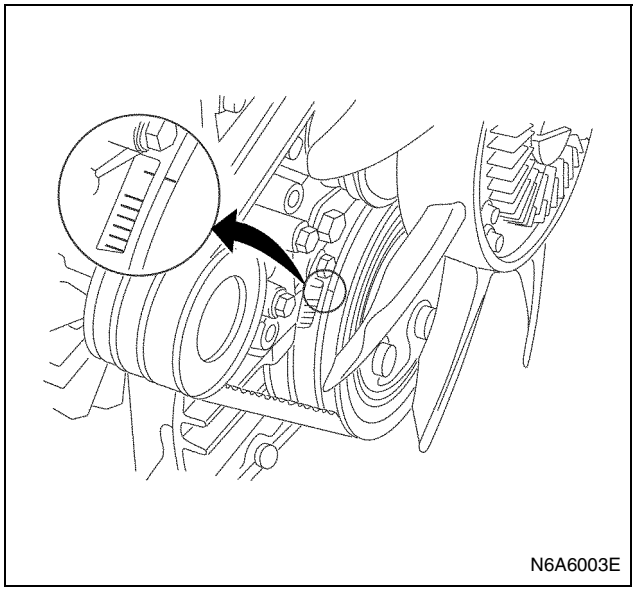


Legend
1. Fuel Supply Pump
2. Fuel Supply Gear
3. Nut

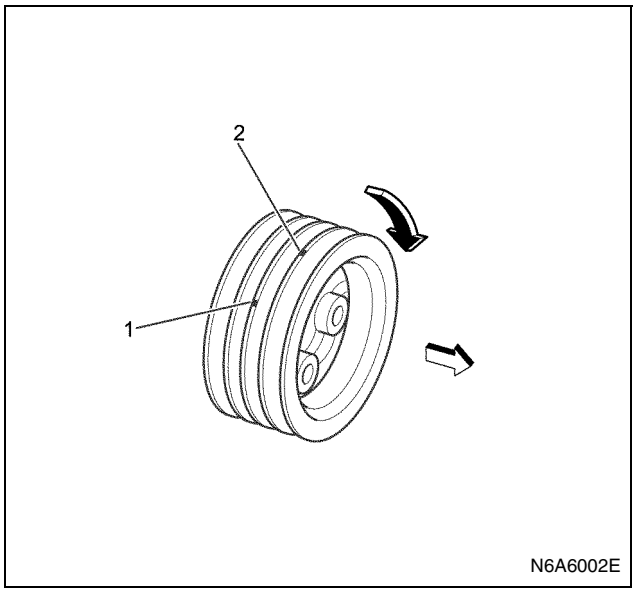
4. Apply white paint to the top of the fuel supply pump gear tooth directly above the stamped 'O' mark. Refer to the illustration.



5. Turn the crankshaft in the normal direction of engine rotation until the No. 1 or No. 4 cylinder is at TDC on the compression stroke.
   Refer to the illustration.



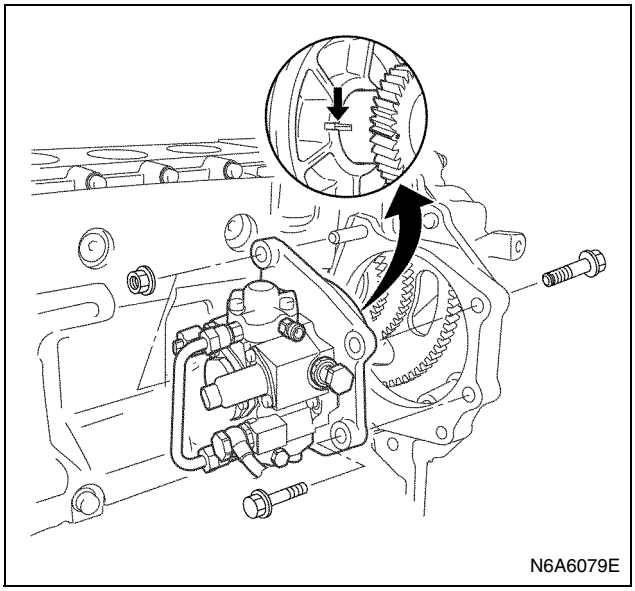
Notice:
There are 2 timing marks on the crankshaft pulley.
Mark (1) is near the front cover and is used to bring the 4HK1-TC engine to TDC.
Mark (2) is not applicable to this engine.
Be sure to use mark (1) when bringing the engine to TDC.



6. Remove the oil drain adapter.
7. Install the O-ring to the fuel supply pump.
8. Align the slits as shown in the illustration.
9. Insert the stud bolts into the guides and temporarily tighten them.

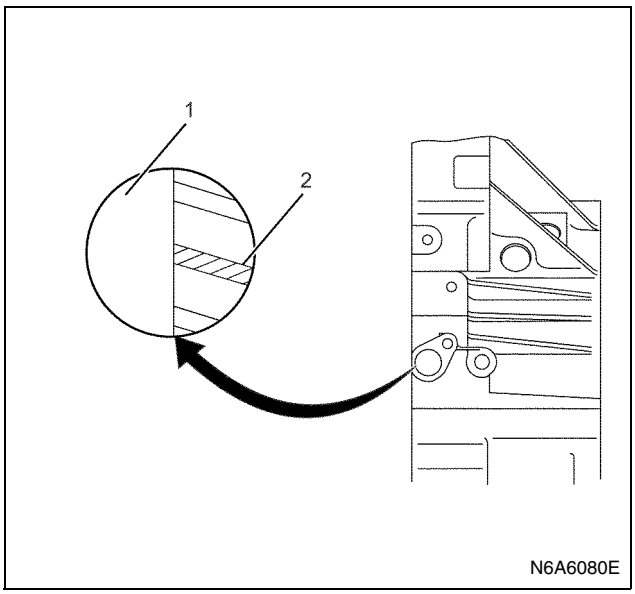
Caution:

- If the stud bolts (cylinder block side) have been loosened or replaced, apply Loctite 262 to the recessed portion of the bolts.



- Check that the round alignment mark (white paint) is positioned as shown in the illustration when viewed from the plug hole. If necessary, reposition the gear.
- Tighten the stud bolts and the nuts to the specified torque.

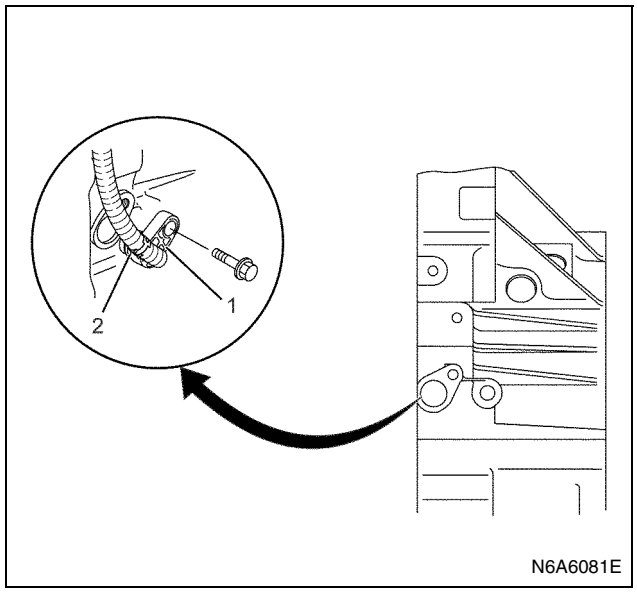
Tighten:
Nut to 50 N·m (5.1 kg·m/37 lb·ft)
Bolt to 76 N·m (7.7 kg·m/56 lb·ft)



Legend
1. Plug Hole
2. Alignment Mark

10. Apply a light coat of engine oil to the O-ring.
11. Install the oil drain adapter to the plug hole. Tighten the bolt to the specified torque.

Tighten:
Bolt to 8 N·m (0.8 kg·m/69 lb·in)

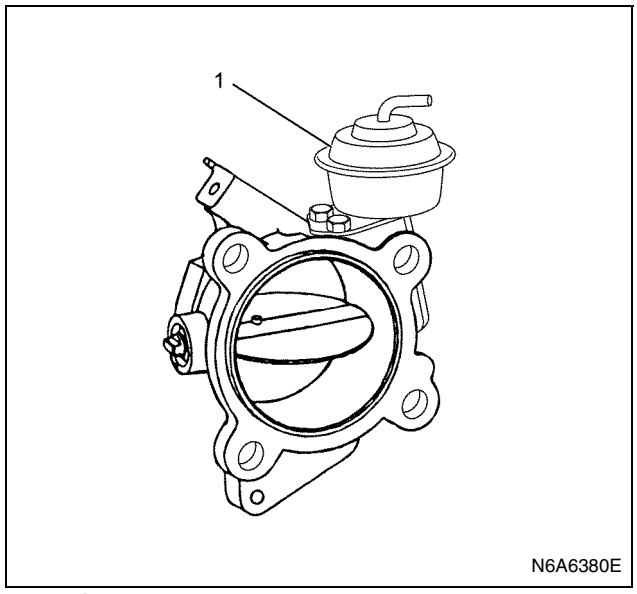


Legend
1. Oil Drain Adapter
2. O-ring

12. Connect the fuel temperature sensor and the suction control valve connectors to the fuel supply pump.
13. Install the fuel feed hose.
14. Install the throttle assembly.
    - Coat the fluid gasket and mount within 7 minutes.

Tighten:
Throttle assembly to 24 N·m (2.4 kg·m/17 lb·ft)

- Install the intake throttle valve chamber hose.



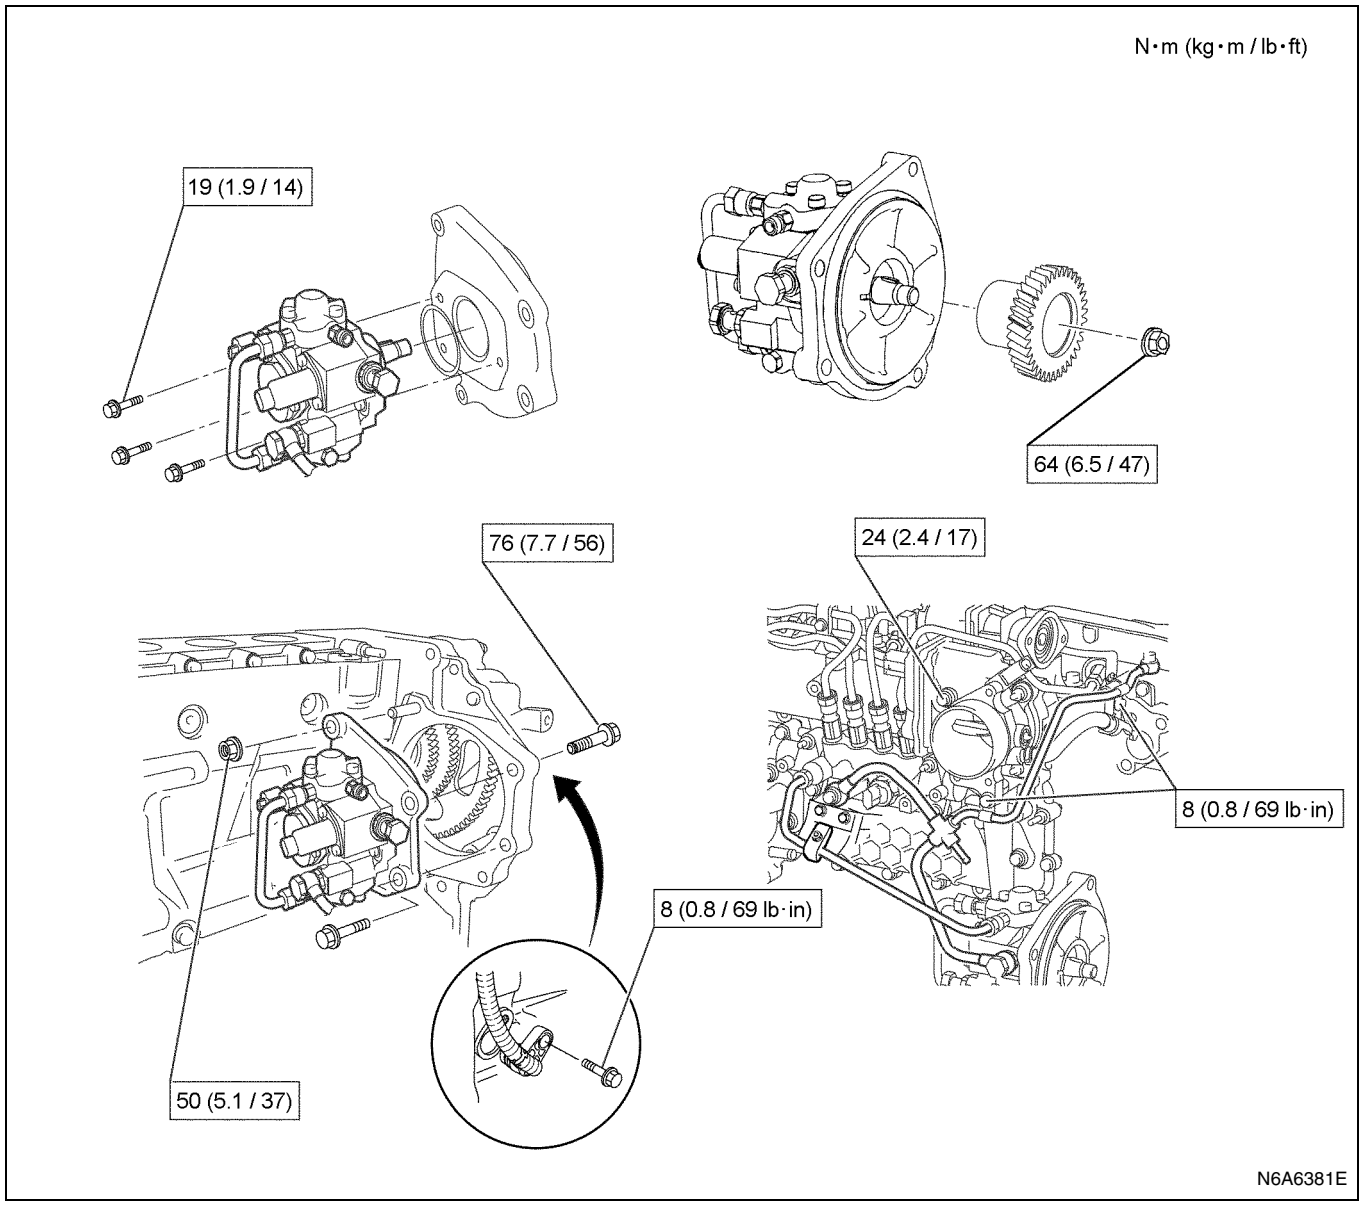
Legend
1. Intake Throttle Valve Chamber

15. Install the fuel pipe and fuel leak-off pipe.

Important:
In order to make the fuel supply pump characteristic learn into the ECM, let the engine idle until warm-up. If the fuel system DTC's stored in the meantime, once clear DTC and warm-up the engine again.

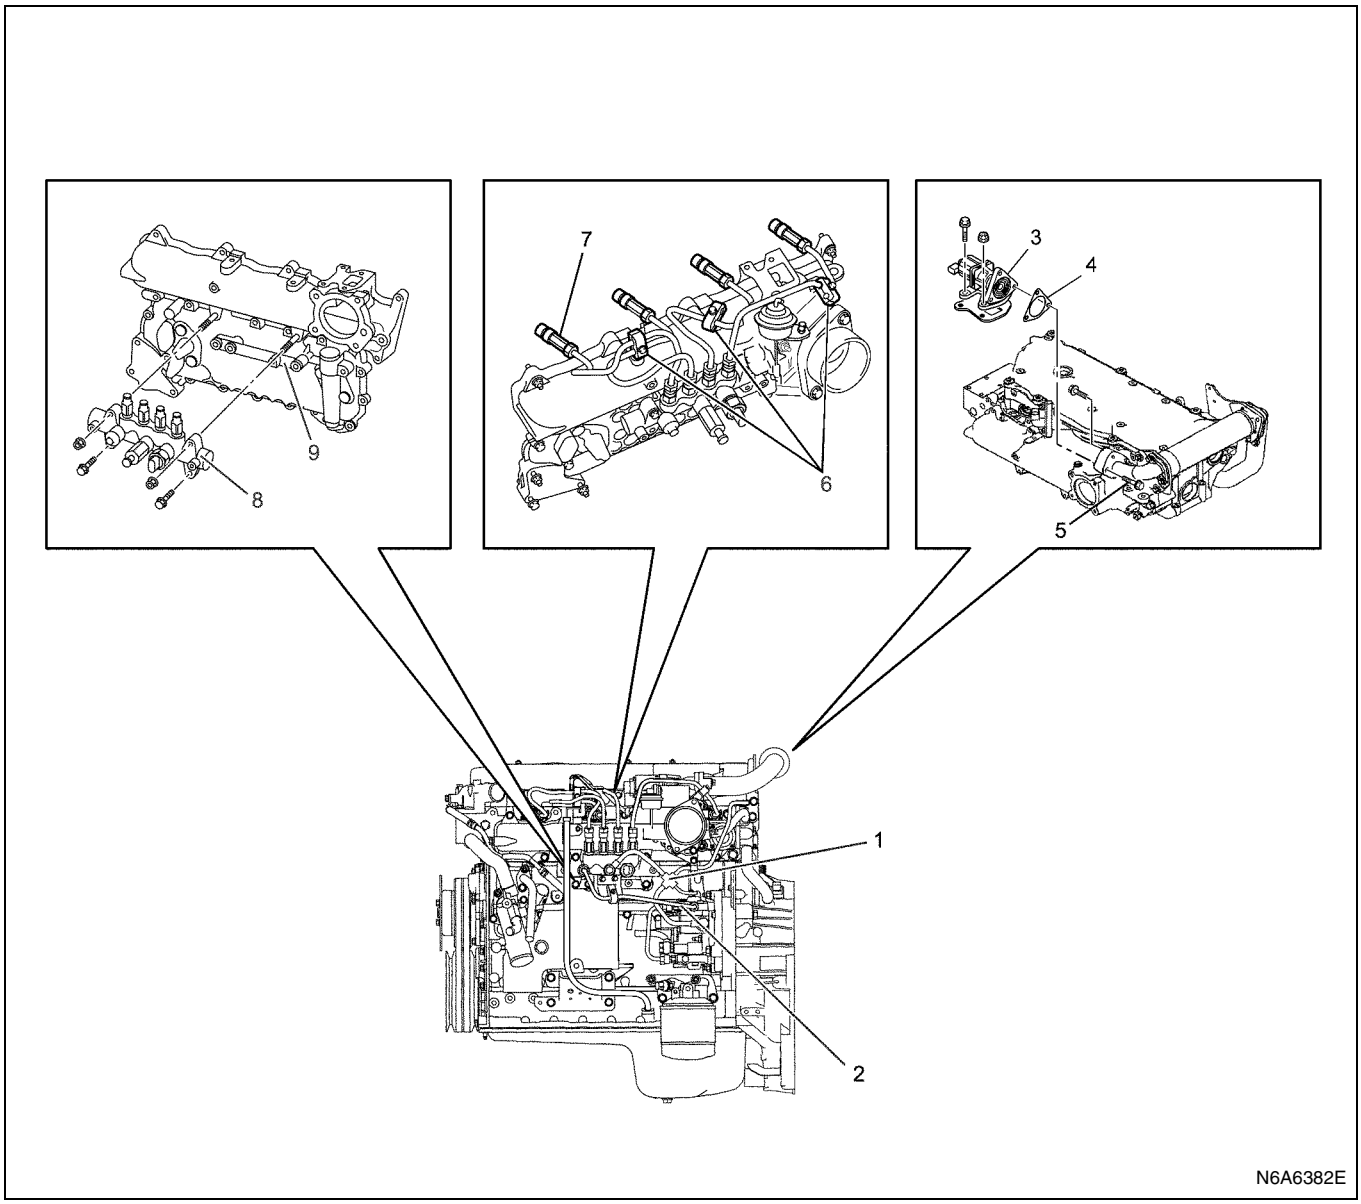
16. Inspect for a proper engine running condition and for no DTC's. Refer to the Diagnostic System Check-Engine Controls if needed.

Torque Specifications



Fuel Rail

Components



Legend

1. Fuel Leak-off Pipe
2. Fuel Pipe
3. EGR Valve
4. EGR Valve Gasket
5. EGR Adapter
6. Injection Pipe Clip
7. Injection Pipe (#1 to #4)
8. Fuel Rail
9. Fuel Rail Bracket

Parts of the fuel system such as the internal part of the fuel injector, holes and clearances that form passages for fuel are finished to a very high degree of accuracy. They are therefore highly sensitive to foreign matter and the entry of foreign matter could cause damage to the fuel passage. Therefore, effective measures should be taken to prevent the entry of foreign matter.

Removal

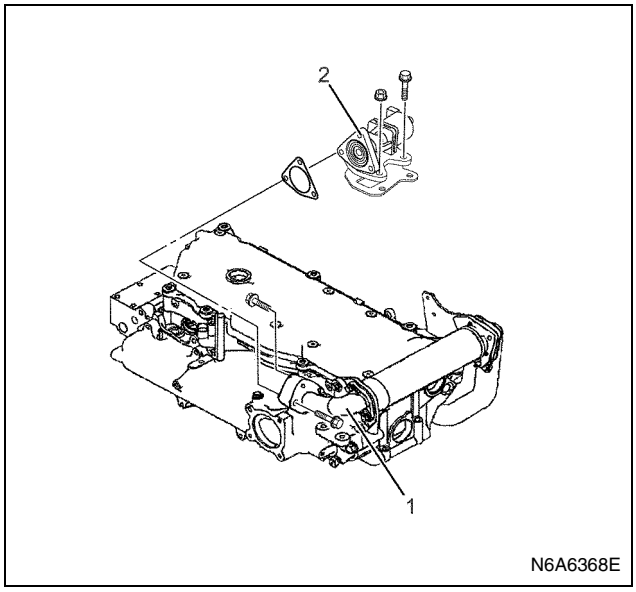
WARNING:
TO PREVENT LEAKED FUEL FROM CATCHING FIRE, DO NOT WORK WHILE THE ENGINE IS HOT.

Preparation:

- Pour detergent into a steam cleaner, and throughly wash around the sensor and the fuel rail.
- Remove water completely using air blow.

Notice:
Make sure that foreign matter will be prevented from getting in.

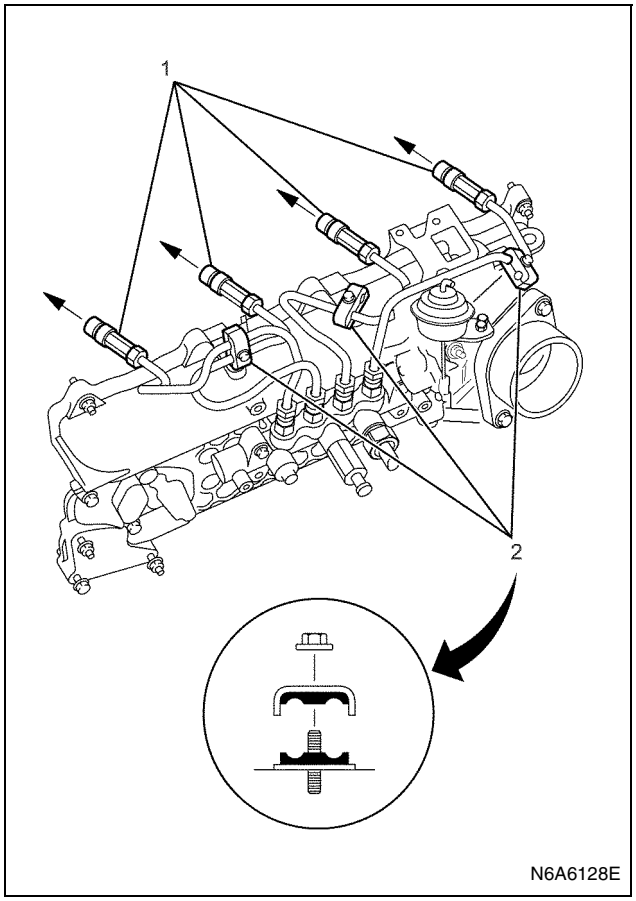
1. Remove the air intake pipe.
   - Disconnect the connector for the intake air temperature sensor.
2. Remove the fuel leak-off hose from the leak-off pipe.
   - Cover the removed fuel hose, keep it facing upward and secure it using wire, etc.
3. Disconnect the fuel rail pressure sensor harness connectors.
4. Remove the EGR valve and the EGR adapter.
5. Tape the EGR case holes shut to prevent the entry of foreign material.



Legend
1. EGR Adapter
2. EGR Valve

6. Remove the injection pipe clip and remove the injection pipes.

Important:
Loosen the injection pipes gradually not to scatter high pressure fuel.

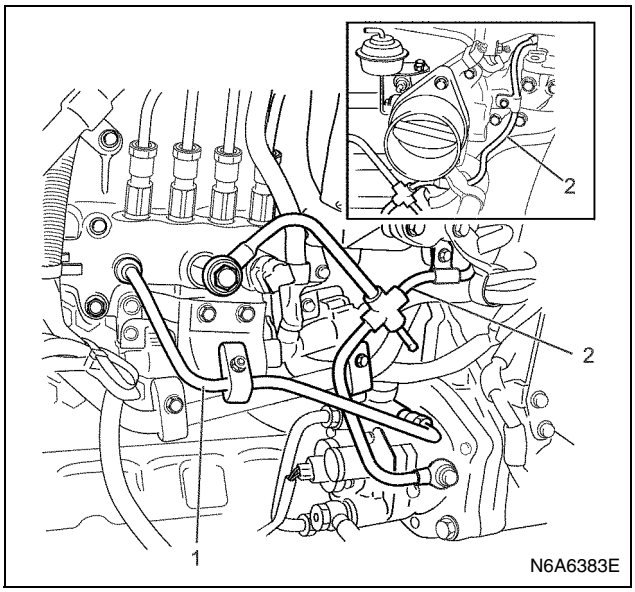


Legend
1. Fuel Injection Pipe
2. Fuel Injection Pipe Clip

7. Remove the fuel pipe.

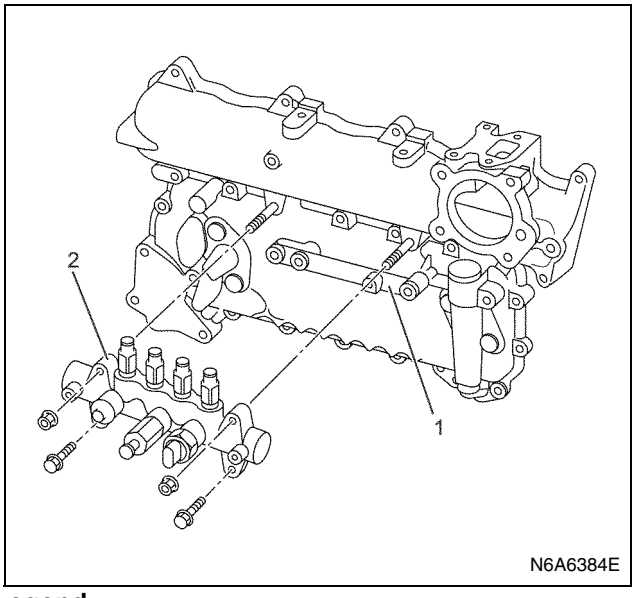
Important:
Loosen the fuel pipe gradually not to scatter high pressure fuel.

8. Remove the clips and the fuel leak-off pipe.



Legend
1. Fuel Pipe
2. Fuel Leak-off Pipe

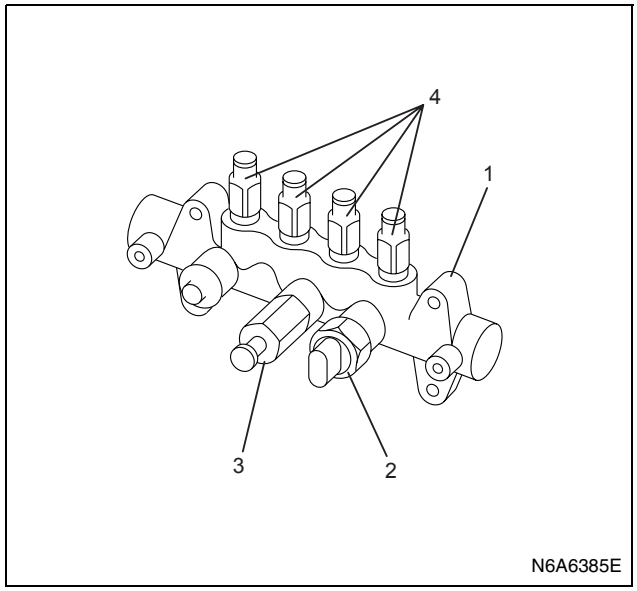
9. Remove the fuel rail and the fuel rail bracket.
   - Do not remove the flow damper.
     The dampers should always remain in the fuel rail.
   - Take care not to damage the connector unit of the pressure sensor.



Legend
1. Fuel Rail Bracket
2. Fuel Rail

Disassembly

1. Remove the fuel pressure limiter.
2. Remove the fuel rail pressure sensor.



Legend
1. Fuel Rail
2. Fuel Rail Pressure Sensor
3. Fuel Pressure Limiter
4. Flow Damper

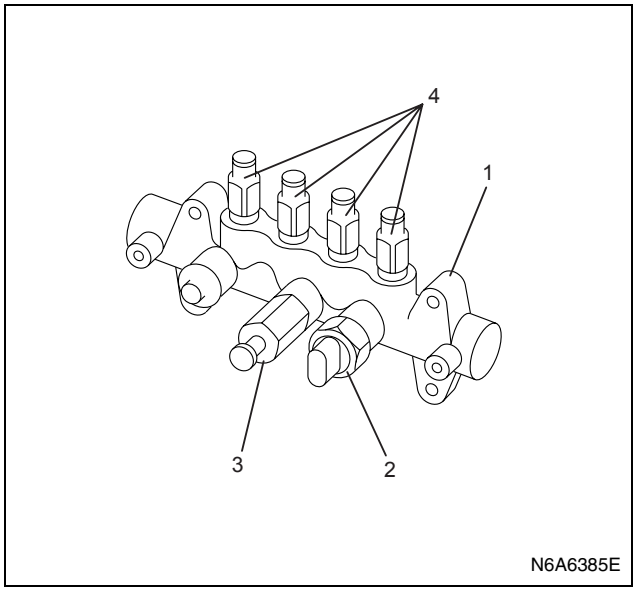
Reassembly

1. Install the fuel pressure limiter.

Tighten:
Fuel pressure limiter to 172 N·m (17.5 kg·m/127 lb·ft)

2. Install the fuel rail pressure sensor.

Tighten:
Fuel rail pressure sensor to 98 N·m (10 kg·m/72 lb·ft)



Legend
1. Fuel Rail
2. Fuel Rail Pressure Sensor
3. Fuel Pressure Limiter
4. Flow Damper

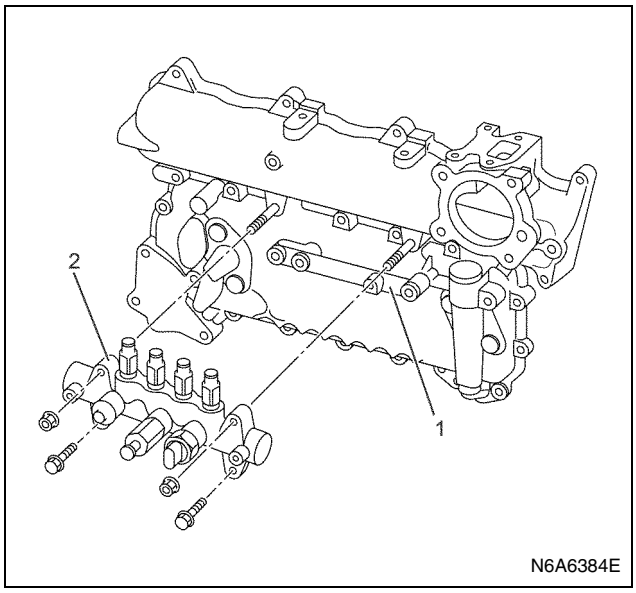
Installation

1. Tighten the fuel rail bracket using the specified mounting torque.

Tighten:
Nuts to 19 N·m (1.9 kg·m/14 lb·ft)

2. Tighten the fuel rail using the specified mounting torque.

Tighten:
Bolts to 19 N·m (1.9 kg·m/14 lb·ft)



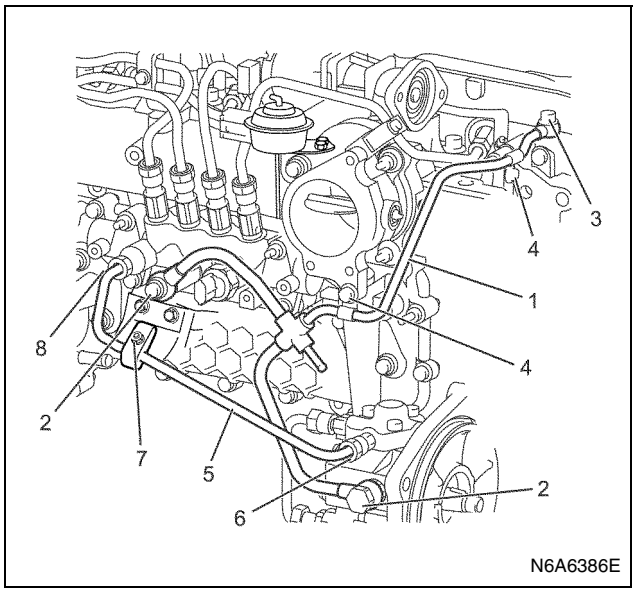
Legend
1. Fuel Rail Bracket
2. Fuel Rail

3. Tighten the fuel leak-off pipe (1) using the mounting eyebolt and the clips using the specified torque.

Tighten:
(2) to 18 N·m (1.8 kg·m/13 lb·ft)
(3) to 12 N·m (1.2 kg·m/104 lb·in)
(4) to 8 N·m (0.8 kg·m/69 lb·in)

4. Tighten the fuel pipe (5) using the mounting sleeve nut and the clip using the specified torque.

Tighten:
(6) to 44 N·m (4.5 kg·m/33 lb·ft)
(7) to 6 N·m (0.6 kg·m/52 lb·in)
(8) to 44 N·m (4.5 kg·m/33 lb·ft)

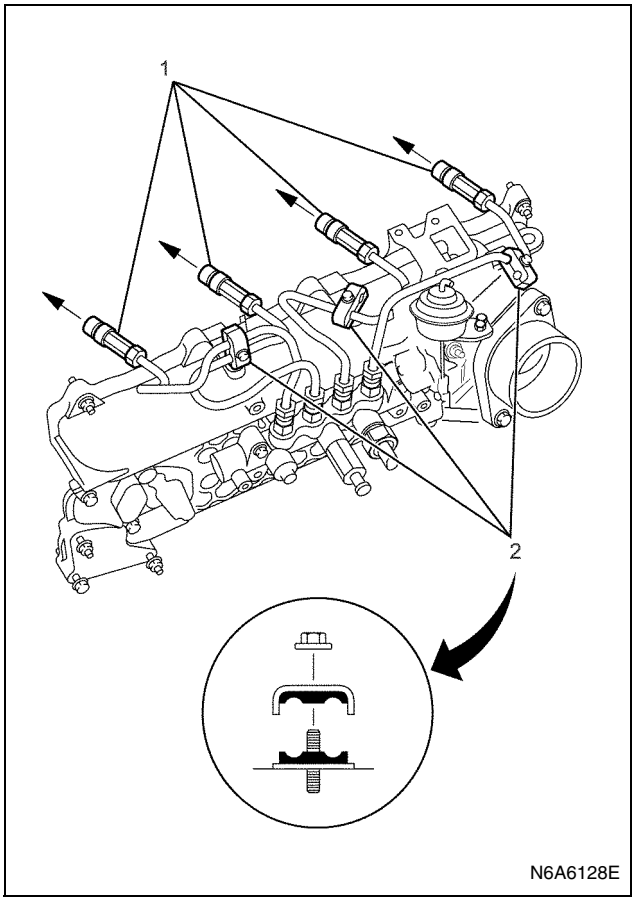


5. Install the fuel leak-off hose to the fuel leak-off pipe.
6. Tighten the injection pipe and the clip using the specified mounting torque.

Tighten:
Injection pipe sleeve nut to 44 N·m (4.5 kg·m/33 lb·ft)

Tighten:
Injection pipe clip to 6 N·m (0.6 kg·m/52 lb·in)

- Apply a thin coat of engine oil on the periphery of the sleeve nut on the fuel injector side and assemble.



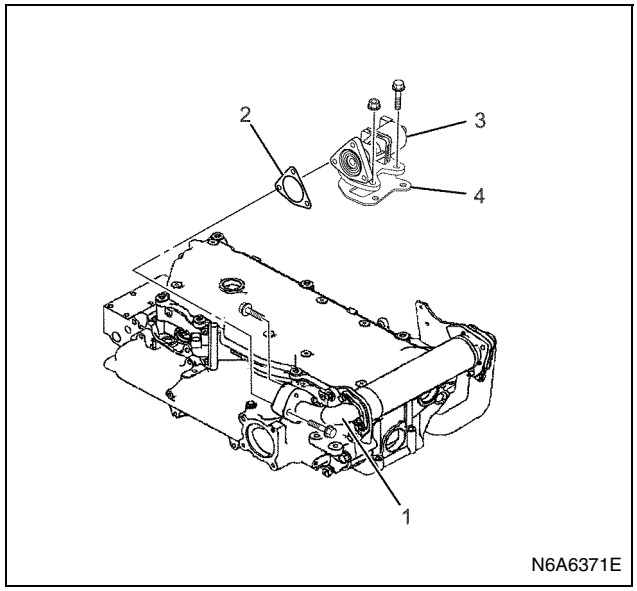
Legend
1. Fuel Injection Pipe
2. Fuel Injection Pipe Clip

7. Connect the fuel rail pressure (FRP) sensor connector.
8. Install the gasket to the EGR valve and tighten the bolts to the specified torque.

Tighten:
Bolt to 24 N·m (2.4 kg·m/17 lb·ft)

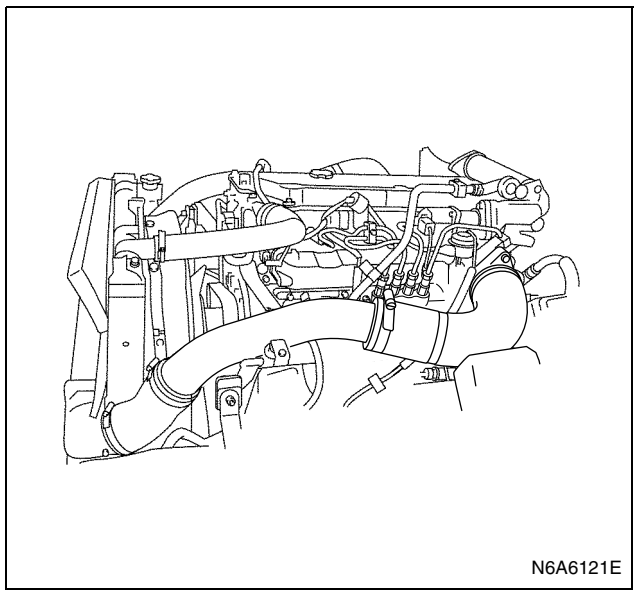
9. Install the gasket to the EGR adapter and tighten the bolts to the specified torque.

Tighten:
Bolt to 24 N·m (2.4 kg·m/17 lb·ft)

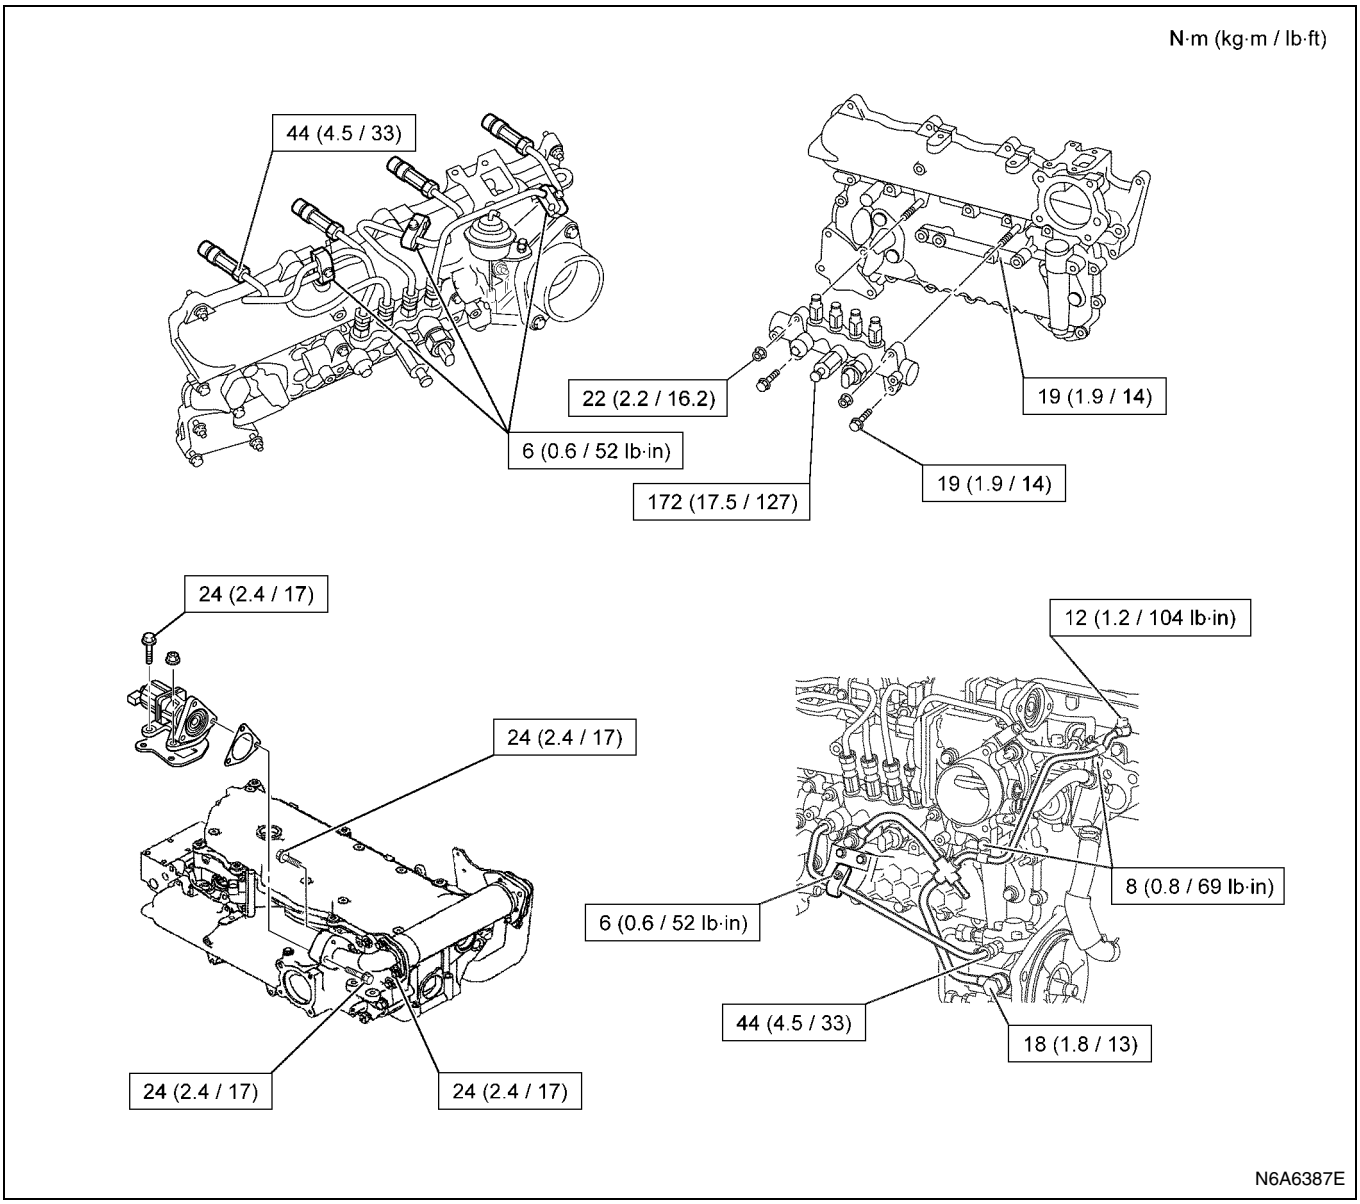


Legend
1. EGR Adapter
2. EGR Valve Gasket
3. EGR Valve
4. EGR Valve Gasket

10. Install the air intake duct.
    - Connect the connector for the intake air temperature sensor.



Torque Specifications

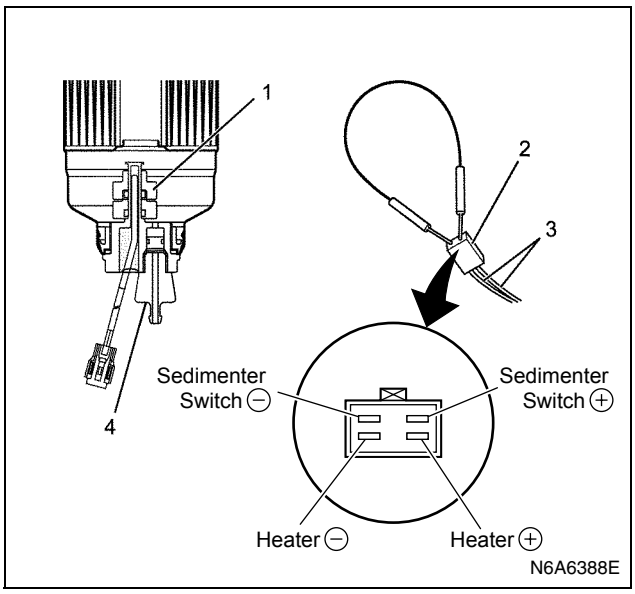


Fuel Sedimenter Switch

Inspection

1. Check that there is continuity between the switch connector terminals when the float in the fuel sedimenter is above the water drain line.
2. Turn on the ignition switch, disconnect the fuel sedimenter connector, and connect the terminals of the connectors on the vehicle side. Confirm that the sedimenter warning lamp lights up.

If abnormalities are detected during the check, replace the switch parts and carry out repairs in case of defective connection between circuits or short circuits.

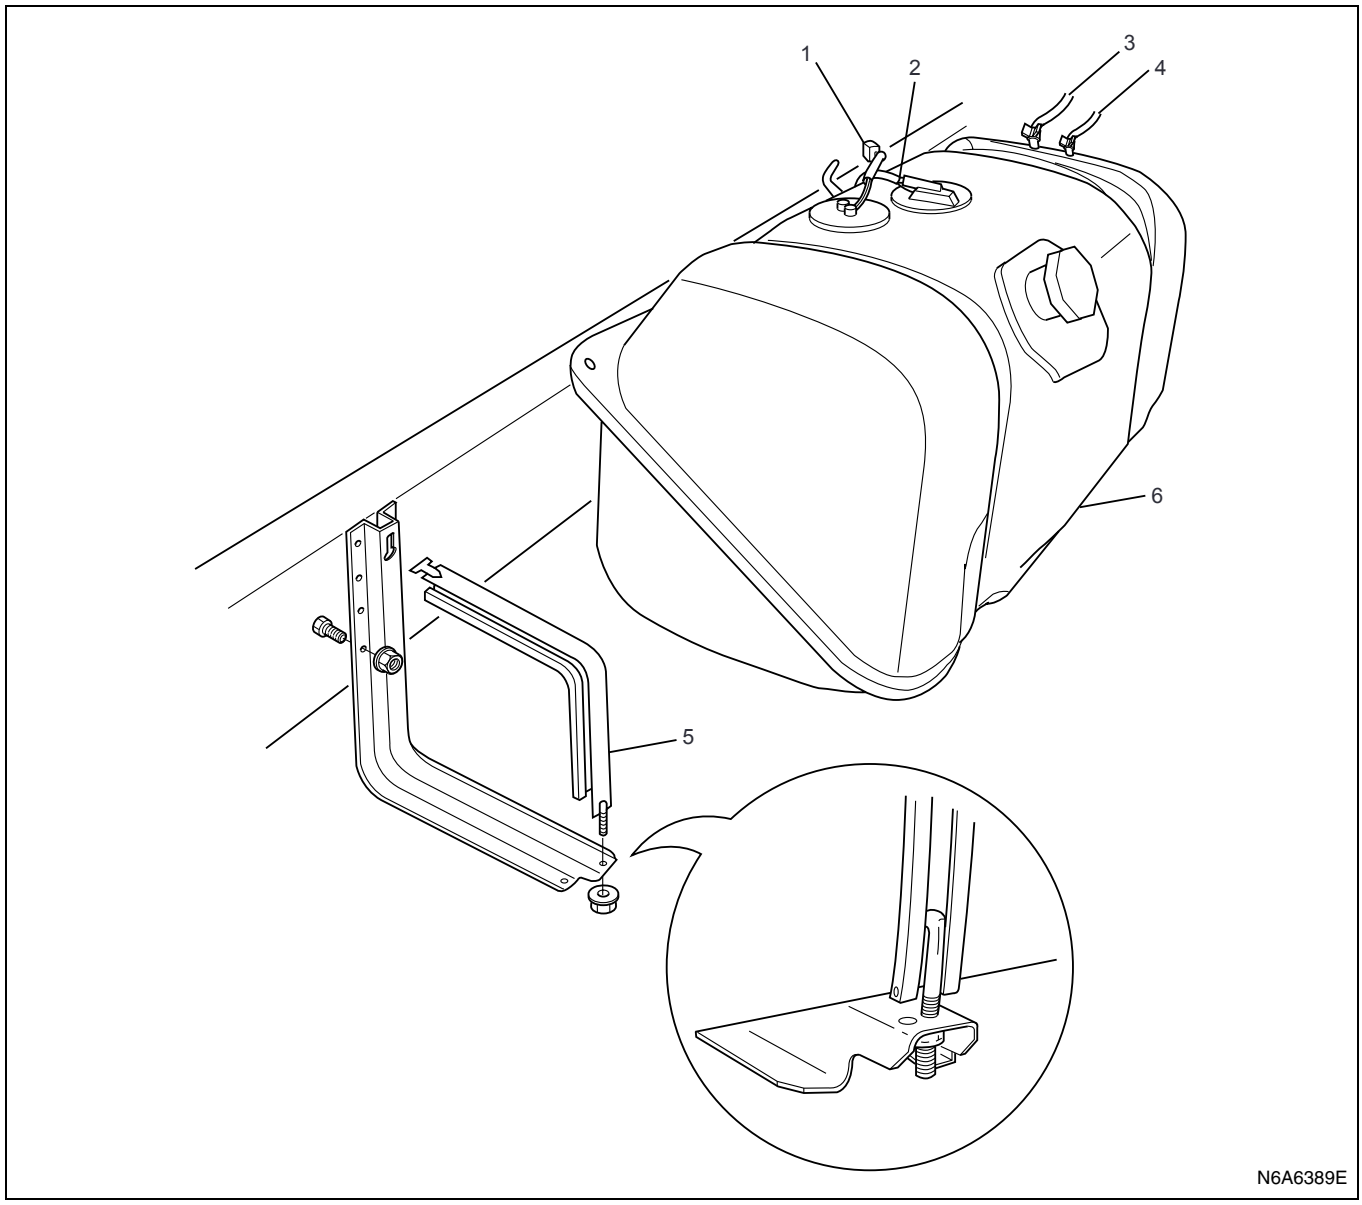


Legend

1. Sensor
2. Connector on The Vehicle Side
3. Harness
4. Drain Cock

Fuel Tank

Components



Legend

1. Fuel Gauge Unit Connector
2. Evaporated Fuel Hose
3. Fuel Feed Hose
4. Fuel Return Hose
5. Band
6. Fuel Tank

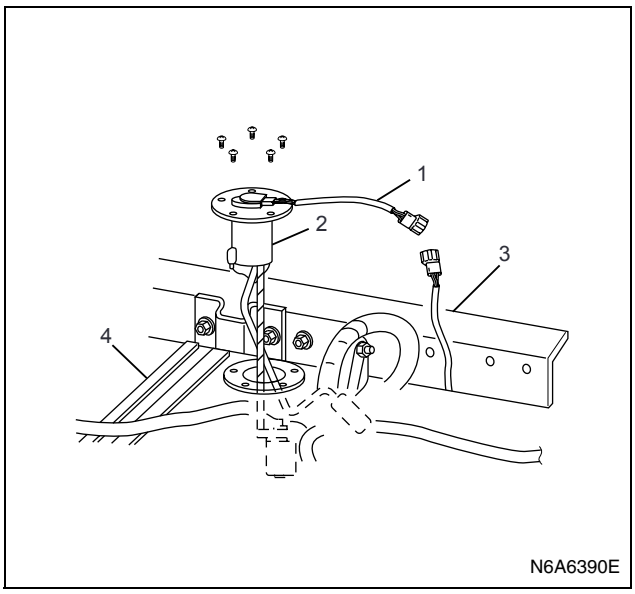
Removal

1. Loosen the fuel filler cap.
2. Drain the fuel from the drain plug.
3. After draining, tighten the drain plug with the specified torque.

Tighten:
20 N·m (2.0 kg·m/15 lb·ft)

4. Remove the fuel gauge unit connector.
5. Remove the evaporated fuel hose.
6. Remove the fuel feed hose.
7. Remove the fuel return hose.
   - Plug the hose so that fuel does not flow out, and tie it to the frame-side with the opening faced up.
8. Remove the nut of band which installs fuel tank, and remove the band tip in the frame-side.
9. Pull out the fuel tank to the outside.

Caution:
If the fuel tank cannot be pulled out, remove the bracket and pull out the fuel tank downward.



Legend
1. Fuel Gauge Unit Connector
2. Fuel Gauge Unit
3. Cross-member
4. Fuel Tank

Installation

1. Install the fuel tank.

Caution:
When the bracket has been removed while taking out the fuel tank, attach the bracket to the frame and tighten it to the specified torque.

Tighten:
55 N·m (5.6 kg·m/41 lb·ft)

Also, when placing the fuel tank on the bracket, make sure that the rubber part attached on the fuel tank is put onto the bracket.

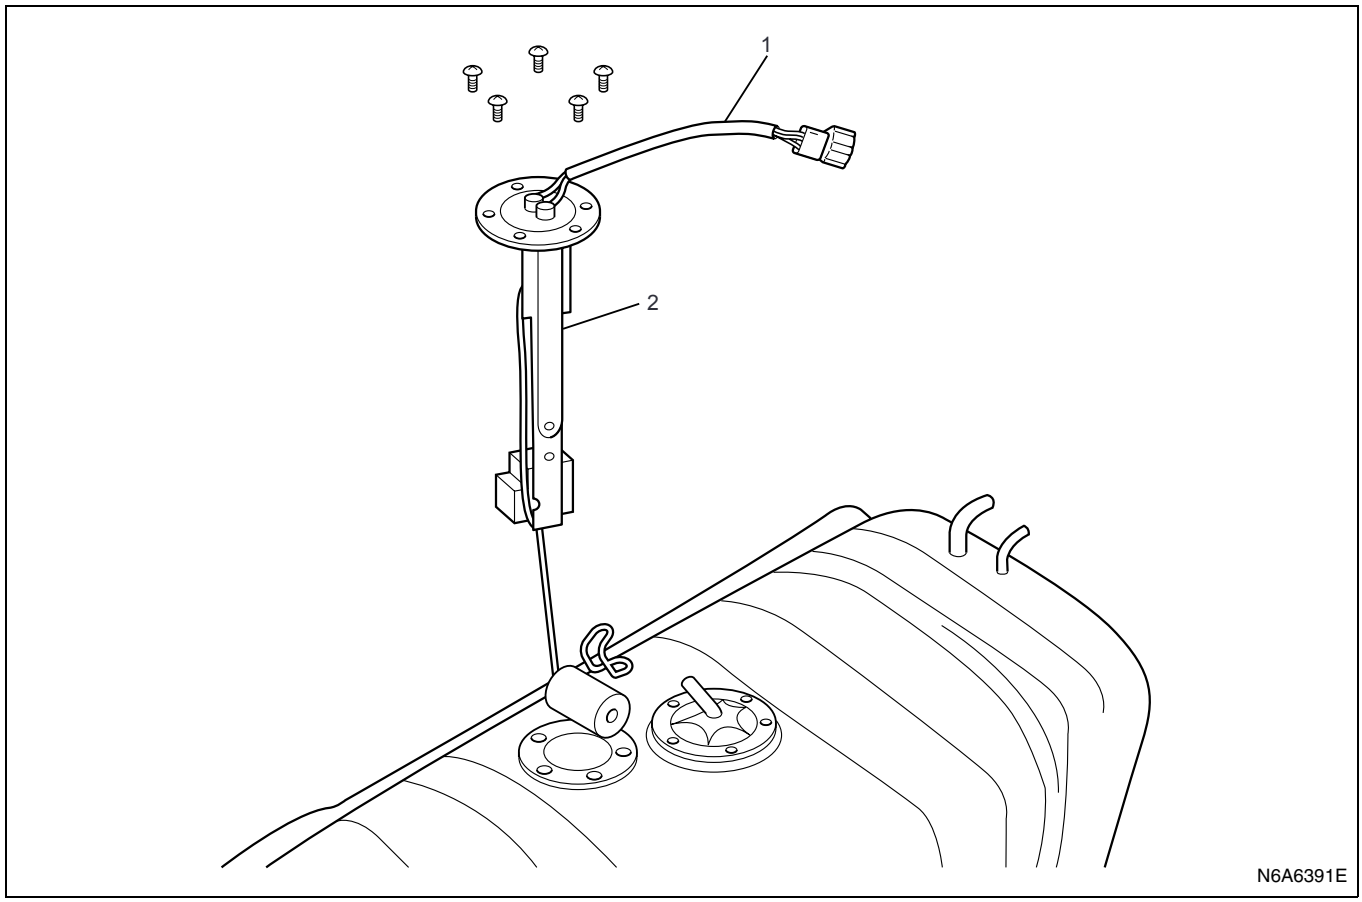
2. Install the band to the fuel tank and tighten up the nuts with the specified torque.

Tighten:
12 N·m (1.2 kg·m/9 lb·ft)

3. Install the fuel return hose.
4. Install the fuel feed hose.
   - Insert the hose into the pipe for more than 25 mm (1.0 in).
5. Install the evaporated fuel hose.
   - Fill the fuel tank with fuel, and tighten the fuel filler cap.
   - Connect the battery earth cable.
   - Make sure there is no fuel leakage from the connector parts of hoses after starting the engine.
6. Connect the fuel gauge unit connector.

Fuel Gauge Unit

Components



Legend

1. Fuel Gauge Unit Connector
2. Fuel Gauge Unit

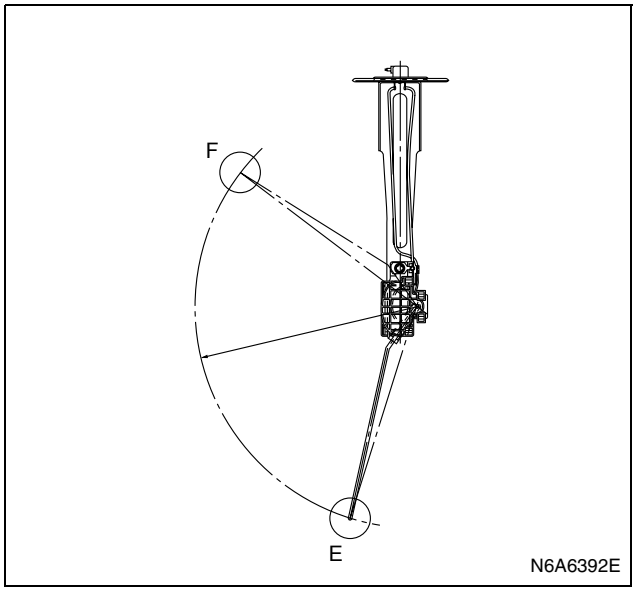
Removal

1. Remove the wiring connector from the fuel gauge unit.
2. Remove the installed screw and remove the fuel gauge unit.

Caution:
When removing/installing the fuel gauge unit, take care not to interfere with adjacent parts and not to let the arm etc. deformed. Also, after removing the fuel gauge unit, cover the tank with a cloth to prevent the entry of dust.

Inspection

The fuel tank unit changes the internal resistance according to the float position (fluid level) to operate the indicator of the fuel meter.



1. While moving the float from “E” to “F”, measure the resistance between the connector terminals 1J-28 and 2J-28.
2. Check that the fuel level warning lamp comes on when the float is at “E” position. If the result of the inspection is unsatisfactory, replace with a new part.

Installation

Assemble in the reverse order of disassembly.

1. Install the fuel gauge unit.
2. Connect the wiring connector to the fuel gauge unit.

Service Precautions

General Procedure

When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

Battery

General Description

There are six battery fluid caps at the top of the battery.

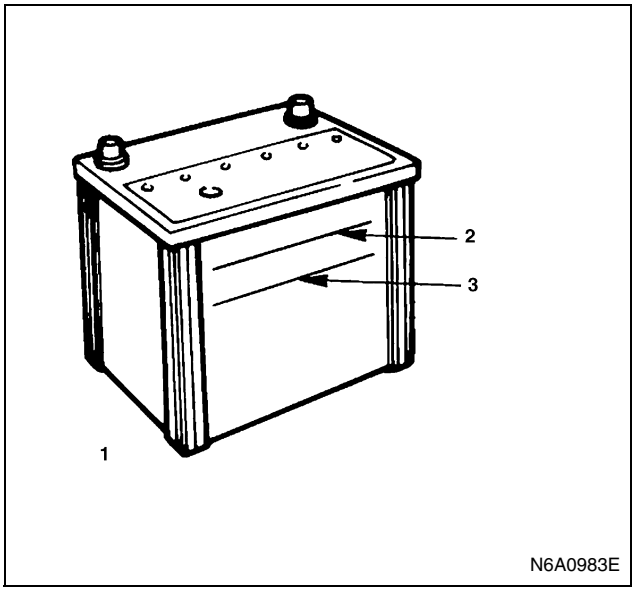
Diagnosis

Visual Inspection

Inspect the battery for obvious physical damage, such as a cracked or broken case, which would permit electrolyte loss.
Replace the battery if obvious physical damage is discovered during inspection.
Check for any other physical damage and correct it as necessary.

Fluid Level Check

The fluid level should be between the upper level line and lower level line on side of the battery.



Legend

1. Battery
2. Upper Level
3. Lower Level

Voltage Check

1. Put voltmeter test leads to battery terminals.
   a. VOLTAGE IS 12.4V OR ABOVE - Go to “Load Test”.
   b. VOLTAGE IS UNDER 12.4V - Go to procedure 2 below.
2. Determine fast charge amperage from specification.
   Fast charge battery for 30 minutes at amperage rate no higher than specified value.
   Take voltage and amperage readings after charge.
   a. VOLTAGE IS ABOVE 16V AT BELOW 1/3 OF AMPERAGE RATE - Replace battery.
   b. VOLTAGE IS ABOVE 16V AT ABOVE 1/3 OF AMPERAGE RATE - Drop charging voltage to 15V and charge for 10 — 15 hours.

   Then go to “Load test”.
   c. VOLTAGE IS BETWEEN 12V AND 16V
      - Continue charging at the same rate for an additional 3-1/2 hours. Then go to “Load test”.
   d. VOLTAGE IS BELOW 12V - Replace battery.

Load Test

1. Connect a voltmeter and a battery load tester across the battery terminals.
2. Apply 300 ampere load for 15 seconds to remove surface charge from the battery.
   Remove load.
3. Wait 15 seconds to let battery recover. Then apply specified load from specifications (See Main Data and Specifications in this section).
   Read voltage after 15 seconds, then remove load.
   1) VOLTAGE DOES NOT DROP BELOW THE MINIMUM LISTED IN FOLLOWING TABLE
      - The battery is good and should be returned to service.
   2) VOLTAGE IS LESS THAN MINIMUM LISTED
      - Replace battery.

ESTIMATED TEMPERATURE		MINIMUM VOLTAGE
°F	°C	
70	21	9.6
60	16	9.5
50	10	9.4
40	4	9.3
30	– 1	9.1
20	– 7	8.9
10	– 12	8.7
0	– 18	8.5
The battery temperature must be estimated by feel and by the temperature the battery has been exposed to for the preceding few hours.		

On-vehicle Service

Battery Charging

Observe the following safety precautions when charging the battery:

1. Never attempt to charge the battery when the fluid level is below the lower level line on the side of the battery.
   In this case, the battery must be replaced.

2. Pay close attention to the battery during the charging procedure.
   Battery charging should be discontinued or the rate of charge reduced if the battery feels hot to the touch.
   Battery charging should be discontinued or the rate of charge reduced if the battery begins to gas or spew electrolyte from the vent holes.
3. Battery temperature can have a great effect on battery charging capacity.
4. The sealed battery used on this vehicle may be either quick-charged or slow-charged in the same manner as other batteries.
   Whichever method you decide to use, be sure that you completely charge the battery. Never partially charge the battery.

Jump Starting

Jump Starting With An Auxiliary (Booster) Battery

Caution:
Never push or to the vehicle in an attempt to start it.
Serious damage to the emission system as well as other vehicle parts will result.
Treat both the discharged battery and the booster battery with great care when using jumper cables.
Carefully follow the jump starting procedure, being careful at all times to avoid sparking.

WARNING:
FAILURE TO CAREFULLY FOLLOW THE JUMP STARTING PROCEDURE COULD RESULT IN THE FOLLOWING:

1. **SERIOUS PERSONAL INJURY, PARTICULARLY TO YOUR EYES.**
2. **PROPERTY DAMAGE FROM A BATTERY EXPLOSION, BATTERY ACID, OR AN ELECTRICAL FIRE.**
3. **DAMAGE TO THE ELECTRONIC COMPONENTS OF ONE OR BOTH VEHICLES PARTICULARLY.**

Never expose the battery to an open flame or electrical spark. Gas generated by the battery may catch fire or explode.
Remove any rings, watches, or other jewelry before working around the battery. Protect your eyes by wearing an approved set of goggles.
Never allow battery fluid to come in contact with your eyes or skin.
Never allow battery fluid to come in contact with fabrics or painted surfaces.
Battery fluid is a highly corrosive acid.
Should battery fluid come in contact with your eyes, skin, fabric, or a painted surface, immediately and thoroughly rinse the affected area with clean tap water.
Never allow metal tools or jumper cables to come in contact with the positive battery terminal, or any other metal surface of the vehicle. This will protect against a short circuit.
Always keep batteries out of the reach of young children.

Jump Starting Procedure

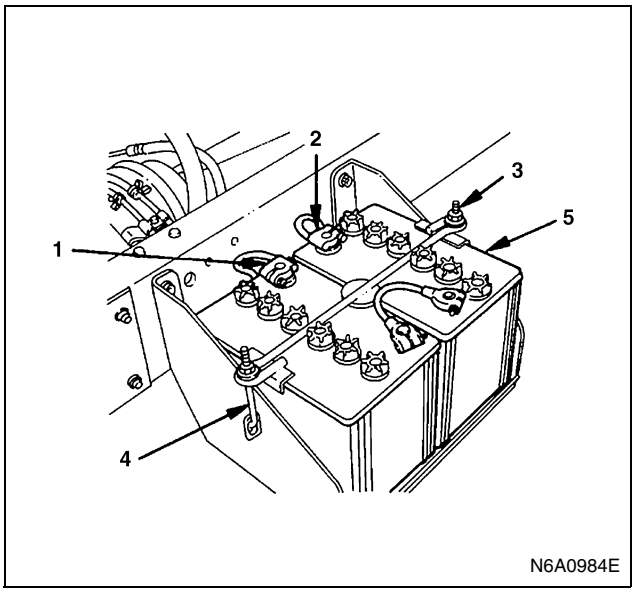
1. Set the vehicle parking brake.
   If the vehicle is equipped with an automatic transmission, place the selector lever in the “PARK” position.
   If the vehicle is equipped with a manual transmission, place the shift lever in the “NEUTRAL” position.
   Turn “OFF” the ignition.
   Turn “OFF” all lights and any other accessory requiring electrical power.
2. Look at the built-in hydrometer. (If equipped)
   If the indication area of the built-in hydrometer is completely clear, do not try to jump start.
3. Attach the end of one jumper cable to the positive terminal of the booster battery.
   Attach the other end of the same cable to the positive terminal of the discharged battery.
   Do not allow the vehicles to touch each other.
   This will cause a ground connection, effectively neutralizing the charging procedure.
   Be sure that the booster battery has a 12 volt rating.
4. Attach one end of the remaining cable to the negative terminal of the booster battery.
   Attach the other end of the same cable to a solid engine ground (such as the A/C compressor bracket or the generator mounting bracket) of the vehicle with the discharged battery.
   This ground connection must be at least 450 mm (18 in) from the battery of the vehicle whose battery is being charged.

WARNING:
NEVER ATTACH THE END OF THE JUMPER CABLE DIRECTLY TO THE NEGATIVE TERMINAL OF THE DEAD BATTERY.

5. Start the engine of the vehicle with the good battery.
   Make sure that all unnecessary electrical accessories have been turned “OFF”.
6. Start the engine of the vehicle with the dead battery.
7. To remove the jumper cables, follow the above directions in the reverse order.
   Be sure to first disconnect the negative cable from the vehicle with the discharged battery.

Removal

1. Negative cable
2. Positive cable
3. Retainer screw and rods
4. Retainer
5. Battery



Installation

To install the battery, follow the removal procedure in the reverse order, noting the following points:

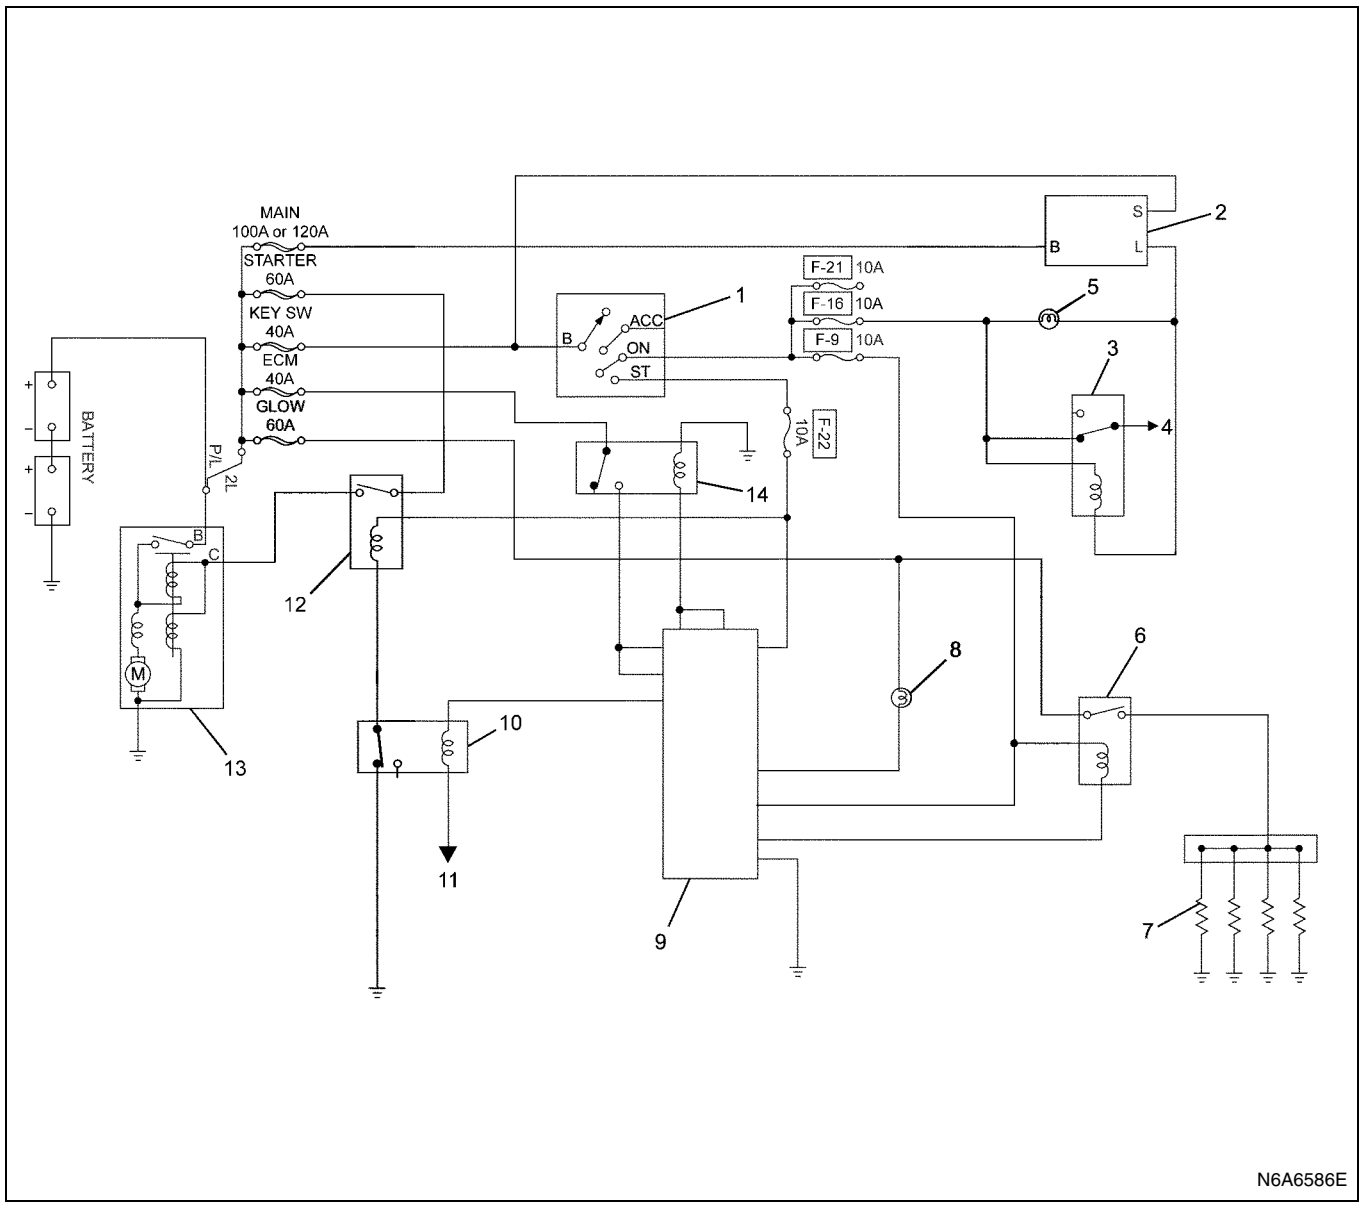
1. Make sure that the rod is hooked on the body side.

Charging System

General Description

The main charging system components are the batteries, the generator and the battery discharge indicator light circuit. The generator is a 110-amp, selfrectifying type with a built-in regulator. The battery discharge indicator light is mounted in the instrument panel. For more details on this circuit, refer to “Meter and Warning/Indicator Lights” in Section 8.

Circuit Diagram



Legend

8. Glow Plug Indicator Light
9. ECM
10. Starter Cut Relay
11. To Exhaust Brake Solenoid Valve
12. Starter Relay
13. Starter
14. ECM Main Relay

Maintenance

The most common indication of charging system troubles is an undercharged or overcharged battery.
Since the battery itself may be defective, the first step should be to check its condition as described under “Diagnosis of Battery.” In the case of an undercharged battery, check for battery drain caused by grounds or by accessories left turned on.
Keep the generator and all other electrical system terminals clean and tight. A loose or badly corroded terminal connection will create excessive resistance in the system and result in hard starting, dim lights etc.
Inspect the generator system at regular intervals and correct any potential causes of trouble before vehicle performance is affected.

Diagnosis of Charging System

Trouble in the charging system will be evidenced as one or more of the following three conditions:

1. The battery discharge warning light will stay on.
2. An undercharged battery as evidenced by slow cranking.
3. An overcharge, or overvoltage, condition.

Undercharged Battery

Inspection

1. Accessories to be sure none were left on for extended periods.
2. Drive belt for proper tension. Refer to “Drive Belt” in Section 6B.
3. The ECM main relay has been ON stuck at the ignition switch OFF position. (Battery voltage is consumed.)
4. Battery. Refer to “Diagnosis of Battery” earlier in this section.
5. Wiring and connections for corrosion or looseness.

Overcharge (or Overvoltage) condition

A charging rate in excess of 29.5-volts for a prolonged period may cause early electrical system failure.
Blown fuses, light bulbs burned out, and even battery failure may result. If this condition exists, test the generator as described under “Generator Output Tests” later in this section.

Noisy Generator

Inspection

1. Drive pulley for looseness.
2. Mounting bolts for looseness.
3. Bearings for dirt, damage, or wear.
   Generator noise may also be caused by worn or damaged diodes and/or starter.

Electrical Tests

Before performing the following generator electrical tests on the vehicle, be certain that the system wiring is not defective and generator belts are not slipping. Also, the battery must be fully charged for a valid test of the charging system.

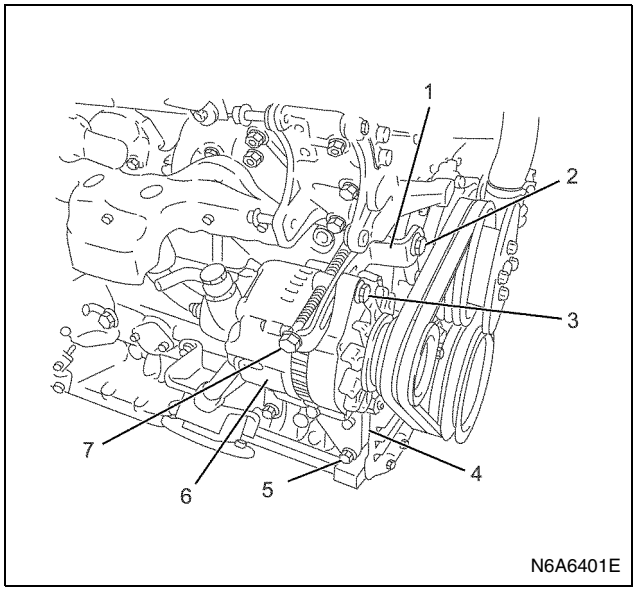
Notice:
To avoid damage to the vehicle electrical system, always observe the following precautions:

- Do not polarize the generator.
- Do not short across or ground any of the terminals in the charging circuit except as specifically instructed herein.
- NEVER operate the generator with the output terminal open-circuited.
- Be sure the generator and battery have the same ground polarity.
- When connecting a charger or booster battery to the vehicle battery, connect negative to negative and positive to positive.

1. With the engine control switch “ON” and engine not running, connect a voltmeter from terminal “E” to ground. The voltmeter should read zero volts.
2. With the engine control switch “ON” and engine not running, connect a voltmeter from terminal “B” to ground. The voltmeter should read at least 24 volts.
3. With the engine control switch “ON” and the engine not running, connect a voltmeter from white wire side of the connector to ground. The voltmeter should show 24 volts.
4. With the engine control switch “ON” and the engine not running, the “charge” light should be on. This shows that the other circuit in the connection is working.
5. With the engine running and the headlight high beams turned on, read the voltage at the “B” post on the generator. The voltage should be at least 24 volts.
6. If steps 1 through 4 are not OK, check connectors in the harness for looseness or corrosion and retest.
7. If step 5 voltage is low, substitute a known good regulator and test again. If the voltage is still low, bench test the generator.

Generator

Component



Legend

1. Generator Adjusting Bracket
2. Bracket Mounting Bolt

4. Generator Bracket
5. Generator Bracket Mounting Bolt
6. Generator
7. Generator Adjusting Bolt (Model equipped with A/C only)

Repair Instruction

Description of Generator

The generator is a 24 volt, 50A or 60A or 80A, model with a solid state regulator mounted to the brush holder. The generator must be disassembled to remove the regulator or brush holder assembly. The generator rotor bearings contain enough grease to eliminate periodic lubrication. Two brushes carry current through two slip rings to the field coil.

The stator windings are assembled on the inside of a laminated core that forms part of the generator frame. A rectifier bridge connected to the stator windings contains six diodes that change the stator AC voltages to a DC voltage.

The vacuum pump is attached to the rear of the generator.

Generator Output Tests

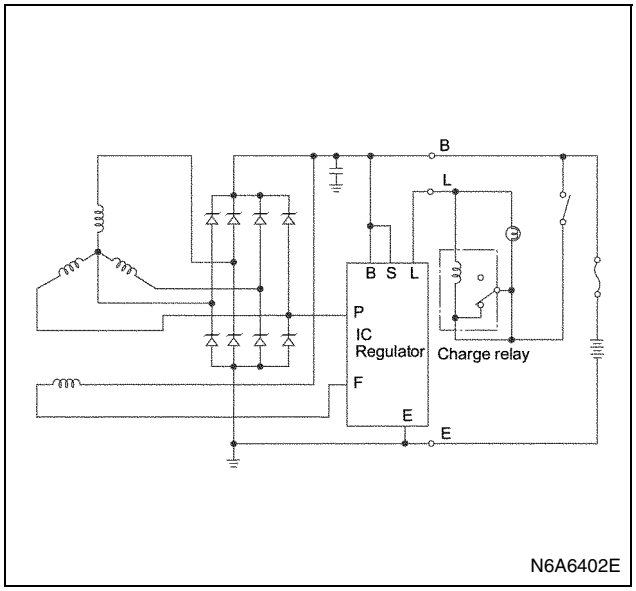
To check the generator in a test stand, proceed as follows:

Important:

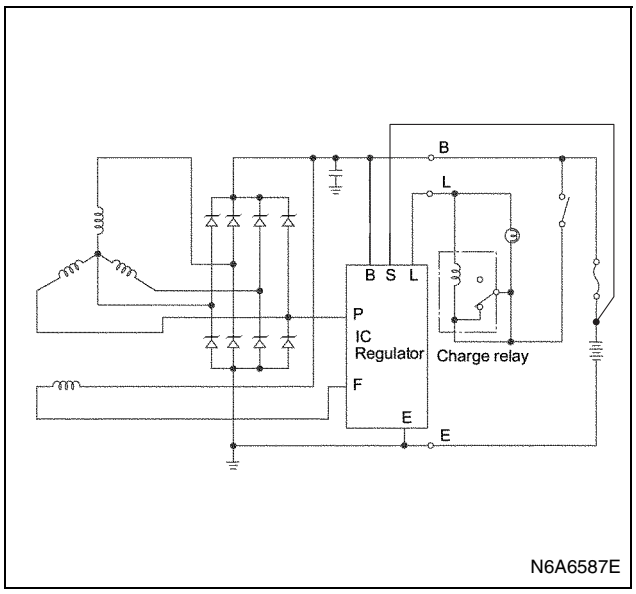
- Use a fully charged battery when performing these tests.

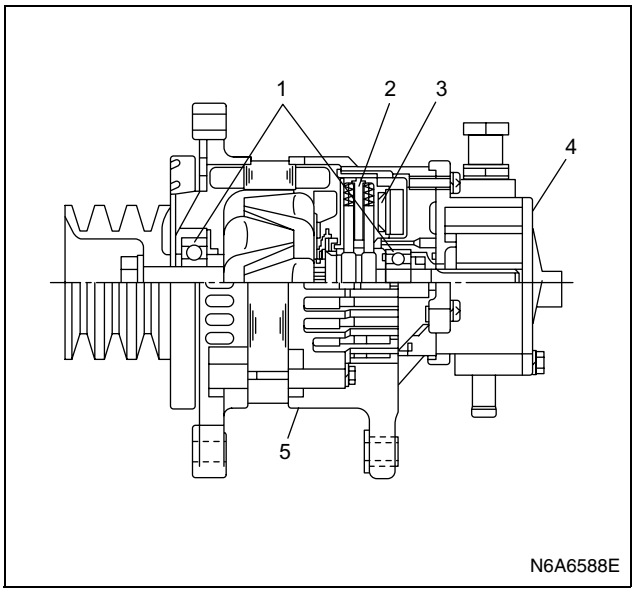
1. Connect an ammeter from the positive (+) battery side to the generator output wire. This is 8 mm (0.032 in) (black) wire. Leave the carbon pile disconnected.
2. Slowly increase the generator speed and observe the voltage meter. If voltage is uncontrolled with speed and increases above 30 volts on a 24-volt system, replace the regulator and check the rotor winding. If the voltage is below 30 volts, connect the carbon pile across the battery.
3. Run the generator at 5,000 RPM and adjust the carbon pile to obtain maximum current output, which should be more than 42A (50A) or 50A (60A) or 75A (80A) at 28 to 29 volts.
4. If the output is not within 10 amperes of the rated output, check the rotor winding, rectifier bridge, and stator as described later under “Inspection” and “Electrical Bench Tests.”

50A Model



60A, 80A Model





Legend

1. Ball Bearings
2. Brush Holder
3. Voltage Regulator
4. Vacuum Pump
5. Generator

Notice:

- Before performing the generator output test, inspect all charging system components, wires and terminals for wear or damage. Repair or replace any parts found defective.

Removal

- Disconnect the battery negative cable.
- Remove the A/C compressor. (Refer to “Engine Assembly” in Section 6A)

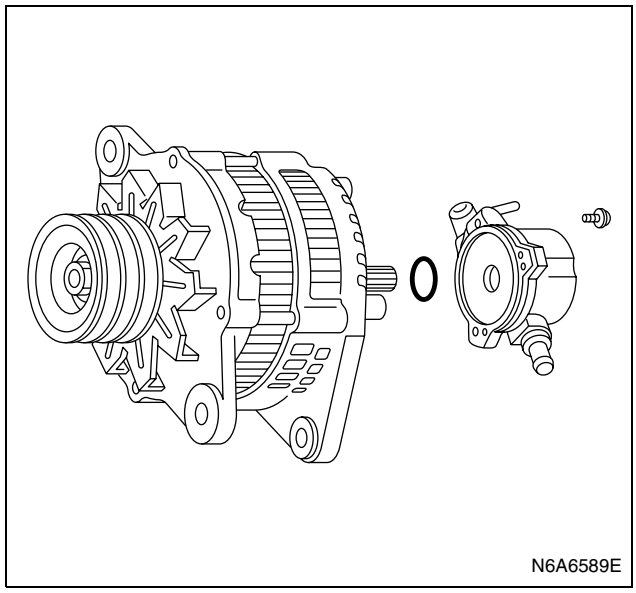
1. Electrical wiring at the generator.
2. Vacuum and oil hoses attached to the rear of the vacuum pump.
3. Loosen the lower mounting bolts.
4. Loosen the adjusting nut.
5. Drive belts.
6. Adjusting bolts.
7. Generator.

Inspection

- Mount brackets for damage.
- Drive belts for wear or damage.

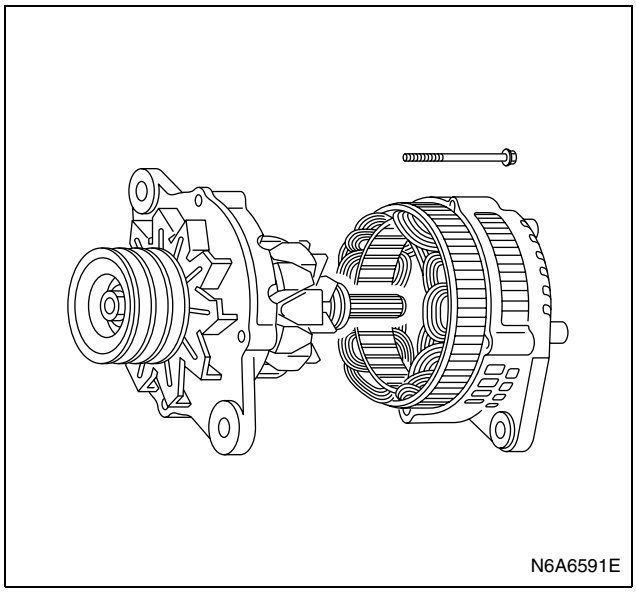
Disassembly

1. Vacuum pump assembly.
   - Remove the vacuum pump screws attached to the back of the generator. Remove the vacuum pump in the direction in line with the rotor shaft. Remove the side plate fixing bolts and the side plate, then remove the rotor and vanes.



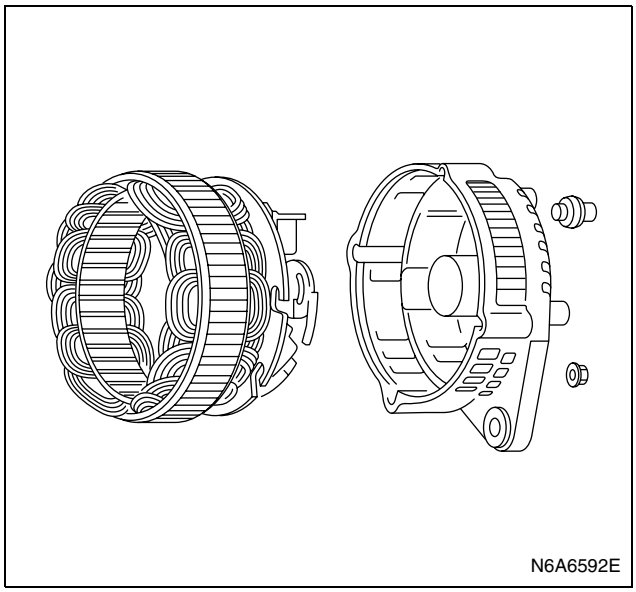
2. Through bolts.
   - Tape the rotor shaft splines to prevent accidental damage.

   - Separate the front cover assembly from the rear cover assembly.
     When separating the front and rear cover assemblies, be sure the stator assembly stays seated in the rear cover.



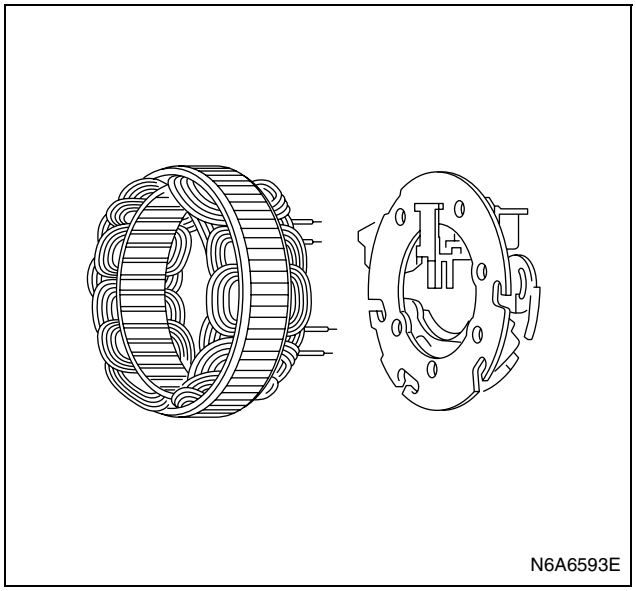
N6A6591E

3. Pulley and rotor assembly.
   - Be sure not to damage the oil seal when removing the pulley and rotor assembly from the rear cover assembly.
4. Rear cover and stator assembly.
5. Pulley nut.
   - Clamp the rotor assembly in a vise to remove the pulley nut.
6. Pulley.
7. Fan.
8. Spacer.
9. Rotor and rear bearing.
10. Bearing retainer.
11. Front ball bearing.
12. Front cover.
13. Rear cover.
    - Remove nuts at the rear cover battery terminal and diode brush regulator assembly.



N6A6592E

14. Stator and diode brush regulator assembly
15. Diode brush regulator assembly.
    - Separate the diode brush regulator assembly from the stator by melting the solder on the stator coils, diodes and N terminal leads. When melting solder, hold the lead wire with long-nose pliers to prevent heat from being transferred to the diodes.



N6A6593E

16. Stator.

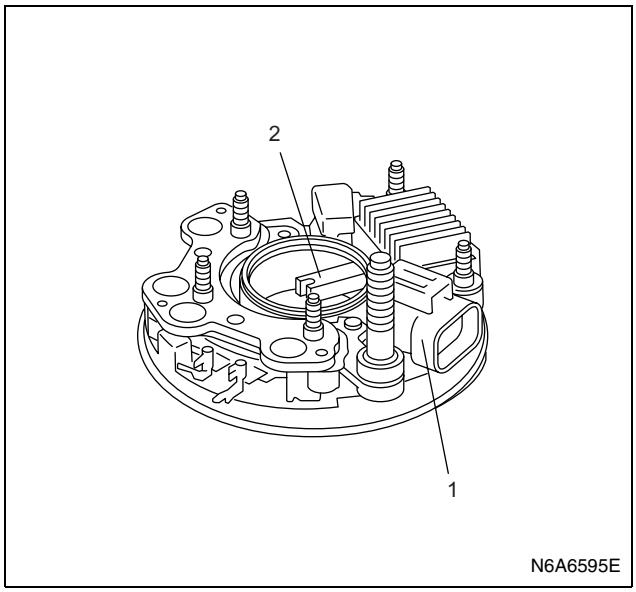
10. Stator
11. Rear Cover
12. Through Bolt
13. Housing
14. Vane
15. Pump Rotor
16. Side Plate
17. Vacuum Pump Assembly

Important:

- Separate the stator and rear cover. Be sure you identify the proper position of the insulated washers to prevent improper installation.

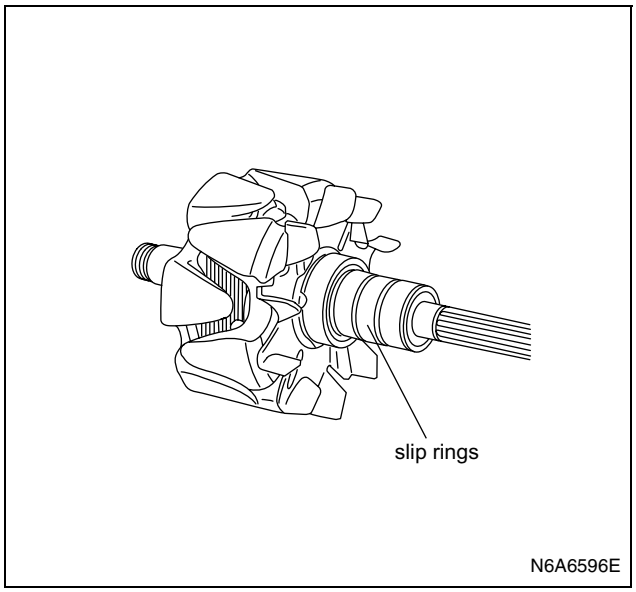
Inspection

- All metal parts except the voltage rectifier bridge, stator, rotor and bearing assemblies in a suitable solvent.
- Wipe or blow the components dry.
- Brush holder and brushes. The brushes have a line that indicates their limit. If the brushes are shorter than 6.5 mm (0.256 in) replace the brushes.



Legend
1. Brush Holder
2. Brushes

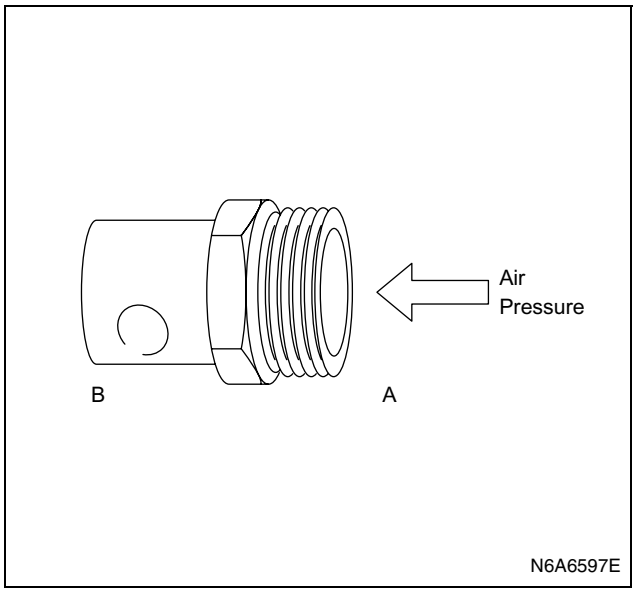
- Voltage regulator for damage or corrosion.
- Bearings and spacer. Rotate the bearing and check for roughness or excessive drag. If in doubt about the bearing, replace it.
- Rotor and stator windings for burned insulation or broken terminal connectors, wires, etc.
  Burned insulation may appear as very dark or blackened wiring, and sometimes charred paint or a combination of the two. Replace the rotor or stator if the windings are burned.
- Generator frames. Check for distortion, cracks or damage. Replace as necessary.
- Rotor slip rings. If the rings are dirty, clean them with 500–600 grain or finer polishing cloth.
  Clean the slip rings with rubbing alcohol if the rings are contaminated. Spin the rotor and hold the polishing cloth against the rings until they are clean. Slip rings which are rough, scored, or out-of-round, must be machined in a lathe to 31.7 mm (1.248 in). Finish the slip rings with 500 – 600 grain or finer polishing cloth and blow away all dust particles after the machining process.



- All vacuum pump components for wear, damage or other abnormal conditions.
- Check valve.
  1) Carefully force the valve from the “B” side as shown in the illustration.
     The valve must move smoothly.
     If it does not, the check valve must be replaced.
  2) Apply compressed air to the “A” side.

Air Pressure	kPa (kg/cm^2 / psi)
98 – 490 (1 – 5/14 – 71)	

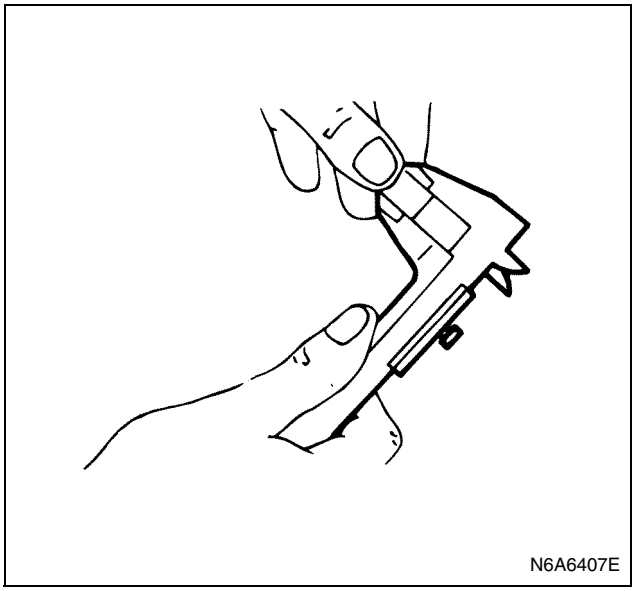
Check for air leakage from the check valve.
If there is air leakage, the valve must be replaced.



- Oil seal (O-ring). Check the inner face of the rear cover for traces of oil leakage. Be sure the inner face of the oil seal is not worn or damaged.
  If worn or damaged, use a screwdriver to remove the oil seal (O-ring) from the rear cover.
  Install a new oil seal (O-ring) using an oil seal installer or equivalent.

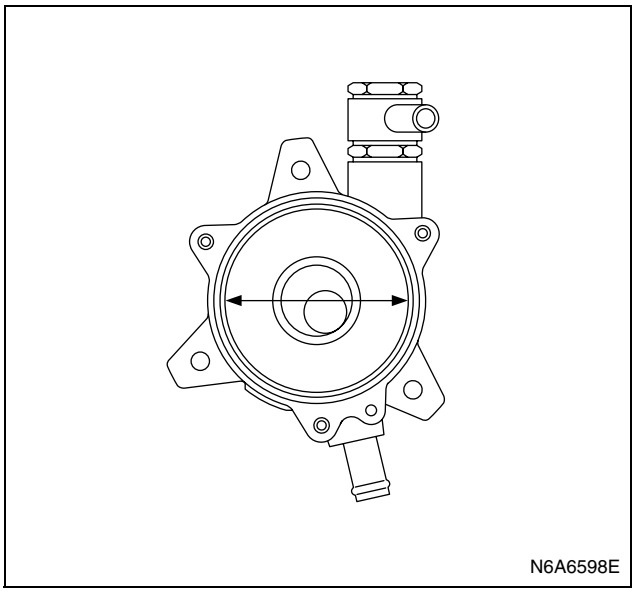
Measure

The length of the vanes	mm (in)
17.0 – 18.0 (0.669 – 0.709)	



Replace the housing if not within these specifications.

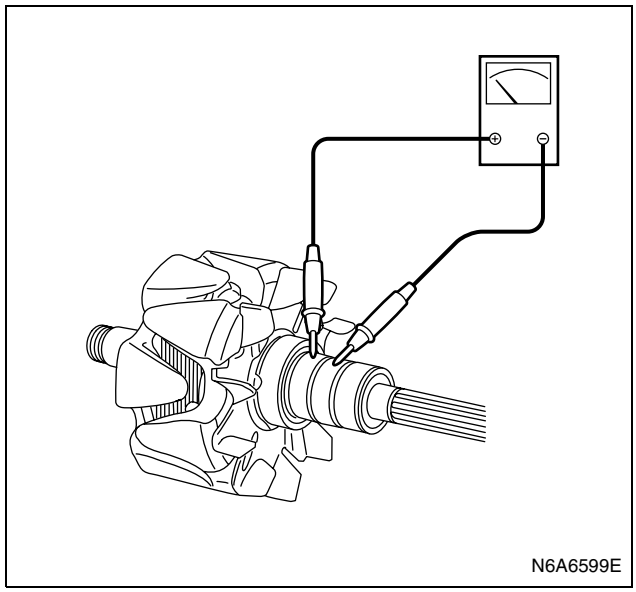
The inside diameter of the vacuum pump housing	mm (in)
69.5 – 69.6 (2.736 – 2.740)	



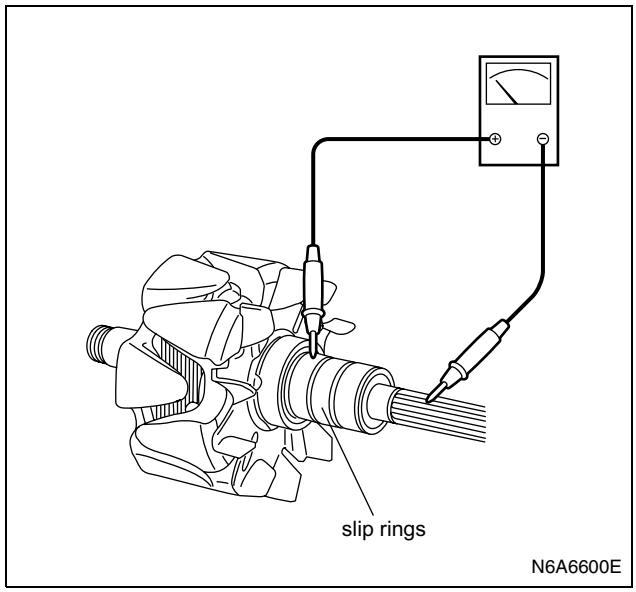
Electrical Bench Tests (Generator)

1. Measure the rotor coil resistance.

Rotor Coil Resistance at 20°C (68°F)		ohms
Standard	50A	7.6
	60A	9.2
	80A	10.2



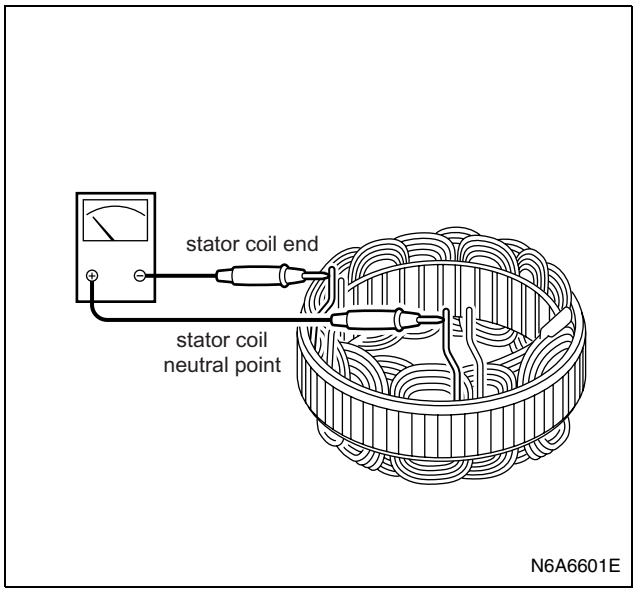
2. Check for continuity between the slip rings and the rotor core or shaft.
   If there is continuity, the entire rotor assembly must be replaced.



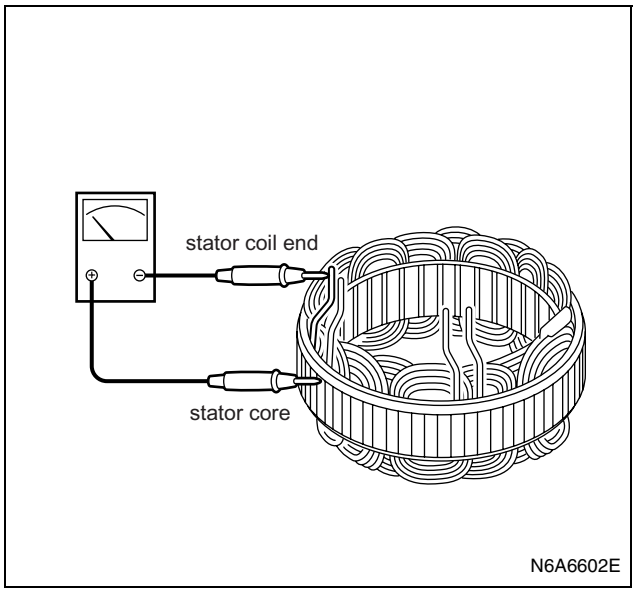
Stator Coil Assembly

1. Check for continuity across the stator coils
   If there is no continuity, the stator coils must be replaced.

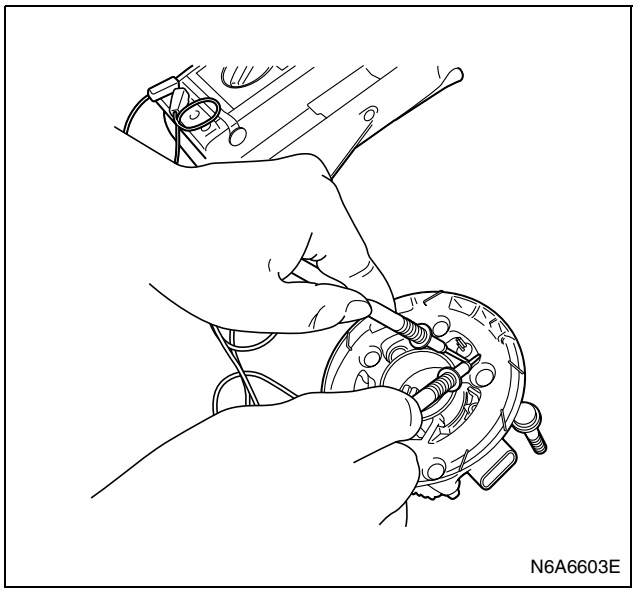
Resistance Between Stator coil neutral point and the Coil Ends (Reference)		mm (in)
Standard	50A	0.195
	60A	0.137
	80A	0.073



2. Check for continuity between each stator coil end and the stator core.
   If there is continuity, the stator coils must be replaced.



Rectifier



Tester wire					
E U, V, and WN	+	–	BAT U, V, and WN	+	–
+	-----	Conductivity	+	-----	No conductivity
–	No conductivity	-----	–	Conductivity	-----

3. DC Regulated Power Supply
4. Lamp 2
5. Lamp 1
6. Switch 3
7. Switch 2
8. Pulse Generator
9. Output Signal

Test circuit

Refer to the judgment criteria shown in the Table below. Carefully check Items 1 – 5. If all the items are OK, the IC regulator is normal.

Circuit components

1	DC regulated power supply	0 – 30 volts variable with output of 1 ampere or more
2	Lamps (2)	24 volts, 1.8 watts
3	Switches (3)	-----
4	DC voltmeter	0 – 60 volts, 0.5 grade
5	Pulse generator (Oscillator)	5 – 30 volts output at a frequency of 1kHz

Judgment criteria

No.	Switch 1	Switch 2	Switch 3	Voltmeter reading	Lamp condition		Remarks
					Lamp 1	Lamp 2	
1	ON	OFF	OFF	24V	On (dim)	ON	Initial excitation check
2	ON	ON	OFF		On or flashing	OFF	Full excitation check
3	ON	ON	OFF	32V	Off or on (dim)		Lamp 1 off or dimly lit when the voltmeter shows less than 24 volts or 32 volts
4	OFF	ON	OFF	24V	On or flashing	ON	Stator and brush separation check
5	ON	ON	ON	36V	On		Excess voltage check

Reassembly

Important:

- When connecting the stator coil leads and diode leads using solder, use long-nose pliers and work as quickly as possible to prevent the heat from transferring to the diodes.

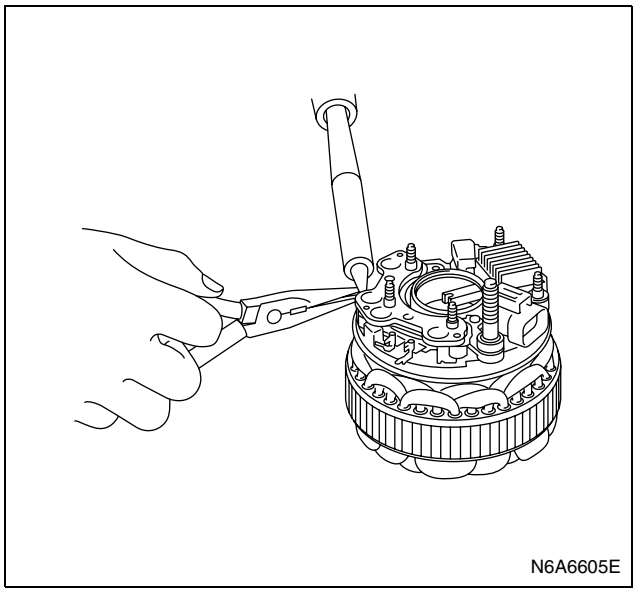
1. Stator.
2. Diode brush regulator assembly.
3. Stator and diode brush regulator assembly.
4. Rear cover.
5. Front cover.
6. Front ball bearing.
7. Bearing retainer.
8. Rotor and rear bearing.
9. Spacer.
10. Fan.
11. Pulley.
12. Pulley nut.

Tighten:
Pulley nut (50A) to 98.0 N·m (10 kg·m/72.3 lb·ft)

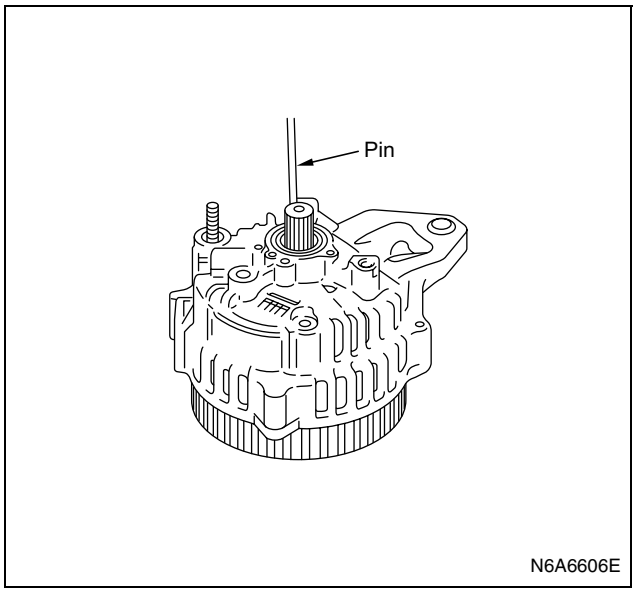
Pulley nut (60A, 80A) to 107.8 N·m (11 kg·m/79.5 lb·ft)

13. Rear cover and stator assembly.
    Use a pair of long-nose plier to connect the stator coil leads and the rectifier leads.

    Finish the work as quickly as possible to prevent the rectifier from heat transferred by the soldering.



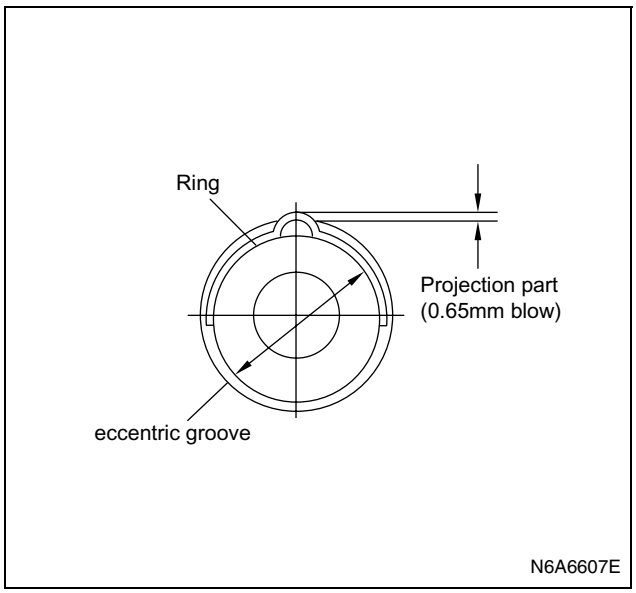
Insert the pin from the outside of the rear cover. Press the brushes into the brush holder. Complete the assembly procedure.



14. Pulley and rotor assembly.
    - Install the pulley and rotor assembly

    The rear ball bearing is pressed into the wheel eccentric groove. The bearing ring projects from the groove.

    During installation, rotate the bearing to the point of minimum bearing ring projection.

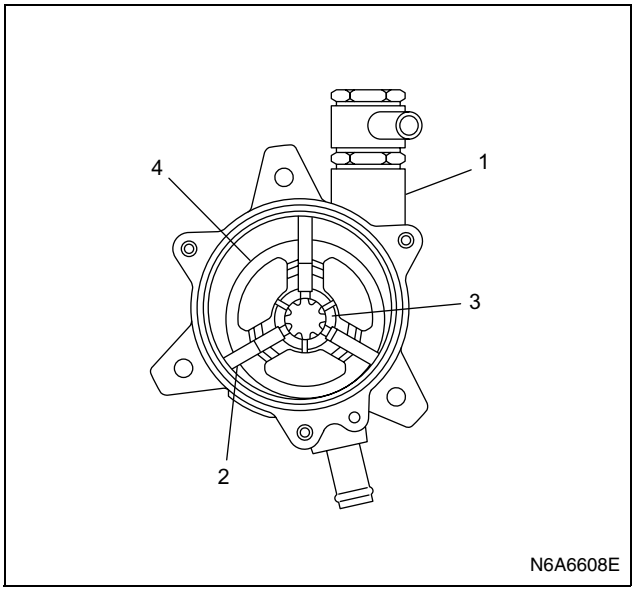


15. Through bolts.
    - Place a guide bar through the holes in the front cover and rear cover flange for proper alignment. Install the through bolts.
    - Remove the tape from the splines.

Tighten:
Through bolts to 4 N·m (0.4 kg·m/35 lb·in)

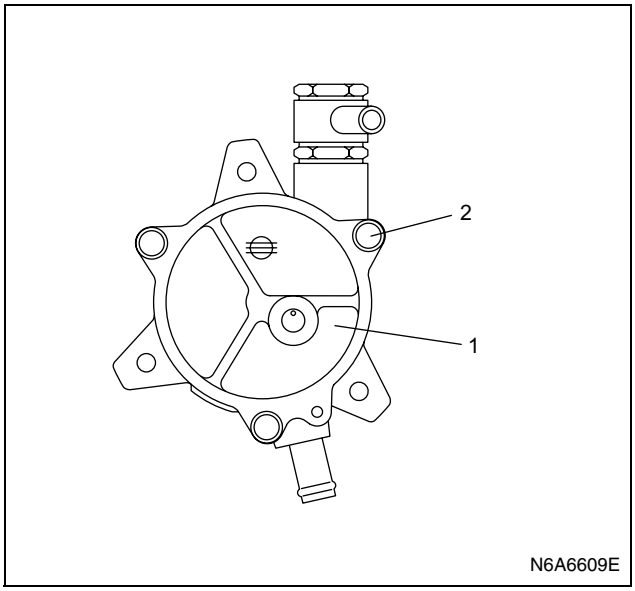
16. Vacuum pump assembly.

- Position the rotor, with the serrated boss turned up, on the housing.



Legend
1. Housing
2. Vane
3. Serrated Boss
4. Pump Rotor

- Align the holes in the housing and rotor.
- Install vanes into the slits in pump rotor.
  The vanes must be installed with the round side turned outward.
- After installation of O-ring, install the side plate.



Legend
1. Side Plate
2. Bolt

- Install the vacuum pump assembly to the back of the generator with 3 screws.

Tighten:
Vacuum pump screws to 7 N·m (0.7 kg·m/61 lb·in)

- Install 5 cc (0.016 oz) engine oil in the filler port, then check that the generator pulley can be turned smoothly by hand.

Installation

1. Generator.

Tighten:
Bracket Mount Bolt to 48 N·m (4.9 kg·m/35.4 lb·ft)

2. Adjusting bolts.

Tighten:
Adjusting Nut to 24 N·m (2.4 kg·m/17 lb·ft)

3. Drive belts.

Tighten:
Lower mount bolt to 40 N·m (4.1 kg·m/30 lb·ft)

4. Vacuum and oil hoses at the vacuum pump.
5. Electrical wiring at the generator.
   - Battery negative cable.
6. Install the A/C compressor. (Refer to “Engine Assembly” in Section 6A.)

Main Data and Specifications

Rated Voltage	24 V
Rated Output	50/60/80 amp
Rated Output at 5000 RPM	More than 42/50/75 amp
Regulated Voltage	28.0 – 29.0 V
Brush Length	
Standard	25 mm (0.984 in)
Limit	6.5 mm (0.256 in)
Slip Ring Diameter	
Standard	31.7 mm (1.248 in)
Limit	30.6 mm (1.205 in)
Generator Pulley Direction (Viewed From Pulley Side) Clockwise Pulley	
Pulley Diameter	82 mm (3.23 in)
Generator Weight (With Vacuum Pump)	50A: 7.4 kg (16.3 lb) 60A: 9.0 kg (19.8 lb) 80A: 9.6 kg (21.2 lb)
Maximum Vacuum Pump Output	90.7 kPa (0.29 kg/cm^2 / 13.2 psi)
Vacuum Pump Vane	
Standard Length	17.0 – 18.0 mm (0.669 – 0.709 in)
Vacuum Pump Housing Inside Diameter	
Standard	69.5 – 69.6 mm (2.736 – 2.740 in)

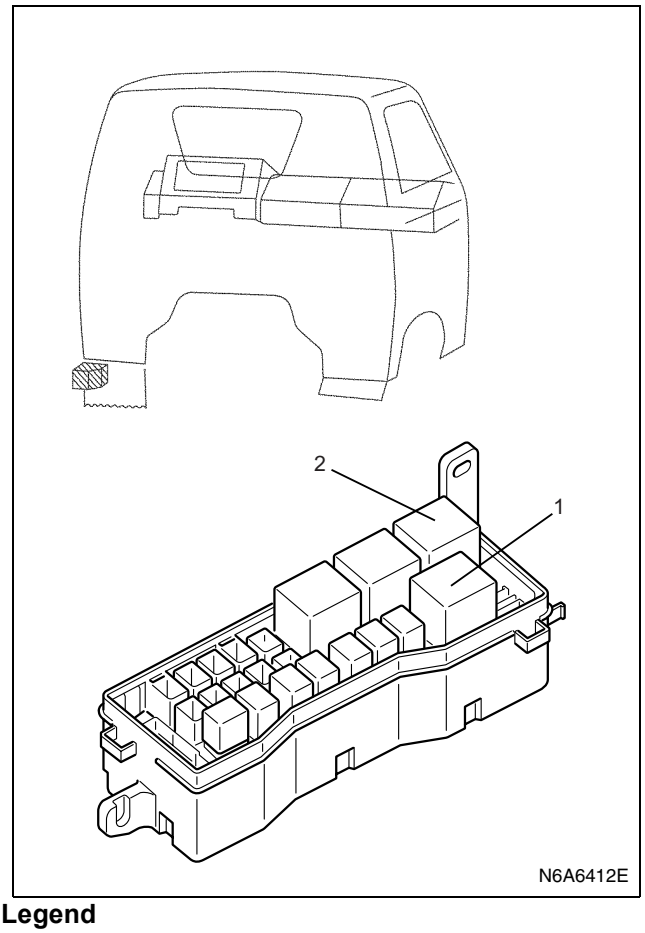
11. To Exhaust Brake Solenoid Valve
12. Starter Relay
13. Starter
14. ECM Main Relay

Starter and Glow Plug Relays

The starter is a 4.5 kilowatt, reduction drive model.
The gear housing and armature end bearing housings are aluminum. The brush assembly has replaceable brushes. The commutator bars are mica insulated and are undercut.
The starter circuit starts at the batteries. The battery cable goes to the large terminal on the starter.
From that terminal wires lead to the engine control switch and the starter relay.
From the engine control switch the starter circuit goes through Fuse #3 and the transmission neutral switch to the starter relay. When the engine control switch is turned to start and the transmission neutral switch is closed, the starter relay closes to complete the circuit from the batteries to the starter solenoid. The starter circuit is also connected to the Engine Control Module (ECM). The Engine Control Module (ECM) operates when the engine control switch is turned to the “ON” position.
The starter and glow plug relays are located on the frame at the left rear side of the cab.



Legend

1. Starter Relay
2. Glow Plug Relay

Maintenance

Keep the starter’s exterior clean. Remove corrosion from the terminals, leads, and connectors.
Tighten the starter to engine mounting bolts and the electrical cable retaining nuts.

Diagnosis of Starting System

1. No Cranking, No Sound
   - Discharged batteries. Turn on the headlights and check the brightness. If the headlights are dim, charge the batteries. Check for the cause of the discharged batteries.
   - Sulfated battery terminals. Turn on the headlights. The headlights will be bright. Attempt to start the engine. The headlights will be very dim or go out. Clean all the battery terminals and cable ends.
   - A starter that draws too much current.
   - Starter relay won’t work. Attempt to start and listen for a “click” at the starter relay. If there is no “click,” check the starter relay control terminals with a test light. If the test light shows that power is getting to the starter relay, check the ground circuit with the test light. If the ground circuit is OK, replace the starter relay.
   - Engine control switch start circuit won’t close.

     With the engine control switch turned to start, check the starter relay with a test light. If the test light doesn’t come on, check the starter circuit at the engine control switch with the test light. If the test light comes on, check the harness for an open and repair. If the test light does not come on, replace the engine control switch.
   - Starter relay power circuit isn’t closing. Attempt to start. The starter relay “clicks.” Check the secondary terminals with a test light. If the test light lights on the battery side only, replace the starter relay. If the test light lights on both terminals, check for an open at the starter.
   - Starter clicks when start is attempted. Check all power connections for corrosion. Clean connections if corrosion is present. Terminal on starter should have at least 18 volts on it when cranking the engine. If voltage is OK, replace the starter.
   - Starter cut relay

     If the problem found, repair the following circuit as necessary.
     - Starter cut relay ground circuit. (Between starter cut relay and ECM.)
     - ECM power supply circuit. (Between fuse 10 A and starter cut relay circuit.)
   - Neutral switch or inhibitor switch

     If the problem found, repair the following circuit as necessary.
     - Neutral switch or inhibitor switch ground circuit. (Between Frame-LH and neutral switch.)
     - Starter relay power supply circuit. (Between fuse 10 A and starter relay.)
     - Starter relay ground circuit. (Between starter cut relay and diode.)
2. Slow Cranking, Solenoid Clicks or Chatters

- Discharged batteries. Turn on the headlights and check the brightness. If the headlights are dim, charge the batteries. Check for cause of discharged batteries.
- Corrosion on the battery terminals. Check for corrosion. Hint: Test for warm terminals. Clean all the battery terminals and connectors.
- Loose or dirty connections. Measure the cranking voltage at the battery terminals. If the voltage is less than 18 volts, load test the battery. If the battery is bad, replace the battery. If the battery is good, repair the starter.

If the voltage is 18 volts or more, measure the voltage from the battery NEGATIVE terminal to the engine block. If the voltage is 0.5 volt or more, repair the ground cable and connections.
If the voltage is less than 0.5 volt, measure the voltage at the battery cable terminal on the starter. If the voltage is 18 volts or more, repair the starter. If the voltage is less than 18 volts, clean and tighten the positive cable connections. If the voltage is still less than 18 volts, replace the positive cable.

On-vehicle Service: Starter System

Maintenance

Keep starter terminals and all other terminals in the electrical system clean and tight. A loose or corroded connection or terminal will cause excessive resistance in the system that will result in hard starting.
At regular intervals, inspect the starting system to locate and correct potential causes of trouble before the system performance is affected.
Starting motors do not require lubrication except during overhaul.

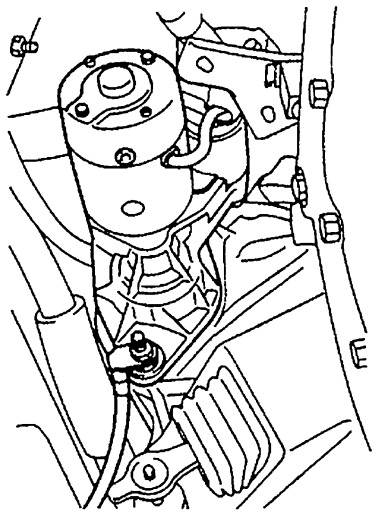
Removal

Preparation

- Disconnect the battery ground cable (both batteries).

1. Starter Earth Cable

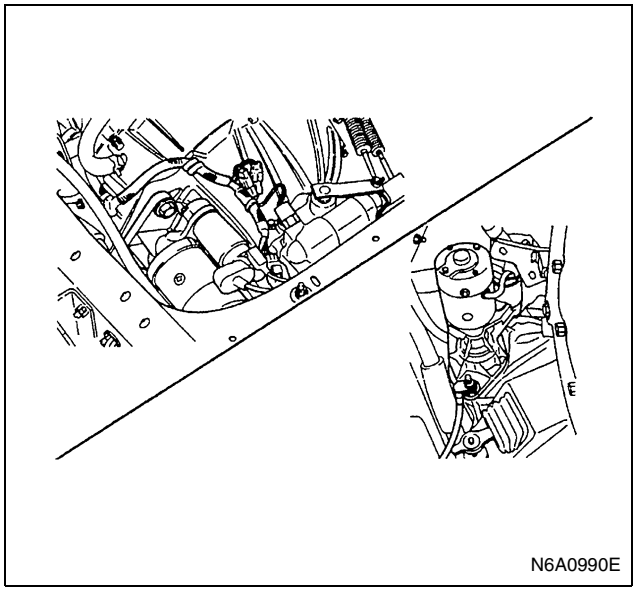


N6A0989E

- Disconnect the starter earth cable at the starter motor.

- Disconnect the front frame harness connector somewhere near the control box of the transmission, remove each clip that fastens the harness.

2. Starter Assembly

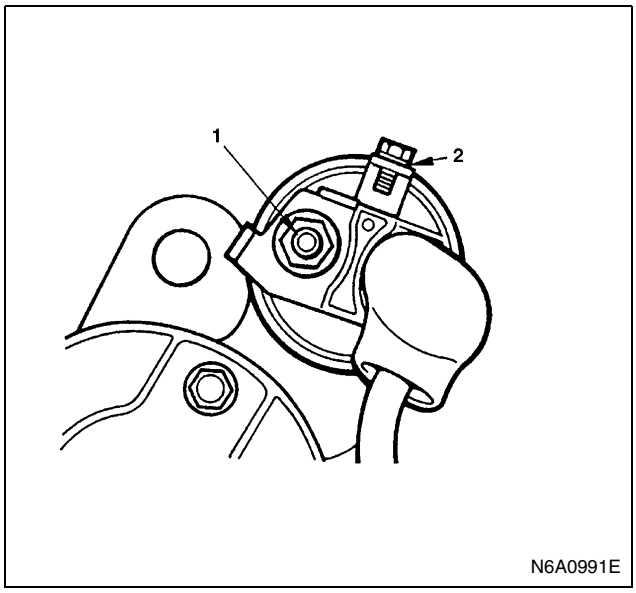


- Remove the starter assembly from flywheel housing.

3. Starter Wiring Connector

Installation

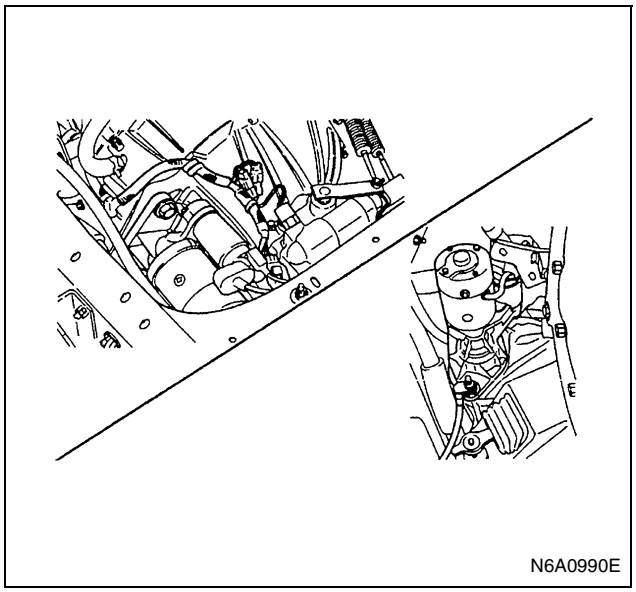
1. Starter Wiring Connector



Legend

1. Terminal B
2. Terminal S

2. Starter Assembly



- Install the starter to the flywheel housing.

Tighten:
Starter bolt to 76 N·m (7.7 kg·m / 56.1 lb·ft)

3. Starter Earth Cable
   - Connect the earth cable to the starter motor.
   - Connect the battery ground cable.

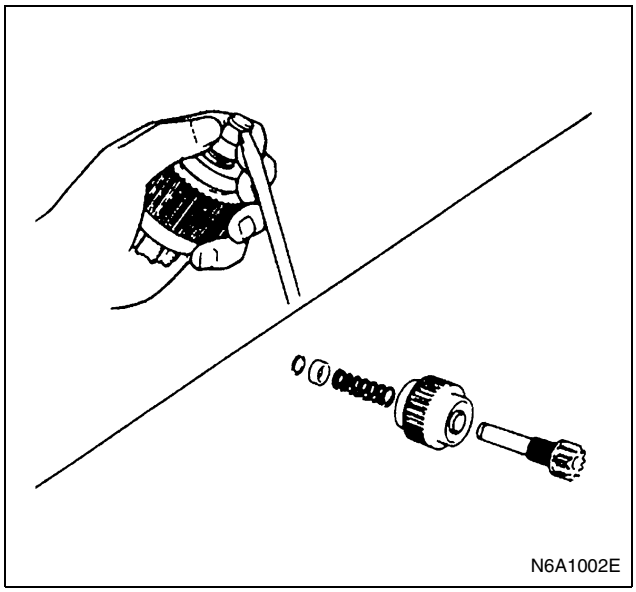
Use a screwdriver to remove the stopper clip. Then disassemble the clutch assembly.



N6A1002E

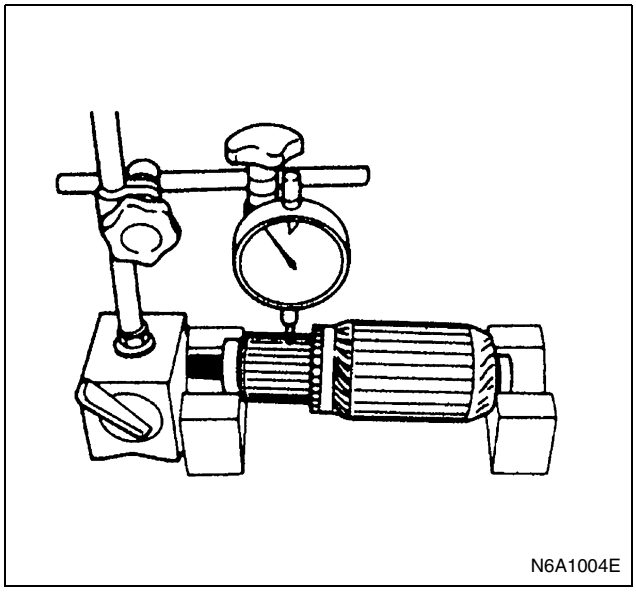
Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Armature

1. Measure the commutator run-out.
   Replace the commutator if the measured run-out exceeds the specified limit.

Commutator Run-Out	mm (in)
Standard	Limit
0.05 (0.002) or less	0.2 (0.008)



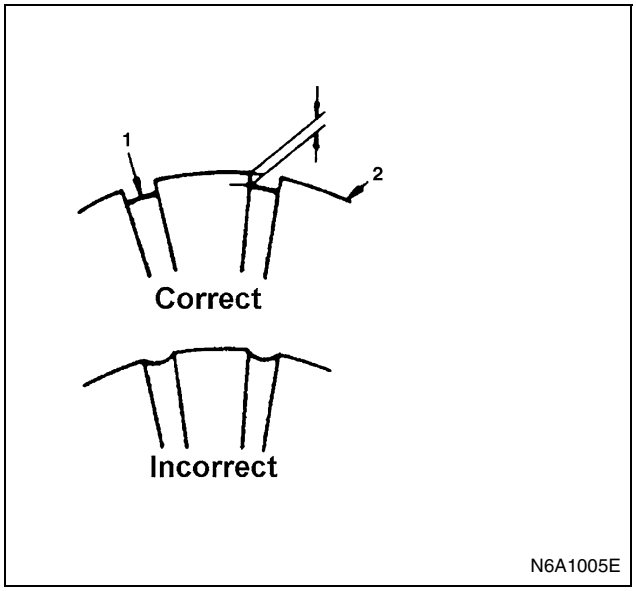
N6A1004E

2. Check the commutator mica segments for excessive wear.
3. Measure the mica segment depth.

Mica Segment Depth	mm (in)
Standard	Limit
0.5 — 0.8 (0.020 — 0.031)	0.2 (0.008)

If the mica segment depth is less than the standard but more than the limit, the commutator may be reground.

If the mica segment depth is less than the limit, the commutator must be replaced.

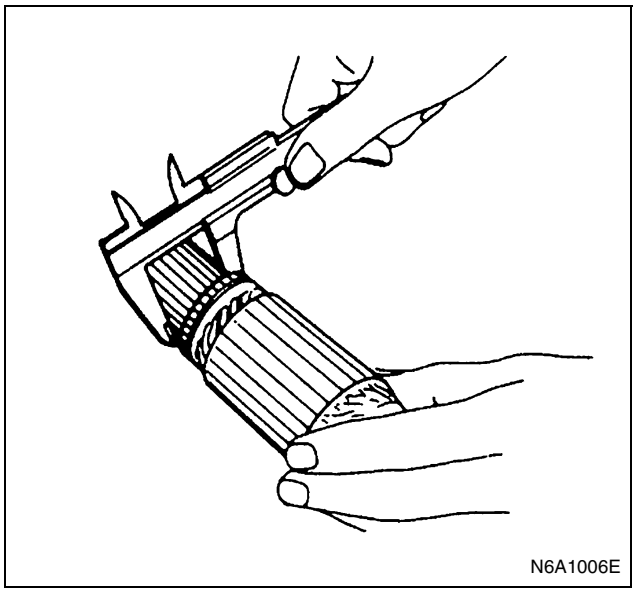


N6A1005E

Legend

1. Insulator
2. Commutator Segments

4. Measure the commutator outside diameter.

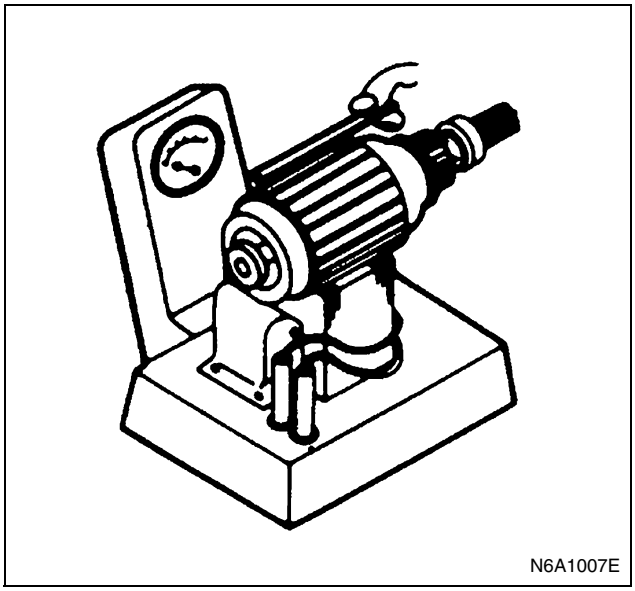


N6A1006E

Commutator Outside Diameter			mm (in)
Model	Yoke Diameter	Standard	Limit
S25-505G	ϕ90	36.5 (1.437)	35.5 (1.398)

If the measured outside diameter is less than the specified limit, the commutator must be replaced.

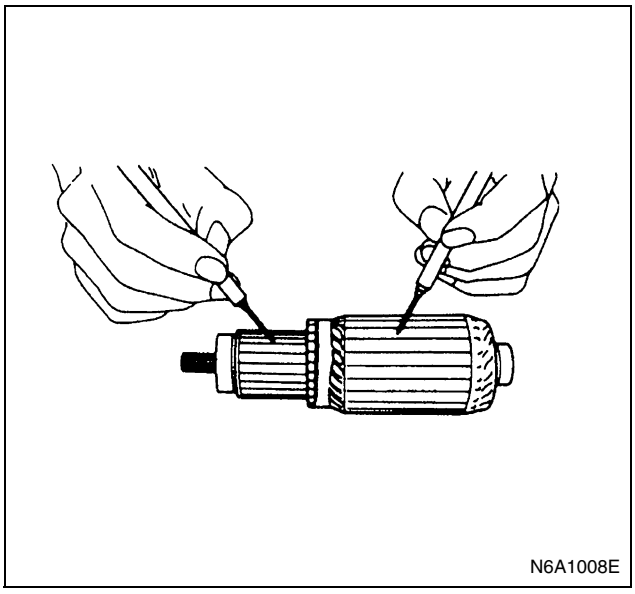
5. Test the armature for short circuiting.



N6A1007E

1) Place the armature in a growler tester.
2) Hold a hacksaw blade against the armature core.
   If the armature has a short circuit, the hacksaw blade will vibrate.
   Replace the armature if there is a short circuit.

6. Use a circuit tester to check the armature for grounding.



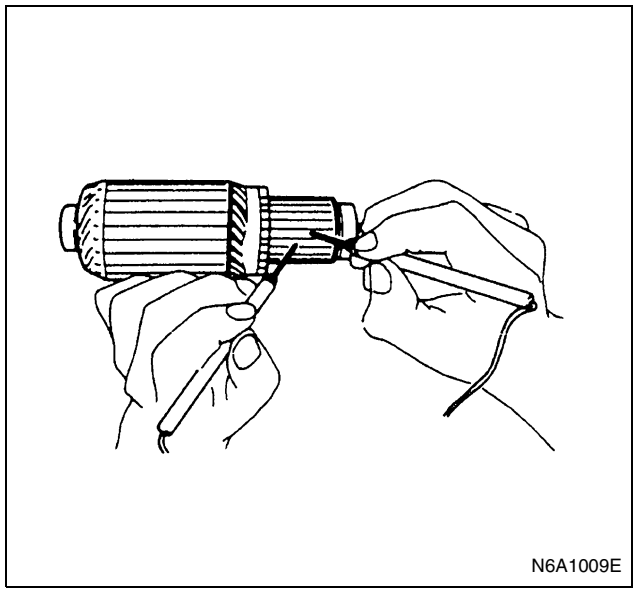
N6A1008E

1) Hold one probe of the circuit tester against the commutator segment.
2) Hold the other circuit tester probe against the armature core.

If the circuit tester indicates continuity, the armature is grounded.

The armature must be replaced.

7. Use the circuit tester to check the armature for continuity.



N6A1009E

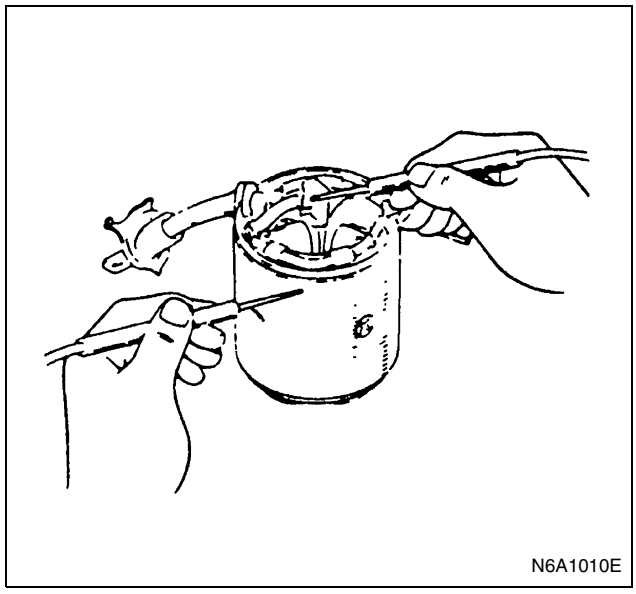
1) Hold the circuit tester probes against two armature core segments.
2) Repeat Step 1 at different segments of the armature core.

There should be continuity between all segments of the armature core.

If there is not, the armature must be replaced.

Yoke

1. Use a circuit tester to check the field winding ground.



N6A1010E

1) Hold one circuit tester probe against the field winding end or brush.

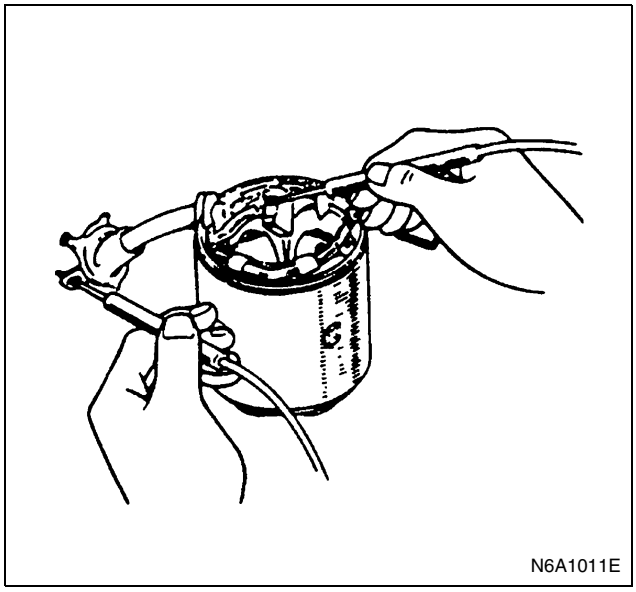
2) Hold the other circuit tester probe against the bare surface of the yoke body.

There should be no continuity.

If there is continuity, the field coil is grounded.

The yoke must be replaced.

2. Use the circuit tester to check the field winding continuity.



N6A1011E

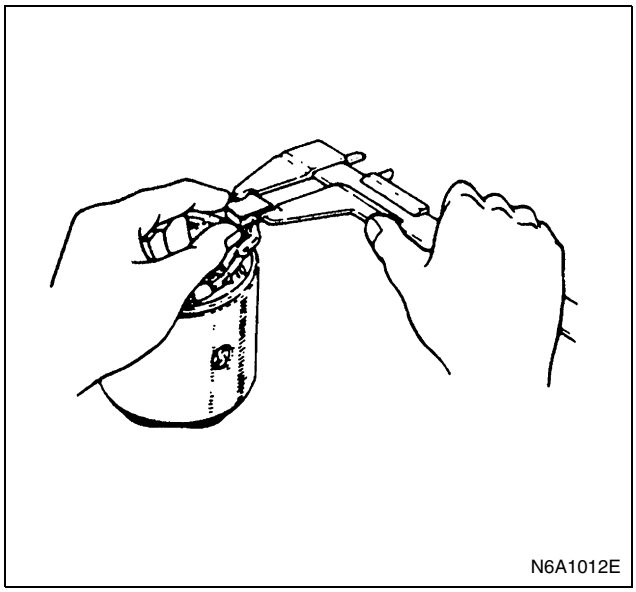
1) Hold one circuit tester probe against the “C” terminal lead wire.
2) Hold the other circuit tester probe against the field winding brush.

There should be continuity.

If there is no continuity, the yoke must be replaced.

Brush and Brush Holder

1. Use a vernier caliper to measure the brush length (four brushes).

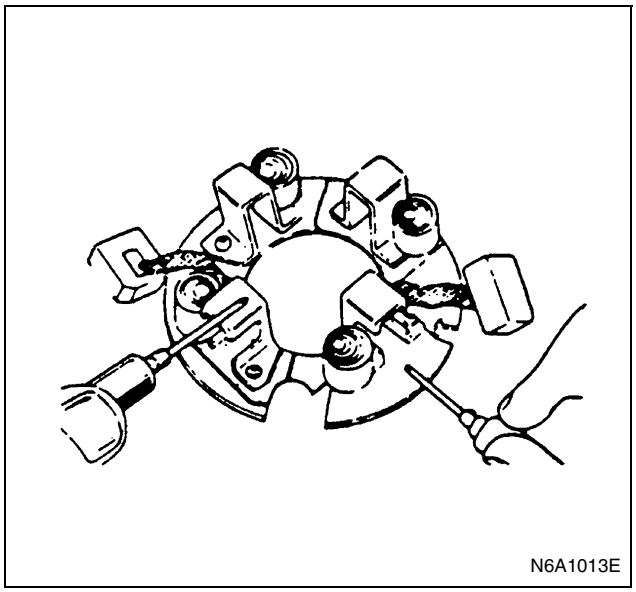


N6A1012E

Replace the brushes as a set if one or more of the brush length is less than the specified limit.

Brush Length			mm (in)
Model	Yoke Diameter	Standard	Limit
S25-505G	ϕ90	15.0 (0.591)	10.5 (0.413)

2. Use a circuit tester to check the brush holder insulation.



N6A1013E

Touch one probe to the holder plate and the other probe to the positive brush holder.

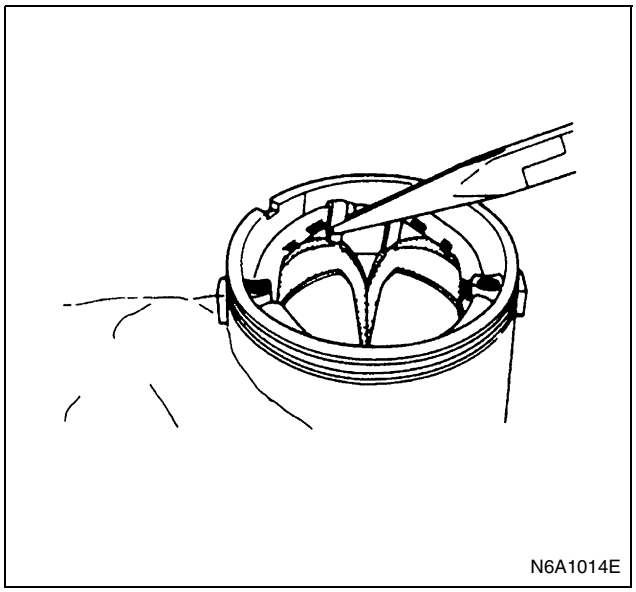
There should be no continuity.

3. Inspect the brushes for excessive wear.

If the negative brushes have excessive wear, the entire brush holder assembly must be replaced.

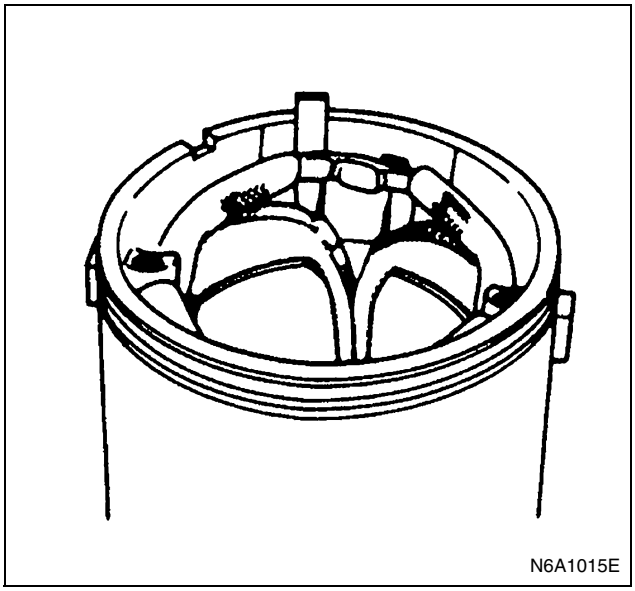
If the positive brushes have excessive wear, only the brushes must be replaced.

1) Use a pair of side cutters to cut the lead wire from the brush.



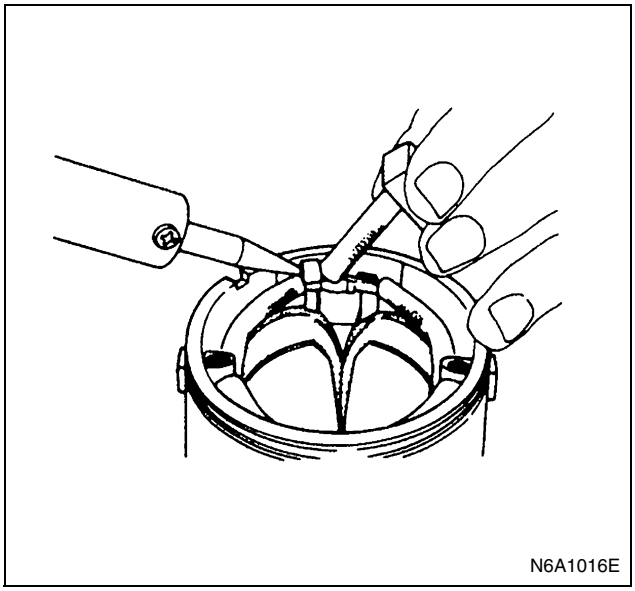
N6A1014E

2) File away any foreign material clinging to the edge of the lead wire.
3) Remove the brushes from the brush holder.
4) Install the new brushes.
5) Straighten the bent portion of the clip.



N6A1015E

6) File away any foreign material clinging to the clip surface.
7) Place the lead wire in the clip.
8) Bend the clip shut.
9) Solder the brush lead.

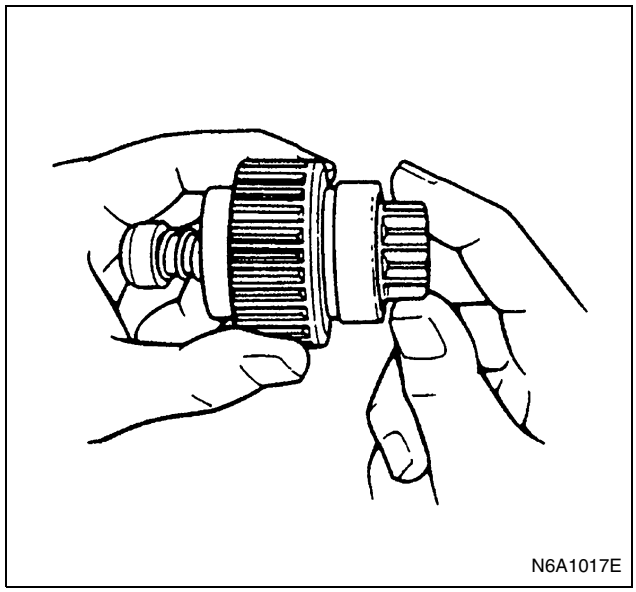


N6A1016E

10) Repeat the procedure for each of the brushes.

Overrunning Clutch

1. Inspect the overrunning clutch gear teeth for excessive wear and damage.
   Replace the overrunning clutch if necessary.
2. Rotate the pinion clockwise.

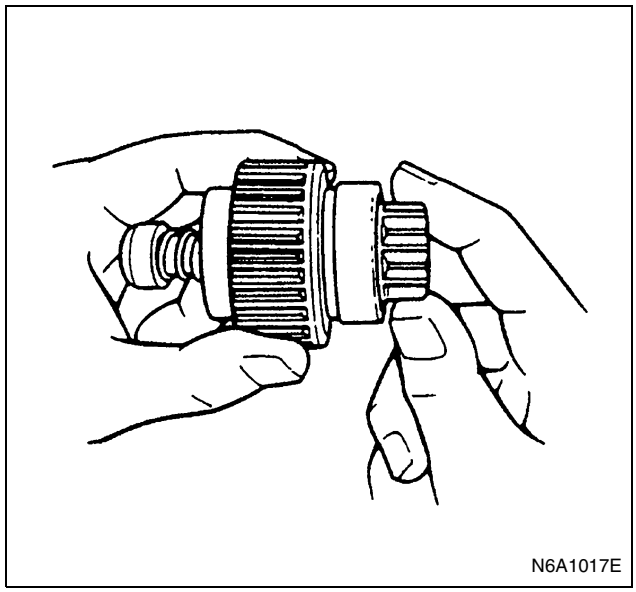


N6A1017E

   It should turn smoothly.
3. Try to rotate the pinion in the opposite direction. The pinion should lock.

Ball Bearing

Inspect the bearings for excessive wear and damage. Replace the bearings if necessary.



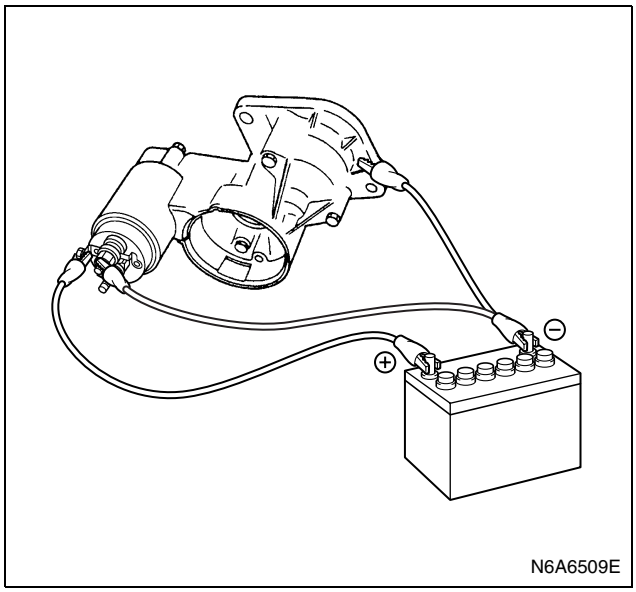
N6A1017E

Magnetic Switch

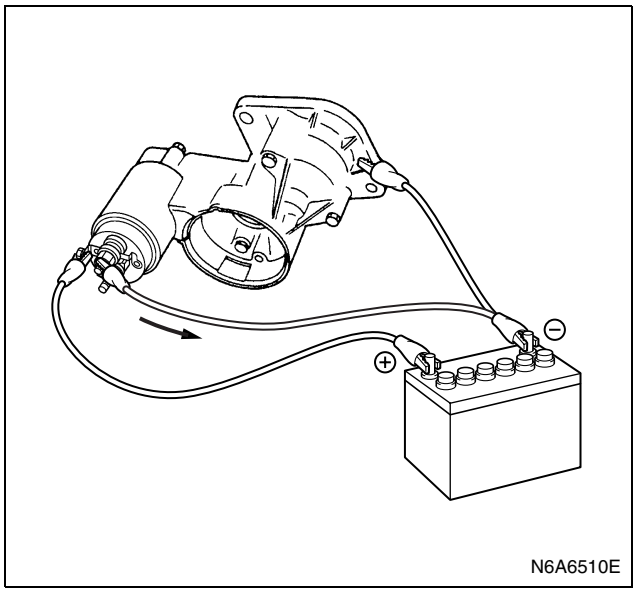
The following tests must be performed with the starter motor fully assembled.
The yoke lead wire must be disconnected from the “C” terminal.
To prevent coil burning, complete each test as quickly as possible (within three to five seconds).
Temporarily connect the magnetic switch between the clutch and the housing and run the following test.
Complete each test within three to five seconds.

1. Pull-Out Test
   Connect the battery negative terminal with the magnetic switch body and the C terminal. When

current is applied to the 50 terminal from the battery positive terminal, the pinion should flutter.



2. Hold-in Maintenance Test
   Disconnect the lead at the C terminal. The pinion should continue to flutter.



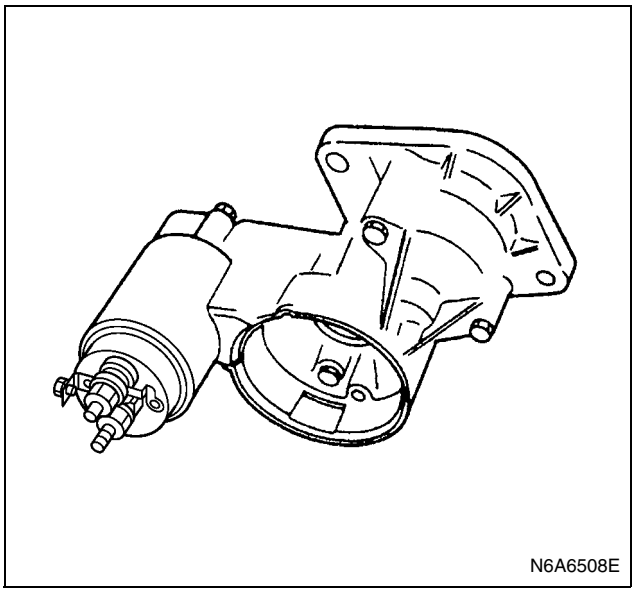
3. Return Test
   Connect the battery negative leads to the starter body and the 50 terminal.

   Connect the battery positive lead at the C terminal. The pinion should return to its home position.

Reassembly

1. Gear Case
2. Magnetic Switch Assembly
3. Torsion Spring
4. Shift Lever
   1) Attach the torsion spring to the hole in the magnetic switch as illustrated.

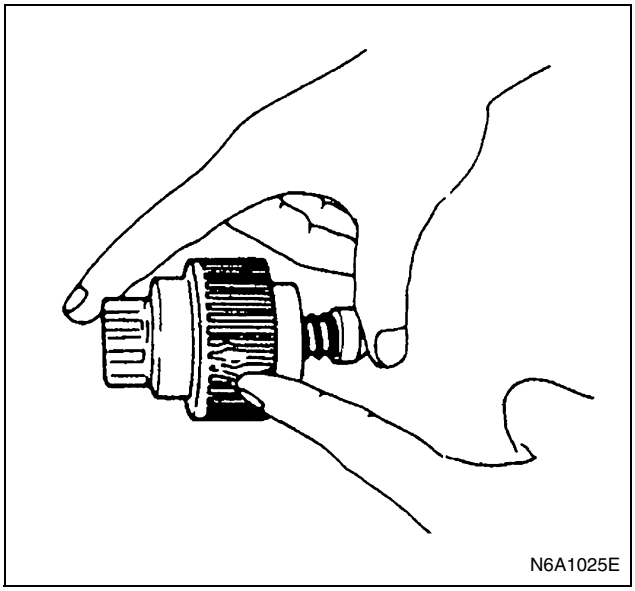
   2) Insert the shift lever into the plunger hole of the magnetic switch.
5. Dust Cover
   Install the dust cover.
6. Bolt
   Install the magnetic switch assembly in the gear case and tighten the bolt to the specified torque.



N6A6508E

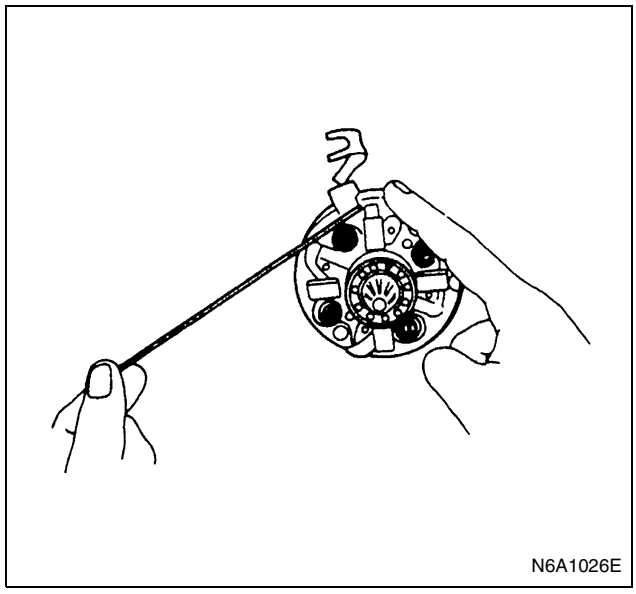
Tighten:
Gear case bolt to 8 N·m (0.8 kg·m / 69 lb·in)

7. Pinion Clutch
8. Pinion Shaft
   Apply a coat of grease to the pinion clutch gear and install the pinion assembly to the armature shaft.



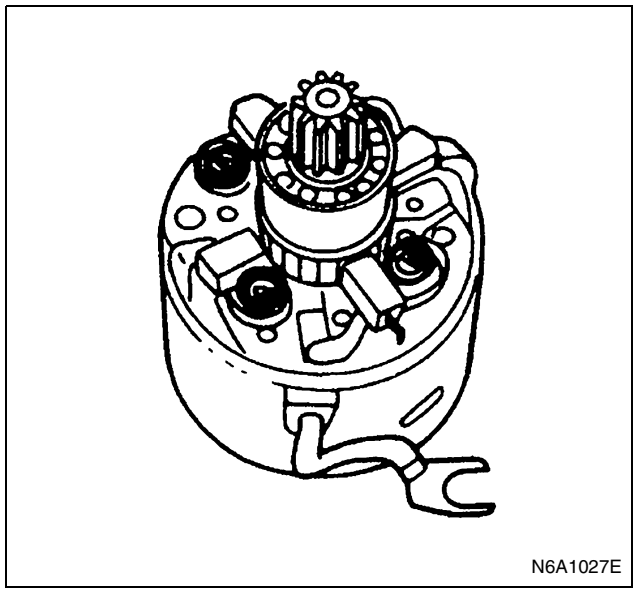
N6A1025E

9. Return Spring
10. Pinion Stopper
11. Pinion Stopper Clip
12. Ball Bearing
13. Bearing Holder
14. Clutch Assembly
15. Bearing Retainer
16. Armature
17. Yoke
18. Brush Holder



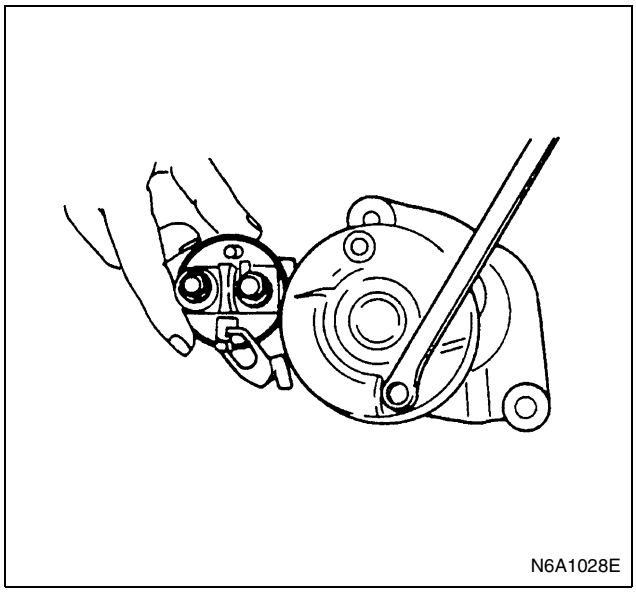
N6A1026E

1) Twist the holder spring and hold it.
2) Install the brush to the brush holder.
3) Repeat step 1 and 2 for the reaming holders.
4) Install the brush holder assembly to the yoke.



N6A1027E

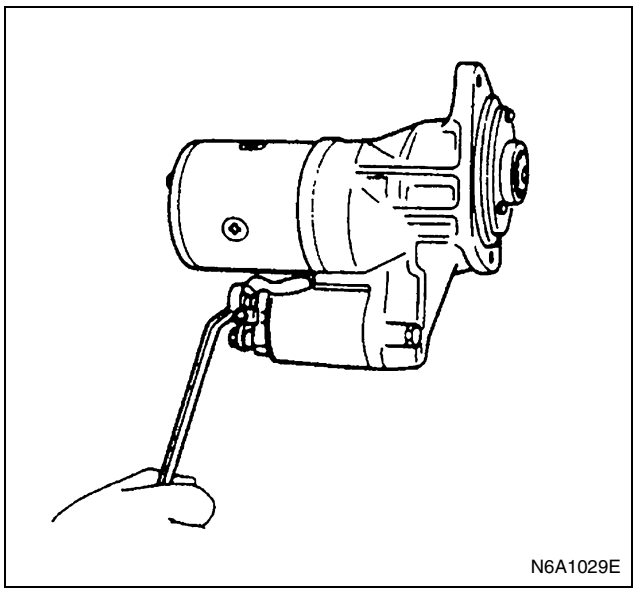
   Take care not to damage the commutator face and the brushes.
19. Rear Cover
20. Through Bolt
    Install the through bolts in the rear cover and tighten them to the specified torque.



N6A1028E

Tighten:
Through bolt to 6 N·m (0.6 kg·m / 52 lb·in)

21. Lead Wire Nut
    Connect the lead wire in the magnetic switch and tighten the terminal nut to the specified torque.

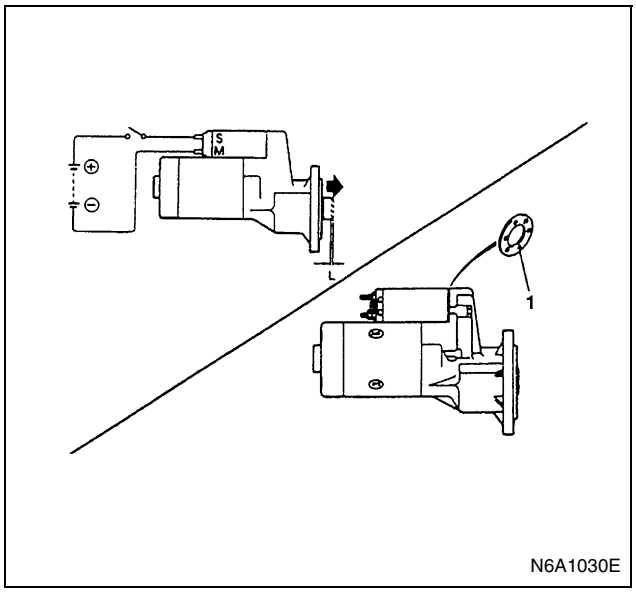


N6A1029E

Tighten:
Lead wire terminal nut to 10 N·m (1.0 kg·m / 87 lb·in)

Pinion Jump-out dimension

- Connect the (+) cable of battery to terminal S and the (−) cable to terminal M. Turn the switch on, and measure pinion travel dimension “L” in thrust direction from the jump-out position.



N6A1030E

Legend
1. Spacer

In measuring the dimension, pull the pinion out a little in the arrow direction.

	mm (in)
Dimension	Standard
L	0.3 — 0.1 (0.01 — 0.004)

If the measured value is out of standard, adjust the of shims.

Preheating System

Glow Plug Replacement

Circuit Diagram

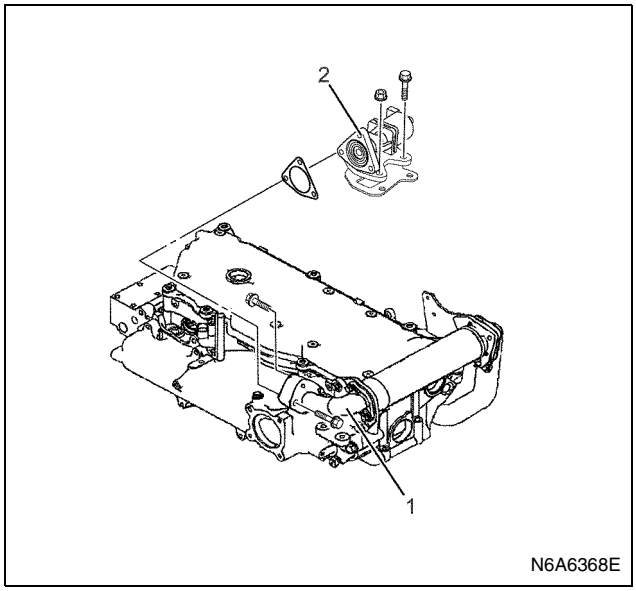
11. To Exhaust Brake Solenoid Valve
12. Starter Relay
13. Starter
14. ECM Main Relay

Precautions during maintenance

Adequate care should be taken as over-tightening the glow plug could lead to damage.

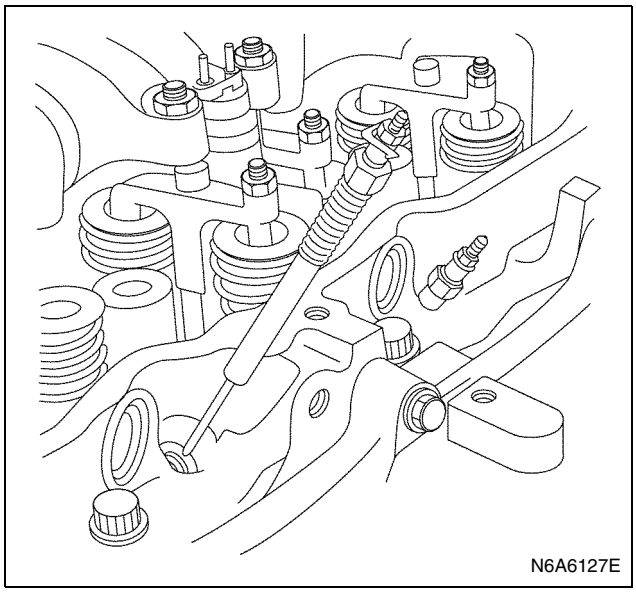
Removal

1. Remove the engine harness, the throttle position sensor, the EGR valve, the pressure sensor, and all of the fuel injector connectors.
2. Remove the EGR valve and the EGR adapter.
3. Tape the EGR case holes shut to prevent the entry of foreign material.



Legend
1. EGR Adapter
2. EGR Valve

4. Remove the glow connector.
5. Remove the glow plug.



Installation

1. Install the glow plug.

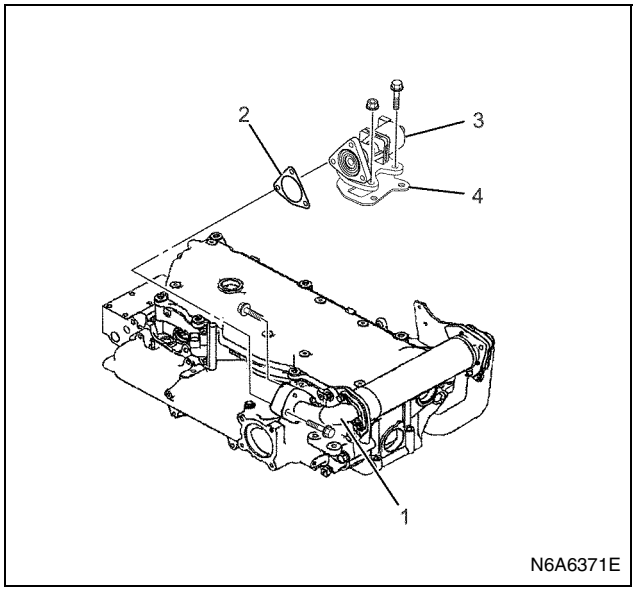
Tighten:
Glow plug to 20 N·m (2.0 kg·m/15 lb·ft)

2. Install and tighten the glow connector with the designated torque.

Tighten:
Glow connector to 12 N·m (1.2 kg·m/10 lb·ft)

3. Install the EGR valve and the EGR adapter.

Tighten:
EGR valve and adapter to 24 N·m (2.4 kg·m/17 lb·ft)



Legend
1. EGR Adapter
2. EGR Valve Gasket
3. EGR Valve
4. EGR Valve Gasket

4. Attach the engine harness connectors. Each composite connector should make a loud click when it is securely attached.

Service Precautions

Adequate care should be taken as over-tightening the glow plug could lead to damage.

Explanations on Functions and Operation

The preheating system consists the ECM, the glow relay, glow plugs and the glow indicator lamp. The preheating system is operated when the engine coolant temperature is low, and make the engine easy to start.

Functional check

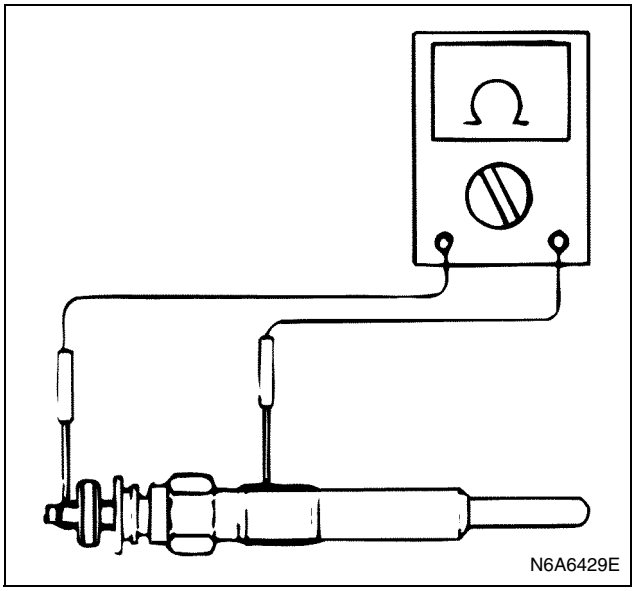
Refer to Section 6E (Glow Control System Check). Except the glow plug.

Glow plug check

- Use the circuit tester and measure the resistance of the glow plug.
- If the measured value deviates from the specified value, then replace the glow plug.

  Resistance value of glow plug is approximately less than 6Ω.

Caution:
Use a set of four glow plugs from the same manufacturer.



A List of Defective Phenomena

- The glow indicator lamp does not light up.
- Preheating does not work.
- The preheating time is too long or too short.

Trouble Shooting

1. The glow indicator lamp does not light up.

Condition	Possible Cause	Correction
The glow indicator lamp does not light up.	Slow blow fuse has blown.	Replace the slow blow fuse.
	Fuse is unavailable.	Replace the fuse.
	Indicator valve is burnt out.	Replace the indicator valve.
	Engine control system is faulty.	Refer to Section 6E.

2. Preheating does not work.

Condition	Possible Cause	Correction
Preheating does not work.	Slow blow fuse has blown.	Replace the slow blow fuse.
	Defective or faulty glow plug relay connector contact.	Re-mount or replace the glow plug relay.
	Engine control system is faulty.	Refer to Section 6E.

3. Preheating time is too long or too short.

Condition	Possible Cause	Correction
The Preheating time is too long or too short.	Thermosensor fault and break in circuit or short circuit.	Replace the thermosensor. Repair the circuit.
	Fault in glow plug.	Replace or tighten the glow plug.
	Engine control system is faulty.	Refer to Section 6E.

EGR System

Service Precautions

Perform EGR related assembly according to the usual procedure of temporarily fitting and then permanently tightening the parts so that unnecessary stresses are not applied on the parts.

Explanations on Functions and Operation

The EGR system recirculates a part of exhaust gas back into the intake manifold, which results in reducing nitrogen oxide (NOx) emissions. The EGR control system uses an electronic control system to ensure both driveability and low emission. The control current from the engine control module (ECM) operates the motor to control the lift amount of EGR valve. Also, an EGR position sensor is provided at the rear of the motor to feed actual valve lift amount back to the ECM for more precision control of the EGR amount.

The EGR control starts when the conditions for engine speed, engine coolant temperature and barometric pressure are satisfied. Then, the valve opening is calculated according to the engine speed, and target fuel injection quantity. Based on this valve opening, the drive duty of the motor is determined and the motor is driven accordingly.

A potentiometer type EGR valve position sensor is employed and installed on the EGR valve body. The EGR valve position sensor is supplied with reference voltage (5V) and ground at all times from the ECM. The ECM reads the EGR position sensor voltage input and determines the EGR lift position.

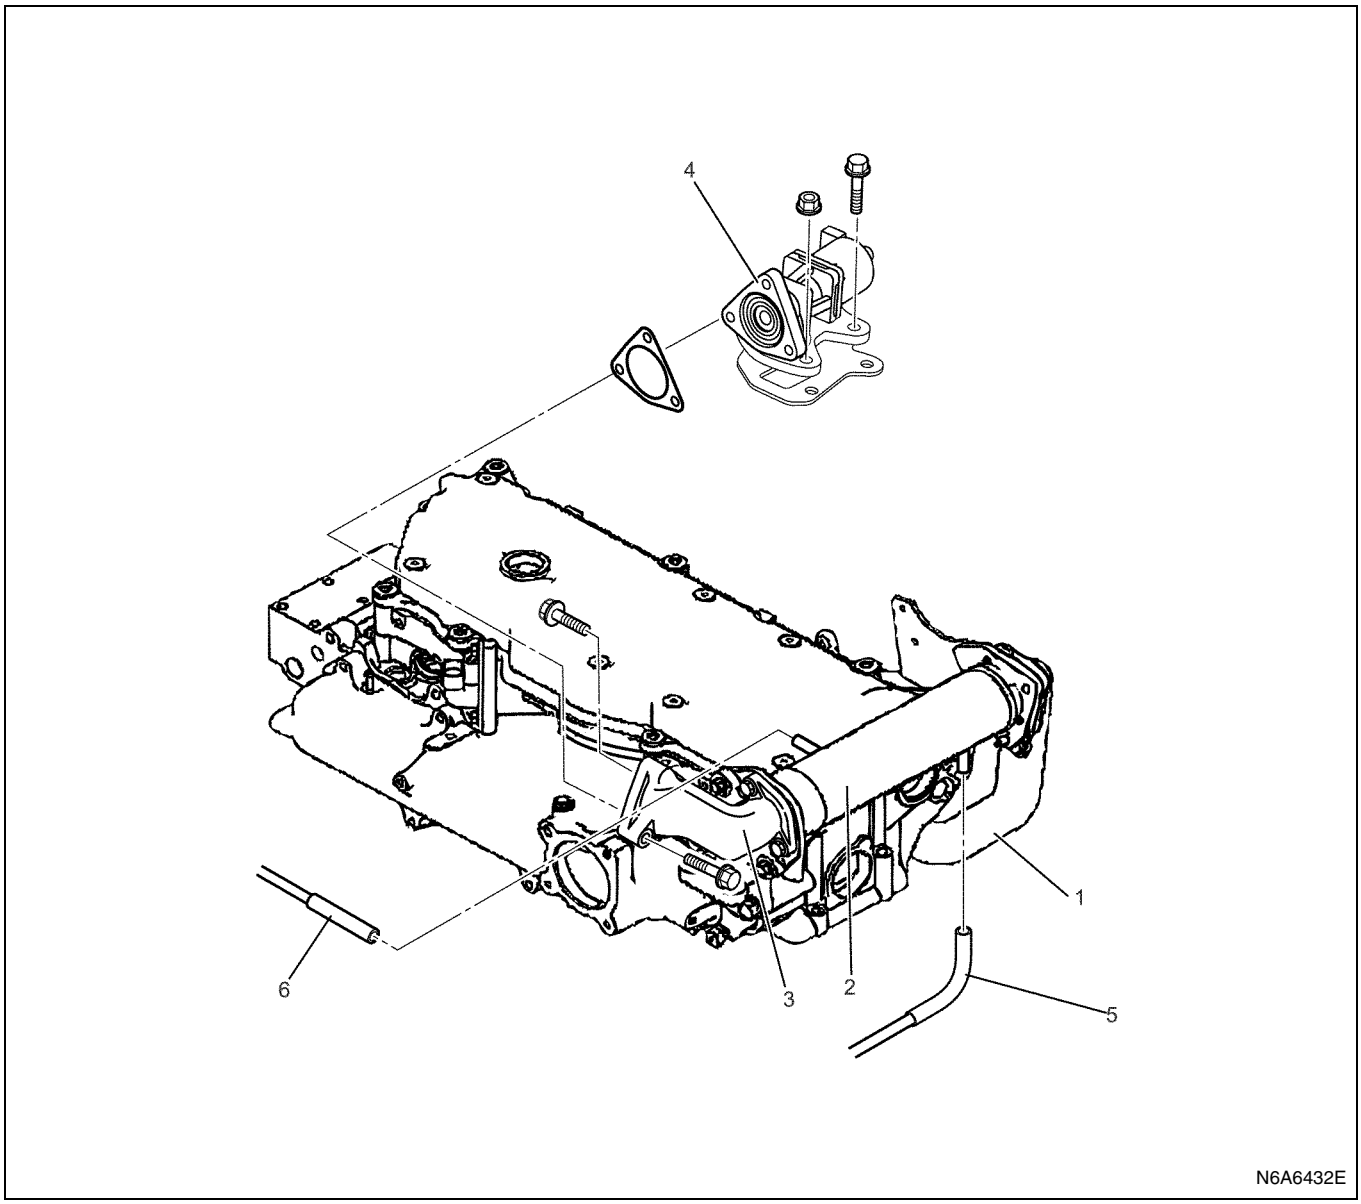
3. EGR Valve

EGR Valve and EGR Cooler

Components



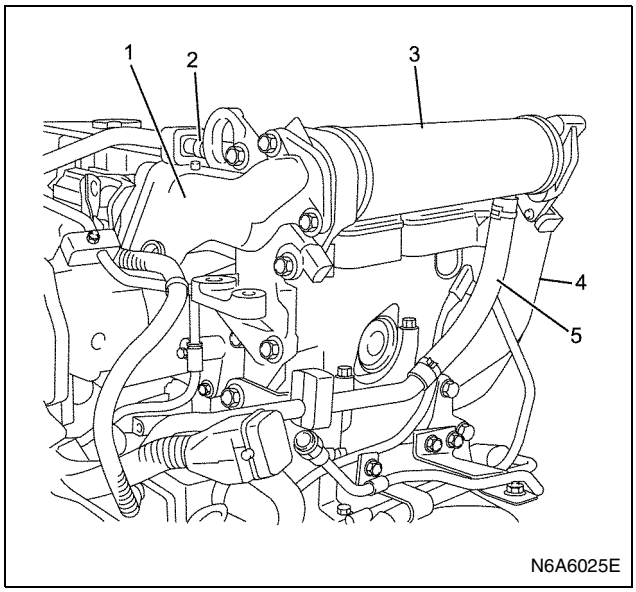
Legend

1. EGR Pipe
2. EGR Cooler
3. EGR Adapter
4. EGR Valve
5. Cooling Water Pipe (IN)
6. Cooling Water Pipe (OUT)

Removal

1. Drain engine coolant. Refer to Engine Cooling System section.
2. Remove the EGR valve connector.

3. Remove the EGR pipe.

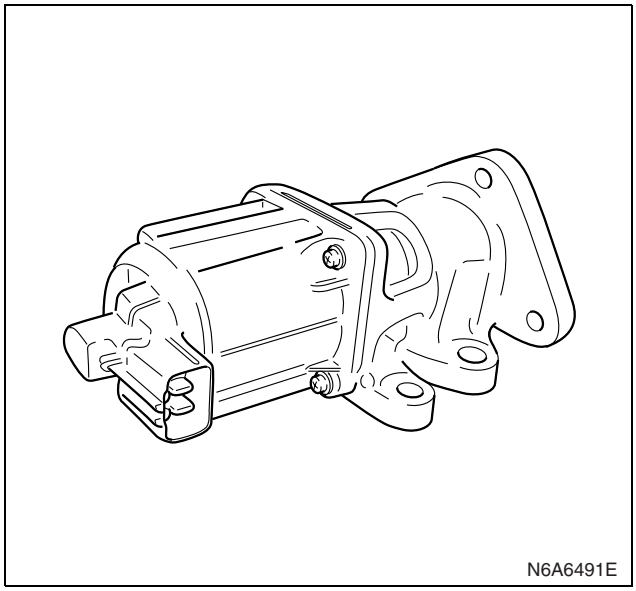


Legend

1. EGR Adapter
2. Water Return Pipe
3. EGR Cooler
4. EGR Pipe
5. Water Feed Pipe

4. Remove the cooling water pipes.
5. Remove the EGR adapter.
6. Remove the EGR cooler.
7. Remove the EGR valve.

Caution:
After removing the EGR valve and EGR adapter, seal the opening so that foreign matter does not enter.



Inspection

- **Gas leak check**
  - Check for gas leak in various parts of the EGR gas line.
    If the results of the check show abnormalities, repair or replace the defective parts.
- **EGR valve check**

Installation

1. Mount the EGR valve.
   - Insert the gasket and temporarily fit the EGR valve.

Notice:
Temporarily tighten the bolts.

2. Install the EGR cooler.
   - Temporarily fit the EGR cooler to the bracket.

Notice:
Temporarily tighten the bolts.

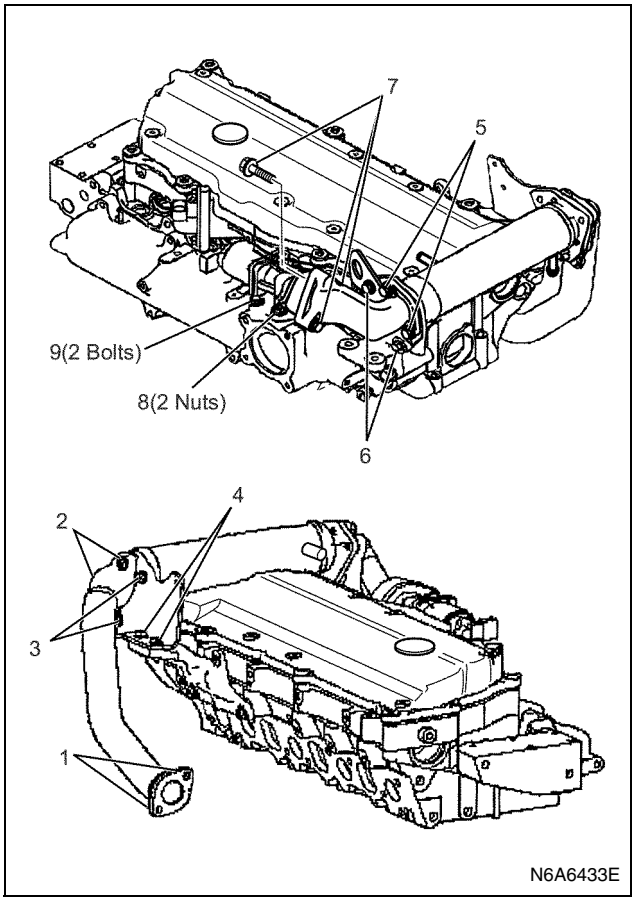
3. Install the EGR adapter.
   - Temporarily fit the EGR adapter between the EGR cooler and exhaust manifold.

Notice:
Temporarily tighten the bolts.

4. Install the EGR pipe.
   - Insert the gasket between the two ends of the EGR pipe and temporarily fit it.

Notice:
Temporarily tighten the bolts.

During temporary assembly, tighten the nuts and bolts to the specified torque in the order shown in the illustration.



Tighten:

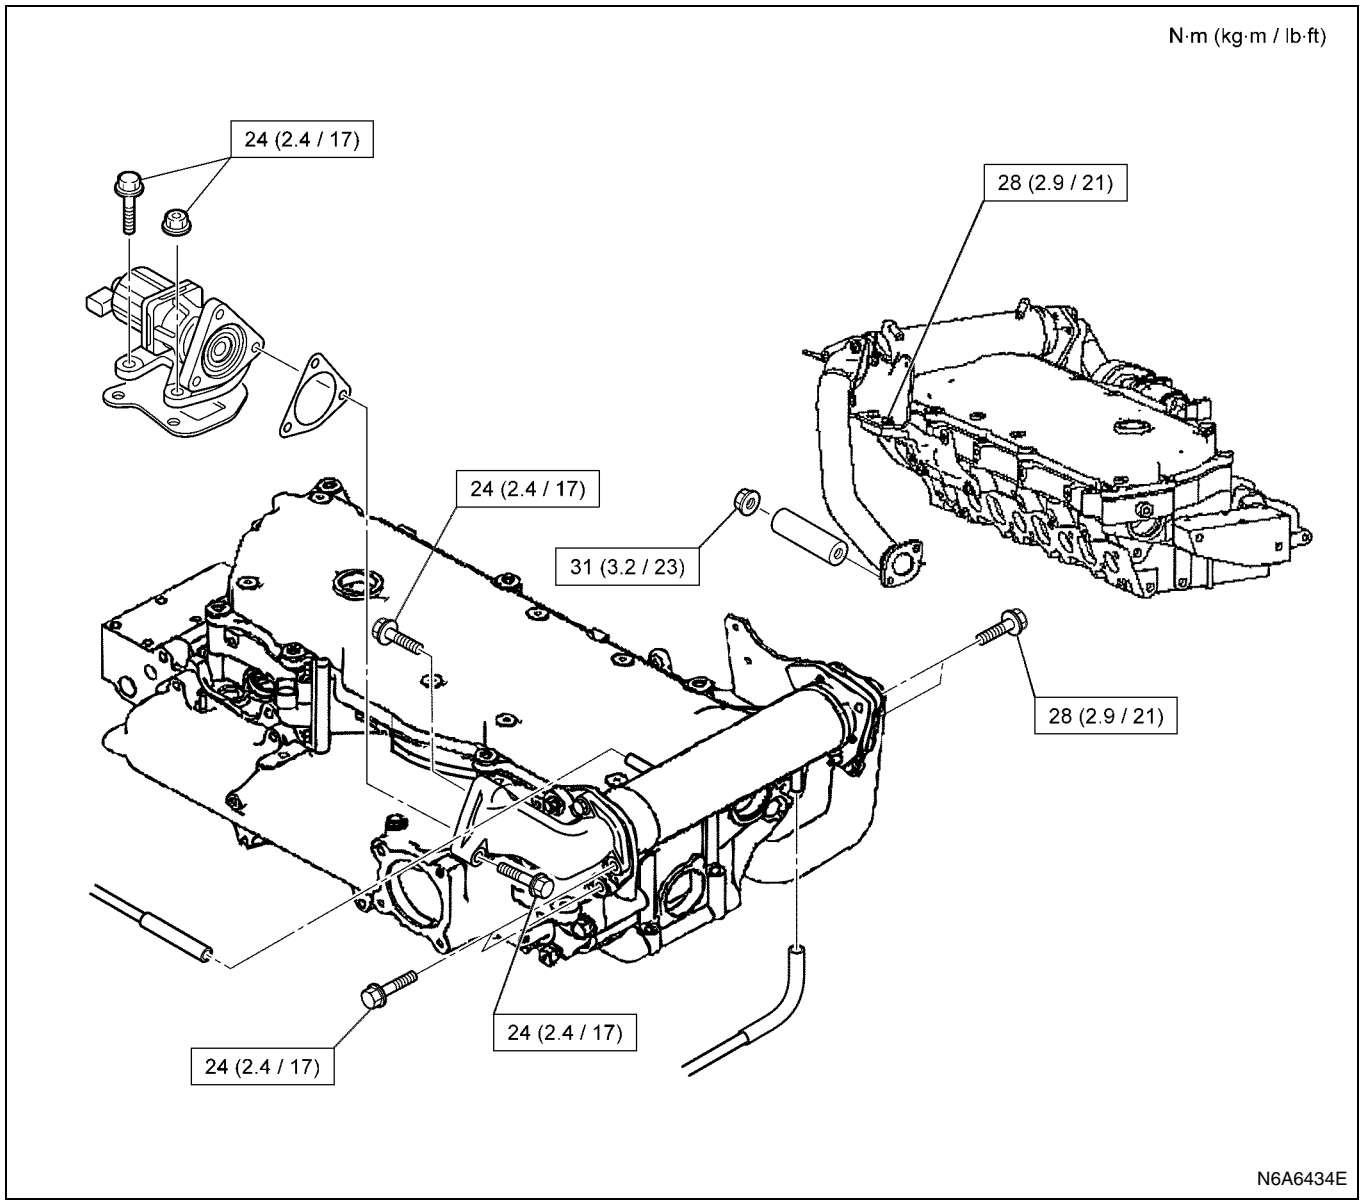
Bolts and nuts to

(1): 31 N·m (3.2 kg·m/23 lb·ft)

(2), (4): 28 N·m (2.9 kg·m/21 lb·ft)

(3), (5), (6), (7), (8), (9): 24 N·m (2.4 kg·m/17 lb·ft)

Torque Specifications



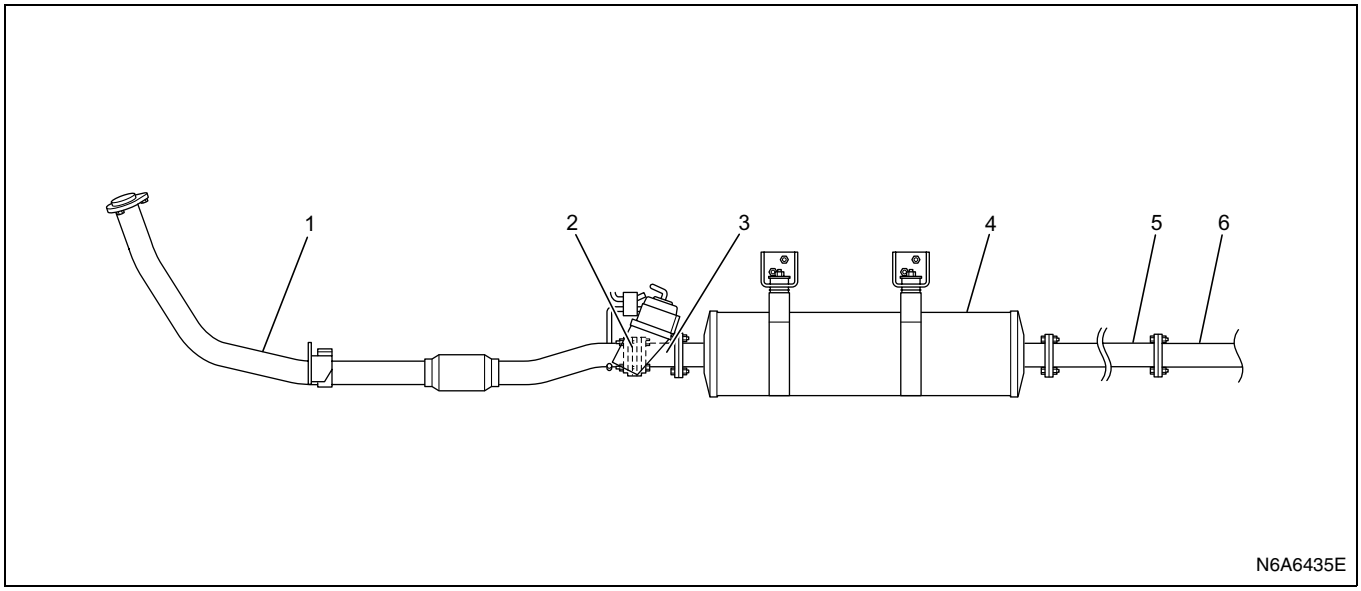
Exhaust System

Service Precautions

Offset in position of the exhaust system during assembly may sometimes cause vibrations or rattling noise. Therefore, temporarily tighten the bolts until all the parts have been positioned, and sequentially tighten from the engine side to the rear pipe side.

Explanations on Functions and Operation

The exhaust brake assembly operates the auxiliary brakes by adjusting the exhaust pressure. The tail pipe has a built-in post silencer. (S-spec only) This improves the silencing effect.
The main parts consist of the front exhaust pipe, center exhaust pipe, exhaust brake unit, silencer, extension pipe, and tail pipe.



Legend

1. Front Exhaust Pipe A
2. Exhaust Brake Assembly
3. Front Exhaust Pipe B
4. Silencer
5. Extension Pipe
6. Tail Pipe

Functional Check

- During check or repairs of the exhaust system, confirm that the clearance between the body and the floor is adequate.
- Adequate care should be taken to prevent damage due to heating or vibrations in the body panel as it may lead to exhaust gas entering the cabin.
- Check for loose or damaged connectors and leakage of exhaust gas.
- Check for degradation, cracks or damage to the clamp or rubber.
- If the pipe or silencer is damaged or has a dent then repair or replace it.
- Check for dents, damage, holes or cracks due to corrosion, and abnormal noise during operation.

List of Abnormal Phenomena

- Vibration or rattling noise from the exhaust system
- Clogging of the exhaust system
- Exhaust leakage or noise

Trouble Shooting

Vibration or rattling noise from the exhaust system

Condition	Possible Cause	Correction
Vibration or rattling noise from the exhaust system	Loose or misaligned components	Match the joints and then re-tighten. Or, check for damage in the hanger, mounting brackets and clamps.

Clogging of the exhaust system

Condition	Possible Cause	Correction
Clogging of the exhaust system	The exhaust brake is in the ON status.	Refer to Section 6E, check the electric system and repair if there are abnormalities. Check if the shaft movement in the exhaust brake throttle valve moves is jerky and replace if there is an abnormality.
	Clogging or deformation of the exhaust piping	Repair or replace the exhaust piping.

Exhaust leakage or noise

Condition	Possible Cause	Correction
Exhaust leakage or noise	Defect or misalignment in mounting	Match the joints and then re-tighten.
	Damage or burn-out of exhaust piping or silencer	Replace the damaged parts.
	Defective components in the exhaust system (clamps, pipes, silencer)	Replace the defective parts.
	Internal damage to silencer	Replace the silencer.

Exhaust Pipe

Removal

1. Remove the silencer fixing nut.
2. Remove the silencer brackets.
3. Remove the silencer.
4. Remove the front exhaust pipe B.
5. Remove the exhaust brake assembly.
6. Remove the front exhaust pipe A.
   - Remove the clamps and then the front exhaust pipe.

Inspection

- Adequate care should be taken to prevent damage due to heating or vibrations in the body panel as it may lead to exhaust gas entering the cabin.
- Check for loose or damaged connectors and leakage of exhaust gas.
- Check for degradation, cracks or damage to the clamp or rubber.
- Check for dents in the pipes or silencer and also for cracks due to corrosion, and repair or replace in case of damage.

Installation

Caution:

- Offset in the position of the exhaust system during assembly may sometimes cause vibrations or rattling noise. Therefore, temporarily tighten the bolts until all the parts have been positioned and then tighten sequentially from engine side to the tail pipe side.
- Do not reuse the removed gasket or nuts.

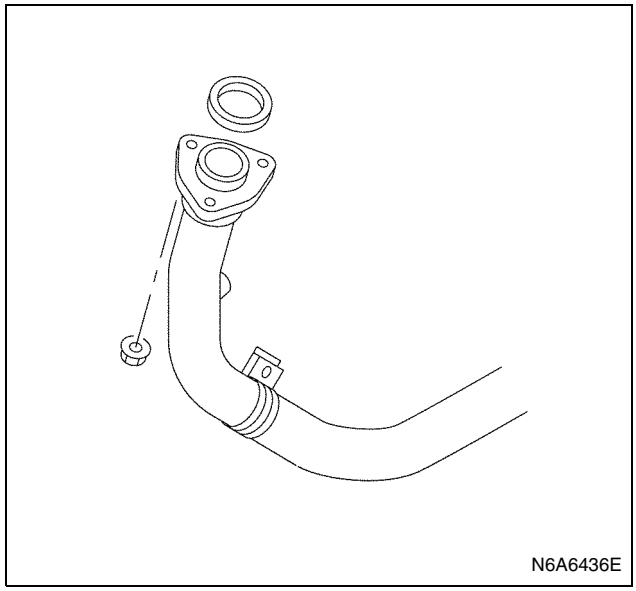
1. Mount the front exhaust pipe A.
   - Assemble the gasket, mount the front exhaust pipe in the turbo charger, and tighten to the specified torque.

Tighten:
Nut to 67 N·m (6.8 kg·m/49 lb·ft)

   - Clamp the front exhaust pipe.

Tighten:
M10 bolt to 41 N·m (4.2 kg·m/30 lb·ft)

Caution:
Tighten the front exhaust pipe evenly and take care to avoid gas leakage.



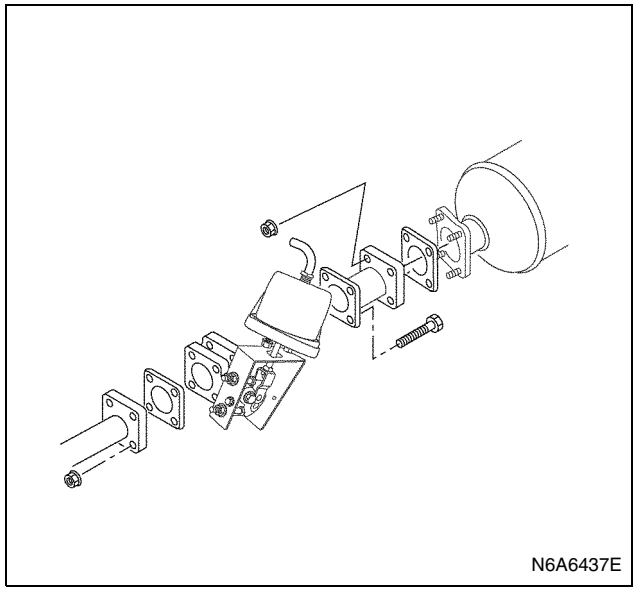
N6A6436E

2. Mount the exhaust brake assembly.
   - Assemble the gasket, connect the front exhaust pipe and the front exhaust pipe B, and tighten.

Tighten:
Bolt to 17 N·m (1.7 kg·m/12 lb·ft)

3. Mount the silencer.
   - Assemble the gasket, mount to the front exhaust pipe B, and tighten to the specified torque.

Tighten:
Nut to 24 N·m (2.4 kg·m/17 lb·ft)

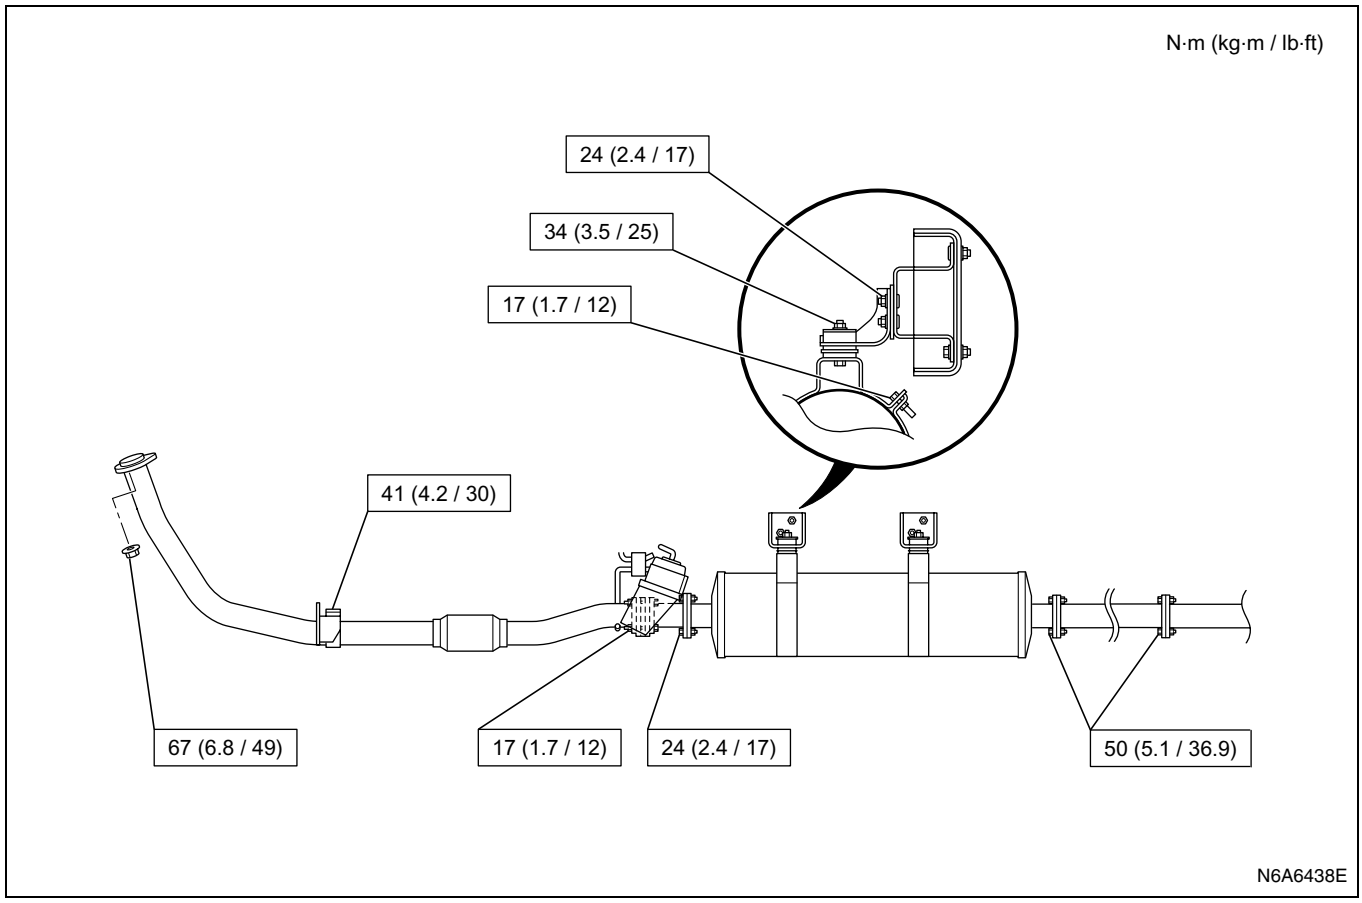


N6A6437E

4. Mount the silencer brackets.
   - Mount the silencer in the brackets.

Tighten:
Nut to 34 N·m (3.5 kg·m/25 lb·ft)

Torque Specifications

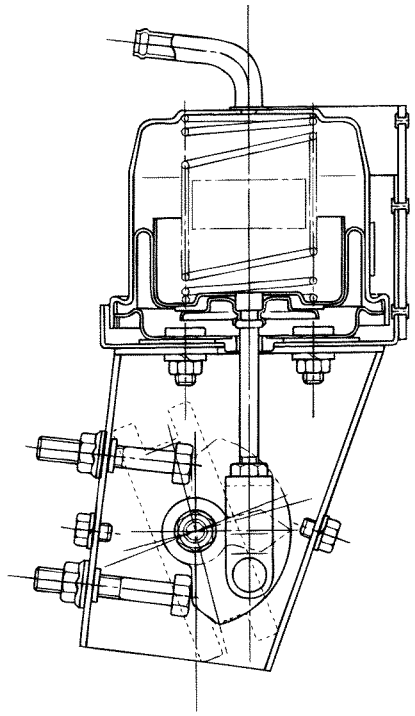


Exhaust Brake System

Service Precautions

During assembly and mounting, mount the parts appropriately at the specified tightening torque value.

Explanations on Functions and Operation



N6A6439E

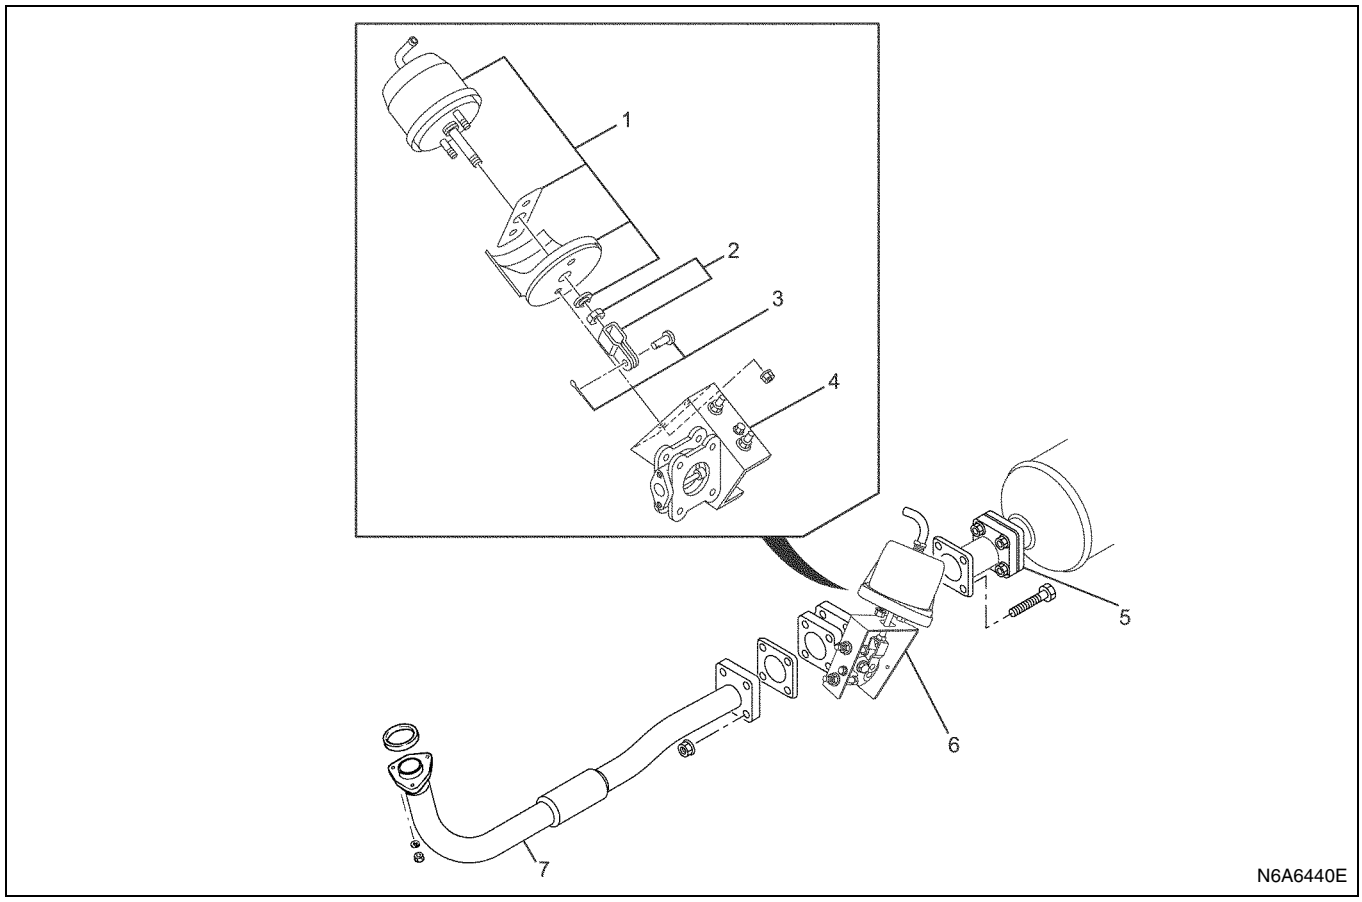
Functional Check

Operational check

- Confirm the sound of the valve touching the stopper when the exhaust brake is operated in the idling condition.

Exhaust Brake

Components



Legend

1. Power Chamber, Insulator, Gasket and Bearing
2. Lock Nuts and Clevis Joint
3. Split Pin and Washer
4. Exhaust Brake Valve
5. Front Exhaust Pipe B
6. Exhaust Brake Assembly
7. Front Exhaust Pipe A

Removal

1. Remove the vacuum hose and clips.
2. Remove the nut.
3. Remove the exhaust pipe.
4. Remove the exhaust brake assembly.

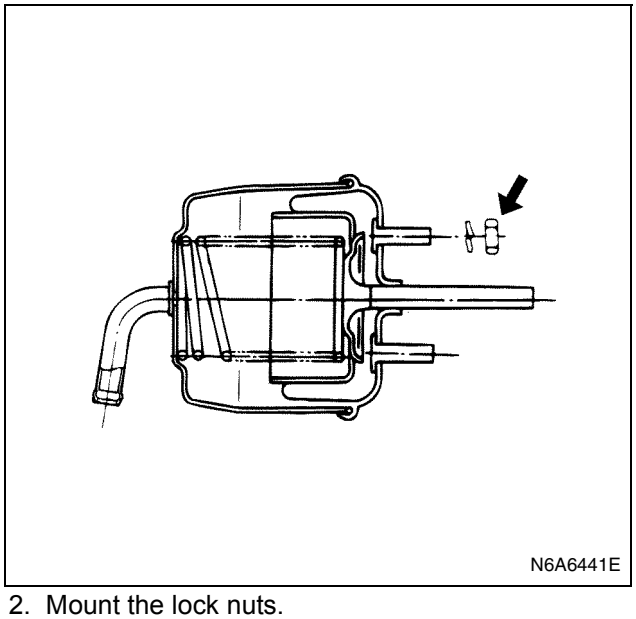
Disassembly

1. Remove the split pin.
2. Remove the lock nuts.
3. Remove the clevis joint.
4. Remove the power chamber.

Reassembly

1. Mount the power chamber.

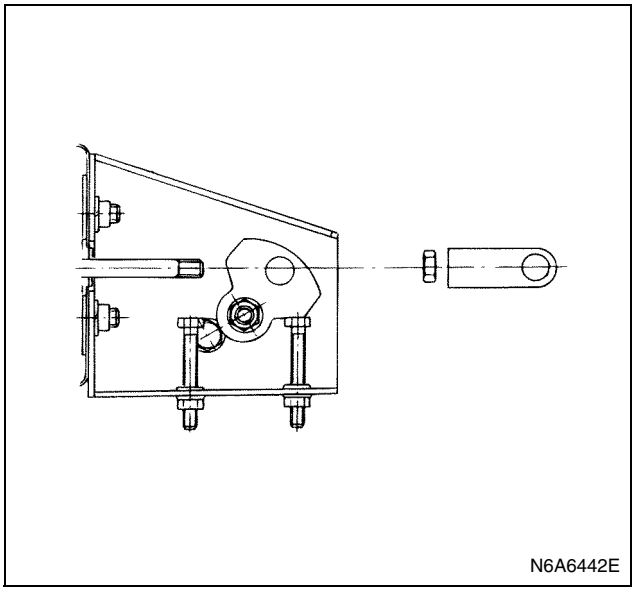
Tighten:
Nut to 14 N·m (1.4 kg·m/122 lb·in)



2. Mount the lock nuts.

3. After mounting the clevis joint, tighten the lock nuts to the specified torque.

Tighten:
Lock nut to 13 N·m (1.3 kg·m/113 lb·in)



N6A6442E

4. Mount the split pin.

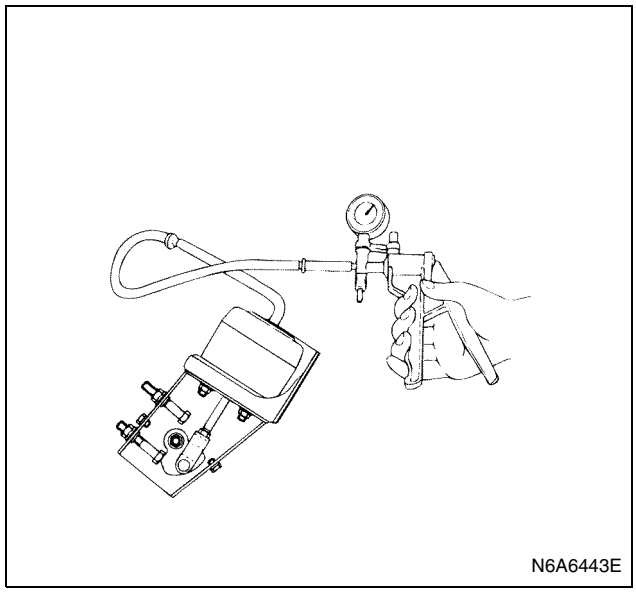
Inspection

Check for damage or degradation in the parts mentioned below.

- Exhaust brake valve
- Exhaust brake shaft
- Butterfly valve
- Bush
- Power chamber

Unit check

- Negative pressure in the power chamber caused by the vacuum pump
  When a pressure of 53.3 - 93.3 kPa (0.54 - 0.95 kg/cm^2 / 7.7 - 13.5 psi) is applied, the exhaust brake valve should open or close smoothly.

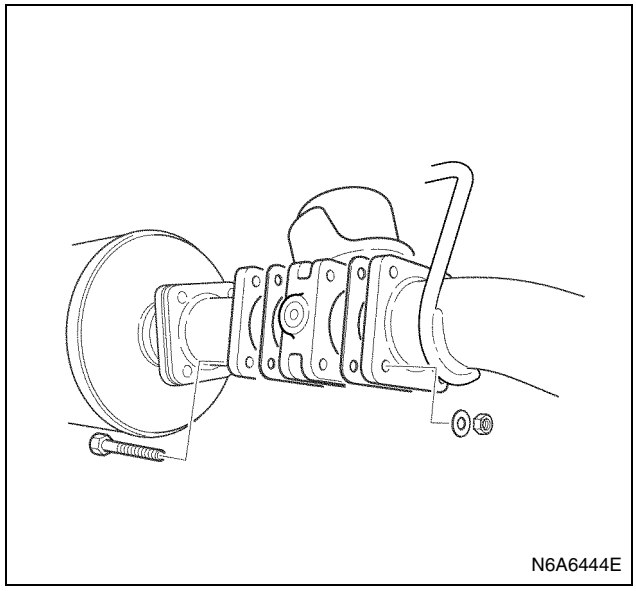


N6A6443E

Installation

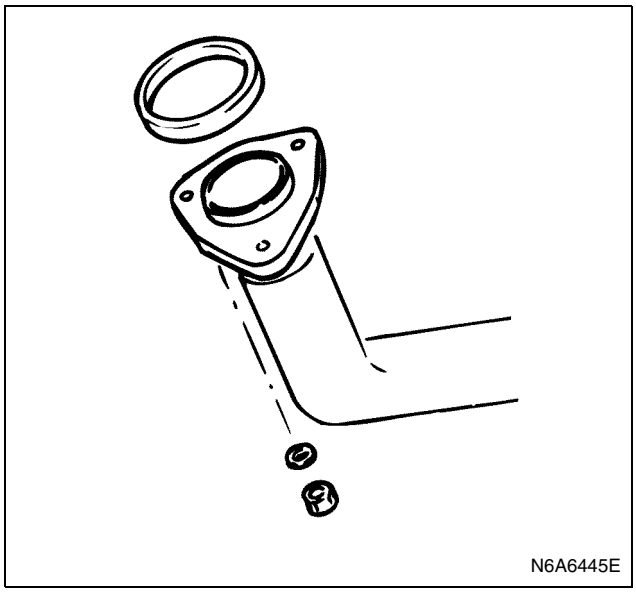
1. Mount the exhaust brake assembly.

Tighten:
Bolt and nut to 17 N·m (1.7 kg·m/12 lb·ft)



N6A6444E

2. Mount the exhaust pipe.



3. Mount the nuts.

Tighten:
Nut to 67 N·m (6.8 kg·m/49 lb·ft)

4. Mount the vacuum hose and the clips.

TROUBLE SHOOTING

Hard Starting

1. Starter Inoperative

Checkpoint	Possible cause	Correction
Battery	Loose battery cable terminal poor connections due to rusting	Clean and/or retighten the battery cable terminal
	Battery discharged or weak	Recharge or replace the battery
	Fan belt loose or broken	Adjust or replace the fan belt
Fusible link	Fusible link shorted	Replace the fusible link
Starter switch	Defective starter switch or starter relay	Replace the starter switch or the starter relay
Starter motor	Defective magnetic switch or starter relay	Repair or replace the magnetic switch
	Defective starter motor	Repair or replace the starter motor

2. Starter Motor Operates But Engine Does Not Turn Over

Checkpoint	Possible cause	Correction
Battery	Loose battery cable terminal	Clean and/or retighten the battery cable terminal
	Poor connections due to rusting	Recharge or replace the battery
	Battery discharged or weak	Recharge or replace the battery
	Fan belt loose or broken	Adjust or replace the fan belt
Starter	Defective pinion gear	Replace the pinion gear
	Defective magnetic switch	Repair or replace the magnetic switch
	Brush wear, Weak brush spring	Replace the brush and/or the brush spring
Engine	Piston, crank bearing seizure, or other damage	Repair or replace the related parts

3. Engine Turns Over But Does Not Start

Checkpoint	Possible cause	Correction
Engine stop mechanism	Defective fuel cut solenoid valve	Replace the fuel cut solenoid valve
Fuel is not Being Delivered to the Injection Pump		
Fuel	Fuel tank is empty	Fill the fuel tank
Fuel piping	Clogged or damaged fuel lines. Loose fuel line connection	Repair or replace the fuel lines Retighten the fuel line connection
Fuel filter	Fuel filter overflow valve does not close	Repair or replace the fuel filter overflow valve
	Clogged fuel filter element	Replace the fuel filter element or the filter cartridge
Fuel system	Air in the fuel system	Bleed the air from the fuel system
Fuel feed pump	Defective feed pump	Repair or replace the feed pump
Fuel is Being Delivered to the Injection Pump		
Fuel	Use of the wrong fuel	Use the correct fuel
	Water particles in the fuel	Change the fuel
Fuel system	Air in the injection pump	Bleed the air from the fuel system
Injection nozzle	Injection nozzle sticking	
	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Injection pump	Defective fuel injection nozzle resulting in the fuel drippage after fuel injection	Replace the delivery valve
	Defective injection pump control rack operation	Repair or replace the injection pump control rack
	Injection pump plunger worn or stuck	Replace the injection pump plunger assembly
	Injection pump drive shaft seizure or other damage	Replace the injection drive shaft
	Injection pump governor spring seizure	Replace the injection pump governor spring

4. Quick-On Start System

Preparation

1. Disconnect the thermoswitch connector.
2. Determine whether or not the glow plugs are receiving power.
   a. Make sure that the starter switch is “OFF”.
   b. Connect a voltmeter between one of the glow plugs and the cylinder wall.
   c. Move the starter switch to the “ON” position.
      The voltmeter needle will show the souse voltage (12V) if the glow plugs are receiving power.
      If the voltmeter needle does not move, the glow plugs are not receiving power.
3. Perform the troubleshooting procedure.

Checkpoint	Possible cause	Correction
Glow Plugs are Receiving Power		
Glow plug indicator light does not turn on	Defective indicator light bulb	Replace the indicator light bulb
Quick-on start timer	Defective quick-on start timer	Replace the quick-on start timer
Glow plug indicator light turns on the 0.3 seconds	Defective quick-on start timer	Replace the quick-on start timer
Glow plug indicator light turns on for 3.5 seconds	Return the starter switch to the “ON” position from the “START” position after the engine starts if the glow plug relay remains on less than 14 seconds, the quick-on start timer is defective	Replace the quick-on start timer
	Move the starter switch from the “OFF” position to the “ON” position if the glow plug relay remains on less than 14 seconds, the quick-on start timer is defective	Replace the quick-on start timer
Thermo switch	Defective thermo switch	Replace the thermo switch
Glow plug continuity	No glow plug continuity	Replace the glow plugs
Glow Plugs are not Receiving Power		
Glow plug indicator light does not turn on	Broken indicator light fuse	Replace the fuse
Quick-on start timer	Defective quick-on start timer	Replace the quick-on start timer
Glow plug indicator light turns on for 3.5 seconds	Defective glow plug relay The glow plug relay does not turn on after the starter switch is moved from the “OFF” position to the “ON” position	Replace the glow plug relay
	Defective quick-on start timer	Replace the quick-on start timer
	Defective glow plug relay wiring harness	Repair or replace the wiring harness
	Defective fusible link or wiring harness The glow plug relay turns on when the starter switch is moved from the “OFF” position to the “ON” position	Replace the fusible link or the wiring harness

* When being normal temperature, the indicator lamp of 4JH1TC is not turn on.

Unstable Idling

Checkpoint	Possible cause	Correction
Idling system	Idling improperly adjusted	Adjust the idling
Fast idling speed	Defective fast idling speed control device	Repair or replace the fast idling speed control device
Accelerator control system	Accelerator control system improperly adjusted	Adjust the accelerator control system
Fuel system	Fuel system leakage or blockage	Repair or replace the fuel system
	Air in the fuel system	Bleed the air from the fuel system
	Water particles in the fuel system	Change the fuel
Fuel filter	Clogged fuel filter element	Replace the fuel filter element or the fuel filter cartridge
Fuel feed pump	Defective fuel feed pump	Repair or replace the fuel feed pump
Injection nozzle	Injection nozzle sticking	Replace the injection nozzle
	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Injection pump	Defective delivery valve resulting in fuel drippage after fuel injection	Replace the delivery valve
	Injection timing improperly adjusted	Adjust the injection timing
	Insufficient injection volume	Adjust the injection volume
	Defective idle spring	Replace the idle spring
	Defective governor lever operation	Repair or replace the governor lever
	Regulator valve improperly adjustment	Adjust or replace the regulator valve
	Broken plunger spring	Replace the plunger spring
	Worn plunger	Replace the plunger assembly
	Worn cam disc	Replace the cam disc
Valve clearance	Valve clearance improperly adjusted	Adjust the valve clearance
Compression pressure	Blown out cylinder head gasket. Worn cylinder liner. Piston ring sticking	Replace the related parts

*The adjustment of the position which is related to the injection pump is unnecessary for 4JH1TC by the adoption of the electronic control injection pump.

Insufficient Power

Checkpoint	Possible cause	Correction
Air cleaner	Clogged air cleaner element	Clean or replace the air cleaner element
Fuel	Water particle in the fuel	Replace fuel
Fuel filter	Clogged fuel filter element	Replace the fuel filter element or the fuel filter cartridge
Fuel feed pump	Defective fuel feed pump	Repair or replace the fuel feed pump
Injection nozzle	Injection nozzle sticking	Replace the injection nozzle
	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Fuel injection pipes	Fuel injection pipes damaged or obstructed	Replace the fuel injection pipes
Injection pump	Defective regulating valve	Repair or replace the regulating valve
	Defective delivery valve	Replace the delivery valve
	Defective timer	Repair or replace the timer
	Worn cam disc	Replace the cam disc
	Improper control lever operation	Adjust or replace the control lever
	Defective injection timing	Adjust the injection timing Repair or replace the injection pump timer
	Weak governor spring	Replace the governor spring
	Worn plunger	Replace the plunger assembly
Compression pressure	Blown out cylinder head gasket. Worn cylinder liner. Piston ring sticking	Replace the related parts
Valve clearance	Valve clearance improperly adjusted	Adjust the valve clearance
Valve spring	Valve spring weak or broken	Replace the valve spring
Exhaust system	Exhaust pipe clogged	Clean the exhaust pipe
Full load adjusting screw seal	Open and improperly set adjusting screw seal	Adjust and reseal the adjusting screw

Excessive Fuel Consumption

Checkpoint	Possible cause	Correction
Fuel system	Fuel leakage	Repair or replace the fuel system related parts
Air cleaner	Clogged air cleaner element	Clean or replace the air cleaner element
Idling speed	Poorly adjusted idling speed	Adjust the idling speed
Injection nozzle	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Fuel injection timing	Fuel injection timing improperly	Adjust the fuel injection timing
Injection pump	Defective Delivery valve resulting is fuel drippage after fuel injection	Replace the delivery valve
Valve clearance	Valve clearance improperly adjusted	Adjust the valve clearance
Compression pressure	Blown out cylinder head gasket. Worn cylinder liner. Piston ring sticking	Replace the related parts
Valve spring	Valve spring weak or broken	Replace the valve spring

Excessive Oil Consumption

Checkpoint	Possible cause	Correction
Engine oil	Engine oil unsuitable Too much engine oil	Replace the engine oil Correct the engine oil level
Oil seal and gasket	Oil leakage from the oil seal and/or the gasket	Replace the oil seal and/or the gasket
Air breather	Clogged air breather	Clean the air breather
Intake and exhaust valve	Worn valve stems and valve guides	Replace the intake and exhaust valves and the valve guides

Overheating

Checkpoint	Possible cause	Correction
Cooling water	Insufficient cooling water	Replenish the cooling water
Fan clutch	Oil leakage from the fan clutch	Replace the fan clutch
Fan belt	Fan belt loose or cracked causing slippage	Replace the fan belt
Radiator	Defective radiator cap or clogged radiator core	Replace the radiator cap or clean the radiator core
Water pump	Defective water pump	Repair or replace the water pump
Cylinder head and cylinder body sealing cap	Defective sealing cap resulting in water leakage	Replace the sealing cap
Thermostat	Defective thermostat	Replace the thermostat
Cooling system	Cooling system clogged by foreign material	Clean the foreign material from the cooling system
Fuel injection timing	Fuel injection timing improperly adjusted	Adjust the fuel injection timing

White Exhaust Smoke

Checkpoint	Possible cause	Correction
Cooling water	Insufficient cooling water	Replace the cooling water
Fuel	Water particles in the fuel	Replace the fuel
Fuel injection timing	Delayed fuel injection timing	Adjust the fuel injection timing
Compression pressure	Blown out cylinder head gasket. Worn cylinder liner. Piston ring sticking	Replace the related parts
Inlet and exhaust valve Valves seals	Defective valve seals. Worn valves stems and valve guides	Replace the valve seals, the valves, and the valve guides

Dark Exhaust Smoke

Checkpoint	Possible cause	Correction
Air cleaner	Clogged air cleaner element	Clean or replace the air cleaner element
Injection nozzle	Injection nozzle injection starting pressure too low Improper spray condition	Adjust or replace the injection nozzle
Fuel injection timing	Fuel injection timing improperly adjusted	Adjust the fuel injection timing
Injection pump	Defective delivery valve resulting in fuel drippage after fuel injection	Replace the delivery valve
	Excessive injection volume	Adjust the injection volume

Oil Pressure Does Not Rise

Checkpoint	Possible cause	Correction
Engine oil	Improper viscosity engine oil. Insufficient engine oil	Replace the engine oil Correct the engine oil volume
Oil pressure gauge or unit	Defective oil pressure gauge or unit	Repair or replace the oil pressure gauge or unit
Oil pressure indicator light	Defective indicator light	Replace the indicator light
Oil filter	Clogged oil filter element	Replace the oil filter element or the oil filter cartridge
Relief valve and by-pass valve	Relief valve sticking and/or weak by-pass valve spring	Replace the relief valve and/or the by-pass valve spring
Oil pump	Clogged oil pump strainer	Clean the oil pump strainer
	Worn oil pump related parts	Replace the oil pump related parts
Rocker arm shaft	Worn rocker arm bushing	Replace the rocker arm bushing
Camshaft	Worn camshaft and camshaft bearing	Replace the camshaft and the camshaft bearing
Crankshaft and bearings	Worn crankshaft and bearings	Replace the crankshaft and/or the bearings

Abnormal Engine Noise

1. Engine Knocking

Check to see that the engine has been thoroughly warmed up before beginning the troubleshooting procedure.

Checkpoint	Possible cause	Correction
Fuel	Fuel unsuitable	Replace the fuel
Fuel injection timing	Fuel injection timing improperly adjusted	Adjust the fuel injection timing
Injection nozzle	Improper injection nozzle starting pressure and spray condition	Adjust or replace the injection nozzle
Compression pressure	Blown out head gasket Broken piston ring	Replace the head gasket or the piston ring

2. Gas Leakage Noise

Checkpoint	Possible cause	Correction
Exhaust pipes	Loosely connected exhaust pipes. Broken exhaust pipes	Tighten the exhaust pipe connections Replace the exhaust pipes
Injection nozzles and/ or glow plugs	Loose injection nozzles and/or glow plugs	Replace the washers Tighten the injection nozzles and/or the glow plugs
Exhaust manifold	Loosely connected exhaust manifold and/ or glow plugs	Tighten the exhaust manifold connections
Cylinder head gasket	Damaged cylinder head gasket	Replace the cylinder head gasket

3. Continuous Noise

Checkpoint	Possible cause	Correction
Fan belt	Loose fan belt	Readjust the fan belt tension
Cooling fan	Loose cooling fan	Retighten the cooling fan
Water pump bearing	Worn or damaged water pump bearing	Replace the water pump bearing
Generator or vacuum pump	Defective generator or vacuum pump Defective generator or vacuum pump	Repair or replace the generator or the vacuum pump
Valve clearance	Clearance improperly adjust	Adjust the valve clearances

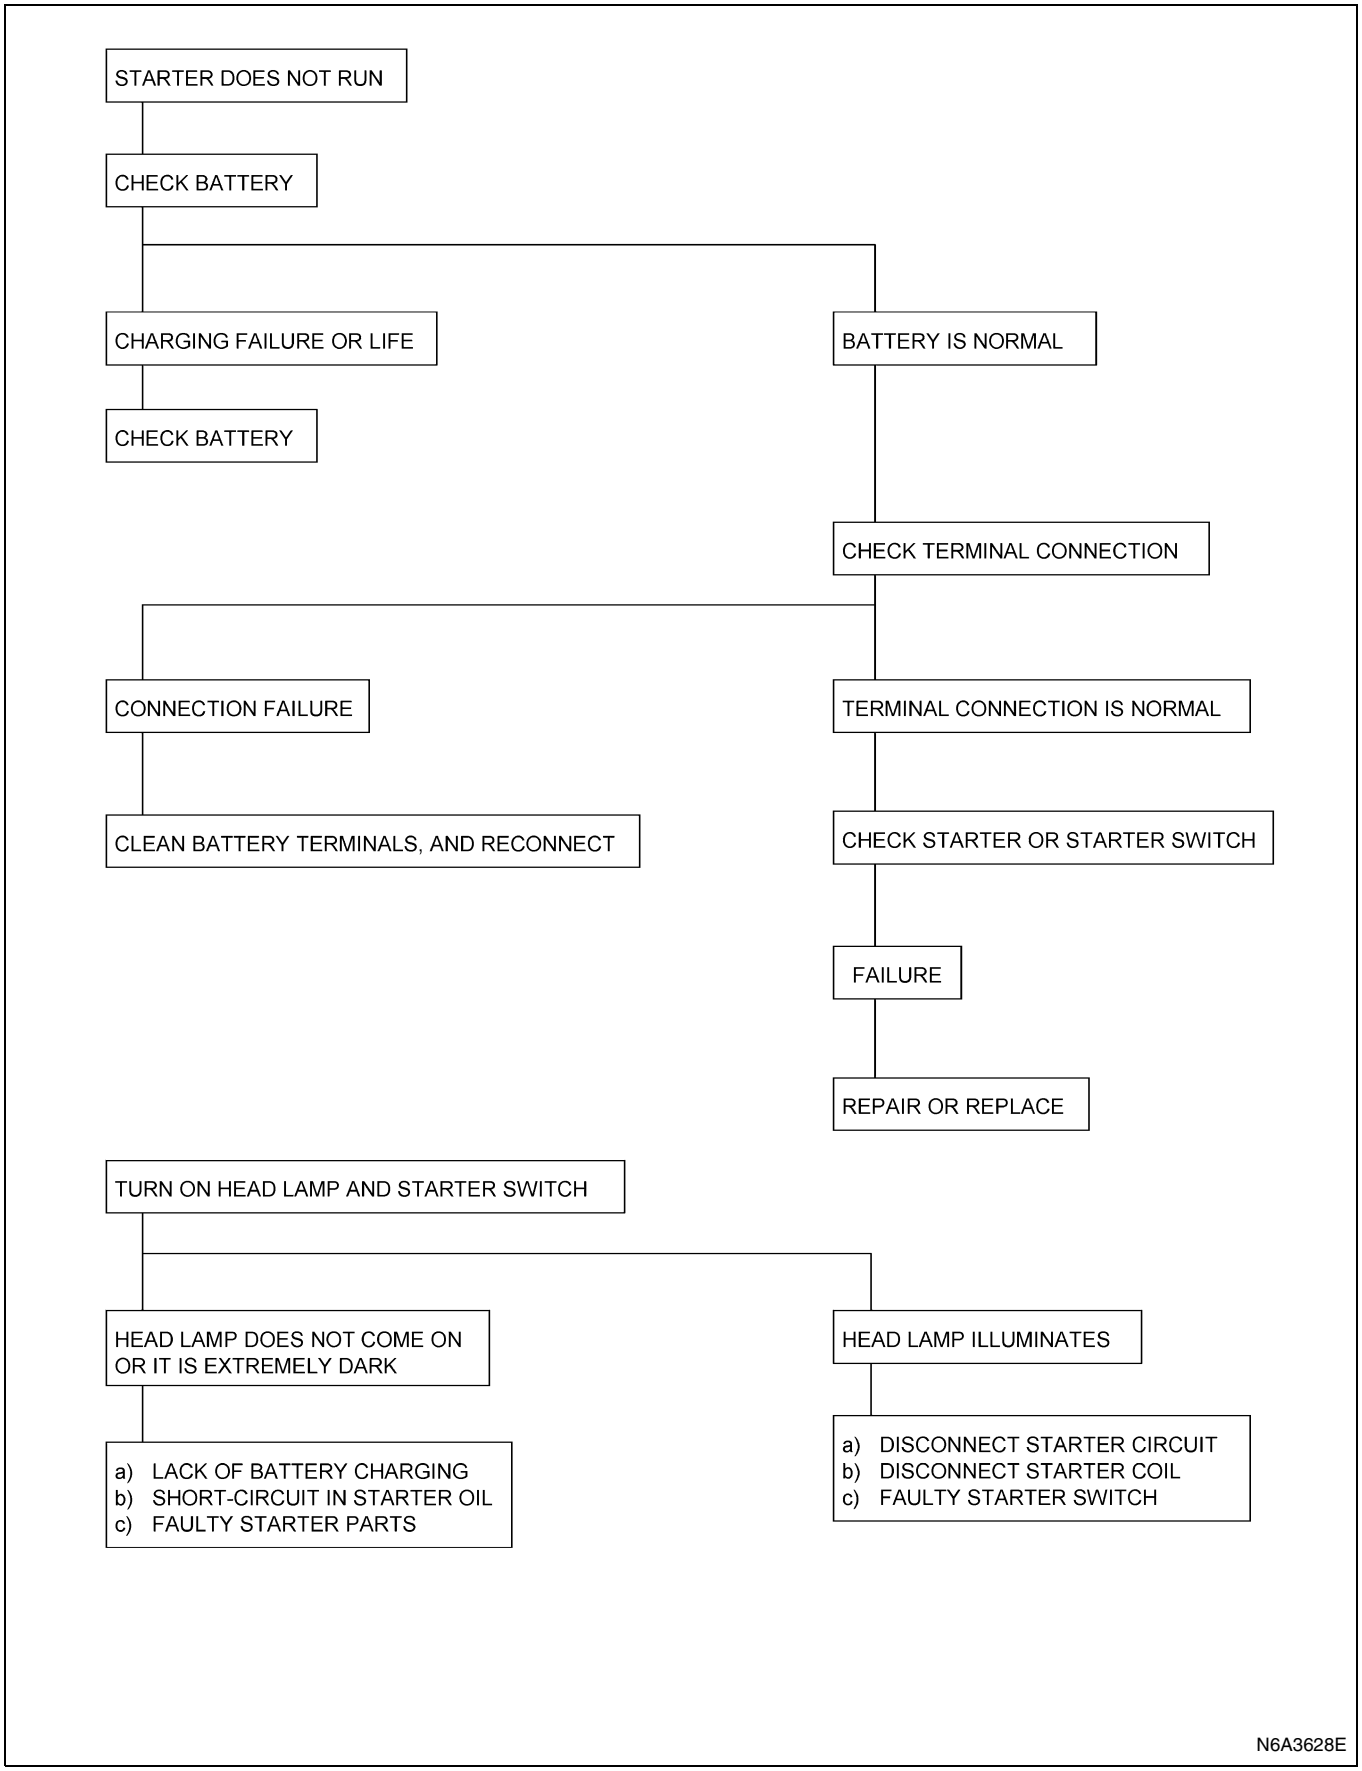
4. Slapping Noise

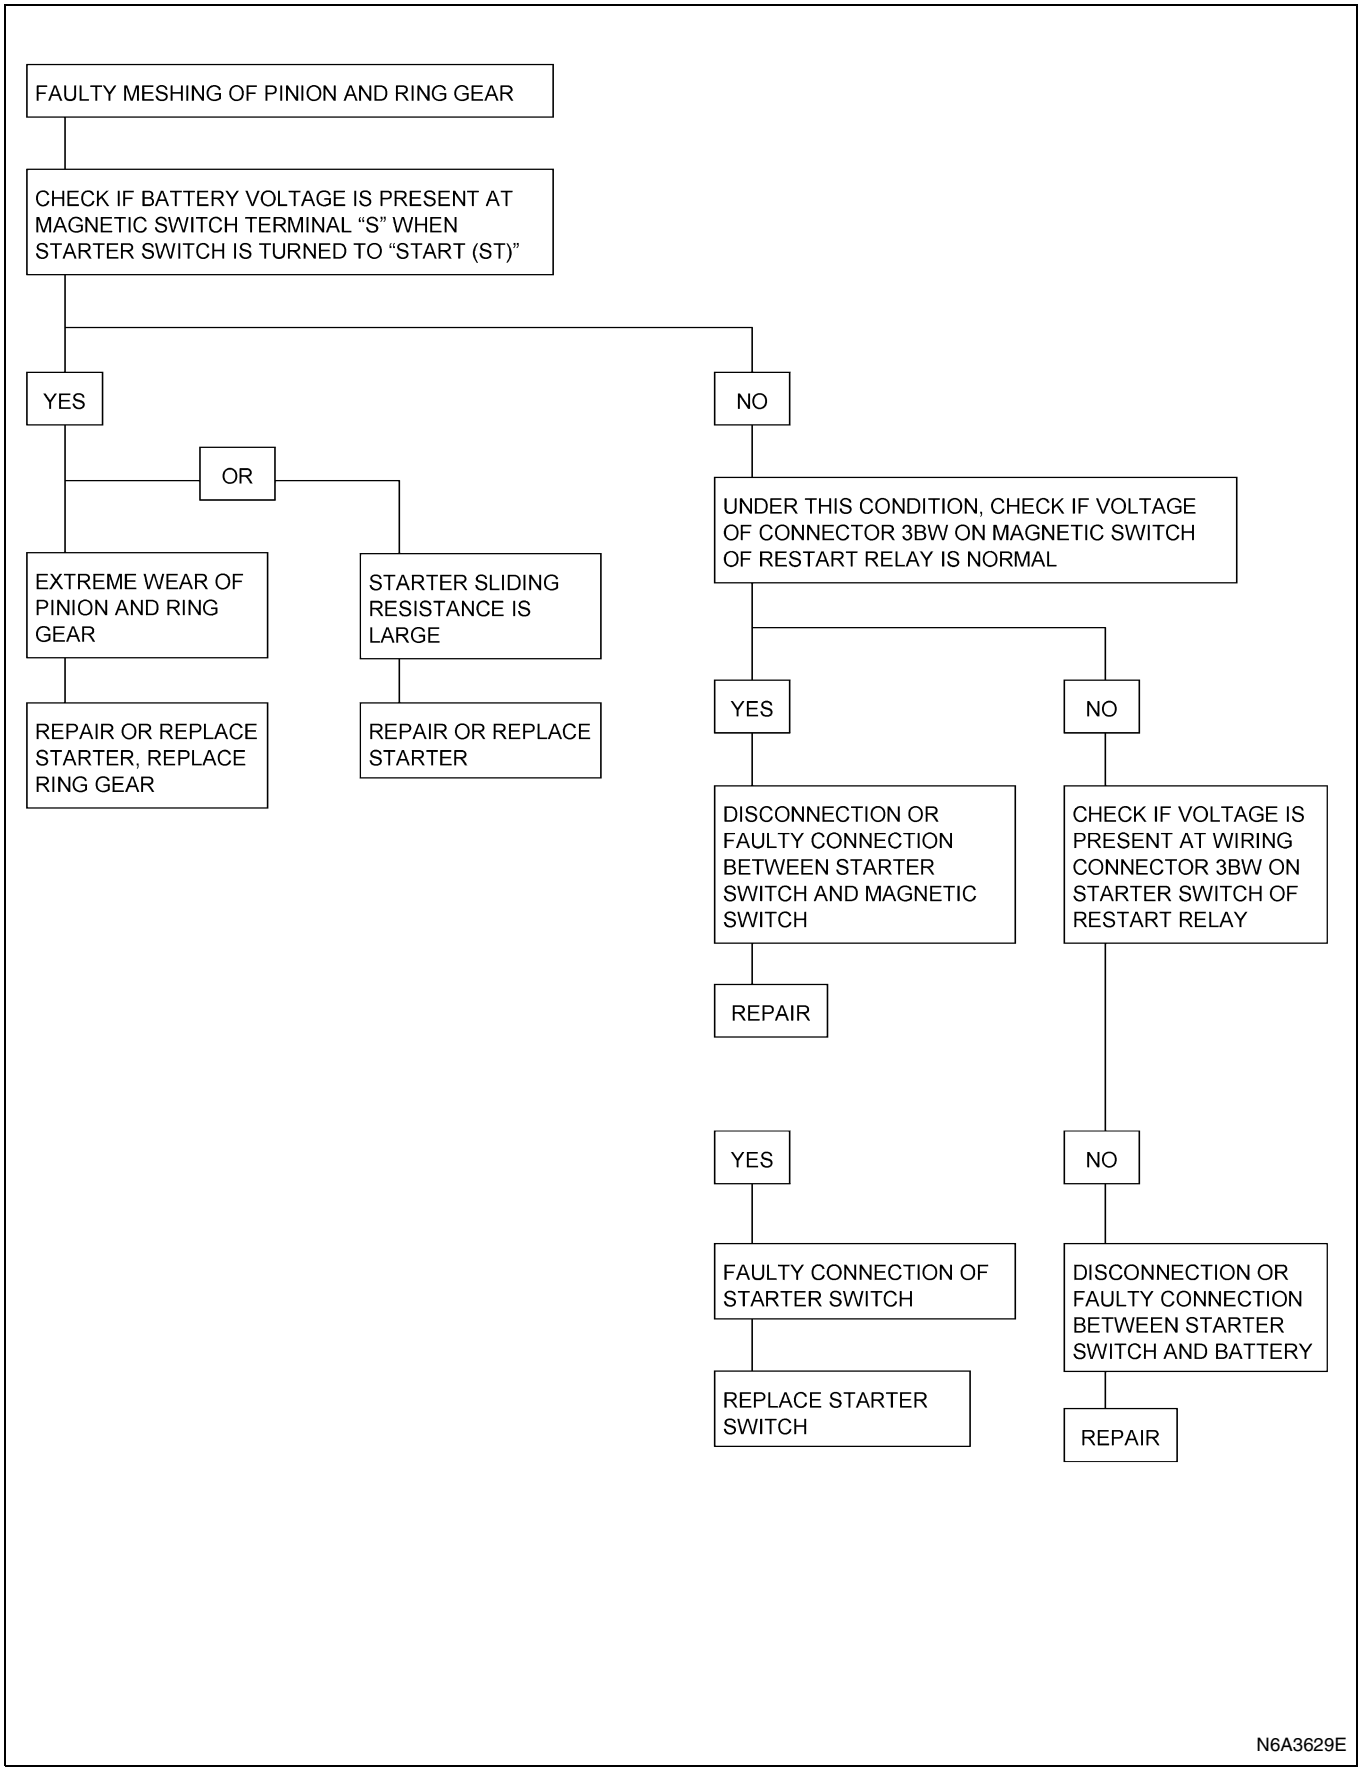
Checkpoint	Possible cause	Correction
Valve clearance	Valve clearance improperly adjusted	Adjust the valve clearance
Rocker arm	Damaged rocker arm	Replace the rocker arm
Flywheel	Loose flywheel bolts	Retighten the flywheel bolts
Crankshaft and thrust bearings	Worn or damaged crankshaft and/or thrust bearings	Replace the crankshaft and/or the thrust bearings
Crankshaft and connecting rod bearings	Worn or damaged crankshaft and/or connecting rod bearings	Replace the crankshaft and/or the connecting rod bearings
Connecting rod bushing and piston pin	Worn or damaged connecting rod bushing and piston pin	Replace the connecting rod bushing and/ or the piston pin
Piston and cylinder liner	Worn or damaged piston and cylinder liner.	Replace the piston and the cylinder liner.

Engine Cooling Trouble

Checkpoint	Possible cause	Correction
Engine overheating	Low coolant level	Replenish
	Thermo unit faulty	Replace
	Faulty thermostat	Replace
	Faulty coolant unit	Repair or replace
	Clogged radiator	Clean or replace
	Faulty radiator cap	Replace
	Low engine oil level or use of improper engine oil	Replenish or change oil Replenish
	Damaged cylinder head gasket	Replace
	Clogged exhaust system	Clean exhaust system or replace faulty parts
	Loose fan belt	Adjust
	Excessive fuel injected	Adjust
	Improper injection timing	Adjust
Engine overcooling	Faulty thermostat	Replace
Too long engine warm-up time	Faulty thermostat	Replace
	Thermo unit faulty	Replace

Engine Electrical Part Trouble





FAULTY MESHING OF PINION AND RING GEAR
CHECK IF BATTERY VOLTAGE IS PRESENT AT MAGNETIC SWITCH TERMINAL “S” WHEN STARTER SWITCH IS TURNED TO “START (ST)”
YES

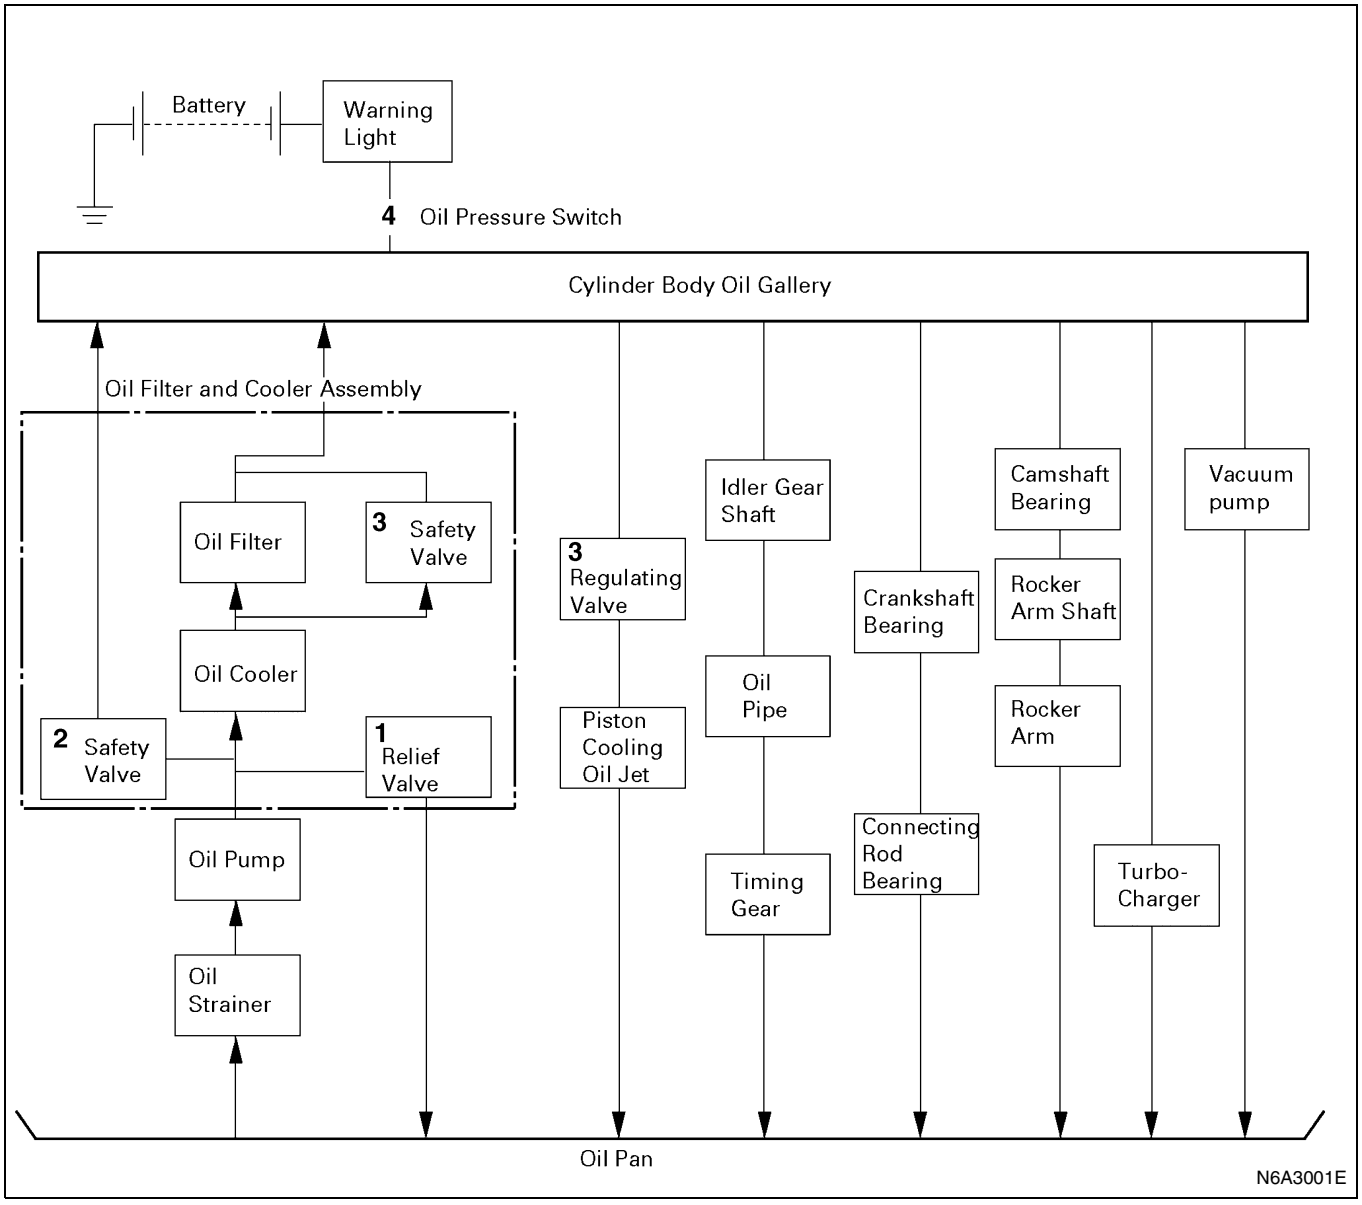
Lubrication Chart

4JB1, 4JB1-TC, 4JG2, 4JH1-TC, Oil Filter & Oil Cooler



Operating Pressure

Oil filter relief valve (1): 559 — 618 kPa (5.7 — 6.3 kg/cm^2/81 — 90 psi)
Oil cooler safety valve (2): 314 — 373 kPa (3.2 — 3.8 kg/cm^2/46 — 54 psi)
Oil filter safety valve (3): 78 — 118 kPa (0.8 — 1.2 kg/cm^2/11 — 19 psi)
Oil pressure switch (4): 29.4 — 49.0 kPa (0.3 — 0.5 kg/cm^2/4.3 — 7.1 psi)
The 4J Series engine lubricating system is a full flow type.
Lubricating oil is pumped from the oil pump to the cylinder body oil gallery through the oil cooler and the oil filter (replaceable type oil filters have on oil cooler). It is then delivered to the vital parts of the engine from the cylinder body oil gallery.

MAIN DATA AND SPECIFICATIONS

Main Data and Specifications

			Engine model		
			4JB1 / 4JB1-TC	4JG2	4JH1-TC
Item	Engine type		Four-cycle, overhead valve, water injection		
	Combustion chamber type		Direct injection	Swirl	Direct injection
	Cylinder liner type		Dry type, chrome plate, stainless steel tube		
	Timing train system		Gear drive	Gear and Belt Drive	Gear drive
	No. of cylinders — Bore × stroke	mm (in)	4 — 93 × 102 (3.66 × 4.02)	4 — 95.4 × 107 (3.76 × 4.21)	4 — 95.4 × 104.9 (3.76 × 4.16)
	No. of piston rings		Compression rings: 2 / Oil ring: 1		
	Total piston displacement	cm^3 (in^3)	2,771 (169.0)	3,059 (186.6)	2,999 (183.3)
	Compression ratio (to 1)		18.2 (4JB1) 18.1 (4JB1-TC)	20.1	18.3
	Compression pressure	kPa (kg/cm^2/psi)	3,038 (31/441)	3,334 (34/483.8)	2,746 (28/398)
	Engine weight (Dry)	N (kg/lb)	Approximately 2,245 (229/505) (4JB1) 2,511 (256/564) (4JB1-TC)	Approximately 2,403 (245/540)	Approximately 2,500 (255/562)
	Fuel injection order		1 — 3 — 4 — 2		
	Fuel injection timing	deg	BTDC 12 (′91/542A) (4JB1) BTDC 4 (4JB1-TC)	TDC 0° (Belt ′91/542B)	Not Adjustment
	Specified fuel type		SAE No. 2 diesel fuel		
	Idling speed	rpm	750 — 790	700 — 740	675 — 725
	Valve clearance (AT cold)	Intake: mm (in)	0.40 (0.016)		
		Exhaust: mm (in)	0.40 (0.016)		
	Valve clearance (AT hot)	Intake: mm (in)	0.45 (0.018)		
		Exhaust: mm (in)	0.45 (0.018)		
	Intake valves	Open at (BTDC) deg	24.5		
		Close at (BTDC) deg	55.5		
	Exhaust valves	Open at (BTDC) deg	54		
		Close at (BTDC) deg	26

		Engine model		
		4JB1 / 4JB1-TC	4JG2	4JH1-TC
Item	**Lubrication system**			
	Lubrication method	Pressurized circulation		
	Specified engine oil (API grade)	CC (4JB1) CD (4JB1-TC)	CC	CD
	Oil pump type	Gear		
	Oil filter type	Disposable cartridge (Spin-on) Paper element		
	Oil capacity lit (US/UK gal) (Including oil filter)	6.6 — 7.1 (1.74 — 1.87/2.62 — 2.82) (For EC 6.2 — 8.2 (2.17 — 1.64/1.36 — 1.80))		6.0 — 8.0 (1.59 — 2.11/2.38 — 3.18)
	Oil cooler type	Water cooled		
	Fuel system			
	Injection pump type	Bosch distributor		Bosch VP44
	Governor type	Mechanical (Partially variable speed) (For EC Variable speed)		Electronically controlled fuel injection system
	Injection nozzle type	Hole	Pinttle	Hole
	Injection nozzle opening pressure kPa (kg/cm^2/psi)	18,142 (185/2,631) (4JB1) 1st: 19,500 (199/2,830) 2nd: 26,500 (270/3,840) (4JB1-TC)	14,710 (150/2,133)	1st: 19,500 (199/2,830) 2nd: 33,800 (345/4,906)
	Main fuel filter type	Cartridge paper element and water separator		Cartridge paper element with built in water separator
	Air cleaner type	Dry paper element		
	Generator capacity V — A (W)	12 — 40 (480) and 12 — 15 (600)	12 — 50	12 — 60 (720) 12 — 80 (960)
	Starter motor output V — kW	12 — 2.0 and 12 — 2.2	12 — 2.0	12 — 2.2 12 — 2.0 (For Taiwan)
	Turbocharger	IHI RHF4 (4JB1-TC)		IHI RHF5

Engine Cooling

Cooling system		Coolant forced circulation
Radiator		(2 tube in row) Tube type Corrugated
Heat radiation capacity	kcal/h	71400
Heat radiation area	m^2 (ft^2)	11.78 (126.8)
Front area	m^2 (ft^2)	0.216 (2.325)
Dry weight	N (kg/lb)	105 (10.7/23.6)
Radiator cap		
Valve opening pressure	kPa (kg/cm^2/psi)	88.2 — 116. 7 (0.899 — 1.199/12.78 — 17.05)
Coolant capacity	lit (Imp.qt./US qt.)	3.1 (2.73/3.28) (For EC 5.8 (5.1/6.13))
Coolant pump		
Pulley type		Centrifugal impeller type
Pulley ratio		1.2
Thermostat type		Wax pellet with jiggle valve.
Valve opening	°C (°F)	82 (180)
Valve full open	°C (°F)	95 (203)
Coolant total capacity	lit (Imp.qt./US qt.)	10 (8.80/10.57) (For EC 7.3 (6.42/7.71))

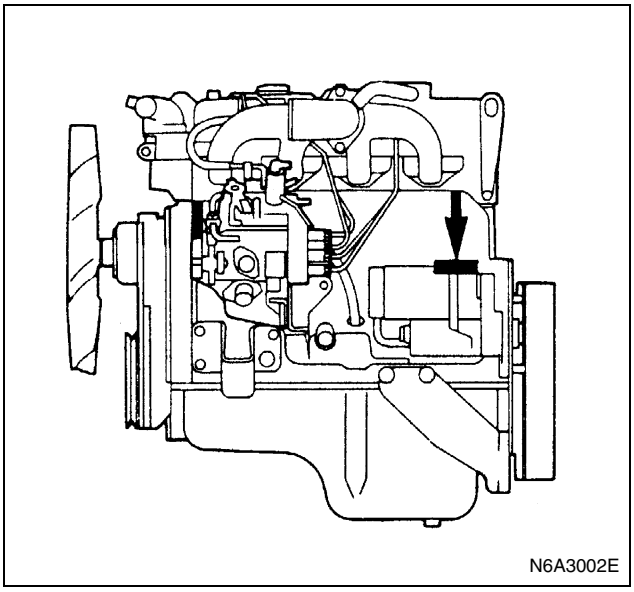
SERVICING

Servicing refers to general maintenance procedures to be performed by qualified service personnel.

Model Identification

Engine Serial Number

The engine number is stamped on the front left hand side of the cylinder body.



Air Cleaner

Dry Type Paper Element

Element cleaning procedures will vary according to the condition of the element.

Dust Fouled Element

Rotate the element with your hand while applying compressed air to the inside of the element. This will blow the dust free.

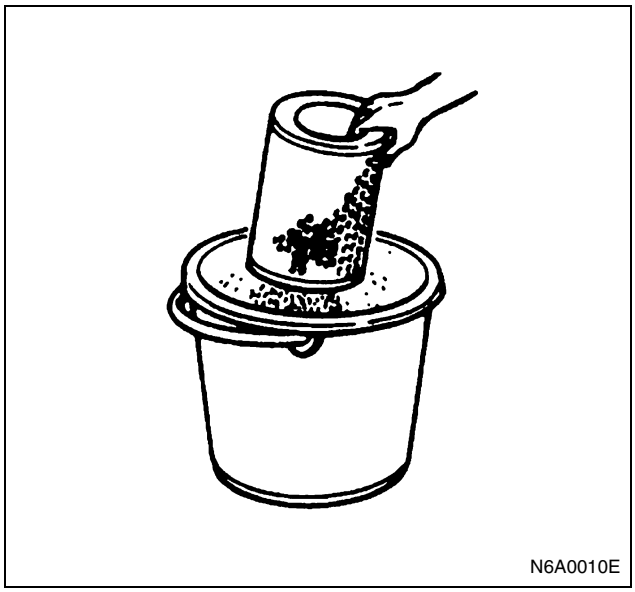
Compressed air pressure	kPa (kg/cm^2/psi)
392 — 490 (4 — 5/57 — 71)	

Caution:

Do not bang the element against another object in an attempt to clean it. Damage to the element will result.

Carbon and Dust Fouled Element

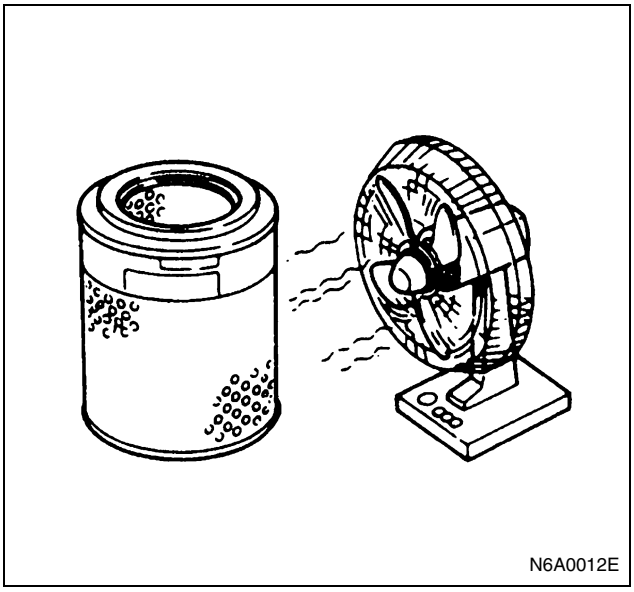
1. Prepare a cleaning solution of Isuzu Genuine Element Cleaner (Donaldson D1400) diluted with water.
2. Submerge the element in the solution for twenty minutes.



3. Remove the element from the solution and rinse it well with running water.
   Water pressure must not exceed 274 kPa (2.8 kg/cm^2/40 psi)

N6A0011E

4. Dry the element in a well ventilated area.
   An electric fan will hasten drying.



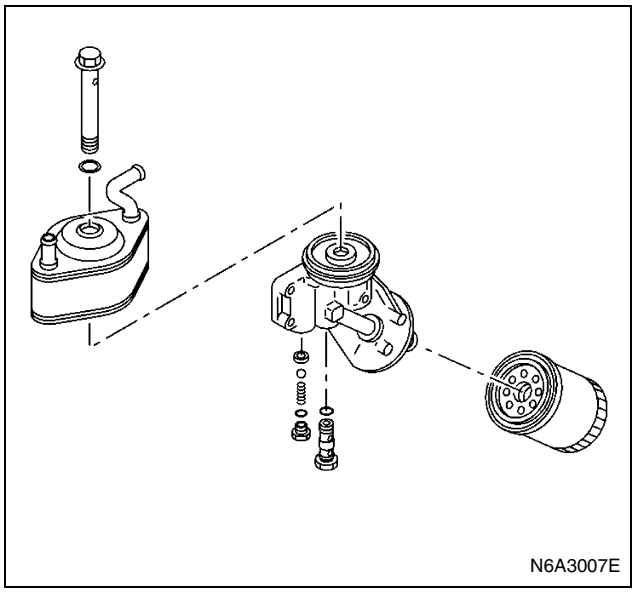
N6A0012E

Notice:
Do not use compressed air or an open flame to dry the element quickly. Damage to the element will result. It will usually take two or three days for the element to dry completely. Therefore, it is a good idea to have a spare on hand to use in the interim.

Lubricating System

Main Oil Filter (Cartridge Type Paper Element) Replacement Procedure

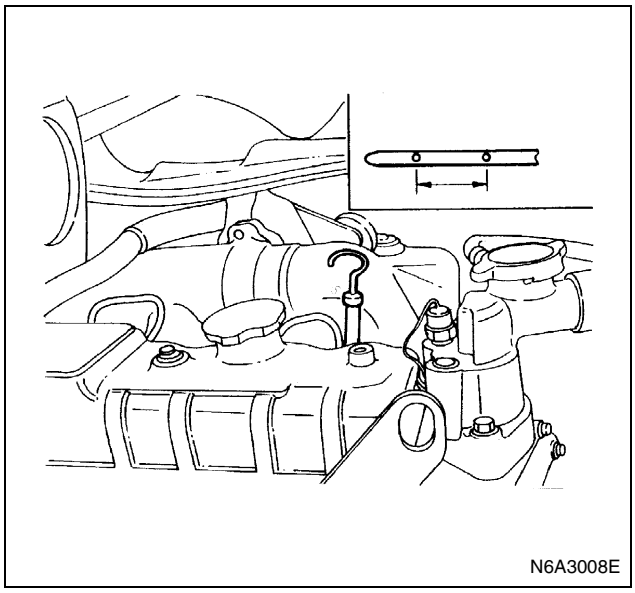
1. Loosen the used oil filter by turning it counterclockwise with the filter wrench.
2. Clean the oil filter fitting face.
   This will allow the new oil filter to seat properly.
3. Apply a light coat of engine oil to the O-ring.
4. Turn in the new oil filter until the filter O-ring is fitted against the sealing face.
5. Use the filter wrench to turn in the filter an additional 1 and 1/4 turns.
   Filter Wrench:
   5-8840-0200-0 (89mm/3.5in)
   5-8840 0202-0 (106mm/4.2in)
   5-8840-2209-0 (100.6mm/4.0in)



N6A3007E

6. Check the engine oil level and replenish to the specified level if required.

Replenishment Engine Oil	lit (Imp qt/US qt)
0.7 (0.62/0.74)	



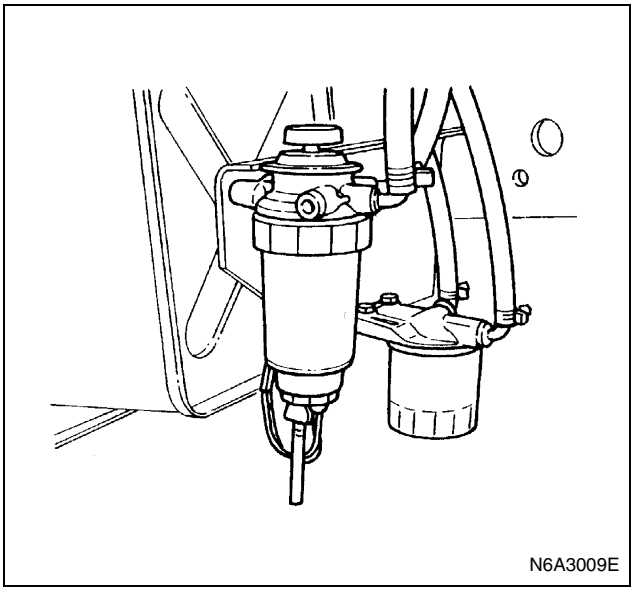
N6A3008E

7. Start the engine and check for oil leakage from the main oil filter.

Fuel System

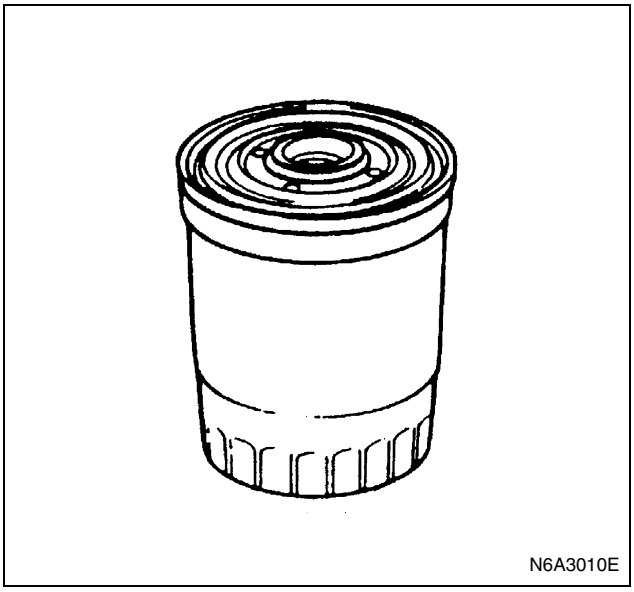
Fuel Filter Replacement Procedure

1. Loosen the used fuel filter by turning it counterclockwise with the filter wrench.
   Filter Wrench: 5-8840-0253-0 (J-22700)



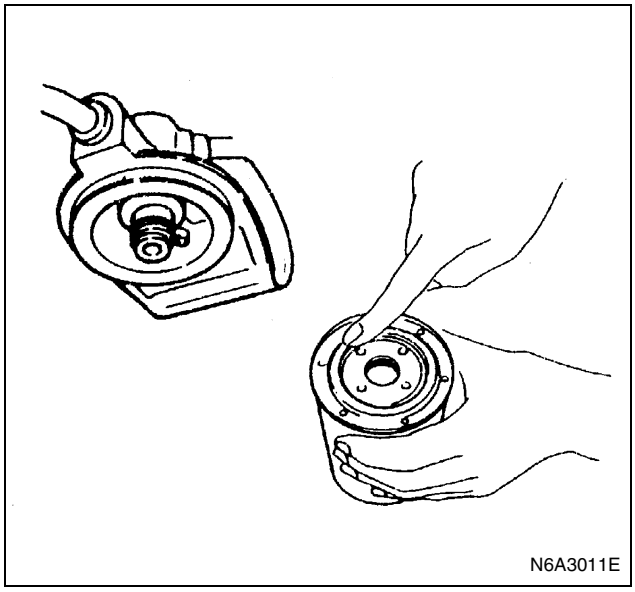
N6A3009E

2. Clean the filter cover fitting faces.
   This will allow the new fuel filter to seat properly.



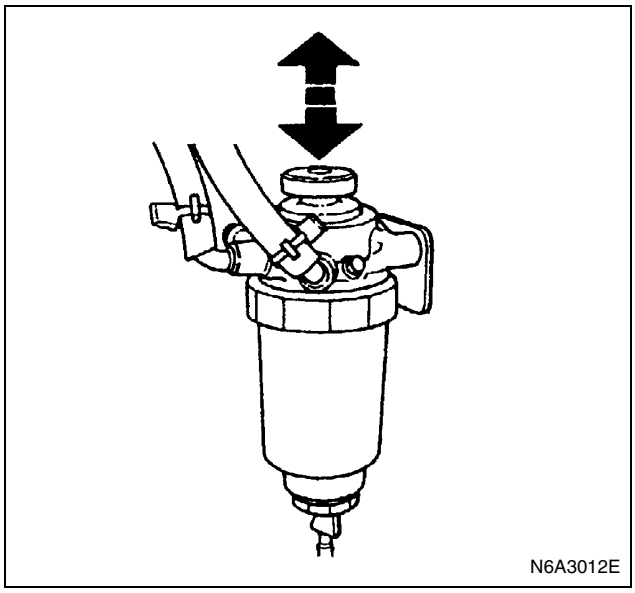
N6A3010E

3. Turn in the fuel filter until the sealing face comes in contact.



N6A3011E

4. Turn in the fuel filter an additional 2/3 of a turn with a filter wrench.
   Filter Wrench: 5-8840-0253-0 (J-22700)
5. Loosen the bleeder plug on the injection pump overflow valve.



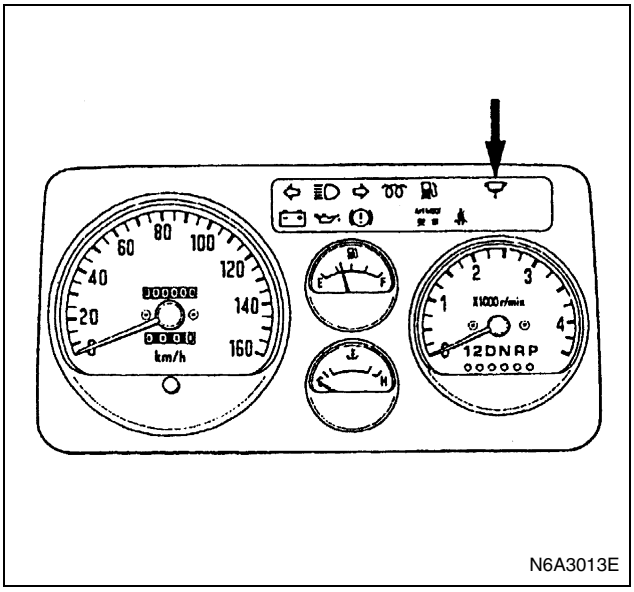
N6A3012E

6. Operate the priming pump until fuel begins to flow from the fuel filter.
7. Retighten the bleeder plug.
8. Operate the priming pump several times and check for fuel leakage.

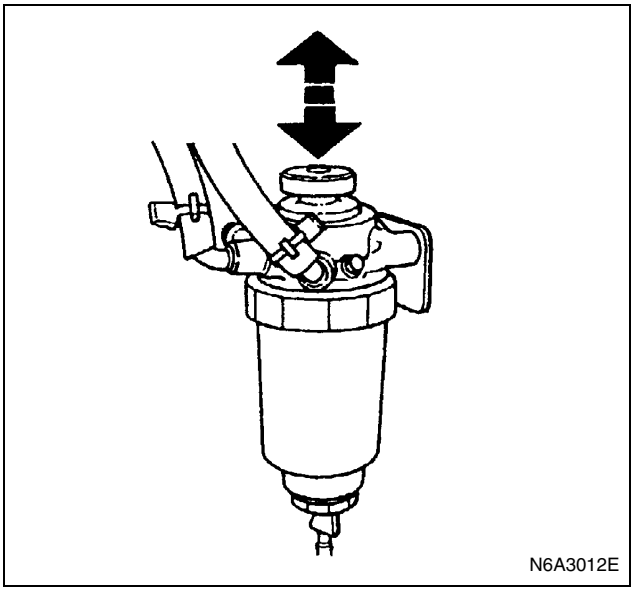
Notice:
The use of an ISUZU genuine fuel filter is strongly recommended.

Fuel Filter Water Draining Procedure

The indicator light will come on when the water level in the water separator exceeds the specified level.
Drain the water and foreign material from the water separator with the following procedure.



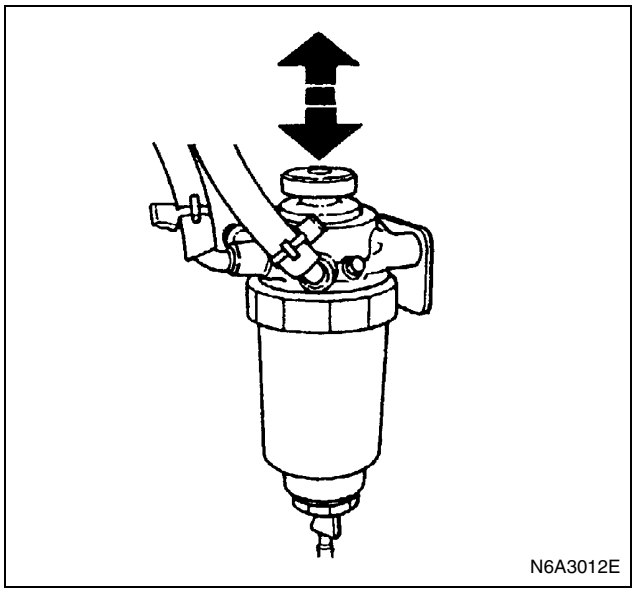
1. Find a safe place to park the vehicle.
2. Open the engine hood and place a container (Approximately 0.2 liter capacity) at the end of the vinyl hose beneath the drain plug on the separator.
3. Loosen the drain plug by turning it counterclockwise (Approximately 5 turns) and operate the priming pump up and down about 10 times until water is drained approximately 0.1 liter.



4. After draining, securely tighten the drain plug by turning it clockwise and operate the priming pump manually up and down several times.
5. After starting the engine, check to see that there is no fuel leak from the drain plug. Also check to see that the fuel filter water indicator light has turned off.
   If water separator requires frequent draining, have the fuel tank drained for removal of water at your Isuzu Dealer.

Air Bleeding

1. Loosen the bleeding plug on the injection pump overflow valve.
2. Operate the priming pump until fuel mixed with foam flows from the bleeding plug.
3. Tighten the bleeding plug.
4. Operate the priming pump several times and check for fuel leakage.



Injection Pump Air Bleeding (4JH1-TC only)

Injection pump air bleeding is required to start the engine when —

- The fuel supply has been exhausted (running out of gas).
- The fuel filter has been replaced.
- The injection pump has been replaced.

Caution:
If the injection pump has been replaced, the air bleeding procedure will require more time and effort (this is because there is no fuel in the pump).

1. Loosen the air bleed nut on the priming pump plunger (at the top of the fuel filter).
2. Move the priming pump plunger up-and-down until strong resistance is felt (about 15 cycles).
3. Stop pumping and tighten the air bleed nut.
4. Wait for 1 minute.
5. Loosen the air bleed nut on the priming pump plunger again.
6. Move the priming pump plunger up-and-down until strong resistance if felt (about 10 cycles).
7. Stop pumping and tighten the air bleed nut.
8. Wait for 1 minute.
9. Loosen the air bleed nut on the priming pump plunger again.
10. Move the priming pump plunger up-and-down until strong resistance is felt (about 5 cycles).
11. Stop pumping and tighten the air bleed nut.

12. Press the accelerator and clutch pedals all the way to the floor and hold them down. Turn the ignition switch to the ON position. Wait until the glow indicator lamp turns on and off.

Caution:
If the engine is cold, the glow indicator light will stay on for 4 — 7 seconds before turning off.

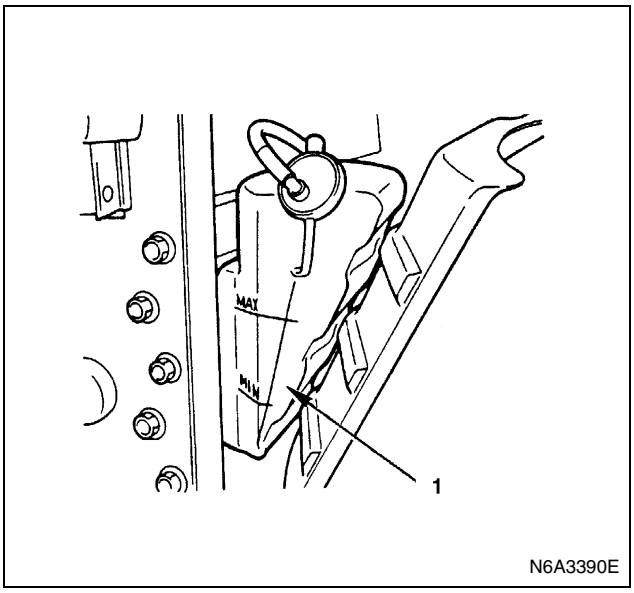
However, if the engine is hot, the lamp will not turn on.

13. Turn the ignition switch to the START position and crank the engine until it starts (do not crank the engine for more than 10 seconds).
    If the engine does not start, repeat Steps 9 — 13.
14. Allow the engine to idle for 5 minutes.

Cooling System

Coolant Level

Check the coolant level and replenish the radiator reserve tank as necessary.
If the coolant level falls below the “MIN” line, carefully check the cooling system for leakage. Then add enough coolant to bring the level up to the “MAX” line.



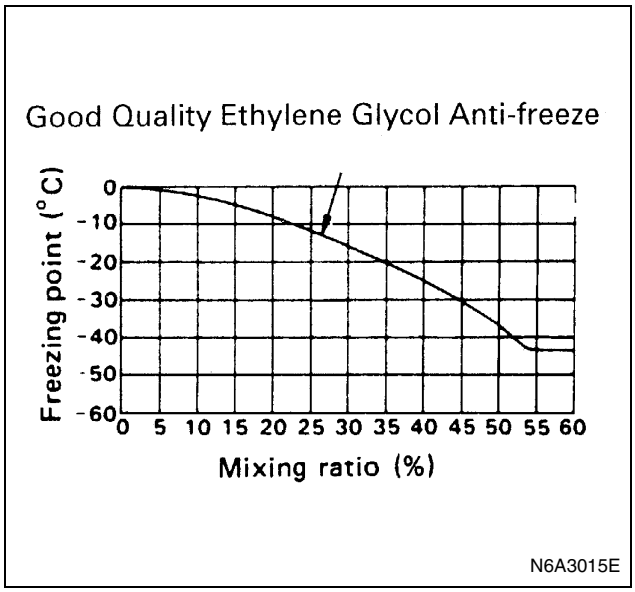
Legend
1. Reserve tank

Engine Coolant Change Procedure

1. To change engine coolant, make sure that the engine is cool.

WARNING:
WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

2. Open radiator cap and drain the cooling system by loosening the drain valve on the radiator and on the cylinder body.



Notice:
For best result it is suggested that the engine cooling system be flushed at least once a year. It is advisable to flush the interior of the cooling system including the radiator before using anti-freeze (ethylene-glycol based).

Replace damaged rubber hoses as the engine anti-freeze coolant is liable to leak out even minor cracks. Isuzu recommends to use Isuzu genuine anti-freeze (ethylene-glycol based) or equivalent, for the cooling system and not add any inhibitors or additives.

Caution:
A failure to correctly fill the engine cooling system in changing or topping up coolant may sometimes cause the coolant to overflow from the filler neck even before the engine and radiator are completely full. If the engine runs under this condition, shortage of coolant may possibly result in engine overheating. To avoid such trouble, the following precautions should be taken in filling the system.

3. To refill engine coolant, pour coolant up to filler neck using a filling hose which is smaller in outside diameter of the filler neck.
   Otherwise air between the filler neck and the filling hose will block entry, preventing the system from completely filling up.
4. Keep a filling rate of 9 liter/min. or less. Filling over this maximum rate may force air inside the engine and radiator. And also, the coolant overflow will increase, making it difficult to determine, whether or not the system is completely full.
5. After filling the system to the full, pull out the filling hose and check to see if air trapped in the system is dislodged and the coolant level goes down. Should the coolant level go down, repeat topping-up until there is no more drop in the coolant level.

6. After directly filling the radiator, fill the reservoir to the maximum level.
7. Install and tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.

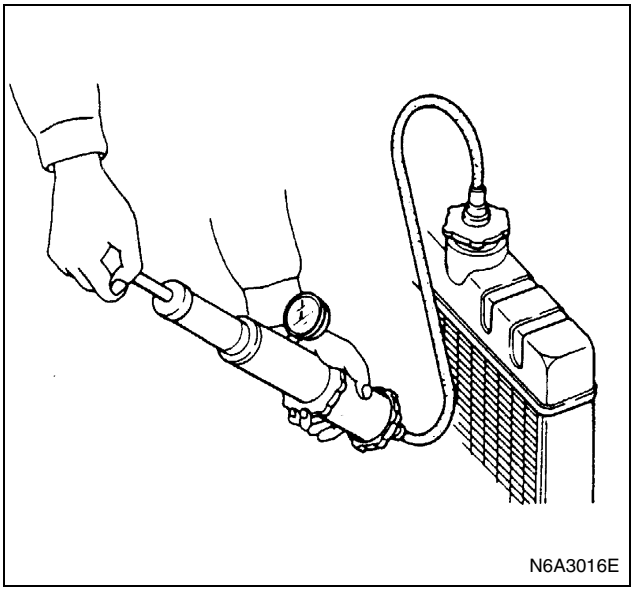
WARNING:
WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP. OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

8. After tightening radiator cap, warm up the engine at about 2,000 rpm. Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
9. Check to see the thermostat has opened through the needle position of water thermometer, conduct a 5 minutes idling again and stop the engine.
10. When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant is found, Check the coolant system and reservoir tank hose for leakage.
11. Fill the coolant into the reservoir tank up to “MAX” line.

Cooling System Inspection

Install a radiator filler cap tester to the radiator. Apply testing pressure to the cooling system to check for leakage.
The testing pressure must not exceed the specified pressure.

Testing Pressure	kPa (Kg/cm^2/psi)
147 (1.5/21)	



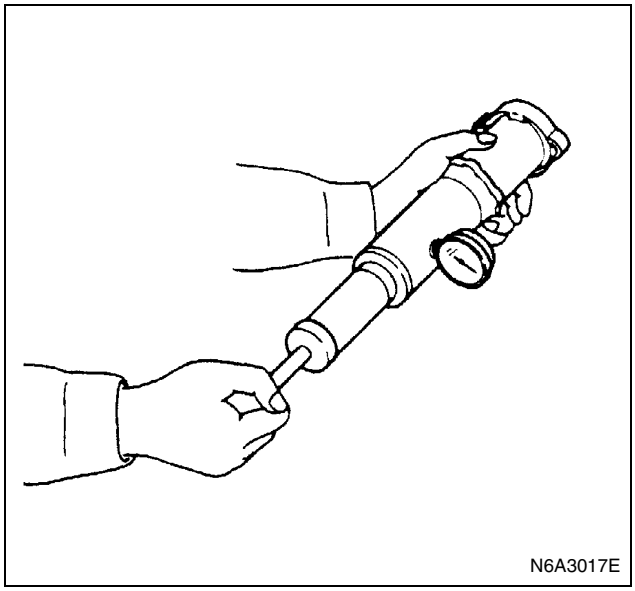
N6A3016E

Radiator Cap Inspection

The radiator filler cap is designed to maintain coolant pressure in the cooling system at 1.05 kg/cm^2 (15 psi / 103 kPa). Check the radiator filler cap with a radiator filler cap tester. The radiator filler cap must be replaced if it fails to hold the specified pressure during the test procedure.
Radiator Filler Cap Pressure

Pressure Valve	kPa (kg/cm^2/psi)
88 — 118 (0.9 — 1.2/12.8 — 17.1)	

Negative Valve (Reference)	kPa (kg/cm^2/psi)
1.0 — 13.9 (0.01 — 0.04/0.14 — 0.57)	



N6A3017E

Thermostat Operating Test

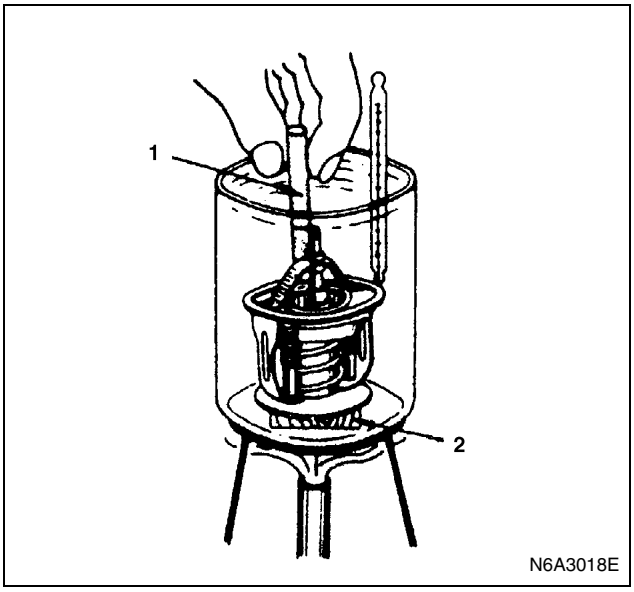
1. Completely submerge the thermostat in water.
2. Heat the water.
   Stir the water constantly by suitable wood bar (1) to avoid direct heat being applied use wood plate (2) to the thermostat.
3. Check the thermostat initial opening temperature.

Thermostat Initial Opening Temperature	°C (°F)
82 (180)	

4. Check the thermostat full opening temperature.

Thermostat Full Opening Temperature	°C (°F)
95 (203)	

Valve Lift at Fully Open Position	mm (in)
10 (0.39)	



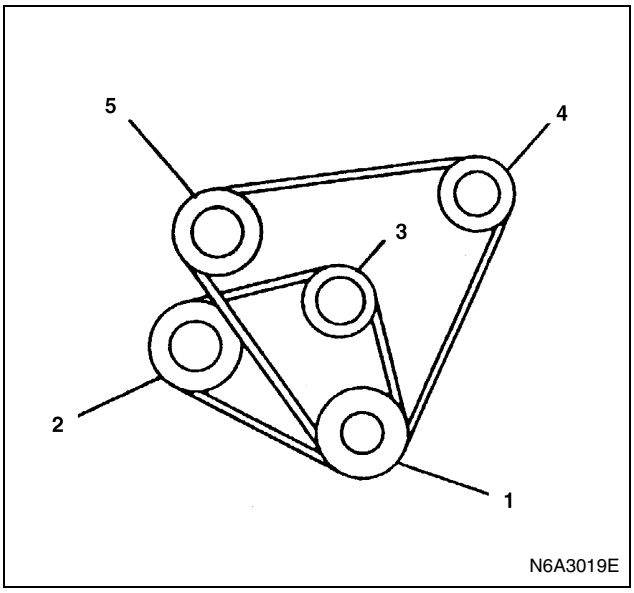
Drive Belt Adjustment

Depress the drive belt mid portion with a 98 N (10 kg / 22 lb) force.

Drive Belt Deflection	mm (in)
8 — 12 (0.32 — 0.47)	

Check the drive belt for cracking and other damage.

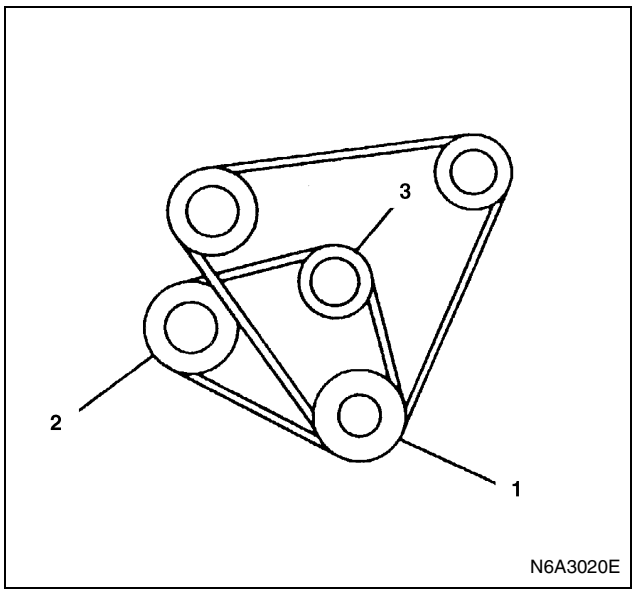
1. Crankshaft damper pulley (1)
2. Generator pulley (2)
3. Cooling fan pulley (3)
4. Oil pump pulley or idler pulley (4)
5. Compressor pulley or idle pulley (5)



Cooling Fan Pulley Drive Belt

Fan belt tension is adjusted by moving the generator.
Depress the drive belt mid portion with a 98 N (10 kg / 22 lb) force.

1. Crankshaft damper pulley (1)
2. Generator pulley (2)
3. Cooling fan pulley (3)

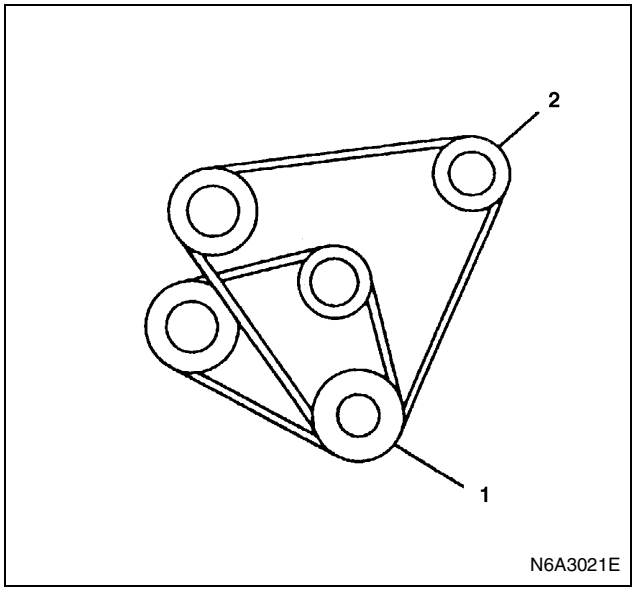


Compressor Pulley Drive Belt

Move the idler pulley as required to adjust the compressor drive belt tension.
If the vehicle is equipped with power steering, move the oil pump as required.
Depress the drive belt mid portion with a 98 N (10 kg / 22 lb) force.

Belt Deflection	mm (in)
8 — 12 (0.32 — 0.47)	

1. Crankshaft damper pulley (1)
2. Oil pump pulley or idler pulley (2)



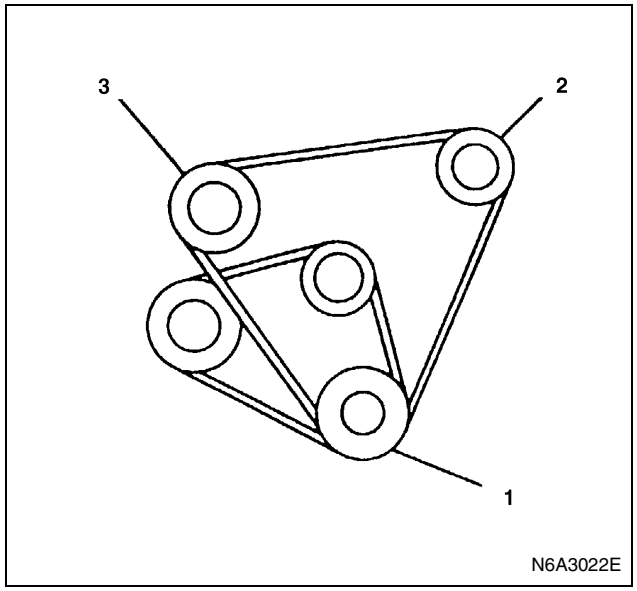
Power Steering Oil Pump Pulley Drive Belt

Move the oil pump as required to adjust the oil pump drive belt tension.
On air conditioner equipped models, both drive belts pulley must always be replaced as a set.

Depress the drive belt mid portion with a 98 N (10 kg / 22 lb) force.

Belt Deflection	mm (in)
8 — 12 (0.32 — 0.47)	

1. Crankshaft damper pulley (1)
2. Oil pump pulley (2)
3. Compressor pulley or idler pulley (3)



Engine Control

Idling Speed Inspection

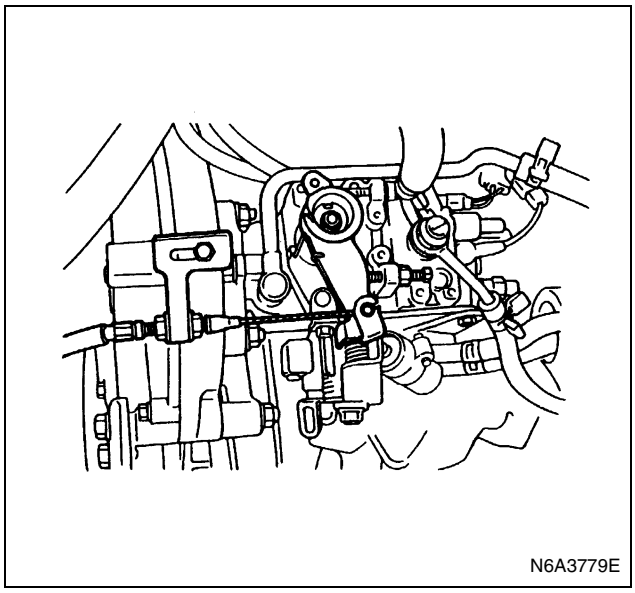
1. Set the vehicle parking brake and choke the drive wheels.
2. Place the transmission in neutral.
3. Start the engine and allow it to warm up.
4. Disconnect the engine control cable from the control lever.
5. Set a tachometer to the engine.
6. Check the engine idling speed.
   If the engine idling speed is outside the specified range, it must be adjusted.

Engine Idling Speed	rpm
4JB1 / 4JB1-TC	750 — 790
4JG2	700 — 740
4JH1-TC	675 — 725

Idling Speed Adjustment

(4JB1/4JB1-TC/4JG2 only)

1. Loosen the idling set bolt lock nut on the injection pump idling set bolt.
2. Adjust the idling speed to the specified range by turning the idling set bolt.
3. Lock the idling set bolt with the idling set bolt lock nut.
4. Check that the idling control cable is tight (free of slack).
   If required, remove the slack from the cable.



Accelerator Control Cable Adjustment

(4JB1/4JB1-TC/4JG2 Only)

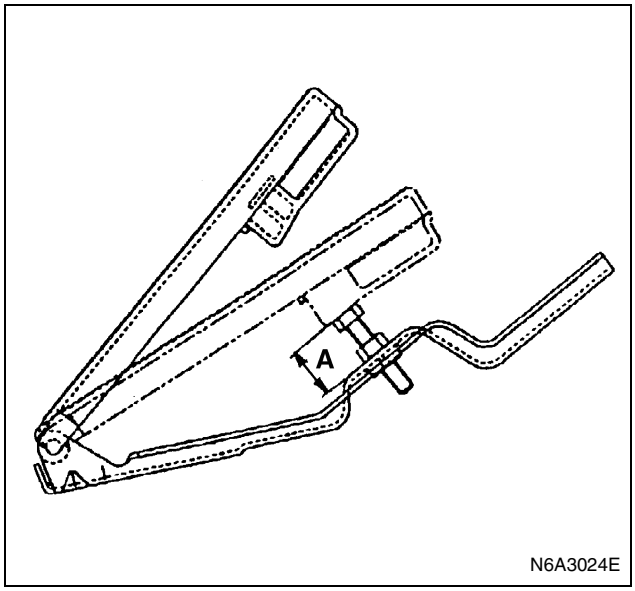
1. Loosen the accelerator cable clamp bolt.
2. Check that the idling control knob on the instrument panel is in the engine idling position.
3. Hold the accelerator lever in the fully closed position and stretch the control cable in the direction indicated by the arrow to remove any slack.

Accelerator Pedal Adjustment

LHD

1. Loosen the lock nut.
2. Adjust bolt height from floor.

Adjust Bolt Height (A)	mm (in)
18 — 28 (0.71 — 1.1)	

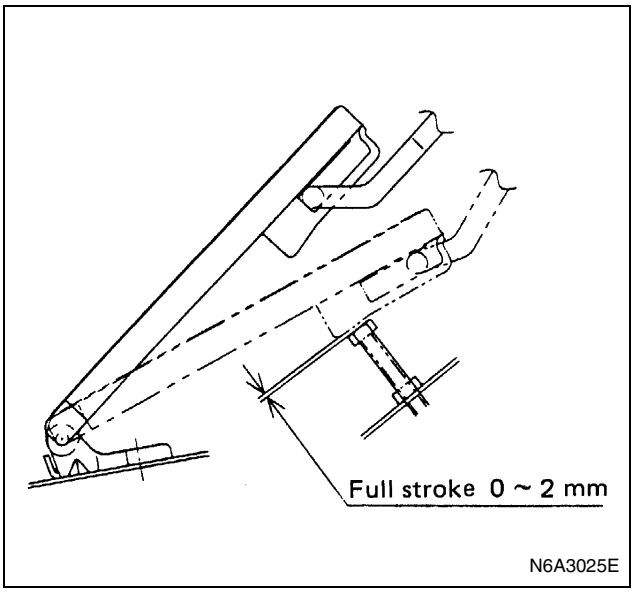


3. Check to see if the accelerator pedal play is in the range of 5 to 10mm above the pedal pad.
4. Press down on the accelerator pedal fully and check to see if the engine rotates at its maximum speed with each of the linkage in the smooth operation.
5. In the operating range of accelerator pedal and the injection pump lever returns to their respective original positions without fail.

RHD

1. Hold the accelerator pedal pad securely by hand, and give it a full stroke.
2. Adjust the stopper bolt so that the clearance between the pad stopper bolt and the rear side of the pad becomes the specified length.

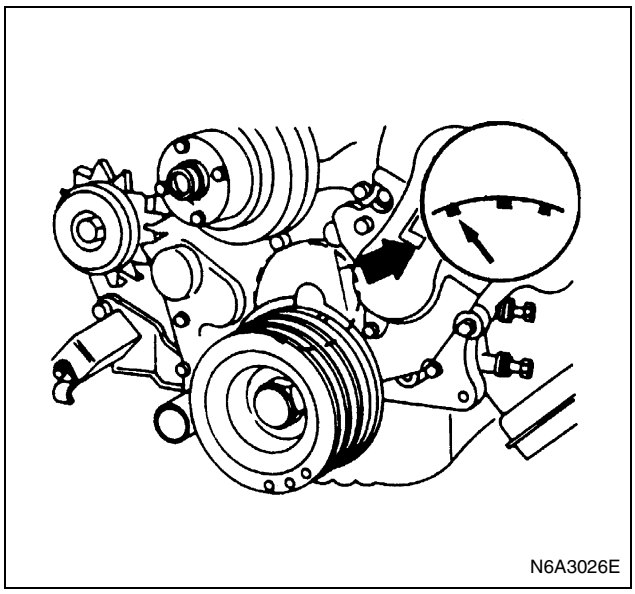
mm (in)
0 — 2 (0 — 0.079)



3. Check to see if the accelerator pedal play is in the range of 5 to 10mm above the pedal pad.
4. Press down on the accelerator pedal fully and check to see if the engine rotates at its maximum speed with each of the linkage in the smooth operation.
5. In the operating range of accelerator pedal and the injection pump lever returns to their respective original positions without fail.

Valve Clearance Adjustment

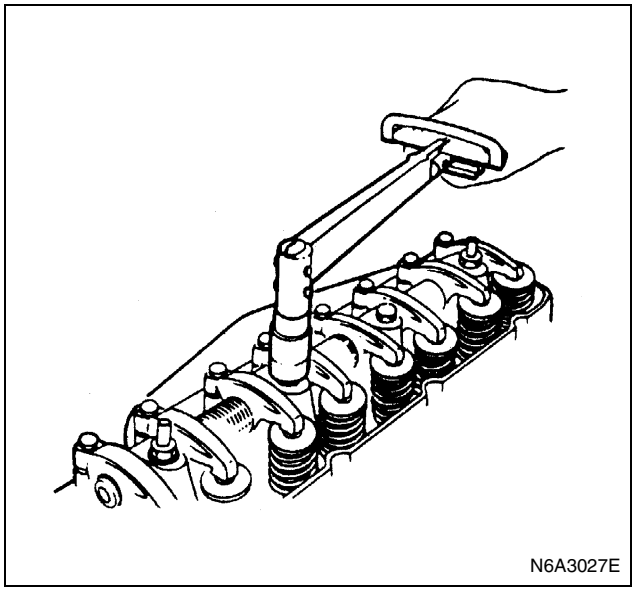
1. Bring the piston in either the No. 1 cylinder or the No. 4 cylinder to TDC on the compression stroke by turning the crankshaft until the crankshaft damper pulley TDC line is aligned with the timing pointer.



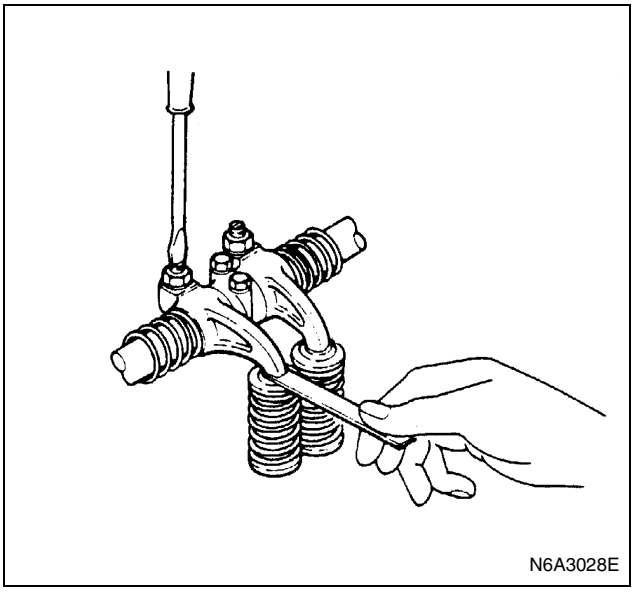
2. Check the rocker arm shaft bracket nuts for looseness.
   Tighten any loose rocker arm shaft bracket nuts before adjusting the valve clearance.

Tighten:

- Rocker arm shaft bracket nut to 54 N·m (5.5 kg·m / 40 lb·ft)



3. Check for play in the No. 1 intake and exhaust valve push rods.
   If the No. 1 cylinder intake and exhaust valve push rods have play, the No. 1 piston is at TDC on the compression stroke.
   If the No. 1 cylinder intake and exhaust valve push rods are depressed, the No. 4 piston is at TDC on the compression stroke.

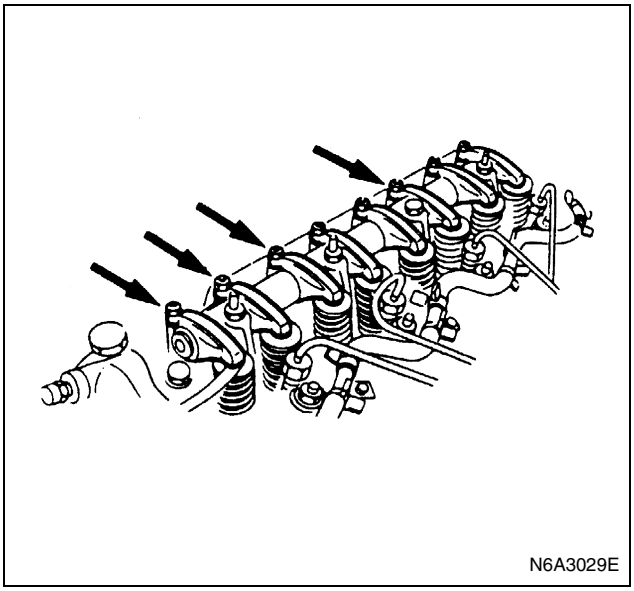


N6A3028E

Adjust the No. 1 or the No. 4 cylinder valve clearance while their respective cylinders are at TDC on the compression stroke.

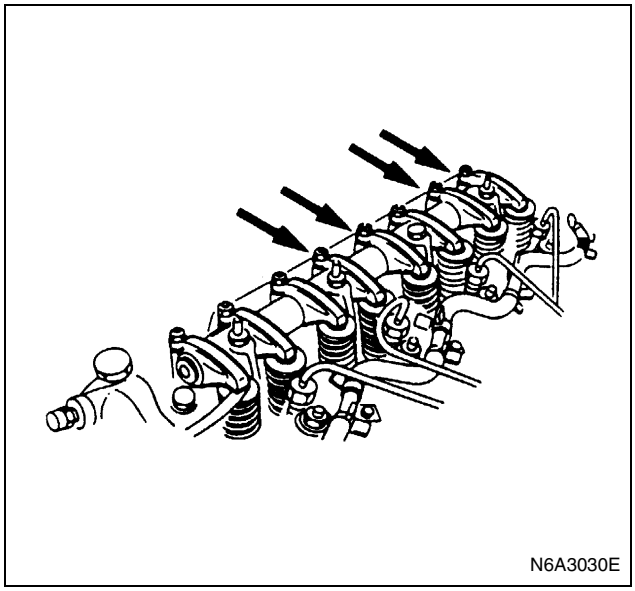
Valve Clearance (At Cold)	mm (in)
0.4 (0.016)	

4. Loosen each valve clearance adjusting screw as shown in the illustration.
   - No.1 Cylinder T.D.C. (Compression stroke)



N6A3029E

5. Insert a feeler gauge of the appropriate thickness between the rocker arm and the valve stem end.
6. Turn the valve clearance adjusting screw until a slight drag can be felt on the feeler gauge.
7. Tighten the lock nut securely.
8. Rotate the crankshaft 360°.
9. Realign the crankshaft damper pulley TDC notched line with the timing pointer.
10. Adjust the clearance for the remaining valves as shown in the illustration.
    - No.4 Cylinder T.D.C. (Compression stroke)

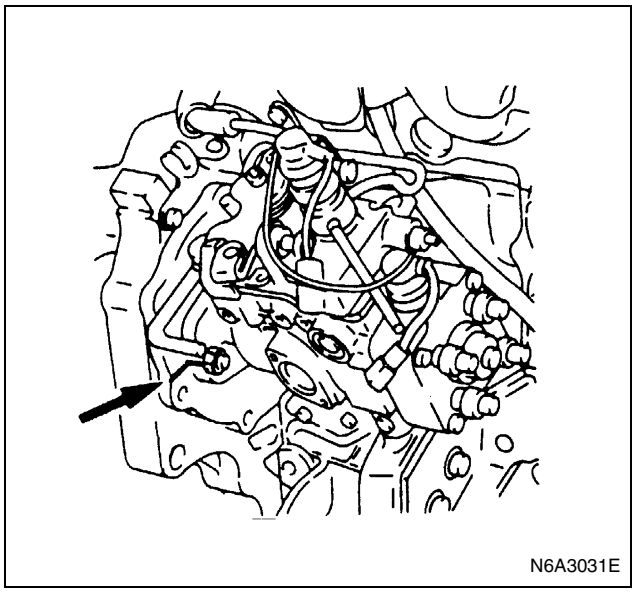


N6A3030E

Injection Timing Adjustment

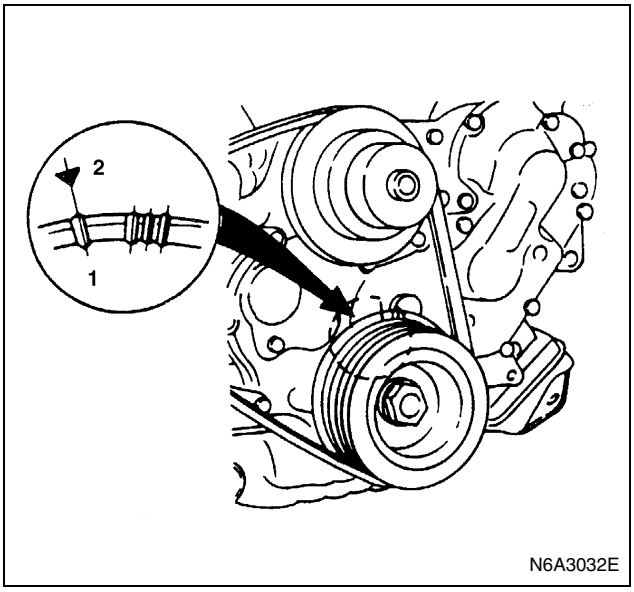
(4JB1/4JB1-TC/4JG2 Only)

1. Check that the notched line on the injection pump flange is aligned with the front plate or the timing gear case notched line.



N6A3031E

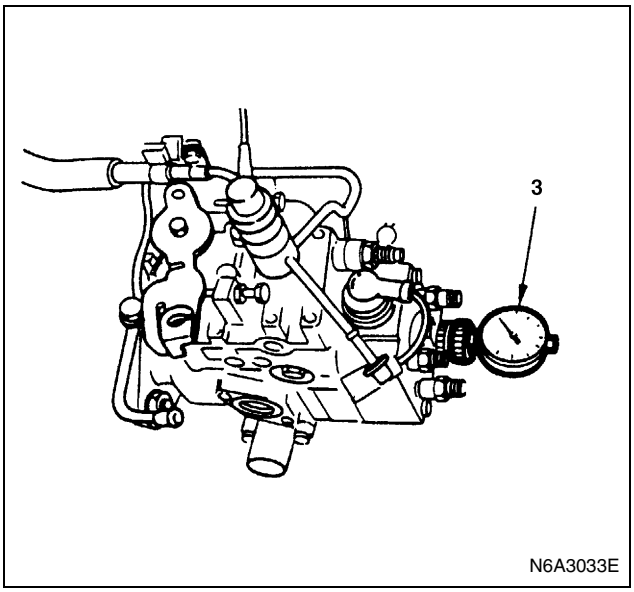
2. Bring the piston in the No. (1) cylinder to TDC 1 on the compression stroke by turning the crankshaft until the crankshaft pulley TDC line is aligned with the timing mark (2).



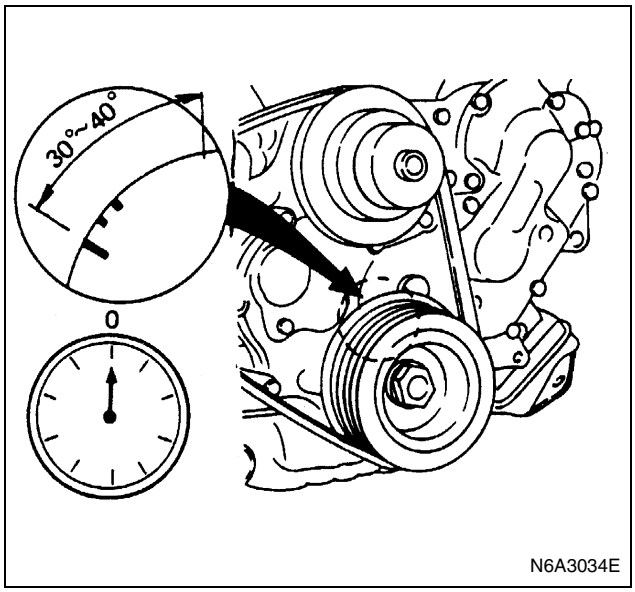
Notice:
Check for play in the No. 1 intake and exhaust valve push rods.

If the No. 1 cylinder intake and exhaust valve push rods have play, the No. 1 piston is at TDC on the compression stroke.

3. Disconnect the injection pipe from the injection pump.
4. Remove one bolt from the distributor head.
5. Insert a screwdriver into a hole in the fast idle lever and turn the lever to release the W-C.S.D. function. (If so equipped)
6. Install the static timing gauge (3).
   The probe of the gauge should be depressed inward approximately 2 mm (0.079 in).
   Static Timing Gauge: 5-8840-0145-0 (J-28827)



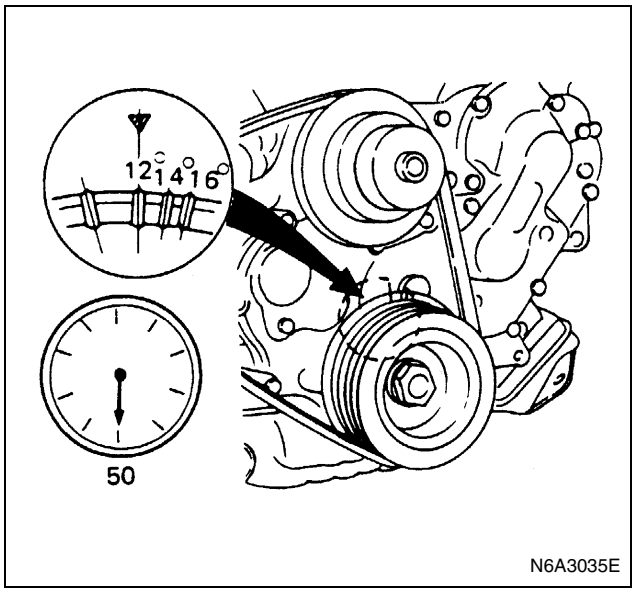
7. Rotate the crankshaft to bring the piston in the No. 1 cylinder to a point 30 — 40° BTDC.
8. Set the timing gauge needle to zero.
9. Move the crankshaft pulley slightly in both directions to check that the gauge indication is stable.



10. Turn the crankshaft clockwise and read the gauge indication when the crankshaft pulley timing mark is aligned with the pointer.

4JB1	BTDC 14°
4JB1-TC	BTDC 4°
4JG2	ATDC 2°

Standard Reading	mm (in)
0.5 (0.02)	



If the injection timing is outside the specified range, continue with the following steps.

11. Loosen the injection pump fixing nuts and bracket bolts.
12. Adjust the injection pump setting angle.

	When large than standard value	When smaller than standard value
Gear drive	A	B

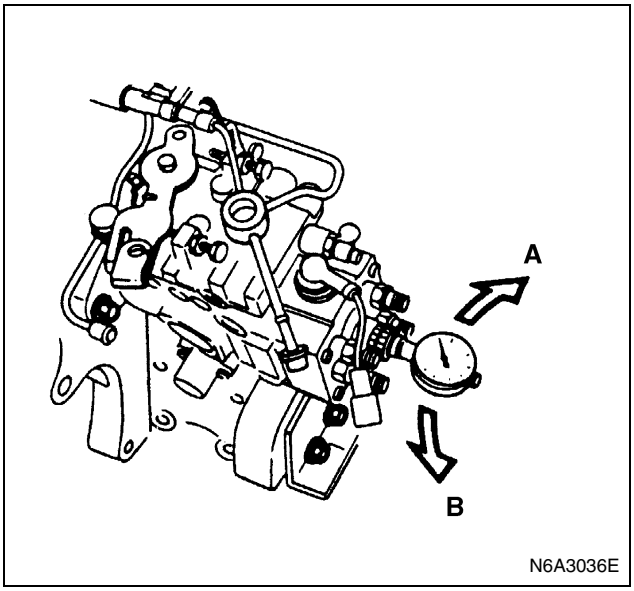
A: Move the injection pump toward the engine.

B: Move the injection pump away from the engine.

Tighten the pump fixing nut, adjust bolt and pump distributor head plug to the specified torque.

Tighten:

- Pump fixing bolt to 24 N·m (2.4 kg·m / 17 lb·ft)
- Adjust bolt to 19 N·m (1.9 kg·m / 14 lb·ft)
- Injection pump distributor head plug to 17 N·m (1.7 kg·m / 12 lb·ft)



Legend

A. To advance

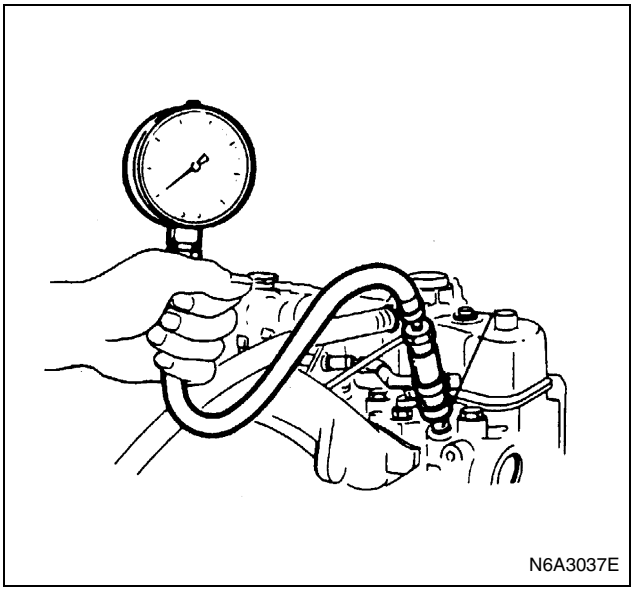
B. To retard

Caution:

When installing the distributor head/plug, be sure to use new copper washer.

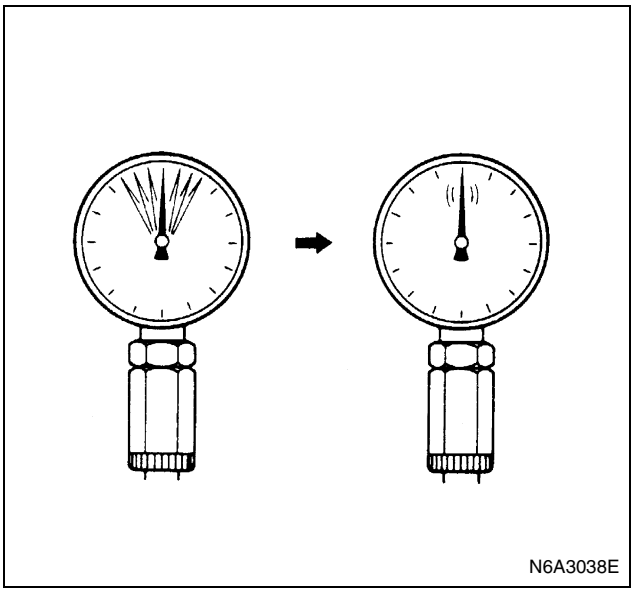
Compression Pressure Measure-ment

1. Start the engine and allow it to idle until the coolant temperature reaches 70 — 80°C (158 — 176°F).
2. Remove the following parts.
   - Glow plugs
   - Fuel cut solenoid connector
   - QOS (Quick-On Start System) fusible link wire at the connector.
3. Set the adapter and compression gauge to the No. 1 cylinder glow plug hole.
   Compression Gauge
   (with Adapter): 5-8840-2008-0 (J-29762)
   Adapter: 5-8531-7001-0



4. Turn the engine over with the starter motor and take the compression gauge reading.

Compression Pressure at 200 rpm kPa (kg/cm^2/psi)		
	Standard	Limit
4JB1	3,038 (31/441)	2,157 (22/313)
4JG2	3,334 (34/484)	2,452 (25/356)

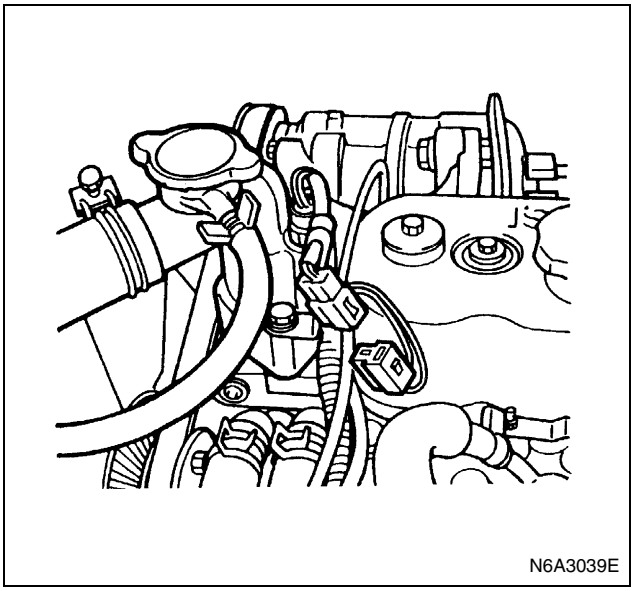


5. Repeat the procedure (Steps 3 and 4) for the remaining cylinders.
   If the measured value is less than the specified limit, refer to “Troubleshooting” in this Manual.

Quick-On Start II System (4JB1 / 4JB1-TC / 4JH1-TC only)

Quick-On Start System Inspection Procedure

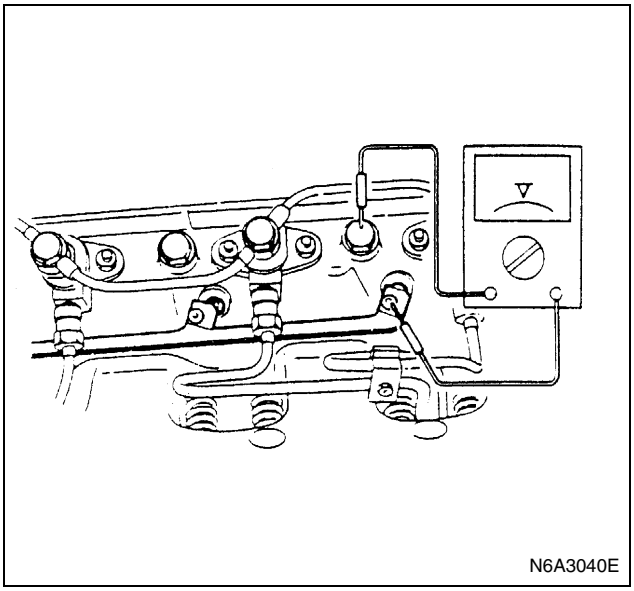
1. Disconnect the thermo-sensor connection on the thermostat outlet pipe.



N6A3039E

2. Turn the starter switch to the “ON” position.
   If the Quick-On Start II System is operating properly, the glow relay will make a clicking sound within 15 seconds after the starter switch is turned on.
3. Measure the glow plug terminal voltage with a circuit tester immediately after turning the starter switch to the “ON” position.

Glow Plug Terminal Voltage	V
Approx. 11	

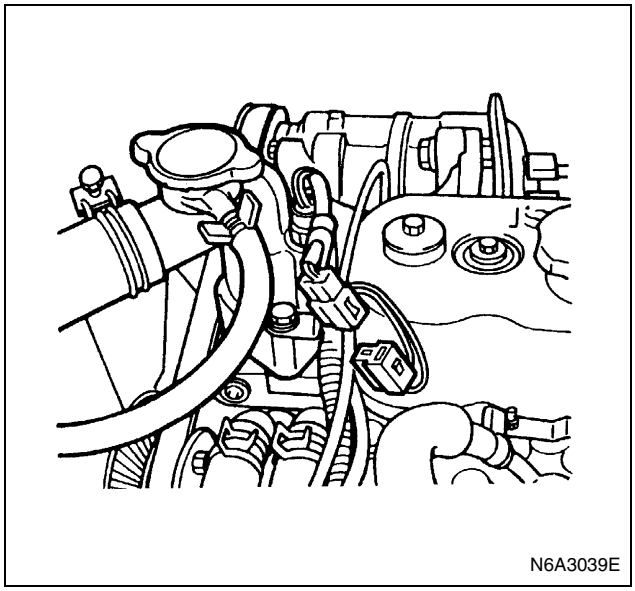


N6A3040E

Quick-ON Start III System (4JG2 only)

Quick-On Start System Inspection Procedure

1. Disconnect the thermo-sensor connection on the thermostat outlet pipe.



N6A3039E

2. Turn the starter switch to the “ON” position.
   If the Quick-On Start III System is operating properly, the glow relay will make a clicking sound within seven seconds after the starter switch is turned on.
3. Measure the glow plug terminal voltage with a circuit tester immediately after turning the starter switch to the “ON” position.

Glow Plug Terminal Voltage	V
8 — 9	

Notice:
Electrical power to the quick-on start system will be cut after the starter has remained in the “ON” position for twenty seconds.

Turn the starter switch to the “OFF” position and back to the “ON” position.

This will reset the Quick-On Start III System.

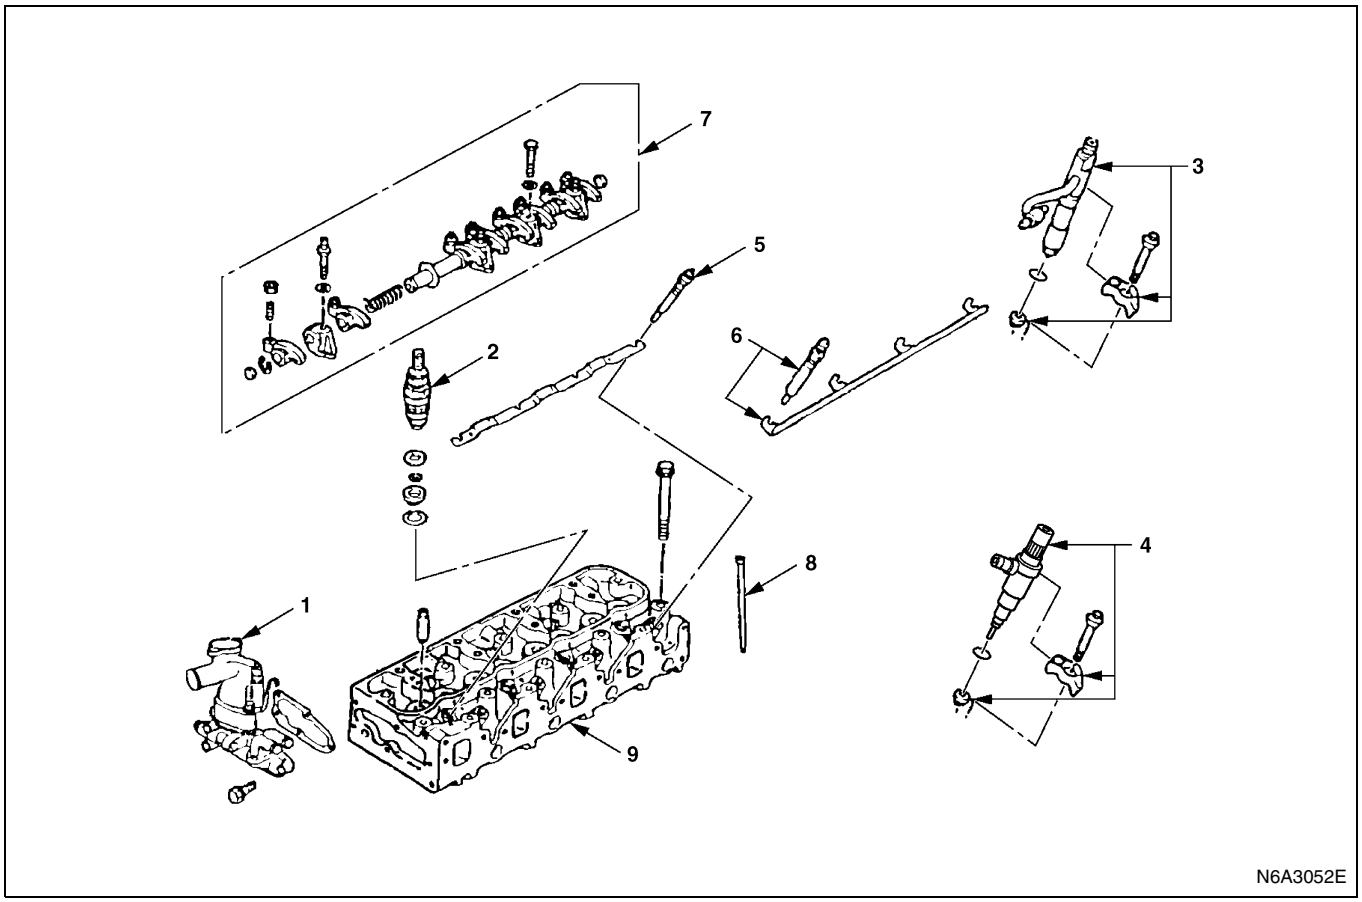
CYLINDER HEAD

Component



Legend

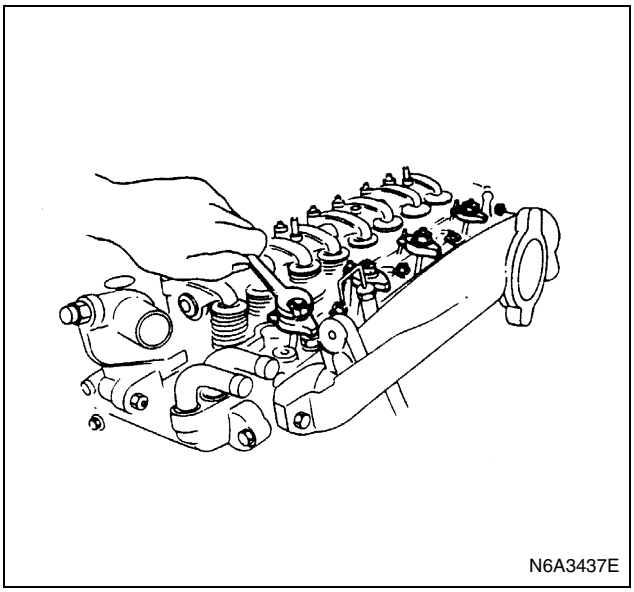
1. Thermostat housing assembly
2. Injection nozzle holder (4JG2)
3. Injection nozzle holder (4JB1, 4JB1-TC)
4. Injection nozzle holder (4JH1-TC)
5. Glow plug and plug connector (4JG2)
6. Glow plug and plug connector (4JB1, 4JB1-TC)
7. Rocker arm shaft and rocker arm
8. Push rod
9. Cylinder head

Notice:

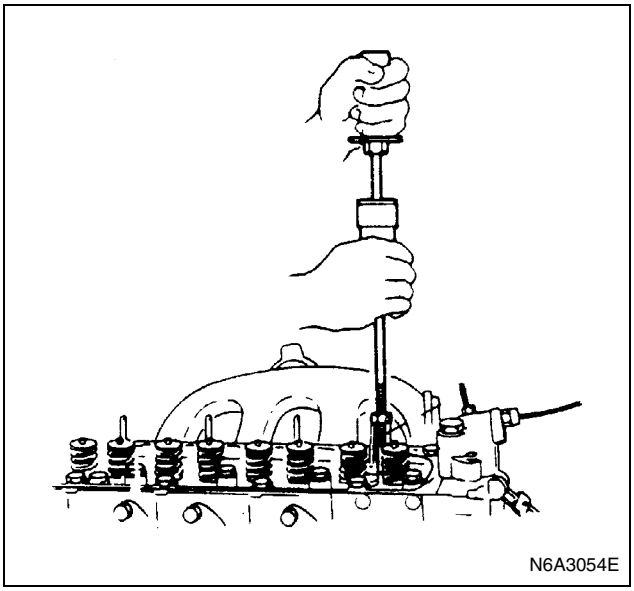
- During disassembly, be sure that the valve train components are kept together and identified so that they can be re-installed in their original locations.
- Before removing the cylinder head from the engine and before disassembling the valve mechanism, make a compression test and note the results.

Disassembly

1. Thermostat Housing Assembly
2. Injection Nozzle Holder (4JG2)
3. Injection Nozzle Holder (4JB1, 4JB1-TC)
4. Injection Nozzle Holder (4JH1-TC)
   1) Remove the nozzle holder bracket nuts.

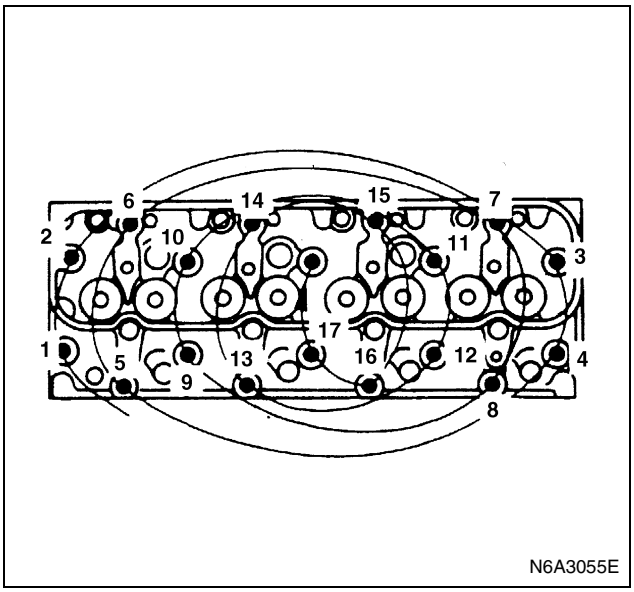


2) Use the nozzle holder remover and the sliding hammer to remove the nozzle holder together with the holder bracket.
Nozzle Holder Remover: 5-8840-2034-0
Sliding Hammer: 5-8840-0019-0



N6A3054E

5. Glow Plug and Glow Plug Connector (4JG2)
6. Glow Plug and Glow Plug Connector (4JB1, 4JB1-TC, 4JH1-TC)
7. Rocker Arm Shaft and Rocker Arm
8. Push Rod
9. Cylinder Head
   - Loosen the cylinder head bolts a little at a time in the numerical order shown in the illustration.



N6A3055E

Notice:
Failure to loosen the cylinder head bolts a little at a time in numerical order will adversely effect the cylinder head lower surface.

Clean

- Cylinder head bolts
- Cylinder head
  Carefully remove all varnish, soot and carbon to the bare metal. Do not use a motorized wire brush on any gasket sealing surface.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

- Cylinder head gasket and mating surfaces for leaks, corrosion and blow-by. If the gasket has failed, determine the cause;
  - Improper installation
  - Loose or warped cylinder head
  - Insufficient torque on head bolts
  - Warped case surface

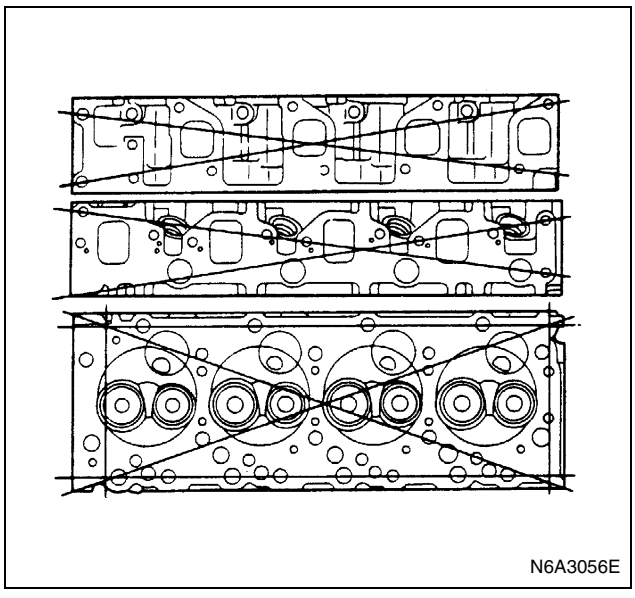
1. Cylinder head bolts for damaged threads or stretching and damaged heads caused by improper use of tools.

Caution:
Suspected bolts must be replaced.

2. Cylinder head for cracks, especially between valve seats and in the exhaust ports.
3. Cylinder head deck for corrosion, sand particles in head and porosity.

Caution:
Do not attempt to weld the cylinder head. Replace it.

4. Cylinder head deck, intake and exhaust manifold mating surfaces for flatness.
   These surfaces may be re-conditioned by milling (except cylinder head lower face). If the surfaces are “out of flat” by more than specification, the surface should be ground to within specifications. If more than limit of specification, it should be replaced.



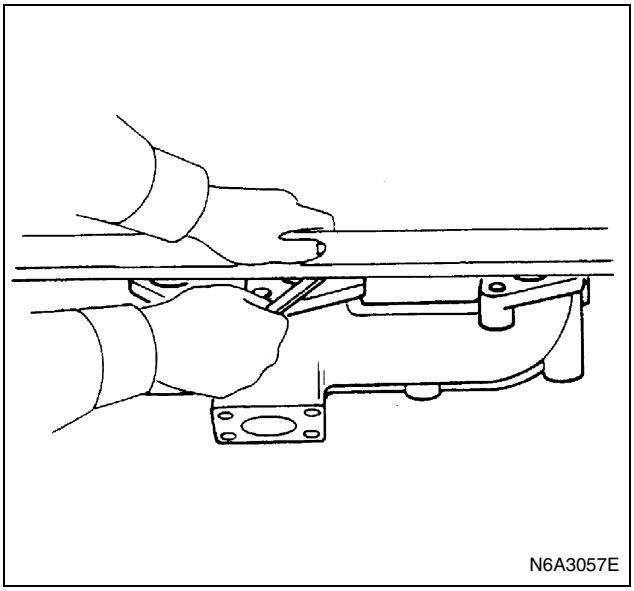
N6A3056E

Notice:
The cylinder head lower face cannot be reground.

		mm (in)
	Standard	Limit
Standard Limit Cylinder Head Lower Face	0.05 (0.002) or less	0.20 (0.0079)
Cylinder Head Height	92 (3.622)	91.55 (3.6043)

5. Water jacket sealing plugs seating surfaces.
6. Use a straight edge and a feeler gauge to measure the manifold cylinder head lifting face warpage. Regrind the exhaust manifold cylinder head lifting surfaces if the measured values are between the specified limit and the standard.
   If the measured values exceed the specified limit, the manifold must be replaced.

Exhaust Manifold Warpage	mm (in)
Standard	Limit
0.05 (0.002) or less	0.20 (0.0079)

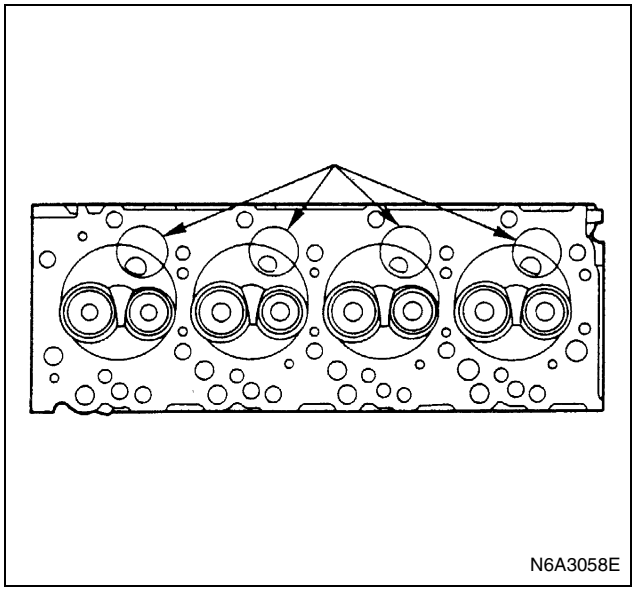


N6A3057E

Hot Plug Depression (4JG2 only)

1. Clean the cylinder head lower side, taking care not to damage the hot plug surfaces.
2. Use a straight edge and feeler gauge to measure hot plug depression in a straight line from the No. 1 hot plug to the No. 4 hot plug.
   If the measured value exceeds the limit, the hot plugs must be replaced.

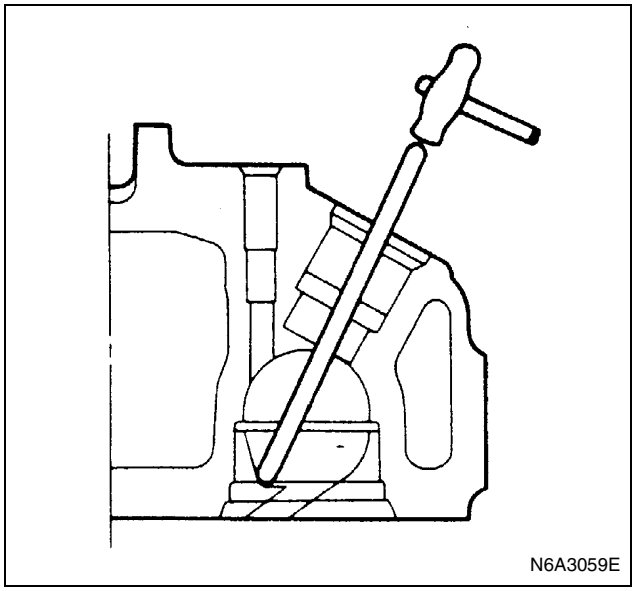
Depression Limit	mm (in)
0.02 (0.0008)	



N6A3058E

Hot Plug Removal (4JG2 only)

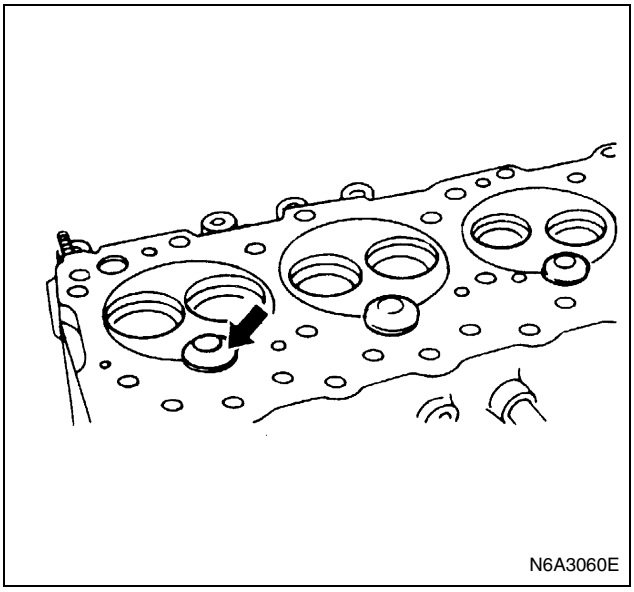
1. Insert a 3.0 — 5.0 (0.12 — 0.20.) diameter bar into the nozzle holder fitting hole unit it makes contact with the hot plug.
2. Lightly tap the bar with a hammer to drive the hot plug free.
   If the measured value exceeds the limit, the hot plugs must be replaced.



N6A3059E

Combustion Chamber Inspection (4JG2 only)

1. Remove the carbon adhering to the inside of the combustion chamber. Take care not to damage the hot plug fitting positions.



N6A3060E

2. Inspect the inside of the combustion chamber, the hot plug, and the hot plug machined faces for cracking and other damage.
   If cracking or damage is present, the cylinder head must be replaced.

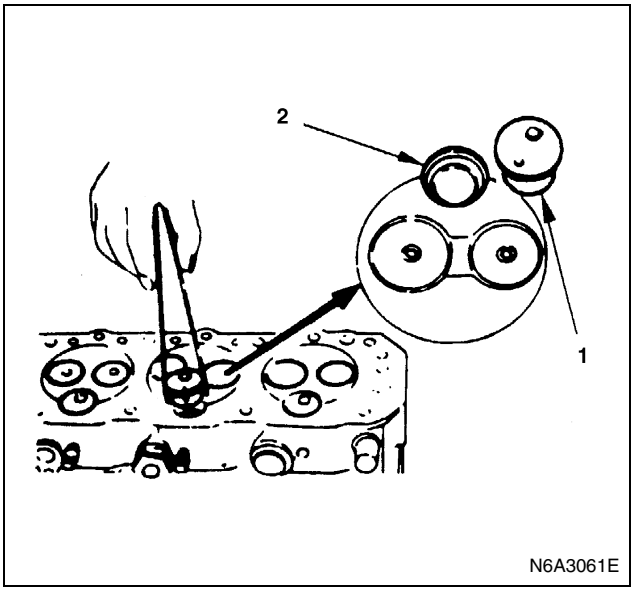
Notice:
Be absolutely certain that there are no scratches or protuberance on the combustion chamber surfaces which will be in contact with the hot plug after it is installed. There flaws will prevent the hot plug from seating correctly.

Hot Plug Inspection

Inspection the hot plugs for excessive wear and other damage. Replace the hot plugs if either of these conditions are discovered.

Hot Plug Installation (4JG2 only)

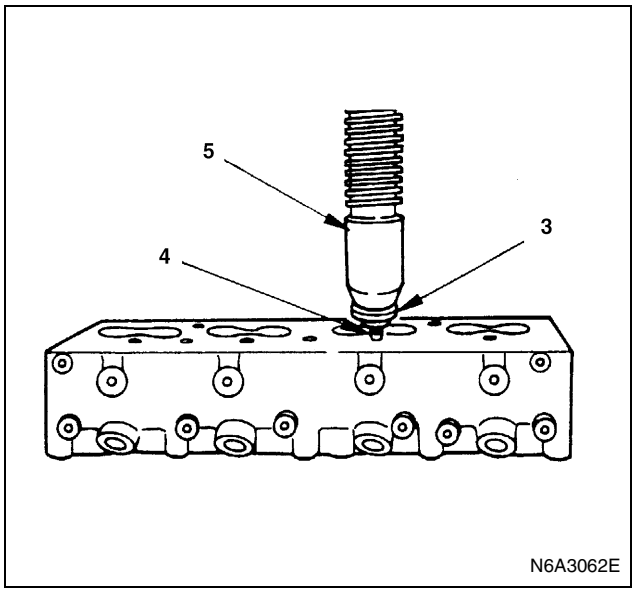
1. Align the hot plug knock ball (1) with the cylinder head groove (2) and tap it temporarily into position with a plastic hammer.



N6A3061E

2. Place an appropriate metal plate (3) thick over the hot plug upper surface (4).
3. Use a press (5) to exert a pressure of 44130 — 53937N (4500 — 5500 kg/9923 — 12128 lbs.) on the metal plate covering the hot plug upper surface. This will drive the hot plug into position.
4. Lightly tap the hot plug heads to make sure that they are firmly seated.
5. Repeat the procedure Steps 1-4 for the remaining hot plugs.

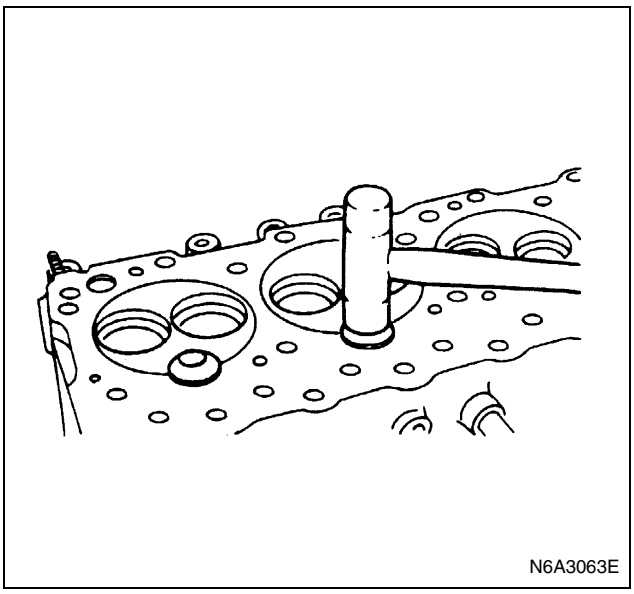
Caution:
Do not apply pressure greater than that specified.
Damage to the cylinder head will result.



N6A3062E

6. Use a surface grinder to grind off any hot plug surface protuberances.
   The hot plug surfaces must be perfectly flush with the cylinder head.
7. After grinding, make sure that the hot plug surfaces are completely free of protuberances.
   The hot plug surfaces must also be free of depressions.

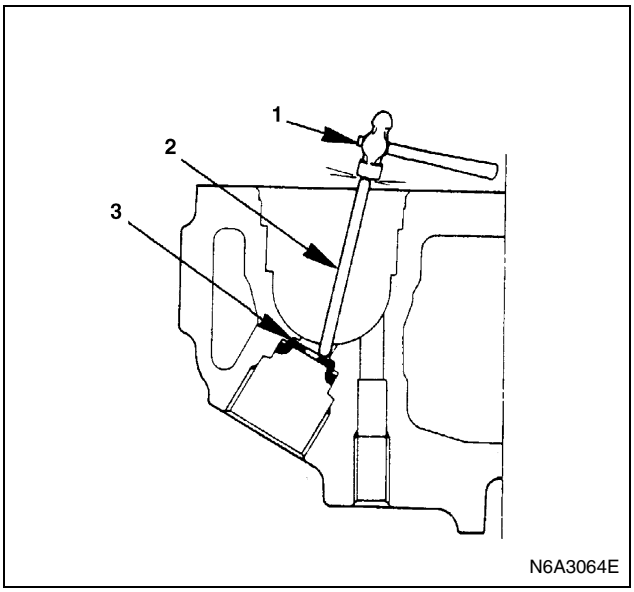
Once again, lightly tap the hot plug heads to make sure that they are firmly seated.



N6A3063E

Heat Shield Removal (4JG2 only)

After removing the hot plugs, use a hammer (1) and a brass bar (2) to lightly tap the lower side of the heat shield (3) and drive it free.



N6A3064E

Heat Shield Installation (4JG2 only)

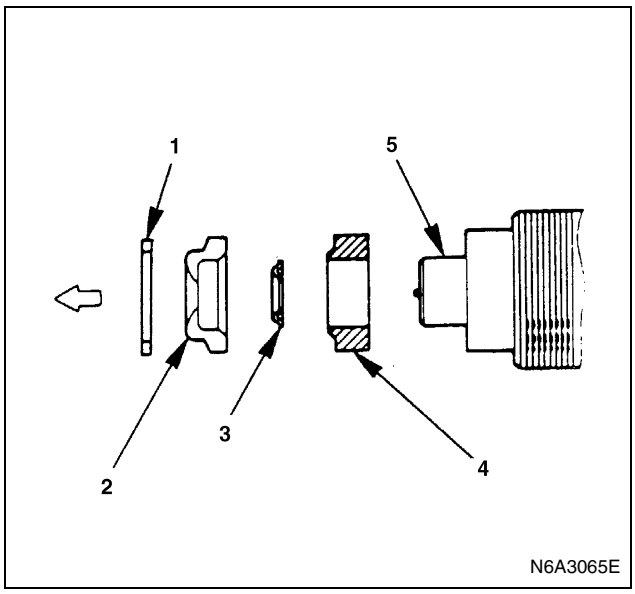
Install the heat shield washer and the heat shield to the cylinder head from the nozzle holder installation hole side.

Lightly tap the flange into place with a brass bar.

The heat shield flange side must be facing up.

Notice:

Always install a new heat shield. Never reuse the old heat shield.



N6A3065E

Legend

1. Gasket
2. Nozzle heat shield
3. Colgate washer
4. Gasket heat shield
5. Nozzle

Reassembly

Cylinder Head

1. Hot plug
   - Set the nock ball in the positioning groove on the cylinder head side according to the order of the cylinders, and hit it lightly with a plastic hammer.

Notice:

After being pressed into the cylinder head, the hot plugs were provided with surface grinding.

Accordingly, their dimensions are different individually among them, and take care not confuse the order of the cylinders.

When replacing the hot plug with new one:

When assembling a new hot plug, set the knock ball in the positioning groove on the cylinder side and hit it lightly with a plastic hammer until the hot plug is set in stably.

With patch attached to the hot plug to prevent it from being damaged, press it in with a force of 4.5 to 5.5 ton applied.

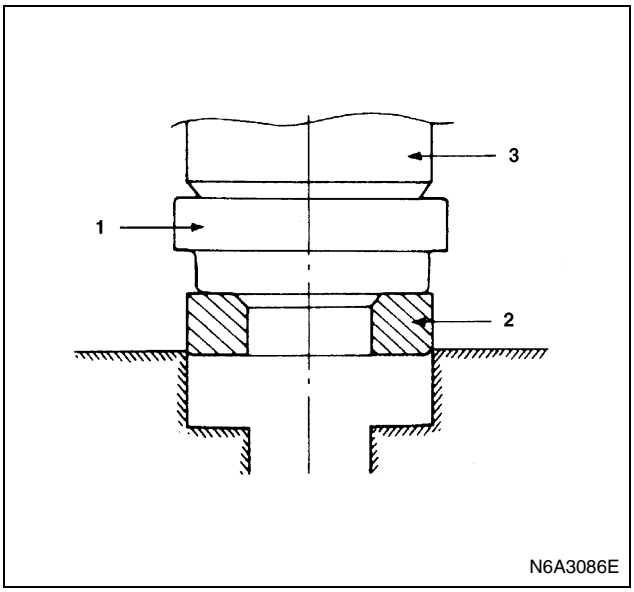
After pressing the hot plug, grind its surface to the cylinder head.

And finally, hit the hot plug lightly with a plastic hammer and check it for any excessive sinking, protrusion or backlash.

2. Valve Seat Insert Installation
   1) Carefully place the attachment (1) (having a smaller outside diameter than the valve seat insert) on the valve seat insert (2).

Notice:
The smooth side of the attachment must contact the valve seat insert.

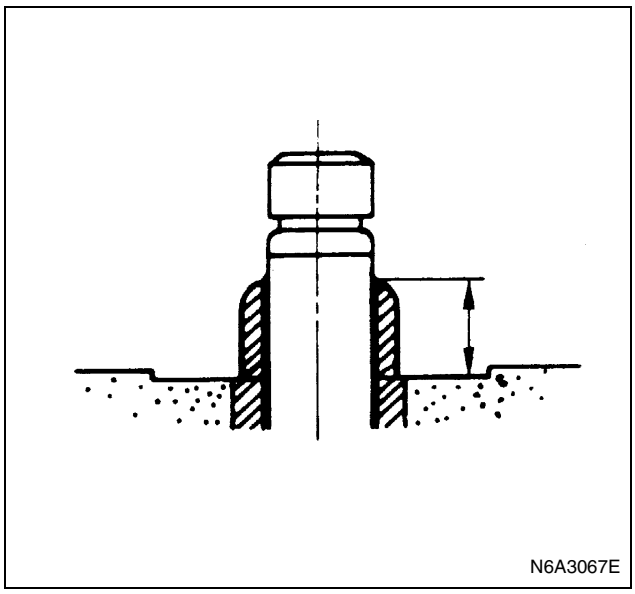
   2) Use the bench press (3) to gradually apply pressure to the attachment and press the valve seat insert into place.



Notice:
Do not apply an excessive amount of pressure with the bench press. Damage to the valve seat will result.

Measure the height of the valve guide upper end from the upper face of the cylinder head.

Valve Guide Upper End Height (H) (Reference) mm (in)
13 (0.51)



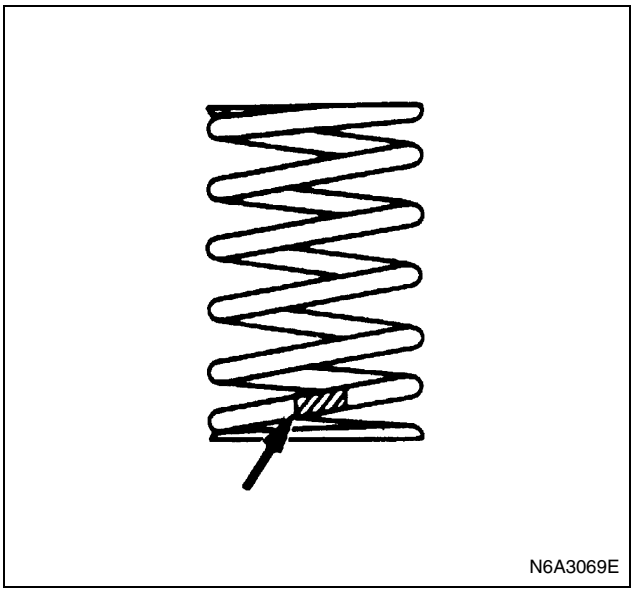
Notice:
If the valve guide has been removed, both the valve and the valve guide must be replaced as a set.

   3) Spring lower seat
   4) Valve stem oil seal
      - Install a new oil controller in the valve.
      - Guide using special tool
        Oil seal installer: 5-8840-2003-0

   5) Valve
      - Apply engine oil to the outside of the valve stem before installing it.
   6) Valve Spring
      - Attach the valve spring to the upper spring seat.

Caution:
- The painted area of the valve spring should be facing downward.
    - Apply compressed air to cylinder from the glow plug hole to hold the valve in place.
    - Install split collar by special tool.

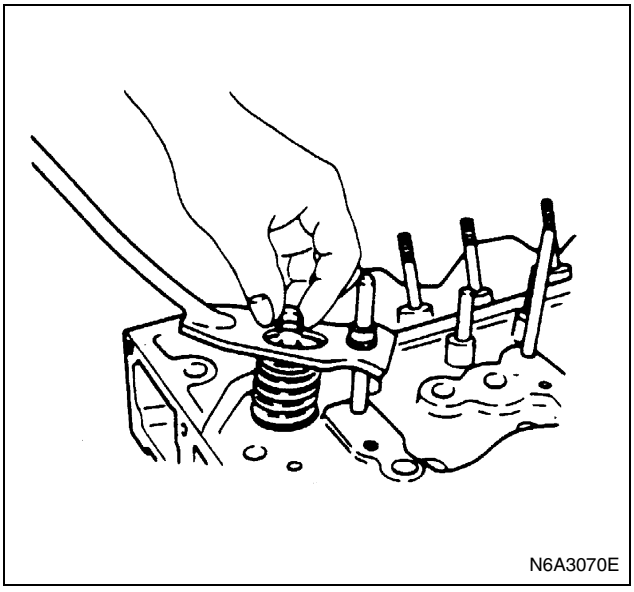
Valve spring compressor: 9-8523-1423-0 (J-29760)



N6A3069E

7) Split Collar
    - Use a spring compressor to push the valve spring into position.
    - Install the spring seat split collar.
    - Set the split collar by tapping lightly around the head of the collar with a rubber hammer.

Valve spring compressor: 9-8523-1423-0 (J-29760)



N6A3070E

3. Push Rod
4. Rocker Arm Shaft and Rocker Arm

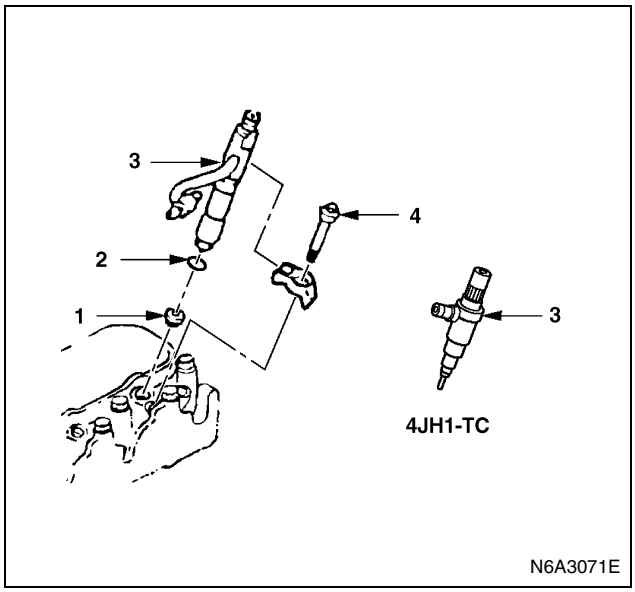
Tighten:
- Rocker arm shaft fixing bolts to 54 N·m (5.5 kg·m/40 lb·ft)

5. Glow Plug and Glow Plug Connector (4JB1/4JB1-TC/4JH1-TC)

Tighten:
Glow plugs to 23 N·m (2.3 kg·m/17 lb·ft)

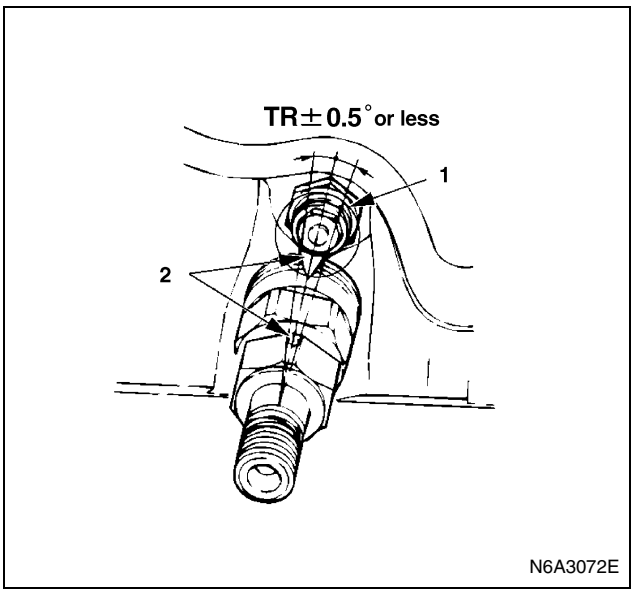
6. Injection Nozzle Holder (4JB1/4JB1-TC only)
7. Injection Nozzle Holder (4JH1-TC only)
    1) Install the injection nozzle gasket (1) and the O-ring (2) to the injection nozzle holder (3). Be sure that the O-ring fits snugly in the injection nozzle groove.
    2) Apply engine oil to the cylinder head nozzle holder hole.
    3) Install the nozzle holder together with the nozzle holder bracket (4) to the cylinder head.

Tighten:
37 N·m (3.8 kg·m/27 lb·ft)



N6A3071E

8. Injection Nozzle (4JG2 only)
    - Lightly tighten the holder nut to suck extent that the nozzle holder can turn one word and one word.
    - Set positioning confirmation drilled hole (ϕ2) within a nozzle turning angle of $\pm$5° against the cylinder head side positioning boss.



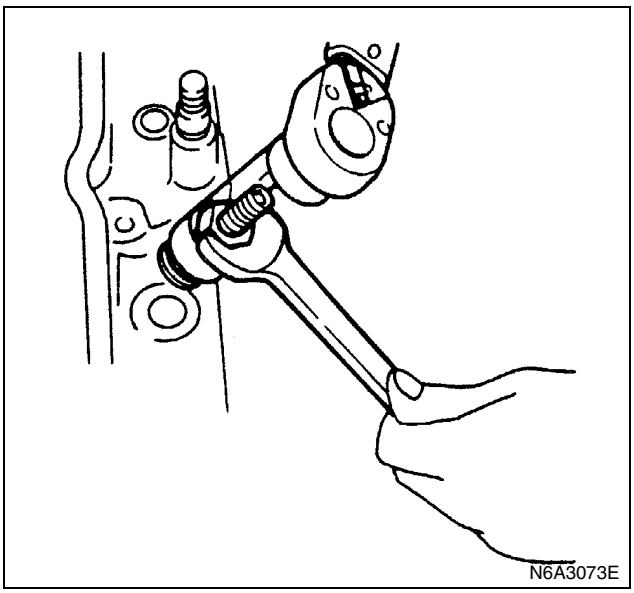
Legend
1. Glow plug
2. Positioning boss

- Apply a wrench as illustrated and tighten the holder nut to the specified torque using a special tool.

Caution:
- After tightening the holder nut, make sure that the drilled hole makes ±5° or smaller with the cylinder head-side positioning boss.
- When mounting leak off pipe, injection nozzle and pipe, clean then with air so that dust may not enter.

Tighten:
Nozzle fixing to 64 N·m (6.5 kg·m/47 lb·ft)

Wrench: Nozzle holder 5-8840-0259-0

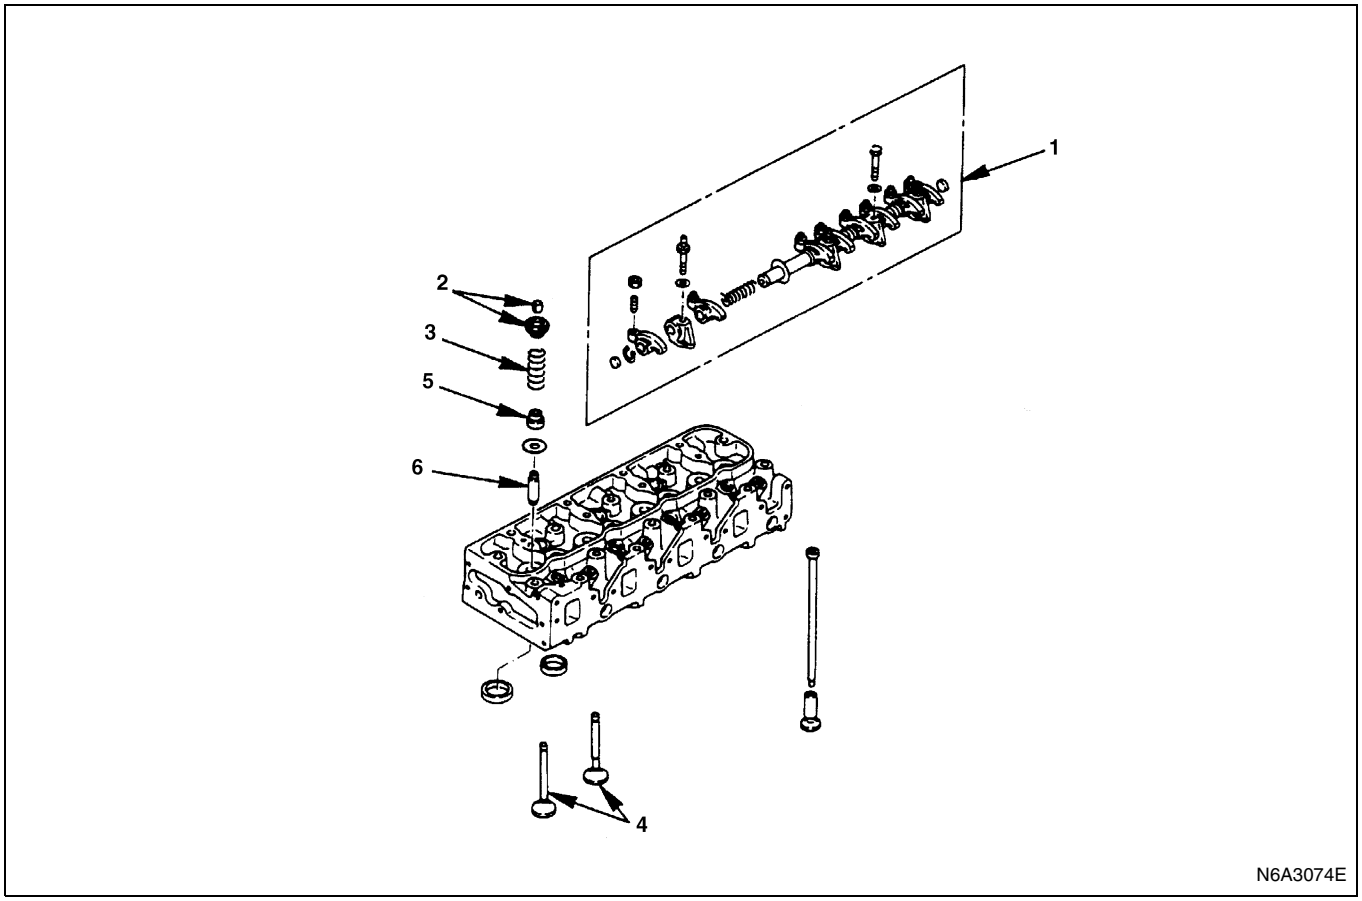


9. Thermostat Housing Assembly

Tighten:
Thermostat housing assembly fixing bolt to 19 N·m (1.9 kg·m/14 lb·ft)

VALVE SPRING, VALVE GUIDE OIL SEAL, VALVE GUIDE, PUSH ROD

Component



Legend

1. Rock arm assembly

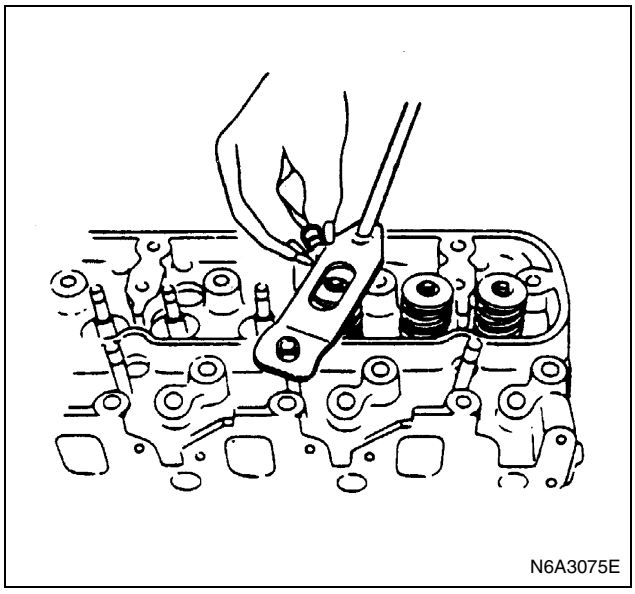
Disassembly

1. Rocker Arm Assembly
2. Split Collar
   Using special Tool, compress valve spring
   Valve spring compressor: 9-8523-1423-0 (J-29760)



3. Valve Spring
4. Valve

5. Valve Guide Oil Seal
6. Valve Guide
   Valve Guide Replacer: 9-8523-1212-0

Inspection and Repair

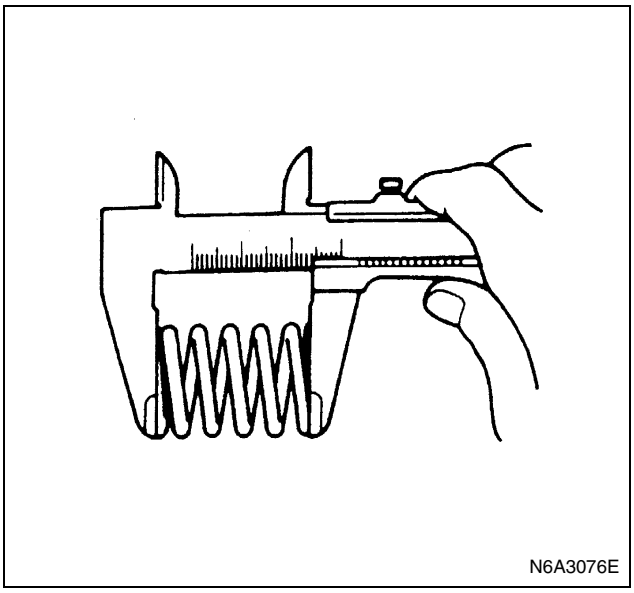
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Valve spring

Caution:
Visually inspect the valve springs and replace them if damage or abnormal wear is evident.

1. Free height
   - Measure the free height of the springs. The springs must be replaced if the height is below the specified limit.

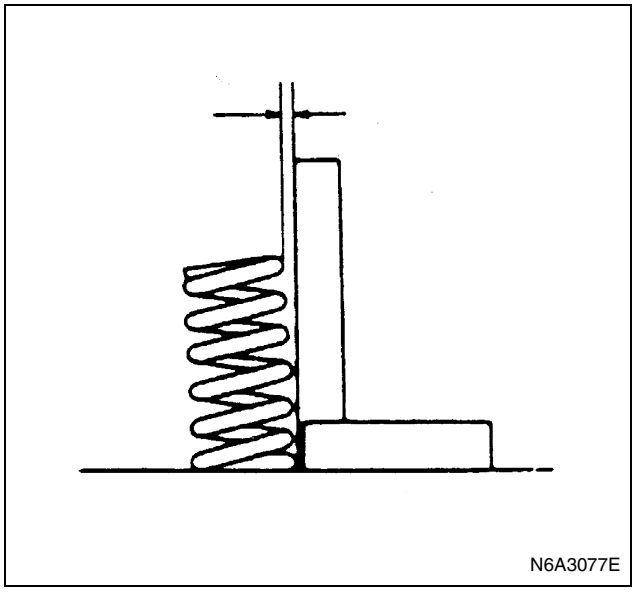
Free Height	mm (in)
Standard	Limit
48.0 (1.891)	47.100 (1.8560)



N6A3076E

2. Squareness
   - Measure the valve spring squareness with a steel square.
   - Replace the valve springs if the measured value exceeds the specified limit.

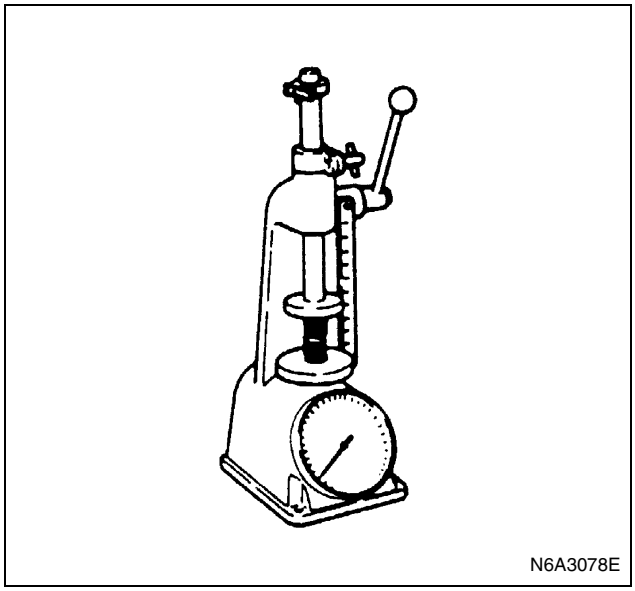
Limit	mm (in)
1.7 (0.067)	



N6A3077E

3. Spring tension
   - Use spring tester to compress the springs to the installed height. Measure the compressed spring tension.
     Replace the springs if the measured tension is below the specified limit.

Tension		N (kg/lb)
At installed height 38.9 mm (1.5 in)	Standard	Limit
	296.2 (30.2/66.6)	257.9 (26.3/57.9)



N6A3078E

Valve Guide

Caution:
Taking care not to damage the valve seat contact surface, when removing carbon adhering to the valve head.

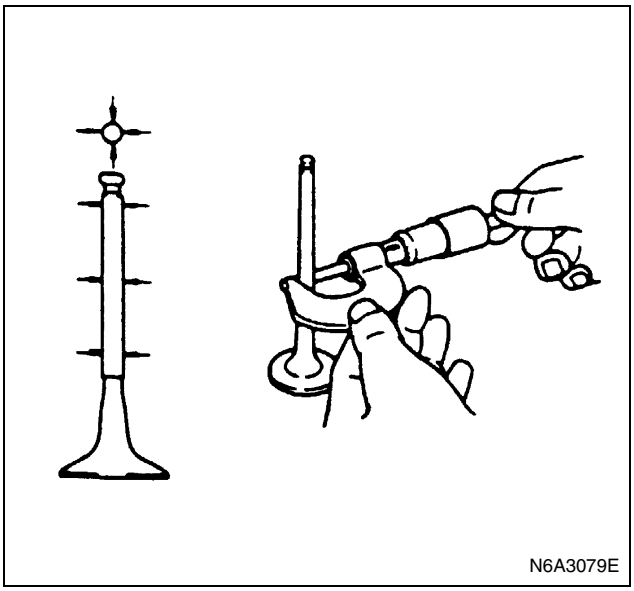
Carefully inspect the valve stem for scratching or abnormal wear. If these conditions are present, the valve and the valve guide must be replaced as a set.

1. Valve Guide Clearance
   - Measure the valve stem diameter with a micrometer.
     If the valve stem diameter is less than the specified limit, the valve and the valve guide must be replaced as a set.

			mm (in)
		Standard	Limit
Diameter of Valve stem	Inlet	7.946 — 7.961 (0.3128 — 0.3134)	7.880 (0.310.2)
	Exhaust	7.921 — 7.936 (0.3118 — 0.3124)	7.850 (0.3091)

   - Measure the inside diameter of the valve guide with a micrometer.
   - Subtract the measured outer diameter of the valve stem from the measured inner diameter of the valve guide. If the valve exceeds of the valve guide.
     If the valve exceeds the specified limit, the valve and the valve guide must be replaced as a set.

Valve Guide Clearance		mm (in)
	Standard	Limit
Inlet clearance	0.039 — 0.069 (0.0015 — 0.0027)	0.200 (0.0079)
Exhaust clearance	0.064 — 0.096 (0.0025 — 0.0038)	0.250 (0.0098)

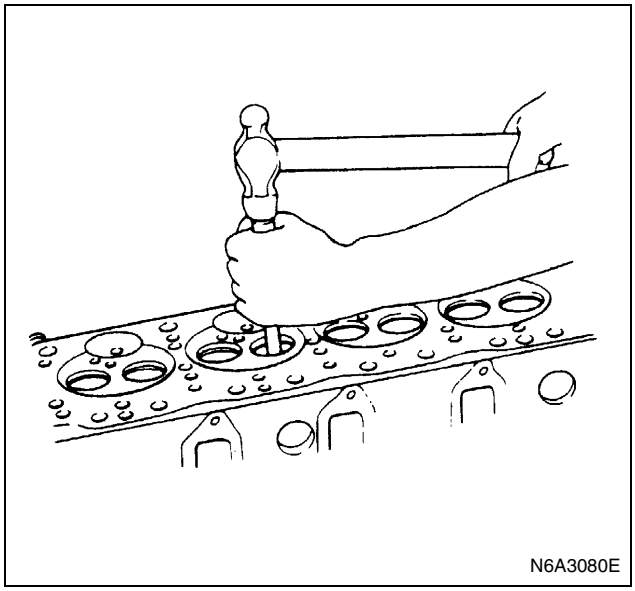


N6A3079E

Valve Guide Replacement

1. Using special tool, drive out the valve guide from the combustion chamber side.

Valve guide replacer: 9-8523-1212-0

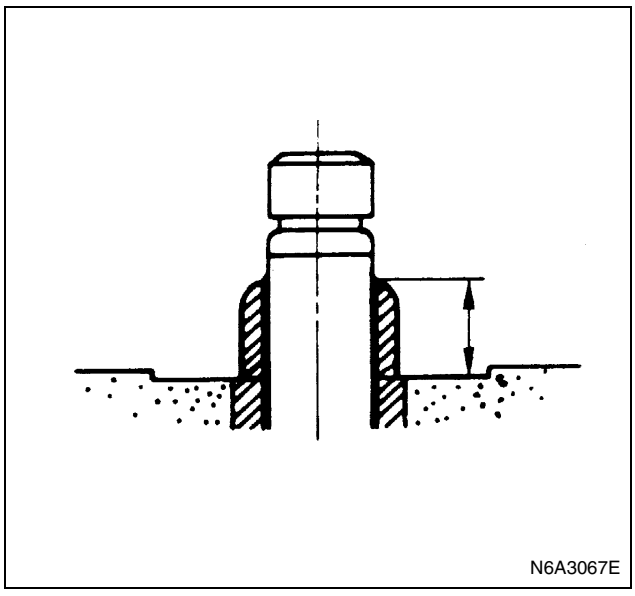


N6A3080E

2. Apply engine oil to the outside of the valve guide. Using special tool, drive in a new valve guide from cylinder head upper face side, and check the valve guide height.

Valve guide replacer: 9-8523-1212-0

Height	mm (in)
13 (0.51)	



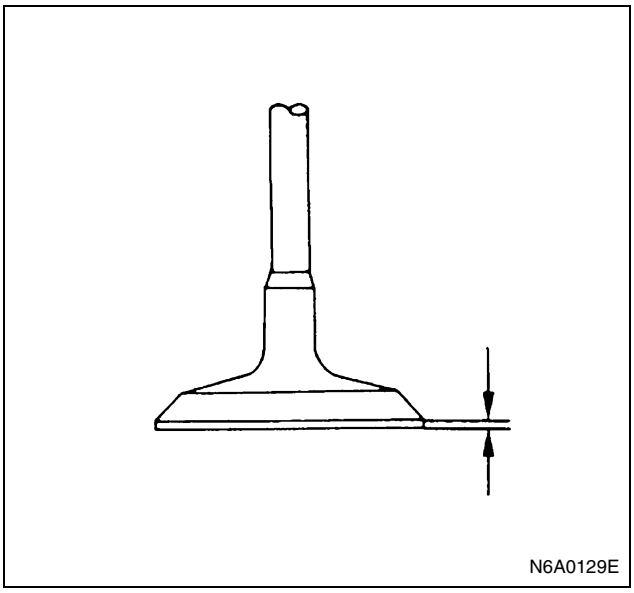
N6A3067E

Notice:
If the valve guide has been removed, both the valve and the valve guide must be replaced as a set.

Valve Thickness

1. Measure the valve thickness
2. If the measured value is less than the specified limit the valve and the valve guide must be replaced as a set.

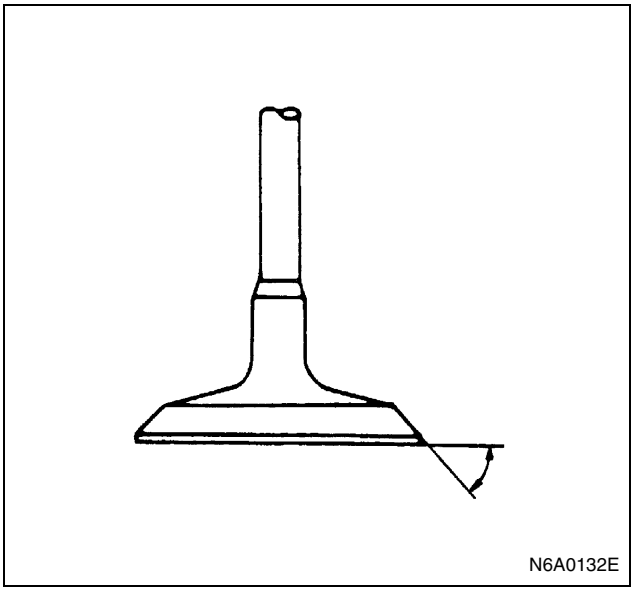
Valve Thickness			mm (in)
	Standard		Limit
4JB1 4JB1-TC	Inlet	1.79 (0.0705)	1.5 (0.06)
	Exhaust	1.83 (0.0720)	
4JG2	Inlet	1.41 (0.0555)	1.1 (0.043)
	Exhaust	1.39 (0.0547)	
4JH1-TC	Inlet	1.41 (0.0555)	1.1 (0.043)
	Exhaust	1.38 (0.0543)	



Contact Surface Angle on Valve Seat on Valve

1. Measure contact surface angle on valve seat.
2. If the measured value exceeds the limit, replace valve guide and valve seat as a set.

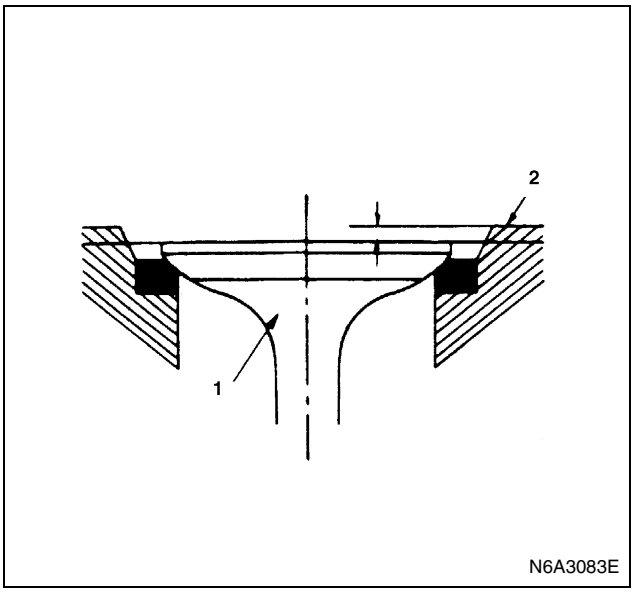
Standard	Degrees
45°	



Valve Depression

1. Install the valve (1) to the cylinder head (2).
2. Use a depth gauge or a straight edge with steel rule to measure the valve depression from the cylinder head lower surface.
   If the measured value exceeds the specified limit, the valve seat insert must be replaced.

Valve Depression			mm (in)
	Standard		Limit
4JB1 4JB1-TC	Inlet	0.73 (0.029)	1.28 (0.050)
	Exhaust	0.70 (0.028)	1.20 (0.047)
4JG2 4JH1-TC	Inlet	1.1 (0.043)	1.6 (0.063)
	Exhaust		

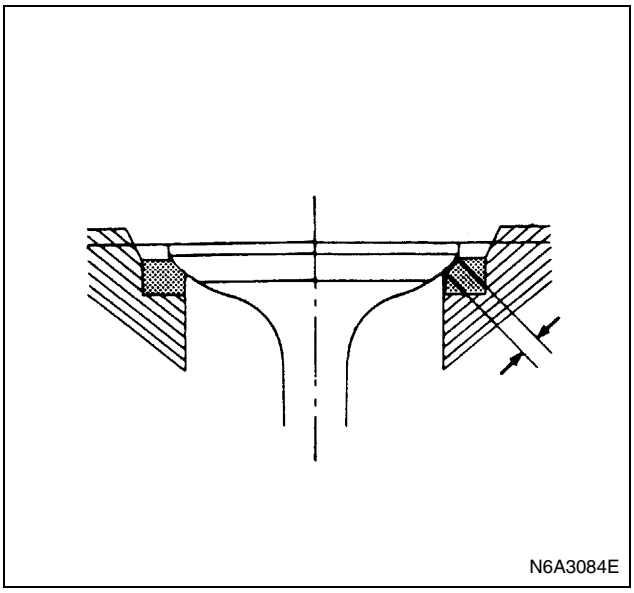


Valve Contact Width

1. Check the valve contact faces for roughness and unevenness. Make smooth the valve contact surfaces.

2. Measure the valve contact width.
   If the measured value exceeds the specified limit, the valve seat insert must be replaced.

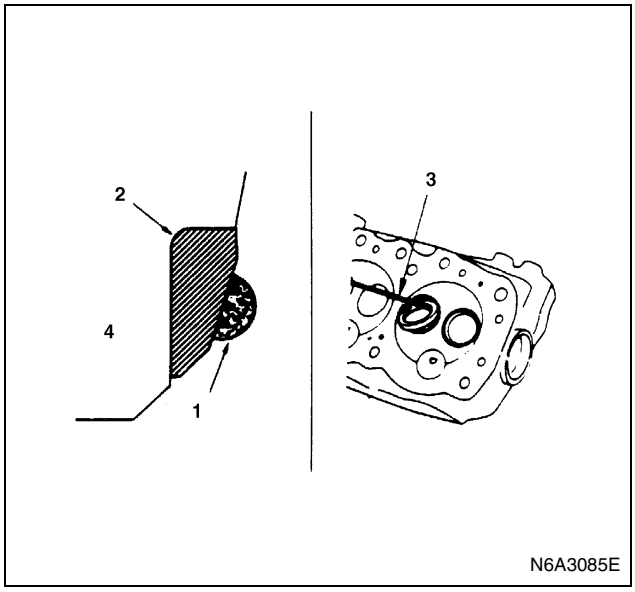
Contact Width		mm (in)
	Standard	Limit
Inlet	1.7 (0.0670)	2.2 (0.0866)
Exhaust	2.0 (0.0788)	2.5 (0.0984)



Valve Seat Insert Replacement

Valve Seat Insert Removal

1. Arc weld the tire inside circumference (1) of the valve seat insert (2).
2. Allow the valve seat insert to cool for a few minutes.
   This will invite contraction and make removal of the valve seat insert easier.
3. Use a screwdriver (3) to pry the valve seat insert free.
   Take care not to damage the cylinder head (4).
4. Carefully remove carbon and other foreign material from the cylinder head insert bore.

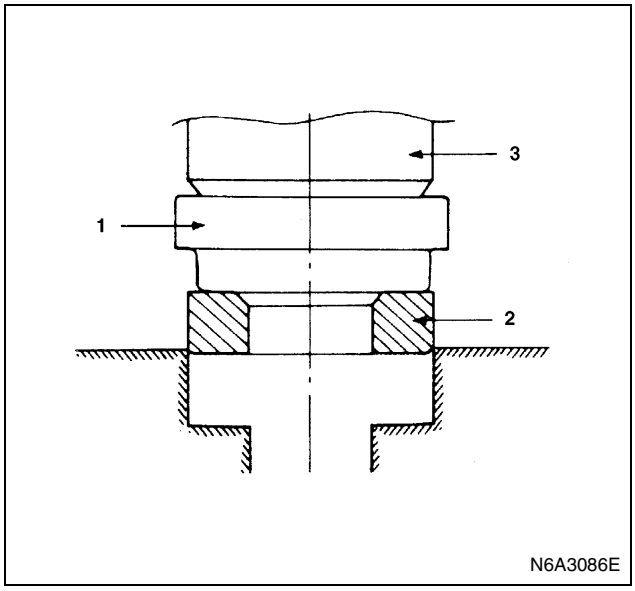


Valve Seat Insert Installation

1. Carefully place the attachment (1) (having a smaller outside diameter than the valve seat insert) on the valve seat insert (2).

Notice:
The smooth side of the attachment must contact the valve seat insert.

2. Use a bench press (3) to gradually apply pressure to the attachment and press the valve seat insert into place.



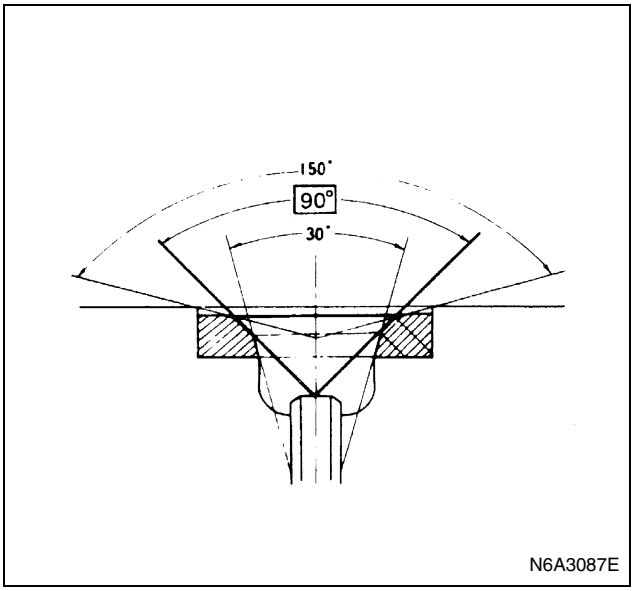
Notice:
Do not apply an excessive amount of pressure with the bench press. Damage to the valve seat insert will result.

Valve Seat Insert Correction

1. Remove the carbon from the valve seat insert surface.

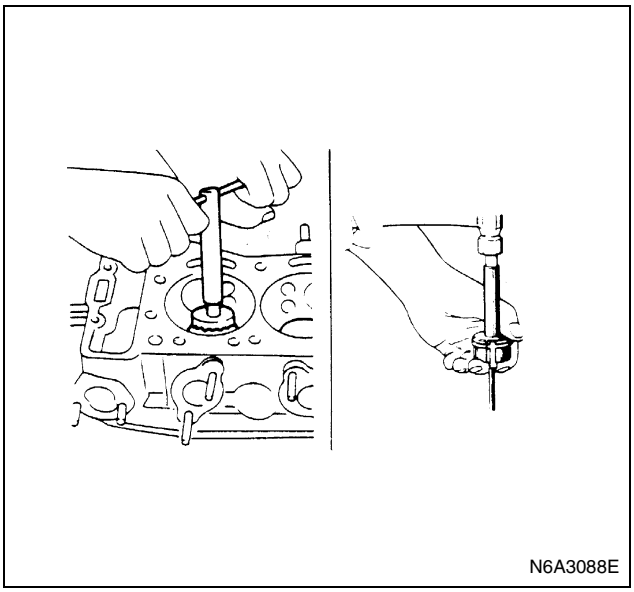
2. Use a valve cutter (15°, 45°, and 75° blades) to minimize scratches and other rough areas, this will bring the contact width back to the standard value. Remove only the scratches and rough areas. Do not cut away too much. Take care not to cut away unblemished area of the valve seat surface.

Valve Seat Angle	degree
45°	

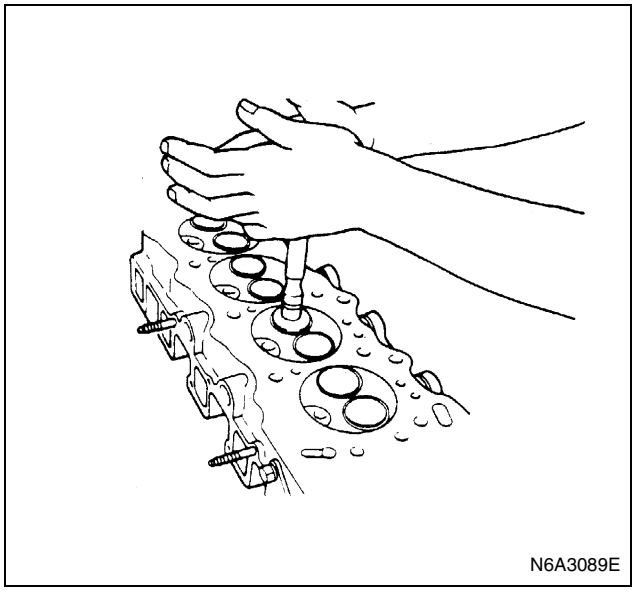


Notice:
Use an adjustable valve cutter pilot.
Do not allow the valve cutter pilot to wobble inside the valve guide.

3. Apply abrasive compound to the valve seat insert surface.



4. Insert the valve into the valve guide.
5. Turn the valve while tapping it to fit the valve seat insert.

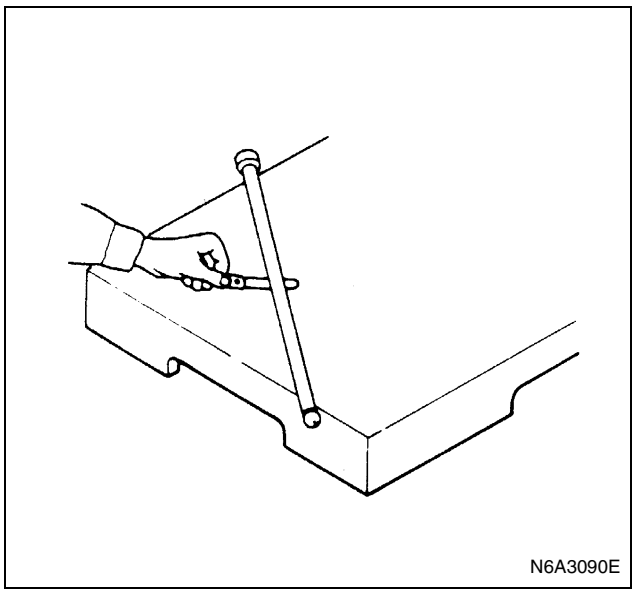


6. Check that the valve contract width is correct.
7. Check that the valve seat insert surface is in contact with the entire circumference of the valve.

Push Rod Curvature

1. Lay the push rod on a surface plate.
2. Roll the push rod along the surface plate and measure the push rod curvature with a thickness gauge.
   If the measure value exceeds the specified limit, the push rod must be replaced.

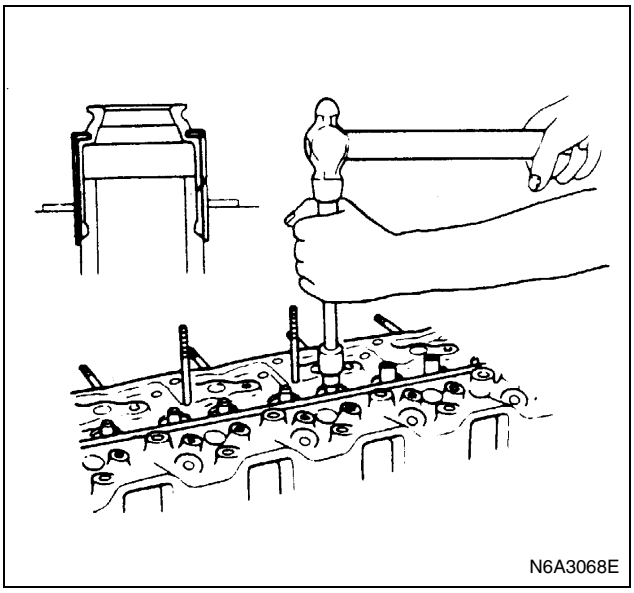
Push Rod Curvature Limit	mm (in)
0.4 (0.0157) or less	



3. Visually inspect both ends of the push rod for excessive wear and damage. The push rod must be replaced if these conditions are discovered during inspection.

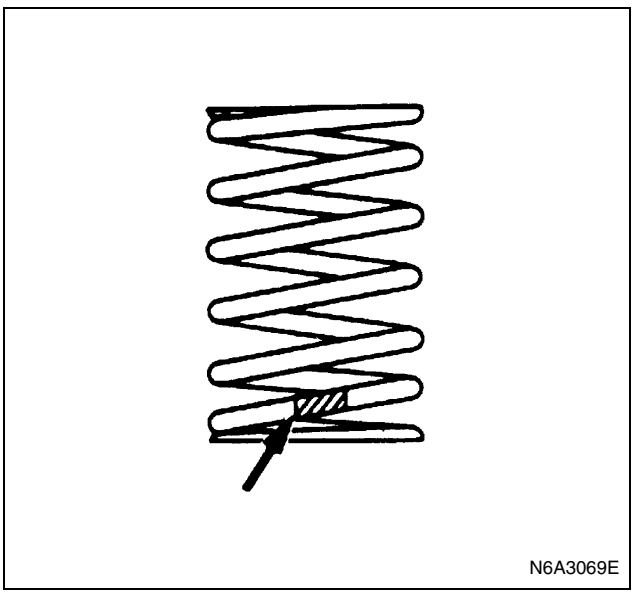
Reassembly

1. Valve Guide
   - Apply engine oil to the outside of the valve guide.
     Using special tool, drive in a new valve guide from the rocker arm shaft side.
     Valve guide replacer: 9-8523-1212-0
2. Valve Guide Oil Seal
   - Using special tool, drive in a new oil seal
     Oil special tool, drive in a new oil seal
     Oil seal installer: 5-8840-2033-0



N6A3068E

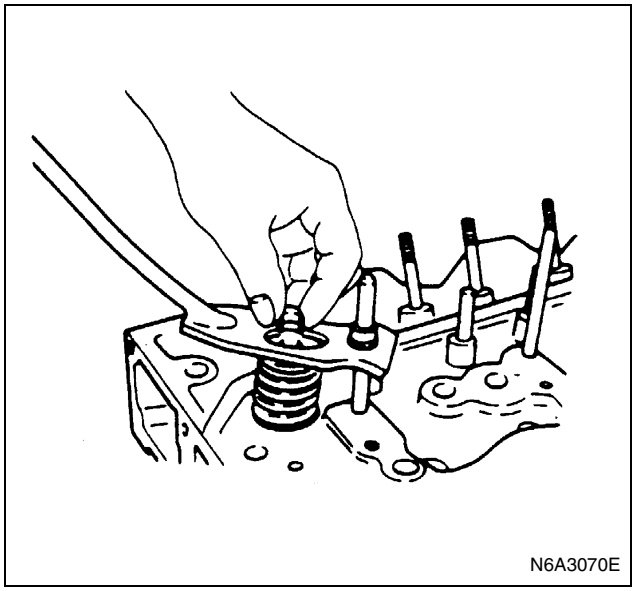
3. Valve
   - Apply engine oil to the outside of the valve stem.
4. Valve Spring
   - Attach the valve seat to the upper spring seat. The painted area of the valve spring should be facing downward.



N6A3069E

5. Split Collar
   - Use a spring compressor to push the valve spring into position.
   - Install the spring seat split collar.
   - Set the split collar by tapping lightly around the head of the collar with a rubber hammer.

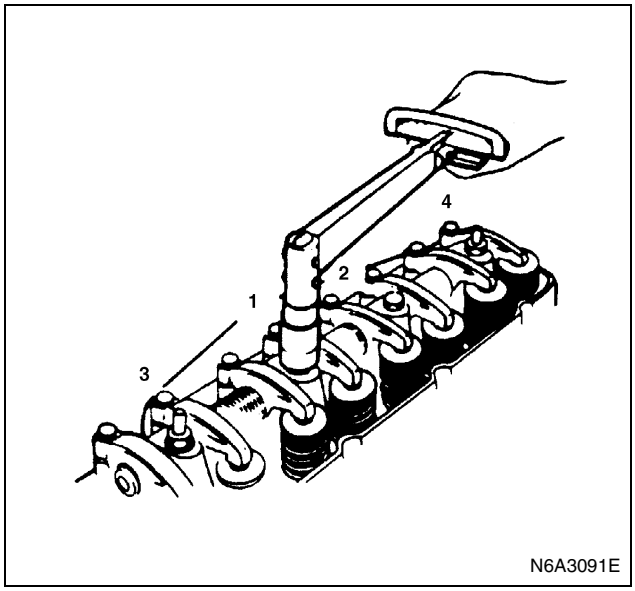
Valve spring compressor: 9-8523-1423-0 (J-29760)



N6A3070E

6. Rocker Arm Assembly

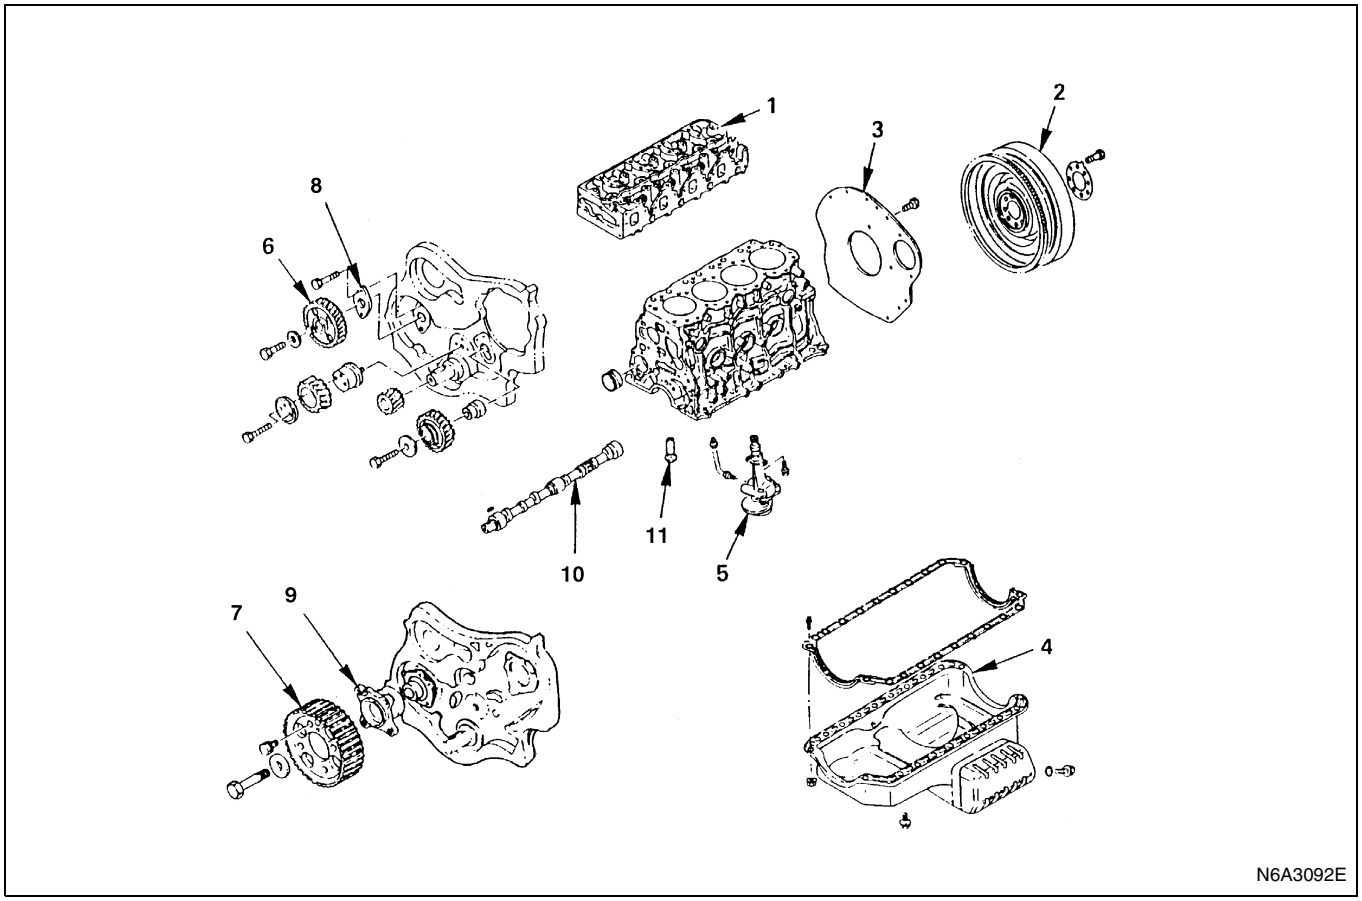
Tighten:
54 N·m (5.5 kg·m/40 lb·ft)



N6A3091E

CAMSHAFT, TAPPET

Component



Legend

1. Cylinder head assembly

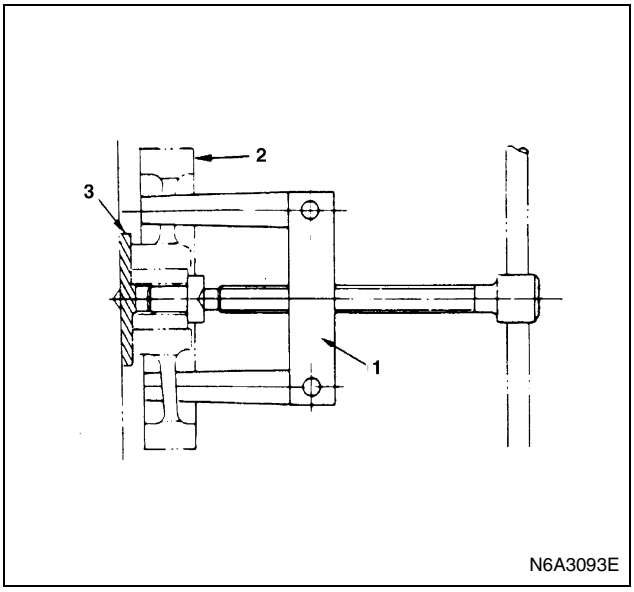
Disassembly

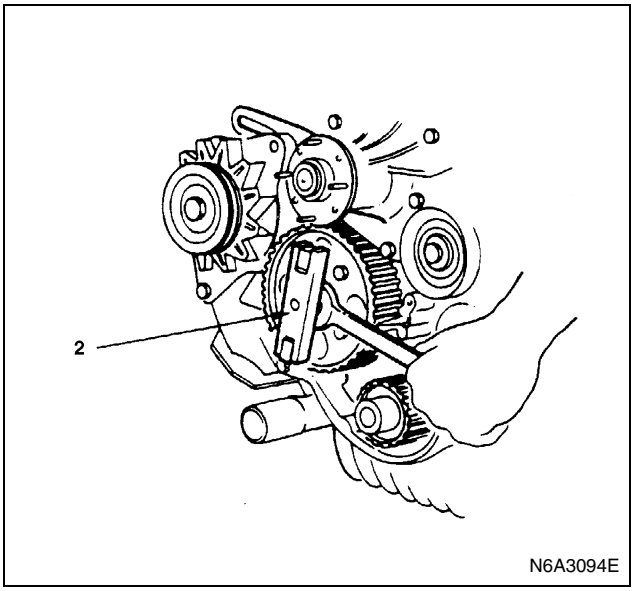
1. Cylinder Head Assembly
2. Flywheel
3. Cylinder Block Rear Plate
4. Oil Pan Assembly
5. Oil Pump Assembly
6. Camshaft Timing Gear (Gear Drive Model)
   - Remove the camshaft timing gear bolt from the camshaft.

Notice:
Hold the camshaft stationary to prevent the camshaft from turning.

- Use the universal puller (1) to pull out the camshaft timing gear (2).
- Universal Puller: 5-8521-0002-0
  Remove the thrust plate (3).



7. Camshaft Timing Pulley (Belt Drive Model)
   - Use the timing pulley puller (2) to remove the pulley.
     Timing Pulley Puller: 5-8840-0086-0
   - Remove the stopper bolt.
8. Camshaft Thrust Plate (Gear Drive Model)
9. Camshaft Pulley Center (Belt Drive Model)
10. Camshaft
11. Tappet



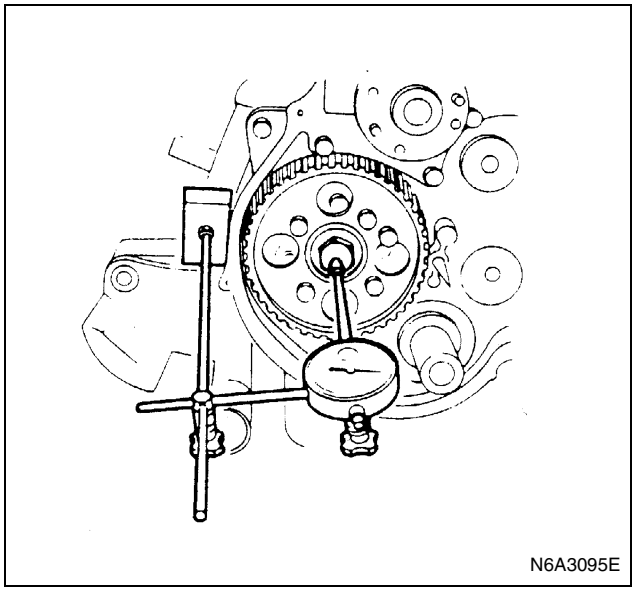
Inspection and Repair

Make the necessary adjustment, repairs, and part replacements if excessive wear or damage is discovered during inspection.

1. Measure the Camshaft Thrust Clearance
   - Use a dial indicator to measure the camshaft end play.
     This must be done before removing the camshaft gear.

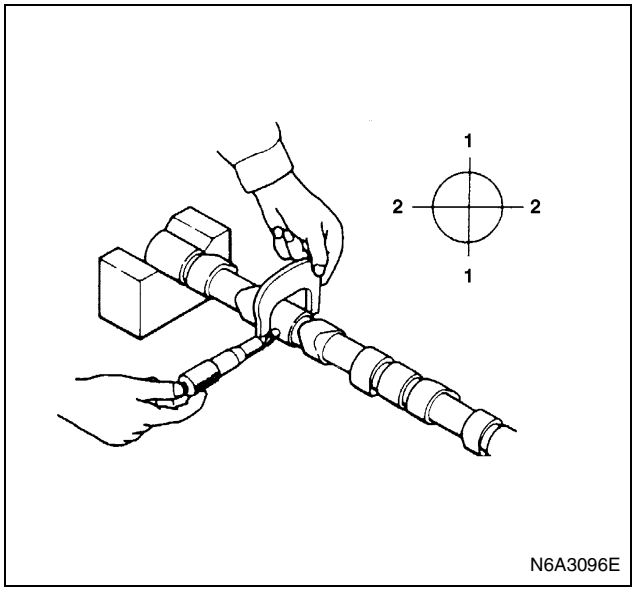
     If the camshaft end play exceeds the specified limit, the thrust plate must be replaced.

Camshaft End Play	mm (in)
Standard	Limit
0.08 (0.0031)	0.2 (0.0079)



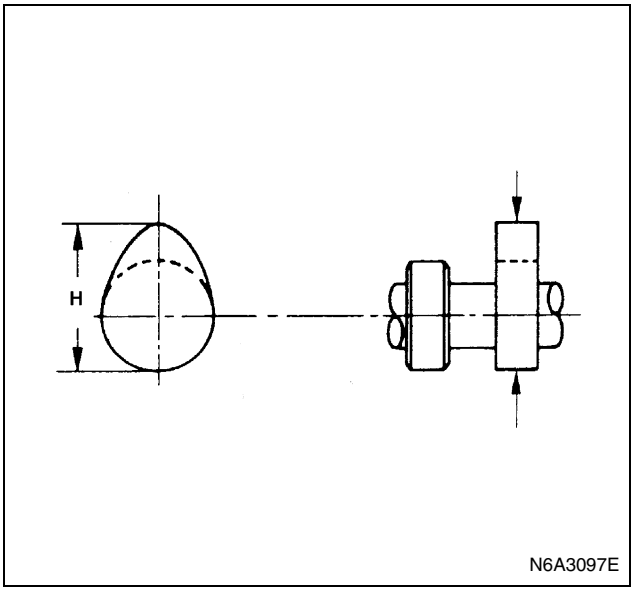
2. Camshaft Journal Diameter
   - Use a micrometer to measure each camshaft journal diameter in two directions (1) and (2). If the measured value is less than the specified limit, the camshaft must be replaced.

Journal Diameter	mm (in)
Standard	Limit
49.945 — 49.975 (1.9663 — 1.9675)	49.60 (1.9528)



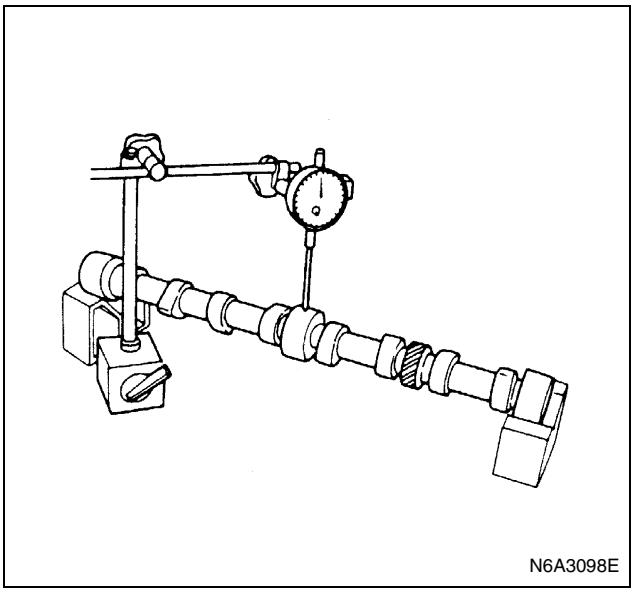
3. Cam Height
   - Measure the cam height H with a micrometer. If the measured value is less than the specified limit, the camshaft must be replaced.

Cam Height	mm (in)
Standard	Limit
42.02 (1.6543)	41.65 (1.6398)



4. Camshaft Run-Out
   - Mount the camshaft on V-blocks.
   - Measure the run-out with a dial indicator. If the measured value exceeds the specified limit, the camshaft must be replaced.

Run-Out	mm (in)
Standard	Limit
0.02 (0.008) or less	0.10 (0.0039)

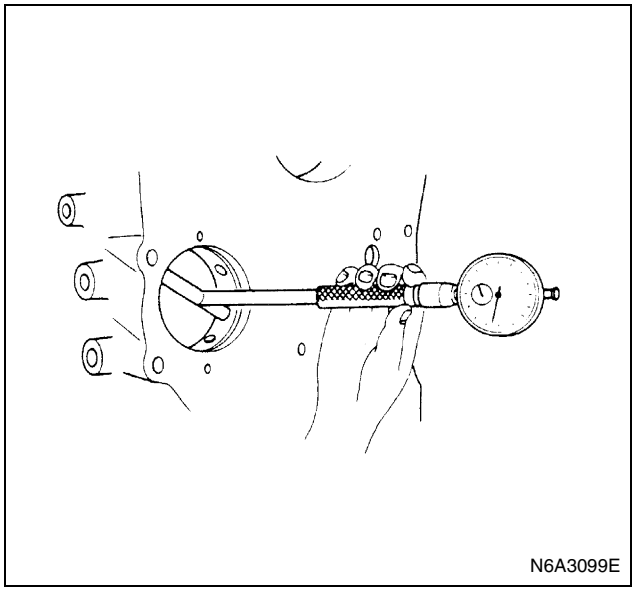


5. Camshaft and Camshaft Bearing Clearance
   - Use an inside dial indicator to measure the camshaft bearing inside diameter.

Camshaft Bearing Inside Diameter	mm (in)
Standard	Limit
50.00 — 50.03 (1.9685 — 1.9696)	50.08 (1.9716)

Camshaft Bearing Clearance	mm (in)
Standard	Limit
0.025 — 0.085 (0.0010 — 0.0033)	0.12 (0.005)

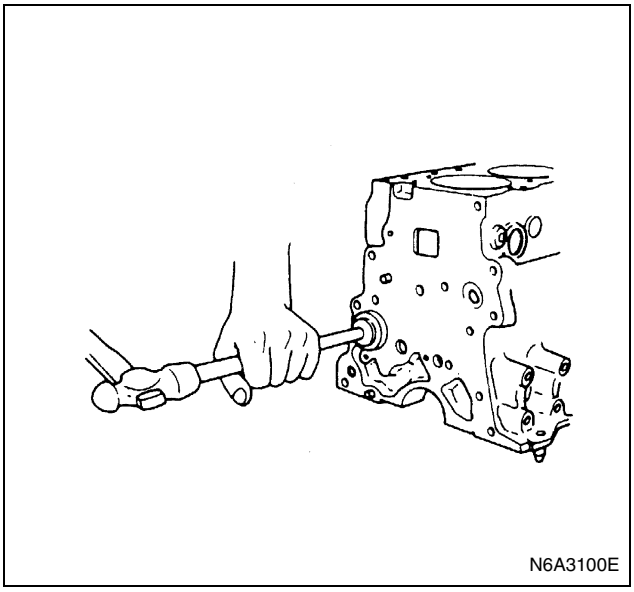
   - If the clearance between the camshaft bearing inside diameter and the journal exceeds the specified limit, the camshaft bearing must be replaced.



Camshaft Bearing Replacement

Camshaft Bearing Removal

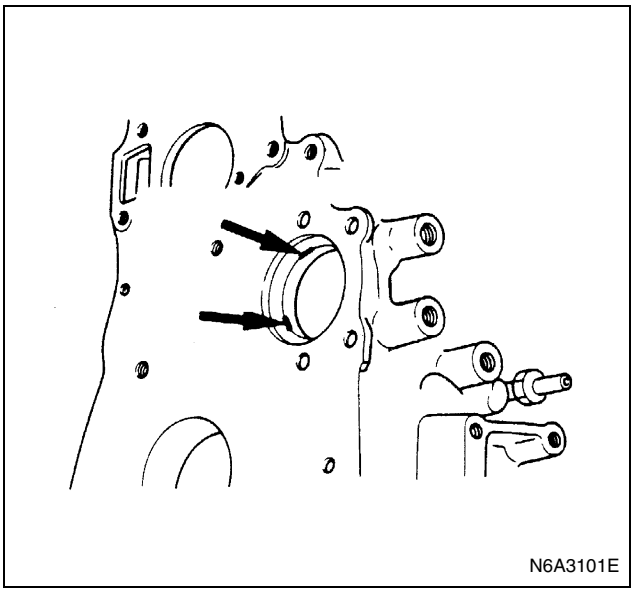
1. Remove the cylinder body plug plate.
2. Use the bearing replacer to remove the camshaft bearing.
   Bearing Replacer: 5-8840-2038-0



N6A3100E

Camshaft Bearing Installation

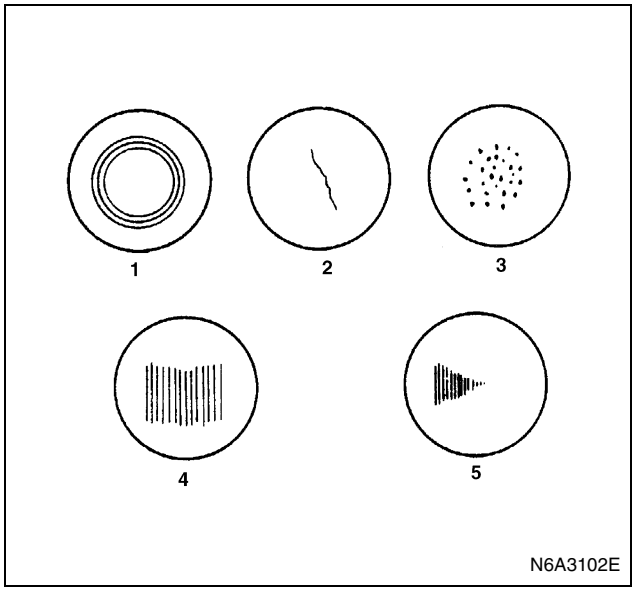
1. Align the bearing oil holes with the cylinder body oil holes.
2. Use the replacer to install the camshaft bearing.
   Bearing Replacer: 5-8840-2038-0



N6A3101E

Tappet

Visually inspect the tappet camshaft contact surfaces for pitting, cracking, and other abnormal conditions. The tappet must be replaced if any of these conditions are present.



N6A3102E

Legend

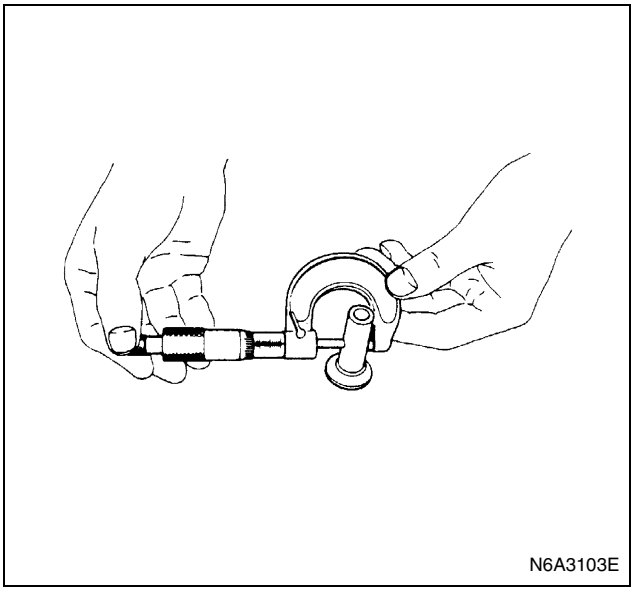
1. Normal contact
2. Cracking
3. Pitting
4. Irregular contact
5. Irregular contact

Notice:
The tappet surfaces are spherical. Do not attempt to grind them with an oil stone or similar tool in an effort to repair the tappet. If the tappet is damaged, it must be replaced.

Tappet Outside Diameter

1. Measure the tappet outside diameter with a micrometer. If the measured value is less than the specified limit, the tappet must be replaced.

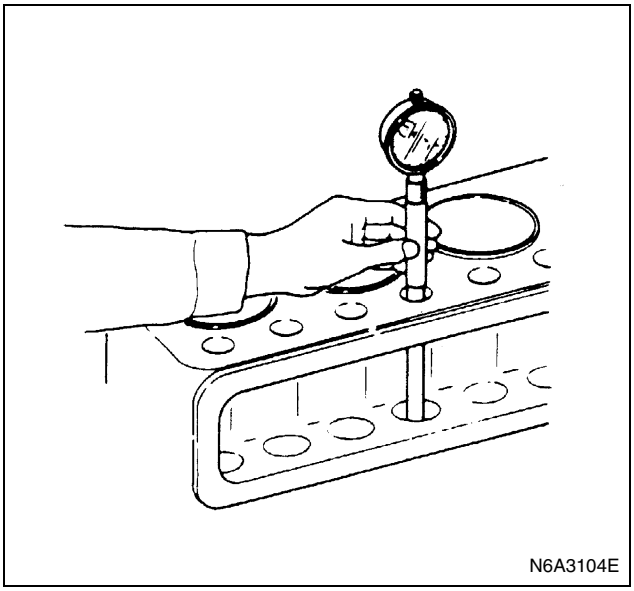
Tappet Outside Diameter	mm (in)
Standard	Limit
12.97 — 12.99 (0.510 — 0.511)	12.95 (0.509)



N6A3103E

2. Measure the inside diameter tappet on the cylinder block and calculate the clearance.
   If the clearance exceeds the limit, replace tappet or/and cylinder block.

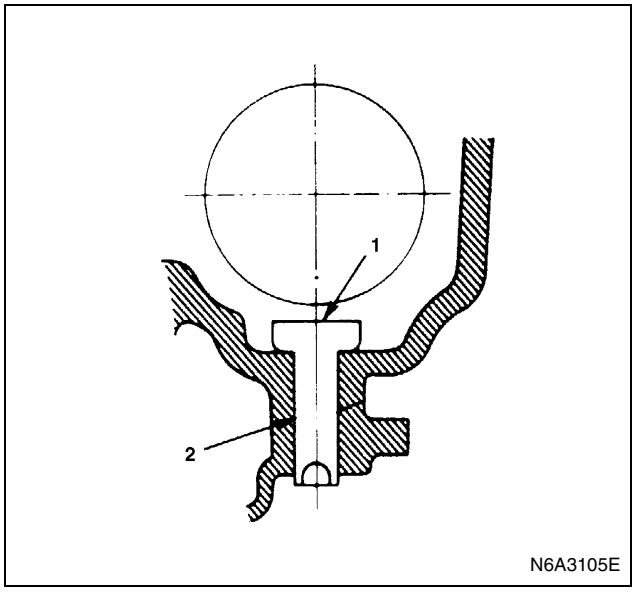
Tappet and Cylinder Body Clearance	mm (in)
Standard	Limit
0.03 (0.001)	0.10 (0.004)



N6A3104E

Reassembly

1. Tappet
   1) Apply a coat of engine oil to the tappet (1) and the cylinder body tappet insert holes (2).

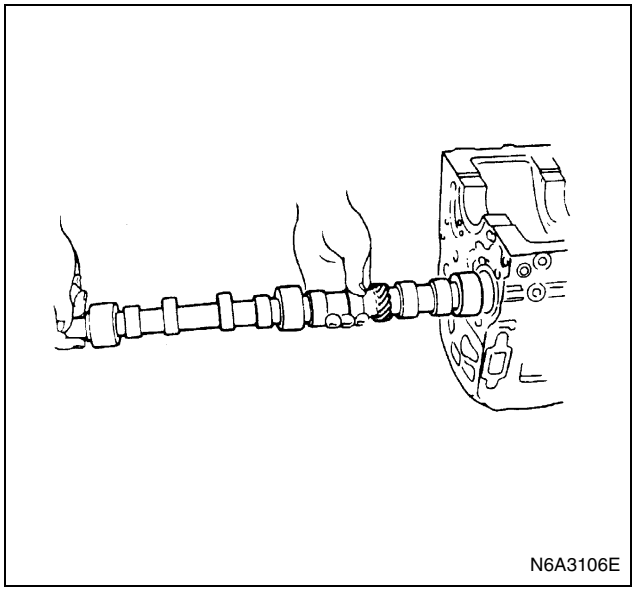


N6A3105E

   2) Locate the position mark applies at disassembly (if the tappet is to be reused).

Notice:
The tappet must be installed before the camshaft.

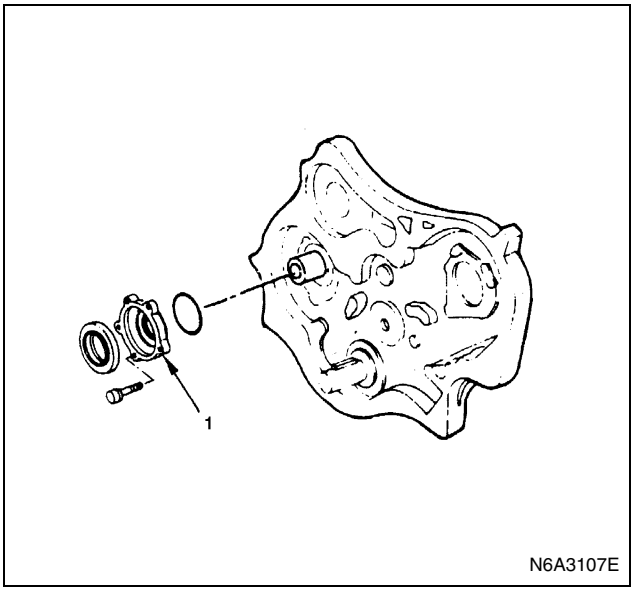
2. Camshaft
   1) Apply a coat of engine oil to the camshaft and the camshaft bearings.
   2) Install the camshaft to the cylinder body.
      Take care not damage the camshaft bearings.



N6A3106E

3. Camshaft Timing Pulley Center (Belt Drive Model)
   - Apply engine oil to the oil seal lip portion of the oil seal retainer.
   - Apply the recommended liquid gasket or its equivalent to the retainer.
   - Install the oil seal retainer to the cylinder body.
   - Tighten the retainer bolts to the specified torque.

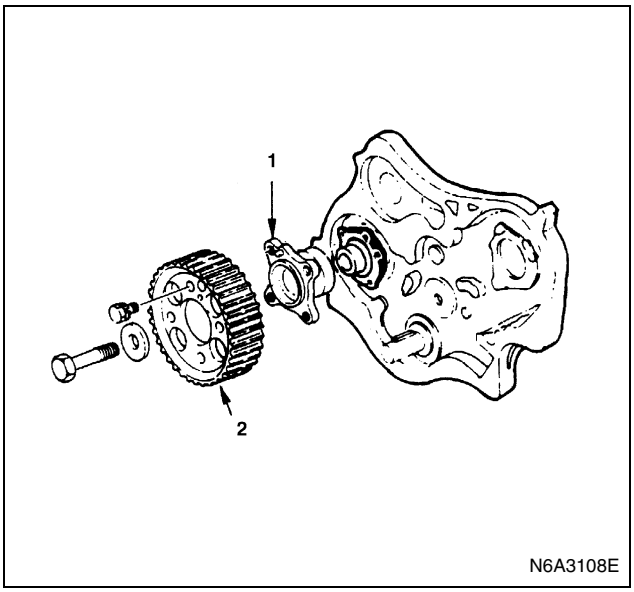
Tighten:
Oil Seal Retainer Bolt to 19 N·m (1.9 kg·m/14 lb·ft)



Legend
1. Retainer

- Align the camshaft timing pulley center with the camshaft key.
- Tighten the timing pulley bolts to the specified torque.

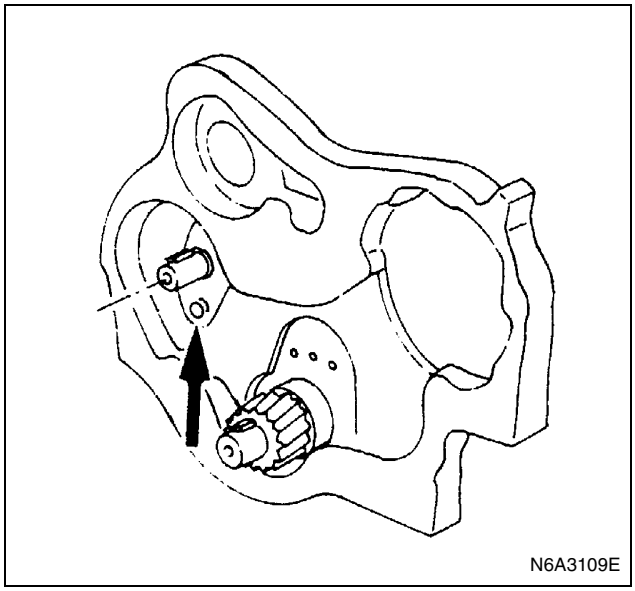
Tighten:
Timing Pulley Bolt to 8 N·m (0.8 kg·m/69 lb·ft)



Legend
1. Timing pulley center
2. Timing pulley

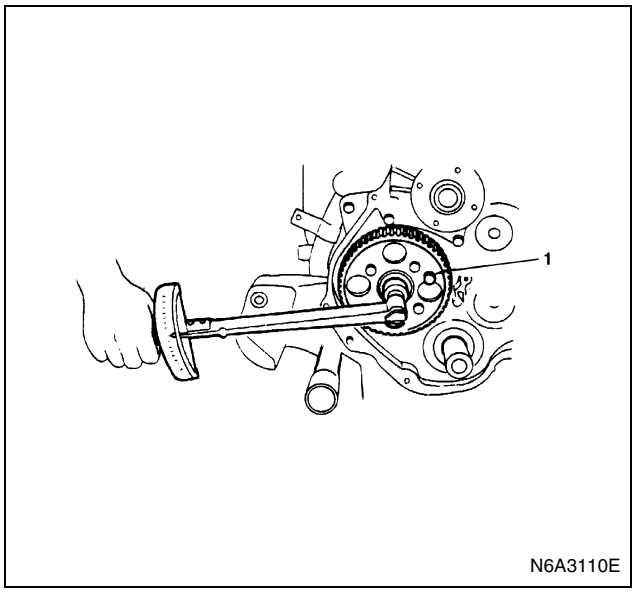
4. Camshaft Thrust Plate (Gear Drive Model)
   Install the thrust plate to the cylinder body and tighten the thrust plate bolts to specified torque.

Tighten:
Thrust Plate Bolt to 18 N·m (1.8 kg·m/13 lb·ft)



5. Camshaft Timing Pulley (Belt Drive Model)
   - Prevent the camshaft from turning when tightening the timing center bolt.
   - Tighten the timing pulley center bolt to the specified torque.

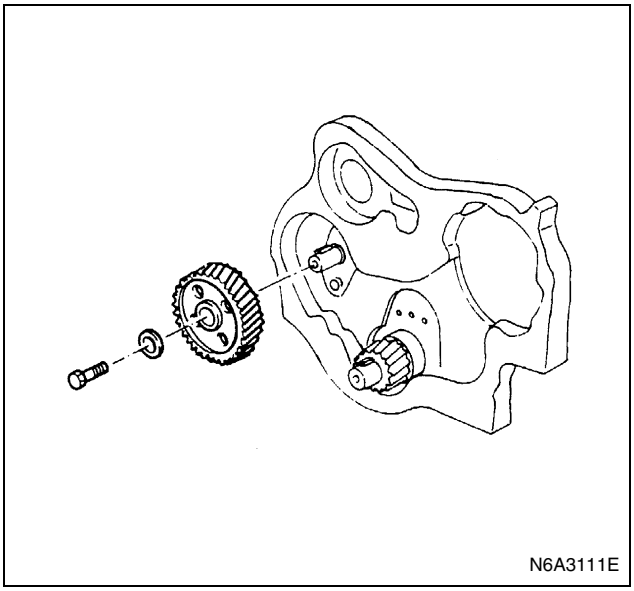
Tighten:
Center Bolt to 64 N·m (6.5 kg·m/47 lb·ft)



Legend
1. Lock bolt

6. Camshaft Timing Gear (Gear Drive Model)
   1) Install the camshaft timing gear to the camshaft.
      The timing gear mark (“Y — Y”) must be facing outward.
   2) Tighten the timing gear to the specified torque

Tighten:
Timing Gear Bolt to 64 N·m (6.5 kg·m/47 lb·ft)



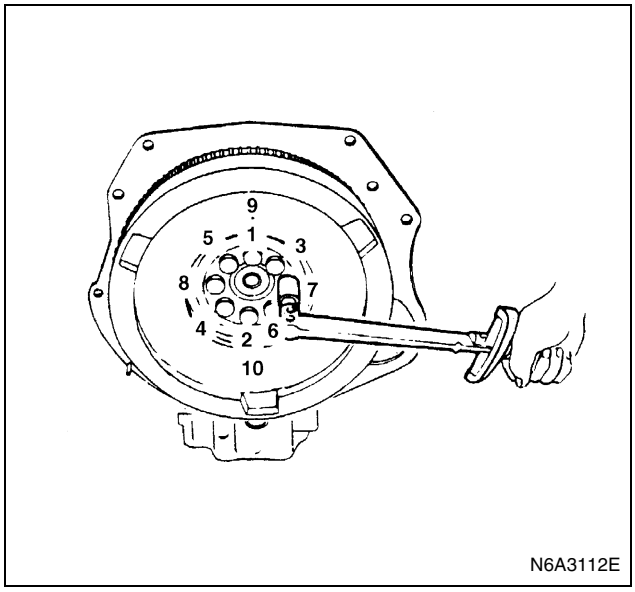
N6A3111E

7. Oil Pump Assembly
8. Oil Pan Assembly
   Above works refer to “OIL PUMP” Section in this manual.
9. Cylinder Block Rear Plate
   - Tighten cylinder block rear plate fixing bolts to the specified torque.

Tighten:
Rear Plate Bolt to 82 N·m (8.4 kg·m/61 lb·ft)

10. Flywheel
    - Apply engine oil to fixing bolts.
    - Tighten the flywheel bolts to the specified torque in two steps using the Angular Tightening Method.
      Follow the numerical order shown in the illustration.

Tighten:
- Flywheel Bolt to
  1st Step (Snug torque): 59 N·m (6.0 kg·m/43 lb·ft)
  2nd Step (Final torque): 60° — 90°



N6A3112E

11. Cylinder Head Assembly
    1) Hot plug
       - Set the nock ball in the positioning groove on the cylinder head side according to the order of the cylinders, and hit it lightly with a plastic hammer.

Notice:
After being pressed into the cylinder head, the hot plugs were provided with surface grinding.

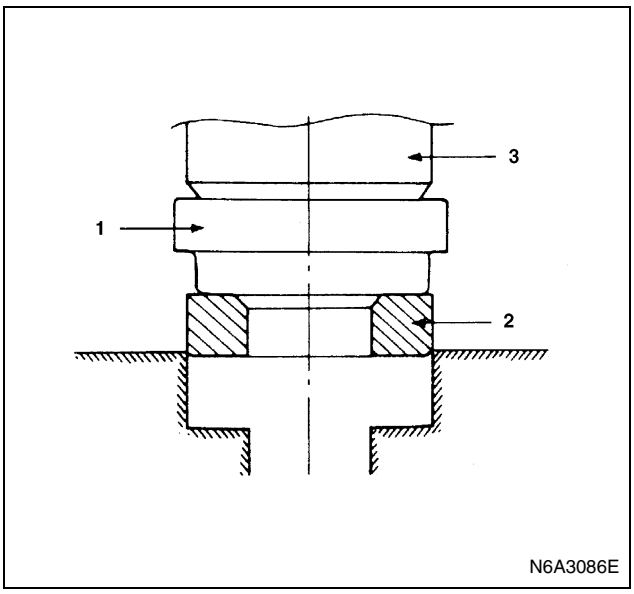
Accordingly, their dimensions are different individually among them, and take care not confuse the order of the cylinders.

When replacing the hot plug with new one:
When assembling a new hot plug, set the knock ball in the positioning groove on the cylinder side and hit it lightly with a plastic hammer until the hot plug is set in stably.
With patch attached to the hot plug to prevent it from being damaged, press it in with a force of 4.5 ~ 5.5 ton applied.

    2) Valve Seat Insert Installation
       - Carefully place the attachment (1) (having a smaller outside diameter than the valve seat insert) on the valve seat insert (2).

Notice:
The smooth side of the attachment must contact the valve seat insert.

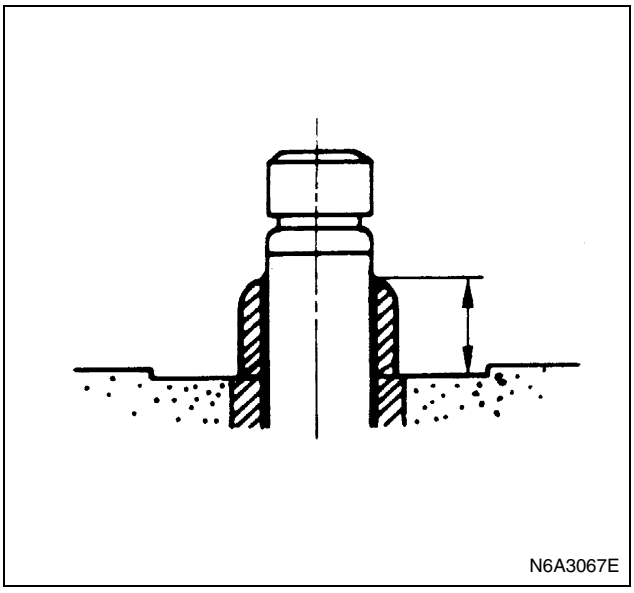
       - Use the bench press (3) to gradually apply pressure to the attachment and press the valve seat insert into place.



Notice:
Do not apply an excessive amount of pressure with the bench press. Damage to the valve seat insert will result.

Measure the height of the valve guide upper end from the upper face of the cylinder head.

Valve Guide Upper End Height (H) (Reference) mm (in)
13 (0.51)

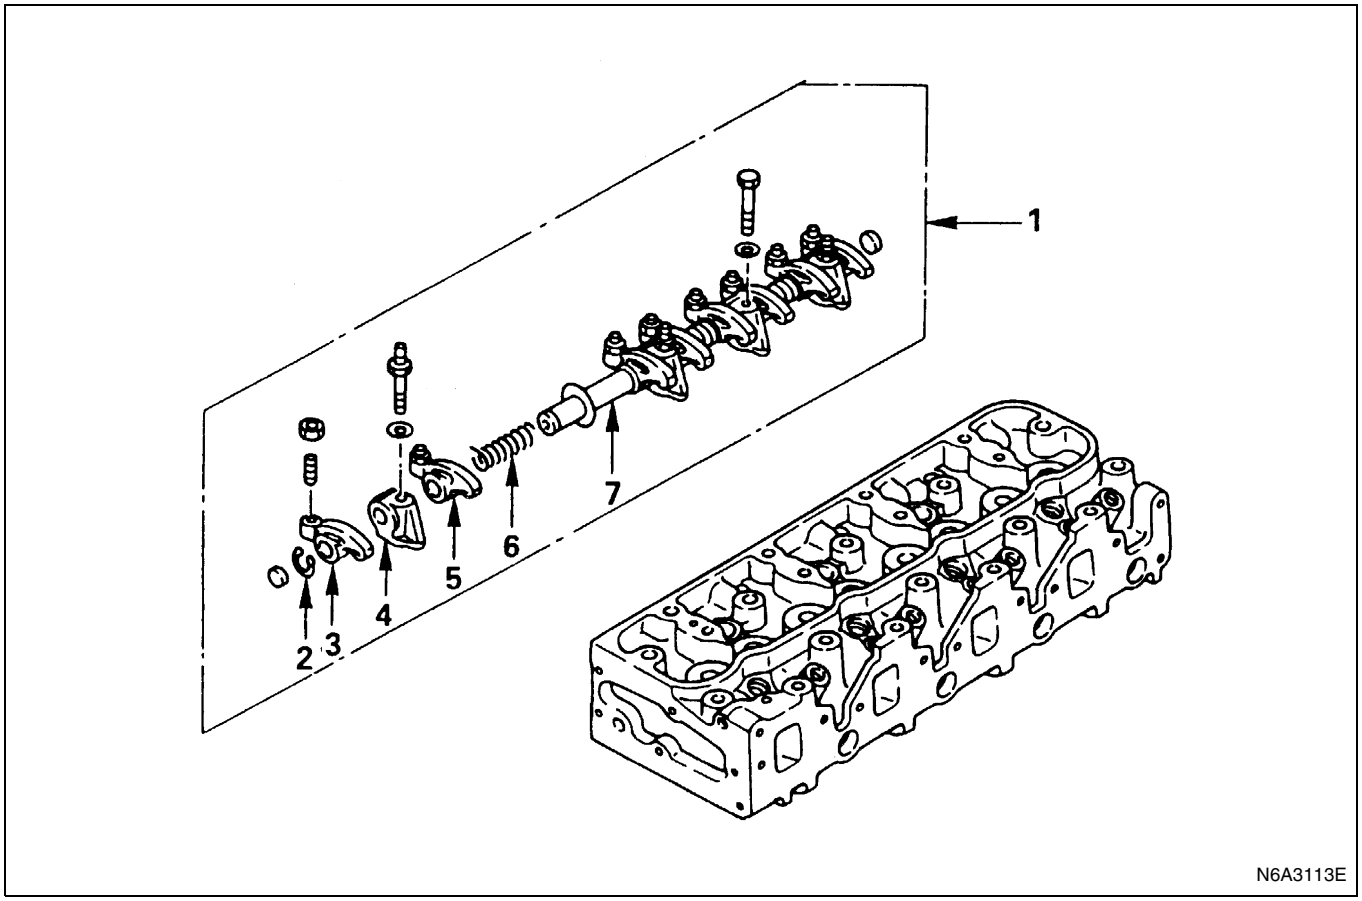


Notice:
If the valve guide has been removed, both the valve and the valve guide must be replaced as a set.

3) Spring Lower Seat
4) Valve Stem Oil Seal
5) Valve
6) Valve Spring
7) Split Collar
   Above works refer to “VALVE” Section in this manual.

ROCKER ARM ASSEMBLY

Component



Legend

1. Rocker arm shaft assembly
2. Rocker arm shaft snap ring
3. Rocker arm
4. Rocker arm shaft bracket
5. Rocker arm
6. Rocker arm shaft spring
7. Rocker arm shaft

Disassembly

1. Rocker Arm Shaft Assembly
2. Rocker Arm Shaft Snap Ring
3. Rocker Arm
4. Rocker Arm Shaft Bracket
5. Rocker Arm
6. Rocker Arm Shaft Spring
7. Rocker Arm Shaft

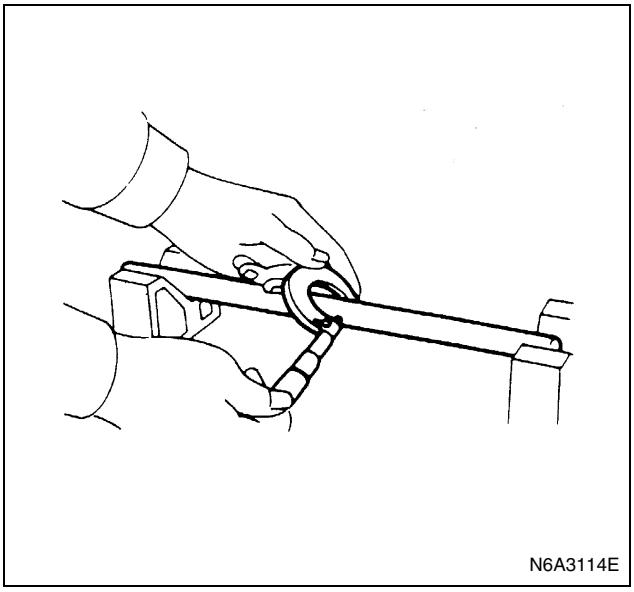
Inspection and Repair

Make the necessary adjustment, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Use a micrometer to measure the rocker shaft outside diameter at the point where the rocker arm moves on the rocker shaft.

Replace the rocker shaft if the diameter exceeds the specified limit.

	mm (in)
Standard	Limit
18.98 — 19.00 (0.7472 — 0.7480)	18.9 (0.744)



N6A3114E

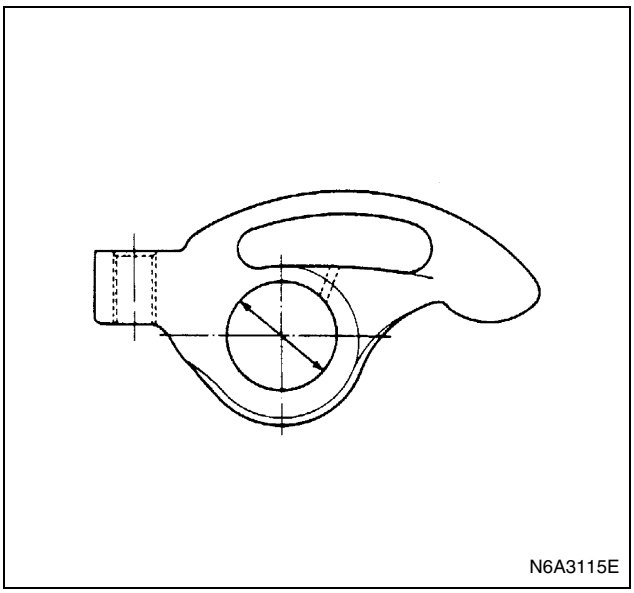
Oil Clearance

1. Use either a vernier caliper or a dial indicator to measure the rocker arm inside diameter.

Rocker Arm Inside Diameter mm (in)	
Standard	Limit
19.036 — 19.060 (0.7494 — 0.7503)	19.100 (0.7519)

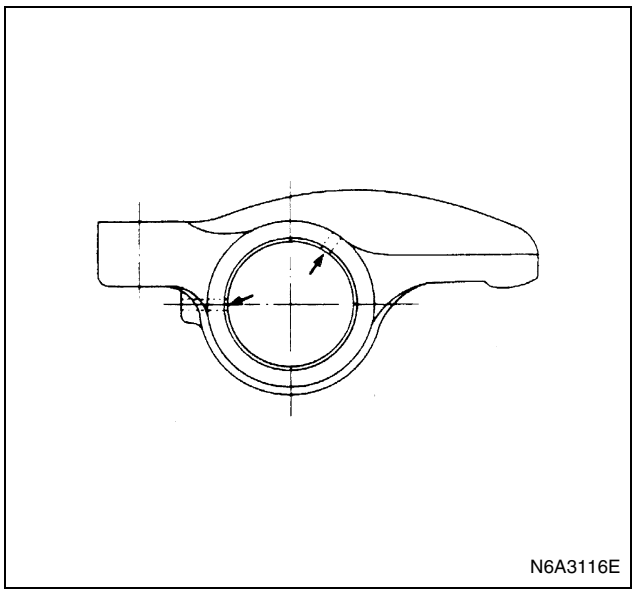
2. Measure the rocker arm shaft outside diameter.
   If the measured value exceeds the specified limit, replace either the rocker arm or the rocker arm shaft.

Rocker Arm and Rocker Shaft Clearance mm (in)	
Standard	Limit
0.06 — 0.08 (0.0024 — 0.0031)	0.10 (0.0039)



N6A3115E

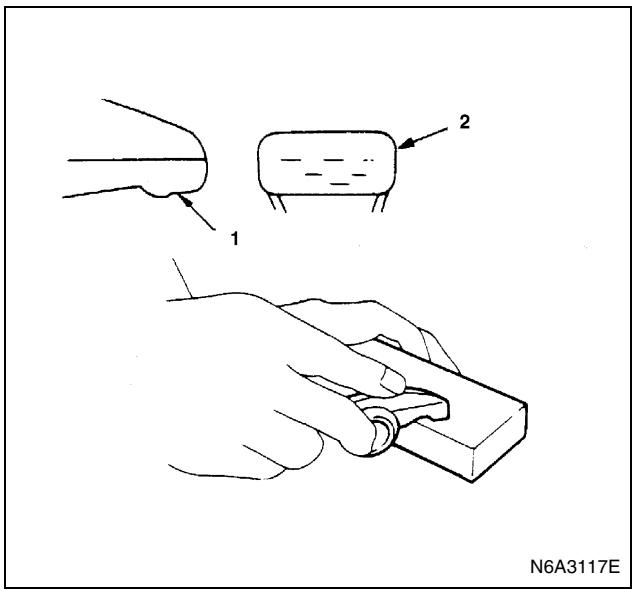
3. Check that the rocker arm oil port is free is obstructions.
   If necessary, use compressed air to clean the rocker arm oil port.



N6A3116E

Rocker Arm Correction

Inspection the rocker arm valve stem contact surface for step wear (1) and scoring (2).
If the contact surfaces have light step wear or scoring, they may be honed with an oil stone.
If the step wear or scoring is severe, the rocker arm must be replaced.

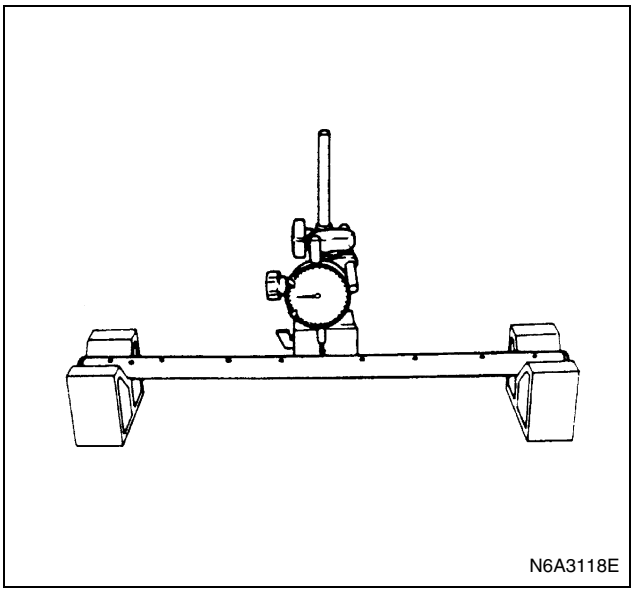


N6A3117E

Rocker Arm Shaft Run-Out

1. Place the rocker arm shaft on a V-block.
2. Use a dial indicator to measure the rocker arm shaft central portion run-out.
   If the run-out is very slight, correct the rocker arm shaft run-out with a bench press. The rocker arm must be at cold condition.
   If the measured rocker arm shaft run-out exceeds the specified limit, the rocker arm shaft must be replaced.

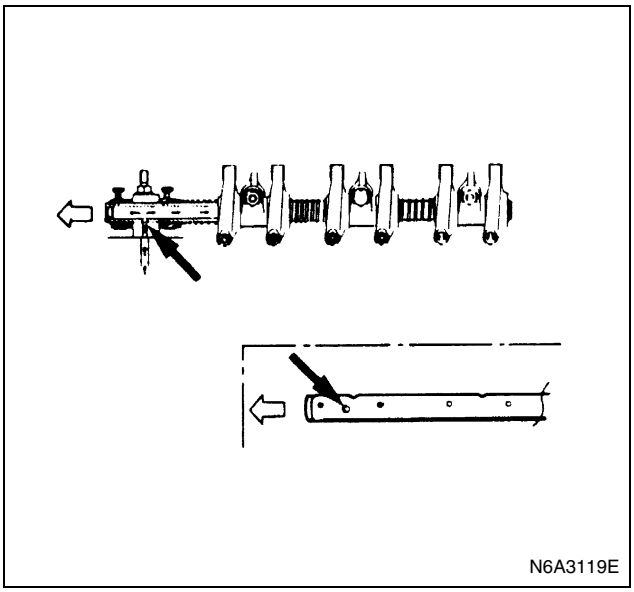
Rocker Arm Shaft Run-Out	mm (in)
	Limit
4JB1 / 4JB1-TC	0.2 (0.008)
4JH1-TC	



N6A3118E

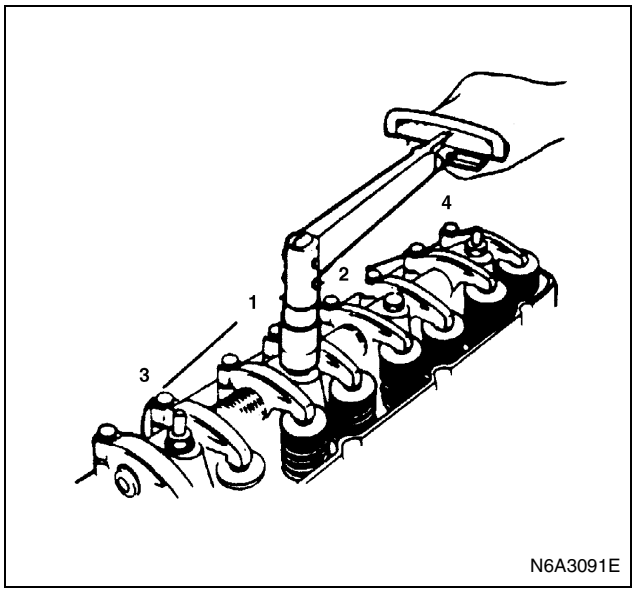
Reassembly

1. Rocker Arm Shaft
   - Apply a light coat of engine oil to the rocker arm shafts.
   - Position the rocker arm shaft with the large oil hole (4ϕ) facing the front of the engine.
   - Install the rocker shaft together with the rocker arm, the rocker arm shaft bracket, and the spring.



N6A3119E

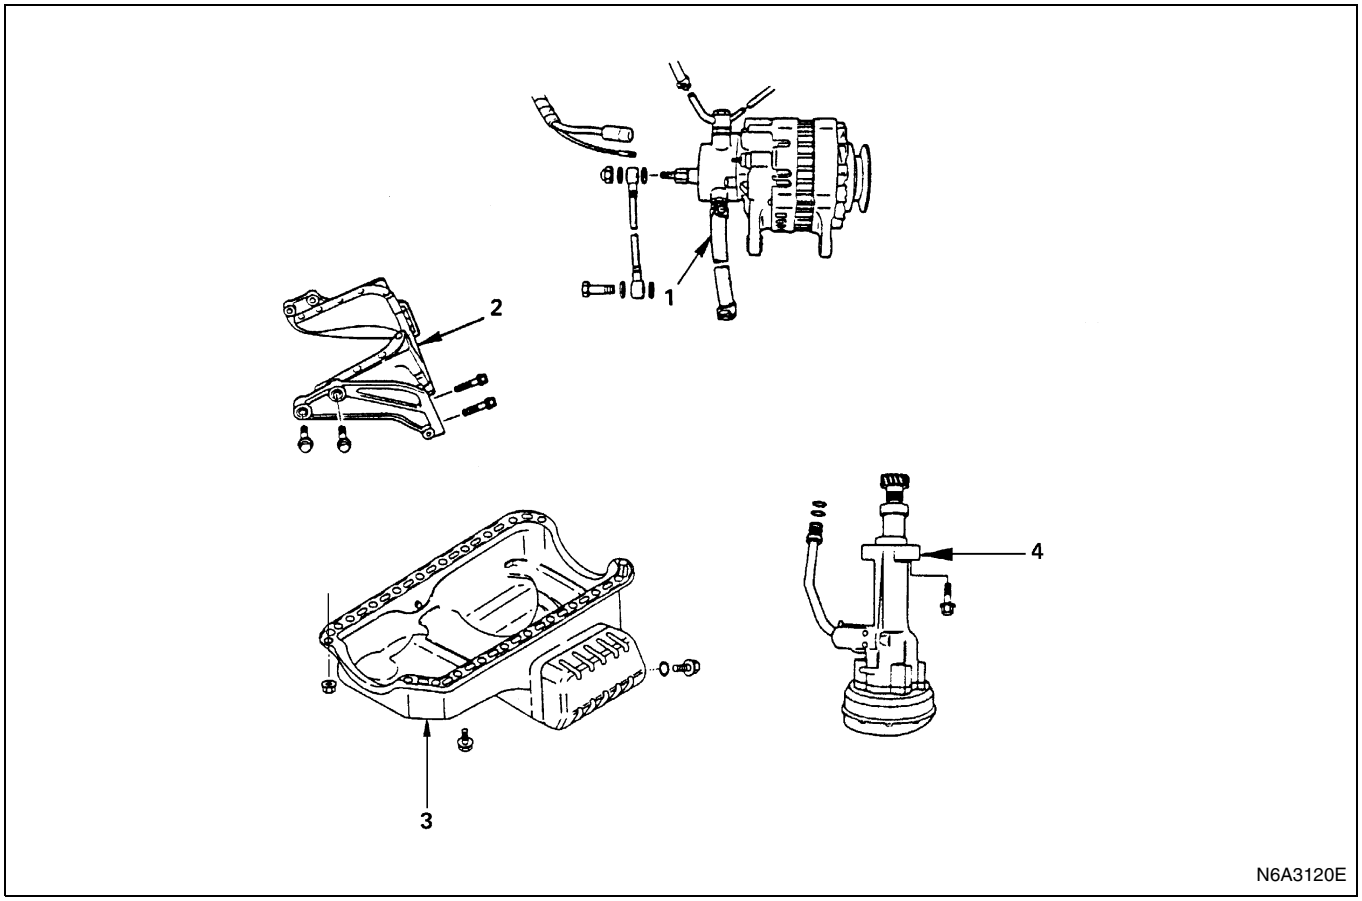
2. Rocker Arm Shaft Spring
3. Rocker Arm
4. Rocker Arm Shaft Bracket
5. Rocker Arm
6. Rocker Arm Shaft Snap Ring
7. Rocker Arm Shaft Assembly
   - Install the rocker arm shaft assembly in cylinder head.
   - Tighten the rocker arm shaft fixing bolts to the specified torque.



N6A3091E

OIL PUMP

Component

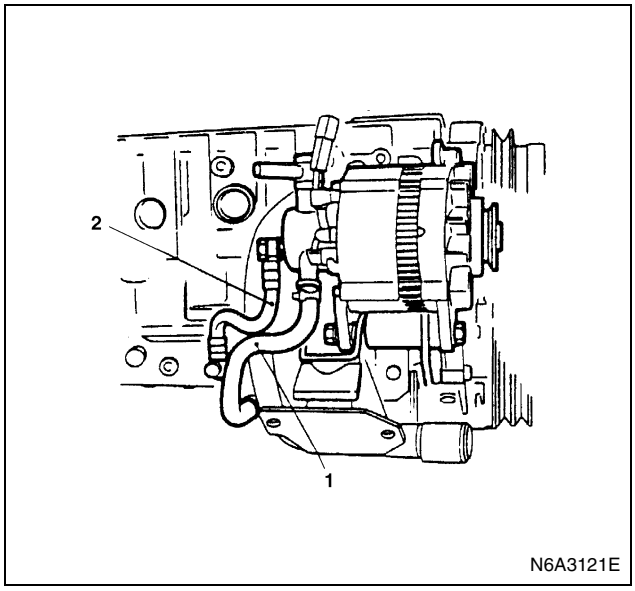


Legend

1. Vacuum pump oil hose
2. Stiffener & space rubber
3. Oil pan assembly
4. Oil pump assembly

Removal

1. Vacuum Pump Oil Hose
   - Remove the oil hose (1) from oil pan.



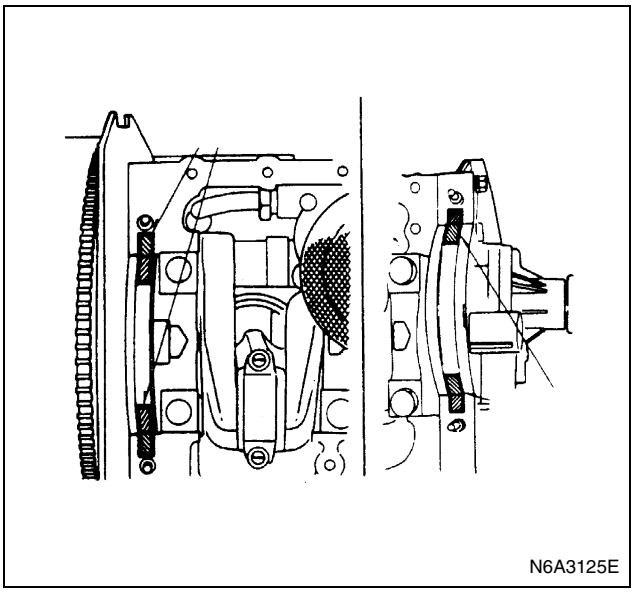
2. Stiffener & Space Rubber
   - Remove the stiffener from of the oil pan left & right side.
   - Take out space rubber.
3. Oil Pan Assembly
4. Oil Pump Assembly

Installation

1. Oil Pump Assembly
   - Apply molybdenum mixed engine oil to drive gear of camshaft and driven gear of oil pump.
   - Tighten the oil pump fixing bolt to the specified torque.

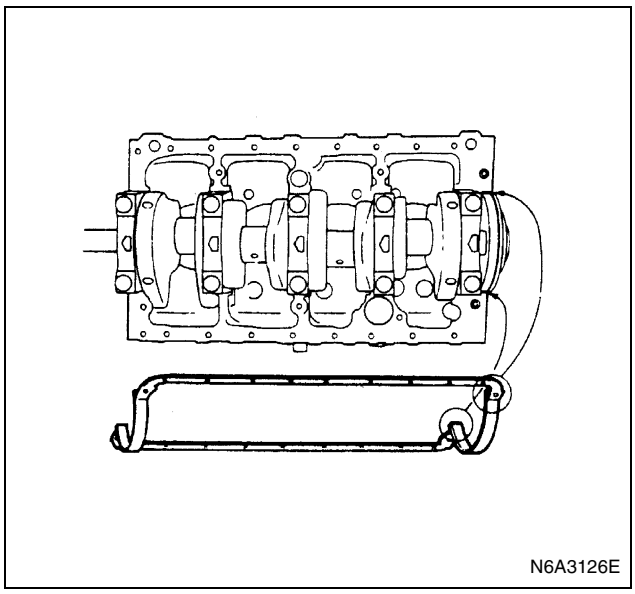
Tighten:
19 N·m (1.9 kg·m/14 lb·ft)

2. Oil Pan Assembly
   - Apply the recommended liquid gasket or its equivalent to the No. 5 bearing cap arches, the grooves, the cylinder block and the timing gear case fitting face at the positions shown in the illustration.



N6A3125E

   - Fit the gasket rear lipped portion into the No. 5 groove.



N6A3126E

   - Be absolutely sure that the lipped portion is fitted snugly into the groove.
   - Install the oil pan to the cylinder body.
   - Tighten the oil pan bolts to the specified torque.

Tighten:
Oil Pan Bolt to 19 N·m (1.9 kg·m/14 lb·ft)

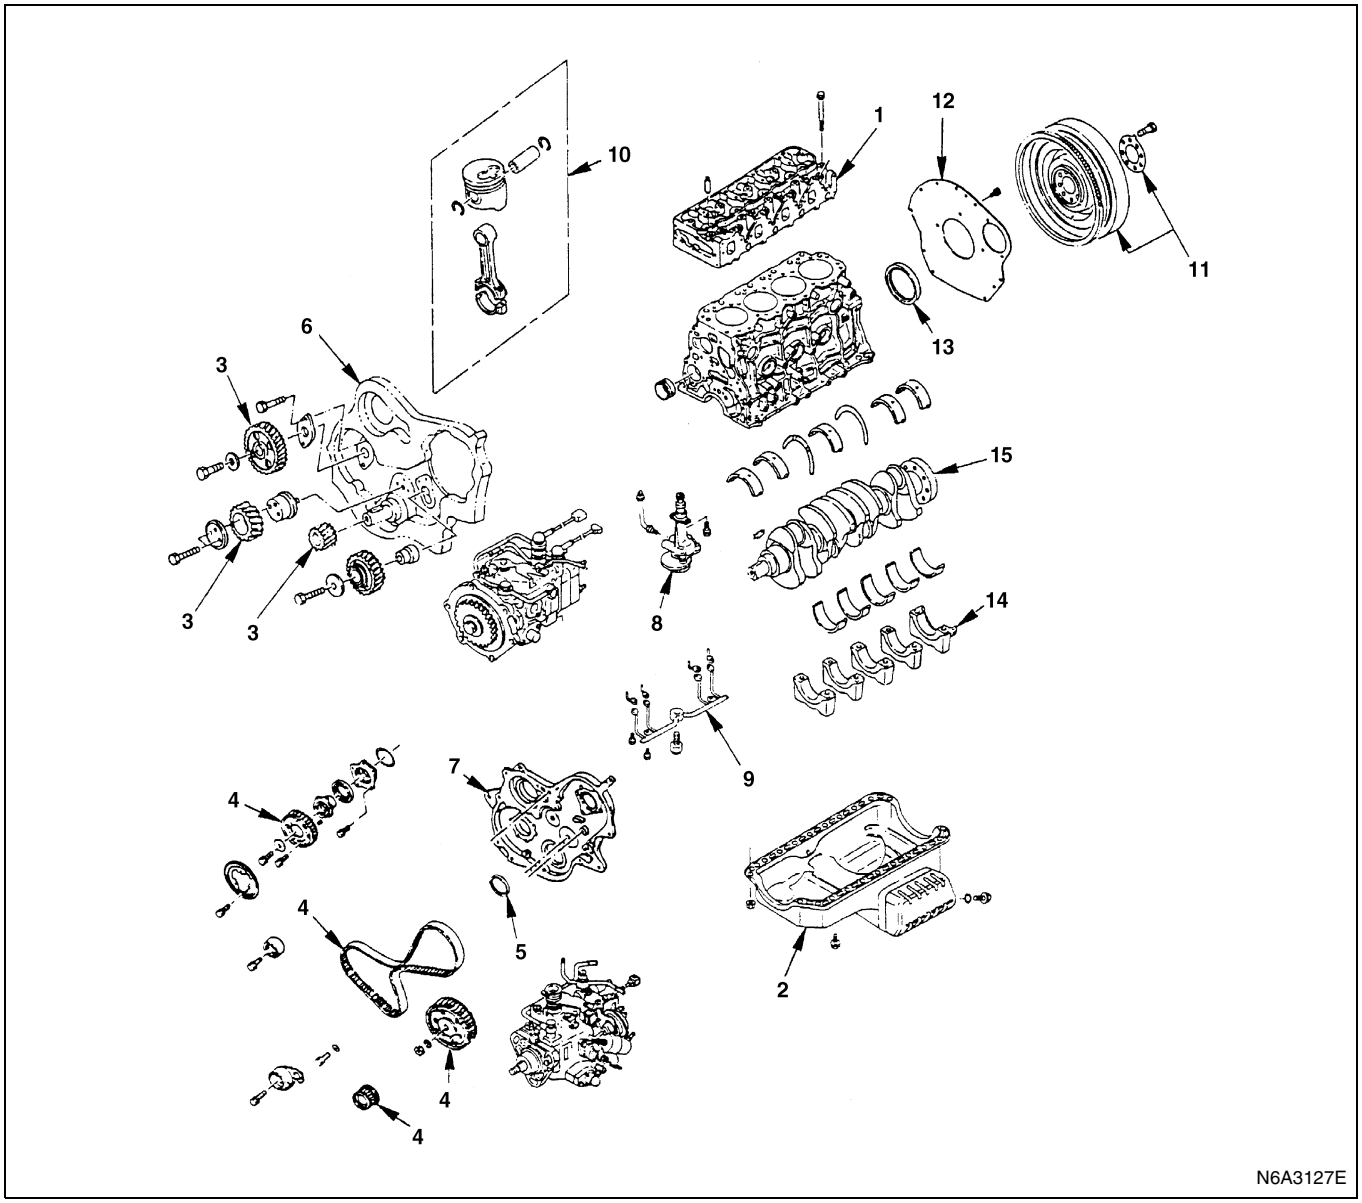
3. Stiffener & Space Rubber
   - Install the space rubber.
   - Install the stiffener tighten to the specified torque.

Tighten:
- Engine Body Side to 37 N·m (3.8 kg·m/27 lb·ft)
- Clutch Housing Side to 78 N·m (8.0 kg·m/58 lb·ft)

4. Vacuum Pump Oil Hose
   - Install the oil hose to oil pan.

CRANKSHAFT

Component



Legend

1. Cylinder head assembly and gasket

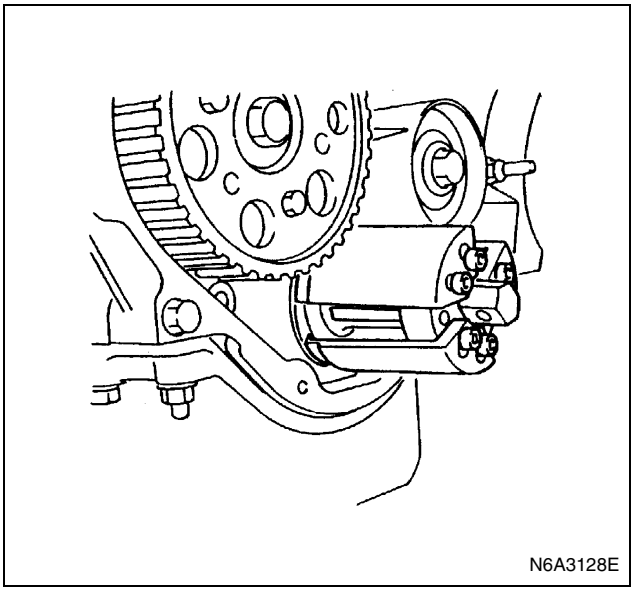
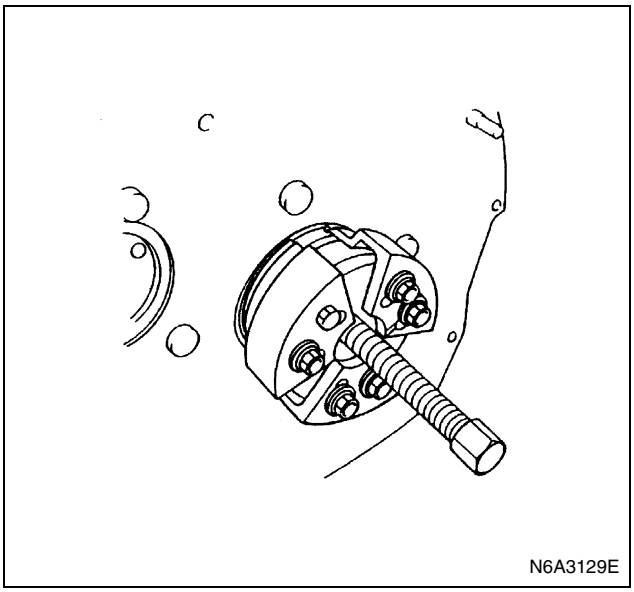
Disassembly

1. Cylinder Head Assembly and Gasket
2. Oil Pan Ambly
3. Timing Gear (Gear Drive Model)
4. Timing Belt and Pulley (Belt Drive Model)
5. Front Oil Seal
   - With the oil seal pushed in deep, install the special tool as shown in the illustration to remove the oil seal.
     Remover: 5-8840-2362-0



N6A3128E

6. Timing Gear Housing
7. Timing Pulley Housing
8. Oil Pump Assembly
9. Piston Cooling Oil Pipe
10. Piston and Connecting Rod
11. Flywheel
12. Cylinder Block Rear Plate
13. Crankshaft Rear Oil Seal (Gear and Belt Drive Model)
    - With the oil seal pushed in deep, install the special tool as shown in the illustration to remove the oil seal.
      Remover: Rear Oil Seal 5-8840-2360-0



N6A3129E

Notice:
Take care not to damage sealing surface of rear plate and crankshaft when removing oil seal.

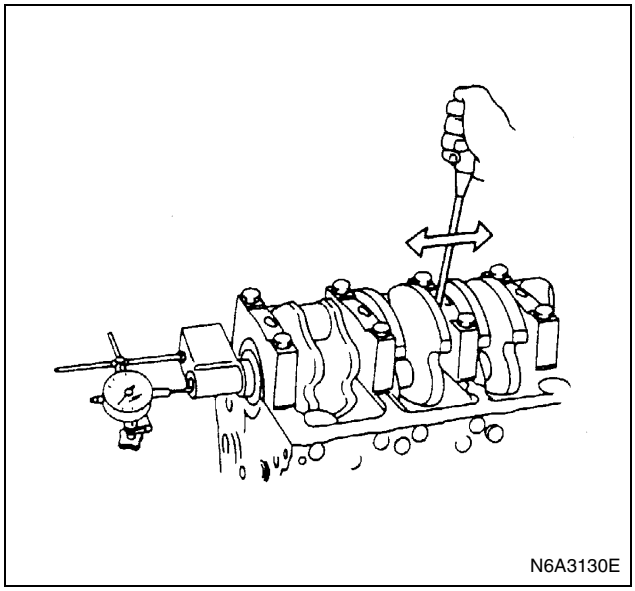
14. Main Bearing Cap
15. Crankshaft

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

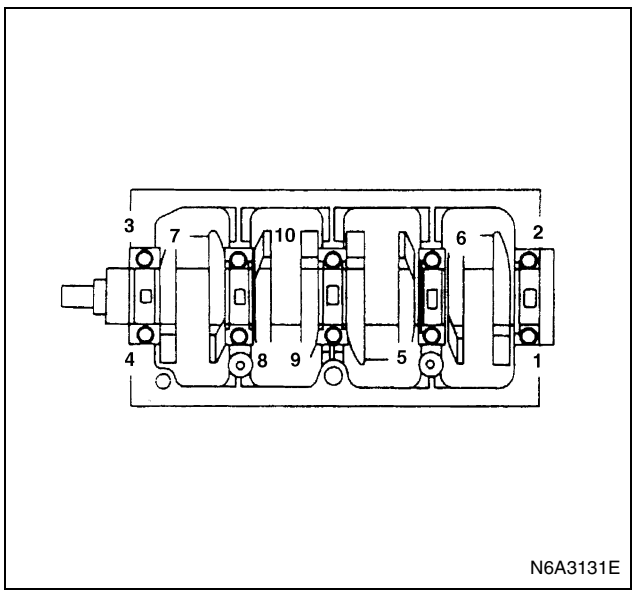
1. Crankshaft
   Thrust clearance
   Set the dial indicator as shown in the illustration and measure the crankshaft thrust clearance.
   If the thrust clearance exceeds the specified limit, replace the thrust bearing as a set.

Thrust clearance	mm (in)
Standard	Limit
0.10 (0.0039)	0.30 (0.0118)



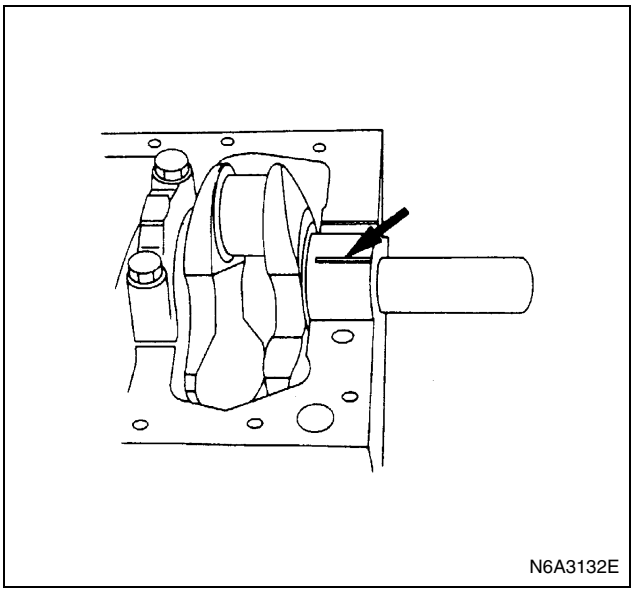
N6A3130E

2. Main bearing clearance
   1) Remove the main bearing caps in the sequence shown in the illustration.
      Arrange the removed main bearing caps in the cylinder number order.



N6A3131E

2) Remove the crankshaft. Remove the main bearings.
3) Clean the upper and lower bearings as well as the crankshaft main journal.
4) Check the bearings for damage or excessive wear.
   The bearings must be replace as a set if damage or excessive wear is discovered during inspection.
5) Set the upper bearings and the thrust washers to their original positions. Carefully install the crankshaft.
6) Set the lower bearings to the bearing cap original position.
7) Apply plastigage to the crankshaft journal unit as shown in the illustration.



N6A3132E

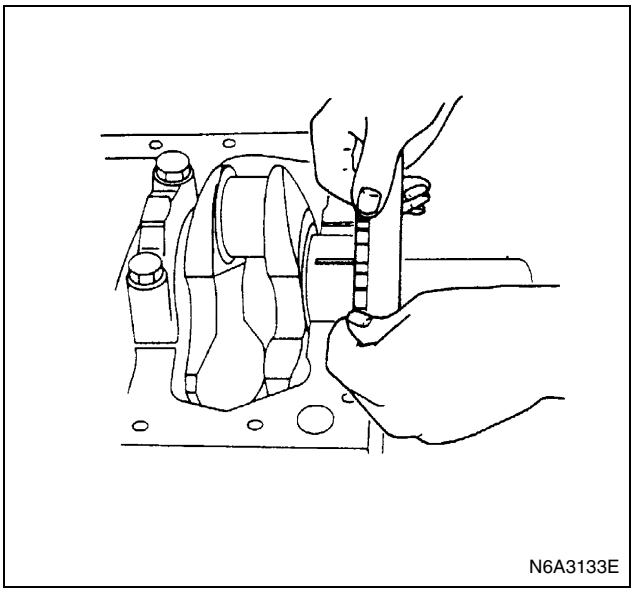
8) Install the main bearing caps. Apply engine oil to the bolt threads and the seats. Tighten the bolts to the specified torque.

Tighten:
167 N·m (17 kg·m/123 lb·ft)

Notice:
Do not allow the crankshaft to rotate.

9) Remove the main bearing caps.
10) Measure the plastigage width and determine the oil clearance. If the oil clearance exceeds the specified limit, replace the main bearings as a set and/or replace the crankshaft.
11) Clean the plastigage from the bearings and the crankshaft.
12) Remove the crankshaft and the bearings.

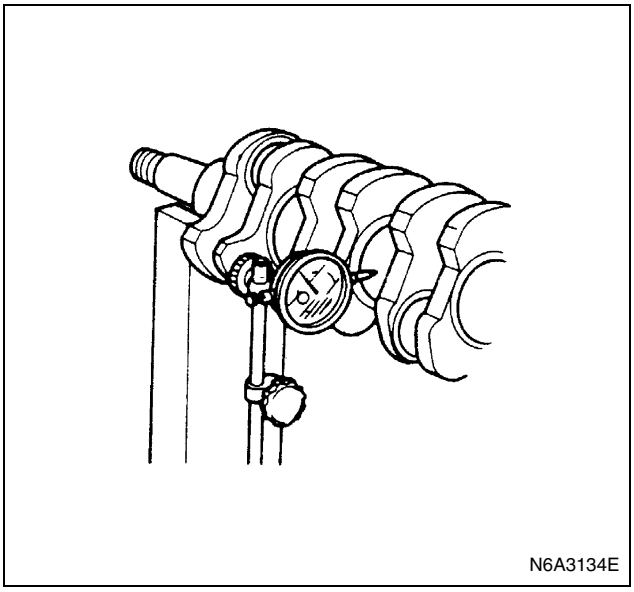
Oil Clearance		mm (in)
	Standard	Limit
4JB1 4JB1-TC	0.035 — 0.080 (0.0014 — 0.0036)	0.11 (0.0043)
4JG2	0.031 — 0.063 (0.0012 — 0.0025)	
4JH1-TC	0.037 — 0.068 (0.0015 — 0.0027)	



N6A3133E

3. Run-out
   1) Carefully set the crankshaft on the V-blocks. Slowly rotate the crankshaft and measure the runout.
      If the crankshaft runout exceeds the specified limit, the crankshaft must be replaced.

Run-Out	mm (in)
Standard	Limit
0.05 (0.0020) or less	0.08 (0.0031)

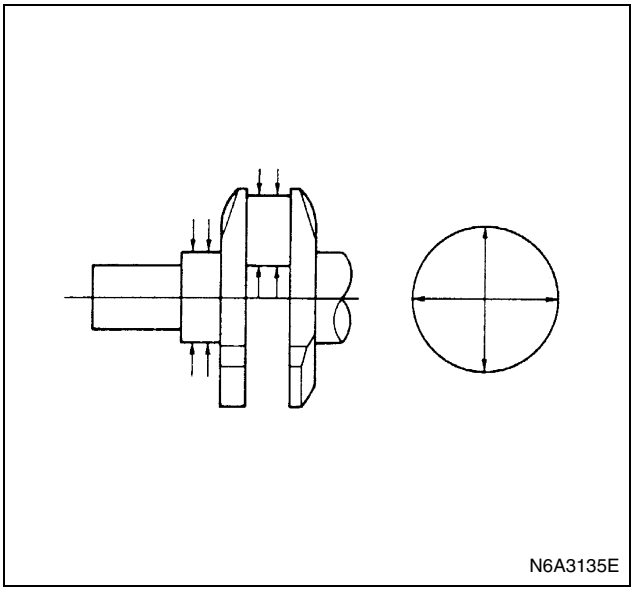


N6A3134E

Measure the diameter and the uneven wear of main journal and crank pin.

If the crankshaft wear exceeds the specified limit, crankshaft must be replaced.

		mm (in)
	Standard	Limit
Main journal diameter	69.917 — 69.932 (2.7526 — 2.7532)	69.91 (2.7524)
Crank pin diameter	52.915 — 52.930 (2.0833)	52.90 (2.0843)
Uneven wear limit	0.05 (0.0020) or less	0.08 (0.0031)



N6A3135E

Crankshaft Inspection

Inspect the surface of the crankshaft journals and crank pins for excessive wear and damage.

Inspect the oil seal fitting surfaces for excessive wear and damage.

Inspect the oil ports for obstructions.

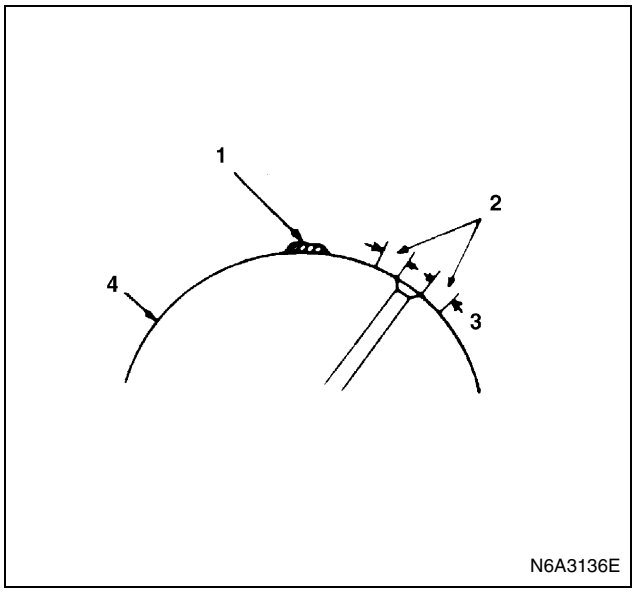
Crankshaft Tufftriding Inspection

The portion to be tested must be held horizontally so as not let the test solution flow (1).

Test liquid should not be applied to the area around the oil port (2).

Approximately 10 mm (0.39 in) (3)

The sliding surface of the pin or journal (4).



N6A3136E

Notice:

To increase crankshaft strength, Tufftride Method (Soft nitriding) has been applied. Because of this, it is not possible to regrind the crankshaft surfaces.

1. Use an organic cleaner to thoroughly clean the crankshaft. There must be no traces of oil the surfaces to be inspected.
2. Prepare a 5 — 10% solution of ammonium cupric chloride (dissolved in distilled water).
3. Use a syringe to apply the solution to the surface to be inspected.
   Hold the surface to be inspected perfectly horizontal to prevent the solution from running.

Notice:

Do not allow the solution to come in contact with the oil ports and their surrounding area.

Testing

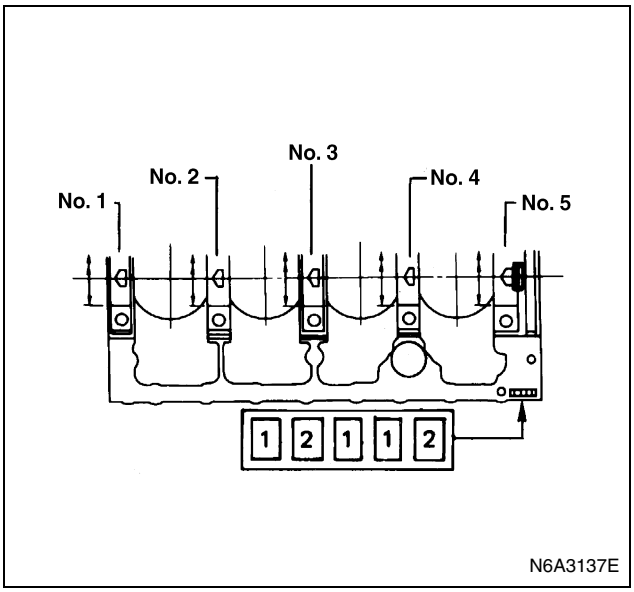
1. Wait for thirty to forty seconds.
   If there is no discoloration after thirty or forty seconds, the crankshaft is usable.
   If discoloration appears (the surface being tested will become the color copper), the crankshaft must be replaced.
2. Steam clean the crankshaft surface immediately after completing the test.

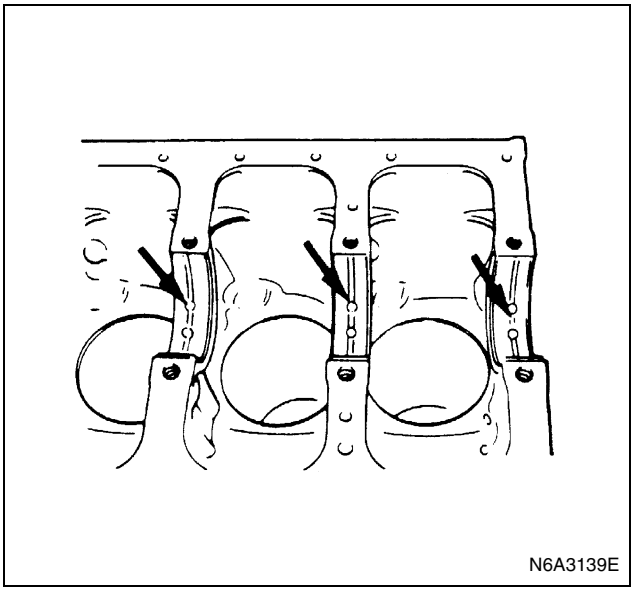
Notice:

The ammonium cupric chloride solution is highly corrosive. Because of this, it is imperative that the surfaces being tested be cleaned immediately after completing the test.

Crankshaft Bearing Selection

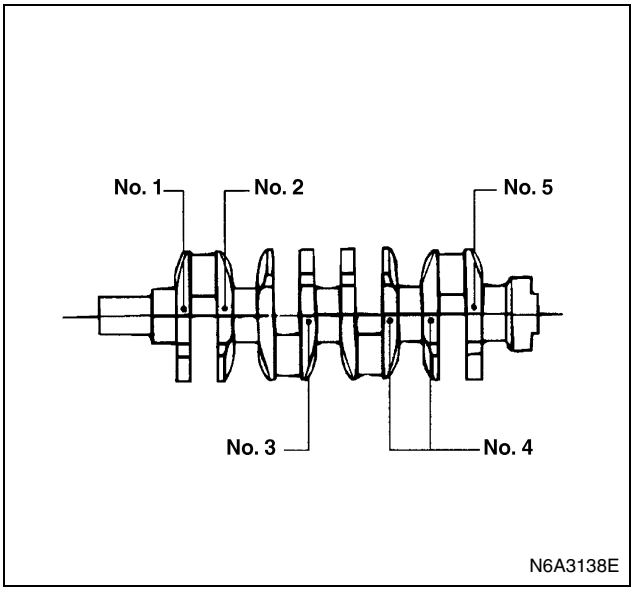
When installing new crankshaft bearings or replacing old bearings, refer to the selection table.





Notice:

Please note that some Crankshaft No. 4 journals made during a limited production period have their number (No. 4) marked on either their front or rear side of webs as shown below.



Notice:

Although all upper journal bearings (cylinder body side) have oil grooves and holes, all lower bearings (bearing cap side) have no groove and hole.

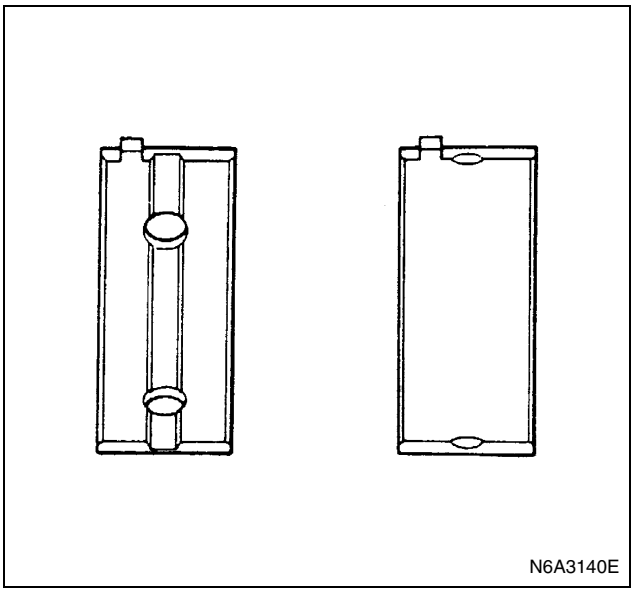
Play close attention to the distinction during the installation procedure.

mm (in)

Crankshaft Bearing Housing		Crankshaft Journal		Crankshaft Bearing Size Code
Grade Mark	Diameter	Grade Mark	Diameter	
1	73.992 — 74.000 (2.9131 — 2.9134)	1 or -	69.927 — 69.932 (2.7530 — 2.7532)	4
		2 or - -	69.922 — 69.927 (2.7528 — 2.7530)	
		3 or - - -	69.917 — 69.922 (2.7556 — 2.7528)	5
2	73.983 — 73.992 (2.9127 — 2.9131)	1 or -	69.927 — 69.932 (2.7530 — 2.7532)	2
		2 or - -	69.922 — 69.927 (2.7528 — 2.7530)	3
		3 or - - -	69.917 — 69.922 (2.7556 — 2.7528)	4
3	73.975 — 73.983 (2.9124 — 2.9127)	1 or -	69.927 — 69.932 (2.7530 — 2.7532)	1
		2 or - -	69.922 — 69.927 (2.7528 — 2.7530)	2
		3 or - - -	69.917 — 69.922 (2.7526 — 2.7528)	

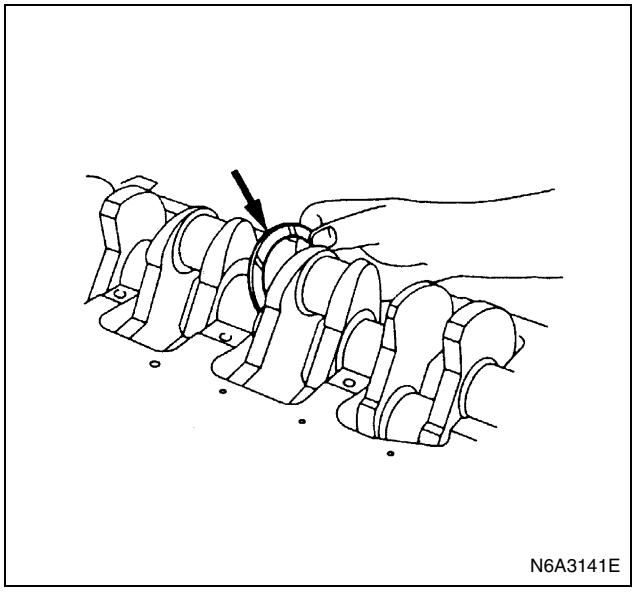
Reassembly

1. Crankshaft
   - Install the main bearings to the cylinder body and the main bearing caps.



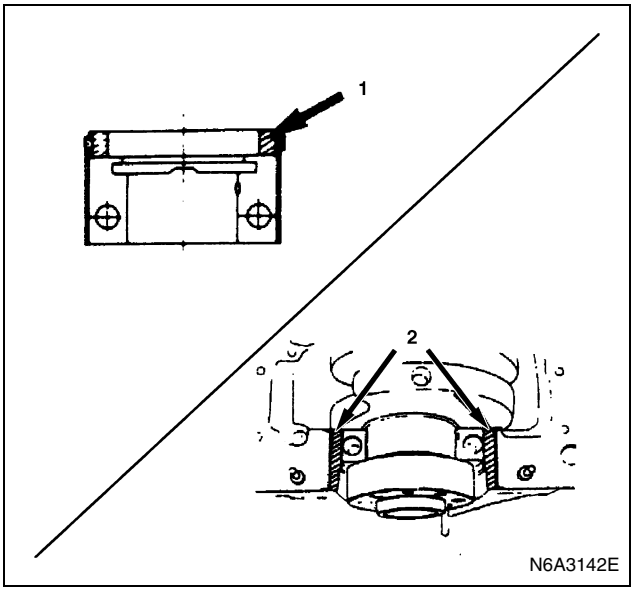
N6A3140E

   - Be sure that they are positioned correctly.
   - Apply new engine oil to the upper and lower main bearing faces.
   - Carefully mount the crankshaft.
   - Apply engine oil to the thrust washer.
   - Assemble the thrust washer to the No.3 bearing journal. The oil grooves must face the crankshaft.



N6A3141E

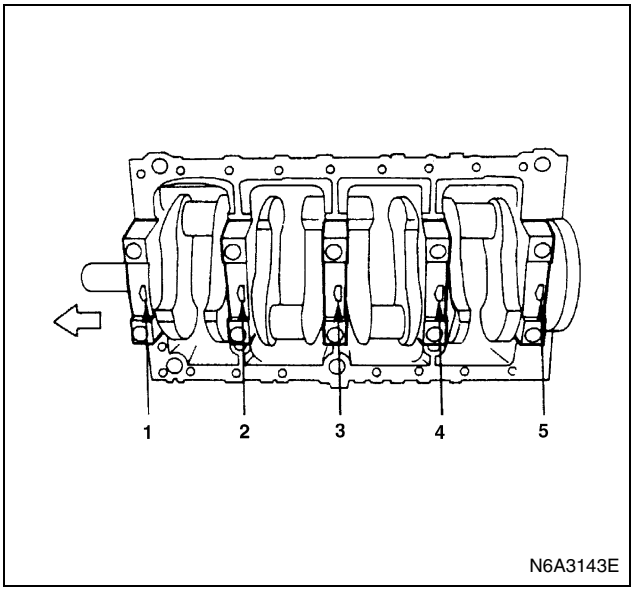
2. Main Bearing Cap
   - Apply the recommended liquid gasket or its equivalent to the No. 5 crankshaft bearing cap (1) as shown in the illustration.
   - Install the arch gasket (2) to the No. 5 bearing cap.
     Use your fingers to push the arch gasket into the bearing cap groove.



Notice:
Be sure that the bearing cap fitting surface is completely free of oil before applying the liquid gasket.

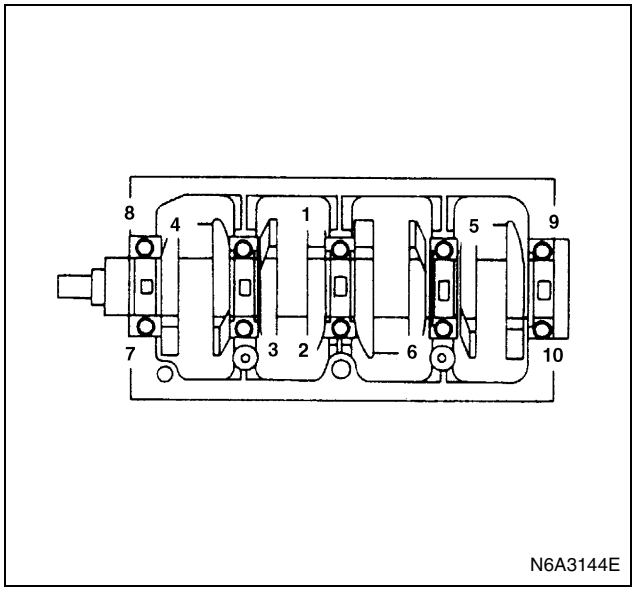
Do not allow the liquid gasket to obstruct the cylinder thread holes and bearings.

- Install the bearing caps with the bearing cap head arrow mark facing the front of the engine.



- Apply engine oil to the crankshaft bearing cap bolts.
- Tighten the crankshaft bearing cap bolts to the specified torque a little at a time in the sequence shown in the illustration.

Tighten:
167 N·m (17 kg·m/123 lb·ft)



Notice:
Check to see that the crankshaft turns smoothly by rotating it manually.

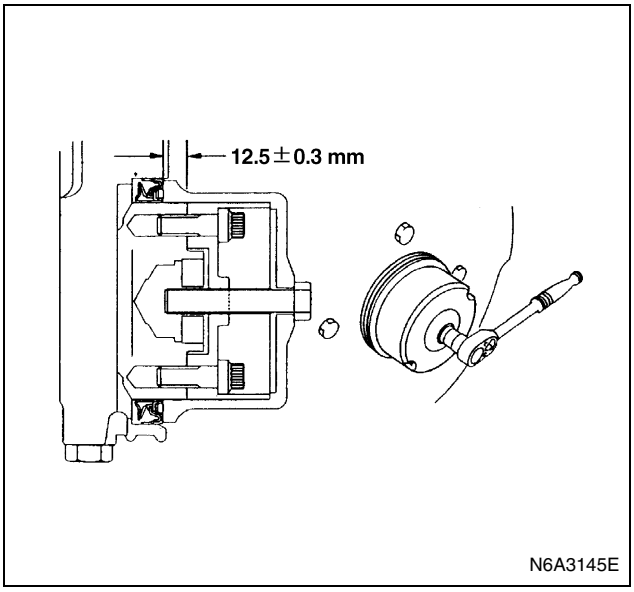
3. Crankshaft Rear Oil Seal (Gear and Belt Drive Model)
   Use the oil seal installer to install the oil seal to the cylinder body.
   Installer: Rear Oil Seal 5-8840-2359-0

Notice:
Wipe off rust and scraps clean from the press-in portion of the oil seal.

Take note of the press-in direction of the oil seal.

1) Install the adapter of the special tool to the rear end of the crankshaft with two bolts.
2) Install the oil seal to the outer circumference of the adapter.
3) Insert the slave into the adapter portion, and tighten it in with the bolt (M12 × 1.75L=70) until the adapter section hits the slave.
4) Remove the adapter and the slave.
5) After installing the oil seal, check the measurement of the oil seal.

Standard	mm (in)
12.2 — 12.8 (0.48 — 0.50)	

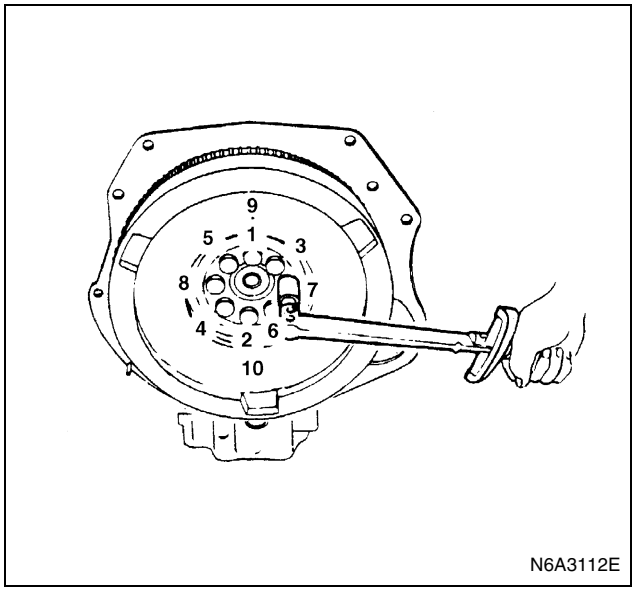


4. Cylinder Block Rear Plate
   Align the rear plate with the cylinder body knock pins.
   Tighten the rear plate to the specified torque

Tighten:
82 N·m (8.4 kg·m/61 lb·ft)

5. Flywheel
   1) Thoroughly clean the remove the oil from the threads of crankshaft.
   2) Mount the flywheel on the crankshaft and then install the washer.
   3) Apply a coat of engine oil to the threads of the flywheel bolts.
   4) Align the flywheel with the crankshaft dowel pin.
   5) Tighten the flywheel bolts to the specified torque in two steps using the Angular Tightening Method.
      Follow the numerical order shown in the illustration.

Tighten:
- Flywheel Bolt to
  1st Step: 59 N·m (6.0 kg·m/43 lb·ft)
  2nd Step: 60° — 90°



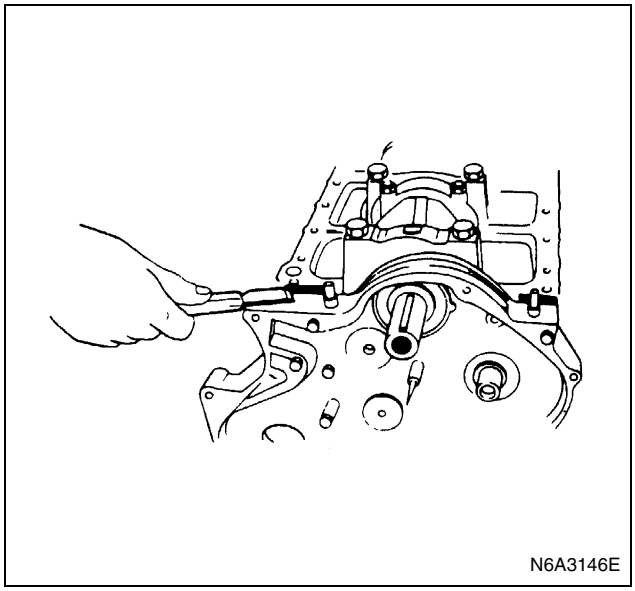
6. Piston and Connecting Rod
7. Piston Cooling Oil Pipe
8. Oil Pump Assembly
   Above works refer to “PISTON AND CONNECTING ROD”
   Section in this manual.
9. Timing Pulley Housing
   1) Install the timing pulley housing to the cylinder body.

Notice:
Take care not to twist the front oil seal.

   2) Tighten the timing pulley housing bolt together with the timing pulley housing gasket to the specified torque.

Tighten:
19 N·m (1.9 kg·m/14 lb·ft)

   3) Cut away the gasket protruding above the fitting surfaces (as shown in the illustration).



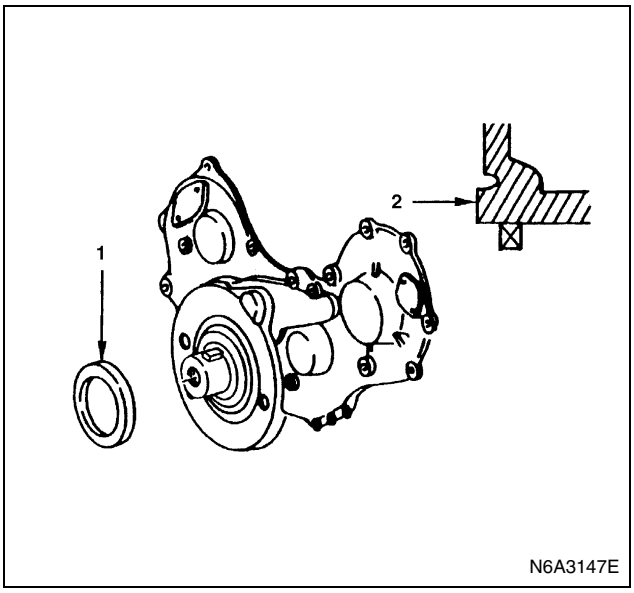
10. Timing Gear Housing

1) Install the timing gear housing to the cylinder body.
2) Tighten the timing gear housing bolt together with the timing gear housing gasket to the specified torque.

Tighten:
19 N·m (1.9 kg·m/14 lb·ft)

3) Cut away the gasket protruding above the fitting surface (as shown in the illustration).

11. Front Oil Seal (Gear Drive Model)
    - Install oil seal using special tool.
      Installer: 5-8840-2061-0



Legend
1. Oil seal
2. Timing pulley housing

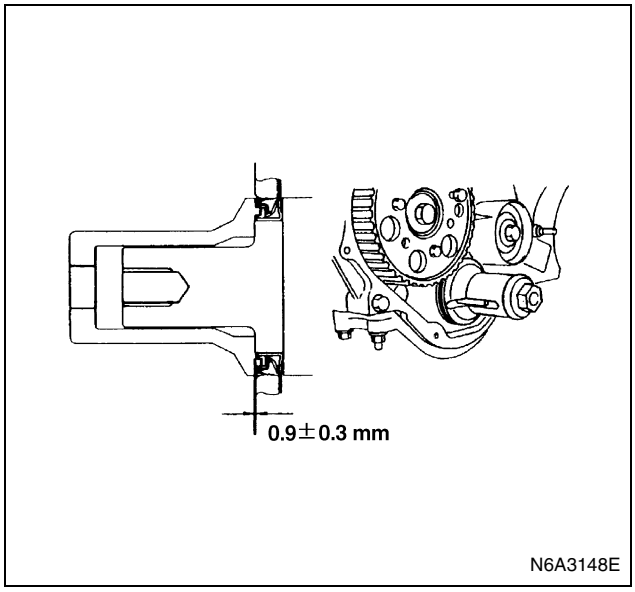
12. Front Oil Seal (Belt Drive model)
    - Install oil seal using special tool.
      Installer: 5-8840-2361-0

Notice:
Wipe off rust and scraps clean from the press-in portion of the oil seal.

Take note of the press-in direction of the oil seal.

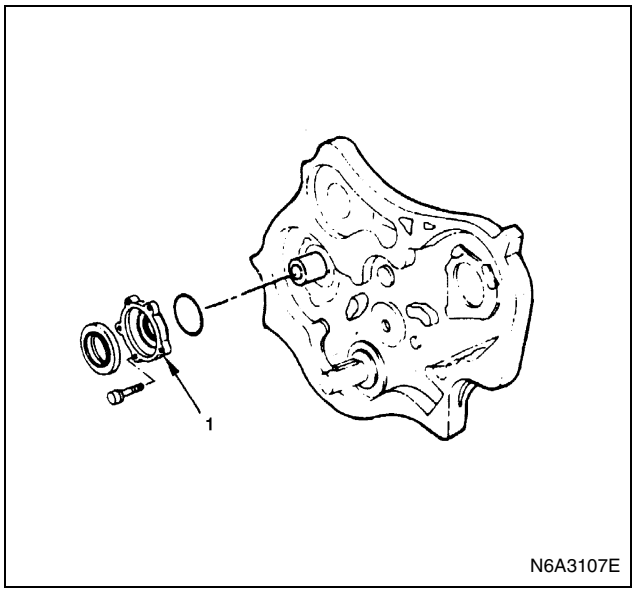
1) With the oil seal attached to the sleeve, put it in the front end of the crankshaft.
2) With the edge of the oil seal attached securely to the crankshaft, tighten it with the center bolt until the sleeve hits securely against the reference plane at the front end of the crankshaft.
3) Remove the sleeve.
4) After pressing in the oil seal, check the measurement of the oil seal.

Standard	mm (in)
0.6 — 1.2 (0.024 — 0.047)	



13. Camshaft Timing Pulley (Belt Drive model)
    1) Apply engine oil to the oil seal lip portion of the oil seal retainer.
    2) Apply the recommended liquid gasket or its equivalent to the retainer.
    3) Install the oil seal retainer to the cylinder body.
    4) Tighten the retainer bolts to the specified torque.

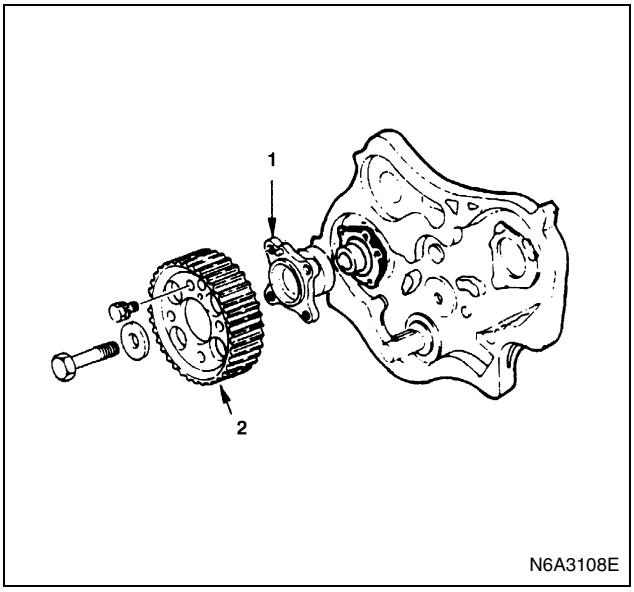
Tighten:
Oil Seal Retainer Bolt to 19 N·m (1.9 kg·m/14 lb·ft)



Legend
1. Retainer

5) Align the camshaft timing pulley center with the camshaft key.
6) Tighten the timing pulley bolts to the specified torque.

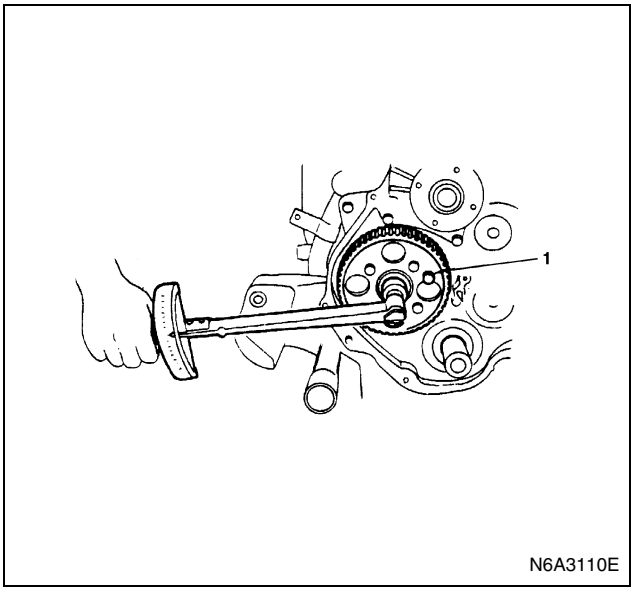
Tighten:
Timing Pulley Bolt to 8 N·m (0.8 kg·m/69 lb·ft)



Legend
1. Timing pulley center
2. Timing pulley

7) Prevent the camshaft from turning when tightening the timing center bolt.
8) Tighten the timing pulley center bolt to the specified torque.

Tighten:
Center Bolt to 64 N·m (6.5 kg·m/47 lb·ft)



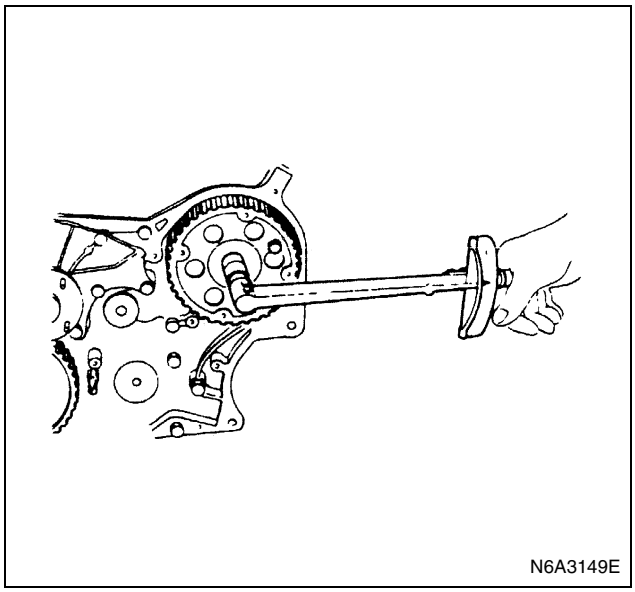
Legend
1. Lock bolt

9) Install the crank pulley.
10) Install the idle pulley and idler pulley.

Tighten:
76 N·m (7.8 kg·m/56 lb·ft)

11) Install the injection pump assembly and install timing pulley.
12) Align the timing pulley with the pump shaft key.
13) Install the stopper bolt to the timing pulley.
This will prevent the timing pulley from moving.
14) Tighten the timing pulley nut to the specified torque.

Tighten:
Injection Pump Timing Pulley Nut to 64 N·m (6.5 kg·m/47 lb·ft)



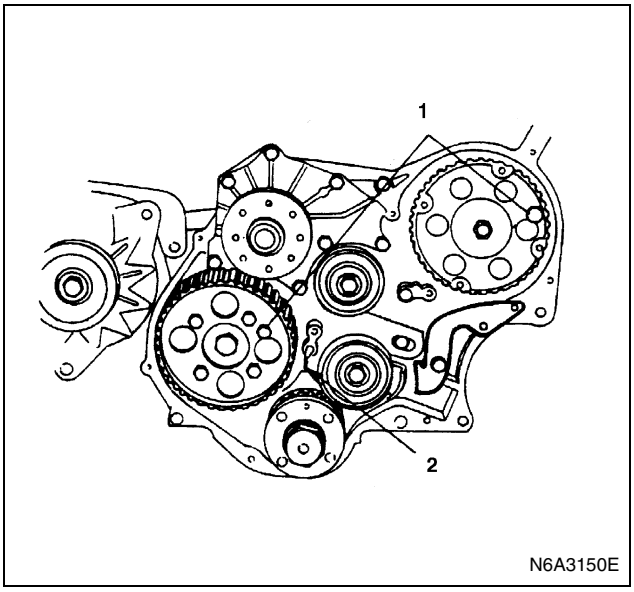
15) Remove the stopper bolt from the injection timing.

14. Timing Belt (Belt Drive model)

Notice:
- When the timing belt is removed, be sure to replace it with a new one.
- The tension of the timing belt may be affected by the changes in temperature. Be sure to install it while the engine cold.
- When the timing belt is bent forcibly, the cord may got snapped, thus resulting in the reduced strength. Do not bend it unnecessarily.

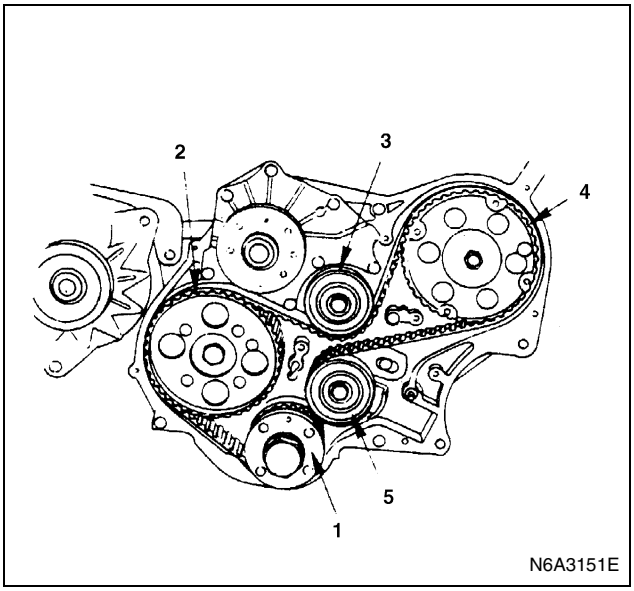
1) Check that the stopper bolts are properly installed to the camshaft timing pulley and the injection pump timing pulley.
2) Check that the timing pulley housing mark and the crankshaft timing pulley mark are aligned.
The No. 1 cylinder should be at TDC on the compression stroke.

Rotate the crankshaft damper pulley clockwise to align the marks.



Legend
1. Lock bolt
2. Setting mark

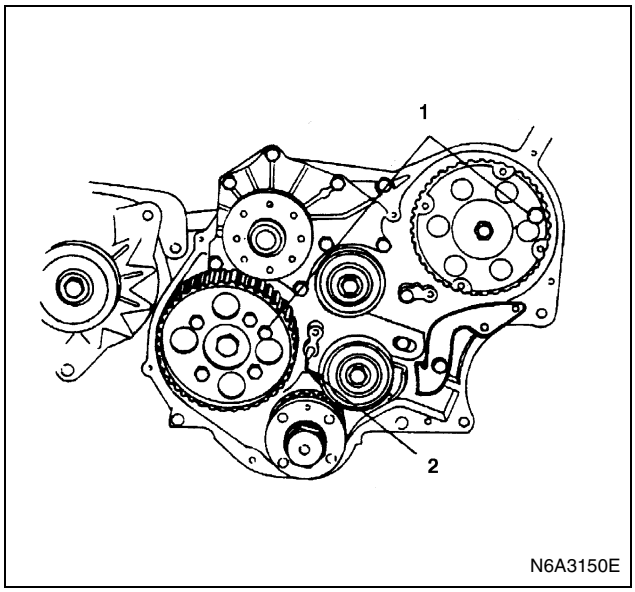
3) Install the timing belt to the crankshaft timing pulley (1), the camshaft timing pulley (2), the tensioner idler (3), and the injection timing pulley (4).
   Follow the numerical order.
4) Install the timing belt tensioner (5) to the timing pulley housing.
5) Temporarily tighten the tensioner bolt.
   The tensioner should move freely.



Notice:
The timing belt is easily damaged. Be careful.

Notice:
After completion of the installation of the timing belt, check to see if the alignment mark of the crankshaft timing pulley is in line with the alignment mark provided on the housing.

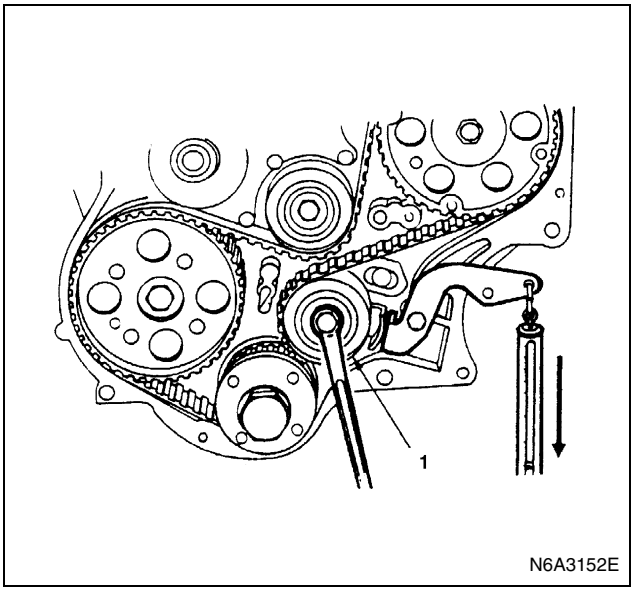
- When the alignment marks are not in line with each other, set them together and reinstall the timing belt.



Legend
1. Lock bolt
2. Setting mark

6) Set the tensioner adjusting lever to the timing pulley housing.
7) Remove the stopper bolts from the camshaft timing pulley and the injection pump timing pulley.
8) Attach the spring balancer.
9) Adjust the timing belt tension by pulling straight down on the spring balancer with the specified force.

Tension Adjusting Lever Force	N (kg/lb)
98 — 118 (10 — 12/22 — 26)	



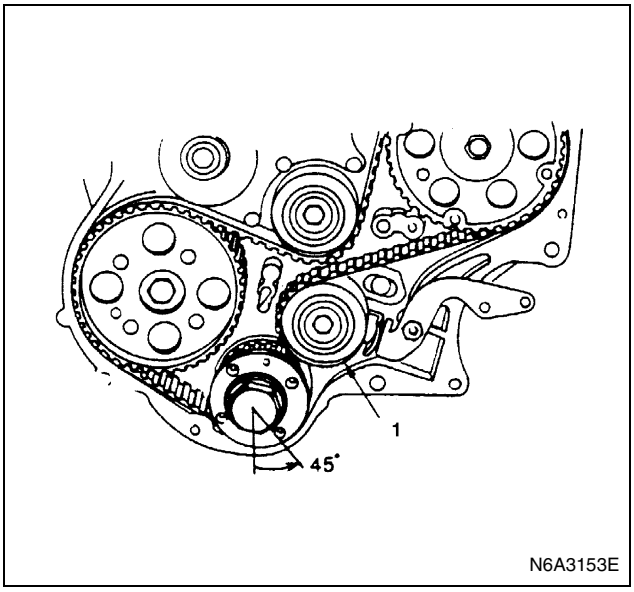
Legend
1. Tensioner

Notice:
Timing belt tension must be adjusted.

Failure to adjust the timing belt tension will result in timing belt damage.

10) Tighten the tension bolt.

11) Rotate the crankshaft 45 degrees counterclockwise.



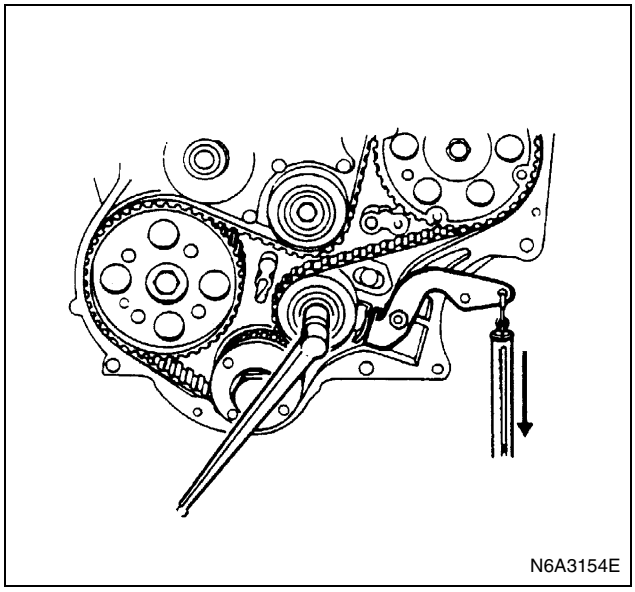
Legend
1. Tensioner

Notice:
Never rotate the crankshaft clockwise when adjusting the timing belt.

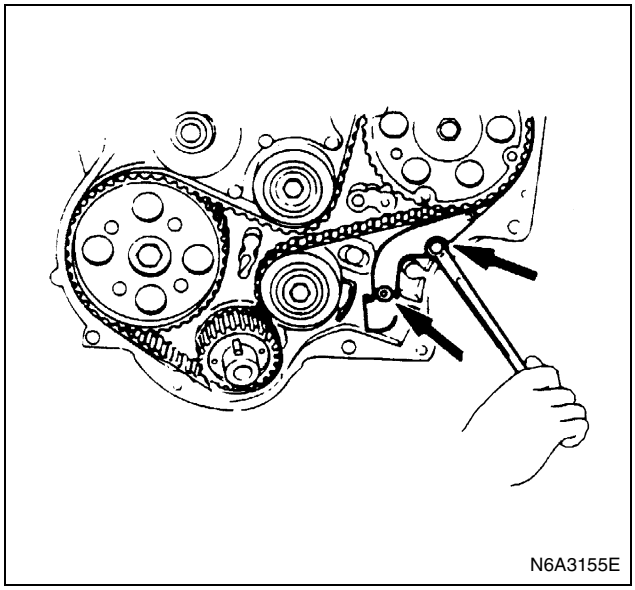
12) Readjust the timing belt tension.
Refer to Step 9
This will remove any remaining timing belt slack.

13) Tighten the tension bolt to the specified torque.

Tighten:
Tensioner Bolt to 76 N·m (7.7 kg·m/56 lb·ft)



14) Tighten the tension adjusting lever nut and bolt.



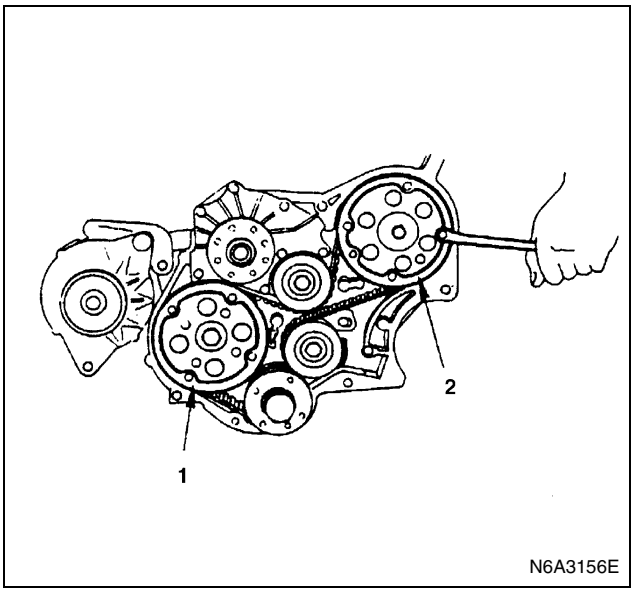
Notice:
If on-vehicle timing belt replacement is performed, the crankshaft must not be allowed to turn.

If the crankshaft is allowed to turn, piston and valve damage will result.

15. Flange: Camshaft Pulley (Belt Drive model)
16. Flange: Injection Pump Pulley (Belt Drive model)
    1) Install the timing pulley flange to the camshaft and injection pump timing pulley.

2) Tighten the timing pulley flange bolts to the specified torque.

Tighten:
Timing Pulley Flange Bolt to 19 N·m (1.9 kg·m/14 lb·ft)

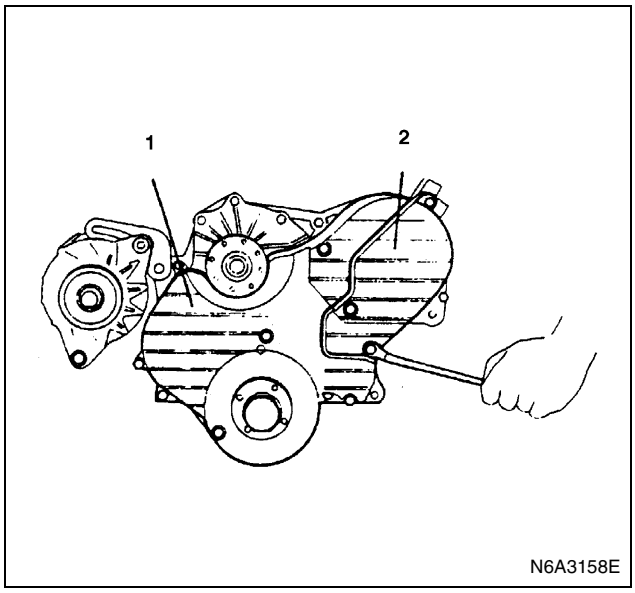


Legend
1. Camshaft pulley
2. Injection pump pulley

17. Timing Pulley Lower Cover (Belt Drive model)
    1) Apply the recommended liquid gasket or its equivalent to the timing pulley lower cover.

    2) Install the lower cover to the timing pulley housing.
    3) Use the lower cover guide bolts to prevent the liquid gasket from running.
18. Timing Pulley Upper Cover (Belt Drive model)
    1) Install the upper cover to the lower cover and the pulley housing.
    2) Tighten the timing pulley cover bolts to the specified torque a little at a time.

Tighten:
Timing Pulley Cover Bolt to 8 N·m (0.81 kg·m/6 lb·ft)



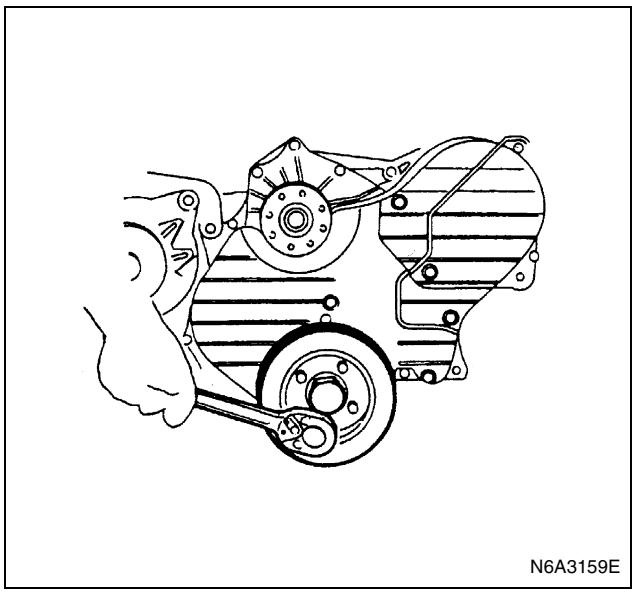
Legend
1. Lower cover
2. Upper cover

    3) Remove the lower cover guide pin.

Tighten:
Crankshaft Center Pulley to 206 N·m (21 kg·m/152 lb·ft)

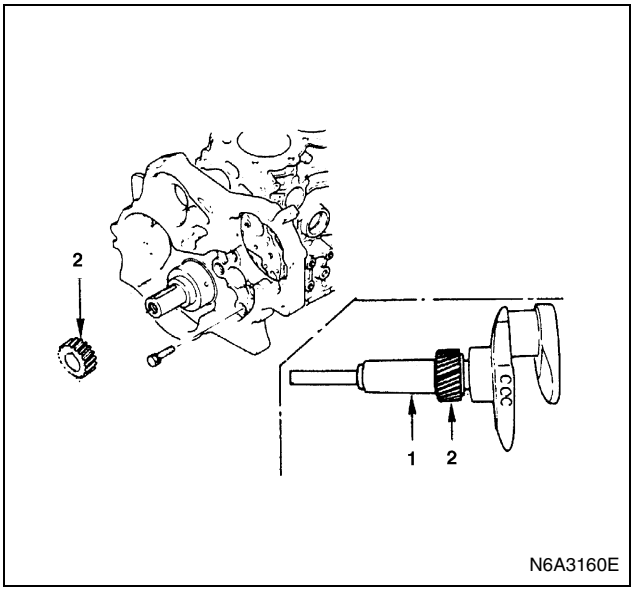
19. Crankshaft Damper Pulley (Belt Drive model)
    1) Install the damper pulley and tighten bolts to the specified torque.

Tighten:
Pulley Bolts to 19 N·m (1.9 kg·m/14 lb·ft)



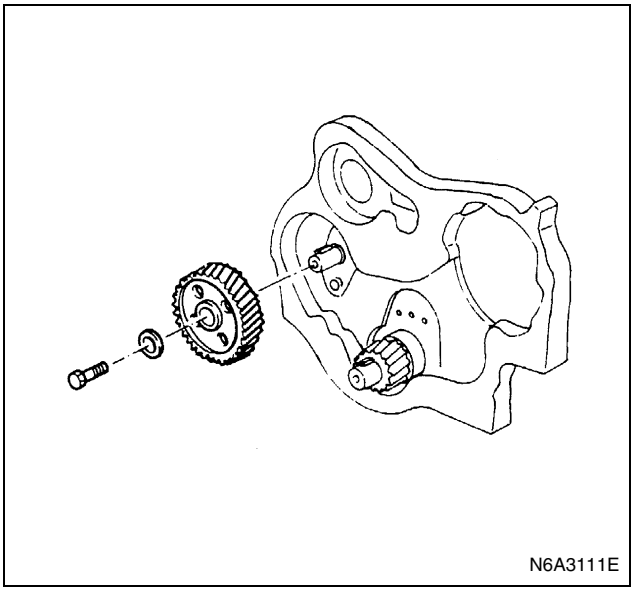
20. Crank Shaft Gear (Gear Drive model)
    1) Install the crankshaft gear.

2) Use the crankshaft gear installer (1) to install the crankshaft gear (2).
The crankshaft gear timing mark ("X — X") or ("· — ·") must be facing outward.
Crankshaft Gear Installer: 9-8522-0020-0



21. Crankshaft Timing Gear (Gear Drive model)
    1) Install the camshaft timing gear to the camshaft.
    The timing gear mark ("Y — Y") or ("· · — · ·") must be facing outward.
    2) Tighten the timing gear to the specified torque.

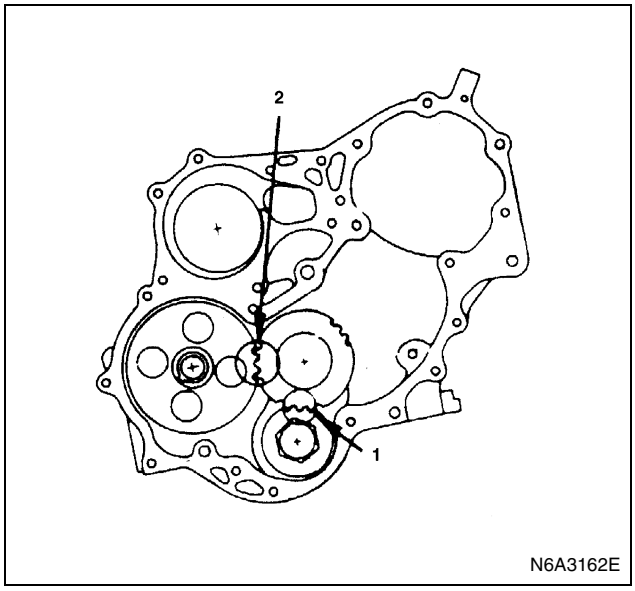
Tighten:
64 N·m (6.5 kg·m/47 lb·ft)



22. Idle Gear (Gear Drive model)
    1) Apply engine oil to the idle gear and the idler gear shaft.
    The idler shaft oil hole must be facing up.
    2) Position the idler gear setting marks "X" or "·" and "Y" or "· ·" so that they are facing the front of the engine.

    3) Align the idler gear "X" or "·" setting mark with the crankshaft timing gear (1) "X — X" or "· — ·" setting mark.
    4) Align the idler gear "Y" setting mark with the camshaft timing gear (1) "Y — Y" or "· · — · ·" setting mark.
    5) Install the thrust collar and bolts to the cylinder body through the shaft.
    The thrust collar oil hole must be facing up, and the thrust collar chamfered must be outward.
    6) Tighten the idler gear bolt to the specified torque.

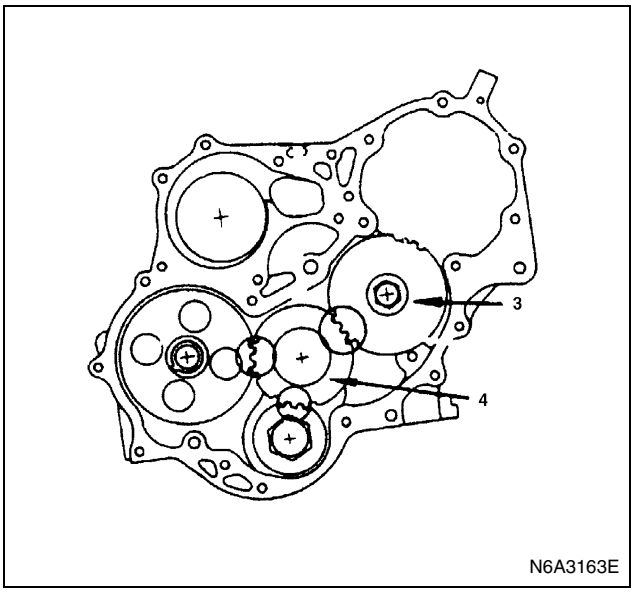
Tighten:
19 N·m (1.9 kg·m/14 lb·ft)



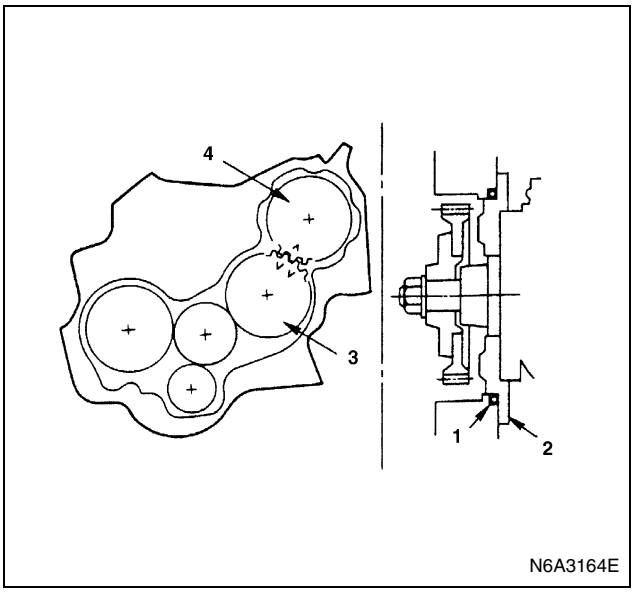
23. Idler Gear "B" and Shaft (Gear Drive model)
    1) Apply engine oil to the idler gear and the idler gear shaft.
    2) Align the idler gear "B" (3) "Z" or ":·" setting mark with the idler gear "A" (4) "Z — Z" or ":· — ·:" setting mark.

3) Tighten the idler gear bolt to the specified torque.

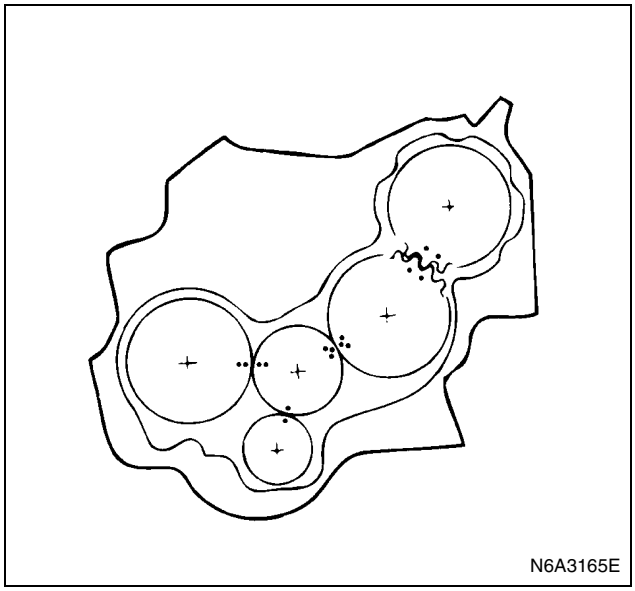
Tighten:
76 N·m (7.7 kg·m/56 lb·ft)



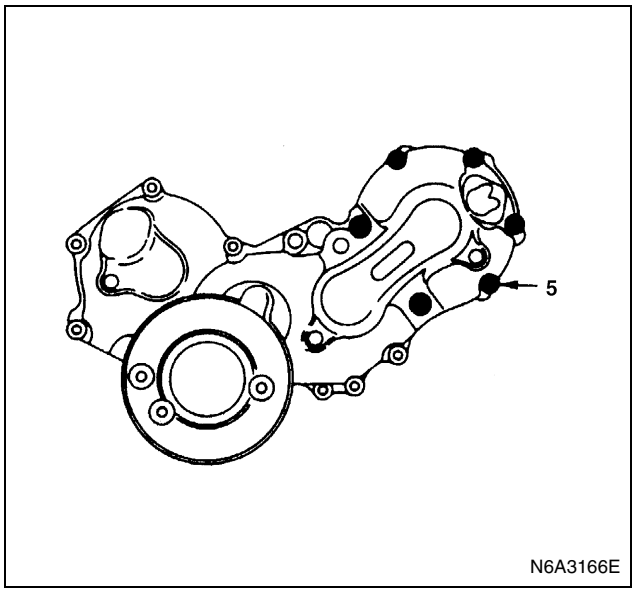
24. Injection Pump (Gear Drive model)
    1) Install the O-ring (1) to the injection pump flange (2).
    2) Install the injection pump to the timing gear case.
       Align the idler gear "B" (3) "V — V" or ": — :" mark.



Gear	4JB1-TC 4JG2	4JH1-TC
Crank gear A|Idle gear "A"	X — X	· — ·
Idle gear "A" — Cam gear	Y — Y	· · — · ·
Idle gear "A" — Idle gear "B"	Z — Z	:· — ·:
Idle gear "B" — Injection pump	V — V	: — :



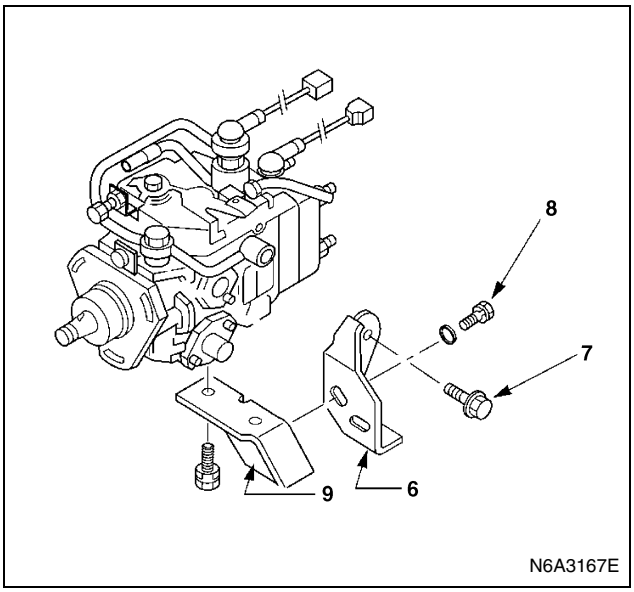
3) Temporarily tighten the six injection pump bolts (5).
   The injection pump bolts will be finally tightened after the injection pump rear bracket bolts.



4) Install the injection pump rear bracket (6) and the rear bracket bolts (7) to the cylinder body.

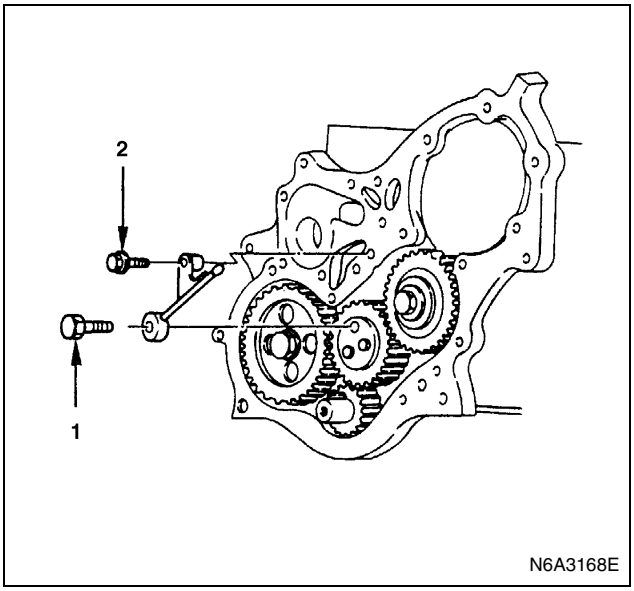
5) Install the rear bracket bolts (8) to the injection pump bracket (9).
Do not tighten the bolts.
The rear bracket bolts (7) and (8) will be finally tightened to the specified torque.

Tighten:
19 N·m (1.9 kg·m/14 lb·ft)



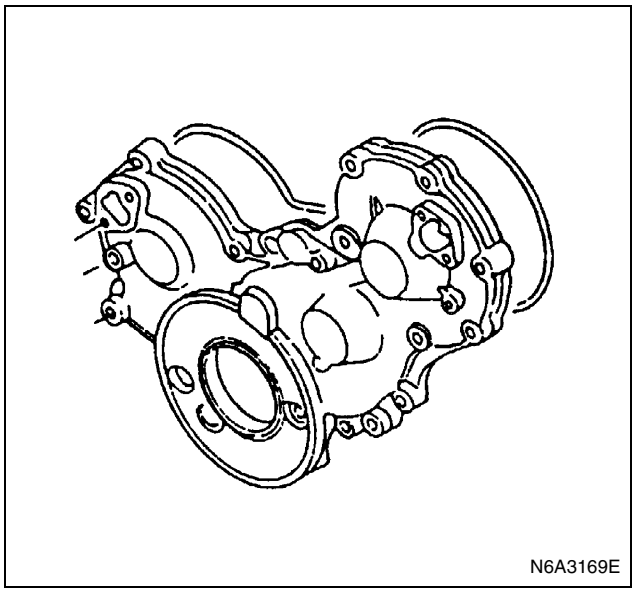
25. Timing Gear Oil Pipe (Gear Drive model)
    1) Install the oil pipe to the timing gear case and idler gear “A”.
    2) Tighten the oil pipe eye bolt (1) and bolt (2) to the specified torque.

Tighten:
13 N·m (1.3 kg·m/9 lb·ft)



26. Timing Gear Case Cover (Gear Drive model)
    1) Align the gear case with the timing gear case knock pin and then install the timing gear case cover.
    2) Tighten the gear case cover bolts to the specified torque.

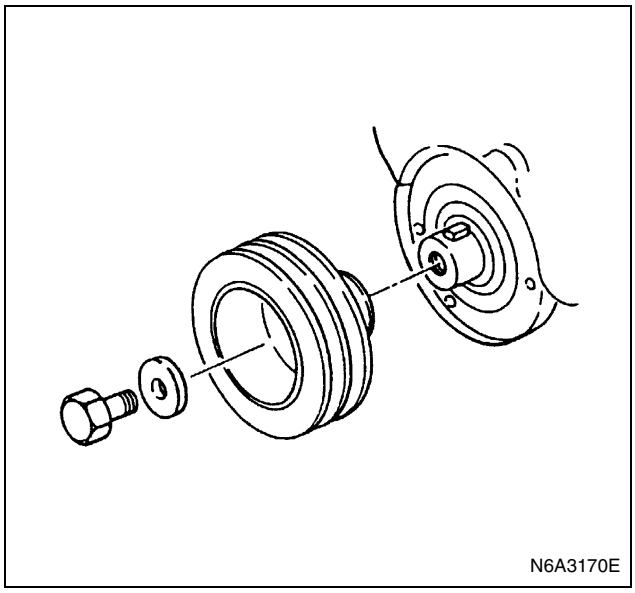
Tighten:
8 N·m (0.8 kg·m/69 lb·in)



27. Crankshaft Damper Pulley (Gear Drive model)
    Tighten the crankshaft damper pulley bolt to the specified torque.

Notice:
Hold the flywheel ring gear stationary to prevent the crankshaft from turning when tightening the damper pulley.

Tighten:
206 N·m (21 kg·m/152 lb·ft)



28. Cooling Fan Assembly (Gear Drive model)
    1) Mount fan pulley, distance piece, and cooling fan asm (in this order) on the water pump, and tighten to the specified torque.

Tighten:
8 N·m (0.8 kg·m/69 lb·in)

29. AC Generator, Power Steering Pump Drive Belt (Gear Drive model)
    1) Install AC Generator, Power Steering pump drive belt and adjust belt tension.
    2) Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

    3) Tighten the idler lock nut to the specified torque.

Tighten:
27 N·m (2.8 kg·m/20 lb·ft)

30. Fan Shroud (Gear Drive model)
    1) Install the fan shroud and reservoir tank hose.
    2) Pour coolant
    3) Start the engine and check coolant leakage.
31. Oil Pan Assembly
    Above works refer to “OIL PUMP” Section in this manual.
32. Cylinder Head Assembly and Gasket
    - Piston Head Projection Measurement Point
    - Cylinder Head Assembly
    - Push Rod
    - Rocker Arm Shaft Assembly

    Valve clearance adjustment.

    Above works refer to “CYLINDER BLOCK” Section in this manual.

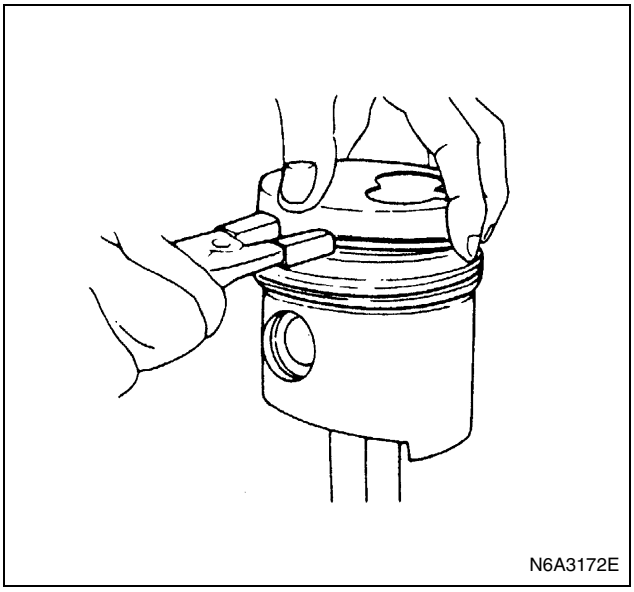
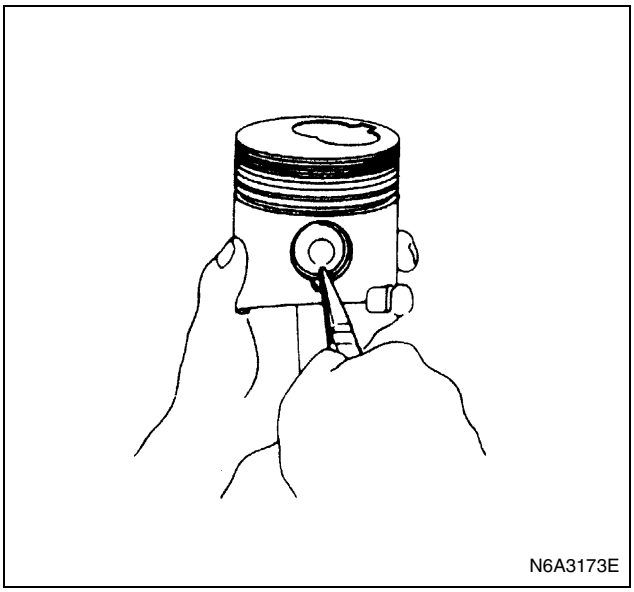
Disassembly

1. Cylinder Head Assembly
2. Oil Pan Assembly
3. Oil Pump Assembly
4. Piston Cooling Oil Pipe
5. Connecting Rod Bearing Cap
6. Piston and Connecting Rod
   - Remove carbon deposits from the upper portion of the cylinder wall with a scraper before removing the piston and connecting rod.
7. Piston Ring
   Remove the piston rings with a piston ring expander.
   Arrange the removed piston rings in the cylinder number order.



N6A3172E

8. Piston Pin Snap Ring
   - Use a pair of pliers to remove the piston pin snap rings.



N6A3173E

9. Piston Pin

Notice:
Keep the parts removed from each cylinder separate.
All parts must be reinstalled in their original positions.

10. Piston
11. Connecting Rod

Inspection and Repair

Piston and Piston Ring

Pistons
Carefully clean away all the carbon adhering to the piston head and the piston ring grooves.

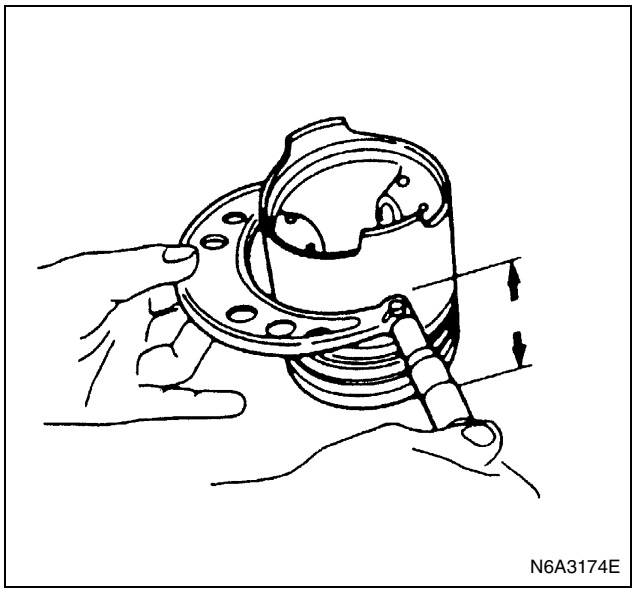
Notice:
Never use a wire brush to clean the pistons. Damage will result.

Visually check each piston for cracking, scoring, and other signs of excessive wear.
If any of the above conditions are present, the piston must be replaced.

Piston Diameter

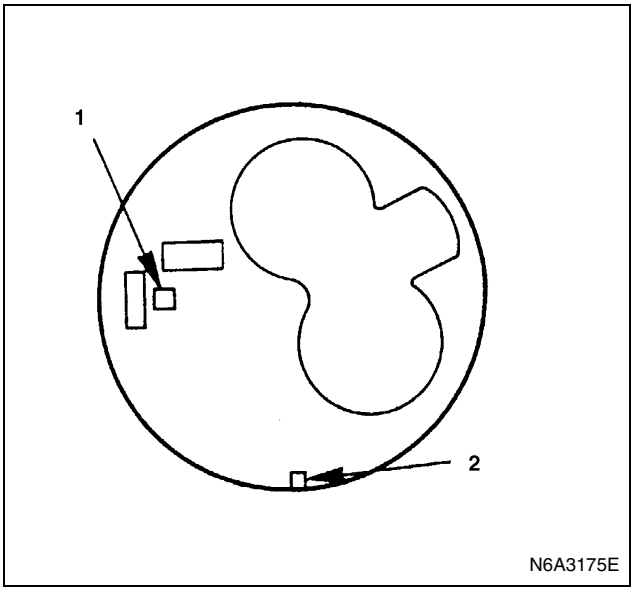
1. Measure the piston outside diameter with micrometer at the piston grading position.

Piston Grading Position	mm (in)
4JB1 / 4JB1-TC	74 (2.913)
4JG2, 4JH1-TC	71.00 (2.797)



N6A3174E

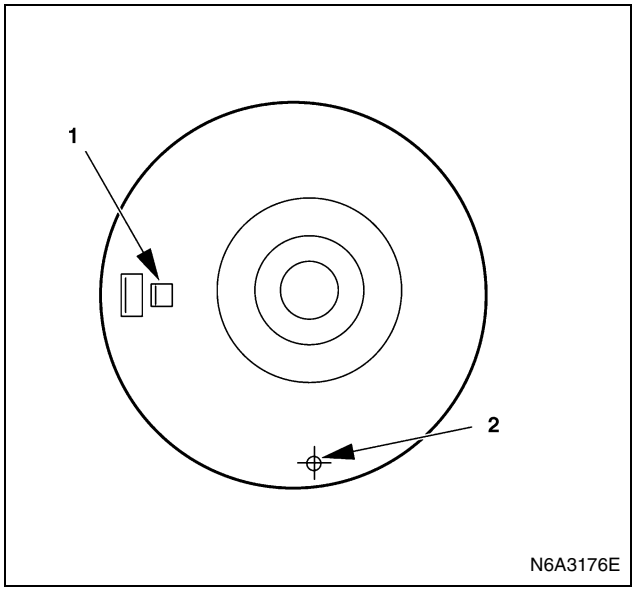
4JB1 / 4JB1-TC mm (in)	
Size Mark	Outside Diameter
A	92.985 — 92.994 (3.6608 — 3.6612)
B	92.995 — 93.004 (3.6612 — 3.6616)
C	93.005 — 93.014 (3.6616 — 3.6620)
D	93.015 — 93.024 (3.6620 — 3.6624)



Legend
1. G-mark
2. Front mark

4JG2	mm (in)
Size Mark	Outside Diameter
A	95.365 — 95.374 (3.7545 — 3.7549)
B	95.375 — 95.384 (3.7549 — 3.7553)
C	95.385 — 95.394 (3.7553 — 3.7557)
D	95.395 — 95.404 (3.7557 — 3.7561)

4JH1-TC	mm (in)
Size Mark	Outside Diameter
A	95.355 — 95.364 (37.5413 — 37.5449)
B	95.365 — 95.374 (37.5453 — 37.5488)
C	95.375 — 95.384 (37.5492 — 37.5528)
D	95.385 — 95.394 (37.5531 — 37.5567)



Legend
1. G-mark
2. Front mark

The grading position for piston outside diameter is represented by the 'G' as shown in Figure.
Measure the cylinder bore inside diameter (refer to "inspection of the cylinder Block" in this Section).
If the piston clearance does not conform to the specified valve, the piston and/or cylinder liners must be replaced.

Piston Clearance	mm (in)
4JB1 / 4JB1-TC	0.061 (0.0024)
4JG2	0.066 (0.0026)
4JH1-TC	0.057 — 0.075 (0.0022 — 0.0029)

Selection Method of Piston Grade for Service Parts.
If you find piston grade A from size mark or piston outside diameter measurement result, you will select AX for service piston grade.
The stamped piston grade on the head of piston for service parts.

Service piston grade	
Piston Size Mark	Service Parts Grade
A	AX
B	AX
C	CX
D	CX

Service piston diameter mm (in)	
Piston Grade	4JB1 / 4JB1-TC
AX	92.989 — 93.004 (3.6610 — 3.6616)
CX	93.005 — 93.020 (3.6616 — 3.6622)

Piston Grade	4JG2
AX	95.369 — 95.384 (3.7547 — 3.7553)
CX	95.385 — 95.400 (3.7553 — 3.7559)

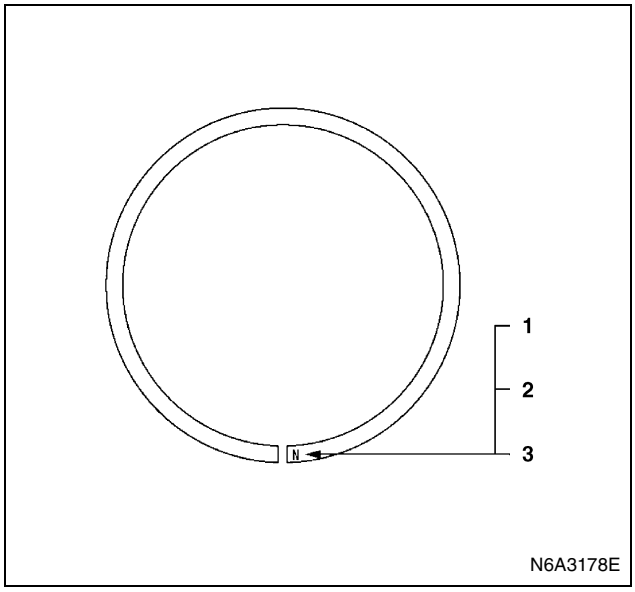
Piston Grade	4JH1-TC
AX	95.359 — 95.374 (3.7543 — 3.7549)
CX	95.375 — 95.390 (3.7549 — 3.7555)

Notice:
It is most important that the correct piston grade be used. Failure to select the correct piston grade will result in engine failure. Always measure the cylinder bore and select the correct piston grade.

Piston Rings
Any worn or damaged part discovered during engine overhaul must be replaced with a new one.

1. Ring end gap measurement
   - Insert the piston ring into the bore.
   - Push the ring by the piston, at a right angle to the wall, into the point ring at which the cylinder bore diameter is the smallest.

   - The top mark of the piston ring are shown in the illustration.



Legend
1. N mark (Top ring) (2nd ring) (4JB1)
2. 1N mark (Top ring) 2N mark (2nd ring) (4JG2)
3. R mark (Top ring) (2nd ring) (4JH-TC)

4JB1 / 4JB1-TC			mm (in)
		Standard	Limit
Compression ring	1st	0.20 — 0.40 (0.0079 — 0.0157	1.5 (0.059)
	2nd	0.20 — 0.40 (0.0079 — 0.0157	
Oil ring		0.10 — 0.30 (0.0039 — 0.0118)	

4JG2			mm (in)
		Standard	Limit
Compression ring	1st	0.20 — 0.35 (0.0079 — 0.0138)	1.5 (0.059)
	2nd	0.37 — 0.52 (0.0146 — 0.0205)	
Oil ring		0.20 — 0.40 (0.0079 — 0.0157)	

4JH1-TC			mm (in)
		Standard	Limit
Compression ring	1st	0.30 — 0.50 (0.0118 — 0.0197)	1.5 (0.059)
	2nd	0.30 — 0.50 (0.0118 — 0.0197)	
Oil ring		0.25 — 0.45 (0.0098 — 0.0117)	

2. Measure the clearance between the piston ring groove and the piston ring with a feeler gauge. If the piston ring groove/piston ring clearance exceeds the specified limit, the piston must be replaced.

4JB1 / 4JB1-TC			mm (in)
		Standard	Limit
Compression ring	1st	0.090 — 0.125 (0.0035 — 0.0049)	1.5 (0.059)
	2nd	0.050 — 0.075 (0.0020 — 0.0030)	
Oil ring		0.03 — 0.07 (0.0012 — 0.0028)	

4JG2			mm (in)
		Standard	Limit
Compression ring	1st	0.09 — 0.13 (0.0035 — 0.0051)	1.5 (0.059)
	2nd	0.05 — 0.07 (0.0020 — 0.0028)	
Oil ring		0.03 — 0.07 (0.0012 — 0.0028)	

4JH1-TC			mm (in)
		Standard	Limit

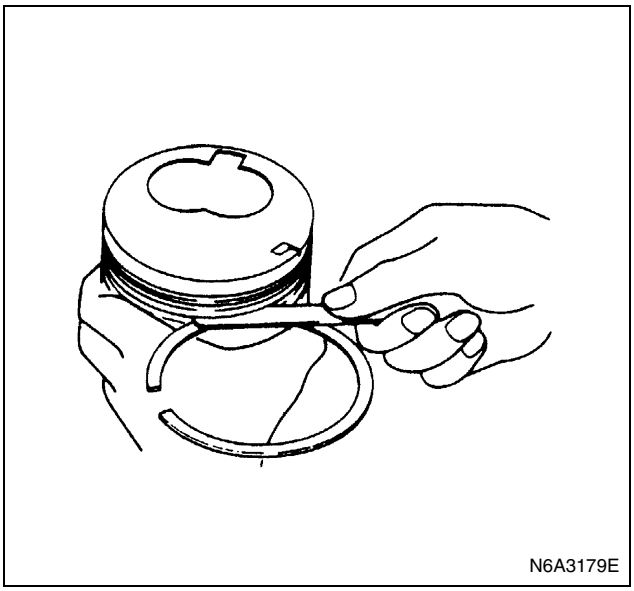
	2nd	0.05 — 0.09 (0.002 — 0.0035)	
Oil ring		0.03 — 0.07 (0.00118 — 0.0028)	



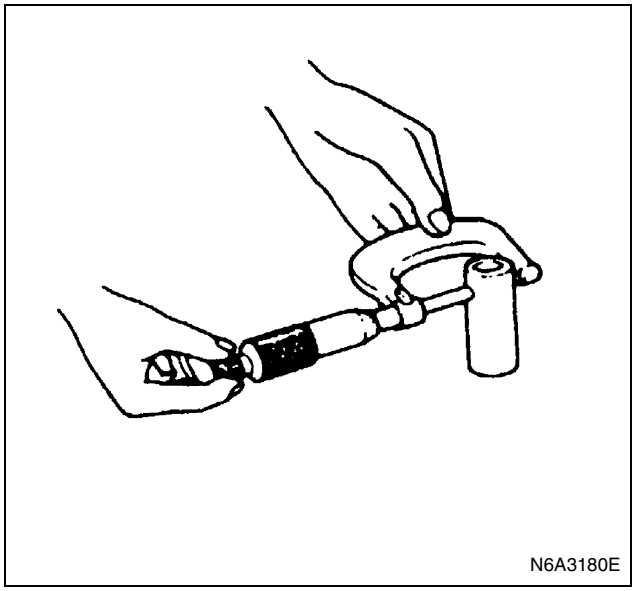
N6A3179E

Piston Pin

Visually inspect the piston pin for cracks, flaws, and other damage and replace if necessary.

1. Use a micrometer to measure the piston pin outside diameter in both directions at three different positions.
   If the measurement exceed the specified limit the piston pin must be replaced.

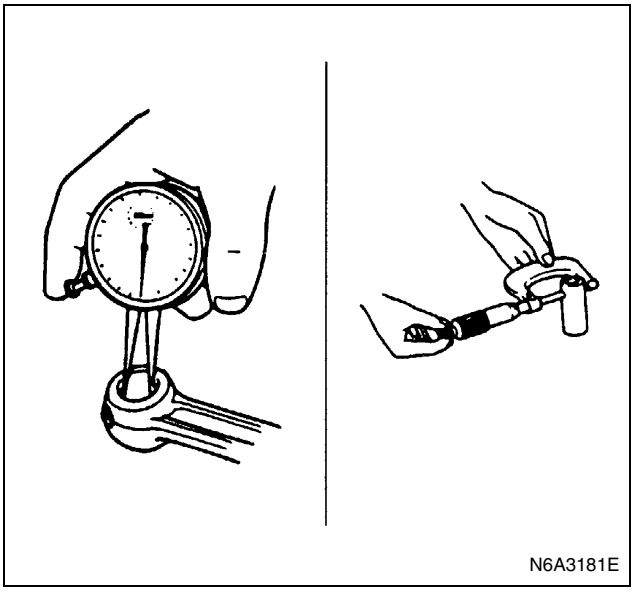
Piston pin outside diameter		mm (in)
	Standard	Limit
4JB1 4JB1-TC 4JH1-TC	30.995 — 31.000 (1.2202 — 1.2204)	30.970 (1.2190)
4JG2	33.995 — 34.000 (1.3384 — 1.3386)	33.970 (1.3374)



N6A3180E

2. Measure the inside diameter of the connecting rod small end. If the clearance between the small end and pin does not conform to the specified value, the connecting rod or bushing and pin must be replaced.

		mm (in)
	Standard	Limit
Clearance	0.008 — 0.020 (0.0003 — 0.0008)	0.05 (0.0020)



N6A3181E

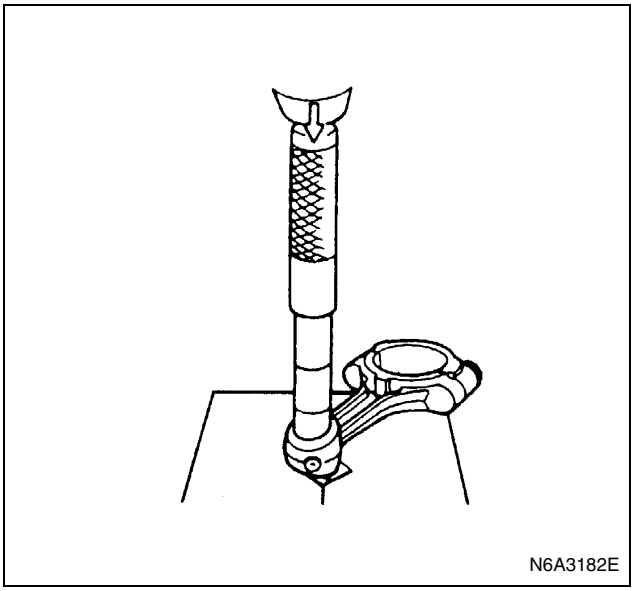
3. Insert the piston pin into the piston and rotate it. If the pin rotates smoothly with no backlash, the clearance is normal. If there is backlash or roughness, measure the clearance. If the clearance exceeds the specified limit, the piston and the piston pin must be replaced.

		mm (in)
	Standard	Limit
Clearance	0.002 — 0.004 (0.00008 — 0.00016)	0.04 (0.0016)

Bushing Replacement

Removal: Use a suitable bar and bench press or hammer.

Installation: Use a suitable bar and bench press.



N6A3182E

Notice:

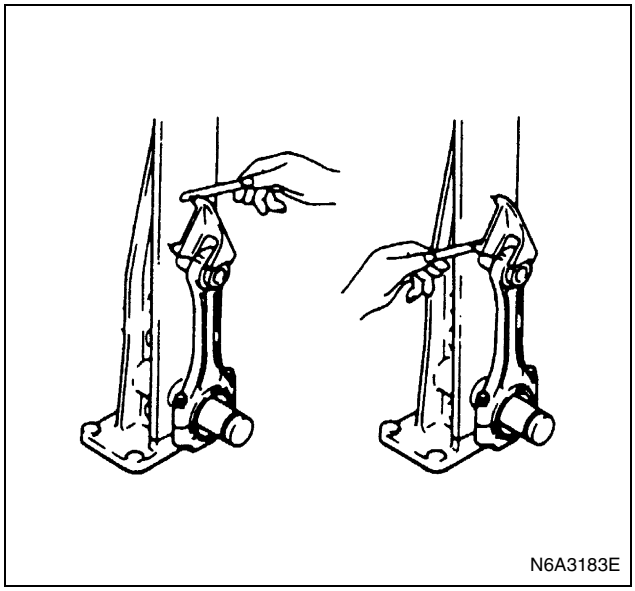
Align the bushing with the connecting rod oil port.

After installing a new bushing, finish the bushing bore with a pin hole grinder.

Connecting Rods

1. Check the connecting rod alignment with a connecting rod aligner.
   If either the bend or the twist exceeds the specified limit, the connecting rod must be replaced.

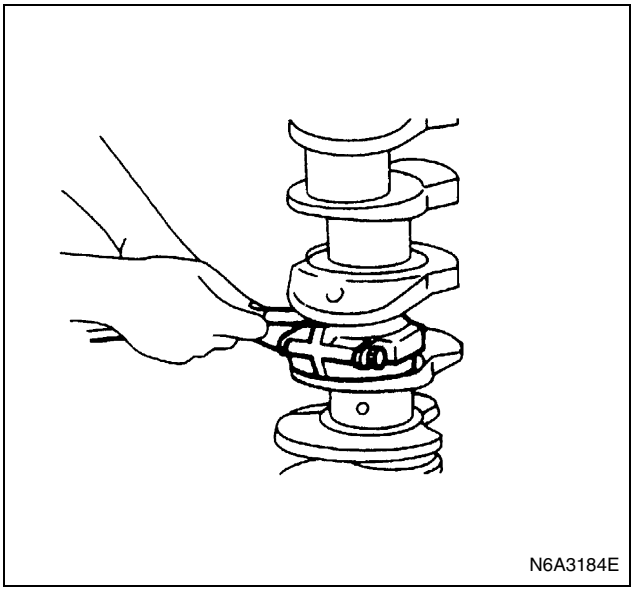
		mm (in)
	Standard	Limit
Bend per 100 (3.94)	0.08 (0.0031) or less	0.20 (0.0079)
Twist per 100 (3.94)	0.05 (0.0020) or less	0.15 (0.0059)



N6A3183E

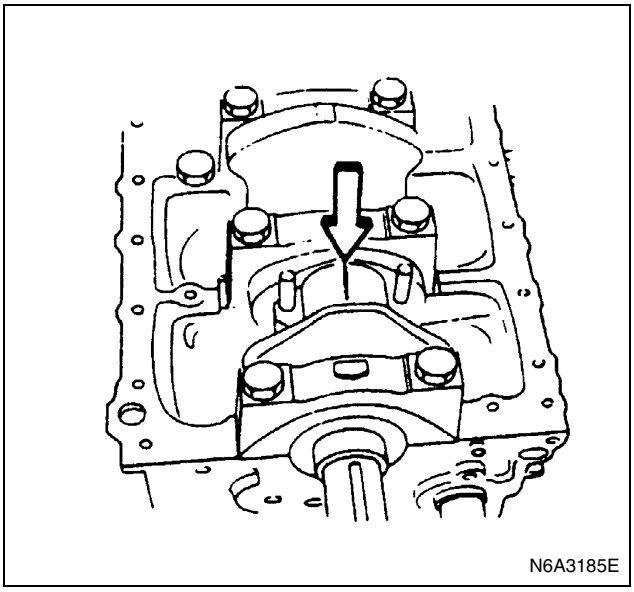
2. Measure the connecting rod thrust clearance.
   Use a feeler gauge to measure the thrust clearance at the big end of the connecting rod.
   If the clearance exceeds the specified limit, the connecting rod must be replaced.

Thrust Clearance	mm (in)
Standard	Limit
0.230 (0.0091)	0.350 (0.0138)



N6A3184E

3. Measure the oil clearance between the connecting rod and the crankshaft by:
   1) Remove the connecting rod cap nuts and the rod caps.
      Arrange the removed rod caps in the cylinder number order.
   2) Clean the rod bearings and the crankshaft pins.
   3) Carefully check the rod bearings.
      If even one bearing is found to be damaged or badly worn, the entire bearing assembly must be replaced as a set. Reinstall the bearings in their original positions.
      Apply plastigage to the crank pin.



N6A3185E

   4) Put the plastigage, and reinstall the rod caps to their original positions.
   5) Tighten the cap nuts in 2 steps, using angular tightening method as shown in the following specifications. (4JG2, 4JH1-TC, 4JB1-TC)

Tighten:
- 4JH1-TC, 4JB1-TC to
  1st Step: 29 N·m (3 kg·m/22 lb·ft)
  2nd Step: 45° — 60°
- 4JB1 to 83 N·m (8.5 kg·m/61 lb·ft)

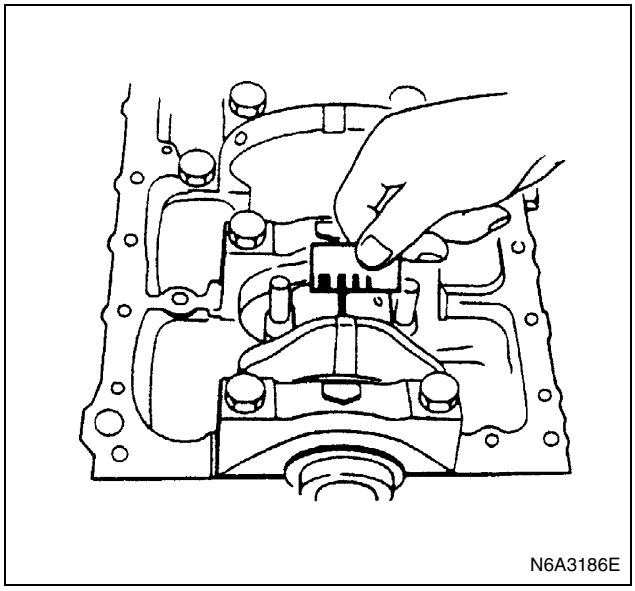
Notice:
Do not allow the crankshaft to rotate.

   6) Remove the rod caps.
   7) Measure the width of the plastigage and determine the oil clearance. If the oil clearance exceeds the limit, replace the rod bearings as a set.
   8) Remove the plastigage from the bearings and the crankshaft pins.

Crankshaft Journal and Bearing Clearance

mm (in)

	Standard	Limit
4JB1 / 4JB1-TC	0.029 — 0.066 (0.0011 — 0.0026)	0.100 (0.0039)
4JG2 4JH1-TC	0.029 — 0.083 (0.0011 — 0.0033	



N6A3186E

Reassembly

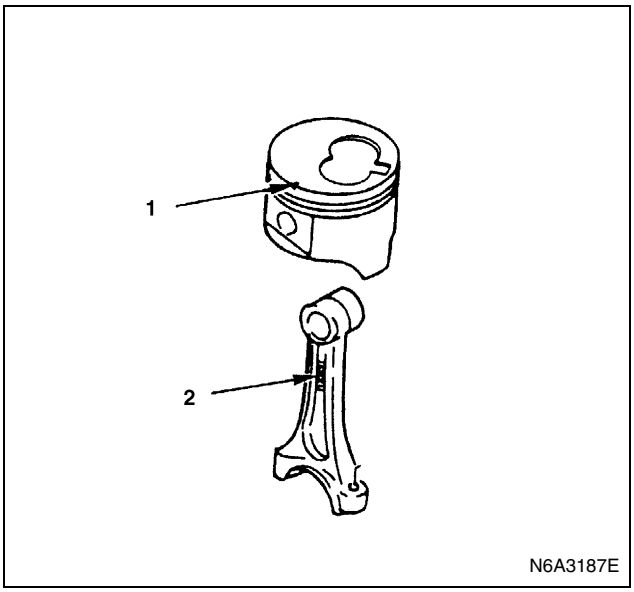
1. Connecting Rod
2. Piston
3. Piston Pin
   Apply a cost of engine oil to the piston pin and the piston pin hole.

4. Piston Pin Snap Ring
   Apply a thin coat of engine oil to the piston pin.
   Try to insert the piston pin into the piston pin hole with normal finger pressure.
   Weigh each piston and connecting rod assembly.
   Select piston and connecting rod combinations so that the weight variation of the different assemblies a held within the specified limits.

	g (oz)
Variance in weight after assembly	Less than 3 (0.1058)

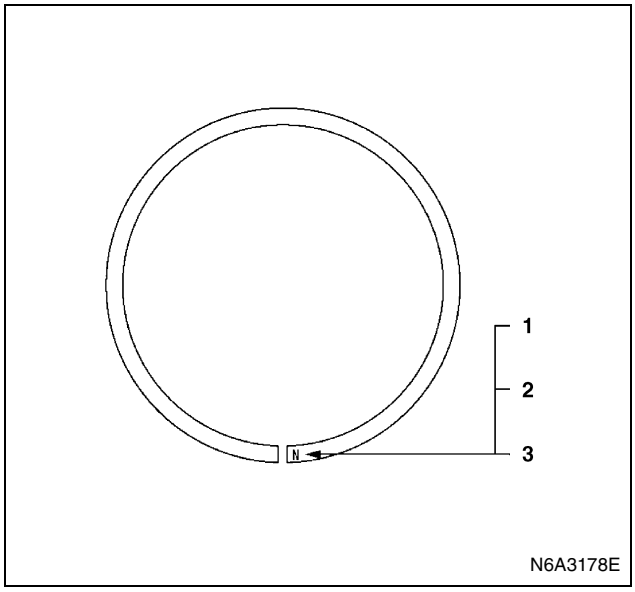
Notice:
When changing piston/connecting rod combinations, do not change the piston/piston pin combination

- Attach the piston to the connecting rod with the piston front mark and the connecting rod ISUZU mark on the same side.



Legend
1. Front mark
2. ISUZU mark

5. Piston Ring
   - Install the piston rings with the piston ring expander.
     The compression ring must be set with the N mark facing up.
   - Discrimination mark is painted as shown in the illustration.

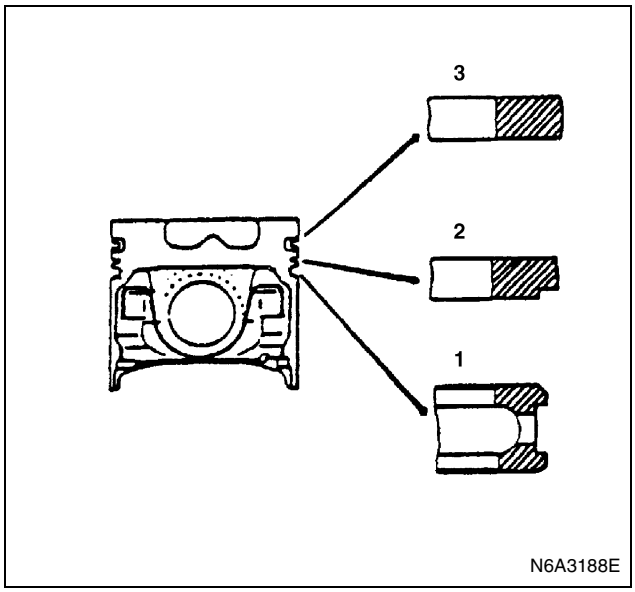


Legend
1. N mark (Top ring) (2nd ring) (4JB1)
2. 1N mark (Top ring) 2N mark (2nd ring) (4JG2)
3. R mark (Top ring) (2nd ring) (4JH-TC)

   - Install piston rings in the following sequence.

   1) Oil ring

4JB1, 4JH1-TC

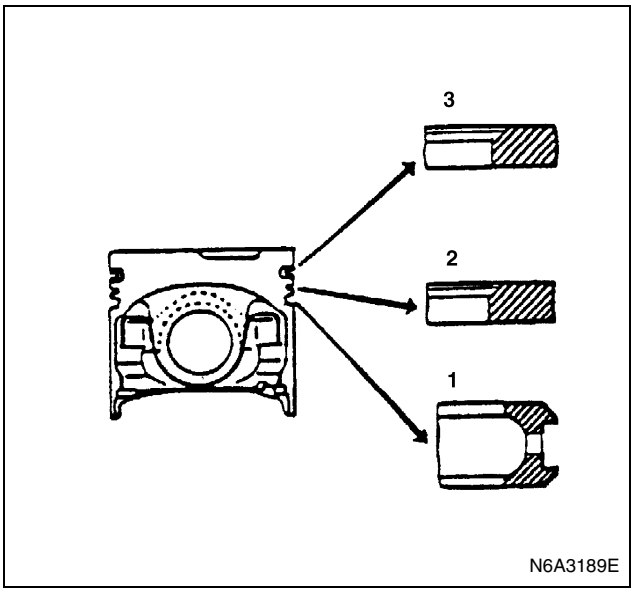


Legend
1. Expander ring
2. Upper side rail
3. Lower side rail

   2) 2nd compression ring
   3) 1st compression ring
      - The compression ring must be set with the 1N or 2N mark (4JG2) facing up.
      - 1st compression ring: 1N (4JG2), N (4JB1), R (4JH1-TC)

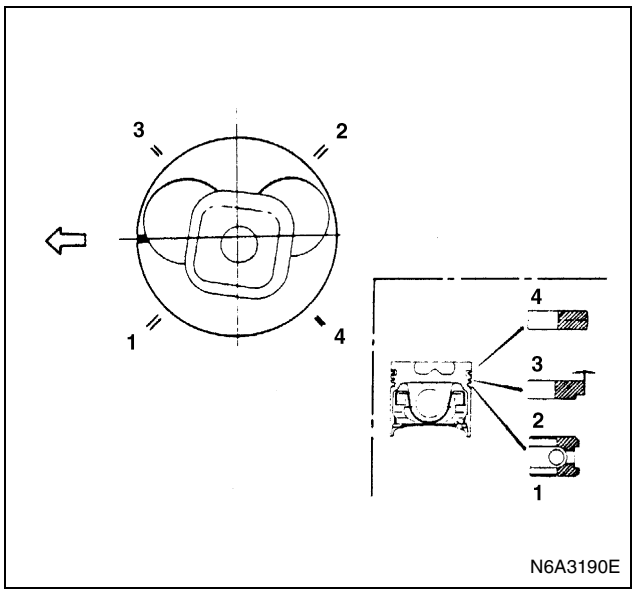
- 2nd compression ring: 2N (4JG2), N (4JB1), R (4JH1-TC)
- After installation, apply engine oil to the entire circumference of the piston rings. Check to see that all the rings rotate smoothly.
- Insert the bearings into the connecting rods and caps. Apply new engine oil to the bearing faces. Cap side bearings have no oil hole. Connecting rod side bearings oil hole should be aligned with oil hole on the connecting rod.

4JG2



Legend
1. Oil ring
2. Compression ring No. 2
3. Compression ring No. 1

6. Piston and Connecting Rod
   - Apply engine oil to the cylinder bores, the connecting rod bearings and the crankshaft pins.
   - Check to see that the piston ring end gaps are correctly positioned.
   - Insert the piston/connecting rod assemblies into each cylinder with the piston ring compressor.
   - The front marks must be facing the front of the engine.



Legend
1. Expander ring
2. Expander ring
3. Upper side rail
4. Lower side rail

7. Connecting Rod Bearing Cap
   - Tighten the cap nuts in 2 steps, using angular tightening method as shown in the following specifications.

Tighten:
4JH1-TC, 4JB1-TC to
- 1st Step: 29 N·m (3.0 kg·m/22 lb·ft)
- 2nd Step: 45° — 60°

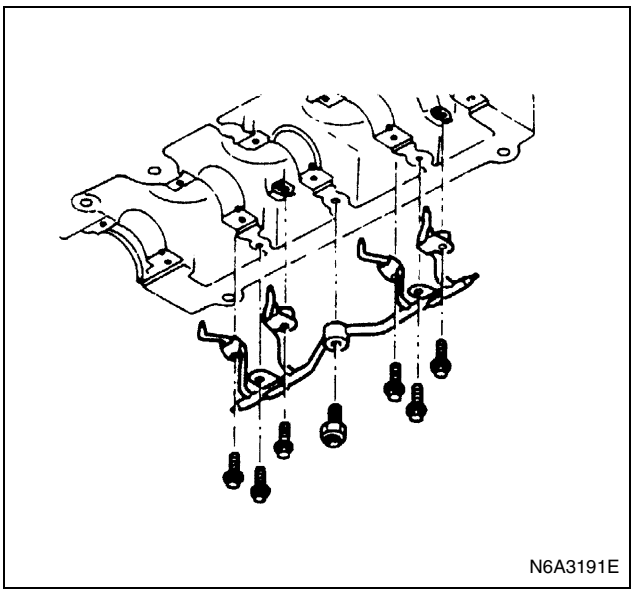
4JB1 to 83 N·m (8.5 kg·m/61 lb·ft)

After tightening the cap nuts, check to see that the crankshaft rotates smoothly.

8. Piston Cooling Oil Pipe
   - Install the piston cooling oil pipe to the cylinder body.
   - Tighten the oil pipe bolts and relief valve to the specified torque.

Tighten:
Oil Pipe Bolt to
- M8 × 1.25: 19 N·m (1.9 kg·m/14 lb·ft)
- M6 × 1.00: 8 N·m (0.8 kg·m/69 lb·in)

Oil Pressure Regulating Valve to
- M16 × 1.5: 29 N·m (3.0 kg·m/22 lb·ft)



Notice:
Check that there is no interference between the piston and the oiling jet pipe by slowly rotating the crankshaft.

9. Oil Pump Assembly
10. Oil Pan Assembly
    Above works refer to “OIL PUMP” Section in this manual.
11. Cylinder Head Assembly
    - Piston Head Projection Measurement Point
    - Cylinder Head Assembly
    - Push Rod
    - Rocker Arm Shaft Assembly

    Valve clearance adjustment.

    Above works refer to “CYLINDER BLOCK” Section in this manual.

Inspection and Repair

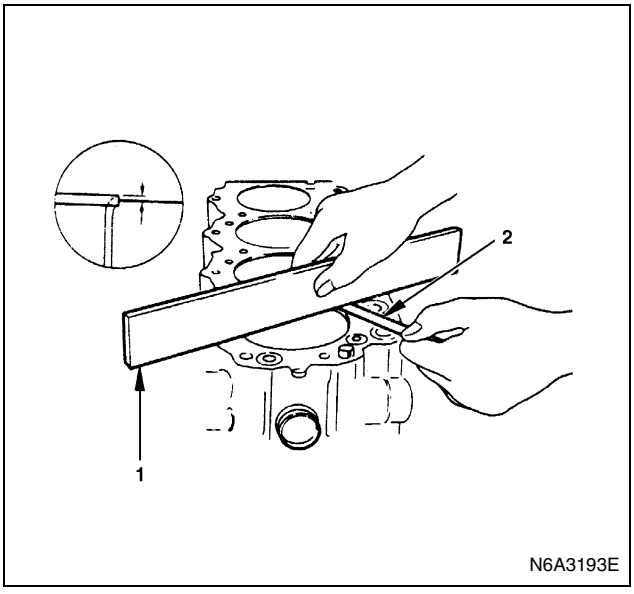
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

1. Remove the gasket and any other material adhering the upper surface of the cylinder block.
   Be very careful not to allow any material to accidental drop into the cylinder block.
   Be very careful not to scratch the cylinder block.
2. Carefully remove the oil pump, Rear Seal retainer and oil pan installation surface seal.
3. Wipe the cylinder block clean.

Cylinder Liner Projection Inspection

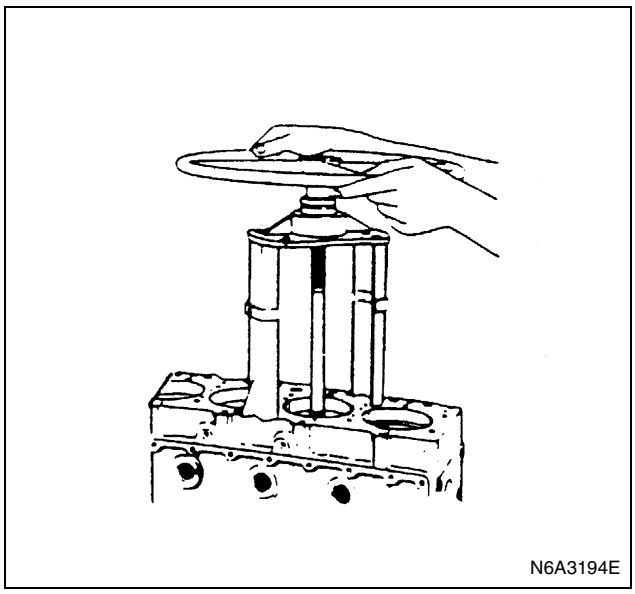
1. Hold a straight edge (1) along the top edge of the cylinder liner to be measured.
2. Use a feeler gauge (2) to measure each cylinder line projection.
   The difference in the cylinder liner projection height between any two adjacent cylinders must not exceed 0.03 mm (0.0012 in).

Standard	mm (in)
0.0 — 0.1 (0.0000 — 0.0039)	



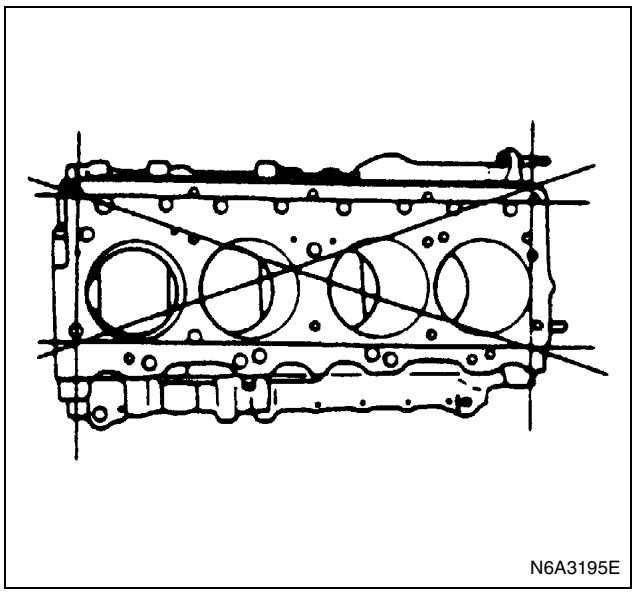
Flatness

1. Remove the cylinder body dowel.
2. Set the cylinder liner remover to the cylinder liner.
3. Check that the remover shaft ankle is firmly gripping the cylinder liner bottom edge.
4. Slowly turn the remover shaft handle counterclockwise to pull the cylinder liner free.
   Cylinder Liner Remover Ankle:
   5-8840-2304-0 (4JG2/4JH1-TC)
   5-8840-2039-0 (4JB1/4JB1-TC)



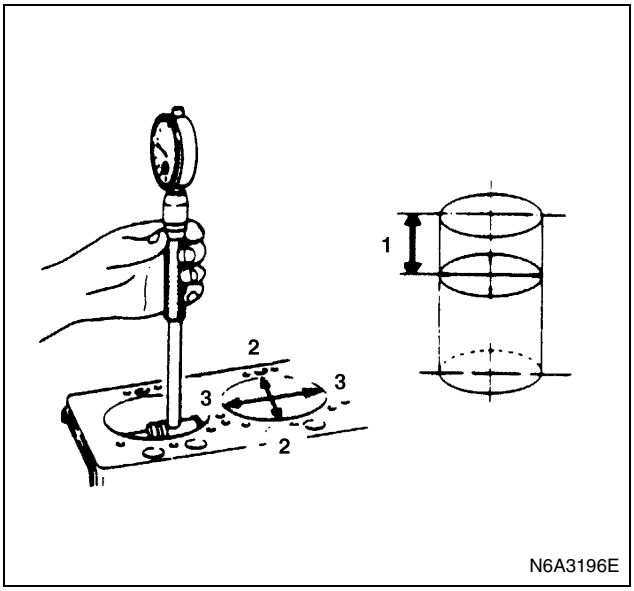
Notice:
Take care not to damage the cylinder body upper during the cylinder liner removal procedure.

5. Use a straight edge and a feeler gauge to measure the four sides and the two diagonals of the cylinder body upper face.
   If the measured values exceeds the limit, the cylinder body must be replaced.



Cylinder Liner Bore Measurement

Use a cylinder indicator to measure the cylinder liner bore at measuring point (1) in the thrust (2) — (2) and axial (3) direction of the crankshaft.
Measuring Point (1) 20mm (0.79 in)
If the measured value exceeds the specified limit, the cylinder liner must be replaced.

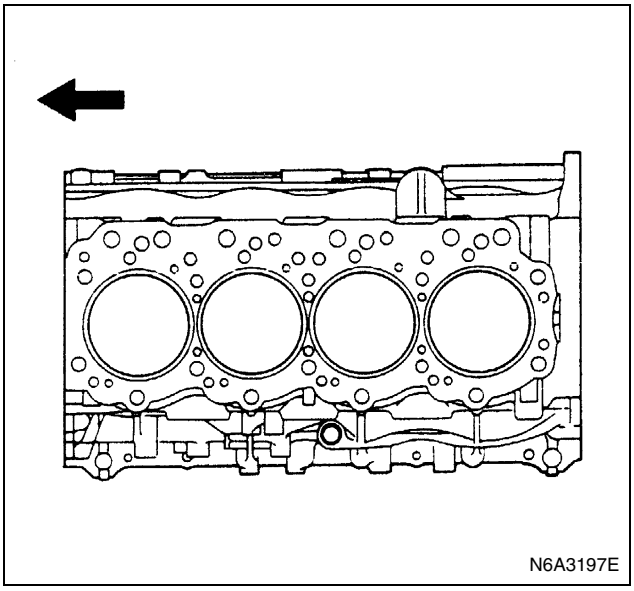


Notice:
The inside of the dry type cylinder liner is chrome plated. It cannot be rebored or honed.

If the inside of the cylinder liner is scored or scorched, the cylinder liner must be replaced.

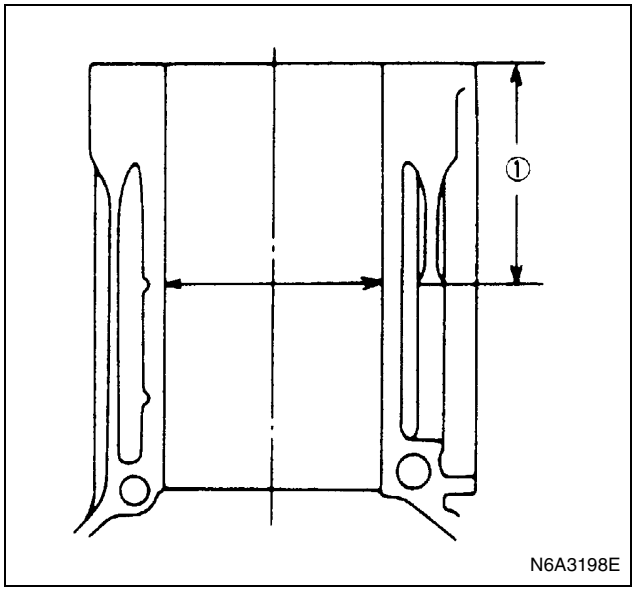
Cylinder Liner Grade Selection

Measure the cylinder body inside diameter and select the appropriate cylinder liner grade.



Standard Lifting Interference	mm (in)
0.01 — 0.019 (0.0004 — 0.0007)	

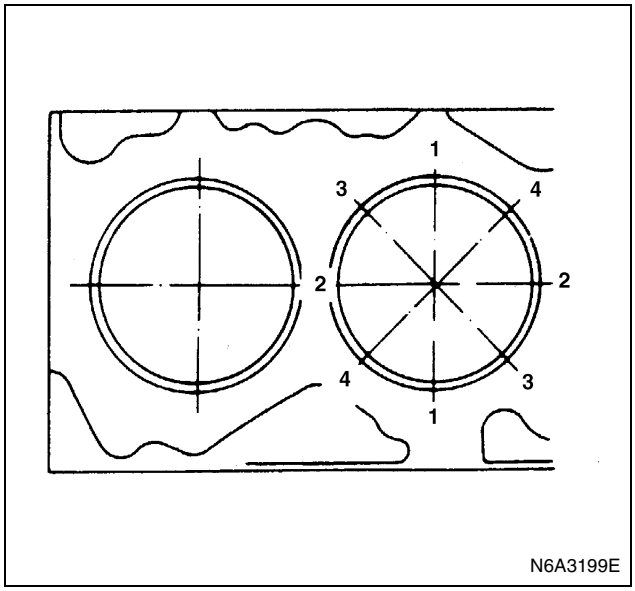
If the cylinder liner fitting interference (1) is too small, engine cooling efficiency will be adversely effected.
If the cylinder liner fitting interference is too large, it will be difficult to insert the cylinder liner into the cylinder body.

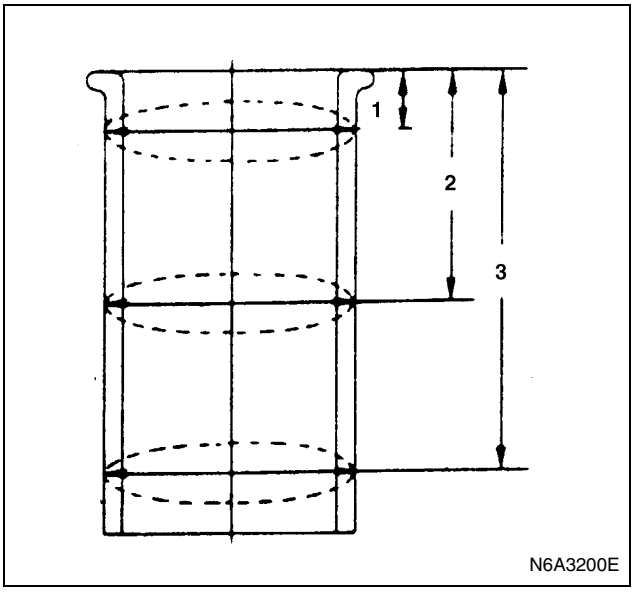


Cylinder Body Bore Measurement

1. Take measurements at measuring point (A) across positions (1) — (1), (2) — (2), (3) — (3), and (4) — (4).

Measuring Point (A) 98mm (3.86 in).





2. Calculate the average value of the four measurements to determine the correct cylinder grade.
3. Consult the following table with the resultant diameter for the correct liner application.

Selection method of cylinder liner and piston grade for service parts.

The production line stamped cylinder liner grade on the top of cylinder body, the cylinder liner outside diameter grade 1, 2, 3, 4.

If you find cylinder liner outside diameter grade 1 and piston outside diameter B on the cylinder body or result of measurement for each parts, you will select service parts grade for cylinder liner 1, AX grade and for piston AX grade.

The stamping grade code on the service parts are;

For cylinder liner grade stamped on the outside of cylinder liner.

For piston grade stamped on the head of piston.

4JB1 / 4JB1-TC — mm (in)

Liner outside Grade	Cylinder bore diameter average	Liner outside diameter	Liner bore Grade	Service liner bore measurement
1	95.001 — 95.010 (3.7402 — 3.7406)	95.011 — 95.020 (3.7406 — 3.7409)	AX	93.035 (3.6628) — 93.050 (3.6634)

			CX	95.451 (3.7579) — 95.466 (3.7585)

Notice:

It is most important that the correct piston grade be used. Failure to select the correct piston grade will result in engine failure. Always measure the cylinder bore and select the correct piston grade.

Cylinder liner kit clearances are preset. However, the cylinder liner installation procedure may result in slight decreases in cylinder liner clearances. Always measure the cylinder liner clearance after installation to be sure that it is correct.

Cylinder Liner Installation

1. Cylinder Liner Installation Using The Special Tool.
   1) Use new kerosene or diesel oil to thoroughly clean the cylinder liners and bores.
   2) Use compressed air to blow-dry the cylinder liner and bore surfaces.

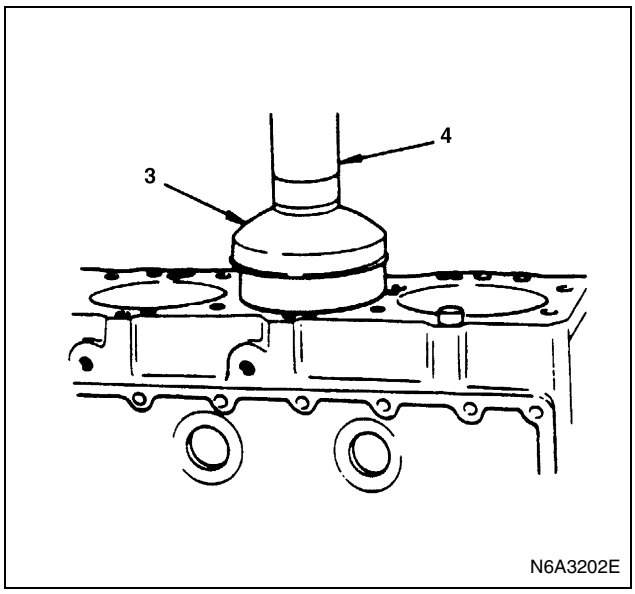
   Cylinder Liner Installer
   : 5-8840-2313-0 (4JG2 / 4JH1-TC)
   : 5-8840-2040-0 (4JB1 / 4JB1-TC)

Notice:
All foreign material must be carefully removed from the cylinder liner and the cylinder bore before installation.

   3) Insert the cylinder liner (1) into the cylinder body (2) from the top of the cylinder body.

   4) Set the cylinder liner installer (3) to the top of the cylinder liner.
      Position the cylinder body so that the installer center is directly beneath the bench press shaft center (4).

   Cylinder Liner Installer
   : 5-8840-2313-0 (4JG2 / 4JH1-TC)
   : 5-8840-2040-0 (4JB1 / 4JB1-TC)

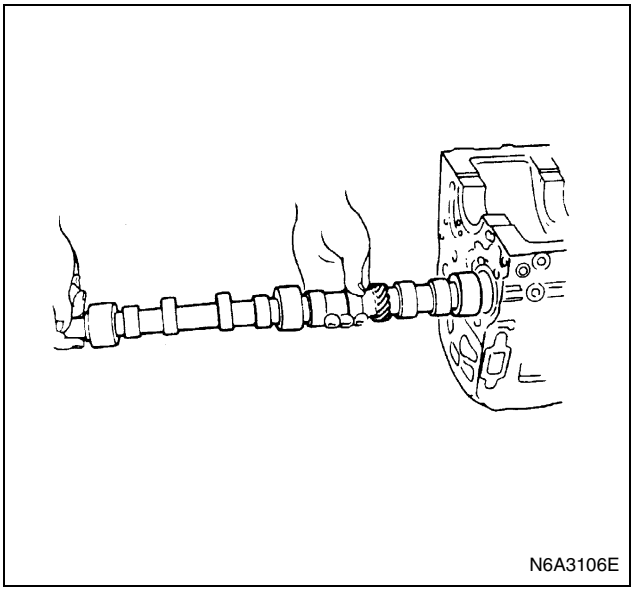


Notice:
Check that the cylinder liner is set perpendicular to the bench press and that there is no wobble.

   5) Use the bench press to apply a seating force of 500 kg (1,102.5 lb/4,900 N) to the cylinder liner.
   6) Apply a force 2,500 kg (5,512.5 lb/24,500 N) to fully seat the cylinder liner.
   7) After installing the cylinder liner, measure the cylinder liner projection.
   8) After installing the cylinder liner, measure the cylinder liner projection.
      Refer to “Cylinder Liner Projection Inspection” in this Section.
      Measure the cylinder liner bore inside diameter and select the appropriate piston grade.

Reassembly

1. Cylinder Block
2. Tappet
3. Camshaft
   - Apply a coat of engine oil to the tappet and the cylinder body tappet insert holes.
   - Locate the position mark applied at disassembly (if the tappet is to be reused).
   - Apply a coat of engine oil to the camshaft and the camshaft bearings.
   - Install the camshaft to the cylinder body.
     Take care not to damage the camshaft bearings.

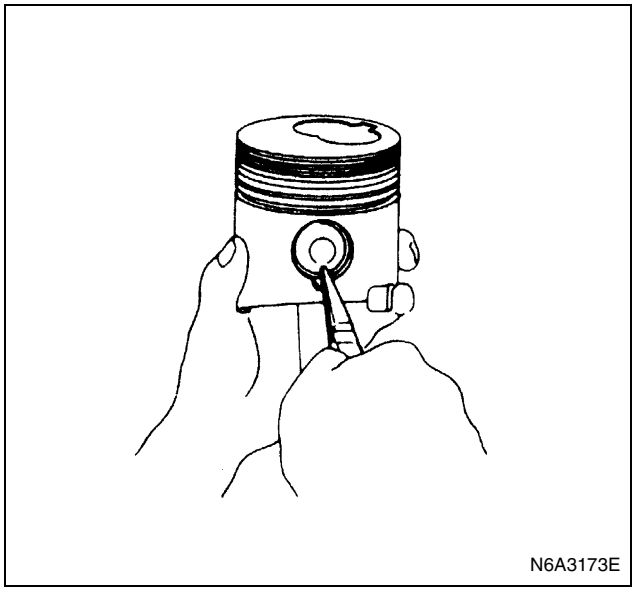


N6A3106E

4. Crankshaft
5. Main Bearing Cap
6. Crankshaft Rear Oil Seal
7. Cylinder Block Rear Plate
8. Flywheel
   Above works refer to “CRANKSHAFT” Section in this manual.
9. Piston and Connecting Rod
   1) Try to insert the piston pin into the piston pin hole with normal finger pressure.
      Weigh each piston and connecting rod assembly.
      Select piston and connecting rod combinations so that the weight variation of the different assemblies is held within the specified limits.

	g (oz)
Variance in weight after assembly	Less than 3 (0.1058)

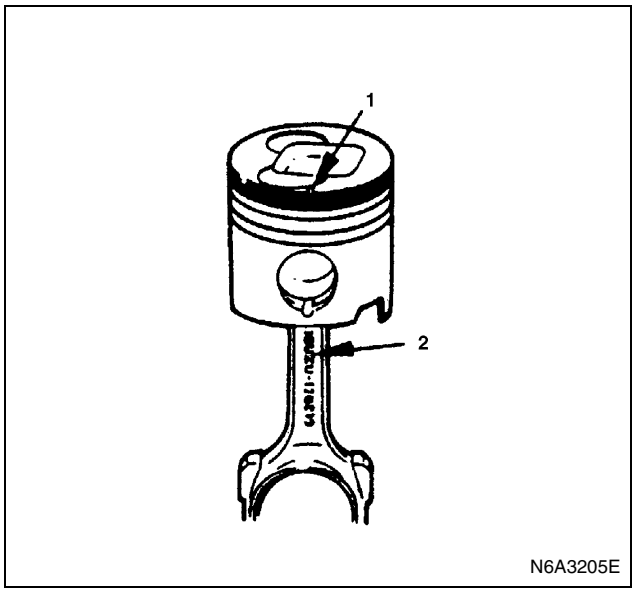
   2) Clamp the connecting rod in a vise.
      Take care not to damage the connecting rod.
   3) Use a pair of pliers to install the piston pin snap ring to the piston.



N6A3173E

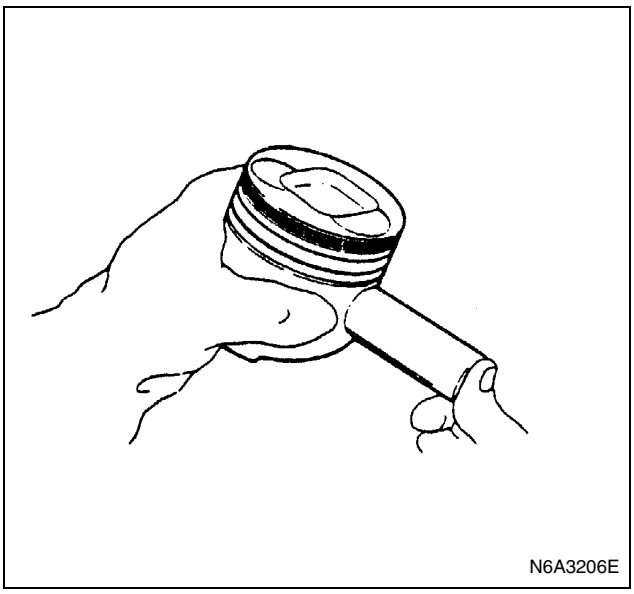
Notice:
When changing piston/connecting rod combinations, do not change the piston/piston pin combination.

   4) Install the piston to the connecting rod.
      The piston head front mark (1) and the connecting rod “ISUZU” casting mark (2) must be facing the same direction.



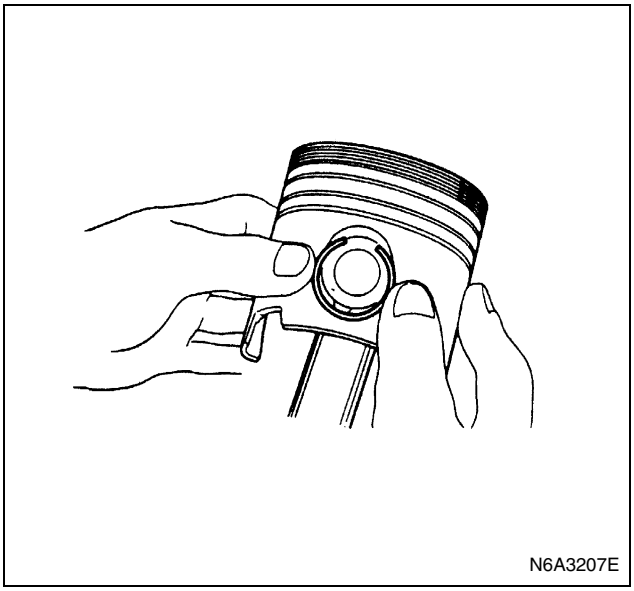
N6A3205E

   5) 5Apply a coat of engine oil to the piston pin and the piston pin hole.
      Use your fingers to force the piston pin into the piston until it makes contact with the snap ring.



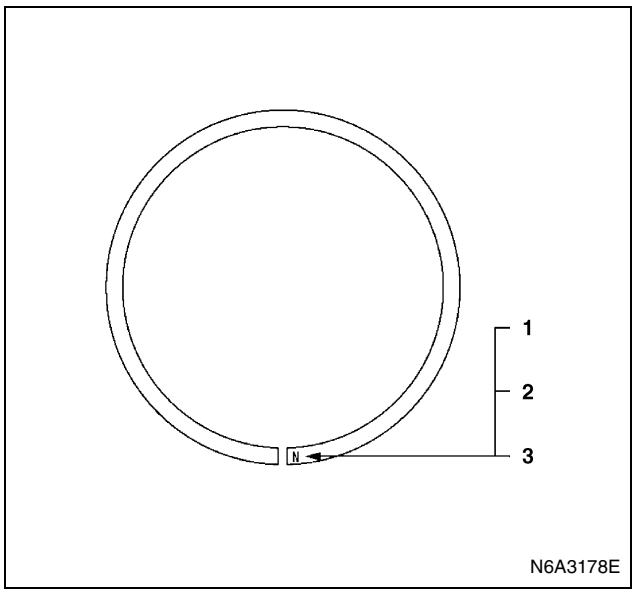
N6A3206E

6) Use your fingers to force the piston pin snap ring into the piston snap ring groove.
Check that the connecting rod moves smoothly on the piston pin.



N6A3207E

7) Install the piston rings with the piston ring expander.
The compression ring must be set with the 1N, 2N mark (4JG2) facing up.
Discrimination mark is painted as shown in the illustration.

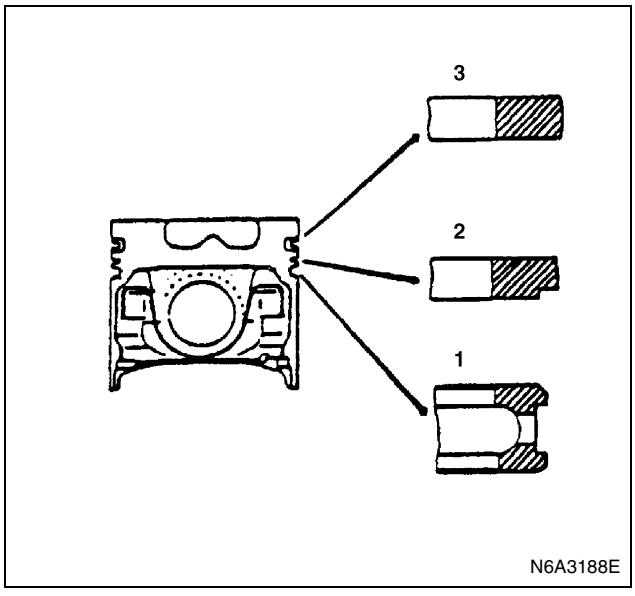


N6A3178E

Legend
1. N mark (Top ring) (2nd ring) (4JB1)
2. 1N mark (Top ring) 2N mark (2nd ring) (4JG2)
3. R mark (Top ring) (2nd ring) (4JH-TC)

8) Use a piston ring replacer to install the three piston rings.
Piston Ring Replacer:
Install the piston rings in the numerical order shown in the illustration.

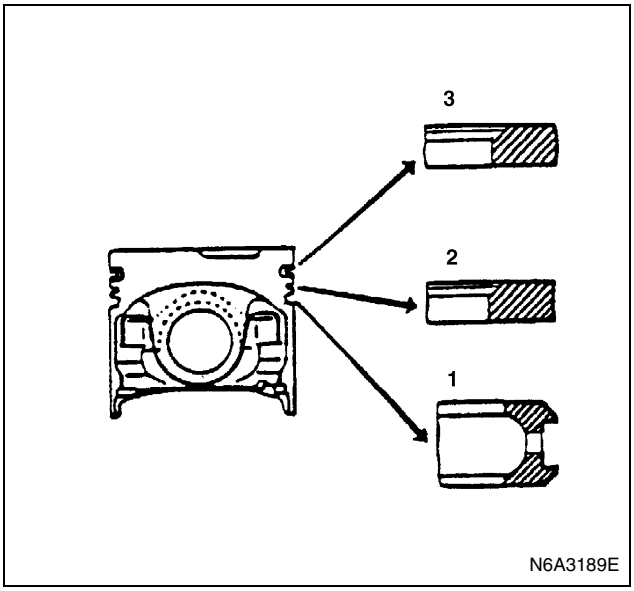
4JB1, 4JH1-TC



N6A3188E

Legend
1. Oil ring
2. 2nd compression ring
3. 1st compression ring

4JG2



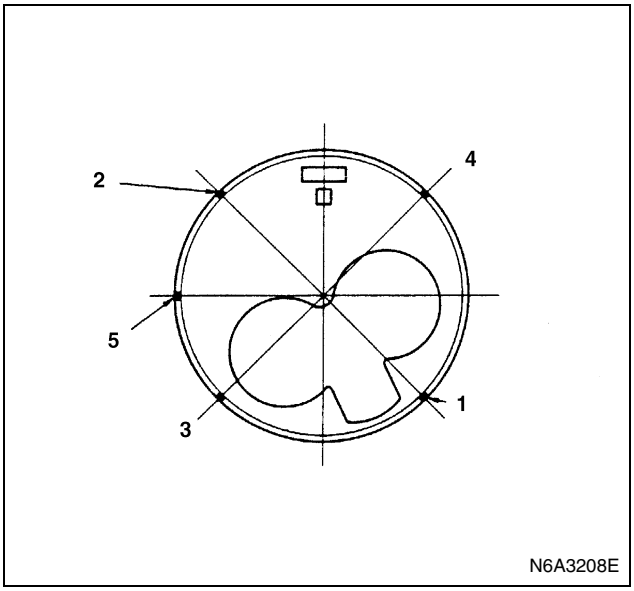
Legend

1. Oil ring
2. Compression ring No. 2
3. Compression ring No. 1

Notice:
Install the compression rings with the stamped side facing up.

Insert the expander coil into the oil ring groove so that there is no gap on either side of the expander coil before installing the oil ring.

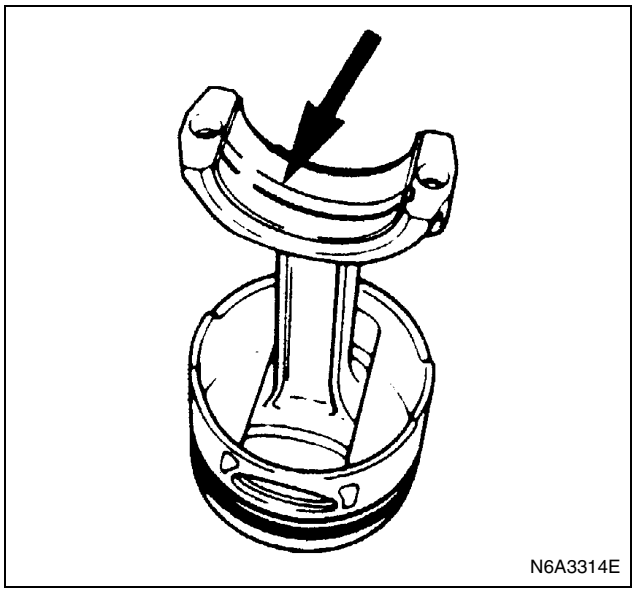
9) Apply engine oil to the piston ring surfaces.
10) Check that the piston rings rotate smoothly in the piston ring grooves.
11) Position the piston ring gaps as shown in the illustration.



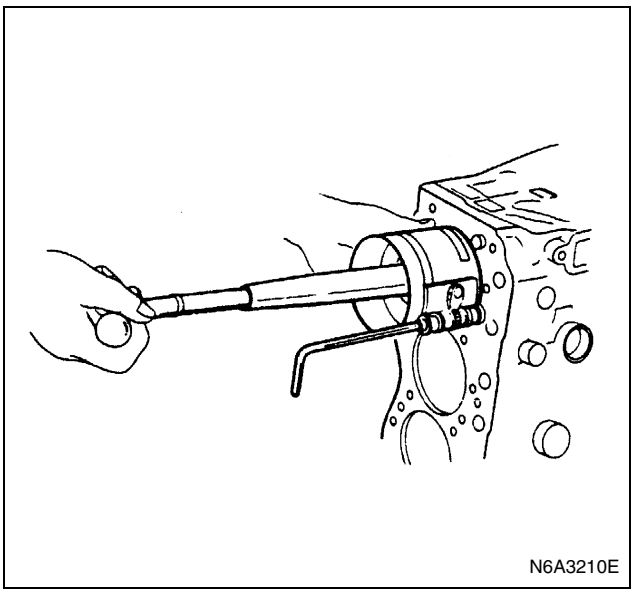
Legend

1. No. 1 Compression ring
2. No. 2 Compression ring
3. Oil ring
4. Expand ring
5. Front mark

12) Carefully wipe any oil or other foreign material from connect rod bearing back face and the connecting rod bearing fitting surface.
13) Apply a coat of engine oil to the upper bearing surfaces.
Apply a coat of engine oil to the cylinder wall.

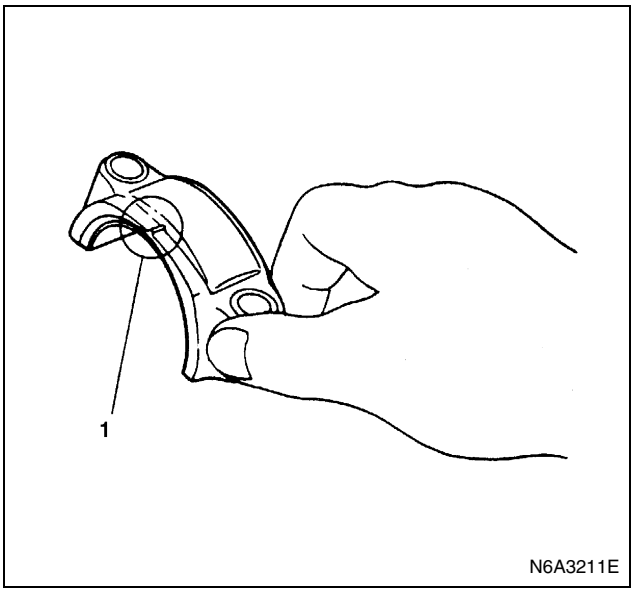


14) Position the piston head from mark so that it is facing the front of engine.
Use the piston ring compressor to compress the piston rings.
Piston Ring Compressor: 5-8840-9018-0 (J-8037)
15) Use a hammer grip to push the piston in until the connecting rod makes contact with the crankpin.
At the same time, rotate the crankshaft until the crankpin is at BDC.



N6A3210E

16) Position the bearing cap front mark so that it is facing the front of the engine.
17) Install the connecting rod bearing caps.
Align the bearing cap cylinder number marks and the connecting rod cylinder number marks.

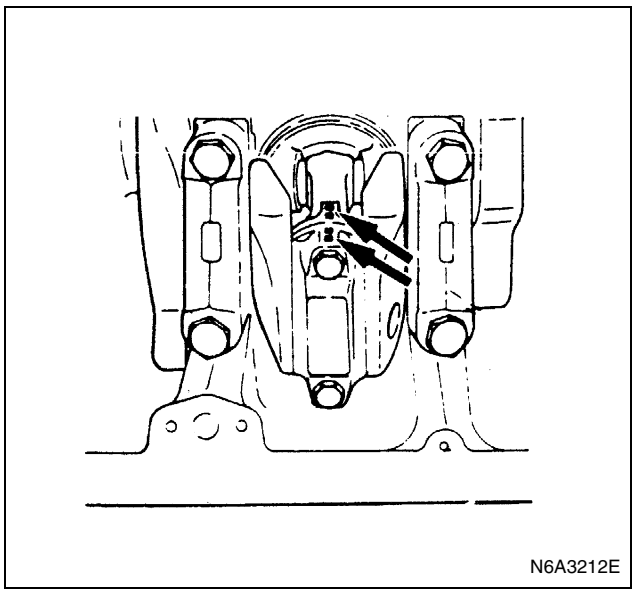


N6A3211E

Legend
1. Front mark

18) Apply a coat of engine oil to the threads and setting faces of each connecting rod cap bolt.
19) Tighten the connecting rod bearing cap bolts to the specified torque in two steps using the Angular Tightening Method.

Tighten:
Connecting Rod Bearing Cap Bolt to
- 4JB1-TC, 4JH1-TC
  1st Step: 29 N·m (3.0 kg·m/22 lb·ft)
  2nd Step: 45° — 60°
- 4JB1: 83 N·m (8.5 kg·m/61 lb·ft)

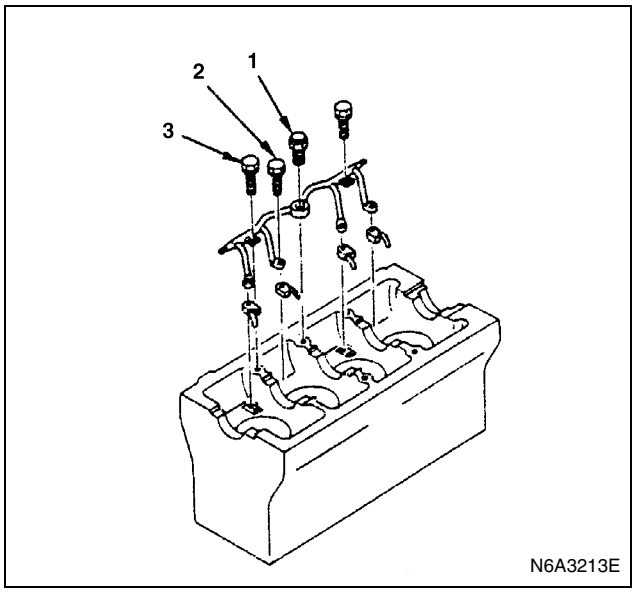


N6A3212E

Notice:
Check to see that the crankshaft turns smoothly by rotating it manually.

10. Piston Cooling Oil Pipe
    1) Fix the oil jet pipes with knock pins on the cylinder block.
    2) Install the oil pipe for piston cooling in the cylinder block, tightening a relief valve (1) and four joint bolts (2) to the specified torque.

Tighten:
- Oil pipe fixing bolts to
  M8: 19 N·m (1.9 kg·m/14 lb·ft)
  M6: 8 N·m (0.8 kg·m/69 lb·in)
- Relief valve fixing bolt to 29 N·m (3 kg·m/22 lb·ft)



N6A3213E

Caution:
After installed the piston assembly. Check and see that there is appropriate clearance between pistons and oil jet pipes by rotating crankshaft slowly.

11. Oil Pump Assembly
    Above works refer to “OIL PUMP” Section in this manual.
12. Timing Pulley Housing
13. Timing Gear Housing
14. Front Oil Seal (Belt Drive Model)
15. Timing Belt and Pulley
    1) Camshaft Timing Pulley
    2) Timing Belt
    3) Flange: Camshaft Pulley
    4) Timing Pulley Lower Cover
    5) Timing Pulley Upper Cover

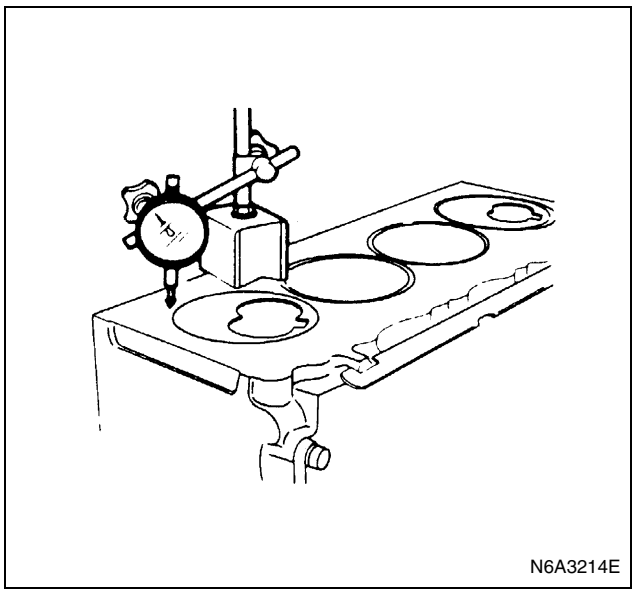
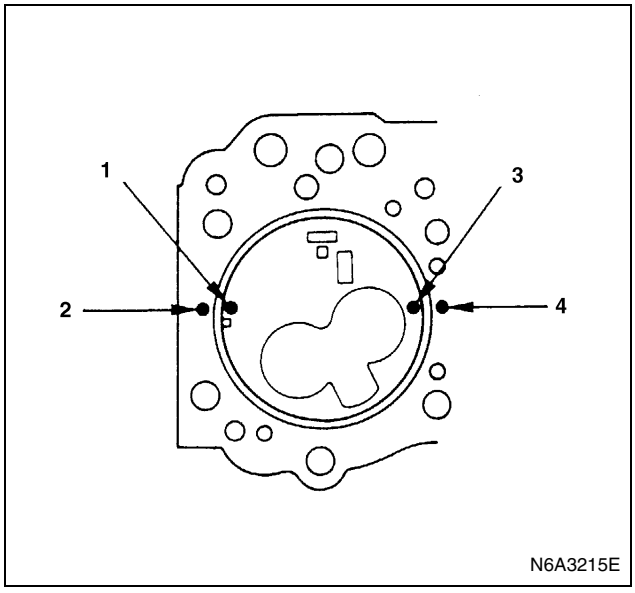
    7) Timing Gear Case Cover
    8) Crankshaft Damper Pulley
    9) Cooling Fan Assembly
    10) AC Generator, Power Steering Pump Drive Belt
    11) Fan Shroud
        Above works refer to “CRANKSHAFT” Section in this manual.
17. Oil Pan Assembly
    Above works refer to “OIL PUMP” Section in this manual.
18. Cylinder Head Assembly and Gasket
    1) Cylinder head gasket is determined by the piston head projection from the cylinder body upper surface, in order to improve engine performance.
       Three types of gasket are provided by the difference of thickness. Select the adequate one out of three grades of gasket, according to the following procedure.
       Before measurement, clear off carbon from the piston head and cylinder body surface and also clean the place where a gasket was installed.



N6A3214E

Piston Head Projection Measurement Point

    2) Use a dial indicator to measure the piston projection amount.
    3) Refer to the illustration for the piston head projection measuring positions.
       All measuring positions should be as close as possible to the cylinder liner.
    4) Measure the points (1) (2) (3) (4) and obtain two difference (1) — (2) and (3) — (4) on each cylinder.
       Calculate the average value of the piston head projection on each cylinder.
    5) Obtain the maximum value in the four cylinders.
    6) Determine the gasket grade required to the maximum value described above in accordance with the following table.



N6A3215E

4JB1 / 4JB1-TC
Cylinder Head Gasket Thickness

mm (in)

1		2	3
A		0.758 - 0.813 (0.030 - 0.032)	1.60 (0.0630)
B		0.813 - 0.859 (0.032 - 0.034)	1.65 (0.0650)
C		0.859 - 0.914 (0.034 - 0.036)	1.70 (0.0670)

Notice:
The difference between the highest measured piston head projection and the lowest measured piston head projection must not exceed 1.0mm (0.039 in).

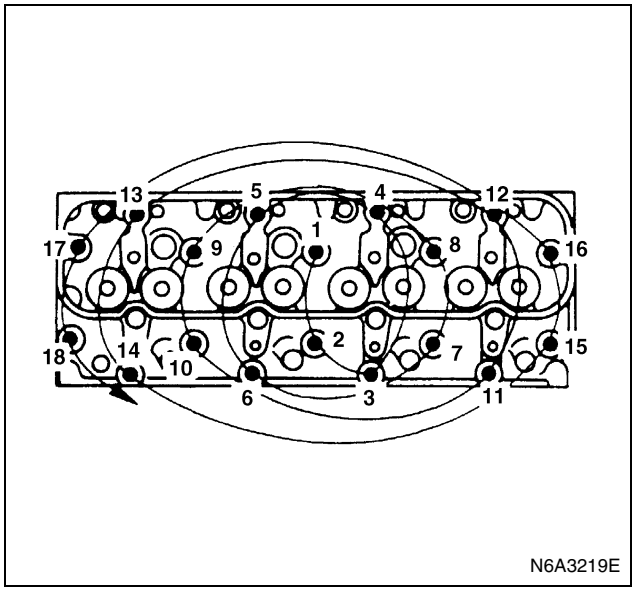
Cylinder Head Assembly

1. Install the dowel in cylinder block.
2. Install the cylinder head gasket with top mark up.
3. Clean up cylinder head lower surface and cylinder body upper surface.
4. Install the cylinder head as softly.
5. Apply molybdenum disulfide grease to screw and seat of cylinder head bolts.
6. Tighten the cylinder head bolts to the specific torque in three step following the numerical and shown in the illustration.

Tighten:
Cylinder Head Bolts to

- 1st Step: 49 N·m (5 kg·m/36 lb·ft)
- 2rd Step: 60° — 75°
- 3rd Step: 60° — 75°



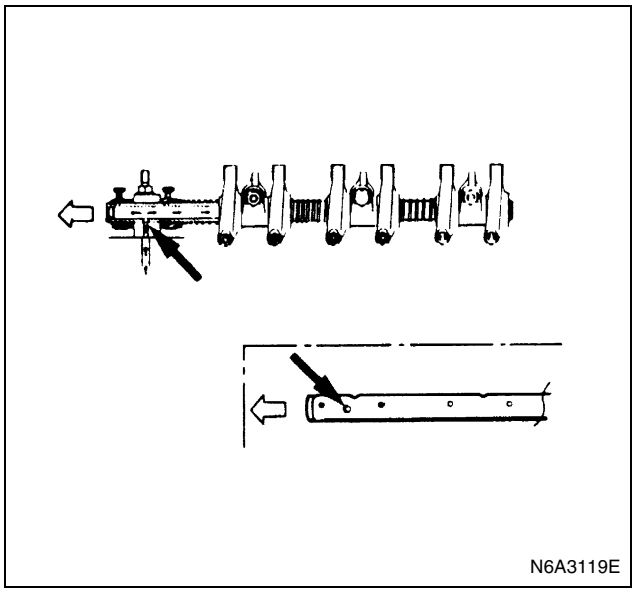
N6A3219E

Push Rod

- Apply engine oil to push rod and into the cylinder head.

Rocker Arm Shaft Assembly

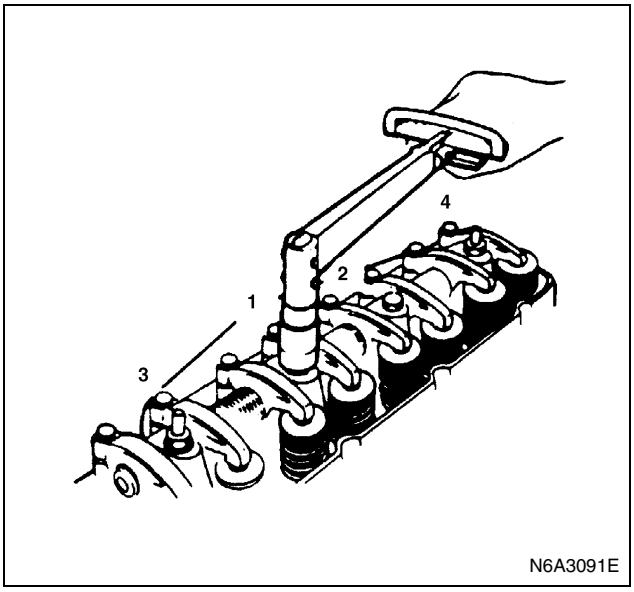
1. Loosen all adjusting screws.
2. Position the rocker arm shaft with the large oil hole (4ϕ) facing the front of the engine.



N6A3119E

3. Tighten the rocker arm shaft bracket bolts to the specified torque in the numerical order shown in the illustration.

Tighten:
Rocker Arm Shaft Bracket Bolt to 54 N·m (5.5 kg·m/40 lb·ft)



- Valve clearance adjustment.

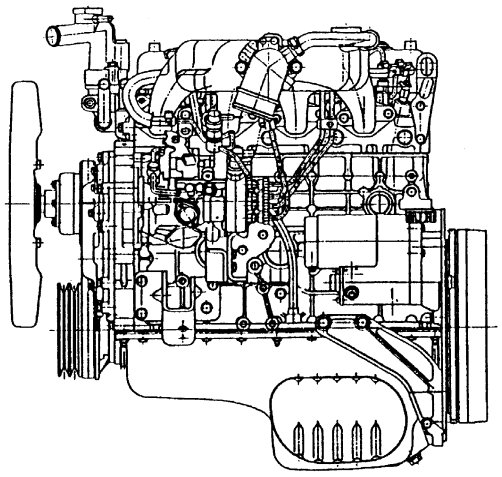
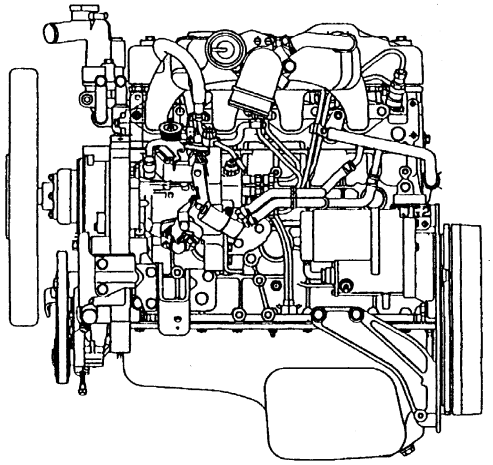
GENERAL DESCRIPTION

4JB1, 4JG2



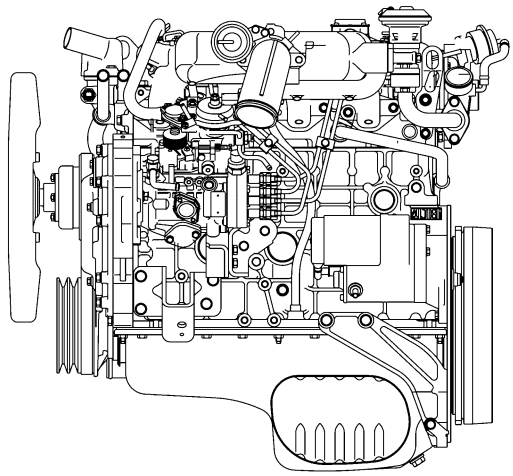
4JB1



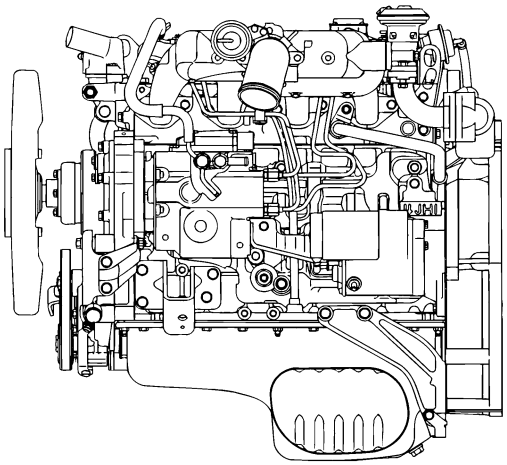
4JG2

N6A3220E

4JB1-TC, 4JH1-TC



4JB1-TC



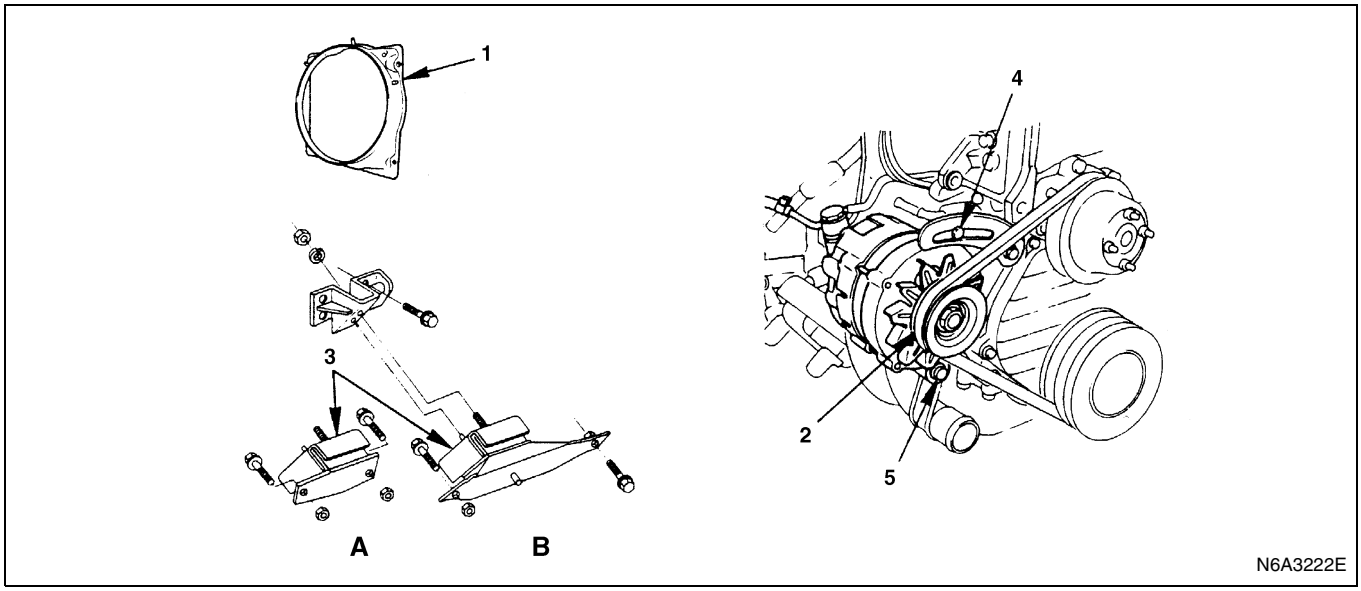
4JH1-TC

N6A3221E

The 4JB1 Model engine employs a square troidal type combustion chamber provided with a fence around it.
These designs employed allow a superior fuel economy over a wide range of driving conditions.
The 4JG2 Model engine employs, for its combustion chamber, the RECARD Comet V Type swirl combustion chamber which provides a superior driving performance, fuel economy and silent combustion over a wide range of driving conditions.
For the cylinder head gasket steel sheets, laminated steel sheets are employed.
Three grades of the gaskets according to the piston head projection measured from the cylinder block are employed to minimize the fluctuation of the engine compression ratio.
The Angular Tightening Method is employed to tighten the cylinder head fixing bolts, connecting rod fixing bolts and flywheel fixing bolts.
The chrome-plated steel dry type (Chromard) cylinder liners provide the highest durability.
Auto-thermic pistons with cast steel struts are used to reduce thermal expansion and resulting engine noise experienced while the engine is cold.
The tufftrided crankshaft has a long service life. Because it is tufftrided, it cannot be reground.
The crankshaft main bearings and the connecting rod bearings are of aluminum alloy. These bearings are especially vulnerable to foreign materials such as metal scraps. It is very important to keep the oil ports and other related surfaces clean and free of foreign materials.
The tufftriding treatment (nitriding treatment) of the crankshaft for the increased strength eliminates the regrinding of crankpins and journals.
An oiling jet device for piston cooling is provided in the lubricating oil circuit which runs through the check valve from the cylinder block oil gallery.
Take care not to damage the oiling jet when removing or installing the piston and the connecting assembly.
The 4JG2 engine use a single spring pintle type injection nozzle.
The 4JB1 Model employs a direct injection type engine provided with a nozzle with four holes, which makes it possible to obtain an excellent mixing ratio of intake air and fuel spray.
4JB1-TC engine has two springs injection nozzle system for efficient control.
The turbocharger increase air intake efficiency, the results in increased engine power, reduced fuel consumption and minimal engine noise.
Turbocharger rotating parts operate at very high speeds and temperatures. The parts materials have been carefully selected and machined to extremely high precision.
The 4JB1 Model engine employs the QOS II preheating system which features a quick-on glow to control the glow time and the afterglow time by the thermometer.
The 4JG2 engine employs the QOS III system which allows the most suitable starting conditions for the glow time to change according to the engine water temperature, and the optimum for the glow time to change according to the engine water temperature, and the optimum changes according to the water temperature immediately after the start of the engine.
The belt-driven type timing drive belt of the 4JG2 Model engine is a very important functional part, and requires the specified maintenance.

ENGINE MOUNT (RH)

Component



Legend

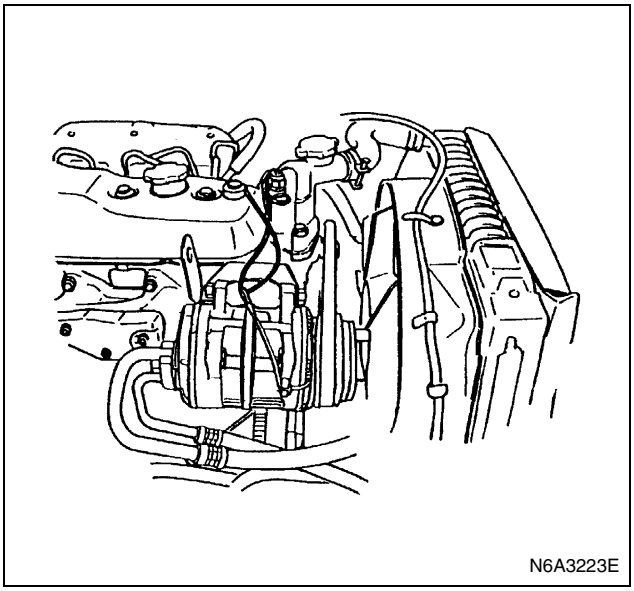
A. Rigid suspension
B. Independent suspension
1. Fan shroud
2. Fan belt
3. Support rubber
4. Lock bolt
5. AC generator fixing bolt

Removal

Preparation

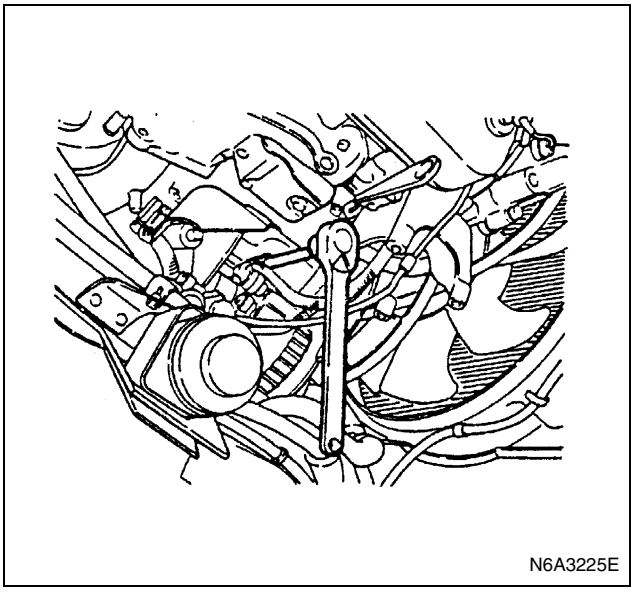
- Disconnect battery ground cable.

1. Fan Shroud
   - Remove reservoir tank hose and fan shroud.



2. Fan Belt
   - Remove adjust plate lock bolt.
   - Loosen generator fixing bolt then remove fan belt.
3. Support Rubber
   - Remove two fixing nuts at the crossmember side.

   - Separate the generator from the engine.
   - Remove the support rubber nut from engine foot side.
   - Remove the support rubber while raising the engine.



N6A3225E

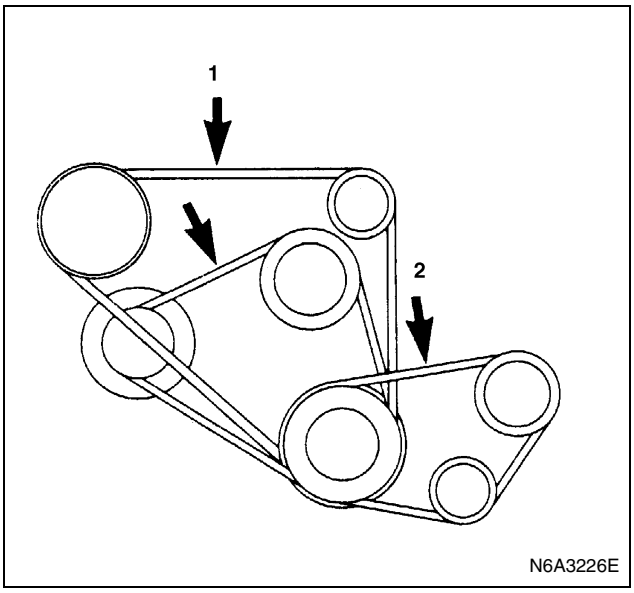
Installation

1. Support Rubber
   - Install the support rubber while raising the engine.
   - Tighten the fixing nuts to the specified torque.

Tighten:
- Engine foot side to 82 N·m (8.4 kg·m / 61 lb·ft)
- Crossmember side to 40 N·m (4.1 kg·m / 30 lb·ft)

2. Fan Belt
   - Install the fan belt.
   - Depress the fan belt mid-portion with a 98 N (10 kg/ 22 lb) force.
   - Tighten the fixing bolt to the specified torque.

Tighten:
- Adjust plate lock bolt to 19 N·m (1.9 kg·m / 14 lb·ft)
- Generator fixing bolt to 40 N·m (4.1 kg·m / 30 lb·ft)



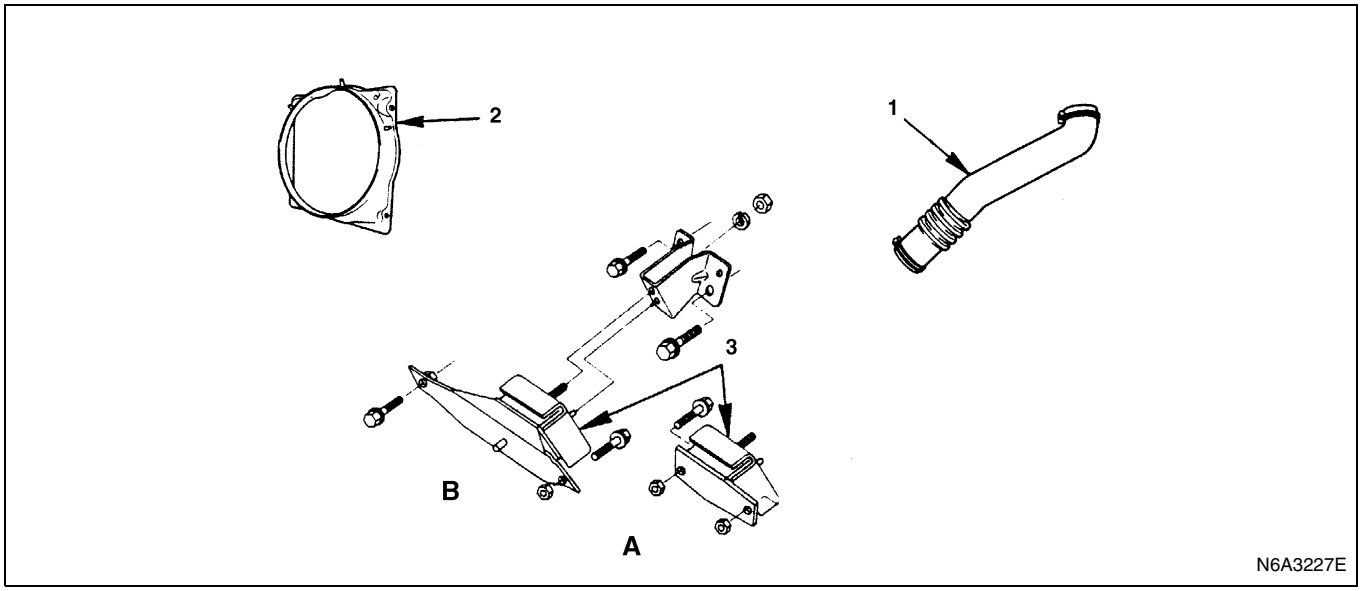
N6A3226E

Legend
1. A/C compressor drive belt
2. P/S oil pump drive belt

3. Fan Shroud
   - Install the fan shroud and clip the reservoir tank hose.

ENGINE MOUNT (LH)

Component



Legend

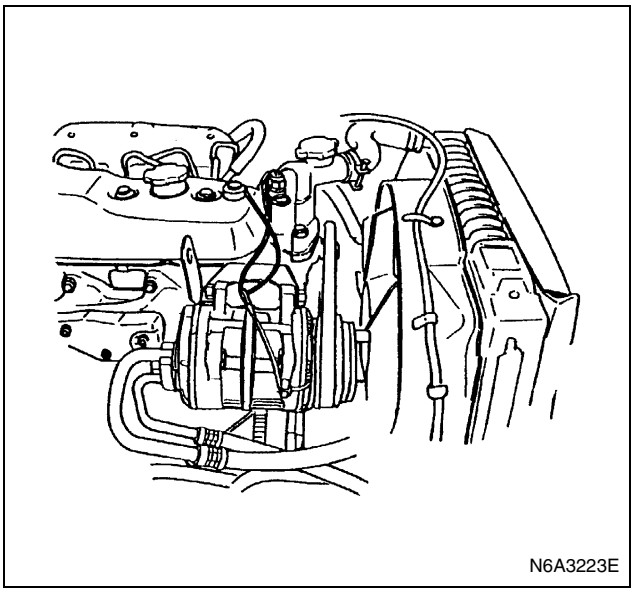
A. Rigid suspension
B. Independent suspension
1. Air intake duct
2. Fan shroud
3. Support rubber

Removal

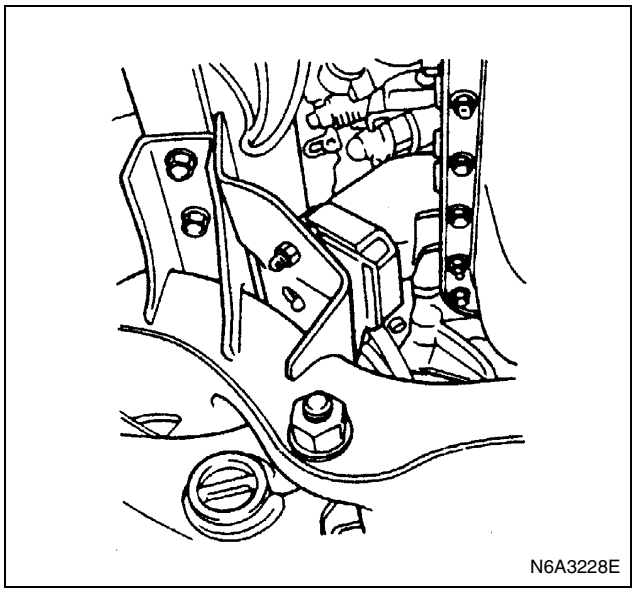
Preparation

- Disconnect battery ground cable.

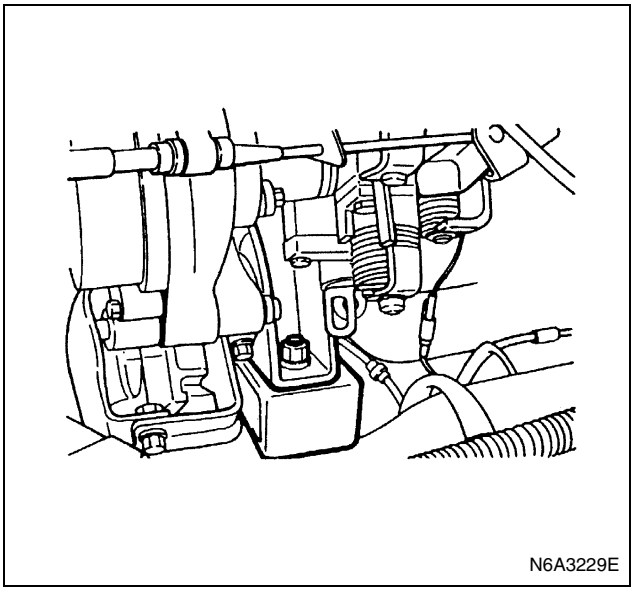
1. Air Intake Duct
   - Remove the intake duct.
2. Fan Shroud
   - Remove reservoir tank hose and fan shroud.



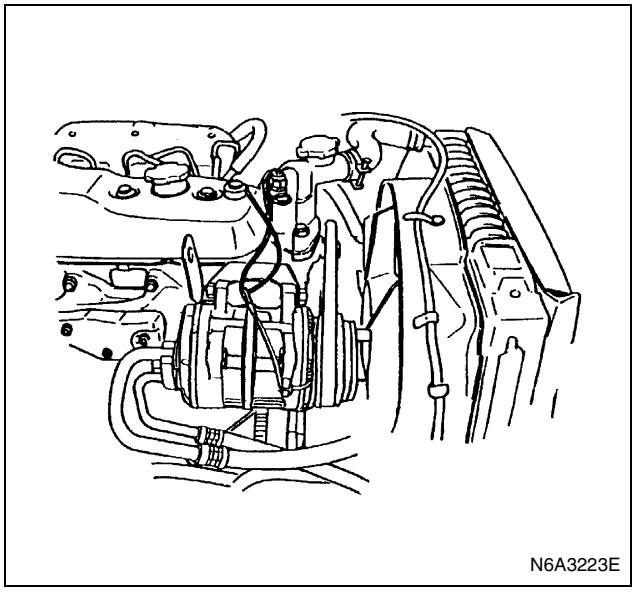
3. Support Rubber
   - Remove two fixing bolts at the crossmember side.



- Remove the support rubber nut from engine foot side.
- Remove the support rubber while raising the engine.



N6A3229E

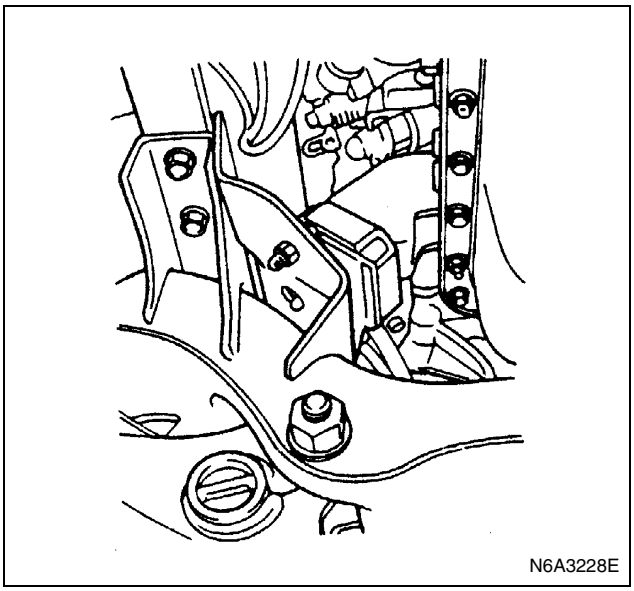


N6A3223E

Installation

1. Support Rubber
   - Install the support rubber while raising the engine.
   - Tighten the fixing nuts to the specified torque.

Tighten:
- Engine foot side to 82 N·m (8.4 kg·m / 61 lb·ft)
- Crossmember side to 40 N·m (4.1 kg·m / 30 lb·ft)



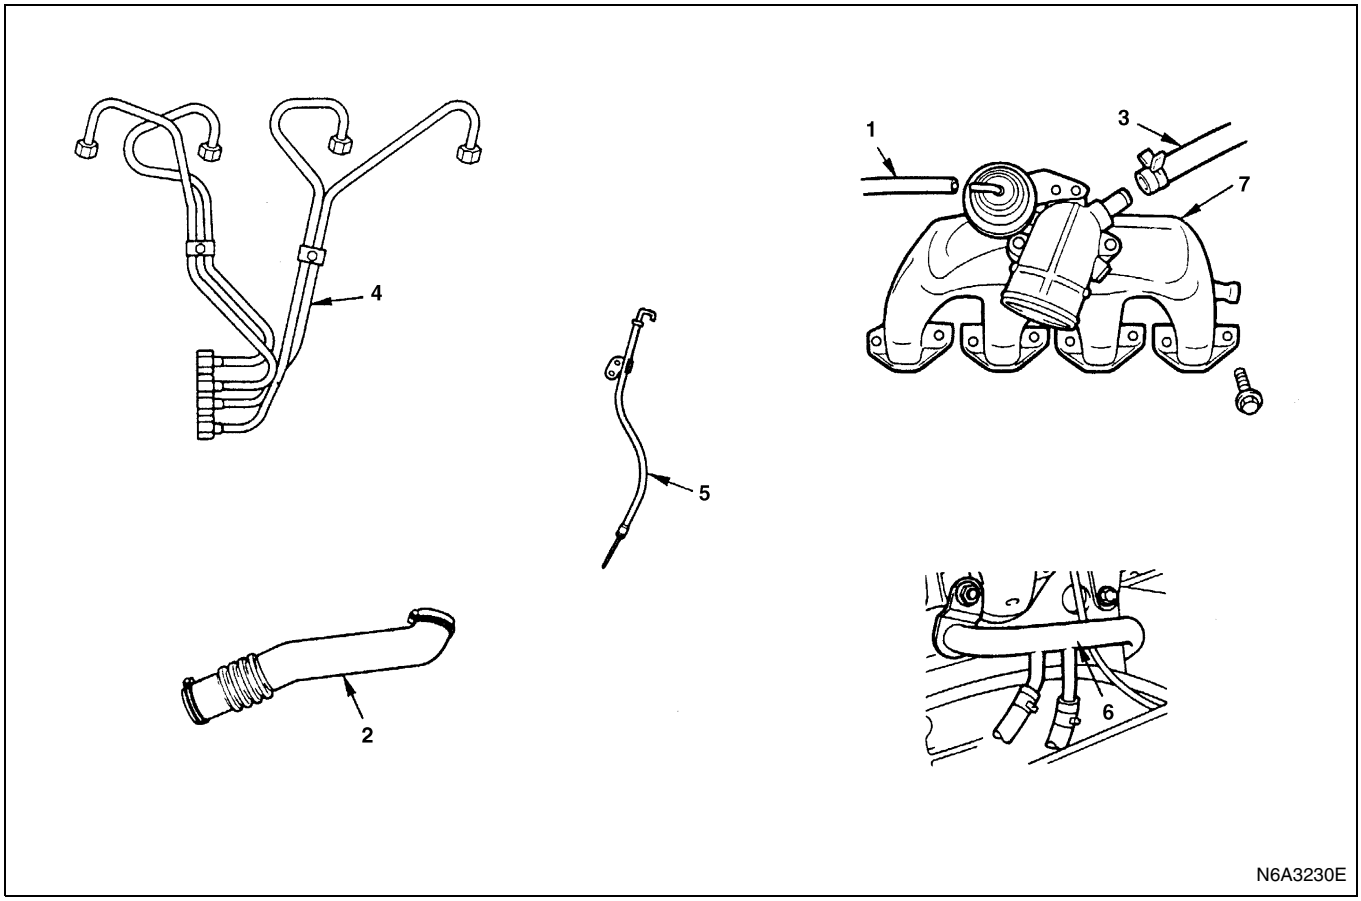
N6A3228E

2. Fan shroud
   - Install the fan shroud and clip the reservoir tank hose.

3. Air Intake Duct
   - Install the air intake duct.
   - Connect battery ground cable.

INLET MANIFOLD

Component



Legend

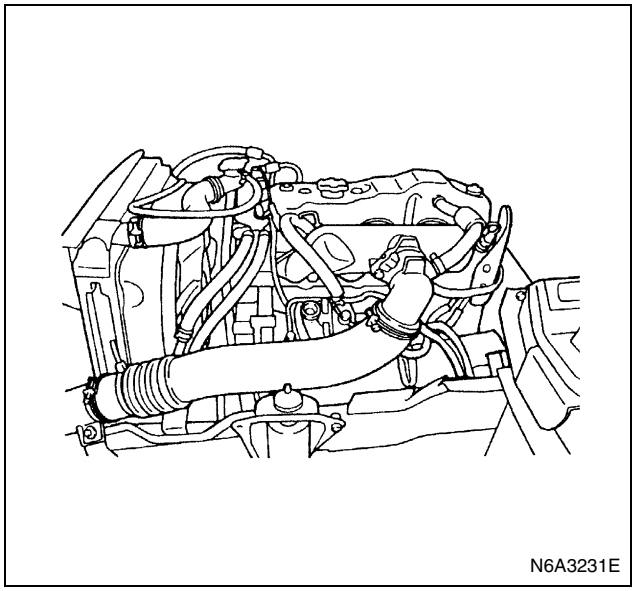
1. Vacuum hose
2. Air intake duct
3. PCV hose
4. Injection pipe
5. Oil level gauge guide tube
6. Oil cooler water pipe (Oil Cooler Model)
7. Inlet manifold

Removal

Preparation

- Disconnect battery ground cable.
- Drain coolant.

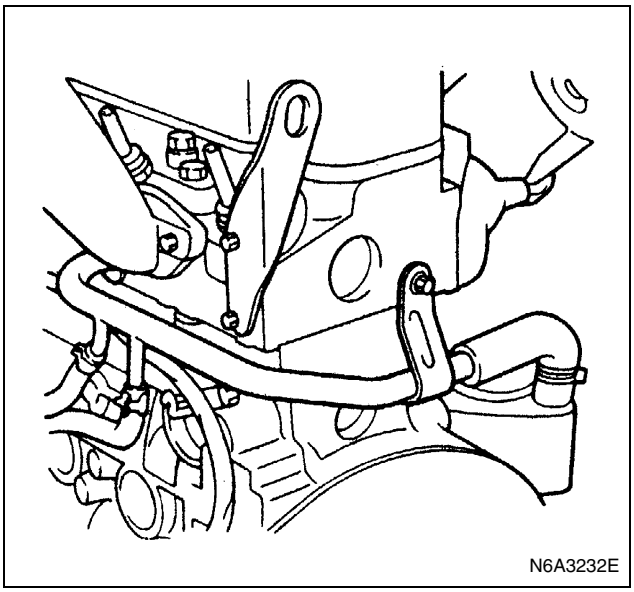
1. Vacuum Hose
2. Air Intake Duct
3. PCV Hose
4. Injection Pipe
   - Release injection pipe clip.
   - Loosen the flare nut on the injection pump side.
   - Loosen the flare nut on the injection nozzle side, disconnect and put a side the pipe.



5. Oil Level Gauge Guide Tube

- Remove the fixing bolt and remove level gauge guide tube.

6. Oil Cooler Water Pipe (Oil Cooler Model)
   - Remove the water pipe bracket bolt.
   - Remove the inlet manifold fixing nut.



N6A3232E

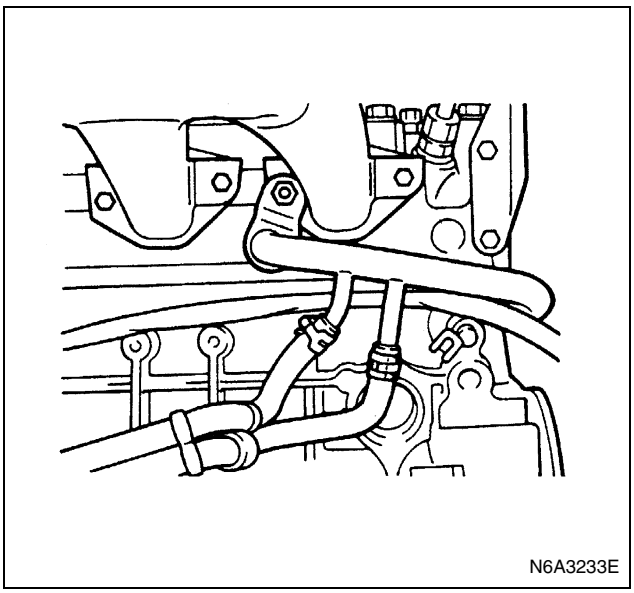
7. Inlet Manifold
   - Remove the manifold fixing bolt and nut.

Installation

1. Inlet Manifold
   - Tighten the fixing bolts and nuts to the specified torque.

Tighten:
- Bolt & nut to 19 N·m (1.9 kg·m / 14 lb·ft)

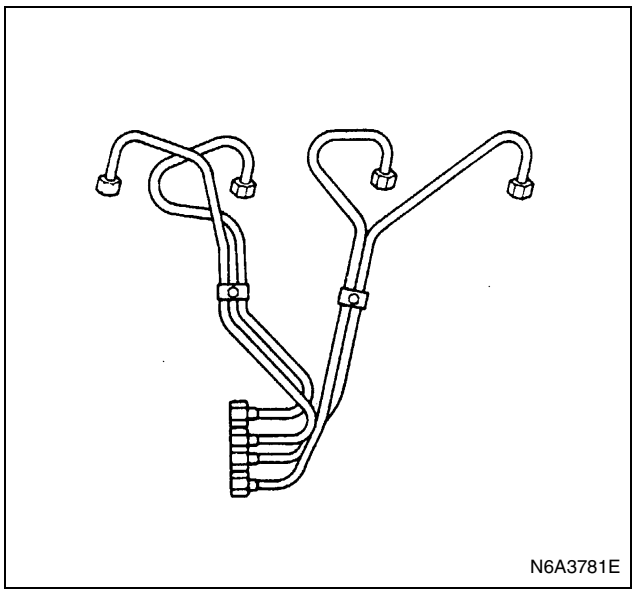
2. Oil Cooler Water Pipe (Oil Cooler Model)
   - Install the water pipe and tighten the manifold with water pipe.
   - Tighten the pipe bracket bolt of cylinder head rear side.



N6A3233E

3. Oil Level Gauge Guide Tube
   - Install the guide tube and tighten the manifold with guide tube.
4. Injection Pipe
   - Connect the injection pipe and tighten flare nut to the specified torque.

Tighten:
- Flare nut to 29 N·m (3.0 kg·m / 22 lb·ft)
   - Install the pipe clip to the original position.

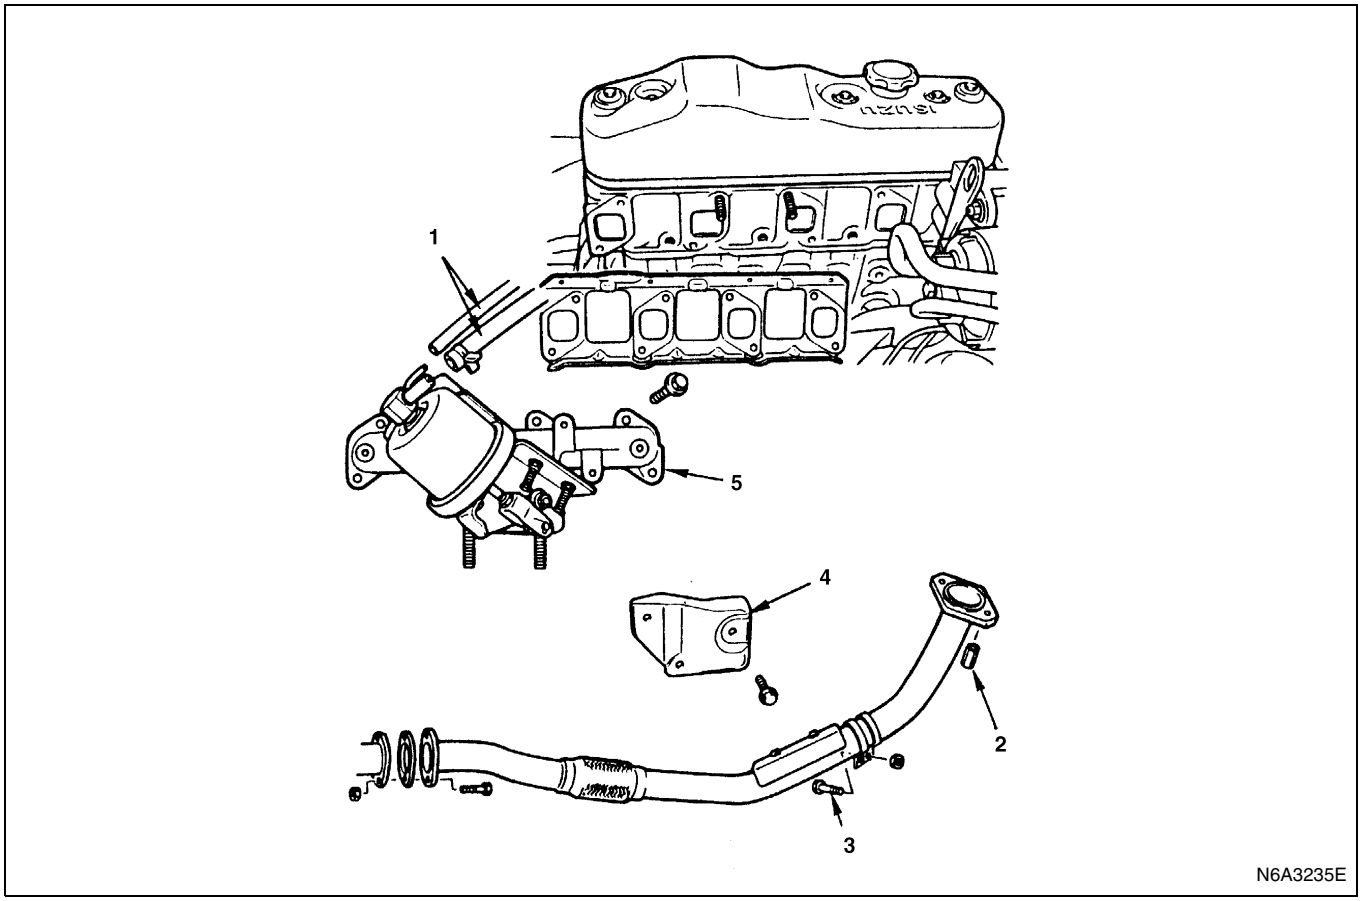


N6A3781E

5. PCV Hose
6. Air Intake Duct
7. Vacuum Hose
   - Connect the battery ground cable.
   - Pour coolant.
   - Start the engine and check coolant leakage.

EXHAUST MANIFOLD

Component



Legend

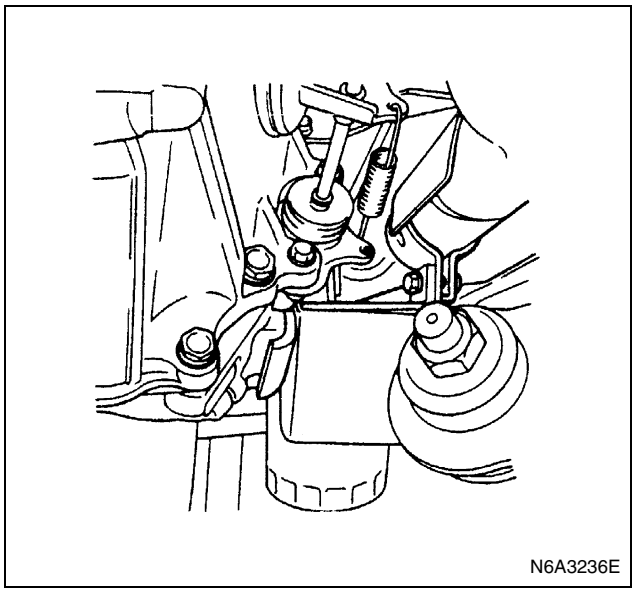
1. Vacuum hose
2. Front exhaust pipe nut
3. Front exhaust pipe stay bolt
4. Heat protector
5. Exhaust manifold

Removal

Preparation

- Disconnect battery ground cable.

1. Vacuum Hose (Exhaust Brake Model)
   - Remove the vacuum actuator hose.
2. Front Exhaust Pipe Nut
   - Remove the fixing nuts from exhaust manifold side.
3. Front Exhaust Pipe Stay Bolt



4. Heat Protector

5. Exhaust Manifold
   - Remove the manifold bolt and nut, then remove the manifold and gasket.

Installation

1. Exhaust Manifold
   - Tighten the fixing nuts and bolts to the specified torque.

Tighten:
- Manifold bolt to 26 N·m (2.7 kg·m / 20 lb·ft)

2. Heat Protector
   - Remove the heat protector and tighten to the specified torque.

Tighten:
- Heat protector bolt to 19 N·m (1.9 kg·m / 14 lb·ft)

3. Front Exhaust Pipe Stay Bolt
   - Tighten the fixing bolts to the specified torque.

Tighten:
- Stay bolt to 40 N·m (4.1 kg·m / 30 lb·ft)

4. Front Exhaust Pipe Nut
   - Tighten the fixing nuts to the specified torque.

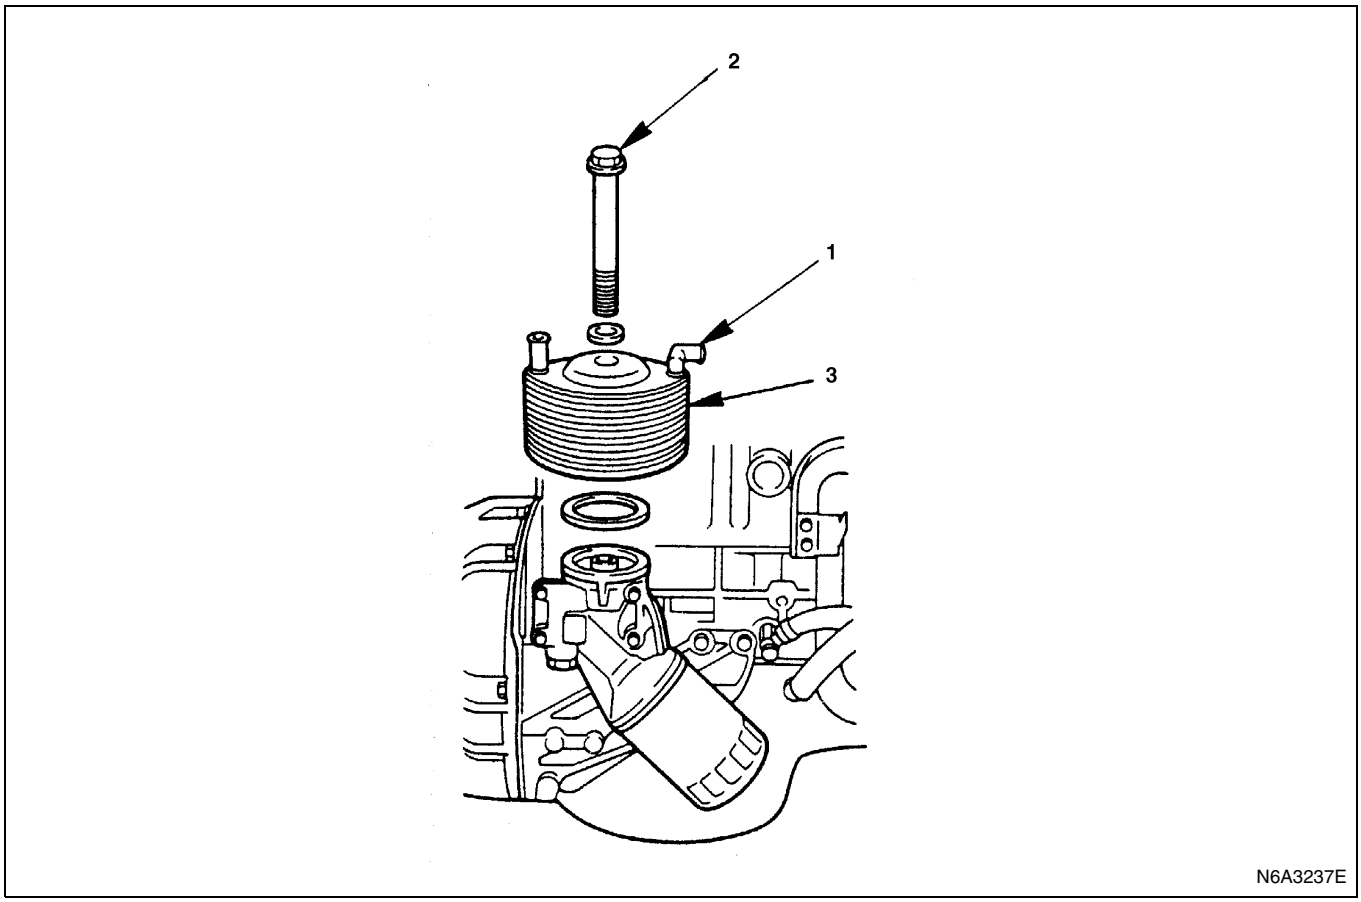
Tighten:
- Without exhaust brake to 69 N·m (7 kg·m / 51 lb·ft)
- With exhaust brake to 69 N·m (7 kg·m / 51 lb·ft)

5. Vacuum Hose (Exhaust Brake Model)
   - Install the two hose a vacuum actuator.
   - Connect battery ground cable.
   - Start the engine and check coolant leakage.

OIL COOLER (Oil Cooler Model)

Component

4JG2, 4JB1, 4JB1-TC, 4JH1-TC



Legend

1. Water hose
2. Oil cooler fixing bolt
3. Oil cooler

Removal

Preparation

- Disconnect battery ground cable
- Drain coolant
- Put rag to beneath side of oil cooler to prevent oil leaking.

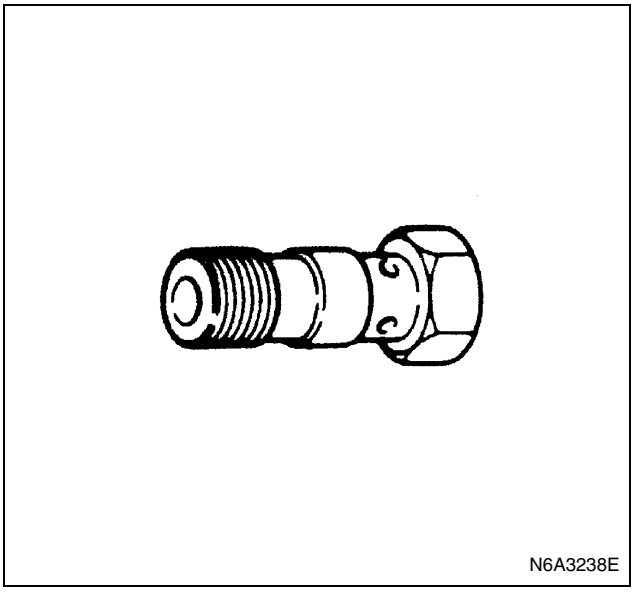
1. Water Hose
   - Disconnect water inlet and outlet hose.
2. Oil Cooler Fixing Bolt
3. Oil Cooler

Inspection

Relief Valve

1. Attach an oil pressure gauge to the oil gallery near the oil filter.
2. Start the engine to check the relief valve opening pressure.

Relief Valve Opening Pressure	kPa (kg/cm^2/psi)
Type1	559 — 618 (5.7 — 6.3/81.0 — 89.6)
Type2	422 — 461 (4.3 — 4.7/61.1 — 66.8)

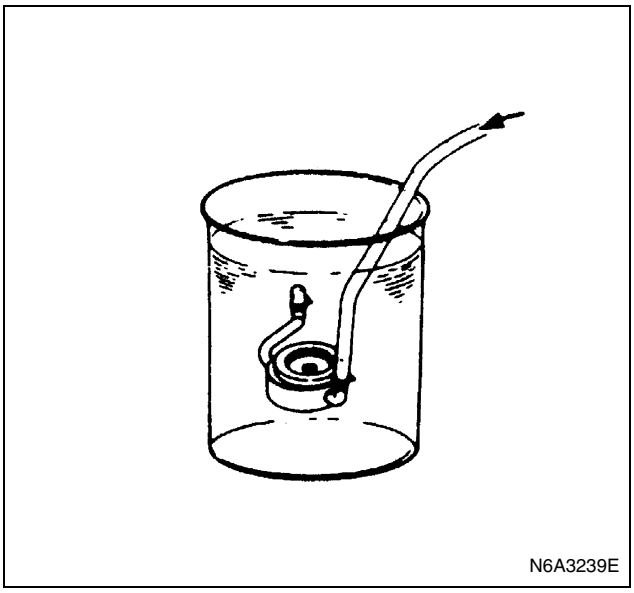


N6A3238E

Oil Cooler

Check for water leakage at the water passage.

1. Plug one side of the oil cooler water passage.
2. Submerge the oil cooler in water.
3. Apply compressed air (2 kg/cm^2 (28.5 psi / 196.0 kPa)) to the other side of the oil cooler water passage.
   If air bubbles rise to the surface, there is water leakage.



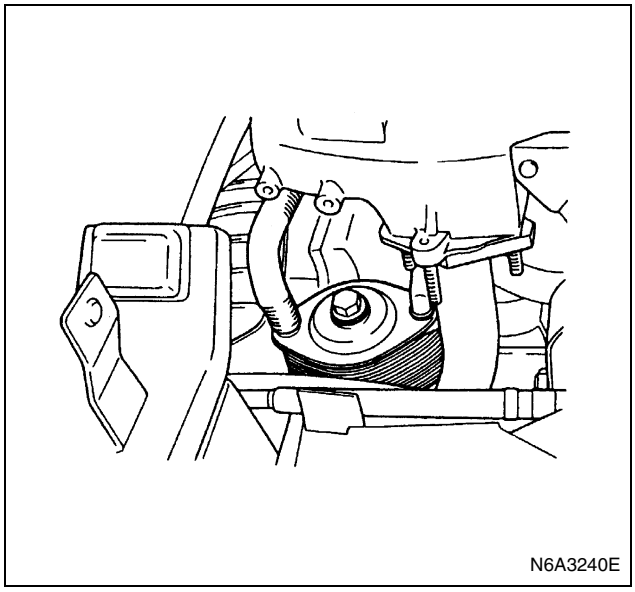
N6A3239E

Installation

1. Oil Cooler
   - Install the O-ring to oil filter body and set the oil cooler.
2. Oil Cooler Fixing Bolt

Tighten:

- Oil cooler bolt to 29 N·m (3.0 kg·m / 22 lb·ft)



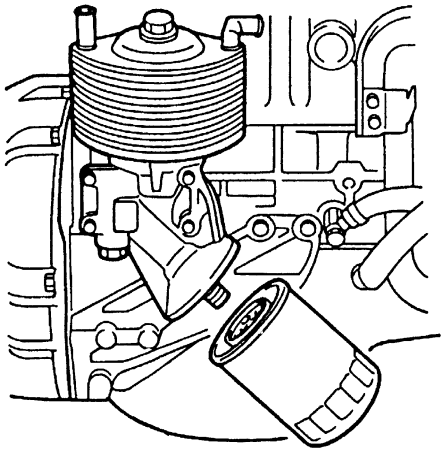
N6A3240E

3. Water Hose
   - Connect water hose.

OIL FILTER CARTRIDGE

Component

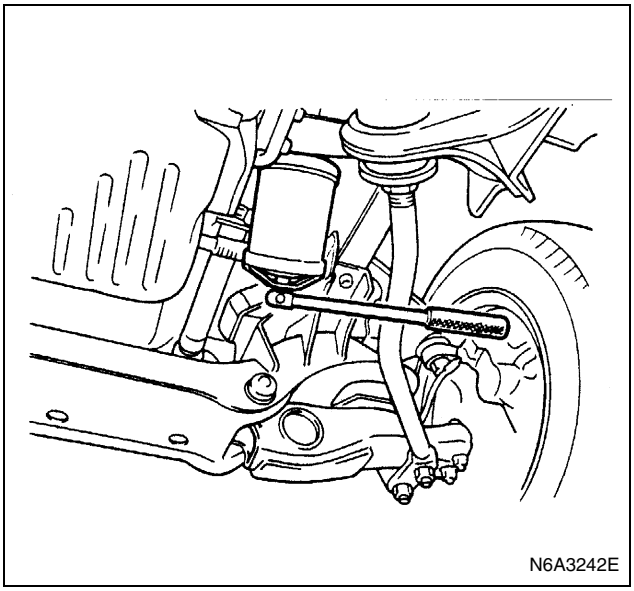
4JG2, 4JB1, 4JB1-TC, 4JH1-TC



N6A3241E

Removal

- Place a receptacle beneath the oil filter to contain the drained oil.
- Remove the oil filter cartridge using filter wrench.
  Filter wrench: 5-8840-0200-0



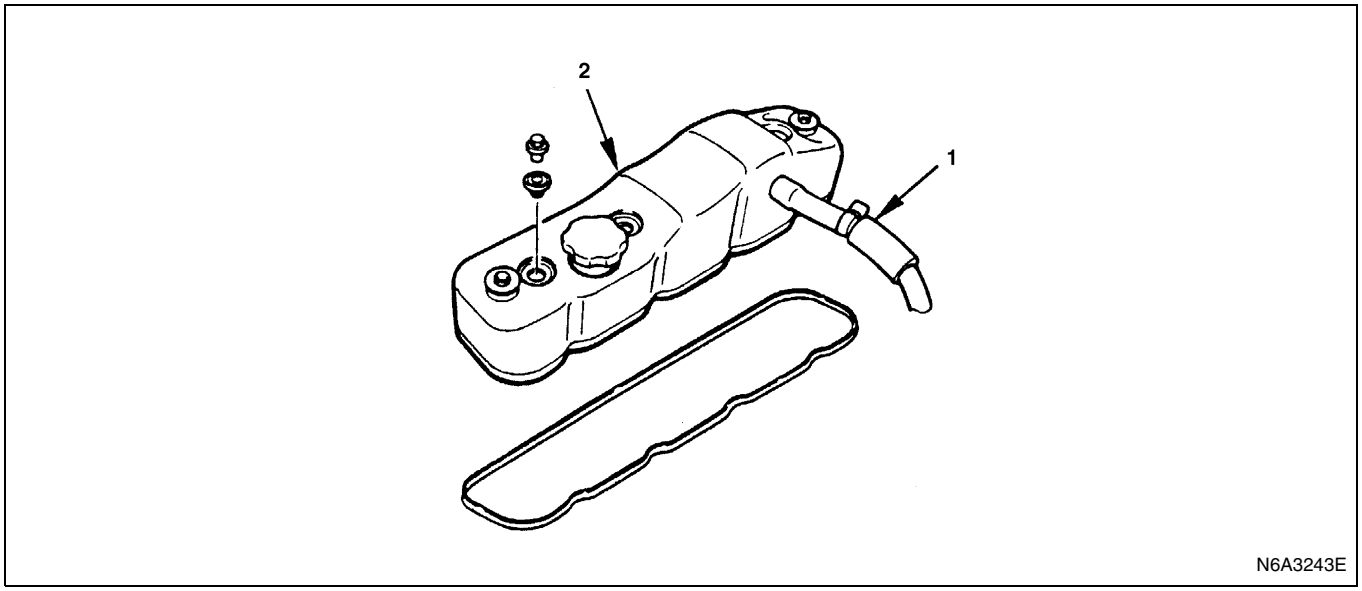
N6A3242E

Installation

- Lightly oil the O-ring of oil filter cartridge.
- Turn in the new oil filter cartridge by hand until the sealing face is fitted against the O-ring.
- Use the filter wrench to turn in the oil filter and additional one and 1.1/8 turns.
- Start the engine and check for oil leakage from oil filter.

CYLINDER HEAD COVER

Component



Legend

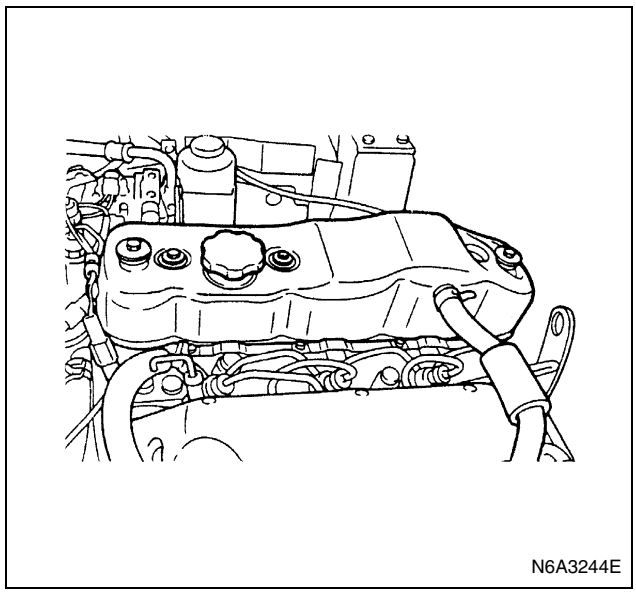
1. PCV hose
2. Cylinder head cover

Removal

Preparation

- Disconnect battery ground cable.

1. PCV Hose
   - Disconnect the PCV hose from intake pipe side.
2. Cylinder Head Cover



Installation

1. Cylinder Head Cover
   - Apply engine oil to the rocker arms and the valve springs.
   - Install the cylinder head cover gasket to the cylinder head cover.
   - The gasket must be perfectly smooth with no loose areas.
   - Tighten the cylinder head cover nuts to the specified torque.

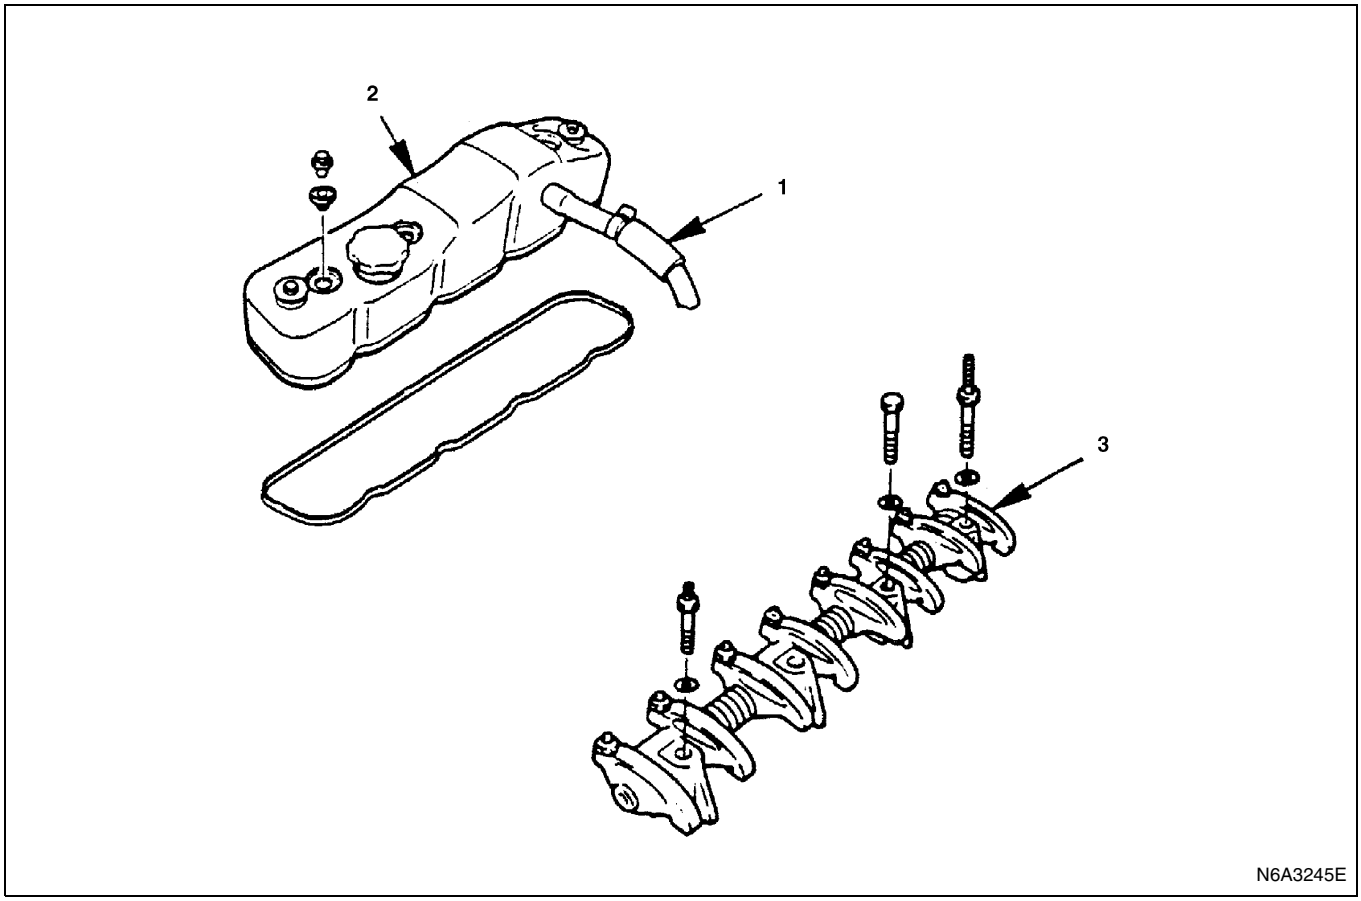
Tighten:

- 13 N·m (1.3 kg·m / 9 lb·ft)

2. PCV Hose
   - Connect the PCV hose to the intake pipe.
   - Connect battery ground cable.

ROCKER ARM SHAFT ASSEMBLY

Component



Legend

1. PCV hose
2. Cylinder head cover
3. Rocker arm shaft assembly

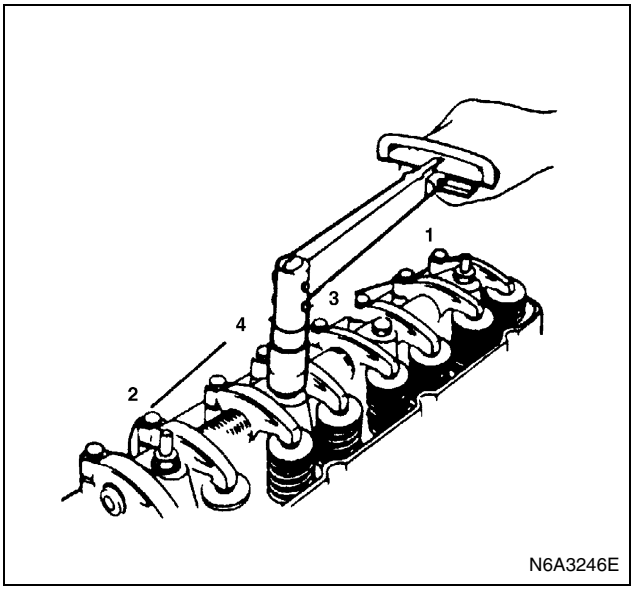
Removal

Preparation

- Disconnect battery ground cable.

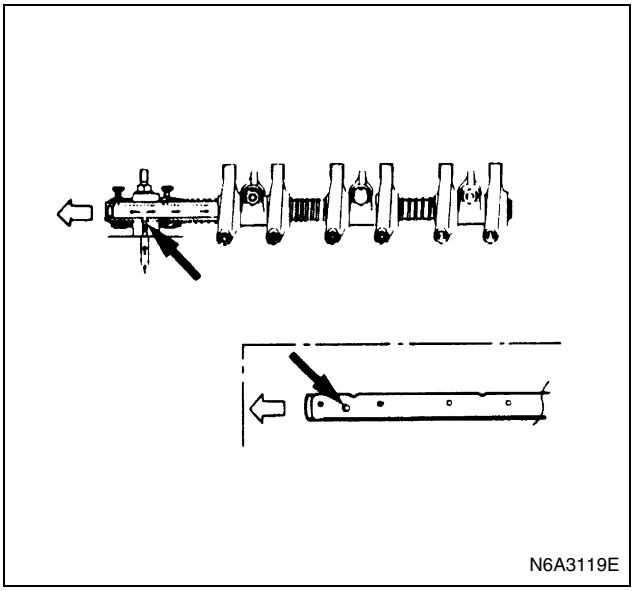
1. PCV Hose
2. Cylinder Head Cover
3. Rocker Arm Shaft Assembly

- Loosen bolts and nuts of rocker shaft bracket by turns and remove rocker shaft assembly.



Installation

1. Rocker Arm Shaft Assembly
   - Install rocker arm shaft with larger oil hole ϕ4) to the front of engine.

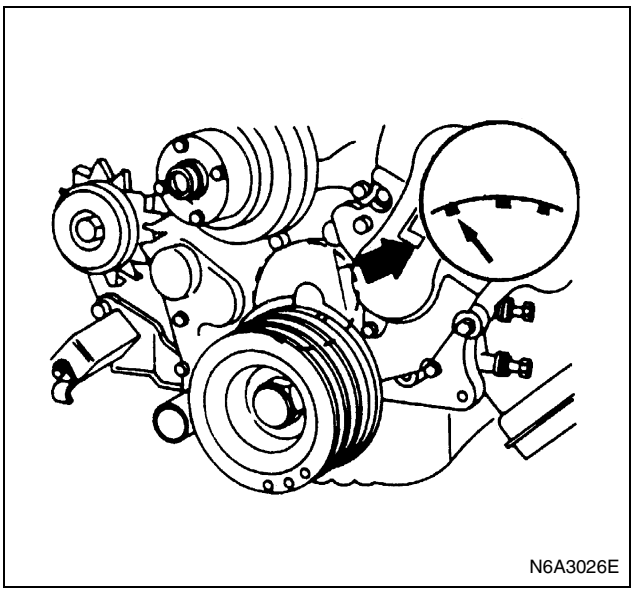


N6A3119E

   - Align fixing bolt with nut of rocker arm shaft and tighten fixing bolts to the specified torque.

Tighten:
- 54 N·m (5.5 kg·m / 40 lb·ft)

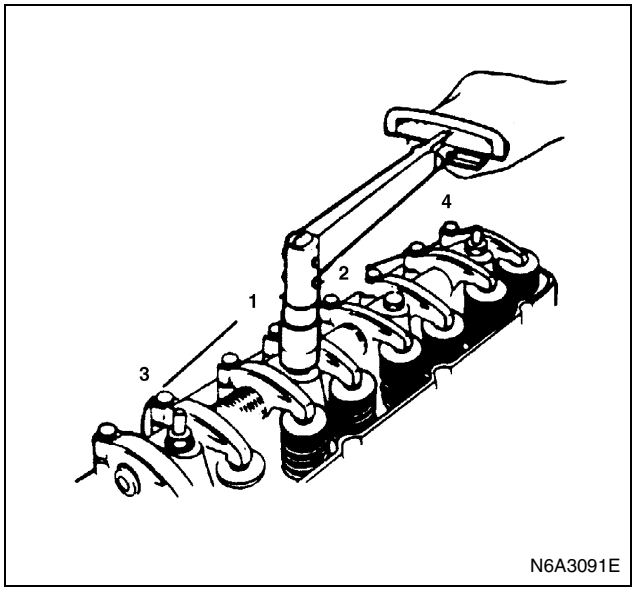
2. Valve clearance adjustment
   1) Bring the piston in either the No.1 cylinder or the No.4 cylinder to TDC on the compression stroke by turning the crankshaft until the crankshaft damper pulley TDC line is aligned with the timing pointer.



N6A3026E

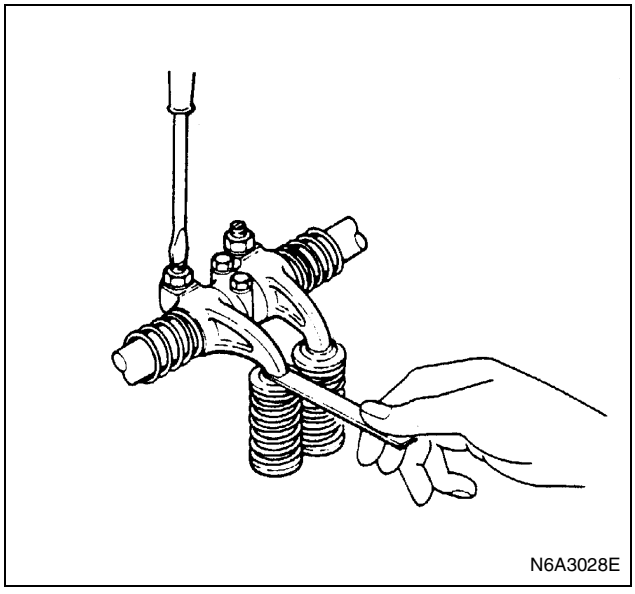
   2) Check the rocker arm shaft bracket nuts for looseness.
      Tighten any loose rocker arm shaft bracket nuts before adjusting the valve clearance.

Tighten:
- Rocker arm shaft bracket nut to 54 N·m (5.5 kg·m / 40 lb·ft)



N6A3091E

   3) Check for play in the No.1 intake and exhaust valve push rods.
      If the No.1 cylinder intake and exhaust valve push rods have play, the No.1 piston is at TDC on the compression stroke.
      If the No.1 cylinder intake and exhaust valve push rods are depressed, the No.4 piston is at TDC on the compression stroke.



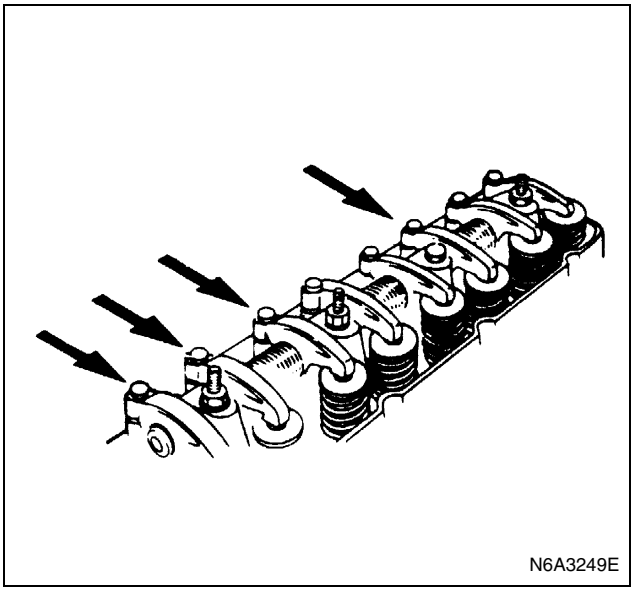
N6A3028E

      Adjust the No.1 or the No.4 cylinder valve clearances while their respective cylinders are at TDC on the compression stroke.

Valve Clearance (At Cold)	mm (in)
0.4 (0.016)	

   4) Loosen each valve clearance adjusting screw as shown in the illustration.

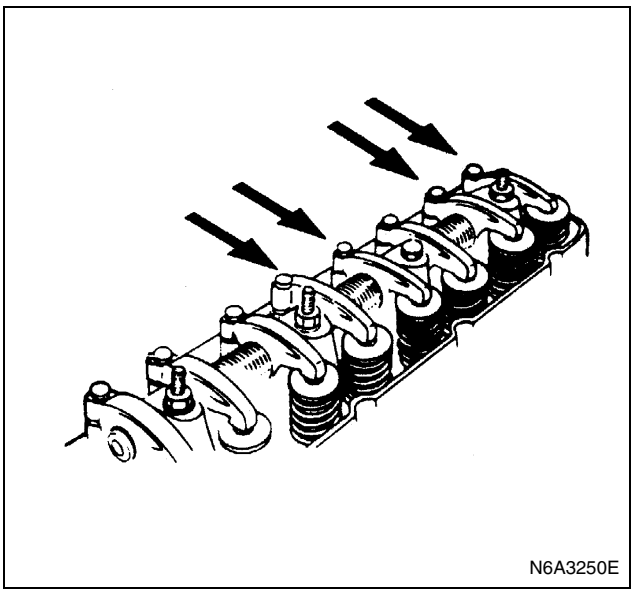
No. 1 Cylinder T.D.C (Compression stroke)



N6A3249E

5) Insert a feeler gauge of the appropriate thickness between the rocker arm and the valve stem end.
6) Turn the valve clearance adjusting screw until a slight drag can be felt on the feeler gauge.
7) Tighten the lock nut securely.
8) Rotate the crankshaft 360°.
9) Realign the crankshaft damper pulley TDC notched line with the timing pointer.
10) Adjust the clearances for the remaining valves as shown in the illustration.

No. 4 Cylinder T.D.C (Compression stroke)



N6A3250E

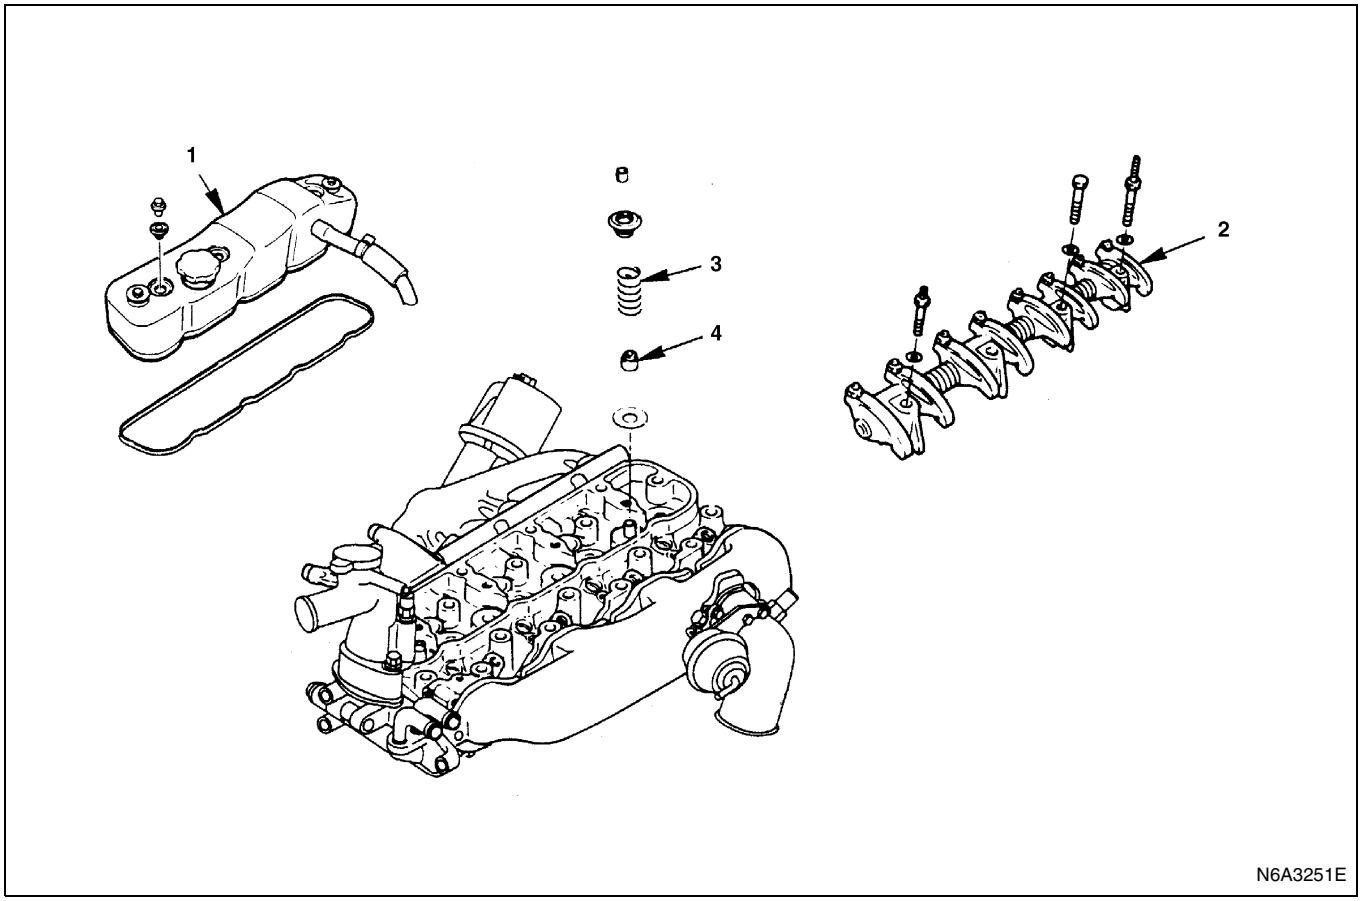
3. Cylinder Head Cover
   • Install cylinder head cover and tighten bolts to the specified torque.

Tighten:
• 13 N·m (1.3 kg·m / 113 lb·in)

4. PCV Hose
   • Connect battery ground cable.

VALVESTEM OIL CONTROLLER & VALVE SPRING

Component



Legend

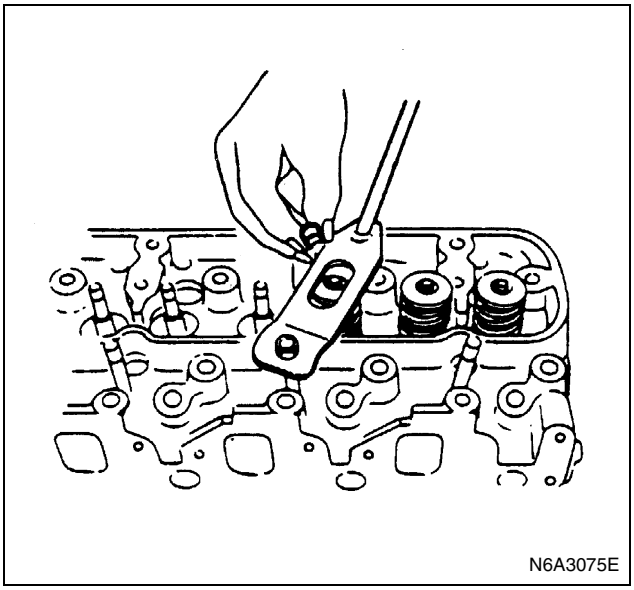
1. Cylinder head cover
2. Rocker arm shaft assembly
3. Valve spring
4. Valve guide oil seal

Removal

Preparation

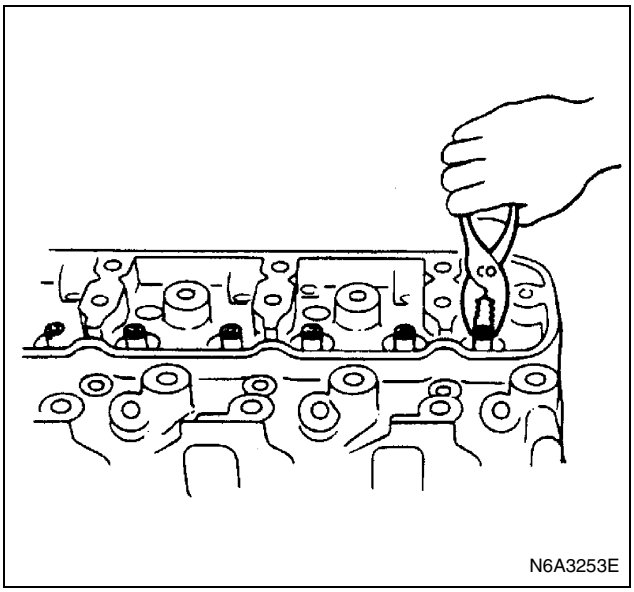
- Disconnect battery cable.

1. Cylinder Head Cover
2. Rocker Arm Shaft Assembly
   - Loosen bolts and nuts of rocker shaft bracket by turns and removal rocker shaft assembly.
3. Valve Spring
   - Apply compressed air to cylinder from the glow plug hole hold the valve in place.
   - Using special tool, compress valve spring and removal split cover.
     Valve spring compressor: 9-8523-1423-0 (J-29760)



Caution:
Put removed valve spring in the order of cylinder number.

4. Valve Guide Oil Seal
   - Remove valve guide oil seal by pliers

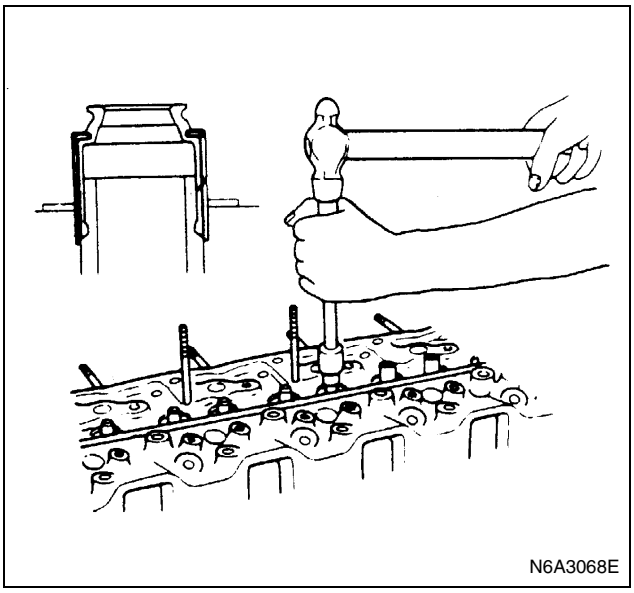


N6A3253E

Caution:
Removed oil controller should not be reused.

Installation

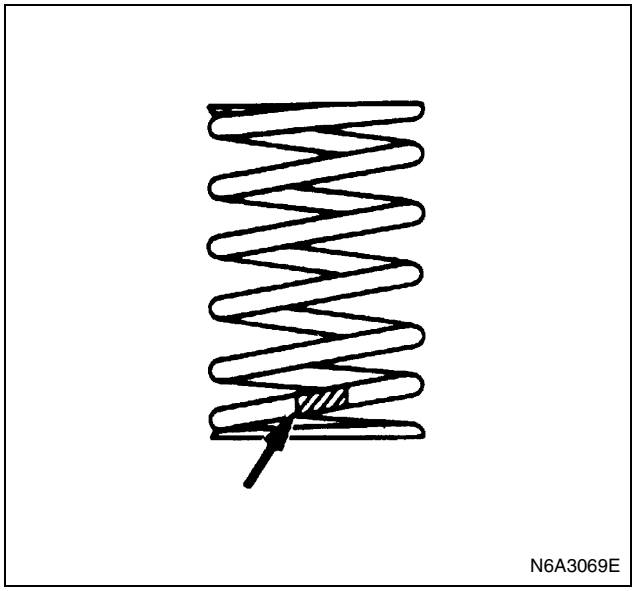
1. Valve Guide Oil Seal
   - Install new valve guide oil seal in valve.
   - Guide using special tool.
     Special tool: 5-8840-2033-0



N6A3068E

2. Valve Spring
   - Attach the new valve spring to the upper spring seat.

Caution:
- The painted area of the valve spring should be facing toward.

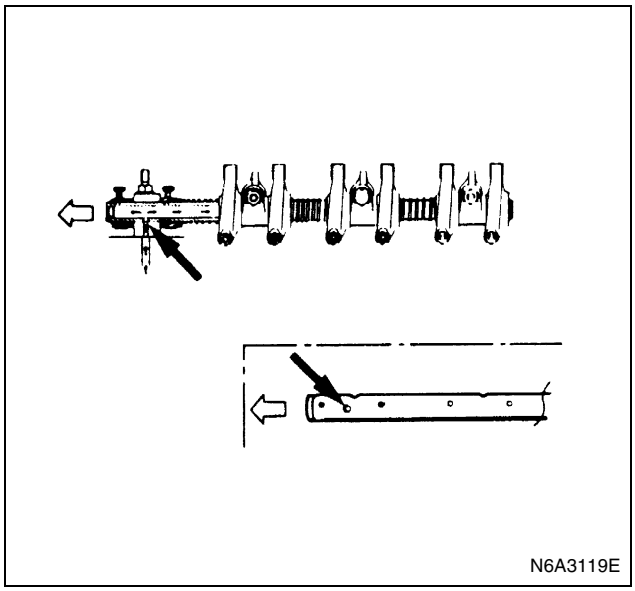


N6A3069E

- Apply compressed air to cylinder from the glow plug hole to hold the valve in place.
- Install split collar by special tool

  Valve spring compressor: 9-8523-1423-0 (J-29760)

3. Rocker Arm Shaft Assembly
   - Install rocker arm shaft with larger oil hole ϕ4) to the front of engine.



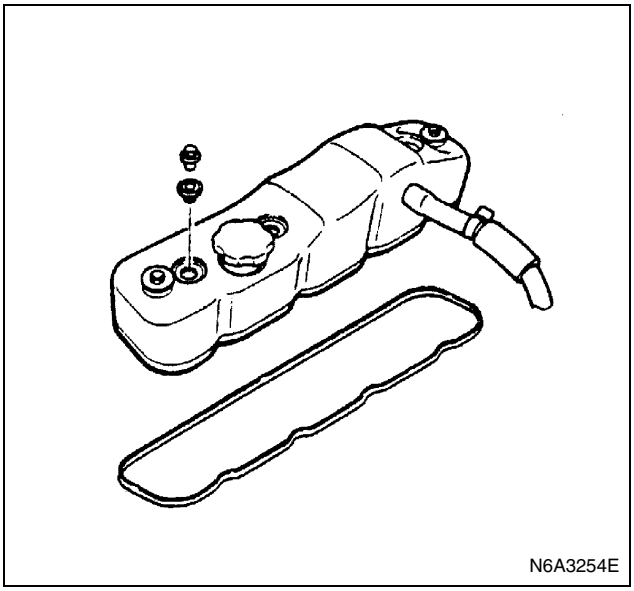
N6A3119E

- Align fixing bolt with nut of rocker arm shaft and tighten fixing bolts to the specified torque.

Tighten:
- 54 N·m (5.5 kg·m / 40 lb·ft)
  - Valve clearance adjustment

4. Valve clearance adjustment
   Above works refer to “ROCKER ARM SHAFT ASSEMBLY” Section in this manual.
5. Cylinder Head Cover
   - Apply engine oil to the rocker arms and the valve spring.
   - Install the cylinder head cover gasket to the cylinder head cover.
     The gasket must be perfectly smooth with no loose areas.
   - Install cylinder head cover and tighten bolt to the specified torque.

Tighten:
- Head cover bolt to 13 N·m (1.3 kg·m / 113 lb·in)

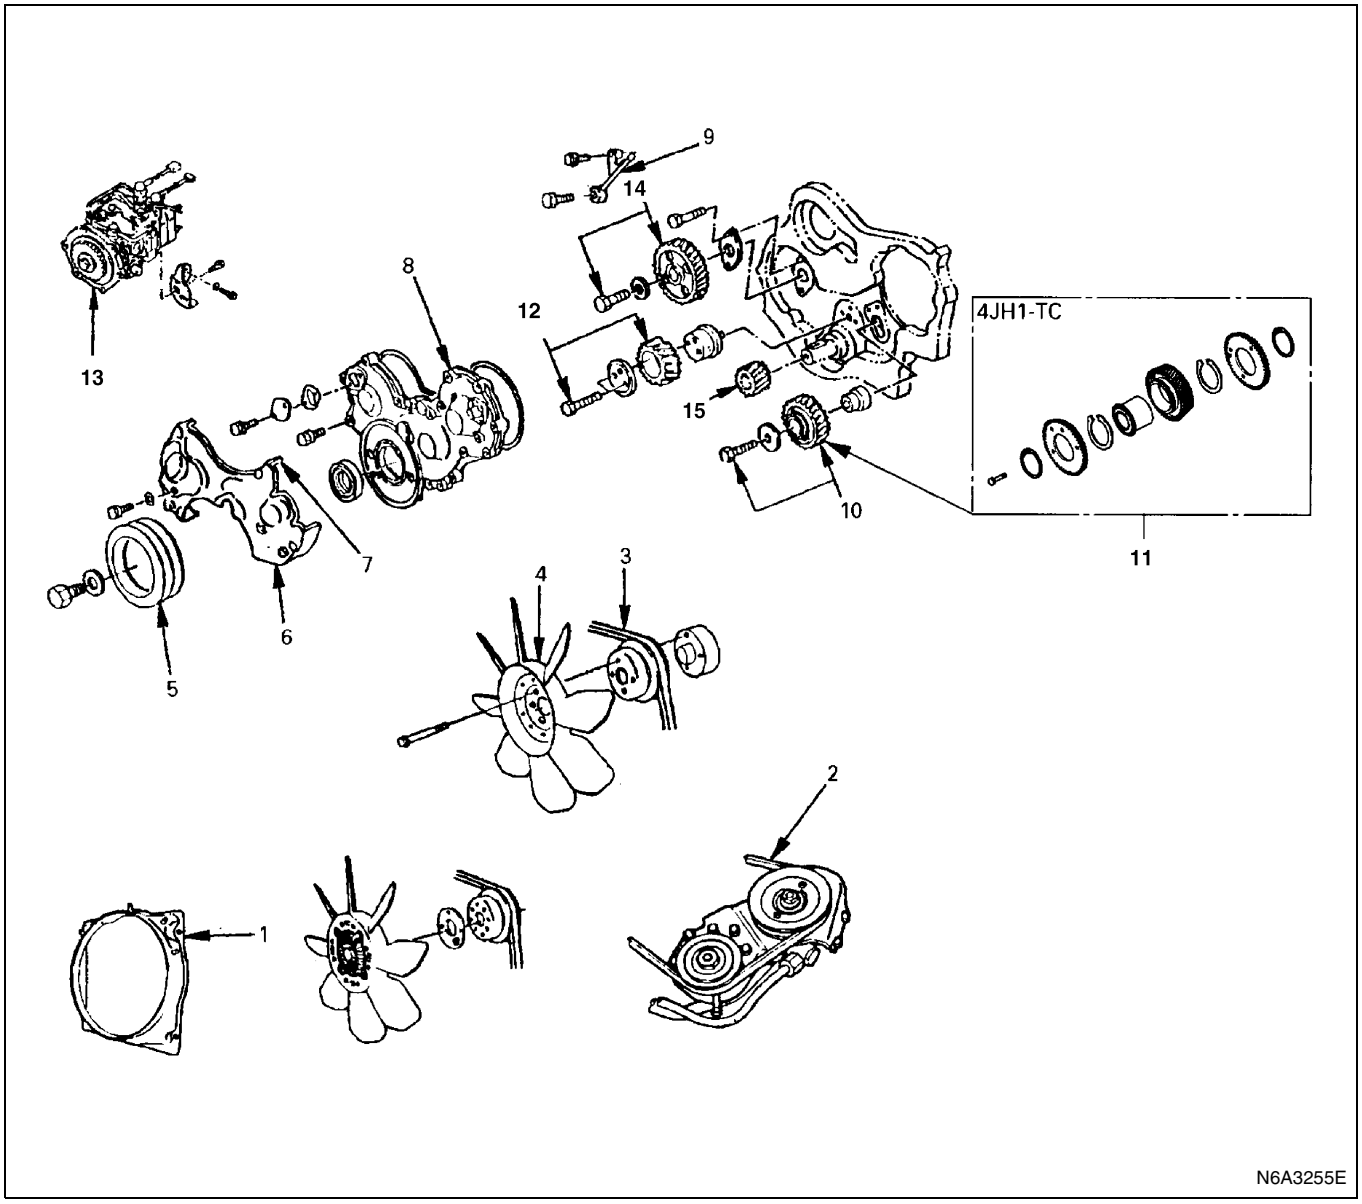


N6A3254E

- Connected PCV hose.
- Connect battery ground cable.

TIMING GEAR (4JB1, 4JB1-TC, 4JH1-TC Gear Type)

Component



Legend

1. Fan shroud
2. Power steering pump drive belt
3. AC generator drive belt
4. Cooling fan assembly
5. Crankshaft damper pulley
6. Noise shield cover
7. Noise cover spacer
8. Timing gear case cover
9. Oil pipe
10. Idle gear
11. Idle gear “B”
12. Idle gear
13. Injection pump
14. Camshaft timing gear
15. Crankshaft gear

Removal

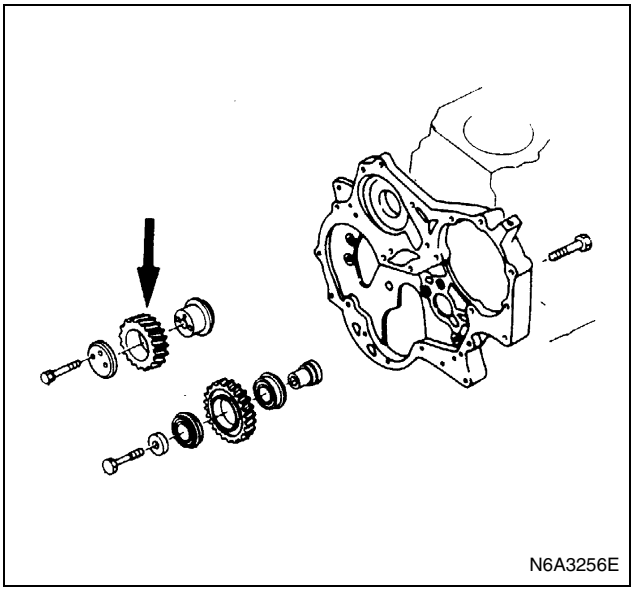
Preparation

- Disconnect battery ground cable.
- Drain coolant.

1. Fan Shroud
2. Power Steering Pump Drive Belt (P/S Model)
   - Loosen power steering pump mounting bolt and adjust bolt, and remove the drive belt.
3. AC Generator Drive Belt

- Loosen AC Generator mounting bolt (under size) and adjust plate lock bolt, and remove the drive belt.

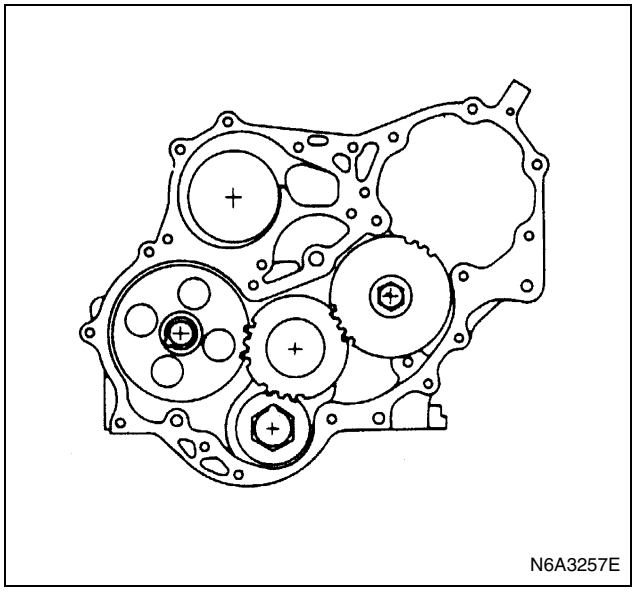
4. Cooling Fan Assembly
   - Remove clamp nut, and remove cooling fan assembly, distant pipe, and fan pulley.
5. Crankshaft Damper Pulley
6. Noise Shield Cover
7. Noise Cover Spacer
8. Timing Gear Case Cover
9. Oil Pipe
10. Idler Gear
    1) Measure the camshaft timing gear backlash and the crankshaft timing gear backlash before removing the idler gear.
    2) Measure the idler gear end play before removing the idler gear.



N6A3256E

Notice:
Refer to the following items for details on the backlash and end play measurement procedures.

11. Timing Gear Backlash Measurement
    1) Set a dial indicator to the timing gear to measured.
       Hold both the gear to be checked and the adjoining gear stationary.



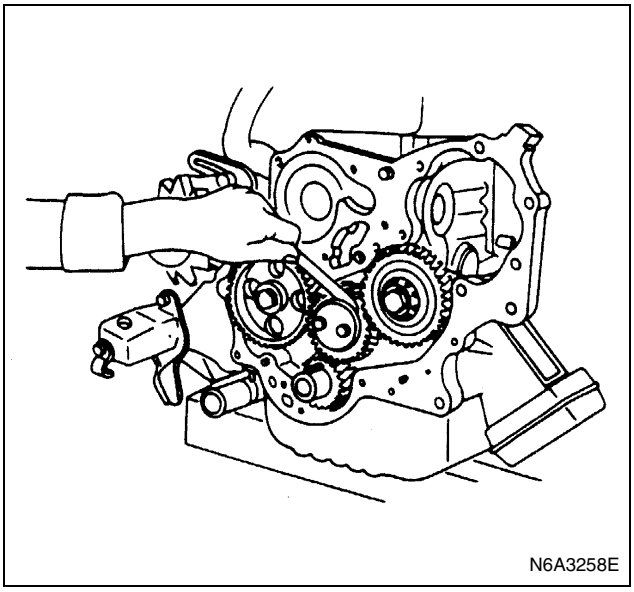
N6A3257E

    2) Move the gear to be checked as far as possible to both the right and the left.
       Take the dial indicator reading.
       If the measured value exceeds the specified limit, the timing gear must be replaced.

Timing Gear Backlash	mm (in)
Standard	Limit
0.010 — 0.17 (0.0039 — 0.0067)	0.30 (0.012)

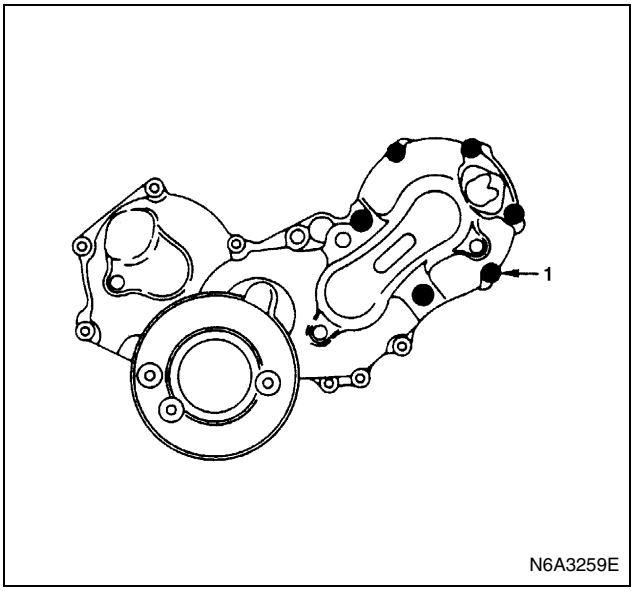
12. Idler Gear “A” End Play Measurement
    Insert a feeler gauge between the idler gear and the thrust collar to measure the gap and determine the idler gear end play.
    If the measured value exceeds the specified limit, the thrust collar must be replaced.

Idle Gear End Play	mm (in)
Standard	Limit
0.07 (0.0028)	0.2 (0.0079)



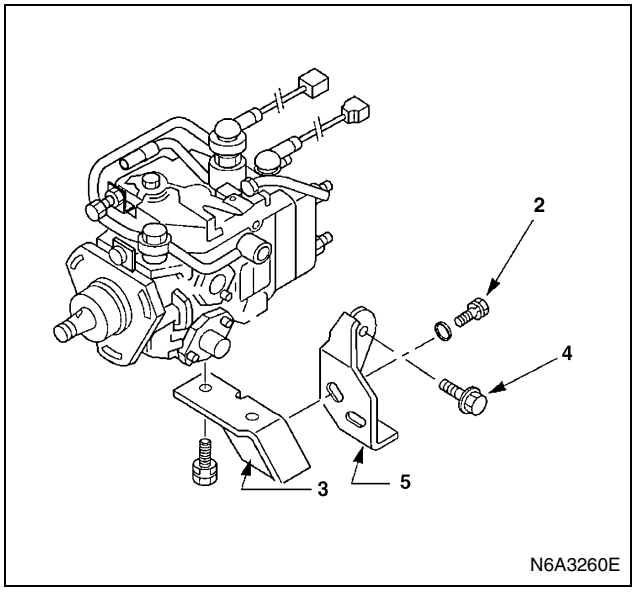
N6A3258E

13. Idle Gear
14. Injection Pump
    1) Remove the six injection pump bracket bolts (1) from the timing gear case.



N6A3259E

    2) Remove the injection pump rear bracket bolts (2) from the injection pump bracket (3).
    3) Remove the injection pump rear bracket bolts (4) and the bracket (5) from the cylinder body.



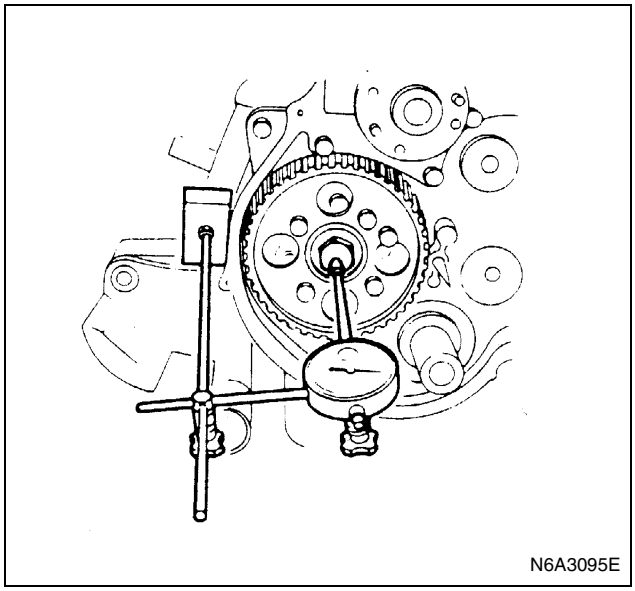
N6A3260E

    4) Pull the injection pump along with the injection pump timing gear free toward the rear of the engine.

Notice:
Plug the injection pump delivery holder ports with the shipping caps (or the equivalent) to prevent the entry of foreign material.

15. Camshaft Timing Gear
    1) Use a dial indicator to measure the camshaft end play. This must be done before removing the camshaft gear.
    If the camshaft end play exceeds the specified limit, the thrust plate must be replaced.

Camshaft End Play	mm (in)
Standard	Limit
0.050 — 0.114 (0.002 — 0.0044)	0.2 (0.008)

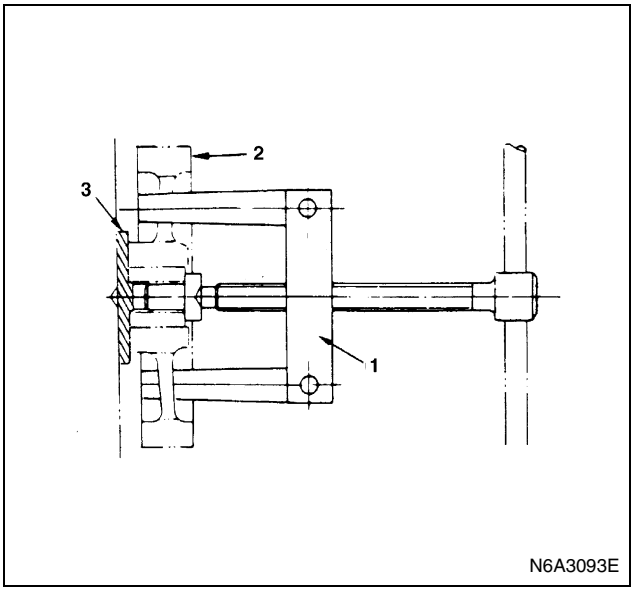


N6A3095E

2) Remove the camshaft timing gear bolt from the camshaft.

Notice:
Hold the camshaft stationary to prevent the camshaft from turning.

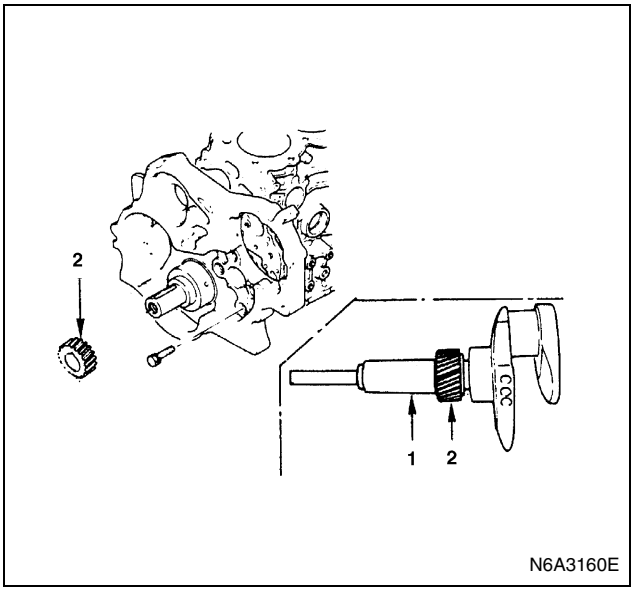
3) Use the universal puller (1) to pull out the camshaft timing gear (2).
Universal Puller: 5-8521-0002-0
4) Remove the thrust plate (3).



16. Crankshaft Gear

Installation

1. Crankshaft Gear
   1) Install the crankshaft gear.
   2) Use the crankshaft gear installer (1) to install the crankshaft gear (2).
   The crankshaft gear timing mark ("X — X") or ("· — ·") must be facing outward.
   Crankshaft Gear Installer: 9-8522-0020-0

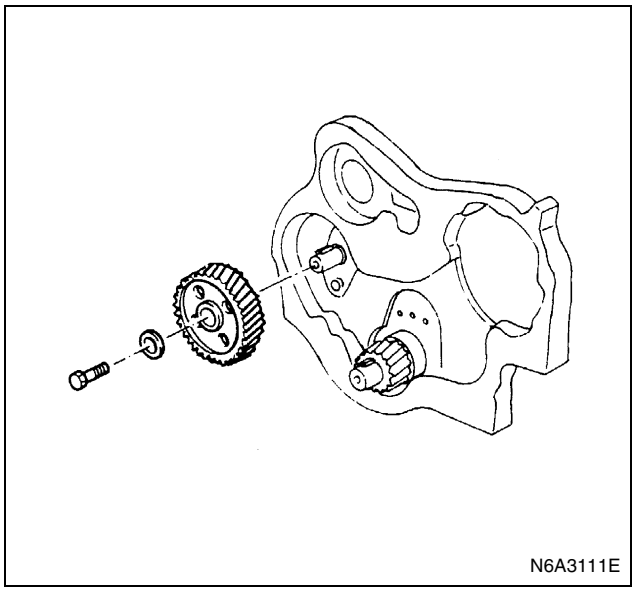


2. Camshaft Timing Gear
   1) Install the thrust plate to the cylinder body.
   2) Tighten the thrust plate bolts to the specified torque.

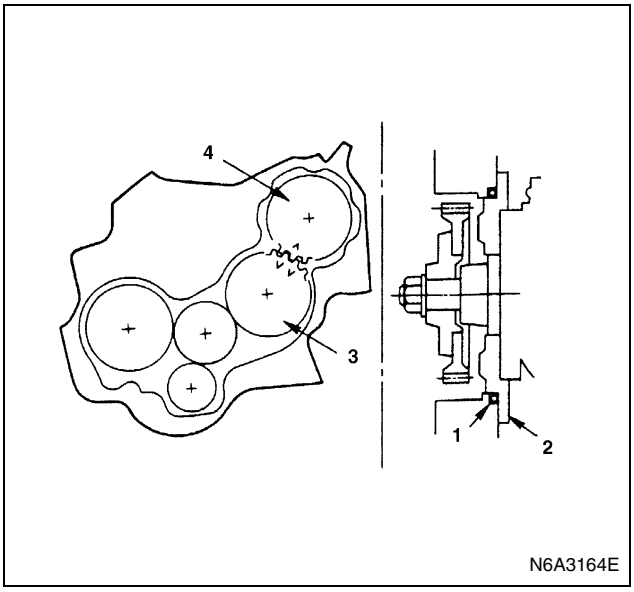
Tighten:
- 18 N·m (1.8 kg·m / 13 lb·ft)

   3) Install the camshaft timing gear to the camshaft.
   The timing gear mark ("Y — Y") or ("·· — ··") must be facing outward.
   4) Tighten the timing gear to the specified torque.

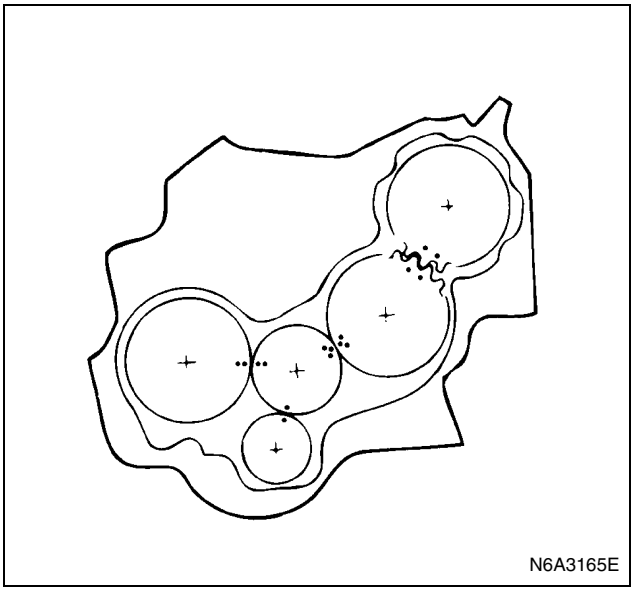
Tighten:
- 64 N·m (6.5 kg·m / 47 lb·ft)



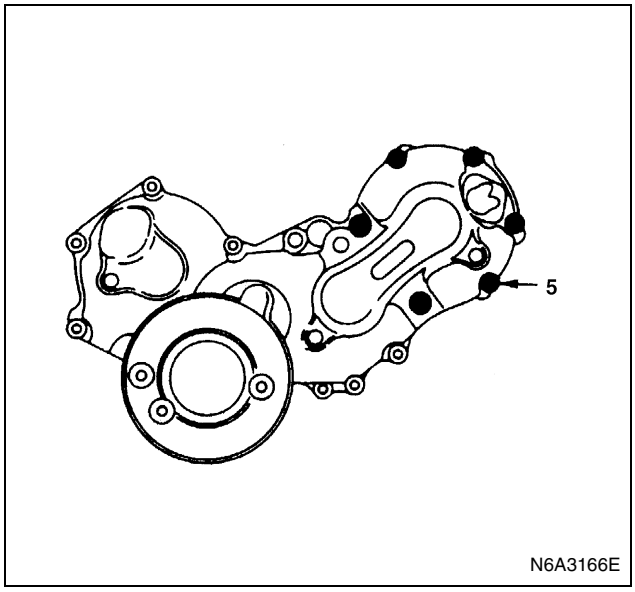
3. Injection Pump
   1) Install the O-ring (1) to the injection pump flange (2).
   2) Install the injection pump to the timing gear case.
   Align the idler gear "B" (3) "V — V" or ": — :" mark with the injection pump timing gear (4) "V" or ":" mark.



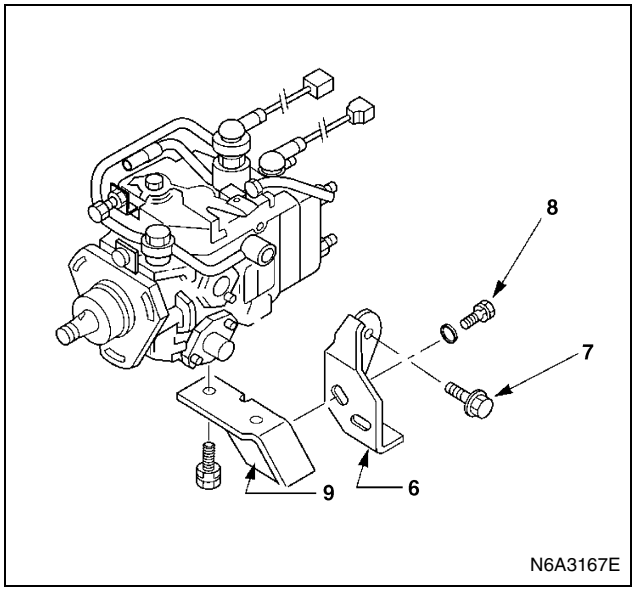
Gear	4JB1-TC, 4JG2	4JH1TC
Crank gear — Idle gear “A”	X — X	· — ·
Idle gear “A” — Cam gear	Y — Y	·· — ··
Idle gear “A” — Idle gear “B”	Z — Z	:· — ·:
Idle gear “B” — Injection pump	V — V	: — :



3) Temporarily tighten the six injection pump bolts (5).
   The injection pump bolts will be finally tightened after the injection pump rear bracket bolts.



4) Install the injection pump rear bracket (6) and the rear bracket bolts (7) to the cylinder body.
5) Install the rear bracket bolts (8) to the injection pump bracket (9).
   Do not tighten the bolts.
   The rear bracket bolts (7) and (8) will be finally tightened to the specified torque after tighten the injection pump nuts.



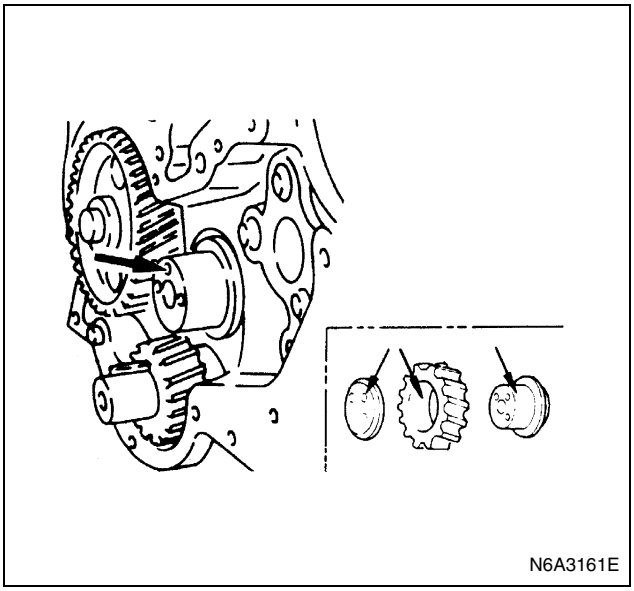
6) Tighten the injection pump nuts to the specified torque.

Tighten:
- 19 N·m (1.9 kg·m / 14 lb·ft)

7) Tighten the injection pump bracket bolts to the specified torque.

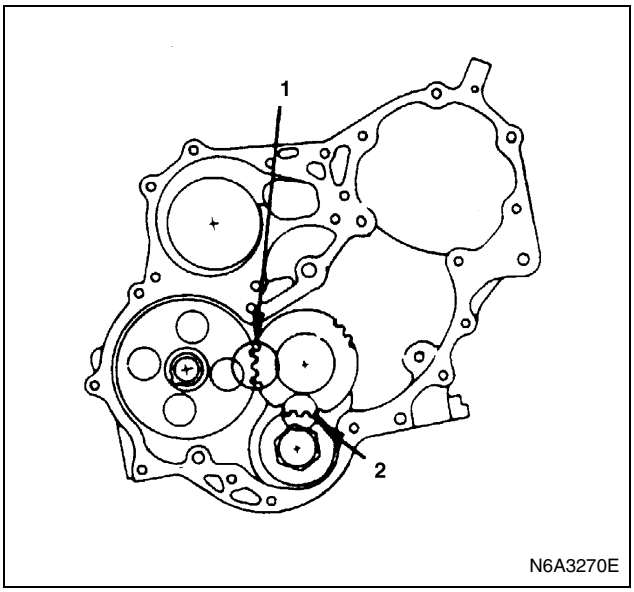
Tighten:
- 19 N·m (1.9 kg·m / 14 lb·ft)

4. Idler Gear
   1) Apply engine oil to the idler gear and the idler gear shaft.
      The idler gear shaft oil hole must be facing up.



N6A3161E

   2) Position the idler gear setting marks “X” or “·” and “Y” or “··” so that they are facing the front of the engine.
   3) Align the idler gear “X” or “·” setting mark with the crankshaft timing gear (1) “X — X” or “· — ·” setting mark.
   4) Align the idler gear “Y” or “··” setting mark with the camshaft timing gear (2) “Y — Y” or “·· — ··” setting mark.

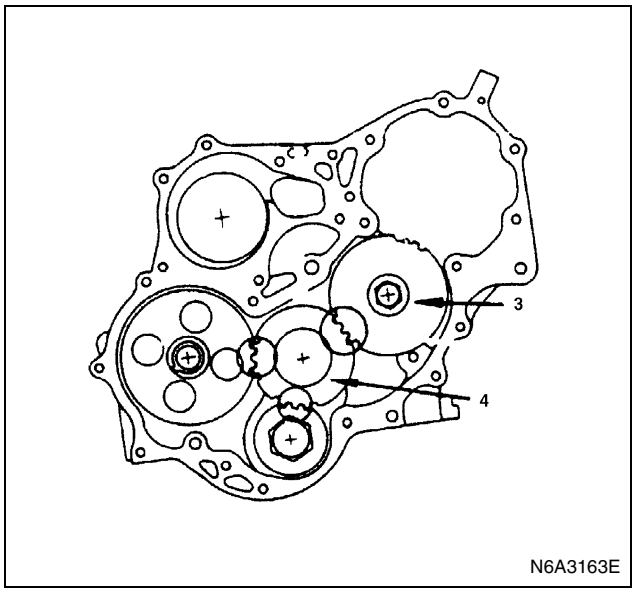


N6A3270E

   5) Install the thrust collar and bolts to the cylinder body through the shaft.
      The thrust collar oil hole must be facing up, and the thrust collar chamfered must be outward.
   6) Tighten the idler gear bolt to the specified torque.

Tighten:
- 19 N·m (1.9 kg·m / 14 lb·ft)

5. Idler Gear
   1) Apply engine oil to the idler gear and the idler gear shaft.
   2) Align the idler gear “B” (3) “Z” or “∴” setting mark with the idler gear “A” (4) “Z — Z” or “:· — ·:” setting mark.



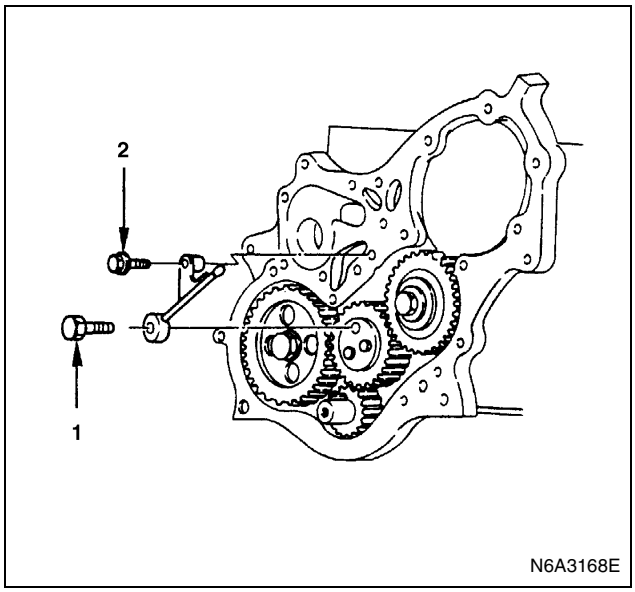
N6A3163E

   3) Tighten the idler gear bolt to the specified torque.

Tighten:
- 76 N·m (7.7 kg·m / 56 lb·ft)

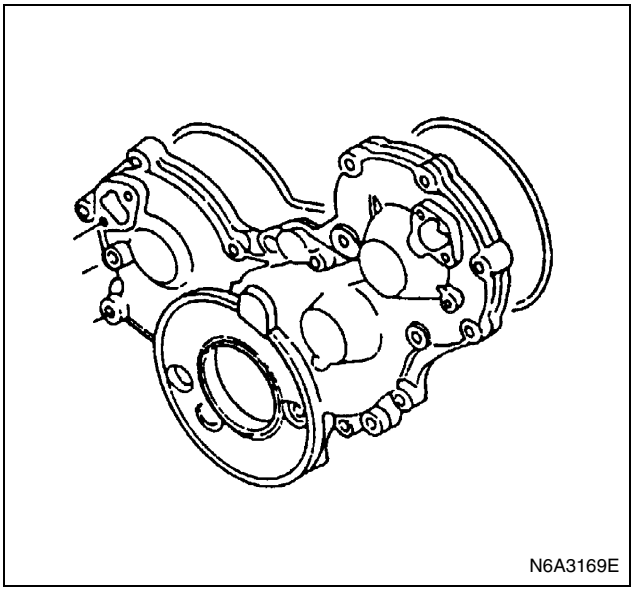
6. Oil Pipe
   1) Install the oil pipe to the timing gear case and idler gear “A”.
   2) Tighten the oil pipe eye bolt (1) and bolt (2) to the specified torque.

Tighten:
- Oil pipe eye bolt to 13 N·m (1.3 kg·m / 9 lb·ft)



N6A3168E

7. Timing Gear Case Cover
   1) Align the gear case with the timing gear case knock pin and then install the timing gear case cover.
   2) Tighten the gear case cover bolts to the specified torque.

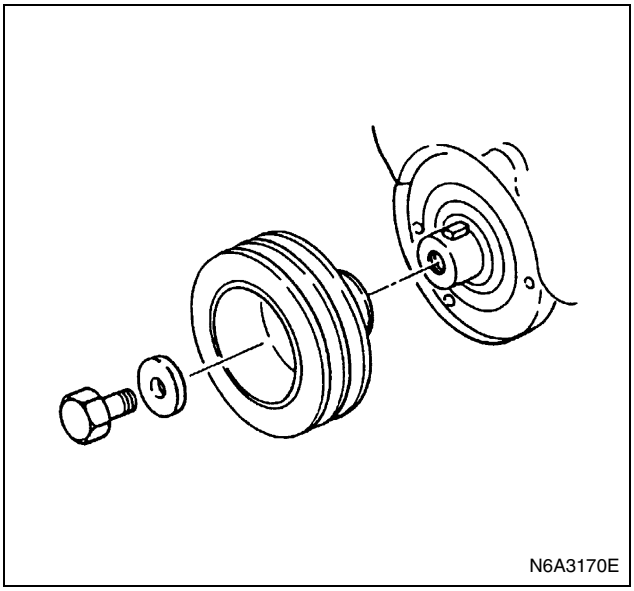


N6A3169E

8. Noise Cover Spacer
9. Noise Shield Cover
10. Crankshaft Damper Pulley
    Tighten the crankshaft damper pulley bolt to the specified torque.

Notice:
Hold the flywheel ring gear stationary to prevent the crankshaft from turning when tightening the damper pulley.

Tighten:
- Pulley boss bolt to 206 N·m (21 kg·m / 152 lb·ft)



N6A3170E

11. Cooling Fan Assembly
    - Mount fan pulley, distance piece, and cooling fan assembly (in this order) on the water pump, and tighten to the specified torque.

Tighten:
- 8 N·m (0.8 kg·m / 69 lb·in)

12. AC Generator Drive Belt
    - Install AC Generator drive belt and adjust belt tension.
    - Depress the drive belt mid-portion with a 98 N (10 kg / 22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

    - Tighten the idler lock nut to the specified torque.

Tighten:
- Idler lock nut to 27 N·m (2.8 kg·m / 20 lb·ft)

13. Power Steering Pump Drive Belt (P/S Model)
    - Install Power Steering pump drive belt and adjust belt tension.
    - Depress the drive belt mid-portion with a 98 N (10 kg / 22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

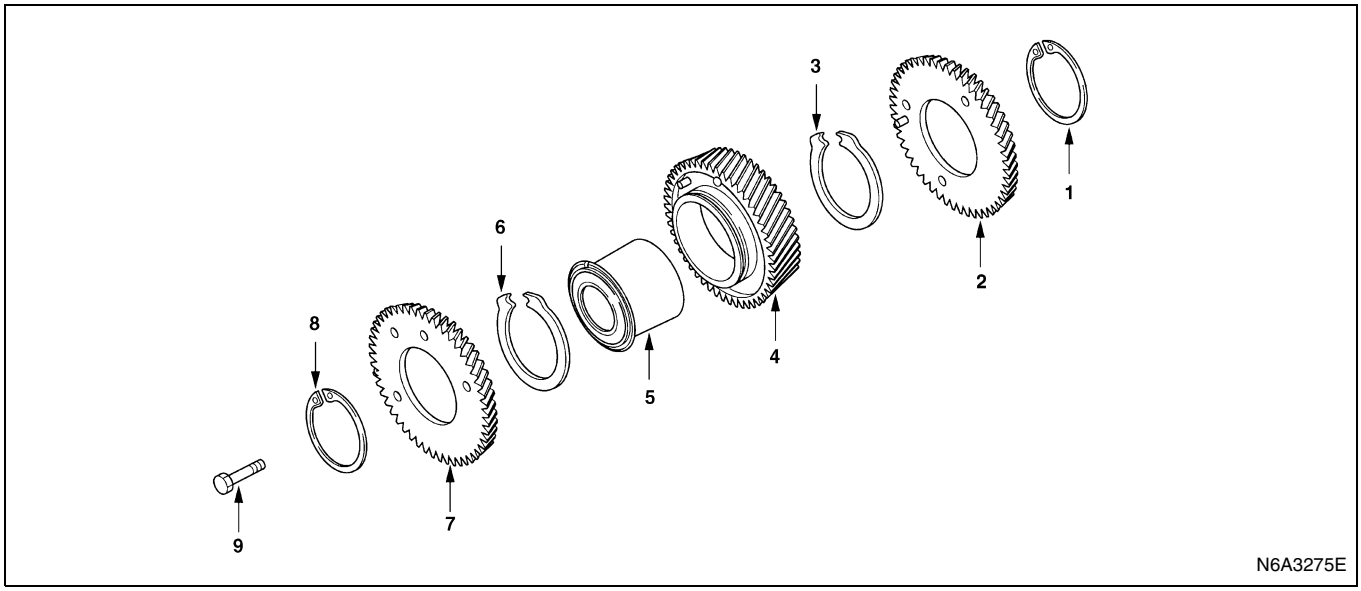
    - Tighten the idler lock nut to the specified torque.

Tighten:
- 27 N·m (2.8 kg·m / 20 lb·ft)

14. Fan shroud
    - Install the fan shroud and reservoir tank hose.
    - Pour coolant
    - Start the engine and check coolant leakage.

IDLE GEAR "B" (4JH1-TC SCISSOR GEAR)

Component

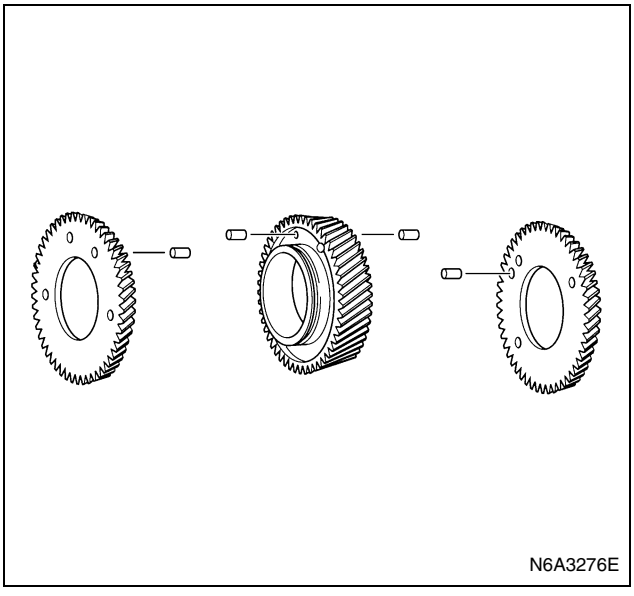


Legend

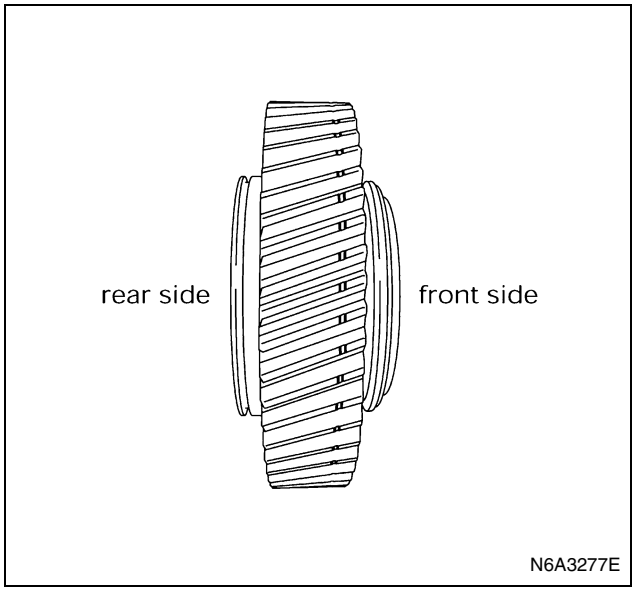
1. Snap ring
2. Rear gear
3. Spring
4. Main gear
5. Bearing
6. Spring
7. Front gear
8. Snap ring
9. Lock bolt

Reassembly

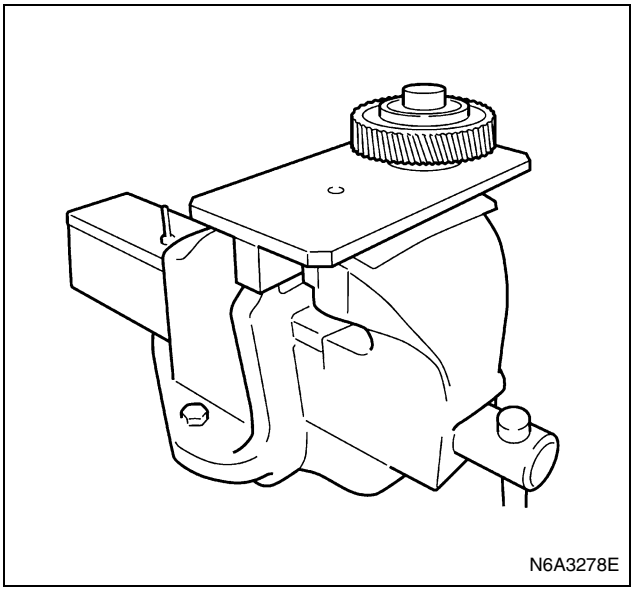
1. Drive pins into the main gear, the front gear, and the rear gear.



2. Apply pressure to the main gear bearing from the front side of the main gear (the side with the groove).

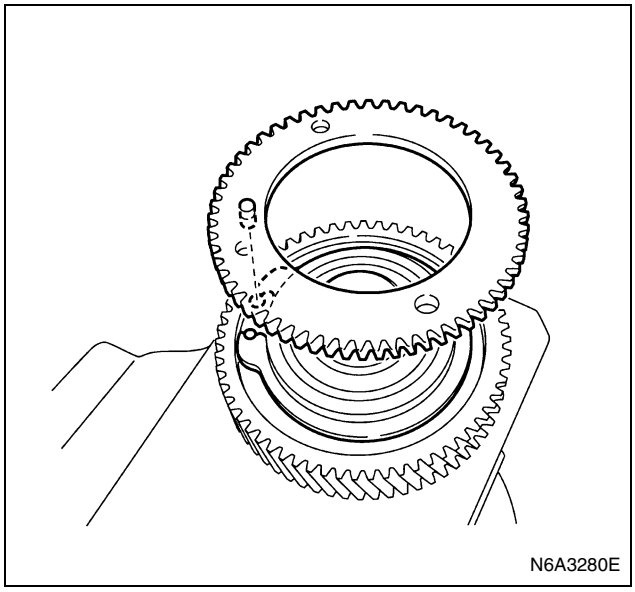


3. Place the special tool in a vise so that the main gear is pushed up toward the rear side.
   Scissor gear setting tool
   Base: 5-86739-149-0



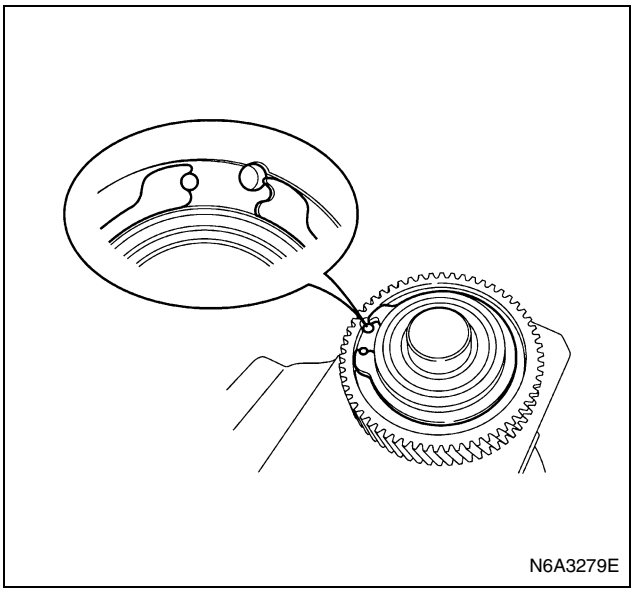
N6A3278E

4. Set the spring as shown in the illustration.



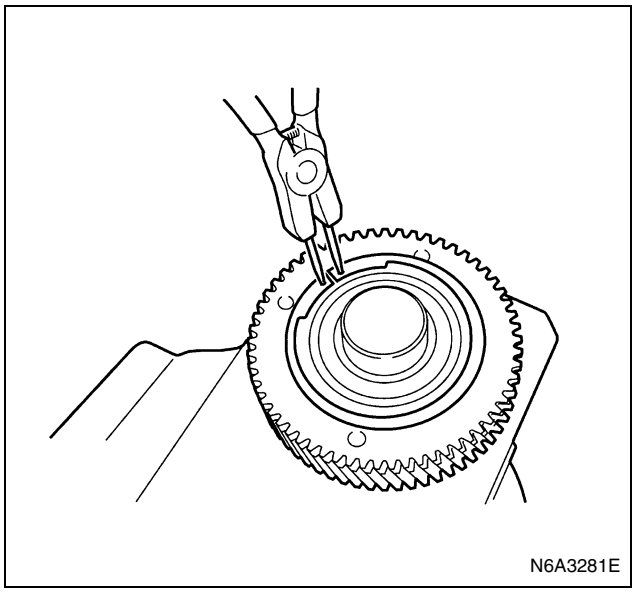
N6A3280E

6. Install the snap ring to the main gear groove.



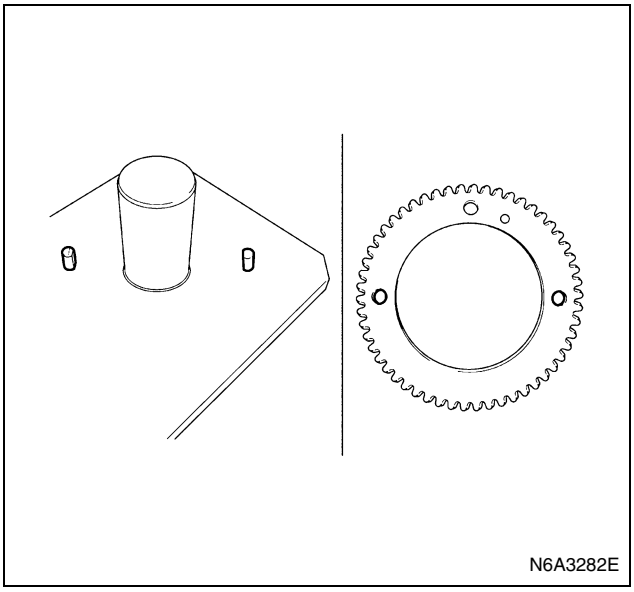
N6A3279E

5. Position the rear gear so that it pin is aligned with the receiving end of the spring.

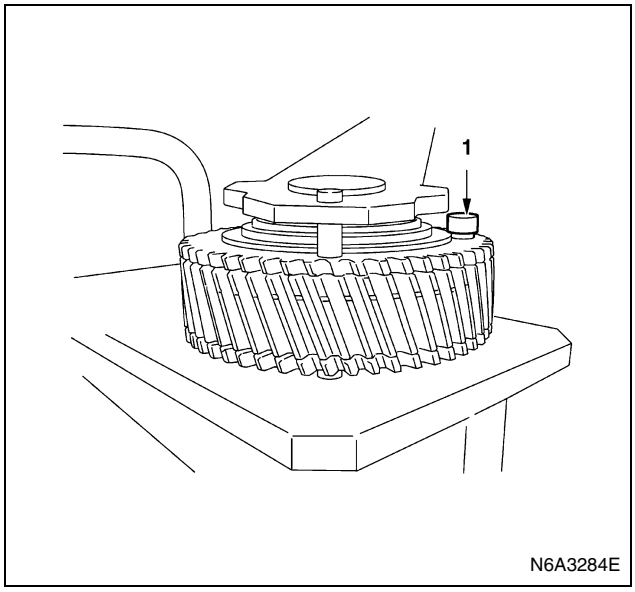


N6A3281E

7. Set the rear gear setting hole to the pin of the special tool.

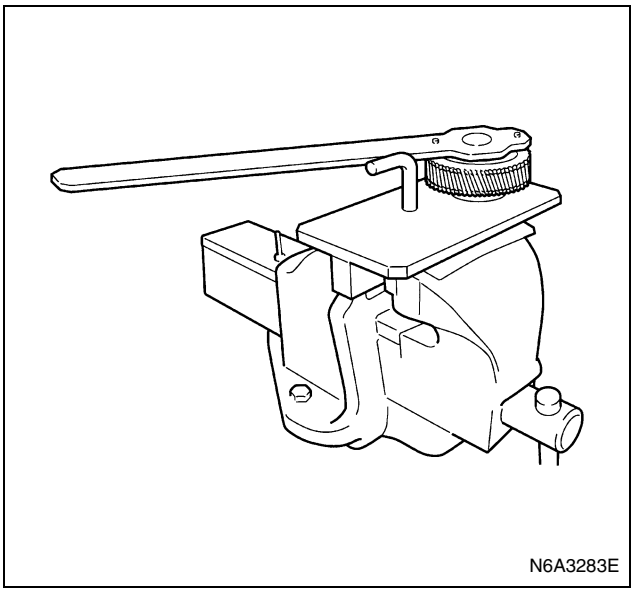


N6A3282E



N6A3284E

8. Place the special tool in a vise so that the main gear is pushed up toward the front side.
9. Repeat Steps 3, 4, and 5.
10. Use the special tool to mesh the teeth of the front gear, the main gear, and the rear gear.

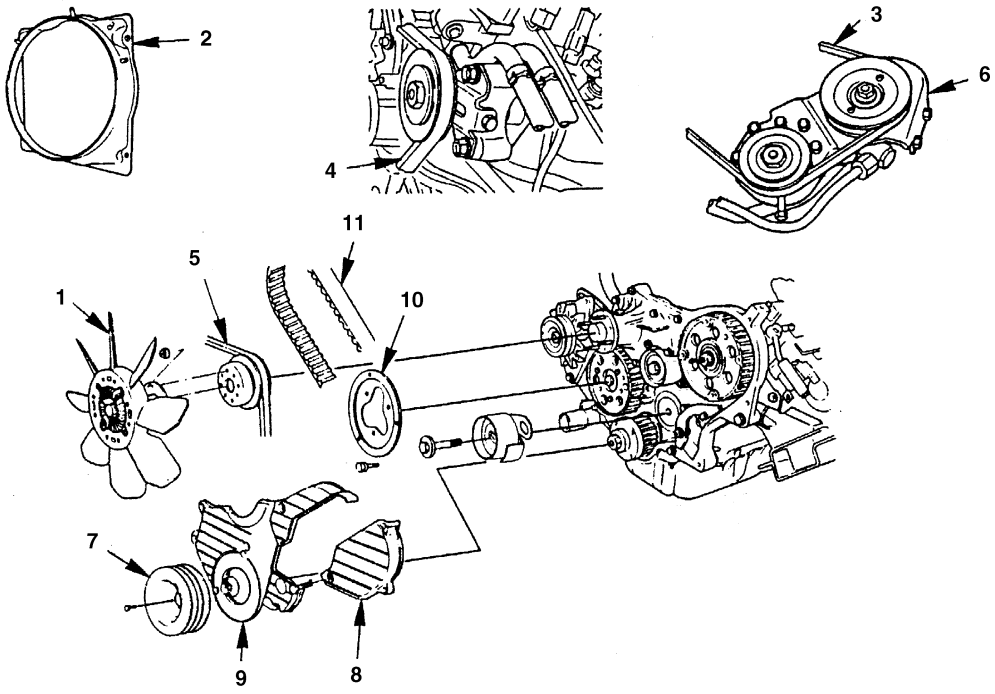


N6A3283E

11. Insert a lock bolt (M6 × 1.00 L = 30) (1) into the scissor gear fixing hole to prevent the scissor gear from turning.
    Scissor gear setting tool
    Lever: 5-86739-150-0

TIMING BELT (4JG2 Belt Type)

Component



Legend

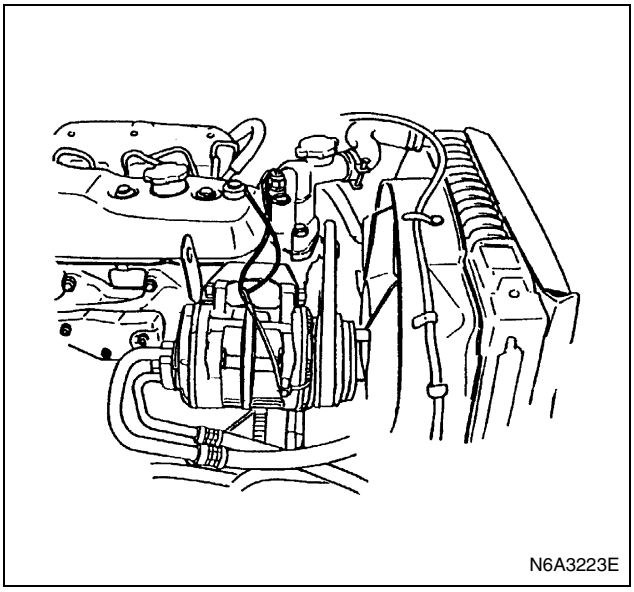
1. Cooling fan assembly
2. Fan shroud
3. Power steering pump drive belt
4. A/C compressor drive belt
5. AC Generator drive belt
6. Power steering pump bracket assembly
7. Crankshaft damper pulley
8. Timing pulley upper cover
9. Timing pulley lower cover
10. Flange; Camshaft pulley
11. Timing belt

Removal

Preparation

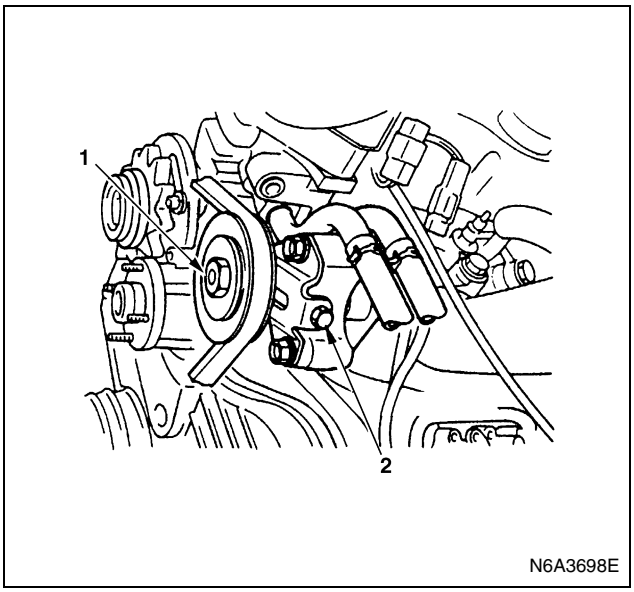
- Disconnect battery ground cable.
- Drain coolant.

1. Cooling Fan Assembly
   - Remove clamp nut, and remove cooling fan asm, distant pipe, and fan pulley.
2. Fan Shroud
   - Removal reservoir tank hose and fan shroud.



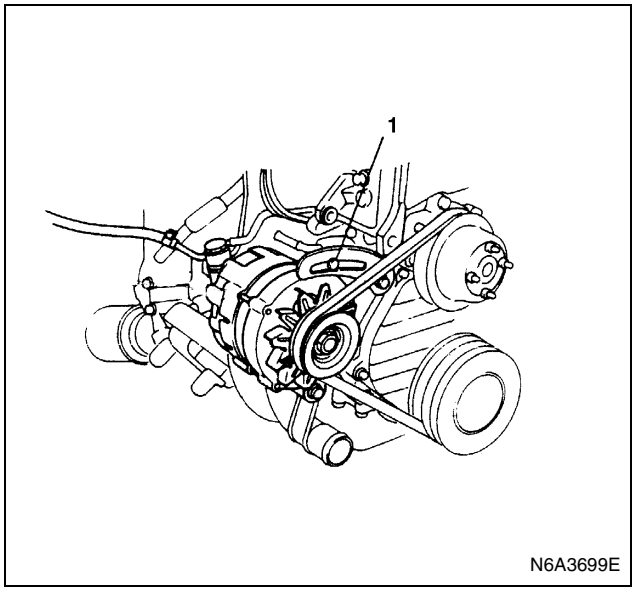
N6A3223E

3. Power Steering Pump Drive Belt (P/S Model)
   - Loosen power steering pump idle pulley lock nut and adjust bolt, and remove the drive belt.



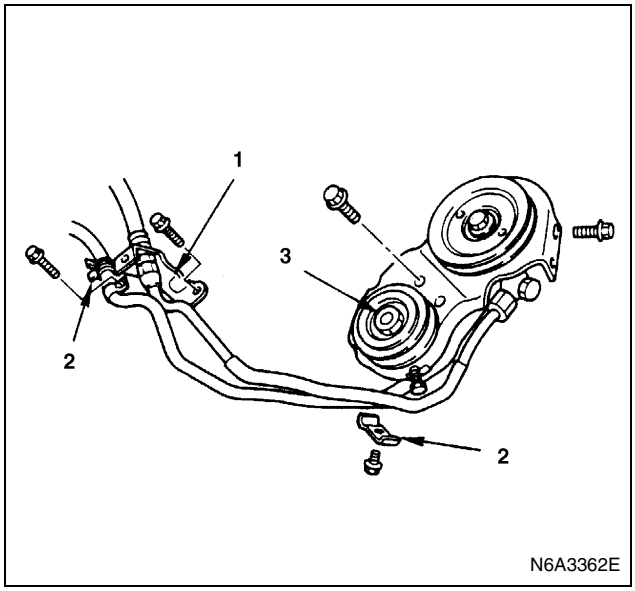
N6A3698E

4. A/C Compressor Drive Belt (A/C Model)
   - Loosen A/C compressor idle pulley lock nut (1) and adjust bolt (2), and remove the drive belt.
5. AC Generator Drive Belt
   - Loosen AC Generator mounting bolt (under side) and adjust plate lock bolt (1), and remove the drive belt.



N6A3699E

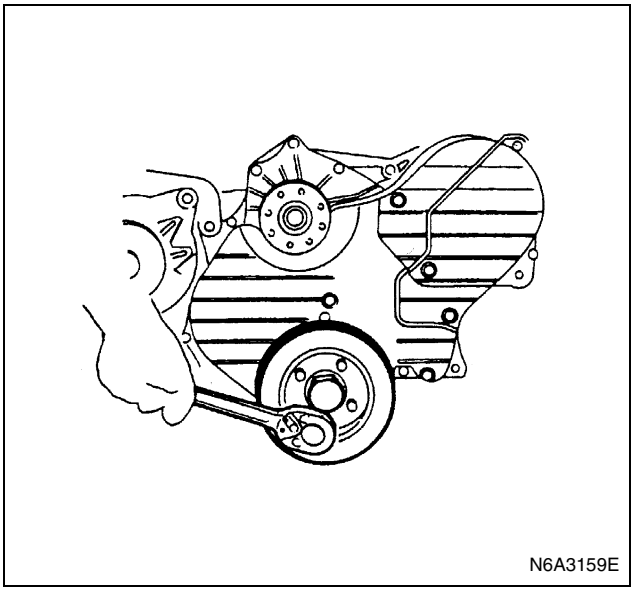
6. Power Steering Pump Bracket Assembly (P/S Model)
   - Loosen power steering oil pipe bracket (1) and clip (2).
   - Remove power steering pump bracket assembly and hang the power steering pump bracket assembly.



N6A3362E

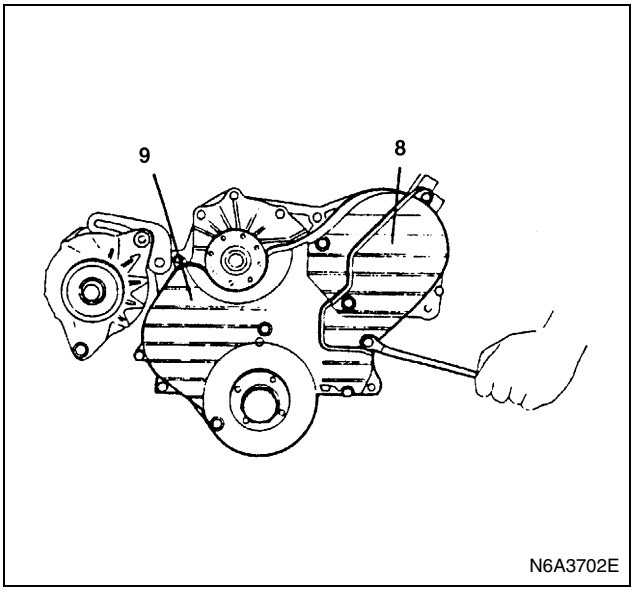
Legend
1. Pipe bracket
2. Clip
3. Lock nut

7. Crankshaft Damper Pulley



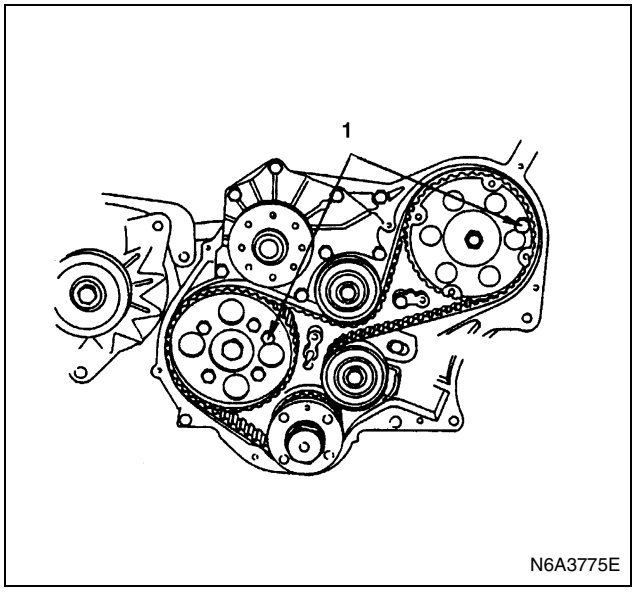
N6A3159E

8. Timing Pulley Upper Cover
9. Timing Pulley Lower Cover



N6A3702E

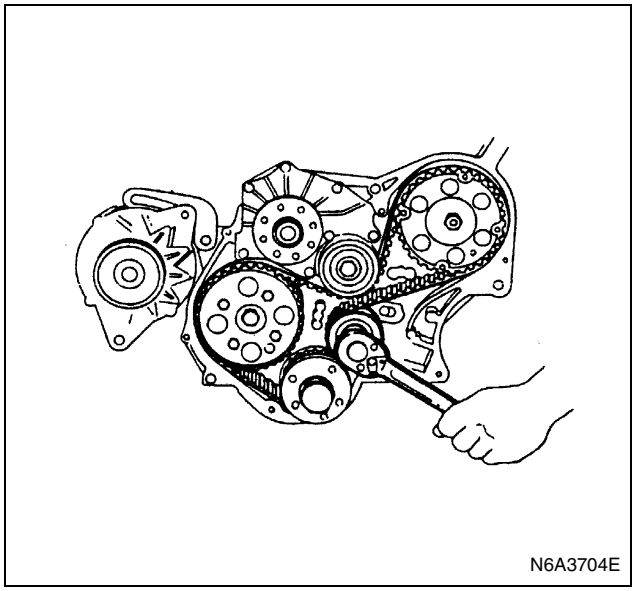
10. Flange; Camshaft Pulley
11. Timing Belt
    - Prepare a fixing bolt (M8 × 40, P = 1.25)
    - Turn crankshaft timing pulley in the normal direction pulley side mark to timing pulley housing side mark.
    - Make sure that the camshaft pulley and injection timing pulley fixing bolt holes are set to each other. Then fit in a fixing bolt (1) and lightly tighten.



N6A3775E

- No.1 cylinder should be at top dead center. If the fixing bolt holes are not set (No.4 cylinder is at top dead center) give another turn.
- Remove tensioner and timing belt.

WARNING:
IF CRANKSHAFT AND CAMSHAFT AND TURNED WITH TIMING BELT BEING NOT MOUNTED, PISTON AND VALVE WILL INTERFERE WITH EACH OTHER. THEREFORE, THE SHAFTS MUST NOT BE TURNED.

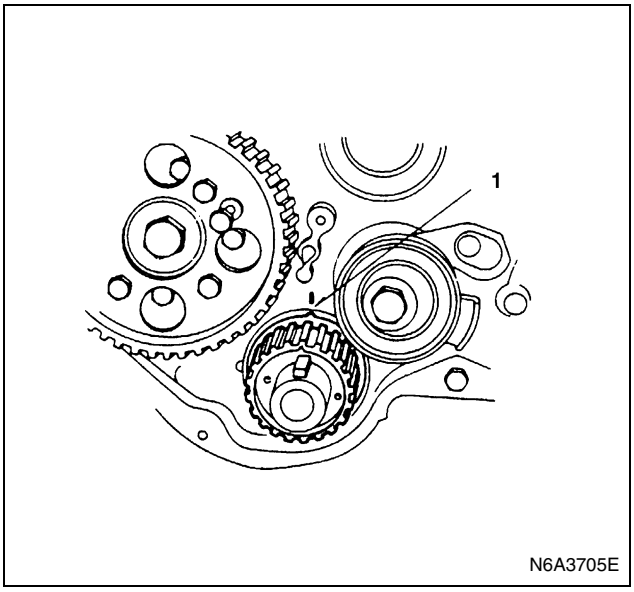


N6A3704E

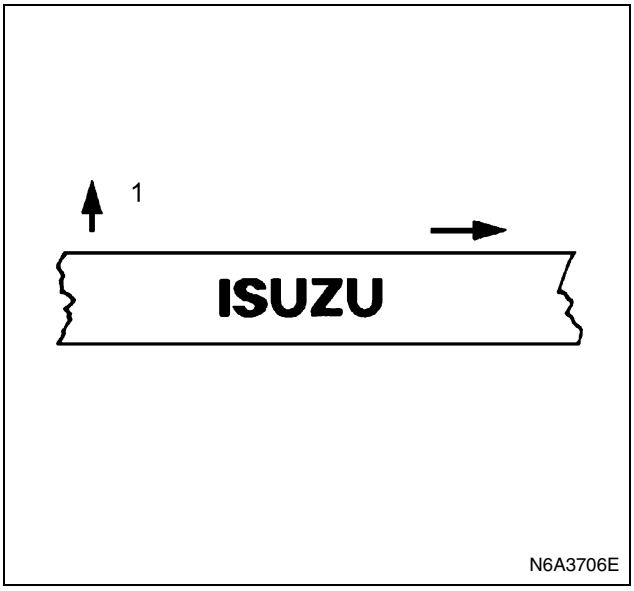
Installation

1. Timing Belt
   - When removing the belt, make sure the marks on the bolt fixed camshaft, injection pulley and crankshaft timing pulley are set to each other (1).

Caution:
Do not turn crankshaft because otherwise piston and valve will interfere with each other.

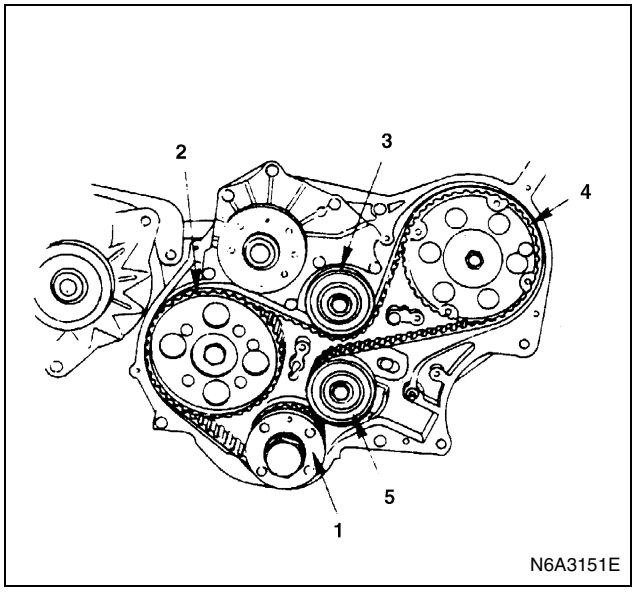


Caution:
For accurate mounting, be sure to mount the belt in the direction that letters on the belt are readable.



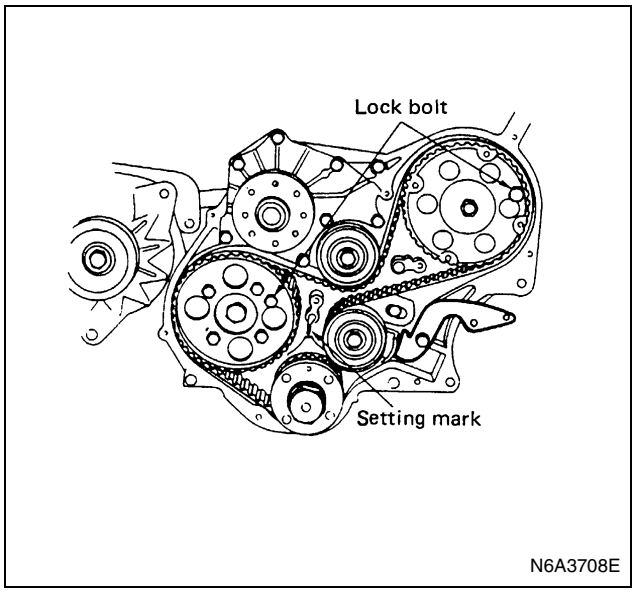
Legend
1. Cylinder head side

- Mount new timing belt on pulleys in the following steps.
  Crankshaft timing pulley (1) → Camshaft Timing pulley (2) → Idle pulley (3) → Injection Pump pulley (4) → tensioner (5)



- Set the belt on crankshaft timing pulley and hold with one hand.
- Stretch and pass the belt round each pulley with the other hand.
- After passing it round injection pump pulley, install tensioner while taking care not to slacken the belt.

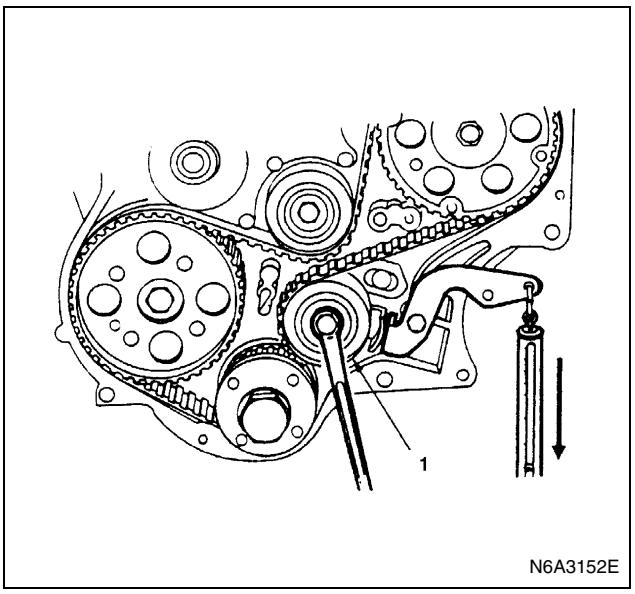
Caution:
- On completion of belt passing, make sure that the setting mark on crankshaft timing pulley is set.
- If not set, reset the mark and repeat the belt passing.



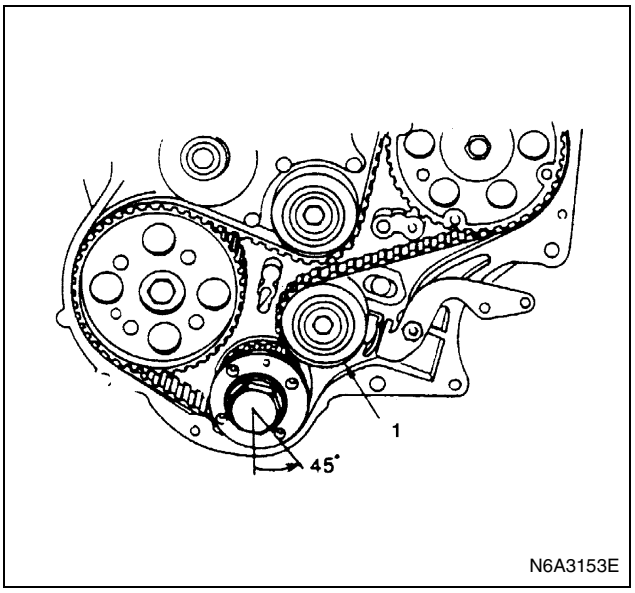
Legend
1. Lock bolt
2. Setting mark

- Remove tension adjust, lever mounting bolt, and loosen the fulcrum bolt to such extent that the lever is movable.

- Hung a spring balance from the end hole of tension adjust lever, and with the balance pulled down with 9 kg., loosen once the tensioner (1) mounting bolt and there retighten it.



- Turn the crankshaft by 45° counterclockwise to shift belt slackness on to the tensioner (1).

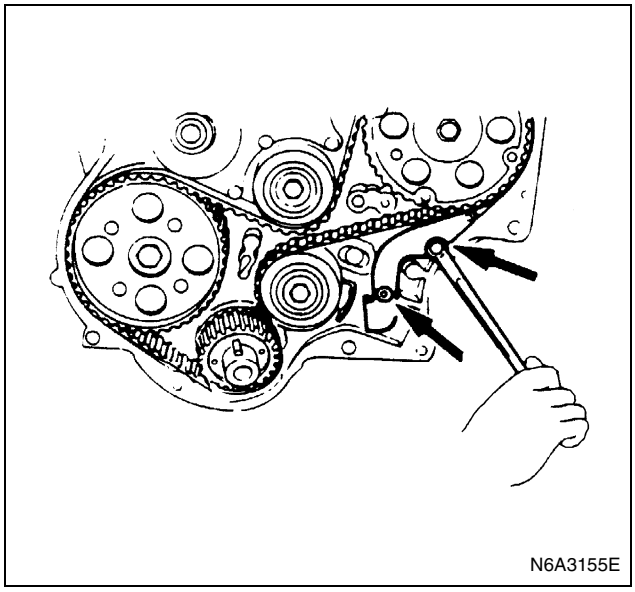


- Again hang the spring balance from the end hole of tension adjust lever and pull it down with the specified force. Under this condition, loosen tensioner mounting bolt to absorb belt slackness and retighten is to specified torque.

Belt	N·(kg/lb)
Tension	98 — 118 (10 — 12/22 — 26)

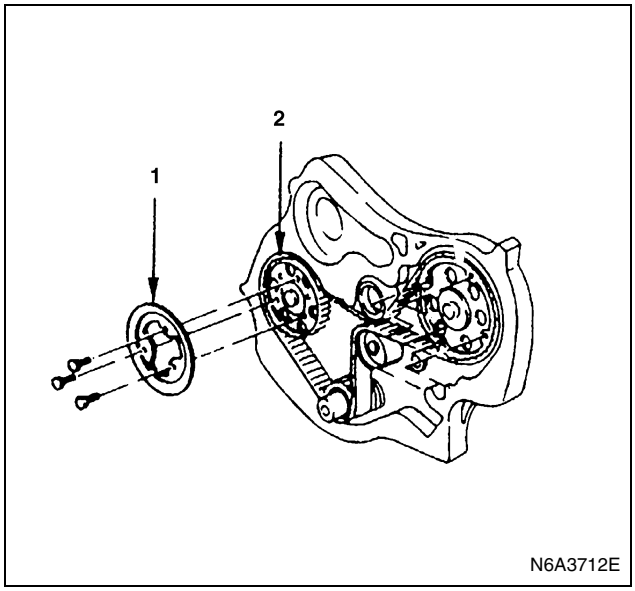
Tighten:
- Bolt to 76 N·m (7.8 kg·m / 56 lb·ft)
  - Fix the tension adjust lever.

Caution:
- In case where the timing belt has been replaced with the actuation of warning light, put off the light with change over switch on the reverse side of meter.
- Refer to Chassis Electrical in Section 8.
- Tighten the tension adjusting lever nut and bolt.



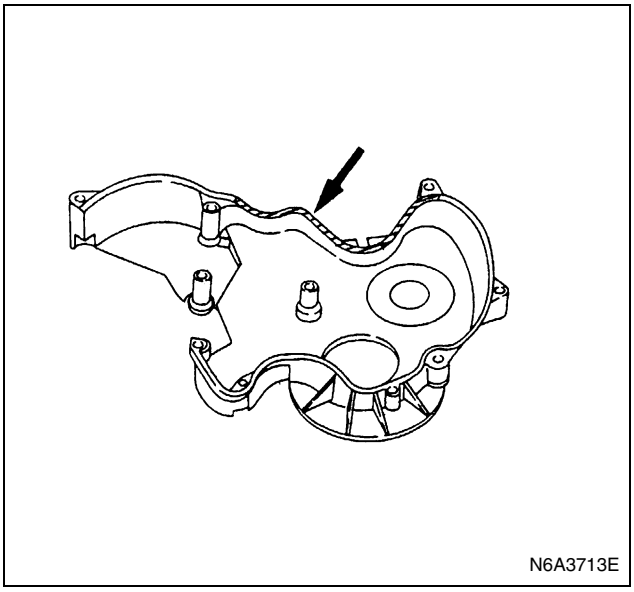
2. Flange; Camshaft Pulley
   - Install the timing pulley flange (1) to the camshaft timing pulley (2).

Tighten:
- Flange bolts to 19 N·m (1.9 kg·m / 14 lb·ft)



3. Timing Pulley Lower Cover
   - Install timing pulley lower cover and tighten bolt to the specified torque.

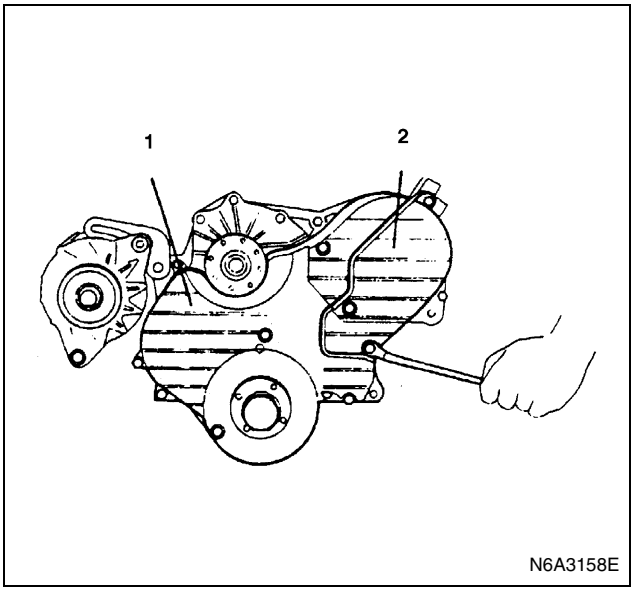
Tighten:
- Cover bolts to 8 N·m (0.8 kg·m / 69 lb·in)



N6A3713E

4. Timing Pulley Upper Cover
   - Install timing pulley upper cover and tighten bolt to the specified torque.

Tighten:
- Cover bolts to 8 N·m (0.8 kg·m / 69 lb·in)

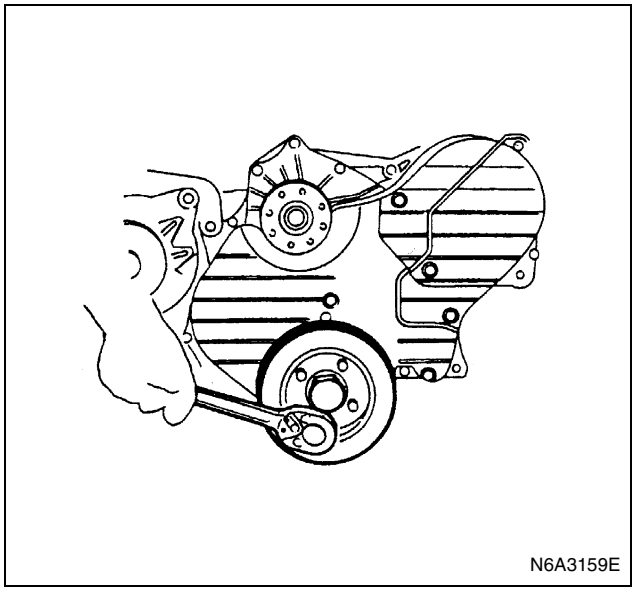


N6A3158E

Legend
1. Lower cover
2. Upper cover

5. Crankshaft Damper Pulley
   - Install crankshaft damper pulley and tighten bolt to the specified torque.

Tighten:
- 19 N·m (1.9 kg·m / 14 lb·ft)

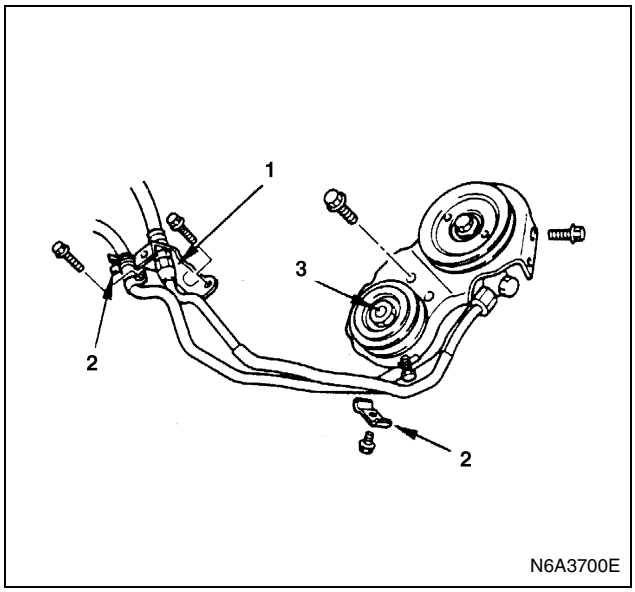


N6A3159E

6. Power Steering Pump Bracket Assembly (P/S Model)
   - Install the pipe bracket & clip and tighten bolts to the specified torque.

Tighten:
- Pipe bracket bolts to 19 N·m (1.9 kg·m / 14 lb·ft)
- Pipe clip bolts to 10 N·m (1.0 kg·m / 87 lb·in)
   - Install the P/S pump & bracket assembly.

Tighten:
- M10 bolts to 40 N·m (4.1 kg·m / 30 lb·ft)
- M8 bolts to 19 N·m (1.9 kg·m / 14 lb·ft)
- Lock nut to 27 N·m (2.8 kg·m / 20 lb·ft)



N6A3700E

Legend
1. Pipe bracket
2. Clip
3. Lock nut

7. AC Generator Drive Belt
   - Install AC Generator drive belt and adjust belt tension.
   - Depress the drive belt mid-portion with a 98 N (10 kg / 22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12(0.47)	

   - Install fixing bolt and tighten bolts to the specified torque.

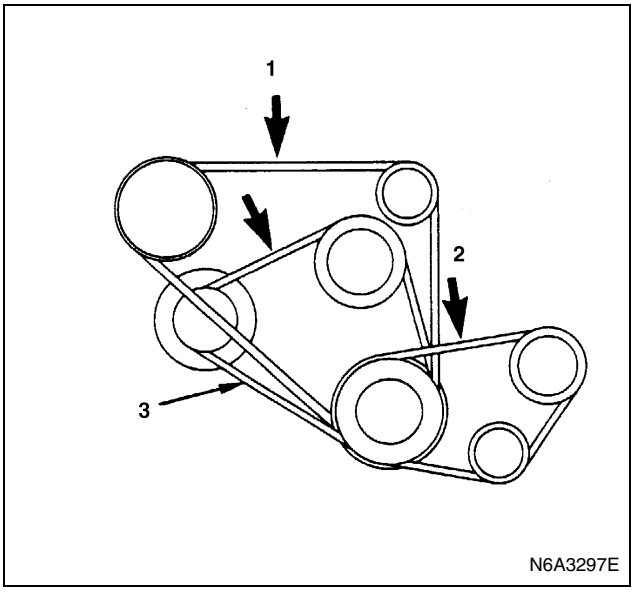
Tighten:
- Generator fixing bolts to 40 N·m (4.1 kg·m / 30 lb·ft)
- Adjust plate fixing bolts to 19 N·m (1.9 kg·m / 14 lb·ft)

8. A/C Compressor Drive Belt (A/C type)
   - Install A/C compressor drive belt and adjust belt tension.
   - Depress the drive belt mid-portion with a 98 N (10 kg / 22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12(0.47)	

   - Tighten the idler lock nut to the specified torque.

Tighten:
- Idler lock nut to 27 N·m (2.8 kg·m / 20 lb·ft)



Legend
1. A/C compressor drive belt
2. P/S pump drive belt
3. AC generator fan pulley

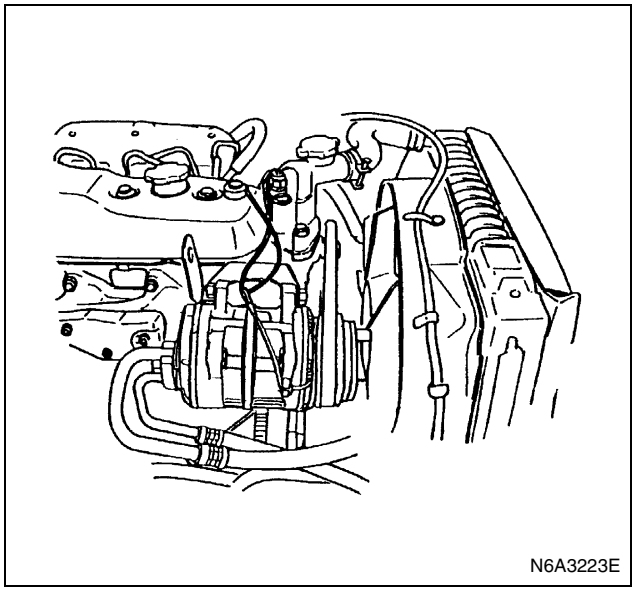
9. Power Steering Pump Drive Belt (P/S pump model)
   - Install PS pump drive belt and adjust belt tension.
   - Depress the drive belt mid-portion with a 98 N (10 kg / 22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12(0.47)	

   - Tighten the idler lock nut to the specified torque.

Tighten:
- Idler lock nut to 27 N·m (2.8 kg·m / 20 lb·ft)

10. Fan Shroud
    - Install the fan shroud and reservoir tank hose.



11. Cooling Fan Assembly
    - Mount fan pulley, distance piece, and cooling fan asm (in this order) on the water pump, and tighten to the specified torque.

Tighten:
- Nut to 8 N·m (0.8 kg·m / 69 lb·in)

   - Connect battery ground cable.
   - Pour coolant.
   - Start the engine and check coolant leakage.

CYLINDER HEAD ASSEMBLY AND GASKET

15. By-pass hose
16. Cylinder head cover
17. Rocker arm shaft
18. Push rod
19. Cylinder head assembly
20. Cylinder head gasket

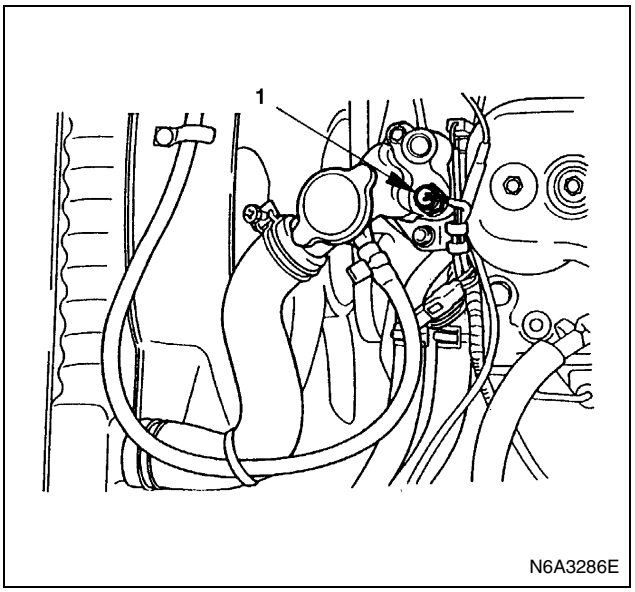
Removal

Preparation

- Disconnect battery ground cable.
- Drain coolant from the radiator and engine.

1. Radiator Hose Upper
   - Disconnect upper radiator hose from engine side.

2. Heater Hose
   - Disconnect heater hose from heater pipe.
3. A/C Compressor Drive Belt
   - Loosen idler lock nut.
   - Loosen adjust bolt and remove drive belt.
4. Engine Harness
   - Disconnect harness connectors from units on thermostat housing.

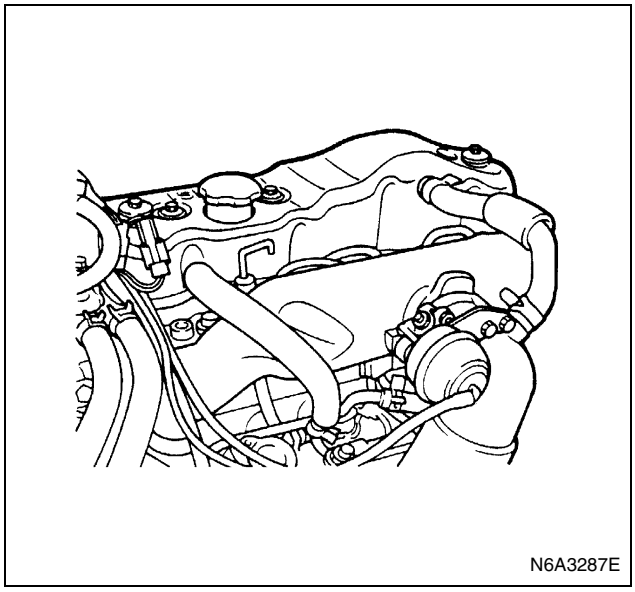


Legend
1. Thermo-sensor

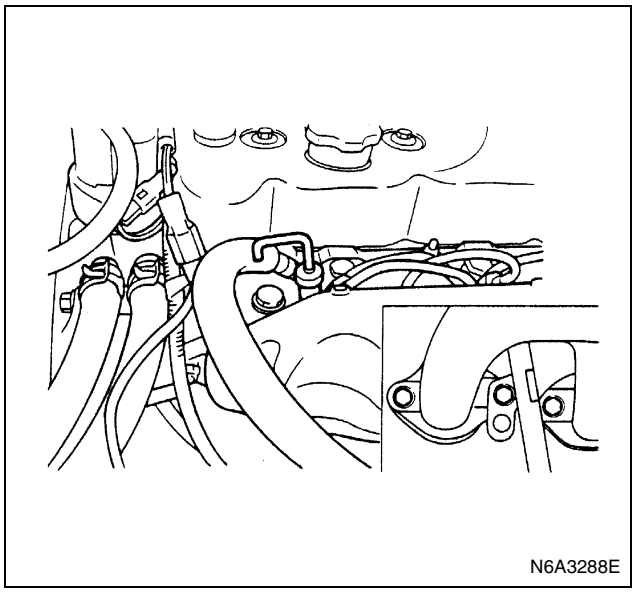
5. Air Intake Duct
   - Remove the clip and air intake duct.
6. Injection Pipe
   - Release injection pipe clip.
   - Remove flare nut injection pump side.
   - Remove flare nut injection nozzle side and remove injection pipe.

Notice:
Plug the injection nozzle holder and the delivery holder to prevent the entry of foreign matters into them.

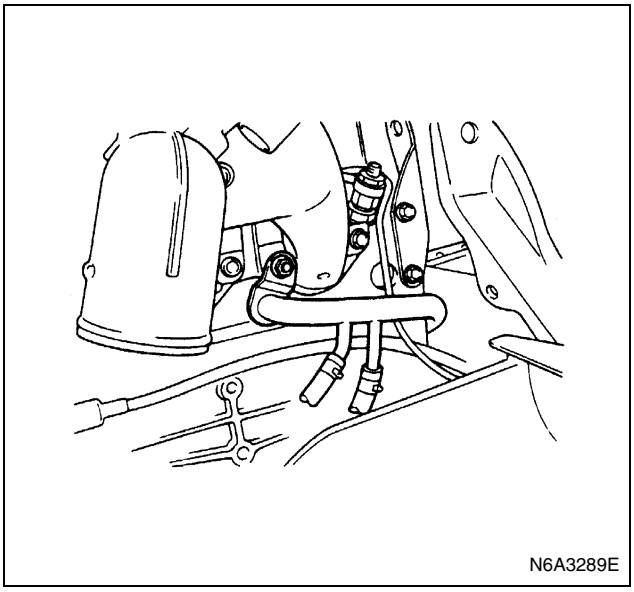
7. Leak Off Pipe
   - Remove the leak off pipe side of leak off hose.
8. PCV Hose
   - Remove the PCV hose from air intake pipe.



9. Glow Plug Harness
10. Oil Level Gauge Guide Tube
    - Remove the guide tube from cylinder head.

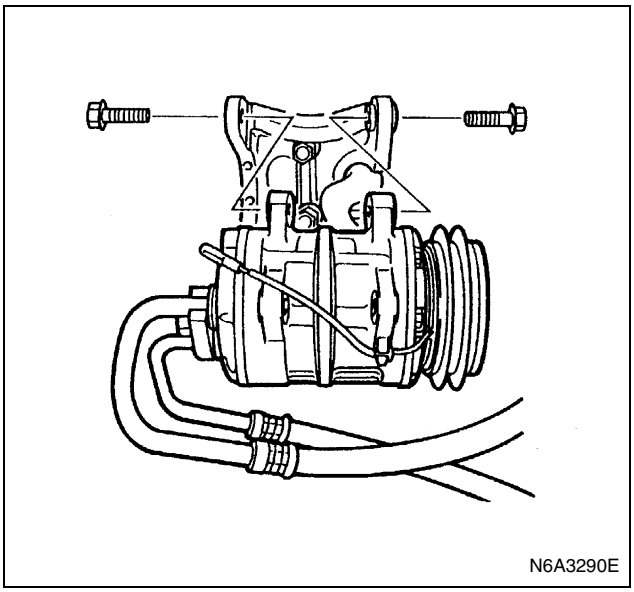


11. Oil Cooler Water Pipe (Oil Cooler Model)
    - Remove the pipe fixing bolt of cylinder head rear side.
    - Remove the oil cooler water pipe fixing nut from inlet manifold.



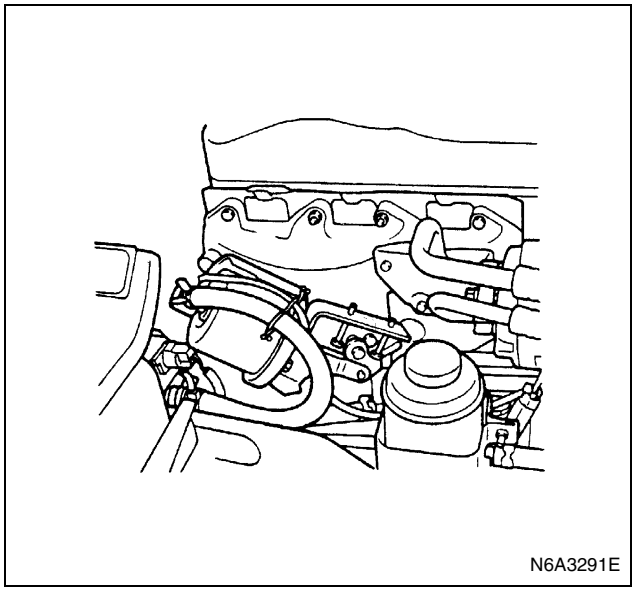
N6A3289E

12. A/C Compressor Assembly (A/C Model)
    - Remove the clutch harness connector.
    - Remove the A/C compressor fixing bolts and temporally tighten the A/C compressor to chassis frame side use the wire.



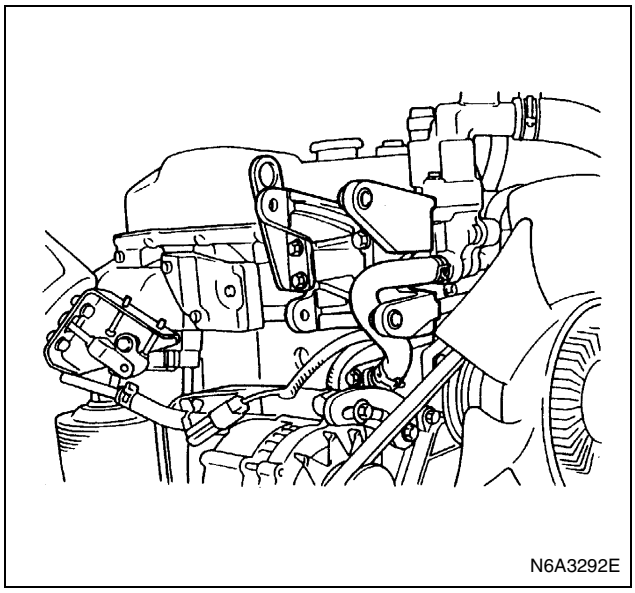
N6A3290E

13. Vacuum Actuator Hose (Exhaust Brake Model)
    - Remove the vacuum hoses from vacuum actuator.



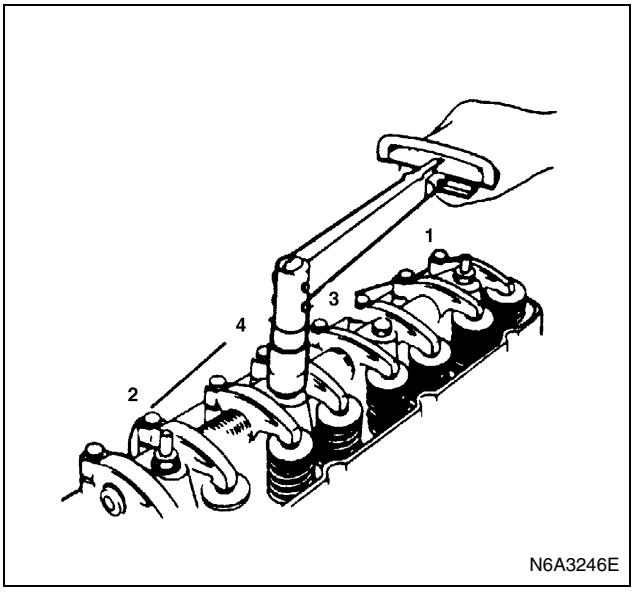
N6A3291E

14. Front Exhaust Pipe
    - Remove the exhaust pipe fixing bolts from exhaust manifold.
    - Remove the exhaust pipe stay bolt.
15. By-pass Hose
16. Cylinder Head Cover



N6A3292E

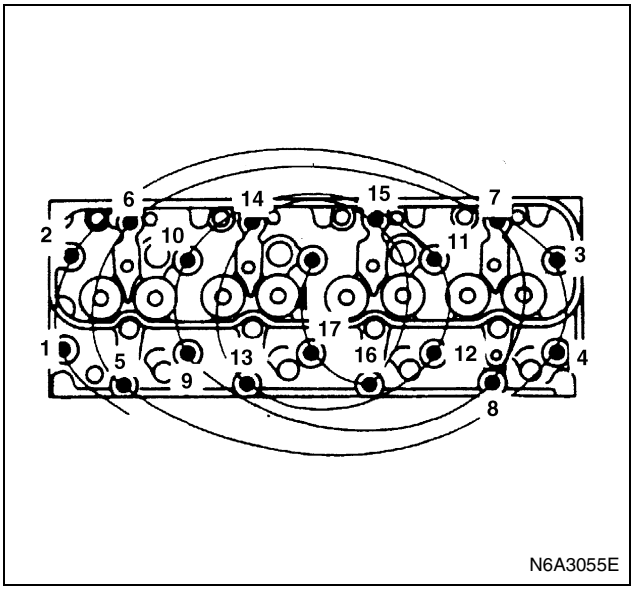
17. Rocker Arm Shaft
    - Loosen the rocker arm shaft bracket bolts a little at a time in the numerical order shown in the illustration.



N6A3246E

Notice:
Failure to loosen the rocker arm shaft bracket bolts a little at a time in numerical order will adversely effect the rocker arm shaft.

18. Push Rod
19. Cylinder Head Assembly
    - Loosen the cylinder head bolts a little at a time in the numerical order shown in the illustration.



N6A3055E

Notice:
Failure to loosen the cylinder head bolts a little at a time in numerical order will adversely effect the cylinder head lower surface.

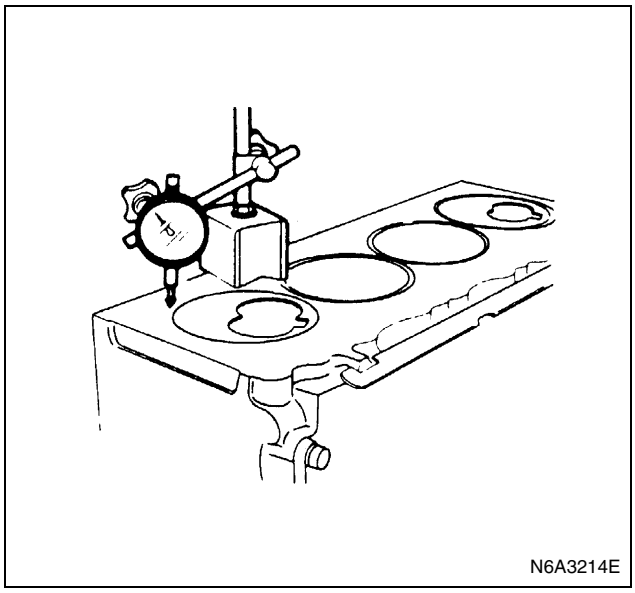
20. Cylinder Head gasket
    - Remove the cylinder head gasket and dowel.

Installation

1. Cylinder Head Gasket
   Cylinder head gasket is determined by the piston head projection from the cylinder body upper surface, in order to improve engine performance.
   Three types of gasket are provided by the difference of thickness. Select the adequate one out of three grades of gasket, according to the following procedure.
   Before measurement, clear off carbon from the piston head and cylinder body surface and also clean the place where a gasket was installed.

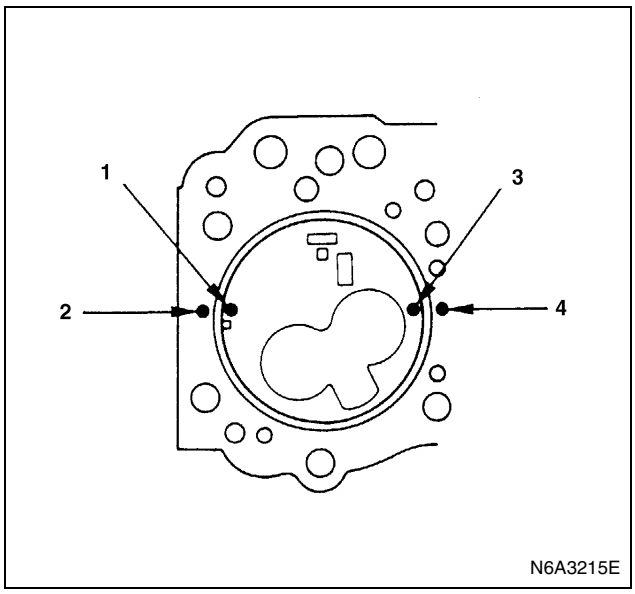
Piston Head Projection Measurement Point

1) Use a dial indicator to measure the piston projection amount.



N6A3214E

2) Refer to the illustration for the piston head projection measuring positions.
   All measuring positions should be as close as possible to the cylinder liner.



N6A3215E

3) Measure the points (1), (2), (3) and (4) and obtain two differences (1) — (2) and (3) — (4) on each cylinder.
   Calculate the average value of the piston head projection on each cylinder.
4) Obtain the maximum value in the four cylinders.
5) Determine the gasket grade required to the maximum value described above in accordance with the following table.

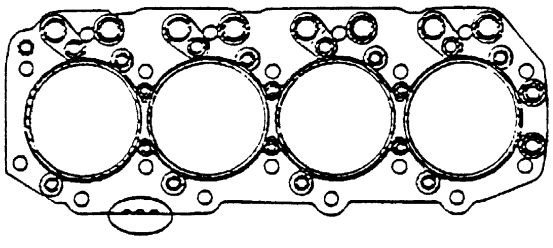
4JB1

mm (in)

1		2	3
A		0.758 - 0.813 (0.030 - 0.032)	1.60 (0.0630)
B		0.813 - 0.859 (0.032 - 0.034)	1.65 (0.0650)
C		0.859 - 0.914 (0.034 - 0.036)	1.70 (0.0670)

N6A3690E

Notice:
The difference between the highest measured piston head projection and the lowest measured piston head projection must not exceed 1.0 mm (0.039 in).



N6A3216E

4JG2

mm (in)

1		2	3
A		0. 658-0.713 (0.0259-0.0281)	1.60 (0.0630)

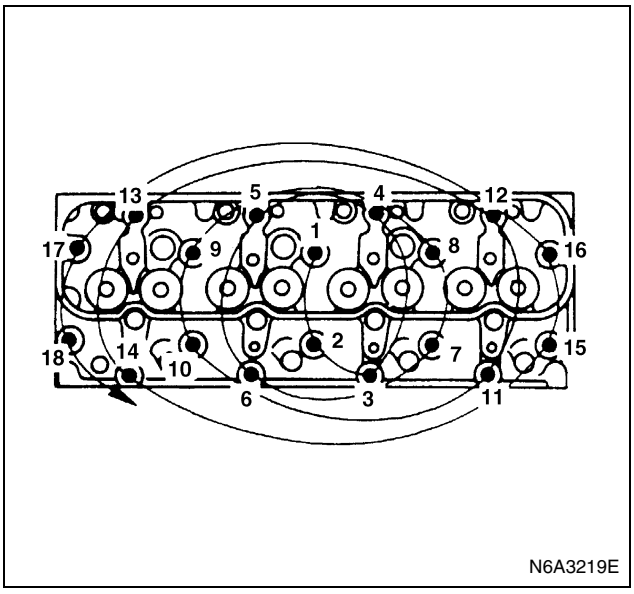
N6A3218E

Legend
1. Grade mark

---

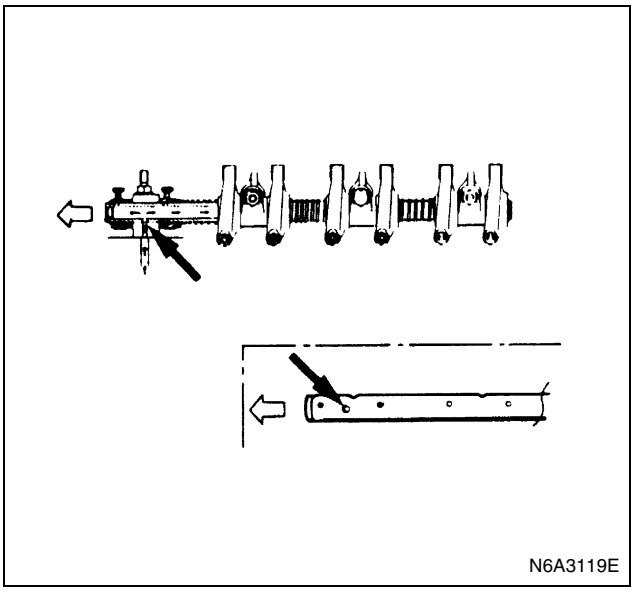
2. Cylinder Head Assembly
   1) Install the dowel in cylinder block.
   2) Install the cylinder head gasket with top mark up.
   3) Clean up cylinder head lower surface and cylinder body upper surface.
   4) Install the cylinder head as softly.
   5) Apply engine oil to screw and seat of cylinder head bolts.
   6) Tighten the cylinder head bolts to the specified torque in three steps following the numerical order shown in the illustration.

Tighten:
Cylinder head bolts to
- 1st step: 49 N·m (5kg·m / 36 lb·ft)
- 2nd step: 60° — 75°
- 3rd step: 60° — 75°



N6A3219E

3. Push Rod
   - Apply engine oil to push rod and in to the cylinder head.
4. Rocker Arm shaft
   1) Loosen all adjusting screws.
   2) Position the rocker arm shaft with the large oil hole (4ϕ) facing the front of the engine.

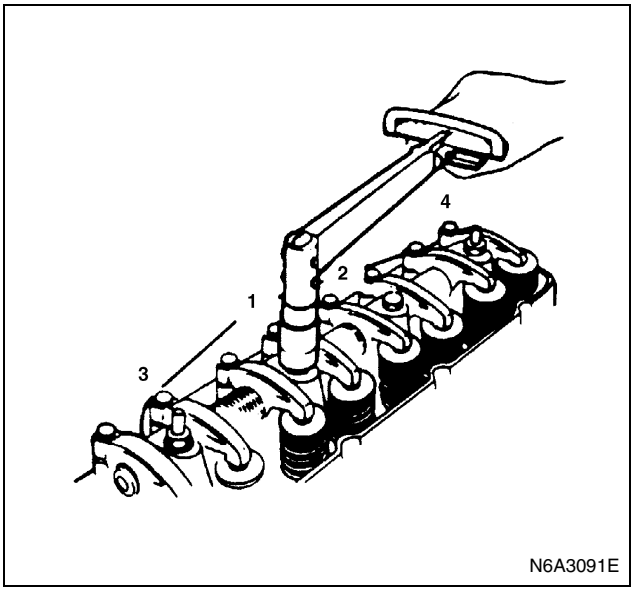


N6A3119E

   3) Tighten the rocker arm shaft bracket bolts to the specified torque in the numerical order shown in the illustration.

Tighten:

- Rocker arm shaft bracket bolt to 54 N·m (5.5kg·m / 40 lb·ft)

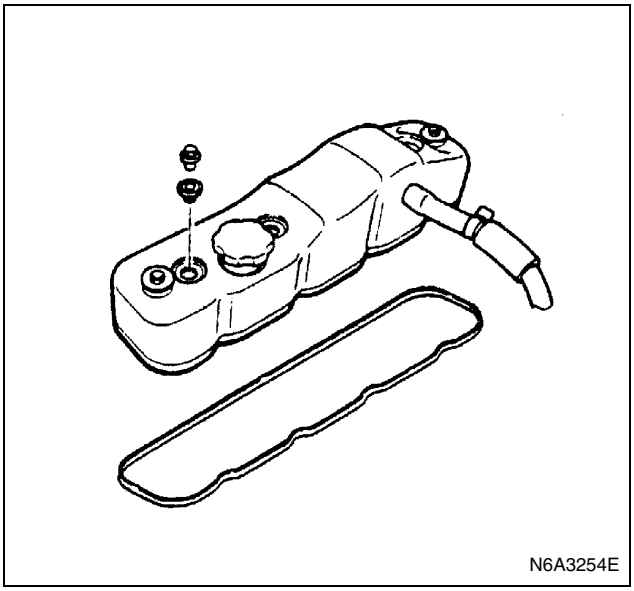


- Valve clearance adjustment.
  Above works refer to "ROCKER ARM SHAFT ASSEMBLY" Section in this manual.

5. Cylinder Head Cover
   - Apply engine oil to the rocker arms and the valve spring.
   - Install the cylinder head cover gasket to the cylinder head cover.
   - The gasket must be perfectly smooth with no loose areas.
   - Tighten the cylinder head cover nuts to the specified torque in the numerical order shown in the illustration.

Tighten:

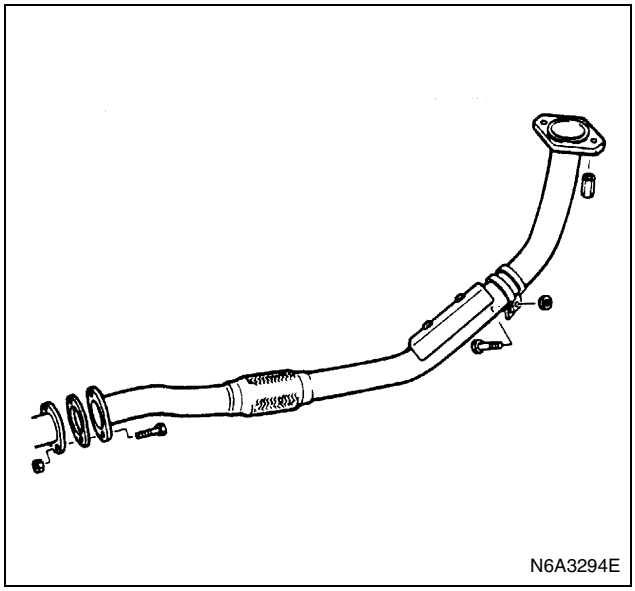
- Cylinder head cover to 13 N·m (1.3kg·m / 113 lb·in)



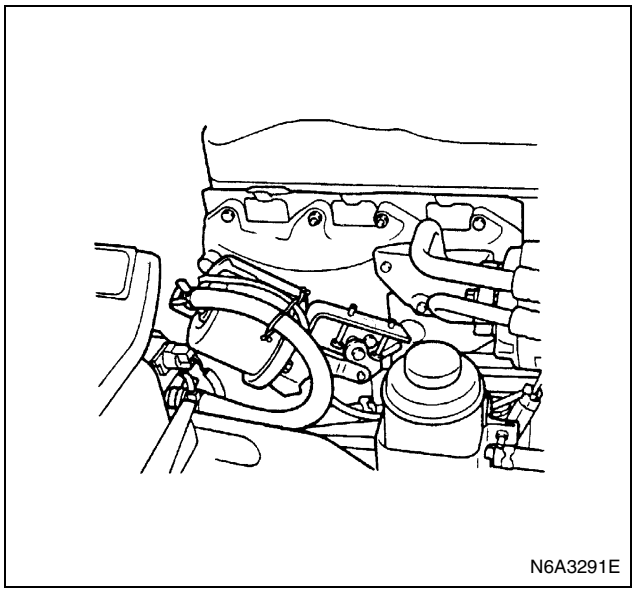
6. By-Pass Hose
7. Front Exhaust Pipe
   - Install the pipe to manifold and tighten bolts and nuts to the specified torque.

Tighten:

- W/Exhaust brake manifold nut to 37 N·m (3.8 kg·m / 27 lb·ft)
- WO/Exhaust brake manifold nut to 40 N·m (4.1 kg·m / 30 lb·ft)
- Pipe stay bolts to 40 N·m (4.1kg·m / 30 lb·ft)



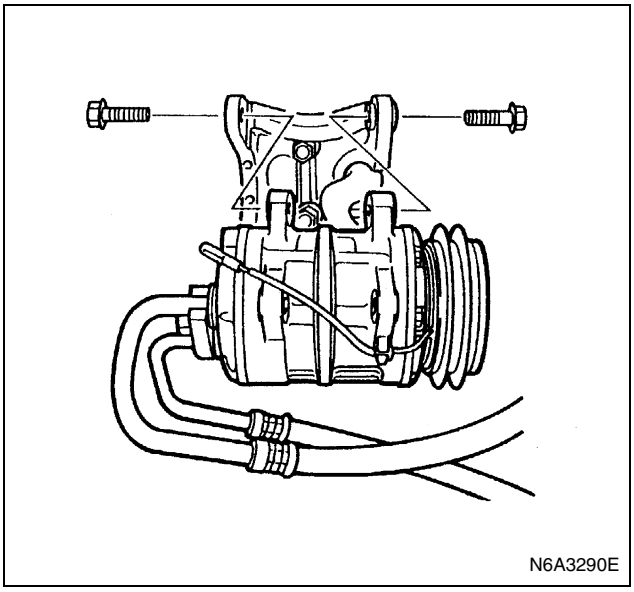
8. Vacuum Actuator Hose (Exhaust Brake Model)
   - Install the vacuum hose to the vacuum actuator.



9. A/C Compressor Assembly (A/C Model)
   - Install the A/C compressor fixing bolts and tighten bolts to the specified torque.

Tighten:

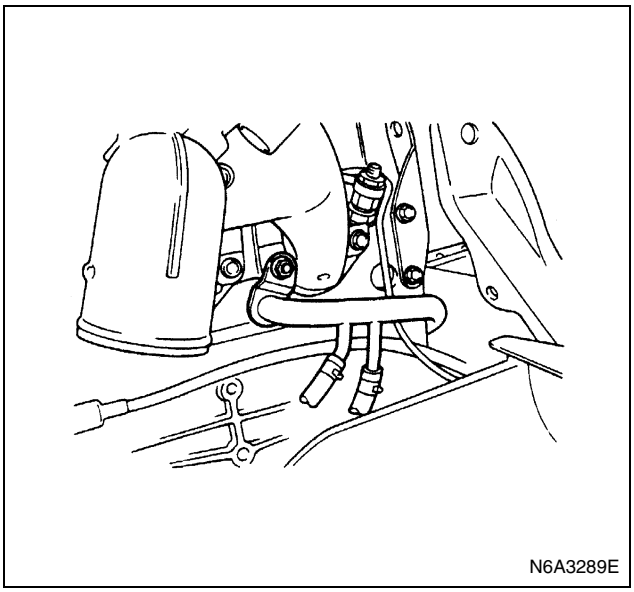
- Compressor bolts to 37 N·m (3.8 kg·m / 27 lb·ft)



N6A3290E

10. Oil Cooler Water Pipe (Oil Cooler Model)
    - Install the water pipe bolt and tighten bolt to the specified torque.

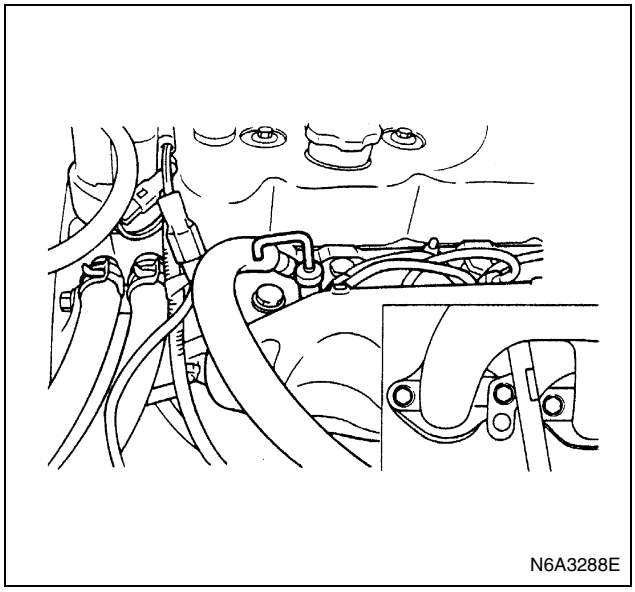
Tighten:
- Water pipe nut to 19 N·m (1.9 kg·m / 1.4 lb·ft)
- Pipe bracket bolt to 40 N·m (4.1kg·m / 30 lb·ft)



N6A3289E

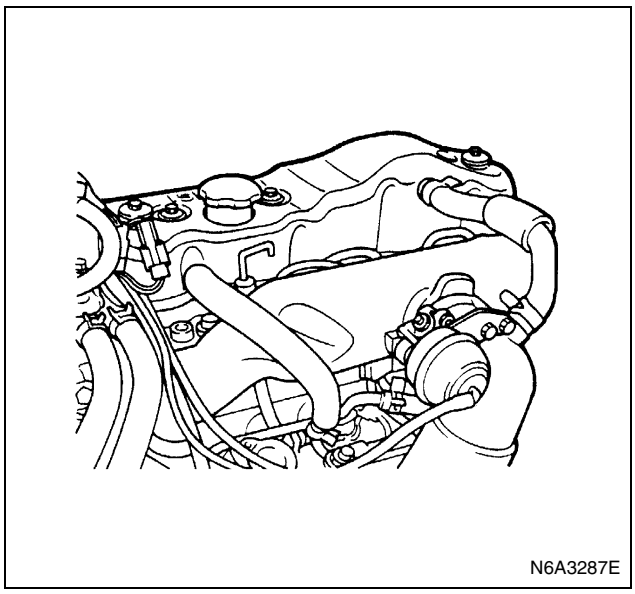
11. Oil Level Gauge Guide Tube
    - Install the guide tube bolt and tighten bolt to the specified torque.

Tighten:
- Guide tube bolt to 19 N·m (1.9 kg·m / 1.4 lb·ft)



N6A3288E

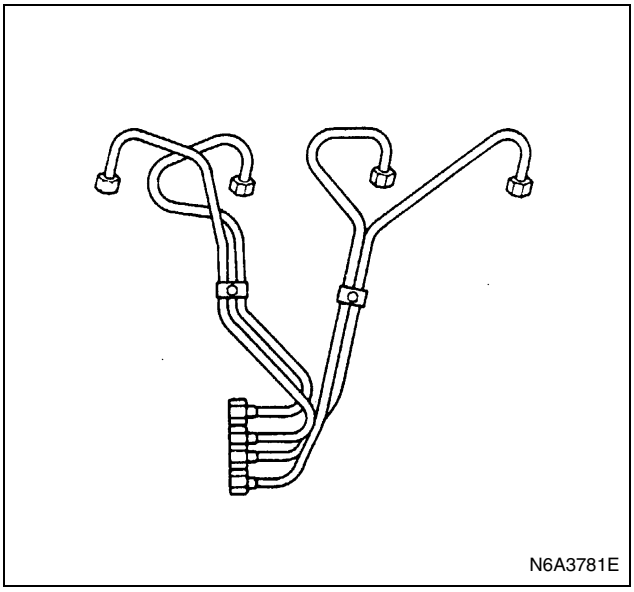
12. Glow Plug Harness
13. PCV Hose



N6A3287E

14. Leak Off Pipe
    - Mount using a new copper washer.
15. Injection Pipe
    - Install the flare nut to injection pump side.
    - Install the flare nut to injection nozzle side.
    - Tighten the flare nut to the specified torque.

Tighten:
- Flare nut to 29 N·m (3.0 kg·m / 22 lb·ft)



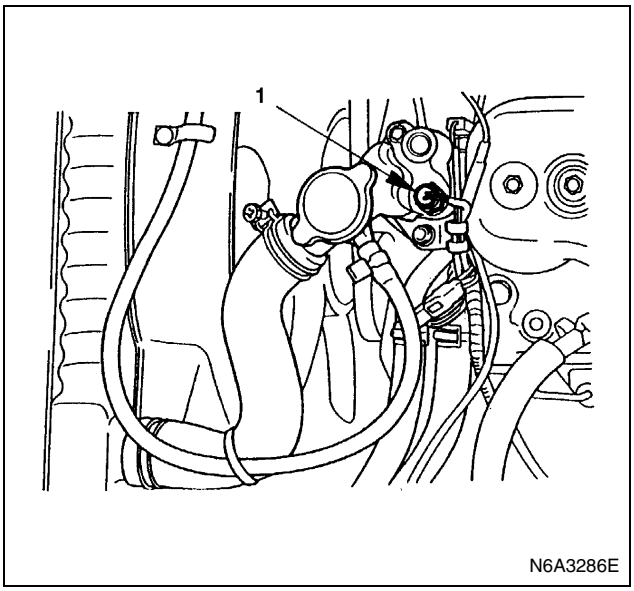
N6A3781E

- Fit pipe clip in specified torque.

Tighten:

- Sleeve nut to 29 N·m (3.0 kg·m / 22 lb·ft)

16. Air Intake Duct
17. Engine Harness
    - Connect the thermo-sensor harness and thermometer unit harness.



N6A3286E

Legend

1. Thermo-sensor

18. A/C Compressor Drive Belt (A/C Model)
    Check drive belts for wear or damage, and replace with new ones as necessary. Check belts for tension, and adjust as necessary.
    - Check drive belts tension.
    - Push the middle of belts with a force of 10 kg and check each bolt for deflection.
    - Standard deflection

	mm (in)
	Initial tension
AC generator & fan pulley drive belt	8 — 12 (0.31 — 0.47)

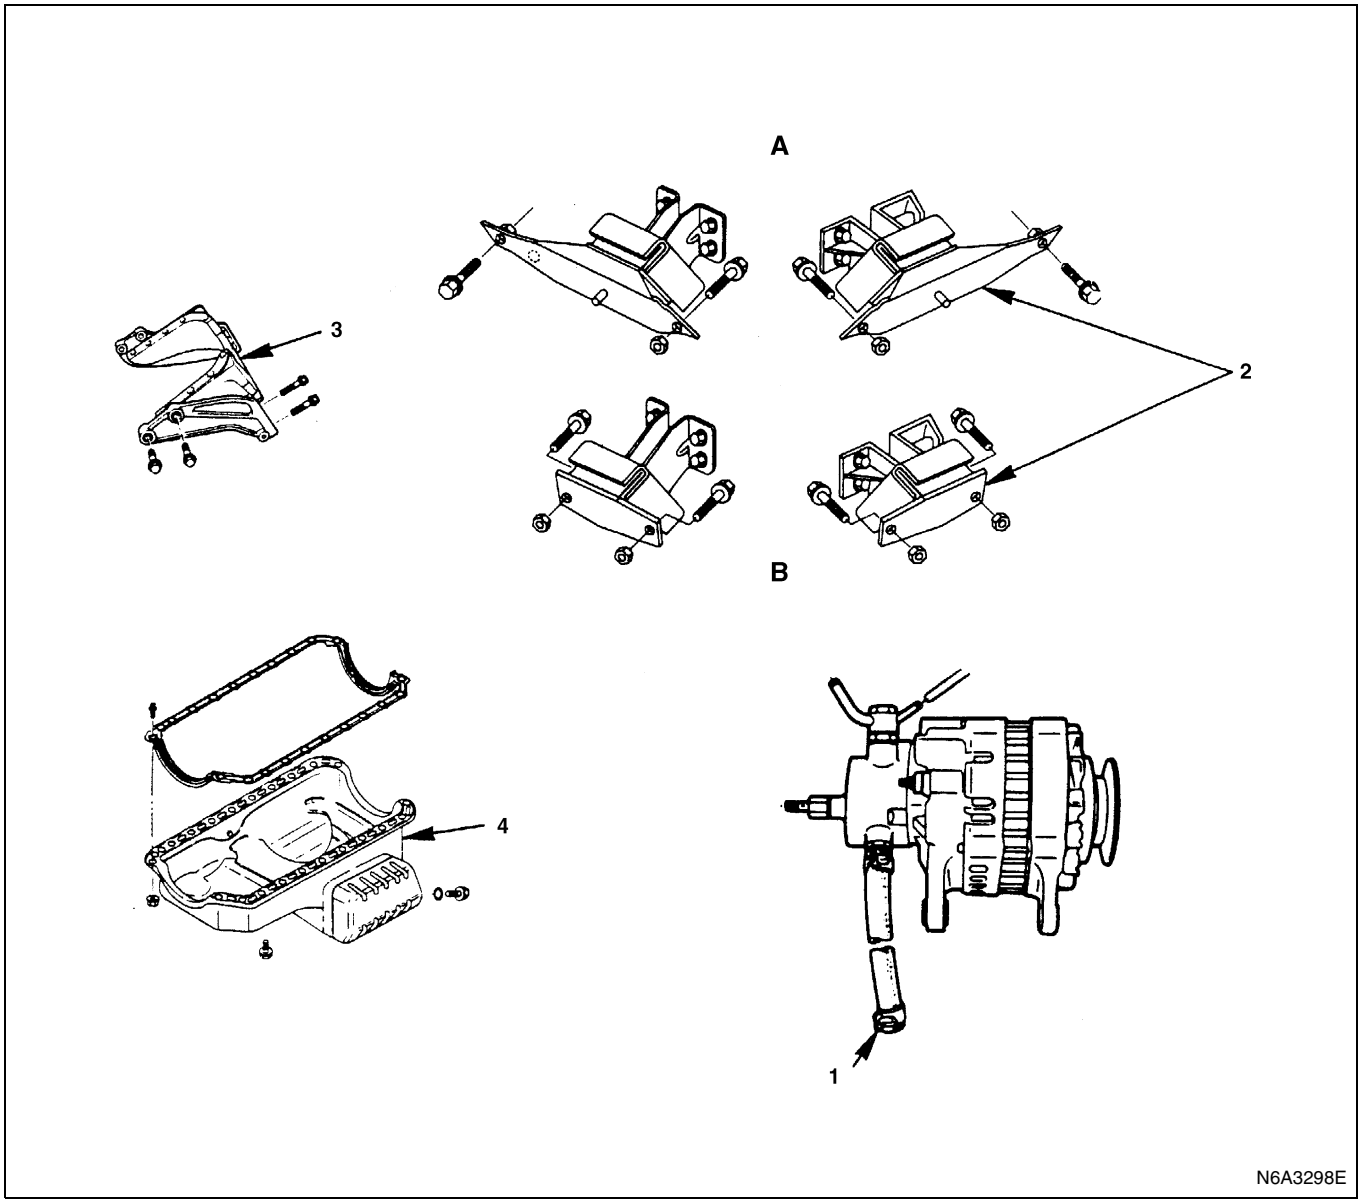
19. Heater Core
    - Connect the heater hose them tighten the clip securely.
20. Radiator Hose Upper
    - Connect the radiator hose them tighten clip securely.
    - Pour coolant.
    - Connect the battery ground cable.
    - Start the engine and check coolant leakage.

OIL PAN

Component



Legend

A. Independent suspension (4 × 2)
B. Rigid suspension (4 × 2)
1. Vacuum pump oil hose
2. Engine mount bolts
3. Stiffener and space rubber
4. Oil pan assembly

Removal

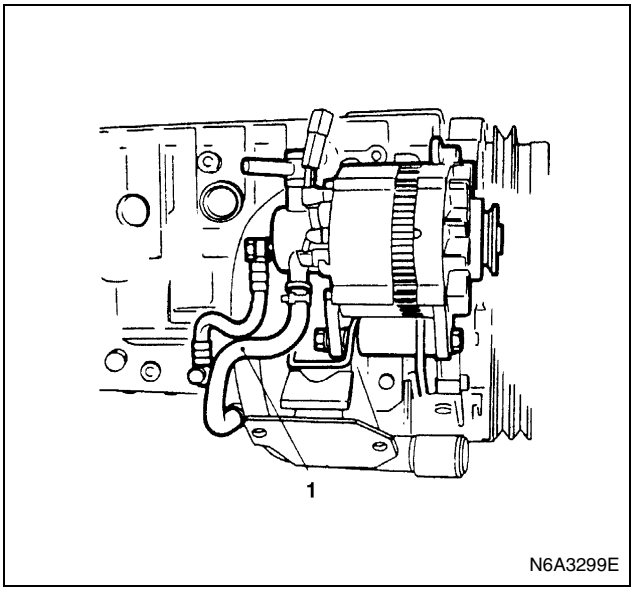
Preparation

- Disconnect battery ground cable.
- Lift up car.
- Drain engine oil.

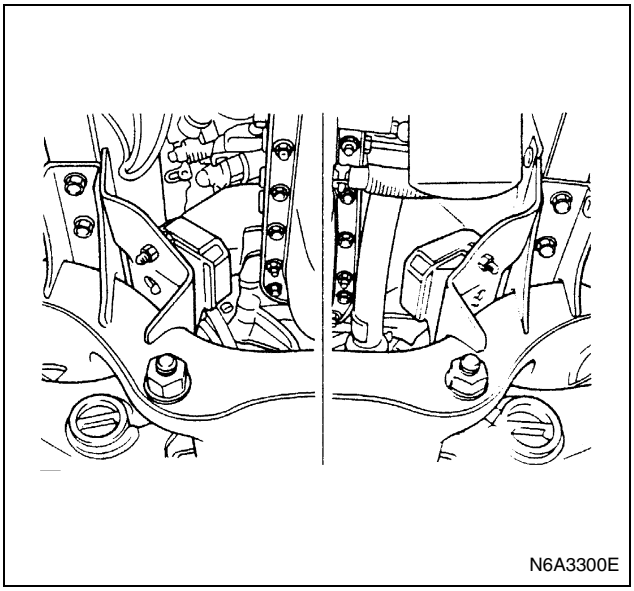
Notice:
Install drain plug with new gasket.

Tighten:
- 44 N·m (4.5 kg·m / 33 lb·ft)

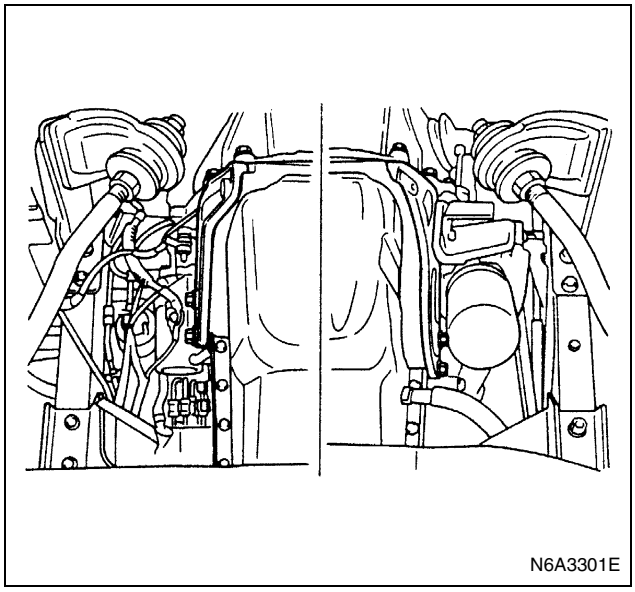
1. Vacuum Pump Oil Hose
   - Remove oil hose (1) from oil pan.



2. Engine Mount Bolts
   - Remove the engine mount bolts right & left side.



3. Stiffener & Space Rubber
   - Remove the exhaust pipe bracket.
   - Remove the stiffener from of the oil pan left & right side.
   - Take out space rubber.

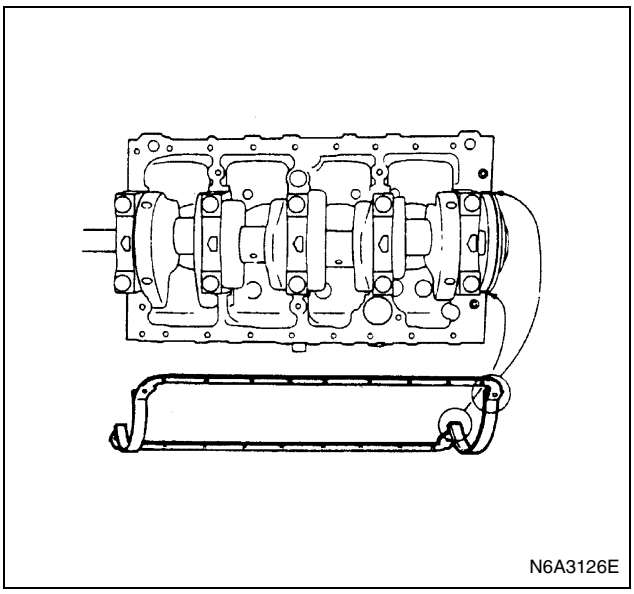


4. Oil Pan Assembly
   - Raising the engine about 50mm.
   - Remove the oil pan from cylinder block.

Installation

1. Oil Pan Assembly
   - Apply the recommended liquid gasket or its equivalent to the No.5 bearing cap arches, the grooves, and the timing gear case arches at the positions shown in the illustration.

   - Fit the gasket rear lipped portion into the No.5 groove.



- Be absolutely sure that the lipped portion in fitted snugly in to the groove.
- Install the oil pan to the cylinder body.
- Tighten the oil pan bolts to the specified torque.

Tighten:
- Oil pan bolt to 19 N·m (1.9 kg·m / 14 lb·ft)

2. Stiffener and Space Rubber
   - Install the space rubber.
   - Install the stiffener left side and right side tighten bolt to the specified torque.

Tighten:
- Engine body side to 37 N·m (3.8 kg·m / 27 lb·ft)
- Clutch housing side to 78 N·m (8.0 kg·m / 58 lb·ft)
  - Install exhaust pipe bracket.

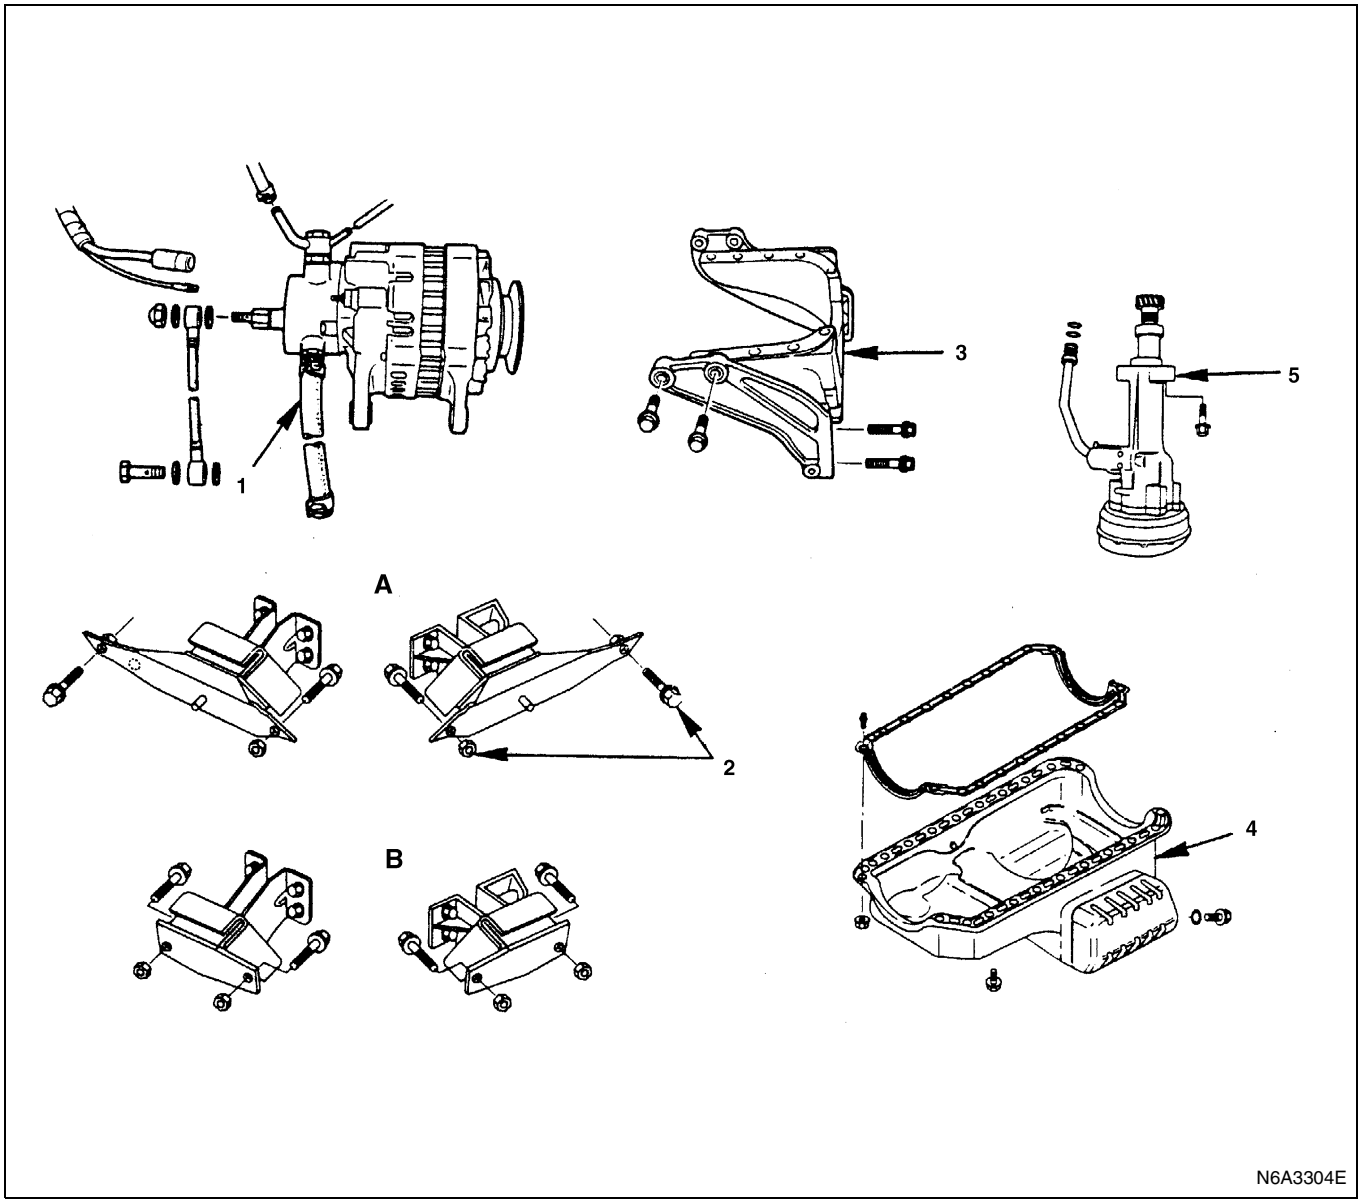
3. Engine Mount Bolts
   - Install the mount bolts and tighten to the specified torque.

Tighten:
- Mount bolt to 40 N·m (4.1 kg·m / 30 lb·ft)
  - Install the oil hose to oil pan.

4. Vacuum Pump Oil Hose
   - Pour engine oil
   - Connect battery ground cable.
   - Start the engine and check coolant leakage.

OIL PUMP ASSEMBLY

Component



Legend

A. Independent suspension (4 × 2)
B. Rigid suspension (4 × 2)
1. Vacuum pump oil hose
2. Engine mount bolts
3. Stiffener and space rubber
4. Oil pan assembly
5. Oil pump assembly

Removal

Preparation

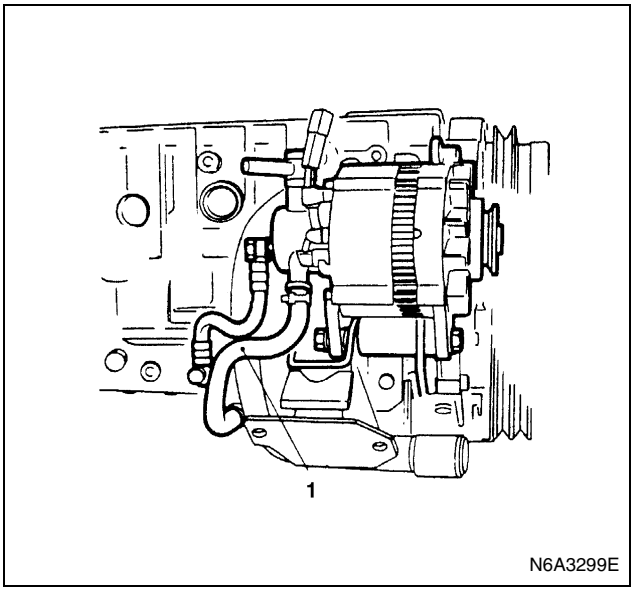
- Disconnect battery ground cable.
- Lift up car.
- Drain engine oil.

Notice:
Install drain plug with new washer.

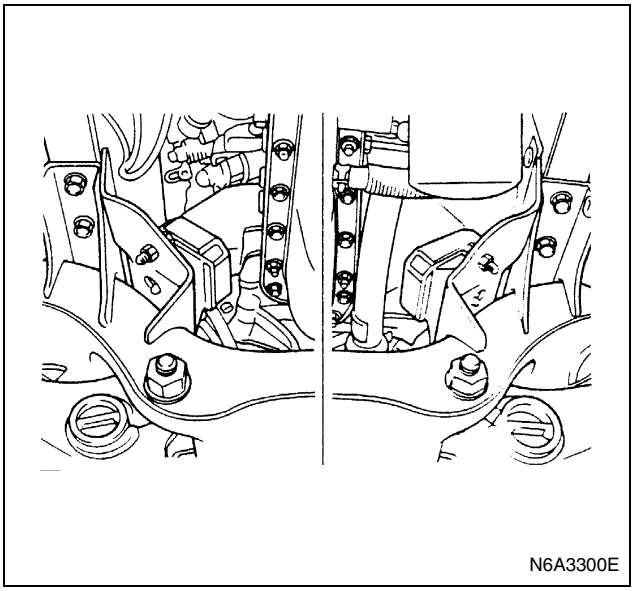
Tighten:

- 44 N·m (4.5 kg·m / 33 lb·ft)

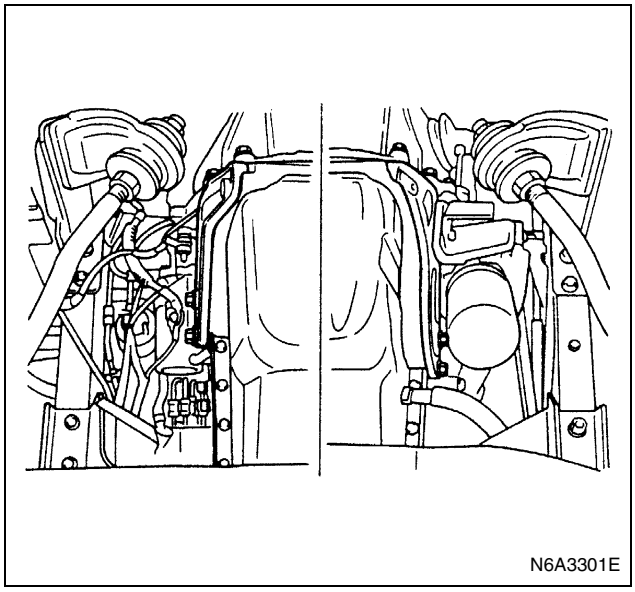
1. Vacuum Pump Oil Hose
   - Remove the oil hose (1) from oil pan.



2. Engine Mount Bolts
   - Remove the engine mount bolts right & left side.



3. Stiffener & Space Rubber
   - Remove the exhaust pipe bracket.
   - Remove the stiffener from of the oil pan left & right side.
   - Take out space rubber.



4. Oil Pan Assembly
   - Raise the engine about 50mm.
   - Remove the oil pan from cylinder block.
5. Oil Pump Assembly
   - Remove the oil pump from cylinder block.

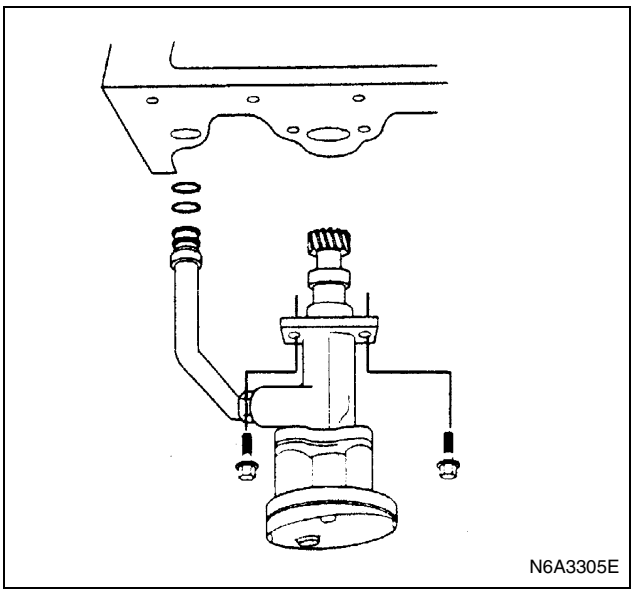
Installation

- Prepare a solution of 80% engine oil and 20% molybdenum disulfide.
- Apply and ample coat of the solution to the teeth of the oil pump pinion.

1. Oil Pump Assembly
   - Apply engine oil to oil pipe O-ring and insert the O-ring in O-ring hold on cylinder block.
   - Install oil pump asm with oil pipe in cylinder block and tighten fixing bolts to the specified torque.

Tighten:
- 19 N·m (1.9 kg·m / 14 lb·ft)
  - Tighten sleeve nut to the specified torque.

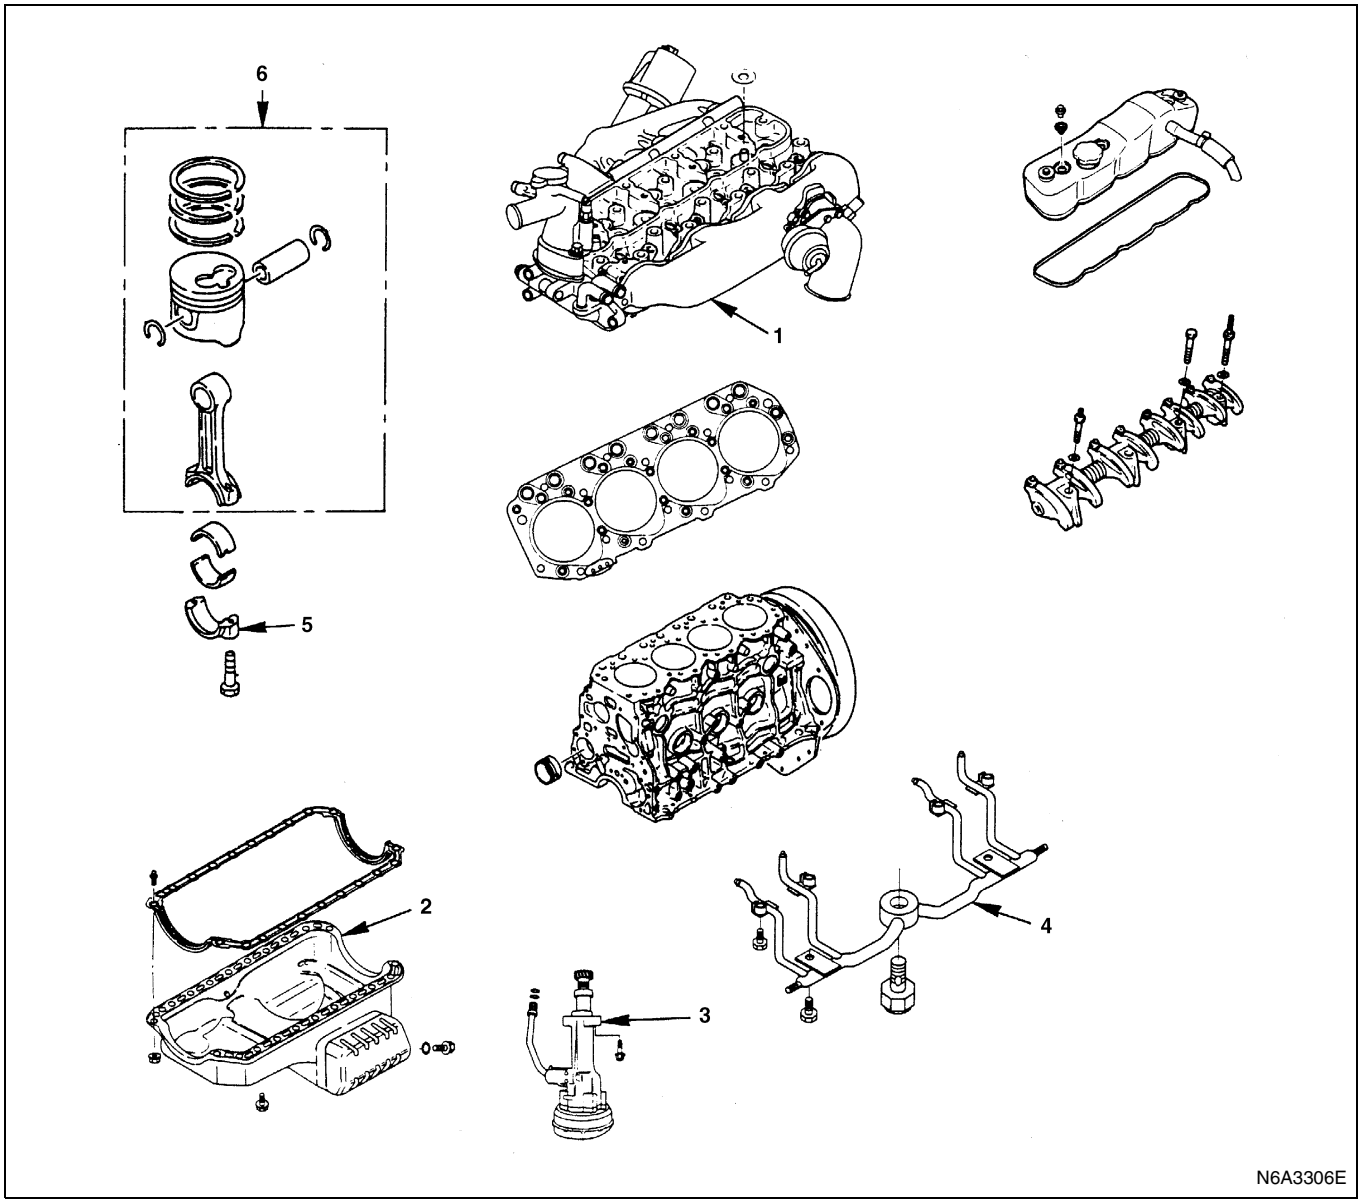
Tighten:
- 25 N·m (2.5 kg·m / 18 lb·ft)



2. Oil Pan Assembly
3. Stiffener & Space Rubber
4. Engine Mount Bolts
5. Vacuum Pump Oil Hose
   Above works refer to “OIL PAN” Section in this manual.

PISTON, PISTON RING AND CONNECTING ROD

Component



Legend

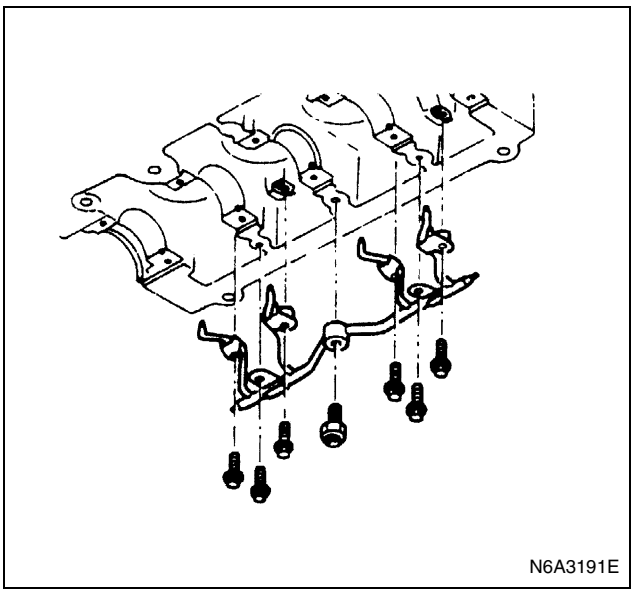
   6) Injection pipe
   7) Leak off pipe
   8) PCV hose
   9) Glow plug harness

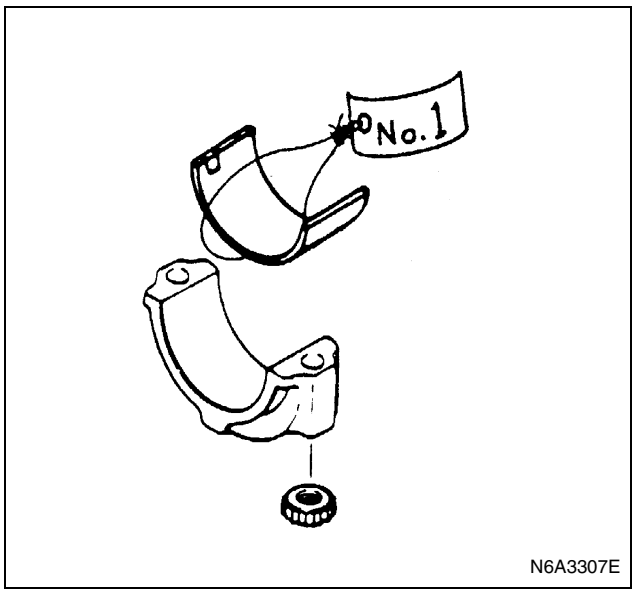
10) Oil level gauge guide tube
11) Oil cooler water pipe (Oil Cooler Model)
12) A/C compressor assembly (A/C Model)
13) Vacuum actuator hose (Exhaust Brake Model)
14) Front exhaust pipe
15) By-pass hose
16) Cylinder head cover
17) Rocker arm shaft
18) Push rod
19) Cylinder head assembly
20) Cylinder head gasket
Above works refer to “CYLINDER HEAD ASSEMBLY AND GASKET” Section in this manual.

2. Oil Pan Assembly
   1) Vacuum pump oil hose
   2) Engine mount bolt
   3) Stiffener and spacer rubber
   4) Oil pan
   Above works refer to “OIL PAN” Section in this manual.
3. Oil Pump Assembly
4. Piston Cooling Oil Pipe
   • Remove the relief valve and oil pipe.



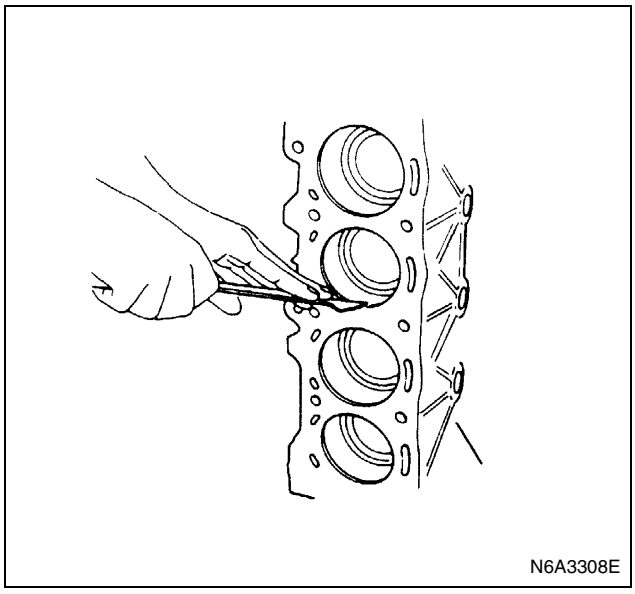
N6A3191E

5. Connecting Rod Bearing Cap
   • If the connecting rod lower bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



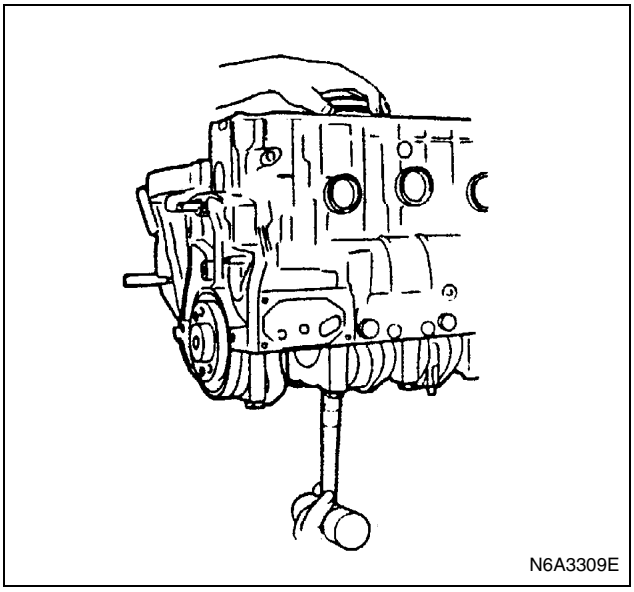
N6A3307E

6. Piston and Connecting Rod Assembly
   1) Remove carbon deposits from the upper portion of the cylinder wall with a scraper before removing the piston and connecting rod.



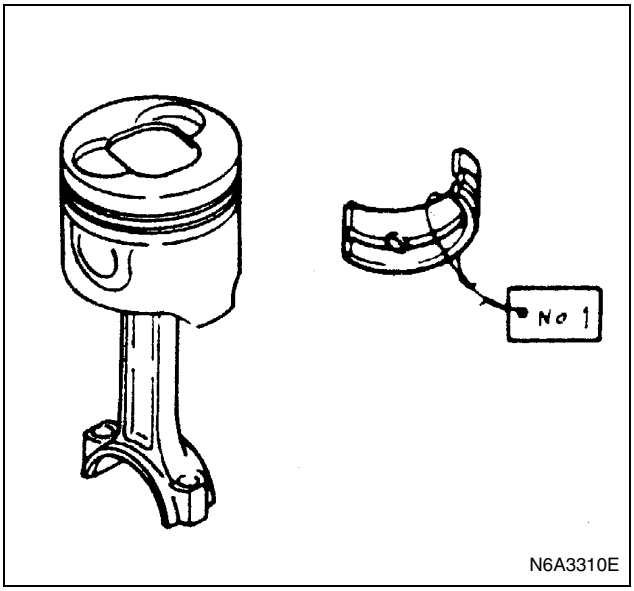
N6A3308E

   2) Move the piston to the top of the cylinder and tap it with a hammer grip or similar object from the connecting rod lower side to drive it out.



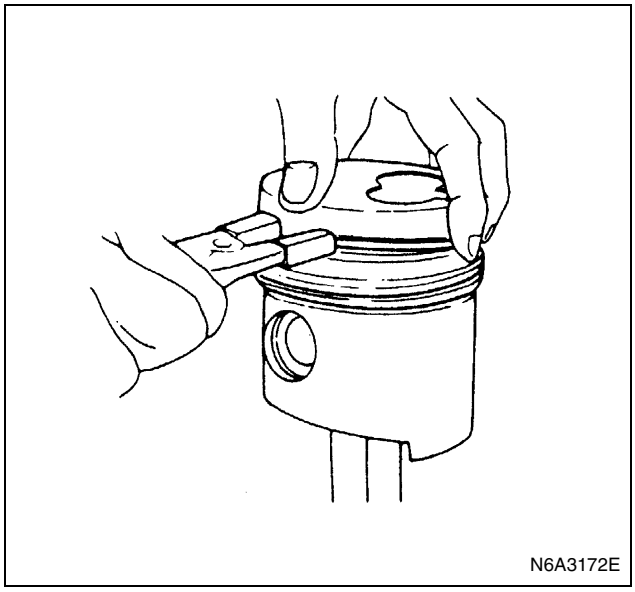
N6A3309E

3) If the connecting rod upper bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



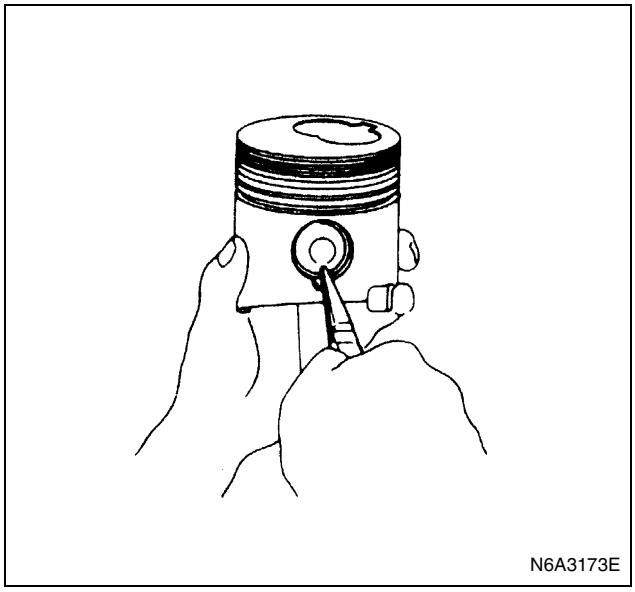
N6A3310E

4) Clamp the connecting rod in a vise.
Take care not to damage the connecting rod.
Use a piston ring replacer to remove the piston rings.
Piston Ring Replacer
Do not attempt to use some other tool to remove the piston rings. Piston ring stretching will result in reduced piston ring tension.



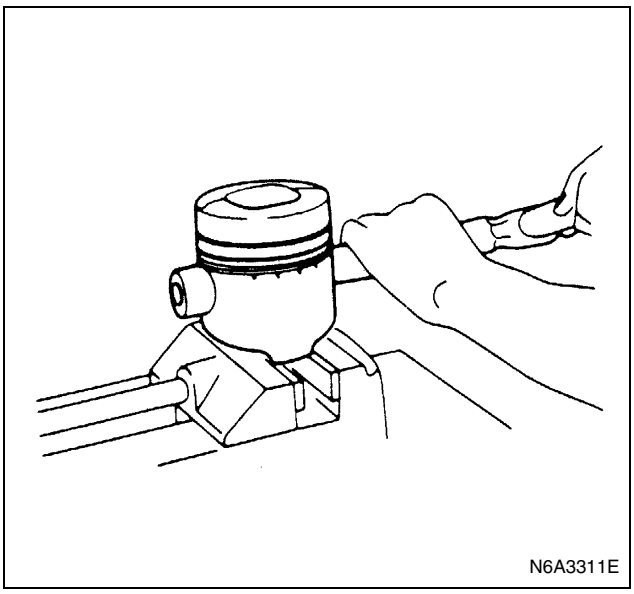
N6A3172E

5) Use a pair of pliers to remove the piston pin snap rings.



N6A3173E

6) Tap the piston pin out with a hammer and a brass bar. If the pistons and piston pins are to be reinstalled, mark their installation positions by tagging each piston and piston pin with the cylinder number from which it was removed.



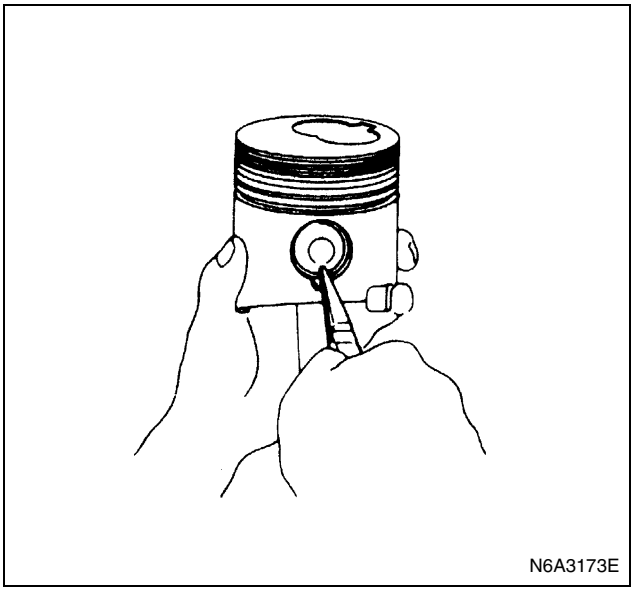
N6A3311E

Installation

1. Piston and Connecting Rod Assembly
   1) Try to insert the piston pin into the piston pin hole with normal finger pressure.
      Weigh each piston and connecting rod assembly.
      Select piston and connecting rod combinations so that the weight variation of the different assemblies is held within the specified limits.

	g (oz)
Variance in weight	Less than
after assembly	3 (0.1058)

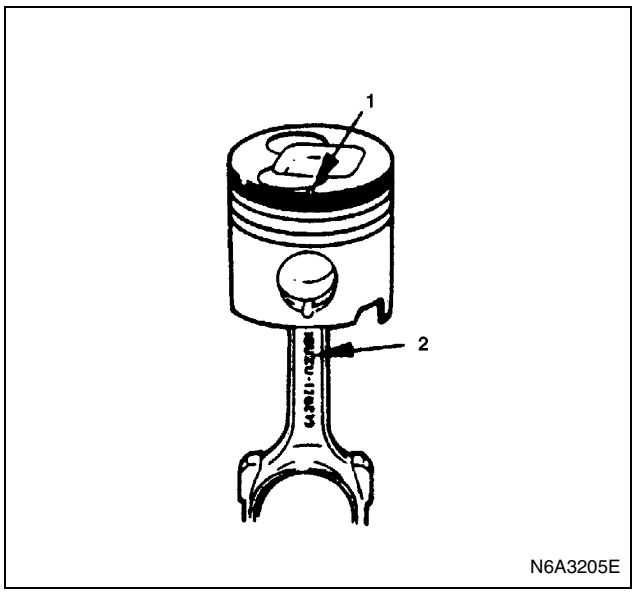
   2) Clamp the connecting rod in a vise.
      Take care not to damage the connecting rod.
   3) Use a pair of pliers to install the piston pin snap ring to the piston.



N6A3173E

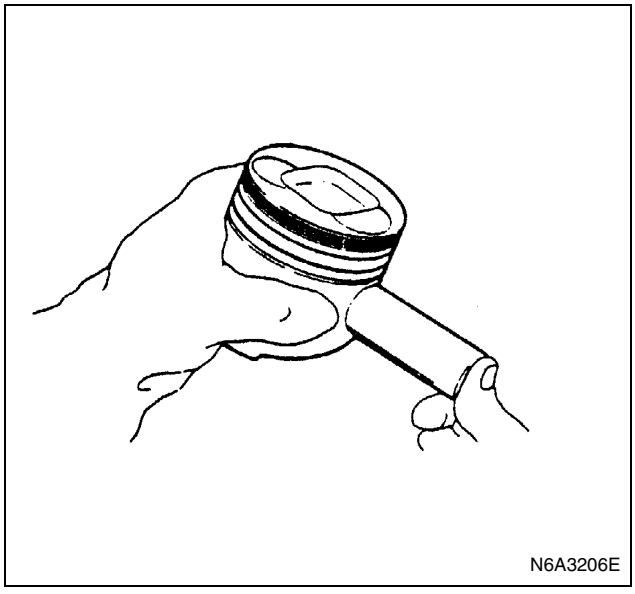
Notice:
When changing piston/connecting rod combinations, do not change the piston/piston pin combination.

   4) Install the piston to the connecting rod.
      The piston head front mark (1) and the connecting rod “ISUZU” casting mark (2) must be facing the same direction.



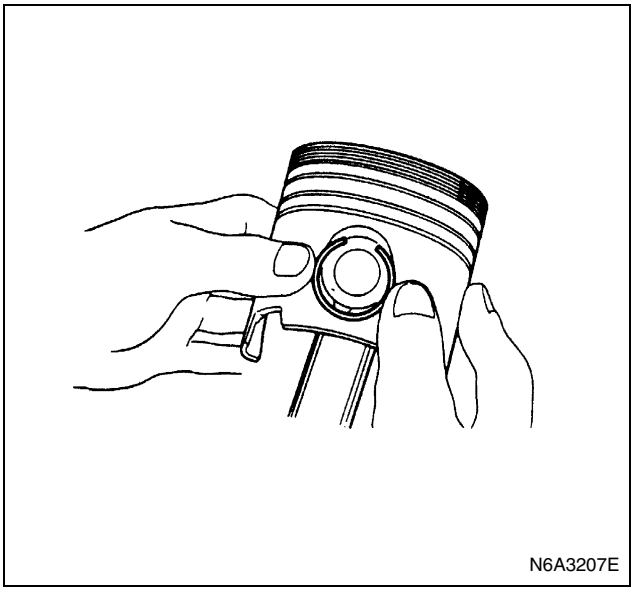
N6A3205E

   5) Apply a coat of engine oil to the piston pin and the piston pin hole.
      Use your fingers to force the piston pin into the piston until it makes contact with the snap ring.



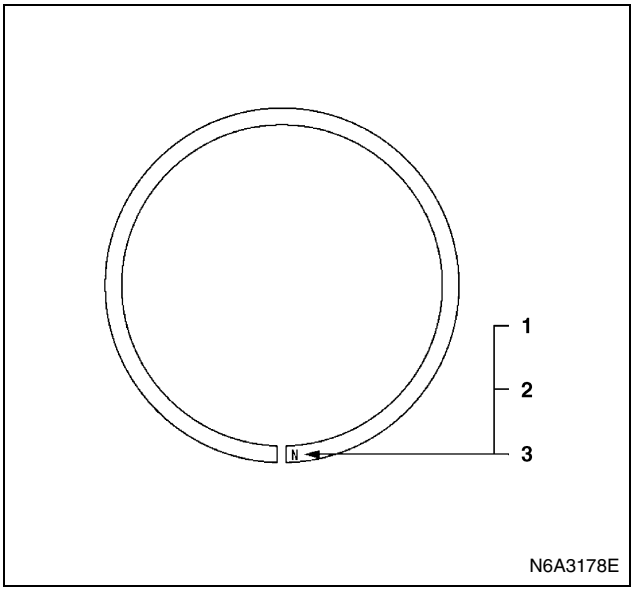
N6A3206E

   6) Use your fingers to force the piston pin snap ring into the piston snap ring groove.
      Check that the connecting rod moves smoothly on the piston pin.



N6A3207E

7) Install the piston rings with the piston ring expander.
The compression ring must be set with the 1N, 2N, R mark facing up.
Discrimination mark is painted as shown in the illustration.

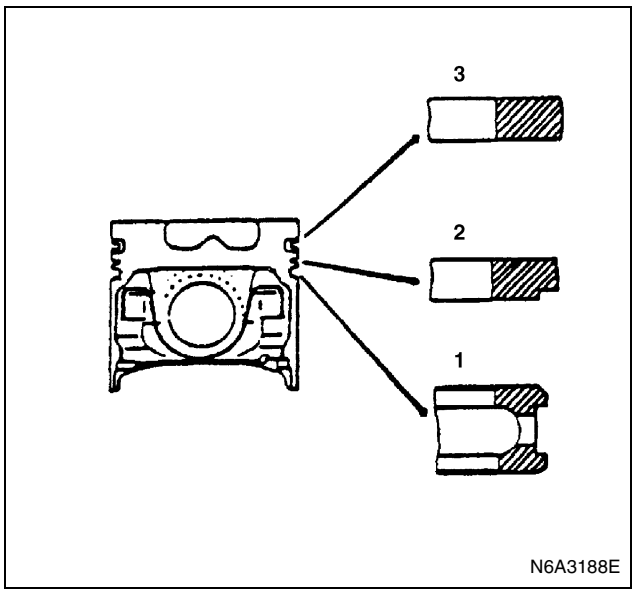


N6A3178E

Legend
1. N mark (Top ring) (2nd ring) (4JB1)
2. 1N mark (Top ring) 2N mark (2nd ring) (4JG2)
3. R mark (Top ring) (2nd ring) (4JH1-TC)

8) Use a piston ring replacer to install the three piston rings.
Piston Ring Replacer
Install the piston rings in the numerical order shown in the illustration.

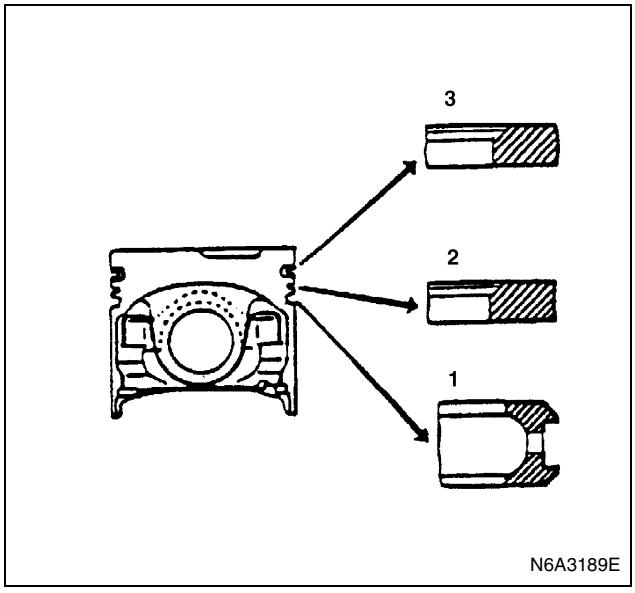
4JH1-TC, 4JB1



N6A3188E

Legend
1. Oil ring
2. 2nd compression ring
3. 1st compression ring

4JG2



N6A3189E

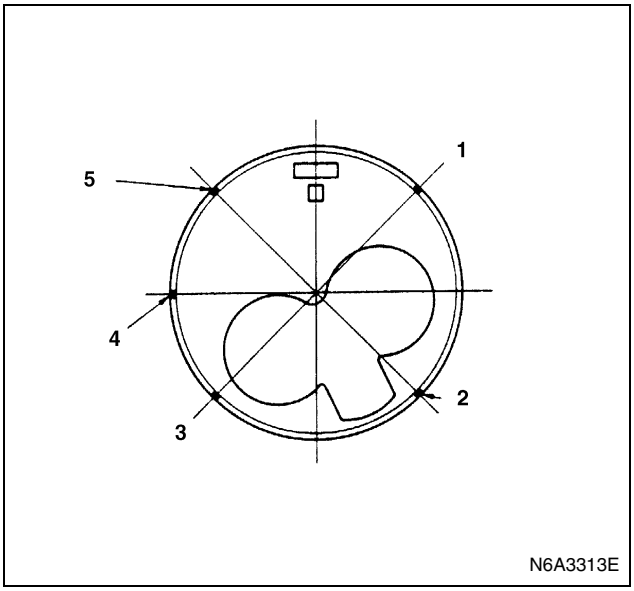
Legend
1. Oil ring
2. Compression ring No. 2
3. Compression ring No. 1

Notice:
Install the compression rings with the stamped side facing up.

Insert the expander coil into the oil ring groove so that there is no gap on either side of the expander coil before installing the oil ring.

9) Apply engine oil to the piston ring surfaces.

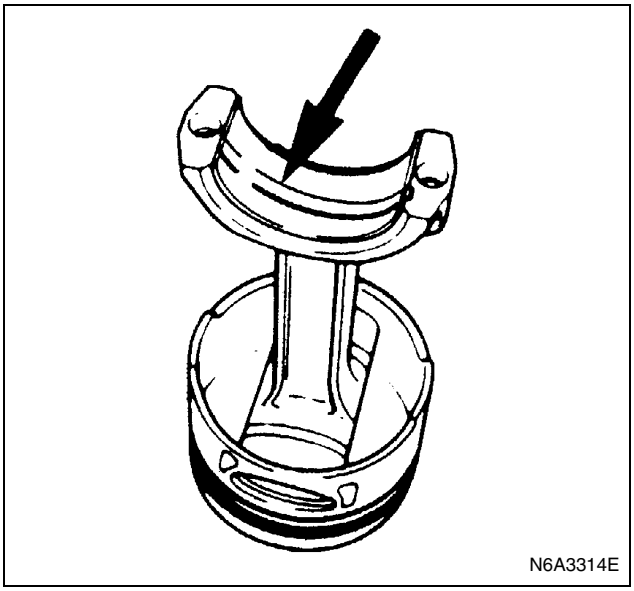
10) Check that the piston rings rotate smoothly in the piston ring grooves.
11) Position the piston ring gaps as shown in the illustration.



Legend

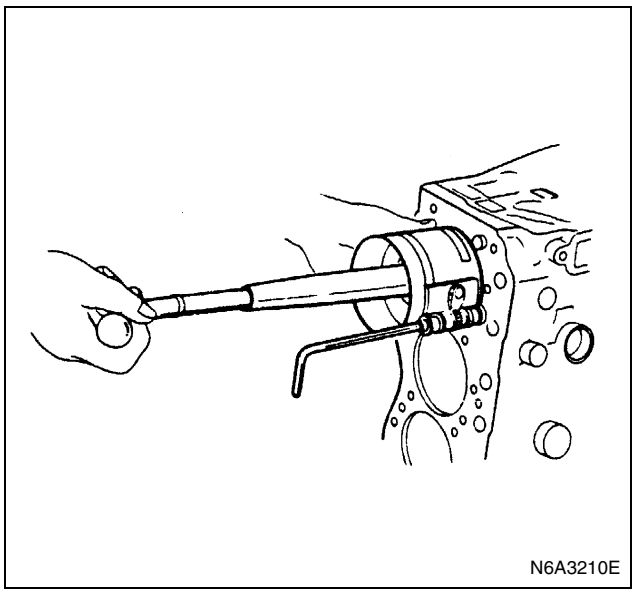
1. Expand ring
2. No. 1 compression ring
3. Oil ring
4. Front mark
5. No. 2 compression ring

12) Carefully wipe any oil or other foreign material from the connecting rod bearing back face and the connecting rod bearing fitting surface.



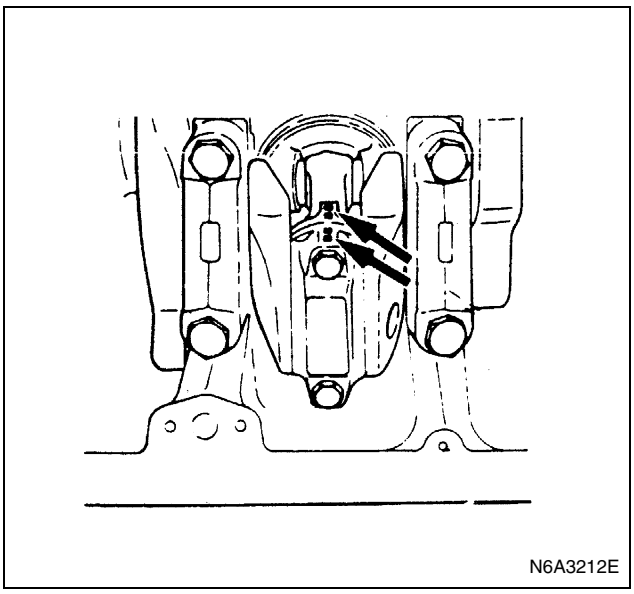
13) Apply a coat of engine oil to the upper bearing surfaces.
Apply a coat of engine oil the cylinder wall.

14) Position the piston head front mark so that it is facing the front of the engine.
Use the piston ring compressor to compress the piston rings.
Piston Ring Compressor: 5-8840-9018-0(J-8037)
15) Use a hammer grip to push the piston in until the connecting rod makes contact with the crankpin.
At the same time, rotate the crankshaft until the crankpin is at BDC.



2. Connecting Rod Bearing Cap
   1) Position the bearing cap front mark (1) so that it is facing the front of the engine.

   2) Install the connecting rod bearing caps.
   Align the bearing cap cylinder number marks and the connecting rod cylinder number marks.
   3) Apply a coat of engine oil to the threads and setting faces of each connecting rod cap bolt.



N6A3212E

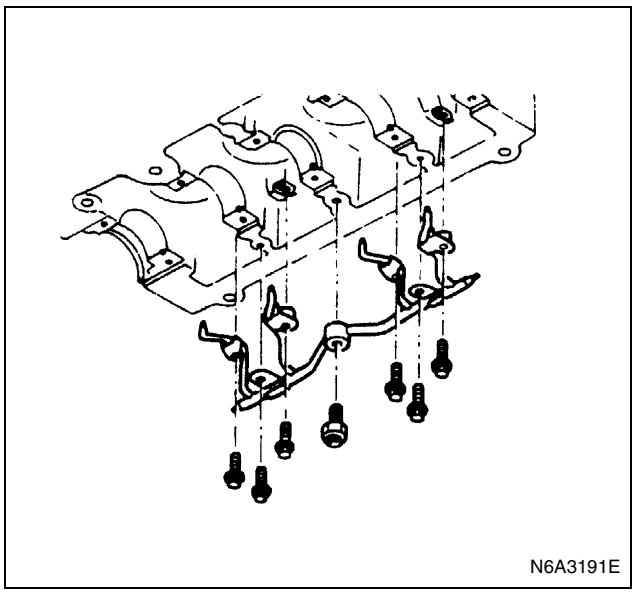
4) Tighten the connecting rod bearing cap bolts to the specified torque in two steps using the Angular Tightening Method.

Tighten:
- 4JB1-TC, 4JG2, 4JH1-TC
  Connecting rod bearing cap bolt to
  1st step: 29 N·m (3.0 kg·m / 22 lb·ft)
  2nd step: 45° — 60°
- 4JB1
  Connecting rod bearing cap bolt to
  83 N·m (8.5 kg·m / 61 lb·ft)

Notice:
Check to see that the crankshaft turns smoothly by rotating it manually.

3. Piston Cooling Oil Pipe
   1) Install the piston cooling oil pipe to the cylinder body.
   2) Tighten the oil pipe bolts and relief valve to the specified torque.

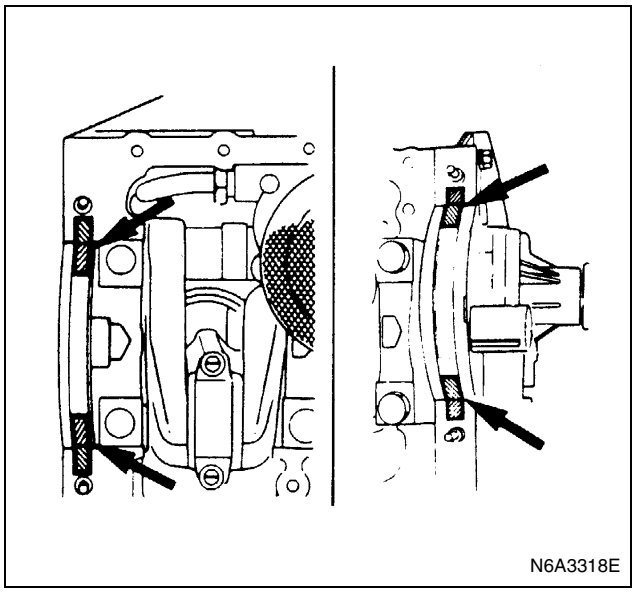
Tighten:
- Oil pipe bolt to
  M8 × 1.25: 19 N·m (1.9 kg·m / 14 lb·ft)
  M6 × 1.00: 8 N·m (0.8 kg·m / 69 lb·in)
- Oil pressure regulating valve to
  M6 × 1.5: 29 N·m (3.0 kg·m / 22 lb·ft)



N6A3191E

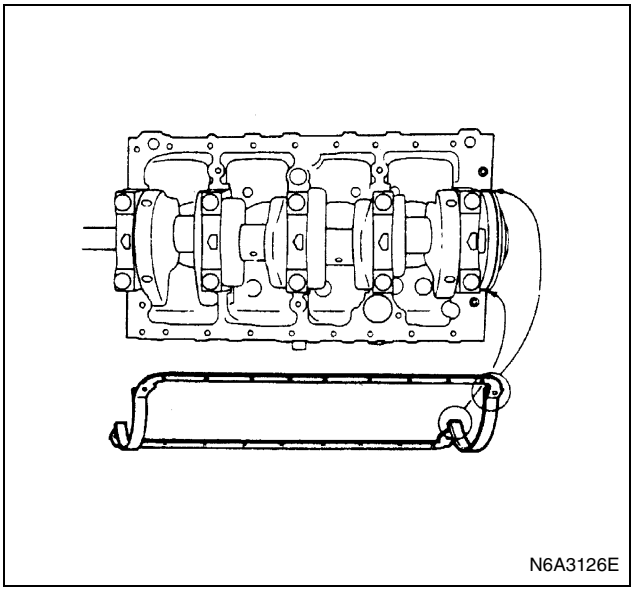
Notice:
Check that there is no interference between the piston and the oiling jet pipe by slowly rotating the crankshaft.

4. Oil Pump Assembly
   Above works refer to “OIL PUMP” Section in this manual.
5. Oil Pan Assembly
   1) Apply the recommended liquid gasket or its equivalent to the No.5 bearing cap arches, the grooves, and the timing gear case arches at the positions shown in the illustration.



N6A3318E

2) Fit the gasket rear lipped portion into the No.5 groove. Be absolutely sure that the lipped portion is fitted snugly into the groove.



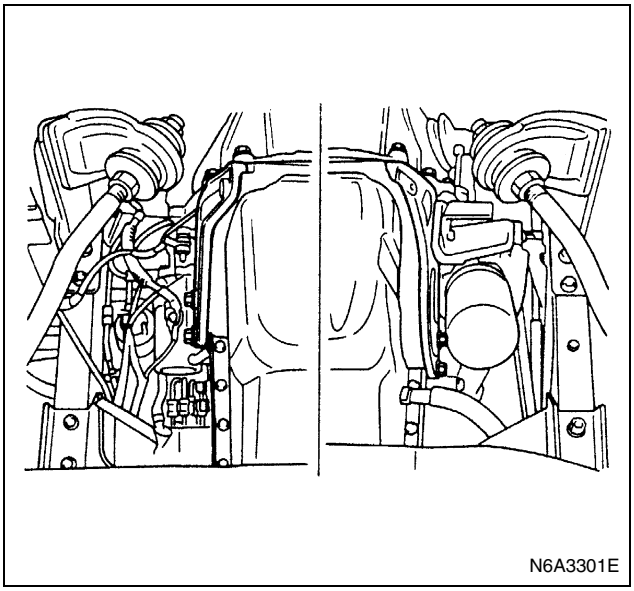
N6A3126E

3) Install the oil pan to the cylinder body.
   - Tighten the oil pan bolts to the specified torque.

Tighten:
- Oil pan bolts to 19 N·m (1.9 kg·m / 14 lb·ft)

4) Install the space rubber and stiffener (right & left side) then tighten bolts to the specified torque.

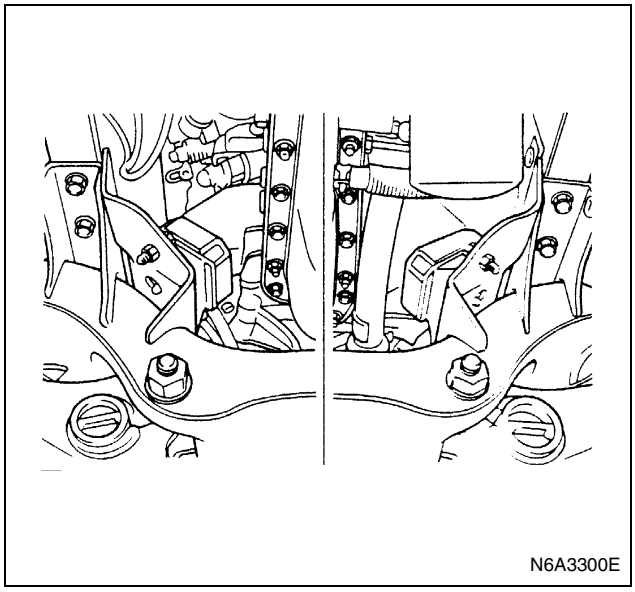
Tighten:
- Engine body side stiffener bolts to 37 N·m (3.8 kg·m / 27 lb·ft)
- Clutch housing side stiffener bolts to 78 N·m (8.0 kg·m / 58 lb·ft)



N6A3301E

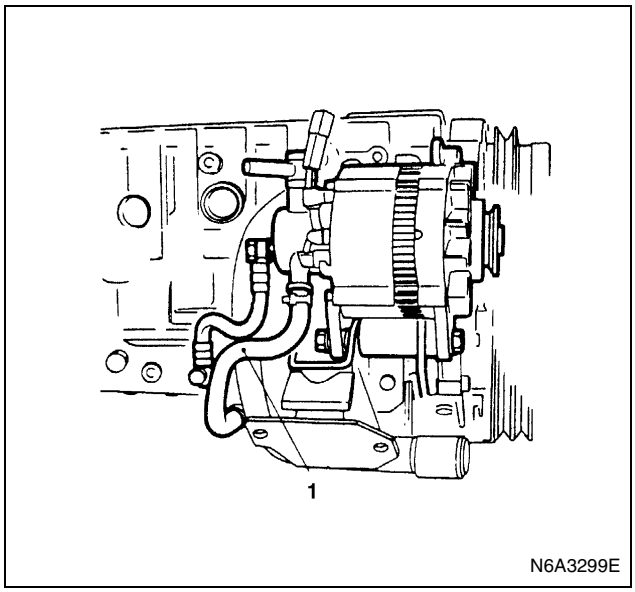
5) Install the exhaust pipe bracket.
6) Install the support rubber and tighten nuts to the specified torque.

Tighten:
- Support rubber nut to 40 N·m (4.1 kg·m / 30 lb·ft)



N6A3300E

7) Install the vacuum pump oil hose (1) to oil pan.



N6A3299E

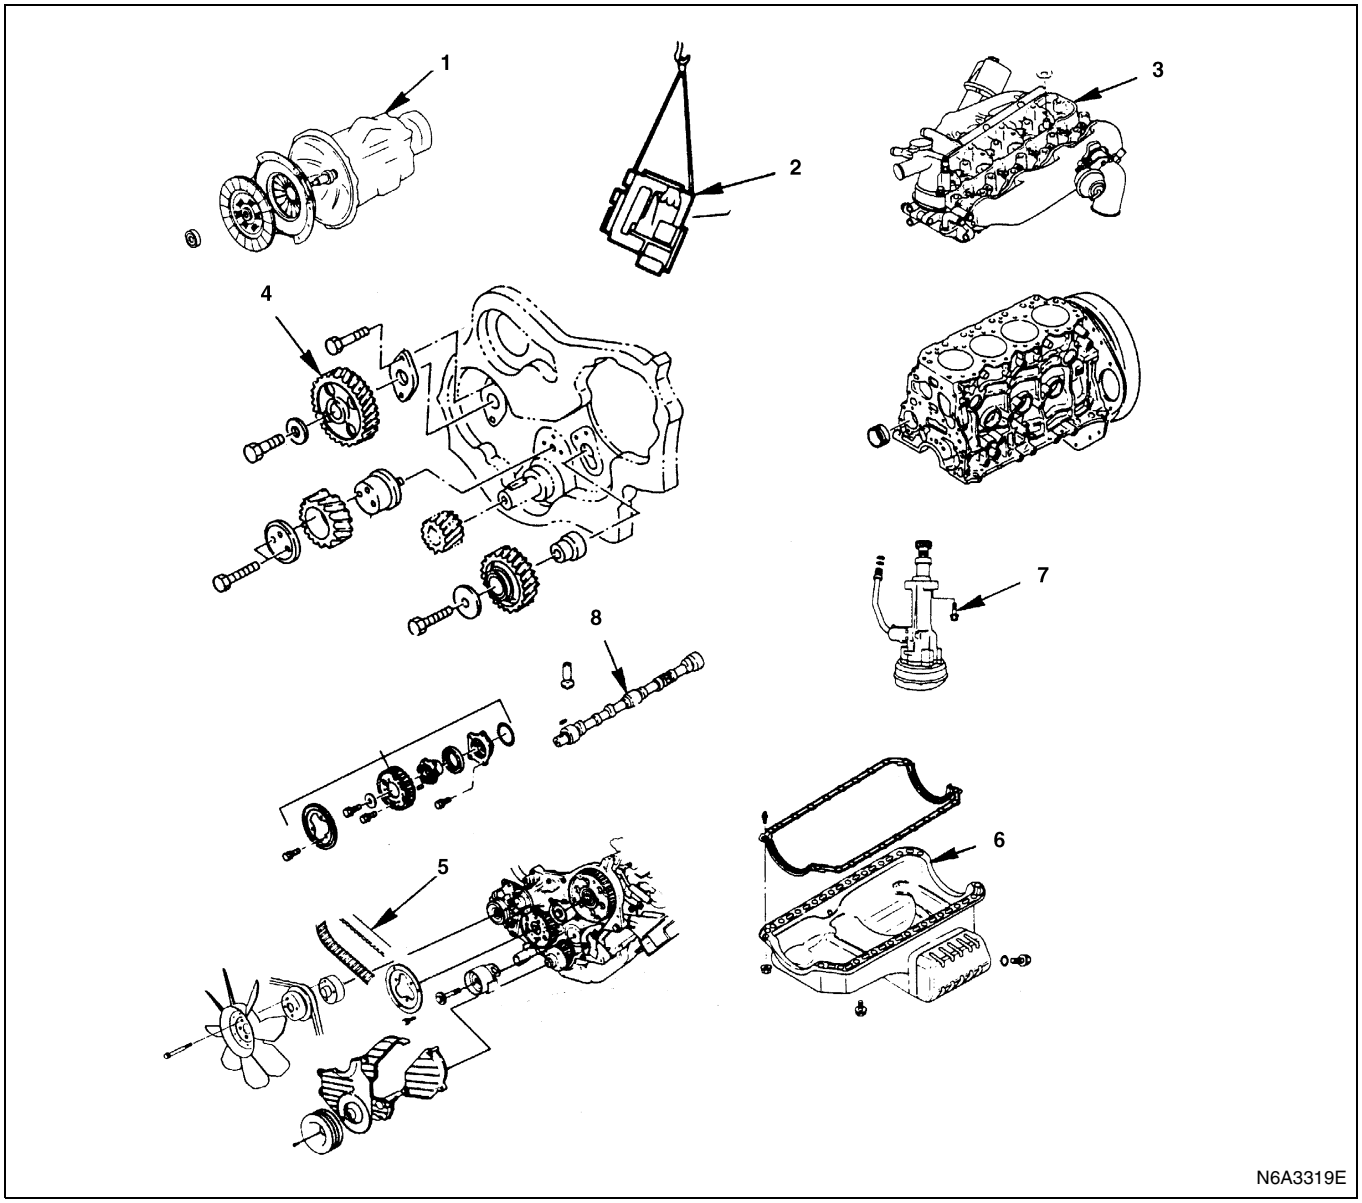
6. Cylinder Head Assembly
   1) Cylinder head gasket
   2) Cylinder head assembly
   3) Push rod
   4) Rocker arm shaft
   5) Valve clearance adjustment
   6) Cylinder head cover
   7) By-pass hoses
   8) Front exhaust pipe
   9) Vacuum actuator hose (Exhaust Brake Model)
   10) A/C compressor assembly (A/C Model)
   11) Oil cooler water pipe (Oil Cooler Model)
   12) Oil level gauge guide tube
   13) Glow plug harness
   14) PCV hose
   15) Leak off pipe
   16) Injection pipe
   17) Air intake duct

18) Engine harness
19) A/C compressor drive belt (With A/C Model)
20) Heater hose

Above works refer to “CYLINDER HEAD ASSEMBLY AND GASKET” Section in this manual.

CAMSHAFT AND TAPPET

Component



Legend

1. Transmission and clutch assembly
2. Engine assembly
3. Cylinder head assembly and gasket
4. Timing gear (Gear drive model)
5. Timing belt (Belt drive model)
6. Oil pan
7. Oil pump
8. Camshaft and tappets

Removal

Preparation

- Disconnect battery ground cable.
- Drain coolant.
- Drain engine oil.

Notice:
Install drain plug with new washer.

Tighten:

- Drain plug to 83 N·m (8.5 kg·m / 61 lb·ft)

1. Transmission and Clutch Assembly
   1) Transmission
   2) Clutch
2. Engine Assembly
   1) Radiator assembly
   2) Intake air duct
   3) Heater hose

4) Engine control cable
5) Glow plug harness
6) Fuel hose
7) Oil pressure switch harness
8) A/C compressor assembly (A/C Model)
9) Power steering pump & bracket assembly (Power steering Model)
10) Actuator vacuum hose (Exhaust Brake Model)
11) Vacuum pump hose (Exhaust Brake Model)
12) Front exhaust pipe
13) Support rubber
14) Engine assembly
Above works refer to “ENGINE ASSEMBLY” Section in this manual.

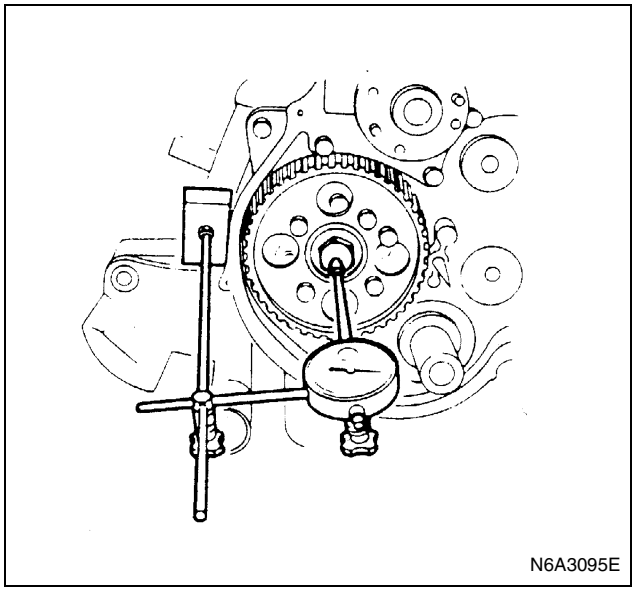
3. Cylinder Head Assembly and Gasket
1) Injection pipe
2) Leak off pipe
3) PCV hose
4) Glow plug harness
5) Oil level gauge guide tube
6) Oil cooler water pipe (Oil Cooler Model)
7) By-pass hose
8) Cylinder head cover
9) Rocker arm shaft
10) Push rod
11) Cylinder head assembly
12) Cylinder head gasket
Above works refer to “CYLINDER HEAD ASSEMBLY AND GASKET” Section in this manual.

4. Timing Gear (Gear Drive Model)
1) Cooling fan assembly
2) Crankshaft damper pulley
3) Noise shield cover
4) Noise cover spacer
5) Timing gear case cover
6) Camshaft timing gear
Above works refer to “TIMING GEAR (Gear Type)” Section in this manual.

5. Timing Belt (Belt Drive Model)
1) Cooling fan assembly
2) Crankshaft damper pulley
3) Timing pulley upper cover
4) Timing pulley lower cover
5) Flange: camshaft pulley
6) Flange: injection pump pulley
7) Timing belt
Above works refer to “TIMING BELT (Belt Type)” Section in this manual.
8) Camshaft timing pulley

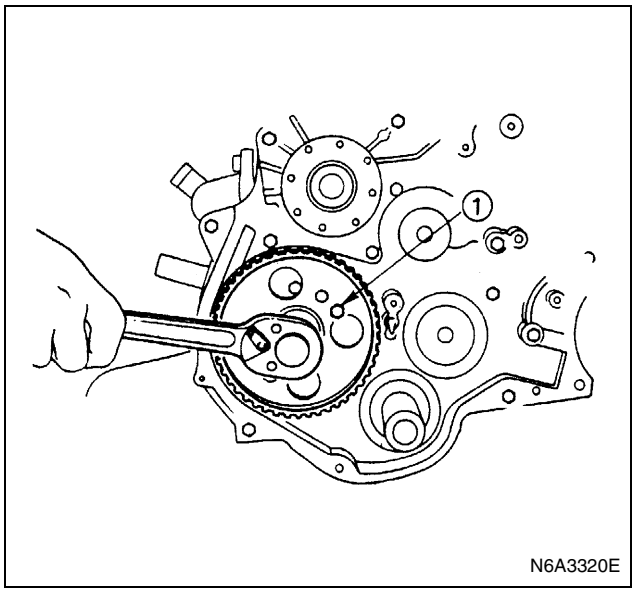
• Use a dial indicator to measure the camshaft end play.
This must be done before removing the oil pump.
If the camshaft end play exceeds the specified limit, the camshaft and/or the driven gear must be replaced.

Camshaft End Play	mm (in)
Standard	Limit
0.08 (0.003)	0.20 (0.008)



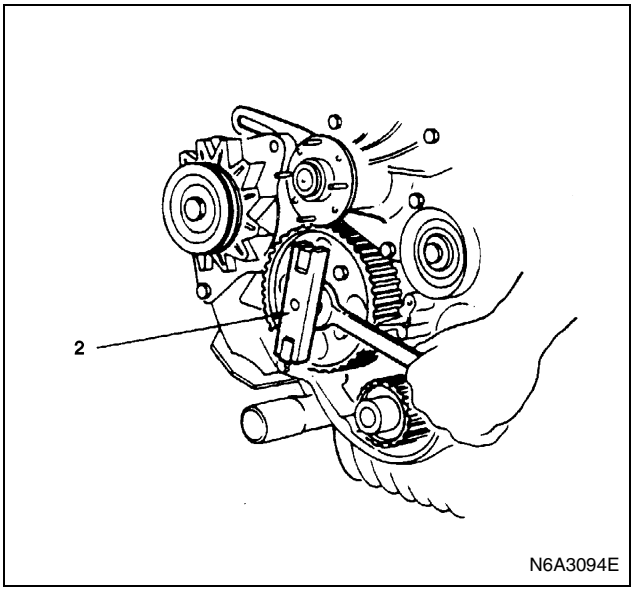
N6A3095E

• Install the stopper bolt (1) to the timing pulley to prevent the pulley from turning.
• Loosen the center bolt.

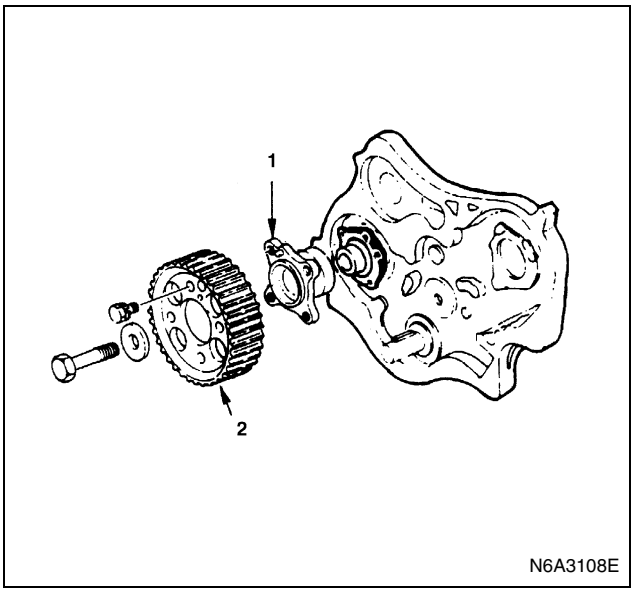


N6A3320E

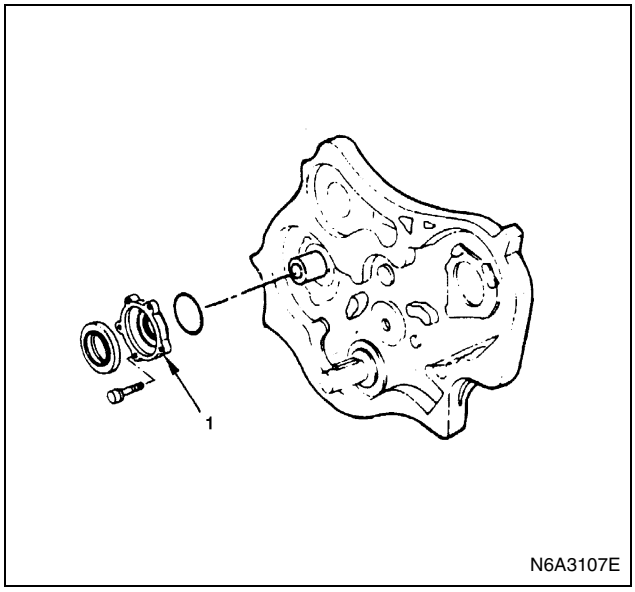
• Use the timing pulley puller (2) to remove the pulley.
Timing Pulley Puller: 5-8840-0086-0



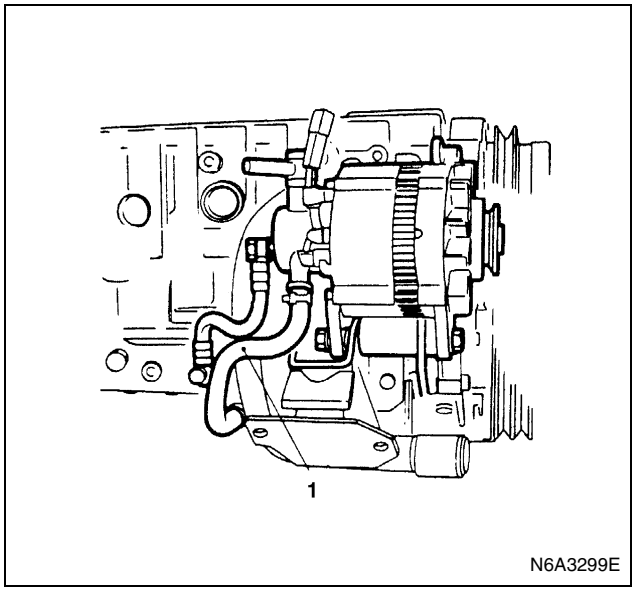
- Remove the stopper bolt.
- Remove the center bolt and remove the timing pulley (2) with pulley center (1).



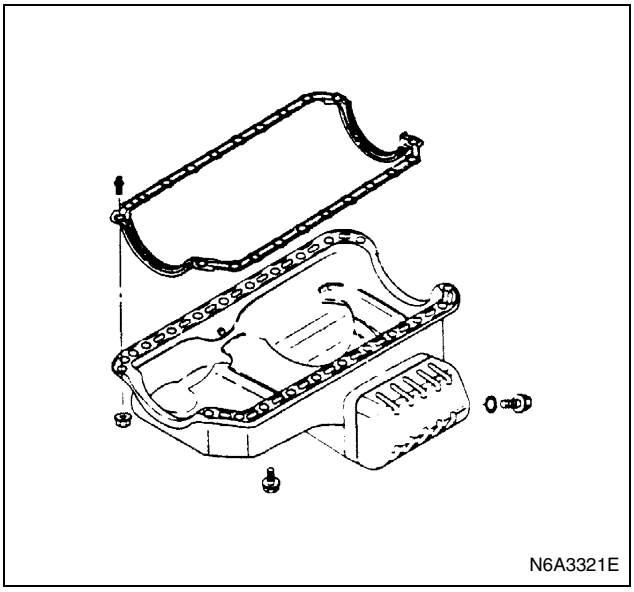
- Remove the oil seal retainer (1).



6. Oil Pan Assembly
   - Disconnect vacuum pump oil hose (1) from oil pan.



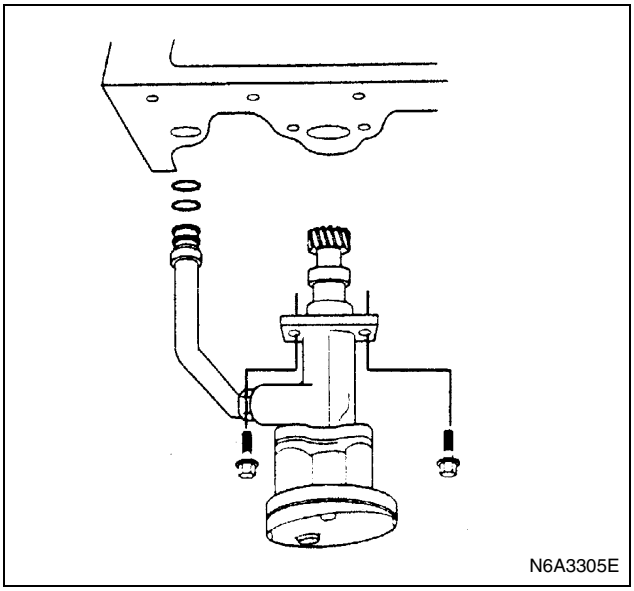
- Remove the stiffener and space rubber from oil pan both side.



N6A3321E

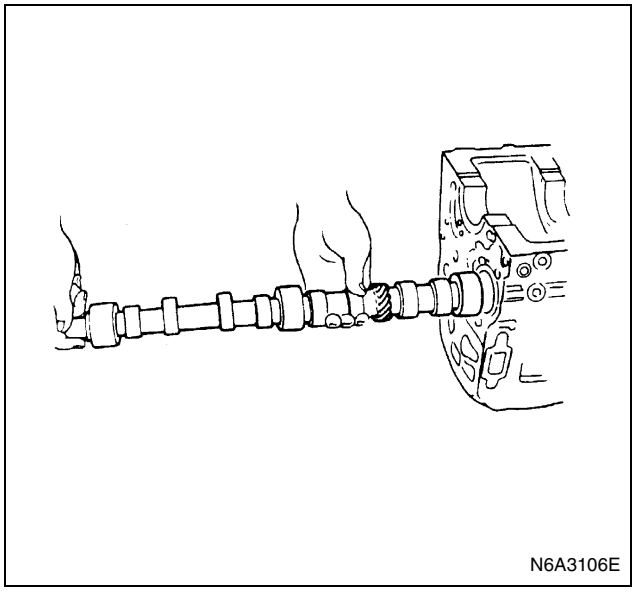
- Remove the oil pan bolts and remove oil pan from cylinder body.

7. Oil Pump Assembly
   - Remove the oil pump assembly from cylinder body.



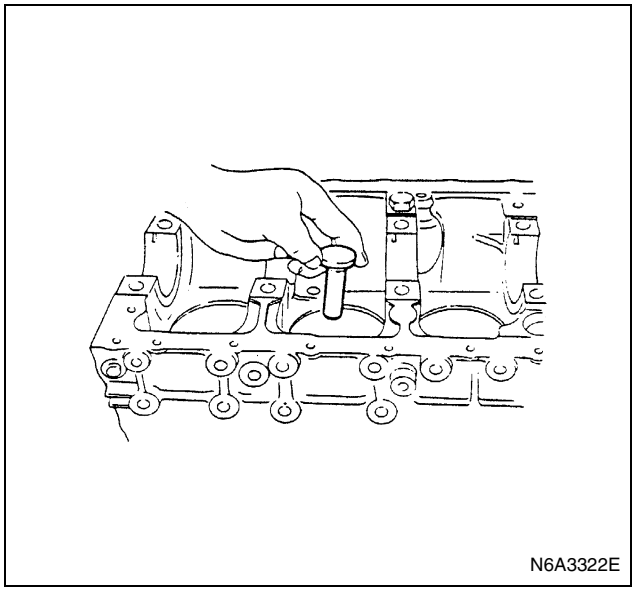
N6A3305E

8. Camshaft and Tappets
   - Remove the camshaft from cylinder body.



N6A3106E

- Take care not to damage the camshaft bearings.
- Take out the tappets from cylinder body.



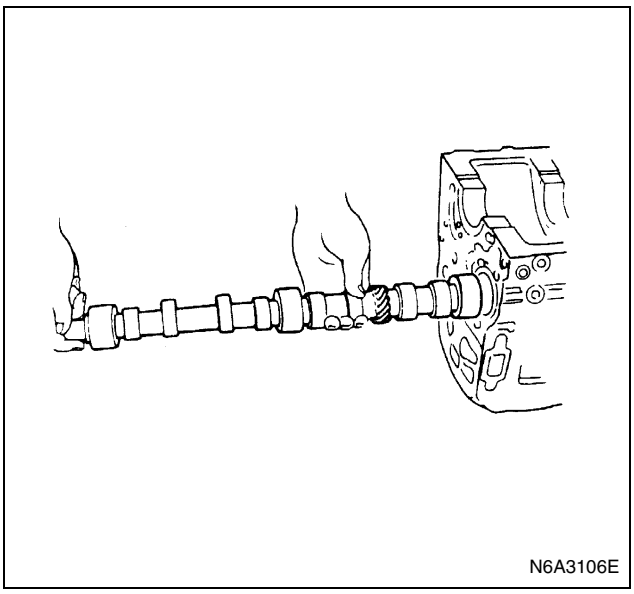
N6A3322E

Installation

1. Camshaft and Tappets
   - Apply a coat of engine oil to the tappet and the cylinder body tappet insert holes.
   - Locate the position mark applied at disassembly (if the tappet is to be reused).

Notice:
The tappet must be installed before the camshaft.

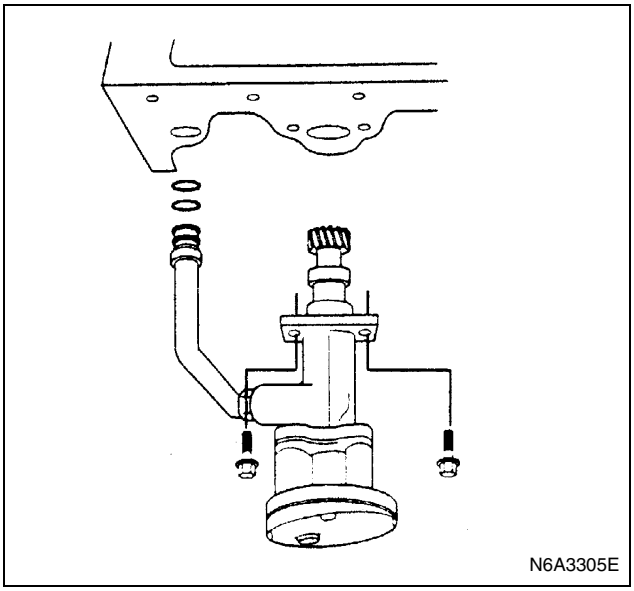
- Apply a coat of engine oil to the camshaft and the camshaft bearings.
- Install the camshaft to the cylinder body.
  Take care not to damage the camshaft bearings.



N6A3106E

2. Oil Pump Assembly
   - Prepare a solution of 80% engine oil and 20% molybdenum disulfide.
   - Apply and ample coat of the solution to the teeth of the oil pump pinion.
   - Apply engine oil to oil pipe O-ring and insert the O-ring in O-ring hold on cylinder block.
   - Install oil pump asm with oil pipe in cylinder block and tighten fixing bolts to the specified torque.

Tighten:
- Oil pump bolt to 19 N·m (1.9 kg·m / 14 lb·ft)



N6A3305E

   - Tighten sleeve nut to the specified torque.

Tighten:
- Oil pump bolt to 25 N·m (2.5 kg·m / 18 lb·ft)

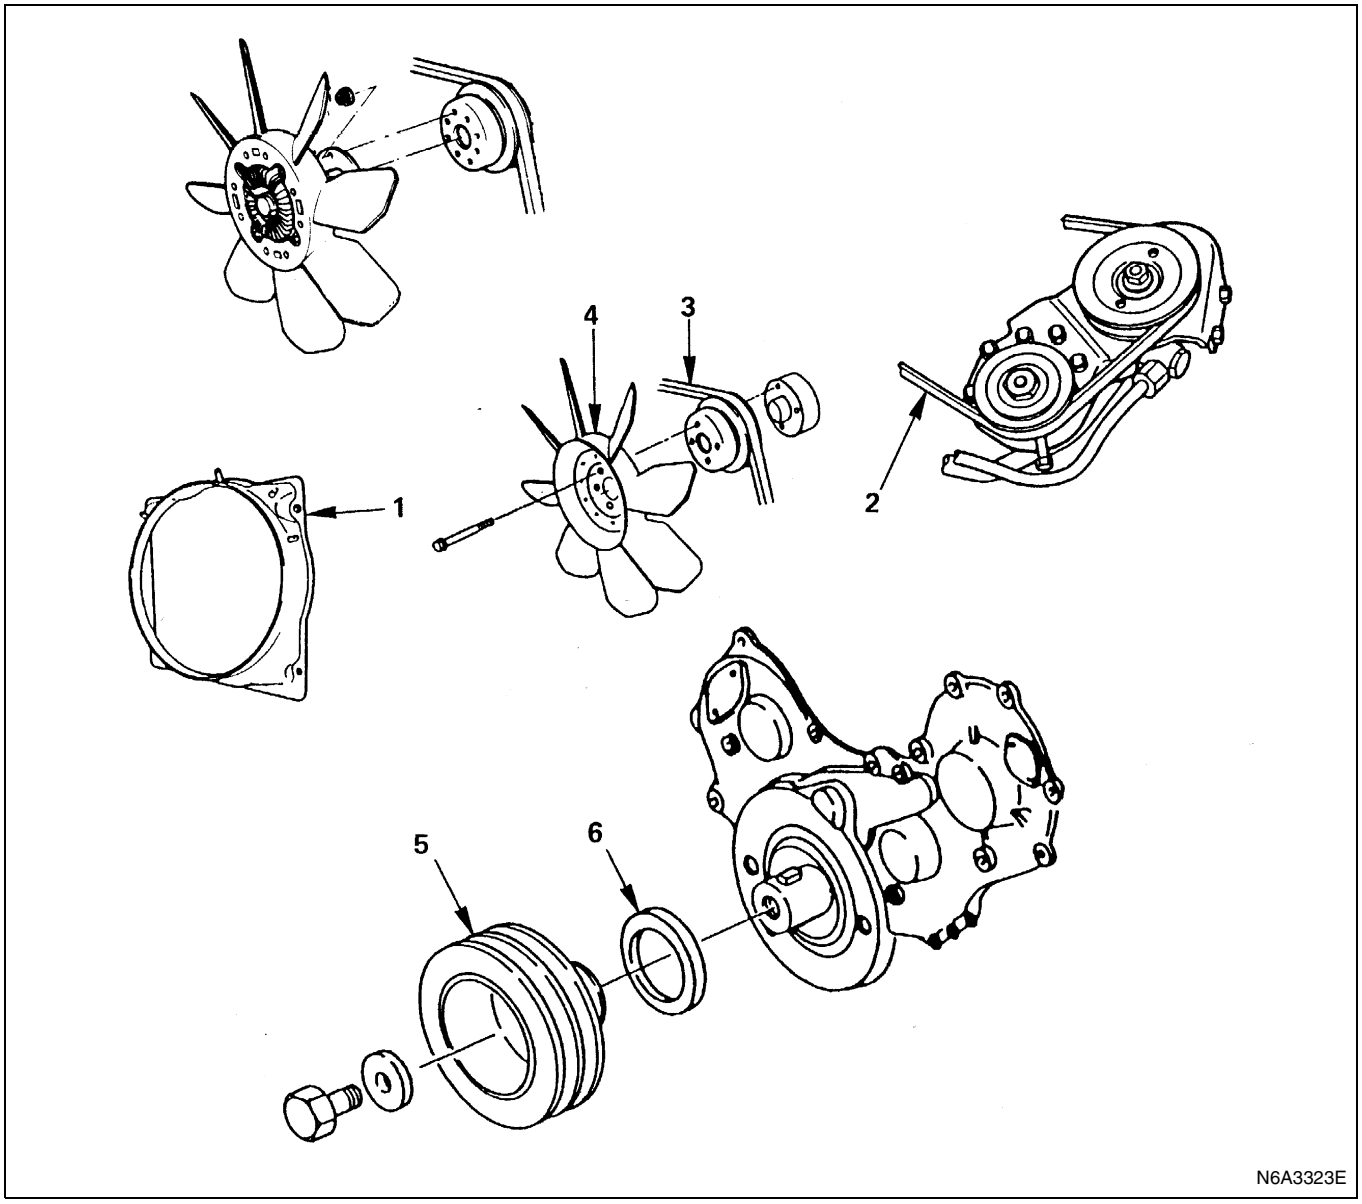
3. Oil Pan Assembly
   Above works refer to “OIL PAN” Section in this manual.
4. Timing Belt
   1) Camshaft timing pulley
   2) Timing belt
   3) Flange: injection pump pulley
   4) Flange: camshaft pulley
   5) Timing pulley lower cover
   6) Timing pulley upper cover
   7) Crankshaft damper pulley
   8) Cooling fan assembly
   Above works refer to “TIMING BELT (Belt Type)” Section in this manual.
5. Timing Gear (Gear Type)
   1) Camshaft timing gear
   2) Timing gear case cover
   3) Noise cover spacer
   4) Noise shield cover
   5) Crankshaft damper pulley
   6) Cooling fan assembly
   Above works refer to “TIMING GEAR (Gear Type)” Section in this manual.
6. Cylinder Head Assembly and Gasket
   1) Cylinder head gasket
   Piston Head Projection Measurement Point
   2) Cylinder head assembly
   3) Push rod
   4) Rocker arm shaft
   Valve Clearance Adjustment
   5) Cylinder head cover
   6) By-pass hose
   7) Oil cooler water pipe (Oil cooler Model)
   8) Oil level gauge guide tube
   9) Glow plug harness
   10) PCV hose
   11) Fuel leak off pipe
   12) Injection pipe
   Above works refer to “CYLINDER HEAD ASSEMBLY AND GASKET” Section in this manual.
7. Engine Assembly
   1) Engine assembly
   2) Support rubber
   3) Front exhaust pipe
   4) Vacuum pump hose
   5) Actuator vacuum hose
   6) Power steering pump & bracket assembly (With Power Steering Model)
   7) A/C compressor assembly (A/C Model)
   8) Oil pressure switch harness
   9) Fuel hose
   10) Glow plug harness
   11) Engine control cable
   12) Heater hose
   13) Intake air duct
   14) Radiator assembly
8. Transmission and Clutch Assembly

1) Clutch
2) Transmission
   Above works refer to “ENGINE ASSEMBLY” Section in this manual.

- Connect the battery ground cable.
- Pour coolant
- Pour engine oil
- Start the engine and check coolant leakage.

CRANKSHAFT FRONT OIL SEAL (Gear Drive Type)

Component



Legend

1. Fan shroud
2. Power steering pump drive belt
3. AC generator drive belt
4. Cooling fan assembly
5. Crankshaft damper pulley
6. Front oil seal

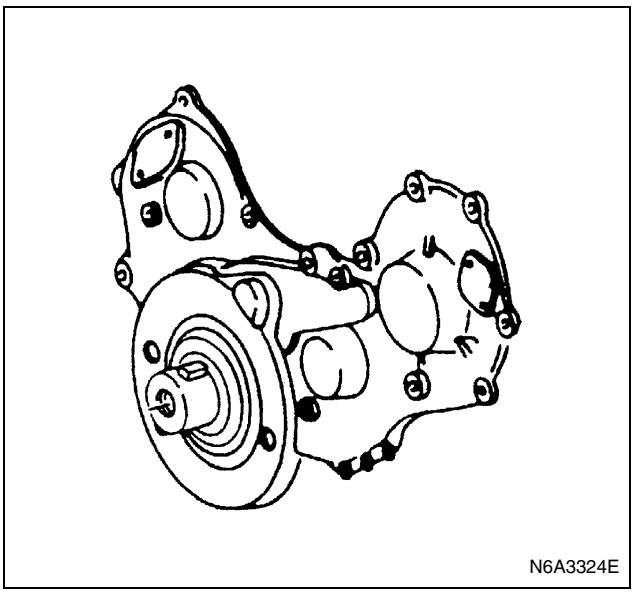
Removal

Preparation

- Disconnect battery ground cable.
- Drain coolant.

1. Fan Shroud
2. Power Steering Pump Drive Belt
   - Loosen power steering pump mounting bolt and adjust bolt, and remove the drive belt.
3. AC Generator Drive Belt
   - Loosen AC Generator mounting bolt (under side) and adjust plate lock bolt, and remove the drive belt.
4. Cooling Fan Assembly
   - Remove clamp nut, and remove cooling fan assembly, distant pipe, and fan pulley.
5. Crankshaft Damper Pulley

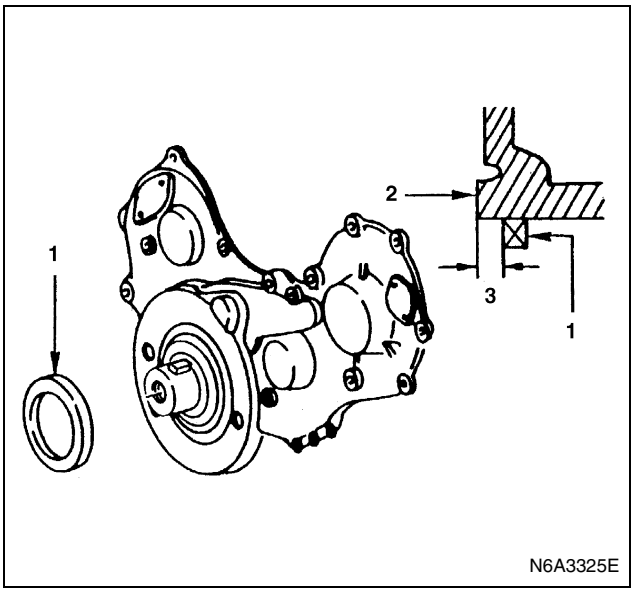
6. Front Oil Seal
   - Use a plastic hammer and a screwdriver to top around the oil seal to free it from the gear case cover.
     Take care not to damage the oil seal fitting surfaces.



N6A3324E

Installation

1. Front Oil Seal
   - Use the installer to install the front oil seal (1) to the gear case cover (2).
     Oil Seal Installer: 5-8840-2061-0
     Note the oil seal installation depth (3) shown in the illustration.
     Depth (3) = 1 mm (0.039 in.)

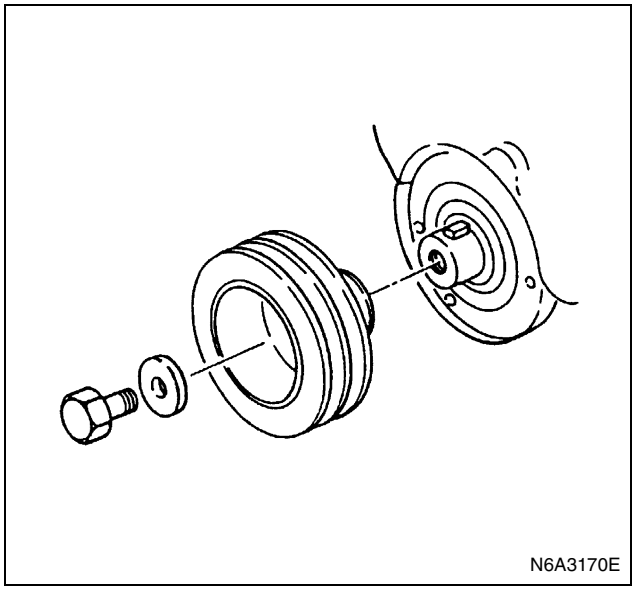


N6A3325E

2. Crankshaft Damper Pulley
   Tighten the crankshaft damper pulley bolt to the specified torque.

Notice:
Hold the flywheel ring gear stationary to prevent the crankshaft from turning when tightening the damper pulley.

Tighten:
- Pulley boss bolt to 206 N·m (21 kg·m / 152 lb·ft)



N6A3170E

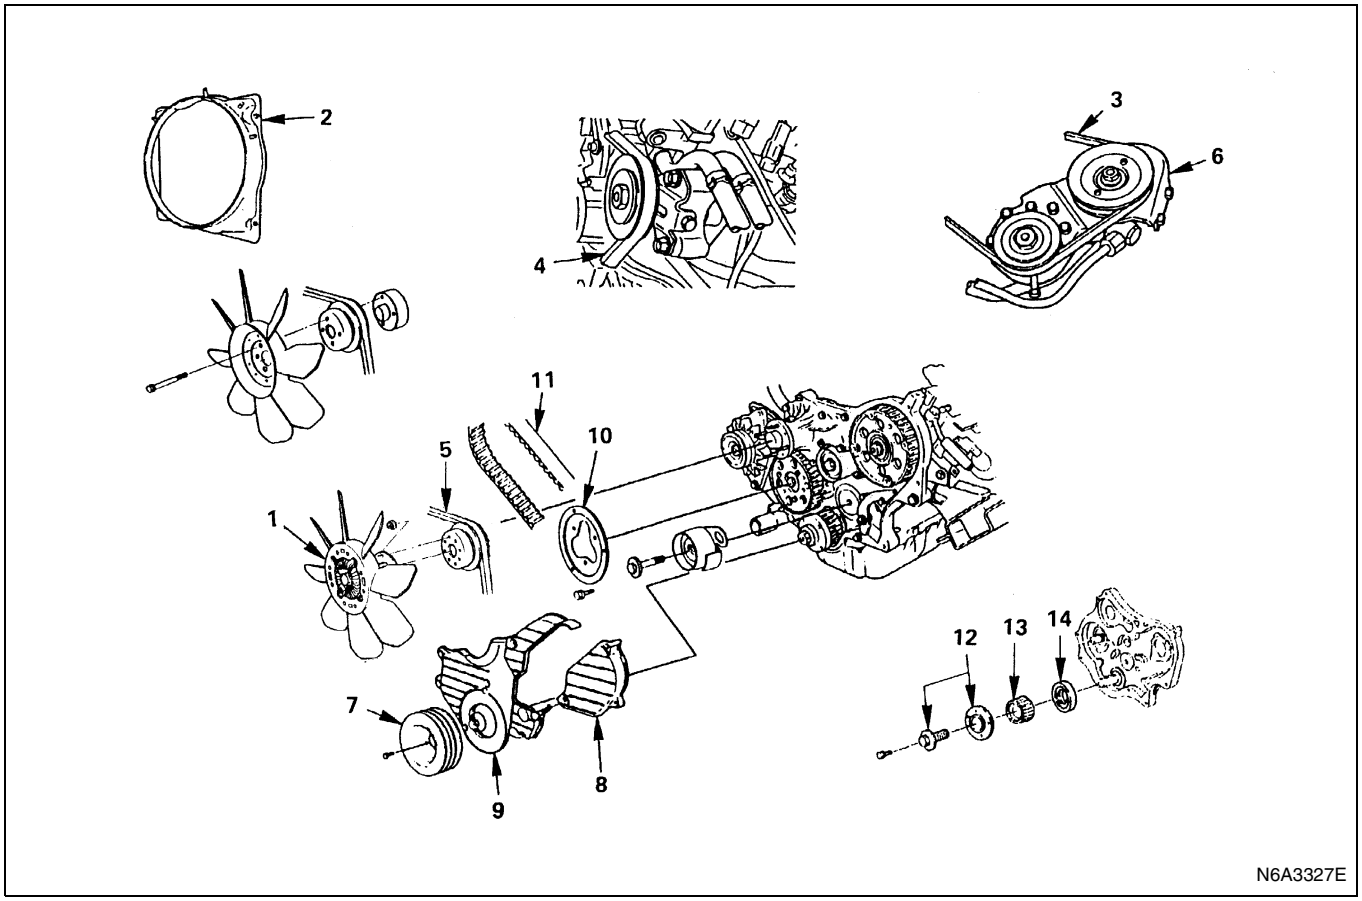
3. Cooling Fan Assembly
   - Mount fan pulley, distance piece, and cooling fan asm (in this order) on the water pump, and tighten to the specified torque.

Tighten:
- Pulley boss bolt to 8 N·m (0.8 kg·m / 69 lb·in)

4. AC Generator Drive Belt
   - Install AC Generator drive belt and adjust belt tension.
   - Refer to Drive Belt Adjustment in this section.
5. Power Steering Pump Drive Belt
   - Install power steering pump drive belt and adjust belt tension.
   - Refer to “Drive Belt Adjustment” in this section.
6. Fan Shroud
   - Install the fan shroud and reservoir tank hose.
   - Pour coolant
   - Start the engine and check coolant leakage.

CRANKSHAFT FRONT OIL SEAL (Belt Drive Type)

Component



Legend

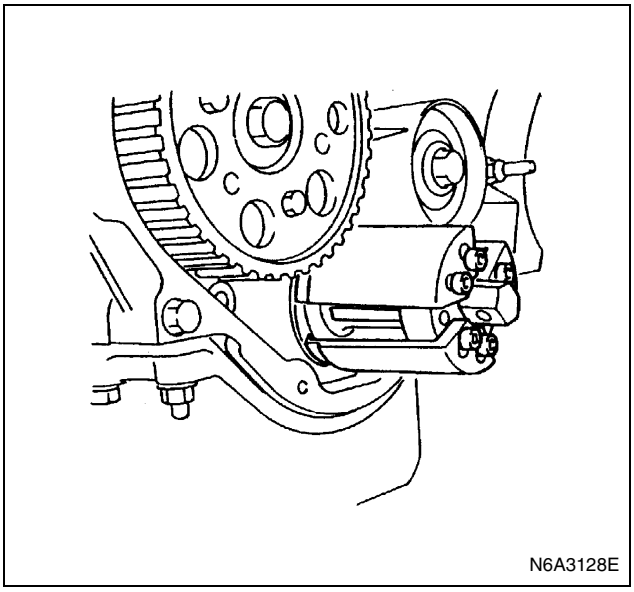
1. Cooling fan assembly
2. Fan shroud
3. Power steering pump drive
4. A/C compressor drive belt
5. AC Generator drive belt
6. Power steering pump bracket assembly
7. Crankshaft damper pulley
8. Timing pulley upper cover
9. Timing pulley lower cover
10. Flange; Camshaft pulley
11. Timing belt
12. Crankshaft pulley center
13. Crankshaft timing pulley
14. Front oil seal

Removal

Preparation

- Disconnect battery ground cable.
- Drain coolant.

1. Cooling Fan Assembly
2. Fan Shroud
3. Power Steering Pump Drive Belt (P/S Model)
4. A/C Compressor Drive Belt (A/C Model)
5. AC Generator Drive Belt
6. Power Steering Pump Bracket Assembly (P/S Model)
7. Crankshaft Damper Pulley
8. Timing Pulley Upper Cover
9. Timing Pulley Lower Cover
10. Flange; Camshaft Pulley
11. Timing Belt
    Above works refer to “TIMING BELT (Belt Type)” Section in this manual.
12. Crankshaft Pulley Center
    - Remove the pulley center by using special tool.
      Remover: 5-8840-0161-0
13. Crankshaft Timing Pulley
14. Front Oil Seal
    - Remove the oil seal by using special tool.
    - With the oil seal pushed in deep, install the special tool as shown in the illustration to remove the oil seal.
      Front oil seal remover: 5-8840-2362-0



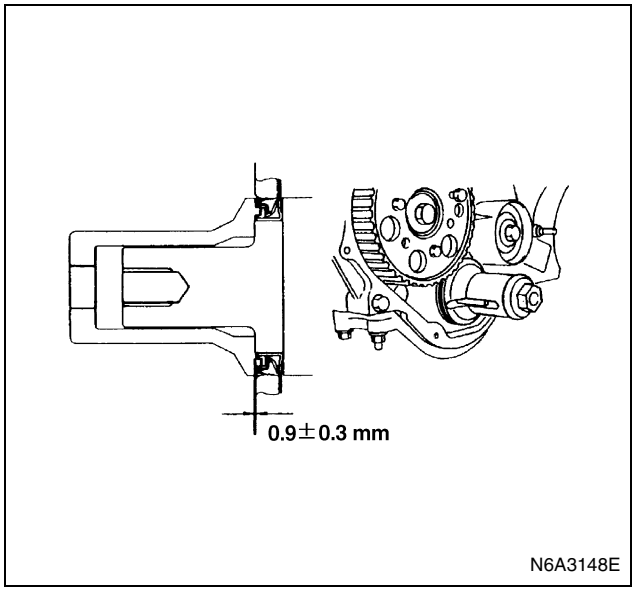
N6A3128E

Notice:
Take care not to damage sealing surface of front plate and crankshaft when removing oil seal.

Installation

1. Front Oil Seal
   - Install the oil seal by using special tool.
     Installer: Front oil seal: 5-8840-2361-0
     1) With the sleeve attached to the oil seal, put it in the front end of the crankshaft.
     2) With the edge portion of the oil seal attached securely to the crankshaft, tighten it with the center bolt until the sleeve hits securely against the reference plane at the front end of the crankshaft.
     3) Remove the sleeve.
     4) After pressing in the seal, check the measurement of the oil seal.

Standard	mm (in)
0.6 — 1.2 (0.024 — 0.047)	

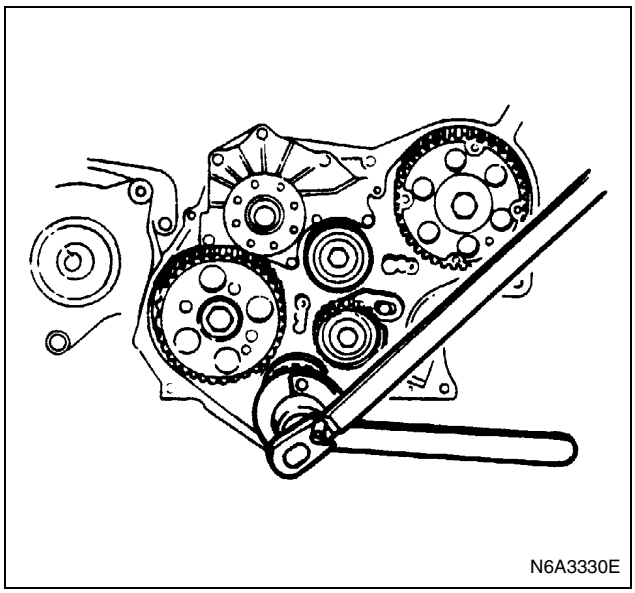


N6A3148E

Notice:
- Install the oil seal after assembling the timing pulley housing.
- The lip portion of the oil seal is applied with oil.
- Take note of the press-in direction of the oil seal.

2. Crankshaft Timing Pulley
3. Crankshaft Pulley Center
   - Install the timing pulley center and tighten bolt to the specified torque.

Tighten:
- Pulley center bolt to 206 N·m (21 kg·m / 152 lb·ft)



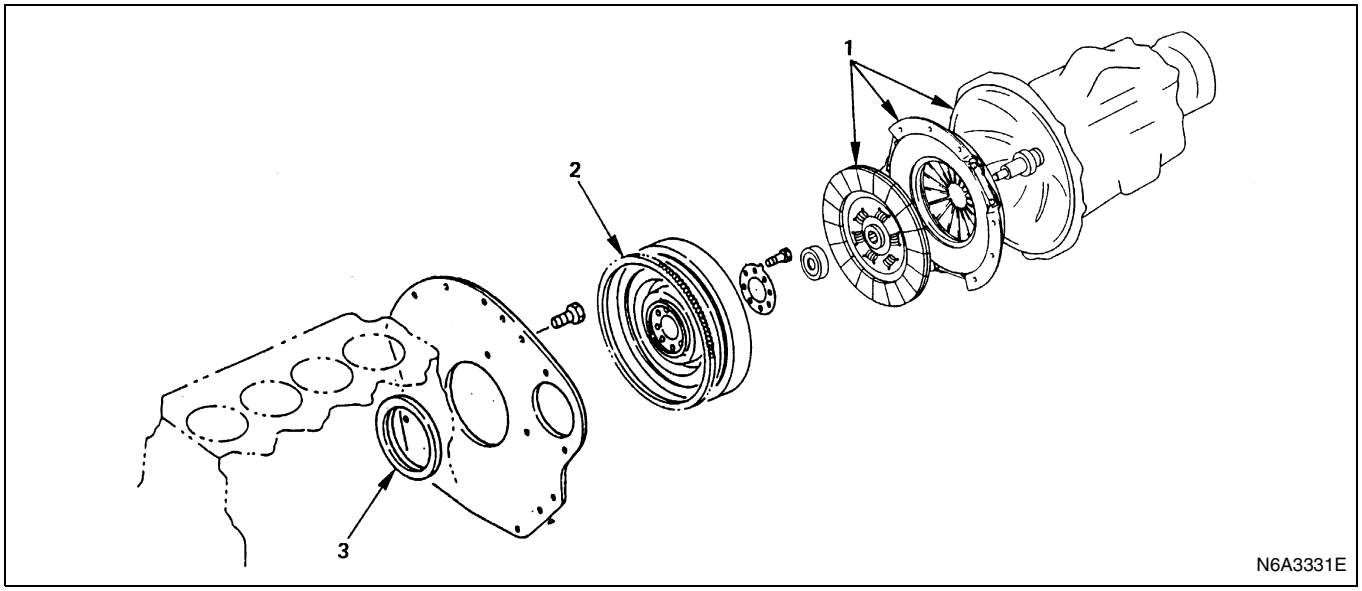
N6A3330E

4. Timing Belt
5. Flange; Camshaft Pulley
6. Timing Pulley Lower Cover
7. Timing Pulley Upper Cover
8. Crankshaft Damper Pulley
9. Power Steering Pump Bracket Assembly (P/S Model)

10. AC Generator Drive Belt
11. A/C Compressor Drive Belt (A/C Model)
12. Power Steering Pump Drive Belt (P/S pump Model)
13. Fan Shroud
14. Cooling Fan Assembly
    Above works refer to “TIMING BELT (Belt Type)” Section in this manual.

CRANKSHAFT REAR OIL SEAL (Gear & Belt Drive Type)

Component



Legend

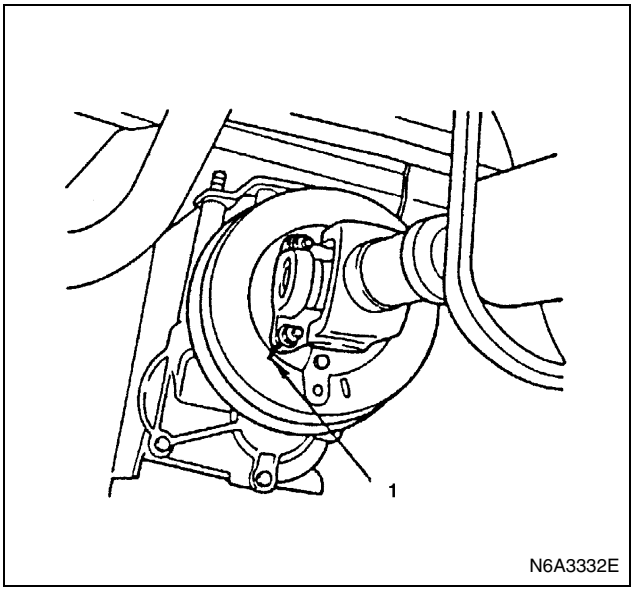
1. Transmission and clutch assembly
2. Flywheel
3. Rear oil seal

Removal

Preparation

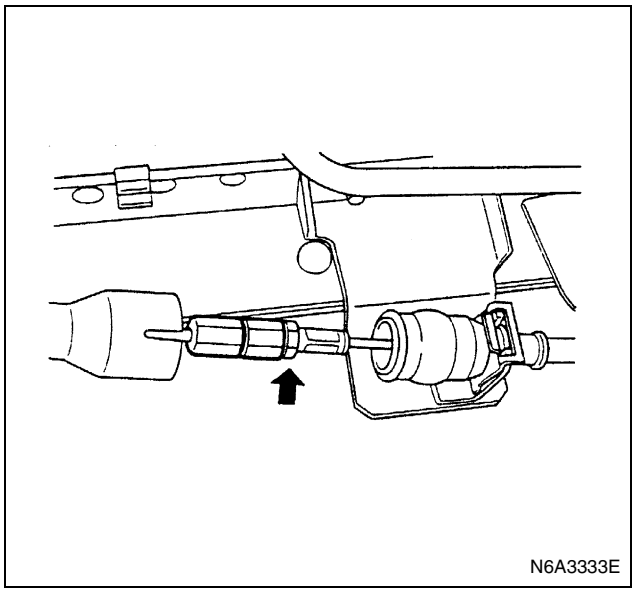
- Disconnect battery ground cable

1. Transmission and Clutch Assembly
   - Raise vehicle and support with suitable safely.
     1) Transmission
        - Reference mark (1) the flange yoke to the parking brake drum.



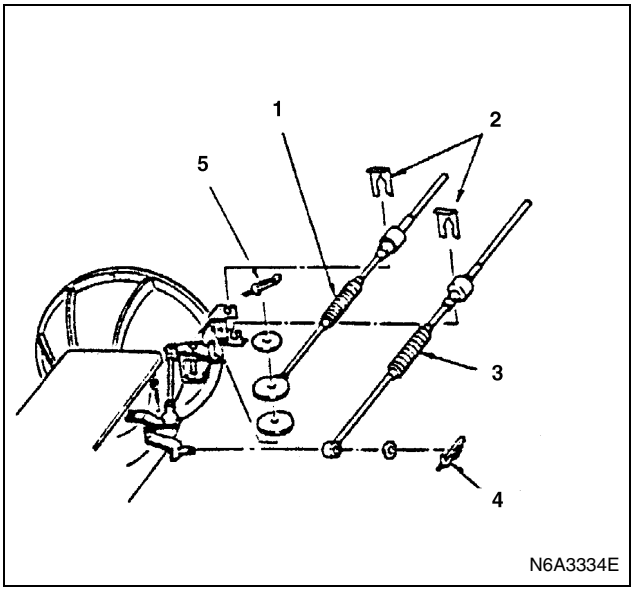
- Disconnect the propeller shaft at flange yoke.
- Put aside the propeller shaft and tie it to the frame so that it does not interface with servicing work.

2) Parking Brake Cable
- Move the joint cover.
- Disconnect the joint bolt.
- Remove the clip then disconnect the cable from the bracket.



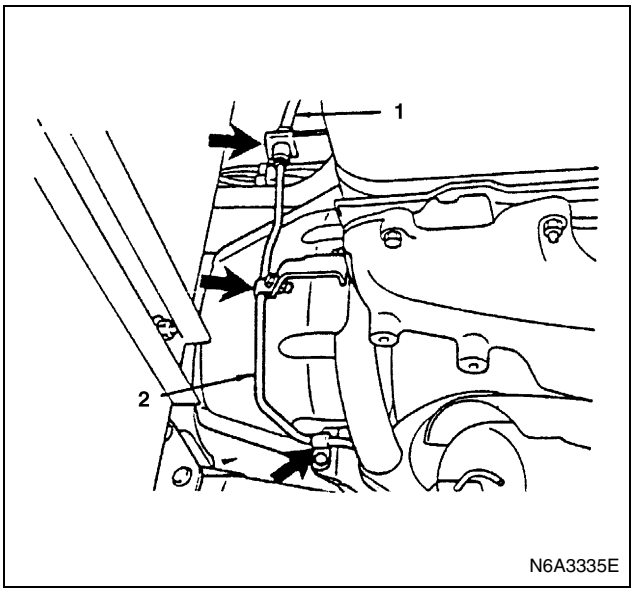
3) Wiring Connector
- Disconnect the wiring connectors from the car speed sensor, the neutral switch and the back-up light switch.

4) Shift Cable and Select Cable
- Disconnect the shift cable and select cable on the transmission side.



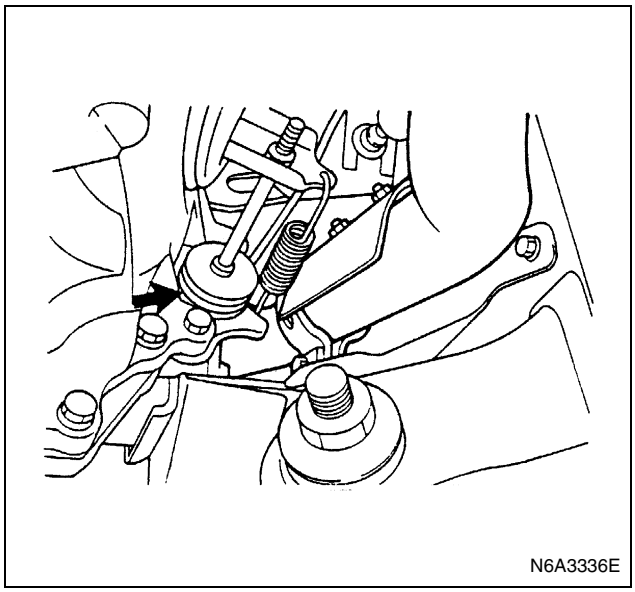
Legend
1. Shift cable
2. Clip
3. Select cable
4. Snap pin
5. Snap pin

5) Clutch Slave Cylinder
- Remove the clutch pipe fixing clips and the clip bracket (Right hand drive models only).

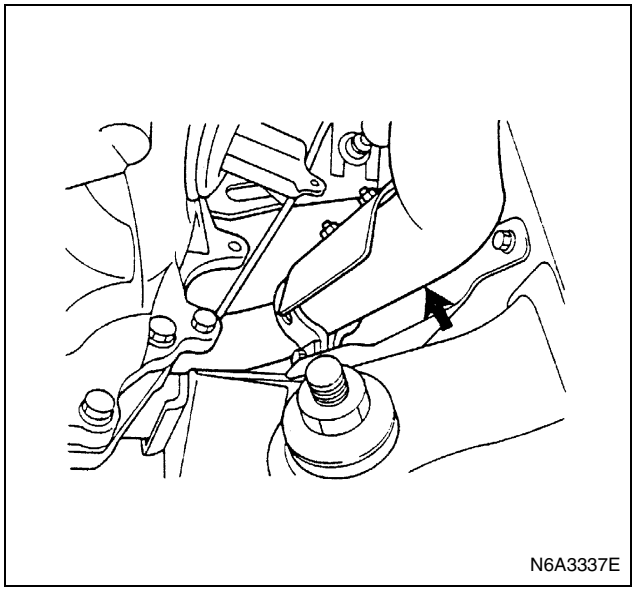


Legend
1. Flexible hose
2. Clutch pipe

- Remove the slave cylinder assembly with the flexible hose attached, and then tie it to the frame so that it does not interface with servicing work.



6) Exhaust Brake Assembly
7) Front Exhaust Pipe



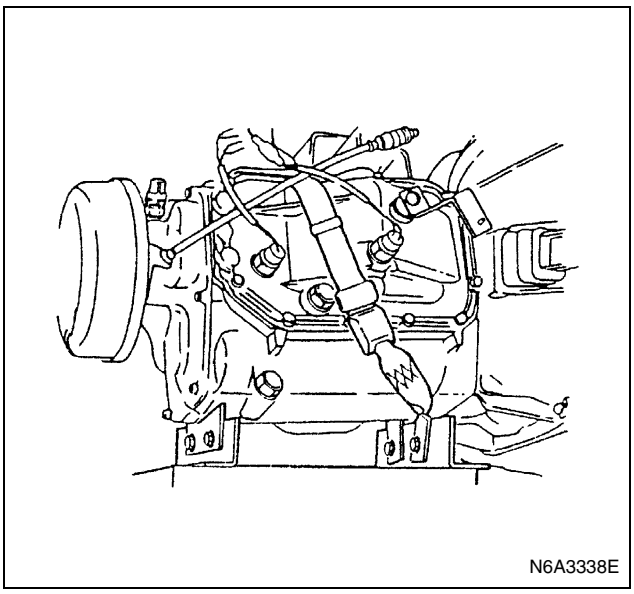
8) Transmission Assembly

Notice:
The exhaust pipe bracket, the gear control bracket and the clips are sometimes installed in the wrong position or direction confusedly. To prevent incorrect installation of these parts, put a correct installation mark on them.

- Support the transmission with mission jack.

Caution:
To prevent the falling of the transmission, tie it firmly to the jack with a chain or belt.

Do not allow transmission to hang unsupported from clutch. Damage to the clutch assembly will result.



N6A3338E

- Remove the nuts of the transmission mounting bracket on the crossmember side.
- Engine and transmission angles may need to be adjusted for removal.
- Hold the rear section of the engine by the jack or hoist.

Caution:
When lifting the engine by the jack, use wood blocks to prevent any possible damage to the oil pan.

- Remove transmission fastening bolts.
- Pull out the transmission assembly rearward.

9) Mounting Bracket

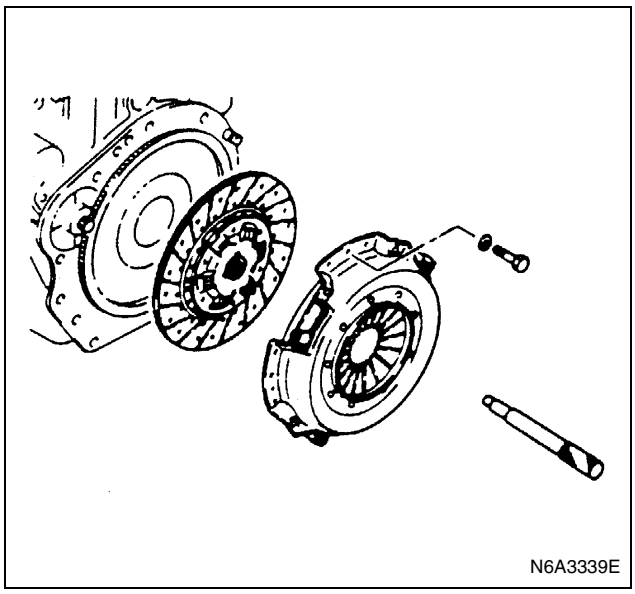
- Raise vehicle and support with suitable safety stands.

Caution:
Do not let clutch fluid remain on a painted surface, wash it off immediately.

10) Pressure Plate Assembly

11) Driven Plate Assembly

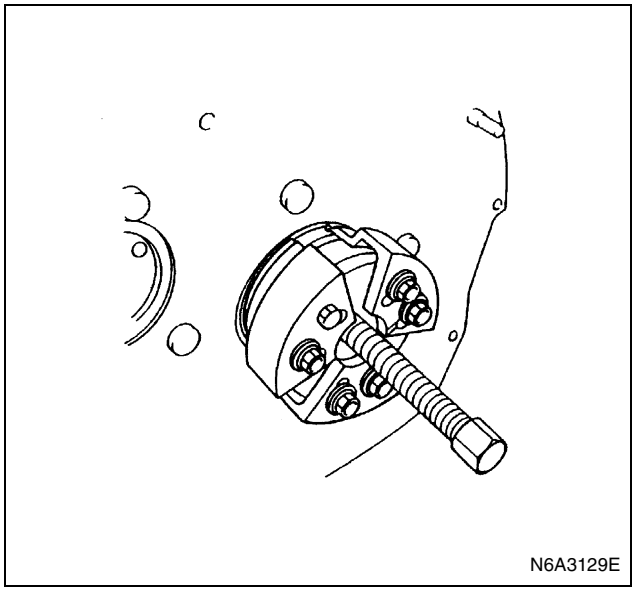
- Use the pilot aligner to prevent the driven plate assembly from falling free.
  Pilot Aligner: 5-5825-3001-0



N6A3339E

- Mark the flywheel and pressure plate lug for alignment when installing.
- Loosen the pressure plate assembly fixing bolts.

2. Flywheel
3. Rear Oil Seal
   - With the oil seal pushed in deep, install the special tool as shown in the illustration to remove the oil seal.
   - Rear oil seal Remove: 5-8840-2360-0



N6A3129E

Notice:
Take care not to damage the crankshaft or oil seal retainer when removing oil seal.

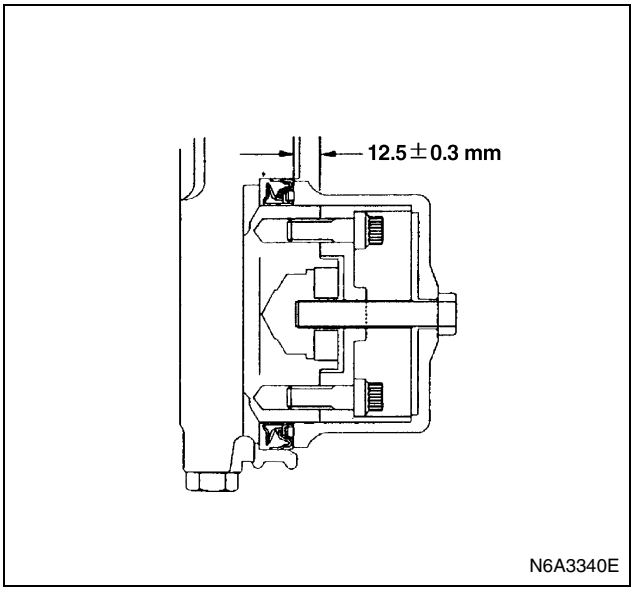
Installation

1. Rear Oil Seal
   - Use the oil seal installer the oil seal to the cylinder body.
     Rear oil seal Install: 5-8840-2359-0

Notice:
Wipe off rust and scraps clean from the press-in portion of the oil seal.

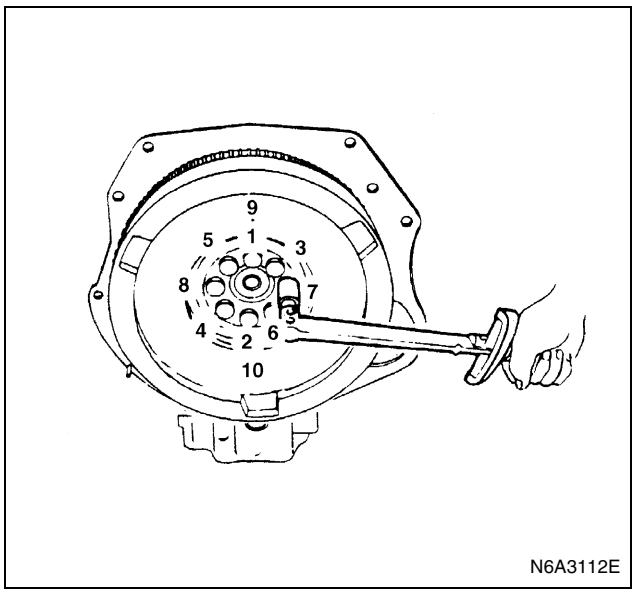
1) Take note of the press-in direction of the oil seal.
2) Install the adapter of the special tool to the rear end of the crankshaft with two bolts.
3) Install the oil seal to the outer circumference of the adapter.
4) Insert the sleeve into the adapter portion, and tighten it in with the bolt (M12 × 1.75L = 70) until the adapter section hits the sleeve.
5) Remove the adapter and the sleeve.
6) After installing the oil seal, check the measurement of the oil seal.

Standard	mm (in)
12.2 — 12.8 (0.48 — 0.50)	



2. Flywheel
   - Apply engine oil to fixing bolts.
   - Tighten the flywheel bolts to the specified torque in two steps using the Angular Tightening Method. Follow the numerical order shown in the illustration.

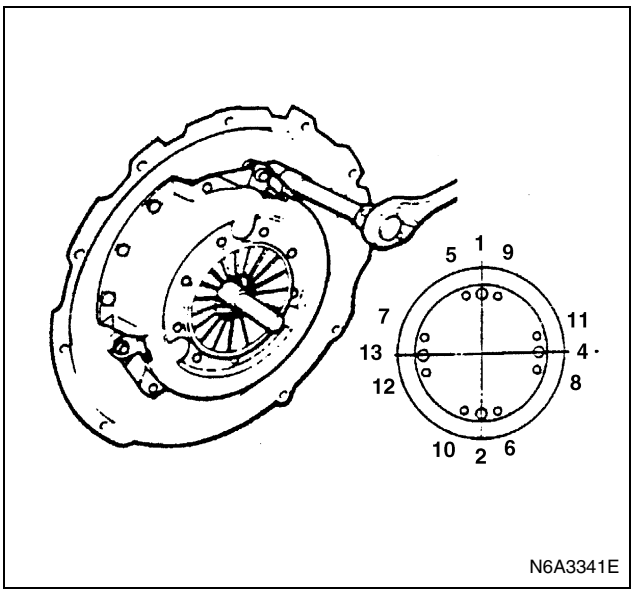
Tighten:
- Flywheel bolt to
  1st step: 59 N·m (6.0 kg·m / 43 lb·ft)
  2nd step: 60° — 90°



3. Transmission and Clutch Assembly
   1) Driven Plate Assembly
      - Apply multi-purpose with MOS2 type grease to the driven plate hub spline.
      - Use the pilot aligner to install the driven plate assembly.
        Pilot Aligner: 5-5825-3001-0

   2) Pressure Plate Assembly
      - Tighten pressure plate assembly fixing bolts in numerical order.

Tighten:
- Pressure plate fixing bolt to 18 N·m (1.3 kg·m / 13 lb·ft)



- Remove the pilot aligner.

Notice:
In case a new pressure plate assembly is mounted, after tightening a pressure plate at the specified torque, be sure to remove the wiring for protection of a diaphragm spring.

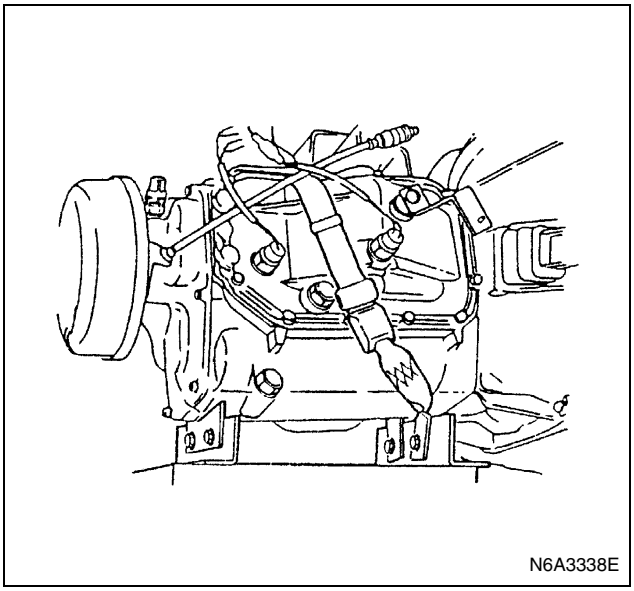
3) Mounting Bracket

Tighten:
- Mounting bracket nuts to 69 N·m (7.0 kg·m / 51 lb·ft)

4) Transmission Assembly

- Support the transmission with mission jack.

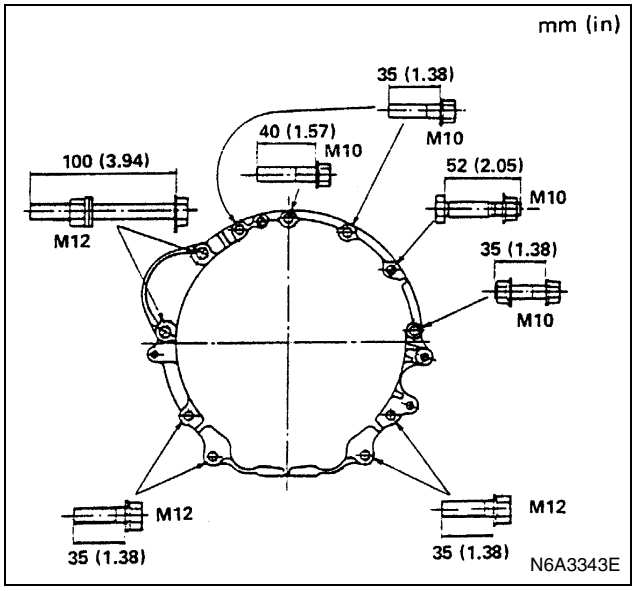
Caution:
To prevent the falling of the transmission, tie it securely to the jack with a chain or belt.



- Shift transmission into high gear.
- Align transmission with engine slope.
- Turn output parking brake drum to aid clutch spring engagement.

Tighten:
- Clutch housing to flywheel hosing bolts to
  M10: 46 N·m (4.7 kg·m / 34 lb·ft)
  M12: 91 N·m (9.3 kg·m / 67 lb·ft)
  - Raise engine and transmission up into rear transmission mount.

Tighten:
- Engine rear mounting nuts and bolts to
  M10: 40 N·m (4.1 kg·m / 30 lb·ft)
  M12: 69 N·m (7.0 kg·m / 51 lb·ft)



5) Front Exhaust Pipe

Tighten:
- Front exhaust pipe bolts to 37 N·m (3.8 kg·m / 27 lb·ft)

6) Exhaust Brake Assembly

Tighten:
- Exhaust brake bolts to 17 N·m (1.8 kg·m / 12 lb·ft)

7) Clutch Slave Cylinder

Tighten:
- Slave cylinder bolts to 19 N·m (1.9 kg·m / 14 lb·ft)
  - Perform slave cylinder adjustment before installation of the return spring.
    a. Loosen the lock nut of the push rod.
    b. Turn the adjust nut until it reaches the shift fork.
    c. Back off the adjust nut 1.5 turns. (shift fork free play Approximately 2 mm / 0.1 in).
    d. Tighten the lock nut.

Tighten:
- Push rod lock nut to 16 N·m (1.6 kg·m / 12 lb·ft)

8) Shift Cable and Select Cable

9) Wiring Connector

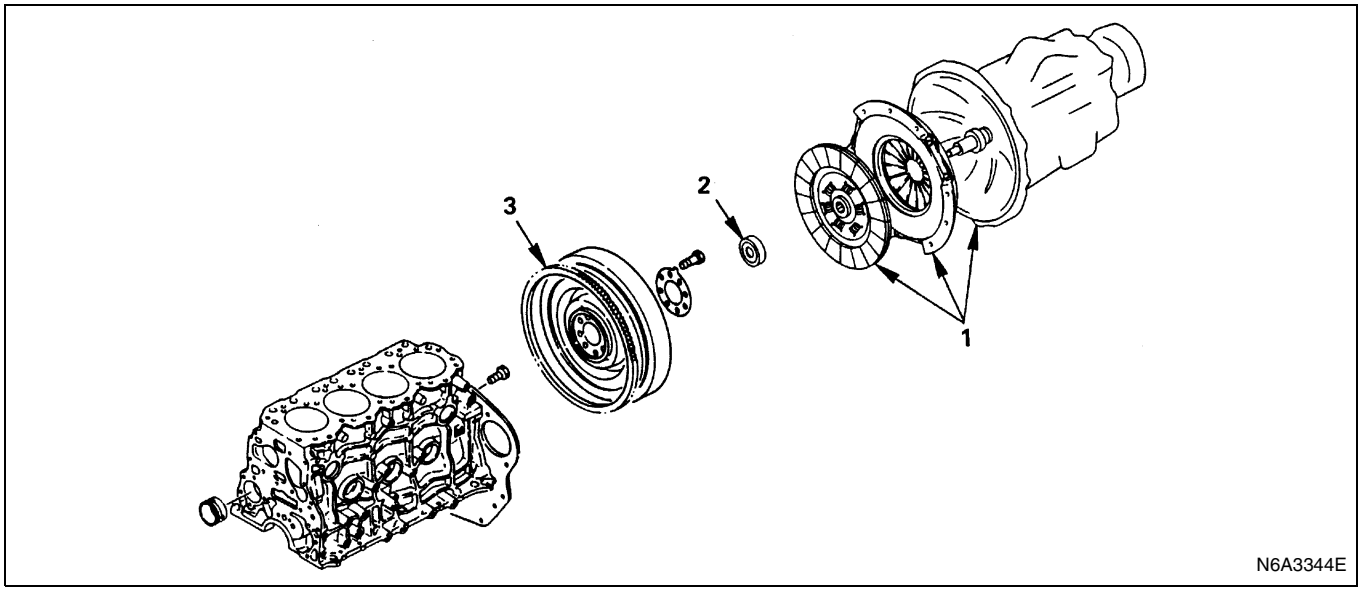
- Color of Connector
  Back-up Light Switch: Brown
  Neutral Switch: Gray

10) Parking Brake Cable
11) Propeller Shaft
- Line up reference mark.

Tighten:
- Propeller shaft nuts to 66 N·m (6.7 kg·m / 48 lb·ft)
- Connect battery ground cable.

FLYWHEEL AND PILOT BEARING

Component



Legend

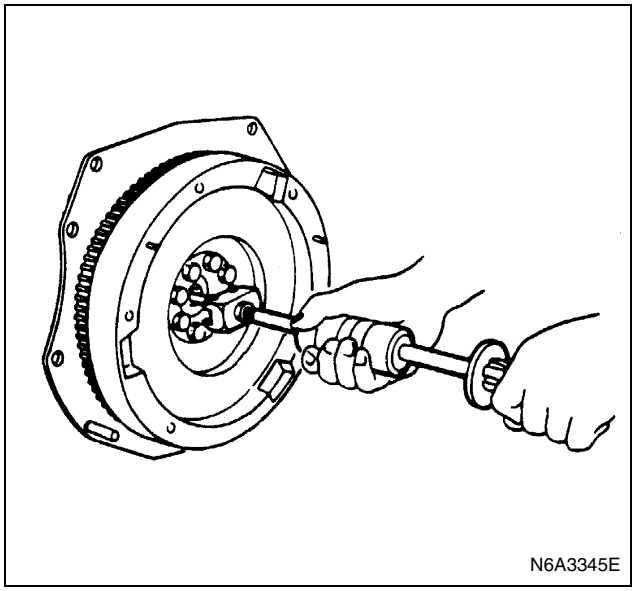
1. Transmission and clutch assembly
2. Pilot bearing
3. Flywheel

Removal

Preparation

- Disconnect battery ground cable.

1. Transmission and Clutch Assembly
   1) Transmission
   2) Clutch
      Above works refer to “ENGINE ASSEMBLY” Section in this manual.
2. Pilot Bearing
   - Remove pilot bearing using remover.
     Pilot Bearing Puller: 5-8840-2000-0
     Sliding hammer: 5-8840-0019-0



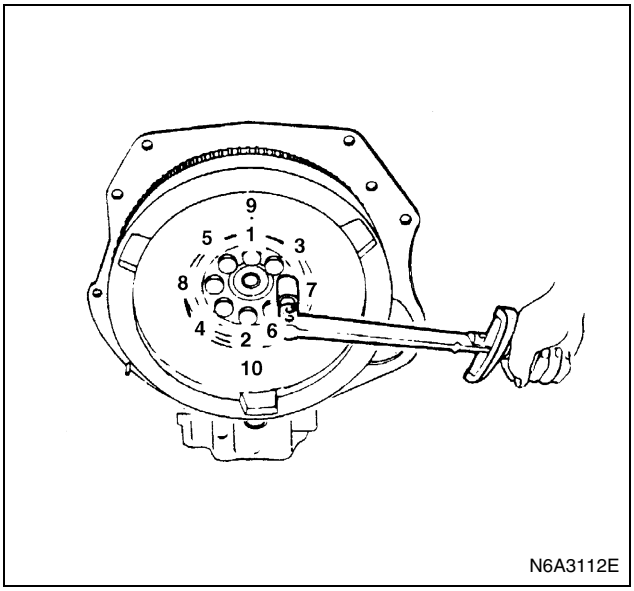
3. Flywheel
   - Set the flywheel stopper.
   - Loosen flywheel fixing bolts then remove the flywheel.

Installation

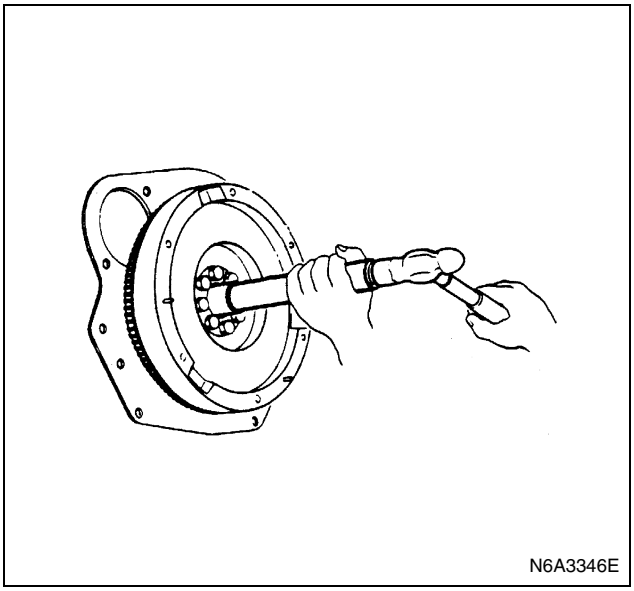
1. Flywheel
   - Apply engine oil to fixing bolts.
   - Tighten the flywheel bolts to the specified torque in two steps using the Angular Tightening Method. Follow the numerical order shown in the illustration.

Tighten:

- Flywheel bolt to
  1st step: 59 N·m (6.0 kg·m / 43 lb·ft)
  2nd step: 60° — 90°



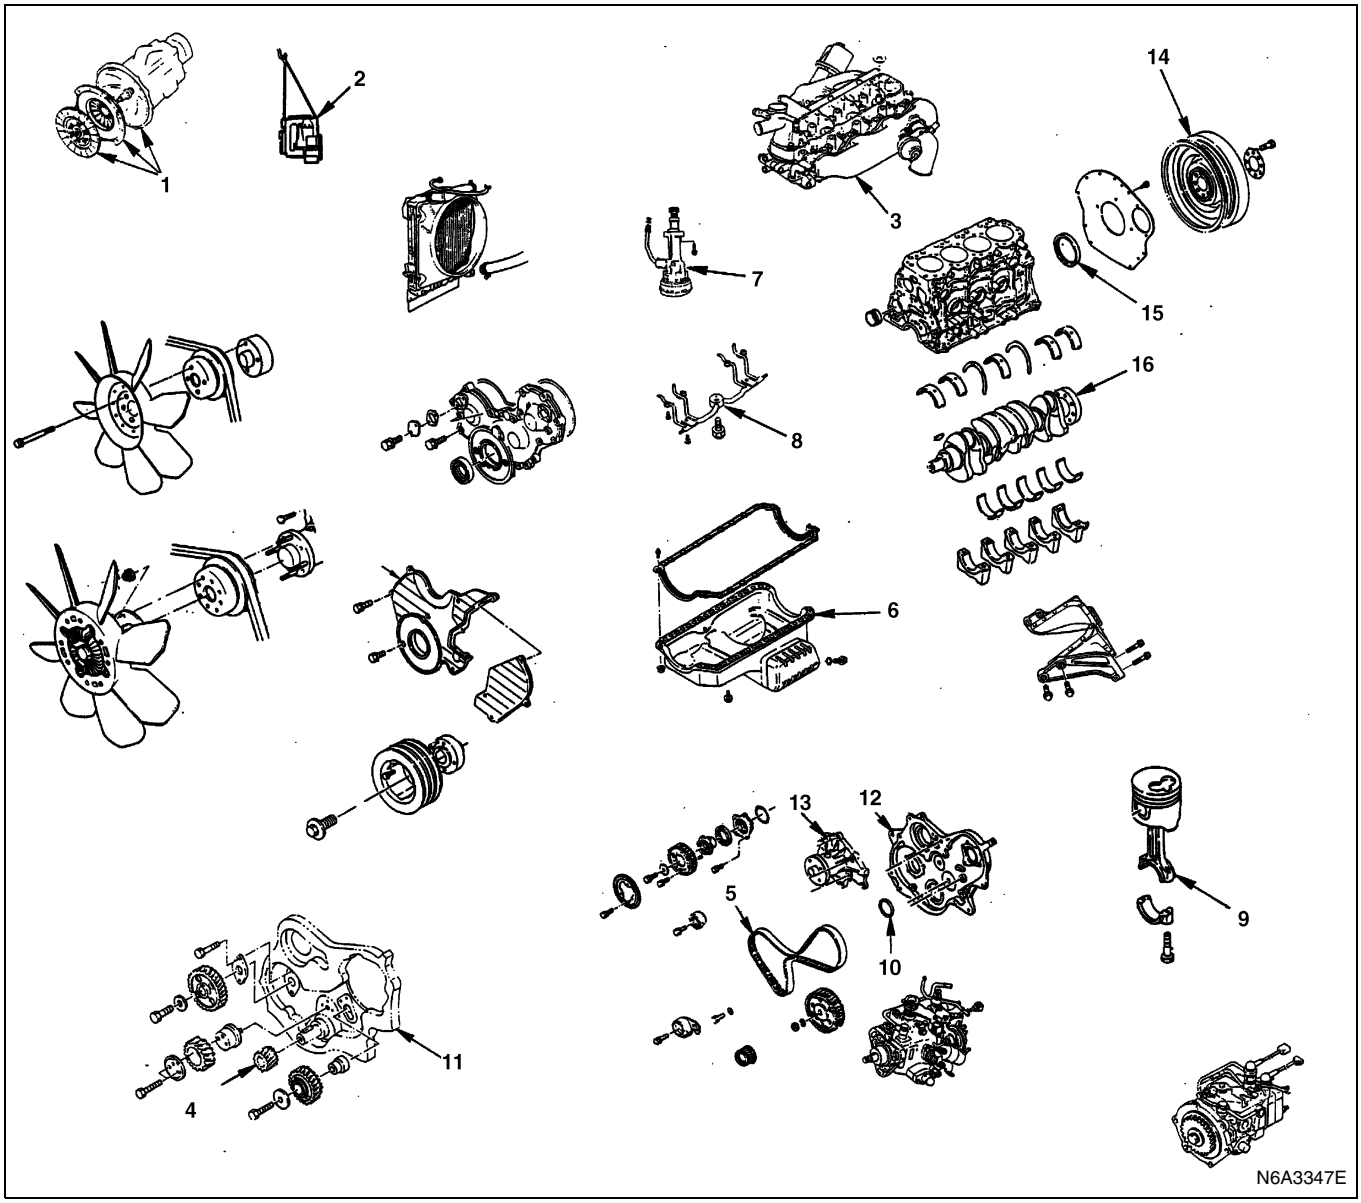
2. Pilot Bearing
   - Install the pilot bearing using installer.
     Pilot bearing Installer: 5-8522-0024-0



3. Transmission and Clutch Assembly
   1) Clutch
   2) Transmission
      Above works refer to “ENGINE ASSEMBLY” Section in this manual.

CRANKSHAFT AND MAIN BEARINGS

Component



Legend

1. Transmission and clutch assembly
2. Engine assembly
3. Cylinder head assembly and gasket
4. Timing gear (Gear drive model)
5. Timing belt (Belt drive model)
6. Oil pan assembly
7. Oil pump assembly
8. Piston cooling oil pipe
9. Piston and connecting rod assembly
10. Front oil seal
11. Timing gear housing
12. Timing pulley housing
13. Water pump assembly
14. Flywheel and rear plate
15. Rear oil seal
16. Crankshaft and main bearing

Removal

Preparation

- Disconnect battery ground cable.
- Drain coolant from the radiator and engine.

1. Transmission and Clutch Assembly
   1) Transmission
   2) Clutch

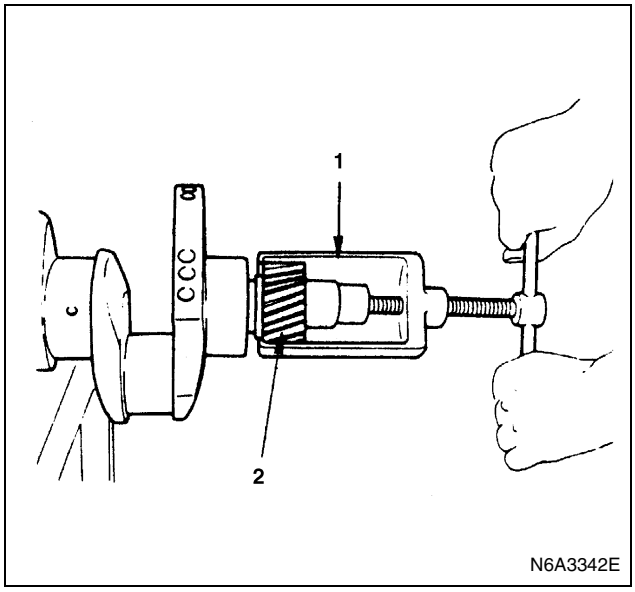
   Above works refer to “ENGINE ASSEMBLY” Section in this manual.
2. Engine Assembly
   1) Radiator assembly

2) Intake air duct
3) Heater hose
4) Engine control cable
5) Glow plug harness
6) Fuel hose
7) Oil pressure switch harness
8) A/C compressor assembly
9) Power steering pump bracket assembly (Power Steering Model)
10) Actuator vacuum hose (Exhaust Brake Model)
11) Vacuum pump hose (Exhaust Brake Model)
12) Front exhaust pipe
13) Support rubber
14) Engine assembly
Above works refer to “ENGINE ASSEMBLY” Section in this manual.

3. Cylinder Head Assembly and Gasket
1) Injection pipe
2) Leak off pipe
3) PCV hose
4) Glow plug harness
5) Oil level gauge guide tube
6) Oil cooler water pipe (Oil Cooler Model)
7) By-pass hose
8) Cylinder head cover
9) Rocker arm shaft
10) Push rod
11) Cylinder head assembly
12) Cylinder head gasket
Above works refer to “CYLINDER HEAD ASSEMBLY AND GASKET” Section in this manual.

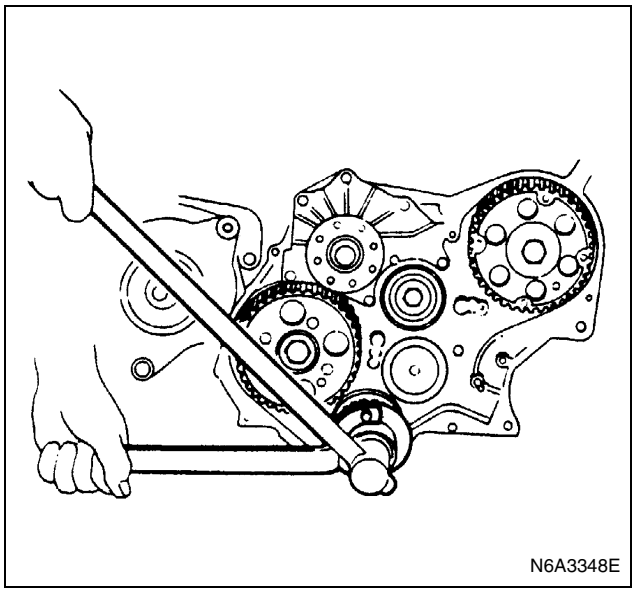
4. Timing Gear (Gear Drive Model)
1) Cooling fan assembly
2) Crankshaft damper pulley
3) Noise shield cover
4) Noise cover spacer
5) Timing gear case cover
6) Oil pipe
7) Idle gear
8) Idle gear “B” and shaft
9) Injection pump
10) Camshaft timing gear
Above works refer to “TIMING GEAR (Gear Type)” Section in this manual.
11) Crankshaft gear

• Use the crankshaft timing gear remover (1) to remove the crankshaft gear (2).
Crankshaft Timing Gear Remover: 5-8840-2057-0



5. Timing Belt (Belt Drive Model)
1) Cooling fan assembly
2) Crankshaft damper pulley
3) Timing pulley upper cover
4) Timing pulley lower cover
5) Flange: camshaft pulley
6) Flange: injection pump pulley
7) Timing belt
Above works refer to “TIMING BELT (Belt Type)” Section in this manual.
8) Crankshaft timing pulley center

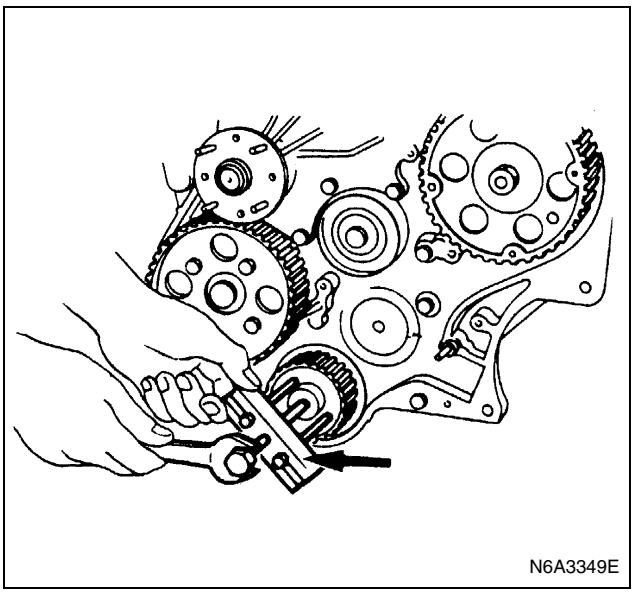
• Use the fixing wrench to prevent the crankshaft from turning.
Fixing Wrench: 5-8840-0161-0
• Remove the timing pulley center from the crankshaft.



9) Crankshaft timing pulley

• Block the crankshaft with a piece of hard wood.

• Use the crankshaft timing pulley puller to remove the timing pulley.
Crankshaft Timing Pulley Puller: 5-8840-2035-0

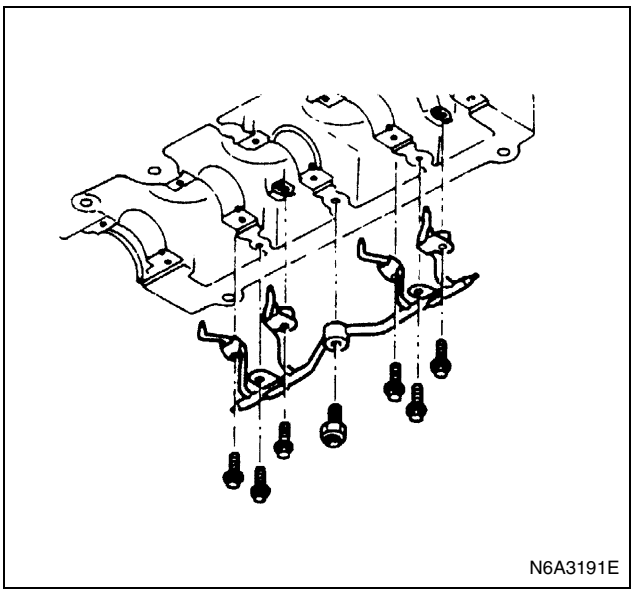


N6A3349E

10) Injection pump timing pulley
11) Injection pump
Above works refer to “CYLINDER BLOCK ASSEMBLY” Section in this manual.
12) Camshaft timing pulley

6. Oil Pan Assembly
7. Oil Pump Assembly
Above works refer to “CAMSHAFT AND TAPPET” Section in this manual.
8. Piston Cooling Oil Pipe

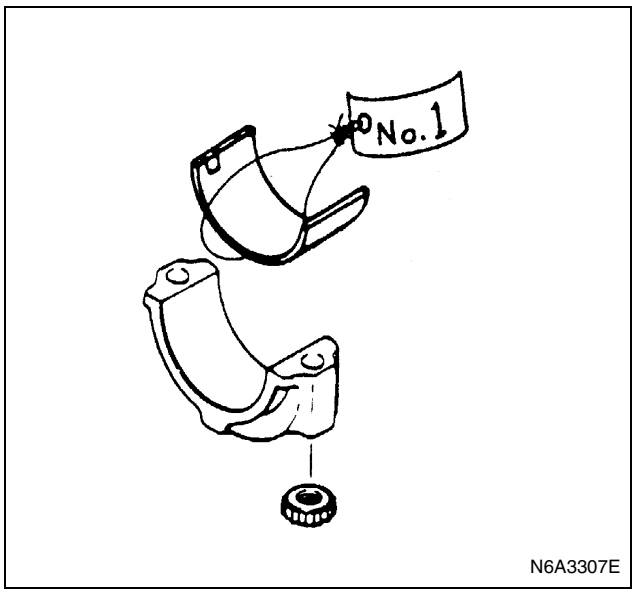
• Remove the oil pipe from cylinder block.



N6A3191E

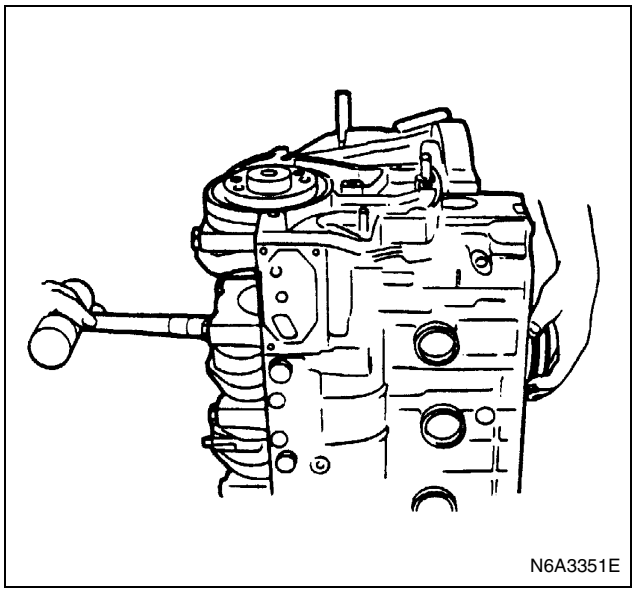
9. Piston and Connecting Rod Assembly

• If the connecting rod lower bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



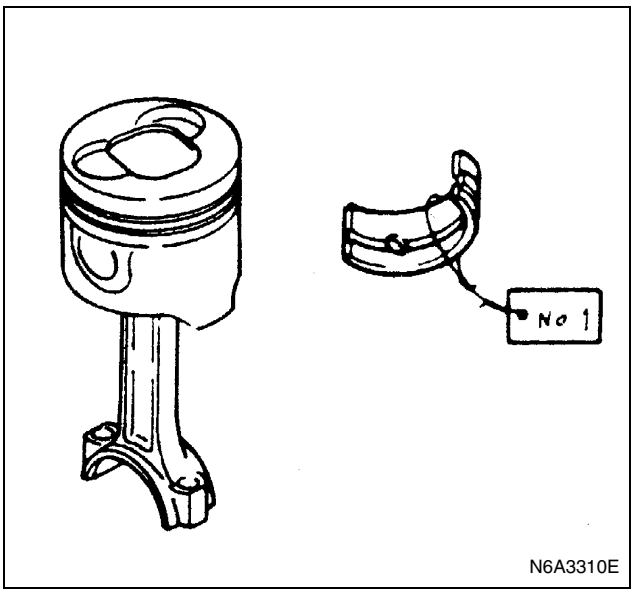
N6A3307E

• Remove carbon deposits from the upper portion of the cylinder wall with a scraper before removing the piston and connecting rod.
Move the piston to the top of the cylinder and tap it with a hammer grip or similar object from the connecting rod lower side to drive it out.

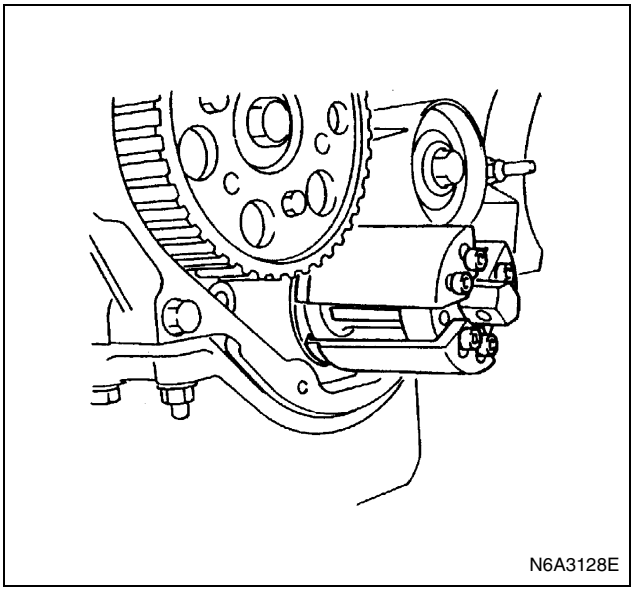


N6A3351E

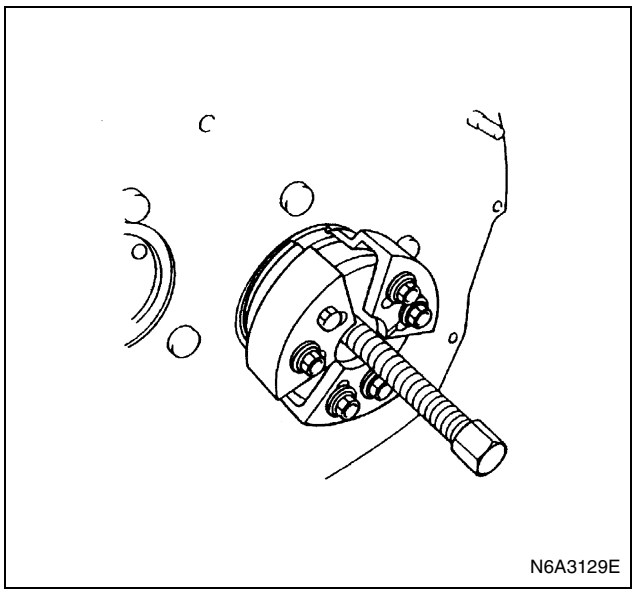
• If the connecting rod upper bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



10. Front Oil Seal (Belt Drive Model)
    - With the oil seal pushed in deep, install the special tool as shown in the illustration to remove the oil seal.
      Front Oil Seal Remover: 5-8840-2362-0



11. Timing Gear Housing
12. Timing Pulley Housing
13. Water Pump Assembly
14. Flywheel and Cylinder Body Rear Plate
    - Set the flywheel stopper.
    - Loosen the flywheel fixing bolts then remove the flywheel.
    - Remove the cylinder block rear plate.
15. Rear Oil Seal (Gear and Belt Drive Model)
    - With the oil seal pushed in deep, install the special tool as shown in the illustration to remove the oil seal.
      Rear Oil Seal Remover: 5-8840-2360-0



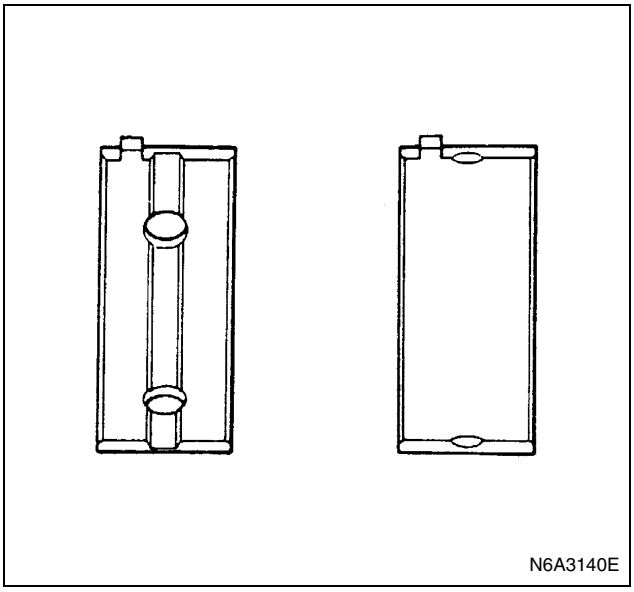
Notice:
Take care not to damage sealing surface of front plate and crankshaft when removing oil seal.

16. Crankshaft and Main Bearing
    1) Remove the main bearing caps and thrust washer.

    2) Remover the crankshaft with care.
    3) Remove the crankshaft upper bearing.

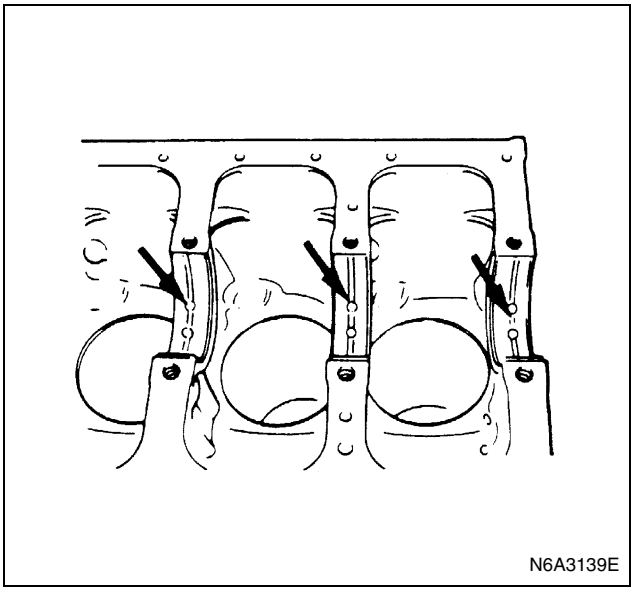
Installation

1. Crankshaft and Main Bearings
   - The crankshaft upper bearings have an oil hole and an oil groove. The lower bearings do not.



N6A3140E

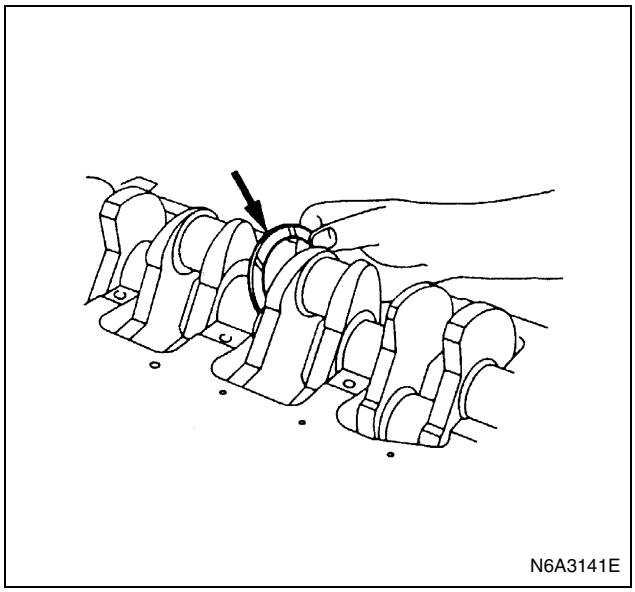
- Install main bearings in the cylinder body and main bearing cap respectively.
- Apply new engine oil to upper and lower main bearings.
- Make sure that main bearing are in correct position.
- Carefully wipe any foreign material from the upper bearing.
- Install the main bearings to the cylinder body and the main bearing caps.



N6A3139E

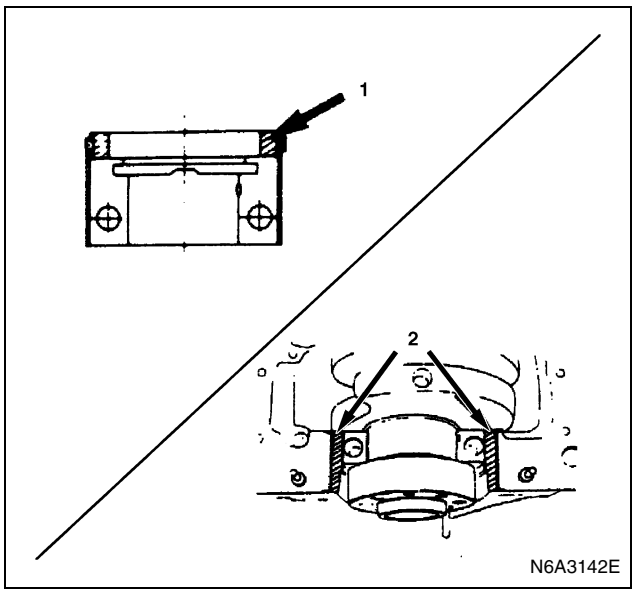
Notice:
Do not apply engine oil to the bearing back faces and the cylinder body bearing fitting surfaces.

- Be sure that they are positioned correctly.
- Apply new engine oil to the upper and lower main bearing faces.
- Carefully mount the crankshaft.
- Apply engine oil to the thrust washer.
- Install thrust washer on No.3 journal.
  Oil grooves in thrust washer must face the crankshaft.



N6A3141E

- Apply the recommended liquid gasket or its equivalent to the No.5 crankshaft bearing cap cylinder body fitting surfaces at points and shown in the illustration.



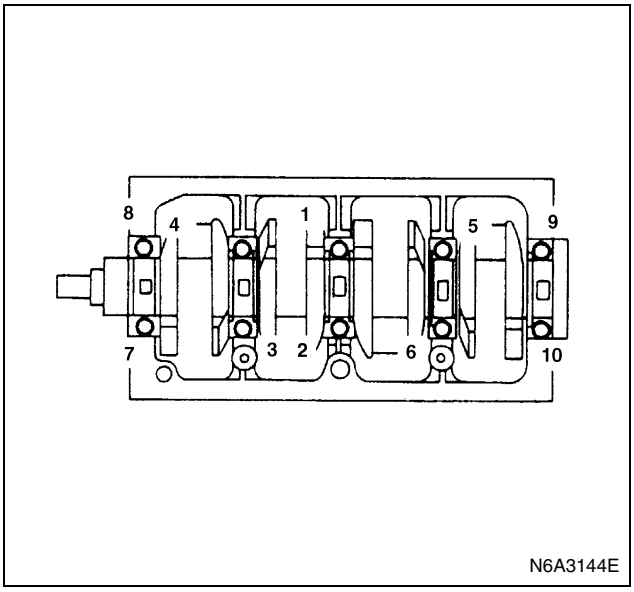
N6A3142E

Notice:
Be sure that the bearing cap fitting surface is completely free of oil before applying the liquid gasket.

Do not allow the liquid gasket to obstruct the cylinder thread holes and bearings.

- Install the bearing caps with the bearing cap head arrow mark facing the front of the engine.
- Apply engine oil to the front of the engine.
- Tighten the crankshaft bearing cap bolts to the specified torque a little at a time in the sequence shown in the illustration.

Tighten:
- 167 N·m (17.0 kg·m / 123 lb·ft)



Notice:
Check to see that the crankshaft turns smoothly by rotating it manually.

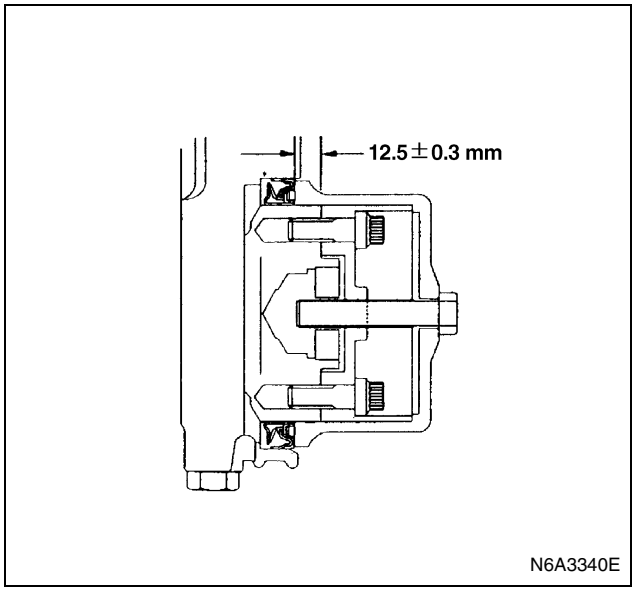
2. Crankshaft Rear Oil Seal
   Use the oil seal installer to install the oil seal to the cylinder body.
   Rear Oil Seal Installer: 5-8840-2361-0

Notice:
Wipe off rust and scraps clean from the press-in portion of the oil seal.

Take note of the press-in direction of the oil seal.

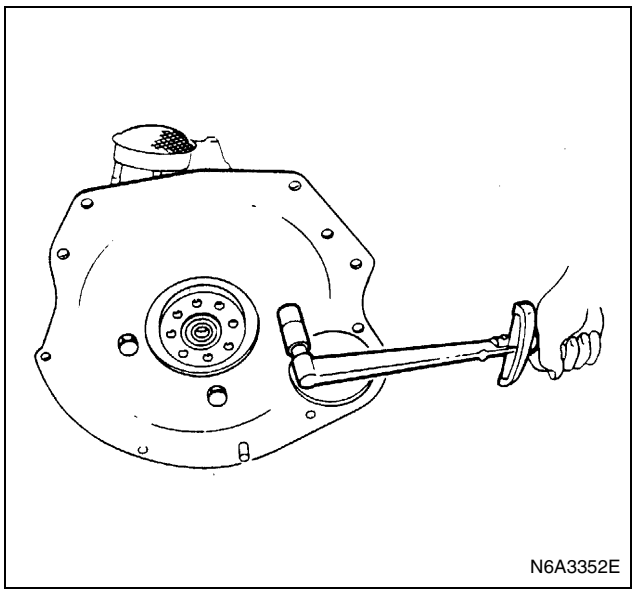
1) Install the adapter of the special tool to the rear end of the crankshaft with two bolts.
2) Install the oil seal to the outer circumference of the adapter.
3) Insert the slave into the adapter portion, and tighten it in with the bolt (M12 × 1.75L = 70) until the adapter section hits the slave.
4) Remove the adapter and the slave.
5) After installing the oil seal, check the measurement of the oil seal.

Standard	mm (in)
12.2 — 12.8 (0.48 — 0.50)	



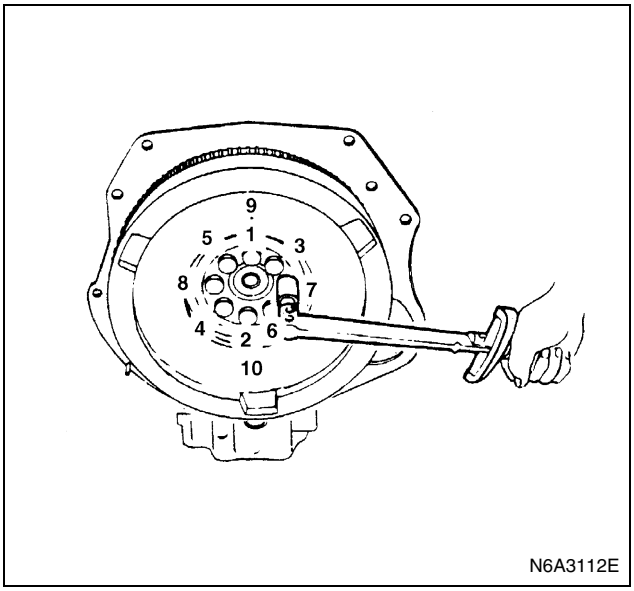
3. Flywheel and Cylinder Body Rear Plate
   - Align the rear plate with the cylinder body knock pins.
   - Tighten the rear plate to the specified torque.

Tighten:
- Rear plate bolts to 82 N·m (8.4 kg·m / 61 lb·ft)



- Block the crankshaft with a piece of hard wood to prevent the flywheel form turning.
- Apply a coat of engine oil to the threads of the flywheel bolts.
- Align the flywheel with the crankshaft dowel pin.
- Tighten the flywheel bolts to the specified torque in two steps using the Angular Tightening Method.
- Follow the numerical order shown in the illustration.

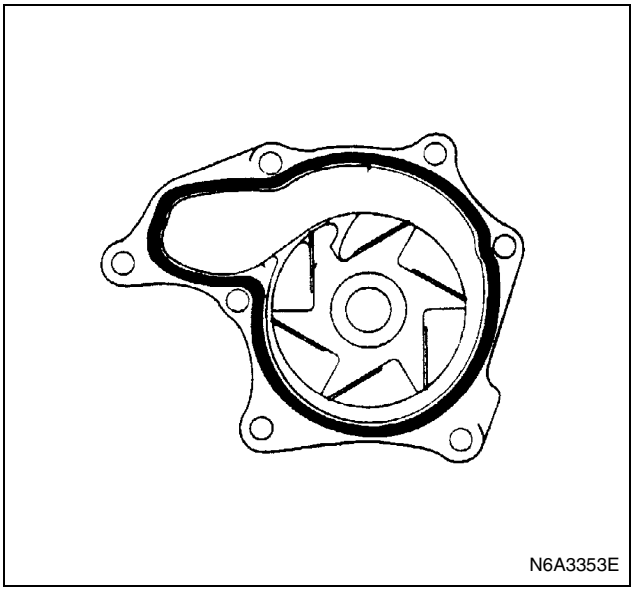
Tighten:
- Flywheel bolt to
  1st step: 59 N·m (6.0 kg·m / 43 lb·ft)
  2nd step: 60° — 90°



N6A3112E

4. Water Pump Assembly
   - Fit the O-ring to the water pump body.
   - Remove the water pump assembly and tighten bolts to the specified torque.

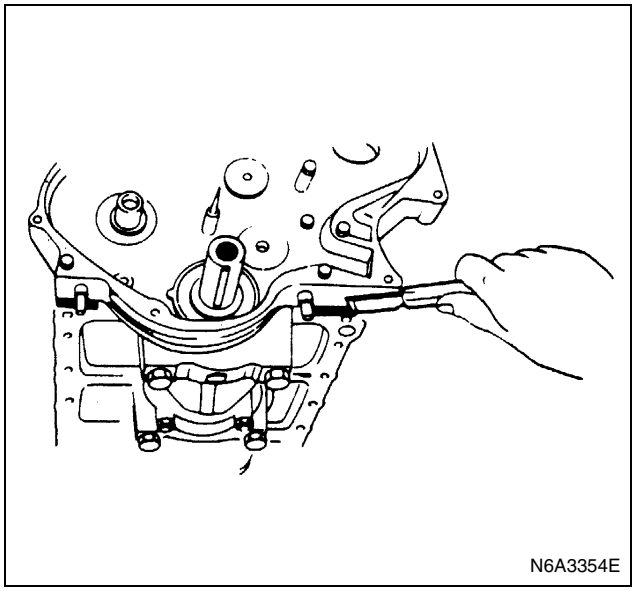
Tighten:
- Water pump bolts to 20 N·m (2.0 kg·m / 14 lb·ft)



N6A3353E

5. Timing Pulley Housing
   - Install the timing pulley housing the cylinder body. Take care not to twist the front oil seal.
   - Tighten the timing pulley housing together with the timing pulley housing gasket to the specified torque.

Tighten:
- Timing pulley housing bolt to 19 N·m (1.9 kg·m / 14 lb·ft)



N6A3354E

   - Cut away the flash from the gasket.
6. Timing Gear Housing
   - Install the timing gear housing the cylinder body.
   - Tighten the timing gear housing together with the timing gear housing gasket to the specified torque.

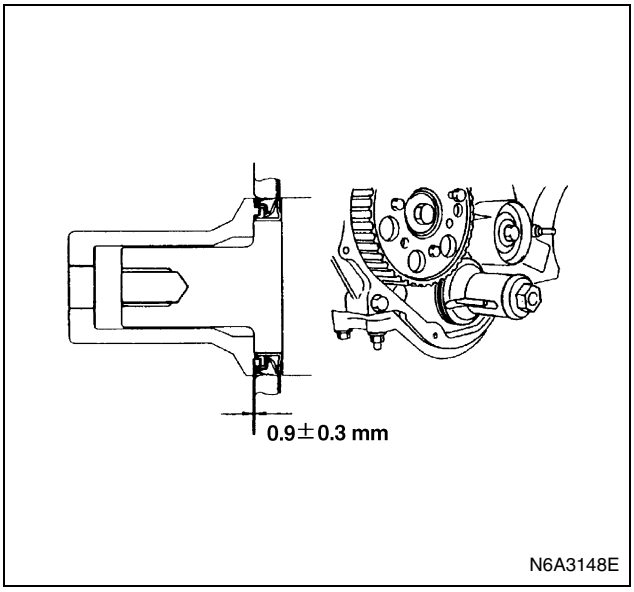
Tighten:
- Timing gear housing bolt to 19 N·m (1.9 kg·m / 14 lb·ft)
  - Cut away the flash from the gasket.
7. Front Oil Seal (Belt Drive Model)
   - Install oil seal using special tool.
     Front Oil Seal Installer: 5-8840-2361-0

Notice:
Wipe off rust and scraps clean from the press-in portion of the oil seal.

Take note of the press-in direction of the oil seal.

1) With the oil seal attached to the sleeve, put it in the front end of the crankshaft.
2) With the edge of the oil seal attached securely to the crankshaft, tighten it with the center bolt until the sleeve hits securely against the reference plane at the front end of the crankshaft.
3) Remove the sleeve.
4) After pressing in the oil seal, check the measurement of the oil seal.

Standard	mm (in)
0.6 — 1.2 (0.024 — 0.047)	



8. Piston and Connecting Rod Assembly
9. Piston Cooling Oil Pipe
   Above works refer to “PISTON” Section in this manual.
10. Oil Pump Assembly
11. Oil Pan Assembly
    Above works refer to “OIL PUMP AND OIL PAN” Section in this manual.
12. Timing Belt (Belt Drive Model)
    1) Camshaft timing pulley
       Above works refer to “CAMSHAFT AND TAPPET” Section in this manual.
    2) Injection pump
    3) Injection pump timing pulley
       Above works refer to “CYLINDER BLOCK ASSEMBLY” Section in this manual.
    4) Crankshaft timing pulley

- Use the crankshaft timing pulley installer to install the timing pulley.
- The timing pulley flange must be facing the cylinder body.
  Crankshaft Timing Pulley Installer: 5-8522-0020-0

    5) Crankshaft timing pulley center

- Install the crankshaft pulley center.
- Use the fixing wrench to prevent the crankshaft from turning.
  Fixing Wrench: 5-8840-0161-0
- Tighten the crankshaft pulley center bolt to the specified torque.

Tighten:

- Crankshaft pulley center bolt to 206 N·m (21 kg·m / 152 lb·ft)

    6) Timing belt
    7) Flange: camshaft pulley
    8) Flange: injection pump pulley
    9) Timing pulley lower cover
    10) Timing pulley upper cover
    11) Crankshaft damper pulley
    12) Cooling fan assembly
        Above works refer to “TIMING GEAR (Belt Type)” Section in this manual.

13. Timing Gear (Gear Drive Model)
    1) Crankshaft gear
    - Install the crankshaft gear.
    - Use the crankshaft gear installer (1) to install the crankshaft gear (2).
    - The crankshaft gear timing mark ("X — X") or ("· — ·") must be facing outward.
      Crankshaft Gear Installer: 9-8522-0020-0

15. Engine assembly

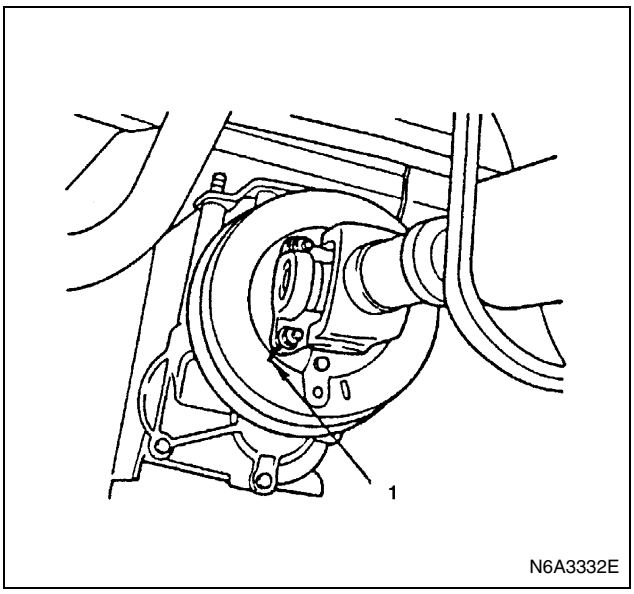
Removal

Preparation

- Disconnect battery ground cable.
- Drain coolant.

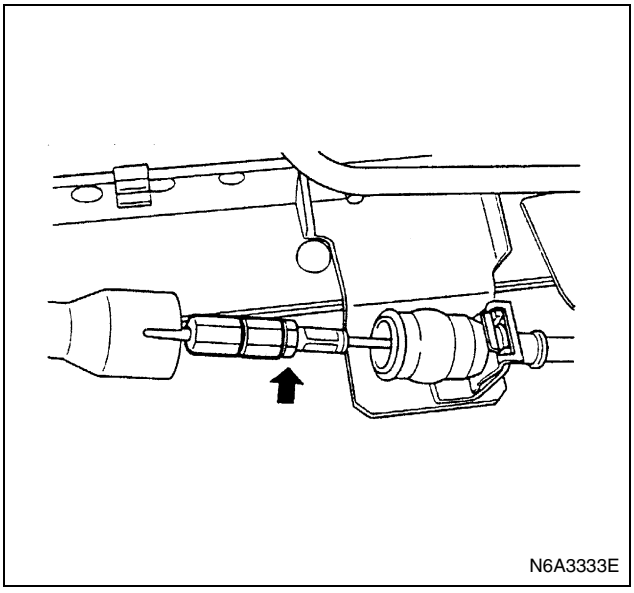
1. Transmission and Clutch Assembly

- Raise vehicle and support with suitable safely.
  1) Propeller Shaft
  - Reference mark the flange yoke to the parking brake drum.
  - Disconnect the propeller shaft at flange yoke.
  - Put aside the propeller shaft and tie it to the frame so that it does not interface with servicing work.



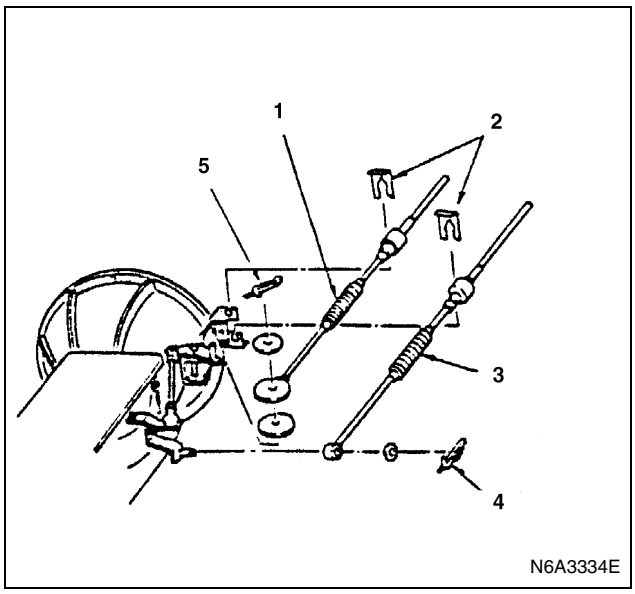
Legend
1. Reference mark

2) Parking Brake Cable
- Move the joint cover.
- Disconnect the joint bolt.
- Remove the clip then disconnect the cable from the bracket.



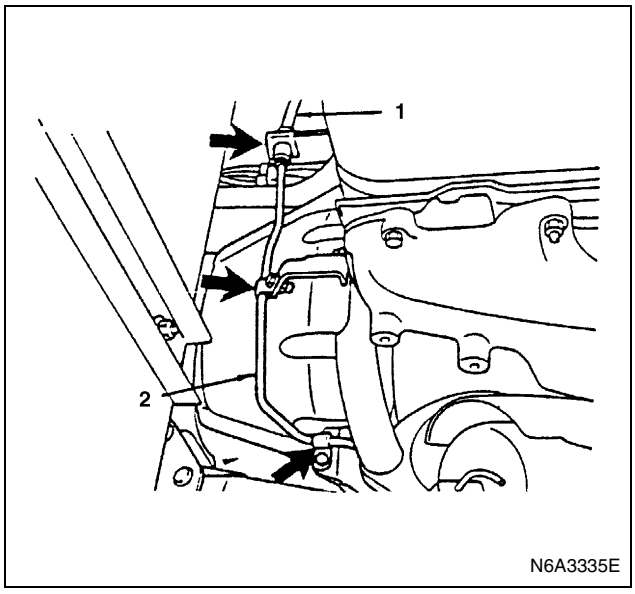
3) Wiring Connector
- Disconnect the wiring connectors from the car speed sensor, the neutral switch and the back-up light switch.

4) Shift Cable and Select Cable
- Disconnect the shift cable and select cable on the transmission side.



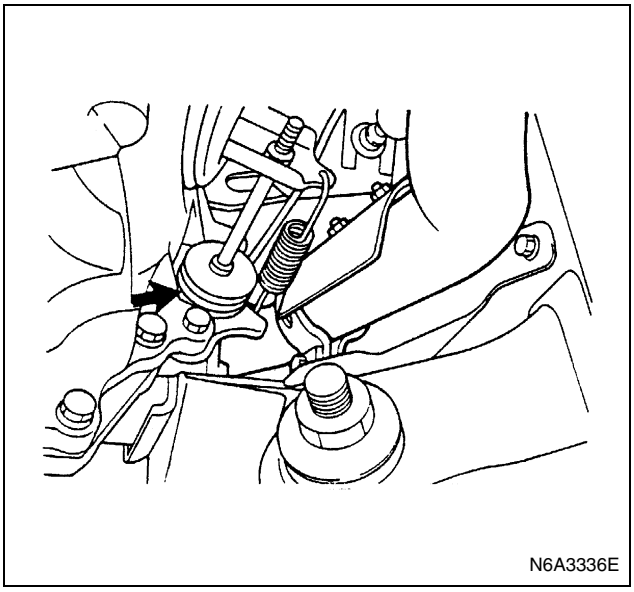
Legend
1. Shift cable
2. Clip
3. Select cable
4. Snap pin
5. Snap pin

5) Clutch Slave Cylinder
- Remove the clutch pipe fixing clips and the clip bracket (Right hand drive models only).



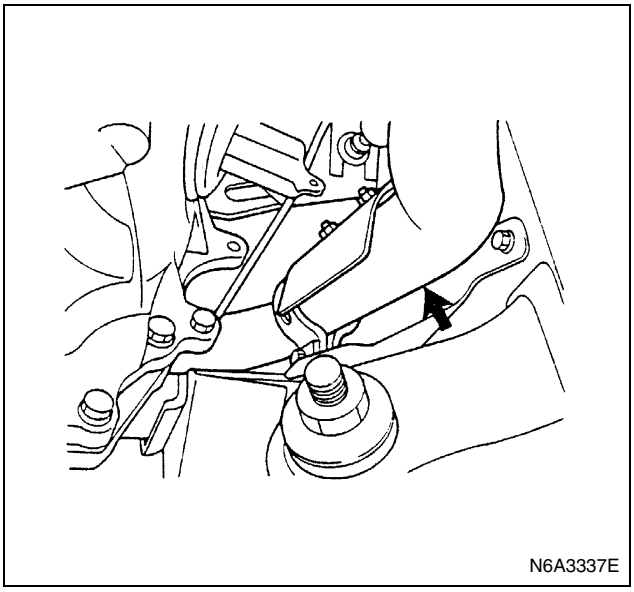
Legend
1. Flexible hose
2. Clutch pipe

- Remove the slave cylinder assembly with the flexible hose attached, and then tie it to the frame so that it does not interface with servicing work.



N6A3336E

6) Exhaust Brake Assembly
7) Front Exhaust Pipe



N6A3337E

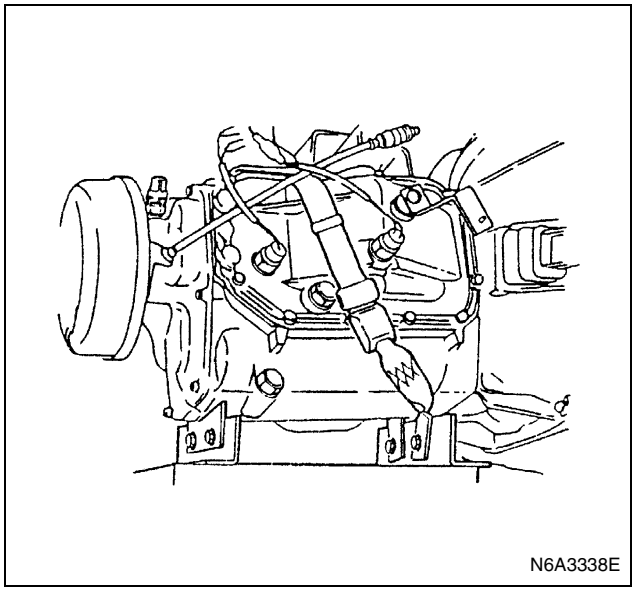
8) Transmission Assembly

Notice:
The exhaust pipe bracket, the gear control bracket and the clips are sometimes installed in the wrong position or direction confusedly. To prevent incorrect installation of these parts, put a correct installation mark on them.

- Support the transmission with mission jack.

Caution:
To prevent the falling of the transmission, tie it firmly to the jack with a chain or belt.

Do not allow transmission to hang unsupported from clutch. Damage to the clutch assembly will result.



N6A3338E

- Remove the nuts of the transmission mounting bracket on the crossmember side.
- Engine and transmission angles may need to be adjusted for removal.
- Hold the rear section of the engine by the jack or hoist.

Caution:
When lifting the engine by the jack, use wood blocks to prevent any possible damage to the oil pan.

- Remove transmission fastening bolts.
- Pull out the transmission assembly rearward.

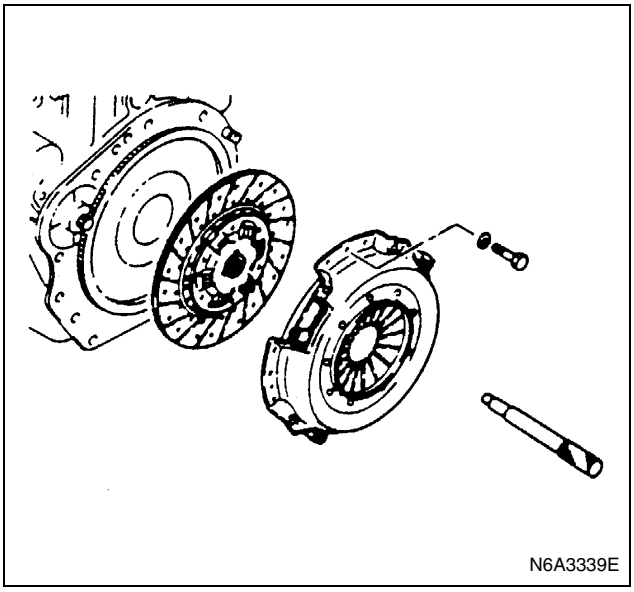
9) Mounting Bracket

- Raise vehicle and support with suitable safety stands.

Caution:
Do not let clutch fluid remain on a painted surface, wash it off immediately.

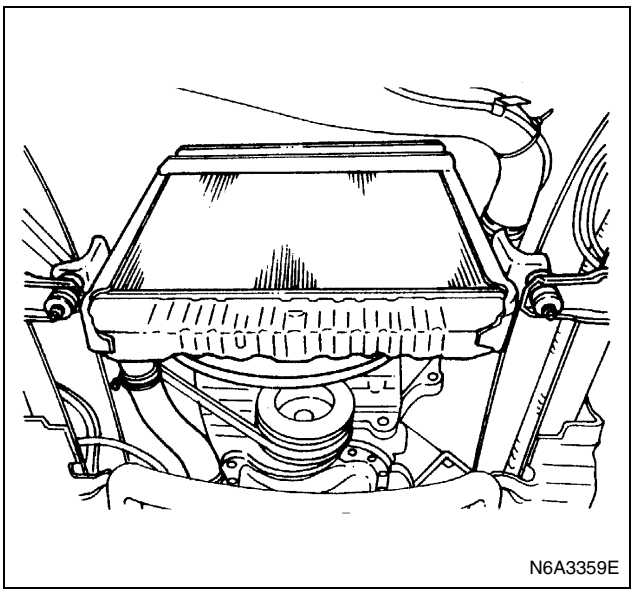
10) Pressure Plate Assembly
11) Driven Plate Assembly

- Use the pilot aligner to prevent the driven plate assembly from falling free.
  Pilot Aligner: 5-5825-3001-0
- Mark the flywheel and pressure plate lug for alignment when installing.
- Loosen the pressure plate assembly fixing bolts.



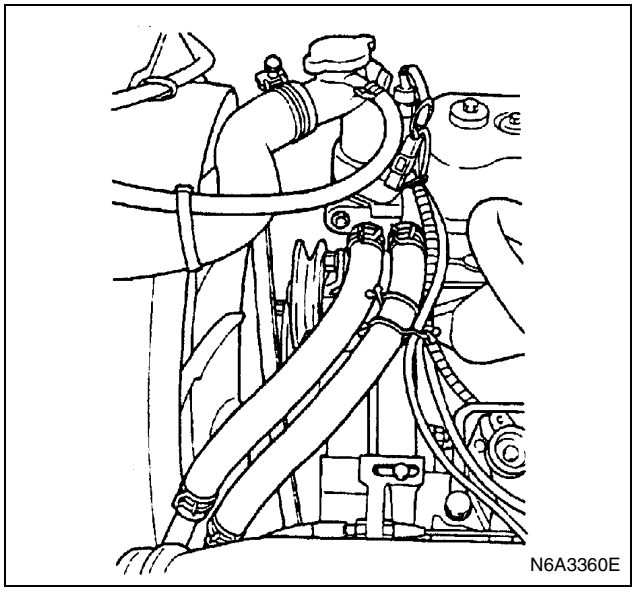
N6A3339E

2. Radiator Assembly
   1) Remove the radiator hose upper and lower.
   2) Remove the reservoir tank hose.
   3) Remove the cushion rubbers on both sides.
   4) Remove the radiator stay.



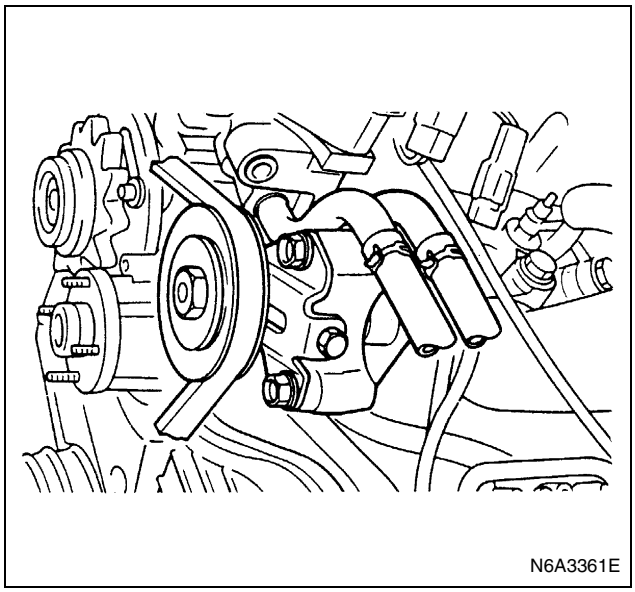
N6A3359E

3. Intake Air Duct
4. Heater Hose
5. Engine Control Cable
   - Loosen the locking nut at the bracket and disconnect accelerator cable from injection pump control lever.



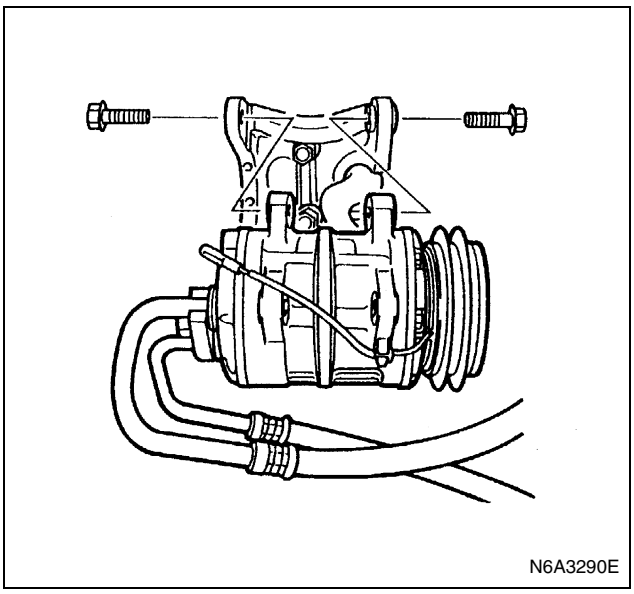
N6A3360E

6. Glow Plug Harness
7. Fuel Hose
   - Remove the fuel inlet hose and fuel return hose.
8. Oil Pressure Switch Harness
9. A/C Compressor Assembly
   - Loosen the idler pulley lock nut.
   - Loosen the adjust bolt then remove the drive belt.



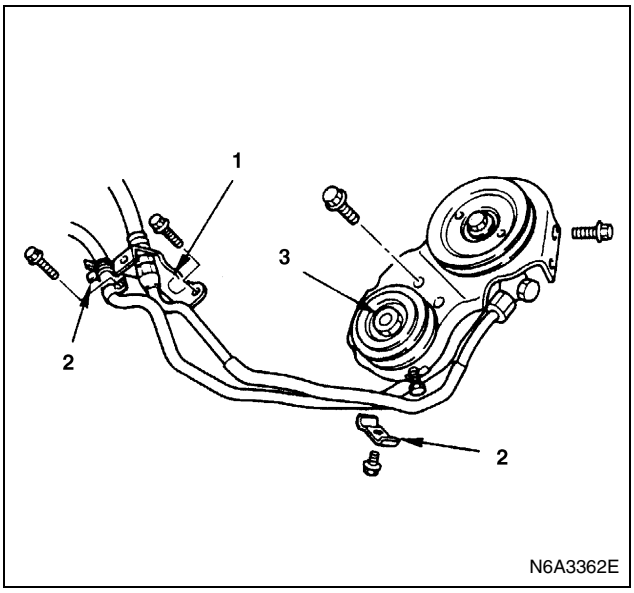
N6A3361E

   - Disconnect magnetic clutch harness connector.
   - Remove the A/C compressor fixing bolts and temporally tighten the A/C compressor to chassis frame side use the wire.



N6A3290E

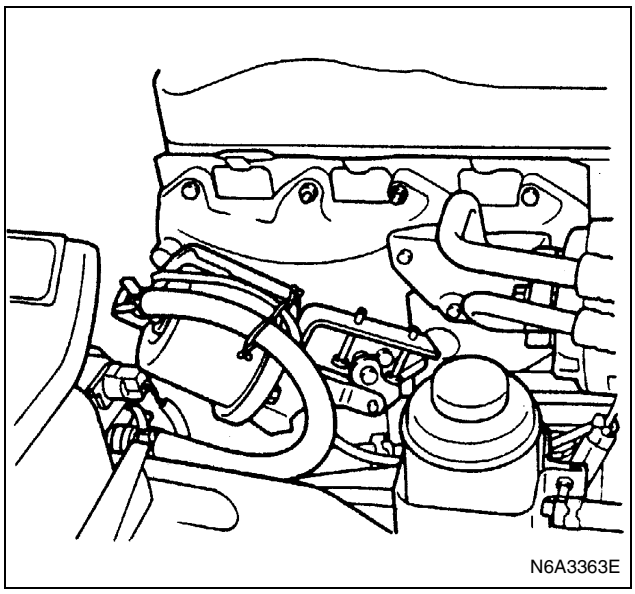
10. Power Steering Pump & Bracket Assembly (Power Steering Model)
    1) Loosen the idler pulley lock nut.
    2) Loosen the adjust bolt then remove the drive belt.
    3) Remove the pipe bracket fixing bolt and clip.
    4) Remove the power steering pump fixing bolts pump to chassis frame side use the wire.



N6A3362E

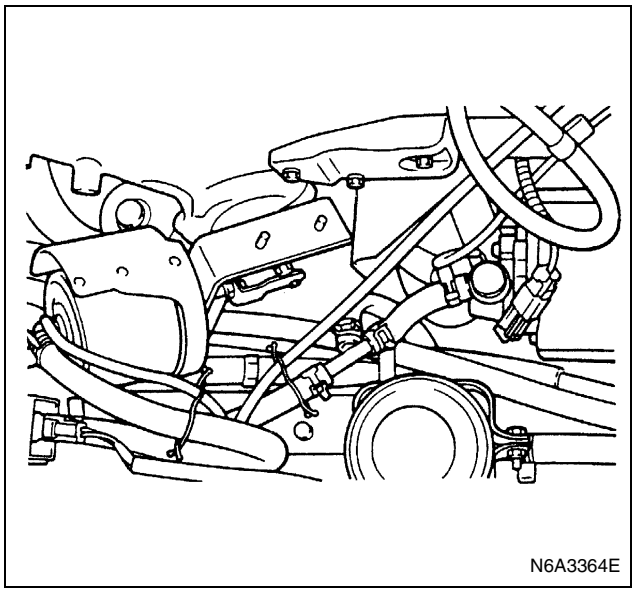
Legend
1. Bracket
2. Clip
3. Lock nut

11. Actuator Vacuum Hose (Exhaust Brake Model)
    - Disconnect the vacuum hose from actuator side.



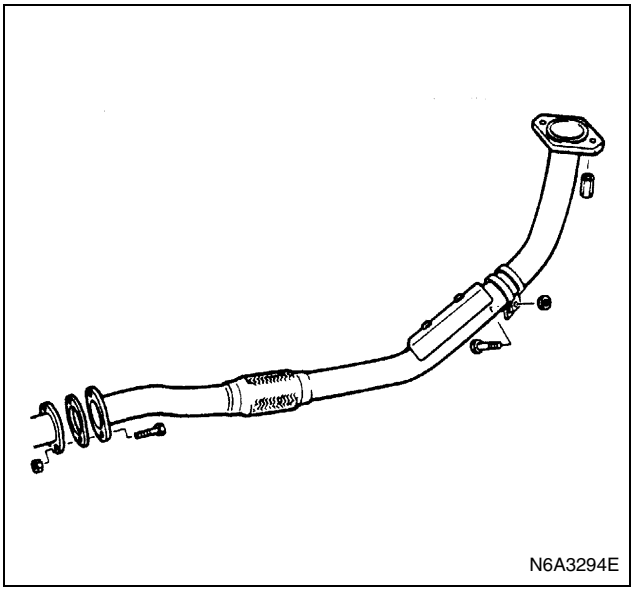
N6A3363E

12. Vacuum Pump Hose (Exhaust Brake Model)
    - Disconnect the vacuum hose from vacuum tank side and magnetic valve side.



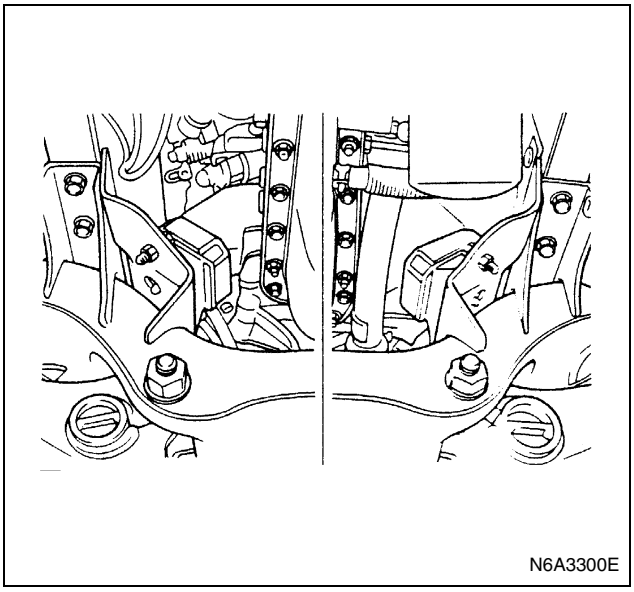
N6A3364E

13. Front Exhaust Pipe
    - Remove the exhaust pipe fixing bolts from exhaust manifold.
    - Remove the exhaust pipe stay bolt.
    - Remover the fixing nuts from front pipe.



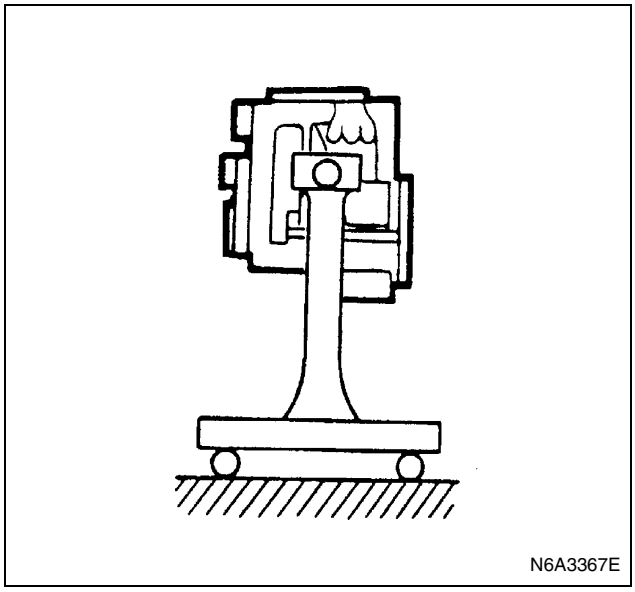
N6A3294E

14. Support Rubber
    1) Right Hand
    • Remove two fixing nuts at the cross member side.
    2) Left Hand
    • Remove two fixing nuts at the cross member side.



N6A3300E

15. Engine Assembly
    1) Lift engine carefully by using hoist.



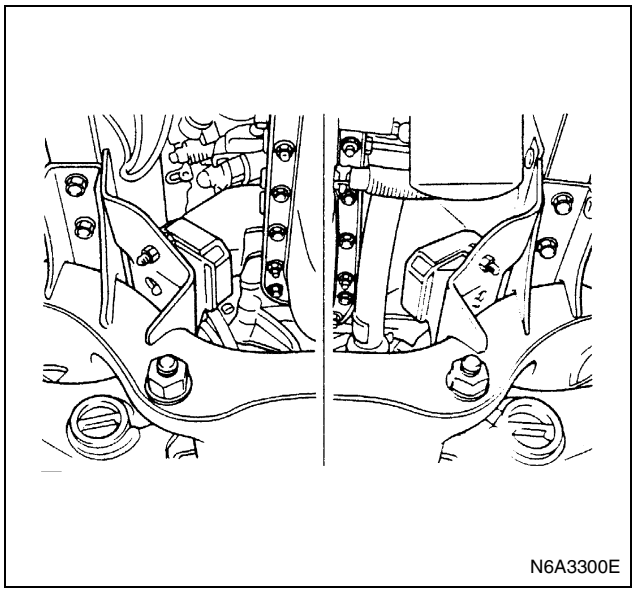
N6A3367E

    2) Lift front part of engine higher than rear part of it.
    3) Take out engine assembly taking care not to damage full pipes, brake pipes and so on.

Installation

1. Engine Assembly
   • Position engine mountings by using hoist.
2. Support Rubber
   • After all fixing bolts (left: two bolts, right: two bolts) were inserted to every holes, and engine asm and tighten fixing bolts to the specified torque.

Tighten:
• 40 N·m (4.1 kg·m / 30 lb·ft)



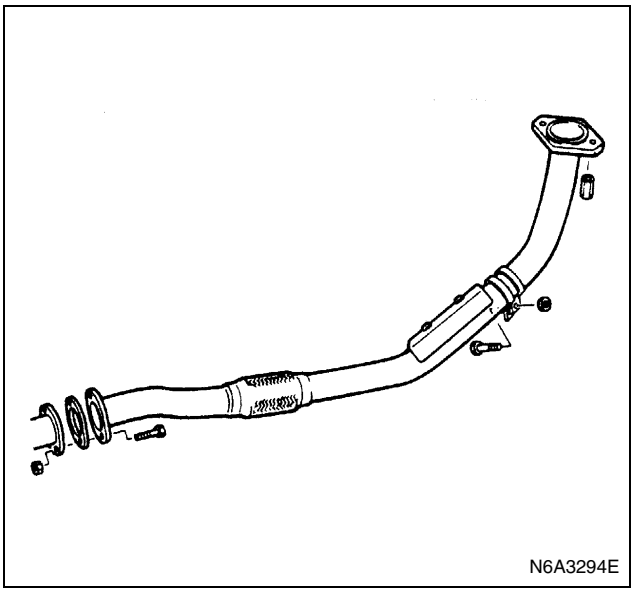
N6A3300E

3. Front Exhaust Pipe
   • Connect the exhaust pipe and tighten nut to the specified torque.

Tighten:
• Exhaust pipe nut to 69 N·m (7.0 kg·m / 51 lb·ft)

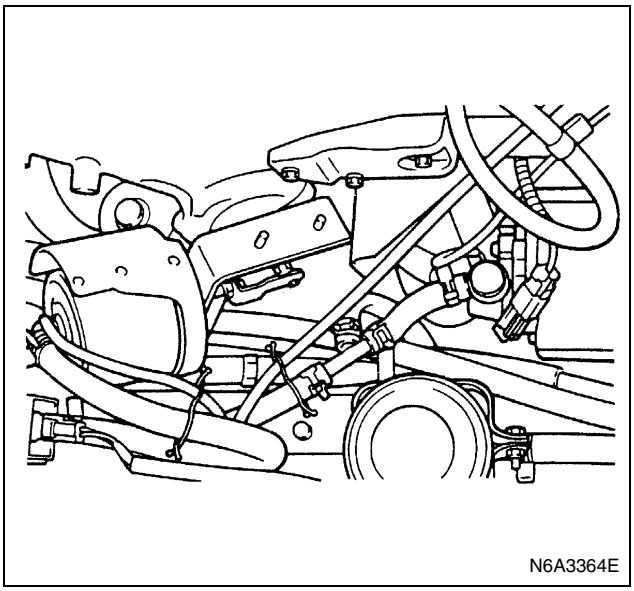
- Install the exhaust pipe stay and tighten bolt nut to the specified torque.

Tighten:
- Stay bolt nut to 40 N·m (4.1 kg·m / 30 lb·ft)



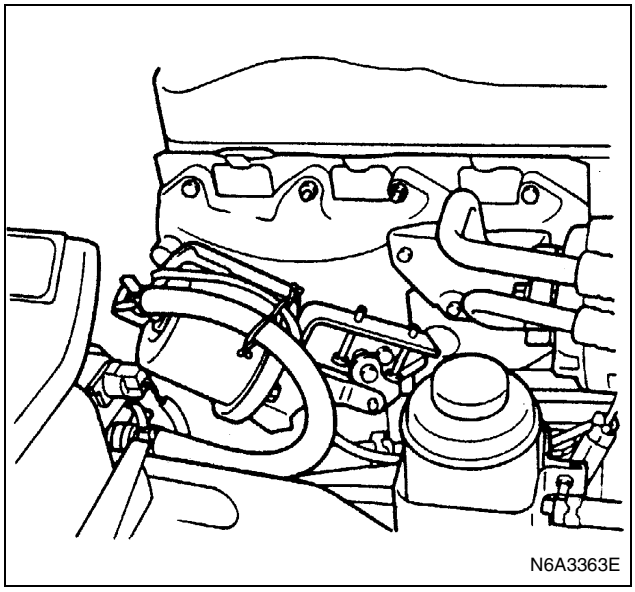
N6A3294E

4. Vacuum Pump Hose (Exhaust Brake Model)
   - Connect the vacuum hose to vacuum tank side and magnetic valve side.



N6A3364E

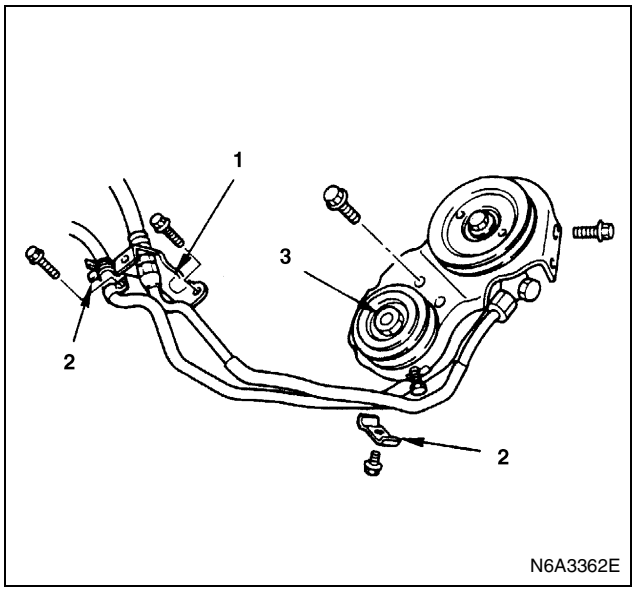
5. Actuator Vacuum Hose (Exhaust Brake Model)
   - Connect the vacuum hose to actuator.



N6A3363E

6. Power Steering Pump & Bracket Assembly (Power Steering Model)
   - Install the power steering pump and pipe bracket then tighten bolts to the specified torque.

Tighten:
- Pump bolts to 19 N·m (1.9 kg·m / 14 lb·ft)
- Pipe bracket bolts to 19 N·m (1.9 kg·m / 14 lb·ft)
- Clip bolt to 10 N·m (1.0 kg·m / 87 lb·in)



N6A3362E

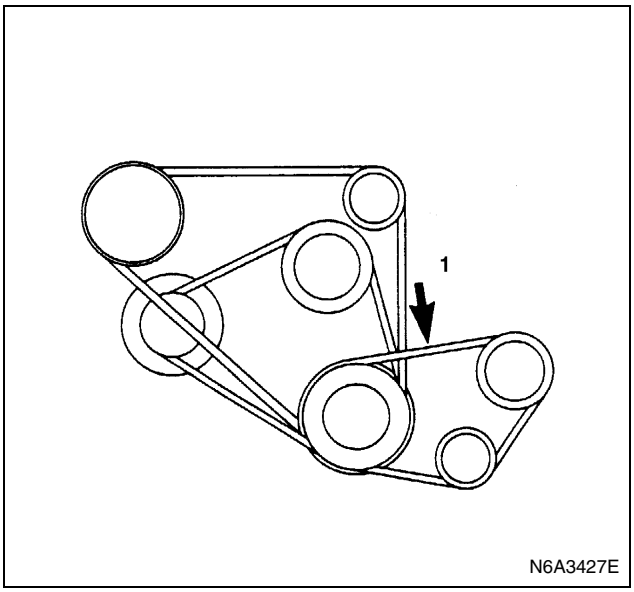
Legend
1. Bracket
2. Clip
3. Lock nut

- Install Power Steering pump drive belt (1) and adjust belt tension.
  Check drive belts for wear or damage, and replace with new ones as necessary.
  Check belts for tension, and adjust as necessary.

- Push the middle of belts with a force of 10 kg and check each bolt for deflection.
- Standard deflection

	mm (in)
	Initial tension
P/S pump drive belt	8 — 12 (0.31 — 0.47)

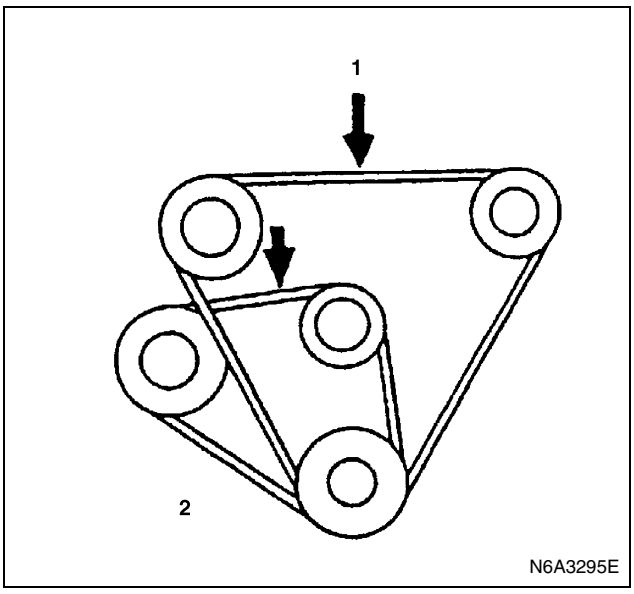
4JG2



- P/S pump lock bolt loose, adjust belt tension with adjust belt.

Tighten:
- Idler lock nut to 27 N·m (2.8 kg·m / 20 lb·ft)

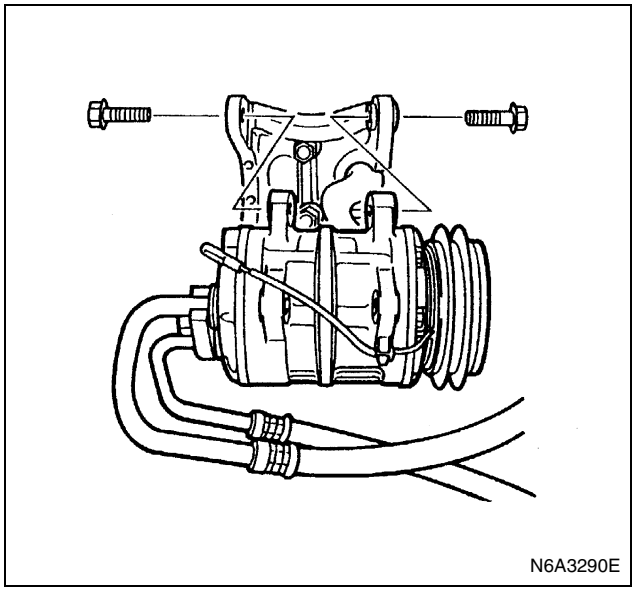
4JB1



Legend
1. A/C compressor drive belt & P/S pump drive belt
2. AC generator & fan pulley drive belt

7. A/C Compressor Assembly (A/C Model)
   - Install the A/C compressor fixing bolts and tighten bolts to the specified torque.

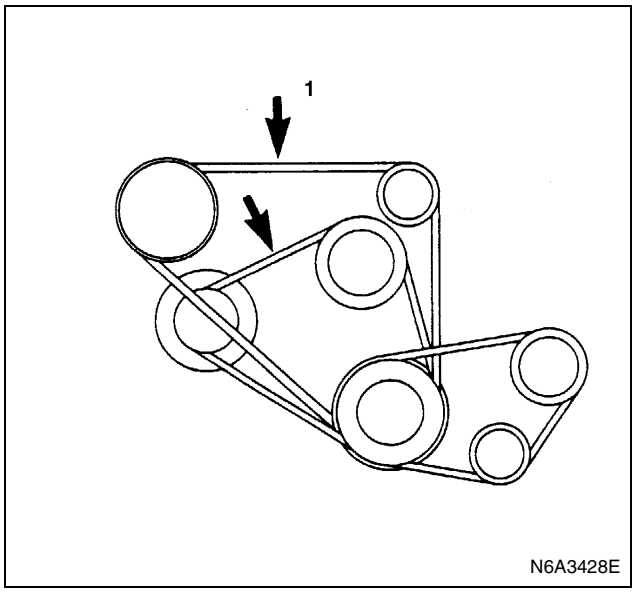
Tighten:
- Compressor fixing bolts to 37 N·m (3.8 kg·m / 27 lb·ft)



- Connect the magnetic clutch harness connector.
- Install A/C compressor drive belt (1) and adjust belt tension.
  Check drive belts for wear or damage, and replace with new ones as necessary. Check belts for tension, and adjust as necessary.
- Push the middle of belts with a force of 10kg and check each bolt for deflection.
- Standard deflection

	mm (in)
	Initial tension
A/C compressor drive belt	8 — 12 (0.31 — 0.47)

4JG2

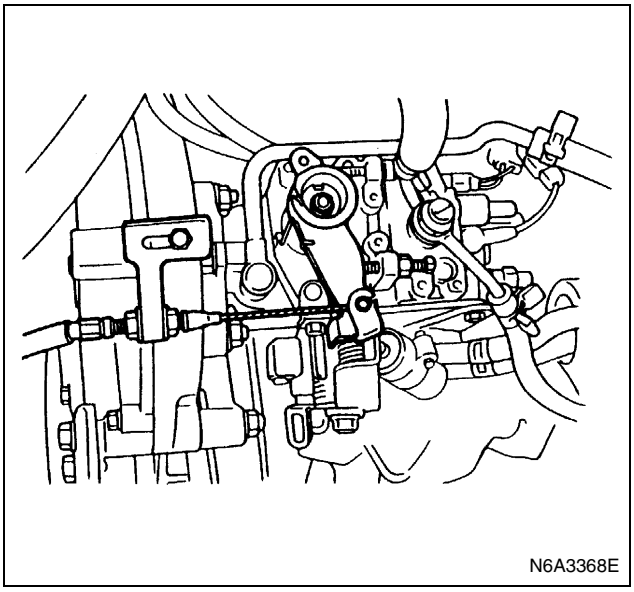


- A/C compressor pulley lock bolt loose, adjust belt tension with adjuster's adjust bolt.

Tighten:

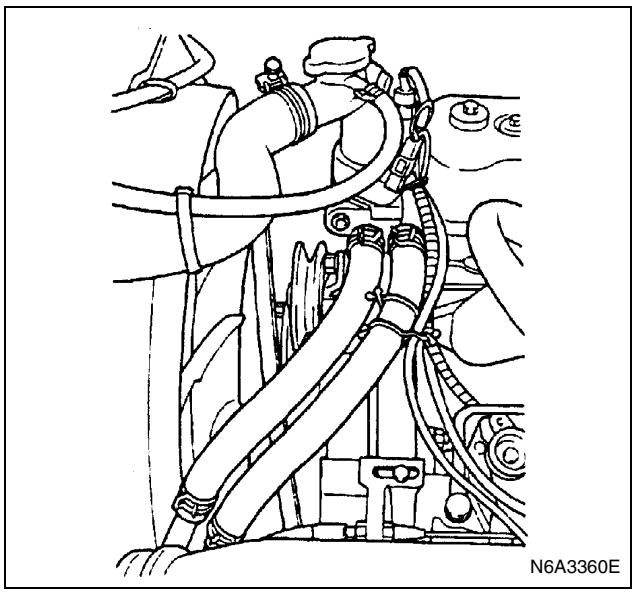
- Idler lock nut to 27 N·m (2.8 kg·m / 20 lb·ft)

8. Oil Pressure Switch Harness
   - Connect the oil pressure switch harness connector.
9. Fuel Hose
   - Connect the fuel feed hose and return hose then tighten clip securely.
10. Glow Plug Harness
    - Install the harness connector then tighten bolt securely.
11. Engine Control Cable
    1) Install the control wire to the engine control lever.
    2) Hold accelerator lever in the fully closed position and stretch the control cable in the direction indicated by the arrow to remove any slack.
    3) Tighten the accelerator cable bracket bolt.



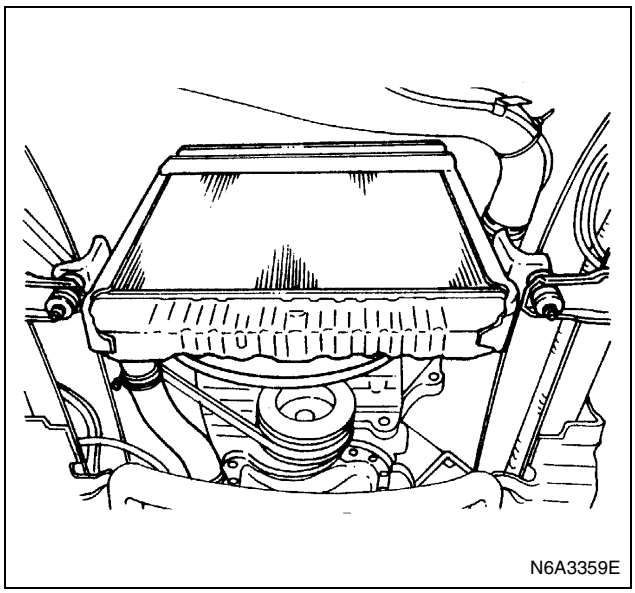
N6A3368E

12. Heater Hose
    - Connect the heater hose then tighten clip securely.
13. Intake Air Duct
    - Connect the air duct then tighten clip securely.



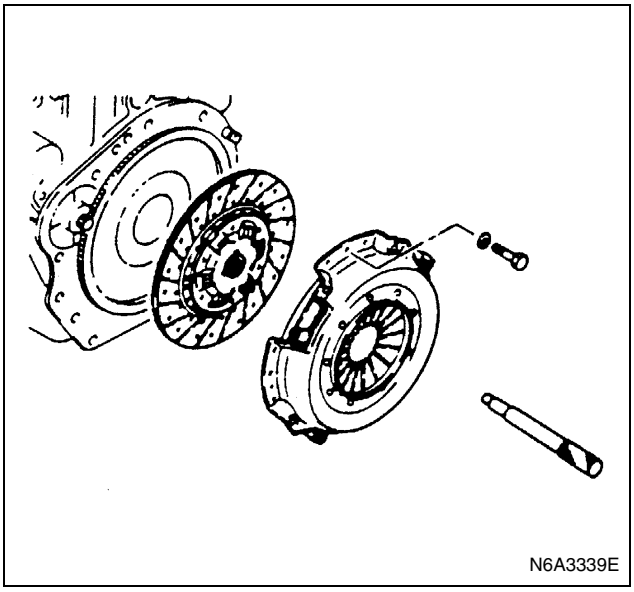
N6A3360E

14. Radiator Assembly
    1) Install the cushion rubber on both sides.
    2) Install the radiator stay
    3) Connect the radiator hose upper and lower.
    4) Connect the reservoir tank hose.



N6A3359E

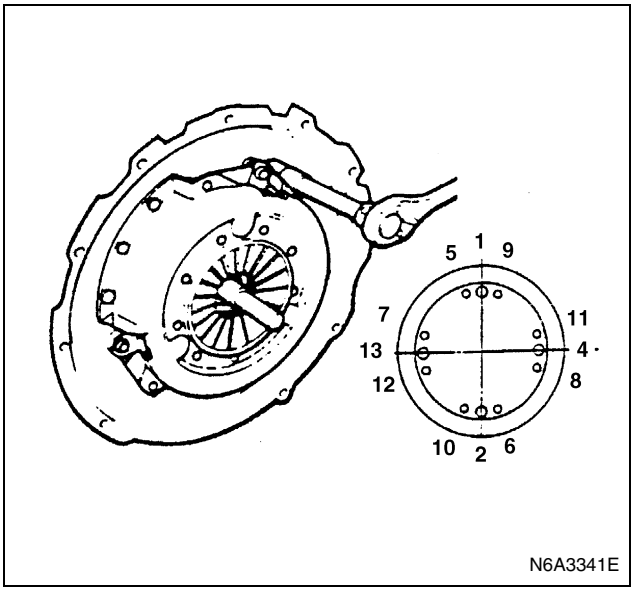
15. Transmission and Clutch Assembly
    1) Driven Plate Assembly
       - Apply multi-purpose with MOS2 type grease to the driven plate hub spline.
       - Use the pilot aligner to install the driven plate assembly.
         Pilot Aligner: 5-5825-3001-0



N6A3339E

2) Pressure Plate Assembly
   - Tighten pressure plate assembly fixing bolts in numerical order.

Tighten:
- Pressure plate fixing bolt to 18 N·m (1.8 kg·m / 13 lb·ft)



N6A3341E

- Remove the pilot aligner.

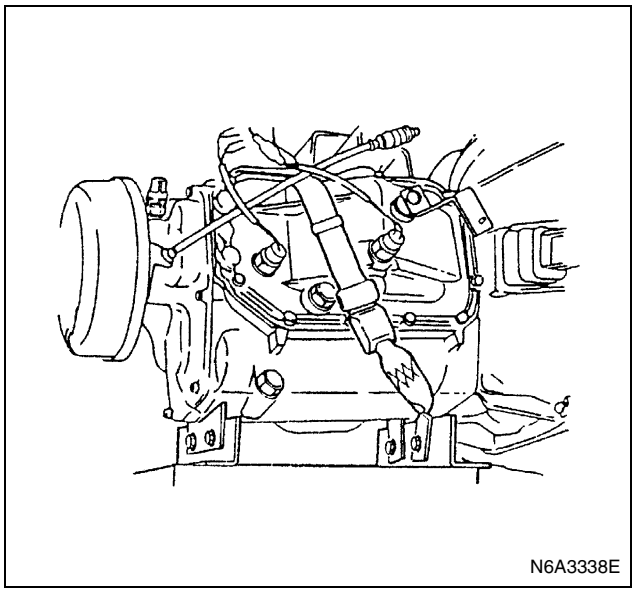
Notice:
In case a new pressure plate assembly is mounted, after tightening a pressure plate at the specified torque, be sure to remove the wiring for protection of a diaphragm spring.

3) Mounting Bracket

Tighten:
- Mounting bracket nuts to 69 N·m (7.0 kg·m / 51 lb·ft)

4) Transmission Assembly
   - Support the transmission with mission jack.

Caution:
To prevent the falling of the transmission, tie it securely to the jack with a chain or belt.

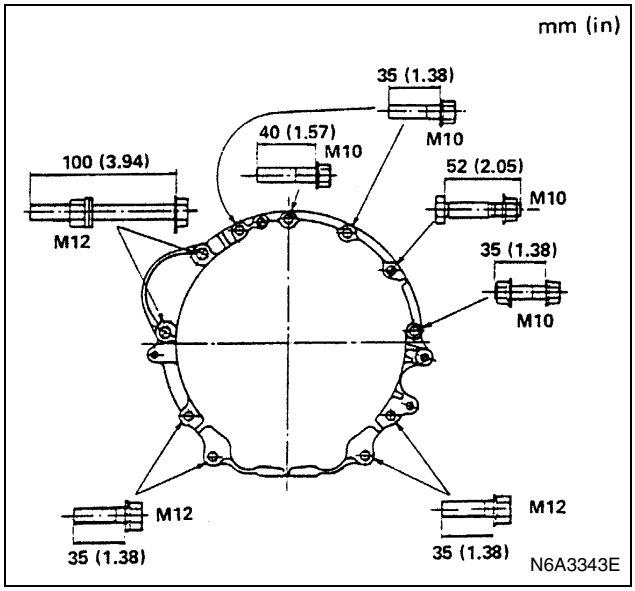


N6A3338E

- Shift transmission into high gear.
- Align transmission with engine slope.
- Turn output parking brake drum to aid clutch spring engagement.

Tighten:
- Clutch housing to flywheel hosing bolts to
  M10: 46 N·m (4.7 kg·m / 34 lb·ft)
  M12: 91 N·m (9.3 kg·m / 67 lb·ft)
  - Raise engine and transmission up into rear transmission mount.

Tighten:
- Engine rear mounting nuts to
  M10: 40 N·m (4.1 kg·m / 30 lb·ft)
  M12: 69 N·m (7.0 kg·m / 51 lb·ft)



N6A3343E

5) Front Exhaust Pipe

Tighten:
- Front exhaust pipe bolts to 37 N·m (3.8 kg·m / 27 lb·ft)

6) Exhaust Brake Assembly

Tighten:
- Exhaust brake bolts to 17 N·m (1.8 kg·m / 12 lb·ft)

7) Clutch Slave Cylinder

Tighten:
- Slave cylinder bolts to 19 N·m (1.9 kg·m / 14 lb·ft)
  - Perform slave cylinder adjustment before installation of the return spring.
    a. Loosen the lock nut of the push rod.
    b. Turn the adjust nut until it reaches the shift fork.
    c. Back off the adjust nut 1.5 turns. (shift fork free play Approximately 2 mm / 0.1 in).
    d. Tighten the lock nut.

Tighten:
- Push rod lock nut to 16 N·m (1.6 kg·m / 12 lb·ft)

8) Shift Cable and Select Cable
9) Wiring Connector
   - Color of Connector
     Back-up Light Switch: Brown
     Neutral Switch: Gray
10) Parking Brake Cable
11) Propeller Shaft
   - Line up reference mark.

Tighten:
- Propeller shaft nuts to 66 N·m (6.7 kg·m / 48 lb·ft)
  - Connect battery ground cable
  - Pour coolant
  - Start the engine and check coolant leakage

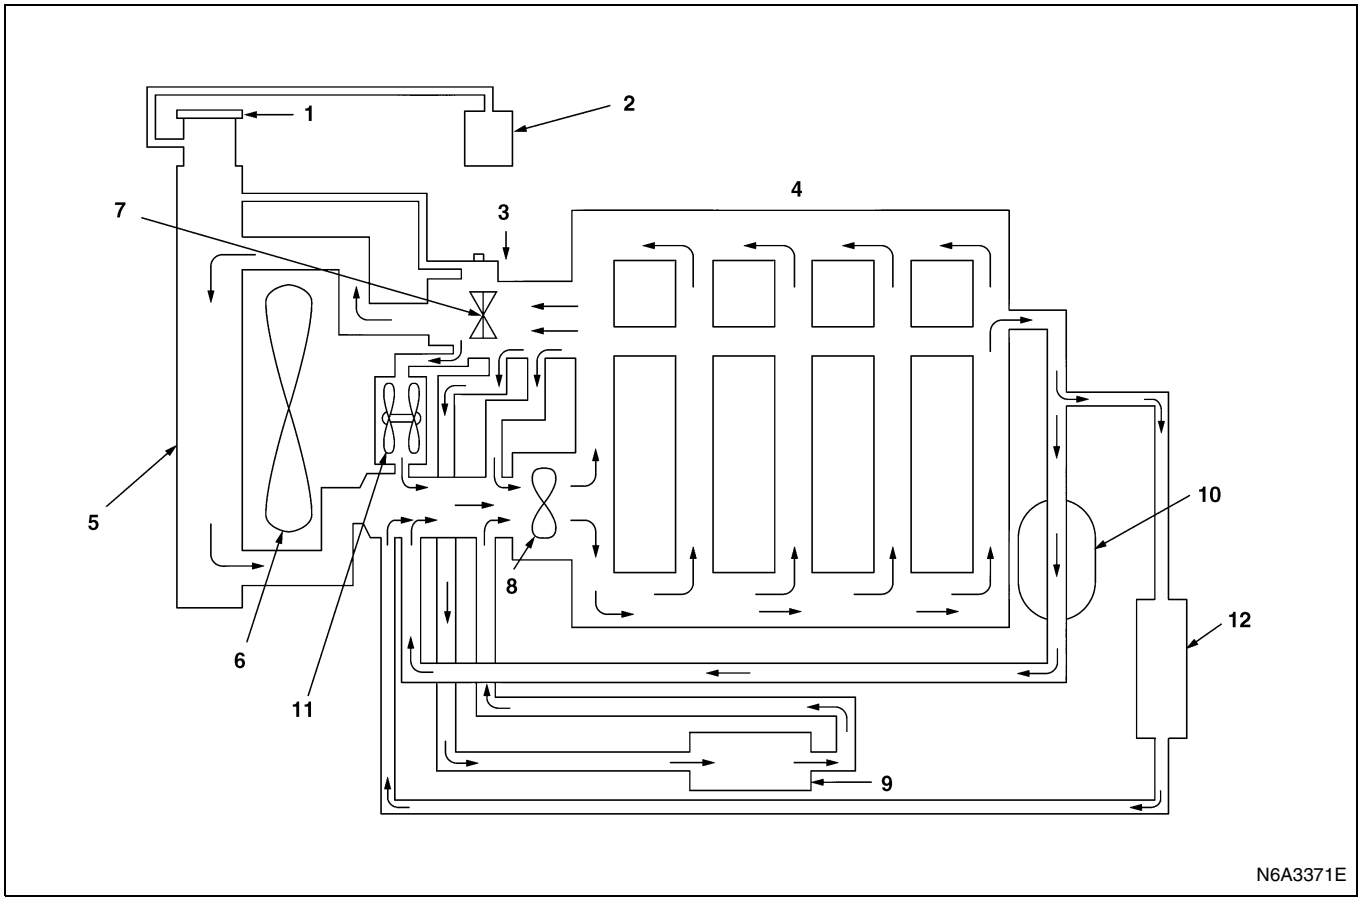
Coolant Flow (4JH1-TC)



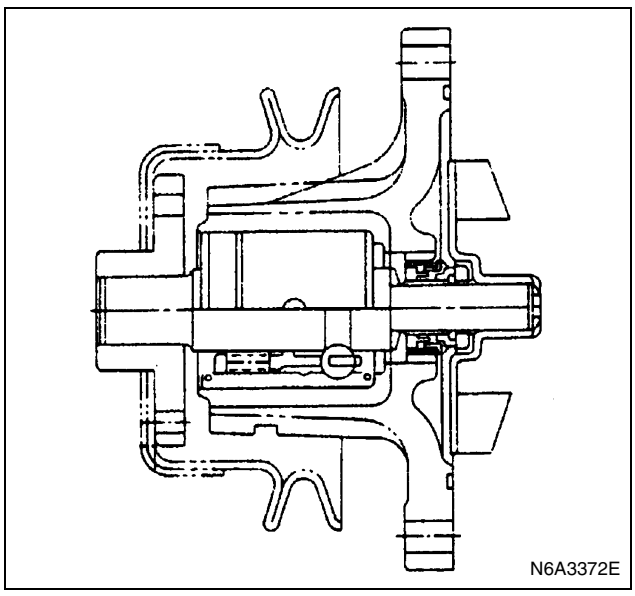
Legend

1. Radiator cap
2. Reservoir tank
3. Air bleeding plug
4. Cylinder head
5. Radiator
6. Cooling fan
7. Thermostat
8. Water pump
9. Car heater
10. Oil cooler
11. Turbo charger
12. EGR Cooler

The cooling system is a pressurized coolant forced circulation type which consists of water pump, thermostat cooling fan, radiator and other components. The circulating coolant cools the lubricating oil in the oil filter and turbocharger.

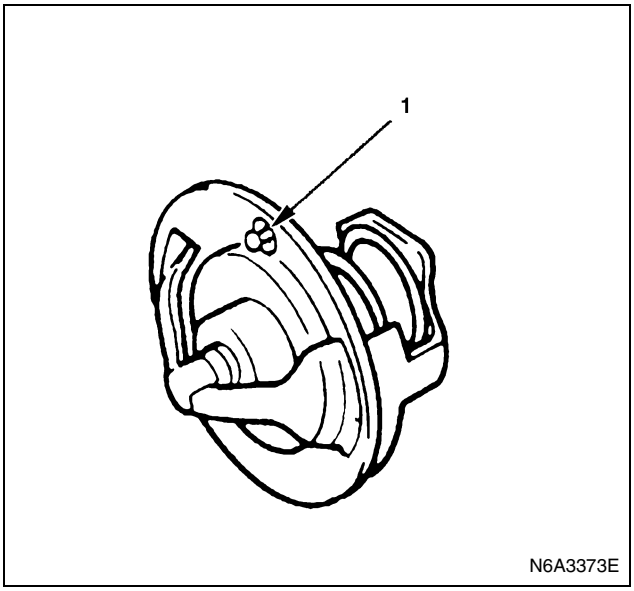
Water Pump

The coolant pump is a centrifugal impeller type and is driven by V type drive belt.
The water pump is not disassembled type.



Thermostat

The thermostat is a wax pellet type with a juggle valve and is installed in the thermostat housing.

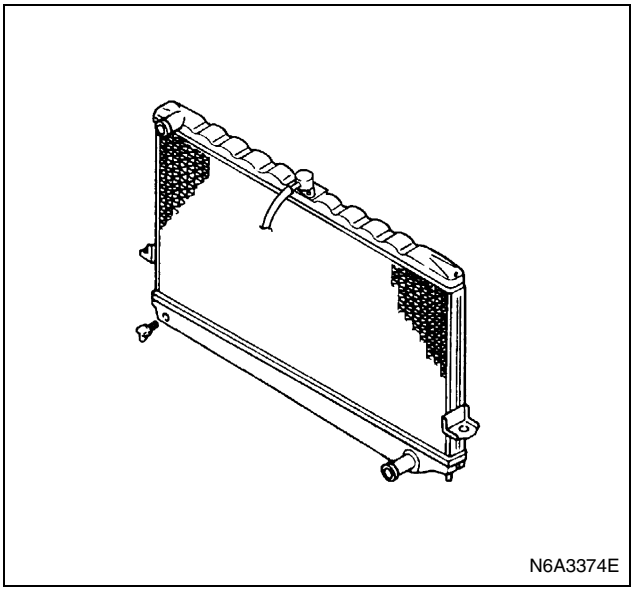


Legend

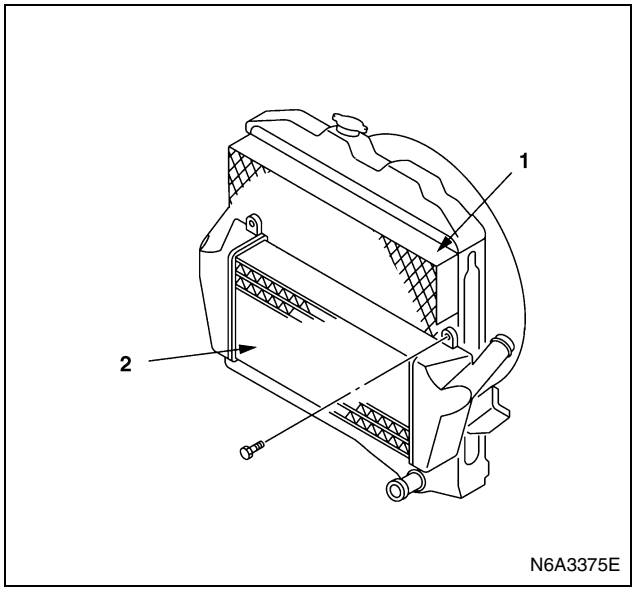
1. Jiggle valve

Radiator

The radiator is a tube type with corrugated fins. In order to raise the boiling point of coolant, the radiator is adjusted through a valve fitted to the upper tank to a pressure range of 93 — 123 kPa (0.95 — 1.25 kg/cm^2). The cap fitted to the cylinder head thermostat housing has only a water supply function.



The 4JH1-TC engine is equipped with the intercooler.



Legend

1. Radiator
2. Charge air cooler

Engine Coolant Change Procedure

1. To change engine coolant, make sure that the engine is cool.

WARNING:
WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP.
OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

2. Open radiator cap and drain the cooling system by loosening the drain valve on the radiator and on the cylinder body.

Notice:
For best result it is suggested that the engine cooling system be flushed at least once a year. It is advisable to flush the interior of the cooling system including the radiator before using specified coolant.

Replace damaged rubber hoses as the engine specified coolant. Coolant is liable to leak out even minor cracks.

Isuzu recommends to use Isuzu genuine specified coolant or equivalent, for the cooling system and not add any inhibitors or additives.

Caution:
A failure to correctly fill the engine cooling system in changing or topping up coolant may sometimes cause the coolant to overflow from the filler neck even before the engine and radiator are completely full.

If the engine runs under this condition, shortage of coolant may possibly result in engine overheating. To avoid such trouble, the following precautions should be taken in filling the system.

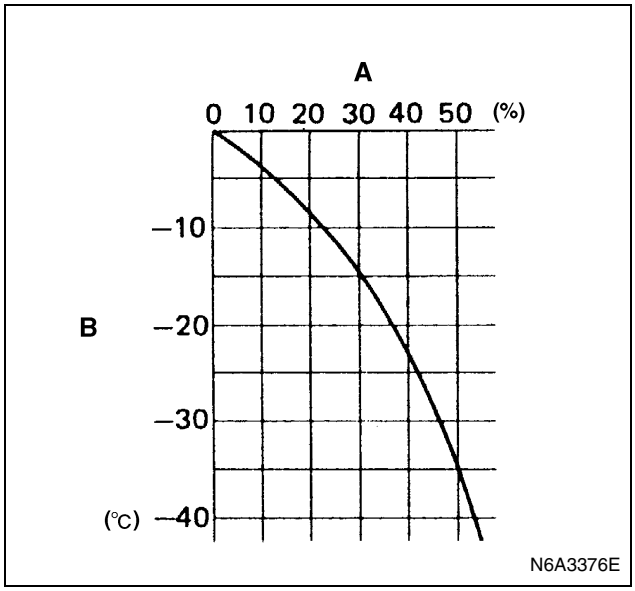
3. To refill engine coolant, pour coolant up to filler neck using a filling hose which is smaller in outside diameter of the filler neck.
   Otherwise air between the filler neck and the filling hose will block entry, preventing the system from completely filling up.
4. Keep a filling rate of 9 liter/min. or less. Filling over this maximum rate may force air inside the engine and radiator.
   And also, the coolant overflow will increase, making it difficult to determine, whether or not the system is completely full.
5. After filling the system to the full, pull out the filling hose and check to see if air trapped in the system is dislodged and the coolant level goes down. Should the coolant level go down, repeat topping-up until there is no more drop in the coolant level.
6. After directly filling the radiator, fill the reservoir to the maximum level.
7. Install and tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.

WARNING:
WHEN THE COOLANT IS HEATED TO A HIGH TEMPERATURE, BE SURE NOT TO LOOSEN OR REMOVE THE RADIATOR CAP.
OTHERWISE YOU MIGHT GET SCALDED BY HOT VAPOR OR BOILING WATER. TO OPEN THE RADIATOR CAP, PUT A PIECE OF THICK CLOTH ON THE CAP AND LOOSEN THE CAP SLOWLY TO REDUCE THE PRESSURE WHEN THE COOLANT HAS BECOME COOLER.

8. After tightening radiator cap, warm up the engine at about 2,000 rpm.
   Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
9. Check to see the thermostat has opened through the needle position of water thermometer, conduct a 5 minutes idling again and stop the engine.
10. When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant is found, check the coolant system and reservoir tank hose for leakage.
11. Fill the coolant into the reservoir tank up to “MAX” line.

Specified Coolant Solution

- Relation between Mixing ratio and Freezing point
  Freezing temperature of the engine coolant varies with the ratio of specified coolant solution in water. Proper mixing ratio can be determined by referring to the chart. Supplemental inhibitors or additives claiming to increase cooling capability that have not been specifically approved by Isuzu are not recommended for addition to the cooling system.



Legend
A. Mixing ratio
B. Freezing point

- Calculation of mixing ratio

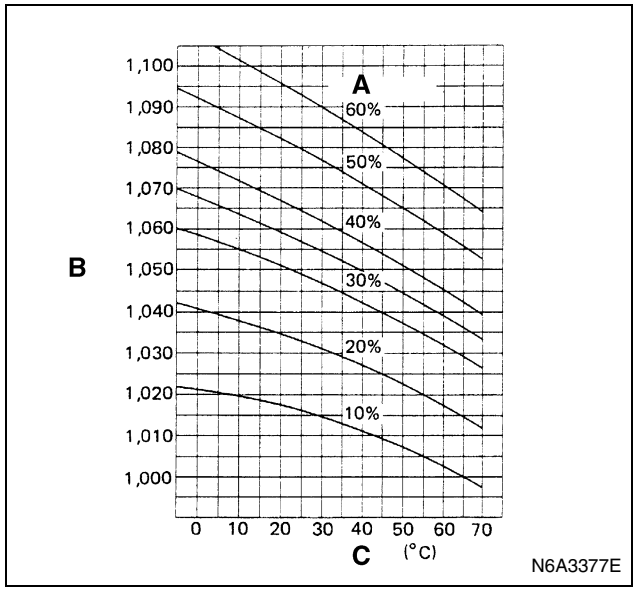
$$\text{Mixing ratio} = \frac{\text{Specified coolant solution (Lit/qt.)}}{\text{Specified coolant solution (Lit/qt.)} + \text{Water (Lit/qt.)}}$$

Notice:
Specified coolant solution + Water = 10 lit
Total cooling system capacity.
In case of 6.8 lit total cooling system capacity

Mixing ratio (%)	Specified coolant solution: lit. (imp. qt./U.S. qt)		Water: lit. (imp. qt/U.S. qt)	
0	0	0	10	(8.80/10.57)
5	0.5	(0.44/0.53)	9.5	(8.36/10.04)
10	1.0	(0.88/1.06)	9.0	(7.92/9.51)
15	1.5	(1.32/1.59)	8.5	(7.48/8.98)
20	2.0	(1.76/2.11)	8.0	(7.04/8.45)
25	2.5	(2.20/2.64)	7.5	(6.60/7.93)
30	3.0	(2.64/3.17)	7.0	(6.16/7.40)
35	3.5	(3.08/3.70)	6.5	(5.72/6.87)
40	4.0	(3.52/4.23)	6.0	(5.28/6.34)
45	4.5	(3.96/4.76)	5.5	(4.84/5.81)

Mixing ratio (%)	Specified coolant solution: lit. (imp. qt./U.S. qt)	Water: lit. (imp. qt/U.S. qt)
50	5.0 (4.40/5.28)	5.0 (4.40/5.28)

- Mixing ratio
  Check the specific gravity of engine coolant in the cooling system in temperature ranges from 0° to 50°C using a suction type hydrometer, then determine the mixing ratio of the coolant by referring to the table.

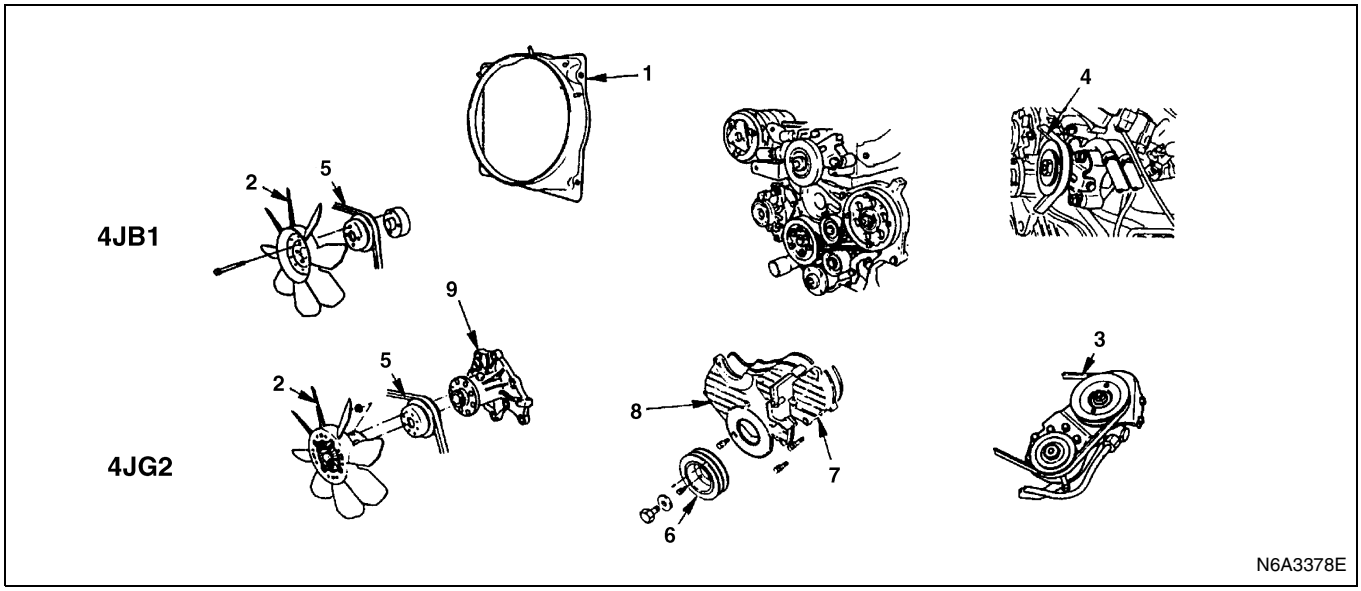


Legend

A. Mixing ratio
B. Specific gravity
C. Coolant temperature

WATER PUMP

Component



Legend

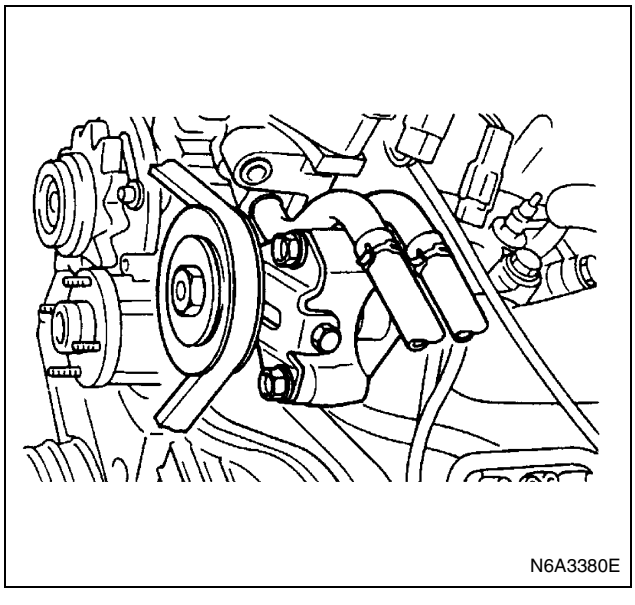
1. Fan shroud
2. Cooling fan assembly
3. Power steering pump drive belt
4. A/C compressor drive belt
5. AC generator drive belt
6. Crankshaft damper pulley
7. Timing pulley upper cover
8. Timing pulley lower cover
9. Water pump assembly

Removal

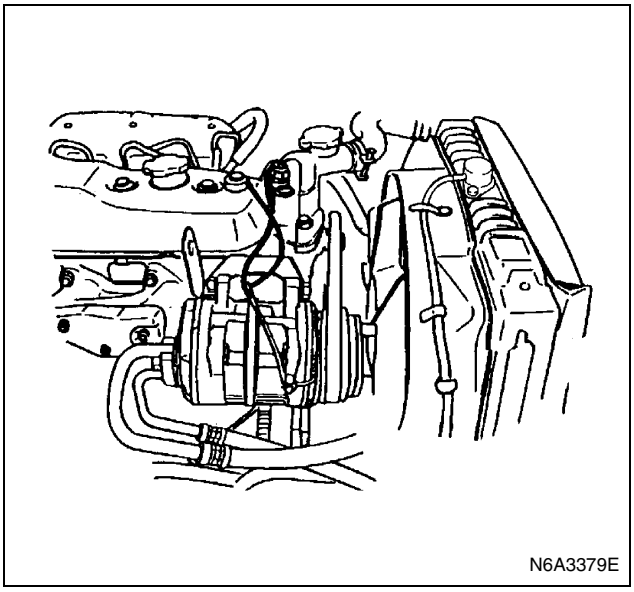
Preparation:

- Disconnect battery ground cable.
- Drain coolant.

1. Fan Shroud
   - Remove the reservoir tank hose, bypass hose and fan guide.
2. Cooling Fan Assembly
   - Remove lock nut and take out cooling fan assembly.
3. Power Steering Pump Drive Belt
   - Loosen the idler pulley lock nut and loosen adjust bolt, and remove the drive belt.

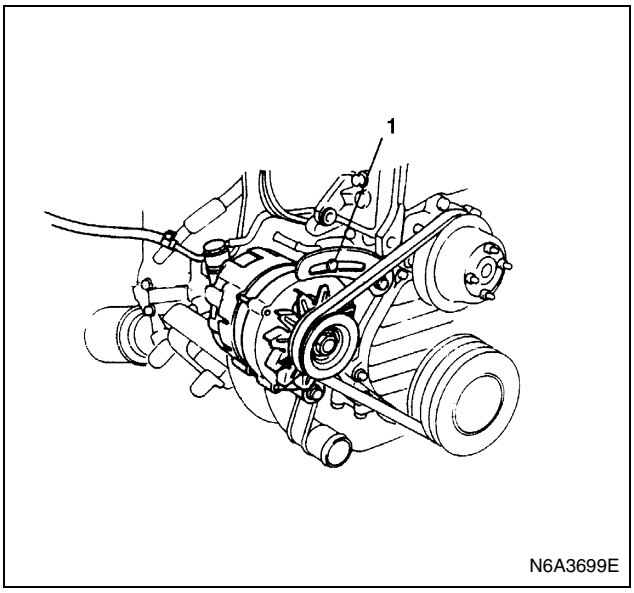


4. A/C Compressor Drive Belt
   - Loosen A/C compressor idler pulley lock nut and adjust bolt and remove the drive belt.



N6A3379E

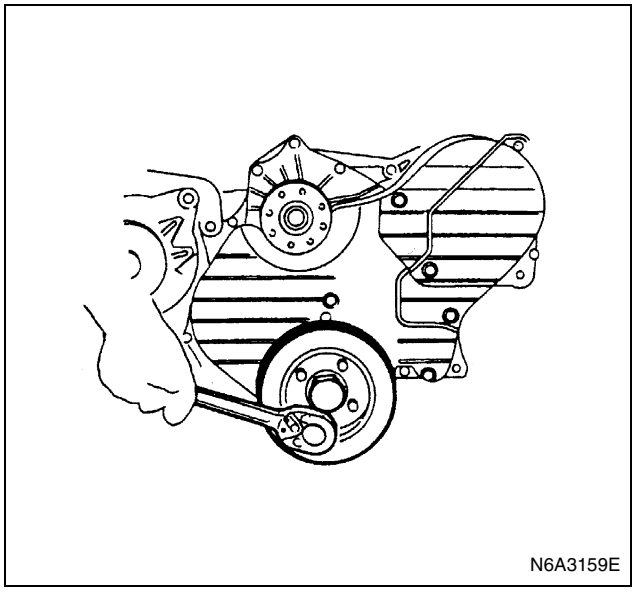
5. AC Generator Drive Belt
   - Loosen AC Generator mounting bolt (under side) and adjust plate lock bolt, and remove the drive belt.



N6A3699E

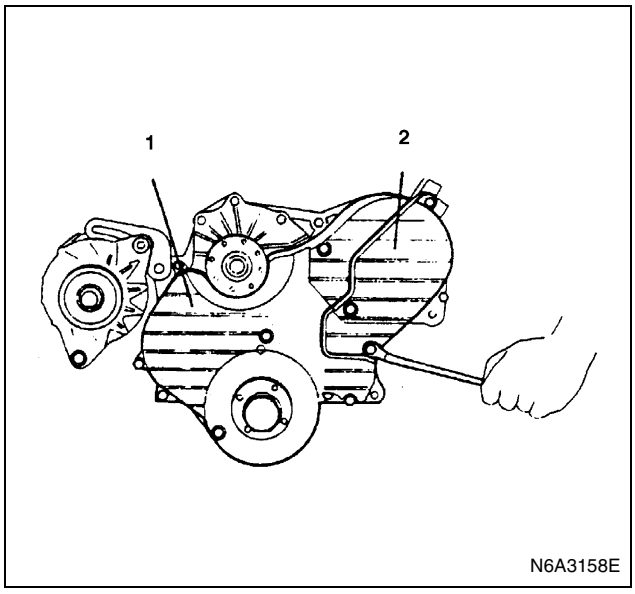
Legend
1. Lock bolt

6. Crankshaft Damper Pulley



N6A3159E

7. Timing Pulley Upper Cover



N6A3158E

Legend
1. Lower cover
2. Upper cover

8. Timing Pulley Lower Cover
9. Water Pump Assembly
   - Remove the O-ring.

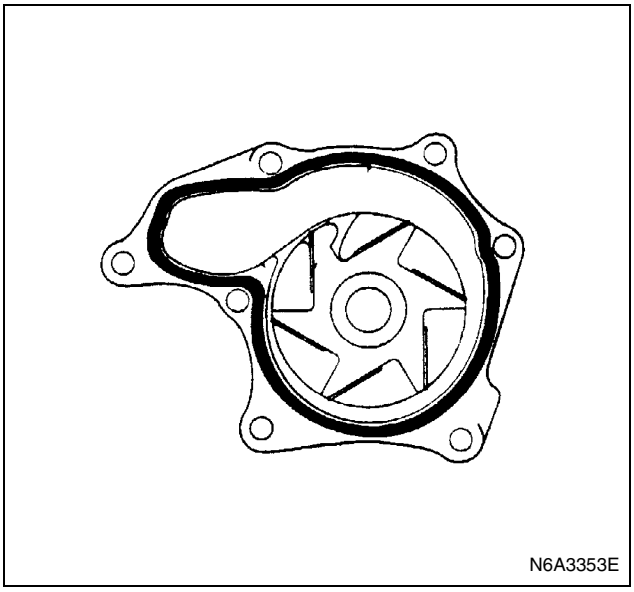
Inspection

Make necessary parts replacement if extreme wear or damage is found during inspection. Should any of the following problems occur, the entire water pump assembly must be replaced.

- Cracks in the coolant pump body
- Coolant leakage from the seal unit
- Play or abnormal noise in the bearing
- Cracks or corrosion in the impeller

Installation

1. Water Pump Assembly
   - Set O-ring in water pump body groove.



N6A3353E

   - Install water pump assembly, and tighten to specified torque.

Tighten:
Pump Fixing Bolt to 20 N·m (2 kg·m/14 lb·ft)

2. Timing Pulley Lower Cover
   - Install timing pulley lower cover, and tighten to specified torque.

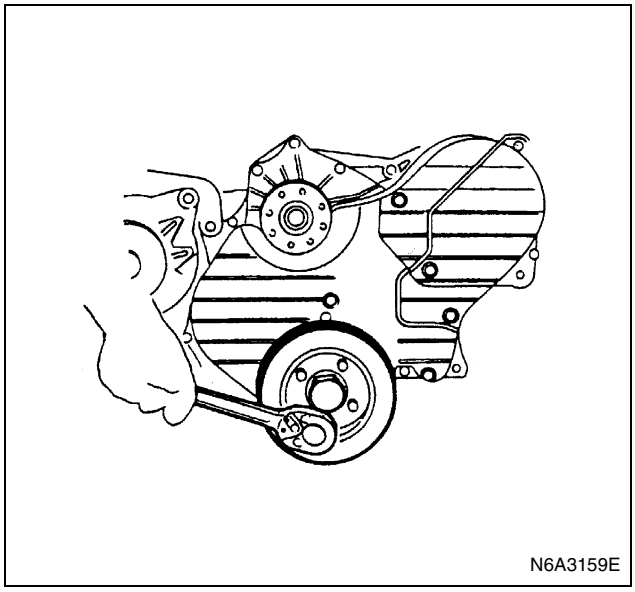
Tighten:
Cover Fixing Bolts to 8 N·m (0.8 kg·m/69 lb·in)

3. Timing Pulley Upper Cover
   - Install timing upper cover, and tighten to specified torque.

Tighten:
Cover Fixing Bolts to 8 N·m (0.8 kg·m/69 lb·in)

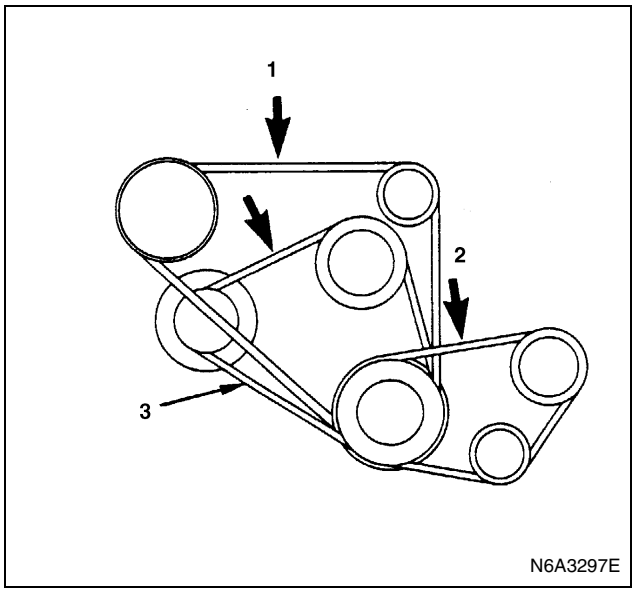
4. Crankshaft Damper Pulley
   - Install crankshaft damper pulley, and tighten to specified torque.

Tighten:
Pulley Bolt to 19 N·m (1.9 kg·m/14 lb·in)



N6A3159E

4JG2



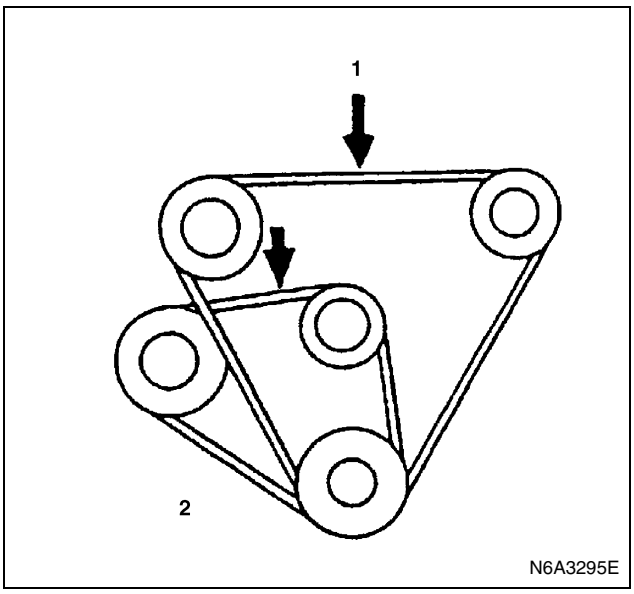
N6A3297E

Legend
1. A/C compressor drive belt
2. P/S oil pump drive belt
3. AC generator & cooling fan drive belt

5. AC Generator Drive Belt
6. A/C Compressor Drive Belt
7. Power Steering Pump Drive Belt
   - Install the drive belts and adjust belt.
     Check drive belts for wear or damage, and replace with new ones as necessary. Check belts for tension, and adjust as necessary.
   - Push the middle of belts with a force of 98 N (10 kg/22 lb) and check each bolt for deflection.
   - Standard deflection

	mm (in)
	Initial tension
AC Generator drive belt A/C compressor drive belt Power Steering pump drive belt	8 — 12 (0.31 — 0.47)

4JB1



Legend

1. A/C compressor drive belt & P/S pump drive belt
2. AC generator & fan pulley drive belt

Tighten:

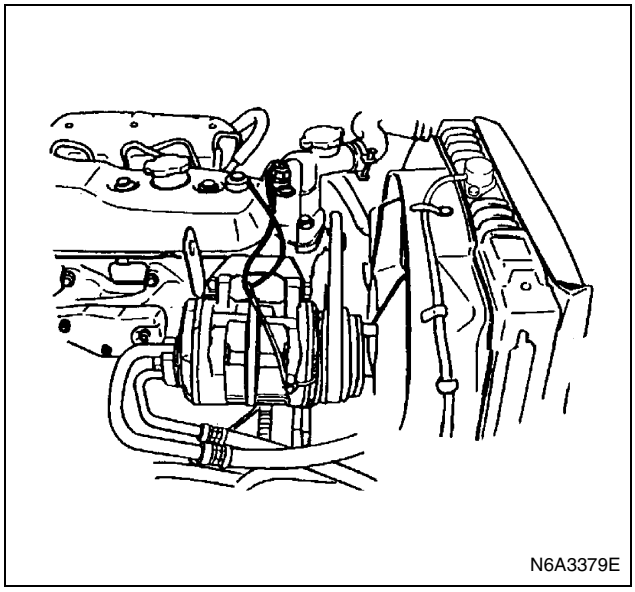
- Generator Fixing Belt to 40 N·m (4.1 kg·m/30 lb·ft)
- Adjust Plate Fixing Belt to 19 N·m (1.9 kg·m/14 lb·ft)
- A/C Idler Pulley Lock Nut to 27 N·m (2.8 kg·m/20 lb·ft)
- P/S Idler Pulley Lock Nut to 27 N·m (2.8 kg·m/20 lb·ft)

8. Cooling Fan Assembly
   - Mount fan pulley and cooling fan assembly on the water pump and tighten to the specified torque.

Tighten:

Fan Pulley Nut to 8 N·m (0.8 kg·m/69 lb·in)

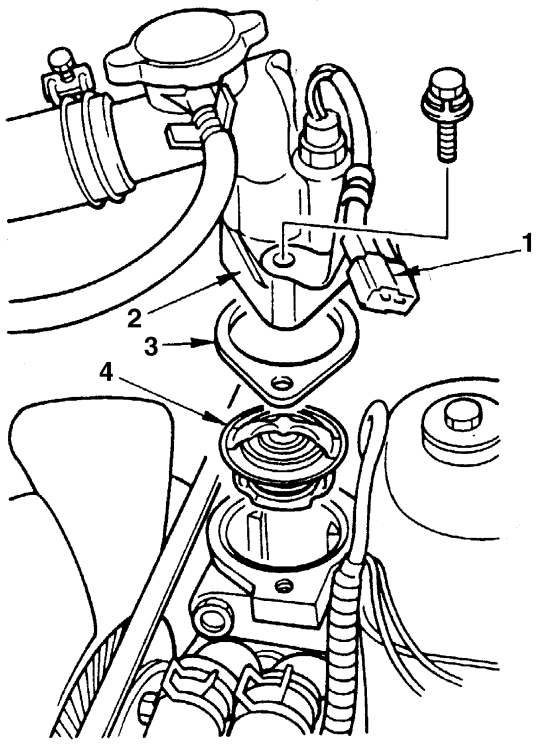
9. Fan Shroud
   - Install the fan shroud and reservoir tank hose and bypass hose.



- Connect the battery ground cable.
- Pour coolant.
- Start the engine and check coolant leakage.

THERMOSTAT

Component



N6A3385E

Legend

1. Switch harness
2. Outlet pipe
3. Gasket
4. Thermostat

Removal

Preparation:

- Disconnect battery ground cable.
- Drain coolant from the radiator and engine.

1. Switch Harness
2. Outlet Pipe
   - Remove mounting bolt and remove outlet pipe together with radiator hose.
3. Gasket
4. Thermostat

Inspection

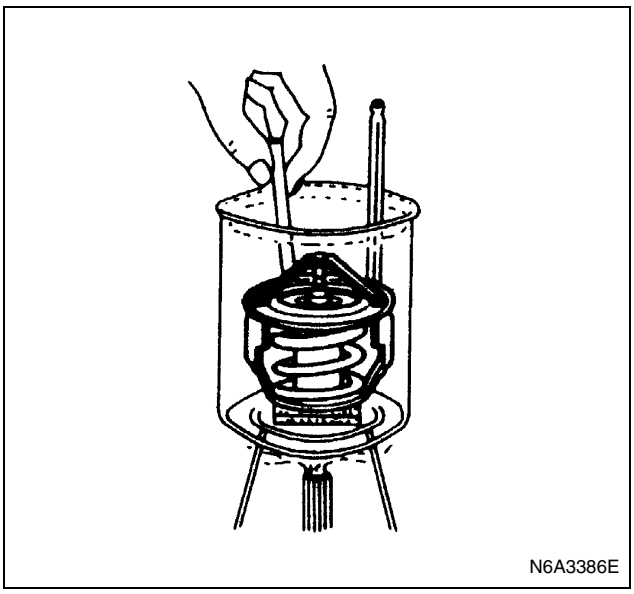
Submerge the thermostat assembly in the water.
Place wooden blocks on the bottom of the water container.
Not to directly heat the thermostat.
Gradually increase the water temperature. Stir the water so that the entire water is same temperature.

- Make sure that primary valve begins to open at the specified temperature.

Valve Opening Temperature °C(°F)
82 (180)

- Make sure that secondary valve opens fully at the specified temperature.

Valve Full Open Temperature °C(°F)
95 (203)



N6A3386E

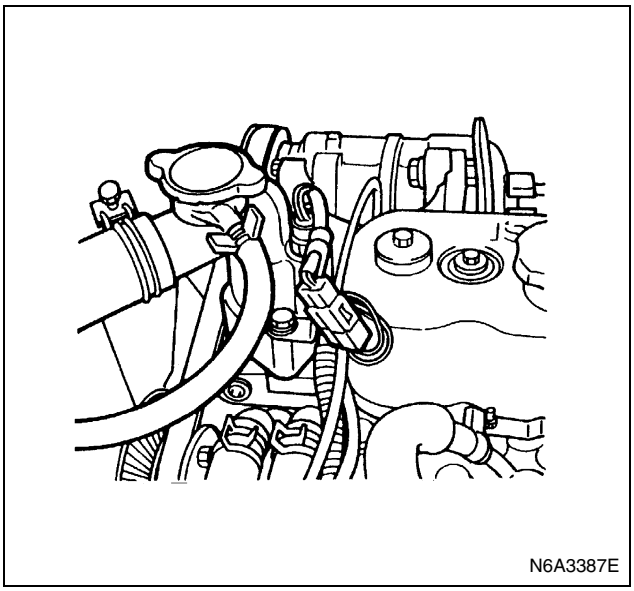
Make necessary repair and parts replacement if extreme wear or damage is found during inspection.

Installation

1. Thermostat
2. Gasket
3. Outlet Pipe
   - Connect outlet pipe and tighten bolts to the specified torque.

Tighten:
19 N·m (1.9 kg·m/14 lb·ft)

4. Switch Harness
   - Install switch harness.

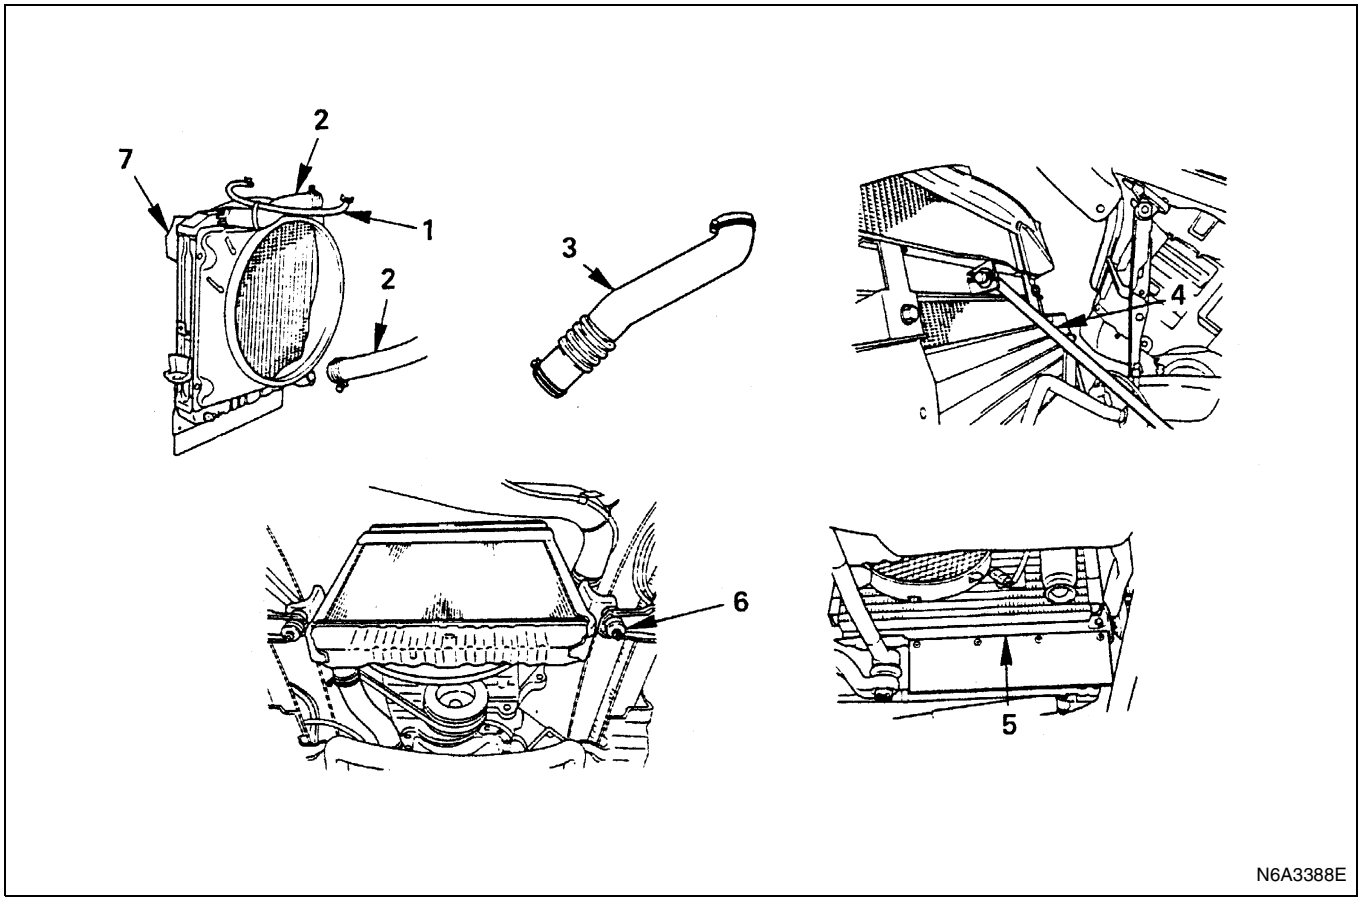


N6A3387E

- Install battery ground cable.
- Pour coolant.
- Start the engine and check coolant leakage.

RADIATOR

Component



Legend

1. Reservoir tank hose & Bypass hose
2. Radiator hose
3. Air intake duct
4. Radiator stay
5. Condenser
6. Cushion rubber
7. Radiator assembly

Removal

Preparation:

- Disconnect battery ground cable.
- Loosen drain plug to drain coolant.

1. Reservoir Tank Hose & Bypass Hose
   - Disconnect the hose from radiator.
2. Radiator Hose
   - Disconnect lower hose and upper hose from the engine.
3. Air Intake Duct
4. Radiator Stay
5. Condenser
   - Remove the condenser from radiator and temporarily tighten the condenser to cab body front side, use the wire.
6. Cushion Rubber
   - Remove cushion rubbers on both sides of the bottom.
7. Radiator Assembly
   - Remove upward the radiator assembly with hose, taking care not to damage the radiator core by fan blade.

Inspection

Radiator Valve

- Apply air pressure from filler neck using radiator cap tester and check the opening pressure of radiator valve. If the valve opening pressure is out of the standard value range, replace with a new radiator valve.

Radiator valve opening pressure kPa (kg/cm^2 /psi)
93 — 123 (0.95 — 1.25/13.5 — 17.8)

- Remove the radiator valve and check a negative pressure valve as the center of the valve seat side. If the negative pressure valve does not work smoothly, clean or replace the radiator valve.

Tighten:
Radiator valve to 6 N·m (0.6 kg·m/4 lb·ft)

- Conduct cooling system leakage check after reinstalling the radiator valve.

Radiator Core

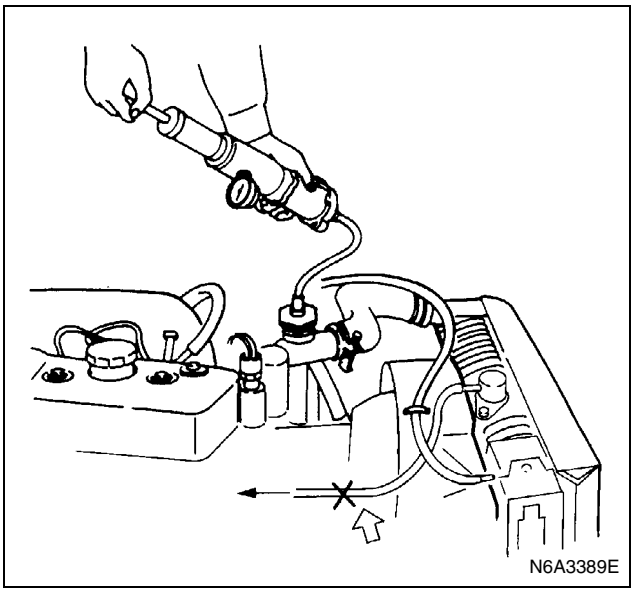
- Deformed radiator fins could reduce radiation effects, resulting in overheat. Straighten the fins. In such a case, take care not to damage the fin roots.
- Remove dust and other foreign materials.

Flushing the Radiator

- Wash the inside of radiator and the coolant passage with water and neutral detergent. Remove all scales and rust.

Checking for Coolant Leakage

- Clog up the reservoir tank hose carefully and check the cooling system for leakage with a radiator cap tester by applying an air pressure of 147 kPa (1.5 kg/cm^2 /21 psi) from filler neck to inside the radiator.

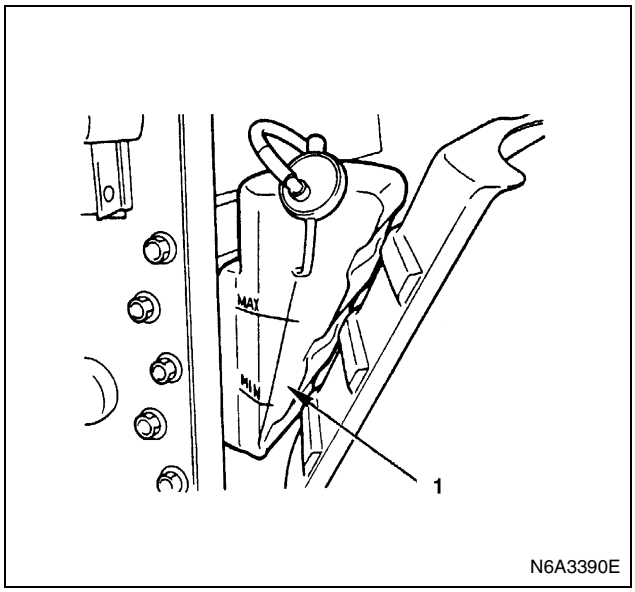


N6A3389E

- As the radiator upper tank is provided with a valve, the pressure fails to rise higher than the valve opening pressure unless the hose is clogged up.

Installation

1. Radiator Assembly
   - Install the radiator.
2. Cushion Rubber
   - Install cushion rubbers on both sides of radiator bottom.
   - Install radiator assembly with hose, taking care not to damage the radiator core by a fan blade.
3. Condenser
4. Radiator Stay
5. Air Intake Duct
   - Connect the duct and tighten clip securely.
6. Radiator Hose
   - Connect inlet hose and outlet hose to the engine.
   - Connect battery ground cable.
   - Pour coolant up to filler neck of radiator, and up to MAX mark of reservoir tank.
7. Reservoir Tank Hose & Bypass Hose
   - Start engine to warm up, and check for coolant level.



N6A3390E

Legend

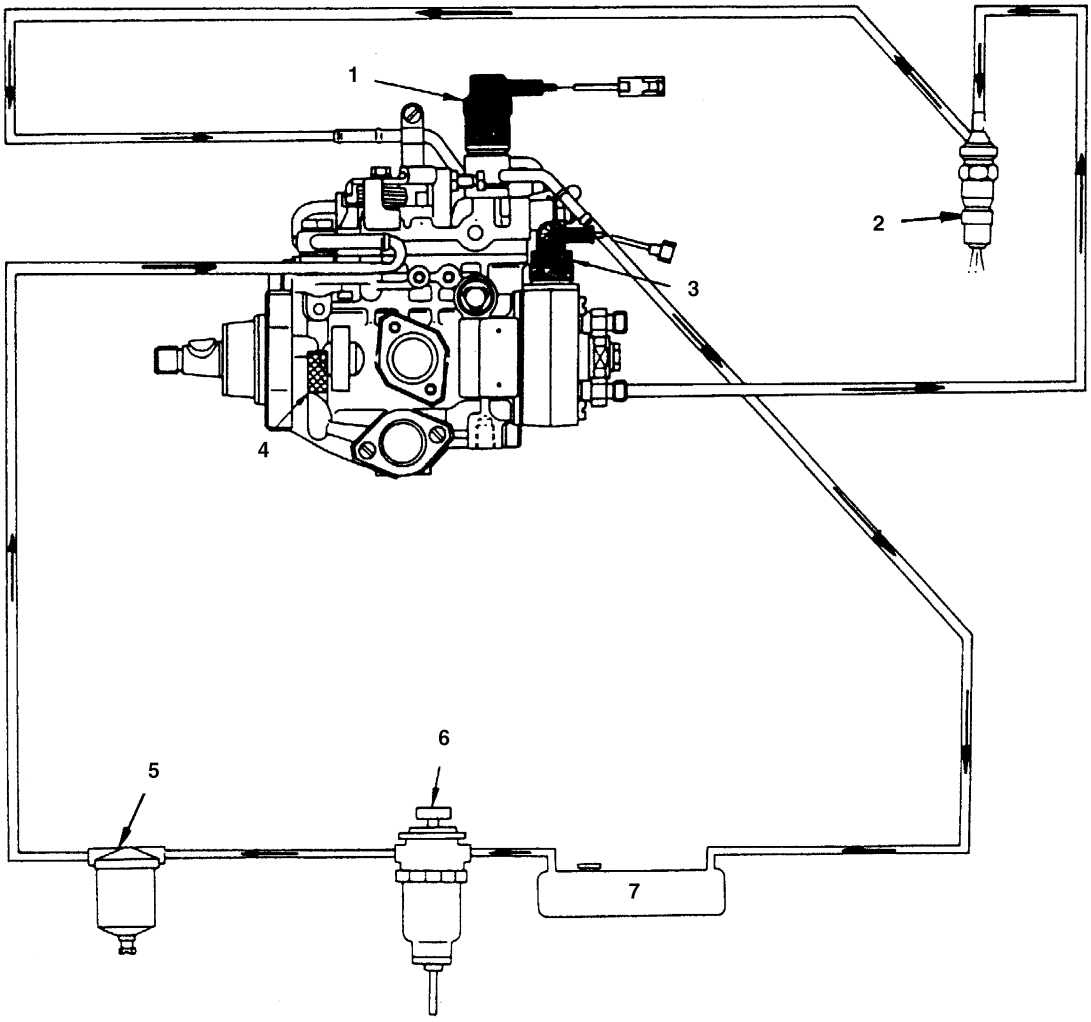
GENERAL DESCRIPTION

When working on the fuel system, there are several things to keep in mind:

- Any time the fuel system is being worked on, disconnect the negative battery cable except for those tests where battery voltage is required.
- Always keep a dry chemical (Class B) fire extinguisher near the work area.
- Replace all pipes with the same pipe and fittings that were removed.
  Clean and inspect O-rings. Replace where required.
- Always relieve the line pressure before servicing any fuel system components.
- Do not attempt repairs on the fuel system until you have read the instructions and checked the pictures relating to that repairs.
- The 4JH1-TC engine is equipped with the electronically controlled fuel injection system.
  For information on fuel injection pump maintenance and/or part replacement, contact the Bosch Automotive Systems Corporation.
- Contact the Bosch Automotive Systems Corporation for information on 4JH1-TC engine fuel injection nozzle maintenance.

Fuel Flow

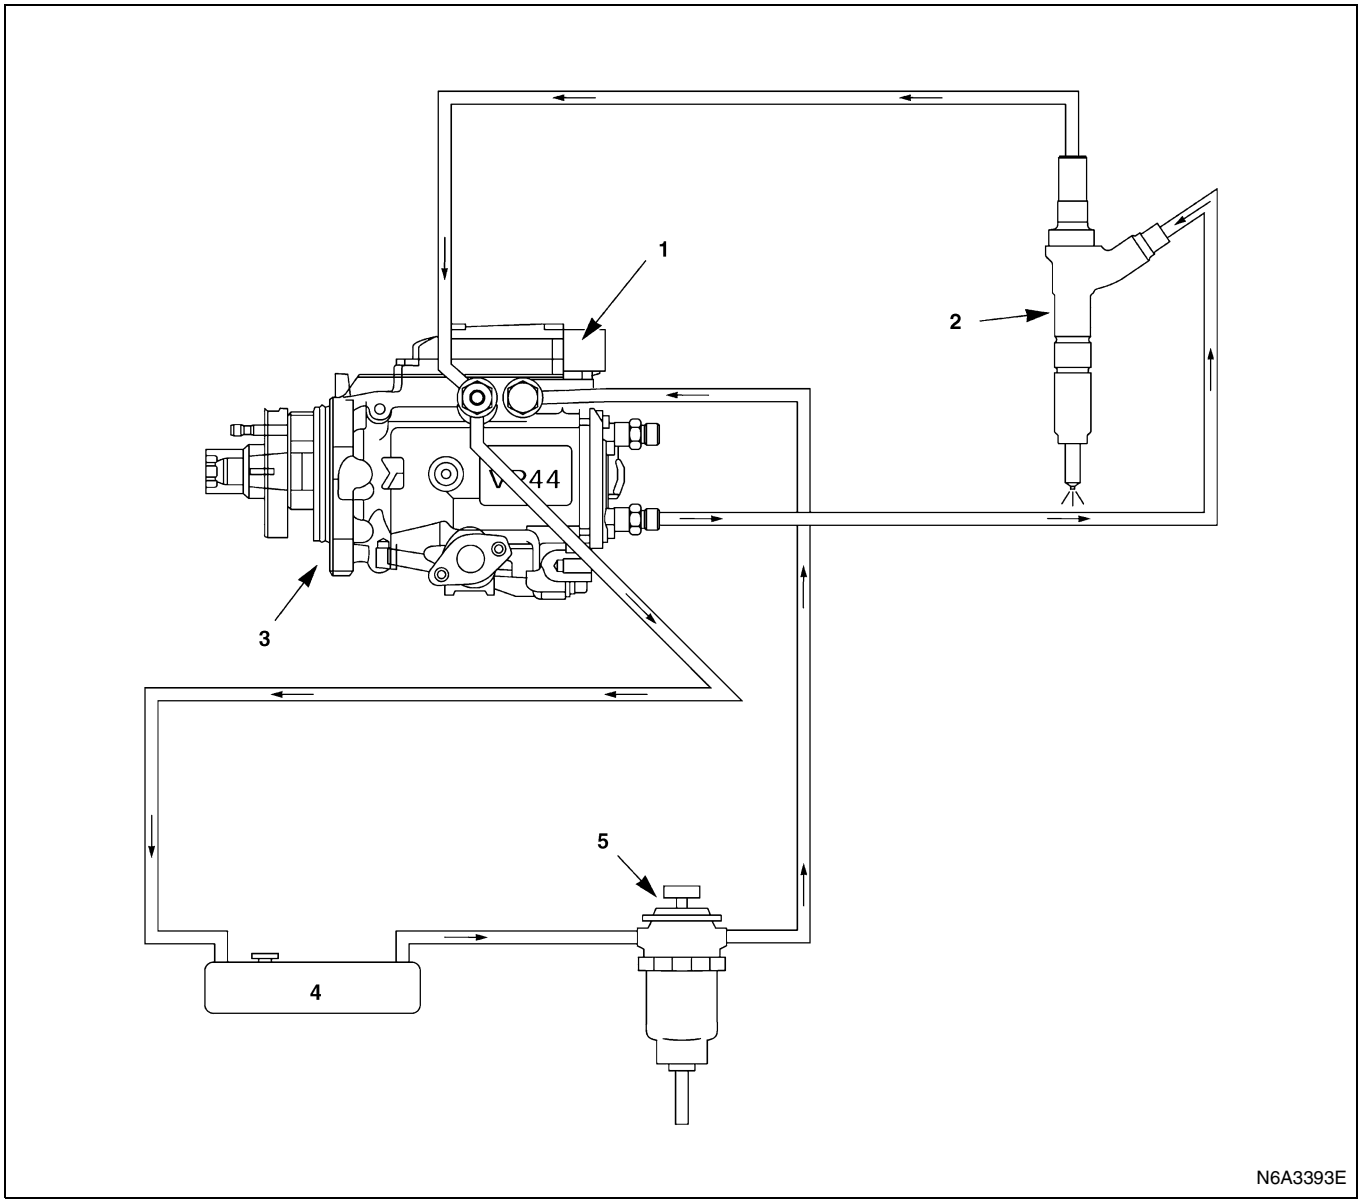


Legend

1. CSD solenoid valve
2. Nozzle
3. Fuel cut solenoid valve
4. VE type injection pump
5. Fuel filter
6. Water separator
7. Fuel tank

The fuel system consists of the fuel tank, the water separator, the fuel filter, the injection pump, and the injection nozzle.
The fuel from the fuel tank passes through the water separator and the fuel filter where water particles and other foreign material are removed from the fuel.
Fuel, fed by the injection pump plunger, is delivered to the injection nozzle in the measured volume at the optimum timing for efficient engine operation.

Fuel Flow (4JH1-TC)



Legend

1. EDU
2. Nozzle
3. Injection pump
4. Fuel tank
5. Fuel filter

Injection Pump

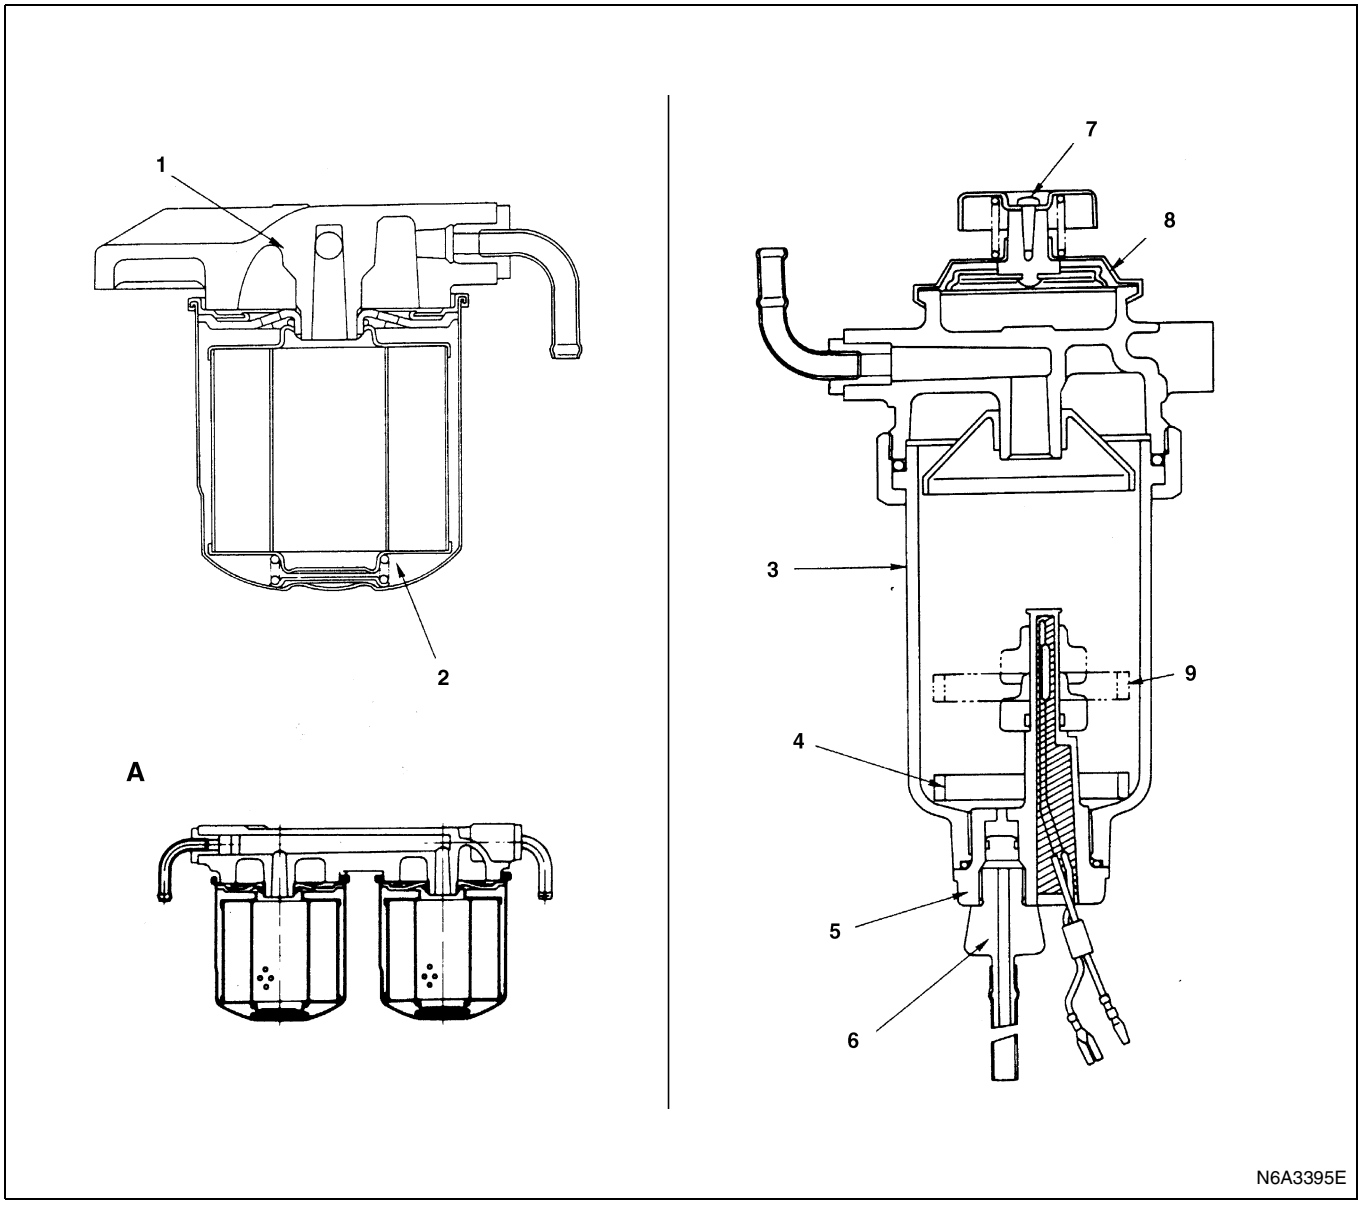
8. Plunger spring
9. Control sleeve
10. Delivery valve
11. Plunger
12. Fuel cut solenoid valve
13. Tension lever
14. Collector lever
15. Aneroid compensator

A Bosch Distributor Type Injection Pump is used. A single reciprocating/revolving plunger delivers the fuel uniformly to the injection nozzles, regardless of the number of cylinders.
The governor, the injection timer, and the feed pump are all contained in the injection pump housing.
The injection pump is compact, light weight, and provides reliable high-speed operation.
An aneroid compensator is available as an option for vehicles to be operated at high altitudes. It adjusts the fuel and air mixing ratio.

Fuel Filter and Water Separator

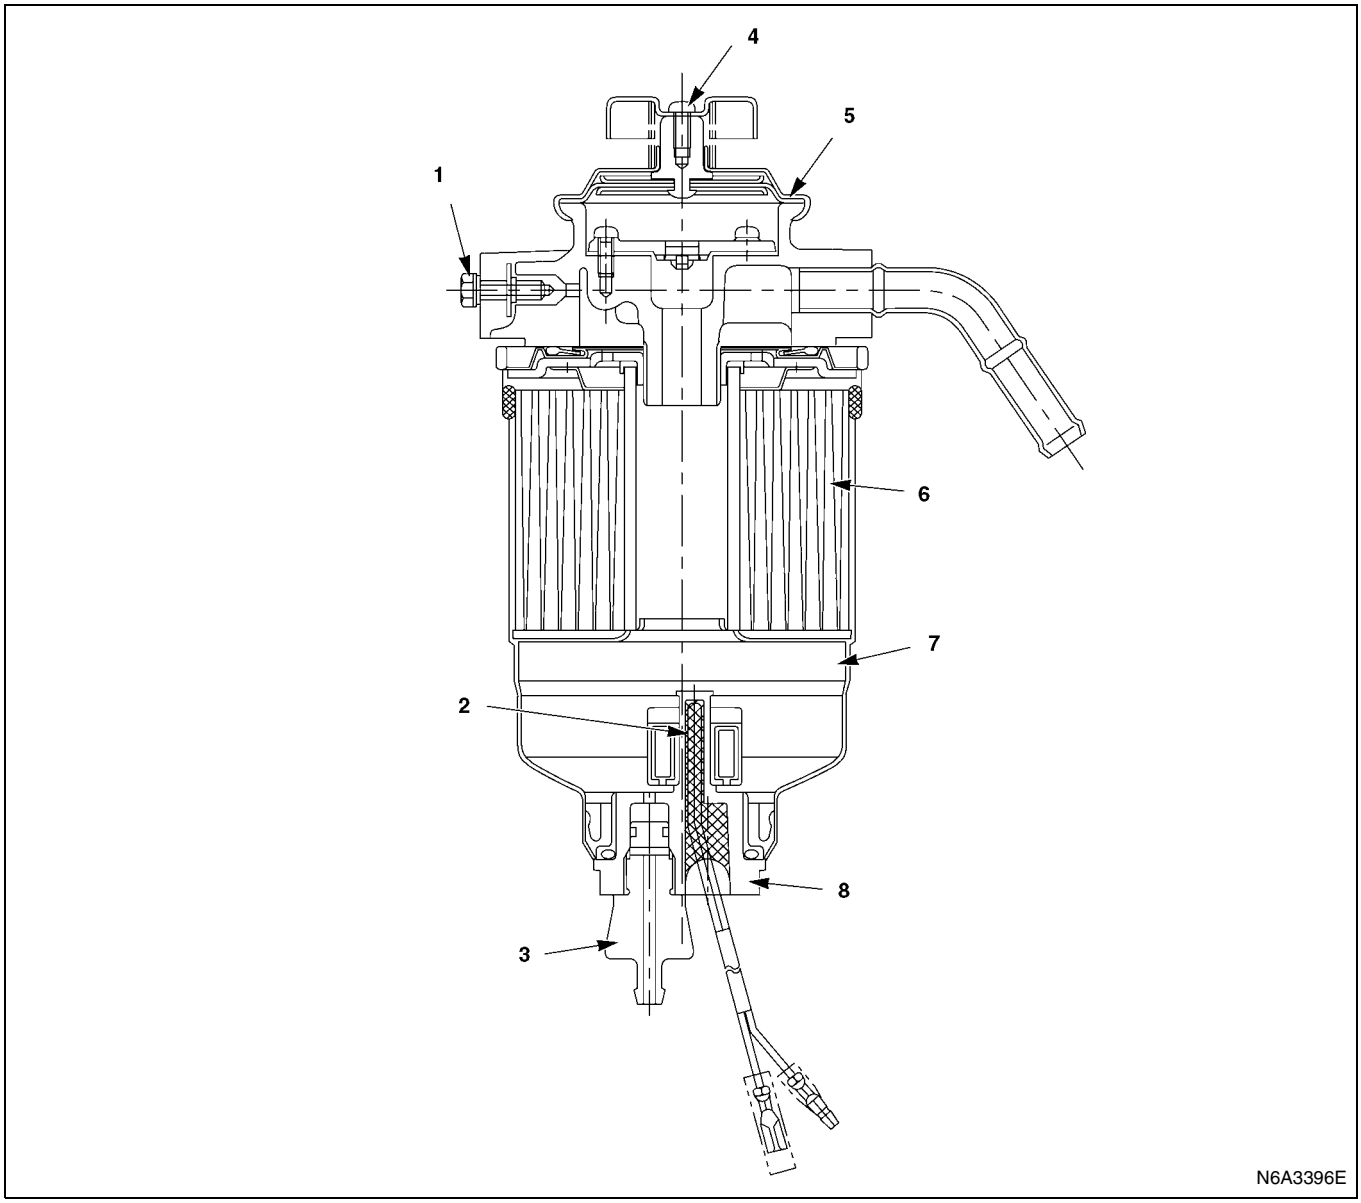


Legend

A. Dual type
1. Body assembly
2. Filter cartridge
3. Case
4. Float
5. Level sensor
6. Drain plug
7. Priming pump
8. Body assembly
9. Water draining level

A cartridge type fuel filter and a water separator are used along with the VE type injection pump.
As the inside of the injection pump is lubricated by the fuel which it is pumping, the fuel must be perfectly clean. The fuel filter and the water separator remove water particles and other foreign material from the fuel before it reaches the injection pump.
The water separator has an internal float. When the float reaches the specified level, a warning light comes on to remind you to drain the water from the water separator.
A diaphragm type priming pump is installed at the top of the water separator. It is used during the water draining and the air bleeding procedures.

Fuel Filter With Built-in Water Separator (4JH1-TC)



Legend

1. Air bleeder plug
2. Float
3. Drain plug
4. Priming pump
5. Body assembly
6. Filter element
7. Filter cartridge
8. Level sensor assembly

A fuel filter with a built-in water separator is used along with the VE type injection pump.
As the inside of the injection pump is lubricated by the fuel which it is pumping, the fuel must be perfectly clean. The fuel filter and the water separator remove water particles and other foreign material from the fuel before it reaches the injection pump.
The water separator has an internal float. When the float reaches the specified level, a warning light comes on to remind you to drain the water from the water separator.
A diaphragm type priming pump is installed at the top of the water separator. It is used during the water draining and the air bleeding procedures.

5. Adjusting shim
6. Retaining nut
7. Nut
8. Gasket
9. Push rod
10. Spacer
11. Pin

For 4J Series diesel engines, there are two types available: Direct injection engine (4JB1) and Indirect injection engine (4JG2). Accordingly, the injection nozzles to be used are different depending on the type of the engine and the combustion chamber.
The injection nozzle sprays pressurized fuel from the injection pump into the combustion chamber through the injection nozzle orifices.

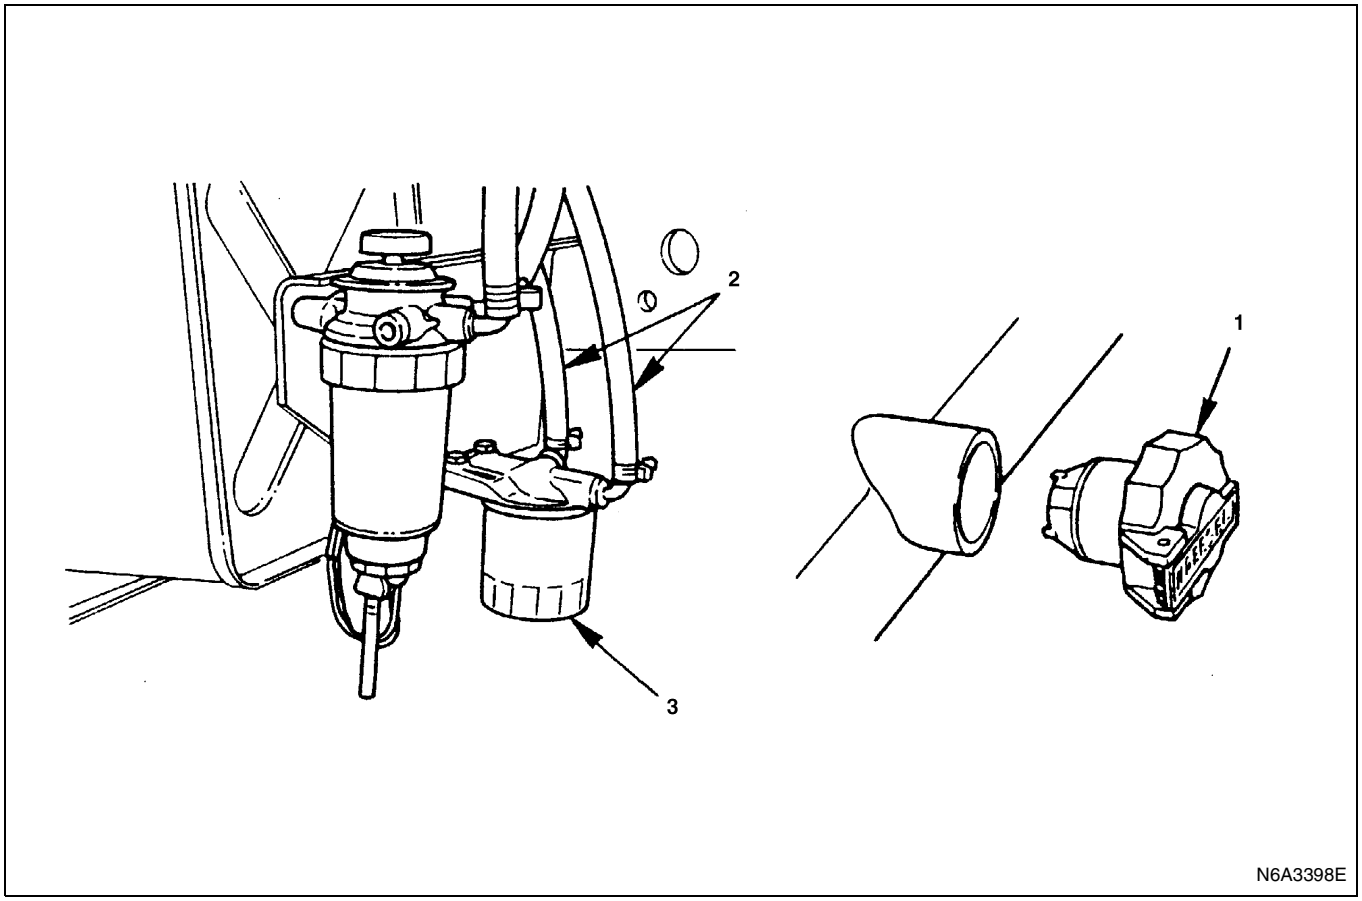
4JB1 engines employ a hole type nozzle with four injection orifices. The nozzle is made up of the nozzle body and the needle valve assembly.
Pressurized fuel from the injection pump is sprayed by the injection nozzle into the combustion chamber through the nozzle body orifices.

4JB1-TC Engine

The two-spring nozzle holder has been developed to reduce NOx (Nitrogen Oxides) and particulates from direct injection diesel engine exhaust.

FUEL FILTER ASSEMBLY

Components



Legend

1. Fuel filler cap
2. Fuel hose
3. Fuel filter assembly

Removal

Preparation

- Disconnect battery ground cable.

1. Fuel Filler Cap
2. Fuel Hose
   - Disconnect fuel hose from filter body.
     Plug the hose ends to prevent fuel spillage.
3. Fuel Filter Assembly
   - Remove the fixing bolts on fuel filter bracket.

Installation

1. Fuel Filter Assembly
   - Install the fuel filter bracket, then tighten fixing bolt.
2. Fuel Hose
   - Connect hoses to filter body.
3. Fuel Filler Cap
   - Connect the battery ground cable.
   - Feed fuel to the injection pump by means of the priming, and bleed the fuel system.

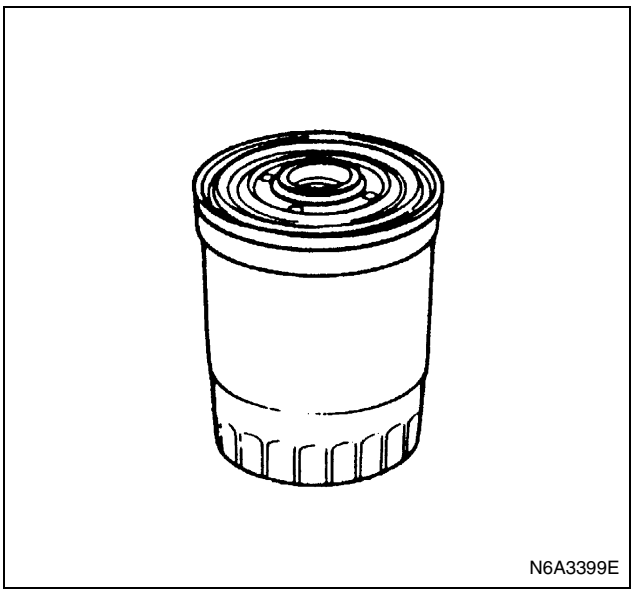
FUEL FILTER CARTRIDGE

Removal

- Remove the cartridge using a filter wrench.
  Filter wrench: 5-8840-0253-0 (J-22700)

Installation

- Clean the cartridge mounting surface of filter body so that the cartridge can be securely.
  Apply engine oil thinly to new cartridge O-ring.
- To facilitate bleeding, fill the new cartridge with light oil.
- Tighten the cartridge until O-ring comes in contact with the sealing, taking care not to spill the light oil.
- Retighten 1/3 — 2/3 using a filter wrench.
  Filter wrench: 5-8840-0253-0 (J-22700)



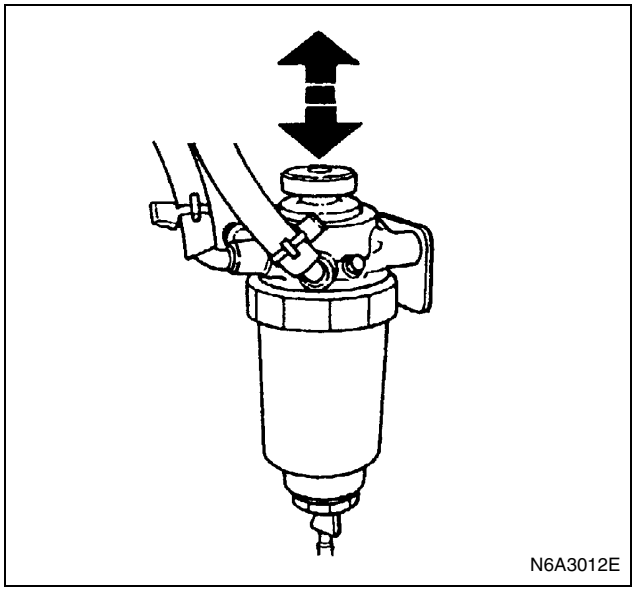
N6A3399E

Air Bleeding

- Operate priming pump to send the air in the fuel system to the injection pump.
- Loosen injection pump bleeding plug, and operate the priming pump until no bubble is made.
- Tighten the bleeding plug.
- Start the engine, and if it is not started in 10 seconds or less, repeat the bleeding steps.
- Make sure of no fuel leakage, and tighten the priming pump.

Draining

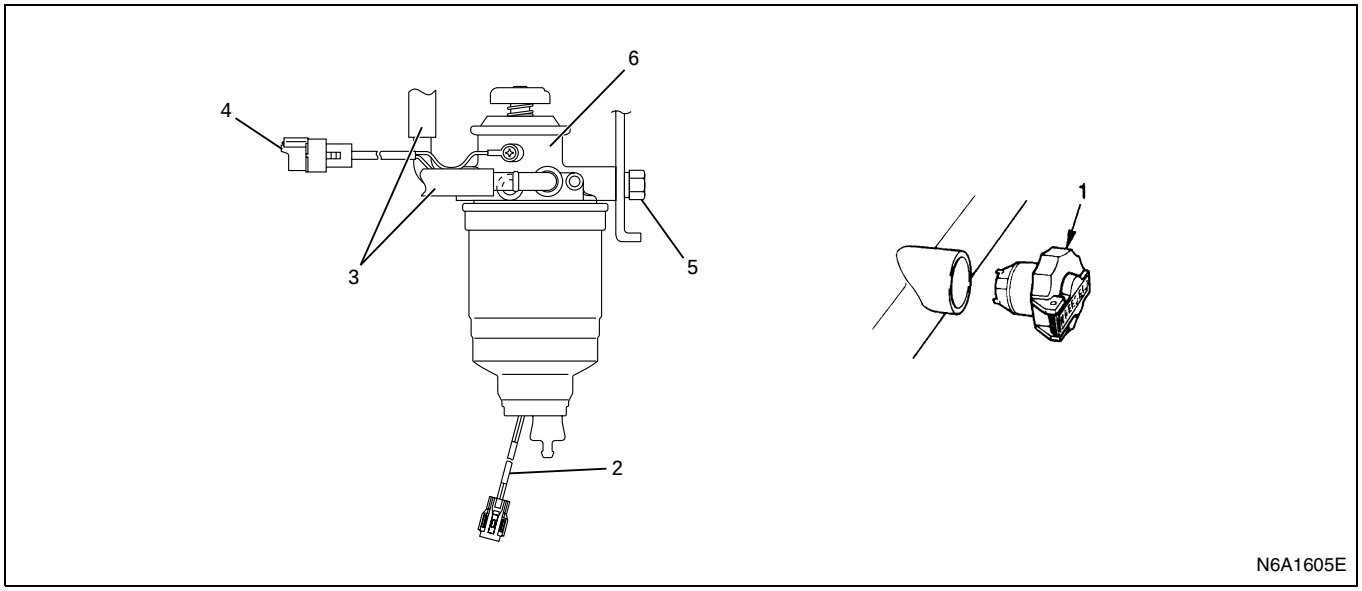
- When the water in the sedimentor reaches the specified volume, warning light is actuated.
  In this case, follow the draining steps below.
- Set a vinyl hose over the drain plug.
- Loosen the drain plug.
- To drain the water, operate the priming pump several times.
- After draining, tighten the drain plug.
- Operate the priming pump several times to check for fuel leakage.
- Check and see the warning light is off.



N6A3012E

FUEL FILTER ASSEMBLY (4JH1-TC)

Components



Legend

1. Filler Cap
2. Fuel Sedimenter Connector
3. Fuel Hose
4. Fuel Heater Connector
5. Bolt
6. Fuel Filter Assembly

Removal

1. Remove the filler cap.
2. Remove the fuel sedimenter connector and fuel heater connector.
3. Remove the feed hose and the return hose from the fuel filter and plug it so that the fuel does not flow out.
4. Remove the bolts for mounting the fuel filter.
5. Remove the fuel filter assembly.

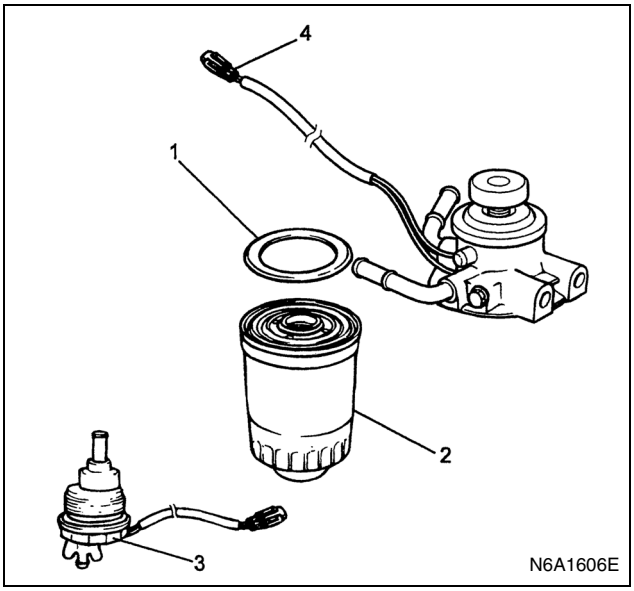
Installation

1. Install the fuel filter assembly.
2. Install the bolts for mounting the fuel filter.
3. Install the feed hose and the return hose.
4. Install the fuel sedimenter and fuel heater connector.
5. Install the filler cap.
6. Bleed out the air.
   - Refer to “Fuel Filter Cartridge (4JH1-TC)”.

FUEL FILTER CARTRIDGE (4JH1-TC)

Removal

1. Remove the cartridge using the filter wrench.
   Filter wrench: J-22700
2. Remove the sedimenter sensor.

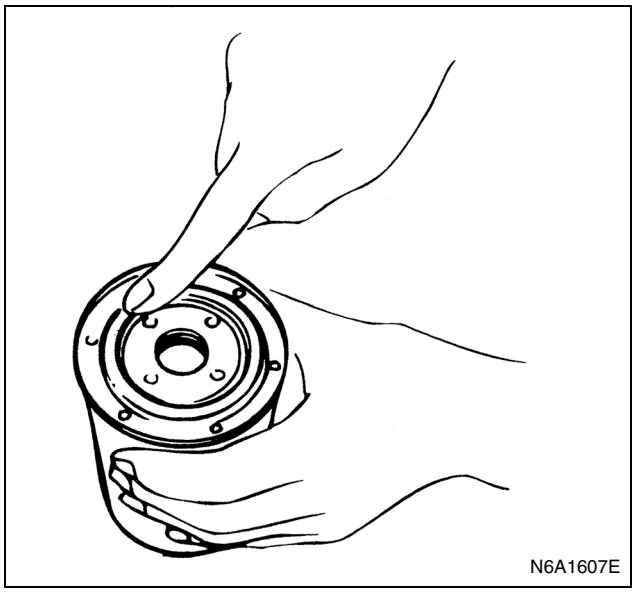


Legend

1. O-ring
2. Cartridge
3. Sendimenter Sensor
4. Fuel Heater Connector

Installation

1. Assemble the sedimenter sensor in the new cartridge.
2. Clean the cartridge mounting surface in the filter body so that the cartridge can be seated securely.
3. Coat a thin layer of engine oil on the O-ring in the new cartridge.
4. To simplify air bleed, fill light oil on the new cartridge.
5. Tighten the cartridge until the O-ring touches the sealing surface. During this process take adequate care that the light oil that is inside does not flow out.
6. Use the filter wrench and tighten rotating by 1/3 to 2/3.
   Filter wrench: J-22700



Injection Pump Air Bleeding (4JH1-TC)

Injection pump air bleeding is required to start the engine when —

- The fuel supply has been exhausted (running out of gas).
- The fuel filter has been replaced.
- The injection pump has been replaced.

Caution:
If the injection pump has been replaced, the air bleeding procedure will require more time and effort (this is because there is no fuel in the pump).

1. Loosen the air bleed nut on the priming pump plunger (at the top of the fuel filter).
2. Move the priming pump plunger up-and-down until strong resistance is felt (about 15 cycles).
3. Stop pumping and tighten the air bleed nut.
4. Wait for 1 minute.
5. Loosen the air bleed nut on the priming pump plunger again.
6. Move the priming pump plunger up-and-down until strong resistance if felt (about 10 cycles).
7. Stop pumping and tighten the air bleed nut.
8. Wait for 1 minute.
9. Loosen the air bleed nut on the priming pump plunger again.
10. Move the priming pump plunger up-and-down until strong resistance is felt (about 5 cycles).
11. Stop pumping and tighten the air bleed nut.
12. Press the accelerator and clutch pedals all the way to the floor and hold them down. Turn the ignition switch to the ON position. Wait until the glow indicator lamp turns on and off.

Caution:
If the engine is cold, the glow indicator light will stay on for 4 — 7 seconds before turning off.

However, if the engine is hot, the lamp will not turn on.

13. Turn the ignition switch to the START position and crank the engine until it starts (do not crank the engine for more than 10 seconds).
    If the engine does not start, repeat Steps 9 — 13.
14. Allow the engine to idle for 5 minutes.

Special Tools

Illustration	Tool Number / Description
	J-22700 Filter wrench

Water drain

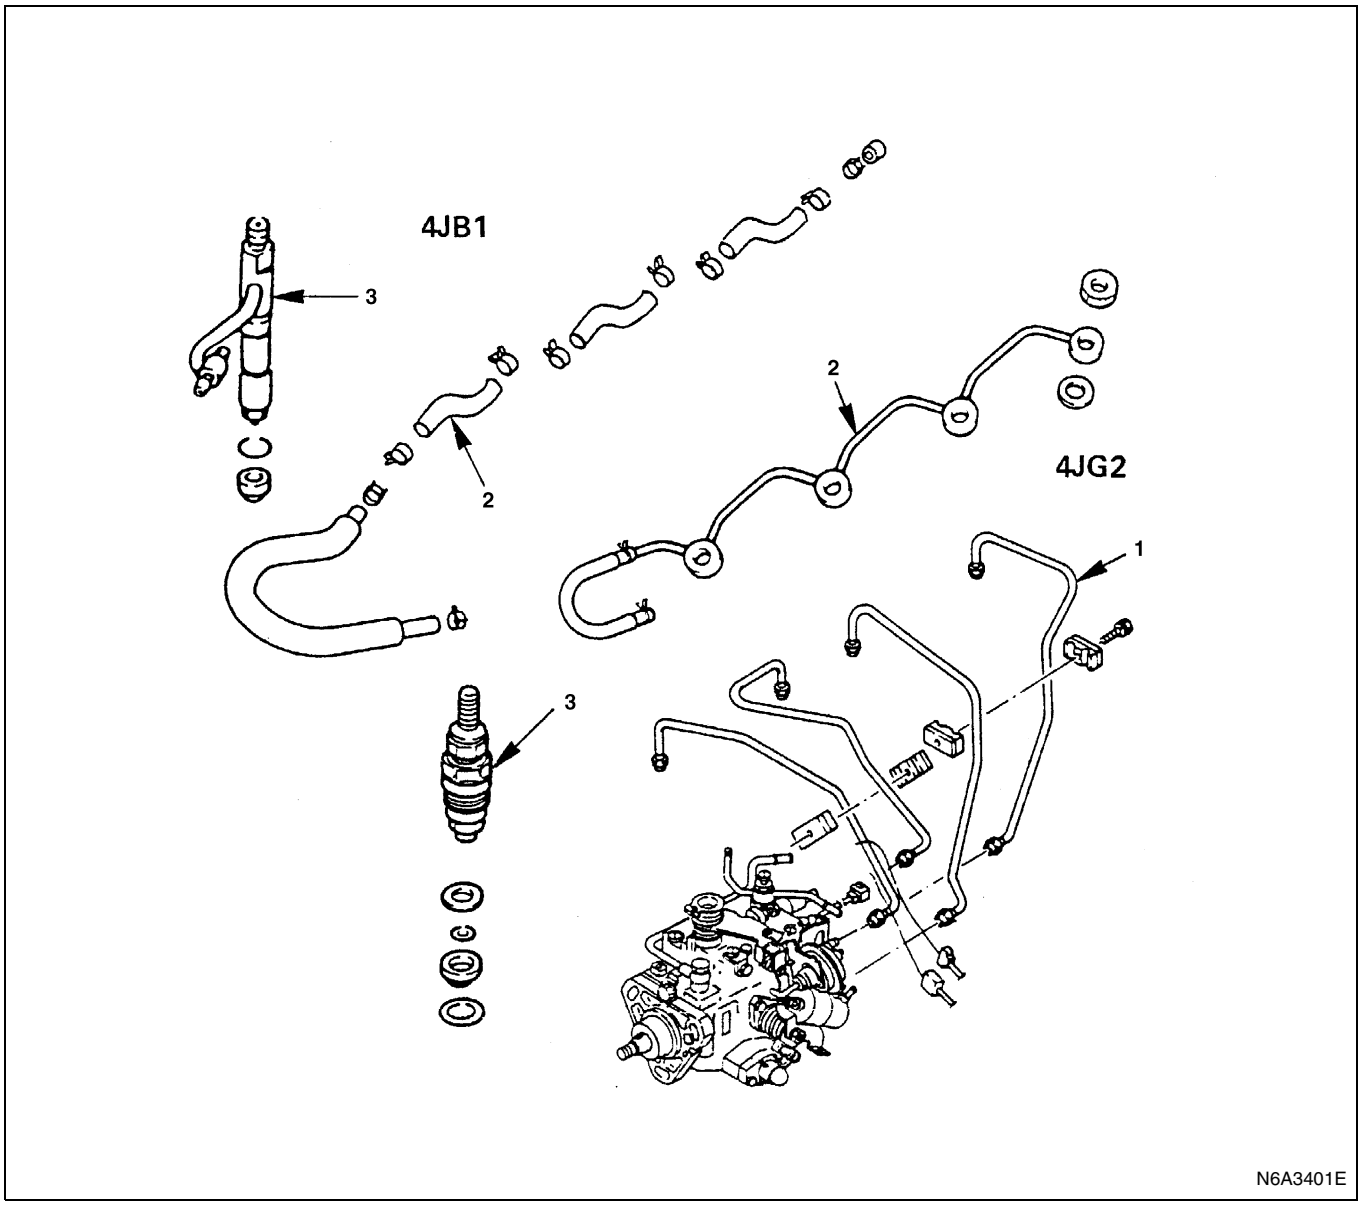
A warning lamp will light up if water above the specified volume collects in the sedimenter. In such cases, drain out the water by performing the following operations:

- Set a container at the tip of the plastic hose.
- Loosen the drain plug.
- Operate the priming pump several times to discharge the water.
- Tighten the drain plug after discharging the water.
- Operate the priming pump several times and check for fuel leakage.
- Check that the warning lamp in the meter is off.

INJECTION NOZZLE

Component

4JB1 / 4JG2



Legend

1. Injection pipe
2. Leak off pipe or hose
3. Injection nozzle

Removal

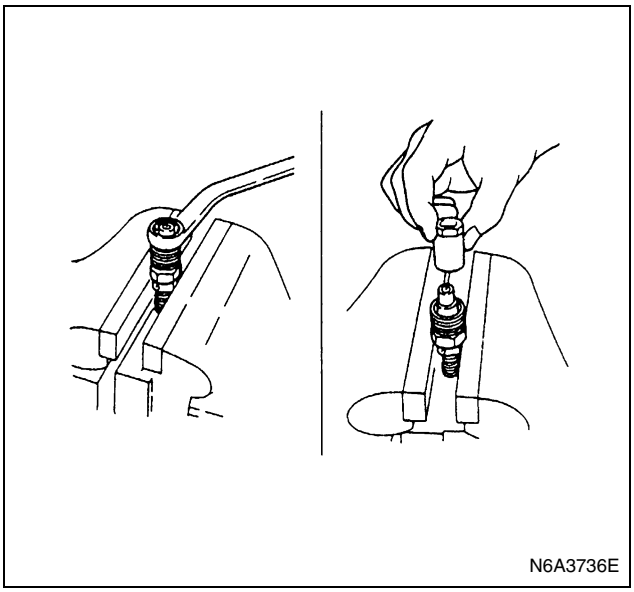
Preparation:

- Disconnect battery ground cable.

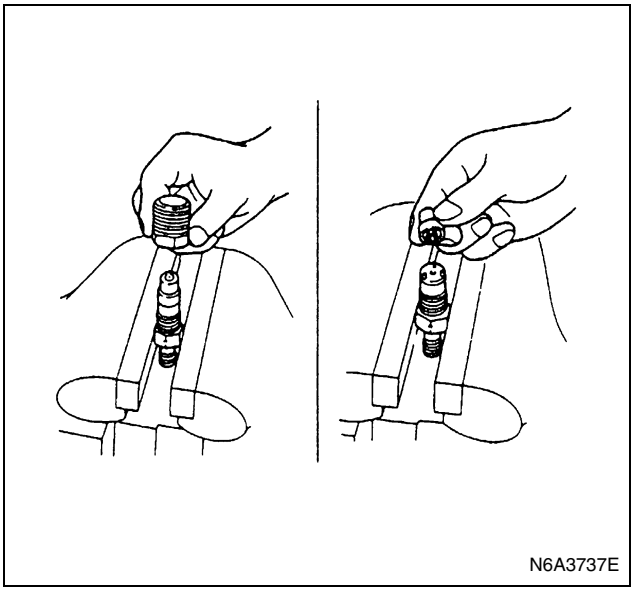
1. Injection Pipe
   - Release injection pipe clip.
   - Loosen the flare nut on the injection pump side.
   - Loosen the flare nut on the injection nozzle side, disconnect and put aside the pipe.
2. Leak off Pipe or Hose
3. Injection Nozzle

Disassembly (4JG2 Engine)

- Grip nozzle holder with a vise, loosen retaining nut and disassemble.
- Loosen holder nut and remove the nozzle.



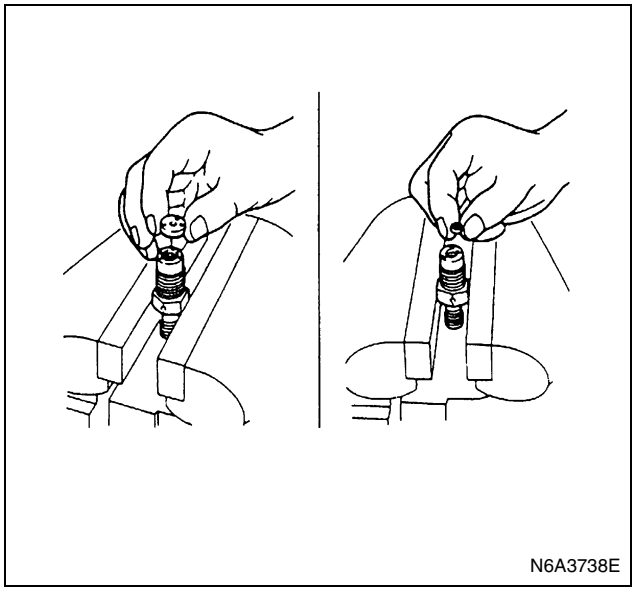
N6A3736E



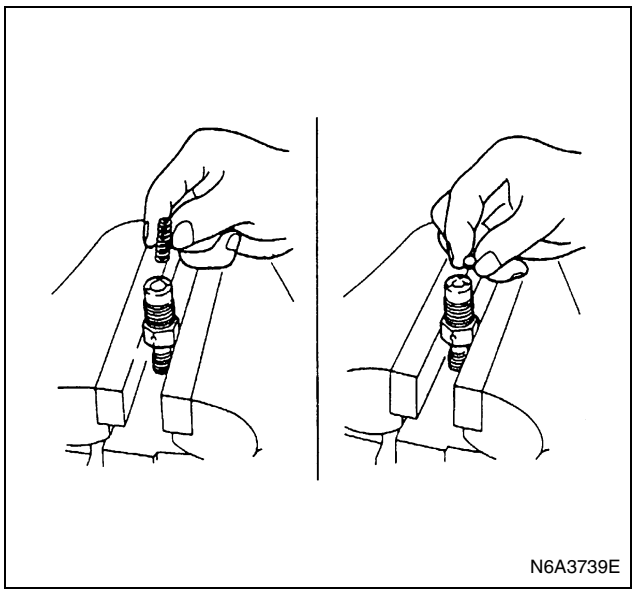
N6A3737E

Caution:

- Be careful not to damage the needle valve.
- Remove spacer, positioning pin, and push rod.
- Remove spring and adjusting shim.



N6A3738E



N6A3739E

Caution:

- Wash all the parts removed and arrange them on a cylinder basis, care should be taken not to miss any parts.
- Soak the nozzle assembly in a parts receptacle filled with light oil.
- Care should be taken not to miss shim, if used.

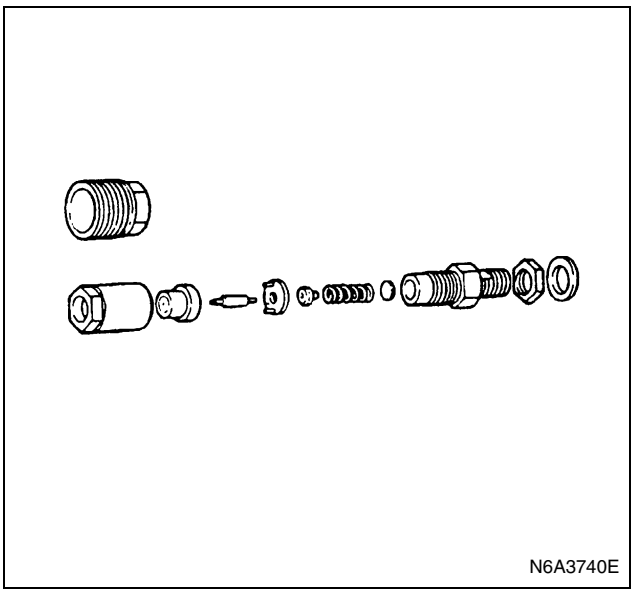
Inspection (4JG2 Engine)

Nozzle

- Soak the nozzle removed in clean light oil, wash nozzle body and needle valve separately, and check and see that the needle valve slide smoothly in the nozzle body.

Caution:

- If the needle valve does not slide smoothly repair or replace with a new nozzle assembly.



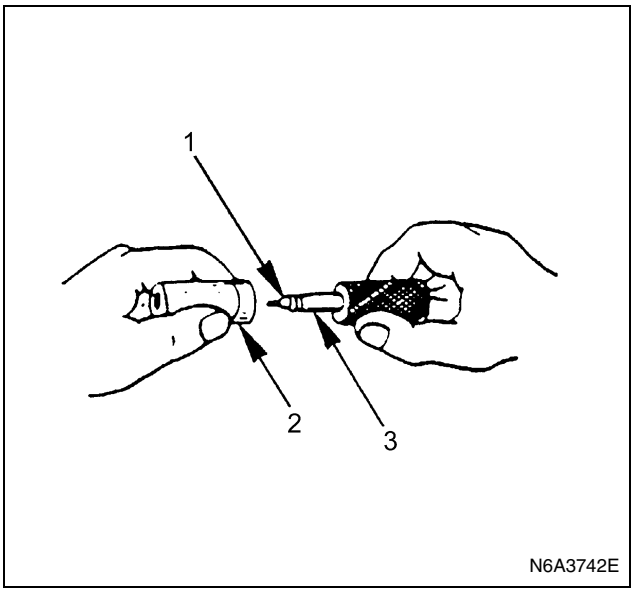
N6A3740E

Nozzle Lapping Procedure

- Apply thinly a compound (Oxide chrome kneaded with animal oil) to the seat of needle valve and lap.

Caution:

- Excess compound may cause worn needle valve, and be sure to wash out the compound after lapping.



N6A3742E

Legend

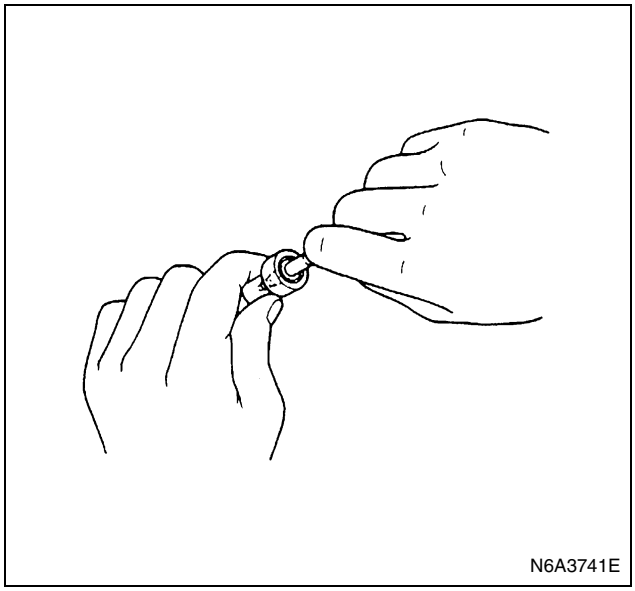
1. Oxidized chrome kneaded with animal oil
2. Nozzle body
3. Needle valve

Nozzle Body & Needle

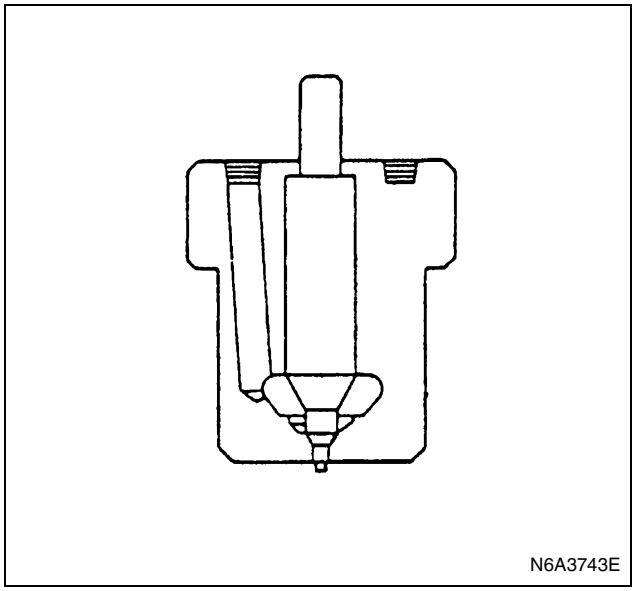
- Check nozzle body and end for seizure.
  If significantly seized, replace as a nozzle assembly basis. Also replace as a nozzle assembly basis, if needle valve end is deformed or seized.

Caution:

- If either nozzle body or needle valve is faulty, replace with a new nozzle assembly.



N6A3741E



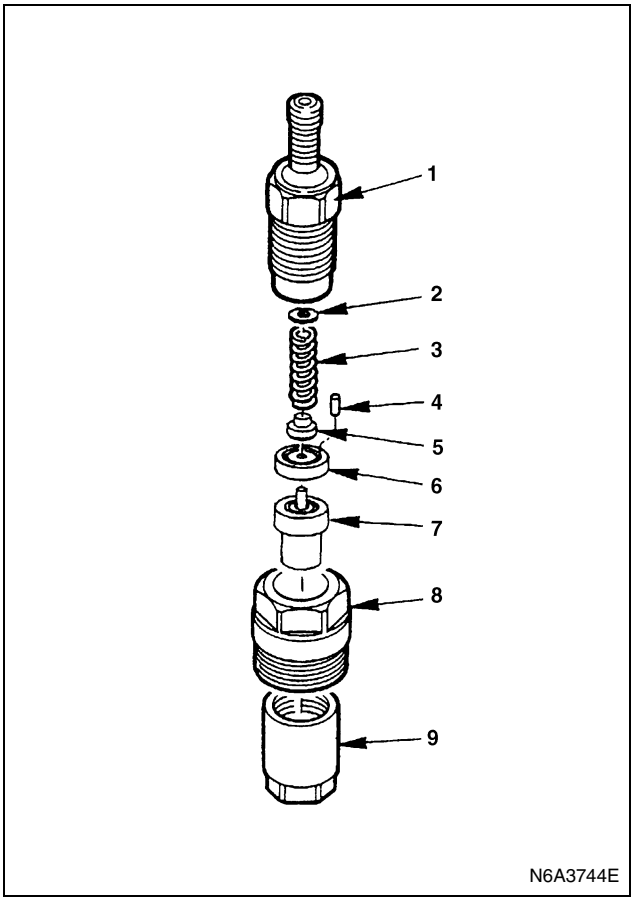
N6A3743E

Reassembly (4JG2 Engine)

To reassemble, follow the removal steps in the reverse order, noting the following point.

Caution:

- Be careful to fit spacer because positioning pins are set off.

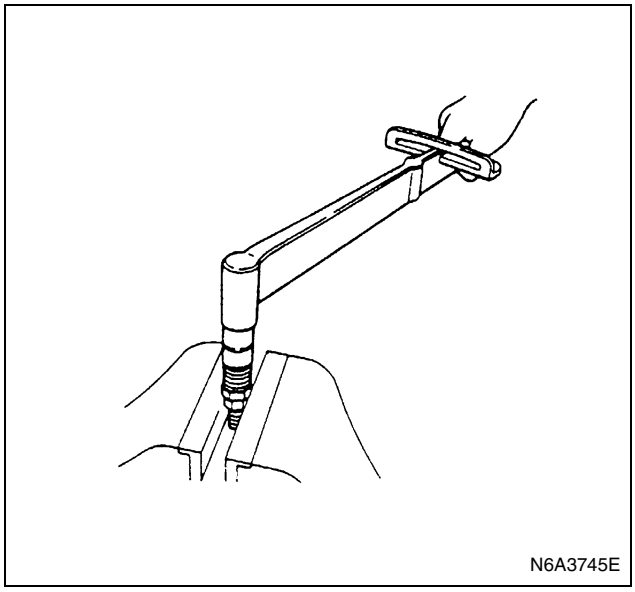


Legend

1. Nozzle holder
2. Adjusting shim
3. Nozzle spring
4. Positioning pin
5. Push rod
6. Spacer
7. Nozzle
8. Holder nut
9. Retaining nut

- Install retaining nut and tighten nut to the specified torque.

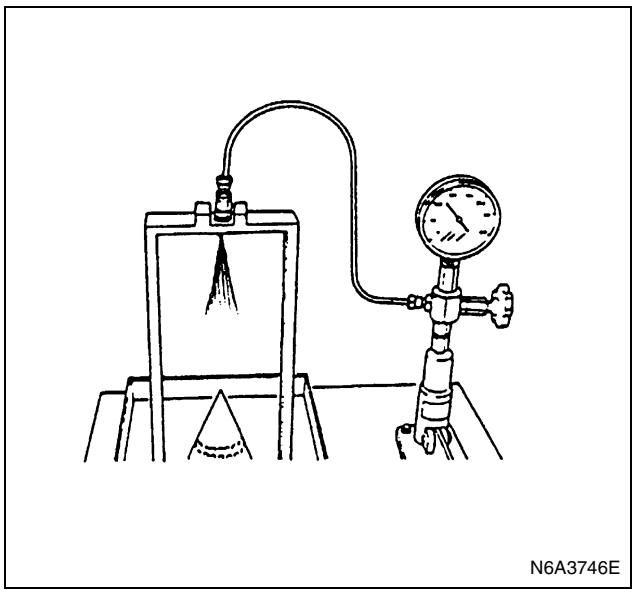
Tighten:
Nut to 39 N·m (4.0 kg·m/32 lb·ft)



Adjustment of Injection Opening Pressure (4JG2 Engine)

- Set nozzle holder assembly on a nozzle tester.
- Apply hydraulic pressure by operating tester handle, and make sure fuel cam be injected under the following pressure.

Kpa (kg/m^2/psi)
14,710 (150/2,133)



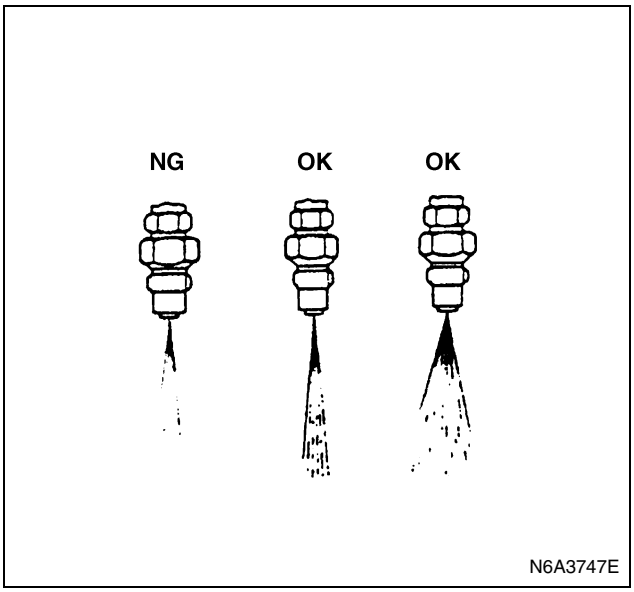
Caution:

- If not injected under the specified pressure, adjust with adjusting shim.

  Types are available in the 1.0 — 1.75 mm (0.039 — 0.069 in) thickness range (on a 0.01 mm (0.00003 in) basis).
- Unless extremely deformed spray in seen, there is no problem.

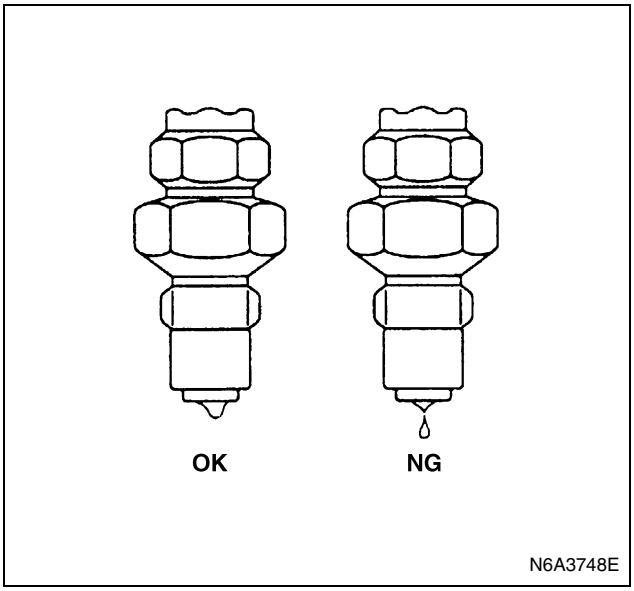
Caution:

- The spray condition, when judged with a nozzle tester, is deemed as normal so long as the spray form is not excessively deformed.



Oil Tight Test (4JG2 Engine)

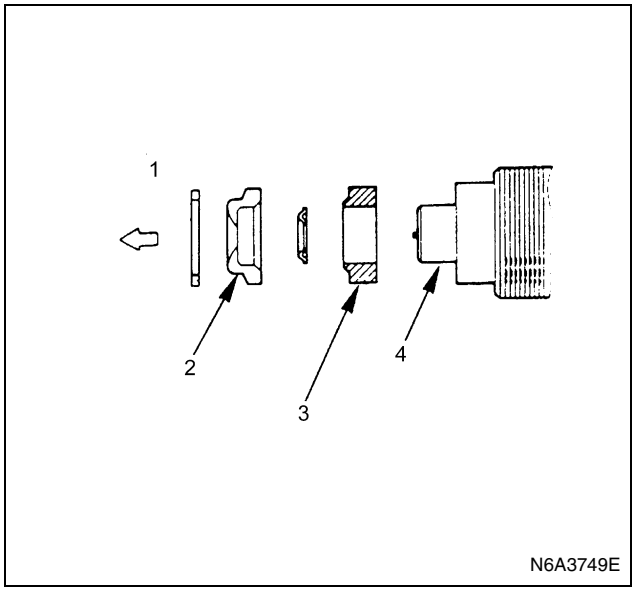
1. After completion of the adjustment of injection pressure, wipe off light oil at the tip of the nozzle with waste.
2. With pressure 1,961 Kpa (20 kg/cm^2/284 psi) less than the specified injection pressure applied, check to see if an oil drop trickles off the tip of the nozzle within 10 seconds after application of pressure. (There is no problem with the nozzle when oil gathers at the tip, but does not drop off.)
3. When an oil drop trickles, clean the nozzle thoroughly.
   Then reassemble it to check for any dropping of oil.
   When oil still drops, change it with a new one.



Installation (4JG2 Engine)

Caution:

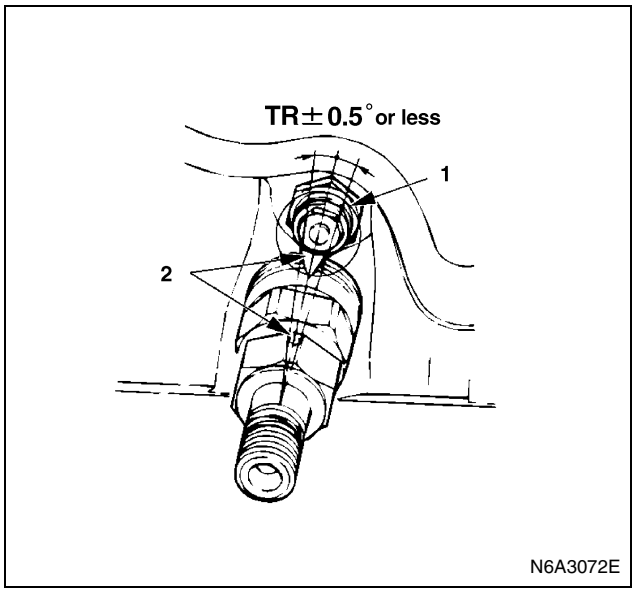
- Nozzle and assembling should be as illustrated.
- Use new heat shield and new corrugated washer.



Legend

1. Cylinder head side
2. Nozzle heat shield
3. Gasket heat shield
4. Nozzle

1. Injection Nozzle (4JG2 only)
   - Lightly tighten the holder nut to suck extent that the nozzle holder can turn one word and one word.
   - Set positioning confirmation drilled hole (ϕ2) within a nozzle turning angle of $\pm$5° against the cylinder headside positioning boss.



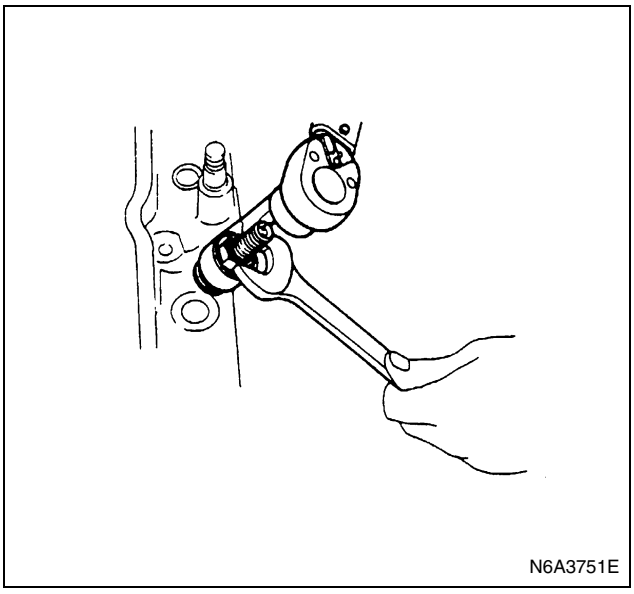
Legend
1. Glow plug
2. Positioning boss

- Apply a wrench as illustrated and tighten the holder nut to the specified torque using a special tool.

Caution:
- After tightening the holder nut, make sure that the drilled hole makes ±5° or smaller with the cylinder head-side positioning boss.
- When mounting leak off pipe, injection nozzle and pipe, clean with air so that dust may not enter.

Tighten:
Nozzle Fixing Nut to 64 N·m (6.5 kg·m/47 lb·ft)

Wrench: nozzle holder 5-8840-0259-0



2. Leak Off Pipe
   - Mount using a new copper washer.
   - Tighten nut to the specified torque.

Tighten:
Pipe Nut to 29 N·m (3.0 kg·m/22 lb·ft)

3. Injection Pipe
   - Connect injection pipe to nozzle holder.
   - Tighten the injection pump side.

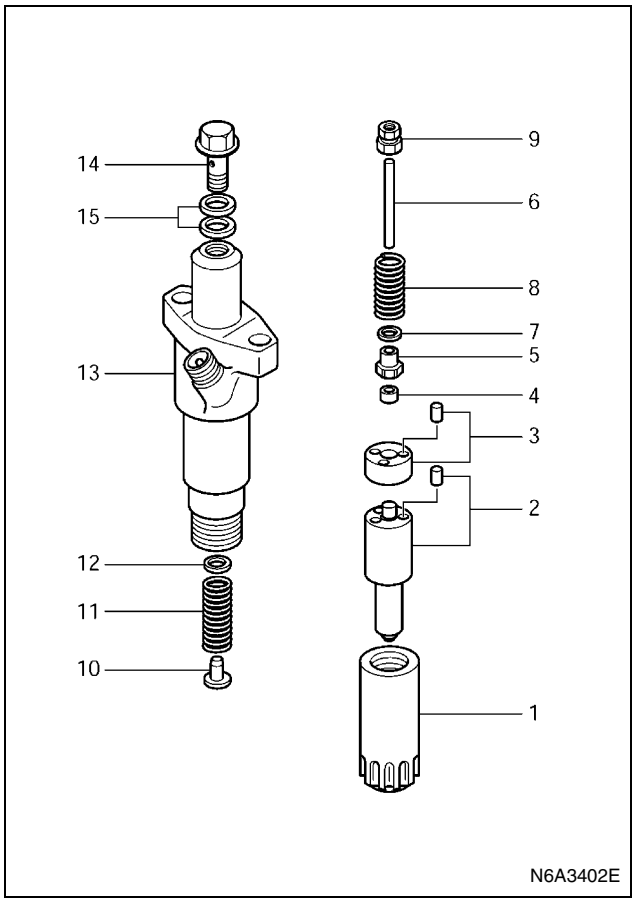
Tighten:
Sleeve Nut to 29 N·m (3.0 kg·m/22 lb·ft)

- Fit pipe clip in specified position.

4-1 Injection Nozzle (Two Spring Nozzle Holder) (4JB1-TC)
The two-spring nozzle holder has been developed to reduce NOx (Nitrogen Oxides) and particulates from direct injection diesel engine exhaust.

Disassembly

1. Retaining nut (1)
2. Nozzle & pin (2)
3. Spacer & pin (3)
4. Lift piece (4)
5. Spring seat (5)
6. Push rod (6)
7. Shim (Second nozzle opening pressure adjustment) (7)
8. Second spring (8)
9. Collar (9)
10. Spring seat (10)
11. First spring (11)
12. Shim (First nozzle opening pressure adjustment) (12)
13. Nozzle holder body (13)
14. Eye bolt (14)
15. Gasket (15)



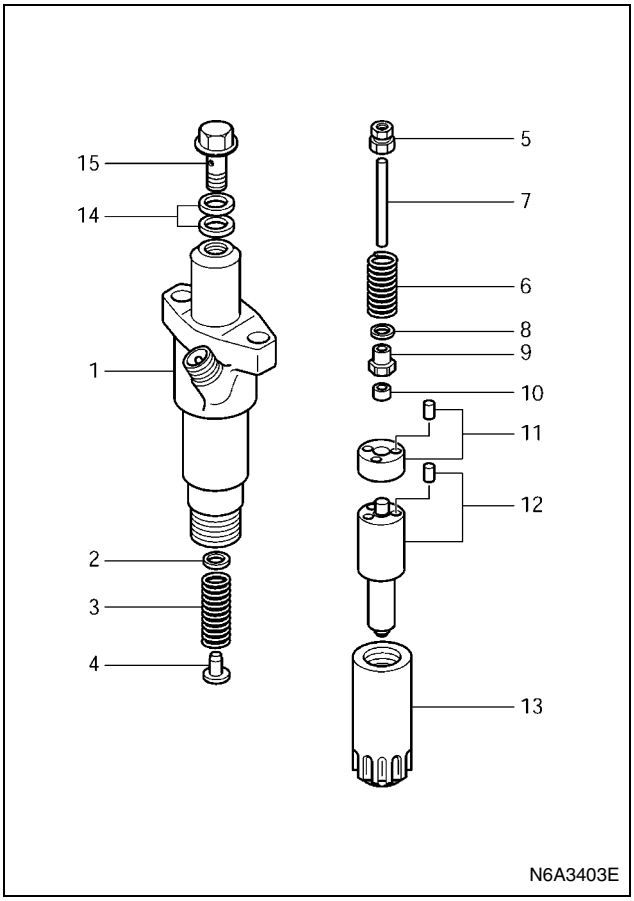
1) Before disassembly, remove carbon deposit from nozzle and nozzle holder using a wire brush and wash the outside nozzle holder assembly.

Caution:
Do not touch nozzle holes with the wire brush during cleaning it.

2) Disassemble the nozzle holder assembly to numerical order.

Reassembly and Opening Pressure Adjustment (4JB1-TC)

1. Nozzle holder body
2. Shim (First opening pressure adjustment)
3. First spring
4. Spring seat
5. Collar
6. Second spring
7. Push rod
8. Shim (Second opening pressure adjustment)
9. Spring seat
10. Lift piece
11. Spacer & pin
12. Nozzle & pin
13. Retaining nut
14. Gasket
15. Eye bolt



The nozzle holder is adjusted as the components are reassembled in the sequence above.
As adjustment of the two-spring nozzle holder is made in hundredths of a millimeter, clean the parts thoroughly in light oil to completely remove any dirt or foreign matter.

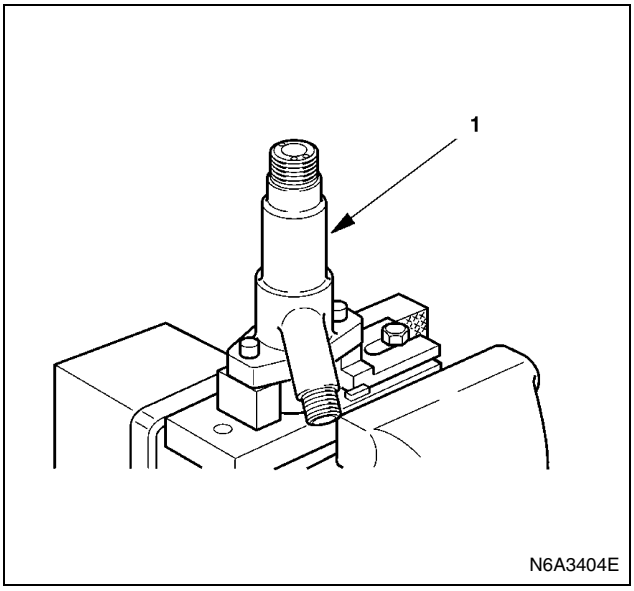
Reassembly and Adjustment Procedure

1	First nozzle opening pressure adjustment	Adjust the first nozzle opening pressure using the shim.
2	Full needle valve lift confirmation	Confirm the full needle valve lift in accordance with the closed method.
3	Pre-lift confirmation	Confirm pre-lift in accordance with the closed method. **CAUTION:** **If not as specified, replace the nozzle assembly, lift piece, pins and spacer using the nozzle service kit.**
4	Second nozzle opening pressure confirmation	Confirm the second nozzle opening pressure in accordance with the closed method.
5	Second nozzle opening pressure adjustment	Adjust the second nozzle opening pressure using the shim.
6	Final inspection	Confirm the condition of the fuel spray with the nozzle and nozzle holder assembled.

N6A3692E

First Nozzle Opening Pressure Adjustment

1. Claim the nozzle holder in a vise.

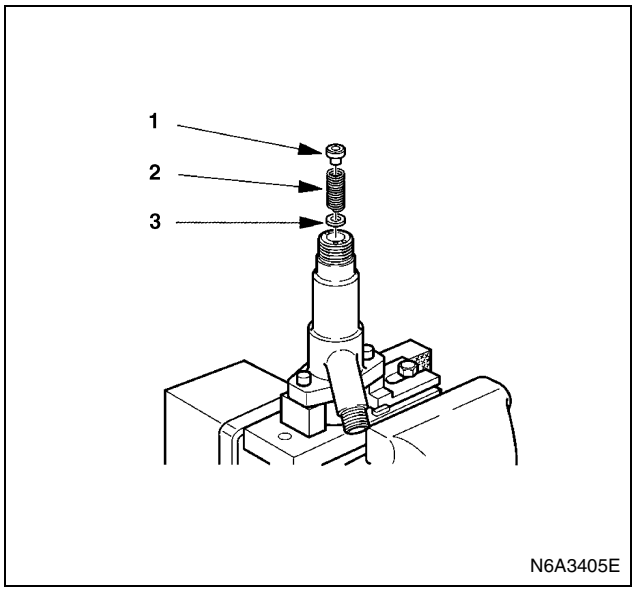


N6A3404E

Legend

1. Nozzle holder body

2. Install the shim, first spring and spring seat in the nozzle holder.

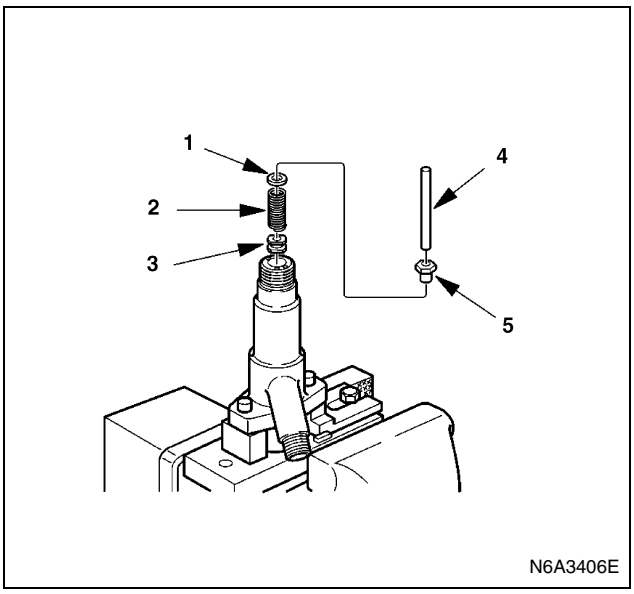


N6A3405E

Legend

1. Spring seat
2. First spring
3. First nozzle opening pressure adjusting shim

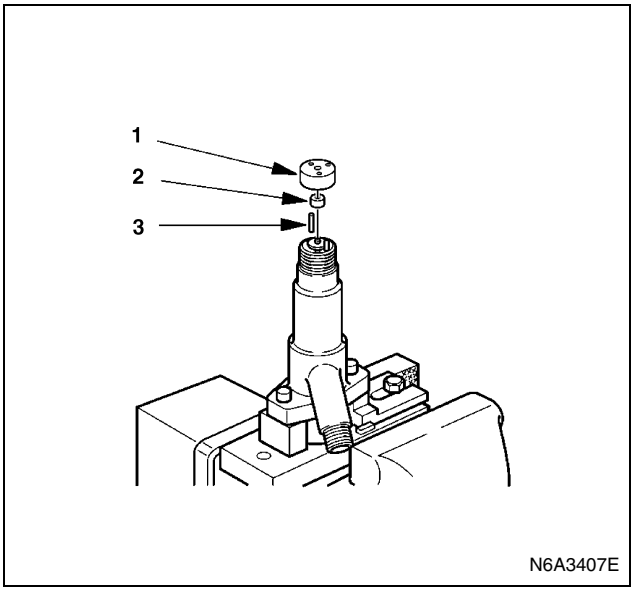
3. Install the collar, second spring, shim, spring seat and push rod in the nozzle holder.



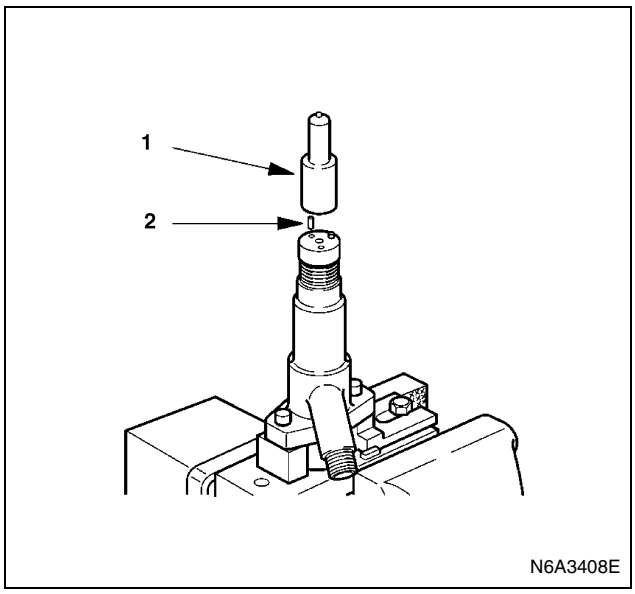
Legend

1. Second nozzle opening pressure adjusting shim
2. Second spring
3. Collar
4. Push rod
5. Spring seat

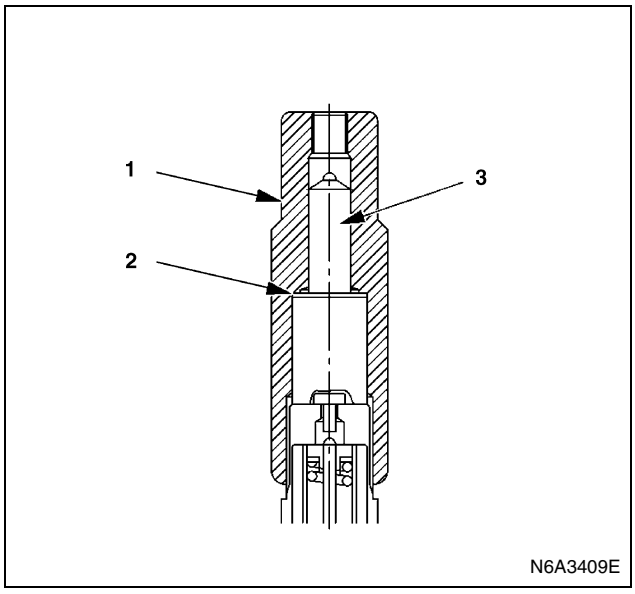
4. Install the pins (3), lift piece (2) and spacer (1) in the nozzle holder.



5. Install the pins (2) in the spacer.
6. Install the nozzle (1) on the spacer.



7. Hand-tighten the adjustment retaining nut together with the gasket to the nozzle holder.
   Retaining nut: 5-8677-7140-0
   Gasket: 5-8677-7139-0

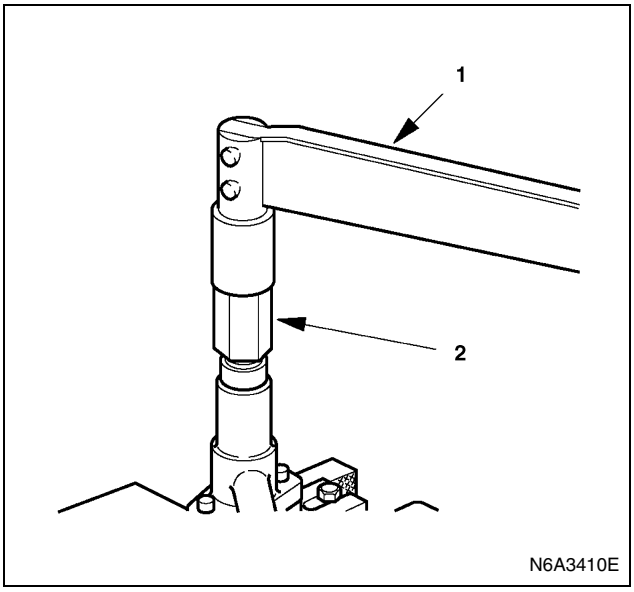


Legend

1. Retaining nut (Special tool)
2. Gasket (Special tool)
3. Nozzle

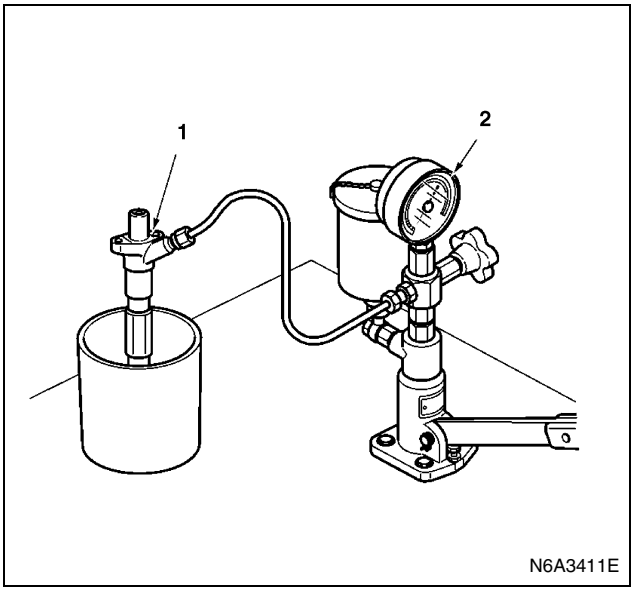
8. Tighten the adjustment retaining nut to the specified torque.

Tighten:
Retaining nut to 29 — 39 N·m (3.0 — 4.0 kg·m)



Legend
1. Torque wrench
2. Retaining nut (Special tool)

9. Set the nozzle holder to the nozzle tester.
10. Operate the nozzle tester and measure the first nozzle opening pressure.



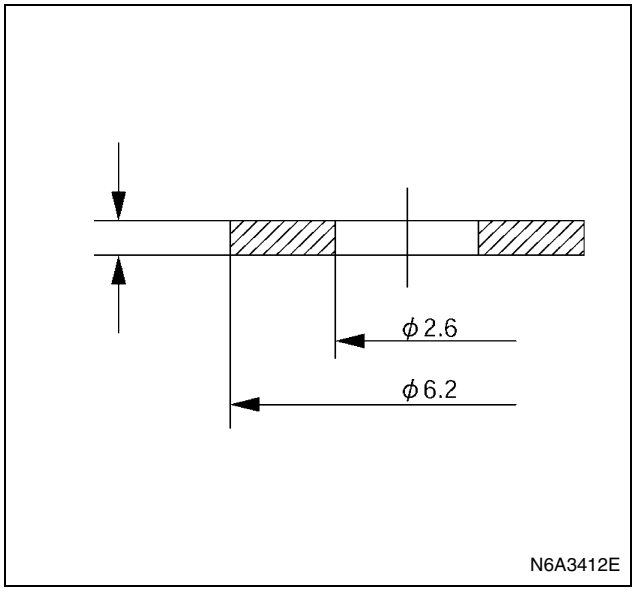
Legend
1. Nozzle holder
2. Nozzle tester

11. If the first nozzle opening pressure is not as specified, disassemble the nozzle holder and replace the shim until the pressure is as specified.

Caution:
Use a micrometer to measure shim thickness.

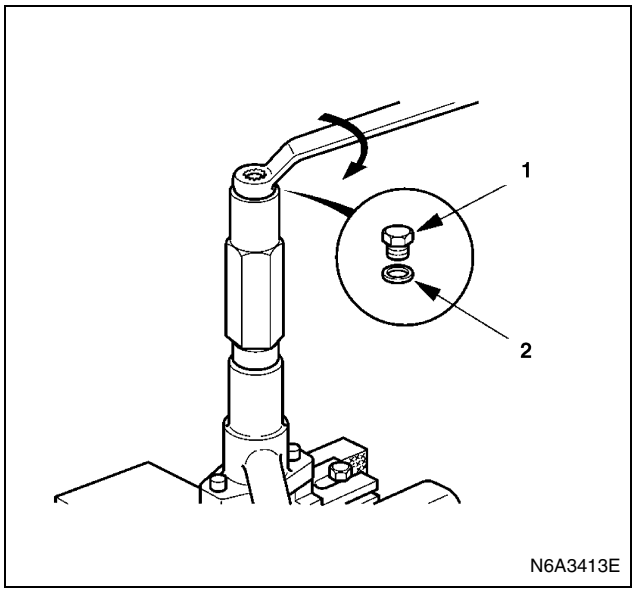
- First nozzle opening pressure adjusting shims

Parts No.	Thickness (mm)
1-1534-9042-0	0.40
1-1534-9043-0	0.50
1-1534-9044-0	0.52
1-1534-9045-0	0.54
1-1534-9046-0	0.56
1-1534-9047-0	0.58
1-1534-9048-0	0.60
1-1534-9049-0	0.70

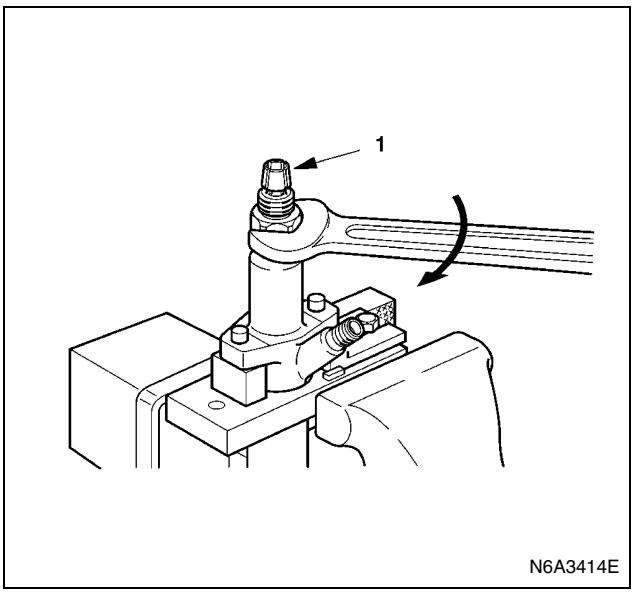


Full Needle Valve Lift Confirmation

1. Install the gasket (2) and plug (1) on the adjustment retaining nut.
   Gasket: 8-9722-7602-0
   Plug: 5-8677-7141-0



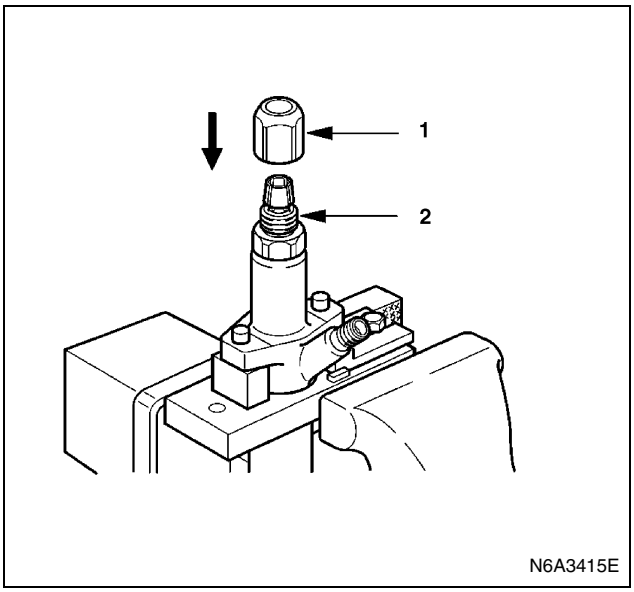
2. Position the nozzle holder with the nozzle facing down and install the dial gauge holder on the nozzle holder.
   Dial gauge holder: 5-8677-7142-0



Legend

1. Dial gauge holder (Special tool)

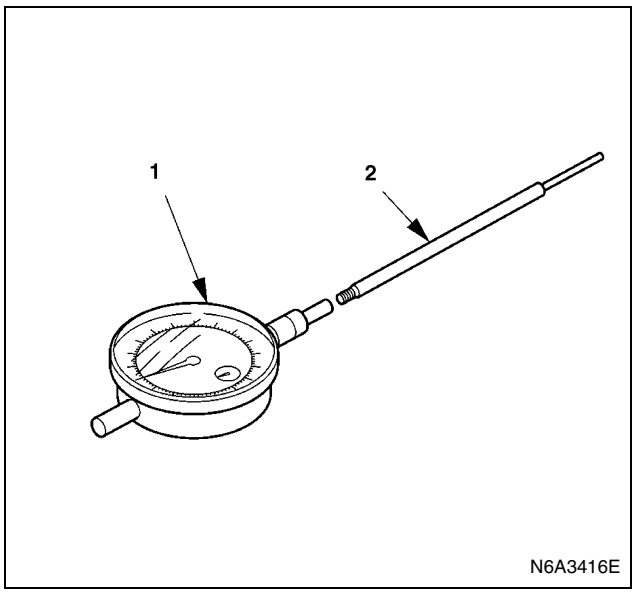
3. Install the nut (1) on the dial gauge holder (2).
   Nut: 5-8677-7143-0



4. Install the pin (2) to the dial gauge (1).

Notice:
The lengths of the pin do not include the threaded portions.

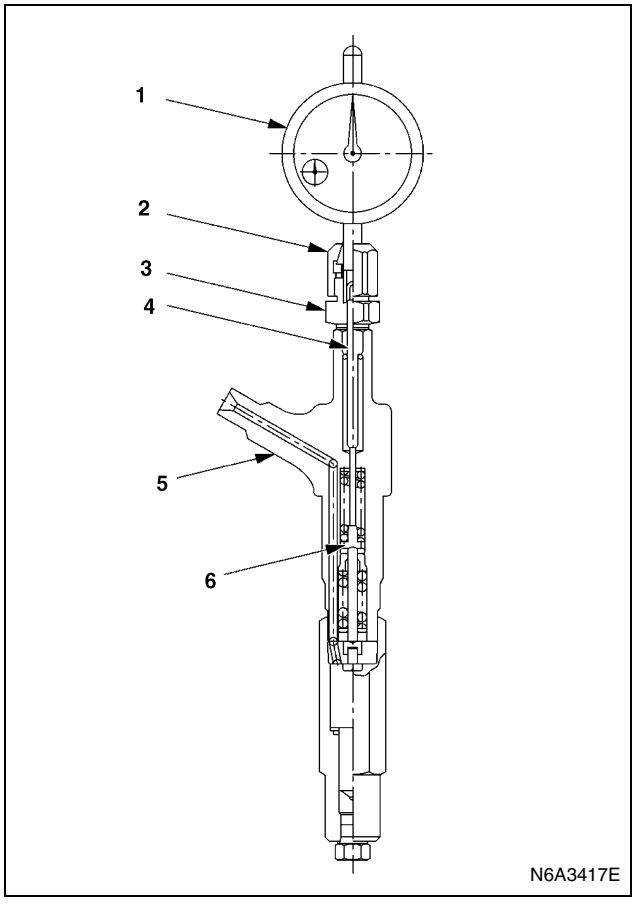
Pin (liter=100 mm): 5-8677-7144-0
Dial gauge: 1-8531-7015-0



5. Secure the dial gauge to the nozzle holder using the nut so that the pin contacts the tip of the first spring seat.

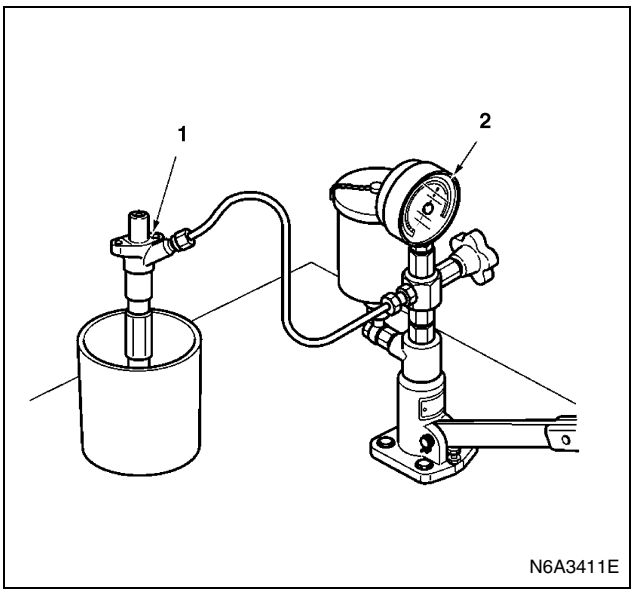
Caution:

- Secure the dial gauge so that a stroke of 2 mm can be measured.
- Do not over-tighten the nut as the dial gauge shaft may jam. (Confirm from the dial gauge that the shaft moves smoothly.)



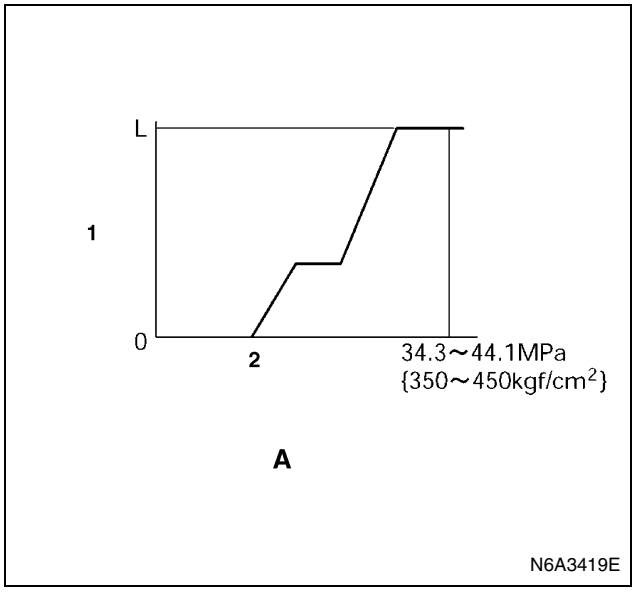
Legend
1. Dial gauge
2. Nut
3. Holder
4. Pin
5. Nozzle holder
6. First spring seat

6. Set the nozzle holder (1) to the nozzle tester (2) and put needle to zero on the dial gauge.
7. Operate the nozzle tester (2) to bleed any air from inside the retaining nut and to confirm that no fuel leaks.



8. Operate the nozzle tester and increase the inline pressure to 34.3 — 44.1 MPa (350 — 450 kg/cm^2) so that the nozzle's needle valve moves through its full lift.
   Record full lift 'L'. (Read dial gauge)

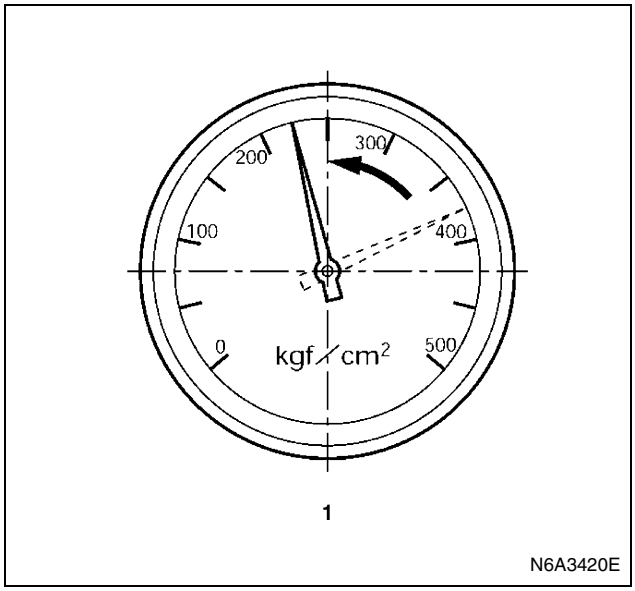
Notice:
The above operation is used to determine whether the nozzle seat is worn and whether the nozzle assembly is in good condition.



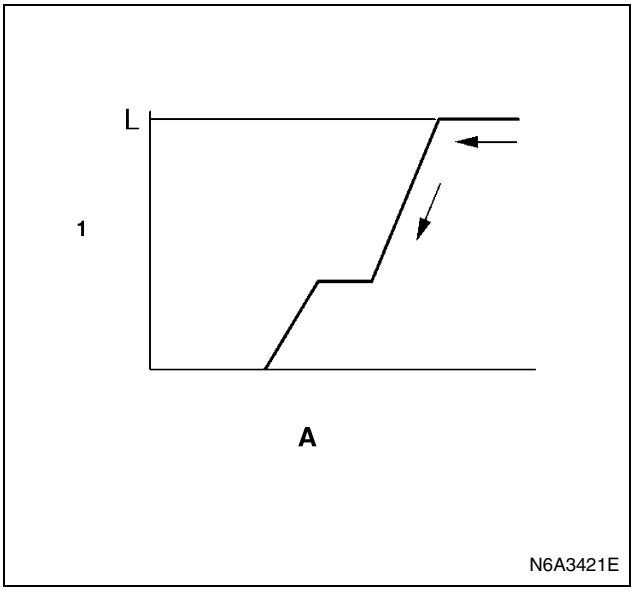
Legend
A. Inline pressure
1. Needle valve lift
2. First nozzle opening pressure

Pre-lift Confirmation

1. With the needle valve at full lift, release the nozzle tester handle.



Legend
1. Pressure gauge

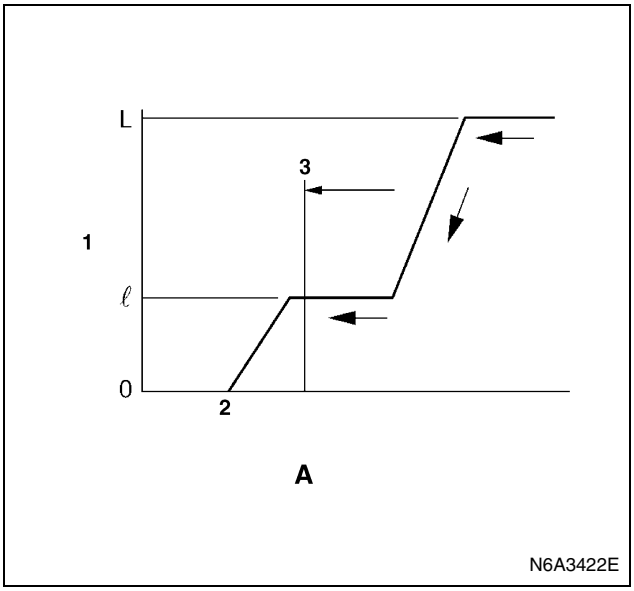


Legend
A. Inline pressure
1. Needle valve lift

Notice:
The inline pressure will decrease and needle valve lift (as indicated on the dial gauge) will also decrease a little.

2. Read the needle valve lift 'liter' from the dial gauge indication (once the needle valve has descended when the second spring has stopped operating). Refer to the pre-lift measuring point for 'liter'.

Pre-Lift Measuring Point:
Read the dial gauge at first nozzle opening pressure +approx 1 MPa (10 kg/cm^2).

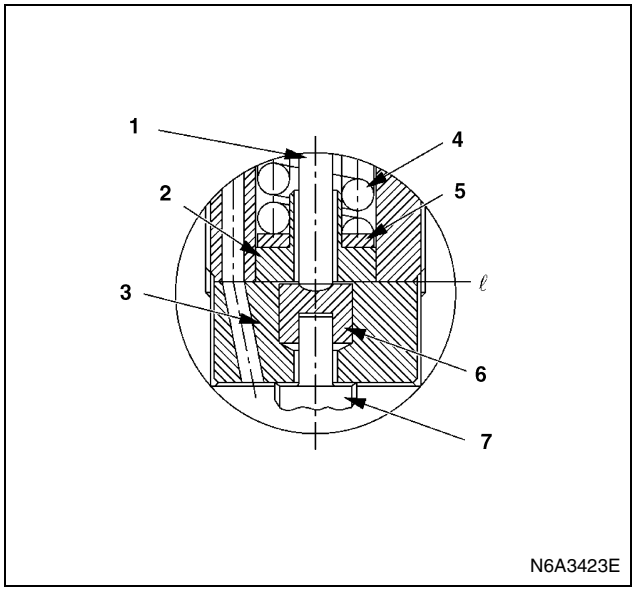


Legend
A. Inline pressure
1. Needle valve lift
2. First nozzle opening pressure
3. Measuring point of pre-lift

Notice:
This point can be found while the pressure is decreasing.

3. Confirm that pre-lift 'liter' is as specified.

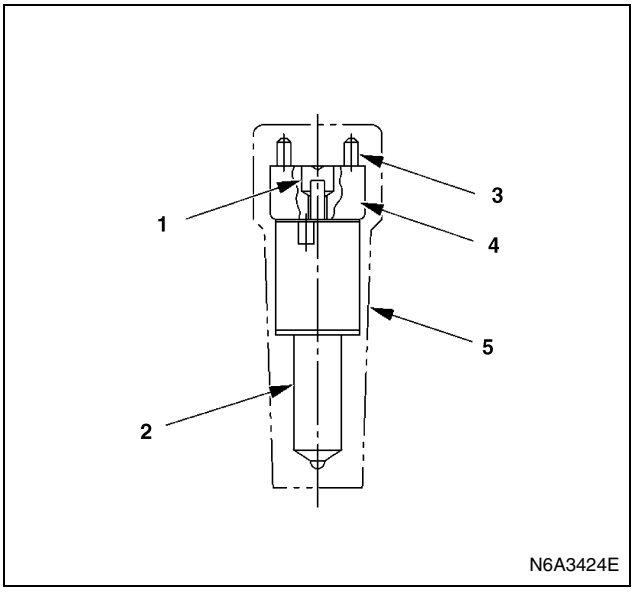
Pre-lift	mm (in)
0.04 (0.002)	



Legend
1. Push rod
2. Spring seat
3. Spacer
4. Second spring
5. Adjusting shim
6. Lift piece
7. Needle valve

4. If pre-lift is not specified, replace the pins, lift piece, spacer and nozzle assembly with the service kit.

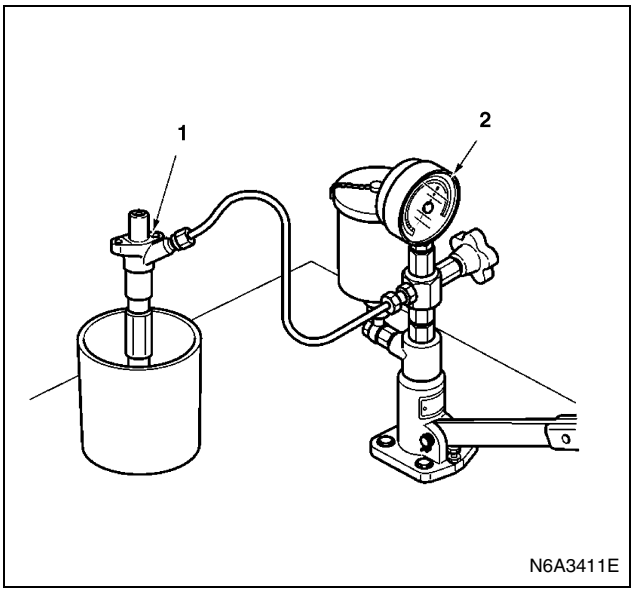
   Service kit:
   8-9720-3470-1



Legend
1. Lift piece
2. Nozzle assembly
3. Pin
4. Spacer
5. Capsule

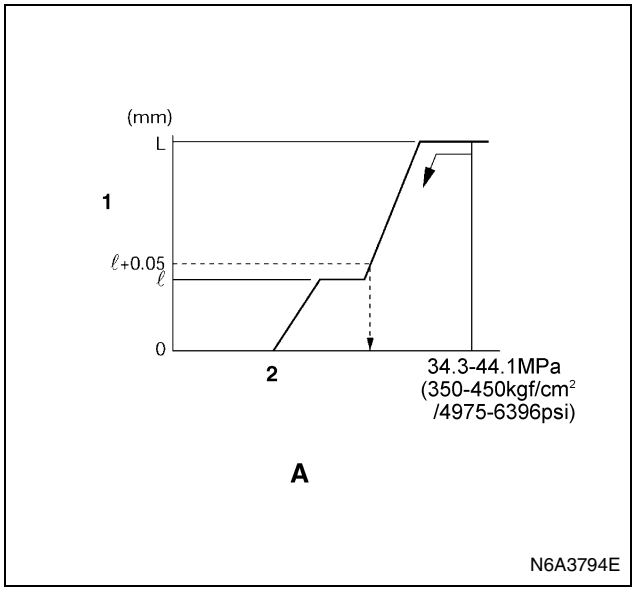
Second Nozzle Opening Pressure Confirmation

1. After pre-lift confirmation, operate the nozzle tester to increase inline pressure to 34.3 — 44.1 MPa (350 — 450 kg/cm^2) so that the nozzle's needle valve moves through its full lift.



Legend
1. Nozzle holder
2. Nozzle tester

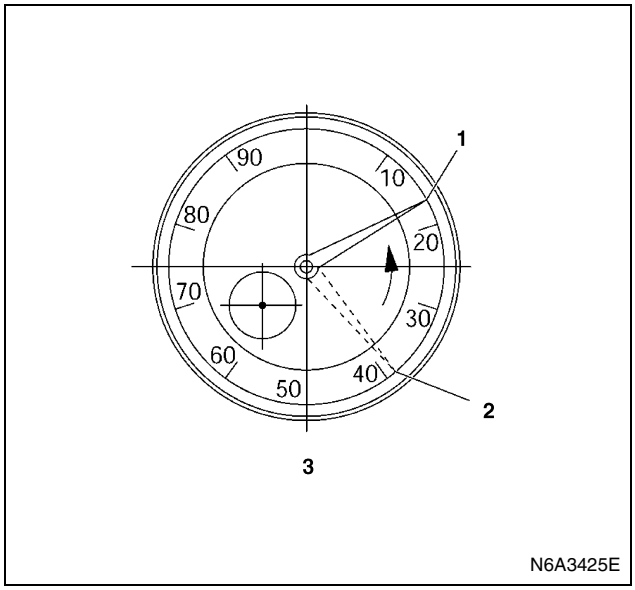
2. Release the nozzle tester handle so that inline pressure decreases.



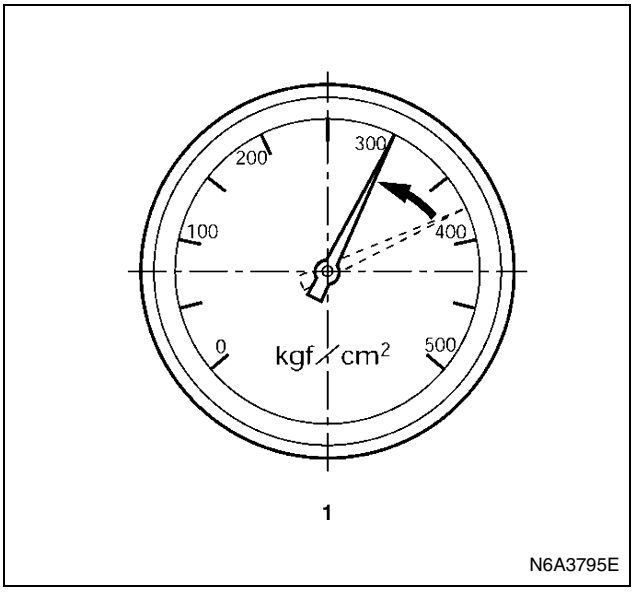
Legend
A. Inline pressure
1. Needle
2. Second nozzle opening pressure

Notice:
The inline pressure will decrease and needle valve lift (as indicated on the dial gauge) will also decrease a little.

3. Then, read the pressure gauge indication (second nozzle opening pressure) the instant that the dial gauge indicates the specified needle valve lift (usually pre-lift liter + 0.05 mm).



Legend
1. When needle valve lift is L + 0.05 mm
2. Full needle valve lift
3. Dial gauge

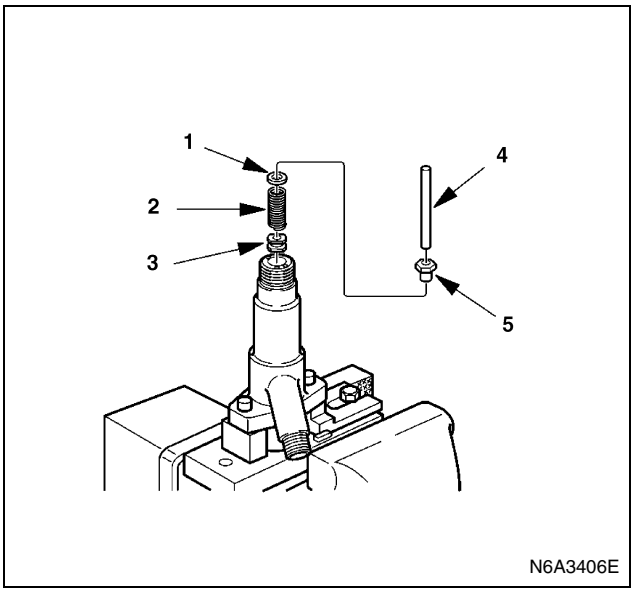


Legend
1. Pressure gauge

Second Nozzle Opening Pressure Adjustment

If the second nozzle opening pressure is not as specified, disassemble the nozzle from the nozzle holder and replace the shim until the pressure is as specified.

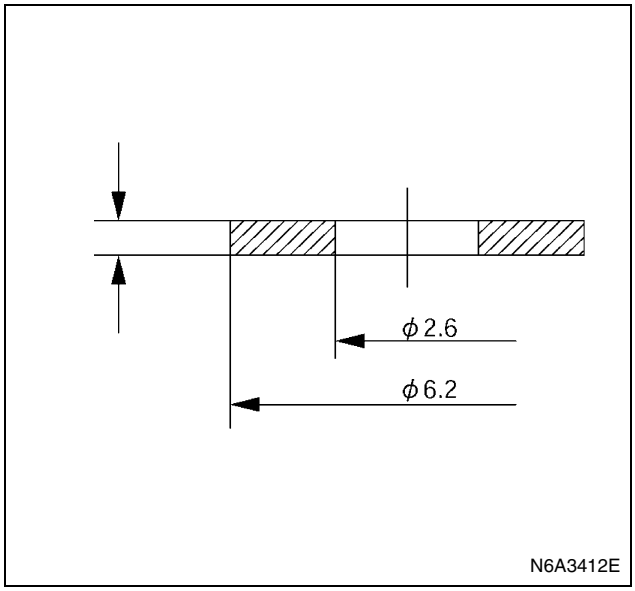
Caution:
- Because the second opening pressure changes when the first opening pressure changes, the second opening pressure must be adjusted when the first opening pressure changes.
- Use a micrometer to measure shim thickness.



Legend
1. Second nozzle opening pressure adjusting shim
2. Second spring
3. Collar
4. Push rod
5. Spring seat

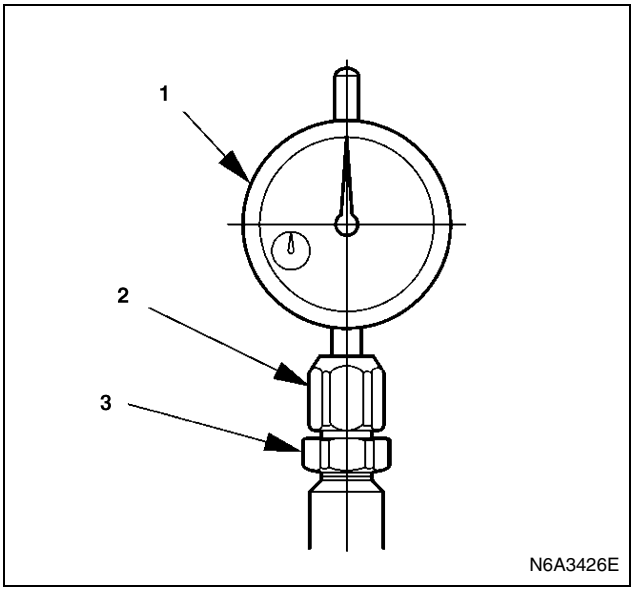
- Second nozzle opening pressure adjusting shims

Part No.	Thickness (mm)
8-9711-6034-0	0.40
8-9711-6035-0	0.50
8-9711-6037-0	0.52
8-9711-6039-0	0.54
8-9711-6041-0	0.56
8-9711-6043-0	0.58
8-9711-6044-0	0.59

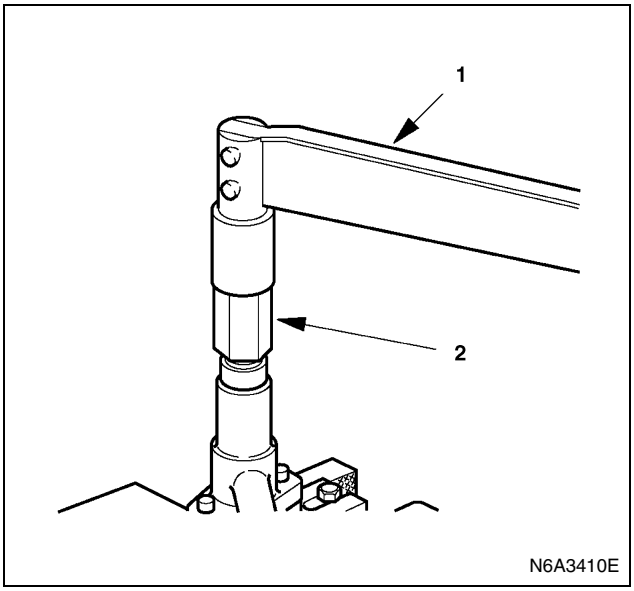


Final Inspection

1. Remove the dial gauge (1), nut (2) and dial gauge holder (3).

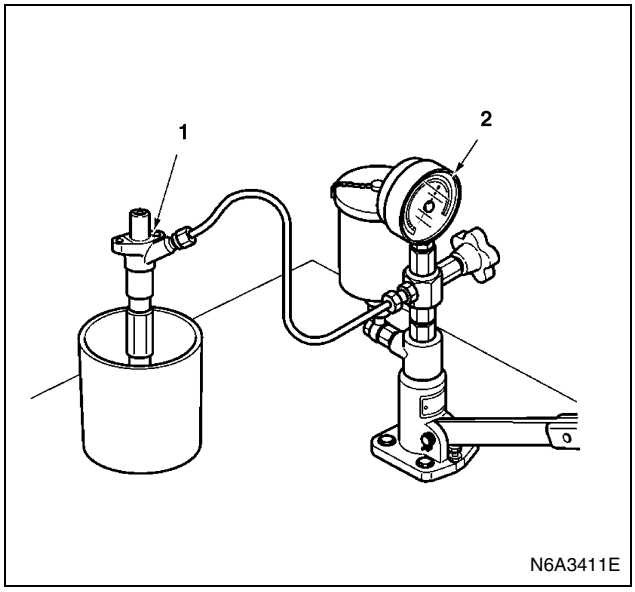


2. Remove the adjustment retaining nut and gasket.
3. Install the original retaining nut, confirm that the pins are inserted fully into the nozzle, and then hand-tighten the retaining nut. Then, tighten the original retaining nut to the specified torque.
   Torque: 59 — 79 N·m (6.0 — 8.0 kg·m/43.5 — 58.2 lb·ft)



Legend
1. Torque wrench
2. Retaining nut (Special tool)

4. Set the nozzle holder to the nozzle tester and check first nozzle opening pressure, spray condition, seat oil tightness and each part for oil leaks.



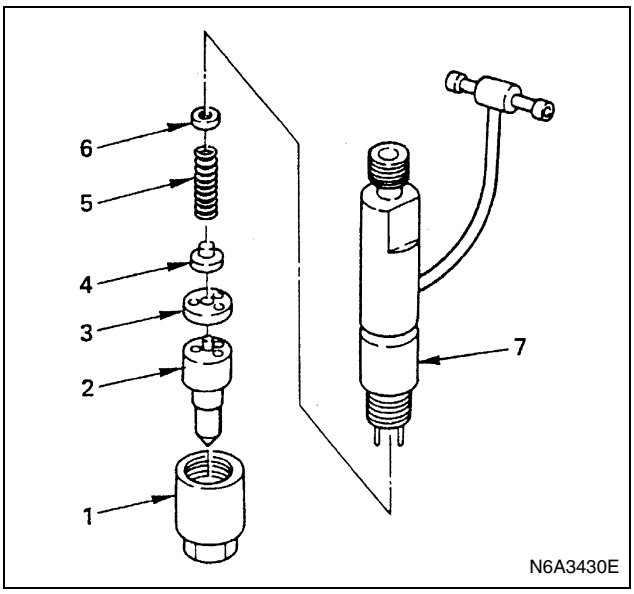
Legend
1. Nozzle holder
2. Nozzle tester

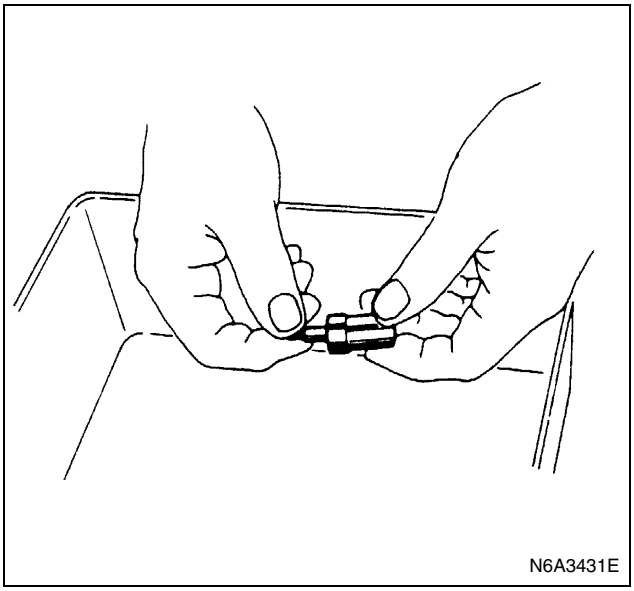
5. When replacing the nozzle, replace the nozzle, lift piece, pins and spacer as a set with the nozzle service kit.

Caution:
Pre-lift will not be as specified if only the nozzle is replaced.

Disassembly (4JB1 Engine)

1. Retaining Nut (1)
2. Injection Nozzle (2)
   1) Remove the nozzle assemblies from the nozzle holders.
      Tag the nozzle assemblies and the nozzle holders to ensure that they are reinstalled in their original positions.
      The nozzle assembly and nozzle holder combinations must not be interchanged.
   2) Immerse the injection nozzle in a tool tray filled with clean diesel oil to protect them from dust.
3. Spacer (3)
4. Spring Seat (4)
5. Spring (5)
6. Adjusting Shim (6)
7. Nozzle Holder (7)



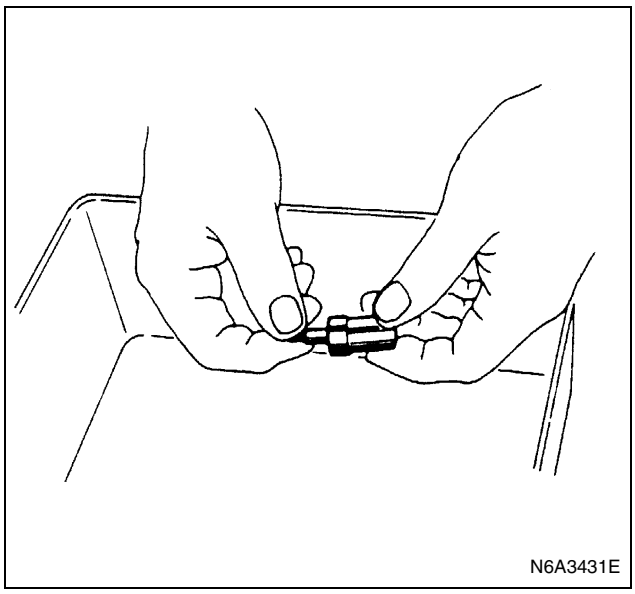


Inspection and Repair (4JB1 Engine)

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Inspection Nozzle Needle Inspection

1. Remove the needle from the nozzle body.
2. Carefully wash the nozzle needle and the nozzle body in clean diesel fuel.
3. Check that the nozzle needle moves smoothly inside the injection nozzle body.
   If the nozzle needle does not move smoothly, it must be repaired (See “Nozzle Lapping Procedure”).

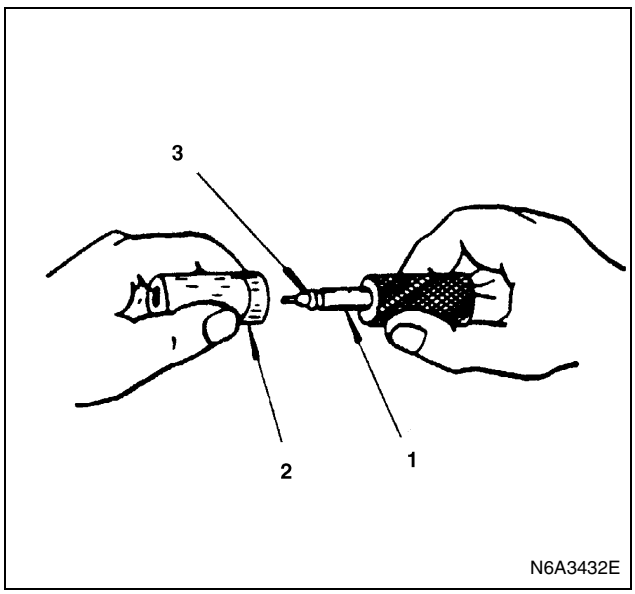


Nozzle Lapping Procedure

1. Lap the nozzle needle (1) and the nozzle body (2) by applying a compound of oxidized chrome and animal oil (3).

Notice:

Do not apply an excessive amount of the oxidized chrome and animal oil compound to the injection needle valve seat area. Applying too much compound will cause the injection nozzle needle and the injection nozzle body cavity to wear excessively.

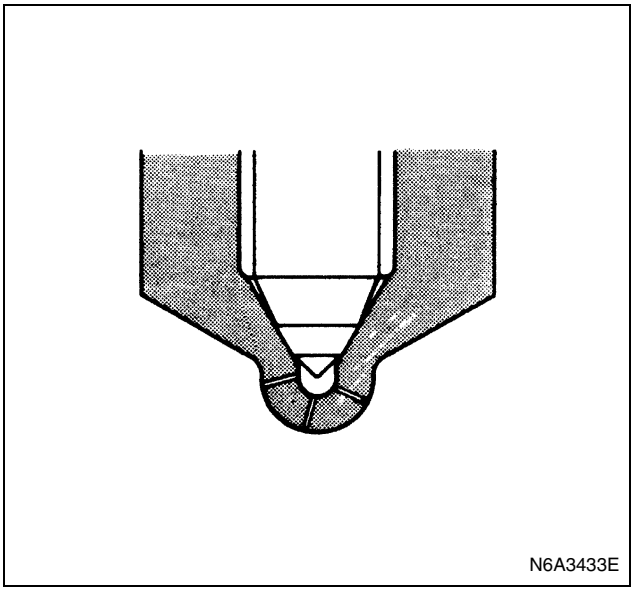


2. Carefully wash the needle valve and the nozzle body in clean diesel fuel after lapping.

Nozzle Body and Needle Valve Inspection

Check the nozzle body and the needle valve for damage and deformation.

The nozzle and body assembly must be replaced if either of these two conditions are discovered during inspection.

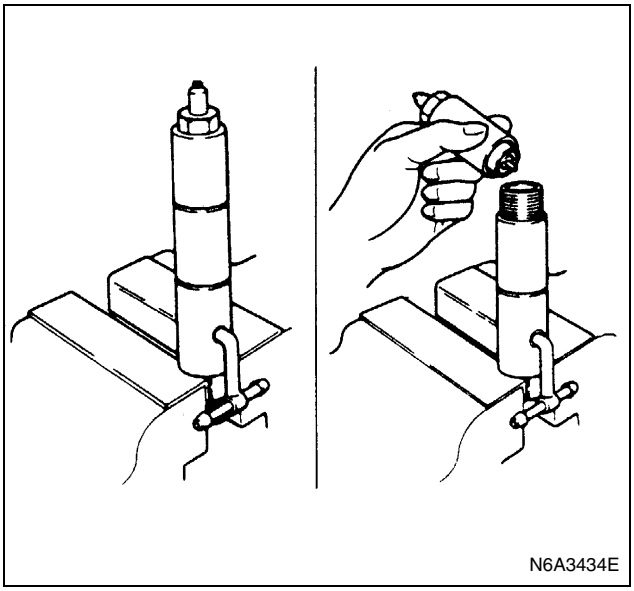


N6A3433E

Reassembly

1. Nozzle Holder
2. Adjusting Shim
3. Spring
4. Spring Seat
5. Spacer
6. Injection Nozzle
7. Retaining Nut

Tighten:
Retaining nut to 34 N·m (3.5 kg·m/25 lb·ft)

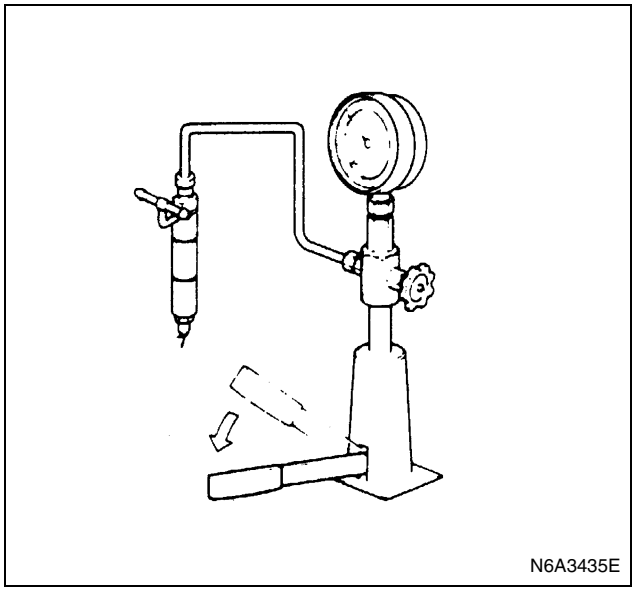


N6A3434E

Injection Nozzle Adjustment

1. Attach the injection nozzle holder to the injection nozzle tester.
2. Apply pressure to the nozzle tester to check that the injection nozzle opens at the specified pressure.

kPa (kg/cm^2 /psi)
18,142 (185/2630)



N6A3435E

If the injection nozzle does not open at the specified pressure, install or remove the appropriate number of adjusting shims to adjust it.

Adjusting Shim Availability	mm (in)
Range	0.50 — 1.50 (0.02 — 0.06)
Increment	0.025 (0.001)
Total number of Shims	40

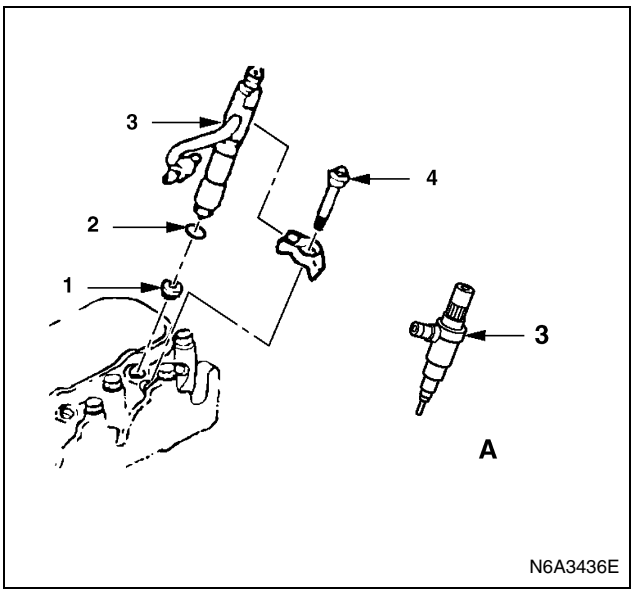
Removing or installing one shim will increase or decrease the nozzle opening pressure approximately 369.46 kPa (3.77 kg/cm^2 /53.6 psi).

WARNING:
TEST FLUID FROM THE INJECTION NOZZLE WILL SPRAY OUT UNDER GREAT PRESSURE. IT CAN EASILY PUNCTURE A PRESON'S SKIN. KEEP YOUR HANDS AWAY FROM THE INJECTION NOZZLE TESTER AT ALL THE TIMES.

Installation (4JB1/4JH1-TC Engine)

1. Injection Nozzle
   1) Install the injection nozzle gasket (1) and the O-ring (2) to the injection nozzle holder (3).
      Be sure that the O-ring fits snugly in the injection nozzle groove.
   2) Apply engine oil to the cylinder head nozzle holder hole.
   3) Install the nozzle holder together with the nozzle holder bracket (4) to the cylinder head.

Tighten:
37 N·m (3.8 kg·m/27 lb·ft)



Legend

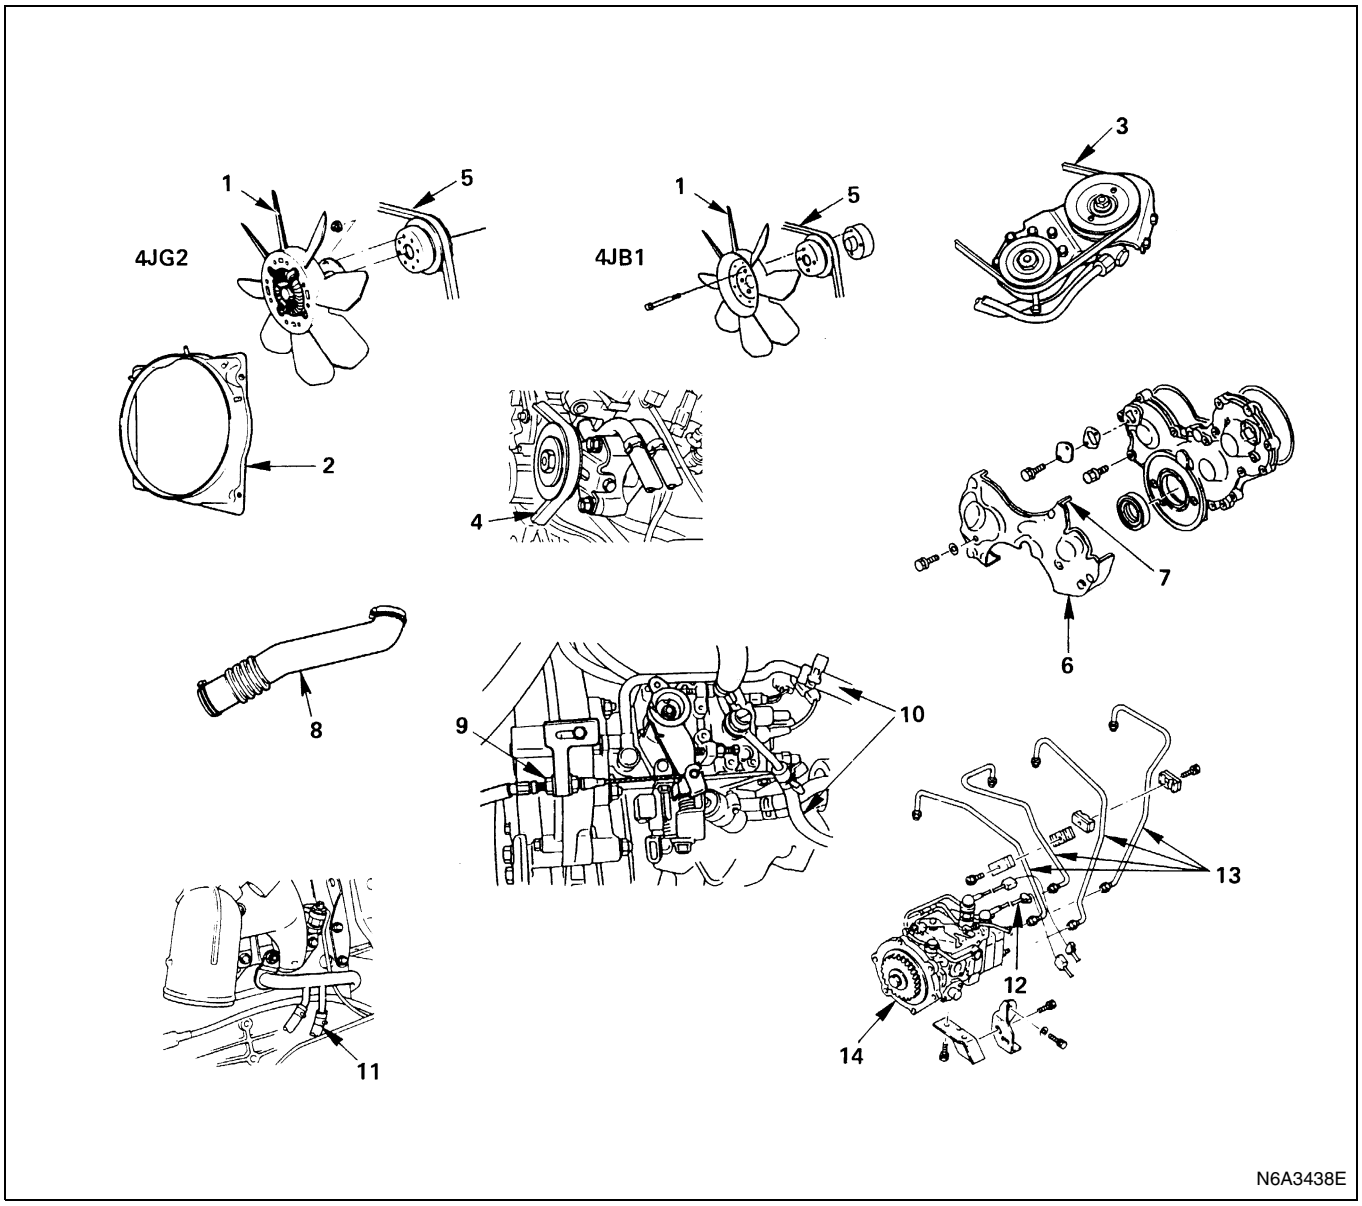
INJECTION PUMP ASSEMBLY (4JB1/4JG2, Gear Drive Type)

Component

4JB1/4JG2



Legend

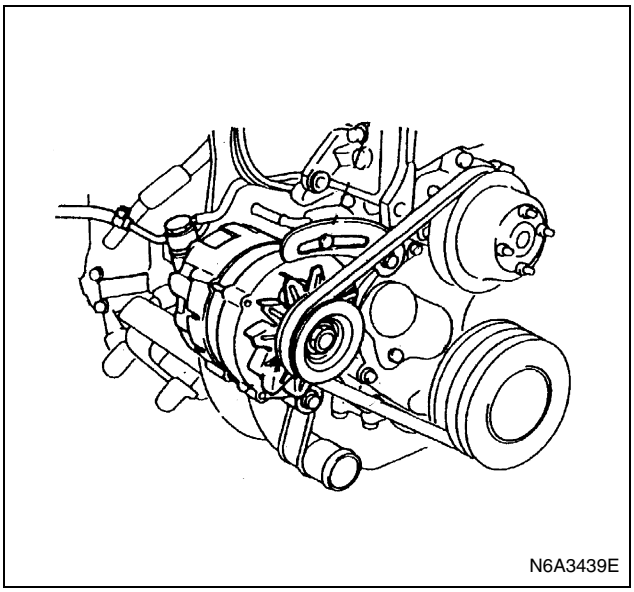
1. Cooling fan assembly
2. Fan Shroud
3. Power steering pump drive belt
4. A/C compressor drive belt
5. AC generator drive belt
6. Noise shield cover
7. Noise cover spacer
8. Air intake duct
9. Injection pump control cable
10. Fuel hose
11. CSD water hose
12. Injection pump harness
13. Injection pipe
14. Injection pump assembly

Removal

Preparation:

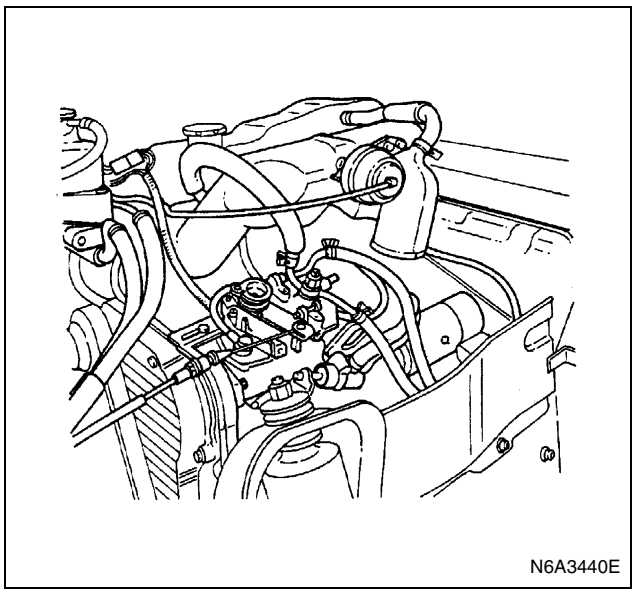
- Disconnect battery ground cable.
- Drain coolant.

1. Cooling Fan Assembly
   - Remove clamp nut, and remove cooling fan assembly, distant pipe, and fan pulley.
2. Fan Shroud
3. Power Steering Pump Drive Belt (P/S Model)
   - Loosen power steering pump mounting bolt and adjust bolt, and remove the drive belt.
4. A/C Compressor Drive Belt (A/C Model)
   - Loosen A/C compressor idler pulley lock nut, adjust bolt and remove the drive belt.
5. AC Generator Drive Belt
   - Loosen AC generator mounting bolt (under side) and adjust plate lock bolt, and remove the drive belt.



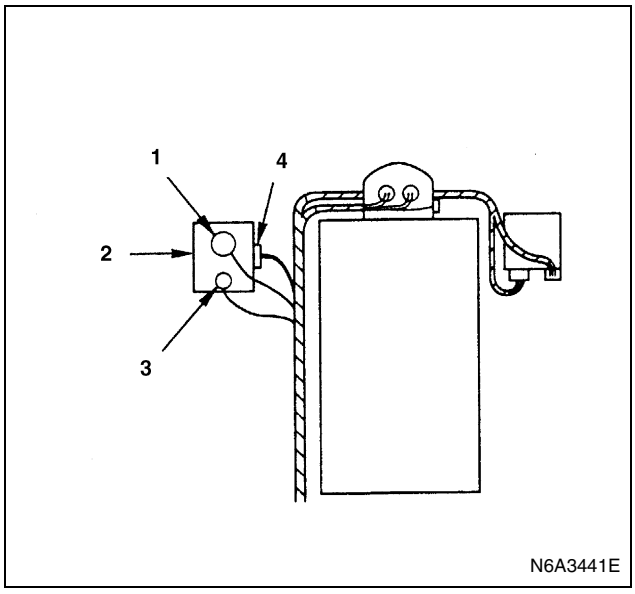
N6A3439E

6. Noise Shield Cover
7. Noise Cover Spacer
8. Air Intake Duct
9. Injection Pump Control Cable
   - Remove the control cable bracket bolt and remove the control lever side.
10. Fuel Hose
    - Disconnect the fuel feed hose and fuel return hose.
11. CSD (Cold Starting Device) Water Hose
    - Disconnect the water hose from injection pump side.



N6A3440E

12. Injection Pump Harness
    - Remove the tachometer sensor (with tachometer), CSD solenoid, fuel cut solenoid.



N6A3441E

Legend

1. CSD solenoid
2. Injection pump
3. Fuel cut solenoid
4. Tachometer sensor

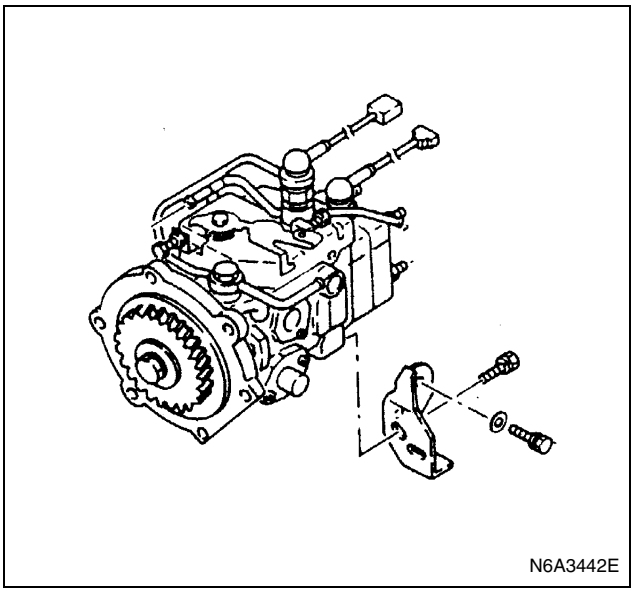
13. Injection Pipe
    - Release pipe clip.
    - Remove the flare nut on the pump side.
    - Remove the flare nut on the injection nozzle side, and remove the injection pipe.

Caution:

- Be sure to plug the injection nozzle holder and delivery holder to prevent the entry of foreign matter.

14. Injection Pump Assembly
    - Remove pump mounting nut.

- Loosen injection pump rear bracket adjuster lock bolt.
- Remove the mounting bolt on the engine side, and pull out the pump from the engine.

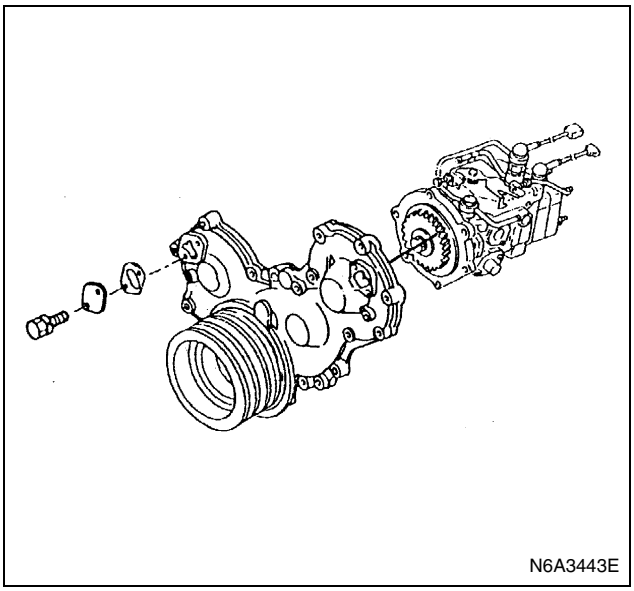


N6A3442E

Notice:
Plug the injection pump delivery holder parts with the shipping caps (or the equivalent) to prevent the entry of foreign materials.

Installation

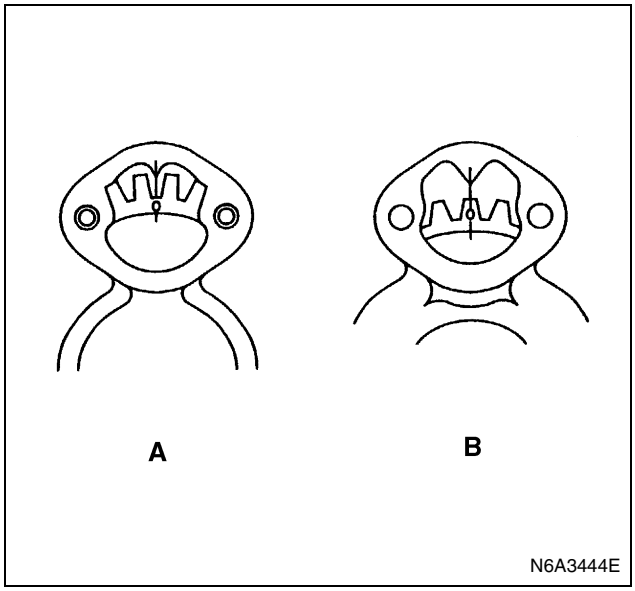
1. Injection Pump Assembly
   1) Timing gear case a camshaft timing gear side c injection pump timing gear side check hold cover.



N6A3443E

   2) Turn the crankshaft clockwise to see the TDC mark of the crank pulley to the pointer, and then bring the No. 1 cylinder to the TDC on the compression stroke.
   3) Look in through the check hole on the crankshaft timing gear side and check to see if the “O” mark on the timing gear is in line with the pointer of the check hole.
   4) In the condition above with the injection pump gear mark “O” set to the pointer of the check hole, install the injection pump assembly.
   - Install the injection pump fixing bolts and tighten them to the specified torque.

Tighten:
Pump Bolts to 15 N·m (1.5 kg·m/11 lb·ft)

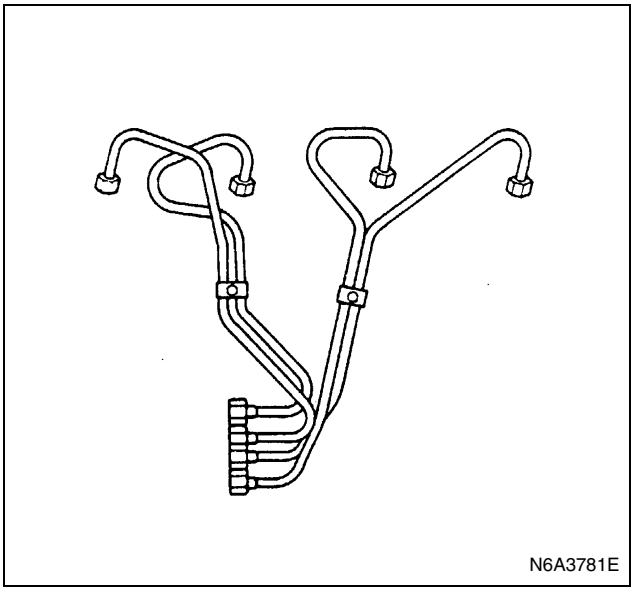


N6A3444E

Legend
A. Camshaft gear
B. Injection pump gear

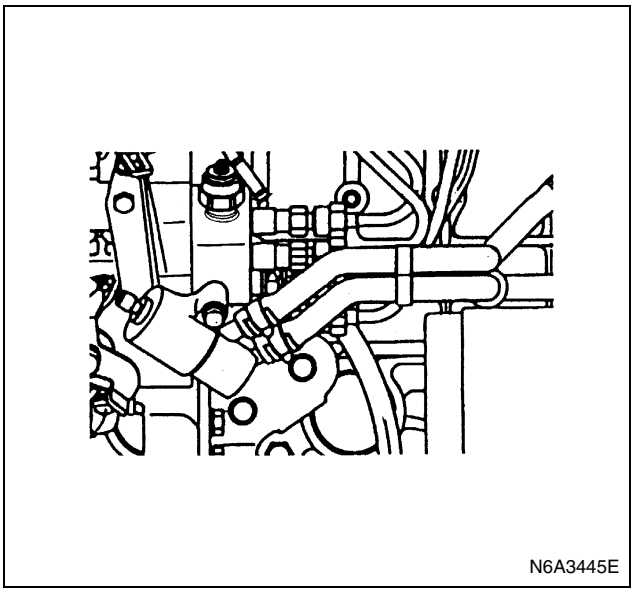
2. Injection Pipe
   - Connect the pump side and nozzle side of the pipe, and tighten securely.
   - Install clip where it was.

Tighten:
Sleeve Nut to 29 N·m (3.0 kg·m/22 lb·ft)



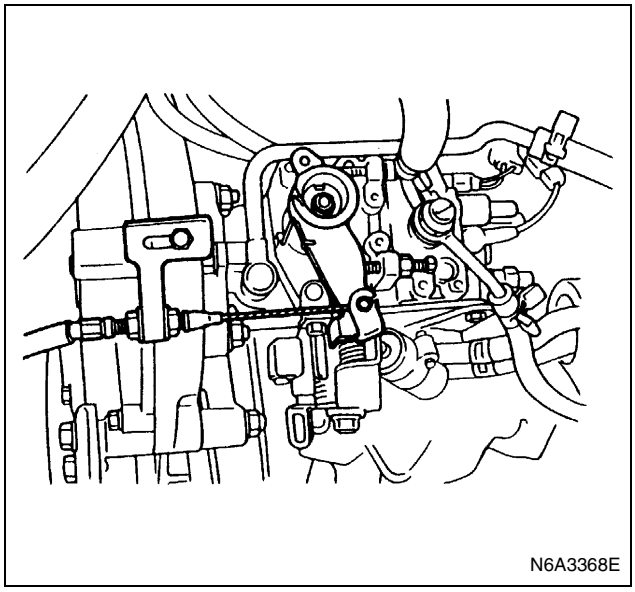
N6A3781E

3. Injection Pump Harness
   - Mount engine harness and connect it to switches.
4. CSD Water Hose
   - Connect the water hose and tighten clip securely.



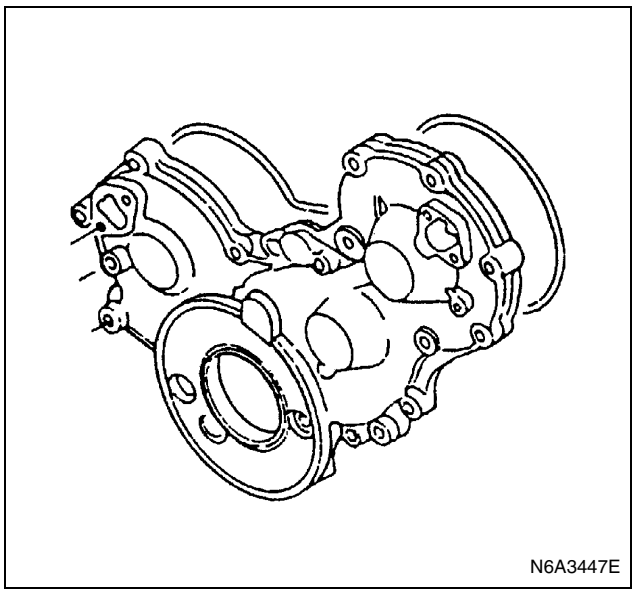
N6A3445E

5. Fuel Hose
   - Connect the fuel feed hose and fuel return hose.
   - Connect the leak off hose.
6. Injection Pump Control Cable
   1) Install the control wire to the engine control lever.
   2) Hold the accelerator lever in the fully closed position and stretch the control cable in the direction indicated by the arrow to remove any slack.
   3) Tighten the accelerator cable bracket bolt.



N6A3368E

7. Air Intake Duct
8. Noise Cover Spacer
9. Noise Shield Cover



N6A3447E

10. AC Generator Drive Belt
    - Install AC generator drive belt and adjust belt tension.
    - Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

4JG2

2. AC generator & fan pulley drive belt

- Install fixing bolt and tighten bolts to the specified torque.

Tighten:
- Generator Fixing Bolt to 40 N·m (4.1 kg·m/30 lb·ft)
- Adjust Plate Fixing Bolt to 19 N·m (1.9 kg·m/14 lb·ft)

11. A/C Compressor Drive Belt (A/C Model)
    - Install A/C compressor drive belt and adjust belt tension.
    - Depress the drive belt mid-portion with a 98N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

    - Tighten the idler lock nut to the specified torque.

Tighten:
27 N·m (2.8 kg·m/20 lb·ft)

12. Power Steering Pump Drive Belt (P/S Model)
    - Install P/S pump drive belt and adjust belt tension.
    - Depress the drive belt mid-portion with a 98 N (10 kg/ 22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

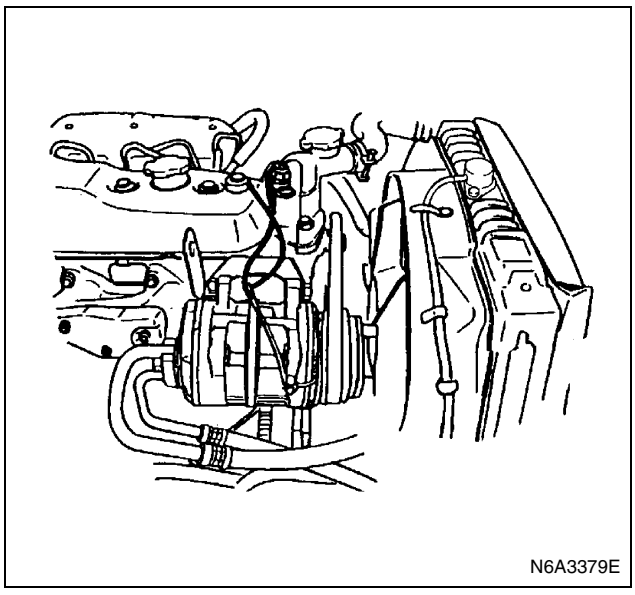
    - Tighten the idler lock nut to the specified torque.

Tighten:
27 N·m (2.8 kg·m/20 lb·ft)

13. Fan Shroud
    - Install the fan shroud and reservoir tank hose.
14. Cooling Fan Assembly
    - Mount fan pulley, distance piece, and cooling fan assembly (in this order) on the water pump, and tighten to the specified torque.

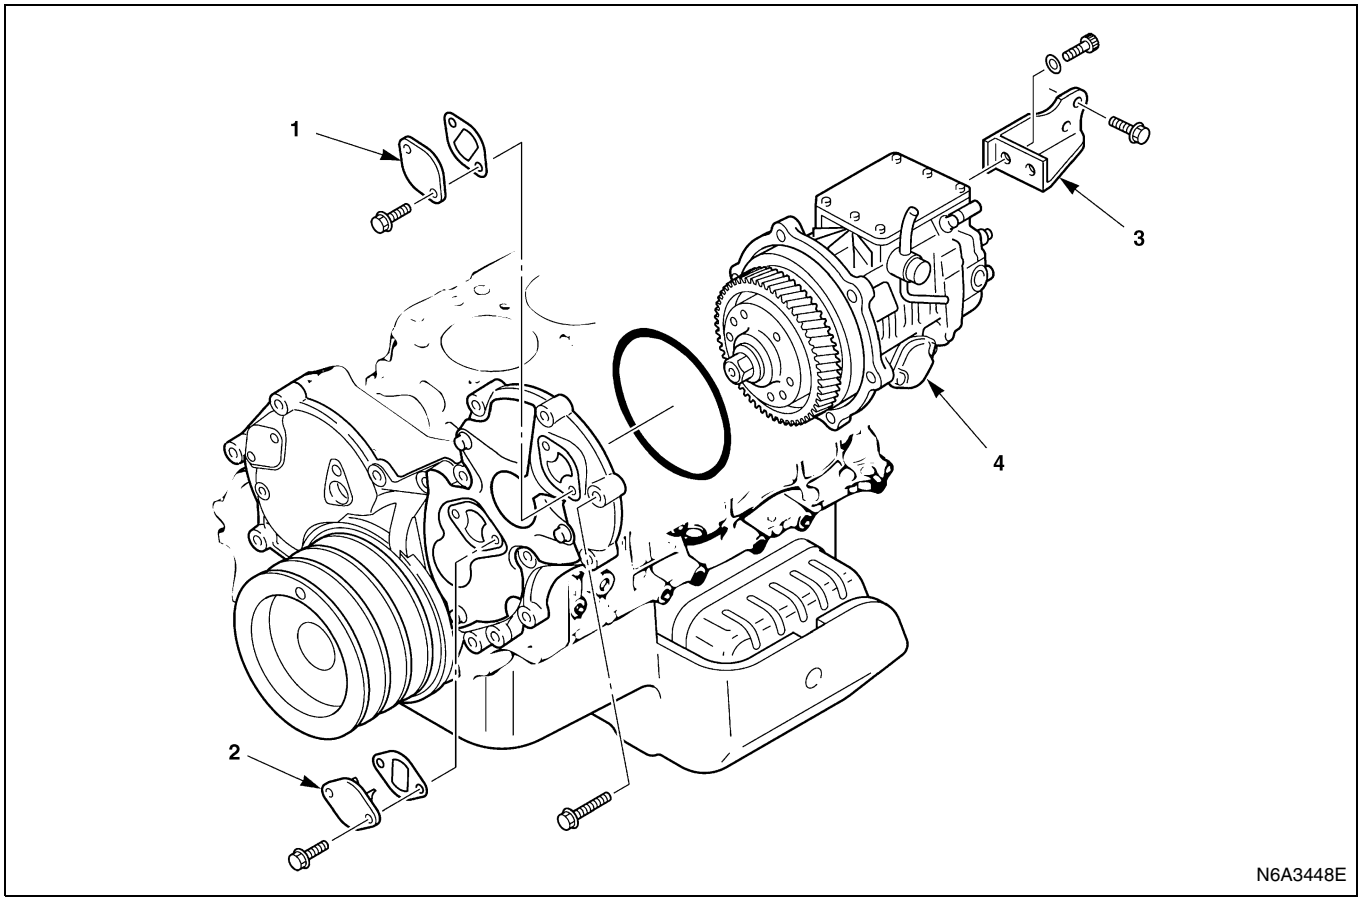
Tighten:
8 N·m (0.8 kg·m/69 lb·ft)

- Connect battery ground cable.
- Pour coolant.



INJECTION PUMP ASSEMBLY (4JH1-TC)

Component



Legend

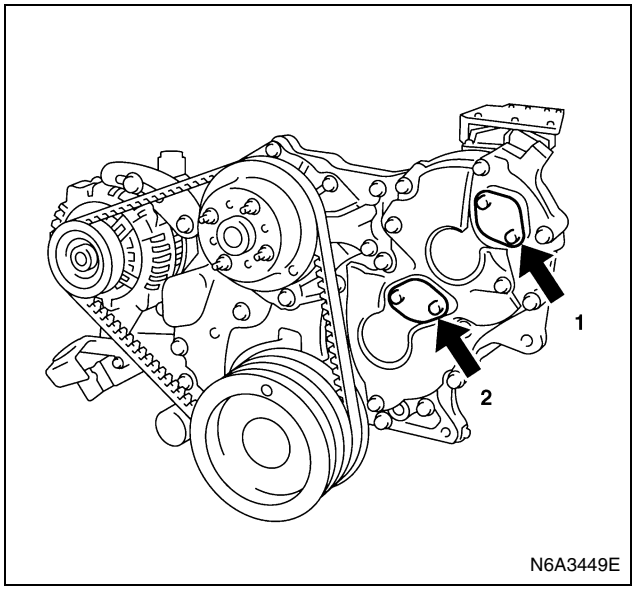
1. Check hole cover: Injection pump gear
2. Check hole cover: Scissor gear
3. Injection pump bracket
4. Injection pump assembly

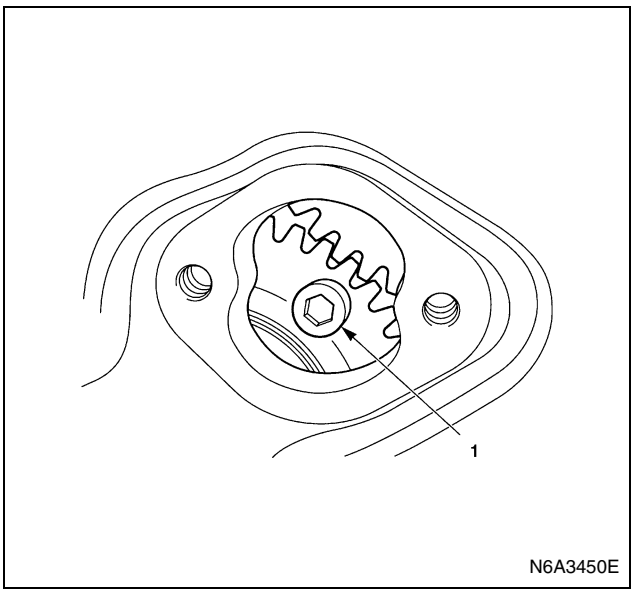
Removal

Preparation:

Remove the fuel pipe and the injection pipe.

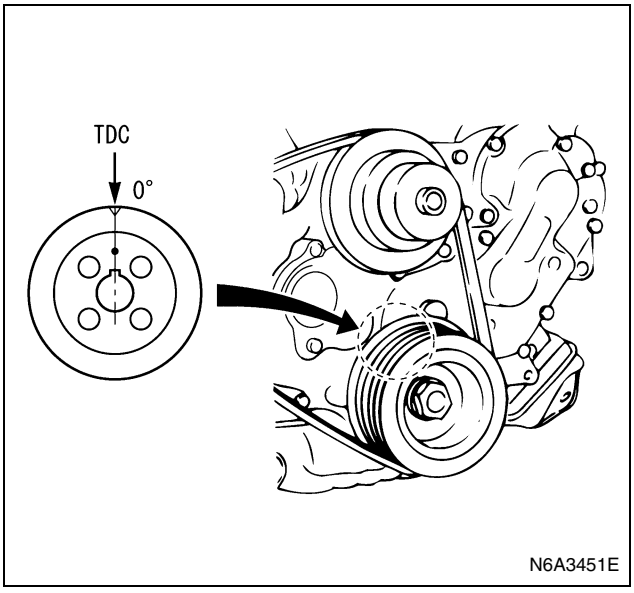
1. Check Hole Cover: Injection Pump Gear
   Remove the check hole cover (1).
2. Check Hole Cover: Scissor Gear
   - Remove the check hole cover (2).
   - Rotate the crank pulley until the hole used to fix the scissor gear (the hole extends from the check hole cover) becomes visible.
   - Thread the lock bolt into the hole in the scissor gear.



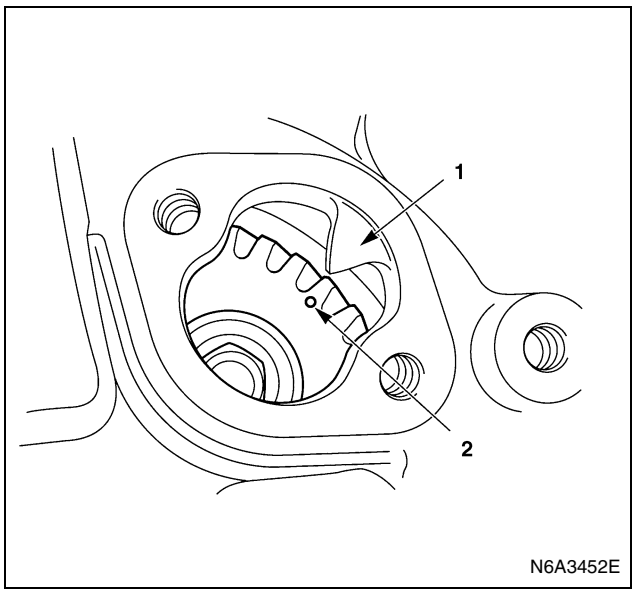


Legend
1. Lock bolt

- Rotate the crank pulley to align the dot on the pulley with the crankshaft TDC mark.



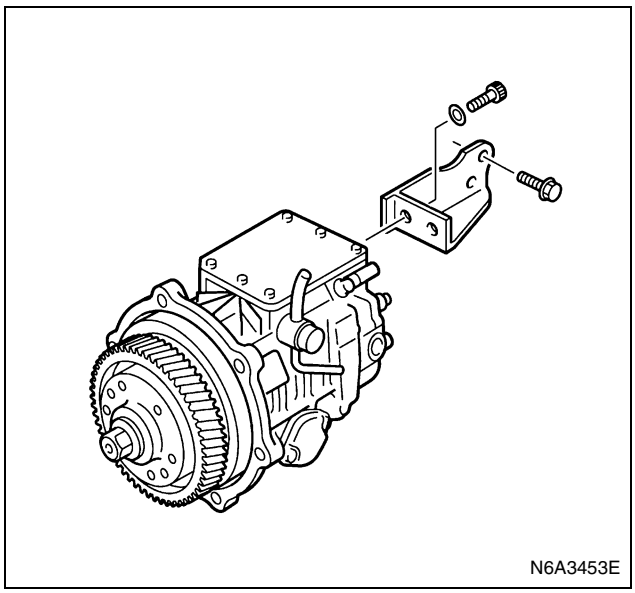
- Check that the injection pump mark is aligned with the arrow mark. If the marks are not aligned, rotate the crank pulley an additional full turn.



Legend
1. Arrow mark
2. Mark

Notice:
When the scissor gear and check hole cover are not installed, the crank pulley can be turned with the scissor gear lock bolt in place.

3. Injection Pump Bracket
   Remove the bracket fixing bolts at the rear of the injection pump.
4. Inspection Pump Assembly
   Loosen the 6 bolts holding the injection pump assembly.

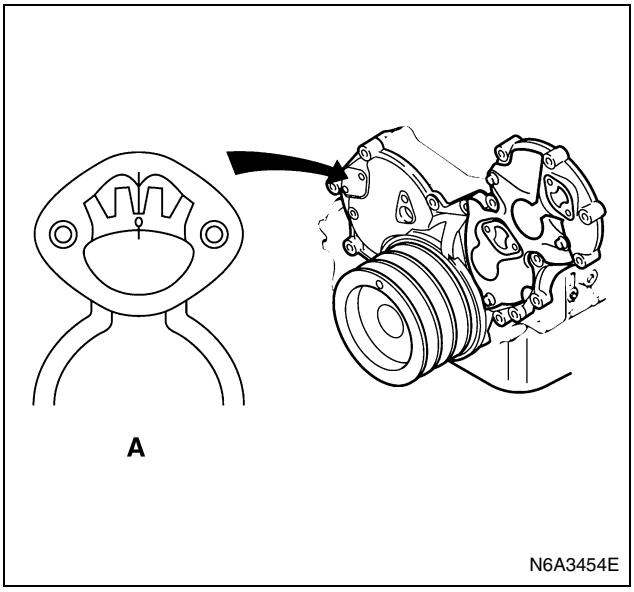


Notice:
Plug the injection pump delivery holder openings with the shipping caps (or some similar object) to prevent the entry of foreign material.

Installation

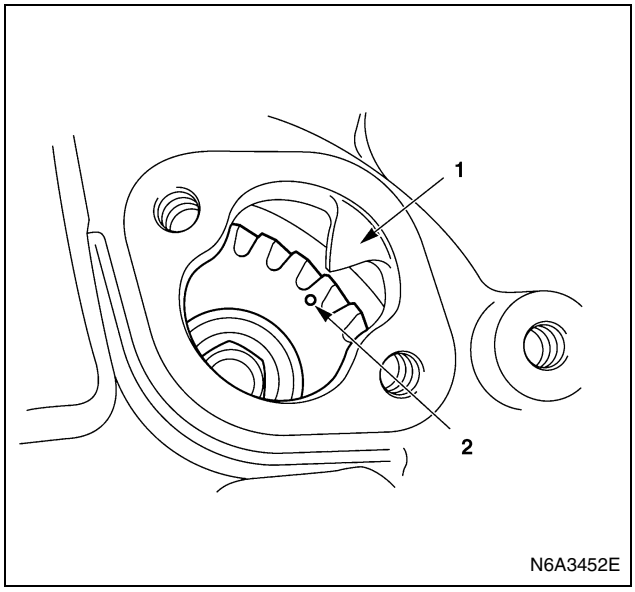
1. Injection Pump Assembly
   - Check the pulley alignment mark and the crankshaft TDC mark are aligned.

   - Remove the camshaft gear check hole cover to check camshaft gear mark alignment.



Legend
A. Camshaft gear

   - Install the O-ring.
   - Install the injection pump assembly. Maintain injection pump gear mark and arrow mark alignment during the installation procedure (look through the check hole).



Legend
1. Arrow mark
2. Mark

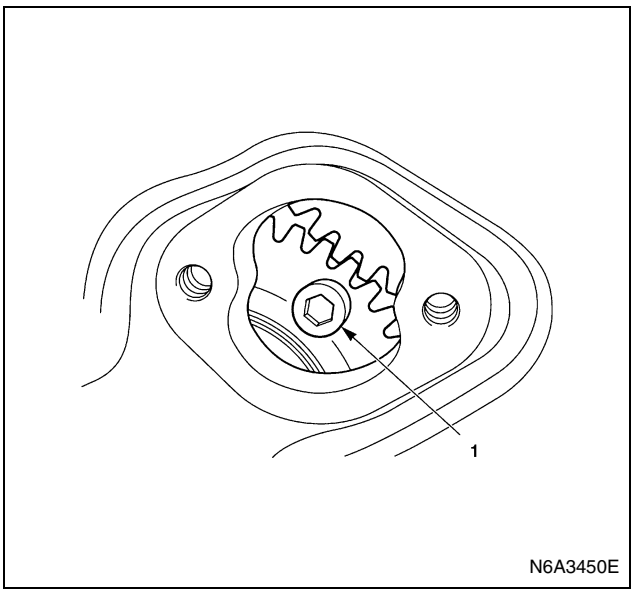
   - Tighten the injection pump bolts to the specified torque.

Tighten:
Pump Bolt to 15 N·m (1.5 kg·m/11 lb·ft)

2. Injection Pump Bracket
   - Install the injection pump bracket to the gear of the injection pump and tighten the bolts to the specified torque.

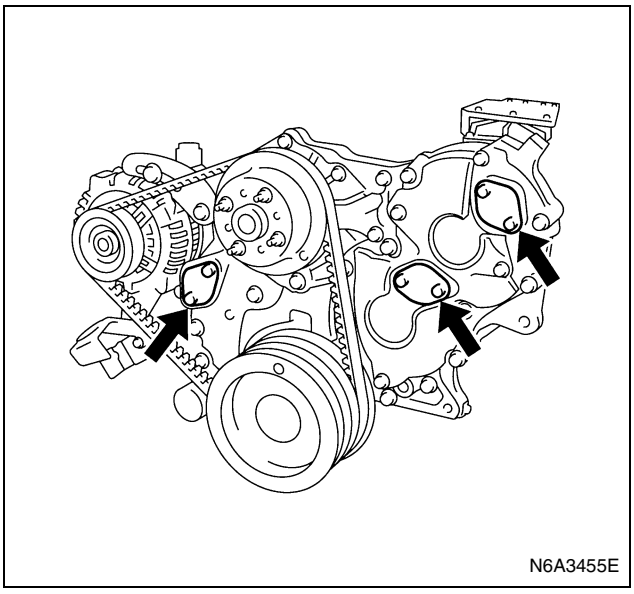
Tighten:
Bracket Bolt to 25 N·m (2.5 kg·m/18 lb·ft)

   - Rotate the crank pulley until the scissor gear lock bolt is visible through the check hole. Remove the bolt.



Legend
1. Lock bolt

3. Check Hole Cover: Scissor Gear
4. Check Hole Cover: Injection Pump



Caution:
Install the check hole covers.

- Be absolutely sure that the check hole covers are properly installed.
- Rotate the crank pulley 2 full turns to confirm that the lock bolt has been removed (if you have forgotten to remove the bolt, the bolt will strike the check hole guides and the crank pulley will not turn).

INJECTION PUMP ASSEMBLY (4JG2 Belt Drive Type)

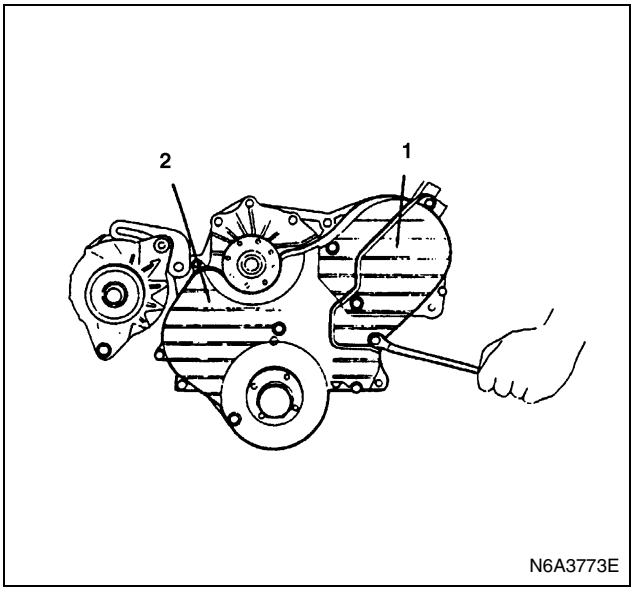
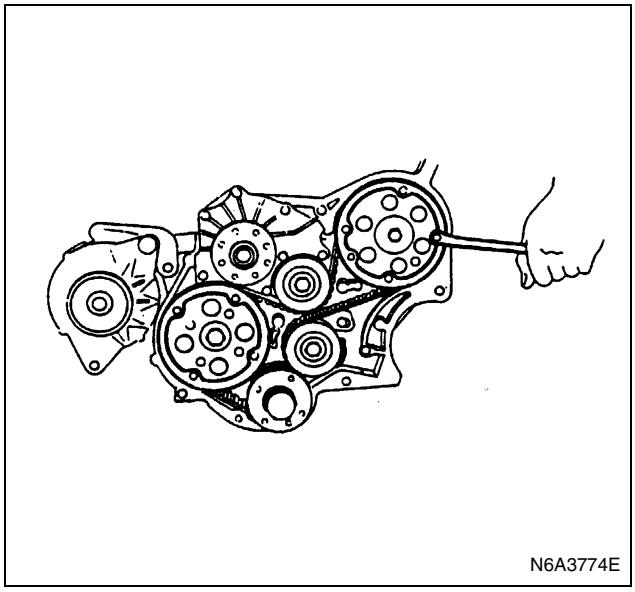
8. Timing Pulley Upper Cover (1)
9. Timing Pulley Lower Cover (2)



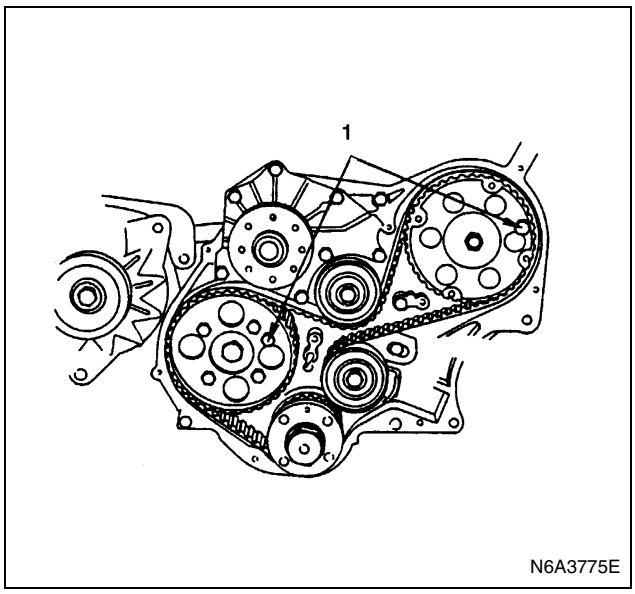
N6A3773E

10. Flange; Camshaft Pulley



N6A3774E

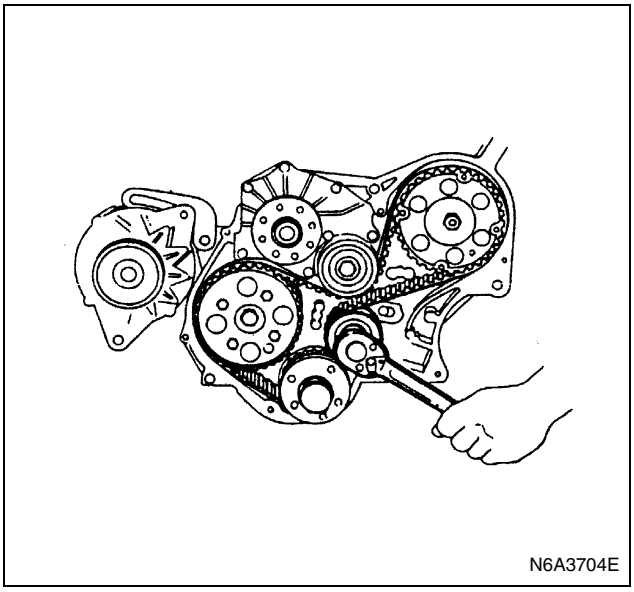
11. Timing Belt
    - Prepare a fixing bolt (M8 × 40, P=1.25).
    - Turn crankshaft timing pulley in the normal direct pulley side mark to timing pulley housing side mark.
    - Make sure that the camshaft pulley and injection timing pulley fixing bolt holes are set to each other. Then fit in a fixing bolt and lightly tighten.



N6A3775E

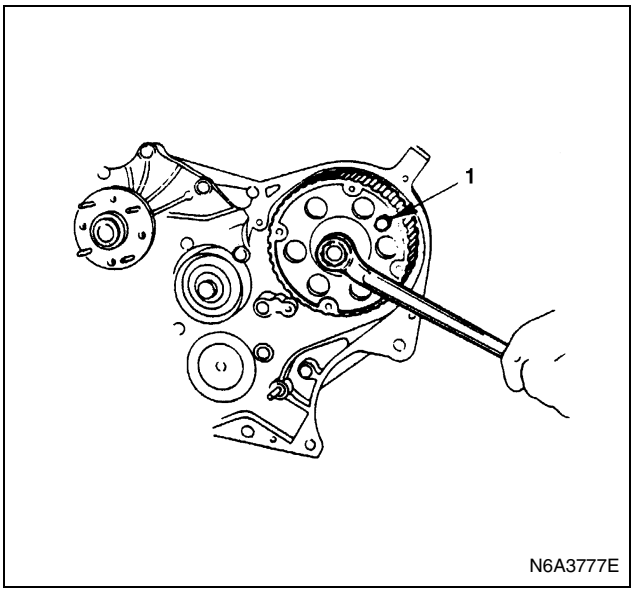
    - No. 1 cylinder should be at top dead center. If the fixing bolt holes are not set (No. 4 cylinder is at top dead center) give another turn.
    - Remove tensioner and timing belt.

WARNING:
- **IF CRANKSHAFT AND CAMSHAFT ARE TURNED WITH TIMING BELT BEING NOT MOUNTED, PISTON AND VALVE WILL INTERFERE WITH EACH OTHER. THEREFORE, THE SHAFTS MUST NOT BE TURNED.**



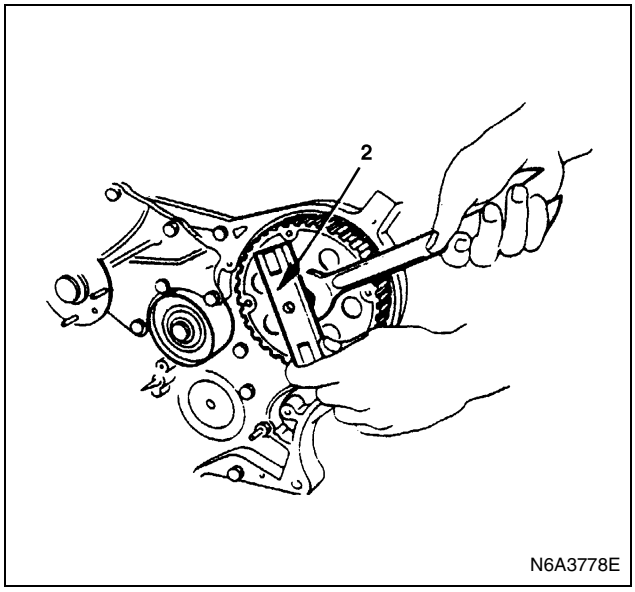
N6A3704E

12. Injection Pump Timing Pulley
    - Install the stopper bolt (1) to the timing pulley to prevent it from turning.



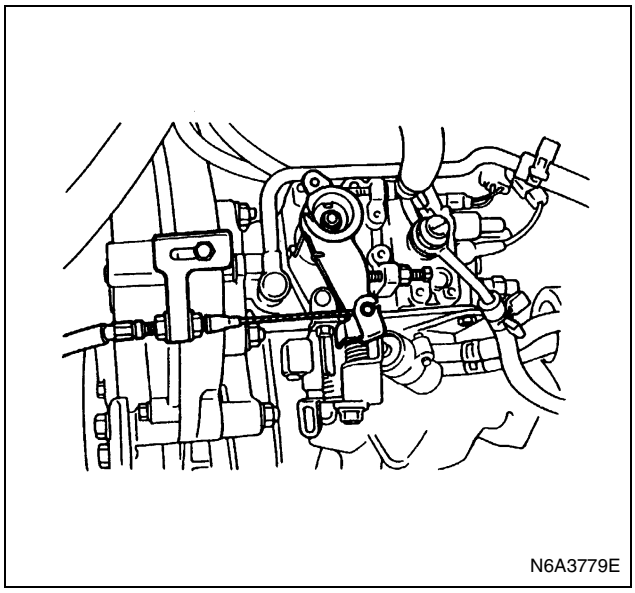
N6A3777E

- Use the timing pulley puller (2) to remove the injection pump timing pulley.
  Timing Pulley Puller: 5-8840-0086-0
- Remove the stopper bolt.



N6A3778E

13. Air Intake Duct
14. Injection Pump Control Cable
    - Remove the control cable bracket bolt and remove the control lever side.
15. Fuel Hose
    - Disconnect the fuel feed hose and fuel return hose.



N6A3779E

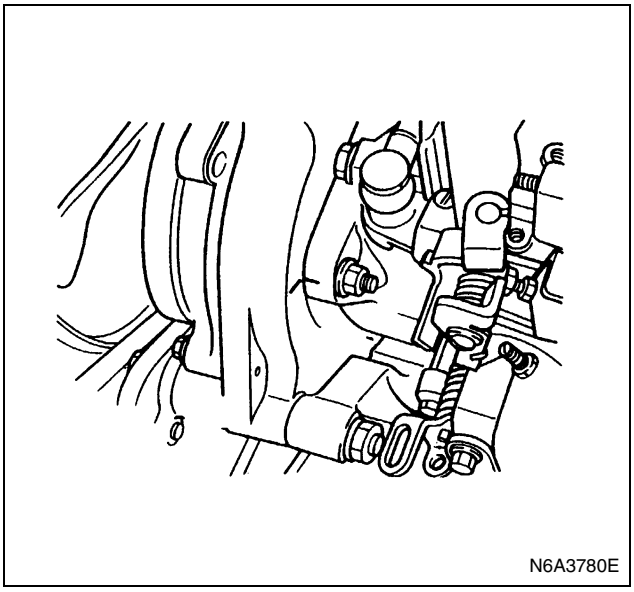
16. CSD Water Hose
17. Injection Pump Harness
18. Injection Pipe
19. Injection Pump Assembly
    - Remove the pump bracket bolt engine side.
    - Remove the adjust lock bolt.
    - Remove the injection pump fixing bolt and take out injection pump.

Installation

1. Injection Pump Assembly
   - Put the timing pulley housing side and injection pump side setting marks together, and temporarily tighten.
   - After adjusting injection timing retighten.
   - Mount rear bracket on cylinder block and tighten to the specified torque.

Tighten:
Rear bracket on cylinder block to 19 N·m (1.9 kg·m/14 lb·ft)

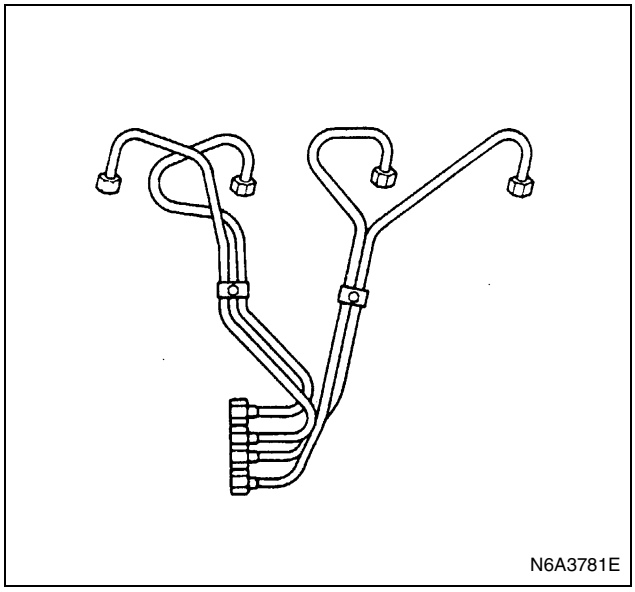
   - Install adjust lock bolt and lightly tighten.
   - After adjusting injection timing, retighten.



N6A3780E

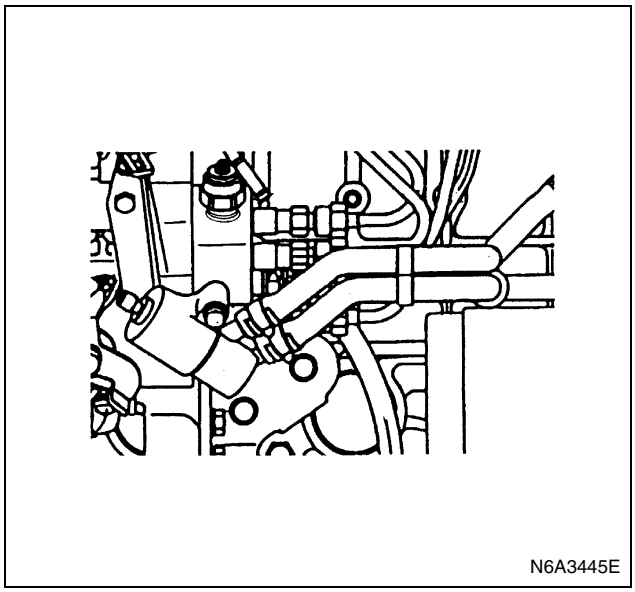
2. Injection Pipe
   - Connect the pump side and nozzle side of the pipe, and tighten securely.
   - Install clip where it was.

Tighten:
Sleeve Nut to 29 N·m (3.0 kg·m/22 lb·ft)



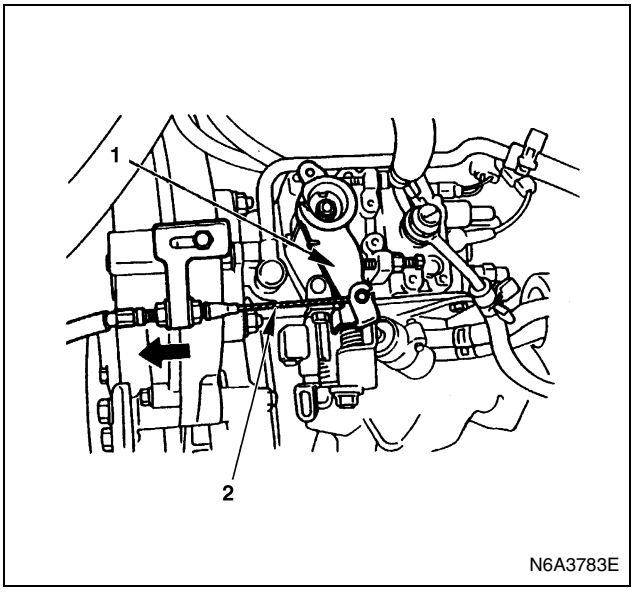
N6A3781E

3. Injection Pump Harness
   - Mount engine harness and connect it to switches.
4. CSD Water Hose
   - Connect the water hose and tighten clip securely.



N6A3445E

5. Fuel Hose
   - Connect the fuel feed hose and fuel return hose.
   - Connect the rear off hose.
6. Injection Pump Control Cable
   1) Install the Control wire to the engine control lever.
   2) Hold the accelerator lever (1) in the fully closed position and stretch the control cable (2) in the direction indicated by the arrow to remove any slack.
   3) Tighten the accelerator cable bracket bolt.

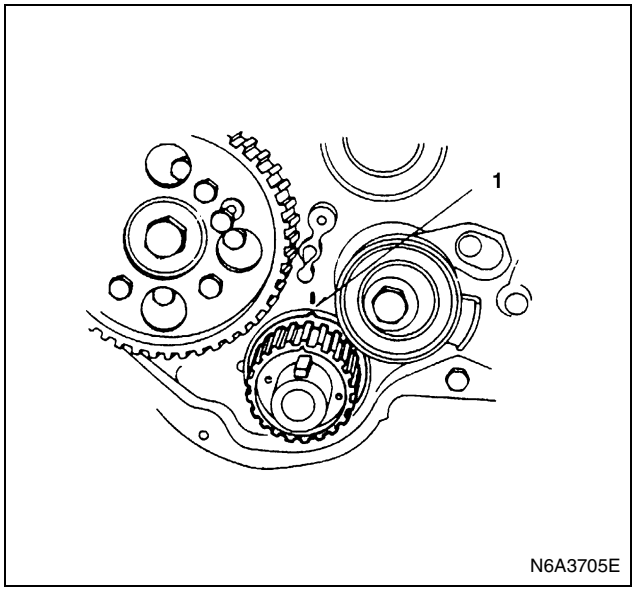


7. Air Intake Duct
   - Connect the air intake duct and tighten clip securely.
8. Injection Pump Timing Pulley
   - Align the timing pulley with the pump shaft key.
   - Install the stopper bolt to the timing pulley.
     This will prevent the timing pulley from moving.
   - Tighten the timing pulley nut to the specified torque.

Tighten:
Injection pump timing pulley nut to 64 N·m (6.5 kg·m/47 lb·ft)

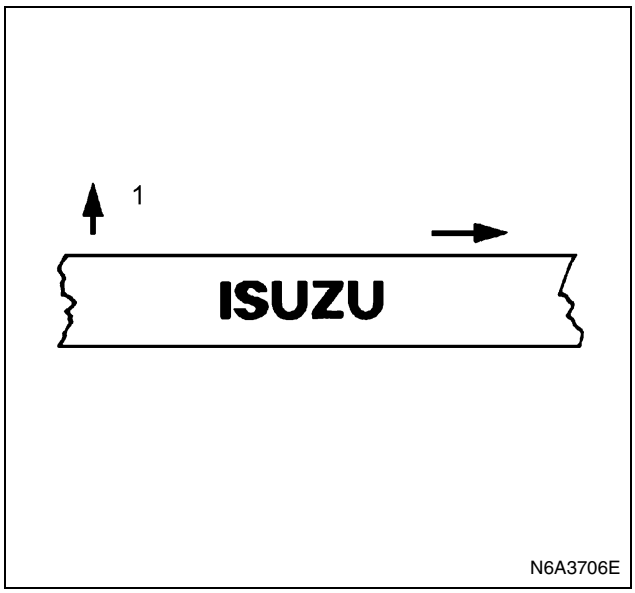
   - Remove the stopper bolt from the injection timing pulley.
9. Timing Belt
   - When removing the belt, make sure the marks on the bolt fixed camshaft, injection pulley and crankshaft timing pulley are set to each other.

Caution:
- Do not turn crankshaft because otherwise piston and valve will interfere with each other.



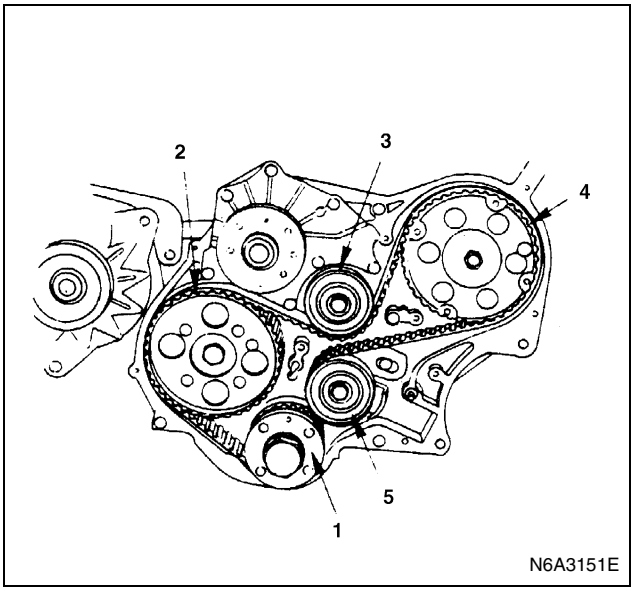
Legend
1. Setting mark

Caution:
- For accurate mounting, be sure to mount the belt in the direction that letters on the belt are readable.



Legend
1. Cylinder head side

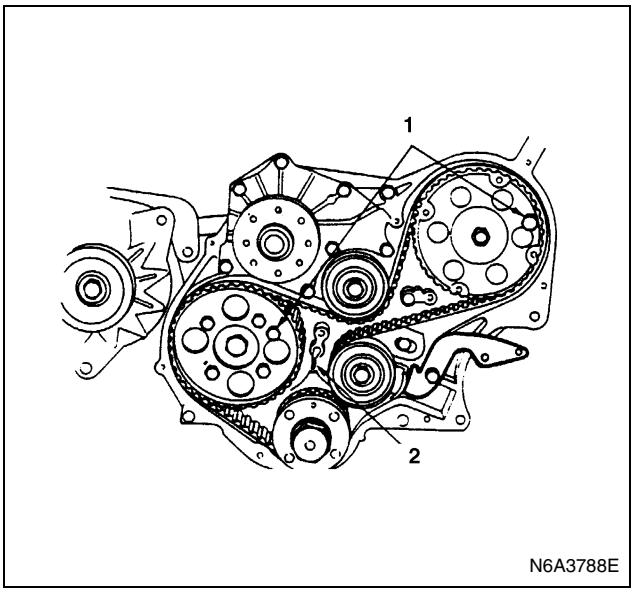
   - Mount new timing belt on pulleys in the following steps.
     Crankshaft timing pulley (1) → Camshaft Timing pulley (2) → Idle pulley (3) → Injection Pump pulley (4) → Tensioner (5)



- Set the belt on crankshaft timing pulley and hold with one hand.
- Stretch and pass the belt round each pulley with the other hand.
- After passing it round injection pump pulley, install tensioner while taking care not to slacken the belt.

Caution:

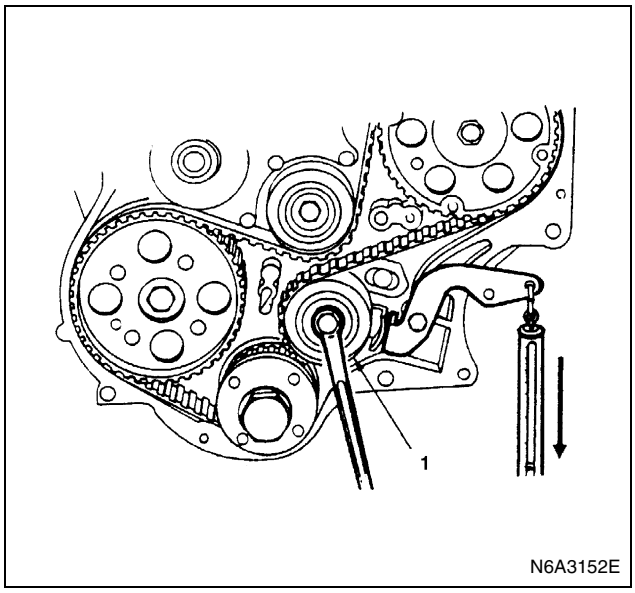
- On completion of belt passing, make sure that the setting mark on crankshaft timing pulley is set.



Legend

1. Lock bolt
2. Setting mark

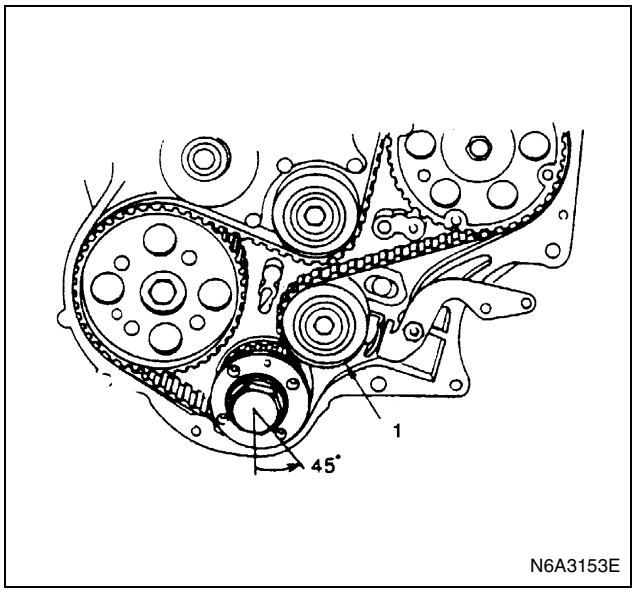
- If not set, reset the mark and repeat the belt passing.
- Remove tension adjust, lever mounting bolt, and loosen the fulcrum bolt to such extent that the lever is movable.
- Hung a spring balance from the end hole of tension adjust lever, and with the balance pulled down with 88 N (9 Kg/20 lb), loosen once the tensioner mounting bolt and then retighten it.



Legend

1. Tensioner

- Turn the crankshaft by 45° counterclockwise to shift belt slackness on the tensioner.



Legend

1. Tensioner

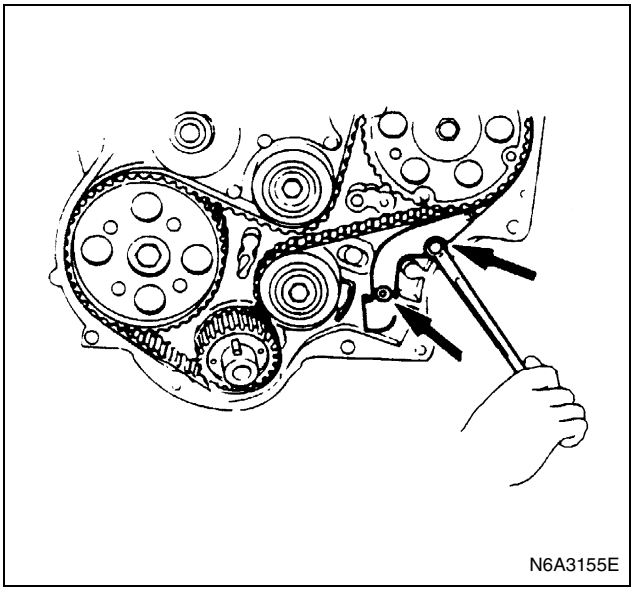
- Again hand the spring balance hanging from the end hole of tension adjust lever and pull it down with the specified force. Under this condition, loosen tensioner mounting bolt to absorb belt slackness and retighten it to specified torque.

Belt Tension	N (Kg/lb)
98 — 118 (10 — 12/22 — 26)	

Tighten:
Bolt to 76 N·m (7.8 kg·m/56 lb·ft)

- Fix the tension adjust lever.

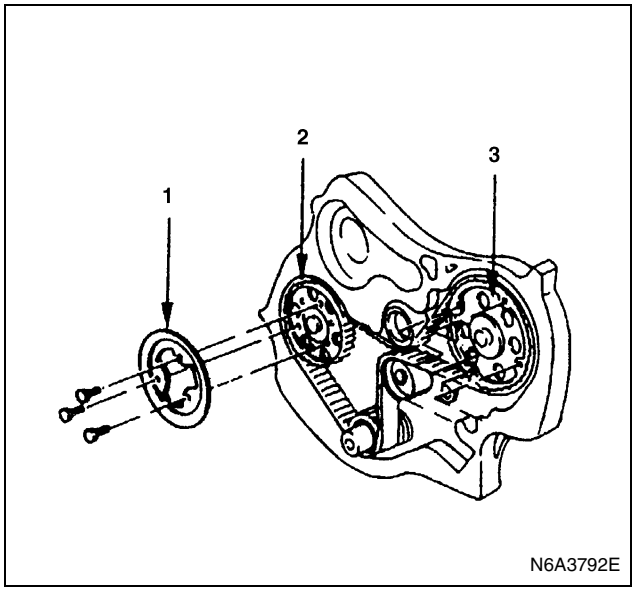
Caution:
- In case where the timing belt has been replaced with the actuation of warning light, put off the light with change over switch on the reverse side of meter.
- Refer to Cab and Chassis Electrical in Section 8.
- Tighten the tension adjusting lever nut and bolt.



N6A3155E

10. Flange; Camshaft Pulley
    - Install the timing pulley flange (1) to the camshaft (2).
    - Tighten the timing pulley flange bolts to the specified torque.

Tighten:
19 N·m (1.9 kg·m/14 lb·ft)



N6A3792E

11. Timing Pulley Lower Cover
    - Install timing pulley lower cover and tighten bolt to the specified torque.

Tighten:
Bolt to 8 N·m (0.8 kg·m/69 lb·in)

12. Timing Pulley Upper Cover
    - Install timing pulley upper cover and tighten bolt to the specified torque.

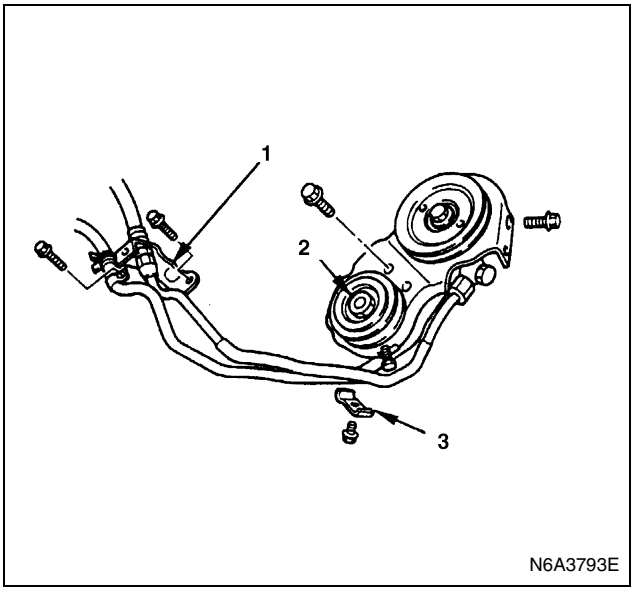
Tighten:
Bolt to 8 N·m (0.8 kg·m/69 lb·in)

13. Crankshaft Damper Pulley
    - Install crankshaft damper pulley and tighten bolt to the specified torque.

Tighten:
Bolt to 19 N·m (1.9 kg·m/14 lb·ft)

14. Power Steering Pump & Bracket Assembly (P/S Model)
    - Install the pipe bracket, clip and tighten bolts to the specified torque.

Tighten:
Pipe bracket bolts to 19 N·m (1.9 kg·m/14 lb·ft)
Pipe clip bolts to 10 N·m (1.0 kg·m/7 lb·ft)



Legend
1. Pipe bracket
2. Lock nut
3. Clip

- Install the Power Steering pump & bracket assembly.

Tighten:
- 10M bolts to 40 N·m (4.1 kg·m/30 lb·ft)
- 8M bolts to 19 N·m (1.9 kg·m/14 lb·ft)
- Lock nut to 27 N·m (2.8 kg·m/20 lb·ft)

15. AC Generator Drive Belt
    - Install AC generator drive belt and adjust belt tension.
    - Depress the drive belt mid-portion with a 98N (10 kg/ 22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

- Install fixing bolt and tighten bolts to the specified torque.

Tighten:
- Generator fixing bolt to 40 N·m (4.1 kg·m/30 lb·ft)
- Adjust Plate Fixing Bolt to 19 N·m (1.9 kg·m/14 lb·ft)

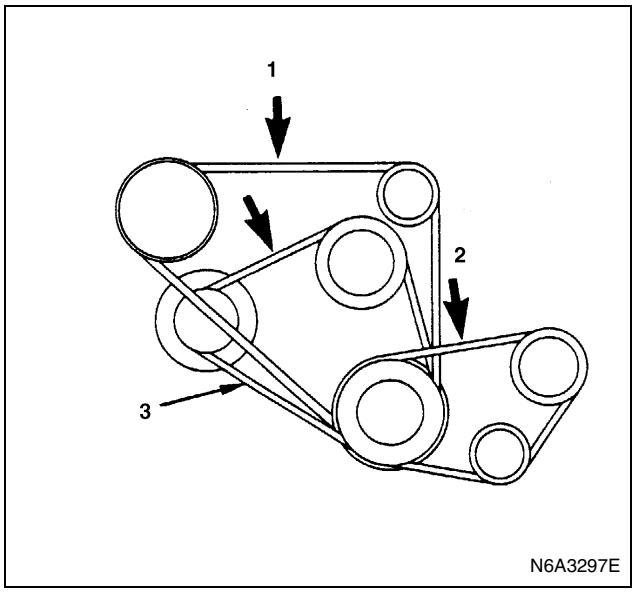
16. A/C Compressor Drive Belt (A/C Model)
    - Install A/C compressor drive belt and adjust belt tension.
    - Depress the drive belt mid-portion with a 98N (10 kg/22lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

- Tighten the Idler lock nut to the specified torque.

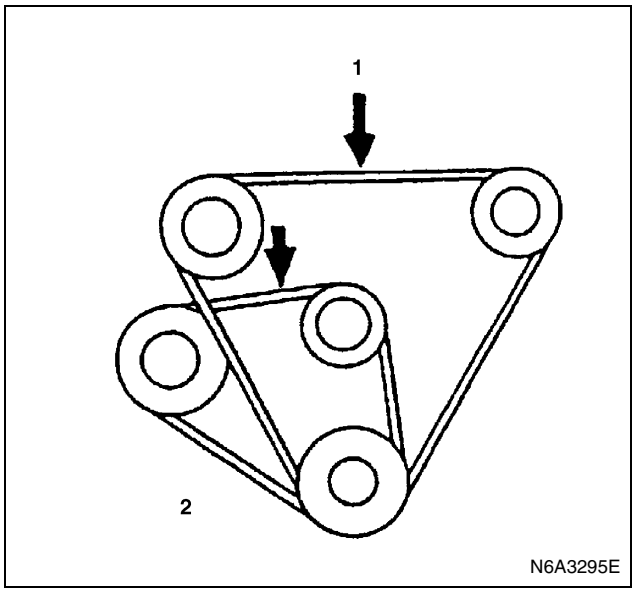
Tighten:
Idler lock nut to 27 N·m (2.8 kg·m/ 20 lb·ft)

4JG2



Legend
1. A/C compressor drive belt
2. P/S oil pump drive belt
3. AC generator fan pulley drive belt

4JB1



Legend
1. A/C compressor drive belt & P/S pump drive belt
2. AC generator & fan pulley drive belt

17. Power Steering Pump Drive Belt (P/S Model)
    - Install power steering pump drive belt and adjust belt tension.

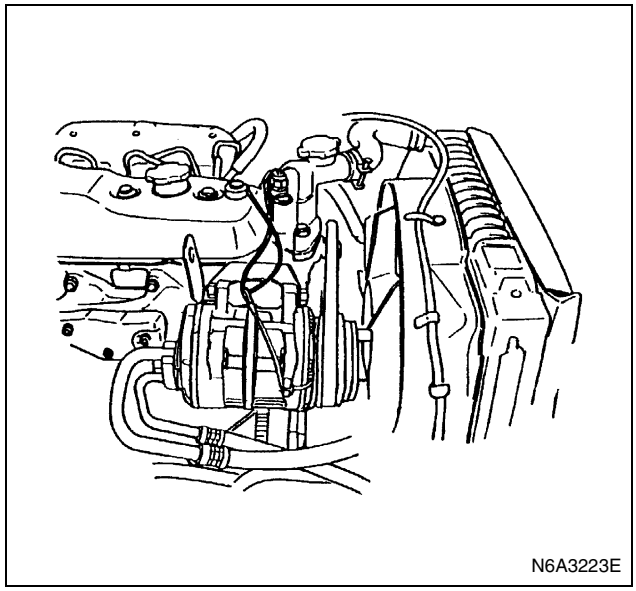
- Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

- Tighten the idler lock nut to the specified torque.

Tighten:
Idler lock nut to 27 N·m (2.8 kg·m/ 20 lb·ft)

18. Fan Shroud
    - Install the fan shroud and reservoir tank hose.



N6A3223E

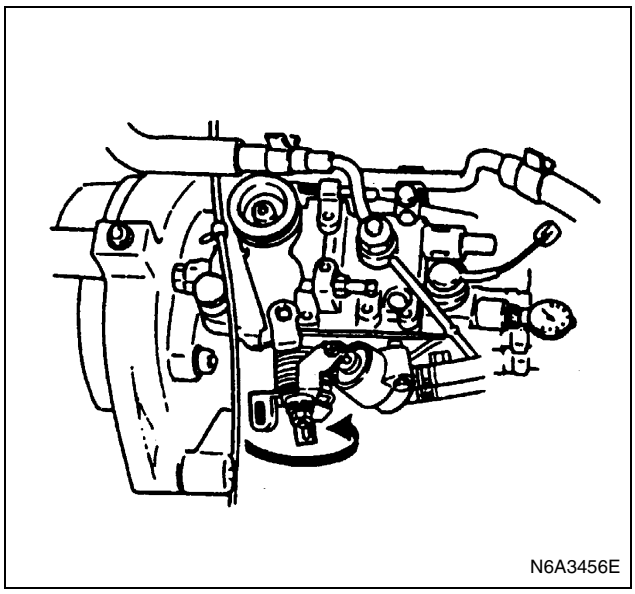
19. Cooling Fan Assembly
    - Mount fan pulley, distance piece, and cooling fan assembly (in this order) on the water pump, and tighten to the specified torque.

Tighten:
Nut to 8 N·m (0.8 kg·m/69 lb·in)

- Connect battery ground cable.
- Pour coolant.
- Start the engine and check coolant leakage.

Injection Timing Adjustment

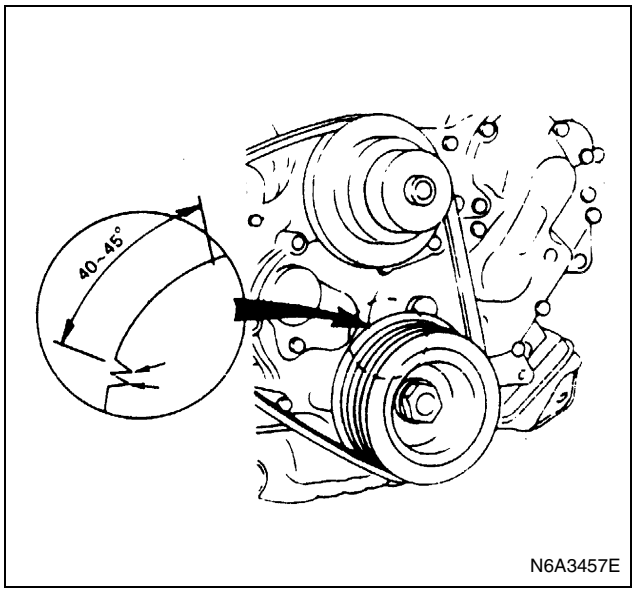
- Set No. 1 cylinder to top dead center.
- Remove injection pump distributor head plug.
- Cancel wax CSD with the handle of a screw driver.
- Fit a dial gauge and set lift to 2 mm.



N6A3456E

Measuring device: 5-8840-0145-0

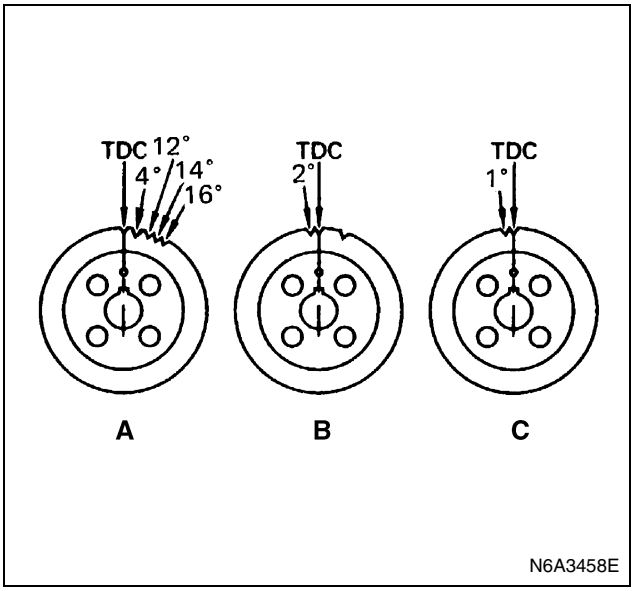
- Set crankshaft damper pulley top dead center mark about 45° before top dead center from the pointer.



N6A3457E

- Set dial gauge in the “0” position.
- Turn the crankshaft a little clockwise and counter-clockwise and see if the pointer is stable in the “0” position.
- Turn the crankshaft in the normal direction and read the measuring device’s indication at as follows.

4JB1	BTDC 14°, BTDC 12° (′91/ 542A)
4JB1-TC	BTDC4°
4JG2 (Belt Drive Type)	ATDC 1° (′91/ 542A) TDC 0° (′91/ 542B)
4JG2 (Gear Drive Type)	ATDC 2 (′91/ 542A)



Legend
A. 4JB1
B. 4JG2 Gear drive type
C. 4JG2 Belt drive type

Measuring Device's Indication	mm (in)
Standard	0.5 (0.0197)

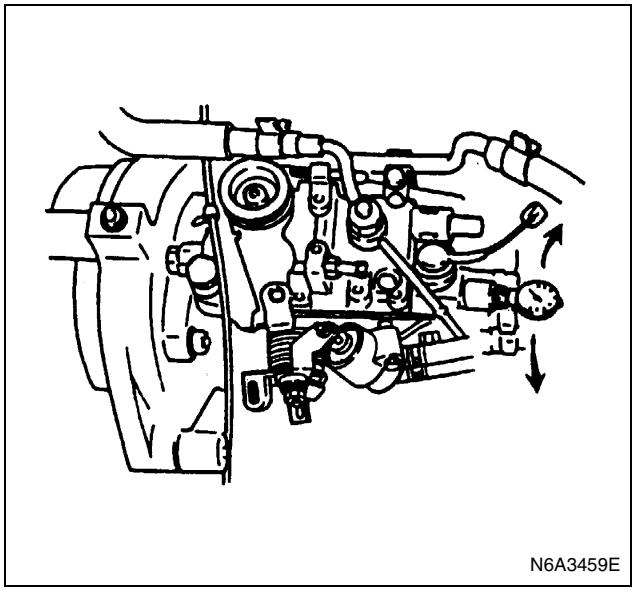
- If it reads abnormal, loosen injection pump fixing nut and pump bracket adjust bolt, make adjustment by changing the pump mounting angle, and tighten the nut and bolt to the specified torque where the dial indicates the specified valve.

Tighten:
- Pump fixing nut to 24 N·m (2.4 kg·m/17 lb·ft)
- Adjust bolt to 19 N·m (1.9 kg·m/14 lb·ft)

- Remove the measuring device and tighten the distributor head plug to the specified torque.

Tighten:
17 N·m (1.7 kg·m/12 lb·ft)

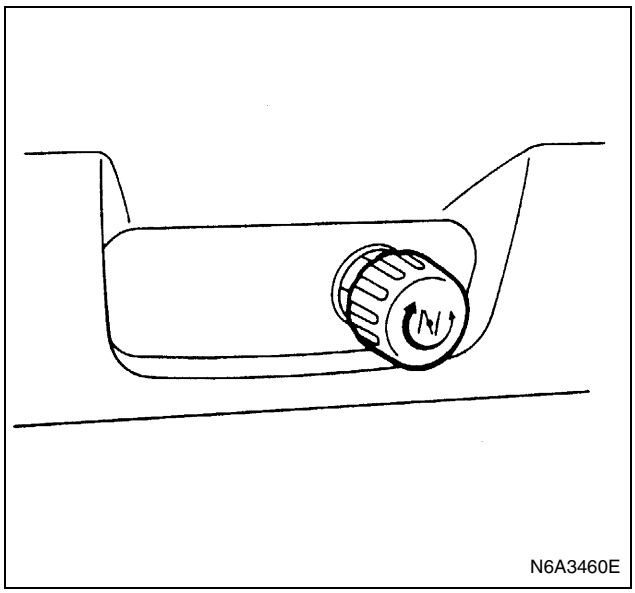
Caution:
- When installing the distributor head plug, be sure to use new copper washer.
- Connect injection pipe.
- Fit pipe clip where specified.



Adjustment of Idling Speed

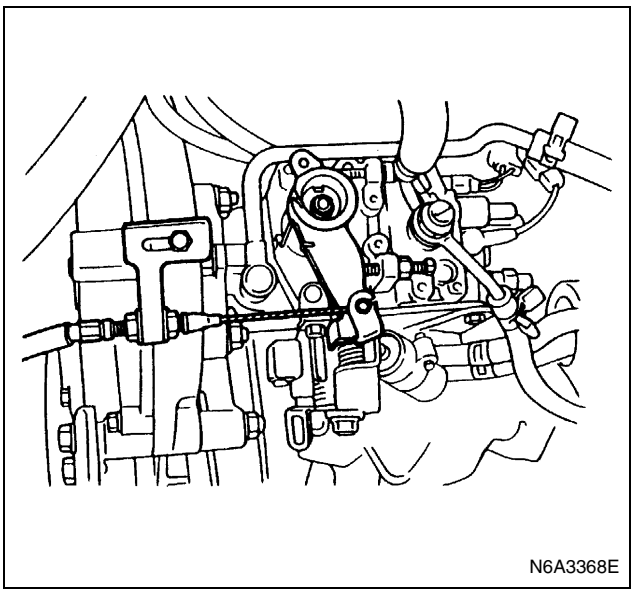
1. Pull the parking brake and lock the wheels.
2. Set the transmission gear to the neutral position.
3. Start the engine and idle it until the water temperature gets to 70 to 80°C (158 to176°F).
4. Turn back the idling control button, and remove the control cable from the control lever (injection pump).
5. Set the engine tachometer.
6. Check the idling rotation.
   When the idling rotation is outside the range of the specified value, adjust it correctly.

Specified value (rpm) = 750 — 790 (4JB1)
700 — 740 (4JG2)
675 — 725 (4JH1-TC)



1) Loosen the lock nut of the idling set bolt.
2) Rotate the idling set bolt to set the idling rotation to the specified value.

3) Tighten the lock nut to lock the set bolt.
4) Check the tension of the control cable, and remove any slackening as required.



N6A3368E

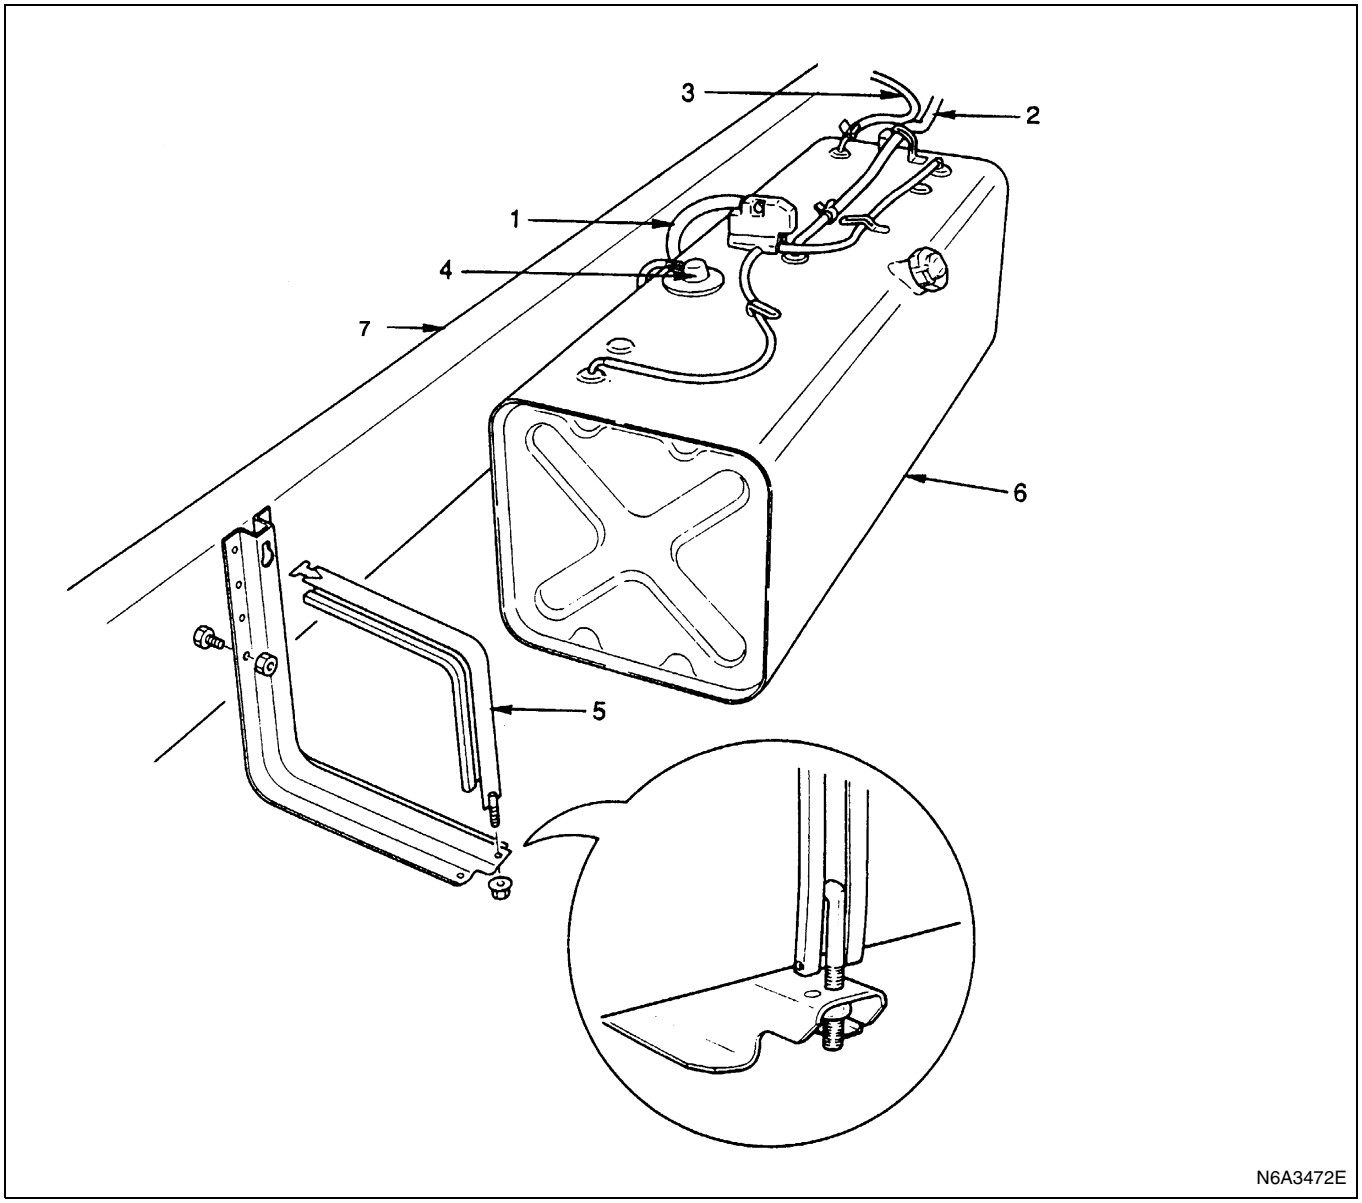
FUEL TANK

Component



Legend

1. Evaporator fuel hose
2. Fuel feed hose
3. Fuel return hose
4. Fuel gauge unit connector
5. Band
6. Fuel tank
7. Frame

Removal

Preparation:

- Disconnect battery ground cable.
- Loosen fuel filler cap.
- Drain fuel from drain plug.
- After the drain fuel, tighten the drain plug to the specified torque.

Tighten:
29 N·m(3 kg·m/22 lb·ft)

1. Evaporator Fuel Hose
2. Fuel Feed Hose
3. Fuel Return Hose
   - Plug the hose to prevent fuel from getting spilt, and tie it to the frame with the plugged end up.
4. Fuel Gauge Unit Connector
   - Remove the connector of the fuel gauge.
5. Band
   - Remove the nut of the fuel tank fixing band, and then remove the band end on the frame side.
6. Fuel Tank
   - Pull out the fuel tank to the outside.

Notice:
When it is not possible to pull out the fuel tank, remove the bracket and then draw out the fuel tank downward.

Installation

1. Fuel Tank

Notice:
When the bracket was removed to take off the fuel tank, install the bracket to the frame and tighten it to the specified torque.

Tighten:
55 N·m(5.6 kg·m/41 lb·ft)

When mounting the fuel tank on the bracket, be sure to place the packing section pasted on the fuel tank securely on the bracket.

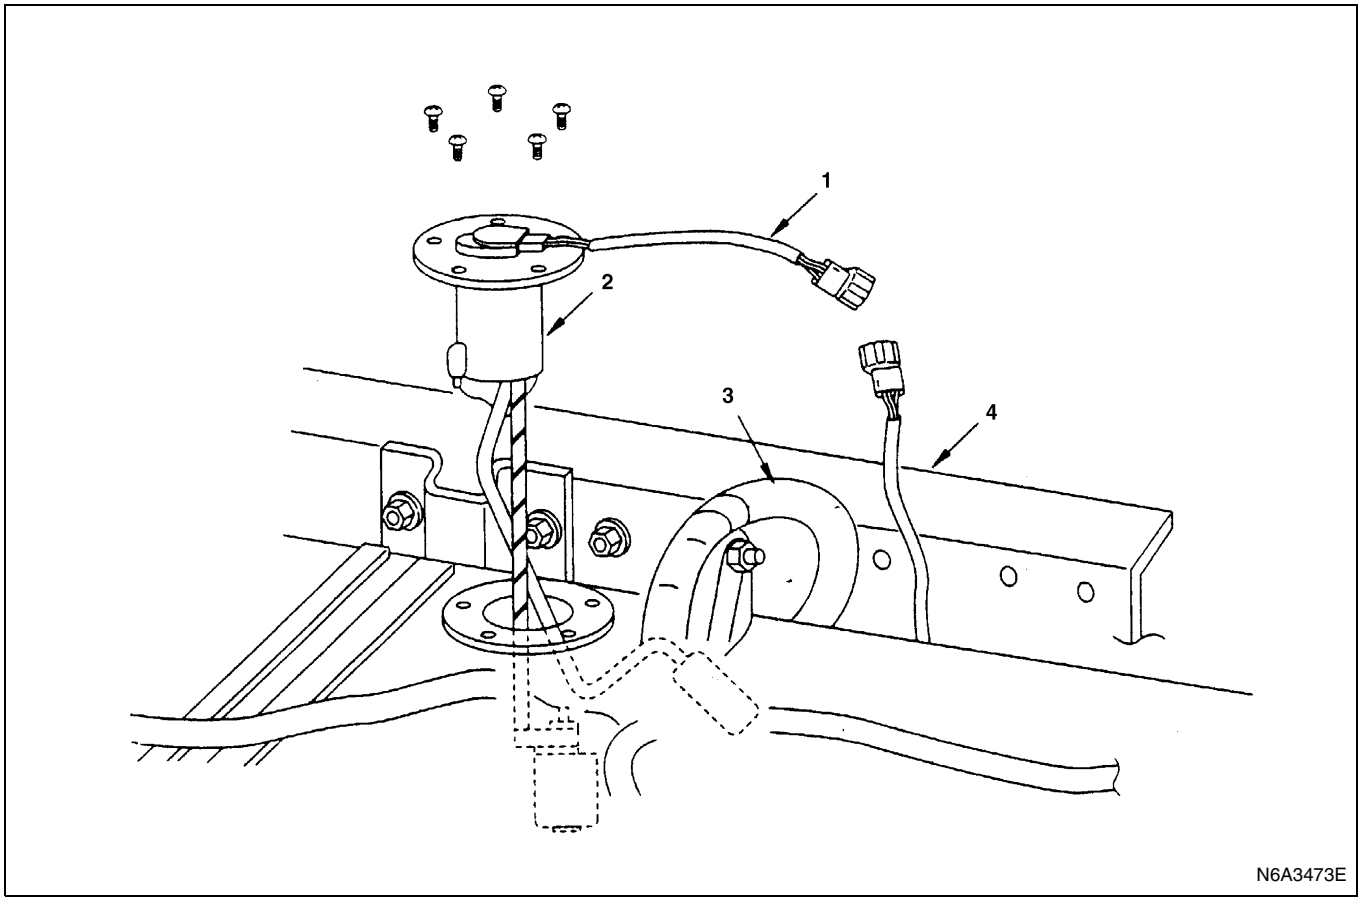
2. Band
   - Tighten the band to the specified torque.

Tighten:
12 N·m(1.2 kg·m/104 lb·ft)

3. Fuel Gauge Unit Connector
   - Connect the fuel gauge unit connector.
4. Fuel Return Hose
5. Fuel Feed Hose
   - Set the hose to the pipe more than 25 mm (0.98 in) deep.
6. Evaporator Fuel Hose
   - Fill the fuel to the fuel tank.
   - Connect battery ground cable.

FUEL GAUGE UNIT

Component



Legend

1. Fuel gauge unit connector
2. Fuel gauge unit
3. Evaporator fuel hose
4. Frame

Removal

Preparation:

- Disconnect battery ground cable.

1. Fuel Gauge Unit Connector
   - Disconnect fuel gauge unit connector from fuel gauge unit.
2. Fuel Gauge Unit
   - Remove fuel gauge unit fixing screw and fuel gauge unit.

Notice:

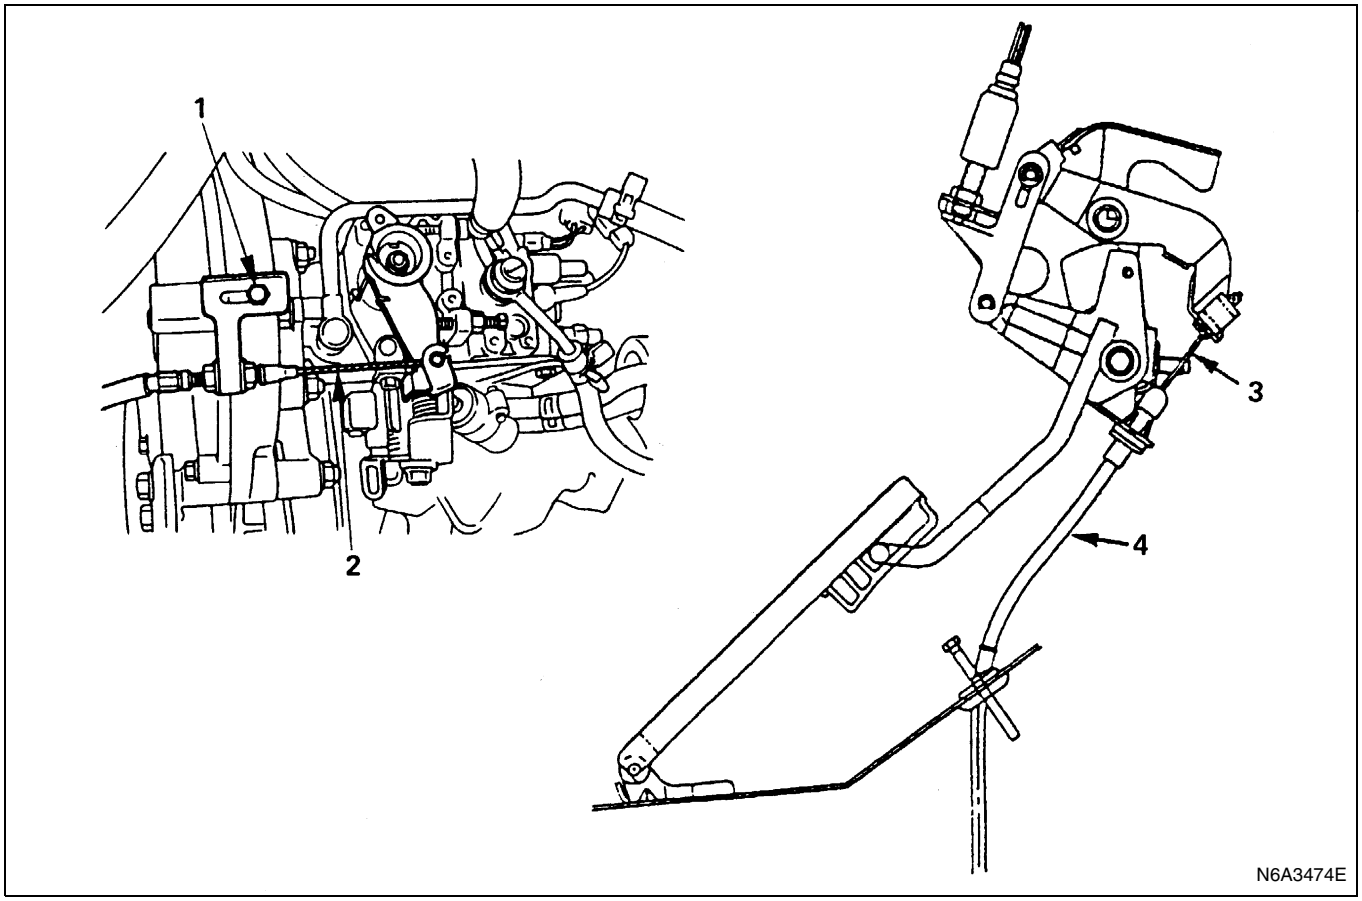
- After removing fuel gauge unit, cover fuel tank with waste to prevent any dust entering.

Installation

1. Fuel Gauge Unit
2. Fuel Gauge Unit Connector
   - Connect the wiring connector to the fuel gauge unit.

ACCELERATOR CONTROL CABLE

Component



Legend

1. Adjust unit
2. Accelerator control wire
3. Accelerator control wire
4. Accelerator control cable

Removal

1. Adjust Nut
   - Loosen the adjust nut on the cable bracket mounted on the inlet manifold.
2. Accelerator Control Wire (Injection Pump Side)
   - Remove the control wire from injection pump control lever.
3. Accelerator Control Wire (Accelerator Pedal Side)
   - Remove the accelerator control wire from accelerator pedal.
4. Accelerator Control Cable
   - Remove the cable clip from intake manifold duct.
   - Remove the cable clip from chassis frame.
   - Pull out the wire to the chassis side through the grommet hole of the floor board, and remove the control cable.

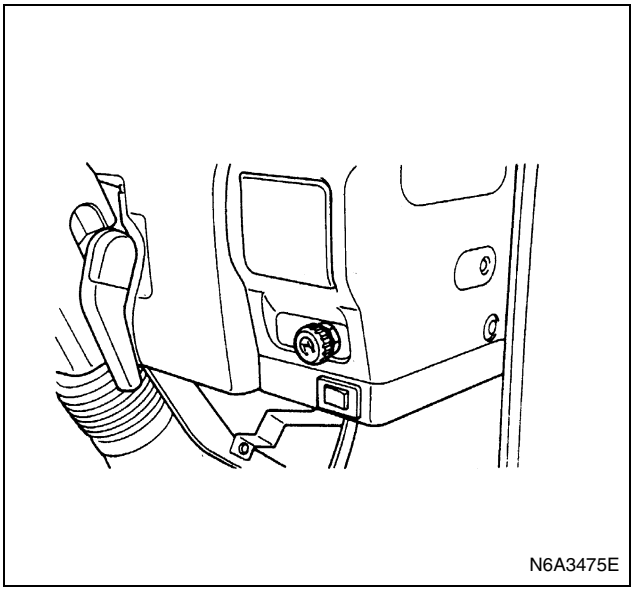
Inspection

Check the following items, and replace the control cable if any abnormality is found.

- The control cable should move smoothly.
- The control cable should not be bent or kinked.
- The control cable should be free of damage and corrosion.

Installation

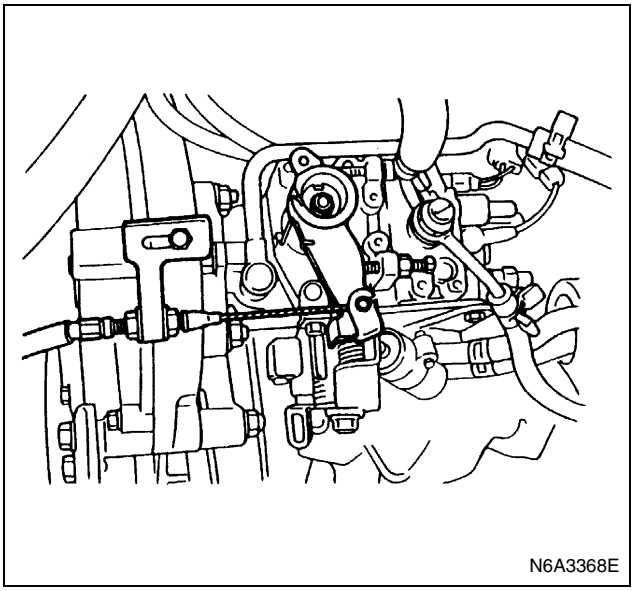
1. Accelerator Control Cable
   - Take care that the core wire of the cable does not get damaged or kinked.
   - Pull the cable through the grommet hole from under the floor.
   - Set the groove of the grommet securely into the floor panel.
   - Lower the cab.
2. Accelerator Control Wire (Accelerator pedal side)
   - Connect the accelerator control wire to the accelerator pedal.
   - Check to see if the idling control knob is fully turned to the left.



N6A3475E

- Tilt up the cab.

3. Accelerator Control Wire (Injection pump side)
   - Install the tip end of the wire to the engine control lever.

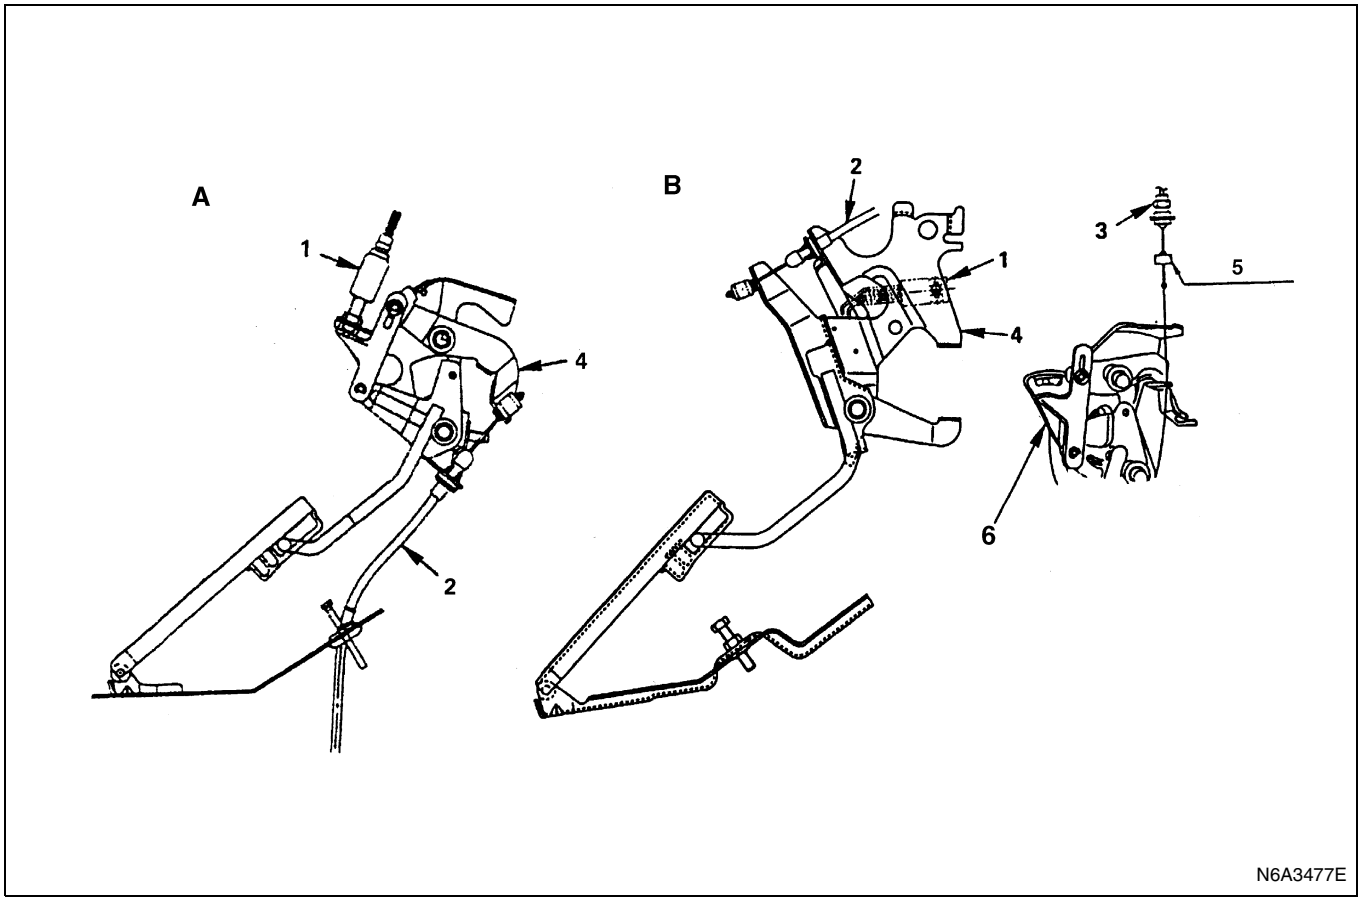


N6A3368E

4. Lock Bolt
   - With the accelerator control lever attached to the stopper bolt, pull the cable lightly toward the front of the axis and fasten the cable bracket with the lock bolt.
   - Check to see if the injection pump lever is at the idle position (with the lever in touch with the stopper bolt).
   - Connect the battery ground cable.
   - Lower the cab.
   - Check to see if the accelerator pedal play is in the range of 5 — 10 mm above the pedal pad.
   - Press down on the accelerator pedal fully, and check to see if the engine rotates at the maximum speed with the linkage in the smooth operation.
   - In the operating range of the accelerator pedal, check to see if the accelerator pedal and the injection pump lever return without fail to their original positions respectively.

ACCELERATOR PEDAL

Component



Legend

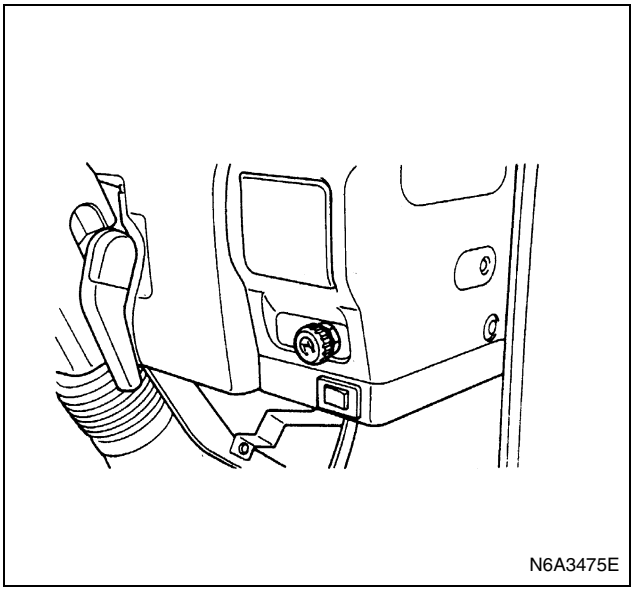
A. RHD
B. LHD
1. Idle switch connector
2. Accelerator control cable
3. Idling control cable
4. Accelerator pedal assembly
5. Wire guard
6. Accelerator pedal bracket

Removal

1. Idle Switch Connector
2. Accelerator Control Cable
   - Remove control cable from accelerator pedal bracket.
3. Idling Control Cable
   - Remove control cable from accelerator pedal bracket.
4. Accelerator Pedal Assembly
   - Remove accelerator pedal assembly from brake pedal bracket.

Installation

1. Accelerator Pedal Assembly
   - Apply the sliding section with grease, and install it to the brake pedal bracket.
2. Idling Control Cable
   - Install the cable to the lever of the accelerator pedal bracket.
3. Accelerator Control Cable
   - After confirming that the idling control knob is fully turned to the left, install the accelerator control cable.
4. Idle Switch Connector



N6A3475E

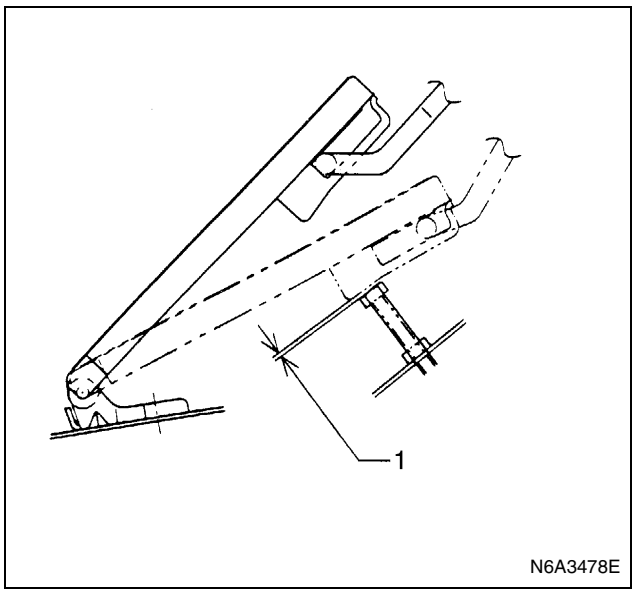
Adjustment of the Press-Down Amount of the Accelerator Pedal

- After installing each cable, give a full stroke to the accelerator pedal while pushing the accelerator pedal pad by hand.
- Adjust the stopper bolt so that the clearance between the pedal pad stopper bolt and the back of the pad becomes 0 — 2 mm (0 — 0.079 in), and tighten the lock nut to the specified torque.

Tighten:
7.4 N·m(0.75 kg·m/65 lb·ft)

- Check to see if the accelerator pedal play is in the range of 5 — 10 mm (0.2 — 0.4 in) above the pedal pad.
- Press down on the accelerator pedal fully, and check to see if the engine rotates at the maximum speed with the linkage in the smooth operation.
- In the operating range of the accelerator pedal, check to see if the accelerator pedal and the injection pump lever return without fail to their original positions respectively.

RHD



N6A3478E

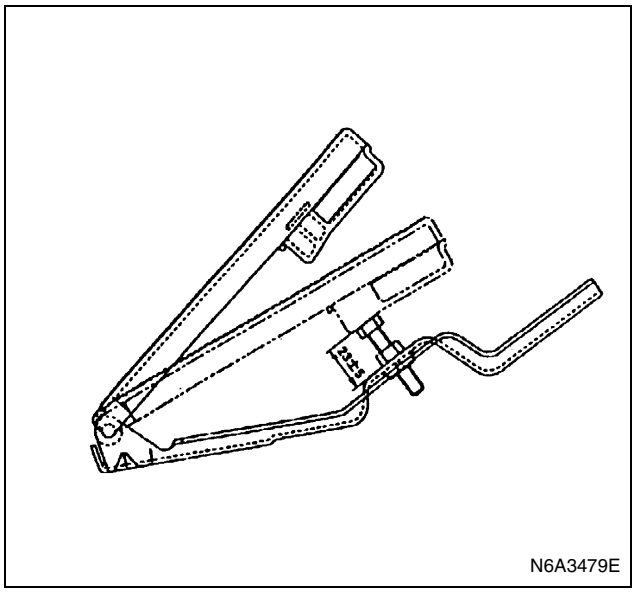
1. Full stroke 0 — 2 mm

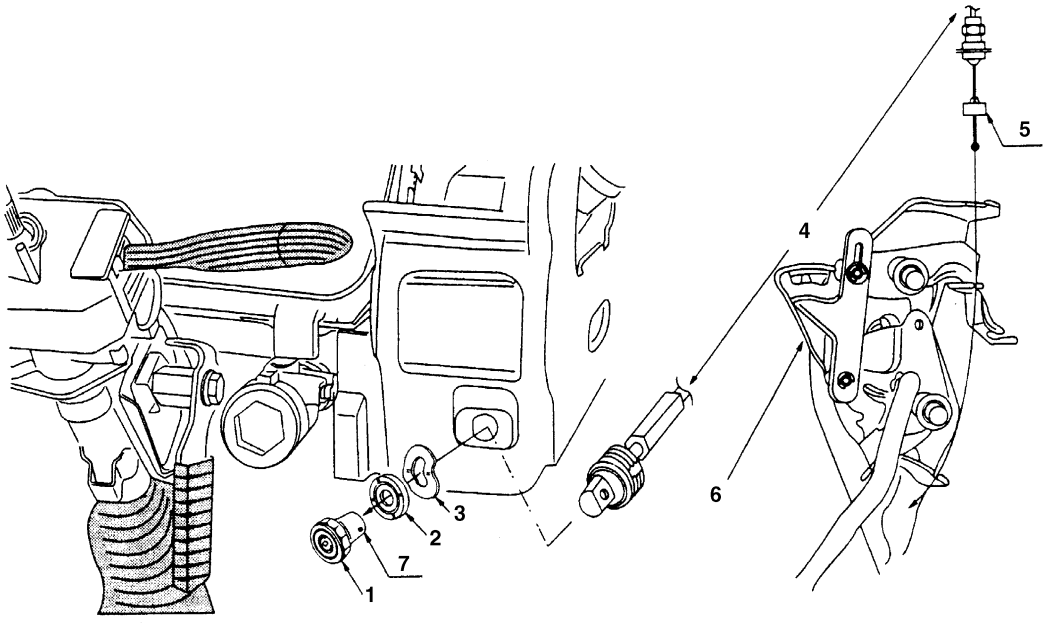
LHD



N6A3479E

IDLING CONTROL CABLE

Component



N6A3480E

Legend

1. Idling control knob
2. Idling control cable nut
3. Wave washer
4. Idling control cable
5. Wire guide
6. Accelerator pedal bracket
7. Screw

Removal

1. Idling Control Knob
   - Loosen the idling control knob screw and remove the knob from cable.
2. Idling Control Cable Nut
3. Wave Washer
4. Idling Control Cable
   - Remove control cable from accelerator pedal bracket.

Inspection

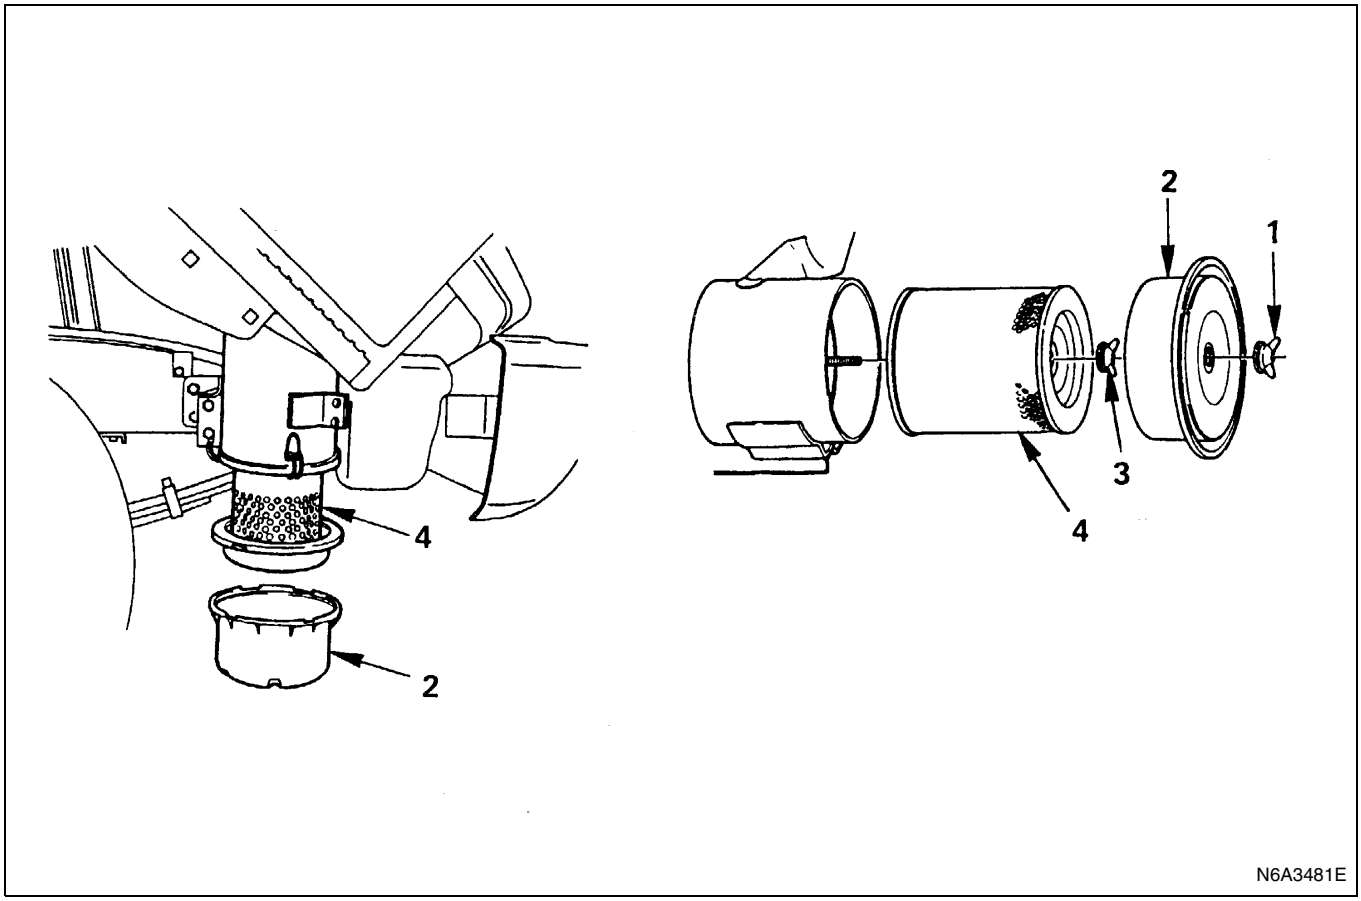
- With the idling control knob not in use, check to see if the injection pump lever is at the idle position (with the lever in contact with the stopper bolt).
- With the idling control knob turned fully to the right, check to see if the engine idles up to 1,500 rpm or more.

Installation

1. Idling Control Cable
   - Install control cable to accelerator pedal bracket.
2. Wave Washer
3. Idling Control Cable Nut
   - Insert the idling control cable into the specified hole of the instrument panel.
   - Install the washer to the cable, and tighten it with the nut.
4. Idling Control Knob
   - Insert the idling control knob into the cable, and tighten the screw.

AIR CLEANER ELEMENT

Component



Legend

1. Cover wing nut
2. End cover
3. Filter wing nut
4. Air cleaner element

Removal

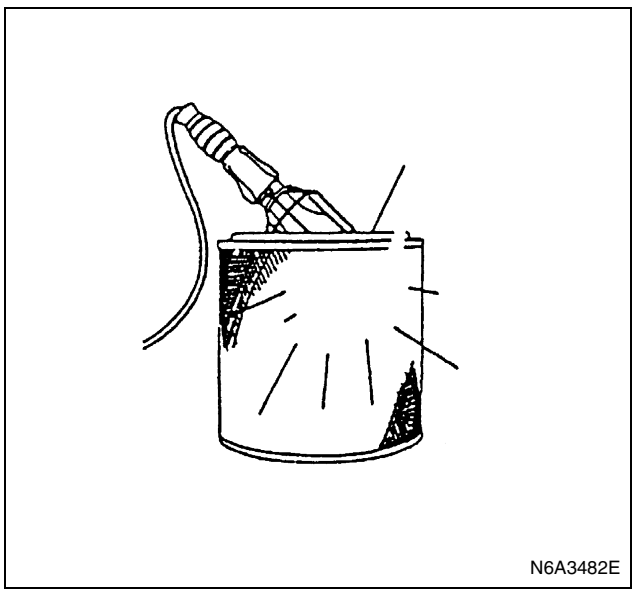
1. Cover Wing Nut
2. End Cover
3. Filter Wing Nut
4. Air Cleaner Element

Clean

- Wipe out the inside of the air cleaner assembly.
- Wipe off the cover.

Inspection

- The air filter with a light for fears or holes.



Cleaning Method
Dust Fouled Element
Rotate the element with your hand while applying compressed air to the inside of the element. This will blow the dust free.

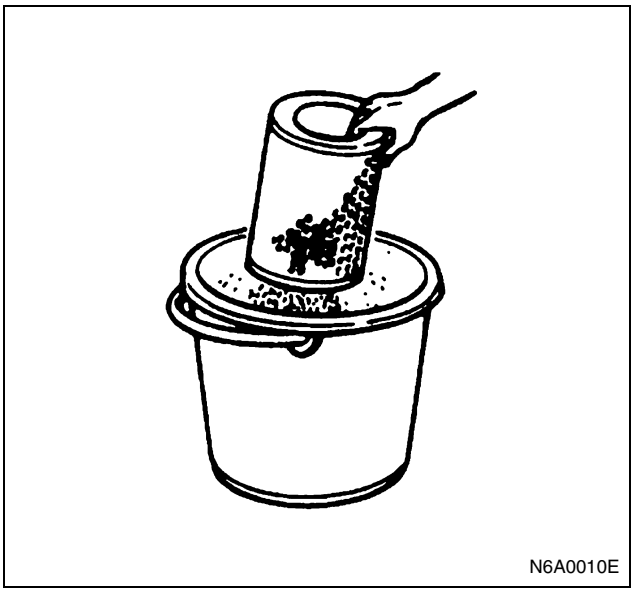
Compressed air pressure	kPa (kg/cm^2 /psi)
392 — 490 (4 — 5/57 — 71)	

Caution:
Do not bang the element against another object in an attempt to clean it. Damage to the element will result.

N6A0009E

Carbon and Dust Fouled Element

1. Prepare a cleaning solution of Isuzu Genuine Element Cleaner (Donaldson D1400) diluted with water.
2. Submerge the element in the solution for twenty minutes.



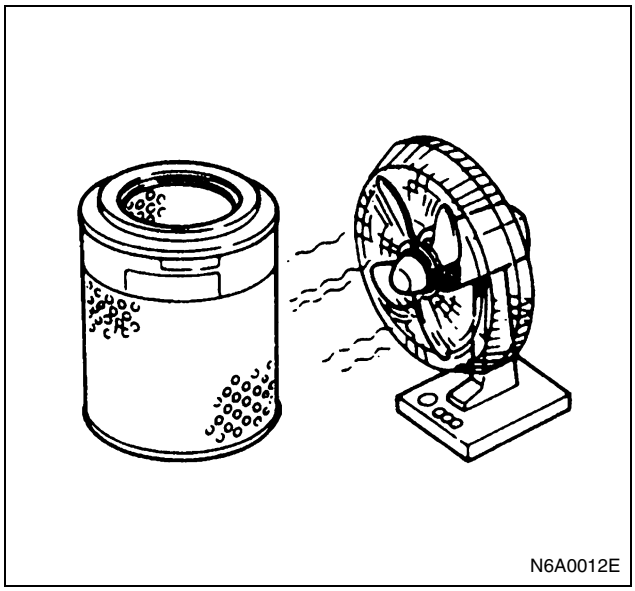
N6A0010E

3. Remove the element from the solution and rinse it well with running water.
   Water pressure must not exceed 274 Kpa (2.8 kg/cm^2 /40 psi).

N6A0011E

4. Dry the element in a well ventilated area.
   An electric fan will hasten drying.

Notice:
Do not use compressed air or an open flame to dry the element quickly. Damage to the element will result. It will usually take two or three days for the element to dry completely. Therefore, it is a good idea to have a spare on hand to use in the interim.



N6A0012E

Installation

1. Air Cleaner Element
2. Filter Wing Nut
3. End Cover
4. Cover Wing Nut

BATTERY

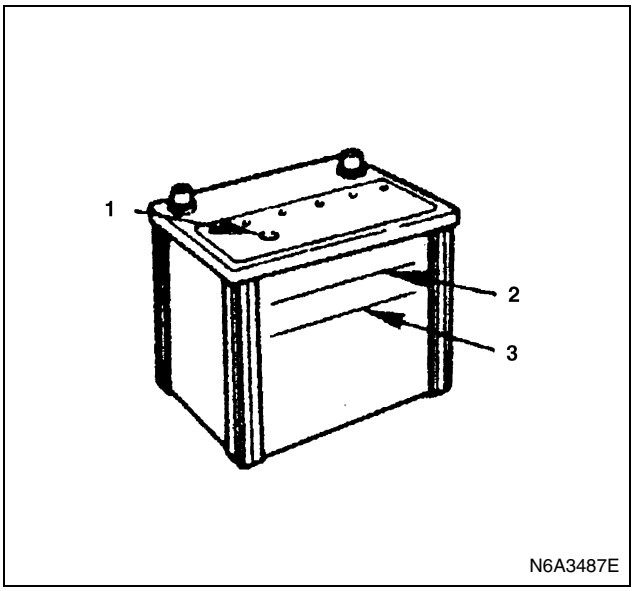
General Description

There are six battery fluid caps at the top of the battery. These are covered by a paper label.
The battery is completely sealed except for the six small vent holes at the side. these vent holes permit the escape of small amounts of gas generated by the battery. This type of battery has the following advantages over conventional batteries.

1. There is no need to add water during the entire service life of the battery.
2. The battery protects itself against overcharging.
   The battery will refuse to accept an excessive charge.
   (A conventional battery will accept an excessive charge, resulting in gassing and loss of battery fluid.)
3. The battery is much less vulnerable to self discharge than a conventional type battery.

Diagnosis

1. Visual Inspection
   Inspect the battery for obvious physical damage, such as a cracked or broken case, which would permit electrolyte loss.
   Replace the battery if obvious physical damage is discovered during inspection.
   Check for any other physical damage and correct it as necessary. If not, proceed to Step 2.
2. Fluid Level Check
   The fluid level should be between the upper level line and lower level line on side of the battery.
   a. Correct Fluid Level - Charge the battery.
   b. Below Lower Level - Replace battery.



Legend
1. Cherge test indicator
2. Upper level
3. Lower level

3. Voltage Check
   1) Put voltmeter test leads to battery terminals.
      a. Voltage is 12.4V or Above - Battery condition OK.
      b. Voltage is Under 12.4V - Go to procedure 2) below.
   2) Determine fast charge amperage from specification (See Main Data and Specifications in this section).
      Fast charge battery for 30 minutes at amperage rate no higher than specified value.
      Take voltage and amperage readings after charge.
      a. Voltage is Above 16V at Below 1/3 of Amperage Rate — Replace battery.
      b. Voltmeter is Above 16V at Above 1/3 of Amperage Rate — Drop charging voltage to 15V and charge for 10 — 15 hours.
      c. Voltage is Between 12V and 16V - Continue charging at the same rate for an additional 3 — 3.5 hours.
      d. Voltage is Below 12V — Replace battery.
4. Load Test
   1) Connect a voltmeter and a battery load tester across the battery terminals.
   2) Apply 300 ampere load for 15 seconds to remove surface charge from the battery.
      Remove load.
   3) Wait 15 seconds to let battery recover. Then apply specified load from specifications (See Main Data and Specifications in this section).
      Read voltage after 15 seconds, then remove load.
      a. Voltage does not Drop Below the Minimum Listed in Following Table - The battery is good and should be returned to service.
      b. Voltage is Less Than Minimum Listed - Replace battery.

Estimated Temperature		Minimum Voltage
°F	°C	Limit
70	21	9.6
60	16	9.5
50	10	9.4
40	4	9.3
30	-1	9.1
20	-7	8.9
10	-12	8.7
0	-18	8.5
The battery temperature must be estimated by atmosphere temperature and outside temperature (the battery has been exposed to for the preceding few hours).		

Battery Charging

Observe the following safety precautions when charging the battery:

1. Never attempt to charge the battery when the fluid level is below the lower level line on the side of the battery. In this case, the battery must be replaced.
2. Pay close attention to the battery during the charging procedure.
   Battery charging should be discontinued or the rate of charge reduced if the battery feels hot to the touch.
   Battery charging should be discontinued or the rate of charge reduced if the battery begins to gas or spew electrolyte from the vent holes.
3. In order to more easily view the hydrometer blue dot or ring, it may be necessary to jiggle or tilt the battery.
4. Battery temperature can have a great effect on battery charging capacity.
5. The sealed battery used on this vehicle may be either quick-charged or slow-charged in the same manner as other batteries.
   Whichever method you decide to use, be sure that you completely charge the battery. Never partially charge the battery.

Jump Starting

Jump Starting With an Auxiliary (Booster) Battery

Caution:
Never push or tow the vehicle in an attempt to start it.

Serious damage to the emission system as well as other vehicle parts will result.

Treat both the discharged battery and the booster battery with great care when using jumper cables.

Carefully follow the jump starting procedure, being careful at all times to avoid sparking.

WARNING:
FAILURE TO CAREFULLY FOLLOW THE JUMP STARTING PROCEDURE COULD RESULT IN THE FOLLOWING:

1. **SERIOUS PERSONAL INJURY, PARTICULARLY TO YOUR EYES.**
2. **PROPERTY DAMAGE FROM A BATTERY EXPLOSION, BATTERY ACID, OR AN ELECTRICAL FIRE.**
3. **DAMAGE TO THE ELECTRONIC COMPONENTS OF ONE OR BOTH VEHICLES PARTICULARLY.**

NEVER EXPOSE THE BATTERY TO AN OPEN FLAME OR ELECTRICAL SPARK. GAS GENERATED BY THE BATTERY MAY CATCH FIRE OR EXPLODE.

REMOVE ANY RINGS, WATCHES, OR OTHER JEWELRY BEFORE WORKING AROUND THE BATTERY. PROTECT YOUR EYES BY WEARING AN APPROVED SET OF GOGGLES.

NEVER ALLOW BATTERY FLUID TO COME IN CONTACT WITH YOUR EYES OR SKIN.

NEVER ALLOW BATTERY FLUID TO COME IN CONTACT WITH FABRICS OR PAINTED SURFACES.

BATTERY FLUID IS A HIGHLY CORROSIVE ACID.

SHOULD BATTERY FLUID COME IN CONTACT WITH YOUR EYES, SKIN, FABRIC, OR A PAINTED SURFACE, IMMEDIATELY AND THOROUGHLY RINSE THE AFFECTED AREA WITH CLEAN TAP WATER.

NEVER ALLOW METAL TOOLS OR JUMPER CABLES TO COME IN CONTACT WITH THE POSITIVE BATTERY TERMINAL, OR ANY OTHER METAL SURFACE OF THE VEHICLE. THIS WILL PROTECT AGAINST A SHORT CIRCUIT.

ALWAYS KEEP BATTERIES OUT OF THE REACH OF YOUNG CHILDREN.

Jump Starting Procedure

1. Set the vehicle parking brake.
   If the vehicle is equipped with an automatic transmission, place the selector lever in the “PARK” position.
   If the vehicle is equipped with a manual transmission place the shift lever in the “NEUTRAL” position.
   Turn “OFF” the ignition.
   Turn “OFF” all lights and any other accessory requiring electrical power.
2. Look at the built-in hydrometer.
   If the indication area of the built-in hydrometer is completely clear, do not try to jump start.
3. Attach the other end of the same cable to the positive terminal of the discharged battery.
   Attach the end of one jumper cable to the positive terminal of the booster battery.
   Do not allow the vehicles to touch each other.
   This will cause a ground connection, effectively neutralizing the charging procedure.
   Be sure that the booster battery has a 12 volt rating.
4. Attach one end of the remaining cable to the negative terminal of the booster battery.
   Attach the other end of the same cable to a solid engine ground (such as the A/C compressor bracket or the generator mounting bracket) of the vehicle with the discharged battery.
   This ground connection must be at least 450 mm (18 in) from the battery of the vehicle whose battery is being charged.

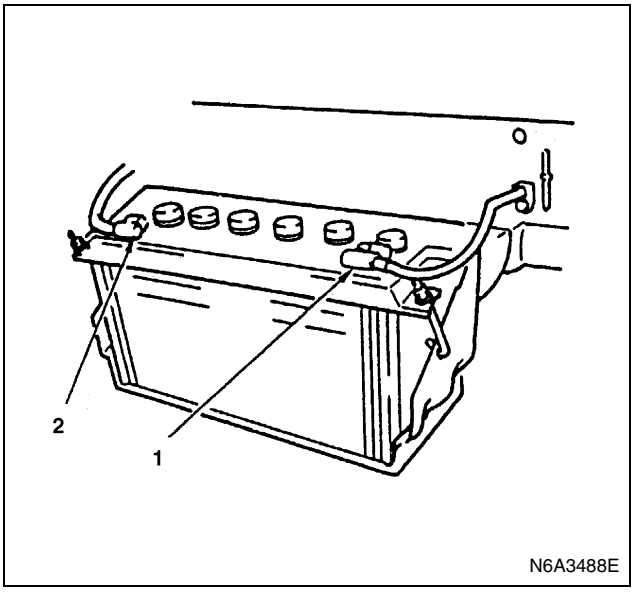
WARNING:
NEVER ATTACH THE END OF THE JUMPER CABLE DIRECTLY TO THE NEGATIVE TERMINAL OF THE DEAD BATTERY.

5. Start the engine of the vehicle with the good battery.
   Make sure that all unnecessary electrical accessories have been turned “OFF”.
6. Start the engine of the vehicle with the dead battery.
7. To remove the jumper cables, follow the above directions in the reverse order.
   Be sure to first disconnect the negative cable from the vehicle with the discharged battery.

Removal and Installation of the Battery

Removal

1. All switches should be in the “OFF” position.
2. Disconnect the battery ground cable. (1)
3. Disconnect the battery positive cable. (2)
4. Disconnect the battery cable.



Caution:
It is important that the battery ground cable be disconnected first.
Disconnecting the battery positive cable first can result in a short circuit.

Installation

To install the battery, follow the removal procedure in the reverse order, noting the following points:

1. Make sure that the rod is hooked on the body side.

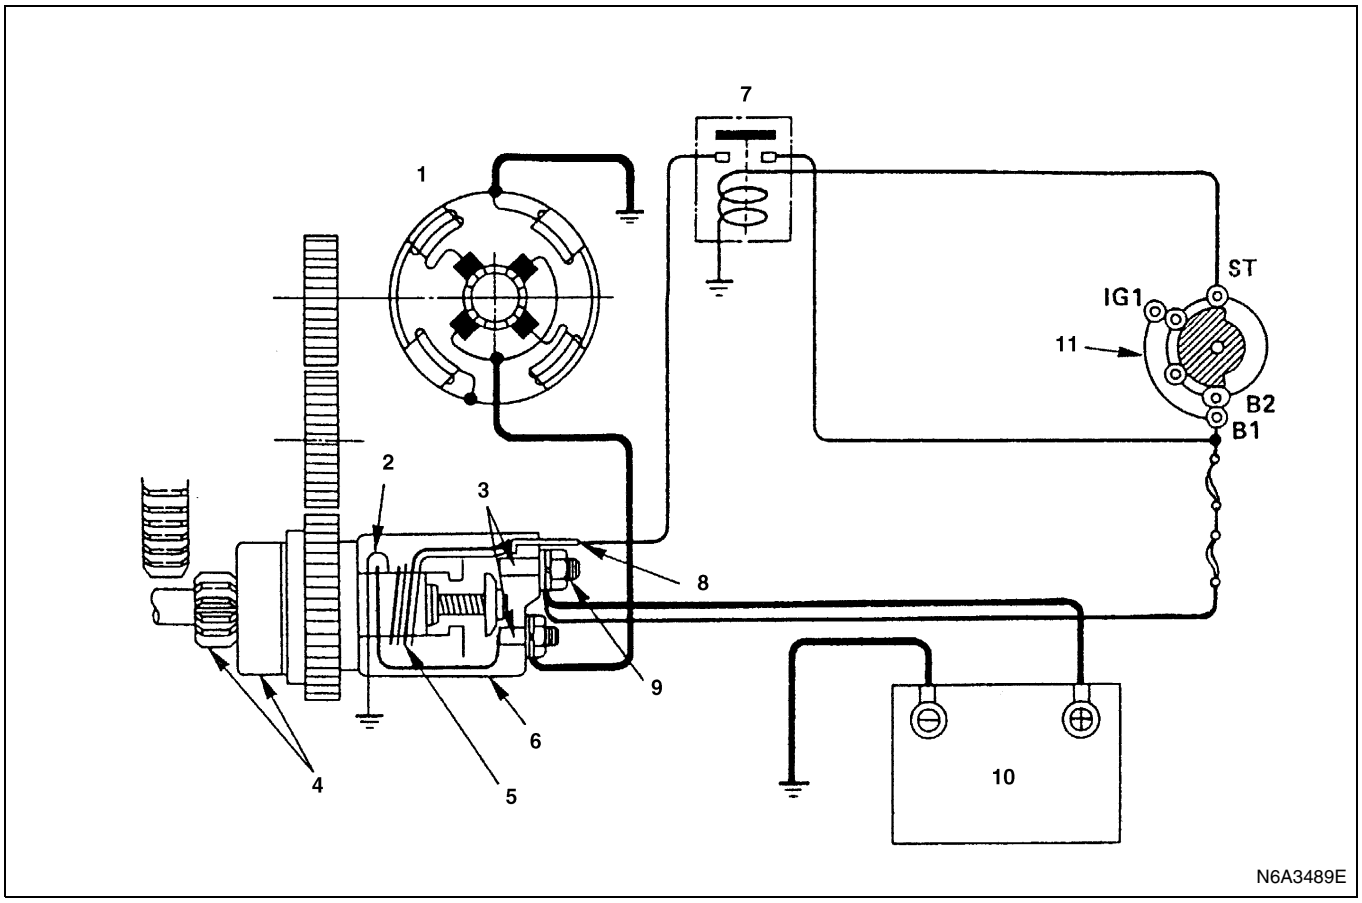
STARTING SYSTEM

General Description

Starting Circuit

The cranking system consists of a battery, starter, starter switch, starter relay, etc. and these main components are connected as shown in Figure. For details of the starting circuit.



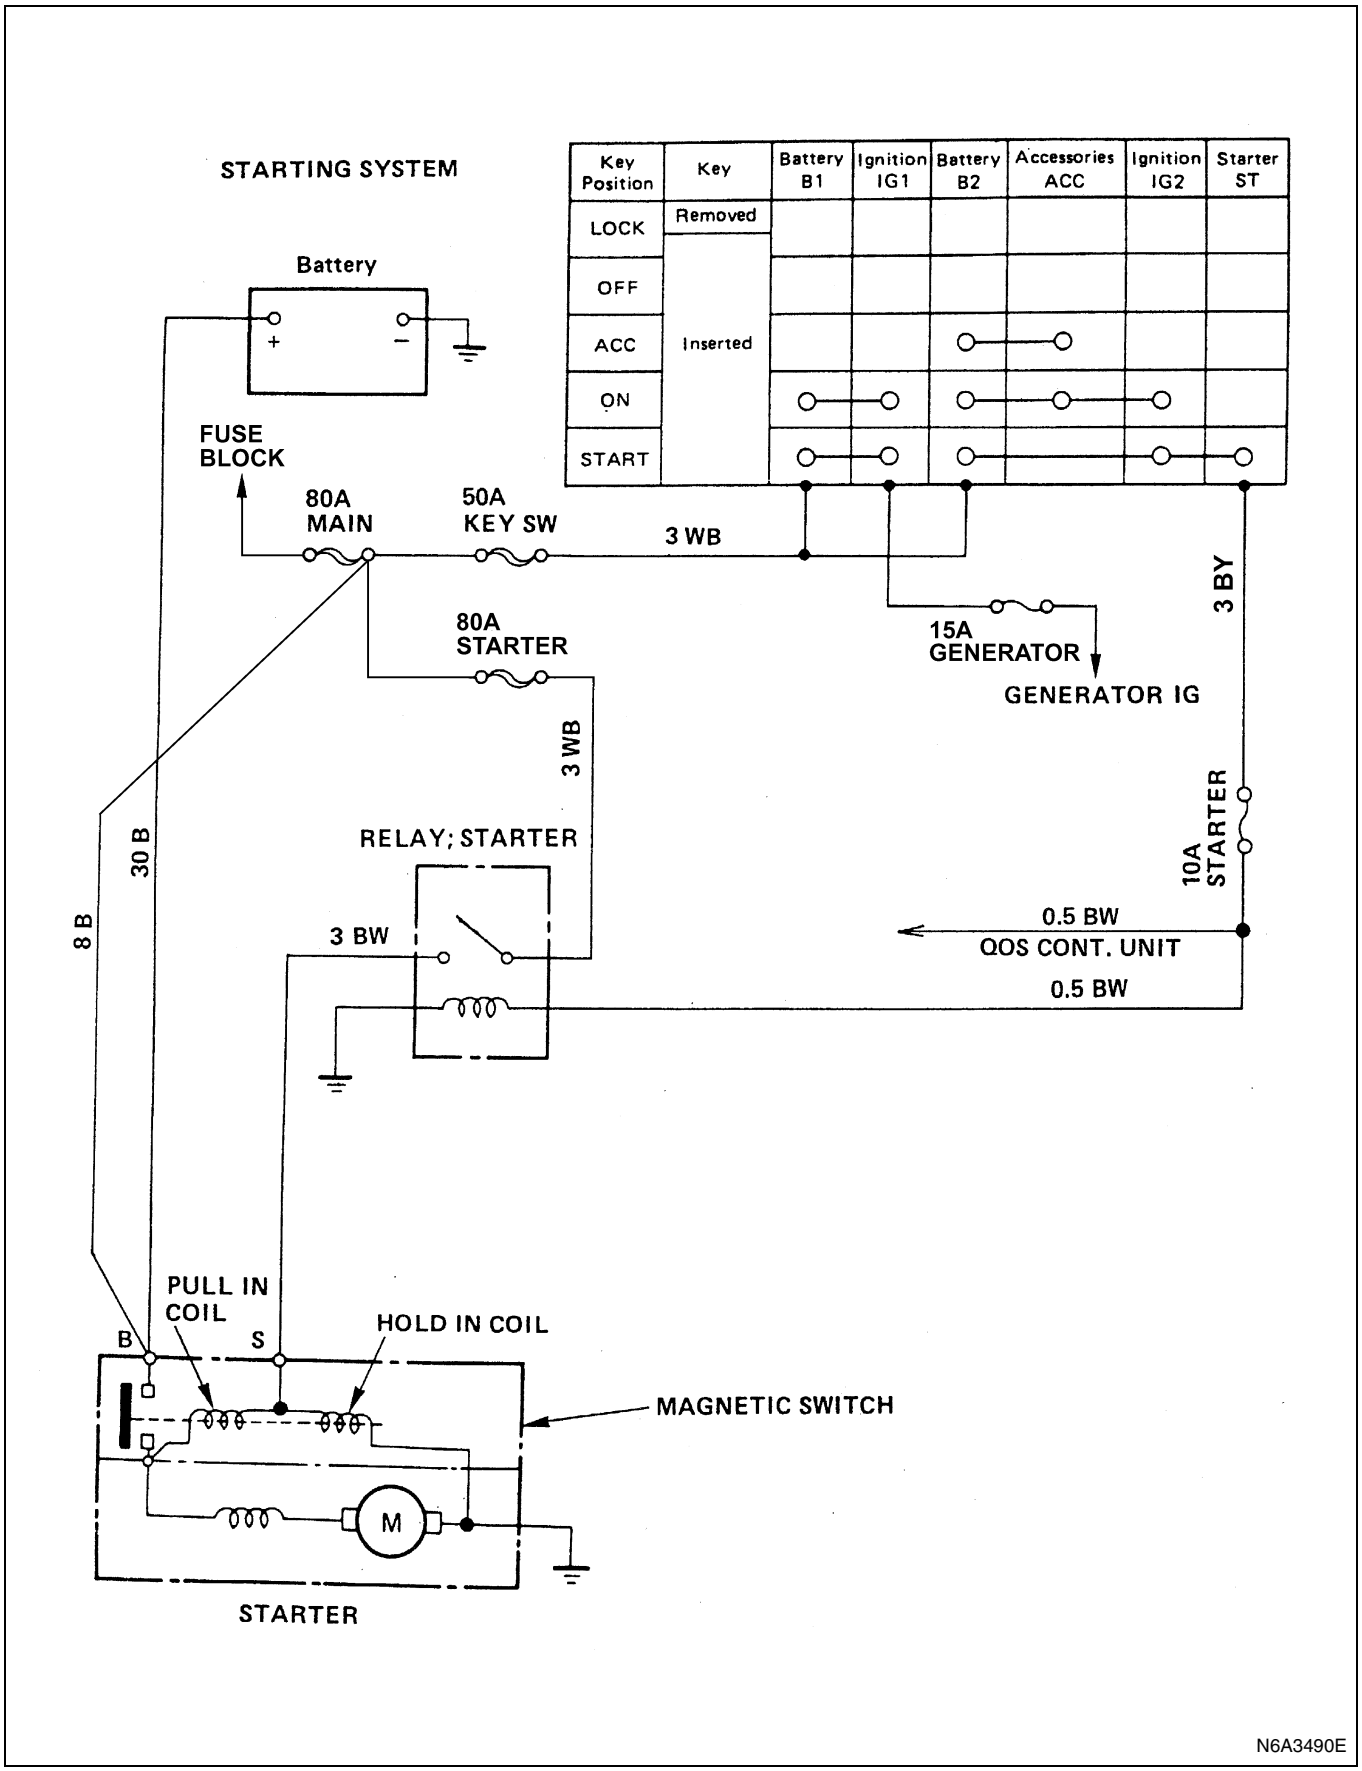
Legend

1. Starter motor
2. Hold coil
3. Contacts
4. Pinion clutch
5. Pull in coil
6. Mognetic switch
7. Relay; starter
8. “50” terminal
9. “30” terminal
10. Battery
11. Starter switch

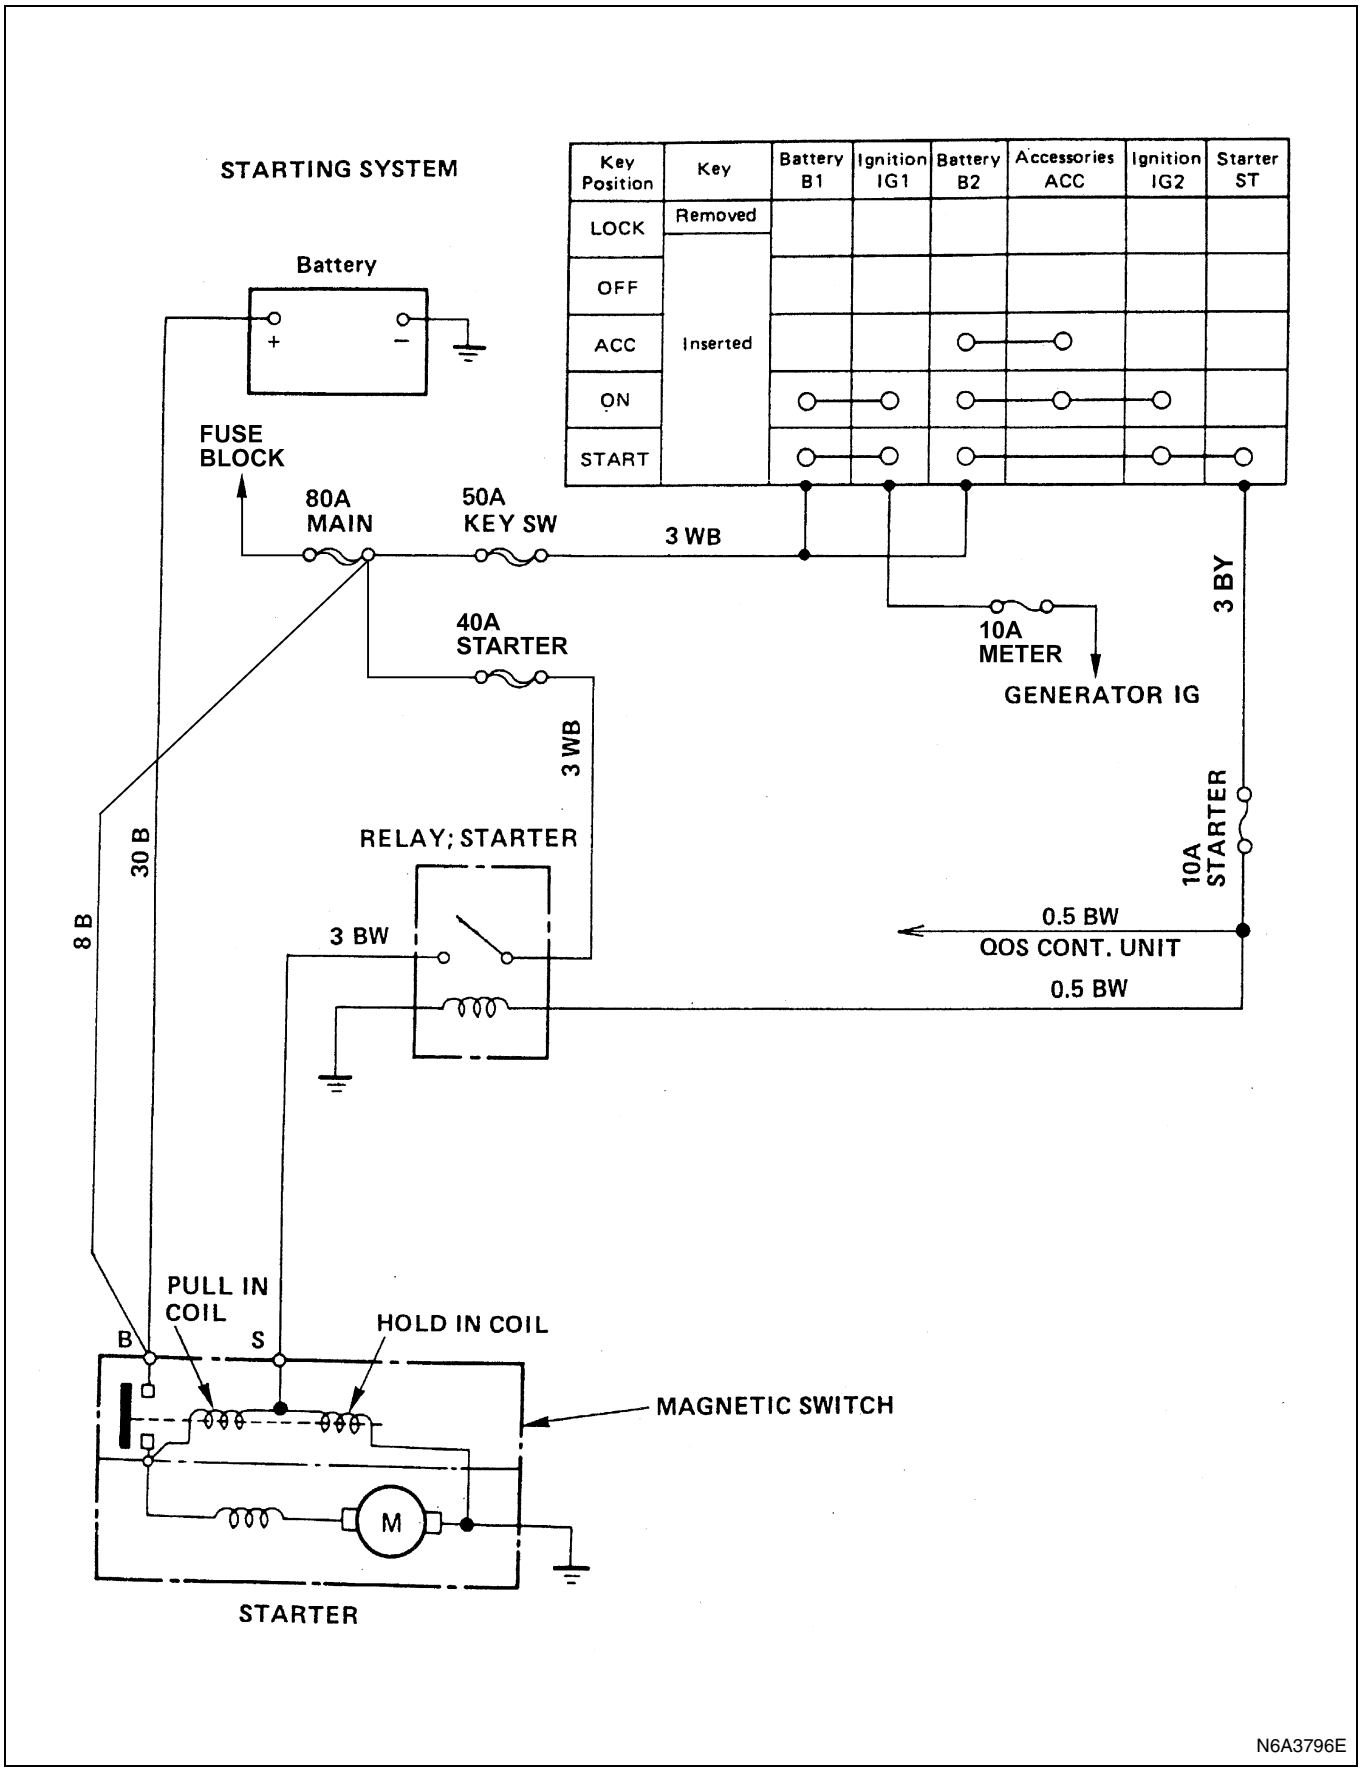
Starter

The starting system employs a magnetic type reduction starter in which the motor shaft is also used as a pinion shaft. When the starter switch is turned on, the contacts of magnetic switch are closed, and the armature rotates.
At the same time, the plunger is attracted, and the pinion is pushed forward by the shift lever to mesh with ring gear. Then, the ring gear runs to start the engine. When the engine starts and the starter switch is turned off, the plunger returns, the pinion is disengaged from ring gear, and the armature stops rotation. When the engine speed is higher than the pinion, the pinion idles, so that the armature is not driven.

Starting Circuit
For 4JB1, 4JB1-TC

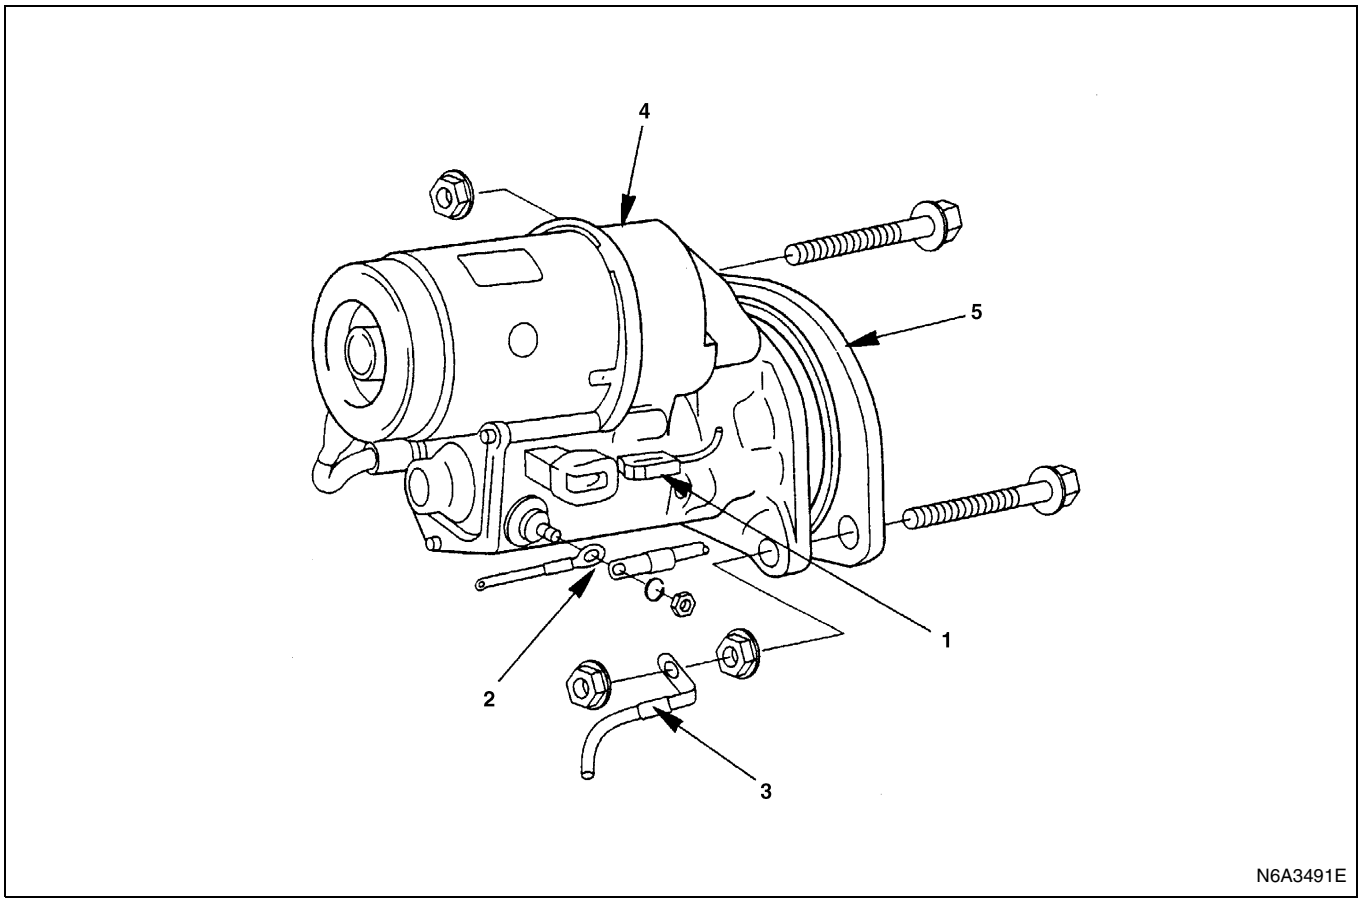


Starting Circuit
For 4JH1



On-Vehicle Service

Component



Legend

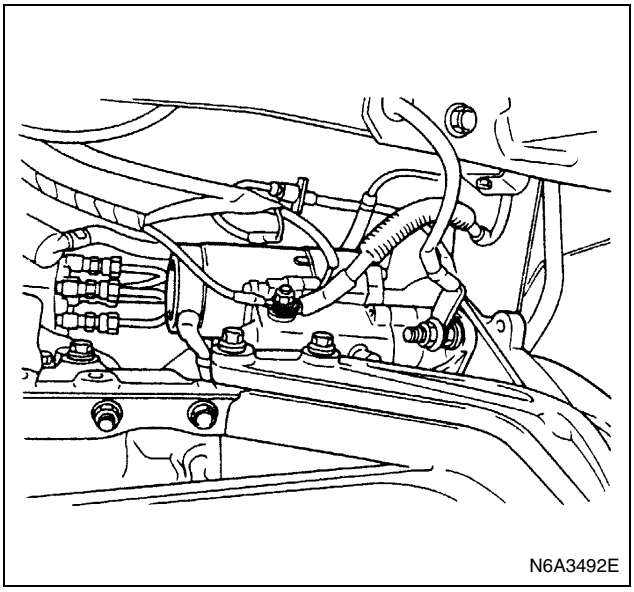
1. 50 terminal
2. 30 terminal
3. Earth cable terminal
4. Starter assembly
5. Spacer (4JB1, except cold area)

Removal

Preparation

- Disconnect Battery Ground Cable.

1. “50” Terminal
2. “30” Terminal
3. Earth Cable Terminal
4. Starter Assembly
5. Spacer (4JB1, Except cold area)



Installation

1. Spacer (4JB1, Except cold area)
2. Starter Assembly
   - Tighten the fixing bolt and nut to the specified torque

Tighten:
Starter Bolts and Nuts to 81 N·m (8.3 Kg·m/60 lb·ft)

3. Earth Cable Terminal
   - Connect the earth cable terminal.
4. “30” Terminal
   - Connect the harness connector.
5. “50” Terminal
   - Connect the battery cable terminal with starter switch harness terminal, then tighten nut to the specified torque.

Tighten:
Fixing Nut to 9 N·m (0.9 Kg·m/78 lb·in)

   - Connect the battery cable.

Unit Repair

Component

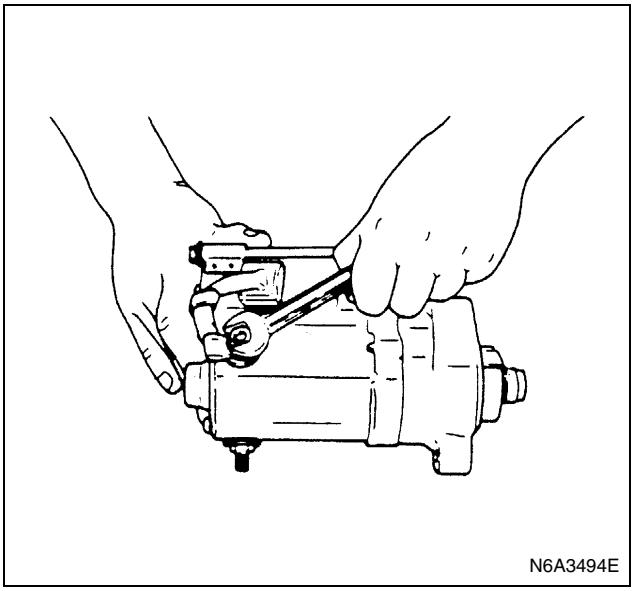
6. Armature
7. Drive side housing
8. Overrunning clutch
9. Return spring
10. Steel ball
11. Idle pinion
12. Retainer
13. Roller
14. Magnetic switch

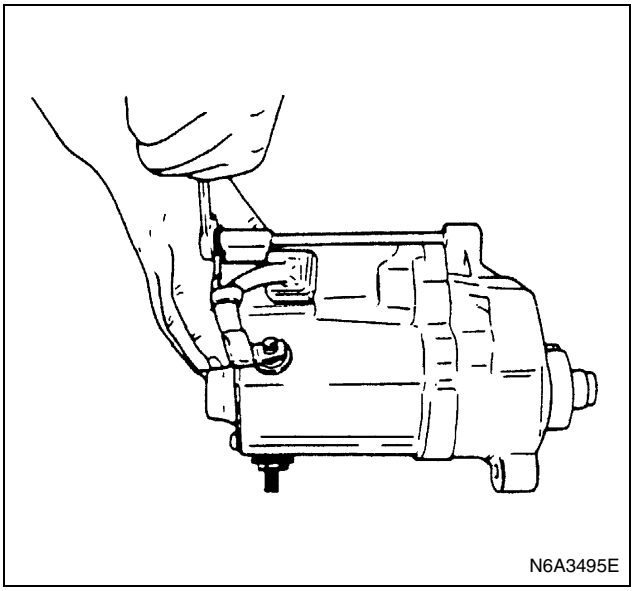
Disassembly

1. Lead Wire
   Disconnect the lead wire from the magnetic switch.



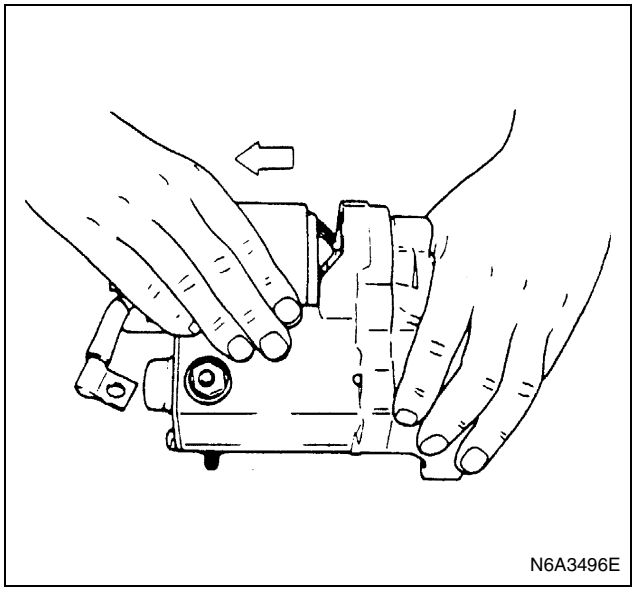
N6A3494E

2. Through Bolt
   Remove the through bolts from the yoke.



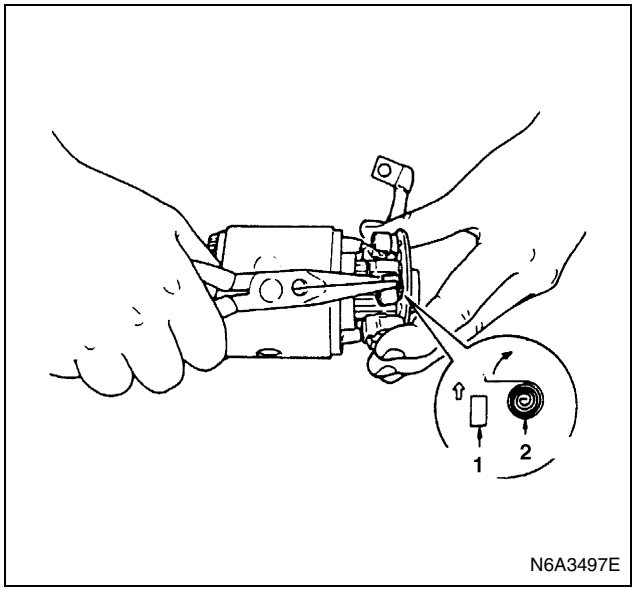
N6A3495E

3. Yoke Assembly
   Separate the yoke from the solenoid switch.
4. Yoke Cover



N6A3496E

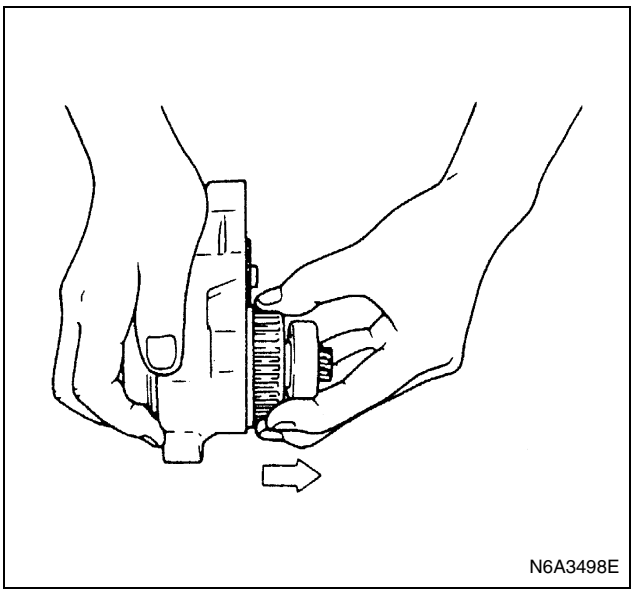
5. Brush and Brush Holder
   Remove (pull out) the brushes and the brush holder from the armature with a pair of long-nose pliers.



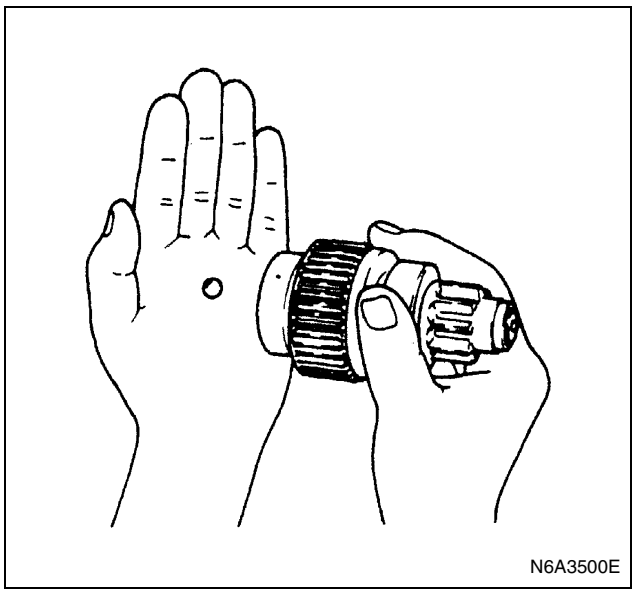
N6A3497E

Legend
1. Bush
2. Spring

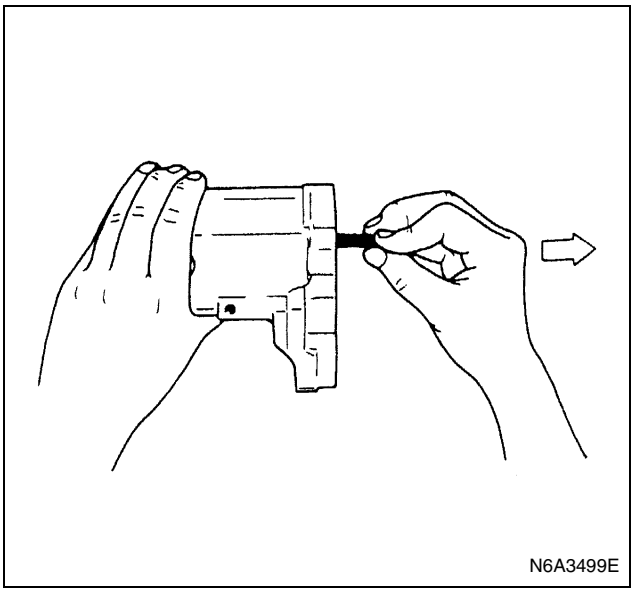
6. Armature
7. Drive Side Housing
8. Overrunning Clutch
   Remove the overrunning clutch from the housing.



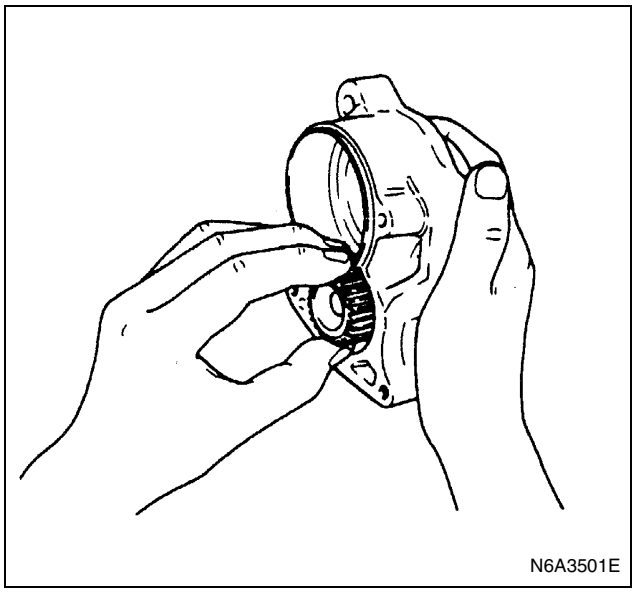
9. Return Spring
   Remove the return spring from magnetic switch.



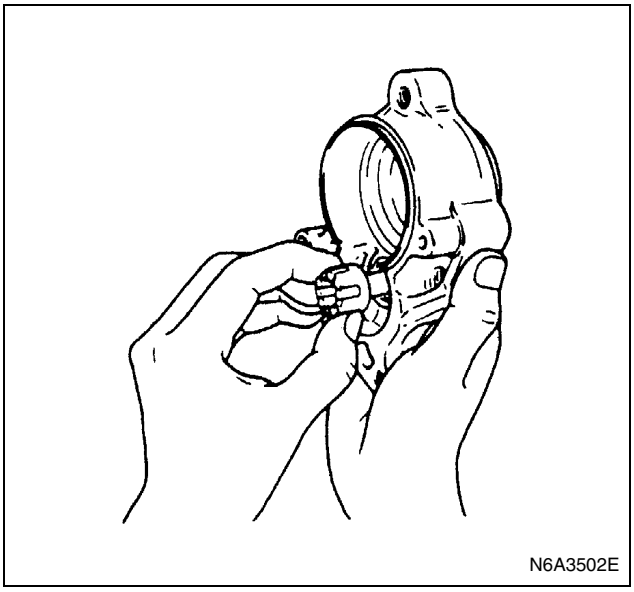
11. Idle Pinion
    Remove the idle pinion from housing.



10. Steel Ball
    Remove the steel ball from the overrunning clutch.



12. Retainer
    Remove the retainer from housing.



N6A3502E

13. Roller
14. Magnetic Switch

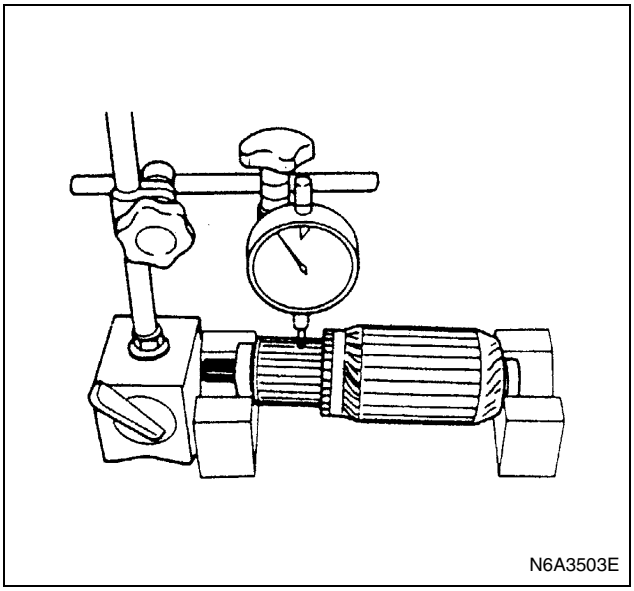
Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal condition are found through inspection.

Armature

Check the commutator for run-out and replace if the amount of run-out exceeds the limit.

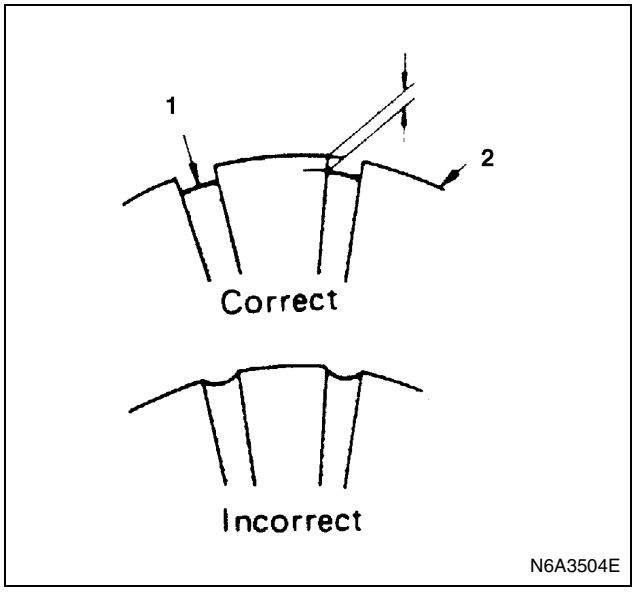
Run-out test		mm (in)
kw	Standard	Limit
2.2	0.02 (0.0008)	0.05 (0.0020)
2.0		



N6A3503E

Check the mica segment for wear.

Depth of mica segment		mm (in)
kw	Standard	Limit
2.2	0.7 — 0.9 (0.028 — 0.035)	0.20 (0.008)
2.0		



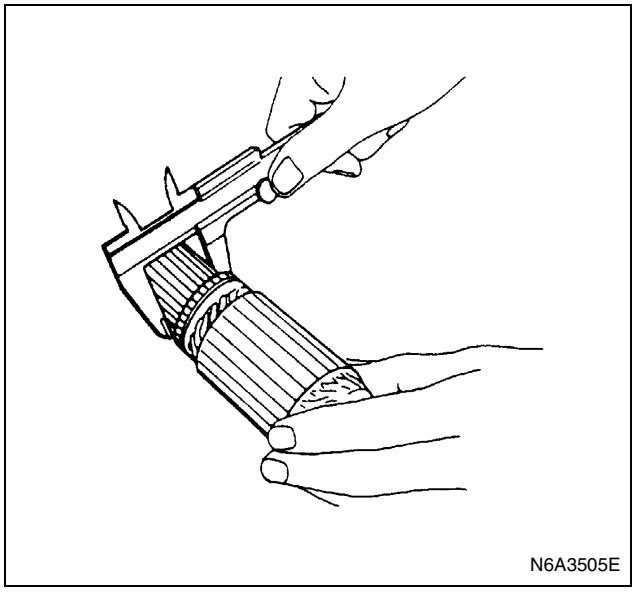
N6A3504E

Legend

1. Insulator
2. Commutator segments

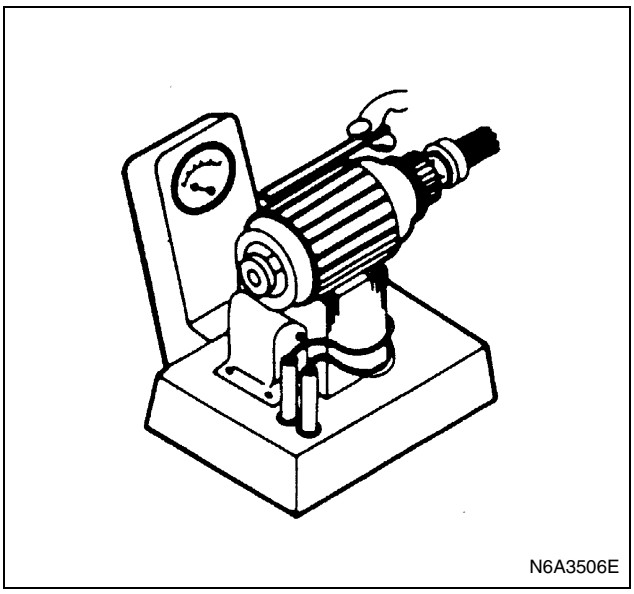
Check the commutator outer diameter.

Commutator outer diameter		mm (in)
kw	Standard	Limit
2.2	35.00 (1.378)	34.00 (1.339)
2.0		



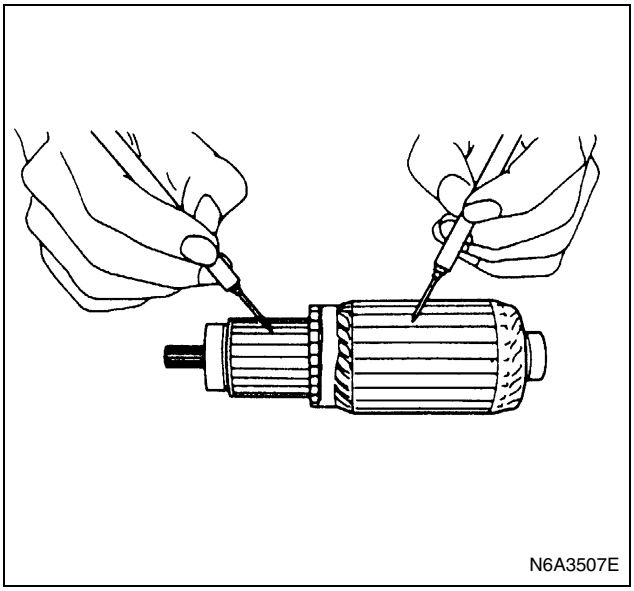
N6A3505E

Armature Short Circuit Test
Check the armature for short circuit by placing it on a growler tester. Hold a piece of hacksaw blade against the armature core while slowly rotating the armature. A short-circuited armature will cause the blade to vibrate and to be attracted by the core. If the hacksaw blade is attracted or vibrates, the armature, is short circuited, and must be replaced.



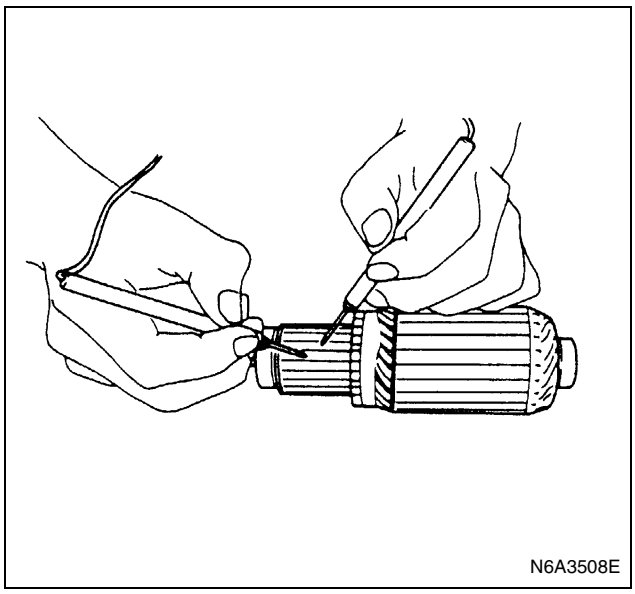
N6A3506E

Armature Ground Test
Touch one probe of a circuit tester to the commutator segment and the other to the armature core. There should be no continuity. If there is a continuity, the armature is grounded. Replace the armature if it is grounded.



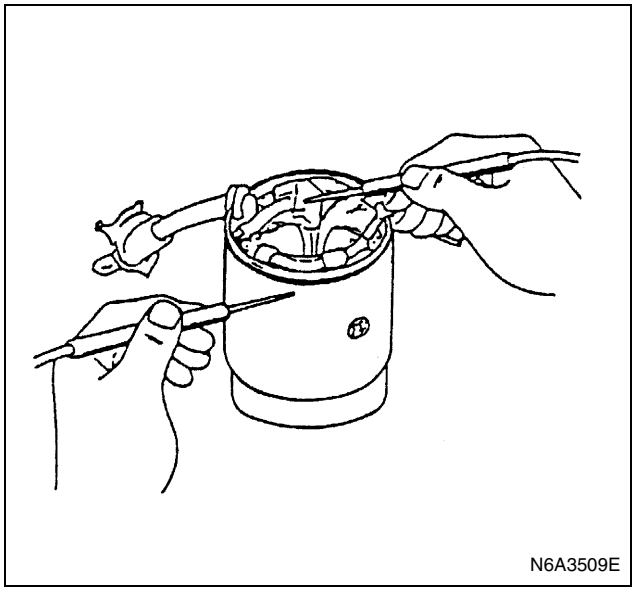
N6A3507E

Armature Continuity Test
Connect the probes of a circuit tester across the 2 segments. There should be continuity at any test points. Replace if it is open-circuited.



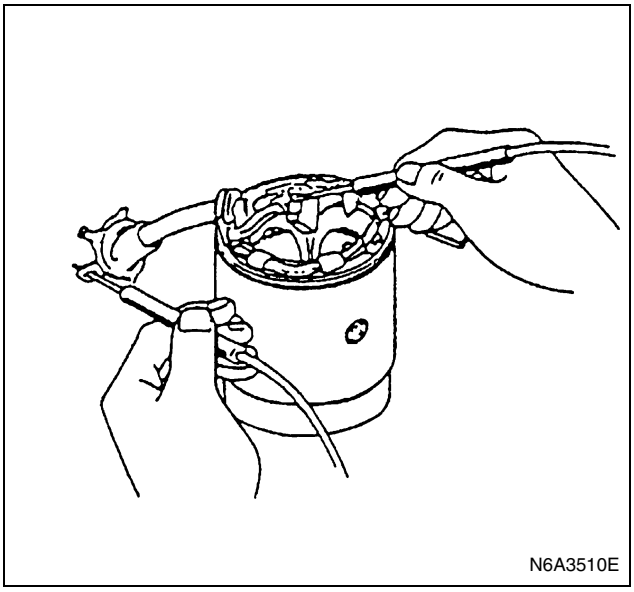
N6A3508E

Yoke
Field Winding Ground Test
Using circuit tester, touch one probe to the field winding end or brush and the other to the bare surface of yoke body.
There should be no continuity. If the tester indicates a continuity, the field coil is grounded and yoke assembly should be replaced.



N6A3509E

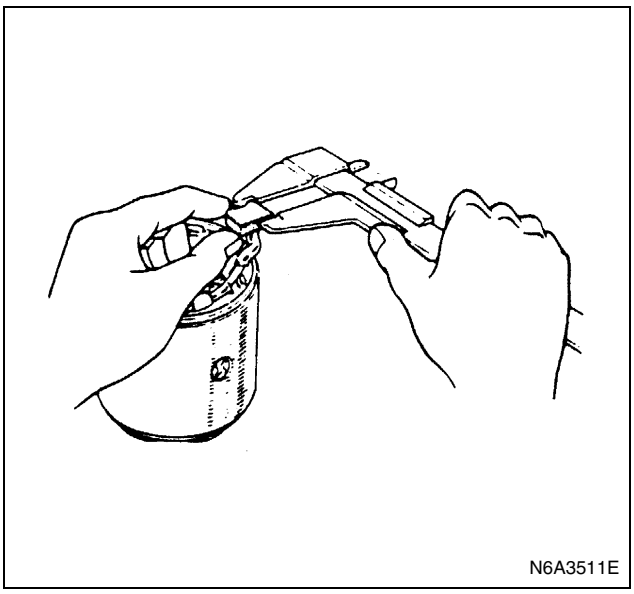
Field Winding Continuity Test
Using a circuit tester, touch one probe to the “C” terminal lead wire and the other to the brush. There should be continuity. Replace the yoke if it is open.



N6A3510E

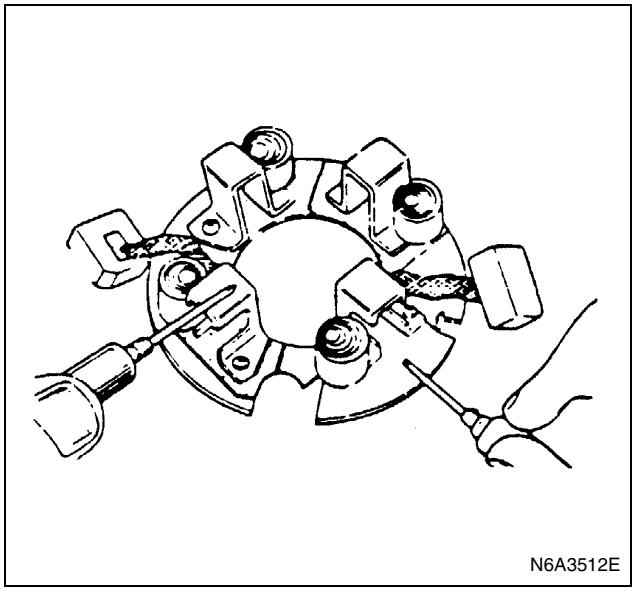
Brush and Brush Holder
Measure the brush length and replace if it is worn beyond the service limit.

Brush length		mm (in)
kw	Standard	Limit
2.2	14.5 (0.57)	10 (0.39)
2.0	16 (0.63)	



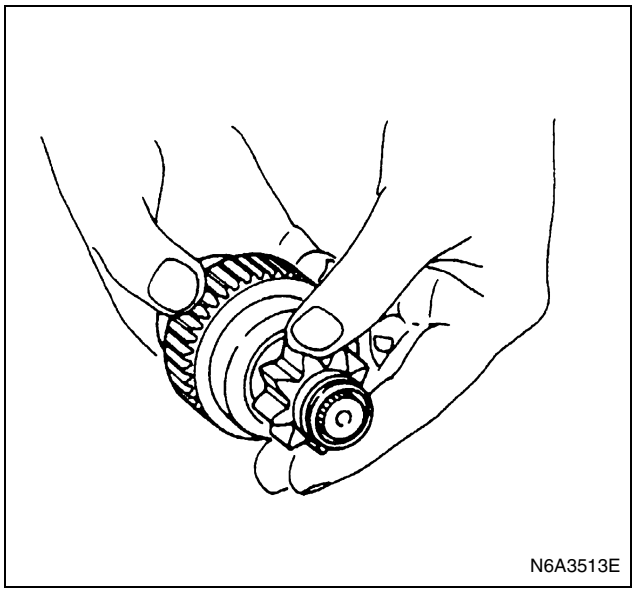
N6A3511E

Brush Holder Insulation Test
Using a circuit tester, check the brush holder insulation. Touch one probe to the holder plate and the other to the positive brush holder. There should be no continuity.



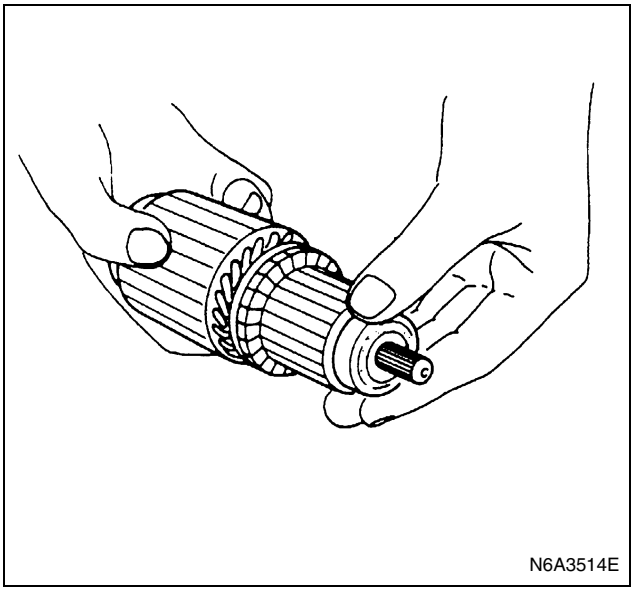
N6A3512E

Overrunning Clutch
Inspect the teeth of pinion for wear and damage. Replace if it damaged.
Rotate the pinion in direction of rotation (clockwise). It should rotate smoothly. But in opposite direction, it should be locked.



N6A3513E

Bearing
Check the bearings for wear and damage. If the bearings are noisy during operation, they should be replaced.



N6A3514E

Reassembly

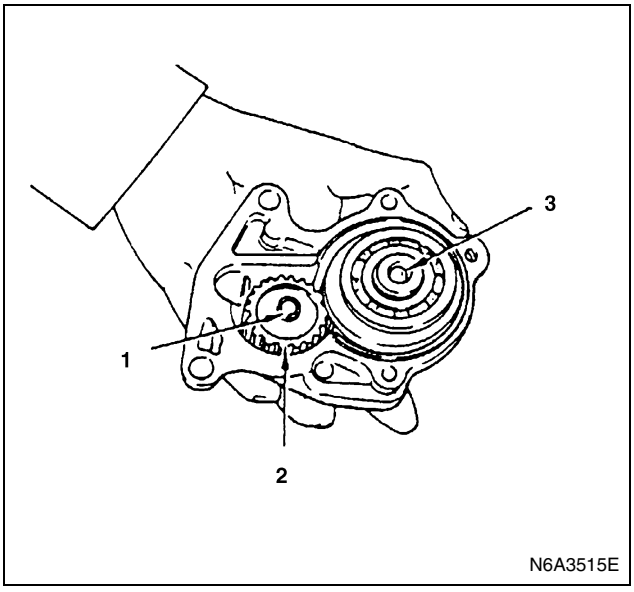
To install, follow the removal steps in the reverse order, noting the following points:

- Magnetic Switch
- Idle Gear
- Clutch assembly
- Housing

1. Install the clutch asm to the magnetic switch.
2. Install the idle gear and housing.

Notice:
Do not fail to assemble the steel ball and the spring between the clutch and magnetic switch.

Assemble the roller to the idle gear in advance.

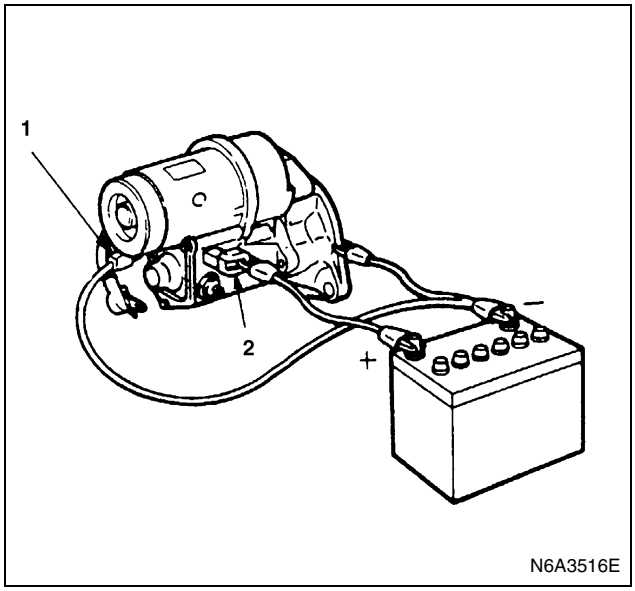


N6A3515E

Legend
1. Roller
2. Idle gear
3. Steel ball

Magnetic Switch
Temporarily connect the solenoid switch between the clutch and the housing and run the following tests.
Complete each test within three to five seconds.

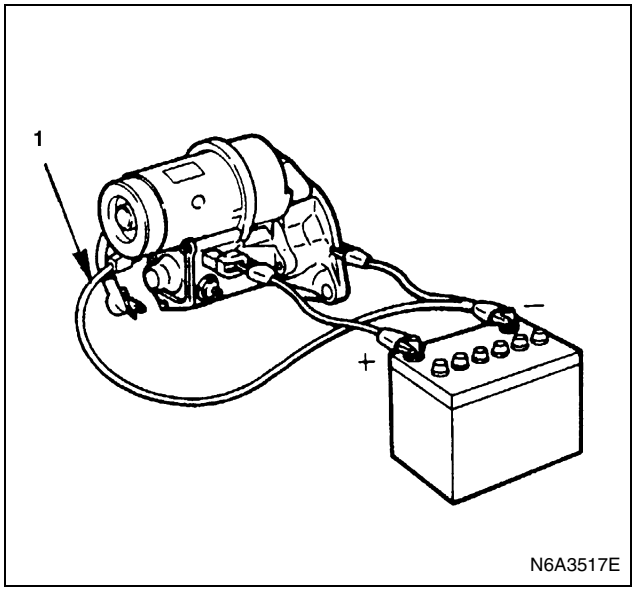
1. Pull-in test
   Connect the battery negative terminal with the solenoid switch body and the M terminal. When current is applied to the 50 terminal from the battery positive terminal, the pinion should flutter.



N6A3516E

Legend
1. M terminal
2. 50 terminal

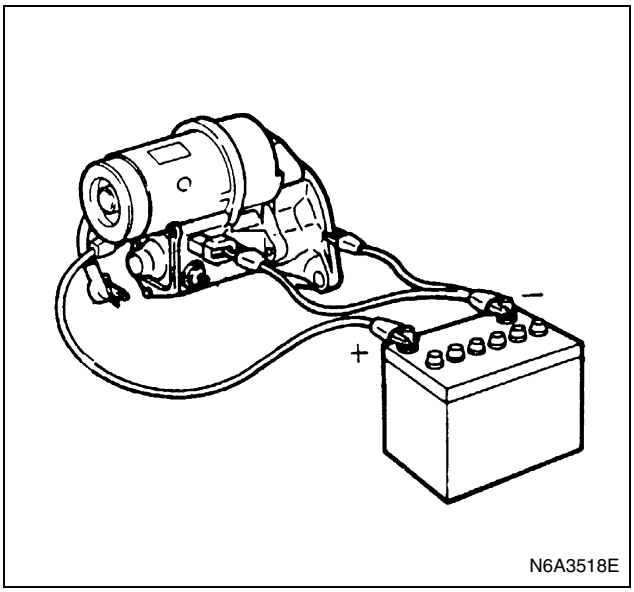
2. Hold-in test
   Disconnect the lead at the M terminal. The pinion should continue to flutter.



N6A3517E

Legend
1. Disconnect

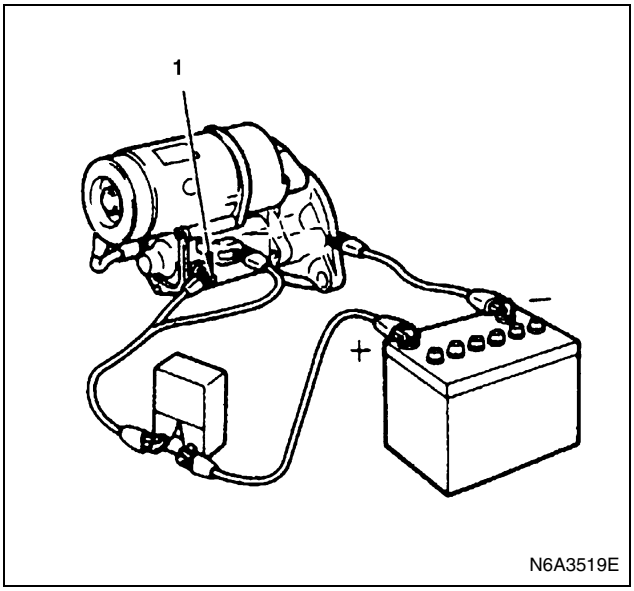
3. Return test
   Connect the battery negative terminal to the 50 terminal and the body. Connect the battery positive terminal to the M terminal. The pinion will flutter. When the lead to the 50 terminal is disconnected, the pinion should immediately return to its stationary positions.



4. Current value
   - Make connections as shown in the illustration, and measure the current value.

Standard = 120 A or less

Notice:
For a battery, be sure to use one fully charged.
For lead wires, use thick ones since a large amount of current flows through them.



Legend
1. 30 terminal

CHARGING SYSTEM

General Description

The charging system is the IC integral regulator charging system and its main components are connected as shown in Figure.

The regulator is a solid state type and it is mounted along with the brush holder assembly inside the generator installed on the rear end cover.

The generator does not require particular maintenance such as voltage adjustment. The rectifier connected to the stators coil has nine diodes to transform A.C. voltage into D.C. voltage. This D.C. voltage is connected to the output terminal of generator.

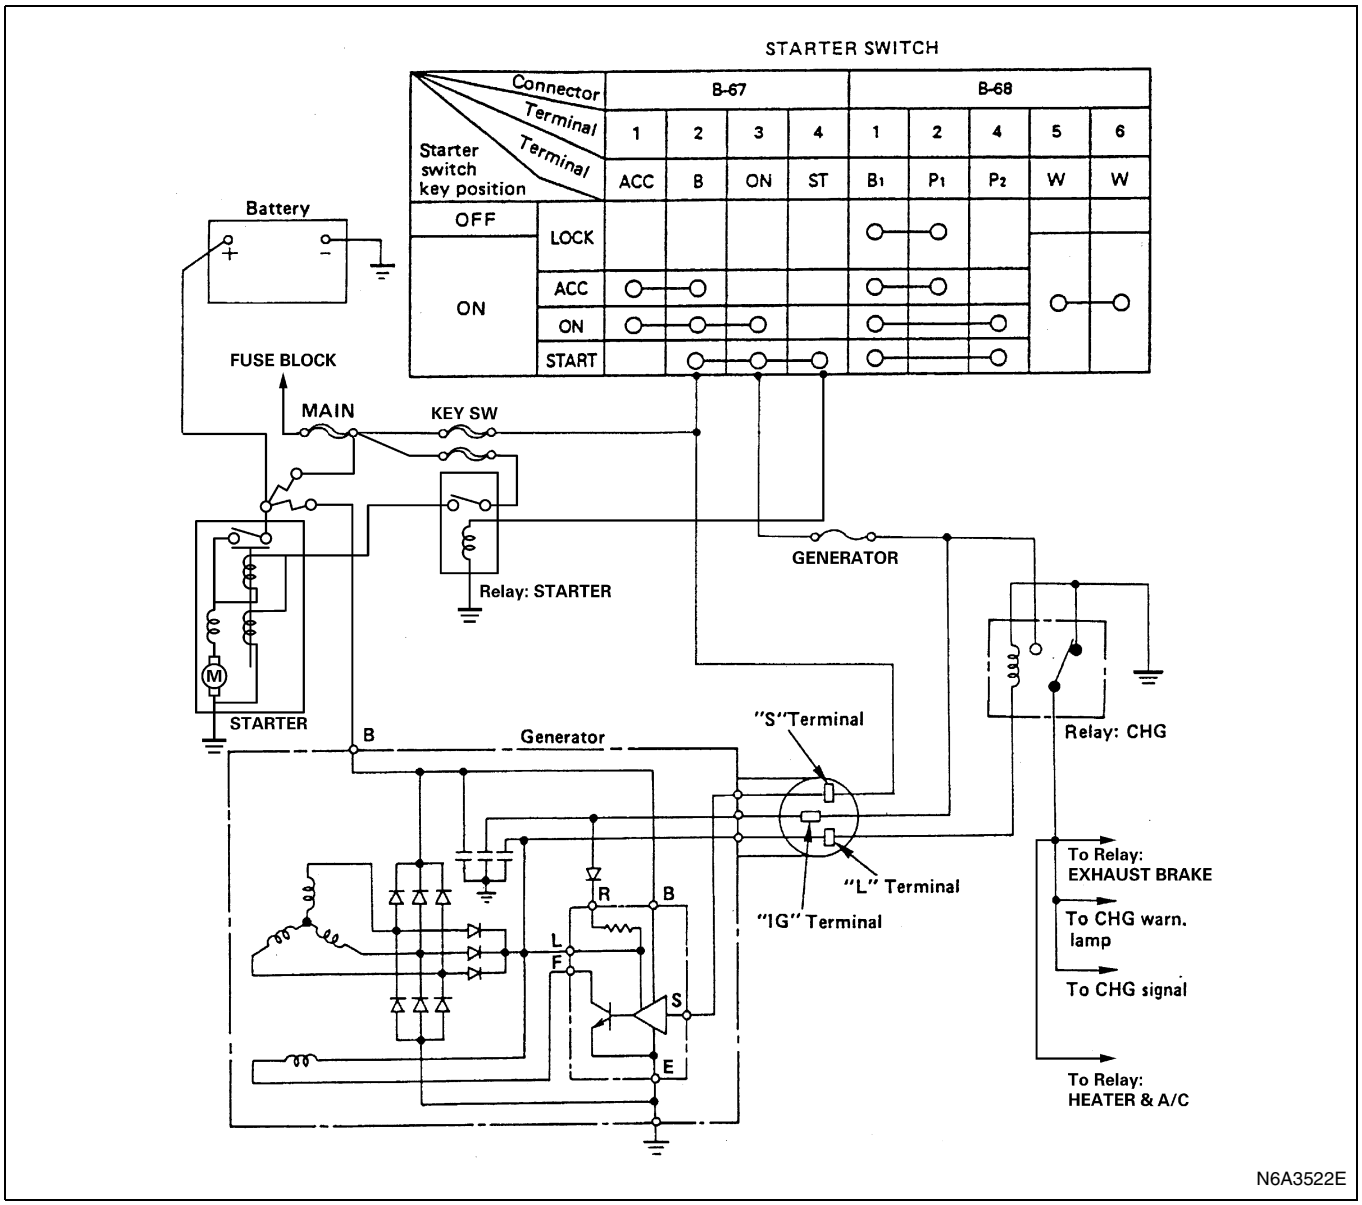
Diagnosis

General On-Vehicle Inspection

The operating condition of charging system is indicated by the charge warning lamp. The warning lamp comes on when the starter switch is turned on “ON” position. The charging system operates normally if the lamp goes off when the engine starts. If the warning lamp shows abnormality or if undercharged or overcharged battery condition is suspected, perform diagnosis by checking the charging system as follows:

For 4JB1, 4JB1-TC



1. Check visually the belt and wiring connector.
2. With the engine in stop status, turn the starter switch to “ON” position and observe the warning lamp.

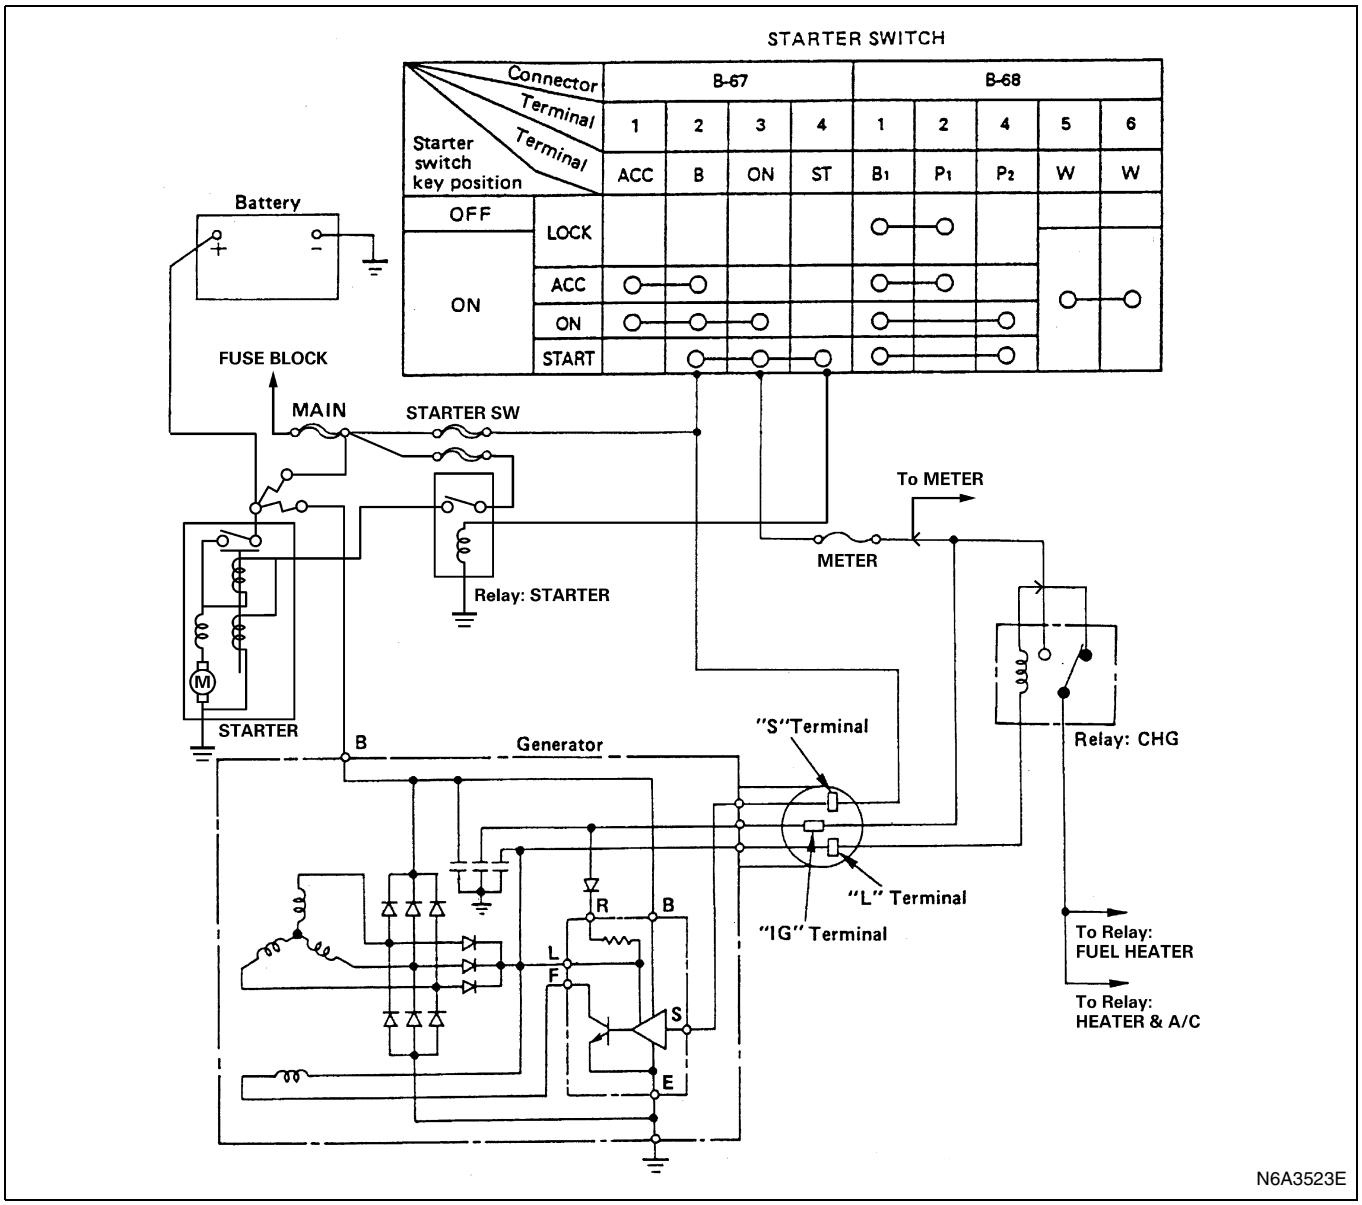
- If lamp does not come on:
  Disconnect wiring connector from generator, and ground the terminal “L” on connector side.
- If lamp comes on:
  Repair or replace the generator.

Diagnosis

General On-Vehicle Inspection

The operating condition of charging system is indicated by the charge warning lamp. The warning lamp comes on when the starter switch is turned on “ON” position. The charging system operates normally if the lamp goes off when the engine starts. If the warning lamp shows abnormality or if undercharged or overcharged battery condition is suspected, perform diagnosis by checking the charging system as follows:

For 4JH1



1. Check visually the belt and wiring connector.
2. With the engine in stop status, turn the starter switch to “ON” position and observe the warning lamp.

- If lamp does not come on:
  Disconnect wiring connector from generator, and ground the terminal “L” on connector side.
- If lamp comes on:
  Repair or replace the generator.

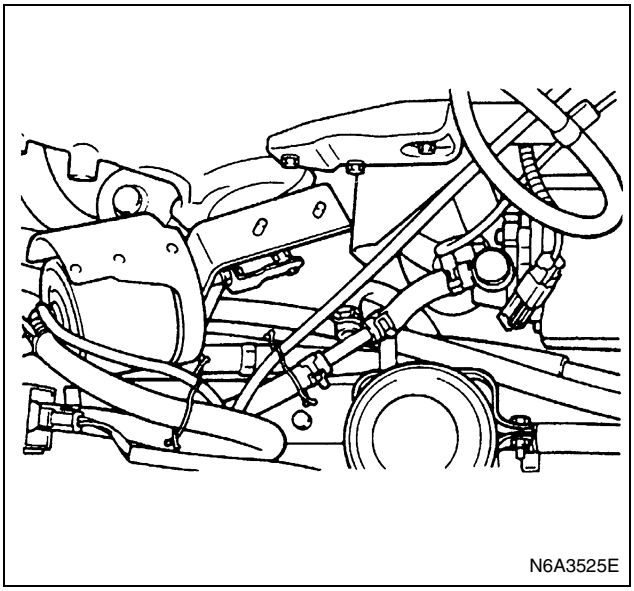
Removal

Preparation

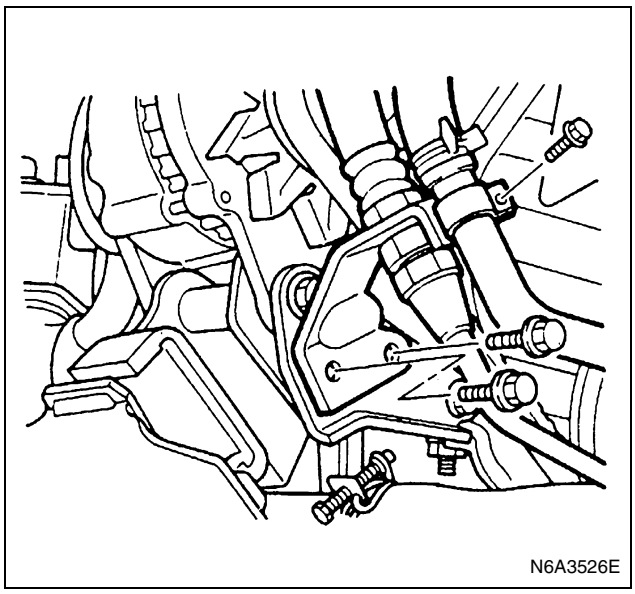
- Disconnect battery ground cable.

1. A/C Compressor Drive Belt (A/C Model)
   - Loosen the idler pulley lock nut
   - Loosen the adjust bolt and remove the drive belt.
2. A/C Compressor Assembly (A/C Model)
   - Disconnect the clutch harness connector.
   - Remove the A/C compressor fixing bolts and temporarily tighten the A/C compressor to chassis frame side use the wire.
3. Harness Connector (A/C Model)
   - Disconnect the “L”, “S”, “IG” terminal.
   - Disconnect the “B” terminal.
4. Vacuum Hose (Exhaust Brake Model)
   - Remove the vacuum hose to vacuum tank and exhaust actuator.
5. Oil Hose
   - Remove the oil hose from oil pan.
   - Remove the oil hose of vacuum pump side.



N6A3525E

6. AC Generator Drive Belt
   - Loosen the adjust plate fixing bolt.
   - Remove the adjust bolt.
   - Loosen the AC Generator fixing bolt then remove the fan belt.
7. Power Steering Oil Pipe Bracket (P/S Model)
   - Remove the oil pressure pipe bracket fixing bolt and pipe clip bolt.
   - Remove the oil suction pipe clip bolt.



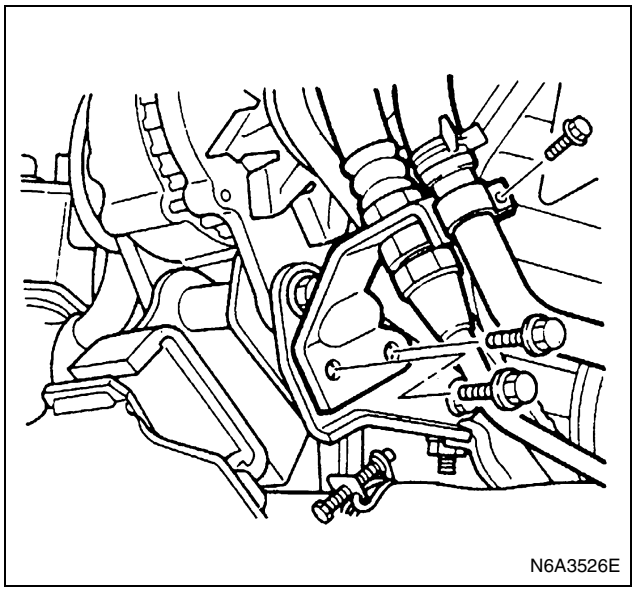
N6A3526E

8. AC Generator Fixing Bolts
9. AC Generator Assembly

Installation

1. AC Generator Assembly
   - Set the AC generator.
2. AC Generator Fixing Bolts
   - Temporary install the AC generator fixing bolt.
3. Power Steering Oil Pipe Bracket (P/S Model)
   - Install the oil pipe bracket and tighten bolts to the specified torque.

Tighten:
Pipe Bracket Bolt to 19 N·m (1.9 kg·m/14 lb·ft)



N6A3526E

- Install the suction pipe clip bolt and tighten bolt to the specified torque.

Tighten:
Pipe Clip Bolt to 10 N·m (1 kg·m/87 lb·in)

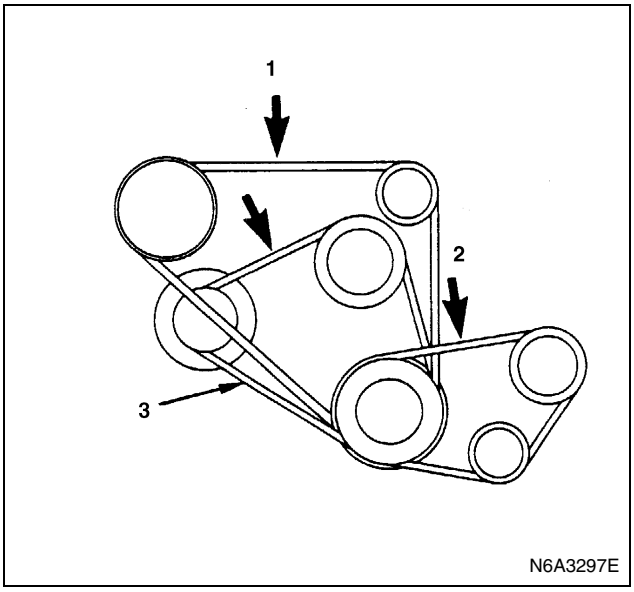
- Install the pressure pipe and suction pipe clip bolt, then tighten bolt to the specified torque.

Tighten:
Pipe Clip Bolt to 10 N·m (1 kg·m/87 lb·in)

4. AC Generator Drive Belt
   - Install the AC Generator drive belt and adjust belt tension.
   - Depress the drive belt mid-portion with a 98 N (10 kg/22 lb) force.

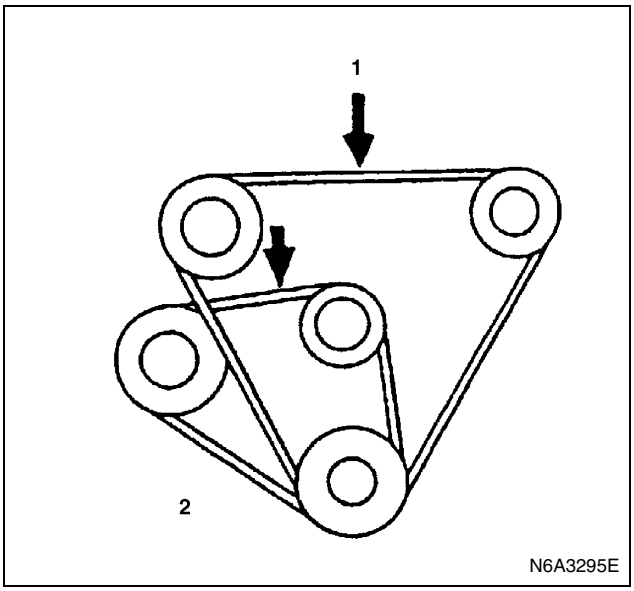
Drive Belt Deflection	mm (in)
8 (0.31) — 12 (0.47)	

4JG2



Legend
1. A/C compressor drive belt
2. P/S oil pump drive belt
3. AC generator fan pulley drive belt

4JB1

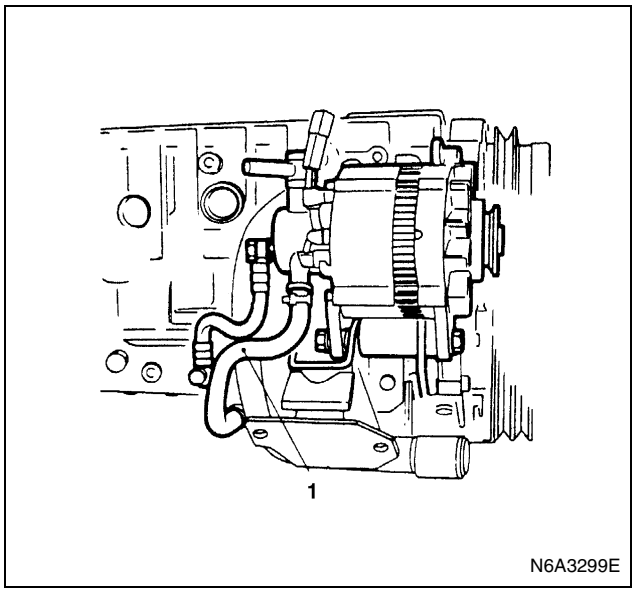


Legend
1. AC compressor drive belt & PS pump drive belt
2. AC generator & fan pulley drive belt

   - Install the fixing bolt and tighten bolt to the specified torque.

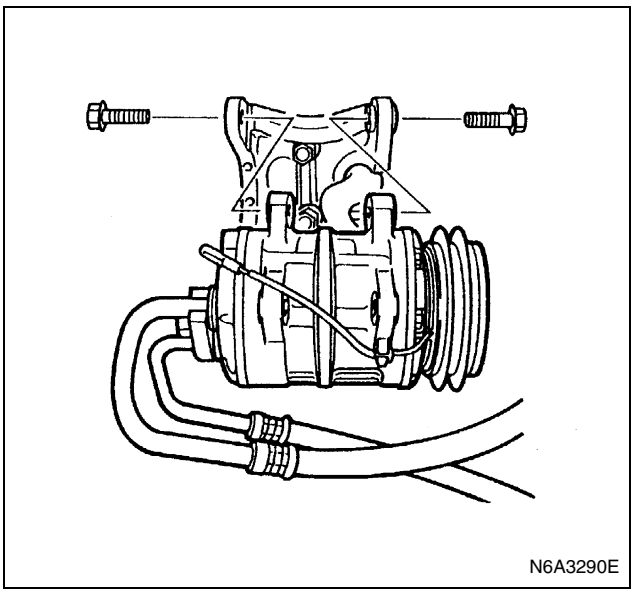
Tighten:
- Generator Fixing Bolt to 40 N·m (4.1/ kg·m/30 lb·ft)
- Adjust Plate Fixing Bolt to 19 N·m (1.9 kg·m/14 lb·ft)

5. Oil Hose
   - Install the oil hose (1) to vacuum pump.
   - Install the oil hose (2) to oil pan.



6. Vacuum Hose (Exhaust Brake Model)
   - Install the vacuum hose to vacuum tank and exhaust actuator.
7. Harness Connector (A/C Model)
   - Connect the “L”, “S”, “IG” terminal and “B” terminal connectors.
8. A/C compressor Assembly (A/C Model)
   - Install the compressor assembly and tighten bolts to the specified torque.

Tighten:
Compressor Bolt to 19 N·m (1.9 kg·m/14 lb·ft)



N6A3290E

- Connect the magnetic switch harness connector.

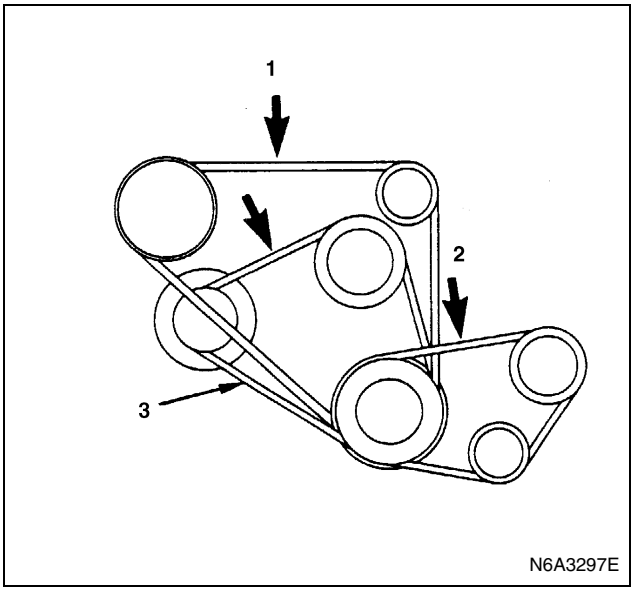
9. A/C compressor Drive Belt (A/C Model)
   - Install A/C compressor drive belt and adjust belt tension.
   - Depress the drive belt mid-portion with a 98N (10 kg/22 lb) force.

Drive Belt Deflection	mm (in)
New 7 — 8 (0.28 — 0.31) Check 12 — 14 (0.47 — 0.55)	

- Tighten the idler lock nut to the specified torque.

Tighten:
Idle Pulley Lock Nut to 27 N·m (2.8 kg·m/20 lb·ft)

4JG2



N6A3297E

Legend
1. A/C compressor drive belt
2. P/S oil pump drive belt
3. AC generator fan pulley drive belt

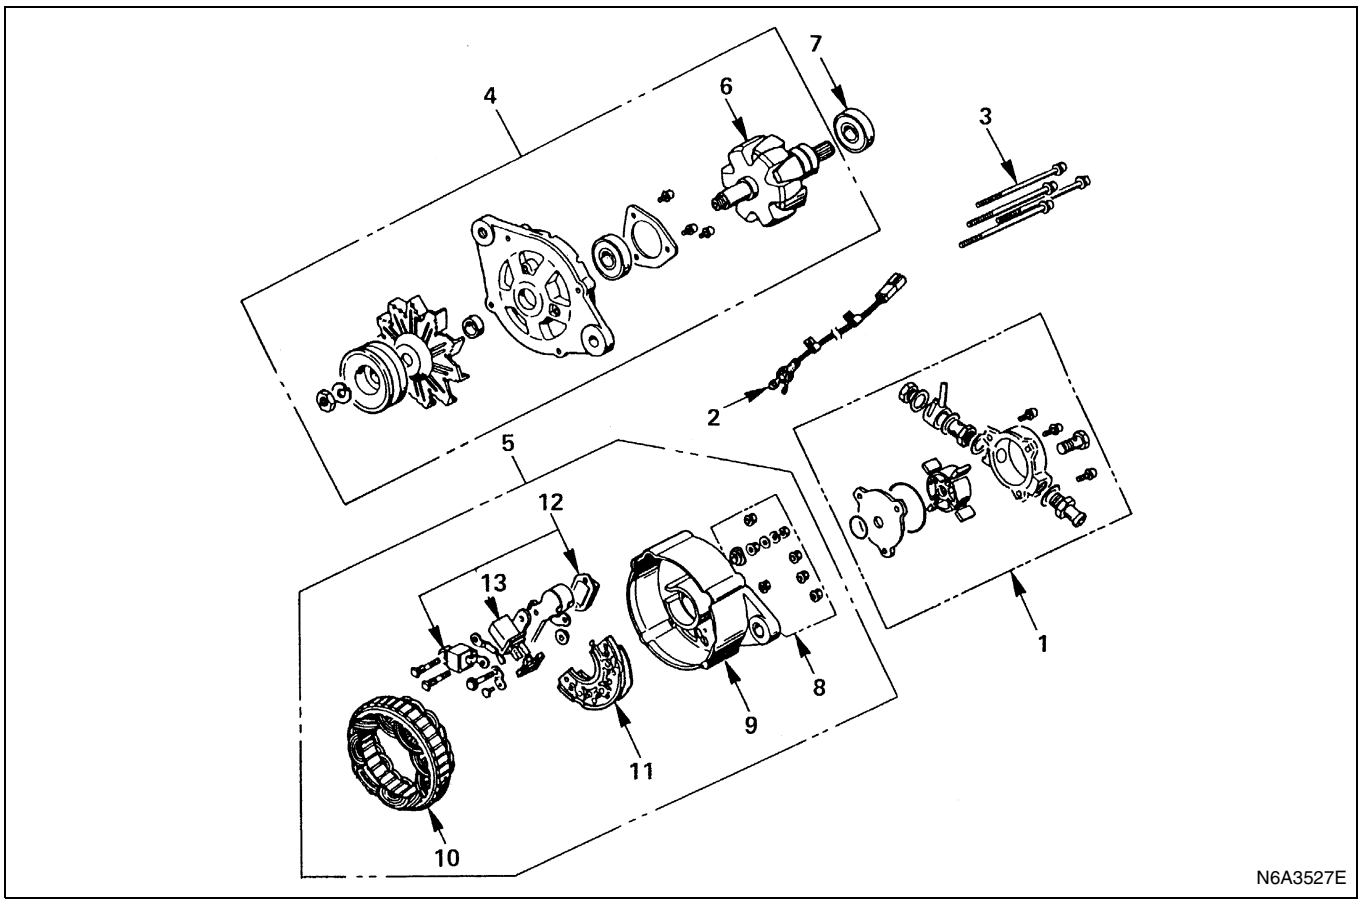
- Connect the battery ground cable.

Unit Repair

Component

12V-50A

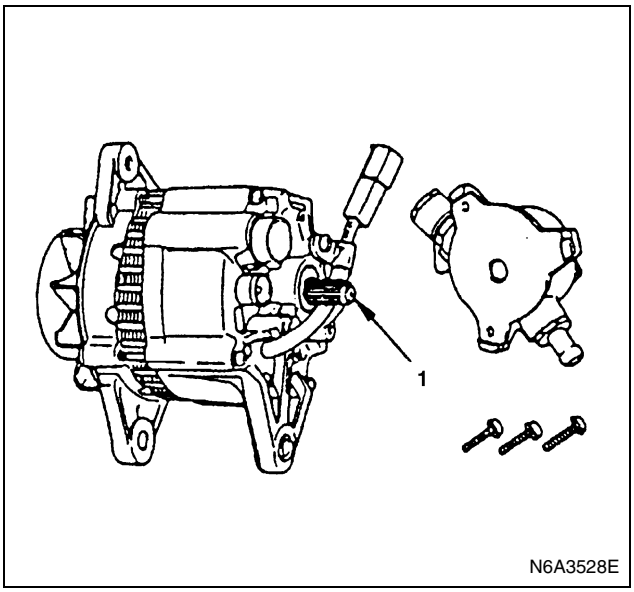


Legend

1. Vacuum pump
2. Lead wire
3. Through bolts
4. Rotor and front cover assembly
5. Stator and rear cover assembly
6. Rotor
7. Rear bearing
8. Terminal bolt and nut
9. Rear cover
10. Stator
11. Diode
12. IC regulator assembly
13. Brush holder

Disassembly

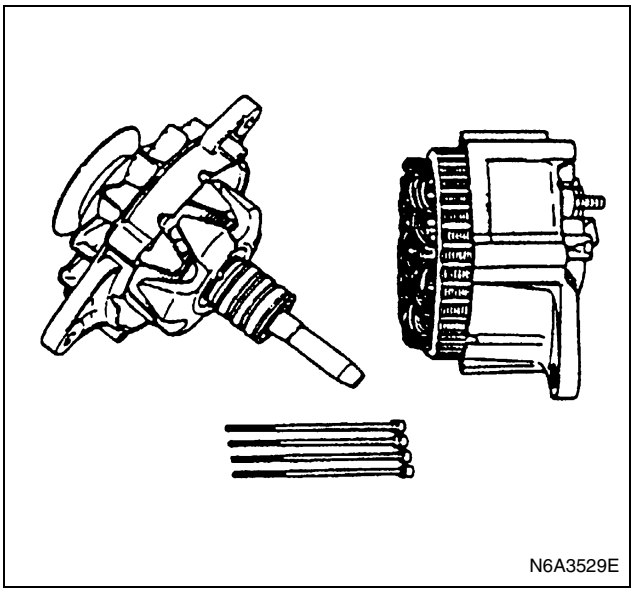
1. Vacuum Pump
   - Drain fluid from discharged port.
   - Remove the vacuum pump fixing bolts. Hold the center plate and remove the vacuum pump horizontally in direction in line with the rotor shaft.
2. Lead Wire
3. Through Bolts



Legend

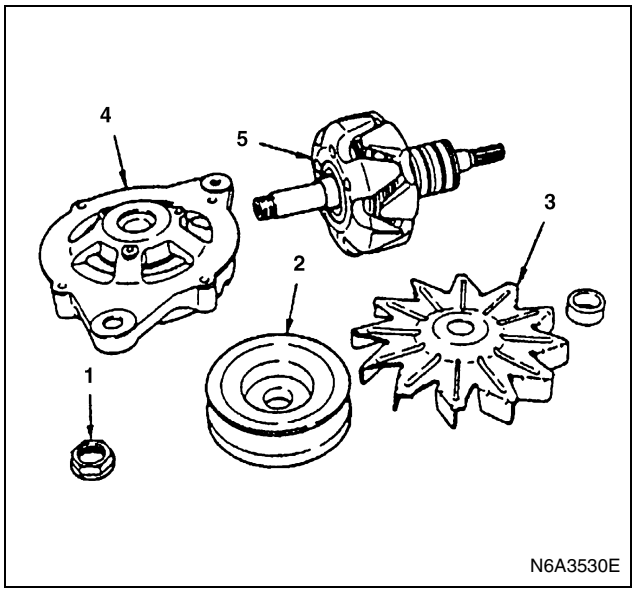
1. Seal protector

4. Rotor and Front Cover Assembly
5. Stator and Rear Cover Assembly
   - Insert a screwdriver into the clearance between the front cover and the stator core, and remove the assembly.

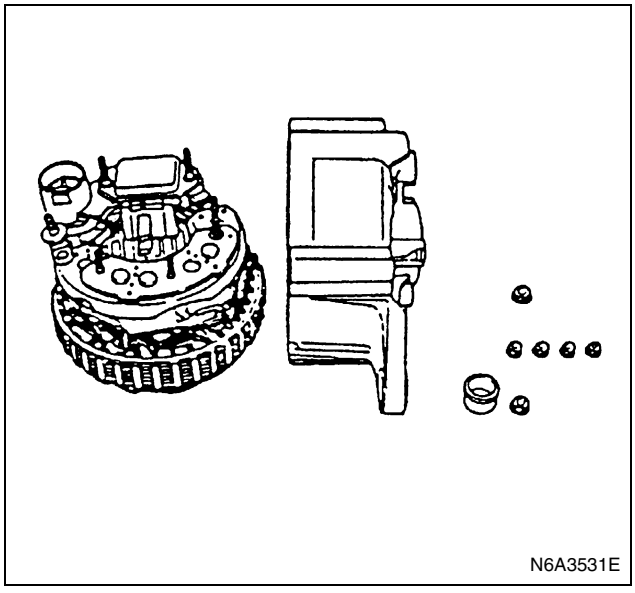


Notice:
Take care not to damage the stator coil with the screwdriver. When the assembly will not come off, hold down the rear cover and hit the end face of the shaft gently with a plastic hammer to detach it.

6. Rotor
   - With the rotor gripped with a vise, remove the pulley nut (1), and then take off the pulley (2), fan (3), front cover (4) and the rotor (5).



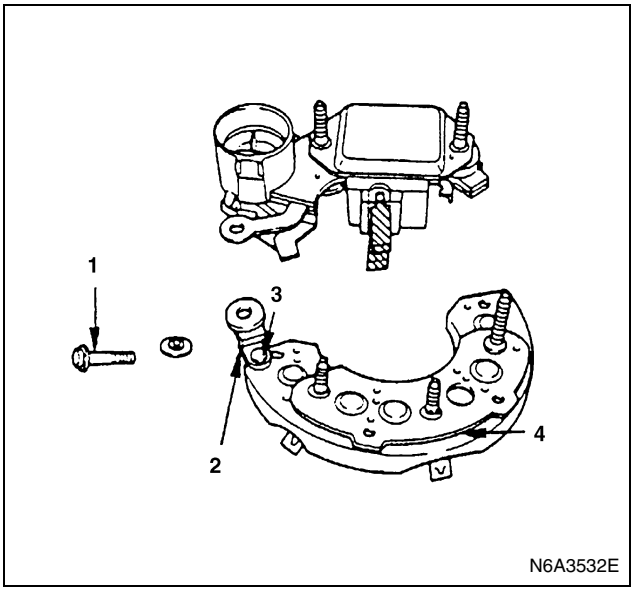
7. Rear Bearing
8. Terminal Bolt and Nut
9. Rear Cover
   - Remove the nuts fixing the B terminal and diode holder.
     Separate the stator and rear cover.
     Note the position of insulation washers to ensure reassembly into original position.



10. Stator
11. Diode

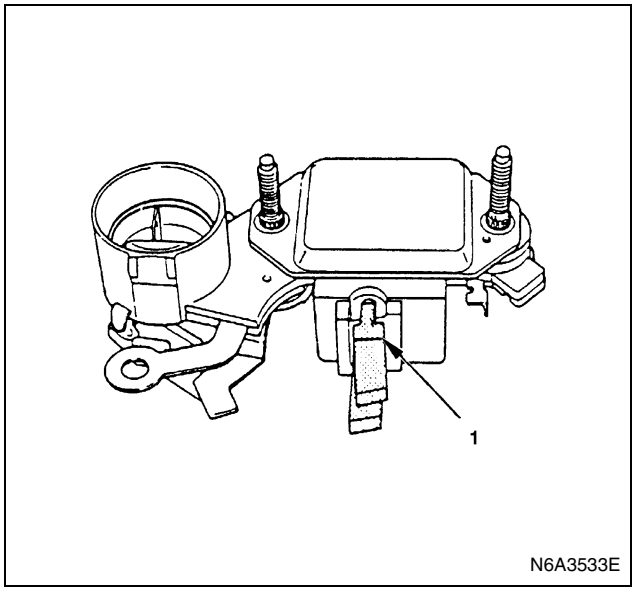
- Separate the diodes from the stator by melting away solder on stator coil and diode.
  When melting solder, hold the lead wire with long nose pliers to prevent heat from being transferred to the diodes.

12. IC Regulator Assembly
    - Separate the IC regulator from the diode by melting away solder on IC regulator holder plate and removing the nut.



Legend
1. Terminal bolt
2. Terminal plate
3. Rivet
4. Diode

13. Brush Holder
    - Remove the serrated bolts and melt away solder on IC regulator.
    - Do not remove the serrated bolts unless the replacement of brush or condenser.
      To install, follow the removal steps in the reverse order.



Legend
1. Wear limit

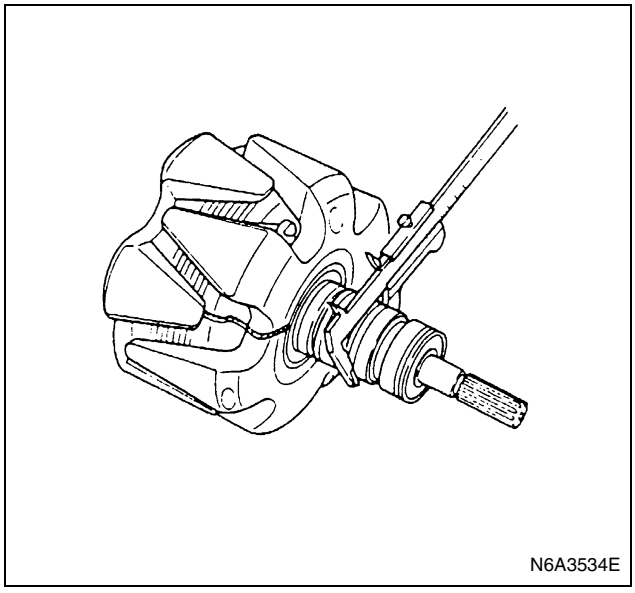
Inspection and Repair

Repair or replace necessary parts if extreme wear or damage is found during inspection.

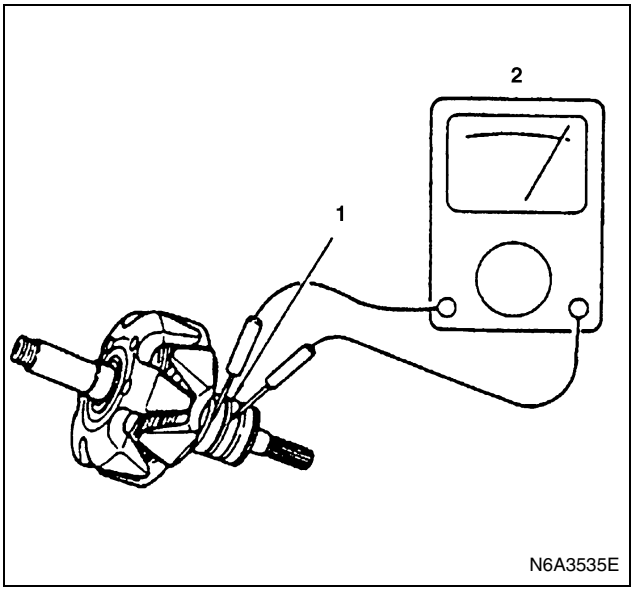
Rotor

1. Check the rotor slip ring surfaces for contamination and roughness. If rough, polish with #500 — 600 sandpaper.
2. Measure the slip ring diameter, and replace if it exceeds the limit.

mm (in)	
Standard	Limit
34.6 (1.36)	33.6 (1.32)

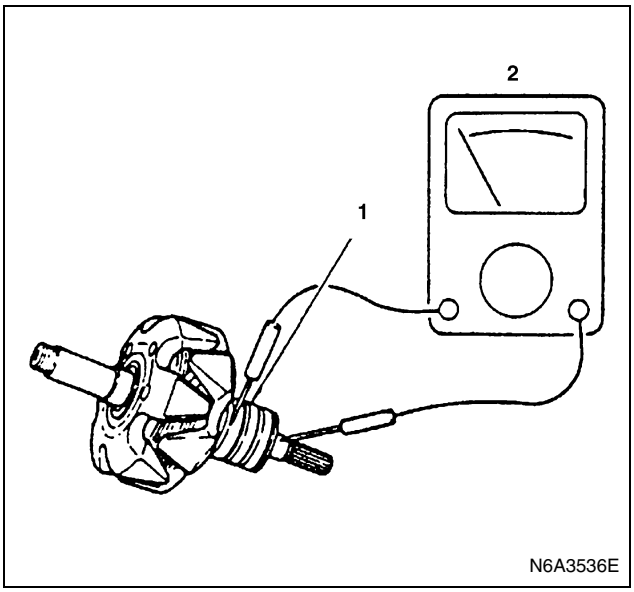


3. Check for continuity between slip rings, and replace if there is no continuity.



Legend
1. Slip ring
2. Tester

4. Check for continuity between slip ring and rotor core or slip ring and rotor shaft.
   In case of continuity, replace the rotor assembly.



Legend
1. Slip ring
2. Tester

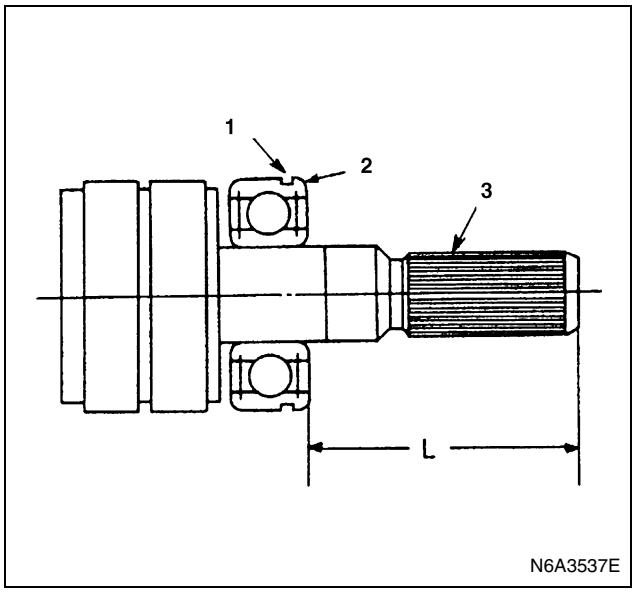
Rear Ball Bearing

Check to see if the ball bearing rotates smoothly with no noises.

When it does not rotate smoothly or any noises are heard, replace it with a new one.

When installing the bearing, press it in with the stopper ring turned to the spline side, while pushing the bearing inner ring.

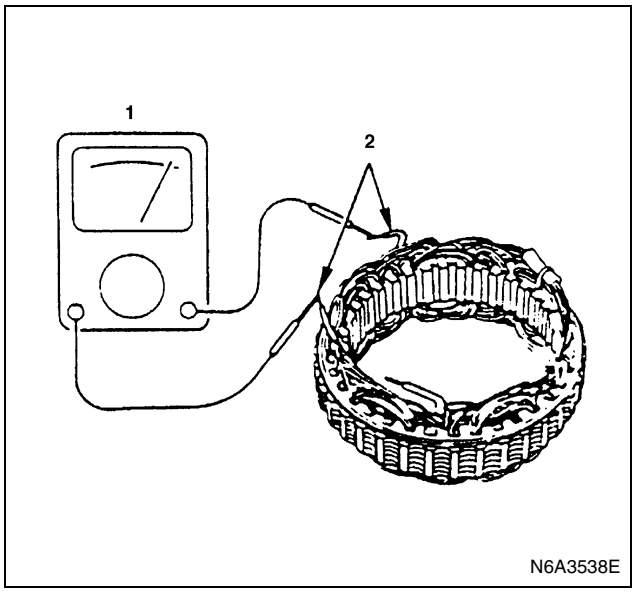
Bearing press-in measurement: L	mm (in)
Standard	41.8 — 42.0 (1.64 — 1.65)



Legend
1. Stopper ring
2. Ball bearing
3. Spline

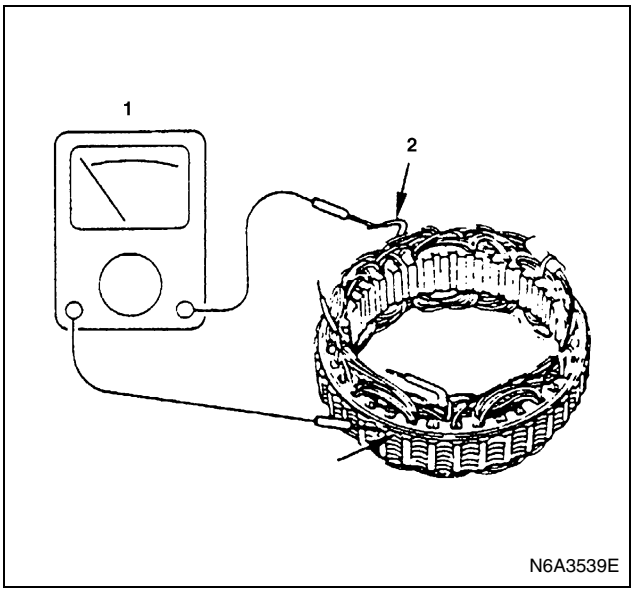
Stator Coil

1. Check for continuity between respective phases.
   In case of no continuity, replace the stator.



Legend
1. Tester
2. Lead wire

2. Check for continuity across one of the stator coils and stator core. If a continuity exists, replace the coil.

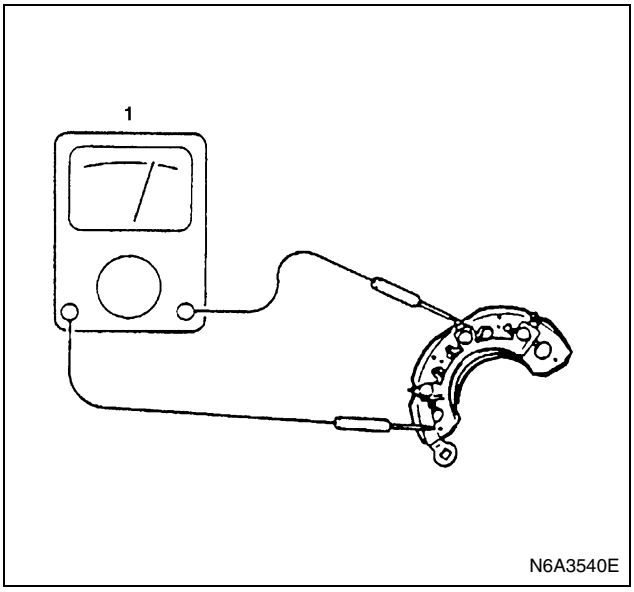


Legend
1. Tester
2. Lead wire

Diode

1. Check for continuity across the terminal (example: across BAT and U). If a continuity exists, the diode is in satisfactory condition. If no continuity exists the diode is defective.
2. Make a test with the polarities reversed. If no continuity exists, the diode is in satisfactory condition. If a continuity exists at any point, the diode is defective and should be replaced.

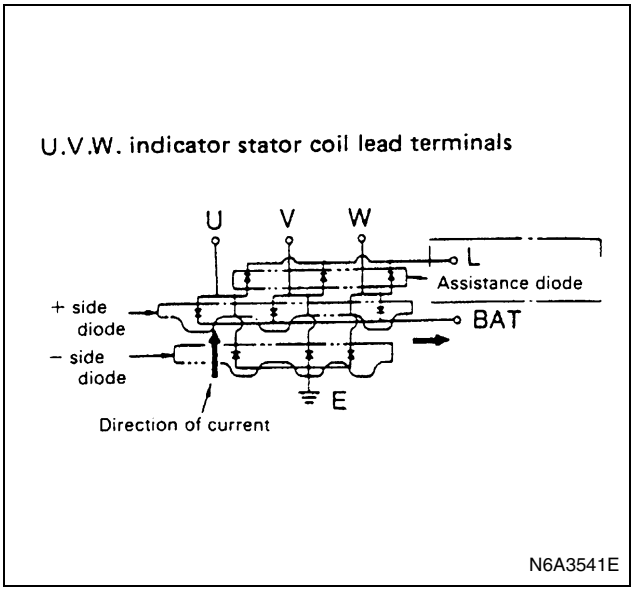
   Auxiliary diodes are not provided with the terminal and continuity test should be made across the terminals of the conventional diodes.



Legend
1. Tester

- side diode check			
Across terminals		BAT (Positive side (+) diodes)	
	Tester pin	Positive side	Negative side
U.V.W	Positive side		No continuity
	Negative side	Continuity	

+ side diode check			
Across terminals		E (Negative side (–) diodes)	
	Tester pin	Positive side	Negative side
U.V.W	Positive side		Continuity
	Negative side	No continuity	

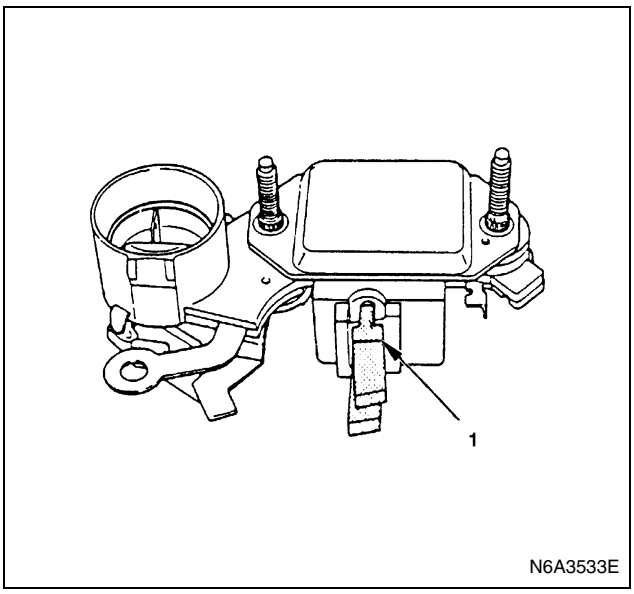


Brush

Measure length of brushes.
Brush length (L)

mm (in)	
Standard	Limit
20 (0.79)	6 (0.24)

Brushes are provided with a line which indicates the limit of usage.



Legend
1. Wear limit

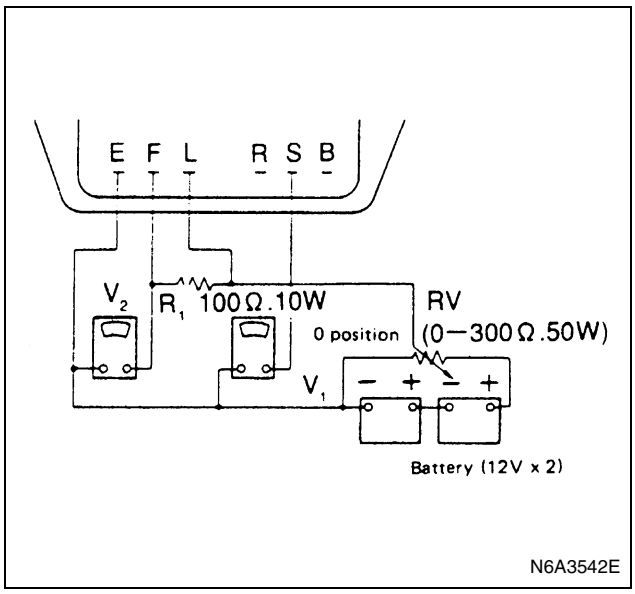
IC Regulator
Measuring instruments is necessary.
Take the following measurements with the instruments connected as shown in the illustration.

V1 Voltage at Battery1	V
Standard	10 — 13

V2 Voltage across F — E	V
Standard	Limit
2 or less	2 or more

Take measurement with 'S' terminal disconnected.

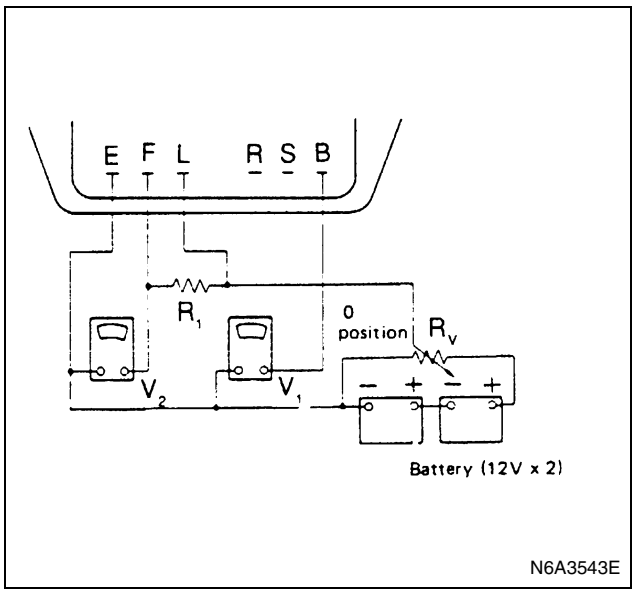
V3 Measure the voltage at Battery1 — Battery2. V	
Standard	20 — 26



- Measurement the voltage across the E — F while varying resistance gradually from zero using variable resistor.
  Then check that voltage increases from 2V to 10 — 13.
  If increase in voltage is interrupted at any point, replace the regulator.
- V4 Measure the voltage across the intermediate tap on variable resistor and 'E' terminal without actuating the variable resistor.

	V
Standard voltage at 20°C (68°F)	14.0 — 14.9

If measured value deviates from the standard, replace the regulator.



Check the following with the instrument connected as illustrated.
Measure the voltage across the terminals B and E by gradually increasing voltage with variable resistor RV.

Check to see if voltage increases from lower than 2V to range from 10 to 13 volts.
If the voltage does not vary, the regulator is defective and should be replaced.
Check the voltage across the intermediate tap of the variable resistor and terminal E without actuating the variable resistor.

	V
Standard voltage at 20°C (68°F)	14.5 — 16.9

If measured voltage deviates from the standard value, replace the regulator.

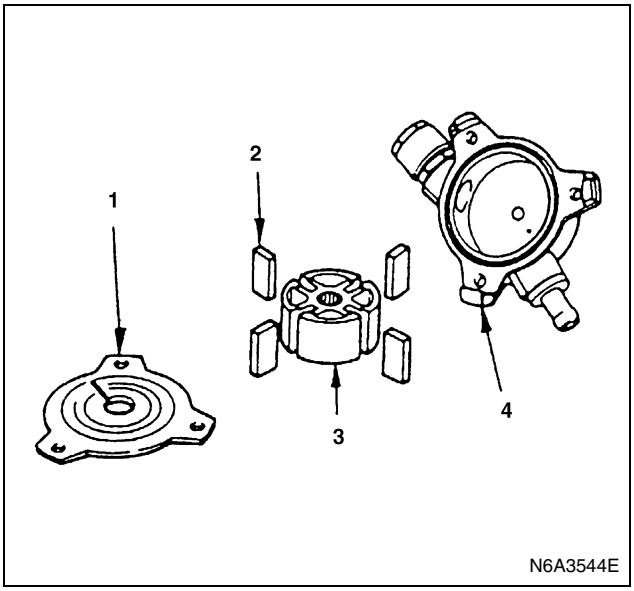
Vacuum Pump

Visual Check

- Inspect the following parts for wear, damage or other abnormal conditions.

Disassembly of Vacuum Pump

- For the center plate, rotor and vane in the mentioned.



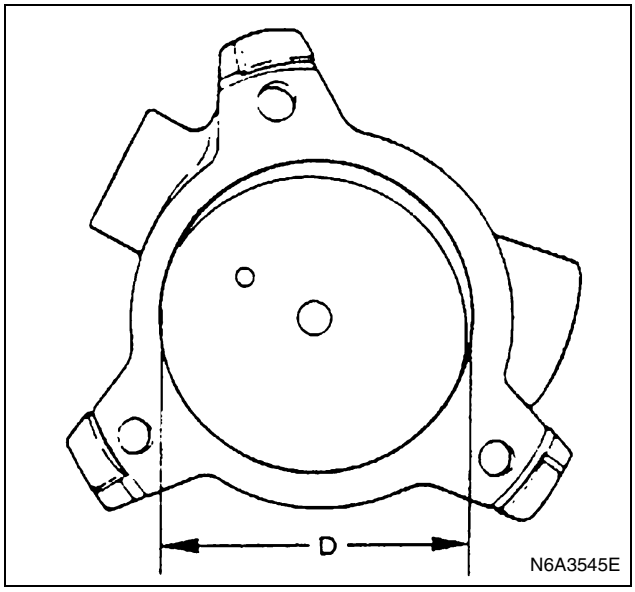
Legend

1. Center plate
2. Vane
3. Rotor
4. Housing

Housing

- Measure the inside diameter of housing and place if it exceed the standard.

	mm (in)
Standard	57.0 — 57.1 (2.244 — 2.248)



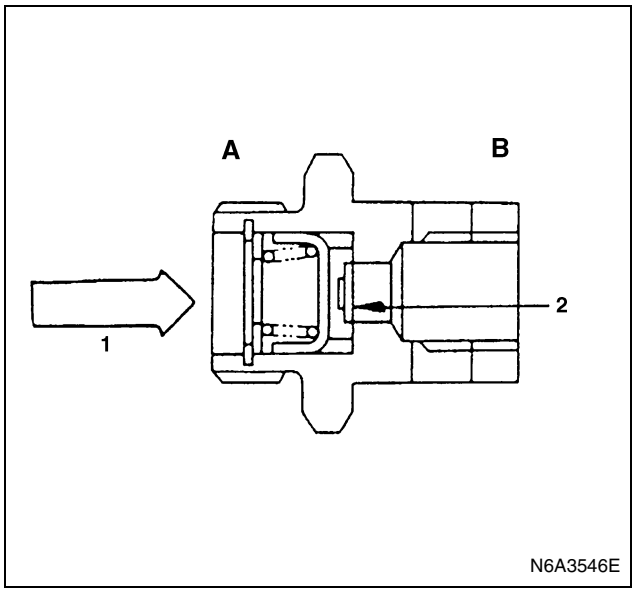
Vane

Measure the length of vanes

	mm (in)
Standard	12.5 — 13.5 (0.492 — 0.531)

Check Valve

1. Apply a light pressure onto the “B” side of valve with a screwdriver and check that valve operates smoothly.
2. Apply compressed air 100 — 500 kPa (1 — 5 kg/cm^2/14.5 — 72.5 psi) onto “A” side of valve and check if there is air leak.

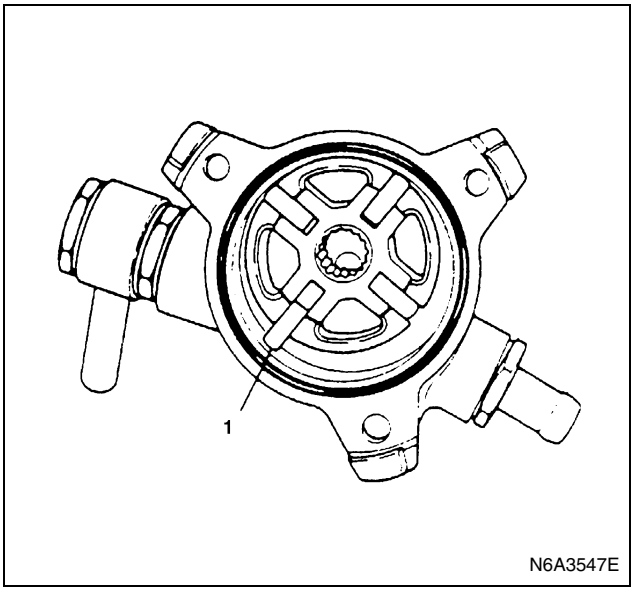


Legend

1. Compressed air
2. Push

Reassembly of Vacuum Pump

1. Position the rotor, with the serrated boss turned up, on the center plate and housing.
   Align the holes in center plate and rotor.
2. Install vanes into slits in rotor.
   The vanes should be installed with chamfered side turned outward.
3. Install the O-ring and center plate



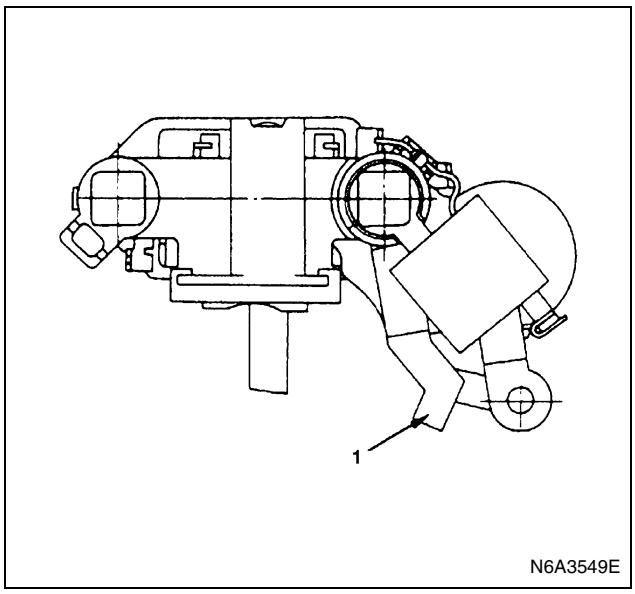
Legend

1. Chamfered side

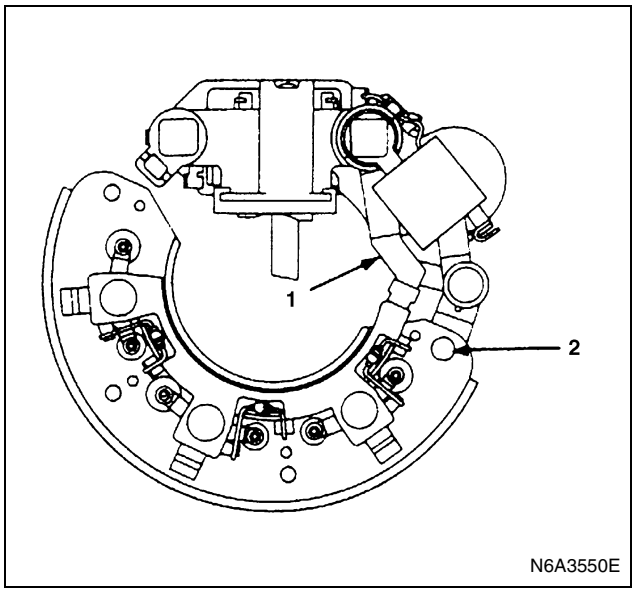
Reassembly

1. Brush Holder
2. IC Regulator Assembly
   - Hold the brush in the holder as shown in the illustration and solder the lead wire.

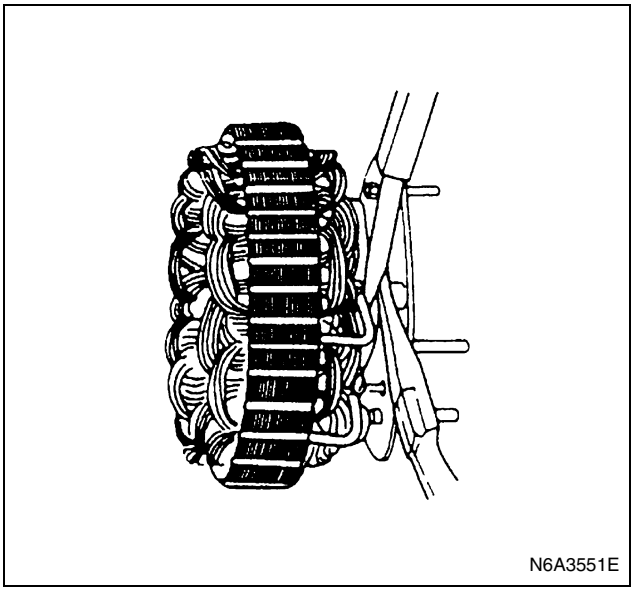
   - Put the IC regulator on the brush holder and press the bolt.
     Bushing and connecting plate (1) must be installed when pressing the bolt.



3. Diode
   - Connect the terminals by fixing the rivet at (1) and soldering the terminal at (2).



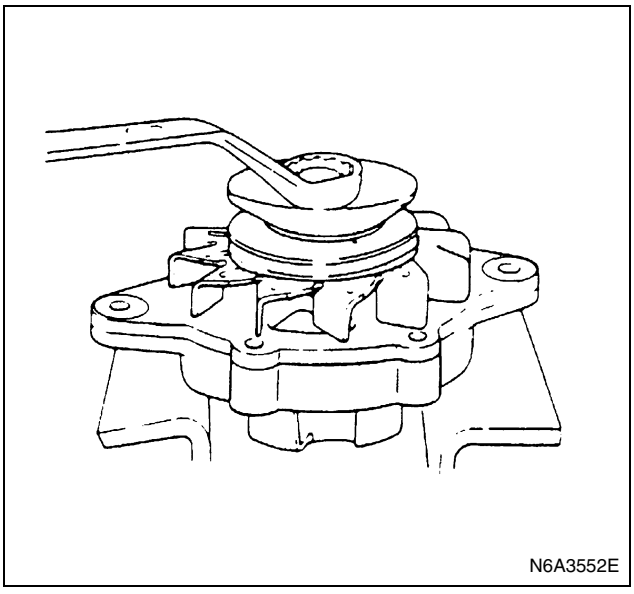
4. Stator
   - When connecting stator coil leads and diode leads using solder, use long-nose pliers and finish the work as quickly as possible to prevent the heat from being transferred to the diodes.



N6A3551E

5. Rear Cover
6. Terminal Bolt and Nut
7. Rear Bearing
8. Rotor
   - Cover vice with copper plates, clamp the rotor with the vice, and tighten nut to the specified torque.

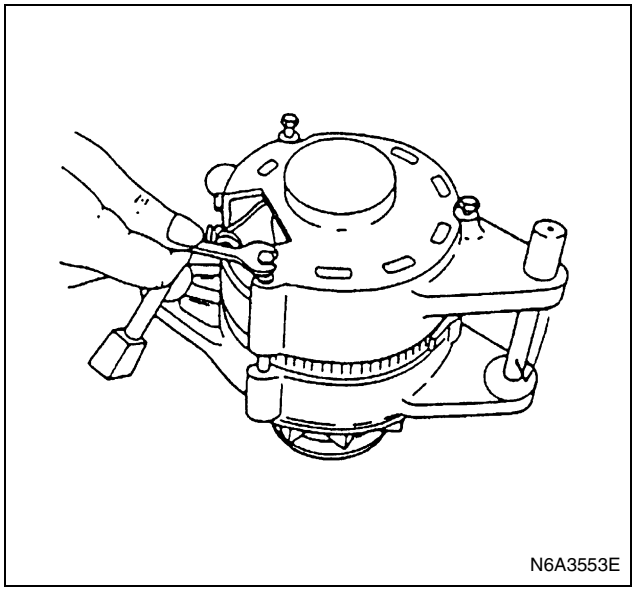
Tighten:
Pulley Nut to 90 N·m (9.2 kg·m/67 lb·ft)



N6A3552E

9. Stator and Rear Cover Assembly
10. Rotor and Front Cover Assembly
11. Through Bolts
    - Place guide bar through the holes in front cover and rear cover flange for alignment, then install the through bolts.
    - Tighten the through bolts to the specified torque

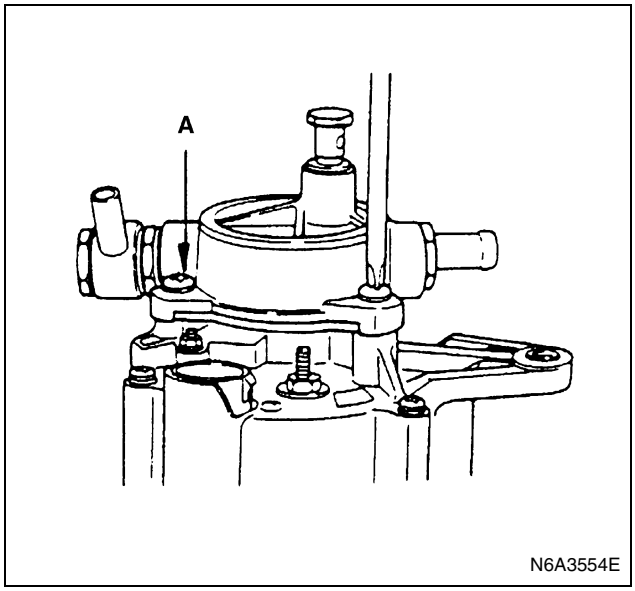
Tighten:
Through Bolts to 3.5 N·m (0.36 kg·m/31 lb·in)



N6A3553E

12. Lead wire
13. Vacuum Pump
    - Install and mount the housing to the generator using 3 bolts.
    - Pour engine oil (5 cc or so) in through the filler port, then check that generator pulley can be turned smoothly with hand.
    - Tighten the pump fixing bolts (A) to the specified torque.

Tighten:
Through Bolts to 3.5 N·m (0.36 kg·m/31 lb·in)



N6A3554E

- Pour engine oil (5 cc or so) through the filler port, and then check the pulley for smooth rotation.

QOSII PREHEATING SYSTEM (4JB1/4JB1-TC/4JH1-TC ONLY)

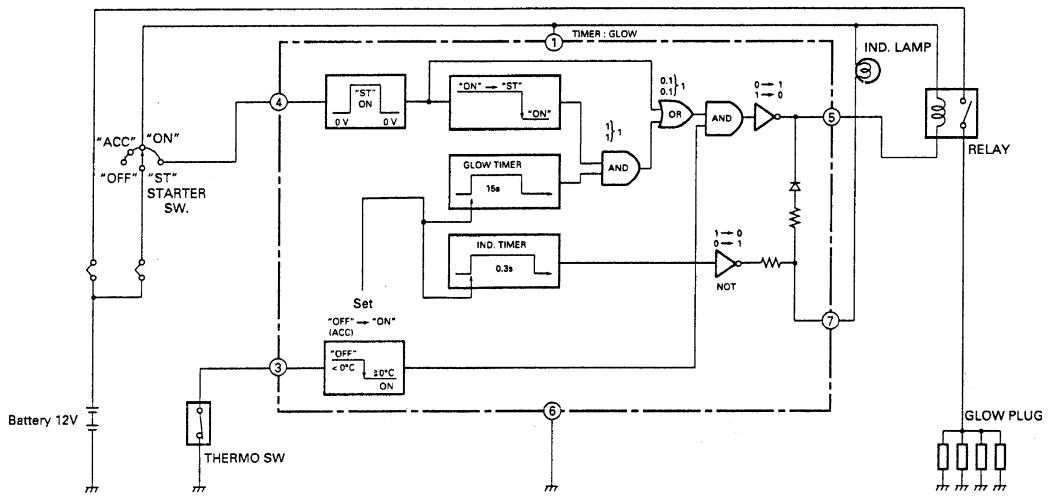
General Description

QOS II preheating system features a quick-on glow plug with thermometer control of the glowing time and the after-glow time function.

The system consists of a controller, indicator lamp, thermoswitch, relay, and glow plug (4 pcs).

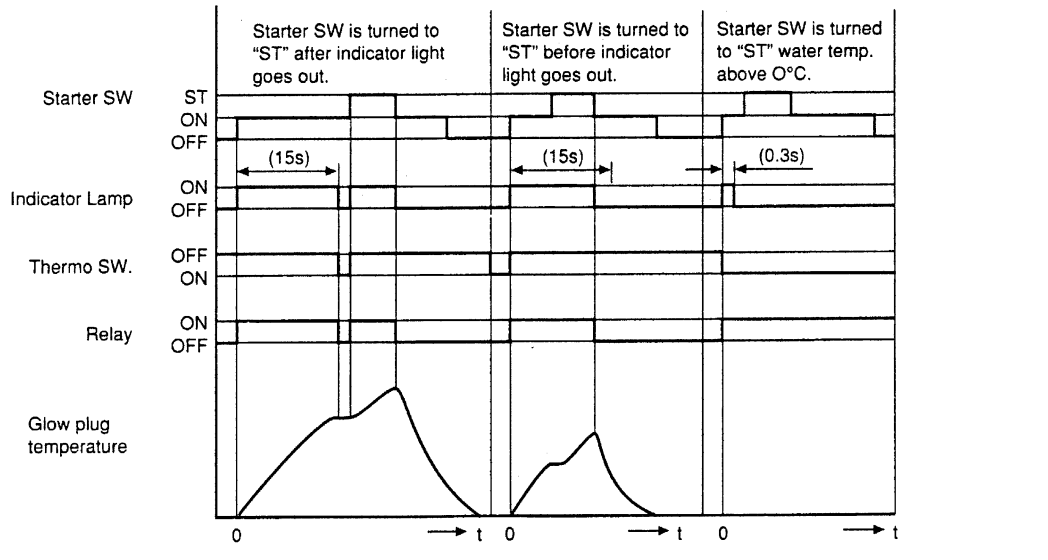
With the employment of the thermoswitch, the glow time changes according to the engine coolant temperature, thus allowing optimum starting conditions to be obtained.

System Diagram



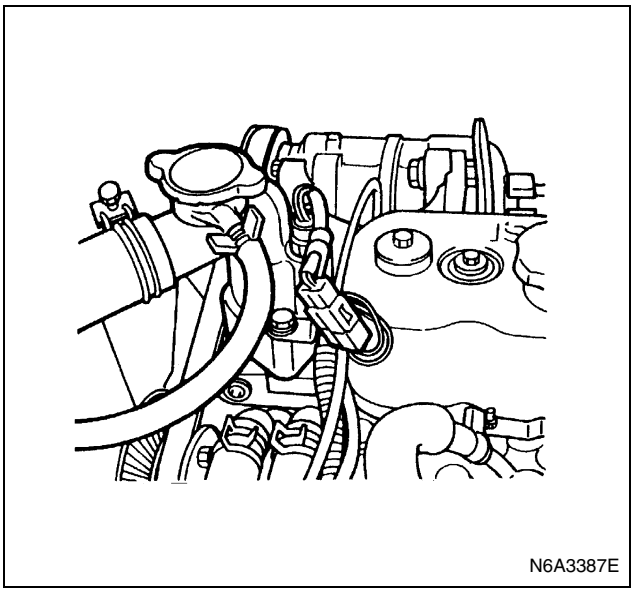
N6A3572E

QOS II Timing Chart



N6A3573E

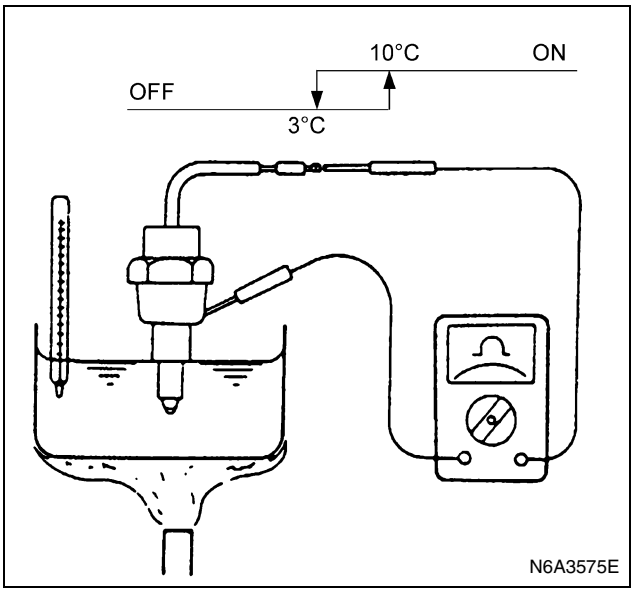
Inspection on QOSII System Operation
Thermo Switch
The thermo switch is located on the water outlet pipe.



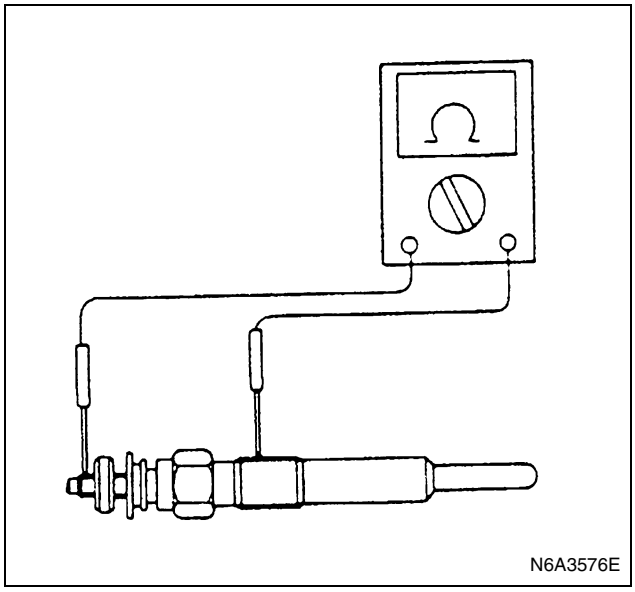
N6A3387E

Use a circuit tester to check the thermo switch for continuity.

OFF → ON	: 7 — 13°C (44.6 — 55.4°F)
ON → OFF	: Below 3°C (37.4°F)



N6A3575E

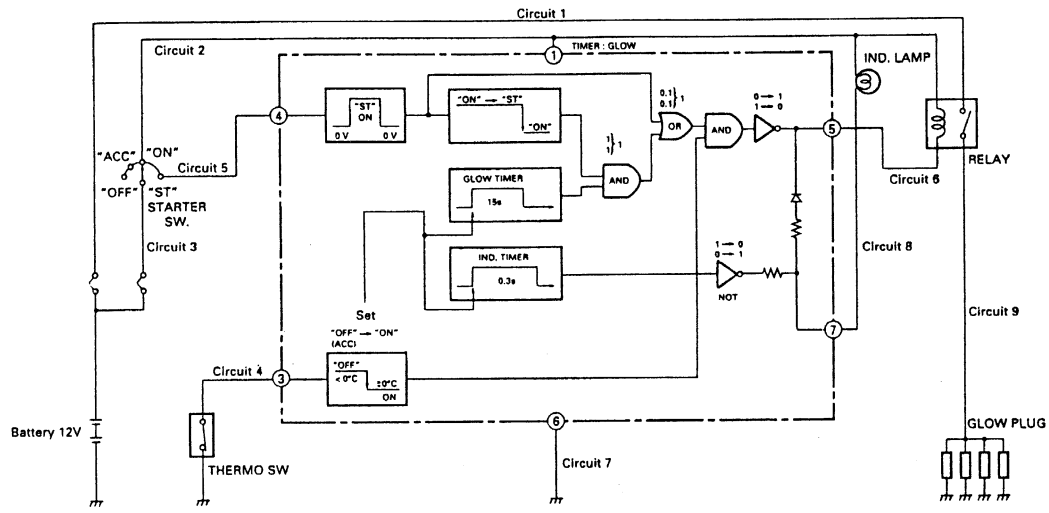


N6A3576E

Glow Plug
Use a circuit tester to test the glow plugs for continuity.

Glow Plug Resistance (Reference)	Ohms
Conventional model	Approximately 1.5
Quick on start model	Approximately 0.9

QOSII System Troubleshooting



1. Problems when the water temperature of the engine is 0°C below.

Condition	Cause	Circuit
Glow plug relay will not be lit.	Bad connection of Fusible link wire between battery and starter.	3
	Bad connection or disconnection of starter SW circuit	
	Bad connection or disconnection of Fuse No. SBF3 Malfunction of other circuits occurred simultaneously.	2
	Bad starter switch.	
	Bad connection of glow plug relay terminal.	1
	Disconnection of glow plug relay excitation coil.	
	Disconnection of circuit between glow plug relay and timer.	6
	Bad glow relay. (The main contact does not pass electricity.)	
	Bad connection of timer.	
	Bad timer.	
	Bad earth circuit of timer.	7
	Bad thermoswitch. (It remains ON even in water temperature below 0°C.)	
	Earth short-circuiting of thermo switch.	7
Through glow plug relay turns ON, pre-heating is not done.	Bad connection of Fusible link wire between battery and glow relay.	1
	Bad connection or disconnection in preheating circuit of glow relay main contact terminal connector.	
	Bad connection between plug connector and preheating circuit.	9
Glow plug relay turns ON, but does not go OFF.	Bad timer.	
	Bad timer. Short circuiting in circuit or earth between 5 terminal and glow relay.	6
	Bad glow relay.	
Indication lamp is not lit.	Bad timer.	
	Burning-out of light bulb. 8	8

Notice:
Circuit number is shown in the previous pre-heating chart.

2. Problems when the time water temperature of the engine is 0°C or above.

Condition	Cause	Circuit
Indicator lamp is not lit	Bad timer Burning-out of bulb. 8	8
Turn glow relay ON.	Bad thermoswitch or disconnection of thermo SW circuit. (Indicator will light up for 3.5 seconds.) Bad timer. Bad timer. Short-circuiting in circuit or earth between terminals 5 and glow relay.	4

Notice:
Circuit number is shown in the previous pre-heating chart.

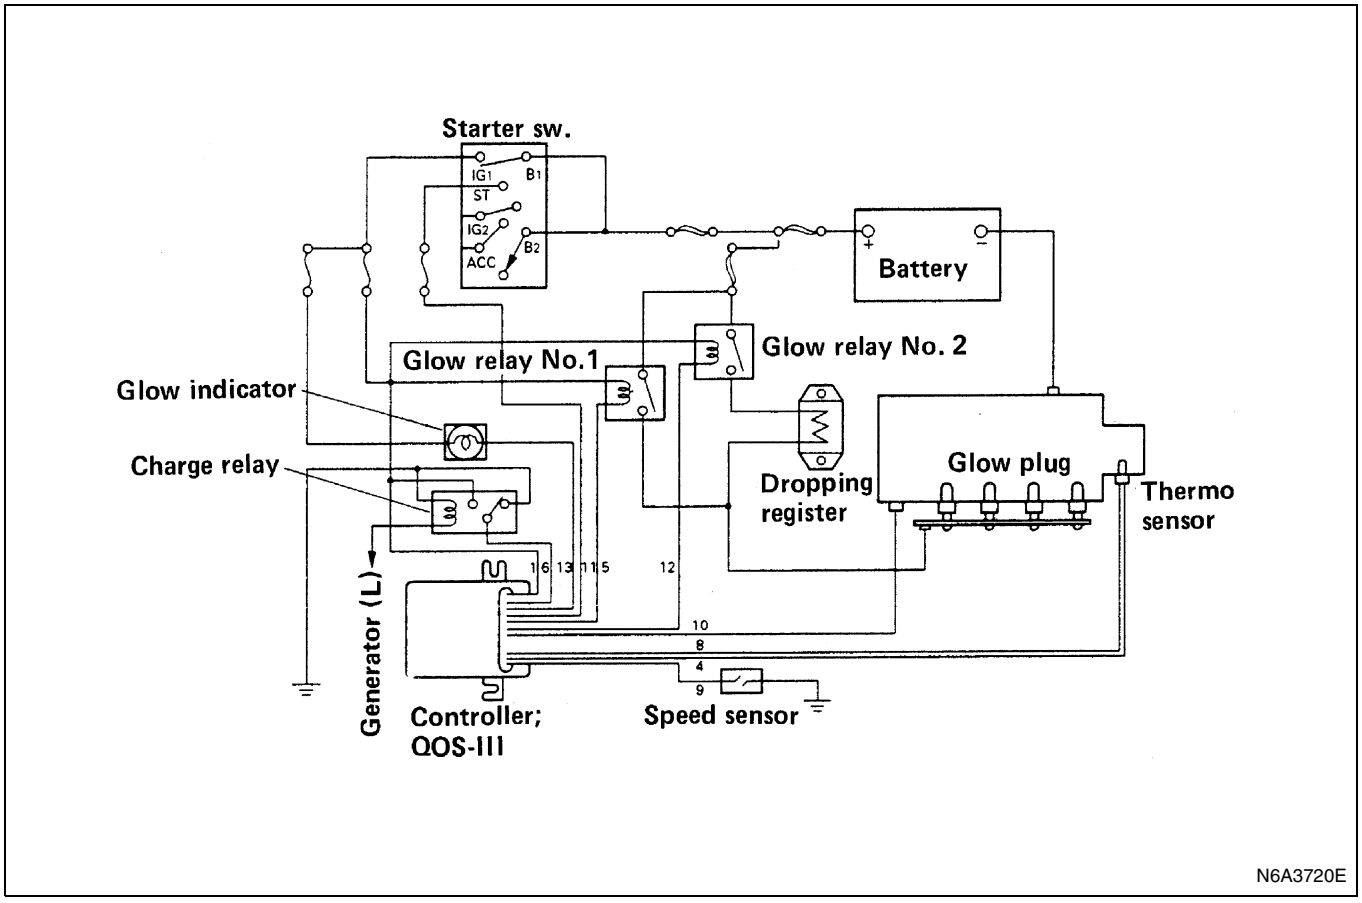
3. Burning-out of glow plug
   When only one line is burned out, it has no effect on the start up of the engine. Even if one line is burned out, judging from the characteristics of the glow plug, the impressed voltage will change only slightly.
   Therefore, no judgment can be made by normal testing while the glow plug is installed. In order to check for disconnections and burn-outs, the glow plugs will have to be removed from the connectors and checked one by one for continuity.

QOSIII PREHEATING SYSTEM (4JG2 ONLY)

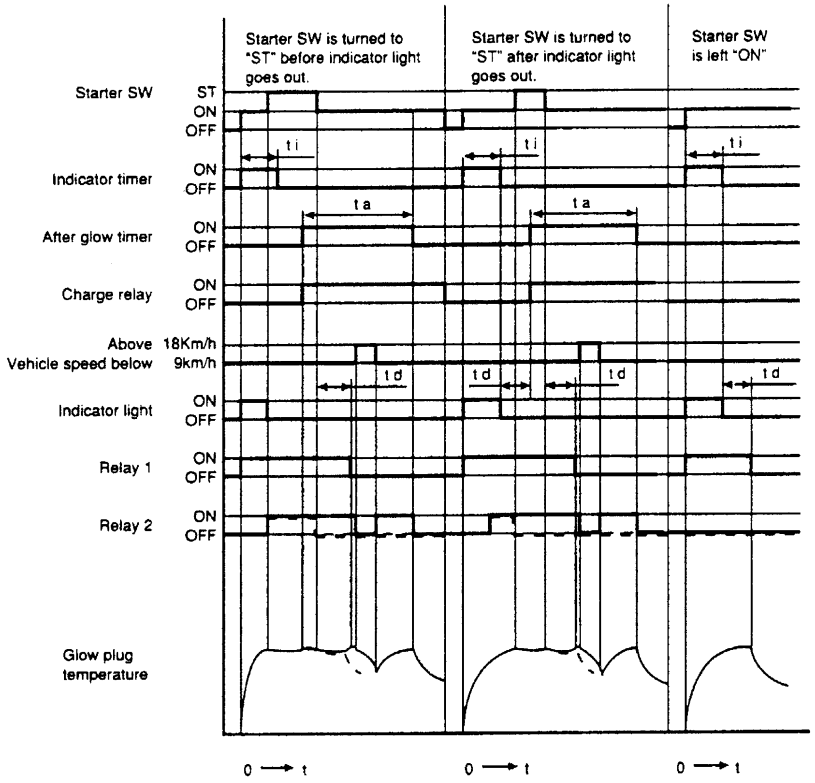
General Description

QOS III preheating system features a quick-on glow plug with thermometer control of the glowing time and the after-glow time function.
The system consists of a controller, indicator lamp, thermosensor, vehicle speedsensor, dropping resistor, relay (2 pcs), and temperature self-control type glow plug (4 pcs)
With the employment of the thermoswitch, the glow time changes according to the engine coolant temperature, thus allowing optimum starting conditions to be obtained.
The afterglow time function is controlled by thermosensor, vehicle speed sensor, and the engine runstall sensor (charge relay).

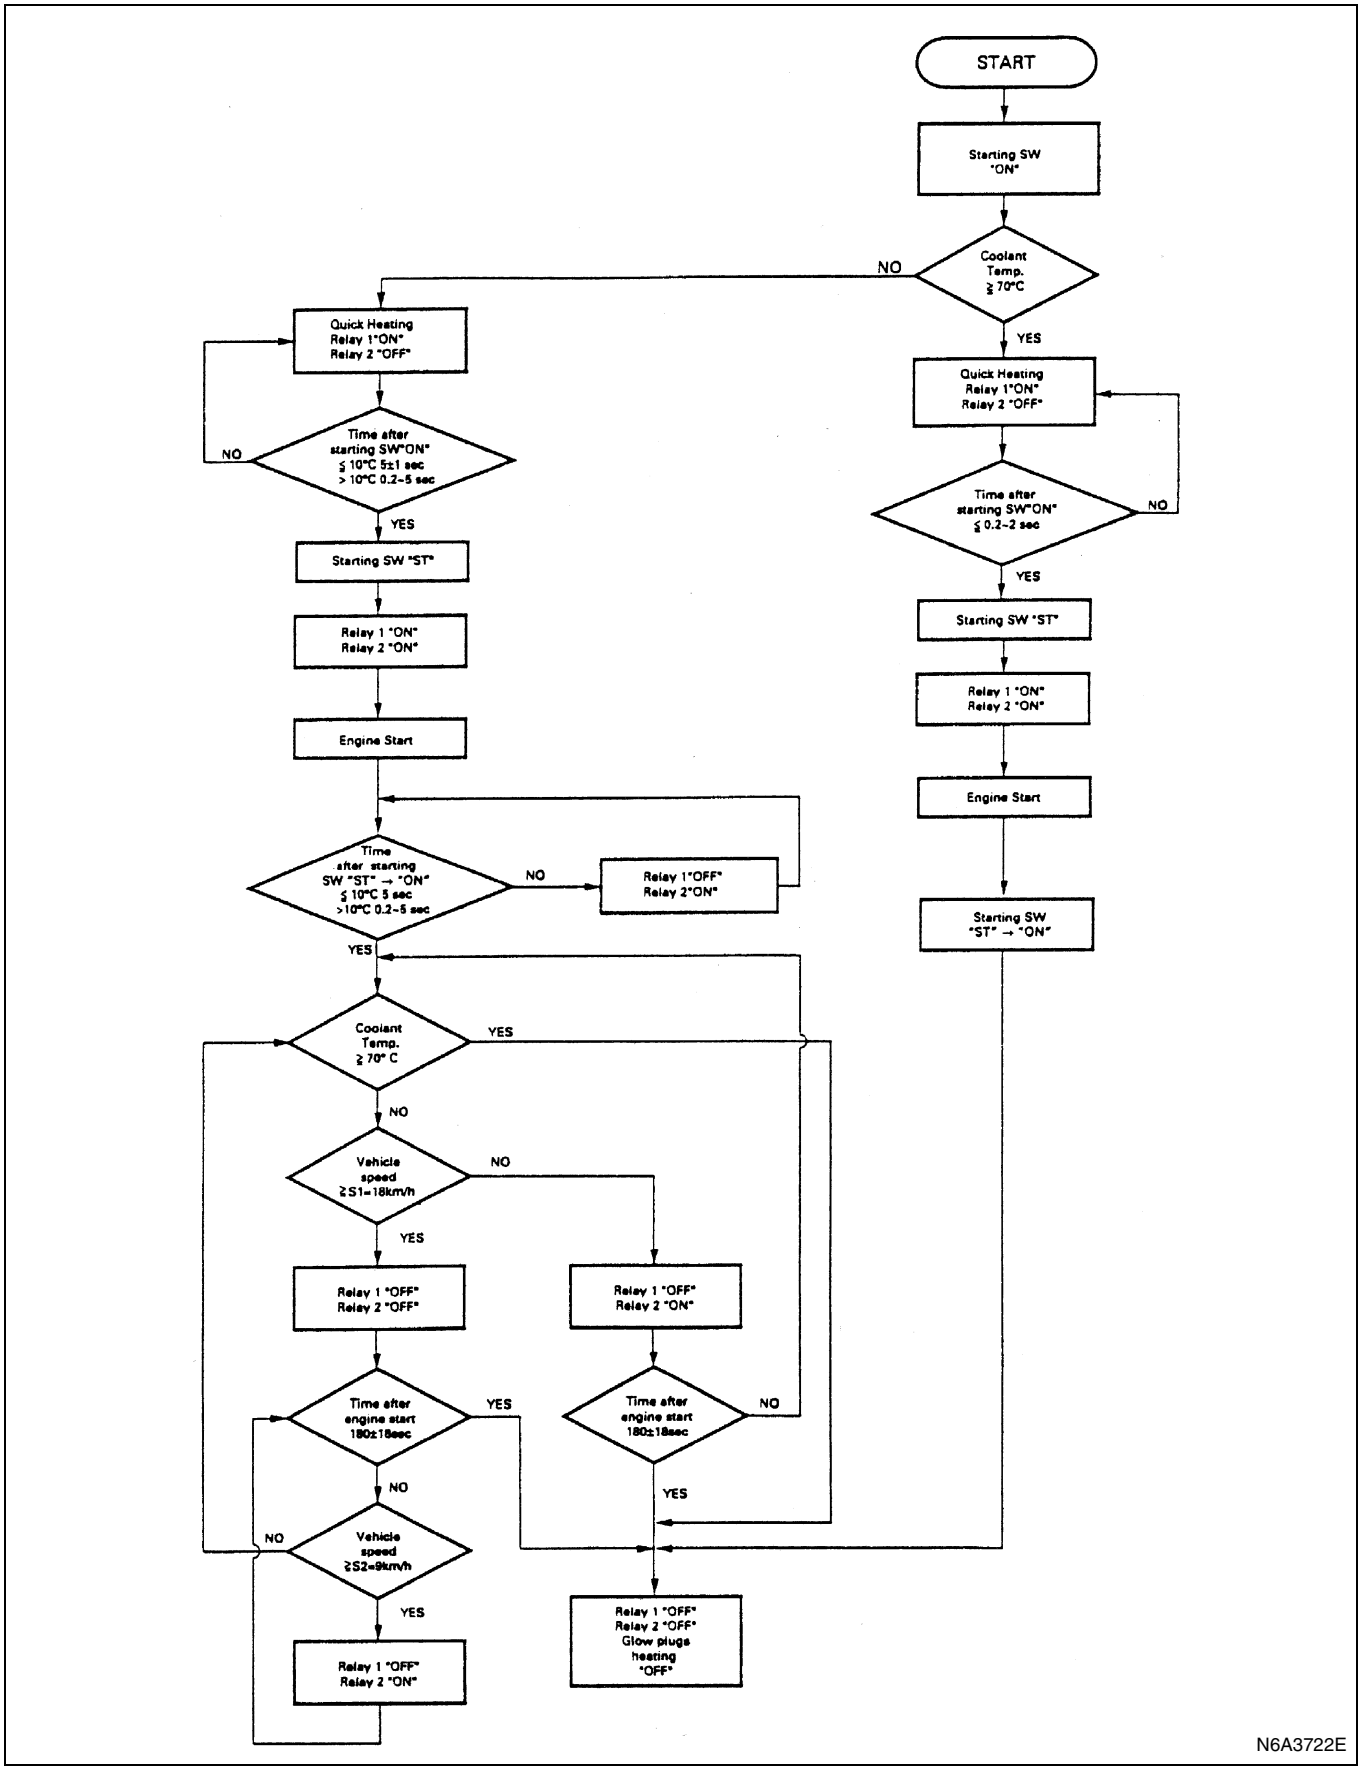
System Diagram



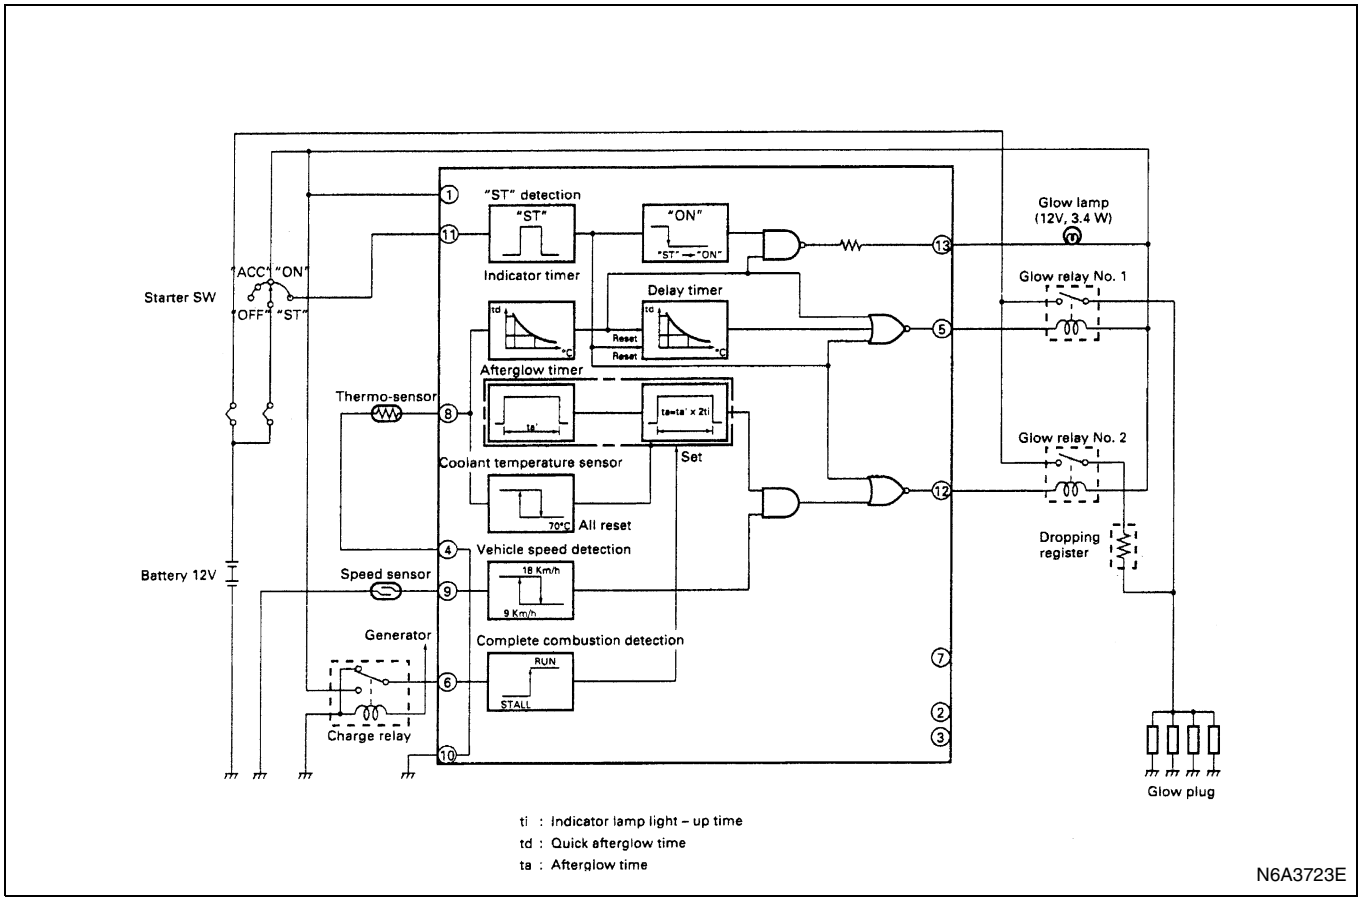
QOS II Timing Chart



QOS III Flow Chart



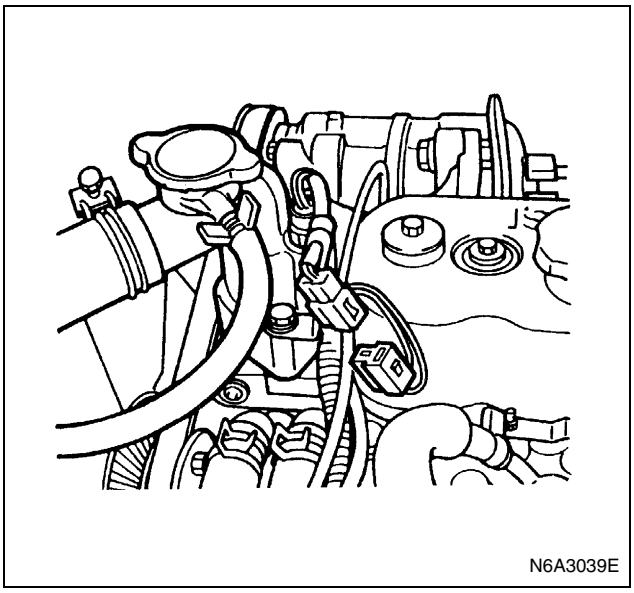
QOS II Timing Chart



Inspection on QOSIII System Operation

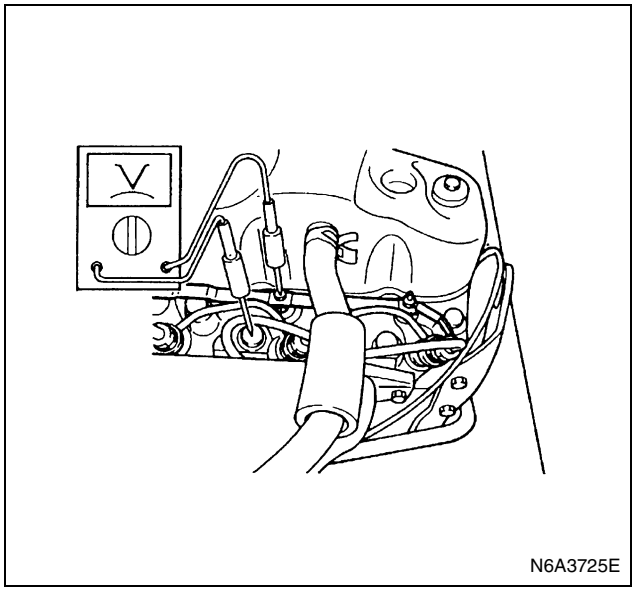
Inspection on Quick Heating Operation

1. Disconnect thermo-sensor connection on the thermostat housing.



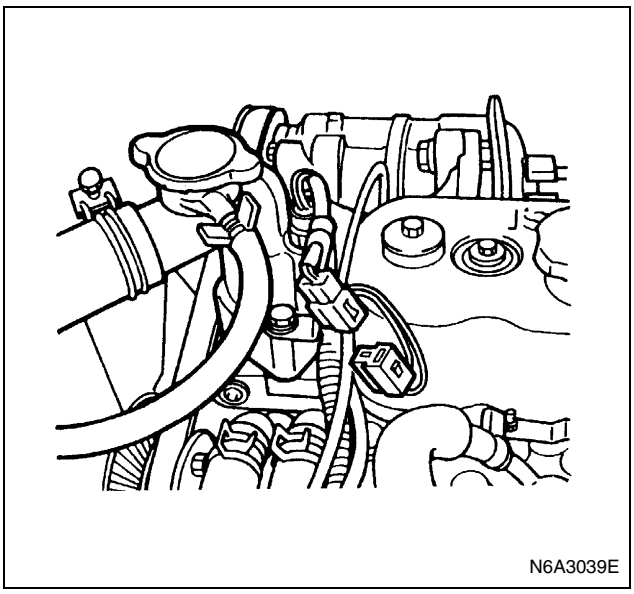
2. Connect the circuit tester between glow plug and engine earth.
3. Inspect the following items with starter switch set to ON position (but do not start the engine).
   1) The glow indicator shall light for 1 — 6 seconds.
   2) The circuit tester shall indicate power supply voltage for 9 — 13 seconds.

- If above specifications are not satisfied, inspect wire harness, glow relay and thermo-sensor. If satisfied, inspect glow plug.



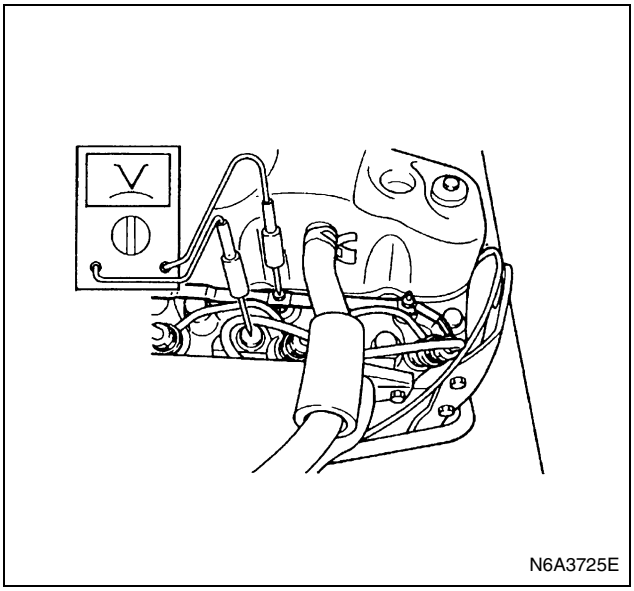
Inspection on Quick Heating Afterglow Operation

1. Disconnect thermo-sensor connection on the thermostat housing.



N6A3039E

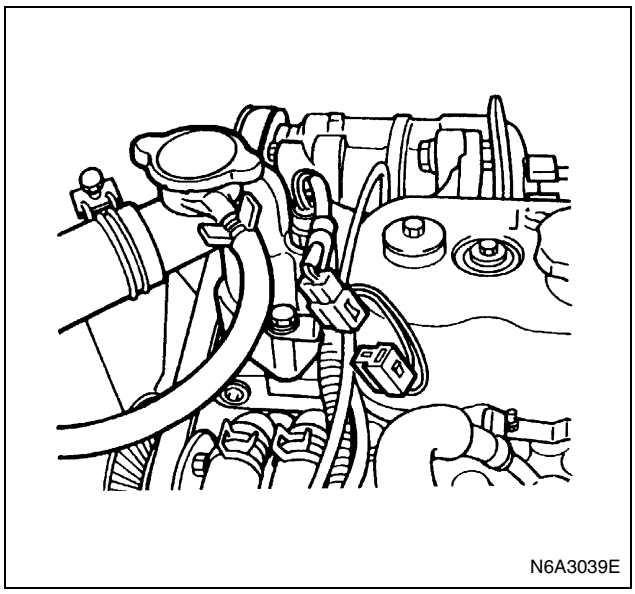
2. Connect the circuit tester between glow plug and engine earth.
3. Inspect the following item with start the engine.
   1) The circuit tester shall indicate power supply voltage for about 5 seconds.
   - If above specification is not satisfied, inspect battery voltage, engine earth, wire harness and starter switch “st” signal to control unit.
     If satisfied, inspect wiring harness, engine earth and starter switch.



N6A3725E

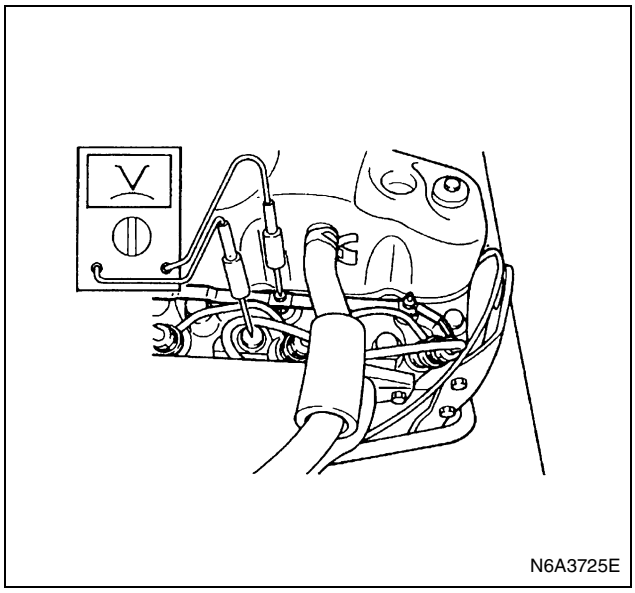
Inspection on Afterglow Operation

1. Disconnect thermo-sensor connection on the thermostat housing.



N6A3039E

2. Connect the circuit tester between glow plug and engine earth.
3. Inspect the following items with start the engine.
   1) The circuit tester shall indicate about 7 volts after 360 seconds of engine start.
   - If above specifications are not satisfied, inspect battery voltage, engine earth, wiring harness, glow plug, dropping resistor, relay No. 2 and charge relay.

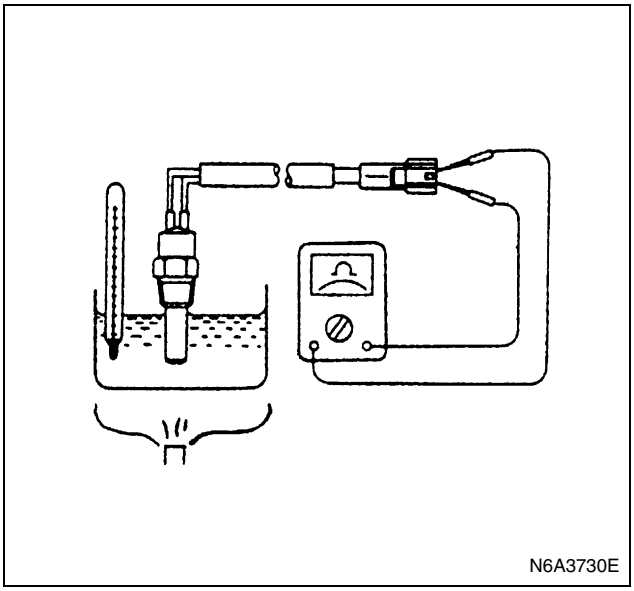


N6A3725E

Thermo Sensor

Measure the resistance depending on the water temperature as shown in the left figure. (Measuring range: 10°C — 50°C)

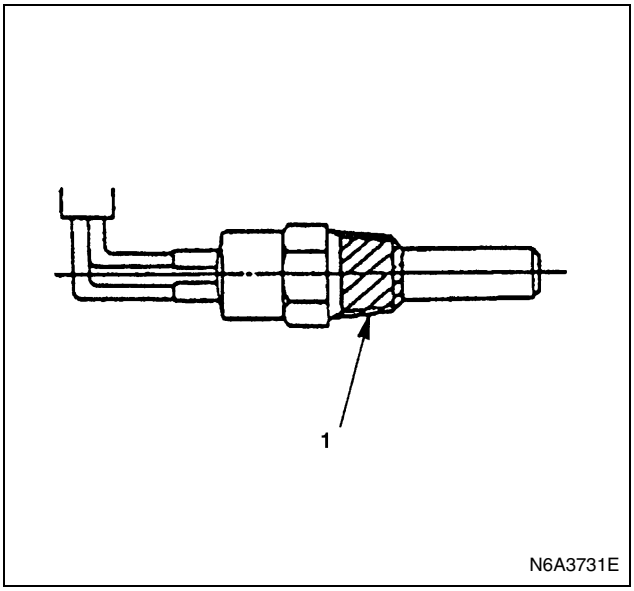
Temperature	Current (mA)	Resistance (KW)
20 ± 1	1.0	2.0 — 3.0
50 ± 1	1.0	0.68 — 1.0



N6A3730E

When installing the thermo sensor, apply sealant (Loctite #262 or equivalent) (1) to narrowed portion in figure to prevent water leakage.

Tighten:
Thermo sensor to 8 N·m (0.8 kg·m/69 lb·in)



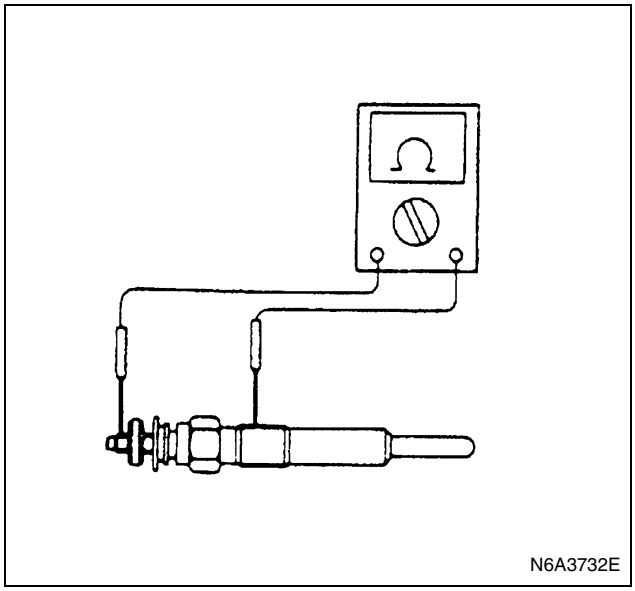
N6A3731E

Glow Plug

Inspect the resistance

Resistance at normal temperature	Ω
0.8 — 1.0	

Tighten:
Glow plug to 23 N·m (2.3 kg·m/17 lb·ft)

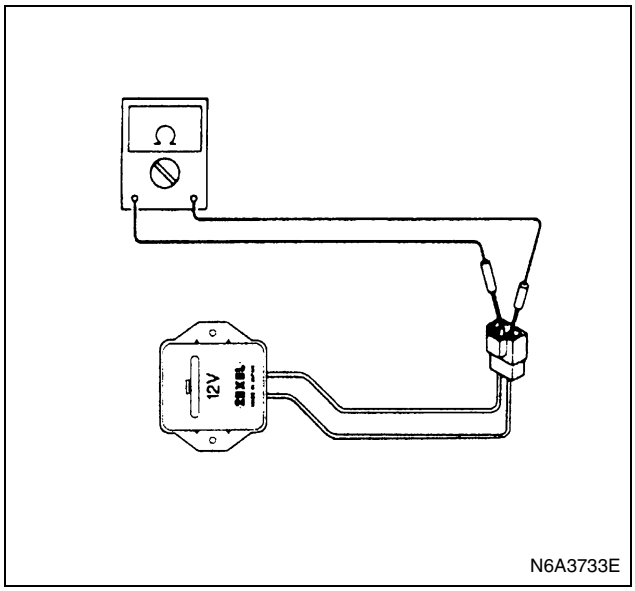


N6A3732E

Dropping Resistor

Inspect the resistance

Resistance of normal ambient temperature	mΩ
225 — 255	



N6A3733E

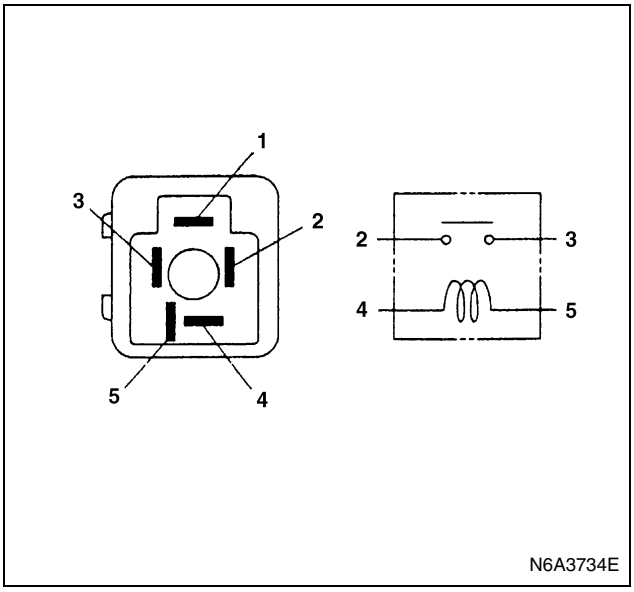
Glow Plug Relay

Inspect the continuity

2 — 3	No Continuity

If apply the battery voltage to terminal between 4 — 5

2 — 3	Continuity



Charge Relay
Inspect the continuity

3 — 5	Continuity
1 — 5	No Continuity

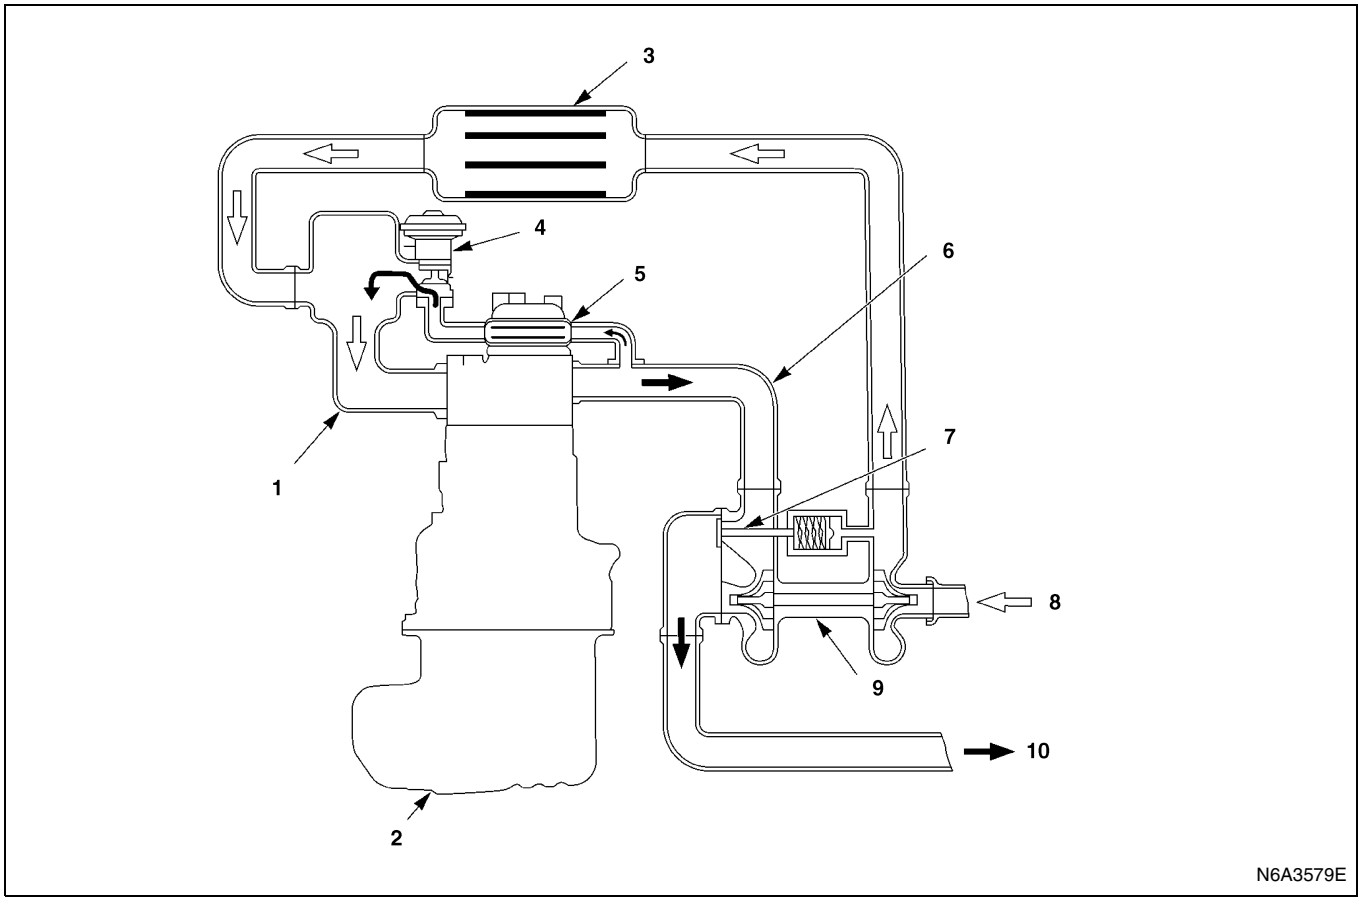
Legend

1. EGR valve
2. Potentiometer
3. Thermo switch
4. Injection pump
5. Vacuum pump
6. V.S.V
7. EGR controller
8. RPM sensor

This system controls the formation of NOx emission by recirculating the exhaust gas into the combustion chamber through the intake manifold.
The EGR valve are controlled by VSV, also VSV are controlled by EGR controller according to signals from RPM sensor and Potentiometer.
The amount of EGR depends on the number of engine rotations and the opening of the accelerator.

4JH1-TC



Legend

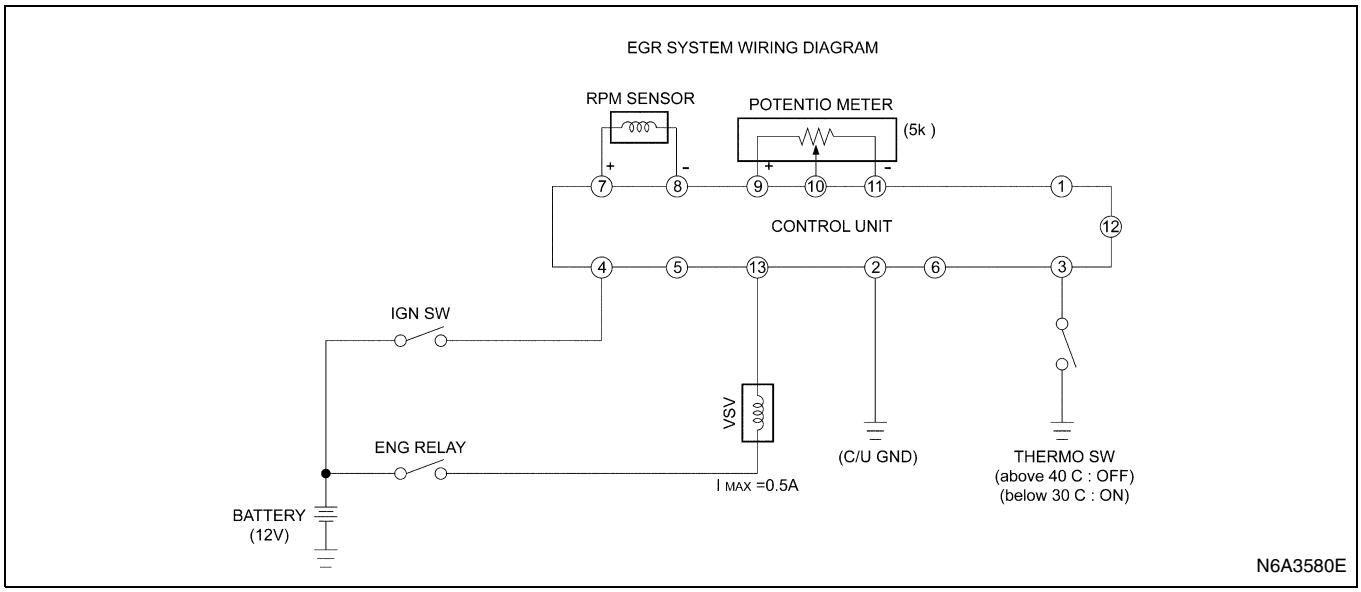
2. Oil pan
3. Inter cooler
4. EGR valve
5. EGR cooler
6. Exhaust manifold
7. Wast gate
8. Fresh air
9. Turbocharger
10. Exhaust gas

The 4JH1-TC engine is equipped with the EGR cooler. The cooler reduces the temperature of the air being drawn into the engine and the combustion temperatures. This results in reducing nitrogen oxide (NOx) emissions.

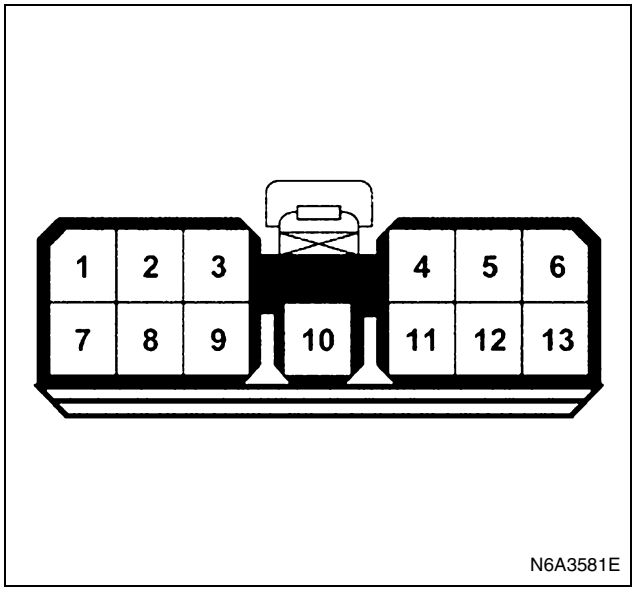
EGR SYSTEM WIRING DIAGRAM

For 4JB1-TC/4JG2



1. Connector Pin Assignment

No.	Connector Name
1	—
2	Battery (–) c/u GND
3	Thermo Switch
4	Battery (+)
5	—
6	—
7	rpm Signal (+)
8	rpm Signal (–)
9	Potentiometer (+)
10	Potentiometer
11	Potentiometer (–)
12	—
13	VSV



EGR SYSTEM OPERATION

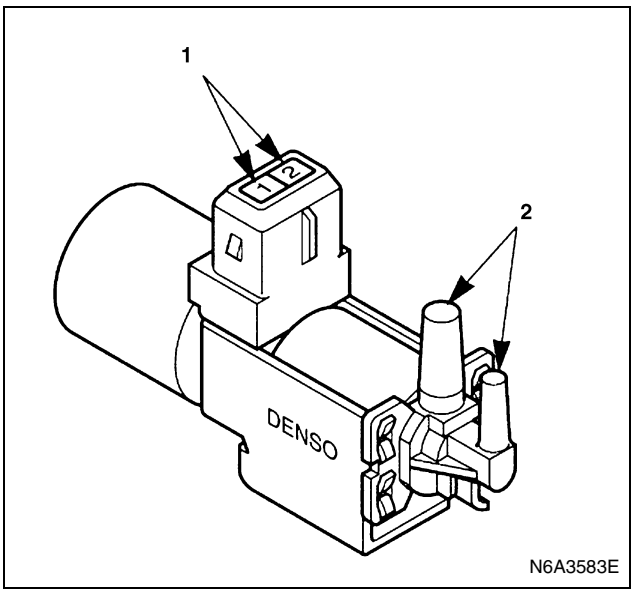
1. On the input side of engine speed, there is provided a hysteresis of 50 rpm on the speed rising side.
2. It does not work until 70 seconds, pass after engine start.
3. It does not work while the water temperature switch is on (30°C or lower).
4. While engine speed drops from 3,800 rpm or higher, it does not work for 25 seconds.

Exhaust Gas Recirculation (EGR) System Check

Step	Action	Value	YES	NO
1	Check the EGR valve for looseness. Is the EGR valve loose?	—	Go to Step 2	Go to Step 3
2	Tighten the EGR valve. Is the action complete?	—	Verify repair	—
3	1. Engine “OFF”. 2. Ignition “ON”. 3. Using test light to ground, check the EGR harness between the EGR valve and ignition feed. Does the test light illuminate?	—	Go to Step 5	Go to Step 4
4	Repair the EGR harness ignition feed. Was the problem corrected?	—	Verify repair	Go to Step 5
5	1. Remove the EGR valve. 2. Visually and physically inspect the EGR valve pintle, valve passages and adapter for excessive deposits, obstructions or any restrictions. Does the EGR valve have excessive deposits, obstructions or any restrictions?	—	Go to Step 6	Go to Step 7
6	Clean or replace EGR system components as necessary. Was the problem corrected?	—	Verify repair	Go to Step 7
7	1. Remove the EGR inlet and outlet pipes from the intake and exhaust manifolds. 2. Visually and physically inspect manifold EGR ports and EGR inlet and outlet pipes for blockage or restriction caused by excessive deposits or other damage. Do the manifold EGR ports or inlet and outlet pipes have excessive deposits, obstructions, or any restrictions?	—	Go to Step 8	EGR system working properly. No problem found.
8	Clean or replace EGR system components as necessary. Is the action complete?	—	Verify repair	—

INSPECTION

Vacuum Switch Valve (VSV)
Check the resistance between the VSV connector terminals using a circuit tester.
Cold Resistance: 37 — 44 (Ω) (for 12 volt)
Connect battery voltage between VSV connector terminals and make sure of the continuity between the ports.



Legend
1. 2 pin
2. Port

EGR Valve
With negative pressure applied to the diaphragm chamber, make sure that the valve is smoothly actuated to make the area between (1) and (2) ventilated.
Startup: About — 18.66±2.67 Kpa (−140±20 mmHg)
Check to see if EGR valve is normally actuated under the following conditions:
QWS off (After warming up)
Engine coolant temp: 80°C or higher

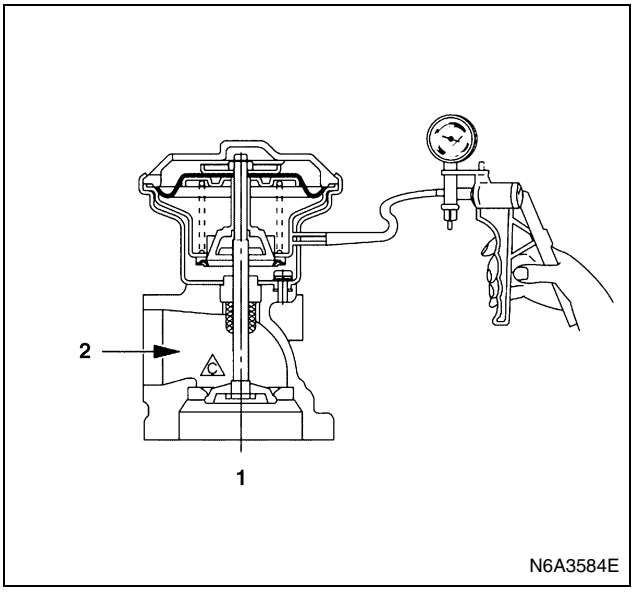


Illustration	Tool Number / Description / Remarks
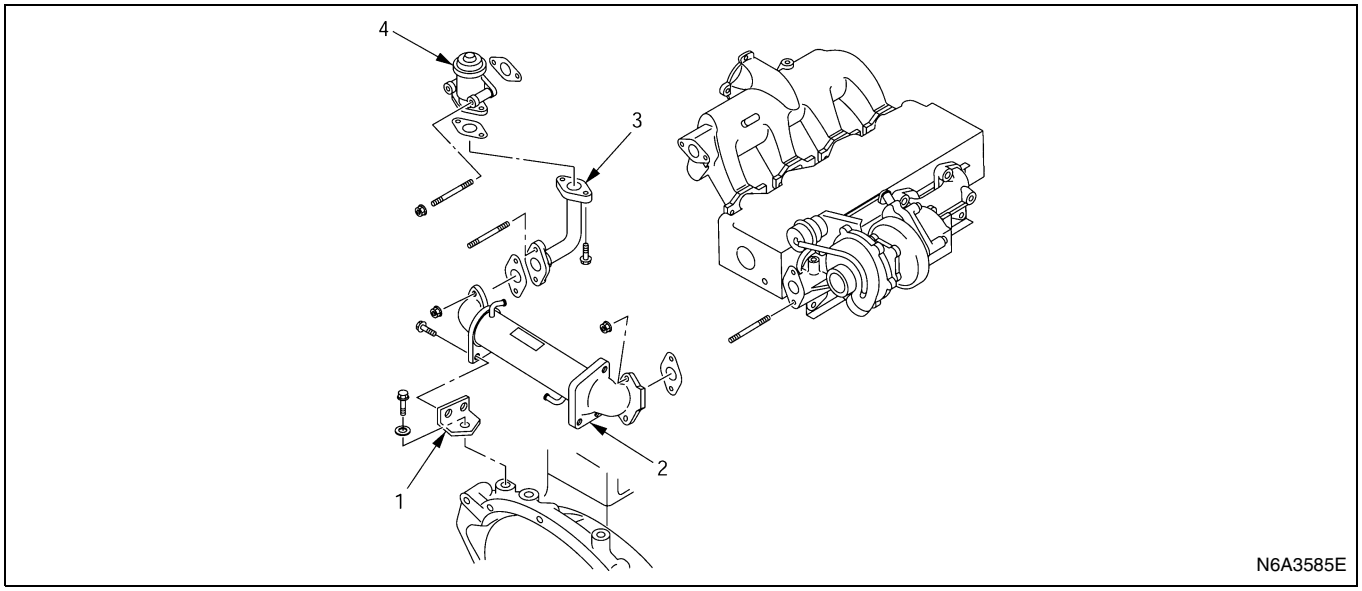
 5884003660	5-8840-0366-0 / High Impedance Multimeter (Digital Voltmeter-DVM)
 5884002790	5-8840-0279-0 / Vacuum Pump with Gauge

EGR COOLER

Component



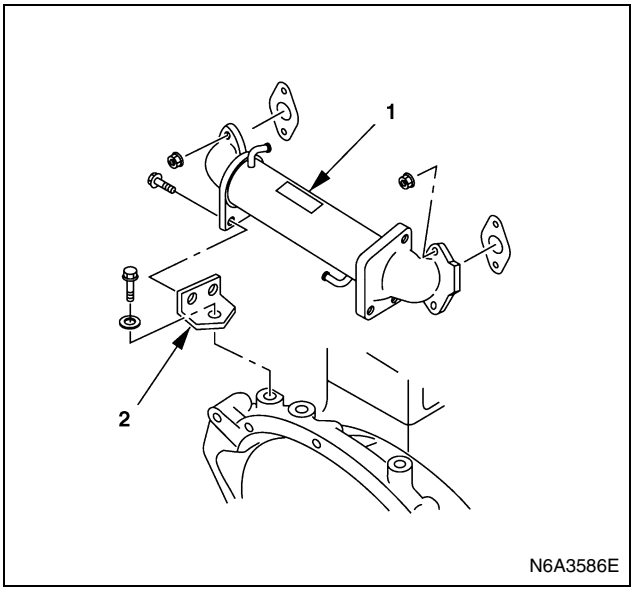
Legend
1. EGR cooler bracket
2. EGR cooler
3. EGR pipe
4. EGR valve

Removal

Preparation

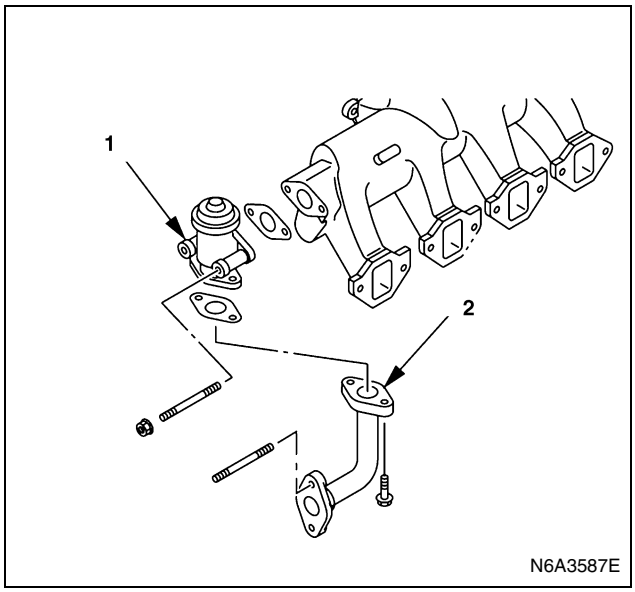
- Disconnect the battery ground cable.
- Drain the coolant.
- Remove the water hose.

1. EGR Cooler Bracket
   Remove the bracket from the flywheel housing.
2. EGR Cooler
   Remove the EGR fixing nuts. Remove the cooler together with the gasket.



Legend
1. EGR cooler
2. EGR cooler bracket

3. EGR Pipe
4. EGR Valve

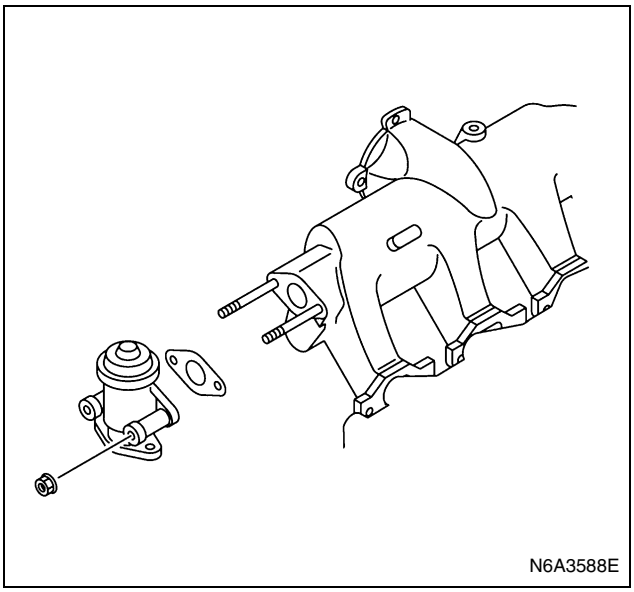


Legend
1. EGR valve
2. EGR pipe

Installation

1. EGR Valve
   - Install the gasket to the intake manifold.
   - Install the EGR valve and tighten the nuts to the specified torque.

Tighten:
- Nut to 24 N·m (2.4 kg·m / 17 lb·ft)

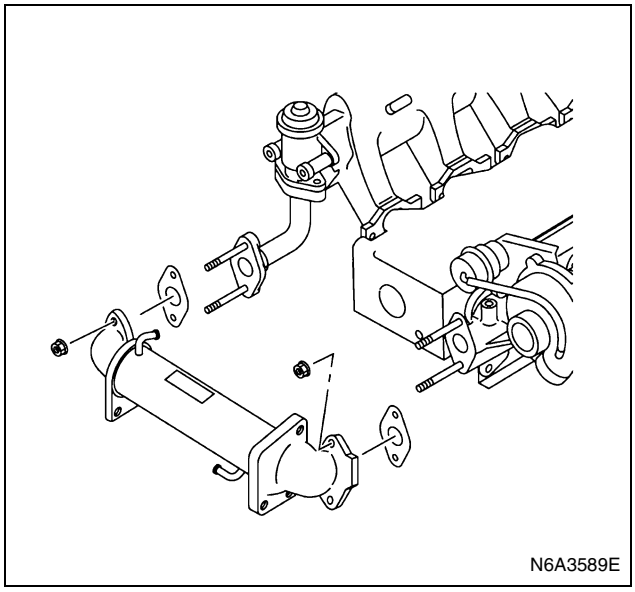


N6A3588E

2. EGR Pipe
   - Install the gasket to the EGR valve.
   - Install the EGR pipe and tighten the bolts to the specified torque.

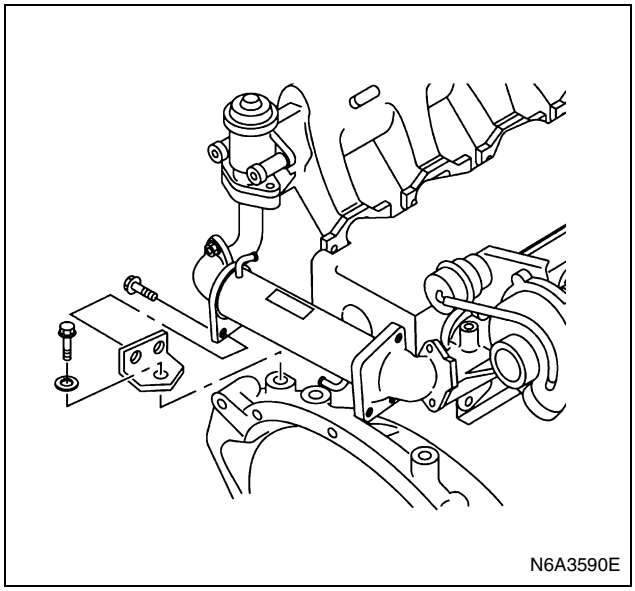
Tighten:
- Bolt to 19 N·m (1.9 kg·m / 14 lb·ft)

3. EGR Cooler
   - Install the gaskets to the EGR pipe and the exhaust manifold.
   - Install the EGR cooler.
   - Tighten the nuts until they seat (do not final tighten).



N6A3589E

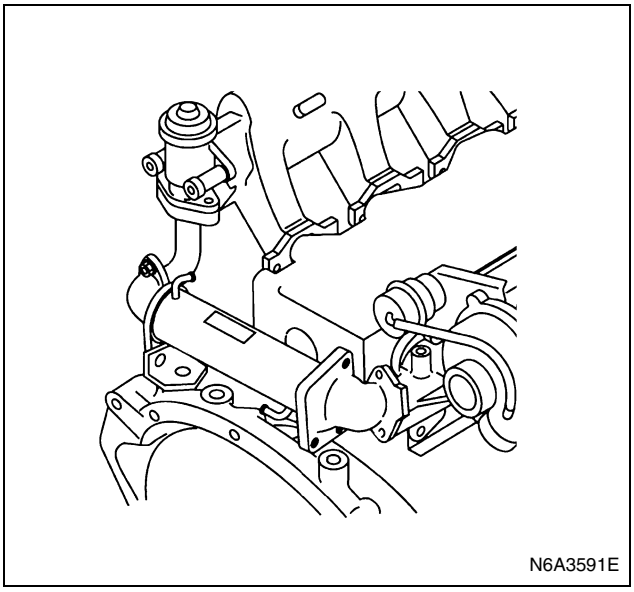
4. EGR Cooler Bracket
   - Install the bracket to the EGR cooler.
   - Install the washer to the flywheel housing side.
   - Tighten the bolts until they seat (do not final tighten).



N6A3590E

Tighten the nuts and bolts to the specified torque in the order shown in the illustration.

Tighten:
- Nuts to 24 N·m (2.4 kg·m / 17 lb·ft)
- Bolts to 19 N·m (1.9 kg·m / 14 lb·ft)



N6A3591E

ENGINE 4J SERIES

SECTION 6F
ENGINE EXHAUST

Caution:
Exhaust system components must have enough clearance from the underbody to prevent overheating of the floor pan and possible damage to the passenger compartment, insulation and trim materials.

Contents

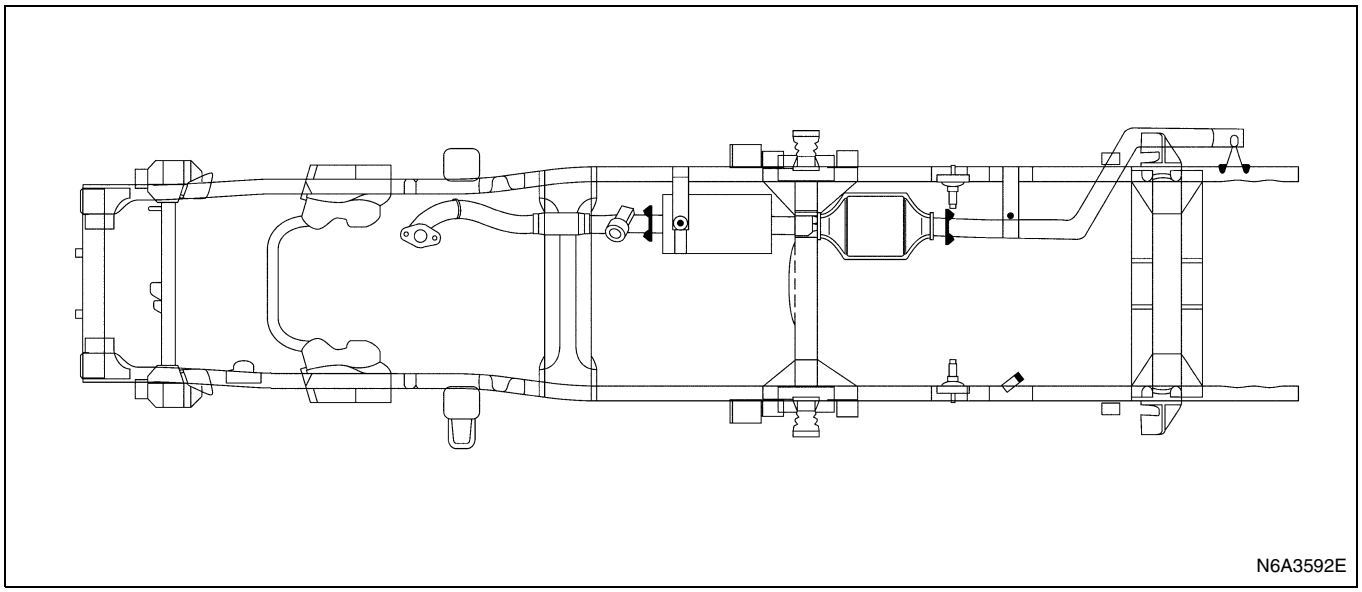
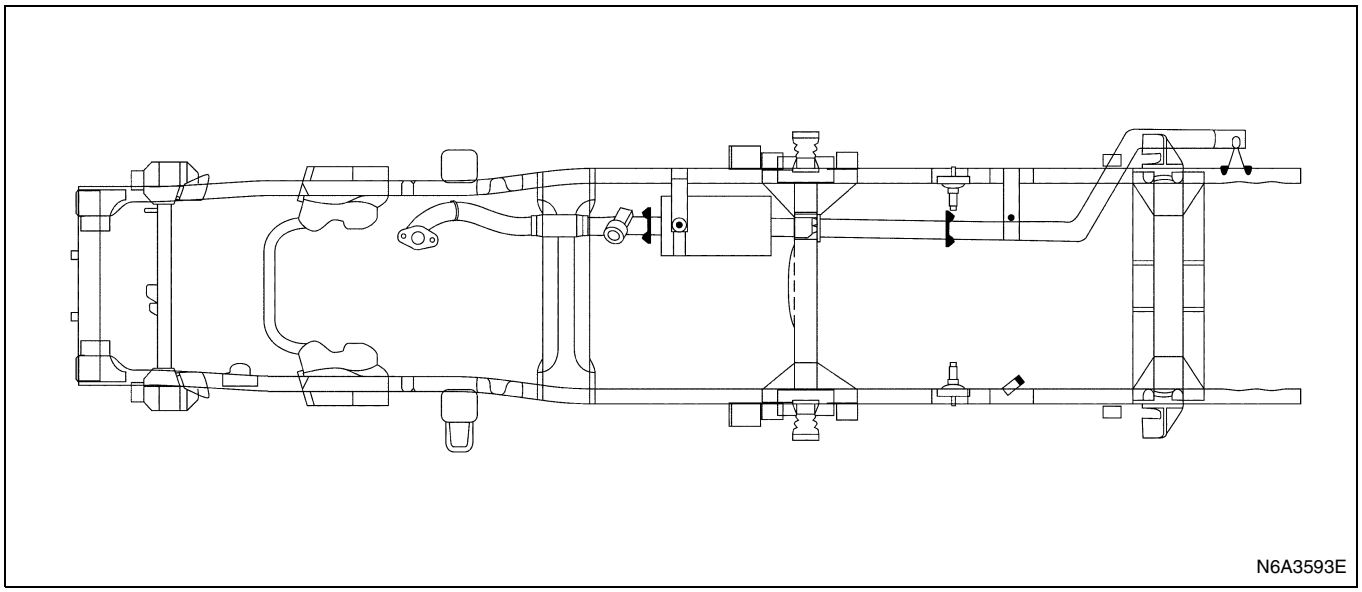
THREE WAY CATALYTIC CONVERTER 6F-3
On-Vehicle Service 6F-3
FRONT EXHAUST PIPE 6F-4
Component 6F-4
Removal 6F-4
Installation 6F-4
EXHAUST BRAKE UNIT 6F-6
Inspection 6F-6

GENERAL DESCRIPTION

Model '91/542B (Euro 2)



General Export

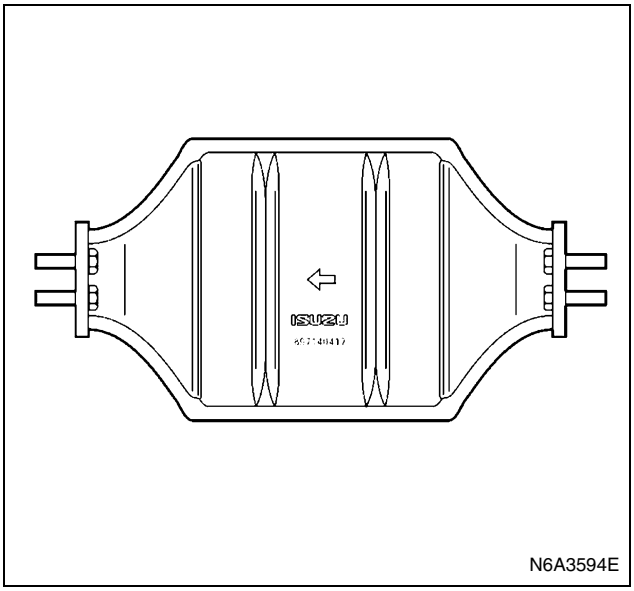


When inspecting or replacing exhaust system components, make sure there is adequate clearance from all points on the underbody to prevent overheating of the floor pan and possible damage to the passenger compartment insulation and trim materials.

Check complete exhaust system and nearby body areas and rear compartment lid for broken, damaged, missing or mispositioned parts, open seams, holes, loose connections or other deterioration which could permit exhaust fumes to seep into the rear compartment or passenger compartment. Dust or water in the rear compartment may be an indication of a problem in one of these areas. Any faulty areas should be corrected immediately.

THREE WAY CATALYTIC CONVERTER

The three way catalytic converter is an emission control device added to the exhaust system to reduce pollutants from the exhaust gas stream.



Caution:
The catalytic converter requires the use of unleaded fuel only.

Periodic maintenance of the exhaust system is not required. If the vehicle is raised for other service, it is advisable to check the condition of the complete exhaust system.
A dual bed monolith catalytic converter is used in combination with three way catalytic converter.
Catalytic Types:
Three way (Reduction/Oxidation) catalyst
The catalyst coating on the three way (reduction) converter contains platinum and rhodium which lowers the levels of oxide of nitrogen (NOx) as well as hydrocarbons (CH) and carbon monoxide (Co).

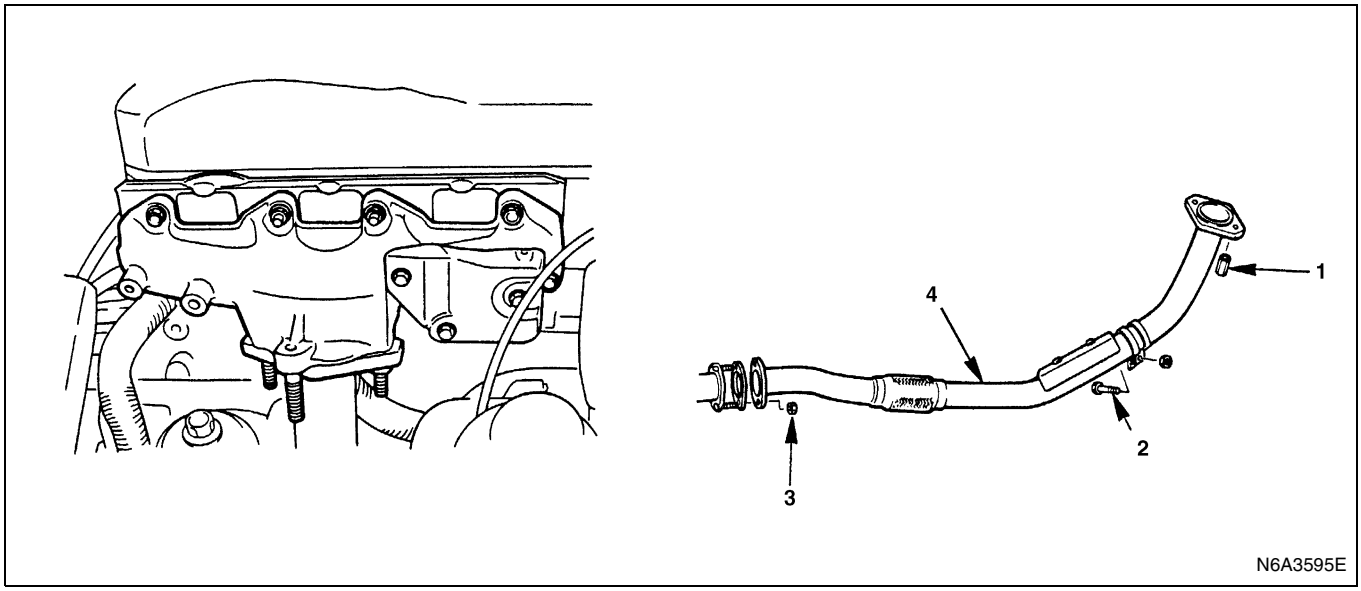
On-Vehicle Service

Rattles and noise vibrations in the exhaust system are usually caused by misalignment of parts. When aligning the system, leave all bolts or nuts loose until all parts are properly aligned; then tighten, working from front to rear.

1. Check connections for looseness or damage, especially for exhaust gas leakage.
2. Check clamps and rubbers for weakness, cracks or damage.
3. If any part of the converter heat shield is damaged or dented to the extent that it contacts the catalyst, repair or replace.
4. Check for dents or damage and for any holes or cracks caused by corrosion.

FRONT EXHAUST PIPE

Component



Legend

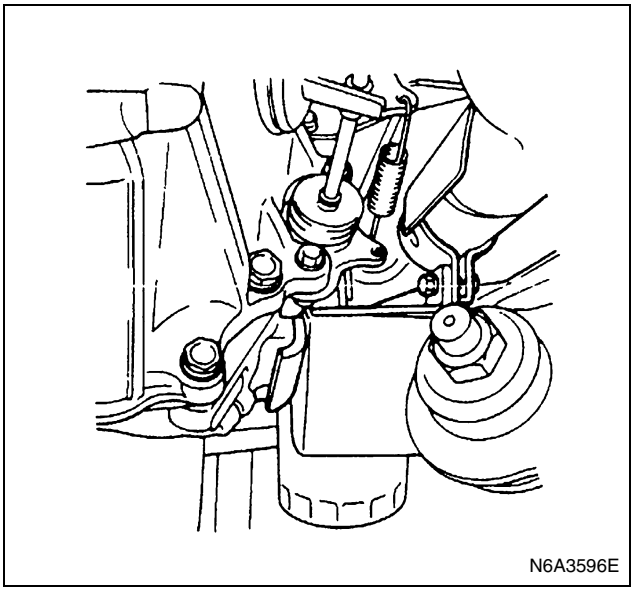
1. Exhaust manifold fixing washer and nut.
2. Front exhaust pipe mounting bracket fixing bolt and nut.
3. Front exhaust pipe fixing nut.
4. Front exhaust pipe.

Removal

Preparation

- Battery ground cable

1. Exhaust manifold fixing nuts.
   - Remove two fixing nuts from exhaust manifold and front pipe.
2. Front exhaust pipe mounting bracket fixing bolt and nut.



3. Front exhaust pipe fixing bolts and nuts.
   - Remove two bolts fixed from front pipe and center pipe.
4. Front exhaust pipe.
   - Take out the exhaust pipe to another side.

Installation

1. Front exhaust pipe.
2. Front exhaust pipe fixing bolts and nuts.
   - Tighten the fixing nuts to the specified torque

Tighten:

- 50 N·m (5.1 kg·m / 37 lb·ft)

3. Front exhaust pipe mounting bracket fixing bolt and nut.
   - Tighten the fixing bolt to the specified torque

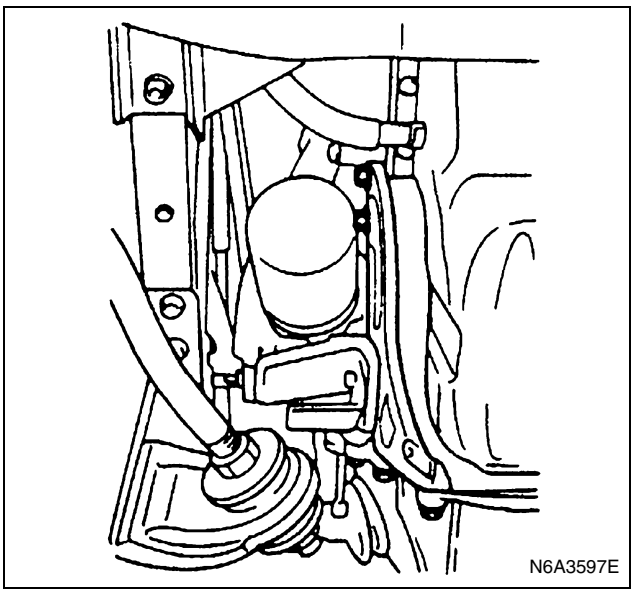
Tighten:

- 40 N·m (4.1 kg·m / 30 lb·ft)

4. Exhaust manifold fixing nuts
   - Tighten the fixing nuts to the specified torque

Tighten:

- 69 N·m (7 kg·m / 51 lb·ft)



- Connect battery ground cable.
- After assembling each part, start the engine to check for any leakage of gas at each connection.

EXHAUST BRAKE UNIT

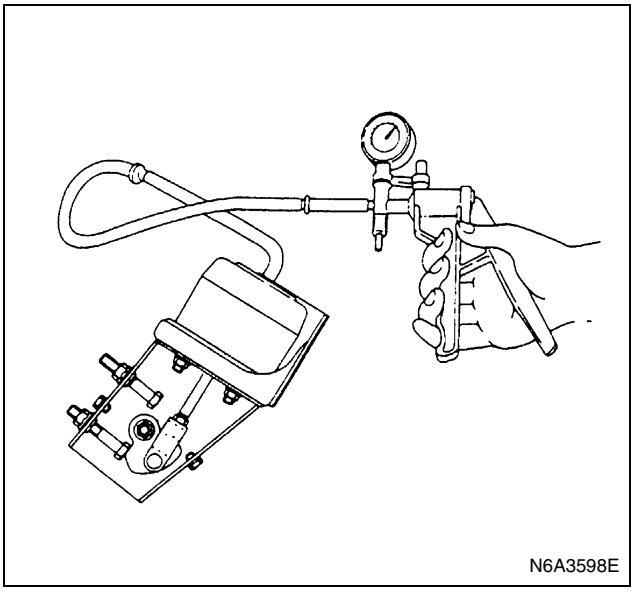
Inspection

Operational Inspection

- With the engine idling, operate the exhaust brake to check for the sound of the valve hitting against the stopper.

Unit Inspection

- Check to see if the exhaust valve opens and closes smoothly when the power chamber is applied with a negative pressure (400 mmHg — 700 mmHg) by the vacuum pump.



- Check to see if the clearance between the valve and the body is in the range of 0.1 mm — 0.2 mm (the minimum of 0.1 mm) on an average of the points “A” and “B” when the power chamber is applied with a negative pressure (650 mmHg — 700 mmHg) by the vacuum pump.
  When the clearance is outside this range, adjust the clearance with the adjust bolt.

TURBOCHARGER

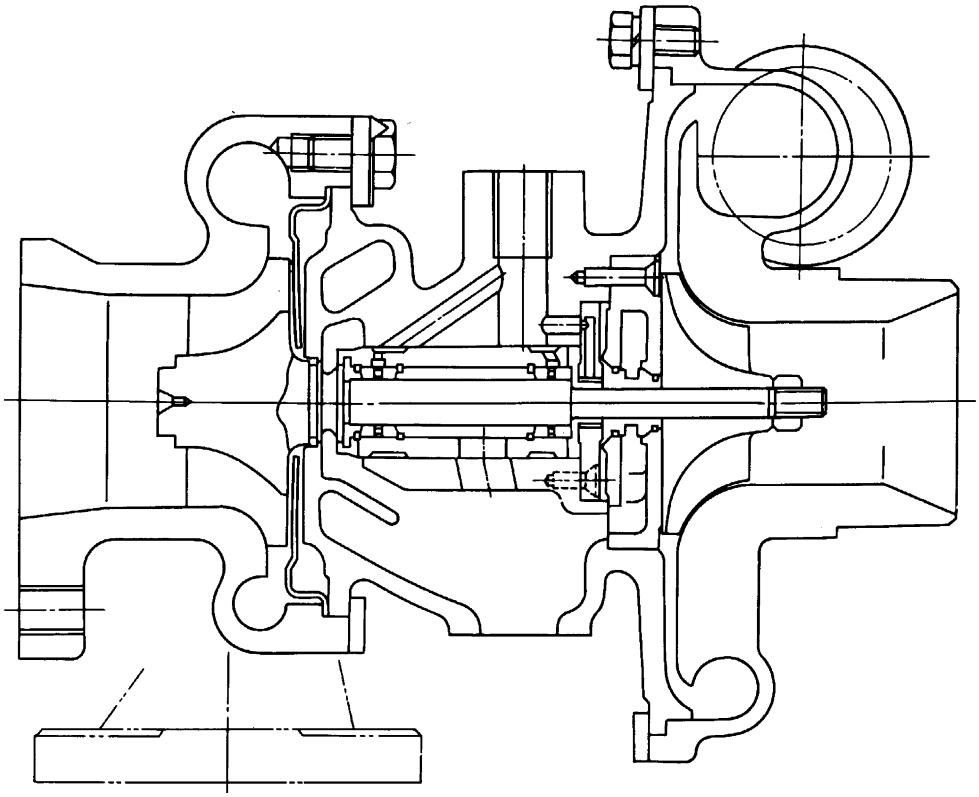
Main Data and Specifications

Model		IHI RHF 4H	IHI RHB 5
Turbine type		Mixed-flow	Radial-inflow
Compressor type		Centrifugal	
Maximum permissible speed	rpm	180,000	
Wastegate opening pressure	kPa (mmHg)	109 ± 4.4 (815 ± 33)	120 ± 4.8 (898 ± 36)
Weight	N (kg/lb)	41 (4.2/9.3)	45 (4.6/10.1)

IHI: Ishikawajima-Harima Heavy Industries., Ltd.

GENERAL DESCRIPTION

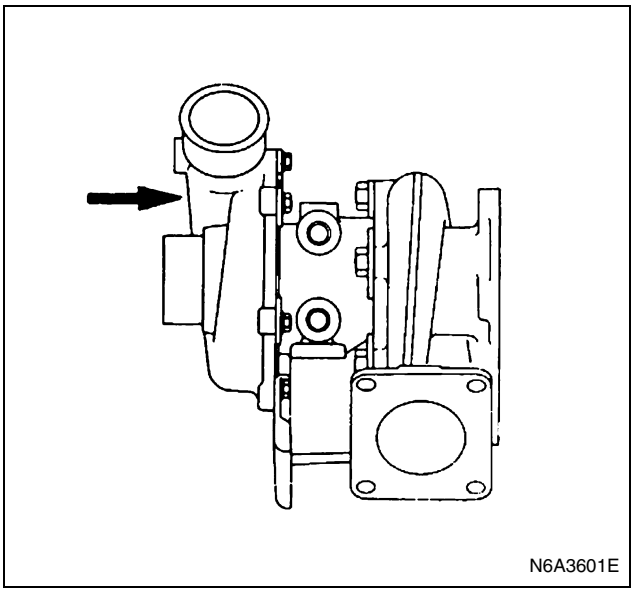


N6A3600E

The turbocharger internal mechanism consists of the turbine wheel, the compressor wheel, and the radial bearings. These parts are supported by the bearing housing.
The turbocharger external mechanism consists of the compressor housing air intake port and the turbine housing air exhaust port.
The turbocharger increases air intake efficiency. This results in increased engine power, reduced fuel consumption, and minimal engine noise.
The turbocharger operates at very high speeds and temperatures. Part materials have been carefully selected and machined to extremely high precision.
Turbocharger servicing requires great care and expertise.
If reduced performance is noted, check the engine for damage or wear. If there is no apparent engine damage or wear, trouble with the turbocharger is indicated.

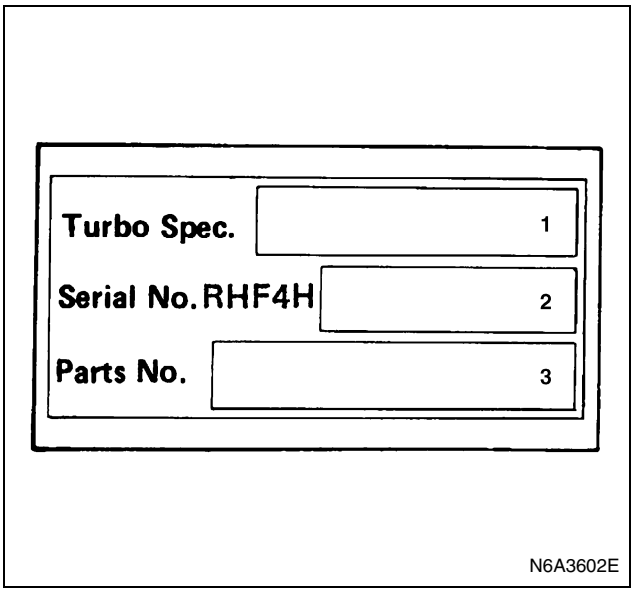
Identification of Unit

The turbocharger nameplate gives the date of manufacture and other important information required to identify the unit when service inquiries are made.



The turbocharger nameplate has the following information stamped on it.

1. Turbocharger Specification Number, Production Year and Month
2. Production Date, Serial Number
3. ISUZU Parts Number



Turbocharger Servicing

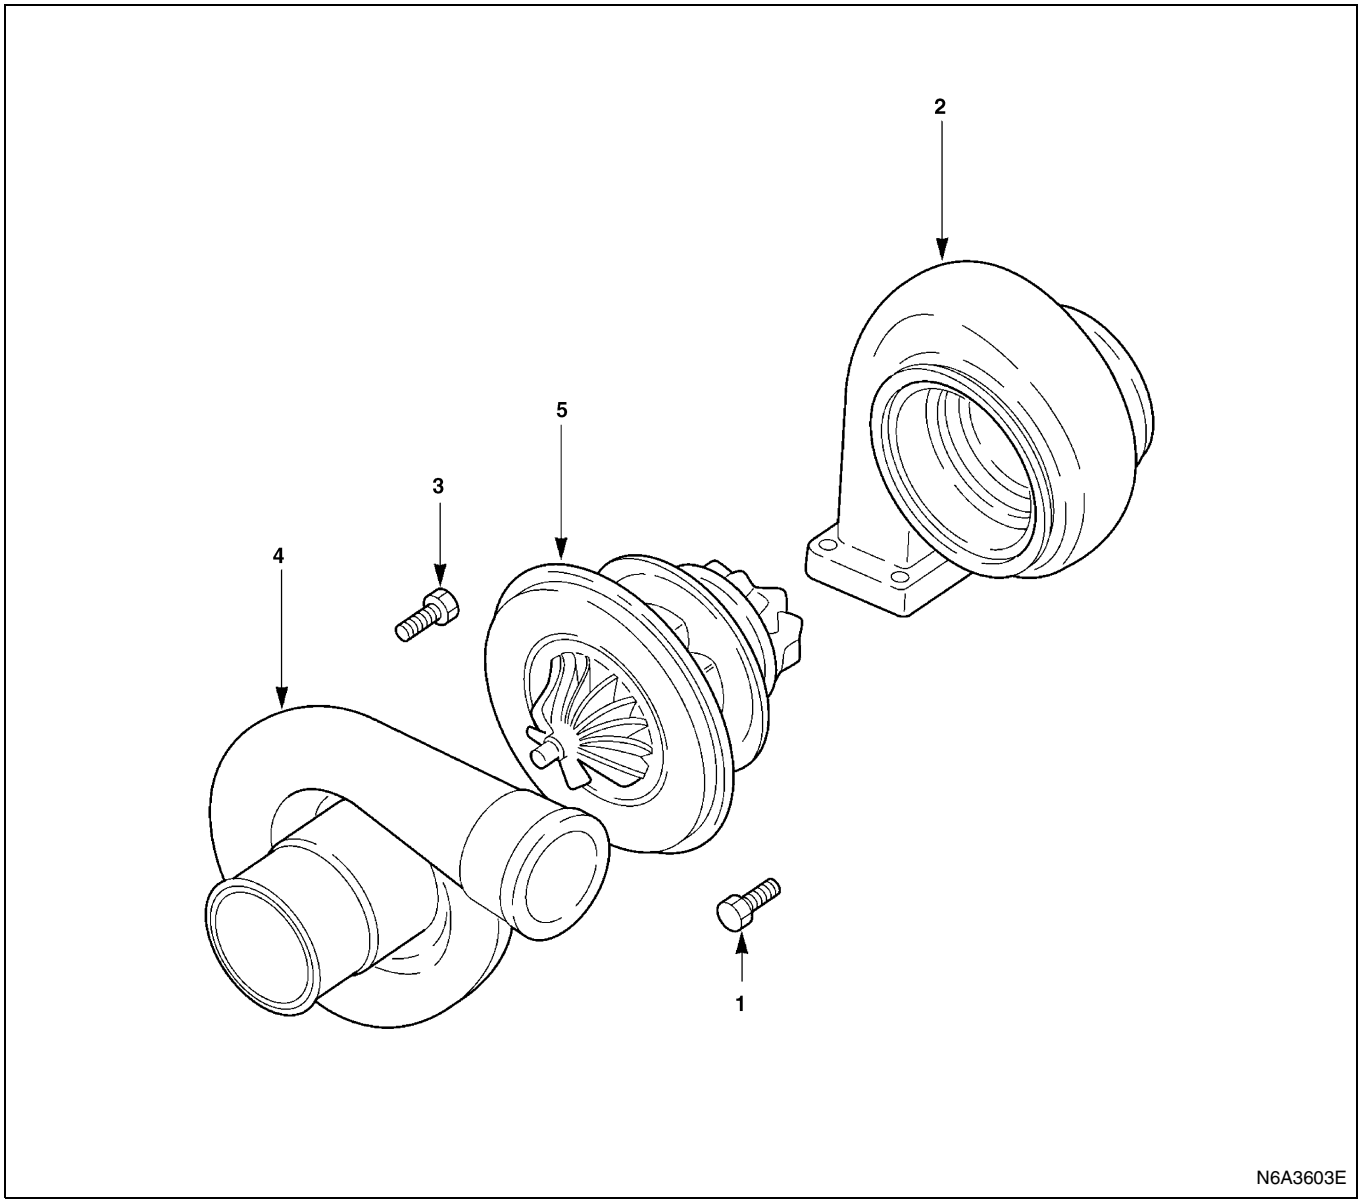
1. Refer to TROUBLESHOOTING in this Manual to determine whether or not turbocharger repair or overhaul is required.
2. The following procedures should also be performed (either with the turbocharger on the vehicle or removed from the vehicle but not disassembled) to determine whether or not turbocharger repair or overhaul is required.
   - Visual checks
   - Clearance measurements
   - End play measurements
     Refer to INSPECTION AND REPAIR
3. The turbocharger compressor and turbine housing may be removed from the center housing and rotating assembly (CHRA) for further visual inspection.
   Refer to DISASSEMBLY and REASSEMBLY.

Precautions

Turbocharger servicing requires great care and expertise.
Faulty turbocharger servicing procedures can result in serious damage to pistons, valves, cylinder liners, and other important engine parts.
ISUZU does not recommended the performance of any servicing procedure not specified described in this Manual.
Contact your nearest IHI service facility to have the turbocharger assembly repaired or overhauled.
The identification plate and assembly number will be required by the service facility.
A list of IHI Turbocharger Service Network locations is given at the end of this Section.

DISASSEMBLY

Component

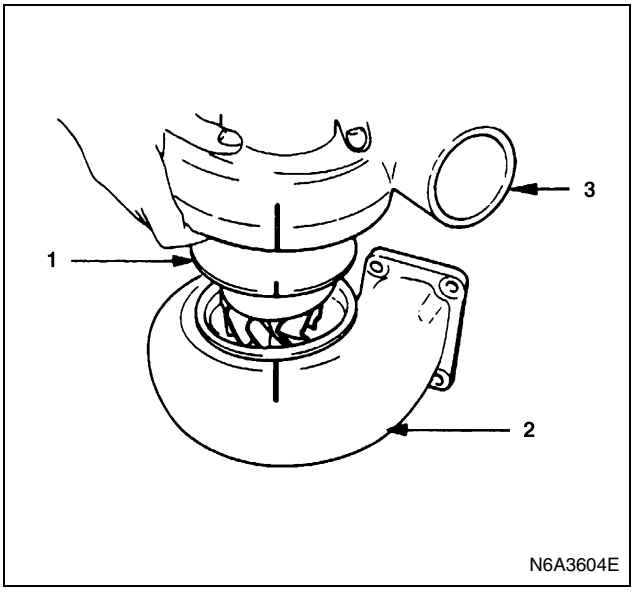


Legend

1. Bolt
2. Turbine housing
3. Bolt
4. Compressor housing
5. Center housing and rotating assembly

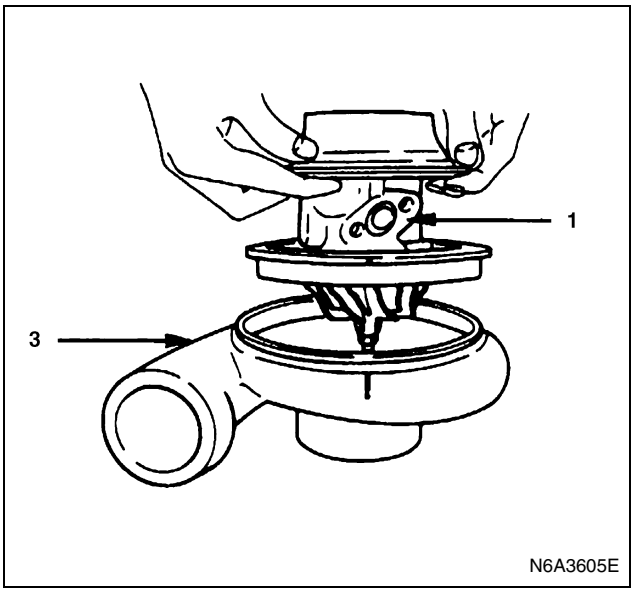
Disassembly Steps

1. Bolt
   Apply a setting mark across the center housing and rotating assembly (1), the turbine housing (2), and the compressor housing (3).



2. Turbine Housing
3. Bolt
4. Compressor Housing
5. Center Housing and Rotating Assembly
   1) Loosen the bolts.
   2) Disassembly the parts.
      Handle the parts with extreme care.
      Be particularly careful not to damage the turbine wheel blades and the compressor wheel blades. Take care not to allow foreign material to enter the center housing.

Notice:
Disassembly and servicing of the center housing and rotating assembly is not recommended.

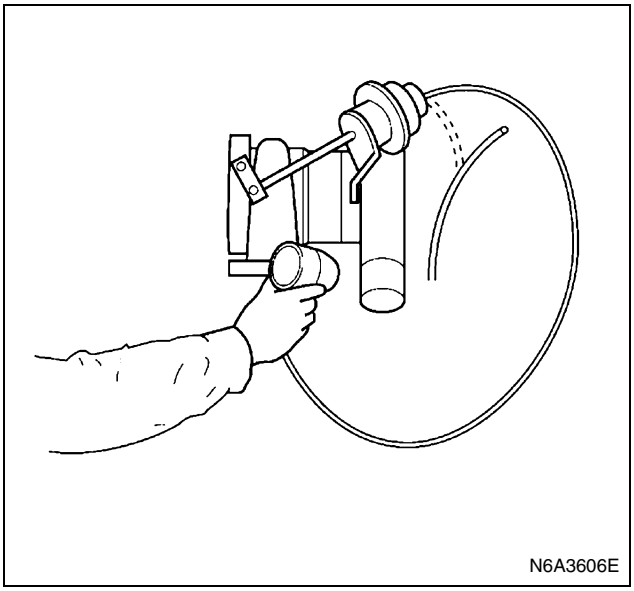


INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.
Minor servicing operations are described in this Section. Contact the nearest IHI SERVICE FACILITY for major repairs and maintenance.
Refer to “IHI SERVICE NETWORK” at the end of this Section.

Turbocharger Pressure Check

1. Remove the waste gate control chamber connecting hose.
2. Connect the pressure gauge.
3. Start the engine and gradually increase the engine speed (the vehicle must be stationary with no load applied to the engine).
4. Check to see that turbocharger pressure rises to approximately 500 mmHg.
   Pressure Gauge: 5-8840-0075-0

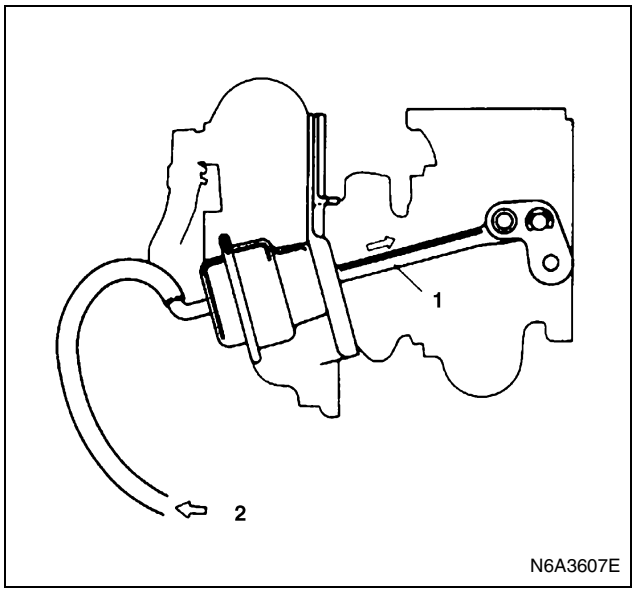


N6A3606E

Waste Gate Operation Check

1. Remove the hose between the waste gate control chamber and the intake pipe.
2. Connect the pressure gauge.
3. Check to see that the rod begins to move when a pressure of approximately 665 mmHg is applied to the waste gate, control chamber.

Notice:
Do not apply a pressure greater than 1467 mmHg (196 kPa) to the waste gate during this check.

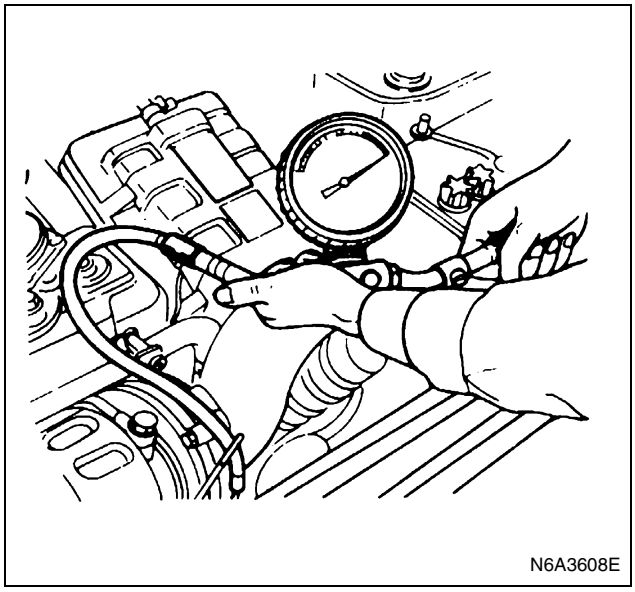


N6A3607E

Legend
1. Rod
2. Pressure

4. Check to see the pressure required to move the control rod 2 mm is within the limits shown below.

Control Rod Operating Pressure	kPa (mmHg)
4JB1-TC (IHI RHF4)	109 ± 4.4 (815 ± 33)

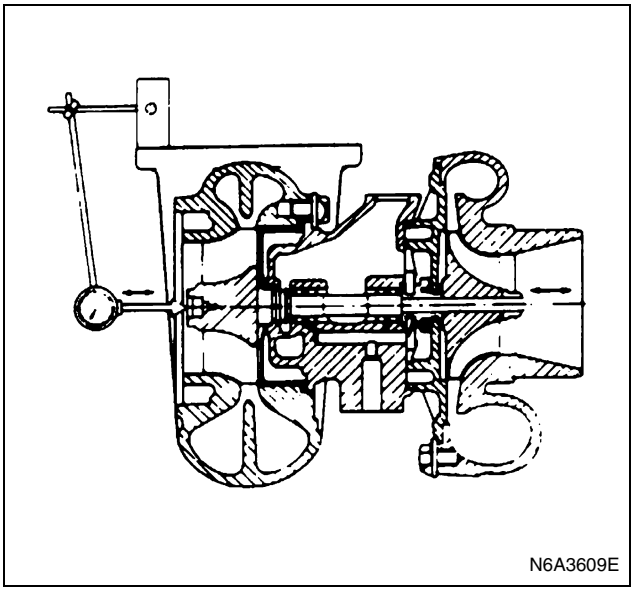


N6A3608E

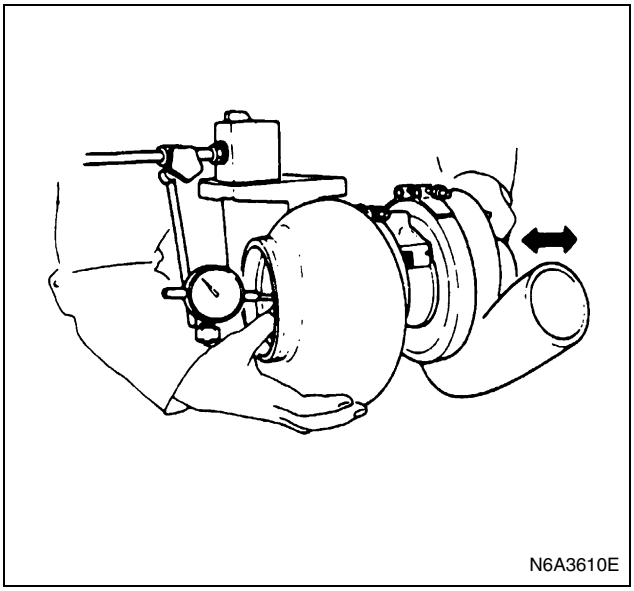
Important wheel shaft end play and bearing clearance standards and limits are included below for your reference.

Wheel Shaft End Play
Use a dial indicator to measure the wheel shaft end play. Apply a force of 1.2 kg (2.6 lb / 11.8 N) alternately to the compressor wheel end and the turbine wheel end.

Wheel Shaft End Play	mm (in)
Standard	Limit
0.02 — 0.08 (0.0008 — 0.0031)	0.09 (0.0035)



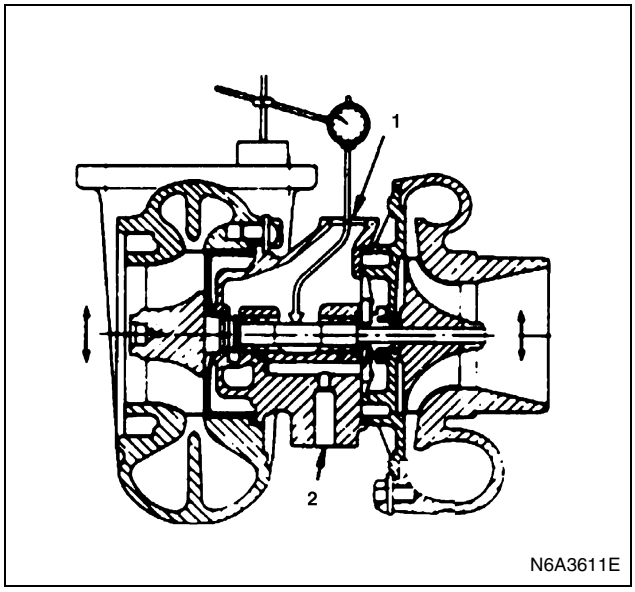
N6A3609E



N6A3610E

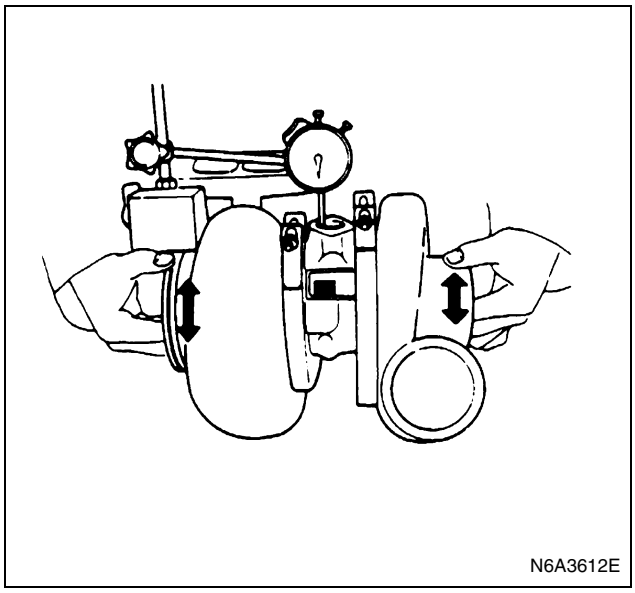
Wheel Shaft and Bearing Clearance
Use a dial indicator to measure the wheel shaft and bearing clearance.

Wheel Shaft and Bearing Clearance	mm (in)
Standard	Limit
0.07 — 0.12 (0.0028 — 0.0047)	0.16 (0.0063)



N6A3611E

Legend
1. Oil return port
2. Oil feed port



N6A3612E

REASSEMBLY

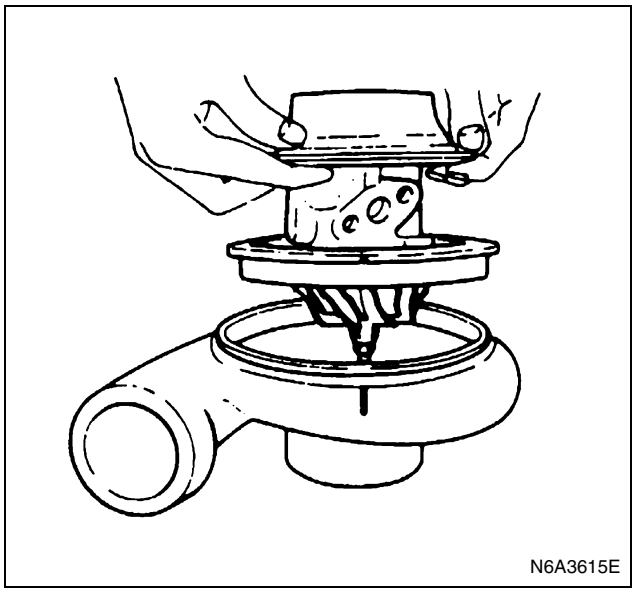
Reassembly Steps

1. Center Housing and Rotating Assembly
2. Compressor Housing
3. Bolt
   1) Apply Threebond 1215 (1) or equivalent to flange surface of compressor housing shown in the illustration.

   2) Align the setting marks (applied at disassembly) on the center housing and rotating assembly and the compressor housing.
      Handle the parts with extreme care to avoid damaging the compressor wheel blades.
   3) Apply and anti-seizing agent (LOCTITE ANTI-SEIZE LUBRICANT or the equivalent) to the new bolt threads.
   4) Install the new bolts to the compressor housing.
   5) Tighten the bolts to the specified torque.

Tighten:

- Compressor housing bolt to 4.7 N·m (0.5 kg·m / 3.5 lb·ft)



4. Turbine Housing
5. Lock Plate and Bolt
   1) Align the setting marks (applied at disassembly) on the center housing and rotating assembly and the turbine housing.
      Handle the parts with extreme care to avoid damaging the turbine shaft wheel blade.
   2) Apply and anti-seizing agent (LOCTITE ANTI-SEIZE LUBRICANT or the equivalent) to the bolt.
   3) Tighten the bolt to the specified torque.

Tighten:

- Turbine housing bolt to 28.0 N·m (2.85 kg·m / 20.6 lb·ft)

   4) Check that the rotating assembly turns smoothly.

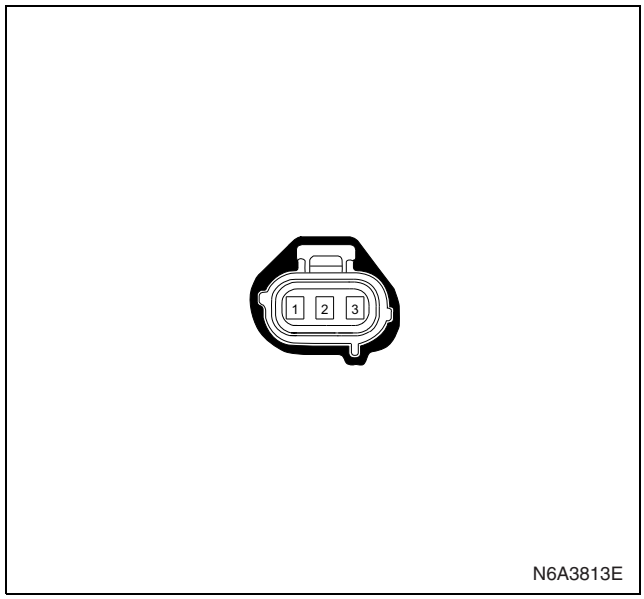
2	BRN	PTO Throttle Sensor Signal
3	PNK/BLK	PTO Throttle Sensor Low Reference

Vehicle Speed Sensor (VSS)



Connector No.		J-32
Connector Color		Gray
Test Adapter No.		J-35616-33
Pin	Wire Color	Pin Function
1	BLK/YEL	VSS Ignition Voltage
2	BLK	VSS Low Reference
3	YEL/GRN	VSS Signal

Diagnostic Information and Procedures

General Service Information

Non-OEM Parts

All of the on-board diagnostic (OBD) has been calibrated to run with original equipment manufacturer (OEM) parts. Accordingly, if commercially sold sensor or switch is installed, it makes a wrong diagnosis and turn on the malfunction indicator lamp (MIL). Aftermarket electronics, such as cellular phones, stereos, and anti-theft devices, may indicate electromagnetic interference (EMI) into the control system if they are improperly installed. This may cause a false sensor reading and turn on the MIL.

Poor Vehicle Maintenance

The sensitivity of OBD will cause the MIL turn on if the vehicle is not maintained properly. Restricted oil filters, fuel filters, and crankcase deposits due to lack of oil changes or improper oil viscosity can trigger actual vehicle faults that were not previously monitored prior to OBD. Poor vehicle maintenance cannot be classified as a “non-vehicle fault”, but with the sensitivity of OBD diagnostics, vehicle maintenance schedules must be more closely followed.

Visual / Physical Engine Compartment Inspection

Perform a careful visual and physical engine compartment inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual / physical inspection:

- Inspect all vacuum hoses for punches, cuts, disconnects, and correct routing.
- Inspect hoses that are difficult to see behind other components.
- Inspect all wires in the engine compartment for proper connections, burned or chafed spots, pinched wires, contact with sharp edges or contact with hot exhaust manifolds or pipes.

Basic Knowledge of Tools Required

Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in an incorrect diagnosis or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge. A basic understanding of hand tools is necessary to effectively use this section of the service manual.

Malfunction Indicator Lamp (MIL)

Basically, the MIL is turned on when the ECM detects a DTC that will impact the vehicle emission or performance. When the MIL remains “ON” while the engine is running, or when a malfunction is suspected due to a driveability or emissions problem, a Diagnostic System Check must be performed. The procedures for these checks are given in Diagnostic System Check - Engine Controls.

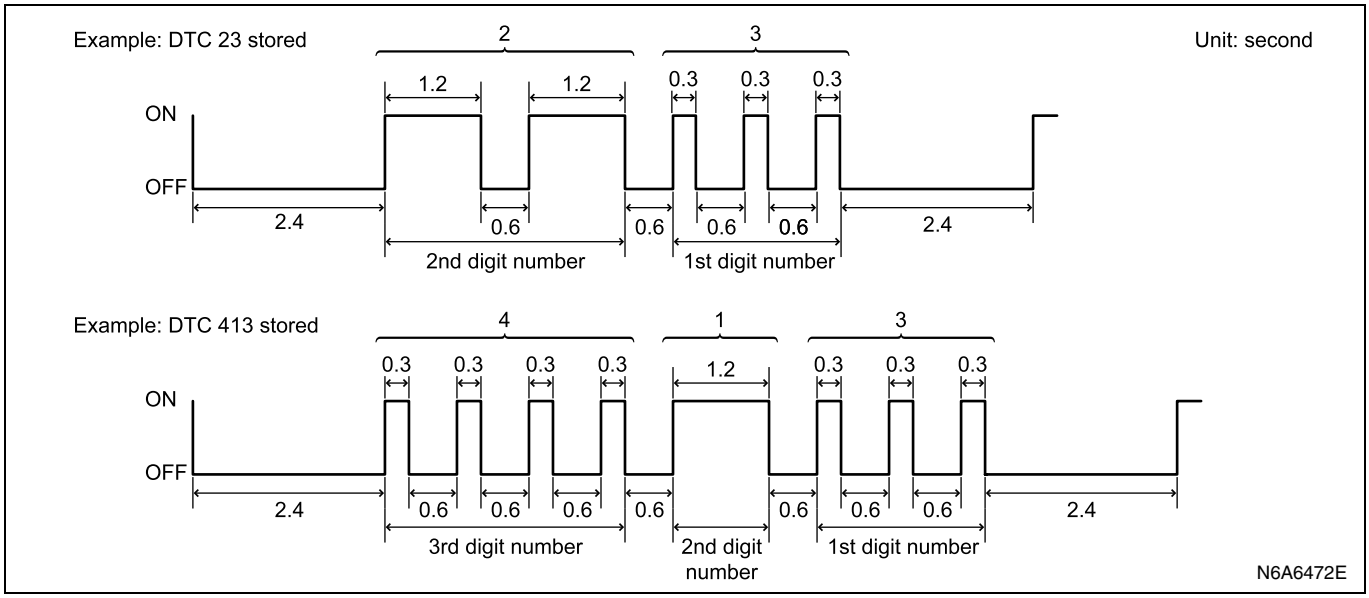
DTC Types

Characteristic of Code

- Stores a DTC on the first trip with a fail
- Dose not request illumination of any lamp

Reading Flash Diagnostic Trouble Codes (DTC)

The provision for communicating with the ECM is the Data Link Connector (DLC). The DTCs stored in the ECM memory can be read either through a hand-held diagnostic scanner such as Tech 2 plugged into the DLC or by counting the number of flashes of the MIL when the diagnostic test terminal of the DLC is grounded. The DLC terminal “1” (diagnostic request) is pulled “Low” (grounded) by jumped to DLC terminal “4”, which is a ground wire. Once terminals “1” and “4” have been connected, the ignition switch must be moved to the “ON” position, with the engine not running. The MIL will indicate a DTC three times is a DTC is present and history. If more than one DTC has been stored in the ECM’s memory, the DTCs will be output numerical order with each DTC being displayed three times. The flash DTC display will continue as long as the DLC is shorted.



Reading Diagnostic Trouble Codes (DTCs) with The Tech 2

The procedure for reading DTC(s) is used a diagnostic Tech 2. To read DTCs, use the Tech 2 “Read DTC Info As Stored By ECU”.

Clearing Diagnostic Trouble Codes (DTCs) with The Tech 2 or without Tech 2

Do not clear DTCs unless directed to do so by the service information provided for each diagnostic procedure. To clear DTCs, use with the Tech 2 “Clear DTC Information”. If there is no Tech 2, clear with accelerator pedal operation.

Notice:
A history DTC clears after 20 consecutive driving cycles without a fault.

DTC Clear Method with Accelerator Pedal Operation

1. Turn ON the ignition, with the engine OFF.
2. Use a jumper wire and the DLC terminal “1” (diagnostic request) is pulled “Low” (grounded) by jumped to DLC terminal “4”.
3. Depress accelerator pedal within 1 – 3 seconds.
4. Release accelerator pedal within 1 – 3 seconds.
5. Depress accelerator pedal within 1 – 3 seconds.
6. Release accelerator pedal within 1 – 3 seconds.
7. Depress accelerator pedal within 1 – 3 seconds.
8. Release accelerator pedal within 1 – 3 seconds.

Notice:
DO NOT touch the accelerator pedal when it is released.

Operating Procedure

1. Press Enter at start screen.
2. Select Diagnostic > appropriate vehicle identification > Engine > 4HK1(Common Rail).
3. The following table shows, which functions are used the available equipment versions.

- F0: Diagnostic Trouble Codes
  - F0: Read DTC Info As Stored By ECU
  - F1: Clear DTC Information
- F1: Data Display
- F2: Snapshot
- F3: Actuator Test
  - F0: Fuel System
    - F0: Rail Pressure Control

    - F2: Upload ID Code
    - F3: Download ID Code

N6A6473E

Tech 2 Scan Tool

Isuzu recommend using Tech 2. Refer to the Tech 2 Users Guide for proper start up procedures.

F0: Diagnostic Trouble Codes

The purpose of this mode is to display stored trouble code in the ECM. When “Clear DTC Information” is selected, “Clear DTC Information”, warning screen appears. This screen informs you that by cleaning DTCs “all stored DTC information in the ECM will be erased”.

F1: Data Display

The purpose of this mode is to continuously monitor data parameters. The current actual values of all important sensors and signals, solenoid commands in the system are display through this mode.
Refer to the Tech 2 Data List in this section.

F2: Snapshot

“Snapshot” allow you to focus on making the condition occur, rather than trying to view all of the data in anticipation of the fault. The snapshot will collect parameter information around a trigger point that you select.
Refer to the Tech 2 user instructions for more information.

F3: Actuator Test

The purpose of this mode is to check for correct operation of electronic system actuators. Using actuator test menus can test the state of each actuator and related sensors. Especially when DTC cannot be detected, a faulty circuit can be diagnosed by testing. Even DTC has been detected, the circuit tests using these menus could help discriminate between a mechanical trouble and an electrical trouble.
Refer to the Tech 2 Output Controls in this section.

F4: Programming

The purpose of this mode is to program the fuel injector ID code into the ECM if the fuel injector or ECM is to be replaced.

Tech 2 Data List

The Tech 2 Data List contains all engine related parameters that are available on the Tech 2. Use the Tech 2 Data List only after the following is determined:

- The Diagnostic System Check – Engine Controls is completed.
- No diagnostic trouble codes (DTCs) are present.
- On-board diagnostics are functioning properly.

Tech 2 values from a properly running engine may be used for comparison with the engine you are diagnosing. The Tech 2 Data List represents values that would be seen on a normal running engine.

Important:
A Tech 2 that displays faulty data should not be used. The Tech 2 problem should be reported to the manufacturer. Use of a faulty Tech 2 can result in misdiagnosis and unnecessary parts replacement. Only the parameters listed below are referenced in this service manual for use in diagnosis.

Tech 2 Parameter	Units Displayed	Typical Data Value at Engine Idle	Typical Data Value at 1600 RPM
Operating Conditions: Engine Idling or 1600 RPM / Engine Coolant Temperature is between 75-85°C (167-185°F) / Accelerator Pedal is Constant / Neutral / Accessories OFF / Vehicle Located at Sea Level			
Ignition Voltage	V	22.0 – 30.0	22.0 – 30.0
Battery Voltage	V	22.0 – 30.0	22.0 – 30.0
Desired Idle Speed	RPM	650	650
Engine Speed	RPM	600 – 700	1550 – 1650
APP Sensor 1 (Accelerator Pedal Position)	V	0.3 – 0.7	1.2 – 1.6
APP Sensor 2 (Accelerator Pedal Position)	V	4.1 – 4.5	3.4 – 3.8
Accelerator Pedal Position (APP) Angle	%	0	20 – 26
Differential Fuel Rail Pressure	MPa / psi	-5 – 5 MPa / -725 – 725 psi	-5 – 5 MPa / -725 – 725 psi
Fuel Rail Pressure Sensor	V	1.4 – 1.6	More than 2.0 volts
Rail Pressure Feedback	Shutoff Mode / Wait Mode / Feedback Mode	Feedback Mode	Feedback Mode
Fuel Rail Pressure (FRP) Regulator Command	%	35 – 45	30 – 40
FRP Regulator Feedback	mA	900 – 1300	800 – 1200
Coolant Temperature Sensor	V	0.4 – 0.6	0.4 – 0.6

Tech 2 Parameter	Units Displayed	Typical Data Value at Engine Idle	Typical Data Value at 1600 RPM
Coolant Temperature	°C / °F	75 – 85°C / 167 – 185°F	75 – 85°C / 167 – 185°F
Intake Air Temperature Sensor	V	1.1 – 2.1	1.1 – 2.1
Intake Air Temperature	°C / °F	20 – 40°C / 68 – 104°F	20 – 40°C / 68 – 104°F
Fuel Temperature Sensor	V	2.4 – 2.8	2.4 – 2.8
Fuel Temperature	°C / °F	20 – 50°C / 50 – 122°F	20 – 50°C / 50 – 122°F
Barometric Pressure Sensor	V	Nearly 2.3 volts at sea level	Nearly 2.3 volts at sea level
Barometric Pressure	KPa / psi	Nearly 100 KPa / 14.5 psi at sea level	Nearly 100 KPa / 14.5 psi at sea level
EGR Position Sensor	V	Less than 1.5 volts	Less than 2.0 volts
EGR Position Variance	%	-5 – 5%	-5 – 5%
EGR Solenoid Command	%	Less than 20%	Less than 30%
Boost Pressure Sensor	V	Nearly 1.0 volt at sea level	Less than 1.3 volts at sea level
Boost Pressure	KPa / psi	Nearly 100 KPa / 14.5 psi at sea level	Less than 115 KPa / 16.7 psi at sea level
ASR System Command APP Angle	%	100	100
Vehicle Speed	Km/h / MPH	0	0
Cylinder 1 Compensation	mm^3/st	-5.0 – 5.0 (Varies)	0.0
Cylinder 2 Compensation	mm^3/st	-5.0 – 5.0 (Varies)	0.0
Cylinder 3 Compensation	mm^3/st	-5.0 – 5.0 (Varies)	0.0
Cylinder 4 Compensation	mm^3/st	-5.0 – 5.0 (Varies)	0.0
Engine Mode	Halt Mode / Wait Mode / Crank Mode / Fuel Mode	Fuel Mode	Fuel Mode
Engine Warm Up Switch	On / Off	Off	Off
Ignition Switch	On / Off	On	On
Starter Switch	On / Off	Off	Off
Clutch Pedal Switch	Applied / Release	Released	Released
Park / Neutral Switch	On / Off	On	On
Parking Brake Switch	Applied / Released	Applied	Applied
Exhaust Brake Switch	On / Off	Off	Off
Exhaust Brake Solenoid Valve Command	On / Off	Off	Off
PTO Switch	On / Off	Off	Off
PTO Remote Throttle Angle	%	0	0
PTO Remote Throttle Sensor	V	Less than 0.4 volts	Less than 0.4 volts
Idle Up Sensor	V	0.3 – 0.6	0.3 – 0.6
A/C Clutch Switch (Air Conditioning)	On / Off	Off	Off
ABS Exh. Brake Cut Request	Yes / No	No	No
TCM Exh. Brake Cut Request	Yes / No	No	No
Refrigerator Switch	On / Off	Off	Off
Glow Relay Command	On / Off	Off	Off
Glow Indicator Lamp Command	On / Off	Off	Off

Tech 2 Data Definitions

A list of each message displayed on the Tech 2 will be explained in Engine Controls. This information will assist in emission or driveability problems. The displays can be viewed while the vehicle is being driven. Always perform the Diagnosis System Check – Engine Controls first. The Diagnostic System Check will confirm proper system operation.

Ignition Voltage
This parameter displays the ignition voltage measured at the ignition feed circuit of the ECM. Voltage is applied to the ECM when the ignition switch is ON position.

Battery Voltage
This parameter displays the battery voltage measured at the ECM main relay switched voltage feed circuit of the ECM. Voltage is applied to the ECM when the ECM main relay is energized.

Desired Idle Speed
This parameter displays the idle speed requested by the ECM. The ECM will change desired idle speed based on engine coolant temperature (ECT) and Idle up sensor status.

Engine Speed
This parameter displays the speed of the crankshaft as calculated by the ECM based on inputs from the crankshaft position (CKP) sensor or camshaft position (CMP) sensor. The Tech 2 will display the engine speed in revolution per minute (RPM).

APP Sensor 1 (Accelerator Pedal Position)
This parameter displays the voltage signal sent to the ECM from the accelerator pedal position (APP) sensor 1 of the APP sensor assembly. APP sensor 1 is a range of values indicating a low voltage when the accelerator pedal is not depressed to a high voltage when the accelerator pedal is fully depressed.

APP Sensor 2 (Accelerator Pedal Position)
This parameter displays the voltage signal sent to the ECM from the accelerator pedal position (APP) sensor 2 of the APP sensor assembly. APP sensor 2 is a range of values indicating a high voltage when the accelerator pedal is not depressed to a low voltage when the accelerator pedal is fully depressed.

Accelerator Pedal Position (APP) Angle
This parameter displays the angle of the accelerator pedal as calculated by the ECM using the signals from the accelerator pedal position sensors. The APP indicated angle is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.

Differential Fuel Rail Pressure
This parameter displays the difference of actual and desired fuel rail pressure (actual value – desired value) as calculated by the ECM using the signal from the fuel rail pressure (FRP) sensor. The negative value is indicating a lower actual fuel rail pressure. The positive value is indicating a higher actual fuel rail pressure.

Fuel Rail Pressure Sensor
This parameter displays the voltage signal sent to the ECM from the fuel rail pressure (FRP) sensor. FRP sensor is a range of values indicating a low voltage when the fuel rail pressure is low to a high voltage when the fuel rail pressure is high.

Rail Pressure Feedback
This parameter displays the state of the fuel rail pressure feedback to the ECM. Wait Mode indicates the ignition switch is turned ON position. Feedback Mode indicates the engine is during crank or run. Shutoff Mode indicates the ignition switch is turned OFF position.

Fuel Rail Pressure (FRP) Regulator Command
This parameter displays the fuel rail pressure (FRP) regulator control duty ratio signal based on inputs to the ECM from various engine sensors. The Tech 2 will display a low percentage when the FRP regulator is controlled to open (fuel supply quantity to the fuel rail is increased). The Tech 2 will display a high percentage when the FRP regulator is controlled to close (fuel supply quantity to the fuel rail is reduced).

FRP Regulator Feedback
This parameter displays the fuel rail pressure (FRP) regulator control feedback current as calculated by the ECM. The Tech 2 will display a low current when the FRP regulator is controlled to open (fuel supply quantity to the fuel rail is increased). The Tech 2 will display a high current when the FRP regulator is controlled to close (fuel supply quantity to the fuel rail is reduced).

Coolant Temperature Sensor
This parameter displays the voltage signal sent to the ECM from the engine coolant temperature (ECT) sensor. Coolant temperature sensor is a range of value indicating a low voltage when the temperature is high and a high voltage when the temperature is low.

Coolant Temperature
This parameter displays the temperature of the engine coolant as calculated by the ECM using the signal from the engine coolant temperature (ECT) sensor. The Tech 2 will display a low temperature when the ECT sensor signal voltage is high, and a high temperature when the ECT sensor signal voltage is low.

Intake Air Temperature Sensor
This parameter displays the voltage signal sent to the ECM from the intake air temperature (IAT) sensor. IAT is a range of value indicating a low voltage when the temperature is high and a high voltage when the temperature is low.

Intake Air Temperature
This parameter displays the temperature of the intake air as calculated by the ECM using the signal from the intake air temperature (IAT) sensor. The Tech 2 will display a low temperature when the IAT sensor signal voltage is high, and a high temperature when the IAT sensor signal voltage is low.

Fuel Temperature Sensor
This parameter displays the voltage signal sent to the ECM from the fuel temperature (FT) sensor. FT sensor is a range of value indicating a low voltage when the temperature is high and a high voltage when the temperature is low.

Fuel Temperature
This parameter displays the temperature of the fuel as calculated by the ECM using the signal from the fuel temperature (FT) sensor. The Tech 2 will display a low temperature when the FT sensor signal voltage is high, and a high temperature when the FT sensor signal voltage is low.

Barometric Pressure Sensor
This parameter displays the voltage signal sent to the ECM from the barometric pressure (BARO) sensor. BARO sensor is a range of values indicating a low voltage in high altitude area to a high voltage in low altitude area.

Barometric Pressure
This parameter displays the barometric pressure (BARO) as calculated by the ECM using the signal from the barometric pressure (BARO) sensor. The Tech 2 will display a low barometric pressure in high altitude area to a high barometric pressure in low altitude area.

EGR Position Sensor
This parameter displays the voltage signal sent to the ECM from the EGR position sensor of the EGR valve. EGR position sensor is a range of values indicating a low voltage when the EGR valve is closed to a high voltage when the EGR valve is opened.

EGR Position Variance
This parameter displays the difference of actual and desired EGR valve position (actual value – desired value) as calculated by the ECM using the signal from the EGR position sensor. The negative value is indicating a lower actual valve position (more closed). The positive value is indicating a higher actual valve position (more opened).

EGR Solenoid Command
This parameter displays the EGR valve control duty ratio signal based on inputs to the ECM from various engine sensors. The Tech 2 will display a low percentage when the EGR valve is controlled to close. The Tech 2 will display a high percentage when the EGR valve is controlled to open.

Boost Pressure Sensor
This parameter displays the voltage signal sent to the ECM from the boost pressure sensor. Boost pressure sensor is a range of values indicating a low voltage when the boost pressure is low (idle or lower engine load) and a high voltage when the boost pressure is high (higher engine load).

Boost Pressure
This parameter displays the boost pressure in the intake duct as calculated by the ECM using the signal from the boost pressure sensor. The Tech 2 will display a low boost pressure when the low engine load to a high boost pressure when the high engine load. Note that the true boost pressure is determined by subtracting barometric pressure from the actual reading.

ASR System Command APP Angle
This parameter displays the controlled angle of the accelerator pedal calculated by the electric hydraulic control module (EHCU) (ABS module) when anti slip regulator (ASR) system operated. The Tech 2 will display 100% when the ECM is not controlled to reduce fuel injection quantity. The Tech 2 will display a low percentage when the ECM is controlled to reduce fuel injection quantity to reduce drive wheels spinning.

Vehicle Speed
This parameter indicates the vehicle speed calculated by the ECM using the signal from the vehicle speed sensor (VSS). The Tech 2 will display a low value at lower vehicle speeds, and a high value at higher vehicle speeds.

Cylinder 1 Compensation
This parameter displays the adjustment of fuel volume for cylinder 1 at low engine speed area as calculated by the ECM. The Tech 2 will display a negative value if the fuel volume is lowered. The Tech 2 will display a positive value if the fuel volume is increased. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code.

Cylinder 2 Compensation
This parameter displays the adjustment of fuel volume for cylinder 2 at low engine speed area as calculated by the ECM. The Tech 2 will display a negative value if the fuel volume is lowered. The Tech 2 will display a positive value if the fuel volume is increased. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code.

Cylinder 3 Compensation
This parameter displays the adjustment of fuel volume for cylinder 3 at low engine speed area as calculated by the ECM. The Tech 2 will display a negative value if the fuel volume is lowered. The Tech 2 will display a positive value if the fuel volume is increased. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code.

Cylinder 4 Compensation
This parameter displays the adjustment of fuel volume for cylinder 4 at low engine speed area as calculated by the ECM. The Tech 2 will display a negative value if the fuel volume is lowered. The Tech 2 will display a positive value if the fuel volume is increased. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code.

Engine Mode
This parameter displays the state of engine. Wait Mode indicates the ignition switch is turned ON position. Crank Mode indicates the engine is during crank. Fuel Mode indicates the engine is run. Halt Mode indicates the ignition switch is tuned OFF position.

Engine Warm Up Switch
This parameter displays the input state of the engine warm up switch to the ECM. The Tech 2 will display On or Off. On indicates the engine warm up switch is closing the engine warm up request circuit to the ECM and allowing to energize the exhaust brake solenoid valve and intake throttle solenoid valve depending on engine condition. Off indicates the engine warm up switch is open.

Ignition Switch
This parameter displays the input state of the ignition switch to the ECM. The Tech 2 will display On or Off. On indicates the ignition switch is turned ON position.

Starter Switch
This parameter displays the input state of the starter switch to the ECM. The Tech 2 will display On or Off. On indicates the ignition switch is turned at START position.

Clutch Pedal Switch
This parameter displays the state of the clutch pedal switch to the ECM. The Tech 2 will display Applied or Released. Released indicates the clutch pedal is not being push down. Applied indicates the clutch switch is being depressed.

Park / Neutral Switch
This parameter displays the input state of the neutral switch to the ECM. The Tech 2 will display On or Off. On indicates the neutral switch is ON position (actual position).

Parking Brake Switch
This parameter displays the input state of the parking brake switch to the ECM. The Tech 2 will display Applied or Released. Applied indicates the parking brake lever is pulled position.

Exhaust Brake Switch
This parameter displays the input state of the exhaust brake switch to the ECM. The Tech 2 will display On or Off. On indicates the exhaust brake switch is closing the exhaust brake request circuit to the ECM and allowing to energize the exhaust brake solenoid valve and intake throttle solenoid valve depending on driving condition. Off indicates the exhaust brake switch is open and exhaust brake will not engage.

Exhaust Brake Solenoid Valve Command
This parameter displays the commanded state of the exhaust brake solenoid valve control circuit. The Tech 2 will display On or Off. On indicates the exhaust brake solenoid valve is being energized by the ECM. Off indicates the exhaust brake solenoid valve is not being commanded On by the ECM.

PTO Switch
This parameter displays the state of the PTO switch to the ECM. The Tech 2 will display On or Off. On indicates the PTO switch is being pressed by controlling the PTO lever or button.

PTO Remote Throttle Angle
This parameter displays the angle of the PTO remote throttle sensor as calculated by the ECM using the signal from the PTO remote throttle sensor. The PTO remote throttle angle is a range of values indicating a low percentage when the throttle sensor is not operated to a high percentage when the throttle sensor is operated.

PTO Remote Throttle Sensor
This parameter displays the voltage signal sent to the ECM from the PTO remote throttle sensor. The PTO remote throttle sensor is a range of values indicating a low voltage when the throttle sensor is not operated to a high voltage when the throttle sensor is operated.

Idle Up Sensor
This parameter displays the voltage signal sent to the ECM from the idle up sensor. The idle up sensor is a range of values indicating a low voltage when the idle up sensor rotates in a counterclockwise direction to a high voltage when the idle up sensor rotates in a clockwise direction.

A/C Clutch Switch (Air Conditioning)
This parameter displays the state of the air conditioning (A/C) compressor engage. On indicates the ECM receiving an A/C compressor On signal. Off indicates the ECM is not receiving an A/C compressor On signal.

ABS Exh. Brake Cut Request
This parameter displays the state of the exhaust brake cut request to the ECM from the electric hydraulic control module (EHCU) (ABS module). The Tech 2 will display Yes or No. Yes indicates the EHCU is commanding to release the exhaust brake. No indicates the EHCU is not being commanded to the ECM.

TCM Exh. Brake Cut Request
This parameter displays the state of the exhaust brake cut request to the ECM from the transmission control module (TCM). The Tech 2 will display Yes or No. Yes indicates the TCM is commanding to release the exhaust brake. No indicate the TCM is not being commanded to the ECM.

Refrigerator Switch
This parameter displays the state of the refrigerator compressor engage. On indicates the ECM receiving a refrigerator compressor On signal. Off indicates the ECM is not receiving a refrigerator compressor On signal.

Glow Replay Command
This parameter displays the commanded state of the glow relay control circuit. The Tech 2 will display On or Off. On indicates the glow relay control circuit is being grounded by the ECM, allowing voltage to the glow plugs. Off indicates the glow relay is not being commanded On by the ECM.

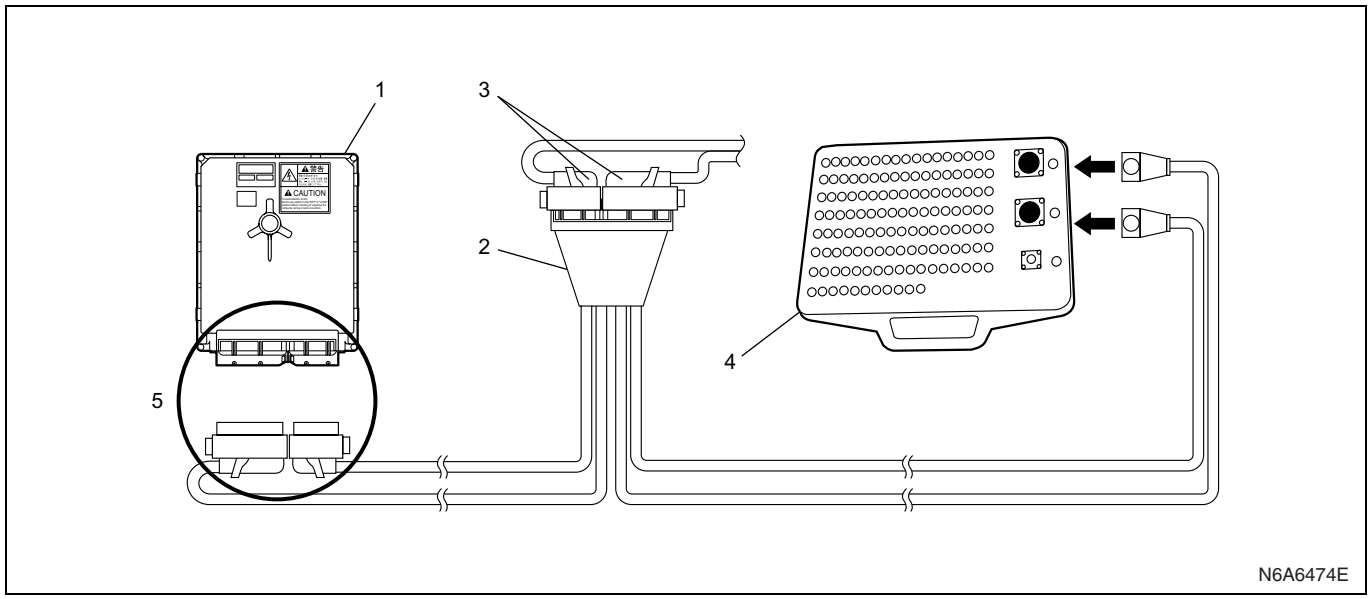
Glow Indicator Lamp Command
This parameter displays the commanded state of the glow indicator lamp control circuit. The glow indicator lamp should be On when the Tech 2 indicates the glow indicator lamp command is On. The glow indicator lamp should be Off when the Tech 2 indicates the glow indicator lamp command is Off.

Tech 2 Output Controls

Tech 2 Output Control	Additional Menu Selection(s)	Descriptions
Rail Pressure Control	Fuel System	The purpose of this test is for checking whether the fuel rail pressure is changing when commanded within 30 – 80 MPa (4,350 – 11,600 psi) when commanded. Faulty fuel supply pump, fuel rail pressure (FRP) regulator solenoid, pressure limiter valve or other fuel lines could be considered if the Differential Fuel Rail Pressure is large.
Injector Balancing	Fuel System	The purpose of this test is for checking whether the fuel injector is operating when commanded OFF. Faulty injector(s) could be considered if engine does not change speed when commanded OFF.
Injection Timing	Fuel System	The purpose of this test is for checking whether the main injection timing is changing when commanded Retard / Advance within -4 – 5°CA.
Pre Injection Stop	Fuel System	The purpose of this test is for checking whether the pilot fuel injection is operated when it is commanded to Off. Faulty injector(s) could be considered if engine noise does not change when commanded Stop.
Injector Forced Drive	Fuel System	The purpose of this test is for checking whether the fuel injector is correctly operating when commanded ON. Faulty injector(s) could be considered if it does not create a clicking noise (solenoid operating noise), contains an interrupted noise or has abnormal noise when commanded ON.
Glow Plug Relay	Device Controls	The purpose of this test is for checking whether the glow relay is operating when commanded ON. Faulty circuit(s) or a faulty glow relay could be considered if not energizing when commanded ON.
Exhaust Brake Control	Device Controls	The purpose of this test is for checking whether the exhaust brake solenoid valve and intake throttle solenoid valve are operating when commanded ON. Faulty circuit(s) or a solenoid valve(s) could be considered if not energizing when commanded ON.
EGR Control	Device Controls	The purpose of this test is for checking whether the EGR valve is correctly moved with command. Restricted valve movement by foreign materials, excessive deposits or a faulty valve could be considered if the EGR Position Variance is large.

Breaker Box

Breaker Box Connection Type A

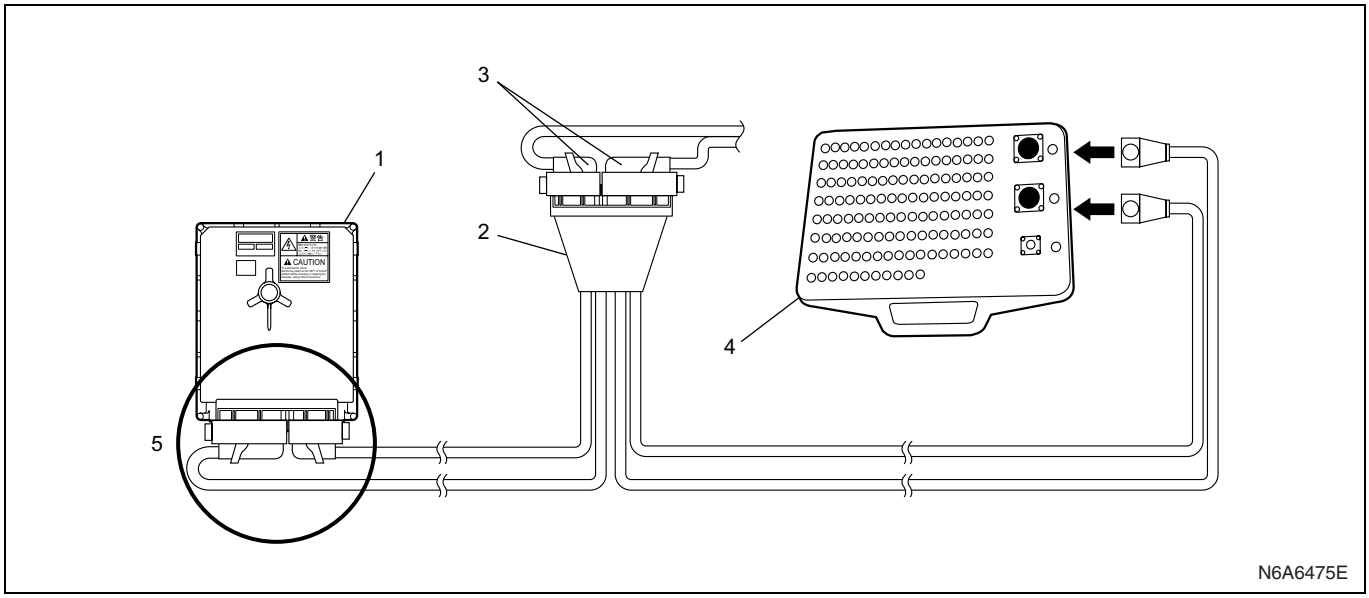


Legend

1. Engine Control Module (ECM)
2. Adapter Harness
3. ECM – Harness Connector
4. Breaker Box
5. ECM disconnected

Although probe to the engine control module (ECM) harness connector is possible by Test Adapter, Breaker Box Connection Type A is suitable usage to prevent misprobe and damage of female terminals when test open circuit or short to ground between the ECM and electrical components, since the terminals where the harness connector of the ECM is thin have gathered.

Breaker Box Connection Type B



Legend

1. Engine Control Module (ECM)
2. Adapter Harness
3. ECM – Harness Connector
4. Breaker Box
5. ECM connected

The ECM and other connectors have water proof terminal that is not allowed to back probe. Breaker Box Connection Type B is suitable usage to test short to voltage circuit or signal check between the ECM and electrical components.

Diagnostic Starting Point – Engine Controls

Begin the system diagnosis with Diagnostic System Check – Engine Controls. The Diagnostic System Check – Engine Controls will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and the their statuses.

The use of the Diagnostic System Check – Engine Controls will identify the correct procedure for diagnosing the system and where the procedure is located.

Important:
Engine Control System Check Sheet must be used to verify the customer complaint, you need to know the correct (normal) operating behavior of the system and verify that the customer complaint is a valid failure of the system.

Diagnostic System Check – Engine Controls

Description

The Diagnostic System Check – Engine Controls is an organized approach to identifying a condition that is created by a malfunction in the electronic engine control system. The Diagnostic System Check must be the starting point for any driveability concern. The Diagnostic System Check directs the service technician to the next logical step in order to diagnose the concern. Understanding and correctly using the diagnostic table reduces diagnostic time, and prevents the replacement of good parts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.
1. Lack of communication may be because of a partial or a total malfunction of the Keyword 2000 serial data circuit. The specified procedure determines the particular condition.
4. The presence of DTCs which begin with U, indicate that some other module is not communicating.
10. If there are other modules with DTCs set, refer to the DTC list. The DTC list directs you to the appropriate diagnostic procedure. If the control module stores multiple DTCs, diagnose the DTCs in the following order.

- Component level DTCs, such as sensor DTCs, solenoid DTCs, actuator DTCs, and relay DTCs. Diagnose the multiple DTCs within this category in numerical order. Begin with the lowest numbered DTC, unless the diagnostic table directs you otherwise.

Diagnostic System Check – Engine Controls

Important:

- DO NOT perform this diagnostic if there is not a driveability concern, unless another procedure directs you to this diagnostic.
- Before you proceed with diagnosis, search for applicable service bulletins.
- Unless a diagnostic procedure instructs you, DO NOT clear the DTCs.
- If there is a condition with the starting system, refer to the starting system section in the engine mechanical.
- Ensure the battery has a full charge.
- Ensure the battery cables (+) (–) are clean and tight.
- Ensure the ECM grounds are clean, tight, and in the correct location.
- Ensure the ECM harness connectors are clean and correctly connected.
- Ensure the ECM terminals are clean and correctly mating.
- Ensure the vehicle maintenance has been done enough.
- Ensure the Fuel Injector ID Code Data is correctly programmed.
- If there are fuel system DTC's (P0087, P0088, P0089, P1093, P1094 or P1095), diagnose sensor DTCs, solenoid DTCs, actuator DTCs and relay DTCs FIRST.

Step	Action	Value(s)	Yes	No
1	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to establish communication with the listed control modules. • Engine control module (ECM) • Transmission control module (TCM) (Smoother only) • Hill start aid (HSA) control module (If so equipped) • Supplemental restraint system (SRS) control module (If so equipped) Does the Tech 2 communicate with all the listed control modules?	—	Go to Step 2	Go to Tech 2 Does Not Communicate with Keyword Device
2	Attempt to start the engine. Does the engine start and idle?	—	Go to Step 3	Go to Engine Cranks but Does Not Run
3	Select the DTC display function for the following control modules: • ECM • TCM (Smoother only) • HSA control module (If so equipped) • SRS control module (If so equipped) Does the Tech 2 display any DTCs?	—	Go to Step 4	Go to Step 11
4	Does the Tech 2 display DTCs which begin with a U or other control module communication fault DTCs?	—	Go to Applicable DTC	Go to Step 5
5	Does the Tech 2 display ECM DTCs P0601, P0603, P0606, P0611, P0612 or P1630?	—	Go to Applicable DTC	Go to Step 6
6	Does the Tech 2 display ECM DTC P1625?	—	Go to Applicable DTC	Go to Step 7
7	Does the Tech 2 display ECM DTCs P1631, P1632, P1633, P1634 or P1635?	—	Go to Applicable DTC	Go to Step 8
8	Does the Tech 2 display ECM DTCs P0219, P0335, P0336, P0340, P0341 or P1345?	—	Go to Applicable DTC	Go to Step 9
9	Does the Tech 2 display ECM DTCs P0090, P0201, P0202, P0203, P0204, P1261 or P1262?	—	Go to Applicable DTC	Go to Step 10
10	Is there any other code in any controller that has not been diagnosed?	—	Go to Applicable DTC	Go to Step 11
11	Is the customer's concern with the transmission?	—	Go to Diagnostic System Check – Transmission Controls	Go to Step 12
12	Is the customer's concern with the HSA system?	—	Go to Diagnostic System Check – HSA Controls	Go to Step 13
13	Is the customer's concern with the SRS airbag system?	—	Go to Diagnostic System Check – SRS Controls	Go to Step 14

Step	Action	Value(s)	Yes	No
14	1. Review the following symptoms. 2. Refer to the applicable symptom diagnostic table: • Hard Start • Rough, Unstable, or Incorrect Idle and Stalling • High Idle • Cuts Out, Misses • Surge / Chuggles • Lack of Power, Sluggishness, or Sponginess • Hesitation, Sag, Stumble • Fuel Knock / Combustion Noise • Poor Fuel Economy • Excessive Smoke (Black Smoke) • Excessive Smoke (White Smoke) Did you find and correct the condition?	—	System OK	Go to Intermittent Conditions

Tech 2 Does Not Communicate with Keyword Device

Circuit Description

The engine control module (ECM), transmission control module (TCM) and supplemental restraint system (SRS) control module communicates with the Tech 2 over the Keyword 2000 serial data link. The hill start aid (HSA) control module communicates with the Keyword 82 serial data link. However, the ECM, TCM, electric hydraulic control module (EHCU) (ABS module) and the data recording module (DRM) communicate with each other over the controller area network (CAN) link. The CAN link is not used for communication with the Tech 2 and is shared only among each module.

Diagnostic Aids

The following conditions will cause a loss of Keyword serial data communication between the TCM, SRS control module and HSA control module or between the Tech 2 and any control module:

- A Keyword serial data circuit open.
- A Keyword serial data circuit shorted to ground.
- A Keyword serial data circuit shorted to voltage.
- An internal condition within a module or connector on the Keyword serial data circuit, that causes a short to voltage or ground to the Keyword serial data circuit.

Tech 2 Does Not Communicate with Keyword 2000 Device

Schematic Reference: Engine Controls Schematics

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to communicate with the listed control modules. • Engine control module (ECM) • Transmission control module (TCM) (Smoother only) • Hill start aid (HSA) control module (If so equipped) • Supplemental restraint system (SRS) control module (If so equipped) Does the Tech 2 communicate with all the listed control modules?	—	Go to Step 3	Go to Step 8
3	Does the Tech 2 communicate with the ECM?	—	Go to Step 4	Go to Lost Communication with The ECM
4	Does the Tech 2 communicate with the TCM?	—	Go to Step 5	Go to Diagnostic System Check – Transmission Controls
5	Does the Tech 2 communicate with the HSA control module?	—	Go to Step 6	Go to Diagnostic System Check – HSA Controls
6	Does the Tech 2 communicate with the SRS control module?	—	Go to Step 7	Go to Diagnostic System Check – SRS Controls
7	Test the Keyword serial data circuit for an intermittently short to ground or intermittently short to voltage. Then, test the Keyword serial data circuit for an intermittently open (based on which control module did not communicate) at the connection in the circuit. Did you find and correct the condition?	—	Go to Step 17	System OK

Step	Action	Value(s)	Yes	No
8	1. Turn OFF the ignition. 2. Disconnect the ECM E-111 and J-191 harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Attempt to communicate with the TCM, HSA control module and SRS control module. Does the Tech 2 communicate with the TCM, HSA control module and SRS control module?	—	Go to Step 13	Go to Step 9
9	1. Turn OFF the ignition. 2. Reconnect the ECM E-111 and J-191 harness connectors. 3. Disconnect the TCM B-425, B-426, B-427 and B-428 harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the ECM, HSA control module and SRS control module. Does the Tech 2 communicate with the ECM, HSA control module and SRS control module?	—	Go to Step 14	Go to Step 10
10	1. Turn OFF the ignition. 2. Reconnect the TCM B-425, B-426, B-427 and B-428 harness connectors. 3. Disconnect the HSA control module B-285 harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the ECM, TCM and SRS control module. Does the Tech 2 communicate with the ECM, TCM and SRS control module?	—	Go to Step 15	Go to Step 11
11	1. Turn OFF the ignition. 2. Reconnect the HSA control module B-285 harness connectors. 3. Disconnect the SRS B-243 control module harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the ECM, TCM and HSA control module. Does the Tech 2 communicate with the ECM TCM and HSA control module?	—	Go to Step 16	Go to Step 12
12	Repair the short to ground or short to voltage on the Keyword serial data circuit between the DLC and ECM, TCM, HSA control module and SRS control module. Did you complete the repair?	—	Go to Step 17	—
13	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 17	—

Step	Action	Value(s)	Yes	No
14	Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in the transmission section. Did you complete the replacement?	—	Go to Step 17	—
15	Replace the HSA control module. Refer to Hill Start Aid (HSA) Control Module Replacement in the brake section. Did you complete the replacement?	—	Go to Step 17	—
16	Replace the SRS control module. Refer to Supplemental Restraint System (SRS) control module Replacement in the restraint system section. Did you complete the replacement?	—	Go to Step 17	—
17	Attempt to communicate with the ECM, TCM, HSA control module and SRS control module. Does the Tech 2 communicate with the ECM, TCM, HSA control module and SRS control module?	—	System OK	Go to Step 2

Lost Communication with The Engine Control Module (ECM)

Circuit Description

The engine control module (ECM), transmission control module (TCM) and supplemental restraint system (SRS) control module communicates with the Tech 2 over the Keyword 2000 serial data link. The hill start aid (HSA) control module communicates with the Keyword 82 serial data link. However, the ECM, TCM, electric hydraulic control module (EHCU) (ABS module) and the data recording module (DRM) communicate with each other over the controller area network (CAN) link. The CAN link is not used for communication with the Tech 2 and is shared only among each module.

Lost Communication with The Engine Control Module (ECM)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	Attempt to establish engine control module (ECM) communications with the Tech 2. Does the ECM communicate with the Tech 2?	—	Go to Intermittent Conditions	Go to Step 3
3	Check the ECM E-111 and J-191 connectors for poor connections. Did you find and correct the condition?	—	Go to Step 15	Go to Step 4
4	1. Turn ON the ignition, with the engine OFF. 2. Check the ECM (40A) slow blow fuse, ECM (10A) fuse and Engine (IG) (10A) fuse. Replace and retest if open. If any fuse continues to open, check for a short to ground on each circuit fed by that fuse. 3. Turn OFF the ignition. 4. Disconnect the ECM J-191 harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Connect a test lamp to ground and check for voltage at the ignition voltage supply circuit at the ECM (pin 24 of J-191 connector). Does the test lamp illuminate?	—	Go to Step 5	Go to Step 12
5	1. Turn OFF the ignition. 2. Connect a DMM between the Keyword serial data circuit at the ECM (pin 38 of J-191 connector) and the data link connector (DLC) (pin 7 of B-79 connector). 3. Test the circuits for an open circuit or high resistance. 4. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 6
6	**Important:** An open in a ground circuit at the ECM will not cause a loss of communication. 1. Check ECM ground for corrosion and tightness. 2. Clean or tighten grounds as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Reconnect the ECM harness connector if previously disconnected. 3. Turn ON the ignition, with the engine OFF. 4. Replace the ECM main relay with the glow relay or replace with a known good relay. 5. Attempt to establish Tech 2 communications with the ECM. Does the ECM communicate with the Tech 2?	—	Go to Step 13	Go to Step 8
8	1. Turn OFF the ignition. 2. Remove the ECM main relay. 3. Turn ON the ignition, with the engine OFF. 4. Using a test lamp, check for battery voltage at both of the battery voltage supply circuits to the ECM main relay (pins 3 and 4 of X-18 connector). 5. Repair the open in the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 9
9	1. Reinstall the ECM main relay. 2. Turn the ignition ON and OFF while listening or feeling for the ECM main relay click. Wait 7 seconds between transitions. Does the ECM main relay click when the ignition is turned ON or OFF?	—	Go to Step 11	Go to Step 10
10	Repair the ECM main relay ground circuit between the ECM main relay (pin 5 of X-18 connector) and chassis ground terminal (J-9) for the following conditions: • An open circuit • High resistance or a poor connection at ECM main relay and ground terminal Did you complete the repair?	—	Go to Step 15	—
11	1. Test the ECM main relay voltage feed circuit to the ECM (pins 2 and 5 of J-191 connector) for the following conditions: • An open circuit • High resistance or a poor connection at ECM and ECM main relay 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
12	Repair the open in the ignition voltage circuit to the ECM. Did you complete the repair?	—	Go to Step 15	—
13	Replace the ECM main relay. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 15	—

Step	Action	Value(s)	Yes	No
15	1. Turn OFF the ignition. 2. Reconnect all previously disconnected fuse, relay and harness connector(s). 3. Turn the ignition ON with the engine OFF. 4. Attempt to establish Tech 2 communications with the ECM. Does the Tech 2 communicate with the ECM?	—	System OK	Go to Step 3

Engine Cranks but Does Not Run

Description

The Engine Cranks but Does Not Run diagnostic table is an organized approach to identifying a condition that causes an engine to not start. The diagnostic table directs the service technician to the appropriate system diagnosis. The diagnostic table assumes the following conditions are met:

- The battery is completely charged and terminals are cleaned and tight.
- The engine cranking speed is normal.
- There is adequate fuel in the fuel tank.
- There is no fuel leak in the fuel line.
- There is no air in the fuel line.
- Filters (Air, Fuel) are clean.
- Fuse and slow blow fuse are normal.

Notice:

- The engine will start even if exhuast brake is fully engage.

Diagnostic Aid

If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The numbers below refers to the step number on the diagnostic table.
5. If the fuel rail pressure (FRP) regulator low control circuits between the ECM and the FRP regulator are shorted to ground, FRP Regulator Feedback will be approximately 300 mA or more low as compared with normal.

Engine Cranks but Does Not Run

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Crank the engine for specified amount of time. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the Tech 2 display any DTCs that failed this ignition?	15 seconds	Go to Diagnostic Trouble Code (DTC) List	Go to Step 3
3	1. Turn OFF the ignition. 2. Wait 2 minutes for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Observe the Fuel Rail Pressure (FRP) Sensor parameter with a Tech 2. Is the FRP Sensor parameter the specified value?	0.9 – 1.0 Volts	Go to Step 4	Go to Step 6
4	**Notice:** If the vehicle has run out of fuel, air may be trapped in the fuel system. 1. Make sure the fuel tank(s) have adequate fuel and the fuel quality is good (take a sample). 2. Observe the FRP Sensor parameter on the Tech 2 while cranking over the engine for 5 seconds. Does the FRP Sensor reach the specified value during crank?	1.4 Volts	Go to Step 9	Go to Step 5

Step	Action	Value(s)	Yes	No
5	Observe the FRP Regulator Feedback parameter on the Tech 2 while cranking over the engine for 5 seconds. Does the SCV Feedback parameter more than the specified value during crank?	800 mA	Go to Fuel System Check in the Fuel System Section	Go to Step 8
6	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-113 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP sensor circuit at the harness connector of the ECM (pins 82, 87, 90 and 101 of E-111 connector). 6. Test for high resistance on each FRP sensor circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 7
7	Replace the FRP sensor. Refer to Fuel Rail Pressure (FRP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 12	—
8	1. Test the FRP regulator low control circuits between the engine control module (ECM) (pins 89 and 97 of E-111 connector) and the FRP regulator (pin 2 of E-116 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
9	1. Check for normal readings at key up for the following sensor inputs: Use the Tech 2 Data List or a known good vehicle to determine nominal values. • Coolant Temperature • Barometric Pressure (BARO) • Boost Pressure Sensor • EGR Valve Position Sensor 2. Repair the circuit(s) or replace the sensor as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10

Step	Action	Value(s)	Yes	No
10	1. Other possible causes for the no-start condition: • Engine mechanical timing • Flywheel installed incorrectly causing the crankshaft position (CKP) sensor to be incorrectly timed to the engine. Disconnect sensor and attempt to start engine to verify. • Heavily restricted intake or exhaust plugged solid. • Poor engine compression. • Water or gasoline contamination in fuel. 2. Repair as necessary. Did you find and correct the condition?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Attempt to start the engine. Does the engine start and continue to run?	—	Go to Step 13	Go to Step 2
13	Observe the DTC information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

Engine Starts and Stalls

Description

The engine control module (ECM) constantly monitors the information from various sensors. The ECM controls the systems that affect engine performance. The ECM performs the diagnostic function of the system. The ECM can recognize operational conditions, alert the driver through the malfunction indicator lamp (MIL), and store diagnostic trouble codes (DTCs). DTCs identify the faulty areas to aid the technician in making repairs.
The main relay supplies power to external output devices.

Diagnostic Aid

- Poor connection at the main relay
  Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness
  Inspect the wiring harness for damage, shorts to ground, shorts to battery, and open circuits. If the harness appears to be OK, observe the power supply or data list display on the Tech 2 while moving connectors and wiring harnesses related to the main relay. A change in the scan tool display will indicate the location of the fault.
- Air / water or gasoline contamination in the fuel system.

Engine Starts and Stalls

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	Does the engine fail to start?	—	Go to Engine Cranks but Does Not Run	Go to Step 3
3	1. Perform the following checks before proceeding with this chart. • Make sure the idle up control knob to the lowest position. (Full counterclockwise direction) • Check for an adequate supply of fuel in the fuel tank(s) and the quality of the fuel (water or gasoline contamination). If the outside temperature is very cold, the fuel may be gelled. • Check the battery cables for corrosion and for tightness. • Make an under cab visual inspection for obvious fuel leaks and for fuel system line problems. • Make a vehicle inspection for obvious intake or exhaust restrictions (collapsed induction tubing or crushed exhaust). • Check the engine control module (ECM) connectors and ring terminal grounds for tightness. • Check the engine oil level viscosity and quality. 2. Repair as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn ON the ignition with the engine OFF. 2. Install the Tech 2 if not installed. 3. Observe the following parameters for skewed sensor readings: • Fuel Rail Pressure (FRP) Sensor with the engine OFF. The FRP Sensor should read 0.9 – 1.0 volt with the key ON and engine OFF. After the engine has stopped running for a minimum 2 minutes. • Boost Pressure and Barometric Pressure (BARO) with the engine OFF. The Boost Pressure and BARO parameters should be within 7.0 kPa (1.0 psi) each other. • Coolant Temperature with the engine OFF and a cold engine. The Coolant Temperature, Intake Air Temperature and Fuel Temperature parameters should be within 5°C (9°F) each other. 4. Refer to the Tech 2 Data List for nominal values. 5. Refer to appropriate DTC or schematic if a problem was found and repair as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	1. Other possible causes of engine stall: • Incorrect crankshaft to camshaft timing or sensor tooth / gear surface damage / incorrect machining • Poor fuel quality (water or gasoline contamination) • Fuel supply pump problem. Perform the Rail Pressure Control test with the Tech 2. The Differential Fuel Rail Pressure parameter should be within ± 5 MPa (± 725 psi) when commanded pressure range. • Fuel injector(s) problem. Perform the Injector Balancing test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not change engine speed when commanded OFF. Perform the Injector Forced Drive test with the Tech 2. Repair the wire or replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise). • ECM main relay circuit malfunction • ECM power / grounding problem 2. Repair as necessary. Did you find and correct the condition?	—	Go to Step 6	Possible fuel related. Refer to Fuel System Check in the Fuel System Section
6	1. Turn OFF the ignition for 30 seconds. 2. Start the engine and accelerate up and down the RPM band. Does the engine continue to run?	—	System OK	Go to Step 2

Diagnostic Trouble Code (DTC) List

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0087	227	ON	Fuel Rail Pressure (FRP) Too Low	• DTCs P0090, P0192, P0193, P0201 – P0204, P0611, P0612, P1095, P1261, P1262, P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	Either of following condition is met: • The ECM detects that the FRP sensor signal voltage is 1.0 volt for 10 seconds when the engine speed is between 0 – 600 RPM. • The ECM detects that the FRP sensor signal voltage is less than 1.2 volts for 10 seconds when the engine speed is higher than 900 RPM.	• Fuel leaking at high pressure side. • Loss fuel or less fuel in the fuel tank. • Pressure limiter valve opening pressure drop. • Faulty fuel injector. • Fuel suction side looseness, kinks or blocked. • Faulty or clogged fuel filter. • FRP sensor circuit is intermittently open circuit, poor connection or corrosion. • FRP sensor circuit high resistance. • FRP regulator circuit is intermittently open circuit, poor connection or corrosion. • FRP regulator circuit high resistance. • Faulty FRP sensor. • Faulty FRP regulator. • Faulty fuel supply pump.
P0088	118	ON	Fuel Rail Pressure (FRP) Too High	• DTCs P0192, P0193, P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine is running.	First Stage DTC • The ECM detects that the FRP sensor signal voltage is more than 3.9 volts for longer than 10 second. Second Stage DTC • The ECM detects that the FRP sensor signal voltage is more than 4.0 volts for longer than 10 second during the ignition cycle after first stage has occurred.	• Loss fuel or less fuel in the fuel tank. • Faulty fuel injector. • Fuel suction side looseness, kinks or blocked. • Faulty or clogged fuel filter. • FRP sensor circuit is intermittently open circuit, poor connection or corrosion. • FRP sensor circuit high resistance. • FRP regulator circuit is intermittently open circuit, poor connection or corrosion. • FRP regulator circuit high resistance. • Faulty FRP sensor. • Faulty FRP regulator. • Faulty fuel supply pump.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0089	151	ON	Fuel Rail Regulator Performance	• DTCs P0090, P0192, P0193, P0201 – P0204, P0611, P0612, P1261, P1262, P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine is running. • The FRP regulator command is more than 40% or commanded fuel supply is less than a predetermined value.	Either of following condition is met: • The ECM detects that the deferential fuel rail pressure is higher than 20 MPa (2,900 psi) for longer than 10 seconds when the engine speed is between 0 – 600 RPM. • The ECM detects that the differential fuel rail pressure is higher than 40 MPa (5,800 psi) for longer than 10 seconds when the engine speed is higher than 900 RPM.	• Faulty or clogged fuel filter. • FRP sensor circuit is intermittently open circuit, poor connection or corrosion. • FRP sensor circuit high resistance. • FRP regulator circuit is intermittently open circuit, poor connection or corrosion. • FRP regulator circuit high resistance. • Faulty FRP sensor. • Faulty FRP regulator. • Faulty fuel supply pump.
P0090	247	ON	Fuel Pressure Regulator Solenoid Control Circuit	• DTC P1630 is not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The FRP regulator command duty cycle is between 10 – 90%.	Either of following condition is met: • The ECM detects that the FRP regulator solenoid feedback current is less than 50 mA. • The ECM detects that the FRP regulator solenoid feedback current is more than 2400 mA. • The ECM detects that the difference of commanded FRP regulator solenoid current and feedback current is more than 1000 mA.	• FRP regulator low control circuit is short to battery, ignition voltage, short to ground, short to the high control circuit, open circuit or high resistance. • FRP regulator high control circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • Poor harness connector connection. • Faulty FRP regulator. • Faulty ECM.
P0107	71	ON	Barometric Pressure Sensor Circuit Low Voltage	• DTCs P1630 and P1632 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the BARO sensor signal voltage is less than 0.5 volts for 10 seconds.	• Sensor 5V reference circuit is short to ground or short to the low reference circuit. (P1632 may also set.) • Sensor 5V reference circuit is open circuit, high resistance. • Sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0108	71	ON	Barometric Pressure Sensor Circuit High Voltage	• DTCs P1630 and P1632 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the BARO sensor signal voltage is more than 4.9 volts for 10 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage. (P1632 may also set.) • Sensor signal circuit is short to battery, ignition voltage or short to any 5V reference circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P0112	22	ON	Intake Air Temperature (IAT) Sensor Circuit Low Voltage	• DTCs P1630 and P1632 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the IAT sensor signal voltage is less than 0.1 volts for 10 seconds.	• Sensor signal circuit is short to ground or short to the low reference circuit. • Faulty sensor. • Faulty ECM.
P0113	22	ON	Intake Air Temperature (IAT) Sensor Circuit High Voltage	• DTCs P1630 and P1632 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine run time is longer than 3 minutes.	• The ECM detects that the IAT sensor signal voltage is more than 4.8 volts for 10 seconds.	• Sensor signal circuit is short to battery, ignition voltage, short to any 5V reference circuit, open circuit, high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P0117	23	ON	Engine Coolant Temperature (ECT) Sensor Circuit Low Voltage	• DTCs P1630 and P1634 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the ECT sensor signal voltage is less than 0.1 volts for 10 seconds.	• Sensor signal circuit is short to ground or short to the low reference circuit. • Faulty sensor. • Faulty ECM.
P0118	23	ON	Engine Coolant Temperature (ECT) Sensor Circuit High Voltage	• DTCs P1630 and P1634 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine run time is longer than 3 minutes.	• The ECM detects that the ECT sensor signal voltage is more than 4.8 volts for 10 seconds.	• Sensor signal circuit is short to battery, ignition voltage, short to any 5V reference circuit, open circuit, high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0182	221	ON	Fuel Temperature Sensor Circuit Low Voltage	• DTCs P1630 and P1634 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the FT sensor signal voltage is less than 0.1 volts for 10 seconds.	• Sensor signal circuit is short to ground or short to the low reference circuit. • Faulty sensor. • Faulty ECM.
P0183	211	ON	Fuel Temperature Sensor Circuit High Voltage	• DTCs P1630 and P1634 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine run time is longer than 3 minutes.	• The ECM detects that the FT sensor signal voltage is more than 4.8 volts for 10 seconds.	• Sensor signal circuit is short to battery, ignition voltage, short to any 5V reference circuit, open circuit, high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P0192	245	ON	Fuel Rail Pressure (FRP) Sensor Circuit Low Voltage	• DTCs P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the FRP sensor signal voltage is less than 0.7 volts.	• Sensor 5V reference circuit is short to ground or short to the low reference circuit. (P1635 may also set.) • Sensor 5V reference circuit is open circuit or high resistance. • Sensor signal circuit is short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P0193	245	ON	Fuel Rail Pressure (FRP) Sensor Circuit High Voltage	• DTCs P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the FRP sensor signal voltage is more than 4.5 volts.	• Sensor 5V reference circuit is short to battery, ignition voltage. (P1635 may also set.) • Sensor signal circuit is short to battery, ignition voltage, short to any 5V reference circuit, open circuit or high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0201	271	ON	Injector 1 Control Circuit	• DTCs P0204, P0611 and P1261 are not set. • The ignition switch is ON. • The battery voltage is more than 18 volts. • The engine is running.	• The ECM detects that the cylinder #1 fuel injector solenoid coil control circuit is open circuit, shorted to voltage or shorted to common 1 fuel injector drive circuit during engine rotations.	• Cylinder #1 fuel injector solenoid coil control circuit is open circuit, high resistance. • Cylinder #1 fuel injector solenoid coil control circuit is short to battery, ignition voltage or short to common 1 fuel injector drive circuit. • Faulty fuel injector. • Faulty ECM.
P0202	272	ON	Injector 2 Control Circuit	• DTCs P0203, P0612 and P1262 are not set. • The ignition switch is ON. • The battery voltage is more than 18 volts. • The engine is running.	• The ECM detects that the cylinder #2 fuel injector solenoid coil control circuit is open circuit, shorted to voltage or shorted to common 2 fuel injector drive circuit during engine rotations.	• Cylinder #2 fuel injector solenoid coil control circuit is open circuit, high resistance. • Cylinder #2 fuel injector solenoid coil control circuit is short to battery, ignition voltage or short to common 2 fuel injector drive circuit. • Faulty fuel injector. • Faulty ECM.
P0203	273	ON	Injector 3 Control Circuit	• DTCs P0202, P0612 and P1262 are not set. • The ignition switch is ON. • The battery voltage is more than 18 volts. • The engine is running.	• The ECM detects that the cylinder #3 fuel injector solenoid coil control circuit is open circuit, shorted to voltage or shorted to common 2 fuel injector drive circuit during engine rotations.	• Cylinder #3 fuel injector solenoid coil control circuit is open circuit, high resistance. • Cylinder #3 fuel injector solenoid coil control circuit is short to battery, ignition voltage or short to common 2 fuel injector drive circuit. • Faulty fuel injector. • Faulty ECM.
P0204	274	ON	Injector 4 Control Circuit	• DTCs P0201, P0611 and P1261 are not set. • The ignition switch is ON. • The battery voltage is more than 18 volts. • The engine is running.	• The ECM detects that the cylinder #4 fuel injector solenoid coil control circuit is open circuit, shorted to voltage or shorted to common 1 fuel injector drive circuit during engine rotations.	• Cylinder #4 fuel injector solenoid coil control circuit is open circuit, high resistance. • Cylinder #4 fuel injector solenoid coil control circuit is short to battery, ignition voltage or short to common 1 fuel injector drive circuit. • Faulty fuel injector. • Faulty ECM.
P0219	543	OFF	Engine Overspeed	• The ignition switch is ON.	• The ECM detects that the engine speed is higher than 4300 RPM.	• Engine over-running. • Faulty CKP sensor. • Faulty ECM. • Electromagnetic interference and electrical noise.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0234	42	ON	Turbocharger Engine Overboost	• DTCs P0237, P0238, P1630 and P1634 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine is running. • The fuel injection quantity is lower than a predetermined value.	• The ECM detects that the boost pressure is higher than 228 kPa (33 psi) for 3 seconds.	• Faulty turbocharger wastegate valve. • Faulty boost pressure sensor. • Faulty BARO sensor.
P0236	65	ON	Turbocharger Engine Underboost	• DTCs P0107, P0108, P0237, P0238, P1630 and P1634 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine is running. • The fuel injection quantity is higher than a predetermined value.	Either of following condition is met: • The ECM detects that the boost pressure is lower than 78 kPa (11 psi) for 20 seconds when the engine speed is lower than 900 RPM. • The ECM detects that the boost pressure is lower than 82 – 151 kPa (12 – 22 psi) for 20 seconds when the engine speed is between 1200 – 3000 RPM. • The ECM detect that the boost pressure is lower than 100 – 158 kPa (15 – 23 psi) for 20 seconds when the engine speed is between 3300 – 3600 RPM.	• Air leakage. • Intake duct is disconnected. • Intake system is obstructed. • Intake throttle plate sticking in the closed position. • Faulty turbocharger wastegate valve. • Faulty turbocharger. (Shaft stick) • Faulty boost pressure sensor. • Faulty BARO sensor. • Faulty fuel system. (Low fuel pressure)

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0237	32	ON	Turbocharger Boost Sensor Circuit Low Voltage	• DTCs P1630 and P1634 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the boost pressure sensor signal voltage is less than 0.1 volts for 5 seconds.	• Sensor 5V reference circuit is short to ground or short to the low reference circuit. (P1634 may also set.) • Sensor 5V reference circuit is open circuit, high resistance. • Sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P0238	32	ON	Turbocharger Boost Sensor Circuit High Voltage	• DTCs P1630 and P1634 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the boost pressure sensor signal voltage is more than 4.9 volts for 5 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage. (P1634 may also set.) • Sensor signal circuit is short to battery, ignition voltage or short to any 5V reference circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P0335	15	ON	Crankshaft Position (CKP) Sensor Circuit	• DTCs P0336, P0340, P0341 and P1345 are not set. • The ignition switch is ON. • The CMP sensor signal pulse is detected.	• The ECM detects that the CKP sensor pulses are not generated during engine rotations.	• Sensor installation is poor condition. • Faulty sensor wheel. • Sensor high circuit is short to battery, ignition voltage, short to any 5V reference circuit, short to ground, open circuit or high resistance. • Sensor low circuit is short to battery, ignition voltage, short to any 5V reference circuit, short to ground, open circuit or high resistance. • Sensor circuits short to each other. • Poor harness connector connection. • Faulty sensor. • Faulty ECM. • Electromagnetic interference and electrical noise.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0336	15	ON	Crankshaft Position (CKP) Sensor Performance	• DTCs P0335, P0340, P0341 and P1345 are not set. • The ignition switch is ON. • The CKP sensor signal is detected.	• The ECM detects extra or missing CKP sensor pulses during engine rotations.	• Sensor installation is poor condition. • Faulty sensor wheel. • Sensor circuit is intermittently open circuit or poor connection. • Faulty sensor. • Electromagnetic interference and electrical noise.
P0340	14	ON	Camshaft Position (CMP) Sensor Circuit	• DTCs P0335, P0336, P0341 and P1345 are not set. • The ignition switch is ON. • The crankshaft position (CKP) sensor signal pulse is detected.	• The ECM detects that the CMP sensor pulses are not generated during engine rotations.	• Sensor installation is poor condition. • Faulty sensor wheel. • Sensor 12V reference circuit is short to battery, ignition voltage, short to any 5V reference circuit, short to ground, open circuit or high resistance. • Sensor signal circuit is short to battery, ignition voltage, short to any 5V reference circuit, short to ground, open circuit or high resistance. • Sensor circuits short to each other. • Poor harness connector connection. • Faulty sensor. • Faulty ECM. • Electromagnetic interference and electrical noise.
P0341	14	ON	Camshaft Position (CMP) Sensor Circuit Performance	• DTCs P0335, P0336, P0340 and P1345 are not set. • The ignition switch is ON. • The CMP sensor signal pulse is detected.	• The ECM detects extra or missing CMP sensor pulses during engine rotations.	• Sensor installation is poor condition. • Faulty sensor wheel. • Sensor circuit is intermittently open circuit or poor connection. • Faulty sensor. • Electromagnetic interference and electrical noise.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0380	66	ON	Glow Plug Relay Control Circuit	• The ignition switch is ON. • The battery voltage is between 16 – 32 volts.	Either of following condition is met: • The ECM detects a low voltage condition on the glow relay control circuit when the relay is commanded OFF for longer than 5 seconds. • The ECM detects a high voltage condition on the glow relay control circuit when the relay is commanded ON for longer than 5 seconds.	• Relay voltage feed circuit is open circuit or high resistance. • Relay control circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • Poor harness connector connection. • Faulty relay. • Faulty ECM.
P0381	67	OFF	Glow Plug Lamp Control Circuit	• The ignition switch is ON. • The ignition voltage is more than 18 volts.	Either of following condition is met: • The ECM detects a low voltage condition on the glow indicator lamp control circuit when the indicator is commanded OFF for longer than 5 seconds. • The ECM detects a high voltage condition on the glow indicator lamp control circuit when the indicator is commanded ON for longer than 5 seconds.	• Lamp voltage feed circuit is open circuit or high resistance. • Lamp control circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • Poor harness connector connection. • Faulty instrument panel cluster. • Faulty lamp. • Faulty ECM.
P0485	44	ON	EGR Valve Position Sensor Circuit Low Voltage	• DTCs P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the EGR valve position sensor signal voltage is less than 0.1 volts for 5 seconds.	• Sensor 5V reference circuit is short to ground or short to the low reference circuit. (P1635 may also set.) • Sensor 5V reference circuit is open circuit, high resistance. • Sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty sensor. (EGR valve) • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0486	44	ON	EGR Valve Position Sensor Circuit High Voltage	• DTCs P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the EGR valve position sensor signal voltage is more than 4.9 volts for 5 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage. (P1635 may also set.) • Sensor signal circuit is short to battery, ignition voltage or short to any 5V reference circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. (EGR valve) • Faulty ECM.
P0488	45	ON	Exhaust Gas Recirculation (EGR) Valve Performance	• DTCs P0485, P0486, P1630 and P1635 are not set. • The ignition switch is ON. • The battery voltage is between 20 – 32 volts. • The ignition voltage is more than 18 volts. • The desired EGR valve position is stable.	• The ECM detects a variance between the actual EGR valve position and desired valve position is more than 20% for longer than 20 seconds when the EGR solenoid command duty is more than 90%.	• Valve stick. • Motor voltage feed circuit is short to battery, ignition voltage, short to ground, short to the sensor low reference circuit, open circuit or high resistance. • Duty signal circuit is short to battery, ignition voltage, short to ground, short to the sensor low reference circuit, open circuit or high resistance. • Poor harness connector connection. • Faulty EGR valve. • Faulty ECM.
P0500	25	ON	Vehicle Speed Sensor (VSS) Circuit	• The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine speed is more than 2000 RPM. • The commanded fuel is OFF (accelerator pedal is released).	• The ECM detects that the VSS signals are not generated for 5 seconds.	• Faulty sensor installation. • Sensor voltage feed circuit is open circuit or high resistance. • Sensor signal circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM. • Electromagnetic interference and electrical noise.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0501	25	ON	Vehicle Speed Sensor (VSS) Performance	• The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the VSS signal are changed larger than a predetermined vehicle speed.	• Sensor installation is poor condition. • Sensor circuit is intermittently open circuit or poor connection. • Faulty sensor. • Electromagnetic interference and electrical noise.
P0601	53	ON	Control Module Read Only Memory (ROM)	—	• The ECM detects a malfunction in its internal flash read memory (ROM).	• Faulty ECM.
P0603	54	ON	Control Module Read Only Memory (ROM)	—	Either of following condition is met: • The ECM detects a malfunction in its internal electrically erasable & programmable read only memory (EEPROM). • The ECM detects that the calculated checksum does not agree with the ECM internal registered checksum.	• Faulty ECM.
P0606	51/52	ON	Control Module Internal Performance	• The ignition switch is ON. • The battery voltage is more than 16 volts.	Either of following condition is met: • The ECM detects a malfunction in its internal main central processing unit (CPU). (Flash Code 51) • The ECM detects a malfunction in its internal sub CPU. (Flash Code 52)	• ECM voltage feed circuit is high resistance. • ECM ground circuit is open circuit or high resistance. • Faulty ECM.
P0611	34	ON	Fuel Injector Control Module Performance Group 1	• The ignition switch is ON. • The battery voltage is more than 18 volts.	• The ECM detects that the common 1 fuel injector charge up circuit is insufficient charge.	• ECM voltage feed circuit is high resistance. • ECM ground circuit is open circuit or high resistance. • Faulty ECM.
P0612	34	ON	Fuel Injector Control Module Performance Group 2	• The ignition switch is ON. • The battery voltage is more than 18 volts.	• The ECM detects that the common 2 fuel injector charge up circuit is insufficient charge.	• ECM voltage feed circuit is high resistance. • ECM ground circuit is open circuit or high resistance. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0615	19	ON	Starter Relay Control Circuit	• The ignition switch is ON. • The battery voltage is between 16 – 32 volts.	Either of following condition is met: • The ECM detects a low voltage condition on the starter cut relay control circuit when the relay is commanded OFF for longer than 10 seconds. • The ECM detects a high voltage condition on the starter cut relay control circuit when the relay is commanded ON for longer than 10 seconds.	• Relay voltage feed circuit is open circuit or high resistance. • Relay control circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • Poor harness connector connection. • Faulty relay. • Faulty ECM.
P0650	77	OFF	Malfunction Indicator Lamp (MIL) Control Circuit	• The ignition switch is ON. • The ignition voltage is more than 18 volts.	Either of following condition is met: • The ECM detects a low voltage condition on the MIL control circuit when the indicator is commanded OFF for longer than 3 seconds. • The ECM detects a high voltage condition on the MIL control circuit when the indicator is commanded ON for longer than 3 seconds.	• Lamp voltage feed circuit is open circuit or high resistance. • Lamp control circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • Poor harness connector connection. • Faulty instrument panel cluster. • Faulty lamp. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1093	227	ON	Fuel Rail Pressure (FRP) Too Low	• DTCs P0090, P0192, P0193, P0201 – P0204, P0611, P0612, P1095, P1261, P1262, P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The FRP regulator command is less than 33% or commanded fuel supply is more than a predetermined value.	Either of following condition is met: • The ECM detects that the differential fuel rail pressure is -10 MPa (-1,450 psi) for longer than 15 seconds when the engine speed is between 0 – 900 RPM. • The ECM detects that the deferential fuel rail pressure is -15 MPa (-2,170 psi) for longer than 15 seconds when the engine speed is higher than 1200 RPM.	• Loss fuel or less fuel in the fuel tank. • Pressure limiter valve opening pressure drop. • Faulty fuel injector. • Fuel suction side looseness, kinks or blocked. • Faulty or clogged fuel filter. • FRP sensor circuit is intermittently open circuit, poor connection or corrosion. • FRP sensor circuit high resistance. • FRP regulator circuit is intermittently open circuit, poor connection or corrosion. • FRP regulator circuit high resistance. • Faulty FRP sensor. • Faulty FRP regulator. • Faulty fuel supply pump.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1094	226	ON	Fuel Rail Pressure (FRP) Too Low	FRP Regulator Command High DTC • DTCs P0090, P0117, P0118, P0192, P0193, P0201 – P0204, P0500, P0501, P0611, P0612, P1095, P1261, P1262, P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine is running. • The accelerator pedal position is 0%. • The engine coolant temperature is more than 50°C (122°F). • The vehicle speed is less than 5 km/h (4 MPH). • The engine speed does not vary more than 50 RPM. FRP Drop DTC • DTCs P0090, P0192, P0193, P0201 – P0204, P0611, P0612, P1095, P1261, P1262, P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine is running. • The accelerator pedal position is 0%. • The engine coolant temperature is more than 50°C (122°F). • The vehicle speed is more than 50 km/h (30 MPH). • The commanded fuel injection quantity is OFF.	FRP Regulator Command High DTC • The ECM detects that the FRP regulator commanded fuel is more than a predetermined range for longer than 15 seconds when the engine speed is between 600 – 1500 RPM. FRP Drop DTC • The ECM detects that the FRP sensor signal voltage is shapely dropped more than 0.2 volts when the engine cuts fuel.	• Fuel leaking at high pressure side. • Loss fuel or less fuel in the fuel tank. • Pressure limiter valve opening pressure drop. • Faulty fuel injector. • Fuel suction side looseness, kinks or blocked. • Faulty or clogged fuel filter. • FRP sensor circuit is intermittently open circuit, poor connection or corrosion. • FRP sensor circuit high resistance. • FRP regulator circuit is intermittently open circuit, poor connection or corrosion. • FRP regulator circuit high resistance. • Faulty FRP sensor. • Faulty FRP regulator. • Faulty fuel supply pump.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1095	225	ON	Fuel Pressure Limiter Activation	• DTCs P0192, P0193, P1630 and P1635 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the FRP sensor signal voltage drops quickly from more than 3.7 volts to less than 2.3 volts, and then the differential fuel rail pressure is more than -30 MPa (4,350 psi).	• Loss fuel or less fuel in the fuel tank. • Faulty fuel injector. • Fuel suction side looseness, kinks or blocked. • Faulty or clogged fuel filter. • FRP sensor circuit is intermittently open circuit, poor connection or corrosion. • FRP sensor circuit high resistance. • FRP regulator circuit is intermittently open circuit, poor connection or corrosion. • FRP regulator circuit high resistance. • Faulty FRP sensor. • Faulty FRP regulator. • Faulty fuel supply pump.
P1173	542	OFF	Engine Overheat	• DTCs P0117, P0118, P1630 and P1634 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The engine is running.	• The ECM detects that the engine coolant temperature is more than 110°C (230°F) for 15 seconds.	• Engine overheat. • Faulty engine cooling system. • Faulty engine coolant temperature sensor.
P1220	28	ON	PTO Engine Speed Selector Sensor Circuit High Voltage	• DTCs P1630 and P1631 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the PTO throttle sensor signal voltage is more than 4.8 volts.	• Sensor 5V reference circuit is short to battery or ignition voltage. (P1631 may also set.) • Sensor signal circuit is short to battery, ignition voltage or short to any 5V reference circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1225	31	ON	Engine Idle Speed Selector Sensor Circuit	• DTCs P1630 and P1631 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	Either of following condition is met: • The ECM detects that the idle up sensor signal voltage is less than 0.1 volts for 5 second. • The ECM detects that the idle up sensor signal voltage is more than 4.9 volts for 5 second.	• Sensor 5V reference circuit is short to battery or ignition voltage, short to ground or short to the low reference circuit. (P1631 may also set.) • Sensor 5V reference circuit is open circuit, high resistance. • Sensor signal circuit is short to battery, ignition voltage or short to any 5V reference circuit, short to ground, short to the low reference circuit, open circuit or high resistance. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P1261	158	ON	Injector Positive Voltage Control Circuit Group 1	• DTC P0611 is not set. • The ignition switch is ON. • The battery voltage is more than 18 volts. • The engine is running.	Either of following condition is met: • The ECM detects that the common 1 fuel injector drive circuit is open circuit, shorted to ground or shorted to voltage during engine rotations. • The ECM detects that the cylinder #1 or #4 fuel injector solenoid coil control circuit is shorted to ground during engine rotations.	• Cylinder #1 or #4 fuel injector solenoid coil control circuit is short to ground. • Common 1 fuel injector drive circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • Faulty fuel injector. • Faulty ECM.
P1262	159	ON	Injector Positive Voltage Control Circuit Group 2	• DTC P0612 is not set. • The ignition switch is ON. • The battery voltage is more than 18 volts. • The engine is running.	Either of following condition is met: • The ECM detects that the common 2 fuel injector drive circuit is open circuit, shorted to ground or shorted to voltage during engine rotations. • The ECM detects that the cylinder number 2 or number 3 fuel injector solenoid coil control circuit is shorted to ground during engine rotations.	• Cylinder #2 or #3 fuel injector solenoid coil control circuit is short to ground. • Common 2 fuel injector drive circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • Faulty fuel injector. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1271	24	ON	Accelerator Pedal Position (APP) Sensor 1-2 Correlation	• DTCs P1630, P1631 and P1632 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the APP sensor 1 and sensor 2 are more than 45% out of range of each other.	• Sensor 5V reference circuit is high resistance. • Sensor signal circuit is high resistance. • Sensor low reference circuit is high resistance. • Faulty sensor. • Faulty ECM. • Electromagnetic interference and electrical noise.
P1277	24	ON	Accelerator Pedal Position (APP) Sensor 1 Circuit Low Voltage	• DTCs P1630 and P1631 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the APP sensor 1 signal voltage is less than 0.2 volts.	• Sensor 5V reference circuit is short to ground or short to the low reference circuit. (P1631 may also set.) • Sensor 5V reference circuit is open circuit, high resistance. • Sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P1278	24	ON	Accelerator Pedal Position (APP) Sensor 1 Circuit High Voltage	• DTCs P1630 and P1631 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the APP sensor 1 signal voltage is more than 4.9 volts.	• Sensor 5V reference circuit is short to battery or ignition voltage. (P1631 may also set.) • Sensor signal circuit is short to battery, ignition voltage or short to any 5V reference circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1282	24	ON	Accelerator Pedal Position (APP) Sensor 2 Circuit Low Voltage	• DTCs P1630 and P1632 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the APP sensor 2 signal voltage is less than 0.2 volts.	• Sensor 5V reference circuit is short to ground or short to the low reference circuit. (P1632 may also set.) • Sensor 5V reference circuit is open circuit, high resistance. • Sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P1283	24	ON	Accelerator Pedal Position (APP) Sensor 2 Circuit High Voltage	• DTCs P1630 and P1632 are not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts.	• The ECM detects that the APP sensor 2 signal voltage is more than 4.9 volts.	• Sensor 5V reference circuit is short to battery or ignition voltage. (P1632 may also set.) • Sensor signal circuit is short to battery, ignition voltage or short to any 5V reference circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty sensor. • Faulty ECM.
P1345	16	ON	Crankshaft Position (CKP) – Camshaft Position (CMP) Correlation	• DTCs P0335, P0336, P0340 and P0341 are not set. • The ignition switch is ON • The CKP sensor signal is detected. • The CMP sensor signal is detected.	• The ECM detects that the CKP sensor signals and CMP sensor signals are out of synchronization during engine rotations.	• Incorrect engine mechanical timing.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1625	416	ON	Main Relay System Error	ECM main relay open stuck DTC • DTC P1630 is not set. • The ignition switch is ON. • The ignition voltage is more than 18 volts. • The ignition ON time is longer than 3 seconds.	ECM Main Relay Open Stuck DTC • The ECM detects a low voltage condition on the ECM main relay voltage feed circuit when the relay is commanded ON for longer than 5 seconds. ECM Main Relay Close Stuck DTC • The ECM detects that the ECM has been ON when the relay is commanded OFF for longer than 10 seconds.	• Relay switch side voltage feed circuit is open circuit or high resistance. • Relay switched voltage feed circuit is short to battery or high resistance. • Relay coil side voltage supply circuit is short to battery or high resistance. • Relay coil side ground circuit is open circuit or high resistance. • Faulty relay. • Faulty ECM
P1630	36	ON	Control Module A/D Converter Error	—	• The ECM detects a malfunction in its internal analog / digital (A/D) converter.	• Faulty ECM.
P1631	55	ON	5V Reference Circuit 1	• DTC P1630 is not set. • The ignition switch is ON. • The battery voltage is between 16 – 32 volts.	Either of following condition is met: • The ECM detects that the 5 volts reference circuit 1 voltage is less than 4.5 volts. • The ECM detects that the 5 volts reference circuit 1 voltage is more than 5.5 volts.	• APP sensor 1 5V reference circuit is short to battery, ignition voltage or short to ground. • Idle up sensor 5V reference circuit is short to battery, ignition voltage or short to ground. • PTO throttle sensor 5V reference circuit is short to battery, ignition voltage or short to ground. • Faulty APP sensor. • Faulty idle up sensor. • Faulty PTO throttle sensor. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1632	55	ON	5V Reference Circuit 2	• DTC P1630 is not set. • The ignition switch is ON. • The battery voltage is between 16 – 32 volts.	Either of following condition is met: • The ECM detects that the 5 volts reference circuit 2 or 5 voltage is less than 4.5 volts. • The ECM detects that the 5 volts reference circuit 2 or 5 voltage is more than 5.5 volts.	• APP sensor 2 5V reference circuit is short to battery, ignition voltage or short to ground. • FRP sensor 5V reference circuit is short to battery, ignition voltage or short to ground. • EGR valve position sensor 5V reference circuit is short to battery, ignition voltage or short to ground. • BARO sensor 5V reference circuit is short to battery, ignition voltage or short to ground. • Faulty APP sensor. • Faulty FRP sensor. • Faulty EGR valve. • Faulty BARO sensor. • Faulty ECM.
P1633	55	ON	5V Reference Circuit 3	• DTC P1630 is not set. • The ignition switch is ON. • The battery voltage is between 16 – 32 volts.	Either of following condition is met: • The ECM detects that the 5 volts reference circuit 3 or 4 voltage is less than 4.5 volts. • The ECM detects that the 5 volts reference circuit 3 or 4 voltage is more than 5.5 volts.	• Same as DTC P1634.
P1634	55	ON	5V Reference Circuit 4	• DTC P1630 is not set. • The ignition switch is ON. • The battery voltage is between 16 – 32 volts.	Either of following condition is met: • The ECM detects that the 5 volts reference circuit 3 or 4 voltage is less than 4.5 volts. • The ECM detects that the 5 volts reference circuit 3 or 4 voltage is more than 5.5 volts.	• Boost pressure sensor 5V reference circuit is short to battery, ignition voltage or short to ground. • Faulty boost pressure sensor. • Faulty ECM.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1635	55	ON	5V Reference Circuit 5	• DTC P1630 is not set. • The ignition switch is ON. • The battery voltage is between 16 – 32 volts.	Either of following condition is met: • The ECM detects that the 5 volts reference circuit 2 or 5 voltage is less than 4.5 volts. • The ECM detects that the 5 volts reference circuit 2 or 5 voltage is more than 5.5 volts.	• Same as DTC P1632.
P1681	46	ON	Exhaust Brake Valve Circuit Low Voltage	• The ignition switch is ON. • The battery voltage is between 16 – 32 volts. • The engine is running.	• The ECM detects a low voltage condition on the exhaust brake solenoid valve control circuit for longer than 10 seconds when the solenoid valve is commanded OFF.	• Exhaust brake solenoid valve voltage feed circuit is open circuit or high resistance. • Exhaust brake solenoid valve control circuit is short to ground, open circuit or high resistance. • Poor harness connector connection. • Faulty exhaust brake solenoid valve. • Faulty ECM.
P1682	46	ON	Exhaust Brake Valve Circuit High Voltage	• The ignition switch is ON. • The battery voltage is between 16 – 32 volts. • The engine is running.	• The ECM detects a high voltage condition on the exhaust brake solenoid valve control circuit for longer than 10 seconds when the solenoid valve is commanded ON.	• Exhaust brake solenoid valve control circuit is short to battery or ignition voltage. • Faulty exhaust brake solenoid valve. • Faulty ECM.
U2104	84	ON	CAN Bus Reset Counter Overrun	• The ignition switch is ON.	• The ECM detects that the CAN Bus OFF status.	• CAN Low circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • CAN High circuit is short to battery, ignition voltage, short to ground, open circuit or high resistance. • Faulty resistor 1. • Faulty resistor 2. • Faulty ECM. • Faulty DRM. • Faulty TCM. • Faulty EHCU. • Electromagnetic interference and electrical noise.

DTC	Flash Code	MIL Status	DTC Name	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
U2106	85	ON	Lost CAN Communications With Transmission Control System	• The ignition switch is ON.	• The ECM detects that the CAN Bus messages from the TCM are not being received.	• CAN Low circuit to the TCM is open circuit. • CAN High circuit to the TCM is open circuit. • Faulty resistor 1. • Faulty resistor 2. • Faulty ECM. • Faulty TCM. • Electromagnetic interference and electrical noise.

P0087 (Flash Code 227)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the engine control module (ECM) using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. In case of fuel rail overpressure, a pressure limiter valve threaded into the fuel rail will open to release overpressure and return fuel back to the fuel tank.
If the ECM detects that the fuel rail pressure is certain pressure low as compared with engine speed, this DTC will set.

Condition for Running the DTC

- DTCs P0090, P0192, P0193, P0201 – P0204, P0611, P0612, P1095, P1261, P1262, P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the FRP sensor signal voltage is 1.0 volt for 10 seconds when the engine speed is between 0 – 600 RPM.
- The ECM detects that the FRP sensor signal voltage is less than 1.2 volts for 10 seconds when the engine speed is higher than 900 RPM.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become low enough to set this DTC.
- Normal FRP Sensor readings on the Tech 2 with the engine running in neutral at idle is around 1.4 – 1.6 volts.
- An intermittently sticking fuel injector may have allowed the fuel pressure to drop too much. Use the Tech 2 to perform the Injector Balancing test for each injector. Verify a consistent engine speed change when commanding each fuel injector ON and OFF.
- A skewed FRP sensor value (shifted to a lower pressure) can set this DTC. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes.

Notice:

- This DTC most likely indicates a loss of fuel pressure by a fuel leak from the high pressure side. Inspect the high pressure side fuel leakage between the fuel supply pump and fuel injector FIRST.

Notice:

- The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight or if there is a crack in one of the fuel hoses. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC.

Notice:

- If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the supply pump is interrupted and this DTC may set. Perform bleeding of fuel system after refilling.

Test Description

The numbers below refers to the step number on the diagnostic table.
7. This step checks for a fuel restriction by determining if a high vacuum is being pulled on the fuel system during normal operation.
8. This step checks for an air leak on the suction side of the fuel system by determining if a vacuum can be pulled when a fuel line is plugged.

DTC P0087 (Flash Code 227)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Inspect the high pressure side between the fuel supply pump and the fuel injectors for fuel leakage. The following components may contain an external leak. • Fuel supply pump • Fuel rail • Pressure limiter valve • Flow damper valve • Fuel rail pressure (FRP) sensor • Fuel pipe between the fuel supply pump and fuel rail • Fuel pipe between the fuel rail and fuel injectors • Each fuel pipe sleeve nuts **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. **Notice:** Remove and inspect the inlet high pressure joint to the fuel injectors for fuel leaking from the sleeve nut(s). Replace the fuel injector and injection pipe when foreign material was in contact. 2. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 3
3	1. Remove each glow plug from the cylinder head. 2. Inspect the tip of the plugs for wet fuel. **Notice:** Use the engine compression gauge (5-8840-2675-0 / J-26999-12) and gauge adapter (5-8840-2815-0 / EN-46722) to inspect the damage of engine. If poor engine compression (less than 1960 kPa [284 psi]) or variation of each cylinder (more than 294 kPa [43 psi]) is found, inspect the engine mechanical. Refer to the Engine Mechanical section. Repair as necessary. Did you find wet fuel on the glow plug(s)?	—	Go to Step 16	Go to Step 4
4	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0090, P0192, P0193, P0201 – P0204, P1094, P1095, P1261 or P1262 set?	—	Go to Applicable DTC	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Wait 2 minutes for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition with the engine OFF. DO NOT start the engine. 4. Observe the FRP Sensor parameter with the Tech 2. Is the FRP Sensor parameter the specified value?	0.9 – 1.0 volt	Go to Step 6	Go to Step 13
6	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC. 3. Pump the priming pump on the fuel filter until it becomes firm. If there is a leak on the suction side of the fuel system between the priming pump and the fuel supply pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Start the engine and check for high side fuel system leaks at the fuel supply pump and fuel rail. **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 5. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Remove the rubber fuel hose from the fuel filter housing (fuel supply pump side). Use a pan to catch the fuel leakage from the removed fuel line. **Important:** The fuel vacuum pump / pressure gauge connector and the adapter hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the tools line may damage the fuel supply pump. 3. Connect the suction side fuel pressure / vacuum gauge adapter (5-8840-2844-0 / EN-47667) with fuel pressure / vacuum gauge assembly (5-8840-2844-0 / J-44638) in series with the filter housing and the disconnected fuel hose. Ensure the service tool and fuel line connections are tight. 4. Bleed the fuel system by priming the priming pump until it becomes firm, then crank over the engine for a maximum of 5 seconds. Repeat as necessary until the engine starts. 5. Let the engine run at idle for at least 1 minute. 6. Monitor the fuel pressure / vacuum gauge while holding the engine speed higher than 2500 RPM for a minimum of 1 minute. Does the fuel pressure / vacuum gauge ever indicate a larger vacuum than the specified amount during the test?	5 inHg	Go to Step 9	Go to Step 8
8	1. Fully clamp off a fuel hose as close to the fuel tank as possible (this will draw vacuum on the fuel system). You can also disconnect a fuel line and plug it. 2. Start the engine and turn the idle up control knob to the highest position. (Full clockwise direction. The idle speed is increased up to 1600 RPM.) 3. Monitor the fuel pressure / vacuum gauge. **Notice:** Release the clamp or open the plug when the gauge is likely to be more than 8 inHg during the test. Can a vacuum of at least the specified amount be pulled on the fuel system?	8 inHg	Go to Step 11	Go to Step 10
9	1. Inspect the fuel lines between the fuel supply pump and fuel tank for being crushed or kinked. 2. Inspect for a plugged fuel tank vent hose. 3. Inspect inside the fuel tank (if possible) for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. 4. Repair as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 14

Step	Action	Value(s)	Yes	No
10	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 3. Repair as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 12
11	1. Turn OFF the ignition. 2. Unclamp or unplug the fuel line from the previous step and reconnect the fuel line (if disconnected). 3. Start the engine and allow it to run for at least 1 minute. 4. Perform the Injector Balancing test with the Tech 2. 5. Command each injector OFF and verify an engine speed change for each injector. Is there an injector that does not change engine speed when commanded OFF?	—	Go to Step 17	Go to Step 19
12	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-116). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP regulator circuit at the harness connector of the ECM (pins 89, 97, 105 and 113 of E-111 connector). 6. Test for high resistance on each FRP regulator circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 18
13	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-113 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP sensor circuit at the harness connector of the ECM (pins 82, 87, 90 and 101 of E-111 connector). 6. Test for high resistance on each FRP circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 15

Step	Action	Value(s)	Yes	No
14	Replace the fuel filter cartridge. Refer to Fuel Filter Cartridge Replacement in the Fuel System Section. Did you complete the replacement?	—	Go to Step 20	—
15	Replace the FRP sensor. Refer to Fuel Rail Pressure (FRP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 20	—
16	**Important:** Replacement injector must be programmed. Replace the appropriate injector that was leaking fuel found at Step 3. Refer to Fuel Injector Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 20	—
17	**Important:** Replacement injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 20	—
18	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement in this section and Fuel Filter Cartridge Replacement in Fuel System section. Did you complete the replacement?	—	Go to Step 20	—
19	**Notice:** There is a possibility that the pressure limiter valve stuck open or opening pressure has fallen. Replace the pressure limiter valve. Refer to Fuel Rail Replacement in this section. Did you complete the replacement?	—	Go to Step 20	—
20	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 21
21	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0088 (Flash Code 118)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the engine control module (ECM) using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. In case of fuel rail overpressure, a pressure limiter valve threaded into the fuel rail will open to release overpressure and return fuel back to the fuel tank.
If the ECM detects that the fuel pressure went excessively high for a certain length of time, this DTC will set (First Stage DTC).
If the ECM detects that during the same ignition cycle the fuel pressure rose even higher than the amount to set DTC P0088 (Second Stage DTC) for a certain length of time, this DTC will also set.

Condition for Running the DTC

- DTCs P0192, P0193, P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The engine is running.

Condition for Setting the DTC

First Stage DTC

- The ECM detects that the FRP sensor signal voltage is more than 3.9 volts for longer than 10 second.

Second Stage DTC

- The ECM detects that the FRP sensor signal voltage is more than 4.0 volts for longer than 10 second during the ignition cycle after first stage has occurred.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become high enough to set this DTC.
- Normal FRP Sensor readings on the Tech 2 with the engine running in neutral at idle is around 1.4 – 1.6 volts.
- A skewed FRP sensor value (shifted to a higher pressure) can set this DTC. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes.

Test Description

The numbers below refer to the step number on the diagnostic table.
6. This step checks for a fuel restriction by determining if a high vacuum is being pulled on the fuel system during normal operation.
7. This step checks for an air leak on the suction side of the fuel system by determining if a vacuum can be pulled when a fuel line is plugged.

DTC P0088 (Flash Code 118)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls

Step	Action	Value(s)	Yes	No
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P0089, P0090, P0192, P0193, P0201 – P0204, P1095, P1261 or P1262 set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition for 30 seconds. 2. Place the transmission in Neutral and set the park brake. 3. Start the engine. 4. Observe the Fuel Rail Pressure (FRP) Sensor parameter with the Tech 2. 5. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Tech 2. Does the FRP Sensor parameter ever exceed the specified value?	3.9 volts	Go to Step 4	An intermittent problem by foreign material in the fuel is suspected. Go to Step 13
4	1. Turn OFF the ignition. 2. Wait 2 minutes for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition with the engine OFF. DO NOT start the engine. 4. Observe the FRP Sensor parameter with the Tech 2. Is the FRP Sensor parameter the specified value?	0.9 – 1.0 volt	Go to Step 5	Go to Step 12
5	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel supply pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC. 3. Pump the priming pump on the fuel filter until it becomes firm. If there is a leak on the suction side of the fuel system between the priming pump and the fuel supply pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Start the engine and check for high side fuel system leaks at the fuel supply pump and fuel rail. **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 5. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Remove the rubber fuel hose from the fuel filter housing (fuel supply pump side). Use a pan to catch the fuel leakage from the removed fuel line. **Important:** The fuel vacuum pump / pressure gauge connector and the adapter hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the tools line may damage the fuel supply pump. 3. Connect the suction side fuel pressure / vacuum gauge adapter (5-8840-2844-0 / EN-47667) with fuel pressure / vacuum gauge assembly (5-8840-2844-0 / J-44638) in series with the filter housing and the disconnected fuel hose. Ensure the service tool and fuel line connections are tight. 4. Bleed the fuel system by priming the priming pump until it becomes firm, then crank over the engine for a maximum of 5 seconds. Repeat as necessary until the engine starts. 5. Let the engine run at idle for at least 1 minute. 6. Monitor the fuel pressure / vacuum gauge while holding the engine speed higher than 2500 RPM for a minimum of 1 minute. Does the fuel pressure / vacuum gauge ever indicate a larger vacuum than the specified amount during the test?	5 inHg	Go to Step 8	Go to Step 7
7	1. Fully clamp off a fuel hose as close to the fuel tank as possible (this will draw vacuum on the fuel system). You can also disconnect a fuel line and plug it. 2. Start the engine and turn the idle up control knob to the highest position. (Full clockwise direction. The idle speed is increased up to 1600 RPM.) 3. Monitor the fuel pressure / vacuum gauge. **Notice:** Release the clamp or open the plug when the gauge is likely to be more than 8 inHg during the test. Can a vacuum of at least the specified amount be pulled on the fuel system?	8 inHg	Go to Step 10	Go to Step 9
8	1. Inspect the fuel lines between the fuel supply pump and fuel tank for being crushed or kinked. 2. Inspect for a plugged fuel tank vent hose. 3. Inspect inside the fuel tank (if possible) for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. 4. Repair as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 13

Step	Action	Value(s)	Yes	No
9	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 3. Repair as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 11
10	1. Turn OFF the ignition. 2. Unclamp or unplug the fuel line from the previous step and reconnect the fuel line (if disconnected). 3. Start the engine and allow it to run for at least 1 minute. 4. Perform the Injector Balancing test with the Tech 2. 5. Command each injector OFF and verify an engine speed change for each injector. Is there an injector that does not change engine speed when commanded OFF?	—	Go to Step 15	Go to Step 11
11	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-116). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP regulator circuit at the harness connector of the ECM (pins 89, 97, 105 and 113 of E-111 connector). 6. Test for high resistance on each FRP regulator circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
12	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-113 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each FRP sensor circuit at the harness connector of the ECM (pins 82, 87, 90 and 101 of E-111 connector). 6. Test for high resistance on each FRP circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 14

Step	Action	Value(s)	Yes	No
13	Replace the fuel filter cartridge. Refer to Fuel Filter Cartridge Replacement in the Fuel System Section. Did you complete the replacement?	—	Go to Step 17	—
14	Replace the FRP sensor. Refer to Fuel Rail Pressure (FRP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—
15	**Important:** Replacement injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 17	—
16	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement in this section and Fuel Filter Cartridge Replacement in Fuel System section. Did you complete the replacement?	—	Go to Step 17	—
17	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 18
18	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0089 (Flash Code 151)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the engine control module (ECM) using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. In case of fuel rail overpressure, a pressure limiter valve threaded into the fuel rail will open to release overpressure and return fuel back to the fuel tank.
If the ECM detects that fuel pressure is a certain pressure higher than the desired fuel pressure for a certain length of time, this DTC will set.

Condition for Running the DTC

- DTCs P0090, P0192, P0193, P0201 – P0204, P0611, P0612, P1261, P1262, P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The engine is running.
- The FRP regulator command is more than 40% or commanded fuel supply is less than a predetermined value.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the deferential fuel rail pressure is higher than 20 MPa (2,900 psi) for longer than 10 seconds when the engine speed is between 0 – 600 RPM.
- The ECM detects that the differential fuel rail pressure is higher than 40 MPa (5,800 psi) for longer than 10 seconds when the engine speed is higher than 900 RPM.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become high enough to set this DTC.
- Normal FRP Sensor readings on the Tech 2 with the engine running in neutral at idle is around 1.4 – 1.6 volts.
- A skewed FRP sensor value (shifted to a higher pressure) can set this DTC. The FRP Sensor on the Tech 2 should read 0.9 – 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 2 minutes.

P0090 (Flash Code 247)

Circuit Description

The fuel rail pressure (FRP) regulator is installed to the fuel supply pump and controls the suction fuel quantity into the fuel rail. The FRP regulator is fully opened in the normal state and larger drive current results in smaller opening. The engine control module (ECM) calculates desired fuel rail pressure and fuel flow rate and it compares the calculated desired fuel rail pressure to the actual value to determine the FRP regulator position. When the actual fuel rail pressure is higher than the desired value, the FRP regulator is closed to decease the flow rate. If the ECM detects an excessively low or high FRP regulator solenoid feedback current, this DTC will set.

Condition for Running the DTC

- DTC P1630 is not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The FRP regulator command duty cycle is between 10 – 90%.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the FRP regulator solenoid feedback current is less than 50 mA.
- The ECM detects that the FRP regulator solenoid feedback current is more than 2400 mA.
- The ECM detects that the difference of commanded FRP regulator solenoid current and feedback current is more than 1000 mA.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The numbers below refers to the step number on the diagnostic table.
7. If the FRP regulator high control circuits between the ECM and the FRP regulator are shorted to voltage, engine stalls and will not start.
8. If the FRP regulator low control circuits between the ECM and the FRP regulator are shorted to ground, this DTC may not set. This condition will cause engine stall or no engine start.

Step	Action	Value(s)	Yes	No
5	1. Turn ON the ignition, with the engine OFF. 2. Disconnect the FRP regulator harness connector. 3. Connect a test lamp between the FRP regulator high control circuit (pin 1 of E-116 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. DO NOT start the engine. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 9
6	1. Turn OFF the ignition. 2. Connect a test lamp between the FRP regulator low control circuit (pin 2 of E-116 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. Does the test lamp illuminate?	—	Go to Step 11	Go to Step 10
7	1. Test the FRP regulator high control circuits between the engine control module (ECM) (pins 105 and 113 of E-111 connector) and the FRP regulator (pin 1 of E-116 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
8	1. Test the FRP regulator low control circuits between the ECM (pins 89 and 97 of E-111 connector) and the FRP regulator (pin 2 of E-116 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
9	1. Test the FRP regulator high control circuits between the ECM (pins 105 and 113 of E-111 connector) and the FRP regulator (pin 1 of E-116 connector) for the following conditions: • An open circuit • A short to ground • A short to the low control circuits • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
10	**Important:** The ECM may be damaged if the FRP regulator low control circuit is shorted to a voltage source. 1. Test the FRP regulator low control circuits between the ECM (pins 89 and 97 of E-111 connector) and the FRP regulator (pin 2 of E-116 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12

Step	Action	Value(s)	Yes	No
11	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent and for poor connections at the FRP regulator harness connector. 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the FRP regulator circuits at the harness connector of the ECM (pins 89, 97, 105 and 113 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. Replace the fuel supply pump. Refer to Fuel Supply Pump Replacement in this section. (FRP regulator is part of the fuel supply pump assembly) Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0107 (Flash Code 71)

Circuit Description

The barometric pressure (BARO) sensor is located under the instrument panel cluster (IPC) near the pedal bracket. The BARO sensor is a transducer that varies voltage according to the barometric pressure changes and the generated voltage is input to the engine control module (ECM) for the BARO signal. The BARO sensor has the following circuits.

- 5 volts reference circuit.
- Low reference circuit.
- BARO sensor signal circuit.

The ECM supplies 5 volts to the BARO sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The BARO sensor provides a signal to the ECM on the BARO signal circuit, which is relative to the pressure changes barometric pressure. The ECM should detect a low signal voltage at a low barometric pressure, such as high altitude place. The ECM should detect high signal voltage at a high barometric pressure. The ECM uses this voltage signal to calibrate the fuel injection quantity and injection timing for altitude compensation. If the ECM detects an excessively low BARO sensor signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1632 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the BARO sensor signal voltage is less than 0.5 volts for 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a BARO substitution of 75 kPa (11 psi) for engine control.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0107 (Flash Code 71)

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P1632 also set?	—	Go to DTC P1632	Go to Step 3
3	1. Turn ON the ignition, with the engine OFF. 2. Observe the Barometric Pressure (BARO) Sensor parameter with the Tech 2. Is the BARO Sensor parameter less than the specified value?	0.5 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the BARO sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit of the BARO sensor harness (pin 3 of B-422 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 5	Go to Step 6

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit of the BARO sensor harness (pins 3 and 2 of B-422 connector). 3. Turn ON the ignition, with the engine OFF. 4. Observe the BARO Sensor parameter with the Tech 2. Is the BARO Sensor parameter more than specified value?	4.5 volts	Go to Step 8	Go to Step 7
6	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 61 of J-191 connector) and the BARO sensor (pin 3 of B-422 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	1. Test the signal circuit between the ECM (pin 71 of J-191 connector) and the BARO sensor (pin 2 of B-422 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the BARO sensor (pins 2 and 3 of B-422 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the BARO sensor circuits at the harness connector of the ECM (pins 61 and 71 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the BARO sensor. Refer to Barometric Pressure (BARO) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 12	—

Step	Action	Value(s)	Yes	No
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13
13	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0108 (Flash Code 71)

Circuit Description

The barometric pressure (BARO) sensor is located under the instrument panel cluster (IPC) near the pedal bracket. The BARO sensor is a transducer that varies voltage according to the barometric pressure changes and the generated voltage is input to the engine control module (ECM) for the BARO signal. The BARO sensor has the following circuits.

- 5 volts reference circuit.
- Low reference circuit.
- BARO sensor signal circuit.

The ECM supplies 5 volts to the BARO sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The BARO sensor provides a signal to the ECM on the BARO signal circuit, which is relative to the pressure changes barometric pressure. The ECM should detect a low signal voltage at a low barometric pressure, such as high altitude place. The ECM should detect high signal voltage at a high barometric pressure. The ECM uses this voltage signal to calibrate the fuel injection quantity and injection timing for altitude compensation. If the ECM detects an excessively high BARO sensor signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1632 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the BARO sensor signal voltage is more than 4.9 volts for 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a BARO substitution of 75 kPa (11 psi) for engine control.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the BARO sensor. Refer to Barometric Pressure (BARO) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0112 (Flash Code 22)

Circuit Description

The intake air temperature (IAT) sensor is fitted between the air cleaner and turbocharger. The IAT sensor is a variable resistor. The IAT sensor has a signal circuit and a low reference circuit. The IAT sensor measures the temperature of the air entering the engine. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and a ground for the IAT low reference circuit. When the IAT sensor is cold, the sensor resistance is high. When the air temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the IAT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the IAT signal circuit. If the ECM detects an excessively low IAT signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1632 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the IAT sensor signal voltage is less than 0.1 volts for 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an IAT substitution of -10°C (14°F) for engine control.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the IAT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

P0117 (Flash Code 23)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor has a signal circuit and a low reference circuit. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit. If the ECM detects an excessively low ECT signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1634 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the ECT sensor signal voltage is less than 0.1 volts for 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an ECT substitution of -20°C (-4°F) for engine starting control.
- The ECM uses an ECT substitution of 110°C (230°F) for engine control.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

4	1. Test the signal circuit between the engine control module (ECM) (pin 84 of E-111 connector) and the ECT sensor (pin 1 of E-90 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6
5	Replace the ECT sensor. Refer to Engine Coolant Temperature (ECT) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 8	—
6	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect connections on the ECT sensor circuits at the harness connector of the ECM (pins 84 and 109 of E-111 connector) for corrosion. 4. Repair or clean the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
7	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 9
9	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0118 (Flash Code 23)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor has a signal circuit and a low reference circuit. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit. If the ECM detects an excessively high ECT signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1634 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The engine run time is longer than 3 minutes.

Condition for Setting the DTC

- The ECM detects that the ECT sensor signal voltage is more than 4.8 volts for 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an ECT substitution of -20°C (-4°F) for engine starting control.
- The ECM uses an ECT substitution of 110°C (230°F) for engine control.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

P0182 (Flash Code 211)

Circuit Description

The fuel temperature (FT) sensor is installed to the fuel supply pump. The FT sensor is a variable resistor. The FT sensor has a signal circuit and a low reference circuit. The FT sensor measures the fuel temperature of the fuel. The engine control module (ECM) supplies 5 volts to the FT signal circuit and a ground for the FT low reference circuit. When the FT sensor is cold, the sensor resistance is high. When the fuel temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the FT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the FT signal circuit. If the ECM detects an excessively low FT signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1634 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the FT sensor signal voltage is less than 0.1 volts for 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a FT substitution of -20°C (-4°F) for engine starting control.
- The ECM uses a FT substitution of 70°C (158°F) for engine control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- Before starting a cold engine, FT sensor and engine coolant temperature (ECT) sensor temperature should be relatively close to each other.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

P0192 (Flash Code 245)

Circuit Description

The fuel rail pressure (FRP) sensor is installed to the fuel rail and it detects the fuel pressure in the fuel rail, converts the pressure into a voltage signal, and sends the signal to the engine control module (ECM). The FRP sensor has the following circuits.

- 5 volts reference circuit.
- Low reference circuit.
- FRP sensor signal circuit.

The ECM supplies 5 volts to the FRP sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. Higher fuel rail pressure provides higher FRP sensor voltage while lower pressure provides lower FRP sensor voltage. The ECM calculates actual fuel rail pressure (fuel pressure) from the voltage signal and uses the result in fuel injection control and other control tasks. The ECM monitors the FRP sensor signal for voltage outside the normal range. If the ECM detects an excessively low FRP sensor signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the FRP sensor signal voltage is less than 0.7 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Electrical or magnetic interference may affect intermittent condition.
- The Differential Fuel Rail Pressure parameter on the Tech 2 will be fixed at 0 MPa (0 psi) when this DTC is set.

P0193 (Flash Code 245)

Circuit Description

The fuel rail pressure (FRP) sensor is installed to the fuel rail and it detects the fuel pressure in the fuel rail, converts the pressure into a voltage signal, and sends the signal to the engine control module (ECM). The FRP sensor has the following circuits.

- 5 volts reference circuit.
- Low reference circuit.
- FRP sensor signal circuit.

The ECM supplies 5 volts to the FRP sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. Higher fuel rail pressure provides higher FRP sensor voltage while lower pressure provides lower FRP sensor voltage. The ECM calculates actual fuel rail pressure (fuel pressure) from the voltage signal and uses the result in fuel injection control and other control tasks. The ECM monitors the FRP sensor signal for voltage outside the normal range. If the ECM detects an excessively high FRP sensor signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the FRP sensor signal voltage is more than 4.5 volts.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits accelerator control range.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Electrical or magnetic interference may affect intermittent condition.
- The Differential Fuel Rail Pressure parameter on the Tech 2 will be fixed at 0 MPa (0 psi) when this DTC is set.

9	1. Test the signal circuits between the ECM (pins 82 and 90 of E-111 connector) and the FRP sensor (pin 2 of E-113 connector) for a short to any 5 volts reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14

Step	Action	Value(s)	Yes	No
10	**Important:** The FRP sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuits between ECM (pins 82 and 90 of E-111 connector) and the FRP sensor (pin 2 of E-113 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
11	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the FRP sensor (pins 1 and 2 of E-113 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the FRP sensor circuits at the harness connector of the ECM (pins 82, 90 and 101 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Replace the FRP sensor. Refer to Fuel Rail Pressure (FRP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0201 (Flash Code 271)

Circuit Description

The engine control module (ECM) calculates the optimum fuel injection ON time using data sent from various engine sensors. The ECM supplies a high voltage along with grounding the fuel injector control circuit when it needs to energize the fuel injector (turn it ON). The ECM also supplies battery voltage to the fuel injector solenoid control circuit to allow for fault detection. If the cylinder number 1 fuel injector solenoid control circuit is open circuit, shorted to voltage or shorted to the common 1 fuel injector drive circuit, this DTC will set.

Condition for Running the DTC

- DTCs P0204, P0611 and P1261 are not set.
- The ignition switch is ON.
- The battery voltage is more than 18 volts.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the cylinder number 1 fuel injector solenoid coil control circuit is open circuit, shorted to voltage or shorted to common 1 fuel injector drive circuit during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0201 (Flash Code 271)

P0203 (Flash Code 273)

Circuit Description

The engine control module (ECM) calculates the optimum fuel injection ON time using data sent from various engine sensors. The ECM supplies a high voltage along with grounding the fuel injector control circuit when it needs to energize the fuel injector (turn it ON). The ECM also supplies battery voltage to the fuel injector solenoid control circuit to allow for fault detection. If the cylinder number 3 fuel injector solenoid control circuit is open circuit, shorted to voltage or shorted to the common 2 fuel injector drive circuit, this DTC will set.

Condition for Running the DTC

- DTCs P0202, P0612 and P1262 are not set.
- The ignition switch is ON.
- The battery voltage is more than 18 volts.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the cylinder number 3 fuel injector solenoid coil control circuit is open circuit, shorted to voltage or shorted to common 2 fuel injector drive circuit during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

P0204 (Flash Code 274)

Circuit Description

The engine control module (ECM) calculates the optimum fuel injection ON time using data sent from various engine sensors. The ECM supplies a high voltage along with grounding the fuel injector control circuit when it needs to energize the fuel injector (turn it ON). The ECM also supplies battery voltage to the fuel injector solenoid control circuit to allow for fault detection. If the cylinder number 4 fuel injector solenoid control circuit is open circuit, shorted to voltage or shorted to the common 1 fuel injector drive circuit, this DTC will set.

Condition for Running the DTC

- DTCs P0201, P0611 and P1261 are not set.
- The ignition switch is ON.
- The battery voltage is more than 18 volts.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the cylinder number 4 fuel injector solenoid coil control circuit is open circuit, shorted to voltage or shorted to common 1 fuel injector drive circuit during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

P0219 (Flash Code 543)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. The engine control module (ECM) calculates the engine speed and exact position of the crankshaft based on the signal from the CKP sensor. If the ECM detects an engine overrun condition, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the engine speed is higher than 4300 RPM.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- This DTC is caused by an engine overspeed condition, which was most likely caused by driver error (i.e. downshifting a manual transmission on a steep grade). Since this DTC does not illuminate any lamps, clear the DTC and ensure there are no signs of engine damage. Excessive engine overspeed may damage internal engine components.
- Make sure the CKP sensor is tight and the sensor wheel teeth are not damaged.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	**Important:** If DTC P0335, P0336, P0340 or P0341 is also set, diagnose that DTC first. 1. Install the Tech 2. 2. Start the engine. 3. Observe the Engine Speed parameter with the Tech 2. 4. Accelerate the engine as necessary. Does the Engine Speed parameter ever exceed the specified value?	3700 RPM	Go to Step 4	Go to Step 3
3	Ask the driver if overrun is caused by gear slip-out, shift error, down-slope driving, etc. If engine overrun has experienced, the engine must be inspected and repaired as necessary. Did you complete the action?	—	Go to Step 17	—
4	1. Remove the crankshaft position (CKP) sensor. Refer to CKP Sensor replacement in this section. 2. Visually inspect the CKP sensor for the following conditions: • For physical damage • For being loose • For improper installation Did you find and correct the condition?	—	Go to Step 17	Go to Step 5

Step	Action	Value(s)	Yes	No
5	Visually inspect for damage, metal particles on magnet and for flywheel teeth damage. Did you find and correct the condition?	—	Go to Step 17	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the crankshaft position (CKP) sensor harness connector. 3. Connect a DMM across the CKP sensor terminals. 4. Measure the resistance across the CKP sensor. Does the CKP sensor resistance measure within the specified range?	105 – 145 Ω	Go to Step 7	Go to Step 15
7	1. Connect a DMM across the CKP sensor terminals (measure sensor output voltage). 2. Place the DMM on the AC volt scale. 3. Start the engine. 4. Monitor the DMM while accelerating the engine between idle and W.O.T. (accelerator pedal full travel). Does the DMM indicate an AC voltage increase in accordance with an engine speed increase?	—	Go to Step 8	Go to Step 15
8	1. Turn ON the ignition, with the engine OFF. 2. Connect a DMM between the CKP sensor harness (pin 1 of E-98 connector) and a known good ground. 3. Connect a DMM between the CKP sensor harness (pin 2 of E-98 connector) and a known good ground. Is each DMM voltage within the specified value?	0.4 – 1.4 volts	Go to Step 10	Go to Step 9
9	Is the DMM voltage more than the specified value at Step 8?	—	Go to Step 12	Go to Step 11
10	1. Test the CKP sensor circuits between the engine control module (ECM) (pins 106 and 107 of E-111 connector) and CKP sensor (pins 1 and 2 of E-98 connector) for a short to each other. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 13
11	1. Test the CKP sensor circuits between the ECM (pins 106 and 107 of E-111 connector) and CKP sensor (pins 1 and 2 of E-98 connector) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 14

Step	Action	Value(s)	Yes	No
12	1. Test the CKP sensor circuits between the ECM (pins 106 and 107 of E-111 connector) and CKP sensor (pins 1 and 2 of E-98 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
13	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the CKP sensor (pins 1 and 2 of E-98 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
14	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the CKP sensor circuits at the harness connector of the ECM (pins 106 and 107 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
15	Replace the CKP sensor. Refer to Crankshaft Position (CKP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—
16	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 17	—
17	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Accelerate the Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Engine Speed parameter with Tech 2. Does the Engine Speed parameter ever exceed the specified value?	3700 RPM	Go to Step 4	Go to Step 18
18	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0234 (Flash Code 42)

Circuit Description

The boost pressure sensor is located in the air induction tubing. The sensor is a transducer that varies voltage according to changes in the air pressure inside the air tubing. The engine control module (ECM) monitors the boost pressure sensor signal for abnormal values. If the ECM detects that the boost pressure sensor signal is excessively high, this DTC will set.

Condition for Running the DTC

- DTCs P0237, P0238, P1630 and P1634 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The engine is running.
- The fuel injection quantity is lower than a predetermined value.

Condition for Setting the DTC

- The ECM detects that the boost pressure is higher than 228 kPa (33 psi) for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- An open circuit or high resistance in the boost pressure low reference circuit may set this DTC.
- Check the turbocharger wastegate valve for a sticking or close stuck condition.
- Use the Tech 2 to verify the integrity of the boost pressure sensor signal. Compare the sensor values under all load conditions for an excessively high value. Use the Tech 2 data list values for nominal sensor readings.
- The fuel with which gasoline was mixed may set this DTC.

Test Description

The numbers below refer to the step number on the diagnostic table.
2. A skewed boost pressure sensor value (shifted to a higher pressure) can set this DTC. The Boost Pressure on the Tech 2 should read near Barometric Pressure (BARO) with the key ON and engine OFF.
3. A skewed BARO sensor value (shifted to a lower pressure) may indicate a wrong boost pressure sensor reading. The BARO on the Tech 2 should read near surrounding barometric pressure.

DTC P0234 (Flash Code 42)

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Boost Pressure and Barometric Pressure (BARO) with the Tech 2. Does the Tech 2 indicate that the difference between the Boost Pressure and BARO is more than the specified value?	7.0 kPa (1.0 psi)	Go to Step 3	Go to Step 4
3	1. Observe the BARO parameter with the Tech 2. 2. Compare the BARO value to the range specified in the altitude vs. barometric pressure table. Refer to Altitude vs Barometric Pressure. Is the BARO parameter within the range specified?	—	Go to Step 5	Go to Step 8

Step	Action	Value(s)	Yes	No
4	1. Inspect the following for possible causes of high boost pressure. • Wastegate for a stuck closed condition. Refer to the Turbocharger in Engine Mechanical section for diagnosis. • Oil in the air induction tubing causing an incorrect boost pressure sensor signal. When there is adhesion of oil inside of the tubing, intercooler or turbocharger it needs to be wiped off. 2. Repair the condition as necessary. Did you find and correction the condition?	—	Go to Step 11	Go to Diagnostic Aids
5	1. Turn OFF the ignition. 2. Disconnect the boost pressure sensor harness connector. 3. Inspect for an intermittent and for a poor connection at the boost pressure sensor harness connector (pin 1 of J-216 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 6
6	1. Turn ON the ignition, with the engine OFF. 2. Connect a test lamp between the boost pressure sensor low reference circuit (pin 1 of J-216 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 7
7	Repair the high resistance in low reference circuit between the engine control module (ECM) (pin 109 of E-111 connector) and boost pressure sensor (pin 1 of J-216 connector). Did you complete the repair?	—	Go to Step 11	—
8	1. Turn OFF the ignition. 2. Disconnect the BARO sensor harness connector. 3. Inspect for an intermittent and for poor connections at the BARO sensor harness connector (pins 2 and 3 of B-422 connector). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each BARO sensor circuit at the harness connector of the ECM (pins 61 and 71 of J-191 connector). 6. Test for high resistance on each BARO sensor circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	Replace the boost pressure sensor. Refer to Boost Pressure Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 11	—
10	Replace the BARO sensor. Refer to Barometric Pressure (BARO) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 11	—

Step	Action	Value(s)	Yes	No
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 12
12	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0236 (Flash Code 65)

Circuit Description

The boost pressure sensor is located in the air induction tubing. The sensor is a transducer that varies voltage according to changes in the air pressure inside the air tubing. The engine control module (ECM) monitors the boost pressure sensor signal for abnormal values. If the ECM detects that the boost pressure sensor signal is excessively low, this DTC will set.

Condition for Running the DTC

- DTCs P0107, P0108, P0237, P0238, P1630 and P1634 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.
- The engine is running.
- The fuel injection quantity is higher than a predetermined value.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the boost pressure is lower than 78 kPa (11 psi) for 20 seconds when the engine speed is lower than 900 RPM.
- The ECM detects that the boost pressure is lower than 82 – 151 kPa (12 – 22 psi) for 20 seconds when the engine speed is between 1200 – 3000 RPM.
- The ECM detect that the boost pressure is lower than 100 – 158 kPa (15 – 23 psi) for 20 seconds when the engine speed is between 3300 – 3600 RPM.

Notice:

- If the barometric pressure (BARO) is lower than 100 kPa (15 psi), a compensated value (100 kPa – BARO) is added to the above thresholds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- Induction air leakage can cause a low boost pressure condition. A whistling noise may be heard if a component is allowing air to enter the induction system. Close the throttle plate, remove the boost pressure sensor and introduce shop air into the line. Feel around the air tubing for leaks.
- Check for cracked air tubing that may only open during certain engine movement conditions.
- Check the turbocharger wastegate valve for a sticking or stuck open condition.
- Use the Tech 2 to verify the integrity of the boost pressure sensor signal. Compare the sensor values under all load conditions for an excessively low value. Use the Tech 2 data list values for nominal sensor readings.
- Fuel system problem (low fuel pressure condition) may set this DTC.

Test Description

The numbers below refer to the step number on the diagnostic table.
3. A skewed boost pressure sensor value (shifted to a low pressure) can set this DTC. The Boost Pressure on the Tech 2 should read near barometric pressure (BARO) with the key ON and engine OFF.
4. A BARO sensor value (shifted to a higher pressure) may indicate a wrong boost pressure sensor reading. The BARO on the Tech 2 should read near surrounding barometric pressure.

P0237 (Flash Code 32)

Circuit Description

The boost pressure sensor is located in the air induction tubing. The boost pressure sensor is a transducer that varies voltage according to changes in the air pressure inside the air tubing. The boost pressure sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Boost pressure sensor signal circuit

The engine control module (ECM) supplies 5 volts to the boost pressure sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The boost pressure sensor provides a signal to the ECM on the boost pressure signal circuit which is relative to the pressure changes in the manifold. The ECM should detect a low signal voltage at a low boost pressure, such as low engine load. The ECM should detect high signal voltage at a high boost pressure, such as high engine load. The ECM monitors the boost pressure sensor signal for voltage outside the normal range of the boost pressure sensor. If the ECM detects an excessively low boost pressure sensor signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1634 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the boost pressure sensor signal voltage is less than 0.1 volts for 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a boost pressure substitution of 100 kPa (14.5 psi) for engine control.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

11	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13
13	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0238 (Flash Code 32)

Circuit Description

The boost pressure sensor is located in the air induction tubing. The boost pressure sensor is a transducer that varies voltage according to changes in the air pressure inside the air tubing. The boost pressure sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Boost pressure sensor signal circuit

The engine control module (ECM) supplies 5 volts to the boost pressure sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The boost pressure sensor provides a signal to the ECM on the boost pressure signal circuit which is relative to the pressure changes in the manifold. The ECM should detect a low signal voltage at a low boost pressure, such as low engine load. The ECM should detect high signal voltage at a high boost pressure, such as high engine load. The ECM monitors the boost pressure sensor signal for voltage outside the normal range of the boost pressure sensor. If the ECM detects an excessively high boost pressure sensor signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1634 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the boost pressure sensor signal voltage is more than 4.9 volts for 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a boost pressure substitution of 100 kPa (14.5 psi) for engine control.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Observe the Boost Pressure Sensor parameter with the Tech 2. Is the Boost Pressure Sensor parameter more than the specified value?	4.9 volts	Go to Step 3	Go to Diagnostic Aids
3	1. Start the engine. 2. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P1634 also set?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Disconnect the boost pressure sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Boost Pressure Sensor parameter with the Tech 2. Is the Boost Pressure Sensor parameter less than the specified value?	0.1 volts	Go to DTC P1634	Go to Step 7

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the boost pressure sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Boost Pressure Sensor parameter with the Tech 2. Is the Boost Pressure Sensor parameter less than the specified value?	0.1 volts	Go to Step 6	Go to Step 7
6	1. Turn OFF the ignition. 2. Connect a test lamp between the low reference circuit of the boost pressure sensor harness (pin 1 of J-216 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
7	**Important:** The boost pressure sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the engine control module (ECM) (pin 91 of E-111 connector) and the boost pressure sensor (pin 2 of J-216 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the low reference circuit between the ECM (pin 109 of E-111 connector) and the boost pressure sensor (pin 1 of J-216 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
9	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the boost pressure sensor (pin 1 of J-216 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the boost pressure sensor circuit at the harness connector of the ECM (pin 109 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the boost pressure sensor. Refer to Boost Pressure Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0335 (Flash Code 15)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 56 notches spaced 6° apart and a 30° section that is open span. This open span portion allows for the detection of cylinder #1 top dead center (TDC). The CKP sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the crankshaft rotational speed. The engine control module (ECM) monitors both the CKP sensor and camshaft position (CMP) sensor signals to ensure they correlate with each other. If the ECM receives a certain amount of CMP sensor signal pulses without a CKP sensor signal, this DTC will set.

Condition for Running the DTC

- DTCs P0336, P0340, P0341 and P1345 are not set.
- The ignition switch is ON.
- The CMP sensor signal pulse is detected.

Condition for Setting the DTC

- The ECM detects that the CKP sensor pulses are not generated during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the sensor is tight and the flywheel teeth are not damaged.

DTC P0335 (Flash Code 15)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine (Note a slight start delay may be noticed). 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the crankshaft position (CKP) sensor harness connector. 3. Connect a DMM across the CKP sensor terminals. 4. Measure the resistance across the CKP sensor. Does the CKP sensor resistance measure within the specified range?	105 – 145 Ω	Go to Step 4	Go to Step 13
4	1. Connect a DMM across the CKP sensor terminals (measure sensor output voltage). 2. Place the DMM on the AC volt scale. 3. Start the engine. 4. Monitor the DMM while accelerating the engine between idle and W.O.T. (accelerator pedal full travel). Does the DMM indicate an AC voltage increase in accordance with an engine speed increase?	—	Go to Step 5	Go to Step 10

Step	Action	Value(s)	Yes	No
5	1. Turn ON the ignition, with the engine OFF. 2. Connect a DMM between the CKP sensor harness (pin 1 of E-98 connector) and a known good ground. 3. Connect a DMM between the CKP sensor harness (pin 2 of E-98 connector) and a known good ground. Is each DMM voltage within the specified value?	0.4 – 1.4 volts	Go to Step 7	Go to Step 6
6	Is the DMM voltage more than the specified value at Step 5?	—	Go to Step 9	Go to Step 8
7	1. Test the CKP sensor circuits between the engine control module (ECM) (pins 106 and 107 of E-111 connector) and CKP sensor (pins 1 and 2 of E-98 connector) for a short to each other. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 11
8	1. Test the CKP sensor circuits between the ECM (pins 106 and 107 of E-111 connector) and CKP sensor (pins 1 and 2 of E-98 connector) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
9	1. Test the CKP sensor circuits between the ECM (pins 106 and 107 of E-111 connector) and CKP sensor (pins 1 and 2 of E-98 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
10	1. Inspect the CKP sensor for tightness. Retest if the sensor was loose. 2. Remove the CKP sensor and check for damage, metal particles on magnet and for flywheel teeth damage. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
11	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the CKP sensor (pins 1 and 2 of E-98 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14

Step	Action	Value(s)	Yes	No
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the CKP sensor circuits at the harness connector of the ECM (pins 106 and 107 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Replace the CKP sensor. Refer to Crankshaft Position (CKP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0336 (Flash Code 15)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 56 notches spaced 6° apart and a 30° section that is open span. This open span portion allows for the detection of cylinder #1 top dead center (TDC). The CKP sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the crankshaft rotational speed. The engine control module (ECM) monitors both the CKP sensor and camshaft position (CMP) sensor signals to ensure they correlate with each other. If the ECM receives extra or missing CKP sensor signal pulses, this DTC will set.

Condition for Running the DTC

- DTCs P0335, P0340, P0341 and P1345 are not set.
- The ignition switch is ON.
- The CKP sensor signal is detected.

Condition for Setting the DTC

- The ECM detects extra or missing CKP sensor pulses during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- An intermittent CKP sensor signal may set this DTC.
- Ensure the sensor is tight and the flywheel teeth are not damaged.

Did you find and correct the condition?	—	Go to Step 9	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Inspect for an intermittent and for a poor connection on these CKP sensor circuits at the harness connector of the ECM (pins 106, 107 and 108 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 6
6	1. Remove the CKP sensor. Refer to Crankshaft Position (CKP) Sensor Replacement in this section. 2. Visually inspect the CKP sensor for the following conditions: • Physical damage • Loose or improper installation 3. The following conditions may cause this DTC to set: • Excessive air gap between the CKP sensor and the sensor rotor • Electromagnetic interference in the CKP sensor circuits • Foreign material passing between the CKP sensor and the sensor rotor Did you find and correct the condition?	—	Go to Step 9	Go to Step 7
7	Inspect the CKP sensor rotor for the following conditions: • Physical damage • Improper installation Refer to Flywheel Replacement in Engine Mechanical section. Did you find and correct the condition?	—	Go to Step 9	Go to Step 8
8	Replace the CKP sensor. Refer to Crankshaft Position (CKP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 9	—
9	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 10
10	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0340 (Flash Code 14)

Circuit Description

The camshaft position (CMP) sensor is installed on the cylinder head at the rear of the camshaft gear. The CMP sensor has the following circuits.

- 12 volts reference circuit
- CMP sensor signal circuit
- CMP sensor shield circuit

The engine control module (ECM) supplies 12 volts to the CMP sensor on the 12 volts reference circuit. The CMP sensor provides a signal to the ECM on the CMP signal circuit. The CMP sensor detects a total of five through holes (four holes arranged equally every 90° and one reference hole on the camshaft gear flange surface) and sends signals to the engine control module (ECM). Receiving these signals, the ECM determines cylinder #1 compression top dead center (TDC). If the ECM detects that CMP sensor signals are not generated, this DTC will set.

Condition for Running the DTC

- DTCs P0335, P0336, P0341 and P1345 are not set.
- The ignition switch is ON.
- The crankshaft position (CKP) sensor signal pulse is detected.

Condition for Setting the DTC

- The ECM detects that the CMP sensor pulses are not generated during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the sensor is tight and the camshaft gear flange surface is not damaged.

Notice:

- If this DTC is set, the engine cranks but does not start.

Test Description

The numbers below refers to the step number on the diagnostic table.
6. If the CMP sensor signal circuit between the ECM and the sensor is shorted to ground or shield circuit, the voltage reading on the DMM indicates same level as battery.

DTC P0340 (Flash Code 14)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If engine does not start, crank over the engine for 10 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the camshaft position (CMP) sensor harness connector. 3. Connect a DMM between the 12 volts reference circuit (pin 3 of E-112 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage indicate within the specified value?	11 – 13 volts	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	Is the DMM voltage more than the specified value at Step 3?	—	Go to Step 9	Go to Step 8
5	1. Turn OFF the ignition. 2. Connect a DMM between the signal circuit (pin 2 of E-112 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	22 volts	Go to Step 6	Go to Step 10
6	1. Turn OFF the ignition. 2. Connect a test lamp between the signal circuit (pin 2 of E-112 connector) and battery voltage. 3. Connect a DMM between the probe of the test lamp and battery voltage. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	22 volts	Go to Step 11	Go to Step 7
7	1. Turn OFF the ignition. 2. Connect a test lamp between the shield circuit (pin 1 of E-112 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 12
8	1. Test the CMP sensor 12 reference circuit between the engine control module (ECM) (pin 99 of E-111 connector) and the CMP sensor (pin 3 of E-112 connector) for the following conditions: • An open circuit • A short to ground • A short to any 5 volts reference • A short to the signal circuit • A short to the shield circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 14
9	1. Test the CMP sensor 12 volts reference circuit between the ECM (pin 99 of E-111 connector) and the CMP sensor (pin 3 of E-112 connector) for short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18

Step	Action	Value(s)	Yes	No
10	**Important:** The CMP sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the CMP sensor signal circuit between the ECM (pin 98 of E-111 connector) and the CMP sensor (pin 2 of E-112 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • A short to any 5 volts reference • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 14
11	1. Test the CMP sensor signal circuit between the ECM (pin 98 of E-111 connector) and the CMP sensor (pin 2 of E-112 connector) for a short to ground or short to the shield circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
12	**Important:** The ECM may be damaged if the sensor shield circuit is shorted to a voltage source. 1. Test the CMP sensor shield circuit between the ECM (pin 100 of E-111 connector) and the CMP sensor (pin 1 of E-112 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 14
13	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the CMP sensor (pins 1, 2 and 3 of E-112 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
14	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on these CMP sensor circuits at the harness connector of the ECM (pins 98, 99 and 100 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18

Step	Action	Value(s)	Yes	No
15	1. Remove the CMP sensor. Refer to Camshaft Position (CMP) Sensor Replacement in this section. 2. Visually inspect the CMP sensor for the following conditions: • For physical damage • For being loose • For improper installation Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
16	Visually inspect the camshaft gear surface for damage. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
17	Replace the CMP sensor. Refer to Camshaft Position (CMP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
18	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. If engine does not start, crank over the engine for 10 seconds. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 20
20	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0341 (Flash Code 14)

Circuit Description

The camshaft position (CMP) sensor is installed on the cylinder head at the rear of the camshaft gear. The CMP sensor has the following circuits.

- 12 volts reference circuit
- CMP sensor signal circuit
- CMP sensor shield circuit

The engine control module (ECM) supplies 12 volts to the CMP sensor on the 12 volts reference circuit. The CMP sensor provides a signal to the ECM on the CMP signal circuit. The CMP sensor detects a total of five through holes (four holes arranged equally every 90° and one reference hole on the camshaft gear flange surface) and sends signals to the engine control module (ECM). Receiving these signals, the ECM determines cylinder #1 compression top dead center (TDC). If the ECM receives extra or missing CMP sensor signal pulses, this DTC will set.

Condition for Running the DTC

- DTCs P0335, P0336, P0340 and P1345 are not set.
- The ignition switch is ON.
- The CMP sensor signal pulse is detected.

Condition for Setting the DTC

- The ECM detects extra or missing CMP sensor pulses during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- An intermittent CMP sensor signal may set this DTC.
- Ensure the sensor is tight and the camshaft gear flange surface is not damaged.

Notice:

- If this DTC is set, the engine cranks but does not start.

10	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0380 (Flash Code 66)

Circuit Description

The engine control module (ECM) controls the glow relay which supplies power to the glow plugs based on engine coolant temperature. In the after glow phase, the glow indicator light is not illuminated but glow plugs remain active for a certain period. If the ECM detects an open circuit or short circuit on the glow relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The battery voltage is between 16 – 32 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a low voltage condition on the glow relay control circuit when the relay is commanded OFF for longer than 5 seconds.
- The ECM detects a high voltage condition on the glow relay control circuit when the relay is commanded ON for longer than 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The numbers below refers to the step number on the diagnostic table.
2. Listen for an audible click when the glow relay operates. Command both the ON and OFF states.
6. Tests if ground is constantly being applied to the glow relay.

13	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0381 (Flash Code 67)

Circuit Description

The glow indicator lamp is located on the instrument panel cluster (IPC). The glow control system is operated when the engine coolant temperature is low, which allows easier engine starting. If the ignition switch is turned ON when the engine coolant temperature is low, the engine control module (ECM) illuminates the glow indicator lamp and turns ON the glow plugs. After a fixed time passes, the ECM turns OFF the glow indicator lamp and the glow plugs. The ECM monitors the glow indicator lamp control circuit for conditions that are incorrect for the commanded state of the glow indicator lamp. For example, a failure condition exists if the ECM detects low voltage when the glow indicator lamp is commanded OFF, or high voltage when the glow indicator lamp is commanded ON. If the ECM detects an improper voltage on the glow indicator control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a low voltage condition on the glow indicator lamp control circuit when the indicator is commanded OFF for longer than 5 seconds.
- The ECM detects a high voltage condition on the glow indicator lamp control circuit when the indicator is commanded ON for longer than 5 seconds.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0381 (Flash Code 67)

Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Verify whether the instrument cluster is operational. If the instrument panel cluster (IPC) is completely inoperative, refer to Diagnostic System Check. 2. Turn OFF the ignition for 30 seconds. 3. Disconnect the engine coolant temperature (ECT) sensor harness connector in order to gain glow ON time long enough. 4. Turn ON the ignition for 20 seconds while observing the Diagnostic Trouble Code (DTC) Information with the Tech 2. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse in the glove box. Is the Meter (10A) fuse open?	—	Go to Step 4	Go to Step 5
4	Replace the Meter (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (10A) fuse or replace the shorted attached component fed by the Meter (10A) fuse. Did you complete the repair?	—	Go to Step 19	—

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) J-191 harness connector. 3. Turn ON the ignition, with the engine OFF. Is the glow indicator lamp OFF?	—	Go to Step 6	Go to Step 13
6	1. Remove the Meter (10A) fuse that supplies voltage to the glow indicator lamp. 2. Turn ON the ignition, with the engine OFF. 3. Measure the voltage from the glow indicator lamp control circuit in the ECM harness connector (pin 11 of J-191 connector) to a good ground. Is the voltage less than the specified value?	1 volt	Go to Step 7	Go to Step 14
7	1. Turn OFF the ignition. 2. Install the Meter (10A) fuse that supplies ignition voltage to the glow indicator lamp. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the glow indicator lamp control circuit of the ECM harness connector (pin 11 of J-191 connector) and a known good ground. Is the glow indicator lamp illuminated?	—	Go to Step 12	Go to Step 8
8	1. Turn OFF the ignition. 2. Remove the IPC. 3. Remove the glow indicator lamp bulb from the IPC. Is the glow indicator bulb burned out?	—	Go to Step 16	Go to Step 9
9	1. Connect a test lamp between the glow indicator lamp ignition voltage circuit of the IPC harness connector (pin 18 of B-51 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 10	Go to Step 15
10	1. Test the glow indicator lamp control circuit between the ECM (pin 11 of J-191 connector) and the IPC (pin 15 of B-52 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 11
11	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the IPC (pins 18 of B-51 and 15 of B-52 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17

Step	Action	Value(s)	Yes	No
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the glow indicator lamp control circuit at the harness connector of the ECM (pin 11 of J-191 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
13	Repair the short to ground on the control circuit of the glow indicator lamp between the ECM (pin 11 of J-191 connector) and the IPC (pin 15 of B-52 connector). Did you complete the repair?	—	Go to Step 19	—
14	Repair the short to battery or ignition voltage on the control circuit of the glow indicator lamp between the ECM (pin 11 of J-191 connector) and the IPC (pin 15 of B-52 connector). Did you complete the repair?	—	Go to Step 19	—
15	Repair the open or high resistance on the ignition voltage circuit of the glow indicator lamp between the Meter (10A) fuse and the IPC (pin 18 of B-51 connector). Did you complete the repair?	—	Go to Step 19	—
16	Replace the glow indicator lamp bulb. Did you compete the replacement?	—	Go to Step 19	—
17	Repair or replace the IPC. Did you complete the repair or replacement?	—	Go to Step 19	—
18	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Disconnect the ECT sensor harness connector in order to gain glow ON time long enough. 5. Turn ON the ignition for 20 seconds while observing the DTC Information with the Tech 2. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 20
20	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0485 (Flash Code 44)

Circuit Description

The exhaust gas recirculation (EGR) valve position sensor is installed on the EGR valve body together with the EGR valve control motor. The EGR valve position sensor changes output voltage according to EGR valve position. The EGR position sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- EGR valve position sensor signal circuit

The engine control module (ECM) supplies 5 volts to the EGR valve position sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The EGR valve position sensor provides a signal to the ECM on the EGR valve position signal circuit, which is relative to the position changes of the EGR valve. The ECM monitors the EGR position sensor signals for voltage outside the normal range of the EGR position. If the ECM detects an excessively low EGR valve position signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the EGR valve position sensor signal voltage is less than 0.1 volts for 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0485 (Flash Code 44)

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit of the EGR valve position sensor harness (pins 1 and 3 of E-94 connector). 3. Turn ON the ignition, with the engine OFF. 4. Observe the EGR Position Sensor parameter with the Tech 2. Is the EGR Position Sensor parameter more than specified value?	4.5 volts	Go to Step 8	Go to Step 7
6	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 87 of E-111 connector) and the EGR valve position sensor (pin 1 of E-94 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	1. Test the signal circuit between the ECM (pin 86 of E-111 connector) and the EGR valve position sensor (pin 3 of E-94 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the EGR valve (pins 1 and 3 of E-94 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the EGR valve position sensor circuits at the harness connector of the ECM (pins 86 and 87 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the EGR valve. Refer to EGR Valve Replacement in this section. (EGR valve position sensor is internal to EGR valve) Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 12	—

Step	Action	Value(s)	Yes	No
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13
13	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0486 (Flash Code 44)

Circuit Description

The exhaust gas recirculation (EGR) valve position sensor is installed on the EGR valve body together with the EGR valve control motor. The EGR valve position sensor changes output voltage according to EGR valve position. The EGR position sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- EGR valve position sensor signal circuit

The engine control module (ECM) supplies 5 volts to the EGR valve position sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The EGR valve position sensor provides a signal to the ECM on the EGR valve position signal circuit, which is relative to the position changes of the EGR valve. The ECM monitors the EGR position sensor signals for voltage outside the normal range of the EGR position. If the ECM detects an excessively high EGR valve position signal voltage, this DTC will set.

Condition for Running the DTC

- DTCs P1630 and P1635 are not set.
- The ignition switch is ON.
- The ignition voltage is more than 18 volts.

Condition for Setting the DTC

- The ECM detects that the EGR valve position sensor signal voltage is more than 4.9 volts for 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check – Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the Tech 2. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Observe the EGR Position Sensor parameter with the Tech 2. Is the EGR Position Sensor parameter more than the specified valve?	4.9 volts	Go to Step 3	Go to Diagnostic Aids
3	1. Start the engine. 2. Monitor the Diagnostic Trouble Code (DTC) Information with the Tech 2. Is DTC P1635 also set?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the EGR Position Sensor parameter with the Tech 2. Is the DMM voltage less than the specified value?	0.1 volts	Go to DTC P1635	Go to Step 7

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the EGR Position Sensor parameter with the Tech 2. Is the DMM voltage less than the specified value?	0.1 volts	Go to Step 6	Go to Step 7
6	1. Turn OFF the ignition. 2. Connect a test lamp between the low reference circuit of the EGR position sensor harness (pin 2 of E-94 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
7	**Important:** The EGR position sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the engine control module (ECM) (pin 86 of E-111 connector) and the EGR position sensor (pin 3 of E-94 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the low reference circuit between the ECM (pin 101 of E-111 connector) and the EGR position sensor (pin 2 of E-94 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the EGR position sensor connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the EGR position sensor (pin 2 of E-94 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the EGR position sensor circuit at the harness connector of the ECM (pin 101 of E-111 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the EGR valve. Refer to EGR Valve Replacement in this section. (EGR valve position sensor is internal to EGR valve) Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement / Fuel Injector ID Code Data Programming in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the Tech 2. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with the Tech 2. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

P0488 (Flash Code 45)

Circuit Description

The engine control module (ECM) controls the EGR valve opening based on the barometric pressure, engine speed, engine coolant temperature and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR motor. The EGR valve position is detected by the EGR valve position sensor, and relayed to ECM. If the ECM detects a variance between the actual EGR position and desired EGR position for a calibrated amount of time while the EGR valve is commanded open, this DTC will set.

Condition for Running the DTC

- DTCs P0485, P0486, P1630 and P1635 are not set.
- The ignition switch is ON.
- The battery voltage is between 20 – 32 volts.
- The ignition voltage is more than 18 volts.
- The desired EGR valve position is stable.

Condition for Setting the DTC

- The ECM detects a variance between the actual EGR valve position and desired valve position is more than 20% for longer than 20 seconds when the EGR solenoid command duty is more than 90%.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM inhibits EGR valve control.

Condition for Clearing the MIL / DTC

- The ECM turns OFF the MIL when the key is cycled after a current DTC clears.
- A current DTC clears when the diagnostic runs and does not fail at next driving cycle.
- A history DTC clears after 20 consecutive driving cycles without a fault. Or clear with the Tech 2 or accelerator pedal operation.

Diagnostic Aid

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking EGR valve may set this DTC.
