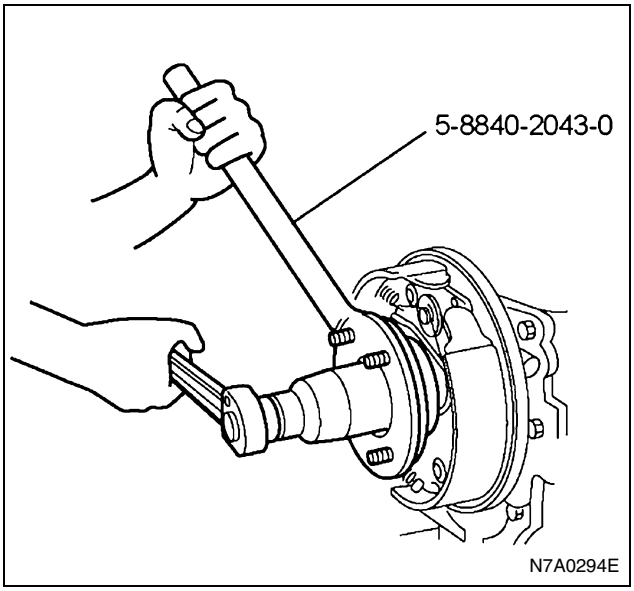
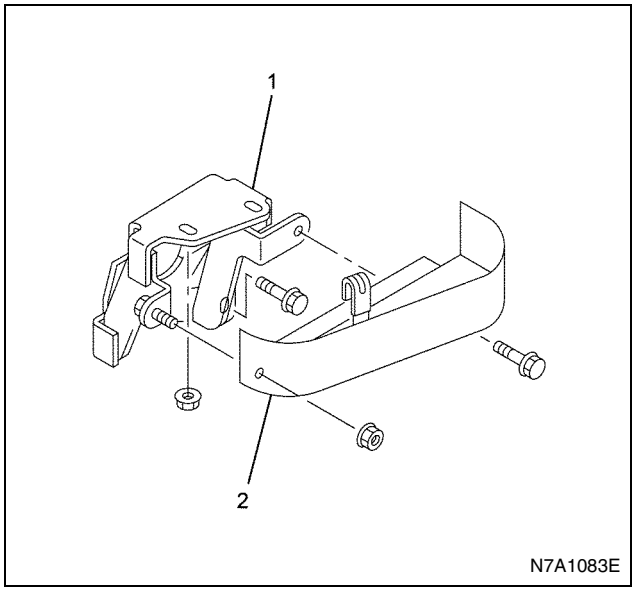
Caution:
The transmission case and clutch housing are made of aluminium, to be sure to exercise sufficient care to ensure they are not damaged. A particularly high level of care is required to protect against rib damage, which can affect the strength of the case.

Also take care to avoid personal injury when working with cases, gears, and other heavy items.

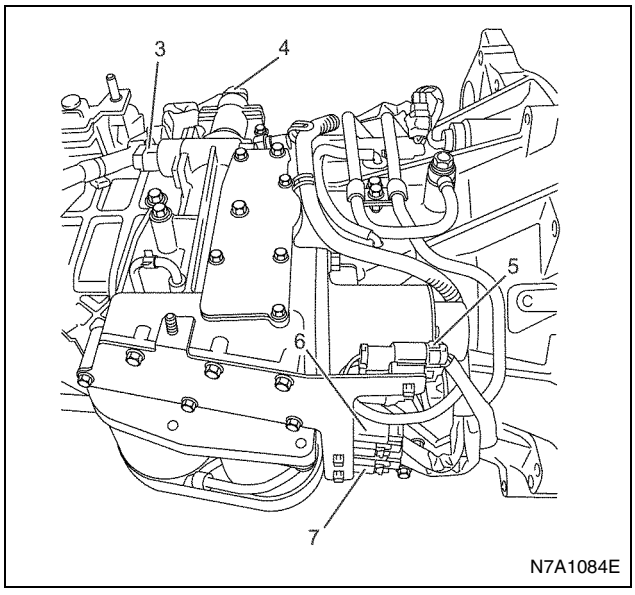
1. Remove the parking brake drum.
   - Refer to “Parking Brake”.
2. Carefully release the caulking (two points) of the coupling driver lock nut, and remove the lock nut by fixing it with the flange holder (5-8840-2043-0).



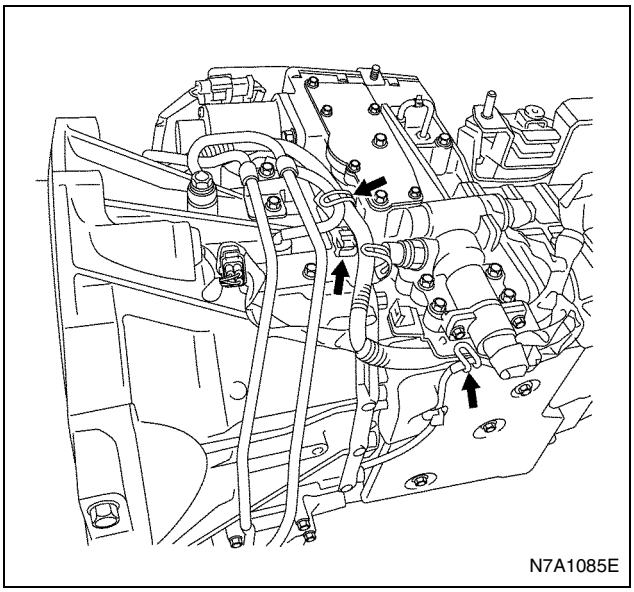
3. Remove the coupling driver and O-ring.
4. Remove the parking brake assembly.
   - Refer to “Parking Brake”.
5. Remove the parking brake cable bracket from the transmission case.
6. Remove the filler plug and O-ring.
7. Remove the drain plug and O-ring.
   - Drain the transmission oil. When draining the oil, check the oil amount, and check for metal bits and foreign matter.
8. Remove the heat protector (2) and heat protector bracket (1).



9. Remove the gearshift control box.
   a. Disconnect the five connectors from the control box.
      - Disconnect the connectors of the select sensor (3), shift sensor (4), select solenoid (5), 2-4-6-R shift solenoid (6), and 1-3-5 shift solenoid (7).



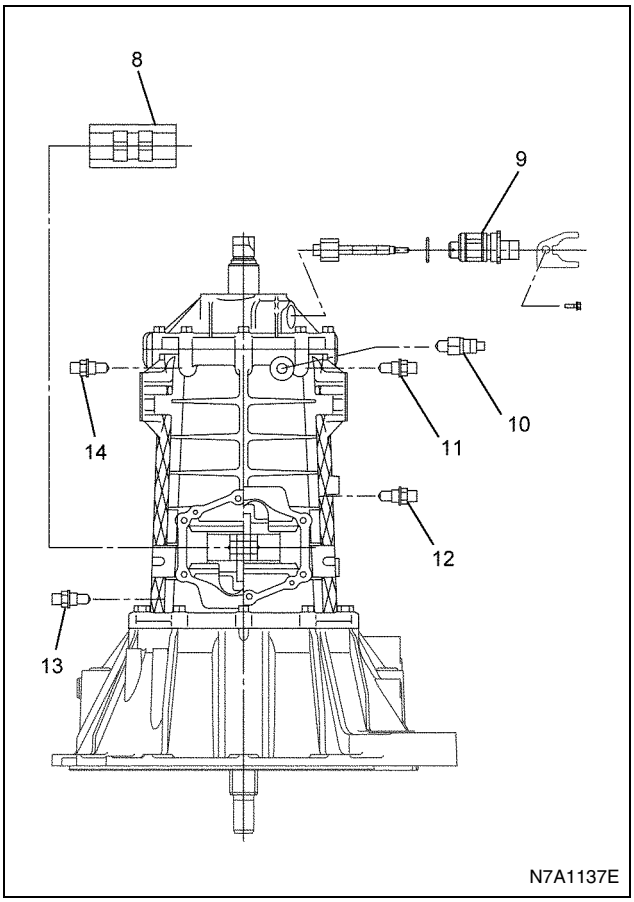
b. Remove the harness from the clip (two points), and remove the neutral switch connector from the bracket.



N7A1085E

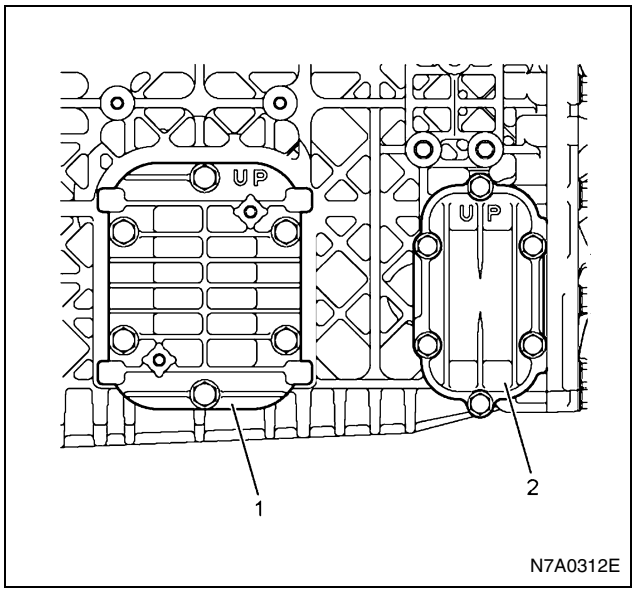
c. Remove the six bolts and the gearshift control box.

10. Remove the interlock plate (8).
11. Remove the speedometer driven gear (9).
12. Remove the reverse switch (10).
13. Remove the detent assembly (11), (12), (13), (14).



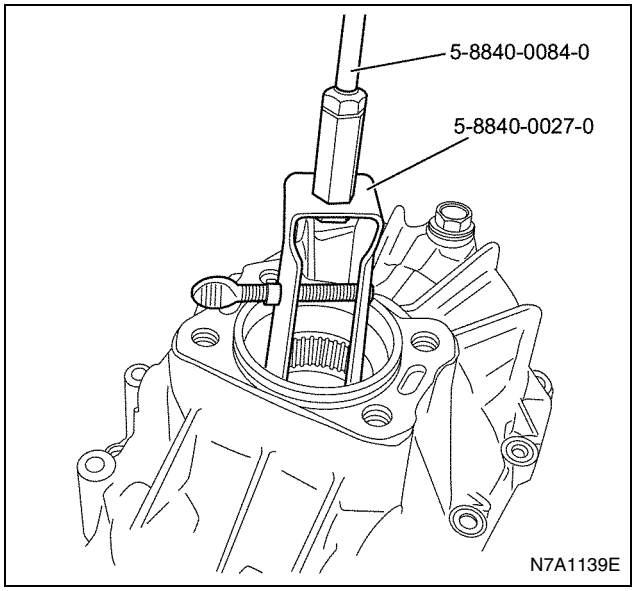
N7A1137E

14. Remove the input shaft speed sensor.
15. Remove the PTO cover (1).
16. Remove the reverse idle cover (2).



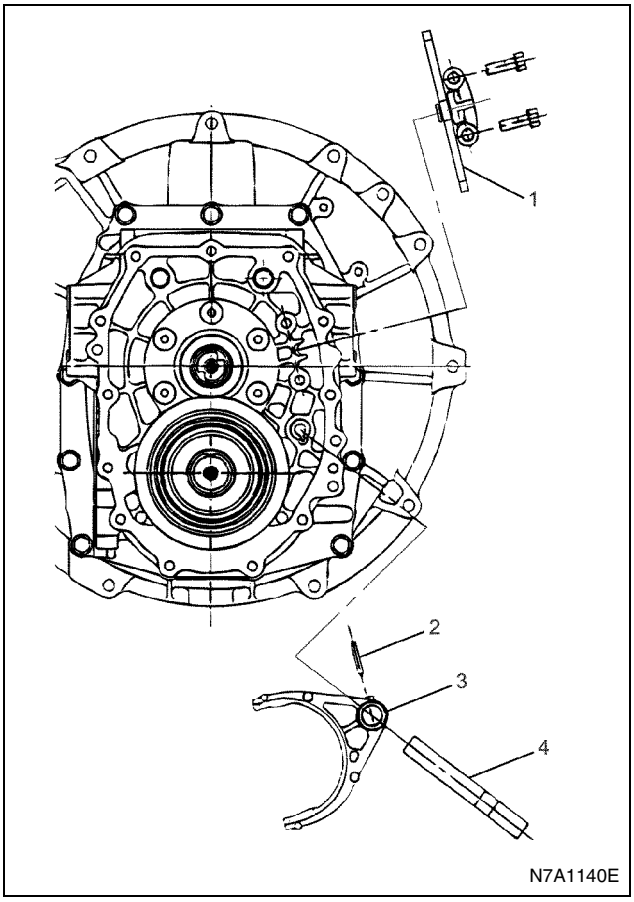
N7A0312E

17. Remove the rear cover assembly.
18. Inspect the rear cover oil seal. If it is worn or damaged, remove it from the rear cover.
19. Use a remover (5-8840-0027-0) and sliding hammer (5-8840-0084-0) to remove the main end needle bearing from the rear cover.

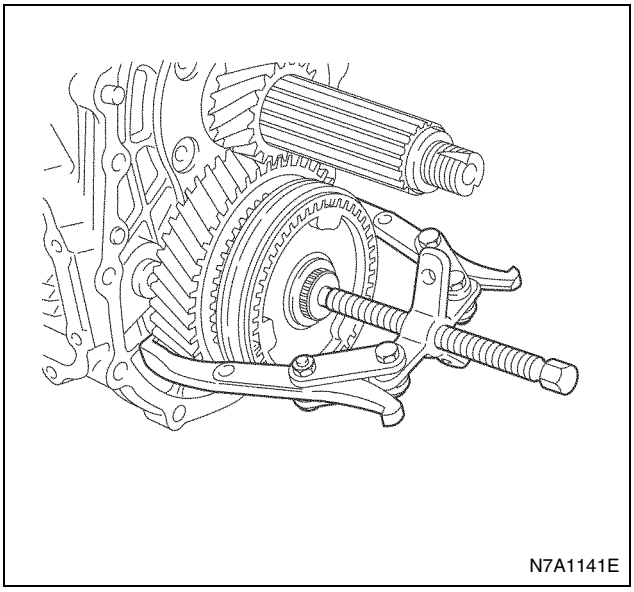


N7A1139E

20. Remove the 6th relay lever (1).
21. Remove the 6th shift arm (3) and 6th shift rod (4).
    - Use a spring remover to drive out the spring pin (2).



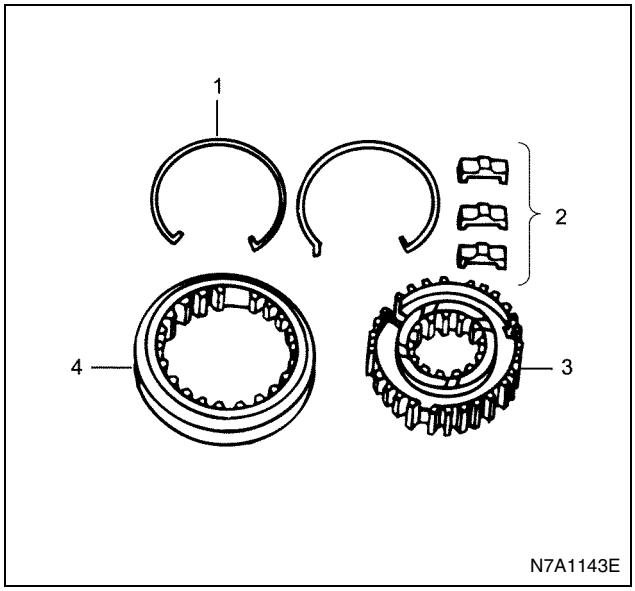
22. Use snap ring pliers to remove the 6th clutch hub snap ring.
23. Use a puller to remove the 6th clutch hub assembly and sleeve, 6th block ring, 6th gear, and needle bearing from the counter shaft.



24. Disassemble the 6th clutch hub assembly and sleeve.
    a. Remove the stopper plate from the clutch hub.
    • The arrow indicates the front of the transmission.

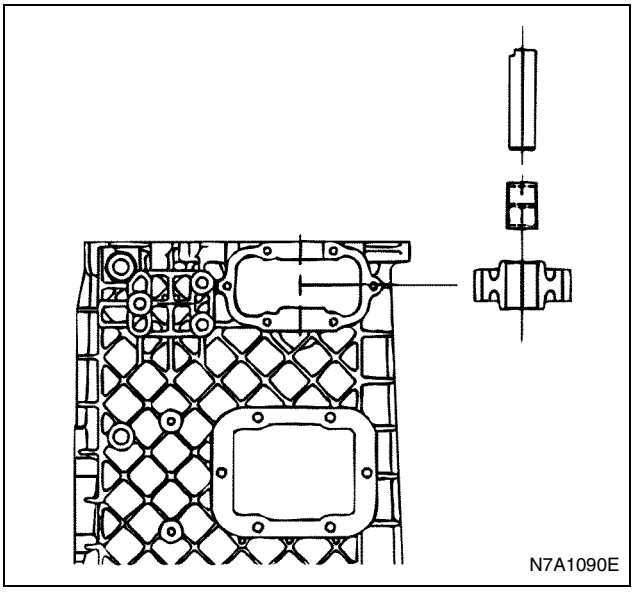
Caution:
If you remove the stopper plate, replace it with a new plate when re-installing.

    b. Disassemble the clutch hub assembly and sleeve.



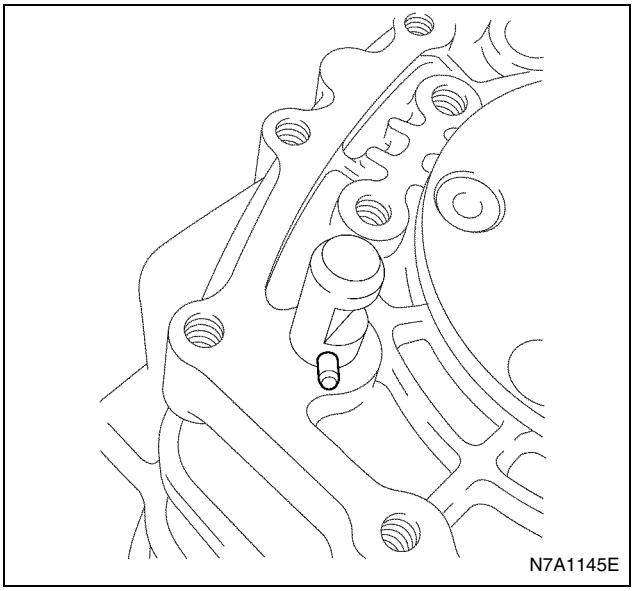
Legend
1. Spring
2. Insert Key
3. Clutch Hub
4. Sleeve

25. Remove the speedometer gear.
    • Remove the collar.
26. Remove the retainer from the transmission case.
27. Pull out the reverse idle shaft, and remove the reverse idle gear and needle bearing.



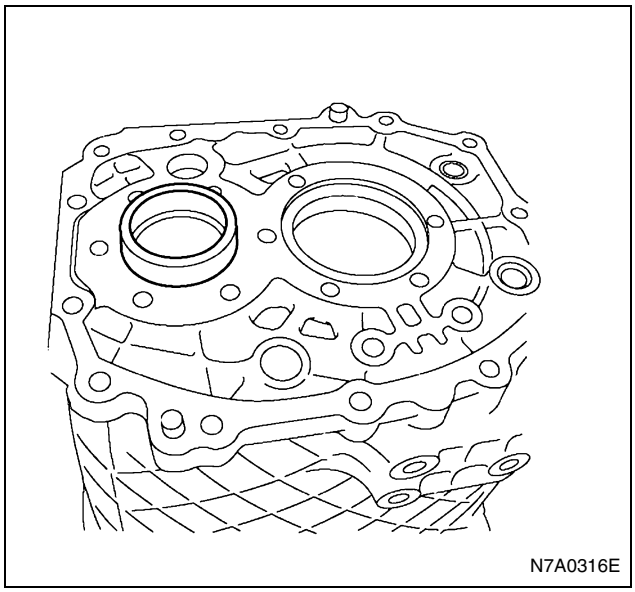
N7A1090E

28. Remove the rear outer snap ring from the main shaft rear bearing.
29. Remover the counter shim.
30. Remove the 4th — 5th and 6th shift rod snap rings.



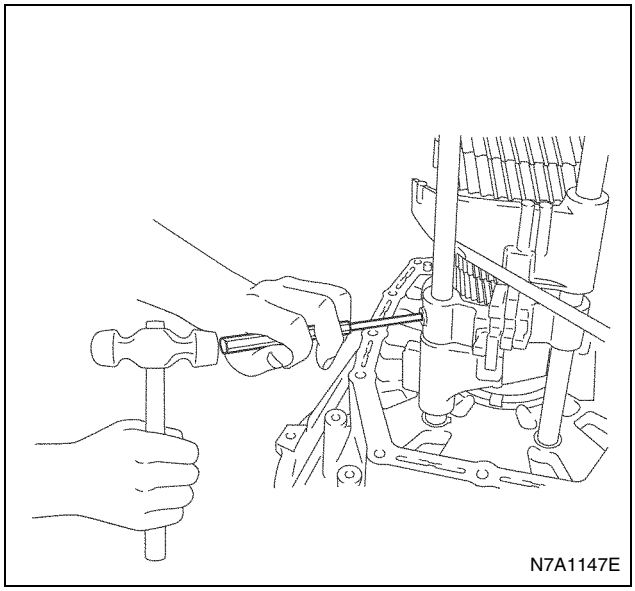
N7A1145E

31. Remove the transmission case from the clutch housing.
32. Remove the bearing rear outer race from the transmission case.



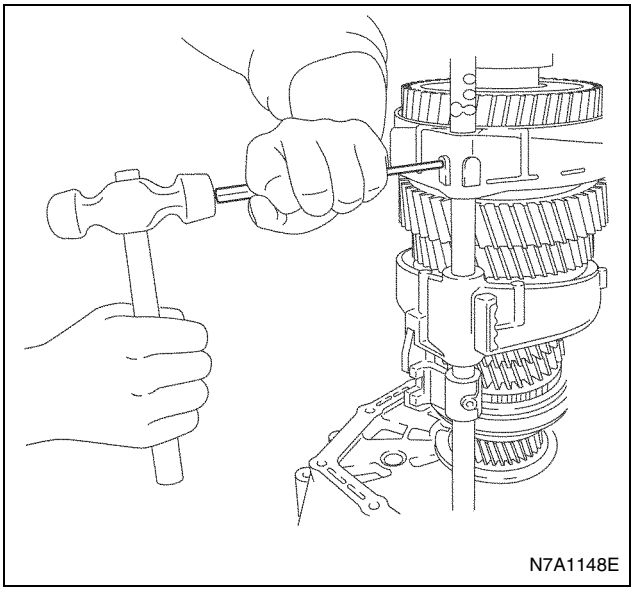
N7A0316E

33. Remove the 4th — 5th and 6th shift rod, 1st — Reverse and 6th shift block, 4th — and 5th shift arm.
    - When driving out the spring pin, insert a round bar on the opposite side of the shift rod, and use a spring pin remover to remove the spring pin while taking care to avoid damage to other parts.



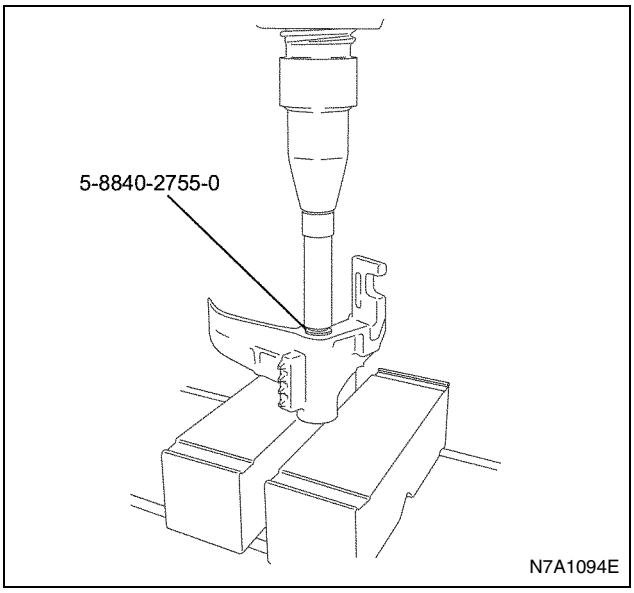
N7A1147E

34. Remove the 1st — Reverse and 2nd — 3rd shift rod, 1st — Reverse shift arm, 3rd — 2nd shift arm, 1st — and Reverse and 6th shift block.
    - When driving out the spring pin, insert a round bar on the opposite side of the shift rod, and use a spring pin remover to remove the spring pin while taking care to avoid damage to other parts.



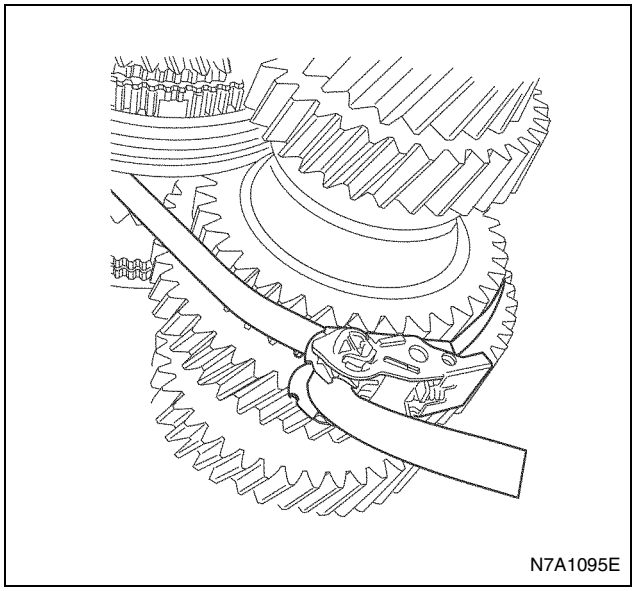
N7A1148E

35. Use a remover (5-8840-2755-0) to remove the bushing from the 4th — 5th shift arm.
36. Use a remover (5-8840-2755-0) to remove the busing from the 3rd — 2nd shift arm.
    - Use the remover in combination with a round bar of a length that makes it possible to push in as far as possible.



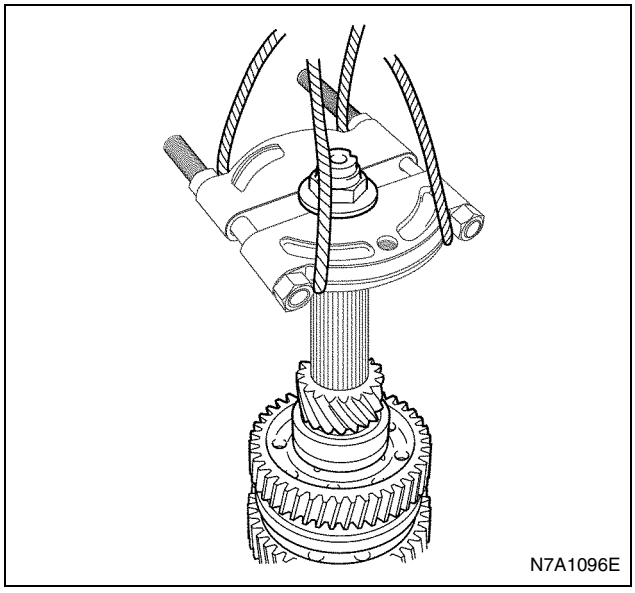
N7A1094E

37. Remove the magnet from the clutch housing.
38. Remove the main shaft assembly, top gear shaft assembly, and counter shaft assembly.
    a. Use a lashing belt or some other belt from a lashing device to bundle the main shaft assembly, counter shaft assembly, and top gear shaft assembly at two points so they cannot separate. Tighten the belt securely.

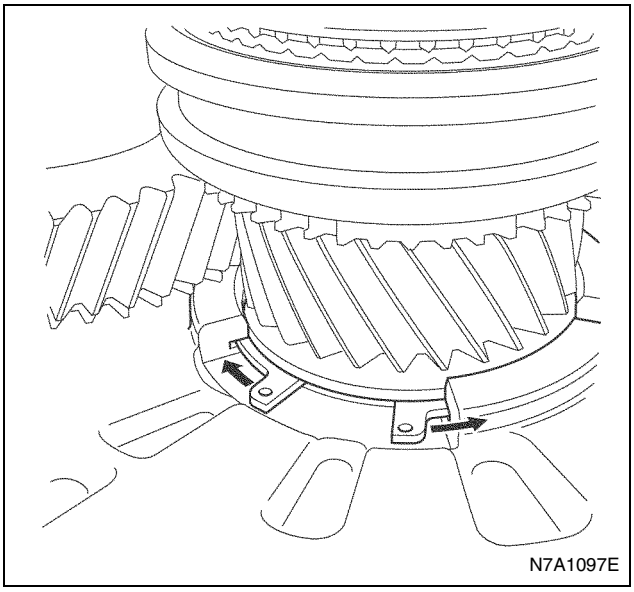


N7A1095E

    b. Attach a bearing remover to the main shaft and secure with a lock nut. Then attach a wire and raise it using a hoist. While opening the top gear shaft bearing outer snap ring attached to the clutching housing, simultaneously remove the top gear shaft assembly, main shaft assembly, and counter shaft assembly from the clutch housing.

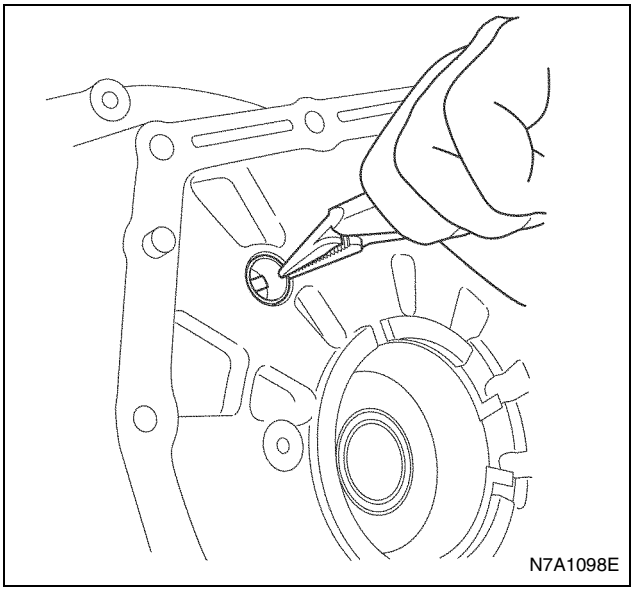


N7A1096E



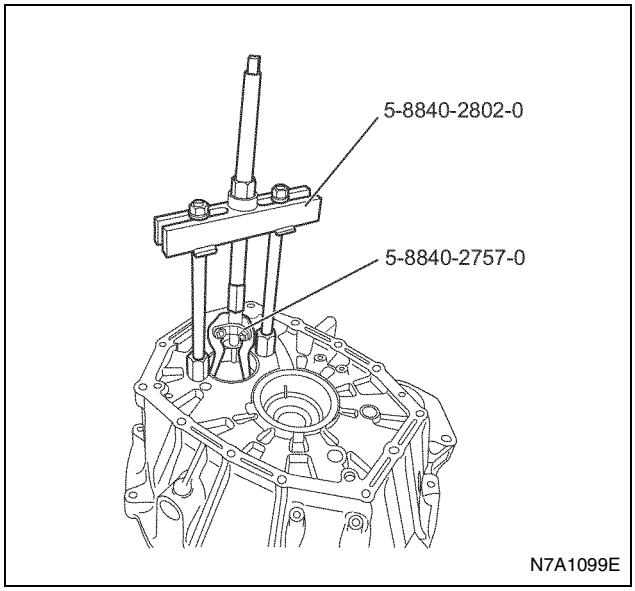
N7A1097E

39. Inspect the clutch housing bushing. If it is worn or damaged, use pliers to remove it from the clutch housing.



N7A1098E

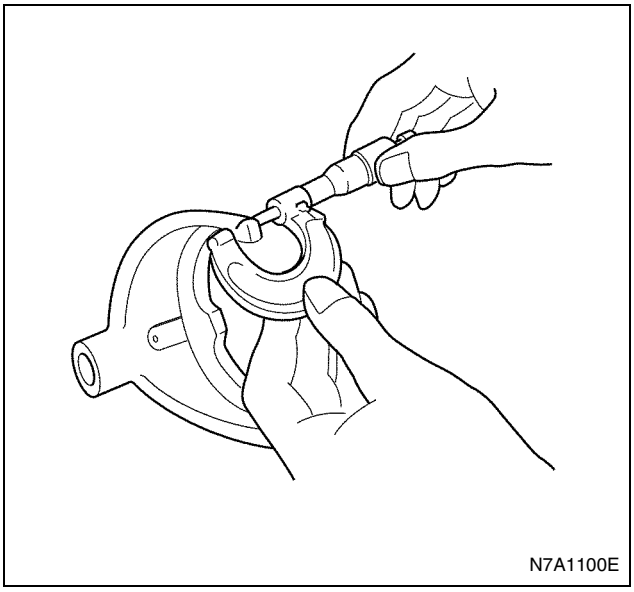
40. Inspect the counter shaft front bearing. If it is worn or damaged, use a bearing remover (5-8840-2757-0) and bushing puller (5-8840-2802-0) to remove the bearing outer race from the clutch housing.



N7A1099E

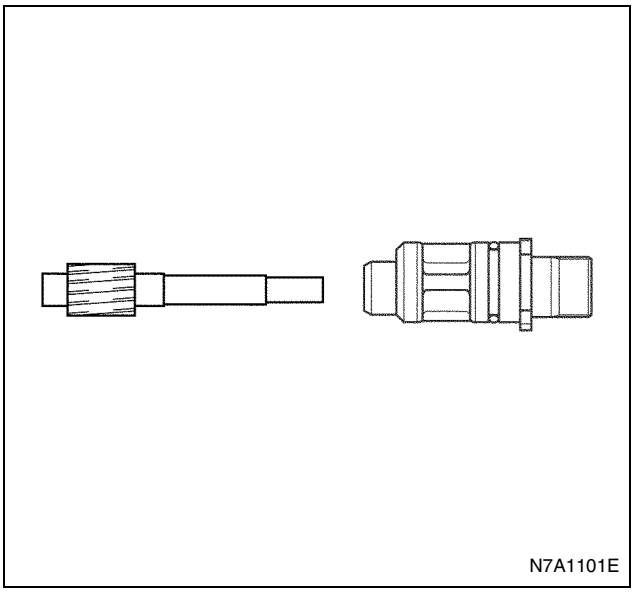
41. Inspect the front oil seal. If it is worn or damaged, remove it from the clutch housing cover.
Inspect each part. Replace or repair as required if anything is worn or damaged or if any other defect is discovered.
42. Inspect each shift mechanism component. Repair any minor damage, bending, or stepped wear. Replace any component that is badly damaged or worn, and any component that exceeds the allowable limit.
    - Shift rod and shift arm bending, wear, damage
    - Shift arm thickness
        – Use a micrometer to measure the thickness of the shift arm tip.

Shift Arm Thickness (mm)		
	Specified Value	Limit
1st — Reverse 3rd — 2nd 5th — 4th	9.60 — 9.85	9.00
6th	9.60 — 9.85	9.30



N7A1100E

43. Inspect the speedometer driven gear and driven gear bushing for wear.
    - Replace if there is excessive wear.



N7A1101E

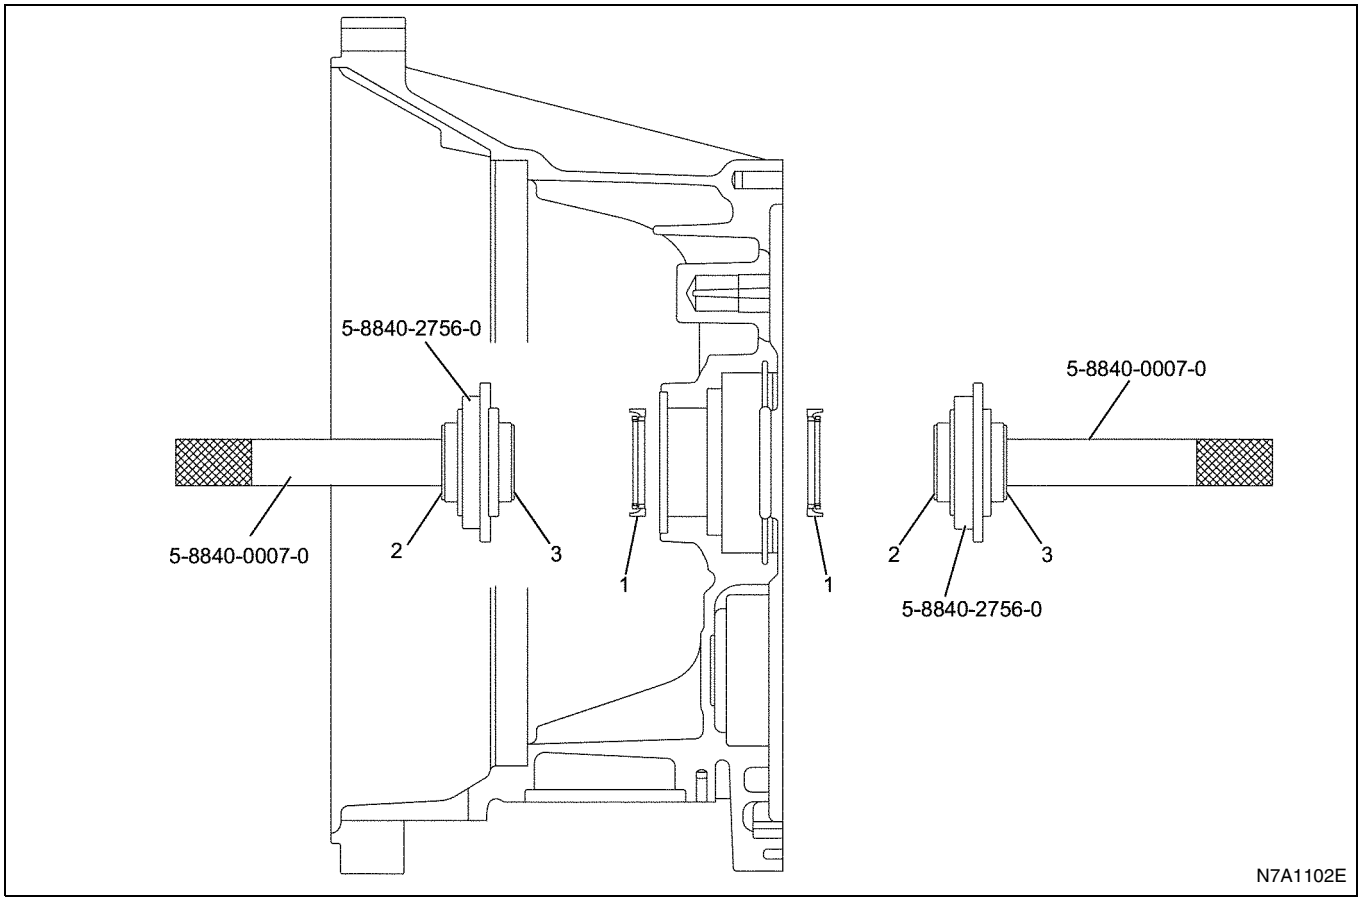
44. Measure the gap between the insert key and the block ring groove.
    - Use a caliper to measure the gap.
    - If the measured value exceeds the limit, replace the insert key and block ring.

Gap Between the Insert Key and Block Ring Groove (mm)	
	Specified Value
6th	3.46 — 3.76

Assembly

1. Inspect the oil seal. If it needs to be replaced due to wear or damage, apply engine oil or grease to the oil seal's outer circumference, and then use an installer (5-8840-2756-0) and grip (5-8840-0007-0) to press-fit it into the clutch housing as shown in the illustration, taking care that the front-back orientation of the front oil seal is correct.
    - Fill the lip of the oil seal with Besco L2 grease.

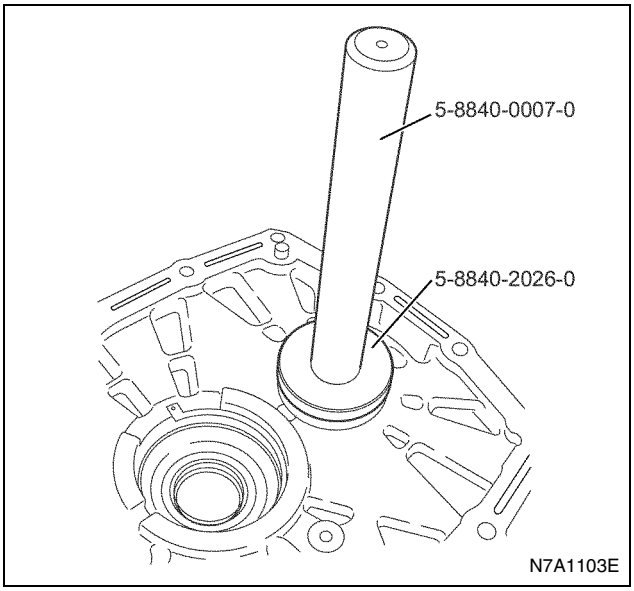
Caution:
Take care to avoid damaging the oil seal lip.



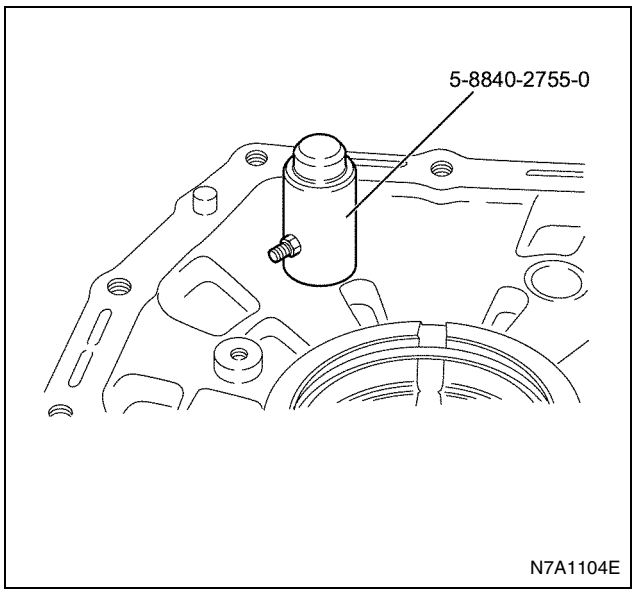
Legend

1. Front Oil Seal
2. T/M Mark
3. ENG Mark

2. Inspect the counter shaft front bearing. If it needs to be replaced with a new one due to wear or damage, use a grip (5-8840-0007-0) and installer (5-8840-2026-0) to press-fit the bearing outer race.

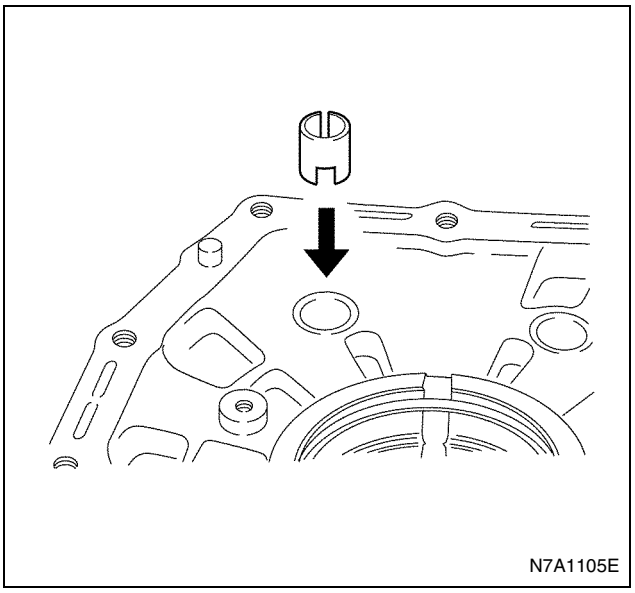


3. Inspect the clutch housing bushing. If it needs to be replaced with a new one due to wear or damage, use an installer (5-8840-2755-0) to press-fit.



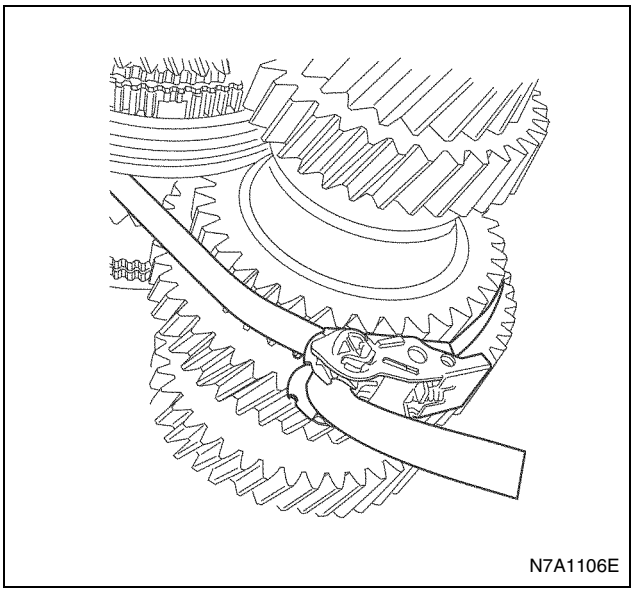
- Before installing, carefully remove all protrusions from the bore side of the old caulking.

- Before installing, carefully caulk at three points, avoiding the old caulking points and grooves.
- For the second and subsequent press-fitting, the notched part should face in the direction of the clutch housing.
- After press-fitting, check that the shift rod slides smoothly.



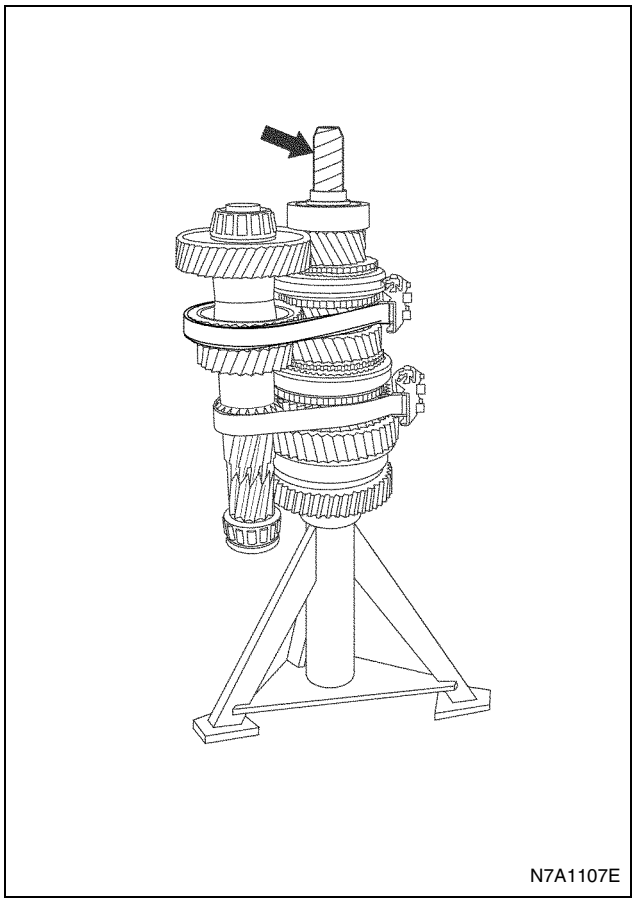
N7A1105E

4. Install the main shaft assembly, top gear shaft assembly, and counter shaft assembly.
   a. Use a lashing belt or some other belt from a lashing device to bundle the main shaft assembly, counter shaft assembly, and top gear shaft assembly at two points so they cannot separate. Tighten the belt securely. When handing the top gear shaft, take care that it does not drop.



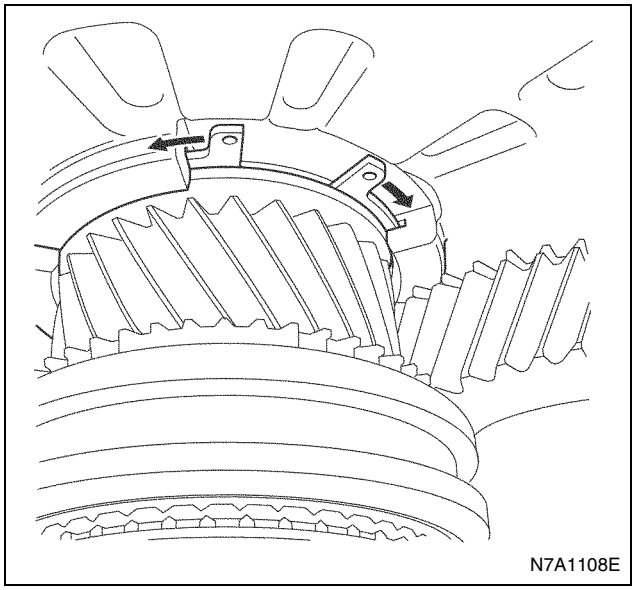
N7A1106E

   b. Stand the top gear shaft assembly, main shaft assembly, and counter shaft assembly on a support stand with the top gear shaft assembly on top.
   c. Wrap the main shaft with tape to avoid damage to the front oil seal.



N7A1107E

   d. While using snap ring pliers to open the top gear shaft bearing outer snap ring, which already has been set on the clutch housing, insert the top gear shaft, counter shaft, and shaft rod into their appropriate positions in the clutch housing.

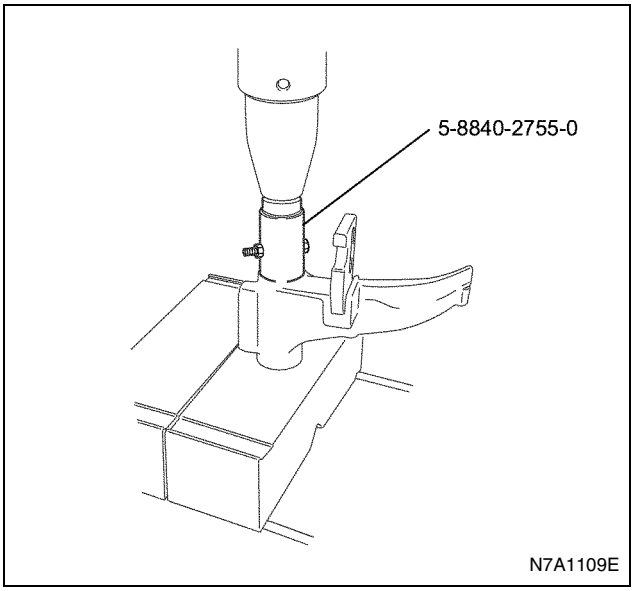


N7A1108E

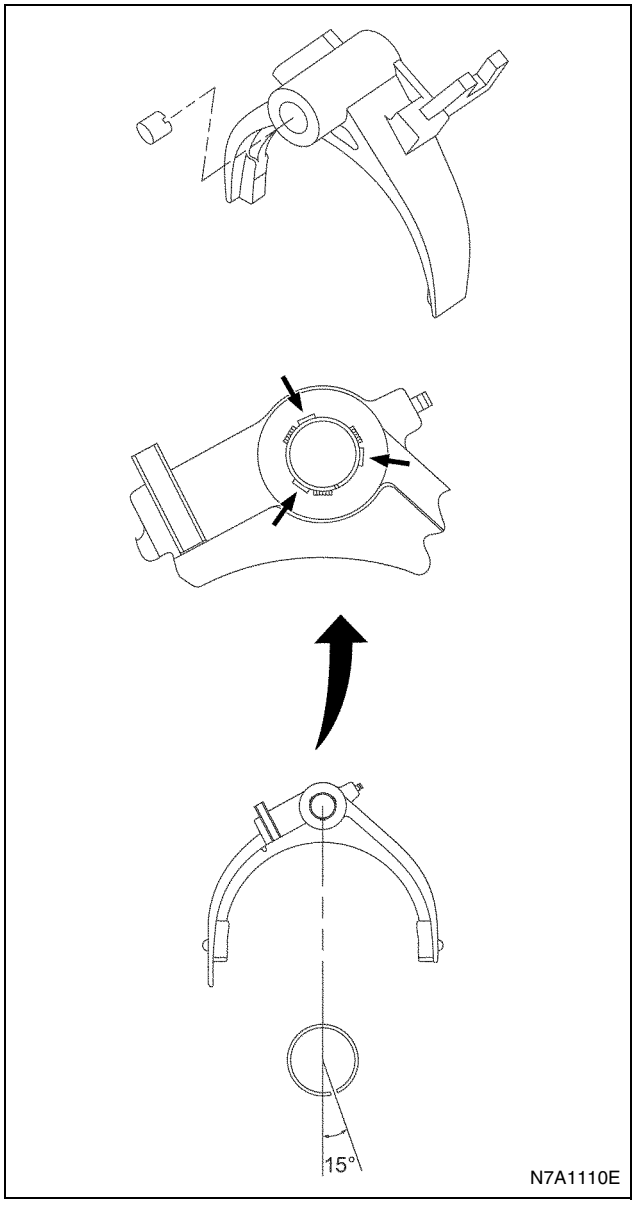
Caution:
- Confirm that the snap ring is installed properly.

- Work carefully in order to avoid damaging the front oil seal.

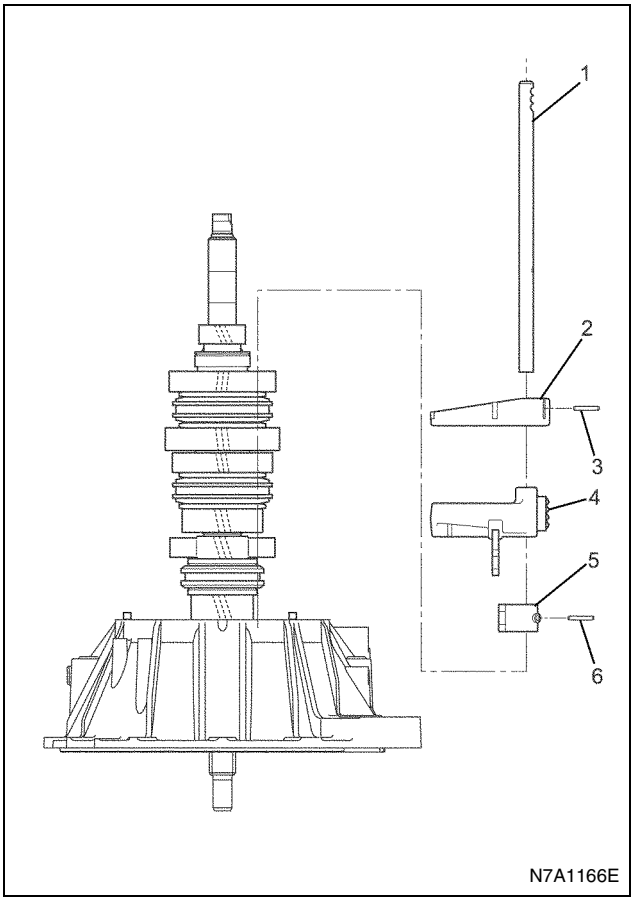
5. Install the magnet in the clutch housing.
6. Inspect the 3rd — 2nd shift arm bushing. If it needs to be replaced with a new one due to wear or damage, use an installer (3-8840-2755-0) to press-fit with a press.
7. Inspect the 4th — 5th shift arm bushing. If it needs to be replaced with a new one due to wear or damage, use an installer (5-8840-2755-0) to press-fit with a press.



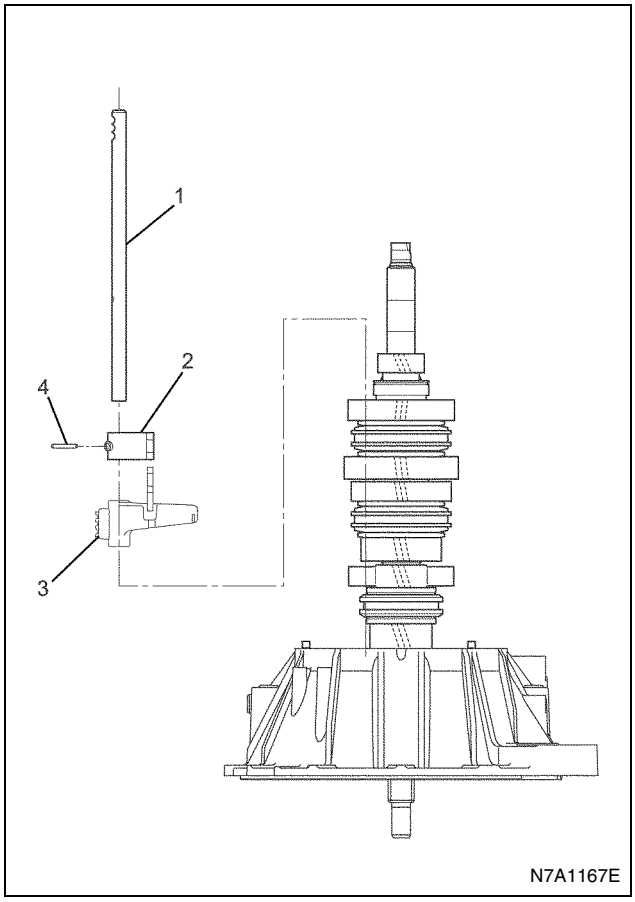
- Before installing, carefully remove all protrusions from the bore side of the old caulking.
- Press-fit the shift arm bushing taking care to use the correct orientation and angle. Caulk at three points, avoiding the bushing gap and old caulking.
- After press-fitting, check that the shift rod slides smoothly.



8. Install the 1st — Reverse and 2nd — 3rd shift rod (1) on the 1st — Reverse 6th shift block (5), 2nd — 3rd shift arm (4), 1st — Reverse shift arm (2).
   - Use a hammer to drive the spring pins (3), (6) into the spring pin holes.
   - When press-fitting spring pins, insert a round bar on the opposite side of the shift rod, and press-fit while taking care to avoid damage to other parts.

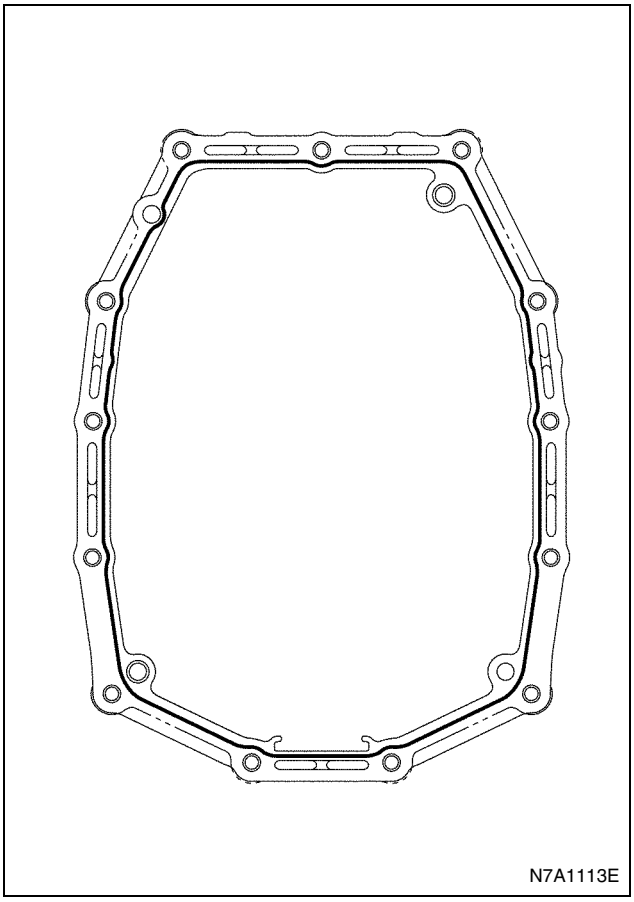


9. Install the 4th — 5th and 6th shift rod (1) on the 4th — 5th shift arm (3), 1st — Reverse and 6th shift block (2).
   - Use a hammer to drive the spring pin (4) into the spring pin hole.
   - When press-fitting spring pins, insert a round bar on the opposite side of the shift rod, and press-fit while taking care to avoid damage to other parts.



10. Apply Three Bond TB1215 to the mating surface of the transmission case and clutch housing, and install to the clutch housing.
    - Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

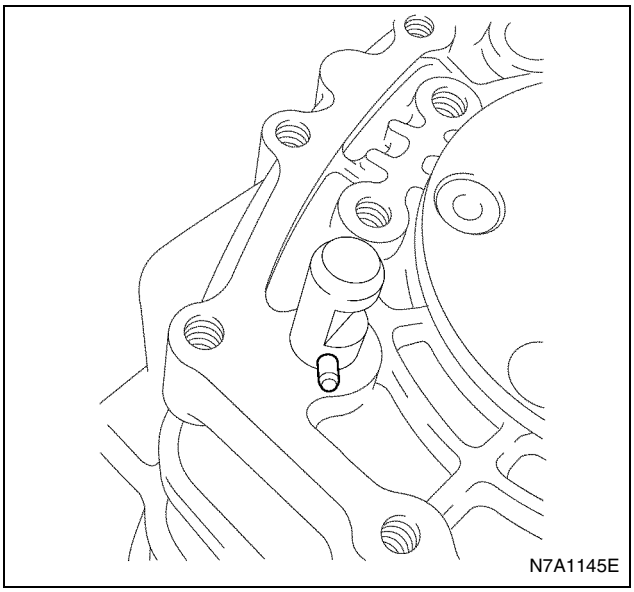
Tighten:
46 N·m (4.7 kg·m / 33.9 lb·ft)



N7A1113E

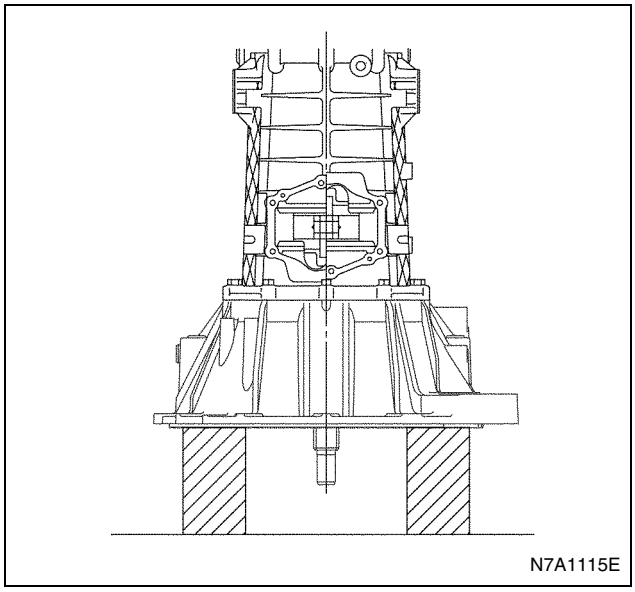
11. Install the bearing rear outer race in the transmission case.
12. Remove the 4th — 5th and 6th shift rod snap ring.

Caution:
If the spring pin is deformed or damaged, replace it with a new one and check to make sure it is installed securely.



N7A1145E

13. Install counter shims.
    a. Set the gear position to neutral.
    b. Position the transmission assembly so the clutch housing is downwards.



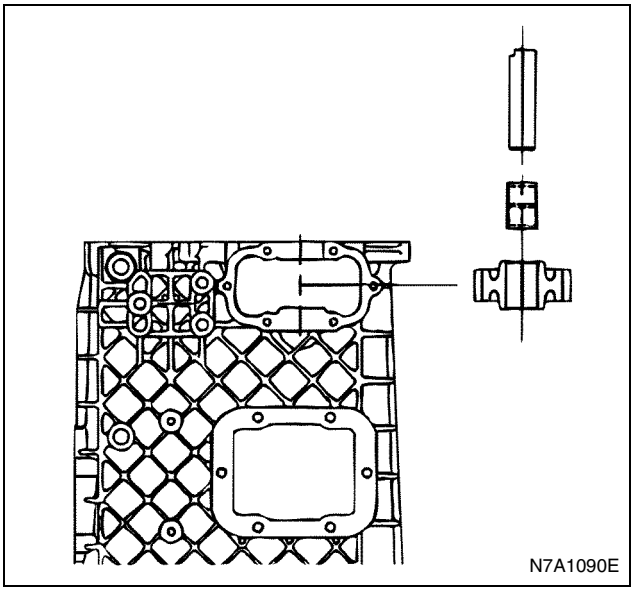
N7A1115E

    c. Rotate the counter shaft at least 30 turns to make the taper roller bearing seated.
    d. Select the counter shim.
       - At 120-degree intervals, take measurements at three points at a depth from the transmission case back surface up to the counter shaft rear bearing outer ring surface, and then calculate the average of the measured values.
       - Use the table below to select the shim thickness to match the measured average value.

Measured Value (mm)	Shim Thickness (mm)
From — To	
3.34 — 3.40	3.19
3.28 — 3.34	3.13
3.22 — 3.28	3.07
3.16 — 3.22	3.01
3.10 — 3.16	2.95
3.04 — 3.10	2.89
2.98 — 3.04	2.83
2.92 — 2.98	2.77
2.86 — 2.92	2.71
2.80 — 2.86	2.65
2.74 — 2.80	2.59
2.68 — 2.74	2.53
2.62 — 2.68	2.47
2.56 — 2.62	2.41
2.50 — 2.56	2.35
2.44 — 2.50	2.29
2.38 — 2.44	2.23

Measured Value (mm)	Shim Thickness (mm)
From — To	
2.32 — 2.38	2.17
2.26 — 2.32	2.11

14. Install the rear outer snap ring in the main shaft rear bearing.
15. Apply engine oil to the needle bearing, install the reverse idle gear and needle bearing, and insert the reverse idle shaft.



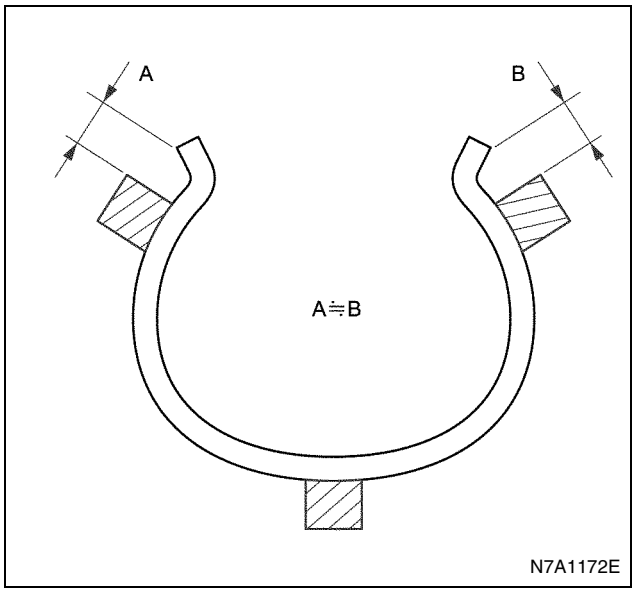
16. Install the retainer in the transmission case.

Tighten:
26 N·m (2.7 kg·m / 19.2 lb·ft)

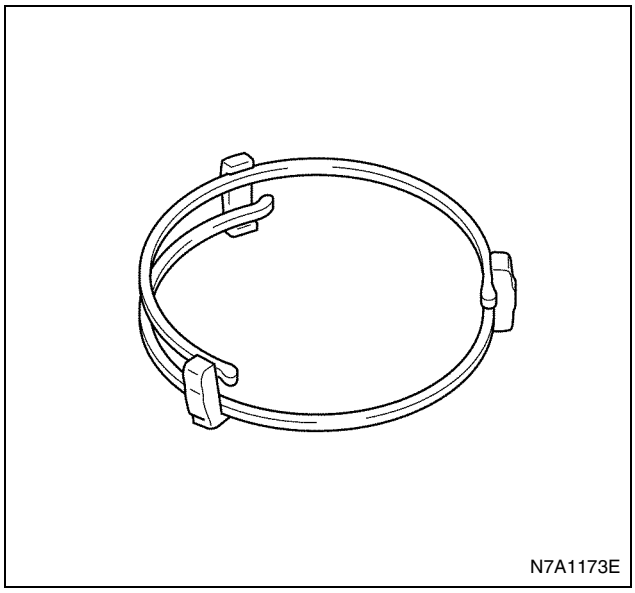
Caution:
Thoroughly remove the sealant from the threads of the transmission case, and use all new screws.

17. Install the speedometer gear.
    - Install the collar.
18. Perform the following steps to assemble the 6th clutch hub assembly (2) and sleeve (1).
    a. Securely assemble the insert key (3) into the block ring insert key groove.
    b. Install the insert spring (4) on the insert key.

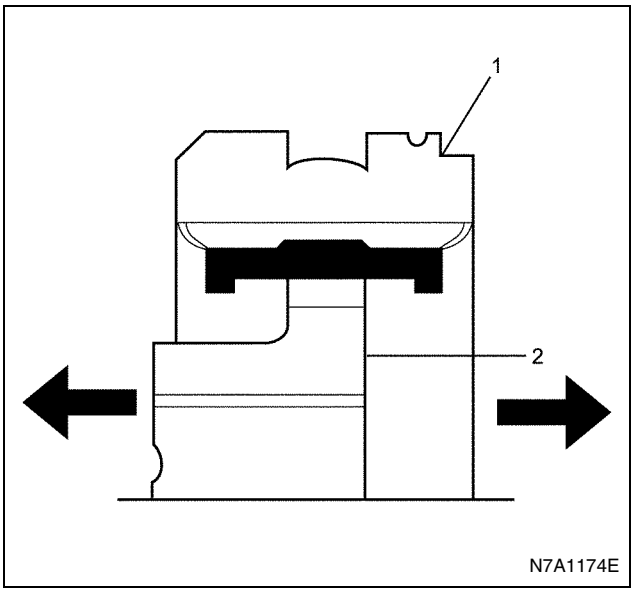
Caution:
- When assembling the insert spring, make sure that the surplus length on either end of the spring is about the same that it does not interfere with the interior diameter of the hub.

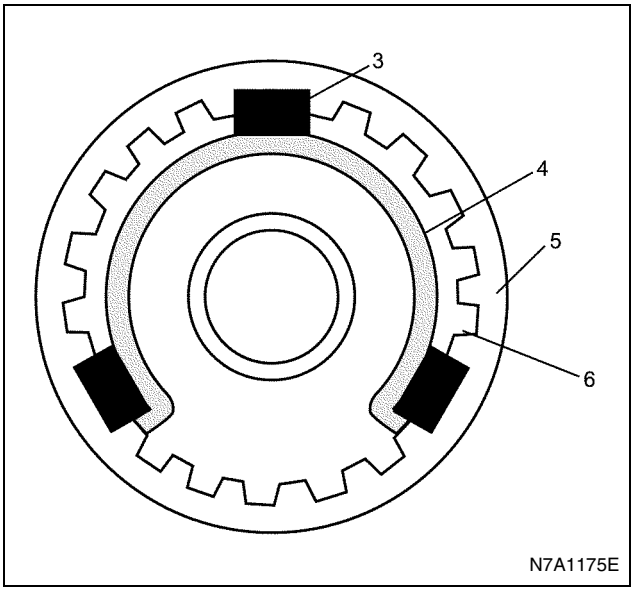


- The insert spring opening on the back should not be in the same position as the front opening.



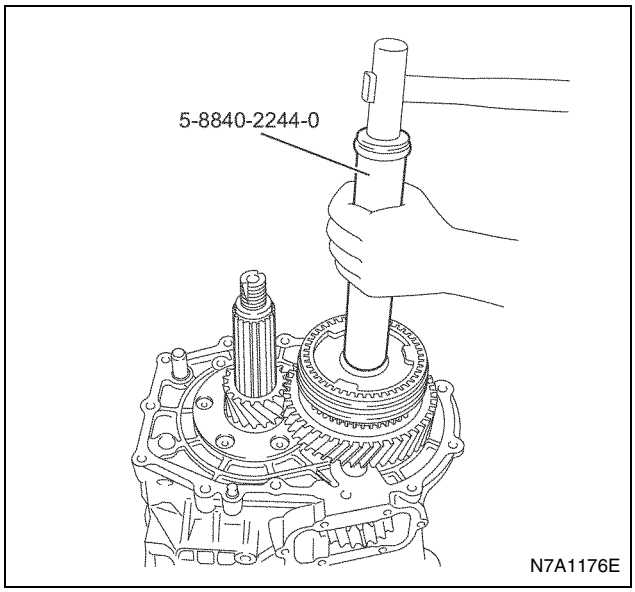
c. Confirm that the clutch hub (5) and sleeve (6) slide smoothly.





d. Install a new stopper plug to the clutch hub.

19. Apply engine oil to the needle bearing and block ring bore. Assemble the 6th gear and needle bearing, and the 6th block ring. In phase with the clutch hub block ring groove, assemble the 6th clutch hub assembly and sleeve and use an installer (5-8840-2244-0) to press fit with a hammer.



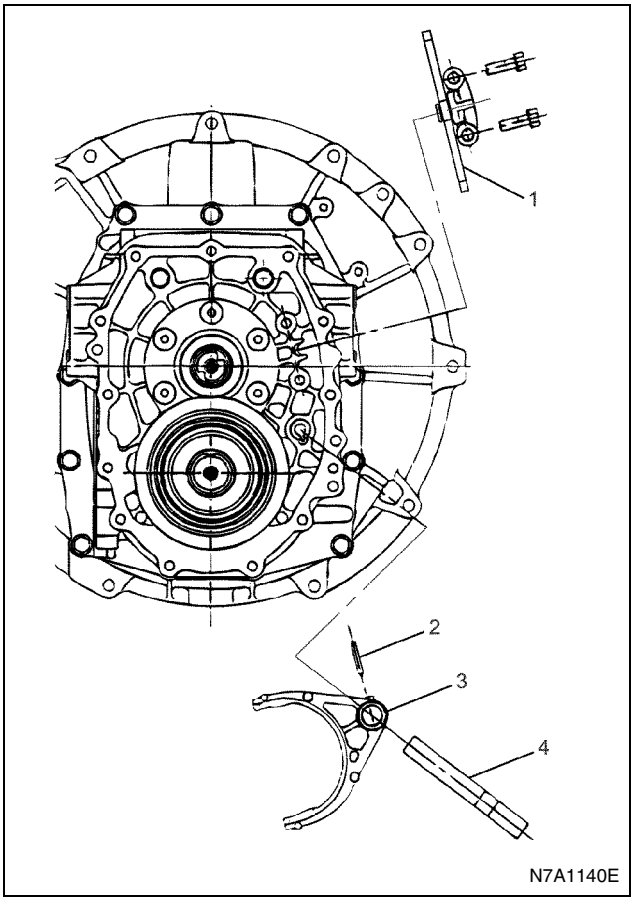
20. Use snap ring pliers to install the 6th clutch hub snap ring.
    - Select the thickest snap ring from among the three types that can be installed.

Thickness (mm)	Color Code
1.7	White
1.8	None
1.9	Blue

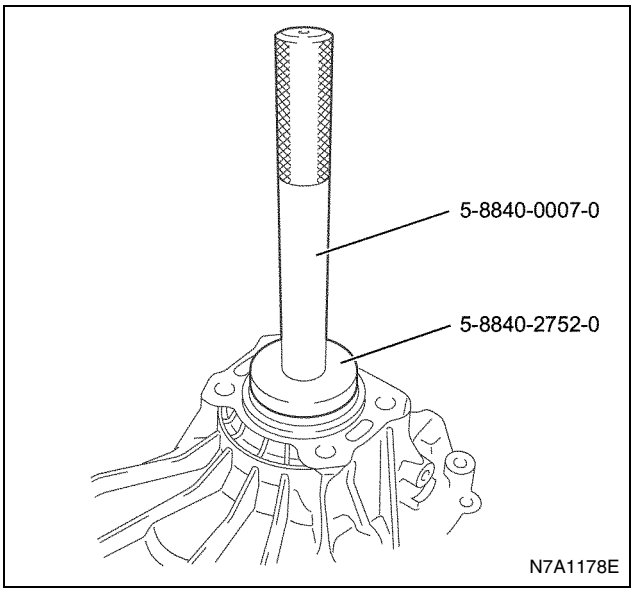
Caution:
If the snap ring is deformed or damaged during installation, replace it with a new one and check to make sure it is installed securely.

21. Apply engine oil to the transmission case shift rod hole. Install the 6th shift arm (3) and 6th shift rod (4) and press-fit the spring pin (2) by aligning with the spring pin hole.
22. Install the 6th relay lever (1).

Tighten:
44 N·m (4.5 kg·m / 32.5 lb·ft)

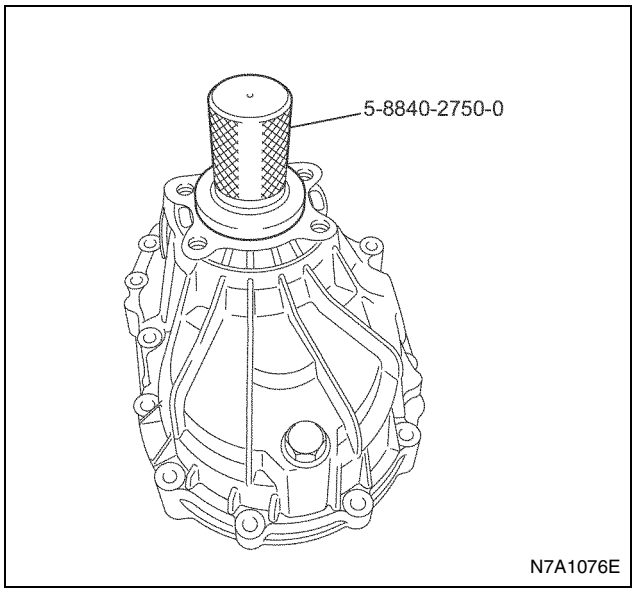


23. Install the main end needle bearing.
    - Apply Besco L2 grease to the inside of the needle bearing, and apply engine oil to the rear cover bearing contact surface bore.
    - With the stamped surface of the bearing facing outwards, use an installer (5-8840-2752) and grip (5-8840-0007-0) to press fit the needle bearing to the rear cover, from the outside.



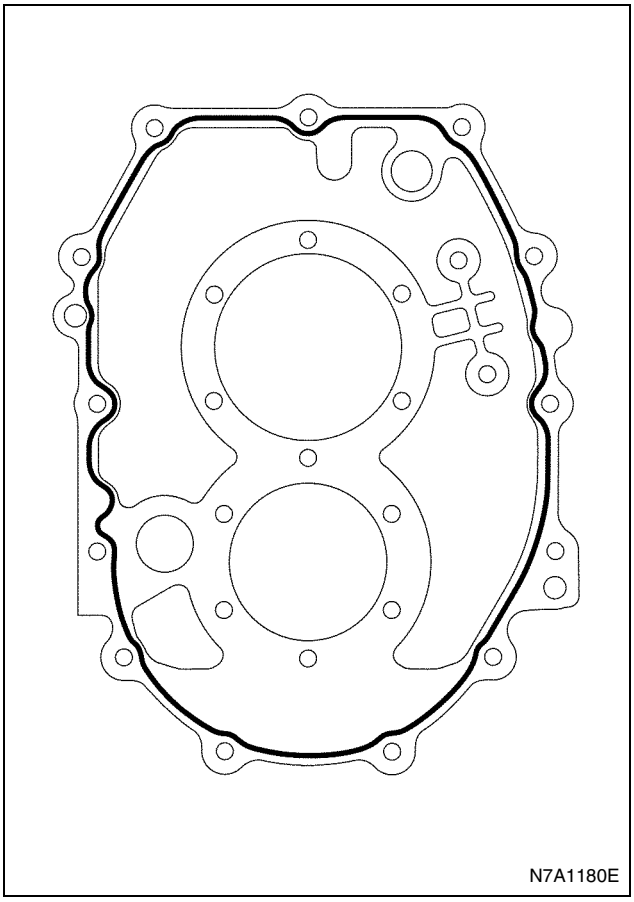
24. Inspect the rear cover oil seal. If it needs to be replaced with a new one due to wear, damage, or main end needle bearing replacement, apply engine oil to the outer circumference of the oil seal, and then use an installer (5-8840-2750-0) to press-fit it.
    - Apply Besco L2 grease to the lip of the oil seal.

Caution:
Take care to avoid damaging the oil seal lip.



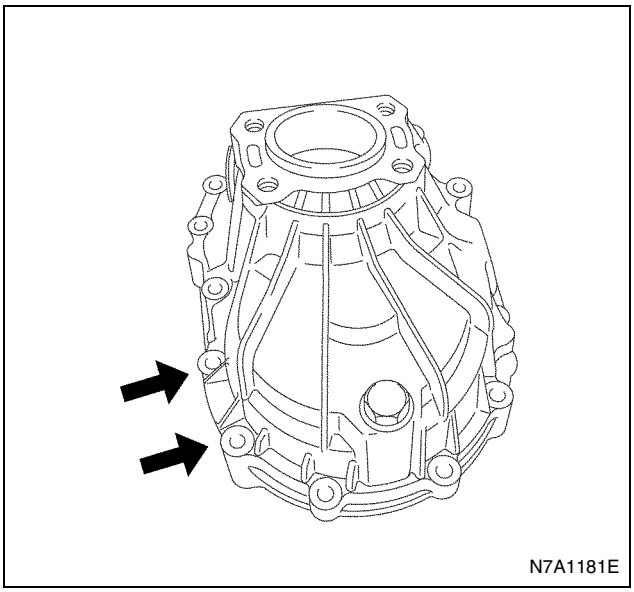
25. Apply Three Bond TB1215 to the mating surface of the transmission case rear cover, and install the rear cover.
    - Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

Tighten:
46 N·m (4.7 kg·m / 33.9 lb·ft)



N7A1180E

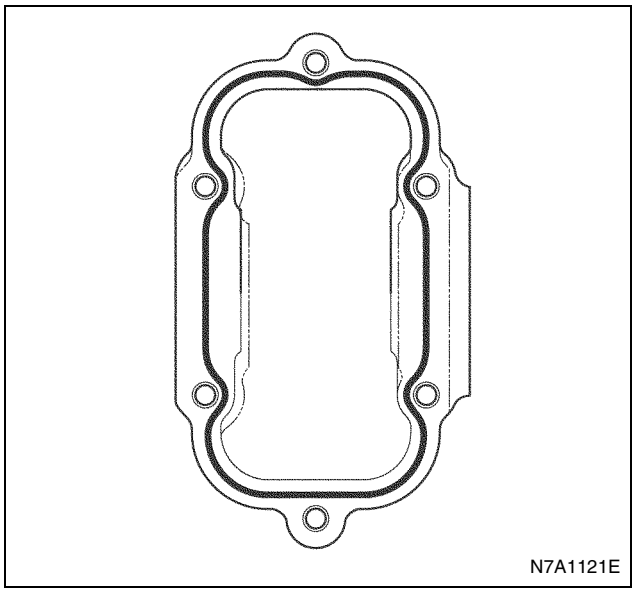
Caution:
The bolts indicated by arrows (two points) have Loctite applied. Thoroughly remove the sealant from the transmission case threads, and use new Loctite coated bolts.



N7A1181E

26. Apply Three Bond TB1215 to the mating surface of the transmission case reverse idle cover, and install the reverse idle cover.
    - Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

Tighten:
19 N·m (1.9 kg·m / 14 lb·ft)

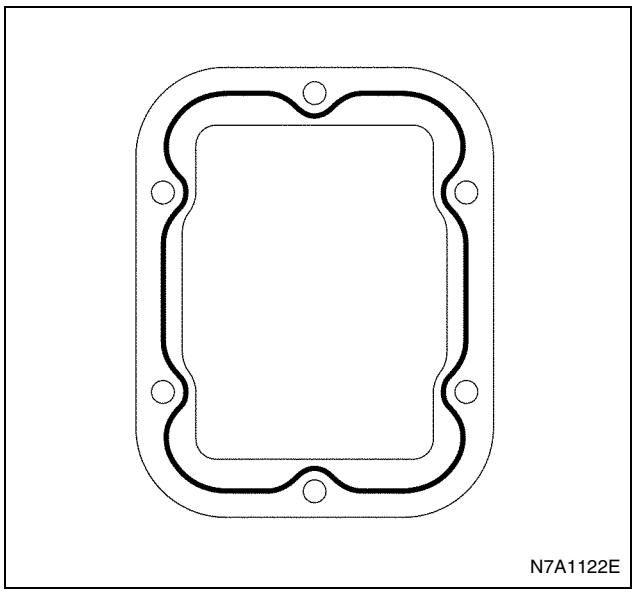


N7A1121E

27. Apply Three Bond TB1215 to the mating surface of the transmission case PTO cover, and install the PTO cover.
    - Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

Tighten:
37 N·m (3.8 kg·m / 27.3 lb·ft)

Caution:
The bolts have Loctite applied. Thoroughly remove the sealant from the transmission case threads, and use new Loctite coated bolts.



N7A1122E

28. Apply engine oil to the input shaft speed sensor O-ring, and install the input shaft speed sensor.

Tighten:
9 N·m (0.9 kg·m / 6.6 lb·ft)

29. Thoroughly remove sealant from the threads of the detent assembly (14), (13), (12), (11), apply Loctite 242, and install.

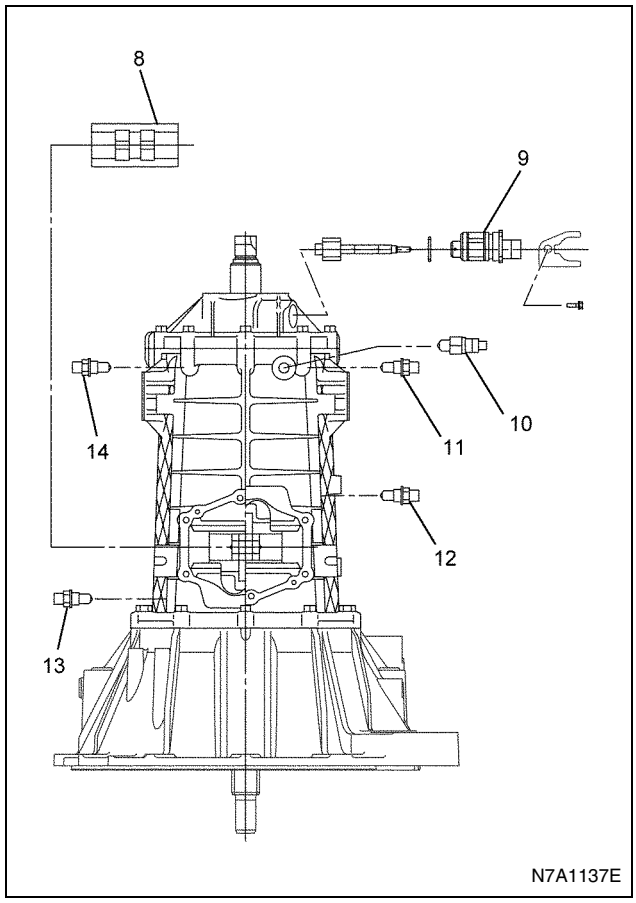
Tighten:
27 N·m (2.8 kg·m / 19.9 lb·ft)

30. Apply Loctite 242 to the reverse switch threads, and install the reverse switch (10).

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

31. Apply engine oil to the speedometer driver gear and O-ring, and then install the speedometer driven gear (9).

Tighten:
20 N·m (2.0 kg·m / 14.8 lb·ft)



32. Install the control box.
    a. Set the gear position to neutral, apply Three Bond TB1215 to the surface, which mates with control box, of the transmission case, and install the interlock plate and control box.
       - Before applying the Three Bond, remove all moisture and oil from the contact surface. Use a bead diameter of at least 2mm across the entire surface, ensuring there are no gaps.

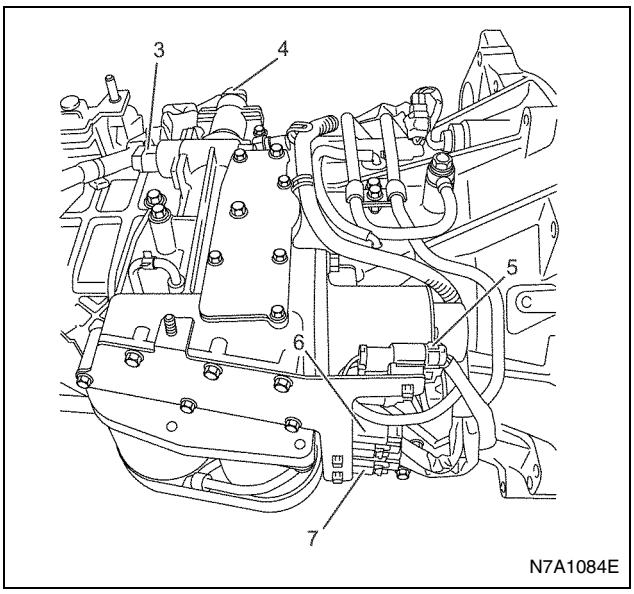
Caution:
The bolts have Loctite applied. Thoroughly remove the sealant from the transmission case threads, and use new Loctite coated bolts.

Tighten:
27 N·m (2.8 kg·m / 19.9 lb·ft)

    b. Attach clips to the harness (two points) and install the neutral switch connector to the bracket.

    c. Connect the five connectors to the control box.

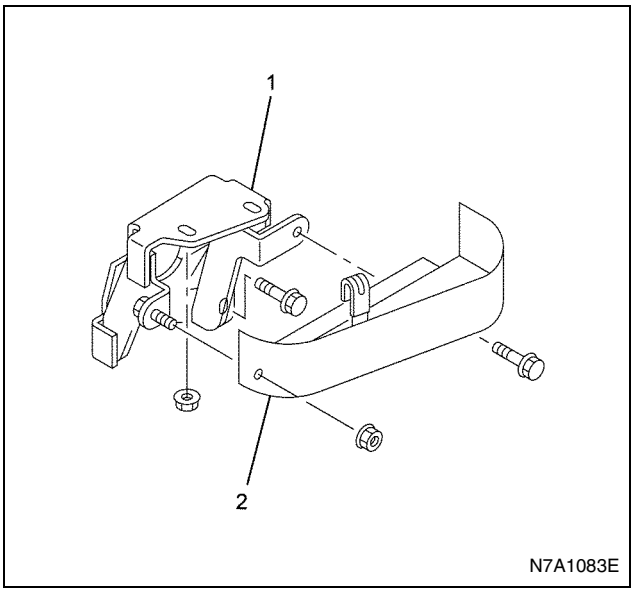
- Connect the connectors of the select sensor (3), shift sensor (4), select solenoid (5), 2-4-6-R shift solenoid (6), and 1-3-5 shift solenoid (7).



33. Install the heat protector bracket (1) and heat protector (2).

Tighten:

Bracket	45 N·m (4.6 kg·m / 33.2 lb·ft)
Protector	23 N·m (2.3 kg·m / 17 lb·ft)



34. Apply engine oil to the O-ring, and then install the drain plug and O-ring.

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

35. Apply engine oil to the O-ring, and then install the filler plug and O-ring.

Tighten:
39 N·m (4.0 kg·m / 28.8 lb·ft)

36. Install the parking brake assembly.
    - Refer to “Parking Brake”.
37. Install the parking brake bracket in the transmission case.

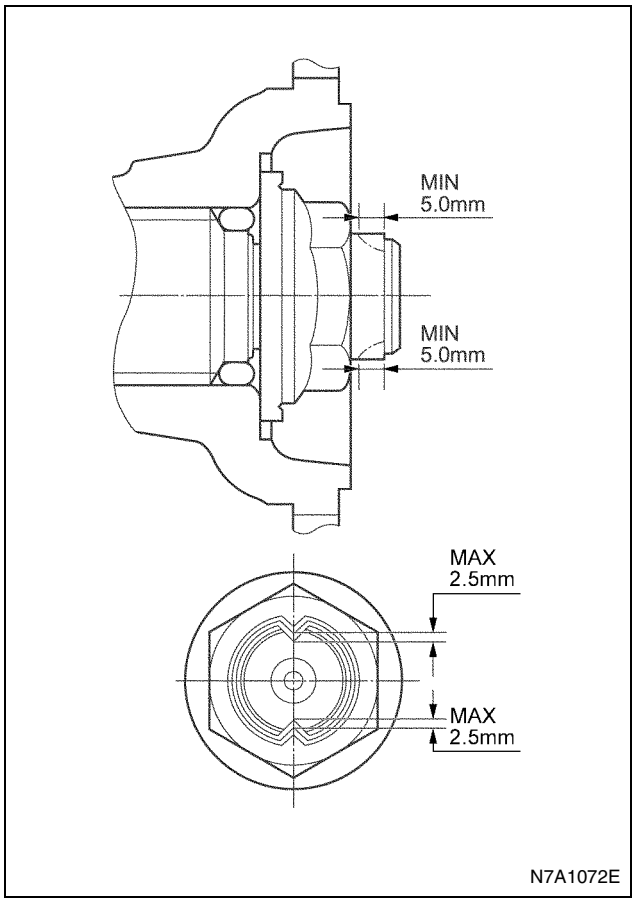
Tighten:
48 N·m (4.9 kg·m / 35.4 lb·ft)

38. Apply engine oil to the O-ring, and then install the coupling driver and O-ring.
39. Using a new lock nut, use the flange holder (5-8840-2043-0 for MYY, 9-8529-2101-1) to tighten the lock nut.

Tighten:
289 N·m (29.5 kg·m / 213.2 lb·ft)

- After tightening the lock nut to the specified torque, stake it (2 points) securely using a chisel (chisel tip shape: approx. 1 mm in radius × 60 degrees) so the lock nut lip gap is aligned with the V-groove of the shaft and is at least 5 mm, and the clearance between the V-groove bottom and the nut lip is 2.5 mm or less.

Caution:
After caulking, check the caulking of the nut. If any cracks are discovered, replace the lock nut and re-caulk.



40. Install the parking brake drum.
    - Refer to “Parking Brake”.

Tightening Torques

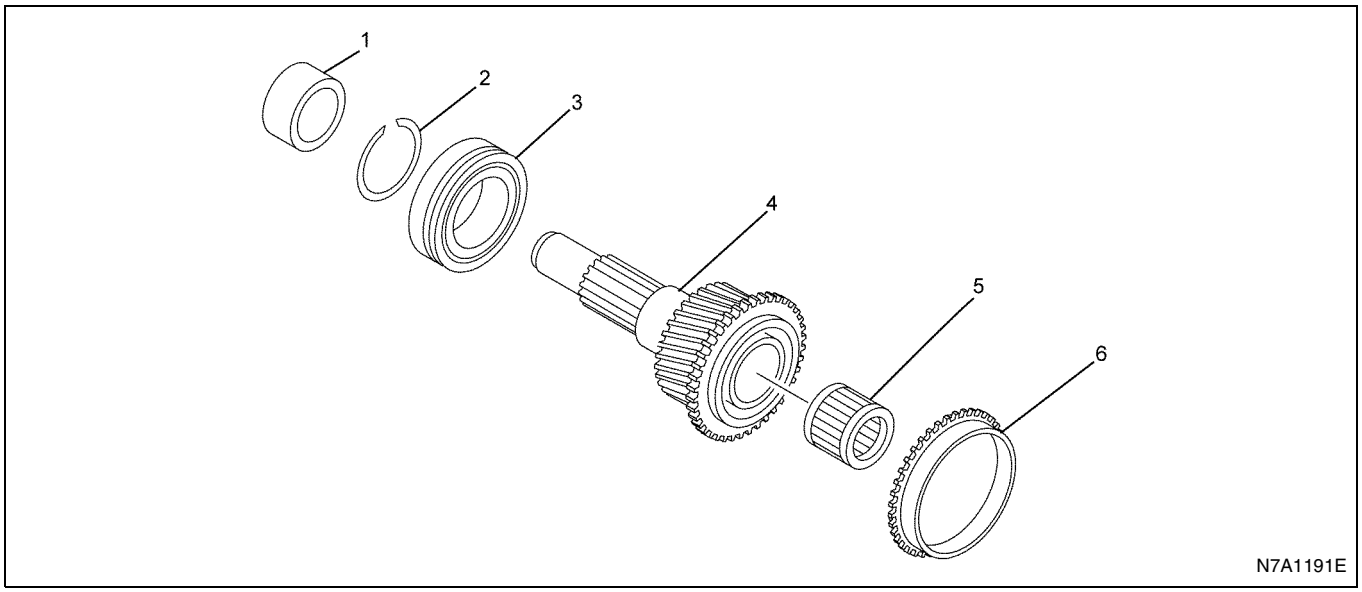
Top Gear Shaft

Components



Legend

1. Collar
2. Snap Ring
3. Bearing
4. Top Gear Shaft
5. Needle Bearing
6. Block Ring

Disassembly

1. Remove the block ring from the top gear shaft.
2. Remove the needle bearing from the top gear shaft.
   - Since the needle bearing is a separator type, take care that you do not drop it or damage it during disassembly and assembly. During assembly, remove all foreign matter, apply Besco L2 grease, and then assemble it.
3. Use snap ring pliers to remove the snap ring.
4. Use a bearing remover to remove the bearing with a press.
5. Remove the collar.

Inspect each part. Replace or repair as required if anything is worn or damaged or if any other defect is discovered.

6. Inspect the gear tooth surface, spline, and tip sliding surface for damage and wear. If any abnormality is detected, replace the applicable part.
7. Inspect each of the bearings for the following characteristics. If any abnormality is detected, replace the applicable bearing.
   - Smoothness of rotation
   - Noise
   - Damage, rust, or other visible abnormality
   - Abnormal play in the thrust direction
   - Discoloration, extreme wear, or pitching of the needle bearing rolling element or rolling surface

Inspect each part. Replace or repair as required if anything is worn or damaged or if any other defect is discovered.

9. Inspect each of the bearings for the following characteristics. If any abnormality is detected, replace the applicable bearing.
   - Smoothness of rotation
   - Noise
   - Damage, rust, or other visible abnormality
   - Abnormal play in the thrust direction
10. Inspect the gear bore.
    - Use an inside dial gauge to measure the bore of each gear.
    - If the measured value exceeds the limit, replace the gear.

Gear Bore (mm)		
	Specified Value	Limit
5th Gear	44.009 — 44.025	44.065
3rd Gear	63.010 — 63.029	63.069
2nd Gear	63.010 — 63.029	63.069

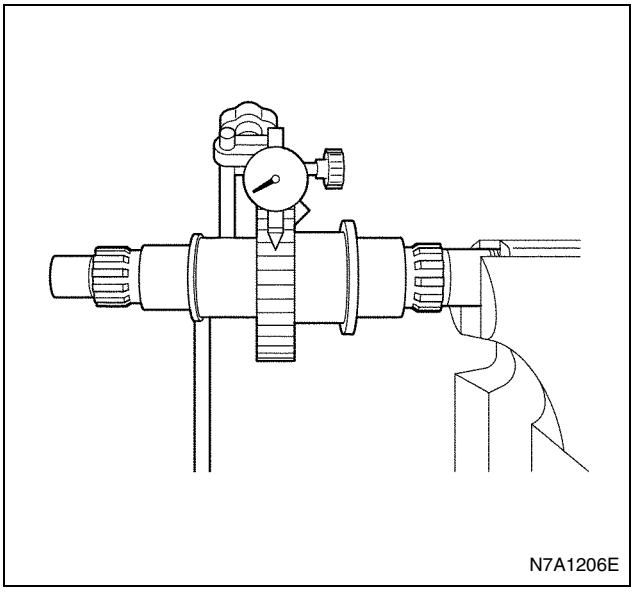
3. Inside Ring

14. Inspect the sliding part of the clutch hub and sliding sleeve, the insert key of the spline, and the insert key groove for wear and damage.
15. Measure the play in the spline rotation direction (on the clutch hub outer circumference).
    - If the measured value exceeds the limit, replace.

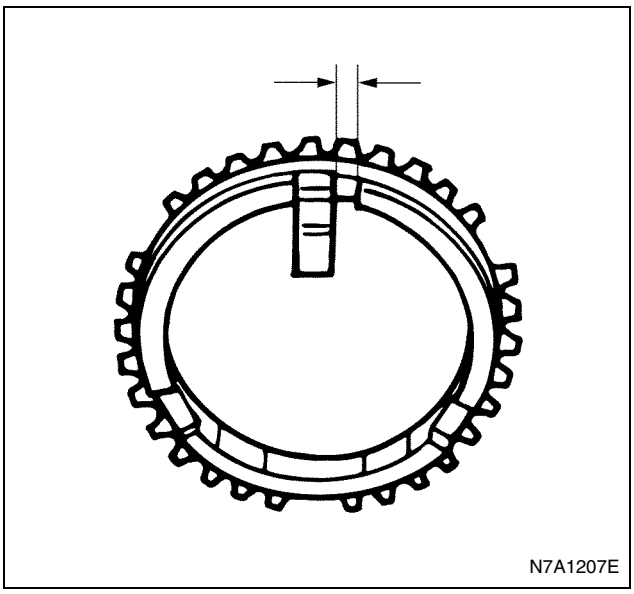
Spline Play (mm)	
Specified Value	Limit
0 — 0.05	0.3



N7A1206E

16. Use a caliper to measure the gap between the insert key and block ring groove.
    - If the measured value exceeds the limit, replace the insert key and block ring.

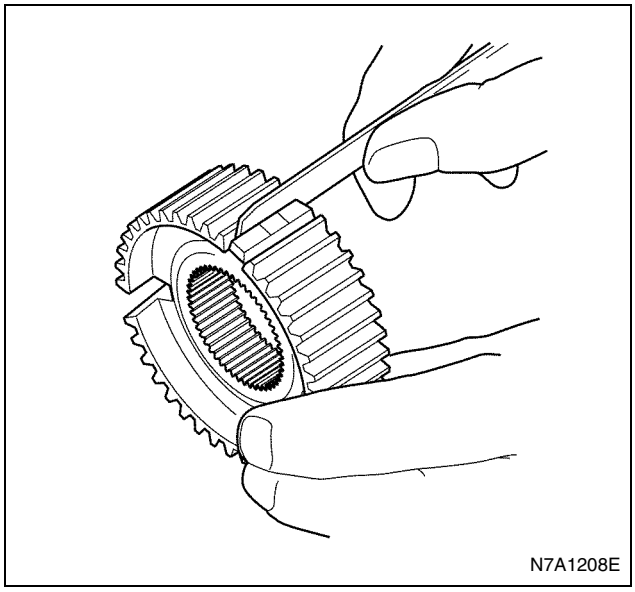
Gap Between the Insert Key and Block Ring Groove (mm)	
	Specified Value
4th/5th	3.46 — 3.76



N7A1207E

17. Use a thickness gauge to measure the gap between the insert key and clutch hub.
    - If the measured value exceeds the limit, replace the insert key and clutch hub.

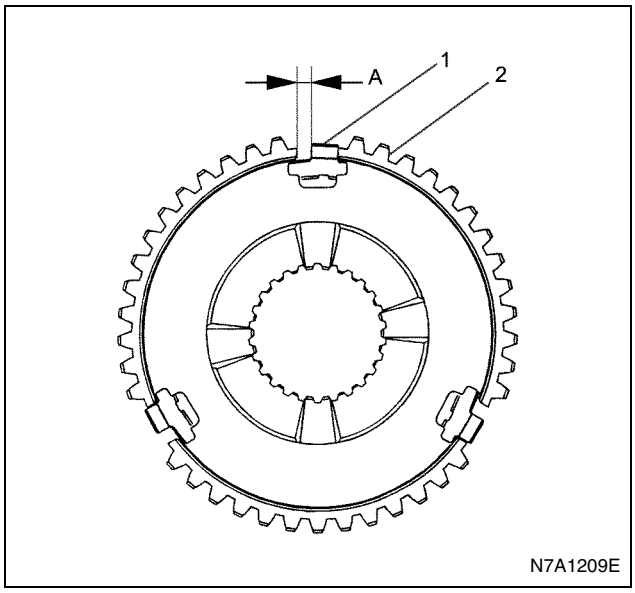
Gap Between the Insert Key and Block Ring Groove (mm)	
	Specified Value
4th/5th	0.01 — 0.21



N7A1208E

18. Use a thickness gauge to measure gap A between the index block and clutch hub.
    - If the measured value exceeds the specified value, replace the index block and clutch hub.

Gap Between the Index Block and Clutch Hub (mm)	
	Specified Value
2nd/3rd	4.30 — 4.70



N7A1209E

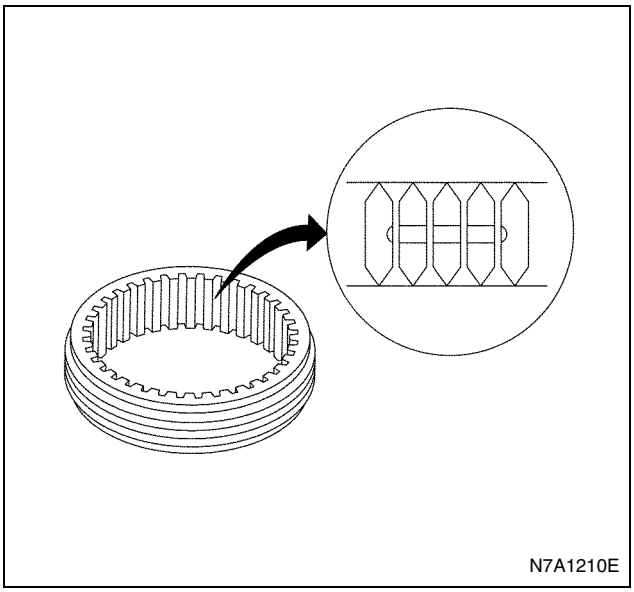
Legend
1. Index Block
2. Clutch Hub

Assembly

- Thoroughly clean each part.

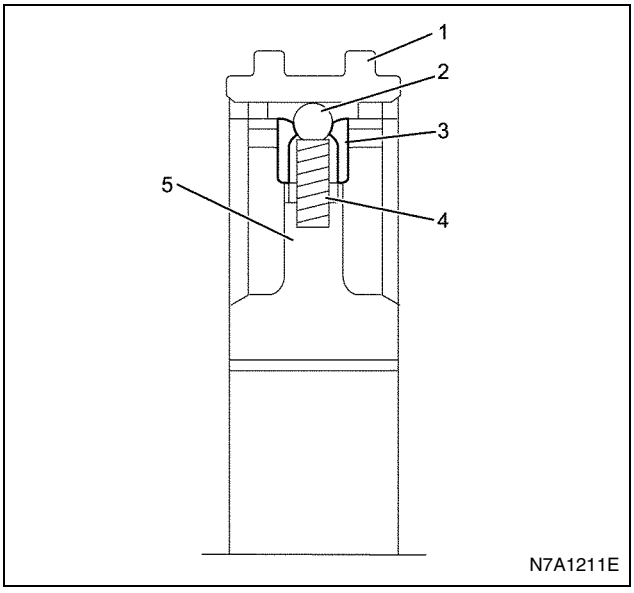
- Set the main shaft into a vice, with the long spline length downwards. At this time, take care to avoid damage to the grinding surface.

1. Perform the following steps to assemble the 2nd — 3rd clutch hub assembly and sleeve.
   a. Install the index block and spring onto the clutch hub.
   b. There are three ball grooves on the inner surface of the sleeve. Align the phase so the balls are in the center of the ball grooves.



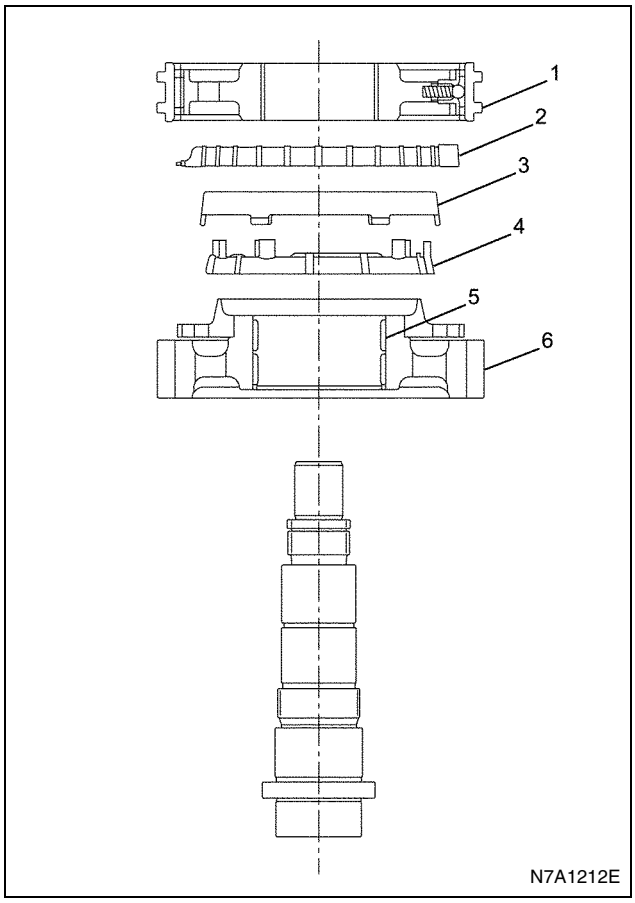
N7A1210E

   c. Insert the sleeve (1) on the clutch hub (5) until the index block is slightly covered.
   d. While pressing in the balls (2), index block (2), and spring (4), securely insert the sleeve until balls enter the sleeve ball grooves.



N7A1211E

2. Apply engine oil to the needle bearing, 2nd gear thrust surface and synchro cone taper. With the dog gear upwards, install the 2nd gear (6) and needle bearing (5) on the main shaft.
3. Install the 2nd inside ring (4), 2nd outside ring (3) and 2nd block ring (2) so the outside ring claw enters the hole in the 2nd gear dog gear. At this time, apply engine oil to both surfaces of the inside ring and outside ring, and the bore surface of the block ring.
4. Install the 2nd — 3rd clutch hub assembly and sleeve (1) so the six inside ring claws are aligned with the six holes of the hub, and use an installer (5-8840-2345-0) to press-fit.

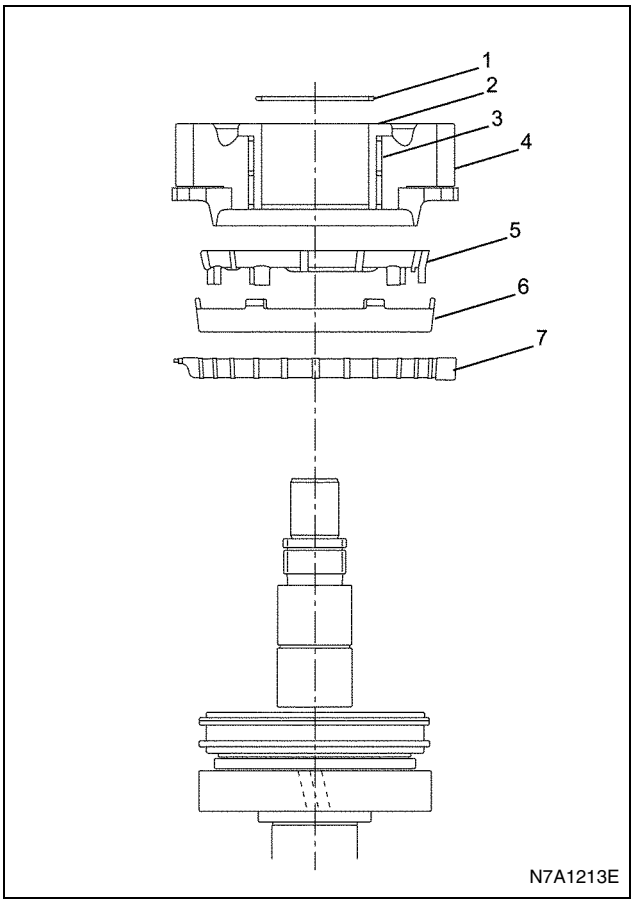


N7A1212E

5. Install the 3rd block ring (7), 3rd outside ring (6), and 3rd inside ring (5) so their six inside ring claws align with the six holes of the hub. At this time, apply engine oil to the bore surface of the inside ring and outside ring, and the bore surface of the block ring.

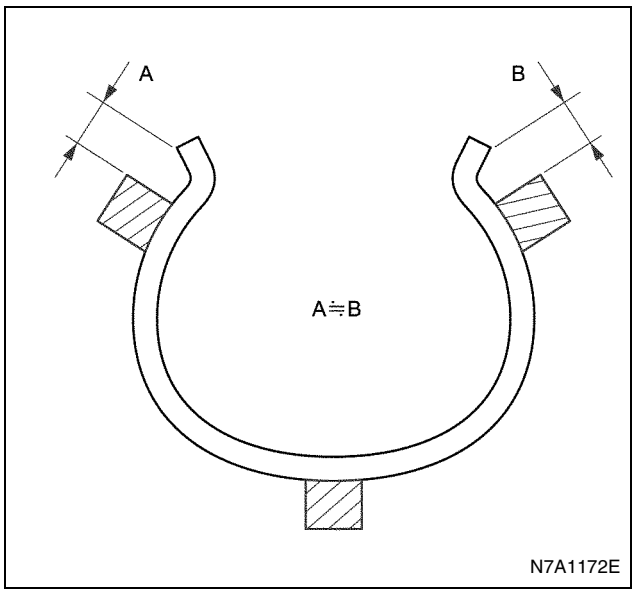
6. Apply engine oil to the needle bearing, 3rd gear thrust surface, and synchro cone taper. With the dog gear facing downwards, use an installer (5-8840-2345-0) to press-fit the 3rd gear (4), needle bearing (3), and collar (2) so the outer ring claw aligns with the 3rd gear dog gear hole.
7. Use snap ring pliers to install the snap ring (1).

Caution:
If the snap ring is deformed or damaged, replace it with a new one and check to make sure it is installed securely.

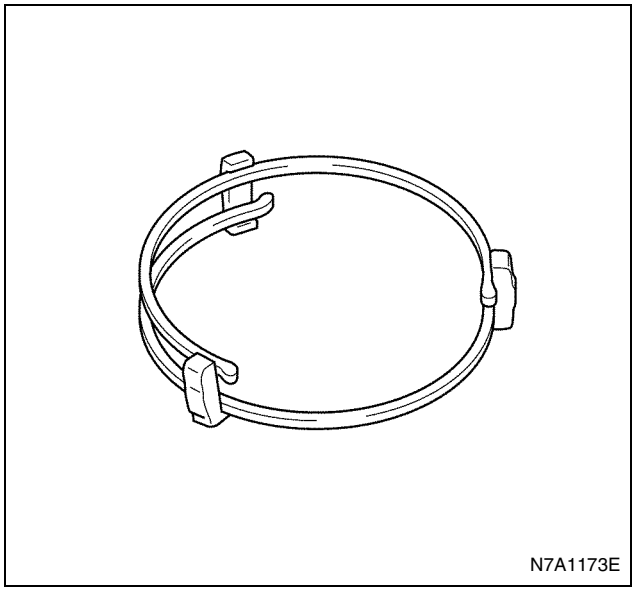


8. Perform the following steps to assemble the 4th — 5th clutch hub assembly and sleeve.
   a. Securely assemble the insert key (2) into the block ring insert key groove.
   b. Install the insert spring (3) on the insert key.

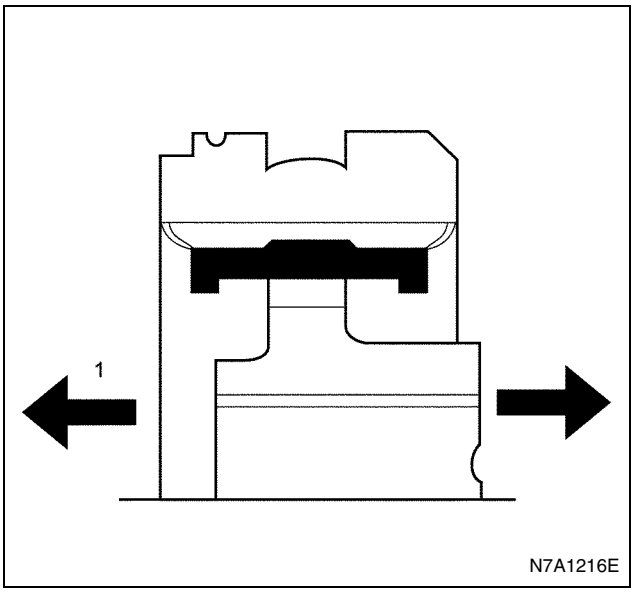
Caution:
- When assembling the insert spring, make sure that the surplus length on either end of the spring is about the same that it does not interfere with the interior diameter of the hub.

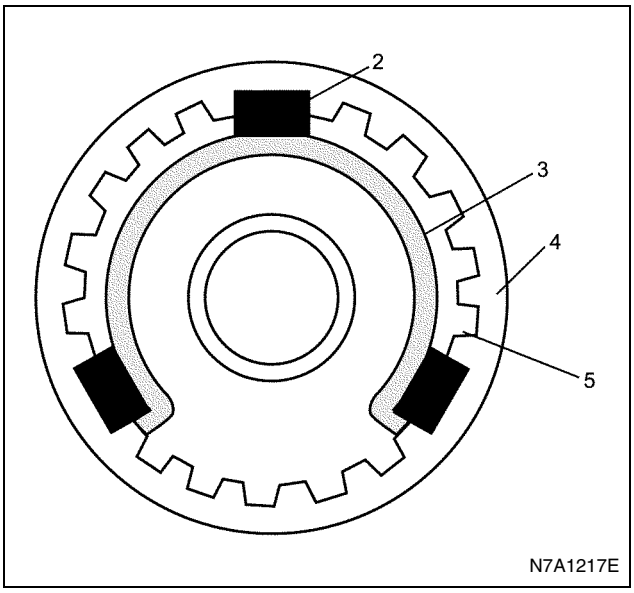


- The insert spring opening on the back should not be in the same position as the front opening.



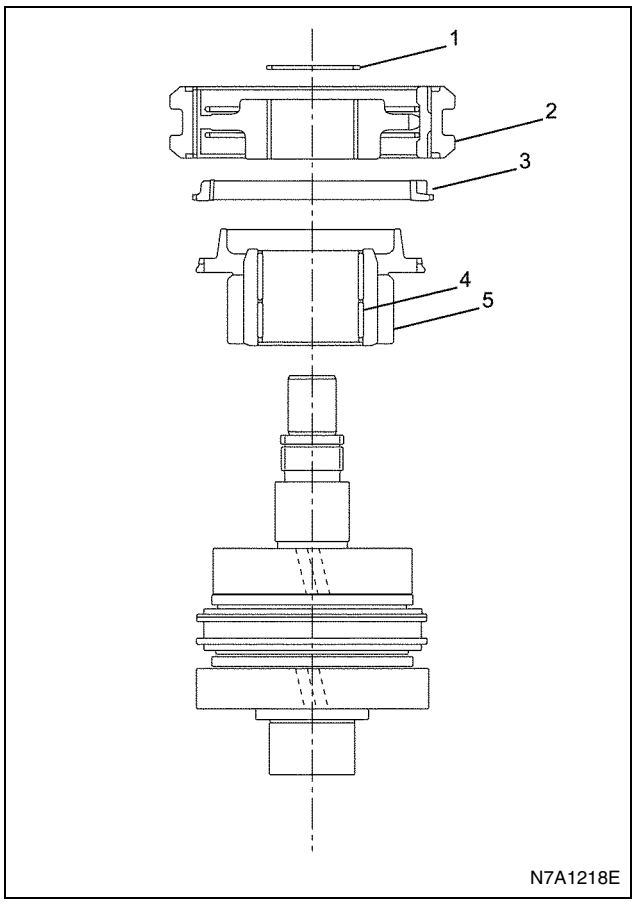
c. Confirm that the clutch hub (4) and sleeve (5) slide smoothly.
   - The arrow (1) indicates the front of the transmission.



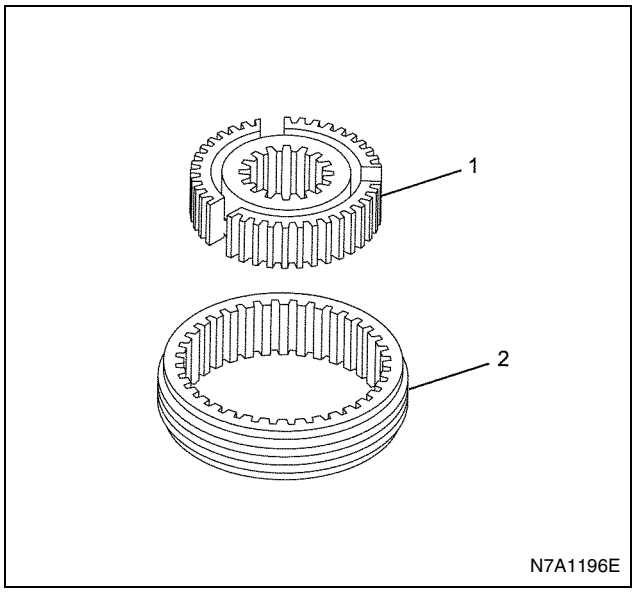


9. Apply engine oil to the needle bearing, 5th gear thrust surface and synchro cone taper. With the dog gear upwards, install the 5th gear (5) and needle bearing (4).
10. Apply engine oil to the 5th block ring (3), and install.
11. With the oil groove surface of the 4th — 5th clutch hub assembly and spring (2) facing downwards, align with the phase of the 4th — 5th block ring groove, and use an installer (5-8840-2345-0) to press-fit.
12. Use snap ring pliers to install the snap ring (1).

Caution:
If the snap ring is deformed or damaged, replace it with a new one and check to make sure it is installed securely.



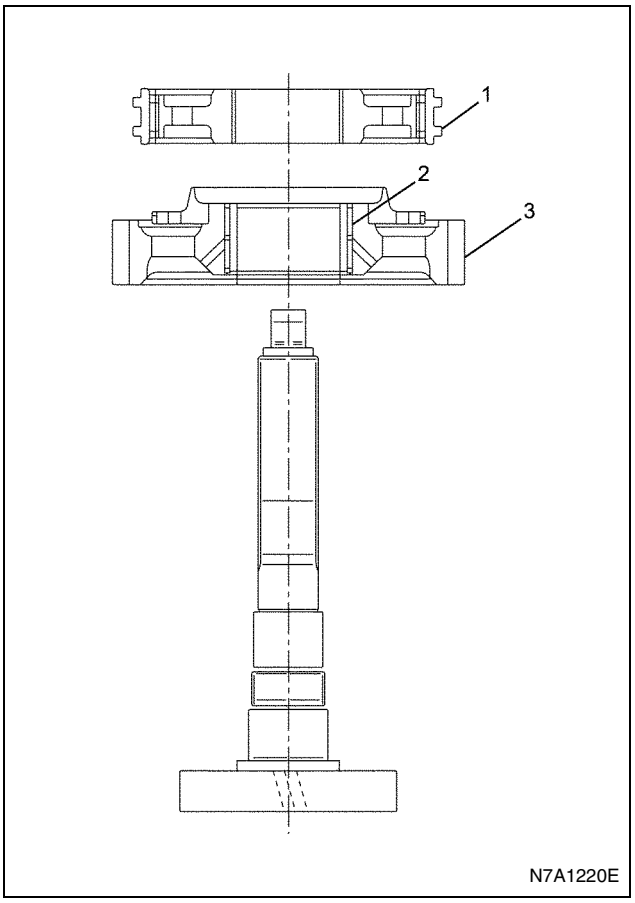
13. Assemble the 1st — Reverse clutch hub assembly and sleeve.



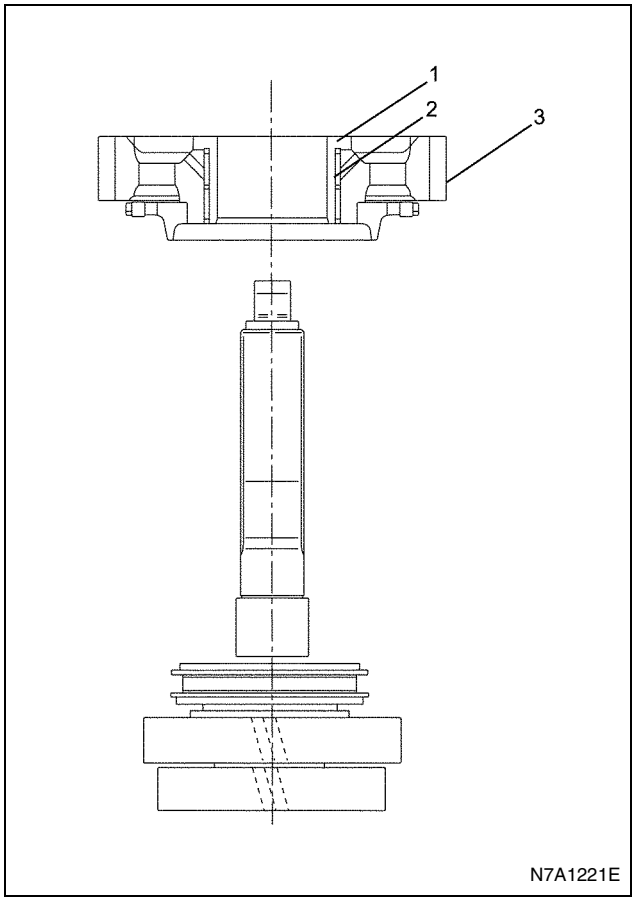
Legend
1. Clutch Hub
2. Sleeve

14. Apply engine oil to the needle bearing, 1st gear thrust surface and synchro cone taper. With the dog gear upwards, install the 1st gear (3) and needle bearing (2).

15. Install the 1st — Reverse clutch hub assembly and sleeve (1), and use an installer (5-8840-2345-0) to press-fit.



16. Apply engine oil to the needle bearing and reverse gear thrust surface. With the dog gear of the reverse gear (3) facing downwards, use an installer (5-8840-2345-0) to press-fit the needle bearing (2) and collar (1).



17. Install the spacer (2).

18. With the stamped surface (4) of the bearing (1) facing upwards and stamped surface (3) facing downwards, use an installer (5-8840-2345-0) to press-fit.

Inspect each part. Replace or repair as required if anything is worn or damaged or if any other defect is discovered.

10. Inspect each of the bearings for the following characteristics. If any abnormality is detected, replace the applicable bearing.
    - Smoothness of rotation
    - Noise
    - Damage, rust, or other visible abnormality
    - Abnormal play in the thrust direction
11. Inspect the gear bore.
    - Use an inside dial gauge to measure the bore of each gear.
    - If the measured value exceeds the limit, replace the gear.

Gear Bore (mm)		
	Specified Value	Limit
6th Gear	50.009 — 50.025	50.065
5th Gear	44.009 — 44.025	44.065
4th Gear	44.009 — 44.025	44.065

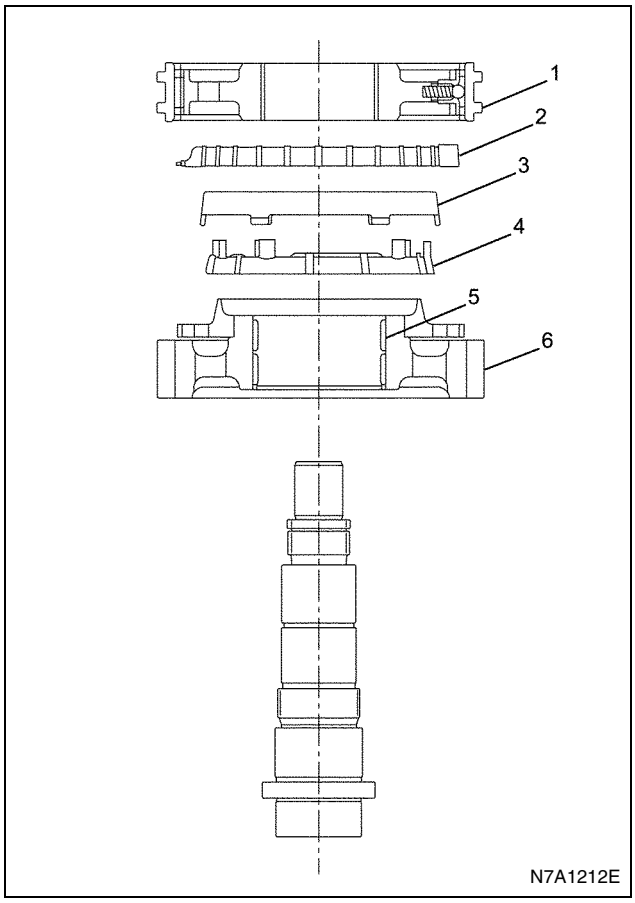
2. Apply engine oil to the needle bearing, 2nd gear thrust surface and synchro cone taper. With the dog gear upwards, install the 2nd gear (6) and needle bearing (5) on the main shaft.
3. Install the 2nd inside ring (4), 2nd outside ring (3) and 2nd block ring (2) so the outside ring claw enters the hole in the 2nd gear dog gear. At this time, apply engine oil to the bore surface of the inside ring and outside ring, and the bore surface of the block ring.
4. Install the 2nd — 3rd clutch hub assembly and sleeve (1) so the six inside ring claws are aligned with the six holes of the hub, and use an installer (5-8840-2345-0) to press-fit.

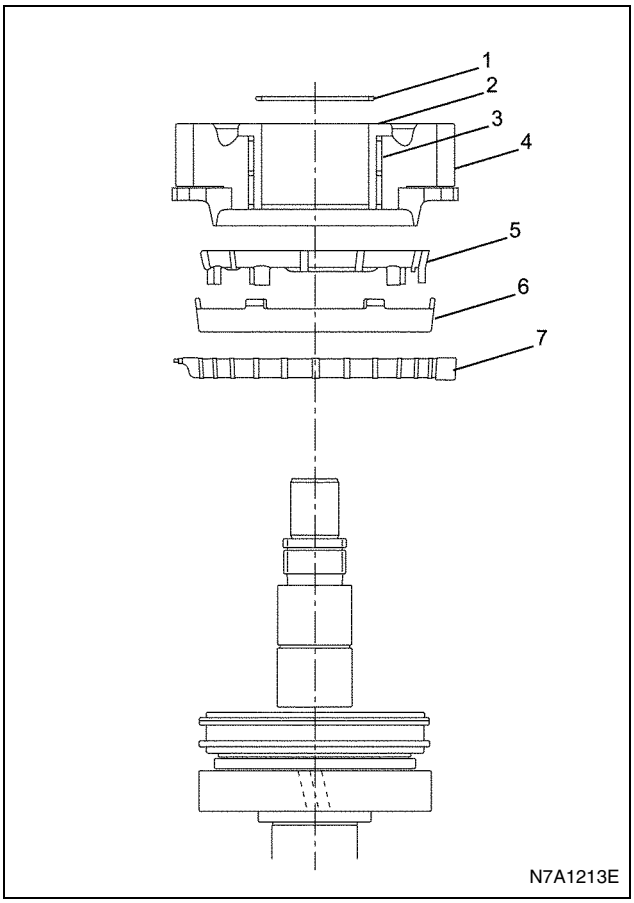


N7A1212E

5. Install the 3rd block ring (7), 3rd outside ring (6), and 3rd inside ring (5) so their six inside ring claws align with the six holes of the hub. At this time, apply engine oil to the bore surface of the inside ring and outside ring, and the bore surface of the block ring.

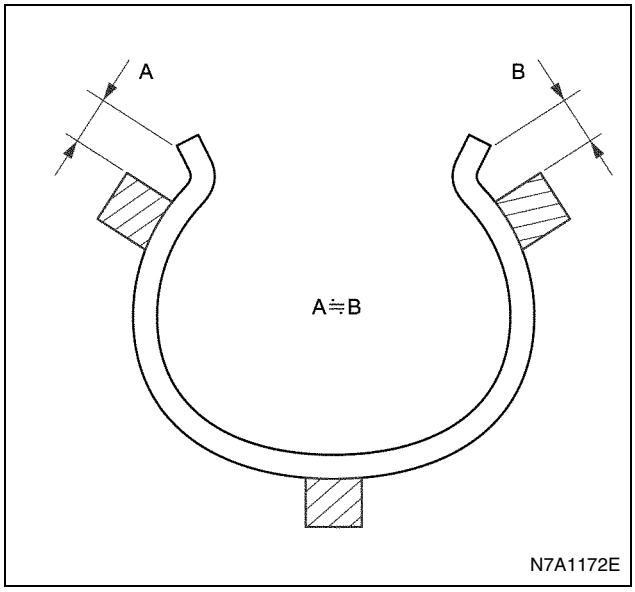
6. Apply engine oil to the needle bearing, 3rd gear thrust surface, and synchro cone taper. With the dog gear facing downwards, use an installer (5-8840-2345-0) to press-fit the 3rd gear (4), needle bearing (3), and collar (2) so the outer ring claw aligns with the 3rd gear dog gear hole.
7. Use snap ring pliers to install the snap ring (1).

Caution:
If the snap ring is deformed or damaged, replace it with a new one and check to make sure it is installed securely.

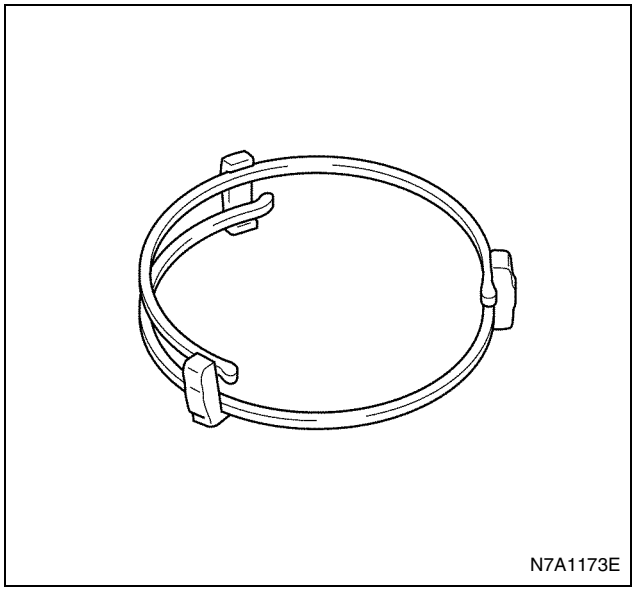


8. Perform the following steps to assemble the 4th — 5th clutch hub assembly and sleeve.
   a. Securely assemble the insert key (2) into the block ring insert key groove.
   b. Install the insert spring (3) on the insert key as shown in the illustration.

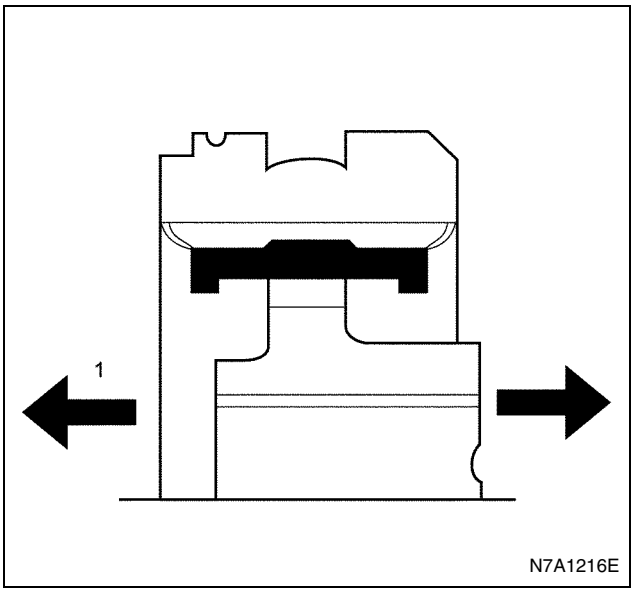
Caution:
- When assembling the insert spring, make sure that the surplus length on either end of the spring is about the same that it does not interfere with the interior diameter of the hub.

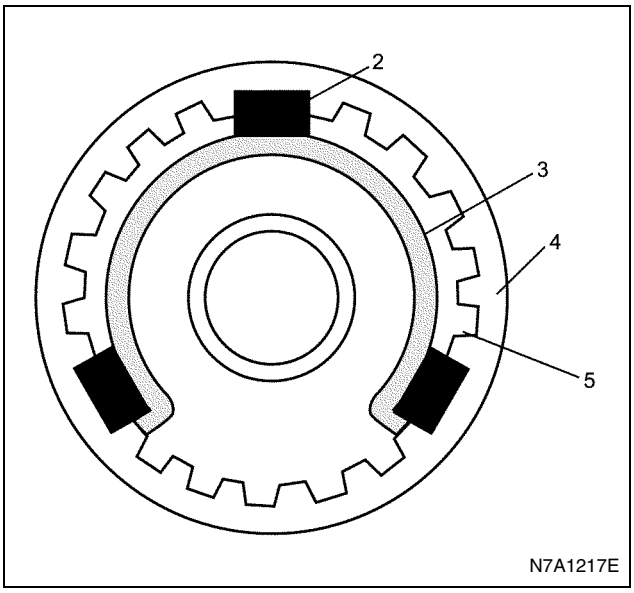


- The insert spring opening on the back should not be in the same position as the front opening.



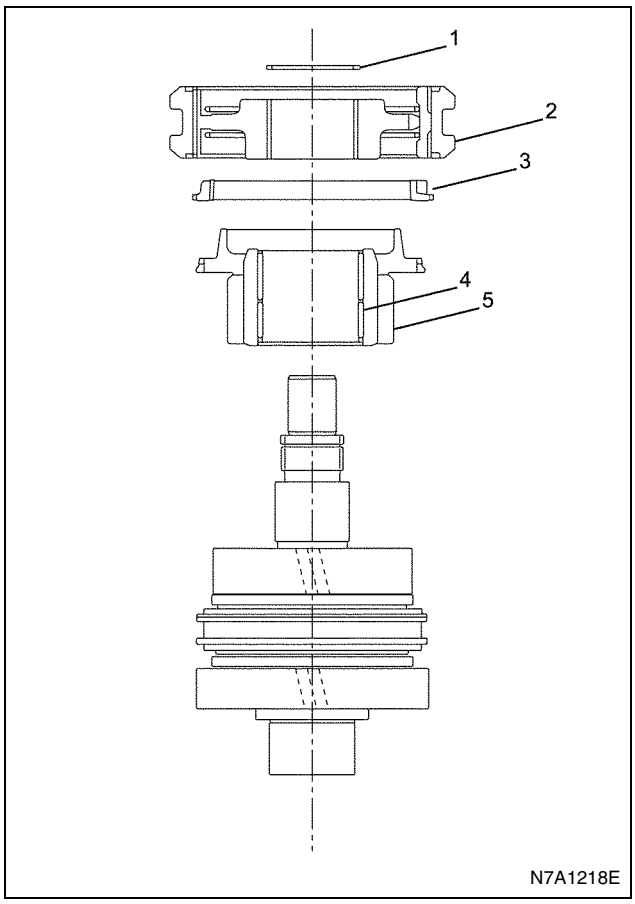
c. Confirm that the clutch hub (4) and sleeve (5) slide smoothly.
   - The arrow (1) indicates the front of the transmission.



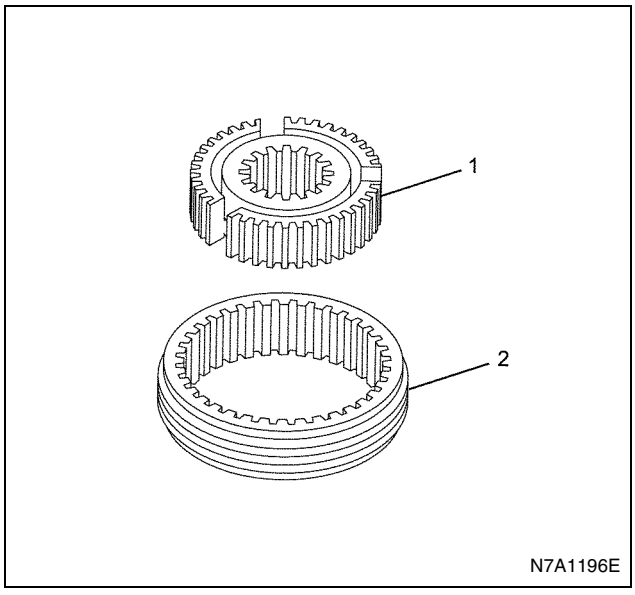


9. Apply engine oil to the needle bearing, 4th gear thrust surface and synchro cone taper. With the dog gear upwards, install the 4th gear (5) and needle bearing (4).
10. Apply engine oil to the 4th block ring (3), and install.
11. With the oil groove surface of the 4th — 5th clutch assembly and sleeve (2) facing downwards, align with the pass of the 4th — 5th block ring groove and use an installer (5-8840-23450-0) to press-fit.
12. Use snap ring pliers to install the snap ring (1).

Caution:
If the snap ring is deformed or damaged, replace it with a new one and check to make sure it is installed securely.



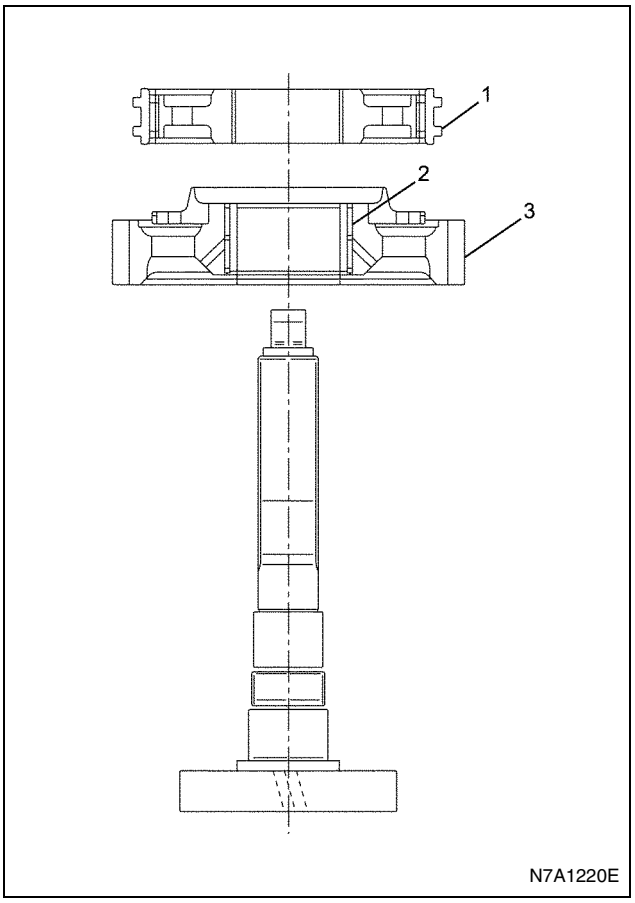
13. Assemble the 1st — Reverse clutch hub assembly and sleeve.



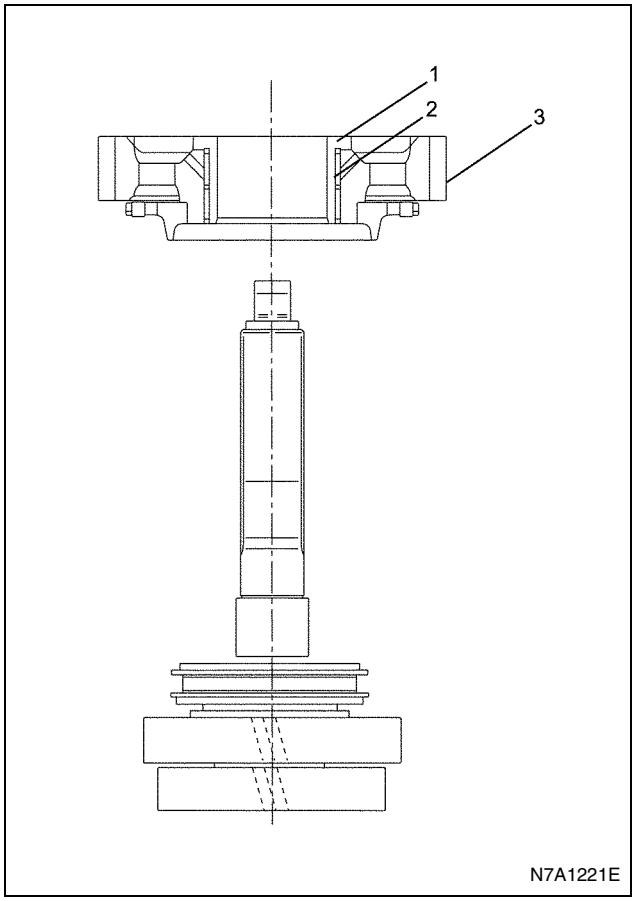
Legend
1. Clutch Hub
2. Sleeve

14. Apply engine oil to the needle bearing, 1st gear thrust surface and synchro cone taper. With the dog gear upwards, install the 1st gear (3) and needle bearing (2).

15. Install the 1st — Reverse clutch hub assembly and sleeve (1), and use an installer (5-8840-2345-0) to press-fit.

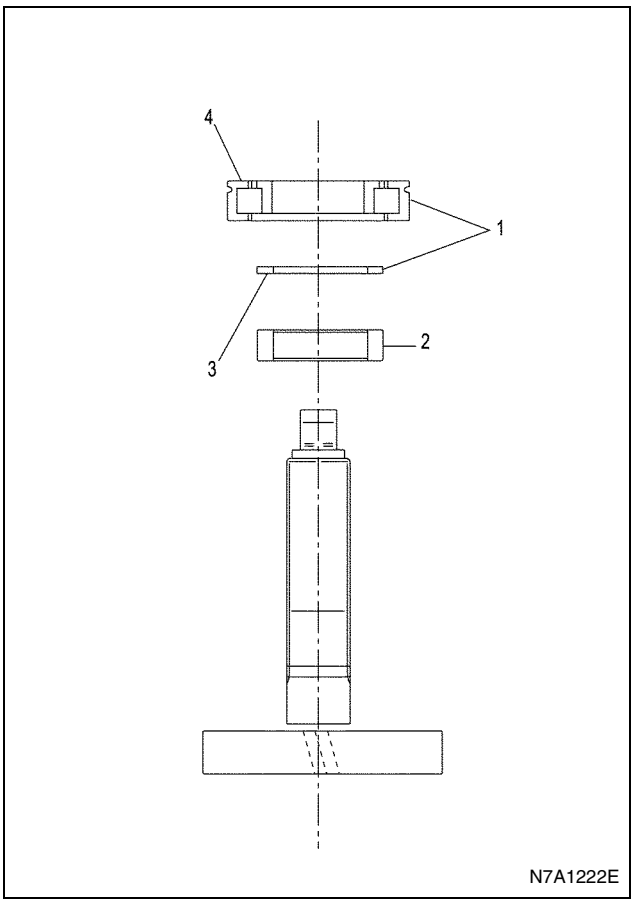


16. Apply engine oil to the needle bearing and reverse gear thrust surface. With the dog gear of the reverse gear (3) facing downwards, use an installer (5-8840-2345-0) to press-fit the needle bearing (2) and collar (1).



17. Install the spacer (2).

18. With the stamped surface (4) of the bearing (1) facing upwards and stamped surface (3) facing downwards, use an installer (5-8840-2345-0) to press-fit.



19. Install the 6th gear.
    - Install with the convex portion facing downwards.

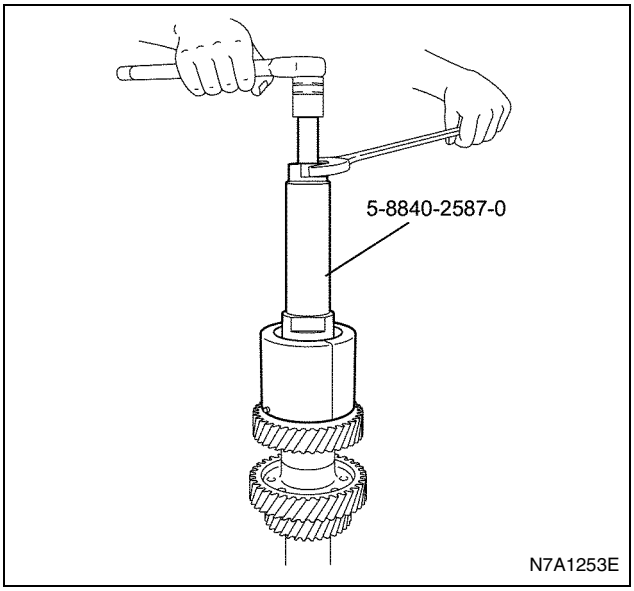
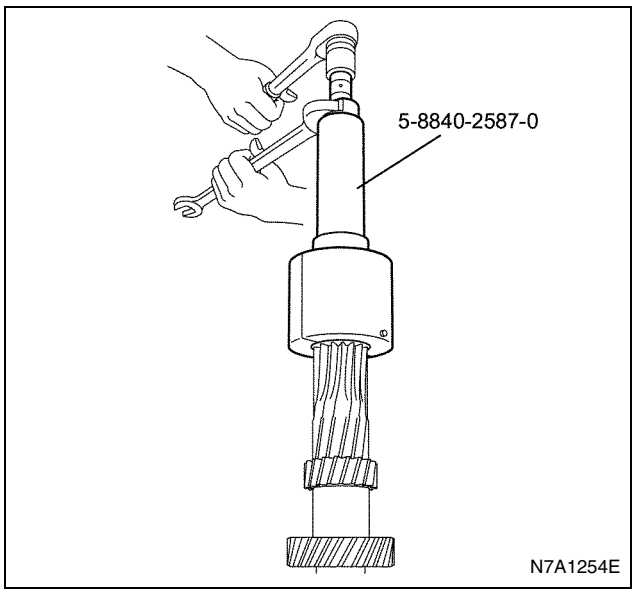
Disassembly

1. Use snap ring pliers to remove the snap ring that fixes the bearing.
2. Use a bearing remover (5-8840-2587-0) to remove the counter front bearing.
   - Use a 303173 bearing remover insert and 44802 collet.



3. Use a bearing remover (5-8840-2587-0) to remove the counter rear bearing.
   - Use a 303173 bearing remover insert and 44802 collet.



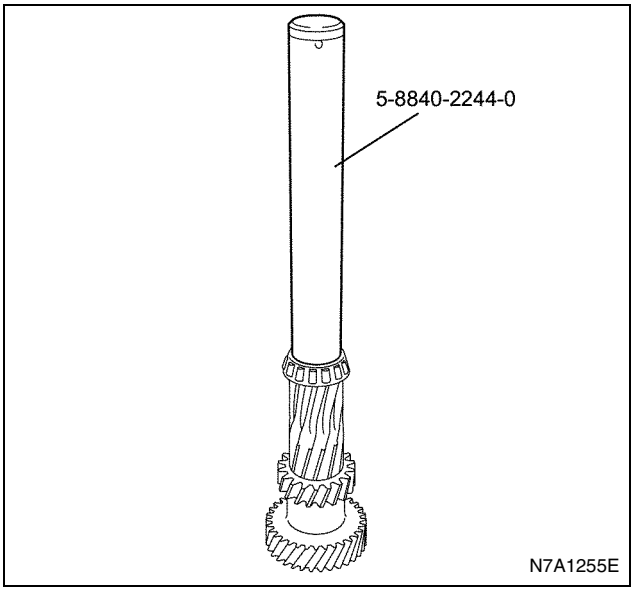
Inspect each disassembled part. Replace or repair as required if anything is worn or damaged or if any other defect is discovered.

4. Inspect each gear profile for damage and wear. If any abnormality is detected, replace the applicable gear.
5. Inspect each of the bearings for the following characteristics. If any abnormality is detected, replace the applicable bearing.
   - Smoothness of rotation
   - Noise
   - Damage, rust, or other visible abnormality

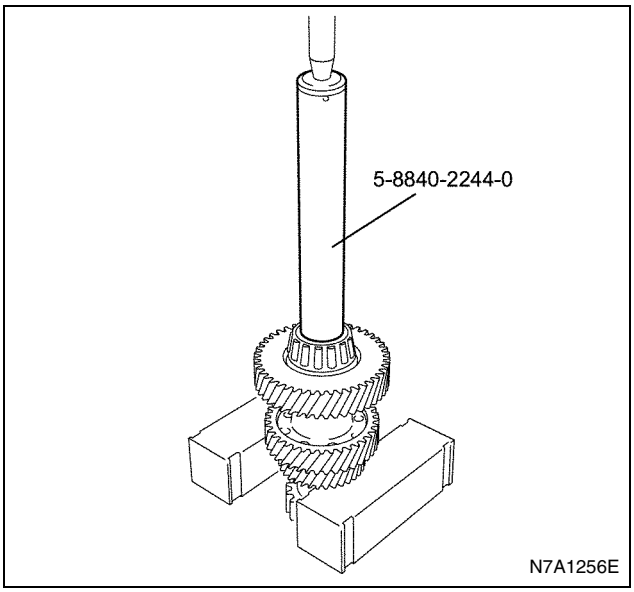
- Abnormal play in the thrust direction

Assembly

1. Use an installer (5-8840-2244-0) to press fit the counter rear bearing with a press.



2. Use an installer (5-8840-2244-0) to press fit the counter front bearing with a press.



3. Use snap ring pliers to install the snap ring that fixes the bearing.
   - Select the thickest snap ring from among the three types that can be installed.

Thickness (mm)	Color Code
1.9	Blue
2.1	Yellow
2.3	Pink

Caution:
If the snap ring is deformed or damaged, replace it with a new one and check to make sure it is installed securely.

Disassembly

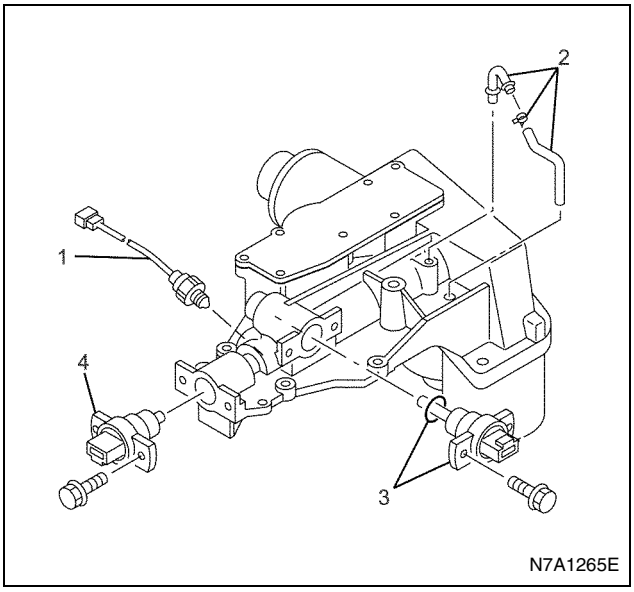
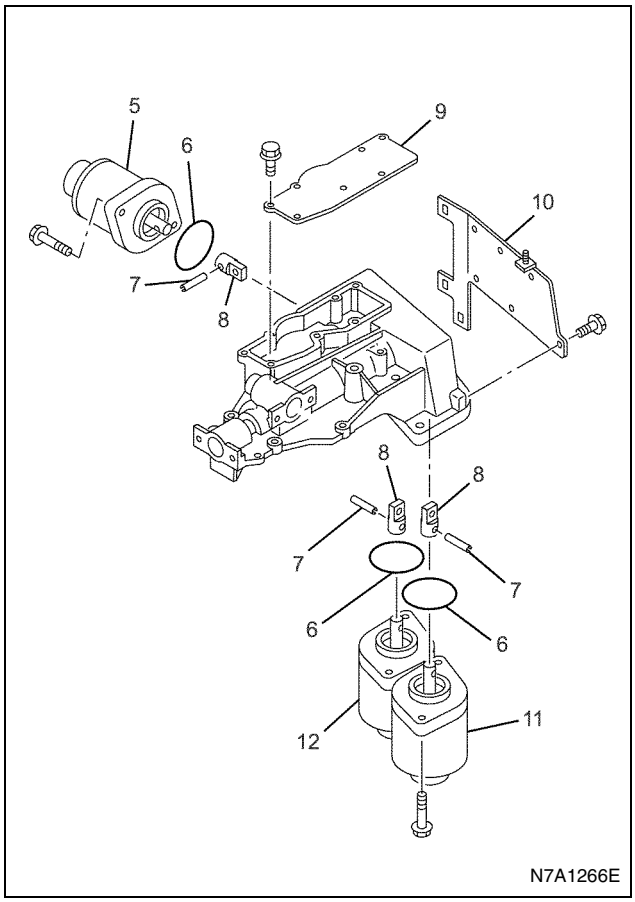
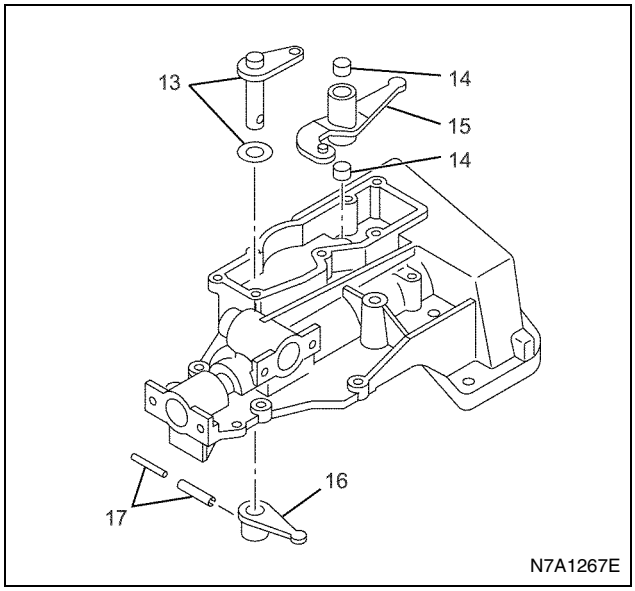
1. Remove the neutral switch (1), the breather pipe, breather hose and clip (2), the gear select position sensor and O-ring (3), and the gear shift position sensor (4).



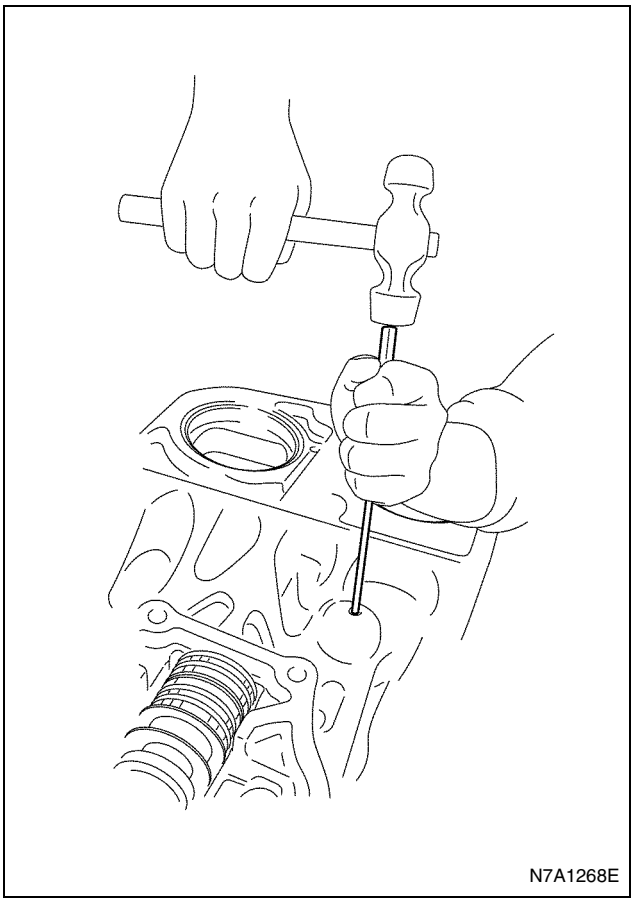
2. Remove the plate (10).
   a. Remove the select solenoid, 2-4-6-R shift solenoid, and 1-3-5 shift solenoid connectors from the plate.
   b. Remove the plate from the gearshift control box.
3. Remove 2-4-6-R shift solenoid (11) and 1-3-5 shift solenoid (12).
4. Remove the cover (9).
5. Remove the select solenoid (5).
6. Remove 2-4-6-R shift solenoid, 1-3-5 shift solenoid, and select solenoid O-rings (6) and joints (8).
   a. Remove the O-rings from the solenoids.
   b. Use a spring pin remover to remove the spring pins (7), and then remove the joints.



7. Use a spring pin remover to remove the spring pin (17), and then remove the select internal lever (16), and select external lever and washer (13).
8. Remove the relay lever (15).
   - Remove the lever bushing (14) from the relay lever.

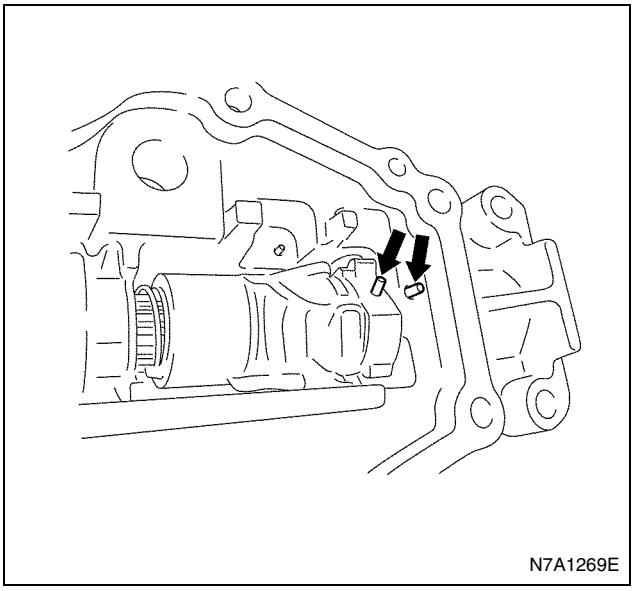


9. Use a spring pin remover to remove the relay lever shaft.



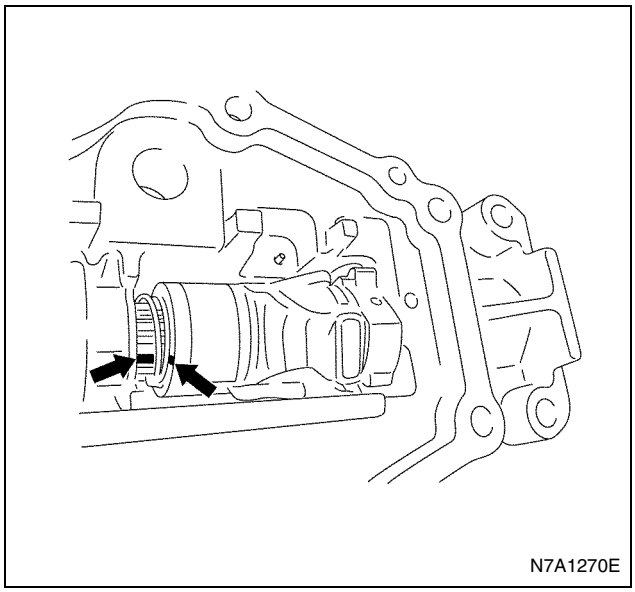
N7A1268E

10. Use pliers to remove the spring pin; stopper ring and spring pin; shift lever shaft.



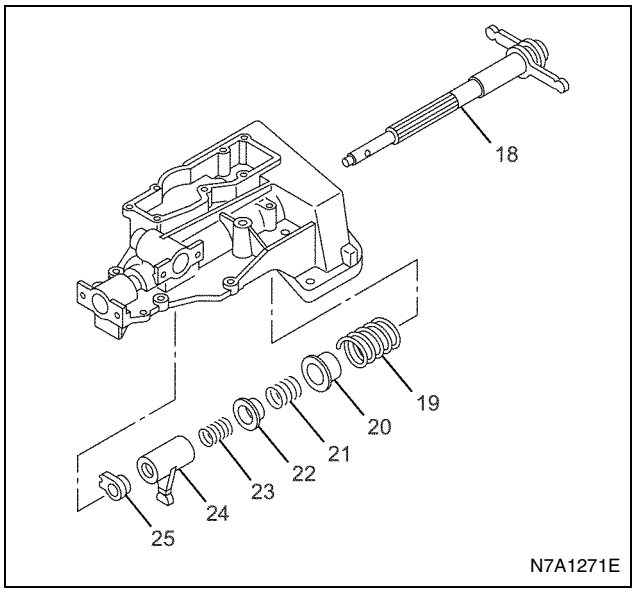
N7A1269E

11. Mark where the shift lever shaft and internal lever align.



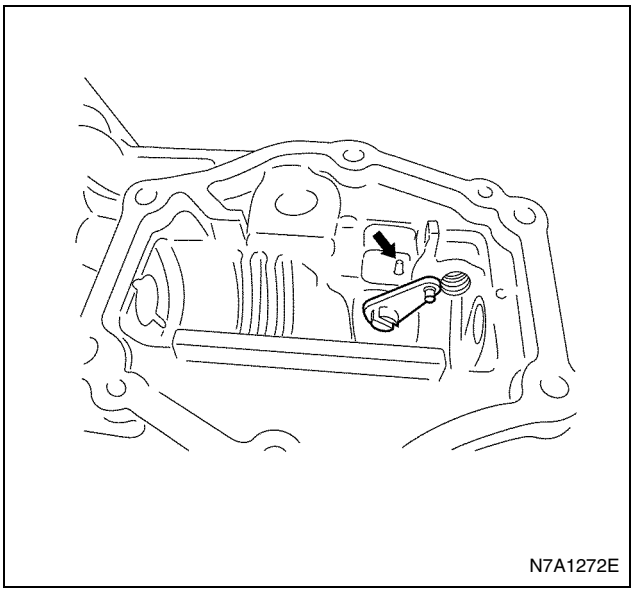
N7A1270E

12. Pull out the shift lever shaft (18), and remove the stopper ring (25), internal lever (24), spring (23), spring seat (22), spring (21), spring seat (20), and spring (19).



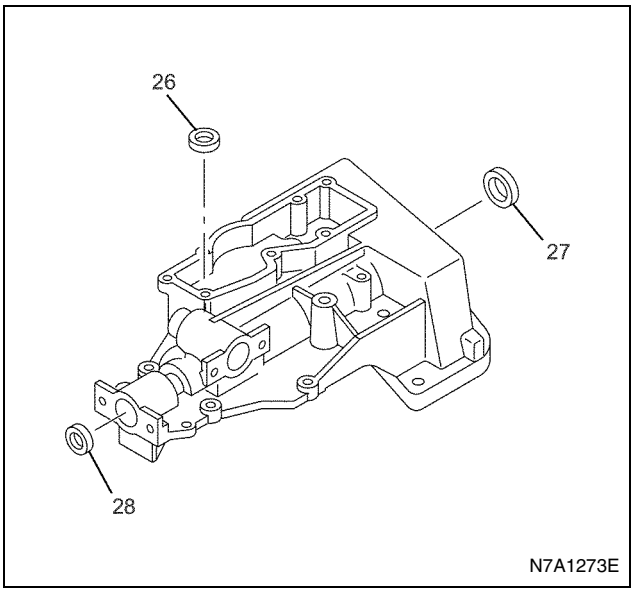
N7A1271E

13. Use pliers to remove the spring pin and select lever.



N7A1272E

14. Remove the select external lever oil seal (26), shift lever shaft oil seal A (27), and shift lever shaft oil seal B (28) from the gearshift control box.

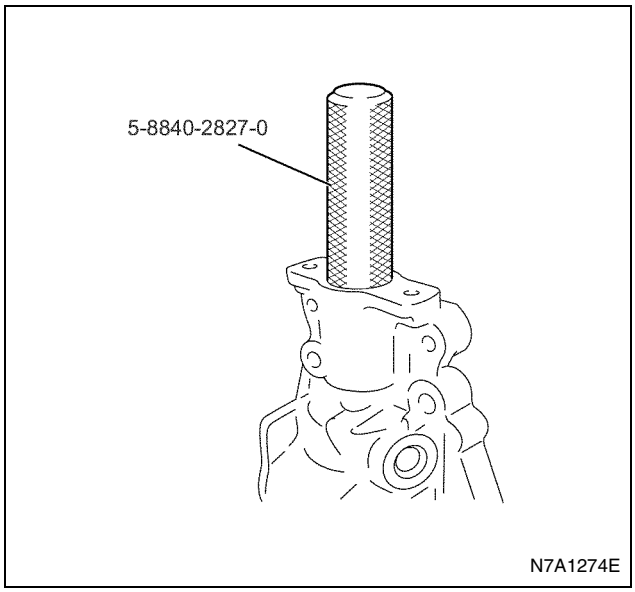


N7A1273E

15. Inspect each disassembled part for wear, damage, or other defects. Replace or repair as required if any abnormality is discovered.
16. Inspect the shift lever shaft for wear, looseness with the control box, and operation for lack of smooth operation. Replace if any abnormality is discovered.
17. Inspect the select solenoid, 2-4-6-R shift solenoid, and 1-3-5 shift solenoid rods to ensure they slide smoothly without sticking. Replace if any abnormality is discovered.

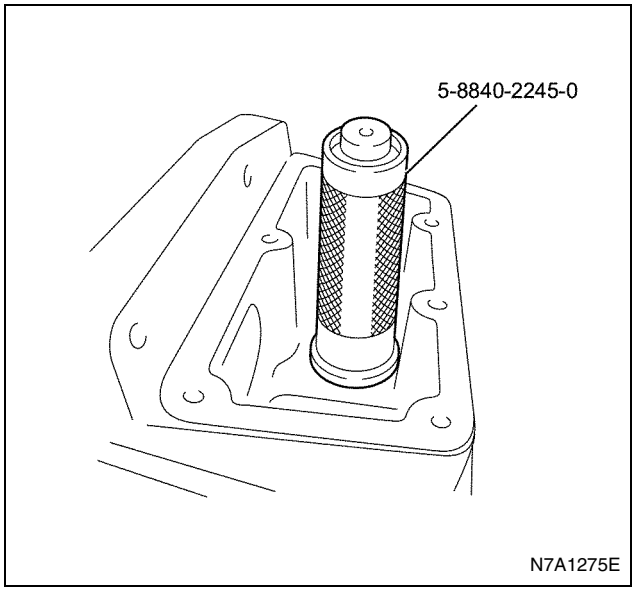
Assembly

1. Use an installer (5-8840-2827-0) to install the shift lever shaft oil seal B on the control box.
   - Coat the outer circumference of the oil seal with engine oil.



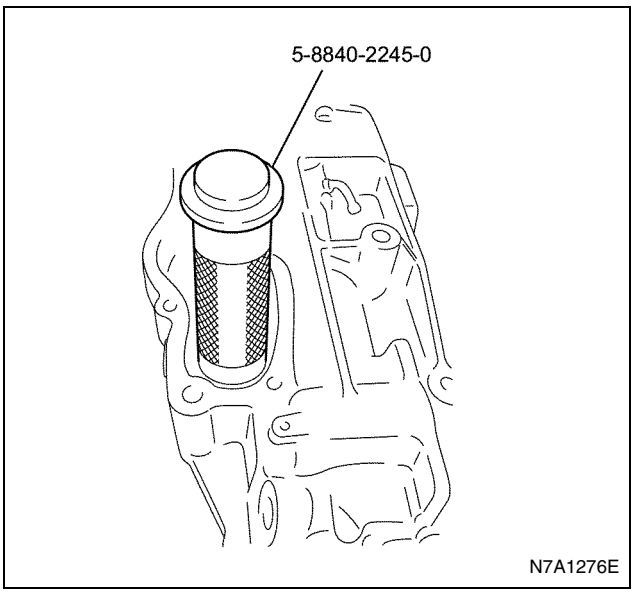
N7A1274E

2. Use an installer (5-8840-2245-0) to install the shift lever shaft oil seal A on the gearshift control box.
   - Coat the outer circumference of the oil seal with engine oil.

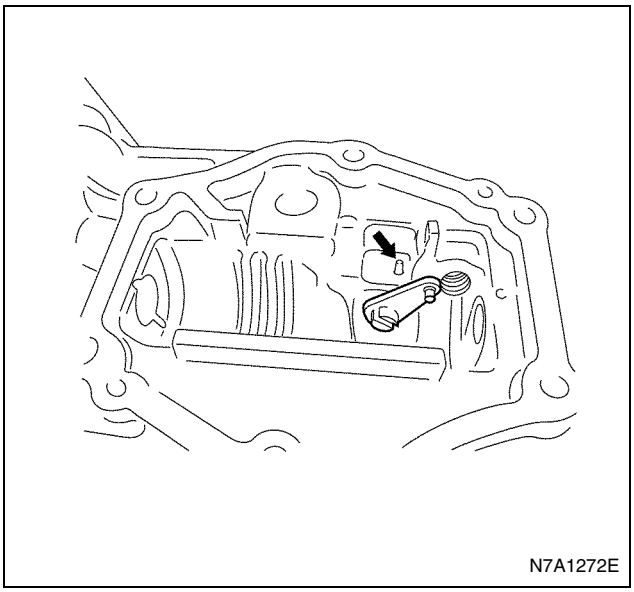


N7A1275E

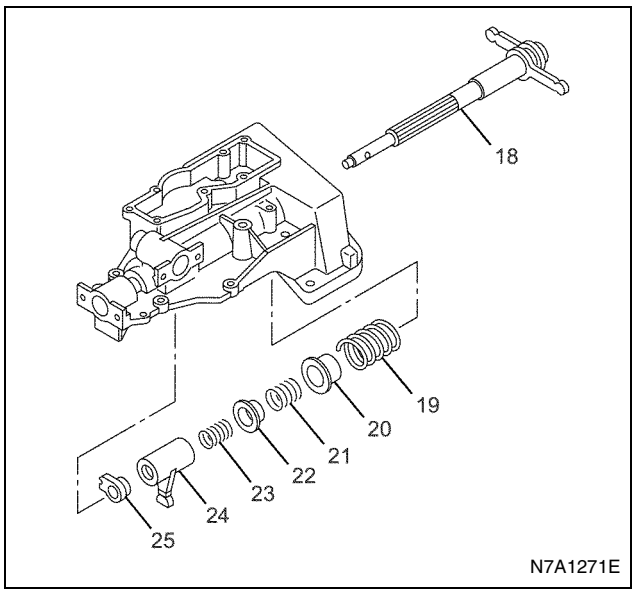
3. Use an installer (5-8840-2245-0) to install the select external lever oil seal on the gearshift control box.
   - Coat the outer circumference of the oil seal with engine oil.

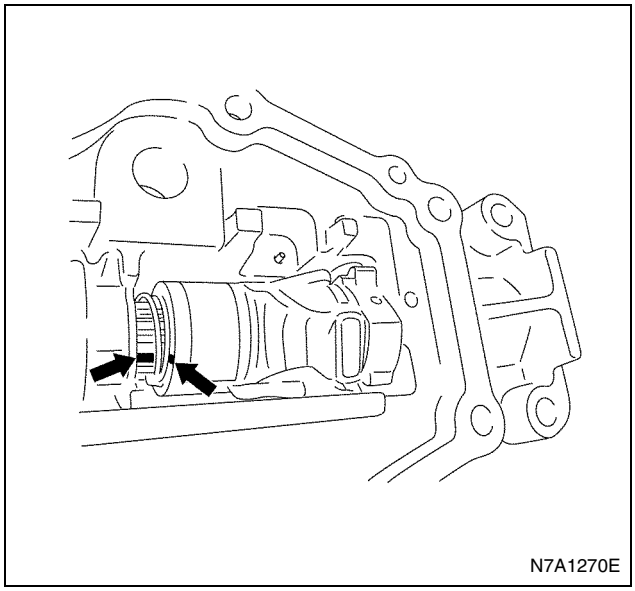


4. Install the select lever, using a hammer to drive a new spring pin.

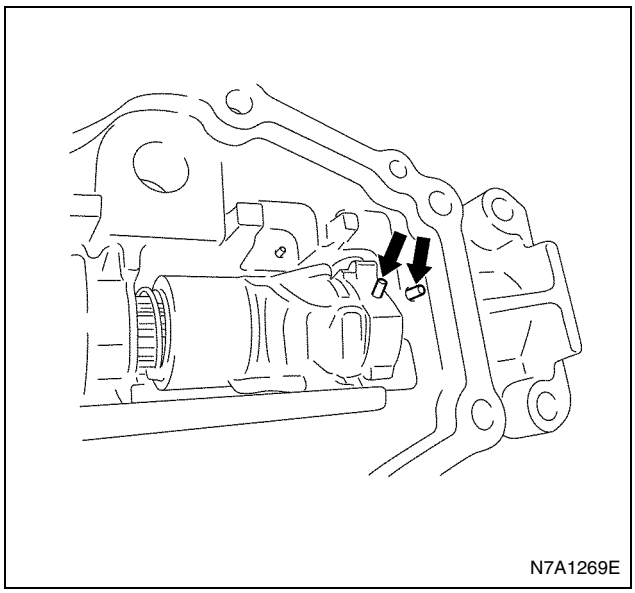


5. Assemble the spring (19), spring seat (20), spring (21), spring seat (22), spring (23), internal lever (24), and stopper ring (25) in the gearshift control box, and insert the shift lever shaft (18) so it is aligned with the internal lever alignment mark.
   - Apply GL-5 oil to the sliding part of the shift lever shaft.

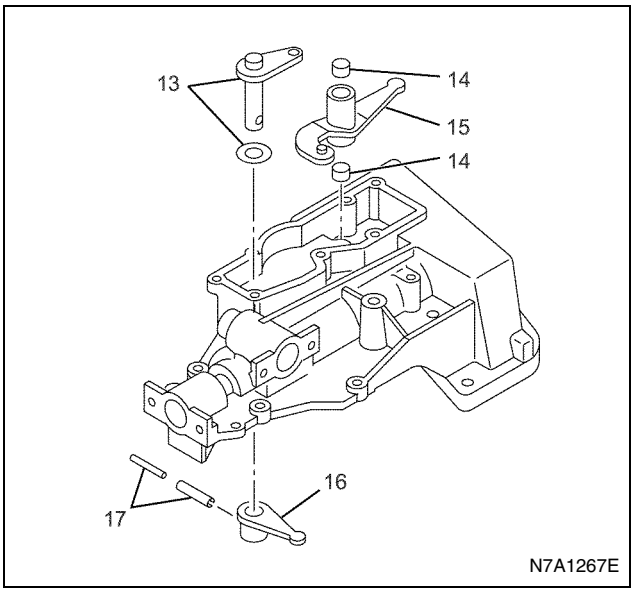




6. Use a hammer to drive a new spring pin; stopper ring and spring pin; shift lever shaft.



7. With the groove of the relay lever shaft facing upwards, use a hammer to drive it into the gearshift control box.
   - Apply Unimax R No. 2 grease or equivalent to the shaft.
8. Install the lever bushing (14) on the relay lever.
9. Insert the relay lever (15) in the shaft.
10. Install the select external lever and washer (13) and select internal lever (16). Use a hammer to drive a new spring pin (17).
    - Apply GL-5 oil to the shaft of the select external lever.
    - Apply Unimax R No. 2 grease or equivalent to the joint of the select external lever and the relay lever.



11. Install the 2-4-6-R shift solenoid, 1-3-5 shift solenoid, select solenoid O-rings (6), and joints (8).
    a. Install the joints, using a hammer to drive new spring pins (7).

Caution:
When driving spring pins, secure the solenoid in order to avoid distortion of the shafts.

    b. Install the O-rings in the solenoids.
12. Install the select solenoid (5).
    - Apply sufficient amount of Unimax R No. 2 grease or equivalent to the joint hole.

Tighten:
44 N·m (4.5 kg·m / 32.5 lb·ft)

13. Apply Three Bond TB1215 to the mating surface of the control box cover, and install the cover (9).

Tighten:
6 N·m (0.6 kg·m / 4.4 lb·ft)

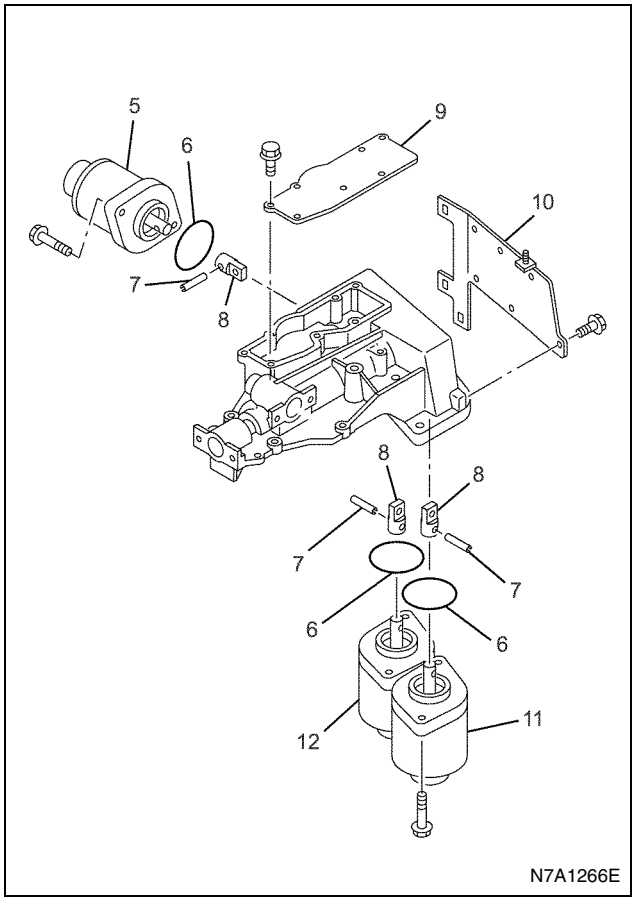
14. Install the 2-4-6-R shift solenoid (11) and 1-3-5 shift solenoid (12).
    - Apply sufficient amount of Unimax R No. 2 grease or equivalent to the joint hole.
    - During installation, check the stud hole position.

Tighten:
44 N·m (4.5 kg·m / 32.5 lb·ft)

15. Install the plate (10).
    a. Apply Three Bond TB1215 to the mating surface of the control box plate, and install the plate.

Tighten:
6 N·m (0.6 kg·m / 4.4 lb·ft)

    b. Install the select solenoid, 2-4-6-R shift solenoid, and 1-3-5 shift solenoid connectors on the plate.



16. Install the gear shift position sensor (4), gear select position sensor, and O-rings (3).
    a. Insert the sensors while aligning the angle of sensor shaft tip with the groove in connection. Rotate the sensor to align with the installation bolt hole.
    b. Secure the sensors with bolts.

Tighten:
6 N·m (0.6 kg·m / 4.4 lb·ft)

Caution:
Take care to install the gear shift position sensor and gear select position sensor correctly.

17. Apply Loctite 262 or Three Bond TB1386, and then install the breather pipe, breather hose, and clip (2).
18. Install the neutral switch (1).
    - Carefully remove any sealant remaining on the threads, and then apply Loctite 242 to the threads.

Tighten:
34 N·m (3.5 kg·m / 25.1 lb·ft)

GENERAL INFORMATION

General Information

The chassis electrical system is of 12-volt specifications with a negative ground polarity.
Wire sizes are appropriate to respective circuits, and classified by color. (The classification of harnesses by color is shown on the circuit diagram for ease of harness identification.)
The wire size is determined by load capacity and the length of wire required.
The vehicle harnesses are: body harness, floor harness, engine harness, frame front harness, frame rear harness, rear body harness, dome light harness, door harness and battery cable.
The harnesses are protected either by tape or corrugated tube, depending on harness location.
The circuit for each system consists of the power source, wire, fuse, relay switch, load parts and ground, all of which are shown on the circuit diagram.
In this manual, each electrical device is classified by system. For major parts shown on the circuit based on the circuit diagram for each system, a summary, diagnosis of troubles, inspection and removal and installation procedures are detailed.

Notes for Working on Electrical Items

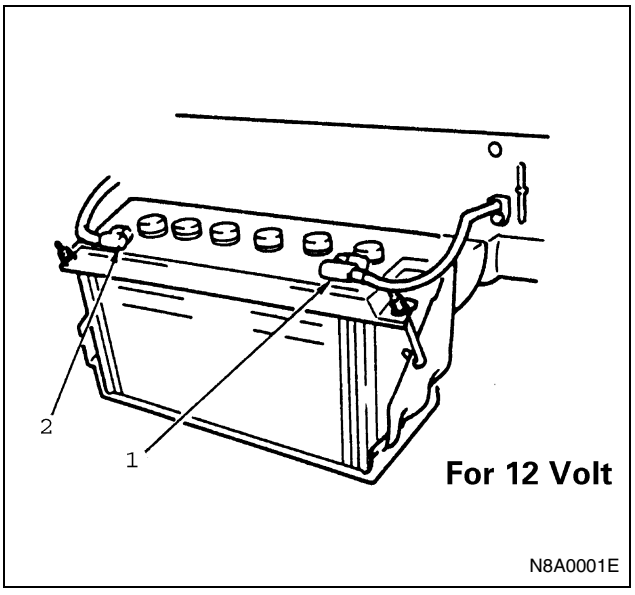
Battery Cable

Disconnecting The Battery Cable

1. All switches should be in the “OFF” position.
2. Disconnect the battery ground cable 1.
3. Disconnect the battery positive cable 2.
4. Disconnect the battery cable 3.

Caution:
It is important that the battery ground cable be disconnected first.

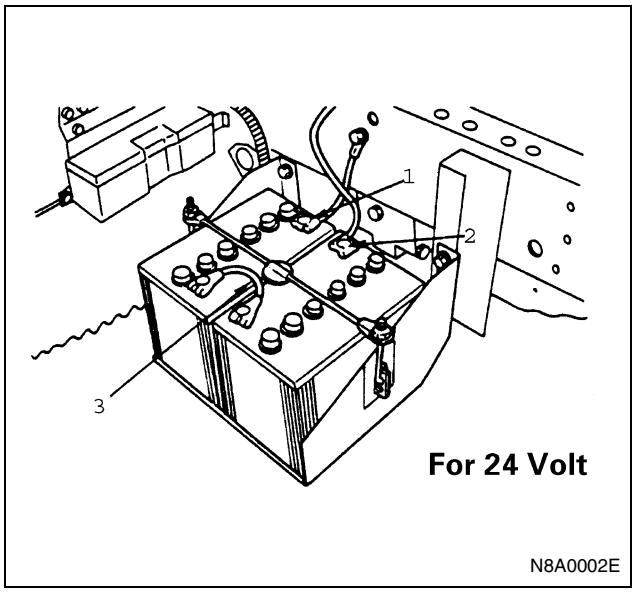
Disconnecting the battery positive cable first can result in a short circuit.



Connecting The Battery Cable

Follow the disconnecting procedure in the reverse order.

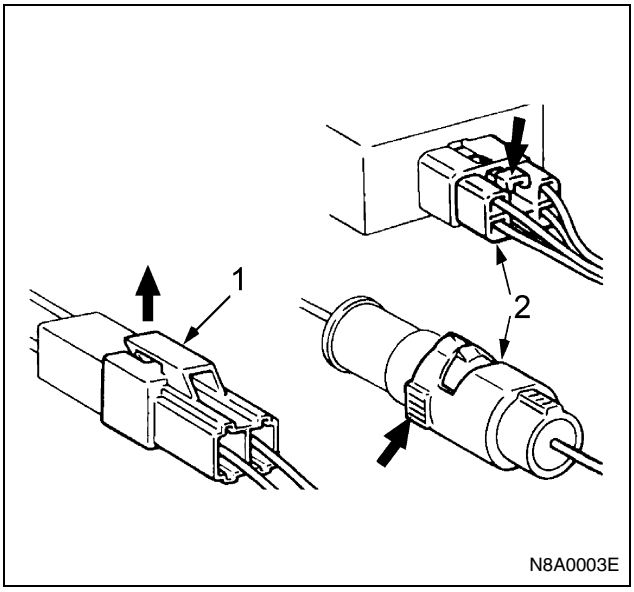
Caution:
Clean the battery terminal and apply a light coat of grease to prevent terminal corrosion.



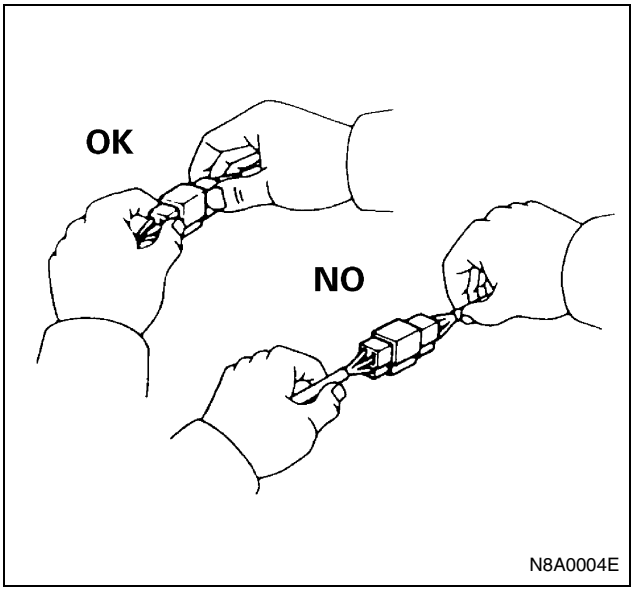
Connector Handling

Disconnecting The Connectors

Some connectors have a tang lock to hold the connectors together during vehicle operation.
Some tang locks are released by pulling them towards you 1.
Other tang locks are released by pressing them forward 2.
Determine which type of tang lock is on the connector being handled.
Firmly grasp both sides (male and female) of the connector.
Release the tang lock and carefully pull the two halves of the connector apart.

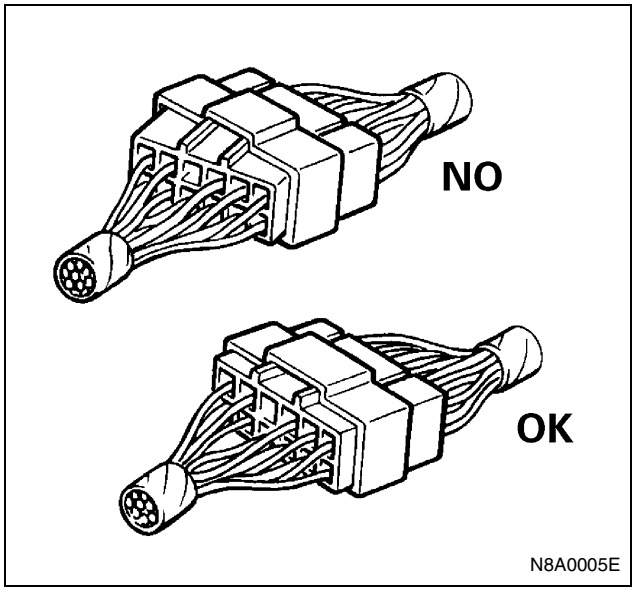


Never pull on the wires to separate the connectors. This will result in wire breakage.



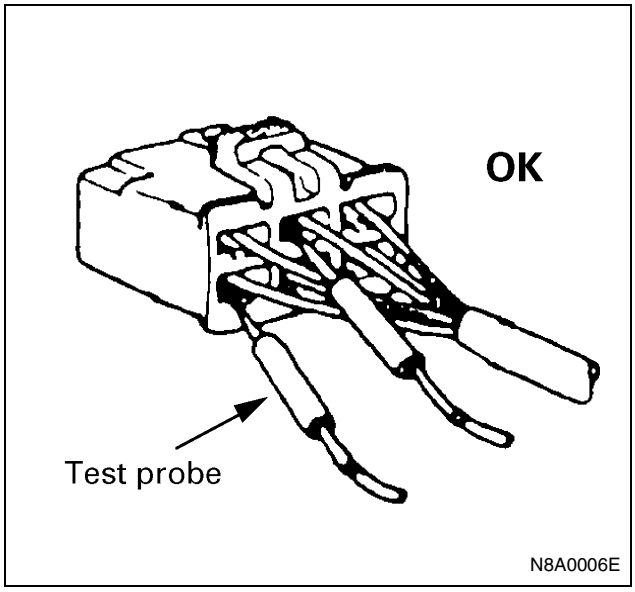
Connecting the Connector

Firmly grasp both sides (male and female) of the connector. Be sure that the connector pins and pin holes match. Be sure that both sides of the connector are aligned with each other. Firmly but carefully push the two sides of the connector together until a distinct click is heard.

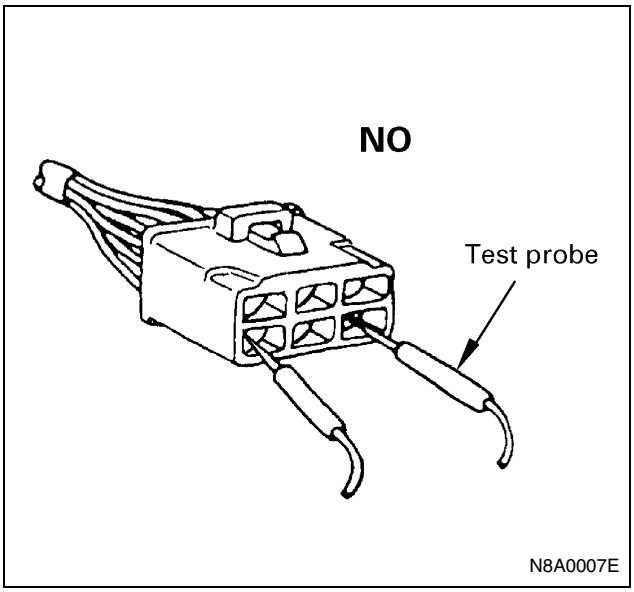


Connector Inspection

Use a circuit tester to check the connector for continuity. Insert the test probes from the connector wire side.

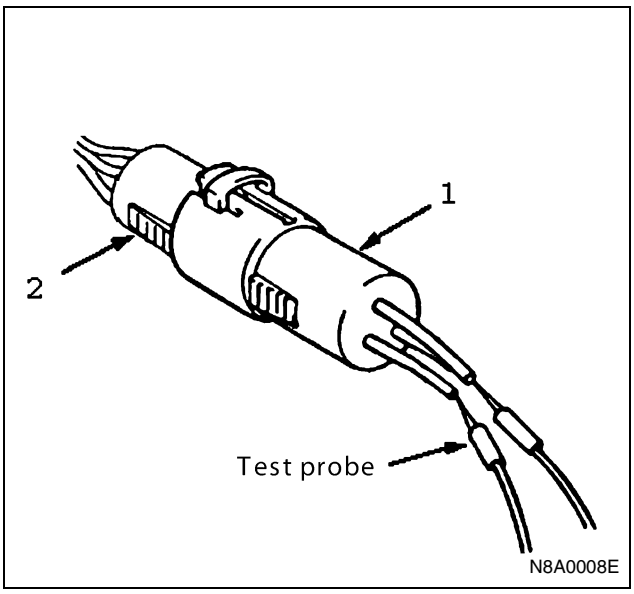


Never insert the circuit tester test probes into the connector open end to test the continuity. Broken or open connector terminals will result.



Waterproof Connector Inspection

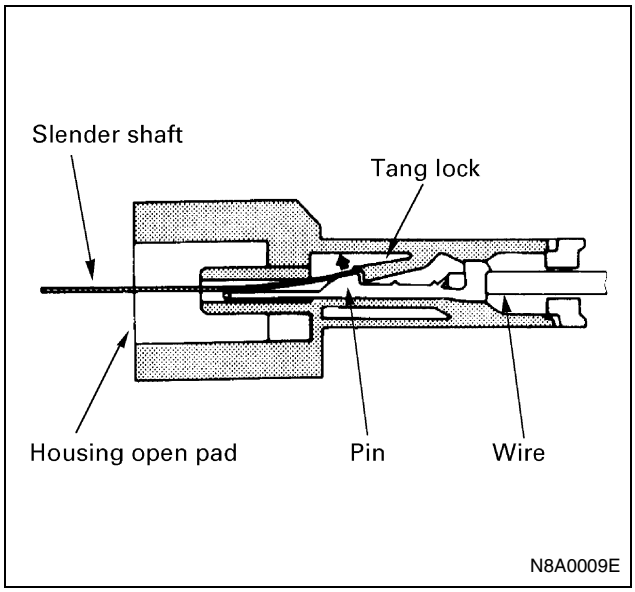
It is not possible to insert the test probes into the connector wire side of a waterproof connector.
Use one side of a connector 1 with its wires cut to make the test. Connect the test connector 2 to the connector to be tested. Connect the test probes to the cut wires to check the connector continuity.



Connector Pin Removal

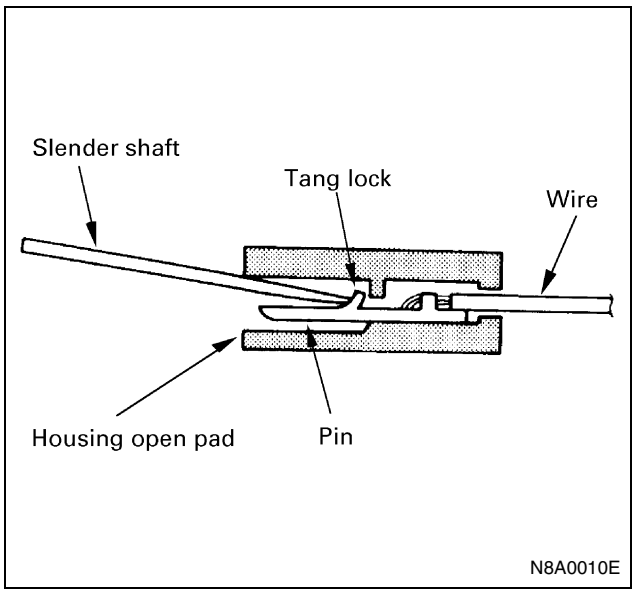
Connector Housing Tang Lock Type

1. Insert a slender shaft into the connector housing open end.
2. Push the tang lock up (in the direction of the arrow in the illustration). Pull the wire with pin free from the wire side of the connector.



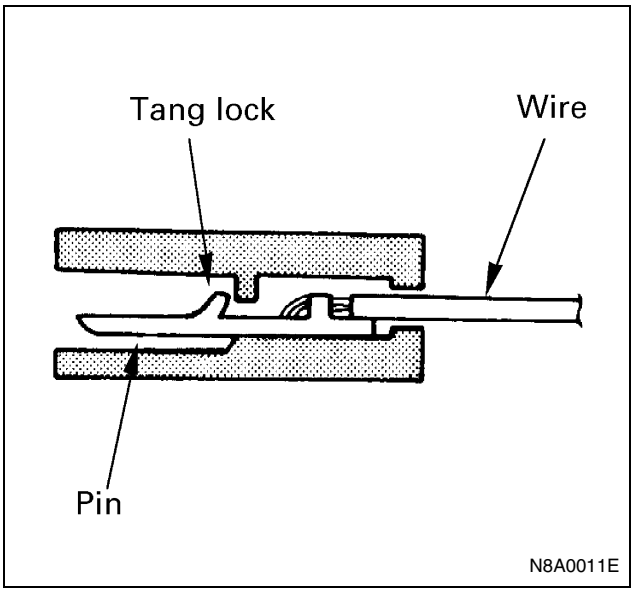
Pin Tang Lock Type

1. Insert a slender shaft into the connector housing open end.
2. Push the tang lock flat (toward the wire side of the connector). Pull the wire with pin free from the wire side of the connector.



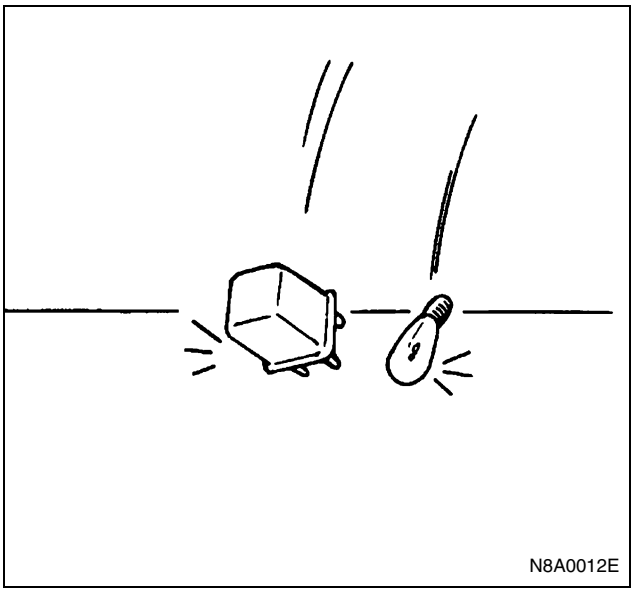
Connector Pin Insertion

1. Check that the tang lock is fully up.
2. Insert the pin from the connector wire side. Push the pin in until the tang lock closes firmly.
3. Gently pull on the wires to make sure that the connector pin is firmly set in place.



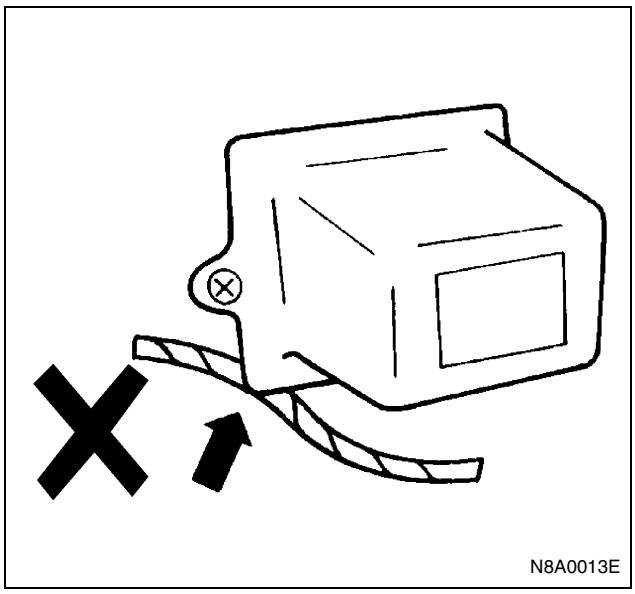
Parts Handling

Be careful when handling electrical parts. They should not be dropped or thrown, because short circuit or other damage may result.

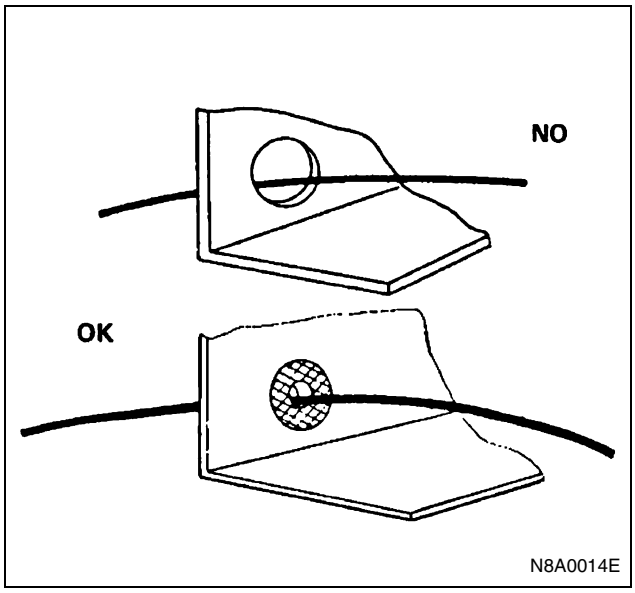


Cable Harness

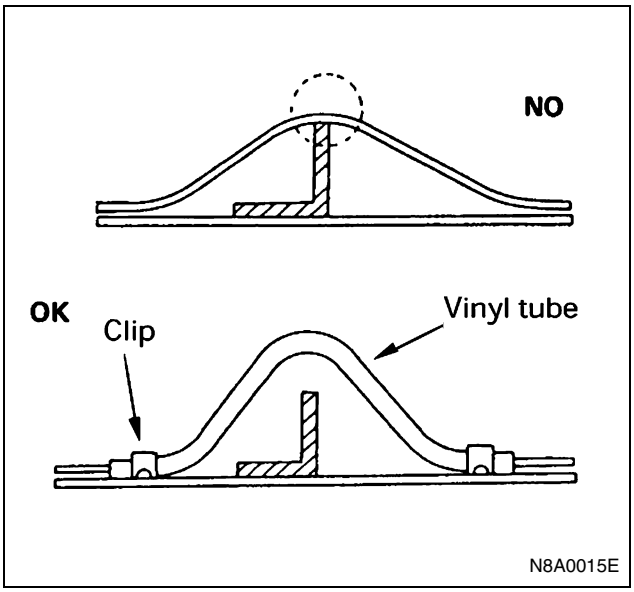
When installing the parts, be careful not to pinch or wedge the wiring harness.
All electrical connections must be kept clean and tight.



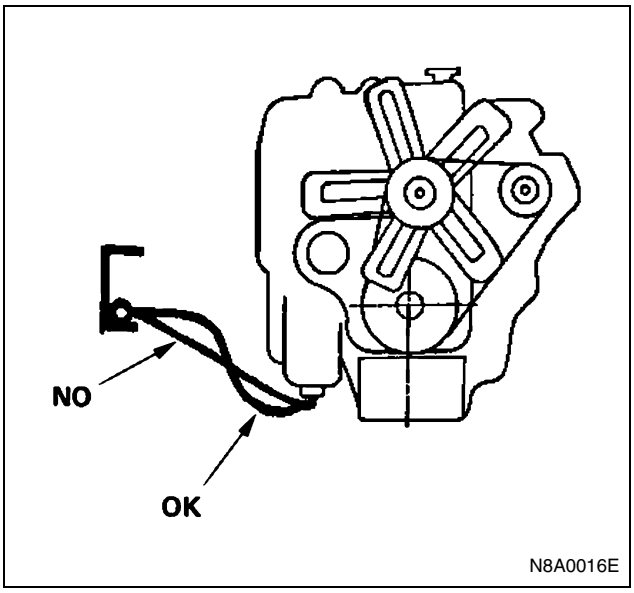
Use a grommet or guard tube to protect the wiring harness from contacting a sharp edge or surface.



Position the wiring harness with a enough clearance from the other parts and guard the wiring harness with a vinyl tube and clips to avoid direct contact.

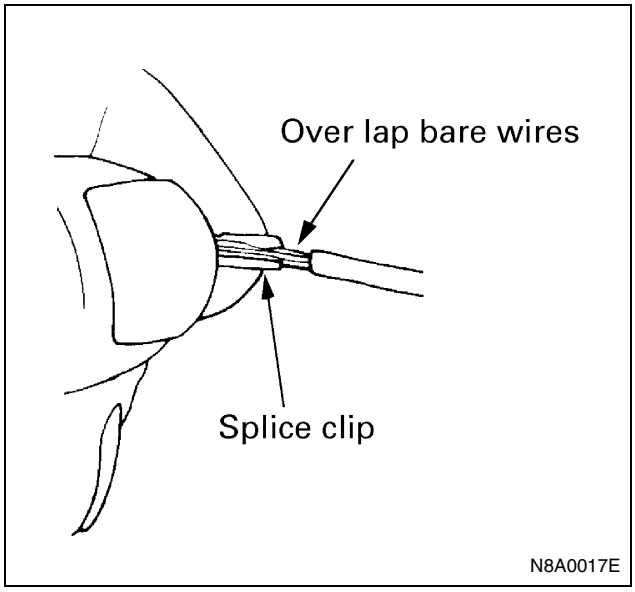


The wiring harness between engine and chassis should be long enough to prevent chafing or damage due to various vibrations.

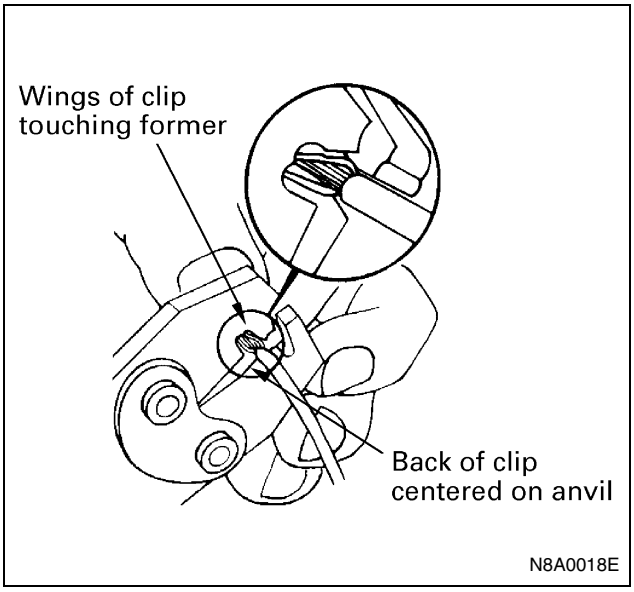


Splicing Wire

1. Open the Harness
   If the harness is taped, remove the tape. To avoid wire insulation damage, use a sewing “seam ripper” (available from sewing supply stores) to cut open the harness.
   If the harness has a block plastic conduit, simply pull out the desired wire.
2. Cut the wire
   Begin by cutting as little wire off the harness as possible. You may need the extra length of wire later if you decide to cut more wire off to change the location of a splice. You may have to adjust splice locations to make certain that each splice is at least 1-2/2″ (40 mm) away from other splices, harness branches, or connectors.
3. Strip the insulation
   When replacing a wire, use a wire of the same size as the original wire. Check the stripped wire for nicks or cut stands. If the wire is damaged, repeat the procedure on a new section of wire. The two stripped wire ends should be equal in length.
4. Crimp the Wires
   Select the proper clip to secure the splice. To determine the proper clip size for the wire being spliced, follow the directions included with your clips.
   Select the correct anvil on the crimper. (On most crimpers your choice is limited to either a small or large anvil.) Overlap the two stripped wire ends and hold them between your thumb and forefinger.
   Then, center the splice clip under the stripped wires and hold it in place.



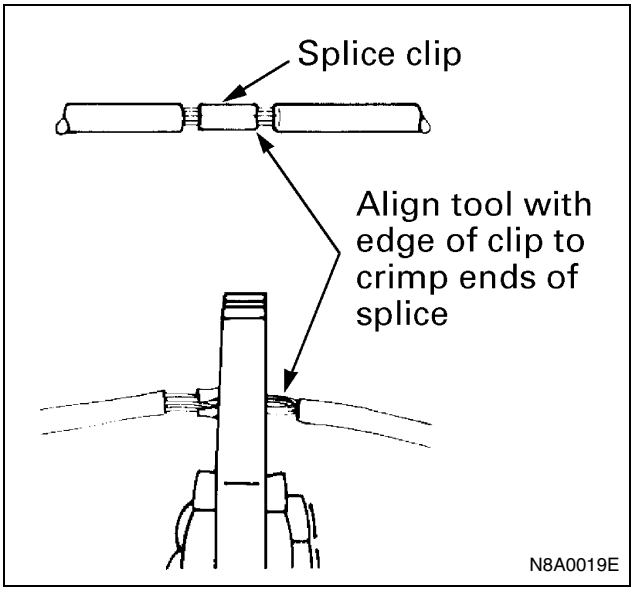
- Open the crimping tool to its full width and rest one handle on a firm flat surface.
- Center the back of the splice clip on the proper anvil and close the crimping tool to the point where the back of the splice clip touches the wings of the clip.
- Make sure that the clip and wires are still in the correct position. Then, apply steady pressure until the crimping tool closes.



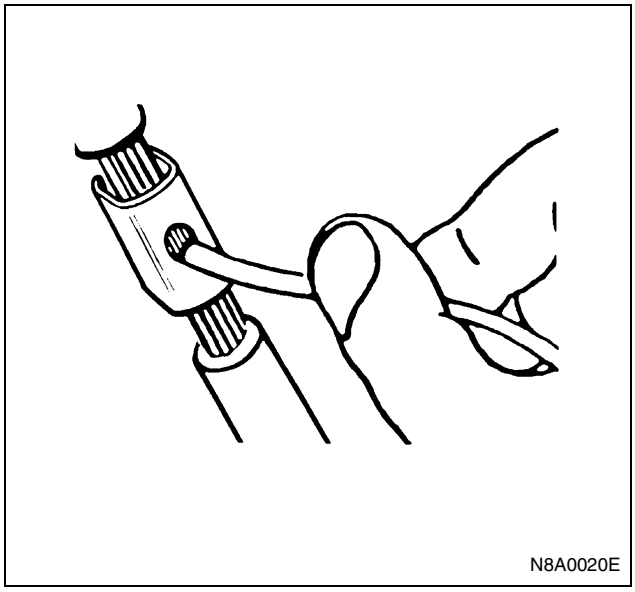
Before crimping the ends of the clip, be sure that:

- The wires extend beyond the clip in each direction.
- No strands of wire are cut loose, and
- No insulation is caught under the clip.

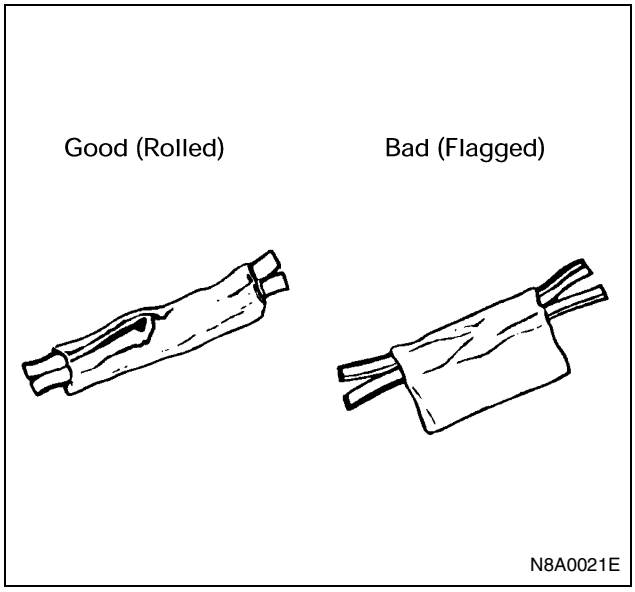
Crimp the splice again, once on each end. Do not let the crimping tool extend beyond the edge of the clip or you may damage or nick the wires.



5. Solder
   Apply 60/40 rosin core solder to the opening in the back of the clip. Follow the manufacturer's instructions for the solder equipment you are using.



6. Tape the Splice
   Center and roll the splicing tape. The tape should cover the entire splice. Roll on enough tape to duplicate the thickness of the insulation on the existing wires. Do not flag the tape. Flagged tape may not provide enough insulation, and the flagged ends will tangle with the other wires in the harness.



If the wire does not belong in a conduit or other harness covering, tape the wire again. Use a winding motion to cover the first piece of tape.

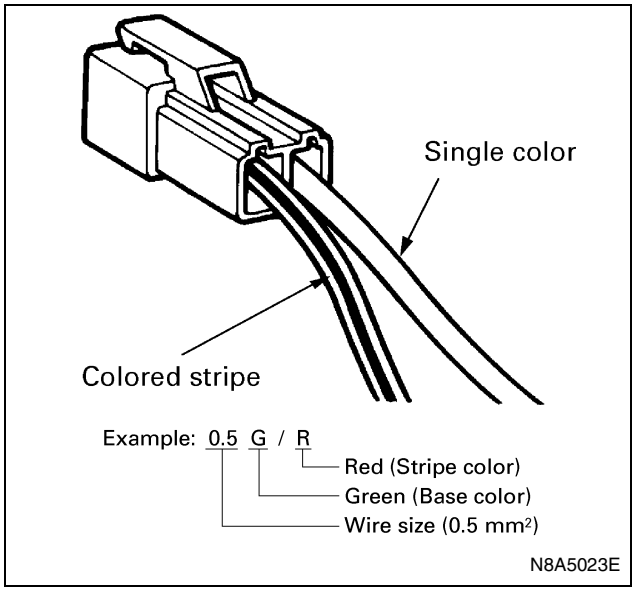
Parts for Electrical Circuit

Wiring

Wire Color

All wires have color-coded insulation.
Wires belonging to a system's main harness will have a single color. Wires belonging to a system's subcircuits will have a colored stripe. Striped wires use the following code to show wire size and colors.



Abbreviations are used to indicate wire color within a circuit diagram.
Refer to the following table.

Wire Color Coding

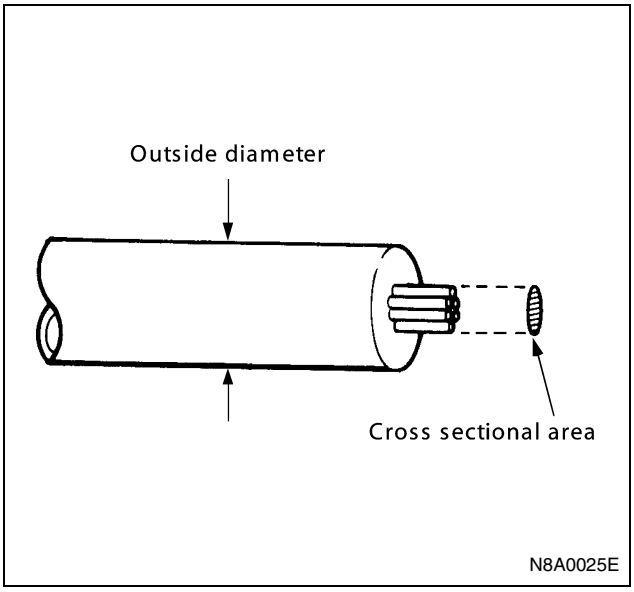
Color-Coding	Meaning	Color-Coding	Meaning
B	Black	BR	Brown
W	White	LG	Light green
R	Red	GR	Grey
G	Green	P	Pink
Y	Yellow	LB	Light blue
L	Blue	V	Violet
O	Orange		

Distinction of Circuit by Wire Base Color

Base color	Circuits	Base color	Circuits
B	Starter circuit	Y	Instrument circuit
W	Charging circuit	L, O, BR, LG, GR, P, LB, V	Other circuit
R	Lighting circuit		
G	Signal circuits		

Wire Size

The size of wire used in a circuit is determined by the amount of current (amperage), the length of the circuit, and the voltage drop allowed. The following wire size and load capacity, shown below, are specified by AWG (American Wire Gauge) (Nominal size means approximate cross sectional area).



Wire Size Table

Nominal size	Cross sectional area (mm^2)	Outside diameter (mm)	Allowable current (A)	AWG size (cross reference)
0.3	0.372	1.8	9	22
0.5	0.563	2.0	12	20
0.85	0.885	2.2	16	18
1.25	1.287	2.5	21	16
2	2.091	2.9	28	14
3	3.296	3.6	37.5	12
5	5.227	4.4	53	10
8	7.952	5.5	67	8
15	13.36	7.0	75	6
20	20.61	8.2	97	4

Fuse, Fusible Link and Circuit Breaker

Fuse

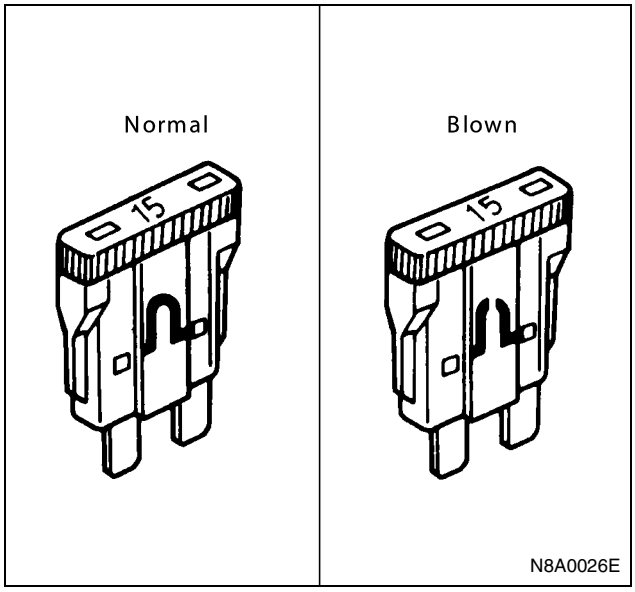
Fuses are the most common form of circuit protection used in vehicle wiring. A fuse is a thin piece of wire or strip of metal encases in a glass or plastic housing. It is wired in series with the circuit it protects. When there is an overload of current in a circuit, such as a short of a ground, the wire or metal strip is designed to burn out and interrupt the flow of current. This prevents a surge of high current from reaching and damaging other components in the circuit.

Determine the cause of the overloaded before replacing the fuse.

The replacement fuse must have the same amperage specifications as the original fuse.

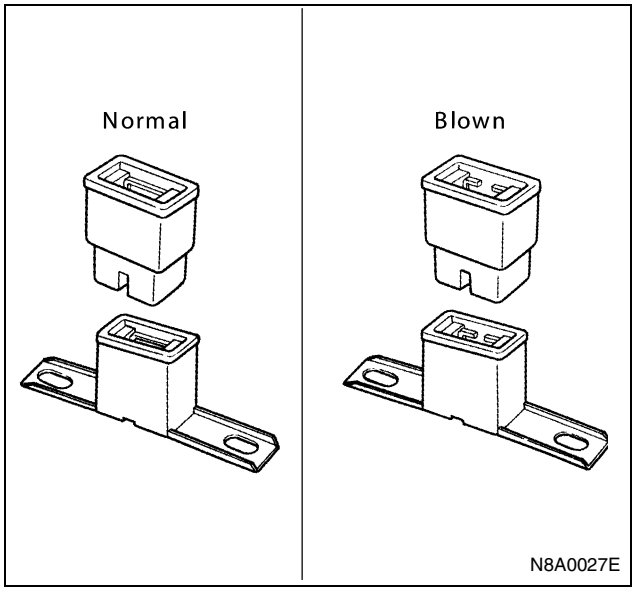
Never replace a blown fuse with a fuse of a different amperage specification.

Doing so can result in an electrical fire or other serious circuit damage. A blown fuse is easily identified.



Fusible Link

The fusible link is primarily used to protect circuits where high amounts of current flow and where is would not be practical to use a fuse. For example, the starter circuit. When a current overload occurs, the fusible link melts open and interrupts the flow of current so as to prevent the rest of the wiring harness from burning.
Determine the cause of the overload before replacing the fusible link. The replacement fusible link must have the same amperage specification as the original fusible link.
Never replace a blown fusible link with fusible link of a different amperage specification. Doing so can result in an electrical fire or other serious circuit damage.
A blown fusible link is easily identified.

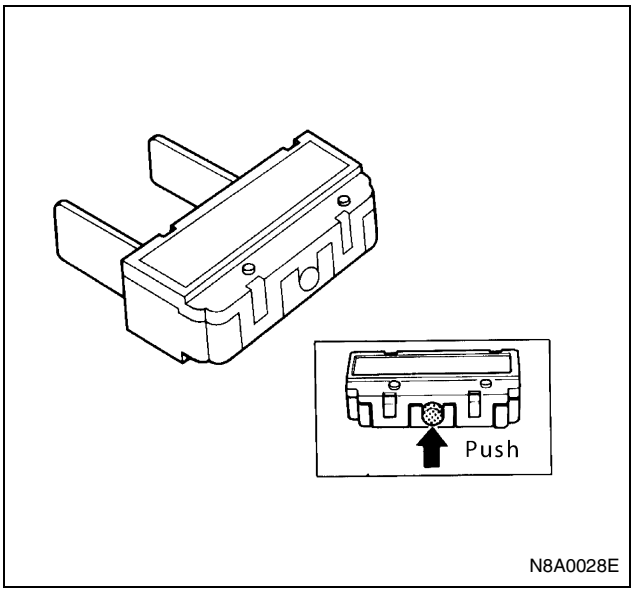


Fusible Link Specifications

Type	Rating	Case Color	Maximum Circuit Current (A)
Connector	30 A	Pink	15
Connector	40 A	Green	20
Bolted	50 A	Red	25
Bolted	60 A	Yellow	30
Bolted	80 A	Black	40

Circuit Breaker

The circuit breaker is a protective device designed to open the circuit when a current load is in excess of rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. The reset knob pops out when the circuit is open. Push the reset knob in place to restore the circuit after repairing it.



Relay

Battery and load location may require that a switch be placed some distance from either component. This means a longer wire and a higher voltage drop 1.
The installation of a relay between the battery and the load reduces the voltage drop 2.
Because the switch controls the relay, amperage through the switch can be reduced.

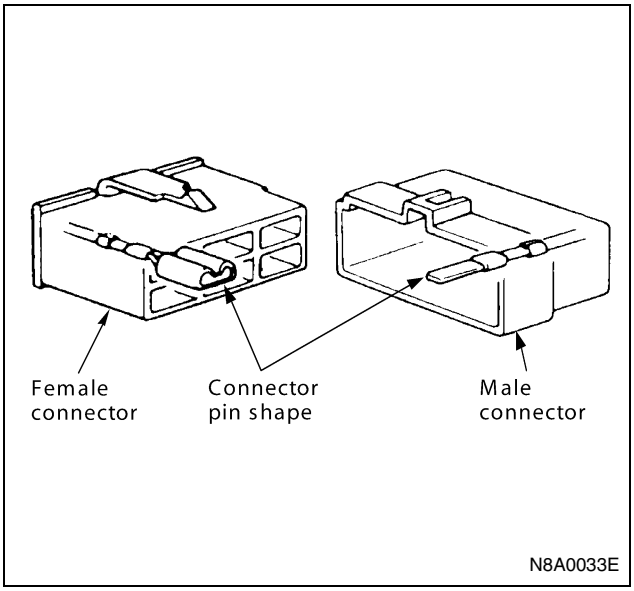
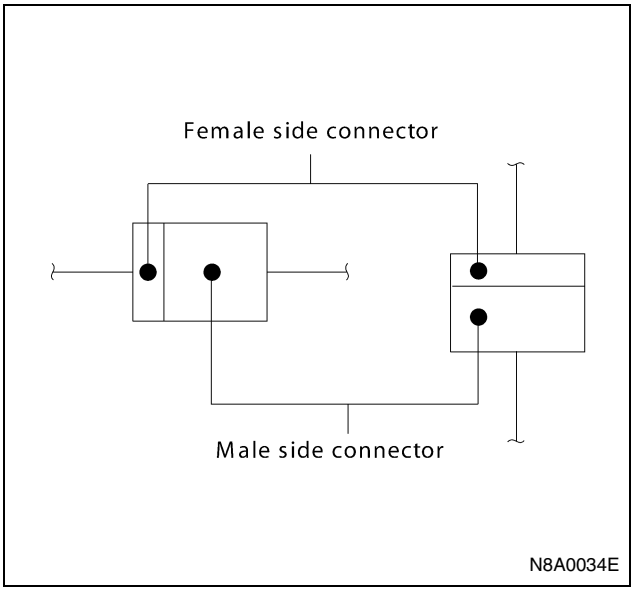
Connector

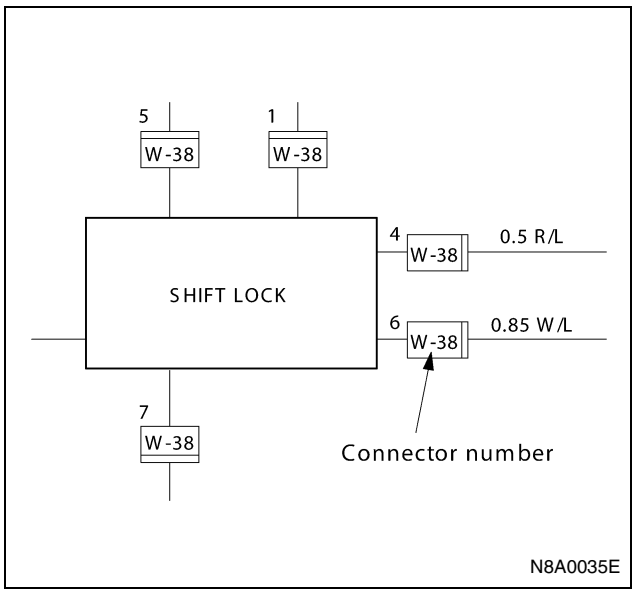
The connector pin shape determines whether the connector is male or female.
The connector housing configuration does not determine whether a connector is male or female.



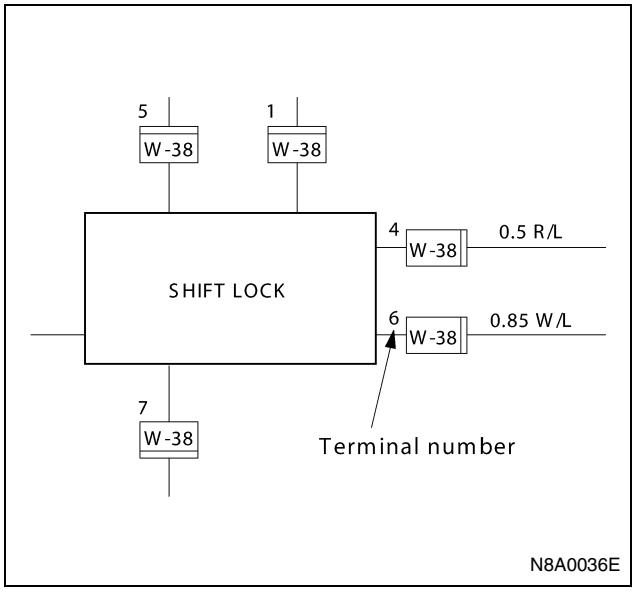
The symbol illustrated in the figure is used as connector, in the circuit of this section.



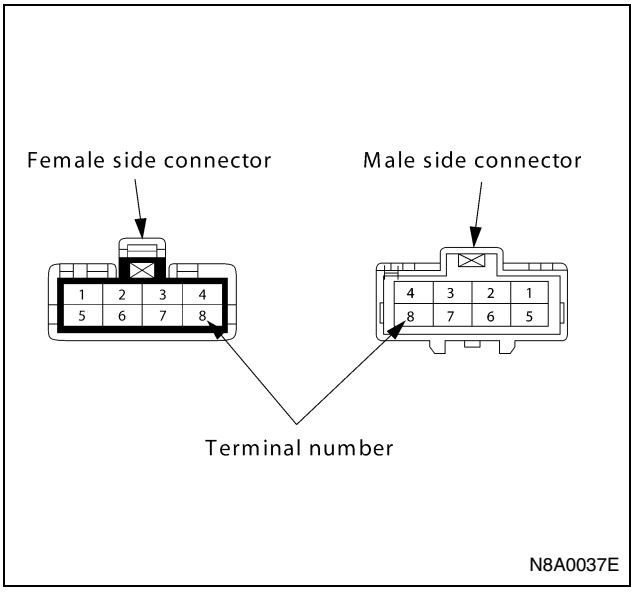
Connector is identified with a number.



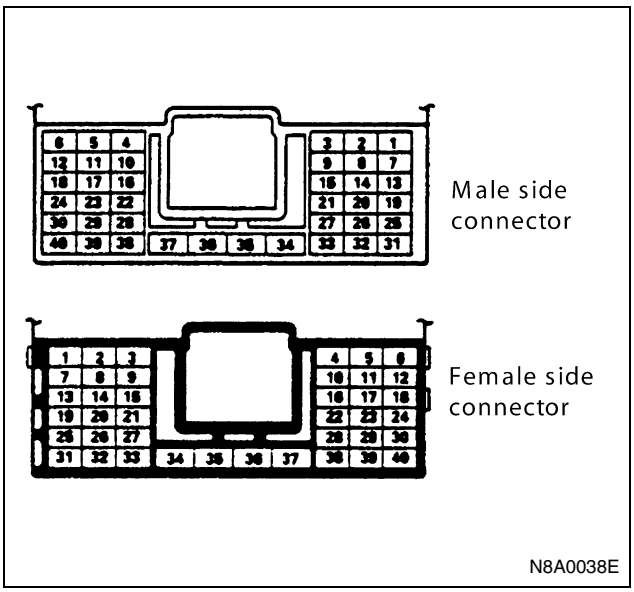
The applicable terminal number is shown for each connector.



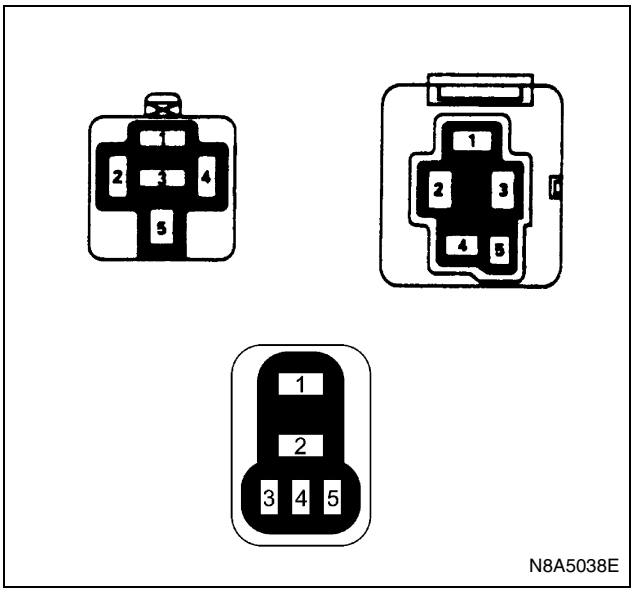
Connector terminal numbers are clearly shown.
Male side connector terminal numbers are in sequence from upper right to lower left.
Female side connector terminal numbers are in sequence from upper left to lower right.



Notice:
For those connectors on which specific terminal numbers or symbols are shown (such as ECM), the terminal numbers or symbols are used in the circuit diagram, irrespective of the above rule.



The connectors used for relays have their own terminal number assignment, irrespective of the above rule.

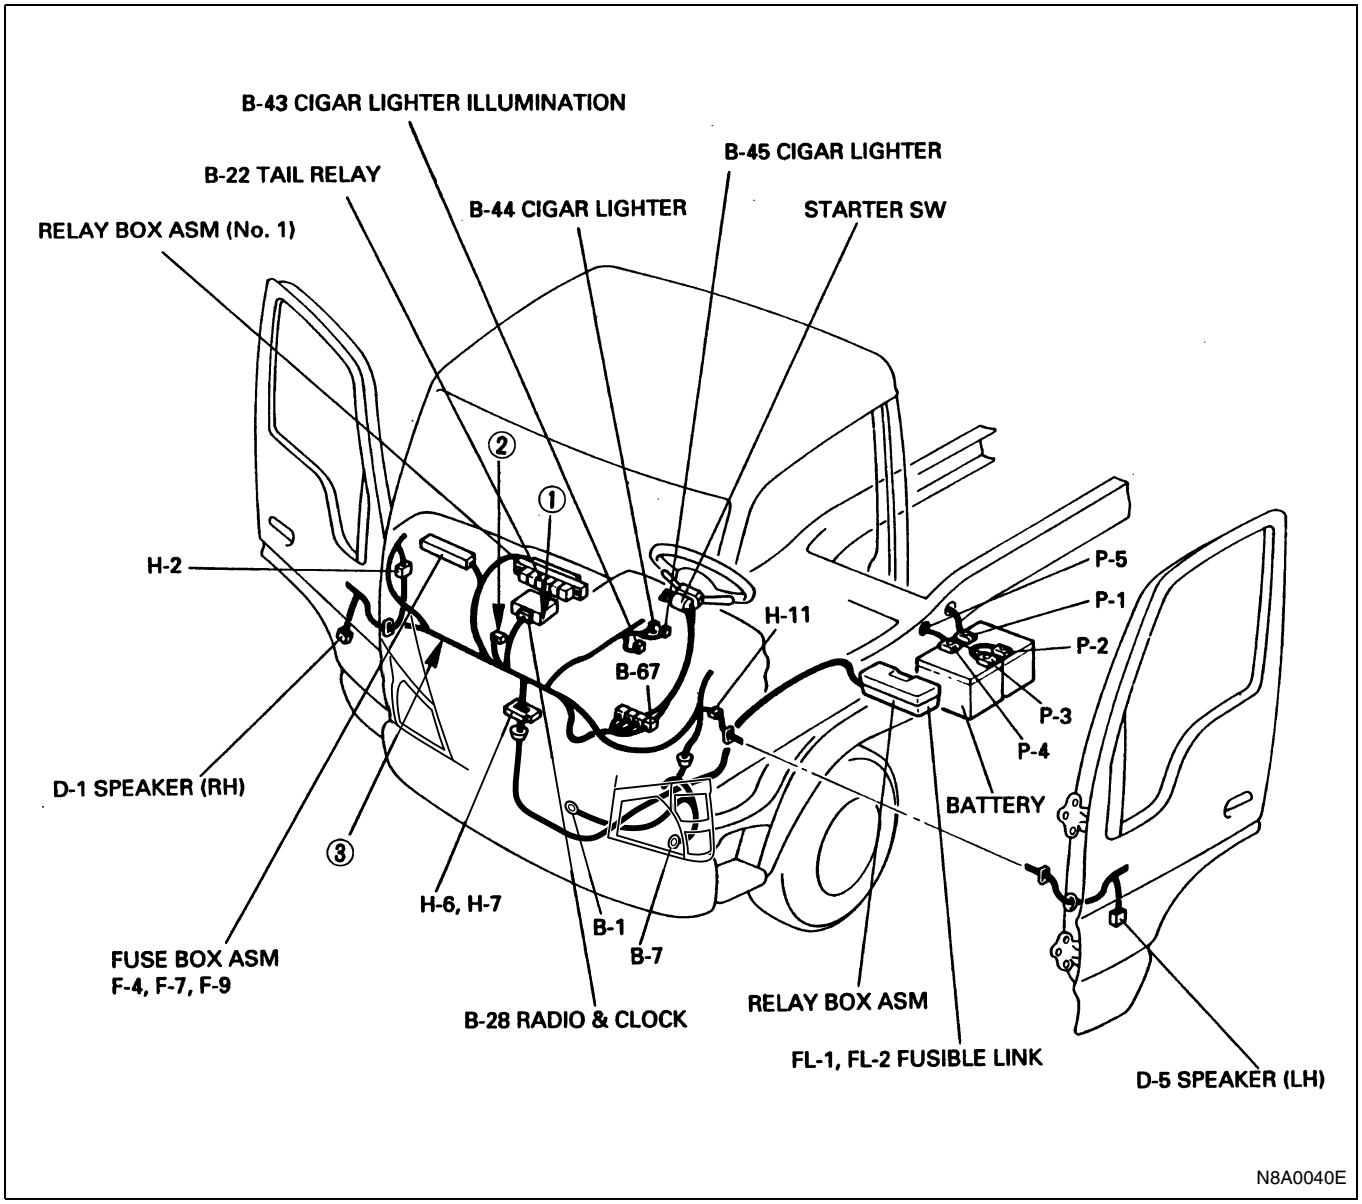


Reading The Circuit Diagram

In this manual, each system has its own parts location illustration, circuit diagram and connector configuration used in the circuit diagram.

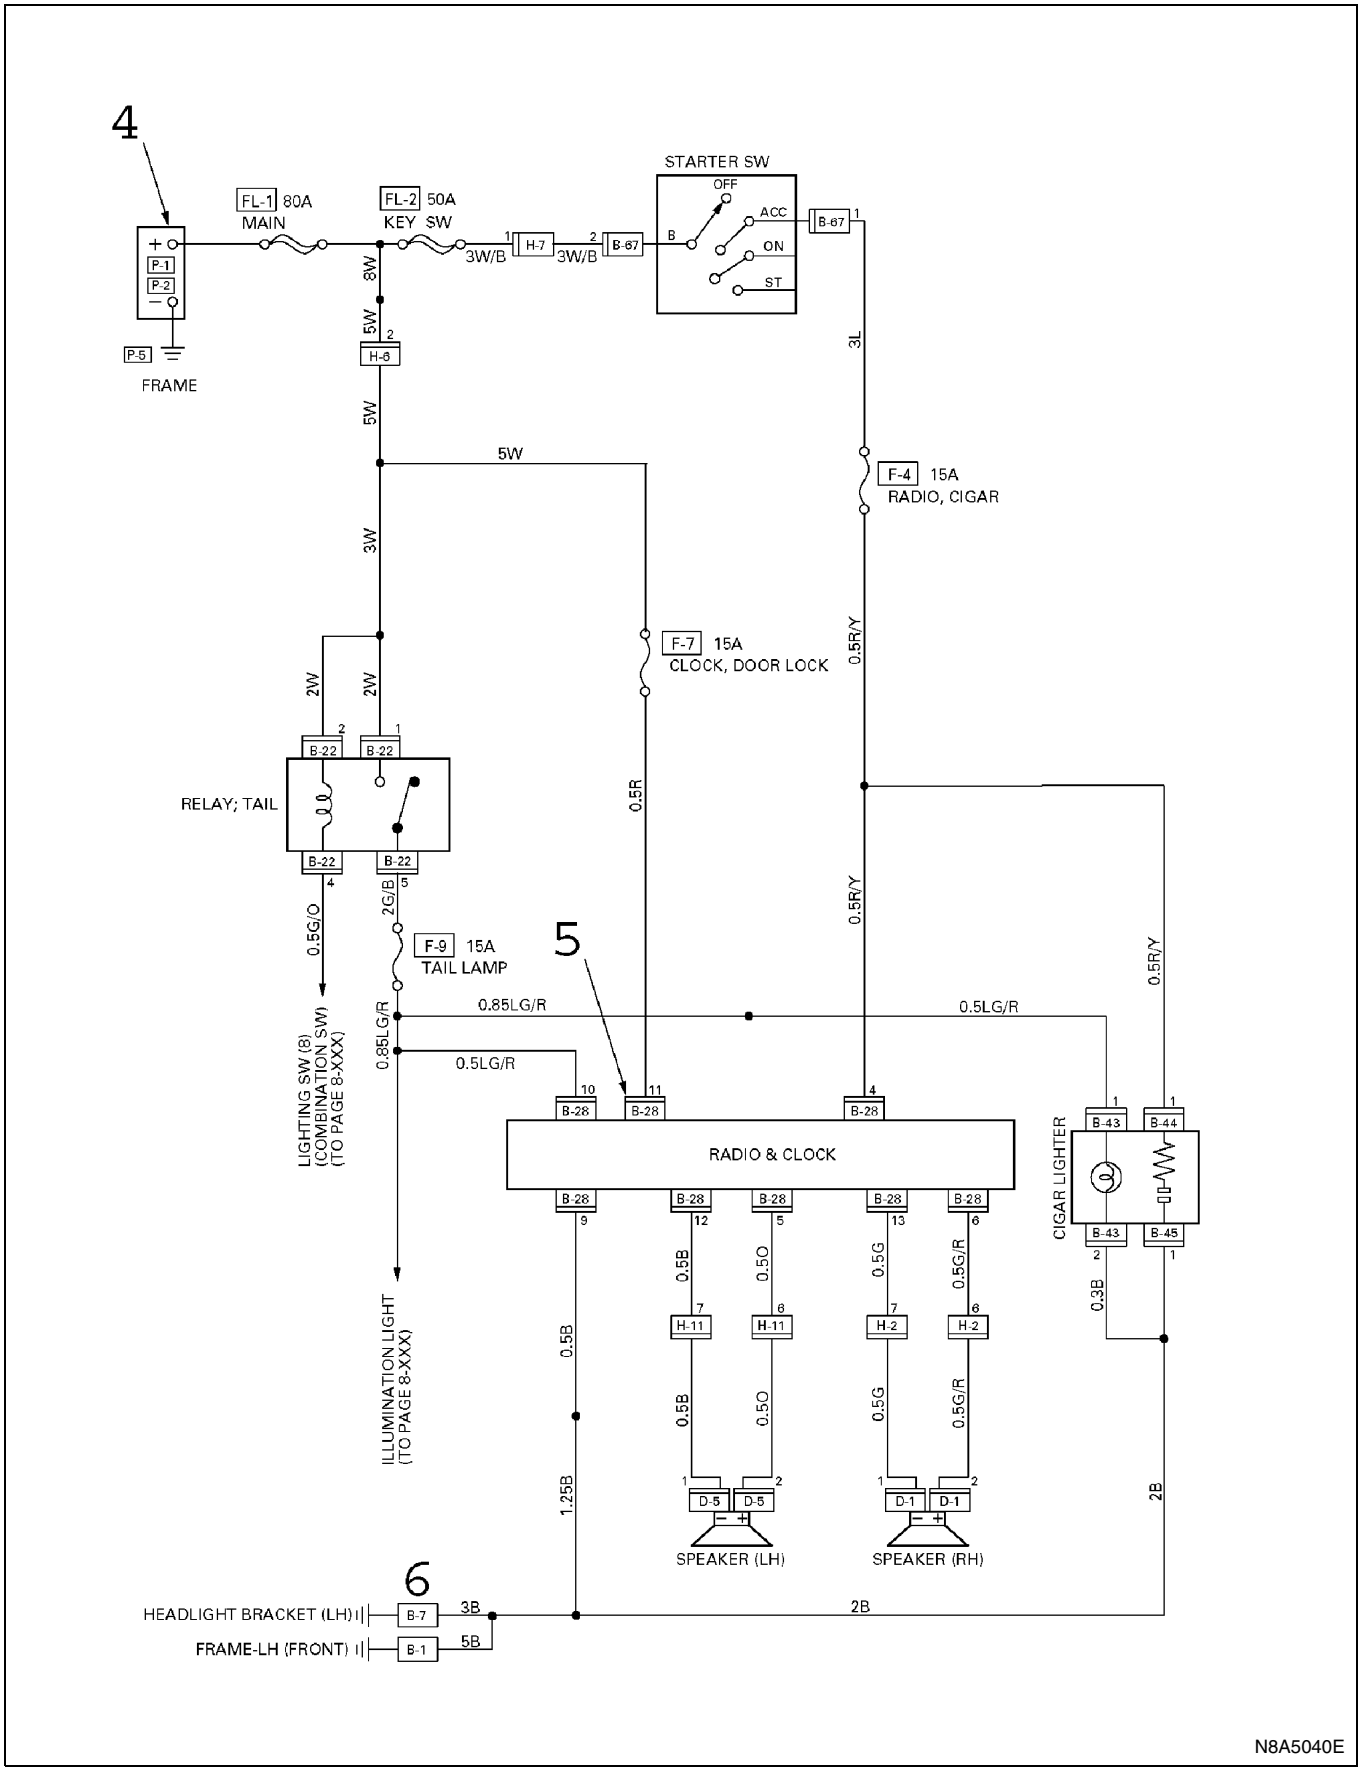
Parts Location

The parts location shows the location of the parts 1 and the connector 2 used in each harness routing 3.



Circuit Diagram

The circuit diagram shows the power supply 4 the load or loads 5 and the grounding point(s) 6.



N8A5040E

Connector List

The connector list shows each connectors' configuration 7 and the pin number 8.

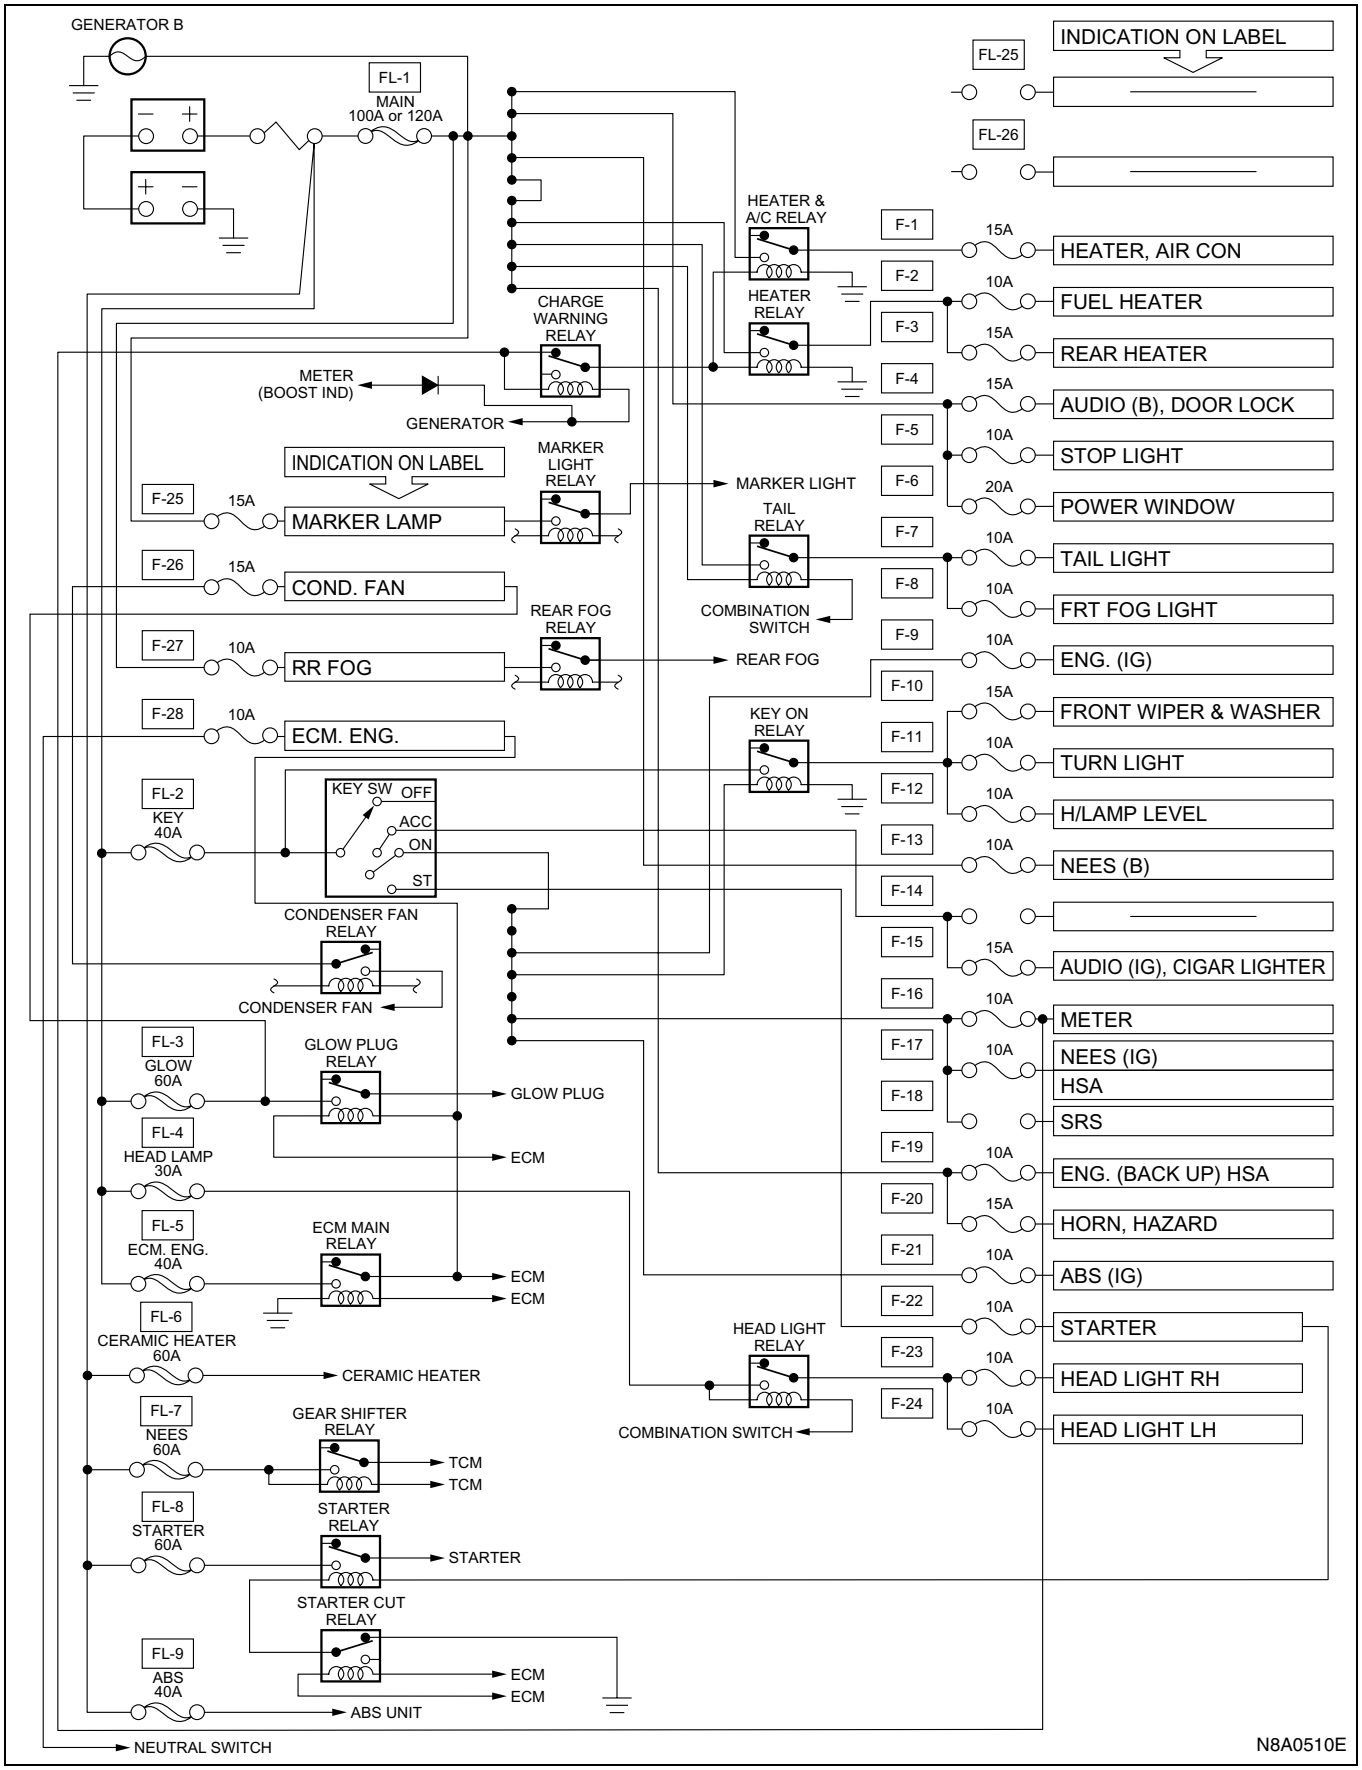
For 24 Volt-4HK1 Engine



Reference Table of Fuse and Circuit Breaker

Fuse

12 Volt 4JB1 Engine

Fuse No.	Capacity	Indication on label	Main parts (Load)
F-1	10 A	AIR CON	A/C switch, A/C thermo relay, Pressure switch, Magnetic clutch, VSV: FICD, Electronic thermostat
F-2	15 A	EXH. BRAKE, FUEL HEATER	Exhaust brake switch, Exhaust brake control relay, Exhaust brake magnetic valve, Clutch switch, Accel switch, Fuel heater
F-3	15 A	REAR HEATER	Rear heater, Rear heater switch
F-4	15 A	AUDIO (B), DOOR LOCK	Radio & clock, Dome light switch, Dome light, Door switch (RH & LH), Door lock switch, Door lock actuator, Door lock controller, Speedometer, Key cylinder switch, Key remind buzzer
F-5	10 A	STOP LIGHT	Stoplight switch, Stoplight
F-6	10 A	FRT FOG LIGHT, CORNERING LAMP	Fog light switch, Fog light, Lighting switch, Cornering light relay, Cornering light, Cornering light switch
F-7	10 A	TAIL LIGHT	Tail relay, Illumination light(s), Clearance light(s), Tail light(s)
F-8	10 A	EGR	ECM ignition
F-9	10 A	FUEL CUT	Fuel cut solenoid
F-10	15 A	FRONT WIPER & WASHER	Wiper & Washer switch, Wiper motor, Washer motor, Intermittent relay
F-11	10 A	TURN LIGHT	Flasher unit, Front turn signal light, Rear turn signal light, Turn signal light switch, Hazard warning switch
F-12	10 A	H/LAMP LEVEL	Headlight leveling switch, Headlight leveling motor (actuator)
F-13	—	—	—
F-14	—	—	—
F-15	15 A	AUDIO (IG), CIGAR LIGHTER	Radio, Cigar lighter
F-16	10 A	METER	Exhaust brake control relay, CSD Relay, Key remind buzzer, Backup light switch, Backup light, Neutral switch, Starter relay, QOS-II controller, QOS-III controller, Glow relay, Glow-1 relay, Glow-2 relay, Glow indicator (Meter), Coolant temperature gauge, Thermo unit, Vehicle speed sensor (Installed on the meter assembly & Transmission), Meter assembly, Power window relay, Cornering light relay
F-17	—	—	—
F-18	—	—	—
F-19	15 A	HORN, HAZARD	Horn, Horn relay, Horn switch, Flasher unit, Hazard warning switch
F-20	10 A	ABS (IG)	ABS
F-21	15 A	GENERATOR	Generator
F-22	10 A	STARTER	Starter relay, QOS-II controller, QOS-III controller
F-23	10 A	HEAD LIGHT RH	Headlight (RH), Dimmer relay, High beam indicator light
F-24	10 A	HEAD LIGHT LH	Headlight (LH), Dimmer relay
F-25	15 A	MARKER LAMP	Marker light, Marker light relay
F-26	15 A	COND. FAN	Condenser fan
F-27	10 A	RR FOG	Rear fog light switch, Rear fog light relay

SYSTEM REPAIR

Start and Charging

General Description

The system consists of the starter switch, starter, AC generator, starter relay, charge relay and heater and A/C relay. When the starter SW is set to the “ST” position, the battery voltage is applied to the starter solenoid coil through the starter relay to start the starter.

- On the 4HK1 engine, the function that ECM controls STARTER RELAY is added.

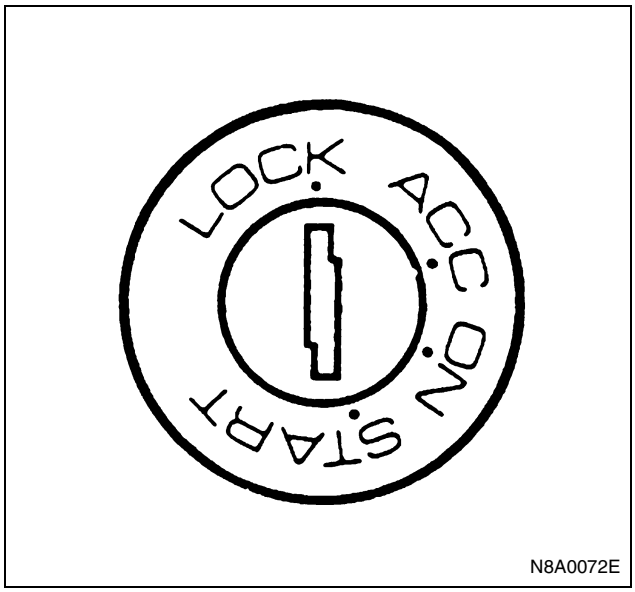
Starter Switch

The starter switch positions are LOCK, ACC, ON and START. Turning the starter key to these positions a circuit for starting the engine, the operation of accessories, or stop the engine.



Inspection

Check the continuity between the starter switch connector terminals.
Repair or replace the switch when the result of inspection is found abnormal.

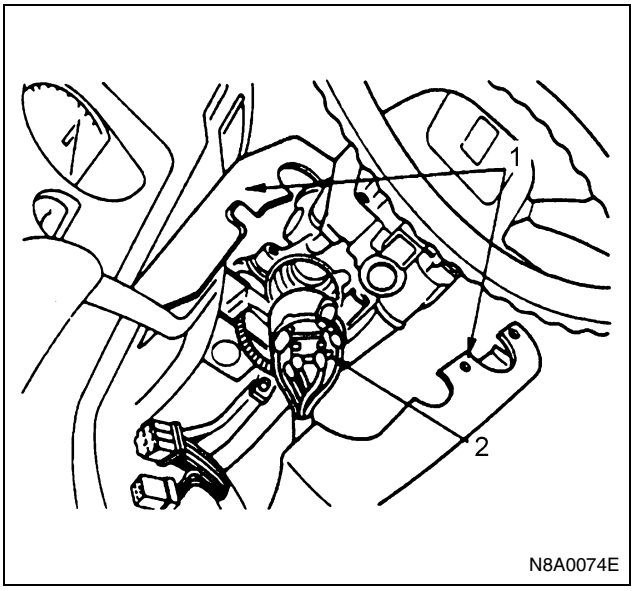
Removal

Preparation:

Disconnect the battery ground cable.

1. Steering Cowl
   Remove four screws and take off the steering cowl.
2. Starter Switch
   1) Disconnect the connector.
   2) Remove the screw.



N8A0074E

QOS (Quick On Start) II System (4HF1 and 4JB1 Engine Model)

General Description

The circuit consists of starter switch, QOSII control unit, glow relay, thermo switch, glow plug, fuel cut solenoid, CSD relay, CSD solenoid and glow indicator light.
The QOS-II controller controls glow plug relay by the ON or OFF signal of QOS thermo switch.
Immediately when the starter switch turns “ON”, the glow plug relay indicator light turns on to start preheating.
The engine should be started after the indicator light is off. However, the glow plug relay keeps preheating for a fixed period even after the indicator light turns off. When the fixed time is over, QOS-II controller performs to switch the glow plug relay off to stop preheating.
For details, refer to “PREHEATING SYSTEM”.

Exhaust Brake System

General Description

This circuit consists of starter switch, exhaust brake switch (combination switch), accelerator switch, clutch switch, vacuum switching valve, neutral switch and relay.

Exhaust brake is a system to increase exhaust pressure by means of squeezing exhaust gas from engine and exert engine brake.

Turn the exhaust brake SW on, and the exhaust brake valve starts to work by the function of the magnetic valve to enable the exhaust bake to operate, when the exhaust brake indicator light will be on.

When either the accelerator pedal or the clutch pedal is depressed while driving, the switch of the depressed pedal will turn off, subsequently the exhaust braking will stop working.

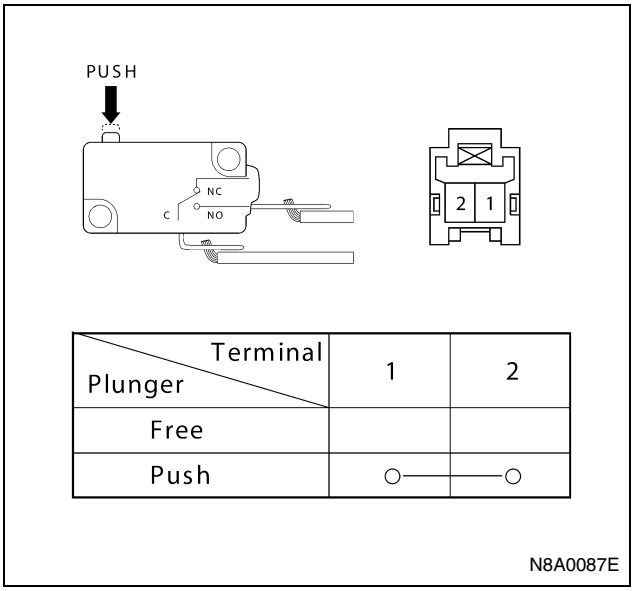
Accel Switch

Inspection

1. Check the continuity between the switch connector terminals.
2. Check to see if switch plunger operates smoothly. Repair or replace the accel switch when result of inspection is found abnormal.

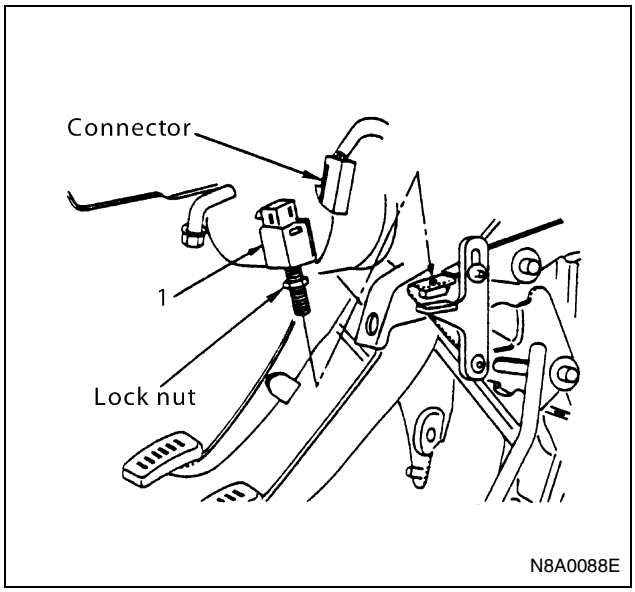


Removal

Preparation:

Disconnect the battery ground cable.

1. Accel Switch
   1) Disconnect the connector.
   2) Remove the two screws.



Installation

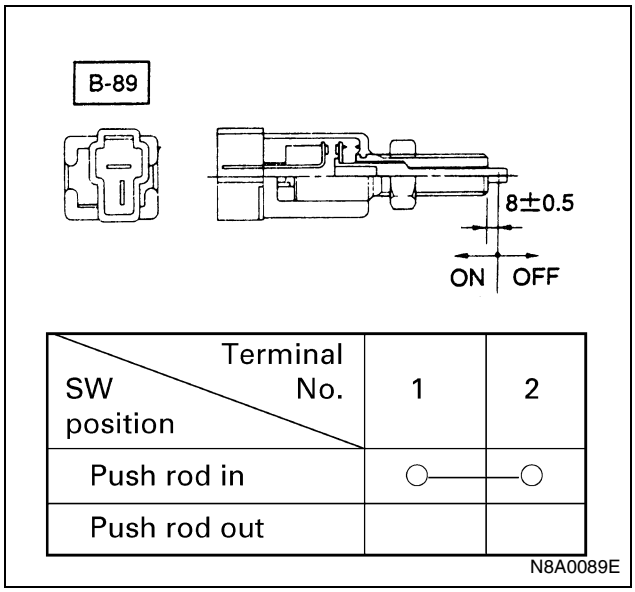
To install, follow the removal steps in the reverse order, noting the following points.

1. Check to see if the accel pedal has been returned by the return spring to the specified position.

Clutch Switch

Inspection

1. Check the continuity between the switch connector terminals.
2. Check to see if switch push rod operates smoothly. Repair or replace the switch when result of inspection is found abnormal.

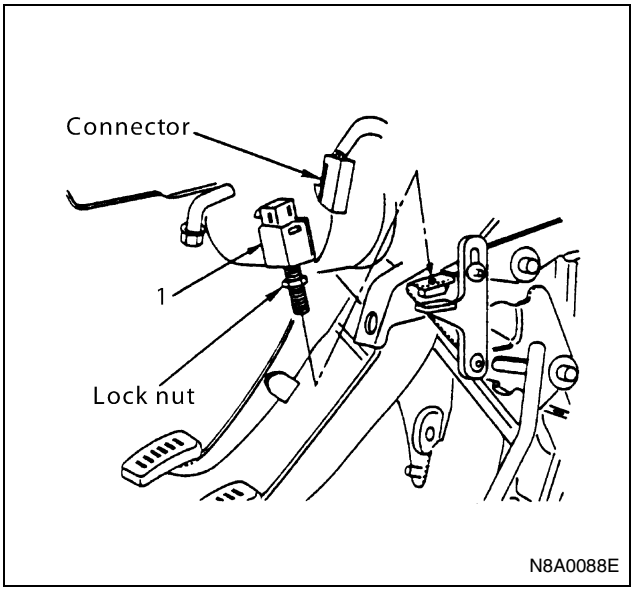


Removal

Preparation:

Disconnect the battery ground cable.

1. Clutch Switch
   1) Disconnect the connector.
   2) Loosen the lock nut of the switch.
   3) Remove the switch by turning it.



Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Check to see if the clutch pedal has been returned by the return spring to the specified position.
2. Turn the clutch switch clockwise until the tip of the threaded portion of the switch contacts the pedal arm.
3. Tighten the lock nut to the specified torque.

Tighten:

Lock nut to 13 N·m (130 kg·cm / 115 lb·in)

Exhaust Brake Switch

Inspection

Check the continuity between the terminals of the exhaust brake switch.
Repair or replace the switch when the result of inspection is found abnormal.

Engine Stop System

General Description

The circuit consists of starter switch and engine stop motor.
The engine stop mechanism aims at shut-off of fuel supply.
Available are motor type and solenoid type depending on the types of the engine mounted.
Motor type is forcible pull the injection pump control rack to the direction of fuel supply reduction by means of engine stop motor, thus shutting it off.
Solenoid type is to have the starter switch turn from “ON” position to “OFF”, so that the solenoid valve fitted to the injection pump closes to shut off the fuel circuit.

Engine stop system	Engine model
Motor type	4HF1, 4HG1,4HE1
Solenoid type	4JB1, 4JG2

Parts Location

4JB1 / 4JG2 / 4HG1 (N-Spec) Engine

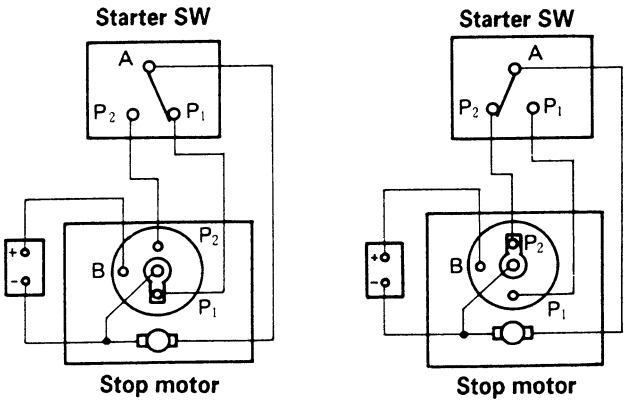
Function of Engine Stop Motor



Turn the starter switch from "ACC" position to "ON", and the engine stop motor will turn by 180 degrees (from 0° to 180°) so that the stop motor's electrode will be in potential equal to that of the starter switch for the stop.

Turn the starter switch from "ON" position to "ACC" or "LOCK", and then the stop motor will rotate by 180 degrees(from 180° to 360°) and crease operating.

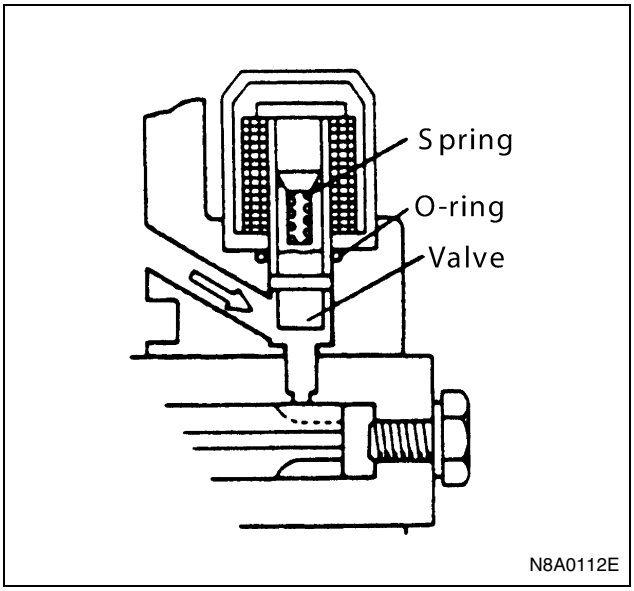
Starter SW key position \ Connector No. / Terminal No.	B-68 A (1)	B-68 P1 (2)	B-68 P2 (4)	Stop motor	Stop lever position
LOCK	○	○		0° (360°)	Stop
ACC	○	○			
ACC → ON				0° → 180°	Stop → Run
ON	○		○	180°	Stop
START	○		○		
ON → ACC LOCK				0° → 360°	Stop → Run

N8A5127E

Solenoid Type

Starter Switch and Solenoid Valve

Turn the starter switch from “ON” position to “OFF”, and then the solenoid valve fitted to the injection pump closes to cut off the fuel circuit.



Key position	Solenoid valve
LOCK	Close
ACC	
ON	Open
START	

Headlight, Fog Light, Rear Fog Light and Cornering Light

General Description

The circuit consists of headlight, fog light, cornering light, starter switch, combination switch (Lighting switch, dimmer / passing switch, cornering light switch), fog light switch, rear fog light switch, rear fog light, high beam indicator light and relay.

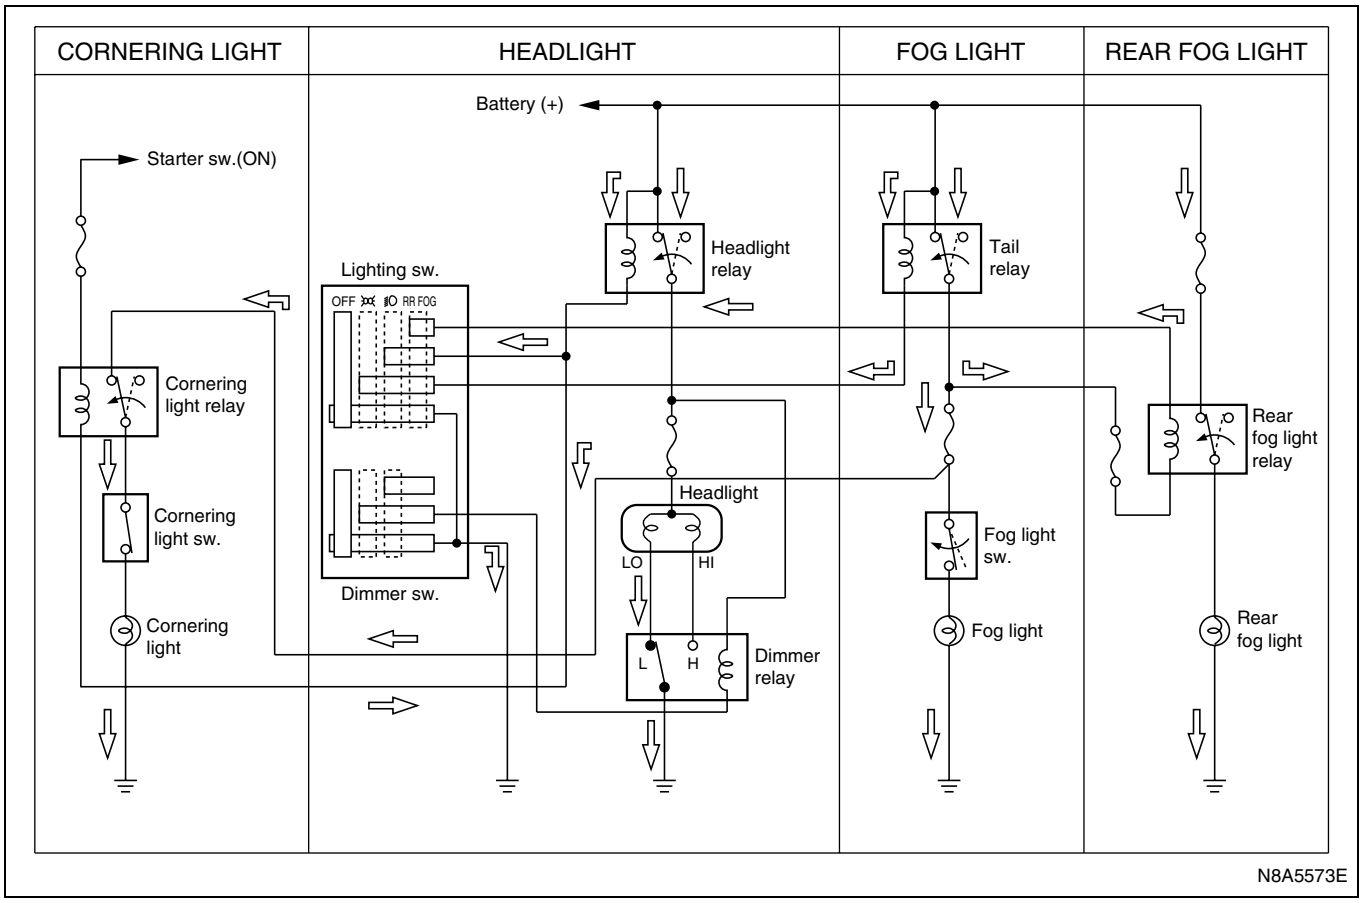
When the lighting SW is turned on by setting it at headlight position, the lighting relay is actuated to turn on the headlight. The optical axis of the headlight can be turned up or down by operating the dimmer SW while headlight is on.

The passing SW is independent of the lighting SW, and the optical axis of the passing light can be turned up only while the switch lever is pulled up and held in this state.

Fog light turns on by switching it to “ON” position to activate relay only while lighting SW is on. Rear fog light turns on by switching it to “ON” position to activate relay only while lighting SW is at headlight position.

When the headlight is on, turn the turn-signal switch left or right, and then the cornering switch built in the combination switch turns on, followed by the cornering light turning on.

Lighting Circuit



Notice:

Arrow marks indicate the direction of current.

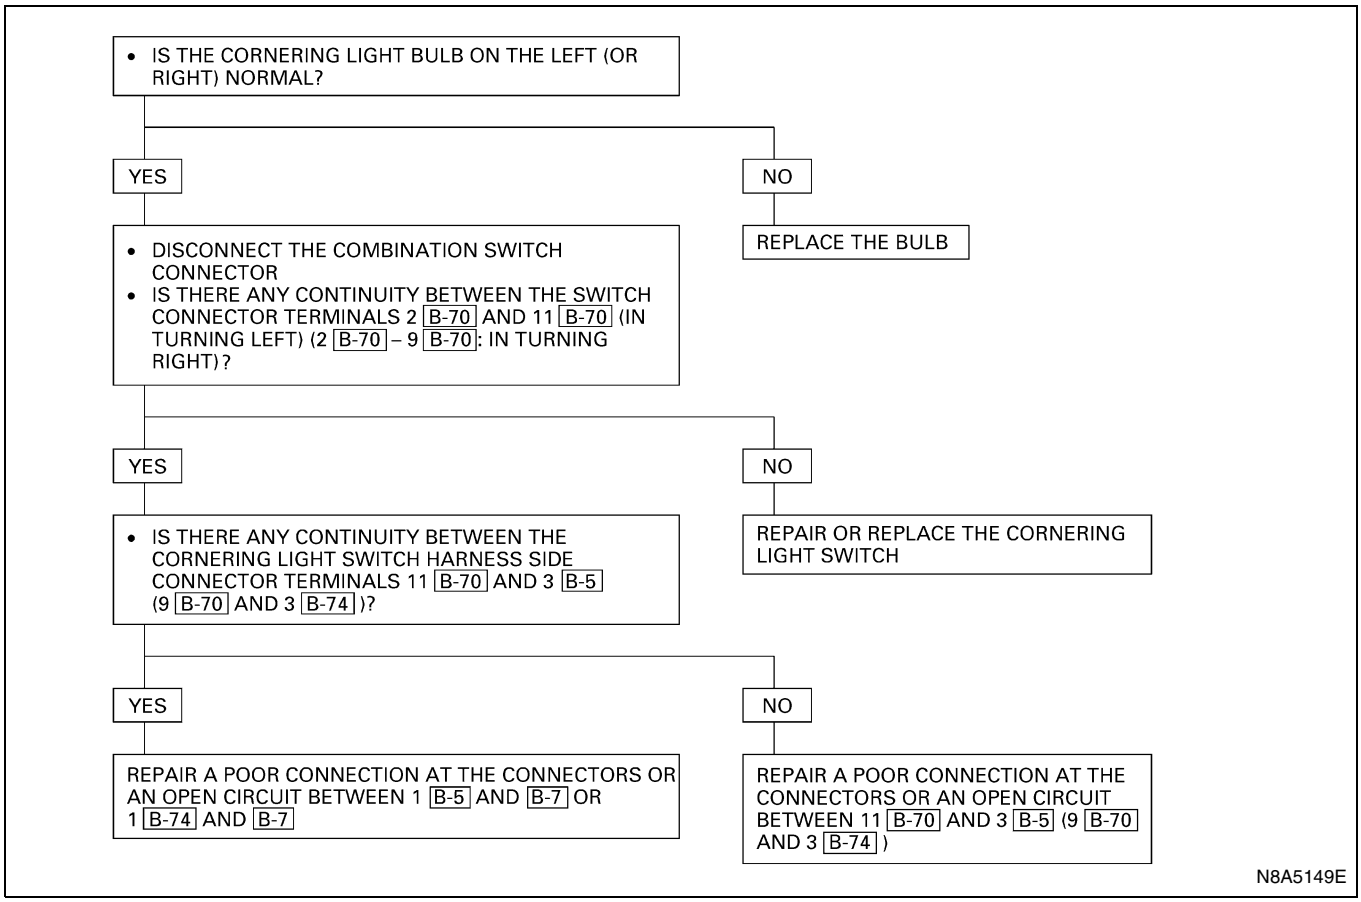
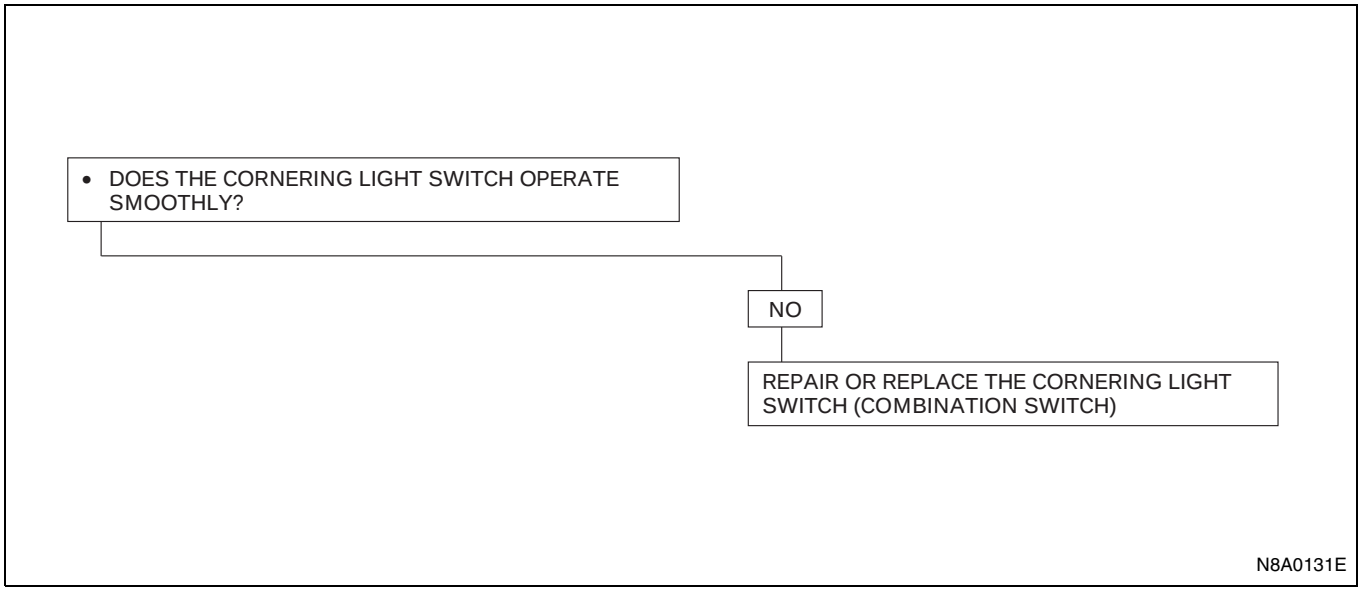
3-2. Cornering Light on The Left (or Right) Side Inoperative

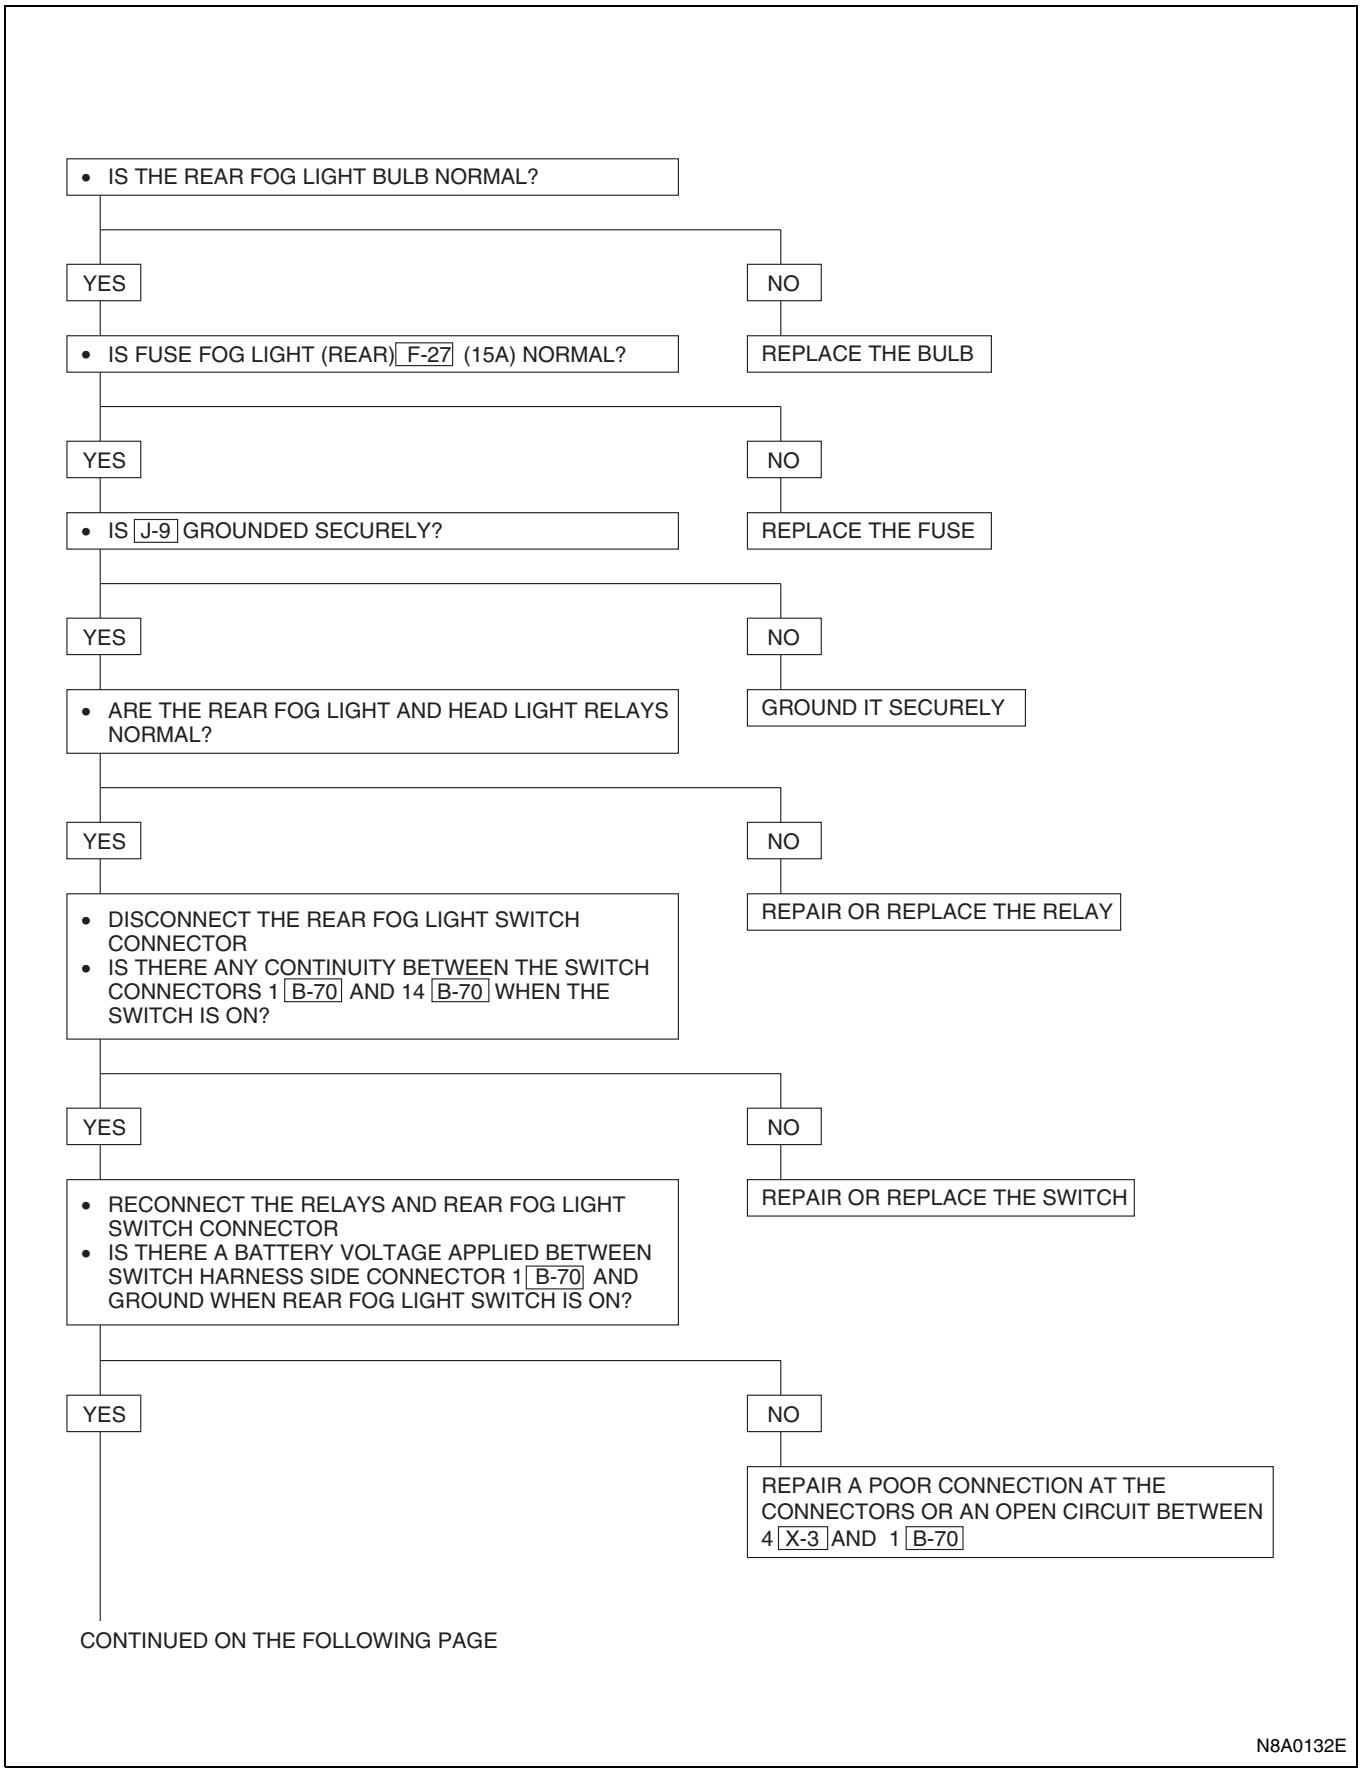


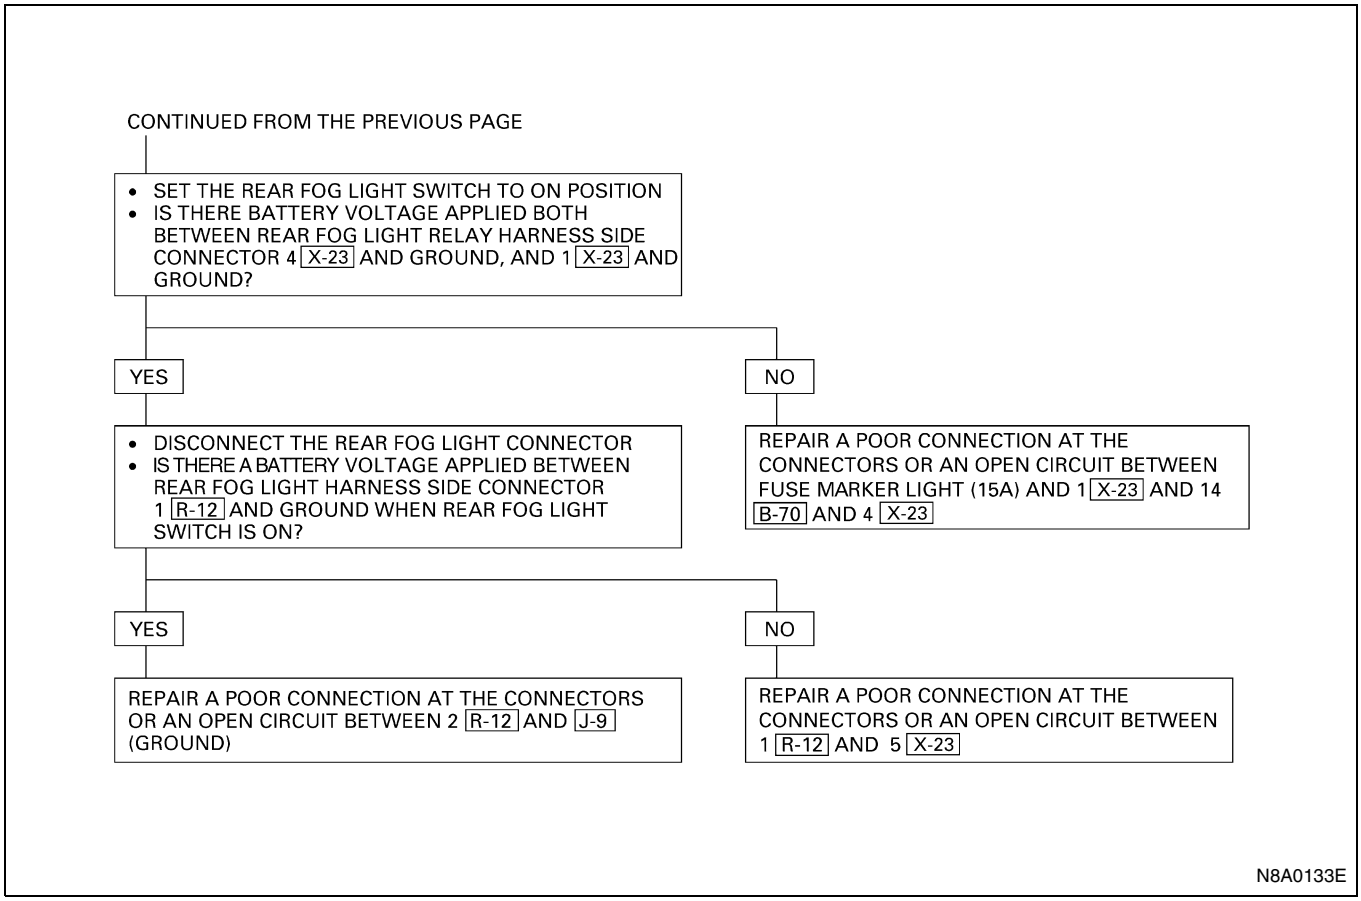
Notice:
Figures in parenthesis “( )” indicate place of inspection for the cornering light on the right.

3-3. Cornering Light Remains on Even when Steering Wheel is in Straight Ahead Position



4. Rear Fog Light
4-1. Rear Fog Light Inoperative (while Headlight is On)





Starter Switch

Refer to “START AND CHARGING” in this section.

High Beam Indicator Light

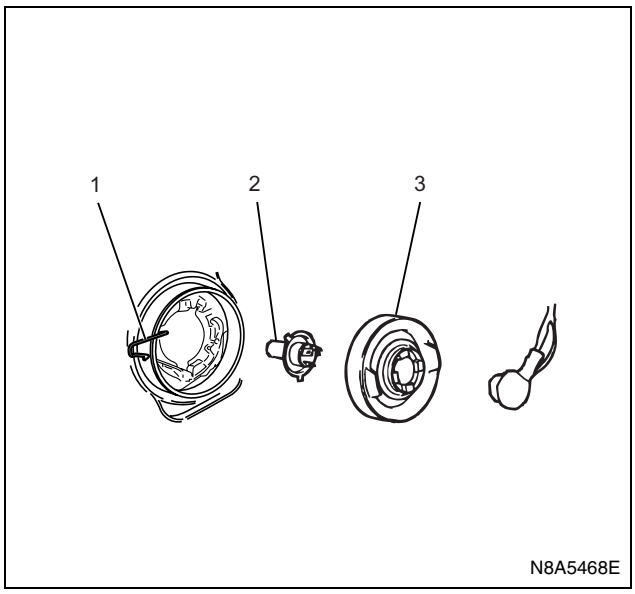
Refer to “METER AND WARNING/INDICATOR LIGHT” in this section.

Headlight Bulb Replacement

Removal

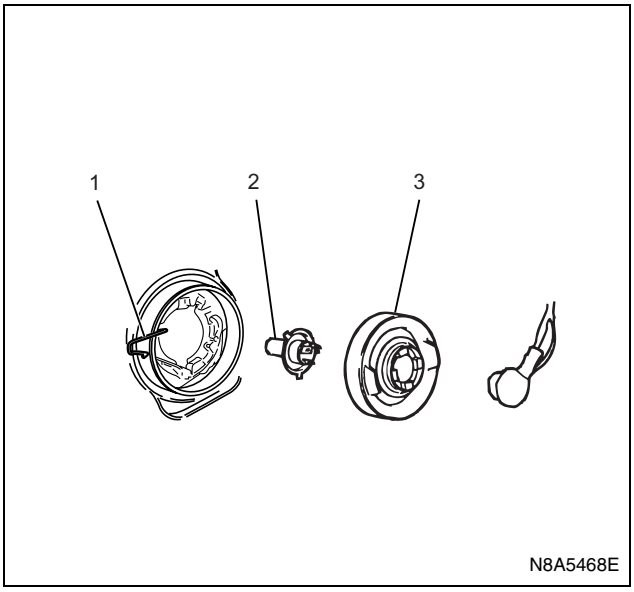
1. Remove the battery ground cable at the battery.
2. Remove the headlight assembly. (Refer to ‘Headlight Replacement’ below.)
3. Remove the headlight bulb.
   - Remove the dust cover (3).
   - Remove the clip (1).
   - Remove the headlight bulb (2).

Caution:
Do not touch the glass portion of the bulb with your fingers.



Installation

1. Install the headlight bulb.
   - Set the headlight bulb (2).
   - Fix the headlight bulb with clip (1).
   - Install the dust cover (3).
2. Install the headlight assembly.
   (Refer to ‘Headlight Replacement’ below.)
3. Connect the battery ground cable at the battery.
4. Check if the light lights.



Caution:
Do not touch the glass portion of the new bulb with your fingers.

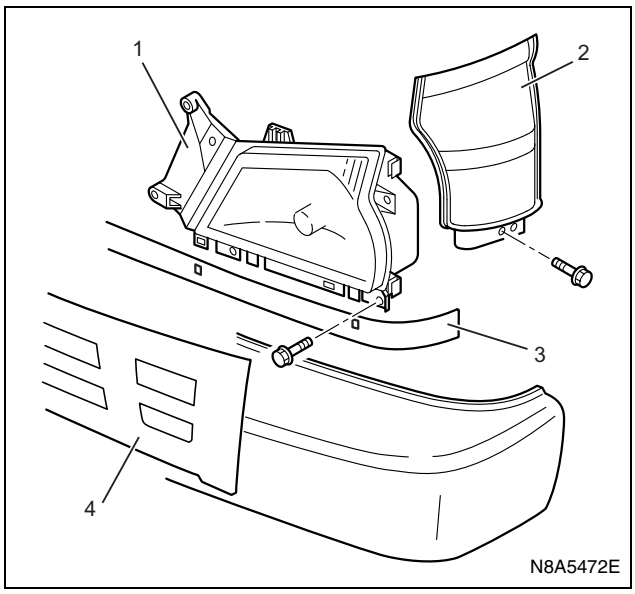
Headlight Replacement

Removal

Preparation: Disconnect the battery ground cable.

1. Remove the battery ground cable at the battery.
2. Remove the seal rubber (3).
   - Remove the seal rubber from beneath the headlight.
3. Remove the front combination light (2).
   - Open the cab door. Insert a screwdriver (1) into the space between the cab and the cab door. Use the screwdriver to force out the stud pin at the center of the grommet (the pin securing the front combination light).

   - Remove the fixing screw.
   - Remove the two catches.
   - Remove the front combination light connector.
4. Remove the front grille (4).
   - Remove the bolt at the center of the front grille.
   - Remove the four clips securing the front grille.
   - The grille is secured by 4 clips (2 clips at the inside of each headlight). Pull the grille toward you to remove it.
5. Remove the front corner panel.
6. Remove the headlight (1).
   - Remove the four bolts securing the headlight (loosen the fixing bolts at the bottom of the front side panel to create working space).
   - Remove the headlight clips.
   - Remove the headlight connector.



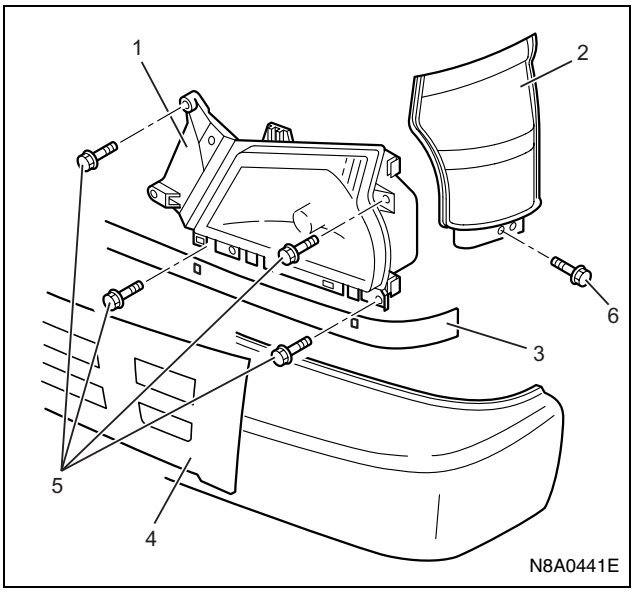
Installation

1. Assemble the headlight assembly (1).
   - Connect the connector.
   - Fix it to body panel with four bolts (5).
2. Assemble the front panel side.
   (Refer to “DOOR” in section 2.)
3. Install the front grille (4).
4. Install the front combination assembly (2).
   1) Position it by aligning two pawls with the groove of H/L.
   2) Fit the iron PIN in the upper portion by aligning it with the center of corresponding grommet.

Notice:
Push it into securely with a force of approx. 250 N (25 kgf) until click is heard.

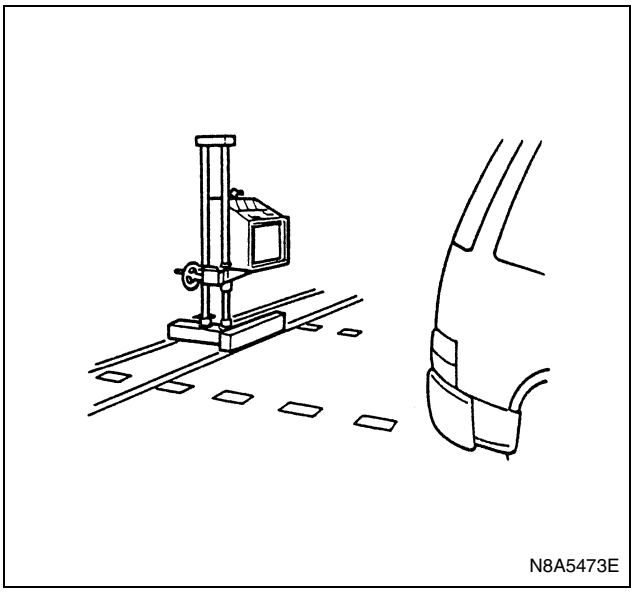
   3) Pull the front combination light assembly lightly toward the front of vehicle to make sure that the PIN and grommet are engaged securely.
   4) Tighten one bolt (6) in the lower portion of front combination light assembly.
   5) Hook the seal rubber (3) on two projections under H/L.

5. Connect the battery ground cable.
6. Check the operation and lighting of each lamp.



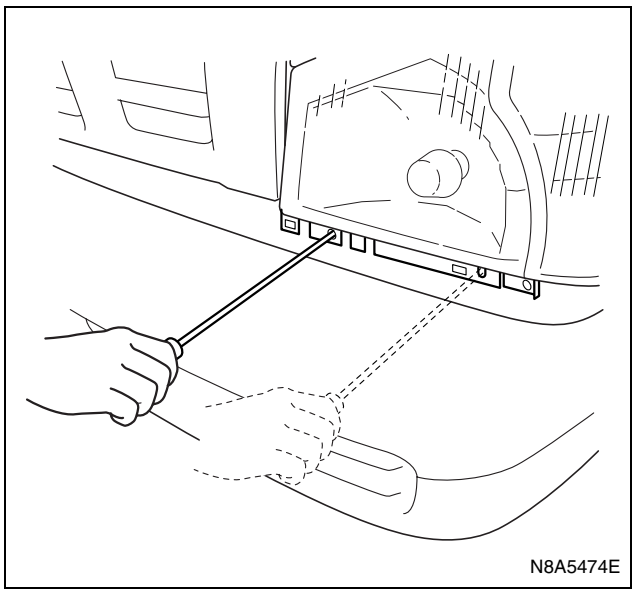
Aiming of Headlight

Preparation: Place the unloaded vehicle on a level surface and check to see if the inflation pressure of the tires is correct, the lenses are clean, and the battery is sufficiently charged. Adjust the aim with the headlight tester. When adjusting, follow the procedure of the tester manufacturer's.



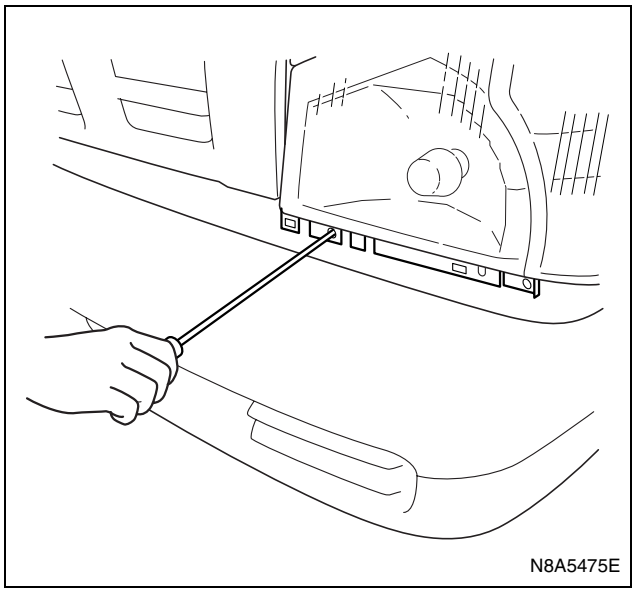
Vertical Adjustment

Insert the tip of a screwdriver into the hole beneath the headlight (the shaft of the screwdriver must be slanted up) until contact is made with the head of the adjusting screw. Turn the screw to adjust headlight focus up or down.
Two vertical aim screws should be turned in the same direction at the same time to adjust aiming.



Horizontal Adjustment

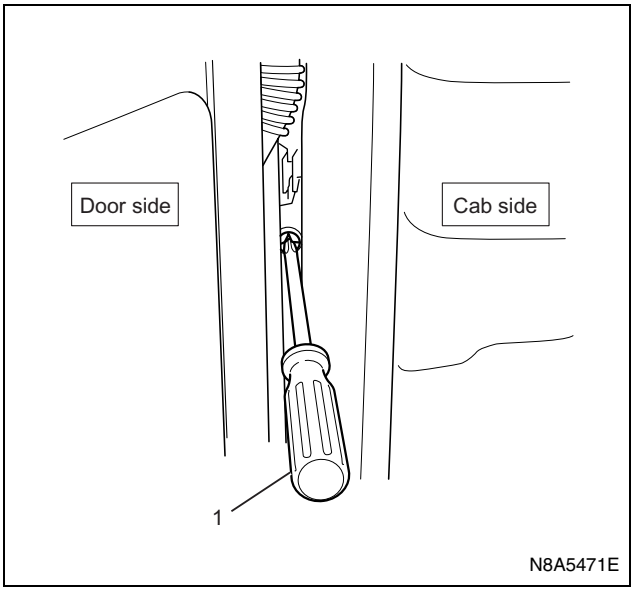
Insert the tip of a screwdriver into the hole beneath the headlight (the shaft of the screwdriver must be slanted up) until contact is made with the head of the adjusting screw. Turn the screw to adjust headlight focus to the left or right.



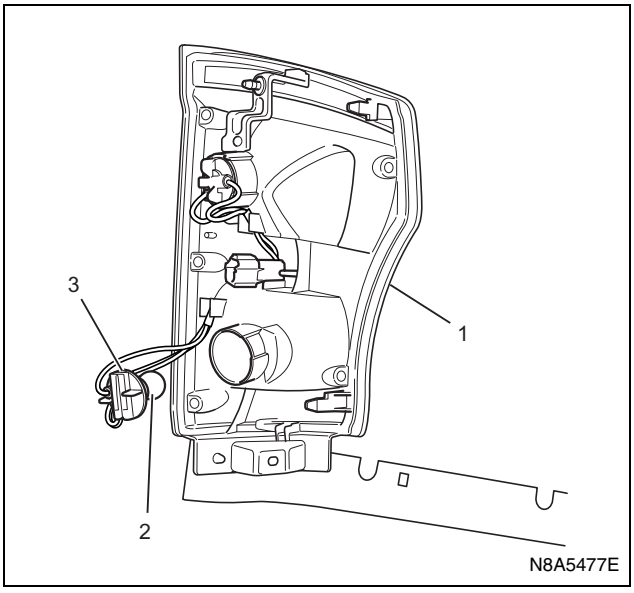
Cornering Light Bulb Replacement

Removal

1. Remove the battery ground cable at the battery.
2. Remove the front combination light.
   - Open the cab door. Insert a screwdriver (1) into the space between the cab and the cab door. Use the screwdriver to force out the stud pin at the center of the grommet (the pin securing the front combination light).



- Remove the fixing screw.
- Remove the two catches.
- Remove the front combination light (1) connector.



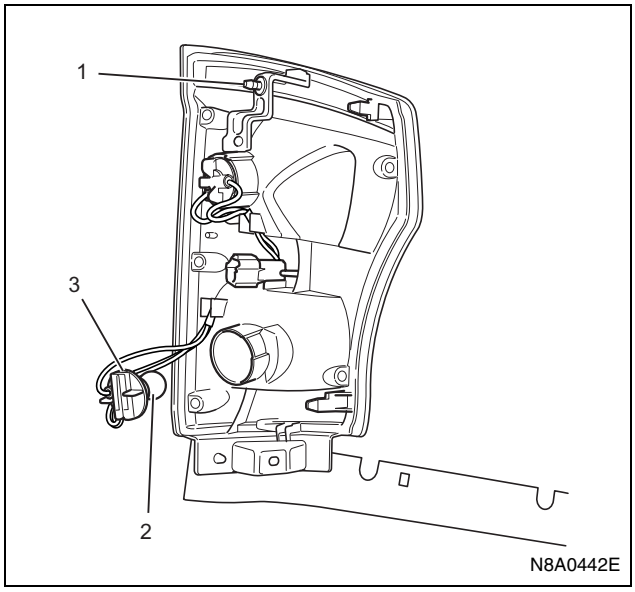
3. Remove the cornering light bulb.
   - Turn the cornering / clearance bulb socket (3) to the left to remove it.
   - Press the bulb (2) in and turn it to the left to remove it from the socket.

Installation

1. Install the cornering / clearance bulb.
   - While pressing the bulb (2), turn it clockwise to fit.

Notice:
Do not let the glass portion dirty with sebum etc.

- Turn the bulb socket (3) clockwise to fit.



2. Installation procedure of front combination light assembly
   - Connect the connector of the front combination light assembly.
   - Position it by aligning two pawls with the groove of H/L.
   - Fit the iron PIN (1) in the upper portion of the side by aligning it with the center of corresponding grommet.

Notice:
Push it into securely with a force of approx. 250 N (25 kgf) until click is heard.

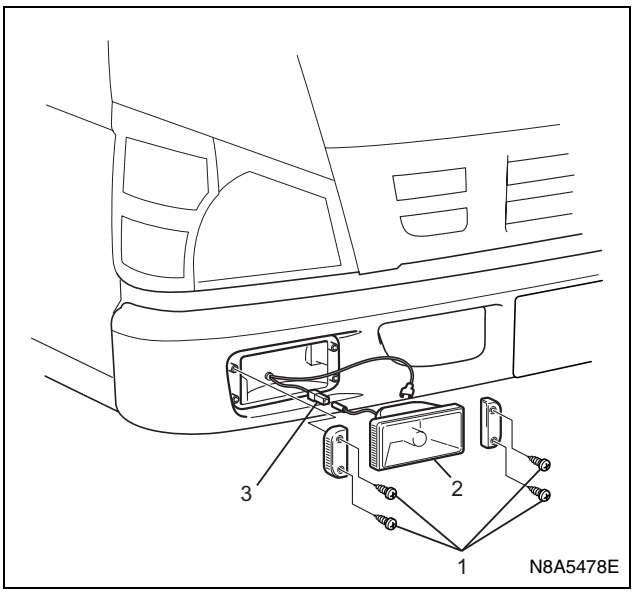
- Pull the front combination light assembly lightly toward the front of vehicle to make sure that the PIN and grommet are engaged securely.
- Tighten one bolt in the lower portion of front combination light assembly.

3. Hook the seal rubber on two projections under H/L.
4. Connect the battery ground cable.
5. Check lighting of each light.

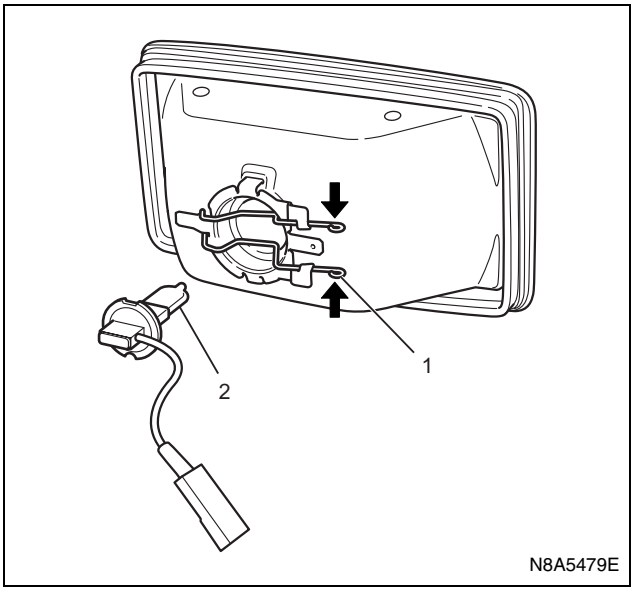
Fog Light Bulb

Removal

1. Remove the battery ground cable at the battery.
2. Remove the four screws (1) to remove the cover which holds fog light assembly (2).
3. Remove the connector (3).
4. Remove the fog light assembly (2).

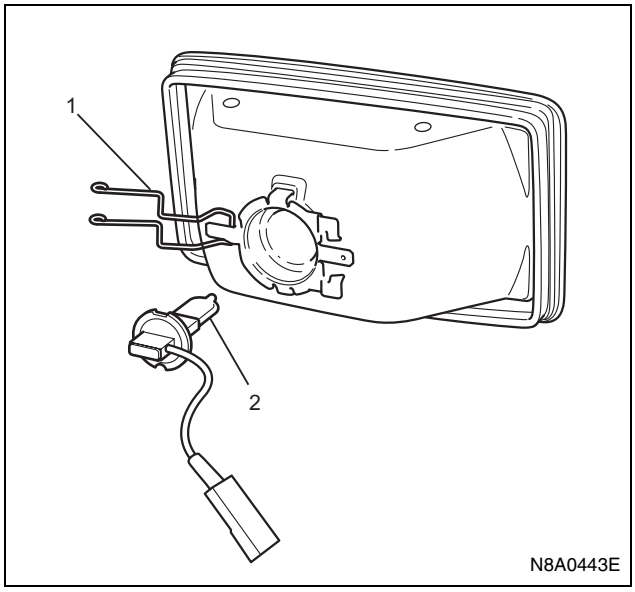


5. Bulb
   - Push the clip (1) inward as arrow to remove.
   - Remove the bulb (2).



Installation

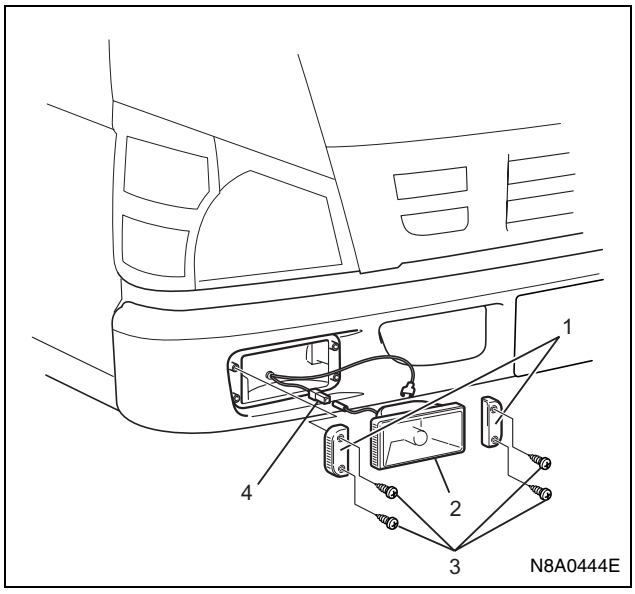
1. Install the fog light bulb.
   - Set the fog light bulb (2).
   - Hook the clip (1) to secure fog light bulb.



2. Connect the two locations of connector (4).
3. Install the fog light assembly.
   - Hold the fog light (2) with right and left covers (1) and secure it with four screws (3).

Notice:
Make sure that “TOP” mark on the lens comes upside.

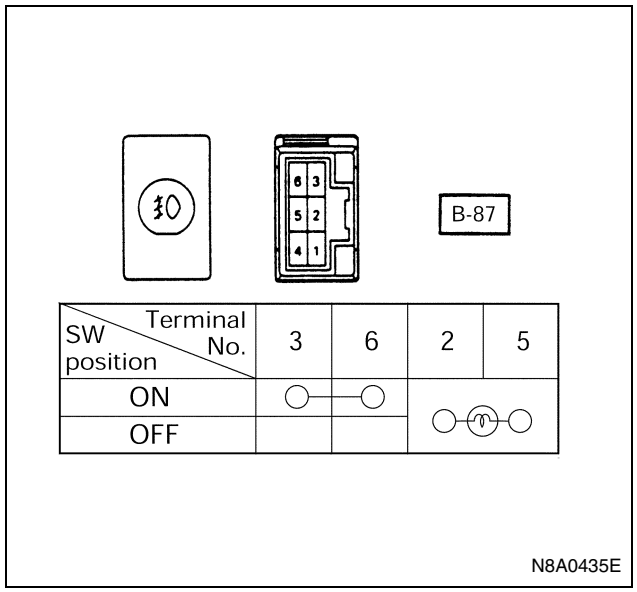
4. Connect the battery ground cable.
5. Check lighting.



Fog Light Switch

Inspection

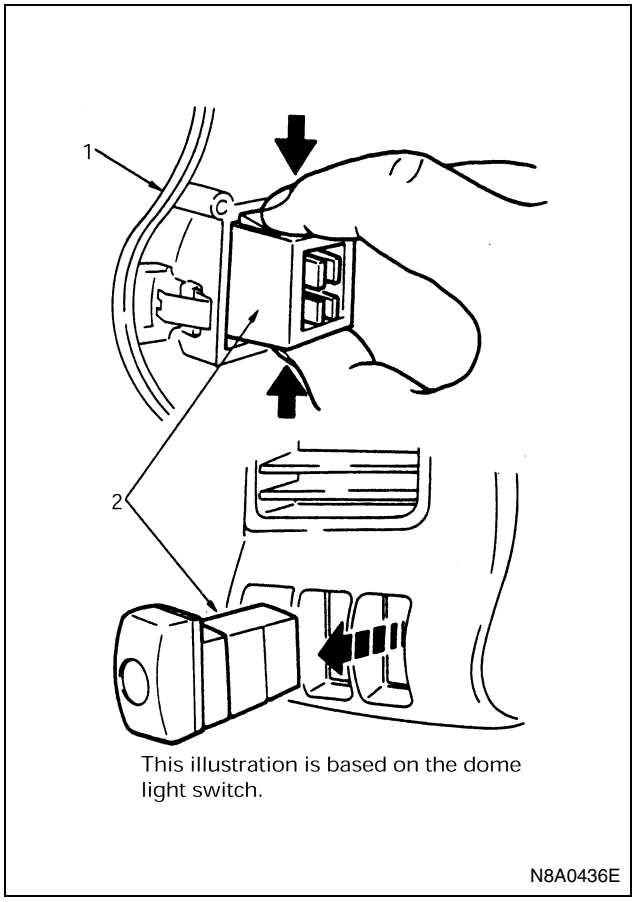
Check the continuity between the connector terminals while operating the switch.
Replace the switch when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Meter Cluster
   Refer to “METER AND WARNING/INDICATOR LIGHT” in this section.
2. Fog Light Switch
   Release the lock pushing the switch from the back side of the meter cluster.



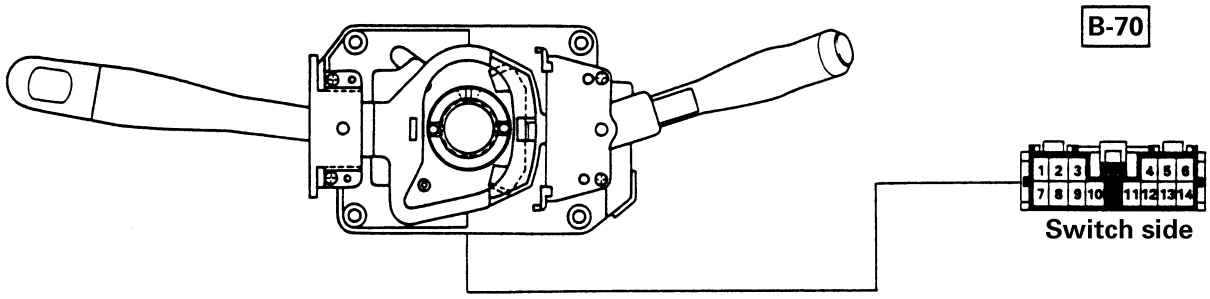
Installation

To install, follow the removal steps in the reverse order.

Combination Switch (Lighting Switch, Dimmer, Passing Switch, Cornering Light Switch and Rear Fog Light Switch)

Inspection

Check the continuity between the connector terminals while operating the switch.
Replace the switch when the result of inspection is found abnormal.



SW position \ Terminal No.		1	2	4	5	7	8	9	10	11	12	13	14

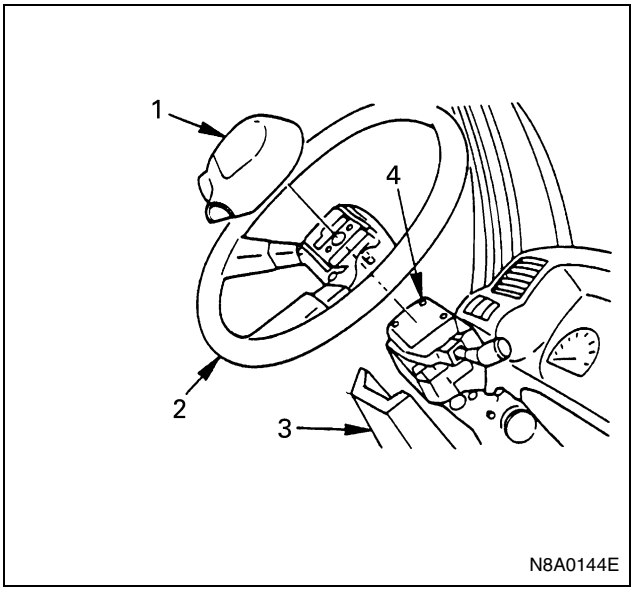
	Passing			○		○			○				
Cornering light SW	Turning left		○							○			
	Neutral												
	Turning right		○					○					

N8A0143E

Removal

Preparation:
Disconnect the battery ground cable.

1. Horn Pad
   1) Hold the horn pad and pull it upward.
2. Steering Wheel
   1) Remove the steering shaft nut.
   2) Remove the steering wheel by using steering wheel remover.
      (Refer to Section 3B4 “STEERING COLUMN” for steering wheel removal steps.)
3. Steering Cowl
   Remove the four screws.
4. Combination Switch
   1) Remove the four screws.
   2) Disconnect the connector.



Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the steering shaft nut to the specified torque.

Tighten:

Shaft nut to 49 N·m (5 kg·m / 36 lb·ft)

Headlight Leveling

General Description

The circuit consists of starter SW, headlight leveling SW and headlight leveling actuator.

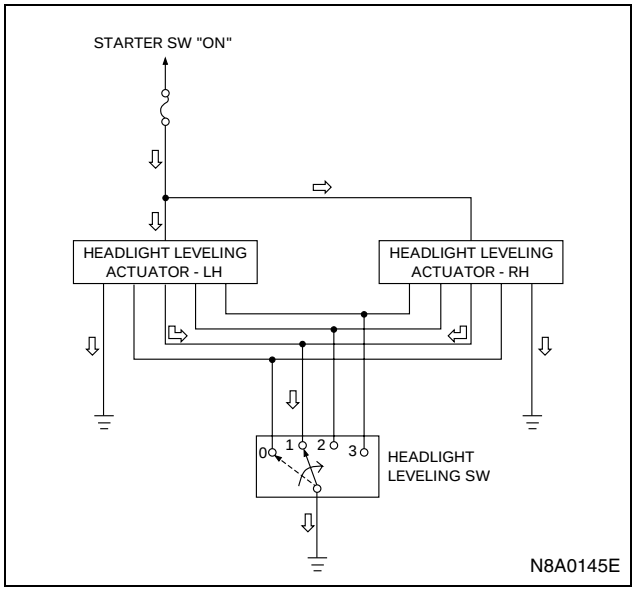
When the headlight leveling SW is operated with the starter SW at ON position, the actuator is operated to change the angle of the optical axis of the headlight.

Operation of The Circuit

Notice:

Arrow marks indicate the direction of current.

1. When headlight leveling SW is turned to “1” position



2. When headlight leveling SW is turned to “0” position

Starter Switch

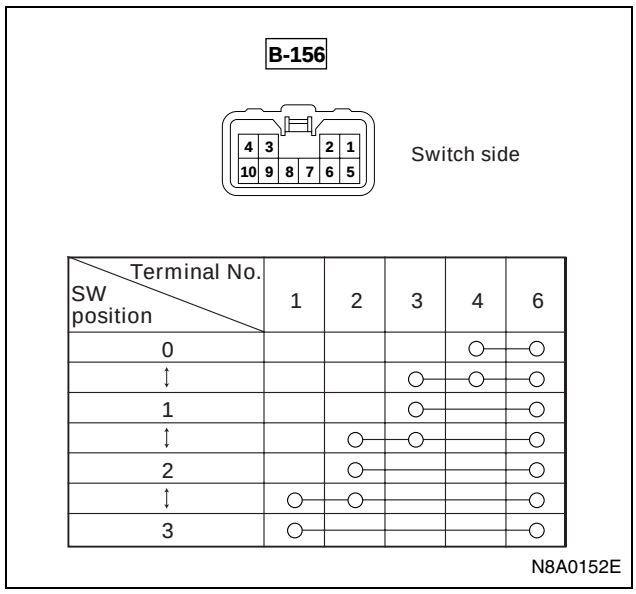
Refer to “START AND CHARGING” in this manual.

Headlight Leveling Switch

Inspection

Check the continuity between the switch connector terminals.

Repair or replace the switch when the result of inspection is found abnormal.

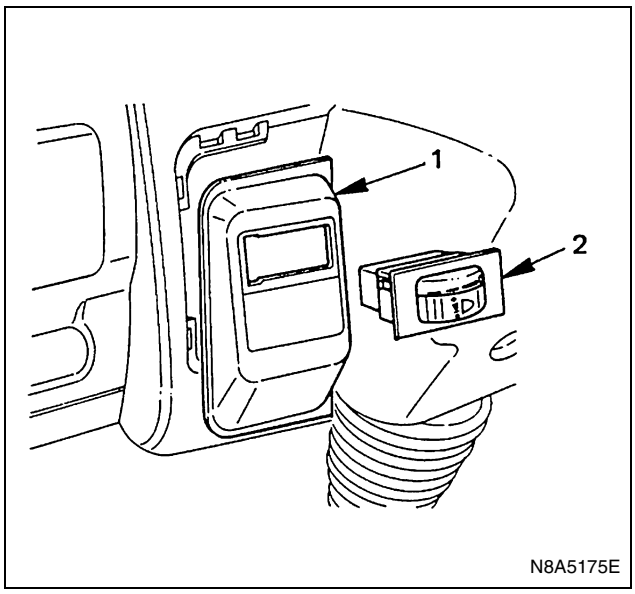


Removal

Preparation:

Disconnect the battery ground cable.

1. Switch Bezel
2. Headlight Leveling Switch
   Disconnect the connector.



Installation

To install, follow the removal steps in the reverse order.

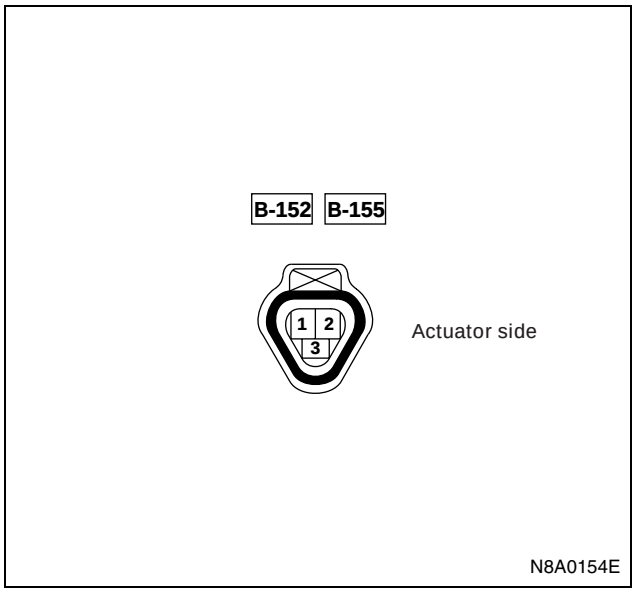
Headlight Leveling Actuator

Inspection

Apply the battery voltage to the connector terminals and check its function.

This actuator has a mechanism that the angle of headlight leveling varies according to input voltage of SIGNAL.

1. Make sure that the voltage specified in table is output to vehicle harness connector which will be connected to actuator.
   If the power supply is not 12 V, the SIGNAL output varies in proportion to its voltage.
2. Connect the connector of actuator and vehicle harness connector.
   Make sure that the reflector of headlight moves to the position indicated by HEAD LAMP LEVELING SW.



1	2	3
SIGNAL	–	+

		Input signal voltage ratio for SIGNAL when the voltage difference between positive and negative is specified as 100%	–	+
HEAD LAMP POSITION	Position 0	10.0% (1.2 V)	0 V	12 V
	Position 1	23.4% (2.8 V)	0 V	12 V
	Position 2	36.7% (4.4 V)	0 V	12 V
	Position 3	50.0% (6.0 V)	0 V	12 V
	Position 4	63.4% (7.6 V)	0 V	12 V

Caution:

1. For vehicles with 12 V and 24 V, this leveling input voltage is 12 V.
2. Input to SIGNAL must be less than 65% of the input voltage to positive terminal.

Clearance Light, Taillight, License Plate Light and Illumination Light

General Description

The circuit consists of the lighting switch, clearance light, taillight, license plate light and the illumination light for each of switch, meter and ashtray.
All these lights come on when the lighting switch is turned on with the switch to either clearance or headlight position.

Lighting Switch

Refer to “HEADLIGHT, FOG LIGHT AND CORNERING LIGHT” in this section.

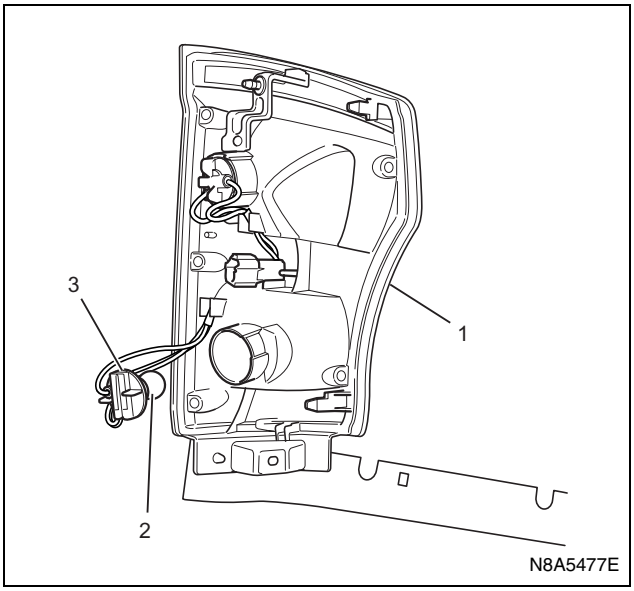
Clearance Light/Bulb

Removal

1. Remove the battery ground cable at the battery.
2. Remove the front combination light.
   - Open the cab door. Insert a screwdriver (1) into the space between the cab and the cab door. Use the screwdriver to force out the stud pin at the center of the grommet (the pin securing the front combination light).

   - Remove the fixing screw.

- Remove the two catches.
- Remove the front combination light (1) connector.



3. Remove the clearance light bulb.
   - Turn the bulb socket (3) to the left to remove it.
   - Press the bulb (2) in and turn it to the left to remove it from the socket.

Installation

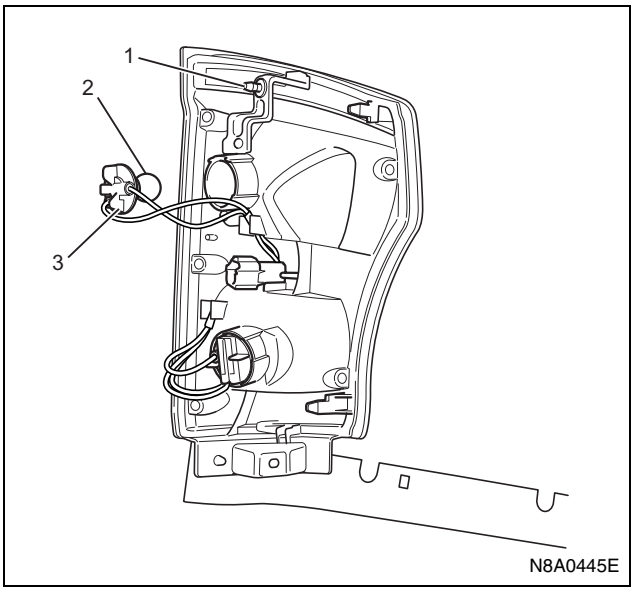
Installation procedure of cornering/clearance light bulb

1. Install the cornering/clearance light bulb.
   - While pressing the bulb (2), turn it clockwise to fit.

Notice:

Do not let the glass portion dirty with sebum etc.

- Turn the bulb socket (3) clockwise to fit.



2. Installation procedure of front combination light assembly
   - Connect the connector of the combination light assembly.
   - Position it by aligning two pawls with the groove of H/L.
   - Fit the iron PIN (1) in the upper portion of the side by aligning it with the center of corresponding grommet.

Notice:

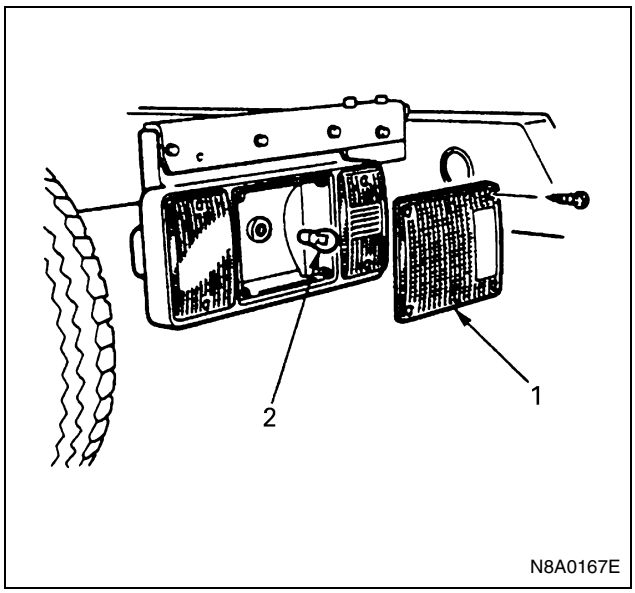
Push it into securely with a force of approx. 250 N (25 kgf) until click is heard.

   - Pull the front combination light assembly lightly toward the front of vehicle to make sure that the PIN and grommet are engaged securely.
   - Tighten one bolt in the lower portion of front combination light assembly.
3. Hook the seal rubber on two projections under H/L.
4. Connect the battery ground cable.
5. Check lighting of each light.

Taillight Bulb

Removal

1. Lens
2. Bulb



Installation

To install, follow the removal steps in the reverse order.

License Plate Light Bulb

Turn Signal Light, Hazard Warning Light, and Stoplight

General Description

The circuit consists of the starter switch, turn signal light (front and rear), turn signal light switch, hazard warning light, flasher unit, stoplight and stoplight switch.

When turning on the respective switches with the starter switch on, the turn signal light will operate. When the turn signal light is flashing, the indicator light in the meter also starts flashing. When the hazard warning switch is turned on, the current flows to the flasher unit through the hazard warning switch to cause the hazard warning light to flash, independent of the position of the starter switch. At the same time, the indicator lights in the meter also start flashing.

The stoplight switch will turn on and the light comes on once the brake pedal is depressed, independent of the position of the starter switch.

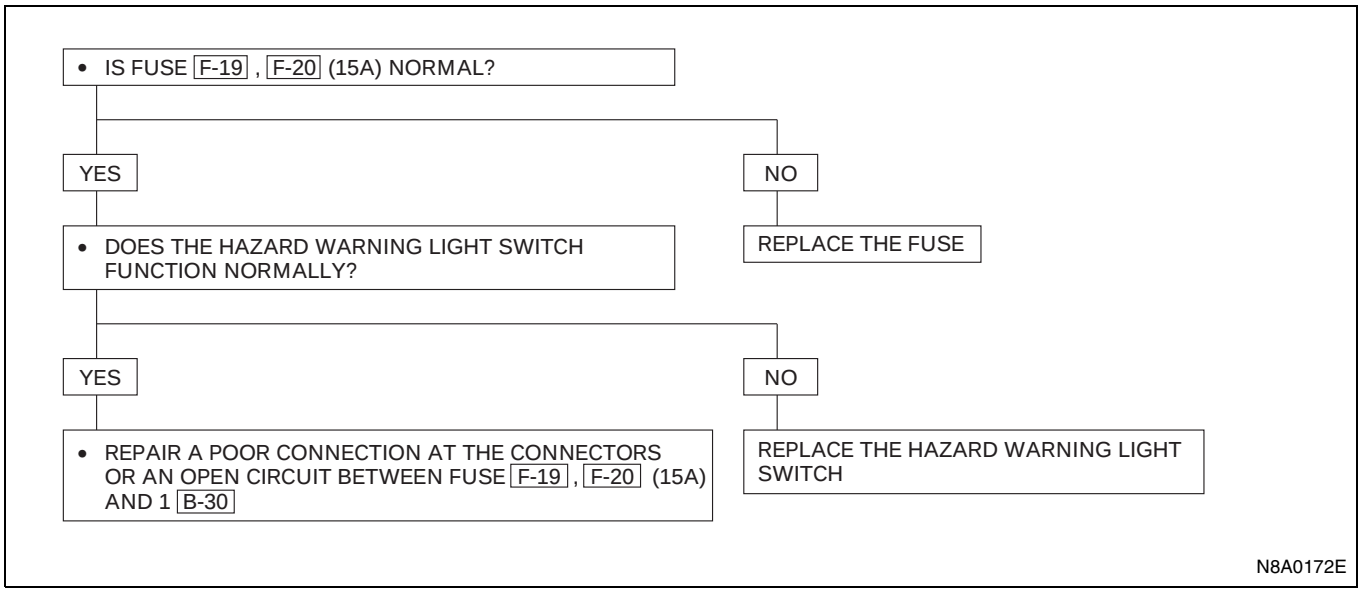
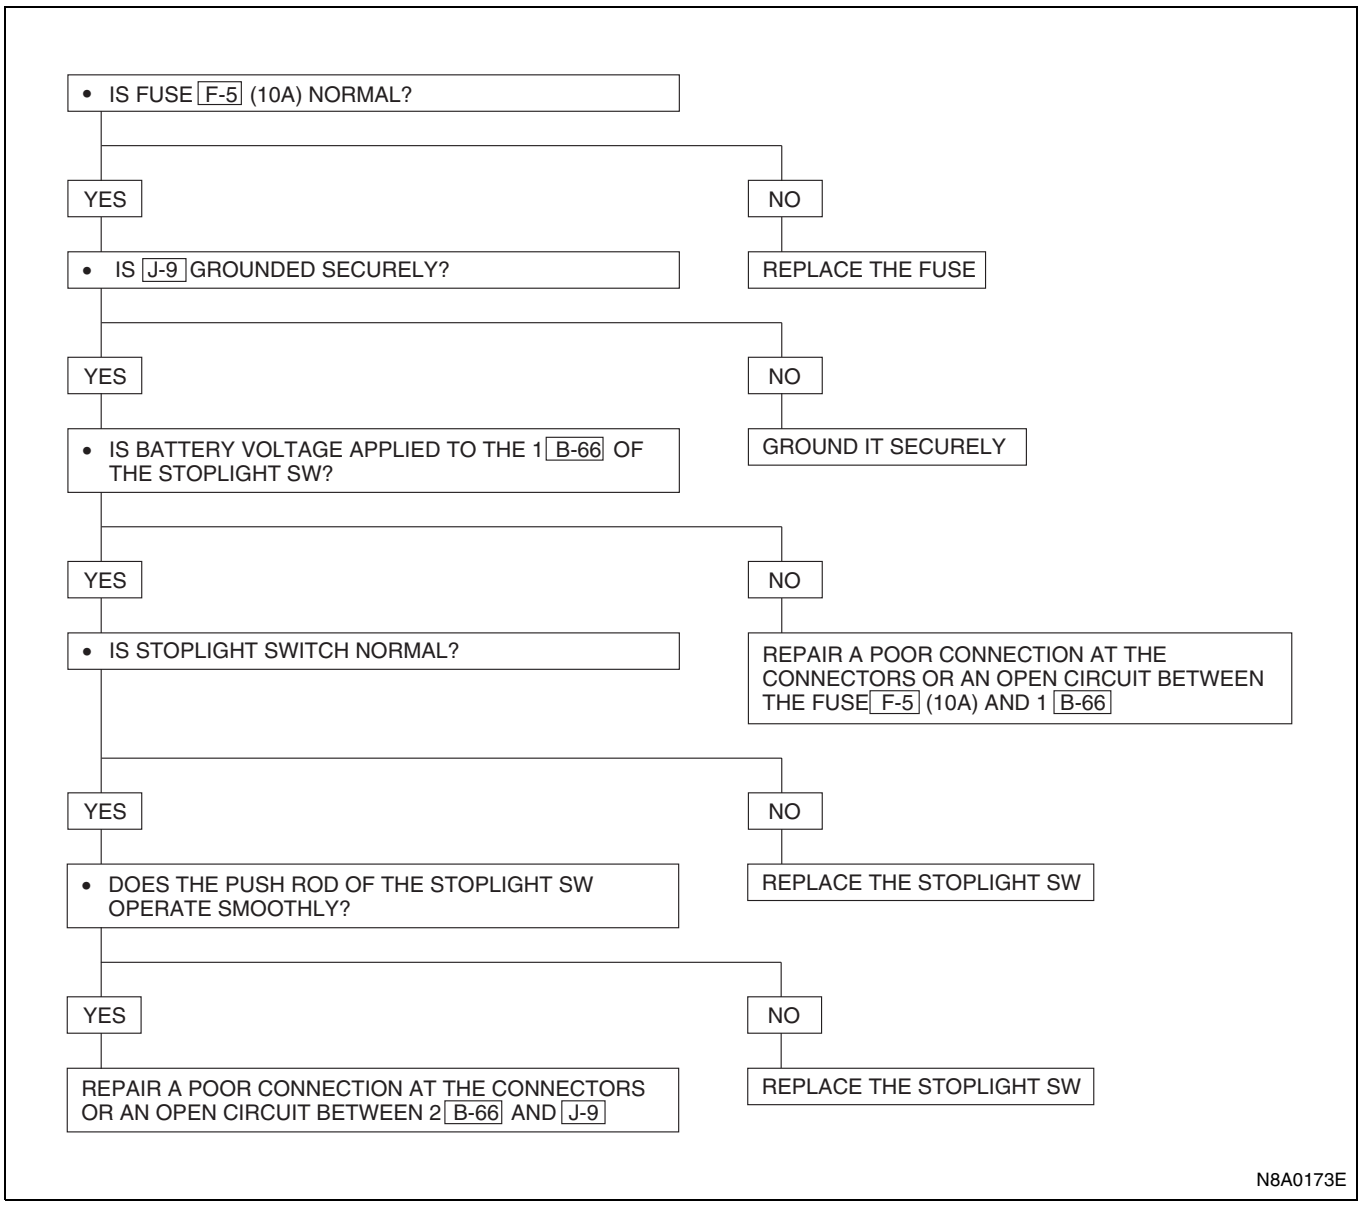
1-3. Hazard Warning Lights Inoperative

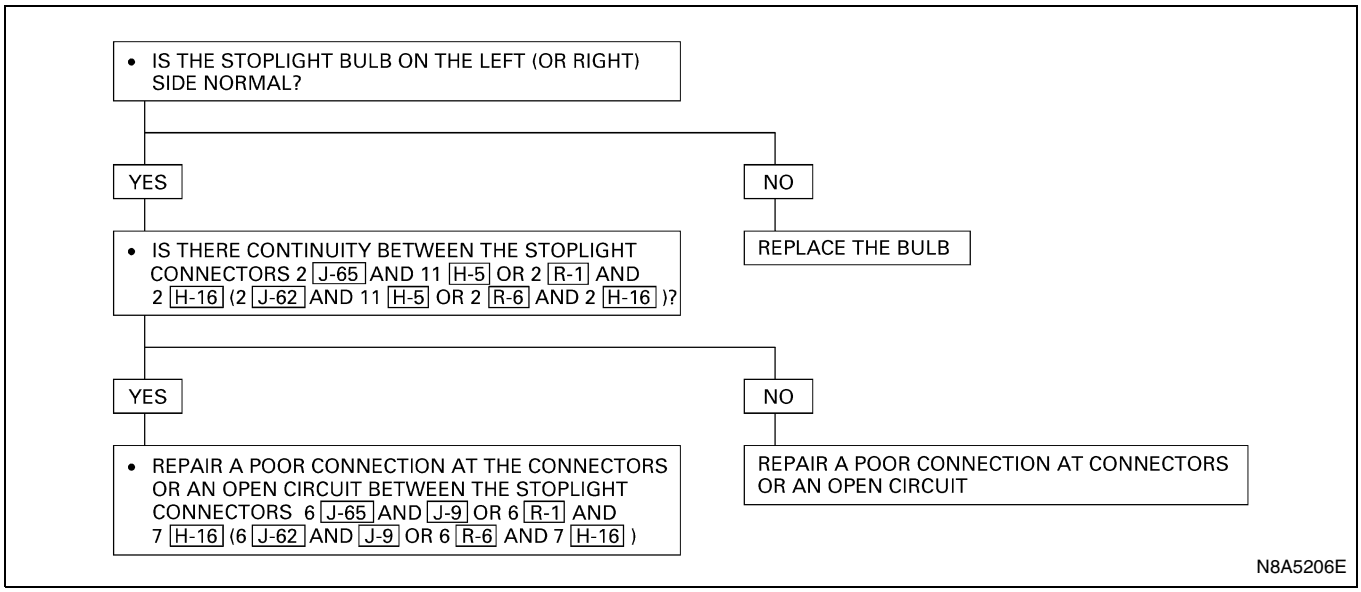


2. Stoplight

2-1. Both Stoplights Inoperative



2-2. Stoplight on the Left (or Right) Side Inoperative



Notice:
Figure in parenthesis “( )” indicates the place of inspection for the right side stoplight.

Starter Switch

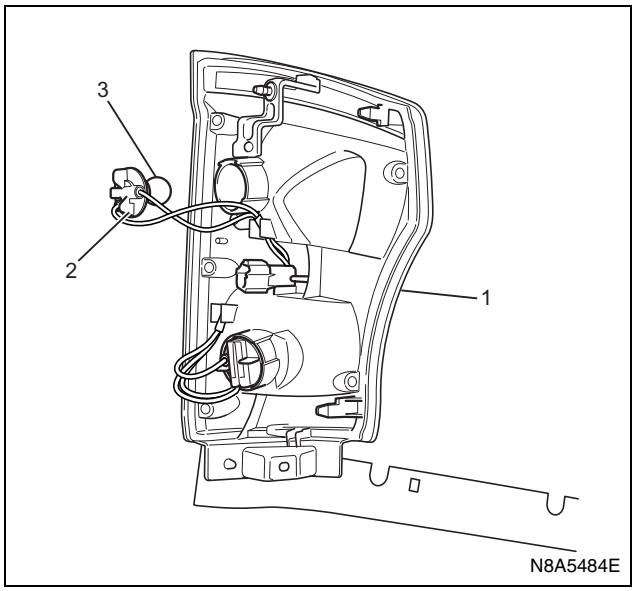
Refer to “START AND CHARGING” in this section.

Front Turn Signal Light/Bulb

Removal

1. Remove the battery ground cable at the battery.
2. Remove the front combination light.
   - Open the cab door. Insert a screwdriver (1) into the space between the cab and the cab door. Use the screwdriver to force out the stud pin at the center of the grommet (the pin securing the front combination light).

   - Remove the fixing screw.
   - Remove the two catches.
   - Remove the front combination light (1) connector.



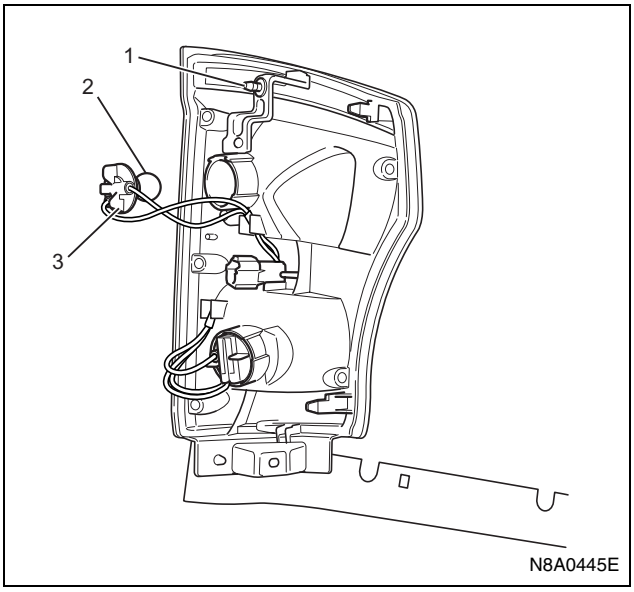
3. Remove the front turn signal light bulb.
   - Turn the bulb socket (2) to the left to remove it.
   - Press the bulb (3) in and turn it to the left to remove it from the socket.

Installation

1. Install the front turn signal light bulb.
   - While pressing the bulb (2), turn it clockwise to fit.

Notice:
Do not let the glass portion dirty with sebum etc.

   - Turn the bulb socket (3) clockwise to fit.



2. Installation procedure of front combination light assembly
   - Connect the connector of the front combination light assembly.
   - Position it by aligning two pawls with the groove of H/L.
   - Fit the iron PIN (1) in the upper portion of the side by aligning it with the center of corresponding grommet.

Notice:
Push it into securely with a force of approx. 250 N (25 kgf) until click is heard.

   - Pull the front combination light assembly lightly toward the front of vehicle to make sure that the PIN and grommet are engaged securely.
   - Tighten one bolt in the lower portion of front combination light assembly.

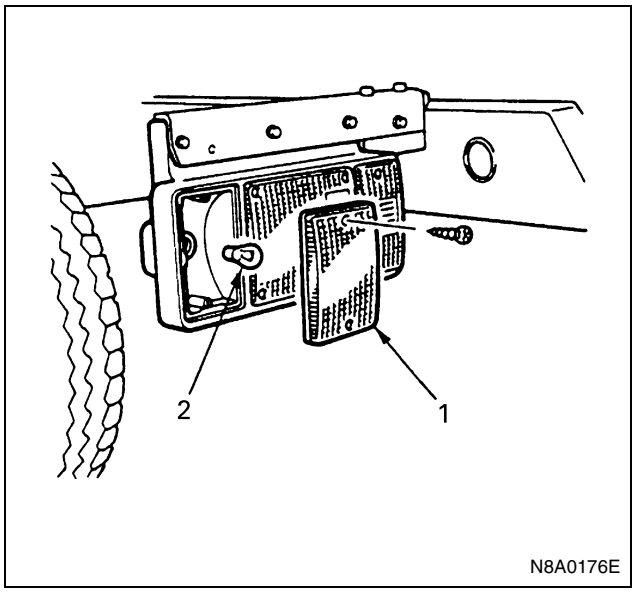
3. Hook the seal rubber on two projections under H/L.
4. Connect the battery ground cable.
5. Check lighting of each light.

Rear Turn Signal Light/Bulb

Removal

Preparation:
Disconnect the battery ground cable.

1. Lens
2. Bulb



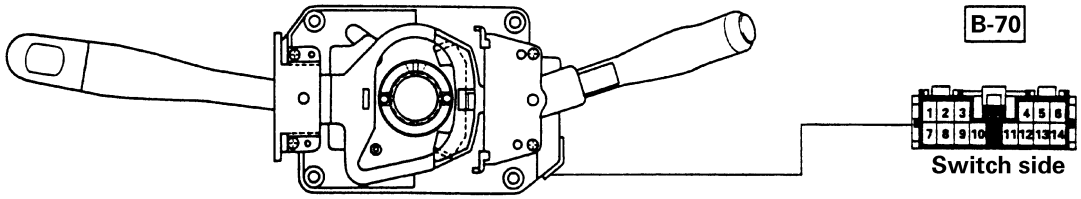
Installation

To install, follow the removal steps in the reverse order.

Turn Signal Light Switch (Combination Switch)

Inspection

Check the continuity between the terminals of the turn signal light switch.
Repair or replace the switch when the result of inspection is found abnormal.



SW position \ Terminal No.		2	5	9	11	12	13
Turn signal light SW	Turning left		○			○	
	Neutral						
	Turning right					○	○

N8A0177E

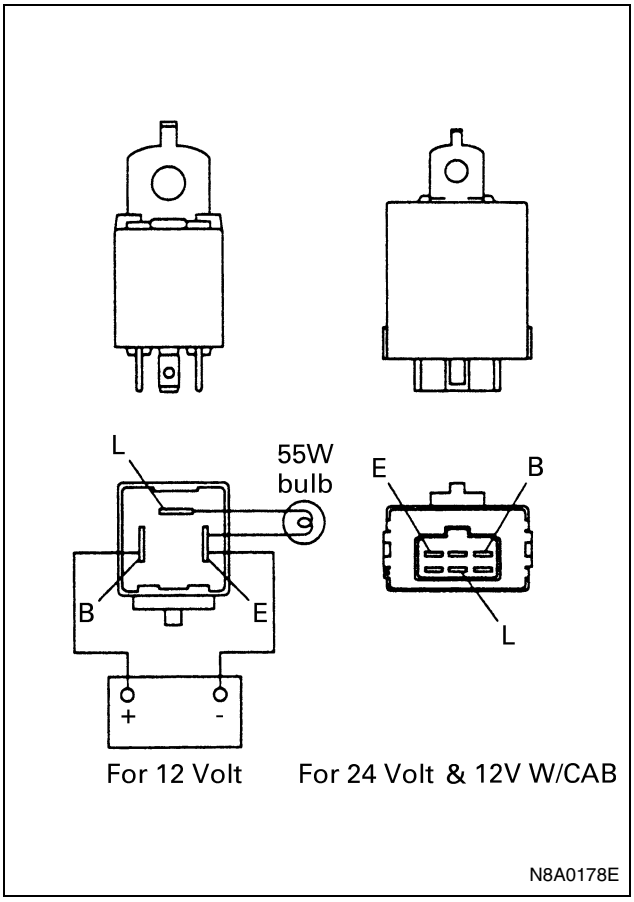
Removal and Installation

Refer to “HEADLIGHT, FOG LIGHT AND CORNERING LIGHT” in this section.

Flasher Unit

Inspection

When a 55W bulb is connected to the unit side terminals “L” and “E” while connecting the battery (+) terminal to terminal “B”, and the battery (−) terminal to terminal “E”, does the bulb light on and off?
Replace the unit when the result of inspection is found abnormal.



Stoplight Bulb

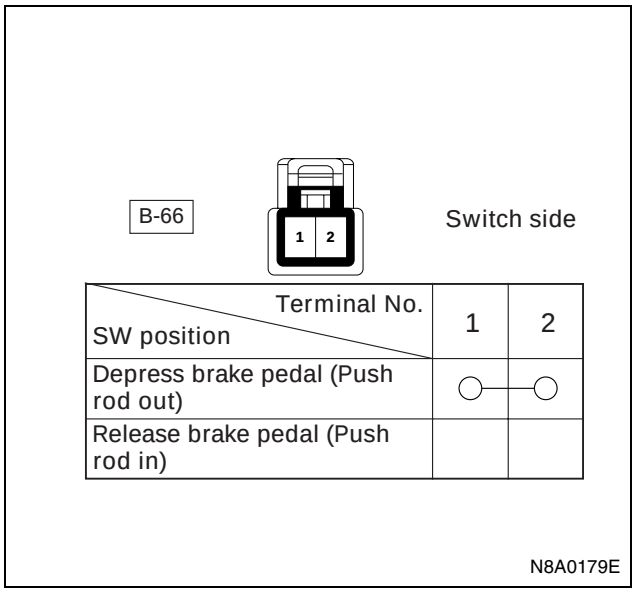
Removal and Installation

Refer to “CLEARANCE LIGHT, TAILLIGHT, LICENSE PLATE LIGHT AND ILLUMINATION LIGHT” for TAILLIGHT BULB removal and installation steps in this section.

Stoplight Switch

Inspection

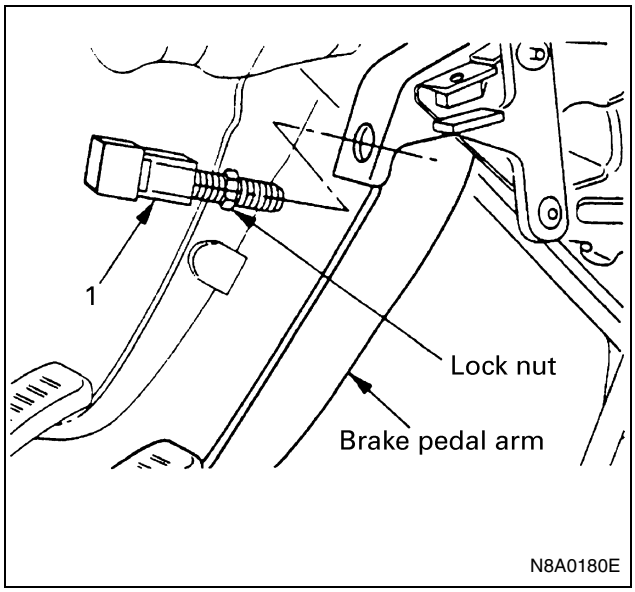
1. Check to see if the stoplight switch is installed correctly to the specified position. Adjust the position when the result of the inspection is found abnormal.
2. Check to see if there is any continuity between the terminals of the stoplight switch.
   Replace the switch when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

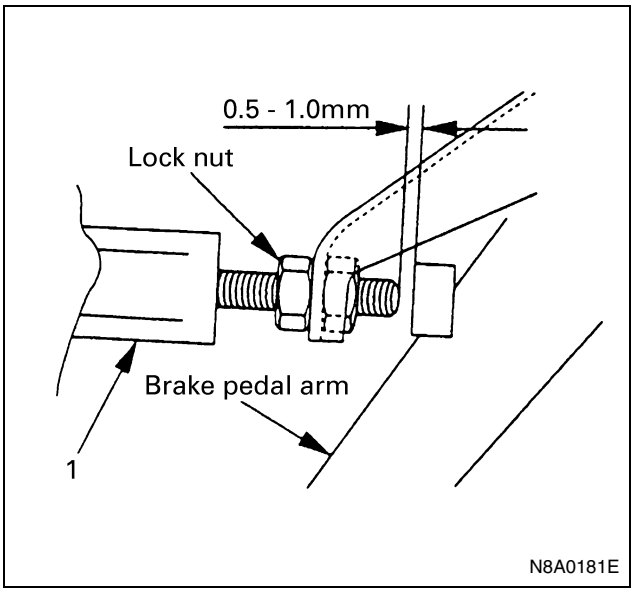
1. Stoplight Switch
   1) Disconnect the connector.
   2) Loosen the lock nut of the switch.
   3) Remove the switch by turning it.



Installation

To install, follow the removal steps in the reverse order, noting the following points.

1) Check to see if the brake pedal has been returned by the return spring to the specified position.
2) Turn the stoplight switch clockwise until the tip of the threaded portion of the switch contacts the pedal arm.
3) Turn the switch counterclockwise until the space between the tip of the threaded portion and the pedal arm is 0.5 to 1.0 mm (0.02 — 0.04 in.).

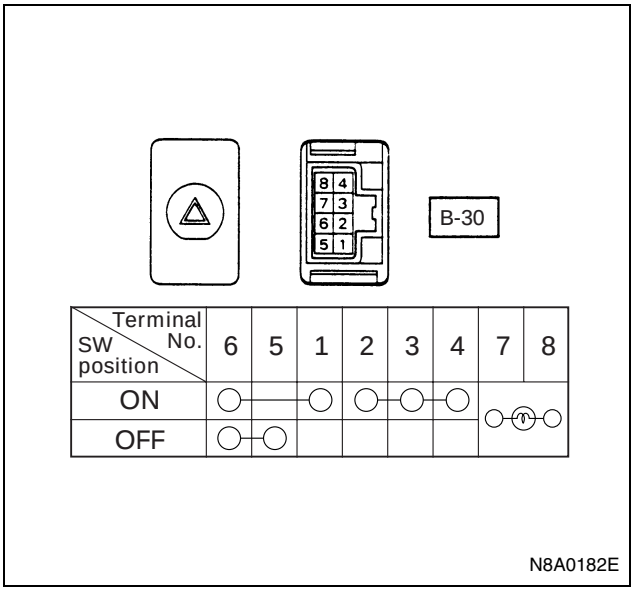


Hazard Warning Switch

Inspection

Check the continuity between the terminals of the hazard warning switch.

Repair or replace the switch when the result of inspection is found abnormal.

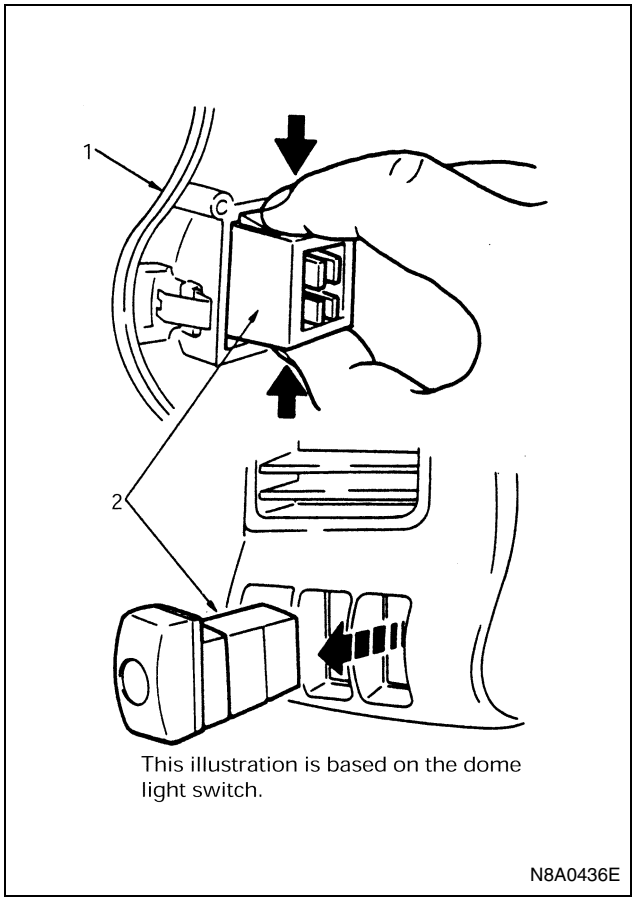


Removal

Preparation:

Disconnect the battery ground cable.

1. Meter Cluster
   Refer to the “METER AND WARNING/INDICATOR LIGHT” in this section.
2. Hazard Warning Switch
   Release the lock pushing the switch from the back side of the meter cluster.



Installation

To install, follow the removal steps in the reverse order noting the following point.

1. Push the switch with your fingers until locks securely.

Horn, Backup Light and Backup Buzzer

General Description

The circuit consists of the starter switch, horn, horn switch, backup light (Rear combination light), backup light switch, back buzzer and the relay.
When the horn switch is turned on independent of the position of the starter switch, the relay is activated to sound the horn. When the backup light switch turns on with the starter switch on, the backup light will operate.

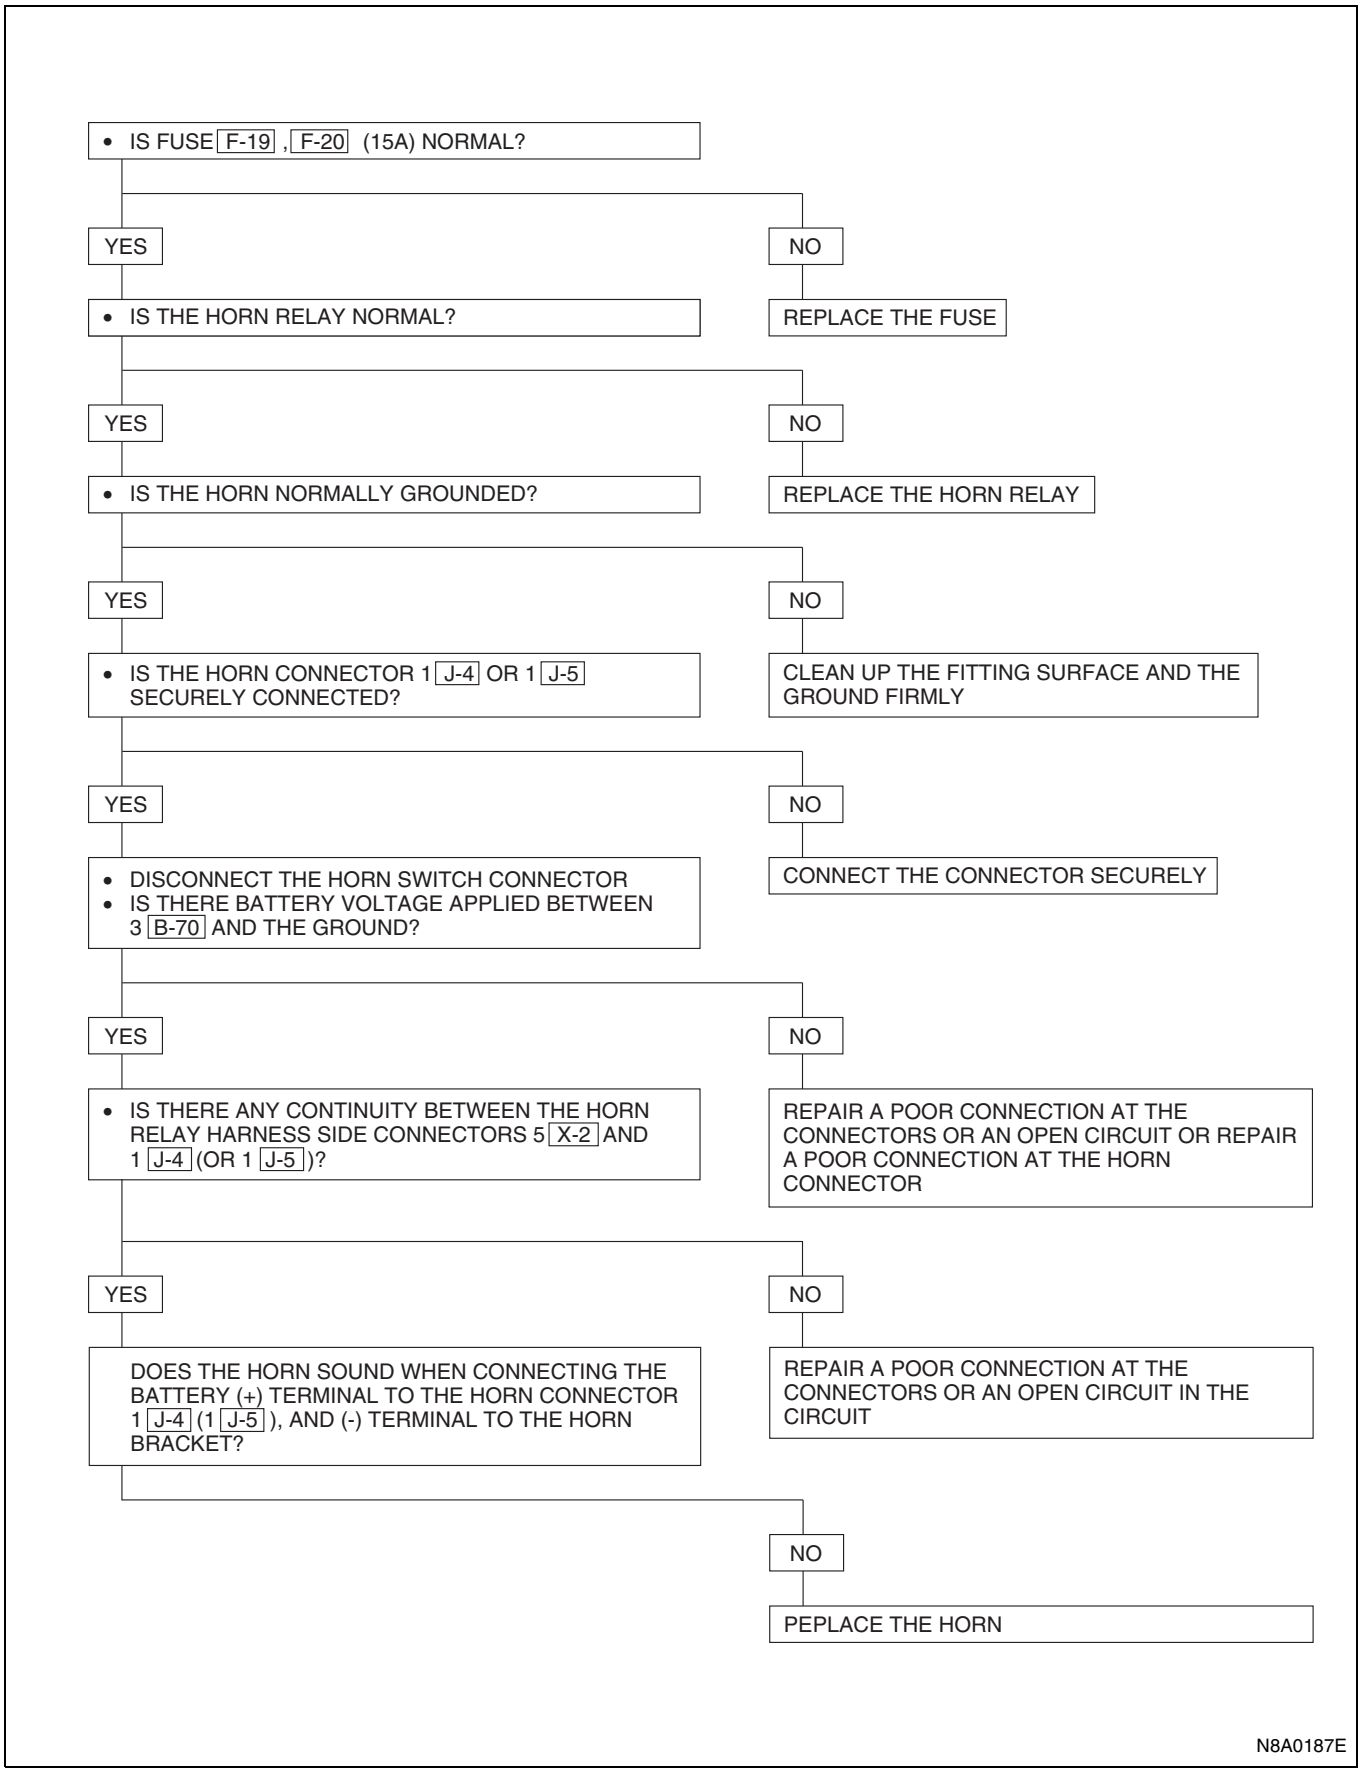
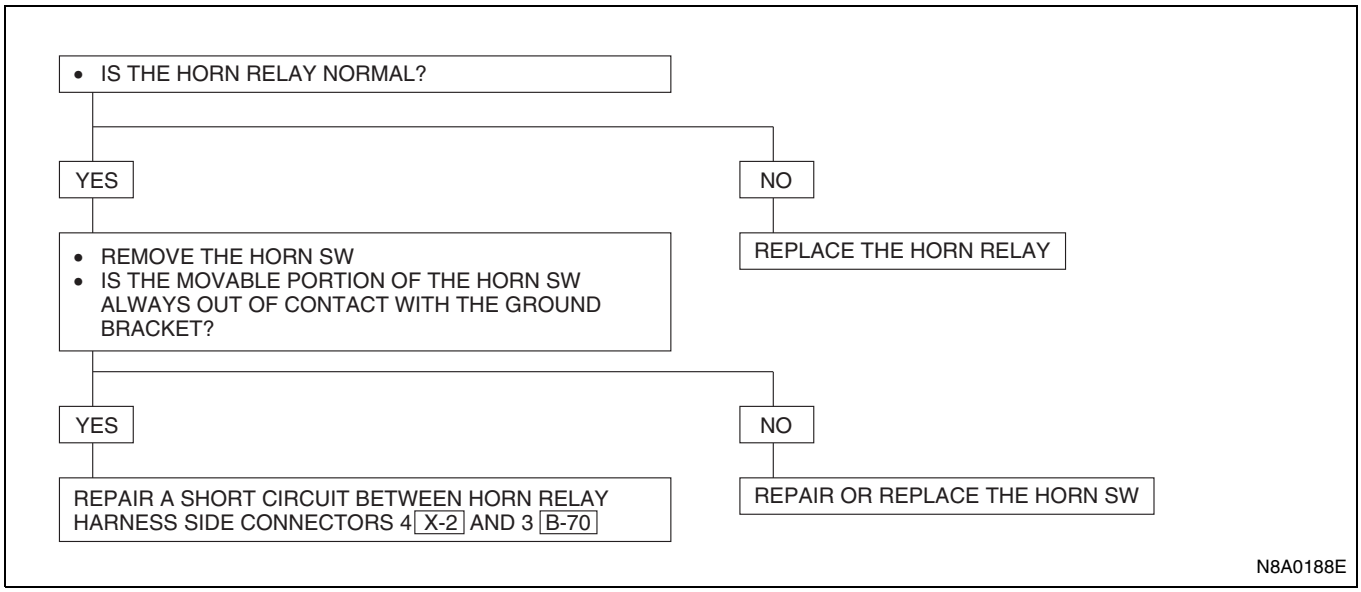
1-1. Horn Does Not Sound

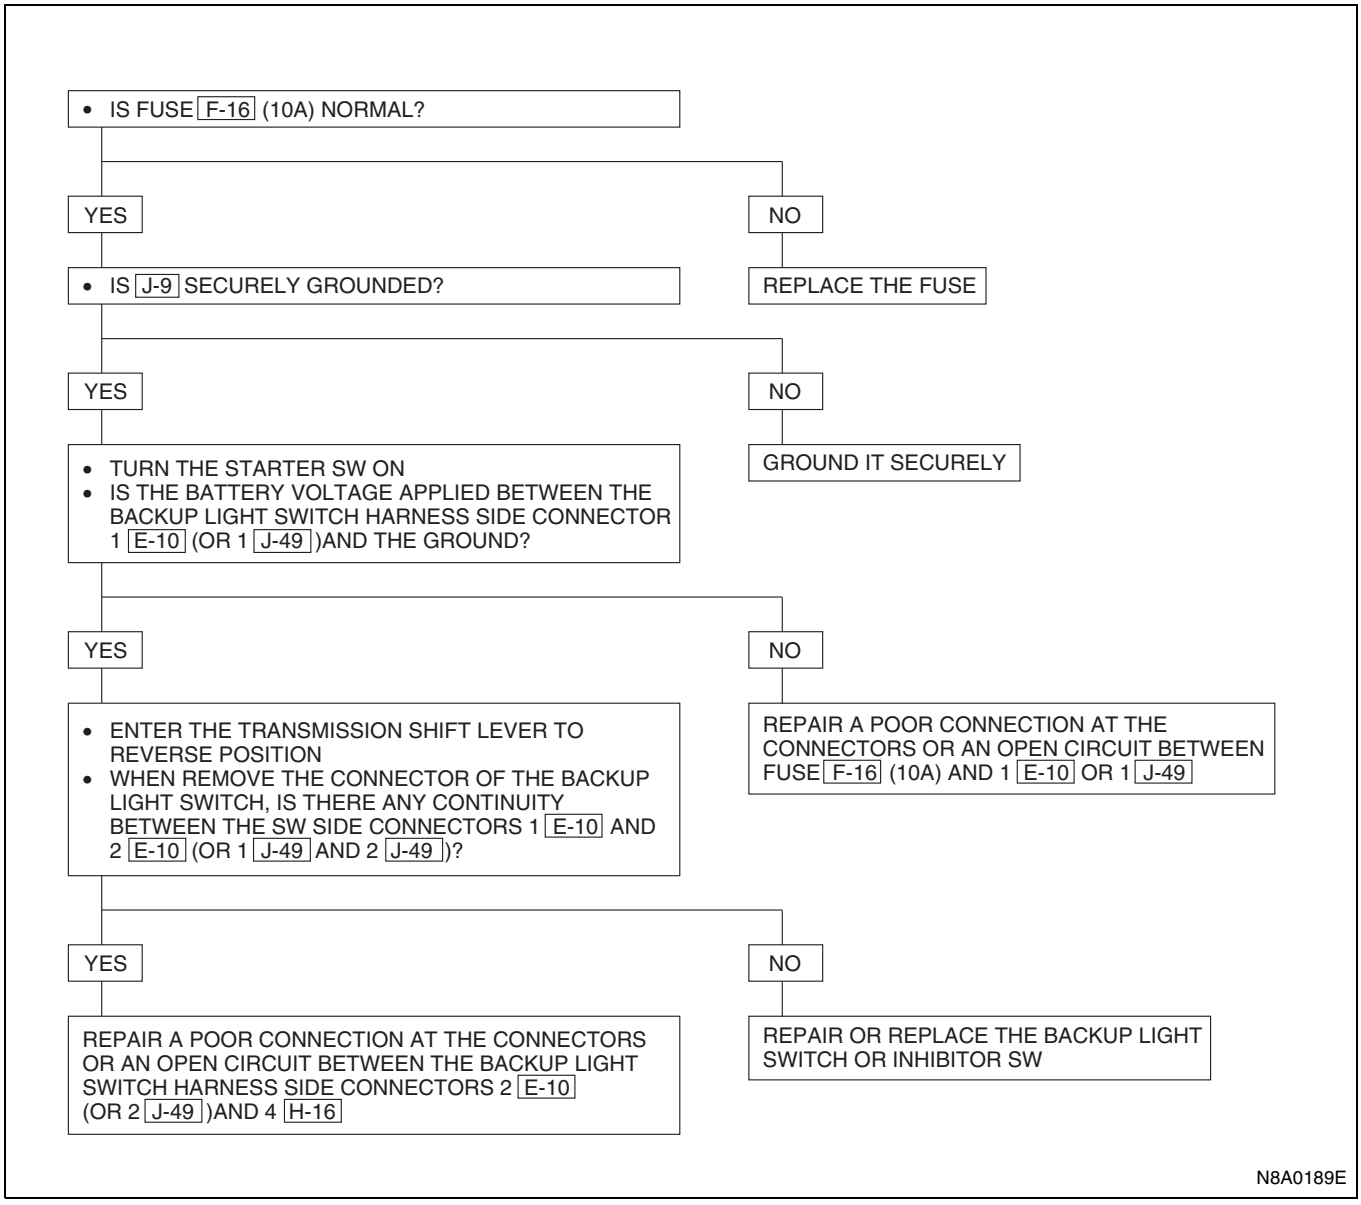


1-2. Horn Does Not Shut Off

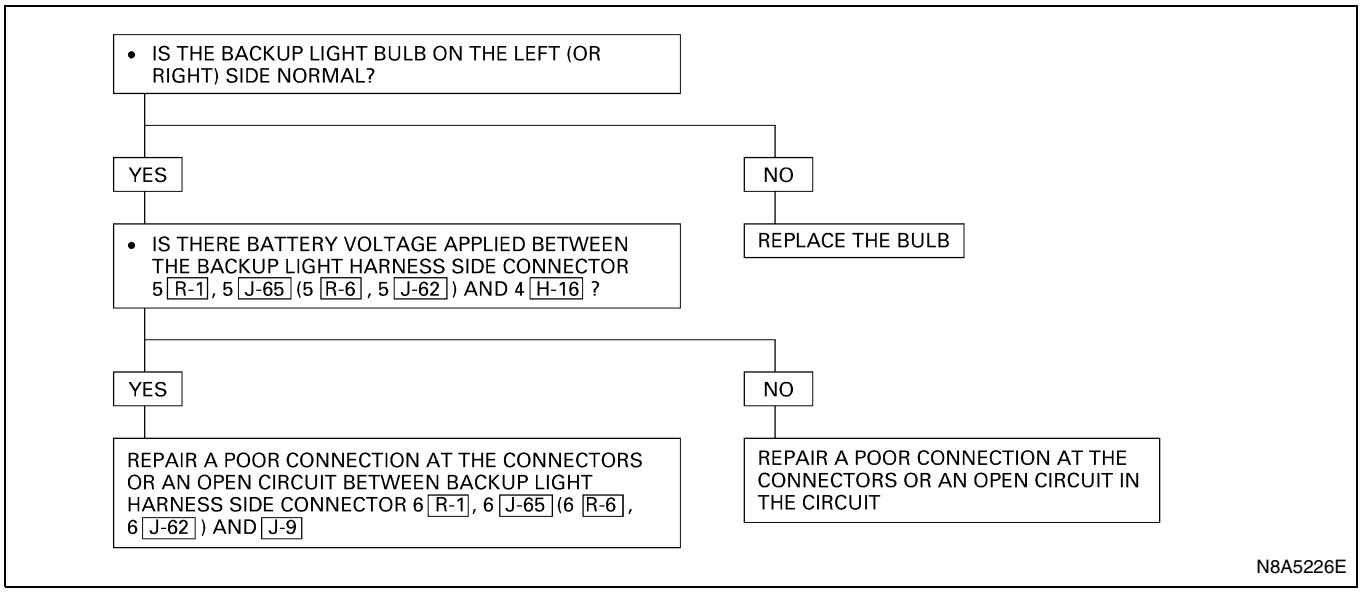


2. Backup Light

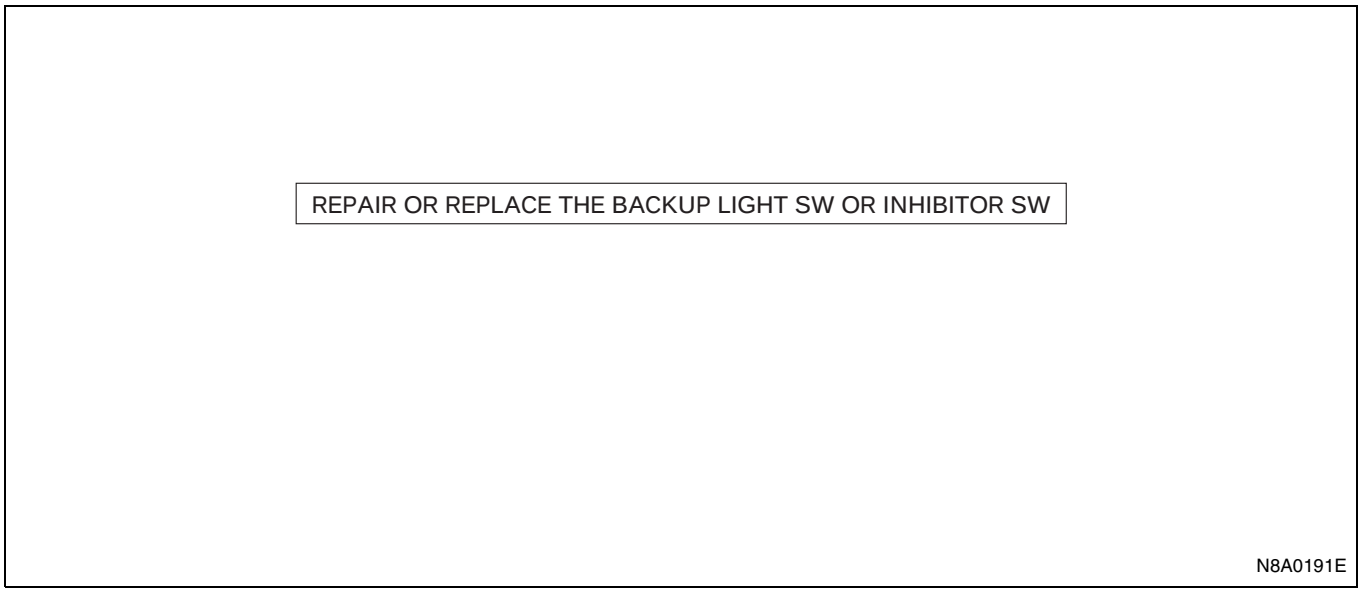
2-1. Backup Lights Inoperative



2-2. Backup Light on the Left (or Right) Side Inoperative



2-3. Backup Light Remains on



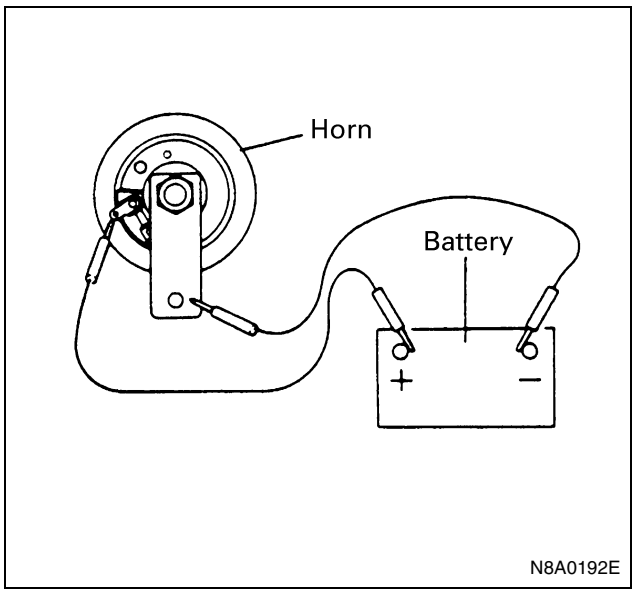
Starter Switch

Refer to “START AND CHARGING” in this section.

Horn

Inspection

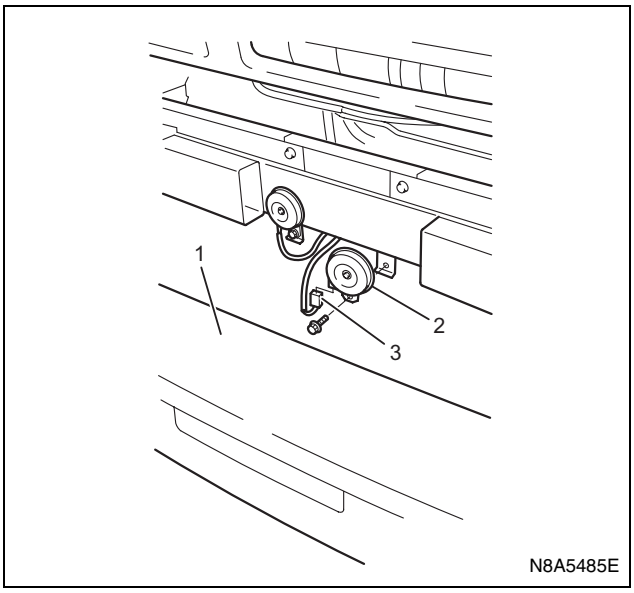
Check to see if horn sound when a battery voltage between horn terminal and the fixing bracket. Repair or replace the horn when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

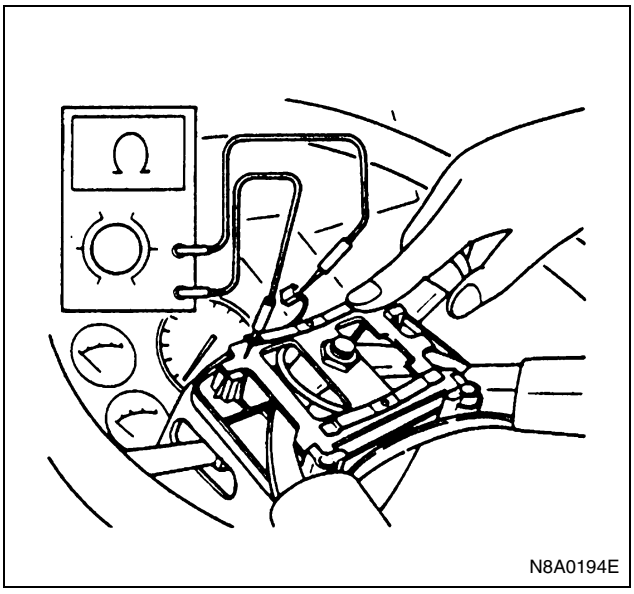
1. Bumper
   Refer to “BUMPER” in section 2.
2. Horn
   Disconnect the connector (3).



Installation
To install, follow the removal steps in the reverse order.

Horn Switch

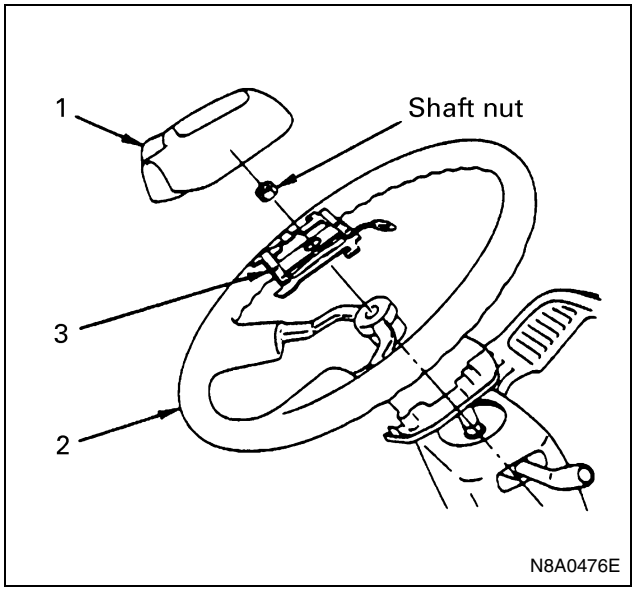
Inspection
With the contact point of the horn switch pressed to the switch bracket, check the continuity between the connector terminal and the bracket of the switch.
Check the contact condition between horn contact of the combination switch and contact plate of steering wheel.
Repair or replace the switch when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Horn Pad
   1) Hold the horn pad and pull it upward.
2. Steering Wheel
   1) Remove the steering shaft nut.
   2) Remove the steering wheel by using steering wheel remover.
      (Refer to Section 3B4 “STEERING COLUMN” for steering wheel removal steps.)
3. Horn Switch



Installation
To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the steering shaft nut to the specified torque.

Tighten:
Shaft nut to 49 N·m (5 kg·m / 36 lb·ft)

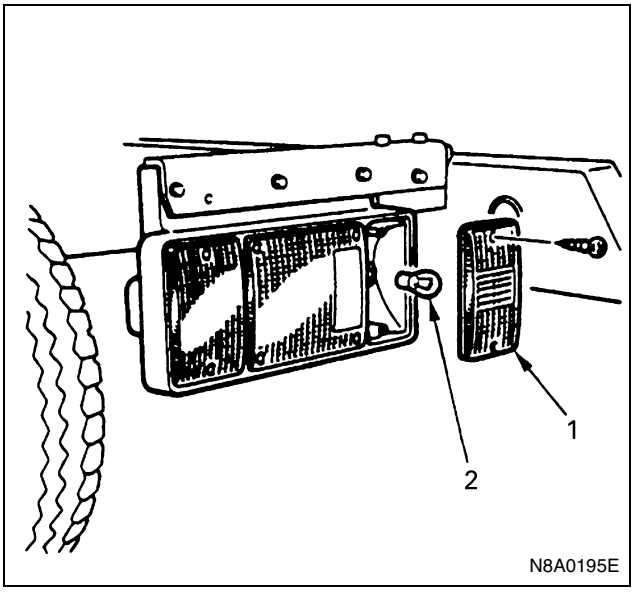
Backup Light Bulb

Removal

Preparation:

Disconnect the battery ground cable.

1. Lens
2. Bulb



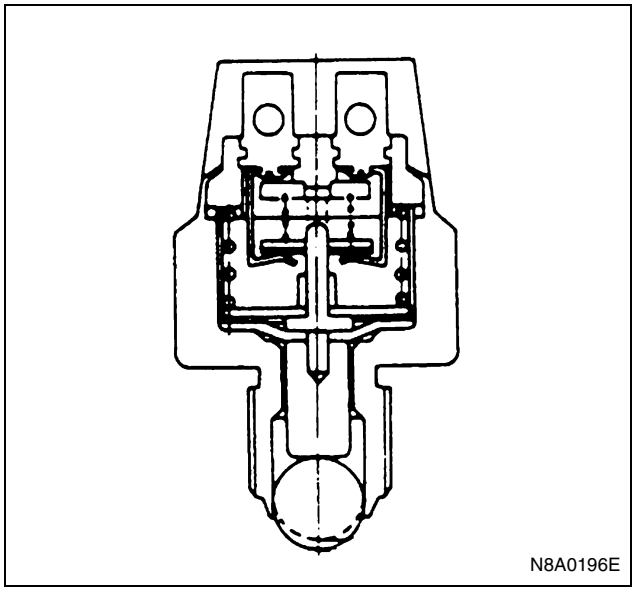
Installation

To install, follow the removal steps in the reverse order.

Backup Light Switch

Inspection

1. With the switch installed to the transmission, check the continuity between the terminals of the switch connectors.
   When the continuity is found between the terminals only with the switch shifted to the reverse position, the switch is normal.
2. When the result of the above inspection is found abnormal, remove the switch from the transmission and conduct a test on the switch alone.
   If the continuity appears between the connector terminals when the ball of the switch is released, the switch is normal. (When the ball is pushed, the continuity disappears.)
3. If there is no continuity with the switch installed to the transmission, even though the switch is found to be normal, then adjust the stroke of the switch by changing the thickness of the switch gasket.



Removal

Preparation:

Disconnect the battery ground cable.

1. Backup Light Switch
   1) Disconnect the connectors.
   2) Remove the switch by turning it counterclockwise.

Installation

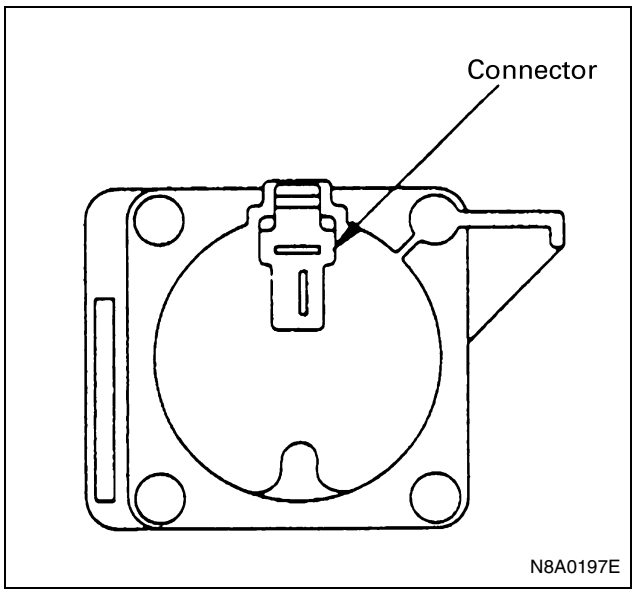
1. Backup Light Switch
   Apply liquid gasket to the screw portion of the switch to prevent oil leak.

Backup Buzzer

Inspection

Apply battery voltage to the backup buzzer connector to check the buzzer sound.

Repair or replace the buzzer when the result of inspection is found abnormal.

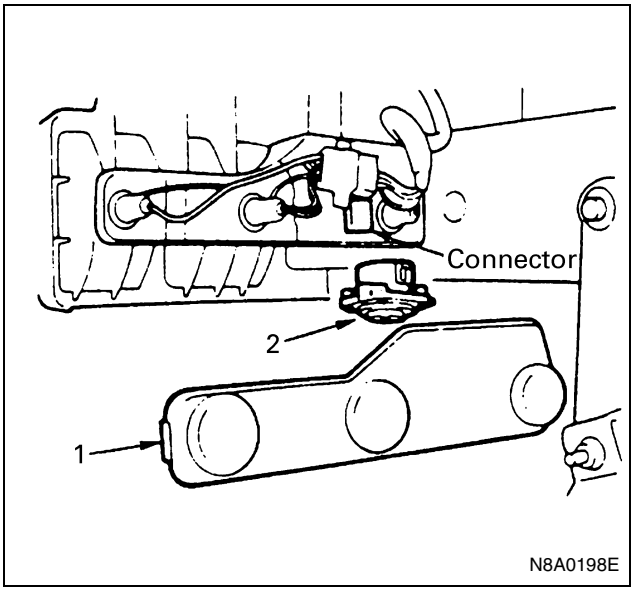


Removal

Preparation:

Disconnect the battery ground cable.

1. Rear Combination Light Cover
2. Backup Buzzer
   1) Remove the rear combination light connector fixing screw.
   2) Remove buzzer fixing screw.
   3) Disconnect the connector.



Installation

To install, follow the removal steps in the reverse order.

Dome Light and Key Remind Buzzer

General Description

The circuit consists of the starter switch, dome light, dome light switch, door switch, backup light switch and the key remind buzzer.
The dome light lights up when the left or right side door is opened with the switch set at the door mode. It can be lit by operating ON or OFF of the dome light switch.
The dome light can be lit by respective switch independent of the position of the starter switch.
By operating the dome light switch fitted on the instrument panel, the dome light can be lit independent of the switch position of dome light.
Key remind buzzer sounds to remind the driver of leaving the key in the starter switch when opening the driver's side door.

Removal

Preparation:

Disconnect the battery ground cable.

1. Lens
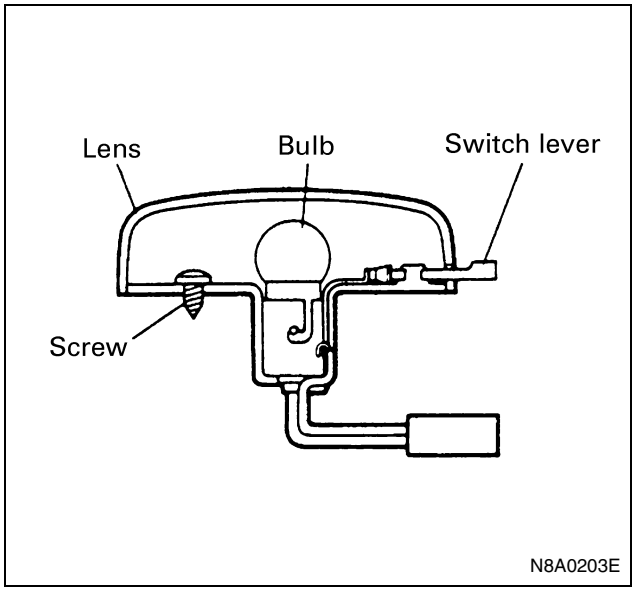
   Hold the lens and pull it down.
2. Bulb



Installation

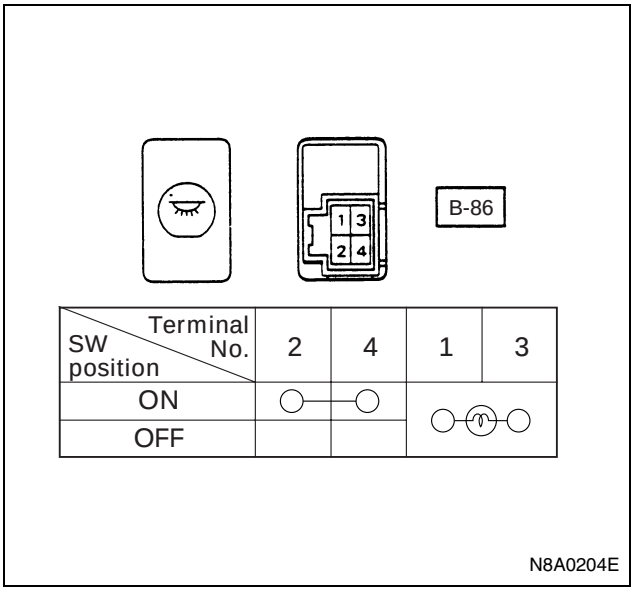
To install, follow the removal steps in the reverse order.

Dome Light Switch

Inspection

Check the continuity between the dome light switch connector terminals.

Repair or replace the switch when the result of inspection is found abnormal.



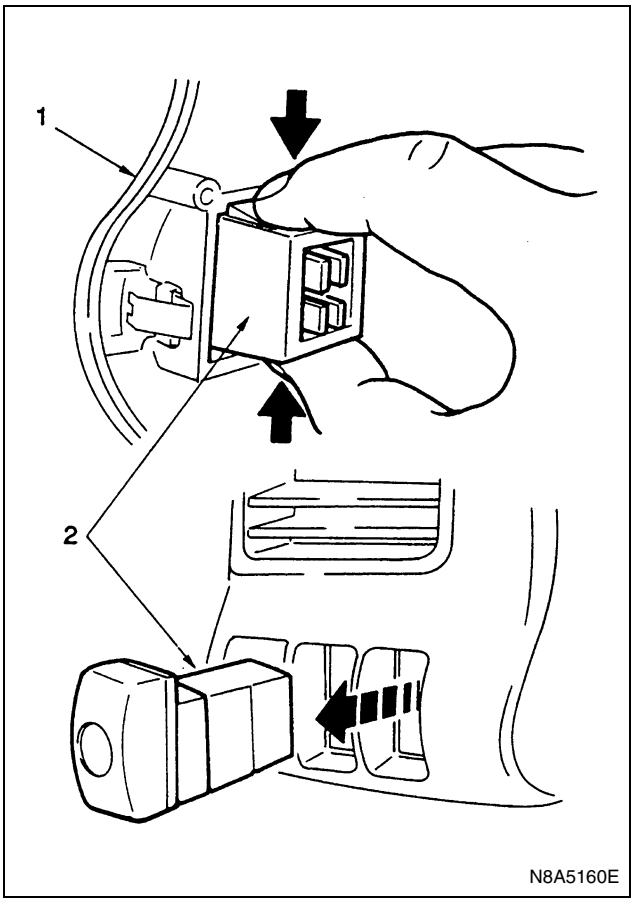
SW position \ Terminal No.	2	4	1	3
ON	○	○	○	○
OFF				

Removal

Preparation:

Disconnect the battery ground cable.

1. Meter cluster
   Refer to the “METER AND WARNING/INDICATOR LIGHT” in this section.
2. Dome Light Switch
   Release the lock pushing the switch from the back side of the meter cluster.



Installation

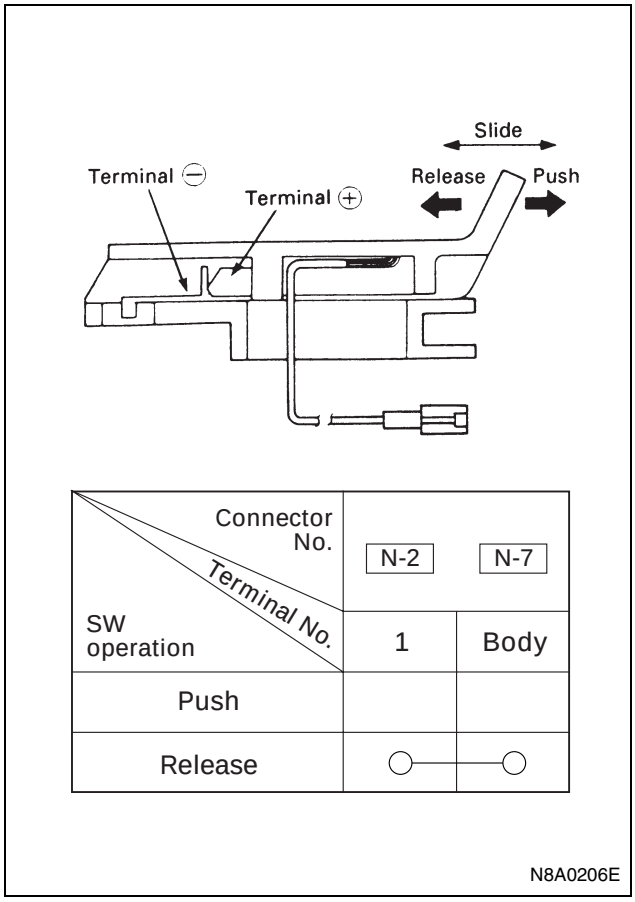
To install, follow the removal steps in the reverse order noting the following point.

1. Push the switch with your fingers until locks securely.

Door Switch

Inspection

Check to see if there is any continuity between the terminals and the body while operating the door switch. Repair or replace the switch, when the result of inspection is found abnormal.



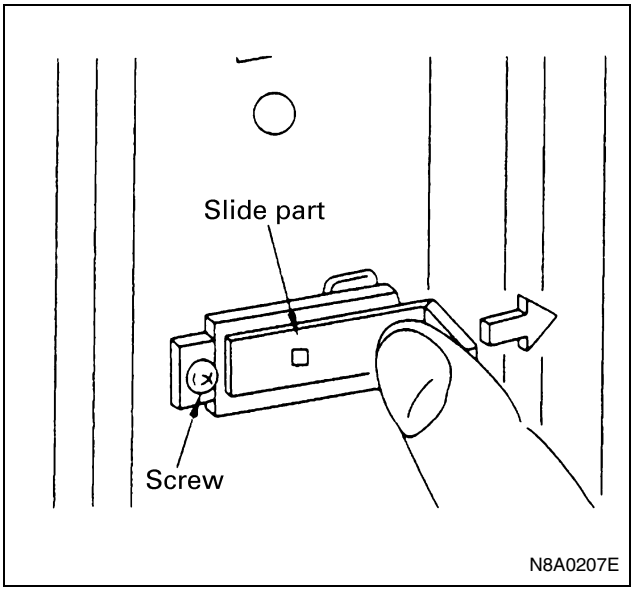
SW operation \ Connector No. / Terminal No.	N-2	N-7
	1	Body
Push		
Release	○	○

Removal

Preparation:

Disconnect the battery ground cable.

1. Door Switch
   1) Remove the screw.
   2) Disconnect the connector of the switch.

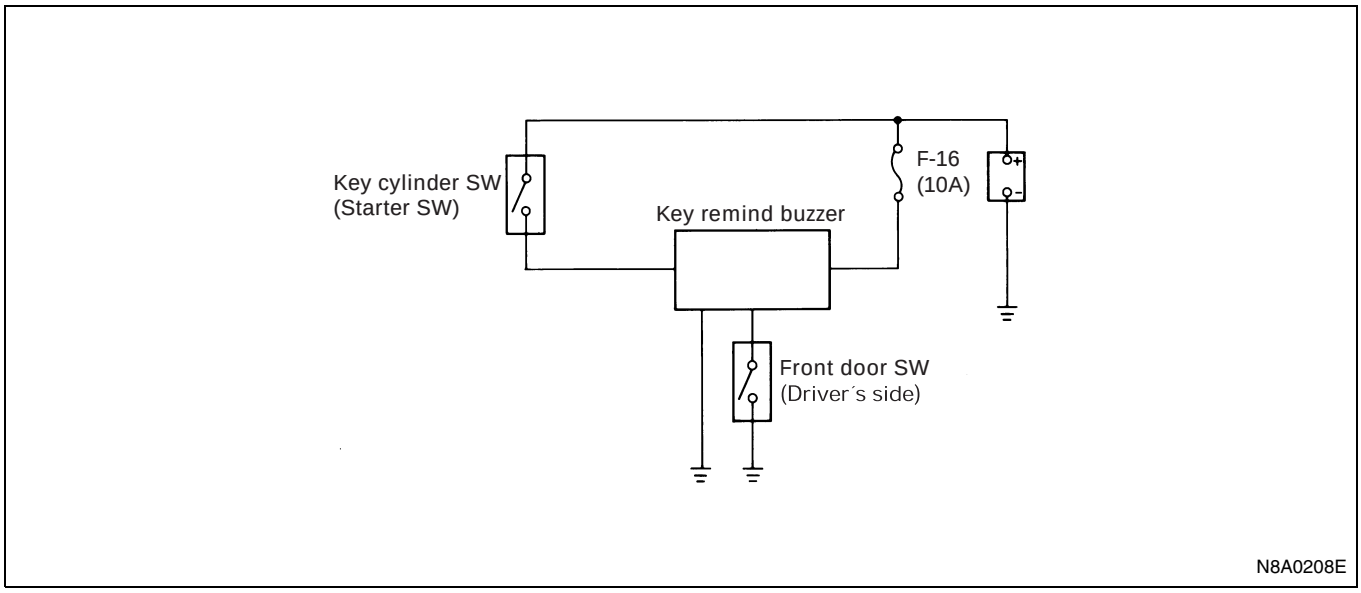


Installation

To install, follow the removal steps in the reverse order.

Key Remind Buzzer

The key remind buzzer sounds to remind the driver to remove the starter key from the starter switch when front driver side door is opened (Front driver side door switch is on).



Inspection of The Buzzer Circuit

Disconnect the key remind buzzer connector, measure the continuity and voltage between the harness side connector terminals.

B-83

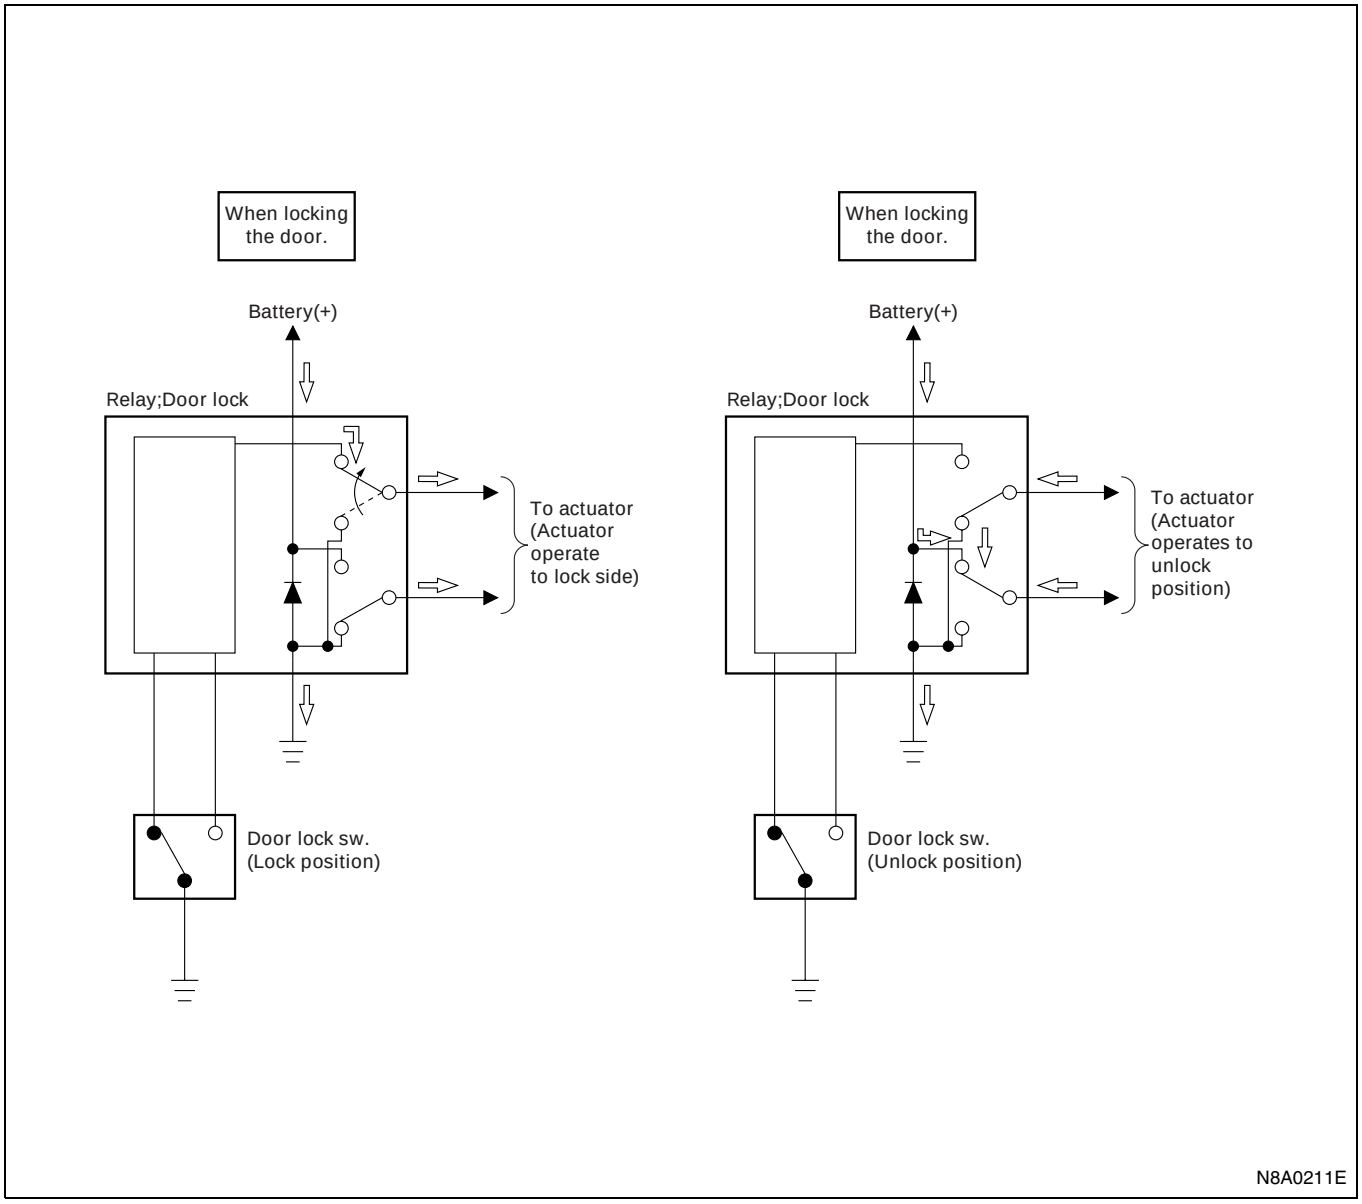
Power Door Lock

General Description

The circuit consists of the door lock switch, actuator for the front passenger door, rear doors and the door lock controller.
The door lock controller is always provided with battery voltage. The key or the inside lock knob on the driver's door can activate the lock mechanism of all the doors.
When the driver's door lock switch is turned on, current flows for about one second to the door lock actuator of each door connected in parallel with the controller to activate the actuator to lock and unlock the doors.

Operation of Door Lock Controller



Notice:
Arrow marks indicate the direction of current.

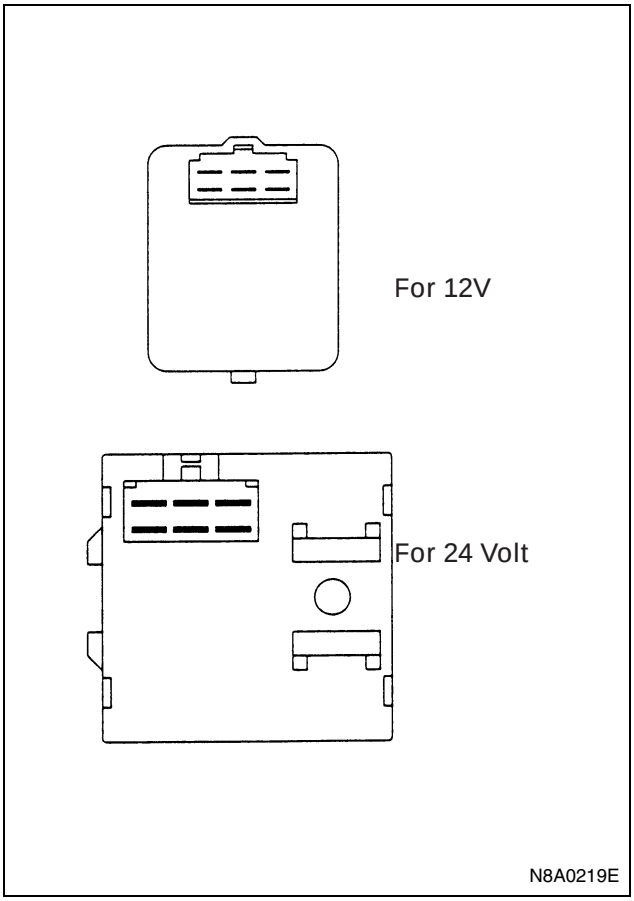
N8A0218E

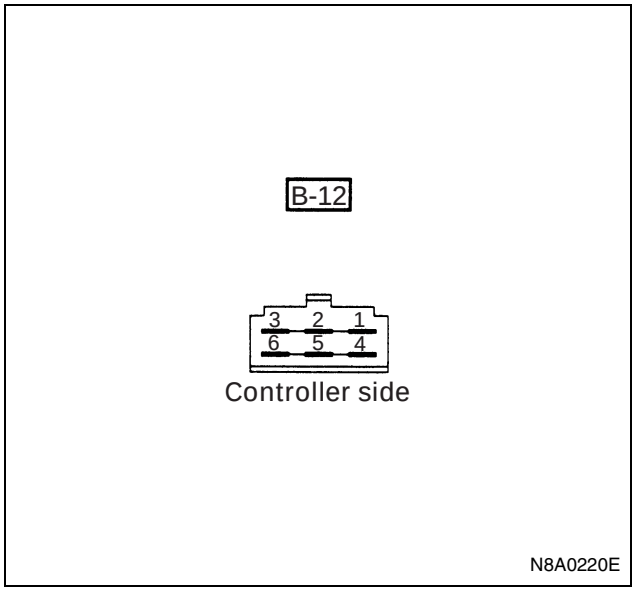
Door Lock Relay

The door lock controller sends out to each door lock actuator the lock/unlock signals received from door lock switch of driver seat side.



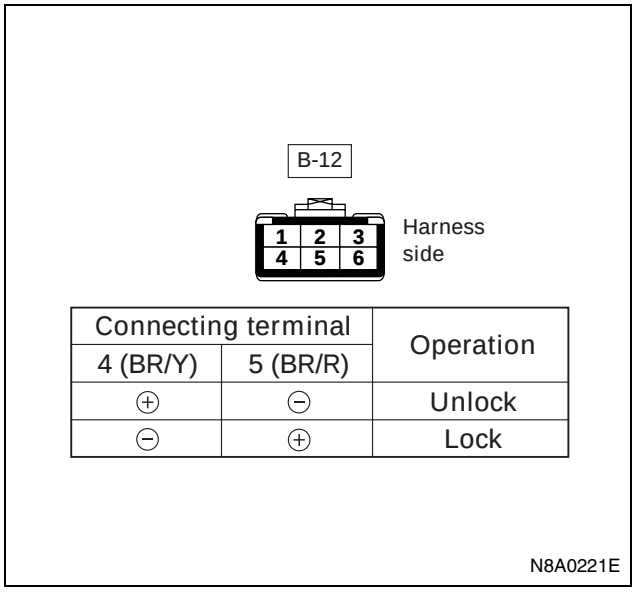
Inspection

Remove the connector of the door lock controller, and check the continuity and the voltage between the controller side connector terminals.
(Connect the (+) terminal of the battery to 6 B-12 and the (–) terminal to 3 B-12.)
3 B-12 — 5 B-12.....Continuity
3 B-12 — 4 B-12.....Continuity
(Then, ground 2 B-12.)
5 B-12.....Voltage for approx. 1 second
(Disconnect the ground of 2 B-12, and ground 1 B-12.)
4 B-12.....Voltage for approx. 1 second
Replace the controller when the result of inspection is found abnormal.



Door Lock Operation Test

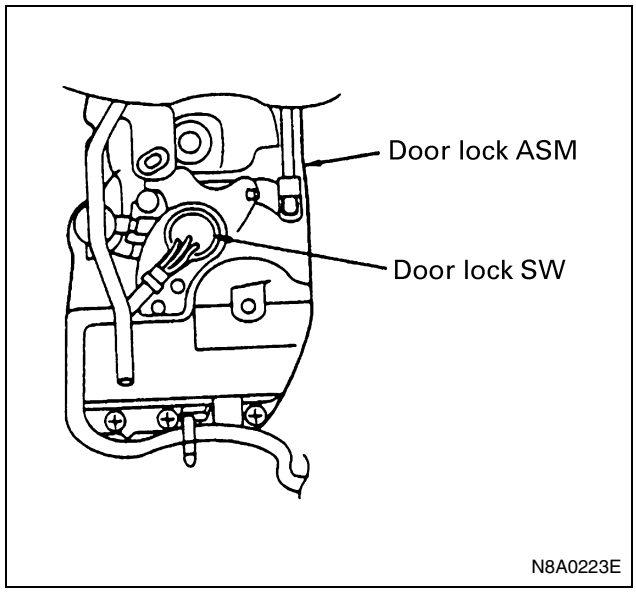
After confirming that there is continuity between the harness side connector terminals 4 B-12 and 5 B-12 of the door lock controller, apply battery voltage to each of the terminals to conduct the operation test.
When the door lock will not operate, check the door lock actuator for any trouble.



Connecting terminal		Operation
4 (BR/Y)	5 (BR/R)	
⊕	⊖	Unlock
⊖	⊕	Lock

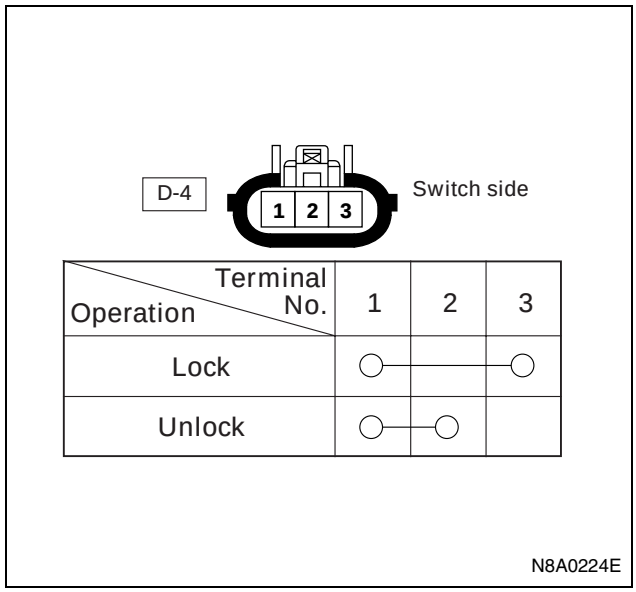
Door Lock Switch (Driver Seat Side)

The door lock switch on the driver's door is connected with the door lock cylinder and the inside lock knob with a rod. The switch sends lock/unlock signals to the door lock controller.



Inspection

Check to see if there is any continuity between the connector terminals of the door lock switch.
Replace the switch when the result of inspection is found abnormal.

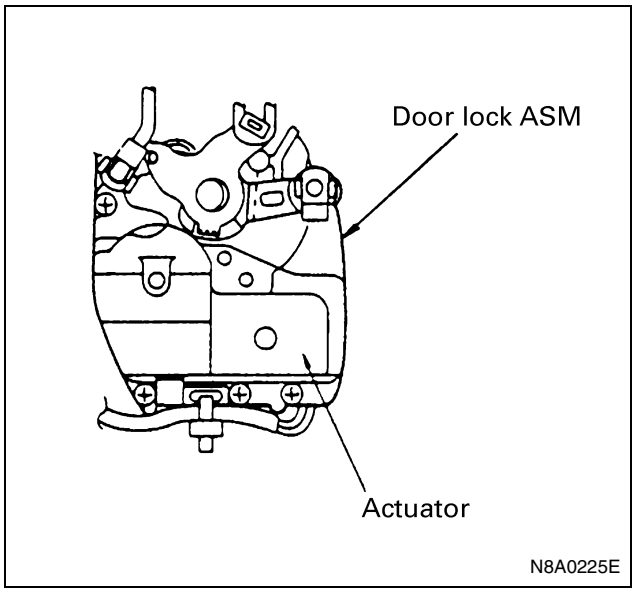


Removal and Installation

Refer to Section 2 for "DOOR LOCK ASSEMBLY".

Door Lock Actuator

Receiving forward or reverse current from the door lock controller, the door lock actuator locks or unlocks the door with the rod connected to the door lock mechanism.



Inspection of The Door Lock Actuator

Apply the battery voltage to the connector terminals of the door lock actuator to check the operation.
When the door lock actuator is checked on the vehicle and there is no continuity, and when the door lock actuator itself is checked and no trouble is found, check the circuit between the door lock actuator and the door lock controller for any failure.

N8A0226E

Removal and Installation

Refer to Section 2 for “DOOR LOCK ASSEMBLY”.

Power Window

General Description

The circuit consists of the starter switch, power window switch for each of the windows and power window motor.
When the starter switch is turned on, the battery voltage is applied to each of the power window switches through the circuit breaker and the power window relay on the circuit.
By operating the switches of each window to select “UP” or “DOWN”, the revolving direction of the power window motor changes to open or close the window.
The driver’s power window switch has a built-in one-touch operating circuit which allows to automatically open the window by operating the switch to the AUTO position.
When the driver’s power lock switch at the driver side is depressed, the power source to the passenger’s power window switches will be shut off and passenger’s side power window motor will not operate if the switch is operated.

Operation of Passenger Side Window

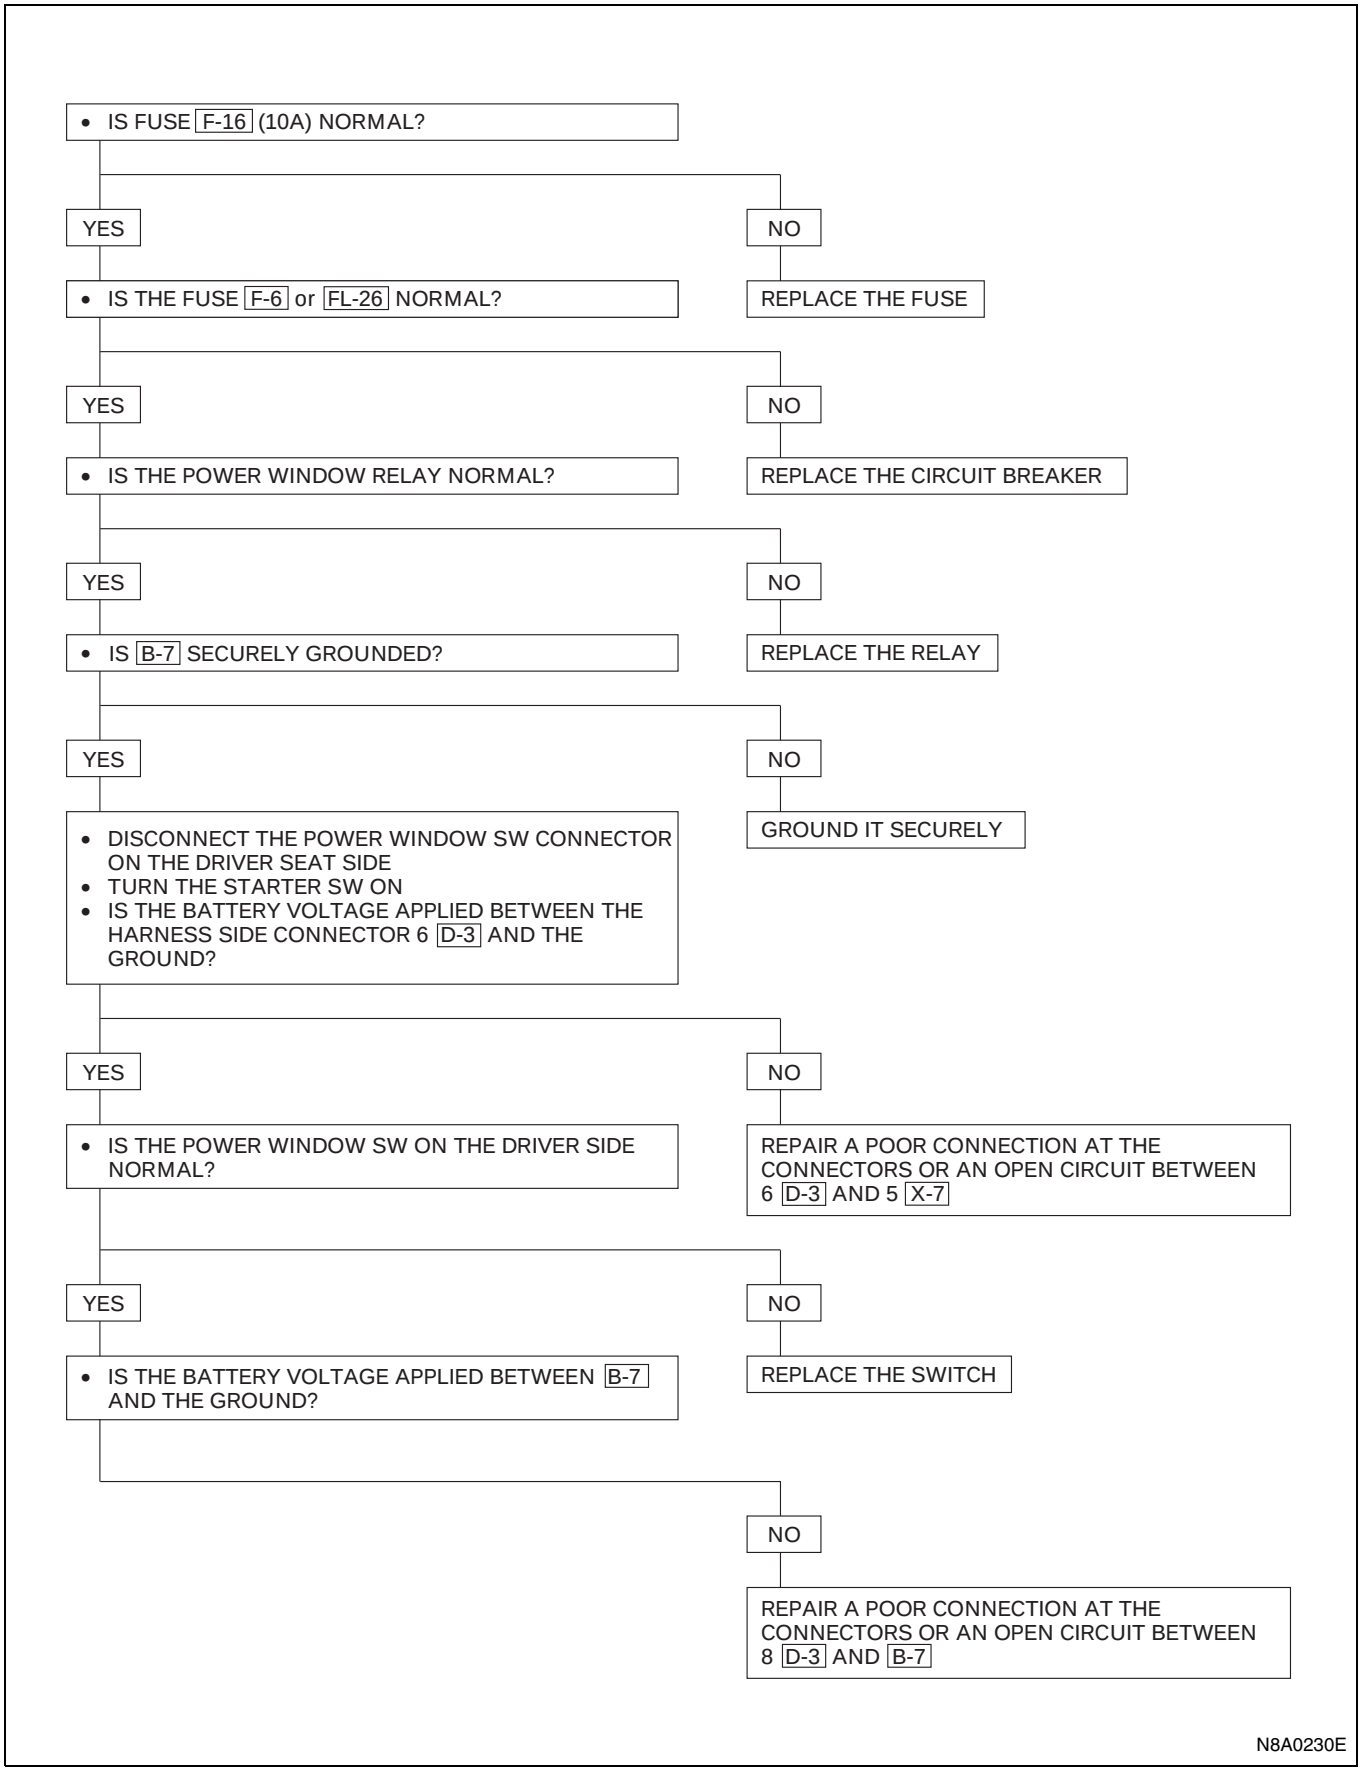
All Windows Do Not Operate



Lock Sw Does Not Function

REPAIR OR REPLACE THE POWER WINDOW SW ON THE DRIVER SEAT SIDE

N8A0231E

Window on the Driver Side Does Not Operate

- IS THE POWER WINDOW SWITCH ON THE DRIVER SEAT SIDE NORMAL?

YES

- DISCONNECT THE CONNECTOR OF THE POWER WINDOW MOTOR ON THE DRIVER SEAT SIDE
- WHEN CONNECTING THE MOTOR CONNECTOR 1 [D-2] TO THE BATTERY (+) TERMINAL AND 2 [D-2] TO THE (-) TERMINAL, DOES THE MOTOR ROTATE IN THE "UP" DIRECTION OF THE WINDOW (OR WHEN CONNECTING 2 [D-2] TO THE (+) TERMINAL AND 1 [D-2] TO THE (-) TERMINAL, DOES THE MOTOR ROTATE IN THE "DOWN" DIRECTION OF THE WINDOW)?

YES

REPAIR A POOR CONNECTION AT THE CONNECTORS OR AN OPEN CIRCUIT BETWEEN HARNESS SIDE CONNECTOR TERMINALS 1 [D-3] AND POWER WINDOW MOTOR 1 [D-2] OR 2 [D-3] AND 2 [D-2]

NO

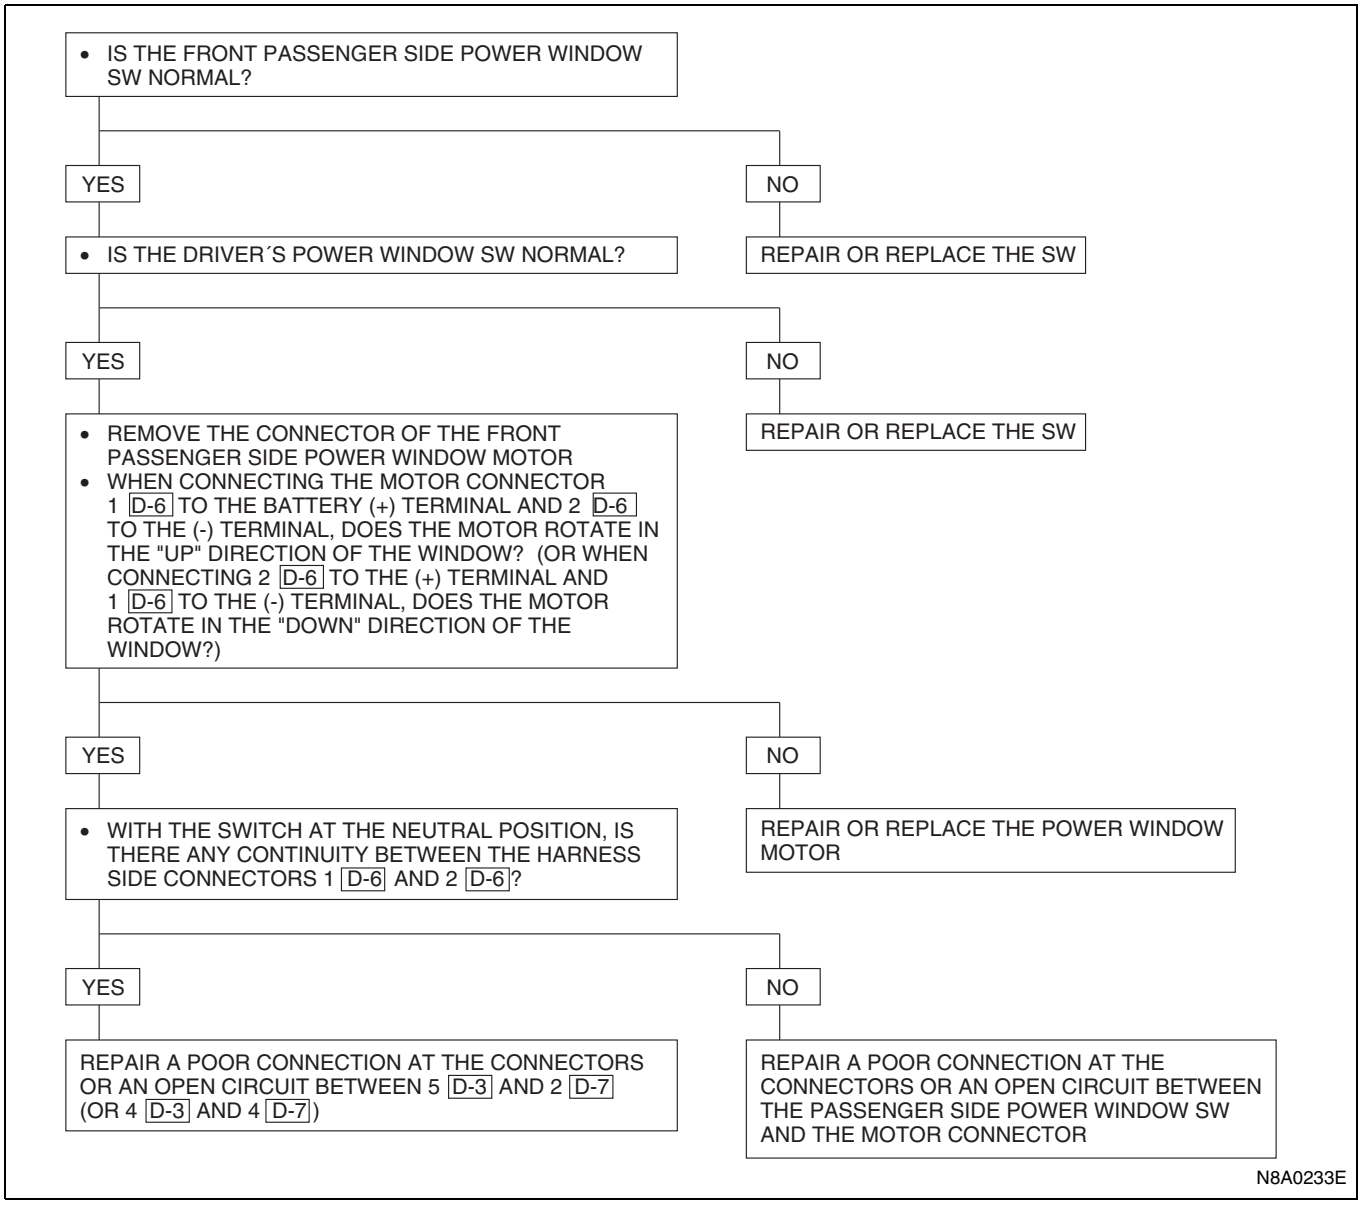
REPAIR OR REPLACE THE POWER WINDOW MOTOR

NO

REPLACE THE POWER WINDOW SWITCH ON THE DRIVER SEAT SIDE

N8A0232E

Window on the Front Passenger Side Does Not Operate



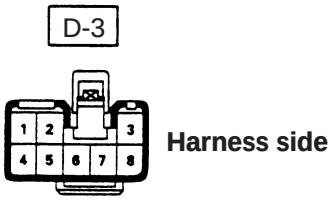
Starter Switch

Refer to “START AND CHARGING” in this section.

Power Window Switch-driver Side

Circuit Inspection

Disconnect the switch connectors to check the voltage and the continuity between the harness side connector terminals.



Terminal No.	Wire color	Connected to	Item to be checked	Connecting terminal	Checking conditions	Standard
1	L/W	Driver seat side motor	Continuity (resistance)	1-2	-	Continuity

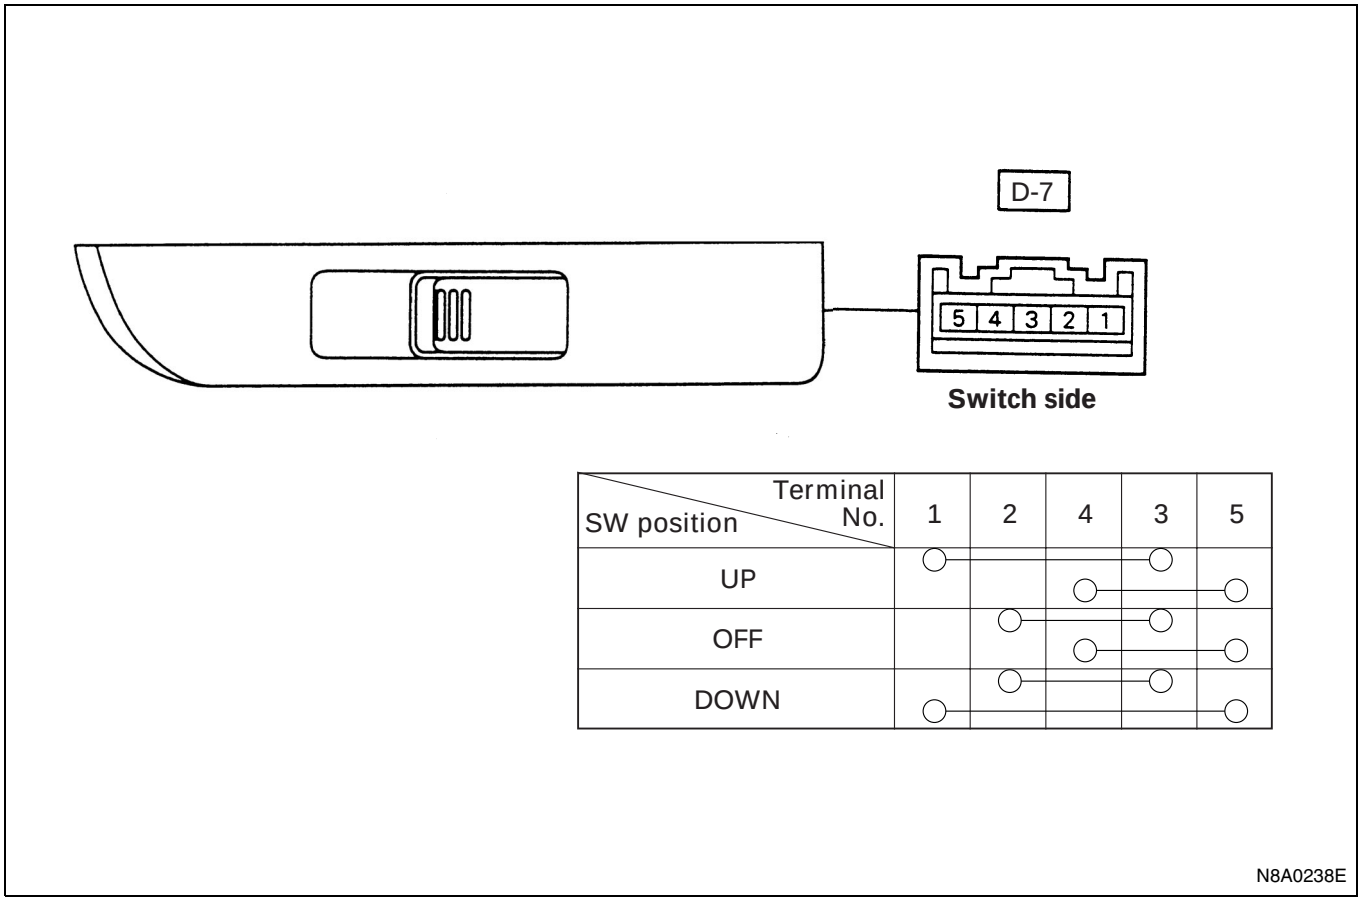
5	BR/Y	Passenger side motor	Continuity (Resistance)	5-3	–	Continuity

N8A5280E

Inspection

Check the continuity between the connector terminals of the switch.
Repair or replace the switch when the result of inspection is found abnormal.

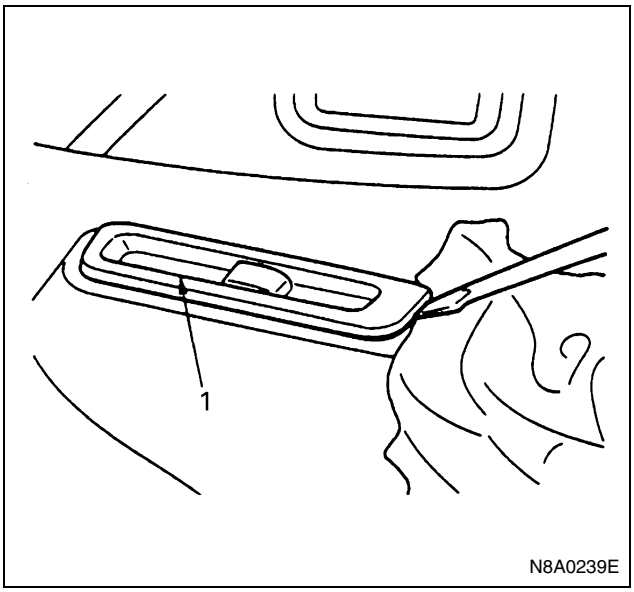


Removal

Preparation:

Disconnect the battery ground cable.

1. Switch
   1) Insert the screw driver to the cut off portion to remove the switch.
   2) Disconnect the connector.



Installation

To install, follow the removal steps in the reverse order.

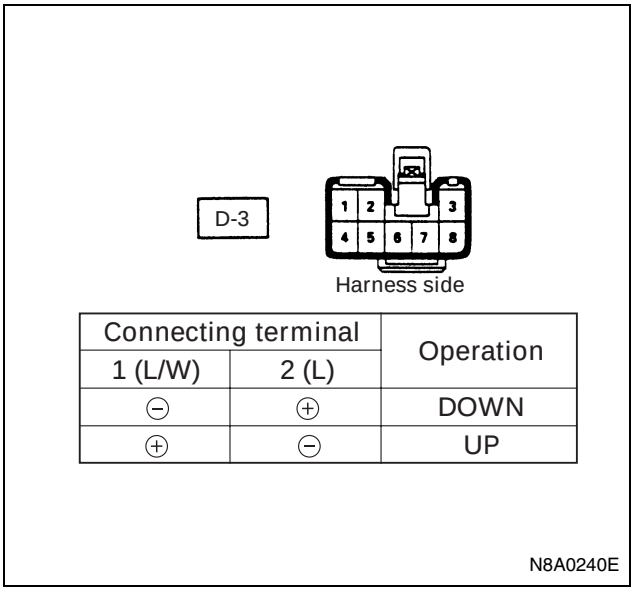
Driver Seat Side Power Window Motor

Inspection

Before checking to see if the motor functions correctly, be sure to check the circuit through the connector D-3 of the driver's power window switch.

If the motor does not operate smoothly, either the motor or the circuit between the switch and the motor is defective.

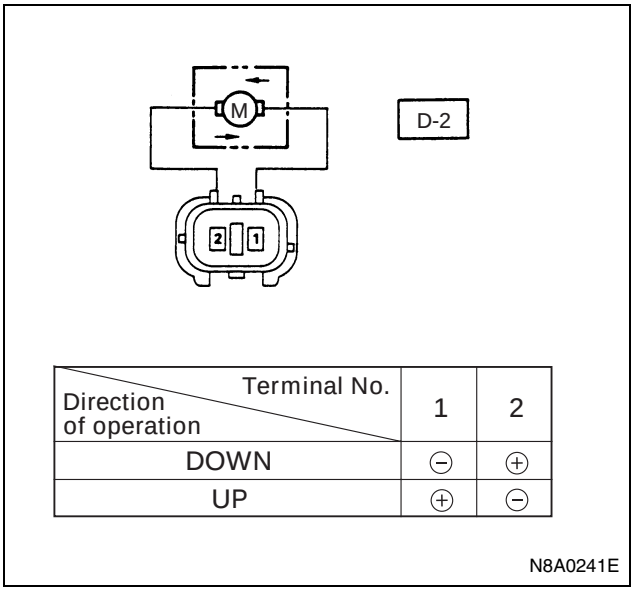
1. Circuit inspection of the driver side window switch
   Disconnect the switch connector and apply battery voltage to the harness side connector terminals to check its function.



Connecting terminal		Operation
1 (L/W)	2 (L)	
⊖	⊕	DOWN
⊕	⊖	UP

N8A0240E

2. Inspection of the driver seat side motor
   Remove the motor connector and apply battery voltage to the motor side connector terminals to check its function.
   Replace the motor when the result of inspection is found abnormal.



Direction of operation \ Terminal No.	1	2
DOWN	⊖	⊕
UP	⊕	⊖

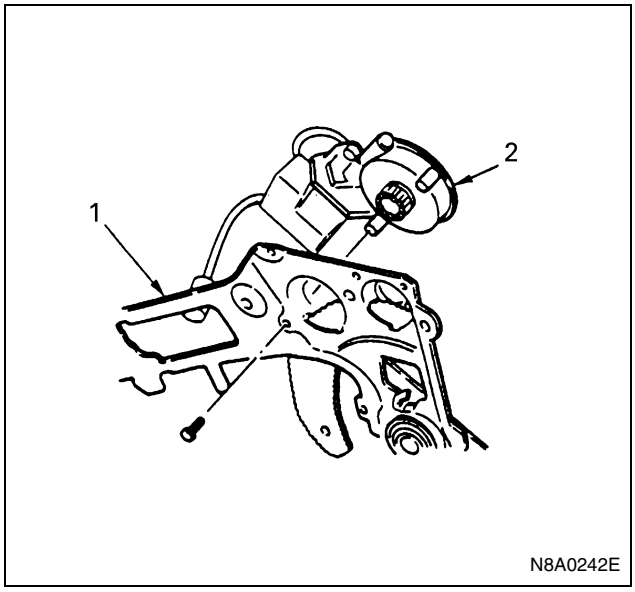
N8A0241E

Removal

Preparation:

Disconnect the battery ground cable.

1. Window Regulator Assembly
   Refer to Section 2 for Window Regulator and Glass.
2. Power Window Motor
   Remove three screws.



N8A0242E

Installation

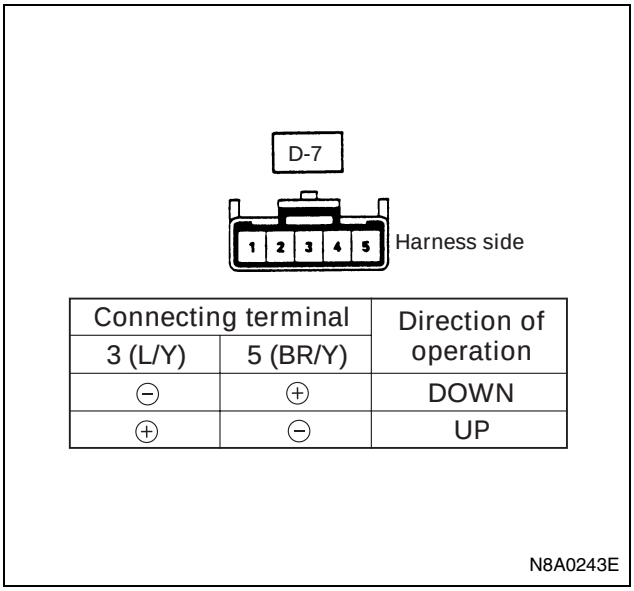
To install, follow the removal steps in the reverse order.

Front Passenger Seat Side Power Window Motor

Inspection

Before checking to see if the motor functions correctly, be sure to check the circuit through the front passenger's switch connector D-7 and the driver's power window switch connector D-3.
If the motor does not operate smoothly, either the motor or the circuit between the switch and the motor is defective.

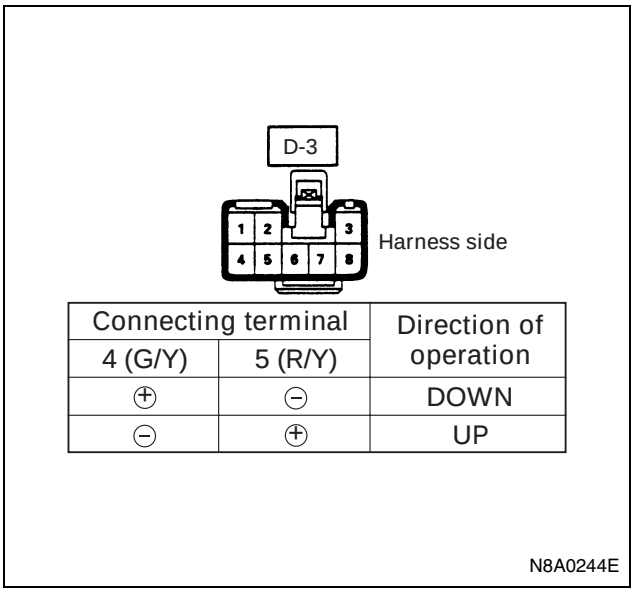
1. Circuit inspection of the front passenger seat side window
   Disconnect the switch connector and apply battery voltage to the harness side connector terminals to check its function.



Connecting terminal		Direction of operation
3 (L/Y)	5 (BR/Y)	
⊖	⊕	DOWN
⊕	⊖	UP

N8A0243E

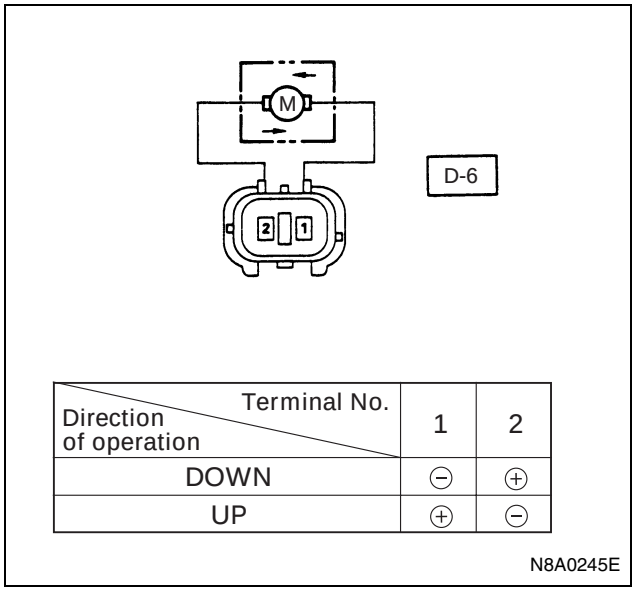
2. Circuit inspection of the driver seat side switch
   Disconnect the switch connector and apply battery voltage to the harness side connector terminals to check its function.



Connecting terminal		Direction of operation
4 (G/Y)	5 (R/Y)	
⊕	⊖	DOWN
⊖	⊕	UP

N8A0244E

3. Inspection of the front passenger window motor
   Disconnect the motor connector and apply battery voltage to the motor side connector terminals to check its function.
   Repair or replace the motor when the result of inspection is found abnormal.



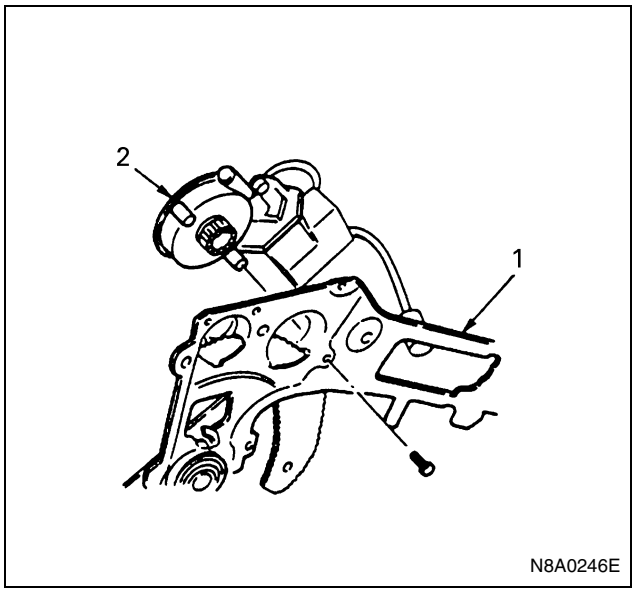
Direction of operation \ Terminal No.	1	2
DOWN	⊖	⊕
UP	⊕	⊖

N8A0245E

Removal

Preparation:
Disconnect the battery ground cable.

1. Window Regulator Assembly
   Refer to Section 2 for Window Regulator and Glass.
2. Power Window Motor
   Remove three screws.



N8A0246E

Installation

To install, follow the removal steps in the reverse order.

Windshield Wiper and Washer

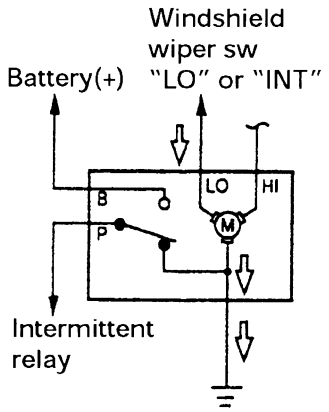
General Description

The circuit consists of the starter switch, windshield wiper & washer switch, wiper motor, washer motor and the intermittent relay.
When the wiper & washer switch is turned on with starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.
The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The intermittent relay is used to control motion of the wiper.

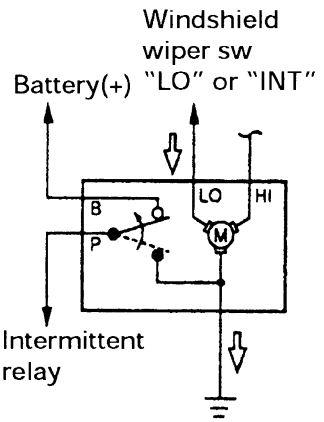
Operation of Windshield Wiper Motor

(When wiper “LO” or “INT” position)

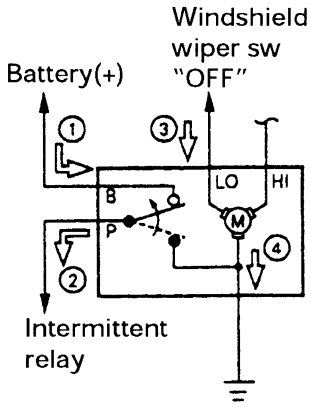
1. Condition of wiper switch is "LO"or "INT"position (Wiper motor is starting to operate)



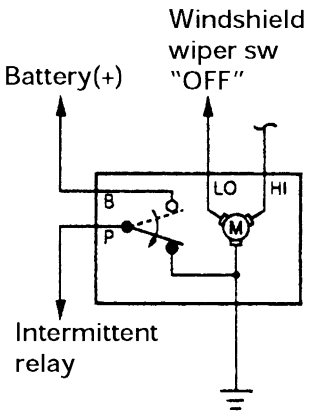
2. Condition of wiper motor is operating



3. Condition of wiper switch is just "OFF" (Wiper motor is still operating until auto-stop position)



4. Wiper motor stops at auto-stop position



N8A0250E

Notice:
Arrow marks indicate the direction of current.

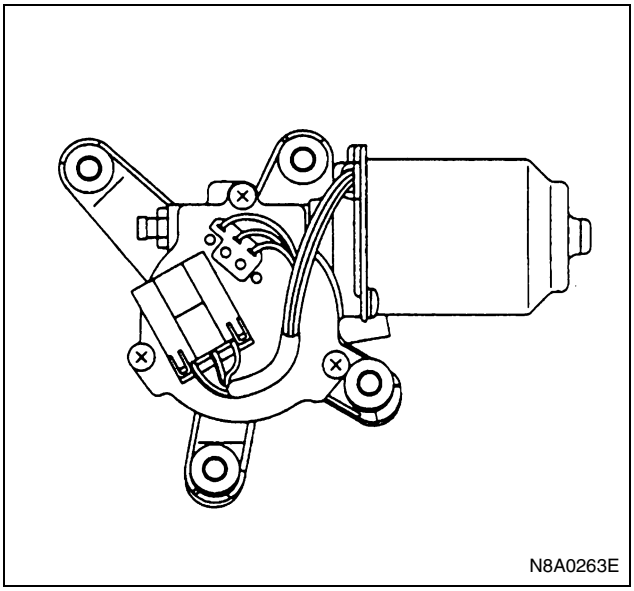
N8A0262E

Removal and Inspection

Refer to “HEADLIGHT, FOG LIGHT AND CORNERING LIGHT” in this section.

Windshield Wiper Motor



N8A0263E

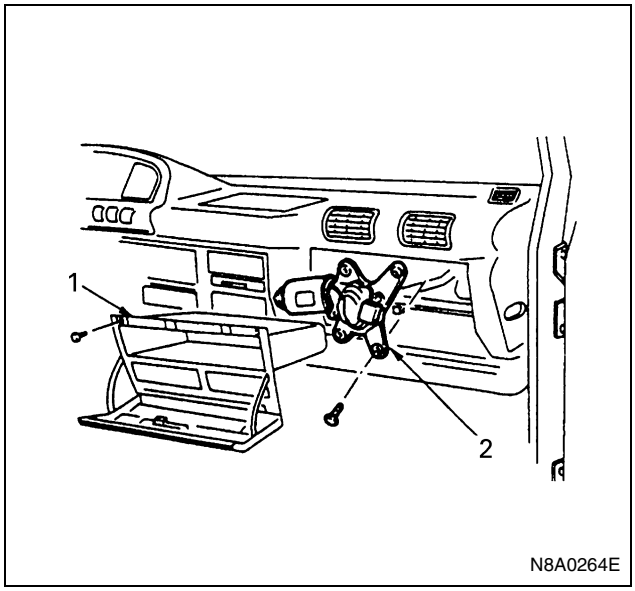
Inspection

1. Operation in low speed
   With the motor connector terminal 2 B-11 connected to the battery (+) terminal and the connector 1 B-11 to the (–) terminal, check to see if the motor rotates in low speed.
2. Operation in high speed
   With the motor connector terminal 3 B-11 connected to the battery (+) terminal and the connector 1 B-11 to the (–) terminal, check to see if the motor rotates in low speed.
3. Stop operation
   After stopping the windshield wiper in the position on the way by confirming the operation at the low speed in item No. 1.
   When the connectors 2 B-11 and 5 B-11 are connected, while connecting the motor connector terminal 4 B-11 to the battery (+) terminal, check to see, if the motor rotates at low speed and stops at the auto-stop position.
   Repair or replace the motor when the results of the above inspections are found abnormal.

Removal

Preparation:
Disconnect the battery ground cable.

1. Glove Box
   Refer to “INSTRUMENT PANEL” of section 2.
2. Windshield Wiper Motor
   1) Disconnect the connector.
   2) Remove four screws.
   3) Remove the ball joint between crank arm and wiper link.



N8A0264E

Installation

To install, follow the removal steps in the reverse order, noting the following points.

- Windshield Wiper Motor
  When the crank arm is removed from the windshield wiper motor, tighten the motor shaft nut with the specified torque.

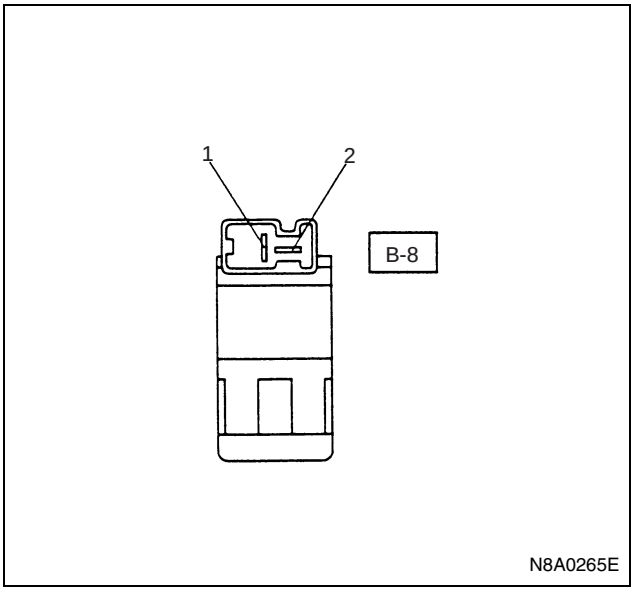
Tighten:
Shaft nut to 17 N·m (170 kg·cm/147 lb·in)

- Temporarily fit the motor by using one of the four wiper motor fixing screws.
- Put the crank arm ball joint in the wiper link hole and fix them together while pulling the wiper link.

Windshield Washer Motor

Inspection

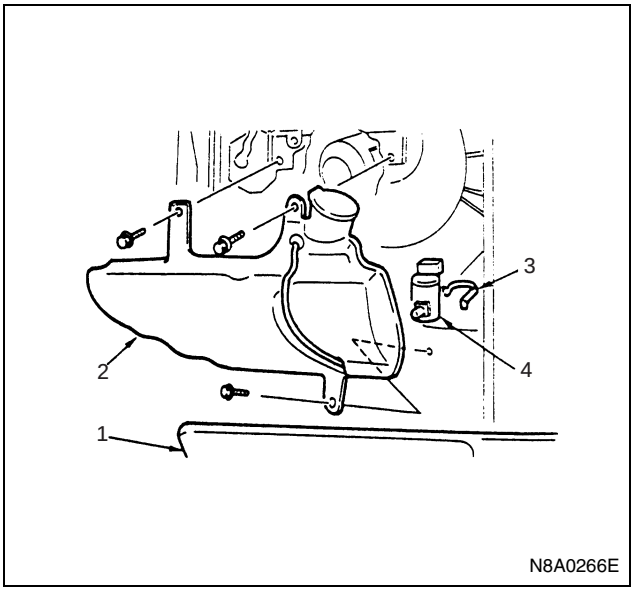
With the battery (+) terminal connected to the washer motor connector terminal 1 B-8 and the (−) terminal to the connector 2 B-8, check to see if the cleaning fluid pushes out.
Replace the tank/motor when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Instrument Panel Under Cover
   Refer to “INSTRUMENT PANEL” of section 2.
2. Washer Tank
   1) Disconnect the washer motor connector.
   2) Disconnect the washer hose.
   3) Remove three fixing screws.
3. Clip Band
4. Windshield Washer Motor
   Hold the motor and pull it out from the washer tank.

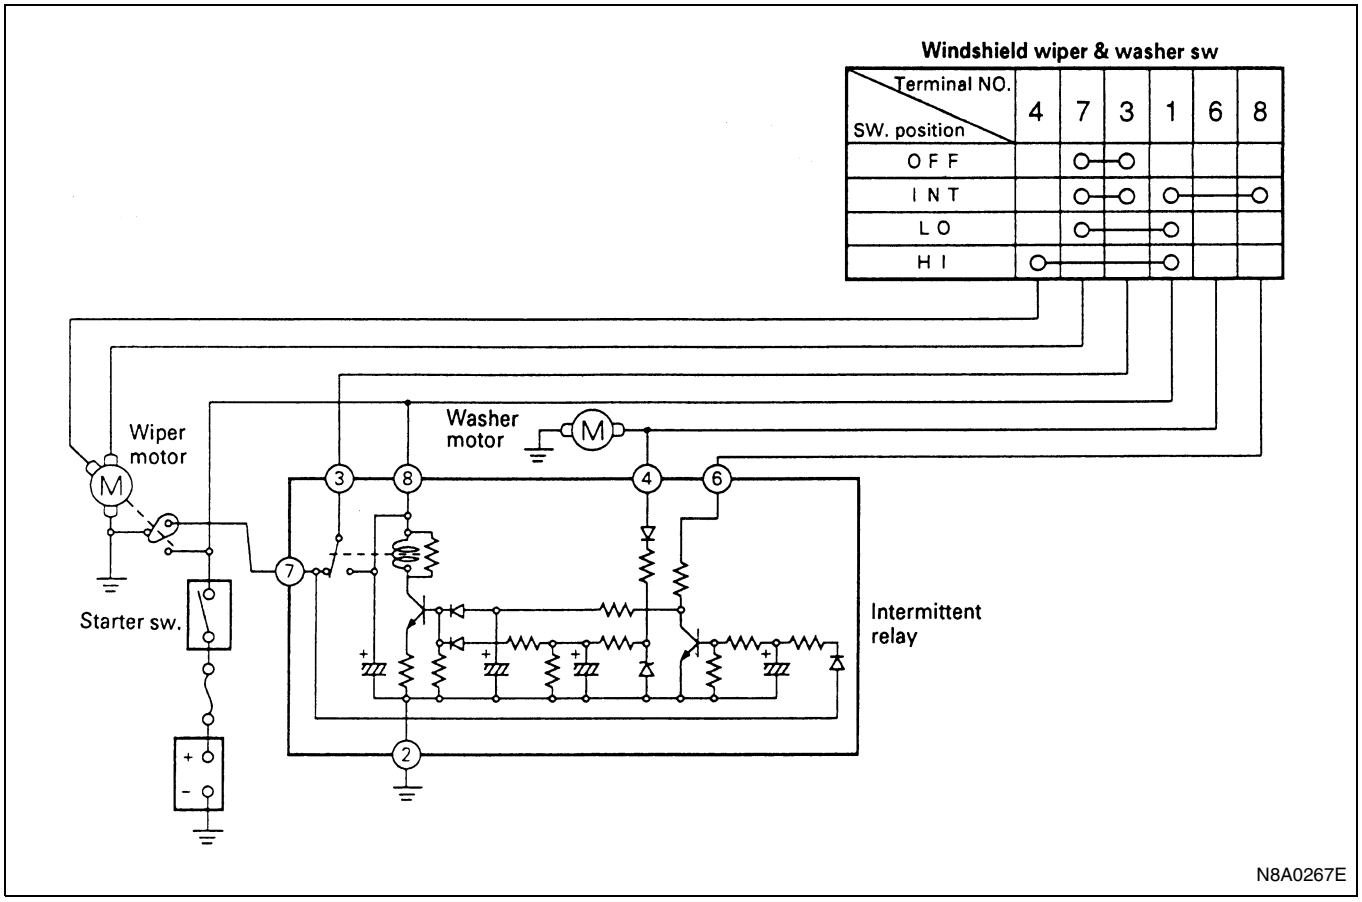


Installation

To install, follow the removal steps in the reverse order.

Intermittent Relay

Circuit Diagram

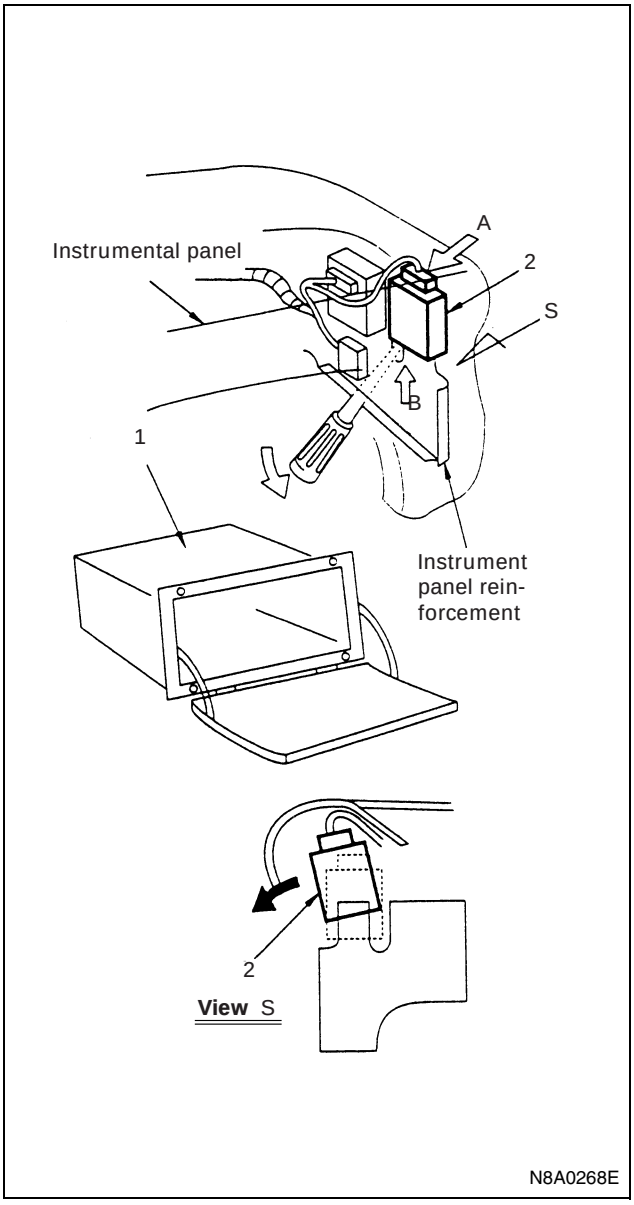


Removal

Preparation:

Disconnect the battery ground cable.

1. Glove Box
   Open the lid and remove the four screws.
2. Intermittent Relay
   1) Press A position with your finger and pry up B position with the tip of a screw-driver.
   2) When the relay moves up by about 2/3 of its size, tilt and take off the relay to avoid interference with the instrument panel.
   3) Disconnect the connector.



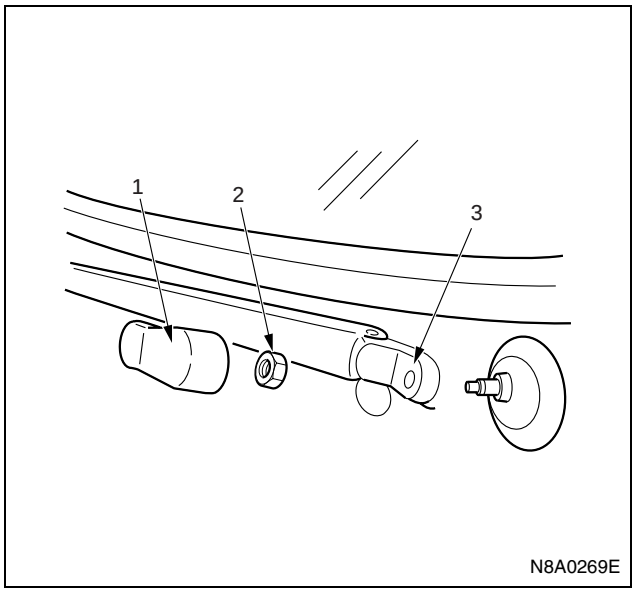
Installation

To install, follow the removal steps in the reverse order.

Windshield Wiper Arm & Blade

Removal

1. Cover
2. Wiper Arm Nut
3. Wiper Arm & Blade



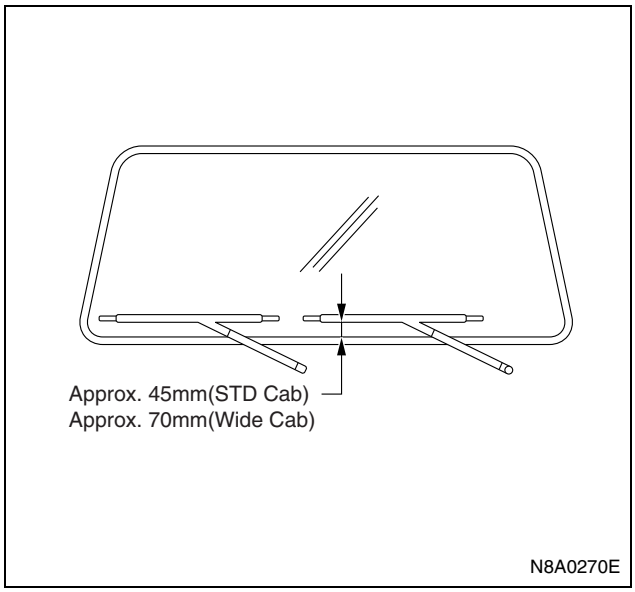
Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Before installing the wiper arm & blade to the shaft, confirm that the motor stops at the auto-stop position.
2. Set the wiper arm & blade so that the tips of both blades are positioned as shown in the illustration.
3. Tighten the wiper arm nut to the specified torque.

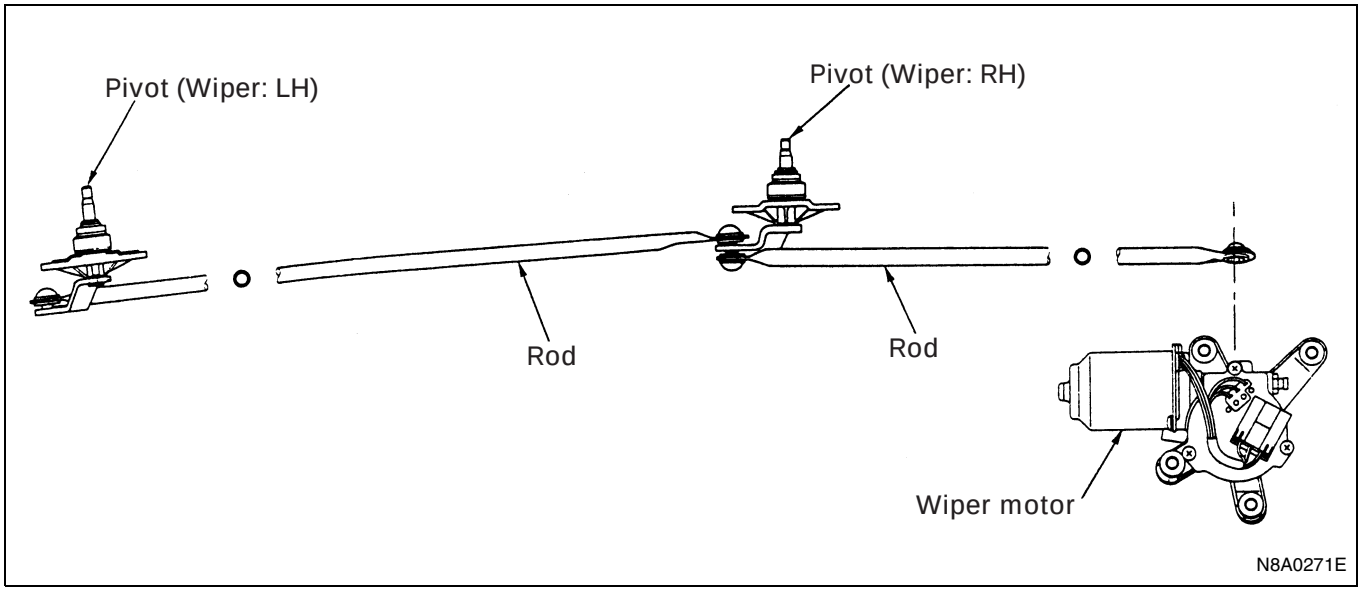
Tighten:

Wiper arm nut to 17 N·m (170 kg·cm/147 lb·in)



Windshield Wiper Linkage

Location of Rod and Pivot

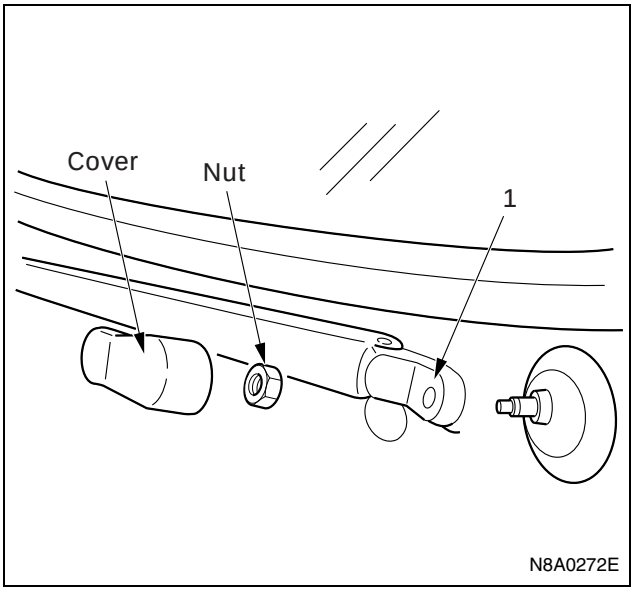


Removal

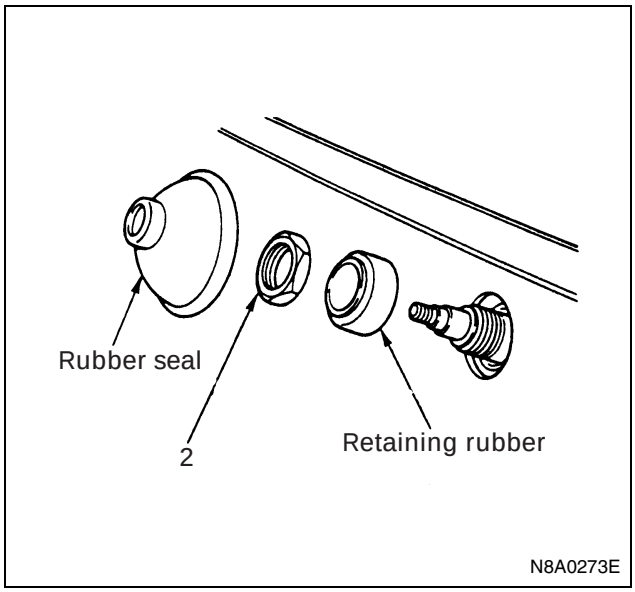
Preparation:

Disconnect the battery ground cable.

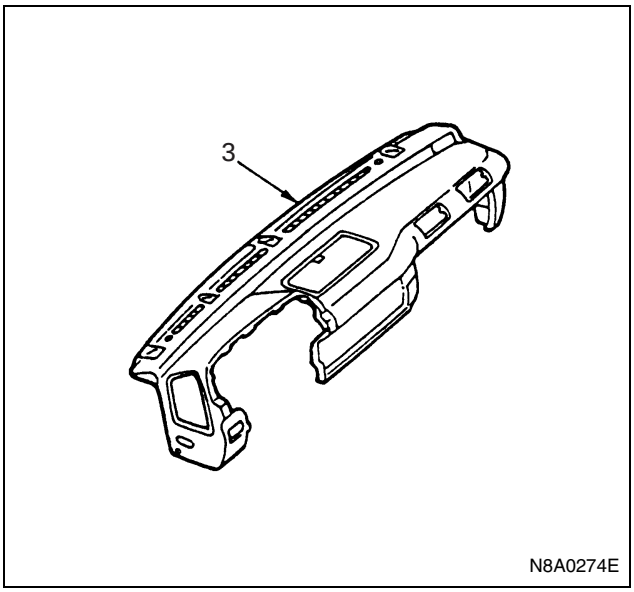
1. Wiper Arm & Blade
   Remove the cover, nut and wiper arm & blade.



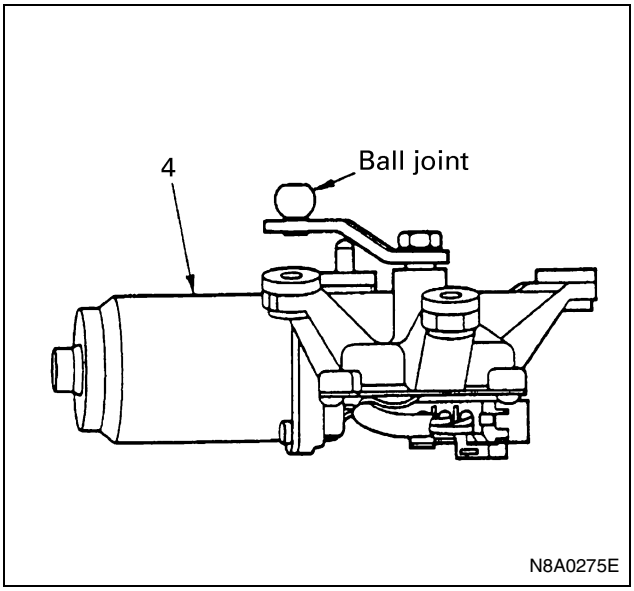
2. Pivot Nut
   Remove the rubber seal, nut and retaining rubber.



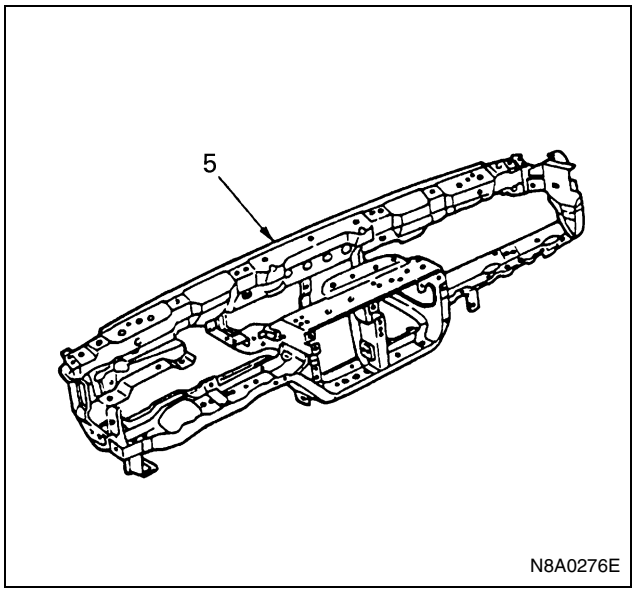
3. Instrument Panel Assembly
   Refer to “INSTRUMENT PANEL” of section 2.



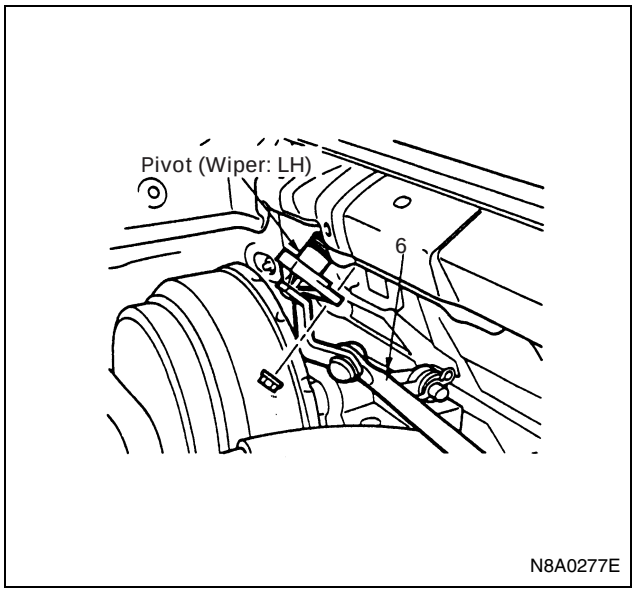
4. Wiper Motor
   1) Remove the four screws.
   2) Disconnect the ball joint between the crank arm and the wiper link.



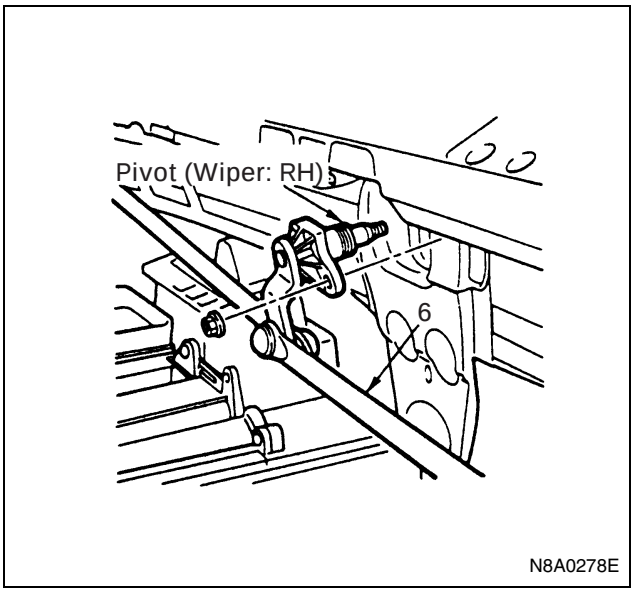
5. Instrument Panel Reinforcement
   Refer to “INSTRUMENT PANEL” of section 2.



6. Wiper Link Assembly
   Remove two retaining nuts from left hand side of pivot.



Remove two retaining nuts from right hand side of pivot.



Installation

To install, follow the removal steps in the reverse order, noting the following points.

- Temporarily fit the wiper motor by using one of the four wiper motor fixing screws.
- Put the crank arm ball joint in the wiper link hole and fix them together while pulling the wiper link.
- Fit the motor with four screws.
- Tighten the pivot nut with the specified torque.

Tighten:

Pivot nut to 8 N·m (80 kg·cm/70 lb·in)

- Tighten the wiper arm nut with the specified torque.

Tighten:

Wiper arm nut to 17 N·m (170 kg·cm/147 lb·in)

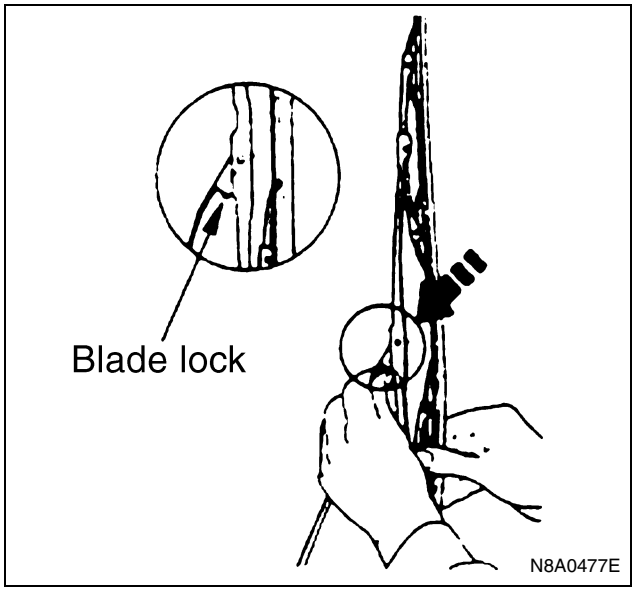
Wiper Blade Rubber

Removal

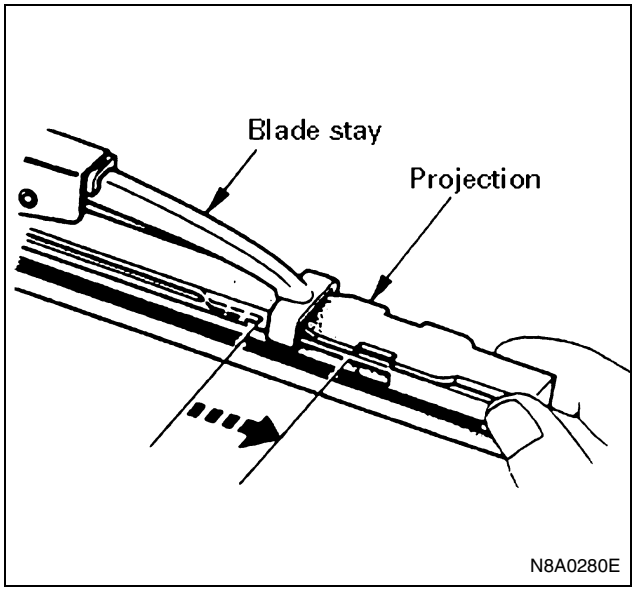
1. Wiper Blade
   Push the wiper blade lock while pulling the wiper blade in the arrow direction.

Notice:

When the wiper blade has been removed, wrap the tip of the wiper arm with cloth, to avoid damaging the glass.

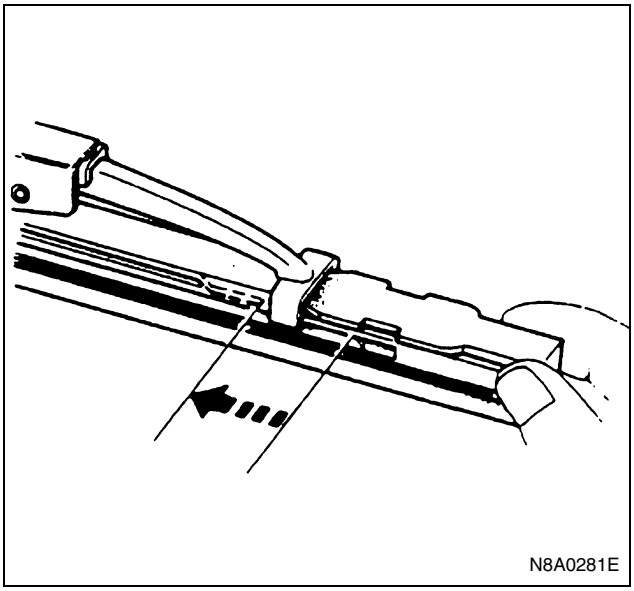


2. Wiper Blade Rubber
   1) Pull the end of rubber and remove the projection from the click of the blade stay.
   2) Pull the rubber out in the same direction.



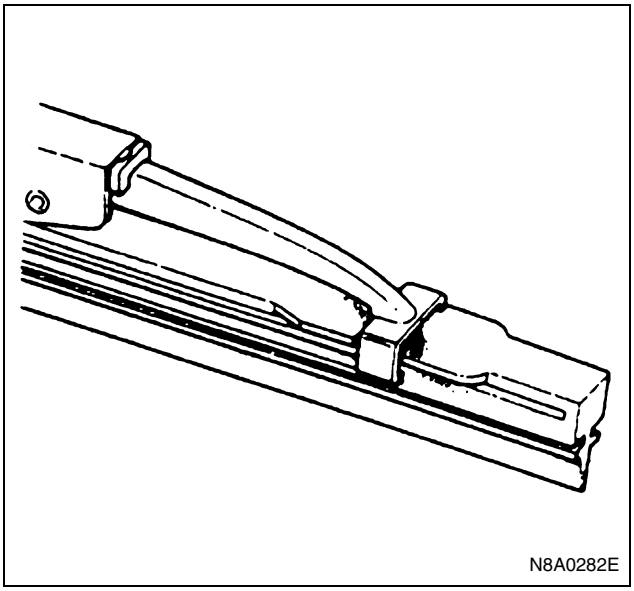
Installation

1. Wiper Blade Rubber
   Install the click of the blade stay in the groove of the new rubber and slide it in. Complete installation by pushing the click.



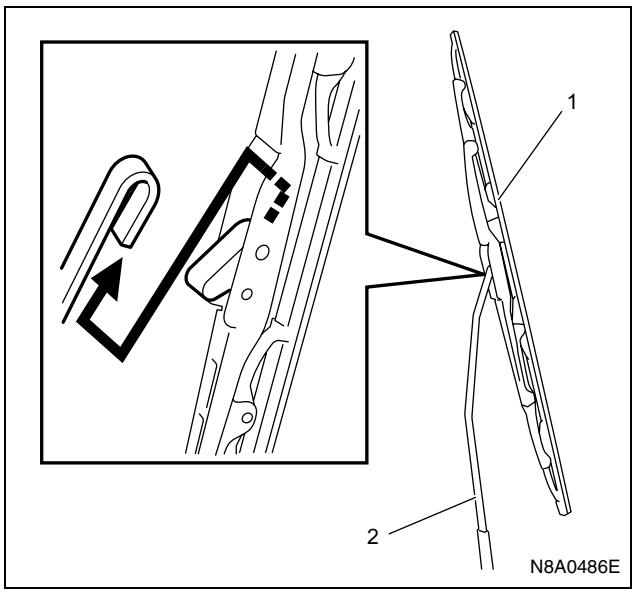
N8A0281E

   Finally, check that the click of the stay has caught in the hole of the rubber.



N8A0282E

2. Wiper Blade
   Push the lock of wiper blade (1) into the retentive portion on the tip of wiper arm (2).



Audio and Cigar Lighter

General Description

The circuit consists of the starter switch, radio, cigar lighter and the relay.
The audio circuit is designed for the current to flow through the receiver circuit when the radio switch is turned on with the starter switch in “ACC” or “ON”. Current runs through the memory circuit of the audio regardless of the position of the starter switch.
When the cigar lighter is pushed in with the starter switch at either “ACC” or “ON” position, a circuit is formed in the cigar lighter case to heat the lighter coil. The cigar lighter is spring back to its original position after the lighter coil is heated.

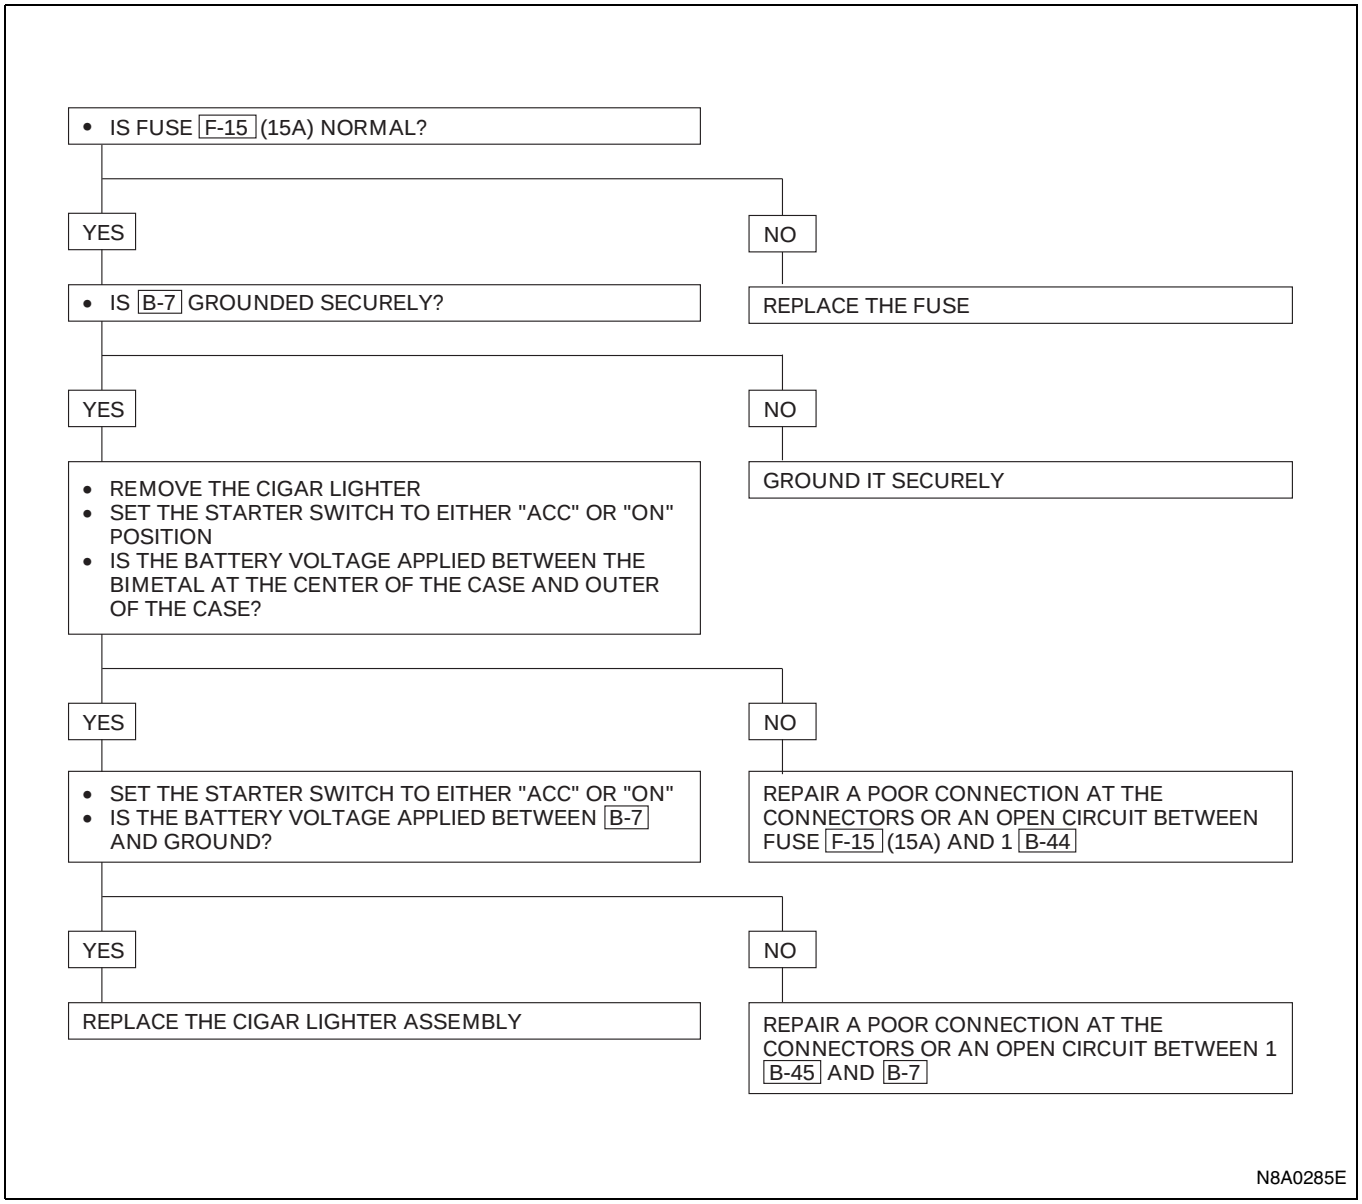
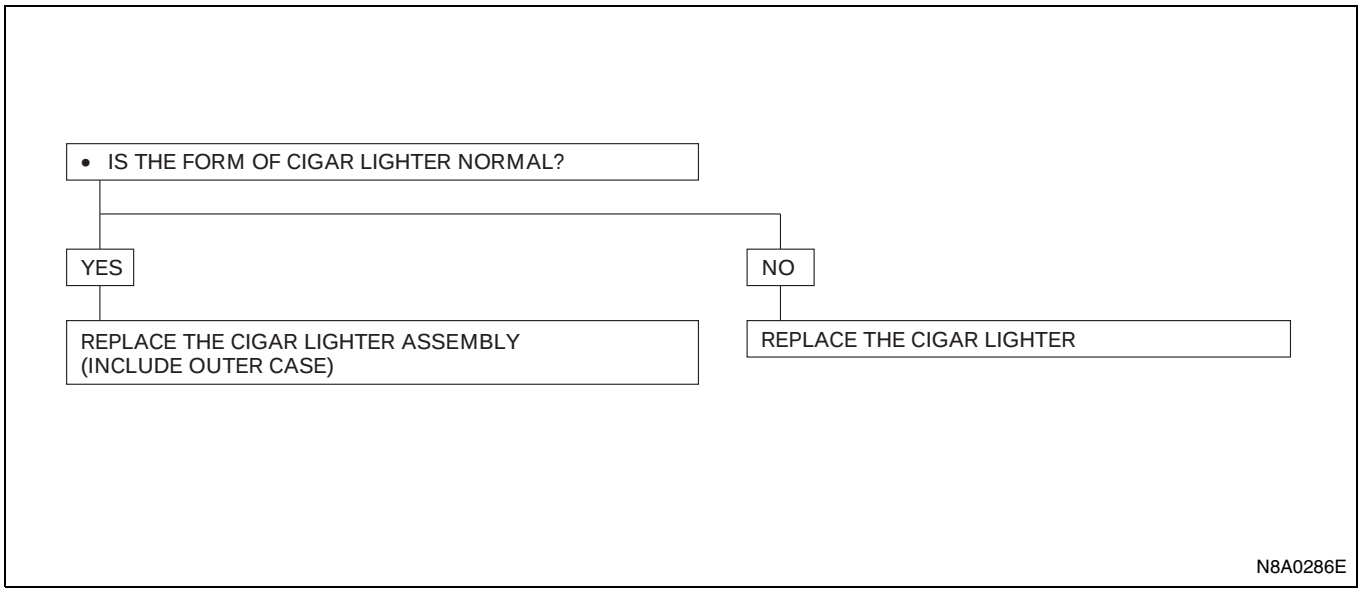
Diagnosis

1. Cigar Lighter Does Not Heat Sufficiently



2. The Cigar Lighter Does Not Spring Out After Being Heated



Starter Switch

Refer to “START AND CHARGING” in this section.

Radio

Removal

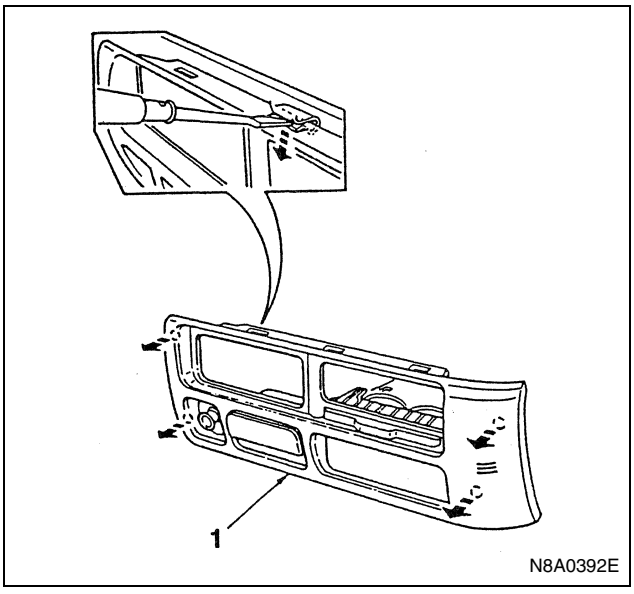
Preparation:

Disconnect the battery ground cable.

1. Center Cluster
   1) Pull it to remove. Pry off three clips by the tip of screwdriver.
   2) Remove the cigar lighter power source and its illumination connector.

Notice:

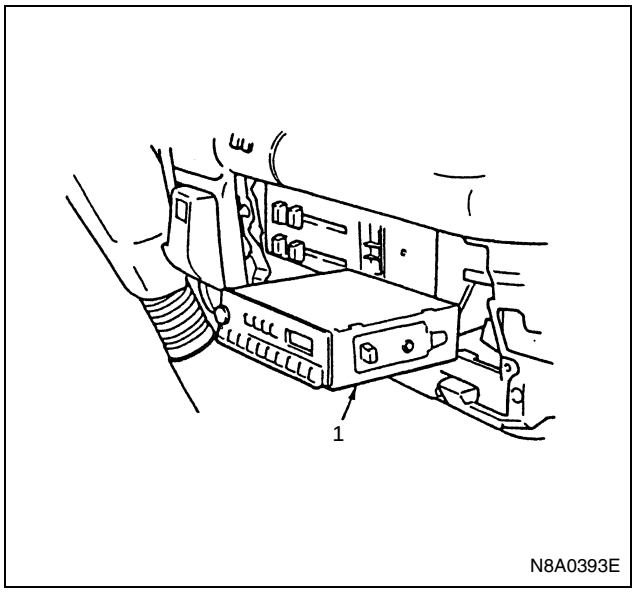
To remove the center cluster, do not force to pry off three clips at upper portion of the center cluster.



Legend

1. Center Cluster

2. Radio
   1) Remove the two radio fixing screws.
   2) Disconnect the connector and feeder plug.



Legend

1. Radio

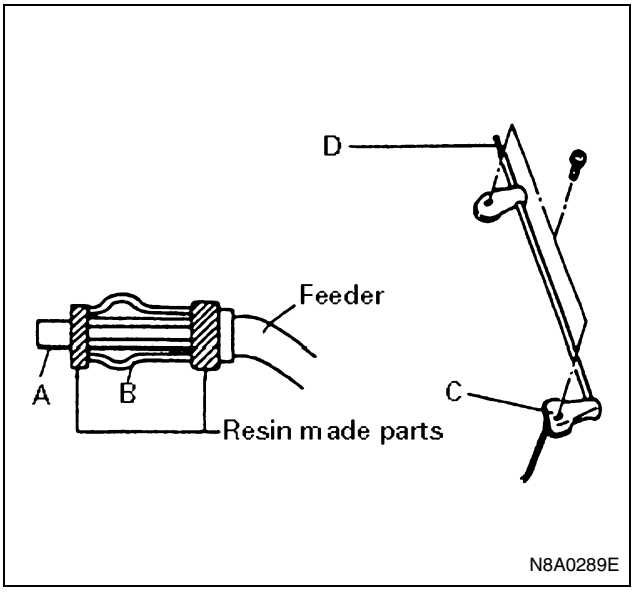
Installation

To install, follow the removal steps in the reverse order.

Antenna

Inspection

The metal A is connected to the pole D at the top of the antenna through the core of the feeder.
The metal B is fitted in the feeder shielding the core, and grounded at the screw C to avoid the core hampered by noise.
Defective grounding would cause noise.



In checking, measure the following three points with the circuit tester in the range of "resistance x 1 (Ω)."

Between A and B

No continuity (No reading at the indicator) → Normal

Continuity (A bite in the feeder. The core grounded) → Lower reception

Between B and C

Continuity (Indicator reading: 0Ω) → Normal

No continuity (Shielded core disconnected or defective grounding at the screw → Hampered by noise)

Between A and D

Continuity or no continuity

There are some antenna feeders and relay feeders with a condenser built in their connections.

Measuring resistance between the two points does not result in correct judgment. Connect temporarily another normal antenna to the radio and check to see if its reception is audible. Most antenna now available are slide type. Rust at the screw C and the cab panel where grounded would lead no continuity, followed by lower reception.

Keep this portion clean to avoid rust.

Removal

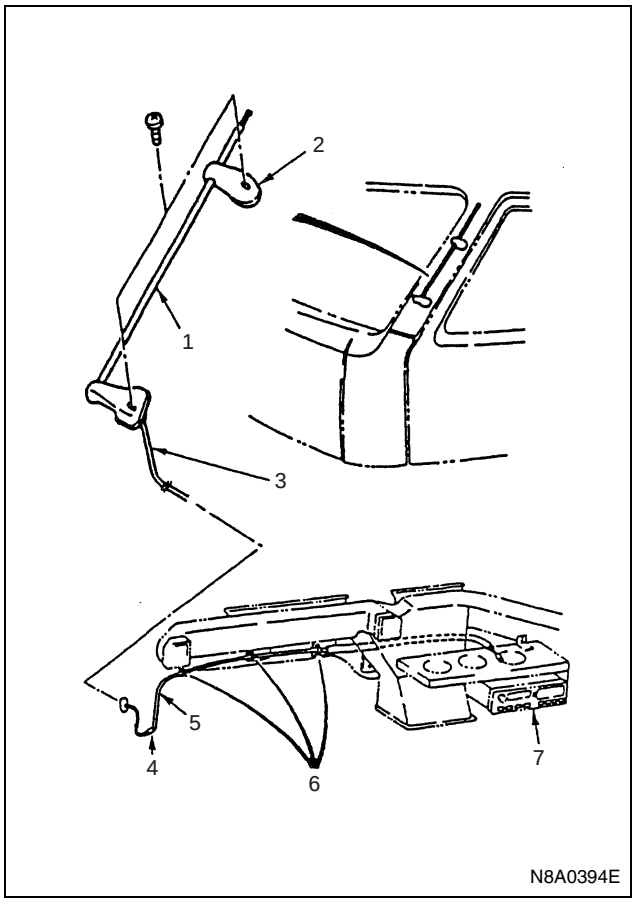
Preparation:

Disconnect the battery ground cable.

1. Antenna
   1) Disconnect the joint connector.
   2) Remove the upper and lower side antenna bracket.
   3) Pull out the antenna feeder.

Notice:

For easier fitting, tie the lead wire to the end of the antenna feeder in advance.



Legend

1. Antenna
2. Antenna Bracket
3. Feeder
4. Joint Connection
5. Feeder
6. Clip
7. Radio

Installation

To install, follow the removal steps in the reverse order.

Speaker

Inspection

1. With the circuit tester set to the range of × 1 (Ω), connect the circuit tester probes (red and black) to the (+) and (−) terminals of the speaker.
2. When the speaker is normal, a low buzzing sound is heard.
3. When the speaker is defective, no sound is heard. However, the distortion or chattering of the sound cannot be identified.
   When the speaker is installed to the vehicle, disconnect the connectors before checking.

When no sound is heard, the following are considered as the cause.

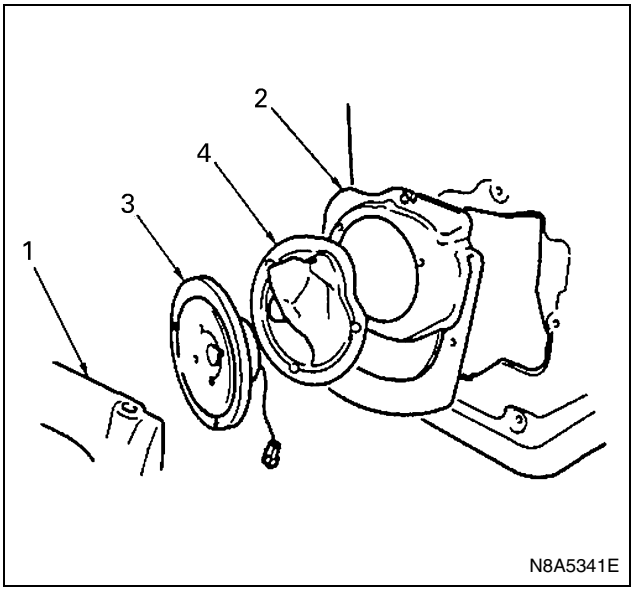
- The speaker wiring is disconnected at the speaker terminals.
- The speaker body is defective.
- There is an open circuit somewhere in the speaker harness on the vehicle side.
- The speaker harness on the vehicle side is grounded or caught up.

Removal

Preparation:

Disconnect the battery ground cable.

1. Door Pad
   Refer to “FRONT DOOR TRIM PAD” of section 2.
2. Speaker Panel
   Disconnect the speaker connector.
3. Speaker
4. Waterproof Sheet



Legend

1. Trim Panel
2. Speaker Panel
3. Speaker
4. Waterproof Sheet

Installation

To install, follow the removal steps in the reverse order.

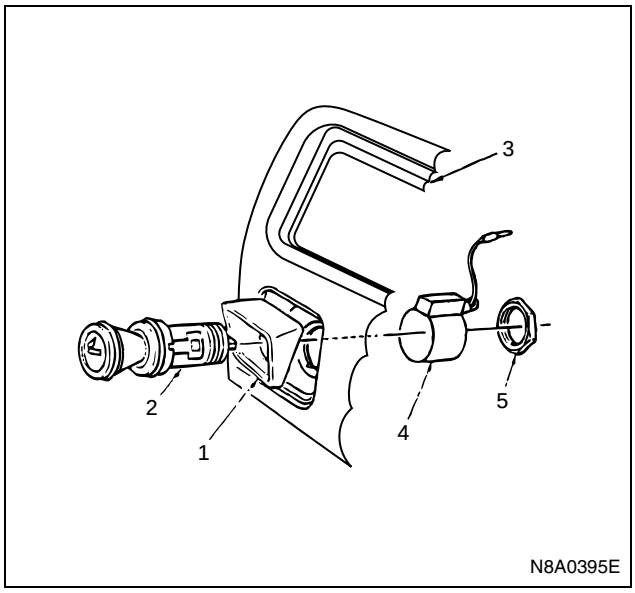
Cigar Lighter

Removal

Preparation:

Disconnect the battery ground cable.

1. Center Cluster
   Refer to “RADIO” in this section.
2. Cigar Lighter Assembly
   Remove the nut, then remove cigar lighter assembly, bezel and outer case.



Legend

1. Bezel
2. Cigar Lighter Assembly
3. Center Cluster
4. Outer Case
5. Nut

Installation

To install, follow the removal steps in the reverse order.

Meter and Warning/indicator Light

General Description

The circuit consists of the starter switch, meter assembly, vacuum tank switch, seat belt switch, oil pressure switch, fuel sedimenter switch, brake fluid switch, parking brake switch, vehicle speed sensor, fuel tank unit, thermo unit and engine speed sensor.

The meter assembly contains the speedometer, tachometer, fuel meter, thermometer and the warning/indicator light.

The meter warning/indicator lights and their bulb sockets are a unit, they are installed from the back of the speedometer assembly.

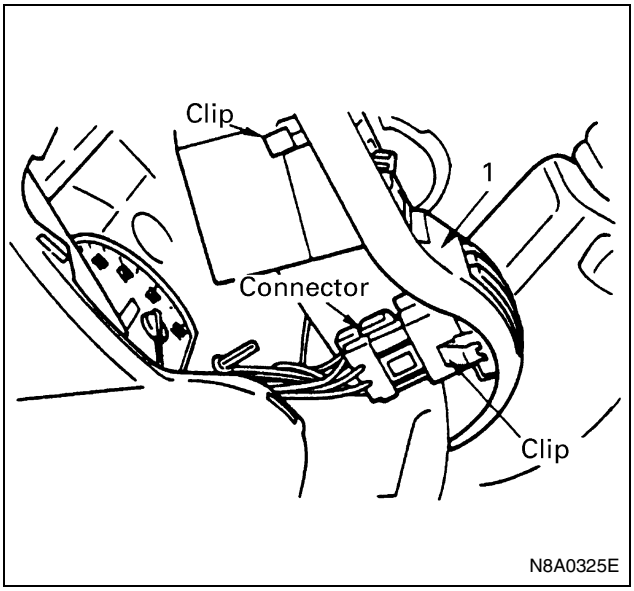
Removal

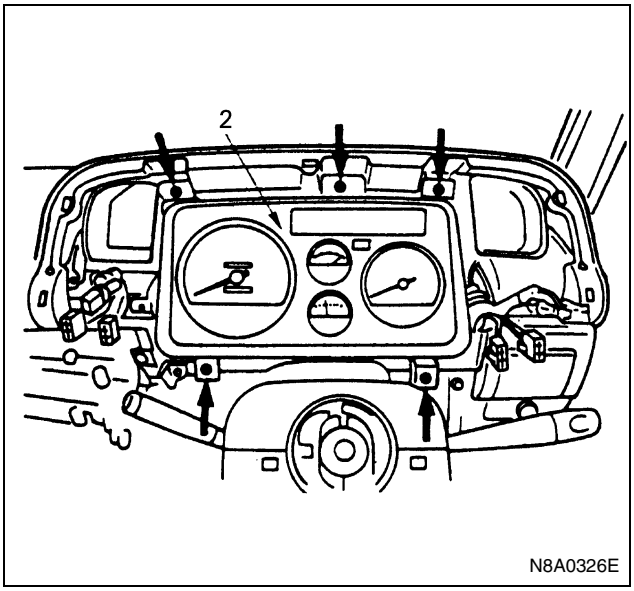
Preparation:

Disconnect the battery ground cable.

1. Meter Cluster



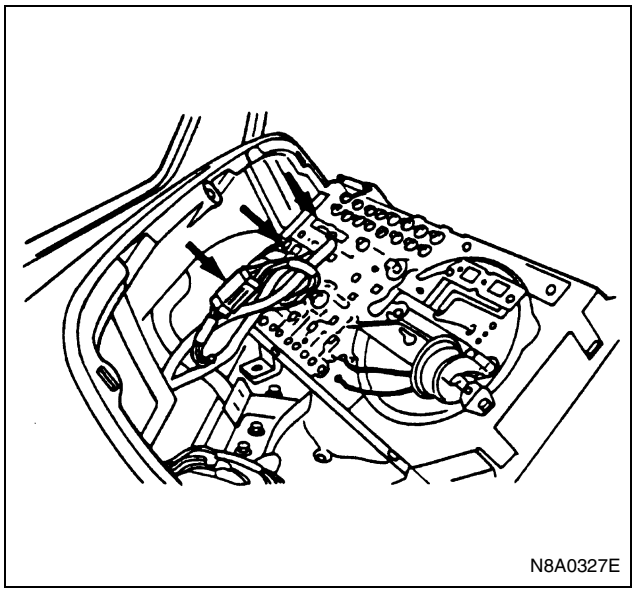
2. Meter Assembly
   Remove the five screws.



Disconnect the meter connectors.

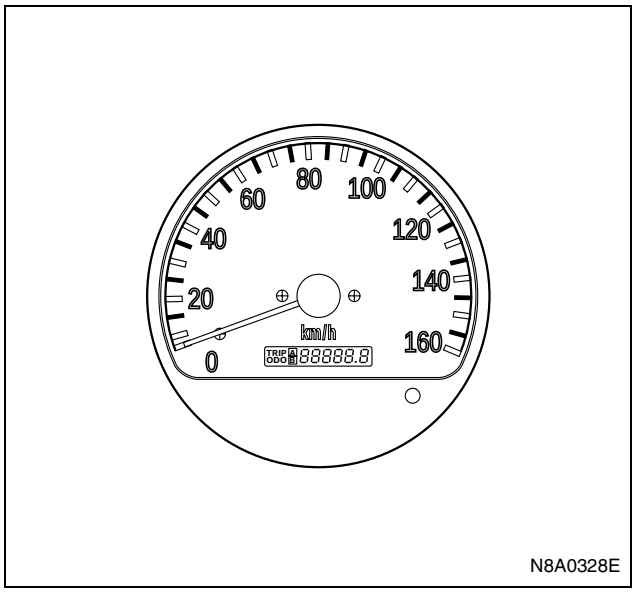
Installation

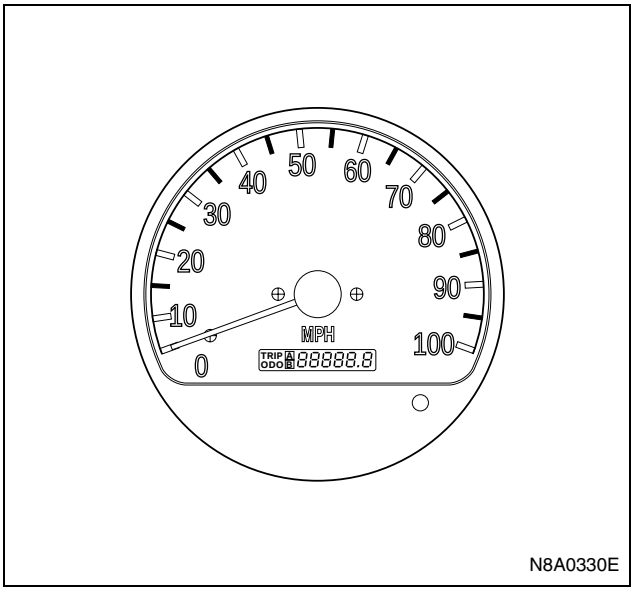
To install, follow the removal steps in the reverse order.



Speedometer

The speedometer is made up of the cross coil type ammeter (movement) that displays indications, the stepper motor that drives and adds up the odometer and trip meter, and the driving circuit (printed circuit board) that makes exchanges between the pulse signals and the current.





On-vehicle Service

Check the meter display accuracy and the operation of the odometer with the speedometer tester.

Notice:

Inappropriate tire inflation may affect the accuracy of the odometer.

(To conduct this test, refer to the tester manufacturer's instruction manual.)

Since the meter display permissible levels above are specifications solely for the meter, they are to be used as reference values when conducting on-vehicle service.

Except 4HK1-TC

Tester display speed	Meter display permissible level
20 km/h	17.5 — 22.5 km/h
40	37.5 — 42.5
60	57.5 — 62.5
80	77.5 — 82.5
100	97.6 — 103.4
120	117.6 — 123.4
140	137.6 — 143.4

Tester display speed	Meter display permissible level
20 MPH	18.3 — 21.7 MPH
40	38.3 — 41.7
60	58.3 — 61.7
80	77.8 — 82.8

For 4HK1-TC (General Export)

Tester display speed	Meter display permissible level
40 km/h	37 — 41 km/h
60	58 — 62
80	77.5 — 82.5
100	97.5 — 103
120	117 — 122.5
140	137.5 — 143

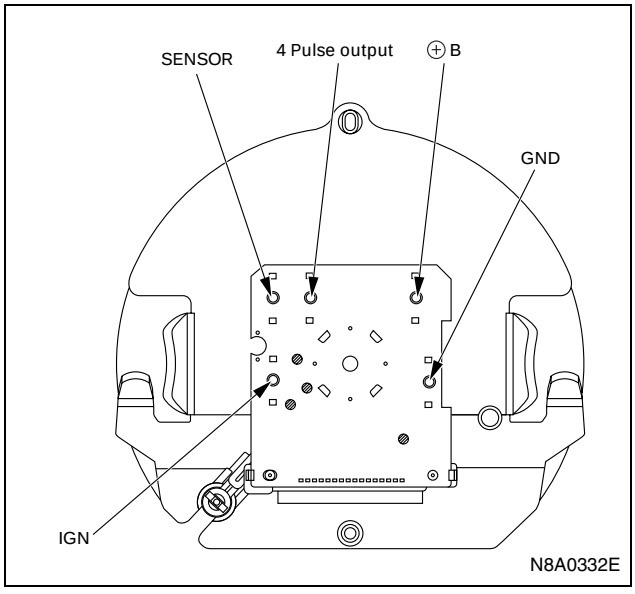
For 4HK1-TC (Europe)

Tester display speed	Meter display permissible level
20 km/h	20 — 22.5 km/h
40	40 — 42.5
60	60 — 63.2
80	79.7 — 83.4

Individual Inspection

Remove the speedometer from the meter assembly and measure the resistance and the current consumption between each terminals.

Replace the speedometer when the result of inspection is found abnormal.



Terminal symbol	Resistance value
IGN — GND	58±20 kΩ
SEN — GND	70±20 kΩ
4P — GND	∞

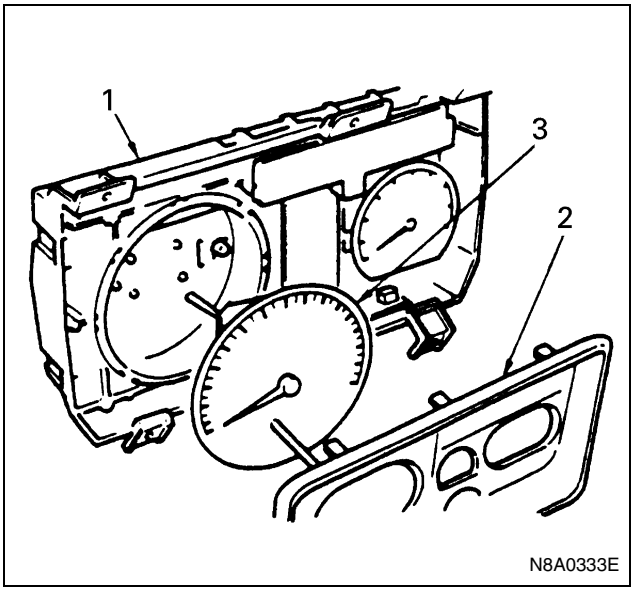
Removal

Preparation:

Disconnect the battery ground cable.

- Except 4HK1-TC

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Meter Glass
   Remove it by pushing the catches with your finger.
3. Speedometer
   Remove four screws securing the meter at the back side.



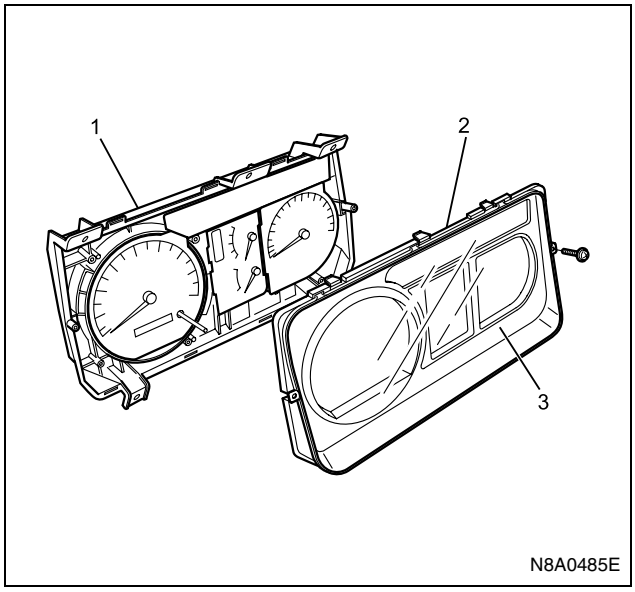
- For 4HK1-TC

1. Remove the meter assembly/speedometer (1).

Notice:
Speedometer cannot be removed as a single unit since it is integrated into the meter assembly.

   - Refer to “Meter Assembly” in this section.

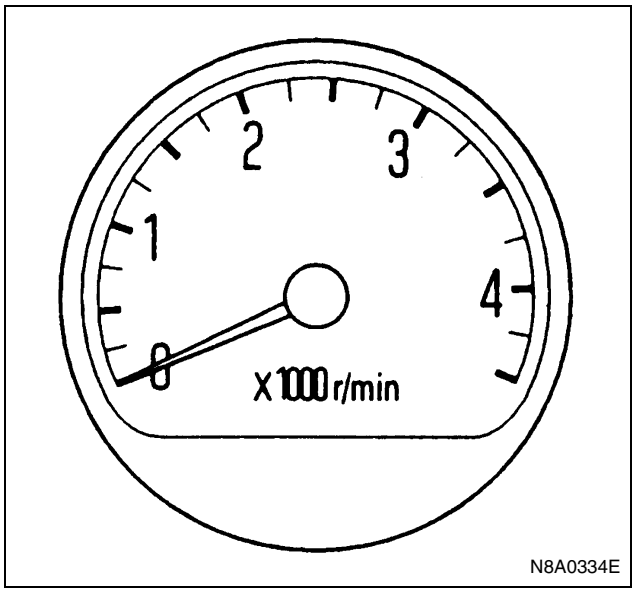
2. Remove the meter plate (2) and meter glass (3).
   - Remove the two installing screws on the meter surface.
   - Remove the meter plate by pushing the catches with your finger.



Installation
To install, follow the removal steps in the reverse order.

Tachometer

The tachometer is made up of the cross coil type ammeter (movement) that displays indications, and the drive circuit (printed board) that makes exchange between the pulse signals and the current.



On-vehicle Service Inspection

1. Set up the tune-up tester to the engine.
2. Start the engine and compare the readings displayed by the tachometer and the tester.
   When the difference between these two readings differs largely from the specified value, replace it with a correct one.

Notice:
Since the meter display permissible levels above are specifications solely for the meter, they are to be used as reference values when conducting on-vehicle inspection.

Except 4HK1-TC

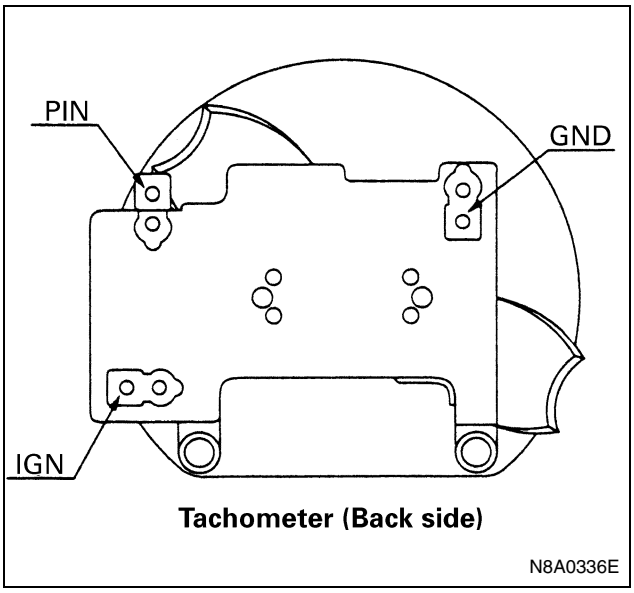
Tester display speed	Meter display permissible level
500	400 — 500
1000	800 — 1050
2000	1800 — 2050
3000	2800 — 3050
4000	3800 — 4050

For 4HK1-TC

Tester display speed	Meter display permissible level
750	700 — 800
2000	1900 — 2150
3000	2950 — 3200
4000	3950 — 4200

Individual Inspection

Remove the tachometer from the meter assembly and measure the resistance value and the current consumption between each terminals.
Replace the tachometer when the result of inspection is found abnormal.



Tachometer (Back side)

N8A0336E

1. Resistance value

Use the analog type circuit tester. (Range: 1K)
For 12 Volt tachometer

Terminal symbol	Tester terminal			
	Red (+)	Black (–)	Black (–)	Red (+)
IGN — GND	IGN	GND	IGN	GND
	∞		30±5 kΩ	
PIN — GND	PIN	GND	PIN	GND
	33±5 kΩ		500 — 1000 kΩ	

For 24 Volt tachometer

Terminal symbol	Tester terminal			
	Red (+)	Black (–)	Black (–)	Red (+)
IGN — GND	IGN	GND	IGN	GND
	∞		30±5 kΩ	
PIN — GND	PIN	GND	PIN	GND
	33±5 kΩ		500 — 1000 kΩ	

2. Current value

Use the analog type circuit tester.
Since the current consumption fluctuates as the power voltage varies, check to be sure that the voltage applied is 12±1 V or 24±1 V.

Voltage	Connecting terminal	Current consumption	Remarks
12Volt	IGN — GND	12±1 V (when 12±1 V applied)	No signal input
24Volt		24±1 V (when 24±1 V applied)	No signal input

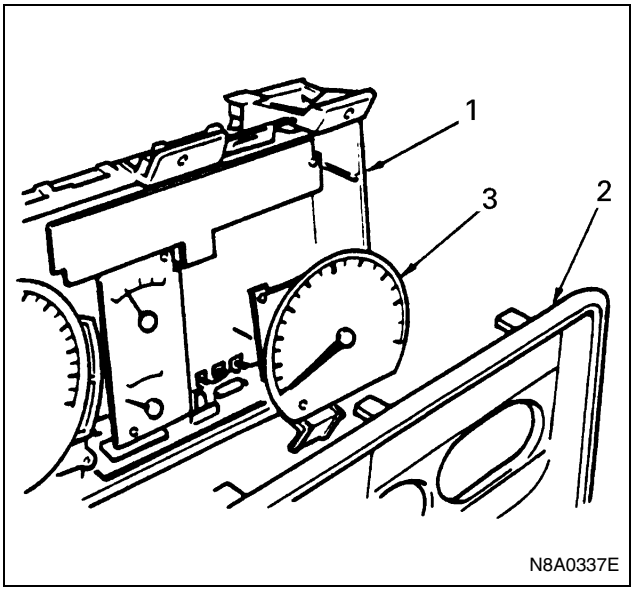
Removal

Preparation:

Disconnect the battery ground cable.

- Except 4HK1-TC

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Meter Glass
   Remove it by pushing the catches with your finger.
3. Tachometer
   Remove three screws securing the meter at the back side.



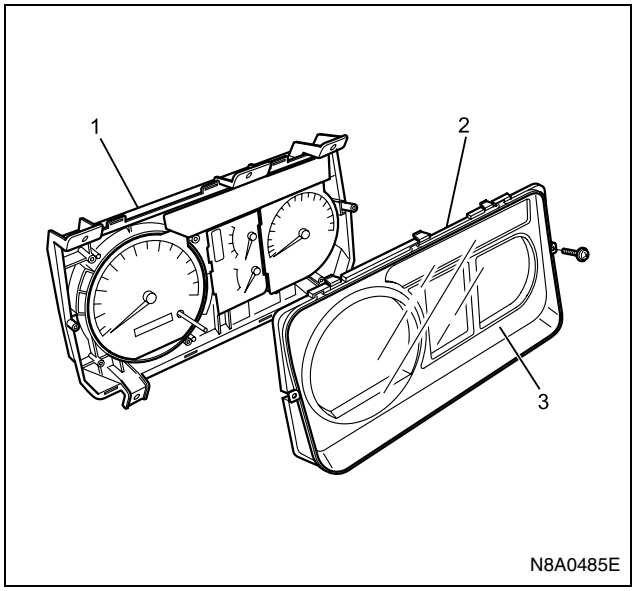
- For 4HK1-TC

1. Remove the meter assembly/tachometer (1).

Notice:
Tachometer cannot be removed as a single unit since it is integrated into the meter assembly.

- Refer to “Meter Assembly” in this section.

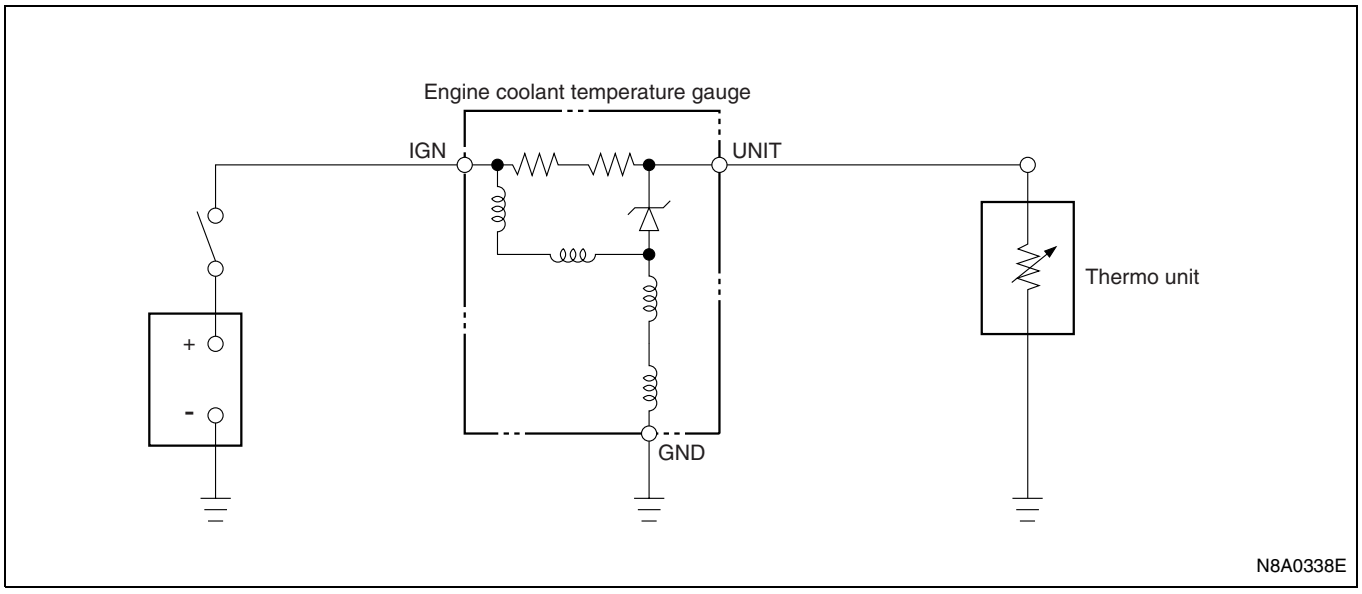
2. Remove the meter plate (2) and meter glass (3).
   - Remove the two installing screws on the meter surface.
   - Remove the meter plate by pushing the catches with your finger.



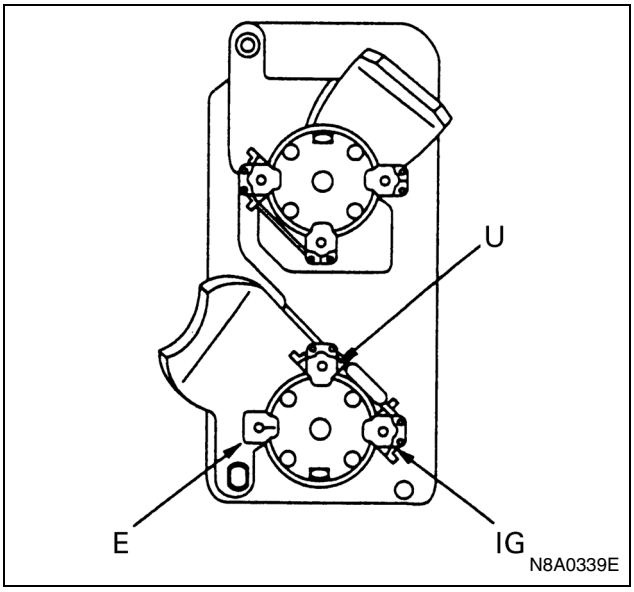
Installation
To install, follow the removal steps in the reverse order.

Coolant Temperature Gauge

Circuit Diagram



Inspection
Remove the coolant temperature gauge from the meter assembly, and measure the resistance value between each terminal.
Replace the coolant temperature gauge when the result of inspection is found abnormal.



Terminal symbol	Resistance value
IG — U	169 Ω±10%
U — E	333 Ω±10%
IG — E	242 Ω±10%

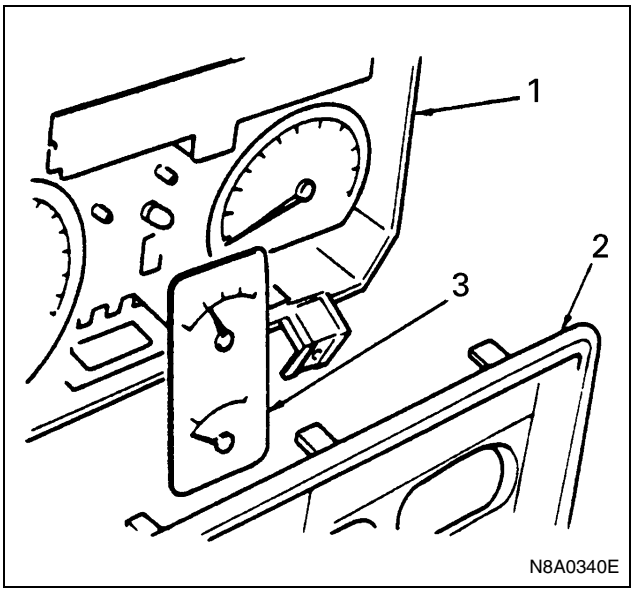
Removal

Preparation:

Disconnect the battery ground cable.

- Except 4HK1-TC

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Meter Glass
   Remove it by pushing the catches with your finger.
3. Coolant Temperature Gauge
   Remove six screws securing the meter at the back side.



- For 4HK1-TC

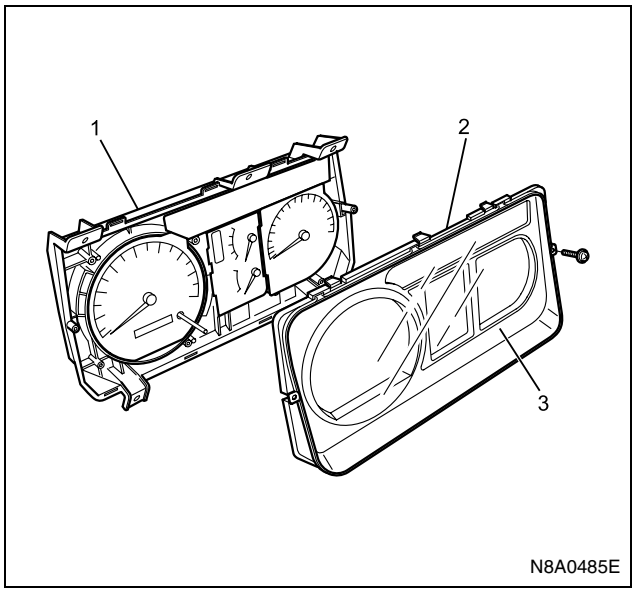
1. Remove the meter assembly (1).

Notice:

Coolant temperature gauge and fuel gauge cannot be removed as a single unit since they are integrated into the meter assembly.

- Refer to “Meter Assembly” in this section.

2. Remove the meter plate (2) and meter glass (3).
   - Remove the two installing screws on the meter surface.
   - Remove the meter plate by pushing the catches with your finger.

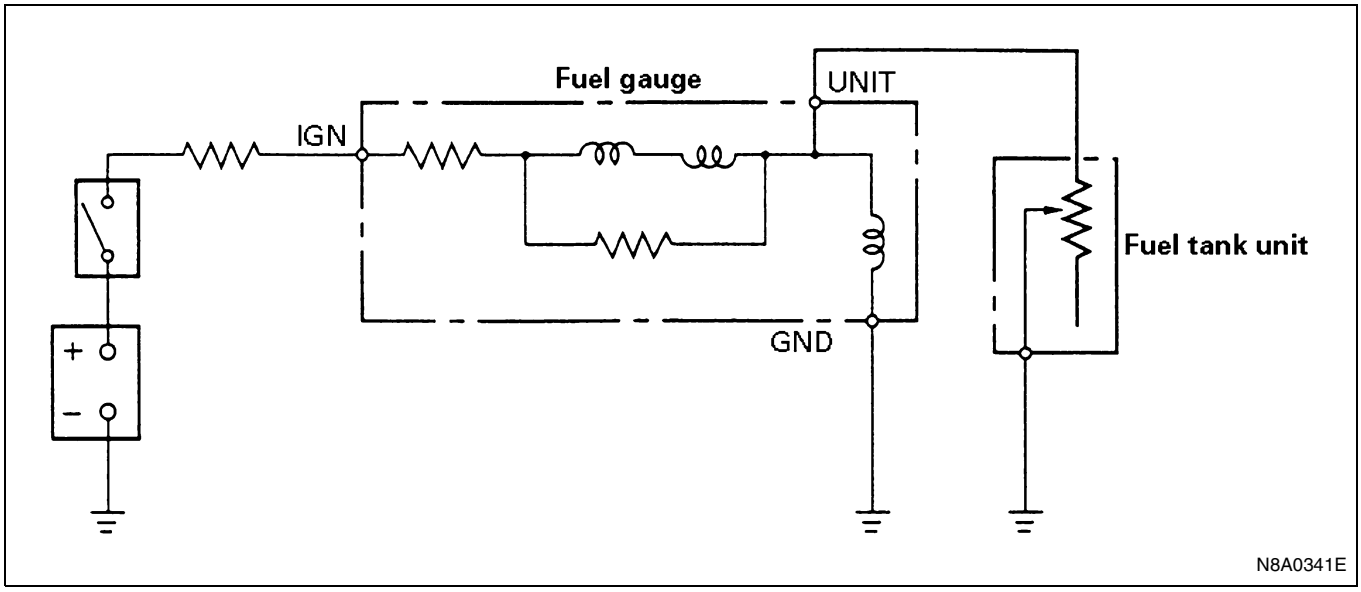


Installation

To install, follow the removal steps in the reverse order.

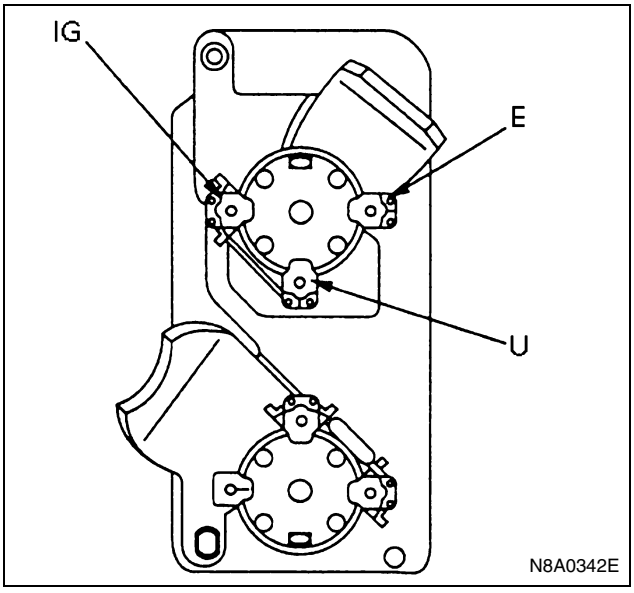
Fuel Gauge

Circuit Diagram



Inspection

Remove the fuel gauge from the meter assembly, and measure the resistance value between each terminal. Replace the meter when the result of inspection is found abnormal.



Terminal symbol	Resistance value
IG — U	108.1 Ω±10%
U — E	103 Ω±10%
IG — E	211.1 Ω±10%

Removal and Installation

Refer to the “COOLANT TEMPERATURE GAUGE” in this section.

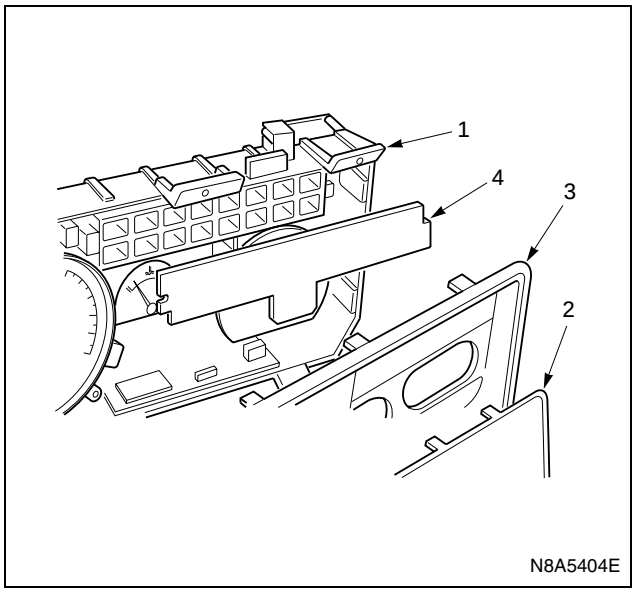
Warning Lens

Removal

Preparation:

Disconnect the battery ground cable.

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Meter Glass
   Remove it by pushing the catches with your finger.
3. Meter Plate
   Remove it by pushing the catches with your finger.
4. Warning Lens



Legend

1. Meter Assembly
2. Meter Glass
3. Meter Plate
4. Warning Lens

Installation

To install, follow the removal steps in the reverse order.

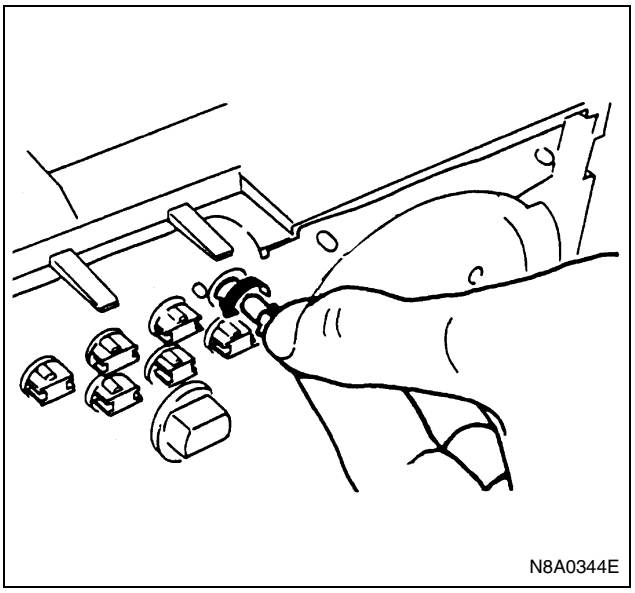
Warning Light Bulb, Indicator Light Bulb and Illumination Light Bulb

Removal

Preparation:

Disconnect the battery ground cable.

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Socket and Bulb
   Hold the bulb socket by hand and rotate it counterclockwise to remove them from the meter body.
3. Bulb
   Pull out the bulb from the socket.



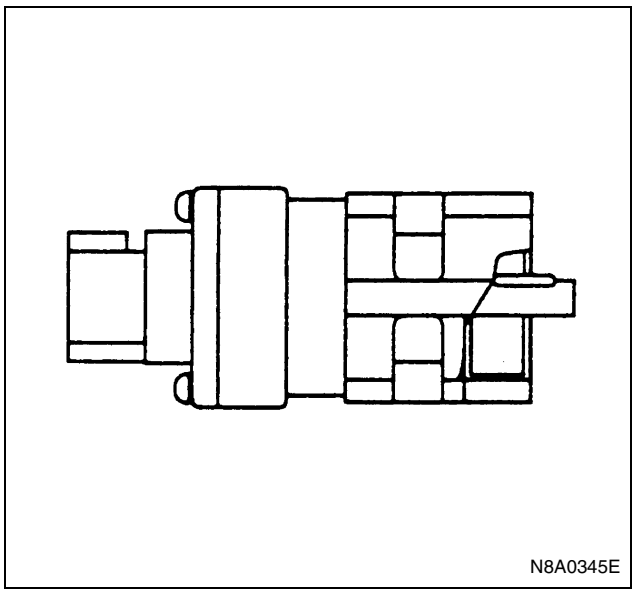
N8A0344E

Installation

To install, follow the removal steps in the reverse order.

Vehicle Speed Sensor

The vehicle speed sensor is installed on the rear portion of the transmission or transfer case.
The number of pulses generated is four pulses per one rotation of the pinion shaft.



N8A0345E

Inspection

1. Connect a resistance of 390 Ω±5%, 2W between connector terminal 1 J-32 and battery (+) terminal and connect the connector terminal 2 J-32 to the battery (−) terminal.

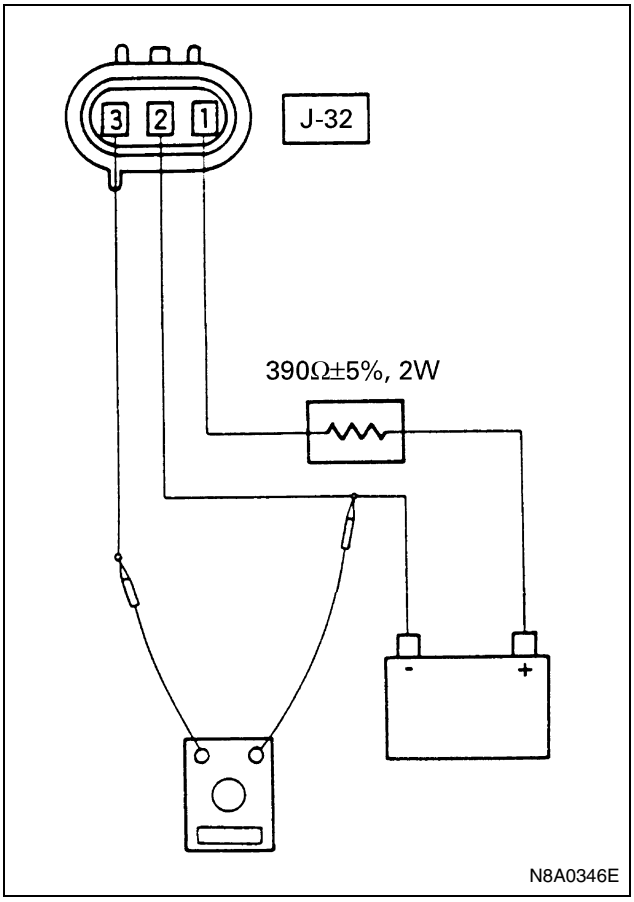
Caution:

Be extremely careful not to connect the battery (+) terminal to the connector 3 J-32.

This may damage the vehicle speed sensor.

2. Rotate the shaft of the vehicle speed sensor slowly and measure the voltage between 3 J-32 and 2 J-32 with a digital tester.

The voltage, with one rotation of shaft, fluctuates four times in the following range: 10 to 14V ↔ 24 or less.
Replace the sensor when the result of inspection is found abnormal.

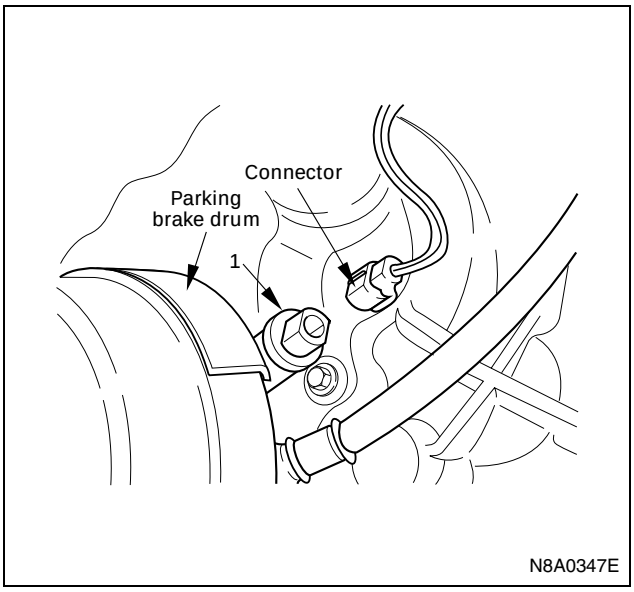


Removal

Preparation:

Disconnect the battery ground cable.

1. Vehicle Speed Sensor
   Disconnect the connector.



Installation

1. Tighten the vehicle speed sensor to the specified torque.

Tighten:

Vehicle speed sensor to 25 N·m (2.5 kg·m/18 lb·ft)

Caution:

Tightening must be made at the hexagonal part of the sensor.

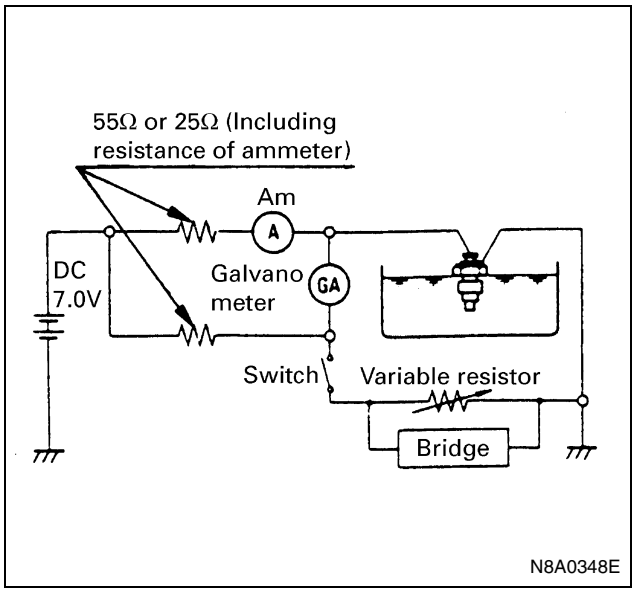
To tighten the connector itself would cause damage.

Thermo Unit

Inspection

The thermo unit is thermistor type and must be inspected under the conditions as shown below.

1. Put the deviation of the galvanometer to 0 by using the variable resistor, switch the thermo unit off and then measure the resistance of the resistor through the bridge.
   Confirm that the resistance is continuously variable in any other points than those shown below.
2. Dip the thermo unit into 80 — 90°C (176 — 194°F) water and confirm that there is no bubble continuously coming out of inside of the unit.
   Replace the unit when the result of inspection is found abnormal.

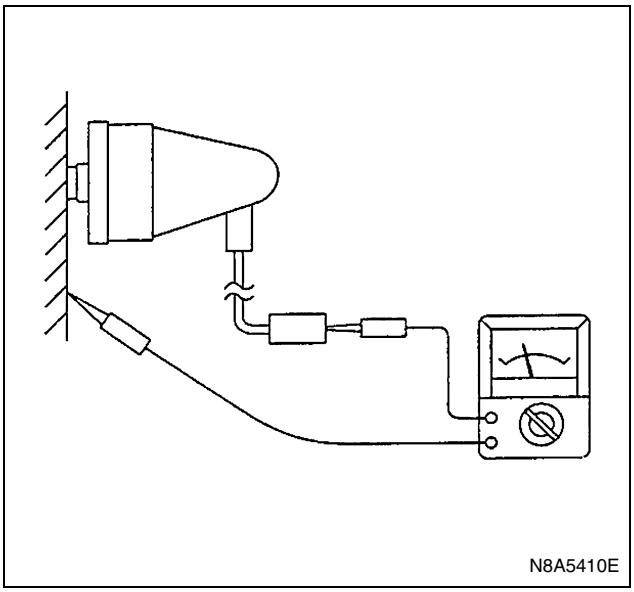


Check condition		Temperature	
		50°C (112°F)	115°C (239°F)
7 V 55 Ω Gauge	Resistance value (Ω)	+33.6 −33.6 226.0	+1.71 −2.21 26.4
7 V 25 Ω Gauge		—	+2.68 −3.68 24.3

Oil Pressure Switch

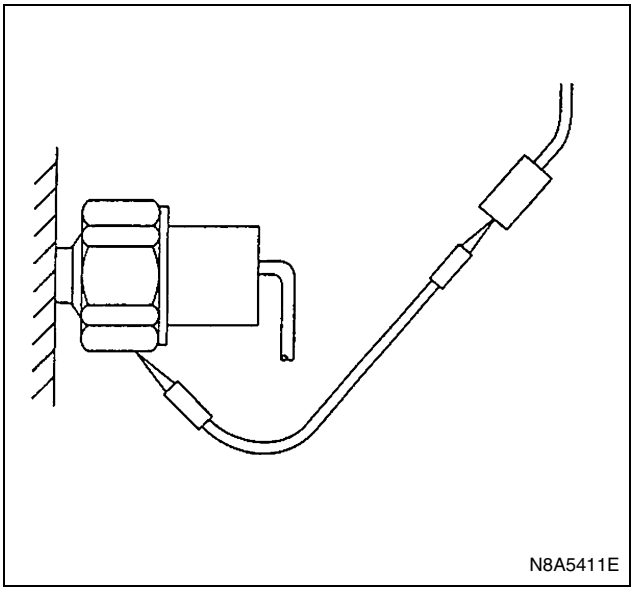
Inspection

Check the continuity between the switch terminal and the body ground with the starter switch is OFF position. Replace the switch when the result of inspection is found abnormal.



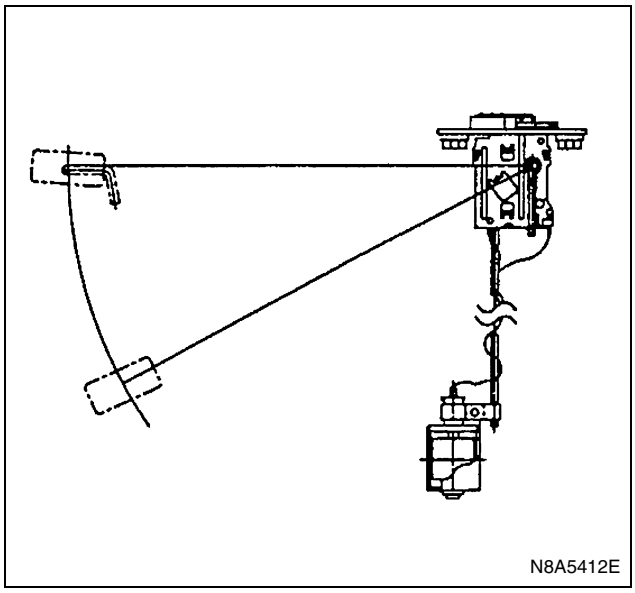
Circuit Inspection

1. Start the engine.
2. When disconnecting the oil pressure switch connector then connecting the harness side connector to the ground, check to see if the oil pressure warning light lights up. When the light will not light up, check the circuit between the meter and the oil pressure switch, and repair an open circuit if necessary.



Fuel Tank Unit

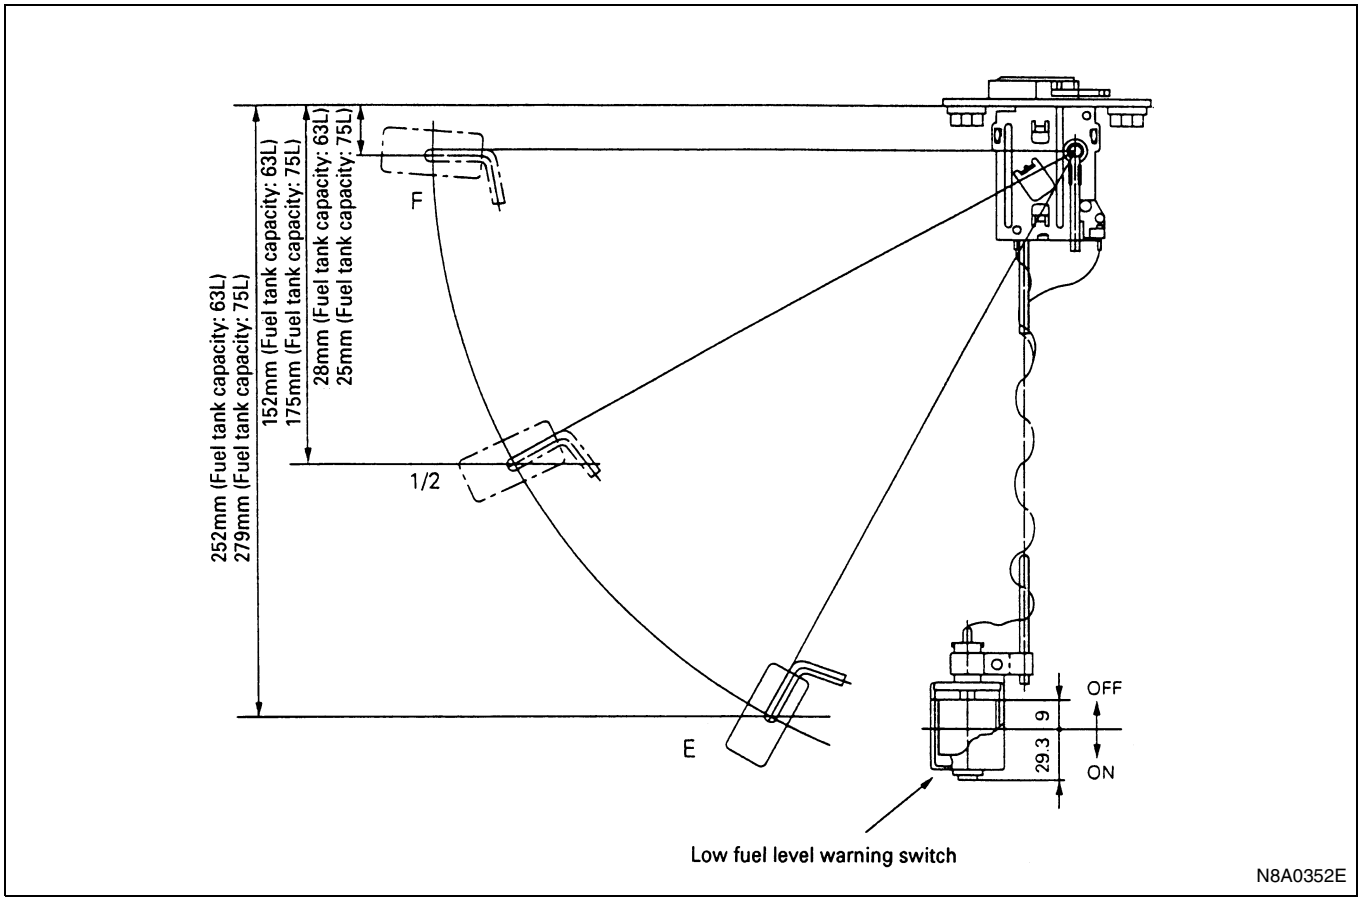
The tank unit varies the internal resistance according to the float position (fluid level) to operate the fuel meter needle. Also available is the build-in switch type to warn the driver of low fuel level (about 5 liters left in the tank) by illuminating the fuel warning light.



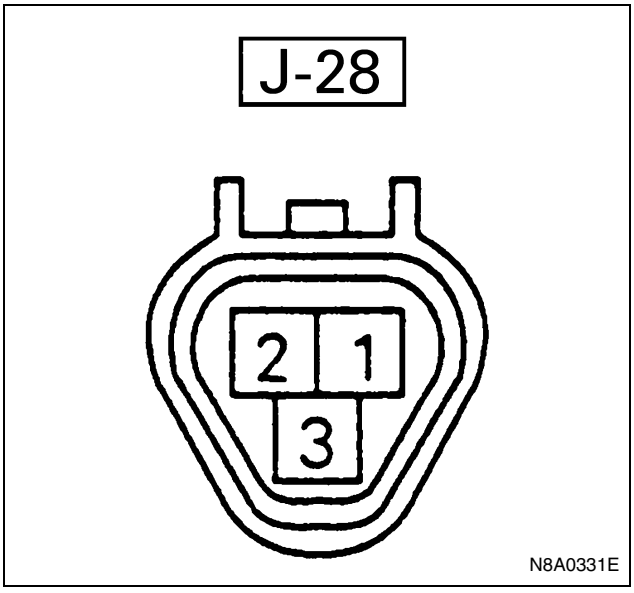
Inspection

(Level Switch type of warn low fuel level)

1. Check the resistance between the connector terminals 1 J-28 and 3 J-28 while shifting the float from “E” to “F” point.
2. Check if the low fuel warning switch turns on and off at the specified positions. If found defective, replace the fuel tank unit.



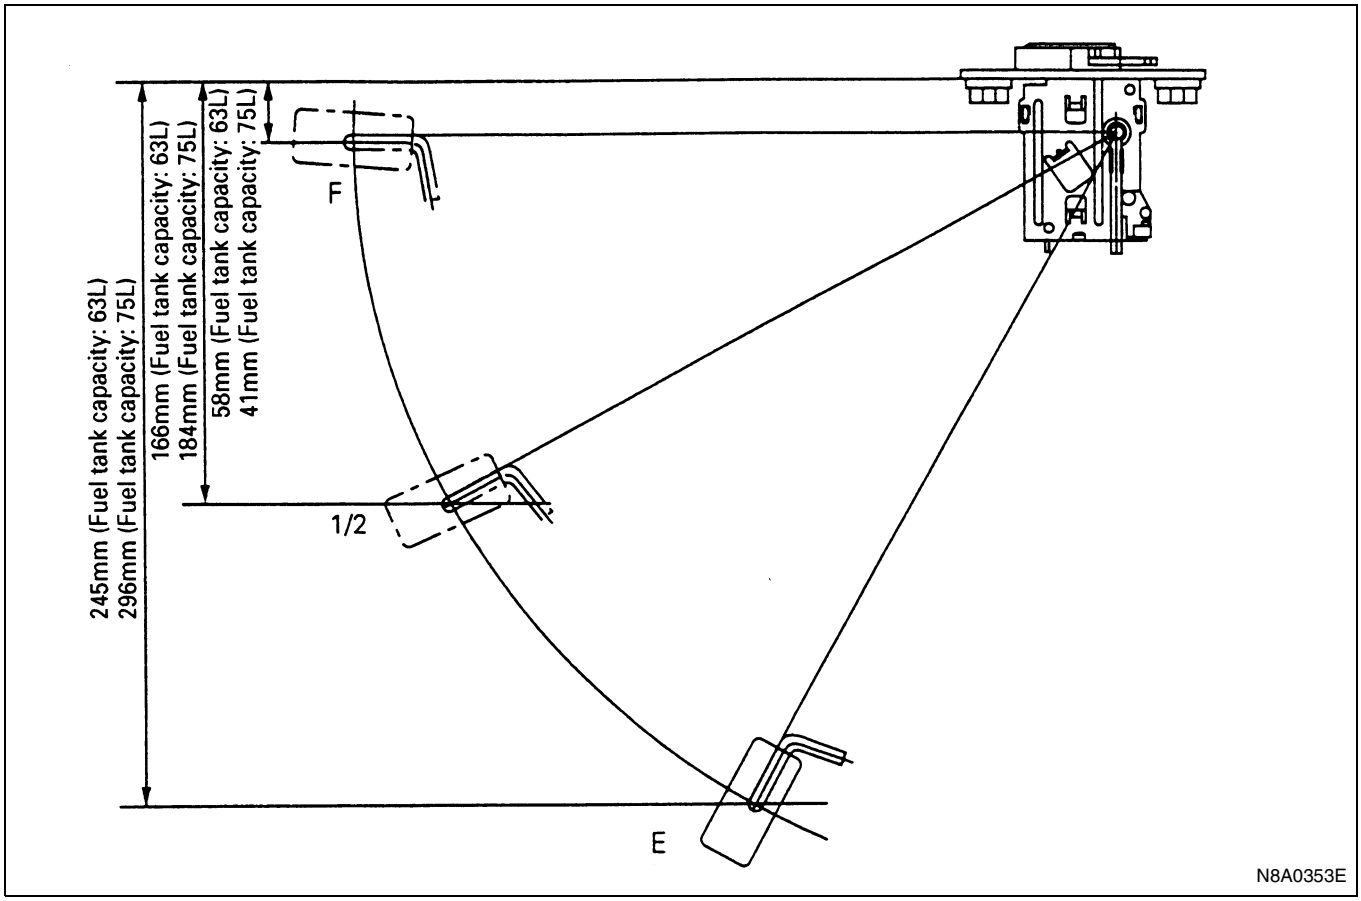
2. Check if the low fuel warning light turns on when the float is at “E” position. If found defective replace the fuel tank unit.

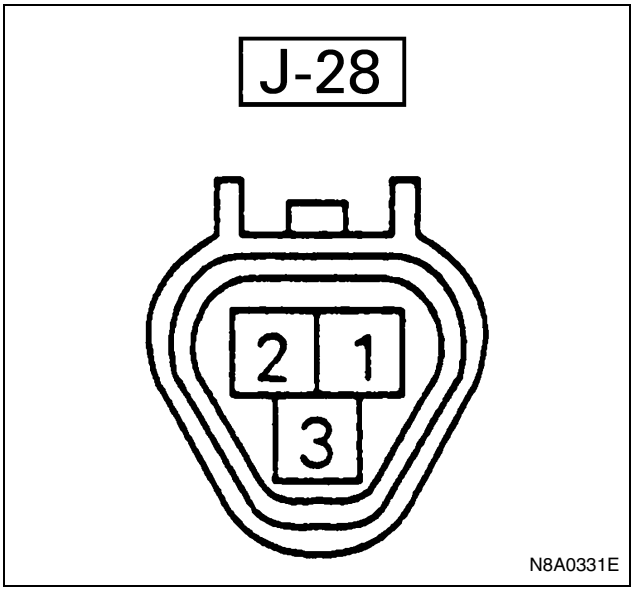


Float position	Resistance value (Ω)
F	3±2.1
1/2	32.5±4.8
E	110±7.7

(Float type of warn low fuel level)

1. Check the resistance between the connector terminals 1 J-28 and 3 J-28 while shifting the float from “E” to “F” point.





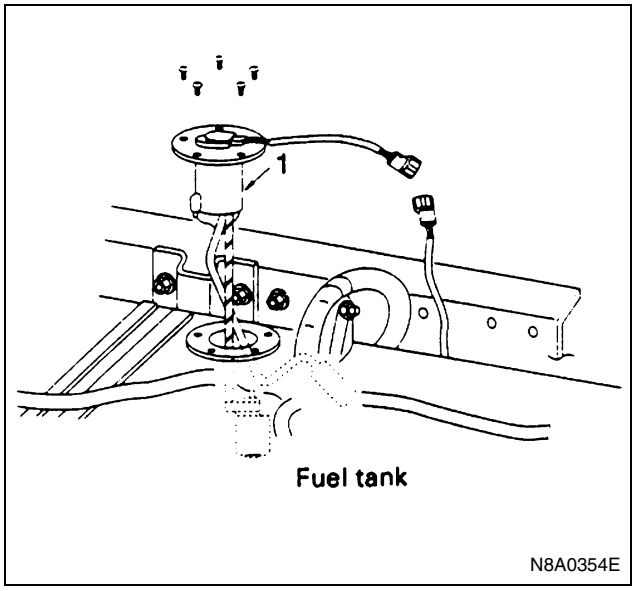
Float position	Resistance value (Ω)
F	3±2.1
1/2	32.5±4.8
E	110±7.7

Removal

Preparation:

Disconnect the battery ground cable.

1. Fuel Tank Unit
   1) Disconnect the connector.
   2) Remove five screws.



Installation

To install, follow the removal steps in the reverse order.

Engine Speed Sensor

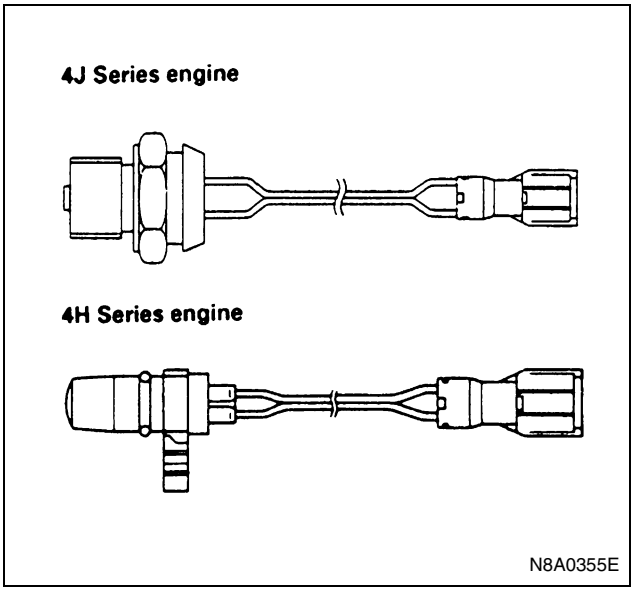
Inspection

Measure the resistance value between the engine speed sensor connector terminals.

Replace the engine speed sensor when the result of inspection is found abnormal.

4J Series engine = 1.36 — 1.86 KΩ

4H Series engine = 0.57 — 0.86 KΩ

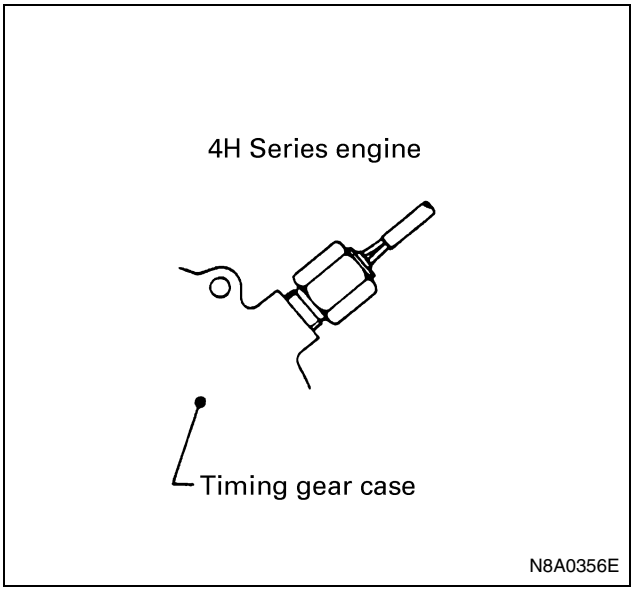


Removal

Preparation:

Disconnect the battery ground cable.

1. Engine Speed Sensor
   1) Disconnect the connector.
   2) Remove the engine speed sensor.



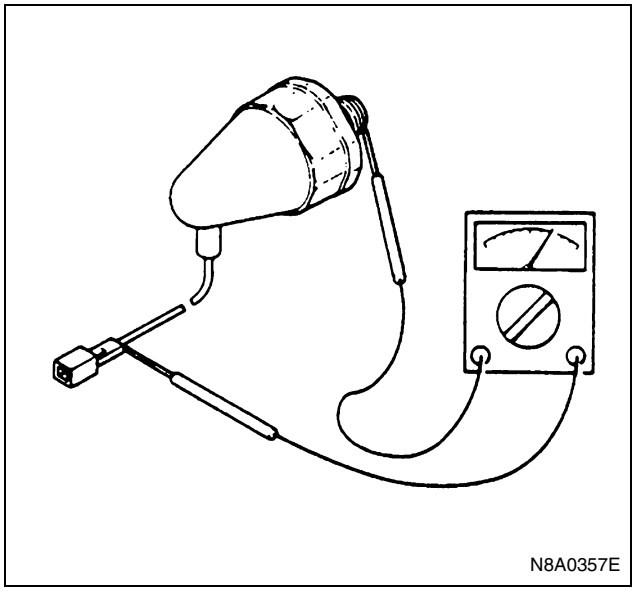
Installation

To install, follow the removal steps in the reverse order.

Vacuum Switch

Inspection

When the pressure value is below 250±30 mm Hg (33.3±4.0 kPa), check to see if there is continuity between the terminal and the ground. If no continuity, replace the switch with a normal one.



Removal

Preparation:

Disconnect the battery ground cable.

1. Vacuum Switch
   1) Disconnect the connector.
   2) Remove the vacuum switch.

Installation

Apply liquid gasket to the screw portion of the switch to prevent vacuum leak.

Vacuum Warning Buzzer

Inspection

Apply battery voltage to the buzzer connector terminals to check the buzzer sound.

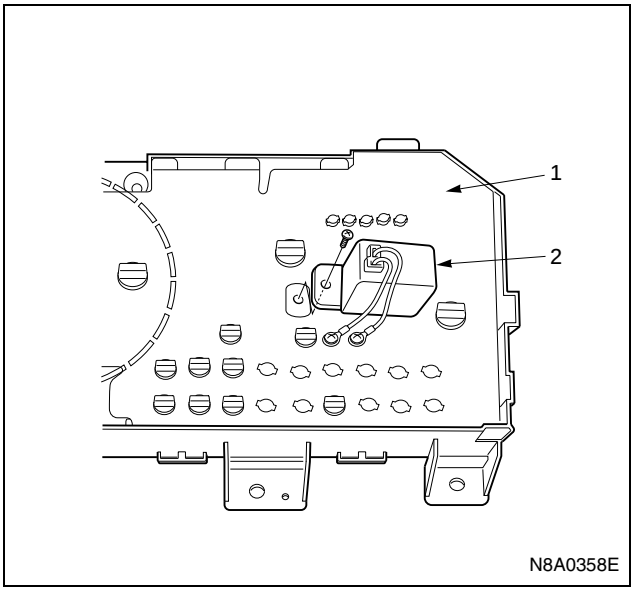
Replace the buzzer when the result of inspection is found abnormal.

Removal

Preparation:

Disconnect the battery ground cable.

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Vacuum Warning Buzzer
   1) Disconnect the connector.
   2) Remove the buzzer fixing screw.



Legend

1. Meter Assembly
2. Vacuum Warning Buzzer

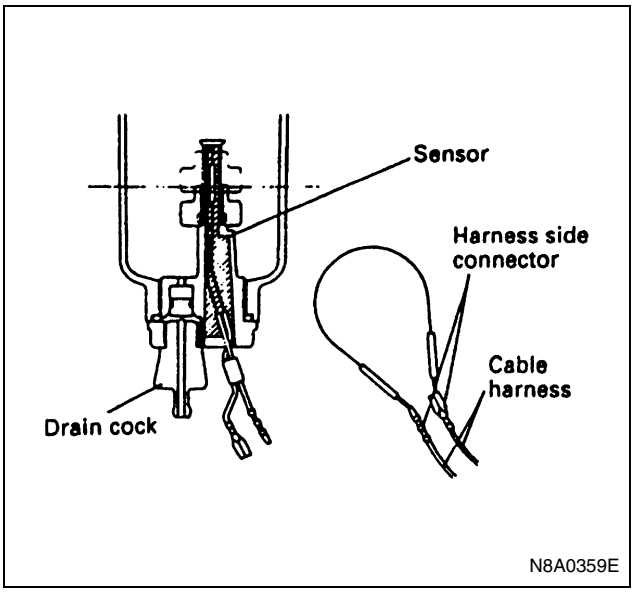
Installation

To install, follow the removal steps in the reverse order.

Water Sedimenter Switch

Inspection

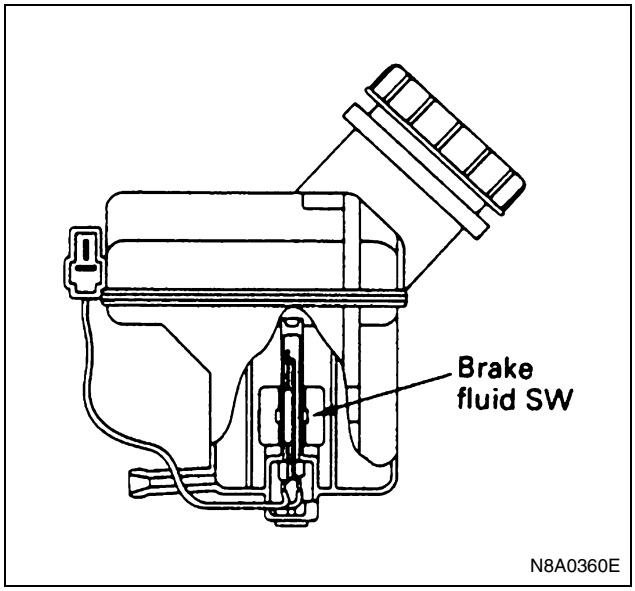
1. When the float in the water sedimenter is above the drain warning level, confirm if there is continuity between the switch connector terminals.
2. Turn the starter switch on, disconnect the water sedimenter connector and connect the harness side connector terminals. Then confirm that the sedimenter warning light turns on.
   If found defective, replace the switch or repair a poor connection or an open circuit between the connector terminals.



Brake Fluid Switch

Inspection

1. Confirm there is continuity between the switch connector terminals when the brake fluid in the tank is between 60 — 75 cc level.
2. Turn the switch on, disconnect the brake fluid switch connector and connect the harness side connector terminals. Then confirm that brake warning light turns on.
   If found defective, replace the tank, or repair a poor connection or an open circuit between the connector terminals.



Removal

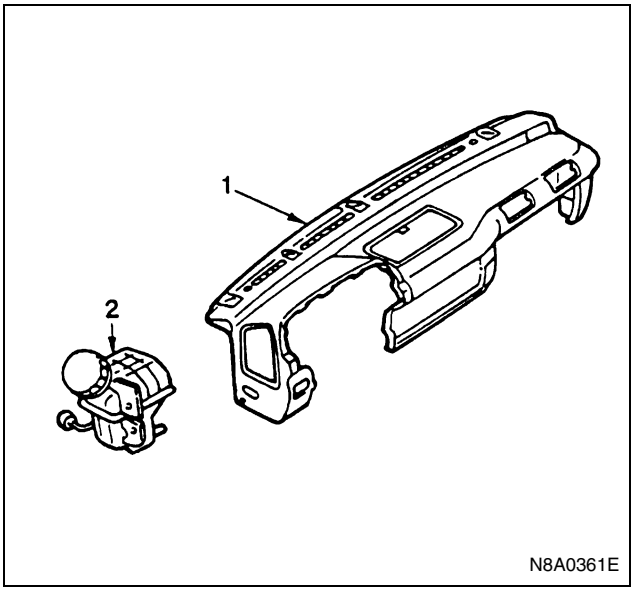
Preparation:

Disconnect the battery ground cable.

1. Instrument Panel Assembly
   Refer to “INSTRUMENT PANEL” of section 2.
2. Brake Fluid Tank (Brake Fluid Switch)
   1) Disconnect the switch connector.
   2) Remove four fixing nuts.
   3) Drain brake fluid in the tank.
   4) Disconnect the tubes.

Caution:

Be very careful not to allow the brake fluid to come in contact with painted surfaces or resin parts surfaces.



Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Bleed the air from brake and clutch fluid pipe line.
2. Check to see if the brake fluid level in the tank within specified level.
3. Check to see if brake warning light comes on when starter switch is turned on and then warning light goes off after the engine running.

Parking Brake Indicator Light

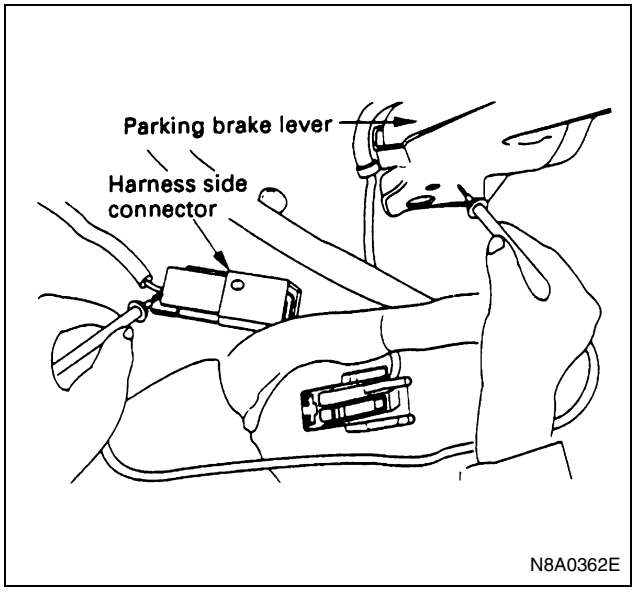
The parking brake indicator light is connected in series with the parking brake switch installed to the parking brake lever bracket.
The light comes on when the parking brake lever is pulled, and goes out when the parking brake lever is fully released.

Notice:

The parking brake indicator light illuminates to warn the driver that the parking brake is on. This light does not indicate the condition of the operability of the parking brake.

Circuit Inspection

1. Disconnect the parking brake switch connector.
2. Connect the harness side connector terminal to the ground.
3. Check to see if the indicator light comes on with the starter switch “ON”.
   Check the bulb or the harness when the result of inspection is found abnormal.



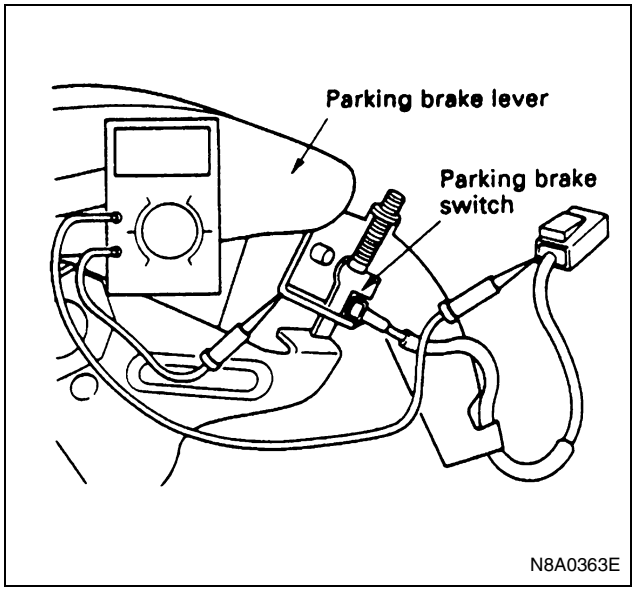
Parking Brake Switch

Inspection

1. Disconnect the parking brake switch connector.
2. Check to see if there is any continuity between the switch terminal and the body ground with the circuit tester connected between them.

When parking brake applied	Continuity
When parking brake released	No continuity

Repair the parking brake switch or replace it when the result of inspection is found abnormal.

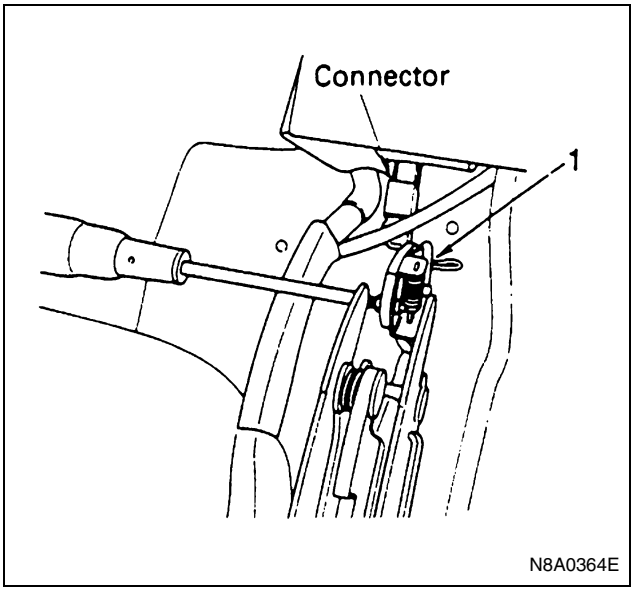


Removal

Preparation:

Disconnect the battery ground cable.

1. Parking Brake Switch
   1) Disconnect the connector.
   2) Remove the fixing screw.



Installation
To install, follow the removal steps in the reverse order.

Heater and Air Conditioning

General Description

The air conditioning consists of compressor, evaporator, condenser, A/C switch, fan switch, etc. When the engine is rotating, the A/C starts to work with both the A/C and fan switches “ON”, followed by the engagement of the magnetic clutch. It stops to work when either the fan switch or the A/C switch turns “OFF”. In addition to the switches, the A/C has the function of temporary stop of its operation by the sensing system in the A/C cycle, such as:

- sensing abnormal rise of the refrigerant pressure by means of the pressure switch.
- sensing temperature of the blowing-off air by means of the thermo switch preventing the evaporator from freezing.
- sensing the coolant temperature by the thermo switch (available for limited models only).

Fuel Heater and Rear Heater

General Description

The circuit consists of fuel heater, rear heater, rear heater switch and the exhaust brake relay.
The fuel heater circuit is always in “ON” position when the generator is charging and its temperature is automatically controlled by the circuit breaker built in the fuel heater.

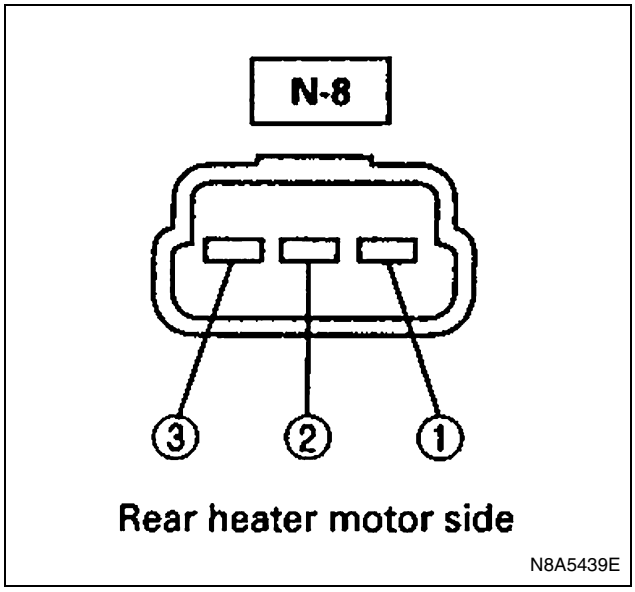
HI		○	○

Rear Heater Motor

Inspection

Disconnect the rear heater connector.
Connect the battery positive terminal to the NO.3 terminal of the rear heater motor side connector and negative to the NO.2. Check to see if rear heater motor operates low-speed correctly.
Connect the battery positive terminal to the NO.3 terminal of the rear heater motor side connector and negative to the NO.1. Check to see if rear heater motor operates high-speed correctly.
Replace the rear heater motor when the result of inspection is found abnormal.



4WD Transfer (Vacuum Control)

General Description

The circuit consists of the starter switch, 4WD switch, 4WD detect switch, 4L switch, vacuum switching valve, 4WD indicator light, neutral switch and the relay.
When the 4WD switch is turned on to drive in the 4WD mode, the vacuum switching valve for the transfer control is activated through the 4WD relay, and the transfer shift rod connected to the vacuum actuator is shifted to the 4WD side to turn on the 4WD detect switch. At the same time, the indicator light in the meter lights on to tell that the mode is transferred to 4WD mode.
However, when running in the normal mode (2WD), the 4WD switch is not operated. Accordingly, no current flows through the 4WD vacuum switching valve for the transfer control, with the 4WD detect switch left in the “OFF” condition (2WD mode).

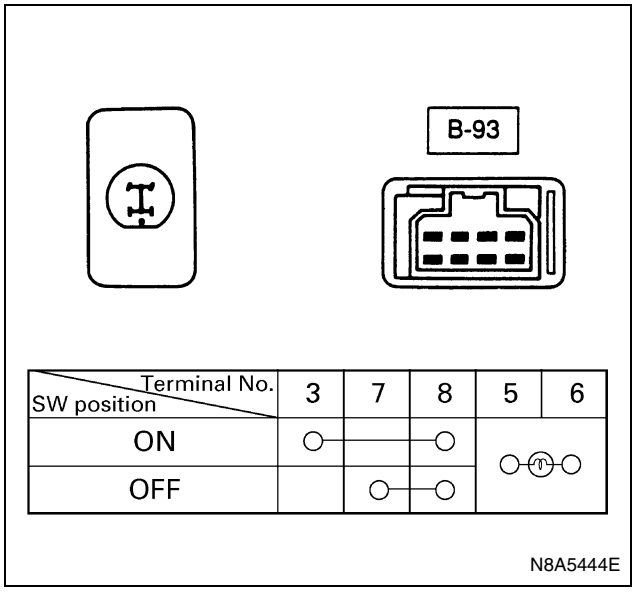
4WD Switch

Inspection

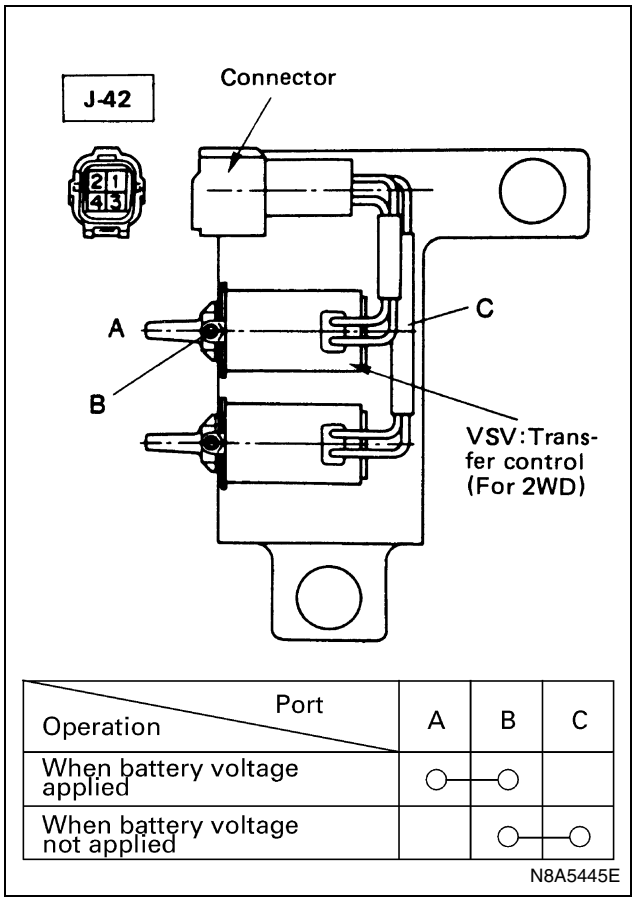
Check the continuity between the connector terminals while operating the switch.
Replace the switch when the result of inspection is found abnormal.



Vacuum Switching Valve: Transfer Control (for 2WD)

Inspection

Connect the vacuum switching valve connector terminal No. 1 to the battery (+) terminal and terminal No. 3 to the (−) terminal and then check the continuity among each port.



Vacuum Switching Valve: Transfer Control (for 4WD)

Inspection

Connect the vacuum switching valve connector terminal No. 2 to the battery (+) terminal and terminal No. 4 to the (−) terminal and then check the continuity among each port.

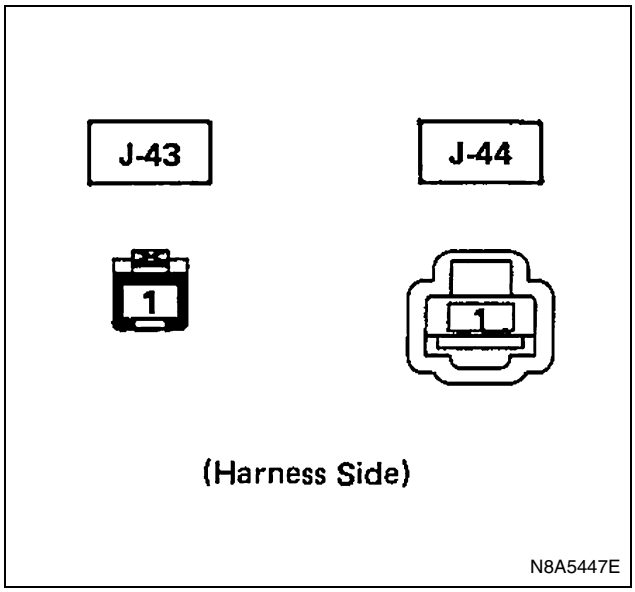
When battery voltage applied	○	○	
When battery voltage not applied		○	○

N8A5446E

4WD Detective Switch

Inspection of the 4WD Warning Light Circuit

1. Disconnect the 4WD switch connectors.
2. Connect the harness side connector terminals.
3. Check to see if the indicator light comes on with the starter switch “ON”.
   Check the bulb or harness when the result of inspection is found abnormal.



N8A5447E

Inspection

1. Shift the transfer lever to the 4H (4L) position.
2. Check to see if there is continuity between the 4WD switch connectors.
   Replace the switch when the result of the inspection is found abnormal.

ABS/ASR System

General Description

ABS (Anti-lock Brake System) and ASR (Anti-Slip Regulator) are the system to prevent the wheels from locking and wheel spin, and to assure stability and steering ability of the vehicle.
When a malfunction occurs in the system, fail-safe deactivate the ABS and ASR, and the warning lamp comes on. Also, the self-diagnosis function is equipped to improve serviceability.

Transmission Control System (Smoother)

General Description

"Smoother" is the name of a new-generation drive train that provides benefits in terms of both life cycle costs (low initial cost and maintenance cost, lower fuel consumption, etc.) and easy driving. Smoother is a system that adds an automatic transmission to the existing Smoother, for even better fuel consumption and easier driving. This is accomplished by installing a solenoid system shift control box on the Smoother, which combines a manual transmission with fluid coupling, so all shifting is performed automatically in accordance with signals from the transmission control module (TCM). When starting moving the vehicle, depressing the brake pedal and operating the change lever as on an automatic vehicle causes a change lever position signal to be detected by the TCM. This actuates the shift control box solenoid and shifts the gear into the starting position or the reverse position, and then engages the shift change clutch (wet multi-disc clutch). (After the shift clutch engages, creep force is generated the same as on an AT vehicle.) Releasing the foot from the brake pedal and pressing the accelerator pedal starts the vehicle moving forward. If there is an up-shift or down-shift while running, the control unit determines the vehicle status based on vehicle speed, accelerator opening angle, and other factors, and shifts to the optimal gear automatically. If the driver moves the change lever in the "+" or "-" direction, a gear change is indicated, so sequential manual shifting is also possible. (Even during sequential manual shifting, the transmission shifts to the starting position when the vehicle is stopped.)

Electronic Control Type PTO

General Description

This circuit consists of starter switch, PTO switch (for dump vehicle, it shares with dump control switch), relay, diodes, solenoid and control unit.

Electronic control type PTO is installed on the left side of transmission.

PTO's gears are engaged at any time. There is a sleeve installed on the output shift, and the sleeve is shifted by the solenoid through the shift rods(s) and shift arm(s). This causes turning the power on or off.

GENERAL INFORMATION

General Information

The chassis electrical system is of 12-volt specifications with a negative ground polarity.
Wire sizes are appropriate to respective circuits, and classified by color. (The classification of harnesses by color is shown on the circuit diagram for ease of harness identification.)
The wire size is determined by load capacity and the length of wire required.
The vehicle harnesses are: body harness, floor harness, engine harness, frame front harness, frame rear harness, rear body harness, dome light harness, door harness and battery cable.
The harnesses are protected either by tape or corrugated tube, depending on harness location.
The circuit for each system consists of the power source, wire, fuse, relay switch, load parts and ground, all of which are shown on the circuit diagram.
In this manual, each electrical device is classified by system. For major parts shown on the circuit based on the circuit diagram for each system, a summary, diagnosis of troubles, inspection and removal and installation procedures are detailed.

Notes for Working on Electrical Items

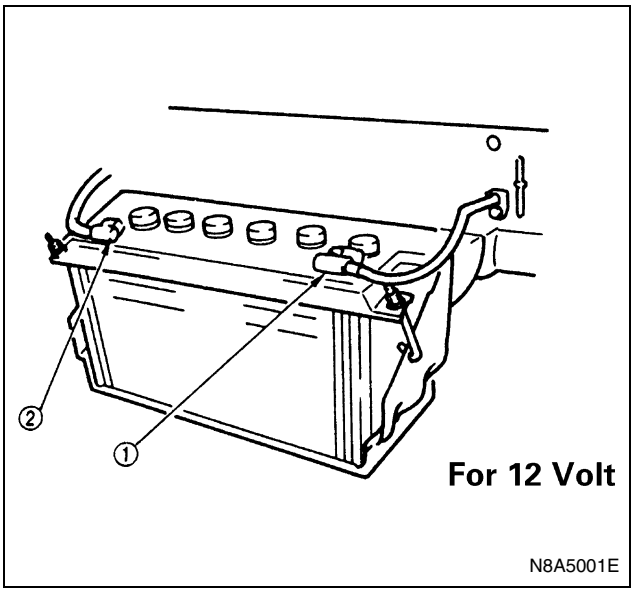
Battery Cable

Disconnecting The Battery Cable

1. All switches should be in the “OFF” position.
2. Disconnect the battery ground cable.
3. Disconnect the battery positive cable.
4. Disconnect the battery cable 3.

Caution:
It is important that the battery ground cable be disconnected first.

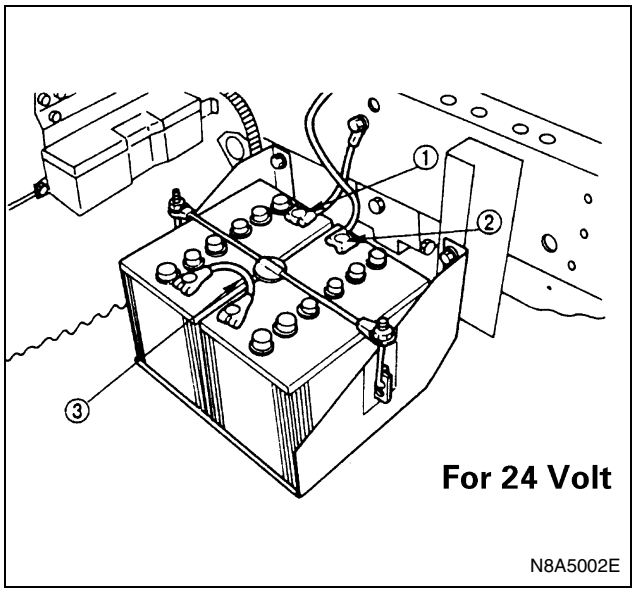
Disconnecting the battery positive cable first can result in a short circuit.



Connecting The Battery Cable

Follow the disconnecting procedure in the reverse order.

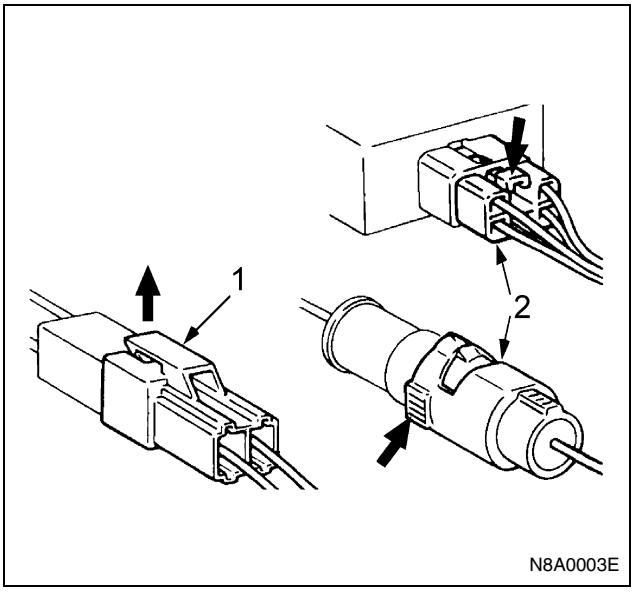
Caution:
Clean the battery terminal and apply a light coat of grease to prevent terminal corrosion.



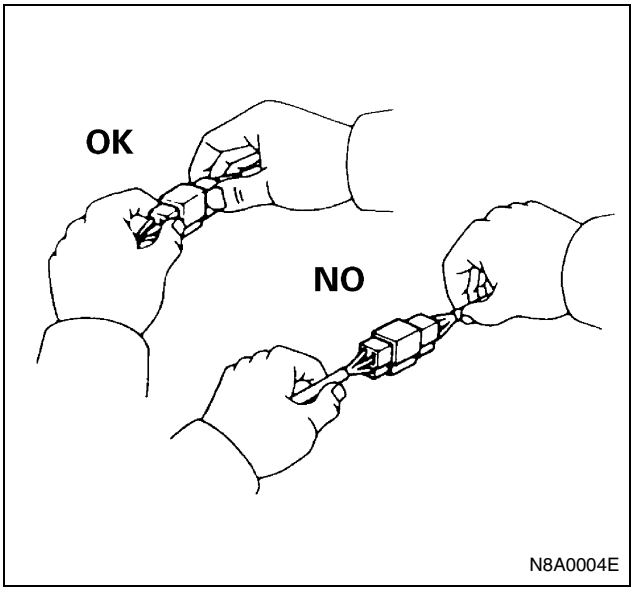
Connector Handling

Disconnecting The Connectors

Some connectors have a tang lock to hold the connectors together during vehicle operation.
Some tang locks are released by pulling them towards you 1.
Other tang locks are released by pressing them forward 2.
Determine which type of tang lock is on the connector being handled.
Firmly grasp both sides (male and female) of the connector.
Release the tang lock and carefully pull the two halves of the connector apart.

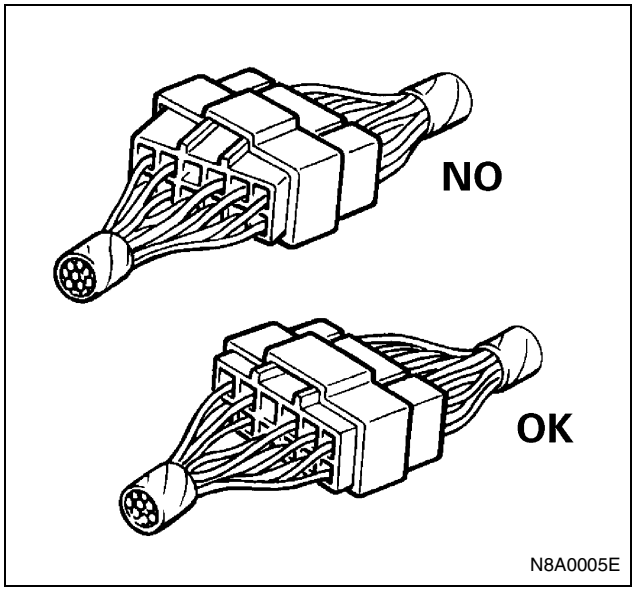


Never pull on the wires to separate the connectors. This will result in wire breakage.



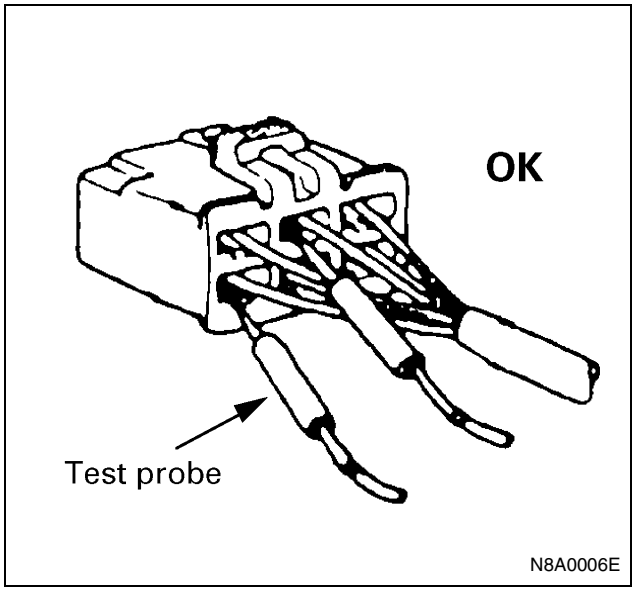
Connecting the Connector

Firmly grasp both sides (male and female) of the connector. Be sure that the connector pins and pin holes match. Be sure that both sides of the connector are aligned with each other. Firmly but carefully push the two sides of the connector together until a distinct click is heard.

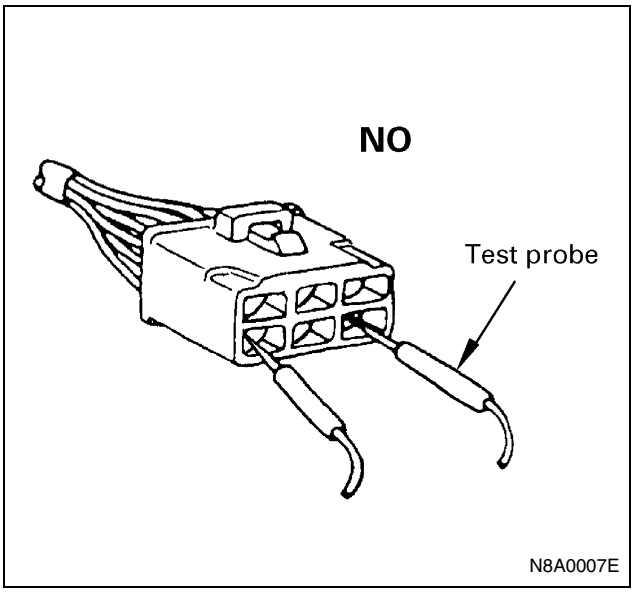


Connector Inspection

Use a circuit tester to check the connector for continuity. Insert the test probes from the connector wire side.

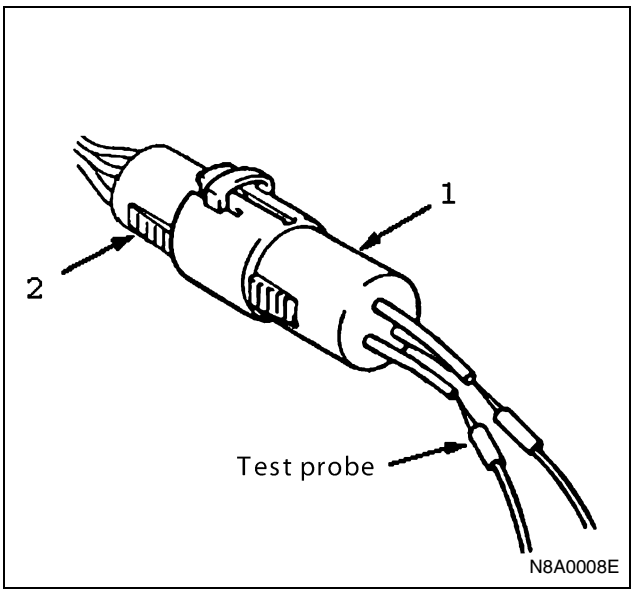


Never insert the circuit tester test probes into the connector open end to test the continuity. Broken or open connector terminals will result.



Waterproof Connector Inspection

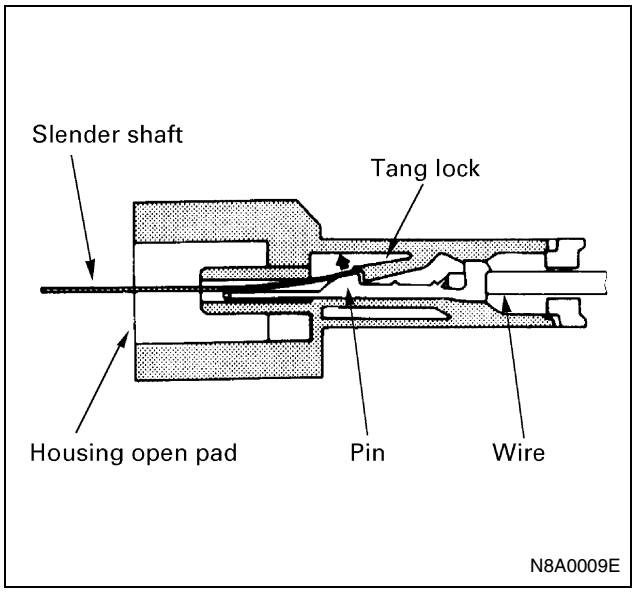
It is not possible to insert the test probes into the connector wire side of a waterproof connector.
Use one side of a connector 1 with its wires cut to make the test. Connect the test connector 2 to the connector to be tested. Connect the test probes to the cut wires to check the connector continuity.



Connector Pin Removal

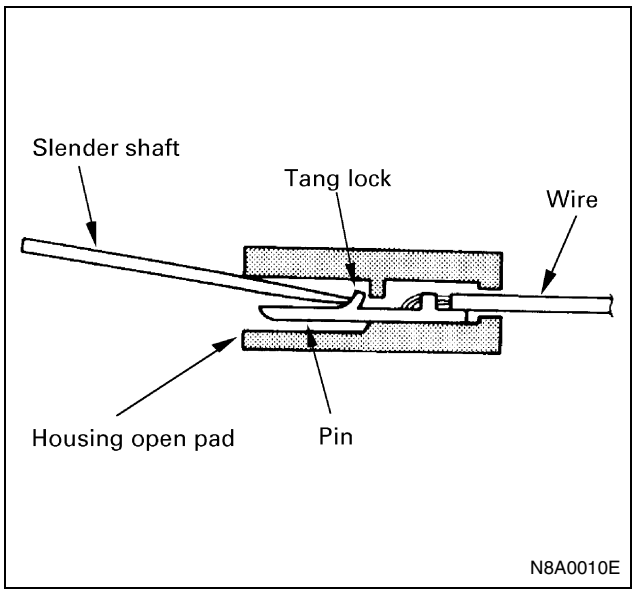
Connector Housing Tang Lock Type

1. Insert a slender shaft into the connector housing open end.
2. Push the tang lock up (in the direction of the arrow in the illustration). Pull the wire with pin free from the wire side of the connector.



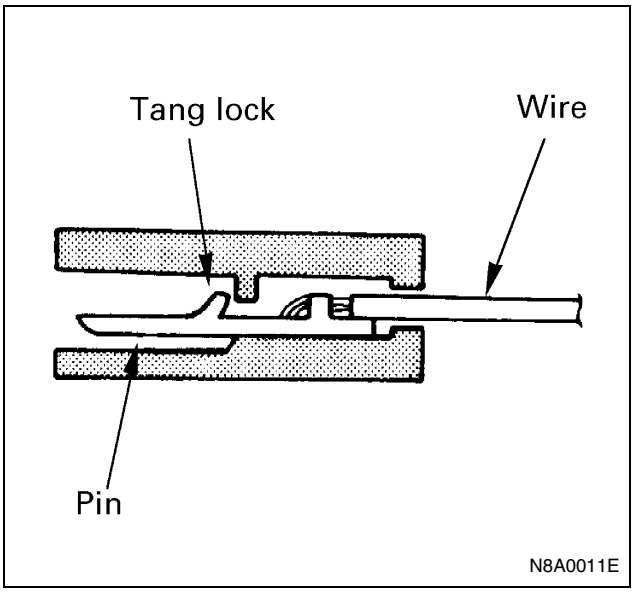
Pin Tang Lock Type

1. Insert a slender shaft into the connector housing open end.
2. Push the tang lock flat (toward the wire side of the connector). Pull the wire with pin free from the wire side of the connector.



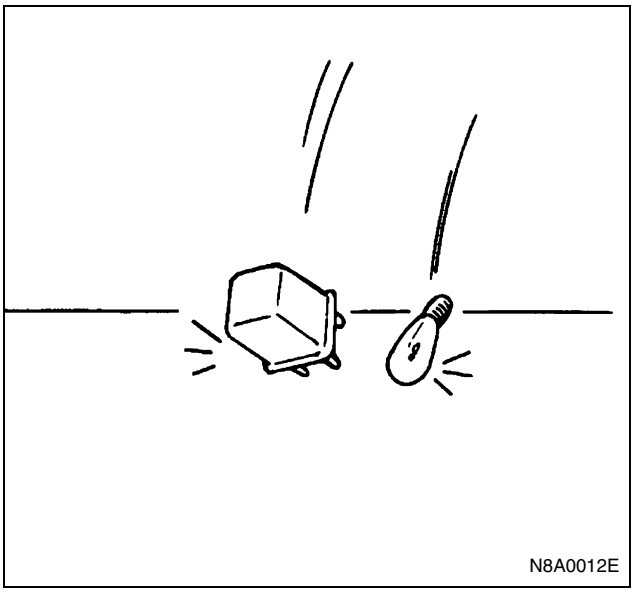
Connector Pin Insertion

3. Check that the tang lock is fully up.
4. Insert the pin from the connector wire side. Push the pin in until the tang lock closes firmly.
5. Gently pull on the wires to make sure that the connector pin is firmly set in place.



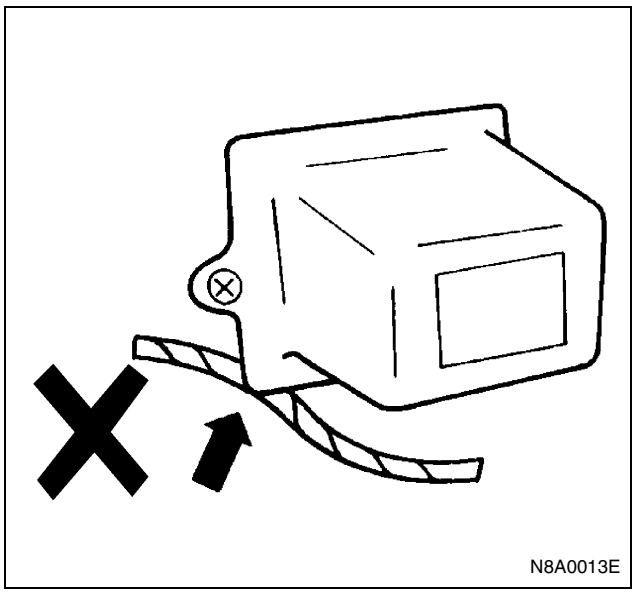
Parts Handling

Be careful when handling electrical parts. They should not be dropped or thrown, because short circuit or other damage may result.

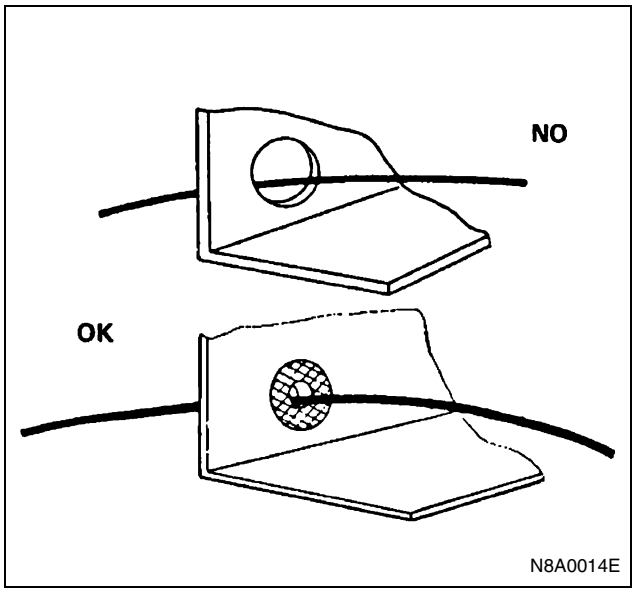


Cable Harness

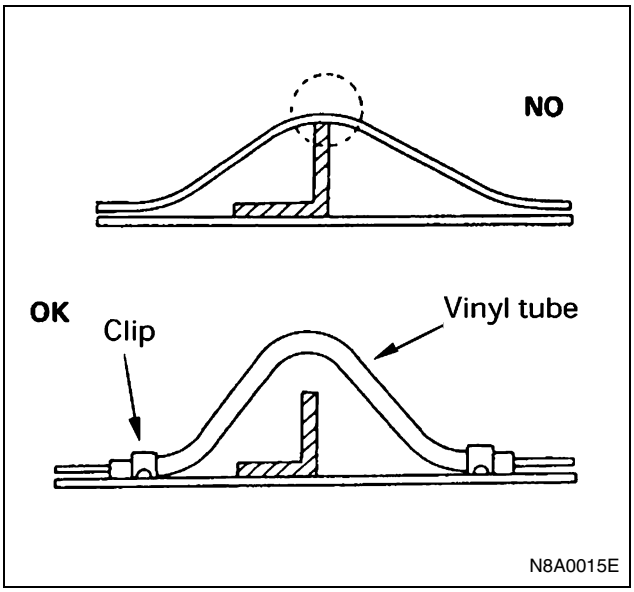
When installing the parts, be careful not to pinch or wedge the wiring harness.
All electrical connections must be kept clean and tight.



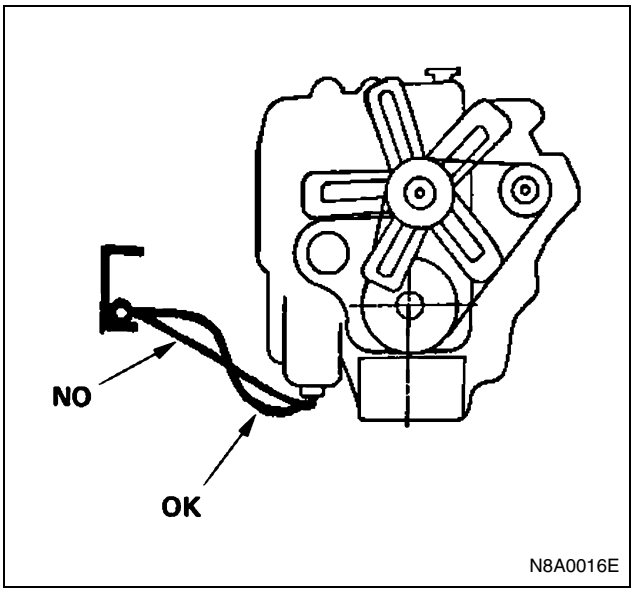
Use a grommet or guard tube to protect the wiring harness from contacting a sharp edge or surface.



Position the wiring harness with a enough clearance from the other parts and guard the wiring harness with a vinyl tube and clips to avoid direct contact.

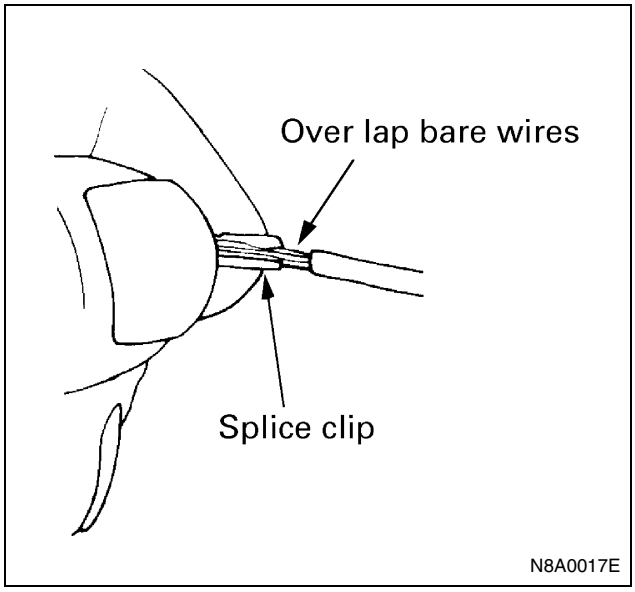


The wiring harness between engine and chassis should be long enough to prevent chafing or damage due to various vibrations.

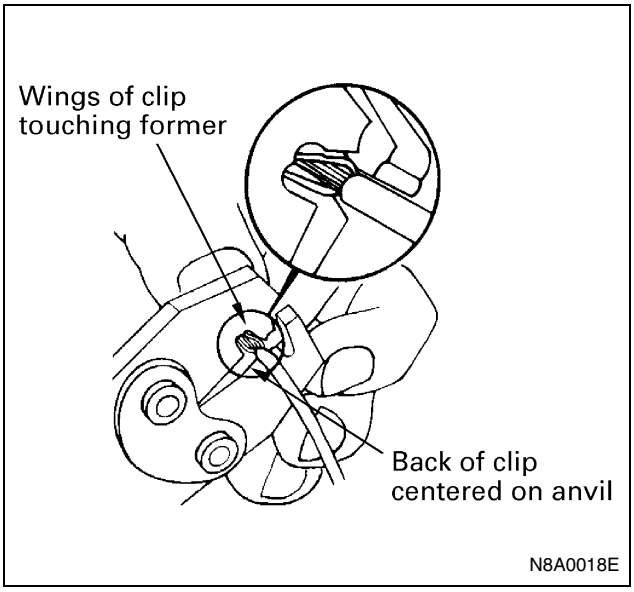


Splicing Wire

1. Open the Harness
   If the harness is taped, remove the tape. To avoid wire insulation damage, use a sewing “seam ripper” (available from sewing supply stores) to cut open the harness.
   If the harness has a block plastic conduit, simply pull out the desired wire.
2. Cut the wire
   Begin by cutting as little wire off the harness as possible. You may need the extra length of wire later if you decide to cut more wire off to change the location of a splice. You may have to adjust splice locations to make certain that each splice is at least 1-2/2″ (40 mm) away from other splices, harness branches, or connectors.
3. Strip the insulation
   When replacing a wire, use a wire of the same size as the original wire. Check the stripped wire for nicks or cut stands. If the wire is damaged, repeat the procedure on a new section of wire. The two stripped wire ends should be equal in length.
4. Crimp the Wires
   Select the proper clip to secure the splice. To determine the proper clip size for the wire being spliced, follow the directions included with your clips.
   Select the correct anvil on the crimper. (On most crimpers your choice is limited to either a small or large anvil.) Overlap the two stripped wire ends and hold them between your thumb and forefinger.
   Then, center the splice clip under the stripped wires and hold it in place.



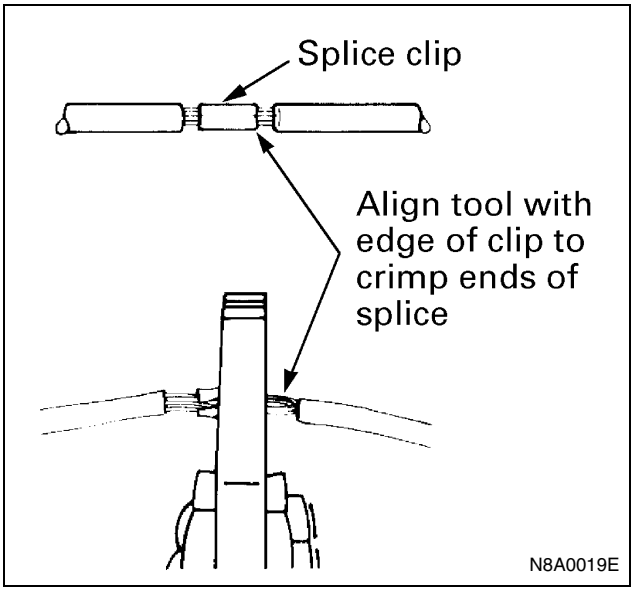
- Open the crimping tool to its full width and rest one handle on a firm flat surface.
- Center the back of the splice clip on the proper anvil and close the crimping tool to the point where the back of the splice clip touches the wings of the clip.
- Make sure that the clip and wires are still in the correct position. Then, apply steady pressure until the crimping tool closes.



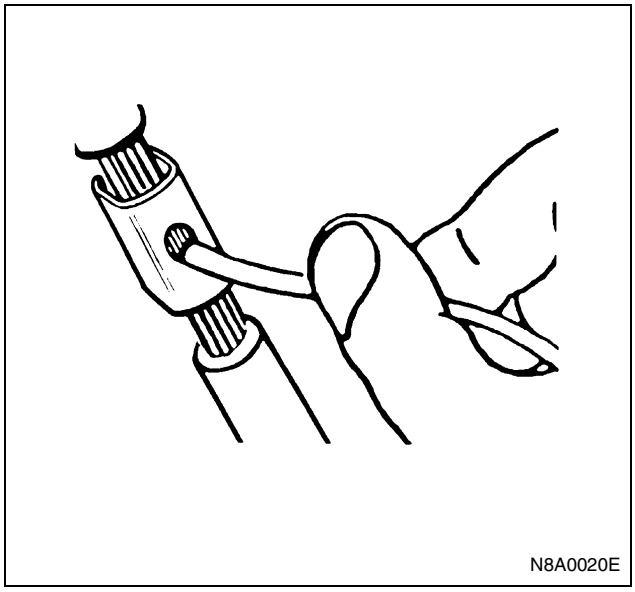
Before crimping the ends of the clip, be sure that:

- The wires extend beyond the clip in each direction.
- No strands of wire are cut loose, and
- No insulation is caught under the clip.

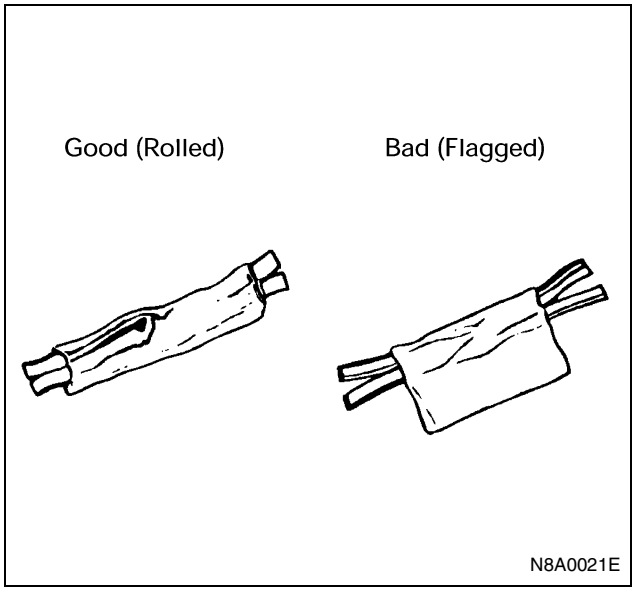
Crimp the splice again, once on each end. Do not let the crimping tool extend beyond the edge of the clip or you may damage or nick the wires.



5. Solder
   Apply 60/40 rosin core solder to the opening in the back of the clip. Follow the manufacturer's instructions for the solder equipment you are using.



6. Tape the Splice
   Center and roll the splicing tape. The tape should cover the entire splice. Roll on enough tape to duplicate the thickness of the insulation on the existing wires. Do not flag the tape. Flagged tape may not provide enough insulation, and the flagged ends will tangle with the other wires in the harness.



If the wire does not belong in a conduit or other harness covering, tape the wire again. Use a winding motion to cover the first piece of tape.

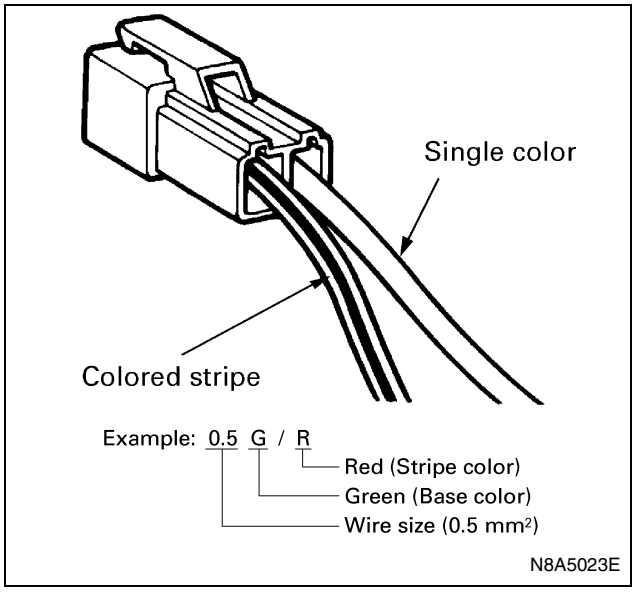
Parts for Electrical Circuit

Wiring

Wire Color

All wires have color-coded insulation.
Wires belonging to a system's main harness will have a single color. Wires belonging to a system's subcircuits will have a colored stripe. Striped wires use the following code to show wire size and colors.



Abbreviations are used to indicate wire color within a circuit diagram.
Refer to the following table.

Wire Color Coding

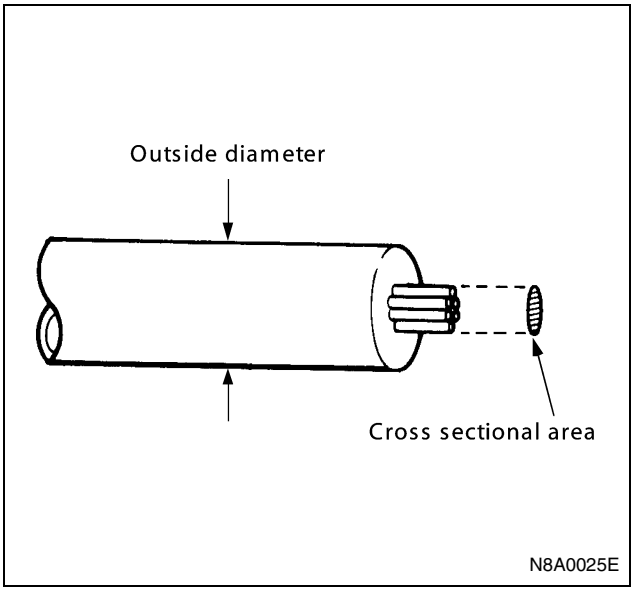
Color-Coding	Meaning	Color-Coding	Meaning
B	Black	BR	Brown
W	White	LG	Light green
R	Red	GR	Grey
G	Green	P	Pink
Y	Yellow	LB	Light blue
L	Blue	V	Violet
O	Orange		

Distinction of Circuit by Wire Base Color

Base color	Circuits	Base color	Circuits
B	Starter circuit	Y	Instrument circuit
W	Charging circuit	L, O, BR, LG, GR, P, LB, V	Other circuit
R	Lighting circuit		
G	Signal circuits		

Wire Size

The size of wire used in a circuit is determined by the amount of current (amperage), the length of the circuit, and the voltage drop allowed. The following wire size and load capacity, shown below, are specified by AWG (American Wire Gauge) (Nominal size means approximate cross sectional area).



Wire Size Table

Nominal size	Cross sectional area (mm^2)	Outside diameter (mm)	Allowable current (A)	AWG size (cross reference)
0.3	0.372	1.8	9	22
0.5	0.563	2.0	12	20
0.85	0.885	2.2	16	18
1.25	1.287	2.5	21	16
2	2.091	2.9	28	14
3	3.296	3.6	37.5	12
5	5.227	4.4	53	10
8	7.952	5.5	67	8
15	13.36	7.0	75	6
20	20.61	8.2	97	4

Fuse, Fusible Link and Circuit Breaker

Fuse

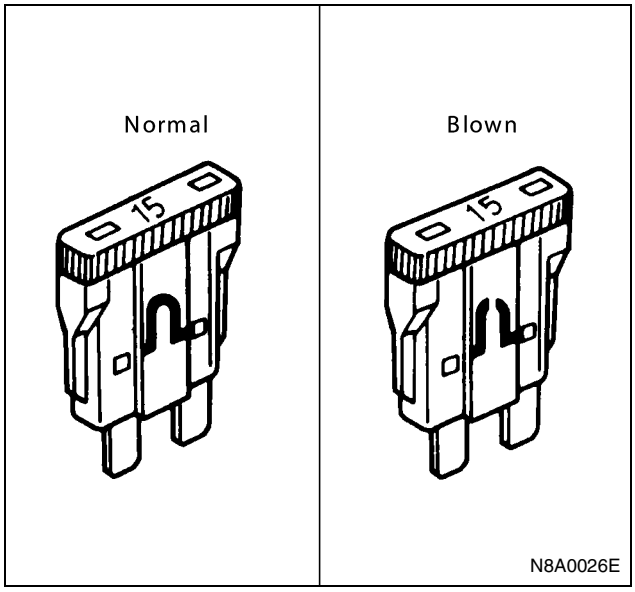
Fuses are the most common form of circuit protection used in vehicle wiring. A fuse is a thin piece of wire or strip of metal encases in a glass or plastic housing. It is wired in series with the circuit it protects. When there is an overload of current in a circuit, such as a short of a ground, the wire or metal strip is designed to burn out and interrupt the flow of current. This prevents a surge of high current from reaching and damaging other components in the circuit.

Determine the cause of the overloaded before replacing the fuse.

The replacement fuse must have the same amperage specifications as the original fuse.

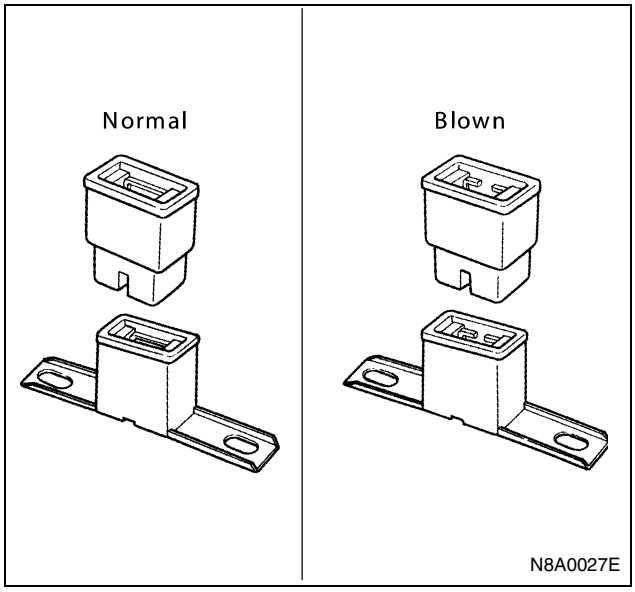
Never replace a blown fuse with a fuse of a different amperage specification.

Doing so can result in an electrical fire or other serious circuit damage. A blown fuse is easily identified.



Fusible Link

The fusible link is primarily used to protect circuits where high amounts of current flow and where is would not be practical to use a fuse. For example, the starter circuit. When a current overload occurs, the fusible link melts open and interrupts the flow of current so as to prevent the rest of the wiring harness from burning.
Determine the cause of the overload before replacing the fusible link. The replacement fusible link must have the same amperage specification as the original fusible link.
Never replace a blown fusible link with fusible link of a different amperage specification. Doing so can result in an electrical fire or other serious circuit damage.
A blown fusible link is easily identified.

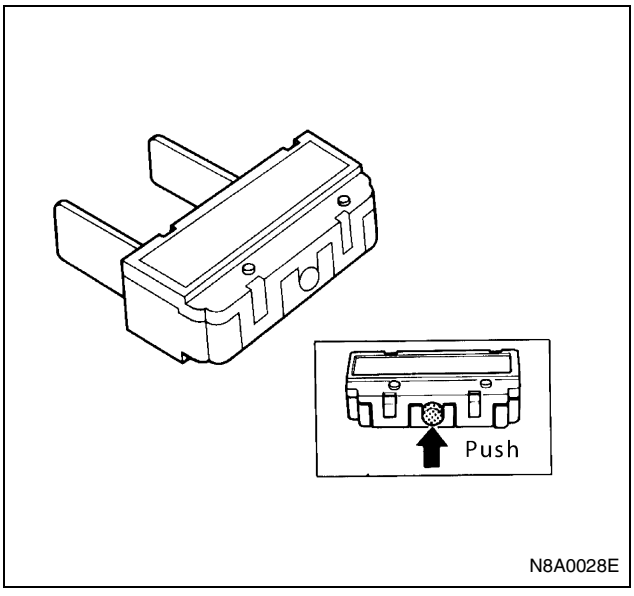


Fusible Link Specifications

Type	Rating	Case Color	Maximum Circuit Current (A)
Connector	30 A	Pink	15
Connector	40 A	Green	20
Bolted	50 A	Red	25
Bolted	60 A	Yellow	30
Bolted	80 A	Black	40

Circuit Breaker

The circuit breaker is a protective device designed to open the circuit when a current load is in excess of rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. The reset knob pops out when the circuit is open. Push the reset knob in place to restore the circuit after repairing it.



Relay

Battery and load location may require that a switch be placed some distance from either component. This means a longer wire and a higher voltage drop 1.
The installation of a relay between the battery and the load reduces the voltage drop 2.
Because the switch controls the relay, amperage through the switch can be reduced.

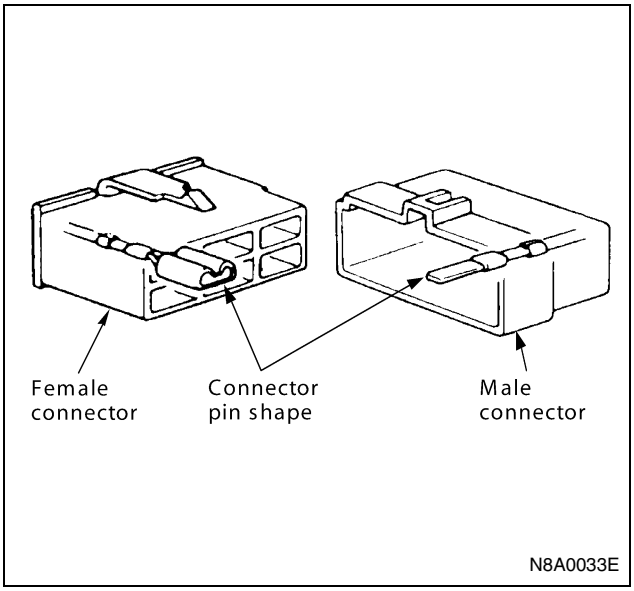
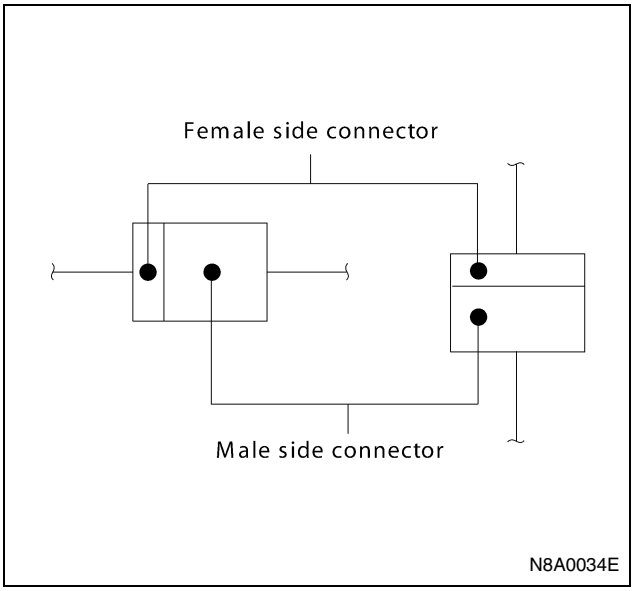
Connector

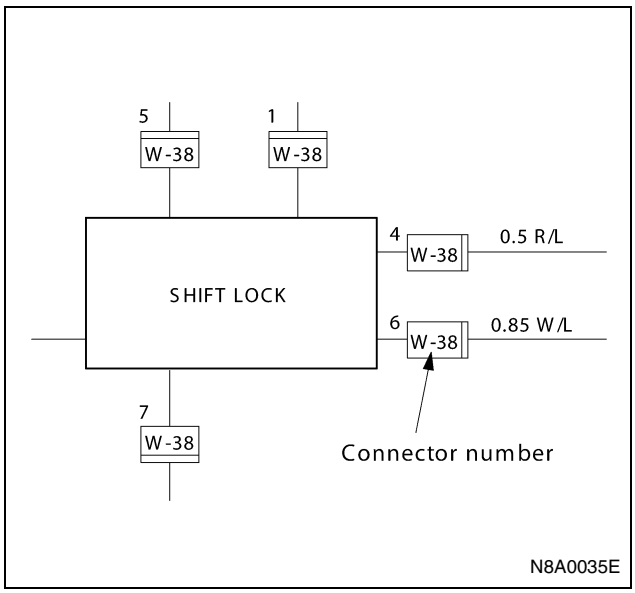
The connector pin shape determines whether the connector is male or female.
The connector housing configuration does not determine whether a connector is male or female.



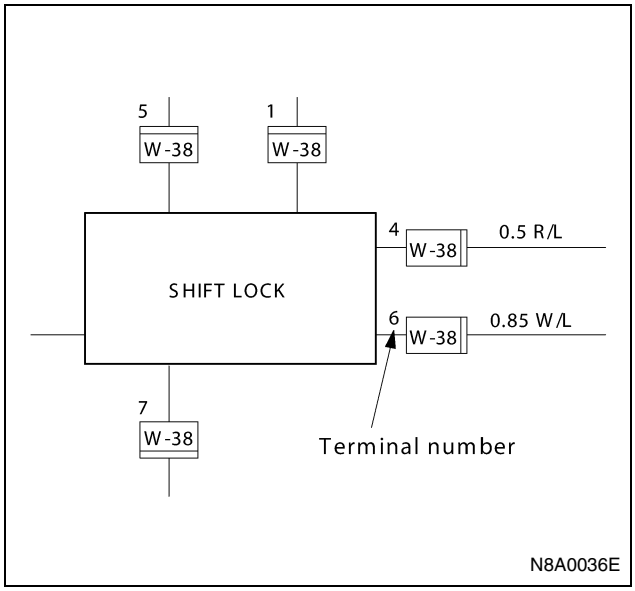
The symbol illustrated in the figure is used as connector, in the circuit of this section.



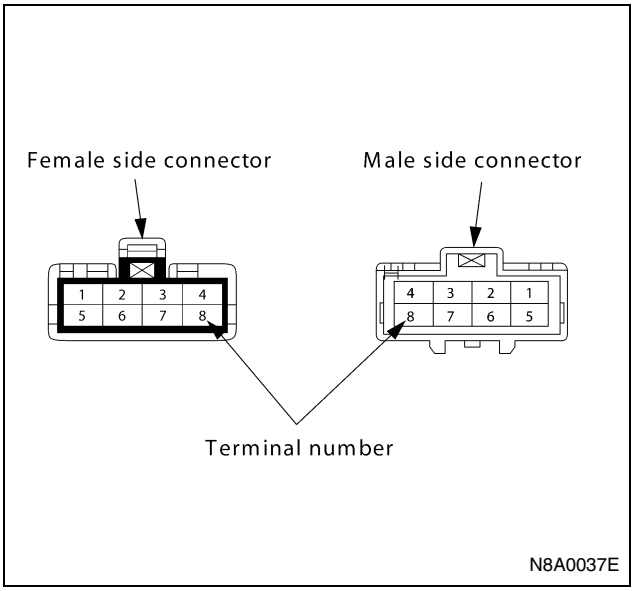
Connector is identified with a number.



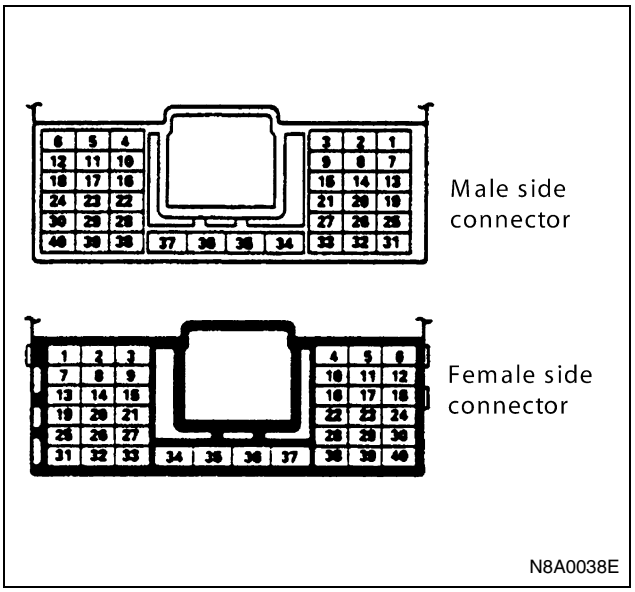
The applicable terminal number is shown for each connector.



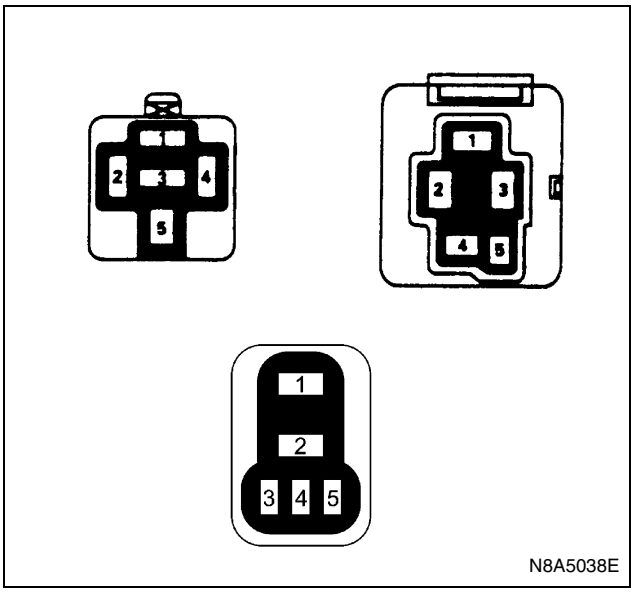
Connector terminal numbers are clearly shown.
Male side connector terminal numbers are in sequence from upper right to lower left.
Female side connector terminal numbers are in sequence from upper left to lower right.



Notice:
For those connectors on which specific terminal numbers or symbols are shown (such as ECM), the terminal numbers or symbols are used in the circuit diagram, irrespective of the above rule.



The connectors used for relays have their own terminal number assignment, irrespective of the above rule.

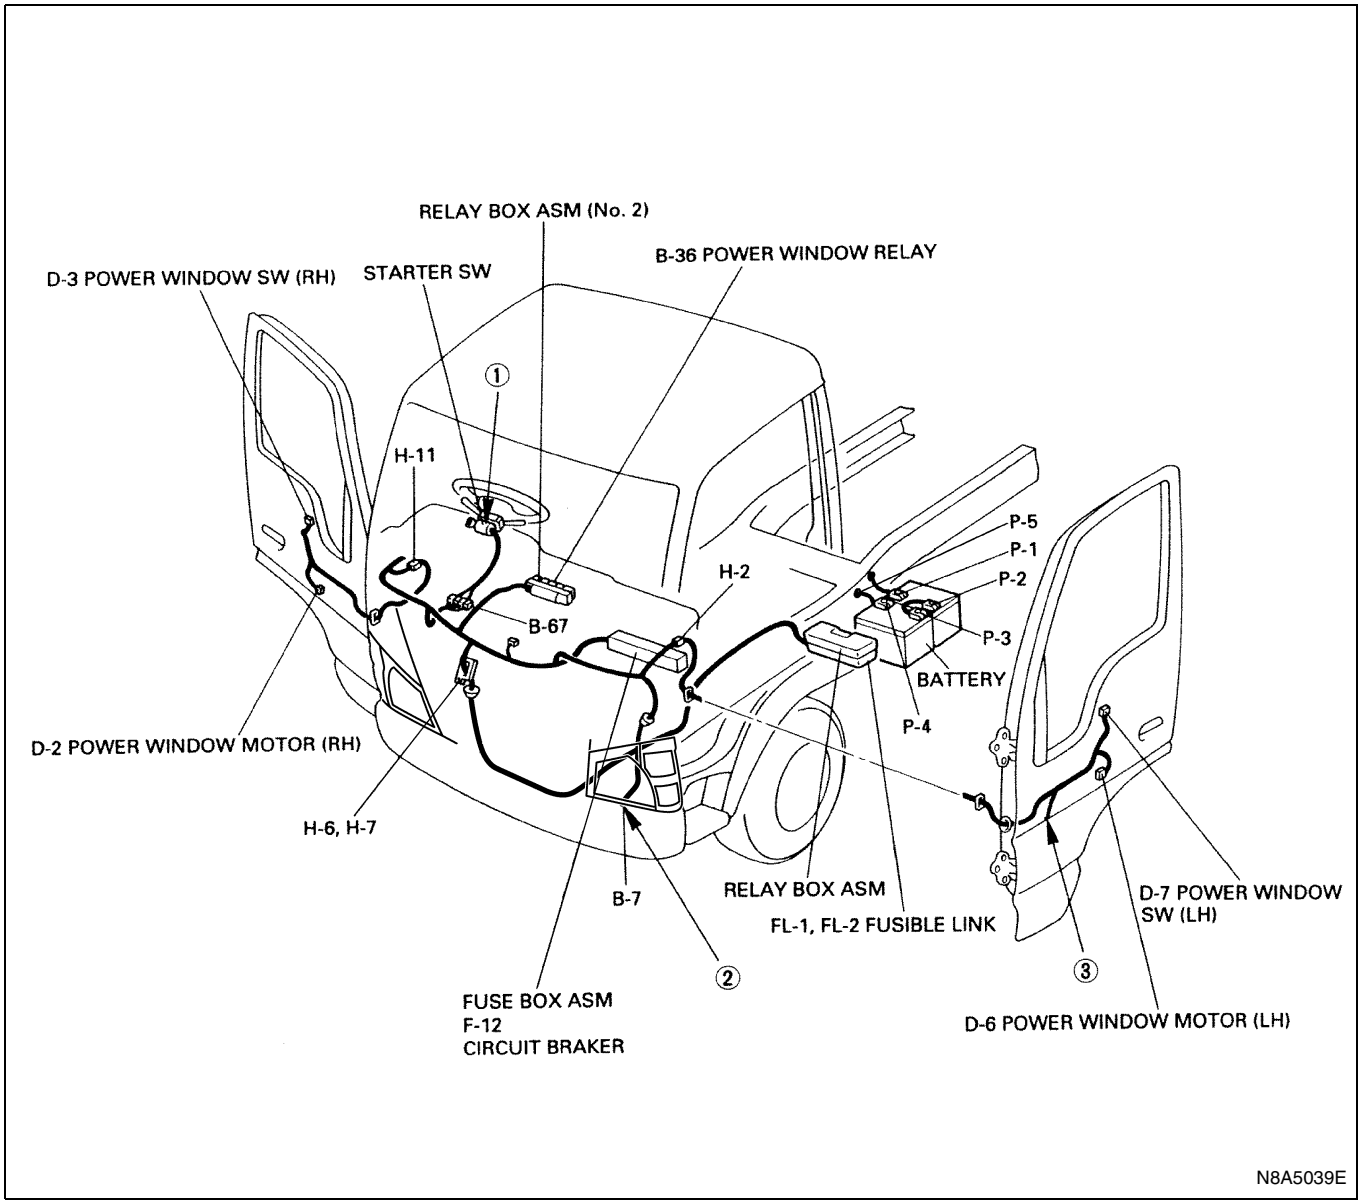


Reading The Circuit Diagram

In this manual, each system has its own parts location illustration, circuit diagram and connector configuration used in the circuit diagram.

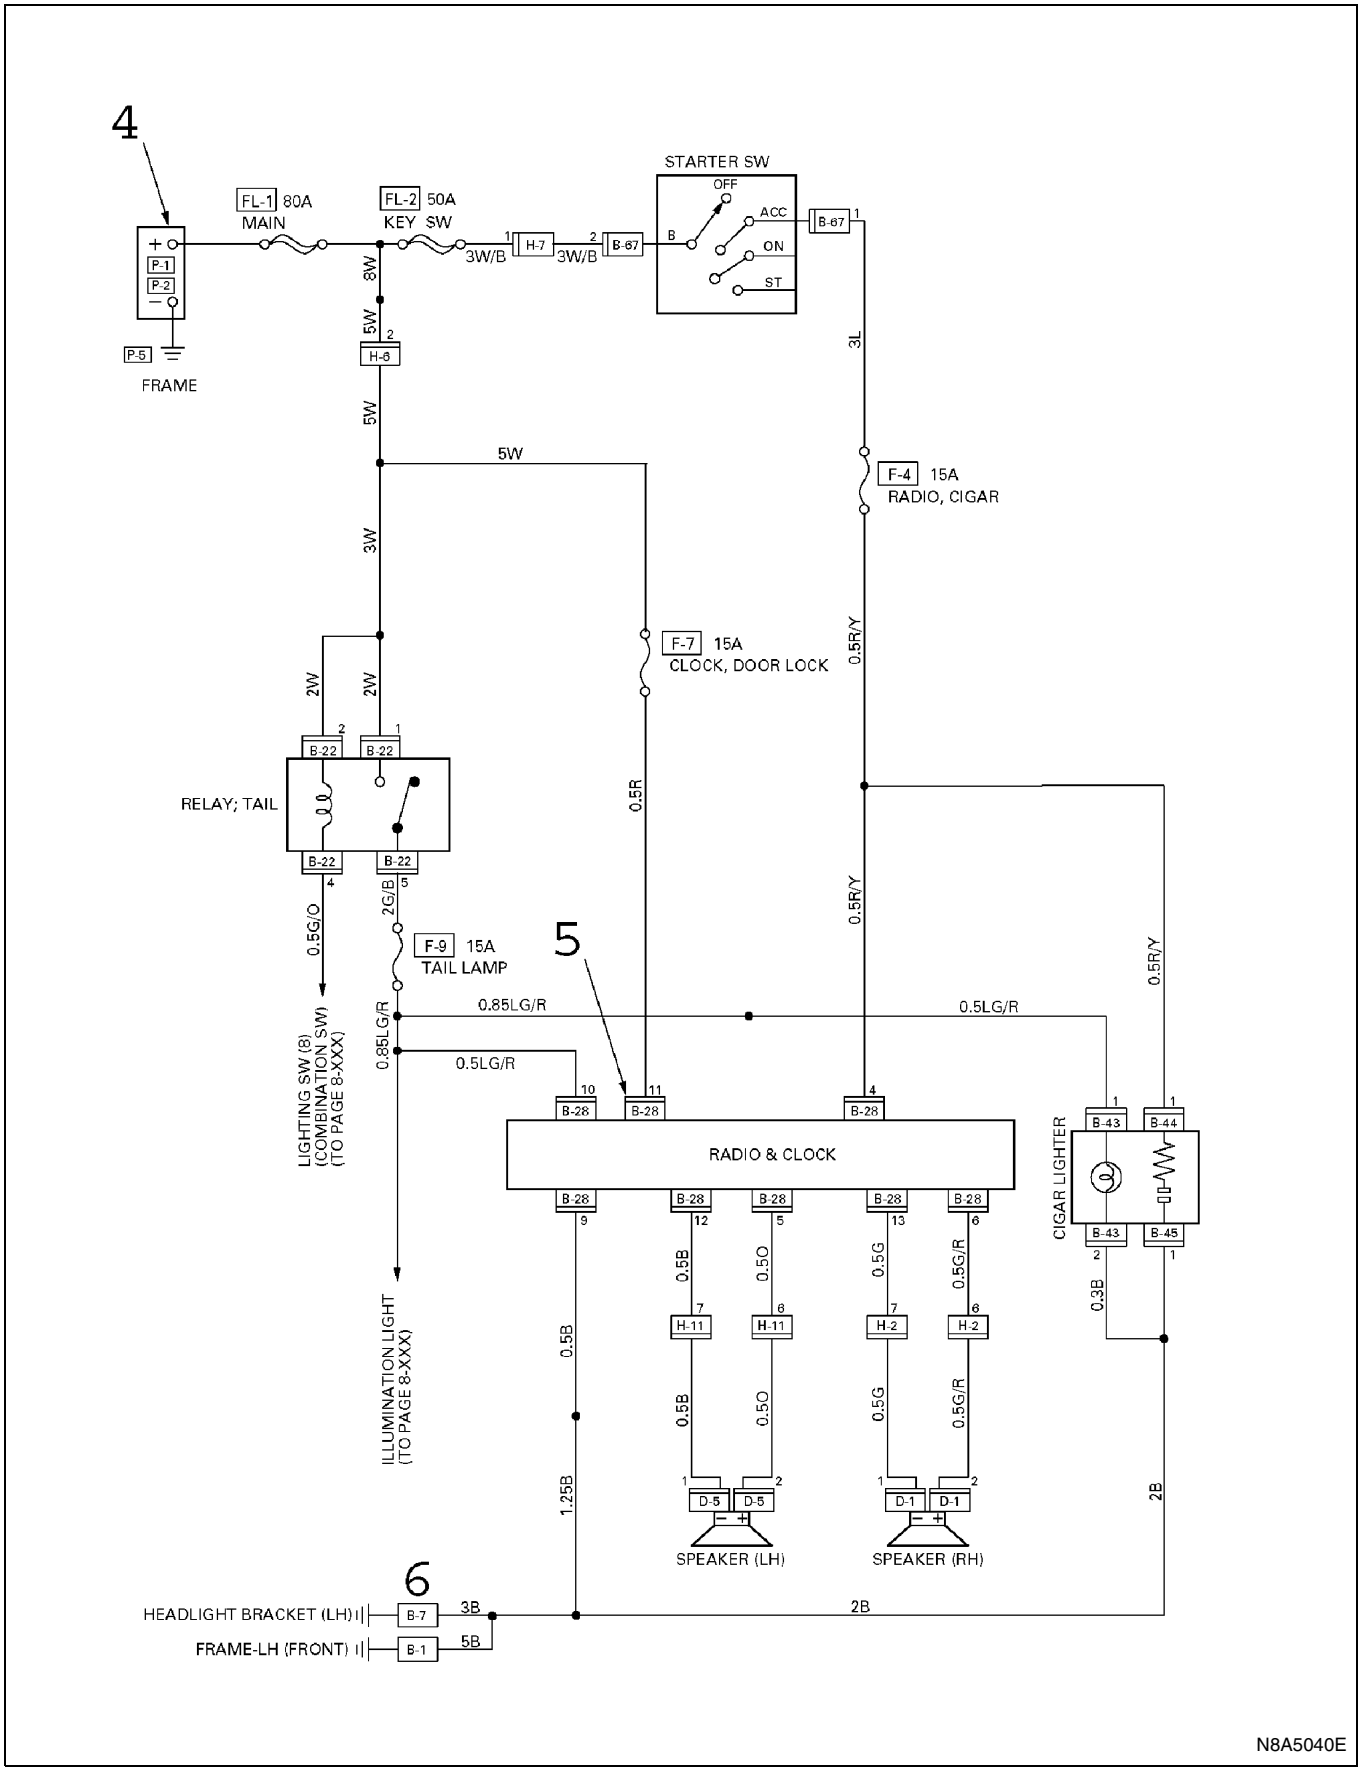
Parts Location

The parts location shows the location of the parts 1 and the connector 2 used in each harness routing 3.



Circuit Diagram

The circuit diagram shows the power supply 4 the load or loads 5 and the grounding point(s) 6.



N8A5040E

Connector List

The connector list shows each connectors' configuration 7 and the pin number 8.

Notice:
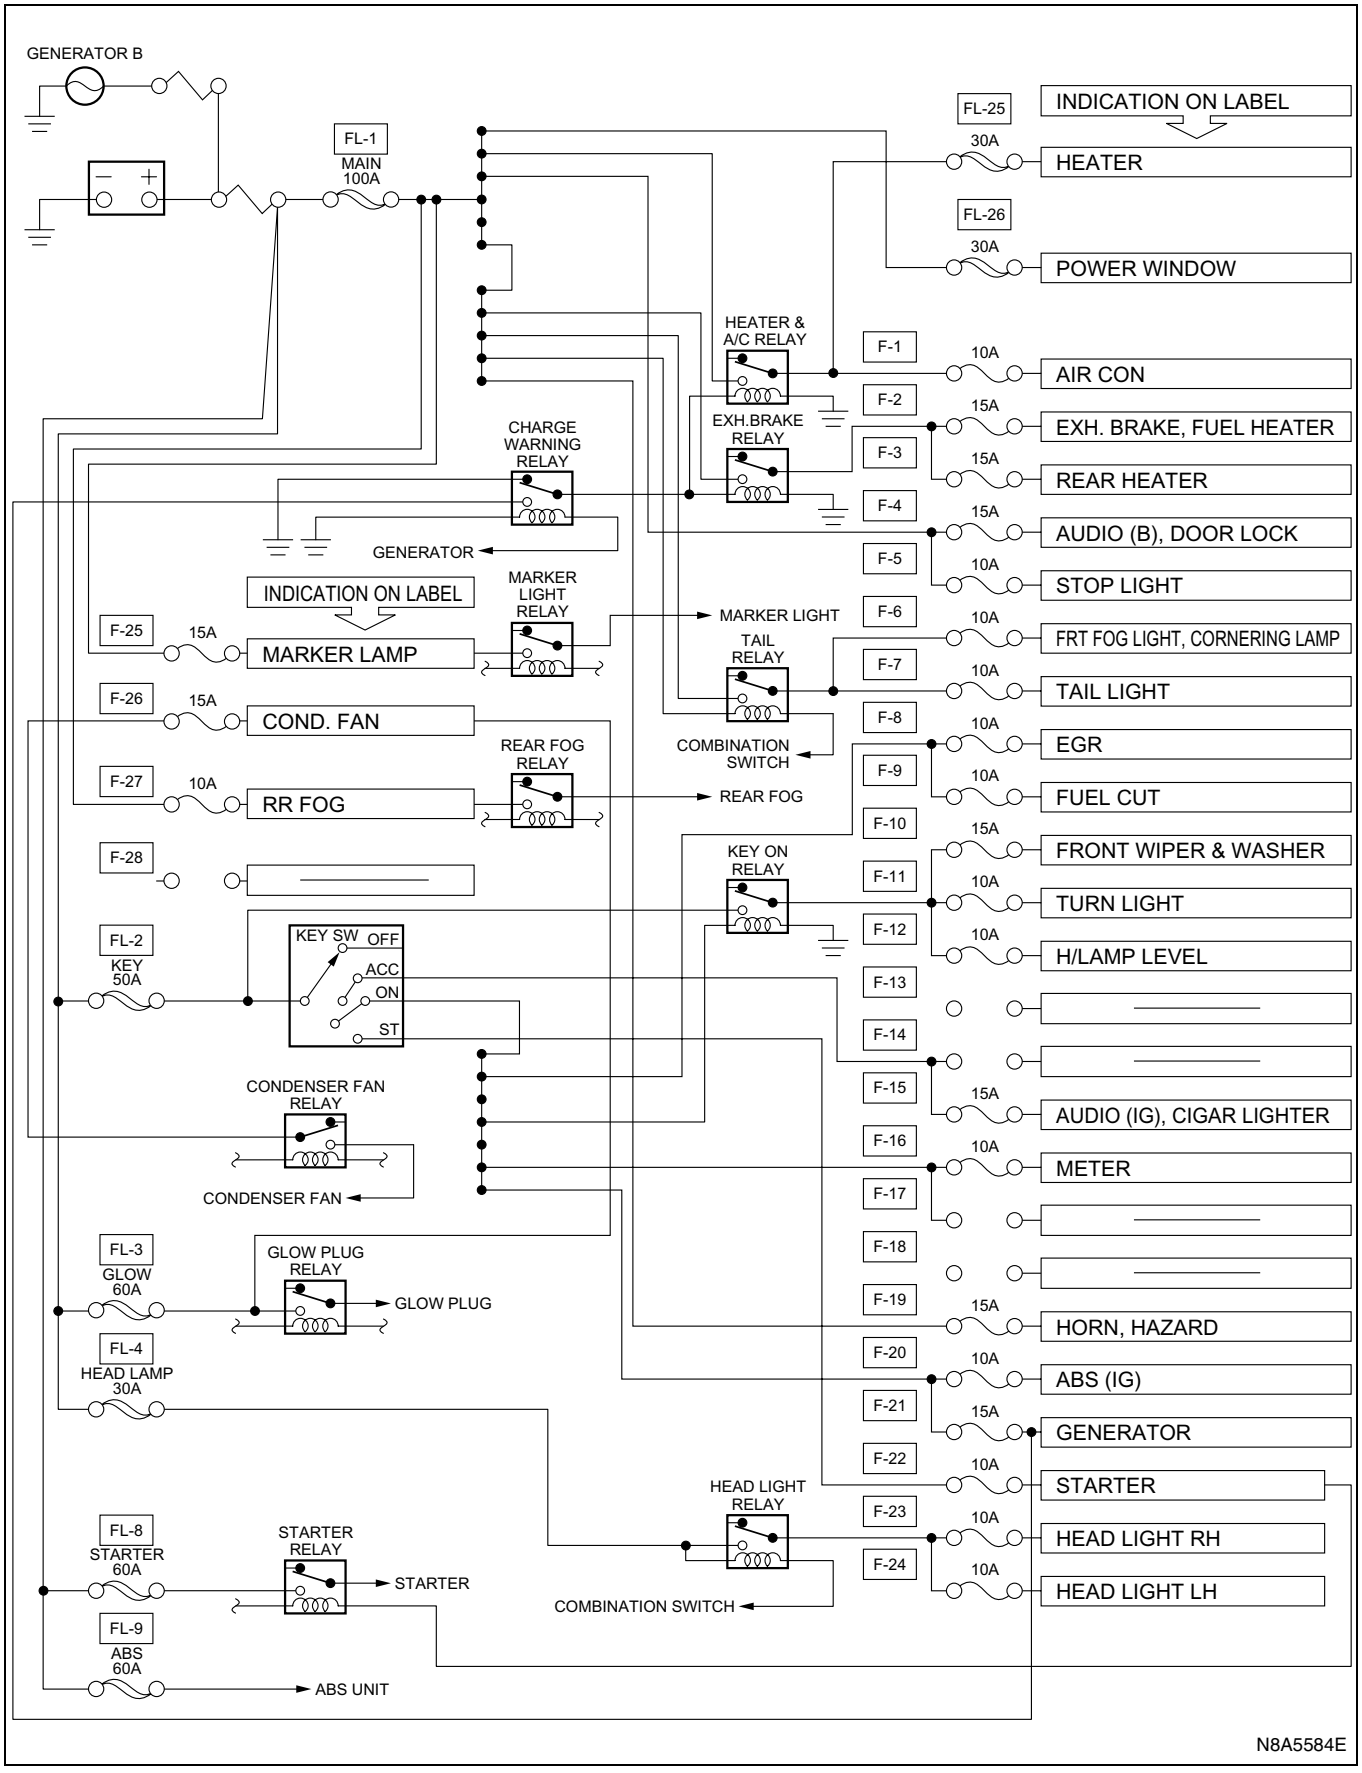
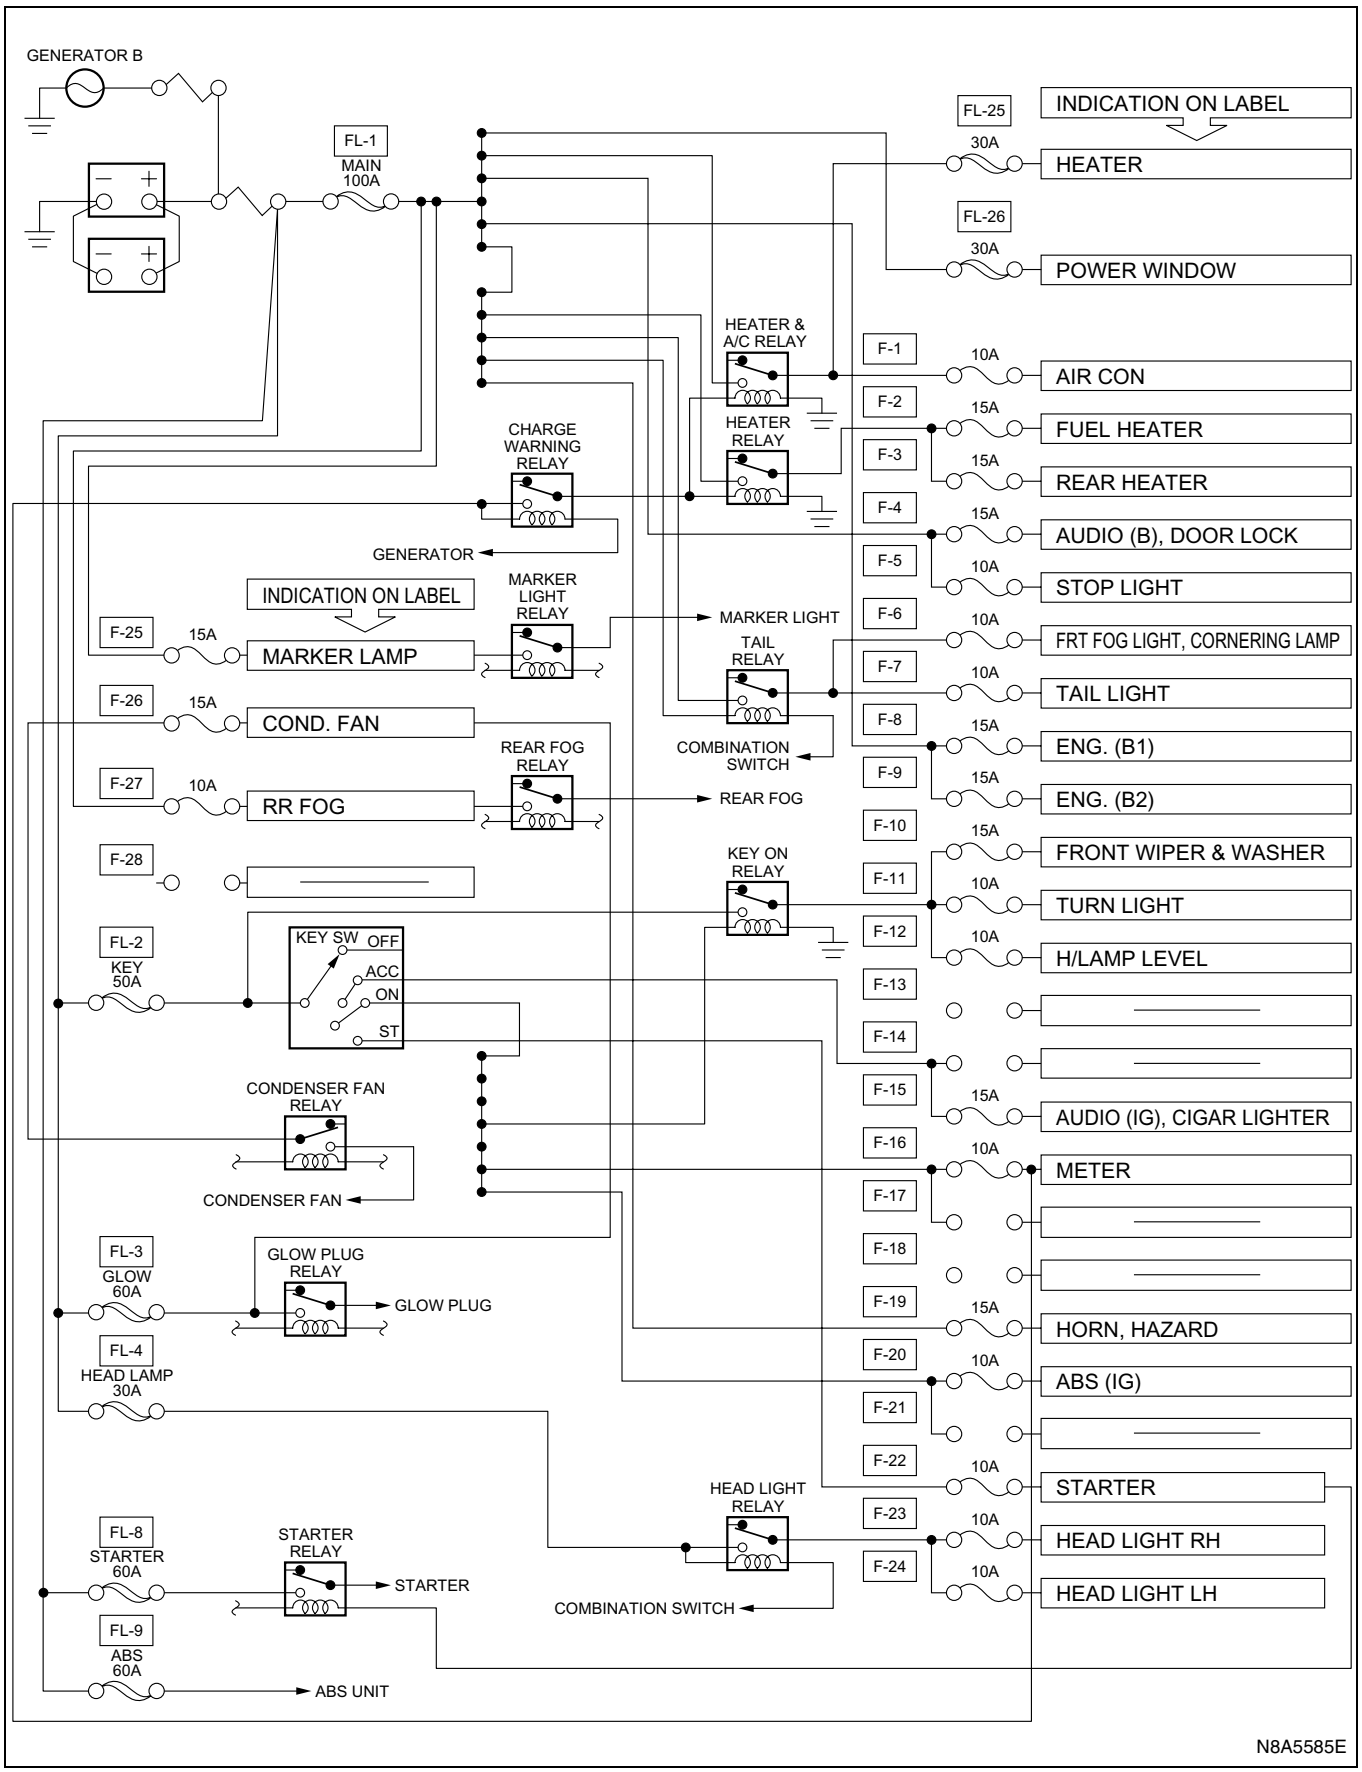
The fusible link numbers (1) — (26) are expressed as FL-1 — FL-26 in the circuit diagrams of this manual.

Fuse Block Circuit

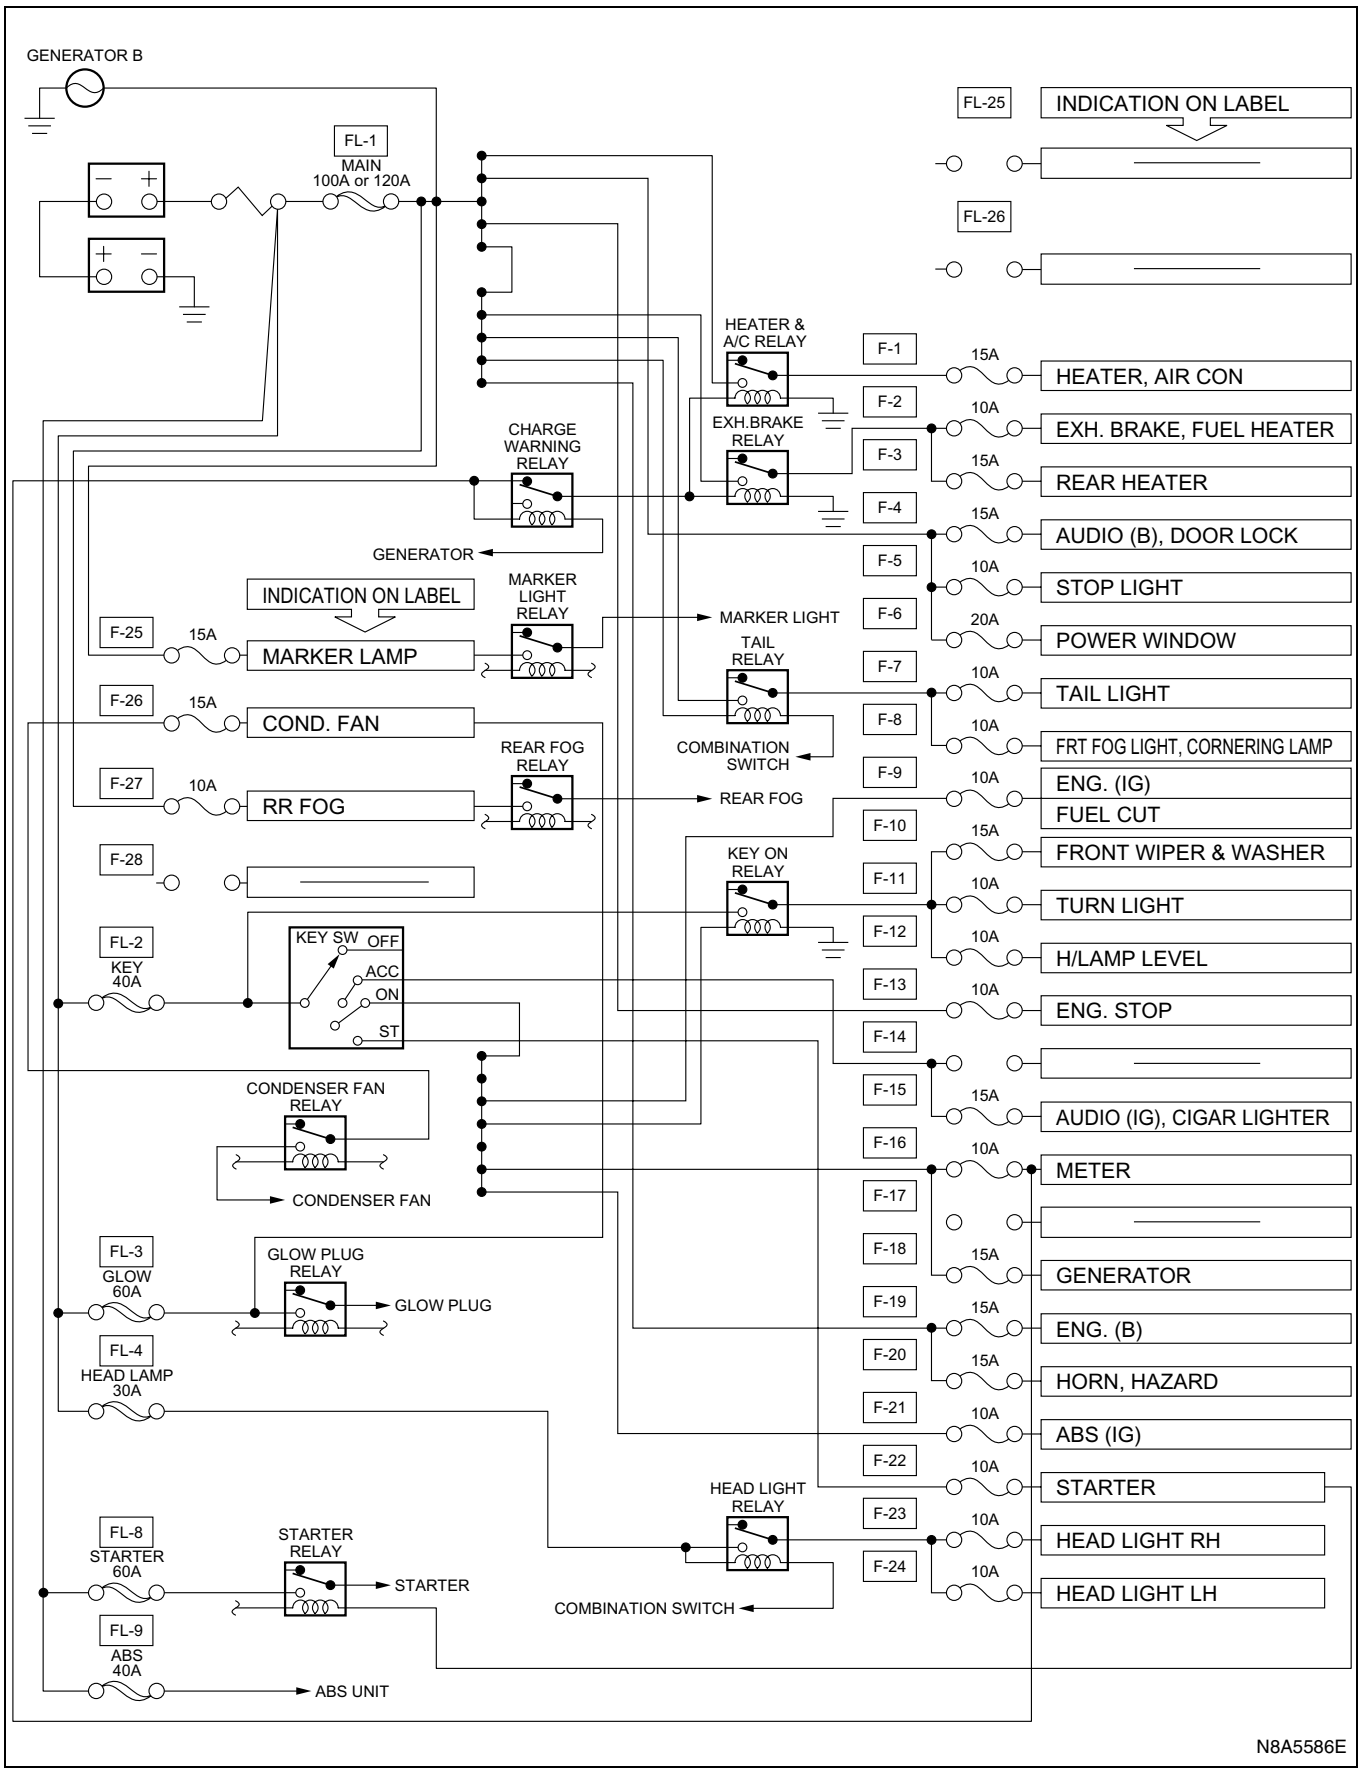
For 12 Volt-4JB1 / 4JG2 Engine



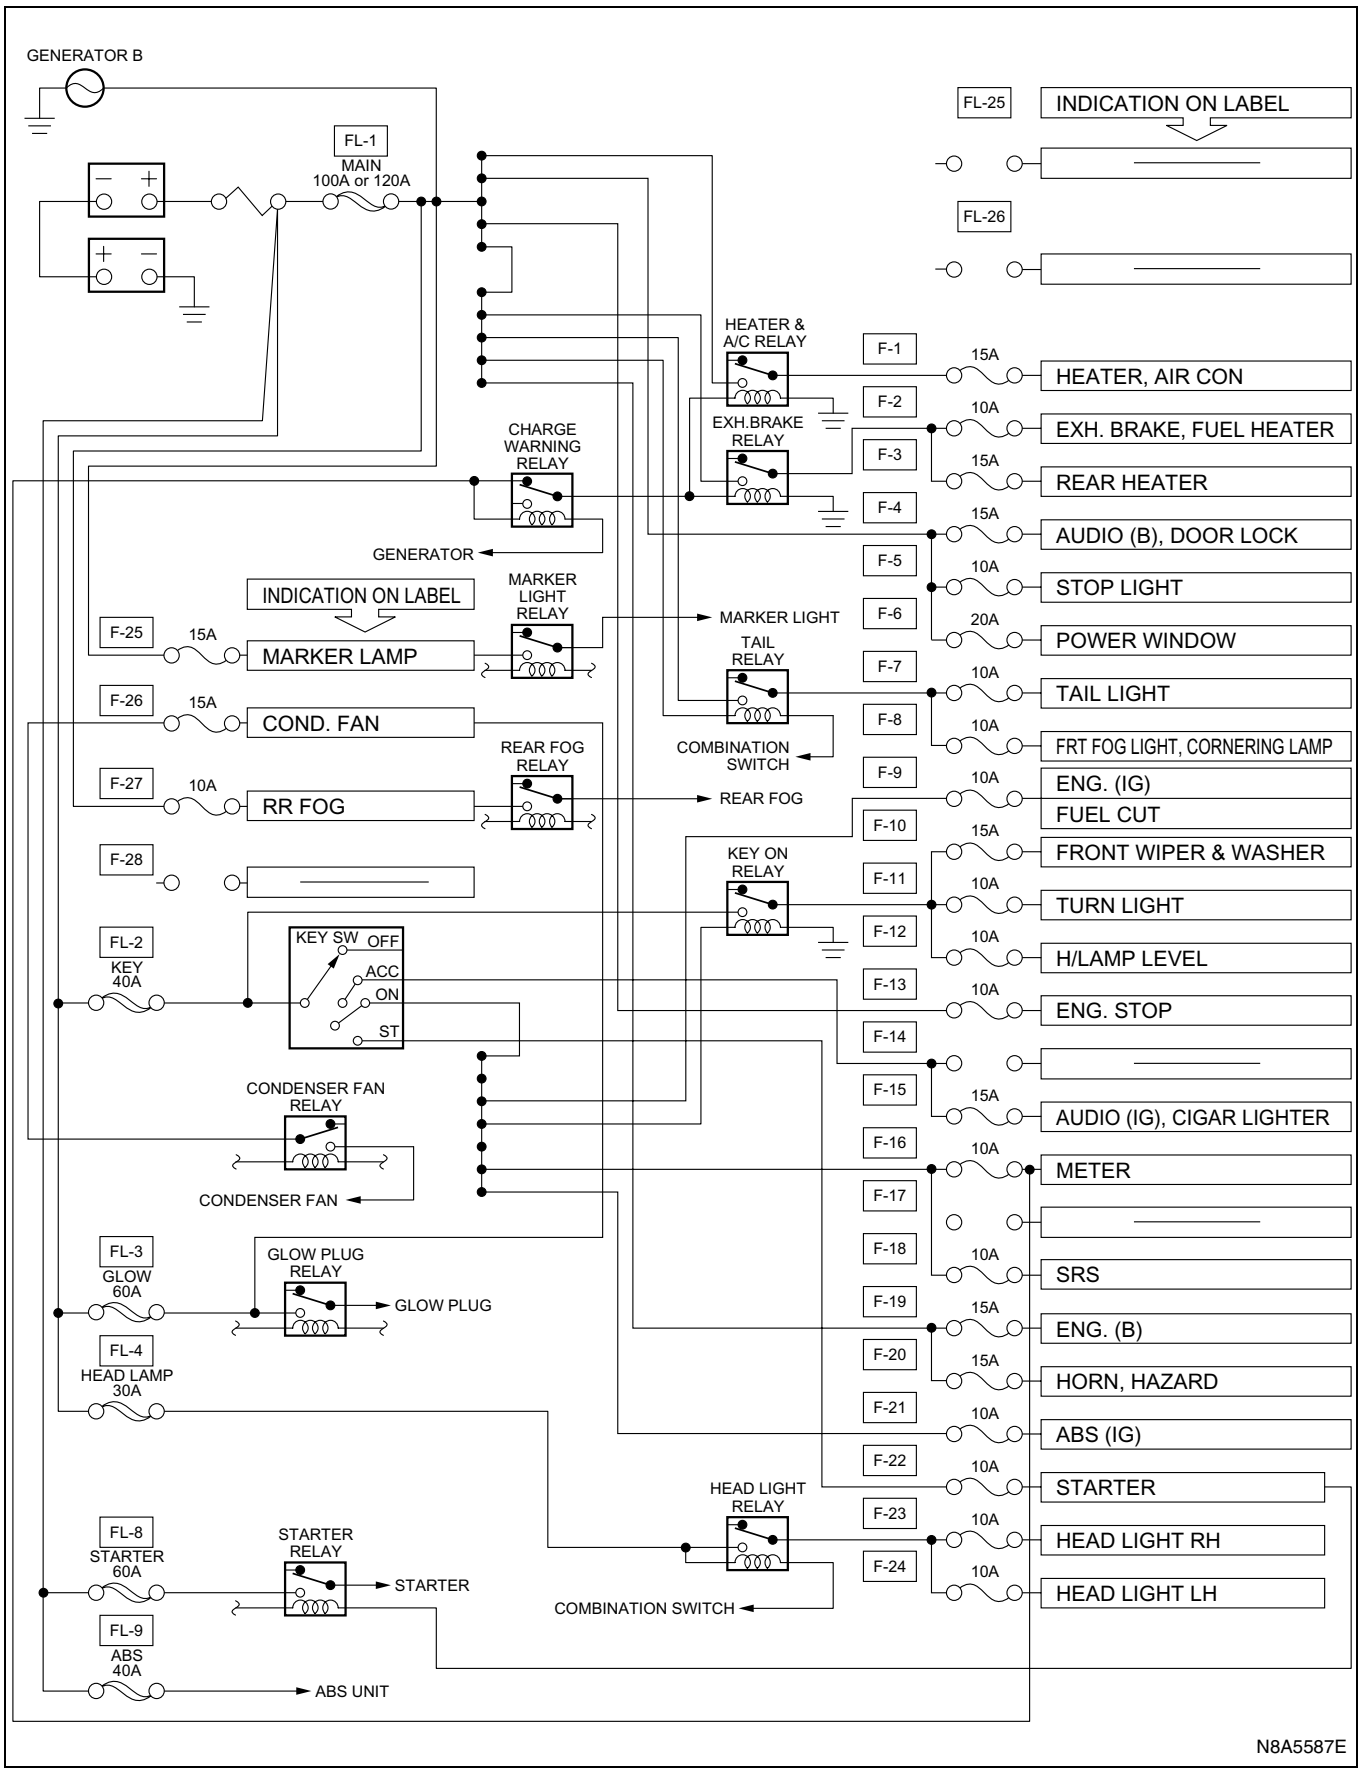
For 12 Volt-4JH1 Engine



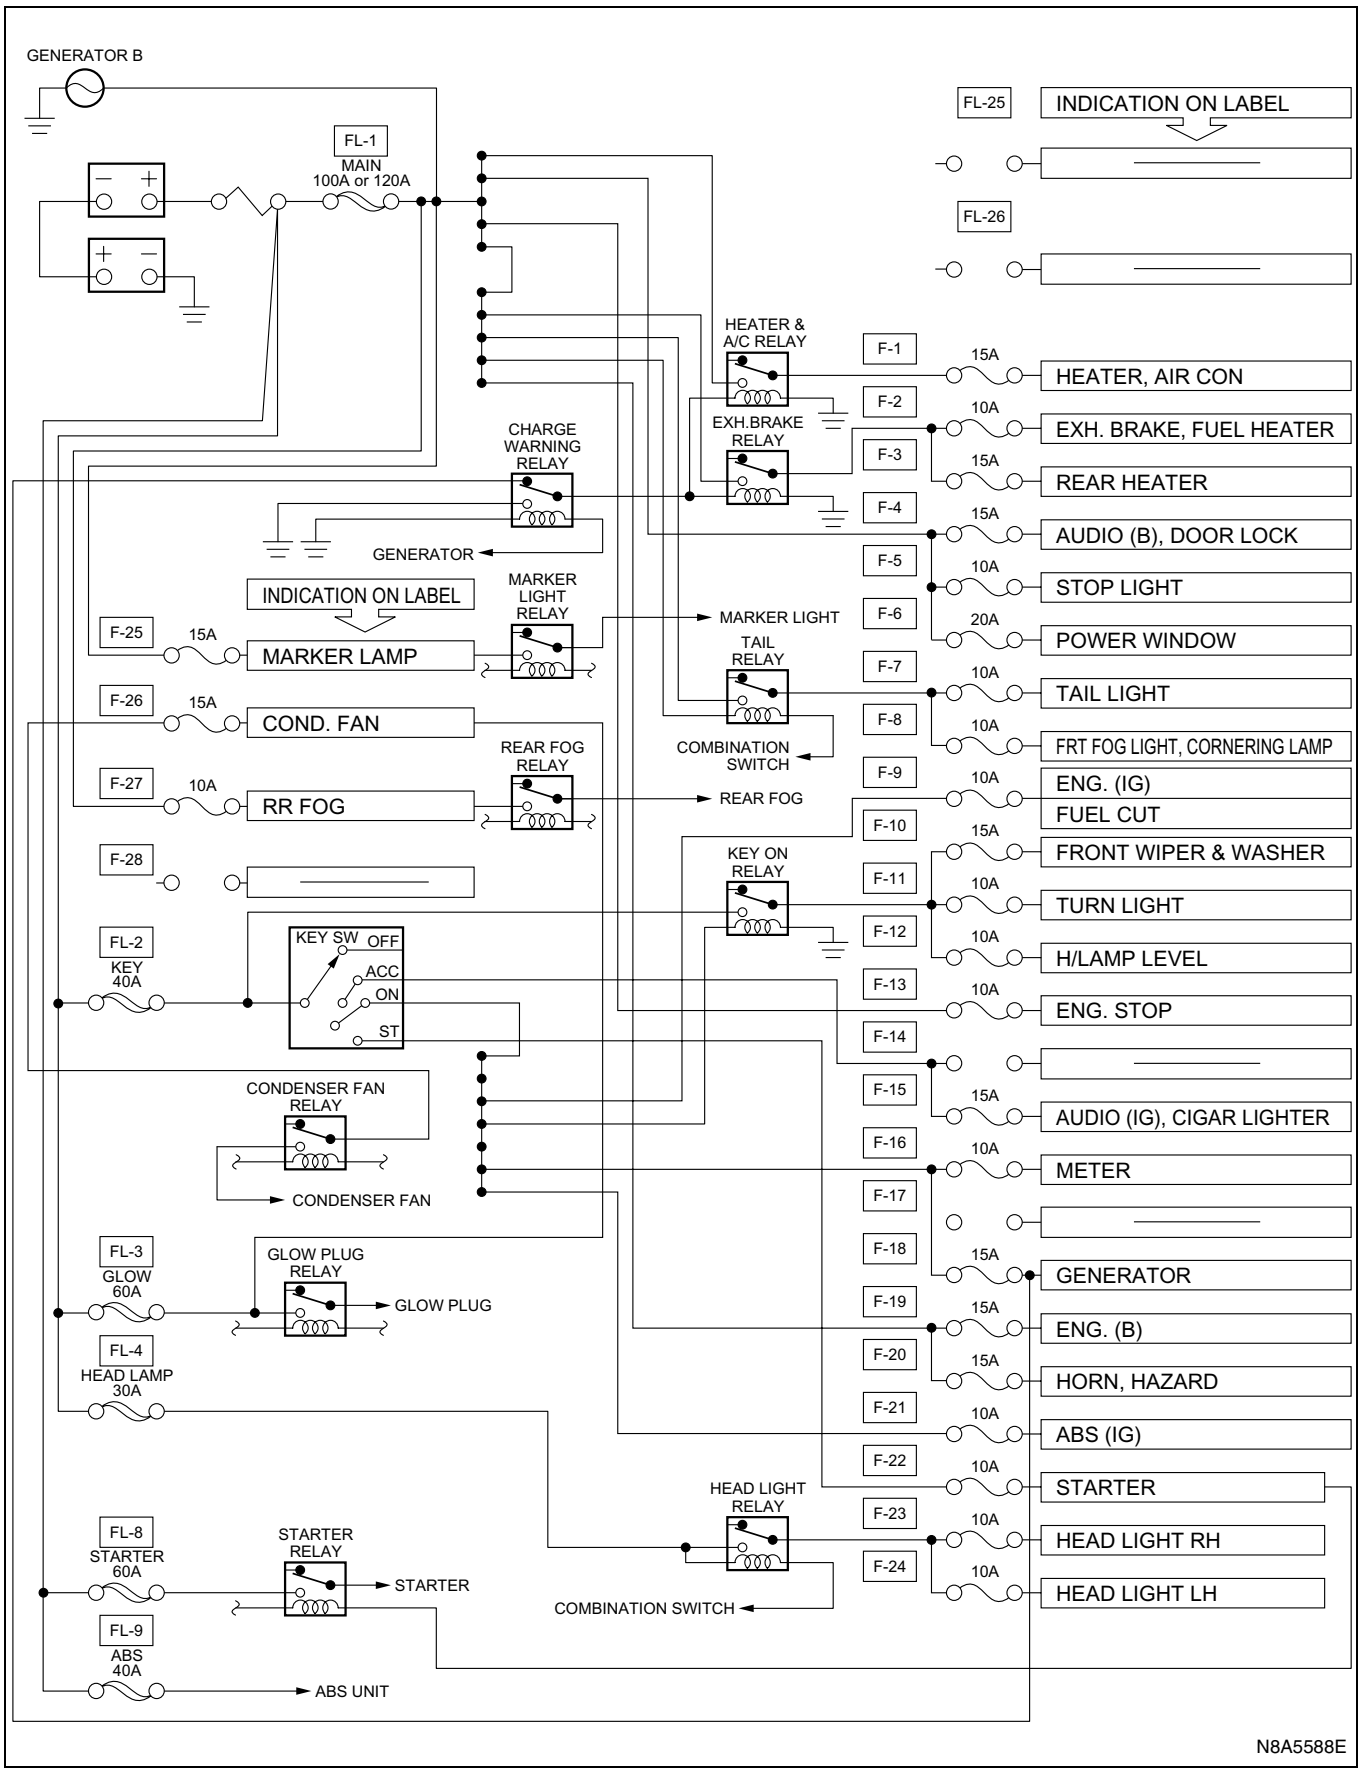
For 24 Volt-4HF1 / 4HG1 / 4HE1 (Except Hong Kong) Engine



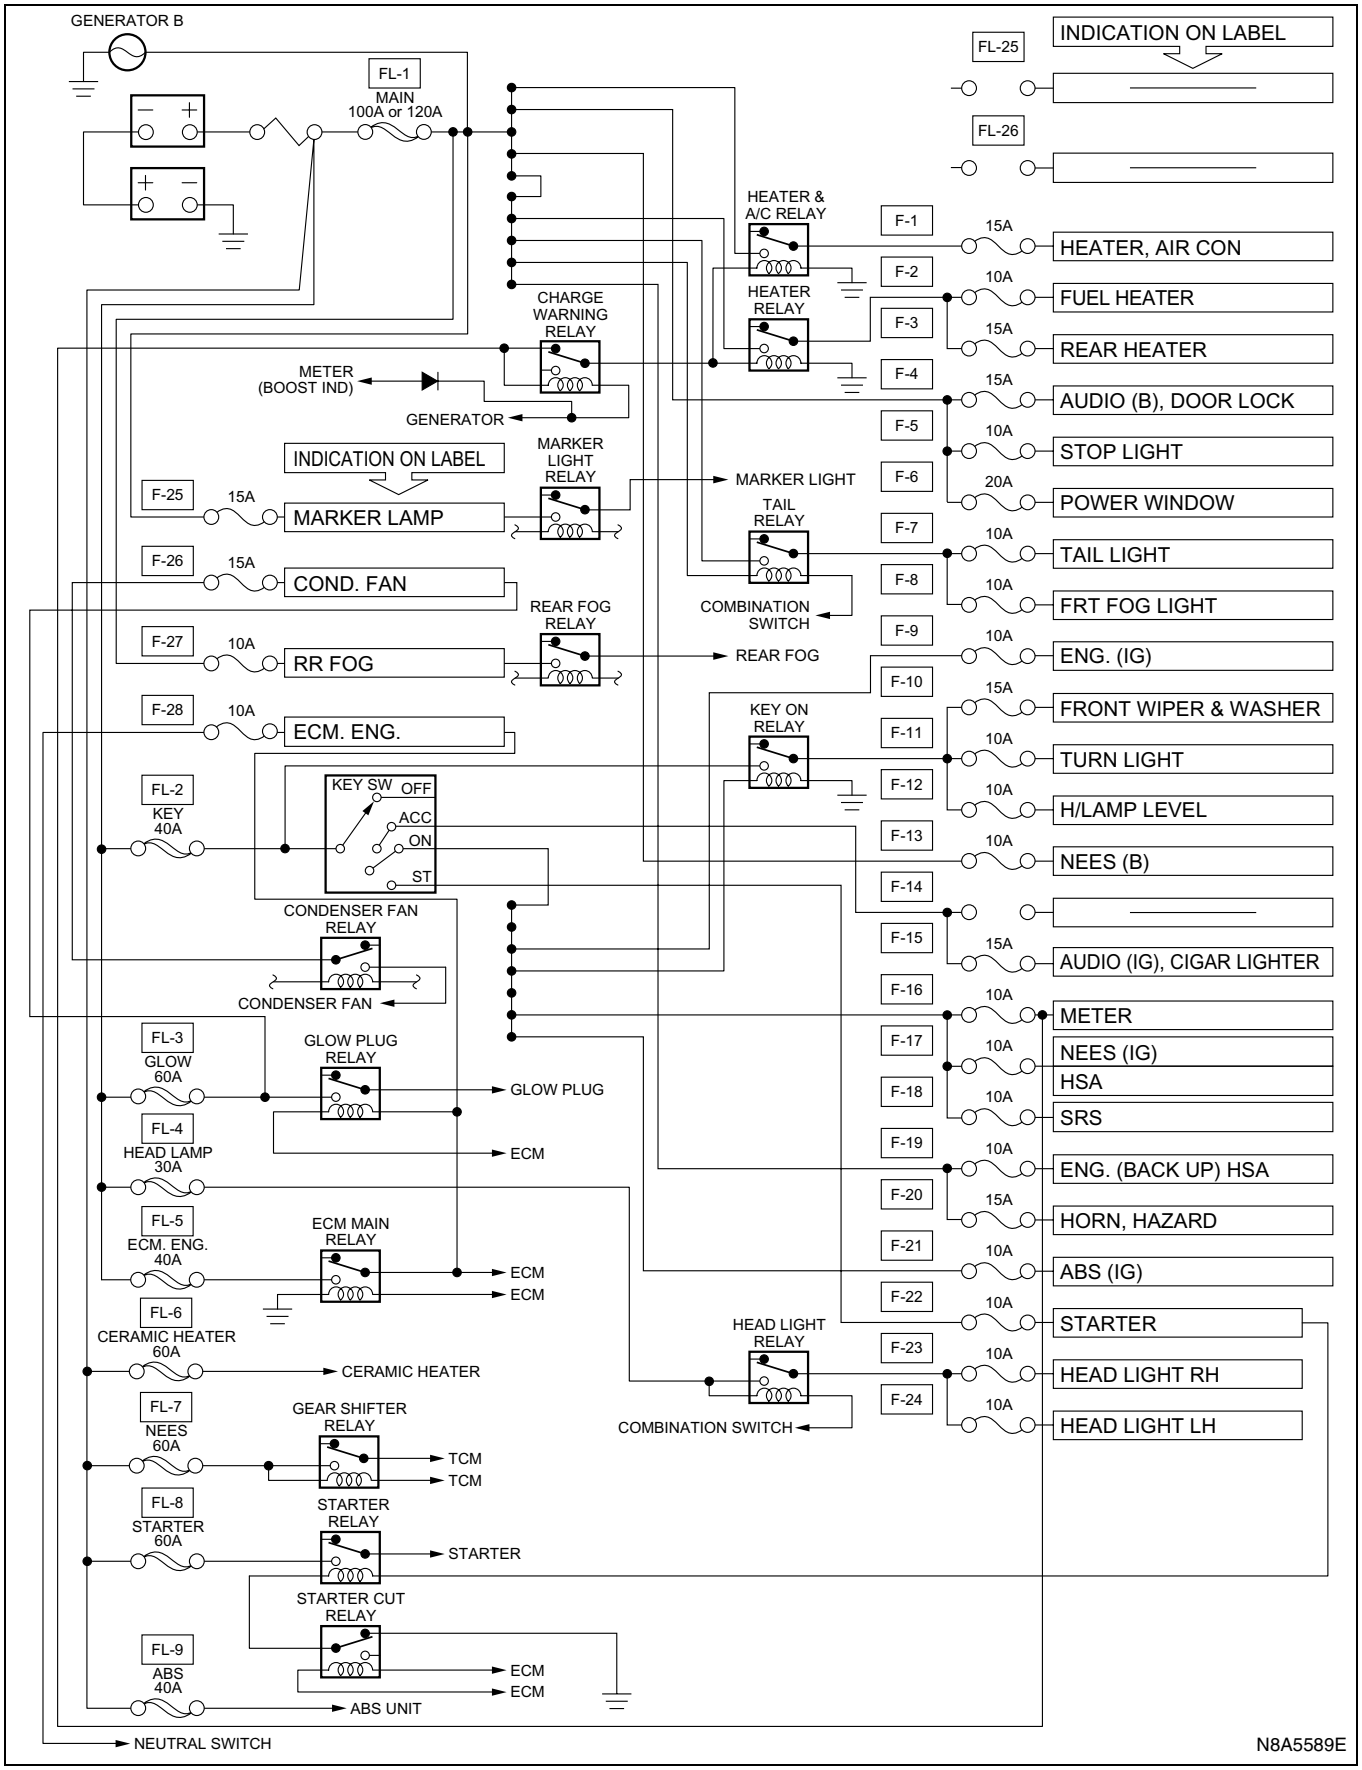
For 24 Volt-4HE1 (For Hong Kong) Engine



For 24 Volt-4HF1 / 4HG1 (For Indonesia) Engine



For 24 Volt-4HK1 Engine



Reference Table of Fuse and Circuit Breaker

Fuse

12 Volt 4JB1 / 4JG2 Engine

Fuse No.	Capacity	Indication on label	Main parts (Load)
F-1	10 A	AIR CON	A/C switch, A/C thermo relay, Pressure switch, Magnetic clutch, VSV: FICD, Electronic thermostat
F-2	15 A	EXH. BRAKE, FUEL HEATER	Exhaust brake switch, Exhaust brake control relay, Exhaust brake magnetic valve, Clutch switch, Accel switch, Fuel heater
F-3	15 A	REAR HEATER	Rear heater, Rear heater switch
F-4	15 A	AUDIO (B), DOOR LOCK	Radio & clock, Dome light switch, Dome light, Door switch (RH & LH), Door lock switch, Door lock actuator, Door lock controller, Speedometer, Key cylinder switch, Key remind buzzer
F-5	10 A	STOP LIGHT	Stoplight switch, Stoplight
F-6	10 A	FRT FOG LIGHT, CORNERING LAMP	Fog light switch, Fog light, Lighting switch, Cornering light relay, Cornering light, Cornering light switch
F-7	10 A	TAIL LIGHT	Tail relay, Illumination light(s), Clearance light(s), Tail light(s)
F-8	10 A	EGR	ECM ignition
F-9	10 A	FUEL CUT	Fuel cut solenoid
F-10	15 A	FRONT WIPER & WASHER	Wiper & Washer switch, Wiper motor, Washer motor, Intermittent relay
F-11	10 A	TURN LIGHT	Flasher unit, Front turn signal light, Rear turn signal light, Turn signal light switch, Hazard warning switch
F-12	10 A	H/LAMP LEVEL	Headlight leveling switch, Headlight leveling motor (actuator)
F-13	—	—	—
F-14	—	—	—
F-15	15 A	AUDIO (IG), CIGAR LIGHTER	Radio, Cigar lighter
F-16	10 A	METER	Exhaust brake control relay, CSD Relay, Key remind buzzer, Backup light switch, Backup light, Neutral switch, Starter relay, QOS-II controller, QOS-III controller, Glow relay, Glow-1 relay, Glow-2 relay, Glow indicator (Meter), Coolant temperature gauge, Thermo unit, Vehicle speed sensor (Installed on the meter assembly & Transmission), Meter assembly, Power window relay, Cornering light relay
F-17	—	—	—
F-18	—	—	—
F-19	15 A	HORN, HAZARD	Horn, Horn relay, Horn switch, Flasher unit, Hazard warning switch
F-20	10 A	ABS (IG)	ABS
F-21	15 A	GENERATOR	Generator
F-22	10 A	STARTER	Starter relay, QOS-II controller, QOS-III controller
F-23	10 A	HEAD LIGHT RH	Headlight (RH), Dimmer relay, High beam indicator light
F-24	10 A	HEAD LIGHT LH	Headlight (LH), Dimmer relay
F-25	15 A	MARKER LAMP	Marker light, Marker light relay
F-26	15 A	COND. FAN	Condenser fan
F-27	10 A	RR FOG	Rear fog light switch, Rear fog light relay

Fuse No.	Capacity	Indication on label	Main parts (Load)
F-28	—	—	—

12 Volt 4JH1 Engine

Fuse No.	Capacity	Indication on label	Main parts (Load)
F-1	10 A	AIR CON	A/C switch, A/C thermo relay, Pressure switch, Magnetic clutch, VSV: FICD, Electronic thermostat
F-2	15 A	FUEL HEATER	Fuel heater
F-3	15 A	REAR HEATER	Rear heater, Rear heater switch
F-4	15 A	AUDIO (B), DOOR LOCK	Radio & clock, Dome light switch, Dome light, Door switch (RH & LH), Door lock switch, Door lock actuator, Door lock controller, Speedometer, Key cylinder switch, Key remind buzzer
F-5	10 A	STOP LIGHT	Stoplight switch, Stoplight
F-6	10 A	FRT FOG LIGHT, CORNERING LAMP	Fog light switch, Fog light, Lighting switch, Cornering light relay, Cornering light, Cornering light switch
F-7	10 A	TAIL LIGHT	Tail relay, Illumination light(s), Clearance light(s), Tail light(s)
F-8	15 A	ENG. (B1)	ECM battery
F-9	15 A	ENG. (B2)	ECM battery
F-10	15 A	FRONT WIPER & WASHER	Wiper & Washer switch, Wiper motor, Washer motor, Intermittent relay
F-11	10 A	TURN LIGHT	Flasher unit, Front turn signal light, Rear turn signal light, Turn signal light switch, Hazard warning switch
F-12	10 A	H/LAMP LEVEL	Headlight leveling switch, Headlight leveling motor (actuator)
F-13	—	—	—
F-14	—	—	—
F-15	15 A	AUDIO (IG), CIGAR LIGHTER	Radio, Cigar lighter
F-16	10 A	METER	Key remind buzzer, Backup light switch, Backup light, Starter relay, Glow indicator (Meter), Coolant temperature gauge, Thermo unit, Vehicle speed sensor (Installed on the meter assembly & Transmission), Meter assembly, Power window relay, Cornering light relay
F-17	—	—	—
F-18	—	—	—
F-19	15 A	HORN, HAZARD	Horn, Horn relay, Horn switch, Flasher unit, Hazard warning switch
F-20	10 A	ABS (IG)	ABS
F-21	—	—	—
F-22	10 A	STARTER	Starter relay, QOS-II controller, QOS-III controller
F-23	10 A	HEAD LIGHT RH	Headlight (RH), Dimmer relay, High beam indicator light
F-24	10 A	HEAD LIGHT LH	Headlight (LH), Dimmer relay
F-25	15 A	MARKER LAMP	Marker light, Marker light relay
F-26	15 A	COND. FAN	Condenser fan
F-27	10 A	RR FOG	Rear fog light switch, Rear fog light relay
F-28	—	—	—

24 Volt 4HF1 / 4HG1 / 4HE1 Engine

Fuse No.	Capacity	Indication on label	Main parts (Load)
F-1	15 A	HEATER, AIR CON	Blower motor, Blower resistor, Fan switch, A/C switch, A/C thermo relay, Pressure switch, A/C cut relay, Thermo switch (A/C cut), VSV: FICD, Electronic thermostat
F-2	10 A	EXH. BRAKE, FUEL HEATER	Exhaust brake switch, Exhaust brake control relay, Exhaust brake magnetic valve, Clutch switch, Accel switch, Fuel heater
F-3	15 A	REAR HEATER	Rear heater, Rear heater switch
F-4	15 A	AUDIO (B), DOOR LOCK	Radio & clock, Dome light switch, Dome light, Door switch (RH & LH), Door lock switch, Door lock actuator, Door lock controller, Speedometer, Key cylinder switch, Key remind buzzer
F-5	10 A	STOP LIGHT	Stoplight switch, Stoplight
F-6	20 A	POWER WINDOW	Power window
F-7	10 A	TAIL LIGHT	Tail relay, Illumination light(s), Clearance light(s), Tail light(s)
F-8	10 A	FRT FOG LIGHT, CORNERING LAMP	Fog light switch, Fog light, Lighting switch, Cornering light relay, Cornering light, Cornering light switch
F-9	10 A	ENG. (IG)	ECM ignition (EXCEPT 4HF1-2)
		FUEL CUT	Fuel cut solenoid (4HF1-2)
F-10	15 A	FRONT WIPER & WASHER	Wiper & Washer switch, Wiper motor, Washer motor, Intermittent relay
F-11	10 A	TURN LIGHT	Flasher unit, Front turn signal light, Rear turn signal light, Turn signal light switch, Hazard warning switch
F-12	10 A	H/LAMP LEVEL	Headlight leveling switch, Headlight leveling motor (actuator)
F-13	10 A	ENG. STOP	Engine stop motor
F-14	—	—	—
F-15	15 A	AUDIO (IG), CIGAR LIGHTER	Radio, Cigar lighter
F-16	10 A	METER	Exhaust brake control relay, CSD Relay, Key remind buzzer, Backup light switch, Backup light, Inhibitor Switch, Neutral switch, Starter relay, QOS-II controller, QOS-III controller, Glow relay, Glow-1 relay, Glow-2 relay, Glow indicator (Meter), Coolant temperature gauge, Thermo unit, Vehicle speed sensor (Installed on the meter assembly & Transmission), Meter assembly, Power window relay, Cornering light relay
F-17	—	—	—
F-18	15 A	GENERATOR	Generator (Except Hong Kong)
	10 A	SRS	SRS (For Hong Kong)

SYSTEM REPAIR

Start and Charging

General Description

The system consists of the starter switch, starter, AC generator, starter relay, charge relay, heater and A/C relay, inhibitor switch and neutral switch. When the starter SW is set to the “ST” position, the battery voltage is applied to the starter solenoid coil through the starter relay to start the starter.

- On the 4HK1 engine, the function that ECM controls STARTER RELAY is added.

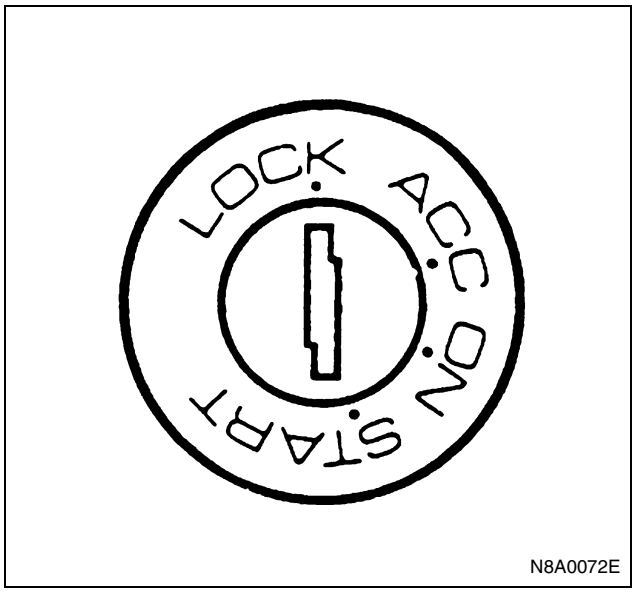
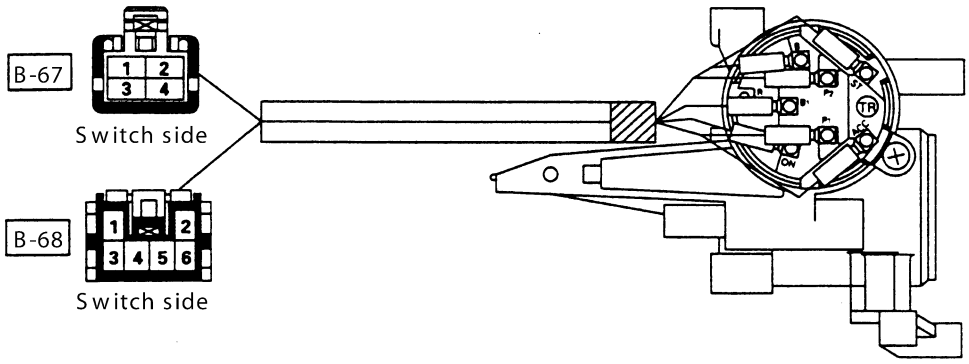
Starter Switch

The starter switch positions are LOCK, ACC, ON and START. Turning the starter key to these positions a circuit for starting the engine, the operation of accessories, or stop the engine.



Inspection

Check the continuity between the starter switch connector terminals.
Repair or replace the switch when the result of inspection is found abnormal.



Starter SW key position	Terminal No. / Connector No.	B-67 1	B-67 2	B-67 3	B-67 4	B-68 1	B-68 2	B-68 4	B-68 5	B-68 6

Inserted	ACC	○—○				○—○			○—○	
	ON	○—○—○				○———○				
	START		○—○—○			○———○				

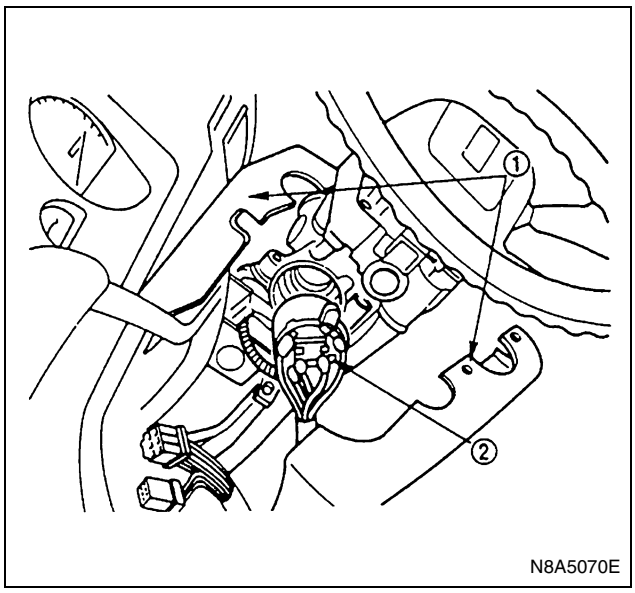
N8A0073E

Removal

Preparation:

Disconnect the battery ground cable.

1. Steering Cowl
   Remove four screws and take off the steering cowl.
2. Starter Switch
   1) Disconnect the connector.
   2) Remove the screw.



N8A5070E

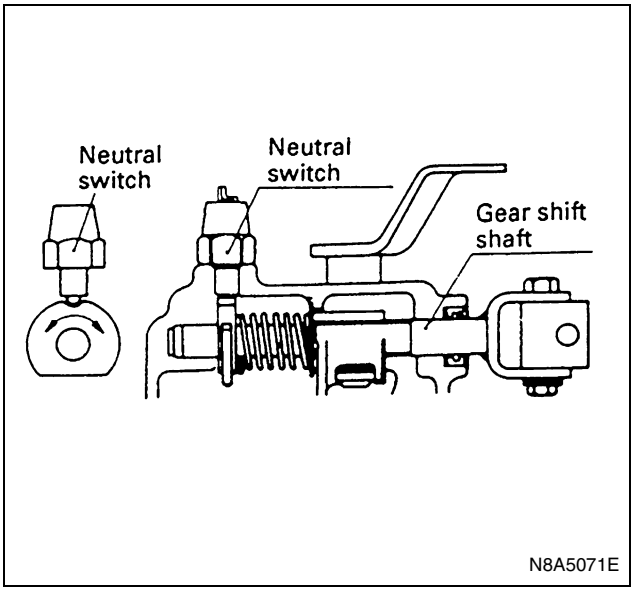
Installation

To install, follow the removal steps in the reverse order.

Neutral switch

Inspection

Check to see if there is any continuity between the switch terminals.
Replace the switch when the result of inspection is found abnormal.



QOS (Quick On Start) II System (4HF1 and 4JB1 Engine Model)

General Description

The circuit consists of starter switch, QOSII control unit, glow relay, thermo switch, glow plug, fuel cut solenoid, CSD relay, CSD solenoid and glow indicator light.
The QOS-II controller controls glow plug relay by the ON or OFF signal of QOS thermo switch.
Immediately when the starter switch turns “ON”, the glow plug relay indicator light turns on to start preheating.
The engine should be started after the indicator light is off. However, the glow plug relay keeps preheating for a fixed period even after the indicator light turns off. When the fixed time is over, QOS-II controller performs to switch the glow plug relay off to stop preheating.
For details, refer to “PREHEATING SYSTEM”.

QOS (Quick On Start) III System (4JG2 Engine Model)

General Description

The system consists of starter switch, QOS III control unit, glow relay, charge relay, fuel cut solenoid, dropping resistor, thermo sensor, glow plug, engine speed sensor, accel switch and glow indicator light.
Perceiving the engine coolant temperature when the engine started, the thermo sensor varies the glowing time to always get the most suitable condition for engine starting.
The indicator timer starts to operate as soon as the starter switch turns to “ON” position, and the indicator light turns on and keeps lit until the glow plugs have been heated to the level ready for the engine starting, when the indicator light is off.
For details, refer to “PREHEATING SYSTEM”.

Exhaust Brake System

General Description

This circuit consists of starter switch, exhaust brake switch (combination switch), accelerator switch, clutch switch, vacuum switching valve, neutral switch and relay.

Exhaust brake is a system to increase exhaust pressure by means of squeezing exhaust gas from engine and exert engine brake.

Turn the exhaust brake SW on, and the exhaust brake valve starts to work by the function of the magnetic valve to enable the exhaust bake to operate, when the exhaust brake indicator light will be on.

When either the accelerator pedal or the clutch pedal is depressed while driving, the switch of the depressed pedal will turn off, subsequently the exhaust braking will stop working.

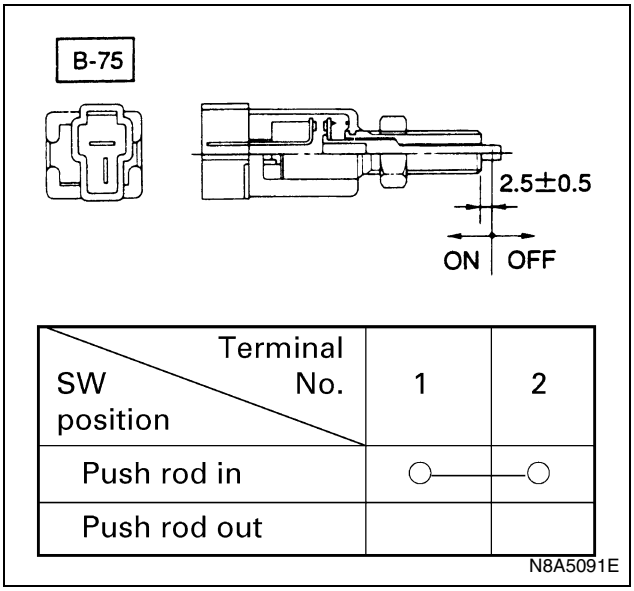
Starter Switch

Refer to “START AND CHARGING” in this section.

Accel Switch

Inspection

1. Check the continuity between the switch connector terminals.
2. Check to see if switch push rod operates smoothly. Repair or replace the accel switch when result of inspection is found abnormal.



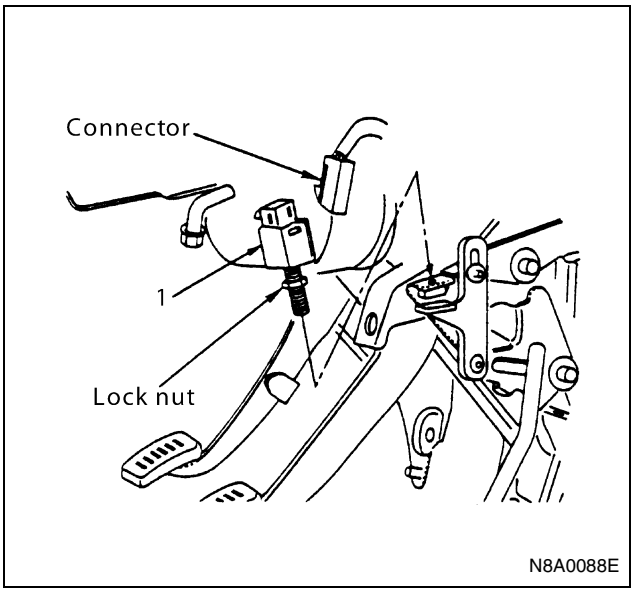
SW position \ Terminal No.	1	2
Push rod in	○	○
Push rod out		

Removal

Preparation:

Disconnect the battery ground cable.

1. Accel Switch
   1) Disconnect the connector.
   2) Loosen the lock nut of the switch.
   3) Remove the switch by turning it.



Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Check to see if the accel pedal has been returned by the return spring to the specified position.
2. Turn the accel switch clockwise until the tip of the threaded portion of the switch contacts the pedal arm.
3. Tighten the lock nut to the specified torque.

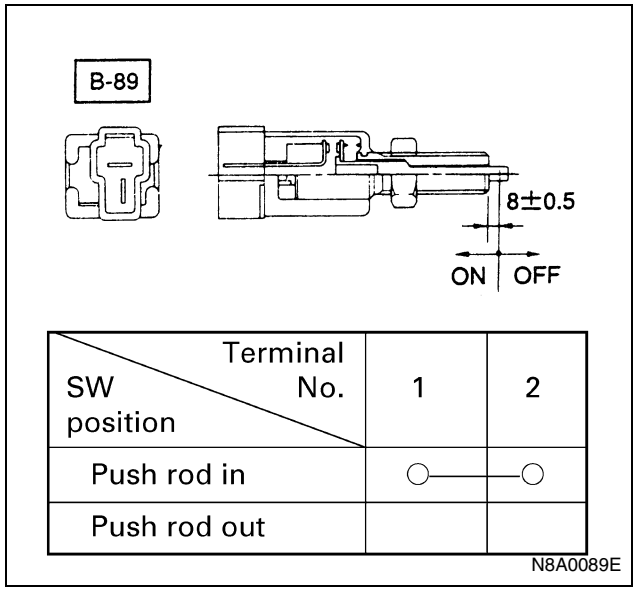
Tighten:

Lock nut to 13 N·m (130 kg·cm / 115lb·in)

Clutch Switch

Inspection

1. Check the continuity between the switch connector terminals.
2. Check to see if switch push rod operates smoothly. Repair or replace the switch when result of inspection is found abnormal.



SW position \ Terminal No.	1	2
Push rod in	○	○
Push rod out		

N8A0089E

Removal and Installation

Engine Stop System

General Description

The circuit consists of starter switch and engine stop motor.
The engine stop mechanism aims at shut-off of fuel supply.
Available are motor type and solenoid type depending on the types of the engine mounted.
Motor type is forcible pull the injection pump control rack to the direction of fuel supply reduction by means of engine stop motor, thus shutting it off.
Solenoid type is to have the starter switch turn from “ON” position to “OFF”, so that the solenoid valve fitted to the injection pump closes to shut off the fuel circuit.

Engine stop system	Engine model
Motor type	4HF1, 4HG1, 4HE1
Solenoid type	4JB1, 4JG2

Parts Location

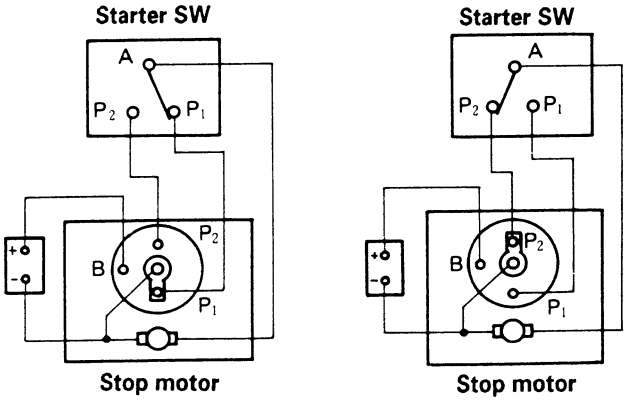
Function of Engine Stop Motor



Turn the starter switch from "ACC" position to "ON", and the engine stop motor will turn by 180 degrees (from 0° to 180°) so that the stop motor's electrode will be in potential equal to that of the starter switch for the stop.

Turn the starter switch from "ON" position to "ACC" or "LOCK", and then the stop motor will rotate by 180 degrees(from 180° to 360°) and crease operating.

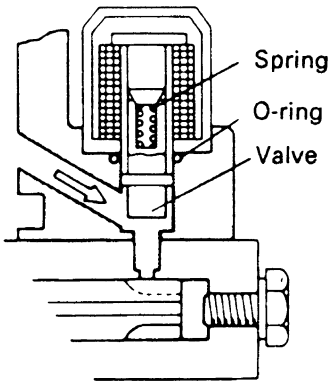
Connector No. / Terminal No. / Starter SW key position	B-68			Stop motor	Stop lever position
	A	P1	P2		
	1	2	4		
LOCK	○——○			0° (360°)	Stop
ACC	○——○				
ACC → ON				0° → 180°	Stop → Run
ON	○————○			180°	Stop
START	○————○				
ON → ACC → LOCK				0° → 360°	Stop → Run

N8A5127E

Solenoid Type

Starter Switch and Solenoid Valve

Turn the starter switch from “ON” position to “OFF”, and then the solenoid valve fitted to the injection pump closes to cut off the fuel circuit.
For the circuit of solenoid type fuel cut, refer to QOSIII circuit diagrams in this section.



Key position	Solenoid valve
LOCK	Close
ACC	
ON	Open
START

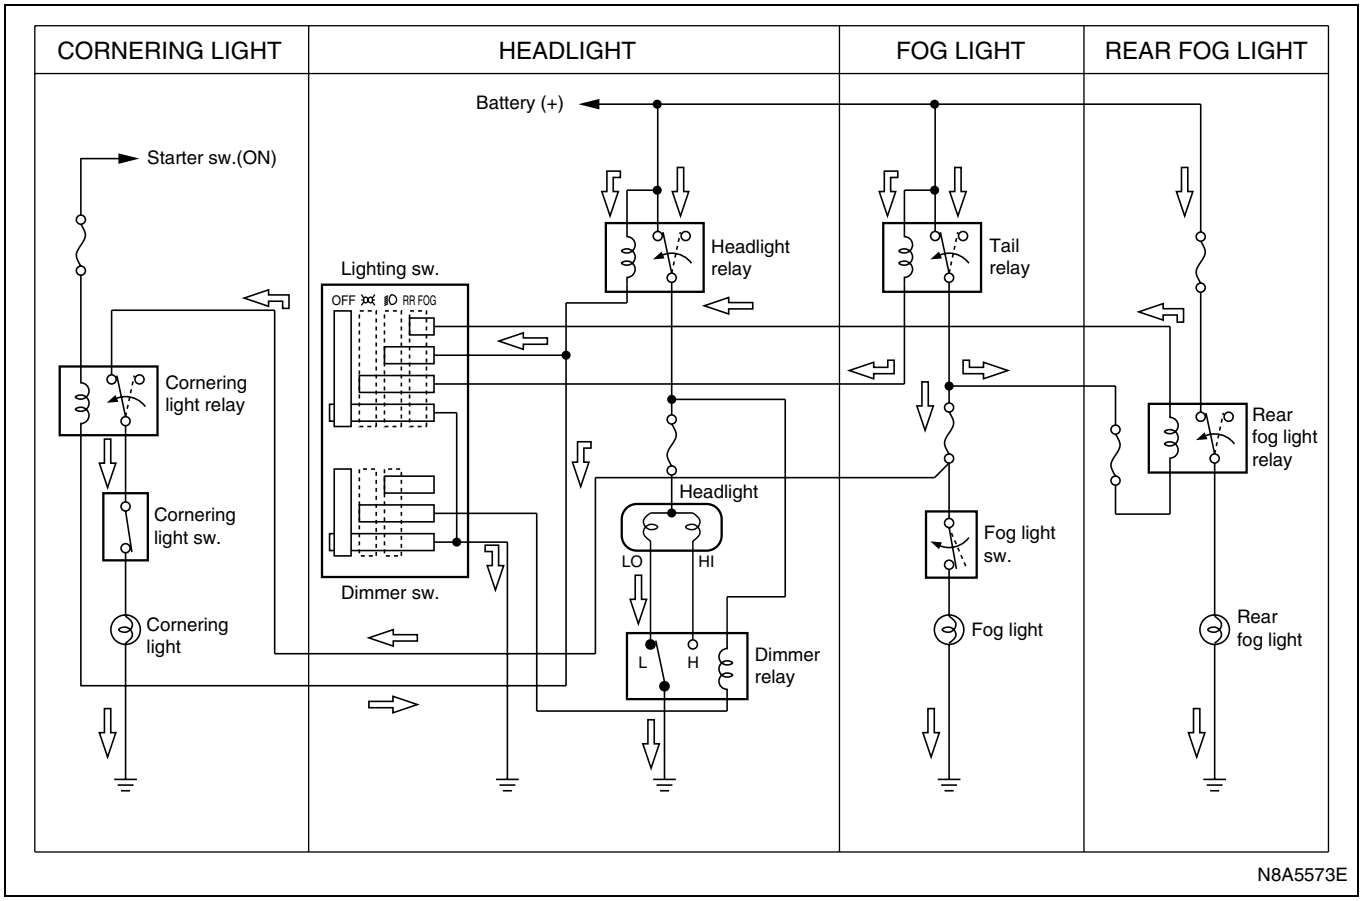
Headlight, Fog Light, Rear Fog Light and Cornering Light

General Description

The circuit consists of headlight, fog light, cornering light, starter switch, combination switch (Lighting switch, dimmer / passing switch, cornering light switch), fog light switch, high beam indicator light and relay.
When the lighting SW is turned on by setting it at headlight position, the lighting relay is actuated to turn on the headlight. The optical axis of the headlight can be turned up or down by operating the dimmer SW while headlight is on.
The passing SW is independent of the lighting SW, and the optical axis of the passing light can be turned up only while the switch lever is pulled up and held in this state.
Fog light turns on by switching it to “ON” position to activate relay only while lighting SW is on.
When the headlight is on, turn the turn-signal switch left or right, and then the cornering switch built in the combination switch turns on, followed by the cornering light turning on.

Lighting Circuit



Notice:
Arrow marks indicate the direction of current.

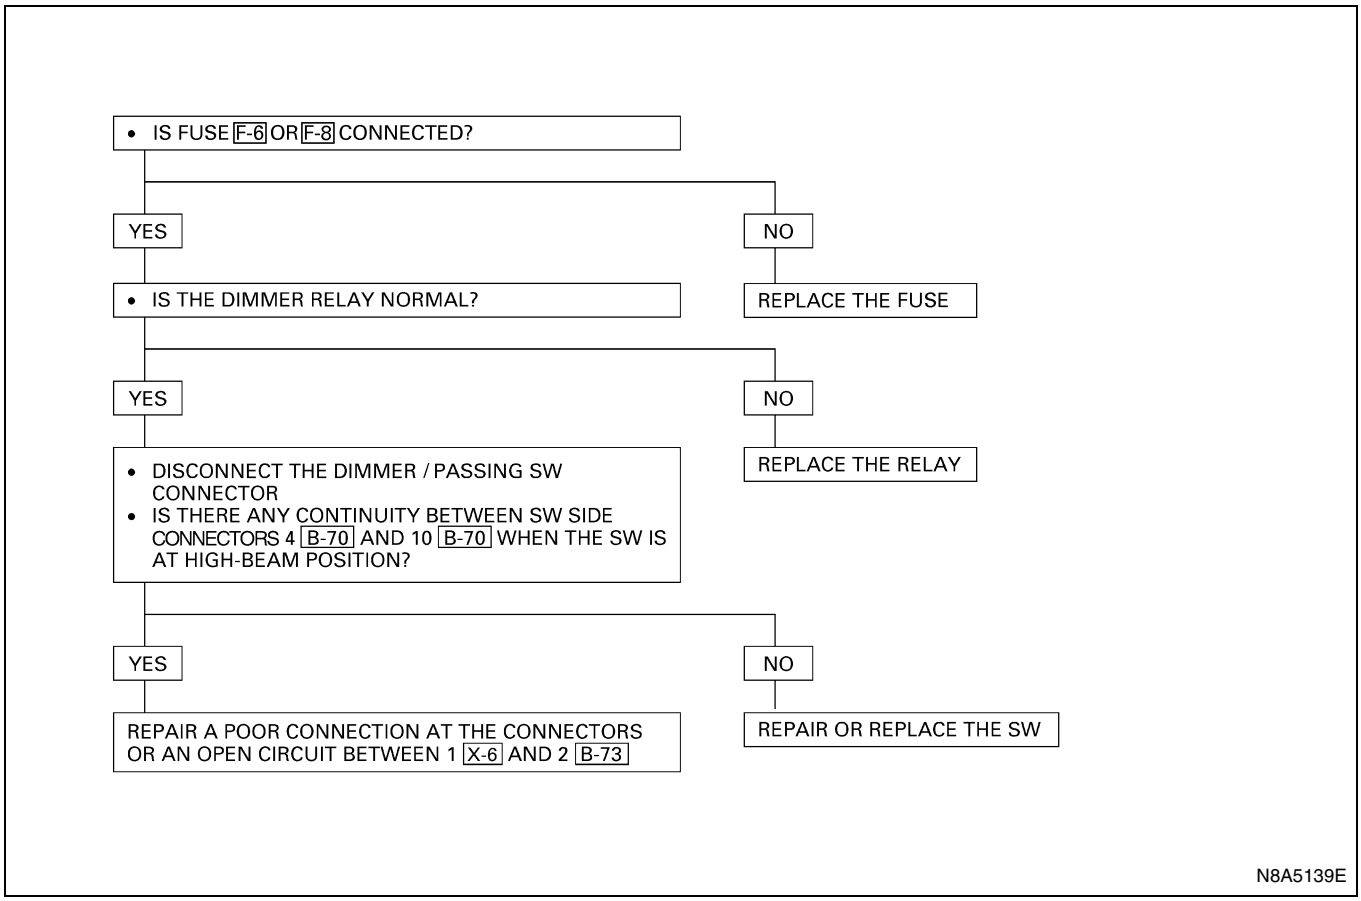
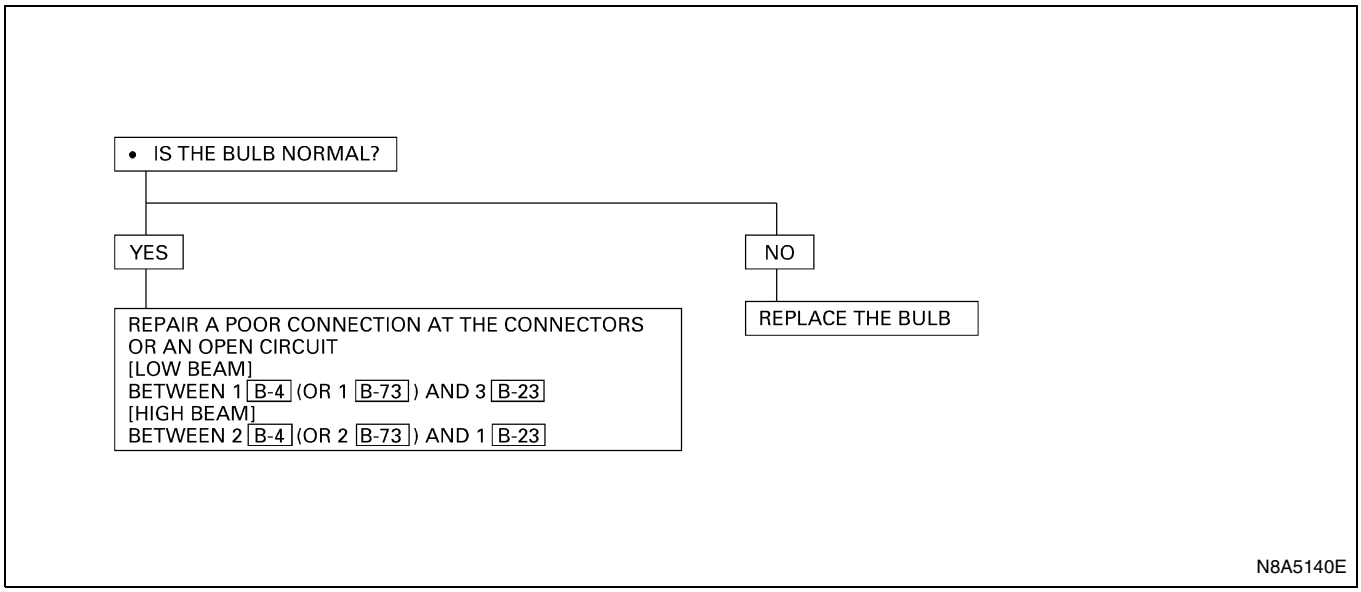
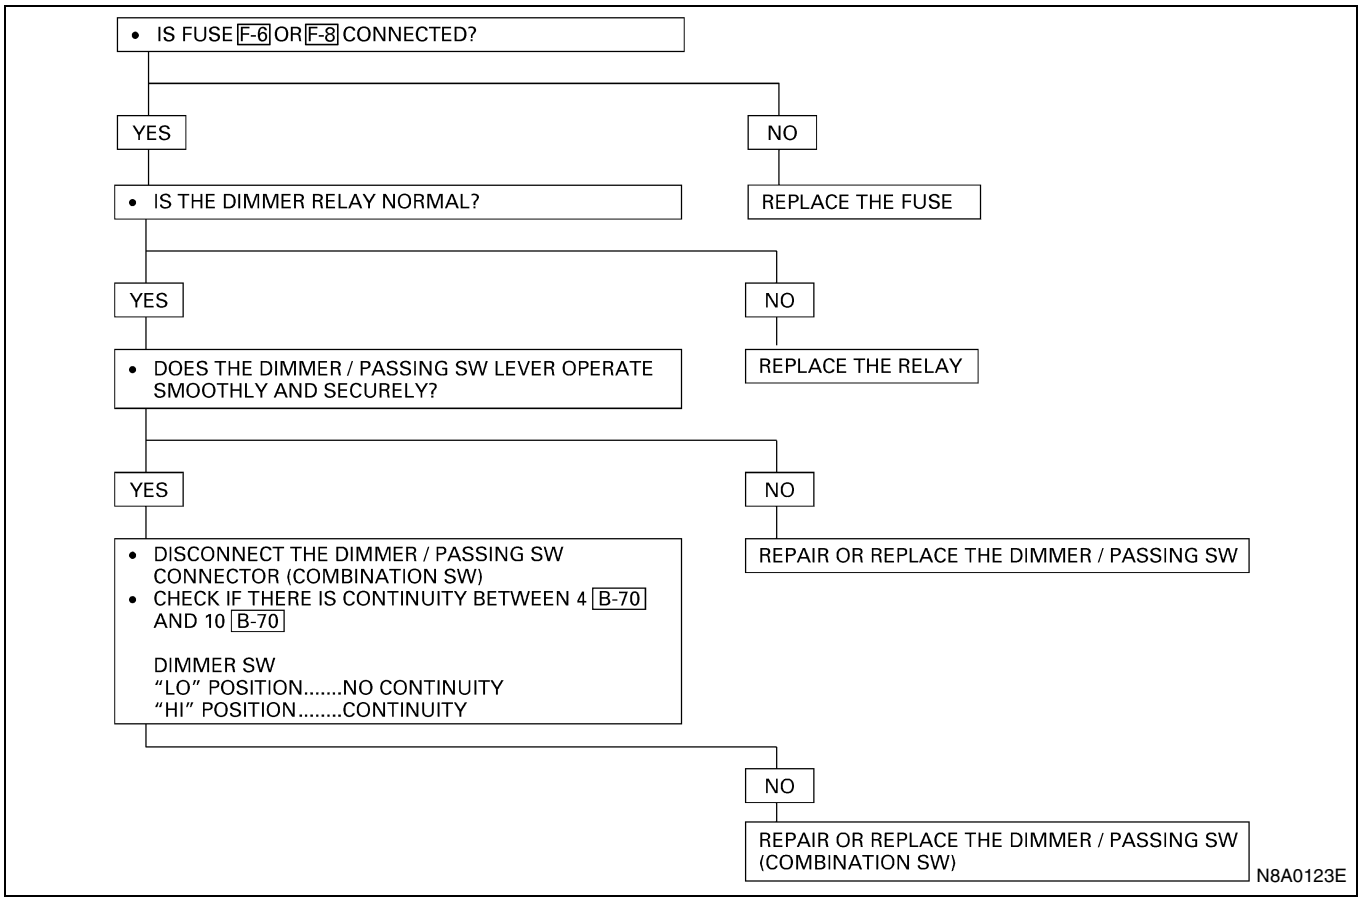
1-4. Headlight in High-beam Inoperative



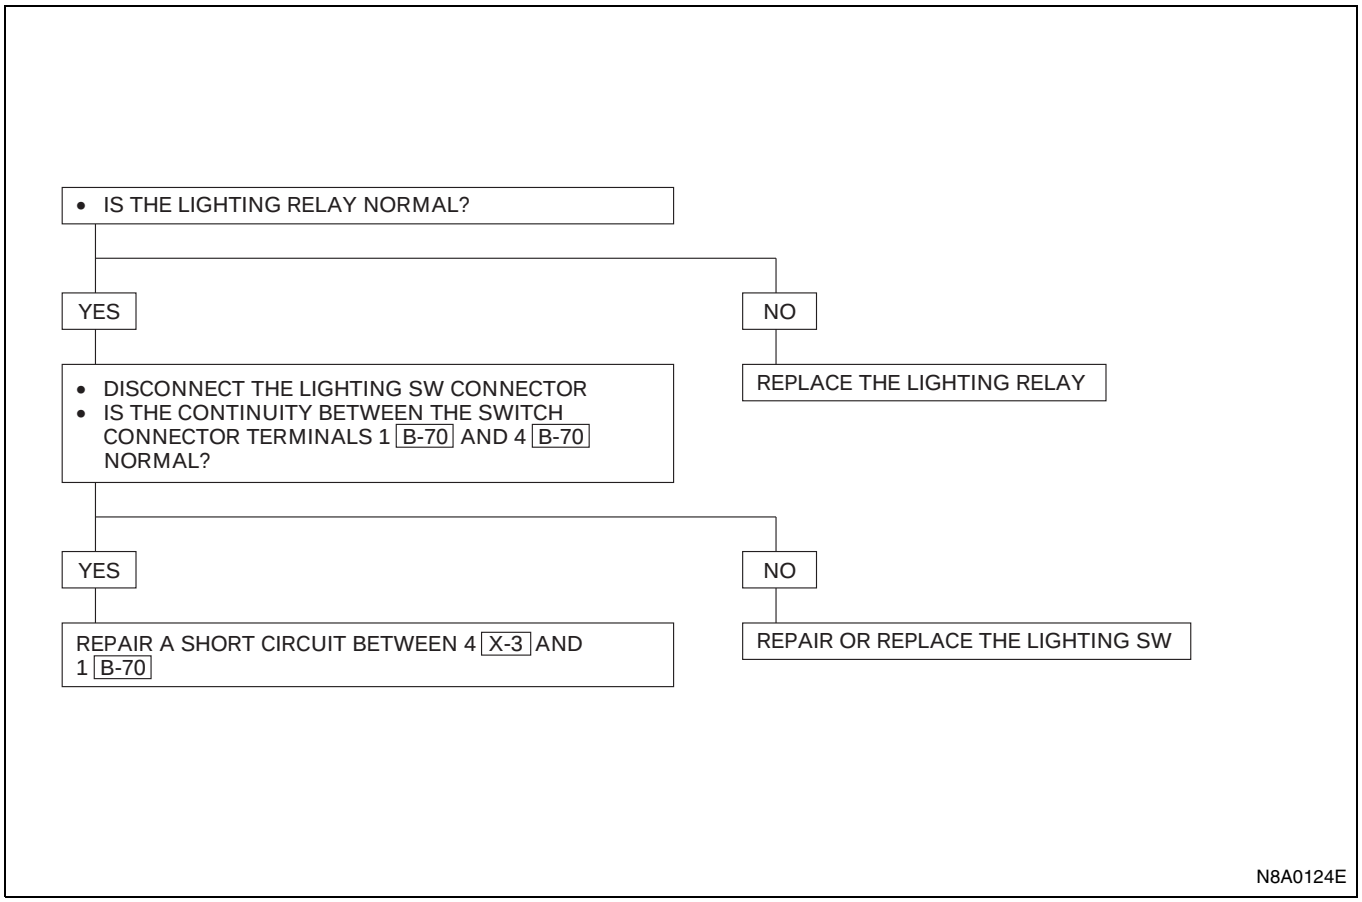
1-5. Headlight on The Left (or Right) Side in Low (or High)-beam Inoperative



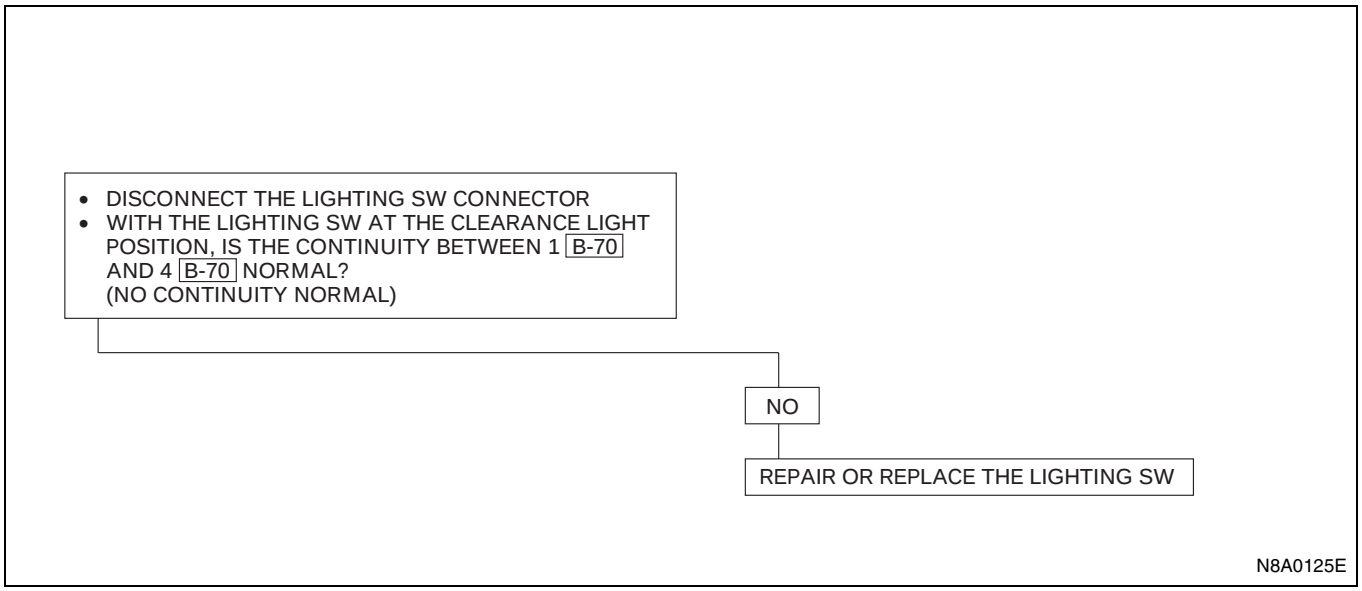
1-6. Headlight Beam Does Not Change



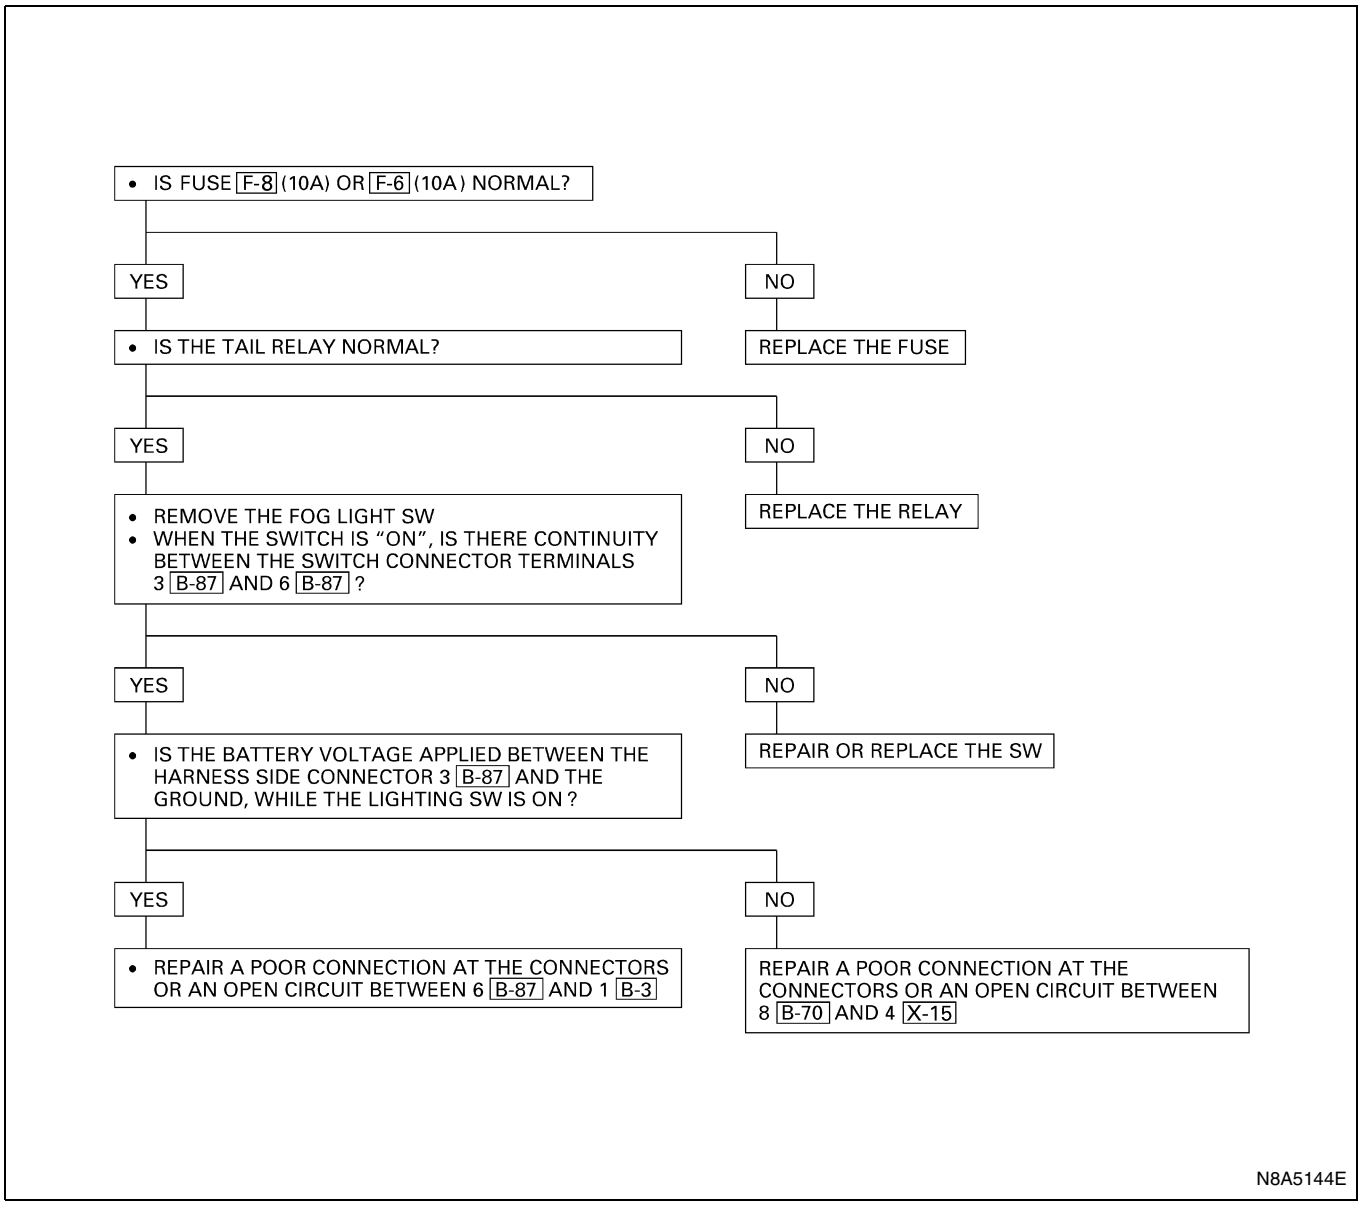
1-7. Headlight Remains On When The Lighting SW is Turned Off



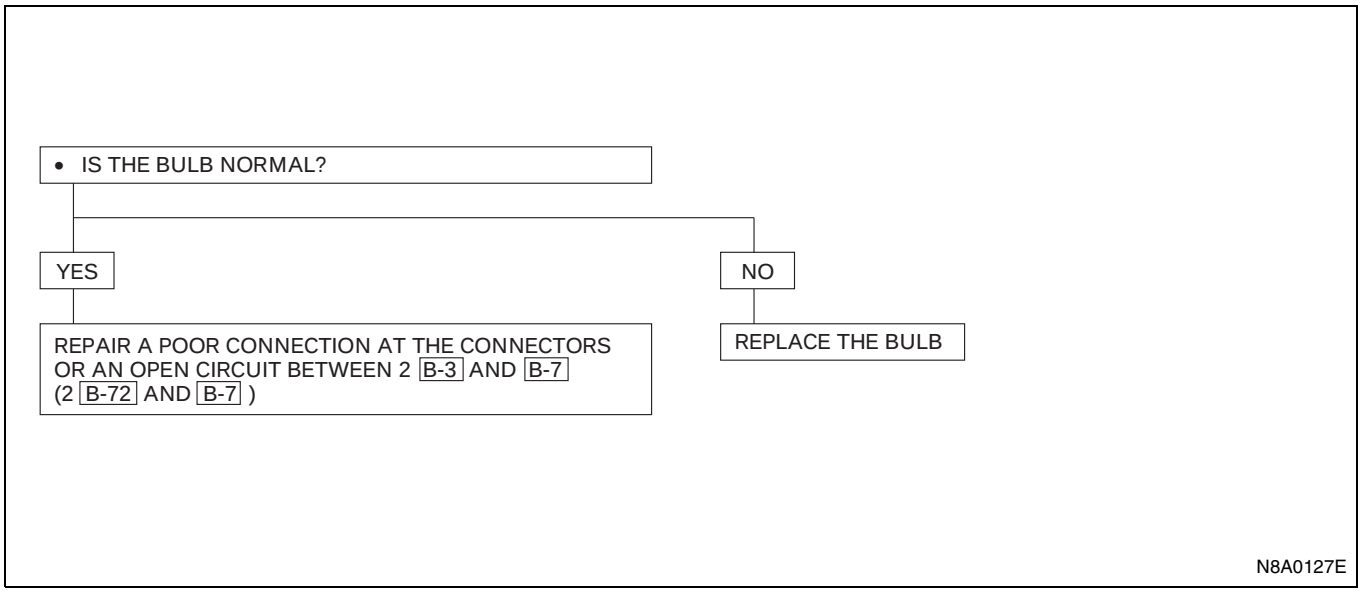
1-8. Headlight Comes On With The Lighting SW at The Clearance Light Position



2. Fog Light
2-1. Both Fog Lights Inoperative (while Lighting Switch is On)

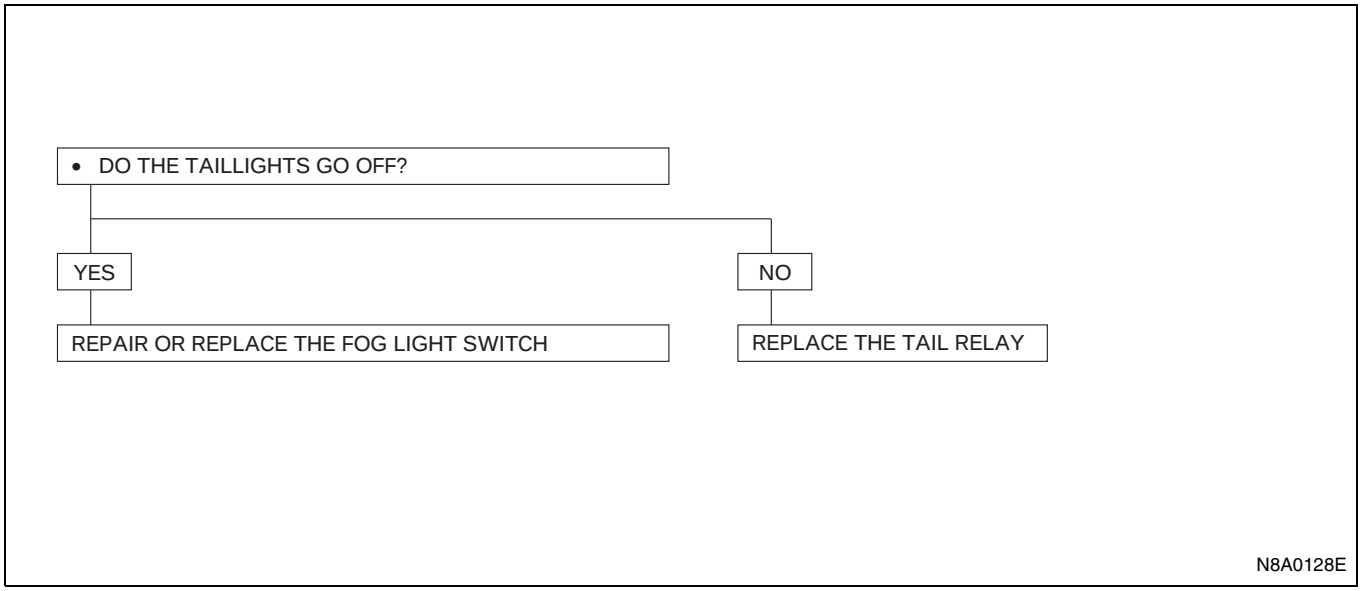


2-2. Fog Light on The Left (or Right) Side Inoperative (while Lighting Switch is On)

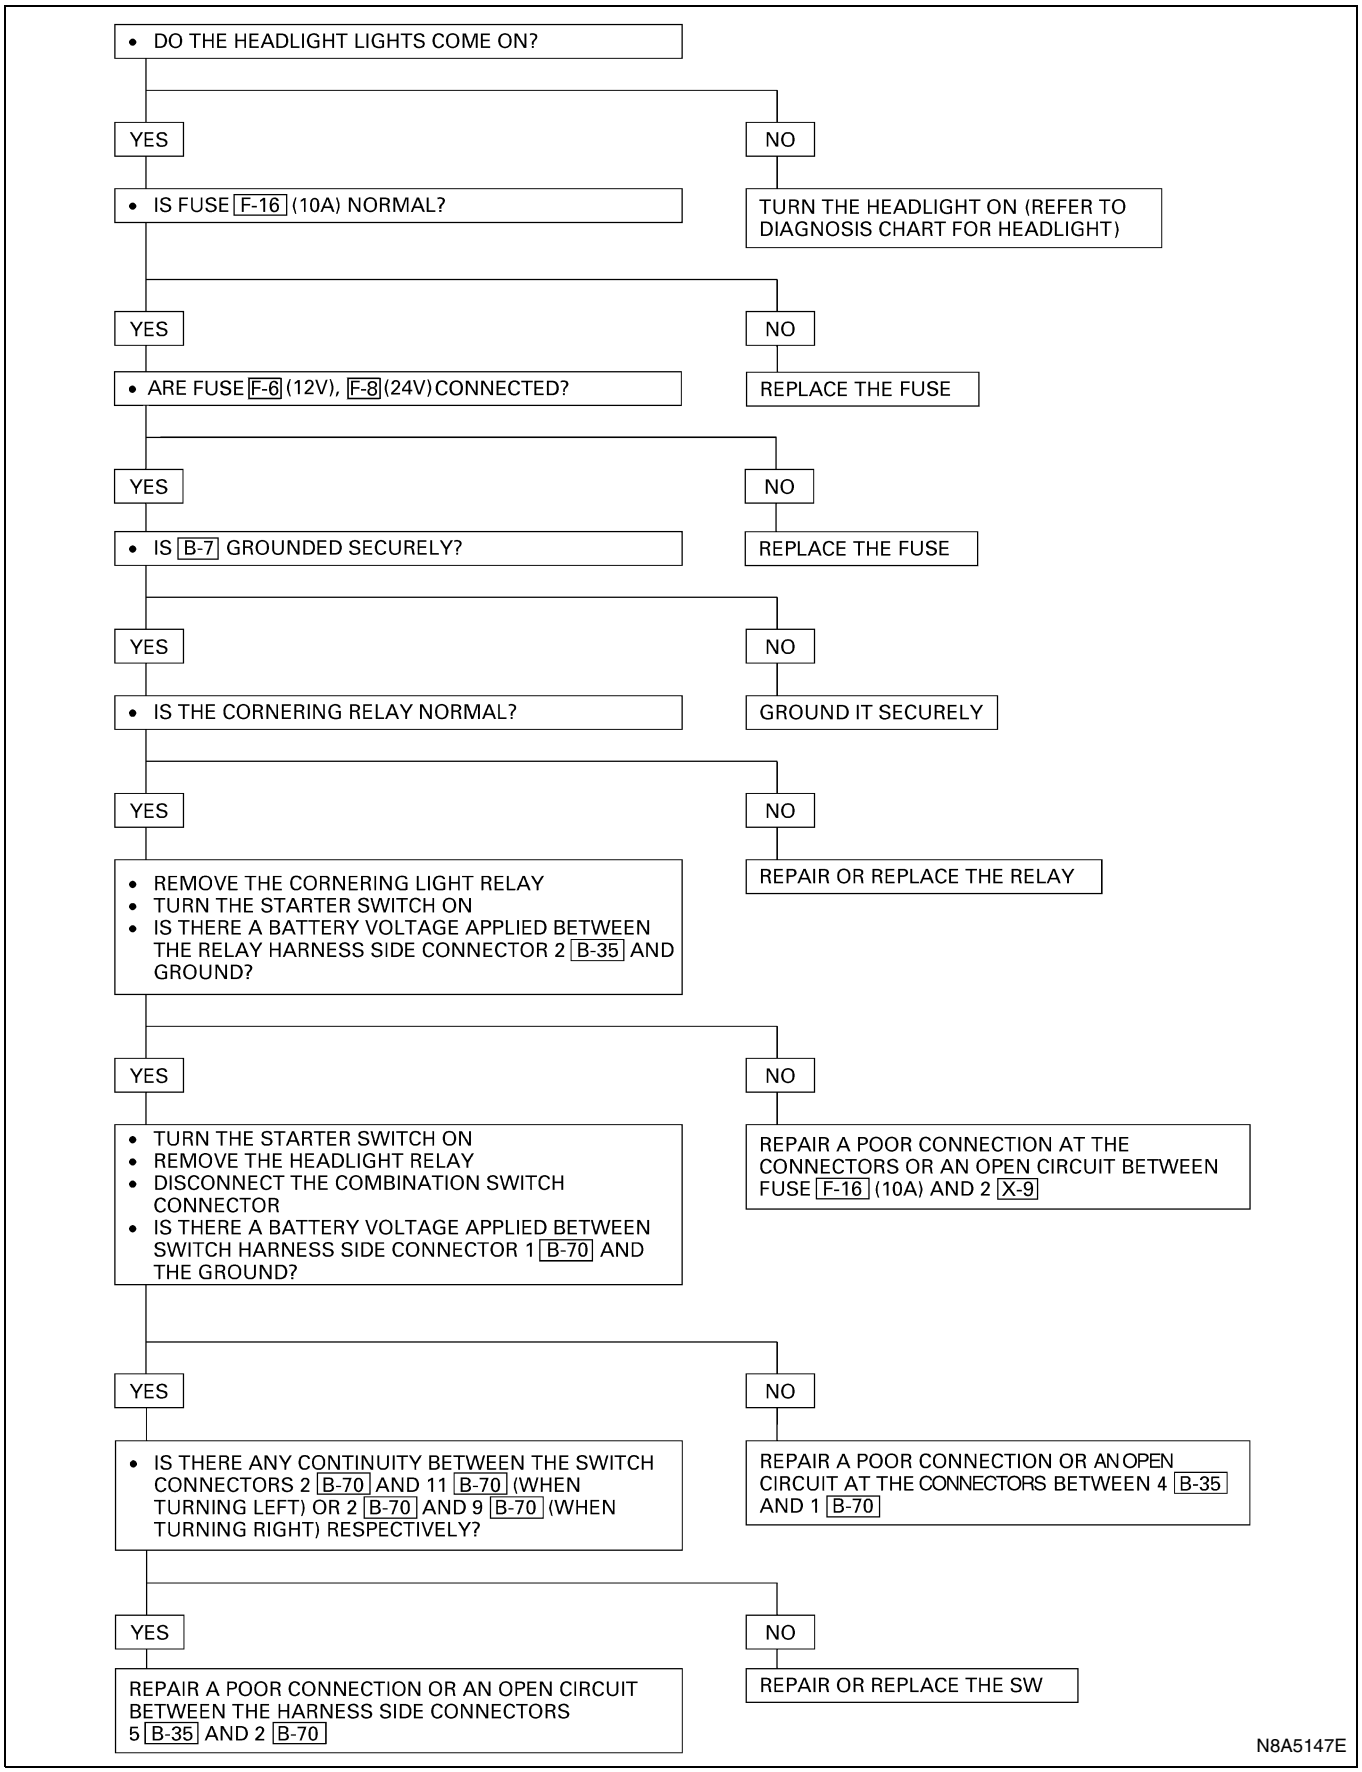


Notice:
Figures in parenthesis “( )” indicate place of inspection for the fog light on the right.

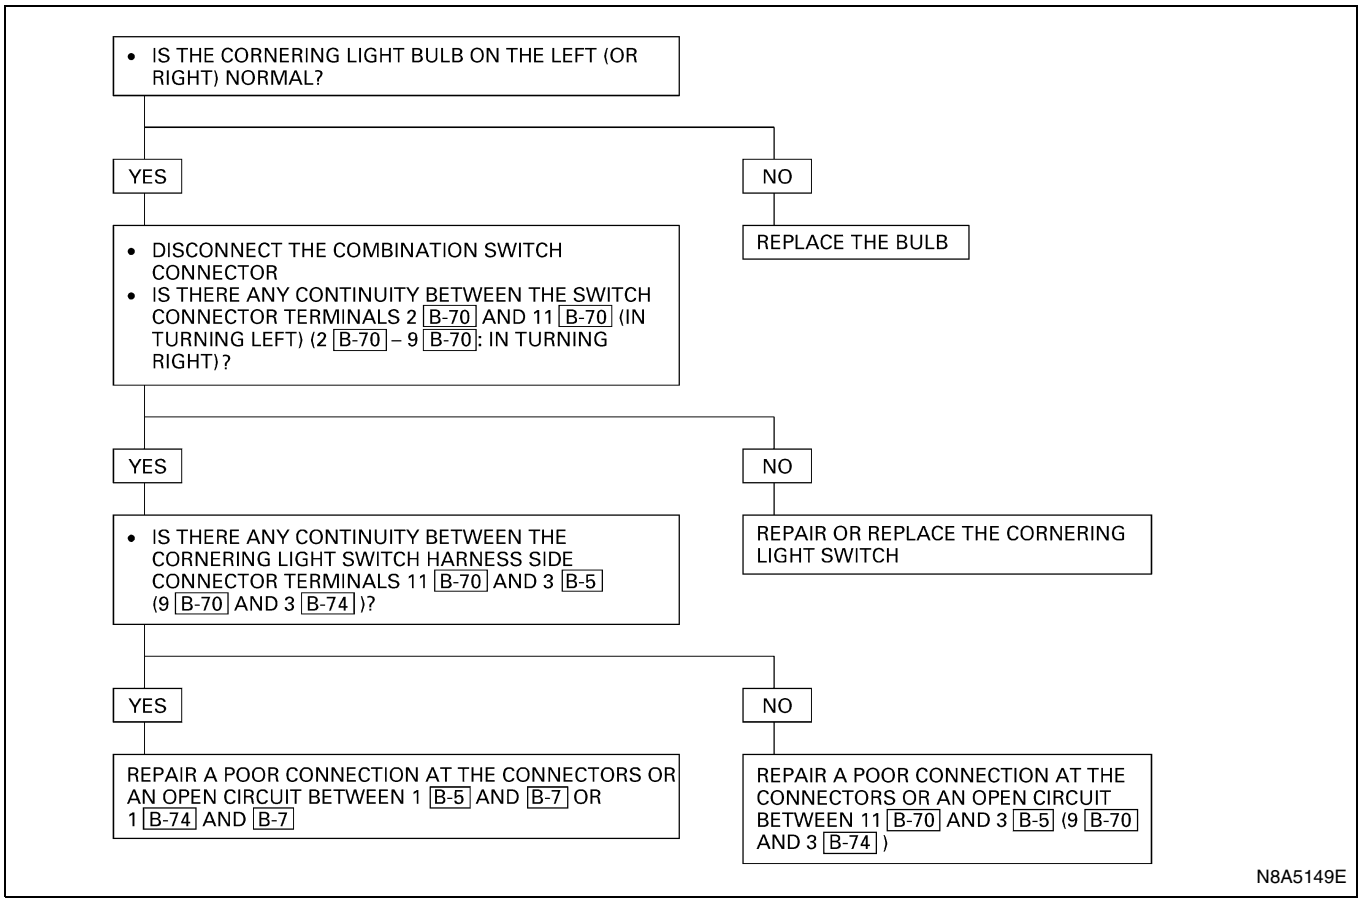
2-3. Fog Light Remains On



3. Cornering Light
3-1. Both Cornering Lights Inoperative

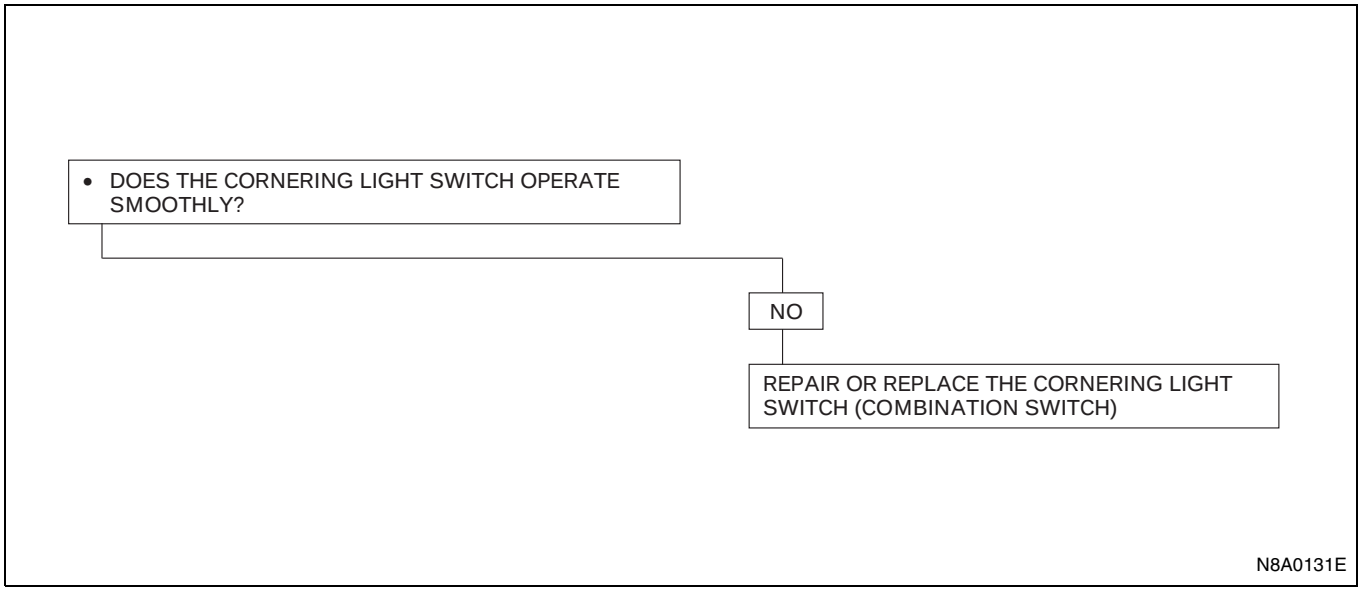


3-2. Cornering Light on The Left (or Right) Side Inoperative

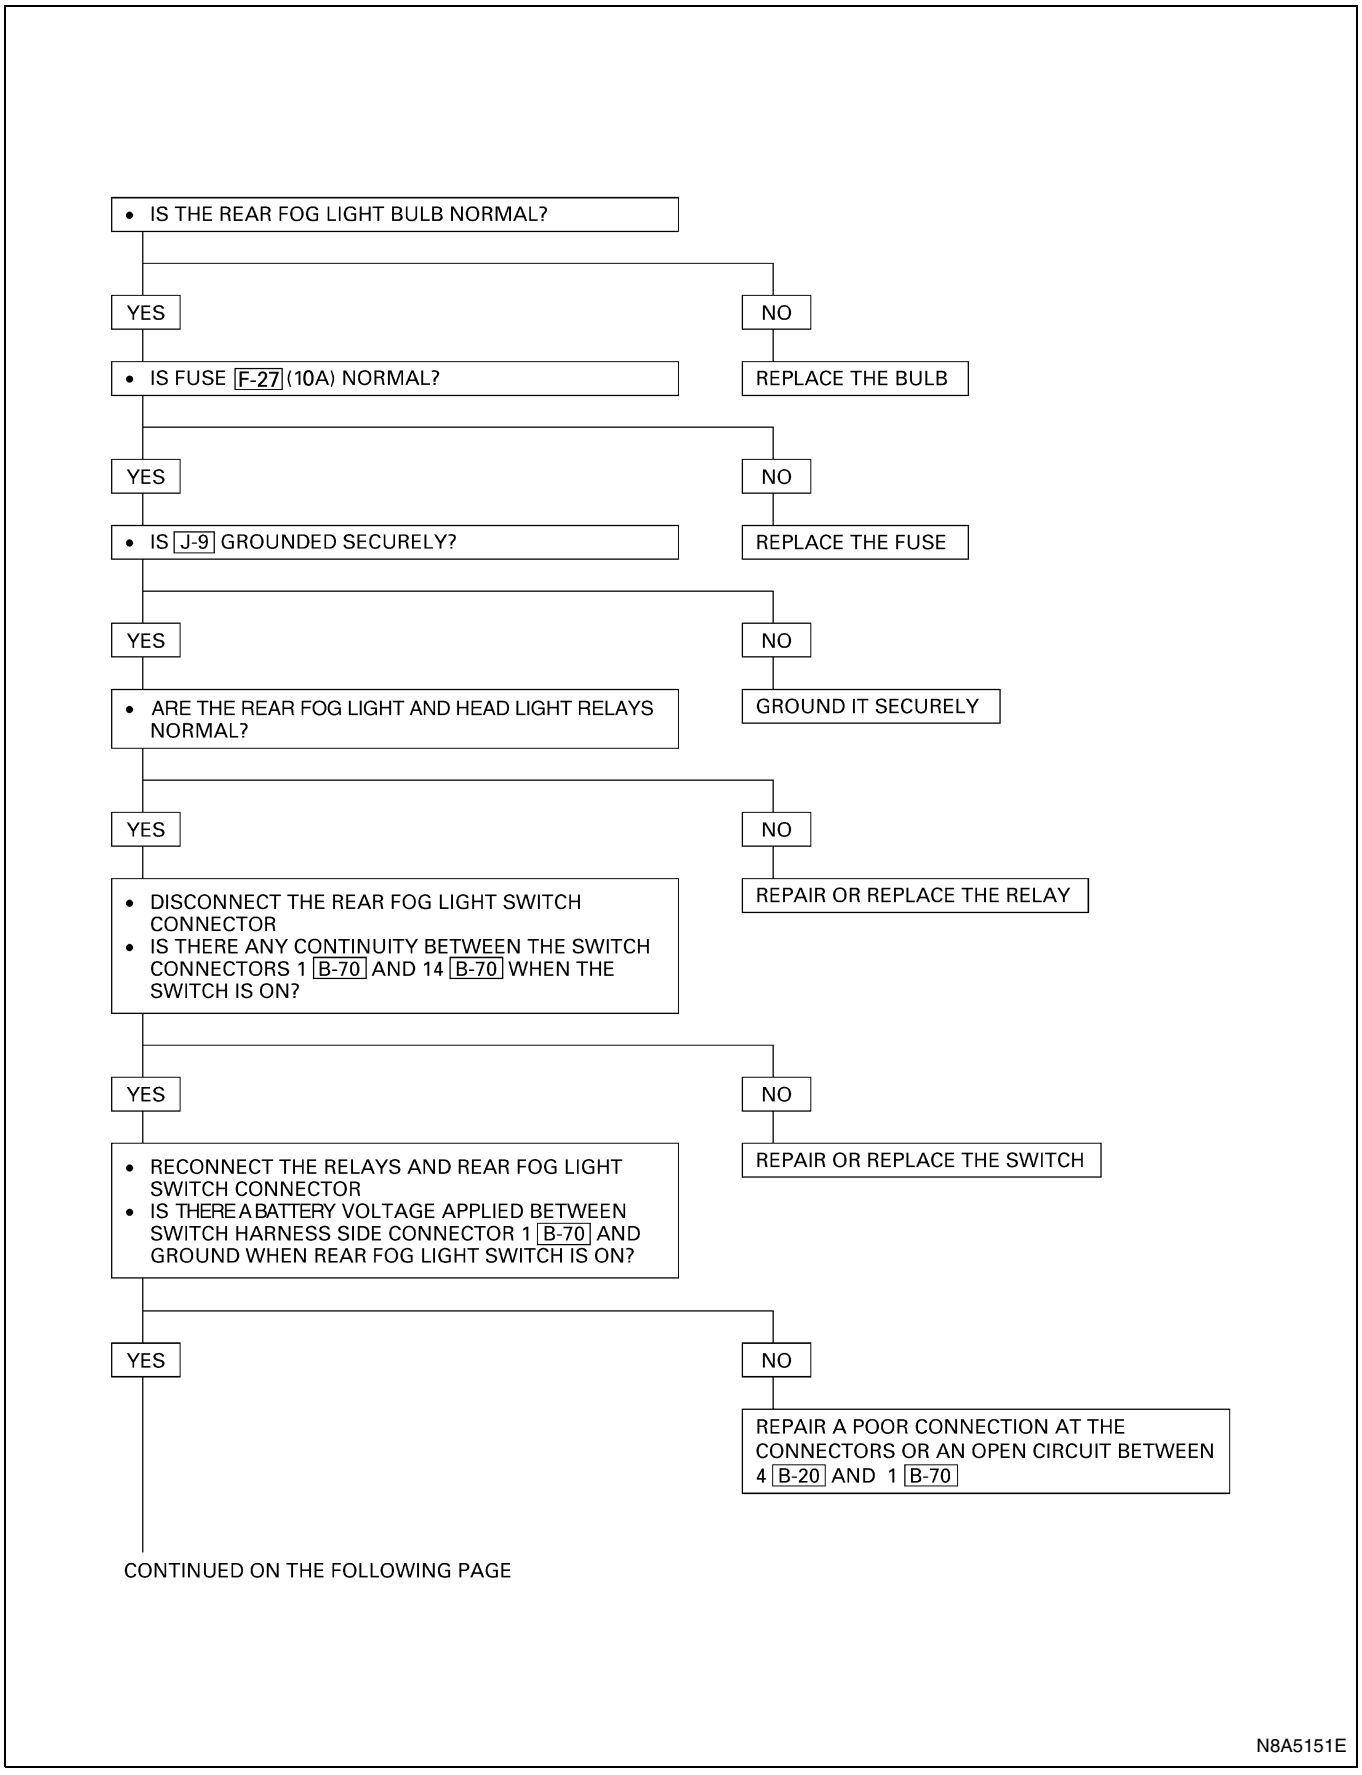


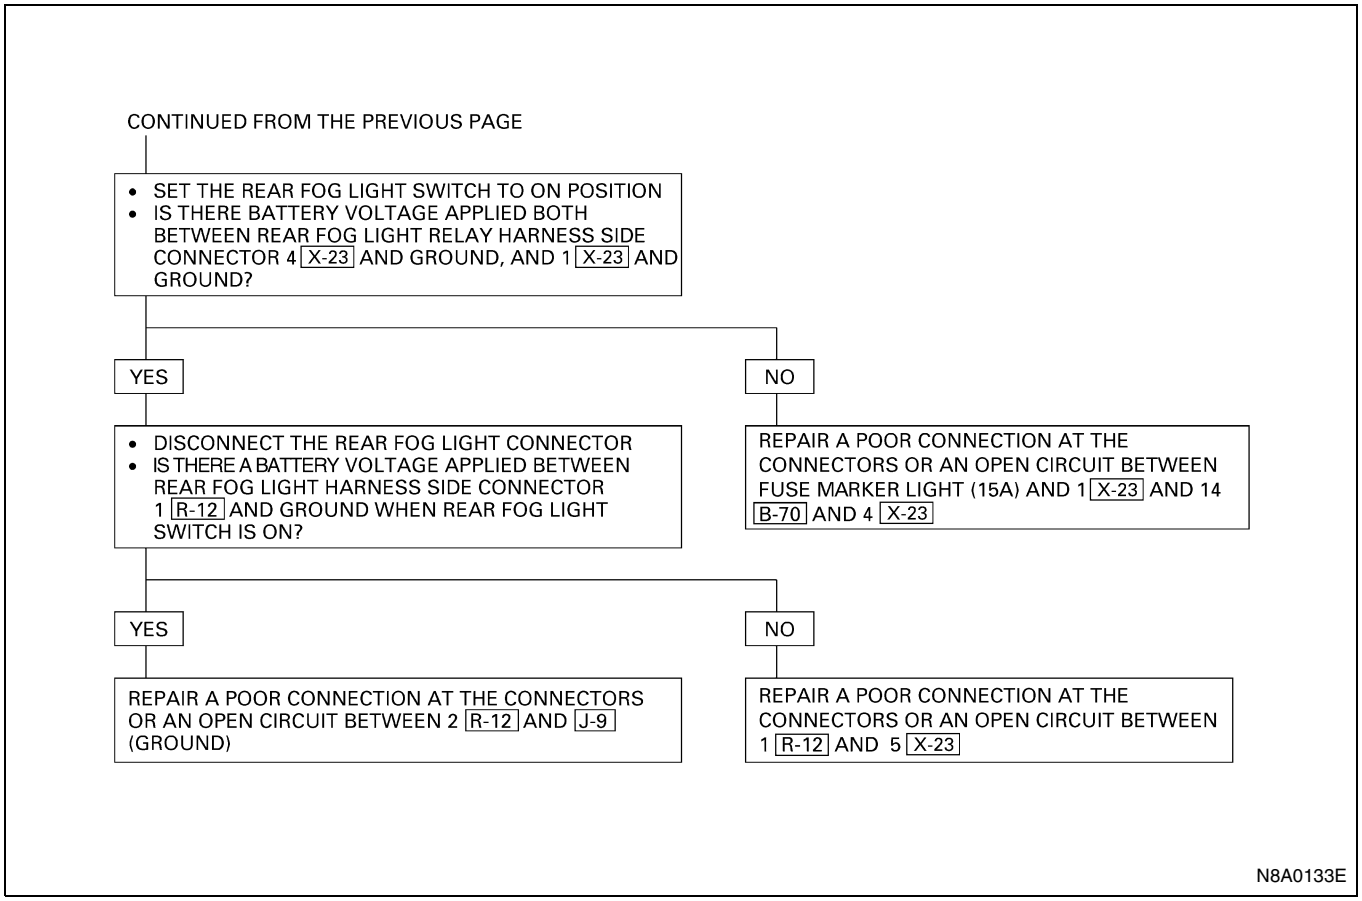
Notice:
Figures in parenthesis “( )” indicate place of inspection for the cornering light on the right.

3-3. Cornering Light Remains On Even When Steering Wheel is in Straight Ahead Position



4. Rear Fog Light
4-1. Rear Fog Light Inoperative (while Headlight is ON)





Starter Switch

Refer to “START AND CHARGING” in this section.

High Beam Indicator Light

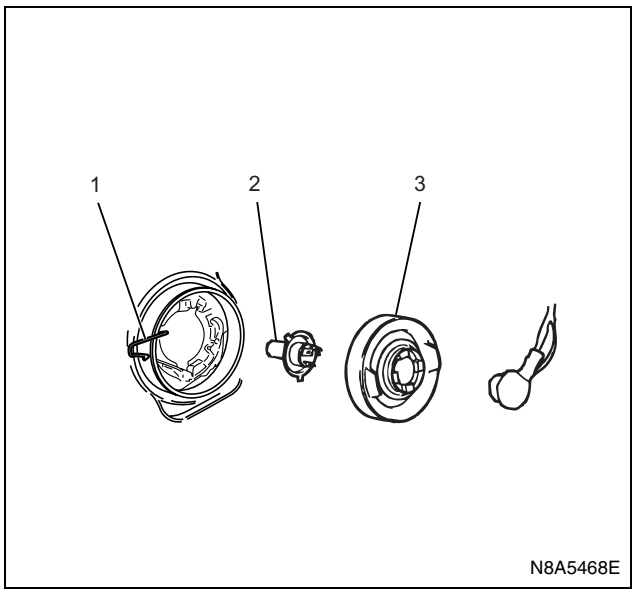
Refer to “METER AND WARNING/INDICATOR LIGHT” in this section.

Headlight Bulb Replacement

Removal

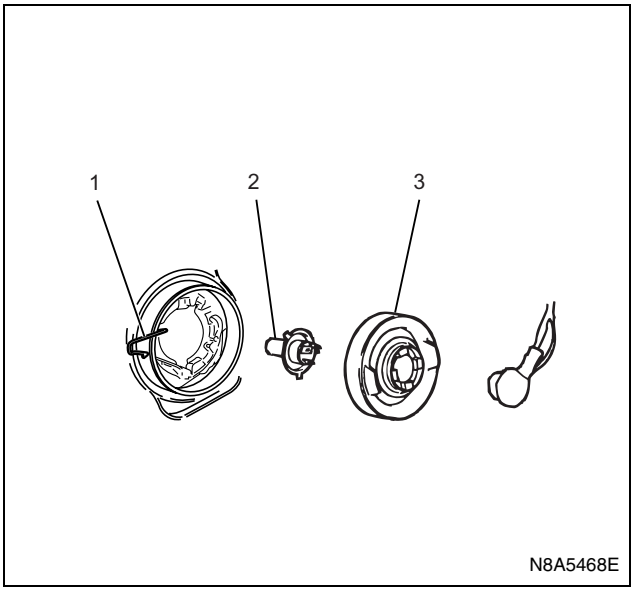
1. Remove the battery ground cable at the battery.
2. Remove the headlight assembly. (Refer to ‘Headlight Replacement’ below.)
3. Remove the headlight bulb.
   - Remove the dust cover (3).
   - Remove the clip (1).
   - Remove the headlight bulb (2).

Caution:
Do not touch the glass portion of the bulb with your fingers.



Installation

1. Install the headlight bulb.
   - Set the headlight bulb (2).
   - Fix the headlight bulb with clip (1).
   - Install the dust cover (3).
2. Install the headlight assembly.
   (Refer to ‘Headlight replacement’ below.)
3. Connect the battery ground cable at the battery.
4. Check if the light lights.



Caution:
Do not touch the glass portion of the new bulb with your fingers.

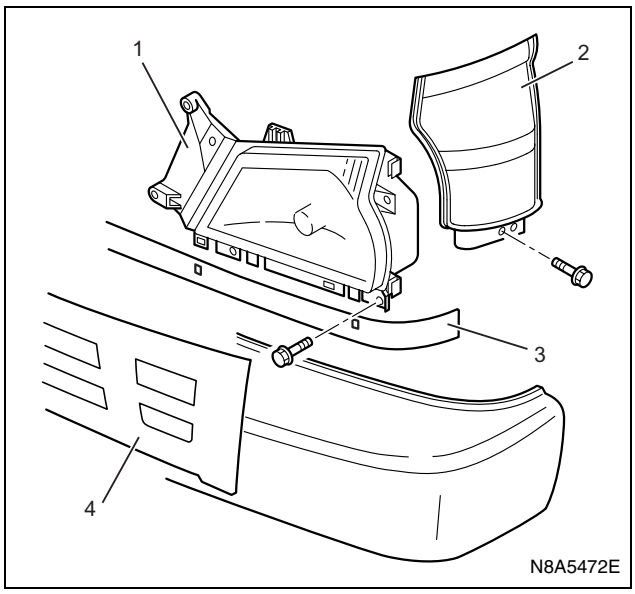
Headlight Replacement

Removal

Preparation: Disconnect the battery ground cable.

1. Remove the battery ground cable at the battery.
2. Remove the seal rubber (3).
   - Remove the seal rubber from beneath the headlight.
3. Remove the front combination light (2).
   - Open the cab door. Insert a screwdriver (1) into the space between the cab and the cab door. Use the screwdriver to force out the stud pin at the center of the grommet (the pin securing the front combination light).

   - Remove the fixing screw.
   - Remove the two catches.
   - Remove the front combination light connector.
4. Remove the front grille (4).
   - Remove the bolt at the center of the front grille.
   - Remove the four clips securing the front grille.
   - The grille is secured by 4 clips (2 clips at the inside of each headlight). Pull the grille toward you to remove it.
5. Remove the front corner panel.
6. Remove the headlight (1).
   - Remove the four bolts securing the headlight (loosen the fixing bolts at the bottom of the front side panel to create working space).
   - Remove the headlight clips.
   - Remove the headlight connector.



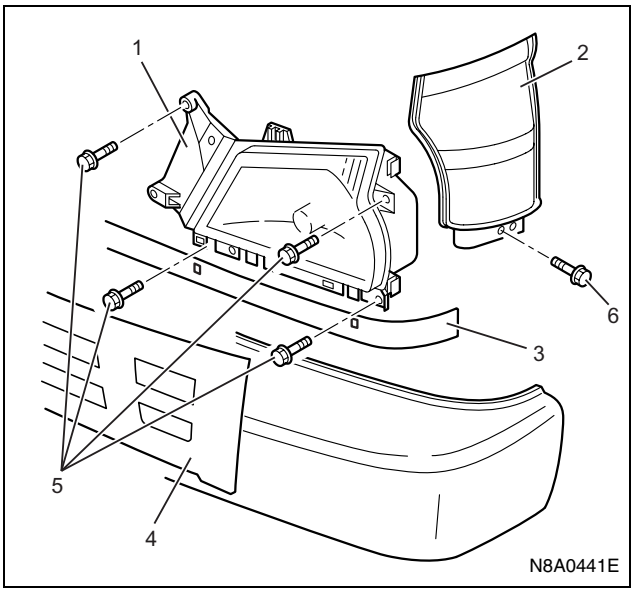
Installation

1. Assemble the headlight assembly (1).
   - Connect the connector.
   - Fix it to body panel with four bolts (5).
2. Assemble the front panel side.
   (Refer to “DOOR” in section 2.)
3. Install the front grille (4).
4. Install the front combination assembly (2).
   1) Position it by aligning two pawls with the groove of H/L.
   2) Fit the iron PIN in the upper portion by aligning it with the center of corresponding grommet.

Notice:
Push it into securely with a force of approx. 250 N (25 kgf) until click is heard.

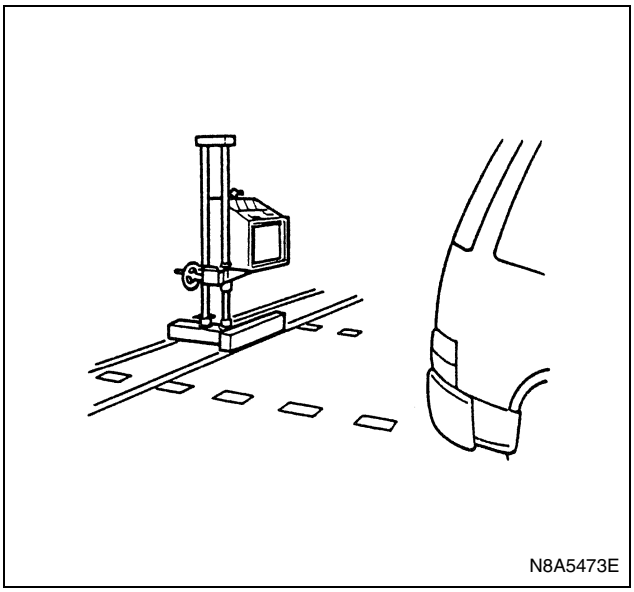
   3) Pull the front combination light assembly lightly toward the front of vehicle to make sure that the PIN and grommet are engaged securely.
   4) Tighten one bolt (6) in the lower portion of front combination light assembly.
   5) Hook the seal rubber (3) on two projections under H/L.

5. Connect the battery ground cable.
6. Check the operation and lighting of each lamp.



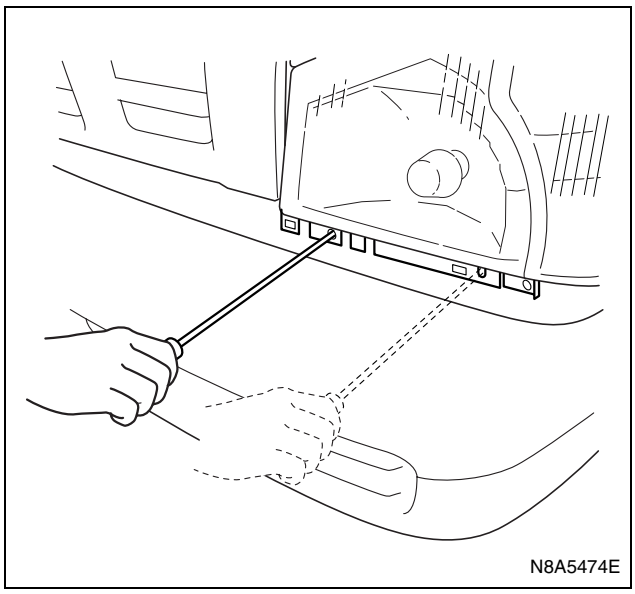
Aiming of Headlight

Preparation: Place the unloaded vehicle on a level surface and check to see if the inflation pressure of the tires is correct, the lenses are clean, and the battery is sufficiently charged. Adjust the aim with the headlight tester. When adjusting, follow the procedure of the tester manufacturer's.



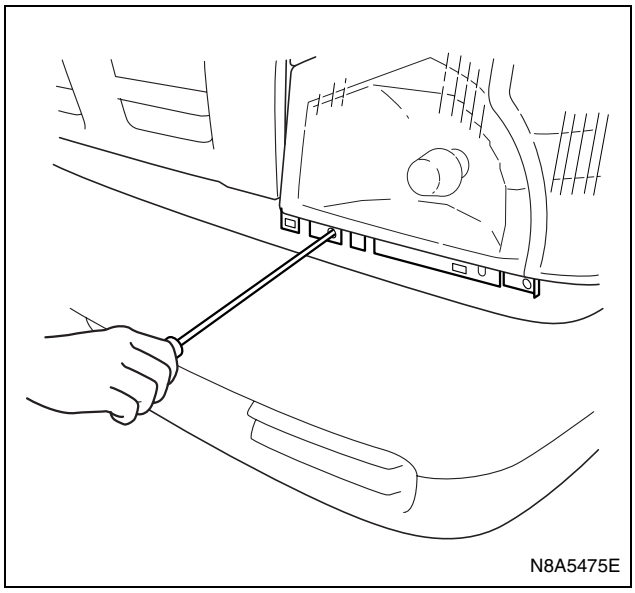
Vertical Adjustment

Insert the tip of a screwdriver into the hole beneath the headlight (the shaft of the screwdriver must be slanted up) until contact is made with the head of the adjusting screw. Turn the screw to adjust headlight focus up or down.
Two vertical aim screws should be turned in the same direction at the same time to adjust aiming.



Horizontal Adjustment

Insert the tip of a screwdriver into the hole beneath the headlight (the shaft of the screwdriver must be slanted up) until contact is made with the head of the adjusting screw. Turn the screw to adjust headlight focus to the left or right.

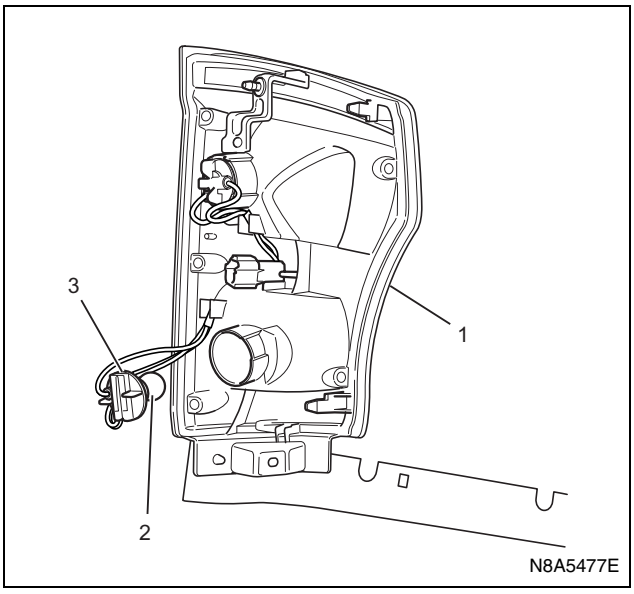


Cornering Light Bulb Replacement

Removal

1. Remove the battery ground cable at the battery.
2. Remove the front combination light.
   - Open the cab door. Insert a screwdriver (1) into the space between the cab and the cab door. Use the screwdriver to force out the stud pin at the center of the grommet (the pin securing the front combination light).

   - Remove the fixing screw.
   - Remove the two catches.
   - Remove the front combination light (1) connector.



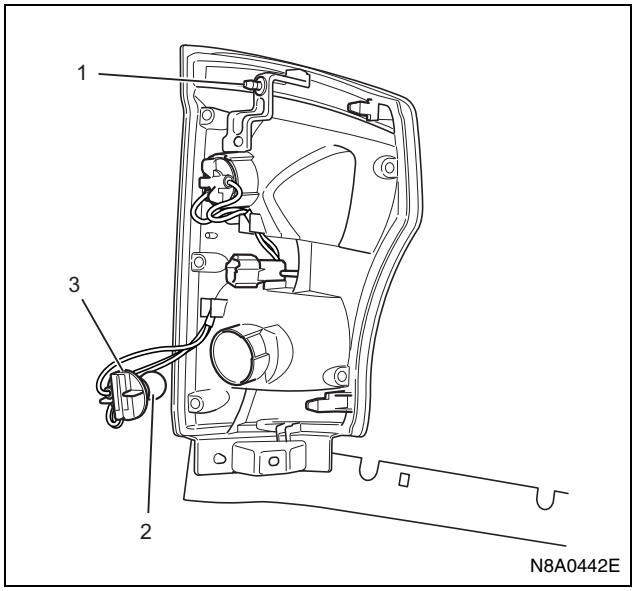
3. Remove the cornering light bulb.
   - Turn the cornering / clearance bulb socket (3) to the left to remove it.
   - Press the bulb (2) in and turn it to the left to remove it from the socket.

Installation

1. Install the cornering / clearance bulb.
   - While pressing the bulb (2), turn it clockwise to fit.

Notice:
Do not let the glass portion dirty with sebum etc.

   - Turn the bulb socket (3) clockwise to fit.



2. Installation procedure of front combination light assembly
   - Connect the connector of the front combination light assembly.
   - Position it by aligning two pawls with the groove of H/L.
   - Fit the iron PIN (1) in the upper portion of the side by aligning it with the center of corresponding grommet.

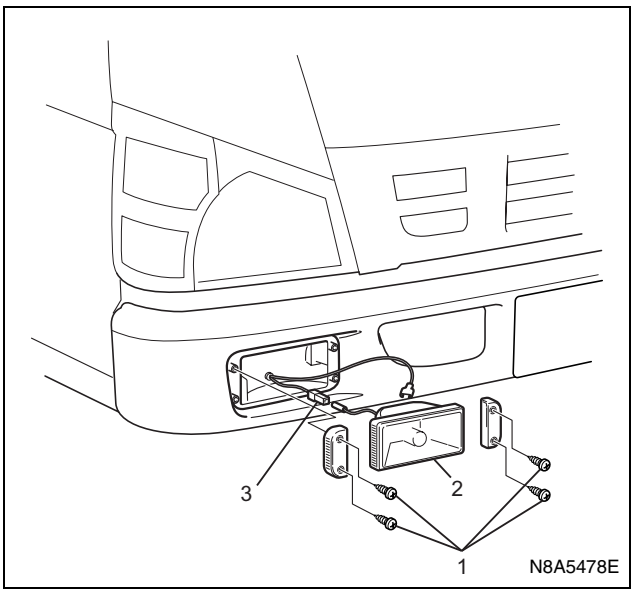
Notice:
Push it into securely with a force of approx. 250 N (25 kgf) until click is heard.

   - Pull the front combination light assembly lightly toward the front of vehicle to make sure that the PIN and grommet are engaged securely.
   - Tighten one bolt in the lower portion of front combination light assembly.
3. Hook the seal rubber on two projections under H/L.
4. Connect the battery ground cable.
5. Check lighting of each light.

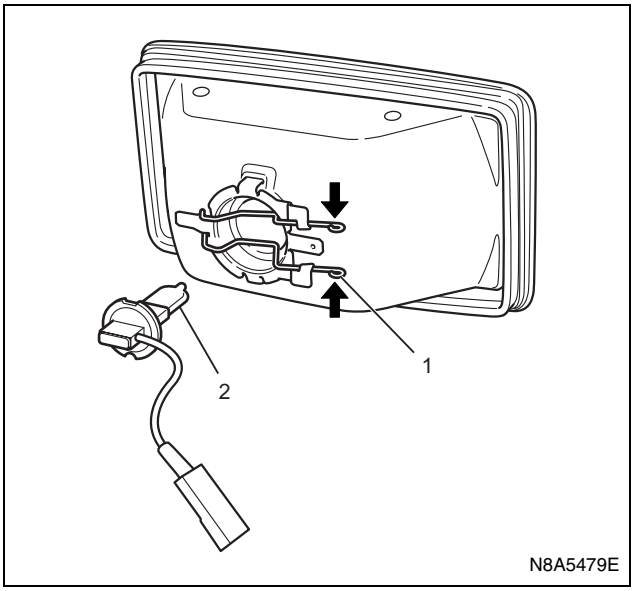
Fog Light Bulb

Removal

1. Remove the battery ground cable at the battery.
2. Remove the four screws (1) to remove the cover which holds fog light assembly (2).
3. Remove the connector (3).
4. Remove the fog light assembly (2).

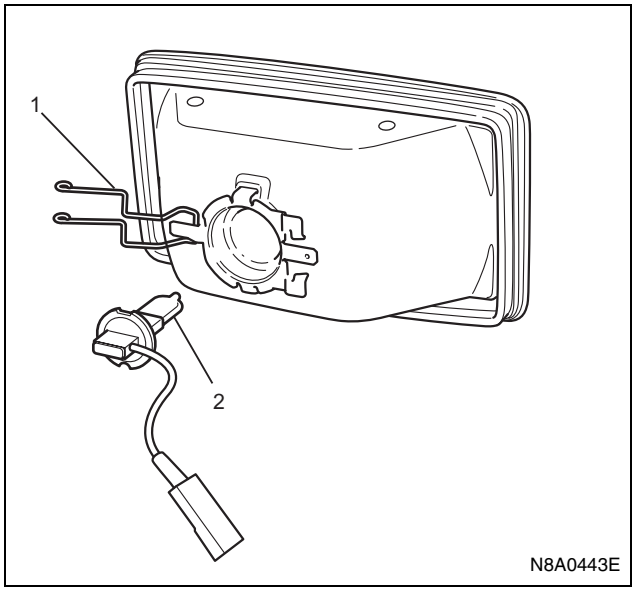


5. Bulb
   - Push the clip (1) inward as arrow to remove.
   - Remove the bulb (2).



Installation

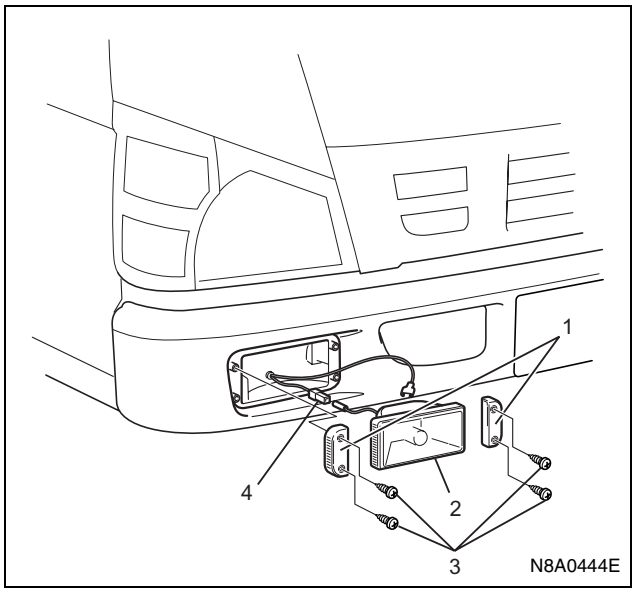
1. Install the fog light bulb.
   - Set the fog light bulb (2).
   - Hook the clip (1) to secure fog light bulb.



2. Connect the two locations of connector (4).
3. Install the fog light assembly.
   - Hold the fog light (2) with right and left covers (1) and secure it with four screws (3).

Notice:
Make sure that “TOP” mark on the lens comes upside.

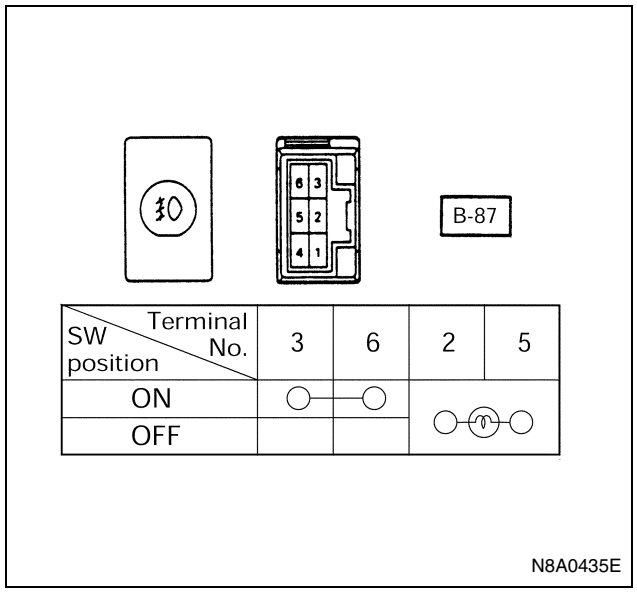
4. Connect the battery ground cable.
5. Check lighting.



Fog Light Switch

Inspection

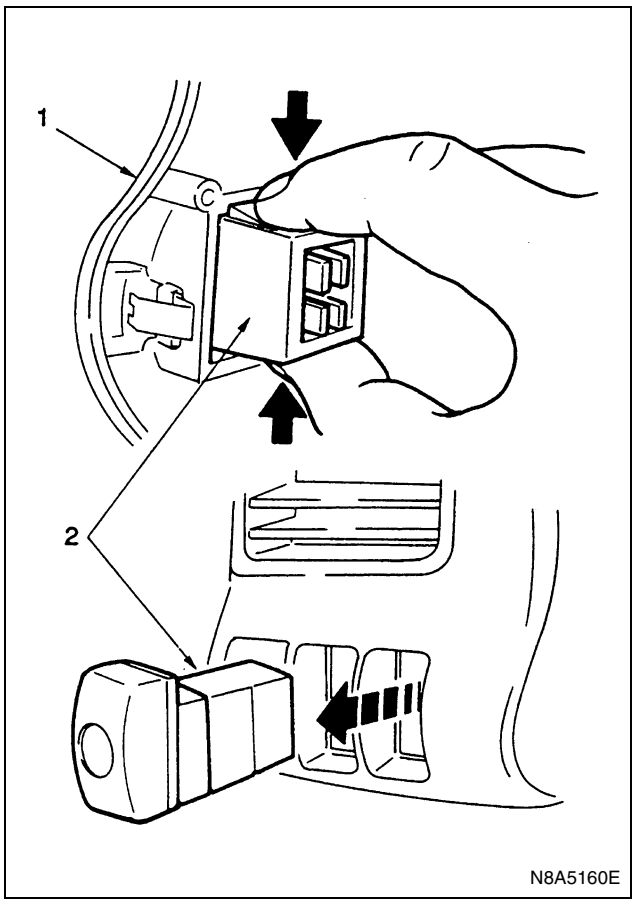
Check the continuity between the connector terminals while operating the switch.
Replace the switch when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Meter Cluster
   Refer to “METER AND WARNING/INDICATOR LIGHT” in this section.
2. Fog Light Switch
   Release the lock pushing the switch from the back side of the meter cluster.



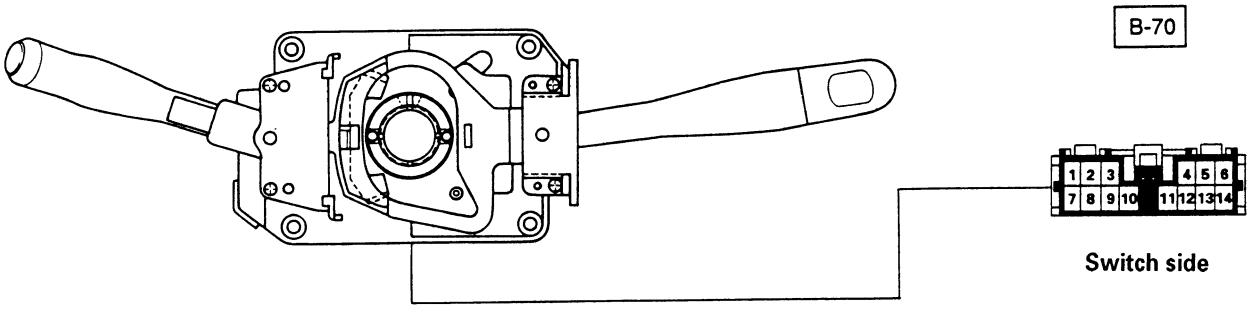
Installation

To install, follow the removal steps in the reverse order.

Combination Switch (Lighting Switch, Dimmer, Passing Switch, Cornering Light Switch and Rear Fog Light Switch)

Inspection

Check the continuity between the connector terminals while operating the switch.
Replace the switch when the result of inspection is found abnormal.



SW position \ Terminal No.		1	2	4	5	7	8	9	10	11	12	13	14

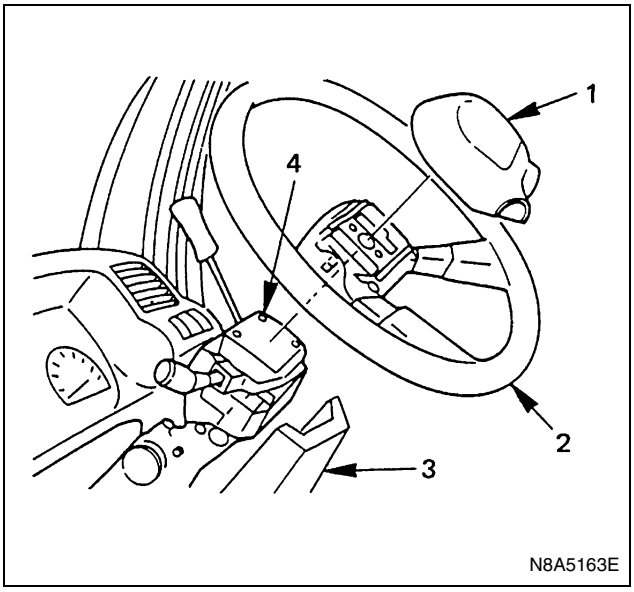
	Passing			○		○			○				
Cornering light SW	Turning left		○							○			
	Neutral												
	Turning right		○					○					

N8A5162E

Removal

Preparation:
Disconnect the battery ground cable.

1. Horn Pad
   1) Hold the horn pad and pull it upward.
2. Steering Wheel
   1) Remove the steering shaft nut.
   2) Remove the steering wheel by using steering wheel remover.
      (Refer to Section 3B4 “STEERING COLUMN” for steering wheel removal steps.)
3. Steering Cowl
   Remove the four screws.
4. Combination Switch
   1) Remove the four screws.
   2) Disconnect the connector.



Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the steering shaft nut to the specified torque.

Tighten:

Shaft nut to 49 N·m (5 kg·m / 36 lb·ft)

Headlight Leveling

General Description

The circuit consists of starter SW, headlight leveling SW and headlight leveling actuator.

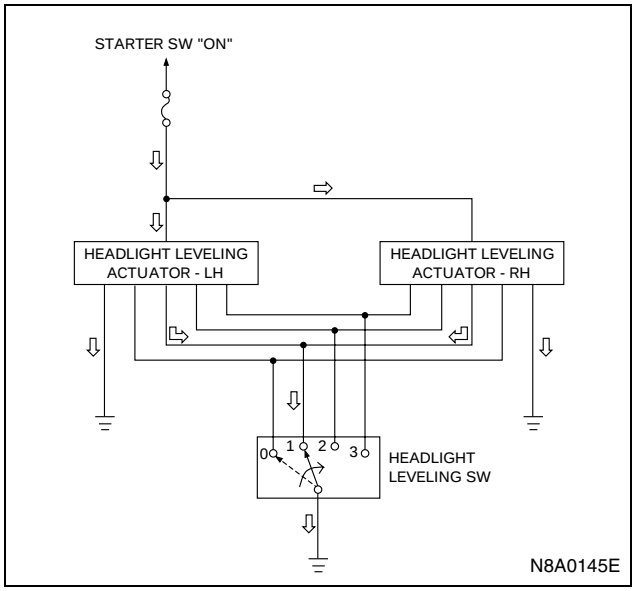
When the headlight leveling SW is operated with the starter SW at ON position, the actuator is operated to change the angle of the optical axis of the headlight.

Operation of The Circuit

Notice:

Arrow marks indicate the direction of current.

1. When headlight leveling SW is turned to “1” position



2. When headlight leveling SW is turned to “0” position

Starter Switch

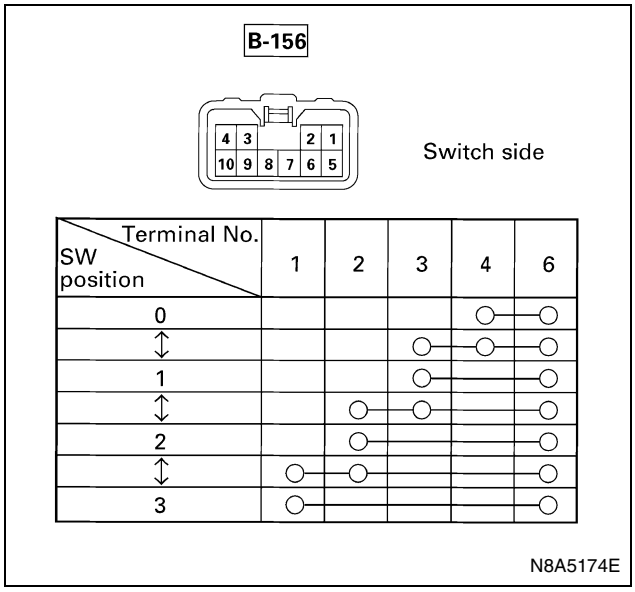
Refer to “START AND CHARGING” in this manual.

Headlight Leveling Switch

Inspection

Check the continuity between the switch connector terminals.

Repair or replace the switch when the result of inspection is found abnormal.

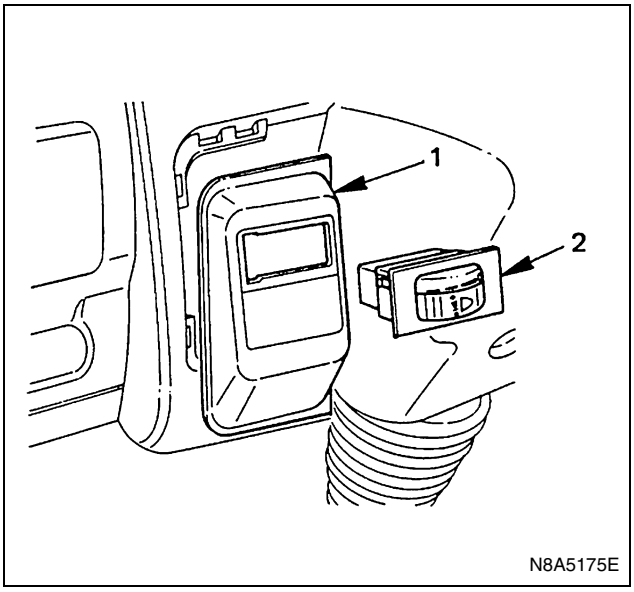


Removal

Preparation:

Disconnect the battery ground cable.

1. Switch Bezel
2. Headlight Leveling Switch
   Disconnect the connector.



Installation

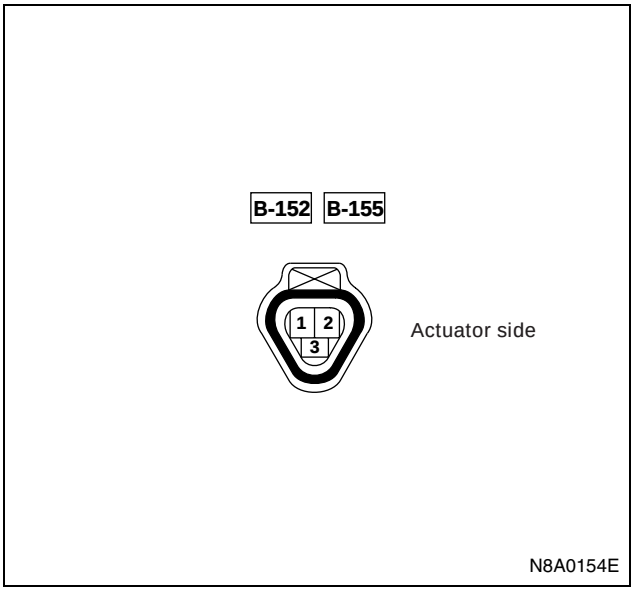
To install, follow the removal steps in the reverse order.

Headlight Leveling Actuator

Inspection

This actuator has a mechanism that the angle of head light leveling varies according to input voltage of SIGNAL.

1. Make sure that the voltage specified in table is output to vehicle harness connector which will be connected to actuator.
   If the power supply is not 12 V, the SIGNAL output varies in proportion to its voltage.
2. Connect the connector of actuator and vehicle harness connector.
   Make sure that the reflector of headlight moves to the position indicated by HEAD LAMP LEVELING SW.



1	2	3
SIGNAL	–	+

		Input signal voltage ratio for SIGNAL when the voltage difference between positive and negative is specified as 100%	–	+
HEAD LAMP POSITION	Position 0	10.0% (1.2 V)	0 V	12 V
	Position 1	23.4% (2.8 V)	0 V	12 V
	Position 2	36.7% (4.4 V)	0 V	12 V
	Position 3	50.0% (6.0 V)	0 V	12 V
	Position 4	63.4% (7.6 V)	0 V	12 V

Caution:

1. For vehicles with 12 V and 24 V, this leveling input voltage is 12 V.
2. Input to SIGNAL must be less than 65% of the input voltage to positive terminal.

Clearance Light, Taillight, License Plate Light and Illumination Light

General Description

The circuit consists of the lighting switch, clearance light, taillight, license plate light and the illumination light for each of switch, meter and ashtray.
All these lights come on when the lighting switch is turned on with the switch to either clearance or headlight position.

Refer to “HEADLIGHT, FOG LIGHT AND CORNERING LIGHT” in this section.

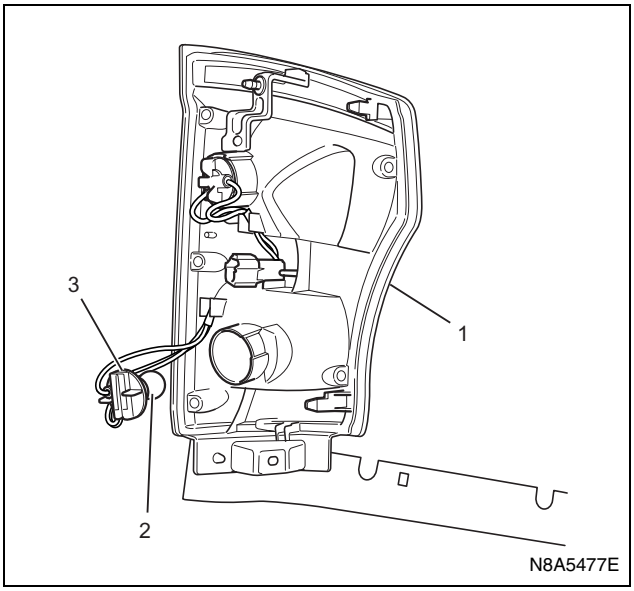
Clearance Light/Bulb

Removal

1. Remove the battery ground cable at the battery.
2. Remove the front combination light.
   - Open the cab door. Insert a screwdriver (1) into the space between the cab and the cab door. Use the screwdriver to force out the stud pin at the center of the grommet (the pin securing the front combination light).

   - Remove the fixing screw.

- Remove the two catches.
- Remove the front combination light (1) connector.



3. Remove the clearance light bulb.
   - Turn the bulb socket (3) to the left to remove it.
   - Press the bulb (2) in and turn it to the left to remove it from the socket.

Installation

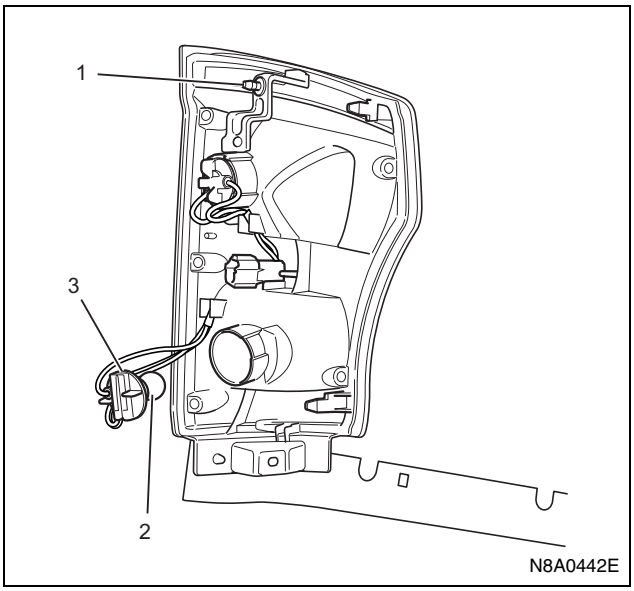
Installation procedure of cornering/clearance light bulb

1. Install the cornering/clearance light bulb.
   - While pressing the bulb (2), turn it clockwise to fit.

Notice:

Do not let the glass portion dirty with sebum etc.

- Turn the bulb socket (3) clockwise to fit.



2. Installation procedure of front combination light assembly
   - Connect the connector of the combination light assembly.
   - Position it by aligning two pawls with the groove of H/L.
   - Fit the iron PIN (1) in the upper portion of the side by aligning it with the center of corresponding grommet.

Notice:

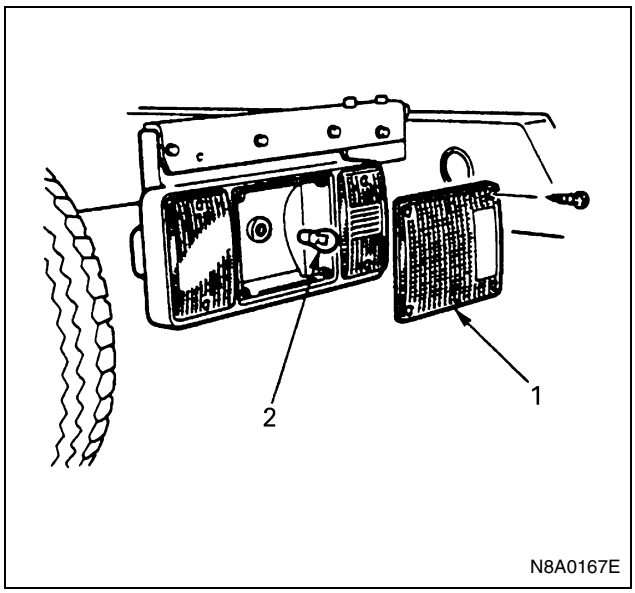
Push it into securely with a force of approx. 250 N (25 kgf) until click is heard.

   - Pull the front combination light assembly lightly toward the front of vehicle to make sure that the PIN and grommet are engaged securely.
   - Tighten one bolt in the lower portion of front combination light assembly.
3. Hook the seal rubber on two projections under H/L.
4. Connect the battery ground cable.
5. Check lighting of each light.

Taillight Bulb

Removal

1. Lens
2. Bulb



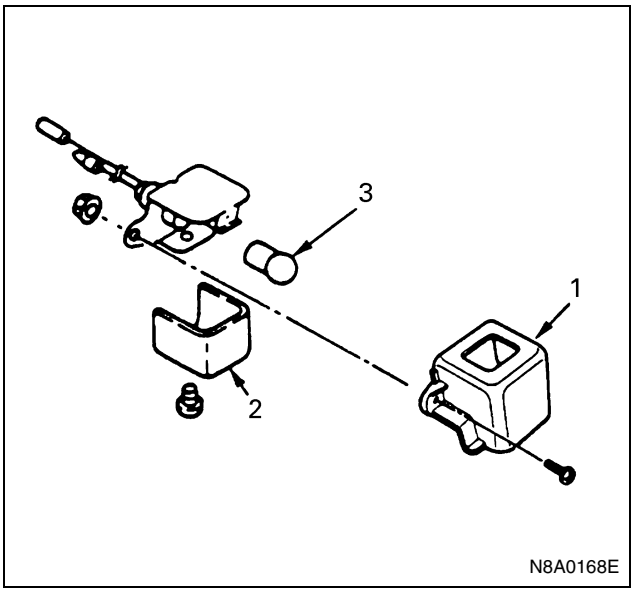
Installation

To install, follow the removal steps in the reverse order.

License Plate Light Bulb

Removal

1. Cover
2. Lens
3. Bulb



Installation

To install, follow the removal steps in the reverse order.

Turn Signal Light, Hazard Warning Light, and Stoplight

General Description

The circuit consists of the starter switch, turn signal light (front and rear), turn signal light switch, hazard warning light, flasher unit, stoplight and stoplight switch.

When turning on the respective switches with the starter switch on, the turn signal light will operate. When the turn signal light is flashing, the indicator light in the meter also starts flashing. When the hazard warning switch is turned on, the current flows to the flasher unit through the hazard warning switch to cause the hazard warning light to flash, independent of the position of the starter switch. At the same time, the indicator lights in the meter also start flashing.

The stoplight switch will turn on and the light comes on once the brake pedal is depressed, independent of the position of the starter switch.

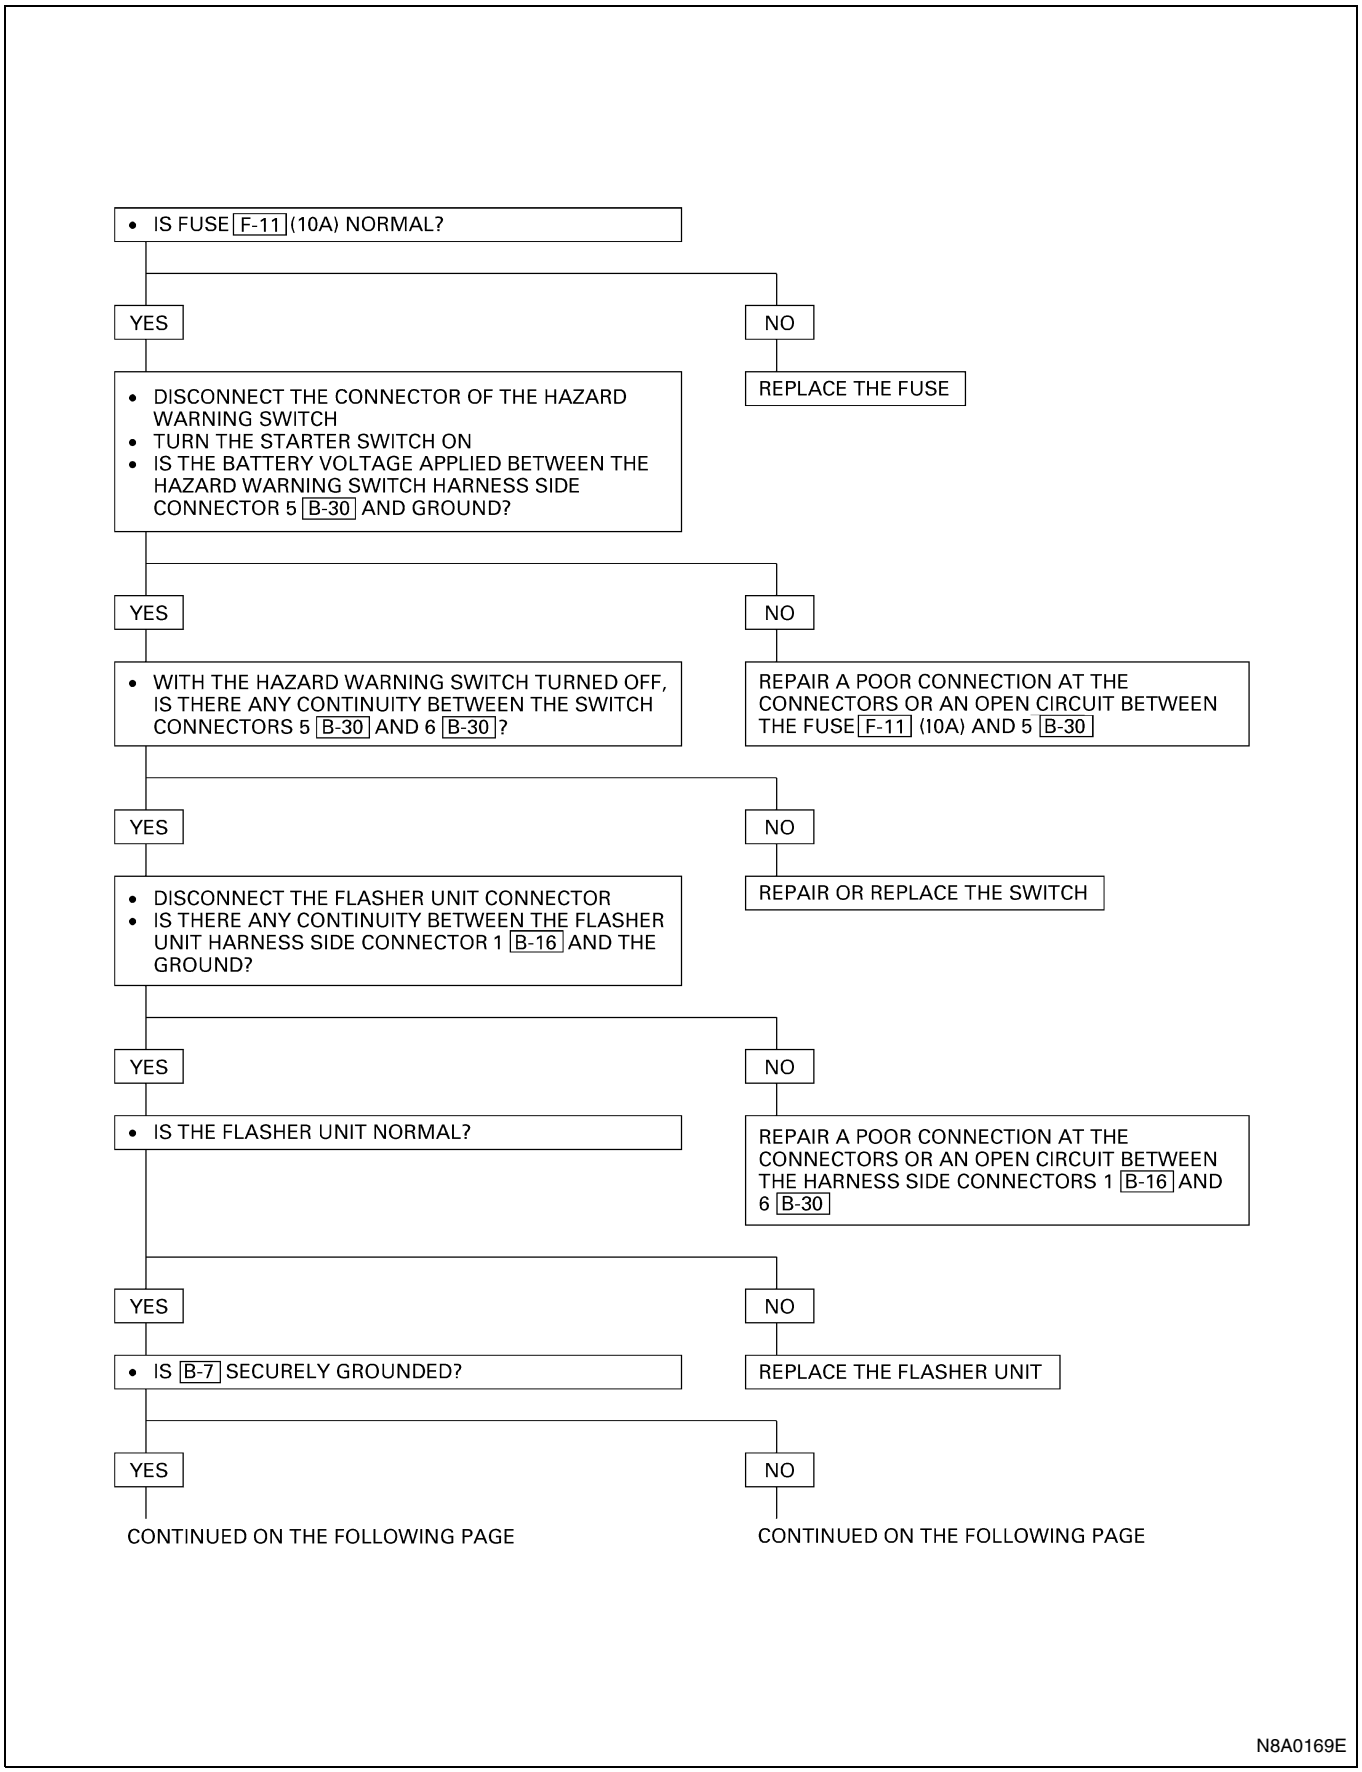
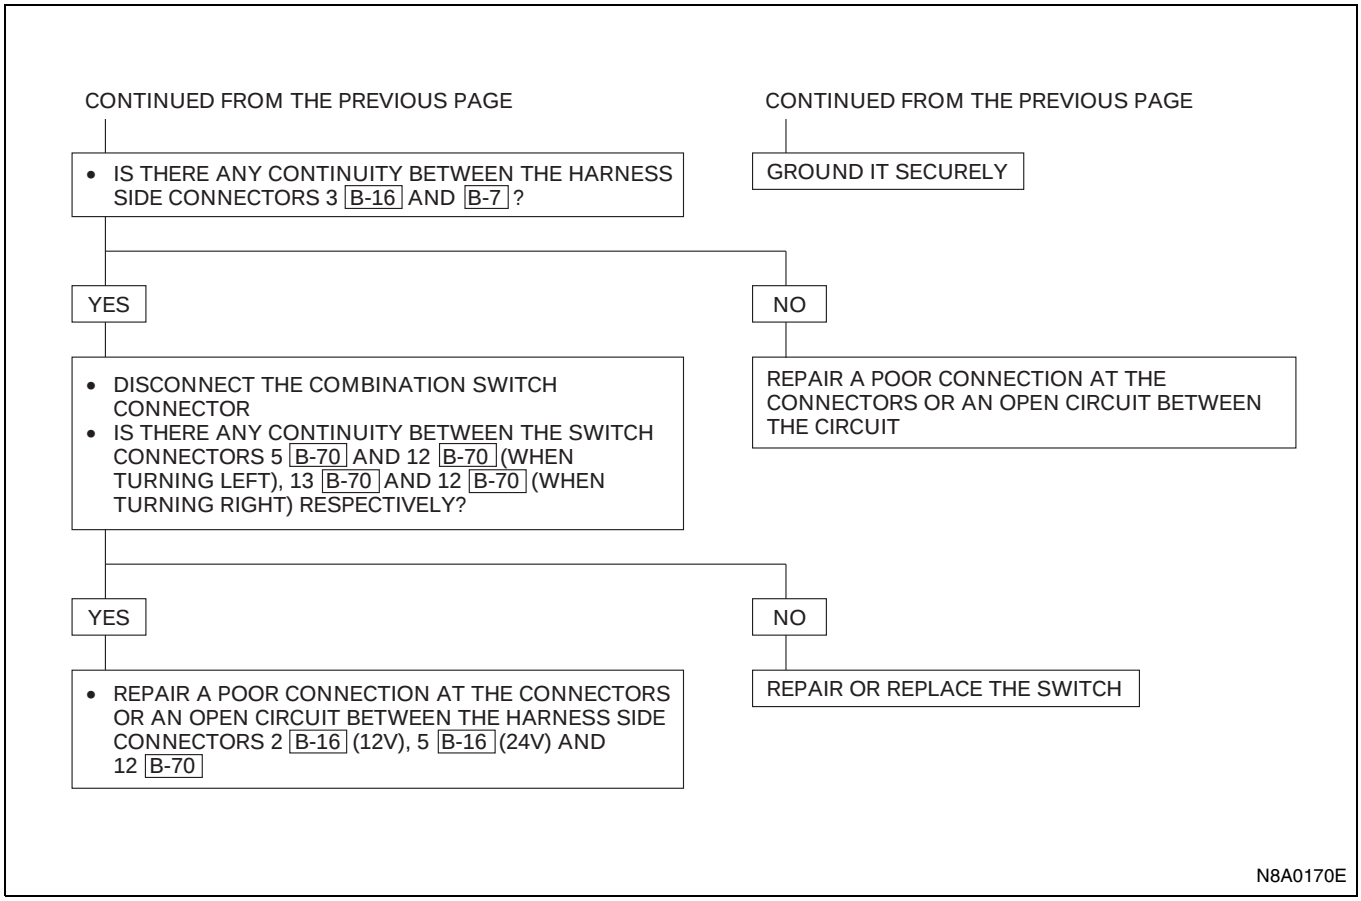
2. Stoplight

		Check point			
		Fuse F-5 (10 A)	Stoplight SW	Stoplight bulb	Cable harness
Trouble mode	2-1. Both stoplights inoperative	❍	❍		❍
	2-2. Stoplight on the left (or right) side inoperative			❍	❍

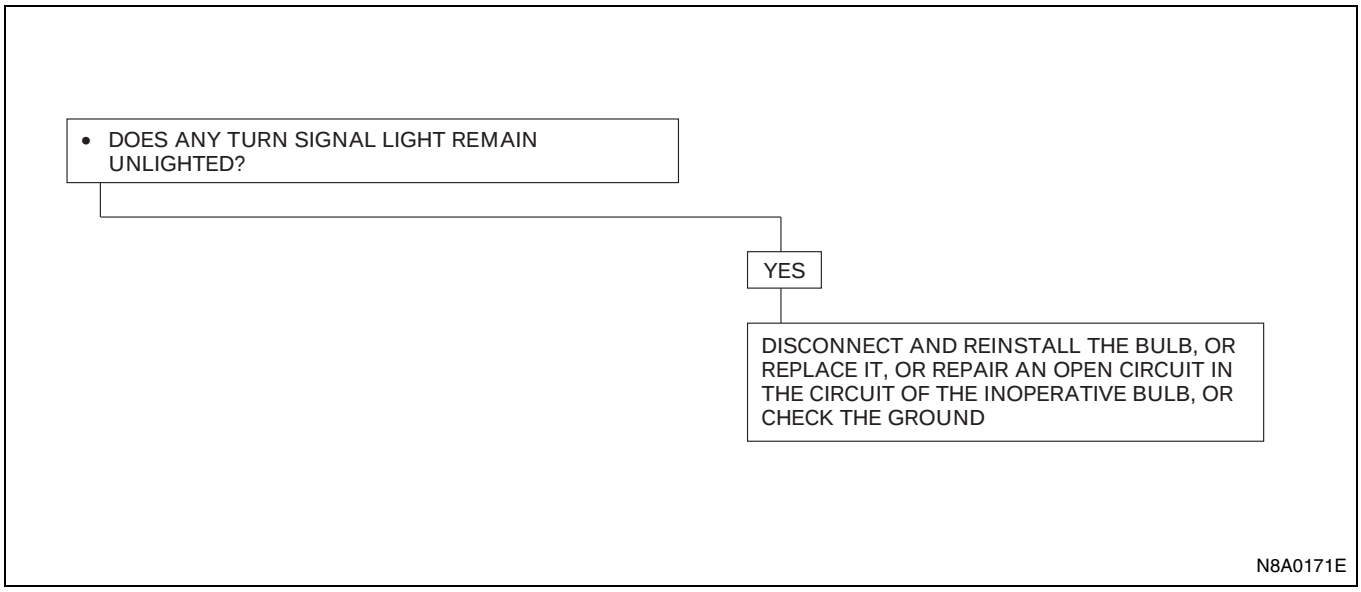
Notice:
Figure in parenthesis “( )” indicates the order of inspection.

1. Turn Signal Light, Hazard Warning Light
1-1. Turn Signal Lights Inoperative

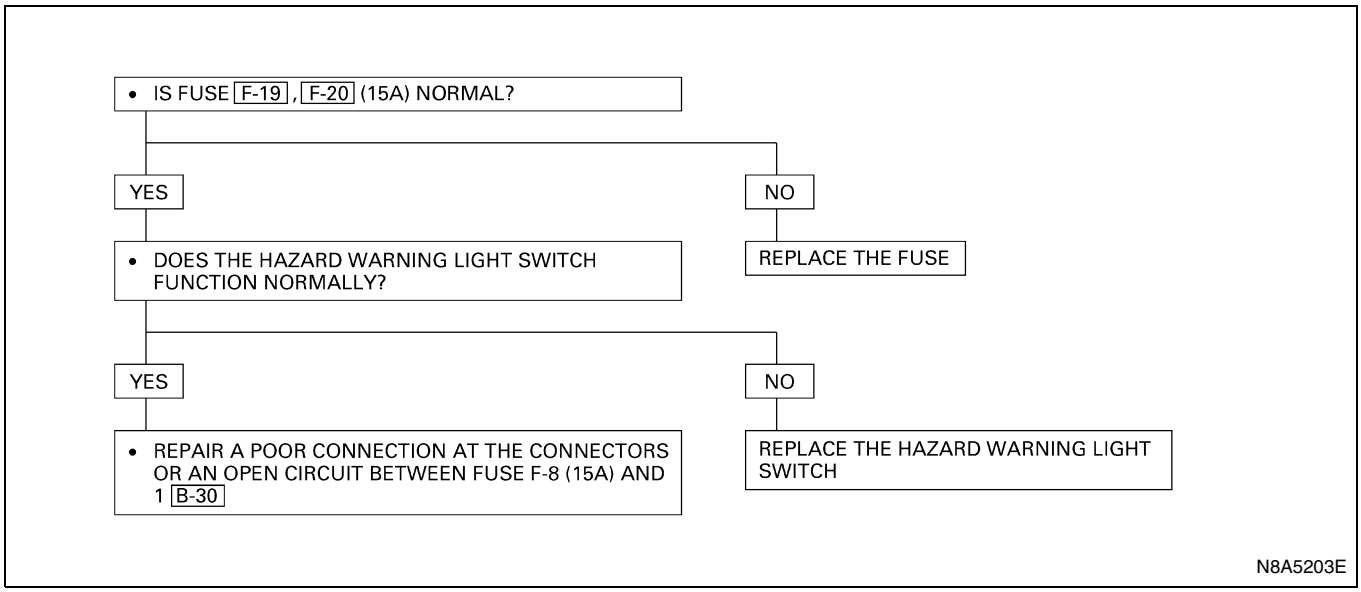




1-2. Turn Signal Lights Flash Too Quickly

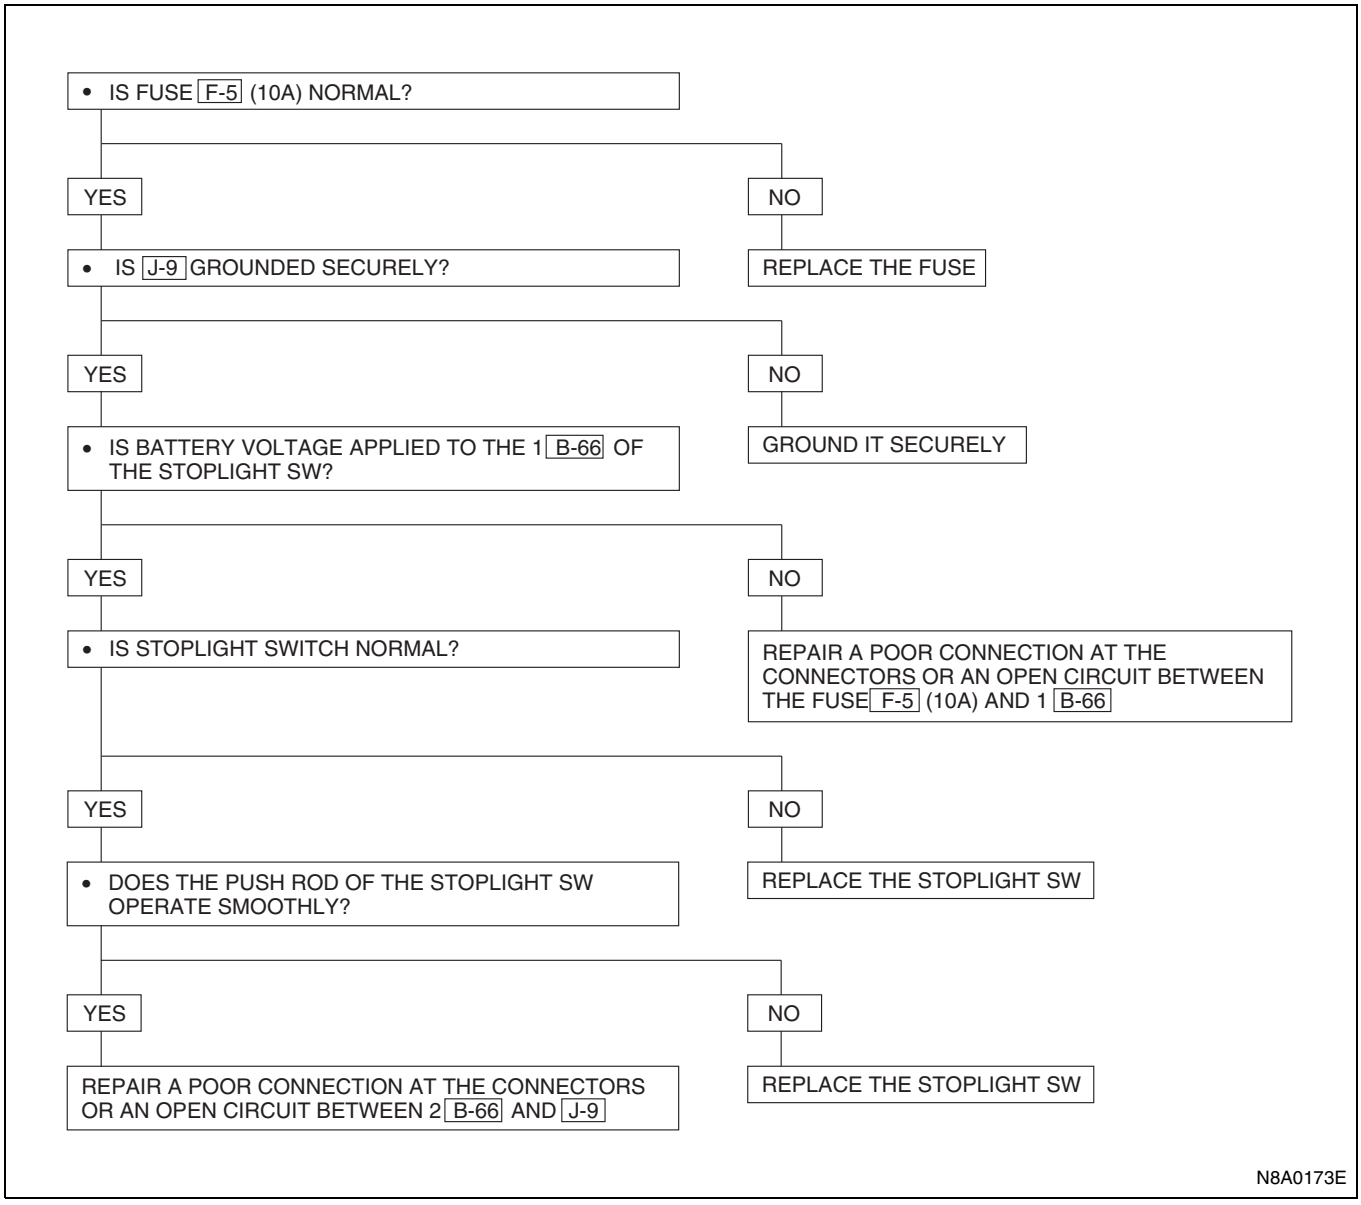


1-3. Hazard Warning Lights Inoperative

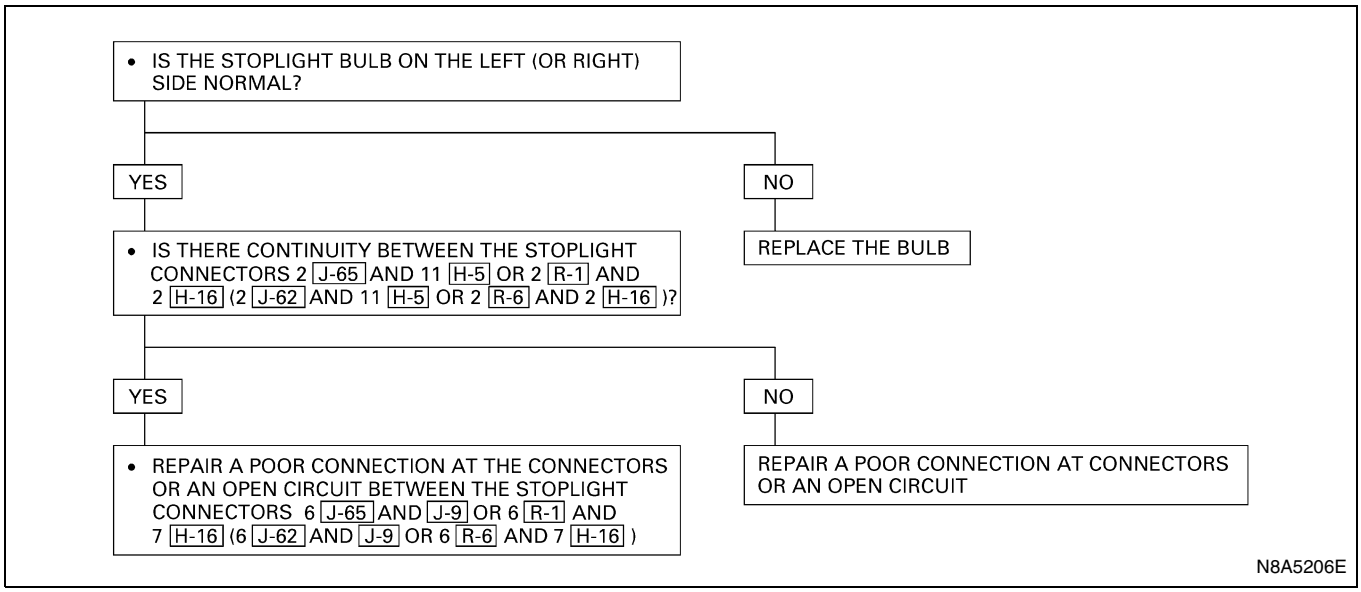


2. Stoplight

2-1. Both Stoplights Inoperative



2-2. Stoplight on The Left (or Right) Side Inoperative



Notice:
Figure in parenthesis “( )” indicates the place of inspection for the right side stoplight.

Starter Switch

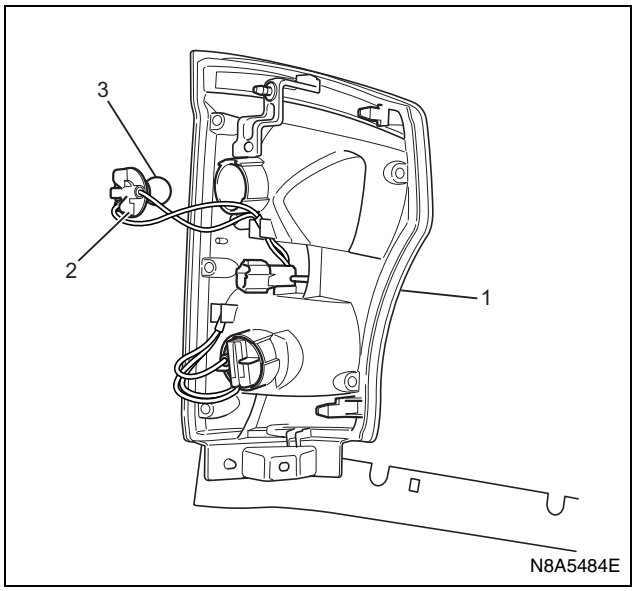
Refer to “START AND CHARGING” in this section.

Front Turn Signal Light/Bulb

Removal

1. Remove the battery ground cable at the battery.
2. Remove the front combination light.
   - Open the cab door. Insert a screwdriver (1) into the space between the cab and the cab door. Use the screwdriver to force out the stud pin at the center of the grommet (the pin securing the front combination light).

   - Remove the fixing screw.
   - Remove the two catches.
   - Remove the front combination light (1) connector.



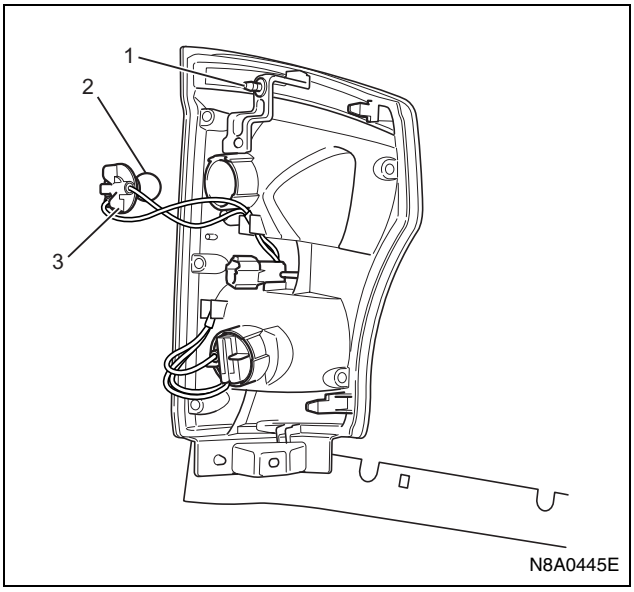
3. Remove the front turn signal light bulb.
   - Turn the bulb socket (2) to the left to remove it.
   - Press the bulb (3) in and turn it to the left to remove it from the socket.

Installation

1. Install the front turn signal light bulb.
   - While pressing the bulb (2), turn it clockwise to fit.

Notice:
Do not let the glass portion dirty with sebum etc.

   - Turn the bulb socket (3) clockwise to fit.



2. Installation procedure of front combination light assembly
   - Connect the connector of the front combination light assembly.
   - Position it by aligning two pawls with the groove of H/L.
   - Fit the iron PIN (1) in the upper portion of the side by aligning it with the center of corresponding grommet.

Notice:
Push it into securely with a force of approx. 250 N (25 kgf) until click is heard.

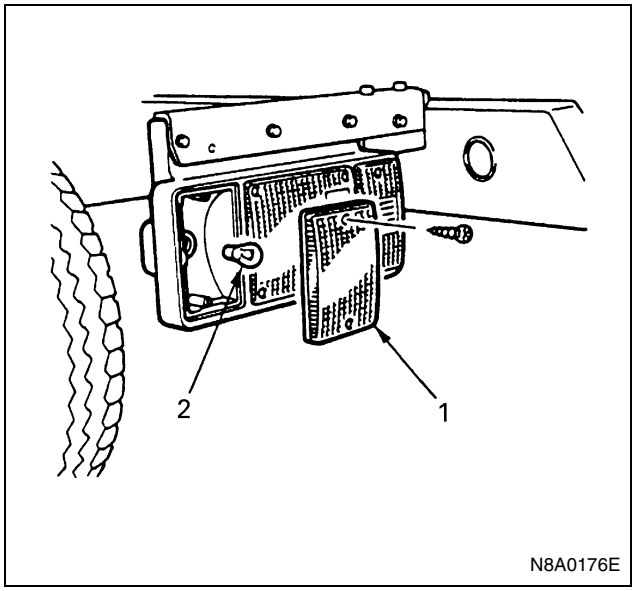
   - Pull the front combination light assembly lightly toward the front of vehicle to make sure that the PIN and grommet are engaged securely.
   - Tighten one bolt in the lower portion of front combination light assembly.
3. Hook the seal rubber on two projections under H/L.
4. Connect the battery ground cable.
5. Check lighting of each light.

Rear Turn Signal Light/Bulb

Removal

Preparation:
Disconnect the battery ground cable.

1. Lens
2. Bulb



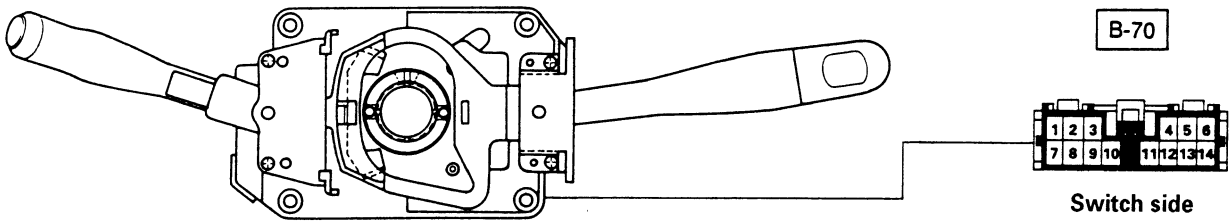
Installation

To install, follow the removal steps in the reverse order.

Turn Signal Light Switch (Combination Switch)

Inspection

Check the continuity between the terminals of the turn signal light switch.
Repair or replace the switch when the result of inspection is found abnormal.



SW position \ Terminal No.		2	5	9	11	12	13
Turn signal light SW	Turning left		○			○	
	Neutral						
	Turning right					○	○

N8A5209E

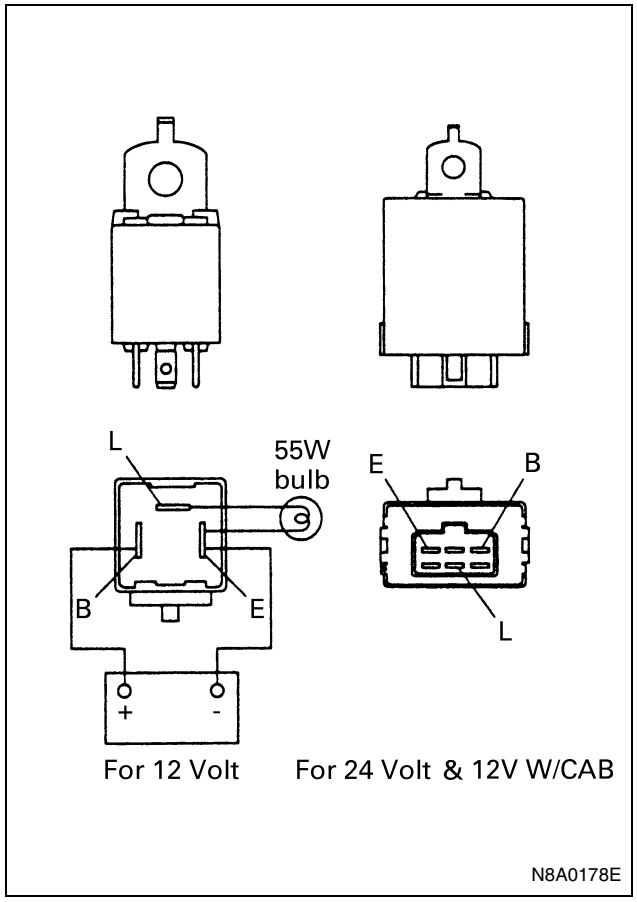
Removal and Installation

Refer to “HEADLIGHT, FOG LIGHT AND CORNERING LIGHT” in this section.

Flasher Unit

Inspection

When a 55W bulb is connected to the unit side terminals “L” and “E” while connecting the battery (+) terminal to terminal “B”, and the battery (−) terminal to terminal “E”, does the bulb light on and off?
Replace the unit when the result of inspection is found abnormal.



Stoplight Bulb

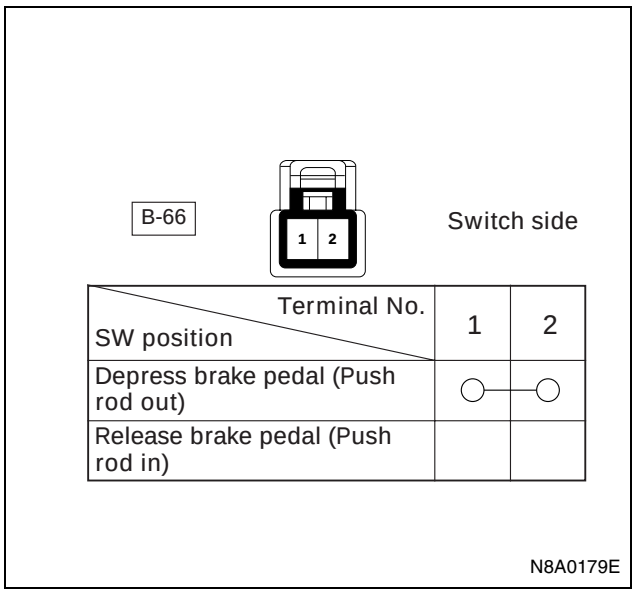
Removal and Installation

Refer to “CLEARANCE LIGHT, TAILLIGHT, LICENSE PLATE LIGHT AND ILLUMINATION LIGHT” for TAILLIGHT BULB removal and installation steps in this section.

Stoplight Switch

Inspection

1. Check to see if the stoplight switch is installed correctly to the specified position. Adjust the position when the result of the inspection is found abnormal.
2. Check to see if there is any continuity between the terminals of the stoplight switch.
   Replace the switch when the result of inspection is found abnormal.

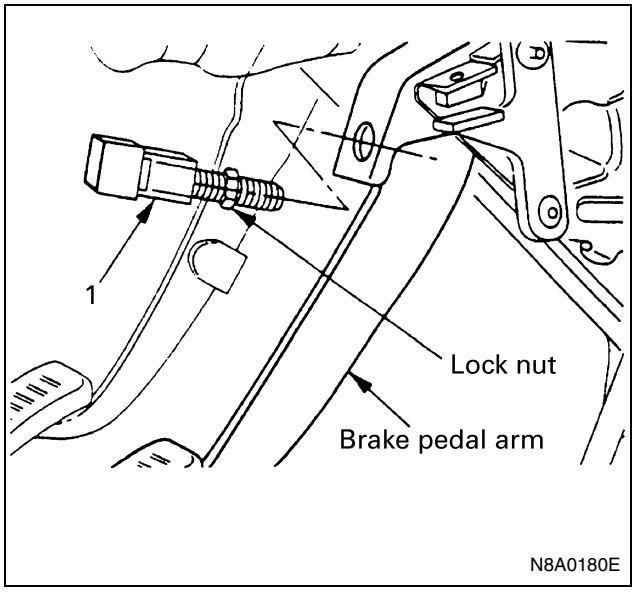


SW position \ Terminal No.	1	2
Depress brake pedal (Push rod out)	○	○
Release brake pedal (Push rod in)		

Removal

Preparation:
Disconnect the battery ground cable.

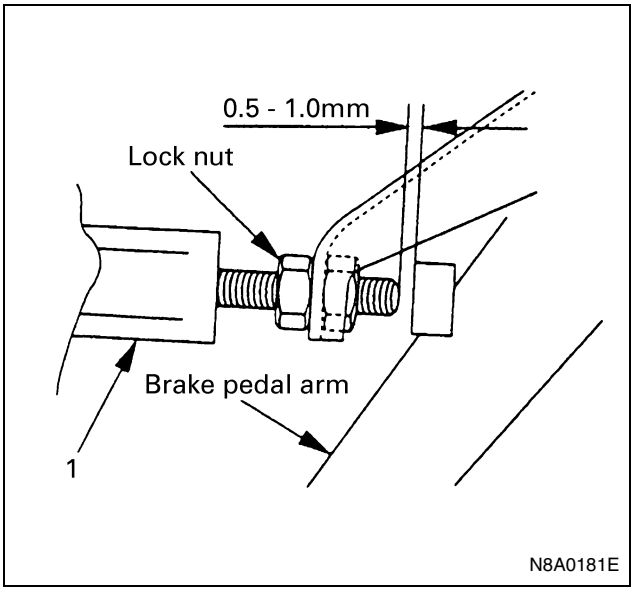
1. Stoplight Switch
   1) Disconnect the connector.
   2) Loosen the lock nut of the switch.
   3) Remove the switch by turning it.



Installation

To install, follow the removal steps in the reverse order, noting the following points.

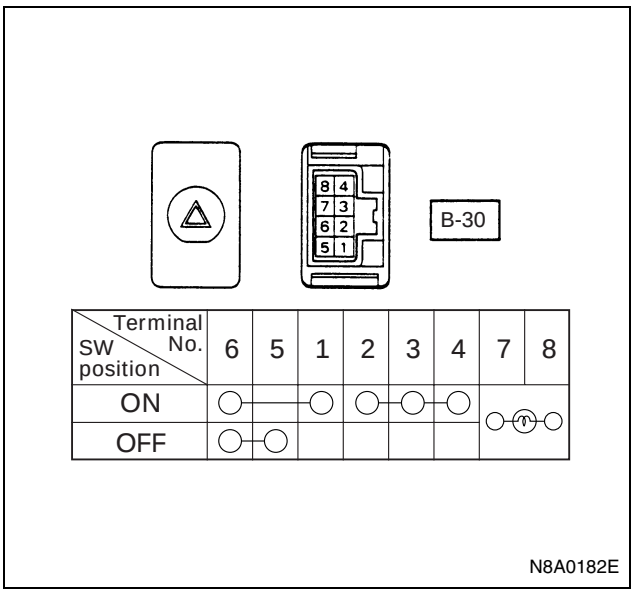
1) Check to see if the brake pedal has been returned by the return spring to the specified position.
2) Turn the stoplight switch clockwise until the tip of the threaded portion of the switch contacts the pedal arm.
3) Turn the switch counterclockwise until the space between the tip of the threaded portion and the pedal arm is 0.5 to 1.0 mm (0.02 — 0.04 in.).



Hazard Warning Switch

Inspection

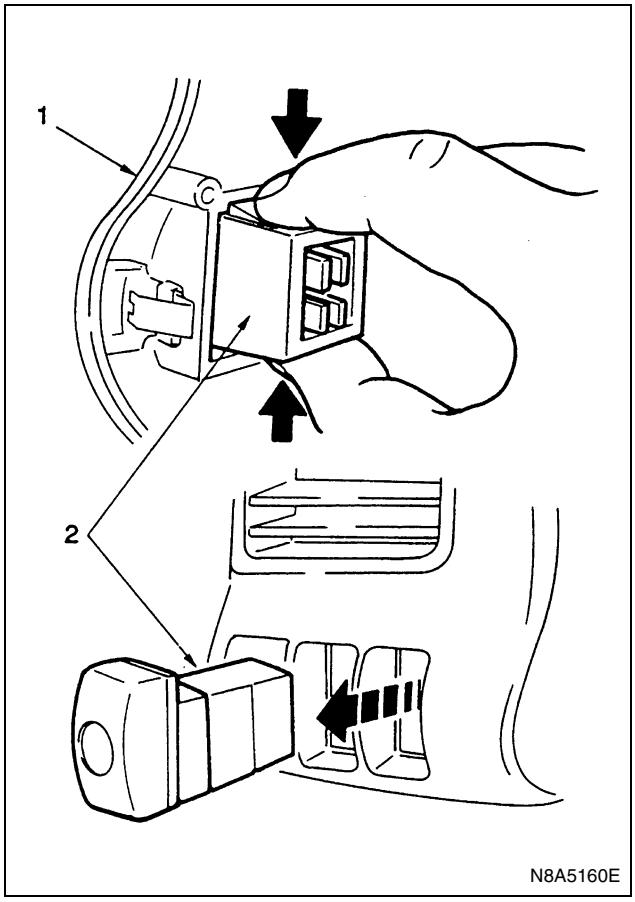
Check the continuity between the terminals of the hazard warning switch.
Repair or replace the switch when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Meter Cluster
   Refer to the “METER AND WARNING/INDICATOR LIGHT” in this section.
2. Hazard Warning Switch
   Release the lock pushing the switch from the back side of the meter cluster.



Installation

To install, follow the removal steps in the reverse order noting the following point.

1. Push the switch with your fingers until locks securely.

Horn, Backup Light and Backup Buzzer

General Description

The circuit consists of the starter switch, horn, horn switch, backup light (Rear combination light), backup light switch, back buzzer and the relay.
When the horn switch is turned on independent of the position of the starter switch, the relay is activated to sound the horn. When the backup light switch turns on with the starter switch on, the backup light will operate.

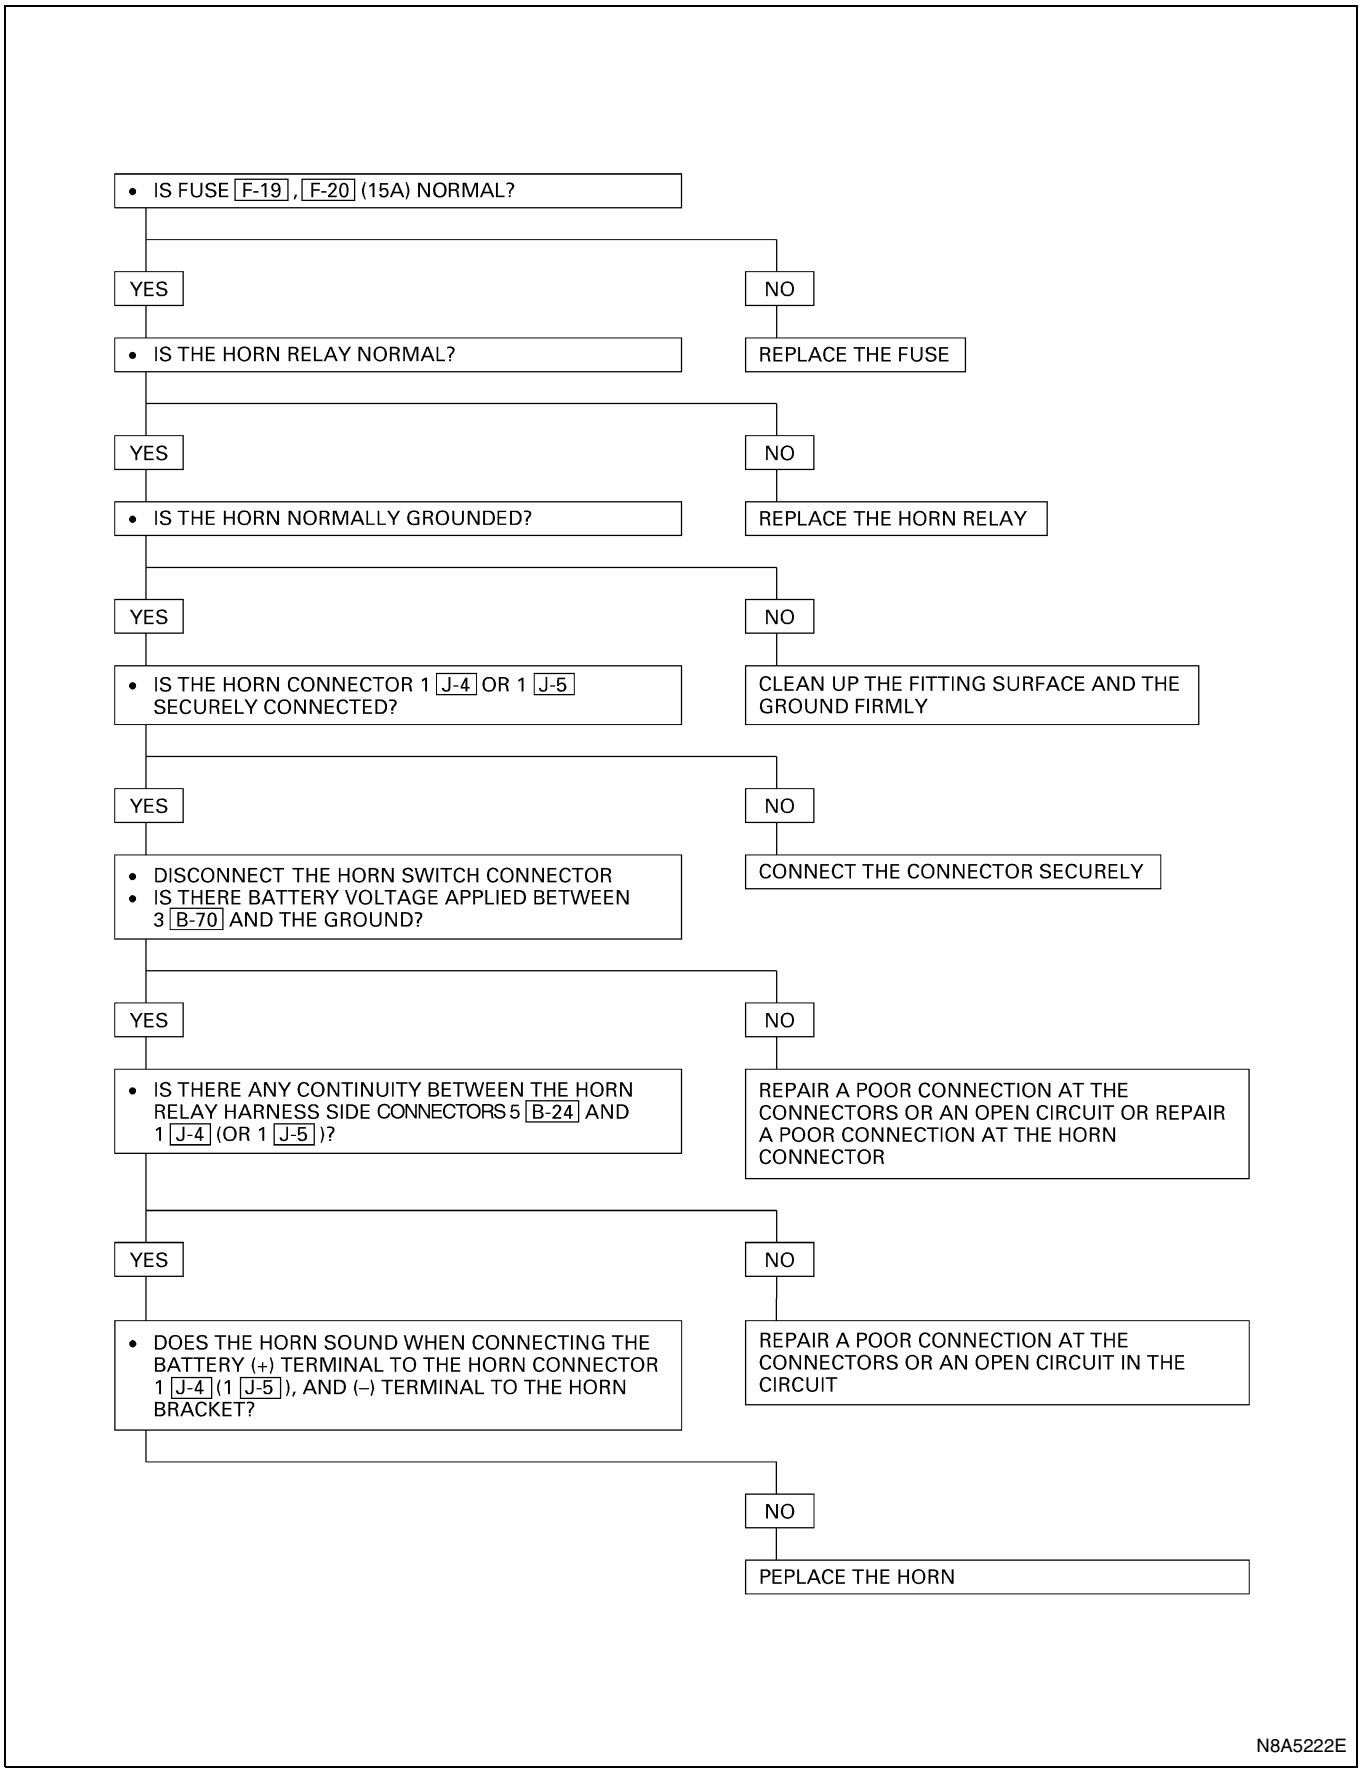
	2-3. Backup light remains on		❍ (1)			

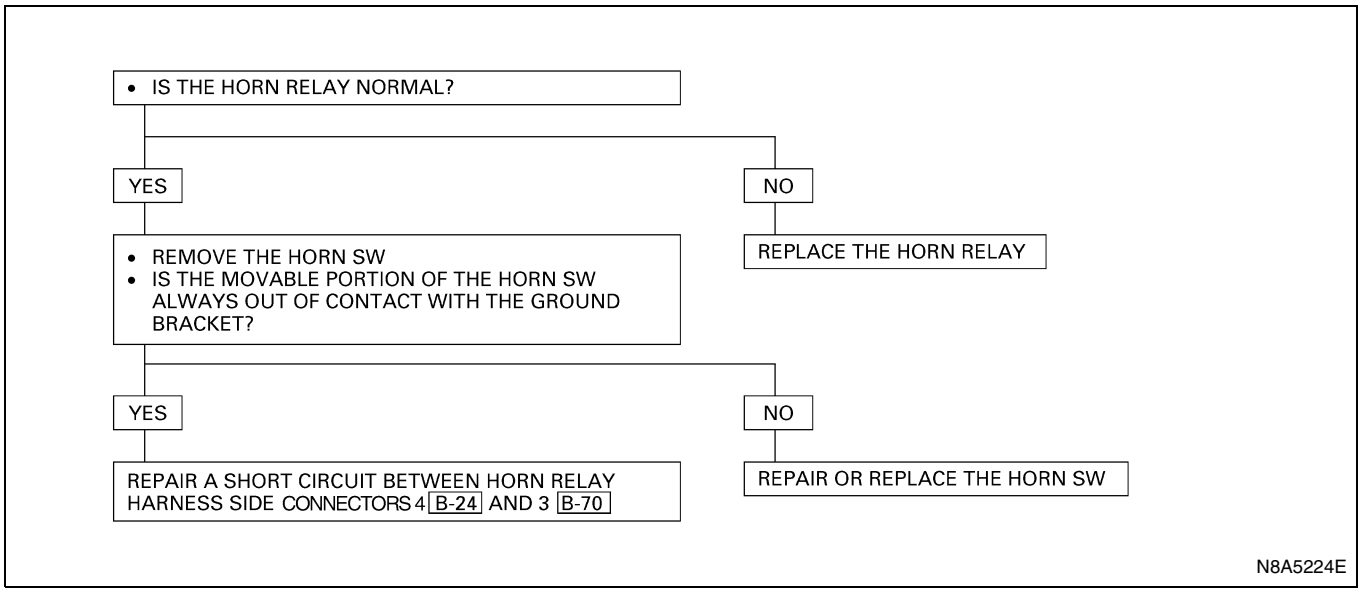
Notice:
Figure in parenthesis “( )” indicates the order of inspection.

1. Horn

1-1. Horn Does Not Sound

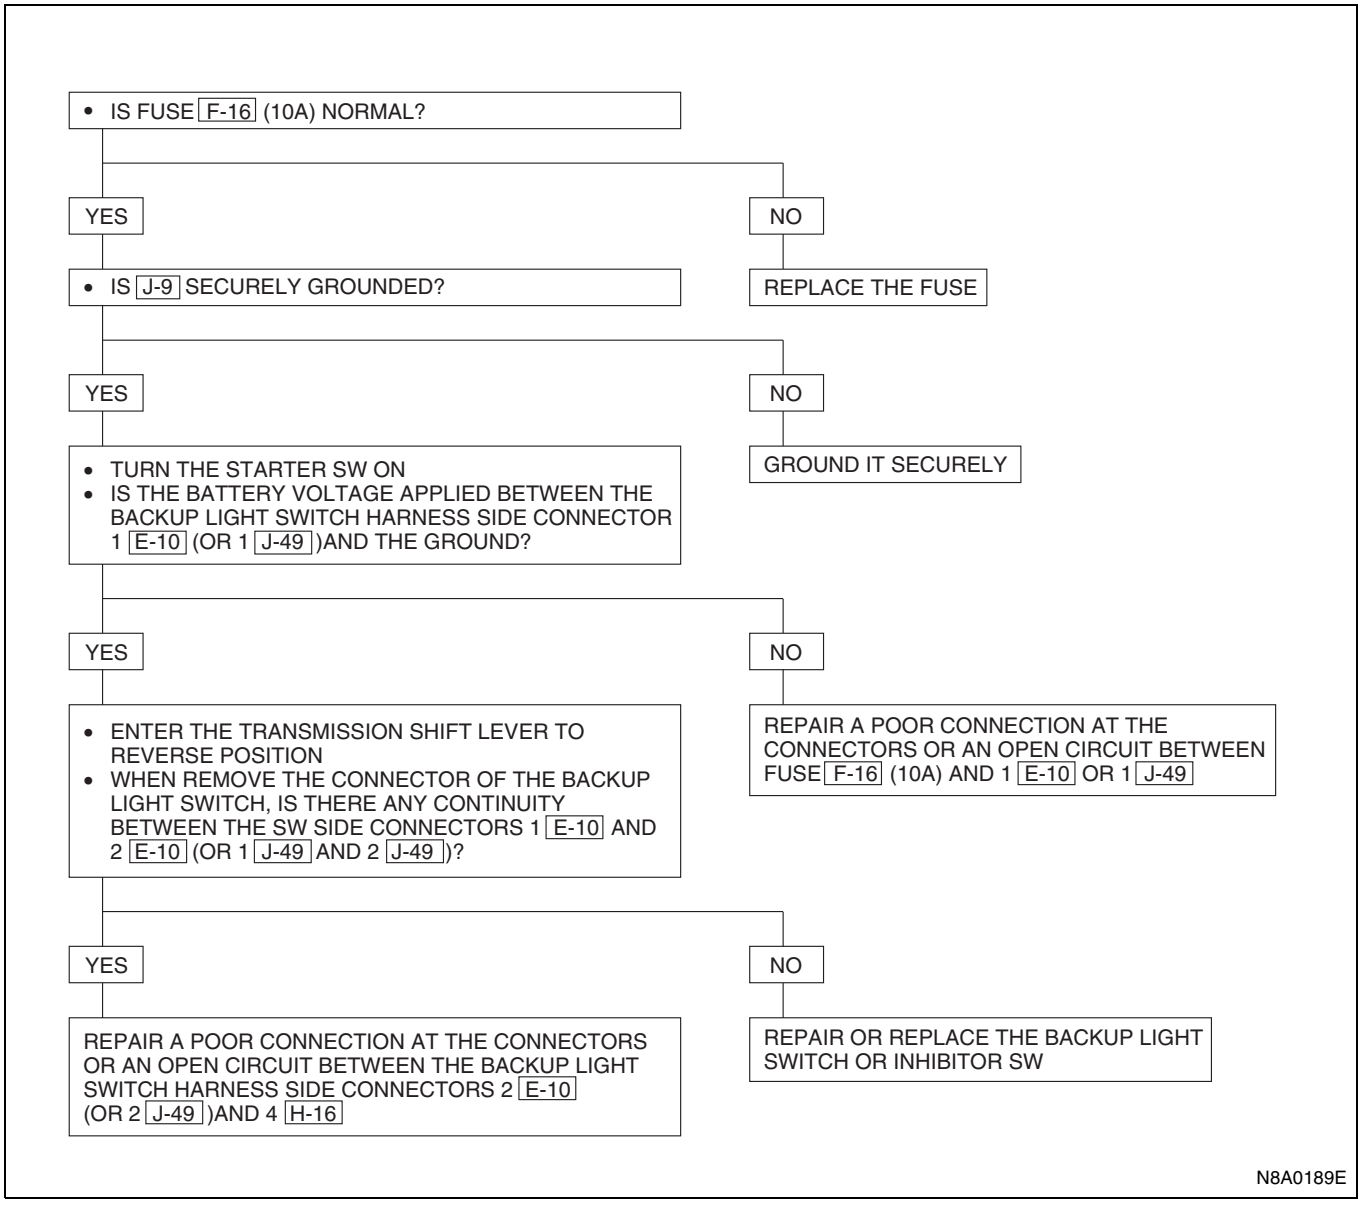


1-2. Horn Does Not Shut Off

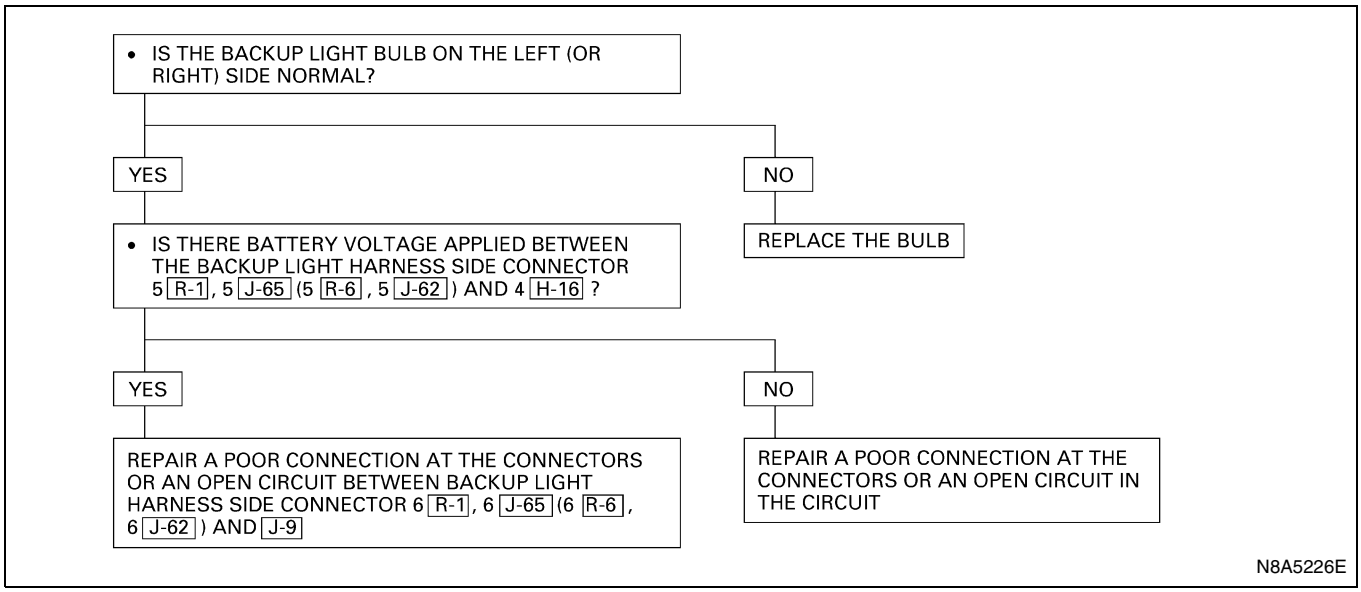


2. Backup Light

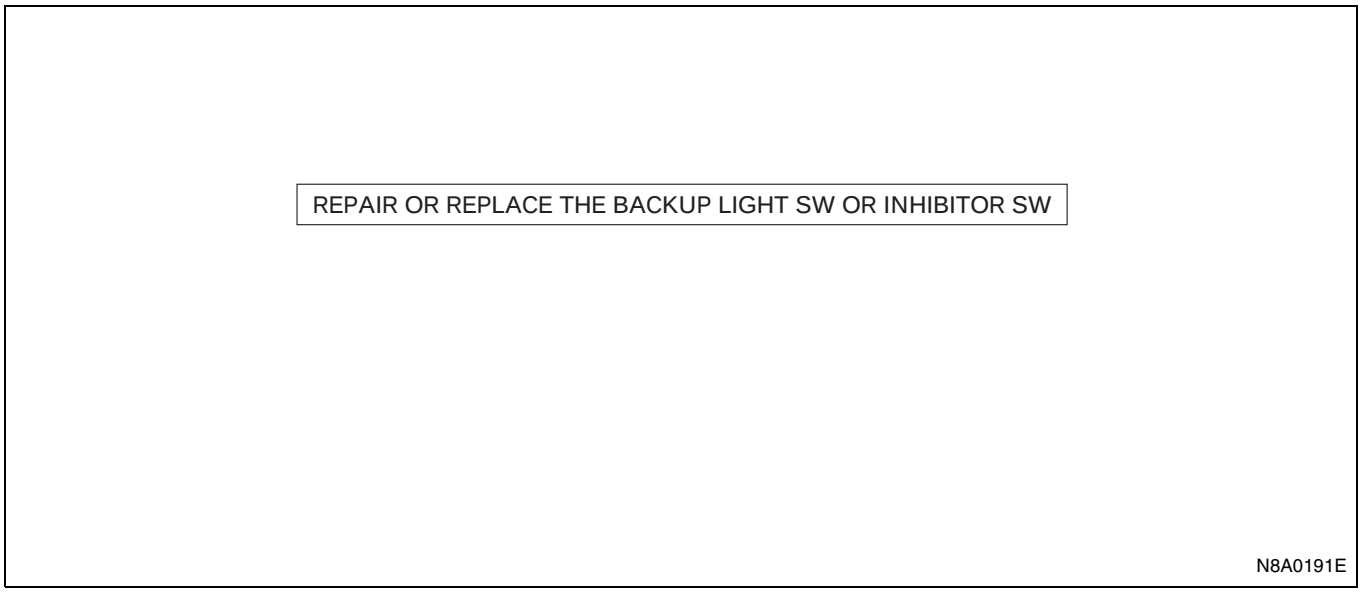
2-1. Backup Lights Inoperative



2-2. Backup Light on the Left (or Right) Side Inoperative



2-3. Backup Light Remains on



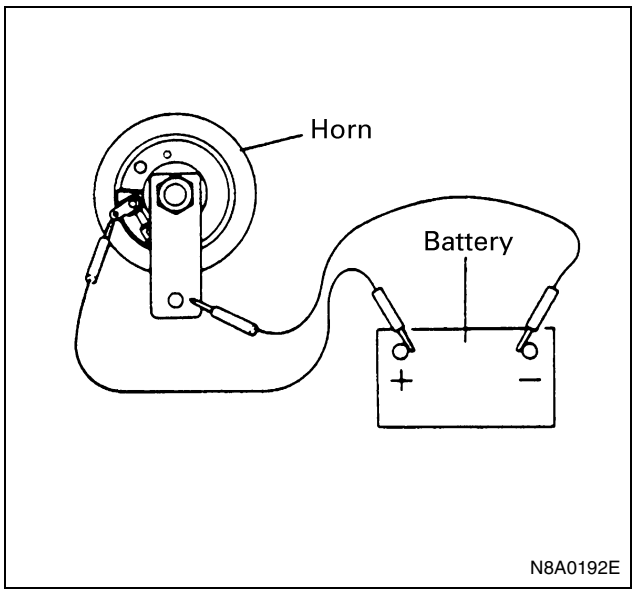
Starter Switch

Refer to “START AND CHARGING” in this section.

Horn

Inspection

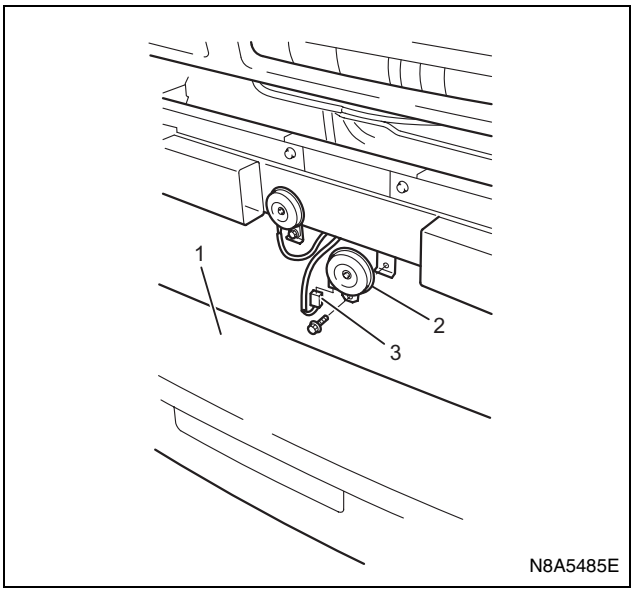
Check to see if horn sound when a battery voltage between horn terminal and the fixing bracket. Repair or replace the horn when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Bumper
   Refer to “BUMPER” in section 2.
2. Horn
   Disconnect the connector (3).



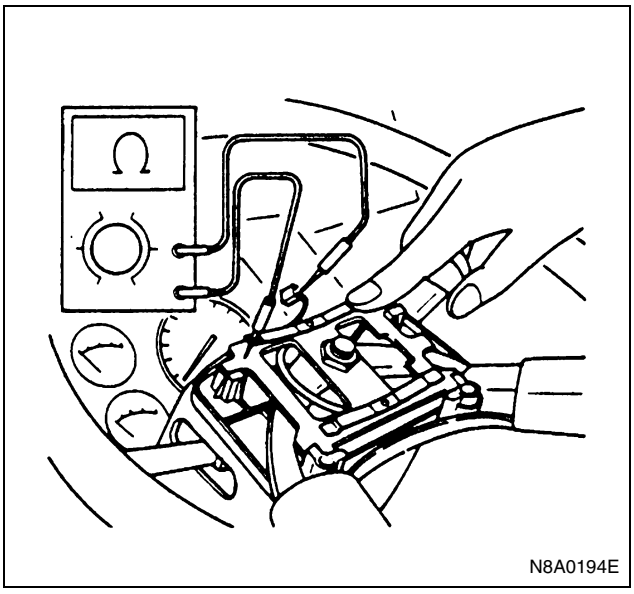
Installation

To install, follow the removal steps in the reverse order.

Horn Switch

Inspection

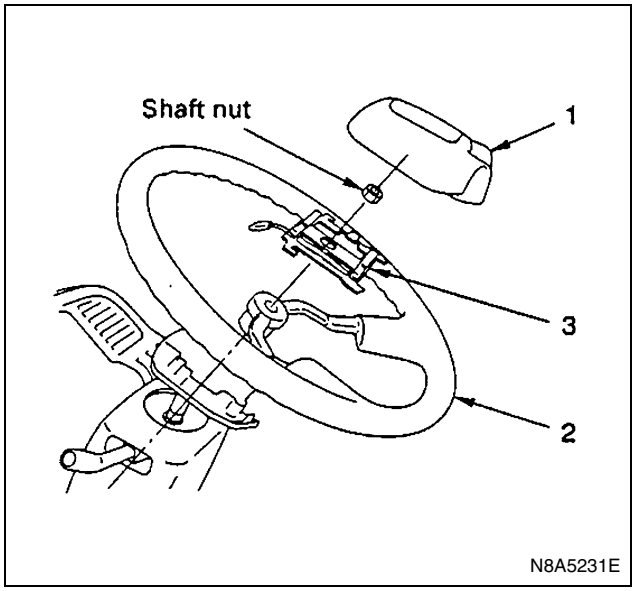
With the contact point of the horn switch pressed to the switch bracket, check the continuity between the connector terminal and the bracket of the switch.
Check the contact condition between horn contact of the combination switch and contact plate of steering wheel.
Repair or replace the switch when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Horn Pad
   1) Hold the horn pad and pull it upward.
2. Steering Wheel
   1) Remove the steering shaft nut.
   2) Remove the steering wheel by using steering wheel remover.
      (Refer to Section 3B4 “STEERING COLUMN” for steering wheel removal steps.)
3. Horn Switch



Installation

To install, follow the removal steps in the reverse order, noting the following point.

1. Tighten the steering shaft nut to the specified torque.

Tighten:
Shaft nut to 49 N·m (5 kg·m / 36 lb·ft)

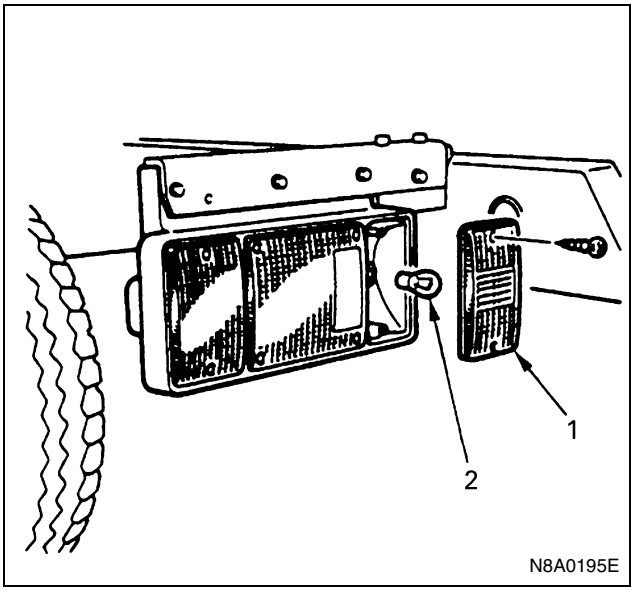
Backup Light Bulb

Removal

Preparation:

Disconnect the battery ground cable.

1. Lens
2. Bulb



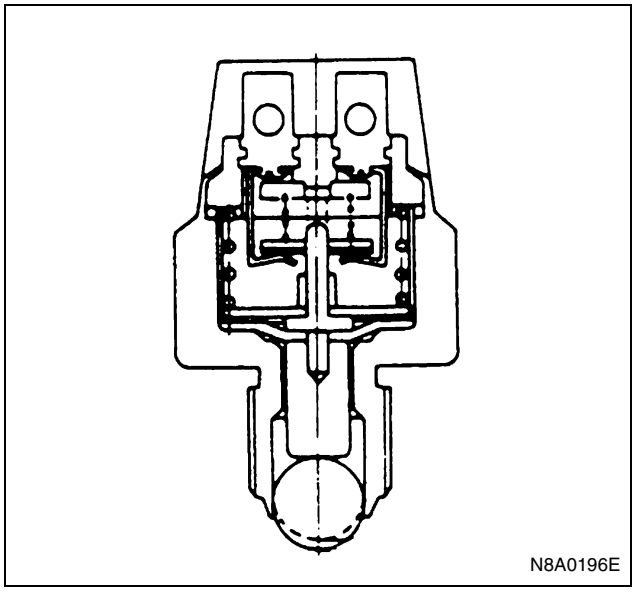
Installation

To install, follow the removal steps in the reverse order.

Backup Light Switch

Inspection

1. With the switch installed to the transmission, check the continuity between the terminals of the switch connectors.
   When the continuity is found between the terminals only with the switch shifted to the reverse position, the switch is normal.
2. When the result of the above inspection is found abnormal, remove the switch from the transmission and conduct a test on the switch alone.
   If the continuity appears between the connector terminals when the ball of the switch is pushed, the switch is normal. (When the ball is released, the continuity disappears.)
3. If there is no continuity with the switch installed to the transmission, even though the switch is found to be normal, then adjust the stroke of the switch by changing the thickness of the switch gasket.



Removal

Preparation:

Disconnect the battery ground cable.

1. Backup Light Switch
   1) Disconnect the connectors.
   2) Remove the switch by turning it counterclockwise.

Installation

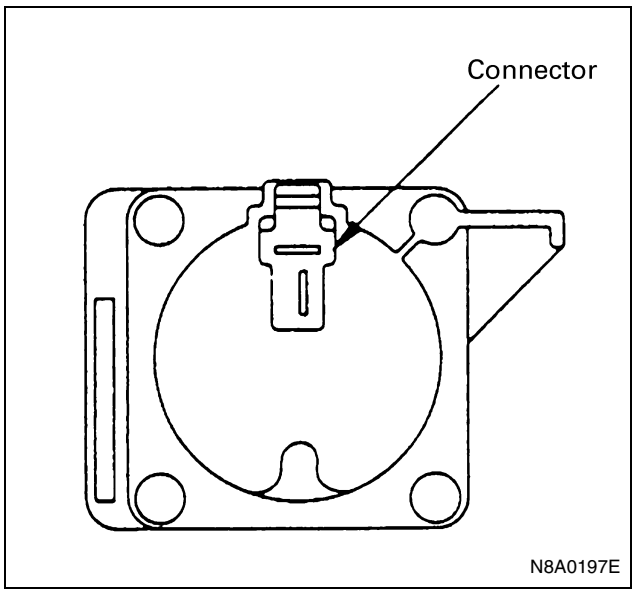
1. Backup Light Switch
   Apply liquid gasket to the screw portion of the switch to prevent oil leak.

Backup Buzzer

Inspection

Apply battery voltage to the backup buzzer connector to check the buzzer sound.

Repair or replace the buzzer when the result of inspection is found abnormal.

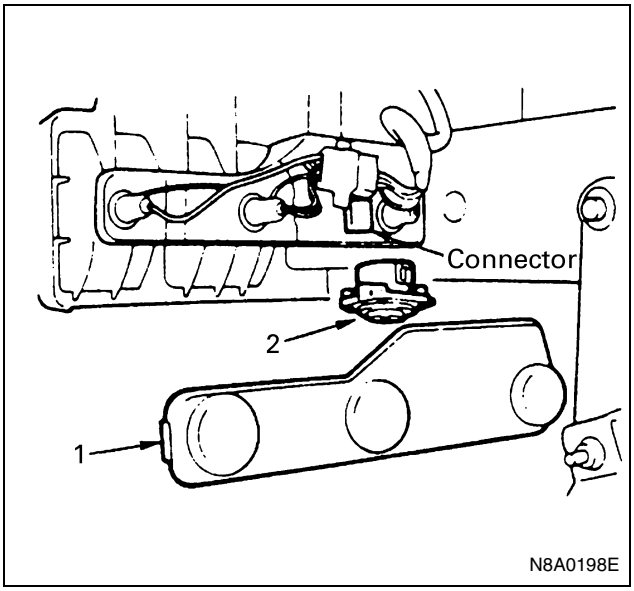


Removal

Preparation:

Disconnect the battery ground cable.

1. Rear Combination Light Cover
2. Backup Buzzer
   1) Remove the rear combination light connector fixing screw.
   2) Remove buzzer fixing screw.
   3) Disconnect the connector.



Installation

To install, follow the removal steps in the reverse order.

Dome Light and Backup Buzzer

General Description

The circuit consists of the starter switch, dome light, dome light switch, door switch, backup light switch and the back-up buzzer.
The dome light lights up when the left or right side door is opened with the switch set at the door mode. It can be lit by operating ON or OFF of the dome light switch.
The dome light can be lit by respective switch independent of the position of the starter switch.
By operating the dome light switch fitted on the instrument panel, the dome light can be lit independent of the switch position of dome light.

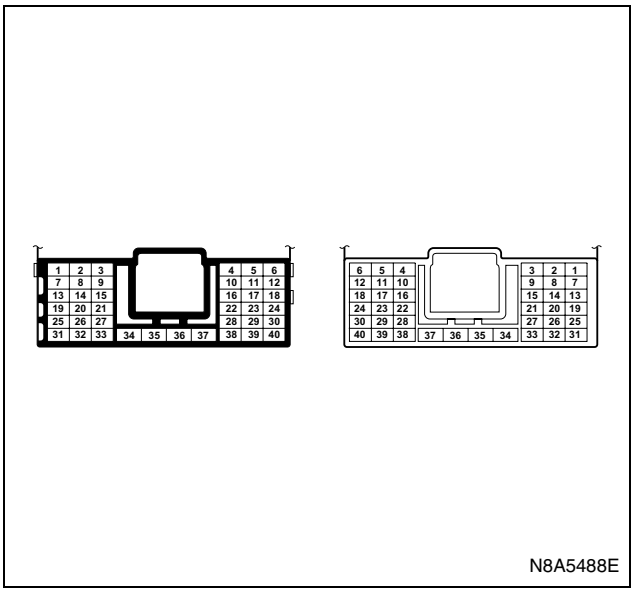
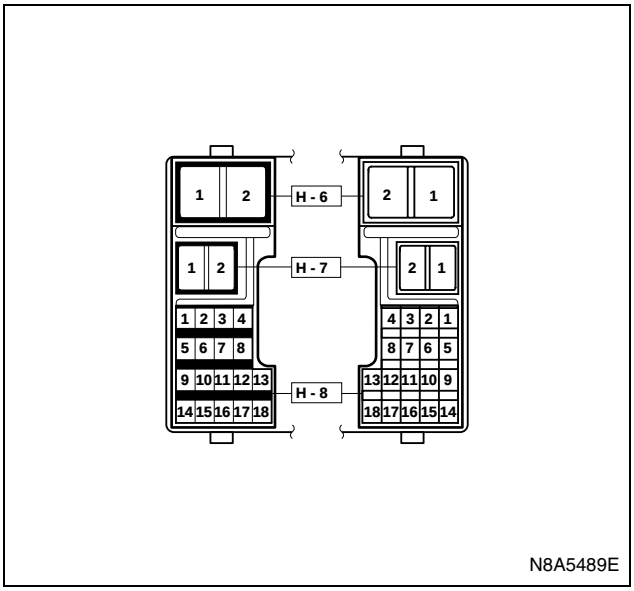
H-5



H-6, H-7



Starter Switch

Refer to “START AND CHARGING” in this section.

Key Cylinder Switch

Refer to “START AND CHARGING” in this section.

Backup Light Switch

Refer to “HORN, BACKUP LIGHT AND BACKUP BUZZER” in this section.

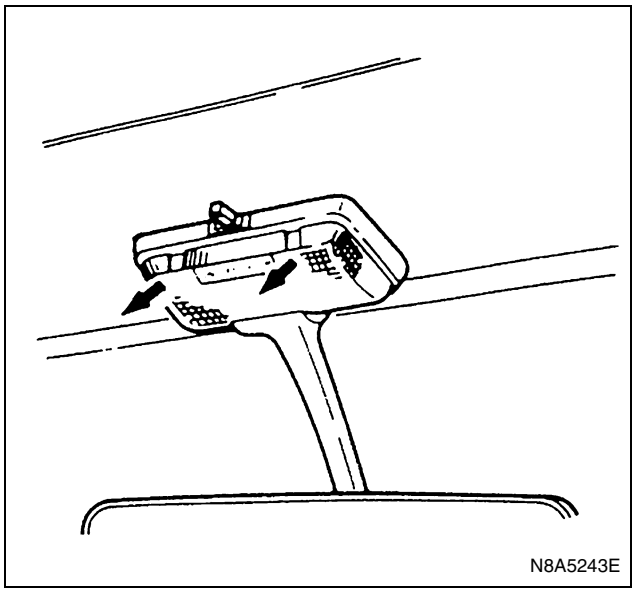
Dome Light Bulb

Removal

Preparation:

Disconnect the battery ground cable.

1. Lens
   Hold the lens and pull it downward.



2. Bulb

Installation

To install, follow the removal steps in the reverse order.

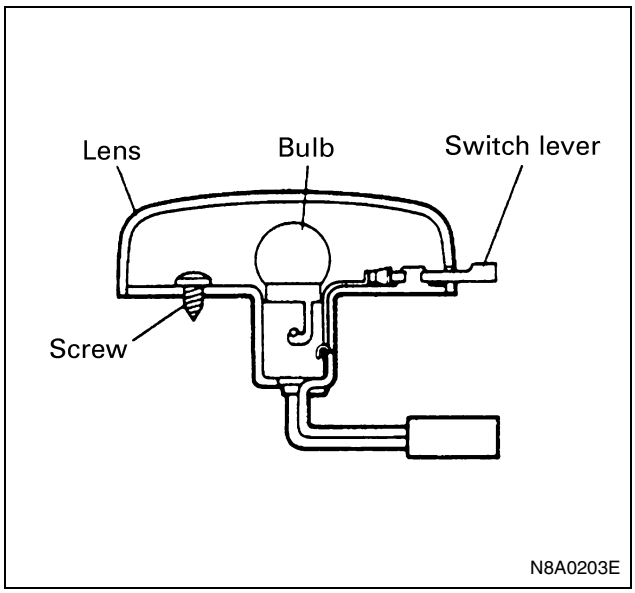
Dome Light Bulb (for Crew Cab)

Removal

Preparation:

Disconnect the battery ground cable.

1. Lens
   Hold the lens and pull it down.
2. Bulb



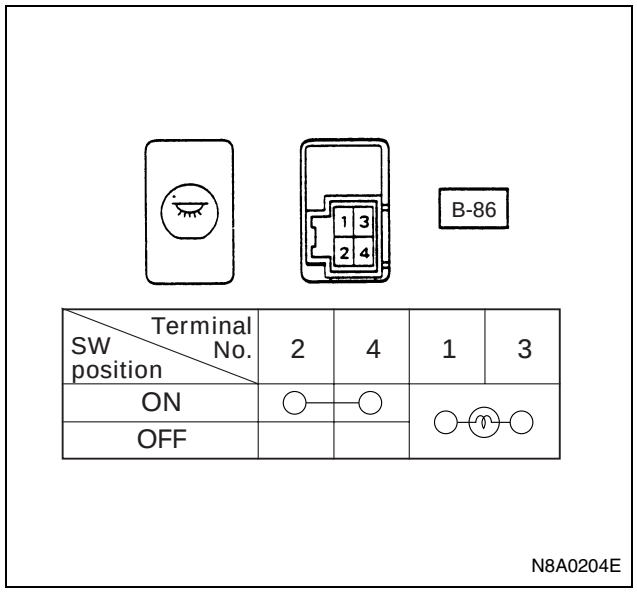
Installation

To install, follow the removal steps in the reverse order.

Dome Light Switch

Inspection

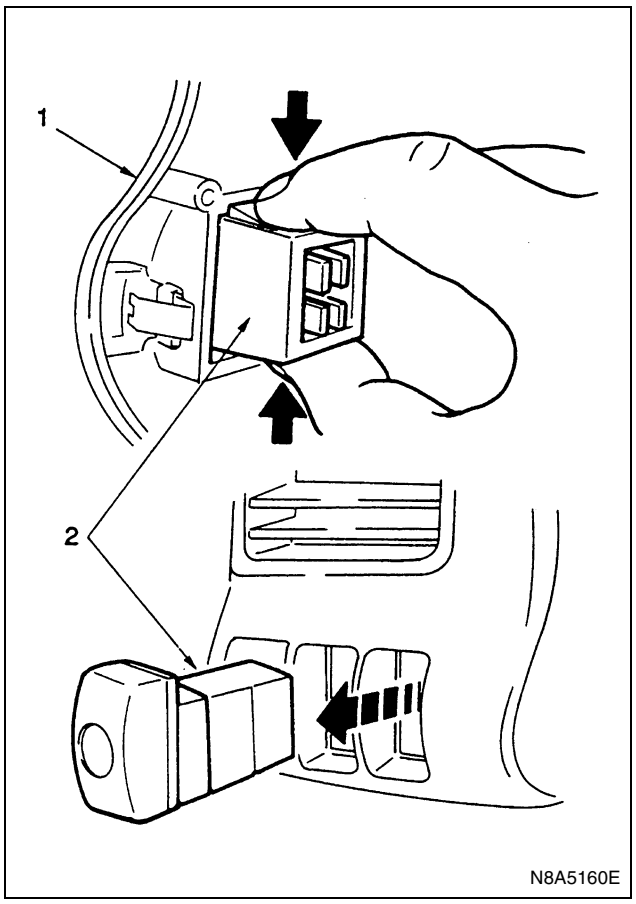
Check the continuity between the dome light switch connector terminals.
Repair or replace the switch when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Meter cluster
   Refer to the “METER AND WARNING/INDICATOR LIGHT” in this section.
2. Dome Light Switch
   Release the lock pushing the switch from the back side of the meter cluster.



Installation

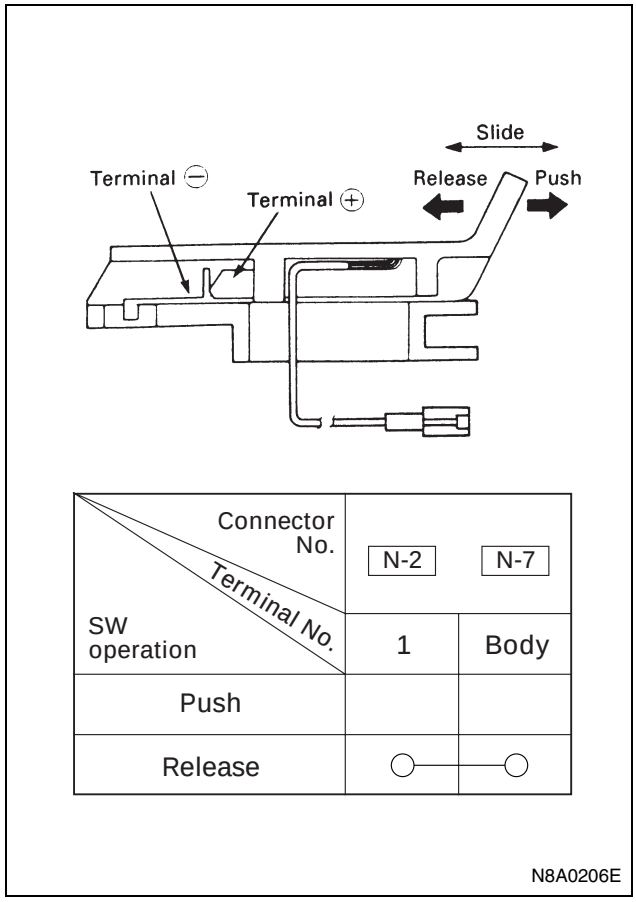
To install, follow the removal steps in the reverse order noting the following point.

1. Push the switch with your fingers until locks securely.

Door Switch

Inspection

Check to see if there is any continuity between the terminals and the body while operating the door switch.
Repair or replace the switch, when the result of inspection is found abnormal.

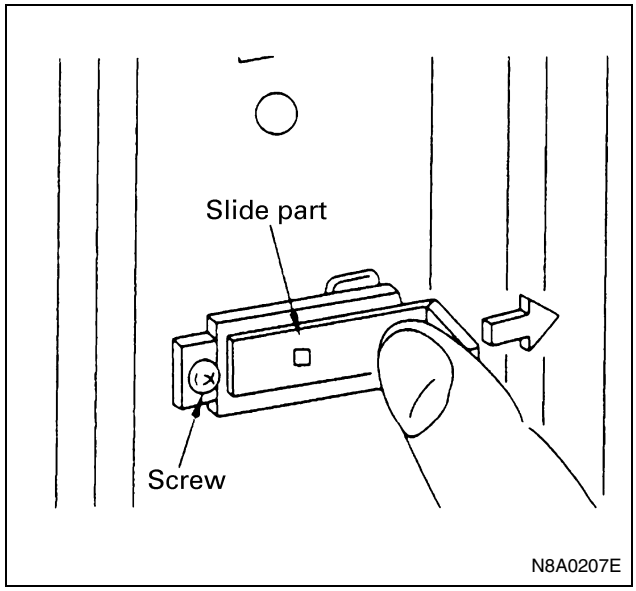


Removal

Preparation:

Disconnect the battery ground cable.

1. Door Switch
   1) Remove the screw.
   2) Disconnect the connector of the switch.

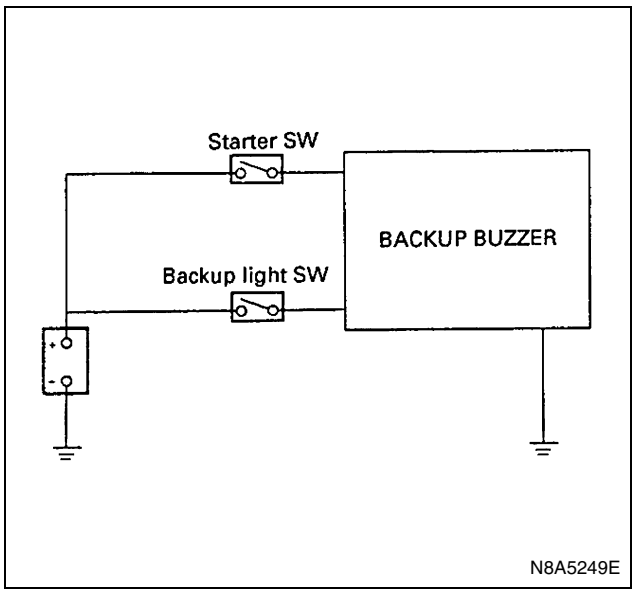


Installation

To install, follow the removal steps in the reverse order.

Backup Buzzer

Warning function	Operative conditions
Warning to reverse driving	When the transmission shift lever is engaged to the reverse position.



Inspection of the Buzzer Circuit

Disconnect the backup buzzer connector, measure the continuity and voltage between the harness side connector terminals.

Harness side

Terminal No.	Wire color	Connected to	Item to be checked	Connecting terminal	Checking conditions	Standard

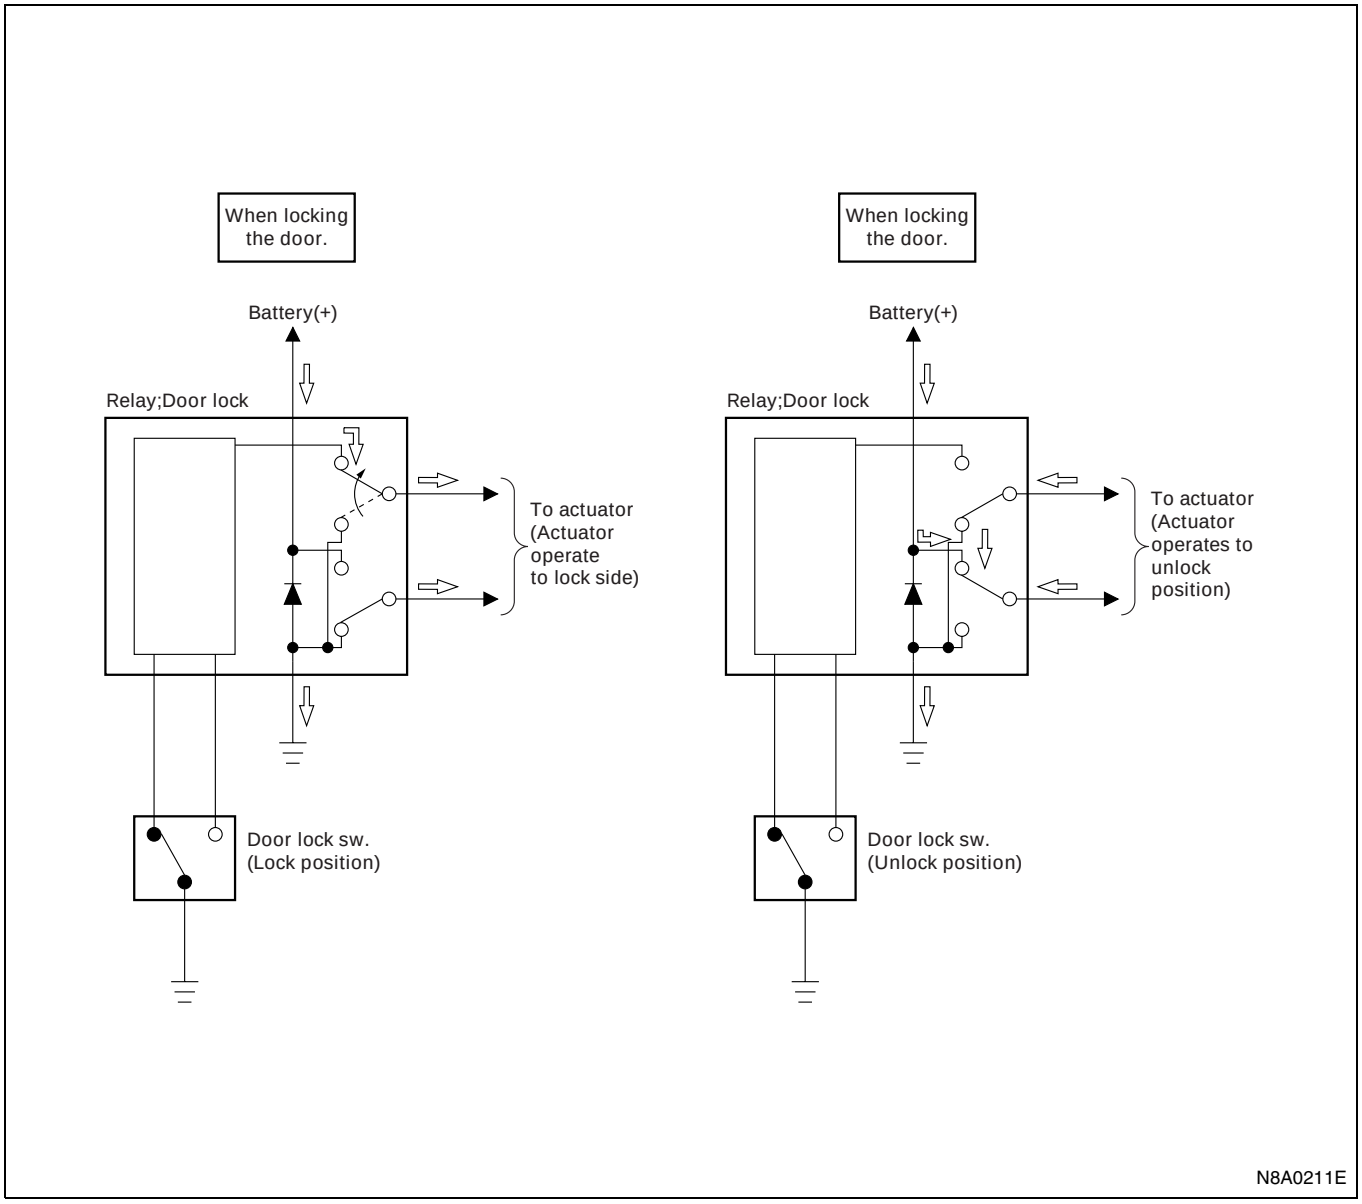
Power Door Lock

General Description

The circuit consists of the door lock switch, actuator for the front passenger door, rear doors and the door lock controller.
The door lock controller is always provided with battery voltage. The key or the inside lock knob on the driver's door can activate the lock mechanism of all the doors.
When the driver's door lock switch is turned on, current flows for about one second to the door lock actuator of each door connected in parallel with the controller to activate the actuator to lock and unlock the doors.

Operation of Door Lock Controller



Notice:
Arrow marks indicate the direction of current.

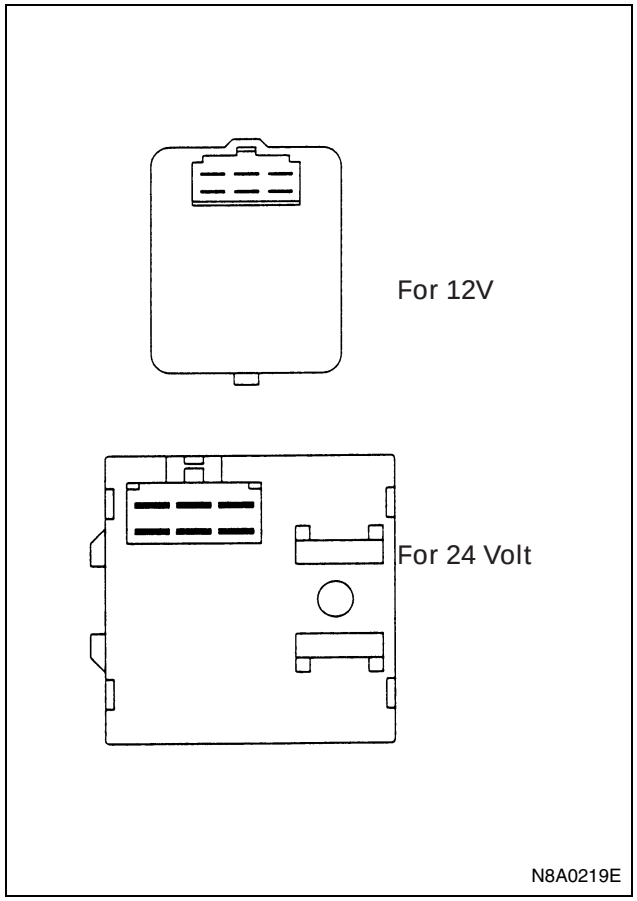
N8A0218E

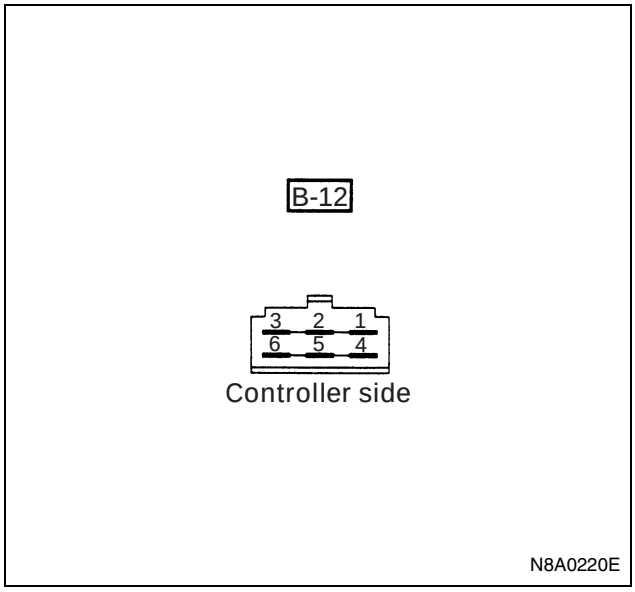
Door Lock Controller

The door lock controller sends out to each door lock actuator the lock/unlock signals received from door lock switch of driver seat side.



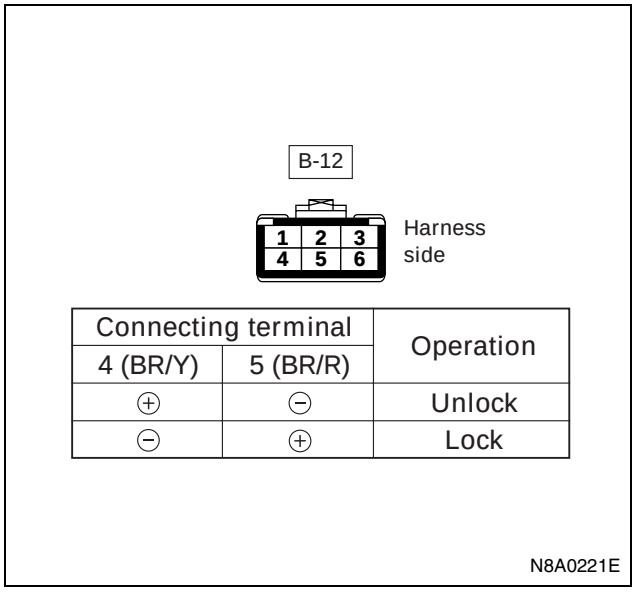
Inspection

Remove the connector of the door lock controller, and check the continuity and the voltage between the controller side connector terminals.
(Connect the (+) terminal of the battery to 6 B-12 and the (–) terminal to 3 B-12.)
3 B-12 — 5 B-12.....Continuity
3 B-12 — 4 B-12.....Continuity
(Then, ground 2 B-12.)
5 B-12.....Voltage for approx. 1 second
(Disconnect the ground of 2 B-12, and ground 1 B-12.)
4 B-12.....Voltage for approx. 1 second
Replace the controller when the result of inspection is found abnormal.



Door Lock Operation Test

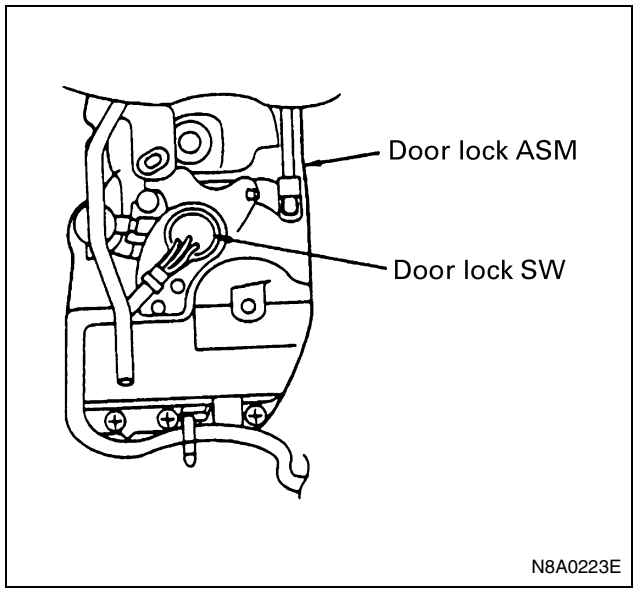
After confirming that there is continuity between the harness side connector terminals 4 B-12 and 5 B-12 of the door lock controller, apply battery voltage to each of the terminals to conduct the operation test.
When the door lock will not operate, check the door lock actuator for any trouble.



Connecting terminal		Operation
4 (BR/Y)	5 (BR/R)	
⊕	⊖	Unlock
⊖	⊕	Lock

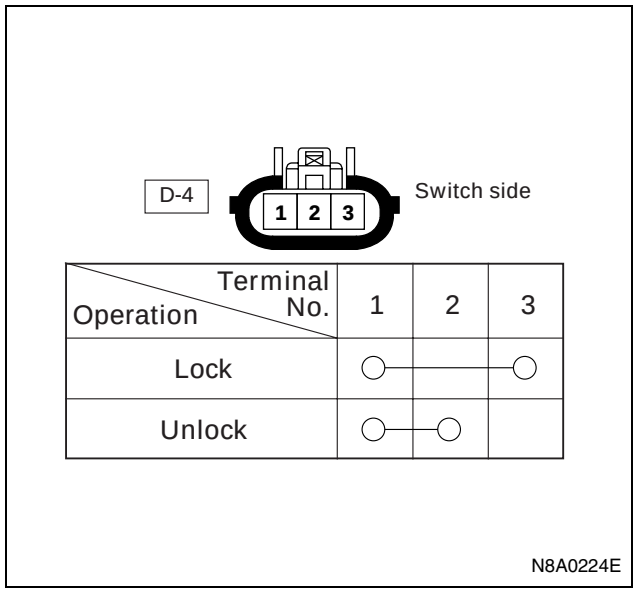
Door Lock Switch (Driver Seat Side)

The door lock switch on the driver's door is connected with the door lock cylinder and the inside lock knob with a rod. The switch sends lock/unlock signals to the door lock controller.



Inspection

Check to see if there is any continuity between the connector terminals of the door lock switch.
Replace the switch when the result of inspection is found abnormal.

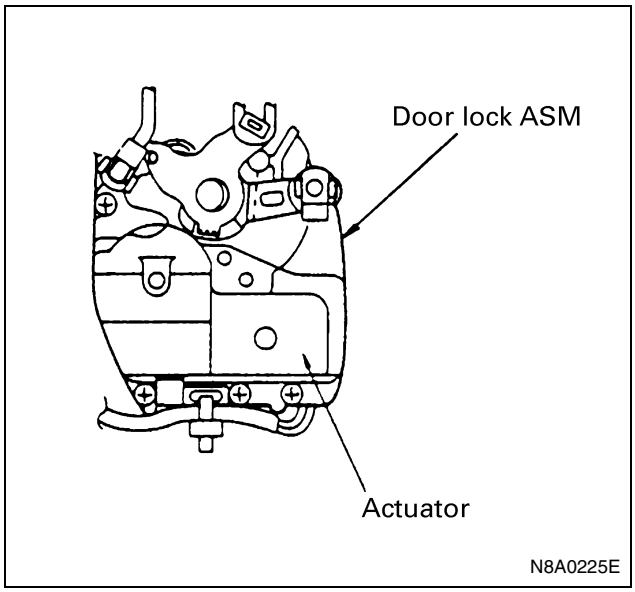


Removal and Installation

Refer to Section 2 "CAB AND FRAME" for "DOOR LOCK ASSEMBLY".

Door Lock Actuator

Receiving forward or reverse current from the door lock controller, the door lock actuator locks or unlocks the door with the rod connected to the door lock mechanism.



Inspection of the Door Lock Actuator

Apply the battery voltage to the connector terminals of the door lock actuator to check the operation.
When the door lock actuator is checked on the vehicle and there is no continuity, and when the door lock actuator itself is checked and no trouble is found, check the circuit between the door lock actuator and the door lock controller for any failure.

Unlock	⊕	⊖	⊖	⊕	⊖	⊕

N8A5267E

Removal and Installation

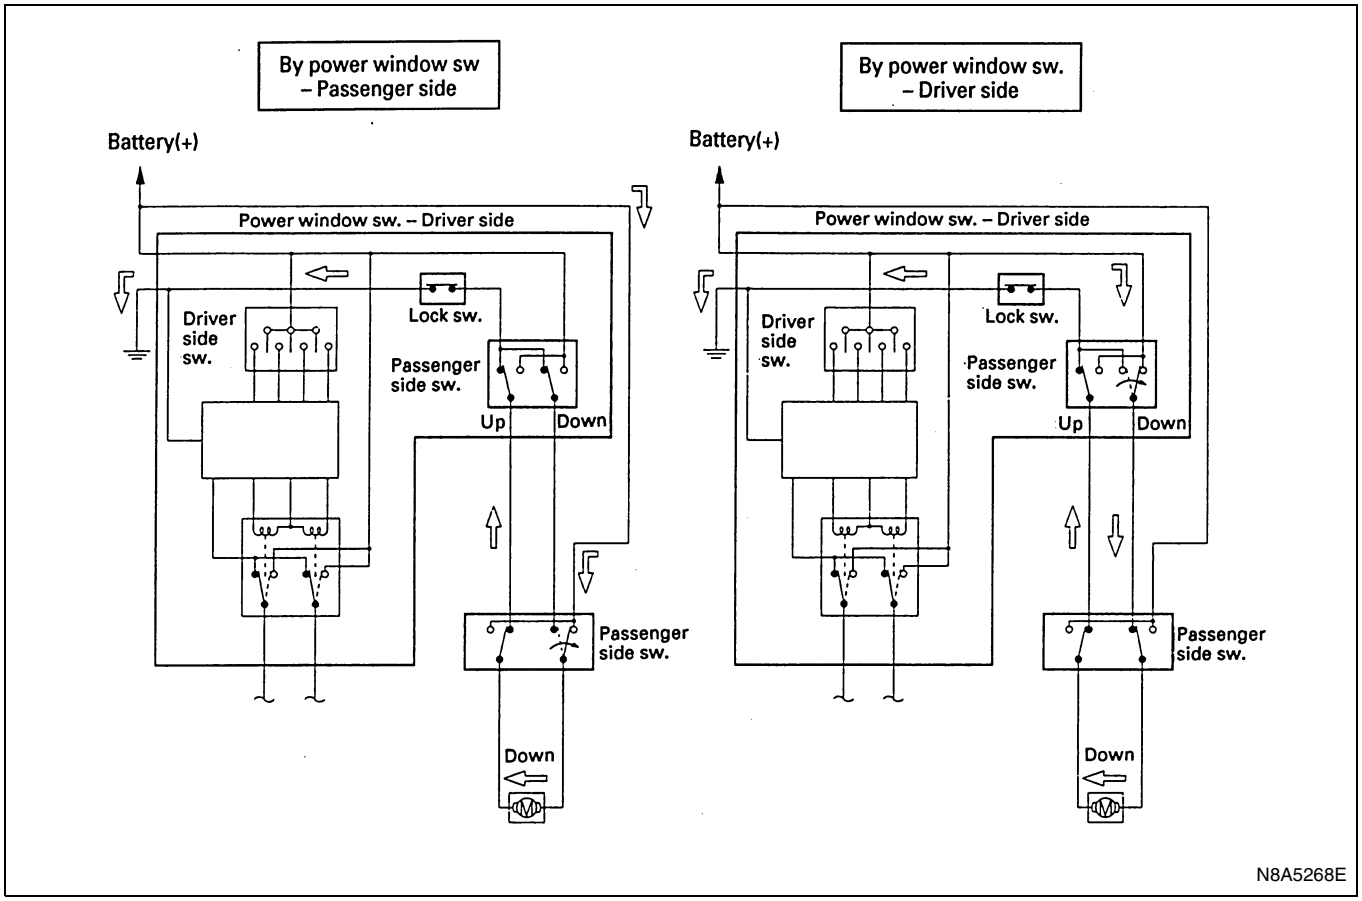
Refer to Section 2 “CAB AND FRAME” for “DOOR LOCK ASSEMBLY”.

Power Window

General Description

The circuit consists of the starter switch, power window switch for each of the windows and power window motor.
When the starter switch is turned on, the battery voltage is applied to each of the power window switches through the circuit breaker and the power window relay on the circuit.
By operating the switches of each window to select “UP” or “DOWN”, the revolving direction of the power window motor changes to open or close the window.
The driver’s power window switch has a built-in one-touch operating circuit which allows to automatically open the window by operating the switch to the AUTO position.
When the driver’s power lock switch at the driver side is depressed, the power source to the passenger’s power window switches will be shut off and passenger’s side power window motor will not operate if the switch is operated.

Operation of Passenger Side Window



Notice:
Arrow marks indicate the direction of current.

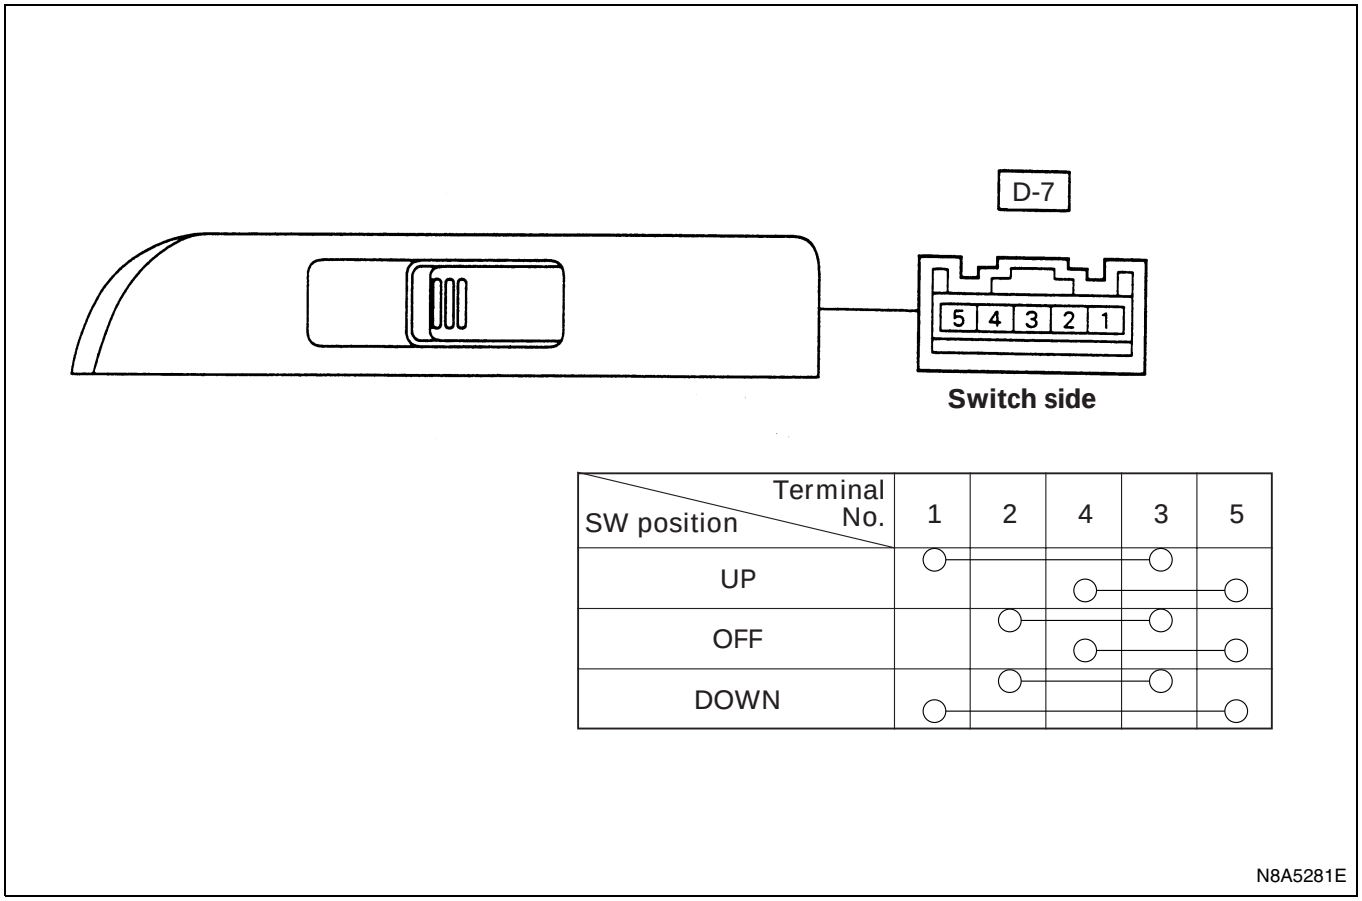
5	BR/Y	Passenger side motor	Continuity (Resistance)	5-3	–	Continuity

N8A5280E

Inspection

Check the continuity between the connector terminals of the switch.

Repair or replace the switch when the result of inspection is found abnormal.

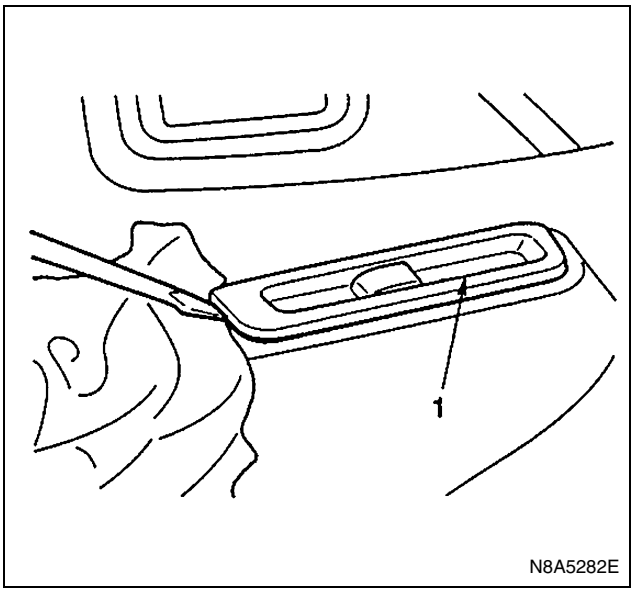


Removal

Preparation:

Disconnect the battery ground cable.

1. Switch
   1) Insert the screw driver to the cut off portion to remove the switch.
   2) Disconnect the connector.



Installation

To install, follow the removal steps in the reverse order.

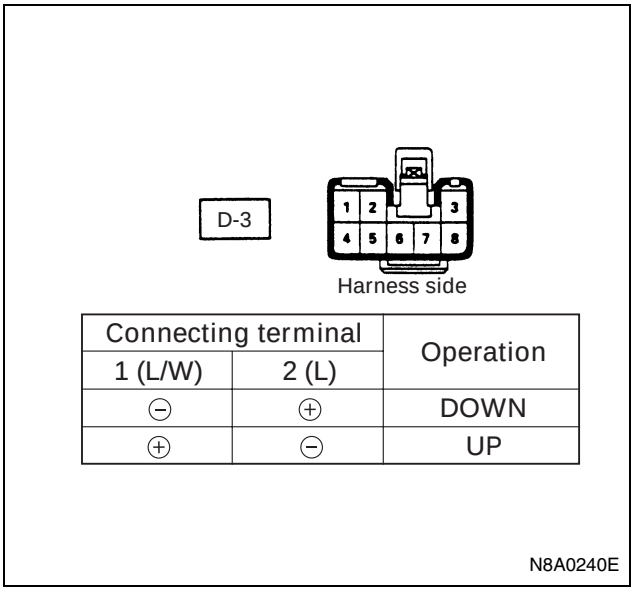
Driver Seat Side Power Window Motor

Inspection

Before checking to see if the motor functions correctly, be sure to check the circuit through the connector D-3 of the driver's power window switch.

If the motor does not operate smoothly, either the motor or the circuit between the switch and the motor is defective.

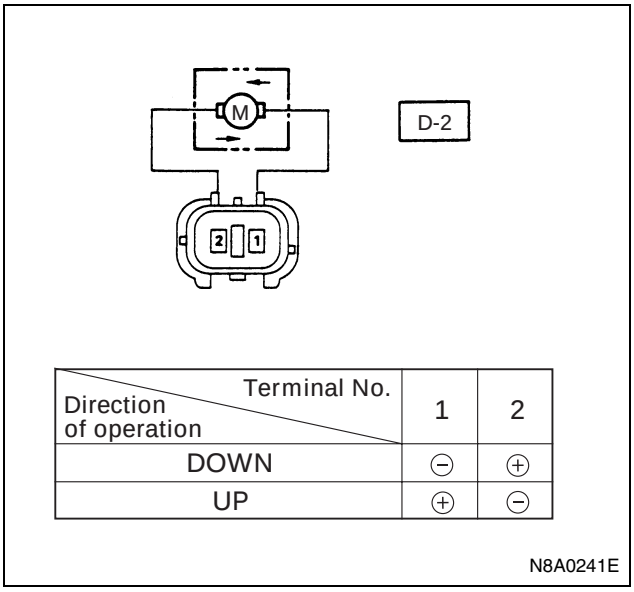
1. Circuit inspection of the driver side window switch
   Disconnect the switch connector and apply battery voltage to the harness side connector terminals to check its function.



Connecting terminal		Operation
1 (L/W)	2 (L)	
⊖	⊕	DOWN
⊕	⊖	UP

N8A0240E

2. Inspection of the driver seat side motor
   Remove the motor connector and apply battery voltage to the motor side connector terminals to check its function.
   Replace the motor when the result of inspection is found abnormal.



Direction of operation \ Terminal No.	1	2
DOWN	⊖	⊕
UP	⊕	⊖

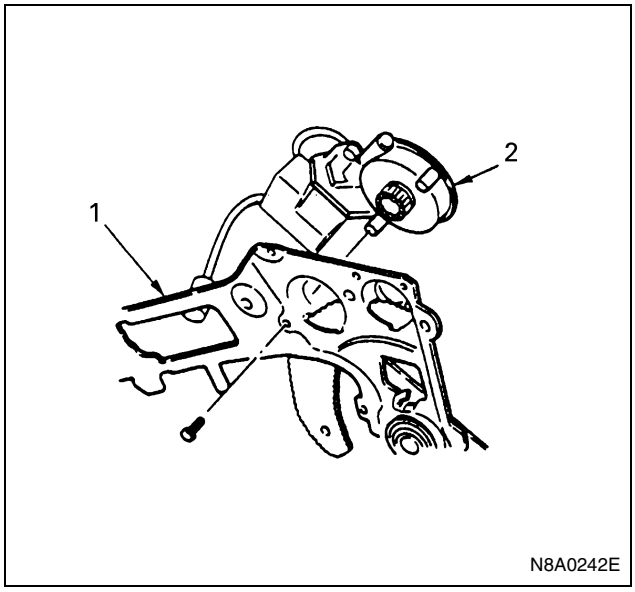
N8A0241E

Removal

Preparation:

Disconnect the battery ground cable.

1. Window Regulator Assembly
   Refer to Section 2 for Window Regulator and Glass.
2. Power Window Motor
   Remove three screws.



N8A0242E

Installation

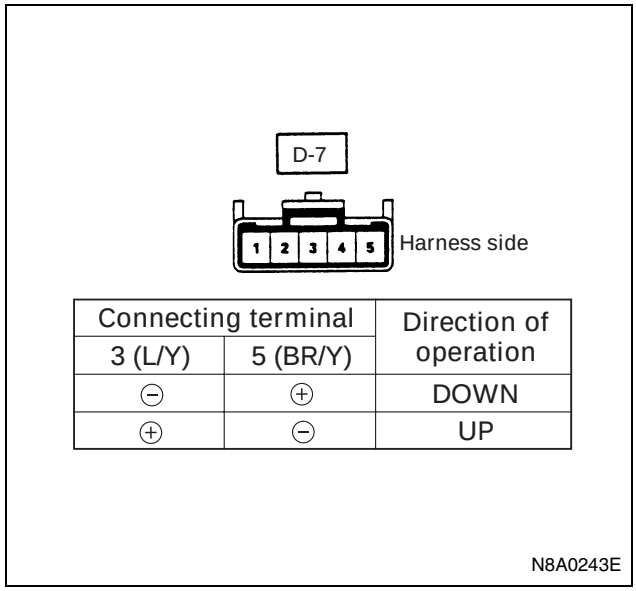
To install, follow the removal steps in the reverse order.

Front Passenger Seat Side Power Window Motor

Inspection

Before checking to see if the motor functions correctly, be sure to check the circuit through the front passenger's switch connector D-7 and the driver's power window switch connector D-3.
If the motor does not operate smoothly, either the motor or the circuit between the switch and the motor is defective.

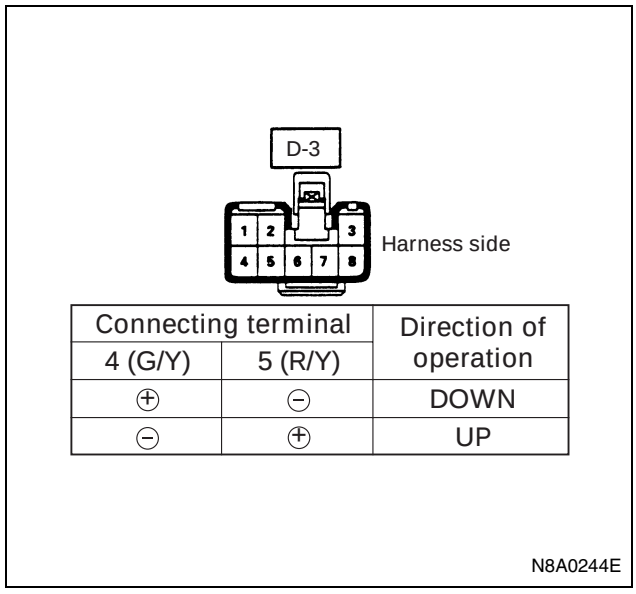
1. Circuit inspection of the front passenger seat side window
   Disconnect the switch connector and apply battery voltage to the harness side connector terminals to check its function.



Connecting terminal		Direction of operation
3 (L/Y)	5 (BR/Y)	
⊖	⊕	DOWN
⊕	⊖	UP

N8A0243E

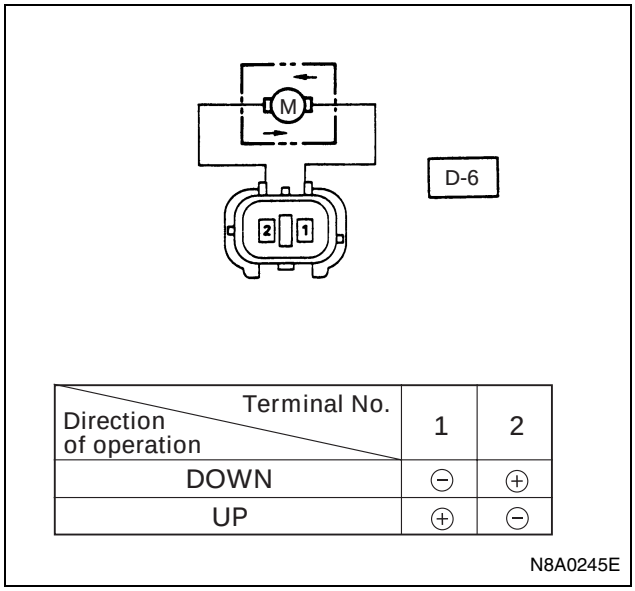
2. Circuit inspection of the driver seat side switch
   Disconnect the switch connector and apply battery voltage to the harness side connector terminals to check its function.



Connecting terminal		Direction of operation
4 (G/Y)	5 (R/Y)	
⊕	⊖	DOWN
⊖	⊕	UP

N8A0244E

3. Inspection of the front passenger window motor
   Disconnect the motor connector and apply battery voltage to the motor side connector terminals to check its function.
   Repair or replace the motor when the result of inspection is found abnormal.



Direction of operation \ Terminal No.	1	2

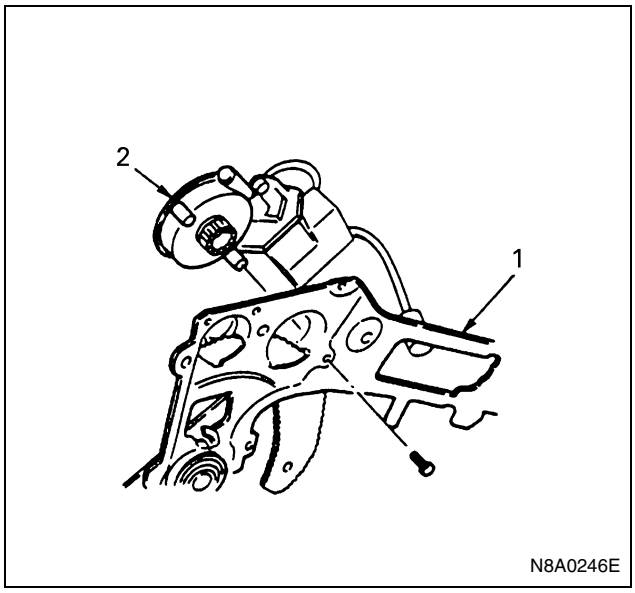
UP	⊕	⊖

N8A0245E

Removal

Preparation:
Disconnect the battery ground cable.

1. Window Regulator Assembly
   Refer to Section 2 for Window Regulator and Glass.
2. Power Window Motor
   Remove three screws.



N8A0246E

Installation

To install, follow the removal steps in the reverse order.

Windshield Wiper and Washer

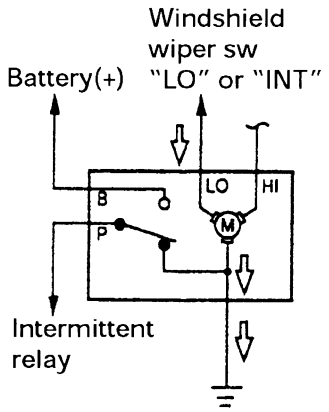
General Description

The circuit consists of the starter switch, windshield wiper & washer switch, wiper motor, washer motor and the intermittent relay.
When the wiper & washer switch is turned on with starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.
The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The intermittent relay is used to control motion of the wiper.

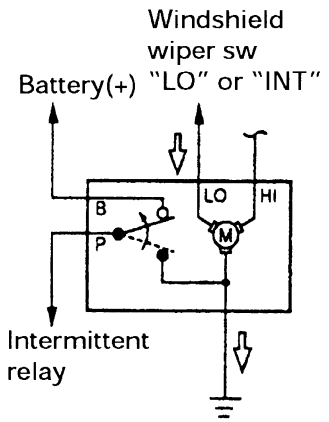
Operation of Windshield Wiper Motor

(When wiper "LO" or "INT" position)

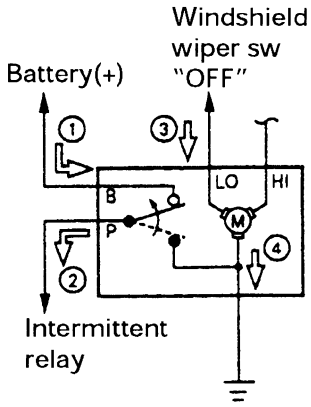
1. Condition of wiper switch is "LO"or "INT"position (Wiper motor is starting to operate)



2. Condition of wiper motor is operating



3. Condition of wiper switch is just "OFF" (Wiper motor is still operating until auto-stop position)



4. Wiper motor stops at auto-stop position

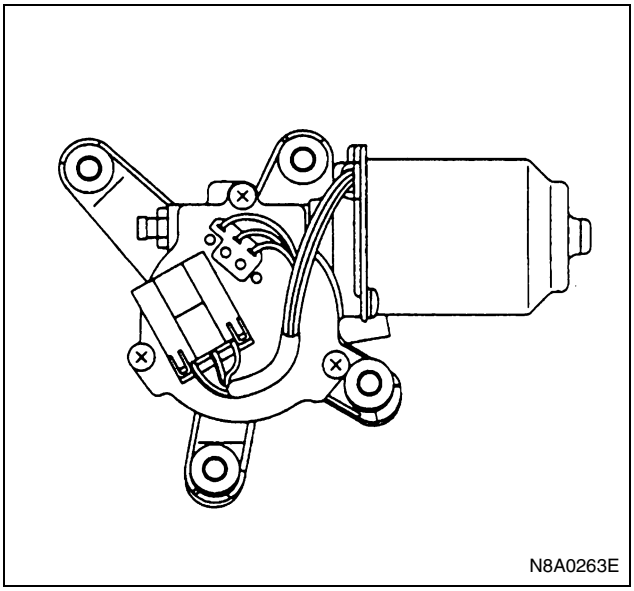
N8A5311E

Removal and Inspection

Refer to “HEADLIGHT, FOG LIGHT AND CORNERING LIGHT” in this section.

Windshield Wiper Motor



N8A0263E

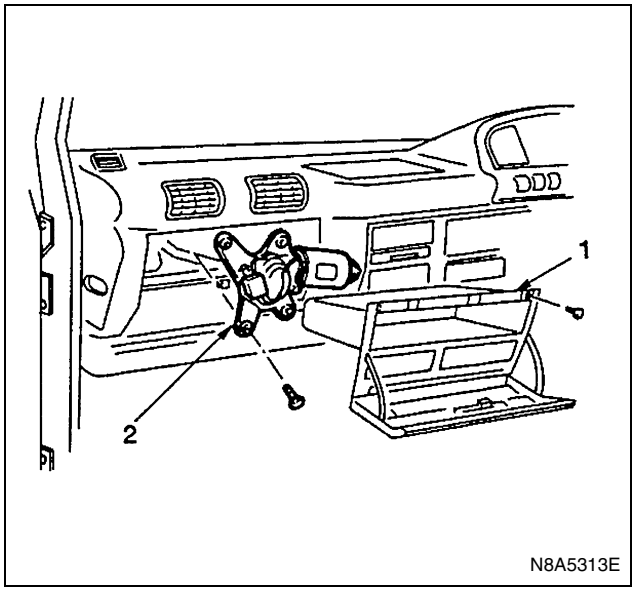
Inspection

1. Operation in low speed
   With the motor connector terminal 2 B-11 connected to the battery (+) terminal and the connector 1 B-11 to the (–) terminal, check to see if the motor rotates in low speed.
2. Operation in high speed
   With the motor connector terminal 3 B-11 connected to the battery (+) terminal and the connector 1 B-11 to the (–) terminal, check to see if the motor rotates in low speed.
3. Stop operation
   After stopping the windshield wiper in the position on the way by confirming the operation at the low speed in item No. 1.
   When the connectors 2 B-11 and 5 B-11 are connected, while connecting the motor connector terminal 4 B-11 to the battery (+) terminal, check to see, if the motor rotates at low speed and stops at the auto-stop position.
   Repair or replace the motor when the results of the above inspections are found abnormal.

Removal

Preparation:
Disconnect the battery ground cable.

1. Glove Box
   Refer to “INSTRUMENT PANEL” of section 2.
2. Windshield Wiper Motor
   1) Disconnect the connector.
   2) Remove four screws.
   3) Remove the ball joint between crank arm and wiper link.



N8A5313E

Installation

To install, follow the removal steps in the reverse order, noting the following points.

- Windshield Wiper Motor
  When the crank arm is removed from the windshield wiper motor, tighten the motor shaft nut with the specified torque.

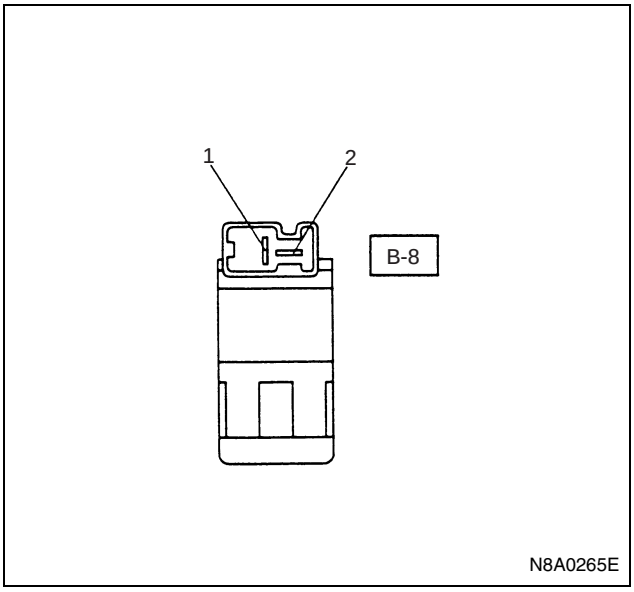
Tighten:
Shaft nut to 17 N·m (170 kg·cm/147 lb·in)

- Temporarily fit the motor by using one of the four wiper motor fixing screws.
- Put the crank arm ball joint in the wiper link hole and fix them together while pulling the wiper link.

Windshield Washer Motor

Inspection

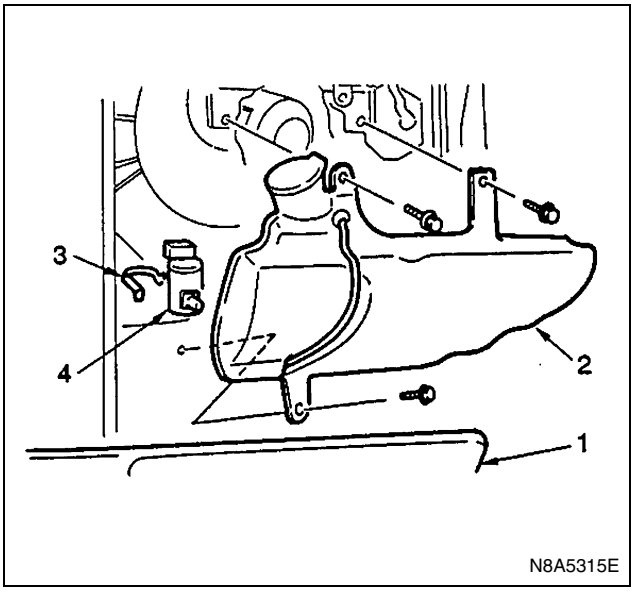
With the battery (+) terminal connected to the washer motor connector terminal 1 B-8 and the (−) terminal to the connector 2 B-8, check to see if the cleaning fluid pushes out.
Replace the tank/motor when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Instrument Panel Under Cover
   Refer to “INSTRUMENT PANEL” of section 2.
2. Washer Tank
   1) Disconnect the washer motor connector.
   2) Disconnect the washer hose.
   3) Remove three fixing screws.
3. Clip Band
4. Windshield Washer Motor
   Hold the motor and pull it out from the washer tank.

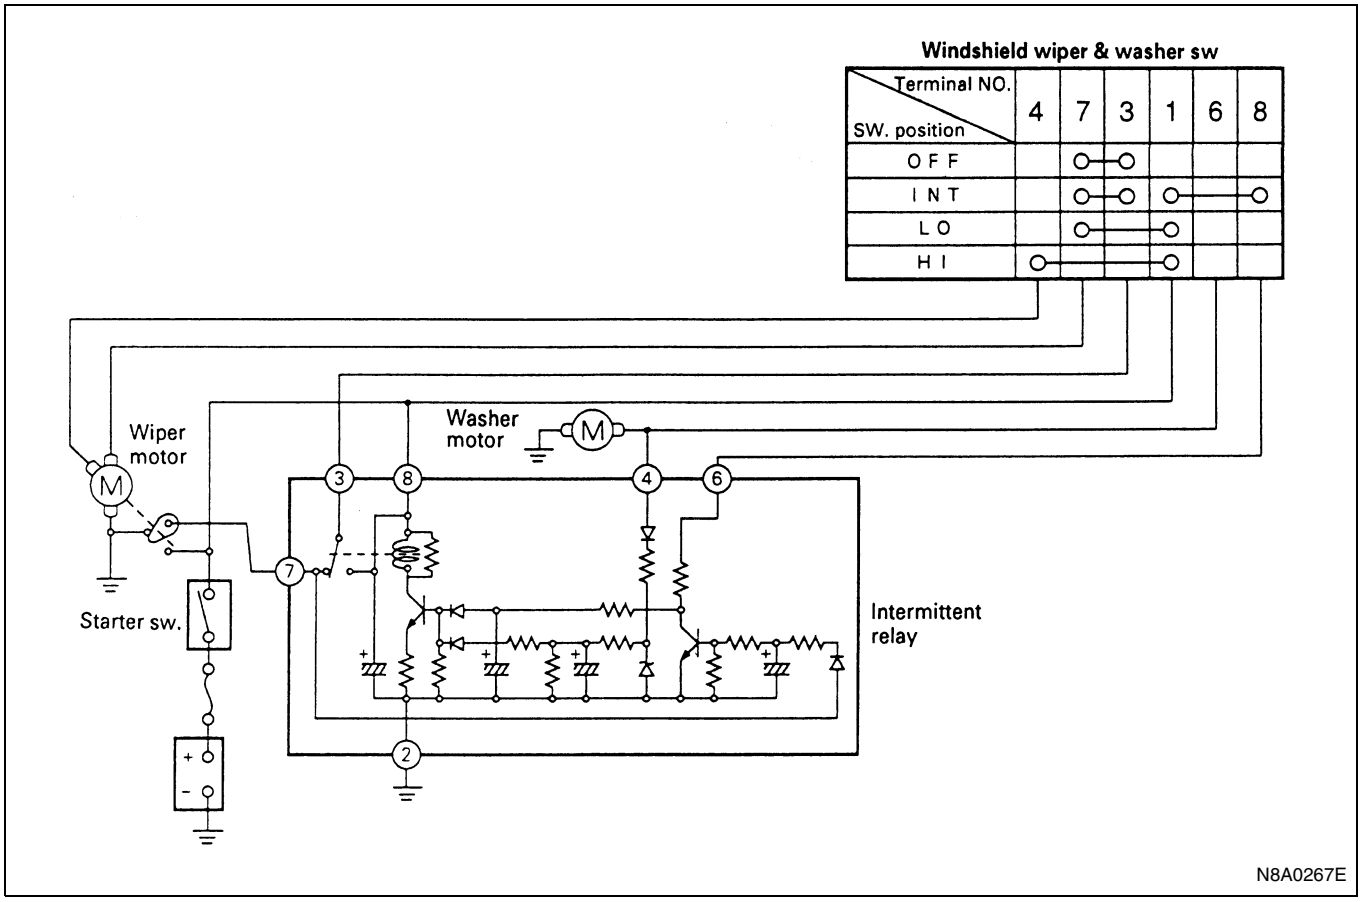


Installation

To install, follow the removal steps in the reverse order.

Intermittent Relay

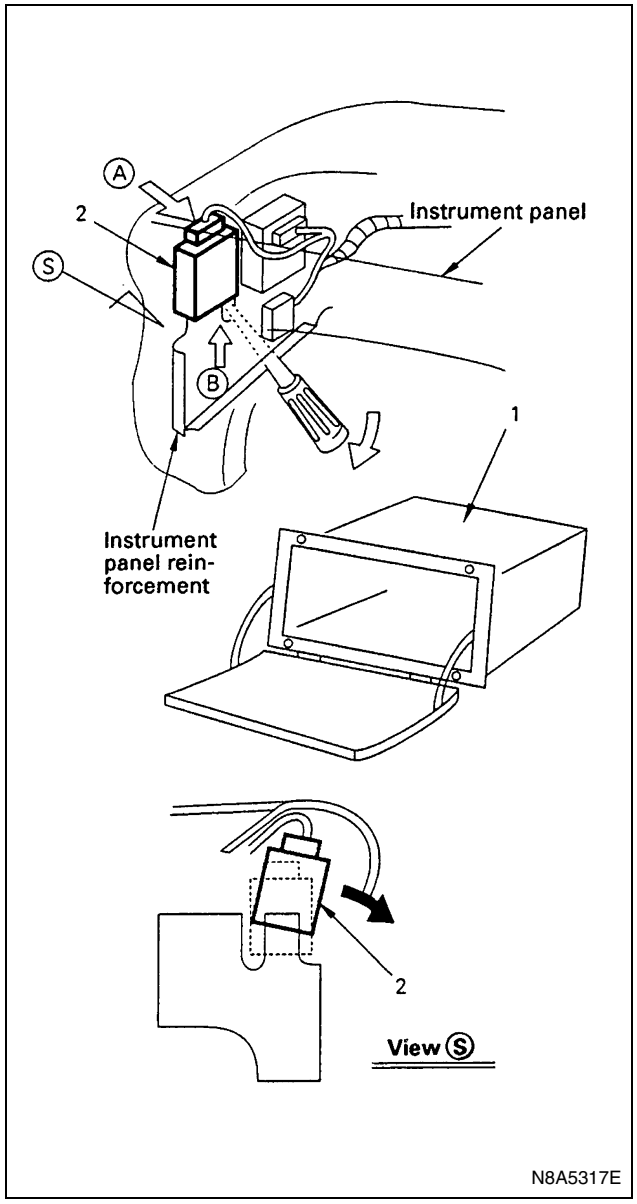
Circuit Diagram



Removal

Preparation:
Disconnect the battery ground cable.

1. Glove Box
   Open the lid and remove the four screws.
2. Intermittent Relay
   1) Press A position with your finger and pry up B position with the tip of a screw-driver.
   2) When the relay moves up by about 2/3 of its size, tilt and take off the relay to avoid interference with the instrument panel.
   3) Disconnect the connector.

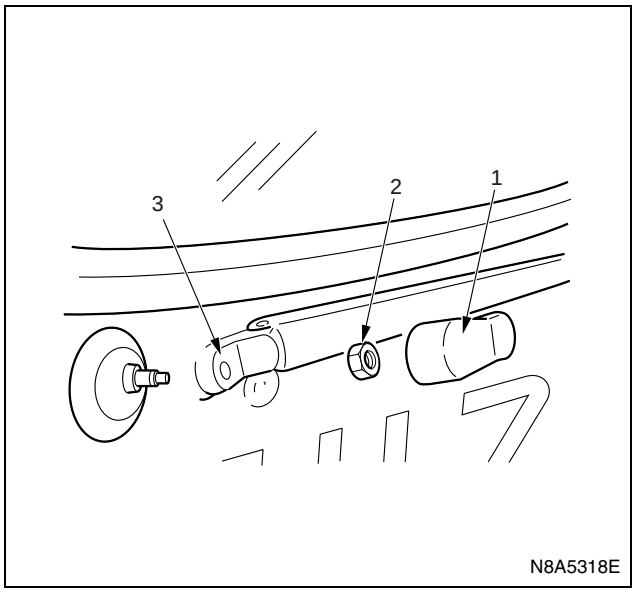


Installation
To install, follow the removal steps in the reverse order.

Windshield Wiper Arm & Blade

Removal

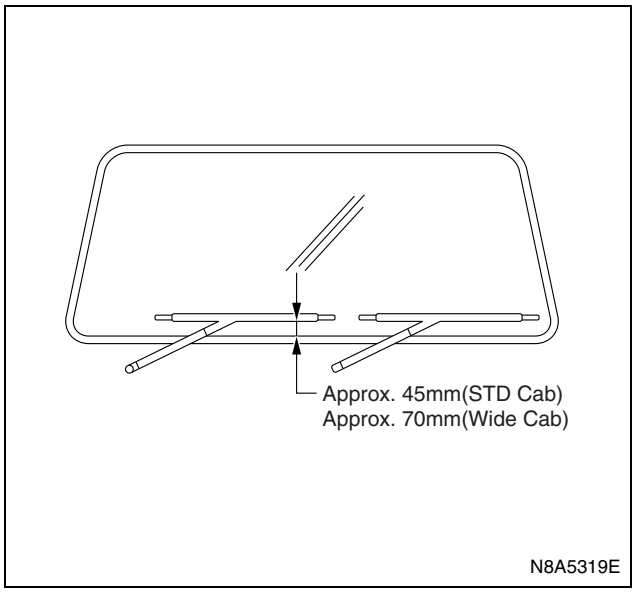
1. Cover
2. Wiper Arm Nut
3. Wiper Arm & Blade



Installation
To install, follow the removal steps in the reverse order, noting the following points.

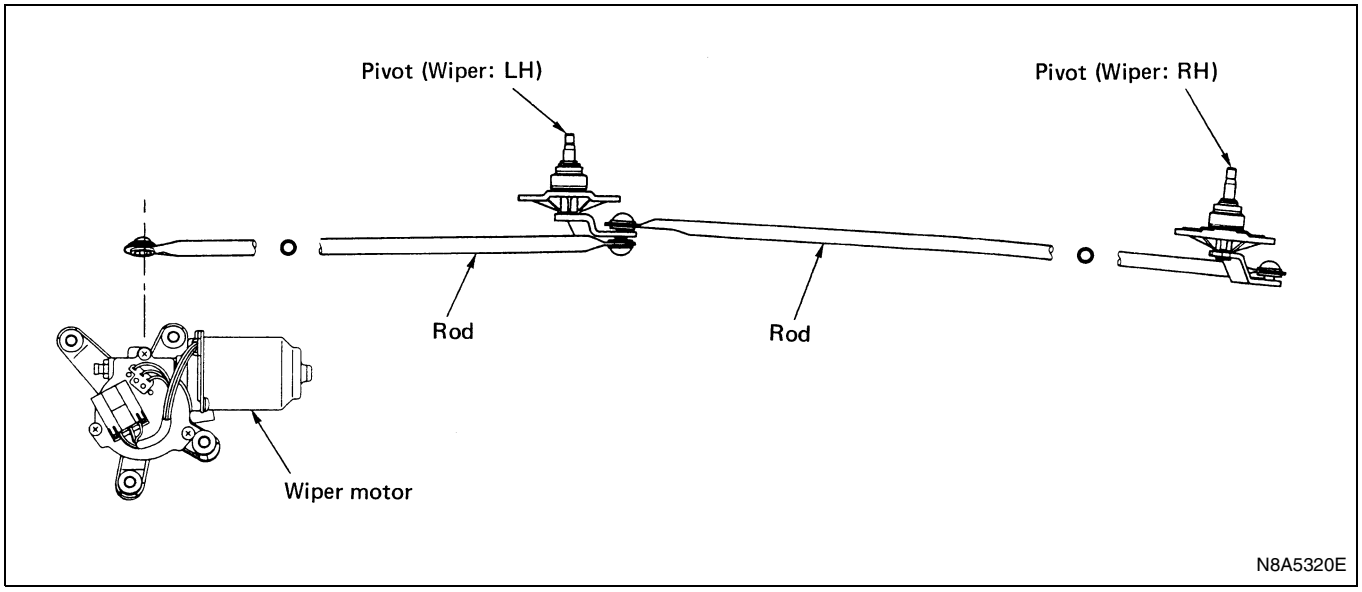
1. Before installing the wiper arm & blade to the shaft, confirm that the motor stops at the auto-stop position.
2. Set the wiper arm & blade so that the tips of both blades are positioned as shown in the illustration.
3. Tighten the wiper arm nut to the specified torque.

Tighten:
Wiper arm nut to 17 N·m (170 kg·cm/147 lb·in)



Windshield Wiper Linkage

Location of Rod and Pivot

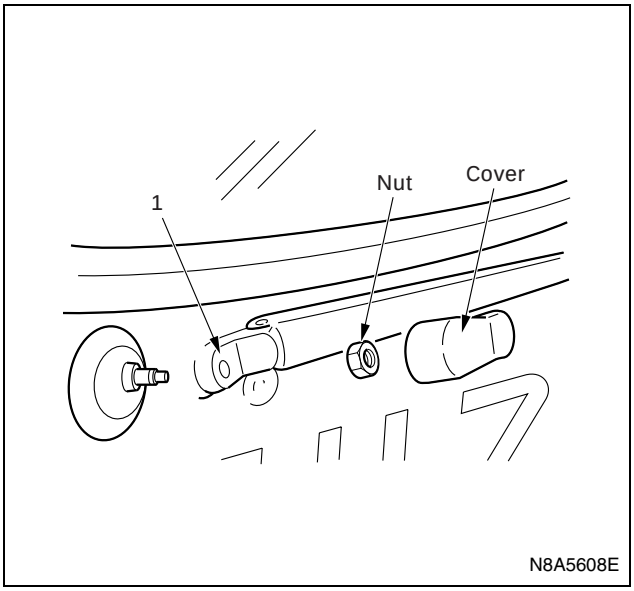


Removal

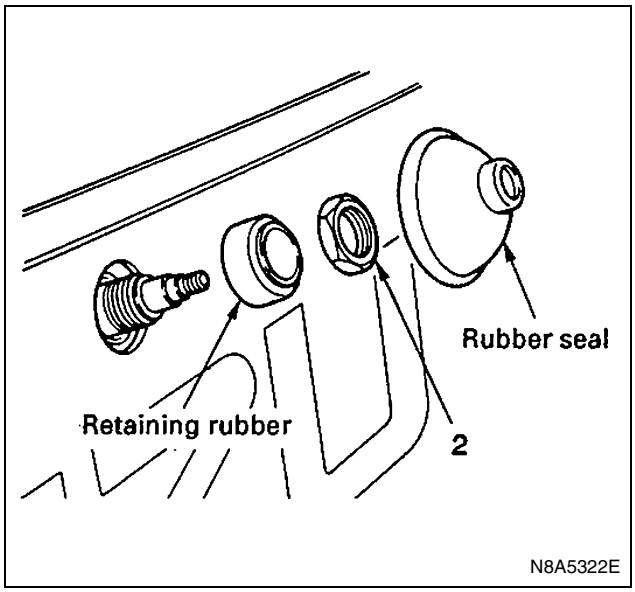
Preparation:

Disconnect the battery ground cable.

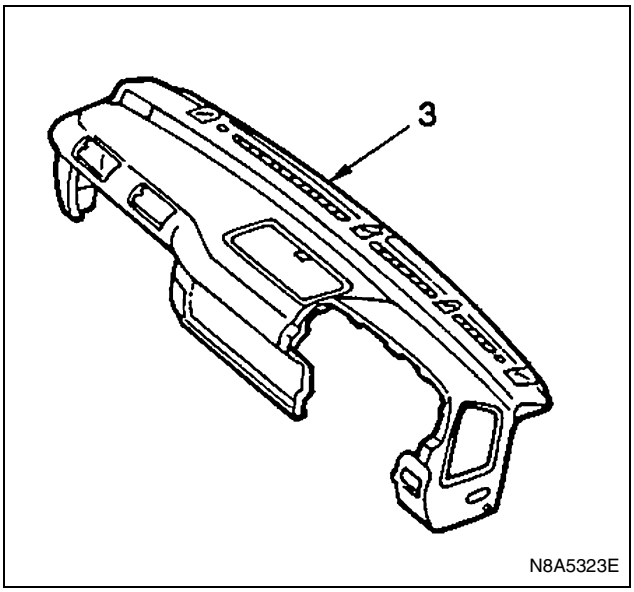
1. Wiper Arm & Blade
   Remove the cover, nut and wiper arm & blade.



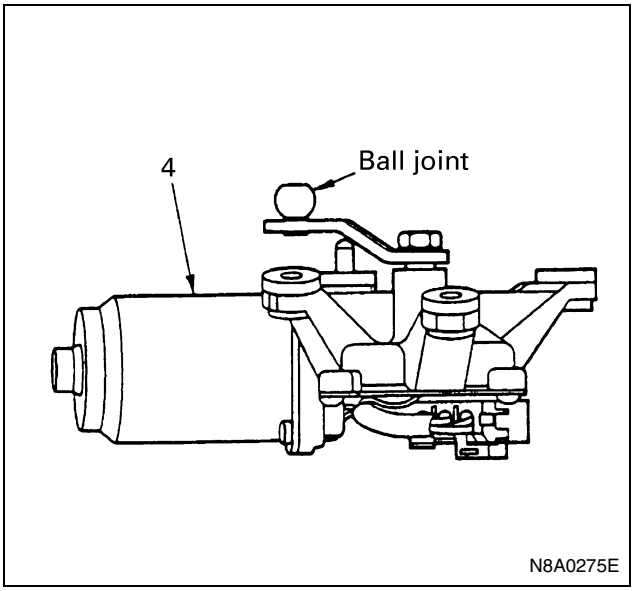
2. Pivot Nut
   Remove the rubber seal, nut and retaining rubber.



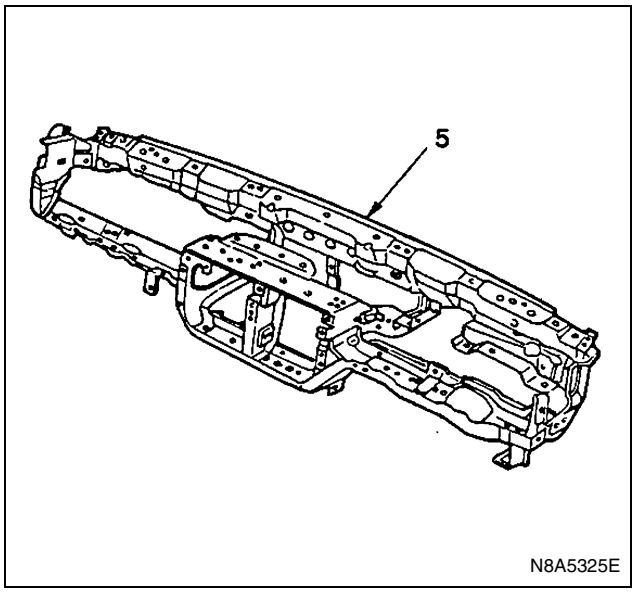
3. Instrument Panel Assembly
   Refer to “INSTRUMENT PANEL” of section 2.



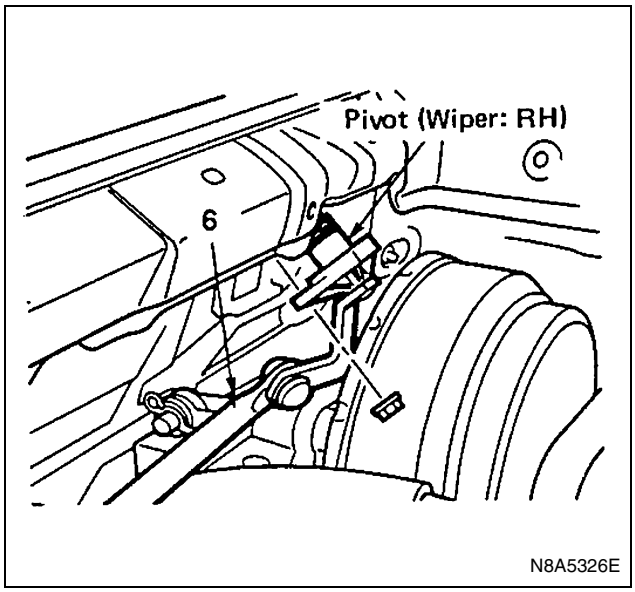
4. Wiper Motor
   1) Remove the four screws.
   2) Disconnect the ball joint between the crank arm and the wiper link.



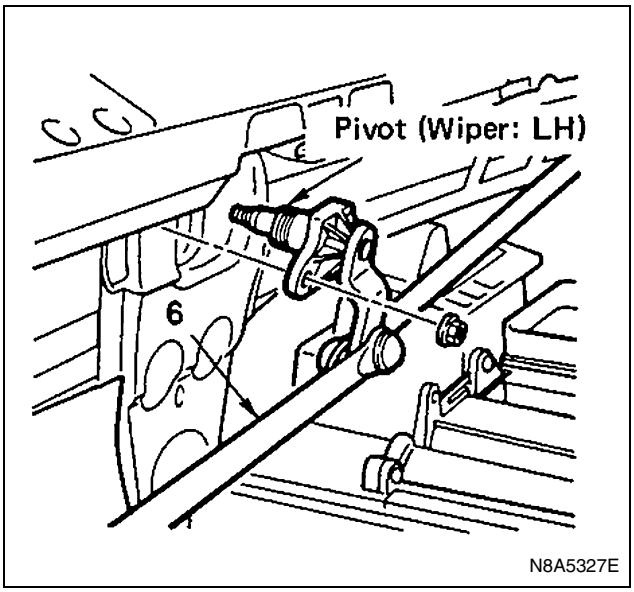
5. Instrument Panel Reinforcement
   Refer to “INSTRUMENT PANEL” of section 2.



6. Wiper Link Assembly
   Remove two retaining nuts from right hand side of pivot.



Remove two retaining nuts from left hand side of pivot.



Installation

To install, follow the removal steps in the reverse order, noting the following points.

- Temporarily fit the wiper motor by using one of the four wiper motor fixing screws.
- Put the crank arm ball joint in the wiper link hole and fix them together while pulling the wiper link.
- Fit the motor with four screws.
- Tighten the pivot nut with the specified torque.

Tighten:

Pivot nut to 8 N·m (80 kg·cm/70 lb·in)

- Tighten the wiper arm nut with the specified torque.

Tighten:

Wiper arm nut to 17 N·m (170 kg·cm/147 lb·in)

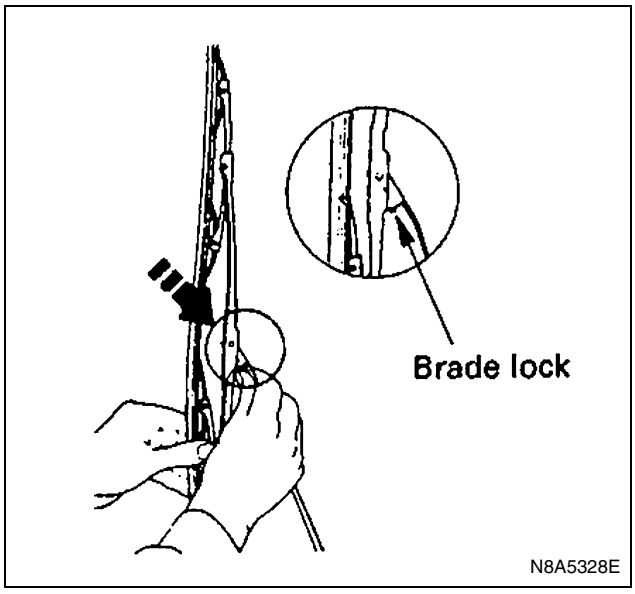
Wiper Blade Rubber

Removal

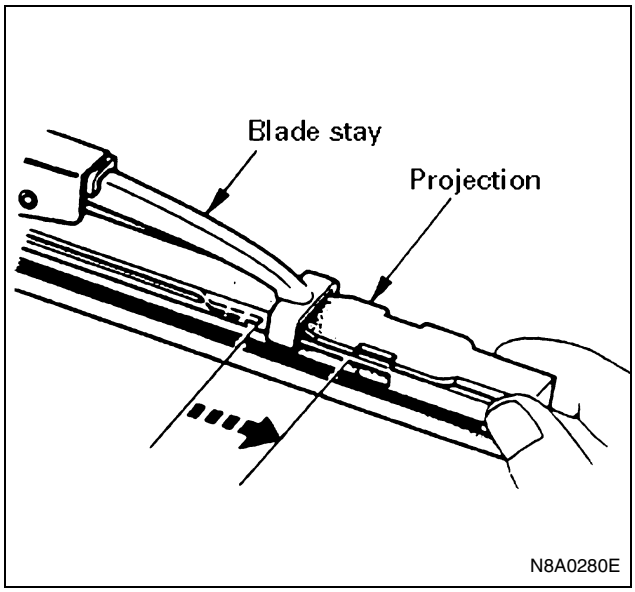
1. Wiper Blade
   Push the wiper blade lock while pulling the wiper blade in the arrow direction.

Notice:

When the wiper blade has been removed, wrap the tip of the wiper arm with cloth, to avoid damaging the glass.

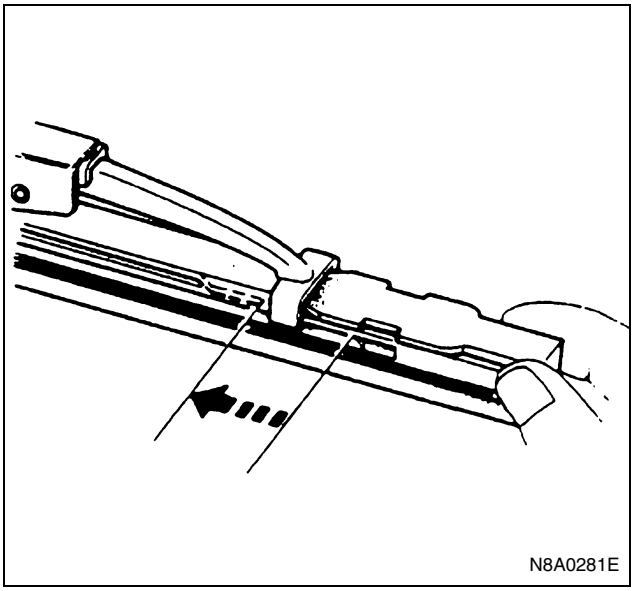


2. Wiper Blade Rubber
   1) Pull the end of rubber and remove the projection from the click of the blade stay.
   2) Pull the rubber out in the same direction.



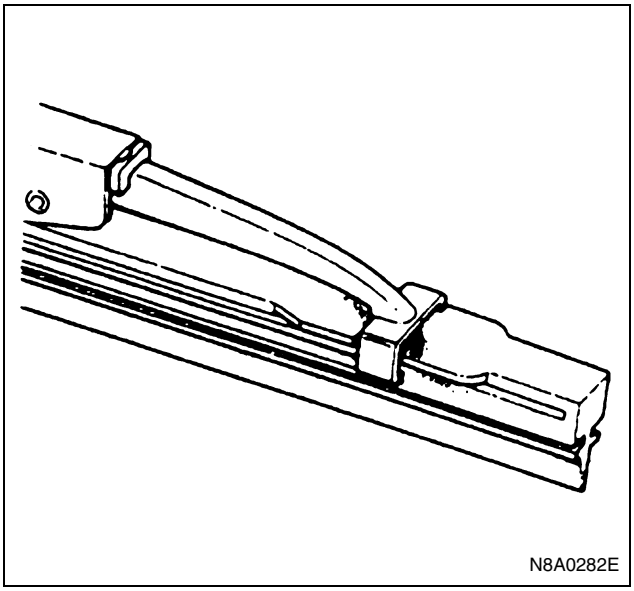
Installation

1. Wiper Blade Rubber
   Install the click of the blade stay in the groove of the new rubber and slide it in. Complete installation by pushing the click.



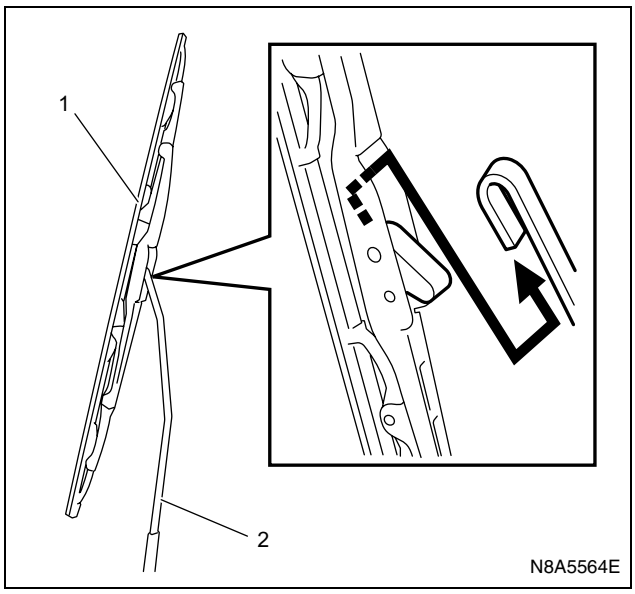
N8A0281E

   Finally, check that the click of the stay has caught in the hole of the rubber.



N8A0282E

2. Wiper Blade
   Push the lock of wiper blade (1) into the retentive portion on the tip of wiper arm (2).



N8A5564E

Audio and Cigar Lighter

General Description

The circuit consists of the starter switch, radio, cigar lighter and the relay.
The audio circuit is designed for the current to flow through the receiver circuit when the radio switch is turned on with the starter switch in “ACC” or “ON”. Current runs through the memory circuit of the audio regardless of the position of the starter switch.
When the cigar lighter is pushed in with the starter switch at either “ACC” or “ON” position, a circuit is formed in the cigar lighter case to heat the lighter coil. The cigar lighter is spring back to its original position after the lighter coil is heated.

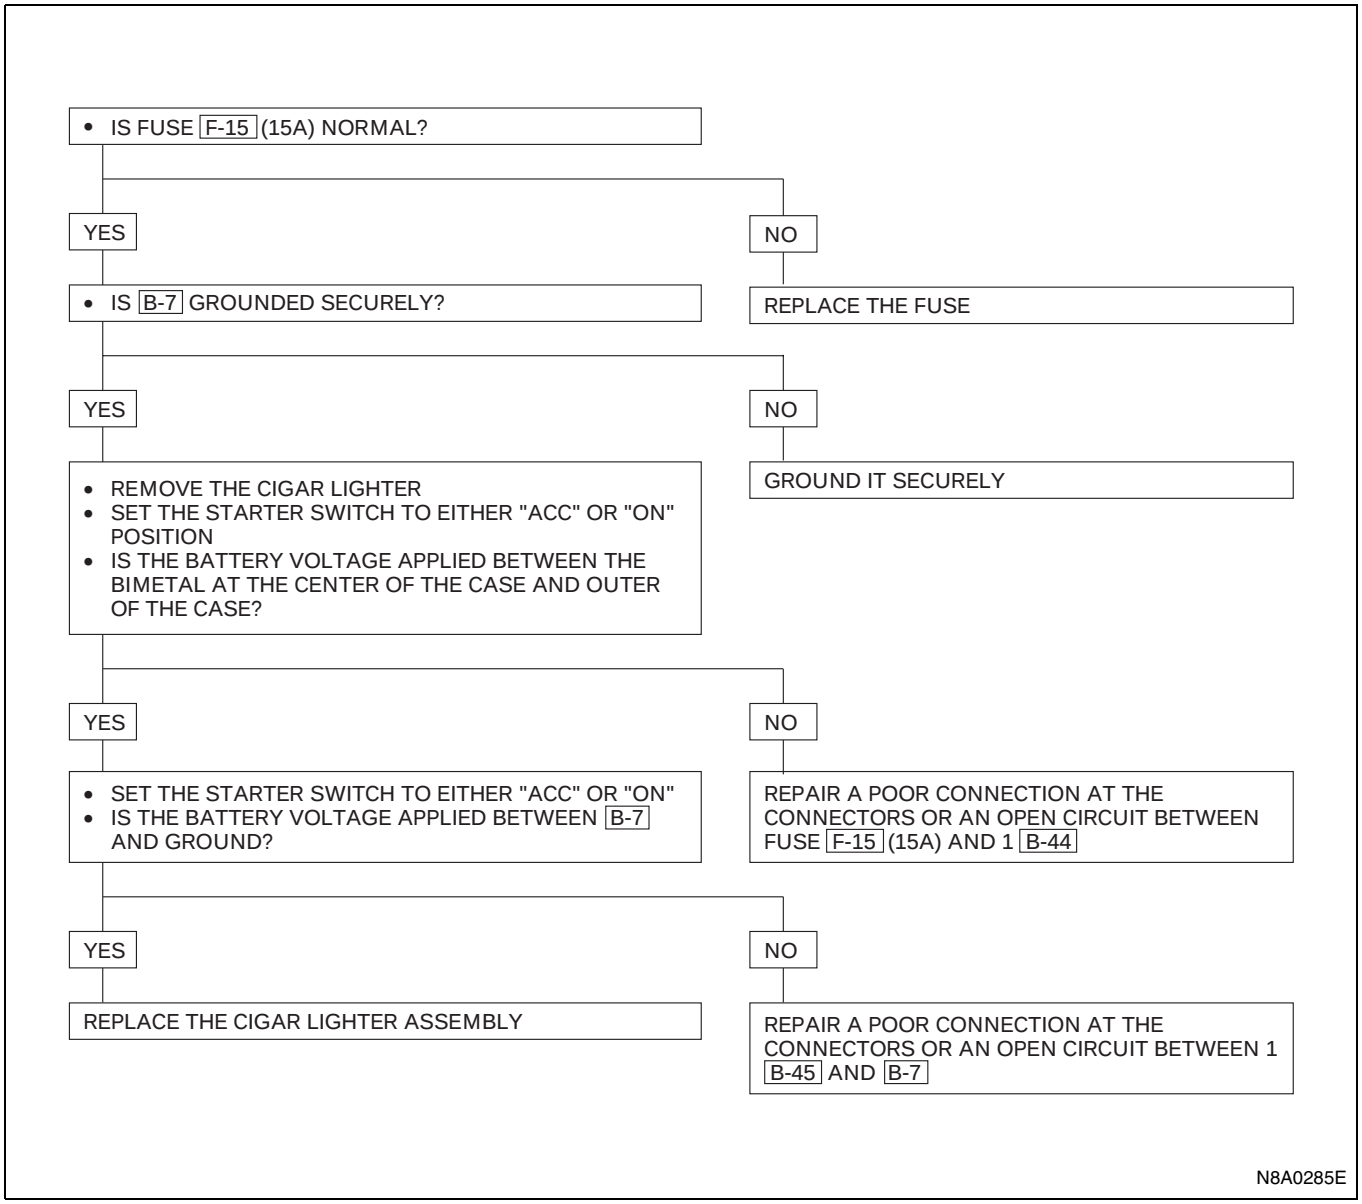
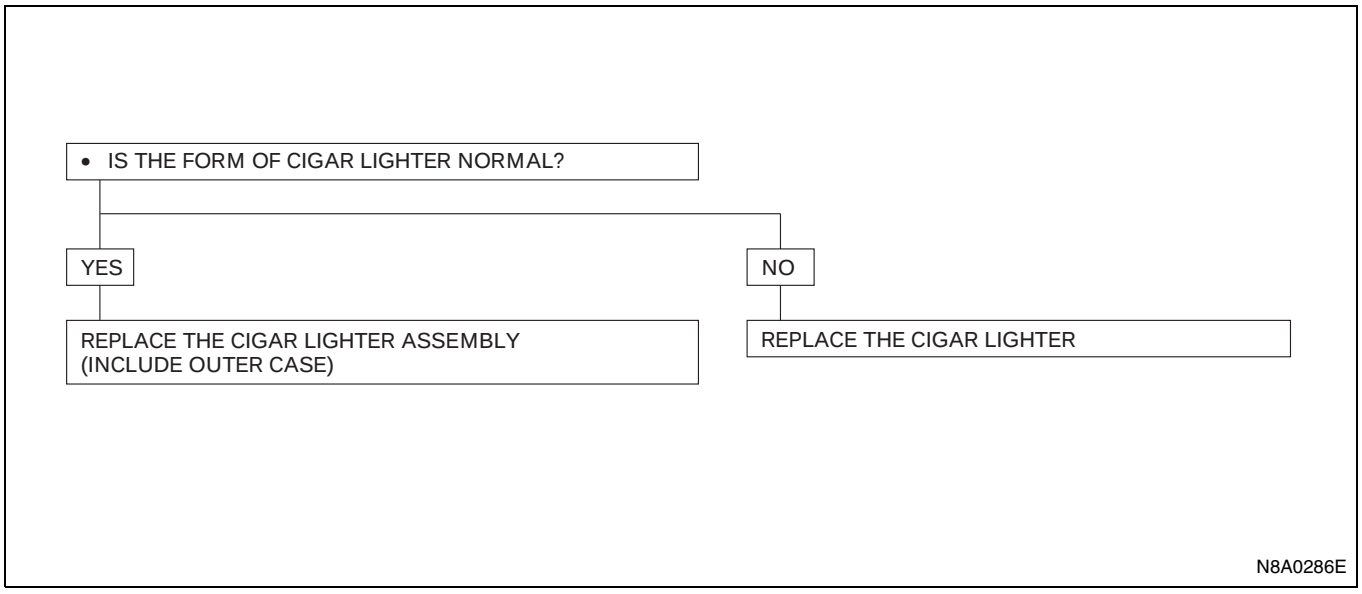
Diagnosis

Cigar Lighter Does Not Heat Sufficiently



The Cigar Lighter Does Not Spring Out After Being Heated



Starter Switch

Refer to “START AND CHARGING” in this section.

Radio

Removal

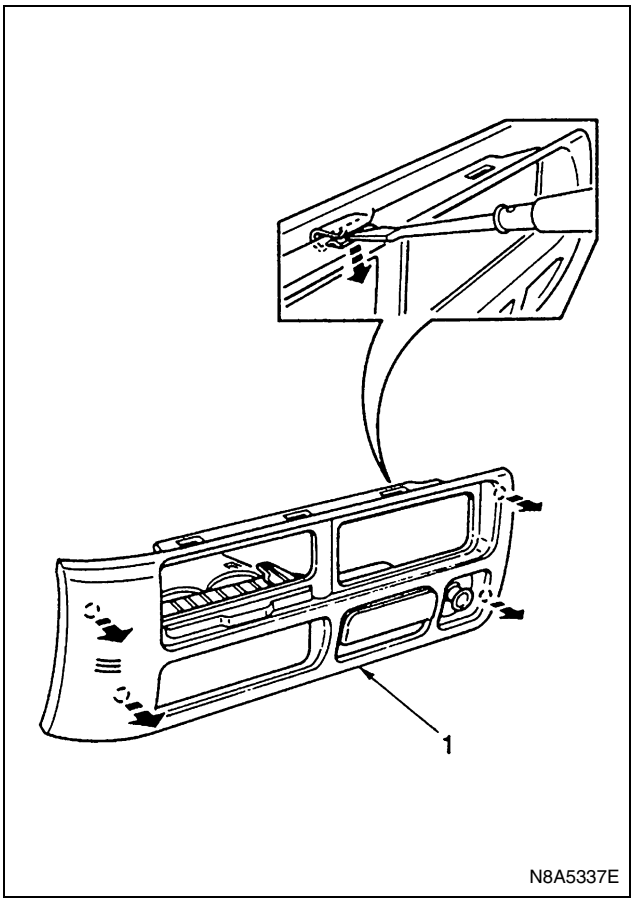
Preparation:

Disconnect the battery ground cable.

1. Center Cluster
   1) Pull it to remove. Pry off three clips by the tip of screwdriver.
   2) Remove the cigar lighter power source and its illumination connector.

Notice:

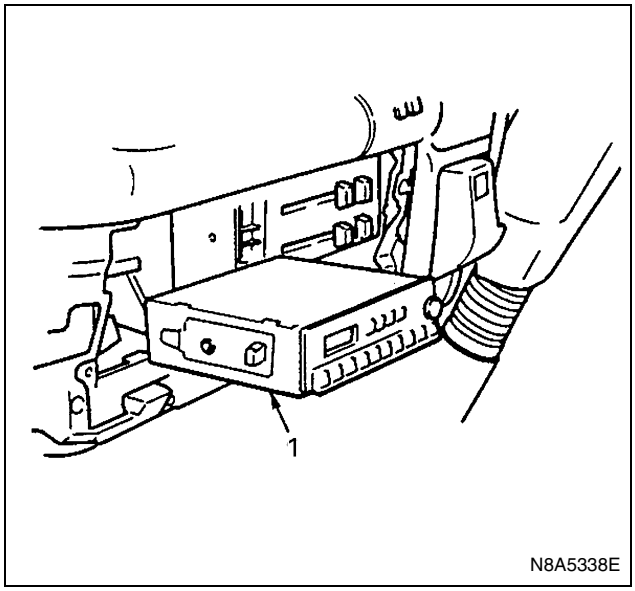
To remove the center cluster, do not force to pry off three clips at upper portion of the center cluster.



Legend

1. Center Cluster

2. Radio
   1) Remove the two radio fixing screws.
   2) Disconnect the connector and feeder plug.



Legend

1. Radio

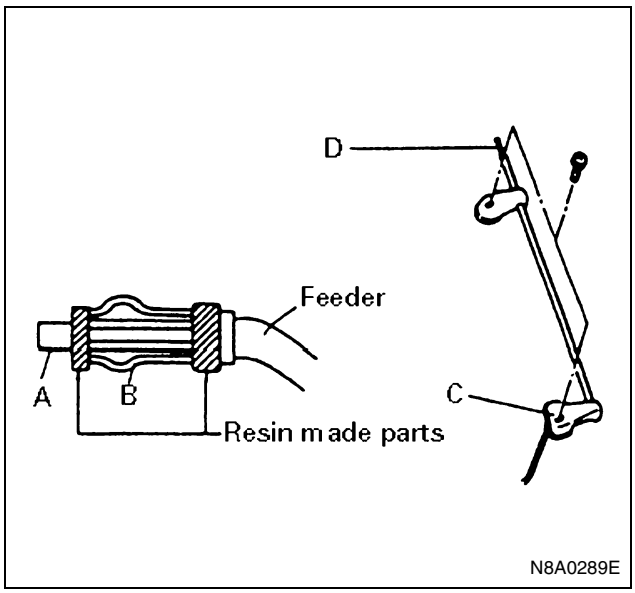
Installation

To install, follow the removal steps in the reverse order.

Antenna

Inspection

The metal A is connected to the pole D at the top of the antenna through the core of the feeder.
The metal B is fitted in the feeder shielding the core, and grounded at the screw C to avoid the core hampered by noise.
Defective grounding would cause noise.



In checking, measure the following three points with the circuit tester in the range of "resistance x 1 (Ω)."

Between A and B

No continuity (No reading at the indicator) → Normal

Continuity (A bite in the feeder. The core grounded) → Lower reception

Between B and C

Continuity (Indicator reading: 0Ω) → Normal

No continuity (Shielded core disconnected or defective grounding at the screw → Hampered by noise)

Between A and D

Continuity or no continuity

There are some antenna feeders and relay feeders with a condenser built in their connections.

Measuring resistance between the two points does not result in correct judgment. Connect temporarily another normal antenna to the radio and check to see if its reception is audible. Most antenna now available are slide type. Rust at the screw C and the cab panel where grounded would lead no continuity, followed by lower reception.

Keep this portion clean to avoid rust.

Removal

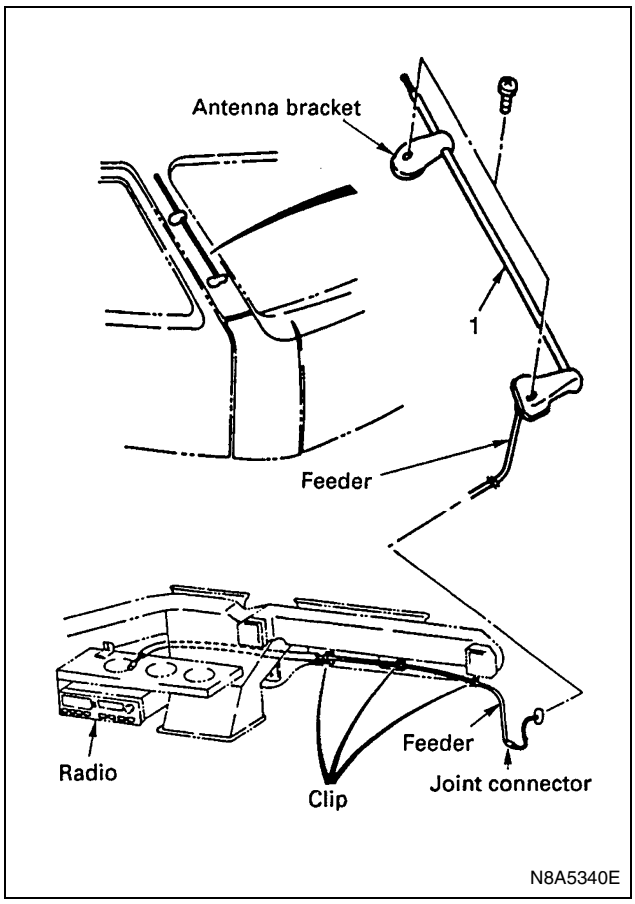
Preparation:

Disconnect the battery ground cable.

1. Antenna
   1) Disconnect the joint connector.
   2) Remove the upper and lower side antenna bracket.
   3) Pull out the antenna feeder.

Notice:

For easier fitting, tie the lead wire to the end of the antenna feeder in advance.



Legend

1. Antenna

Installation

To install, follow the removal steps in the reverse order.

Speaker

Inspection

1. With the circuit tester set to the range of × 1 (Ω), connect the circuit tester probes (red and black) to the (+) and (−) terminals of the speaker.
2. When the speaker is normal, a low buzzing sound is heard.
3. When the speaker is defective, no sound is heard. However, the distortion or chattering of the sound cannot be identified.
   When the speaker is installed to the vehicle, disconnect the connectors before checking.
   When no sound is heard, the following are considered as the cause.

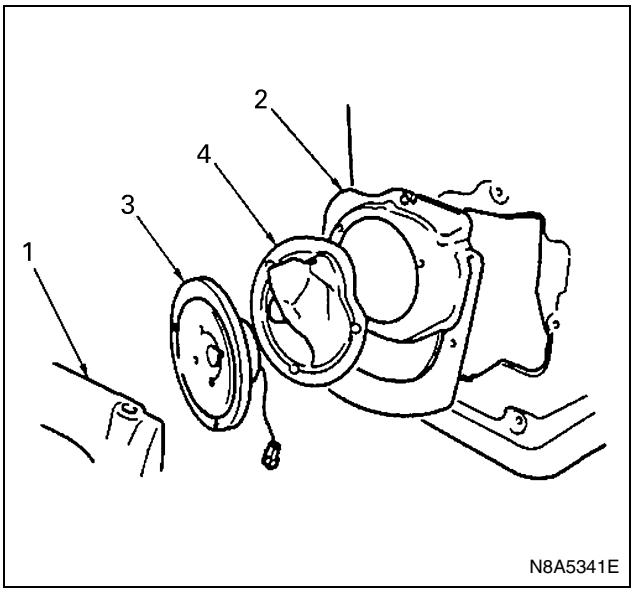
- The speaker wiring is disconnected at the speaker terminals.
- The speaker body is defective.
- There is an open circuit somewhere in the speaker harness on the vehicle side.
- The speaker harness on the vehicle side is grounded or caught up.

Removal

Preparation:

Disconnect the battery ground cable.

1. Door Pad
   Refer to “FRONT DOOR TRIM PAD” of section 2.
2. Speaker Panel
   Disconnect the speaker connector.
3. Speaker
4. Waterproof Sheet



Legend

1. Trim Panel
2. Speaker Panel
3. Speaker
4. Waterproof Sheet

Installation

To install, follow the removal steps in the reverse order.

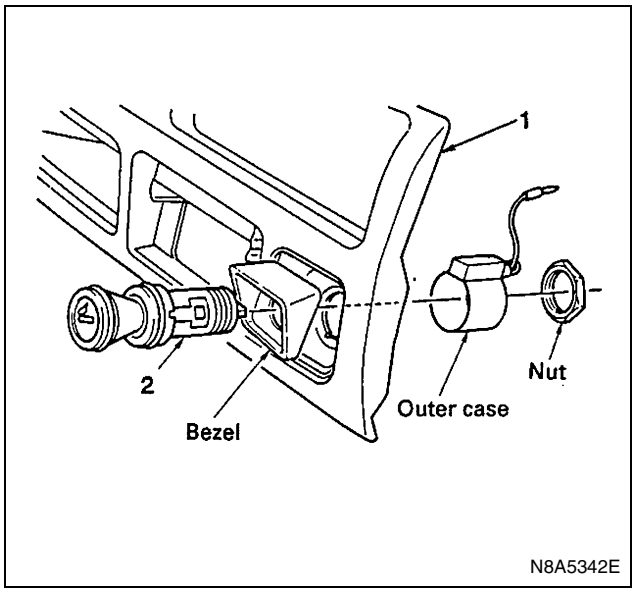
Cigar Lighter

Removal

Preparation:

Disconnect the battery ground cable.

1. Center Cluster
   Refer to “RADIO” in this section.
2. Cigar Lighter Assembly
   Remove the nut, then remove cigar lighter assembly, bezel and outer case.



Legend

1. Center Cluster
2. Cigar Lighter Assembly

Installation

To install, follow the removal steps in the reverse order.

Meter and Warning/indicator Light

General Description

The circuit consists of the starter switch, meter assembly, vacuum tank switch, seat belt switch, oil pressure switch, fuel sedimenter switch, brake fluid switch, parking brake switch, vehicle speed sensor, fuel tank unit, thermo unit and engine speed sensor.

The meter assembly contains the speedometer, tachometer, fuel meter, thermometer and the warning/indicator light.

The meter warning/indicator lights and their bulb sockets are a unit, they are installed from the back of the speedometer assembly.

2. Tachometer

		Check point		
		Tachometer	Engine speed sensor	Cable harness
Trouble mode	2-1. Tachometer does not function	❍ (3)	❍ (1)	❍ (2)
	2-2. Tachometer needle fluctuates (May be wide fluctuation)	❍ (3)	❍ (1)	❍ (2)
	2-3. Tachometer needle jumps erratically	❍ (3)	❍ (1)	❍ (2)

Notice:
Figure in parenthesis “( )” indicates the order of inspection.

3. Coolant Temperature Gauge

		Check point				
		Meter ASM	Thermo meter	Thermo unit	Thermo seat	Cable harness
Trouble mode	3-1. Coolant temperature gauge needle does not move	❍ (3)	❍ (4)	❍ (2)		❍ (1)
	3-2. Coolant temperature gauge reading is too low (or high)	❍ (4)	❍ (5)	❍ (3)	❍ (1)	❍ (2)
	3-3. Needle overshoots (or goes up to the “H” range)	❍ (3)	❍ (4)	❍ (1)		❍ (2)

Notice:
Figure in parenthesis “( )” indicates the order of inspection.

4. Fuel Gauge

		Check point			
		Meter ASM	Fuel gauge	Fuel tank unit	Cable harness
Trouble mode	4-1. Fuel gauge needle does not move	❍ (3)	❍ (4)	❍ (2)	❍ (1)
	4-2. Even when the tank is filled up with fuel, the needle does not reach “F”	❍ (3)	❍ (4)	❍ (2)	❍ (1)
	4-3. When the tank is not full of fuel, the needle overshoots (or goes to “F”)	❍ (3)	❍ (4)	❍ (2)	❍ (1)

Notice:
Figure in parenthesis “( )” indicates the order of inspection.

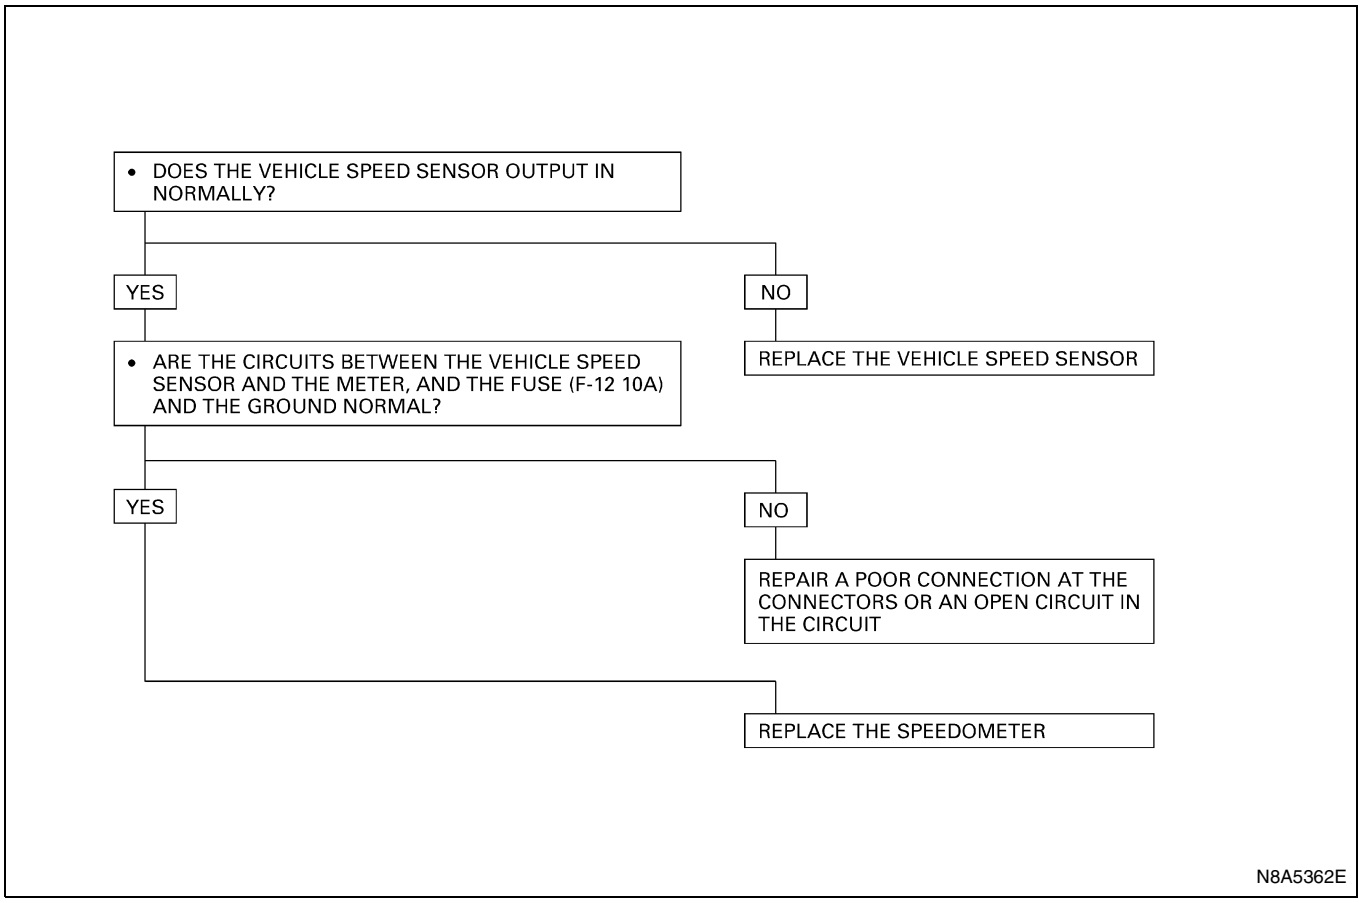
5. Warning/indicator Light

		Check point									
		Light bulb	Parking brake SW	Brake fluid SW	Oil pressure SW	Fuel tank unit	Vacuum SW	4WD SW	Sedimenter SW	Seat belt SW	Cable harness
Trouble mode	5-1. When the parking brake lever is pulled, the indicator light does not light up	❍ (2)	❍ (1)								❍ (3)
	5-2. Even when the parking brake lever is released, the indicator light does not go off		❍ (1)								❍ (2)
	5-3. While the engine operating, the oil pressure warning light does not go off				❍ (2)						❍ (1)
	5-4. Even when the tank is full with fuel, the fuel warning light lights up					❍ (1)					❍ (2)
	5-5. Even when the tank is empty, the low fuel warning light does not light up	❍ (1)				❍ (2)					❍ (3)
	5-6. Even when the transfer level is shifted to 4WD position, the indicator light does not light up	❍ (2)						❍ (1)			❍ (3)
	5-7. Even when the float in the water sedimenter goes up above the drain warning level, the indicator light does not light up	❍ (2)							❍ (1)		❍ (3)
	5-8. Even when the brake fluid is lower than specified level, the level warning light does not light up	❍ (1)		❍ (2)							❍ (3)
	5-9. Even when the vacuum tank is empty vacuum warning buzzer does not sound						❍ (1)				❍ (2)

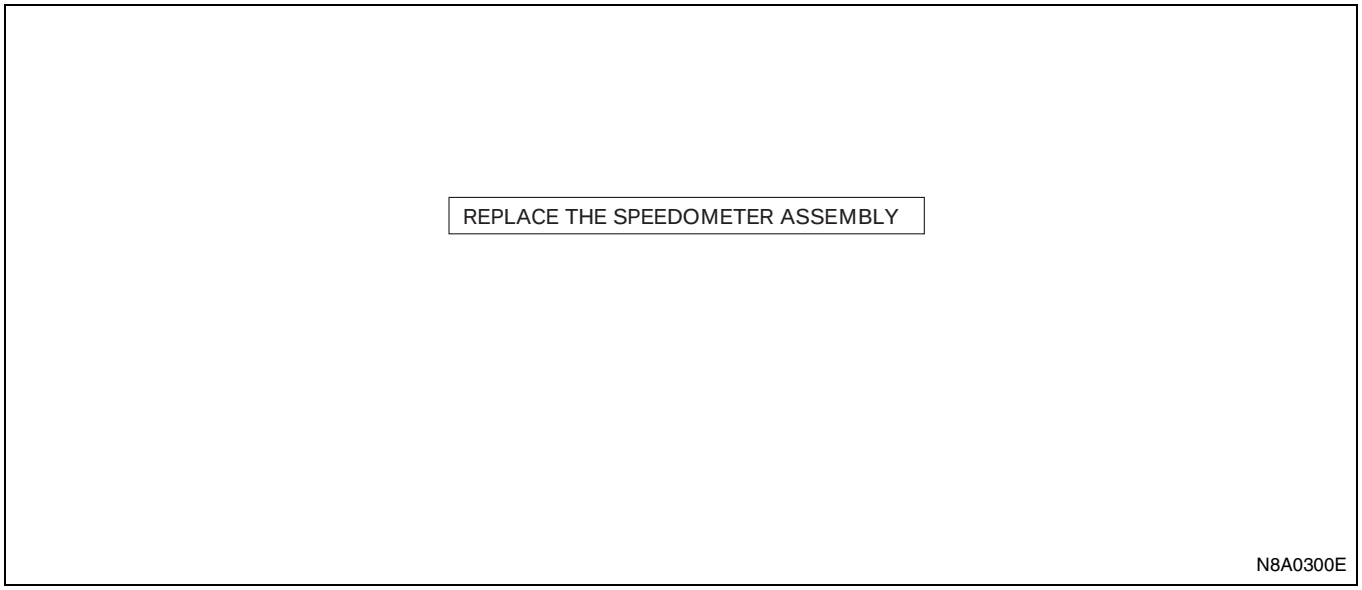
Notice:
Figure in parenthesis “( )” indicates the order of inspection.

1. Speedometer

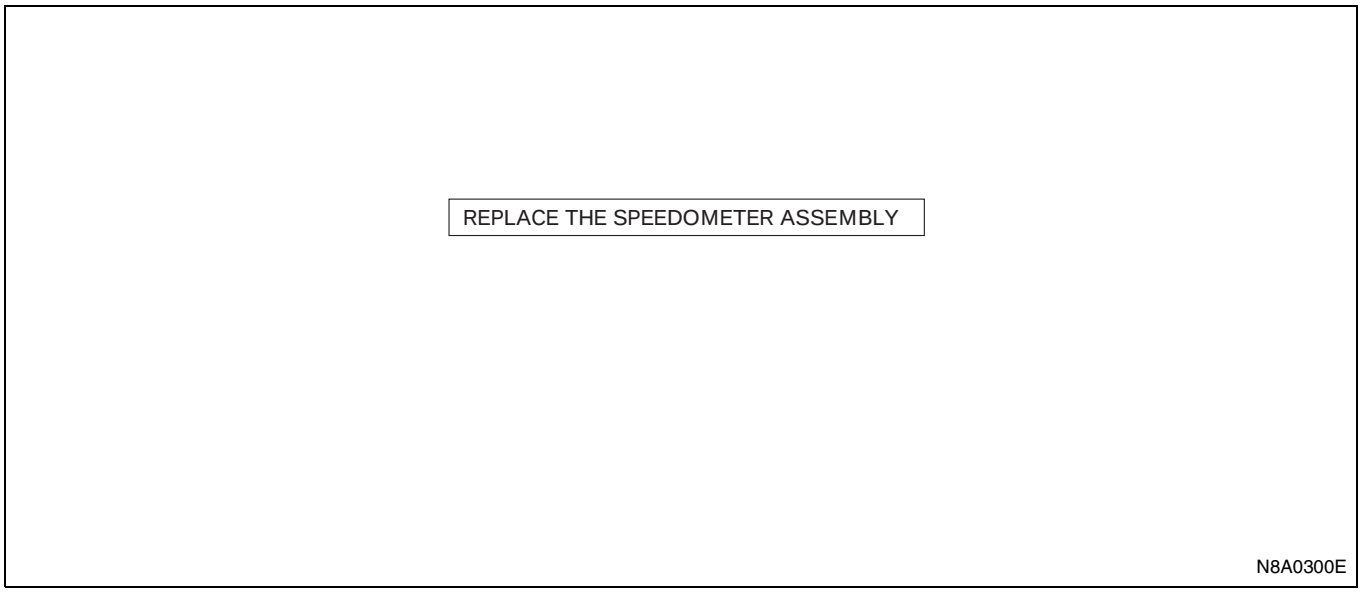
1-1. Speedometer and Odometer Do Not Function



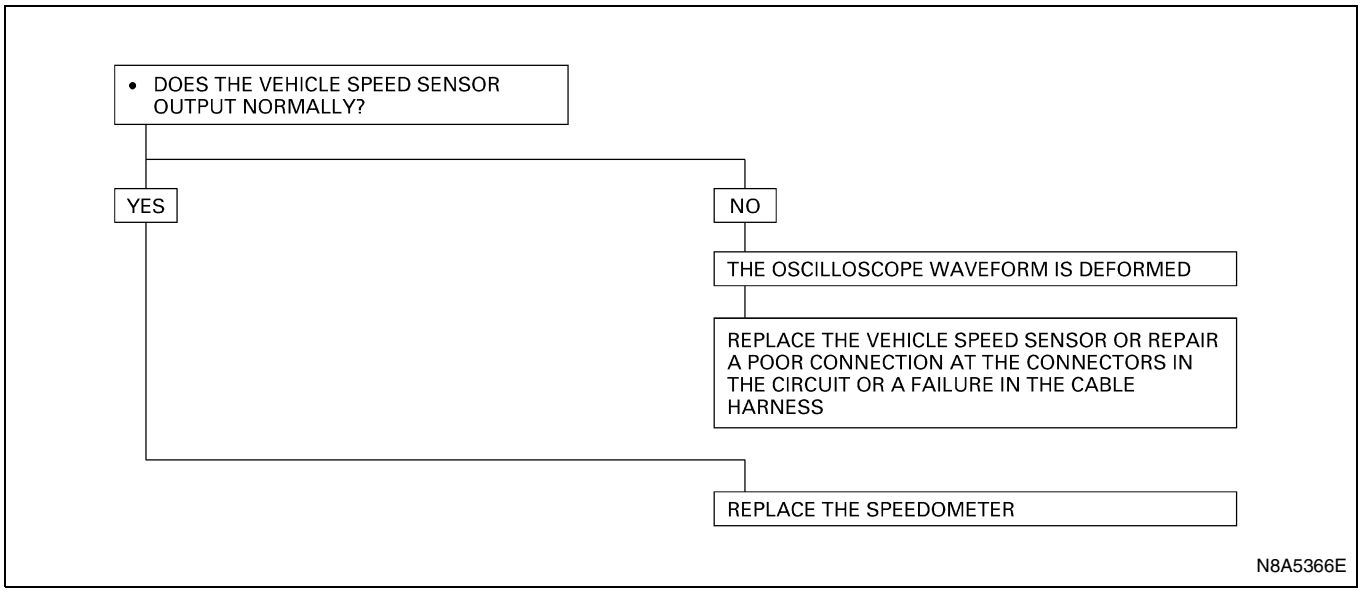
1-2. Speedometer Does Not Function (Odometer Is Normal)



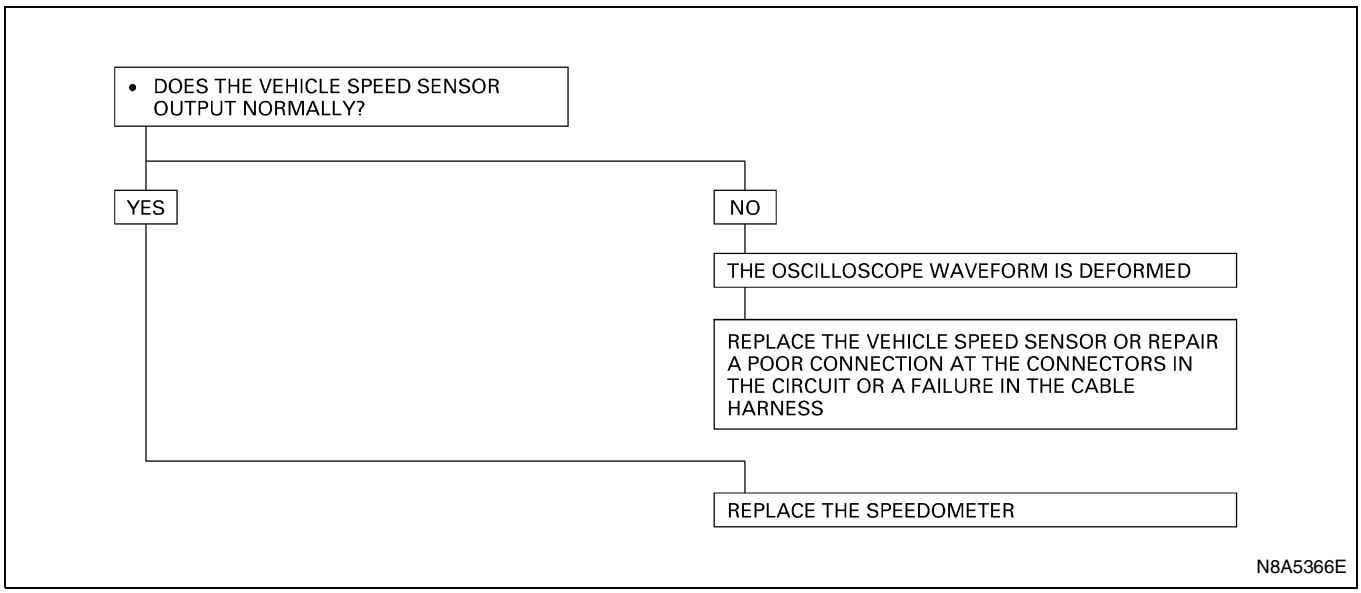
1-3. Odometer Does Not Function (Speedometer Is Normal)



1-4. Speedometer Needle Fluctuates (May Be Wide Fluctuation)

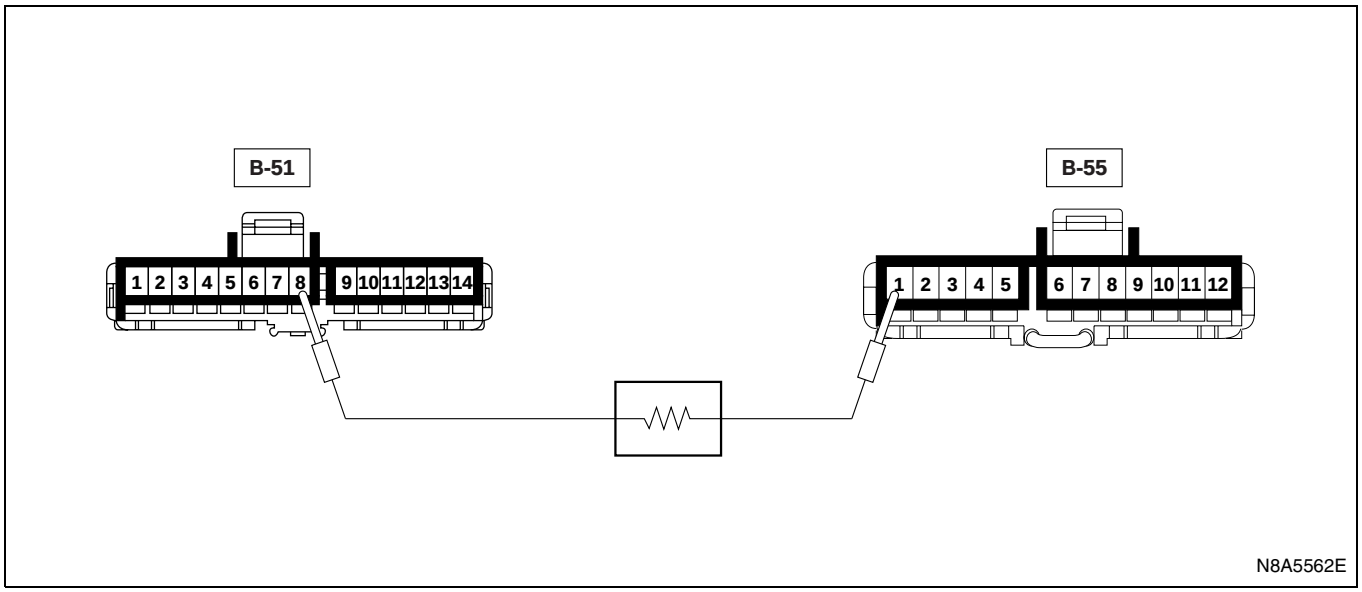


1-5. Speedometer Needle Jumps Erratically

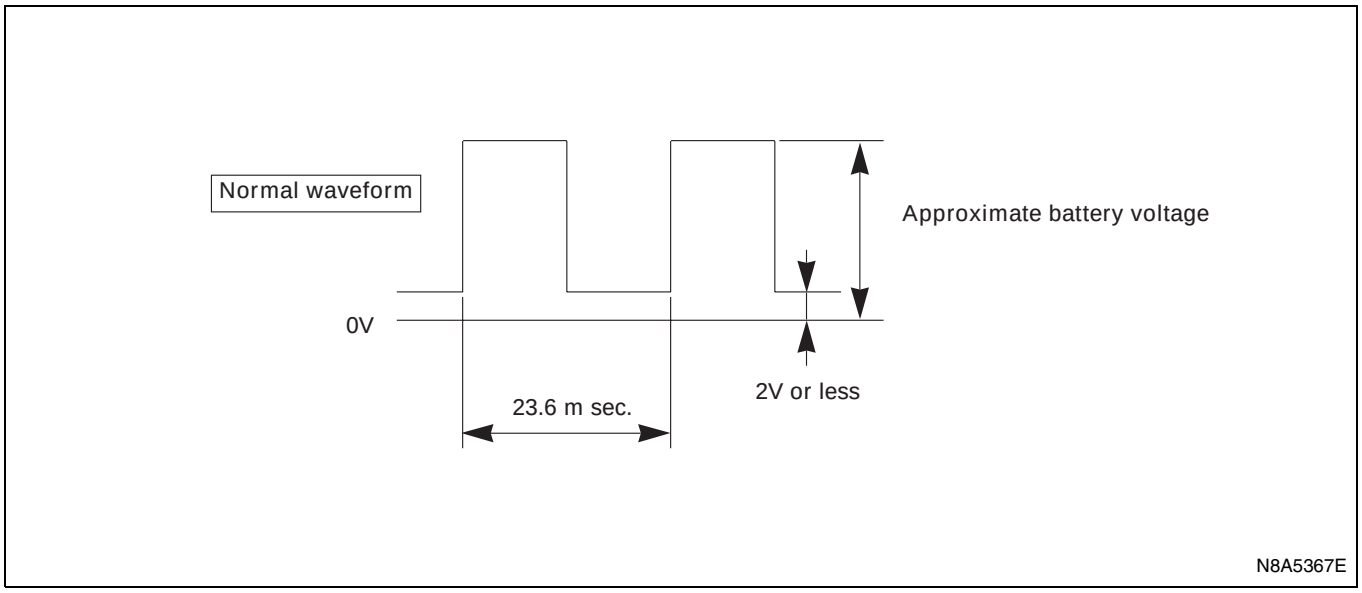


Inspection of waveform by oscilloscope

1. Connect a resistance of 1.3 to 5k ohm (1.4W or more) between the harness side connectors 8 B-51 and 1 B-55 of the meter.

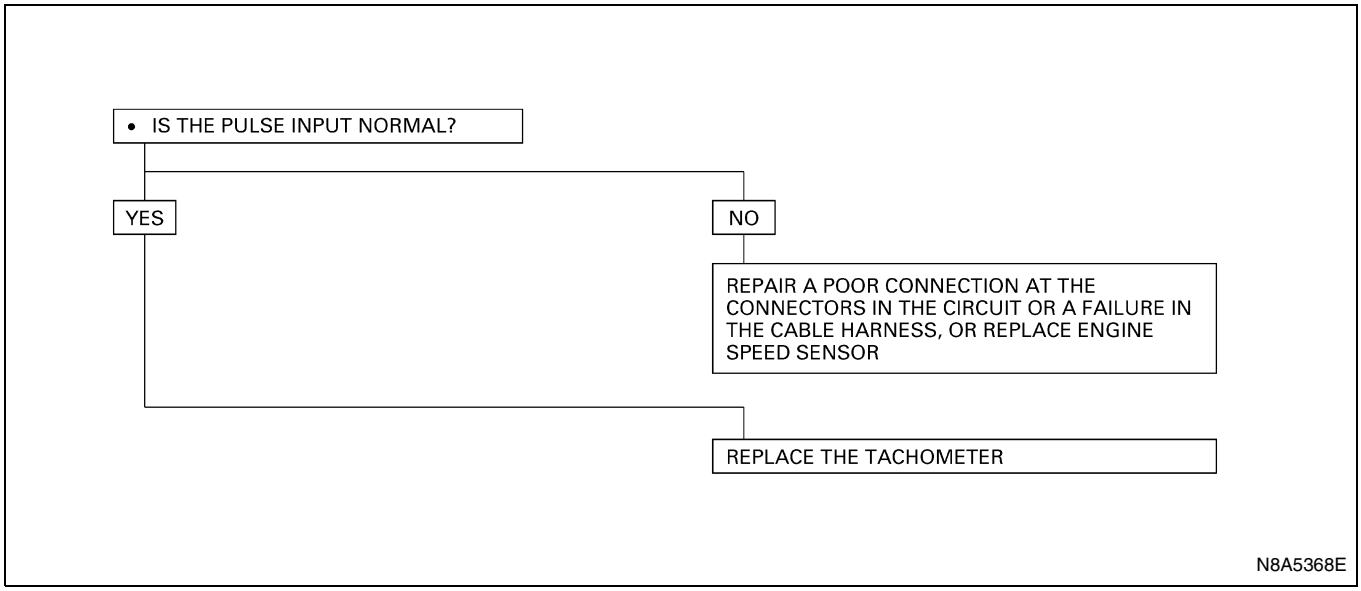


2. Install a speedometer tester.
3. Turn on the starter SW.
4. Check the waveform at the time when the vehicle speed is at 60 Km (37 mph).

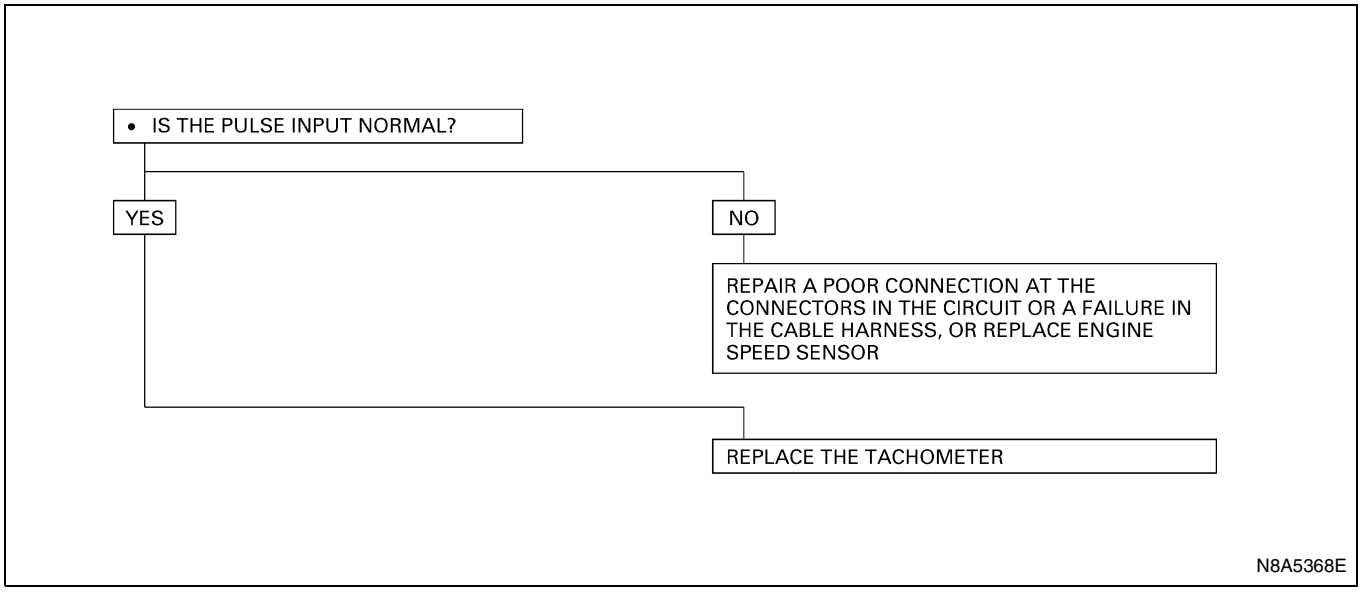


2. Tachometer

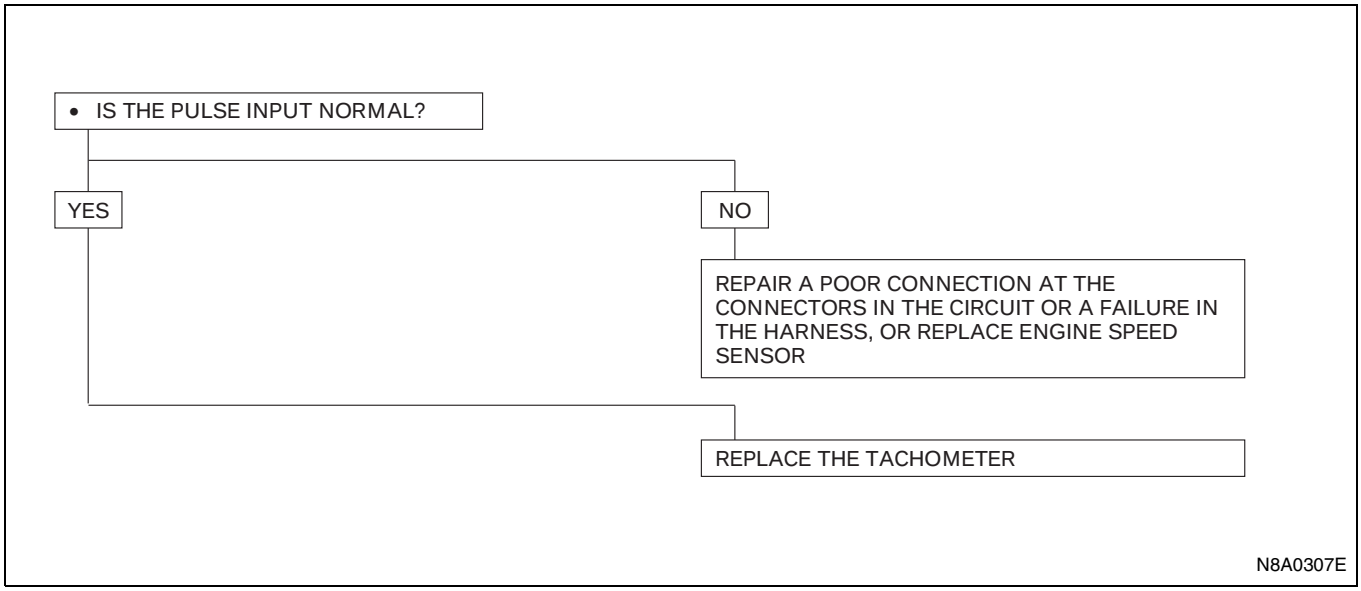
2-1. Tachometer Does Not Function



2-2. Tachometer Needle Fluctuates (May Be Wide Fluctuation)

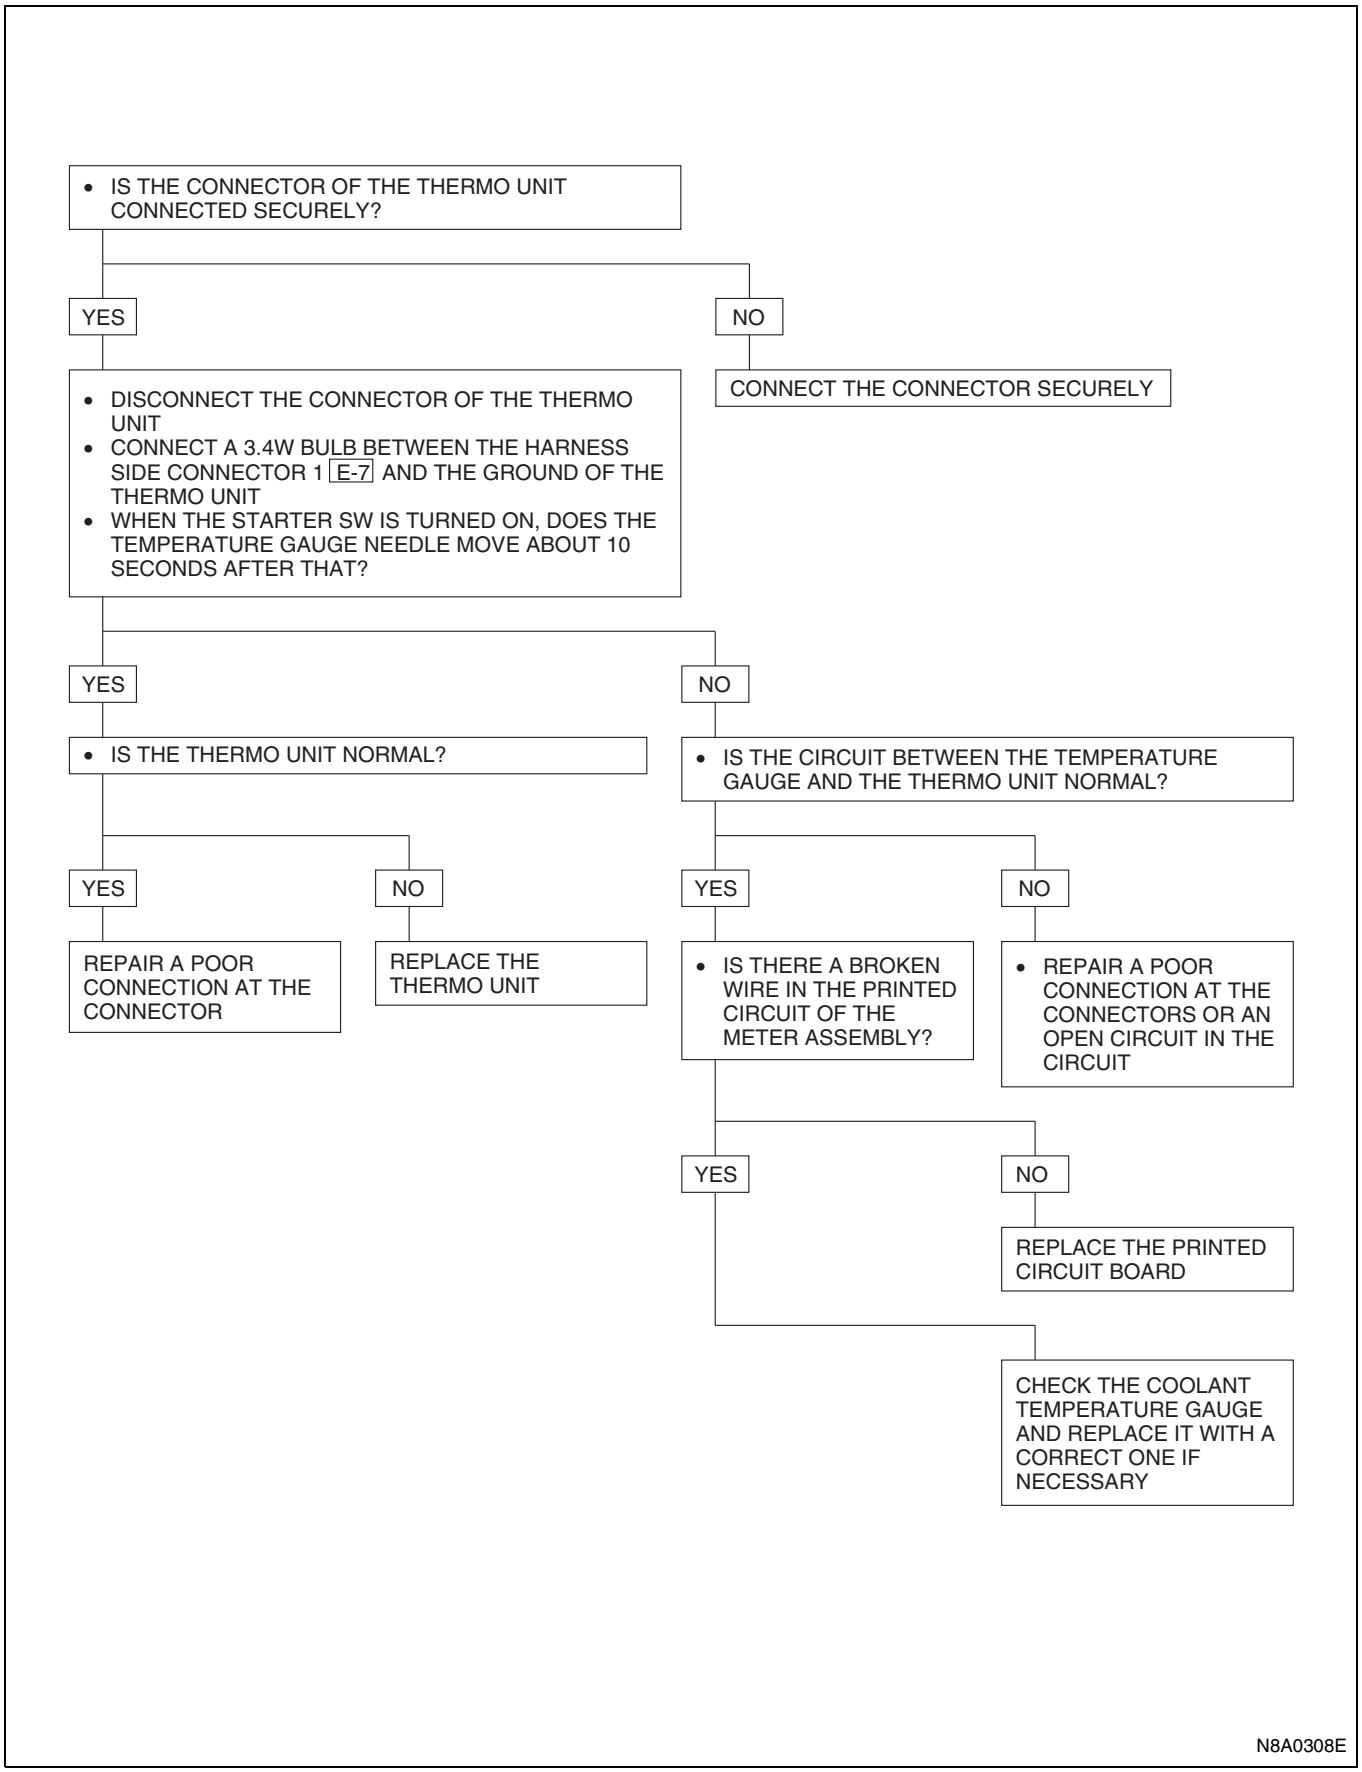


2-3. Tachometer Needle Jumps Erratically

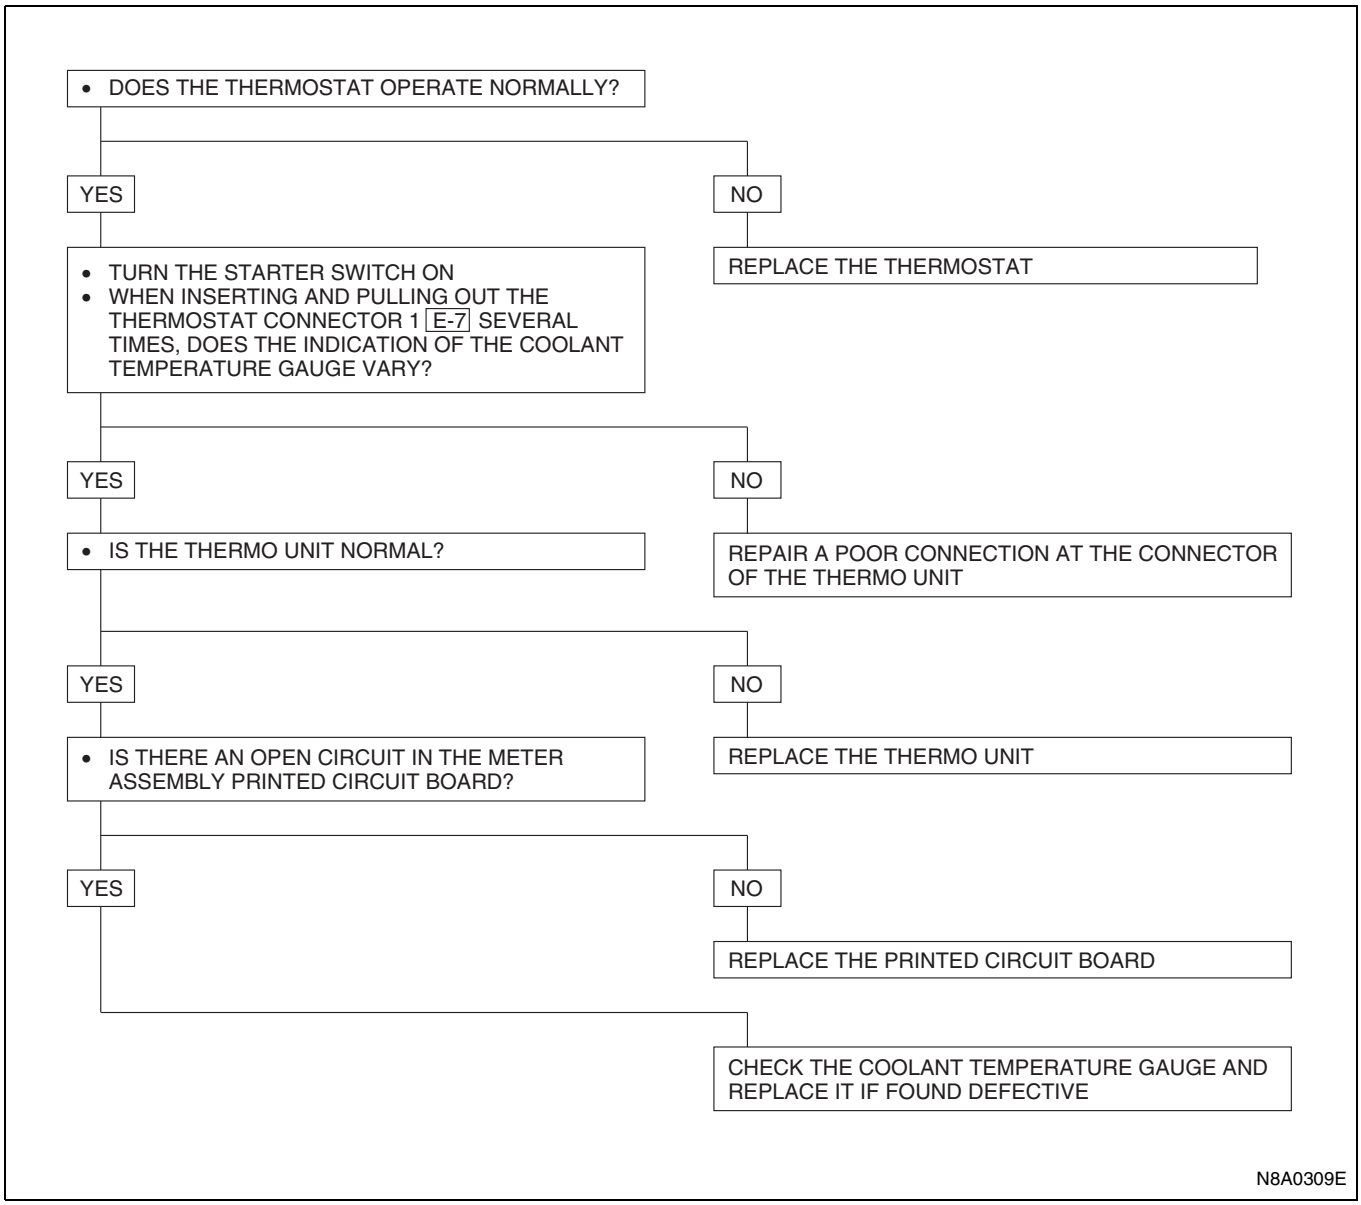


3. Coolant Temperature Gauge

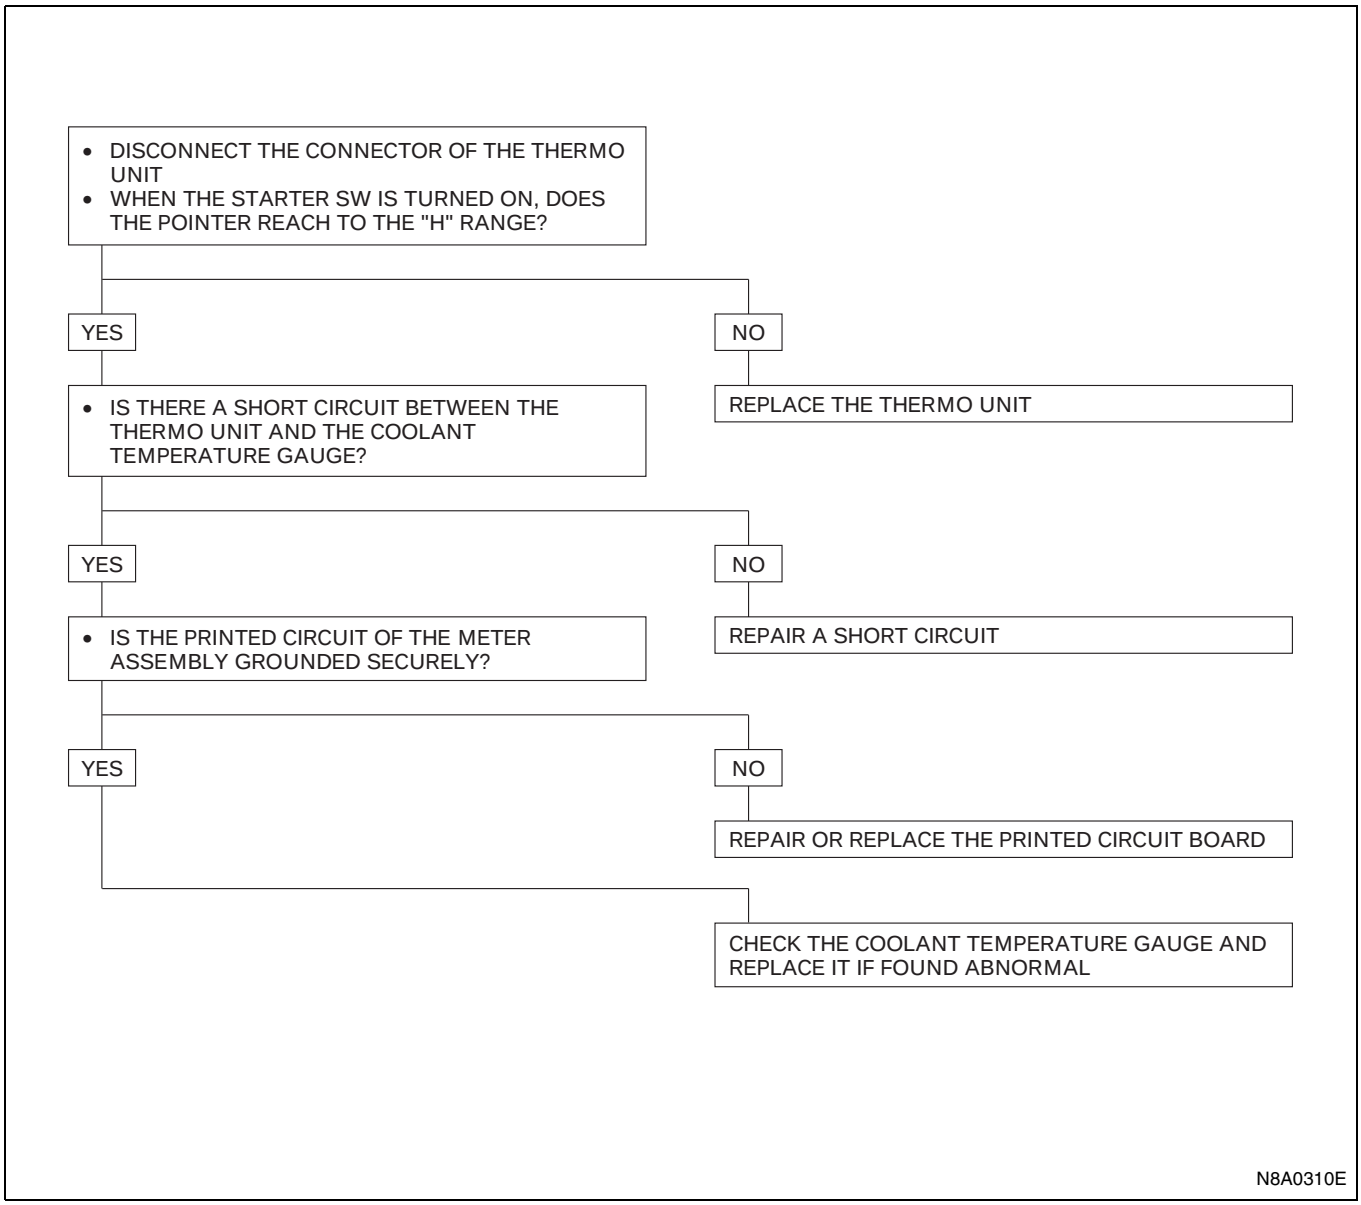
3-1. Coolant Temperature Gauge Needle Does Not Move



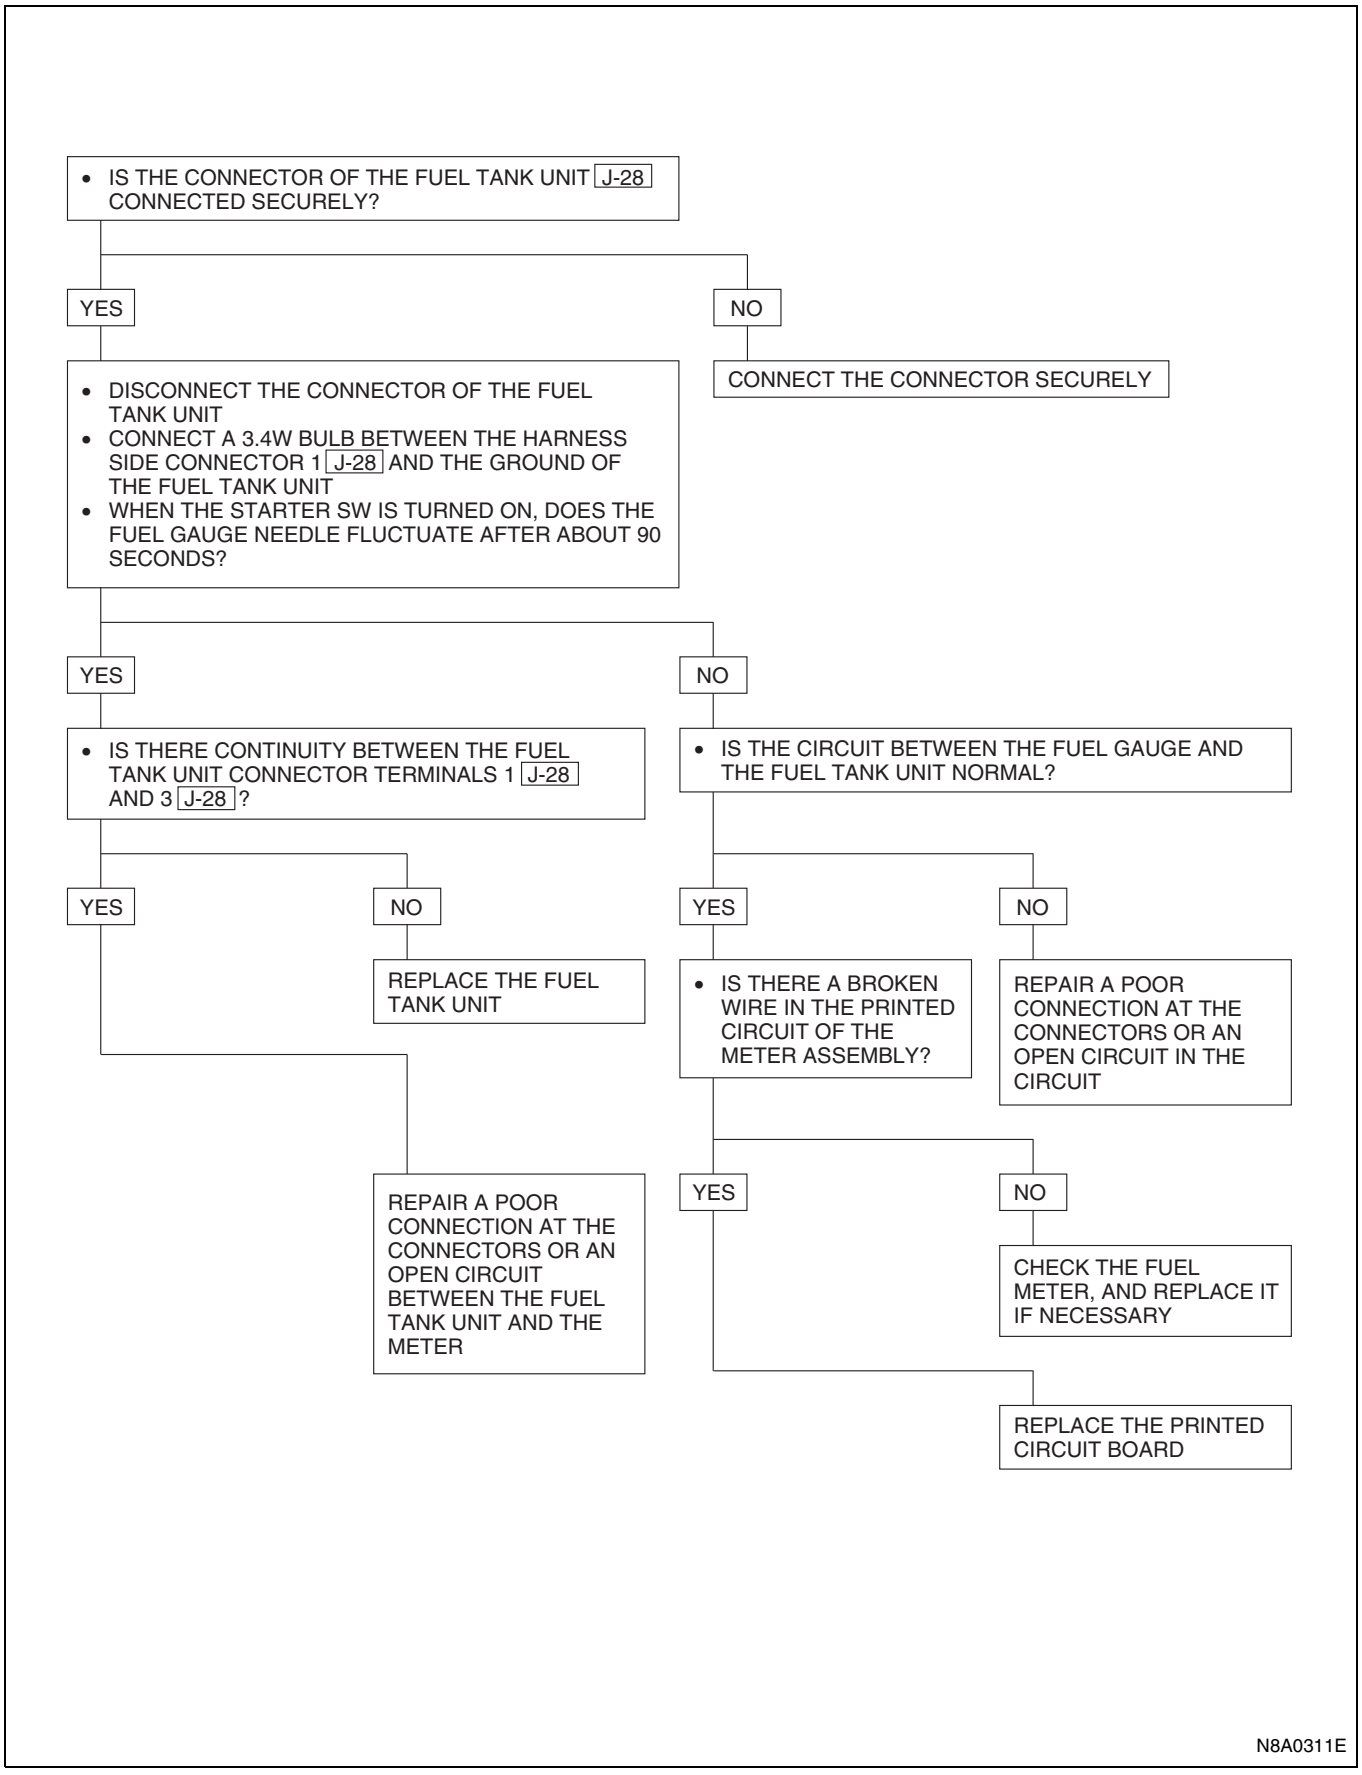
3-2. Coolant Temperature Gauge Reading Is Too Low (or High)



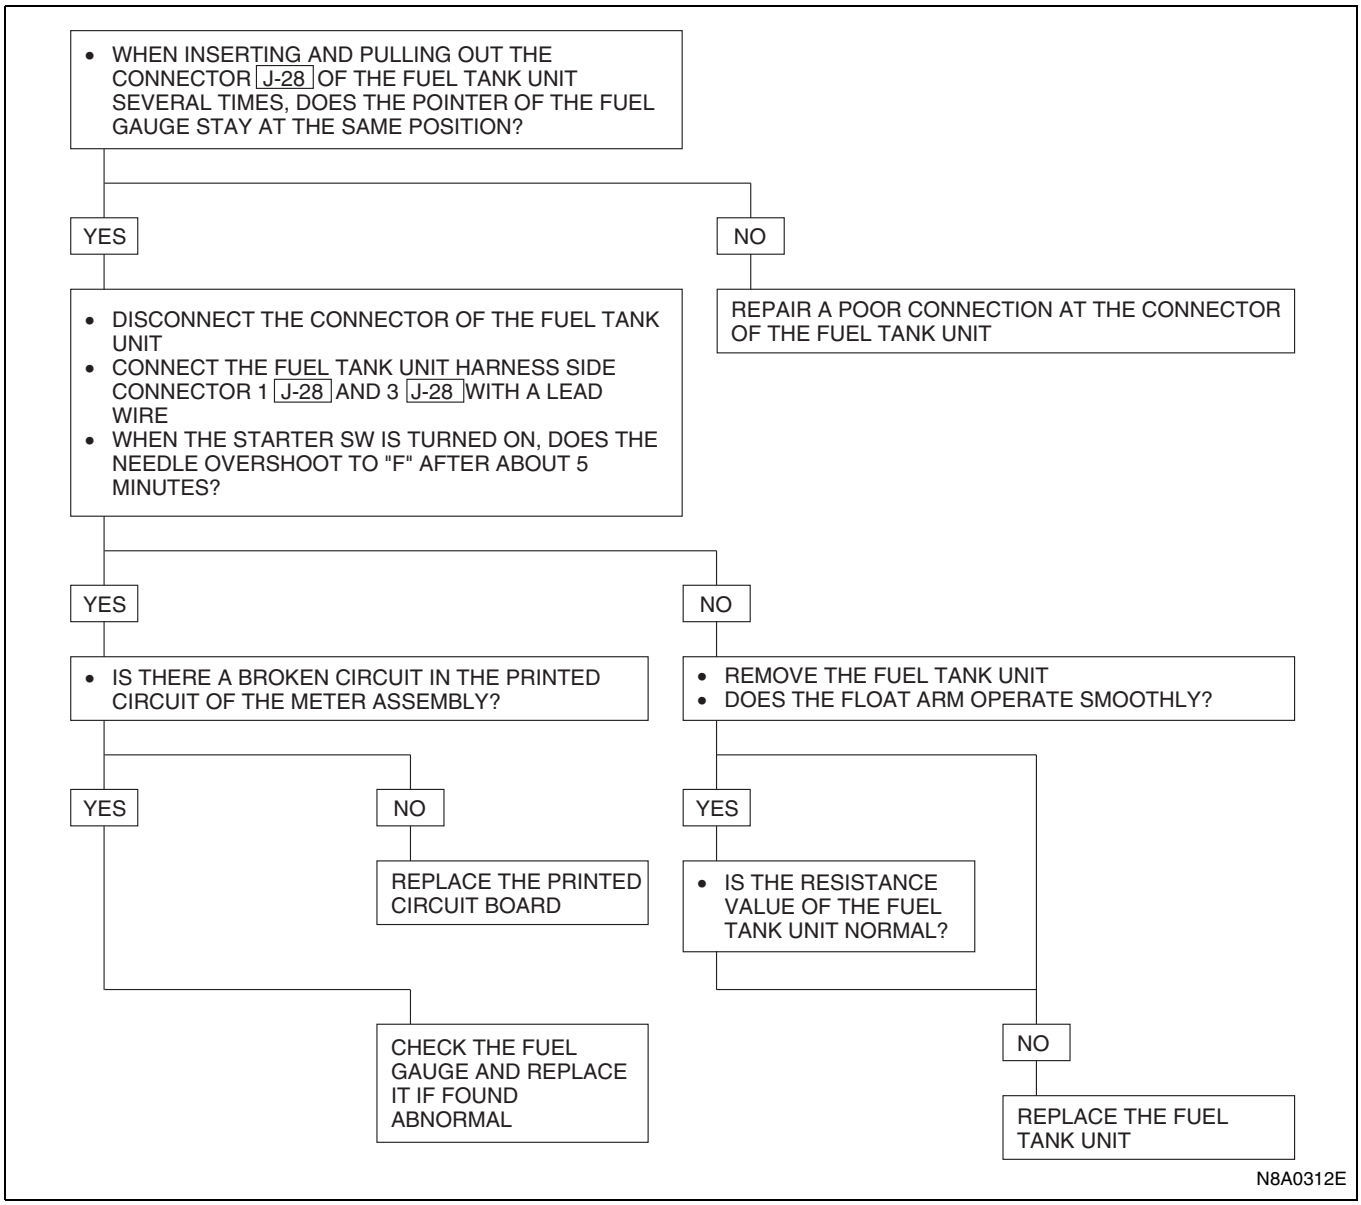
3-3. Needle Overshoots (or Goes Up to the “H” Range)



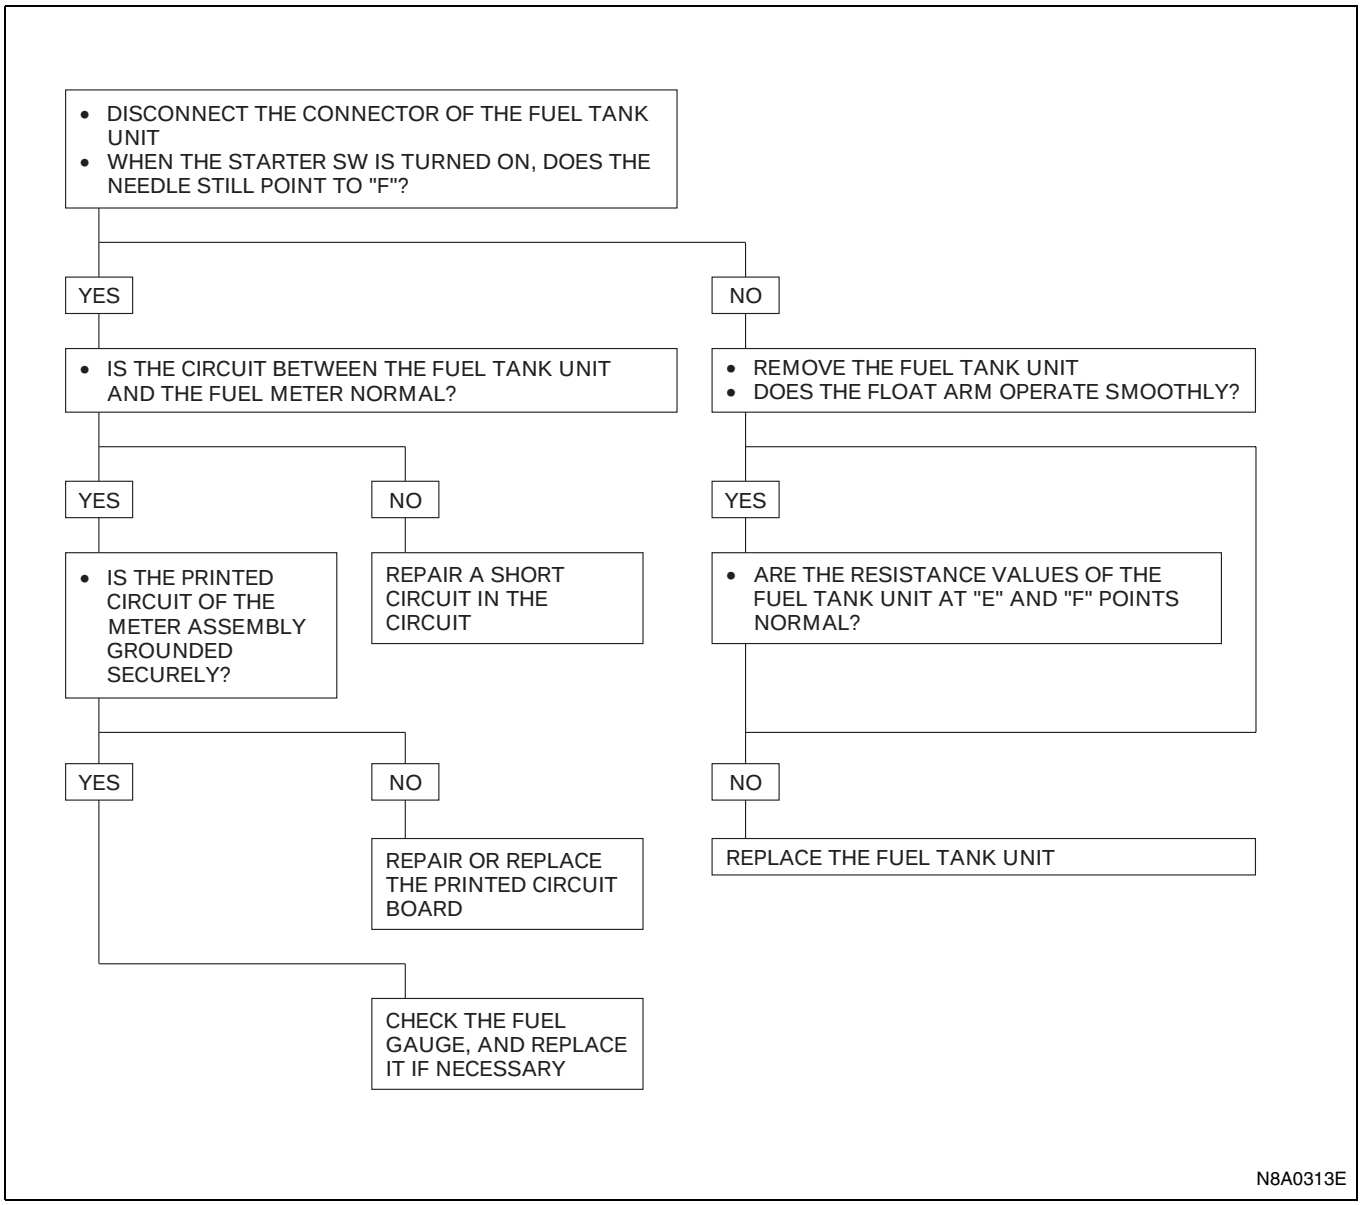
4. Fuel Gauge
4-1. Fuel Gauge Needle Does Not Move



4-2. Even when The Tank Is Filled Up with Fuel, The Needle Does Not Reach “F”

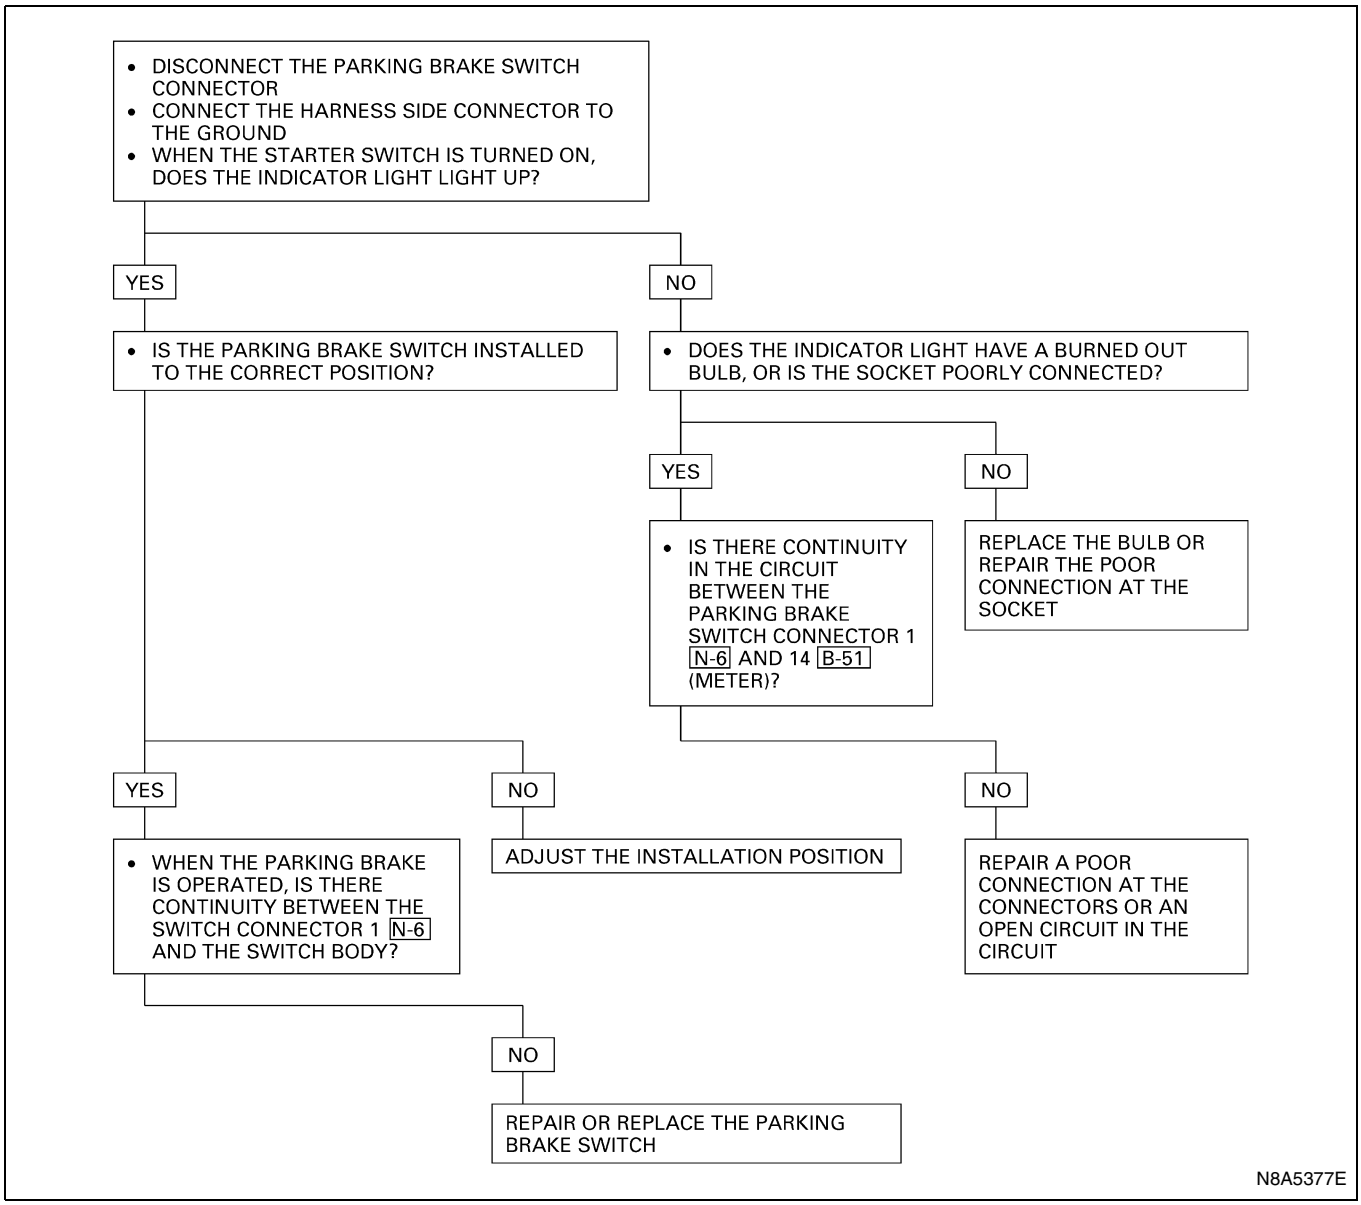


4-3. When The Tank Is Not Full of Fuel, The Needle Overshoots (or Goes Up to “F”)

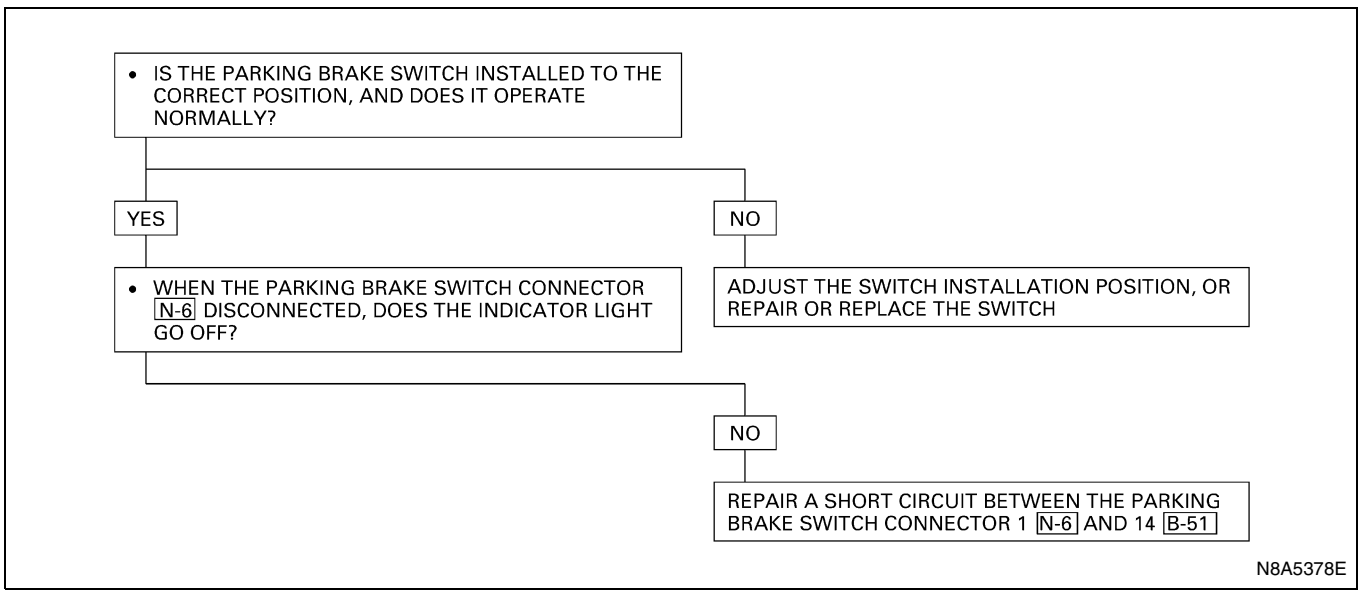


5. Warning/indicator Light

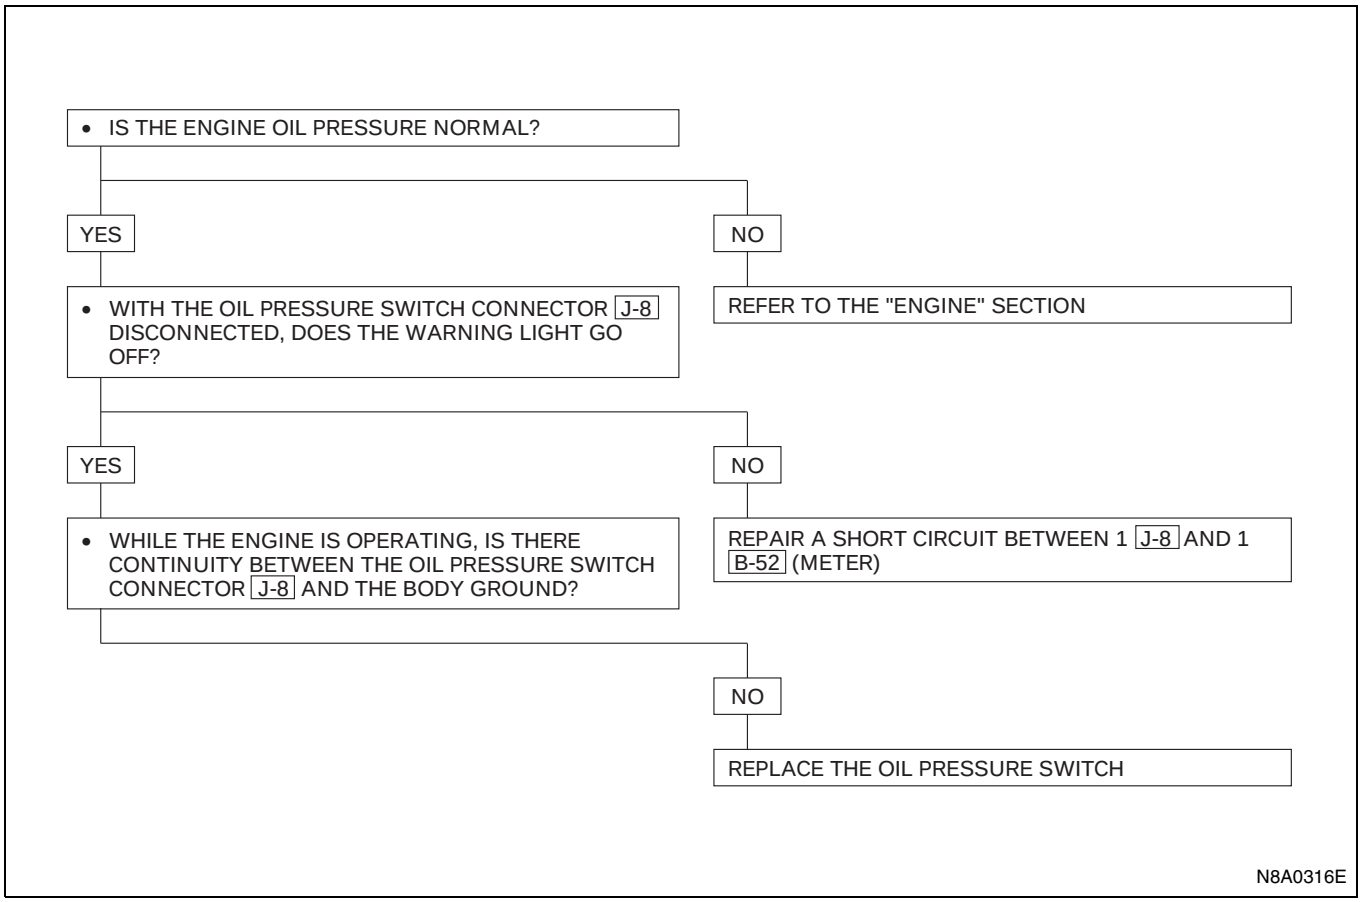
5-1. When The Parking Brake Lever Is Pulled, The Indicator Light Does Not Light Up



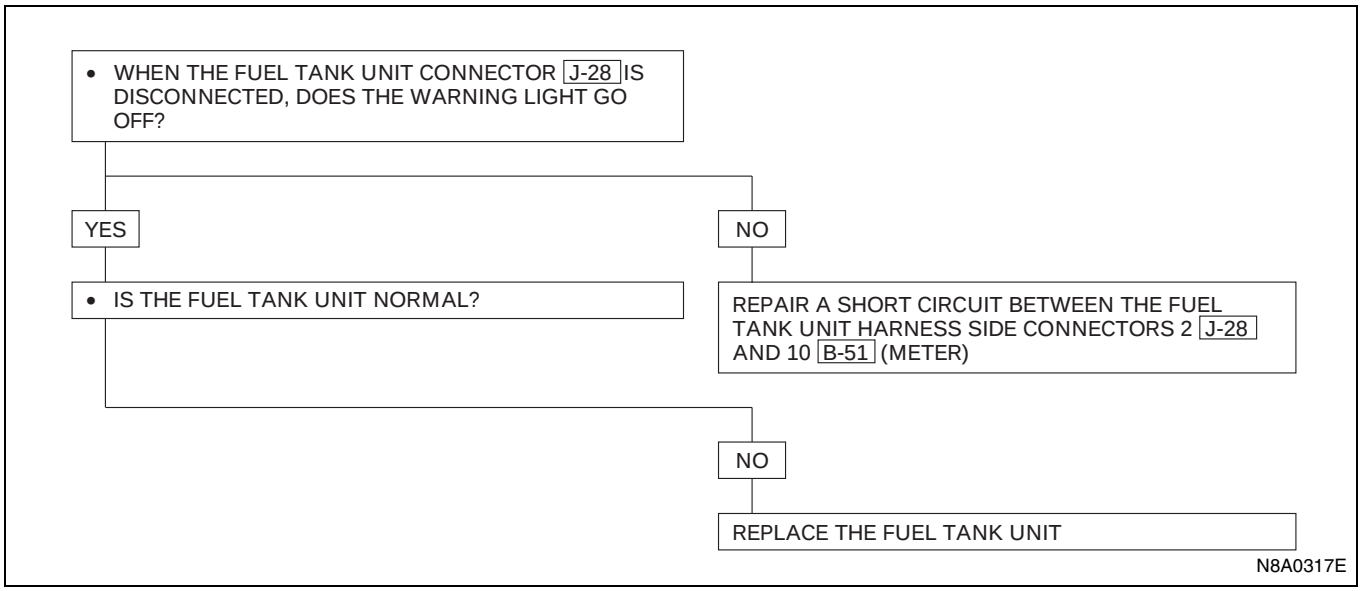
5-2. Even When The Parking Brake Lever Is Released, The Indicator Light Does Not Go Off



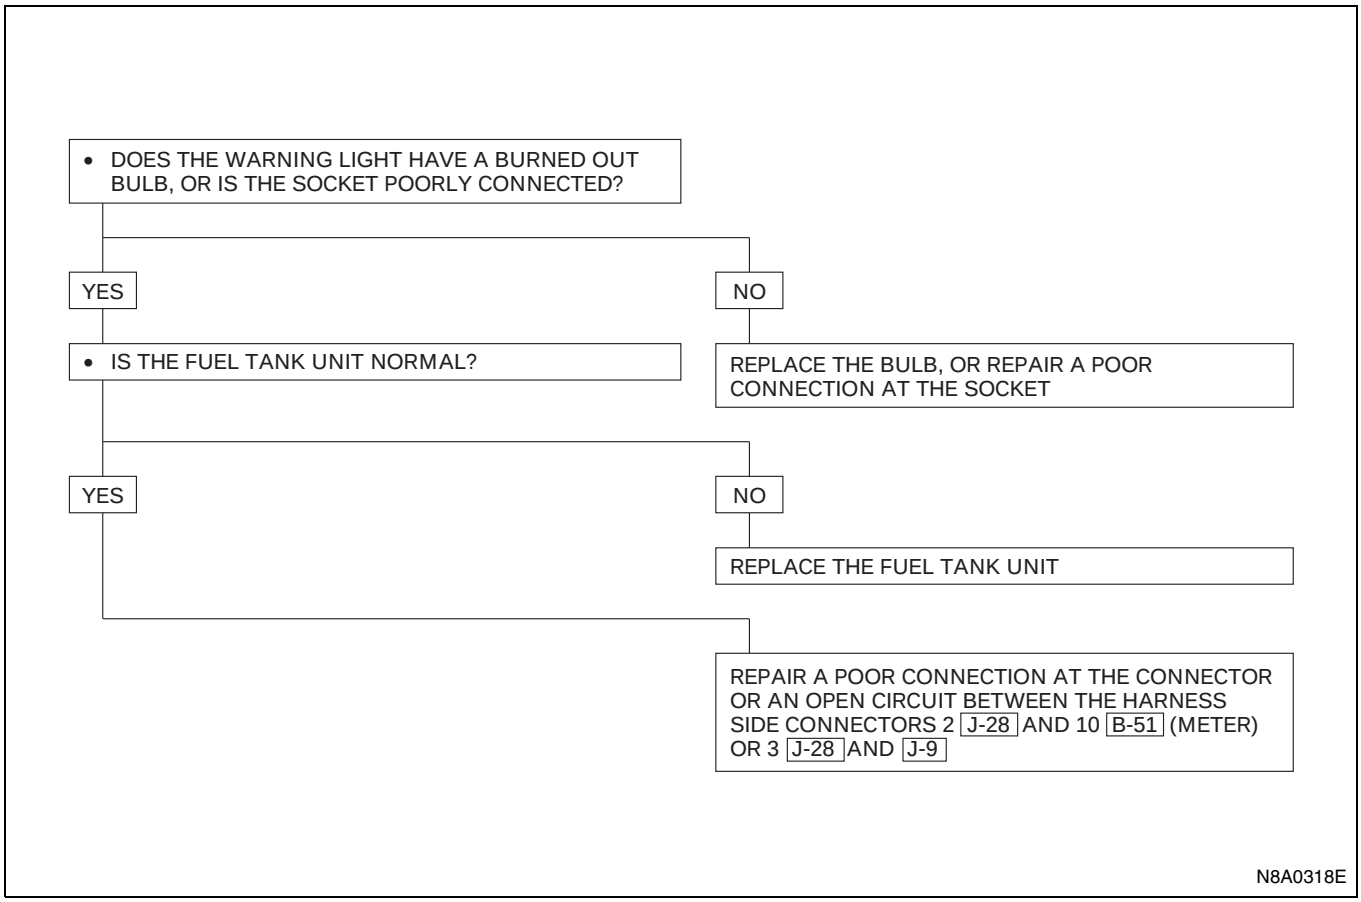
5-3. While The Engine Is Operating, The Oil Pressure Warning Light Does Not Go Off



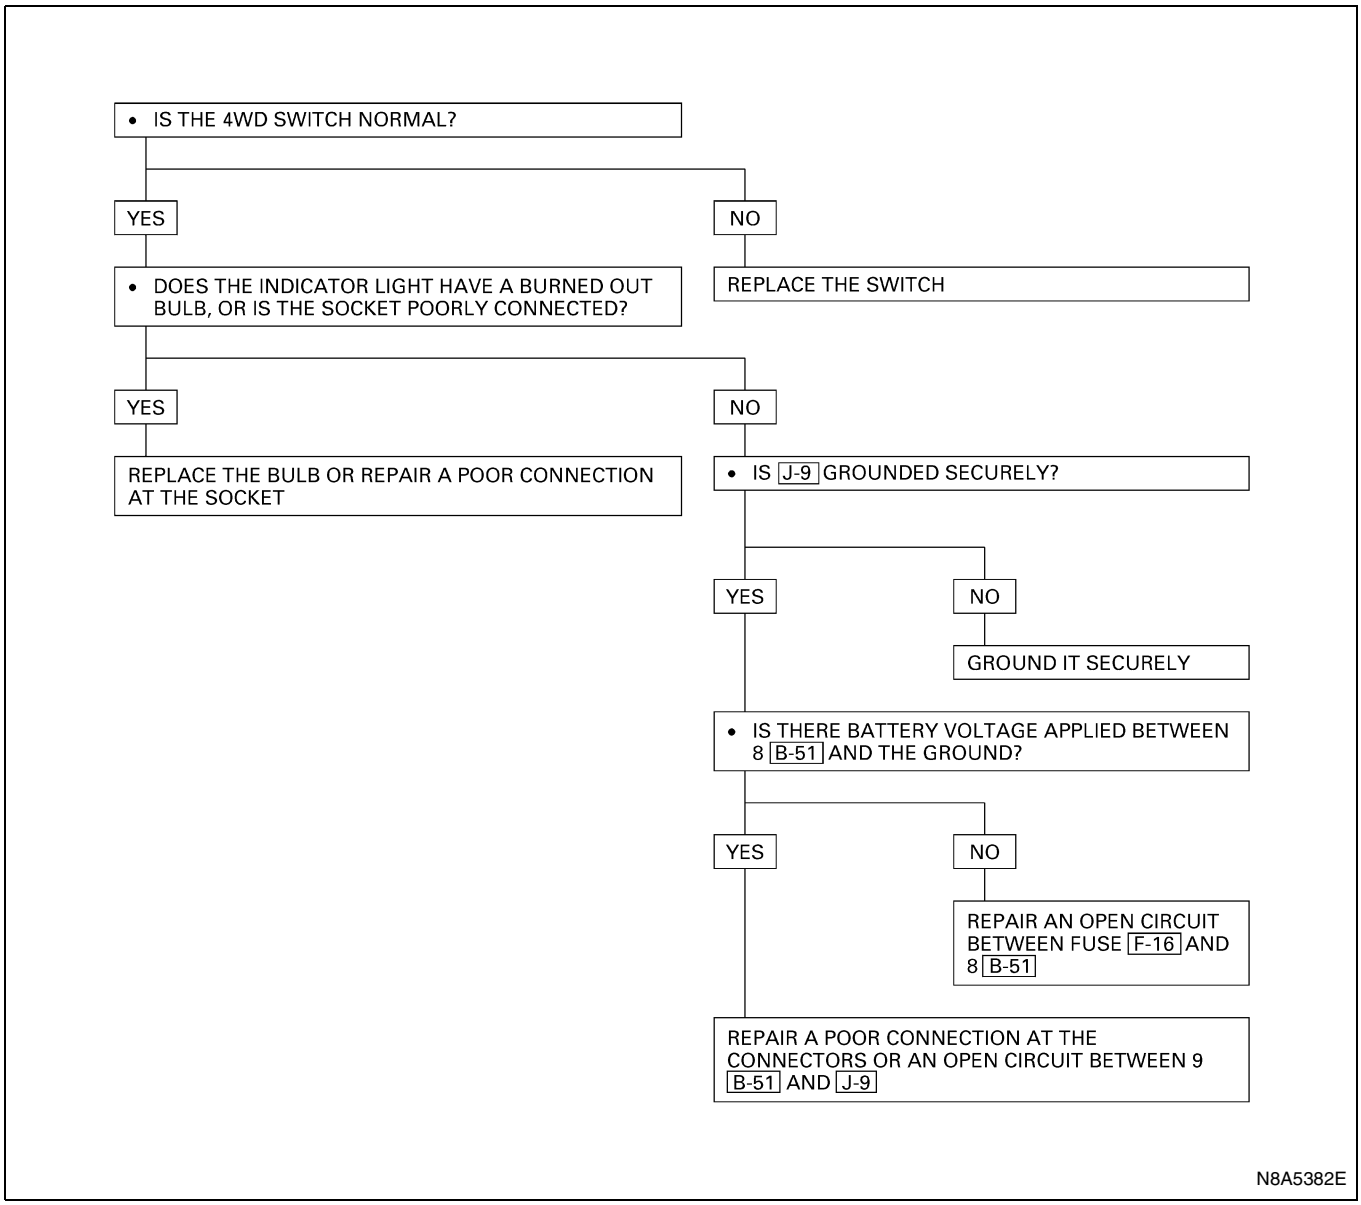
5-4. Even When The Fuel Tank Is Full with Fuel, The Fuel Warning Light Lights Up



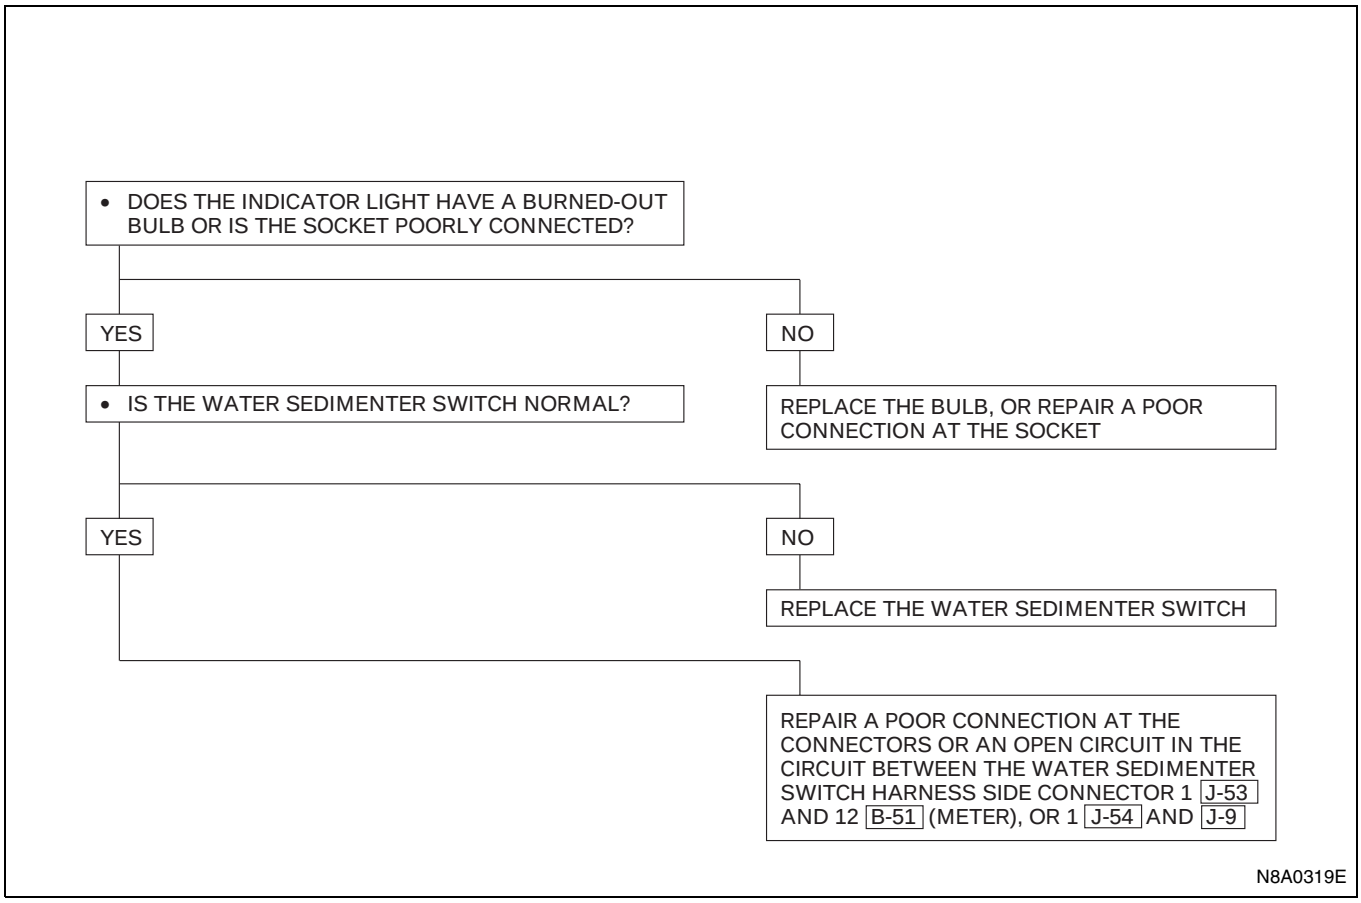
5-5. Even When The Fuel Tank Is Empty, The Low Fuel Warning Light Does Not Light Up



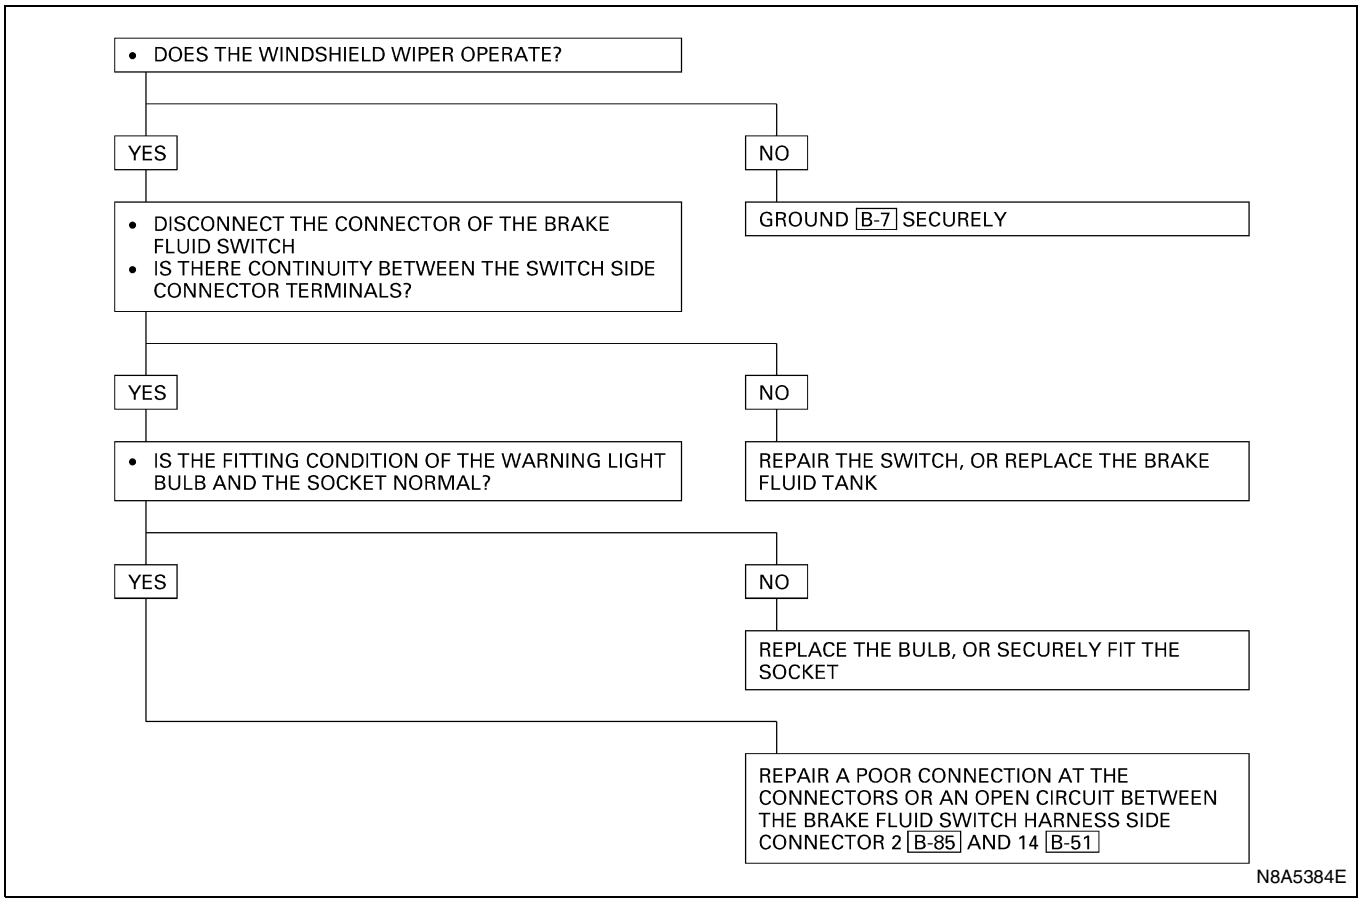
5-6. Even When The Transfer Level Is Shifted to 4wd Position, The Indicator Light Does Not Light Up



5-7. Even When The Float in The Water Sedimenter Goes Up above The Drain Warning Level, The Indicator Light Does Not Light Up



5-8. Even When The Brake Fluid Is Lower than Specified Level, The Level Warning Light Does Not Light Up



5-9. Vacuum Warning Buzzer Does Not Sound

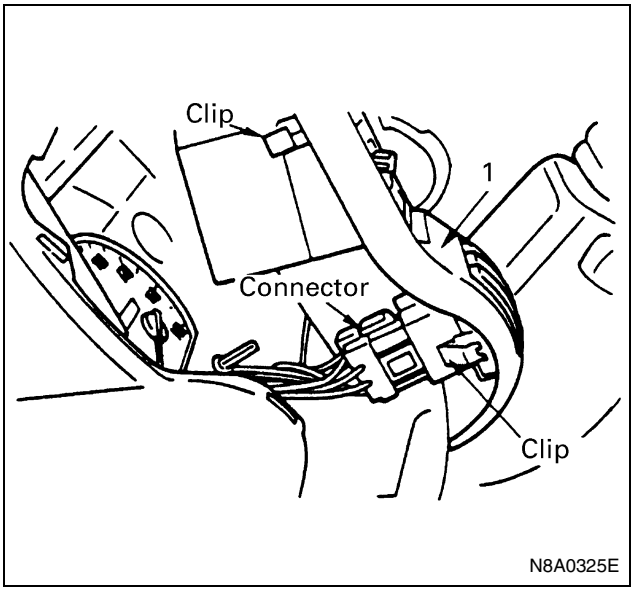
Removal

Preparation:

Disconnect the battery ground cable.

1. Meter Cluster

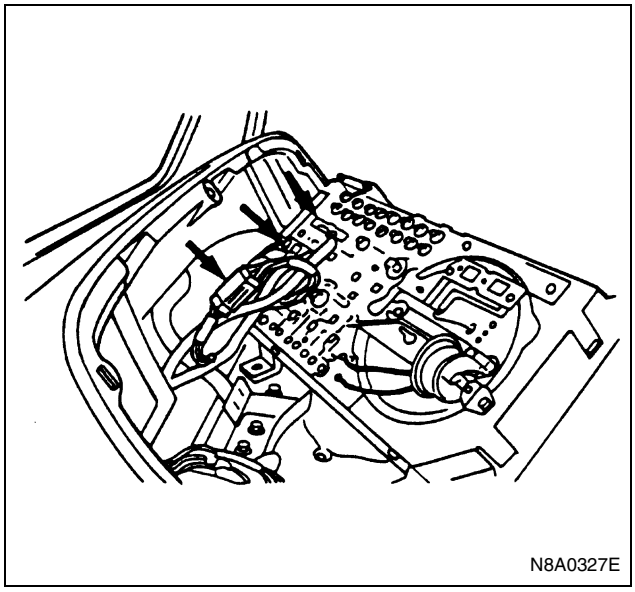


2. Meter Assembly
   Remove the five screws.

   Disconnect the meter connectors.

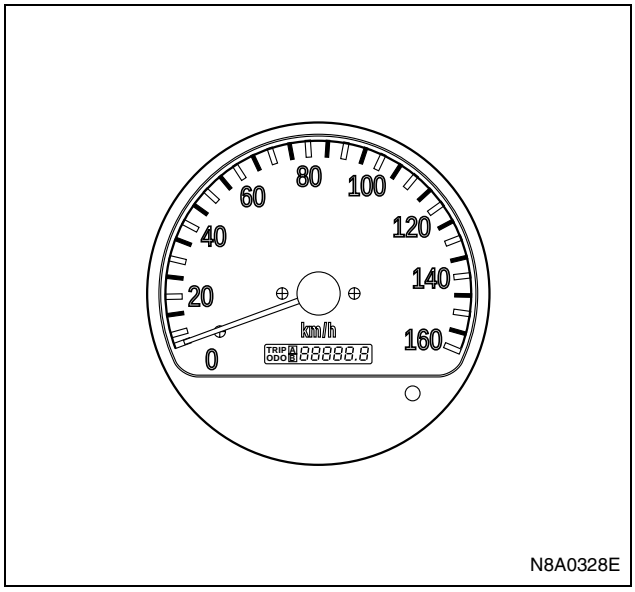
Installation

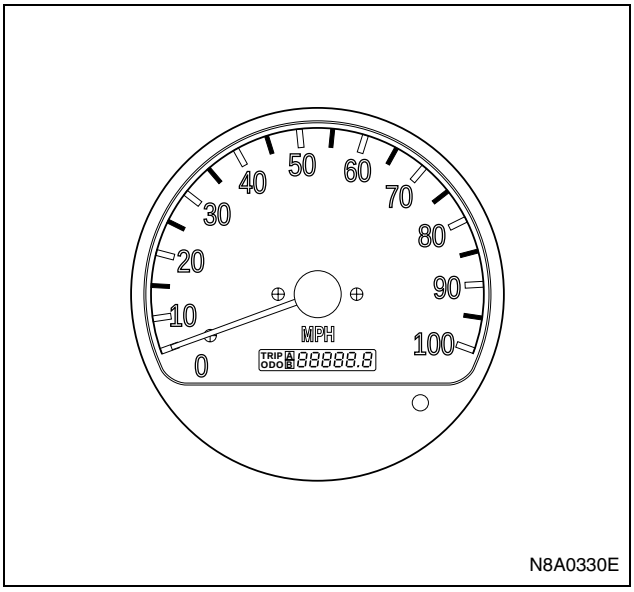
To install, follow the removal steps in the reverse order.



Speedometer

The speedometer is made up of the cross coil type ammeter (movement) that displays indications, the stepper motor that drives and adds up the odometer and trip meter, and the driving circuit (printed circuit board) that makes exchanges between the pulse signals and the current.





On-vehicle Service

Check the meter display accuracy and the operation of the odometer with the speedometer tester.

Notice:

Inappropriate tire inflation may affect the accuracy of the odometer.

(To conduct this test, refer to the tester manufacturer's instruction manual.)

Since the meter display permissible levels above are specifications solely for the meter, they are to be used as reference values when conducting on-vehicle service.

Except 4HK1-TC

Tester display speed	Meter display permissible level
20 km/h	17.5 — 22.5 km/h
40	37.5 — 42.5
60	57.5 — 62.5
80	77.5 — 82.5
100	97.6 — 103.4
120	117.6 — 123.4
140	137.6 — 143.4

Tester display speed	Meter display permissible level
20 MPH	18.3 — 21.7 MPH
40	38.3 — 41.7
60	58.3 — 61.7
80	77.8 — 82.8

For 4HK1-TC (General Export)

Tester display speed	Meter display permissible level
40 km/h	37 — 41 km/h
60	58 — 62
80	77.5 — 82.5
100	97.5 — 103
120	117 — 122.5
140	137.5 — 143

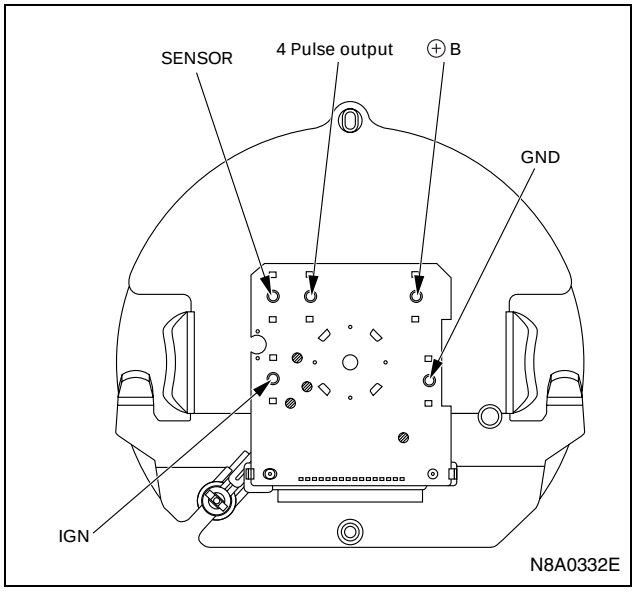
For 4HK1-TC (Europe)

Tester display speed	Meter display permissible level
20 km/h	20 — 22.5 km/h
40	40 — 42.5
60	60 — 63.2
80	79.7 — 83.4

Individual Inspection

Remove the speedometer from the meter assembly and measure the resistance and the current consumption between each terminals.

Replace the speedometer when the result of inspection is found abnormal.



Terminal symbol	Resistance value
IGN — GND	58±20 kΩ
SEN — GND	70±20 kΩ
4P — GND	∞

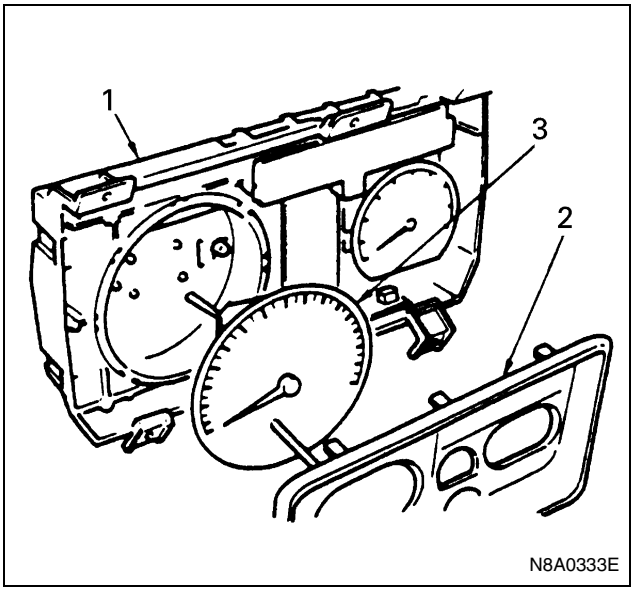
Removal

Preparation:

Disconnect the battery ground cable.

- Except 4HK1-TC

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Meter Glass
   Remove it by pushing the catches with your finger.
3. Speedometer
   Remove four screws securing the meter at the back side.



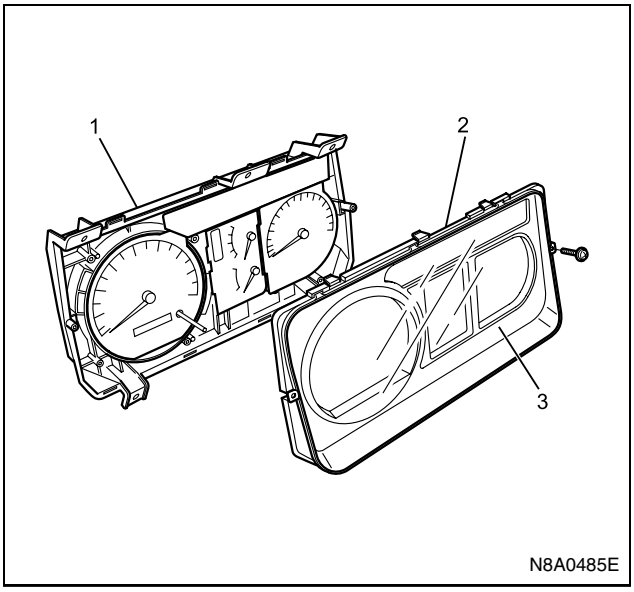
- For 4HK1-TC

1. Remove the meter assembly/speedometer (1).

Notice:
Speedometer cannot be removed as a single unit since it is integrated into the meter assembly.

- Refer to “Meter Assembly” in this section.

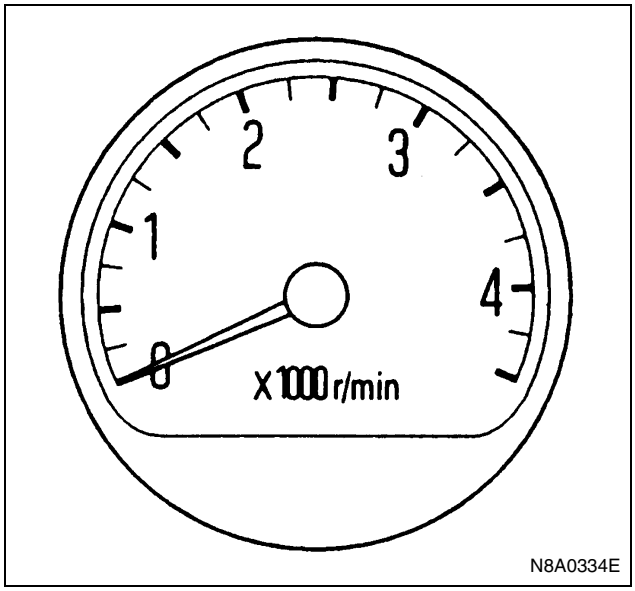
2. Remove the meter plate (2) and meter glass (3).
   - Remove the two installing screws on the meter surface.
   - Remove the meter plate by pushing the catches with your finger.



Installation
To install, follow the removal steps in the reverse order.

Tachometer

The tachometer is made up of the cross coil type ammeter (movement) that displays indications, and the drive circuit (printed board) that makes exchange between the pulse signals and the current.



On-vehicle Service Inspection

1. Set up the tune-up tester to the engine.
2. Start the engine and compare the readings displayed by the tachometer and the tester.
   When the difference between these two readings differs largely from the specified value, replace it with a correct one.

Notice:
Since the meter display permissible levels above are specifications solely for the meter, they are to be used as reference values when conducting on-vehicle inspection.

Except 4HK1-TC

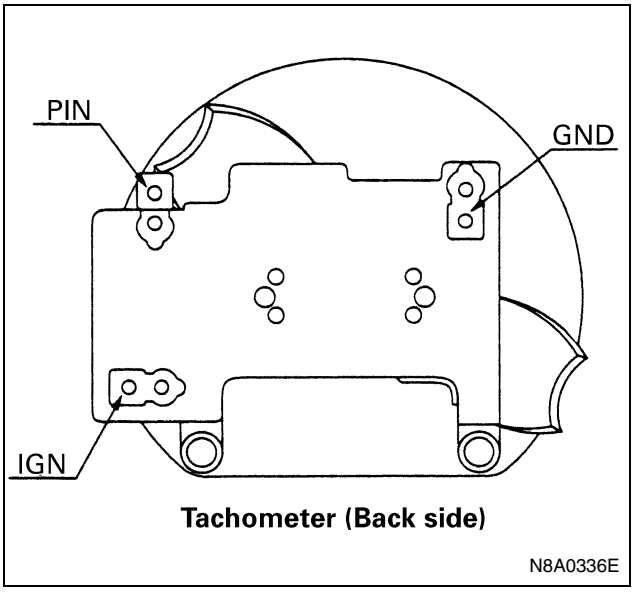
Tester display speed	Meter display permissible level
500	400 — 500
1000	800 — 1050
2000	1800 — 2050
3000	2800 — 3050
4000	3800 — 4050

For 4HK1-TC

Tester display speed	Meter display permissible level
750	700 — 800
2000	1900 — 2150
3000	2950 — 3200
4000	3950 — 4200

Individual Inspection

Remove the tachometer from the meter assembly and measure the resistance value and the current consumption between each terminals.
Replace the tachometer when the result of inspection is found abnormal.



Tachometer (Back side)

N8A0336E

1. Resistance value

Use the analog type circuit tester. (Range: 1K)
For 12 Volt tachometer

Terminal symbol	Tester terminal			
	Red (+)	Black (–)	Black (–)	Red (+)
IGN–GND	IGN	GND	IGN	GND
	∞		30±5 kΩ	
PIN–GND	PIN	GND	PIN	GND
	33±5 kΩ		500 — 1000 kΩ	

For 24 Volt tachometer

Terminal symbol	Tester terminal			
	Red (+)	Black (–)	Black (–)	Red (+)
IGN — GND	IGN	GND	IGN	GND
	∞		30±5 kΩ	
PIN — GND	PIN	GND	PIN	GND
	33±5 kΩ		500 — 1000 kΩ	

2. Current value

Use the analog type circuit tester.
Since the current consumption fluctuates as the power voltage varies, check to be sure that the voltage applied is 12±1 V or 24±1 V.

Voltage	Connecting terminal	Current consumption	Remarks
12Volt	IGN — GND	12±1 V (when 12±1 V applied)	No signal input
24Volt		24±1 V (when 24±1 V applied)	No signal input

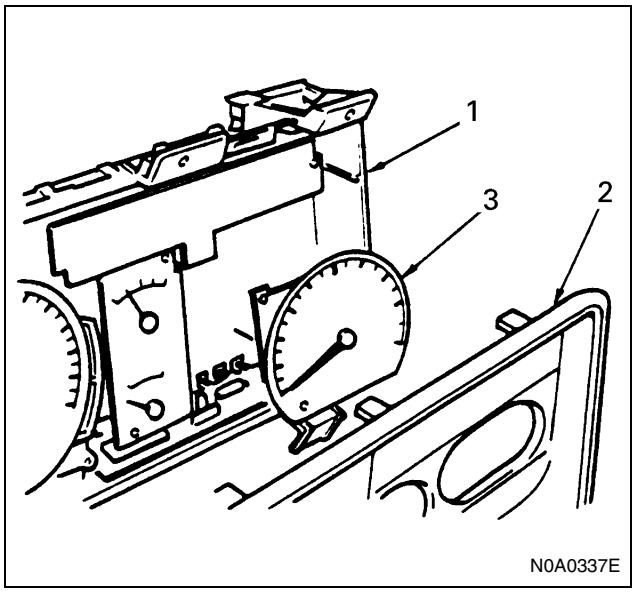
Removal

Preparation:

Disconnect the battery ground cable.

- Except 4HK1-TC

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Meter Glass
   Remove it by pushing the catches with your finger.
3. Tachometer
   Remove three screws securing the meter at the back side.



N0A0337E

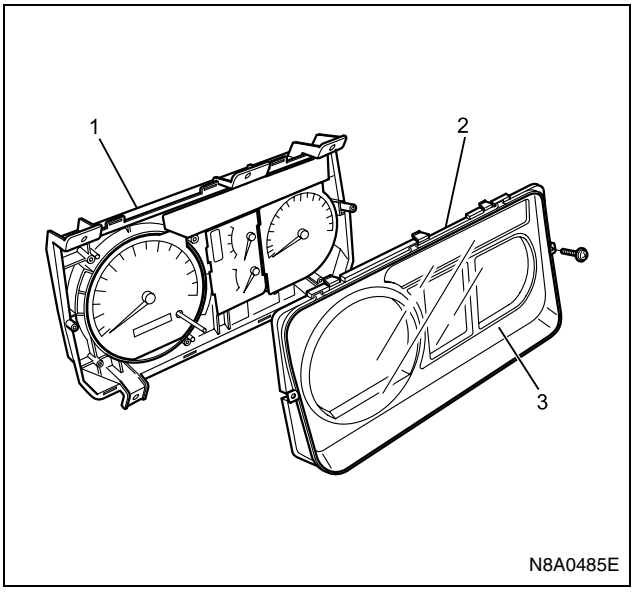
- For 4HK1-TC

1. Remove the meter assembly/tachometer (1).

Notice:
Tachometer cannot be removed as a single unit since it is integrated into the meter assembly.

- Refer to “Meter Assembly” in this section.

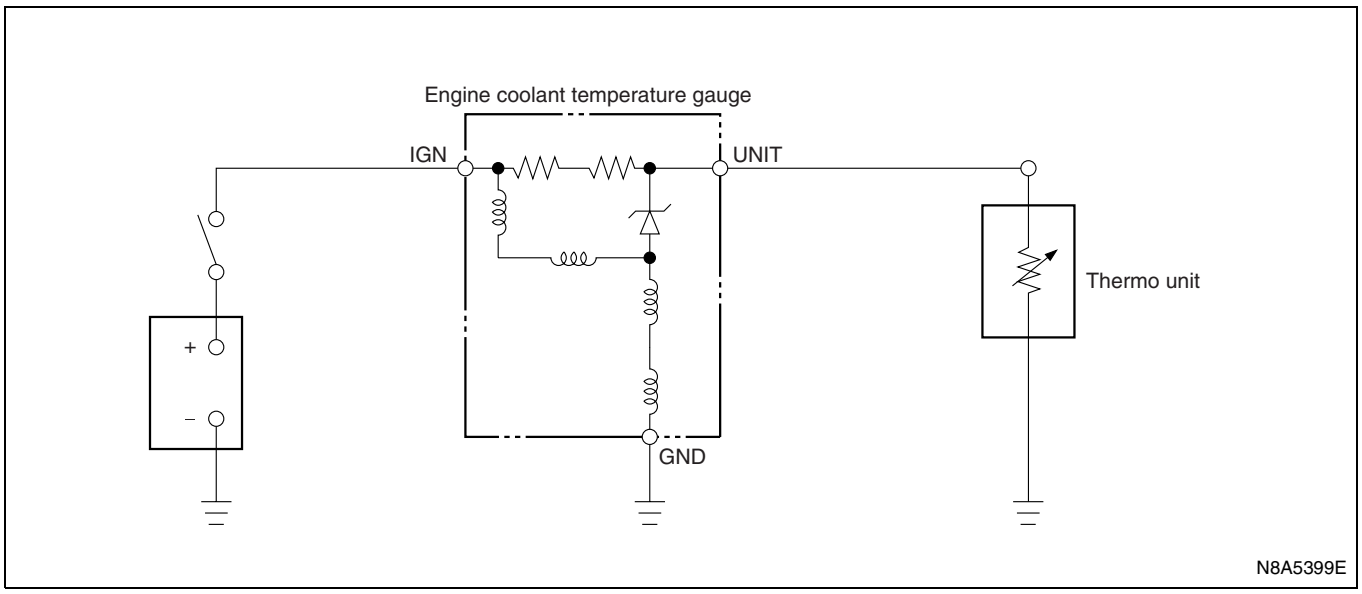
2. Remove the meter plate (2) and meter glass (3).
   - Remove the two installing screws on the meter surface.
   - Remove the meter plate by pushing the catches with your finger.



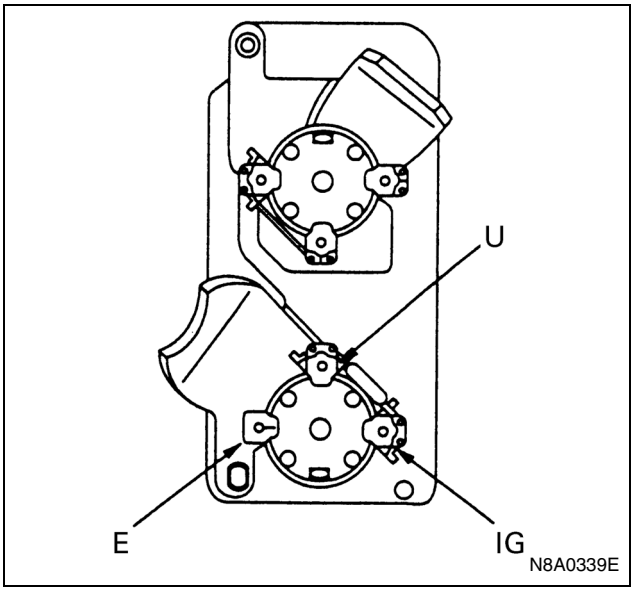
Installation
To install, follow the removal steps in the reverse order.

Coolant Temperature Gauge

Circuit Diagram



Inspection
Remove the coolant temperature gauge from the meter assembly, and measure the resistance value between each terminal.
Replace the coolant temperature gauge when the result of inspection is found abnormal.



Terminal symbol	Resistance value
IG — U	169 Ω±10%
U — E	333 Ω±10%
IG — E	242 Ω±10%

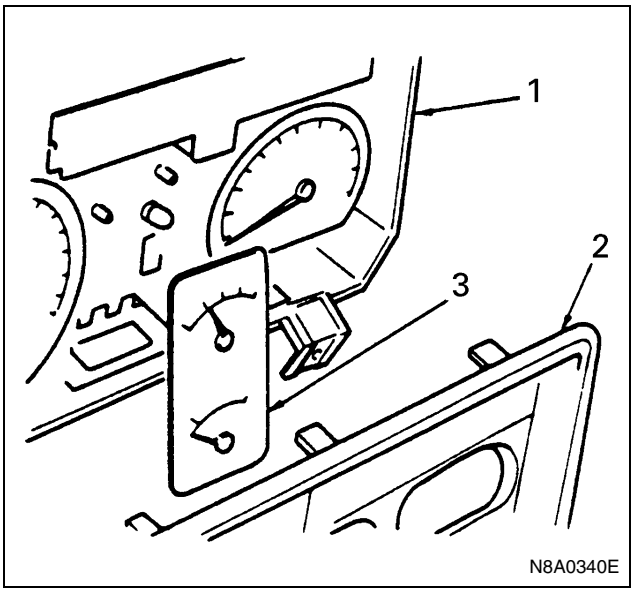
Removal

Preparation:

Disconnect the battery ground cable.

- Except 4HK1-TC

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Meter Glass
   Remove it by pushing the catches with your finger.
3. Coolant Temperature Gauge
   Remove six screws securing the meter at the back side.



- For 4HK1-TC

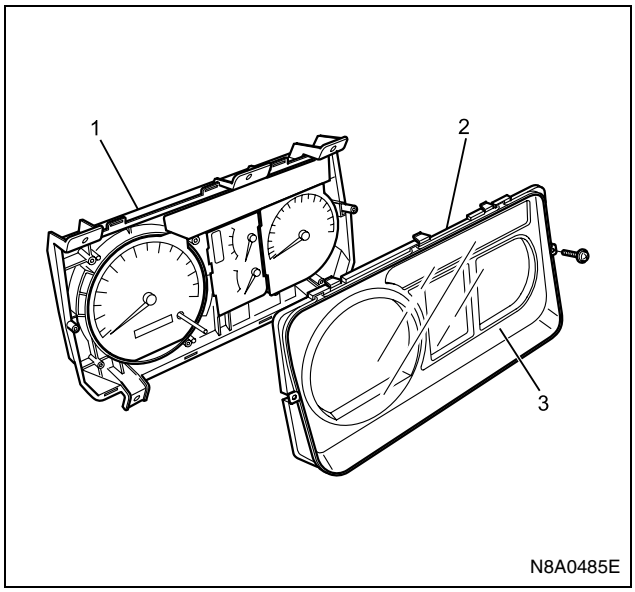
1. Remove the meter assembly (1).

Notice:

Coolant temperature gauge and fuel gauge cannot be removed as a single unit since they are integrated into the meter assembly.

- Refer to “Meter Assembly” in this section.

2. Remove the meter plate (2) and meter glass (3).
   - Remove the two installing screws on the meter surface.
   - Remove the meter plate by pushing the catches with your finger.

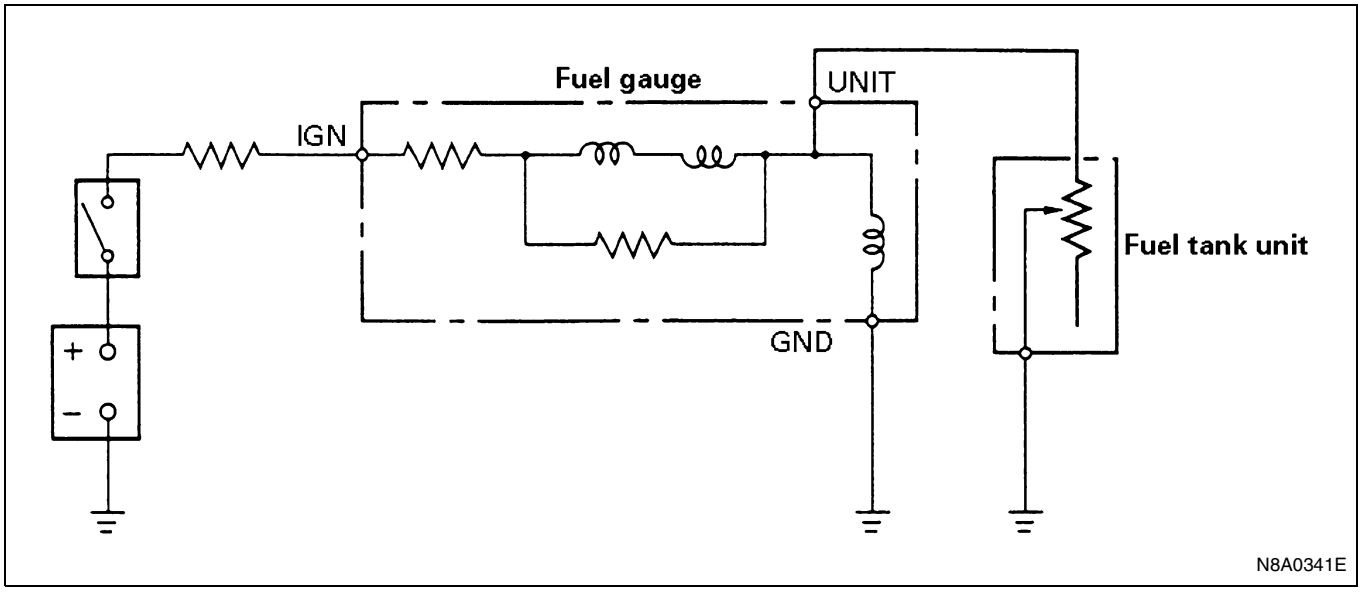


Installation

To install, follow the removal steps in the reverse order.

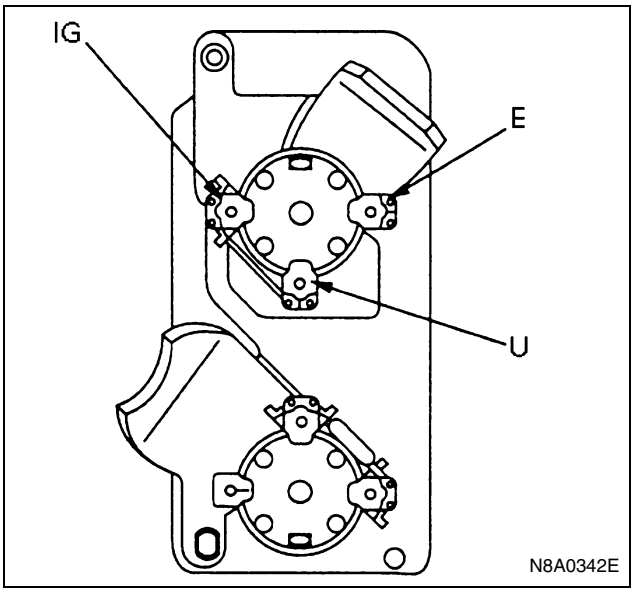
Fuel Gauge

Circuit Diagram



Inspection

Remove the fuel gauge from the meter assembly, and measure the resistance value between each terminal. Replace the meter when the result of inspection is found abnormal.



Terminal symbol	Resistance value
IG — U	108.1 Ω±10%
U — E	103 Ω±10%
IG — E	211.1 Ω±10%

Removal and Installation

Refer to the “COOLANT TEMPERATURE GAUGE” in this section.

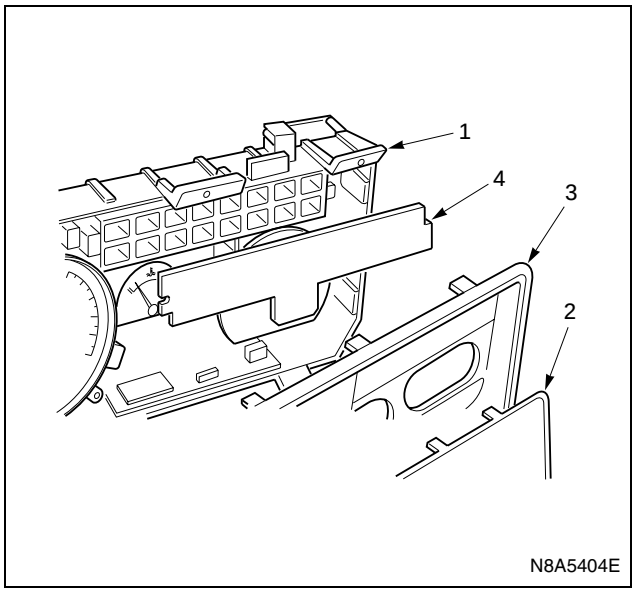
Warning Lens

Removal

Preparation:

Disconnect the battery ground cable.

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Meter Glass
   Remove it by pushing the catches with your finger.
3. Meter Plate
   Remove it by pushing the catches with your finger.
4. Warning Lens



Legend

1. Meter Assembly
2. Meter Glass
3. Meter Plate
4. Warning Lens

Installation

To install, follow the removal steps in the reverse order.

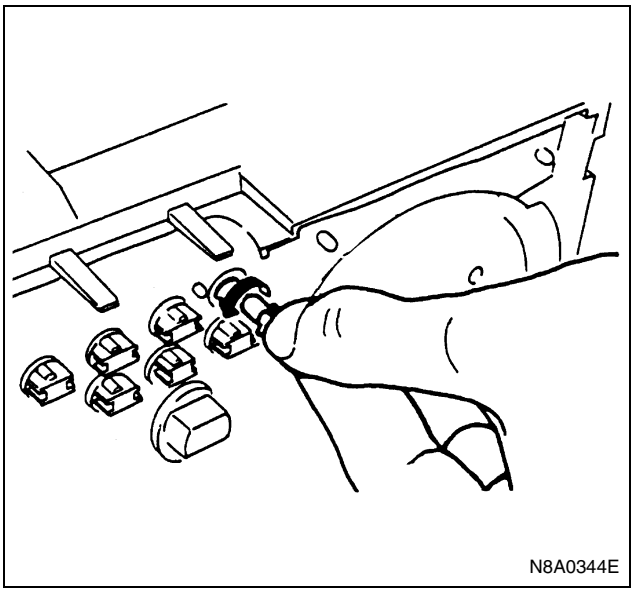
Warning Light Bulb, Indicator Light Bulb and Illumination Light Bulb

Removal

Preparation:

Disconnect the battery ground cable.

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Socket and Bulb
   Hold the bulb socket by hand and rotate it counterclockwise to remove them from the meter body.
3. Bulb
   Pull out the bulb from the socket.



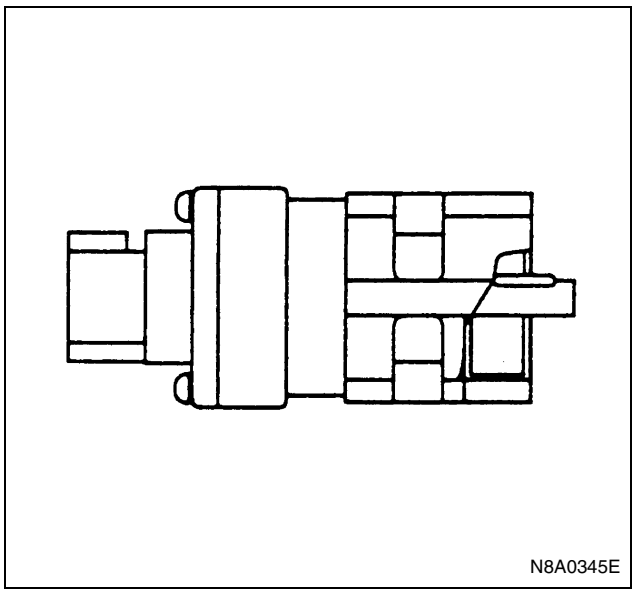
N8A0344E

Installation

To install, follow the removal steps in the reverse order.

Vehicle Speed Sensor

The vehicle speed sensor is installed on the rear portion of the transmission or transfer case.
The number of pulses generated is four pulses per one rotation of the pinion shaft.



N8A0345E

Inspection

1. Connect a resistance of 390 Ω±5%, 2W between connector terminal 1 J-32 and battery (+) terminal and connect the connector terminal 2 J-32 to the battery (−) terminal.

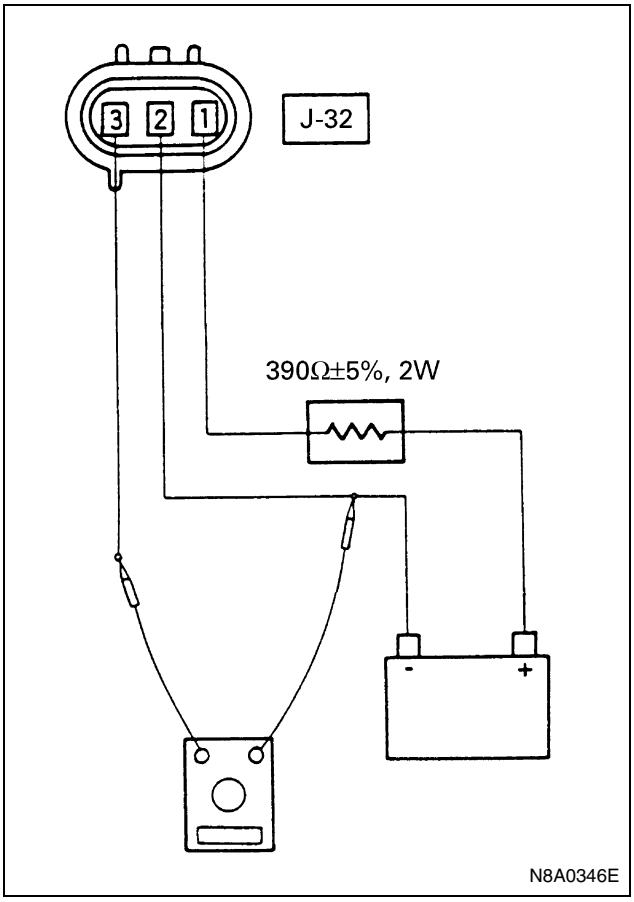
Caution:

Be extremely careful not to connect the battery (+) terminal to the connector 3 J-32.

This may damage the vehicle speed sensor.

2. Rotate the shaft of the vehicle speed sensor slowly and measure the voltage between 3 J-32 and 2 J-32 with a digital tester.

The voltage, with one rotation of shaft, fluctuates four times in the following range: 10 to 14V ↔ 24 or less.
Replace the sensor when the result of inspection is found abnormal.

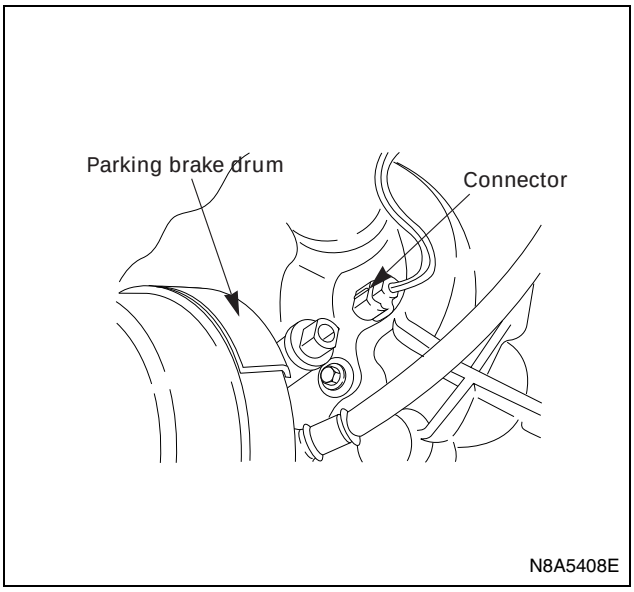


Removal

Preparation:

Disconnect the battery ground cable.

1. Vehicle Speed Sensor
   Disconnect the connector.



Installation

1. Tighten the vehicle speed sensor to the specified torque.

Tighten:

Vehicle speed sensor to 25 N·m (2.5 kg·m/18 lb·ft)

Caution:

Tightening must be made at the hexagonal part of the sensor.

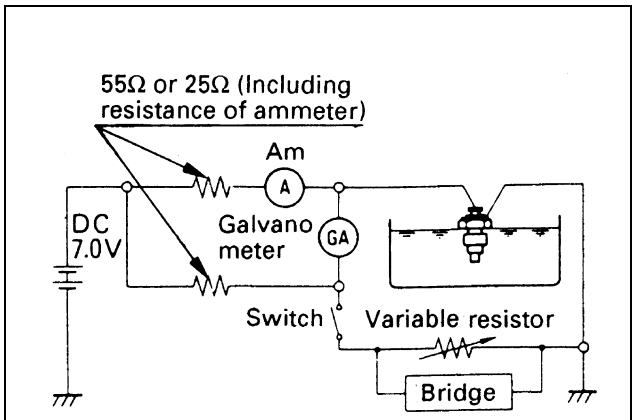
To tighten the connector itself would cause damage.

Thermo Unit

Inspection

The thermo unit is thermistor type and must be inspected under the conditions as shown below.

1. Put the deviation of the galvanometer to 0 by using the variable resistor, switch the thermo unit off and then measure the resistance of the resistor through the bridge.
   Confirm that the resistance is continuously variable in any other points than those shown below.
2. Dip the thermo unit into 80 — 90°C (176 — 194°F) water and confirm that there is no bubble continuously coming out of inside of the unit.
   Replace the unit when the result of inspection is found abnormal.



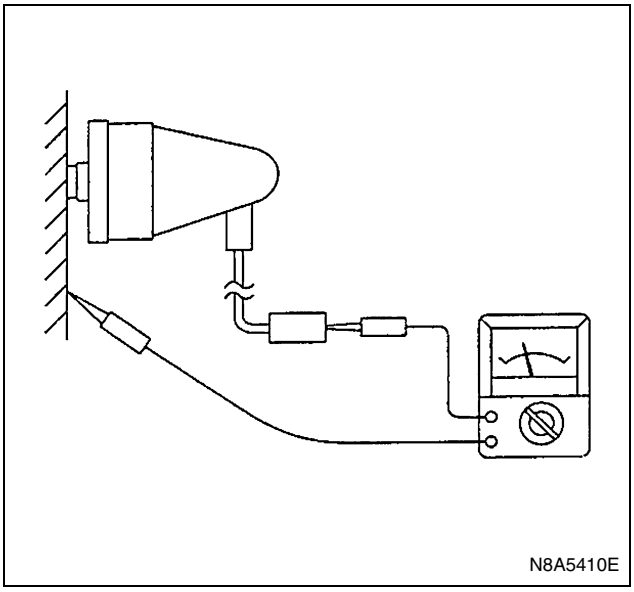
Check condition \ Temperature		50°c (112°F)	115°c (239°F)
7V 55Ω Gauge	Resistance value (Ω)	+33.6 −36.6 226.0	+1.71 −2.21 26.4
7V 25Ω Gauge		–	+2.68 −3.68 24.3

N8A5409E

Oil Pressure Switch

Inspection

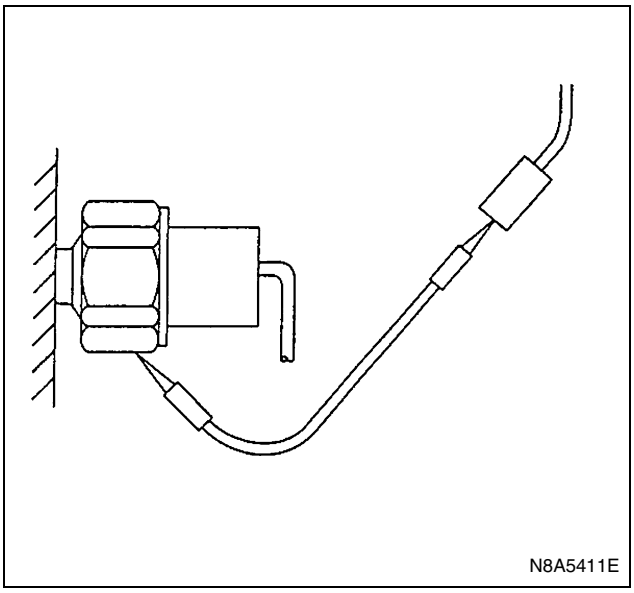
Check the continuity between the switch terminal and the body ground with the starter switch is OFF position. Replace the switch when the result of inspection is found abnormal.



N8A5410E

Circuit Inspection

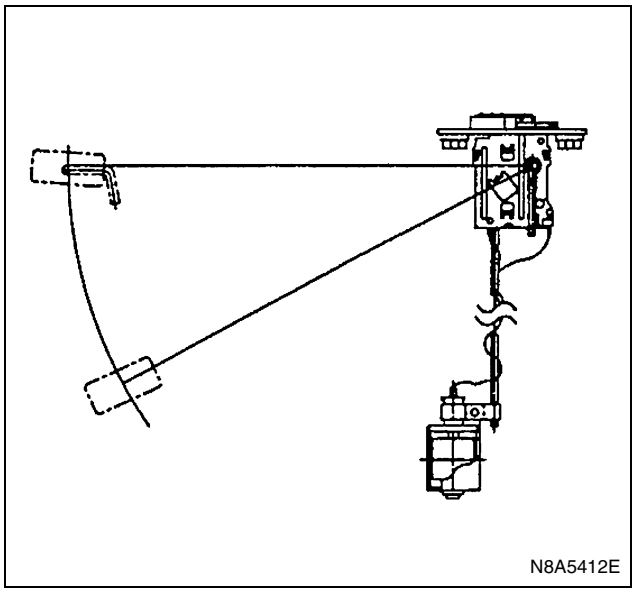
1. Start the engine.
2. When disconnecting the oil pressure switch connector then connecting the harness side connector to the ground, check to see if the oil pressure warning light lights up. When the light will not light up, check the circuit between the meter and the oil pressure switch, and repair an open circuit if necessary.



N8A5411E

Fuel Tank Unit

The tank unit varies the internal resistance according to the float position (fluid level) to operate the fuel meter needle. Also available is the build-in switch type to warn the driver of low fuel level (about 5 liters left in the tank) by illuminating the fuel warning light.

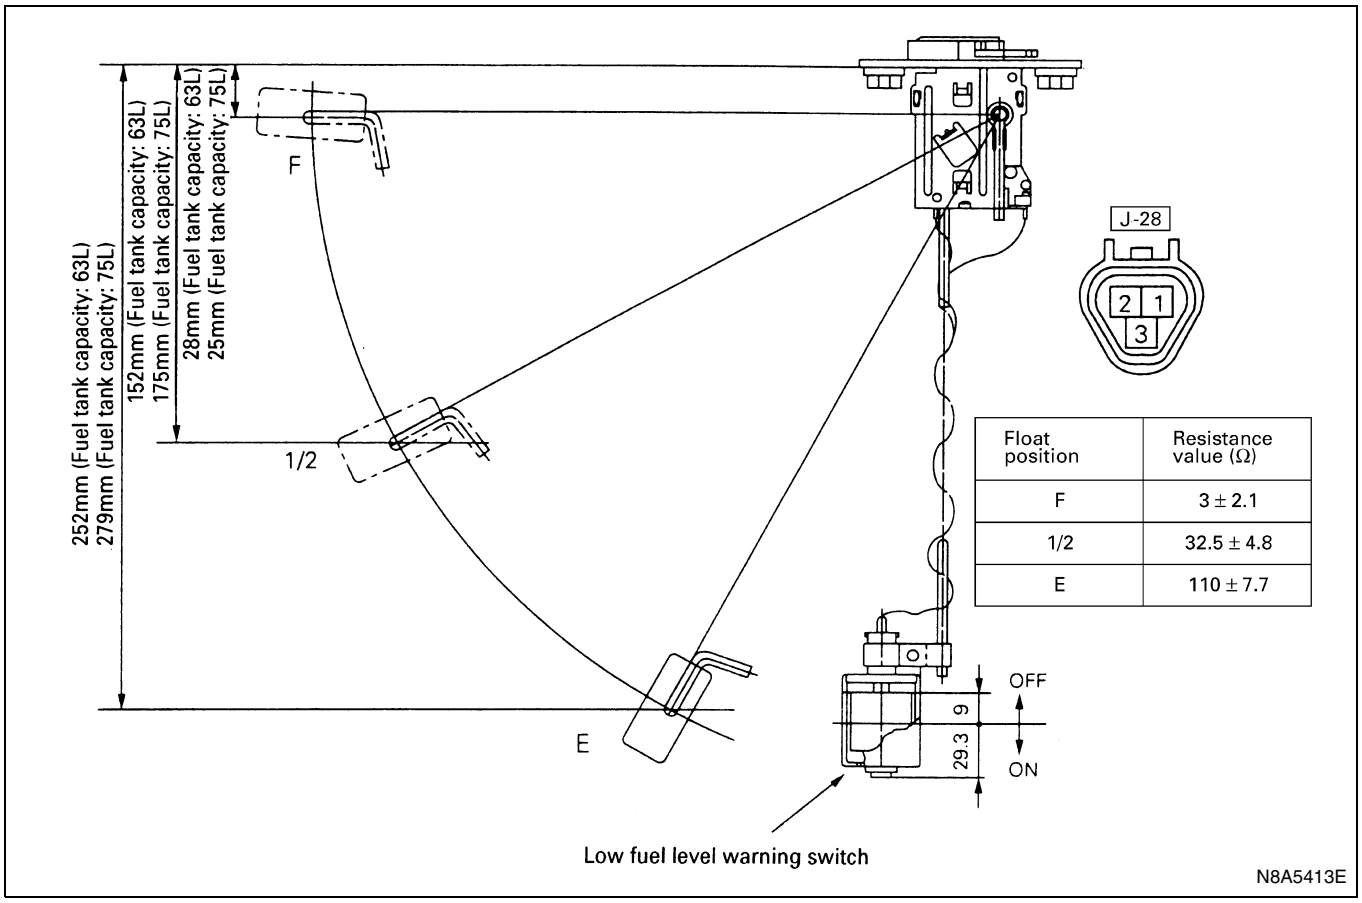


N8A5412E

Inspection

(Level Switch type of warn low fuel level)

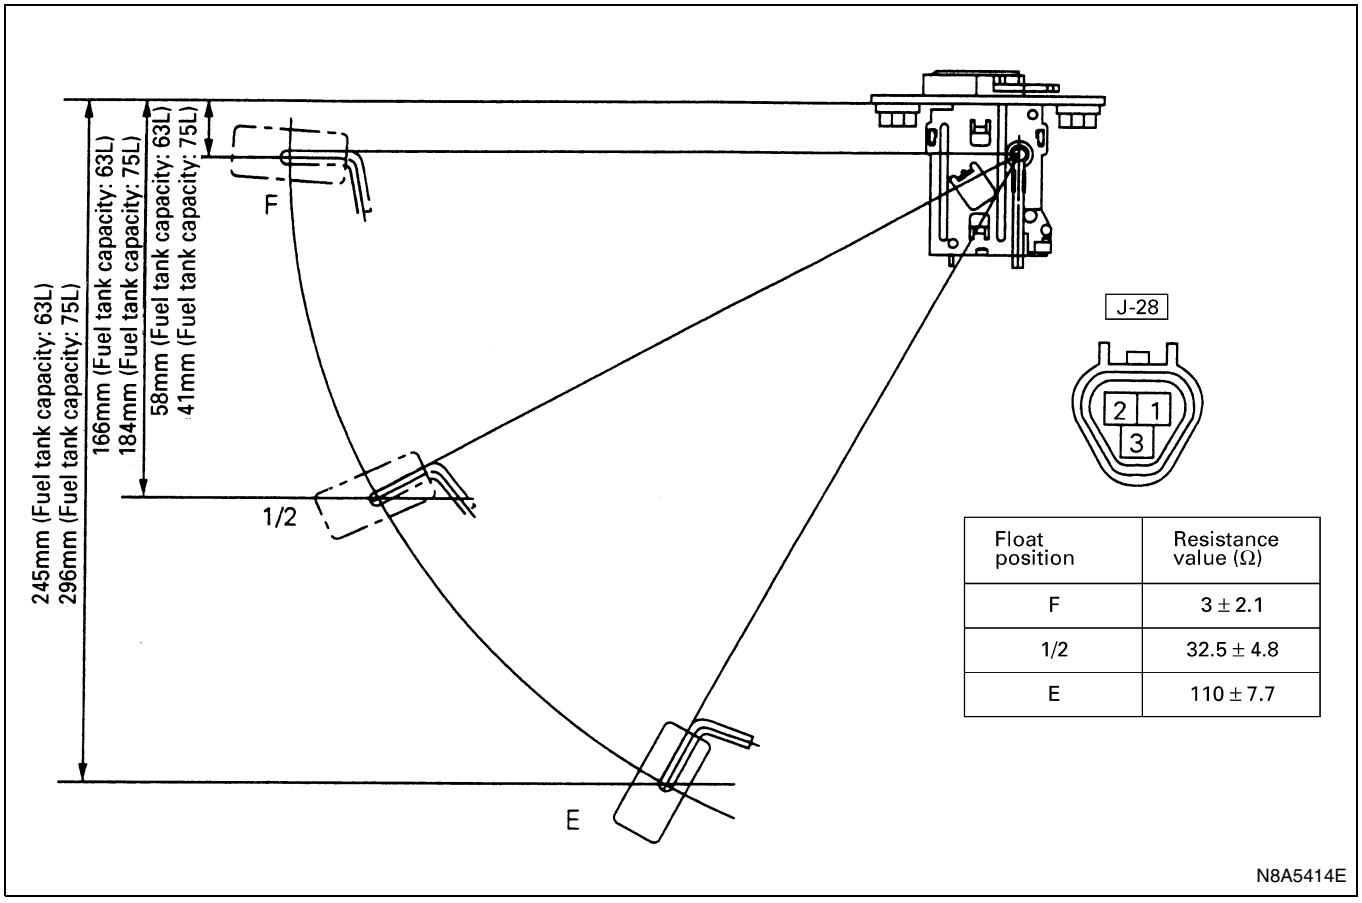
1. Check the resistance between the connector terminals 1 J-28 and 3 J-28 while shifting the float from “E” to “F” point.
2. Check if the low fuel warning switch turns on and off at the specified positions. If found defective, replace the fuel tank unit.



Float position	Resistance value (Ω)
F	3 ± 2.1
1/2	32.5 ± 4.8
E	110 ± 7.7

(Float type of warn low fuel level)

1. Check the resistance between the connector terminals 1 J-28 and 3 J-28 while shifting the float from “E” to “F” point.
2. Check if the low fuel warning light turns on when the float is at “E” position. If found defective replace the fuel tank unit.



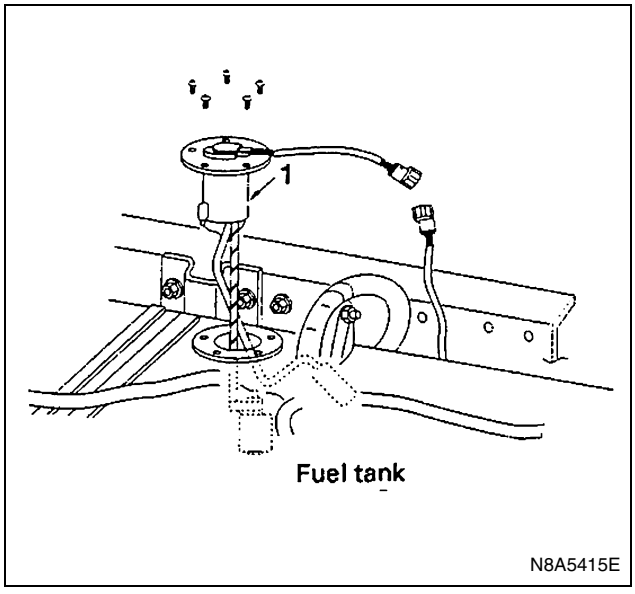
Float position	Resistance value (Ω)
F	3 ± 2.1
1/2	32.5 ± 4.8
E	110 ± 7.7

Removal

Preparation:

Disconnect the battery ground cable.

1. Fuel Tank Unit
   1) Disconnect the connector.
   2) Remove five screws.



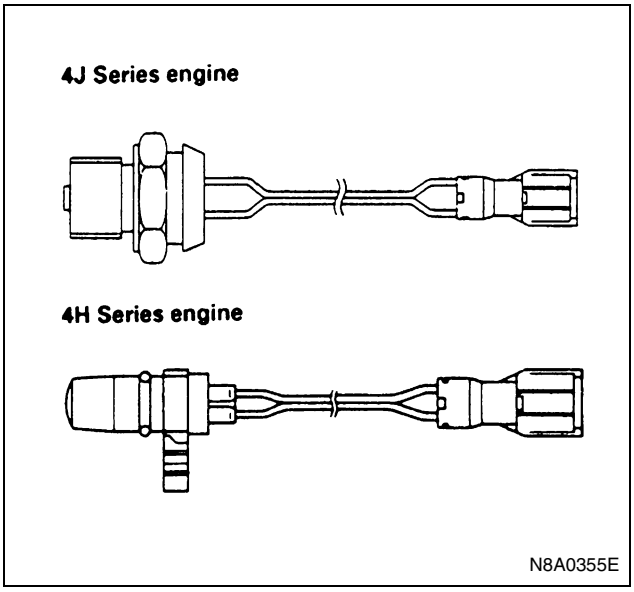
Installation

To install, follow the removal steps in the reverse order.

Engine Speed Sensor

Inspection

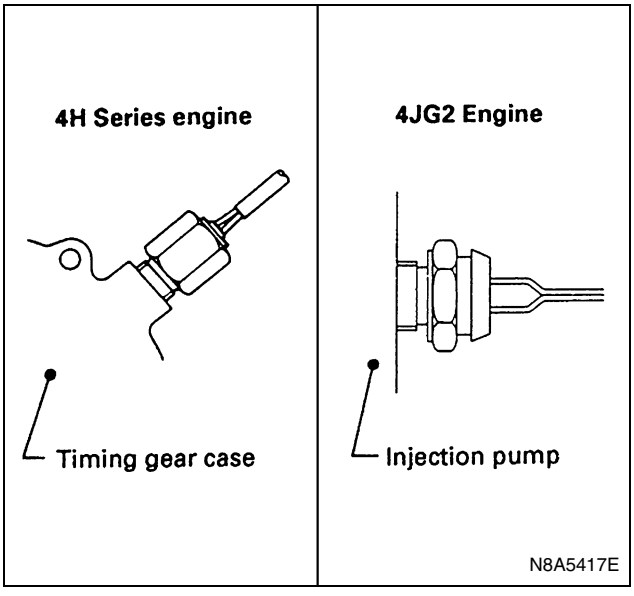
Measure the resistance value between the engine speed sensor connector terminals.
Replace the engine speed sensor when the result of inspection is found abnormal.
4J Series engine = 1.36 — 1.86 KΩ
4H Series engine = 0.57 — 0.86 KΩ



Removal

Preparation:
Disconnect the battery ground cable.

1. Engine Speed Sensor
   1) Disconnect the connector.
   2) Remove the engine speed sensor.



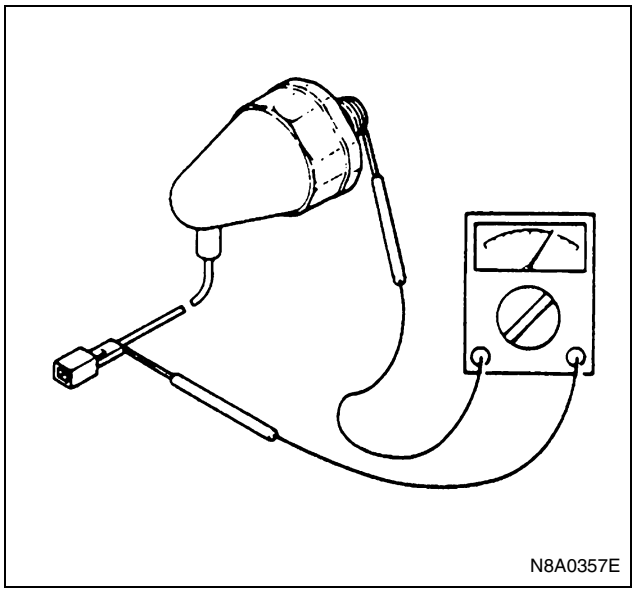
Installation

To install, follow the removal steps in the reverse order.

Vacuum Switch

Inspection

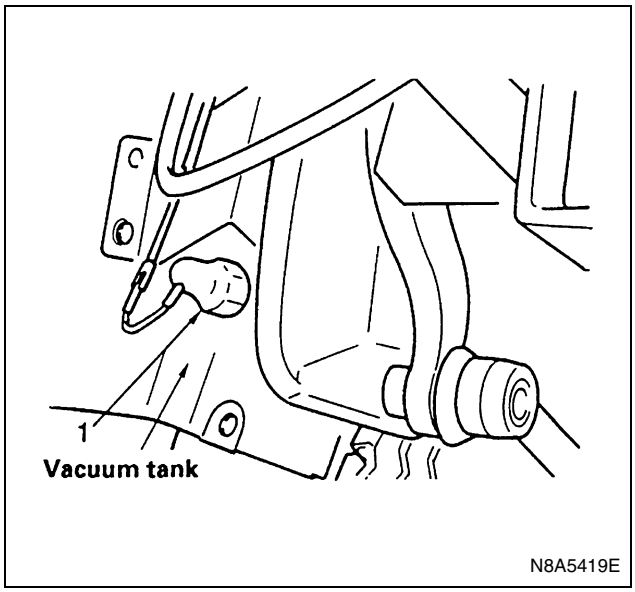
When the pressure value is below 250±30 mm Hg (33.3±4.0 kPa), check to see if there is continuity between the terminal and the ground. If no continuity, replace the switch with a normal one.



Removal

Preparation:
Disconnect the battery ground cable.

1. Vacuum Switch
   1) Disconnect the connector.
   2) Remove the vacuum switch.



Installation

Apply liquid gasket to the screw portion of the switch to prevent vacuum leak.

Vacuum Warning Buzzer

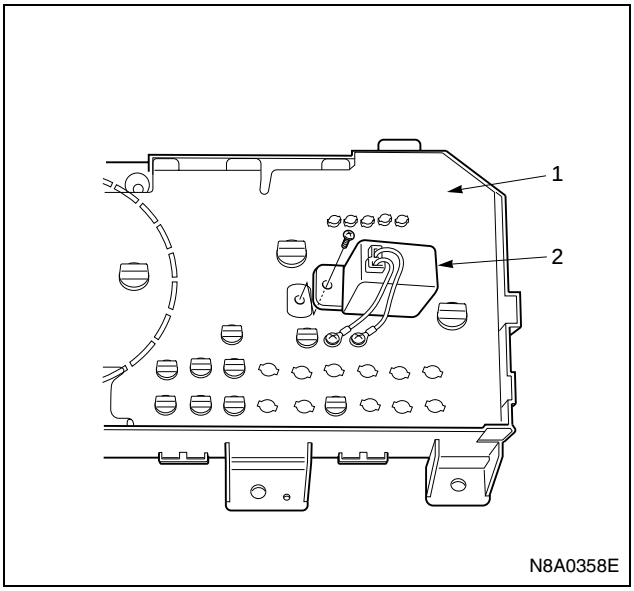
Inspection

Apply battery voltage to the buzzer connector terminals to check the buzzer sound.
Replace the buzzer when the result of inspection is found abnormal.

Removal

Preparation:
Disconnect the battery ground cable.

1. Meter Assembly
   Refer to “METER ASSEMBLY” in this section.
2. Vacuum Warning Buzzer
   1) Disconnect the connector.
   2) Remove the buzzer fixing screw.



Legend

1. Meter Assembly
2. Vacuum Warning Buzzer

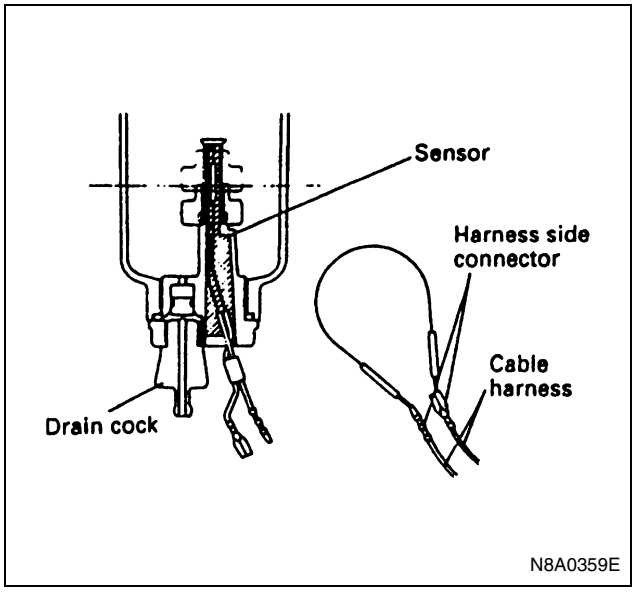
Installation

To install, follow the removal steps in the reverse order.

Water Sedimenter Switch

Inspection

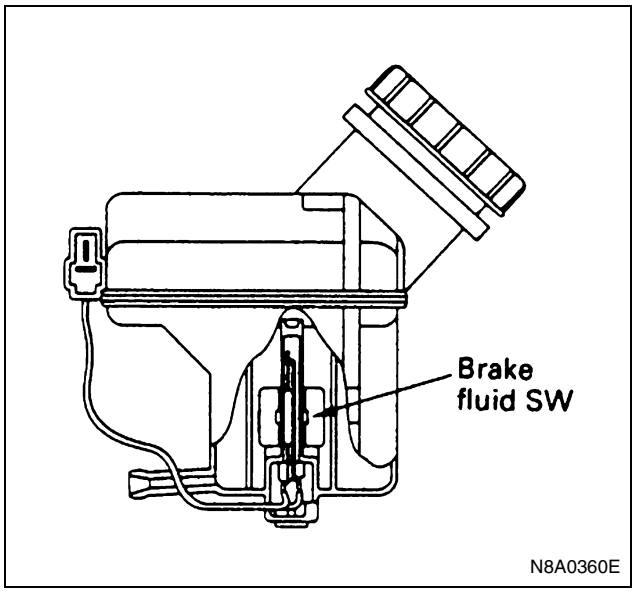
1. When the float in the water sedimenter is above the drain warning level, confirm if there is continuity between the switch connector terminals.
2. Turn the starter switch on, disconnect the water sedimenter connector and connect the harness side connector terminals. Then confirm that the sedimenter warning light turns on.
   If found defective, replace the switch or repair a poor connection or an open circuit between the connector terminals.



Brake Fluid Switch

Inspection

1. Confirm there is continuity between the switch connector terminals when the brake fluid in the tank is between 60 — 75 cc level.
2. Turn the switch on, disconnect the brake fluid switch connector and connect the harness side connector terminals. Then confirm that brake warning light turns on.
   If found defective, replace the tank, or repair a poor connection or an open circuit between the connector terminals.



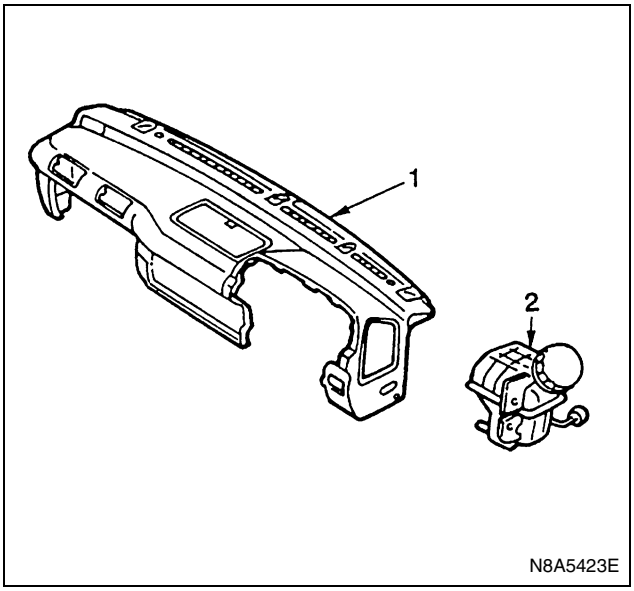
Removal

Preparation:
Disconnect the battery ground cable.

1. Instrument Panel Assembly
   Refer to “INSTRUMENT PANEL” of section 2.
2. Brake Fluid Tank (Brake Fluid Switch)
   1) Disconnect the switch connector.
   2) Remove four fixing nuts.

3) Drain brake fluid in the tank.
4) Disconnect the tubes.

Caution:
Be very careful not to allow the brake fluid to come in contact with painted surfaces or resin parts surfaces.



Installation

To install, follow the removal steps in the reverse order, noting the following points.

1. Bleed the air from brake and clutch fluid pipe line.
2. Check to see if the brake fluid level in the tank within specified level.
3. Check to see if brake warning light comes on when starter switch is turned on and then warning light goes off after the engine running.

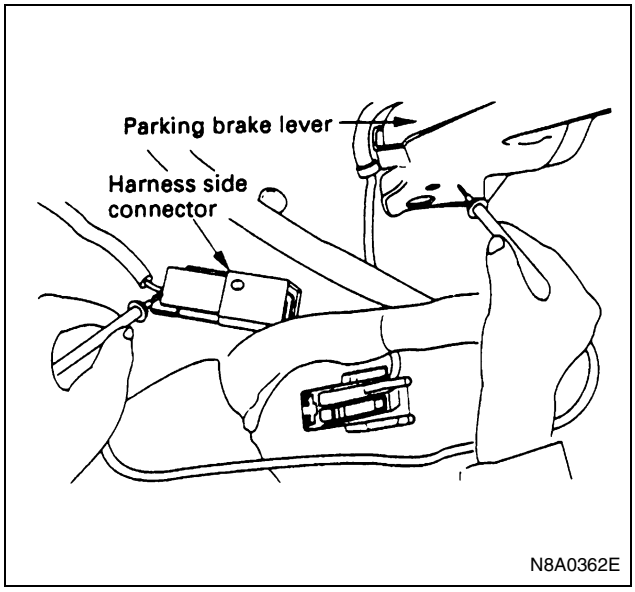
Parking Brake Indicator Light

The parking brake indicator light is connected in series with the parking brake switch installed to the parking brake lever bracket.
The light comes on when the parking brake lever is pulled, and goes out when the parking brake lever is fully released.

Notice:
The parking brake indicator light illuminates to warn the driver that the parking brake is on. This light does not indicate the condition of the operability of the parking brake.

Circuit Inspection

1. Disconnect the parking brake switch connector.
2. Connect the harness side connector terminal to the ground.
3. Check to see if the indicator light comes on with the starter switch “ON”.
   Check the bulb or the harness when the result of inspection is found abnormal.



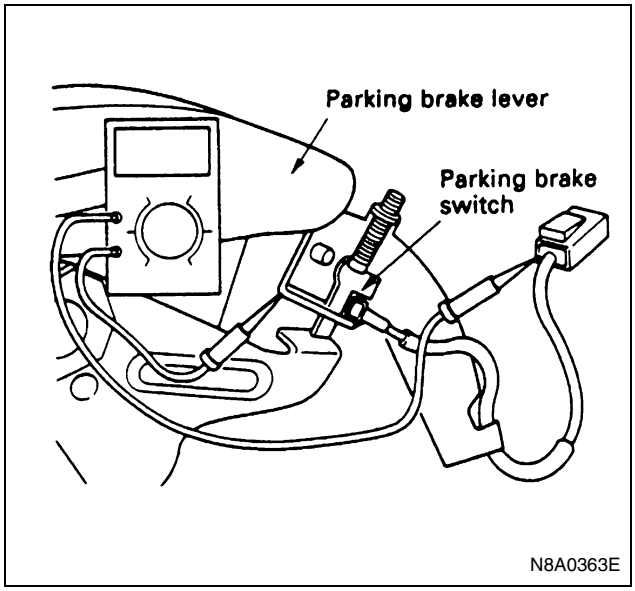
Parking Brake Switch

Inspection

1. Disconnect the parking brake switch connector.
2. Check to see if there is any continuity between the switch terminal and the body ground with the circuit tester connected between them.

When parking brake applied	Continuity
When parking brake released	No continuity

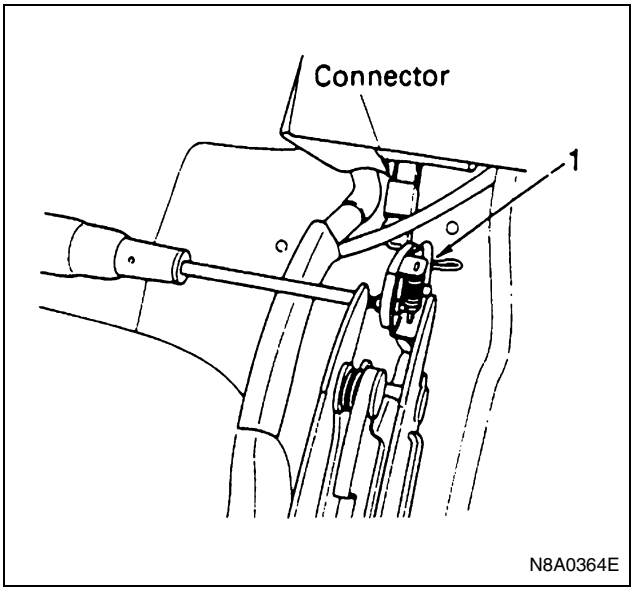
Repair the parking brake switch or replace it when the result of inspection is found abnormal.



Removal

Preparation:
Disconnect the battery ground cable.

1. Parking Brake Switch
   1) Disconnect the connector.
   2) Remove the fixing screw.



Installation

To install, follow the removal steps in the reverse order.

Parts Location

SRS Control System

General Description

SRS airbag supplements the driver's seat belt protection by deploying airbag at the top center of the steering column.

SRS airbag deploys in case of front collision over certain degree of impact.

This system consists of SRS control unit, driver's SRS airbag, SRS coil assembly, exclusive wire harness, and "SRS" warning lamp in the meter and forms a deployment circuit.

A sensor is equipped to this circuit to convert the impact into an electrical signal in case of front collision over certain degree of impact. The electrical signal generated at this time will be processed in the SRS control unit to compare with the value stored in the memory.

When the generated signal exceeds the setting value, SRS control unit sends sufficient current to SRS airbag for deployment.

Heater and Air Conditioning

General Description

The air conditioning consists of compressor, evaporator, condenser, A/C switch, fan switch, etc. When the engine is rotating, the A/C starts to work with both the A/C and fan switches “ON”, followed by the engagement of the magnetic clutch. It stops to work when either the fan switch or the A/C switch turns “OFF”. In addition to the switches, the A/C has the function of temporary stop of its operation by the sensing system in the A/C cycle, such as:

- sensing abnormal rise of the refrigerant pressure by means of the pressure switch.
- sensing temperature of the blowing-off air by means of the thermo switch preventing the evaporator from freezing.
- sensing the coolant temperature by the thermo switch (available for limited models only).

When fan control knob (fan switch) is put on with temp. Control lever being in the “FULL HOT” position (FULL HOT switch on) ceramic heater within heater unit generates heat, raising a heater blow-off temperature to enhance heating performance.

Fuel Heater and Rear Heater

General Description

The circuit consists of fuel heater, rear heater, rear heater switch and the exhaust brake relay.
The fuel heater circuit is always in “ON” position when the generator is charging and its temperature is automatically controlled by the circuit breaker built in the fuel heater.

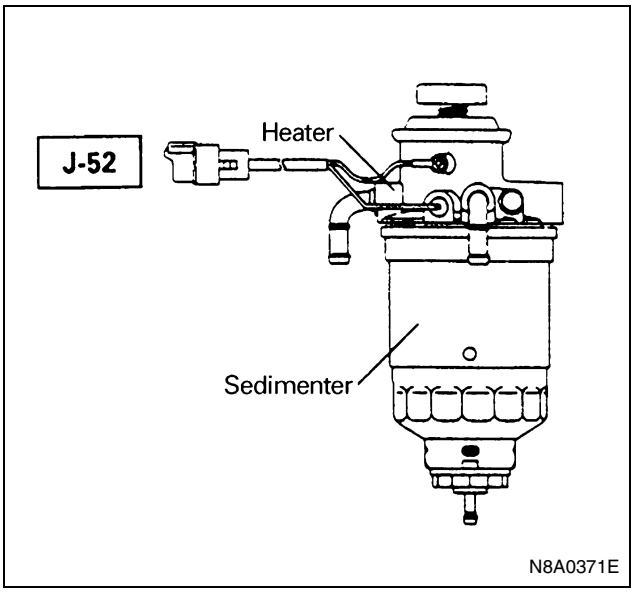
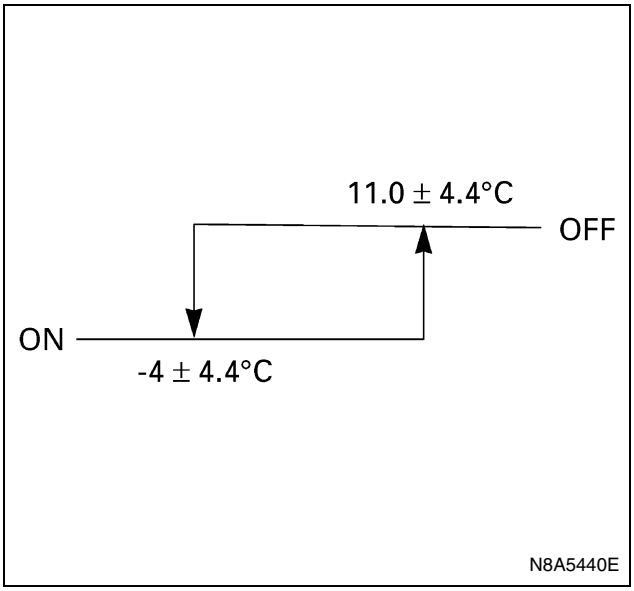
Fuel Heater



N8A0371E

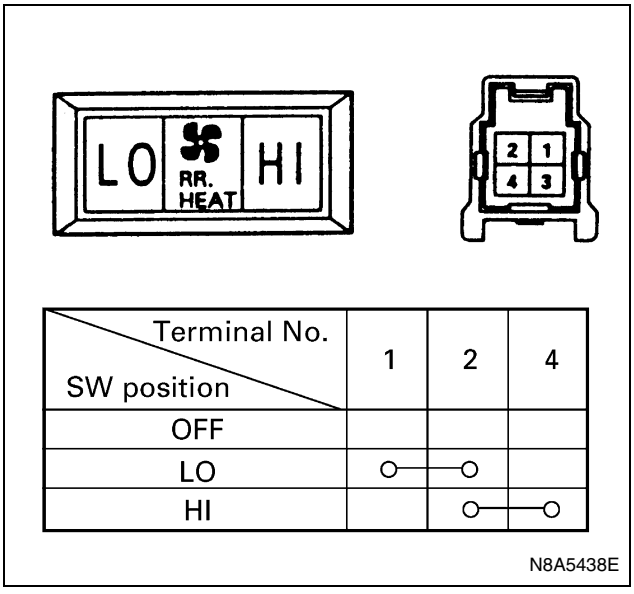
Characteristic of fuel heater



Rear Heater Switch

Inspection

Check the continuity between the connector terminals while operating the switch.
Replace the switch when the result of inspection is found abnormal.

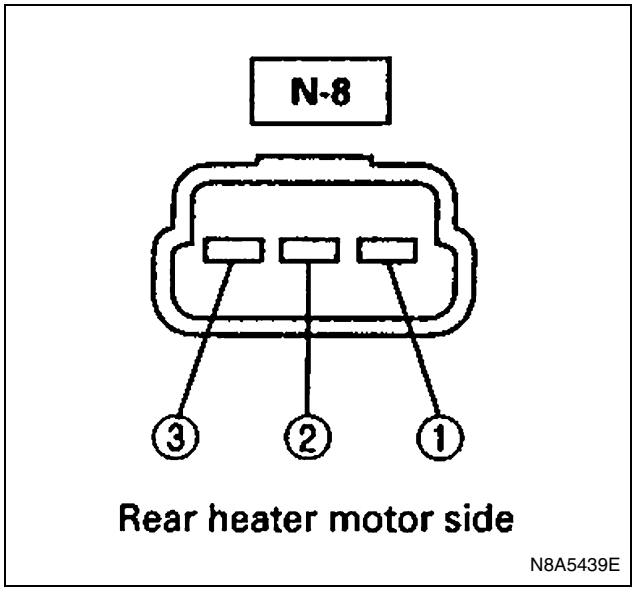


Terminal No. / SW position	1	2	4
OFF			
LO	○	○	
HI		○	○

Rear Heater Motor

Inspection

Disconnect the rear heater connector.
Connect the battery positive terminal to the NO.3 terminal of the rear heater motor side connector and negative to the NO.2. Check to see if rear heater motor operates low-speed correctly.
Connect the battery positive terminal to the NO.3 terminal of the rear heater motor side connector and negative to the NO.1. Check to see if rear heater motor operates high-speed correctly.
Replace the rear heater motor when the result of inspection is found abnormal.



4WD Transfer (Vacuum Control)

General Description

The circuit consists of the starter switch, 4WD switch, 4WD detect switch, 4L switch, vacuum switching valve, 4WD indicator light, neutral switch and the relay.
When the 4WD switch is turned on to drive in the 4WD mode, the vacuum switching valve for the transfer control is activated through the 4WD relay, and the transfer shift rod connected to the vacuum actuator is shifted to the 4WD side to turn on the 4WD detect switch. At the same time, the indicator light in the meter lights on to tell that the mode is transferred to 4WD mode.
However, when running in the normal mode (2WD), the 4WD switch is not operated. Accordingly, no current flows through the 4WD vacuum switching valve for the transfer control, with the 4WD detect switch left in the “OFF” condition (2WD mode).

Starter Switch

Refer to “START AND CHARGING” in this section.

Neutral Switch

Refer to “START AND CHARGING” in this section.

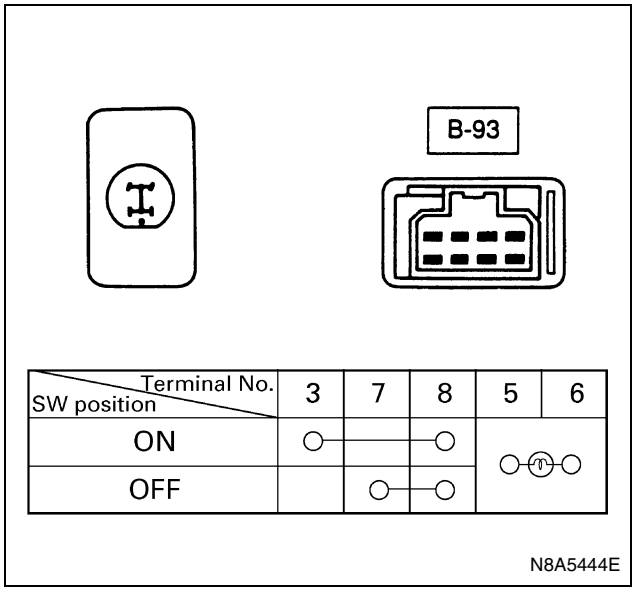
4WD Indicator Light

Refer to “METER AND WARNING/INDICATOR LIGHT” in this section.

4WD Switch

Inspection

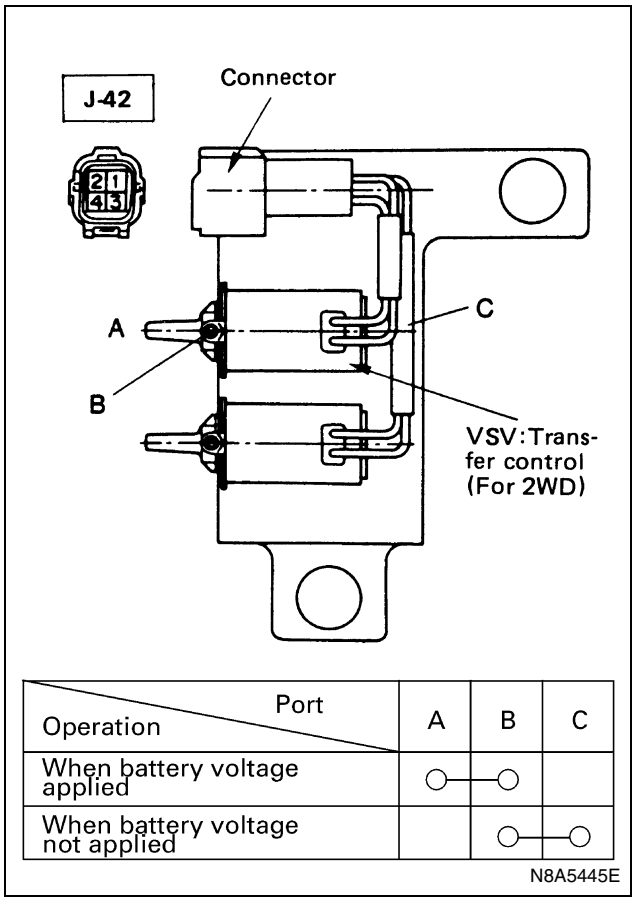
Check the continuity between the connector terminals while operating the switch.
Replace the switch when the result of inspection is found abnormal.



Vacuum Switching Valve: Transfer Control (for 2WD)

Inspection

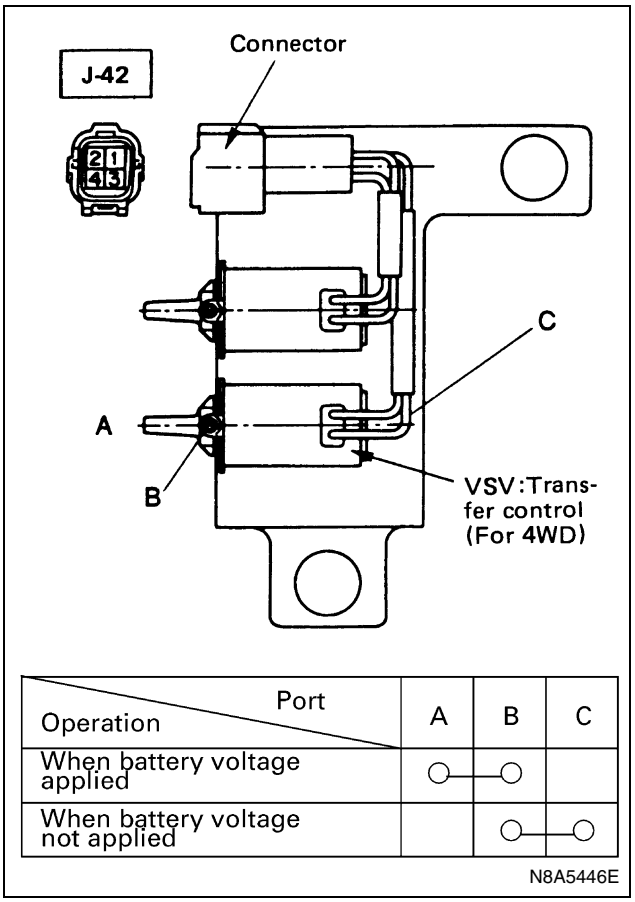
Connect the vacuum switching valve connector terminal No. 1 to the battery (+) terminal and terminal No. 3 to the (−) terminal and then check the continuity among each port.



Vacuum Switching Valve: Transfer Control (for 4WD)

Inspection

Connect the vacuum switching valve connector terminal No. 2 to the battery (+) terminal and terminal No. 4 to the (−) terminal and then check the continuity among each port.



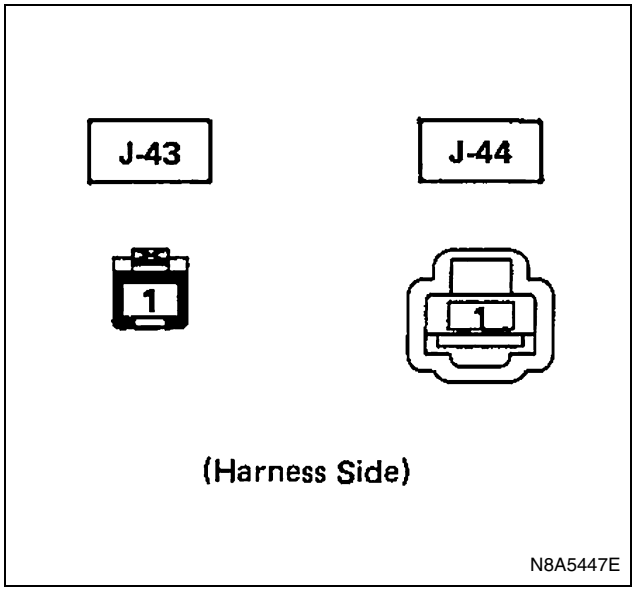
Operation \ Port	A	B	C
When battery voltage applied	○	○	
When battery voltage not applied		○	○

N8A5446E

4WD Detective Switch

Inspection of The 4WD Warning Light Circuit

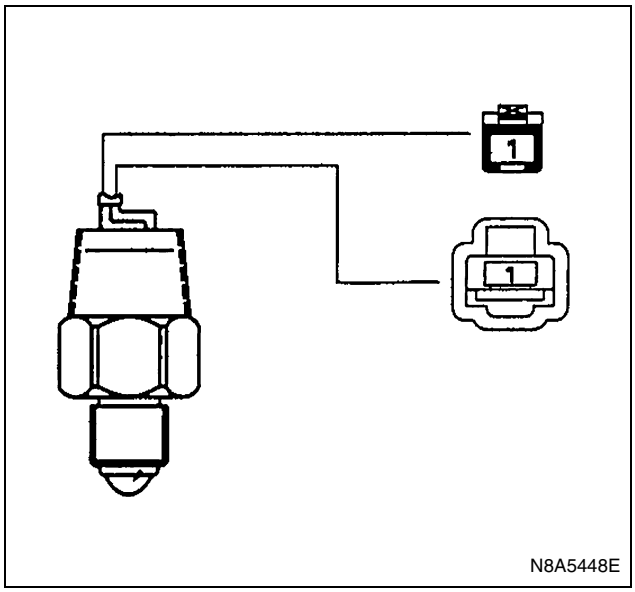
1. Disconnect the 4WD switch connectors.
2. Connect the harness side connector terminals.
3. Check to see if the indicator light comes on with the starter switch “ON”.
   Check the bulb or harness when the result of inspection is found abnormal.



N8A5447E

Inspection

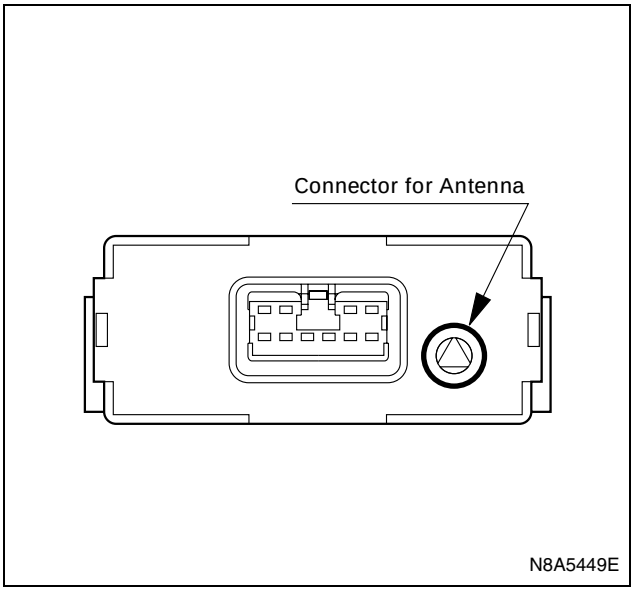
1. Shift the transfer lever to the 4H (4L) position.
2. Check to see if there is continuity between the 4WD switch connectors.
   Replace the switch when the result of the inspection is found abnormal.



N8A5448E

Keyless Entry System

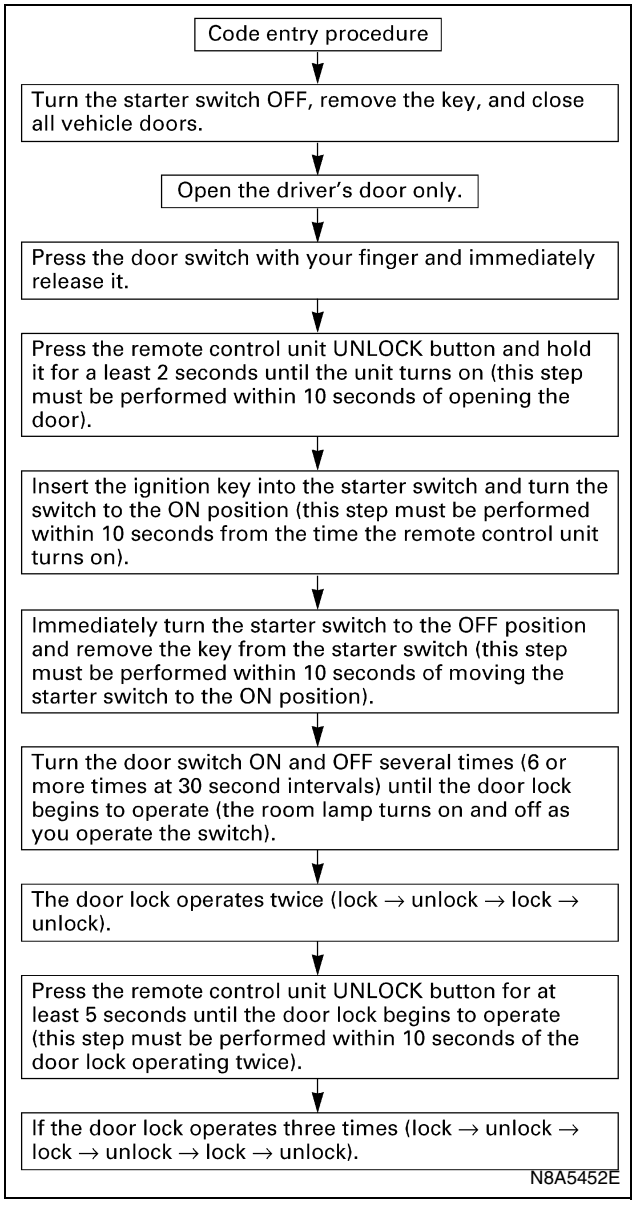
Keyless Entry Control Unit

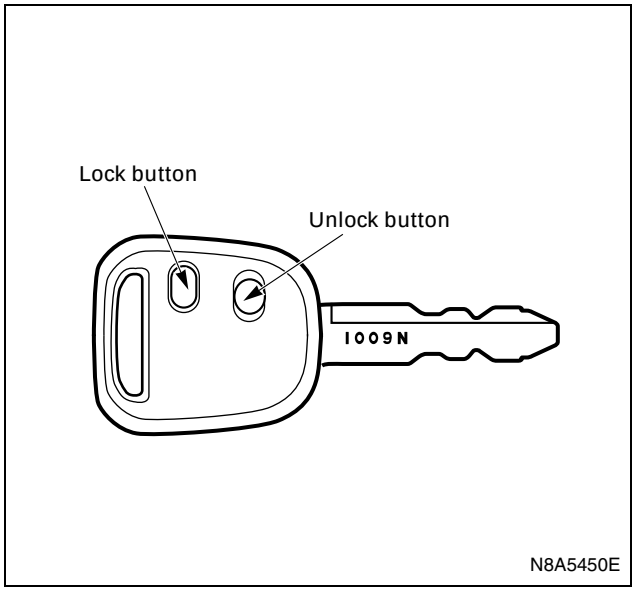


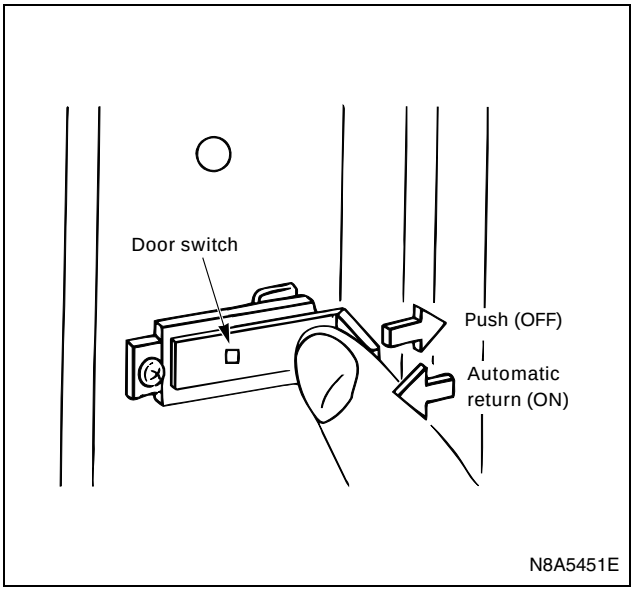
The unit receives a LOCK or UNLOCK signal from the remote control unit. This signal is conveyed to the driver's door lock switch and the door lock actuator(s) on the other door(s).

1. Remote control code registration
   - A single code is registered at a time.
   - Up to 3 codes can be registered and stored.
   - If a 4th code is registered, the oldest existing code is automatically erased (overwritten).

The remote control unit is built-in to the ignition key.



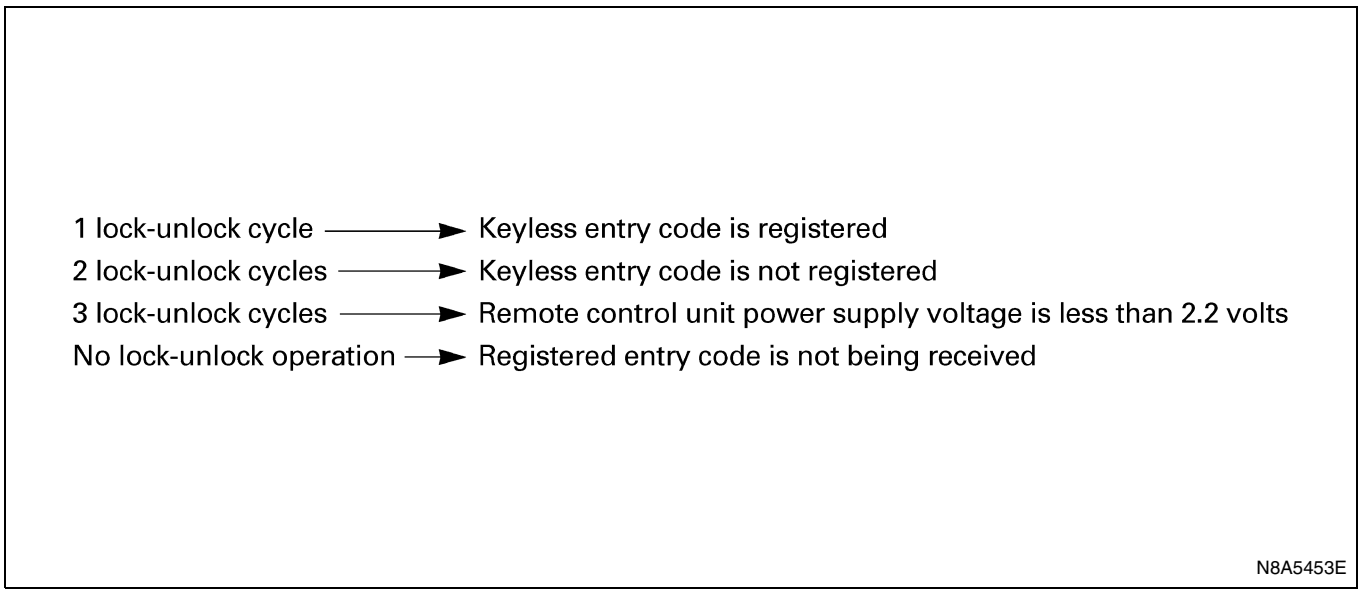




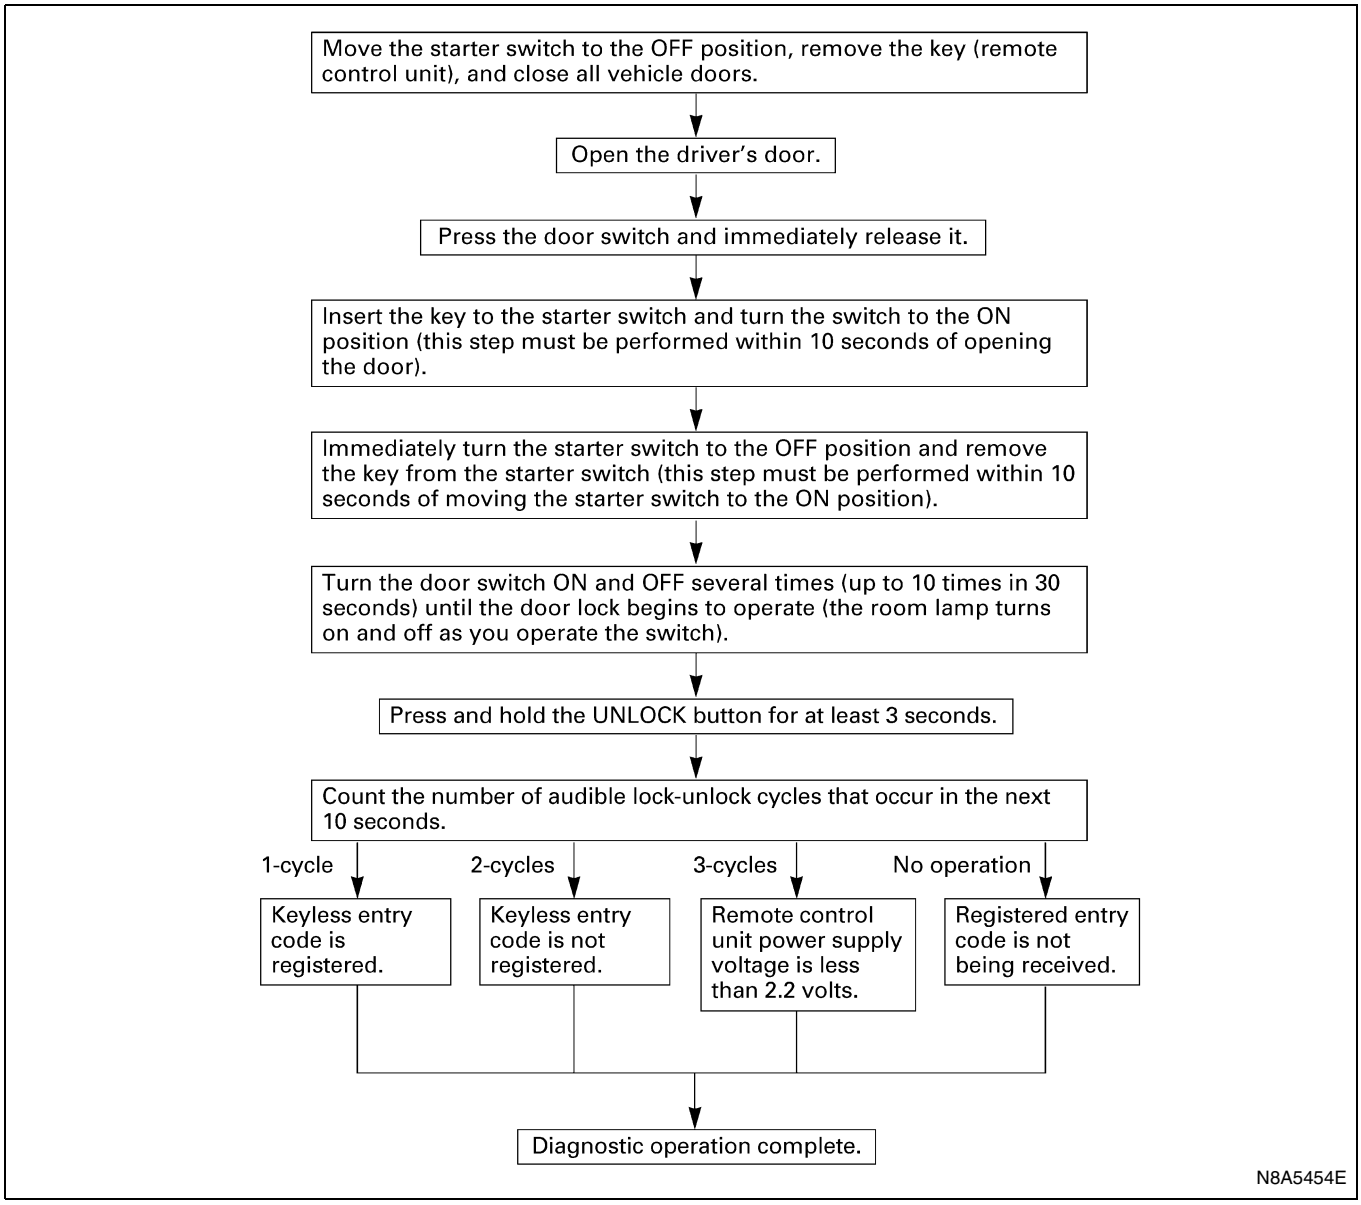
2. Timer lock
   The doors will automatically relock 30 seconds after being unlocked with the remote control unit.
   A second or more may elapse between lock and unlock operation when the LOCK and UNLOCK buttons are pressed in quick succession.

Diagnostic Functions

When the unit is in diagnostic mode, the door locks operate as specified below to indicate normal operation or a specific problem.

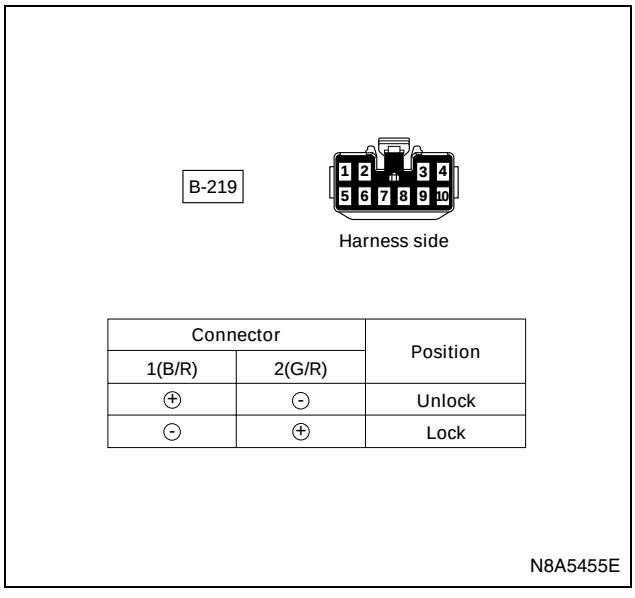


Diagnostic Mode



Door Lock Operational Test

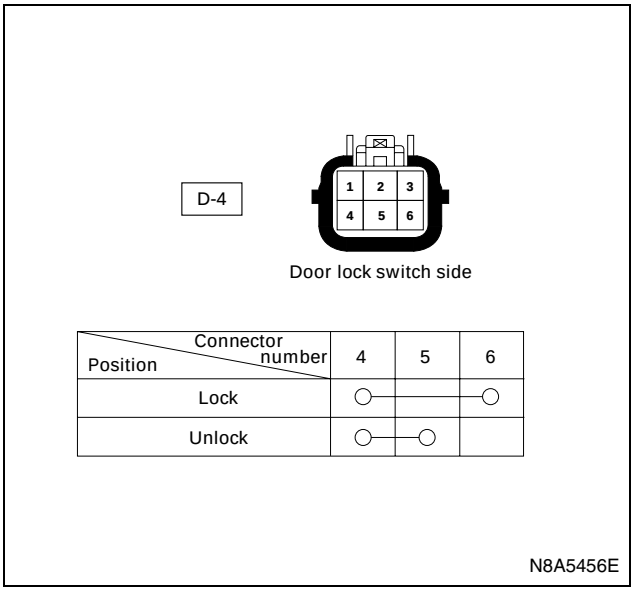
1. Check for continuity between the 1-B-219 connector and the 2-B-219 connector (harness side).
2. Check the remaining connectors to see that they have battery voltage.
3. If the above conditions are normal but the lock does not operate, check the door lock switch (driver's door).
   Refer to the item below.



Connector		Position
1(B/R)	2(G/R)	
⊕	⊖	Unlock
⊖	⊕	Lock

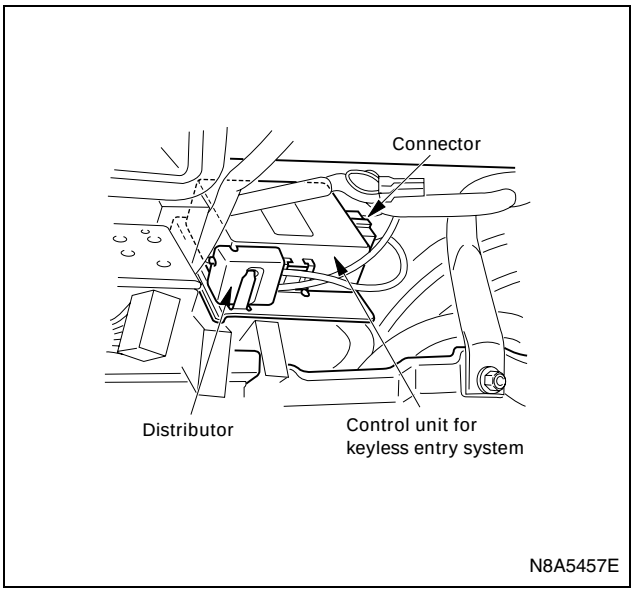
Door Lock Switch Inspection

Check for continuity between the connectors. If there is no continuity, the switch must be replaced.



Control Unit Removal

1. Remove the meter cluster. Refer to the item “Meter assembly” in this Manual.
2. Release the pawl to remove the brackets holding the tail lamp and stop lamp warning light relays.
3. Remove the connectors.
4. Remove the distributor from its bracket.
5. Loosen the fixing screws.
6. Remove the control unit from the bracket.



Control Unit Installation

Follow the removal steps in reverse order to install the control unit.

ABS/ASR System

General Description

ABS (Anti-lock Brake System) and ASR (Anti-Slip Regulator) are the system to prevent the wheels from locking and wheel spin, and to assure stability and steering ability of the vehicle.
When a malfunction occurs in the system, fail-safe deactivate the ABS and ASR, and the warning lamp comes on. Also, the self-diagnosis function is equipped to improve serviceability.

HSA (Hill Start Aid) System

General Description

The HSA (hill start aid) is the system to retain the brake force with brake pedal not depressed when the vehicle is parked, and to automatically release the brake force when starting the vehicle.

The HSA control unit drives the HSA valve located in the pipe route between the master cylinder and the wheel cylinder, to hold/release the brake fluid pressure. Also, alarm function (activates when the door opened with HSA operating, when the HSA system has running long time, when the HSA pressure goes down) and self-diagnosis function are equipped with the HSA control unit.

Transmission Control System (Smoother)

General Description

“Smoother” is the name of a new-generation drive train that provides benefits in terms of both life cycle costs (low initial cost and maintenance cost, lower fuel consumption, etc.) and easy driving. Smoother is a system that adds an automatic transmission to the existing Smoother, for even better fuel consumption and easier driving. This is accomplished by installing a solenoid system shift control box on the Smoother, which combines a manual transmission with fluid coupling, so all shifting is performed automatically in accordance with signals from the transmission control module (TCM). When starting moving the vehicle, depressing the brake pedal and operating the change lever as on an automatic vehicle causes a change lever position signal to be detected by the TCM. This actuates the shift control box solenoid and shifts the gear into the starting position or the reverse position, and then engages the shift change clutch (wet multi-disc clutch). (After the shift clutch engages, creep force is generated the same as on an AT vehicle.) Releasing the foot from the brake pedal and pressing the accelerator pedal starts the vehicle moving forward. If there is an up-shift or down-shift while running, the control unit determines the vehicle status based on vehicle speed, accelerator opening angle, and other factors, and shifts to the optimal gear automatically. If the driver moves the change lever in the “+” or “-” direction, a gear change is indicated, so sequential manual shifting is also possible. (Even during sequential manual shifting, the transmission shifts to the starting position when the vehicle is stopped.)

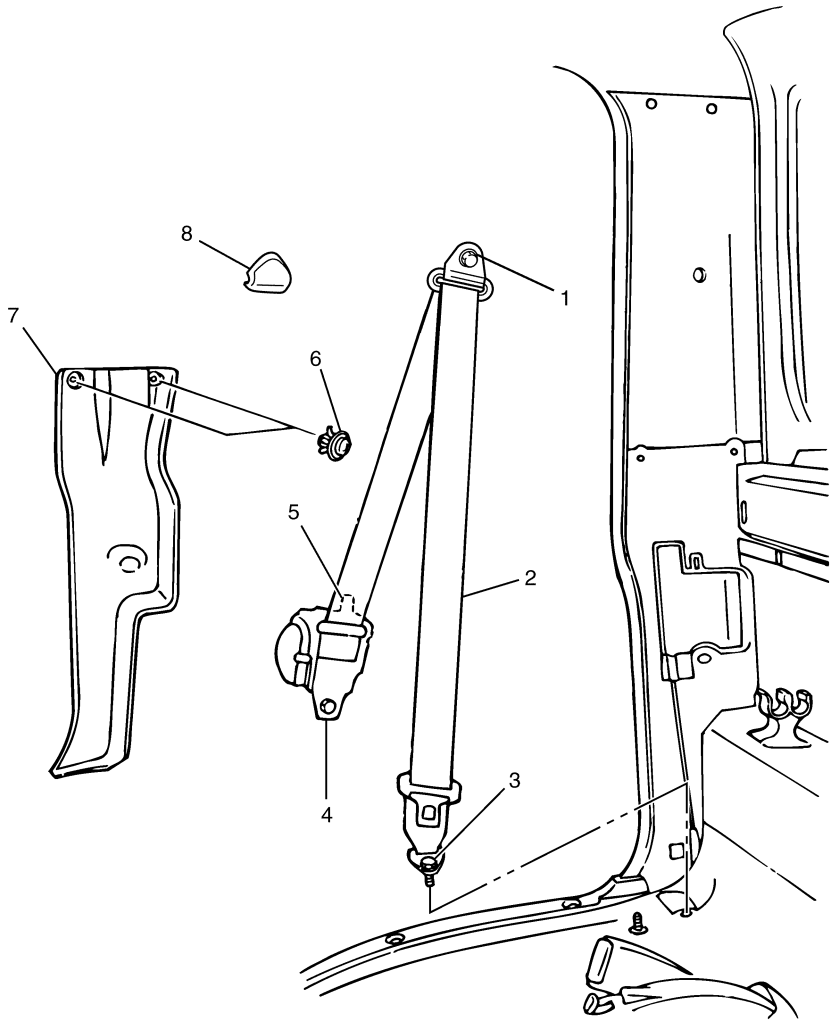
Tongue Side Seat Belt (Single Cab Model)

Components



Legend

1. Seat belt upper anchor bolt
2. Tongue side seat belt assembly
3. Seat belt lower anchor bolt
4. Retractor fixing bolt
5. Bracket
6. Clip
7. Rear pillar lower trim cover
8. Through anchor cover

Removal

1. Remove the seat belt lower anchor bolt.
2. Remove the rear pillar lower trim cover.
   - Refer to “Rear Side Trim Cover” in Interior & Exterior Trim Section of Cab Repair Manual.
3. Remove the through anchor cover.
4. Remove the seat belt upper anchor bolt.
5. Remove the retractor fixing bolt.
   - Remove the bolt and pull the retractor upper bracket from panel to remove.

Installation

For installation, reverse the removal procedure taking the following points into consideration.

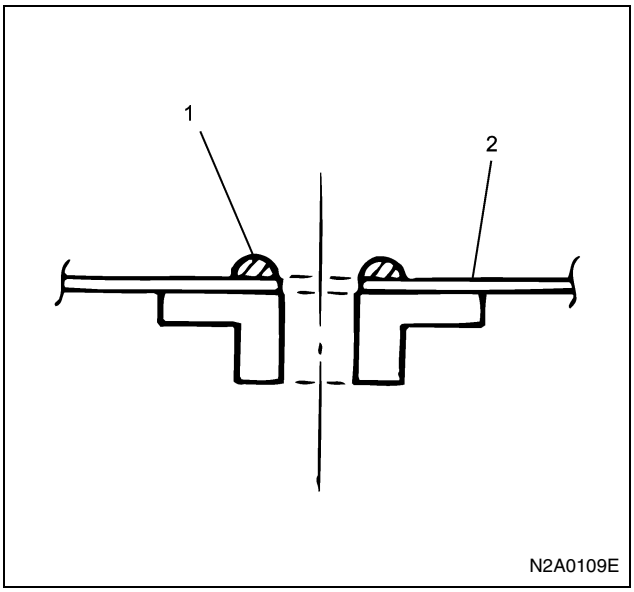
1. Tighten the seat belt upper anchor bolt to the specified torque.

Tighten:

Anchor bolt to 44 N·m (4.5 kg·m / 32.5 lb·ft)

2. Apply the sealant (1) around the seat belt lower anchor bolt mounting hole on the floor part (2).

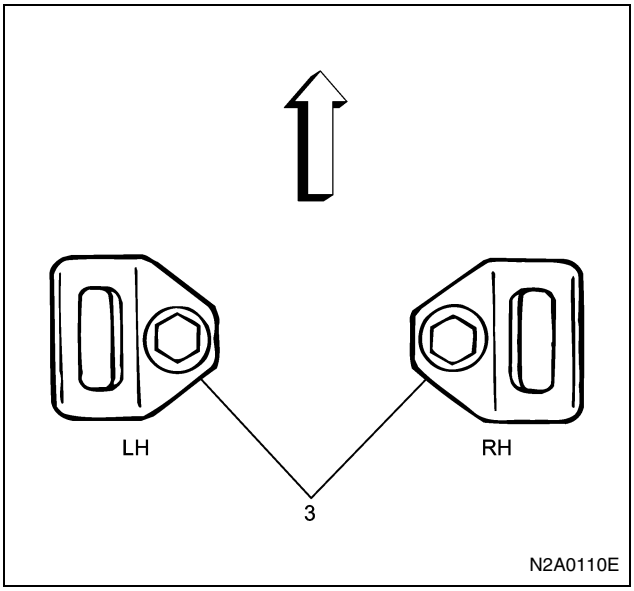
Sealant TOKIWA CHEMICAL INDUSTRY 770GA or equivalent



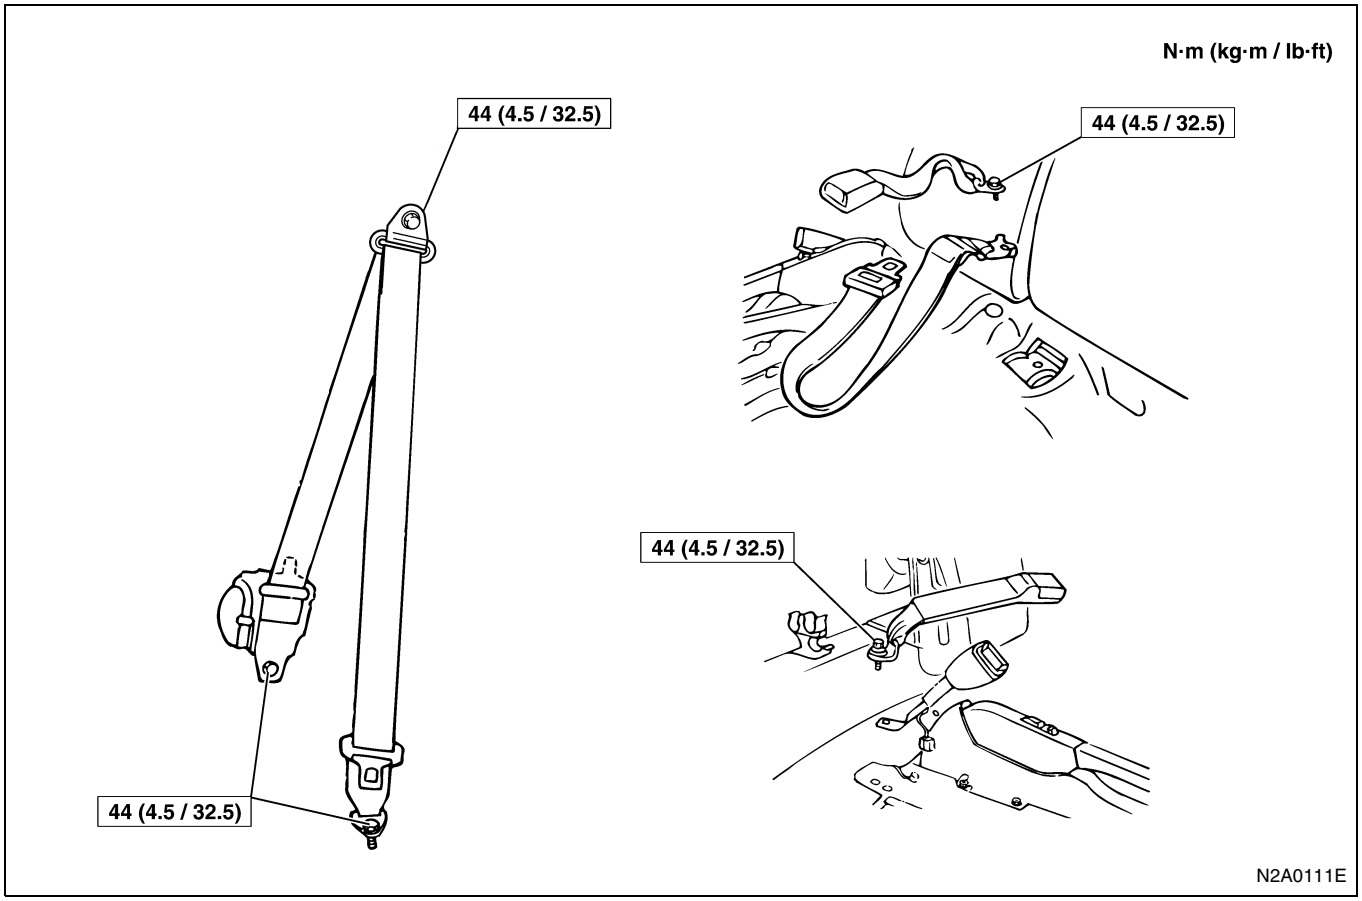
3. Install the seat belt lower anchor (3) in the specified direction, and tighten it to the specified torque.

Tighten:
Anchor bolt to 44 N·m (4.5 kg·m / 32.5 lb·ft)

Caution:
Install the seat belt lower anchor so that it may not run on the anchor detent bead.

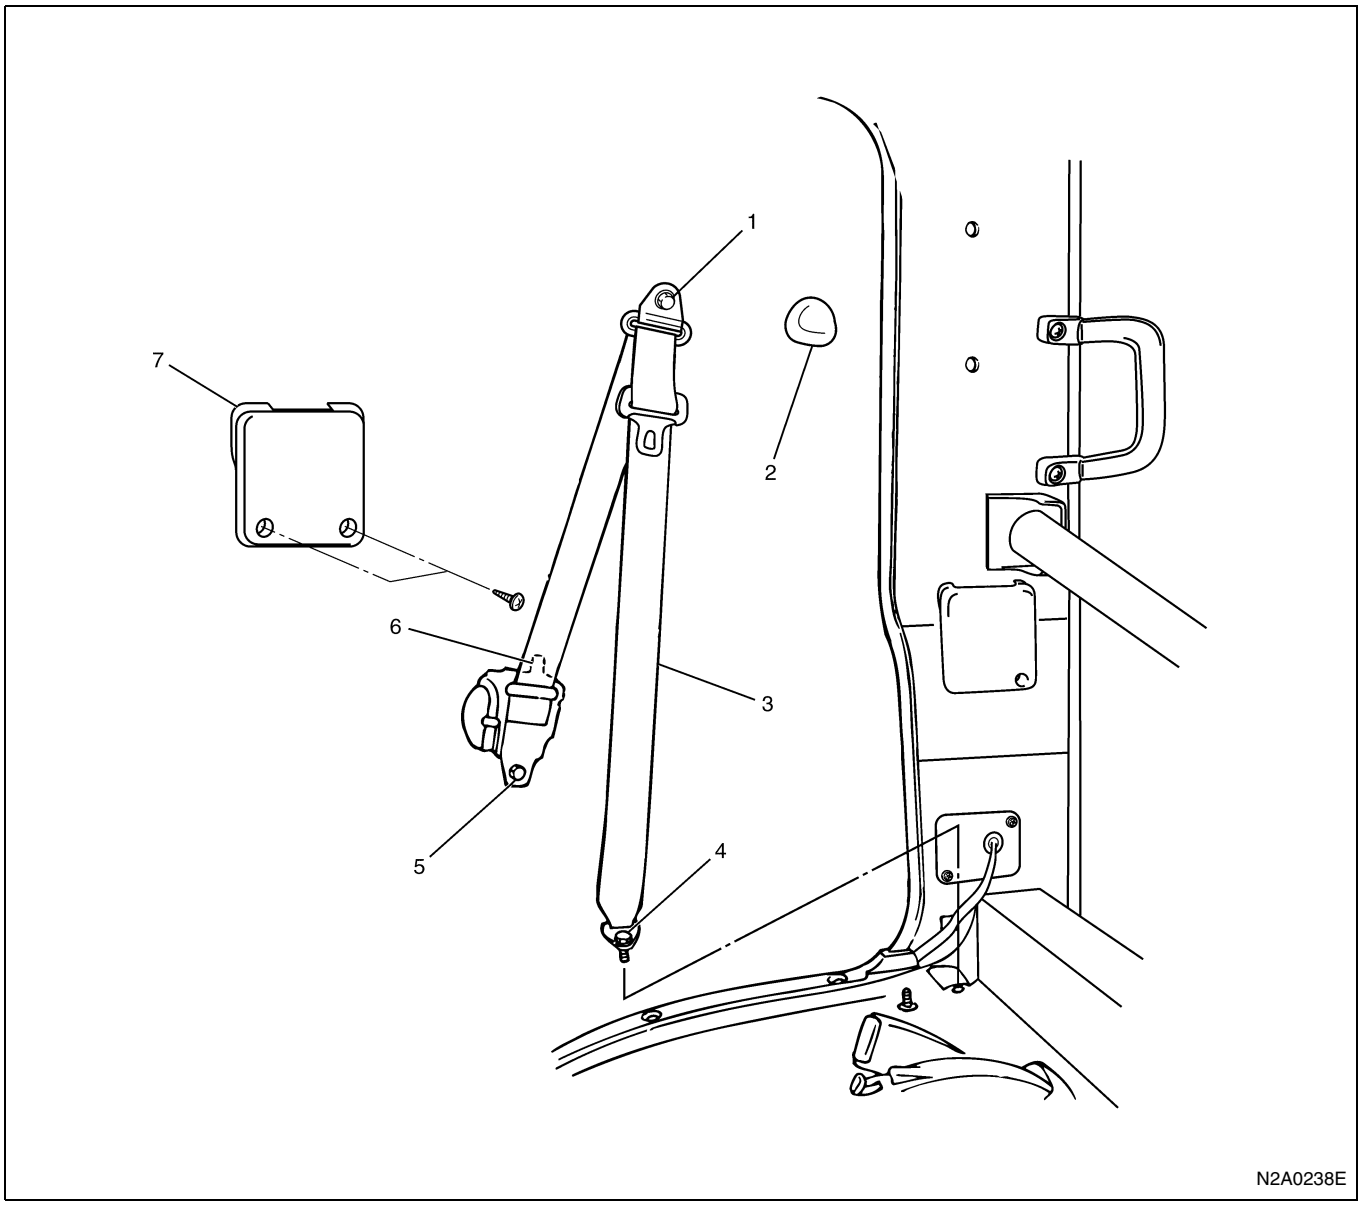


Fixing Torque



Tongue Side Seat Belt (Crew Cab Model)

Components



Legend

1. Seat belt upper anchor bolt
2. Through anchor cover
3. Tongue side seat belt assembly
4. Seat belt lower anchor bolt
5. Retractor fixing bolt
6. Bracket
7. Retractor cover

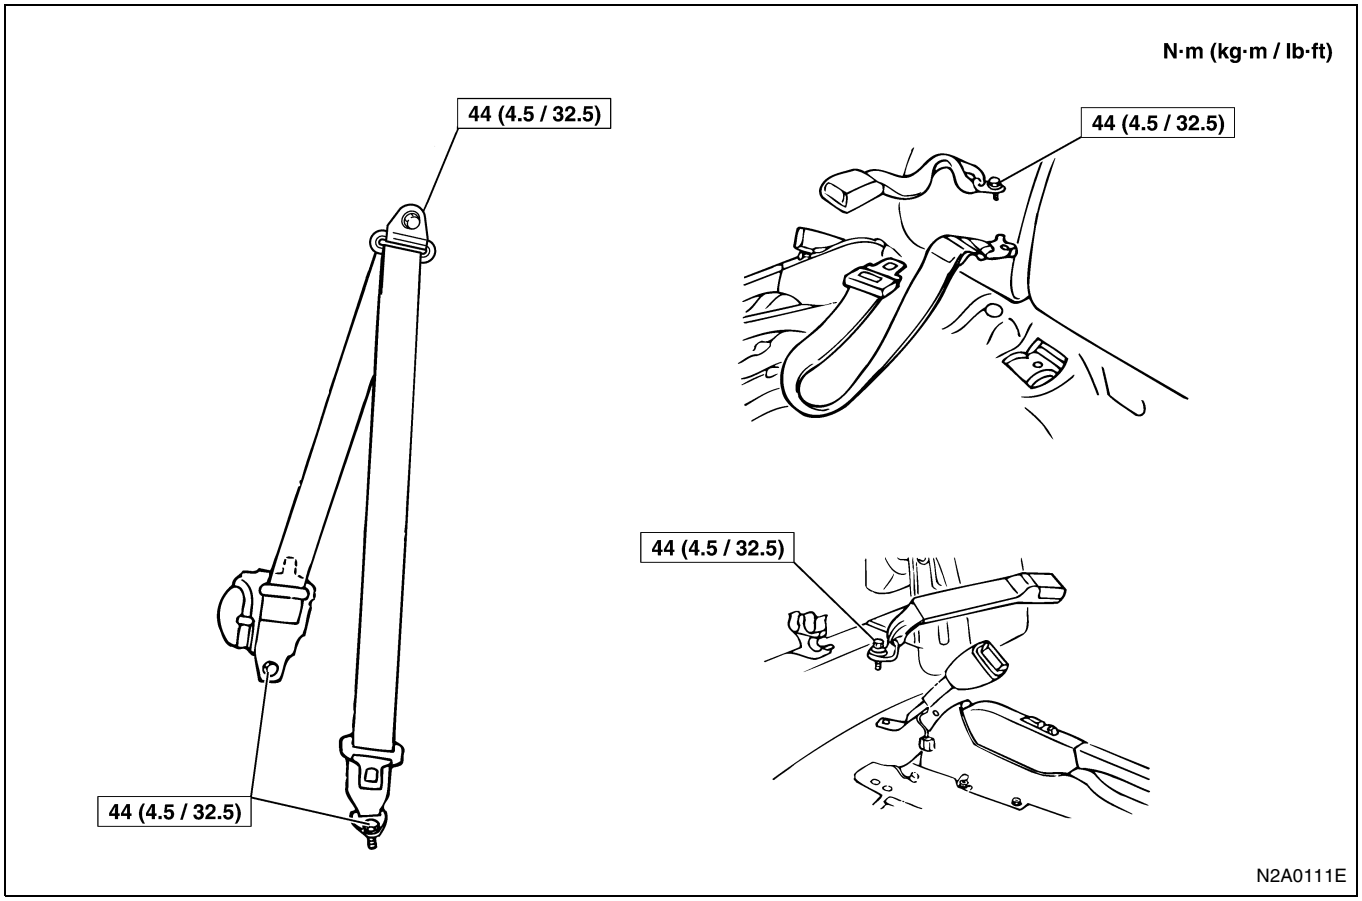
Removal

1. Remove the seat belt lower anchor bolt.
2. Remove the retractor cover.
   - Remove the 2 fixing screws.
3. Remove the through anchor cover.
4. Remove the seat belt upper anchor bolt.
5. Remove the retractor fixing bolt.
   - Remove the bolt and pull the retractor upper bracket from panel to remove.
6. Remove the adjuster cover.

Installation

For installation, refer to “Tongue Side Seat Belt (Single Cab Model)” in this section, and reverse the removal procedure.

Fixing Torque

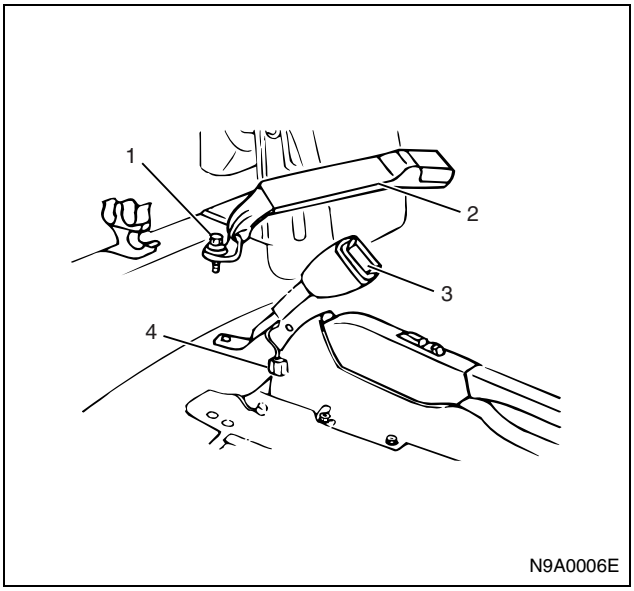


Front Center and Driver's Side Seat Belt Buckle

Removal

1. Disconnect the battery ground cable.
2. Remove the fixing bolt (1).
3. Remove the center seat belt buckle (2).
4. Disconnect the seat belt warning connector (4).
5. Remove the driver's seat belt belt buckle (3).

Caution:
For wide cab model, perform the steps 1 and 2 (Center), or the steps 1, 3 and 4 (Driver's side).

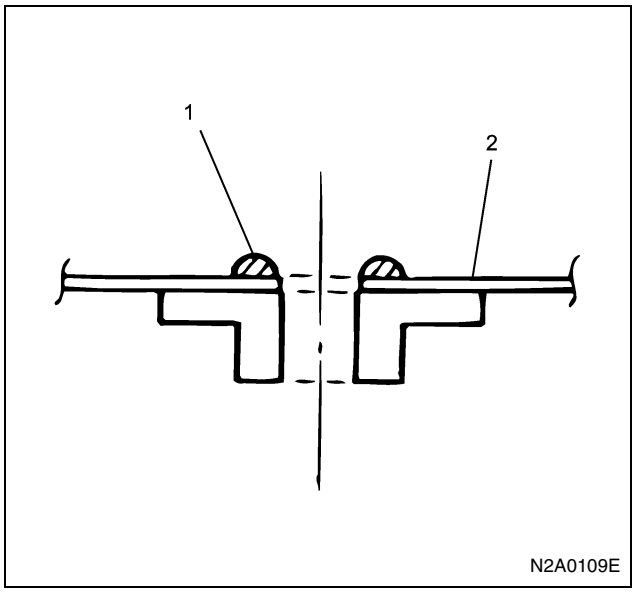


Installation

For installation, reverse the removal procedure taking the following points into consideration.

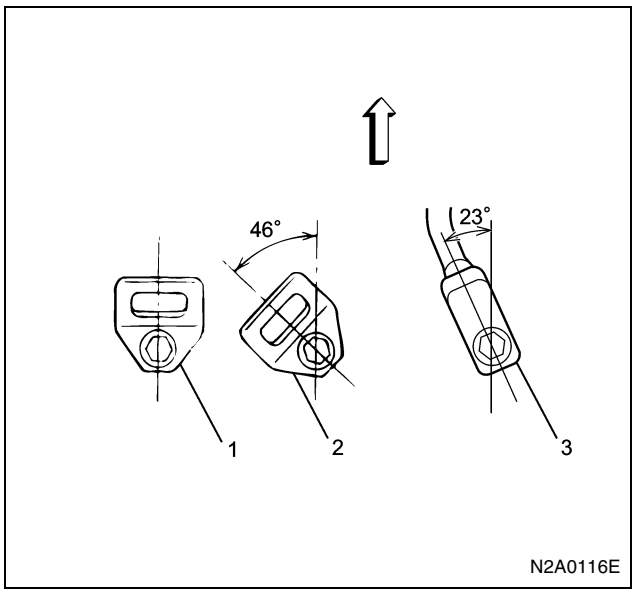
1. Apply the sealant (1) around the fixing bolt mounting hole on the floor part (2).

Sealant TOKIWA CHEMICAL INDUSTRY 770GA or equivalent



2. Install the anchor in the specified direction, and tighten it to the specified torque.

Tighten:
Fixing bolt to 44 N·m (4.5 kg·m / 32.5 lb·ft)

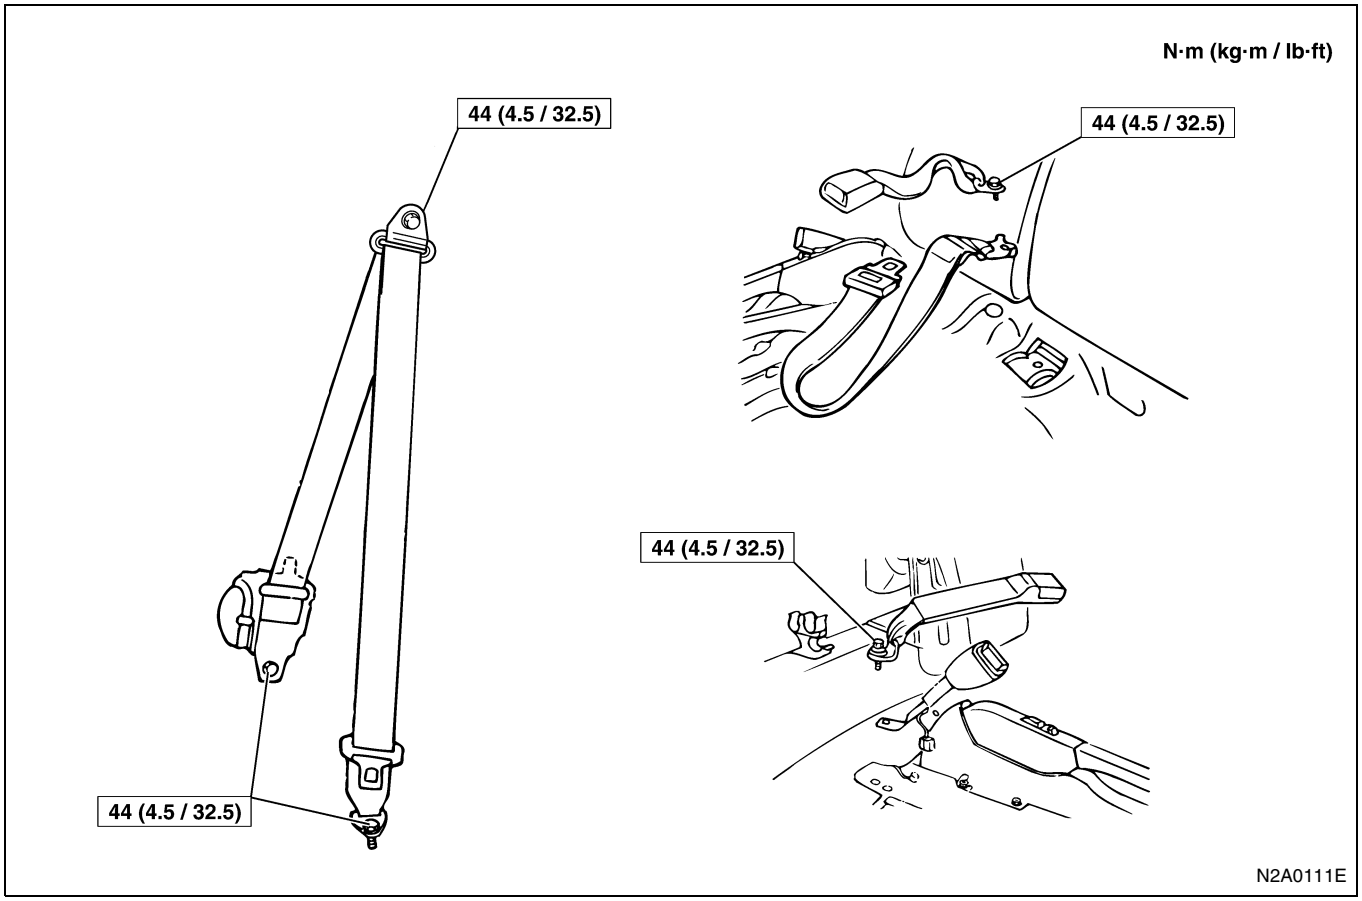


Legend
1. Center seat belt buckle (Wide cab model)
2. Center seat belt buckle (Except wide cab model)
3. Driver's side seat belt buckle

3. Pass the center seat belt buckle through the band on the end of seat cushion.

Caution:
Install it so that it may not run on the anchor detent bead.

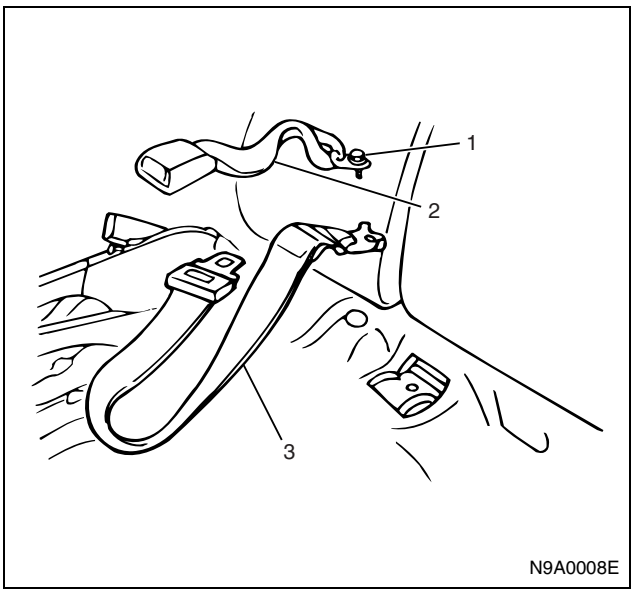
Fixing Torque



Front Center Seat Belt and Assistant's Side Seat Belt Buckle

Removal

1. Remove the assistant's seat cushion (three-passenger vehicle).
   - Refer to "Center and Assistant's Side Seat" in Seat Section of Cab Repair Manual.
2. Remove the fixing bolt (1).
3. Remove the assistant's seat belt buckle (2).
4. Remove the center seat belt (3).



Installation

For installation, reverse the removal procedure taking the following points into consideration.

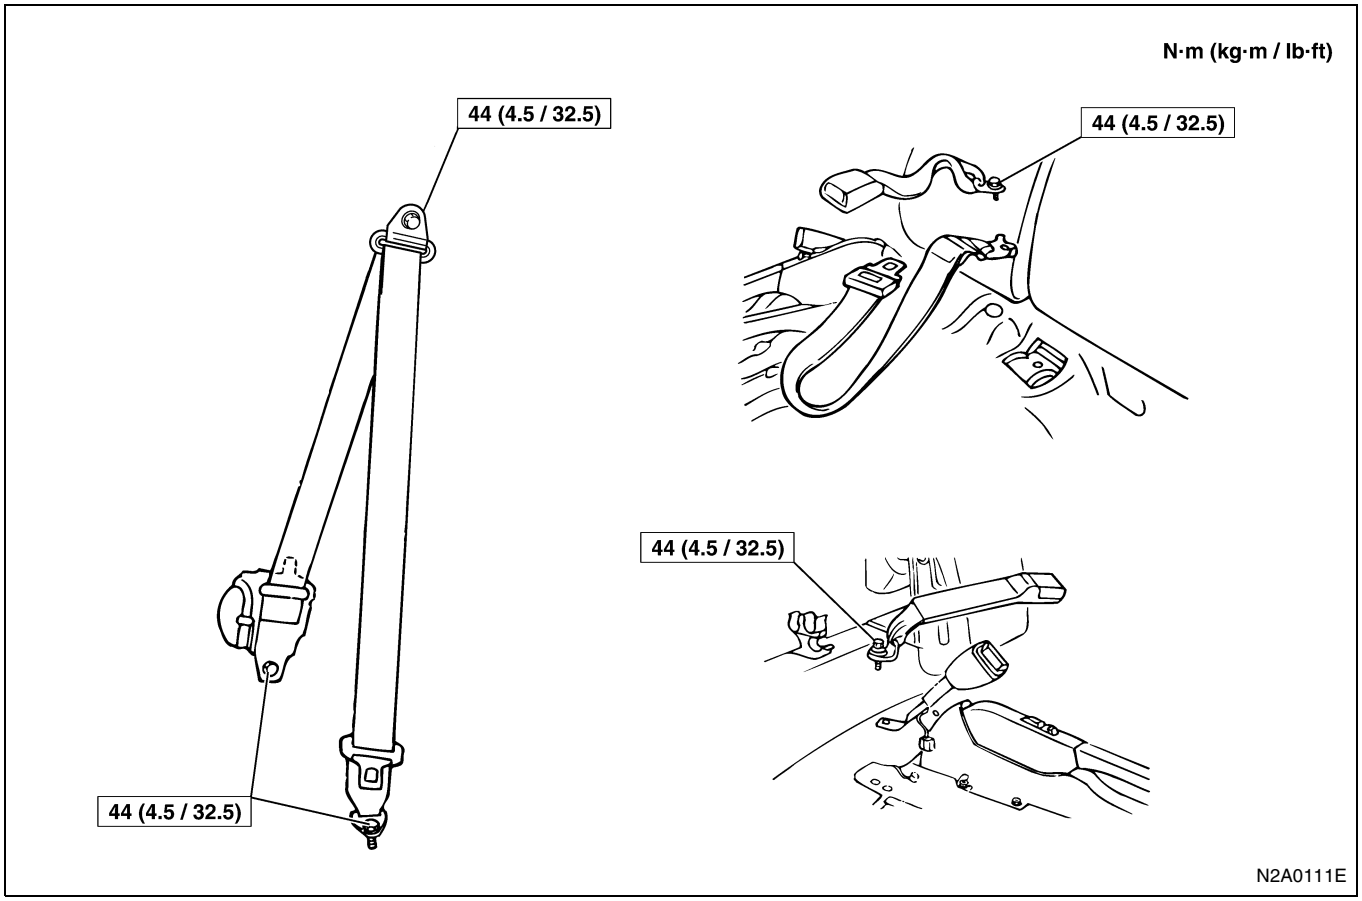
1. Apply the sealant around the fixing bolt mounting hole.

Sealant TOKIWA CHEMICAL INDUSTRY 770GA or equivalent

2. Install the anchor parallel to the traveling direction of vehicle.
3. Tighten the fixing bolts to the specified torque.

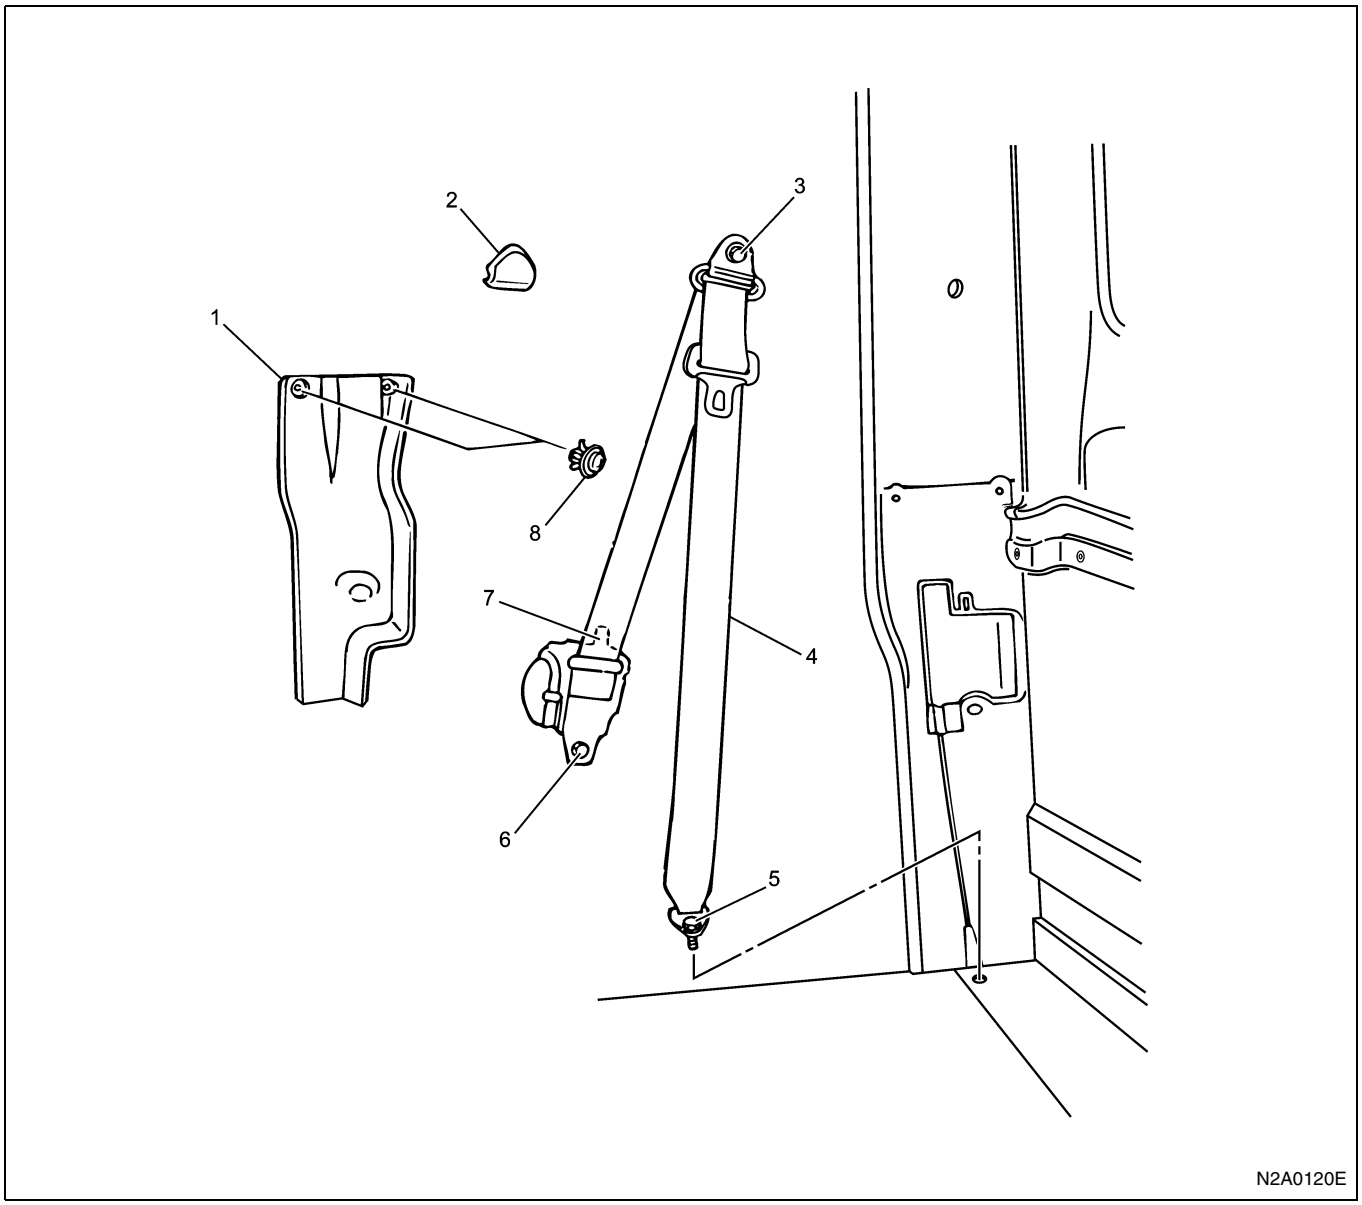
Tighten:
Fixing bolt to 44 N·m (4.5 kg·m / 32.5 lb·ft)

Fixing Torque



Rear Seat Belt (Crew Cab Model)

Components



Legend

1. Rear pillar lower trim cover
2. Through anchor cover
3. Seat belt upper anchor bolt
4. Rear seat belt assembly
5. Seat belt lower anchor bolt
6. Retractor fixing bolt
7. Bracket
8. Clip

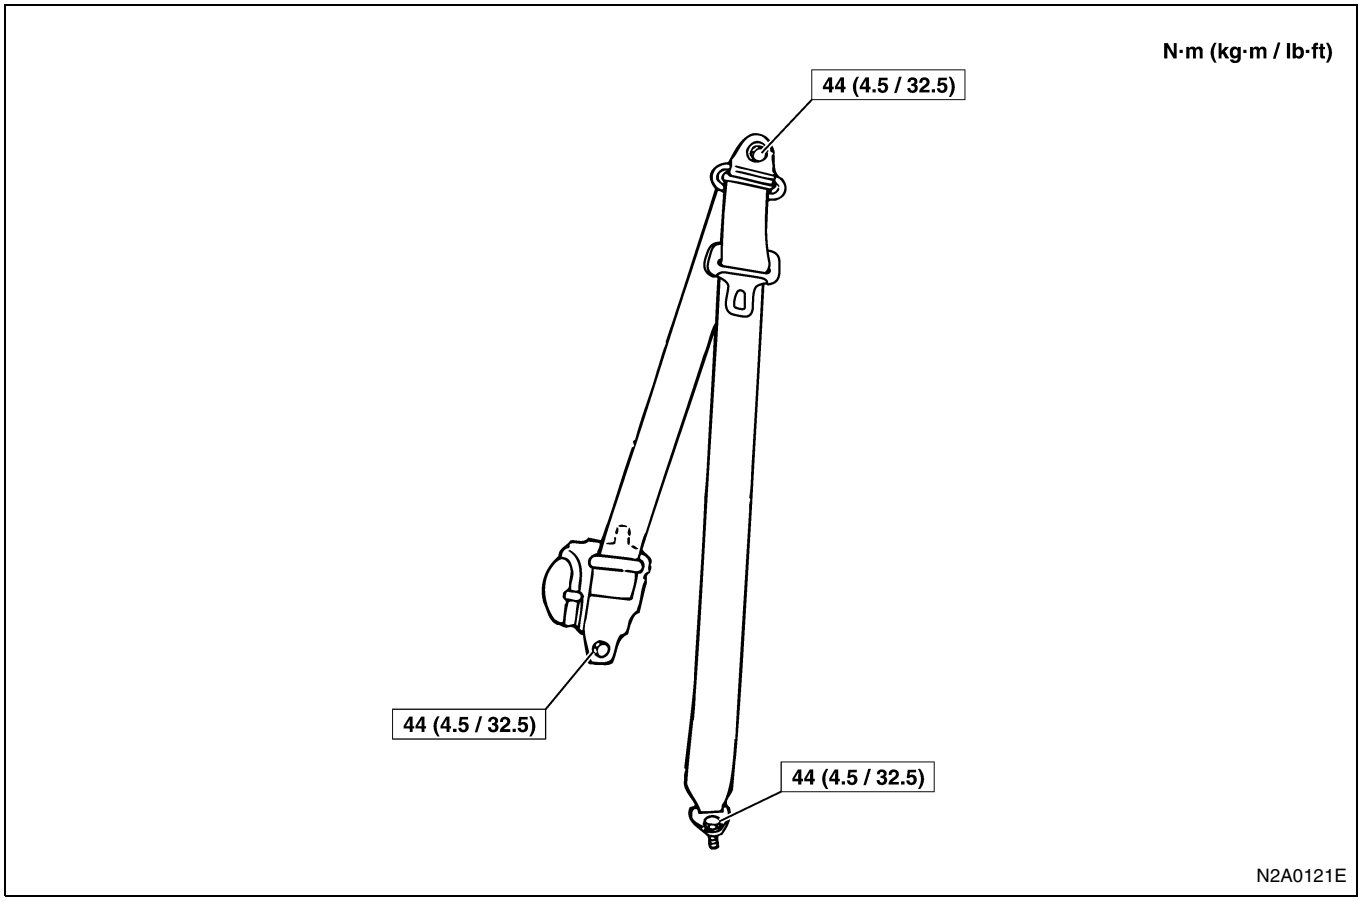
Removal

1. Remove the seat belt lower anchor bolt.
2. Remove the rear pillar lower trim cover.
   - Remove the 2 clips and pull it upward.
3. Remove the through anchor cover.
4. Remove the seat belt upper anchor bolt.
5. Remove the retractor fixing bolt.
   - Remove the bolt and pull the retractor upper bracket from panel to remove.

Installation

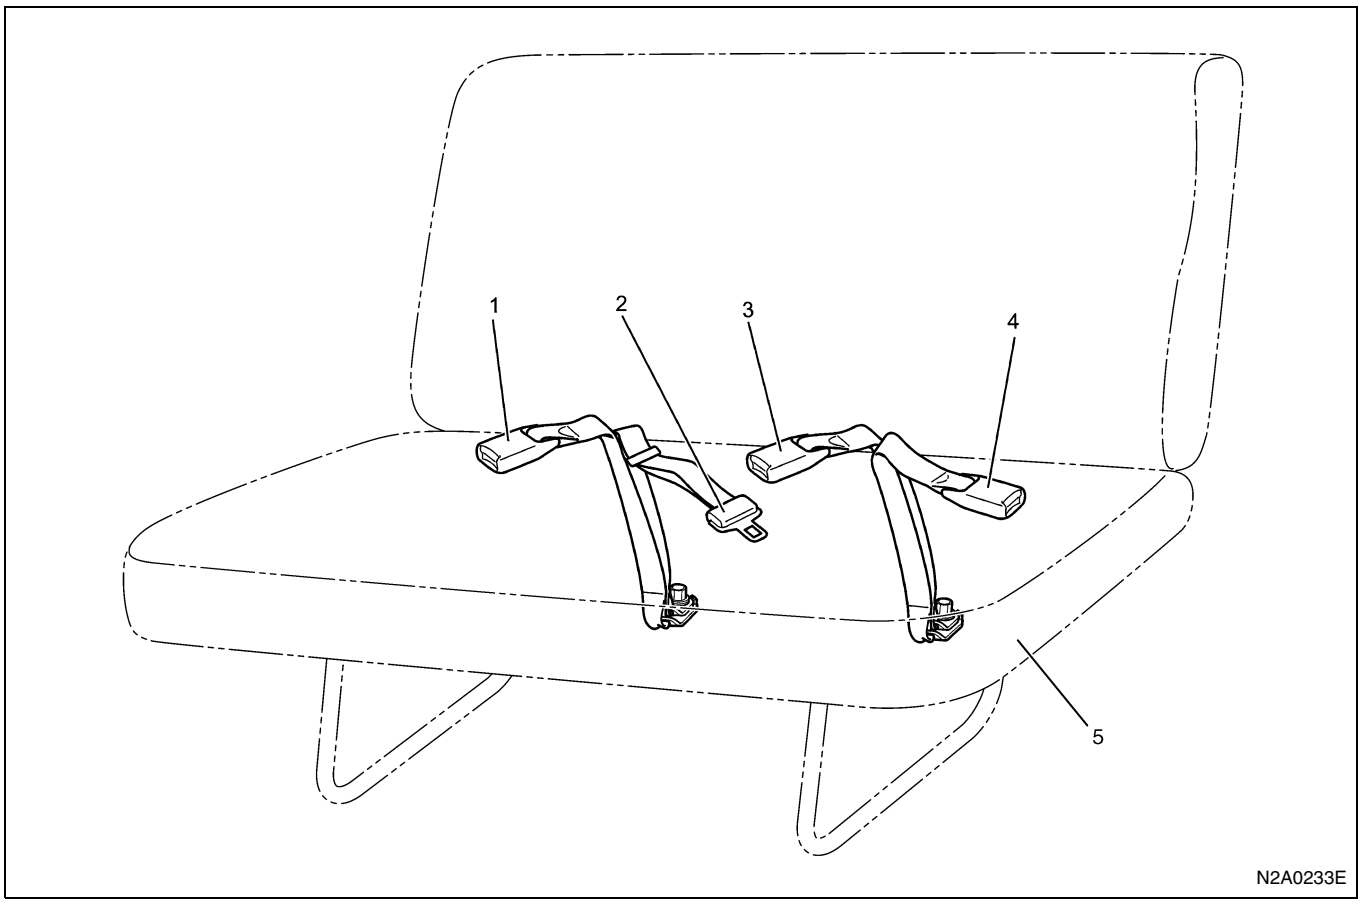
For installation, refer to “Tongue Side Seat Belt (Single Cab Model)” in this section, and reverse the removal procedure.

Fixing Torque



Rear Seat Belt Buckle and Rear Center Seat Belt/Buckle (Narrow Cab Model)

Components



Legend

1. Rear seat belt buckle (RH)
2. Rear center seat belt
3. Rear center belt buckle
4. Rear seat belt buckle (LH)
5. Rear seat cushion

Removal

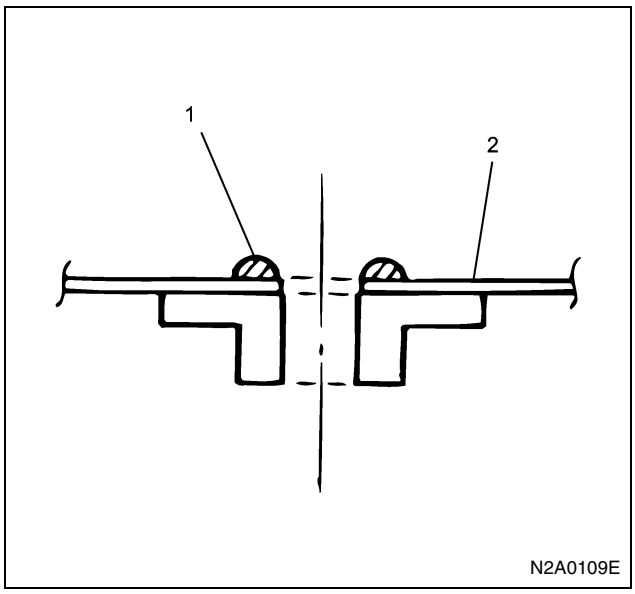
1. Fold the rear seat cushion.
   - Pull out each seat belt buckle and seat belt from the interval of the seat cushion and release the lock lever of rear seat cushion stay to fold it.
2. Remove the fixing bolt of each seat belt.

Installation

For installation, reverse the removal procedure taking the following points into consideration.

1. Apply the sealant (1) around the fixing bolt mounting hole on the floor part (2).

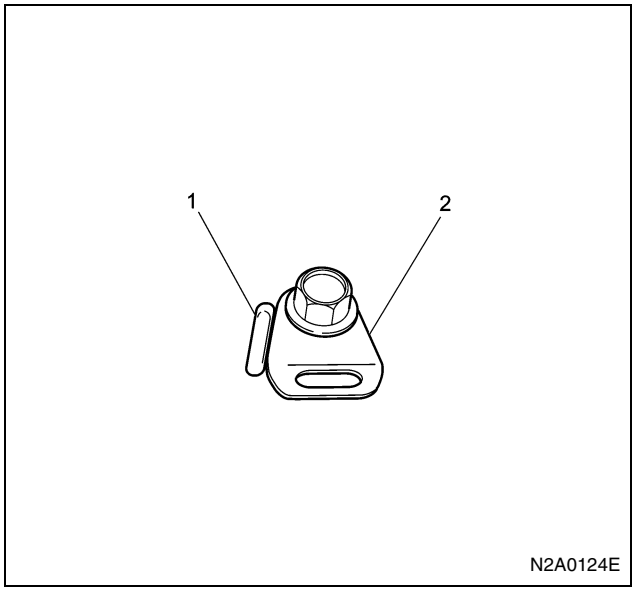
Sealant TOKIWA CHEMICAL INDUSTRY 770GA or equivalent



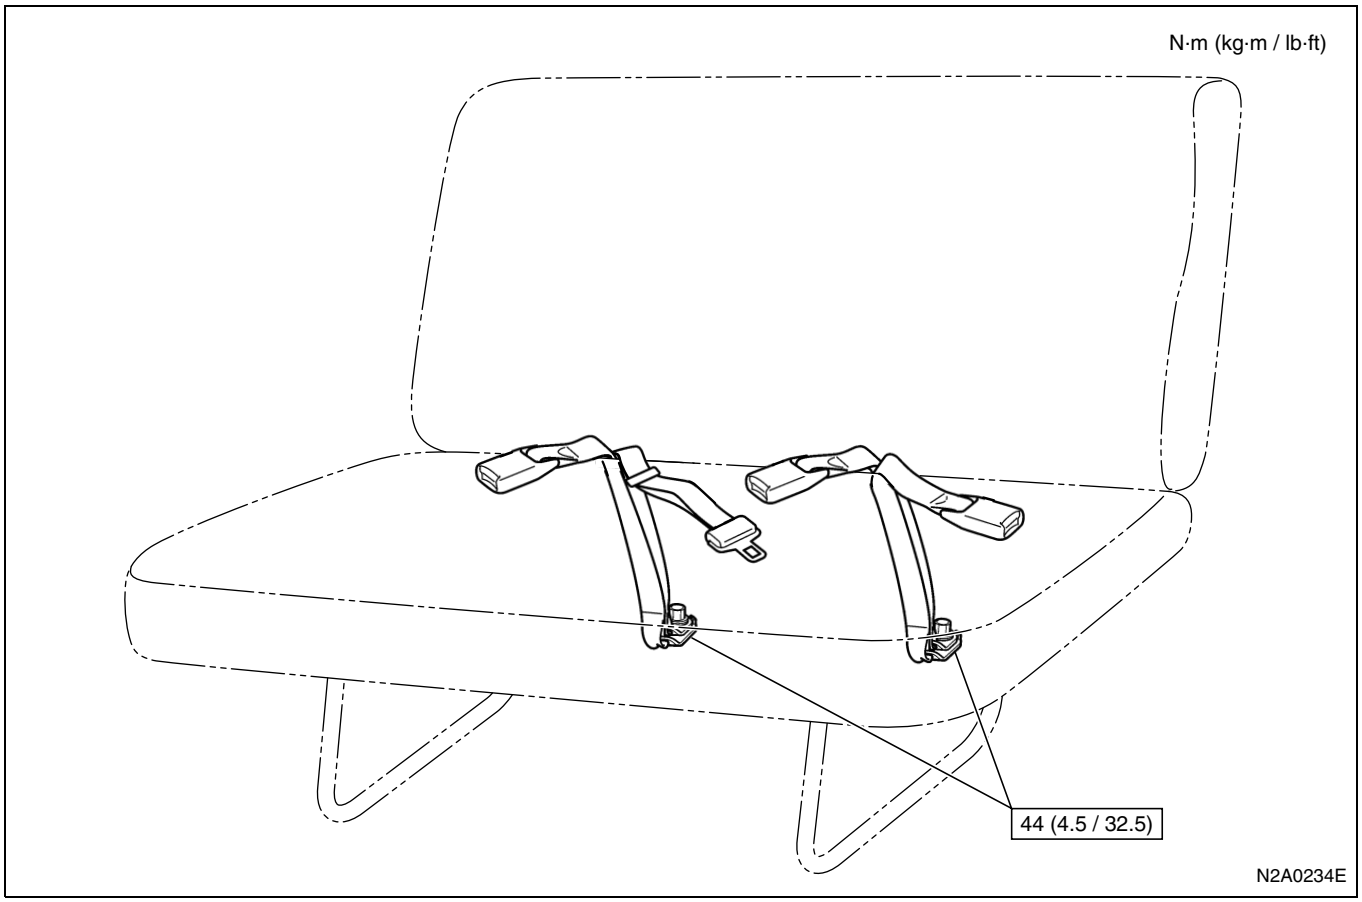
2. Install the anchor parallel to the traveling direction of vehicle.
3. Tighten the fixing bolts to the specified torque.

Tighten:
Fixing bolts to 44 N·m (4.5 kg·m / 32.5 lb·ft)

Caution:
Install the anchor bracket (2) so that it may not run on the anchor detent bead (1).

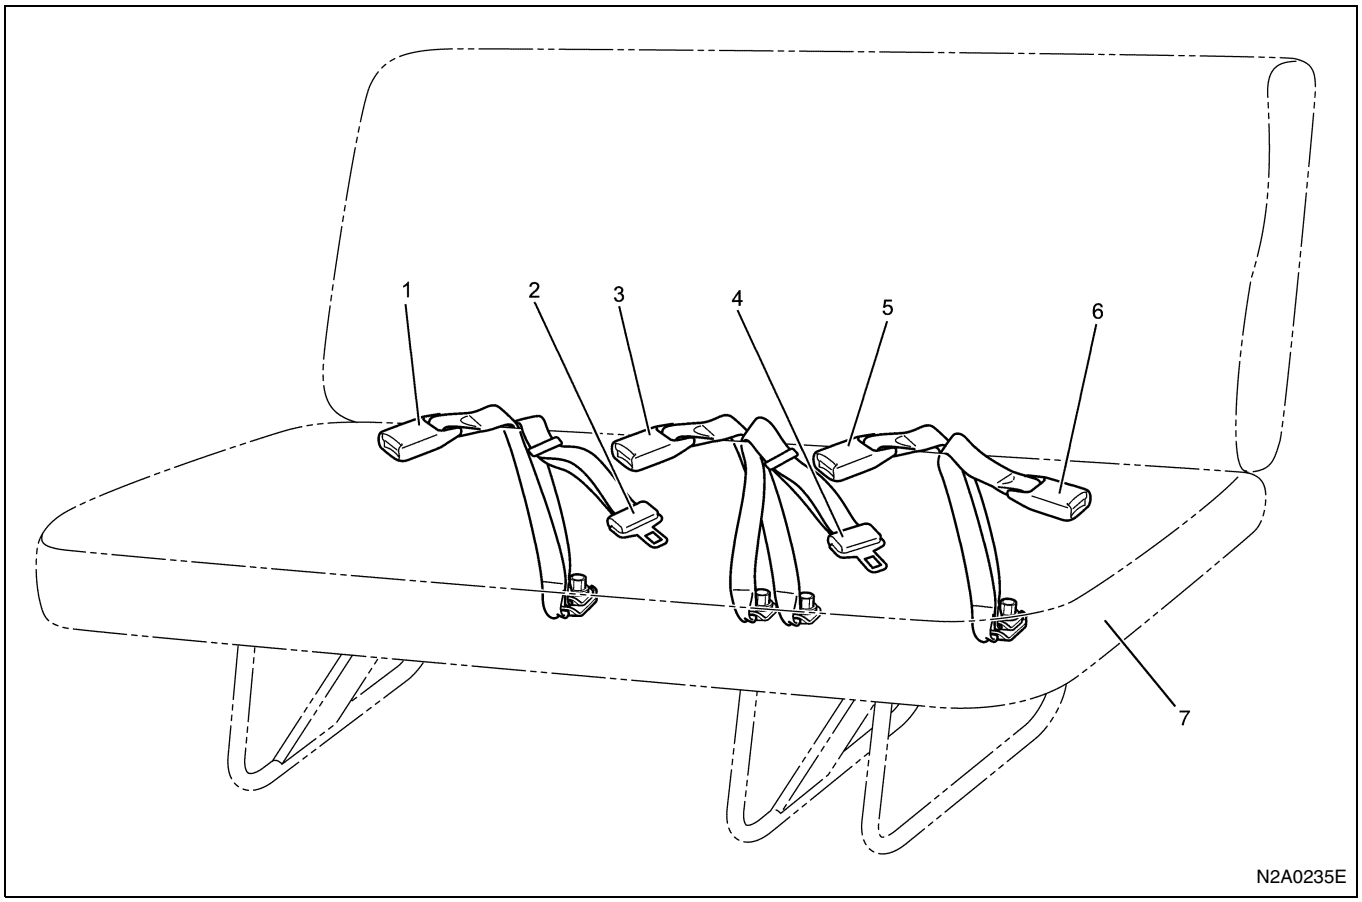


Fixing Torque



Rear Seat Belt Buckle and Rear Center Seat Belt/Buckle (Wide Cab Model)

Components



Legend

1. Rear seat belt buckle (RH)
2. Rear center seat belt (RH)
3. Rear center seat belt buckle (RH)
4. Rear center seat belt (LH)
5. Rear center seat belt buckle (LH)
6. Rear seat belt buckle (LH)
7. Rear seat cushion

Removal

Refer to “Rear Seat Belt Buckle and Rear Center Seat Belt/Buckle (Narrow Cab Model)” in this section for removal.

Installation

Refer to “Rear Seat Belt Buckle and Rear Center Seat Belt/Buckle (Narrow Cab Model)” in this section for installation.

SRS System Assembly

Precautions on Service Work

WARNING:
WHEN SERVICING SRS SYSTEM PARTS (SRS CONTROL UNIT, AIRBAG, HARNESS, ETC.) OR ITS CIRCUMFERENCE, STOP TEMPORARILY THE FUNCTION OF SRS ACCORDING TO THE PROCEDURE. FAILURE TO FOLLOW THE PROCEDURE MAY CAUSE INJURY DUE TO SRS AIRBAG DEPLOYMENT OR UNNECESSARY REPAIR.

Turn the starter switch to “LOCK” at first. Then, disconnect the battery or remove the fuse which sends power to SRS control unit. After that, do not perform the work at least 15 seconds since airbag may be deployed. In the service procedure, remove “SRS fuse” and detach SRS airbag from deployment circuit to prevent unnecessary SRS parts from deploying.
If removing SRS airbag from deployment circuit according to “Procedure to stop the function of SRS” in this topic, service work can be performed immediately without waiting for 15 seconds.

About Tools

WARNING:
WHEN SERVICING SRS, DO NOT USE ELECTRICAL TEST EQUIPMENTS EXCEPT ONES DESCRIBED IN THIS MANUAL TO AVOID DEPLOYMENT OF SRS AIRBAG. FAILURE TO FOLLOW THIS MANUAL MAY CAUSE INJURY DUE TO UNNECESSARY DEPLOYMENT OF SRS AIRBAG.

It is necessary to measure voltage and resistance. Familiarize yourself with use of Tech 2, SRS substitute load (5-8840-2421-0), connector test adapter kit (5-8840-0385-0), DVM (digital multi-meter, 5-8840-0366-0).

Necessary Repair and Inspection After Collision

- If the parts of this system are damaged, replacement is needed. If mounting portion of SRS parts are damaged, replacement is needed.
- Never use system parts of other vehicle.
- Do not disassemble or repair SRS control unit, SRS coil assembly or SRS airbag. These parts must be replaced with new ones.
- Confirm the part number to make sure that replacement SRS parts are legitimate.

Caution:
Do not use SRS airbag of other vehicle or model. Be sure to confirm the part number to use appropriate SRS airbag.

Caution:
After repair and replacement, set back the SRS airbag to the correct specification so that it is operated properly.

It is necessary to replace SRS control unit and SRS airbag, and inspect the dimension of steering column. If the mounting bracket of SRS control unit are damaged clearly, replacement is needed. Besides, the dimension of steering column should be inspected regardless of SRS airbag deployment.

Replacement and Inspection of Parts After Collision with Deployment

If frontal collision with airbag deployment occurs, following system parts must be replaced. It is necessary to check whether SRS coil assembly is damaged.

- SRS airbag assembly
- SRS control unit
- Combination switch assembly (including SRS coil)

Caution:
Refer to “Replacement guideline for SRS control unit” described later for important information about replacement of SRS control unit after collisions with deployment and without.

- Inspect SRS coil assembly harness and connector for burn due to excessive heat, dissolution or damage. If damaged, refer to “SRS Coil Assembly”.

Inspection of Parts After Collision with or Without Deployment

The certain parts of this system and supplemental restraint system should be inspected regardless of airbag deployment. The parts to be inspected are shown as follows.

- Steering column: inspect the dimension according to “Examination of damage for steering column” described in “Steering column”.
- Steering support bracket: inspect for distortion, bent, crack or other damage.
- Instrument panel bracket: inspect for distortion, bent, crack or other damage.
- Seat belt and its mounting portion: refer to “Seat Belt” section.

Replacement Guideline for SRS Control Unit

If collision with airbag deployment occurs, replacement of SRS control unit is needed. If “SRS” warning lamp illuminates, perform SRS diagnosis according to “Function check: SRS system check” in “SRS control system” in SRS Control System section.

Damaged Harness

If the SRS harness is damaged, it must be replaced.

Damaged SRS Connector (Case and Terminal)

If the connector or terminal of SRS harness (except lead wire) is damaged, replace it.

Damaged Lead Wire of SRS Part

If the lead wire of parts for SRS airbag, combination switch assembly (including SRS coil assembly), etc. is damaged, replace all the parts (including lead wire).

Procedure to Stop the Function of SRS

Removal

Turn the starter switch to “LOCK”, and remove the key.

1. Disconnect the SRS fuse from the fuse box on the upper right portion of dashboard or disconnect terminal of battery.
2. Disconnect the 2-pole connector (yellow) located in the lower portion of steering column. (for SRS airbag)

Caution:
When removing SRS fuse and turn starter switch to ON, SRS warning lamp remains on. This is normal condition.

Procedure to Resume the Function of SRS

Installation

WARNING:
DO NOT USE SRS AIRBAG OF OTHER VEHICLE OR MODEL. BE SURE TO CONFIRM THE PART NUMBER TO USE APPROPRIATE SRS AIRBAG.

Turn the starter switch to “LOCK”, and remove the key.

1. Connect the 2-pole connector (yellow) located in the lower portion of steering column and confirm that it is connected securely.
2. Install the SRS fuse to fuse box on the upper right portion of dashboard.

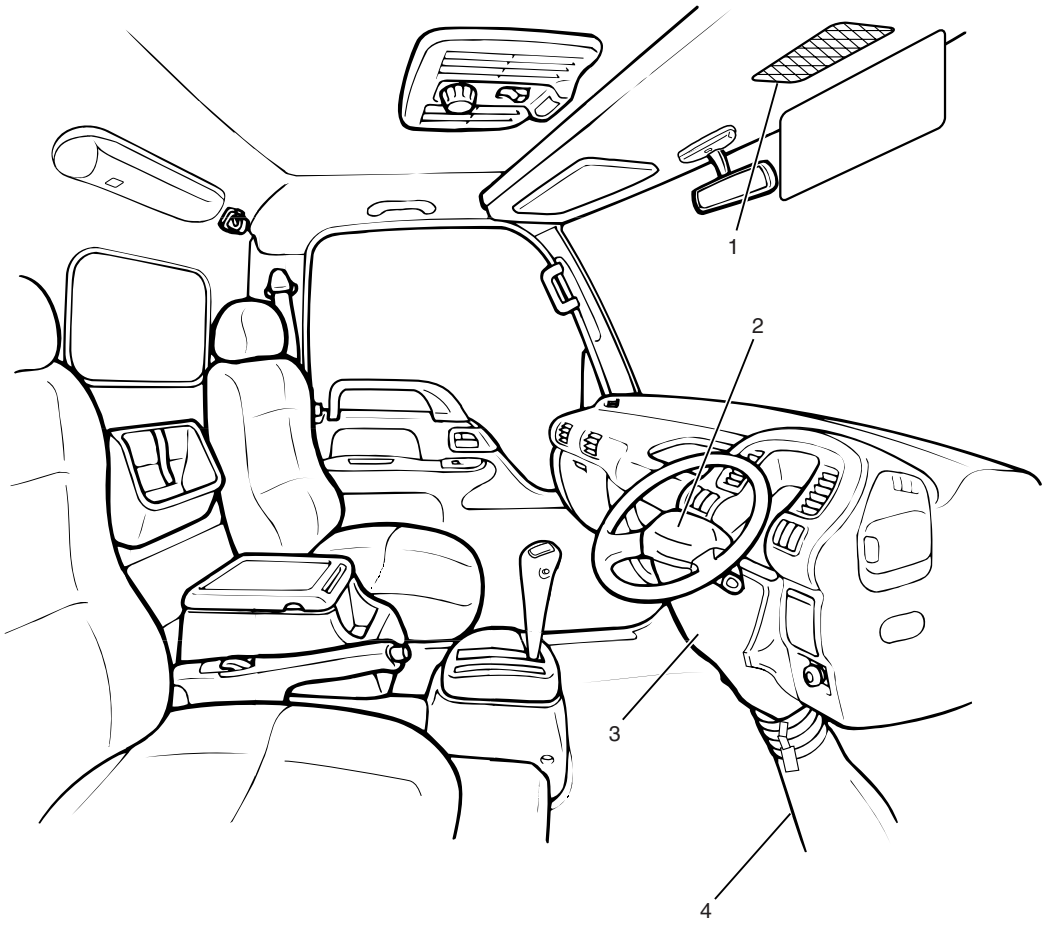
Turn the starter switch to “ON”, and confirm that the “SRS” warning lamp goes off after it blinks seven times. If the “SRS” warning lamp does not operate in that way, perform “Function check: SRS system check” in “SRS control system” in SRS Control System section.

Precautions on Handling/Installation/Diagnosis

- Do not expose SRS airbag to temperature of 93°C (199°F) or more.
- If SRS airbag and SRS control unit are dropped down with some sort of reason, do not use them.
- If disconnecting connectors related to SRS airbag and SRS control unit during repair, be sure to make sure that they are connected completely during reassembly.
- When replacing SRS control unit, install it to mounting surface correctly. Be sure to make sure there is no dust or other foreign matter on mounting surface of SRS control unit.
- When installing airbag parts, be sure to install them with specified tightening torque.
- Do not energize the system unless all SRS system parts are connected or diagnosis chart requires. If energizing the system, unnecessary diagnostic trouble code will be set in SRS control unit.
- Never diagnose the circuit using other than specified tester.
- At first, perform “SRS system check”. “SRS system check” checks whether “SRS” warning lamp operates properly and proceeds to appropriate chart to judge the function fault of system. Failure to perform this procedure leads to longer diagnosis period, wrong diagnosis or replacement of wrong part.

About Caution Labels

Caution labels, which describe exclusive precautions for driver's SRS airbag, are attached on vehicle at five locations.



N9A0016E

1. Backside of sun visor

⚠ 警告 SRSエアバッグ

SRSエアバッグ装着車（ステアリングホイール・センターパッド部に"SRS AIRBAG"の表示がある車）については、エアバッグの衝撃により、命にかかわる重大なけがをしないよう次の点を必ずお守りください。
(1)エアバッグはシートベルトの補助装置ですので、シートベルトは必ず着用してください。
(2)エアバッグに必要以上に近づいたり、寄りかかったりしないで正しい運転姿勢をとってください。
(3)エアバッグの上に物を置かないでください。
(4)エアバッグ警告灯が、走行中に点灯した場合又はスタータースイッチを"ON"位置にした時に点滅しない場合は、必ず販売店で点検を受けてください。

※SRSエアバッグの取扱い、交換、廃棄等については、販売店にご相談ください。

ーくわしくは、取扱説明書をごらんくださいー

⚠ 注意 坂路発進補助装置(HSA)

坂路発進補助装置（HSA）装着車については、次の点をお守りください。
(1)運転席を離れる時は、必ずパーキングブレーキを使用してください。
(2)HSA作動中にスタータースイッチやHSAÐOFFスイッチを操作するとブレーキ力が解除され、坂路では下がります。
(3)車両に異常があった場合には、HSAÐOFFスイッチでHSAを解除してください。

操作要領
(1)車両停止時にギヤーをニュートラルにした状態でブレーキを踏むと作動します。（HSAランプ 点灯）
(2)ギヤーをニュートラル以外のポジションにしてクラッチを継ぐとブレーキが解除します。（HSAランプ消灯）
※パーキングブレーキを引いているとHSAは、作動しません。
※HSAÐOFFスイッチを押すとHSAが解除されHSAÐOFFランプが点灯します。

About Terms

SRS airbag

This is expansion-type cloth cushion designed to be deployed on frontal collision above a certain impact. Airbag reduces an impact on occupant's head and trunk and supplements the protection by seat belts.

B+

Battery voltage (B+)

Warning lamp bulb check

When no function fault is detected after starter switch is turned to "ON" position, "SRS" warning lamp blinks seven times and goes off.

"Constant diagnosis"

Fault diagnosis is constantly performed by SRS control unit as long as "Ignition A" voltage is within the range of specified operating voltage of the unit.

Diagnostic connector (16-pin)

This is a connector to communicate with Tech 2.

Deployment

This means expansion of airbag.

Deployment circuit

This is a circuit which sends current to airbag assembly to deploy airbag.

Diagnostic trouble code (DTC)

This is number used by SRS control unit to identify the trouble in SRS function. (Self-diagnosis code)

Current supply for driver's seat

This is output of SRS control unit to send current to driver's airbag assembly circuit during "Ignition device resistance test".

EEPROM

This is an electrically erasable programmable read only memory. This is a memory which can store contents without power on SRS control unit.

Ignition device

This is electric ignition device to combust gas generating agent of inflator.

Specified operating voltage range

This is voltage range from 18 to 32 V measured between "Ignition A" terminal and "Ground" terminal of SRS control unit.

Tech 2

This is diagnostic equipment to read diagnostic information from SRS control unit via diagnostic connector.

SRS control unit

This supplies backup current to deployment circuit and deploy airbag if necessary. Also it diagnoses all the SRS parts.

Serial data

This is Tech 2 information which indicates SRS operating condition.

SRS

This means supplemental restraint system.

SRS coil assembly

This is device to maintain successive continuity on deployment circuit for SRS airbag and allow steering wheel to rotate.

SRS harness

These are harnesses and connectors to connect SRS parts electrically.

Initial diagnosis

These are tests for SRS, performed by SRS control unit on the following conditions: after starter switch is "ON", immediately after "Ignition A" voltage is energized by SRS control unit, or before "Constant diagnosis". (performed within 6 seconds after starter switch is "ON")

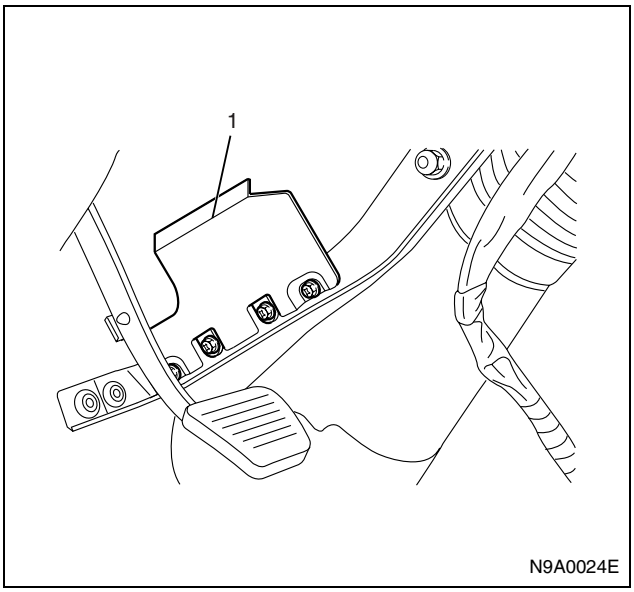
SRS Control Unit

Precautions on Service Work

WARNING:
DURING SERVICE WORK, BE CAREFUL NOT TO TAP OR SHAKE THE SRS CONTROL UNIT. ALSO, FAILURE TO INSTALL THE SRS CONTROL UNIT TO VEHICLE PROPERLY MAY LEAD TO MALFUNCTION OF THE UNIT WHEN THE STARTER SWITCH IS TURNED TO ON. THIS MAY RESULT IN INJURY DUE TO SUDDEN DEPLOYMENT OF SRS AIRBAG.

Removal

1. Stop the function of SRS. (Refer to “Procedure to stop the function of SRS” in “SRS System Assembly”.)
2. Remove the two bolts and protector.
3. Disconnect the SRS control unit harness connector.
4. Remove the four mounting bolts of SRS control unit and remove SRS control unit.



Legend
1. Protector

Installation

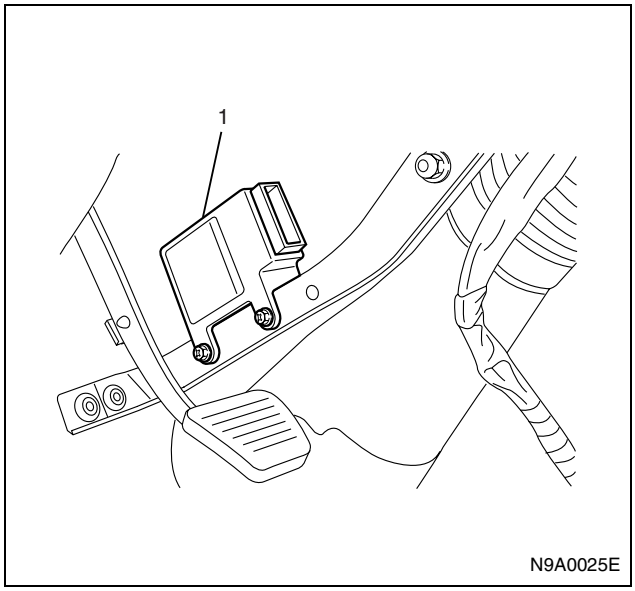
1. Install the SRS control unit to steering support bracket and tighten the mounting bolt to the specified torque.

Tighten:
Bolt to 9.8 ± 2.9 N·m (1.0 ± 0.3 kg·m / 7.2 ± 2.1 lb·ft)

2. Connect the SRS control unit harness connector.
3. Install the protector to steering support bracket and tighten the mounting bolt to the specified torque.

Tighten:
Bolt to 8.0 ± 2.0 N·m (0.8 ± 0.2 kg·m / 5.9 ± 1.5 lb·ft)

4. Resume the function of SRS. (Refer to “Procedure to resume the function of SRS” in “SRS System Assembly”.)



Legend
1. SRS control unit

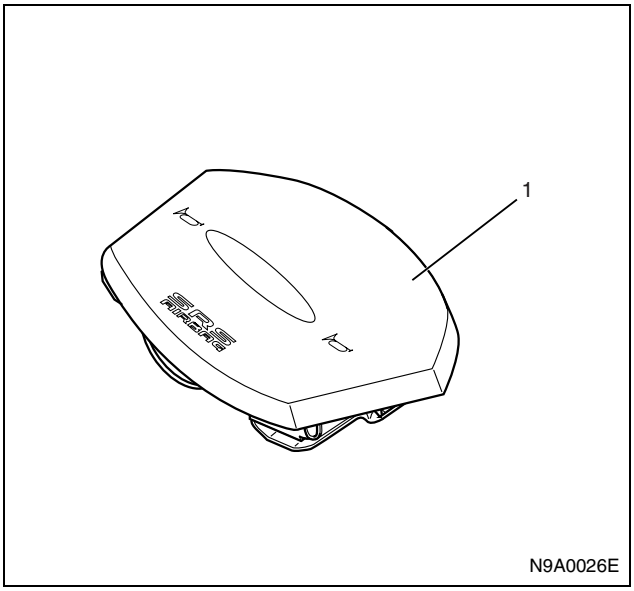
SRS Airbag Assembly

Precautions on Service Work

Procedure to Carry Undeployed SRS Airbag Assembly

Take extreme care when handling and storing undeployed airbag. In case of deployment of SRS airbag, object on the surface of SRS airbag may be blown away due to sudden generation of gas.

WARNING:
WHEN CARRYING UNDEPLOYED SRS AIRBAG ASSEMBLY, BE SURE TO TURN THE TRIM COVER TOWARD OUTSIDE TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT. ALSO, NEVER GRASP THE HARNESS OR CONNECTOR OF SRS AIRBAG TO CARRY IT.



Legend

1. Trim cover

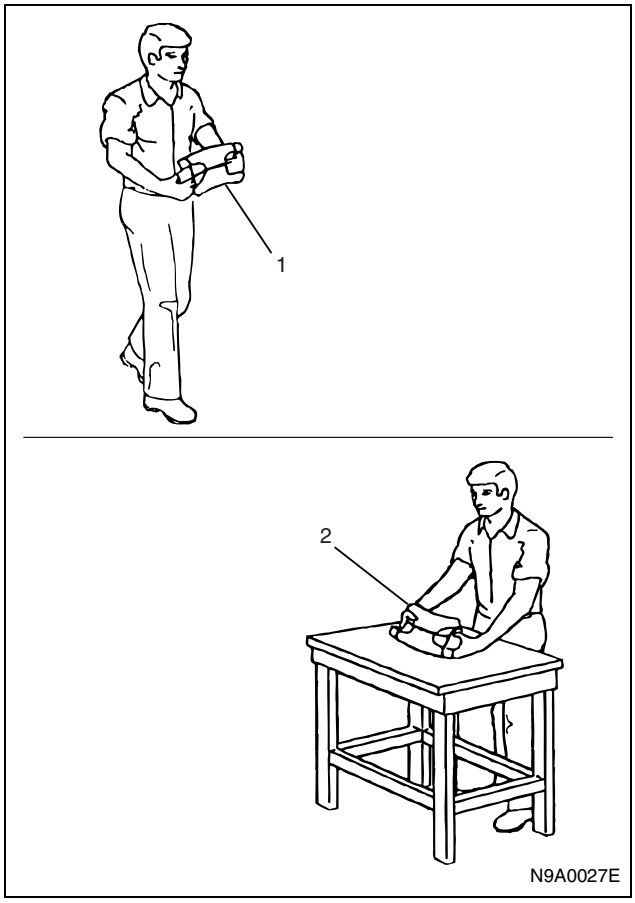
Handling of Deployed Airbag Assembly

After SRS airbag is deployed, do not touch within 30 minutes because a burn may occur due to its heat.
When handling deployed SRS airbag, wear gloves and safety goggles to protect from generated irritant and heat.

Disposal Procedure of SRS Airbag

In some cases, it may be necessary to dispose undeployed SRS airbag during usable life of the vehicle.
Perform the proper disposal procedure of undeployed airbag.
To dispose undeployed SRS airbag, the airbag must be deployed compulsorily beforehand. Undeployed airbag cannot be disposed as it is.

WARNING:
FAILURE TO FOLLOW THE PROPER DISPOSAL PROCEDURE MAY CAUSE INJURY DUE TO DEPLOYMENT OF SRS AIRBAG. UNDEPLOYED AIRBAG MUST BE DEPLOYED BEFORE DISPOSAL.



Legend

1. When carrying undeployed airbag, turn the trim cover toward outside.
2. When placing undeployed airbag, be sure to turn the trim cover upward.

Precautions on Airbag Deployment Procedure for Disposal

Failure to perform the correct procedure leads to serious accident due to airbag malfunction during work. Be sure to perform the correct procedure.

1. Turn the starter switch to OFF (LOCK), disconnect the (−) terminal of battery and wait for 15 seconds before starting work.
   (Because airbag can be activated by backup power even if battery power is cut off at collision.)
2. Never disassemble airbag.
3. Do not make an impact on airbag or put it close to magnet.
   (Because it may cause airbag malfunction. It is very dangerous.)

4. Place airbag with trim cover facing upward. Never put any object on it.
5. Do not put airbag on the floor directly to perform deployment.
   (Because it may be blown away for 2 to 3 meters (7 to 10 feet) due to impact.)
6. If installing airbag to vise or tire, fix it securely.
7. Place battery more than 10 m (33 ft) away from airbag.
8. Before disconnecting the harness of airbag, touch the metal parts of vehicle for body grounding of worker.
   (To prevent malfunction due to static electricity)
9. Do not stand in front of airbag when handling harness.
10. Let nearby personnel know about deployment because loud sound occurs. Also, put blanket on steering wheel or tire, or close the windows to reduce deployment sound as possible if deploying in vehicle.
11. Perform the work in well-ventilated area since deployment emits smoke.
    (For indoor deployment, do not perform near fire-alarm, smoke-alarm, or under fluorescent.)
12. Take care not to inhale smoke emitted on deployment.
13. Put cover on vehicle since glasses of vehicle may be broken on deployment if they are damaged.
14. Directly after airbag is deployed, leave it for 30 minutes since it is very hot.
15. Do not pour water etc. to the deployed airbag.
16. Wear protective tools such as safety goggles, gloves, etc. during work and wash them thoroughly after work.
17. Do not reuse removed airbag to equip other vehicle with.
    (Because operating characteristics depend on vehicle models.)

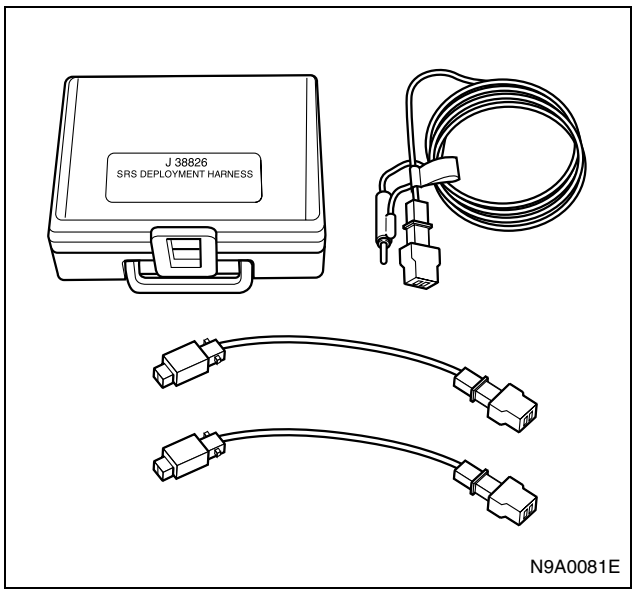
There are two methods to deploy undeployed airbag assembly: out-vehicle deployment and in-vehicle deployment.

Out-vehicle Deployment (Using Deployment Mounting tool)

WARNING:
FAILURE TO FOLLOW THE PROPER DISPOSAL PROCEDURE MAY CAUSE INJURY DUE TO DEPLOYMENT OF SRS AIRBAG. UNDEPLOYED AIRBAG MUST BE DEPLOYED BEFORE DISPOSAL.

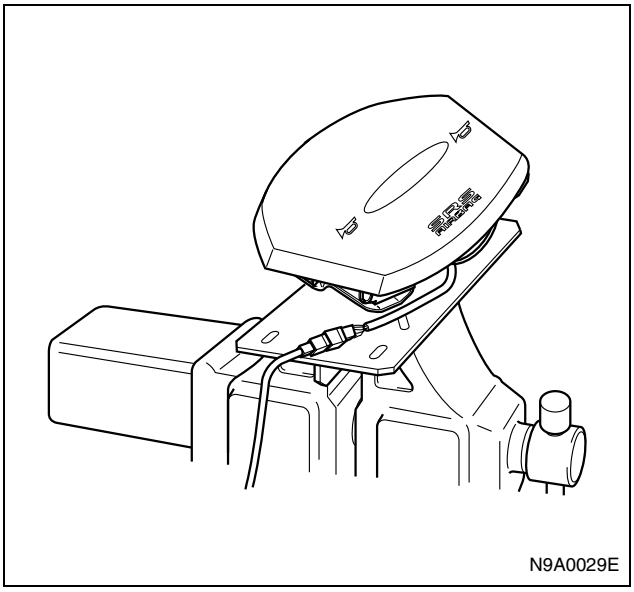
Deployment procedure must be observed to deploy the undeployed airbag assembly out of vehicle.
During deployment procedure, always wear safety goggles until disposing deployed airbag assembly. Before performing deployment procedure, read carefully description to understand the service work of SRS and the proper handling of airbag assembly.

Prepare SRS airbag deployment tool (5-8840-2468-0), 2-pole extension cord, SRS deployment mounting tool (5-8840-2420-0), vise and tire for the procedure. Do not perform the procedure without these tools.



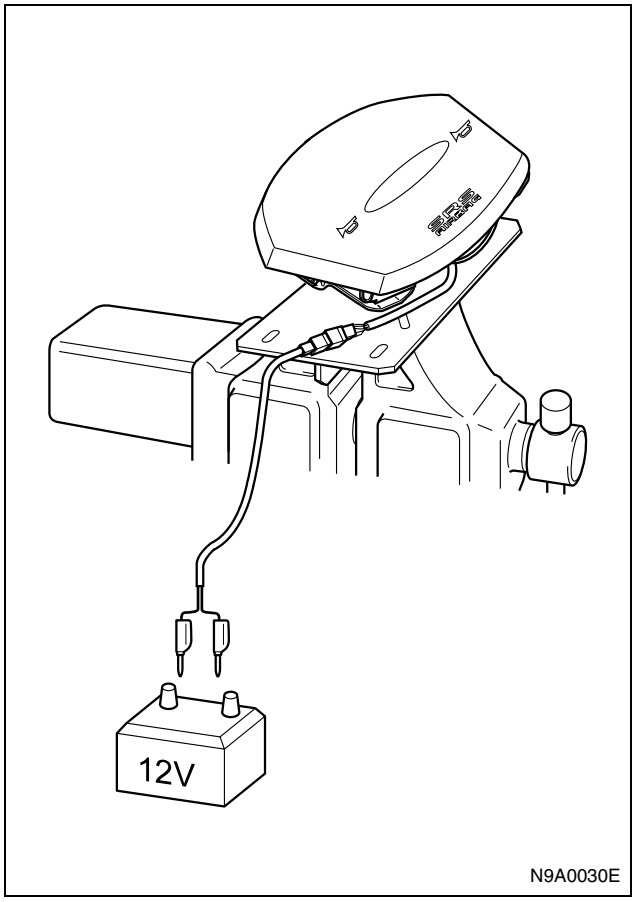
WARNING:
SRS AIRBAG ASSEMBLY DEPLOYS IMMEDIATELY AFTER CONNECTING POWER SUPPLY TO SRS DEPLOYMENT HARNESS. THEREFORE, BE SURE TO CONNECT POWER SUPPLY WITH THE HARNESS IN THE END OF THE DEPLOYMENT PROCEDURE OF SRS AIRBAG ASSEMBLY. FAILURE TO FOLLOW THIS MAY CAUSE INJURY. ALSO, ALWAYS WEAR SAFETY GOGGLES DURING DEPLOYMENT AND DISPOSAL PROCEDURES.

1. Turn the starter switch to “LOCK”, remove the key and wear safety goggles.
2. Inspect SRS airbag deployment tool (5-8840-2468-0) and 2-pole extension cord for damage. If the harness or extension cord is damaged, use new one.
3. Remove the SRS airbag assembly from the vehicle. Refer to “Removal” in “SRS Airbag Assembly”.
4. Make open space (diameter of more than 2 meters) for deployment of SRS airbag assembly mounted to deployment mounting tool. Outdoor paved place in which safety is secured is recommended, however well-ventilated service work place is also available. Besides, make sure that there are no objects or flammable materials in deployment area. (For indoor deployment, do not perform near fire-alarm, smoke-alarm, or under fluorescent.)
5. Install SRS airbag mounting tool (5-8840-2420-0) to vise to stabilize the tool during deployment.



N9A0029E

6. Firmly install SRS airbag assembly with trim cover facing upward to deployment mounting tool (5-8840-2420-0) using bolt or wire.
7. Extend SRS airbag deployment harness and the 2-pole extension cord more than 10 m (33 ft) away from airbag assembly.
8. Insert a banana plug to other banana plug firmly to short two SRS airbag deployment harnesses. Do not connect SRS airbag deployment harness to power supply until the stage of deploying airbag.
9. Place the power supply near the end of extended SRS airbag deployment harness. (Battery with 12 V and 2 A or more is recommended to use.)

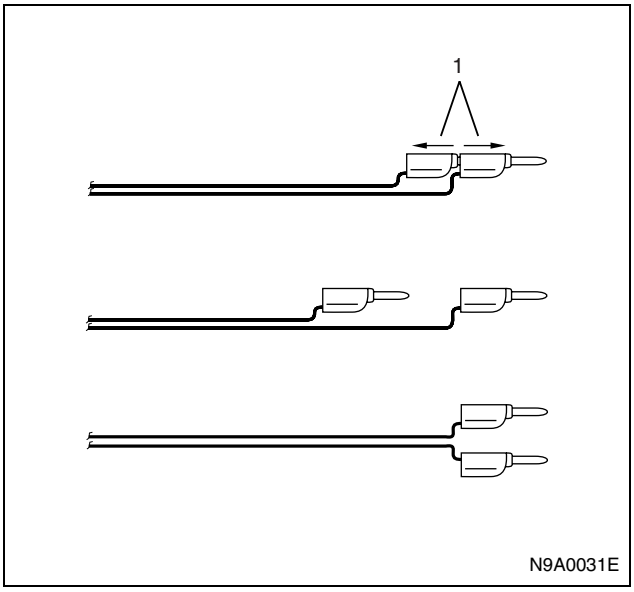


N9A0030E

10. Connect the SRS airbag assembly to 2-pole extension cord of SRS airbag deployment harness. Do not connect deployment harness to power supply until the stage of deploying airbag because airbag deploys immediately after connecting the harness to power supply.

Caution:
Insert the extension cord to the connector of SRS airbag assembly firmly. Failure to insert connector firmly may cause the shorting bar in SRS airbag assembly connector to remain functional (remains short in deployment circuit). Therefore, SRS airbag assembly is not deployed.

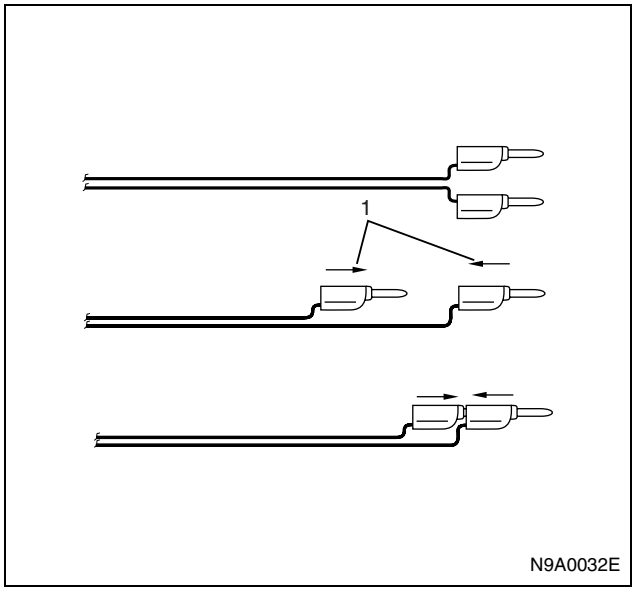
11. Make sure that there are no personnel, objects or flammable materials around SRS airbag assembly.
12. Make sure that SRS airbag assembly is installed correctly and firmly to SRS deployment mounting tool (5-8840-2420-0).
13. Let nearby personnel know about deployment because loud bursting sound occurs due to sudden gas expansion when airbag is deployed.
14. Remove the two banana plugs of SRS airbag deployment harness.



Legend
1. Disconnect the banana plugs.

WARNING:
SRS AIRBAG ASSEMBLY DEPLOYS IMMEDIATELY AFTER CONNECTING POWER SUPPLY TO SRS DEPLOYMENT HARNESS. THEREFORE, BE SURE TO CONNECT POWER SUPPLY WITH THE HARNESS IN THE END OF THE DEPLOYMENT PROCEDURE OF SRS AIRBAG ASSEMBLY. FAILURE TO FOLLOW THIS MAY CAUSE INJURY. ALSO, ALWAYS WEAR SAFETY GOGGLES DURING DEPLOYMENT AND DISPOSAL PROCEDURES.

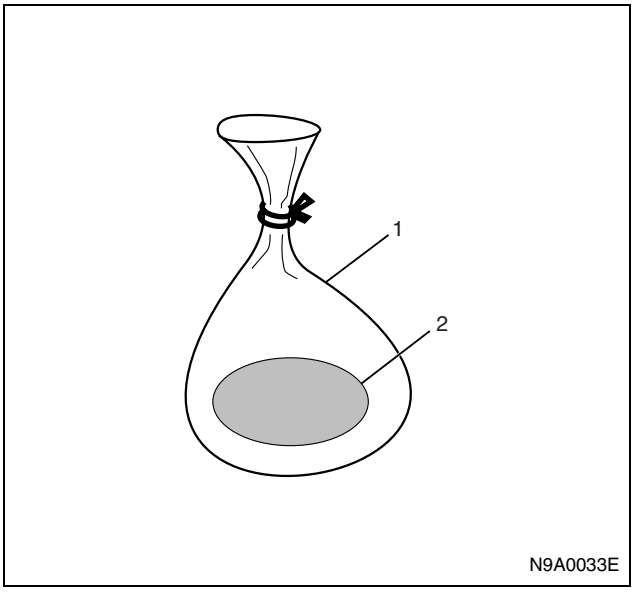
15. When connecting SRS airbag deployment harness to power supply, immediately SRS airbag assembly will be deployed. Battery with 12 V and 2 A or more is recommended to use for deployment.
16. If SRS airbag assembly has not been deployed in these steps, immediately perform the steps from 22 to 24. If SRS airbag assembly has been deployed, perform steps from 17 to 21.
17. Remove the SRS airbag deployment harness from power supply.
18. Insert a banana plug to other banana plug firmly to short two SRS airbag deployment harnesses.



Legend
1. Short the banana plug.

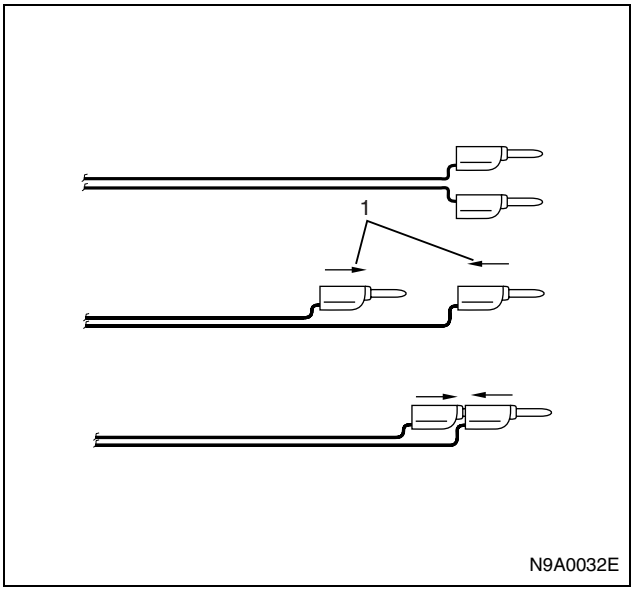
WARNING:
FOLLOW PRECAUTIONS ABOUT SAFETY WHEN HANDLING DEPLOYED SRS AIRBAG ASSEMBLY. METAL SURFACE OF SRS AIRBAG ASSEMBLY WILL BE VERY HOT DIRECTLY AFTER DEPLOYMENT. DO NOT TOUCH IT FOR 30 MINUTES AFTERWARD. DO NOT PUT THE DEPLOYED SRS AIRBAG ASSEMBLY NEAR FLAMMABLE MATERIALS. FAILURE TO FOLLOW THIS MAY CAUSE FIRE OR INJURY. IF THE DEPLOYED SRS AIRBAG ASSEMBLY NEEDS TO BE MOVED BEFORE IT COOLS DOWN, WEAR GLOVES AND GRASP THE SRS AIRBAG OR TRIM COVER TO MOVE.

19. Remove the 2-pole extension cord from SRS airbag assembly soon after deployment to prevent the extension cord and SRS airbag deployment harness from touching the hot metal parts. 2-pole extension cord and deployment harness are reusable. However, inspect them for damage every time after deployment, and replace them if necessary.
20. Leave the deployed SRS airbag assembly for more than 30 minutes to cool down, and put it in sturdy vinyl bag and seal it. Dispose it in the normal disposal procedure.



Legend
1. Sturdy vinyl bag
2. Deployed airbag

21. Wash out your hands with soap thoroughly.
22. Remove the SRS airbag deployment harness from power supply and insert the banana plug to the other banana plug firmly to short two banana plugs.



Legend
1. Short the banana plug.

23. Disconnect the 2-pole extension cord from SRS airbag assembly.

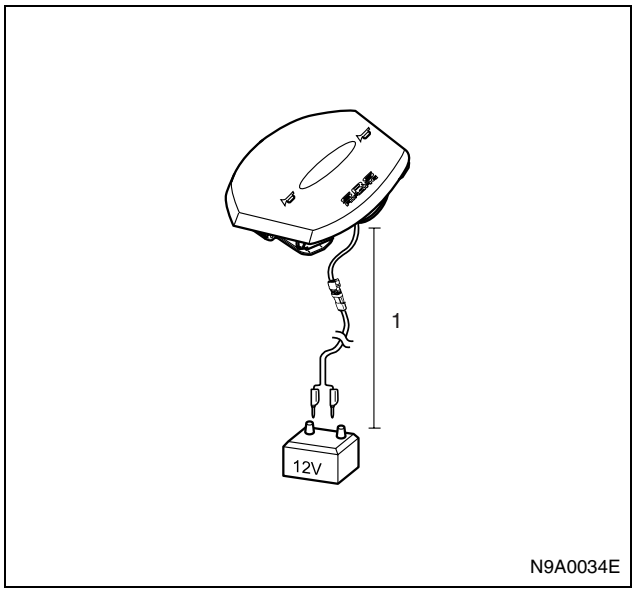
WARNING:
WHEN STORING UNDEPLOYED SRS AIRBAG ASSEMBLY, OR LEAVE IT UNATTENDED ON WORKBENCH OR SOMEWHERE ELSE, BE SURE TO TURN THE TRIM COVER UPWARD TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT.

24. Store temporarily the SRS airbag assembly with the trim cover facing upward. Do not pile it up.

Out-vehicle Deployment (Method of Securing to Tire)

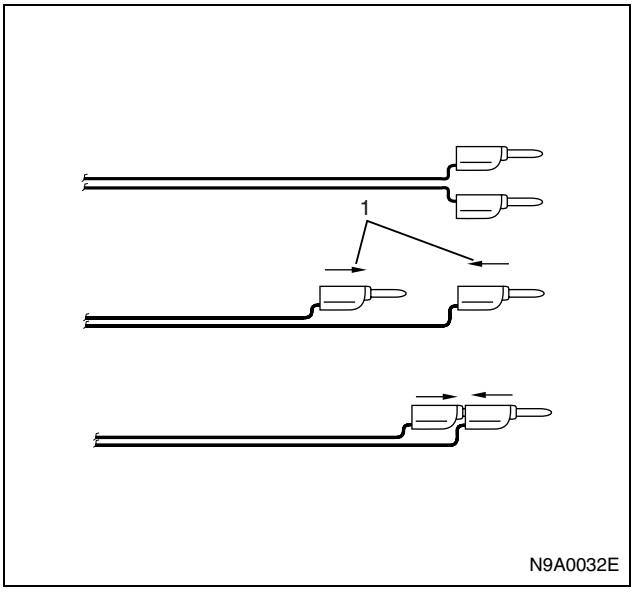
Thoroughly understand description in “Precautions on airbag deployment procedure for disposal” and precautions in “How to secure to deployment mounting tool” to perform safely.

1. Refer to “Removal” in “SRS Airbag Assembly” to remove SRS airbag assembly from the vehicle.
2. Inspect the 2-pole extension cord of SRS deployment for damage. If the harness or extension cord is damaged, use new one.
3. Extend the 2-pole extension cord more than 10 m (33 ft) away from airbag assembly.
4. Place the power supply near the end of extended SRS airbag deployment harness. (Battery with 12 V and 2 A or more is recommended to use.)



Legend
1. Keep more than 10 m (33 ft) away.

5. Insert the banana plug on the end of harness to the other banana plug firmly to short two SRS airbag deployment harnesses. Do not connect SRS airbag deployment harness to power supply until the stage of deploying airbag.

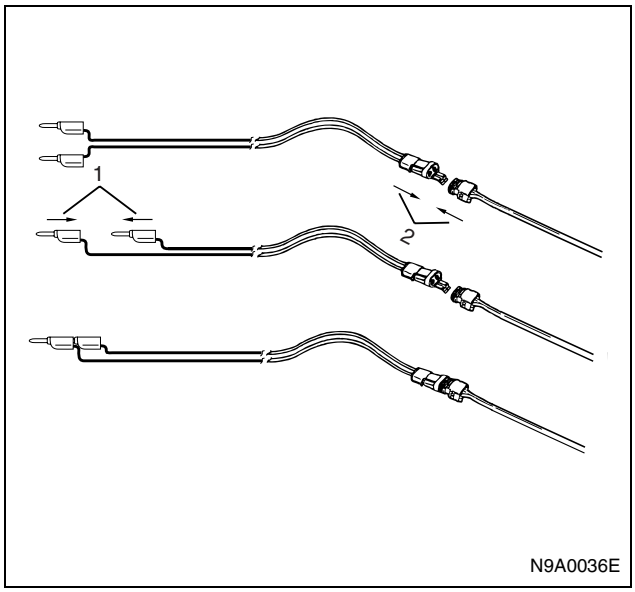


Legend
1. Short the banana plug.

6. Prepare three tires (15-inch or more) without wheel and two tires (same size) with wheel.
7. How to secure driver's airbag
   a. Secure the airbag with the trim cover facing upward to the tire with wheel. Wind automotive wire harness (cross-section of 1.25 mm^2 or more) or wire in triple-round at two locations to secure firmly.

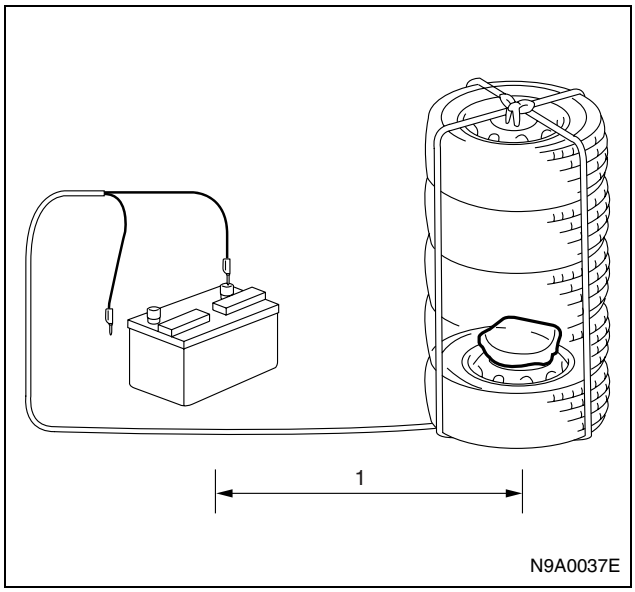
   b. Connect the SRS airbag assembly to 2-pole extension cord of airbag deployment harness. Do not connect deployment harness to power supply until the stage of deploying airbag because airbag deploys immediately after connecting the harness to power supply.

Caution:
Insert the extension cord to the connector of SRS airbag assembly firmly. Failure to insert connector firmly may cause the shorting bar in SRS airbag assembly connector to remain functional (remains short in deployment circuit). Therefore, SRS airbag assembly is not deployed.



Legend
1. Short the banana plug.
2. Connect the connector.

   c. Pile up three tires without wheel onto the tire, which secures airbag, and pile up a tire with wheel onto the top of them. Secure them firmly to prevent tires from tumbling down using ropes at four locations.

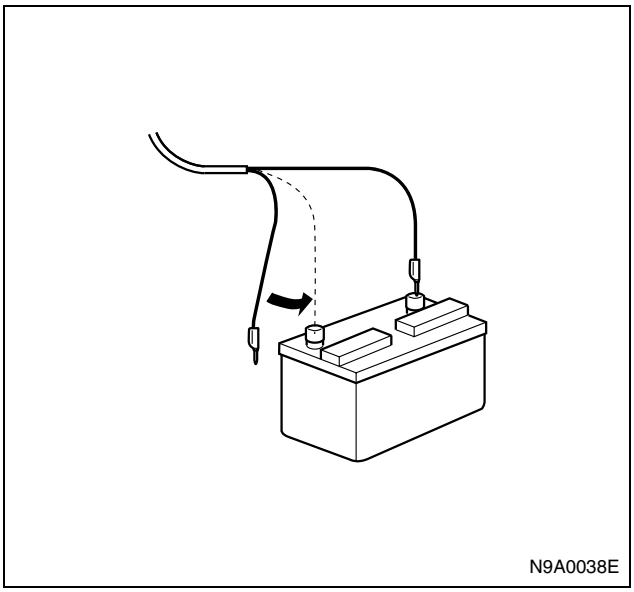


Legend
1. Keep more than 10 m (33 ft) away.

8. Let nearby personnel know about deployment because loud bursting sound occurs due to sudden gas expansion when airbag is deployed.

WARNING:
SRS AIRBAG ASSEMBLY DEPLOYS IMMEDIATELY AFTER CONNECTING POWER SUPPLY TO SRS DEPLOYMENT HARNESS. THEREFORE, BE SURE TO CONNECT POWER SUPPLY WITH THE HARNESS IN THE END OF THE DEPLOYMENT PROCEDURE OF SRS AIRBAG ASSEMBLY. FAILURE TO FOLLOW THIS MAY CAUSE INJURY. ALSO, ALWAYS WEAR SAFETY GOGGLES DURING DEPLOYMENT AND DISPOSAL PROCEDURES.

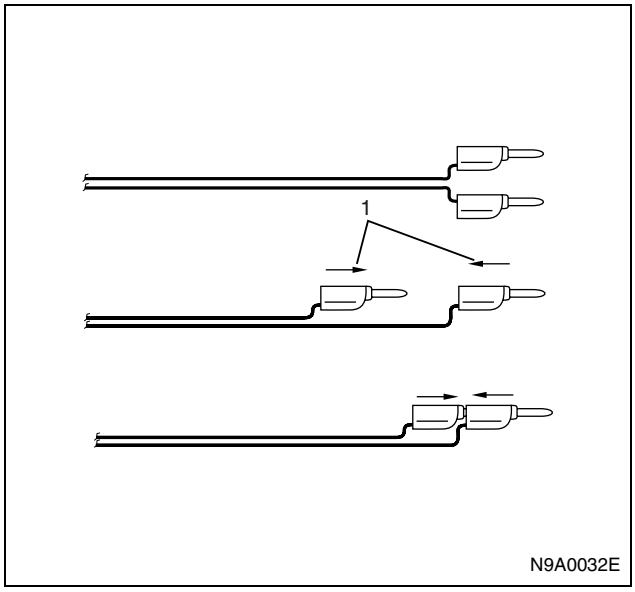
9. Connect the SRS airbag deployment harness to power supply. Immediately SRS airbag assembly will be deployed.



N9A0038E

WARNING:
FOLLOW PRECAUTIONS ABOUT SAFETY WHEN HANDLING DEPLOYED SRS AIRBAG ASSEMBLY. METAL SURFACE OF SRS AIRBAG ASSEMBLY WILL BE VERY HOT DIRECTLY AFTER DEPLOYMENT. DO NOT TOUCH IT FOR 30 MINUTES AFTERWARD. DO NOT PUT THE DEPLOYED SRS AIRBAG ASSEMBLY NEAR FLAMMABLE MATERIALS. FAILURE TO FOLLOW THIS MAY CAUSE FIRE OR INJURY. IF THE DEPLOYED SRS AIRBAG ASSEMBLY NEEDS TO BE MOVED BEFORE IT COOLS DOWN, WEAR GLOVES AND GRASP THE SRS AIRBAG OR TRIM COVER TO MOVE.

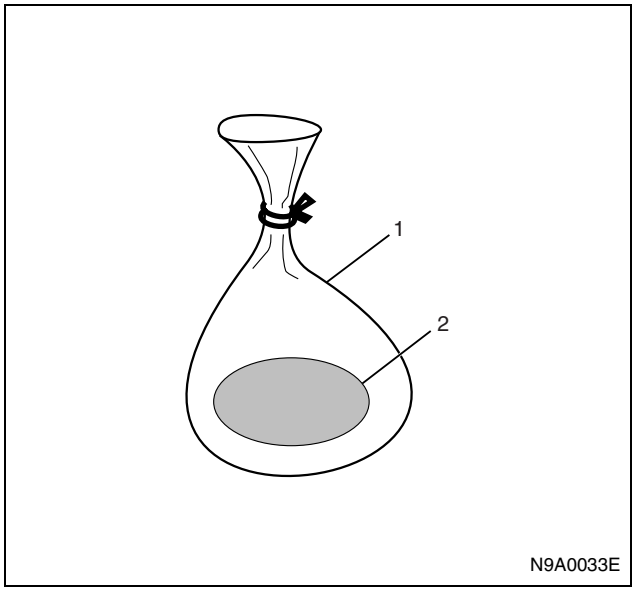
10. If SRS airbag assembly has not been deployed in these steps, immediately perform the steps from 15 to 17. If SRS airbag assembly has been deployed, perform steps from 11 to 14.
11. Remove the SRS airbag deployment harness from power supply and insert the banana plug to the other banana plug firmly to short two banana plugs.



N9A0032E

Legend
1. Short the banana plug.

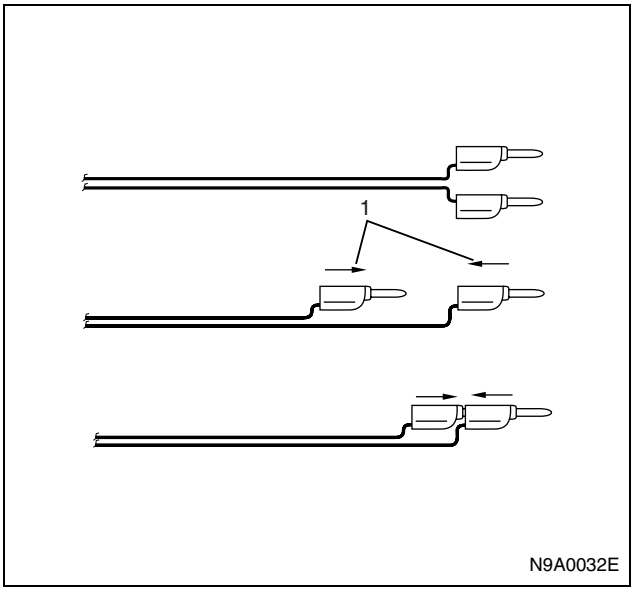
12. Disconnect the 2-pole extension cord from SRS airbag assembly.
13. Leave the deployed SRS airbag assembly for more than 30 minutes to cool down, and put it in sturdy vinyl bag and seal it. Dispose it in the normal disposal procedure.



N9A0033E

Legend
1. Sturdy vinyl bag
2. Deployed airbag

14. Wash out your hands with soap thoroughly.
15. Remove the SRS airbag deployment harness from power supply and insert the banana plug to the other banana plug firmly to short two banana plugs.

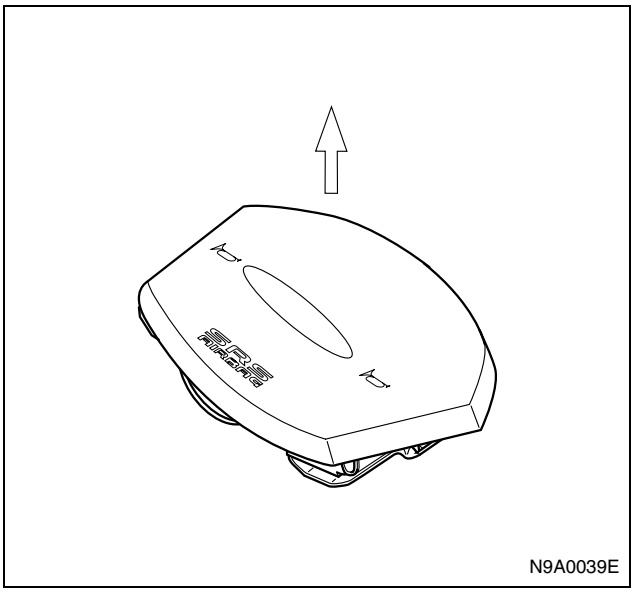


Legend
1. Short the banana plug.

16. Disconnect the 2-pole extension cord from SRS airbag assembly.

WARNING:
WHEN STORING UNDEPLOYED SRS AIRBAG ASSEMBLY, OR LEAVE IT UNATTENDED ON WORKBENCH OR SOMEWHERE ELSE, BE SURE TO TURN THE TRIM COVER UPWARD TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT.

17. Store temporarily the SRS airbag with the trim cover facing upward. Do not pile it up.



In-vehicle Deployment (Using SRS Deployment Harness)

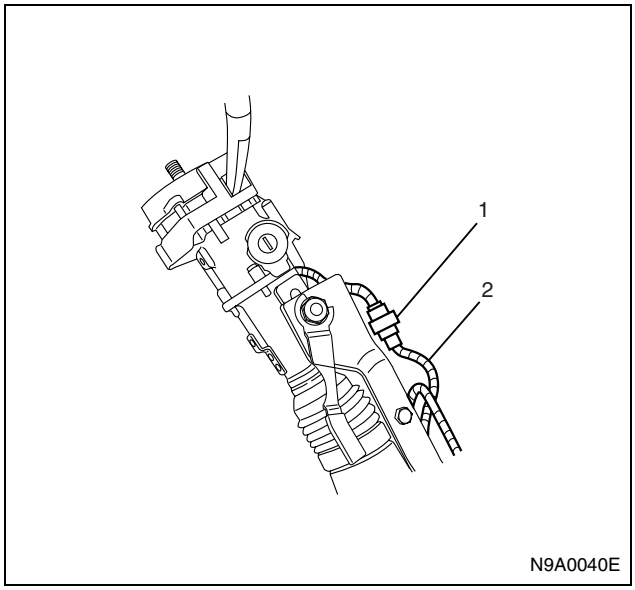
For discarding vehicle or collecting vehicle parts, in-vehicle deployment is proper. This may be one of the following situations.

- Usable life of vehicle ended.
- Vehicle has got damaged without deployment and it is impossible to be repaired.
- Vehicle was stolen and it is ripped off or damaged.

Caution:
If collecting the parts from vehicle to reuse for other one, never reuse SRS parts.

WARNING:
FAILURE TO FOLLOW THE PROPER DISPOSAL PROCEDURE MAY CAUSE INJURY DUE TO DEPLOYMENT OF SRS AIRBAG. UNDEPLOYED AIRBAG MUST BE DEPLOYED BEFORE DISPOSAL.

1. Turn the starter switch to “LOCK”, remove the key and wear safety goggles.
2. Remove all unnecessary objects inside vehicle.
3. Disconnect the 2-pole connector (yellow) of SRS coil. It is located in the lower portion of steering column.

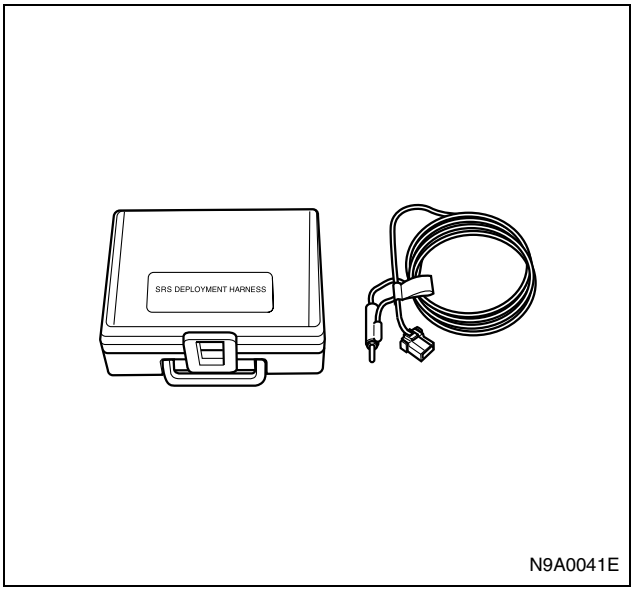


Legend
1. Connector (yellow)
2. SRS coil harness (yellow)

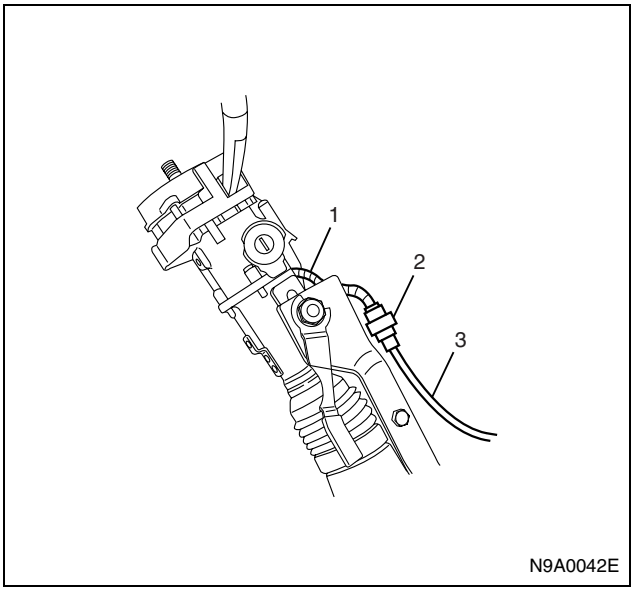
4. Insert a banana plug to other banana plug firmly to short two SRS airbag deployment harnesses.
   Do not connect SRS airbag deployment harness to power supply until the stage of deploying airbag.

WARNING:
SRS AIRBAG ASSEMBLY DEPLOYS IMMEDIATELY AFTER CONNECTING POWER SUPPLY TO SRS DEPLOYMENT HARNESS. THEREFORE, BE SURE TO CONNECT POWER SUPPLY WITH THE HARNESS IN THE END OF THE DEPLOYMENT PROCEDURE OF

SRS AIRBAG ASSEMBLY. FAILURE TO FOLLOW THIS MAY CAUSE INJURY. ALSO, ALWAYS WEAR SAFETY GOGGLES DURING DEPLOYMENT AND DISPOSAL PROCEDURES.



5. Take the SRS deployment harness out of vehicle from driver's side.
6. Make sure that there are no personnel, objects or flammable materials in or around the vehicle.
7. Extend the SRS deployment harness to keep a enough distance from it.
8. Cover windshield glass and front door glass with cloth or blanket completely. (Because personal injury may occur due to vehicle glasses or broken pieces of internal parts.)
9. Let nearby personnel know about deployment because loud bursting sound occurs due to sudden gas expansion when airbag is deployed.
10. Connect the SRS deployment harness to the disconnected harness of SRS coil harness side.



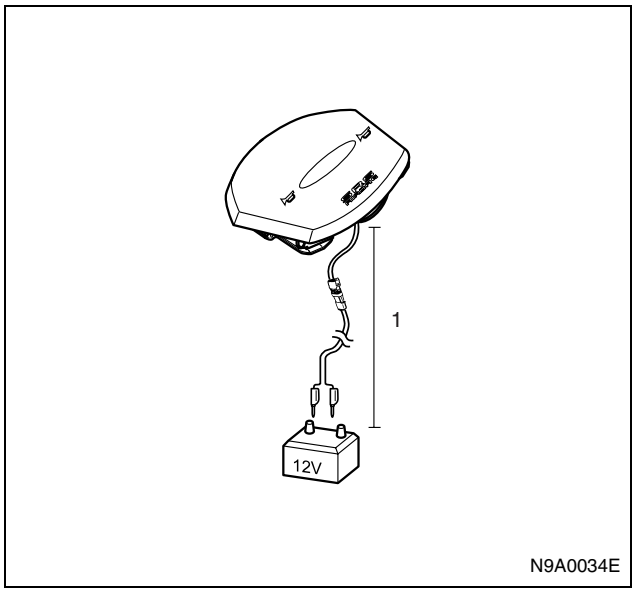
Legend
1. SRS coil harness (yellow)
2. Connector (yellow)
3. SRS deployment harness

11. Remove the insertion of banana plug on the end of SRS deployment harness.

WARNING:
SRS AIRBAG ASSEMBLY DEPLOYS IMMEDIATELY AFTER CONNECTING POWER SUPPLY TO SRS DEPLOYMENT HARNESS. THEREFORE, BE SURE TO CONNECT POWER SUPPLY WITH THE HARNESS IN THE END OF THE DEPLOYMENT PROCEDURE OF SRS AIRBAG ASSEMBLY. FAILURE TO FOLLOW THIS MAY CAUSE INJURY. ALSO, ALWAYS WEAR SAFETY GOGGLES DURING DEPLOYMENT AND DISPOSAL PROCEDURES.

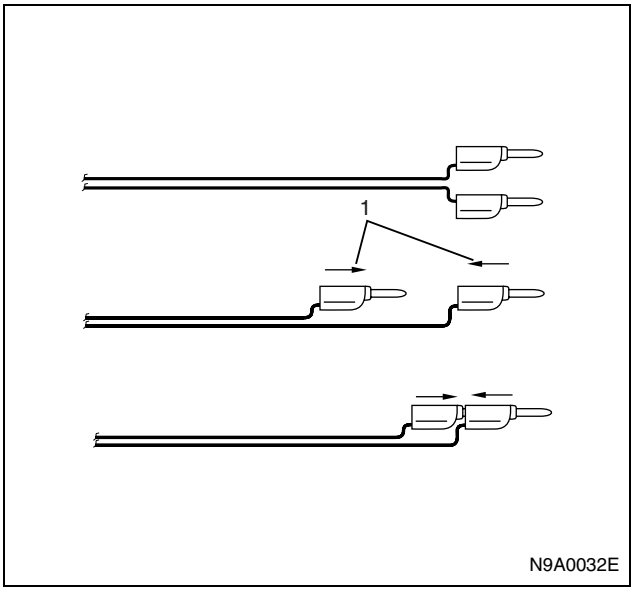
Caution:
Let nearby personnel know about SRS deployment because loud bursting sound occurs due to sudden gas expansion when SRS airbag is deployed.

12. When connecting the banana plug of SRS deployment harness to power supply, immediately SRS airbag will be deployed. Battery with 12 V and 2 A or more is recommended to use.



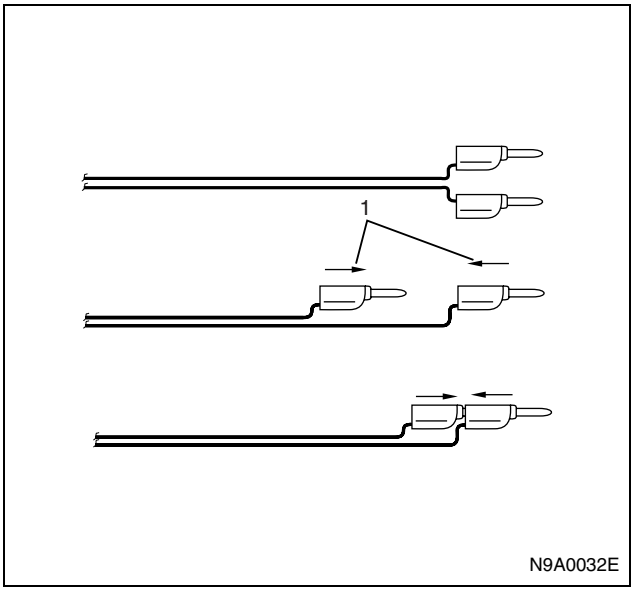
Legend
1. Keep more than 10 m (33 ft) (safe distance) away.

13. If SRS airbag has not been deployed in these steps, perform the steps from 18 to 22. If SRS airbag has been deployed, perform steps from 14 to 17.
14. Take out the SRS airbag deployment harness from power supply and insert the banana plug to the other banana plug firmly to short two banana plugs.



Legend
1. Short the banana plug.

15. Carefully remove the cloth from the vehicle, and remove broken pieces from it or dispose itself.
16. Remove the SRS deployment harness from the vehicle.
17. After deploying SRS airbag, the vehicle can be disposed in the same method as vehicles non-equipped with SRS airbag.
18. Take out the SRS airbag deployment harness from power supply and insert the banana plug to the other banana plug firmly to short two banana plugs.

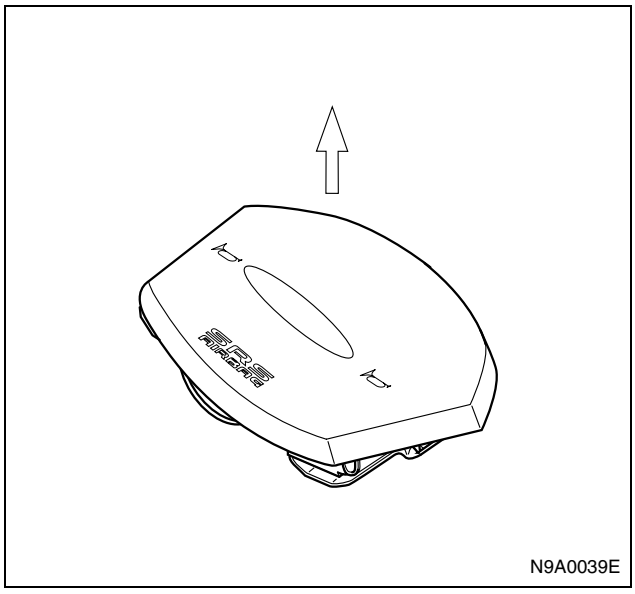


Legend
1. Short the banana plug.

19. Remove the cloth from the vehicle.
20. Remove the SRS deployment harness from the vehicle.
21. Remove the undeployed SRS airbag from the vehicle. Refer to “Removal” in “SRS Airbag Assembly” for SRS airbag.

WARNING:
WHEN STORING UNDEPLOYED SRS AIRBAG ASSEMBLY, OR LEAVE IT UNATTENDED ON WORKBENCH OR SOMEWHERE ELSE, BE SURE TO TURN THE TRIM COVER UPWARD TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT.

22. Store temporarily the SRS airbag with the trim cover facing upward. Do not pile it up.



In-vehicle Deployment (Using SRS Airbag Onboard Deployment tool)

For discarding vehicle or collecting vehicle parts, in-vehicle deployment is proper. This may be one of the following situations.

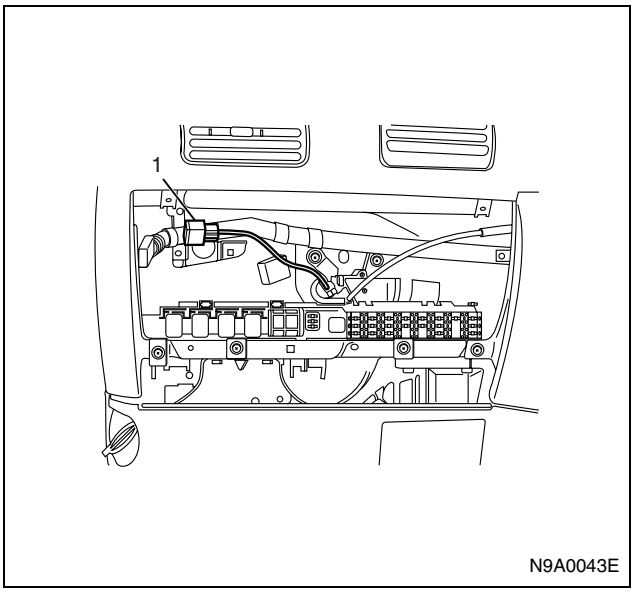
- Usable life of vehicle ended.
- Vehicle has got damaged without deployment and it is impossible to be repaired.
- Vehicle was stolen and it is ripped off or damaged.

Caution:
If collecting the parts from vehicle to reuse for other one, never reuse SRS parts.

WARNING:
FAILURE TO FOLLOW THE PROPER DISPOSAL PROCEDURE MAY CAUSE INJURY DUE TO DEPLOYMENT OF SRS AIRBAG. UNDEPLOYED AIRBAG MUST BE DEPLOYED BEFORE DISPOSAL.

1. Disconnect the battery of disposal vehicle to cut off power supply to SRS control unit.
2. Remove all objects on the front seats.

3. Remove the glove box, and connect the SRS airbag onboard deployment tool to disposal connector on vehicle side.



Legend
1. Disposal connector

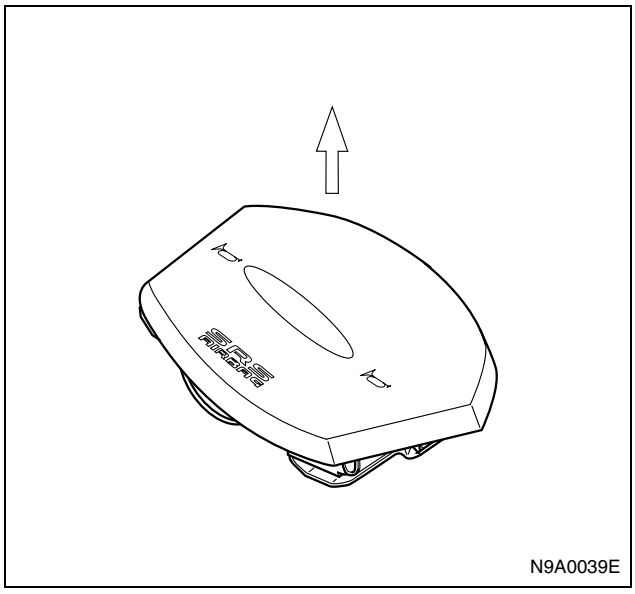
4. Place SRS airbag onboard deployment tool away from it.
5. Make sure that there are no personnel, objects or flammable materials in or around the vehicle.
6. Cover windshield glass and front door glass with cloth or blanket completely. This reduces possibility of injury due to glasses or broken pieces of internal parts.
7. Turn on the SRS airbag onboard deployment tool. This activates SRS control unit to be ready for deployment.

Caution:
Let nearby personnel know about SRS deployment because loud bursting sound occurs due to sudden gas expansion when SRS airbag is deployed.

8. Press the two ignition switches on SRS airbag onboard deployment tool at the same time to deploy the airbag. When handling deployed SRS airbag, wear gloves and safety goggles to protect from generated irritant and heat.
9. If SRS airbag has not been deployed in these steps, perform the steps from 10 to 11, then from 13 to 14. If SRS airbag has been deployed, perform steps from 10 to 12.
10. Carefully remove the cloth from the vehicle, and remove broken pieces from it or dispose itself.
11. Remove the SRS airbag onboard deployment tool from the vehicle.
12. After deploying SRS airbag, the vehicle can be disposed in the same method as vehicles non-equipped with SRS airbag.
13. Remove the undeployed SRS airbag from the vehicle. Refer to “Removal” in “SRS Airbag Assembly” for SRS airbag.

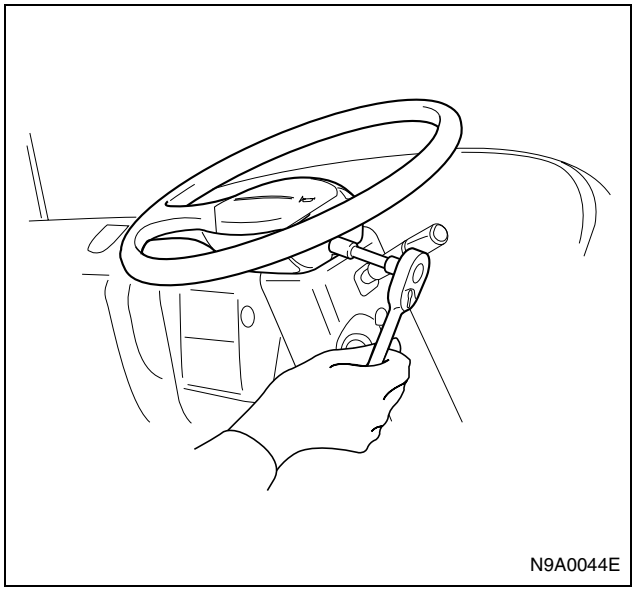
WARNING:
WHEN STORING UNDEPLOYED SRS AIRBAG ASSEMBLY, OR LEAVE IT UNATTENDED ON WORKBENCH OR SOMEWHERE ELSE, BE SURE TO TURN THE TRIM COVER UPWARD TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT.

14. Store temporarily the SRS airbag with the trim cover facing upward. Do not pile it up.

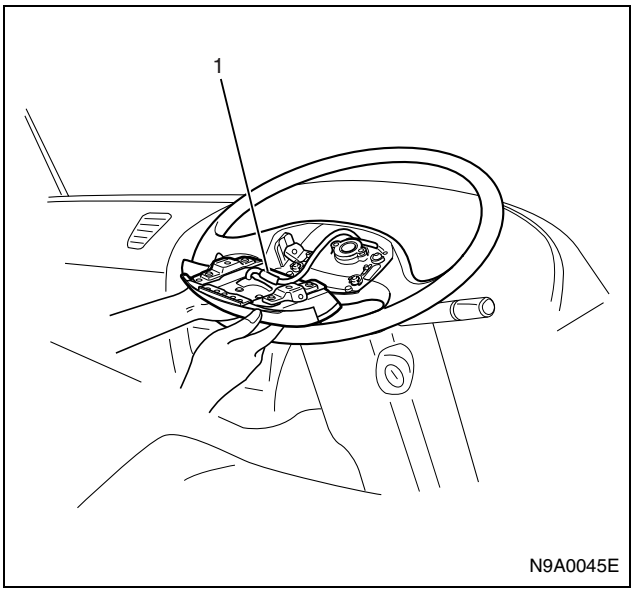


Removal

1. Stop the function of SRS. (Refer to “Procedure to stop the function of SRS” in “SRS System Assembly”.)
2. Loosen the mounting bolt from the back of steering wheel using TORX® driver or equivalent to remove SRS airbag.



3. Disconnect the 2-pole airbag harness connector (yellow) and horn harness located in the back of SRS airbag and remove the airbag.



Legend
1. Airbag harness connector

Installation

1. Connect the 2-pole airbag harness connector (yellow) and horn connector located in the back of SRS airbag.
2. Secure the connector and harness.

Precautions on Service Work

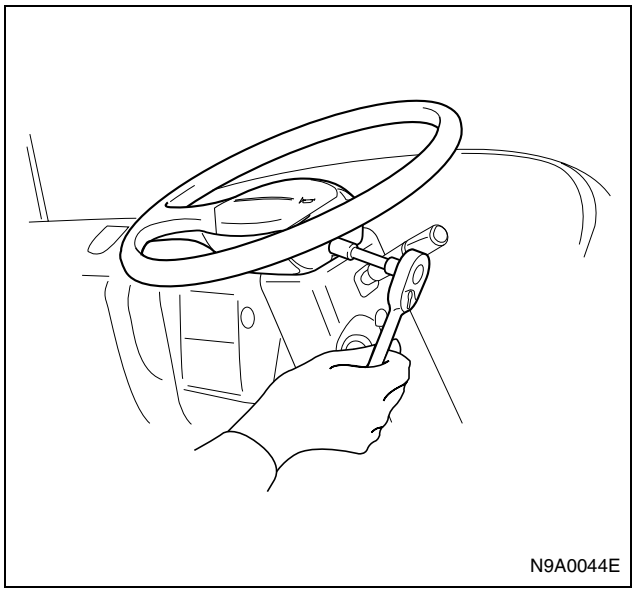
WARNING:
FOLLOW PRECAUTIONS ABOUT SAFETY WHEN HANDLING DEPLOYED SRS AIRBAG ASSEMBLY. METAL SURFACE OF SRS AIRBAG ASSEMBLY WILL BE VERY HOT DIRECTLY AFTER DEPLOYMENT. DO NOT TOUCH IT FOR 30 MINUTES AFTERWARD. DO NOT PUT THE DEPLOYED SRS AIRBAG ASSEMBLY NEAR FLAMMABLE MATERIALS. FAILURE TO FOLLOW THIS MAY CAUSE FIRE OR INJURY. IF THE DEPLOYED SRS AIRBAG ASSEMBLY NEEDS TO BE MOVED BEFORE IT COOLS DOWN, WEAR GLOVES AND GRASP THE SRS AIRBAG OR TRIM COVER TO MOVE.

WARNING:
WHEN CARRYING UNDEPLOYED SRS AIRBAG ASSEMBLY, BE SURE TO TURN THE TRIM COVER TOWARD OUTSIDE TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT. ALSO, NEVER GRASP THE HARNESS OR CONNECTOR OF SRS AIRBAG TO CARRY IT.
WHEN STORING UNDEPLOYED SRS AIRBAG ASSEMBLY, OR LEAVE IT UNATTENDED ON WORKBENCH OR SOMEWHERE ELSE, BE SURE TO TURN THE TRIM COVER UPWARD TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT.

Caution:
If deployment occurs, replace the coil assembly.

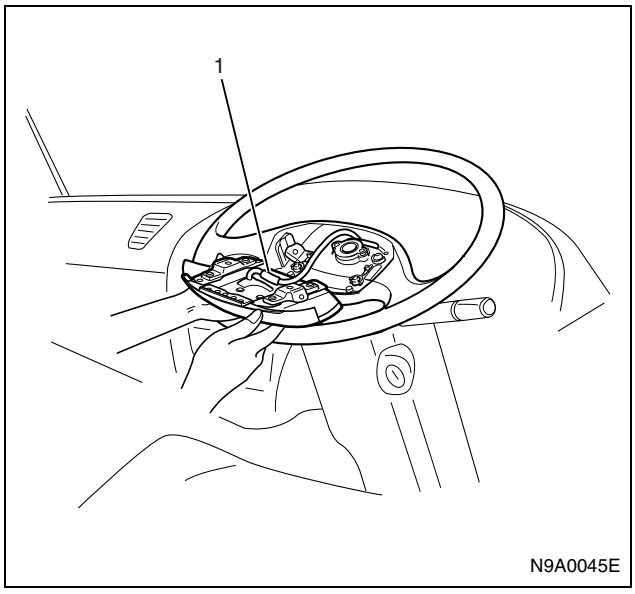
Removal

1. Stop the function of SRS. (Refer to “Procedure to stop the function of SRS”.)
2. Loosen the mounting bolt from the back of steering wheel assembly using TORX® driver or equivalent to remove SRS airbag assembly.



N9A0044E

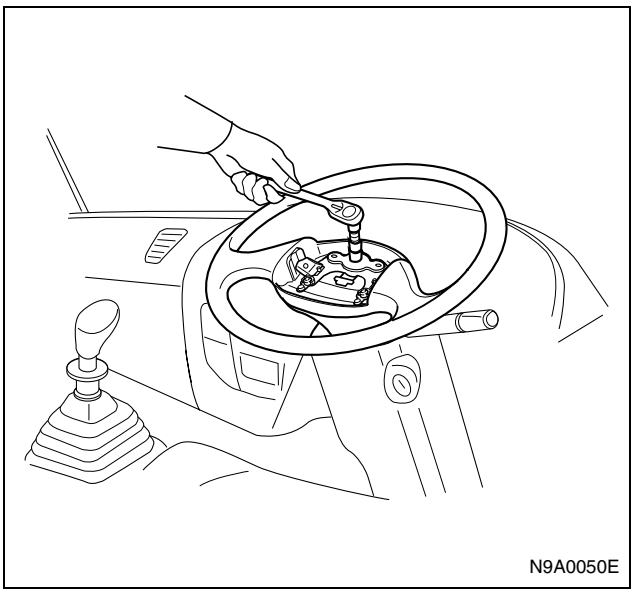
3. Disconnect the 2-pole connector (yellow) and horn harness located in the back of airbag assembly and remove the airbag.



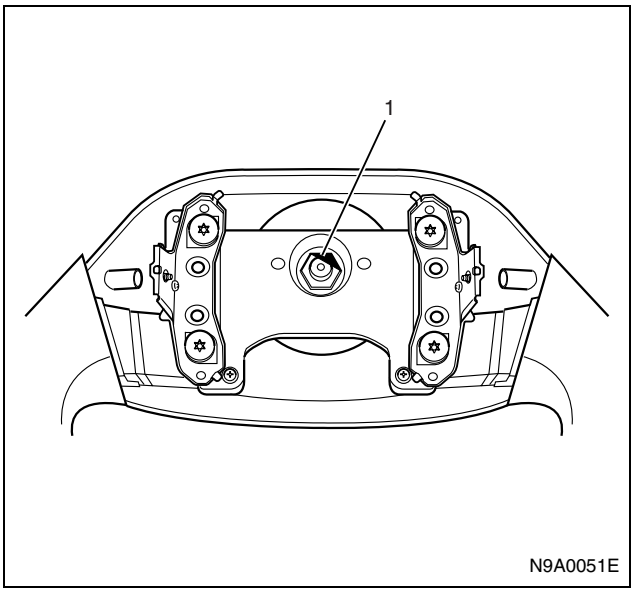
N9A0045E

Legend
1. Airbag harness connector

4. Remove the nut which installs steering wheel.



5. Put the setting marks on steering wheel and shaft in order to reassemble parts to the original position.



Legend
1. Setting mark

6. Set tires in straight position before removing steering wheel. Install the steering wheel puller (5-8840-2035-0) to steering wheel and remove it.
7. After removing the cover of harness through hole, put wire into wheel to remove steering wheel.

Caution:
Steering shaft has function as shock absorber. Do not apply a force in the direction of steering wheel shaft. When removing the steering wheel, use special tool.

Installation

1. Make sure that tires are in the straight position.
2. While checking the engagement in canceller of flasher, install steering wheel straight and align the setting marks.

SRS Coil Assembly

Precautions on Service Work

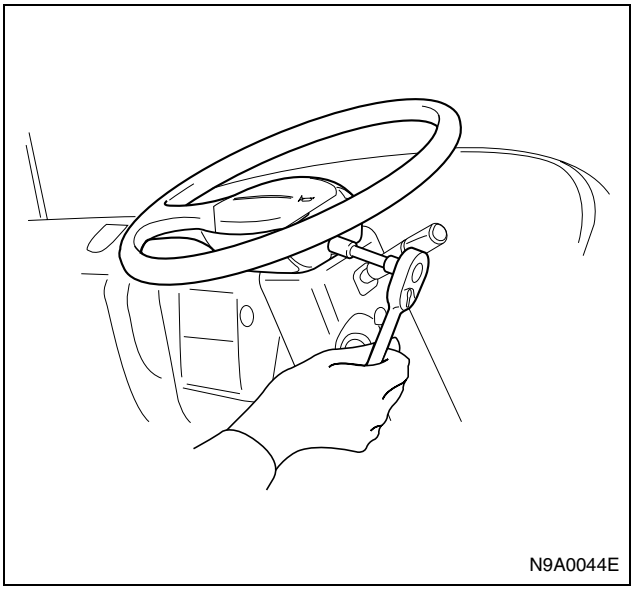
WARNING:
FOLLOW PRECAUTIONS ABOUT SAFETY WHEN HANDLING DEPLOYED SRS AIRBAG ASSEMBLY. METAL SURFACE OF SRS AIRBAG ASSEMBLY WILL BE VERY HOT DIRECTLY AFTER DEPLOYMENT. DO NOT TOUCH IT FOR 30 MINUTES AFTERWARD. DO NOT PUT THE DEPLOYED SRS AIRBAG ASSEMBLY NEAR FLAMMABLE MATERIALS. FAILURE TO FOLLOW THIS MAY CAUSE FIRE OR INJURY. IF THE DEPLOYED SRS AIRBAG ASSEMBLY NEEDS TO BE MOVED BEFORE IT COOLS DOWN, WEAR GLOVES AND GRASP THE SRS AIRBAG OR TRIM COVER TO MOVE.

WARNING:
WHEN CARRYING UNDEPLOYED SRS AIRBAG ASSEMBLY, BE SURE TO TURN THE TRIM COVER TOWARD OUTSIDE TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT. ALSO, NEVER GRASP THE HARNESS OR CONNECTOR OF SRS AIRBAG TO CARRY IT.

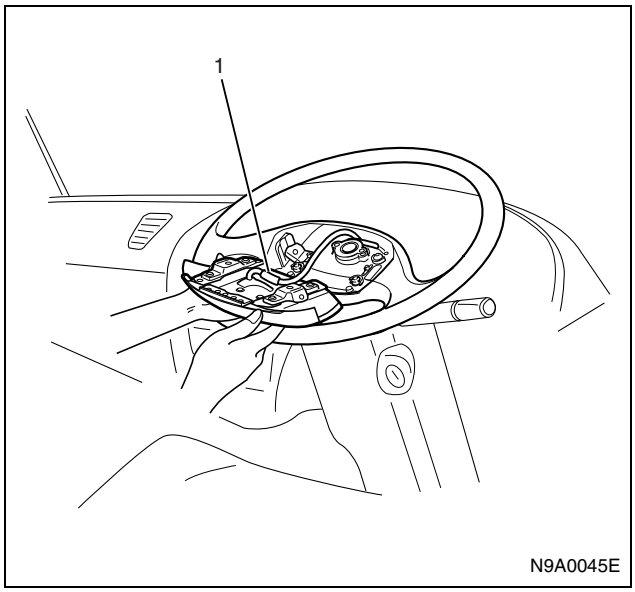
Caution:
If deployment occurs, replace the SRS coil assembly.

Removal

1. Stop the function of SRS. (Refer to “Procedure to stop the function of SRS” in “SRS System Assembly”.)
2. Loosen the mounting bolt from the back of steering wheel using TORX® driver or equivalent to remove SRS airbag.

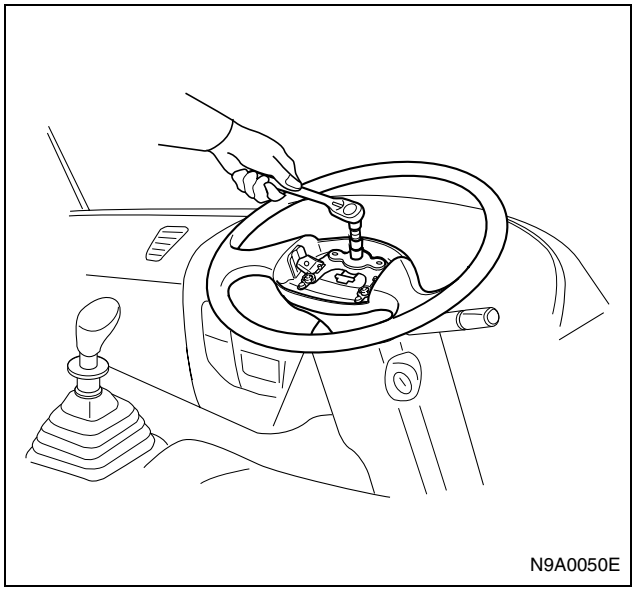


3. Disconnect the 2-pole airbag harness connector (yellow) and horn harness located in the back of SRS airbag assembly and remove the SRS airbag.

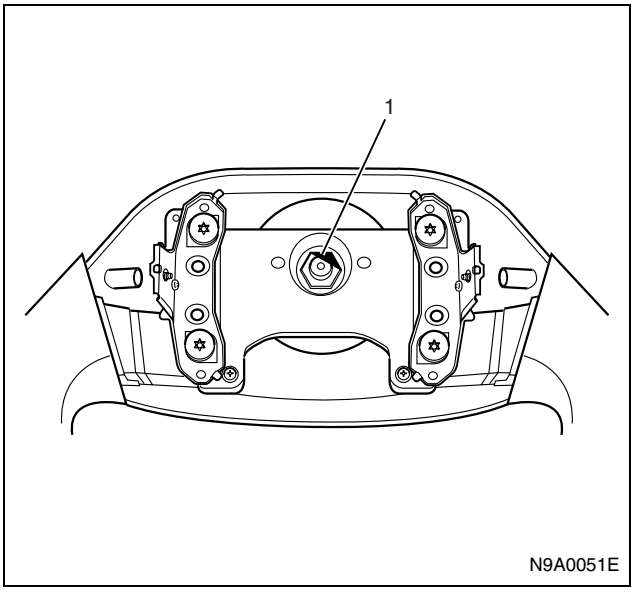


Legend
1. Airbag harness connector

4. Remove the nut which installs steering wheel.



5. Put the setting marks on steering wheel and shaft in order to reassemble parts to the original position.

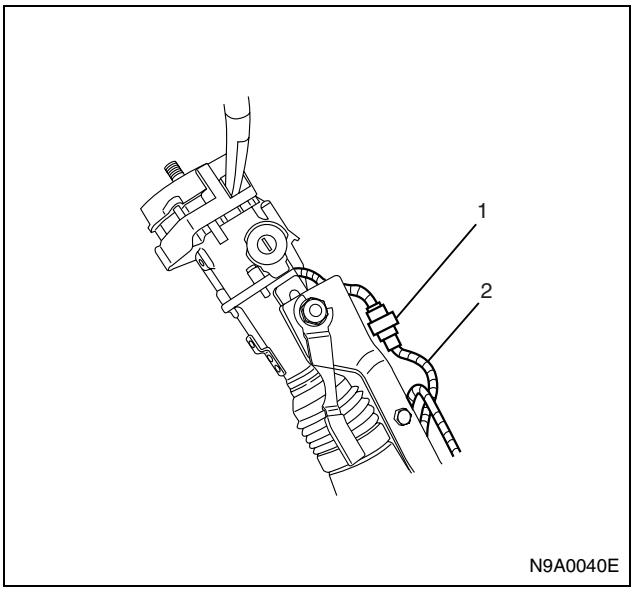


Legend
1. Setting mark

6. Set tires in straight position before removing steering wheel. Install the steering wheel puller (5-8840-2035-0) to steering wheel and remove it.
7. After removing the cover of harness through hole, put wire into wheel to remove it.

Caution:
Steering shaft has function as shock absorber. Do not apply a force in the direction of steering wheel shaft. When removing the steering wheel, use special tool.

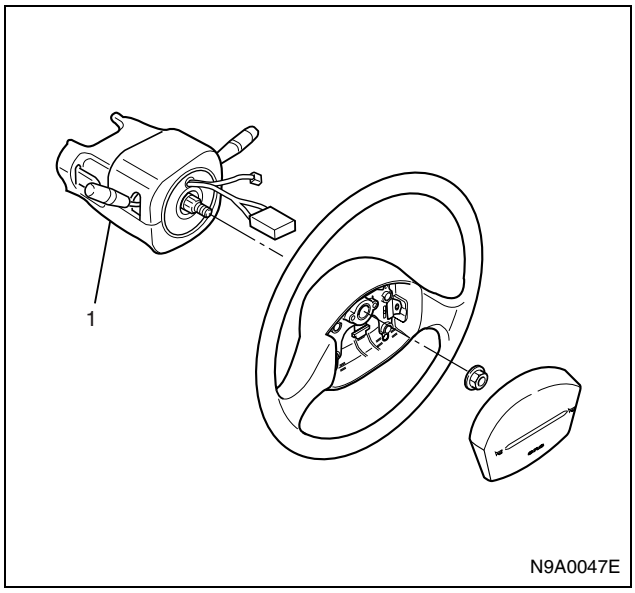
8. Remove the steering cowl.
9. Disconnect SRS harness connector and combination switch harness connector located in the lower portion of steering column.



Legend
1. Connector (yellow)
2. SRS coil harness (yellow)

10. Remove the combination switch.

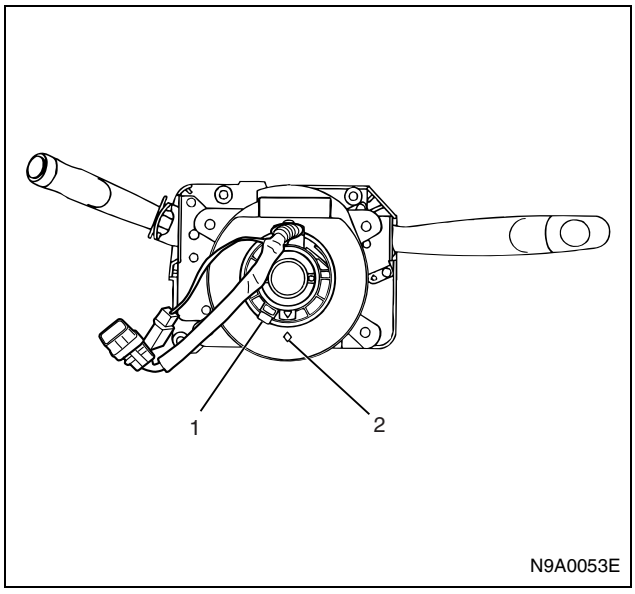
Caution:
Combination switch contains SRS coil assembly. When replacing SRS coil assembly, always replace the combination switch assembly as a unit.



Legend
1. SRS coil and combination switch

Installation

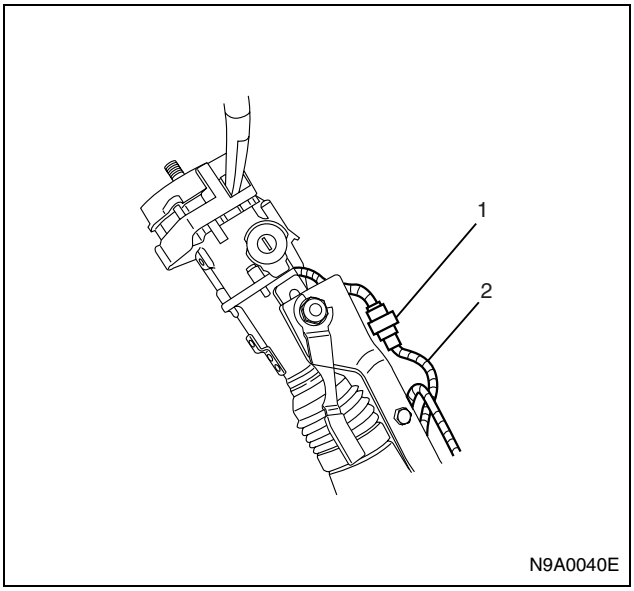
1. Set the steering wheel in the straight position.
2. Install the combination switch assembly.
3. Rotate the SRS coil clockwise fully and back off it about 4 rotations to align neutral mark. (Rotating is not necessary when assembling new SRS coil with lock pin.)



Legend
1. Lock pin
2. Neutral mark

Caution:
- While rotating the SRS coil clockwise fully, stop rotating if resistance is felt. Additional rotation by force may lead to damage or disconnection on SRS coil cable.
- More than 3 rotations from neutral point in each direction lead to damage on SRS coil.

4. Install the combination switch.
5. Connect SRS harness connector (yellow) and combination switch harness connector located in the lower portion of steering column.



Legend
1. Connector (yellow)
2. SRS coil harness (yellow)

6. Install the steering cowl.

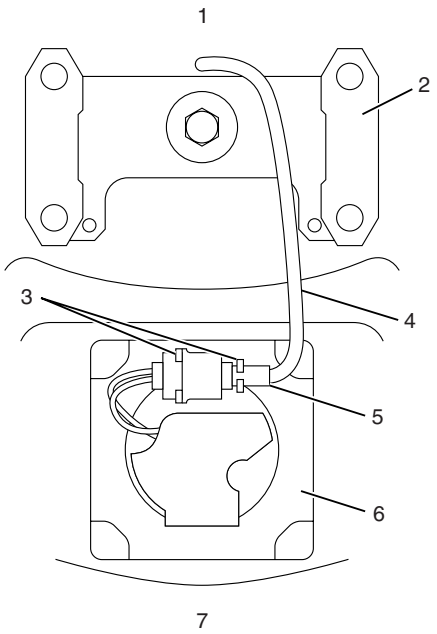
Caution:
When installing steering cowl, assemble carefully not to let wire hang up on starter switch, combination switch or SRS coil.

7. Make sure that tires are in the straight position.
8. While checking the engagement in canceller of flasher, install steering wheel straight and align the setting marks.
9. Tighten the mounting nut which installs steering wheel to the specified torque.

Tighten:
Nut to 42.0 ± 6.8 N·m (4.3 ± 0.7 kg·m / 31.0 ± 5.0 lb·ft)

10. For new combination switch (including SRS coil) with lock pin, pull the lock pin in front to bend.
11. Put the harness through the harness through hole and assembly the cover.
12. Connect the 2-pole connector (yellow) and horn harness located in the back of SRS airbag assembly.
13. Secure the connector and harness.
14. Install the SRS airbag to steering wheel and tighten the bolt to the specified torque.

Tighten:
Bolt to 8.0 ± 2.0 N·m (0.8 ± 0.2 kg·m / 5.9 ± 1.5 lb·ft)



N9A0046E

Legend

1. Front of steering wheel
2. Steering wheel
3. Connector holder portion
4. Airbag harness
5. Connector
6. Back side of SRS airbag
7. Forward direction of SRS airbag

WARNING:
DO NOT USE SRS AIRBAG OF OTHER VEHICLE OR MODEL. BE SURE TO CONFIRM THE PART NUMBER TO USE APPROPRIATE SRS AIRBAG.

15. Resume the function of SRS. (Refer to “Procedure to resume the function of SRS” in “SRS System Assembly”.)

Steering Column

Precautions on Service Work

WARNING:
FOLLOW PRECAUTIONS ABOUT SAFETY WHEN HANDLING DEPLOYED SRS AIRBAG ASSEMBLY. METAL SURFACE OF SRS AIRBAG ASSEMBLY WILL BE VERY HOT DIRECTLY AFTER DEPLOYMENT. DO NOT TOUCH IT FOR 30 MINUTES AFTERWARD. DO NOT PUT THE DEPLOYED SRS AIRBAG ASSEMBLY NEAR FLAMMABLE MATERIALS. FAILURE TO FOLLOW THIS MAY CAUSE FIRE OR INJURY. IF THE DEPLOYED SRS AIRBAG ASSEMBLY NEEDS TO BE MOVED BEFORE IT COOLS DOWN, WEAR GLOVES AND GRASP THE SRS AIRBAG OR TRIM COVER TO MOVE.

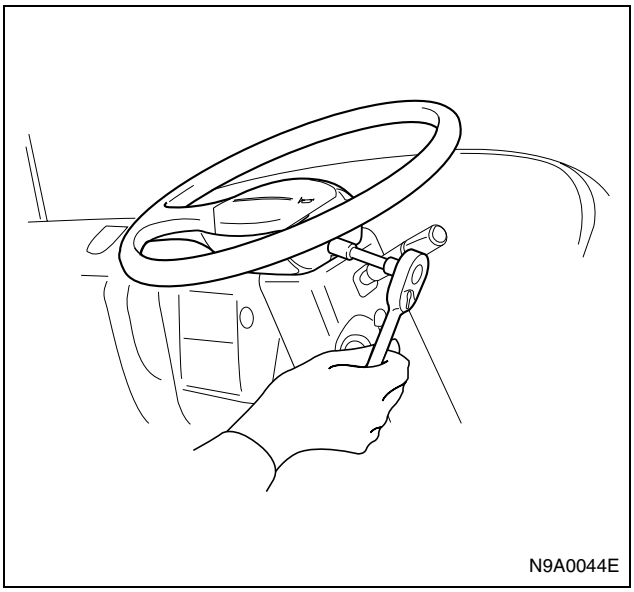
WARNING:
WHEN CARRYING UNDEPLOYED SRS AIRBAG ASSEMBLY, BE SURE TO TURN THE TRIM COVER TOWARD OUTSIDE TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT. ALSO, NEVER GRASP THE HARNESS OR CONNECTOR OF SRS AIRBAG TO CARRY IT.

WHEN STORING UNDEPLOYED SRS AIRBAG ASSEMBLY, OR LEAVE IT UNATTENDED ON WORKBENCH OR SOMEWHERE ELSE, BE SURE TO TURN THE TRIM COVER UPWARD TO REDUCE THE POSSIBILITY OF INJURY IN CASE OF AIRBAG DEPLOYMENT.

Caution:
If deployment occurs, replace the coil assembly.

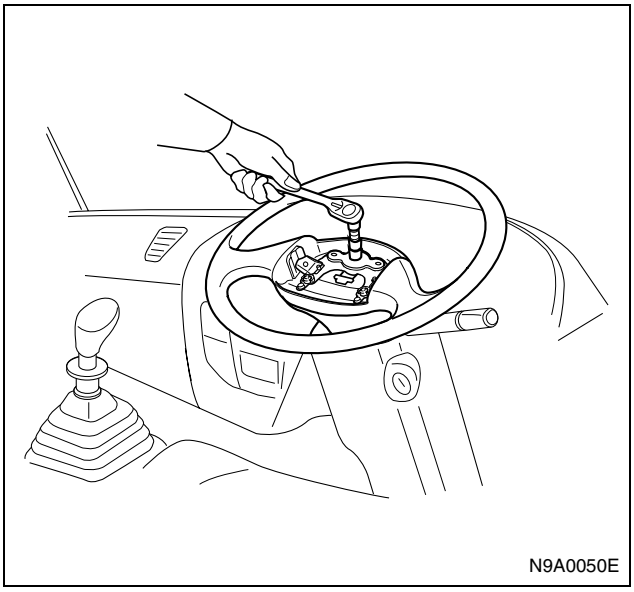
Removal

1. Stop the function of SRS. (Refer to “Procedure to stop the function of SRS”.)
2. Loosen the mounting bolt from the back of steering wheel using TORX® driver or equivalent to remove SRS airbag.



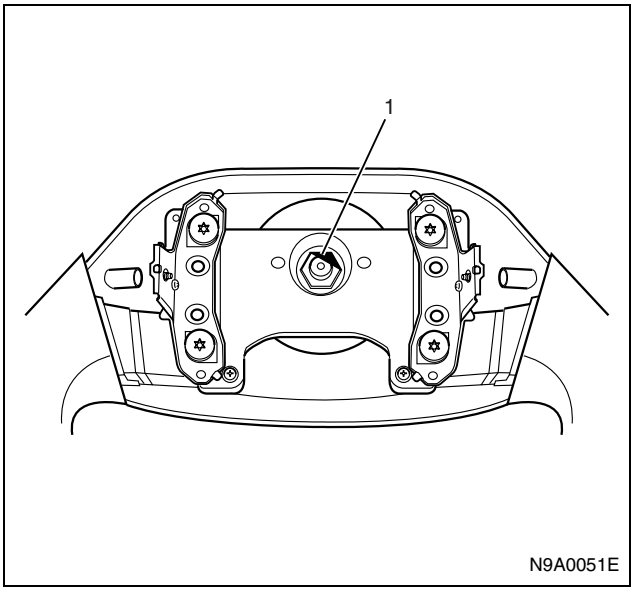
N9A0044E

3. Disconnect the 2-pole connector (yellow) and horn harness located in the back of SRS airbag and remove the SRS airbag.
4. Remove the nut which installs steering wheel.



N9A0050E

5. Put the setting marks on steering wheel and shaft in order to reassemble parts to the original position.

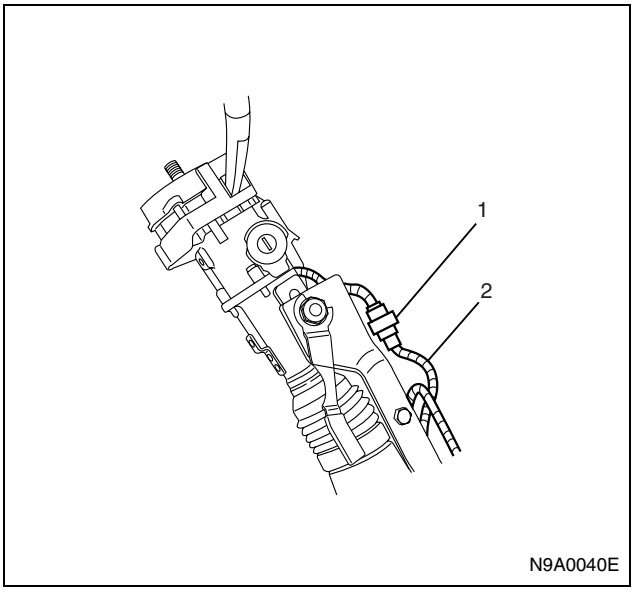


Legend
1. Setting mark

6. Set tires in straight position before removing steering wheel. Install the steering wheel puller (5-8840-2035-0) to steering wheel and remove it.
7. After removing the cover of harness through hole, put wire into wheel to remove it.

Caution:
Steering shaft has function as shock absorber. Do not apply a force in the direction of steering wheel shaft. When removing the steering wheel, use special tool.

8. Remove the steering cowl.
9. Disconnect SRS harness connector (yellow) and combination switch harness connector located in the lower portion of steering column.

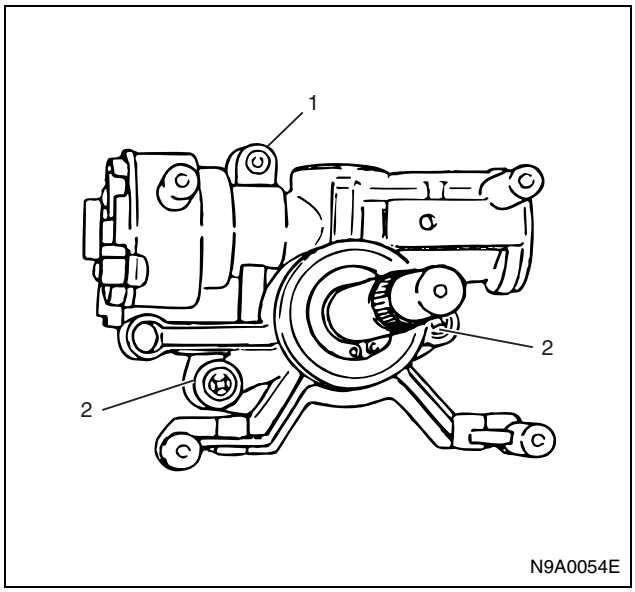


Legend
1. Connector (yellow)
2. SRS coil harness (yellow)

10. Remove the combination switch assembly together with SRS coil.

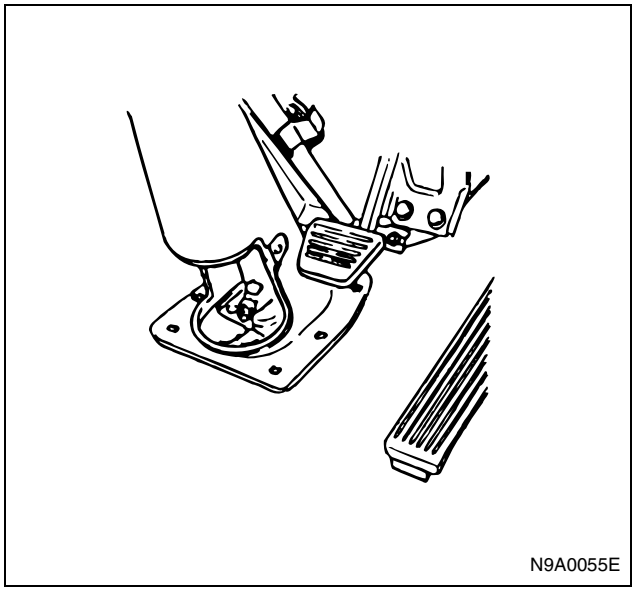
Caution:
Combination switch contains SRS coil assembly. When replacing SRS coil assembly, always replace the combination switch assembly as a unit.

11. Make a small cut on screw of steering lock assembly using a saw, loosen the screw, remove the snap ring, and then remove the steering lock assembly.

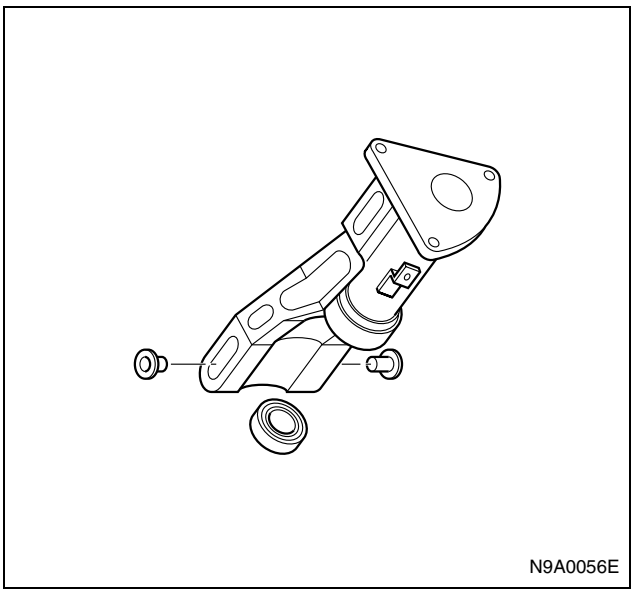


Legend
1. Snap ring
2. Screw

12. Remove the sight glass, put alignment marks on steering shaft and universal joint yoke, and then remove tilt control.



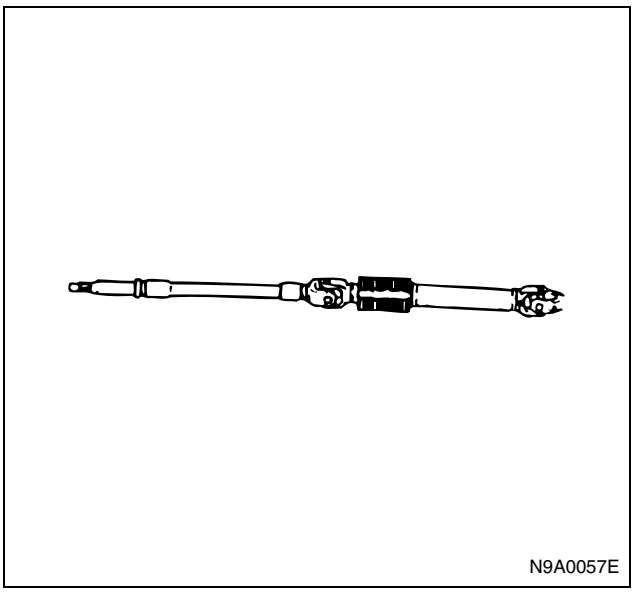
13. Pull out the steering shaft from column and remove the steering column.
    Put alignment marks on the spline shaft and steering shaft and then disassemble them.



N9A0056E

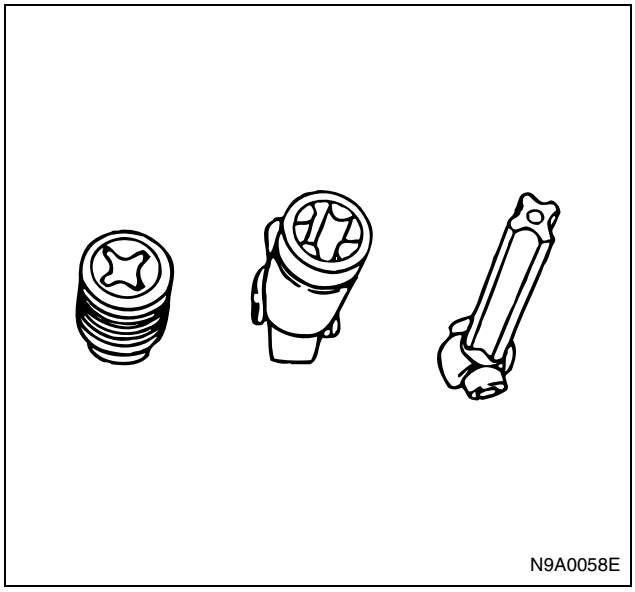
14. Clean disassembled parts and check them.
    Steering shaft
    - Check for bent.
    - Check the universal joint yoke for crack or deformation.
    - Check the joint bearing for play.

Caution:
Universal joint is non-disassembled part.



N9A0057E

Spline shaft
- Check for play in rotational direction against steering shaft.
- Check the joint for play.
- Check the boot for breakage or deterioration.



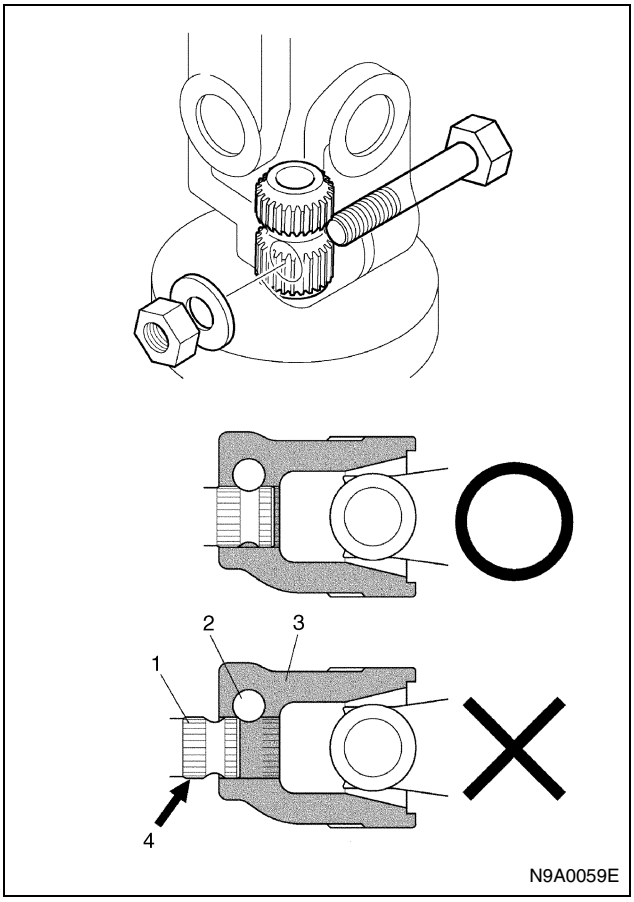
N9A0058E

Installation

1. Install the steering column.
2. By aligning the alignment marks put at disassembly, assemble the steering shaft to install.
   By aligning the alignment marks put at disassembly, install the steering shaft to steering unit and tighten the key bolt to the specified torque.

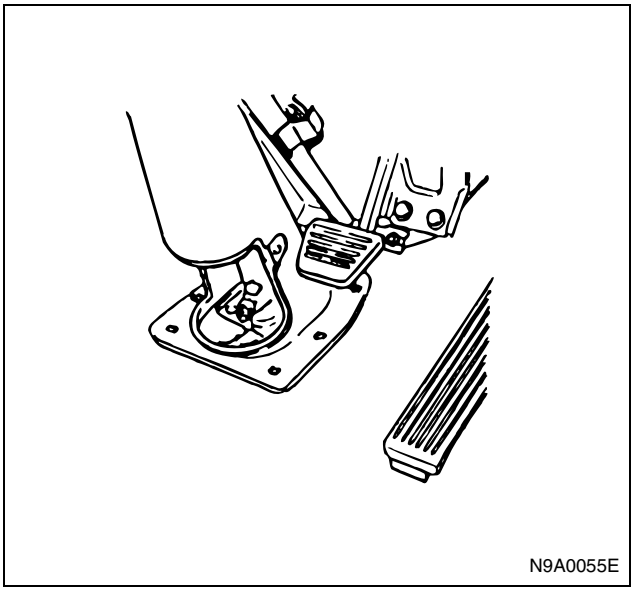
Tighten:
Bolt to 25 ± 5 N·m (2.5 ± 0.5 kg·m / 18.4 ± 3.7 lb·ft)

Caution:
Align the yoke so that the universal mounting bolt comes through the groove of the shaft of steering unit, angle gear box or transfer gear. The mounting bolt must be inserted and tightened after yoke is positioned. (Do not install the yoke after the bolt is temporarily tightened.) After yoke is secured, check that the serration portion is not seen.



Legend

1. Serration shaft
2. Bolt hole
3. Yoke
4. Yoke is not inserted sufficiently if serration can be seen.



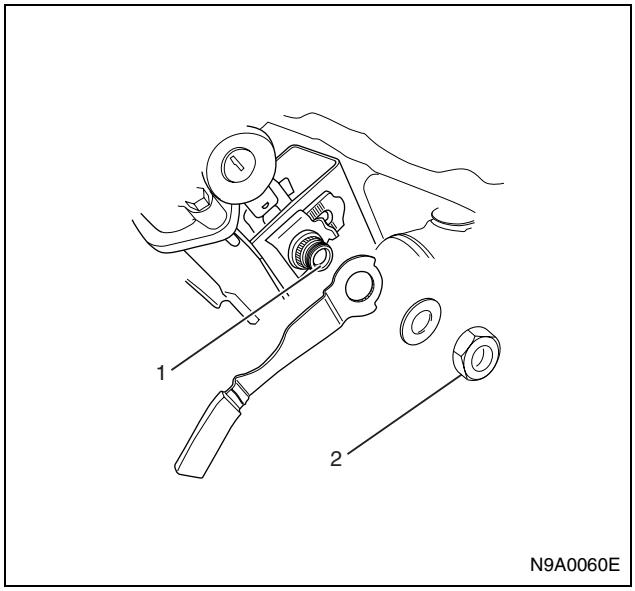
3. Tighten the nut on bottom of tilt control, which installs steering column support bracket, and nut on outside of tilt control to the specified torque.

Tighten:
Nut (bottom) to 13.5 ± 1.5 N·m (1.4 ± 0.2 kg·m / 10.0 ± 1.1 lb·ft)

Tighten:
Nut (outside) to 32.5 ± 2.5 N·m (3.3 ± 0.3 kg·m / 24.0 ± 1.8 lb·ft)

Install the lever to lock position and tighten the nut to the specified torque.

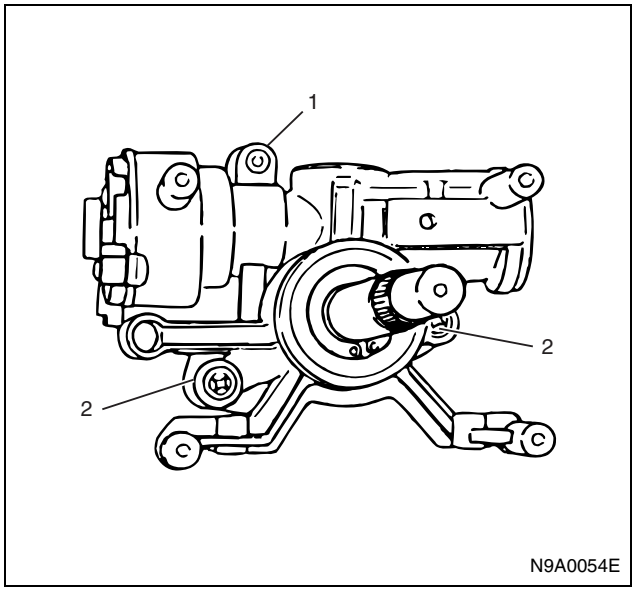
Tighten:
Nut to 22 N·m (2.2 kg·m / 16.2 lb·ft)



Legend

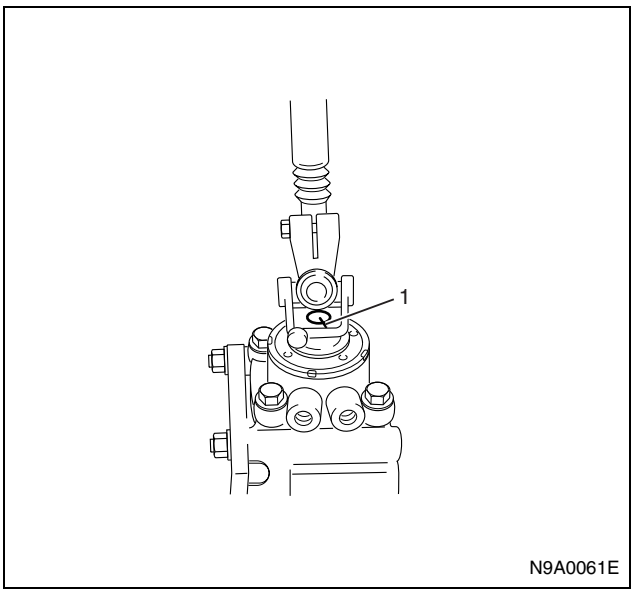
1. Steering column support bracket mounting nut
2. Nut

4. Install the steering lock assembly and insert the snap ring securely.
   Use new screw at this time.



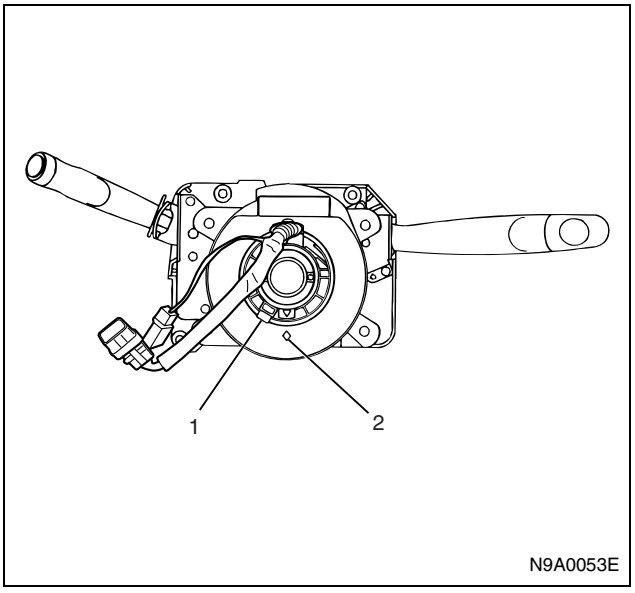
Legend
1. Snap ring
2. Screw

5. Set the steering wheel in the straight position.
6. Install the combination switch assembly (including SRS coil).



Legend
1. Alignment mark

7. Rotate the SRS coil clockwise fully and back off it about 4 rotations to align neutral mark.
   (Rotating is not necessary when assembling new SRS coil with lock pin.)

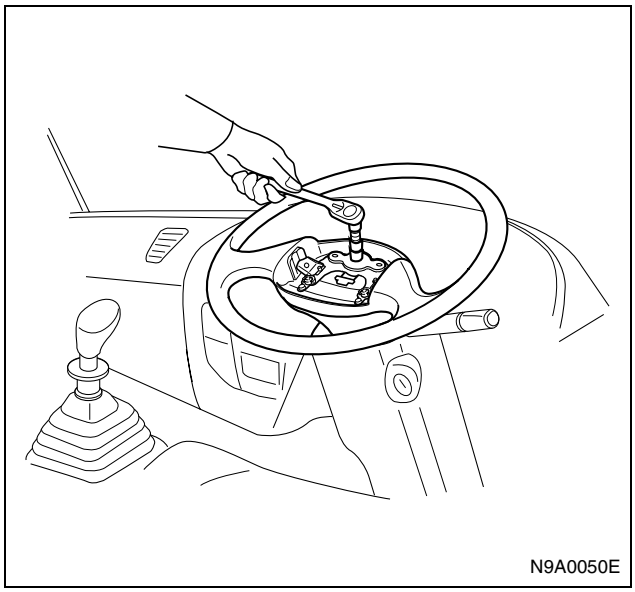


Legend
1. Lock pin
2. Neutral mark

Caution:
- While rotating the SRS coil clockwise fully, stop rotating if resistance is felt. Additional rotation by force may lead to damage or disconnection on SRS coil cable.
- More than 3 rotations from neutral point in each direction lead to damage on SRS coil.

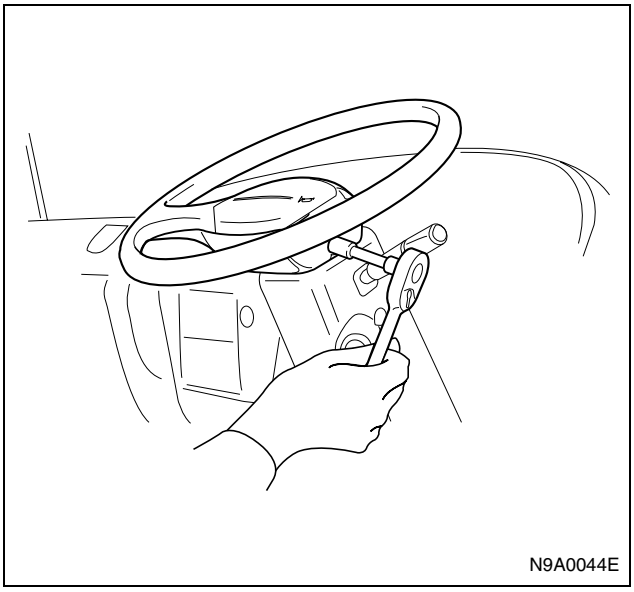
8. Connect SRS harness connector (yellow) and combination switch harness connector located in the lower portion of steering column.
9. Make sure that tires are in the straight position.
10. While checking the engagement in canceller of flasher, install steering wheel straight and align the setting marks.
11. Tighten the mounting nut which installs steering wheel to the specified torque.

Tighten:
Nut to 42 ± 6.8 N·m (4.3 ± 0.7 kg·m / 31.0 ± 5.0 lb·ft)



12. For new combination switch (including SRS coil) with lock pin, pull the lock pin in front to bend.
13. Put the harness through the harness through hole and assembly the cover.
14. Connect the 2-pole connector (yellow) and horn harness located in the back of airbag assembly.
15. Secure the connector and harness.
16. Install the airbag to steering wheel and tighten the bolt to the specified torque.

Tighten:
Bolt to 8.0 ± 2.0 N·m (0.8 ± 0.2 kg·m / 5.9 ± 1.5 lb·ft)



N9A0044E

WARNING:
DO NOT USE SRS AIRBAG OF OTHER VEHICLE OR MODEL. BE SURE TO CONFIRM THE PART NUMBER TO USE APPROPRIATE SRS AIRBAG.

17. Install the steering cowl.

WARNING:
WHEN INSTALLING STEERING COWL, ASSEMBLE CAREFULLY NOT TO LET WIRE HANG UP ON STARTER SWITCH, COMBINATION SWITCH OR SRS COIL.

18. Resume the function of SRS. (Refer to “Procedure to resume the function of SRS”.)

SRS Control System

Precautions on Service Work

WARNING:
WHEN SERVICING SRS SYSTEM PARTS (SRS CONTROL UNIT, AIRBAG, HARNESS, ETC.) OR ITS CIRCUMFERENCE, STOP TEMPORARILY THE FUNCTION OF SRS ACCORDING TO THE PROCEDURE. FAILURE TO FOLLOW THE PROCEDURE MAY CAUSE INJURY DUE TO SRS AIRBAG DEPLOYMENT OR UNNECESSARY REPAIR.

Turn the starter switch to “LOCK” at first. Then, disconnect the battery or remove the fuse which sends power to SRS control unit. After that, do not perform the work at least 15 seconds since airbag may be deployed. In the service procedure, remove “SRS fuse” and detach SRS airbag from deployment circuit to prevent SRS airbag from unnecessary deploying. If removing SRS airbag from deployment circuit according to “Procedure to stop the function of SRS” in this topic, service work can be performed immediately without waiting for 15 seconds.

About tools

WARNING:
WHEN SERVICING SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT EXCEPT ONES DESCRIBED IN THIS MANUAL TO AVOID DEPLOYMENT OF SRS AIRBAG. FAILURE TO FOLLOW THIS MANUAL MAY CAUSE INJURY DUE TO UNNECESSARY DEPLOYMENT OF SRS AIRBAG.

Familiarize yourself with use of Tech 2, SRS substitute load (5-8840-2421-0), Connector test adapter kit (5-8840-0385-0), DMM (digital multi-meter, 5-8840-0366-0), to be able to measure voltage and resistance.

Necessary repair and inspection after collision

- If the parts of this system are damaged, replacement is needed. If mounting portion of SRS parts are damaged, replacement is needed.
- Never use system parts of other vehicle.
- Do not disassemble or repair SRS control unit, SRS coil assembly or SRS airbag. These parts must be replaced with new ones.
- Confirm the part number to make sure that replacement SRS parts are legitimate.

WARNING:
DO NOT USE SRS AIRBAG OF OTHER VEHICLE OR MODEL. BE SURE TO CONFIRM THE PART NUMBER TO USE APPROPRIATE SRS AIRBAG.

Caution:
Always replace the SRS coil with combination switch assembly, since the SRS coil assembly is supplied as an item in the combination switch.

Caution:
After repair and replacement, set back the SRS airbag to the correct specification so that it is operated properly. It is necessary to replace SRS control unit and SRS airbag, and inspect the dimension of steering column. If the mounting bracket of SRS control unit are damaged clearly, replacement is needed. Besides, the dimension of steering column should be inspected regardless of SRS airbag deployment.

Replacement and Inspection of Parts After Collision with Deployment

If front collision with airbag deployment occurs, following system parts must be replaced. It is necessary to check whether SRS coil assembly is damaged.

- SRS airbag assembly
- SRS control unit
- Combination switch assembly (including SRS coil)

Caution:
Refer to “Replacement guideline for SRS control unit” described later for important information about replacement of SRS control unit after collisions with deployment and without.

- Inspect SRS coil assembly harness and connector for burn due to excessive heat, dissolution or damage. If damaged, replace it. Refer to “SRS System Assembly” in SRS section.

Inspection of Parts After Collision with or Without Deployment

The certain parts of this system and supplemental restraint system should be inspected regardless of SRS airbag deployment. The parts to be inspected are shown as follows.

- Steering column: inspect the dimension according to “Examination of damage for steering column” described in “SRS System Assembly” in SRS section.
- Steering support bracket: inspect for distortion, bent, crack or other damage.
- Instrument panel bracket: inspect for distortion, bent, crack or other damage.
- Seat belt and its mounting portion: refer to “Seat Belt” section.

Replacement Guideline for SRS Control unit

If collision with SRS airbag deployment occurs, replacement of SRS control unit is needed. If “SRS” warning lamp illuminates, perform SRS diagnosis according to “Function check: SRS system check”.

Damaged Harness

If the SRS harness is damaged, it must be replaced.

Damaged SRS Connector (Case and Terminal)

If the connector or terminal of SRS harness (except lead wire) is damaged, replace it.

Damaged Lead wire of SRS Part

If the lead wire of parts for SRS airbag, combination switch assembly (including SRS coil assembly), etc. is damaged, replace all the parts (including lead wire).

Procedure to stop the function of SRS

Removal

Turn the starter switch to "LOCK", and remove the key.

1. Disconnect the SRS fuse from the fuse box on the upper right portion of dashboard or disconnect terminal of battery.
2. Remove the 2-pole connector (yellow) located in the lower portion of steering column. (for SRS airbag)

Caution:
When removing SRS fuse and turn starter switch to ON, SRS warning lamp remains on. This is normal condition.

Procedure to Resume the Function of SRS

Installation

WARNING:
DO NOT USE SRS AIRBAG OF OTHER VEHICLE OR MODEL. BE SURE TO CONFIRM THE PART NUMBER TO USE APPROPRIATE SRS AIRBAG.

Turn the starter switch to "LOCK", and remove the key.

1. Connect the 2-pole connector (yellow) located in the lower portion of steering column and confirm that it is connected securely.
2. Install the "SRS fuse" to fuse box on the upper right portion of dashboard.

Turn the starter switch to "ON", and confirm that the "SRS" warning lamp goes off after it blinks seven times. If the "SRS" warning lamp does not operate in that way, perform "Function check: SRS system check".

Precautions on Handling/Installation/Diagnosis

1. Do not expose SRS airbag to temperature of 93°C (199°F) or more.
2. If SRS airbag and SRS control unit are dropped down with some sort of reason, do not use them.
3. If disconnecting connectors related to SRS airbag and SRS control unit during repair, be sure to make sure that they are connected completely during reassembly.
4. When replacing SRS control unit, install it to mounting surface correctly. Be sure to make sure there is no dust or other foreign matter on mounting surface of SRS control unit.
5. When installing SRS airbag parts, be sure to tighten with specified tightening torque.
6. Do not energize the system unless all SRS system parts are connected, or diagnosis chart requires doing so. If energizing the system, unnecessary diagnostic trouble code will be set in SRS control unit.
7. Never diagnose the circuit using other than specified tester.
8. At first, perform "SRS system check".
   "SRS system check" checks whether "SRS" warning lamp operates properly and proceeds to appropriate chart to judge the function fault of system. Failure to perform this procedure leads to longer diagnosis period, wrong diagnosis or replacement of wrong part.

About Terms

SRS airbag

This is expansion-type cloth cushion designed to be deployed on frontal collision above a certain impact. SRS airbag reduces an impact on occupant's head and trunk and supplements the protection by seat belts.

B+

Battery voltage (B+)

Warning lamp bulb check

When no function fault is detected after starter switch is turned to "ON" position, "SRS" warning lamp blinks seven times and goes off.

"Constant diagnosis"

Fault diagnosis is constantly performed by SRS control unit as long as "Ignition A" voltage is within the range of specified operating voltage of the unit.

Diagnostic connector (16-pin)

This is a connector to communicate with Tech 2.

Deployment

This means expansion of airbag.

Deployment circuit

This is a circuit which sends current to SRS airbag assembly to deploy SRS airbag.

Diagnostic trouble code (DTC)

This is number used by SRS control unit to identify the trouble in SRS function. (Self-diagnosis code)

Current supply for driver's seat

This is output of SRS control unit to send current to driver's airbag assembly circuit during "Ignition device resistance test".

EEPROM

This is an electrically erasable programmable read only memory. This is a memory which can store contents without power on SRS control unit.

Ignition device

This is electric ignition device to combust gas generating agent of inflator.

Specified operating voltage range

This is voltage range from 18 to 32 V measured between “Ignition A” terminal and “Ground” terminal of SRS control unit.

Tech 2

This is diagnostic equipment to read diagnostic information from SRS control unit via diagnostic connector.

SRS control unit

This supplies backup current to deployment circuit and deploy airbag if necessary. Also it diagnoses all the SRS parts.

Serial data

This is Tech 2 information which indicates SRS operating condition.

SRS

This means supplemental restraint system.

SRS coil assembly

This is device to maintain successive continuity on deployment circuit for SRS airbag and allow steering wheel to rotate.

SRS harness

These are harnesses and connectors to connect SRS parts electrically.

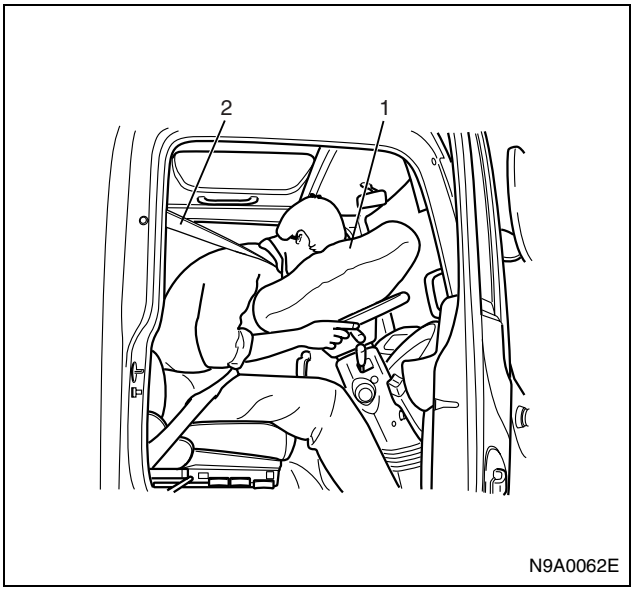
Initial diagnosis

These are tests for SRS, performed by SRS control unit on the following conditions: after starter switch is “ON”, immediately after “Ignition A” voltage is energized by SRS control unit, or before “Constant diagnosis”. (performed within 6 seconds after starter switch is “ON”)

Description of Function and Operation

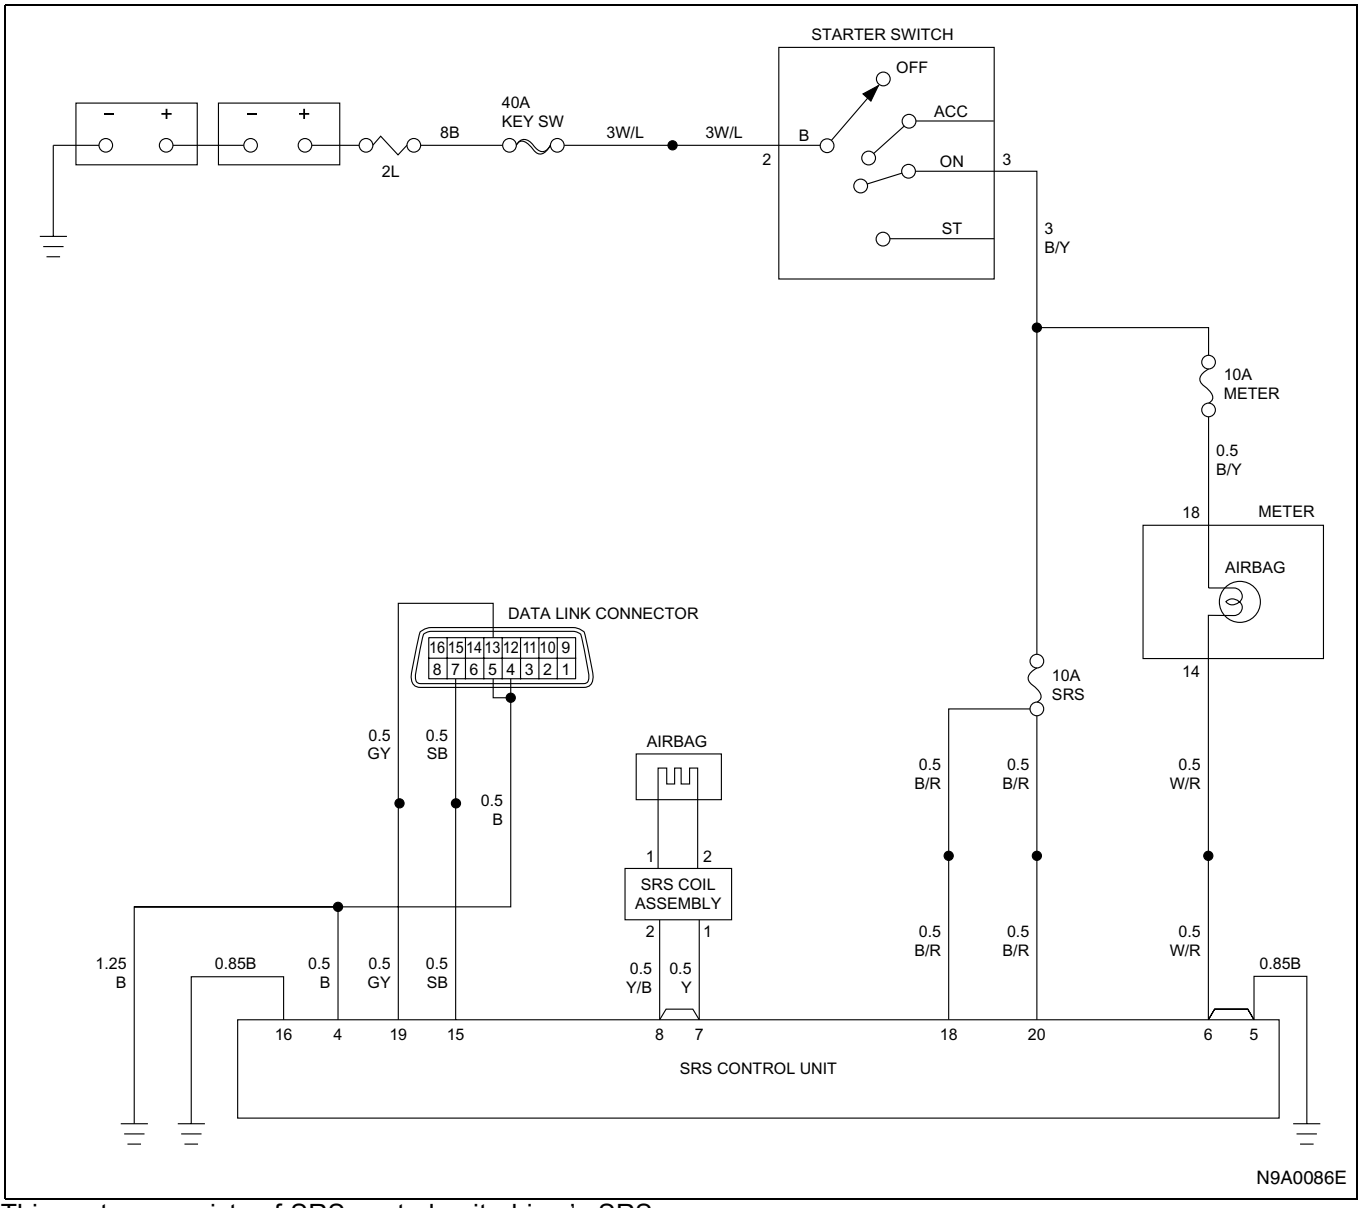
SRS Airbag System

SRS airbag supplements the driver’s seat belt protection by deploying airbag at the top center of the steering column.
SRS airbag deploys in case of front collision over certain degree of impact.



Legend

1. Deployed airbag
2. Seat belt



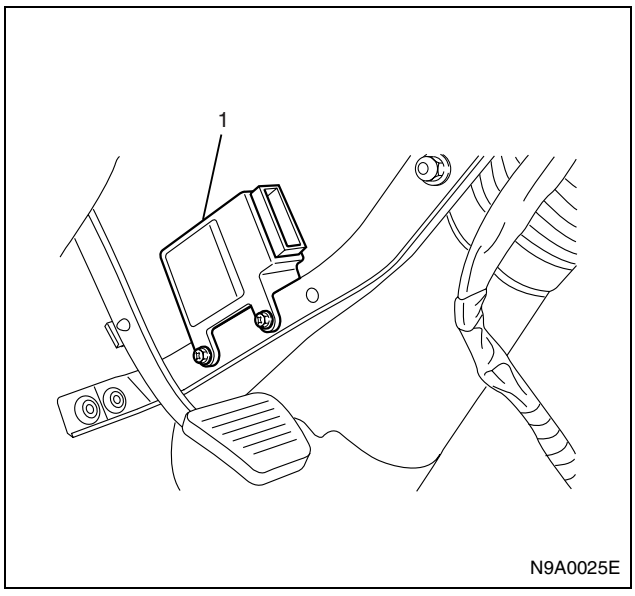
This system consists of SRS control unit, driver's SRS airbag, SRS coil assembly, exclusive wire harness, and "SRS" warning lamp in the meter and forms a deployment circuit.

A sensor is equipped to this circuit to convert the impact into an electrical signal in case of front collision over certain degree of impact. The electrical signal generated at this time will be processed in the SRS control unit to compare with the value stored in the memory.

When the generated signal exceeds the setting value, SRS control unit sends sufficient current to SRS airbag for deployment.

SRS Control Unit

WARNING:
DURING SERVICE WORK, BE CAREFUL NOT TO TAP OR SHAKE THE SRS CONTROL UNIT. ALSO, FAILURE TO INSTALL THE SRS CONTROL UNIT TO VEHICLE PROPERLY MAY LEAD TO MALFUNCTION OF THE UNIT WHEN THE STARTER SWITCH IS TURNED TO ON. THIS MAY RESULT IN INJURY DUE TO SUDDEN DEPLOYMENT OF SRS AIRBAG.



Legend

1. SRS control unit

Following functions are included in the SRS control unit.

1. Energy back-up — SRS control unit builds up the energy necessary to deploy airbag when it lose the ignition voltage during front collision.
2. Front collision detection — SRS control unit monitors the impact and detects the front collision for which airbag must be deployed.
3. SRS airbag deployment — SRS control unit sends sufficient current to the SRS airbag assembly for airbag deployment, when it detects the front collision over certain degree of impact.
4. Function fault detection — SRS control unit diagnoses electrical parts of this system. It set the diagnostic trouble code once it detects function fault.
5. Front collision detection — SRS control unit records information regarding operating conditions of this system during the event of front collision.
6. Function fault diagnostics — SRS control unit displays diagnostic trouble codes (DTC) and operating conditions of the system using Tech 2.
7. Warning to the driver — SRS control unit warns driver of function fault of this system by turning "SRS" warning lamp on.

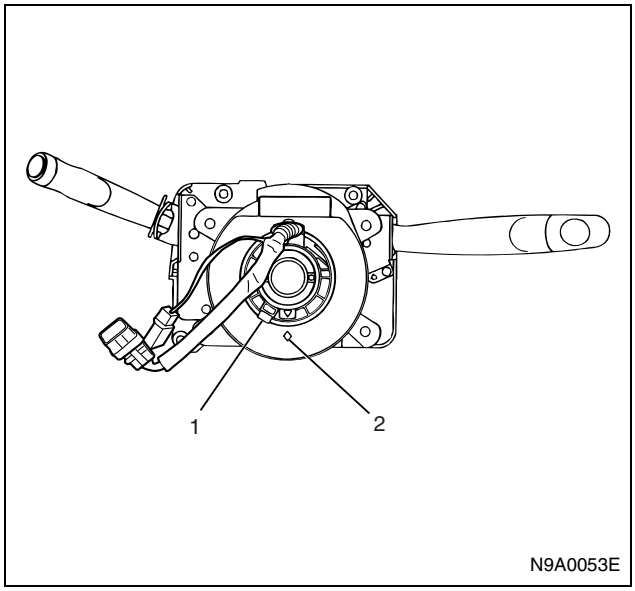
SRS control unit is connected to SRS harness with a 21-pole connector. This harness connector has shorting clip in the contact surface of particular terminal.

"SRS" Warning Lamp

When the starter switch is turned "ON" or "START", SRS control unit controls "SRS" warning lamp as follows.

1. When the starter switch is turned to "ON", it checks "SRS" warning lamp and SRS control unit operations while blinking the "SRS" warning lamp seven times.
2. It warns the driver of function fault in the electrical system of this system. Those function faults may cause undeployment of SRS airbag in the event of front collision, or unnecessary deployment. "SRS" warning lamp tells the driver of function fault of this system. Refer to "SRS system check" for proper operation of warning lamp.

SRS Coil Assembly



Legend

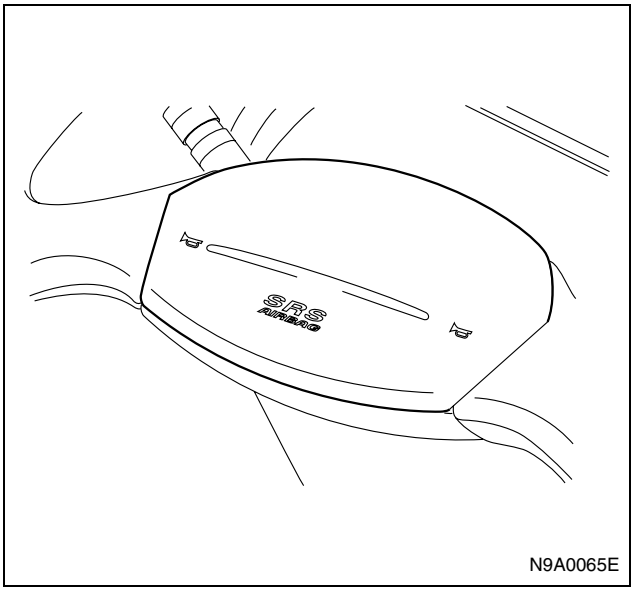
1. Lock pin
2. Neutral mark

SRS coil assembly is installed to the steering column. It maintains successive continuity on deployment circuit for SRS airbag while allowing steering wheel to rotate.

It has shorting clip in the 2-pole connector (yellow) to be connected to the SRS body harness located in the lower portion of steering column.

Upon removal of 2-pole connector (yellow), the shorting clip will short the SRS airbag. This prevents unnecessary deployment of SRS airbag when servicing the steering column or other SRS system parts.

SRS airbag assembly



SRS airbag consists of the airbag and the inflator (a can with gas generator agent and a ignition device). SRS control unit sends current to the deployment circuit in the event of front collision over certain degree of impact. Passage of electric current in the inflator will light the gas generator agent in the SRS airbag.
Gas generated in the reaction rapidly inflate the airbag.
A shorting clip is equipped to the SRS airbag. Upon removal of SRS airbag connector, the shorting clip shorts the SRS airbag circuit.
The circuit to SRS airbag is shorted in this manner. This prevents unnecessary deployment of SRS airbag when servicing SRS airbag assembly, steering column or other SRS system parts.

Procedure of Trouble Diagnosis

Diagnostic Trouble Code (Self-diagnosis Code)

At first, perform “SRS system check”. “SRS system check” is to check whether “SRS” warning lamp operates properly and confirms SRS diagnostic trouble code (DTC) using warning lamp blinking or Tech 2.

1. Active diagnostic trouble code: Function fault currently detected. Active diagnostic trouble codes are stored in the RAM (Random Access Memory). (Code of current trouble)
2. History diagnostic trouble code: Function fault detected after history memory had been cleared last time. History diagnostic trouble codes are stored in the EEPROM. (Trouble code occurred in the past)

System Diagnostic Method

System diagnostic method is a standardized method to repair all the electric/electronic (E/E) systems. Diagnostic procedure is always used to solve the problem of E/E system and is a starting point when service is required. Procedure of diagnosis is described in the following steps:

1. Confirm a customer’s complaint.
   - It is necessary for technicians to understand the normal operations of the systems to confirm a customer’s complaint.
2. Perform pre-inspection.
   - Perform overall visual check.
   - Review service record.
   - Detect noise or abnormal odor.
   - Collect the diagnostic trouble code information for effective repair.
3. Check service information.
   - This includes video, news letter, etc.

If DTC is Stored

Perform service correctly according to the specified DTC chart.

If there is No DTC

Select symptom from the diagnostic chart according to symptom. Complete the service following diagnostic procedure. You may also perform inspection by referring function diagnosis.

If there is No Applicable Symptom

1. Confirm the complaint in detail.
2. Create diagnostic plan.
3. Use wiring diagram and principle of operation.

Ask for technical support when repair history is available for similar case. Connect technician’s knowledge with the effective usage of available service information.

If there is Intermittent (Intermittent Trouble)

The trouble situation not occurring constantly is called intermittent (intermittent trouble). Perform the following steps to solve the intermittent trouble.

1. Check the DTC information and SRS data.
2. Evaluate symptom and situation explained by the customer.
3. Check the circuits or the electric system components using check sheet or other methods.

If the Trouble is not Detected

In this case, the vehicle is judged as it operates properly. The condition explained by the customer may be the normal condition. Confirm the customer’s complaint comparing with the condition of the vehicle to that of another vehicle. That condition may mean an intermittent trouble. Confirm the complaint in the situation the customer explains before returning the vehicle to the customer.

1. Confirm the complaint again.
   If the complaint can not be fully detected or identified, the vehicle must be diagnosed again. Confirm the complaint one more time. The complaint may be an intermittent trouble as defined in “If there is intermittent”, but it may also be possible that the vehicle is normal.

2. Repair and confirm.
   If the problem is confirmed, repair it. Confirm that the vehicle operates properly and the symptoms are corrected.

   This includes road test or other procedures to confirm that the trouble is solved under following conditions:

   - Confirm by testing in the situation that the customer described.
   - If DTC is diagnosed, while monitoring Tech 2 data, reproduce the situation found when the DTC is set, and confirm the repair.

About Diagnostic Procedure

WARNING:
WHEN SERVICING SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT EXCEPT ONES DESCRIBED IN THIS MANUAL TO AVOID DEPLOYMENT OF SRS AIRBAG. FAILURE TO FOLLOW THIS MANUAL MAY CAUSE INJURY DUE TO UNNECESSARY DEPLOYMENT OF SRS AIRBAG.

The purpose of the diagnostic procedure in this topic is to find SRS problems and repair them. The procedures to find SRS problems quickly and repair effectively is described as follows. Failure to perform this procedure leads to longer diagnosis period, wrong diagnosis or replacement of wrong part.

1. Perform pre-inspection.

Always begin the diagnosis with the followings.

- Perform overall visual check. (Such as improper connection of terminal, wire, etc., trace of water (coffee, juice, etc.) contact with SRS control unit)
- Review service record.
- Detect noise or abnormal odor.

2. Perform “SRS system check”.

“SRS system check” includes whether “SRS” warning lamp operates properly and SRS diagnostic trouble code check using “warning lamp blinking” or “Tech 2”.

3. Refer to appropriate diagnostic chart according to the instruction of “SRS system check”.

Go on to the appropriate chart to diagnose SRS problems with “SRS system check”. Failure to perform this procedure leads to longer diagnosis period, wrong diagnosis or replacement of wrong part.

4. Repeat the “SRS system check” after performing repair and diagnostic procedure.

“SRS system check” after every repair or diagnostic procedure can confirm correct repair work and if other problem exists.

About Diagnostic Code

SRS control unit records troubles occurred in the past after the trouble code had been cleared last time.

1. Active code (trouble code occurring currently)

Troubles currently detected during this ignition cycle. Active codes are stored in the RAM (Random Access Memory).

2. History code (trouble code occurred in the past)

All troubles detected after history trouble memory had been cleared last time.
History codes are stored in EEPROM (Electrically Erasable Programmable Read Only Memory).

Necessary Basic Knowledge

Certain basic knowledge is required before using this topic of the service manual. Absence of this knowledge cause difficulty when using diagnostic procedure in this topic. Be cautious to protect from harmful or unnecessary deployment. Be sure to read and understand every caution on the caution label attached to SRS parts as well as the service manual.

Basic Electrical Circuit

Understand the basic electrical theory including serial and pararel circuits, and understand voltage drop in the series resistance. Understand the meaning of voltage, current (ampere), resistance (ohm), and what happens on the circuit by bare wire or short circuit. You must be able to read and understand wiring diagram.

How to Read Trouble Code

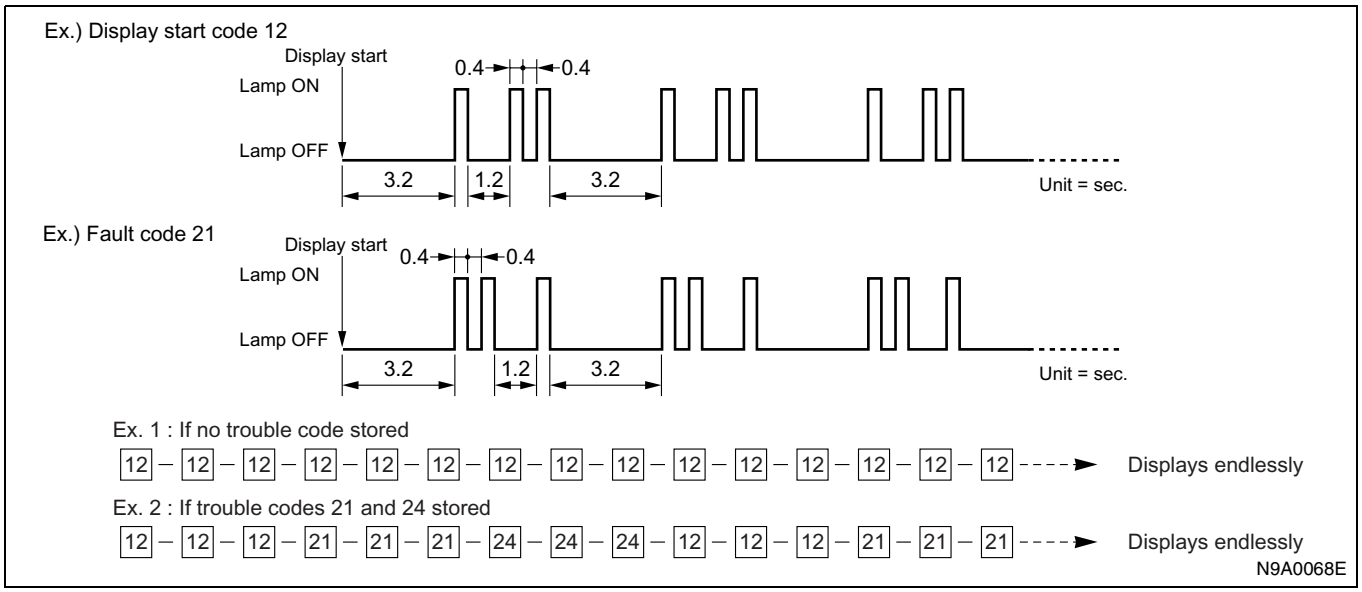
By connecting diagnosis connector, trouble records are displayed by blinking of warning lamp.
Also Tech 2 can read (and clear excluding some code) all codes (current and history codes).

Flash Code Diagnosis

Using SRS warning lamp flash code diagnosis, you can read current code and check if history code exists, but cannot clear the code or read history code. To enable SRS warning lamp flash code diagnosis, short the diagnosis connector terminals No. 4 with No. 13, and turn the starter switch to “ON”.
SRS control unit displays trouble code by blinking “SRS” warning lamp. Before starting blinking mode, it makes the initial lamp off for 1.2 seconds and blinks code “12”. The period of lamp ON and OFF is 0.4 second each, and there is a 1.2-second interval between tens digit and ones digit, and 3.2-second interval between codes. If more than one trouble code are stored, each code is displayed one by one. After all the codes are displayed, they are repeatedly displayed until short circuit is disconnected between diagnosis connector terminals 4 and 13. There are two special codes (code 12 and code 13) in the warning lamp flash code mode. “Code 12” indicates it is in flash display mode. If neither current code nor history code is stored, SRS control unit displays code 12 repeatedly until the connection is removed in the diagnosis connector terminal.
“Code 13” is displayed when history code is detected or when history code is detected but no longer appears as current code. Tech 2 is necessary to read history codes. Normally, keep the diagnosis connector terminals No. 4 and No. 13 disconnected.

If trouble code stored

After displaying the code 12 for three times, the stored trouble code will be displayed for three times.
If more than one trouble code are stored, they are displayed in the ascending order for three times each.
After taking a round, codes are repeatedly displayed starting with code 12. This will last as long as the self-diagnosis connector terminal is kept shorted.



How to clear trouble code

Trouble codes can be cleared only with Tech 2. However, in case DTC 25, 51, 52, 53 or 71 occurs, memory clear cannot be performed. In this occasion, SRS control unit must be replaced.

"Lamp OFF function when replacing SRS control unit"
A function is installed to the system that the lamp will not turn off unless manually turned off using Tech 2 upon completion of all inspection when replacing SRS control unit. By communicating by following the instruction on the display panel in Tech 2, the lamp goes off.
This function allows to confirm if checks are completed.
SRS control unit without this function is also available.

Inspection Standards for SRS airbag system repair

Description		Standard		Standard for parts replacement
		In case of collision	In case of trouble/ periodical inspection	
SRS parts	SRS airbag	❍	❍	• SRS airbag had been deployed by collision. • Pad surface is scratched or cracked. • Connector is chapped or chipped. • Harness is disconnected or wire is exposed.
	SRS control unit	❍	❍	• SRS airbag had been deployed by collision. • SRS control unit body is chapped, cracked, or deformed. • Connector is chapped or chipped. • Result of trouble diagnosis in the service manual indicates to replace SRS control unit. • Water attached to connector adjacent area.
	SRS coil	❍	❍	• SRS airbag had been deployed. • Case body or bracket is chapped, cracked, or deformed. • Result of trouble diagnosis in the service manual indicates to replace parts.
	SRS harness	❍	❍	• Wiring harness in the SRS airbag circuit is open or wire is exposed. • Connector is chapped or chipped. • Result of trouble diagnosis in the service manual indicates to replace parts. • Wheel is out of round.
	Steering wheel	❍		• Bracket is deformed. • New SRS airbag cannot be installed without strain. • When new SRS airbag is installed, pad interferes with steering wheel, or clearance is not uniform.

Description		Standard		Standard for parts replacement
		In case of collision	In case of trouble/ periodical inspection	
Relevant parts	Steering column	❍		• Shaft and shaft support bracket are deformed. • Tilt operation cannot be performed smoothly.
	Instrument panel, crossbeam, cover, etc. Glove box Seat Seat belt Windshield glass	❍		• Dent, bent, chapped, cracked, or deformed. • Replace the seat belt which were used in collusion.
	Counterpart	❍		• If it is dent, bent, chapped, cracked, or deformed, repair or replace with new one. • If installation is loose, tighten the to the specified torque.

Standard

In case of collision: In any case of collision regardless of SRS airbag deployment
In case of trouble: In case trouble code is detected with Tech 2 diagnosis when “SRS” warning lamp does not come on or remains on.

List of Function Checks

Item to be checked	Contents of inspection
SRS system check	Inspection to identify defective point of SRS control system (inspection procedure)
SRS control unit function check (Chart A)	Inspection to identify function fault of SRS control unit (inspection procedure)
“SRS” warning lamp turns on continuously (Chart B)	Check when “SRS” warning lamp turns on continuously when starter switch is turned ON.
“SRS” warning lamp does not come on (Chart C)	Check when “SRS” warning lamp does not come on when starter switch is turned ON.

SRS System Check

Outline

The purpose of the diagnostic procedure in this topic is to find SRS function faults and repair them. For best results, it is important to use diagnostic chart and follow the order indicated as follows.

A. Perform “SRS system check”.

Always begin with “SRS system check” for SRS diagnosis.
“SRS system check” includes whether “SRS” warning lamp operates properly, and whether SRS control unit can communicate via “serial data” line, and if SRS diagnostic trouble code exists.

B. Refer to appropriate diagnostic chart according to the instruction of “SRS system check”.

Go on to the appropriate chart to diagnose SRS function fault with “SRS system check”. Failure to perform this procedure leads to longer diagnosis period, wrong diagnosis or replacement of wrong part.

C. Repeat “SRS system check” after performing repair and diagnostic procedure.

“SRS system check” after every repair or diagnostic procedure can confirm correct repair work and if other function fault exists.

Description of Circuit

Once the starter switch is turned to “ON”, ignition voltage is applied from “SRS fuse” to “Ignition A” input terminal “20” and “Ignition B” input terminal “18” of SRS control unit. SRS control unit executes tests related to SRS, and “SRS” warning lamp responds by blinking seven times.

Cautions at Each Step of “SRS System Check”

(Numbers below indicate step numbers in the system check.)

1. Turn the starter switch to “ON”, and check that the “SRS” warning lamp blinks seven times.
2. Check that the “SRS” warning lamp goes off after it blinks seven times.
3. This test is to check whether “serial data” line operates properly. Also, it detects whether history trouble codes are stored, and confirms the code if stored.
4. This test is to check whether “serial data” line operates properly. Also, it confirms the stored history trouble codes, and confirms whether those are current code or history code.

Point of Diagnosis

Order is very important to diagnose diagnostic trouble code. Be sure to diagnose in the specified order. Failure to do so leads to longer diagnosis period, wrong diagnosis or replacement of wrong part.

Diagnostic Aid

The intermittent “SRS” warning lamp illumination may be caused by poor contact, worn wire insulation or disconnection in insulation. Check for following conditions:

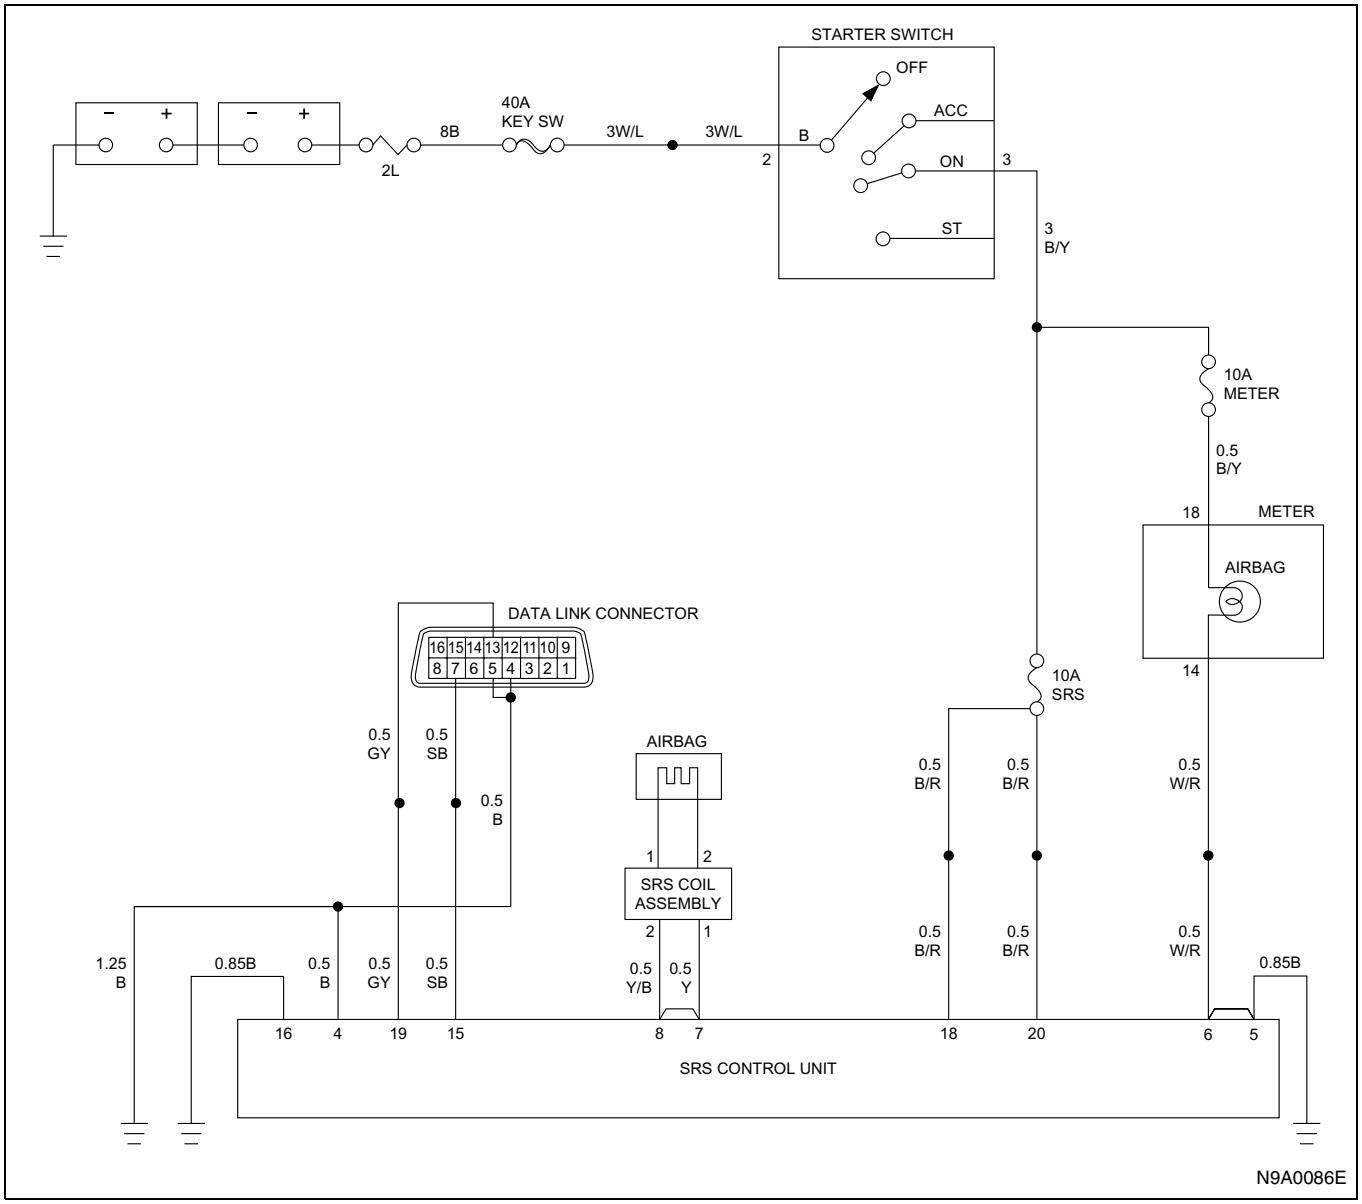
- Check for improper connection of the SRS control unit harness and the connector, lock breakage, deformation or damage of the terminal, poor contact between the terminal and the wire, and damaged harness.

Step	Action	Value	YES	NO
1	Turn the starter switch to “ON”, and check the “SRS” warning lamp operation. Does the “SRS” warning lamp blink seven times?	—	Go to Step2	Go to Chart C “SRS” warning lamp does not come on.
2	Check the “SRS” warning lamp operation after it blinks seven times. Does the “SRS” warning lamp go off?	—	Go to Step3	Go to Step4
3	1. Turn the starter switch to OFF. 2. Connect the Tech 2 with diagnosis connector, and follow the instruction on Tech 2 manual. 3. Turn the starter switch to ON. 4. Request SRS diagnostic trouble code display, and record all the history trouble code in the repair order with taking notes that it is recorded in this manner. Is the diagnostic trouble code displayed?	—	Turn the starter switch to OFF. Refer to “Point of diagnosis” of other specific DTC for all the history code. History DTC indicates that the function fault has been corrected or it is intermittent.	SRS is in function, and there is no function fault. Further diagnosis is not necessary.

Step	Action	Value	YES	NO
4	1. Turn the starter switch to OFF. 2. Connect the Tech 2 to the diagnosis connector. 3. Turn the starter switch to ON. 4. Confirm the diagnostic trouble code (DTC) using Tech 2, and record all the DTC in the repair order with taking notes that it is current code or history code if it appears. Is the diagnostic trouble code (DTC) displayed?	—	If DTC 51 is displayed, go to DTC 51 chart. If DTC 53 is displayed, go to DTC 53 chart. If DTC 25 is displayed, go to DTC 25 chart. If DTC 71 is displayed, go to DTC 71 chart. Diagnose rest of the current DTC in the order from lower level. Refer to “Point of diagnosis” of the specific DTC, if only history codes exist.	Go to Chart B “SRS” warning lamp turns on continuously.

Chart A SRS Control Unit Function Check

Outline



Description of Circuit

If either of the “Ignition A” voltage applied to terminal “20” or “Ignition B” voltage applied to terminal “18” exceeds 10V, the airbag SRS control unit recognizes it and “SRS” warning lamp blinks seven times to confirm operation. At this point, SRS control unit performs “Initial diagnosis” and “Constant diagnosis” subsequently. Once function fault is detected, SRS control unit set the current diagnostic trouble code and turn “SRS” warning lamp to ON.

When SRS control unit does not detect any more function fault except DTC 25, 51, 53, 71, it clears the current diagnostic trouble code moving them to the EEPROM.

Trouble codes cannot be cleared but with “Clear code” command of Tech 2, except following DTCs. In addition, “Clear code” command cannot clear DTCs 25, 51, 53, and 71.

Description of Chart Test

Numbers below indicate step numbers in the diagnostic chart.

1. This test is to confirm current function fault. Refer to “Point of diagnosis” of appropriate DTC, if there is no current function fault (history DTC is set). Do not replace the SRS control unit because of history diagnostic trouble code.
2. Confirm diagnostic trouble code using Tech 2.
3. This test is to check function fault occurred in the SRS control unit during diagnosis. Function fault of SRS control unit hardly cause new function fault during diagnosis.

4. Replace the SRS control unit only when all circuits except SRS control unit are confirmed to be functioning properly. Failure to do so may cause inerasable code stored in the SRS control unit and it may requires replacement again.

Point of Diagnosis

Order is very important to diagnose diagnostic trouble code. Be sure to diagnose in the specified order. Failure to do so leads to longer diagnosis period, wrong diagnosis or replacement of wrong part.

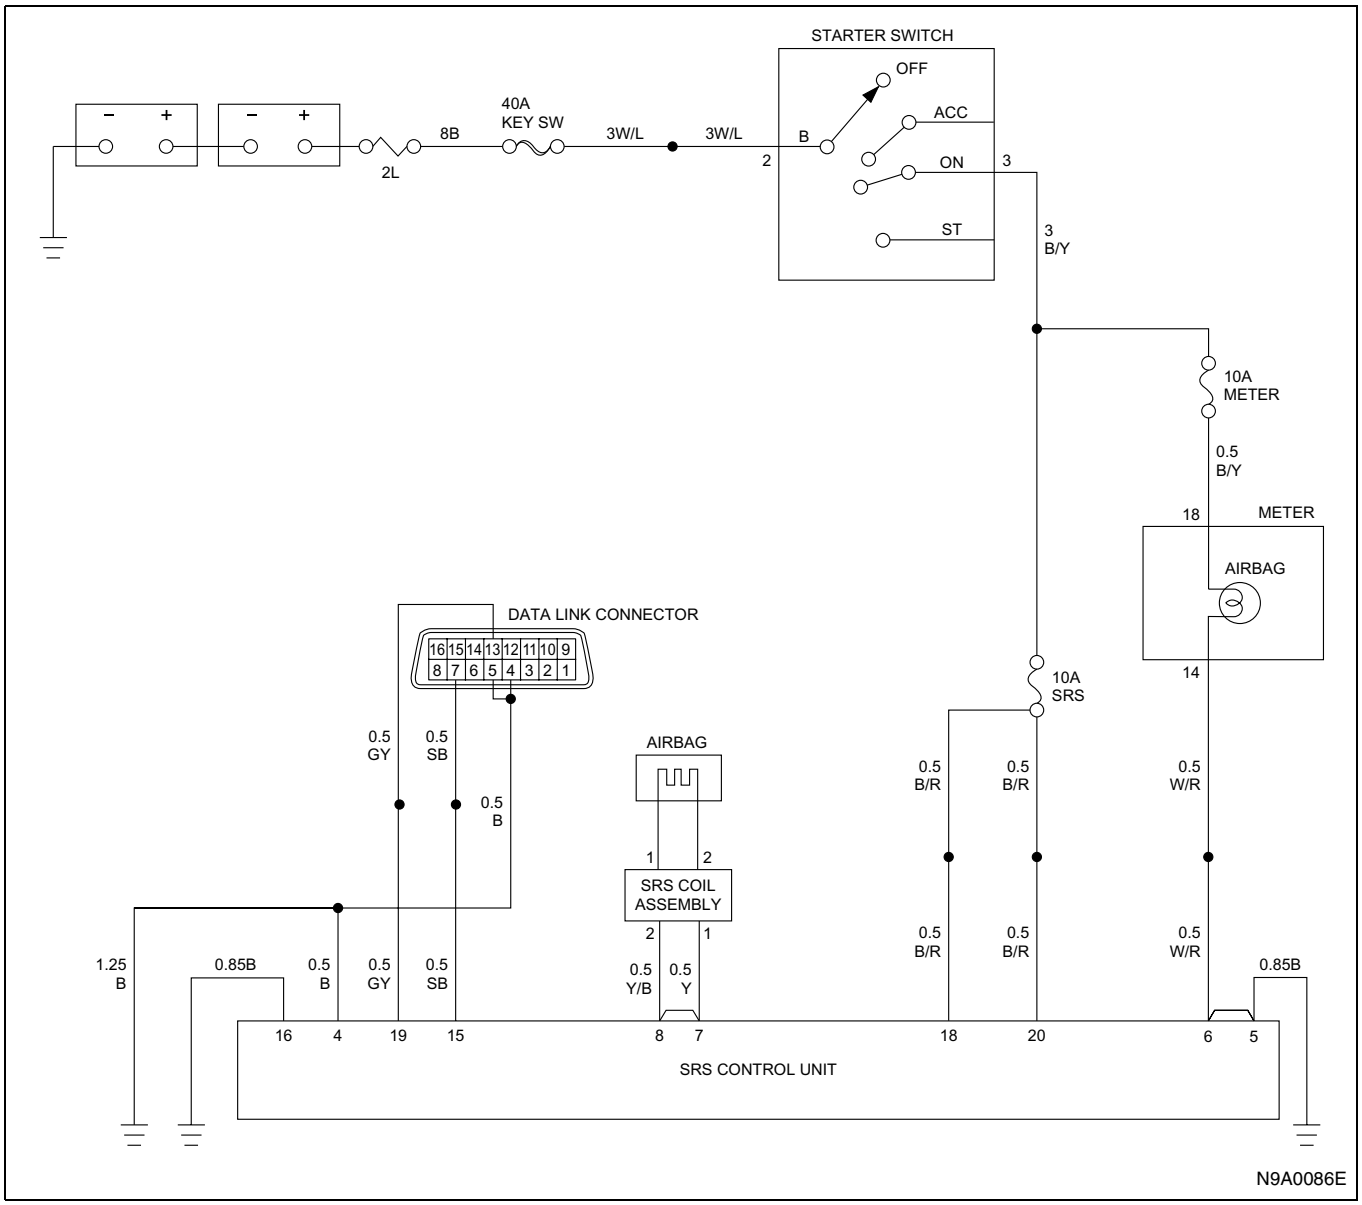
WARNING:
DURING SERVICE WORK, BE CAREFUL NOT TO TAP OR SHAKE THE SRS CONTROL UNIT. ALSO, FAILURE TO INSTALL THE SRS CONTROL UNIT TO VEHICLE PROPERLY MAY LEAD TO MALFUNCTION OF THE UNIT WHEN THE STARTER SWITCH IS TURNED TO ON. THIS MAY RESULT IN INJURY DUE TO SUDDEN DEPLOYMENT OF SRS AIRBAG.

Step	Action	Value	YES	NO
1	1. This chart is based on the assumption that “SRS system check” diagnosis has been performed. Perform the following procedure when the chart shows and proves that all circuits except SRS control unit are confirmed to be functioning properly, and DTC remains stored as current code. 2. Perform the diagnostic procedure to check if the SRS control unit has to be replaced. 3. Turn the starter switch to OFF. 4. Connect all the system components, and make sure those are installed properly. 5. Make sure that the starter switch is “OFF” at least for 15 seconds. 6. Turn the starter switch to “ON”, and check the “SRS” warning lamp operation. Does the “SRS” warning lamp go off after it blinks seven times?	—	Go to Step3	Go to Step2
2	Request diagnostic trouble code display using Tech 2. Is there any other DTC than that appeared at the “SRS system check” in the beginning?	—	Turn the starter switch to OFF. Go to appropriate chart according to the function fault indicated.	Go to Step3
3	1. Clear the SRS DTC. 2. Turn the starter switch to OFF at least for 15 seconds. Turn the starter switch to “ON”, and check the “SRS” warning lamp blinking operation. Does the “SRS” warning lamp go off after it blinks seven times?	—	System is in function, and there is no function fault. Further diagnosis is not necessary.	Turn the starter switch to OFF. Go to Step4

Step	Action	Value	YES	NO
4	1. Replace the SRS control unit. 2. Connect all the SRS components, and check that those are installed properly. 3. Connect the Tech 2, and check if “Event data clear prohibition” flag is displayed. 4. If not, put the flag up. Is this step completed?	—	Check the repair.	Go to Step4

Chart B “SRS” Warning Lamp Turns on Continuously

Outline



Description of Circuit

Turn the starter switch to “ON”. Battery voltage is applied to “SRS” warning lamp and the “SRS” warning lamp comes ON.

“SRS fuse” can apply system voltage to the “Ignition” input terminal “20” and “18”. After “SRS” warning lamp blinks seven times, SRS control unit calls warning lamp drive circuit in the SRS control unit to turn the “SRS” warning lamp off, if there is no current DTC.

If the “Ignition” voltage is less than 10V, “SRS” warning lamp turns on continuously, and no DTC is set.

Description of Chart test

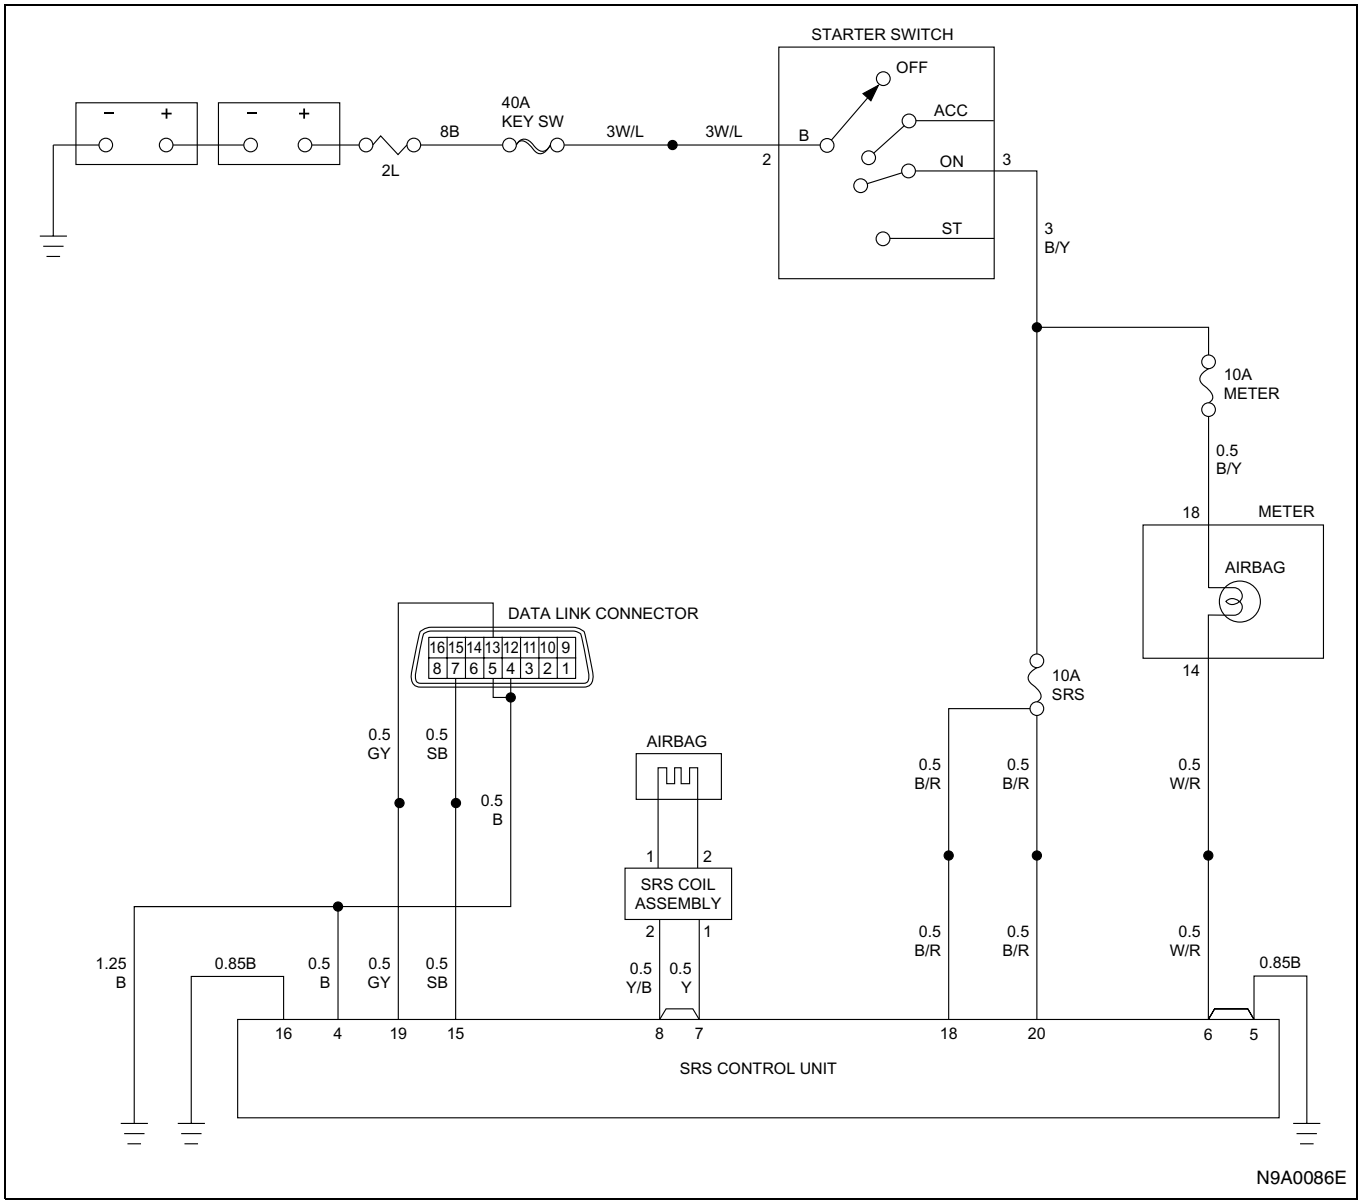
Numbers below indicate step numbers in the diagnostic chart.

1. This test is to check if power is provided to the SRS control unit feeder circuit.
2. This test is to check if the “Ignition” and ground circuit is normal against the SRS control unit.
3. This test is to check if the location of function fault is in the SRS control unit.
4. This test is to check ground short circuit from the SRS control unit feeder circuit.

Step	Action	Value	YES	NO
1	1. Turn the starter switch to OFF. 2. Remove the “SRS fuse” of SRS airbag to inspect. Is the fuse normal?	—	Go to Step2	Go to Step4
2	1. Turn the starter switch to OFF. 2. Disconnect the SRS control unit harness connector. 3. Remove the 2-pole connector (yellow) located in the lower portion of steering column. 4. Turn the starter switch to ON. 5. Measure the voltage between the SRS control unit harness connector terminals “20” and “16”. Is the voltage 18V?	—	Go to Step3	Go to Step5
3	1. Turn the starter switch to OFF. 2. Connect all the parts. 3. Connect the Tech 2, and turn the starter switch to ON. 4. Check if “Event data clear prohibition” flag is displayed. Is the flag displayed?	—	Put the “Event data clear prohibition” flag up.Go to Step7	Go to Chart A SRS control unit function check.
4	1. Replace the “SRS fuse”. 2. Turn the starter switch to ON, and wait for 10 seconds. Then, turn the starter switch to OFF. 3. Remove the “SRS fuse” to inspect. Is the fuse normal?	—	Install the fuse and Go to Step7.	Go to Step6
5	1. The power supply circuit of SRS control unit or ground circuit is open. 2. Find the cause. 3. Replace the SRS harness, if it has problem. Is this step completed?	—	Go to Step7	Go to Step5
6	1. The power supply circuit of SRS control unit is shorted. 2. Find the cause. 3. Replace the SRS harness, if it has problem. Is this step completed?	—	Go to Step4	Go to Step6
7	Reconnect all the parts, and check that those are installed properly. Is this step completed?	—	Check the repair.	Go to Step7

Chart C "SRS" warning lamp does not come on

Outline



Description of Circuit

Turn the starter switch to "ON". Battery voltage is applied to "SRS" warning lamp and the "SRS" warning lamp comes ON.
"SRS fuse" can apply system voltage to the "Ignition" input terminal "20" and "18".
After "SRS" warning lamp blinks seven times, SRS control unit calls warning lamp drive circuit in the SRS control unit to turn the "SRS" warning lamp off, if there is no current DTC.
If the "Ignition" voltage is less than 10V, "SRS" warning lamp turns on continuously, and no DTC is set.

Description of Chart test

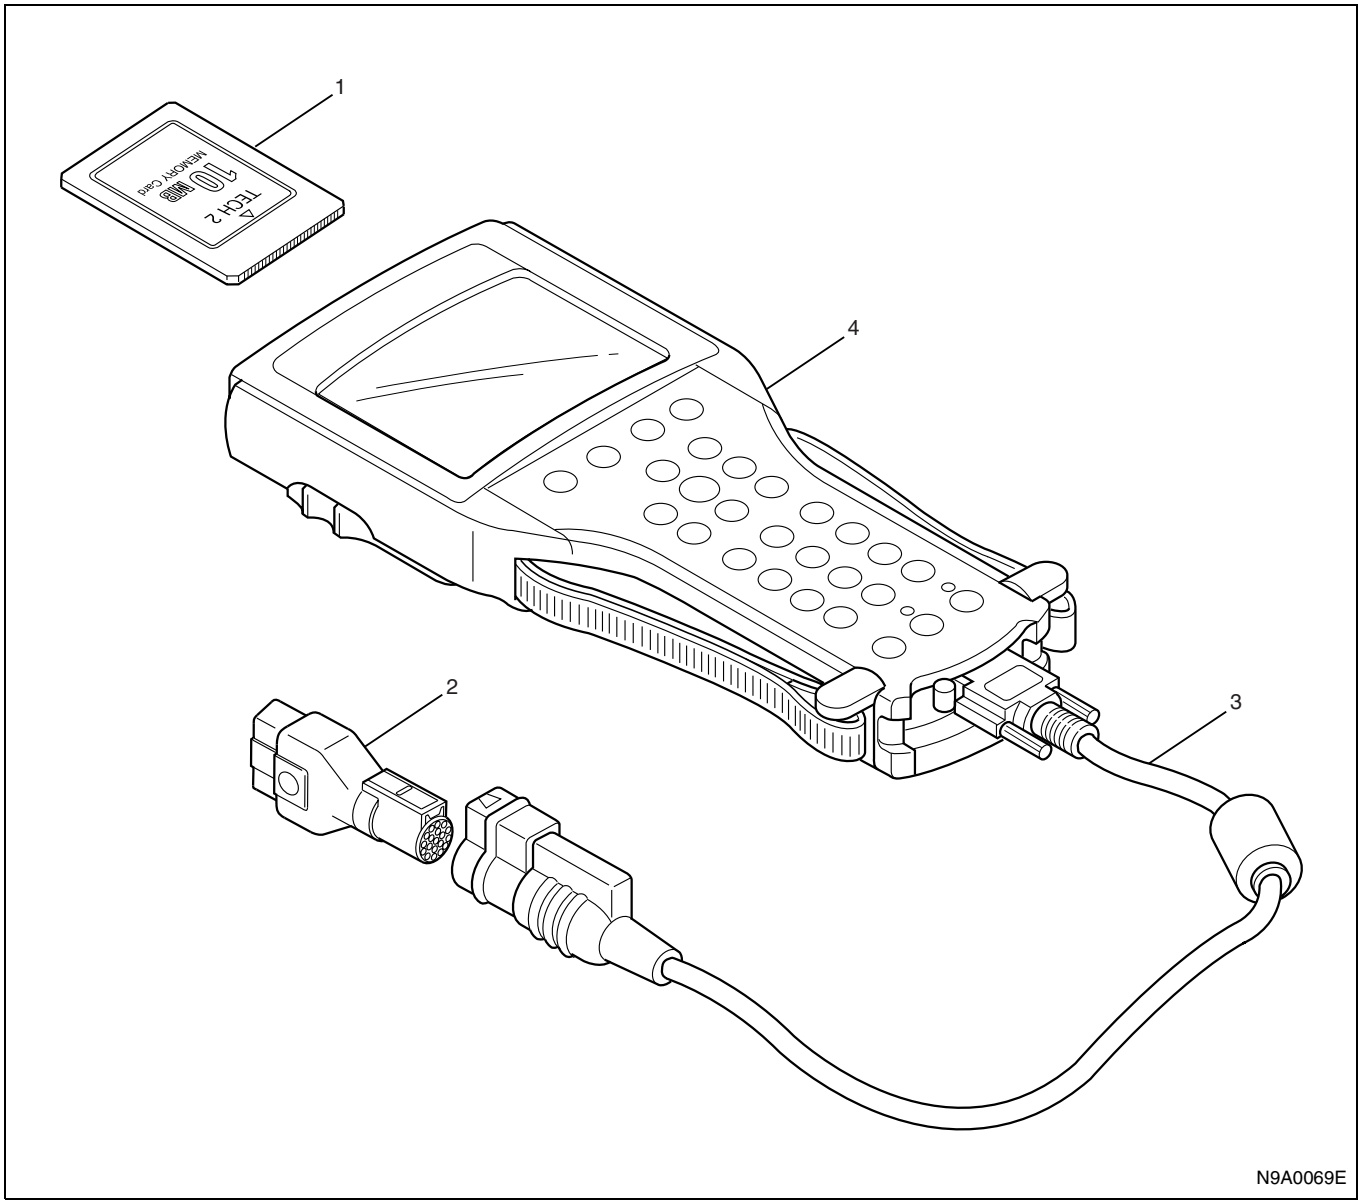
Numbers below indicate step numbers in the diagnostic chart.
1. This test is to check if power is provided to the SRS warning lamp feeder circuit.
2. This test is to check if SRS control unit operates improperly to prevent the "SRS" warning lamp from coming on.
3. This test is to check if the circuit between warning lamp and SRS control unit is shorted to ground.
4. This test is to check if "SRS" warning lamp circuit is normal.
5. This test is to check ground short circuit from the SRS warning lamp feeder circuit.

Step	Action	Value	YES	NO
1	Turn the starter switch to ON. Do warning lamps other than “SRS” operate properly?	—	Go to Step2	Go to Step3
2	1. Turn the starter switch to OFF. 2. Remove the SRS control unit connector. 3. Turn the starter switch to ON. Does the “SRS” warning lamp come on?	—	Replace the SRS control unit.Go to Step5	Go to Step4
3	Replace the meter assembly. Is this step completed?	—	Go to Step5	Go to Step3
4	1. Either of the “SRS” warning lamp power supply circuit or “SRS” warning lamp is open. 2. Find the cause. Is this step completed?	—	Go to Step5	Go to Step4
5	Connect all the SRS parts, and check that those are installed properly. Is this step completed?	—	Check the repair.	Go to Step5

Trouble Diagnosis with Scan Tool

Tech 2

Tech 2 is a useful tool to diagnose electric fault and system check of the airbag system.
Though it is possible to diagnose the fault without Tech 2, using the Tech 2 allows you to diagnose quickly.
Tech 2 is small and light tester. It can communicate with the SRS control unit to perform various types of diagnosis and tests by connecting the self-diagnosis connector equipped to the vehicle.



Legend

1. PCMCIA card
2. SAE 16/19 adapter
3. DLC cable
4. Tech 2

Feature of Tech 2

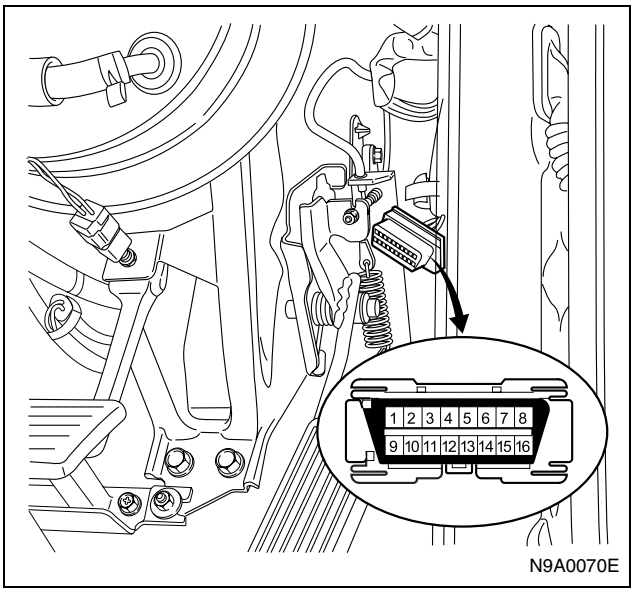
Caution:

- Tech 2 (4) is a 12-V power supply system. Do not use 24-V power supply. If the vehicle system is equipped with a 24-V power supply, use a 12-V battery with an adapter for power distribution.
- Never use cigarette lighter socket.

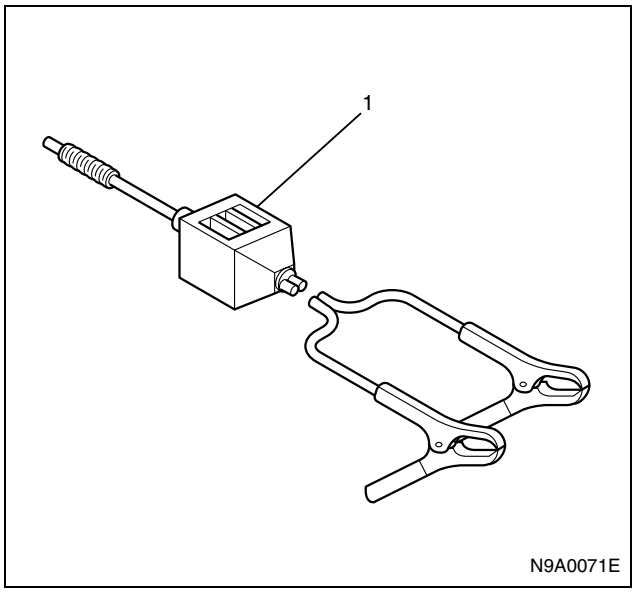
- Set the PCMCIA card (1) to Tech 2, and attach the VCI (Vehicle Communication Interface) (2)(3) to connect to the DLC in the vehicle.
- Turn the power switch off before installing/removing the PCMCIA card.
- Tech 2 has a capacity of equivalent to two snapshots.
- PCMCIA card is sensitive to magnetic and electrostatic. Handle it with care.
- Tech 2 can plot a graph of snapshots.
- Pressing the EXIT key can bring back to the main menu anytime.
- Open the application menu and press the “F1:Clear DTC Info” or the DTC clear to clear diagnosis trouble codes (DTCs).

How to Connect Tech 2

1. Insert the PCMCIA card to the Tech 2 body.
2. Install the SAE 16/19 adapter to the DLC cable.
3. Install the DLC cable to the Tech 2 body.
4. Make sure that the ignition key is OFF.
5. Connect the SAE-16/19 adapter of the Tech 2 to the self-diagnosis connector (black) in the body side.



Connect an adapter cable between the Tech 2 and 12-V battery.



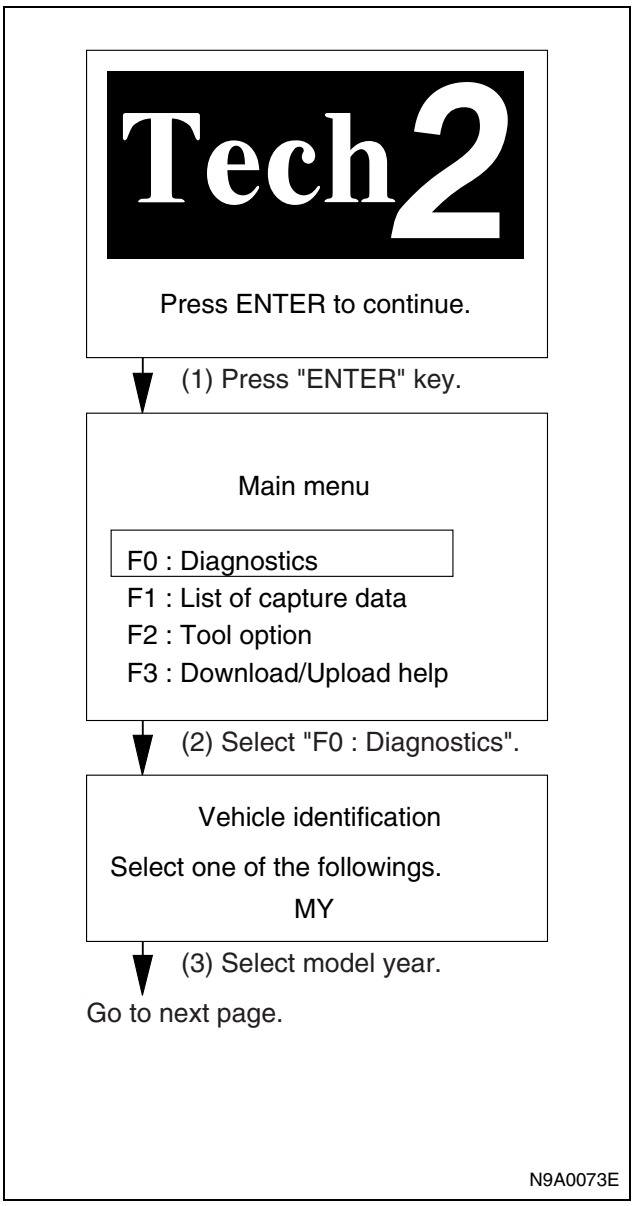
Legend

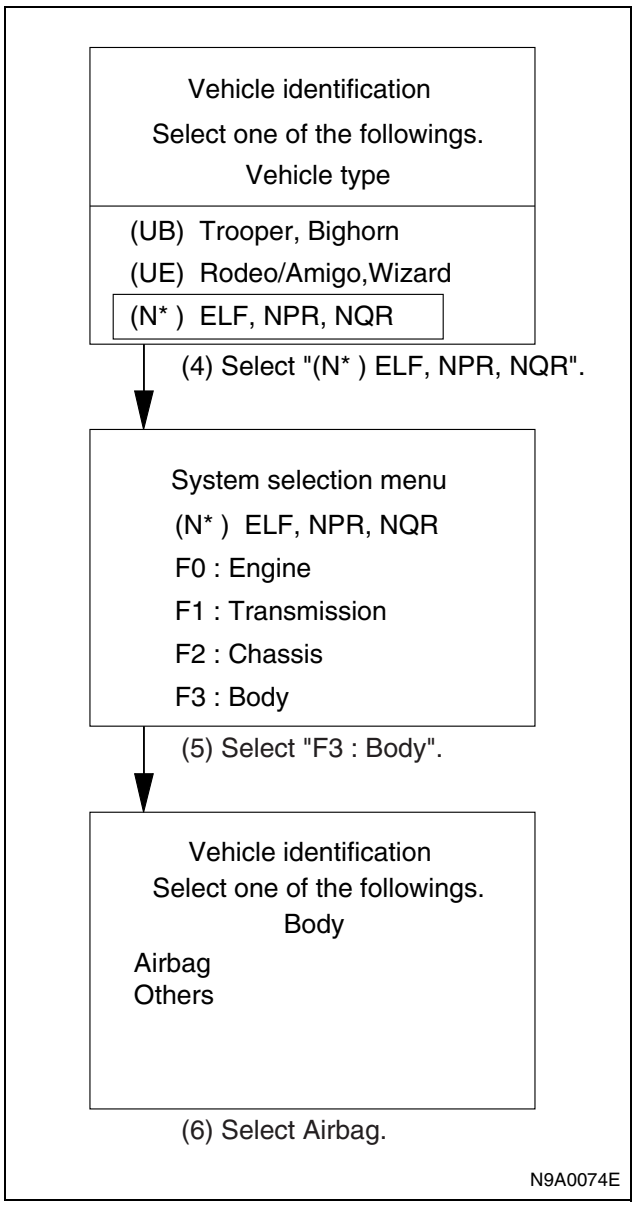
1. 3A-fuse

6. Turn the ignition switch to “ON” and press the “PWR” key of the Tech 2.
7. Check the display of the Tech 2.

Caution:
Make sure that no power is supplied to the Tech 2 when installing/removing the PCMCIA card.

Operation Procedure





Menu

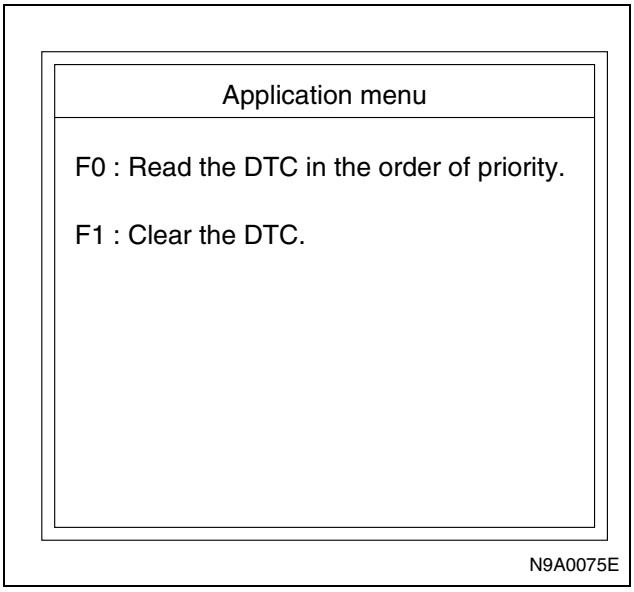
- The following chart shows the functions used by the current Tech 2 software.

F0: Diagnostic trouble code F0: Read the DTC in the order of priority. F1: Clear the DTC.
F1: Data display
F2: Snapshot
F3: Programming F0: Event data clear prohibition

DTC (Diagnostic Trouble Code) Mode

Two options are available for Tech 2 DTC mode. After selecting the DTC, the following menu is displayed.

- DTC Info (DTC information)
- Clear Info (DTC clear)



Data Display

Move the connector or harness by hand. If the display changes from fix to release, connection of connector is faulty, pin tip length is uneven, or open or short circuit in the harness exists where you have moved. Therefore, repair is necessary. When asterisk mark (*) is displayed in place of numeric display; Problem of Tech 2.
If asterisk mark (*) is found any of the data, PCMCIA card must be version upgraded.

Snapshot (Graph Plotting)

- The snapshot can record the data list menu and plot a graph.
- Utilizing this mode, reproduce and record the conditions claimed by the customer to identify the engine data fault.
- The stored data can be replayed with a domestic power supply.

Programming

- Before replacing SRS control unit, be sure to check/save the vehicle information. After replacement, input it.

List of Diagnostic Trouble Code

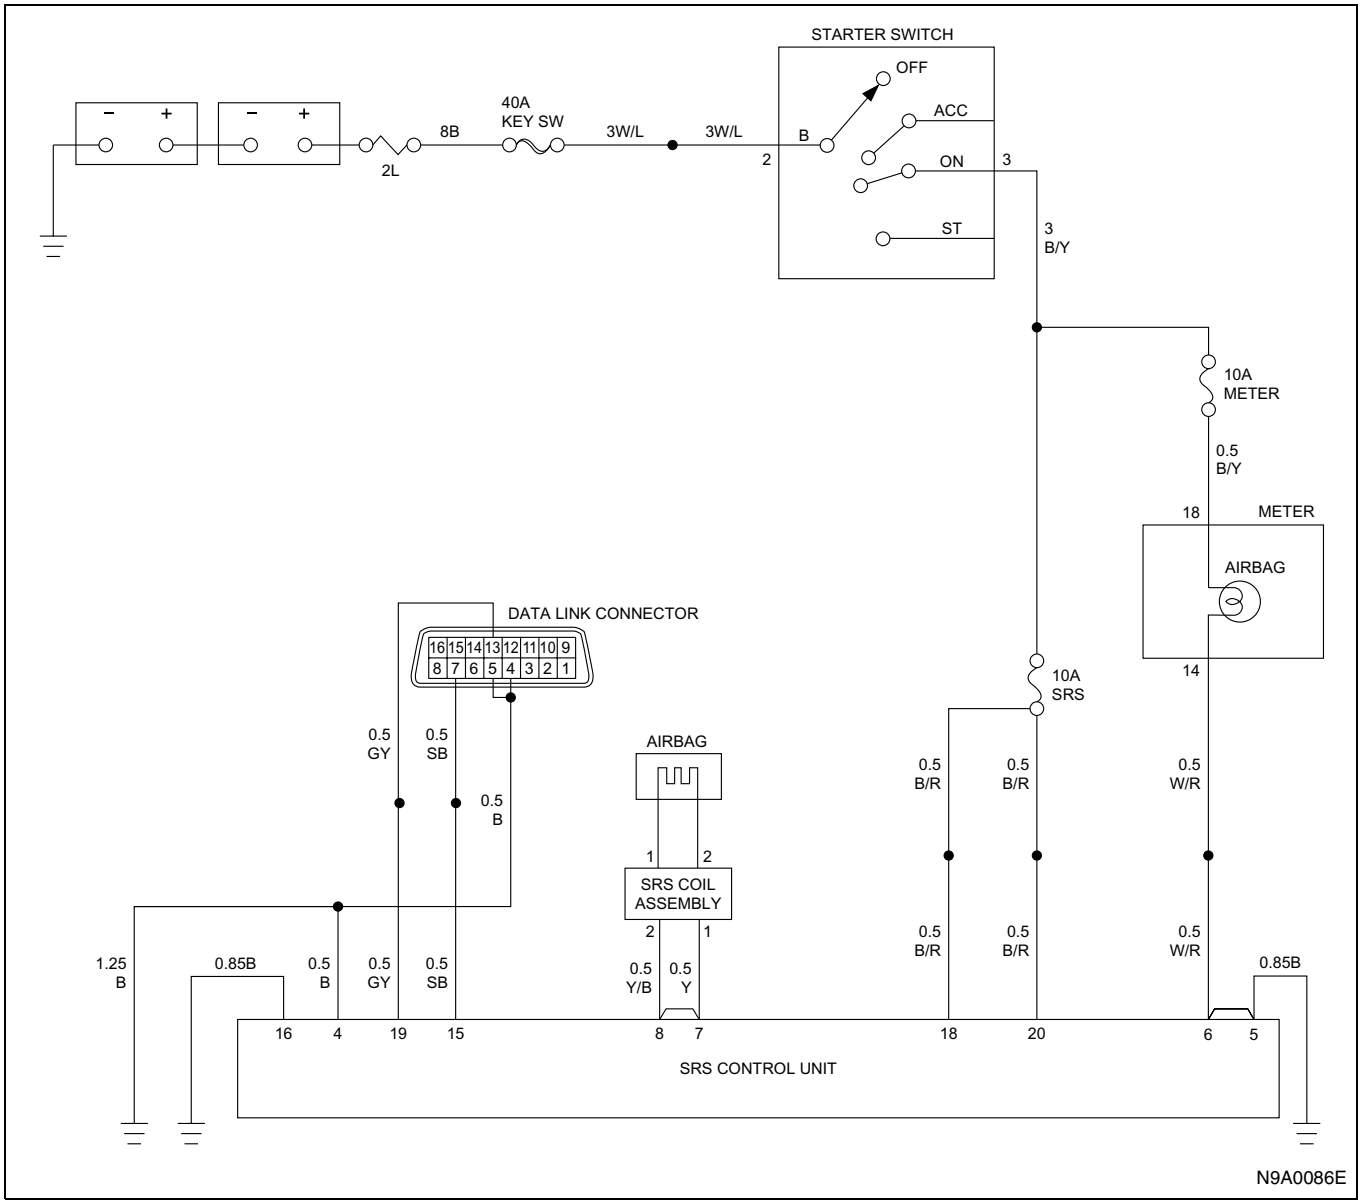
Trouble code No.	Item to be detected	"SRS" warning lamp ON
14	Connector is half-connected	ON
21	Resistance of SRS airbag deployment circuit is large	ON
22	Resistance of SRS airbag deployment circuit is small	ON
24	SRS airbag deployment circuit is shorted to ground	ON
25	SRS airbag deployment circuit is shorted to ignition voltage	ON
26	SRS airbag deployment circuit is open	ON
51	SRS airbag deployment current had output	ON
53	Specific trouble when SRS airbag deployment current had output	ON
54	Deployment output by onboard deployment system communication	
55	Vehicle type error	ON
61	Warning lamp circuit trouble	ON
63	Power supply voltage failure	ON
71	SRS control unit internal trouble	ON

Caution:

- Trouble codes No. 21, 25, 71 cannot be cleared.
- Code No. 12 indicates that the system is normal.

DTC: 14 Connector is Half-connected

Outline



Description of Circuit

Turn the starter switch to “ON”. SRS control unit checks the condition of half-connection detection terminal.

Condition when DTC is set

The half-connection detection terminals “a” and “b” are not connected via connector.

Action to be taken

SRS control unit turns the warning lamp ON and set the code 14.

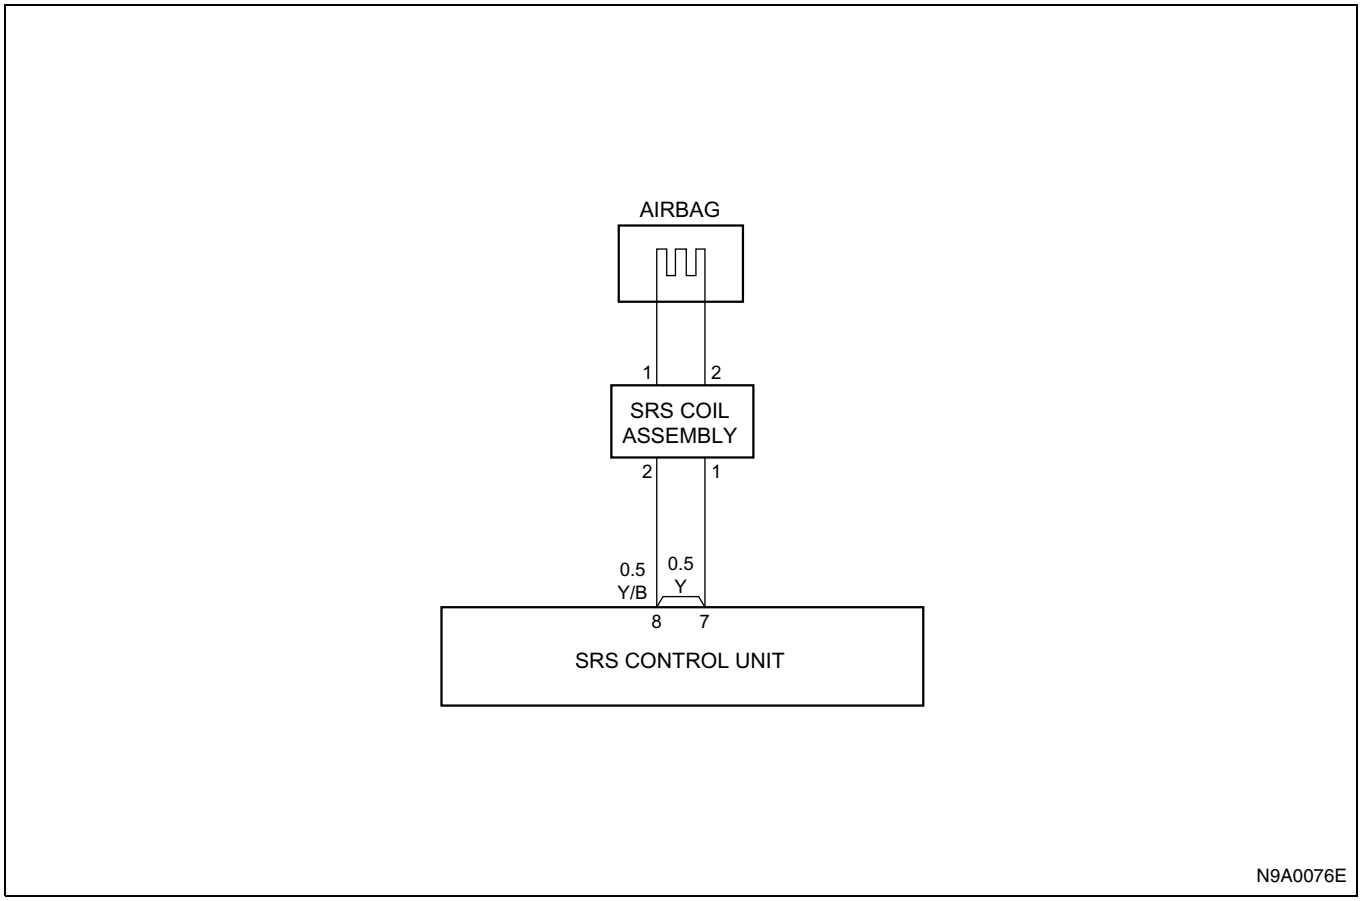
Condition when DTC is cleared

Connector is connected completely, and the half-connected terminal has continuity.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	1. Turn the starter switch to OFF. 2. Check if the connector of the SRS control unit is connected securely. Is the connector of the SRS control unit connected securely?	—	Go to Step3	Insert the SRS control unit connector securely.Go to Step4
3	Temporarily disconnect the SRS control unit connector, and check the half-connection detection terminal for faulty such as bent and dirt. Is there any fault?	—	Replace either of the SRS control unit or SRS harness whichever is faulty.Go to Step4	Go to Chart A SRS control unit function check.
4	1. Reconnect all the parts, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Check the repair.	Go to Step4

DTC: 21 Resistance of SRS Airbag Deployment Circuit is Large

Outline



Description of Circuit

Turn the starter switch to “ON”. SRS control unit performs the tests to diagnose critical function fault inside the SRS control unit. Upon completion of the tests, when the results are pass, “Ignition” voltage and deployment circuit voltage will be measured to check they are within the normal range. Then, the SRS control unit performs “Resistance measurement test”. SRS control unit flows a minimal known amount of current between the terminals “7” and “8”, and measures the voltage difference between the two, and then calculates the combined resistance in the SRS airbag, SRS coil assembly, SRS airbag deployment circuit, and connector terminal contact point.

Condition when DTC is Set

When combined resistance of SRS airbag, SRS coil assembly, SRS airbag deployment circuit, and connector terminal contact point exceeds the specified value. This test is performed constantly after elapse of six seconds from the “Ignition” voltage exceeds 10V.

Action to be Taken

SRS control unit turns the “SRS” warning lamp ON and set the DTC 21.

Condition when DTC is Cleared

When the resistance goes back to less than specified value.

Description of DTC Chart Test

Numbers below indicate step numbers in the diagnostic chart.
2. This test is to check if the location of function fault is in the SRS control unit.
3. This test is to check if the 2-pole connector (yellow) located in the lower portion of steering column is properly connected.
4. This test is to check the 2-pole connector (yellow) terminal located in the lower portion of steering column for secure contact and/or corrosion.
5. This test is to check if the location of function fault is up to the 2-pole connector (yellow) located in the lower portion of steering column.
6. This test is to check the function fault is caused by high resistance value in the wiring.
7. This test is to check if the location of function fault is in the SRS coil assembly or SRS airbag.

Point of Diagnosis

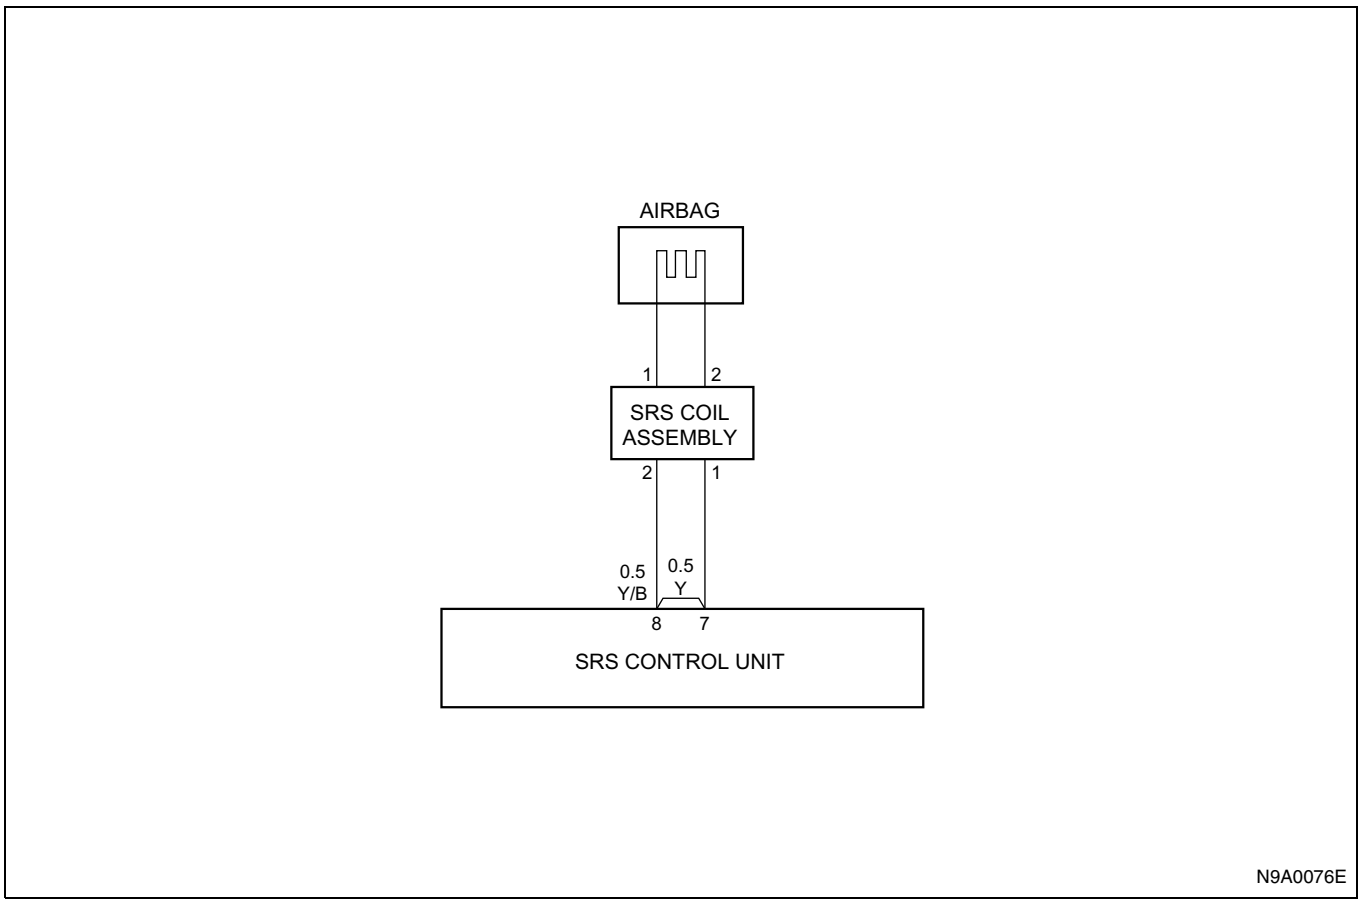
In the situations that the trouble display appears intermittently, it may be caused by improper connection between 2-pole connector terminals “1” and “2” of SRS coil located in the lower portion of steering column, between 2-pole connector terminals “1” and “2” of SRS airbag located in the upper portion of steering column, between SRS control unit terminals “7” and “8”, or between the wire and terminal in SRS airbag deployment circuit.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	1. When measurement is required in this chart, use 5-8840-0366-0 DMM and appropriate terminal adapter in 5-8840-0385-0 Connector test adapter kit. 2. Using the data list function of Tech 2, read the resistance in airbag deployment circuit and record it. Does the resistance in airbag deployment circuit exceed specified value?	7.2Ω	Go to Step3	Go to Chart A SRS control unit function check.
3	1. Turn the starter switch to OFF. 2. Check the 2-pole connector (yellow) of SRS coil located in the lower portion of steering column for proper connection. Is the 2-pole connector connected properly?	—	Go to Step4	Connect the 2-pole connector of SRS coil assembly properly.Go to Step8
4	1. Remove the 2-pole connector (yellow) of SRS coil located in the lower portion of steering column for inspection. 2. If it is normal, reconnect the 2-pole connector of SRS coil assembly properly. 3. Turn the starter switch to ON. Is DTC 21 detected as current trouble?	—	Go to Step5	Go to Step8
5	1. Turn the starter switch to OFF. 2. Remove the 2-pole connector (yellow) of SRS coil assembly located in the lower portion of steering column. 3. Connect the 5-8840-2421-0 SRS substitute load and an appropriate terminal adapter in the 5-8840-0385-0 Connector test adapter kit to the SRS harness side connector which connects to SRS coil assembly. 4. Turn the starter switch to ON. Is DTC 21 detected as current trouble?	—	Go to Step6	Go to Step7

Step	Action	Value	YES	NO
6	1. Turn the starter switch to OFF. 2. Resistance of all circuit in the driver's airbag deployment circuit is increasing. 3. Inspect the SRS airbag deployment circuit and SRS control unit connector terminals "7" and "8", and use high-resolution resistance meter mode of DMM to detect the cause. Is the trouble detected?	—	Replace the SRS harness.Go to Step8	Go to Chart A SRS control unit function check.
7	1. Turn the starter switch to OFF. 2. Remove the 5-8840-2421-0 SRS substitute load from SRS coil assembly harness connector. 3. Connect the 5-8840-2421-0 SRS substitute load to the upper portion of steering column. 4. Reconnect the SRS coil assembly harness connector to the lower portion of steering column. 5. Turn the starter switch to ON. Is DTC 21 detected as current trouble?	—	Turn the starter switch to OFF. Replace the SRS coil assembly by referring to "SRS Coil Assembly" in SRS section. Go to Step8	Turn the starter switch to OFF. Replace the SRS airbag. Go to Step8
8	1. Reconnect all the parts, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Check the repair.	Go to Step8

DTC: 22 Resistance of SRS Airbag Deployment Circuit is Small

Outline



Description of Circuit

Turn the starter switch to “ON”. SRS control unit performs the tests to diagnose critical function fault in the SRS control unit. Upon completion of the tests, when the results are pass, “Ignition” voltage and deployment circuit voltage will be measured to check they are within the normal range. Then, the SRS control unit performs “Resistance measurement test”. SRS control unit flows a minimal known amount of current between the terminals “7” and “8”, and monitors the voltage difference between the two, and then calculates the combined resistance in the SRS airbag, SRS coil assembly, SRS airbag deployment circuit, and connector terminal contact point.

Condition when DTC is Set

When combined resistance of SRS airbag, SRS coil assembly, SRS airbag deployment circuit, and connector terminal contact point is less than the specified value. This test is performed constantly after elapse of six seconds from the “Ignition” voltage exceeds 10V.

Action to be Taken

Airbag SRS control unit turns the “SRS” warning lamp ON and set the DTC 22.

Condition when DTC is Cleared

When the resistance goes back to more than the specified value.

Description of DTC Chart Test

Numbers below indicate step numbers in the diagnostic chart.
2. This test is to check if the location of function fault is in the SRS control unit.
3. This test is to check if the 2-pole connector (yellow) located in the lower portion of steering column is properly connected.
4. This test is to check if the shorting clip of 2-pole connector (yellow) operates properly.
5. This test is to check if the location of function fault is up to the 2-pole connector (yellow) located in the lower portion of steering column.
6. This test is to check the function fault is caused by low resistance value in the wiring.
7. This test is to check if the location of function fault is in the SRS coil assembly or SRS airbag.

Point of Diagnosis

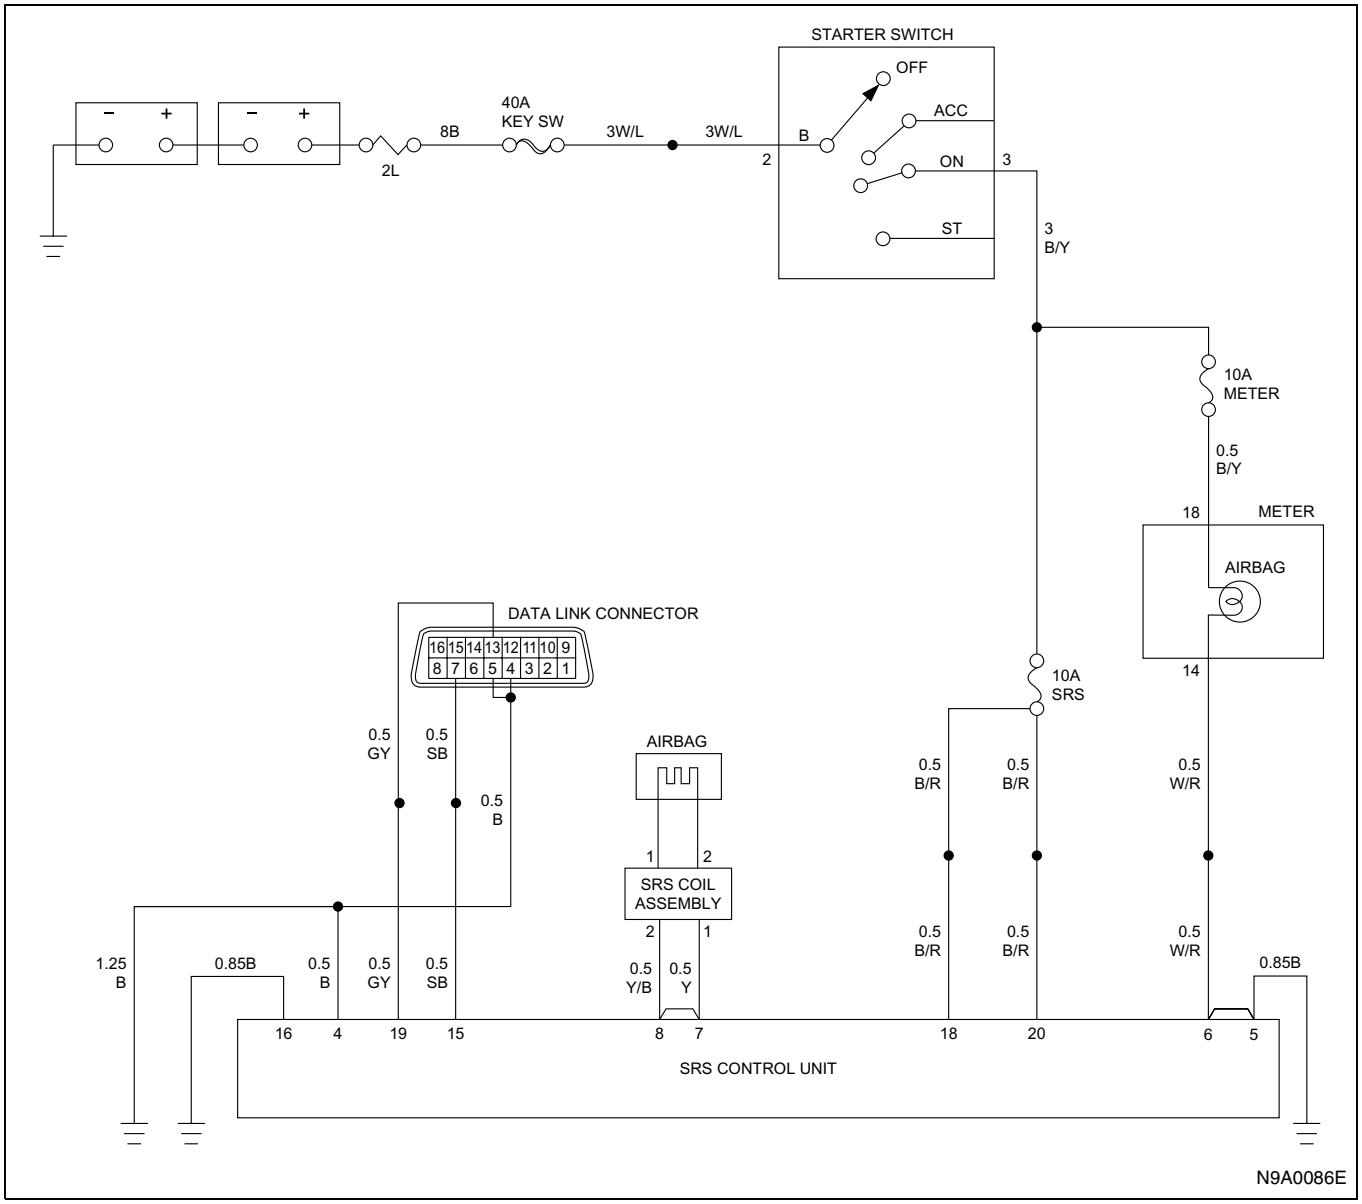
In the situations that the trouble appears intermittently, it may be caused by short circuit in the SRS airbag deployment circuit, or function fault in the SRS airbag or in the shorting clip of SRS coil assembly which requires parts replacement.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	1. When measurement is required in this chart, use 5-8840-0366-0 DMM and appropriate terminal adapter in 5-8840-0385-0 Connector test adapter kit. 2. Using the data list function of Tech 2, read the resistance in SRS airbag deployment circuit and record it. Is the resistance in airbag deployment circuit less than the specified value?	2.1Ω	Go to Step3	Go to Chart A SRS control unit function check.
3	1. Turn the starter switch to OFF. 2. Check the 2-pole connector (yellow) of SRS coil assembly located in the lower portion of steering column for proper connection. Is the 2-pole connector connected properly?	—	Go to Step4	Connect the 2-pole connector of SRS coil assembly properly.Go to Step8
4	1. Remove the 2-pole connector (yellow) of SRS coil assembly located in the lower portion of steering column for inspection. 2. If it is normal, reconnect the 2-pole connector of SRS coil assembly properly. 3. Turn the starter switch to ON. Is DTC 22 detected as current trouble?	—	Go to Step5	Go to Step8
5	1. Turn the starter switch to OFF. 2. Remove the 2-pole connector (yellow) of SRS coil assembly located in the lower portion of steering column. 3. Connect the 5-8840-2421-0 SRS substitute load and an appropriate terminal adapter in 5-8840-0385-0 Connector test adapter kit to the SRS harness side connector which connects to SRS coil assembly. 4. Turn the starter switch to ON. Is DTC 22 detected as current trouble?	—	Go to Step6	Go to Step7
6	1. Turn the starter switch to OFF. 2. Resistance of all circuit in the SRS airbag deployment circuit is decreasing. 3. Inspect the SRS airbag deployment circuit and SRS control unit connector terminals “7” and “8”, and use high-resolution resistance meter mode of 5-8840-0366-0 DMM to detect the cause. Is the trouble detected?	—	Replace the SRS harness.Go to Step8	Go to Chart A SRS control unit function check.

Step	Action	Value	YES	NO
7	1. Turn the starter switch to OFF. 2. Remove the 5-8840-2421-0 SRS substitute load from SRS coil assembly harness connector. 3. Connect the 5-8840-2421-0 SRS substitute load to the upper portion of steering column. 4. Reconnect the SRS coil assembly harness connector to the lower portion of steering column. 5. Turn the starter switch to ON. Is DTC 22 detected as current trouble?	—	Turn the starter switch to OFF. Replace the SRS coil assembly by referring to “SRS Coil Assembly” in SRS section. Go to Step8	Turn the starter switch to OFF. Replace the SRS airbag. Go to Step8
8	1. Reconnect all the parts, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Check the repair.	Go to Step8

DTC: 24 SRS Airbag Deployment Circuit is Shorted to Ground

Outline



Description of Circuit

Turn the starter switch to “ON”. SRS control unit performs the tests to diagnose critical function fault in the SRS control unit. Upon completion of the tests, when the results are pass, “Ignition” voltage and deployment circuit voltage will be measured to check they are within the normal range. SRS control unit detects ground short circuit in the SRS airbag circuit by monitoring the voltage of “Airbag low” terminal “8”.

Condition when DTC is Set

When “Ignition” is within the normal operational voltage. If the voltage of “Airbag low” is less than the specified value, the DTC 24 is set.

Action to be Taken

SRS control unit turns the “SRS” warning lamp ON and set the DTC 24.

Condition when DTC is Cleared

When the voltage of “Airbag low” terminal goes back to more than the specified value.

Description of DTC Chart Test

Numbers below indicate step numbers in the diagnostic chart.
2. This test is to check if the location of function fault is up to the 2-pole connector (yellow) located in the lower portion of steering column.
3. This test is to check if the location of function fault is in the SRS airbag deployment circuit.
4. This test is to check if the location of function fault is in the SRS airbag deployment circuit.
5. This test is to check if the location of function fault is in the SRS coil assembly or SRS airbag.

Point of Diagnosis

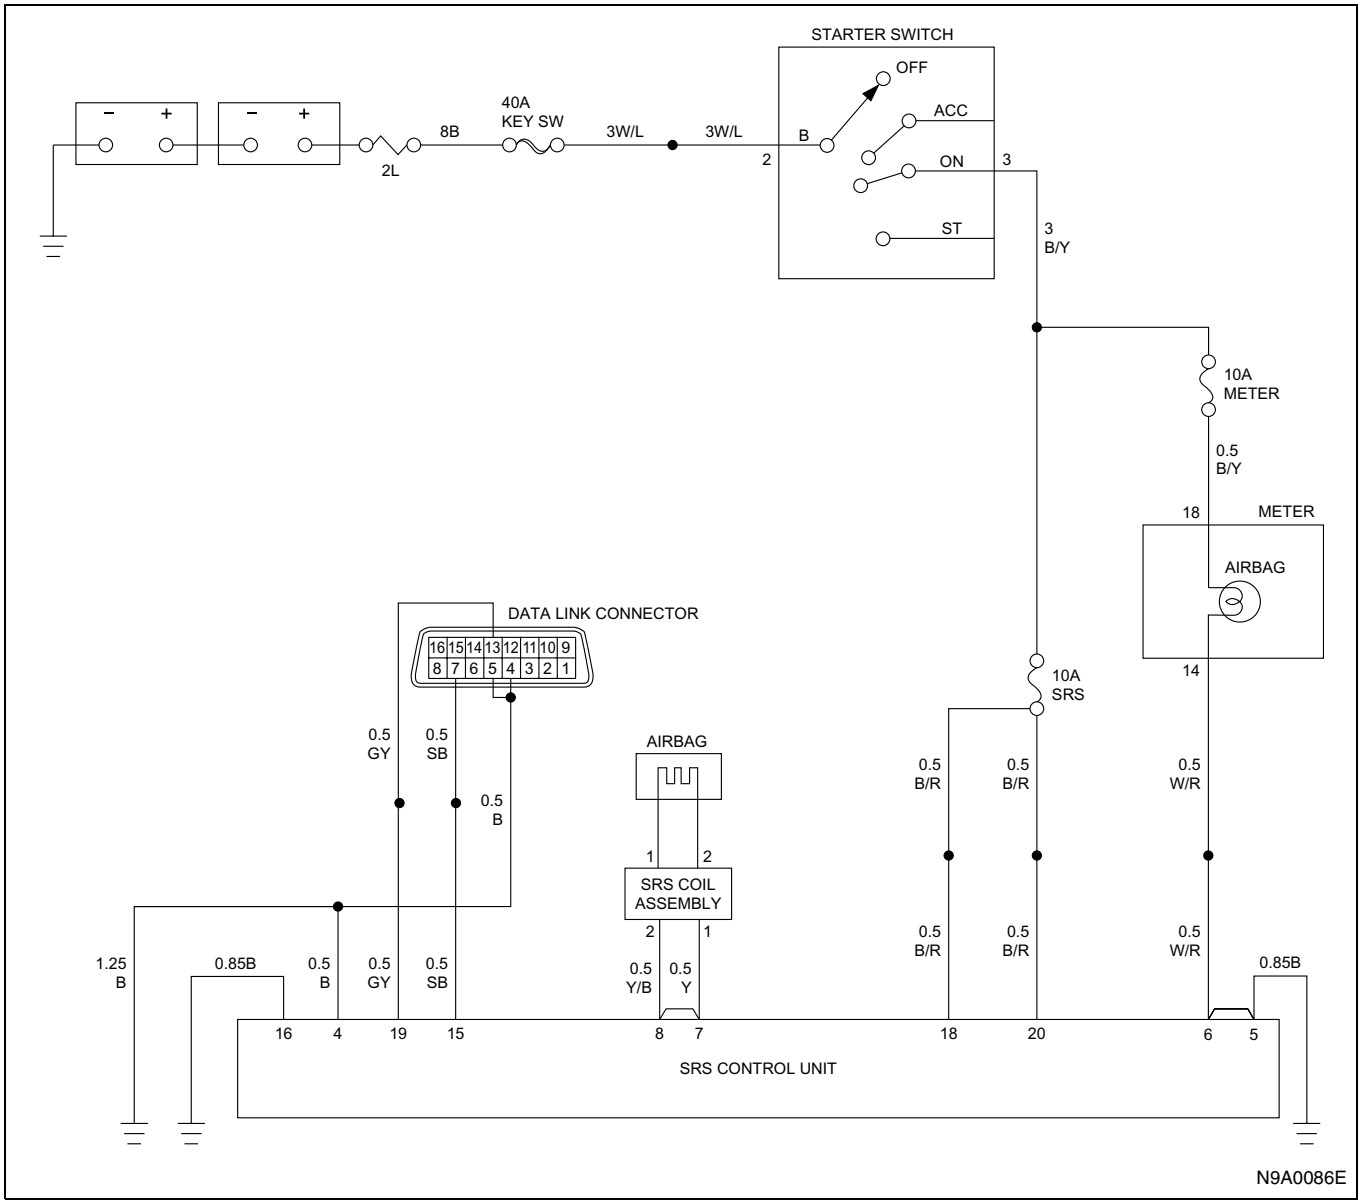
In the situations that the trouble appears intermittently, it may be caused by ground short circuit in the SRS airbag circuit.
Carefully check the SRS airbag deployment circuit for wire breakage or exposed wire.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	1. When measurement is required in this chart, use 5-8840-0366-0 DMM and appropriate terminal adapter in 5-8840-0385-0 Connector test adapter kit. 2. Turn the starter switch to OFF. 3. Remove the 2-pole connector (yellow) of SRS coil assembly located in the lower portion of steering column. 4. Connect the 5-8840-2421-0 SRS substitute load to SRS harness side connector which connects to SRS coil assembly. 5. Turn the starter switch to ON. Is DTC 24 detected as current trouble?	—	Go to Step3	Go to Step5
3	1. Turn the starter switch to OFF. 2. Remove the SRS control unit. 3. Remove the 5-8840-2421-0 SRS substitute load. 4. Measure the resistance between the SRS control unit harness connector terminals “7” and “5” (ground). Does the 5-8840-0366-0 DMM indicate “OL” (infinity)?	—	Go to Step4	Replace the SRS harness.Go to Step6
4	Measure the resistance between the SRS control unit harness connector terminals “8” and “5” (ground). Does the 5-8840-0366-0 DMM indicate “OL” (infinity)?	—	Go to Chart A SRS control unit function check.	Replace the SRS harness.Go to Step6

Step	Action	Value	YES	NO
5	1. Turn the starter switch to OFF. 2. Remove the 5-8840-2421-0 SRS substitute load from SRS coil assembly harness connector. 3. Connect the 5-8840-2421-0 SRS substitute load and an appropriate terminal adapter in the 5-8840-0385-0 Connector test adapter kit to the SRS airbag harness connector located in the upper portion of steering column. 4. Reconnect the SRS coil assembly harness connector to the lower portion of steering column. 5. Turn the starter switch to ON. Is DTC 24 detected as current trouble?	—	Turn the starter switch to OFF. Replace the SRS coil assembly by referring to “SRS Coil Assembly” in SRS section. Go to Step6	Turn the starter switch to OFF. Replace the SRS airbag. Go to Step6
6	1. Reconnect all the parts, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Check the repair.	Go to Step6

DTC: 25 SRS Airbag Deployment Circuit is Shorted to Ignition Voltage

Outline



Description of Circuit

Turn the starter switch to “ON”. SRS control unit performs the tests to diagnose critical function fault in the SRS control unit. Upon completion of the tests, when the results are pass, “Ignition” voltage and deployment circuit voltage will be measured to check they are within the normal range. SRS control unit detects battery voltage short circuit in the SRS airbag circuit by monitoring the voltage of “Airbag low” terminal “8”.

Condition when DTC is Set

When “Ignition” is within the normal operational voltage but the voltage of “Airbag low” exceeds the specified value, the DTC 25 is set.

Action to be Taken

SRS control unit turns the “SRS” warning lamp ON and set the DTC 25.

Condition when DTC is Cleared

When this function fault disappears after SRS control unit replacement.

Description of DTC Chart Test

Numbers below indicate step numbers in the diagnostic chart.
2. This test is to check if the location of function fault is in the SRS airbag deployment circuit.
3. This test is to check if the location of function fault is in the SRS airbag deployment circuit.
4. This test is to check if the location of function fault is in the SRS coil.
5. This test is to check if the location of function fault is in the SRS coil assembly or SRS airbag.

Point of Diagnosis

In the situations that the trouble appears intermittently, it may be caused by battery voltage short circuit in the SRS airbag circuit.
Carefully check the SRS airbag deployment circuit for wire breakage or exposed wire. If the lead wire and SRS coil assembly of SRS airbag are damaged, the part must be replaced. To prevent the replaced SRS control unit from damage, carefully check the SRS airbag deployment circuit including SRS coil assembly and SRS airbag.

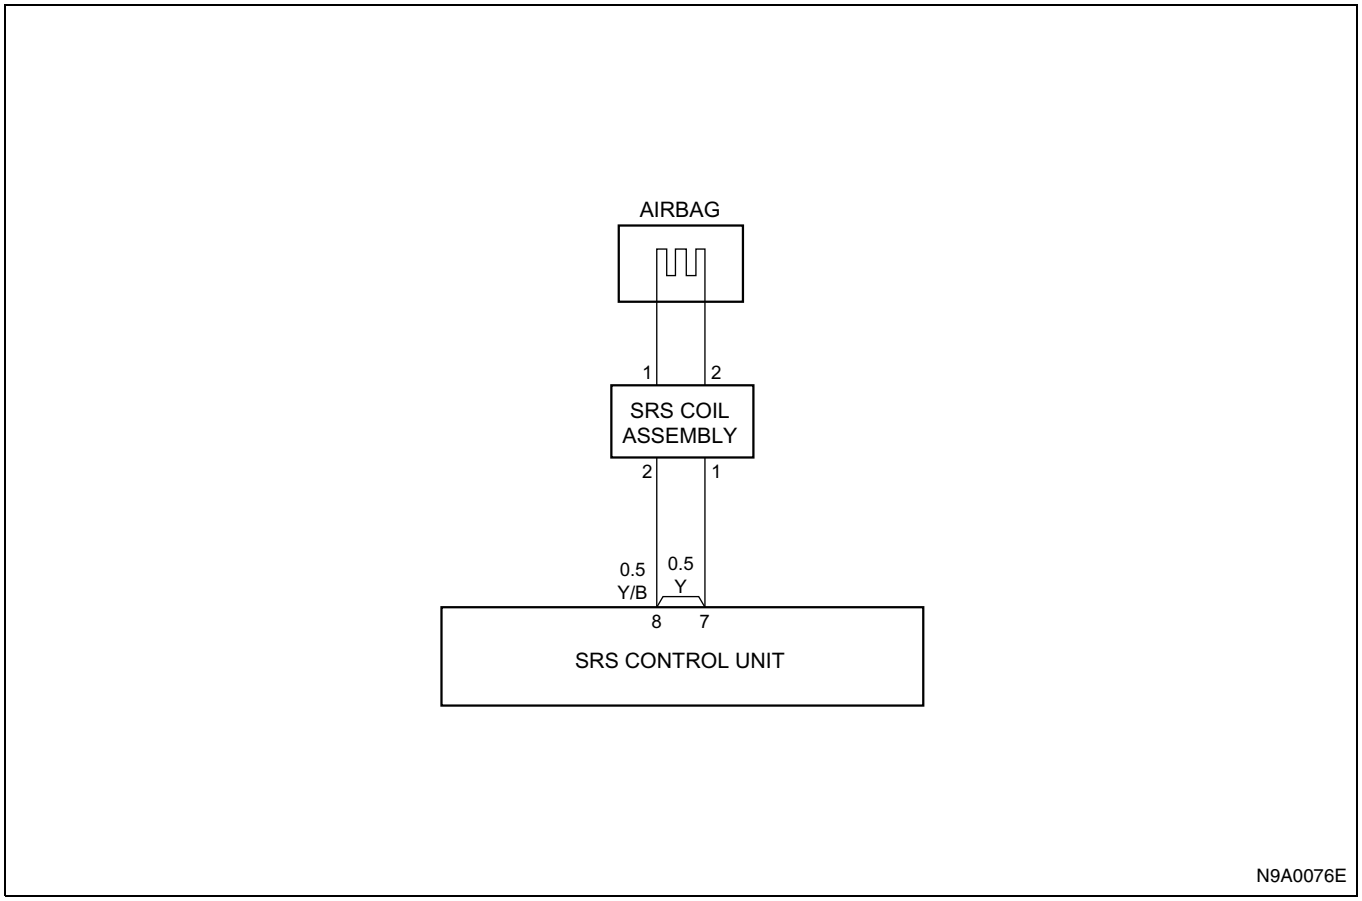
Caution:
When this DTC is set, all the SRS system parts (SRS control unit, airbag, etc.) must be replaced. In addition, This DTC cannot be cleared. Be sure to disconnect the battery cable before replacement, otherwise it will result malfunction of replaced SRS system parts or cause battery short circuit.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	1. When measurement is required in this chart, use 5-8840-0366-0 DMM. 2. Turn the starter switch to OFF. 3. Remove the 2-pole connector (yellow) of SRS coil assembly located in the lower portion of steering column. 4. Remove the SRS control unit. 5. Measure the resistance between the SRS control unit harness connector terminals “8” and “20” (ignition). Does the 5-8840-0366-0 DMM indicate “OL” (infinity)?	—	Go to Step3	Replace the SRS harness. Go to Step6
3	Measure the resistance between the SRS control unit harness connector terminals “7” and “20” (ignition). Does the 5-8840-0366-0 DMM indicate “OL” (infinity)?	—	Go to Step4	Replace the SRS harness. Go to Step6
4	1. Turn the starter switch to OFF. 2. Remove the 2-pole connector (yellow) of SRS airbag harness located in the upper portion of steering column. 3. Reconnect the SRS coil assembly harness connector to the lower portion of steering column. 4. Measure the resistance between the SRS control unit harness connector terminals “8” and “20” (ignition). Does the 5-8840-0366-0 DMM indicate “OL” (infinity)?	—	Go to Step5	Replace the coil assembly.Go to Step7

Step	Action	Value	YES	NO
5	Measure the resistance between the SRS control unit harness connector terminals “7” and “20” (ignition). Does the 5-8840-0366-0 DMM indicate “OL” (infinity)?	—	Replace the driver’s airbag assembly. Go to Step6	Replace the coil assembly.Go to Step6
6	Reconnect all the parts, and check that those are installed properly. Are all the parts installed properly?	—	Turn the starter switch to OFF. Replace the SRS control unit. Go to Step7	Go to Step6
7	1. Reconnect all the parts, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Check the repair.	Go to Step7

DTC: 26 SRS Airbag Deployment Circuit is Open

Outline



Description of Circuit

Turn the starter switch to “ON”. SRS control unit performs the tests to diagnose critical function fault in the SRS control unit. Upon completion of the tests, when the results are pass, “Ignition” voltage and deployment circuit voltage will be measured to check they are within the normal range. SRS control unit detects open circuit in the SRS airbag circuit by monitoring the voltage of “Airbag low” terminal.

Condition when DTC is Set

When the voltage of “Airbag low” terminal is within a certain range.

Action to be Taken

SRS control unit turns the “SRS” warning lamp ON and set the DTC 26.

Condition when DTC is Cleared

When the voltage of “Airbag low” terminal is out of a certain range.

Description of DTC Chart Test

Numbers below indicate step numbers in the diagnostic chart.
2. This test is to check if the 2-pole connector (yellow) located in the lower portion of steering column is properly connected.
3. This test is to check the 2-pole connector (yellow) located in the lower portion of steering column for secure contact and/or corrosion.
4. This test is to check if the location of function fault is up to the 2-pole connector (yellow) located in the lower portion of steering column.
5. This test is to check if the wire is open.
6. This test is to check if the location of function fault is in the SRS coil assembly or SRS airbag.

Point of Diagnosis

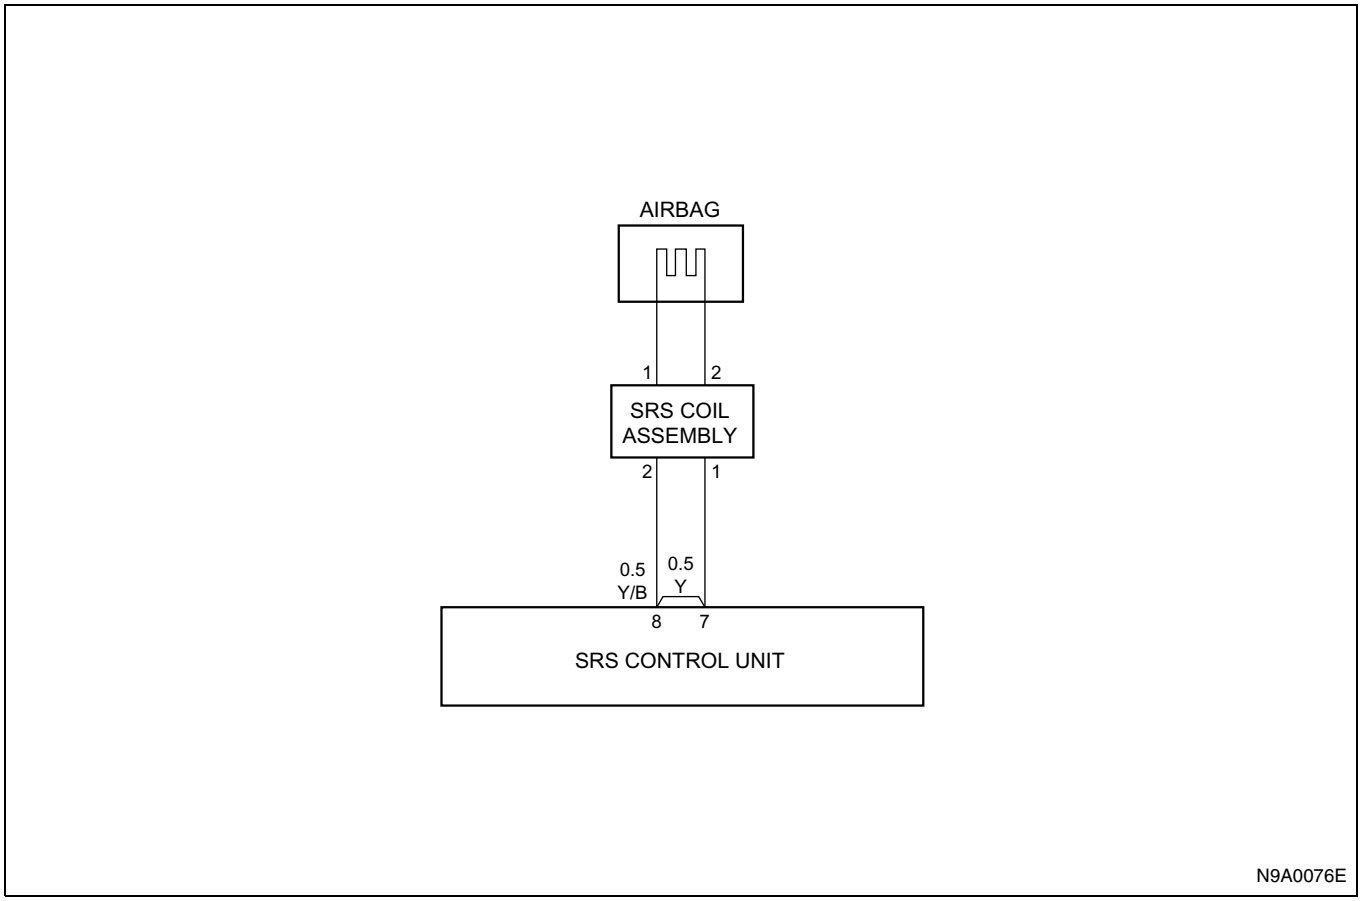
In the situations that the trouble display appears intermittently, it may be caused by improper connection between 2-pole connector terminals “1” and “2” of SRS airbag harness located in the upper portion of steering column, between 2-pole connector terminals “1” and “2” of SRS coil assembly harness, between SRS control unit terminals “7” and “8”, or open circuit in the SRS airbag deployment circuit.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	1. When measurement is required in this chart, use 5-8840-0366-0 DMM and appropriate terminal adapter in 5-8840-0385-0 Connector test adapter kit. 2. Turn the starter switch to OFF. 3. Check the 2-pole connector (yellow) of SRS coil assembly located in the lower portion of steering column for proper connection. Is the 2-pole connector (yellow) connected properly?	—	Go to Step3	Connect the 2-pole connector of SRS coil assembly properly.Go to Step6
3	1. Remove the 2-pole connector (yellow) of SRS coil assembly located in the lower portion of steering column for inspection. 2. If it is normal, reconnect the 2-pole connector of SRS coil assembly properly. 3. Turn the starter switch to ON. Is DTC 26 detected as current trouble?	—	Go to Step4	Go to Step7
4	1. Turn the starter switch to OFF. 2. Remove the 2-pole connector (yellow) of SRS coil assembly located in the lower portion of steering column. 3. Connect the 5-8840-2421-0 SRS substitute load and an appropriate terminal adapter in 5-8840-0385-0 Connector test adapter kit to the SRS harness side connector which connects to SRS coil assembly. 4. Turn the starter switch to ON. Is DTC 26 detected as current trouble?	—	Go to Step5	Go to Step6
5	1. Turn the starter switch to OFF. 2. Driver’s airbag deployment circuit is open. 3. Inspect the SRS airbag deployment circuit and SRS control unit connector terminals “7” and “8”, and use high-resolution resistance meter mode of DMM to detect the cause. Is the trouble detected?	—	Replace the SRS harness.Go to Step7	Go to Chart A SRS control unit function check.

Step	Action	Value	YES	NO
6	1. Turn the starter switch to OFF. 2. Remove the 5-8840-2421-0 SRS substitute load from SRS coil assembly harness connector. 3. Connect the 5-8840-2421-0 SRS substitute load to the upper portion of steering column. 4. Reconnect the SRS coil assembly harness connector to the lower portion of steering column. 5. Turn the starter switch to ON. Is DTC 26 detected as current trouble?	—	Turn the starter switch to OFF. Replace the SRS coil assembly by referring to “SRS Coil Assembly” in SRS section. Go to Step7	Turn the starter switch to OFF. Replace the SRS airbag. Go to Step7
7	1. Reconnect all the parts, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Repeat the “SRS system check”.	Go to Step7

DTC: 51 SRS Airbag Deployment Current Had Output

Outline



Description of Circuit

A sensor is equipped to this circuit to convert the impact applied to SRS control unit into an electrical signal.
The electrical signal generated at this time will be processed in the SRS control unit to compare with the value stored in the memory. When the generated signal exceeds the setting value, SRS control unit sends current to the SRS airbag assembly for deployment, and set the DTC 51.

Condition when DTC is Set

When the control unit detects the front collision over certain degree of impact.

Action to be Taken

SRS control unit turns the “SRS” warning lamp ON, record the “collision data”, and set the DTC 51.

Condition when DTC is Cleared

When SRS control unit is replaced.

Description of DTC Chart Test

Numbers below indicate step numbers in the diagnostic chart.
2. In case the DTC 51 appears even when the collision did not result in SRS airbag assembly deployment, the DTC 51 may have been set erroneously.
3. In case the DTC 51 appears without any deformation caused by front collision, the DTC may have been set erroneously.

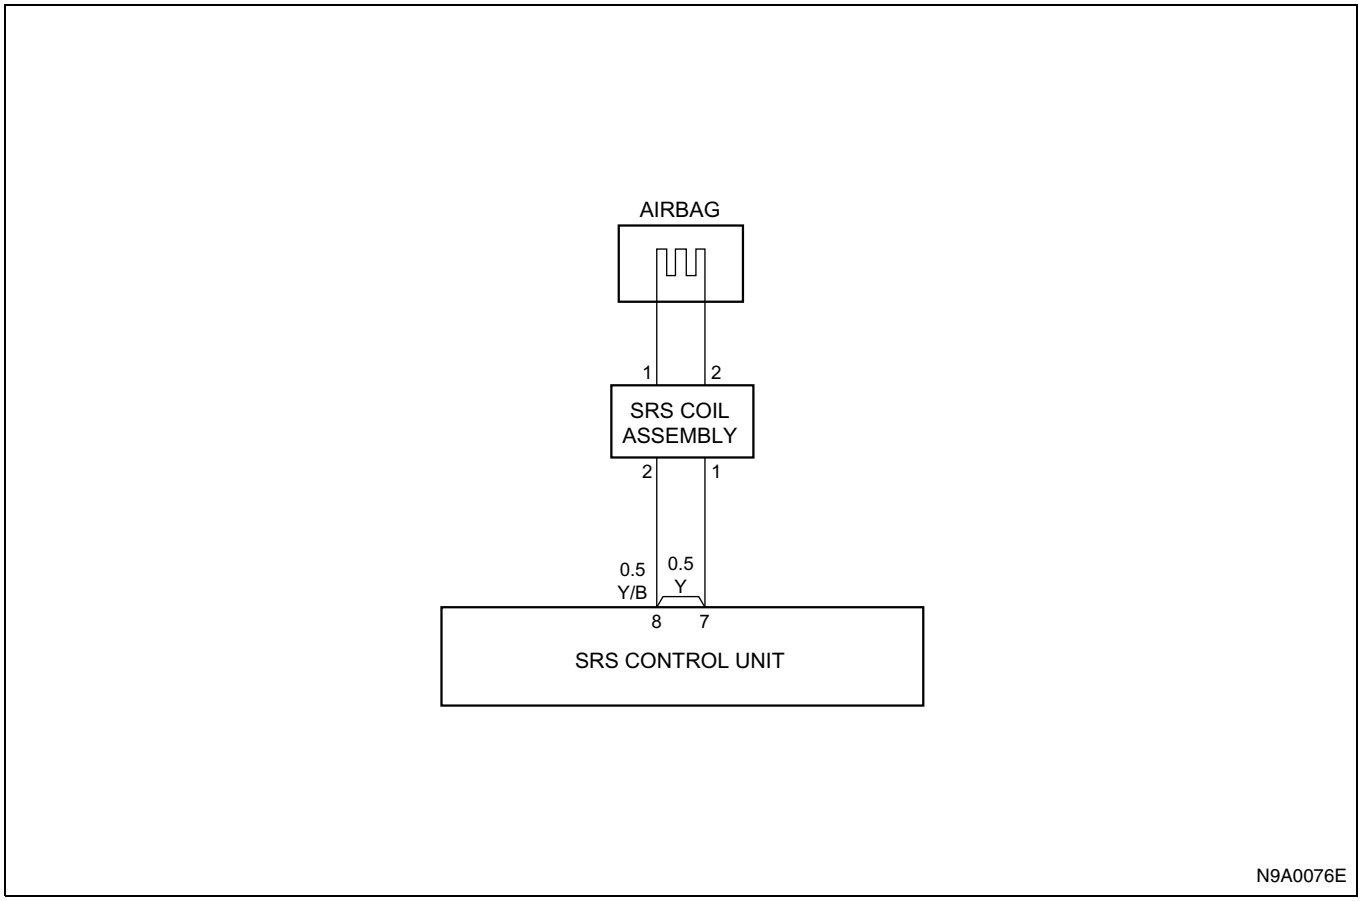
WARNING:
DURING SERVICE WORK, BE CAREFUL NOT TO TAP OR SHAKE THE SRS CONTROL UNIT. ALSO, FAILURE TO INSTALL THE SRS CONTROL UNIT TO VEHICLE PROPERLY MAY LEAD TO MALFUNCTION OF THE UNIT WHEN THE STARTER SWITCH IS TURNED TO ON. THIS MAY RESULT IN INJURY DUE TO SUDDEN DEPLOYMENT OF SRS AIRBAG.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.

Step	Action	Value	YES	NO
2	Turn the starter switch to OFF. Is the airbag assembly deployed?	—	Inspect according to “repair and inspection required after collision” in this section. Clear the DTC. Perform “SRS system check”.	Go to Step3
3	Check front area of the vehicle for deformation caused by front collision. Is any deformation found?	—	Replace the parts, and inspect according to “repair and inspection required after collision” in this section. Clear the DTC. Perform “SRS system check”.	Turn the starter switch to OFF. Replace the SRS control unit. Reconnect all the SRS system parts, and check that those are installed properly. Perform “SRS system check”.

DTC: 53 Specific Trouble when SRS Airbag Deployment Current Had Output

Outline



Description of Circuit

A sensor is equipped to this circuit to convert the impact applied to SRS control unit into an electrical signal.
The electrical signal generated at this time will be processed in the SRS control unit to compare with the value stored in the memory. When the generated signal exceeds the setting value, SRS control unit sends current to the airbag assembly for deployment, and set the DTC 53 and 51.

Condition when DTC is Set

When the SRS control unit detects the front collision over certain degree of impact.

Action to be Taken

SRS control unit turns the “SRS” warning lamp ON, record the “collision data”, and set the DTC.

Condition when DTC is Cleared

When SRS control unit is replaced.

Description of DTC Chart Test

Numbers below indicate step numbers in the diagnostic chart.
2. In case the DTC 53 appears even when the collision did not result in SRS airbag assembly deployment, the DTC 53 may have been set erroneously.
3. In case the DTC 53 appears without any deformation caused by front collision, the DTC may have been set erroneously.

Point of Diagnosis

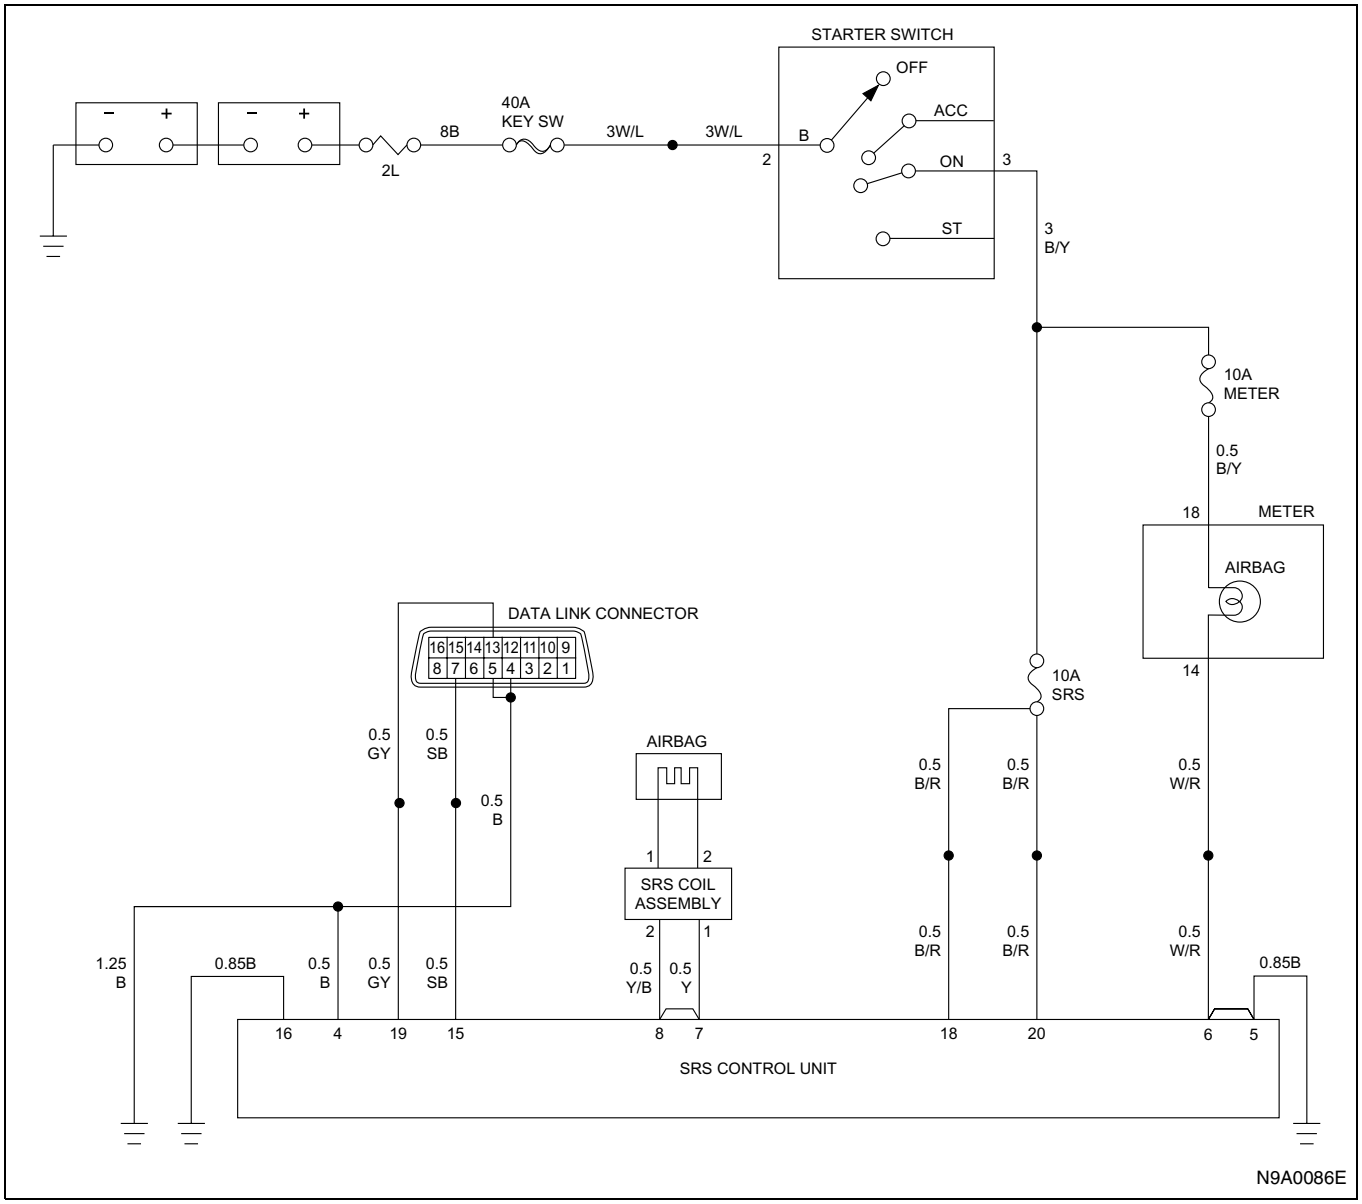
When the DTC 53 is set, more than one DTC is added to be set. The function faults which set the DTCs (expect DTC 71) must be corrected before new SRS control unit installation, in order to prevent the DTCs to be set again.

WARNING:
DURING SERVICE WORK, BE CAREFUL NOT TO TAP OR SHAKE THE SRS CONTROL UNIT. ALSO, FAILURE TO INSTALL THE SRS CONTROL UNIT TO VEHICLE PROPERLY MAY LEAD TO MALFUNCTION OF THE UNIT WHEN THE STARTER SWITCH IS TURNED TO ON. THIS MAY RESULT IN INJURY DUE TO SUDDEN DEPLOYMENT OF SRS AIRBAG.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	Turn the starter switch to OFF. Is the airbag assembly deployed?	—	Inspect according to “repair and inspection required after collision” in this section. Clear the DTC. Perform “SRS system check”.	Go to Step3
3	Check front area of the vehicle for deformation caused by front collision. Is any deformation found?	—	Replace the parts, and inspect according to “repair and inspection required after collision” in this section. Clear the DTC. Perform “SRS system check”.	Turn the starter switch to OFF. Replace the SRS control unit. Reconnect all the SRS system parts, and check that those are installed properly. Perform “SRS system check”.

DTC: 54 Deployment Output by Onboard Deployment System Communication

Outline



Description of Circuit

DTC 54 indicates that the SRS airbag has been deployed by SRS airbag onboard deployment system.

Condition when DTC is Set

When SRS airbag has been deployed by SRS airbag onboard deployment system.

Condition when DTC is Cleared

This DTC code cannot be cleared. Replace the SRS control unit.

Caution:

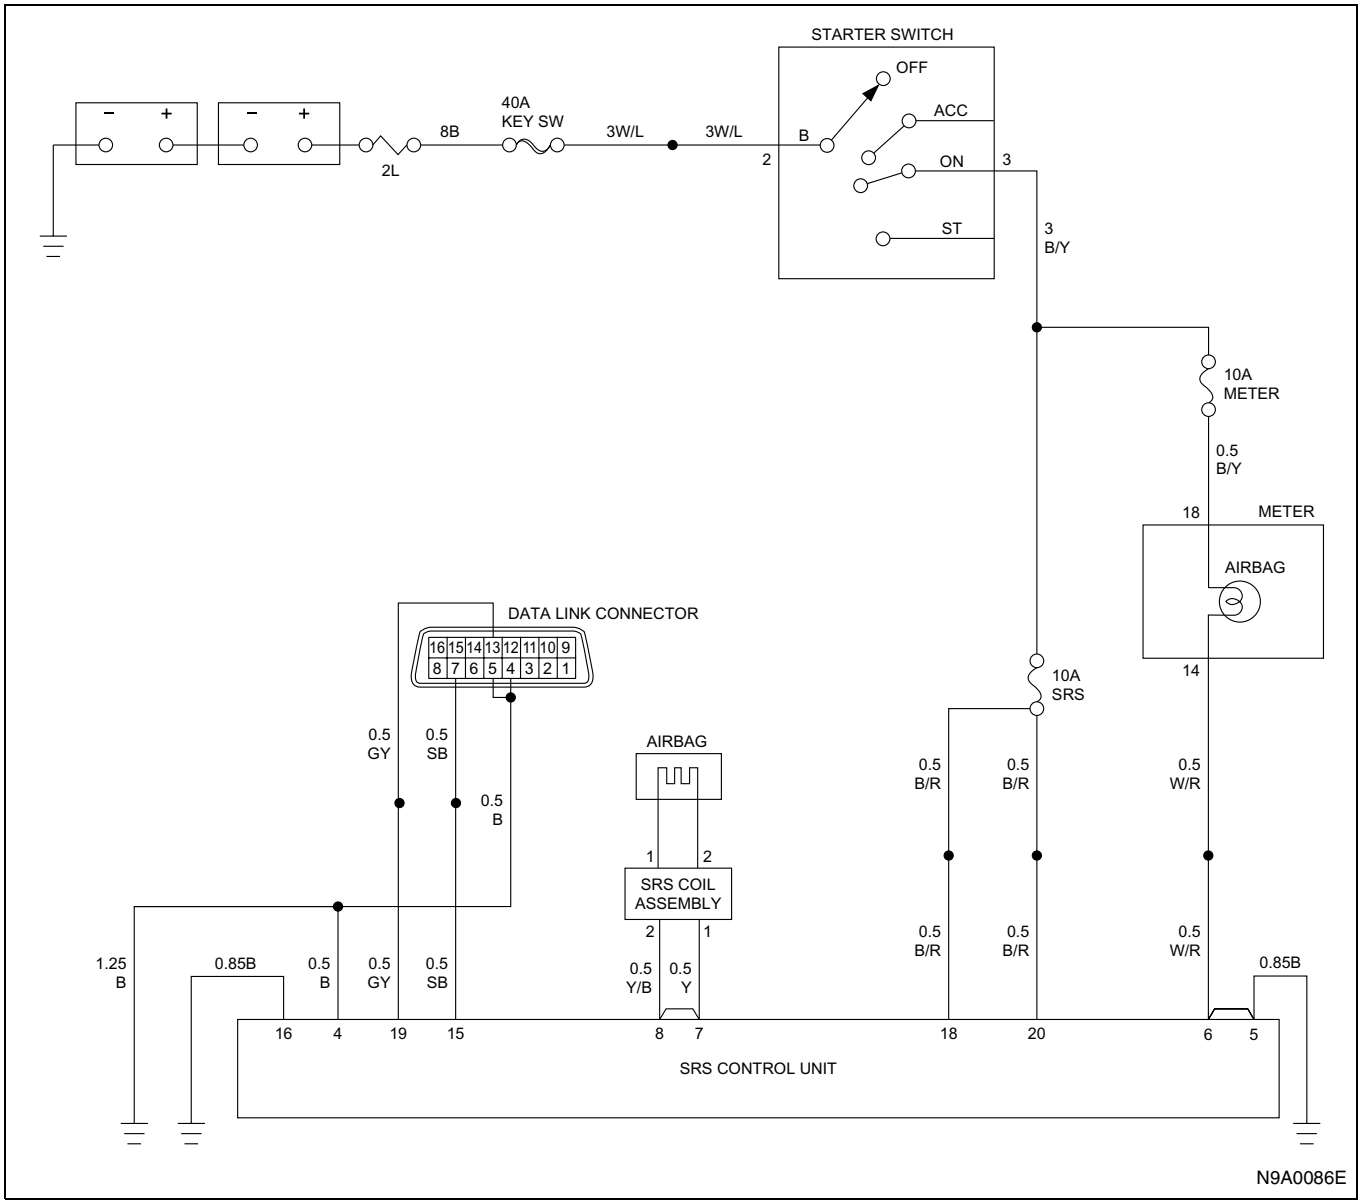
When this DTC is set, all the SRS system parts (SRS control unit, airbag, etc.) must be replaced. In addition, This DTC cannot be cleared. Be sure to disconnect the battery cable before replacement, otherwise it will result malfunction of replaced SRS system parts or cause battery short circuit.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	Is the DTC 54 detected?	—	Go to Step3	Go to Step1

Step	Action	Value	YES	NO
3	Replace the SRS system parts. Is the procedure completed?	—	Check the repair.	—

DTC: 55 Vehicle Type Error

Outline



Description of Circuit

DTC 55 is set when unmatched SRS control unit or SRS harness installation is suspected.
Turn the starter switch to “ON”. SRS control unit reads the condition of vehicle type identification terminals 3, 4, 13, 14 for judgment.

Condition when DTC is Set

It is correct when the terminal 4 only is connected to ground. If the harness is proper, the DTC is set when unmatched SRS control unit is installed. Also, if the SRS control unit is proper, the DTC is set when unmatched harness is installed.

Action to be Taken

SRS control unit turns the “SRS” warning lamp blinking and set the DTC 55.

However, when both of SRS control unit and SRS harness are faulty, the DTC may not be set.

Condition when DTC is Cleared

When turning the starter switch to OFF with correct matching of SRS control unit and SRS harness.

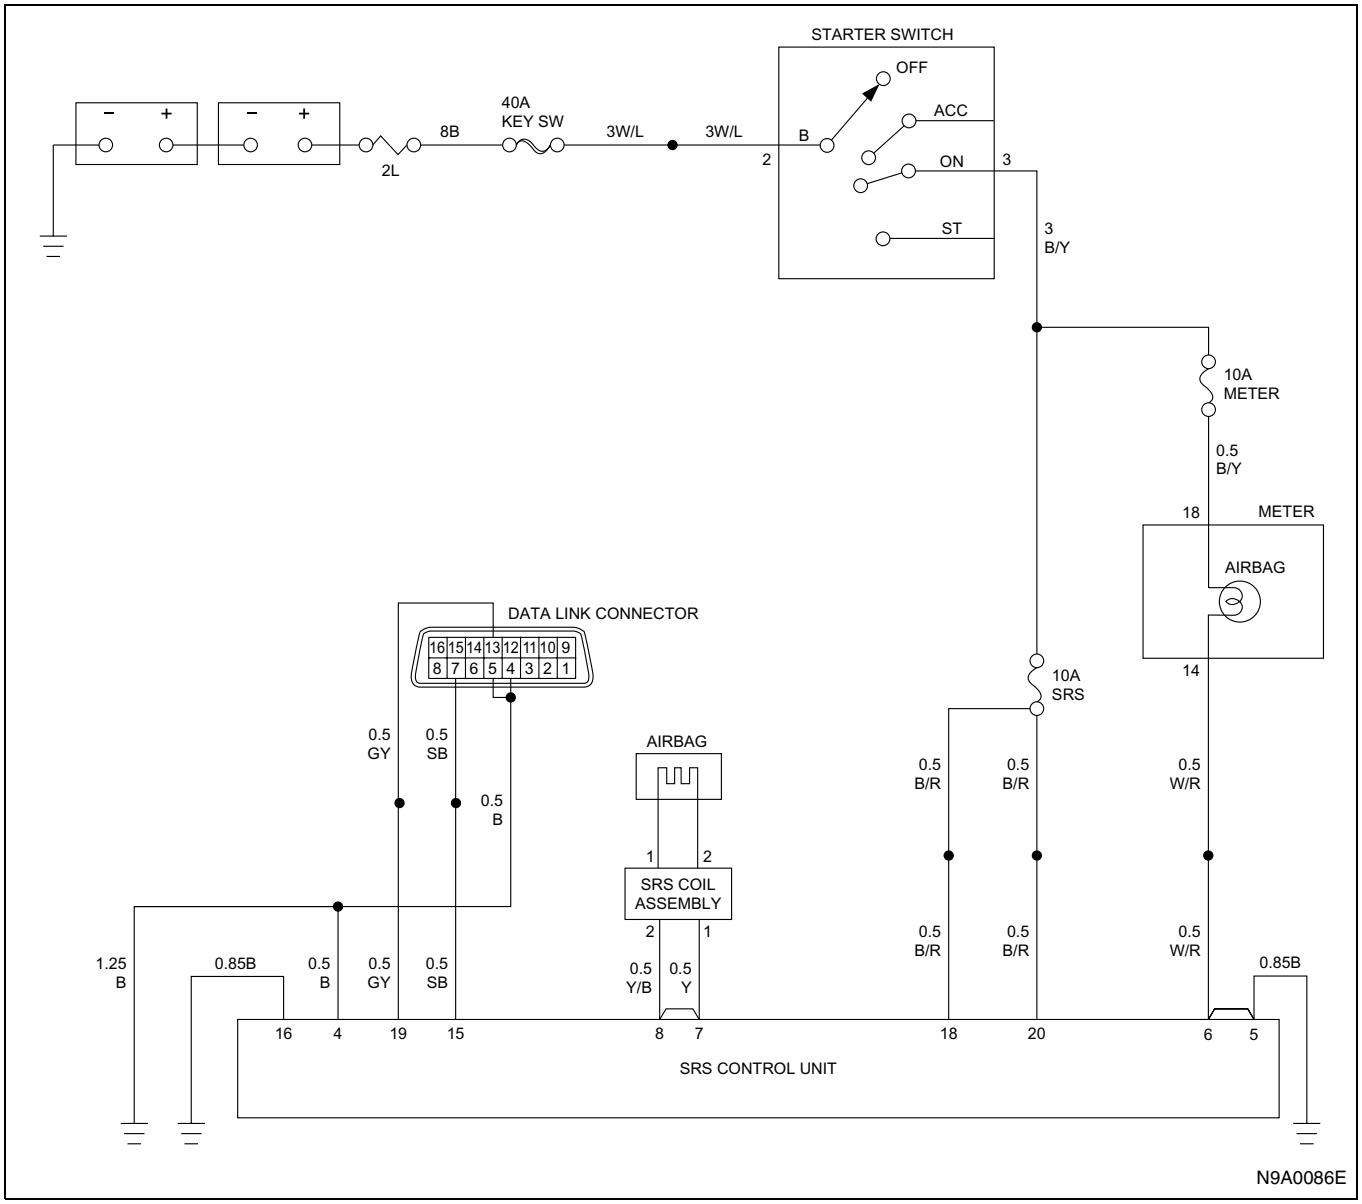
Point of Diagnosis

It is correct when the terminal 4 only is connected to ground. At first, make sure the SRS harness A3, A4, A13, A14 have no terminal.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	1. Turn the starter switch to OFF. 2. Remove the harness connector from SRS control unit. 3. Make sure the “3”, “4”, “13”, “14” of harness connector are in proper condition. Are the “3”, “4”, “13”, and “14” proper?	—	Replace the SRS control unit. Perform “SRS system check”.	Replace the SRS harness. Perform “SRS system check”.

DTC: 61 Warning lamp circuit trouble

Outline



Description of Circuit

Turn the ignition switch to “ON”. Battery voltage is applied to the “SRS” warning lamp and the “Ignition 1” input terminals “18” and “20”.
SRS control unit responds by blinking “SRS” warning lamp seven times. SRS control unit monitors lamp driver output by comparing output condition of the “SRS warning lamp” terminal “6” with the condition ordered to the microprocessor.
When the “Ignition 1” is within the specified range, and the output condition does not match with the condition ordered by the lamp driver, the DTC 61 is set.

Condition when DTC is Set

1. When no voltage is applied to the SRS control unit terminal “6” due to open circuit in the meter, burnt out bulb, or broken harness.
2. When the SRS warning lamp does not go off although the SRS control unit ordered to do so. This test is performed within 6 seconds after starter switch is “ON”.

Action to be Taken

SRS control unit sets the DTC 61, and the “SRS” warning lamp comes ON if its power source and ground line are normal.

Condition when DTC is Cleared

When turning the starter switch to OFF.

Description of Chart Test

2. Make sure the harness is not broken.
3. Detect if the warning lamp is faulty, and if the SRS control unit is faulty.

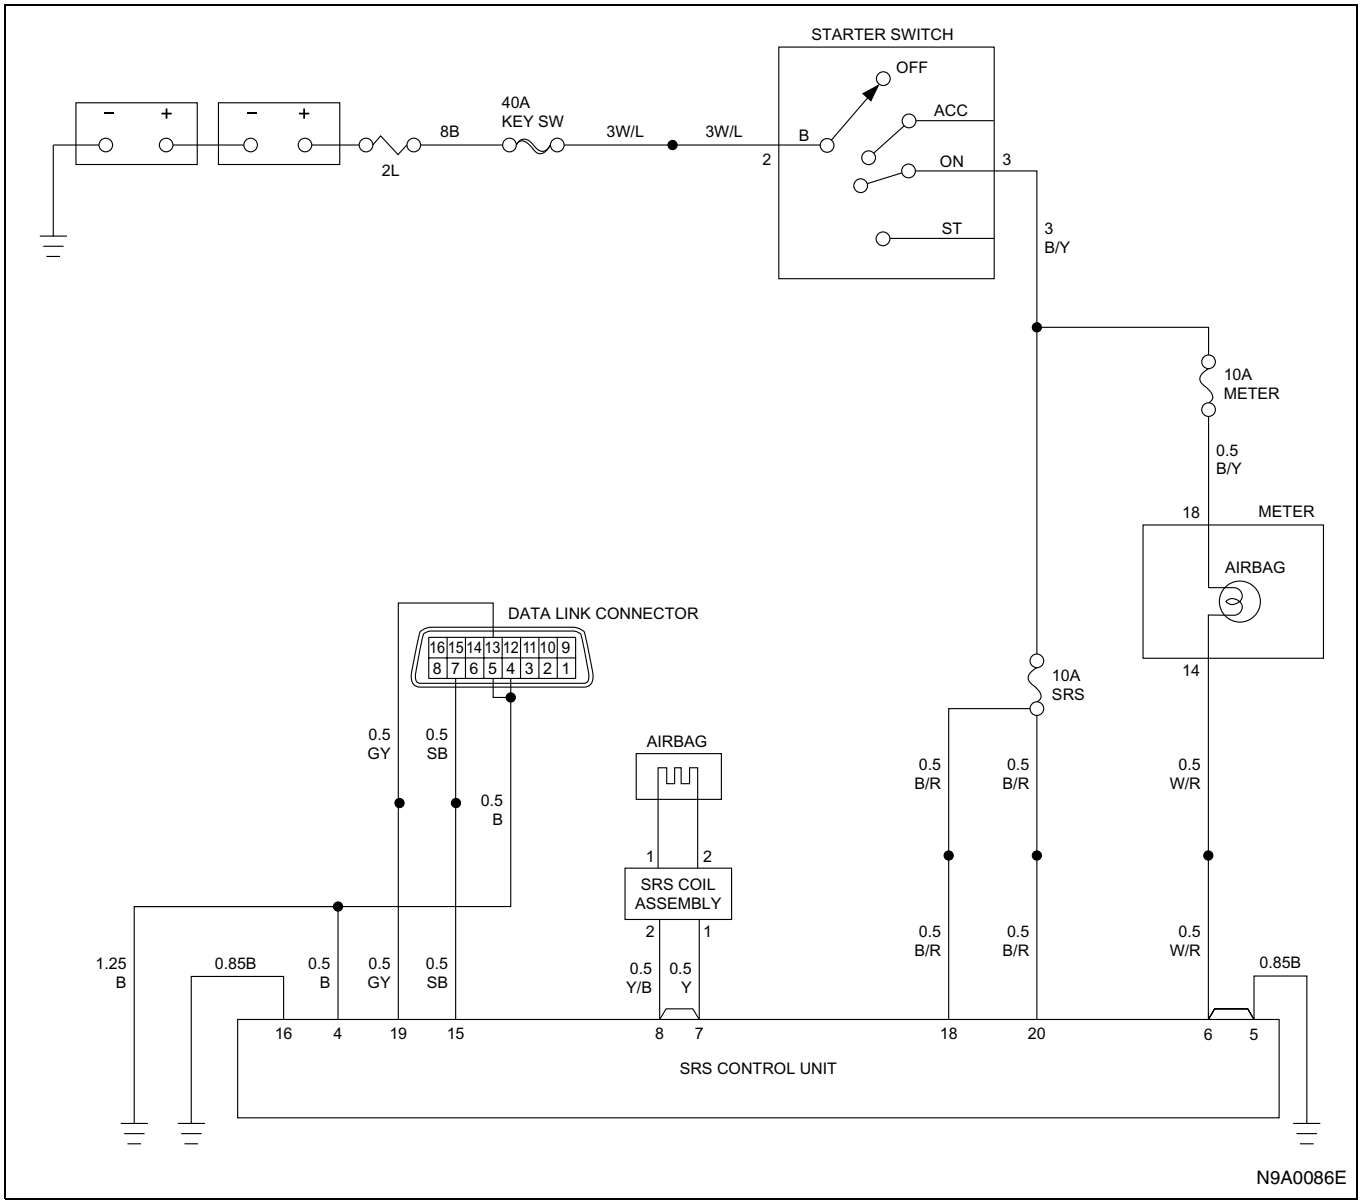
Point of diagnosis

Warning lamp comes on regardless of SRS control unit directly, and turns off when the SRS control unit sends current. Therefore, the warning lamp comes on even when the SRS control unit fuse is blown out if there is no other trouble.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	Turn the starter switch to OFF. Do warning lamps other than “SRS” operate properly?	—	Go to Step4	Go to Step3
3	Replace the meter assembly. Is this step completed?	—	Go to Step5	Go to Step3
4	1. Wiring is open between SRS control unit and SRS warning lamp, or it is shorted with body, or “SRS” warning lamp is blown out. 2. Find the trouble location. 3. Replace the SRS harness, if it has problem. Has the cause been detected and repaired?	—	Go to Step5	Go to Step4
5	1. Reconnect all the parts, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Check the repair.	Go to Step5

DTC: 63 Power Supply Voltage Failure

Outline



Description of Circuit

Turn the starter switch to “ON”. SRS control unit checks if the ignition voltage is in proper range.

Condition when DTC is Set

When ignition voltage is within or 10V to 18V for 30 seconds continuously.

Action to be Taken

SRS control unit turns the “SRS” warning lamp ON and set the DTC 63.

Condition when DTC is Cleared

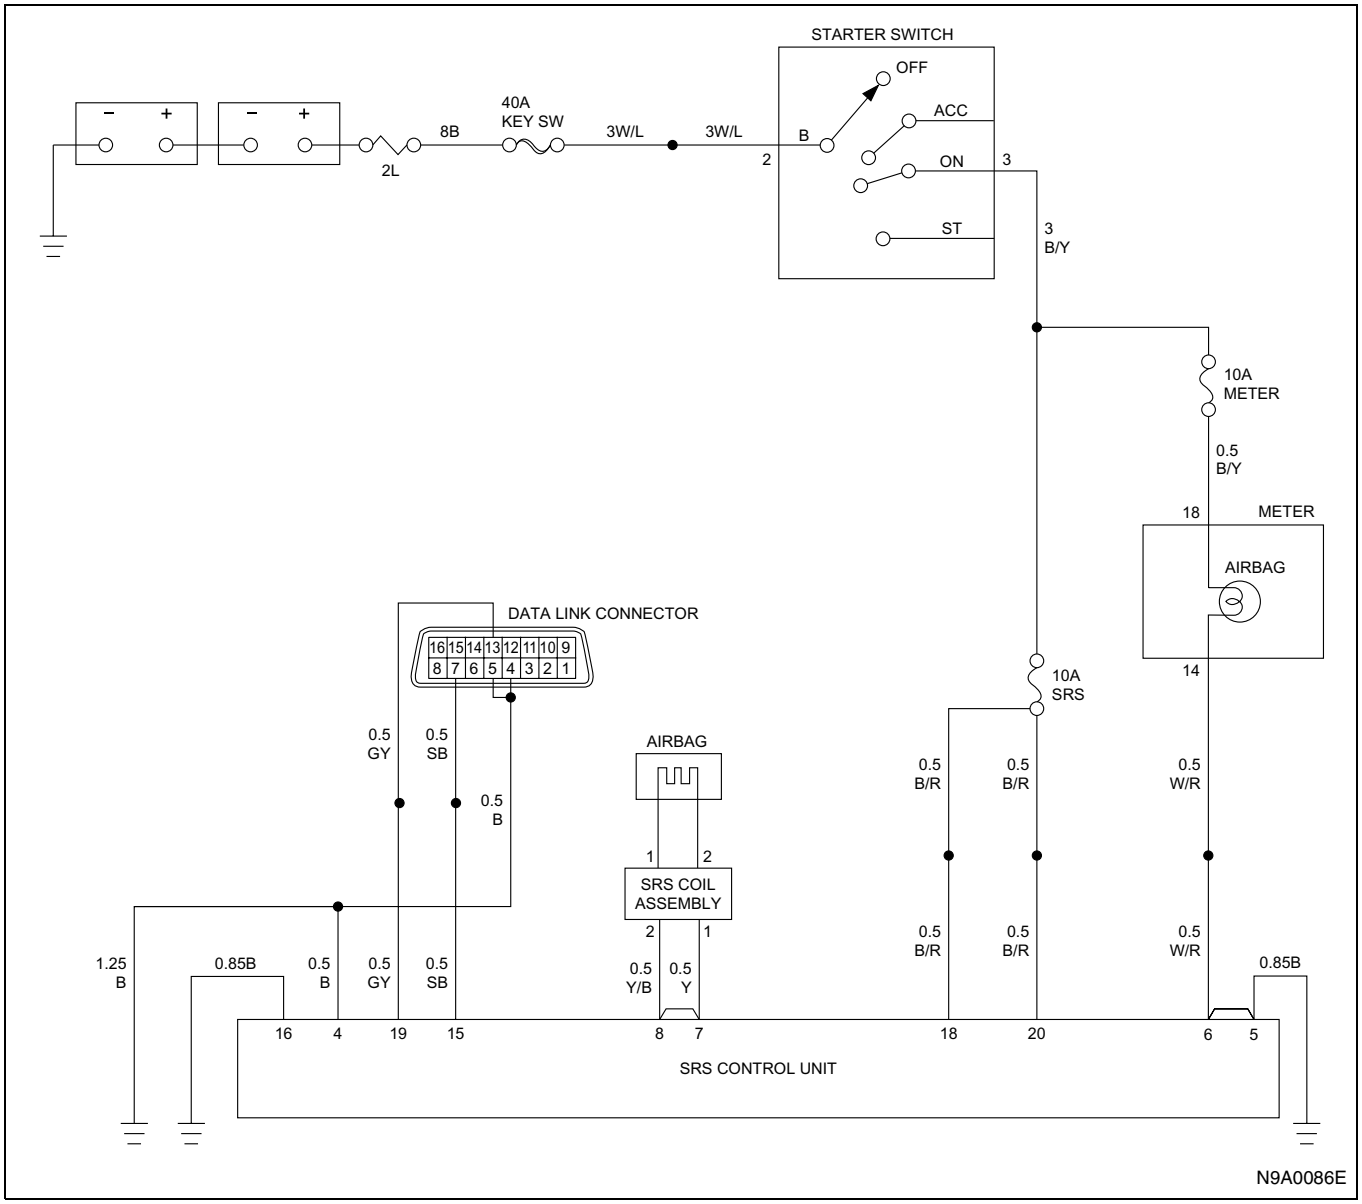
When ignition voltage goes back to more than 18V.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	Read the ignition voltage using Tech 2. Is the ignition voltage less than 18V?	—	Go to Step3	Go to Chart A SRS control unit function check.

Step	Action	Value	YES	NO
3	1. Turn the starter switch to OFF. 2. Check the battery voltage, specific gravity, and power supply system circuit. Correct if faulty. Is this step completed?	—	Go to Step4	Go to Step3
4	1. Reconnect all the parts, and check that those are installed properly. 2. Clear the DTC. Is this step completed?	—	Check the repair.	Go to Step4

DTC: 71 SRS Control Unit Internal Trouble

Outline



Description of Circuit

DTC 71 indicates possibility of function fault inside the SRS control unit.

Condition when DTC is Set

When the function fault is detected inside the SRS control unit.

Action to be Taken

SRS control unit turns the “SRS” warning lamp ON and set the DTC.

Condition when DTC is Cleared

This DTC code cannot be cleared. Replace the SRS control unit.

WARNING:
DURING SERVICE WORK, BE CAREFUL NOT TO TAP OR SHAKE THE SRS CONTROL UNIT. ALSO, FAILURE TO INSTALL THE SRS CONTROL UNIT TO VEHICLE PROPERLY MAY LEAD TO MALFUNCTION OF THE UNIT WHEN THE STARTER SWITCH IS TURNED TO ON. THIS MAY RESULT IN INJURY DUE TO SUDDEN DEPLOYMENT OF SRS AIRBAG.

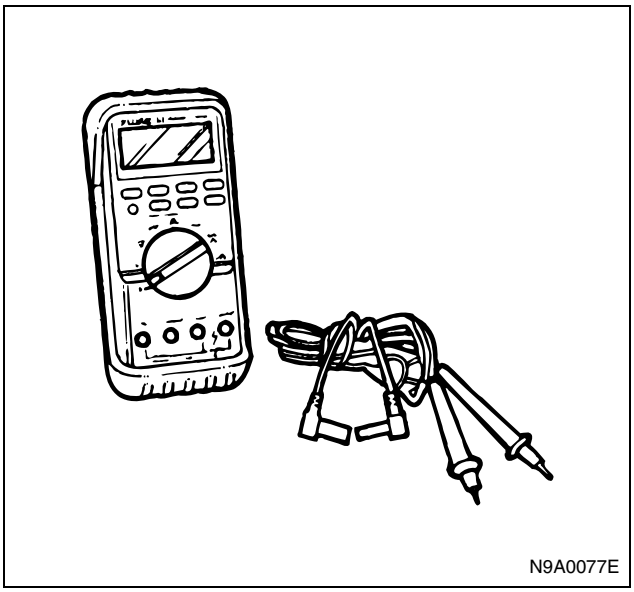
Caution:
When this DTC is set, all the SRS system parts (SRS control unit, airbag, etc.) must be replaced. In addition, This DTC cannot be cleared. Be sure to disconnect the battery cable before replacement, otherwise it will result malfunction of replaced SRS system parts or cause battery short circuit.

Step	Action	Value	YES	NO
1	Has the “SRS system check” been performed?	—	Go to Step2	Go to “SRS system check”.
2	Are DTCs 25, 51, 53 also set as current code or history code (See notes mentioned above)?	—	If DTC 25 is set, go to DTC 25 chart. If DTC 51 is set, go to DTC 51 chart. If DTC 53 is set, go to DTC 53 chart.	Turn the starter switch to OFF. Replace the SRS control unit. Perform “SRS system check”.

Special Tool

5-8840-0366-0 DMM (digital multi-meter)

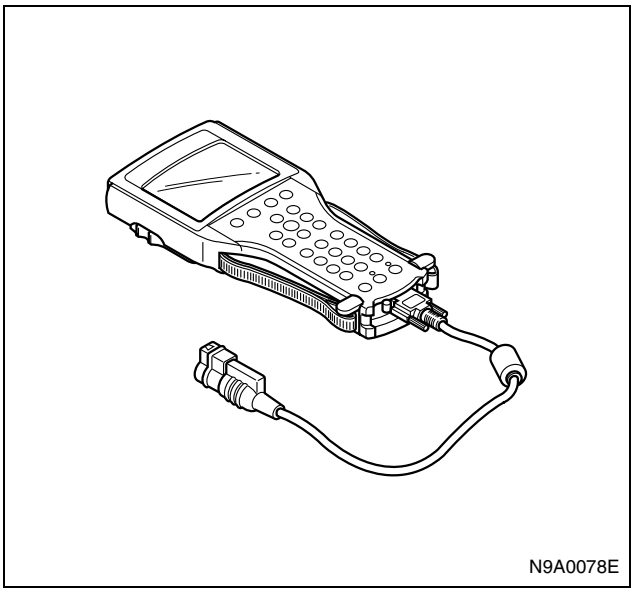
5-8840-0366-0 DMM is preferable for use of SRS diagnostics and repair. Use of other DMM is not authorized for SRS diagnostic and repair.
Use of other DMM may lead SRS parts deployment.



N9A0077E

Tech 2

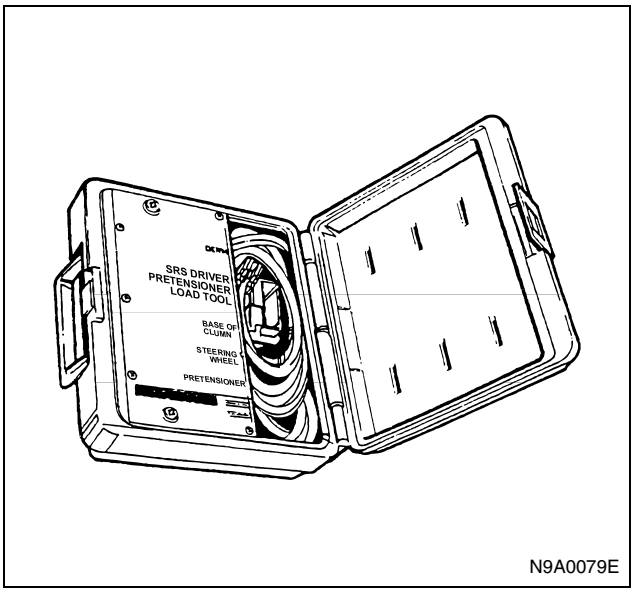
Use Tech 2 to read and clear SRS diagnostic trouble code.



N9A0078E

5-8840-2421-0 SRS substitute load

This tool is used for diagnostic aid and for safety device to prevent unnecessary SRS airbag deployment.
Three yellow connectors are provided to the SRS substitute load case.
These small three connectors work as substitute for resistance load device electrically.
One of the small connector substitutes the load of SRS coil assembly by connecting to the SRS coil assembly located in the upper portion of steering column. Another small connector substitutes the load of driver's airbag assembly by connecting to the SRS harness connector located in the lower portion of steering column.
Use of substitute load in place of inflator circuit resistance when necessary enables to judge if the parts in the inflator circuit cause the system function fault, and also enables to detect which part causes the function fault.
Substitute load must be used only when it is necessary in the diagnostic procedure.



N9A0079E

5-8840-0385-0 Connector test adapter kit

Connector test adapter kit is necessary whenever terminal inspection or detail inspection is requested in the diagnostic procedure. Use appropriate adapter to prevent terminals from damage such as bending by DMM probe. It is also useful to find poor contact caused by insufficient pressure by checking if sufficient pressure is applied to the terminal.
